Dear Reader:

The Department of the Interior (Department) is working with other members of the National Invasive Species Council (NISC) and states and tribes to prepare a report of our recommendations for developing a framework for a national Early Detection and Rapid Response (EDRR) program for invasive plants, animals, and other organisms.

The October 2014 White House *Priority Agenda on Climate Resilience and Natural Resources* called upon the Department and NISC to develop an EDRR framework by September 30, 2015. The Department and NISC convened a group of experts from federal agencies to identify the central elements, parameters, and critical stakeholders. Then a broader group was formed under the umbrella of NISC’s Invasive Species Advisory Committee to serve as a forum to engage states, tribes, and other stakeholders in assessing the national needs and strategic considerations for the design, coordination, and implementation of the initiative’s outputs. Finally, in August the Department and NISC are engaging in a tribal consultation process to solicit further input.

This document is a draft summary of components that will inform the report and is intended for review and comment by tribes, partners, and interested stakeholders. This document does not represent the full final report, and we ask that it not be distributed. The final report will be prepared after careful consideration of all comments and recommendations received during the comment period.

We request that comments and recommendations for improving the report be submitted to invasivespecies@ios.doi.gov (please include “Tribal Comment: EDRR” in the subject line of the email) or fax to (202) 208-4867 until August 25, 2015, as we prepare the final report for delivery to the White House Council on Climate Preparedness and Resilience.

Co-Chairs of the Federal Early Detection and Rapid Response Work Group
U.S. Department of the Interior and National Invasive Species Council

DRAFT - FOR COMMENT

48 **The Charge**

49 In October 2014, the Council on Climate Preparedness and Resilience and Natural Resources Working
50 Group released *Priority Agenda: Enhancing the Climate Resilience of America's Natural Resources*. One
51 of its four priority strategies is to foster climate-resilient lands and waters, calling upon federal agencies
52 to “Identify Landscape Conservation Priorities to Build Resilience.” More specifically, the following
53 charge was given to the U.S. Department of the Interior and the National Invasive Species Council
54 (NISC):

55 Within twelve months, “the Secretary of the Interior, working with other members of the National
56 Invasive Species Council, including Department of Commerce (National Oceanic and Atmospheric
57 Administration [NOAA]), the Environmental Protection Agency (EPA), and the U.S. Department of
58 Agriculture (USDA), will work with states and tribes to develop a framework for a national Early
59 Detection and Rapid Response (EDRR) program that will build on existing programs to assist states
60 and tribes in forestalling the stress caused by the establishment and spread of additional invasive
61 species populations, thereby improving the resilience of priority landscapes and aquatic areas. This
62 will include the development of a plan for creating an emergency response fund to increase the
63 capacity of interagency and inter-jurisdictional teams to tackle emerging invasive species issues
64 across landscapes and jurisdictions.”

65

66 **The Challenge**

67 Invasive species and climate change are two of the most significant threats to natural areas, plant and
68 animal communities, and the ecological services that they provide. Invasive species have long been one
69 of the most significant drivers of environmental degradation in natural areas with wide-ranging impacts
70 on all types of ecosystems and the services that they provide (ISAC 2006). Natural areas are sites whose
71 ecological systems and their components have largely evolved through natural processes, including sites
72 managed specifically to protect biodiversity, maintain ecosystem services, or promote other ecological
73 values.

74 The complex interaction of invasive species and climate change requires an integrated approach to
75 support the resilience of our natural areas to adverse impacts. The specific contribution of EDRR to
76 enhancing the climate resilience of natural areas largely rests on the ability of response efforts to
77 mitigate or eliminate the potential impacts of a new environmental stressor. Overall ecosystem health is
78 a primary determinant of a natural area’s ability to withstand impacts associated with climate change.
79 Thus, removing one additional stressor – invasive species – improves that system’s chance to withstand
80 or appropriately adapt to climate change and its effects.

81

82 **Guiding Principles**

83 The geographic focus of the EDRR framework and funding plan will be on invasive species that affect
84 natural areas, including both aquatic and terrestrial ecosystems in the United States.¹ A wide range of
85 EDRR models and efforts exist that vary across species of concern, geographies, legal jurisdictions, and
86 agency authorities. This national EDRR framework for natural areas will build on this existing work based
87 on the following precepts:

¹ This approach is not intended to include invasive species that solely impact agriculture, livestock, aquaculture, or other commercial production systems. However, the framework may include species that adversely impact these sectors as well as natural areas.

88 **Complementarity:** Conceptually the framework will draw from existing programs and, from the
89 perspective of implementation, will seek to enhance and not duplicate existing efforts.

90 **Cooperation:** Given the focus on working across land-management agencies and stakeholders as
91 partners, this framework will embody a cooperative approach towards EDRR. The framework will
92 recognize the relevance of regulatory authorities in this arena and allow for interface with other
93 regulatory agencies as appropriate.

