

Sea-level Rise Science and Decision Making in an Uncertain Future

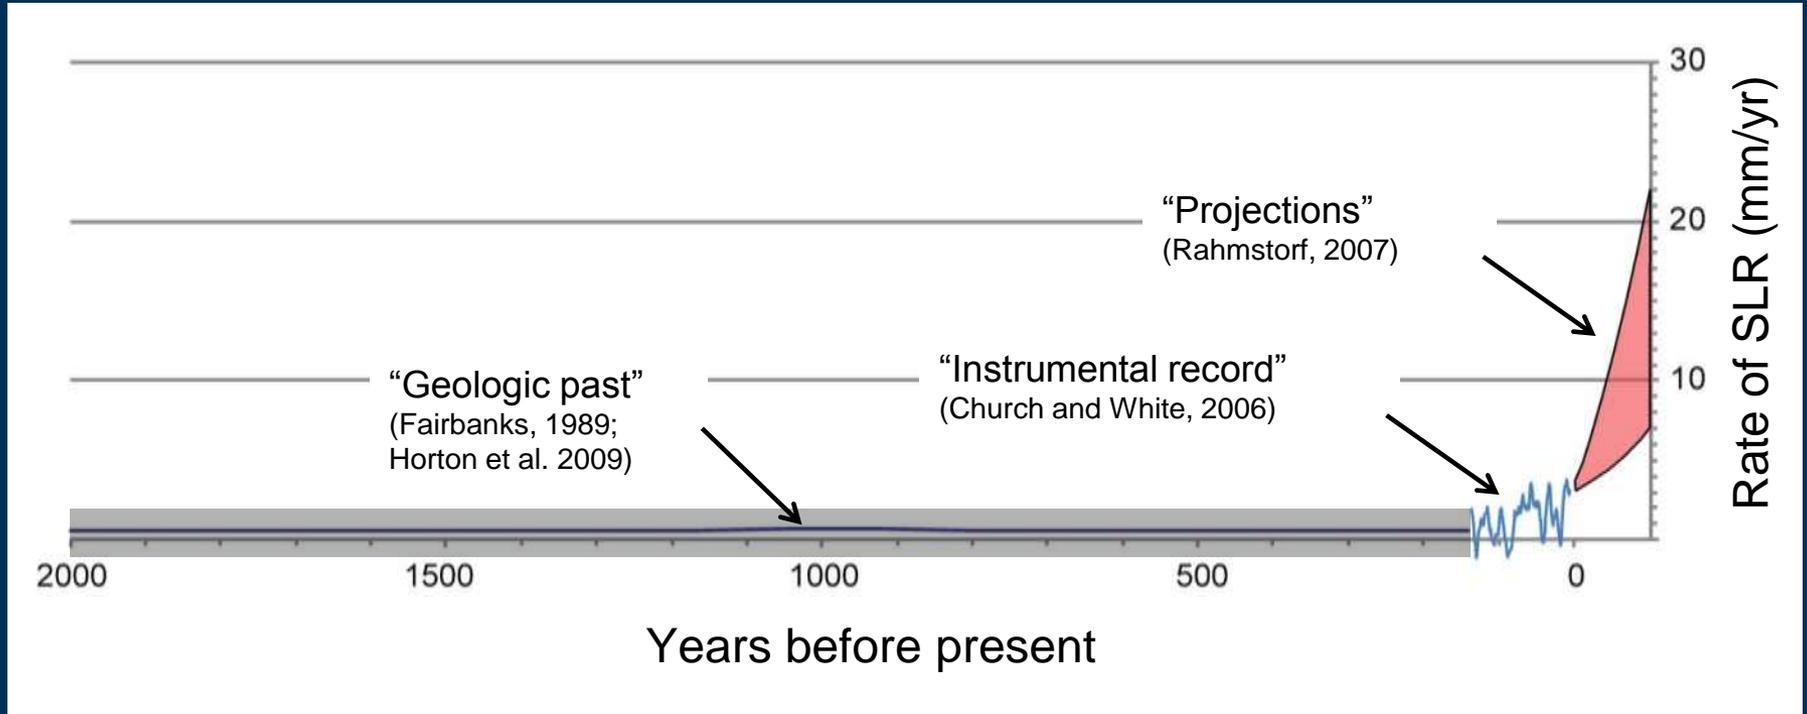

Rob Thieler
U.S. Geological Survey
Woods Hole, MA

Sea-level rise rates since the Last Glacial Maximum

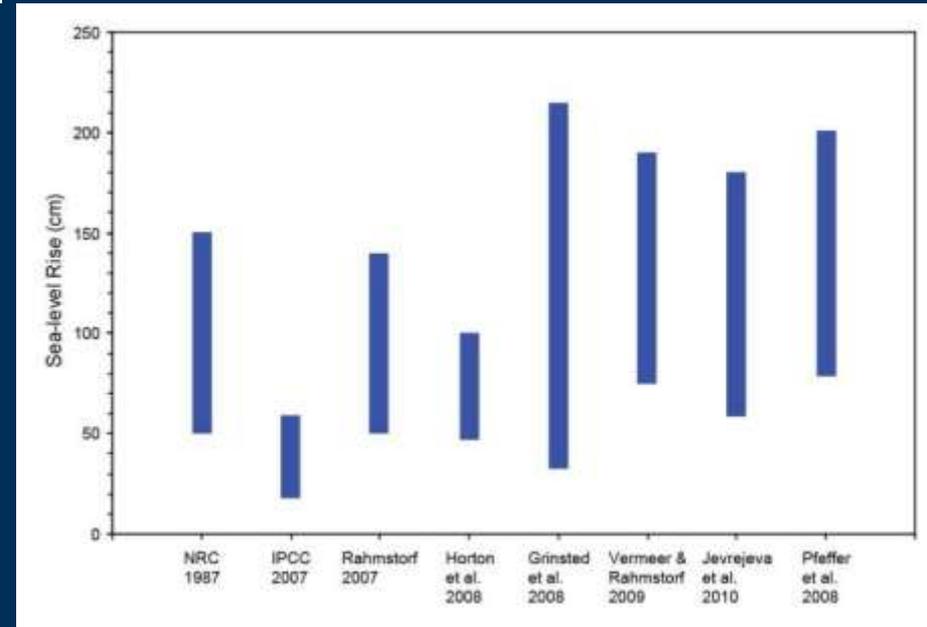

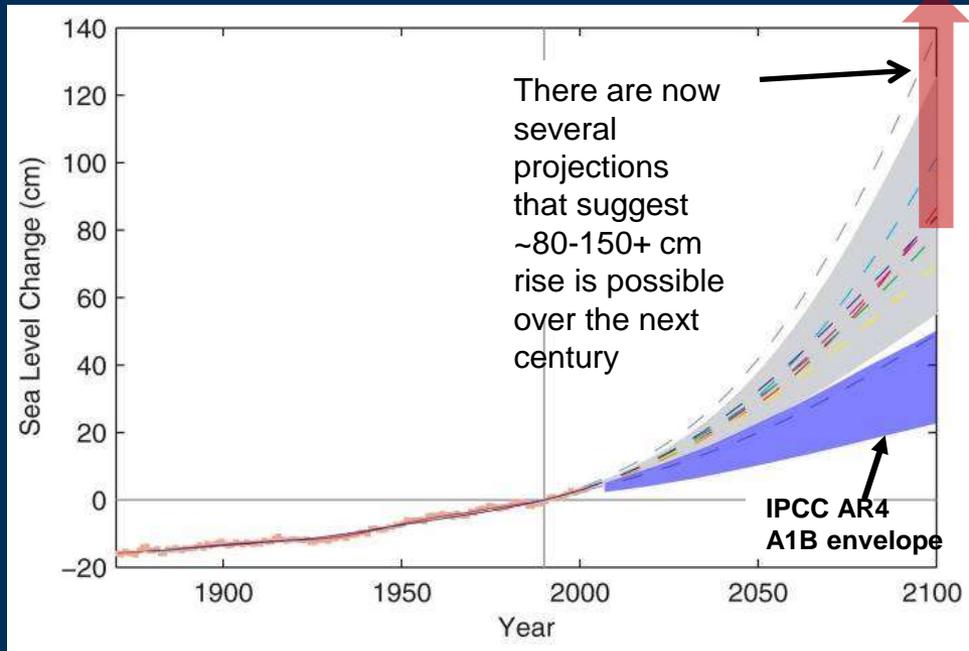

(SLR rate based on Fairbanks, 1989)

