Trichomycterus celsae (a catfish, no common name)
Ecological Risk Screening Summary

U.S. Fish and Wildlife Service, December 2016
Revised, April 2017
Web Version, 4/30/2018

Native Range and Status in the United States

Native Range
From Froese and Pauly (2016):

“South America: Venezuela.”

Status in the United States
This species has not been reported in the United States.

From FFWCC (2017):

“Prohibited nonnative species are considered to be dangerous to the ecology and/or the health and welfare of the people of Florida. These species are not allowed to be personally possessed or used for commercial activities. Very limited exceptions may be made by permit from the
Executive Director […] [The list of prohibited nonnative species includes] *Trichomycterus celsae*

**Means of Introductions in the United States**
This species has not been reported in the United States.

**2 Biology and Ecology**

**Taxonomic Hierarchy and Taxonomic Standing**
From ITIS (2016):

“Kingdom Animalia  
Subkingdom Bilateria  
Infrakingdom Deuterostomia  
Phylum Chordata  
Subphylum Vertebrata  
Infraphylum Gnathostomata  
Superclass Osteichthyes  
Class Actinopterygii  
Subclass Neopterygii  
Infraclass Teleostei  
Superorder Ostariophysi  
Order Siluriformes  
Family Trichomycteridae  
Subfamily Trichomycterinae  
Genus *Trichomycterus*  
Species *Trichomycterus celsae* Lasso and Provenzano, 2002”

“Taxonomic Status: valid”

**Size, Weight, and Age Range**
No information available.

**Environment**
From Froese and Pauly (2016):

“Freshwater; demersal.”

**Climate/Range**
From Froese and Pauly (2016):

“Tropical, preferred ?”
Distribution Outside the United States

Native
From Froese and Pauly (2016):

“South America: Venezuela.”

Introduced
No introductions of this species have been reported.

Means of Introduction Outside the United States
No introductions of this species have been reported.

Short Description
From Lasso and Provenzano (2002):

“Trichomycterus celsae has a uniform light brown color on dorsum and sides of the body; the ventral surface is yellowish or creamy. […] in T. celsae, the skull has the fontanels well separated […] In T. celsae, the dorsal border of the hyomandibula has a conspicuous notch.”

Biology
No information available.

Human Uses
No information available.

Diseases
No information available. No OIE-reportable diseases have been documented for this species.

Threat to Humans
From Froese and Pauly (2016):

“Harmless”

3 Impacts of Introductions
No introductions of this species have been reported.

The Florida Fish and Wildlife Conservation Commission (FFWCC 2017) has listed the parasitic catfish Trichomycterus celsae as a prohibited species.
4 Global Distribution

Figure 1. Known global established locations of *T. celsae*, reported from Venezuela. Map from GBIF (2016).

5 Distribution Within the United States

This species has not been reported in the United States.

6 Climate Matching

Summary of Climate Matching Analysis

The climate match (Sanders et al. 2014; 16 climate variables; Euclidean Distance) was low in all regions of the contiguous U.S. Climate 6 proportion also indicated a low climate match for the contiguous U.S. overall. Climate 6 proportions of 0-0.005, inclusive, are classified as low match; the Climate 6 proportion for *T. celsae* was 0.000.
Figure 2. RAMP (Sanders et al. 2014) source map showing weather stations in Venezuela selected as source locations (red) and non-source locations (gray) for *T. celsae* climate matching. Source locations from GBIF (2016).
Figure 3. Map of RAMP (Sanders et al. 2014) climate matches for *T. celsae* in the contiguous United States based on source locations reported by GBIF (2016). 0=Lowest match, 10=Highest match. Counts of climate match scores are tabulated on the left.

The “High”, “Medium”, and “Low” climate match categories are based on the following table:

<table>
<thead>
<tr>
<th>Climate 6: Proportion of (Sum of Climate Scores 6-10) / (Sum of total Climate Scores)</th>
<th>Climate Match Category</th>
</tr>
</thead>
<tbody>
<tr>
<td>0.000≤X&lt;0.005</td>
<td>Low</td>
</tr>
<tr>
<td>0.005&lt;X&lt;0.103</td>
<td>Medium</td>
</tr>
<tr>
<td>≥0.103</td>
<td>High</td>
</tr>
</tbody>
</table>

7 Certainty of Assessment

*T. celsae* has never been reported as introduced outside its native range, so impacts of introduction remain unknown. Little is known about the biology and ecology of this species. The certainty of this assessment is low.
8 Risk Assessment

Summary of Risk to the Contiguous United States

*Trichomycterus celsae* is a trichomycterid catfish native to southeastern Venezuela. It has not been introduced outside of its native range. Without being able to observe introductions in other parts of the world, it is impossible to know the potential impacts of introduction of *T. celsae* to the U.S. The Florida Fish and Wildlife Conservation Commission has listed the parasitic catfish *T. celsae* as a prohibited species. Climate match to the contiguous U.S. is low. The overall risk posed by this species is uncertain.

Assessment Elements

- History of Invasiveness (Sec. 3): Uncertain
- Climate Match (Sec. 6): Low
- Certainty of Assessment (Sec. 7): Low
- Overall Risk Assessment Category: Uncertain
