

Upper Mississippi River National Wildlife and Fish Refuge
Established 1924
Compatibility Determination

Use: Commercial Fishing (including mussel and turtle harvest)

Refuge Name: Upper Mississippi River National Wildlife and Fish Refuge (Refuge)

Establishing and Acquisition Authority(ies):

The Upper Mississippi River Wildlife and Fish Refuge was established by Public Law No. 268, 68th Congress on June 7, 1924. This act authorized acquisition of lands for Refuge purposes. Additional lands acquired in fee title by the U.S. Army Corps of Engineers are managed as part of the Refuge under a 1963 Cooperative Agreement between the Department of the Army and the Department of the Interior.

Refuge Purpose(s):

“The Refuge shall be established and maintained (a) as a refuge and breeding place for migratory birds included in the terms of the convention between the United States and Great Britain for the protection of migratory birds, concluded August 16, 1916, and (b) to such extent as the Secretary of the Interior by regulations, prescribe, as a refuge and breeding place for other wild birds, game animals, fur-bearing animals, and for the conservation of wild flowers and aquatic plants, and (c) to such extent as the Secretary of the Interior may, by regulations, prescribe a refuge and breeding place for fish and other aquatic animal life.”

National Wildlife Refuge System Mission:

“The mission of the National Wildlife Refuge System is to administer a national network of lands and waters for the conservation, management, and where appropriate, restoration of the fish, wildlife, and plant resources and their habitats within the United States for the benefit of present and future generations of Americans.”

Description of Use:

About 17 species of fish plus turtles are caught commercially within the Refuge boundary. For Pools 4-14 from 1998 to 2001, annual commercial catch averaged 6.6 million pounds with a gross value based on ex vessel price (the price paid to the commercial fisher dockside; i.e., before any processing or distribution) per pound of \$1.7 million (2003 dollars). Commercial catch of turtles averaged 8,475 pounds annually with a gross value of \$4,553. The annual number of commercial fishing licenses averaged 534 for a gross revenue per license of \$3,307 (individuals may have more than one license type). Data on mussel harvest is not available. Once lucrative, mussel harvest in the last decade or so has become sporadic and minimal. Regulation setting, issuing licenses, and maintaining harvest reports are done by the states, with the exception of Spring Lake in

Pool 13, Savanna District. For Spring Lake, the Refuge issues a special use permit for commercial fishing. A total of 57,532 pounds were reported harvested in Spring Lake in 2003, with an estimated value of \$8,629.

Commercial fishing is conducted in accordance with State seasons and regulations and any applicable Refuge regulations. Means of harvest include hoop nets, gill nets, trammel nets, and baskets. Commercial fishing is conducted year round, but primarily from March to October. Primary fish harvested are common carp, buffalo, freshwater drum, and catfish. In recent years, Asian carp species such as silver carp have comprised a larger part of the harvest in the lower end of the Refuge. The main turtle harvested is the snapping turtle.

Availability of Resources:

Commercial anglers use the existing network of roads to access the Mississippi River and its tributaries. The Refuge provides numerous parking lots, boat ramps, platforms, signs and other facilities for use by commercial anglers. The Refuge provides staff to maintain these facilities, disseminate information, and enforce regulations. Fisheries management is conducted in cooperation with the four states' Departments of Natural Resources (Illinois, Iowa, Wisconsin, and Minnesota), La Crosse Fisheries Office, and the Corps of Engineers. Funding for this activity comes from annual operations and maintenance funding for the Refuge and is deemed adequate given the current Refuge involvement.

Anticipated Impacts of the Use:

Commercial harvest levels for fish, mussels, and turtles are currently set by the states which cooperate through the auspices of the Upper Mississippi River Conservation Committee. Regular fishing surveys by the states, and reporting requirements, monitor fishery populations and harvest. Thus, commercial fishing and turtle harvest results in removal and use of a certain percentage of the population each year, but harvest is deemed sustainable and does not represent a threat to overall populations of any species. As noted earlier, mussel harvest is inconsequential, and the states monitor populations and enact restrictions or season closures as necessary. Harvest of Asian carp species is becoming more prevalent, and may be an effective way to reduce or check populations of these injurious species.

Commercial fishing activities may cause temporary disturbance to bald eagles, water birds, waterfowl, and other wildlife. To minimize disturbance some areas are closed to fishing during fall and winter when waterfowl and eagles concentrate. In order to avoid conflicts between commercial fishing and recreational fishing, some backwater areas are restricted to week days only during summer months. In order to avoid the harvest of waterfowl, such as diving ducks being caught in nets, specific backwater areas require that commercial fishing gear must be regularly tended to and cannot be dead set. Undoubtedly some shoreline erosion is caused by wakes from commercial fishing boats, but is minor compared to that caused by barges, annual high water events, floods, recreational boating, and wind-driven wave action. With reasonable use restrictions in

effect, commercial harvest of fish, turtles, and mussels should not result in short- or long-term impacts that adversely affect the purposes of the Refuge or the mission of the National Wildlife Refuge System.

Public Review and Comment:

A draft of this Compatibility Determination was included in the Draft Comprehensive Conservation Plan and Environmental Impact Statement (EIS) released May 1, 2005 for a 120-day comment period. It was also available during a subsequent 90-day review period on a supplement to the EIS released December 3, 2005. Public notification included notices in the Federal Register, media announcements, and 31 public meetings and workshops attended by more than 3,700 persons. Several comments on commercial harvest of fish, mussels, and turtles were received and are found in Chapter 7 of the EIS, with a Service response. However, no comments specific to this determination were received.

Determination:

_____ Use is Not Compatible

xx Use is Compatible with Following Stipulations

Stipulations Necessary to Ensure Compatibility:

1. All applicable state and federal regulations apply. Regulations and monitoring help ensure that harvest levels of commercial fishing do not have harmful long-term impact on fish populations.
2. A permit from the respective state is issued to all commercial anglers and the Refuge will by 2010 dove-tail a Refuge Special Use Permit with the state permit. An annual harvest report is required to identify the total number of pounds of fish caught by species and by navigation pool.
3. Commercial anglers will be asked to avoid or modify their techniques and timing of net tending in Waterfowl Hunting Closed Areas during the respective state waterfowl hunting season to limit disturbance to resting and feeding waterfowl.

Justification:

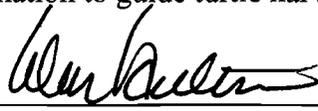

Commercial fishing is primarily limited to the harvest of what are generally considered rough fish. The removal of rough fish improves habitat for many other species of native fish, including a host of sport fish important to recreational fishing. The recent spread of non-native Asian carp such as silver and bighead carp into the Upper Mississippi River has brought many concerns about impacts to the habitat and forage base, and direct impacts to certain species (e.g. black carp feed on mussels). Commercial fishing is a primary method of control for invasive and exotic common carp and Asian carp species,

and as such, directly contributes to the purposes of the Refuge for the conservation of fish, wildlife, and plants. Commercial fishing and its impacts on fishery resources are continually monitored by the four states involved. Together with Refuge-specific regulations and stipulations, this oversight ensures that commercial fishing is sound biologically and has limited adverse impacts on Refuge fish, wildlife, and habitat.

By 2008, a Refuge Fishery and Mussel Management Plan will be prepared which will set specific goals and objectives which will be used in review and updating of the commercial fishing program on the Refuge. Likewise, on-going monitoring and research of turtle populations will provide new information to guide turtle harvest on the Refuge.
