

## Appendix E-4: Dunes and Shorelines

**Total Respondents 1**

### 13. What current monitoring efforts by state agencies are you aware of for the Wildlife in Dunes and Shorelines Habitat in Indiana?

	<b>Yes, these efforts occur</b>	<b>Not aware of these efforts occurring</b>	<b>Response Total</b>
Statewide year-round monitoring conducted by state agencies	0% (0)	100% (1)	<b>1</b>
Statewide once a year monitoring conducted by state agencies	0% (0)	100% (1)	<b>1</b>
Periodic statewide (less than once a year but still regularly scheduled) monitoring conducted by state agencies	0% (0)	100% (1)	<b>1</b>
Occasional statewide (less than once a year and not regularly scheduled) monitoring conducted by state agencies	100% (1)	0% (0)	<b>1</b>
Regional or local year-round monitoring conducted by state agencies	0% (0)	100% (1)	<b>1</b>
Regional or local once a year monitoring conducted by state agencies	0% (0)	100% (1)	<b>1</b>
Periodic regional or local (less than once a year but still regularly scheduled) monitoring conducted by state agencies	0% (0)	100% (1)	<b>1</b>
Occasional regional or local (less than once a year and not regularly scheduled) monitoring conducted by state agencies	0% (0)	100% (1)	<b>1</b>
		<b>Total Respondents</b>	<b>8</b>

### 14. What current monitoring efforts by other organizations are you aware of for the Wildlife in Dunes and Shorelines Habitat in Indiana?

	<b>Yes, these efforts occur</b>	<b>Not aware of these efforts occurring</b>	<b>Response Total</b>
Statewide year-round monitoring conducted by other organizations	0% (0)	100% (1)	<b>1</b>
Statewide once a year monitoring conducted by other organizations	100% (1)	0% (0)	<b>1</b>
Periodic statewide (less than once a year but still regularly scheduled) monitoring conducted by other organizations	0% (0)	100% (1)	<b>1</b>
Occasional statewide (less than once a year and not regularly scheduled) monitoring conducted by other organizations	0% (0)	100% (1)	<b>1</b>
Regional or local year-round monitoring conducted by other organizations	0% (0)	100% (1)	<b>1</b>
Regional or local once a year monitoring conducted by other organizations	0% (0)	100% (1)	<b>1</b>
Periodic regional or local (less than once a year but still regularly scheduled) monitoring conducted by other organizations	100% (1)	0% (0)	<b>1</b>
Occasional regional or local (less than once a year and not			

## Appendix E-4: Dunes and Shorelines

regularly scheduled) monitoring conducted by other organizations

**Total Respondents 8**

### 15. How crucial are these monitoring efforts by state agencies for the conservation of the Wildlife in Dunes and Shorelines Habitat in Indiana?

	<b>Very crucial</b>	<b>Somewhat crucial</b>	<b>Slightly crucial</b>	<b>Not crucial</b>	<b>Unknown</b>	<b>Response Total</b>
Statewide year-round monitoring conducted by state agencies	0% (0)	0% (0)	0% (0)	100% (1)	0% (0)	<b>1</b>
Statewide once a year monitoring conducted by state agencies	0% (0)	0% (0)	0% (0)	100% (1)	0% (0)	<b>1</b>
Periodic statewide (less than once a year but still regularly scheduled) monitoring conducted by state agencies	0% (0)	0% (0)	100% (1)	0% (0)	0% (0)	<b>1</b>
Occasional statewide (less than once a year and not regularly scheduled) monitoring conducted by state agencies	0% (0)	0% (0)	0% (0)	100% (1)	0% (0)	<b>1</b>
Regional or local year-round monitoring conducted by state agencies	0% (0)	0% (0)	0% (0)	100% (1)	0% (0)	<b>1</b>
Regional or local once a year monitoring conducted by state agencies	0% (0)	0% (0)	0% (0)	100% (1)	0% (0)	<b>1</b>
Periodic regional or local (less than once a year but still regularly scheduled) monitoring conducted by state agencies	0% (0)	0% (0)	0% (0)	100% (1)	0% (0)	<b>1</b>
Occasional regional or local (less than once a year and not regularly scheduled) monitoring conducted by state agencies	0% (0)	0% (0)	0% (0)	100% (1)	0% (0)	<b>1</b>
				<b>Total Respondents</b>		<b>8</b>

## Appendix E-4: Dunes and Shorelines

### 16. How crucial are these monitoring efforts by other organizations for the conservation of the Wildlife in Dunes and Shorelines Habitat in Indiana?

	Very crucial	Somewhat crucial	Slightly crucial	Not crucial	Unknown	Response Total				
Statewide year-round monitoring conducted by other organizations	0% (0)	0% (0)	0% (0)	100% (1)	0% (0)	1				
Statewide once a year monitoring conducted by other organizations	0% (0)	0% (0)	100% (1)	0% (0)	0% (0)	1				
Periodic statewide (less than once a year but still regularly scheduled) monitoring conducted by other organizations	0% (0)	0% (0)	0% (0)	100% (1)	0% (0)	1

**8.** Other threats to the Wildlife in Aquatic Systems Impoundments Habitat in Indiana.

No responses were entered for this question.

**Total Respondents**      **0**

**9.** Please briefly describe the top two threats to the Wildlife in Aquatic Systems Impoundments Habitat in Indiana identified above.

1. over population

2. (1) habitat loss (feeding areas) - many reservoirs are getting very old and the once abundant standing timber is now diminishing which is reducing cover for white crappie.

(2) dependence on irregular sources - in many reservoirs, shad is the dominant forage base for crappie. If shad are growing extremely fast, crappie can only utilize shad for a short period of time before the shad outgrow the size crappie can consume.

3. 1) competition with invasives, namely gizzard shad

2) water level control regimes at impoundments

**Total Respondents**      **3**

## Appendix E-5: Impoundments

**10.** Please rank the following threats to the HABITAT of the Wildlife in Aquatic Systems Impoundments Habitat in Indiana.

	<b>Critical threat</b>	<b>Serious threat</b>	<b>Somewhat of a threat</b>	<b>Slight threat</b>	<b>No threat</b>	<b>Unknown</b>	<b>Response Total</b>													
Commercial or residential development (sprawl)	0% (0)	0% (0)	33% (1)	33% (1)	33% (1)	0% (0)	<b>3</b>													
Counterproductive financial incentives or regulations	0% (0)	0% (0)	0% (0)	33% (1)	0% (0)	67% (2)	<b>3</b>													
Invasive/non-native species	0% (0)	33% (1)	0% (0)	33% (1)	0% (0)	33% (1)	<b>3</b>													
Nonpoint source pollution (sedimentation and nutrients)	0% (0)	100% (3)	0% (0)	0% (0)	0% (0)	0% (0)	<b>3</b>

**11.** Other HABITAT threats to the Wildlife in Aquatic Systems Impoundments Habitat in Indiana.

No responses were entered for this question.

**Total Respondents 0**

## Appendix E-5: Impoundments

**12.** Please briefly describe the top two HABITAT threats to the Wildlife in Aquatic Systems Impoundments Habitat in Indiana identified above.

1. (1) regulation of impounded water - extreme water fluctuations in mainly the Army Corps reservoirs can negatively effect crappie populations especially if the water fluctuations occur during spawning  
 (2) habitat degradation - the natural decomposition of flooded timber and woody debris is lessening the available cover for crappie. Also, siltation covers root wads left in the bottom of an impoundment which eliminates useable crappie cover.

2. habitat loss/degradation due to a variety of circumstances

**Total Respondents 2**

**13.** What current monitoring efforts by state agencies are you aware of for the Wildlife in Aquatic Systems Impoundments Habitat in Indiana?

	<b>Yes, these efforts occur</b>	<b>Not aware of these efforts occurring</b>	<b>Response Total</b>
Statewide year-round monitoring conducted by state agencies	0% (0)	100% (3)	<b>3</b>
Statewide once a year monitoring conducted by state agencies	0% (0)	100% (3)	<b>3</b>
Periodic statewide (less than once a year but still regularly scheduled) monitoring conducted by state agencies	0% (0)	100% (3)	<b>3</b>
Occasional statewide (less than once a year and not regularly scheduled) monitoring conducted by state agencies	0% (0)	100% (3)	<b>3</b>
Regional or local year-round monitoring conducted by state agencies	0% (0)	100% (3)	<b>3</b>

Regional or local once a year monitoring conducted by state agencies	33% (1)	33% (1)	33% (1)	0% (0)	0% (0)	3
Periodic regional or local (less than once a year but still regularly scheduled) monitoring conducted by state agencies	33% (1)	67% (2)	0% (0)	0% (0)	0% (0)	3
Occasional regional or local (less than once a year and not regularly scheduled) monitoring conducted by state agencies	33% (1)	33% (1)	33% (1)	0% (0)	0% (0)	3

## Appendix E-5: Impoundments

**18.** Regional or local monitoring by other organizations for the Wildlife in Aquatic Systems Impoundments Habitat in Indiana.

