

A Full-Scale Test of AI-Assisted Drone Surveys for the Mojave Desert Tortoise

Resi

History:

- 2020 – Experiments with styrotorts
- 2021 – Armendaris Ranch, Ivanpah sites, discussions with DTRO
- 2022 – Arena test, Red Cliffs Desert Reserve survey (ca. 5000 acres), MTCF-TFTF grant
- 2023 (Q1) – discussions with DTRO, CDFW, Mexico fieldwork

Object Detection

- Manually tag images to give models some samples
- Train a neural network to detect tortoises and burrows
- Two models – tortoise and burrow

PyTorch

Tortoise Model

Tortoise Model

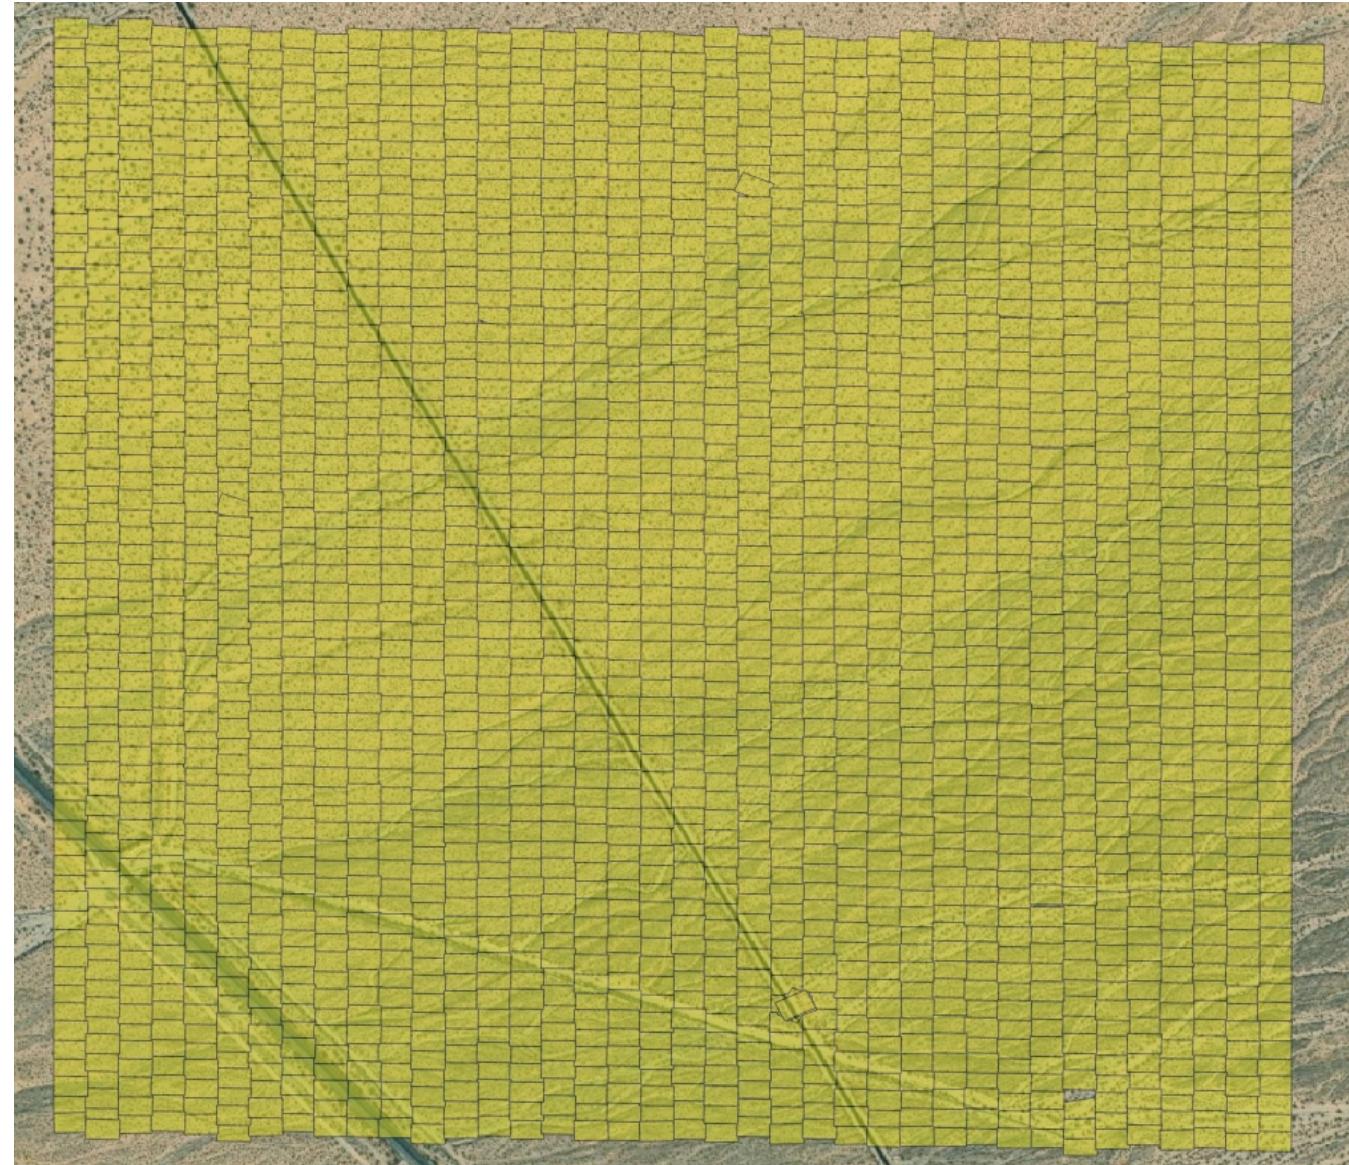

Burrow Model

Drone Surveys

- Program drones to photograph areas of interest
 - ~ 20 m flight elevation
 - ~ 1 sq mile/day
 - ~ Does not require surface access
 - ~ Approx 9 times walking speed
 - ~ Correspondingly cheaper

2022 Fieldwork

- Fly USFWS styrotort arena in Las Vegas
- g_0 surveys to study surface activity in RCDP
- Paired drone and pedestrian survey of non-ACEC portions of Zone 6 of RCDR
- Drone survey of ACEC portion of Zone 6 of RCDR

