

Tilapia thysi

Ecological Risk Screening Summary

U.S. Fish and Wildlife Service, June 2015

Photo not available.

1 Native Range, and Status in the United States

Native Range

From Froese and Pauly (2015):

“Africa: endemic to Lake Bermin, Cameroon [Stiassny et al. 2008].”

Status in the United States

This species has not been reported in the U.S.

Means of Introductions in the United States

This species has not been reported in the U.S.

Remarks

From Moelants (2010):

“Critically Endangered ... The species is endemic to the crater Lake Bermin. The species is currently major threat is from oil plantations and slash and burn agriculture leading to sedimentation and pollution in the lake (one location). There is also a potential threat from the lake 'burping' - CO₂ (as in Lake Nyos and Lake Barombi-Mbo). In addition deforestation of the surroundings of the crater may cause more wind which could lead to the lake 'turning', as the lake is stratified, lower layer being very low in oxygen and high in organic matter. Higher winds may cause currents in the lake which could cause this lower layer to mix with the upper layer where the fish live. This would cause a massive decrease in oxygen in the water and kills the fish.”

2 Biology and Ecology

Taxonomic Hierarchy and Taxonomic Standing

From ITIS (2015):

“Kingdom Animalia
Subkingdom Bilateria
Infrakingdom Deuterostomia
Phylum Chordata
Subphylum Vertebrata

Infraphylum Gnathostomata
Superclass Osteichthyes
Class Actinopterygii
Subclass Neopterygii
Infraclass Teleostei
Superorder Acanthopterygii
Order Perciformes
Suborder Labroidei
Family Cichlidae
Genus *Tilapia*
Species *Tilapia thysi* Stiassny, Schliewen and Dominey, 1992”

“Taxonomic Status: valid”

Size, Weight, and Age Range

From Froese and Pauly (2015):

“Max length : 6.4 cm SL male/unsexed; [Axelrod 1993]”

Environment

From Froese and Pauly (2015):

“Freshwater; benthopelagic.”

Climate/Range

From Froese and Pauly (2015):

“Tropical”

Distribution Outside the United States

Native

From Froese and Pauly (2015):

“Africa: endemic to Lake Bermin, Cameroon [Stiassny et al. 2008].”

Introduced

No introductions of this species have been reported.

Means of Introduction Outside the United States

No introductions of this species have been reported.

Short description

From Froese and Pauly (2015):

“Dorsal spines (total): 16; Dorsal soft rays (total): 10-11; Anal spines: 3; Anal soft rays: 7 - 8. Diagnosis: lower pharyngeal jaw robust and of moderate size, with a large, heart-shaped dentigerous plate, covered with numerous fine, regularly arrayed teeth [Stiassny et al. 1992, 2008]. Mouth not squared or obtuse [Stiassny et al. 2008]. Ventral margin of lower lip smooth; ratio of lower jaw length to lower jaw width < 1; oral jaw teeth slender, movably implanted with spatulate crowns [Stiassny et al. 1992, 2008]. 11-13 gill rakers on first arch [Stiassny et al. 1992].”

Biology

From Froese and Pauly (2015):

“Substrate brooder [Stiassny et al. 2008].”

Human uses

No information available.

Diseases

No OIE-notifiable diseases have been reported for this species.

Threat to humans

From Froese and Pauly (2015):

“Harmless”

3 Impacts of Introductions

No introductions of this species have been reported.

4 Global Distribution

Figure 1. Global distribution of *T. thysi* (GBIF 2013, in Discover Life 2015).

5 Distribution within the United States

This species has not been reported in the U.S.

6 Climate Matching

Insufficient data available for climate matching. RAMP (Sanders et al. 2014) was unable to perform climate matching because no georeferenced locations were available for this species in GBIF (2015). Added locational data would allow climate matching to be completed in the future.

7 Certainty of Assessment

Little information is available on the biology of *T. thysi* and it has not become established outside its native range. The certainty of this assessment is high because the lack of information about this species precludes any assessment other than “uncertain” risk.

8 Risk Assessment

Summary of Risk to the Continental United States

Tilapia thysi is endemic to Lake Bermin in Cameroon, and has not been reported as introduced outside of this location. The species is, in fact, critically endangered in its native range due to deforestation and agriculture. Because *T. thysi* has no history of invasiveness, it is currently impossible to know what impacts *T. thysi* might have if introduced to the US. Climate match is unknown. Overall risk of this species is uncertain.

Assessment Elements

- History of Invasiveness (Sec. 3):** Uncertain
- Climate Match (Sec.6):** Uncertain
- Certainty of Assessment (Sec. 7):** High
- Overall Risk Assessment Category:** **Uncertain**