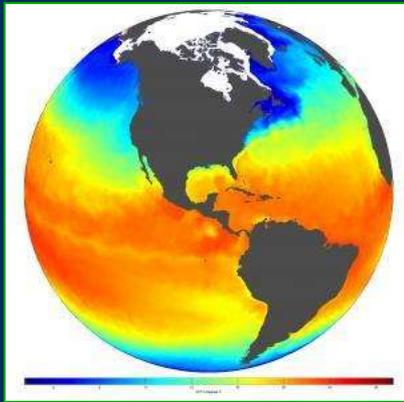

Past, present, and potential future rates of sea-level rise

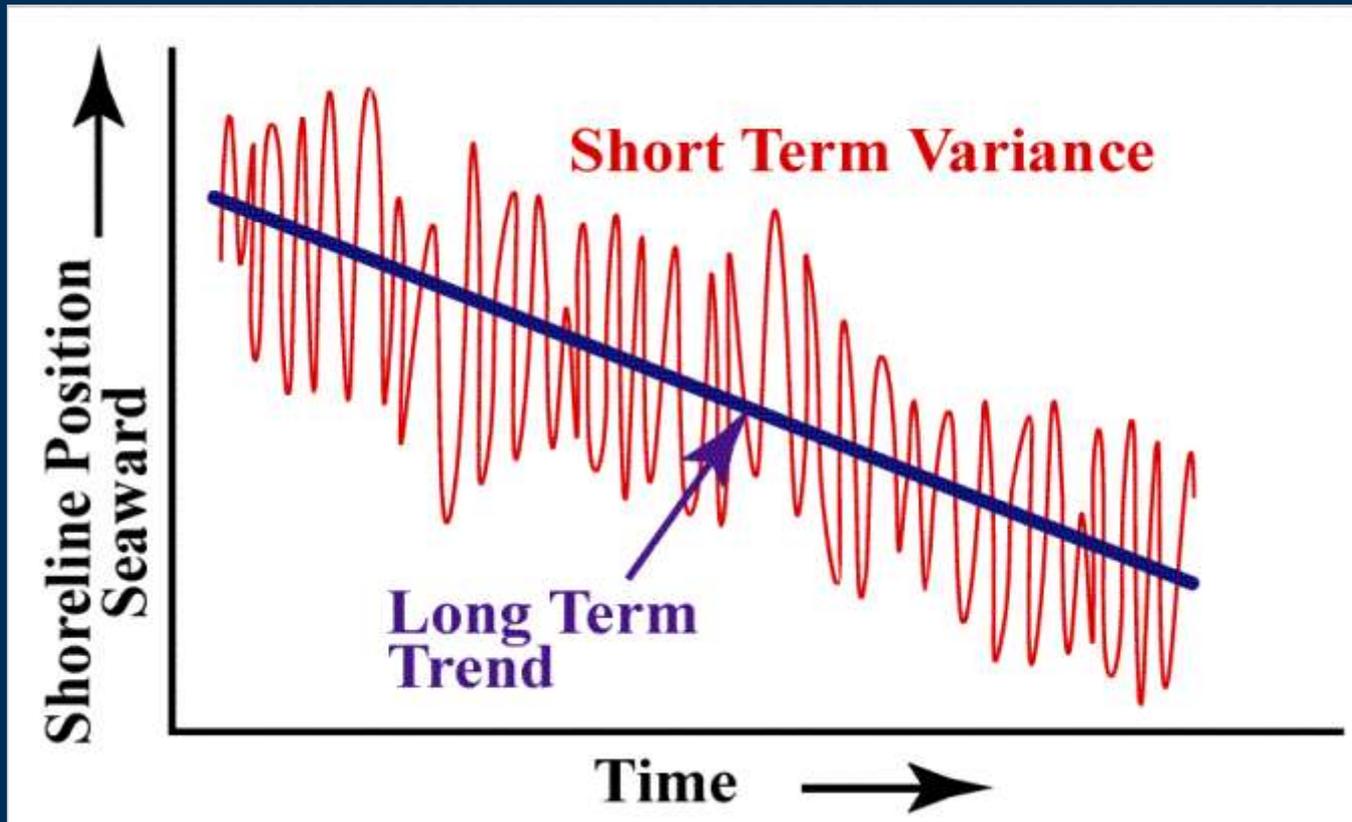

Historic and Projected Sea-level Rise

Importance of Spatial Scale

Importance of Temporal Scale

Short-term Variance

(hours to decade)

Storm impact/recovery

Annual cycles

El Niño

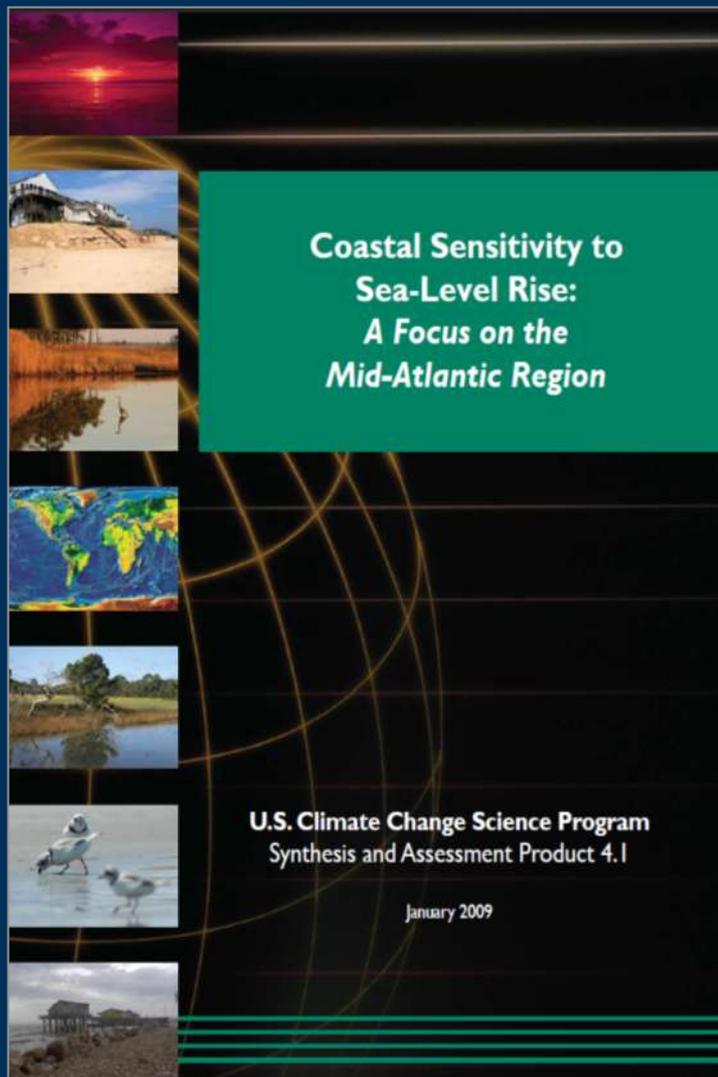

Long-term Trend

(decades to centuries)