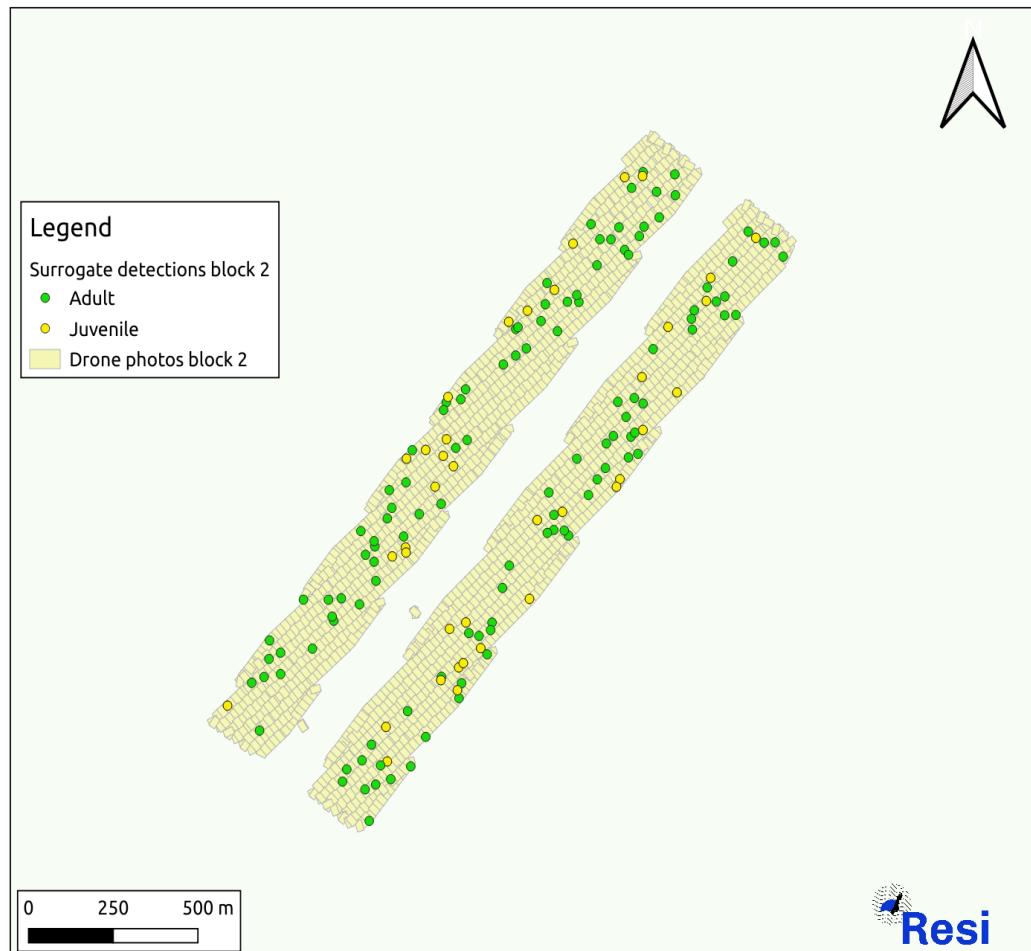

The logo for Resi consists of the word "Resi" in a large, bold, blue sans-serif font. To the left of the "R", there is a graphic element resembling a stylized bird or wave in blue and white.

