Silver Dollar (*Metynnis argenteus*)
Ecological Risk Screening Summary

U.S. Fish and Wildlife Service, January 2013
Revised, February 2018
Web Version, 8/3/2018

1 Native Range and Status in the United States

**Native Range**
From Froese and Pauly (2017):

“South America: Tapajós River basin in Brazil.”

From Eschmeyer et al. (2018):

“Amazon and Orinoco river basins: Brazil, Bolivia and Colombia.”

De Souza et al. (2012) report *M. argenteus* from Guyana.

**Status in the United States**

There are no records of occurrence for *Metynnis argenteus* in the United States; however, Nico et al. (2018) report that the genus *Metynnis* (species uncertain) is locally established in Florida.

From Nico et al. (2018):

“A member of this genus [*Metynnis*] was collected in Florida from a lake on Marco Island, Collier County in January, 1980 (FSBC 19822; listed as *Metynnis lippincotianus* in Courtenay et al. 1984, and as *Metynnis* sp. in Courtenay and Stauffer 1990 and in Courtenay et al. 1991). A reproducing population was found in Halpatiokee Regional Park Conservation Area in Martin County in 2005, with additional specimens taken in 2006 and 2007 (Shafland et al. 2008; Florida Fish and Wildlife Conservation Commission 2009). In Kentucky, a single fish (originally identified as a piranha and as *Metynnis roosevelti*) was taken by hook and line from Lighthouse Lake, Louisville, Jefferson County, in the summer of 1981 (Anonymous 1981; Fossett 1981).”

“There is considerable confusion surrounding the Kentucky record. In original published accounts, the fish was identified as a piranha, but the scientific name provided was *Metynnis roosevelti* (=*Metynnis maculatus*). However, in a photograph of the fish accompanying the newspaper article (Fossett 1981), the specimen actually appears to have a short adipose fin and is probably a pacu, possibly *Piaractus brachypomus*. The collectors gave the live fish to the Louisville Zoo, where it was kept in aquaria; when the fish later died, it was supposedly not preserved. The Kentucky specimen has been the basis for inclusion of the species in published lists of nonestablished foreign species, with earlier listings identifying it as *Metynnis roosevelti* (e.g., Courtenay et al. 1984) and later simply as *Metynnis* sp. (i.e., Courtenay and Stauffer 1990; Courtenay et al. 1991).”

Chapman et al. (1994) list *M. argenteus* among freshwater species imported into the United States for the ornamental trade in October 1992, when the study was conducted.

**Means of Introductions in the United States**

From Nico et al. (2018):

“Records [for *Metynnis* sp.] mostly likely represent aquarium releases.”

**Remarks**

From Nico et al. (2018):

“The genus *Metynnis* is in great need of systematic revision.”

“Several *Metynnis* species are popular aquarium fishes. There is considerable confusion surrounding the Kentucky record. In original published accounts, the fish was identified as a piranha, but the scientific name provided was *Metynnis roosevelti* (=*Metynnis maculatus*).
However, in a photograph of the fish accompanying the newspaper article (Fossett 1981), the specimen actually appears to have a short adipose fin and is probably a pacu, possibly *Piaractus brachypomus*. The collectors gave the live fish to the Louisville Zoo, where it was kept in aquaria; when the fish later died, it was supposedly not preserved. The Kentucky specimen has been the basis for inclusion of the species in published lists of non-established foreign species, with earlier listings identifying it as *Metynnis roosevelti* (e.g., Courtenay et al. 1984) and later simply as *Metynnis* sp. (i.e., Courtenay and Stauffer 1990; Courtenay et al. 1991).”

Froese and Pauly (2017) list four species within the genus *Metynnis* that are referred to as “Silver Dollar”.

## 2 Biology and Ecology

### Taxonomic Hierarchy and Taxonomic Standing

| Species *Metynnis argenteus* Ahl, 1923”’

“Taxonomic status: valid”

Eschmeyer et al. (2018) lists the family as “Serrasalmidae”.

From Nico et al. (2018):

“The genus *Metynnis* is in great need of systematic revision.”

### Size, Weight, and Age Range

From Froese and Pauly (2017):

“Max length: 14.0 cm SL male/unsexed; [Pavanelli et al. 2009]”
Environment
From Froese and Pauly (2017):

“Freshwater; pelagic; pH range: 5.0 - 7.0; dH range: ? – 15.”

“[…] 24°C - 28°C [Riehl and Baensch 1991; assumed to be recommended aquarium water temperatures]”

Climate/Range
From Froese and Pauly (2017):

“Tropical […]”

Distribution Outside the United States
Native
From Froese and Pauly (2017):

“South America: Tapajós River basin in Brazil.”

From Eschmeyer et al. (2018):

“Amazon and Orinoco river basins: Brazil, Bolivia and Colombia.”

De Souza et al. (2012) report *M. argenteus* from Guyana.

Introduced
There are no known introductions of this species outside of its native range.

Means of Introduction Outside the United States
There are no known introductions of this species outside of its native range.