Sediment deficit or surplus

Sea-level rise

Coastal Sensitivity to Sea-Level Rise: A Focus on the Mid-Atlantic Region

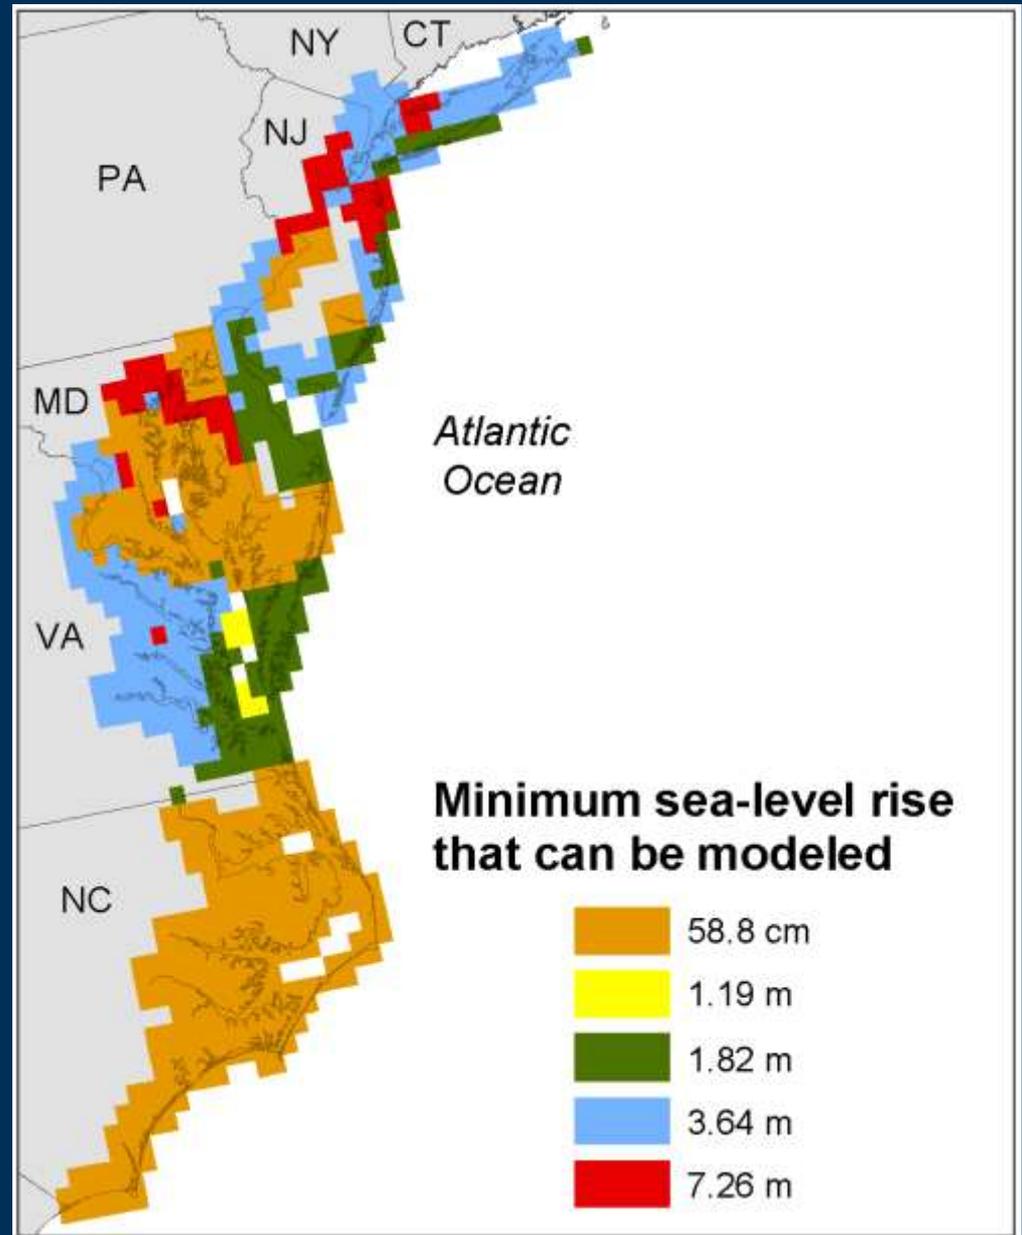

U.S. Climate Change Science Program Synthesis and Assessment Product 4.1

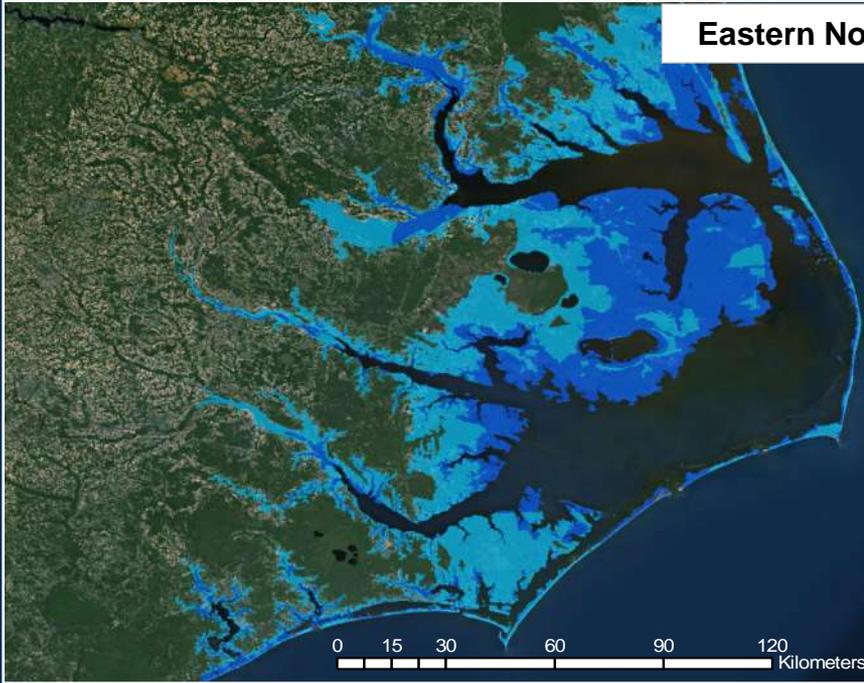

Coastal Elevation Data

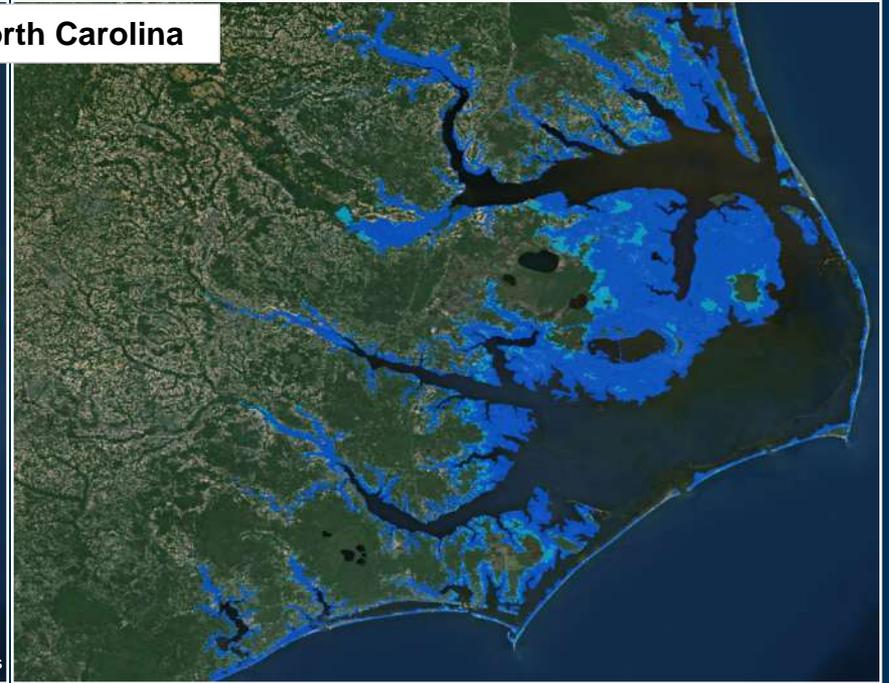

- Elevation is a critical factor in assessing potential impacts (specifically, inundation)
- Current elevation data do not provide the degree of confidence needed for quantitative assessments for local decision making
- Collection of high-quality elevation data (lidar) would be valuable