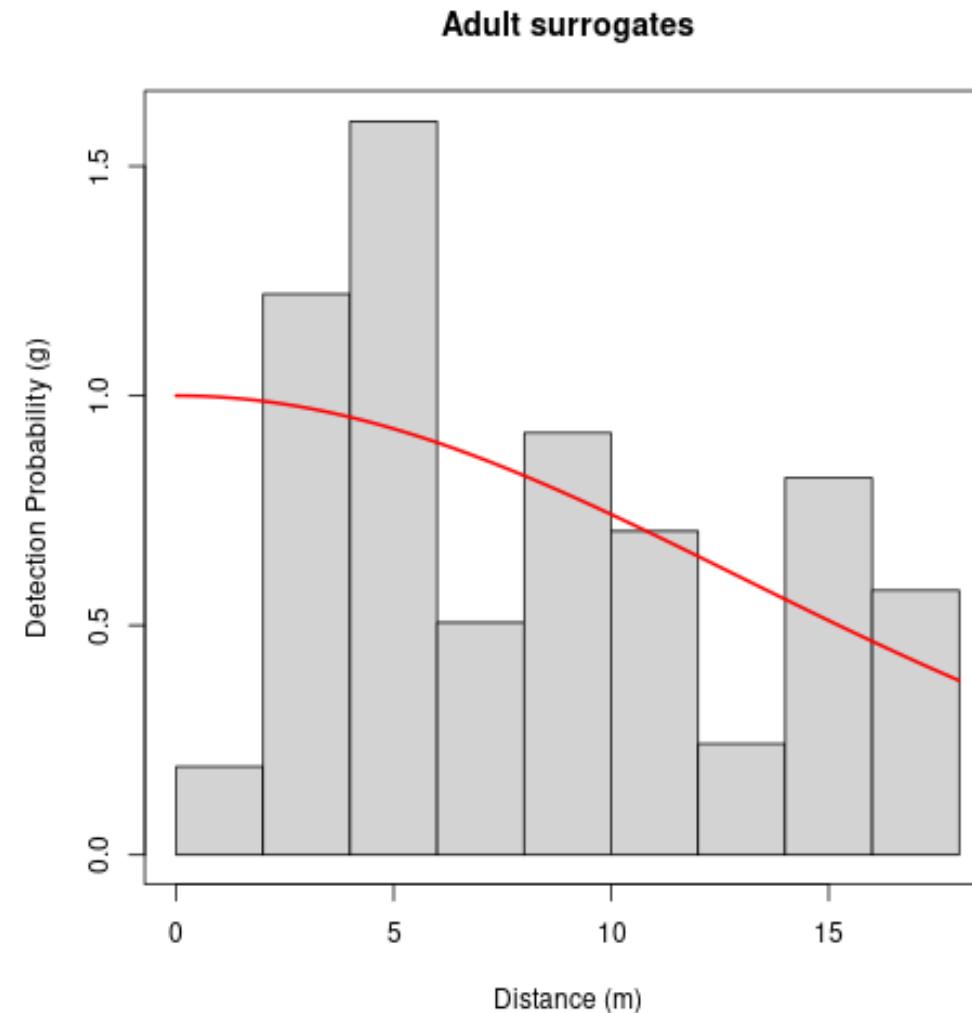

USFWS Arena surveys

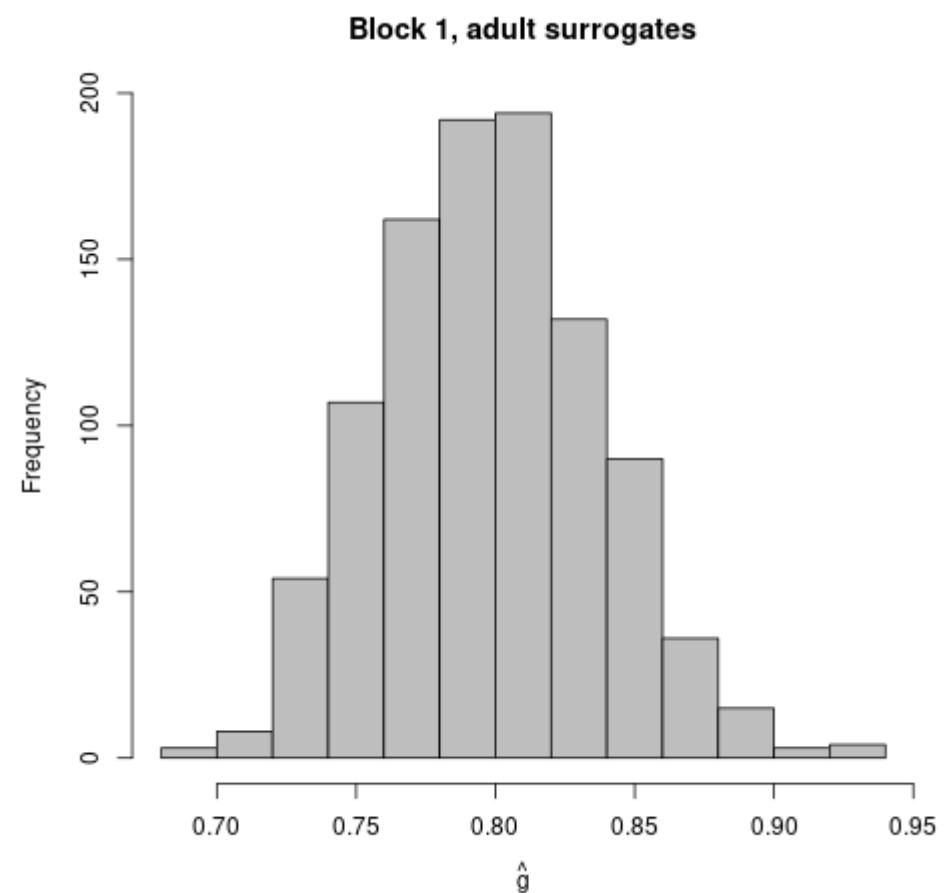

Available	Detected	Percent
288	233	81%

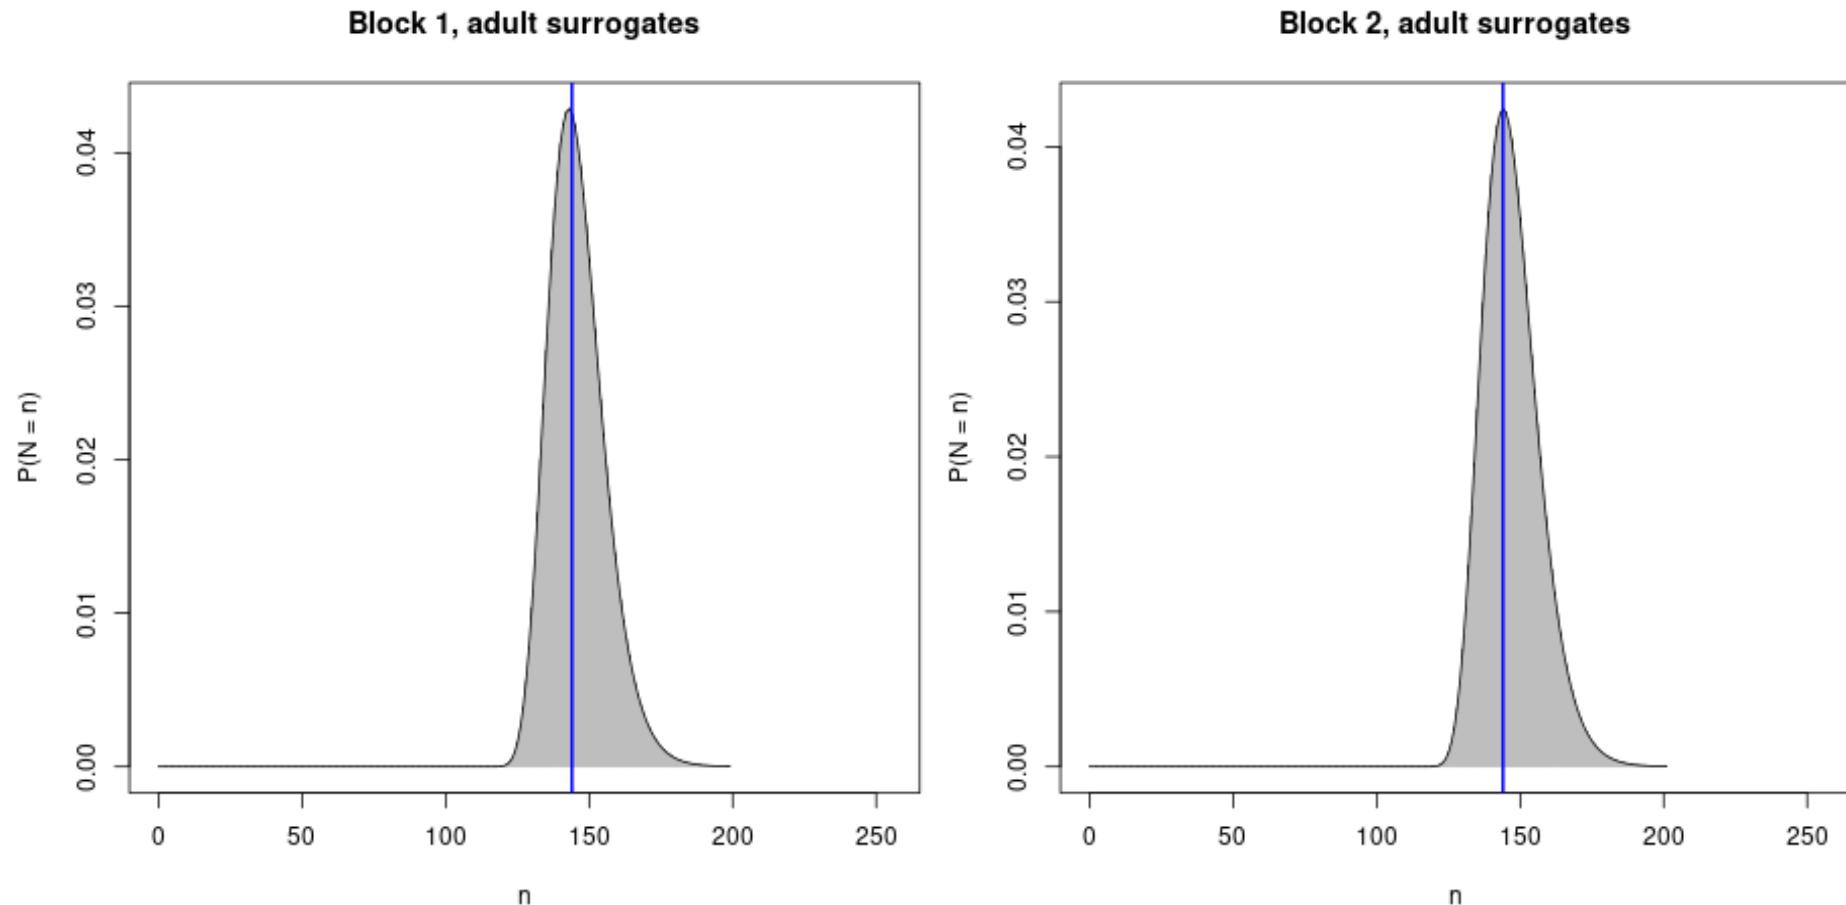

Distance analysis - droneDistance

USFWS Arena surveys

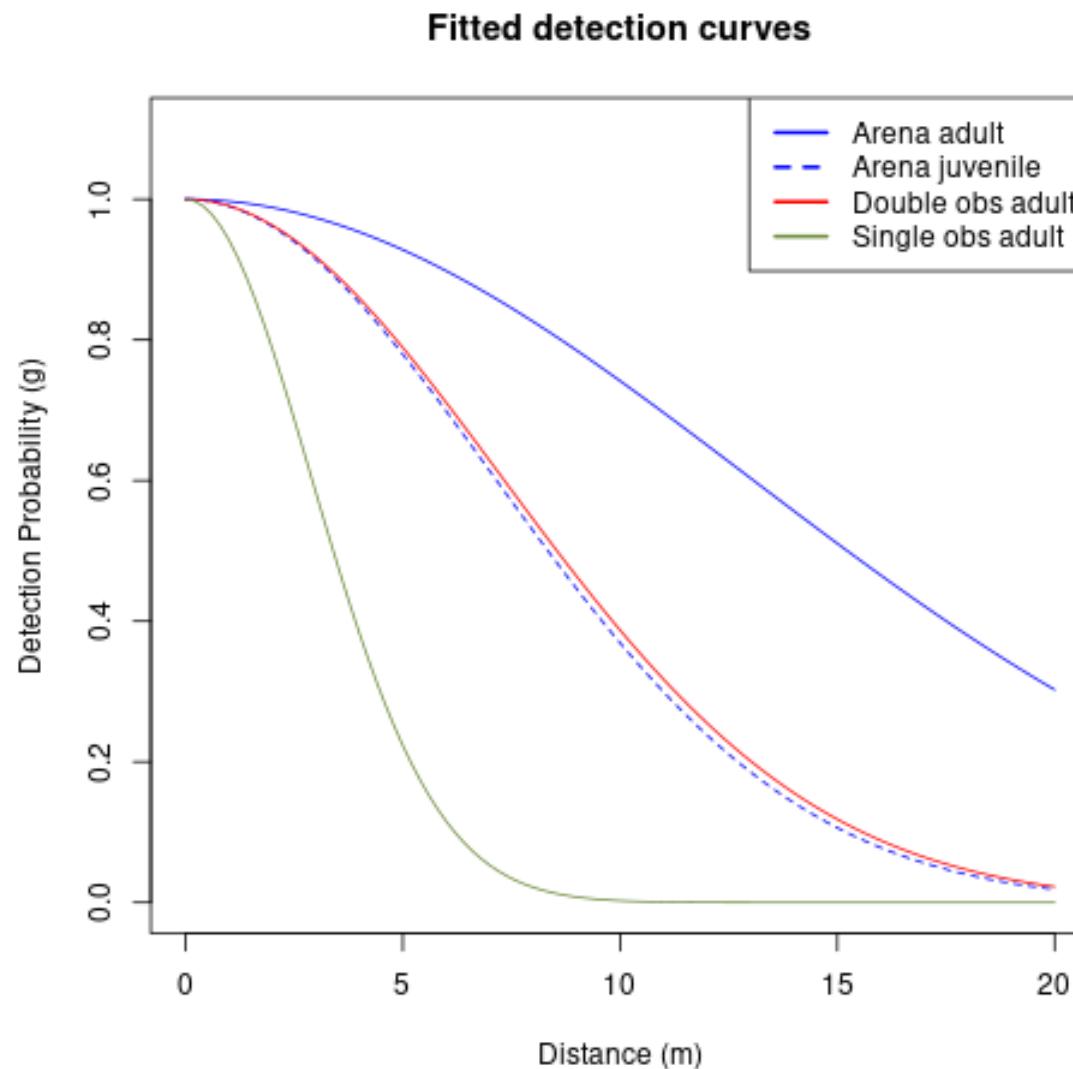

