APPENDICES

Table of Contents

APPENDIX A ACRONYMS AND ABBREVIATIONS

APPENDIX B RELEVANT ENVIRONMENTAL LAWS, REGULATIONS, POLICIES, GUIDANCE, INSTRUCTIONS, AND EXECUTIVE ORDERS

APPENDIX C STATUS OF THE IMPLEMENTATION OF PAST AND PRESENT INTEGRATED NATURAL RESOURCES MANAGEMENT PLAN ACTIONS/PROJECTS

APPENDIX D INTEGRATED NATURAL RESOURCES MANAGEMENT PLAN ANNUAL REPORTS

- D1 2019 ANNUAL REPORT
- D2 2020 ANNUAL REPORT
- D3 2021 ANNUAL REPORT
- D4 2022 ANNUAL REPORT
- D5 2023 ANNUAL REPORT

APPENDIX E SPECIES PRESENCE AND ASSOCIATIONS ON JOINT REGION MARIANAS LANDS AND WITHIN ASSOCIATED NEARSHORE WATERS: GUAM AND COMMONWEALTH OF THE NORTHERN MARIANA ISLANDS

APPENDIX F BIOLOGICAL OPINIONS AND ASSOCIATED CONSERVATION MEASURES FOR JOINT REGION MARIANAS LANDS AND ASSOCIATED IMPLEMENTATION AND TRACKING

- F1 BIOLOGICAL OPINIONS
  - F1A USFWS, BO on the Establishment and Operation of an Intelligence, Surveillance, Reconnaissance, and Strike (ISR Strike) Capability Project on Andersen AFB, Guam (October 2006)
  - F1B USFWS, Request for Informal Section 7 Consultation for the Beddown of Training and Support Initiatives at Northwest Field Project on Andersen AFB, Guam (May 2006)
  - F1C USFWS, Reinitiation of Informal Section 7 Consultation Regarding Beddown of Training and Support Initiatives at Northwest Field, Andersen AFB, Guam (March 2009)
  - F1D USFWS, Second Reinitiation Informal Section 7 Consultation for the Beddown of Training and Support Initiatives at Northwest Field, Andersen AFB, Guam (September 2009)
  - F1E USFWS, Third Reinitiation of Informal Section 7 Consultation for the Beddown of Training and Support Initiatives at Northwest Field, Andersen AFB, Guam (March 2010)

F1F USFWS, BO for the Joint Guam Program Office Relocation of the U.S. Marine Corps from Okinawa to Guam and Associated Activities on Guam and Tinian (September 2010)

F1G USFWS, BO for the DON's Relocation of the U.S. Marine Corps from Okinawa to Guam and Associated Activities on Guam (July 2015)

F1H USFWS, Reinitiation of the 2015 BO on the DON's Relocation of U.S. Marine Corps from Okinawa to Guam and Associated Activities on Guam (July 2017)

F1I USFWS, Biological Opinion, Formal Consultation for Divert Activities and Exercises at the Saipan International Airport, Commonwealth of the Northern Mariana Islands (June 2013)

F1J USFWS, Amendment to the Biological Opinion for the Development of Divert Capabilities and Conducting Divert Activities and Exercises, Saipan and Tinian, CNMI (October 2015)

F1K NMFS, BO and Conference Report for U.S. Military Mariana Islands Training and Testing Activities, NMFS promulgation of regulations and issuance of a letter of authorization pursuant to the MMPA for the U.S. Navy to "take" marine mammals incidental to Mariana Islands Training and Testing activities from August 2015 through August 2020 (June 2015)

F1L USFWS, BO, Mariana Islands Training and Testing Program (February 2015)

F1M USFWS, Revision to BO on the Mariana Islands Training and Testing Program (February 2016)

F1N USFWS, BO for the Permanent Stationing of the Terminal High-Altitude Area Defense System on Andersen AFB, Guam (July 2016)

F1O NMFS, BO for the DON's Proposed Guam and CNMI Military Relocation (August 2010)

F1P NMFS BO for Sumay Cove Repair and Modernization, NBG (August 2011)

F1Q BOfor the Brown Tree Snake Control in the Habitat Management Unit, Andersen AFB (May 2018)

F1R BO for the Removal of Ungulates from Haputo Ecological Reserve Area, Marine Corps Base Camp Blaz, Guam (May 2022)

F1S BO for the Construction of 48 Munition Storage Igloos at Andersen Air Force Base, Guam (June 2020)

F1T BO for Relay Ground Station-Asia, Marine Corps Base Camp Blaz, Guam (December 2022)

F1U BO for Firefighter Training Facility Marine Corps Base Camp Blaz, Guam (September 2023)

F2 IMPLEMENTATION AND TRACKING TABLE FOR BIOLOGICAL OPINIONS AND ASSOCIATED CONSERVATION MEASURES

APPENDIX G GUAM MICRONESIAN KINGFISHER MEMORANDUM OF AGREEMENT (JUNE 2015) AND MODIFICATION TO GUAM MICRONESIAN KINGFISHER MEMORANDUM OF AGREEMENT (DECEMBER 2015)

APPENDIX H ENVIRONMENTAL ASSESSMENT FOR JOINT REGION MARIANAS INTEGRATED NATURAL RESOURCES MANAGEMENT PLAN

Appendix A
Acronyms and Abbreviations

This page intentionally left blank.

ACRONYMS AND ABBREVIATIONS

°	degree
°C	degrees Celsius
°F	degrees Fahrenheit
%	percent
36 CES/CEVN	36th Civil Engineering Squadron Environmental Flight
36 WG	36th Wing
AAV	amphibious assault vehicle
AFB	Air Force Base
AFI	Air Force Instruction
AFPBM TG-31	Armed Forces Pest Management Board Technical Guide No. 31
AGL	above ground level
AMT	Adaptive Management Team
APHIS	Animal and Plant Health Inspection Service
ASN	Assistant Secretary of the Navy
AT/FP	anti-terrorism/force protection
BA	Biological Assessment
BASH	Bird Aircraft Strike Hazard
BE	Biological Evaluation
BECQ	Bureau of Environmental and Coastal Quality
BMP	Best Management Practice
BO	Biological Opinion
BSO	Budget Submitting Office
BTS	brown treesnake
CATM	Combat Arms and Training Maintenance
CATEX	Categorical Exclusions
CCA	crustose coralline algae
CDZ	Cargo Drop Zone
CEQ	Council on Environmental Quality
CERCLA	Comprehensive Environmental Response, Compensation, and Liability Act
CESU	Cooperative Ecosystem Studies Units
CFR	Code of Federal Regulations
CGC	Coast Guard Cutter
CNIC	Commander, Navy Installations Command
CNMI	Commonwealth of the Northern Mariana Islands
CNO	Chief of Naval Operations
CO_2	carbon dioxide
COMNAVMAR	Commander Naval Forces Marianas
COMPACFLT	Commander U.S. Pacific Fleet
COTS	crown-of-thorns seastar
CPA	Commonwealth Ports Authority
CRB	coconut rhinoceros beetle
CRCP	Coral Reef Conservation Program

ACRONYMS AND ABBREVIATIONS

CRMO	Coastal Resources Management Office
CTD	conductivity, temperature, and depth
CWA	Clean Water Act
CWCS	Comprehensive Wildlife Conservation Strategy
CZMA	Coastal Zone Management Act
DCRM	Division of Coastal Resources Management
DDT	Dichlorodiphenyltrichloroethane
DEQ	Division of Environmental Quality
DFW	Division of Fish and Wildlife
DLNR	Department of Lands and Natural Resources
DoD	Department of Defense
DoDI	Department of Defense Instruction
DoDM	Department of Defense Manual
DON	U.S. Department of the Navy
DPS	Distinct Population Segment
DUSD	Deputy Under Secretary of Defense
EA	Environmental Assessment
EEZ	Exclusive Economic Zone
EDS	Early Detection Surveys
EFH	Essential Fish Habitat
EI&E	Energy, Installations, and Environment
EIS	Environmental Impact Statement
EMS	Environmental Management System
EMUA	Exclusive Military Use Area
EO	Executive Order
EOD	Explosive Ordnance Disposal
EPR-Web	Environmental Program Requirements Web
ERA	Ecological Reserve Area
ER-L	Effects Range-Low
ER-M	Effects Range-Median
ERL	Environmental Readiness Level
ESA	Endangered Species Act
ESQD	Explosive Safety Quantity Distance
FAA	Federal Aviation Administration
FDM	Farallon de Medinilla
FEP	Fishery Ecosystem Plan
FES	Forest Enhancement Site
FMC	Fishery Management Council
FMP	Fishery Management Plan
FORT	Fort Collins Science Center
FWCA	Fish and Wildlife Coordination Act
FY	Fiscal Year
GDPR	Guam Department of Parks and Recreation

