

## **Notebook Table of Contents**

- 1. Introductions, Course structure and objectives**
- 2. Why ecological continuity at road-stream crossings is important**
- 3. History of road-stream crossing design approaches and a simple stream simulation example**
- 4. Fluvial processes and channel characteristics important in stream simulation design**
- 5a. Site assessment: Field measurements and interpretations**
  - Site maps, channel planform characteristics, longitudinal profiles**
- 5b. Stream simulation design**
  - Reference reach concept, project alignment and profile, site suitability for stream simulation**
- 6a. Site assessment: Field measurements and interpretations**
  - Channel cross sections and bed material interpretations**
- 6b. Stream simulation design**
  - Bed material size and arrangement**
- 7. Structure selection and design considerations**
- 8. Flood hydrology, discharge estimates, and culvert capacity**
- 9. Sediment entrainment and bed mobility/stability analysis**
- 10. Final design bed-material specifications and contract preparation**
- 11. Construction**
- 12. Monitoring**
- 13. ~~Lessons learned from a few case studies~~**
- 14. Exercises 5a, 5b, 6a, 6b, 7, 9, and 10: Tributary to Schafer Creek example**
- 15. Field trip information**
- 16. References**
- 17. Miscellaneous**