USFWS Arena surveys

	Known	Estimate	Error
Block 1	144	146 ± 9.8	1.4%
Block 2	144	147 ± 9.9	2.1%

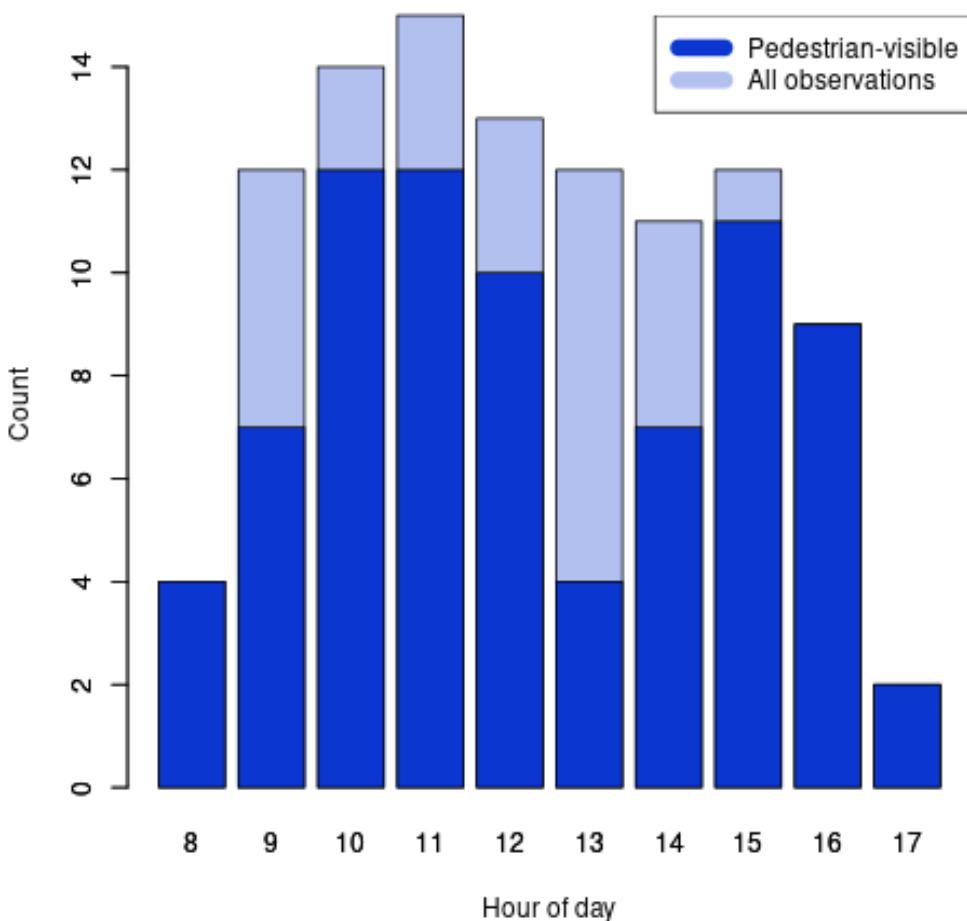

Week	Dates	Ground visibility	Drone visibility
1	April 16-22	0.71	0.37
2	April 23-29	0.79	0.38
Mean	April 16-29	0.75	0.38

