RE: TRU-534-18.84 (PID 90188)

Dear Mr. Hill:

This letter is in response to your letter dated September 13, 2013 received in our office via email on September 16, 2013 requesting consultation for the TRU-534-18.84 bridge replacement project (PID 90188) located in Trumbull County, Ohio. The project as proposed includes improvements to 0.16 mile of State Route 534 which includes the replacement of 2 bridge structures in Farmington Township. The project as proposed includes 240’ of impacts to the Grand River, 0.206 acres of wetland impacts, and impacts to forested areas. Please note that ODOT initially submitted this project under the August 30, 2013 MOA for Service review. However, this project was removed from the MOA when ODOT submitted a tiered formal consultation in an email dated September 16, 2013 from Matt Raymond.

FISH & WILDLIFE COORDINATION ACT COMMENTS:
The Service recommends that impacts to streams and wetlands be avoided, and buffers surrounding these systems be preserved. Streams and wetlands provide valuable habitat for fish and wildlife resources, and the filtering capacity of wetlands helps to improve water quality. Naturally vegetated buffers surrounding these systems are also important in preserving their wildlife-habitat and water quality-enhancement properties. We support and recommend mitigation activities that reduce the likelihood of invasive plant spread and encourage native plant colonization. Prevention of non-native, invasive plant establishment is critical in maintaining high quality habitats. All disturbed areas in the project vicinity should be mulched and revegetated with native plant species.

FEDERALLY LISTED SPECIES:
The project is located within the range of the Indiana bat (Myotis sodalis), a species federally listed as endangered; the clubshell (Pleurobema clava), a federally listed endangered freshwater mussel; eastern massasauga (Sistrurus catenatus), a candidate species for federal listing; and the bald eagle (Haliaeetus leucocephalus), a federal species of concern.

This project lies within the range of the eastern massasauga, a small, docile rattlesnake that is currently a Federal candidate species. We understand that the nearest record for the species is ~7
miles away in Bloomfield Township. We understand from the project descriptions, that the
project area contains marginal habitat for the snake and that the project as proposed includes
impacts to 0.206 acres of wetlands. We appreciate ODOT’s commitment to include a plan note
warning workers about the snakes. ODOT has agreed to include the following plan note:
THIS PROJECT IS WITHIN THE RANGE OF THE EASTERN MASSASAUGA RATTLESNAKE
(SISTRURUS CATENATUS) A STATE ENDANGERED AND FEDERAL CANDIDATE
SPECIES. IF EASTERN MASSASAUGA RATTLESNAKES ARE ENCOUNTERED IN THE
WORK AREA DURING CONSTRUCTION, NO PERSON SHALL HARM OR KILL THE
SNAKES. ADDITIONALLY, NO ATTEMPT SHOULD BE MADE TO HANDLE THE SNAKES,
AS THE EASTERN MASSASAUGA RATTLESNAKE IS A VENOMOUS SPECIES. ALL
CONSTRUCTION OPERATIONS AT THE WORK AREA SHALL TEMPORARILY CEASE AND
ODOT OFFICE OF ENVIRONMENTAL SERVICES – ECOLOGICAL SECTION (614- 466-
7100) AND THE OHIO DEPARTMENT OF NATURAL RESOURCES DIVISION OF WILDLIFE
(614-265-6300) WILL BE IMMEDIATELY CONTACTED.

ODOT has determined that this project will have no effect on the clubshell and the bald eagle; therefore,
consultation with the Service is not required. The remainder of this letter addresses impacts to the Indiana
bat and eastern massasauga.

INDIANA BAT - TIER 2 BIOLOGICAL OPINION:
On January 26, 2007, the U.S. Fish and Wildlife Service (Service) issued a programmatic biological
opinion (PBO) for the Ohio Department of Transportation’s (ODOT) Statewide Transportation Program
through January 2012. This PBO established a two-tiered consultation process for ODOT activities, with
issuance of the programmatic opinion being Tier 1 and all subsequent site-specific project analyses
constituting Tier 2 consultations. Under this tiered process, the Service will produce tiered biological
opinions when it is determined that site-specific projects are likely to adversely affect federally listed
species. When may affect, not likely to adversely affect determinations are made, the Service will review
those projects and if justified, provide written concurrence and section 7(a)(2) consultation will be
considered completed for those site-specific projects.

In issuing the PBO (Tier 1 biological opinion), we evaluated the effects of all ODOT actions outlined in
your Biological Assessment on the federally listed Indiana bat. Your current request for Service review
of the TRU-534-18.84 (PID 90188) bridge replacement project is a Tier 2 consultation under the January
26, 2007, PBO. We have reviewed the information contained in the letter and supporting materials
submitted by your office describing the effects of the proposed project on federally listed species. We
concur with your determination that the action is likely to adversely affect the Indiana bat. As such, this
review focuses on determining whether: (1) this proposed site-specific project falls within the scope of
the Tier 1 PBO, (2) the effects of this proposed action are consistent with those anticipated in the Tier 1
PBO, and (3) the appropriate conservation and mitigation measures identified in the biological assessment
are adhered to.

