Subject: Re: proposed draft e-mail to the GIS/writing team
Date: Friday, February 27, 2015 9:59:52 AM

The short answer is yes to your last question. But let me read through all the notes, etc. and see if we need to clarify in the draft e-mail.

Thanks Pat,

I think this is a good e-mail, but I have a question regarding what layer they are using to do the footprint analysis now; vs. the layer they will use to do the indirect effects analysis. Shouldn't these be the same - i.e., based on the species distribution model? I'm not sure how meaningful it will be to get acreage of direct impact using the range map - which is at a 1:2,000,000 scale.

Are we simply asking them to continue to compile direct footprint layers that we will overlay with abundance and distribution models later to get both the direct and indirect acres?

Jesse and Lief - at last the long-promised e-mail. Let me know what you think - feel free to edit/change/etc. I'd like to get this out tomorrow to the different teams if possible.

thanks!

As a follow-up to the call on Tuesday of this week, the species lead team has proposed that we become the liaison between the three key teams working on the species report - the GIS team, the writing team and the modeling team. We hope this will facilitate communication and allow for more expedient resolution of any issues that might arise, simply because we are involved in reviewing the products of all three teams. This "change", and our outline for next steps, has been agreed to by leadership.

GIS Team:

- Please continue to work on the footprints for the various chapters where we will be doing GIS overlays (e.g. current oil/gas, current ag conversion, infrastructure, mining).
- Continue to use current range for mapping and for initial analysis (acres impacted) WITH ONE EXCEPTION. We have found a discrepancy with the range in MZ IV. It may be nothing, but we need to do our due diligence and make sure that adjustments are not needed. We hope to have that resolved by mid-next-week and will advise you of the results. So footprint mapping can continue in this MZ, but you might want to hold off on doing any calculations as they may change.
- As we get the abundance and distribution models completed, we will also ask for your assistance in intersecting with those layers. At that time will be doing additional analyses that will include the indirect effects calculations. The SLT is working on how that will proceed, so this is a heads up only.

Writing team:

- Continue to work on the chapters and with the GIS team to achieve the footprint analyses.
- If you need GIS analyses beyond calculating the footprint of a threat please copy the SLT on that correspondence. This is simply to ensure we are being consistent across all three teams and don't run into a technical kerfluffle later.
- After we get the abundance and distribution models the GIS team will help overlay those layers with the footprints. Then we will do calculations of indirect effects in the areas of high abundance. The SLT is working out the details of how that will be accomplished.

That's all for now. If you have questions please give one of us a call.

Thanks!