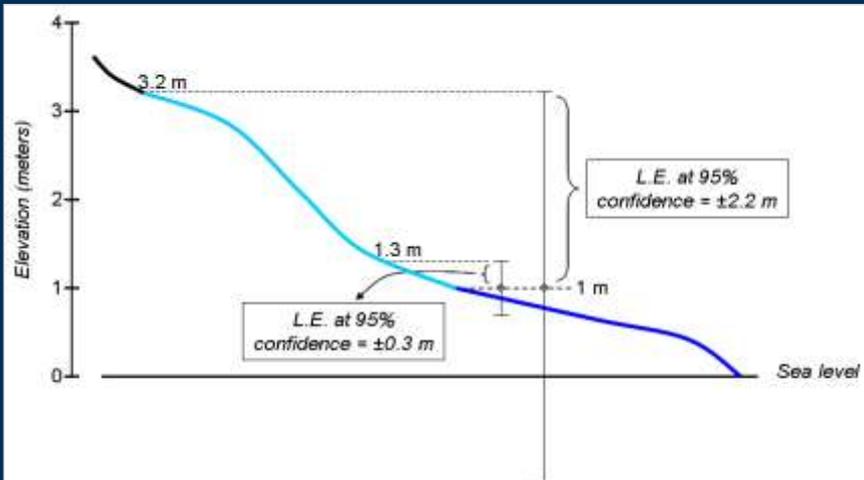

Eastern North Carolina

Elevation source: 30-m DEM

Elevation source: 3-m lidar data

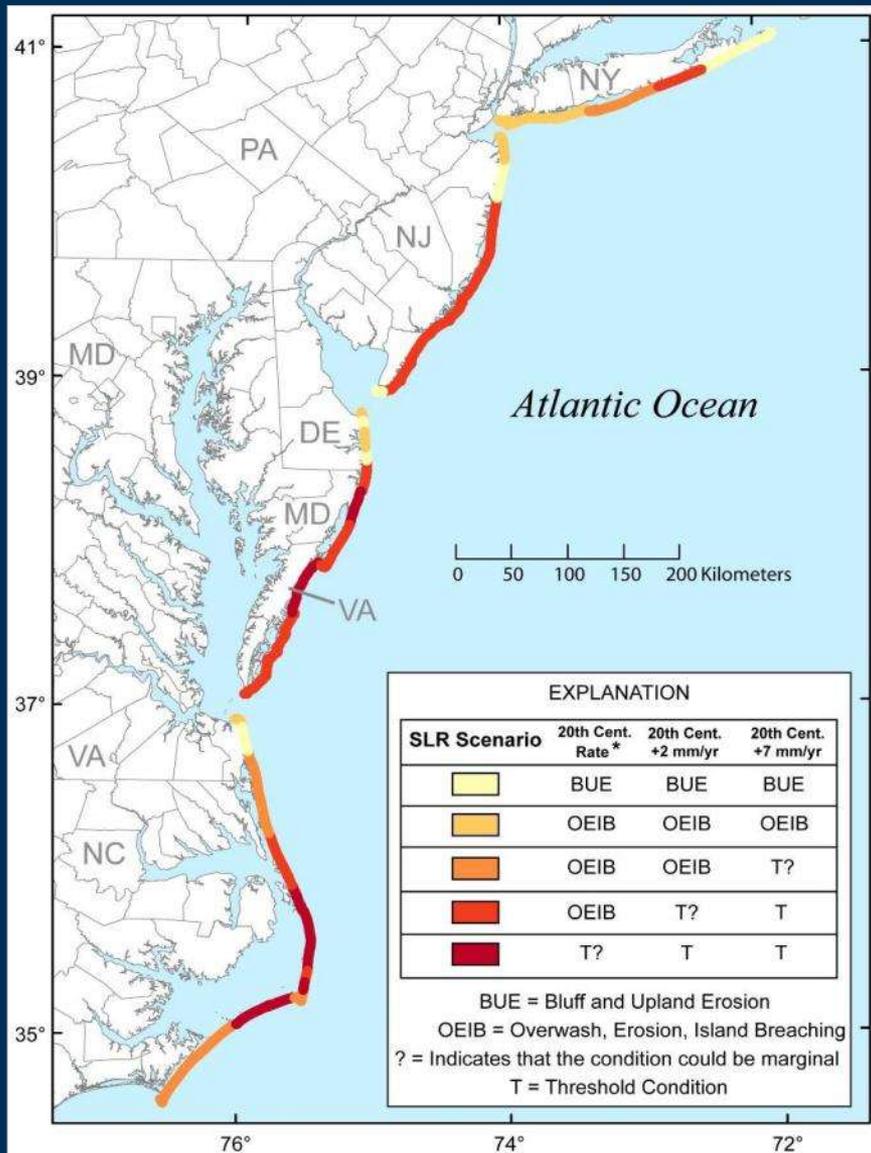

Dark blue Land \leq 1 meter elevation

Light blue Area of uncertainty associated with 1 meter elevation

- High quality elevation data reduce uncertainty of potentially inundated areas