ACRONYMS AND ABBREVIATIONS

GDPW	Guam Department of Public Works
GHS	Guam Homeland Security
GIS	Geographic Information System
GISD	Global Invasive Species Database
GovGuam	Government of Guam
gpd	gallons per day
GPS	Global Positioning System
Guam DAWR	Guam Division of Aquatic and Wildlife Resources
Guam EPA	Guam Environmental Protection Agency
GWA	Guam Water Authority
HACCP	Hazard Analysis and Critical Control Point
HAPC	Habitat Area of Particular Concern
HERA	Haputo Ecological Reserve Area
HMU	Habitat Management Unit
HPO	Historic Preservation Office(r)
I&E	Installations and Environment
IBB	International Broadcasting Bureau
IHA	Incidental Harassment Authorization
INRMP	Integrated Natural Resources Management Plan
IPM	Integrated Pest Management
IRP	Installation Restoration Program
IREI	Island Research & Education Initiative
ISR	Intelligence/Surveillance/Reconnaissance
JGPO	Joint Guam Program Office
JRM	Joint Region Marianas
kph	kilometers per hour
LBA	Lease Back Area
LCAC	Landing Craft Air Cushion
LCU	Landing Craft, Utility
LEED	Leadership in Energy and Environmental Design
LFA	little fire ant
LID	Low Impact Development
LIDAR	Light Detection and Ranging
LMR	living marine resource
LOA	Letter of Authorization
lpd	liters per day
MAPS	Monitoring Avian Productivity and Survivorship
MARAMP	Mariana Archipelago Reef Assessment and Monitoring Program
MARFORPAC	U.S. Marine Corps Forces, Pacific
MBTA	Migratory Bird Treaty Act
MCAG	Marine Corps Activity Guam
MCB	Marine Corps Base
MCBCB	Marine Corps Base Camp Blaz

ACRONYMS AND ABBREVIATIONS

MCE	Mesophotic coral ecosystems
MEDU	Marine Natural Resources Educational Outreach
MFB-RPA	Mariana Fruit Bat-Recovery Plan Action
mgd	million gallons per day
MGIS	Marine GIS and Data Management
MHM	Marine Habitat Management
MHW	Mean High Water
MIG	Migratory Bird Management
MILCON	Military Construction
MIRC	Mariana Islands Range Complex
MIS	Marine Invasive Species Management
MISTCS	Mariana Islands Sea Turtle and Cetacean Survey
MITT	Mariana Islands Training and Testing
MLA	Military Lease Area
MLAW	Marine Natural Resources Law Enforcement
mld	million liters per day
MMPA	Marine Mammal Protection Act
MMRP	Military Munitions Response Program
MOA	Memorandum of Agreement
MOU	Memorandum of Understanding
MOUT	Military Operations in Urban Terrain
mph	miles per hour
MPS	Marine Protected Species Management
MPVCO	Marine Patrol Volunteer Conservation Officer
MRP	Marine Resources Preserve
MSA	Munitions Storage Area
MSC	Military Sealift Command
MSFCMA	Magnuson-Stevens Fishery Conservation and Management Act
MSL	above mean sea level
MUNS	Munitions Squadron
MUS	Management Unit Species
MWR	Morale, Welfare and Recreation
NA	not applicable
N/A	not available
NAVFAC	Naval Facilities Engineering Systems Command
NBG	Naval Base Guam
NCCOS	National Centers for Coastal Ocean Science
NCP	National Oil and Hazardous Substance Pollution Contingency Plan
NCTS	Naval Computer and Telecommunications Station
NDAA	National Defense Authorization Act
NEC	Northern Equatorial Current
NEPA	National Environmental Policy Act
NFA	No-Fire Area

ACRONYMS AND ABBREVIATIONS

NGLA	Northern Guam Lens Aquifer
NHPA	National Historic Preservation Act
NISA	National Invasive Species Act
NMFS	National Marine Fisheries Service
NMS	Naval Munitions Site
NNE	non-nesting emergence
NOAA	National Oceanic and Atmospheric Administration
NOTAM	Notice to Airmen
NOTMAR	Notice to Mariners
NRCS	Natural Resources Conservation Service
NWF	Northwest Field
NWI	National Wetlands Inventory
NWR	National Wildlife Refuge
O&M	Operations and Maintenance
OEIS	Overseas Environmental Impact Statement
OPAREA	Operating Area
OPERA	Orote Peninsula Ecological Reserve Area
OPNAV	Office of the Chief of Naval Operations
OPNAV M	OPNAV Manual
OPNAVINST	Chief of Naval Operations Instruction
OSD	Office of the Secretary of Defense
OUSD	Office of the Under Secretary of Defense
Pacific RAMP	Pacific Reef Assessment and Monitoring Program
PARC	Partners in Amphibian and Reptile Conservation
PCB	Polychlorinated biphenyl
pCO_2	partial pressure carbon dioxide
PIF	Partners in Flight
PIFSC	Pacific Islands Fisheries Service Center
PL	Public Law
PMUS	Pelagic Management Unit Species
POL	Petroleum, Oil, and Lubricants
POM	Program Objectives Memorandum
PPBES	Planning, Programming, Budget, and Execution System
QRP	Qualified Recycling Program
RAMP	Reef Assessment and Monitoring Program
R-	Restricted Area
RBP	Regional Biosecurity Plan
REPI	Readiness Environmental Protection Integration
RF	radio frequency
RPM	Real Property Maintenance
SAIA	Sikes Act Improvement Act
SDZ	Surface Danger Zone
SeaBees	Naval Mobile Construction Battalions

ACRONYMS AND ABBREVIATIONS

SECNAV	Secretary of the Navy
SECNAVINST	Secretary of the Navy Instruction
SERDP	Strategic Environmental Research and Development Program
SME	Subject Matter Expert
SOGCN	Species of Greatest Conservation Need
SPAWAR	Space and Naval Warfare Systems Command
SVL	snout-to-vent length
SWAT	Soil and Water Assessment Tool
TEDU	Terrestrial Natural Resources Educational Outreach
TGIS	Terrestrial GIS and Data Management
THAAD	Terminal High-Altitude Area Defense
THM	Terrestrial Habitat Management
TIS	Terrestrial Exotic and Invasive Species Management
TLAW	Terrestrial Natural Resources Law Enforcement
TNC	The Nature Conservancy
TNWRE	Tom Nance Water Resource Engineering
TPS	Terrestrial Protected Species Management
TS	Telecommunications Site
TSB	Training Support Battalion
U.S.	United States
UOG	University of Guam
USACE	U.S. Army Corps of Engineers
USAF	U.S. Air Force
USC	U.S. Code
USCG	U.S. Coast Guard
USDA	U.S. Department of Agriculture
USDA-NWRC	U.S. Department of Agriculture-National Wildlife Research Center
USEPA	U.S. Environmental Protection Agency
USFS	U.S. Forest Service
USFWS	U.S. Fish and Wildlife Service
USGS	U.S. Geological Survey
USINDOPACOM	U.S. Indo-Pacific Command
USMC	U.S. Marine Corps
UXO	unexploded ordnance
VCO	Volunteer Conservation Officer
VCOP	Volunteer Conservation Officer Program
WAP	Wildlife Action Plan
WERI	Water and Environmental Research Institute
WPRFMC	Western Pacific Regional Fishery Management Council
WWII	World War II

Appendix B
Relevant Environmental Laws, Regulations, Policies, Guidance, Instructions, and Executive Orders

This page intentionally left blank.

APPENDIX B

Relevant Environmental Laws, Regulations, Policies, Guidance, Instructions, Executive Orders, and Consultations

FEDERAL LAWS, REGULATIONS, AND EXECUTIVE ORDERS FOR NATURAL RESOURCES

- Animal Damage Control Act (7 United States Code [USC] 426 et seq.)
- Anti-Deficiency Act (31 USC 1341 et seq.)
- Brown Treesnake Control and Eradication Act (7 USC 8501 et seq.)
- Clean Air Act, as Amended (42 USC 7401 et seq.)
- Clean Water Act (CWA) Sections 401 and 404 (33 USC 1251 et seq.)
- CWA Section 404(b)(1) Regulations (40 Code of Federal Regulations [CFR] 230)
- Coastal Barrier Resources Act of 1982 (16 USC 3501 et seq.)
- Coastal Zone Management Act (16 USC 1451-1465)
- Consolidated Appropriations Act of 2005 (Public Law [PL] 108-447)
- Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) (Superfund) of 1980, (42 USC 9601 et seq.)
- Conservation and Rehabilitation Program on Military and Public Lands, as Amended (16 USC 670 et seq.)
- Coral Reef Conservation Act of 2000 (16 USC 6401 et seq.)
- Council on Environmental Quality (CEQ) Regulations on Implementing National Environmental Policy Act (NEPA) Procedures (40 CFR 1500-1508)
- Defense Environmental Restoration Program (10 USC 2701)
- Department of Defense (DoD) Appropriation Act (PL 102-393)
- Dredge and Fill Nationwide Permit Program (33 CFR 330)
- Endangered and Threatened Wildlife and Plants (50 CFR 17)
- Endangered Species Act (ESA), as Amended (16 USC 1531 et seq.)
- Entering Military, Naval, or Coast Guard Property (18 USC 1382)
- Environmental Effects in the United States (U.S.) of DoD Actions (32 CFR 188)
- Erosion Protection Act (33 USC 426)
- Estuary Protection Act (16 USC 1226)
- Executive Order (EO) 11514, *Protection and Enhancement of Environmental Quality* (as amended by EOs 11541 and 11991)
- EO 11644, *Use of Off-Road Vehicles on the Public Lands*
- EO 11987, *Exotic Organisms*
- EO 11988, *Floodplain Management*
- EO 11989, *Off-Road Vehicles Use on Public Lands*
- EO 11990, *Protection of Wetlands*
- EO 12780, *Federal Agency Recycling and the Council on Federal Recycling and Procurement Policy*
- EO 12902, *Energy Efficiency and Water Conservation at Federal Facilities*
- EO 12962, *Recreational Fisheries*
- EO 13089, *Coral Reef Protection*
- EO 13112, *Invasive Species*
- EO 13158, *Marine Protected Areas*
- EO 13186, *Responsibilities of Federal Agencies to Protect Migratory Birds*
- EO 13352, *Facilitation of Cooperative Conservation*
- EO 13423, *Strengthening Federal Environmental, Energy, and Transportation Management*

