The only difference is the number required to have core constitute 35% of Sage-grouse habitat. That is actually about 2.2 million acres. All other numbers appear to be correct in having incorporated the new core area.

Hi Guys - as the keepers of the spreadsheet, could you please verify these statements are still accurate, given the new proposed core area? Thanks!!

In Montana, core habitat encompasses 10% of the state and 28% of GSG habitat.
Montana would need to add approximately 2.5 million acres of core to approach the Wyoming figure of 35%,
In Montana 54% of core occurs in private ownership and 35% in federal ownership.
