All:

I had asked BLM for recent LHA data earlier this year for GuSG, with the thought of expanding the extent of the request to Greater. There was some initial communication that these data were not yet available, and then I did not hear back from BLM at all. It appears that these raw land health data are now available to join to the allotment polygons. I would recommend that we request the raw data from BLM so that we can then create our own maps, checking that representations and colors are correct.

> It is a nice visual image but some of the mapping colors are incorrectly colored based on the information provided. The map color is based on the Land Health Status response. With a quick check, I found several allotments where the land health comments 2013 dataset indicates that all standards are met but yet the land health status still indicates that the health status is not met due to livestock (so there are more reds (not met due to livestock) than there should be if the information is correct. Found several allotments where the land health status indicates not enough information (orange) but there is information under the 2013 dataset for land health comments. Not sure how to interpret this. There will be a visual difference in the color scheme once everything is corrected but not sure how overall appearance will change based on my quick check. But if you are interested in a specific area, you could check each allotment and get an idea of where the problem areas are located.
