Hi Kevin,

I am wondering what you think of the idea of my extending this meta-analysis, specifically for our needs, by researching and listing the actual moving window distances used in each study along with the rationale each researcher gave for using that sized window? Blaine starts to get at this in tables 4 and 5 and figures 1 and 2, by giving the frequency of scale classes, but the specifics that might help us choose and justify analysis windows are not provided.

Thoughts?
Lara

You should be able to fly quickly through the 2nd chapter – which will eventually become the paper. I think it is publishable. I'd appreciate any input you might have.
