North American Wetlands Conservation Act  
Reporting Requirements

This document fulfills the requirements of Section 10 and 16 of the North American Wetlands Conservation Act of 1989.

**Sec. 10. REPORT TO CONGRESS.**

The Secretary shall report to the appropriate Committees on the implementation of this Act. The report shall include—

- (1) a biennial assessment of—
  - (A) the estimated number of acres of wetlands and habitat for waterfowl and other migratory birds that were restored, protected, or enhanced during such two-year period by Federal, State, and local agencies and other entities in the United States, Canada, and Mexico;
  - (B) trends in the populations size and distribution of North American migratory birds;
  - (C) the status of efforts to establish agreements with nations in the western hemisphere pursuant to section 16; and
  - (D) wetlands conservation projects funded under this Act, listed and identified by type, conservation mechanism (such as acquisition, easement, or lease), location, and duration.
- (2) an annual assessment of the status of wetlands conservation projects, including an accounting of expenditures by Federal, State, and other United States entities, and expenditures by Canadian and Mexican sources to carry out these projects.

**Sec. 16. OTHER AGREEMENTS.**

- (a) The Secretary shall undertake with the appropriate officials of nations in the western hemisphere to establish agreements, modeled after the [North American Waterfowl Management] Plan or the [Tripartite] Agreement, for the protection of migratory birds identified in section 13(a)(5) of the Fish and Wildlife Conservation Act of 1980 (16 U.S.C. 2912(a)). When any such agreements are reached, the Secretary shall make recommendations to the appropriate Committees on legislation necessary to implement the agreements.

**Migratory Bird Trends**  
**[Section 10(I)(B)]**

Each year, the U.S. Fish and Wildlife Service, in conjunction with the States, the Canadian Wildlife Service, provincial governments, and other partners, conducts breeding-ground surveys to estimate the size of duck breeding populations. Specialized surveys track trends in the populations of other harvested migratory species such as the mourning dove and the American woodcock. The North American Breeding Bird Survey, conducted annually on approximately 2,900 routes in the United States and Canada by thousands of volunteers, is used to follow changes in the distribution and abundance of many other migratory bird species utilizing wetlands and associated habitats.

Habitat conditions at the time of the breeding waterfowl surveys in May of 2006 and 2007 were generally improved over 2004 and 2005. Wetland conditions in the U.S. portion of the important duck breeding area known as the Prairie Pothole Region were good following a sustained period of dry conditions due to abundant precipitation that began just after 2005 May surveys; however, high quality duck habitat in the Missouri Coteau region remained poor due to continued drought. Alaska’s conditions were generally good due to a normal spring ice breakup and good water conditions in abundant beaver ponds and small lakes. Maine also continues to have generally good to excellent conditions, and habitat conditions in western Ontario were excellent over most of the surveyed area. Wetland conditions within the traditional surveyed portion Canada were variable ranging from poor to excellent. Good to excellent conditions occurred in the Canadian Parklands and the western Northwest Territories, while conditions in the southern Saskatchewan and Manitoba remained dry. Southern Alberta improved in 2006 and 2007 due to heavy snowpacks and wet soil conditions.

The total number of ducks surveyed in 2007 was 41.2 million in the traditional survey area, about 24 percent above the long-term average (LTA) of 33.3 million. Seven of the 10 most common duck species exceeded species-specific North American Waterfowl Management Plan (Plan) goals: mallard, gadwall, green-winged teal, blue-winged/cinnamon teal, northern shoveler, redhead, and canvasback. Northern pintail and scaup populations are below Plan objectives. Northern pintail and scaup populations remain depressed and concern lingers about the status of these species. The greater and lesser scaup population estimate was 45 percent below the Plan objective and 33 percent below their LTA. Pintail population estimates were 40 percent below the Plan population goal in 2007 and 19 percent below their LTA.

In the eastern survey area, mallards were 11 percent above their LTA. American black ducks (22 percent) and ring-necked ducks (27 percent) were above their long-term averages. Merganser and goldeneye populations each increased between 2006 and 2007 but were similar to their LTA. Eastern populations of scoters, scaup, American wigeon, buffleheads and green-winged teal were populations were similar in 2006 and 2007 and similar to their LTA.

Most goose and swan populations in North America continue to thrive. The following populations displayed significant positive trends over the most recent 10-year period: Mississippi Flyway Giant, Atlantic and Aleutian Canada geese, western Arctic/Wrangle Island snow geese, and Pacific white-fronted geese. Only the eastern population of tundra swans experienced a significant negative 10-year trend.