1. none
2. none known
3. not aware of any

**Total Respondents 3**

**19.** Please list organizations that are monitoring the Wildlife in Aquatic Systems Impoundments Habitat in Indiana.

1. DNR/DFW
2. none known
3. NA

**Total Respondents 3**

## Appendix E-5: Impoundments

**22.** What one or two monitoring techniques would you recommend for effective conservation of the Wildlife in Aquatic Systems Impoundments Habitat in Indiana?

1. Electrofishing surveys
- Trap netting surveys
- Gill netting surveys
- Angler creel surveys
- Population estimates

2. (1) Reporting from harvest(angler creel surveys) - This survey will show angler exploitation.
- (2) Professional survey (fish management surveys) - This survey will show size structure, relative abundance, and provide age and growth information.

**Total Respondents 2**

**23.** What current HABITAT inventory and assessment efforts or activities by state agencies are you aware of for the Wildlife in Aquatic Systems Impoundments Habitat in Indiana?

	Yes, these efforts occur	No effort that I'm aware of	Response Total
Statewide annual inventory and assessment conducted by state agencies	0% (0)	100% (3)	<b>3</b>
Statewide once a year inventory and assessment conducted by state agencies	0% (0)	100% (3)	<b>3</b>

### 47. Other current HABITAT conservation practices for the Wildlife in Aquatic Systems Impoundments Habitat in Indiana.

No responses were entered for this question.

**Total Respondents 0**

### 48. What one or two specific HABITAT practices would you recommend for more effective conservation of the Wildlife in Aquatic Systems Impoundments Habitat in Indiana?

1. (1) Improve land use practices in watershed will reduce sedimentation in impoundments and reduce nutrient inputs. Reducing nutrient inputs will allow a deeper thermocline which is important for crappie growth. Crappie growth suffers when water temperatures become too high.

(2) Habitat restoration in the form of woody debris.

2. in Army Corps of Engineers impoundments alterations in water level control would likely benefit crappie

**44.** Other current conservation practices for the Wildlife in Kettle Lakes Habitat in Indiana.

Unknown

**Total Respondents 1**

Appendix E-6: Kettle Lakes

**45.** What one or two specific practices would you recommend for more effective conservation of the Wildlife in Kettle Lakes Habitat in Indiana?

1. Habitat protection (without habitat the Mallard won't do well) Population management (makes use of surplus numbers and regulates take) "The Mallard" by John Madson Olin Mathieson Chemical Corporation.
2. Habitat Protection (intensive) Reproduction and Protection, Ducks, Geese & Swans of North America, Bellrose Protection of Migrating Routes (intensive) Same
3. Hen houses  
habitat conservation  
buffer zones

**Total Respondents 3**

**46.** How well do the following conservation efforts address the HABITAT threats to the Wildlife in Kettle Lakes Habitat in Indiana?

	Very well	Somewhat	Not at all	Not used	Unknown	Response Total
Habitat protection through regulation	67% (2)	33% (1)	0% (0)	0% (0)	0% (0)	3
Habitat protection on public lands	100% (3)	0% (0)	0% (0)	0% (0)	0% (0)	3
Habitat protection incentives (financial)	33% (1)	67% (2)	0% (0)	0% (0)	0% (0)	3
Habitat restoration through regulation	33% (1)	67% (2)	0% (0)	0% (0)	0% (0)	3
Habitat restoration on public lands	67% (2)	33% (1)	0% (0)	0% (0)	0% (0)	3
Habitat restoration incentives (financial)	33% (1)	67% (2)	0% (0)	0% (0)	0% (0)	3
Artificial habitat creation (artificial reefs, nesting platforms)	33% (1)	33% (1)	0% (0)	33% (1)	0% (0)	3
Selective use of functionally equivalent exotic species in place of extirpated natives	0% (0)	67% (2)	0% (0)	33% (1)	0% (0)	3
Succession control (fire, mowing)	33% (1)	33% (1)	0% (0)	33% (1)	0% (0)	3
Corridor development/protection	33% (1)	33% (1)	0% (0)	33% (1)	0% (0)	3
Managing water regimes	67% (2)	0% (0)	0% (0)	0% (0)	33% (1)	3
Pollution reduction	0% (0)	100% (3)	0% (0)	0% (0)	0% (0)	3
Protection of adjacent buffer zone	33% (1)	67% (2)	0% (0)	0% (0)	0% (0)	3
Restrict public access and disturbance	33% (1)	33% (1)	0% (0)	33% (1)	0% (0)	3

						<b>Total Respondents 53</b>

**47.** Other current HABITAT conservation practices for the Wildlife in Kettle Lakes Habitat in Indiana.

## Appendix E-6: Kettle Lakes

Unknown

**Total Respondents 1**

**48.** What one or two specific HABITAT practices would you recommend for more effective conservation of the Wildlife in Kettle Lakes Habitat in Indiana?

1. Habitat protection through regulation (only sure way to protect habitat without public ownership) Purchase more public land.
2. Habitat protection through regulation, (less intensive)cover a large geographic area. Ducks, Geese & Swans of North America, Bellrose  
Habitat Protection through incentives, (intensive), best landowner cooperation, Same
3. Landowner programs  
buffers  
habitat conservation regulations

**Total Respondents 3**

**49.** Do you have any additional comments or information on the Wildlife in Kettle Lakes Habitat that you feel would be useful in the development of the Indiana Comprehensive Wildlife Strategy?

1. No
2. Kettle Lakes are limited in number, although habitat surrounding them can be manipulated. No new Kettle Lakes can be created so it is critical to provide protection through, regulations, incentives and management.
3. Provide information on habitat creation and farming techniques.  
Provide incentives to create/maintain such habitat

**Total Respondents 3**

## Appendix E-7: Lake Michigan

### 8. Other threats to the Wildlife in Lake Michigan Habitat in Indiana.

Commercial over exploitation resulting in low spawner stock abundance.

Egg predators predation, nutritional requirements, early mortality syndrome

**Total Respondents 2**

### 9. Please briefly describe the top two threats to the Wildlife in Lake Michigan Habitat in Indiana identified above.

Year class failure related to low spawner stock abundance. Competition with non native wildlife species for limited available food resources.

Lack of successful spawning, possibly related to bioenergetics. Too much egg predation.

**Total Respondents 2**

Appendix E-7: Lake Michigan

**10.** Please rank the following threats to the HABITAT of the Wildlife in Lake Michigan Habitat in Indiana.

	<b>Critical threat</b>	<b>Serious threat</b>	<b>Somewhat of a threat</b>	<b>Slight threat</b>	<b>No threat</b>	<b>Unknown</b>	<b>Response Total</b>
Commercial or residential development (sprawl)	0% (0)	0% (0)	0% (0)	0% (0)	100% (2)	0% (0)	<b>2</b>

## Appendix E-7: Lake Michigan

### 31. Other HABITAT inventory and assessment techniques for the Wildlife in Lake Michigan Habitat in Indiana.

Bottom mapping of habitat.

**Total Respondents 1**

### 32. What one or two HABITAT inventory and assessment techniques would you recommend for effective conservation of the Wildlife in Lake Michigan Habitat in Indiana?

Lidar mapping would help identify spawning areas within the nearshore zone along Indiana's coastline.

Digital satellite imagery to conduct bottom contour mapping in nearshore spawning areas.

**Total Respondents 2**

### 33. What is the current body of science for the Wildlife in Lake Michigan Habitat in Indiana?

		Response Total	Response Percent
Complete, up to date and extensive		0	0%
Adequate		1	50%
Inadequate		1	50%
Nonexistent		0	0%
Other (please explain below)		0	0%
		<b>Total Respondents</b>	<b>2</b>

### 34. Please provide a citation (title, author, date, publisher) that would give the best overview of the Wildlife in Lake Michigan Habitat in Indiana, if available. This resource may be used if further detail is needed.