- EO 13751, *Safeguarding the Nation from the Impacts of Invasive Species*
- Farmland Protection Policy Act (7 USC 4201 et seq.)
- Federal Aid in Wildlife Restoration Act (16 USC 669-669i); also known as the "Pittman-Robertson Act"
- Federal Compliance with Pollution Control Standards (42 USC 4321)
- Federal Consistency with Approved Coastal Management Programs under Coastal Zone Management Act (CZMA) (15 CFR 930)
- Federal Environmental Pesticide Control Act (7 USC 2809)
- Federal Facilities Compliance Act (42 USC 6961)
- Federal Insecticide, Fungicide, and Rodenticide Act, as amended (7 USC 136 et seq.)
- Federal Land Policy and Management Act (43 USC 1701 et seq.)
- Federal Noxious Weed Act (7 USC 2801 et seq.)
- Federal Plant Pest Act (7 USC 150aa et seq.)
- Federal Water Pollution Control Act (CWA) (33 USC 1251-1376)
- Federal Water Pollution Control Act, as Amended by the CWA (PL 92-500)
- Fish and Wildlife Conservation Act (16 USC 2901-2911)
- Fish and Wildlife Conservation and Natural Resources Management Programs on Military Reservations (PL 96-561)
- Fish and Wildlife Coordination Act (16 USC 661-667e)
- Fish and Wildlife Improvement Act (16 USC 7421)
- Fishery Ecosystem Plan for the Mariana Archipelago (Western Pacific Regional Fishery Management Council 2009)
- Forest Resources Conservation and Shortage Relief Act (16 USC 620 et seq.)
- Hunting and Fishing on Federal Lands (10 USC 2671 et seq.)
- Interagency Cooperation, ESA of 1973, as Amended (50 CFR 402)
- Lacey Act of 1900 (16 USC 701), and Lacey Act Amendments (16 USC 3371-3378)
- Land and Water Conservation Act (16 USC 4601 et seq.)
- Legacy Resource Protection Program Act (PL 101-511)
- Magnuson Stevens Fishery Conservation and Management Act of 1976 (16 USC 1801 et seq.)
- Marine Mammal Protection Act, as Amended (16 USC 1361 et seq.)
- Marine Protection, Research, and Sanctuaries Act (also referred to as the Ocean Dumping Act) (16 USC 1431 et seq. and 33 USC 1401 et seq.)
- Migratory Bird Conservation Act (16 USC 715 et seq.)
- Migratory Bird Permits; Take of Migratory Birds by the Armed Forces, U.S. Fish and Wildlife Service (USFWS) Final Rule (72 Federal Register 8931-8950 [February 28, 2007])
- Migratory Bird Treaty Act (MBTA) of 1918 (16 USC 703-712)
- Military Construction Authorization Act of 1956, Leases; Non-Excess Property (10 USC 2667)
- Military Construction Authorization Act of 1956, Sale of Certain Interests in Lands, Logs (10 USC 2665)
- Military Construction Authorization Act of 1975 (10 USC 2665)
- Military Readiness Rule (50 CFR Part 21.15)
- Military Reservation and Facilities: Hunting, Fishing and Trapping (10 USC 2671)
- Multiple-Use Sustained Yield Act (16 USC 528)
- National Defense Authorization Act for Fiscal Year 2003
- National Defense Authorization Act for Fiscal Year 2015 (PL 113-291)
- National Defense Authorization Act for Fiscal Year 2016 (PL 114-92)
- National Defense Authorization Act for Fiscal Year 2017 (PL 114-328)
- NEPA of 1969, as Amended (42 USC 4321 et seq.)

- National Historic Preservation Act (NHPA) (PL 89-665) (54 USC 300101 et seq.)
- National Invasive Species Act of 1996 (Formerly, Nonindigenous Aquatic Nuisance Prevention and Control Act of 1990), as Amended (16 USC 4701 et seq.)
- National Oceanic and Atmospheric Administration Coastal Zone Management Program Development and Approval Regulation (15 CFR 923, Subparts A-K)
- National Wildlife Refuge (NWR) System Administration Act of 1996 (16 USC 668dd-668ee)
- Natural Resources Management Program (32 CFR 190)
- Pacific Islands Regional Action Plan (December 2016)
- National Oceanic and Atmospheric Administration (NOAA) Fisheries Climate Science Strategy, NOAA Technical Memorandum NMFS-F/SPO-155 (August 2015)
- Noxious Plant Control Act (43 USC 1241)
- Ocean Dumping Regulations and Criteria (40 CFR 220-229)
- Oil Pollution Act (33 USC 2701 et seq.)
- Outdoor Recreation, Federal/State Program Act (16 USC 4601 et seq.)
- Partners for Fish and Wildlife Act (16 USC 3771 et seq.)
- Plant Quarantine Act (7 USC 151-167)
- Pollution Prevention Act (42 USC 13101 et seq.)
- Presidential Proclamation 9077 – Commonwealth of the Northern Mariana Islands (CNMI), Reserving Certain Submerged Lands in the CNMI (January 15, 2014)
- Presidential Proclamation 4347 – American Samoa, Guam, and the Virgin Islands (February 1, 1975)
- President's Directive on Environmentally and Economically Beneficial Practices on Federal Landscaped Grounds
- Regulations Concerning Marine Mammals (50 CFR 18, 216, 228)
- Resource Conservation and Recovery Act (42 USC 6901 et seq.)
- Rivers and Harbors Act of 1889 (33 USC 403 et seq.)
- Safe Drinking Water Act (42 USC 300(f) et seq.)
- Sales of Forest Products on Federal Lands (10 USC 2665 et seq.)
- Sikes Act Improvement Act (16 USC 670a et seq.)
- Soil and Water Conservation Act (16 USC 2001-2009)
- Soil Conservation Act (16 USC 5901)
- Territorial Submerged Lands Act (PL 93-435)
- USFWS Guidelines for Coordination on Integrated Natural Resources Management Plans (June 2015)
- Water Pollution Prevention and Control (33 USC 1251 et seq.)
- Wetland Resources (16 USC 3901)

FEDERAL GUIDELINES FOR NATURAL RESOURCES

- U.S. Army Corps of Engineers (USACE) 1987 Wetland Delineation Manual
- Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Hawaii and Pacific Islands Region (Version 2.0)
- USFWS Reducing Bird Collisions with Buildings and Building Glass Best Practices (July 2016)