94 **Partnership:** The involvement of and support for states, tribes, non-governmental organizations,
95 corporations, and others working on invasive species in natural areas will be a key aspect of the
96 initiative's cooperative intent. Given the myriad of players and different legal jurisdictions associated
97 with connecting lands and their ownership, the development of effective partnerships is critical for
98 managing threats to the entire landscape.

99 **Scale:** This EDRR framework will be scale independent and it should be considered a template that could
100 be used as a model for the country, a region, state, tribe, or locality. Responsible participants will vary
101 according to the chosen response and its scale.

102 **Implementability:** The added value of this initiative is to make the jump from the numerous conceptual
103 models that exist to an operational framework to conduct EDRR on natural areas that includes the
104 funding, identification of the responsible institutions and other participants, and necessary actions for
105 EDRR events.

106 **Resource availability:** The immediate and sustained availability of resources determines the range of
107 actions that can be successfully implemented at a particular scale in a particular EDRR event. This
108 project will start from the perspective of broad eligibility for the receipt and use of funds in support of
109 cooperative EDRR efforts for natural areas, and identification of different resource streams will be
110 important for underpinning a sustainable funding mechanism.

111 **Metrics:** EDRR activities associated with this initiative will require a set of performance measures to
112 evaluate their efficiency and effectiveness and to improve the design and implementation of the EDRR
113 framework.

114

115 **Statement of Need**

116 Despite a number and diversity of EDRR efforts, a nationally coordinated EDRR program that includes
117 the necessary management and assessment tools, communication and organizational mechanisms, and
118 adequate, sustainable funding does not exist. The purpose of this present effort is not to develop a new
119 and independent EDRR program. Instead the objective is to design a framework that:

- 120 1. builds upon and ties together existing initiatives focused on natural areas and networks;
- 121 2. identifies key gaps in coverage, tools, and human and fiscal resources that need to be filled; and,
- 122 3. coordinates efforts and resources in a manner that contributes to effective and efficient EDRR
123 actions to protect natural areas.

124 The national scope and focus on natural areas requires the involvement, coordination, and cooperation
125 of federal agencies, particularly those with land management responsibilities, scientific expertise,
126 information management, and emergency response capacity. The capacities and capabilities that these
127 agencies leverage at the national level are necessary to link and support regional, state, tribal, and local
128 EDRR efforts.

129 **Approach and Structure**

130 To develop the EDRR framework and funding plan, the Department of the Interior and NISC convened a
131 group of experts from federal agencies to identify the central elements, parameters, and critical
132 stakeholders. Then a broader group was formed under the umbrella of NISC’s Invasive Species Advisory
133 Committee to serve as a forum to engage states, tribes, and other stakeholders in assessing the national
134 needs and strategic considerations for the design, coordination, and implementation of the initiative’s
135 outputs. Finally, in August the Department and NISC are engaging in a tribal consultation process to
136 solicit further input.

137 The following sections are in development and will eventually address the need for EDRR for invasive
138 species in natural areas and how establishing an EDRR framework would augment those efforts. Specific
139 attention will be given to establishing an emergency response fund, given its critical role in supporting
140 the overall function of EDRR activities. Models for obtaining resources and initial recommendations for
141 the implementation of aspects of the framework will also be discussed. The EDRR framework itself is
142 divided into components focused on preparedness, early detection, rapid assessment, and rapid
143 response. Coordination and the identification of responsible institutions and cooperative partnerships
144 are critical elements for outlining the framework’s implementation. Supporting appendices will be
145 added as the final report is prepared.

146

147 **Elements of an EDRR System**

148 Preventing the introduction of invasive species is the first line of defense against invasions; however,
149 even the best prevention efforts will not stop all invasions. The second line of defense is detecting an
150 incipient infestation, optimally soon enough to respond to contain its spread and achieve eradication.
151 Detecting and responding to invasions requires a series of sustained and coordinated actions that can be
152 grouped into four categories:

- 153 • Preparedness: Preparedness establishes the planning frameworks, coordination networks,
154 technical tools, and necessary resources for deployment of detection, rapid assessment, and
155 rapid response measures.
- 156 • Early detection: Early detection provides initial evidence on the occurrence of a potentially
157 invasive species and highlights where existing prevention measures have failed.
- 158 • Rapid assessment: Rapid assessment determines the specific distribution of the species as well
159 as its potential risks and impacts. The assessment also evaluates the availability and efficacy of
160 management responses to address the invasion.
- 161 • Rapid response: Rapid response is the set of coordinated actions to eradicate that invasive
162 species occurrence. Monitoring after response actions is critical and restoration plans should be
163 implemented when needed (NISC 2010).