Title = Preliminary Results of 2004 Ball State University Yellow Perch Research in Indiana Waters of Lake Michigan;

Author = Paul Allen and Thomas Lauer;

Date = October 2004;

				<b>Total Respondents</b>		<b>32</b>

### 44. Other current conservation practices for the Wildlife in Lake Michigan Habitat in Indiana.

Regulation of sport harvest. Closure of commercial fishery to allow spawning stock biomass to increase, thus allowing for the production of offspring that can eventually add to the spawning stock biomass.

**Total Respondents 1**

### 45. What one or two specific practices would you recommend for more effective conservation of the Wildlife in Lake Michigan Habitat in Indiana?

Completely eliminate commercial fishing. This appears to have reduced the spawning stock to a level that could not maintain a fishery.

**Total Respondents 1**

## Appendix E-7: Lake Michigan

**47.** Other current HABITAT conservation practices for the Wildlife in Lake Michigan Habitat in Indiana.

Limiting disturbance through the construction(DOW) permit process.

**Total Respondents 1**

**48.** What one or two specific HABITAT practices would you recommend for more effective conservation of the Wildlife in Lake Michigan Habitat in Indiana?

Habitat creation, ie. artificial structures during lake construction projects

**Total Respondents 1**

## Appendix E-7: Lake Michigan

- 49.** Do you have any additional comments or information on the Wildlife in Lake Michigan Habitat that you feel would be useful in the development of the Indiana Comprehensive Wildlife Strategy?

Much research work has been done on the the yellow perch by Ball State University since the mid 1970's. This works serves as the framework for the management of the population in Indiana's waters of Lake Michigan. It is critical that funding for this project continue to maintain the dataset. It is the largest and longest dataset for yellow perch on all of Lake Michigan and has served as the foundation for many management decisions on sport and commerical harvest decisions.

						<b>Total Respondents</b>	<b>37</b>

**8.** Other threats to the Wildlife in Natural Lakes Habitat in Indiana.

No responses were entered for this question.

**Total Respondents 0**

**9.** Please briefly describe the top two threats to the Wildlife in Natural Lakes Habitat in Indiana identified above.

1. Long-term declines in water quality associated with lake eutrophication.  
Annual and seasonal variations in habitat availability.

2. -Cold, clear water is critical for cisco survival; increased runoff and nutrient loading have degraded the habitat for this species in many of the 50+ lakes it once occurred in. Few lakes still have the species, and there is apparently little to no reproduction.

-The deliberate stocking of predator fish in cisco lakes has been a threat to this species for years; if this hasn't been stopped, it needs to.

1. Loss of habitat (reproductive/feeding) that is essential for northern pike survival  
Over harvest and illegal harvest (This doesn't seem to be a major threat as of now)

1. Loss of undisturbed natural lake habitat.

Appendix E-8: Natural Lakes

## Appendix E-8: Natural Lakes

**12.** Please briefly describe the top two HABITAT threats to the Wildlife in Natural Lakes Habitat in Indiana identified above.

Habitat degradation  
Successional change

Water quality degradation that leads to cloudy water is the key threat.

1. Emergent bulrush and wetland habitat loss. It has been well documented in northern states that northern pike prefer flooded vegetation for spawning during the spring. Loss of this habitat from boating and wildlife (waterfowl and muskrat feeding) may reduce reproductive habitat for northern pike in some natural lakes.

2. Bulkhead seawall development reduces emergent vegetation used by northern pike for reproduction and for cover during feeding.

Shoreline and labeled alterations

**Total Respondents 4**

**13.** What current monitoring efforts by state agencies are you aware of for the Wildlife in Natural Lakes Habitat in Indiana?

	<b>Yes, these efforts occur</b>	<b>Not aware of these efforts occurring</b>	<b>Response Total</b>
Statewide year-round monitoring conducted by state agencies	0% (0)	100% (4)	<b>4</b>
Statewide once a year monitoring conducted by state agencies	0% (0)	100% (4)	<b>4</b>

### 17. Regional or local state agency monitoring for the Wildlife in Natural Lakes Habitat in Indiana.

1. Division of Fish and Wildlife at cisco lakes  
Department of Environmental Management water quality monitoring

2. NE Indiana by DFW (Jed Pearson)

1. Northern Pike are monitored via general fish surveys conducted to update lake status. There is now monitoring of northern pike on a general schedule.
2. There was a tracking study conducted in two Indiana natural lakes in the late 1990's by the IDNR to better understand reproductive habitat of northern pike.

Division of Fish and Wildlife standardized largemouth bass sampling protocols  
Tournament fishing monitoring by the Division of Fish and Wildlife

**Total Respondents**      **4**

### 18. Regional or local monitoring by other organizations for the Wildlife in Natural Lakes Habitat in Indiana.

No responses were entered for this question.

**Total Respondents**      **0**

## Appendix E-8: Natural Lakes

**Total Respondents 0**

**22.** What one or two monitoring techniques would you recommend for effective conservation of the Wildlife in Natural Lakes Habitat in Indiana?

Occasional gill-netting to verify presence followed by intensive netting to confirm low levels or absence.

Large fyke-nets are used in Lake Webster (Kosciusko Co.) to collect brood stock for muskellunge. These nets would be useful in capturing northern pike as well. This would allow biologist to capture enough fish to get a representative sample of adult fish. There is still no effective method of sampling young esocids without mortality.

Springtime dc electrofishing according to DFW standard protocol  
Standard DFW creel survey procedures  
Tournament monitoring by the DFW and bass clubs

**Total Respondents 3**

## Appendix E-8: Natural Lakes

### 45. What one or two specific practices would you recommend for more effective conservation of the Wildlife in Natural Lakes Habitat in Indiana?

1. Habitat protection and education to reduce habitat disturbance

2. -Assure there is no stocking of predator fish in cisco lakes

-Greatly limit/mitigate any new development on cisco lakes, particularly addressing runoff from lawns and other water quality issues

-Work to get any farmlands adjacent to cisco lakes into no-till

1. Implementation of ecozones in undeveloped areas to conserve that vegetation present.

2. Implement a catch and release only regulation in lakes with low densities.

Habitat management and harvest management

**Total Respondents 4**

**47.** Other current HABITAT conservation practices for the Wildlife in Oxboxes/Backwaters/Sloughs/Embayments Habitat in Indiana.

No responses were entered for this question.

**Total Respondents 0**

(skipped this question) 1

**48.** What one or two specific HABITAT practices would you recommend for more effective conservation of the Wildlife in Oxboxes/Backwaters/Sloughs/Embayments Habitat in Indiana?

Habitat protection. However more research is needed to address the effectiveness of habitat restoration on siren conservation.

Corridor protection

**Total Respondents 2**

## Appendix E-9: Oxboxes/Backwaters/Sloughs/Embayments

## Appendix E-9: Oxboxes/Backwaters/Sloughs/Embayments

**49.** Do you have any additional comments or information on the Wildlife in Oxbows/Backwaters/Sloughs/Embayments Habitat that you feel would be useful in the development of the Indiana Comprehensive Wildlife Strategy?

We need to learn a lot more about lesser sirens in order to develop a good conservation design.

**Total Respondents 1**

## Appendix E-10: Rivers and Streams

## Appendix E-10: Rivers and Streams

**12.** Please briefly describe the top two HABITAT threats to the Wildlife in Rivers and Streams Habitat in Indiana identified above.

1. Stream channelization removing nesting sites and destroying brood habitat. Soil runoff caused by poor agricultural practices and urban development.

2. 1. Channelization removes and/or changes the vegetative and invertebrate communities. Channelization also alters the natural water flow which results in a much degraded habitat.

2. The loss of bottomland hardwoods continues to be a threat. These areas provide a high quality food source and nesting sites for woodies.

3. Drainage Practices  
Stream Channelization

The participant is forced to speculate about the meaning of successional and climate change. Agriculture/Forestry practices have different effects. Grouping these practices as a single category does not appropriately represent the individual practice. Point and nonpoint pollution may have a positive or negative impact.

**Total Respondents 4**

## Appendix E-10: Rivers and Streams

**13.** What current monitoring efforts by state agencies are you aware of for the Wildlife in Rivers and Streams Habitat in Indiana?

	<b>Yes, these efforts occur</b>	<b>Not aware of these efforts occurring</b>	<b>Response Total</b>
Statewide year-round monitoring conducted by state agencies	50% (2)	50% (2)	<b>4</b>
Statewide once a year monitoring conducted by state agencies	33% (1)	67% (2)	<b>3</b>
Periodic statewide (less than once a year but still regularly scheduled) monitoring conducted by state agencies	0% (0)	100% (3)	<b>3</b>
Occasional statewide (less than once a year and not regularly scheduled) monitoring conducted by state agencies	0% (0)	100% (3)	<b>3</b>

## Appendix E-10: Rivers and Streams

### 45. What one or two specific practices would you recommend for more effective conservation of the Wildlife in Rivers and Streams Habitat in Indiana?