That is, this letter serves as the Tier 2 biological opinion for the proposed TRU-534-18.84 (PID 90188)
bridge replacement project. As such, this letter also provides the level of incidental take that is
anticipated and a cumulative tally of incidental take that has been authorized and exempted in the PBO.

Description of the Proposed Action
Pages 1-4 of your letter, along with the supporting materials you submitted, include the location and a
thorough description of the proposed action. The action, as proposed, includes improvements to State
Route 534 including 2 bridge replacements in Trumbull County, Ohio. Three trees that exhibit brood-
rearing habitat for the species (potential maternity roost trees) may be removed for this project. A total of 31 trees will be removed for this project (0.26 acres total). ODOT will implement the following conservation measures to avoid, minimize, and/or mitigate adverse impacts to the Indiana bat:

1) any unavoidable tree removal will take place between September 30 and April 1 to avoid direct impacts (avoidance measure A-1). The Service appreciates ODOT’s commitment to adhere to the current cutting date restrictions, clearing only between October 1 and March 31.

2) protection of land/habitat through conservation easements or deed restriction to offset loss of suitable habitat (M-1).

We understand that ODOT will mitigate for project impacts to Indiana bat habitat at a ratio of 3:1. The total forested acreage to be impacted at the project site is 0.26 acres. Therefore, ODOT will subtract 0.78 acres from the approved POR-261 Mitigation Site to compensate for these impacts. We understand that the 0.78 acres will be subtracted from upland forested acreage at the POR-261 site and that this acreage will then be unavailable to mitigate future project impacts.

**Status of the Species**
Species description, distribution, life history, population dynamics, and status are fully described on pages 13-26 for the Indiana bat in the PBO and are hereby incorporated by reference. Since the issuance of the PBO in 2007, there has been no change in the status of the species.

Species descriptions, life histories, population dynamics, status and distributions are fully described on pages 23-30 for the Indiana bat in the PBO and are hereby incorporated by reference. The most recent population estimate indicates 424,708 Indiana bats occur rangewide (King 2011). The current revised Indiana Bat Recovery Plan: First Revision (2007) delineates recovery units based on population discreteness, differences in population trends, and broad level differences in land-use and macrohabitats. There are currently four recovery units for the Indiana bat: Ozark-Central, Midwest, Appalachian Mountains, and Northeast. All of Ohio falls within the Midwest Recovery Unit.

In 2007, white nose syndrome (WNS) was found to fatally affect several species of bats, including the Indiana bat, in eastern hibernacula. To date, WNS is known from New York, Massachusetts, Vermont, West Virginia, Pennsylvania, New Jersey, New Hampshire, Connecticut, Virginia, Tennessee, Oklahoma, Missouri, Maine, Maryland, North Carolina, Kentucky, Ohio, and Indiana as well as the provinces of Ontario and Quebec in Canada. The extent of the impact this syndrome may have on the species rangewide is uncertain, but based on our current limited understanding of WNS, we expect mortality of bats at affected sites to be high (personal communication, L. Pruitt, 2008).

**Environmental Baseline**
The environmental baseline for the species listed above was fully described on pages 21-26 of the PBO and is hereby incorporated by reference. Since the issuance of the PBO in 2007, there has been no change in the environmental baseline.

**Status of the species within the action area**
Since the issuance of the PBO in 2007, there have been no new Indiana bat capture records within the vicinity of this project. Your letter and supporting materials state that suitable habitat exists within the action area, thus we are assuming presence.

**Effects of the Action**
Based on analysis of the information provided in your letter and supporting materials, we have determined that the effects of the proposed action are consistent with those contemplated and fully
described on pages 31-35 of the PBO. Adverse effects to the Indiana bat from this project could occur due to the removal of a potential maternity roost tree. However, implementation of seasonal cutting restrictions (avoidance measure A-1) will avoid direct adverse effects to individual bats. Projects that require the removal of one or more potential primary maternity roost trees outside of the Indiana bats’ maternity season can result in adverse effects to colony members upon their return to maternity areas following hibernation. When a primary roost tree becomes unsuitable, members of a colony may initially distribute themselves among several previously used alternate roost trees (USFWS 2002; Kurta et al. 2002). It is not known how long it takes for the colony to attain the same level of roosting cohesiveness that it experienced prior to the loss of an important primary roost tree. As explained in the PBO, colony cohesiveness is essential for successful birth and rearing of young. It is likely that due to the ephemeral nature of roost trees, the Indiana bat has evolved to be able to relocate replacement roosts, if available, when their previously-used roost trees become unsuitable. Until the bats from the colony locate another desirable primary roost tree and reunite, it is possible, however, that some individual members of a colony will be subject to increased stress resulting from: (1) having to search for a replacement primary roost tree, which increases energy expenditure and risk of predation; (2) having to roost in alternate trees that are less effective in meeting thermoregulatory needs; and (3) having to roost singly, rather than together, which decreases the likelihood in meeting thermoregulatory needs, thereby reducing the potential for reproductive success.