Mid-Atlantic Assessment of Potential Dynamic Coastal Responses to Sea-level Rise

Bluff erosion

Overwash

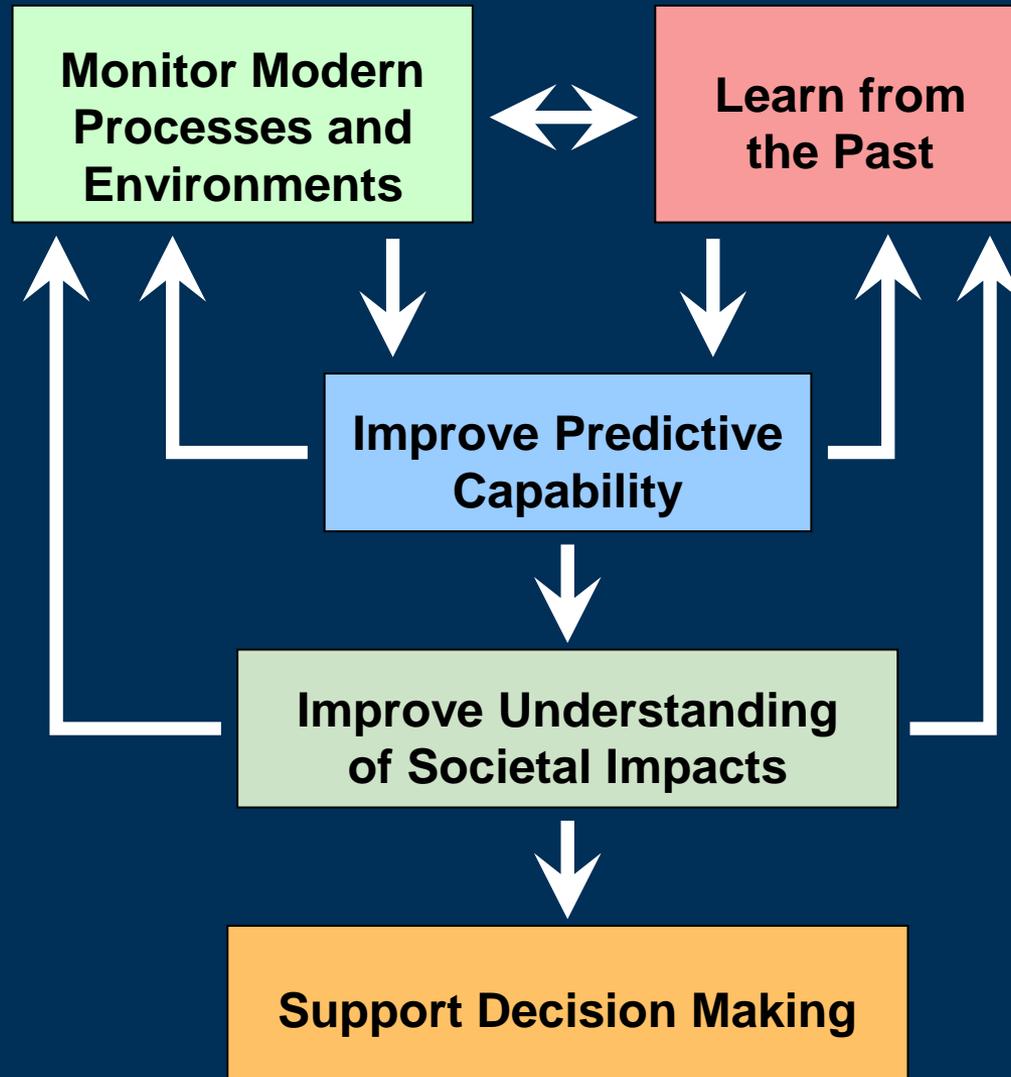

Island Breaching

Threshold Crossing

Science strategy to address the challenge of climate change and sea-level rise

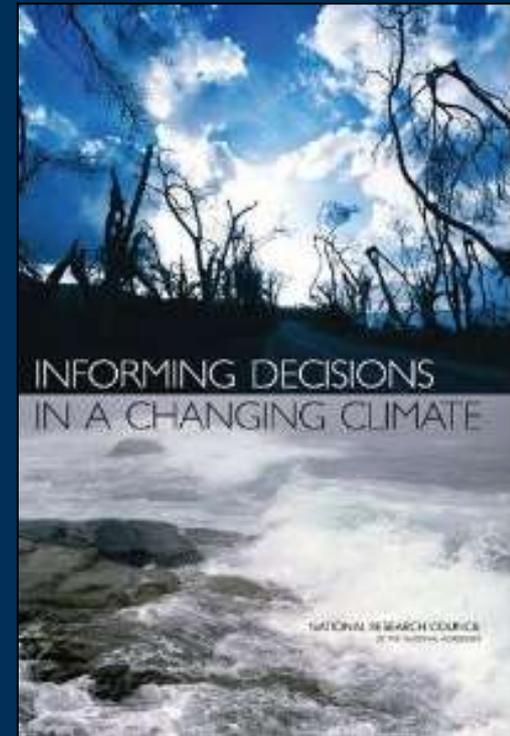

Informing Decisions in a Changing Climate

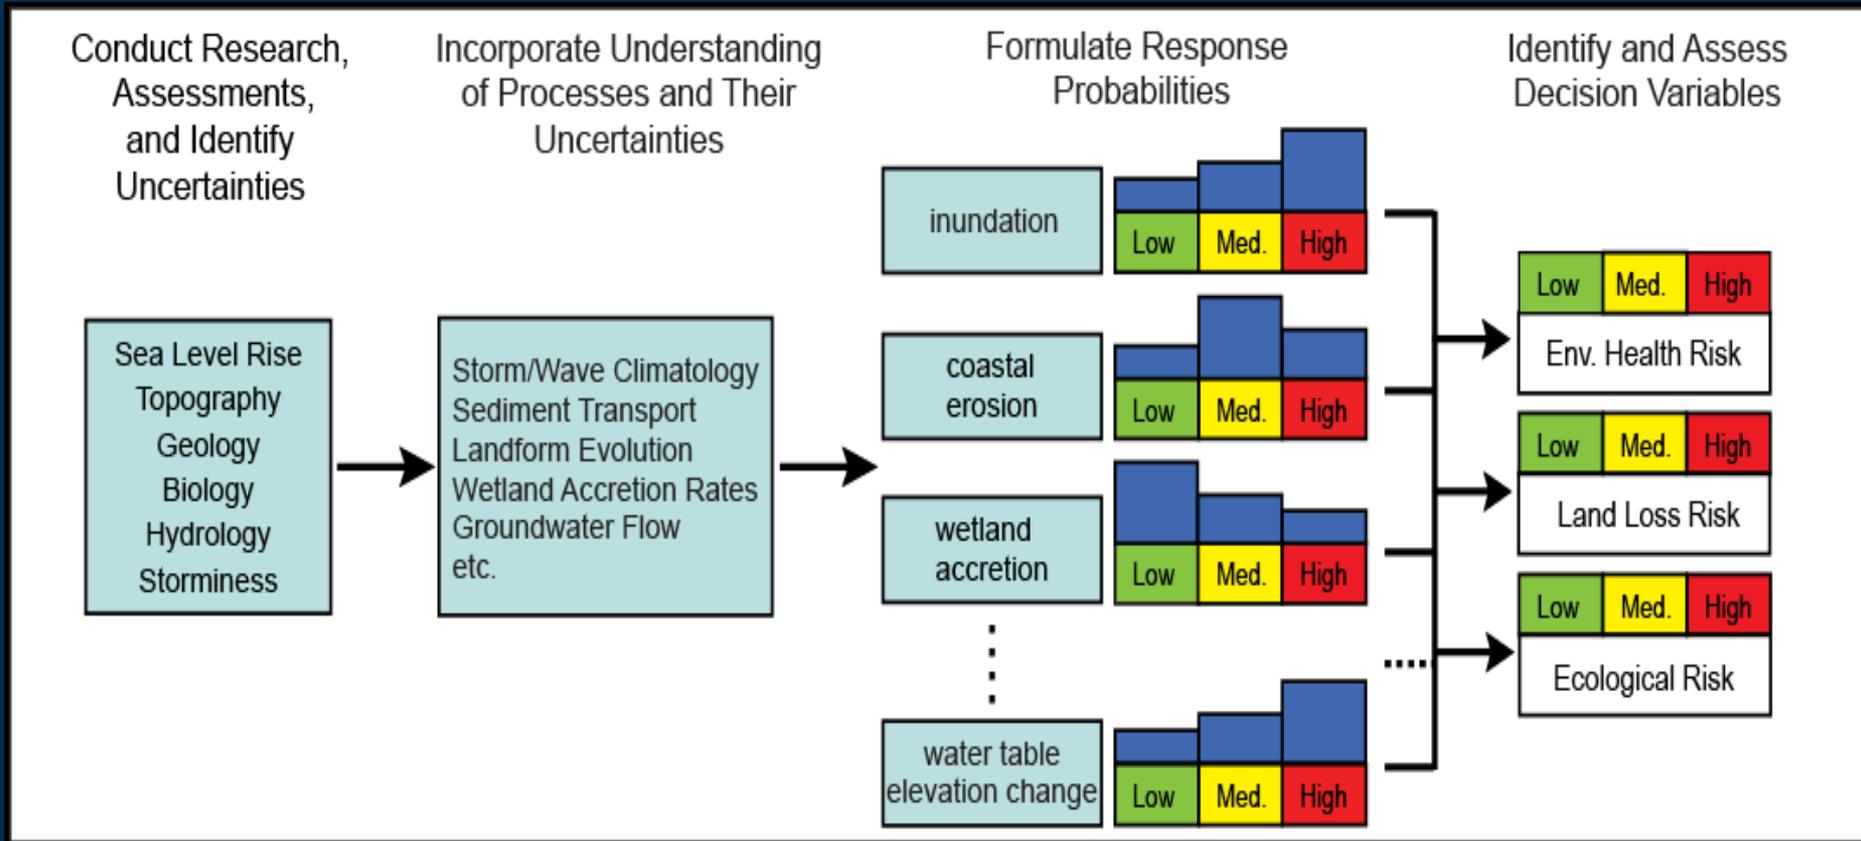

National Research Council (2009)