DEPARTMENT OF DEFENSE DIRECTIVES, INSTRUCTIONS, REGULATIONS, AND POLICIES FOR NATURAL RESOURCES

- Deputy Under Secretary of Defense Memorandum, Integrated Natural Resources Management Plan Template
- DoD Directive 3200.15, *Sustaining Access to the Live Training and Test Domain*
- DoD Directive 4140.1, *DoD Supply Chain Material Management Policy*
- DoD Directive 4700.4, *Natural Resources Management Program*
- DOD Directive 4705.01E, *Management of Land-Based Water Resources in Support of Contingency Operations*
- DoD Directive 4710.1, *Archaeological and Historic Resources Management*
- DoD Directive 4715.21, *Climate Change Adaptation and Resilience*
- DoD Directive 5030.41, *Oil and Hazardous Substance Pollution Prevention and Contingency Program*
- DoD Directive 6050.1, *Environmental Effects in the U.S. of DoD Strategies*
- DoD Directive 6050.15, *Prevention of Oil Pollution from Ships Owned or Operated by the Department of Defense*
- DoD Directive 6050.2 (as Amended), *Use of Off-Road Vehicles on DoD Lands*
- DoD Directive 6050.4, *Marine Sanitation Devices for Vessels Owned or Operated by DoD*
- DoD Integrated Natural Resources Management Plan (INRMP) Handbook, *Resources for INRMP Implementation*
- DoD Instruction 4001.01, *Installation Support*
- DoD Instruction 4150.07, *DoD Pest Management Program*
- DoD Instruction 4165.57, *Air Installations Compatible Use Zones*
- DoD Instruction 4165.59, *DoD Implementation of the Coastal Zone Management Act*
- DoD Instruction 4700.2, *Secretary of Defense Award for Natural Resources and Environmental Management*
- DoD Instruction 4715.03, *Natural Resources Conservation Program*
- DoD Instruction 4715.4, *Pollution Prevention*
- DoD Instruction 4715.06, *Environmental Compliance in the United States*
- DoD Instruction 4715.07, *Environmental Restoration Program*
- DoD Instruction 4715.9, *Environmental Planning and Analysis*
- DoD Instruction 5000.13, *Natural Resources - The Secretary of Defense Natural Resource Conservation Award*
- DoD Instruction 6050.05, *DoD Hazard Communication Program*
- DoD Instruction 6055.06, *DoD Fire and Emergency Services Program*
- DoD Manual 4715.03, *Integrated Natural Resources Management Plan Implementation Manual*
- DoD 2014 Climate Change Adaptation Roadmap (June 2014)
- DoD Environmental Management Systems Compliance Management Plan (November 2009)
- DoD Supplemental Guidance for Implementing and Operating a Joint Base, Office of the Under Secretary of Defense (April 15, 2008)
- Supplemental Guidance for Implementation of the Sikes Act Improvement Act, Office of the Secretary of Defense (November 1, 2004)
- Supplemental Guidance for Implementation of the Sikes Act Improvement Act, Office of the Secretary of Defense (September 5, 2005)
- Updated Guidance For Implementation of the Sikes Act Improvement Act, Office of the Under Secretary of Defense (October 10, 2002)
- Army Regulation 200-1, *Environmental Protection and Enhancement* (December 13, 2007)

U.S. DEPARTMENT OF THE NAVY DIRECTIVES, REGULATIONS, AND POLICIES FOR NATURAL RESOURCES

- Office of the Chief of Naval Operations (OPNAV), Assignment of Accountability for Leased Property in the Northern Mariana Islands (November 1, 1983)
- CINCPACFLTINST 5090.1B, *Pacific Fleet Environmental Protection Program*
- Commander Naval Forces Marianas (COMNAVMARIANAS) Instruction 11320.1, *Fire Prevention Program Instruction*
- U.S. Department of Navy (DON) Procedures for Implementing NEPA (32 CFR 775)
- Final Guam Landscaping Guidelines (2011)
- NAVBASEGUAMINST 5090.2A, *Saltwater Fishing*
- Naval Facilities Engineering Command (NAVFAC) Instruction 11010.45, *Regional Shore Infrastructure Planning*
- NAVFAC Instruction 11012.111A, *Land Use Conservation Planning*
- NAVFAC Instruction 6250.3H, *Applied Biology Program Services and Training*
- NCTAMS Western Pacific Guam Instruction 11011.1C (currently undergoing revision as COMNAVMARIANAS Instructions)
- Chief of Naval Operations Instructions (OPNAVINST) 11010.20F, *Facilities Projects Manual*
- OPNAVINST 5090.1, *Environmental Readiness Program*
- OPNAVINST 5090.6, *Management and Recreation of Natural and Cultural Resources on U.S. Naval Activities, Guam*
- OPNAVINST 6250.4C, *Pest Management Program*
- OPNAVINST 8000.16, *Environmental Security Management*
- OPNAVINST 8026.2C, *Navy Munitions Disposition Policy*
- OPNAV M-5090.1, *Environmental Readiness Program Manual*
- Secretary of the Navy Instruction (SECNAVINST) 5090.6A, *Environmental Planning For Department of the Navy Actions*
- SECNAVINST 5090.8A, *Policy for Environmental Protection, Natural Resources, Cultural Resources Programs*
- SECNAVINST 6240.6E, *Implementation of DoD Directives under DoD Instruction 4700.4*
- INRMP Guidance For Navy Installations (April 2006)
- Management Plan for the Haputo Ecological Reserve Area (ERA) (January 1986)
- Guam Submerged Lands Management Plan. U.S. Navy Region Marianas (September 2007)
- Orote Peninsula ERA General Management Plan (August 2010)
- Haputo ERA General Management Plan (August 2010)
- Joint Region Marianas (JRM) Naval Base Guam Ungulate Management Plan (December 2013)
- JRM Andersen AFB Ungulate Management Plan (December 2013)
- A Cooperative Strategy for 21st Century Seapower (March 2015)
- DON Environmental Strategy (April 2008)

U.S. DEPARTMENT OF THE AIR FORCE DIRECTIVES, REGULATIONS, AND POLICIES FOR NATURAL RESOURCES

- Air Force Instruction (AFI) 32-1053, *Pest Management Program*
- AFI 32-7024, *Integrated Natural Resources Management*
- AFI 32-7060, *Interagency and Intergovernmental Coordination for Environmental Planning*
- AFI 32-7061, *Environmental Impact Analysis Process (EIAP)*
- AFI 32-7064, *Integrated Natural Resources Management*
- AFI 32-7081, *Forest Management Manual*
- AFI 91-202, *U.S. Air Force Mishap Prevention Program*
- Policy Memo for Implementation of Sikes Act Improvement Amendments, U.S. Air Force (USAF) Environmental Office (HQ USAF/ILEV) on January 29, 1999
- Air Force Policy Directive 32-70, *Environmental Quality*
- *Environmental Protection, EIAP* (32 CFR 989)
- 36th Air Base Wing Instruction 32-7003, *Conservation and Management of Natural Resources*
- Sea Turtle (*Chelonia mydas*) Management Plan for Andersen Air Force Base (AFB), Guam (2022)
- Final Mariana Fruit Bat (*Pteropus mariannus mariannus*) Management Plan for Andersen AFB, Guam (August 2008)
- Draft Adaptive Management Plan, Andersen AFB, Guam (February 2011)
- 36th Wing Bird Aircraft Strike Hazard Plan, Andersen AFB, Guam (March 1, 2008)

MEMORANDUMS OF AGREEMENT, MEMORANDUMS OF UNDERSTANDING, AND COOPERATIVE AGREEMENTS REGARDING NATURAL RESOURCES

- DoD Memorandum on Implementation of Ecosystem Management in DoD
- Memorandum of Agreement (MOA) for Brown Treesnake Control among the U.S. Department of Interior, DoD, U.S. Department of Agriculture (USDA), U.S. Depatment of Commerce, U.S. Department of Transportation, National Invasive Species Council, GovGuam, the State of Hawaii, and CNMI (1992, 1999, 2011)
- MOA, and Associated Modification, between the DON and USFWS Regarding Conservation of Guam Micronesian Kingfisher Recovery Habitat in Northern Guam (June and December 2015)
- Memorandum of Understanding (MOU) between the DoD and the USFWS for the Ecosystem-based Management of Fish, Wildlife and Plant Resources on Military Lands (May 17, 1999)
- MOU between the DoD and the USFWS to Promote the Conservation of Migratory Birds (September 5, 2014)
- MOA for Professional and Technical Assistance Conducting Biological Surveys, Research and Related Activities between the DoD and the National Biological Service of the Department of the Interior
- MOA for Cooperative Law Enforcement between the USFWS and Division of Aquatic and Wildlife Resources Department of Agriculture, Territory of Guam (July 9, 1990)
- MOU among the GovGuam and the U.S. Air Force and the U.S. Navy and the USFWS for the Establishment and Management of the Guam NWR, Guam (December 14, 1993)
- MOU between DoD, USFWS, and the Association of Fish and Wildlife Agencies for a Cooperative INRMP on Military Installations (July 29, 2013)
- MOU between the U.S. Environmental Protection Agency (USEPA) and the DoD with Respect to Integrated Pest Management (IPM)
- MOU for Watchable Wildlife Programs
- MOU to Foster the Ecosystem Approach between the CEQ, USDA, Department of the Army, Department of Commerce, DoD, Department of Energy, Department of Housing and Development, Department of the Interior, Department of Justice, Department of Labor, Department of State,