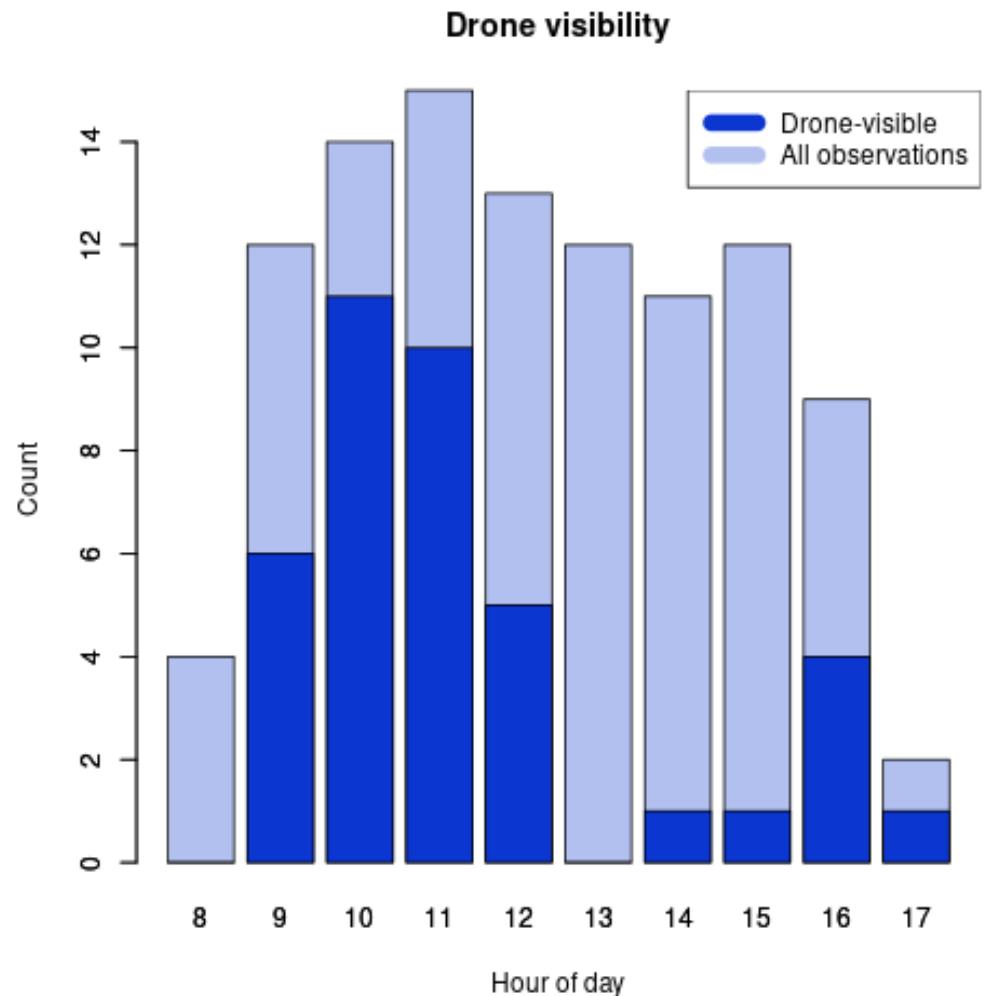

g_0 surveys

Pedestrian visibility

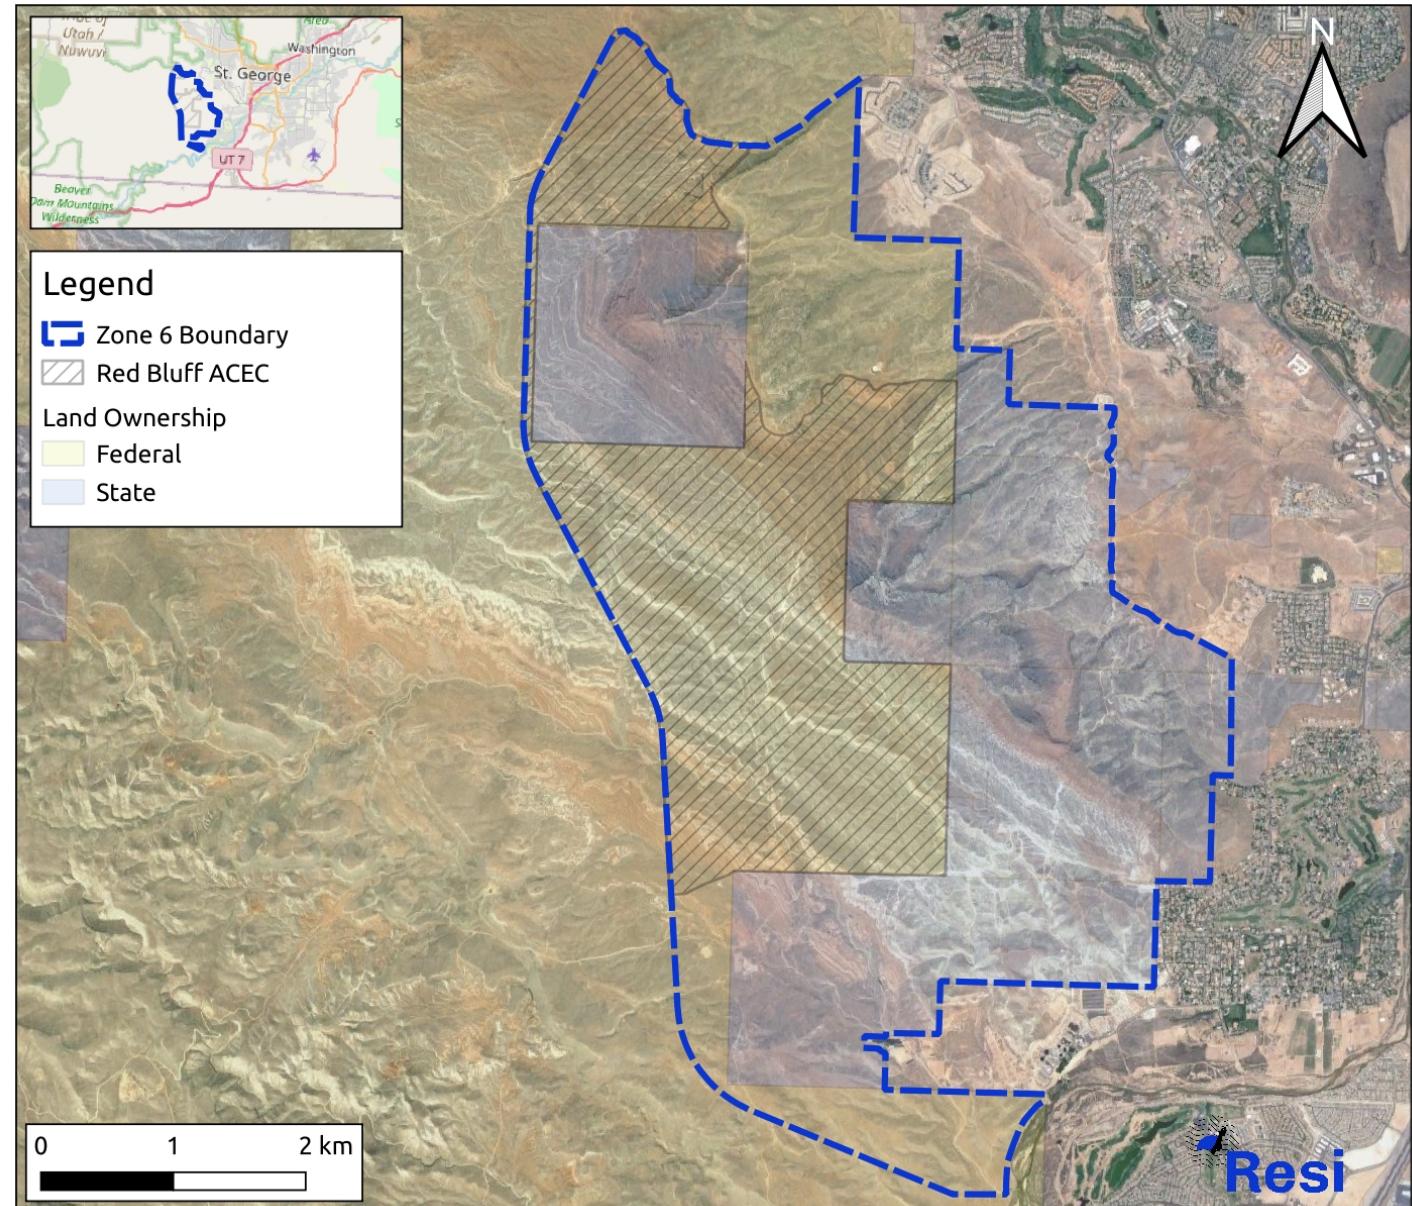

Drone visibility

Project

- St George, UT
- April, 2022
- ~5,000 acres
- 2 weeks
- Transects surveyed by drones and pedestrian crews

