Criteria for use by FO biologists in review of effectiveness of projects entered into the CED
9 Feb 2015

The Conservation Efforts Database (CED) Team has a near-complete report format for use by Field Office (FO) biologists in reviewing and evaluating the effectiveness (in addressing threats to sage-grouse) of projects that have been entered into the CED. FO biologists will receive a report (Excel file) listing projects that address primary threats to sage-grouse in their respective states and WAFWA Management Zones. The report generated for review will include only those projects reported as complete and as effective by the project proponents. FO biologists will be asked to determine whether or not they agree with the proponents' self-reported effectiveness for each project. A key question is how reviewing biologists will document their decision (in columns provided in the spreadsheet for this purpose). (b) (5) [redacted]