The end of “Climate Stationarity” requires that organizations and individuals alter their standard practices and decision routines to take climate change into account. **Scientific priorities and practices need to change** so that the scientific community can provide better support to decision makers in managing emerging climate risks.

- **Decision makers must expect to be surprised** because of the nature of climate change and the incompleteness of scientific understanding of its consequences.
- **An uncertainty management framework should be used** because of the inadequacies of predictive capability.

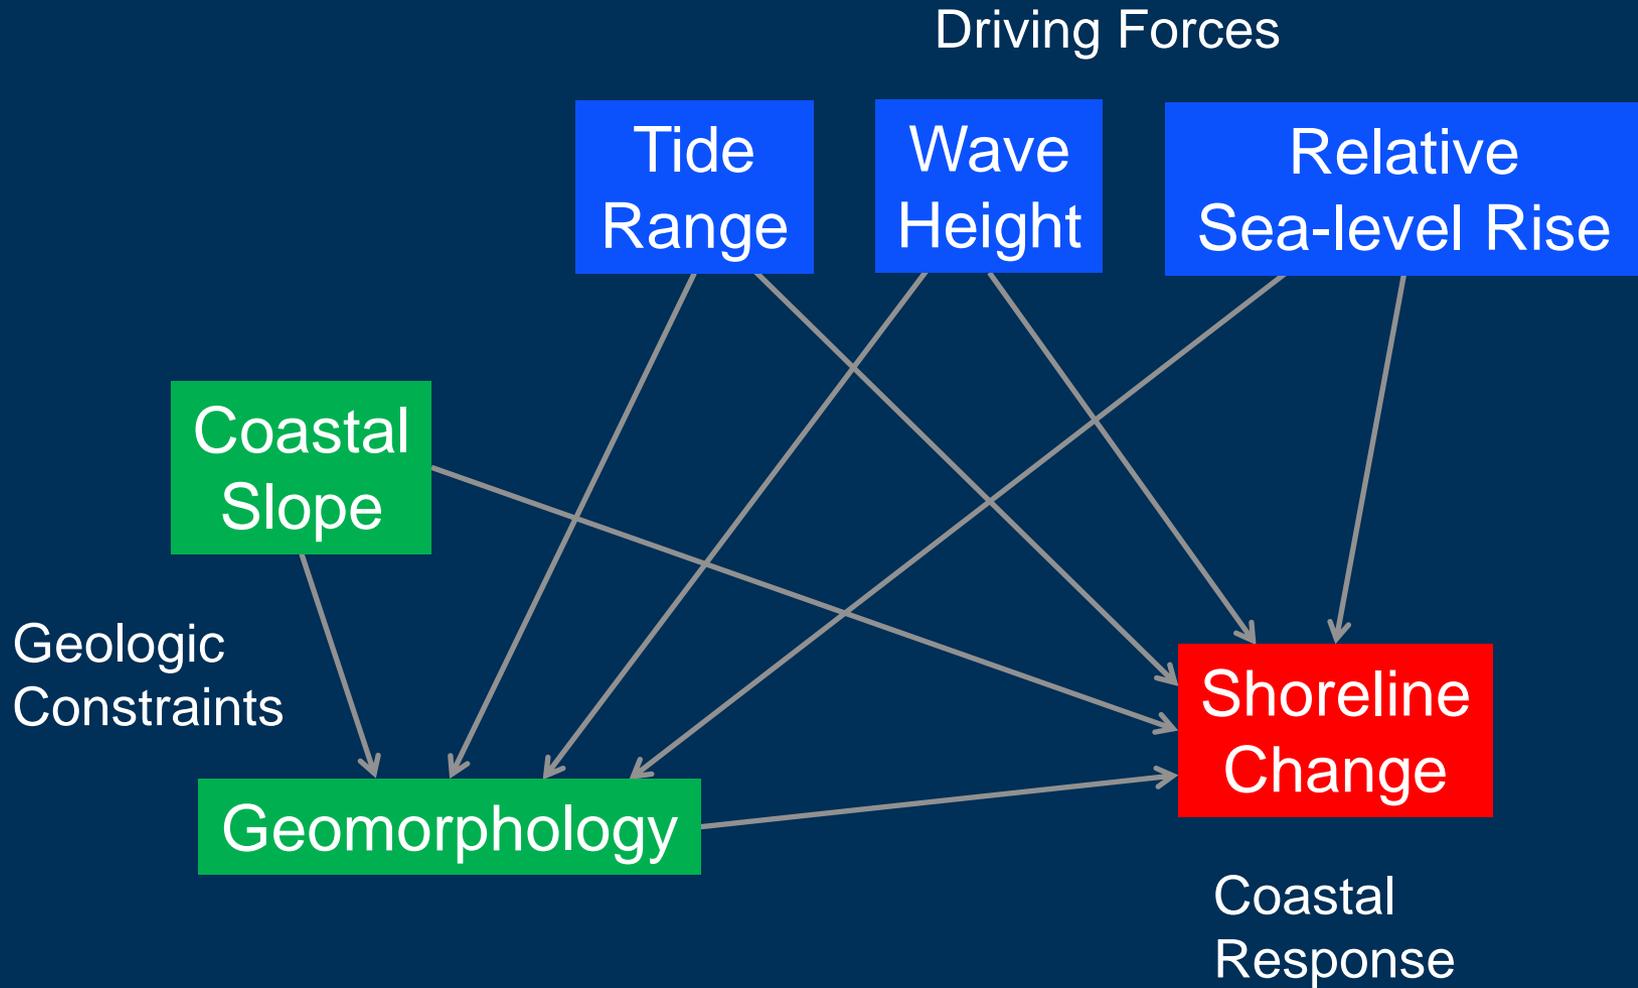

A conceptual approach to the multivariate, uncertainty problem

Explicitly include uncertainties, as well as management application

Step 1. design a network

Step 2. train a network

Utilized existing data for six geological and physical process variables

Geomorphology

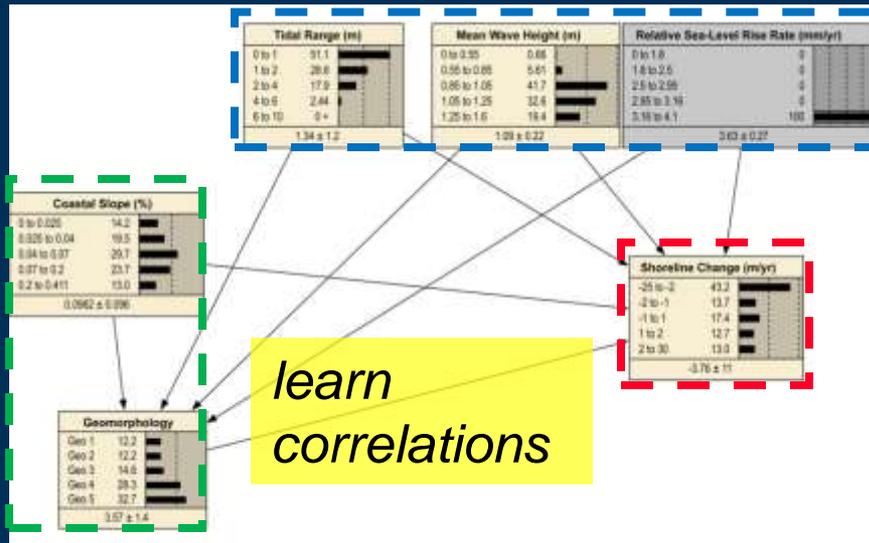

Coastal slope

Relative sea-level rise rate

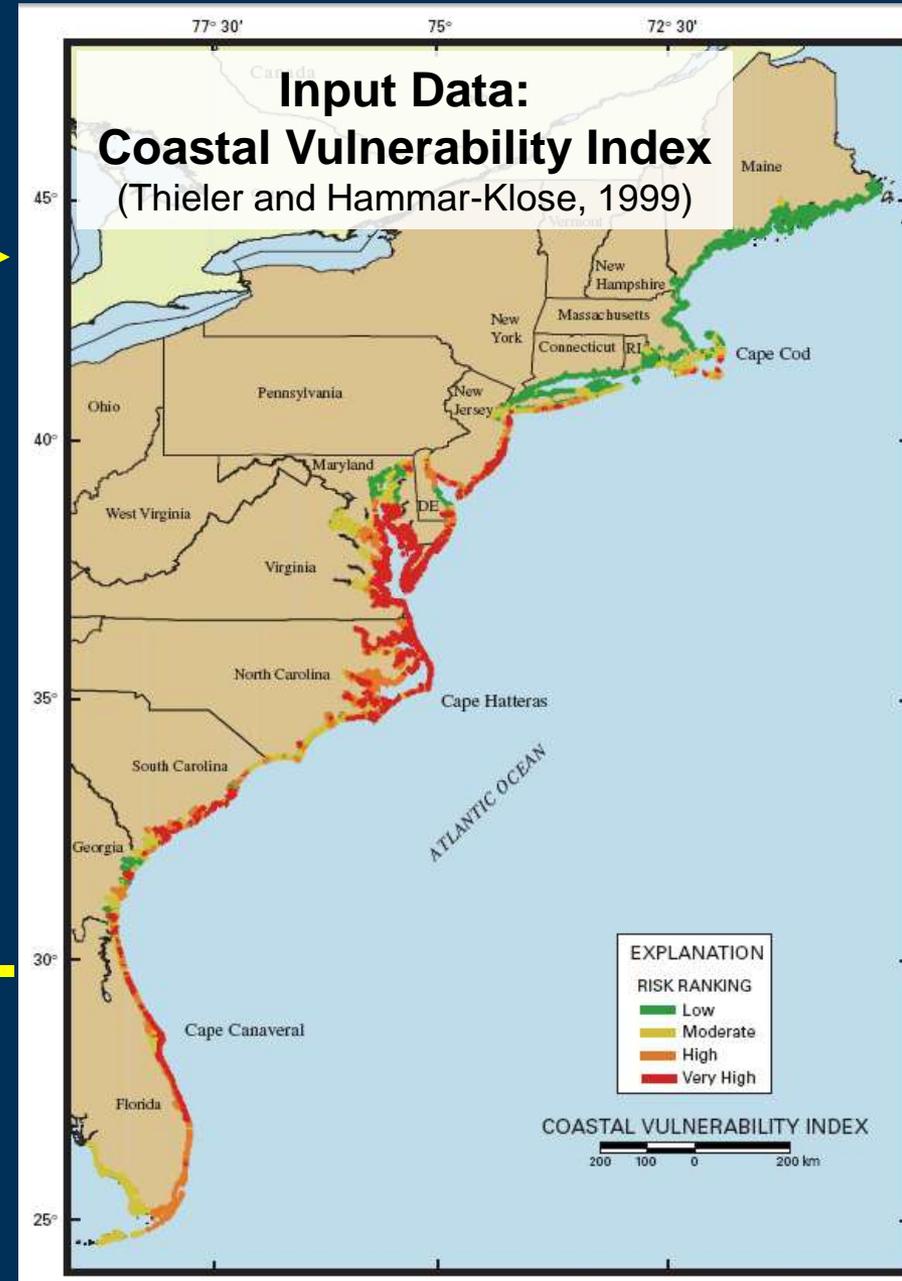

Mean sig. wave height

Mean tidal range

Historic shoreline change rate

learn correlations

Step 3. Make predictions

| Tidal Range (m) | |
|-----------------|-----|
| 0 to 1 | 0 |
| 1 to 2 | 100 |
| 2 to 4 | 0 |
| 4 to 6 | 0 |
| 6 to 10 | 0 |
| 1.5 ± 0.29 | |

| Mean Wave Height (m) | |
|----------------------|-----|
| 0 to 0.55 | 0 |
| 0.55 to 0.85 | 0 |
| 0.85 to 1.05 | 0 |
| 1.05 to 1.25 | 100 |
| 1.25 to 1.6 | 0 |
| 1.15 ± 0.058 | |

| Relative Sea-Level Rise Rate (mm/yr) | |
|--------------------------------------|-----|
| 0 to 1.8 | 0 |
| 1.8 to 2.5 | 100 |
| 2.5 to 2.95 | 0 |
| 2.95 to 3.16 | 0 |
| 3.16 to 4.1 | 0 |
| 2.15 ± 0.2 | |

| Coastal Slope (%) | |
|-------------------|------|
| 0 to 0.025 | 18.0 |
| 0.025 to 0.04 | 24.7 |
| 0.04 to 0.07 | 37.7 |
| 0.07 to 0.2 | 16.2 |
| 0.2 to 0.411 | 3.32 |
| 0.0631 ± 0.062 | |

| Shoreline Change (m/yr) | |
|-------------------------|------|
| -25 to -2 | 5.16 |
| -2 to -1 | 6.47 |
| -1 to 1 | 77.7 |
| 1 to 2 | 5.16 |
| 2 to 30 | 5.54 |
| 0.17 ± 5.5 | |

| Geomorphology | |
|---------------|-----|
| Geo 1 | 0 |
| Geo 2 | 0 |
| Geo 3 | 0 |
| Geo 4 | 0 |
| Geo 5 | 100 |
| 5 | |

For average long-term SLR (2 mm/yr):
No-change is most likely
Prob. (Erosion < -1 m/yr) = 12%

Step 4. Make projections

| Tidal Range (m) | |
|-----------------|-----|
| 0 to 1 | 0 |
| 1 to 2 | 100 |
| 2 to 4 | 0 |
| 4 to 6 | 0 |
| 6 to 10 | 0 |
| 1.5 ± 0.29 | |

| Mean Wave Height (m) | |
|----------------------|-----|
| 0 to 0.55 | 0 |
| 0.55 to 0.85 | 0 |
| 0.85 to 1.05 | 0 |
| 1.05 to 1.25 | 100 |
| 1.25 to 1.6 | 0 |
| 1.15 ± 0.058 | |

| Relative Sea-Level Rise Rate (mm/yr) | |
|--------------------------------------|-----|
| 0 to 1.8 | 0 |
| 1.8 to 2.5 | 0 |
| 2.5 to 2.95 | 0 |
| 2.95 to 3.16 | 100 |
| 3.16 to 4.1 | 0 |
| 3.055 ± 0.061 | |

| Coastal Slope (%) | |
|-------------------|------|
| 0 to 0.025 | 4.04 |
| 0.025 to 0.04 | 24.0 |
| 0.04 to 0.07 | 39.0 |
| 0.07 to 0.2 | 29.2 |
| 0.2 to 0.411 | 3.72 |
| 0.0806 ± 0.066 | |

| Shoreline Change (m/yr) | |
|-------------------------|------|
| -25 to -2 | 17.6 |
| -2 to -1 | 34.6 |
| -1 to 1 | 41.4 |
| 1 to 2 | 1.55 |
| 2 to 30 | 4.80 |
| -2.1 ± 7.2 | |

