Hypostomus macrops (a catfish, no common name)
Ecological Risk Screening Summary

U.S. Fish and Wildlife Service, January 2013
Revised, September 2018
Web Version, 2/25/2019

1 Native Range and Status in the United States

Native Range
From Reis and Lima (2009):

“This species mainly occurs in the Das Velhas River basin, in Brazil. Its distribution also extends throughout the upper San Francisco river basin.”

“Native: Brazil”

Status in the United States
This species has not been reported as introduced or established in the United States. However, unidentified members of the genus are established in the United States.
From Nico et al. (2018):

“Several morphologically distinct but unidentified *Hypostomus* species have been recorded as established in the United States: these included populations in Indian Springs in Nevada; Hillsborough County in Florida; and the San Antonio River and San Felipe Creek in Texas (Courtenay and Deacon 1982; Courtenay et al. 1984, 1986; Courtenay and Stauffer 1990; Page and Burr 1991; López-Fernández and Winemiller 2005). A population of an unidentified *Hypostomus* species is firmly established in Hawaii (Devick 1991a, b). Reported from Arizona, Colorado, Connecticut, Louisiana, and Pennsylvania. Failed in Connecticut, Massachusetts, and Pennsylvania.”

This species was not found for sale from U.S.-based online aquarium retailers and it does not appear to be in trade in the United States.

**Means of Introduction into the United States**

This species has not been reported as introduced or established in the United States. However, unidentified members of the genus are established in the United States.

From Nico et al. (2018):

“Members of this genus have been introduced through a combination of fish farm escapes or releases, and aquarium releases (Courtenay and Stauffer 1990; Courtenay and Williams 1992). In Texas, the initial introduction occurred when *Hypostomus* entered local streams after escaping from pool and canal systems of the San Antonio Zoological Gardens in or before 1962 (Barron 1964); the Comal County introduction was probably due to an aquarium release (Whiteside and Berkhouse 1992).”

**Remarks**

From Nico et al. (2018):

“The genus *Hypostomus* contains about 116 species (Burgess 1989). Highlighting the serious need for additional taxonomic and systematic work, Armbruster (1997) concluded that it is currently impossible to identify most species in the genus. Several apparently different *Hypostomus* species have been collected in the United States but not definitively identified to species level (Page and Burr 1991; Courtenay and Stauffer 1990). Distinguishing characteristics of the genus and a key to loricariid genera were provided by Burgess (1989) and Armbruster (1997). Photographs appeared in Burgess (1989) and Ferraris (1991). *Hypostomus* has officially replaced the generic name *Plecostomus*. The genus was included in the key to Texas fishes of Hubbs et al. (1991) and several identifying traits were also given by Page and Burr (1991).”

According to Fricke et al. (2018), the original name of this species was *Plecostomus macrops*. Information searches for this report were conducted using both the original name and the currently accepted scientific name.
2 Biology and Ecology

Taxonomic Hierarchy and Taxonomic Standing

From ITIS (2018):

“Kingdom Animalia
  Subkingdom Bilateria
   Infrakingdom Deuterostomia
    Phylum Chordata
     Subphylum Vertebrata
      Infraphylum Gnathostomata
       Superclass Actinopterygii
        Class Teleostei
         Superorder Ostariophysi
          Order Siluriformes
           Family Loricariidae
            Subfamily Hypostominae
             Genus Hypostomus
              Species Hypostomus macrops (Eigenmann and Eigenmann, 1888)”

“Current Standing: valid”

From Fricke et al. (2018):

Size, Weight, and Age Range

From Froese and Pauly (2018):

“Max length : 28.8 cm SL male/unsexed; [Zanata and Pitanga 2016]”

Environment

From Froese and Pauly (2018):

“Freshwater; demersal.”

Climate/Range

From Froese and Pauly (2018):

“Tropical”
**Distribution Outside the United States**

Native
From Reis and Lima (2009):

“This species mainly occurs in the Das Velhas River basin, in Brazil. Its distribution also extends throughout the upper San Francisco river basin.”

“Native: Brazil”

Introduced
No introductions of this species have been reported.

**Means of Introduction Outside the United States**

No introductions of this species have been reported.

**Short Description**

From Ramos et al. (2017):

“[…] *H. garmani* and *H. macrops* have large dark spots on the body and fins that are larger than eye diameter (vs. dark spots usually smaller than eye diameter). Additionally, the holotype of *H. macrops* (MCZ 7888, 216.0 mm SL) has 50 premaxillary teeth.”