Short Description
From van der Sleen and Albert (2018):

“[Species in the genus *Metynnis* are] Characterized by: silvery coloration; small to moderate adult body sizes, adults typically much smaller than other serrasalmids; very long adipose-fin base, equal to or longer than distance between dorsal-fin insertion and adipose-fin origin […]; and a relatively small mouth. *Metynnis* includes species with a body profile that is very deep and discoid […] In contrast, certain other *Metynnis* species have a slightly elongate body […]”
**Biology**
From Froese and Pauly (2017):

“In weedy side arms of the river […]”

“[…] minimum population doubling time [estimated to be] less than 15 months […]”

“[Life cycle and mating behavior is] Assumed to be like *Metynnis hypsauchen*.”

From van der Sleen and Albert (2018):

**Human Uses**
From Froese and Pauly (2017):

“Fisheries: minor commercial; aquarium: commercial.”

**Diseases**
From Casal et al. (2006):

“*Myxobolus metynnis* n. sp. (Phylum Myxozoa) is described in the connective subcutaneous tissues of the orbicular region of the fish, *Metynnis argenteus* (Characidae), collected in the lower Amazon River, near the city of Peixe Boi, Pará State, Brazil. […] The pathology associated with this parasite appears, especially during the later stages, when some signs of lyses in the host cells were observed, corresponding to the higher mortality period. The parasite described here is the second report of a *Myxobolus* spp. in a species of the Characidae from the Amazon region.”

No OIE-reportable diseases have been documented for this species.

**Threat to Humans**
From Froese and Pauly (2017):

“Harmless”
3 Impacts of Introductions

There are currently no recorded introductions or impacts of introductions, however unidentified species of *Metynnis* are listed as locally established in Florida.

4 Global Distribution

![Figure 1. Reported global distribution of *Metynnis argenteus*, reported from South America. Map from GBIF Secretariat (2017).](image)

5 Distribution Within the United States

There is currently no known distribution of *Metynnis argenteus* within the United States; however, unidentified species of *Metynnis* are listed as locally established in Florida.

6 Climate Matching

**Summary of Climate Matching Analysis**

The climate match (Sanders et al. 2014; 16 climate variables; Euclidean Distance) was medium for southern Florida and coastal southeastern Texas and low for rest of the United States. Climate 6 score indicated an overall low climate match for the contiguous United States. Scores of 0.005 or less are classified as low match; Climate 6 score for *Metynnis argenteus* was 0.0.
Figure 2. RAMP (Sanders et al. 2014) source map showing weather stations selected as source locations (red; Bolivia, Brazil, Colombia, Guyana, Venezuela) and non-source locations (gray) for Metynnis argenteus climate matching. Source locations from GBIF Secretariat (2017).
Figure 3. Map of RAMP (Sanders et al 2014) climate matches for *Metynnis argenteus* in the contiguous United States based on source locations reported by GBIF Secretariat (2017). 0=Lowest match, 10=Highest match. Counts of climate match scores are tabulated on the left.

The High, Medium, and Low Climate match Categories are based on the following table:

<table>
<thead>
<tr>
<th>Climate 6: Proportion of (Sum of Climate Scores 6-10) / (Sum of total Climate Scores)</th>
<th>Climate Match Category</th>
</tr>
</thead>
<tbody>
<tr>
<td>0.000≤X≤0.005</td>
<td>Low</td>
</tr>
<tr>
<td>0.005&lt;X&lt;0.103</td>
<td>Medium</td>
</tr>
<tr>
<td>≥0.103</td>
<td>High</td>
</tr>
</tbody>
</table>

7 Certainty of Assessment

Peer-reviewed literature on the biology, ecology, distribution and potential invasiveness associated with *Metynnis argenteus* is limited. There are no reported introductions of the species, so impacts of introduction are unknown. Assessment of this species is complicated due to uncertain identification of *Metynnis* spp. captured and established in the United States, and the need for systematic revision of the genus. Additional information and research on this species
will be needed to increase the certainty of this assessment. Based on available data the certainty of this assessment is low.

8 Risk Assessment

Summary of Risk to the Contiguous United States

Silver Dollar (Metynnis argenteus) is a fish native to rivers of northern South America. Metynnis spp. are common in the pet trade, including in the United States, and support a minor commercial fishery where native. There are no reports of introductions of Metynnis argenteus. However, members of the Metynnis genus (species uncertain) have been collected beyond their native range in Florida, where their status is listed as locally established. Metynnis spp. found in Florida are believed to be aquarium releases. Climate match to the contiguous United States is low; however, there are areas of medium climate match in southern Florida and southeastern Texas. Certainty of assessment is low because of a lack of information and taxonomic confusion. Overall risk posed by this species is uncertain.

Assessment Elements

- History of Invasiveness (Sec. 3): Uncertain
- Climate Match (Sec. 6): Low
- Certainty of Assessment (Sec. 7): Low
- Overall Risk Assessment Category: Uncertain