Department of Transportation, USEPA, and Office of Science and Technology Policy (December 15, 1995)
- Mutual DoD and USFWS Guidelines for Streamlined Review of INRMP Updates (July 20, 2015)
- Cooperative Agreement between the DoD and The Nature Conservancy for Assistance in Natural Resources Inventory
- Cooperative Agreement between the U.S. Navy and the USFWS for the Establishment and Management of the Guam NWR, Guam (March 1994)
- Cooperative Agreement between the USAF and the USFWS for the Establishment and Management of the Guam NWR, Guam (March 1994)
- Guam NWR Comprehensive Conservation Plan, Prepared by Guam NWR and USFWS (September 2009)
- Cooperative Agreement for the Protection, Development and Management of Fish and Wildlife Resources at U.S. Naval Communication Area Master Station, Western Pacific (March 14, 1988)
- Cooperative Agreement for the Protection, Development and Management of Fish and Wildlife Resources at U.S. Naval Magazine, Guam (March 7, 1988)
- Cooperative Agreement for the Protection, Development and Management of Fish and Wildlife Resources at U.S. Naval Station, Guam (April 12, 1988)
- Cooperative Agreement for the Protection, Development and Management of Fish and Wildlife Resources at U.S. Navy Public Works Center, Guam (April 11, 1988)
- Cooperative Agreement for the Protection, Development and Management of Fish and Wildlife Resources at U.S. Naval Supply Depot, Guam (February 29, 1988)
- Dedication of Tinian Military Retention Area Land for Wildlife Conservation, Tinian; agreement between the U.S. Government and CNMI Government (September 23, 1999)
- Partial Release of Leasehold Interest by and between the CNMI and the United States of America (September 23, 1999)
- Programmatic Agreement Among the DoD, the Advisory Council on Historic Preservation, the Guam State Historic Preservation Officer, and the CNMI State Historic Preservation Officer Regarding the Military Relocation to the Islands of Guam and Tinian (March 9, 2011)
- Record of Decision for the Final Supplemental Environmental Impact Statement (EIS) for Guam and CNMI Military Relocation (August 28, 2015)
- Record of Decision for Guam and CNMI Military Relocation including Relocating Marines from Okinawa, Transient Nuclear Aircraft Carrier Berth, Air and Missile Defense Task Force (September 21, 2010)
- Conservation and Management of Natural Resources, 36 WGI 32-7003 (July 30, 2007)

GOVERNMENT OF GUAM LAWS, REGULATIONS, AND POLICIES FOR NATURAL RESOURCES

- An Act to Establish Rules and Regulations for the Control of Fisheries by the Department of Agriculture (April 30, 1997) (Guam Public Law 24-21)
- CNMI Guam Stormwater Management Manual (2006)
- ESA of Guam (5 GCA 63205)
- EO 78-37, *Guam Land-Use Policies* (November 15, 1978)
- Game, Forestry and Conservation (5 GCA, Chapter 63, PL 6-85)
- Guam Code Annotated (1 GCA 4002 (a) as Amended by PL 20-185)
- Guam Comprehensive Wildlife Conservation Strategy (2006)
- Guam Coral Bleaching Response Plan (2017)
- Guam Hazard Mitigation Plan (2014)
- Guam Invasive Species Council Act of 2011 (5 GCA 70101 et seq.)
- Guam Marine Biosecurity Action Plan (Miller 2014)
- Guam Soil Erosion And Sediment Control Regulations, 22 GAR, Division II, Chapter 10, § 10103.C.5(d)
- Guam Water Pollution Control Act (10 GCA 47010-47112)
- Importation: Harboring (5 GCA 63124)
- Organic Act of Guam of 1950 (48 USC 1421, et seq., 64 Stat. 384)
- Protection of Wild Animals (5 GCA 63121)
- Protection of Wild Birds (5 GCA 63120)
- Regional Biosecurity Plan (RBP) for Micronesia and Hawaii (formerly referred to as the Micronesia Biosecurity Plan) (University of Guam [UOG] and Secretariat of the Pacific Community 2014)

GOVERNMENT OF THE COMMONWEALTH OF THE NORTHERN MARIANA ISLAND LAWS, REGULATIONS, AND POLICIES FOR NATURAL RESOURCES

- CNMI Comprehensive Wildlife Conservation Strategy (2005)
- CNMI Guam Stormwater Management Manual (2006)
- CNMI Wildlife Action Plan (2015)
- Fish, Game, and ESA (PL 2-51)
- Non-commercial Fish and Wildlife Regulations (CNMI Administrative Code 85-30.1)

TABLE B-1 FORMAL, INFORMAL, TECHNICAL ASSISTANCE, AND TERMINATED CONSULTATIONS

Title of Consultation	*Year*	*Date*	*Location*	*Type*
Mariana Islands Training and Testing Program	2015	2/20/2015	JRM	Formal
Marine Corps Relocation to Guam - Reinitiation 2017	2017	7/18/2017	MCBCB	Formal
Brown Tree Snake Control in the Habitat Management Unit 20180516	2018	5/16/2018	AAFB	Formal
Marine Corps Relocation to Guam - Amendment 2018	2018	10/30/2018	MCBCB	Formal
Marine Corps Relocation to Guam - 2020 Clarification	2020	2/27/2020	MCBCB	Formal
Munitions Storage Area (MSA) Igloo	2020	6/30/2020	AAFB	Formal
Utilities and Infrastructure Area Development Plan Supporting the Terminal High-Altitude Air Defense (THAAD) System	2020	12/18/2020	AAFB	Formal
Haputo Ungulate Eradication	2022	5/6/2022	MCBCB	Formal
Removal of Ungulates from the Haputo Ecological Reserve Area	2022	5/25/2022	MCBCB	Formal
Relay Ground Station-Asia (RGS-A) Site	2022	12/11/2022	MCBCB	Formal
Firefighter Training Facility (J-008)	2023	9/14/2023	MCBCB	Formal
Construction of Ungulate Fence	2015	6/26/2015	NBG	Informal
Reinitiation Testing a Remote Video Monitoring System at Mahlac and Maemong Caves	2018	3/5/2018	NBG	Informal
Reinitiation on Testing a Remote Video Monitoring System at Mahlac and Maemong Caves	2018	3/5/2018	NBG	Informal
Tarague Triangle Fence	2019	6/25/2019	AAFB	Informal
South Parking Pad Radomes at DET2, Northwest Field	2019	10/29/2019	AAFB	Informal
Swiftlet Cave Photography	2020	7/29/2020	NMS	Informal
Air Force Space Command (AFSPC) Snorkel Radome in DET2	2020	10/30/2020	AAFB	Informal
Ungulate Control Using Air Rifle and Archery Equipment	2020	10/30/2020	AAFB	Informal
Fuel Tie In Military Construction (MILCON) P661	2020	11/19/2020	NBG	Informal
Ungulate Fence and Eradication	2021	4/23/2021	AAFB	Informal
Recreational Hunting on AAFB	2021	4/23/2021	AAFB	Informal
Tarague II Fence	2021	4/23/2021	AAFB	Informal
Construction of Ungulate Fence, Scout Beach Road to Serena Beach Road	2021	4/23/2021	AAFB	Informal
Recreational Hunting Using Archery Equipment	2021	7/8/2021	AAFB	Informal
Cultural Site Visit at Mahlac Cave	2021	7/29/2021	NBG	Informal

Title of Consultation	*Year*	*Date*	*Location*	*Type*
Tree Removal at Mahlac and Maemong Caves	2021	9/24/2021	NBG	Informal
Swiftlet Cave Vegetation Management	2021	10/12/2021	NMS	Informal
Night Work Within and Adjacent to the Munitions Storage Annex 2	2021	11/2/2021	AAFB	Informal
Water Quality Monitoring on JRM Submerged Lands Guam	2022	1/6/2022	JRM Submerged Lands Guam	Informal
Tinian Harbor Repairs	2022	1/31/2022	Tinian	Informal
Little Fire Ant Eradication, Urban Training Complex (Andersen South)	2022	3/14/2022	MCBCB	Informal
Recreational Hunting Using Archery Equipment	2022	6/22/2022	AAFB	Informal
Missile Defense Agency (MDA) Munitions and Explosives of Concern (MEC) Reconnaissance Surveys Within JRM	2022	7/8/2022	JRM	Informal
"Tarague 3" Ungulate Exclusion at Tarague Basin Conservation Area	2022	8/4/2022	AAFB	Informal
Water Quality Monitoring on JRM Submerged Lands Tinian	2022	12/8/2022	Tinian	Informal
Water Quality Monitoring on Joint Region Marianas Submerged Lands	2022	12/8/2022	Tinian	Informal
Little Fire Ant Eradication at Haputo Ecological Reserve Area	2022	12/29/2022	MCBCB	Informal
Installation Restoration Program and Munitions Response Program, Guam	2022	8/30/2022	Guam	Technical Assistance
Tinian North Field Adaptive Rehabilitation Project	2023	8/9/2023	Tinian	Technical Assistance
Establishment and Operation of an Intelligence, Surveillance, Reconnaissance, and Strike Capability Project	2020	5/8/2020	AAFB	Termination

Key: AAFB = Andersen Air Force Base; JRM = Joint Region Marianas; MCBCB = Marine Corps Base Camp Blaz; NBG = Naval Base Guam; NMS = Naval Munitions Site

Appendix C
Status of the Implementation of Past and Present Integrated Natural Resources Management Plan Actions/Projects

DEPARTMENT OF THE NAVY
JOINT REGION MARIANAS
PSC 455 BOX 211
FPO AP 96540-1000

5090
Ser J4/ 0036
4 Feb 20

From: Commander, Joint Region Marianas

Subj: FISCAL YEAR 2019 NATURAL RESOURCES/INTEGRATED NATURAL RESOURCES MANAGEMENT PLAN METRICS SUMMARY REPORT

Ref: (a) OPNAVINST 5090.1D

Encl: (1) FY 2019 Natural Resources INRMP Metrics Results
(2) JRM INRMP Summary of FY19 Projects
(3) FY 2019 Natural Resources INRMP Metrics Invitation and Attendee List

1. In accordance with reference (a), Navy installations are required to submit an annual report summarizing the recent Natural Resources/Integrated Natural Resources Management Plan (INRMP) Metrics meeting and status of the INRMP.