The dusky Canada goose population remains a concern. Surveys have been changed from wintering ground mark-resight methods to direct breeding ground counts and recent results are not comparable to long-term data. Aleutian Canada geese (listed as endangered in 1967) have increased an average of 14 percent per year during the last 10 winter surveys and are presently above Plan objectives. Recent declines in indices of Mid-continent white-fronted geese resulted in more conservative harvest strategies. The population has declined at an average rate of 5 percent per year, 1997-2006. Overabundant goose populations (i.e., several populations of temperate-nesting Canada geese, greater and lesser snow geese, and Ross’s geese) continue to impact habitats and human interests. Harvest strategies to reduce the abundance of these populations have been implemented. While these strategies have reduced the populations’ rate of growth, some populations may still be increasing. Additional monitoring data is required to determine if these populations can be held in check through

the regulatory options pursued thus far. In 2008 the Service is expected to issue a conservation order for the first time for greater snow geese in the Atlantic Flyway.

Between 2006 and 2007, call-count indices of mourning dove populations (doves heard) continued to increase significantly in the Eastern Management Unit; but did not change significantly in the Central or Western Units. Breeding dove population indices in 2007 increased from 2006 in the 19 combined hunting states (7.1 percent) in the Eastern Unit but not in the combined non-hunting states. Over the past 10 years, no significant trend was indicated for doves heard in either the Eastern or Western Management Unit, whereas the Central Unit showed a significant decline. Over this same period no unit showed a significant trend in doves seen on survey routes. Over the entire 42-year survey period, all three units have exhibited significant declines in mourning doves heard and a significant decline in doves seen in the Western Unit.

Breeding population indices derived through the American Woodcock Singing-ground Survey in 2007 declined 11.6 percent from 2006 in the Eastern Region; however, the Central Region was unchanged. There was not a significant trend in woodcock heard on the survey in either the Eastern or Central Region between 1997 and 2007. This represents the fourth consecutive year since 1992 that the 10-year trend estimate for either region was not a significant decline. There were significant long-term declines in both regions, however, over the period of 1968 to 2007. The 2006 recruitment index was 11 percent higher than the 21005 index and 2 percent higher than the long-term average; however, if current trends in land-use practices persist, continued long-term population declines are likely.

Trends of other migratory bird species vary widely. Of all species groups, grassland nesting birds have exhibited the most consistent negative population trends since the late 1960s, with 64 percent of these species showing significant population declines and 7 percent with significant increasing trends. These patterns can be explained by extensive loss or degradation of grassland habitat from agricultural uses as well as by increases in haying. Restoration of native grasses or planting of dense-nesting cover under the North American Waterfowl Management Plan and funded through the North American Wetlands Conservation Act has produced positive impacts on the density of nesting birds and nest success in the Prairie Pothole Region. These and other critical programs, such as the Conservation Reserve Program and Partners in Flight, provide hope for these beleaguered populations.

As a whole, 34 percent of wetland/open-water-dependent migratory bird species show significant increasing long-term population trends. Fifteen percent of these species exhibit significant declining long-term trends. However, data from the North American Breeding Bird Survey are poor for many of these species, and conclusions must be viewed with caution.

Throughout North America, there are significant decreasing population trends for 36 percent of species breeding in successional or scrub habitats while 30 percent of species breeding in woodland habitats show significant increasing population trends from 1966. However, there are still 30 species that breed in woodland habitats exhibiting significant decreasing population trends over the 41-year period. Population trends for 40 percent of species breeding in urban habitats are significantly declining over the long term, while 20 percent of urban-nesting species are significantly increasing across North America.

The above species groups contain short-distance migrants and neotropical migrants. Short-distance migrants breed and winter north of the United States-Mexico border, while neotropical migrants winter south of it. In certain areas where the number of short-distance migrant species is highest, such as the northeast United States, Great Lakes states, and the Canadian prairie, negative population trends predominate for this group. In all, 37 percent of these species exhibit significant decreasing trends. Regional population trends of neotropical migrants are complex and patterns are difficult to discern. Thirty-four percent of neotropical migrant species have exhibited significant negative population trends since the late 1960s.

For many species, the extent to which population trend is driven by the destruction and degradation of wintering habitats south of the United States is unknown. However, it is believed that habitat loss south of the United States border is contributing to the decline of some of these species.

International cooperation is needed to assure the conservation of habitats used by migratory birds throughout their annual cycles. Continental programs such as the North American Waterfowl Management Plan and North American Wetlands Conservation Act Grants Program foster international cooperation.

International Agreements  
[Section 10(I)(C)]

No progress has been made to establish agreements with officials of other nations in the Western Hemisphere for the protection of migratory birds.