164 These efforts, collectively referred to as Early Detection and Rapid Response – if timely – increase the
165 likelihood that invasions will be addressed successfully while populations are still localized and small
166 enough to be eradicated, or at a minimum contained (NISC 2010).

167 Early detection and rapid response actions may eradicate invasive species populations that are new to
168 the United States and its states and territories and/or halt the spread of invasive species by eradicating
169 satellite populations that could result in significant range expansions of invasive species. EDRR can also
170 target non-native species when assessment shows them to be a high-risk for becoming invasive in the
171 future.

172 **Coordination, Roles, and Responsibilities**

173 Coordination of EDRR efforts across a range of federal and non-federal partners at scales that range
 174 from local to landscape levels requires an effective EDRR framework that is national in scope. To begin
 175 to develop an EDRR framework and identify possible organizational structures, the potential roles and
 176 responsibilities of the federal agencies and their partners must be considered.

177 Active partners in EDRR activities include federal, state, and tribal governments, as well as regional
 178 bodies and a range of site-based partners and issue experts. An effective EDRR network should build
 179 upon and integrate the services and capabilities offered by this range of entities, while also helping to
 180 identify key geographic, taxonomic, and skill-based gaps. Using the EDRR components of preparedness,
 181 early detection, rapid assessment, and rapid response, Table 1 describes the potential roles and
 182 responsibilities that federal and non-federal (state/tribal/partner) entities could assume across the EDRR
 183 action steps of preparedness, early detection, rapid assessment, and rapid response. The listed activities
 184 are neither exhaustive nor mutually exclusive and therefore are intended to show the relative division of
 185 responsibility between the two categories.

186 Table 1: Federal, State, and Tribal Roles in Early Detection and Rapid Response

EDRR Federal, State, and Tribal Roles	
Preparedness	
Federal	State, Tribal, Partners²
Lead agencies: identify lead federal agencies for different taxa of species in natural areas ³	Lead agencies: identify lead state, tribal, and/or regional/partner entities for different taxa within their respective geographical jurisdiction
Planning: prepare and obtain permits; develop rapid response protocols for priority species; provide templates and standards for data sharing, planning, coordination, and communication efforts	Planning: prepare and obtain permits; fine-tune and adopt protocols, MOUs, and other relevant standards
Horizon scanning: identify invasive species and pathways of national importance	Horizon scanning: identify invasive species and pathways of geographic importance
Risk analysis: develop and apply risk assessment tools to prioritize invasive species and pathways of national importance; develop risk management protocols for priority invasive species/species types	Risk analysis: fine-tune and apply assessment tools to prioritize invasive species and pathways of geographic importance
Funding: develop eligibility criteria; identify and secure sources of funding, disburse funds, and conduct regular audits	Funding: establish process for rapid receipt and disbursement of funds, determine source of funds for cost sharing
Training: provide ICS and rapid assessment training and resources	Training: conduct regular exercises for ICS, rapid assessment, identification and monitoring
Research: develop detection and risk analysis tools; develop control techniques	

² The Priority Agenda specifically identified state and tribal entities but this category may also include federal land management units at the site level and other regional bodies and partners. Reference to “geographic importance” refers to the specific jurisdiction (regional, state, tribal, or federal-land management unit) under consideration.

³ This may include lead agencies to address pathways of national or international concern.

Early Detection	
<p style="text-align: center;">Federal</p> <p>Monitoring: identify and link federal and non-federal programs; maintain national monitoring systems</p> <p>Mapping networks: identify and support mapping networks and tools</p> <p>Identification: support, enhance, and use taxonomic/systematics expertise for verification and vouchering of detected species</p> <p>Information management: develop data protocols that support interoperability and data aggregation</p> <p>Reporting: develop protocols</p>	<p style="text-align: center;">State, Tribal, Partners</p> <p>Monitoring: identify and support local programs and citizen science efforts</p> <p>Mapping networks: identify mapping networks and provide available data</p> <p>Identification: establish procedure for sampling, verification and vouchering of detected species; record and include samples in biological collections</p> <p>Information management: provide and share data</p> <p>Reporting: establish reporting procedure</p>
Rapid Assessment	
<p style="text-align: center;">Federal</p> <p>Rapid assessment networks: identify taxa-specific experts for assessment teams</p> <p>Delineation and initial containment of invasive species of potential national importance, if possible/appropriate</p> <p>Preliminary evaluation: assess newly detected species of potential national importance to determine feasibility of rapid response</p>	<p style="text-align: center;">State, Tribal, Partners</p> <p>Delineation and isolation of invasive species of geographic importance, if possible/appropriate</p> <p>Preliminary evaluation: assess species of geographic significance drawing from federally identified rapid assessment networks as necessary</p>
Rapid Response	
<p style="text-align: center;">Federal</p> <p>Incident Command System (ICS): identify federal, state, and other roles for specific scenarios</p> <p>Treatment: select, design, and implement rapid response plan for invasive species of national importance</p> <p>Monitoring and evaluation: monitor, assess, and report on effectiveness of rapid response actions</p> <p>Restoration: implement restoration activities</p>	<p style="text-align: center;">State, Tribal, Partners</p> <p>ICS/rapid response operational structure</p> <p>Treatment: select, design, and implement rapid response plan for invasive species of geographic importance</p> <p>Monitoring and evaluation: monitor, assess, and report on effectiveness of rapid response actions</p> <p>Restoration: implement restoration activities</p>

