

Figure 1—Greater sage-grouse population densities based on average number of males per lek (from Stiver *et al.* 2006, p. 1-12). Darker areas indicate higher breeding population densities.

Figure 2—The Management Zones for sage-grouse as identified by Stiver *et al.* (2006, p. 1-11). (Delineation primarily based on floristic provinces and population boundaries.)

Figure 3—Total greater sage-grouse harvest by decade for available State-wide harvest estimates. For illustrative purposes, harvest estimates are shown as totals and as a combination for WY, MT, and ID, the States with the greatest individual harvest levels. (Values are underestimates as no data were available for CA, CO, MT, and NV in the 1950s, and total harvest values for WY were not reported prior to 1957; no data were available in the 1960s for CA, ND, or SD, and data for NV and CO were only partially reported; and no data were available for CA and ND in the 1970s).

Figure 4—Population Management Units (PMUs) and greater sage-grouse distribution within the Bi-State planning area, California and Nevada.