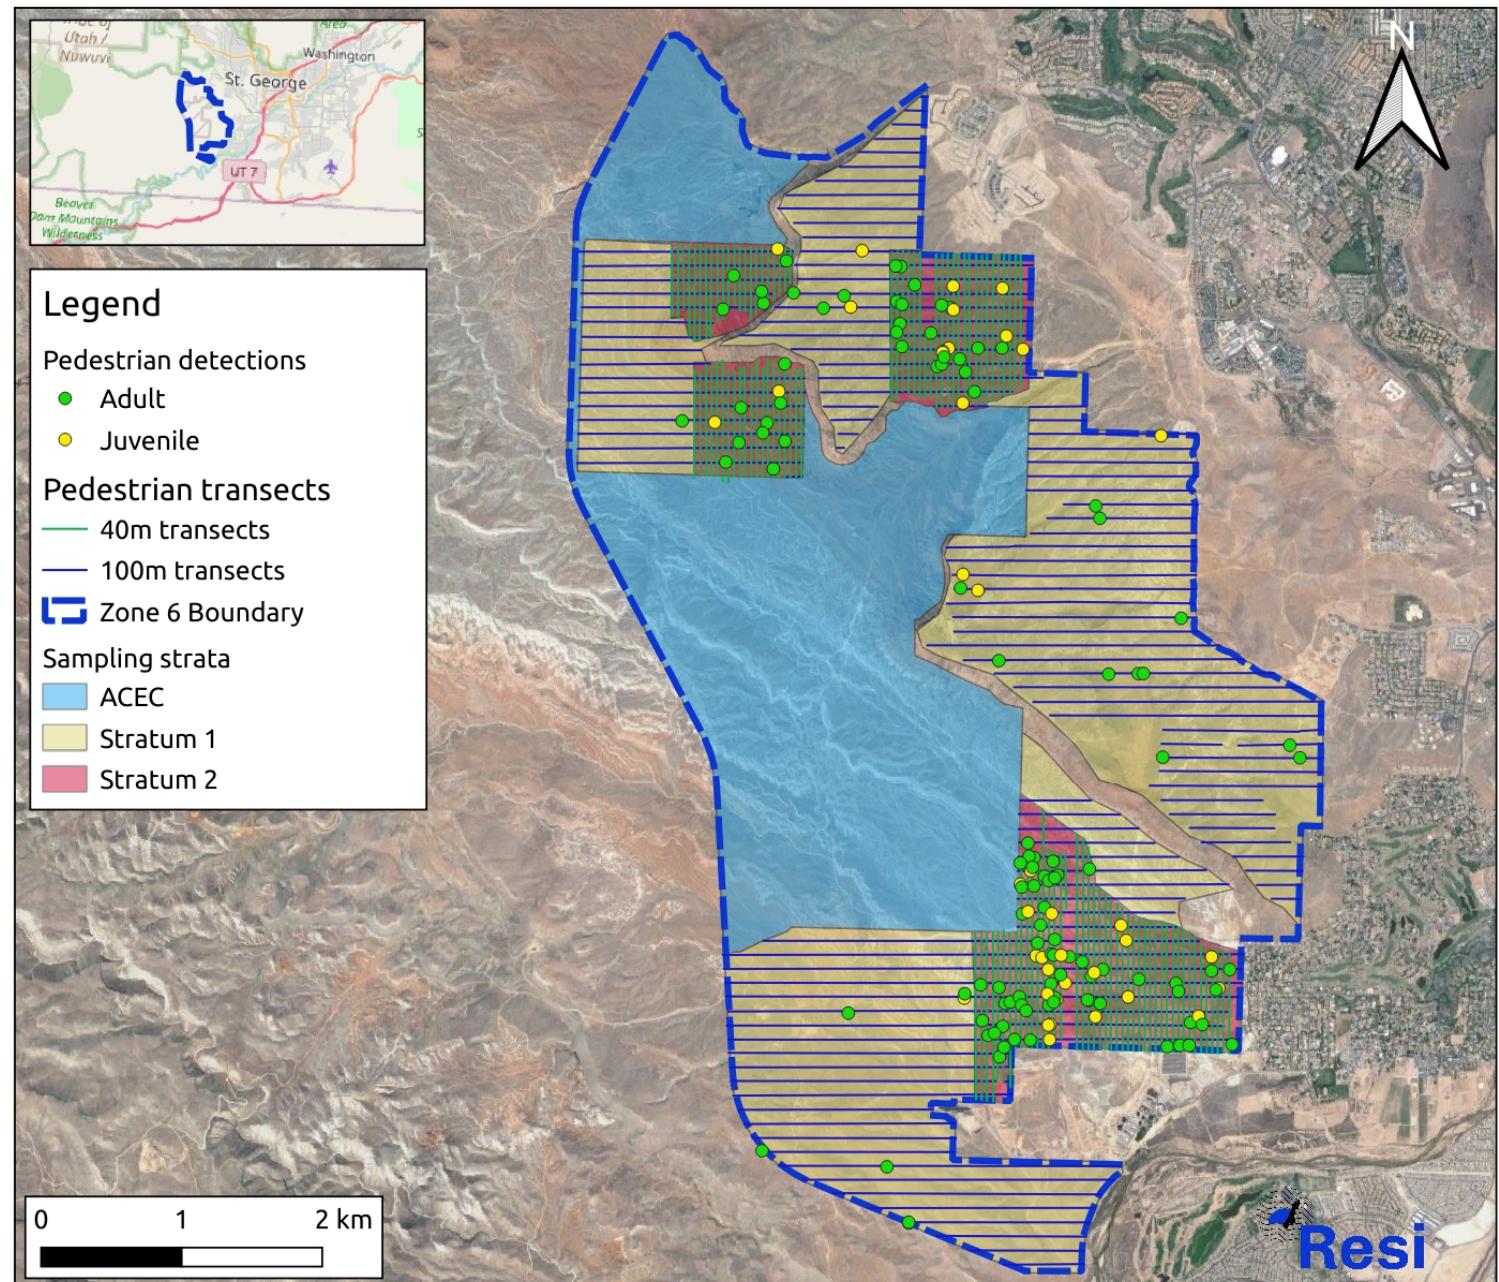

Zone 6 - pedestrian

254 km
surveyed

Detections:

