Monitoring well with at least one detection of cadmium and known inaccurate location

Common discharge areas for ground water
- Ground water typically discharges to the Indiana Harbor Canal, its tributaries, or Lake Michigan
- Ground water typically discharges to leaky sewers or pumping centers
- Ground water typically discharges to the Little Calumet River or south of the study area
- Ground-water discharge areas typically change through time or data is insufficient to determine typical discharge areas for ground water

Facility boundary
- Monitoring well with at least one detection of cadmium
- Monitoring well with at least one detection of cadmium and known inaccurate location

Figure 24. Common discharge areas for ground water in the Calumet aquifer and monitoring wells with at least one detection of cadmium in the study area, northwestern Indiana.