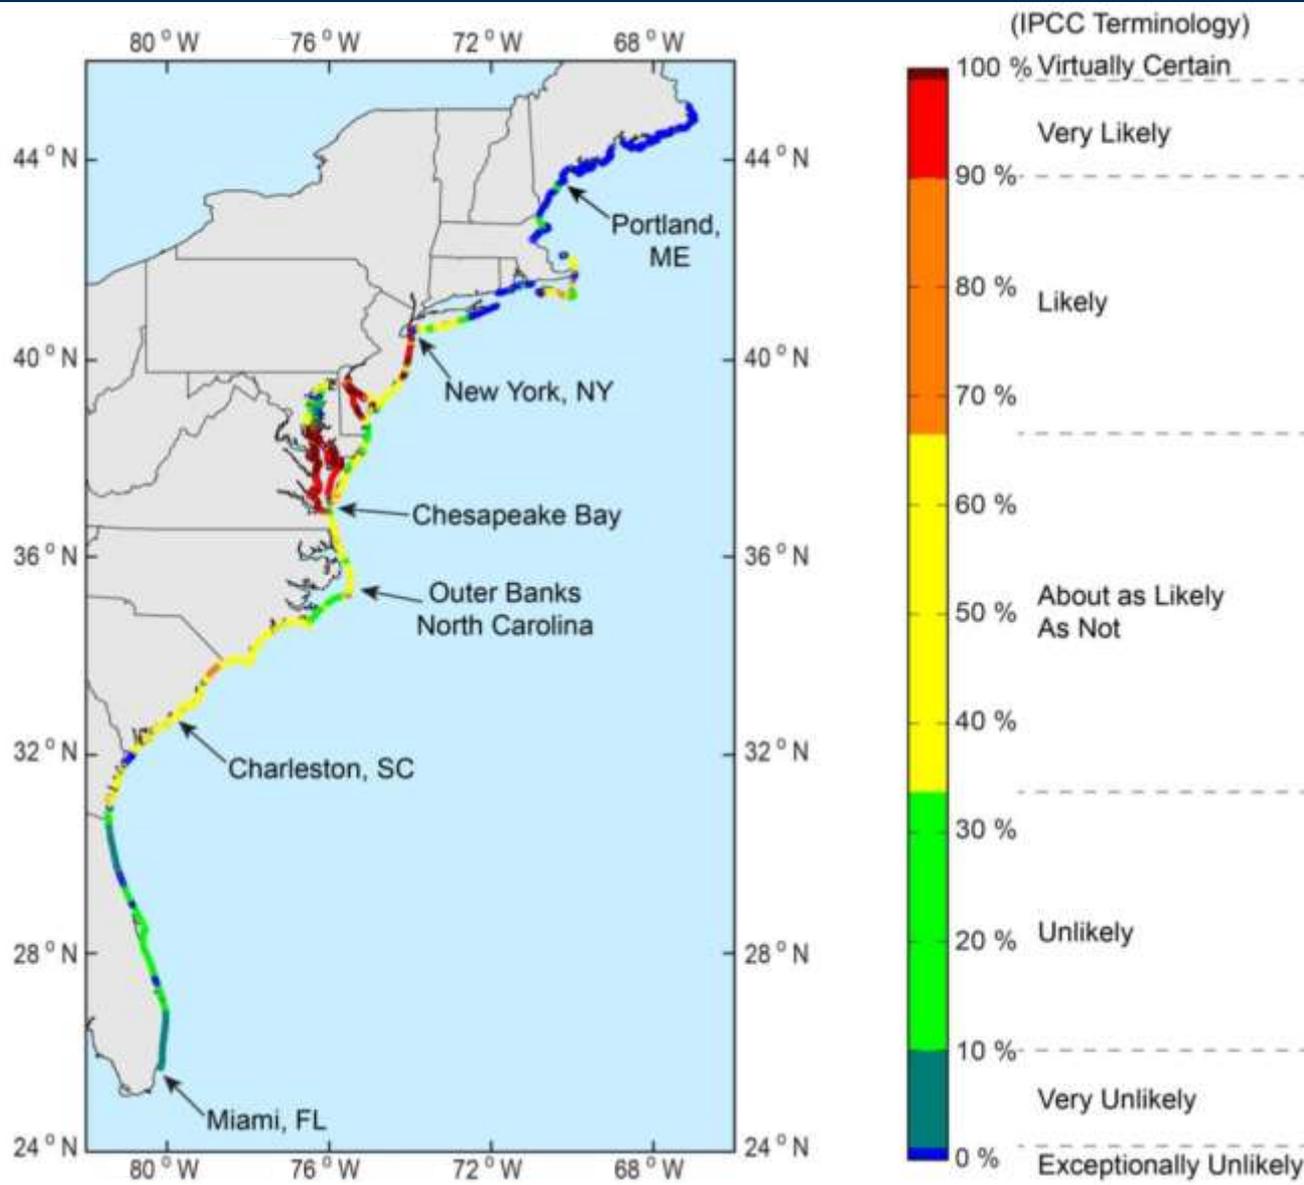

| Geomorphology | |
|---------------|-----|
| Geo 1 | 0 |
| Geo 2 | 0 |
| Geo 3 | 0 |
| Geo 4 | 0 |
| Geo 5 | 100 |
| 5 | |

For higher long-term SLR (3 mm/year):

Prob. (Erosion < -1 m/yr) = 52%

Mapping Erosion Risk Using Bayesian Networks

Probability of shoreline erosion >2 m/yr

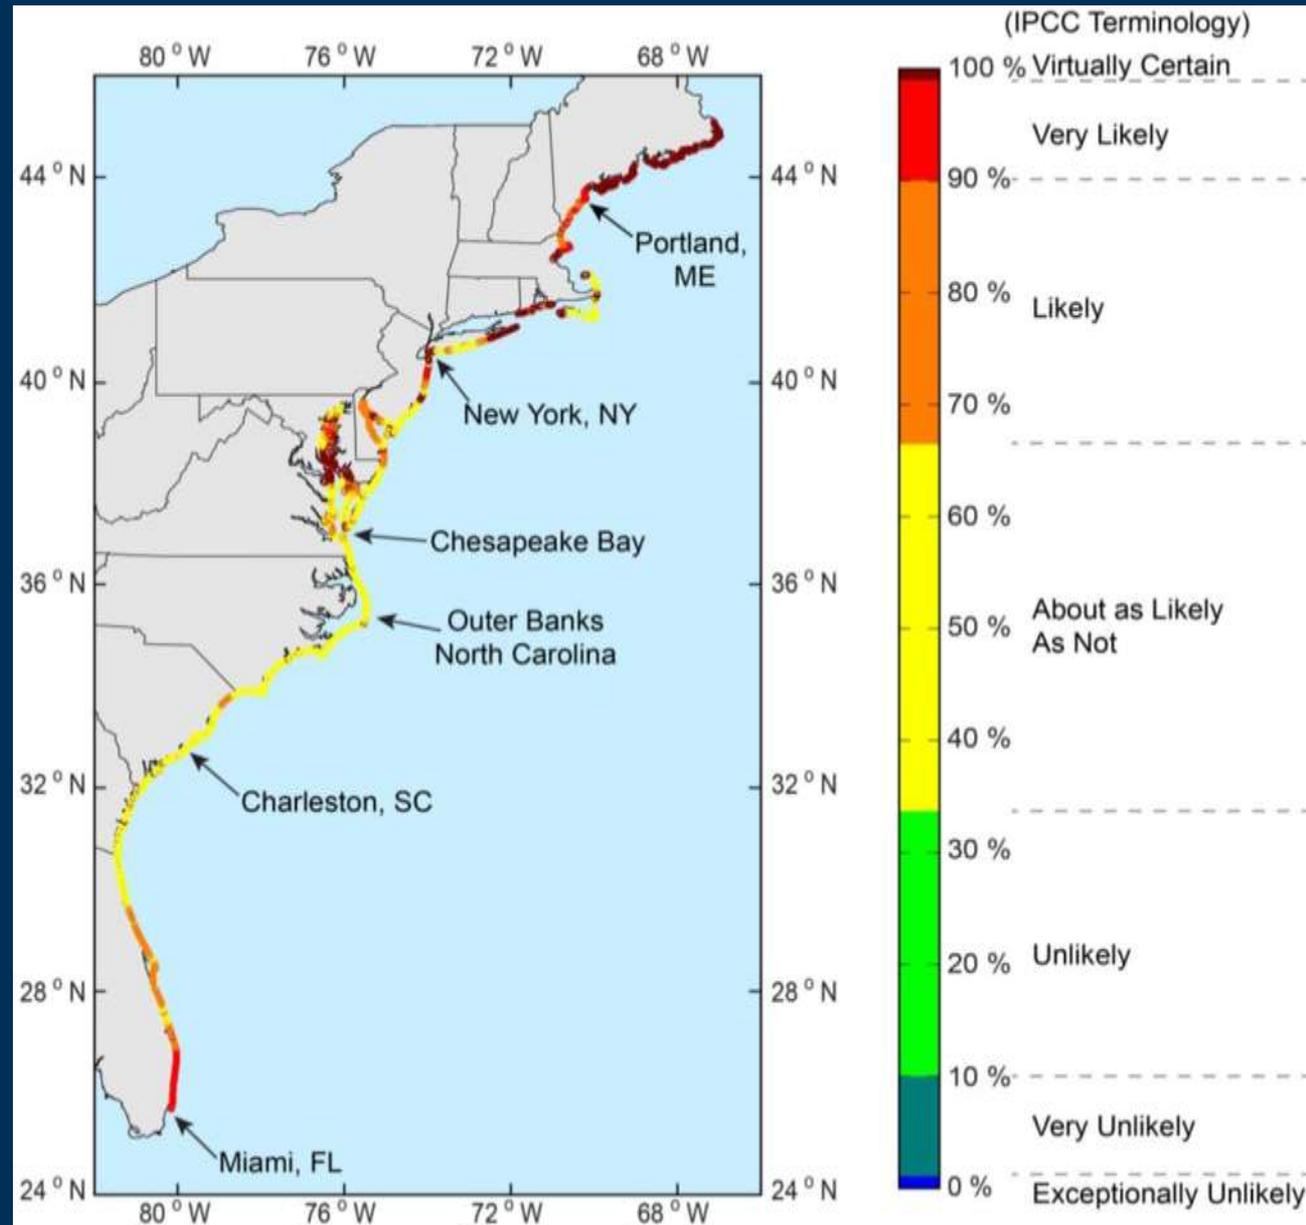

(Gutierrez et al., 2011)

Mapping Prediction Uncertainty

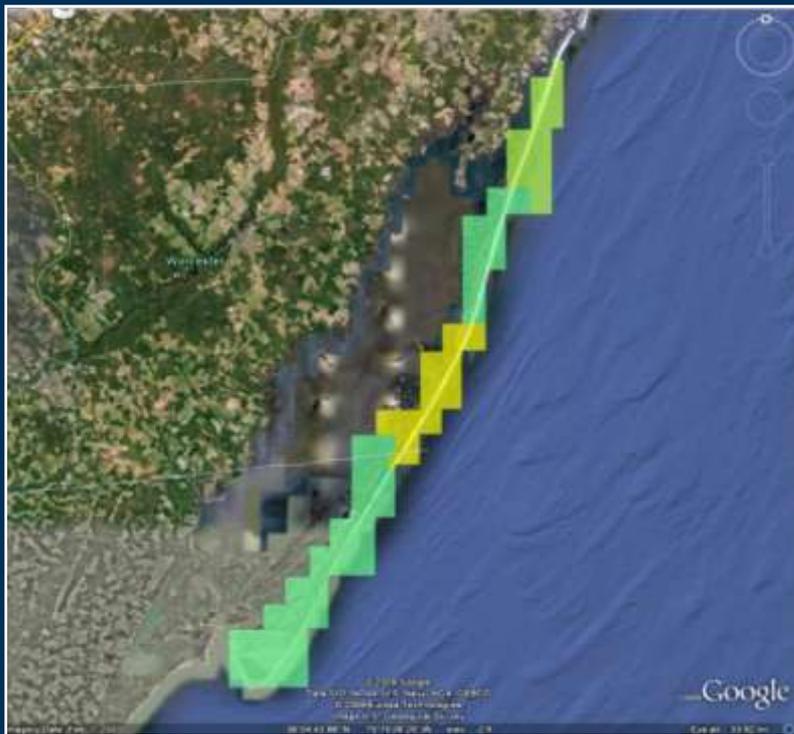

Higher probability = higher certainty of outcome

- Uncertainty map can be used to identify where better information is needed
- Areas of low confidence require
 - better input data
 - better understanding of processes
- Can use this map to focus research resources