187

188 **Funding Plan**

189 A fully operational EDRR program requires that resources are available and easily accessible when a
 190 detection of an invasive species affecting natural areas is made and rapid response action is deemed
 191 necessary. Local resources for responding even to the initial stage of invasions can be quickly
 192 overwhelmed. This reinforces the need for supplemental support to enable federal, state, tribal, and
 193 other stakeholders to act in a timely manner to stop invasions.

194 Successful rapid response is also contingent on preparedness: having the planning, tools, training, and
195 human resources in place to mount eradication efforts. A plan for emergency response funding intended
196 to “increase the capacity of interagency and inter-jurisdictional teams to tackle emerging invasive
197 species issues” thereby needs to consider means to support the continuum of preparedness, early
198 detection, and rapid assessment to ensure that rapid response activities are viable and effective.

199 This section will outline the major elements of a potential emergency response funding plan, including
200 its capabilities, structure, and sourcing.

201

202 **Emerging Themes of Potential Recommendations**

203 Invasive species can quickly cross both geographic and jurisdictional boundaries and cause irreparable
204 harm to natural resources making them less resilient to climate change. Early detection and rapid
205 response activities can halt their establishment and range expansion. Natural areas are particularly
206 susceptible to invasions. Currently, there is no national-scale framework that supports coordinated
207 EDRR for invasive species that impact natural areas. Specific actions that focus on four emerging
208 themes—Coordination, Authorities and Policies, Funding, and Capabilities and Capacity—may be
209 needed to establish an EDRR framework and operationalize a program to fill critical gaps and augment
210 existing efforts and networks.

211

212 **Glossary**

213 **Alien species:** with respect to a particular ecosystem, any species, including its seeds, eggs, spores, or
214 other biological material capable of propagating that species, that is not native to that ecosystem.
215 (EO 13312)

216 **Climate resilience:** the capacity for a socio-ecological system to: (1) absorb stresses and maintain
217 function in the face of external stresses imposed upon it by climate change and (2) adapt,
218 reorganize, and evolve into more desirable configurations that improve the sustainability of the
219 system, leaving it better prepared for future climate change impacts. (Wikipedia, Nelson et al. 2007,
220 Folke 2006)

221 **Early Detection:** activities to conduct surveillance for, and verify, the presence of a nonnative species in
222 an ecosystem, before the species spreads so widely that eradication cannot be implemented.

223 **Established Species:** a species with a permanent, reproducing population that is unlikely to be easily
224 eliminated through human action or natural cause. Established species may or may not be invasive.
225 (Mississippi State Management Plan for Aquatic Invasive Species)

226 **Introduced Species:** an organism that is not native to a designated ecosystem or geographic area.
227 (Mississippi State Management Plan for Aquatic Invasive Species)

228 **Invasive Species:** an alien species whose introduction does or is likely to cause economic or
229 environmental harm or harm to human health.

230 **Natural Area:** a geographical site whose ecological systems and their components have largely evolved
231 through natural processes. This also includes sites managed specifically to protect biodiversity,
232 maintain ecosystem services or promote other ecological values. While there are already systems in
233 place to address agricultural and livestock pests, this effort further recognizes the importance of
234 non-agricultural areas for EDRR activities (e.g., urban settings may serve as the point of introduction
235 for invasive species that impact natural areas).

236 **Preparedness:** having the knowledge, financial resources, tools, trained personnel, and coordination
237 structures in place to streamline activities at each of stage in the EDRR process.

238 **Rapid Assessment:** determination of the species' abundance and distribution, the risks and impacts
239 associated with its occurrence, as well as the potential management responses to address the
240 invasion. (NISC)

241 **Rapid Response:** Activities intended to eradicate a species from a location, before it spreads so widely
242 and becomes so abundant that eradication cannot be implemented. Response activities may be
243 conducted over a period of years. For example, a species that has not spread widely for several
244 years, and may still be practically, effectively, and efficiently eradicated, can be the target of a rapid
245 response action.

246 **Risk Analysis:** the set of tools or processes incorporating risk assessment, risk management, and risk
247 communication, which are used to evaluate the potential risks associated with a species or pathway,
248 possible mitigation measures to address that risk, and the information to be shared with decision-
249 makers and other stakeholders.