2. The Fiscal Year (FY) 2019 Joint Region Marianas (JRM) Natural Resources/INRMP Metrics meeting for Guam resource partners was held on October 16-17, 2019 at the Outrigger Hotel in Tumon, Guam. The JRM INRMP Metrics meeting for Commonwealth of the Northern Mariana Islands (CNMI) resource partners was held on November 7, 2019 at the Hyatt Regency in Saipan. The FY19 Natural Resources (INRMP) Metrics results and summary FY19 JRM INRMP Projects is enclosed. The JRM INRMP Summary of FY19 Projects presents outcomes and benefits of INRMP projects implemented in FY19 and their direct and indirect benefits to listed species. Also enclosed are the metrics, meeting invitations, and lists of those who participated. It should be noted that although the CNMI Metrics meeting was postponed due to inclement weather, CNMI resource partners were provided an opportunity to comment on the FY19 INRMP Metrics; however, no comments were received.

3. The Final 2019 JRM INRMP was finalized and signed by partner agencies (U.S. Fish and Wildlife Service, National Marine Fisheries Service, Guam Department of Agriculture, and CNMI Department of Land and Natural Resources –Division of Fish and Wildlife) June - August 2019. An annual update will be conducted in calendar year 2020 and a 5-year review will be conducted in 2024 per OPNAVINST 5090.1D, reference (b), sections 670a-f.

4. Thank you for your participation in our Natural Resources/INRMP Metrics meeting and for your support of the JRM Natural Resources Program. If you have any questions, please contact Jennifer Horeg, Conservation Resources Program Manager, at jennifer.horeg@fe.navy.mil or 671-339-7348.

Integrated Natural Resources Management Plan
Summary of FY2019 Projects

List of Figures vii
List of Tables xii
Acronyms and Abbreviations xiii
Terrestrial Habitat Management 1
Listed Plant and Invertebrate Surveys 1
Threatened and Endangered Species Preconstruction Surveys 6
Forest Restoration Plan Implementation – NBG 8
Ungulate Fencing – NBG 10
Firebreak Management Plan Implementation – NBG 11
Range Fire Management Plan for Marine Corps Ranges on Guam 15
Cetti Bay Watershed Terrestrial Monitoring 16
Seed Collection from *Heritiera longipetiolata* and *Tabernaemontana rotensis* 18
Forest Restoration in Area - Achae Point 19
Vegetation Restoration for the HMU 21
Maintenance of Ungulate Exclosure – AAFB 22
Northwest Field Ungulate Control Area Fencing and Eradication 23
Ungulate Fencing – AAFB 24
Ungulate Eradication and Control – AAFB 25
Salvage and Transplantation of ESA-listed Orchids – NBG TS and AAFB 27
Salvage and Transplantation of *Cycas micronesica* – NBG TS and AAFB 28
Invasive Plant Control – NBG TS and AAFB 32
North Finegayan Forest Enhancement Site Ungulate Fencing and Eradication 34
North Haputo Ecological Reserve Area Ungulate Fencing 35
Implementation Plan for Phase I of the North Finegayan Forest Enhancement Site 37

Terrestrial Exotic and Invasive Species Management 38

Developing a Framework for Coordinated Management of Vertebrate Restoration and Brown Treesnake Control on Guam 38

Review, Evaluation, and Assessment of Reintroduction Programs as Related to Reintroduction of Guam Micronesian Kingfisher on Joint Region Marianas (JRM) Lands 39

Monitoring to Evaluate Effectiveness of HACCP Plan Implementation at Construction Sites 42

Little Fire Ant (LFA), *Wasmannia auropunctata*, Surveys, Eradication, and Monitoring 43

Invasive Species Management within the Joint Region Marianas Area of Responsibility 47

BTS Control at Mariana Swiftlet Caves 49

Evaluation of Brown Treesnake control to improve management of Guam's remnant Mariana Swiftlet population 50

Feral Pig Control – NBG 51

Feral Dog and Cat Control and Management – NBG 52

Ungulate Management Population Control – NBG 53

Artificial Toxic Bait for Landscape-scale BTS Suppression – AAFB 53

Evaluating Statistical Methods for Estimating Density of Invasive Brown Treesnakes from Camera Trapping Data – AAFB 54

Long-term known fate monitoring of large snakes in conjunction with Closed Population Eradication – AAFB 56

Monitoring of Reduction in Brown Treesnake Abundance during Eradication Activities in the Habitat Management Unit and Evaluation of Alternative Ground Baits for Large Brown Treesnakes 58

Trial Eradication of BTS in the USGS Closed Population Facility (CPF) via Aerial Toxicants, Phases I and II 59

Estimation of Brown Treesnake Predation Threat Thresholds for Persistence of Reintroduced Birds on Guam – AAFB 60

Habitat Management Unit Biomonitor Support and ESA Listed Species Identification Training 61

Using BTS Behavior and Movement to Refine Control on AAFB & for Improved Management of Native Forest Birds 62

Guam Micronesian Kingfisher MOA Program and Project Execution 63

Little Fire Ant (*Wasmannia auropunctata*) Surveys, Eradication, and Monitoring – AAFB 65

Evaluate visual searching versus bait tubes and camera surveillance as a low-density monitoring tool for BTS – AAFB and Rota, CNMI 66

Multi-species Barrier Development Phase I – NBG TS 67

Mariana Islands Training & Testing Biological Opinion Terms & Conditions 1.1 Compliance – CNMI 69

Terrestrial Protected Species Management 70

Conservation Management of Listed Invertebrates 70

Biomonitor Support for Natural Resource Management at Joint Region Marianas Area of Responsibility 71

Mariana Common Moorhen Surveys, Fena Reservoir 72

Sea Turtle Nesting Beach Habitat Enhancement – NBG 73

Sea Turtle Surveys – NBG 74

Survey and Monitoring of Seagrass Bed at Dadi Beach 76

Restoration/Enhancement of Mariana Moorhen Habitat 78

Mariana Swiftlet Recovery and Habitat Use 80

Monitoring of Mariana Swiftlets 82

Sea Turtle Monitoring, Protection, and Educational Outreach – AAFB 85

Mariana Fruit Bat Monitoring – AAFB 87

Serianthes nelsonii Monitoring and Management – AAFB 89

Cycad Conservation – AAFB 91

Tracking Movement of Micronesian Starlings and BTS on Andersen Air Force Base with an Automated Telemetry Tracking Network 94

Evaluating and reducing BTS predation threat in urban Micronesian Starling Habitat – AAFB 95
Monitoring Survival and Demography of Micronesian Starlings 96
Salvage and Transplantation of *Partula radiolata* – NBG TS and AAFB 97
Native Plant Seed Collection, Salvage, Storage, and Nursery Propagation for Forest Enhancement 99
Surveys for ESA-listed Plants, Treesnails, Butterflies and Butterfly Host Plants – NBG TS and NBG 100
Comprehensive Baseline Vegetation Survey and Long Term Monitoring Plan for the Forest Enhancement Areas at Finegayan 104
Cycad Conservation – Tinian 106
Beach Cleanups at Tinian Sea Turtle Nesting Beaches 108
Concrete barrier - Sea Turtle Conservation – CNMI 110
Sea Turtle Surveys – Tinian 111
Mariana Common Moorhen Surveys – Tinian 112
Tinian Forest Bird Monitoring and Assessment 114
Monitoring for Micronesian Megapodes and Mariana Fruit Bats 115
Migratory Bird Management 117
Migratory Bird Surveys – NBG 117
Monitoring of MBTA-Listed Bird Species – FDM 118
Terrestrial Natural Resources Educational Outreach 119
Biosecurity Outreach and Education on Guam 119
Outreach and Education – NBG 120
Terrestrial Geographic Information Systems (GIS) and Data Management 122
Digital Orthography Lidar and Planimetric Data – CNMI 122
Marine Habitat Management 123
Water Quality Monitoring on Joint Region Marianas Submerged Lands – NBG 123
Evaluate Mangrove Functionality in the Atantano Watershed 126
Coral Protection and Mooring Buoy Installation - NBG 128

FDM Fish Video Analyses – FDM 132
Marine Protected Species Management 135
Detection of Scalloped Hammerhead Sharks in Apra Harbor and Adjacent Nearshore Waters using Environmental DNA (eDNA) 137
Sea Turtle Aerial Surveys in FDM Nearshore Waters 140

Terrestrial Habitat Management

Listed Plant and Invertebrate Surveys

Location: JRM **Period of Performance:** SEPT2014 – SEPT2019

Project Objective

This purpose of this project is to conduct plant surveys and to implement management techniques to provide a conservation benefit to federally-listed threatened and endangered species under the Endangered Species Act (ESA).

Conservation Benefit

Identifying locations of ESA-listed plant and invertebrate species will allow for management actions to reduce habitat fragmentation, enhance and restore habitat, buffer protected areas, and implement new conservation strategies.

