

How to read the following plots

- The upper left panels are time series plots of SWP exports (blue line) and the seasonal accumulation of delta smelt salvage *density* at Skinner Fish Facility (red circles in SKT units or fish · 10⁴ m⁻³)
- The lower left panels are time series plots of CVP exports and the seasonal accumulation of delta smelt salvage *density* at Tracy Fish Facility (in SKT units or fish · 10⁴ m⁻³)
- The panels on the right are time series plots of the interaction between OMR flow and turbidity (OMR flow multiplied by CCF turbidity) and how that coincides in time with each fish facility's salvage density. The salvage densities are plotted on the same scale so it is obvious which one ended up salvaging relatively higher or lower densities of smelt that year. The Skinner FF trend is the dashed line and the Tracy FF trend is the solid line.