1. To best benefit the Wood Duck, one must first improve the habitat. This particular question seems redundant with #48. Therefore refer to my answer in box number 48.

2. Habitat protection  
nest boxes

See #43. In addition, although not habitat specific, outreach programs are needed to effectively and accurately educate citizens about wildlife (game and non-game), the wildlife conservation model (for game and non-game), and the need for effective mink management programs.

**Total Respondents 3**

### 46. How well do the following conservation efforts address the HABITAT threats to the Wildlife in Rivers and Streams Habitat in Indiana?

	<b>Very well</b>	<b>Somewhat</b>	<b>Not at all</b>	<b>Not used</b>	<b>Unknown</b>	<b>Response Total</b>
Habitat protection through regulation	25% (1)	50% (2)	25% (1)	0% (0)	0% (0)	<b>4</b>

## Appendix E-12: Rivers and Streams Great Lakes Drainage Headwater

**22.** What one or two monitoring techniques would you recommend for effective conservation of the Wildlife in Headwaters of the Great Lakes Drainage Habitat in Indiana?

Stream sampling using electrofishing techniques and seining. This should be done every 5 years to get a clear picture of changes that occur to habitat, water quality and invasive species introductions and distribution.

Rotational sampling at reference sites along the headwaters. Historical comparisons from the early 80's will be compared with the sampling that was completed 2001-2004.

**Total Respondents      2**

**47.** Other current HABITAT conservation practices for the Wildlife in Headwaters of the Great Lakes Drainage Habitat in Indiana.

No responses were entered for this question.

**Total Respondents 0**

**48.** What one or two specific HABITAT practices would you recommend for more effective conservation of the Wildlife in Headwaters of the Great Lakes Drainage Habitat in Indiana?

Protection of habitat through land use planning. Currently most of the headwaters areas run through agricultural areas and need to maintain riparian buffer strips.

**Total Respondents 1**

## Appendix E-12: Rivers and Streams Great Lakes Drainage Headwater

- 49.** Do you have any additional comments or information on the Wildlife in Headwaters of the Great Lakes Drainage Habitat in Indiana that you feel would be useful in the development of the Indiana Comprehensive Wildlife Strategy?

It has been over 20 years since the surveys were conducted, prior to the 2001-2004 surveys. It is important that surveys be conducted every 5 years or so to document changes to water quality, habitat and riparian zone protection.

**Total Respondents 1**

Appendix E-13: Rivers and Streams Great Lakes Drainage Wadeable/Large River

**7.** Please also rank these threats to the Wildlife in Wadeable/ Large Rivers of the Great Lakes Drainage Habitat in Indiana.

	<b>Critical threat</b>	<b>Serious threat</b>	<b>Somewhat of a threat</b>	<b>Slight threat</b>	<b>No threat</b>	<b>Unknown</b>	<b>Response Total</b>
Habitat loss (breeding range)	0% (0)	100% (3)	0% (0)	0% (0)	0% (0)	0% (0)	<b>3</b>
Habitat loss (feeding/foraging areas)	33% (1)	67% (2)	0% (0)	0% (0)	0% (0)	0% (0)	<b>3</b>
Small native range (high endemism)	0% (0)	0% (0)	0% (0)	0% (0)	67% (2)	33% (1)	<b>3</b>
Near limits of natural geographic range	0% (0)	0% (0)	0% (0)	33% (1)	67% (2)	0% (0)	<b>3</b>
Large home range requirements	0% (0)	0% (0)	0% (0)	0% (0)	67% (2)	33% (1)	<b>3</b>
Viable reproductive population size or availability	0% (0)	0% (0)	33% (1)	33% (1)	33% (1)	0% (0)	<b>3</b>
Specialized reproductive behavior or low reproductive rates	33% (1)	0% (0)	33% (1)	0% (0)	33% (1)	0% (0)	<b>3</b>

Genetic pollution (hybridization)	0% (0)	0% (0)	0% (0)	33% (1)	67% (2)	0% (0)	<b>3</b>
Unknown	0% (0)	0% (0)	0% (0)	0% (0)	50% (1)	50% (1)	<b>2</b>
Other (please specify below)	0% (0)	0% (0)	0% (0)	0% (0)	0% (0)	100% (1)	<b>1</b>
<b>Total Respondents</b>							<b>30</b>

**8.** Other threats to the Wildlife in Wadeable/ Large Rivers of the Great Lakes Drainage Habitat in Indiana.

My area of expertise is effects of contamination on biological organisms, especially aquatic. This makes filling out the survey difficult. My knowledge is applicable to aquatic habitats rather than specific wildlife species in this survey.

**Total Respondents 1**

**9.** Please briefly describe the top two threats to the Wildlife in Wadeable/ Large Rivers of the Great Lakes Drainage Habitat in Indiana identified above.

1. The acute effects of toxicants are recognized as a threat to organisms, but there is little knowledge on ecosystems or regional effects on chronic insults. Toxicants are more destructive to the embryonic stages, but these are poorly documented. Pollution controls do not have definite focus on chronic effects

2. Habitat loss and pollution

Siltation- hornyhead chub are sight-feeders and mound builders for spawning; thus, muddy water will hamper their chances of survival and if the silt covers gravel and their nest, chances for successful reproduction will be limited. Competition from other wildlife species better adapted to muddy and silty stream conditions

1. Runoff, mostly agricultural
2. Instream modifications

Appendix E-13: Rivers and Streams Great Lakes Drainage Wadeable/Large River

Total Respondents 4

**10.** Please rank the following threats to the HABITAT of the Wildlife in Wadeable/ Large Rivers of the Great Lakes Drainage Habitat in Indiana.

	Critical threat	Serious threat	Somewhat of a threat	Slight threat	No threat	Unknown	Response Total
Commercial or residential development (sprawl)	33% (1)	33% (1)	33% (1)	0% (0)	0% (0)	0% (0)	3
Counterproductive financial incentives or regulations	0% (0)	0% (0)	0% (0)	0% (0)	33% (1)	67% (2)	3

**17.** Regional or local state agency monitoring for the Wildlife in Wadeable/ Large Rivers of the Great Lakes Drainage Habitat in Indiana.

IDNR periodically conducts fish stream surveys. IDEM conducts stream health surveys using fish and invertebrates.

IDEM monitors the Great Lakes Drainage once every five years; thus, they may have data available for hornyhead chub captured in the basin as part of the fish community assessments. IDNR may also sample fish communities in this area and have data on the hornyhead chub.

Maumee system

**Total Respondents 3**

**18.** Regional or local monitoring by other organizations for the Wildlife in Wadeable/ Large Rivers of the Great Lakes Drainage Habitat in Indiana.

In some cities stream health is also assessed by fish and invertebrate surveys.

Elkhart Public Works and Utilities has a fisheries biologist on staff that actively collects fish community samples from the Great Lakes Basin (1-2 times in the summer). He may have data on the hornyhead chub as well.

Maumee system

## Appendix E-13: Rivers and Streams Great Lakes Drainage Wadeable/Large River

**22.** What one or two monitoring techniques would you recommend for effective conservation of the Wildlife in Wadeable/ Large Rivers of the Great Lakes Drainage Habitat in Indiana?

Professional Fish Surveys and Creel Surveys

IDEM, IDNR, and Elkhart use electrofishing equipment to sample fish communities; however, a seine could probably be used as well as tagging and radio telemetry to track the species movement.

1. Intensive quantitative sampling of known populations. Need to understand demography of wildlife species. See Strayer & Smith, 2003. AFS Monogr. 8.
2. Less intensive qualitative sampling of new or not recently surveyed areas. Need to determine distribution and status of wildlife species. See same for protocols.

#### 44. Other current conservation practices for the Wildlife in Wadeable/ Large Rivers of the Great Lakes Drainage Habitat in Indiana.

Habitat protection if it greatly reduced the turbidity in streams for hornyhead chub feeding and breeding behaviors. Also, exotic/invasive species control would help the hornyhead population. The hornyhead chub is sensitive to pollution so limiting contact with pollutants/contaminants would benefit the species. The hornyhead chub is also a popular bait fish, so regulation of collecting would be beneficial to the species.

**Total Respondents 1**

## Appendix E-13: Rivers and Streams Great Lakes Drainage Wadeable/Large River

**45.** What one or two specific practices would you recommend for more effective conservation of the Wildlife in Wadeable/ Large Rivers of the Great Lakes Drainage Habitat in Indiana?