FY19 Status

- FY19 surveys were focused on NMS and Andersen Air Force Base (AAFB). This period of performance for this cooperative agreement ended September 2019.
- Transect surveys (5-10 m) for listed plants were conducted over 919 acres in NMS. Plants found are listed in Table 1 and depicted on Figure 1.
- In February 2019, plant surveys were conducted on AAFB in specified areas (Fig 2-4). Surveys were conducted at Northwest Field, Red Horse quarry, Tarague. Results are listed in Table 2.
- A new cooperative agreement was awarded through the Cooperative Ecosystem Studies Units (CESU) Network to University of Guam (UOG) in August of 2019 through August 2020 to conduct surveys for plant and invertebrate surveys on all JRM lands and other lands on Guam and the Commonwealth of the Northern Mariana Islands (CNMI).

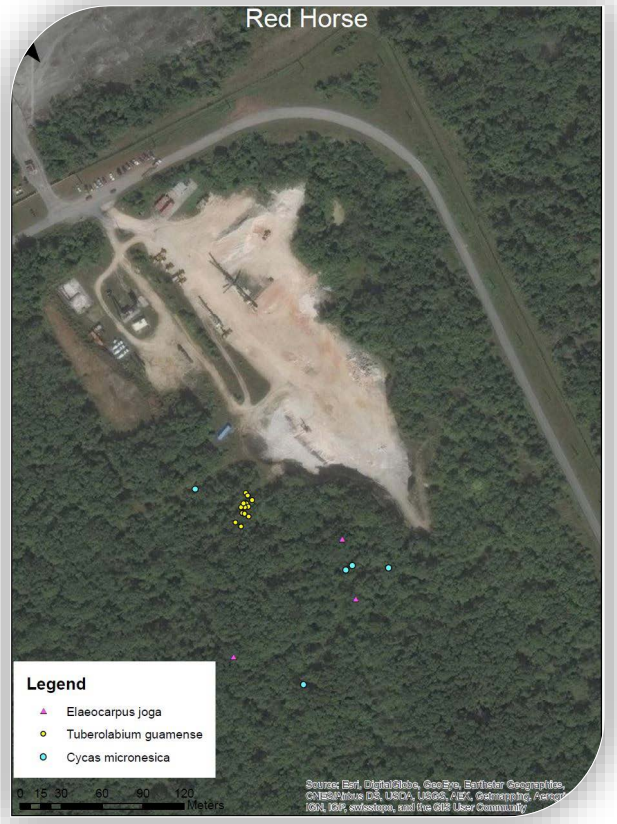

Figure 4. ESA-listed plants found behind the Red Horse quarry, AAFB.

Threatened and Endangered Species Preconstruction Surveys

Location: JRM **Period of Performance:** N/A

Project Objective

Conduct preconstruction surveys prior to vegetation clearing and grubbing for construction and design related activities.

Conservation Benefit

To minimize impacts to specific listed species due to construction and design related activities.

FY19 Status

- Preconstruction fruit bat surveys ongoing for the following construction projects: J-001B, P-102, P-103, P250/P260, and P-715 (Figure 5).
- Preconstruction fruit bat surveys conducted for design-related project P-735.
- Preconstruction ESA listed snail surveys ongoing for J-755.
- Preconstruction ESA listed species surveys completed for J-001B, J-006, J-007, J-755 (except snails), P-102, P-103, P-290, P-295, P-296, P-608, P-715, P-735, P-103, and Haputo fence line.
- Preconstruction ESA listed species survey completed for J-001B Forest Enhancement Fence Phase I.

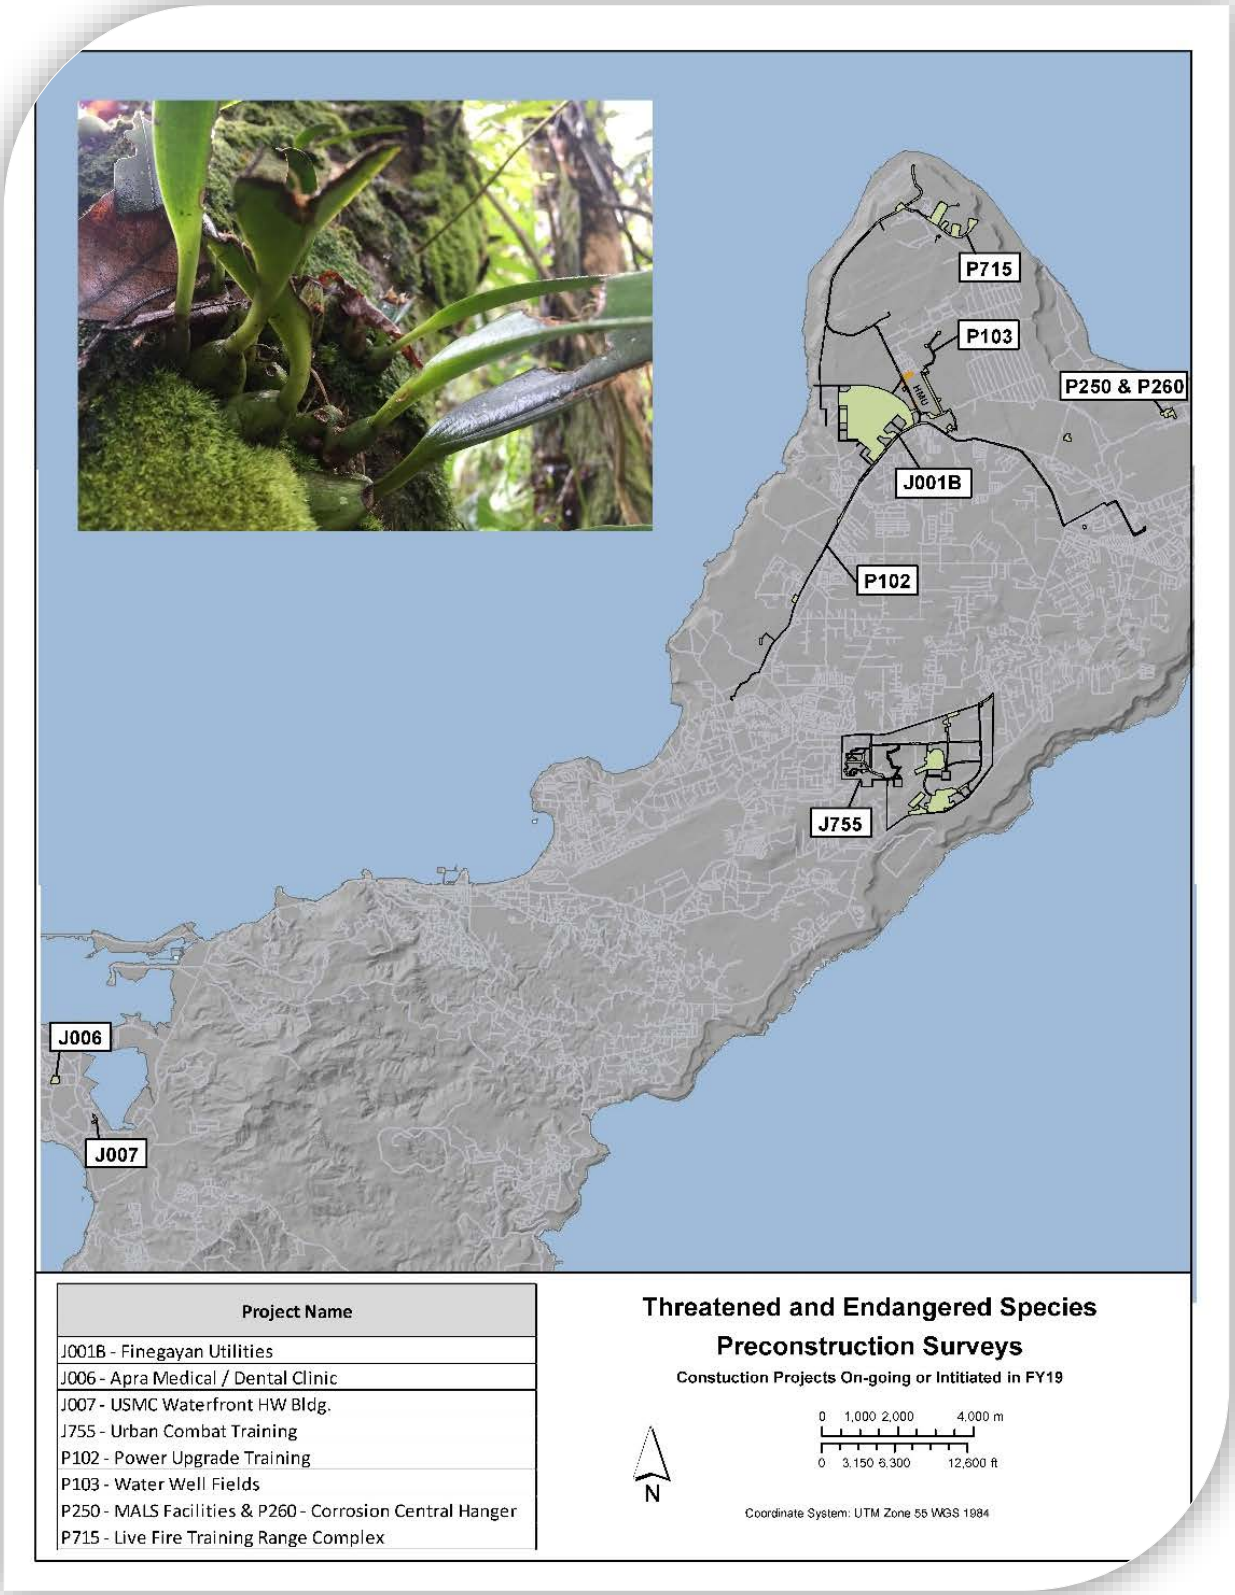

Figure 5: Map of threatened and endangered species preconstruction surveys and consolidated project locations.