113 adult
40 juvenile

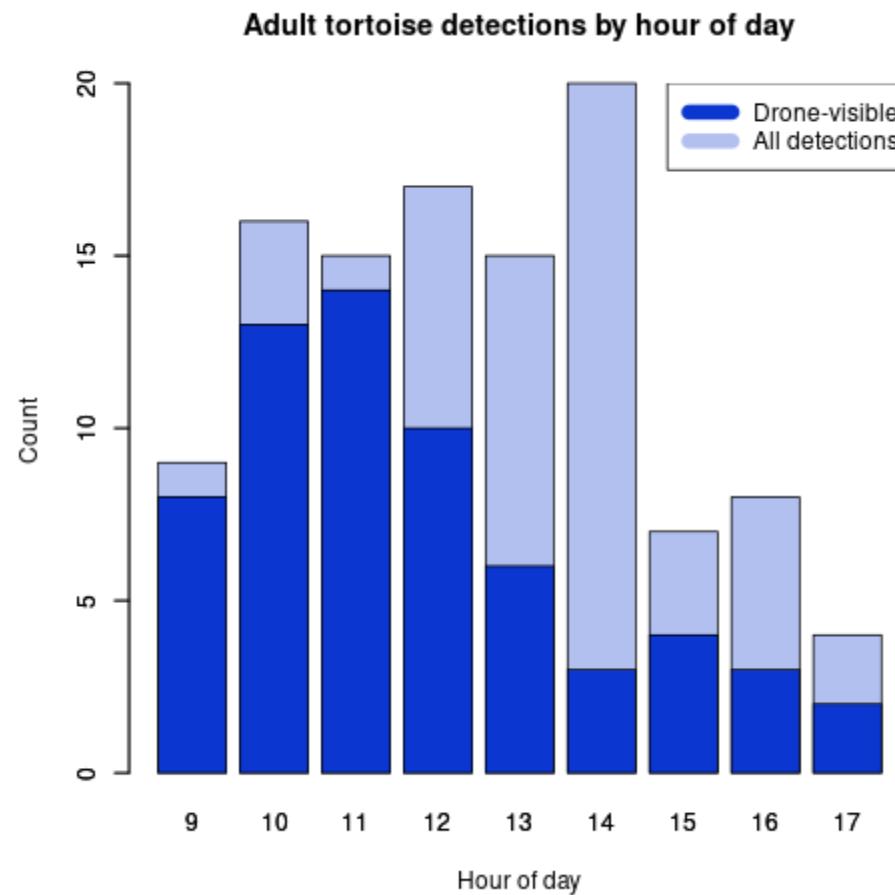

Zone 6 - pedestrian

N	95% CI	D	95% CI
411	303, 556	26.14	19.27, 35.36

Zone 6 - pedestrian

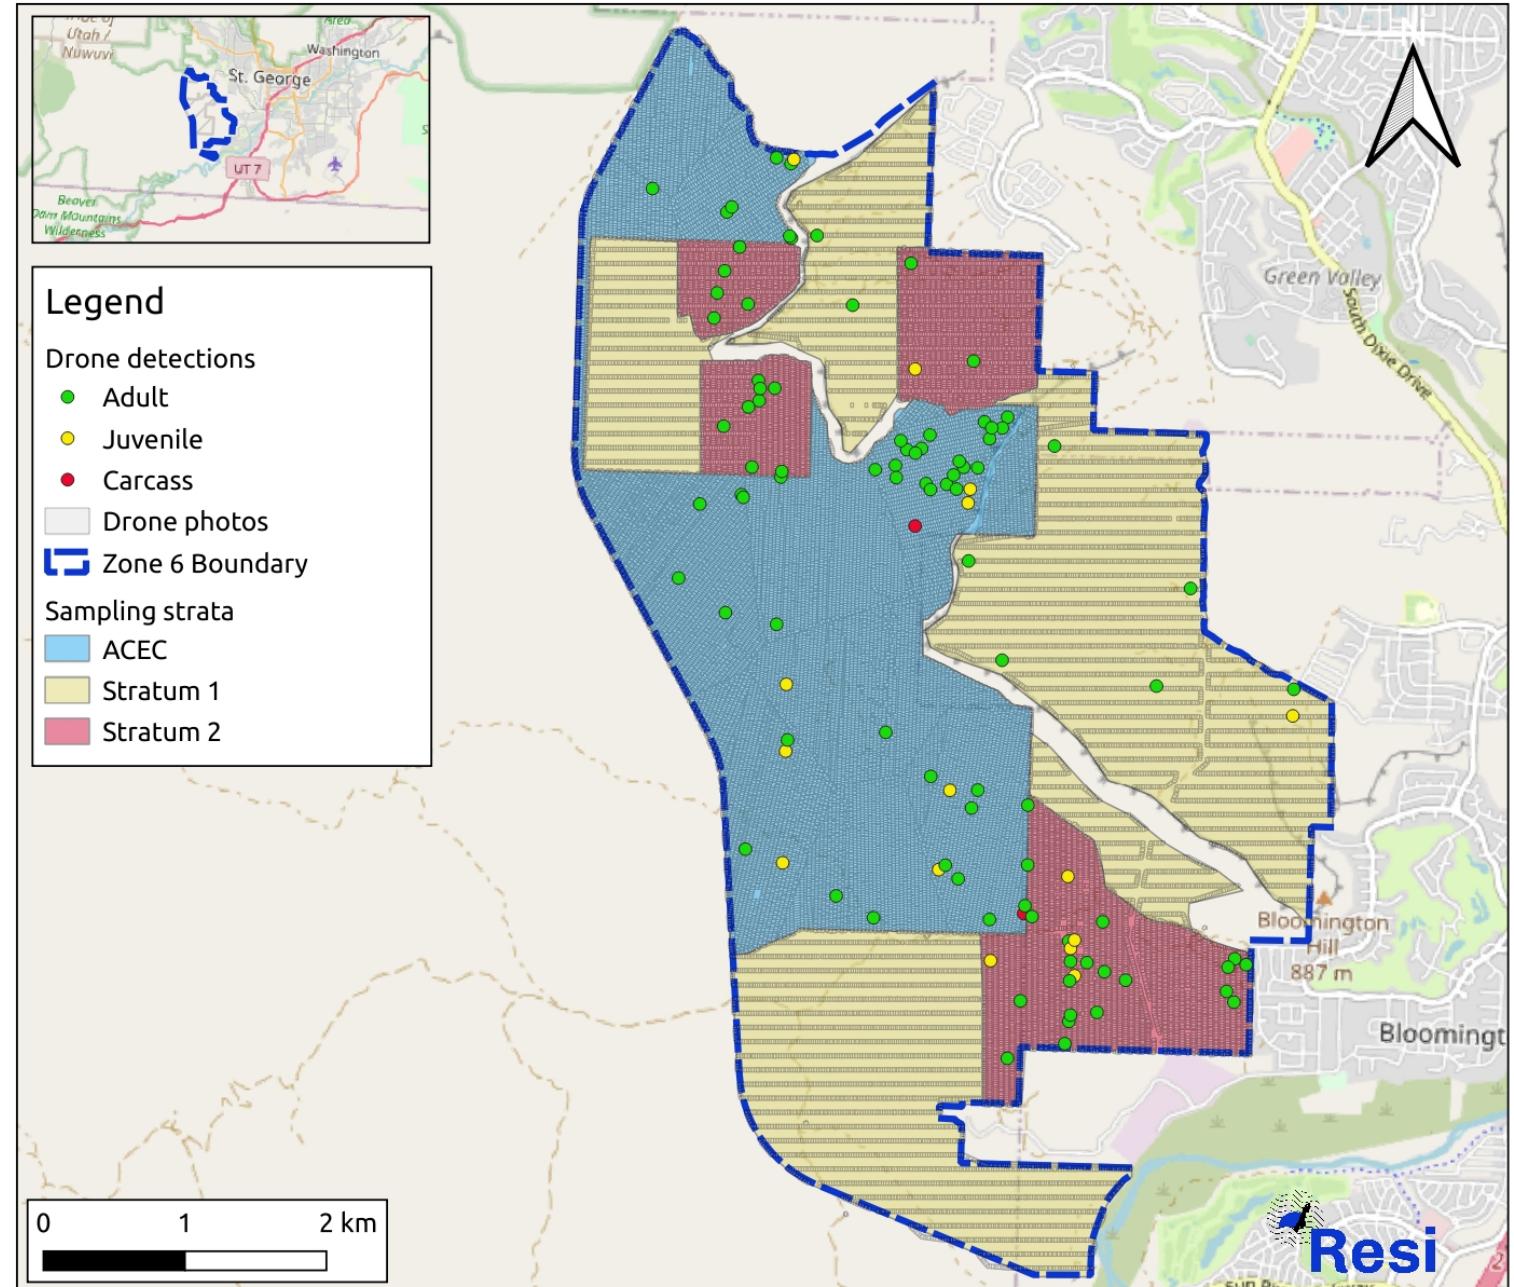

Zone 6 - drone

27.6 km²
surveyed

Detections:

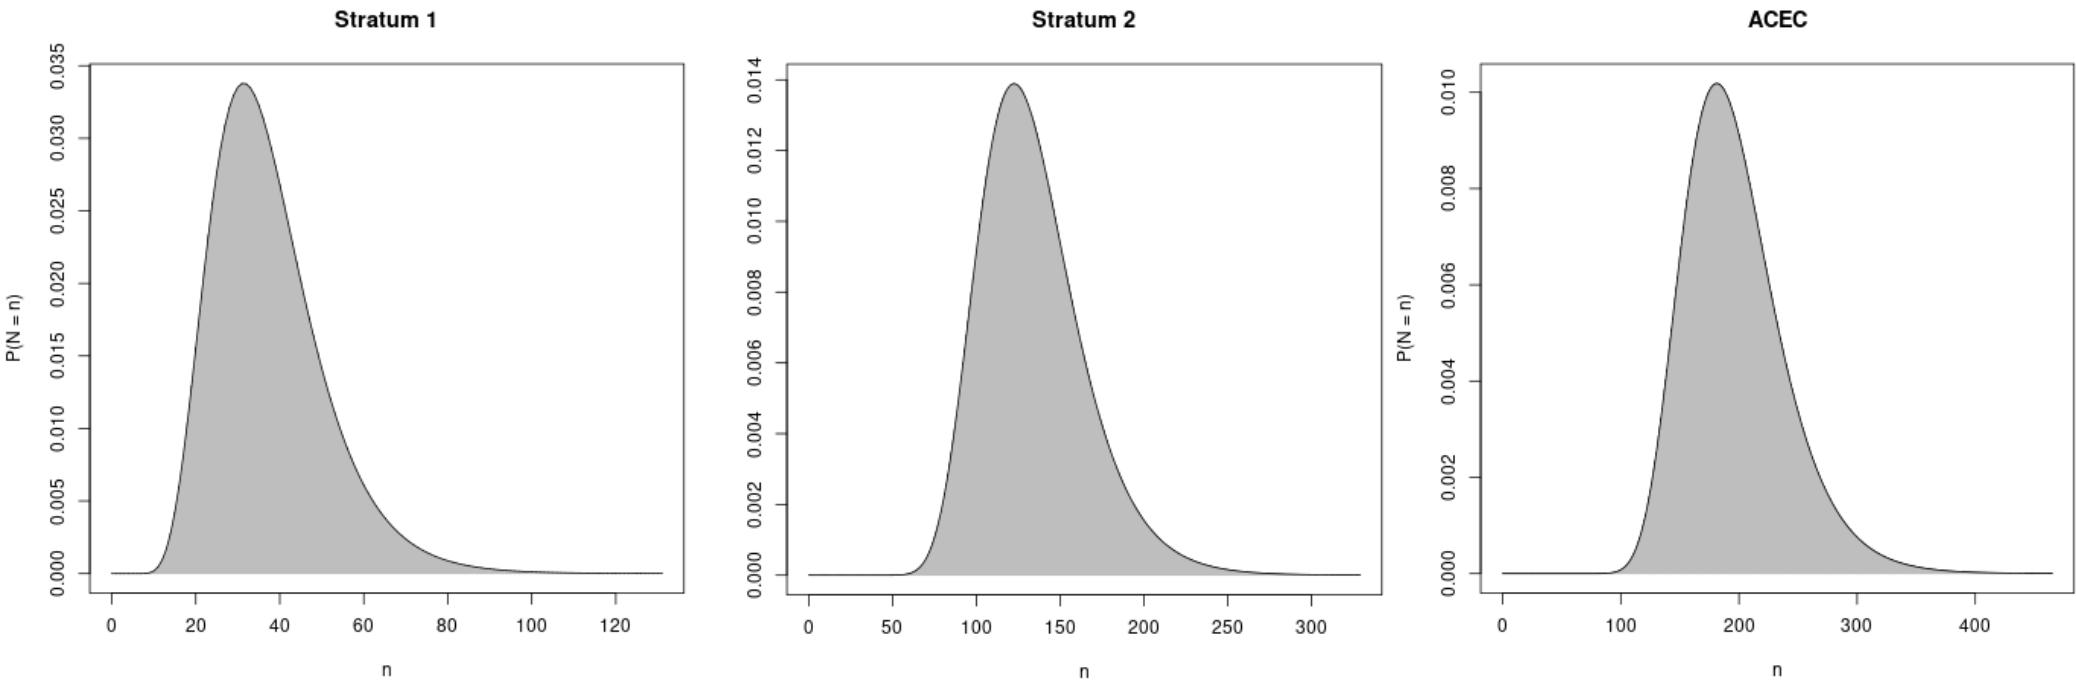

90 adult
15 juvenile
2 carcasses

Zone 6 - drone

Zone 6 - drone

	N	95% CI	D	95% CI
Stratum 1	132	62, 240	9.7	4.6, 17.7
Stratum 2	169	105, 262	40.0	24.8, 61.7
ACEC	197	129, 297	20.2	13.2, 30.5
Total	498	297, 799	18.1	10.8, 29.0

	N	95% CI	D	95% CI
Pedestrian	411	303,556	26.1	19.3, 35.4
Drone	301	168, 502	16.9	9.4, 28.2

Estimates overlap significantly

Difference in means may be due to:

- 1) sampling error
- 2) observer effect

Conclusions

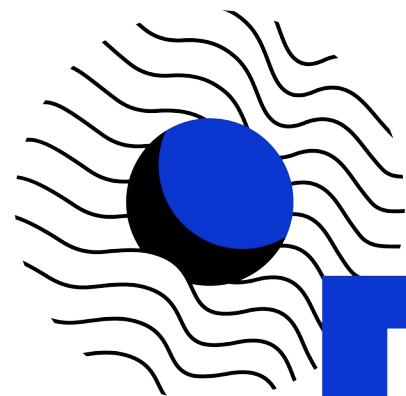

- The drone method is very successful at locating tortoises when they are available for detection
- Fewer tortoises are available for drone detection than for pedestrian detection, leading to lower overall detection rates and wider confidence intervals
- This can be ameliorated by:
 - Increased survey acreage
 - limiting drone surveys to periods of high availability (9 AM to 1 PM)

Conclusions

- Advantages of the drone method:
 - No surface disturbance
 - Less than $\frac{1}{2}$ the cost per km^2
 - Quantitative abundance estimates with CI
 - Can be used for additional resources, further increasing cost effectiveness