Habitat protection and Public Education

Habitat protection - erosion controls

Exotic species - possession of exotic species illegal (must dispose of fish properly and not release back to stream)

1. Intensive quantitative sampling of known populations. Need to understand demography of wildlife species. See Strayer & Smith, 2003. AFS Monogr. 8.

2. Less intensive qualitative sampling of new or not recently surveyed areas. Need to determine distribution and status of wildlife species. See same for protocols.

						<b>Total Respondents      36</b>

## Appendix E-13: Rivers and Streams Great Lakes Drainage Wadeable/Large River

**47.** Other current HABITAT conservation practices for the Wildlife in Wadeable/ Large Rivers of the Great Lakes Drainage Habitat in Indiana.

Habitat protection and restoration on all lands by any means necessary would benefit all wildlife species (except those that are exotic and more tolerant than others) not just the hornyhead chub. Pollution reduction, protection of adjacent buffer zone, land use planning, and conservation easements would all be beneficial practices to the Hornyhead chub.

**Total Respondents 1**

**48.** What one or two specific HABITAT practices would you recommend for more effective conservation of the Wildlife in Wadeable/ Large Rivers of the Great Lakes Drainage Habitat in Indiana?

Protection and restoration of Buffer Zones

Protection of adjacent buffer zone  
Nonpoint Source Pollution reduction

1. Assess riparian corridor
  2. Water quality monitoring
- See Watters, 2000. Proc. 1st FMCS Symposium

**Total Respondents 3**

**49.** Do you have any additional comments or information on the Wildlife in Wadeable/ Large Rivers of the Great Lakes Drainage Habitat that you feel would be useful in the development of the Indiana Comprehensive Wildlife Strategy?

The overall smallmouth bass population in this area is somewhat poor aside from the St. Joseph River. I believe this is mostly due to the lack of habitat and loss of buffer zones. Buffer zones are vital to the health of smallmouth bass populations. They supply and protect habitat that is vital to the survival of the smallmouth bass.

IDEM has collected hornyhead chubs from the Elkhart River (Elkhart & Noble counties), St. Joseph River (DeKalb County), Cedar Creek (Allen Co.), Yellow Creek (Elkhart Co.), and Pigeon River (Lagrange Co.). If you would like the data, we can provide water chemistry, biological, and habitat data assessments.

**8.** Other threats to the Wildlife in Headwaters of the Kankakee River (Illinois River) Drainage Habitat in Indiana.

No responses were entered for this question.

**Total Respondents 0**

**9.** Please briefly describe the top two threats to the Wildlife in Headwaters of the Kankakee River (Illinois River) Drainage Habitat in Indiana identified above.

Pike have suffered a major loss of spawning habitat due to the prevalence of dredging within the watershed. This practice along with levee construction has resulted in the near elimination of instream an emargent wetland vegetation throughout the majority of the watershed.

Habitat loss - requires shallow clear water with little current in weedy areas over gravel, sand, and silt to feed on insects and lay reproduce

Dredging (removal of aquatic vegetation and increasing depth of ditch)

Runoff (increases flow of stream, turbidity, and siltation of needed substrates)

Habitat loss (breeding & feeding)- the tadpole madtom feeds in dense vegetation and hides from predators in the leaf litter, dead wood, and other cover. By removing vegetation and cover in the stream, the tadpole madtom also loses spawning areas (tadpole madtoms typically lay eggs under submerged objects).

Degradation of the stream channel will also increase the velocity of the current (if straightened or cleared of debris)

## Appendix E-14: Rivers and Streams Kankakee River (Illinois River) Drainage Headwater

which will remove the tadpole madtom's preferred current-free, quiet habitat.

**11.** Other HABITAT threats to the Wildlife in Headwaters of the Kankakee River (Illinois River) Drainage Habitat in Indiana.

No responses were entered for this question.

**Total Respondents      0**

**12.** Please briefly describe the top two HABITAT threats to the Wildlife in Headwaters of the Kankakee River (Illinois River) Drainage Habitat in Indiana identified above.

The channelization of many streams in the upper Kankakee watershed and the associated fragmentation of wetland habitat has severely altered the state of the aquatic habitat in general.

Appendix E-14: Rivers and Streams Kankakee River (Illinois River) Drainage Headwater

Non-point source pollution (sedimentation resulting in smothering of substrates and turbidity)  
 Habitat degradation (removal of vegetation and shallow water)

Stream channelization (straighting the channels to move water faster) and Habitat degradation (removal of debris in the stream to speed up the transfer of water off of the land and into the receiving stream)

**Total Respondents 3**

**13.** What current monitoring efforts by state agencies are you aware of for the Wildlife in Headwaters of the Kankakee River (Illinois River) Drainage Habitat in Indiana?

	<b>Yes, these efforts occur</b>	<b>Not aware of these efforts occurring</b>	<b>Response Total</b>
Statewide year-round monitoring conducted by state agencies	0% (0)	100% (3)	<b>3</b>
Statewide once a year monitoring conducted by state agencies	0% (0)	100% (3)	<b>3</b>
Periodic statewide (less than once a year but still regularly scheduled) monitoring conducted by state agencies	0% (0)	100% (3)	<b>3</b>

**17.** Regional or local state agency monitoring for the Wildlife in Headwaters of the Kankakee River (Illinois River) Drainage Habitat in Indiana.

DNR fishery surveys are occasionally conducted on the Iroquois River, the Yellow River, and the Kankakee River. IDEM occasionally samples fish for contaminants analysis for the annual Fish Consumption Advisory.

IDEM and IDNR collect fish community samples in this area; thus, they may have data on the distribution of Least darters.

IDEM monitors the Kankakee River basin once every five years to determine if the stream are supporting a well-balanced warmwater aquatic community. Tadpole madtoms may have been captured while sampling headwater streams.

**22.** What one or two monitoring techniques would you recommend for effective conservation of the Wildlife in Headwaters of the Kankakee River (Illinois River) Drainage Habitat in Indiana?

Periodic electrofishing surveys and mark recapture techniques probably provide the best information about the pike populations.

Representative sites or look for sites where the habitat is suitable for the least darter and seine in the vegetation over rocky substrate.

seining or kick net

**27.** Regional or local state agency HABITAT inventory and assessment for the Wildlife in Headwaters of the Kankakee River (Illinois River) Drainage Habitat in Indiana.

Habitat evaluations are conducted as part of general stream surveys by DNR biologists. Such surveys have been conducted on the Iroquois River, the Yellow River, and the Kankakee River.

As I stated in previous surveys, the QHEI would provide a habitat assessment for sites where least darters were collected.

IDEM conducts a habitat assessment while sampling stream for fish community assessments using the QHEI (Qualitative Habitat Evaluation Index).

**45.** What one or two specific practices would you recommend for more effective conservation of the Wildlife in Headwaters of the Kankakee River (Illinois River) Drainage Habitat in Indiana?

Restoring the connection between the streams and the wetlands that were formerly associated with them to allow pike access to spawning areas. Current water management regimes often rely on pumping to fill restored wetlands, thus, fish passage is still restricted.

Habitat protection and the possible reintroduction of the least darter into suitable habitats that have been restored.

Habitat protection

No responses were entered for this question.

**Total Respondents**      **0**

## Appendix E-14: Rivers and Streams Kankakee River (Illinois River) Drainage Headwater

**48.** What one or two specific HABITAT practices would you recommend for more effective conservation of the Wildlife in Headwaters of the Kankakee River (Illinois River) Drainage Habitat in Indiana?

Wetland restoration projects with connectivity to the stream or "corridor" development that allows passage to wetlands already restored. We need to move toward natural regulation of water levels instead of artificial means.

Habitat protection through regulation  
Protection of adjacent buffer zone.

Habitat protection  
Restrict disturbance to habitat (dredging, removal of debris)

**Total Respondents 3**

**49.** Do you have any additional comments or information on the Wildlife in Headwaters of the Kankakee River (Illinois River) Drainage Habitat that you feel would be useful in the development of the Indiana Comprehensive Wildlife Strategy?

IDEM has captured least darters at the following locations: Ringeisen Ditch, Trib of Carpenter Cr, Keefe Ditch, Claude May Ditch, and Howe Ditch in Jasper County, Singleton Ditch in Lake Co., Weiss Ditch in Newton Co., and Minier Lateral in Benton Co.

IDEM has collected tadpole madtoms on the following streams: West Creek and Singleton Ditch in Lake County, Dausman Ditch in Kosciusko Co., Bogus Run in Starke Co., and Slough Creek in Jasper Co.