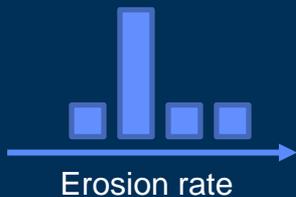

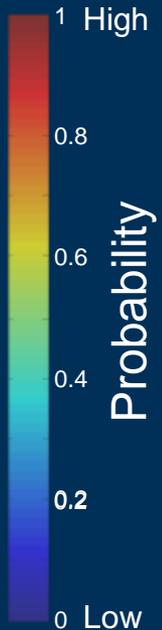

Application of a Bayesian network to an uncertain future: Probability of shoreline erosion >1 m/yr at Assateague Island National Seashore

Current conditions

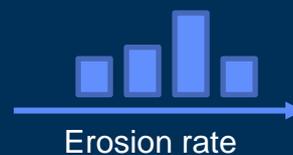

SLR +1 mm/yr, Wave ht. +10%

Narrow probability
distributions

Relatively low uncertainty

Higher likelihood of
erosion

Broader distributions
Increased uncertainty

Decision Support for DOI Agencies

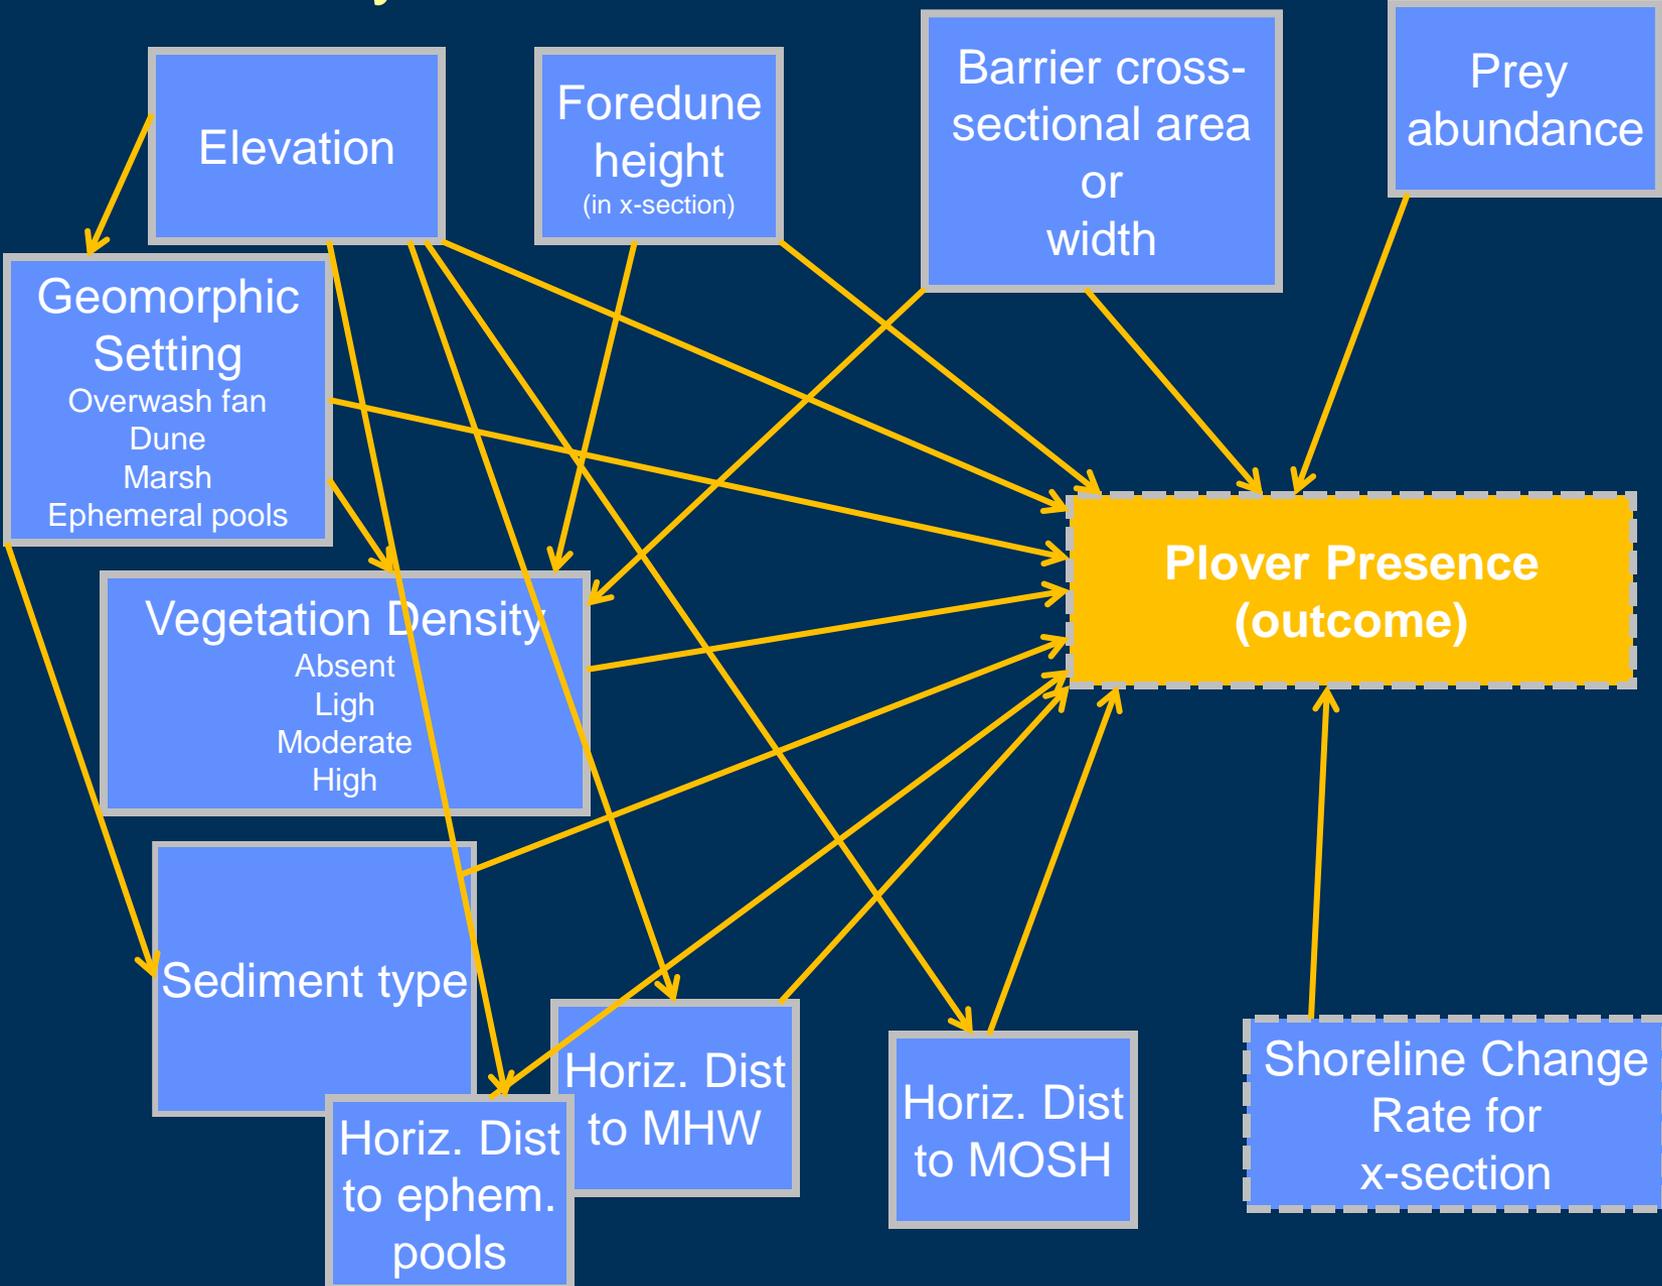

Piping plover, *C. melodus*

Bill Byrne, MA F&W

- Listed species
- DOI management responsibility
- Lifecycle includes substantial time on NPS lands for breeding, migrating, wintering
- Have interesting and specific habitat requirements that we can predict
 - Rangelwide habitat availability
 - Attributes and distribution of breeding, foraging areas
 - Wave run-up and inundation sensitivity (morphologic and hydrodynamic detail)
- Can feed predictions back into population dynamics models

Plovers in a Bayesian Network

Summary

- Future sea-level rise is problematic
 - It is a certain impact (we have already made a commitment to several centuries of SLR)
 - It is an uncertain impact (rates and magnitudes poorly constrained; human response unknown)
- Effective climate change decision support will require changes in how we do science and how decision makers assimilate and use scientific information
- Probabilistic approaches have many applications
 - Convey what we know and what we know we don't know
 - Synthesize data and models
 - Provide basis to focus research resources
 - Furnish information to support decision-making