**Biology**

From Reis and Lima (2009):

“The species of this genus live in large creeks and streams and rivers.”

**Human Uses**

According to Santos and Nóbrega Alves (2016), indigenous Truká fishers in Brazil catch and consume *H. macrops*.

**Diseases**

No information available. No OIE-reportable diseases have been documented in this species.

**Threat to Humans**

From Froese and Pauly (2018):

“Harmless”
3 Impacts of Introductions

No introductions of *H. macrops* have been reported outside its native range so no impacts of introduction are known. However, unidentified members of the genus are established in the United States.

From Nico et al. (2018):

“The effects of these loricariid catfish is largely unknown. In Texas, Hubbs et al. (1978) reported possible local displacement of algae-feeding native fishes such as *Campostoma anomalum* by *Hypostomus*, and López-Fernández and Winemiller (2005) suggest that reductions in *Dionda diaboli* abundance in portions of San Felipe Creek are due to population increases of *Hypostomus*. Because of their abundance in Hawaii, introduced *Hypostomus, Pterygoplichthys*, and *Ancistrus* may compete for food and space with native stream species (Devick 1989; Sabaj and Englund 1999).”

4 Global Distribution

![Map of H. macrops distribution](GBIF_Secretariat_2017)

**Figure 1.** Known global distribution of *H. macrops*, reported from eastern Brazil. Map from GBIF Secretariat (2017).
5 Distribution within the United States
There is currently no known distribution of *Hypostomus macrops* within the United States; however, unidentified species of *Hypostomus* are established in Nevada, Florida, Texas, and Hawaii.

6 Climate Matching

Summary of Climate Matching Analysis
The climate match (Sanders et al. 2018; 16 climate variables; Euclidean Distance) was highest in extreme southwestern Florida. The climate match was medium in the southern half of peninsular Florida and southern Texas, while the majority of the contiguous United States had a low climate match. Climate 6 score indicated that the contiguous United States has a low climate match overall. Scores of 0.005 and below are classified as low match; Climate 6 score for *H. macrops* was 0.001. All states had low climate scores, except Florida, which had a medium score.

Figure 2. RAMP (Sanders et al. 2018) source map showing weather stations selected as source locations (red; Brazil) and non-source locations (gray) for *H. macrops* climate matching. Source locations from GBIF Secretariat (2017).
Figure 3. Map of RAMP (Sanders et al. 2018) climate matches for *H. macrops* in the contiguous United States based on source locations reported by GBIF Secretariat (2017). 0= Lowest match, 10= Highest match.

The “High”, “Medium”, and “Low” climate match categories are based on the following table:

<table>
<thead>
<tr>
<th>Climate 6: Proportion of (Sum of Climate Scores 6-10) / (Sum of total Climate Scores)</th>
<th>Climate Match Category</th>
</tr>
</thead>
<tbody>
<tr>
<td>0.000 ≤ X &lt; 0.005</td>
<td>Low</td>
</tr>
<tr>
<td>0.005 &lt; X ≤ 0.103</td>
<td>Medium</td>
</tr>
<tr>
<td>≥0.103</td>
<td>High</td>
</tr>
</tbody>
</table>

7 Certainty of Assessment

Limited information was available on the biology and ecology of *H. macrops*. It has not been reported as introduced outside its native range, so no impacts of introduction are known. However, unidentified species of *Hypostomus* have become established in the United States, and it is possible that one or more of those populations could be identified later as *H. macrops*. There is considerable uncertainty about the taxonomy of this genus and about species-level identification. Certainty of this assessment is low.
8 Risk Assessment

Summary of Risk to the Contiguous United States

*Hypostomus macrops* is a catfish native to the Das Velhas and upper San Francisco river basins in Brazil. It is consumed locally within its native range. This species has no documented history of introduction in the United States or elsewhere outside its native range. However, unidentified species of *Hypostomus* are established in the United States. History of invasiveness is uncertain. The climate match to the contiguous United States was low overall, with medium matches in southern Florida and southern Texas. Because of the lack of documented introduction history and substantial taxonomic uncertainty, certainty of this assessment is low and overall risk is uncertain.

Assessment Elements
- History of Invasiveness (Sec. 3): Uncertain
- Climate Match (Sec. 6): Low
- Certainty of Assessment (Sec. 7): Low
- Overall Risk Assessment Category: Uncertain