No responses were entered for this question.

**Total Respondents      0**

**9.** Please briefly describe the top two threats to the Wildlife in Wadeable/ Large Rivers of the Kankakee River (Illinois River) Drainage Habitat in Indiana identified above.

habitat loss/unintentional take-'cleaning' and dredging of streams of the Kankakee drainage can result in a large amount of creek heelsplitters being lost  
dependence on other wildlife species-require fish host to reproduce; if fish populations decrease for any of a variety of reasons, then creek heelsplitter reproduction could decrease substantially

Habitat loss - requires shallow clear water with little current in weedy areas over gravel, sand, and silt to feed on insects and lay reproduce  
Dredging (removal of aquatic vegetation and increasing depth of ditch)  
Runoff (increases flow of stream, turbidity, and siltation of needed substrates)

Habitat loss (breeding & feeding)- the tadpole madtom feeds in dense vegetation and hides from predators in the leaf litter, dead wood, and other cover. By removing vegetation and cover in the stream, the tadpole madtom also loses spawning areas (tadpole madtoms typically lay eggs under submerged objects).  
Degradation of the stream channel will also increase the velocity of the current (if straightened or cleared of

Appendix E-15: Rivers and Streams Kankakee River (Illinois River) Drainage  
Wadeable/Large River

Degradation of the stream channel will also increase the velocity of the current (if straightened or cleared of debris) which will remove the tadpole madtom's preferred current-free, quiet habitat.

**8.** Other threats to the Wildlife in Headwaters in the Eastern Corn Belt/Interior Plateau Ecoregions of the Ohio River Drainage Habitat in Indiana.

Threats to the Orangethroat Darter are related to threats to the habitat. It prefers high-functioning, high quality riffle habitat in headwater streams. Headwater streams, are not always given as much protection or value as larger rivers downstream. Threats to the species colonization, such as aquatic passage problems through culverts are one threat. Threats to the species watersheds, such as pollution, clearing of the riparian vegetation, creek gravel mining, and channelization are also threats to the habitat of this species.; Threats to the Orangethroat Darter are related to threats to the habitat. Appendix E-16: Rivers and Streams Ohio River Drainage Eastern Corn Belt/Interior Plateau Ecoregions Headwater

9. Please briefly describe the top two threats to the Wildlife in Headwaters in the Eastern Corn Belt/Interior Plateau Ecoregions of the Ohio River Drainage Habitat in Indiana identified above.

dredging of headwater streams  
alterations of hydrology from land-use changes

1. Runoff
2. Habitat modification

The top two threats for the wildlife species are threats to migration (aquatic passage problems through stream crossing structures) and threats to the breeding habitat (high quality riffles). Threats to riffle habitat result from water quality degradation and loss of stream channel stability due to land management activities such as dredging, channelization, roads, and clearing of riparian vegetation.; The top two threats for the wildlife species are threats to migration (aquatic passage problems through stream crossing structures) and threats to the breeding habitat (high quality riffles). Threats to riffle habitat result from water quality degradation and loss of stream channel stability due to land management activities such as dredging, channelization, roads, and clearing of riparian vegetation.; The top two threats for the wildlife species are threats to migration (aquatic passage problems through stream crossing structures) and threats to the breeding habitat (high quality riffles). Threats to riffle habitat result from water quality degradation and loss of stream channel stability due to land management activities such as dredging, channelization, roads, and clearing of riparian vegetation.

Habitat loss (breeding and foraging/feeding areas): Siltation of small headwater streams is limiting the population of southern redbelly dace because the species spawn over gravel substrates. Also, the removal of vegetation could decrease food availability to the herbivorous species. They occupy streams that have a permanent flow of clear water; thus siltation or alterations in flow regimes could also affect the species.

**17.** Regional or local state agency monitoring for the Wildlife in Headwaters in the Eastern Corn Belt/Interior Plateau Ecoregions of the Ohio River Drainage Habitat in Indiana.

IDNR non-game biologist does mussel surveys. But, he is only one person and there are thousands of miles of streams in state.

? Wabash system

IDEM and the DNR Nongame program also conduct monitoring during the field season, once a year for fish. These above fish surveys are not specific to the Orangethroat Darter, but would include the Orangethroat Darter.; IDEM and the DNR Nongame program also conduct fish monitoring during the field season. These above fish surveys are not specific to the Orangethroat Darter, but would include the Orangethroat Darter.

IDEM monitors the health of major river basins every 5 years by looking at chemical, physical, and biological data collected at random locations within the watershed. Southern redbelly dace have been captured in the Ohio River Drainage Habitat; however, specific monitoring for the species has not occurred to my knowledge by anyone state or other organization.

**19.** Please list organizations that are monitoring the Wildlife in Headwaters in the Eastern Corn Belt/Interior Plateau Ecoregions of the Ohio River Drainage Habitat in Indiana.

None than I know of. Most mussel surveys are on bigger rivers. I was contacted by a college prof. interested in taking a class out to a small stream to learn about mussels. I discouraged him from doing so unless he followed DNR regulations concerning collectors' permits. I haven't heard any more from him.

**21.** Other monitoring techniques for the Wildlife in Headwaters in the Eastern Corn Belt/Interior Plateau Ecoregions of the Ohio River Drainage Habitat in Indiana.

Electro-fishing and seining are appropriate methods for monitoring the Orangethroat darter.; Electro-fishing and seining are appropriate methods for monitoring the Orangethroat darter.; Electro-fishing and seining are appropriate monitoring techniques for the Orangethroat Darter.

**Total Respondents 1**

Appendix E-16: Rivers and Streams Ohio River Drainage Eastern Corn Belt/Interior Plateau Ecoregions Headwater

**22.** What one or two monitoring techniques would you recommend for effective conservation of the Wildlife in Headwaters in the Eastern Corn Belt/Interior Plateau Ecoregions of the Ohio River Drainage Habitat in Indiana?

Intensive quantitative sampling of known populations. Need to understand demography of wildlife species. See Strayer & Smith, 2003. AFS Monogr. 8.

2. Less intensive qualitative sampling of new or not recently surveyed areas. Need to determine distribution and status of wildlife species. See same for protocols.

Electro-fishing streams..take a random sampling of streams within a watershed (5th or 6th level HUC)and standardize the stream reach length for the survey...usually 15 times the stream width. Seining is also an appropriate method for sampling, especially in the riffle habitats.; Electro-fishing streams..take a random sampling of streams within a watershed (5th or 6th level HUC)and standardize the stream reach length for the survey...usually 15 times the stream width. Seining is also an appropriate method for sampling, especially in the riffle habitats.; Electro-fishing can be used to sample stream habitats. I suggest designing a random sample of all streams within a watershed (5th or 6th level HUC). The size of the stream reach sampled would be 15 times the stream width. Seining would also be an appropriate method for sampling.

Target the habitat with seining equipment or electrofishing.

**Total Respondents 3**

**32.** What one or two HABITAT inventory and assessment techniques would you recommend for effective conservation of the Wildlife in Headwaters in the Eastern Corn Belt/Interior Plateau Ecoregions of the Ohio River Drainage Habitat in Indiana?

Assess riparian corridor presence  
Water quality

Two protocols that I recommend for reference include the following:

1. Harrelson, C.C., C.L. Rawlins, and J.P. Potyondy. 1994. Stream Channel Reference Sites: An Illustrated Guide to Field Technique. USDA Forest Service. General Technical Report RM-245.

The above reference offers useful guidance on measuring stream channel cross-sections and substrate within the stream. This information can be used to determine if a stream channel is stable and if the substrate is available within riffle habitats, which are the preferred habitat of the Orangethroat Darter.

2. Simon, T. P. and P.M. Stewart. 1998. Standard Operating Procedures For Development of Watershed Indicators In REMAP: Northern Lakes and Forest Streams.

The above reference is very useful for developing a watershed level sampling design and includes useful methods for measuring stream channel and stream habitat parameters.

3. The Qualitative Habitat Evaluation Index (QHEI) developed by the Ohio EPA is a useful qualitative field method that can be used to prioritize sites within a watershed for stream habitat or water quality improvement.

**47.** Other current HABITAT conservation practices for the Wildlife in Headwaters in the Eastern Corn Belt/Interior Plateau Ecoregions of the Ohio River Drainage Habitat in Indiana.

I am not aware of any of the above for which I marked "not used."

