Tilapia kottae
Ecological Risk Screening Summary

U.S. Fish and Wildlife Service, June 2015

Photo not available.

1 Native Range, and Status in the United States

Native Range
From Froese and Pauly (2015):

“Africa: Lake Barombi-ba-kotta and Lake Mboandong, Cameroon [Stiassny et al. 2008]”

Status in the United States
This species has not been reported in the U.S.

Means of Introductions in the United States
This species has not been reported in the U.S.

Remarks
From Moelants (2010):

“Red List Category & Criteria: Endangered B1ab(iii)+2ab(iii) … The species is endemic to the Lake Barombi-ba-kotta and Lake Mboandong. The species is currently major threat is from oil plantations and slash and burn agriculture leading to sedimentation and pollution in the lakes (two locations). There is also a potential threat from the lake 'burping' - CO2 (as in Lake Nyos and Lake Barombi-Mbo). In addition deforestation of the surroundings of the crater may cause more wind which could lead to the lake 'turning', as the lake is stratified, lower layer being very low in oxygen and high in organic matter. Higher winds may cause currents in the lake which could cause this lower layer to mix with the upper layer where the fish live. This would cause a massive decrease in oxygen in the water and kills the fish.”

2 Biology and Ecology

Taxonomic Hierarchy and Taxonomic Standing
From ITIS (2015):

“Kingdom Animalia
   Subkingdom Bilateria
      Infrakingdom Deuterostomia
         Phylum Chordata
            Subphylum Vertebrata
Infraphylum Gnathostomata  
Superclass Osteichthyes  
Class Actinopterygii  
Subclass Neopterygii  
Infraclass Teleostei  
  Superorder Acanthopterygii  
  Order Perciformes  
  Suborder Labroidei  
  Family Cichlidae  
  Genus Tilapia  
  Species Tilapia kottae Lönnberg, 1904”

“Taxonomic Status: valid”

**Size, Weight, and Age Range**  
From Froese and Pauly (2015):

“Max length : 15.0 cm TL male/unsexed; [Teugels and Thys van den Audenaerde 1991]”

**Environment**  
From Froese and Pauly (2015):

“Freshwater; benthopelagic.”

**Climate/Range**  
From Froese and Pauly (2015):

“Tropical; 24°C - 26°C [Baensch and Riehl 1995]”

**Distribution Outside the United States**  
Native  
From Froese and Pauly (2015):

“Africa: Lake Barombi-ba-kotta and Lake Mboandong, Cameroon [Stiassny et al. 2008].”

Introduced  
No introductions of this species have been reported.

**Means of Introduction Outside the United States**  
No introductions of this species have been reported.

**Short description**  
From Froese and Pauly (2015):
“Dorsal spines (total): 14 - 16; Dorsal soft rays (total): 10-13; Anal spines: 3; Anal soft rays: 8 - 9. Diagnosis: dorsal fin with 14-16 spines and 10-13 soft rays; anal fin with 3 spines and 8-9 soft rays; 28-30 scales in lateral line; 8-10 gill rakers on lower limb of first arch [Stiassny et al. 2008].”

**Biology**
From Froese and Pauly (2015):

“Substrate brooder [Stiassny et al. 2008].”

From Corbet et al. (1973):

“Specimens caught in the middle of Lake Kotto were less frequently ripe than those caught in traps close inshore. Ripe gonads were found in only three out of 50 caught in a gill net set in mid lake, but in six out of 11 fishes of the same size (60-70 mm standard length) from inshore traps. This may indicate an inshore movement of ripe fishes.”

“In Lake Kotto we examined the stomachs of 59 fishes ranging in standard length from 70 to 178 mm. The main contents in most of them was phytoplankton, and in others organic debris or dark plant tissues predominated. Evidently the fishes took some of their food very close to the bottom of the lake because many stomachs contained a few chironomid larvae or mayfly larvae. Some had eaten the eggs of other fishes. Items presumably ingested along with the phytoplankton included rotifers, Chaoborus larvae and schistosome eggs.”

“From Mboandong we examined 14 small fishes ranging in length from 9 to 22 mm, and seven larger fishes ranging from 51 to 73 mm in length. The larger fishes had a much larger proportion of organic debris in their stomachs than the fishes from Lake Kotto, but four also contained phytoplankton. The smaller fishes had a different diet, with ostracods and copepods as the most important items, together with hydracarines and mayfly larvae. Some organic debris and dark plant tissues were also taken, but none of the smaller fishes had taken phytoplankton.”

**Human uses**
No information available.

**Diseases**
No OIE-notifiable diseases have been reported for this species.

**Threat to humans**
From Froese and Pauly (2015):

“Harmless”

**3 Impacts of Introductions**
No introductions of this species have been reported.
4 Global Distribution

![Figure 1. Global distribution of T. kottae. Map from GBIF (2015).](image)

5 Distribution within the United States

This species has not been reported in the U.S.

6 Climate Matching

**Summary of Climate Matching Analysis**

The climate match (Sanders et al. 2014; 16 climate variables; Euclidean Distance) was low throughout the contiguous U.S., reflected in a Climate 6 proportion of 0.0. The range for a low climate match is 0.000 to 0.005.
Figure 2. RAMP (Sanders et al. 2014) source map showing weather stations selected as source locations (red) and non-source locations (gray) for *T. kottae* climate matching. Source locations from GBIF (2015). All source locations are in Cameroon.
Figure 3. Map of RAMP (Sanders et al. 2014) climate matches for *T. kottae* in the continental United States based on source locations reported by GBIF (2015). 0= Lowest match, 10=Highest match. Counts of climate match scores are tabulated on the left.

7 Certainty of Assessment

Little information is available on the biology of *T. kottae* and it has not become established outside its native range. The certainty of this assessment is high because the lack of information about this species precludes any assessment other than “uncertain” risk.

8 Risk Assessment

**Summary of Risk to the Continental United States**

*Tilapia kottae* is a benthopelagic cichlid endemic to two lakes in western Cameroon. The species has not been reported as introduced outside of this location. Because *T. kottae* has no history of invasiveness, it is currently impossible to know what impacts *T. kottae* might have if introduced to the U.S. Climate match to the contiguous U.S. is low. Overall risk of this species is uncertain.
Assessment Elements

- History of Invasiveness (Sec. 3): Uncertain
- Climate Match (Sec. 6): Low
- Certainty of Assessment (Sec. 7): High
- Overall Risk Assessment Category: Uncertain
