

Trinity River Mainstem Redd Survey Update December 12, 2025

The [Arcata Fish and Wildlife Office](#) along with the [California Department of Fish and Wildlife](#), [Yurok Tribal Fisheries Program](#), and [Hoopa Valley Tribal Fisheries Department](#) survey the mainstem Trinity River to recover salmonid carcasses and count and map Chinook Salmon (*Oncorhynchus tshawytscha*) redds. The distribution of Chinook Salmon spawning is expected to change in response to rehabilitation efforts of the [Trinity River Restoration Program](#) and to the relative run sizes of natural- and [Trinity River Hatchery](#)-origin fish. Spawning surveys are attempted weekly between [Lewiston Dam](#) and the North Fork Trinity River (Reaches 1–7) and every other week on the survey reaches downstream of the North Fork Trinity River (Figure 1, Table 1).

This update provides preliminary data on this season's redd observations as of December 12 (Table 1). Figure 2 compares preliminary 2025 cumulative redd counts in Reaches 1–10 with the previous 23 years (2002–2024). Redds constructed by Chinook and Coho salmon are not differentiated until the end of the season when they are apportioned by species (Chinook or Coho salmon) and origin (hatchery or natural) using carcass data.

Figure 1. Mainstem Trinity River salmon redds mapped during the December 8-12 surveys.

Table 1. Preliminary count of redds by reach from the fall 2025 mainstem Trinity River redd survey as of December 12. Reach 8 (Pigeon Point Run) and Reach 11 (Burnt Ranch Gorge) are not surveyed due to abundant whitewater.

Week start	Reach														Total
	1	2	3	4	5	6	7	8	9	10	11	12	13	14	
Sep 1	6	1	-	-	-	-	-								7

‘NS’ = no survey

These data are preliminary and subject to revision.

Figure 2. Cumulative redd counts in Reaches 1–10 of the mainstem Trinity River in 2025 as of December 12 compared to the range of counts from 2002 to 2024.

The spawning success (i.e., pre-spawn mortality versus partially and fully spawned) of female salmon in the Trinity River are tracked during the spawn surveys. Only ‘fresh’ carcasses, those that exhibit minimal decay, are used for assessing pre-spawn mortality because carcasses with extensive decay may not retain unspawned eggs. As of December 12, 694 fresh female Chinook Salmon carcasses have been observed, 5 (0.7%) of which were unspawned.