Adult male and non-reproductive female Indiana bats may also be indirectly exposed to loss of roosting habitat. In general, effects on these individual bats would be less severe than the effects associated with individuals of maternity colonies. Adult male and non-reproductive female Indiana bats are not subject to the physiological demands of pregnancy and rearing young. Males and non-reproductive females typically roost alone or occasionally in small groups. When these individuals are displaced from roosts they must utilize alternative roosts or seek out new roosts. Because these individuals are not functioning as members of maternity colonies, they do not face the challenge of reforming as a colony. Roost tree requirements for non-reproductive Indiana bats are less specific whereas maternity colonies generally require larger roost trees to accommodate multiple members of a colony. Therefore, it is anticipated that adverse indirect effects to non-reproductive bats will be less than the effects to reproductively active females. The Service anticipates that indirect effects to non-reproductive Indiana bats from the loss of roosting habitat will be insignificant.

In addition, ODOT’s placement of conservation-oriented restrictions on the POR-261 site has the potential to provide suitable habitat for the Indiana bat at this location into perpetuity. The access and use restrictions were placed on the POR-261 property and transferred to Kent State University through a State of Ohio Department of Transportation Director’s Deed signed by Director James G. Beasley on October 29, 2008. Prior to establishment of this deed, the POR-261 site was available for development, which likely would have further reduced available habitat for the Indiana bat in eastern Ohio.

We are not aware of any non-federal actions in the action area that are reasonably certain to occur. Thus, we do not anticipate any cumulative effects associated with this project.

Conclusion
We believe the proposed TRU-534-18.84 (PID 90188) bridge replacement project, is consistent with the PBO. After reviewing site specific information, including 1) the scope of the project, 2) the environmental baseline, 3) the status of the Indiana bat and its assumed presence within the project area, 4) the effects of the action, and 5) any cumulative effects, it is the Service’s biological opinion that this project is not likely to jeopardize the continued existence of the Indiana bat.
Incidental Take Statement
The Service anticipates that the proposed action will result in incidental take associated with projects in
the Northeast management unit. Incidental take for this project, based on the potential removal of
approximately 0.26 acres, resulting in the cumulative incidental take of 336.39 for this management unit.
This project, added to the cumulative total of incidental take for the implementation of ODOT’s Statewide
Transportation Program, is well within the level of incidental take anticipated in the PBO through 2012
(see table below).

We determined that this level of anticipated and exempted take of Indiana bats from the proposed project,
in conjunction with the other actions taken by ODOT pursuant to the PBO to date, is not likely to result in jeopardy to the species.

We understand that ODOT is implementing all pertinent Indiana bat conservation measures, specifically
A-1 and M-1 stipulated in the Biological Assessment on pages 29-31. In addition, ODOT is monitoring
the extent of incidental take that occurs on a project-by-project basis. These measures will minimize the
impact of the anticipated incidental take.

This fulfills your section 7(a)(2) requirements for this action. However, should the proposed project be
modified or the level of take identified above be exceeded, ODOT should promptly reinitiate consultation
as outlined in 50 CFR §402.16. As provided in 50 CFR §402.16, reinitiation of formal consultation is
required where discretionary Federal agency involvement or control over the action has been retained (or
is authorized by law) and if: (1) the amount or extent of incidental take is exceeded; (2) new information
reveals effects of the continued implementation of ODOT’s Statewide Transportation Program and
projects predicated upon it may affect listed species in a manner or to an extent not considered in this
opinion; (3) the continued implementation of ODOT’s Statewide Transportation Program and projects
predicated upon it are subsequently modified in a manner that cause an effect to federally listed species
not considered in this opinion; or (4) a new species is listed or critical habitat designated that may be
affected by the action. In instances where the amount or extent of incidental take is exceeded, any
operations causing such take must cease, pending reinitiation. Requests for reinitiation, or questions
regarding reinitiation, should be directed to the U.S. Fish Wildlife Service’s Columbus, Ohio Field
Office.
We appreciate your continued efforts to ensure that this project is consistent with all provisions outlined in the Biological Assessment and PBO. If you have any questions regarding our response or if you need additional information, please contact Sarah Bowman at extension 18 or at Sarah_Bowman@fws.gov.

Sincerely,

Mary Knapp, Ph.D.
Field Supervisor