**Total Respondents 1**

Appendix E-16: Rivers and Streams Ohio River Drainage Eastern Corn Belt/Interior  
Plateau Ecoregions Headwater

Appendix E-16: Rivers and Streams Ohio River Drainage Eastern Corn Belt/Interior Plateau Ecoregions Headwater

**48.** What one or two specific HABITAT practices would you recommend for more effective conservation of the Wildlife in Headwaters in the Eastern Corn Belt/Interior Plateau Ecoregions of the Ohio River Drainage Habitat in Indiana?

Treat small streams as biological resources and not just drainage ditches. At the very least, require that a mussel survey be done before dredging.

1. Promote riparian corridor
2. Limit habitat modifications

1. Streambank stabilization or stream restoration (reconstructing the channel to reconnect it to its natural floodplain elevation).

2. Culvert or stream crossing structure improvement (replace non-functioning culverts or other crossing structures and replace with ones that function and are at the right elevation/location within the stream's longitudinal profile).

3. Restoration of riparian vegetative communities through tree planting, etc.

Habitat protection and Protection of adjacent buffer zone

**Total Respondents 4**

**49.** Do you have any additional comments or information on the Wildlife in Headwaters in the Eastern Corn Belt/Interior Plateau Ecoregions of the Ohio River Drainage Habitat that you feel would be useful in the development of the Indiana Comprehensive Wildlife Strategy?

N/A

IDEM has captured many southern redbelly dace in their random fish sampling program. Most of these specimens came from the Whitewater Basin in headwater streams <20 sq. miles with high gradient and high biological integrity.

**Total Respondents 2**

**8.** Other threats to the Wildlife in Wadeable/Large Rivers in the Eastern Corn Belt/Interior Plateau Ecoregions of the Ohio River Drainage Habitat in Indiana.

High stream flows for a few months following spawning can seriously reduce year class strength.

High stream flows following spawning can seriously reduce year class strength. This threat can be reduced by reducing ditching in headwaters, installing grass waterways and WASCOS, maintaining riparian corridors. All of these measures will slow stream flows and reduce siltation.

**Total Respondents 2**

Appendix E-17: Rivers and Streams Ohio River Drainage Eastern Corn Belt/Interior Plateau  
Ecoregions Wadeable/Large River

9. Please briefly describe the top two threats to the Wildlife in Wadeable/Large Rivers in the Eastern Corn Belt/Interior Plateau Ecoregions of the Ohio River Drainage Habitat in Indiana identified above.

Hellbenders has a small geographic range and population sizes in Indiana. In many locations there is concern about low reproductive rates, but this is unknown in Indiana populations.

1. Runoff
2. Habitat modification

1. Runoff introducing sediments, even if only temporary
2. In-stream modifications

1. Pollution within the Tippecanoe River system in Indiana.

2. Any factor which reduces the reproductive population size.

1. Pollution

2. (1) Habitat loss - siltation of spawning areas and pools, loss of instream cover, riparian destruction, channelization

(2) Point source pollution which triggers fish kills or repels rock bass from the area.

3. Habitat loss and degradation are serious threats to rock bass. They prefer silt free streams to reproduce and thrive. They also relate closely to structure/cover therefore any habitat loss is a threat.

Habitat Loss - The Eastern Sand darter requires sandy bottoms in fast flowing streams to bury eggs, hide from predators, ambush prey, conserve energy, and maintain position in unstable/shifting sandbars. Low reproductive rates/small populations - reach maturity at age 1, but only lives a few years.

Breeding and feeding/foraging habitat loss due to sedimentation from farm fields and stream banks as well as the removal of natural riparian vegetation; breeding and feeding/foraging habitat loss due to sedimentation from farm fields and stream banks as well as the removal of natural riparian vegetation

(1) Habitat loss - siltation which reduces spawning areas and fills pools, loss of instream cover (snagging and log removal), riparian destruction which allows water to warm and will reduce opportunity for logs and woody debris to enter stream, channelization.

(2) Pollution which triggers fish kills or repels smallmouth from the area.

**11.** Other HABITAT threats to the Wildlife in Wadeable/Large Rivers in the Eastern Corn Belt/Interior Plateau Ecoregions of the Ohio River Drainage Habitat in Indiana.

No responses were entered for this question.

**Total Respondents 0**

Appendix E-17: Rivers and Streams Ohio River Drainage Eastern Corn Belt/Interior Plateau  
Ecoregions Wadeable/Large River

**12.** Please briefly describe the top two HABITAT threats to the Wildlife in Wadeable/Large Rivers in the Eastern Corn Belt/Interior Plateau Ecoregions of the Ohio River Drainage Habitat in Indiana identified above.

Habitat degradation of streams

1. Instream modifications
2. Runoff, both agricultural and residential

1. Agricultural runoff
2. Impoundment

1. Any significant sedimentation into the stream can become a major threat.

2. Any toxins or pollutants are a critical threat.

3. Any channelization which reduces the shallow (less than 1.5 feet) sand/gravel substrate can critically reduce or fragment habitat.

(1) (1) Habitat degradation - sedimentation, channelization, cover removal, riparian removal

(2) Point source pollution - waste water treatment plants and confined feeding operations.

Any practices that create more erosion/sediment deposition and eliminates instream cover is a serious threat.

Therefore, I'd have to say nonpoint source pollution and habitat degradation are the most serious threats.

Habitat Degradation and stream channelization because this will directly affect the sediment transfer within the stream and microhabitat of the Eastern Sand Darter.

Breeding and feeding/foraging habitat loss due to sedimentation from farm fields and stream banks as well as the removal of natural riparian vegetation especially thru drainage maintenance activities

(1) Habitat degradation by sedimentation, channelization, cover removal, riparian removal.

(2) Point source pollution - These ecoregions have major threats from large cities causing fish kills from waste water treatment plans. Also, confined feeding operations in the rural areas are a major threat to the stream fish communities.

**17.** Regional or local state agency monitoring for the Wildlife in Wadeable/Large Rivers in the Eastern Corn Belt/Interior Plateau Ecoregions of the Ohio River Drainage Habitat in Indiana.

IDNR Fish & Wildlife Division

Wabash system

Tippecanoe River, Maumee system

Periodic (usually annual) monitoring in the Tippecanoe River by IDNR.

1. Blue River (Harrison County)

Sugar Creek (Shelby County)

Indian Creek (Greene County)

2. (1) IN early to mid 1990's, Division of Fish and Wildlife conducted fish community inventories on the major streams throughout the state.

(2) Game fish population estimates (including rock bass) have been conducted on 5 streams every other year from 1998 through 2004.

3. various streams throughout the region, some are sampled more regularly than others

IDEM Probabilistic sampling

Indiana DNR Special Studies on T&E species- IDNR, Brant Fisher, did a study on the population of Eastern Sand Darters in Indiana over the past five years. IDNR- regional fish collection surveys may have collected some specimens of the Eastern Sand Darter. Indiana Department of Environmental Management (IDEM) occasionally collected Eastern Sand Darters as part of their Surface Water Quality Monitoring Strategy evaluating fish community structure in certain watersheds every 5 years.

See IDEM OWQ's Surface Water Quality Monitoring Strategy and project work plans and IDNR Fisheries Section Work Plans

Blue River (Harrison County)

(1) In early to mid 1990's the Division of Fish and Wildlife conducted a smallmouth bass inventory.

(2) 5 streams have been sampled every other year from 1998 to 2004 to estimate smallmouth bass populations to determine the effect of smallmouth bass population changes due to the imposition of a 12 inch black bass size limit in 1998.

- 21.** Other monitoring techniques for the Wildlife in Wadeable/Large Rivers in the Eastern Corn Belt/Interior Plateau Ecoregions of the Ohio River Drainage Habitat in Indiana.

Unintentional take could be monitored from fish kill cadaver counts if the officers could be trained to identify northern hog suckers instead of not counting them or just lumping them into the generic class of "round bodied suckers"

**Total Respondents 1**

- 22.** What one or two monitoring techniques would you recommend for effective conservation of the Wildlife in Wadeable/Large Rivers in the Eastern Corn Belt/Interior Plateau Ecoregions of the Ohio River Drainage Habitat in Indiana?

Professional Survey

1. Intensive quantitative sampling of known populations. Need to understand demography of the clubshell. See Strayer & Smith, 2003. AFS Monogr. 8.

2. Less intensive qualitative sampling of new or not recently surveyed areas. Need to determine distribution and status of the clubshell. See same for protocols.

1. Intensive quantitative sampling of known populations. Need to understand demography of the clubshell. See Strayer & Smith, 2003. AFS Monogr. 8.

2. Less intensive qualitative sampling of new or not recently surveyed areas. Need to determine distribution and status of the clubshell. See same for protocols.

