

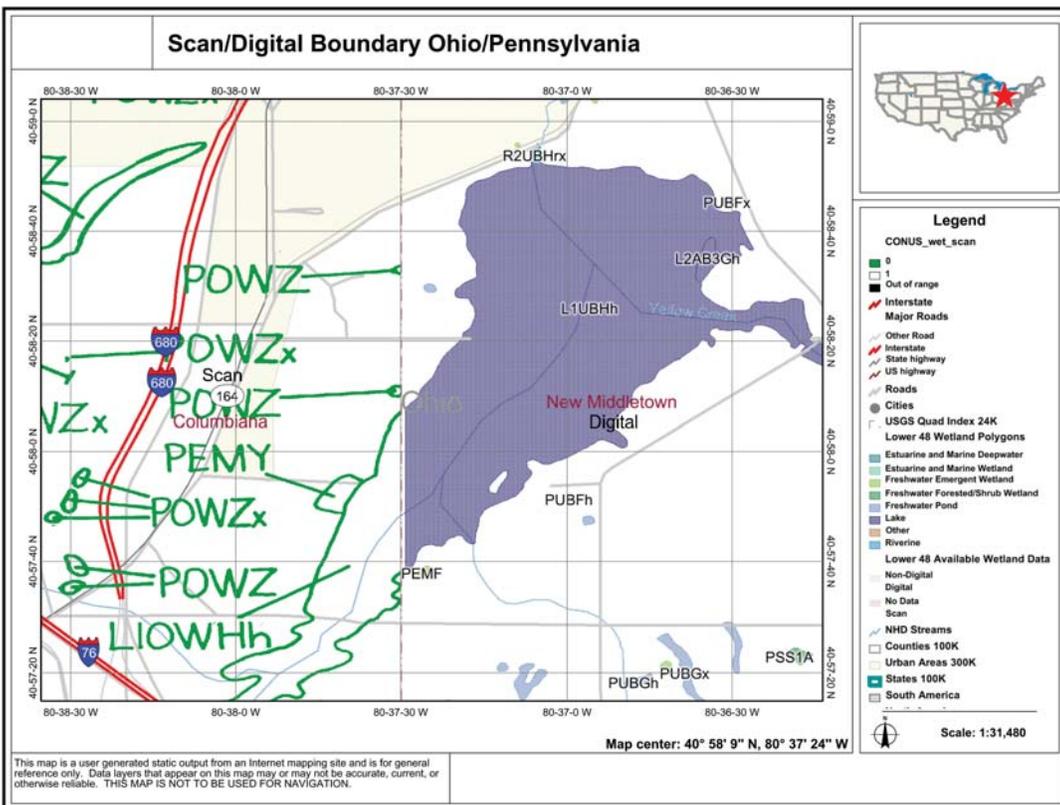

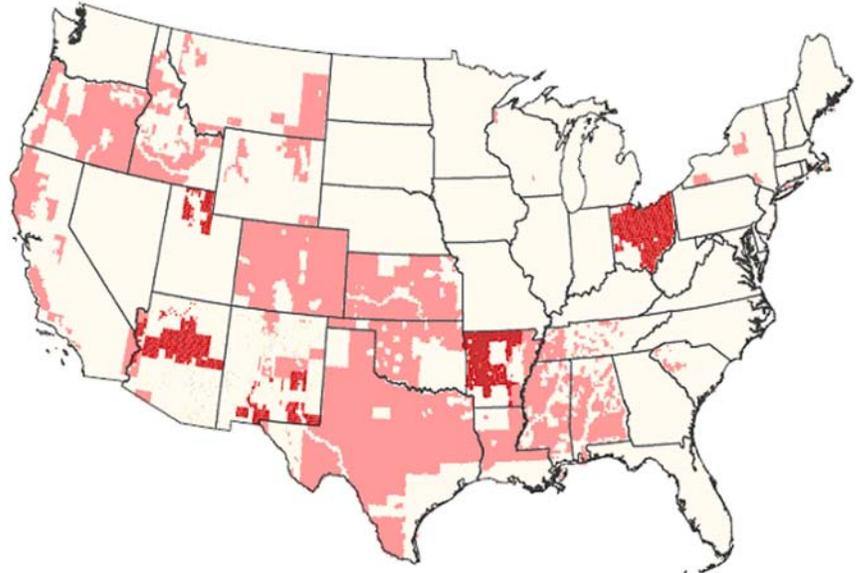

Map Image Scans

National Wetlands Inventory

The National Wetlands Inventory is embarking on a project to scan most existing hard-copy maps and provide them as geo-referenced dumb raster images through the Wetlands Mapper. Areas in **RED** on the map are currently available for viewing with other layers. Areas in **PINK** are waiting to be scanned, with key funding provided by other agencies. Once provided online as georeferenced scanned images, any organization can partner with the Inventory to convert images to digital data.

This PDF file created from the Wetlands Mapper shows a comparison between digital data on the **RIGHT** and scanned image of a hard-copy map on the **LEFT**. Note obsolete OW (Open Water) code has been replaced by UB (Unconsolidated Bottom) in digitized map.