1. State DNR or professional census at representative or probabilistic sites.

2. Development of trained, select volunteer core to undertake surveys at probabilistic sites, particularly where the wildlife species should, or could occur and has not been documented in recent years.

1. Stream fish community surveys.  
Rock bass population estimates.

2. electrofishing surveys

See where populations of the darter have been captured in the past and then with seines or electrofishing equipment mark and recapture the darter to document habitat characteristics, water quality information, and land use characterization where the darters occur. You will need to target the habitat and not the exact location since the sandbars will probably shift over time. Look on the web for mark and recapture surveys as well as other eastern sand darter publications. I found many by just searching the web for Eastern Sand Darter.

Electrofishing results from probabilistic and representative sites

Electrofishing catch rate data

Population estimates

Angler creel surveys

(1) Stream fish community surveys - To determine smallmouth bass distribution and abundance. There may be a correlation of smallmouth abundance to the species richness to the overall fish community.

(2) Smallmouth bass population estimates.

**40.** Other research needs for the Wildlife in Wadeable/Large Rivers in the Eastern Corn Belt/Interior Plateau Ecoregions of the Ohio River Drainage Habitat in Indiana.

To find out why the Clubshell has depopulated most of its former distribution in Indiana. Developing some sort of timeline (late Pleistocene, Holocene (usually archaeological), or historic) for relic valve distribution might narrow the possibilities of critical limiting factors (post-settlement siltation, etc.).

(skipped this question)      1

**45.** What one or two specific practices would you recommend for more effective conservation of the Wildlife in Wadeable/Large Rivers in the Eastern Corn Belt/Interior Plateau Ecoregions of the Ohio River Drainage Habitat in Indiana?

Habitat protection

1. Eliminate instream modifications, including inpoundment
2. Restore riparian corridor

See Watters, 2000, Proc. 1st EMCS Symposium

## Appendix E-17: Rivers and Streams Ohio River Drainage Eastern Corn Belt/Interior Plateau Ecoregions Wadeable/Large River

See Watters, 2000. Proc. 1st FMCS Symposium

1. Strict enforcement of laws regulating instream modification; incentives to farmers.
2. Propagation

Protect the shallow sand/gravel habitat from siltation and channelization, and keep the waters free of pollutants and toxins.

1. Pollution control.  
Habitat protection or enhancement.

2. Rock bass appear to be doing very well with little to no intensive management in streams where there is ample instream cover and good water quality. Therefore, habitat protection and contaminant reduction would be my recommendations.

I am not sure what you are asking in this question. The best way to conserve the eastern sand darter would be to reduce sedimentation covering the sand substrate which the darter needs to survive and reproduce. Current efforts to reduce sedimentation in streams is somewhat effective, but I'm not sure if it is enough to keep the eastern sand darter from disappearing.

Declare moratorium on channel/drainage "improvement" projects that do not mitigate losses;

Pollution control - from waste water treatment plants and confined feeding operations.  
Habitat protection and enhancement.

**47.** Other current HABITAT conservation practices for the Wildlife in Wadeable/Large Rivers in the Eastern Corn Belt/Interior Plateau Ecoregions of the Ohio River Drainage Habitat in Indiana.

Again, I don't know if these practices are working well in Indiana, but the best way to conserve the critical habitat for the eastern sand darter would be habitat protection on all lands through whatever means necessary, habitat restoration of the floodplain would also be critical to the amount of sedimentation reaching the stream bed, managing water regimes may also impact the settling of sediments in stream (thus dam removal may be appropriate), protection of adjacent buffer zone is key to stopping deleterious effects of erosion and sedimentation in the stream, land use planning and conservation easements would also keep the runoff to a minimum.

**Total Respondents 1**

**48.** What one or two specific HABITAT practices would you recommend for more effective conservation of the Wildlife in Wadeable/Large Rivers in the Eastern Corn Belt/Interior Plateau Ecoregions of the Ohio River Drainage Habitat in Indiana?

Habitat protection

## Appendix E-17: Rivers and Streams Ohio River Drainage Eastern Corn Belt/Interior Plateau Ecoregions Wadeable/Large River

1. CREP and other incentives for BMP's
2. Restrict instream modifications  
See Watters, 2000. Proc. 1st FMCS Symposium

1. No instream modifications.
2. Limit runoff through incentives or other means.  
See Watters, 2000. Proc. 1st FMCS Symposium.

Manage pollutants and toxins, maintain available habitat through regulation and buffer zones, increase habitat through incentives, technical assistance and restoration.

1. Protection of adjacent buffer zones (riparian corridor).

2. 1) buffer/riparian zone protection - leads to improved water quality and more instream cover  
2) pollution reduction - improved water quality and fewer fish kills

Habitat protection  
Land use planning

Protection of adjacent buffer zones (riparian corridor). More participation would likely occur with financial incentives.

Appendix E-17: Rivers and Streams Ohio River Drainage Eastern Corn Belt/Interior Plateau  
Ecoregions Wadeable/Large River

**49.** Do you have any additional comments or information on the Wildlife in Wadeable/Large Rivers in the Eastern Corn Belt/Interior Plateau Ecoregions of the Ohio River Drainage Habitat that you feel would be useful in the development of the Indiana Comprehensive Wildlife Strategy?

Too little is known about this wildlife species, especially Indiana populations.

N/A

N/A

1. To find out just why the Clubshell depopulated so much of its former range, which once included much of the interior of Indiana. Knowing this "why" should disclose a critical limiting factor, and could lead to its future preservation.

2. There is a great potential source for select avocational technical assistance (= volunteers) to undertake monitoring and survey where funding falls short.

I would definitely search the internet for more information on specific studies done on the Eastern Sand Darter; however, I could not find much on the habitat itself in the Eastern Corn Belt/Interior Plateau Ecoregions of the Ohio River Drainage. IDEM has a list of sites of where Eastern Sand Darters have been collected with water chemistry and habitat (QHEI) assessments if interested.

The length of this survey possibly destroys its usefulness as many/most experts will not have the time and or patience to do this for very many wildlife species; some may not even do it at all.

no

**11.** Other HABITAT threats to the Wildlife in Great Rivers of the Ohio River Drainage Habitat in Indiana.

Sand and gravel operations could destroy preferred habitat

**Total Respondents 1**

Appendix E-18: Rivers and Streams Ohio River Drainage Great River

**12.** Please briefly describe the top two HABITAT threats to the Wildlife in Great Rivers of the Ohio River Drainage Habitat in Indiana identified above.

- 1. Impoundment
  - 2. Instream modifications
  
  - 1. Dredging (mining, COE)
  - 2. Impoundment
    - 1. Stream channelization
    - 2. Non-point source pollution
- loss of high quality riffles and outside bend deep fast runs
- loss of riparian zone and siltation

**Total Respondents 5**

**13.** What current monitoring efforts by state agencies are you aware of for the Wildlife in Great Rivers of the Ohio River Drainage Habitat in Indiana?

	Yes, these efforts occur	Not aware of these efforts occurring	Response Total
Statewide year-round monitoring conducted by state agencies	0% (0)	100% (9)	9
Statewide once a year monitoring conducted by state agencies	0% (0)	100% (9)	9
Periodic statewide (less than once a year but still regularly scheduled) monitoring conducted by state agencies	11% (1)	89% (8)	9

## Appendix E-18: Rivers and Streams Ohio River Drainage Great River

**47.** Other current HABITAT conservation practices for the Wildlife in Great Rivers of the Ohio River Drainage Habitat in Indiana.

No responses were entered for this question.

**Total Respondents 0**

**48.** What one or two specific HABITAT practices would you recommend for more effective conservation of the Wildlife in Great Rivers of the Ohio River Drainage Habitat in Indiana?

1. Restrict instream modifications
2. Restore free-flowing systems

1. Eliminate habitat modifications (in-stream dredging, channelization, etc.)  
See Watters, 2000. Proc. 1st FMCS Symposium

Buffer strips  
Bank stabilization

1. Non-point source pollution reduction
2. 2. riparian conservation easements

restoration of riparian zones, riffle protection/restoration

**Total Respondents 5**

**49.** Do you have any additional comments or information on the Wildlife in Great Rivers of the Ohio River Drainage Habitat that you feel would be useful in the development of the Indiana Comprehensive Wildlife Strategy?

N/A

N/A

no

The blue sucker population is doing well in the Wabash River and parts of the White River. Reintroduction into additional waterbodies is a possible option, but research is needed to determine why the population is healthy in the Wabash/White and not other Great Rivers.

**Total Respondents 4**