Forest Restoration Plan Implementation – NBG

Location: NMS **Period of Performance:** SEP2017 – DEC2019

Project Objective

- Restore native forest ecosystems within fenced areas where feral pigs, deer and carabao have been removed on the NMS.
- Propagate and plant and/or use direct seed techniques for reforestation following the recommendations of the Naval Base Guam (NBG) Forest Restoration Plan and the Conceptual Limestone Forest Restoration and Enhancement Plan (NAVFAC PAC 2018).
- Manage new plantings for a minimum of three years to ensure establishment.

Conservation Benefit

Increasing native forest habitats would improve species survival, particularly threatened and endangered species enhance native habitat for listed animals, increase the biodiversity of native species, and contributes to the connectivity with surrounding communities in ways that support improved ecosystem functionality. It also contributes to the goals of the Guam NWR as an overlay unit the NMS.

FY19 Status

- Twenty research plots have been established in the NMS. Ten of the plots are within an ungulate exclosure area (Labeled 1 in Figure 6). Ten of the plots are in a control area where ungulates have access to them for comparison.
- Ground vegetation and tree surveys have taken place in all plots to set the baseline.
- Vitex trees (*Vitex parviflora*), which are the most common aggressive invasive tree in the research area will be removed in the dry season of 2020.
- Removal of vitex trees are pending finalization of Section 7 consultation with USFWS.

EPR: 1 CP MAR NBG Native Forest Habitat Restoration; 61755NR856

2019 JRM INRMP Reference: THM-2; 6-39

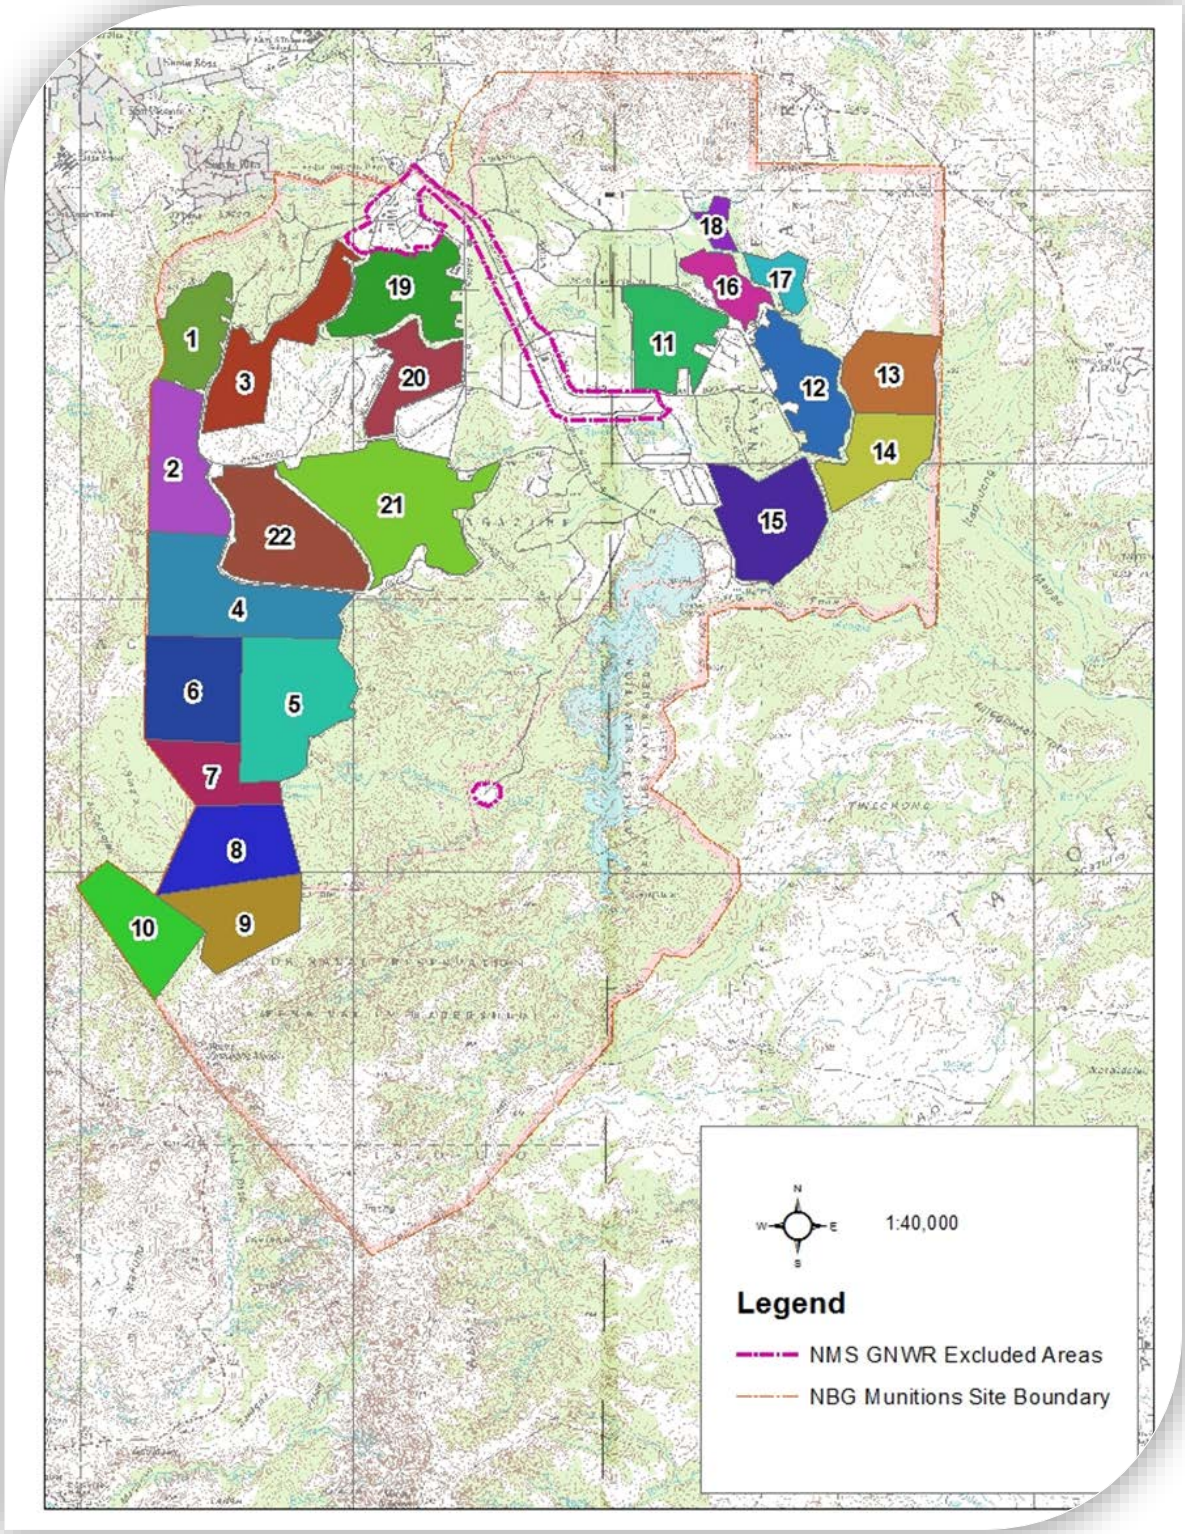

Figure 6: Map depicting location of the fenced and proposed fenced units within NMS. The Plots within the fenced area are located in Site 1.

Ungulate Fencing – NBG

Location: NMS **Period of Performance:** OCT2016 – MAR2020

Project Objective

Construction and maintenance of ungulate fencing on the Naval Munitions Site (NMS) to facilitate eradication of feral pigs, Philippine deer, and carabao and to prevent immigration into the fenced areas. The objective is to fence off native limestone forest on NMS and eradicate ungulates inside the fenced areas (Figure 7).

Conservation Benefit

Will allow native forest regeneration and recovery.

FY 19 Status

- Contract awarded to Sundance EA Inc. in FY2018 to construct second fence.
- An 80-acre fence (#1 in Figure 7) was constructed Jun 2017-February 2018.
- Construction of a second fence (#2 in Figure 7) began in August 2019 and is expected to be completed in October 2019.

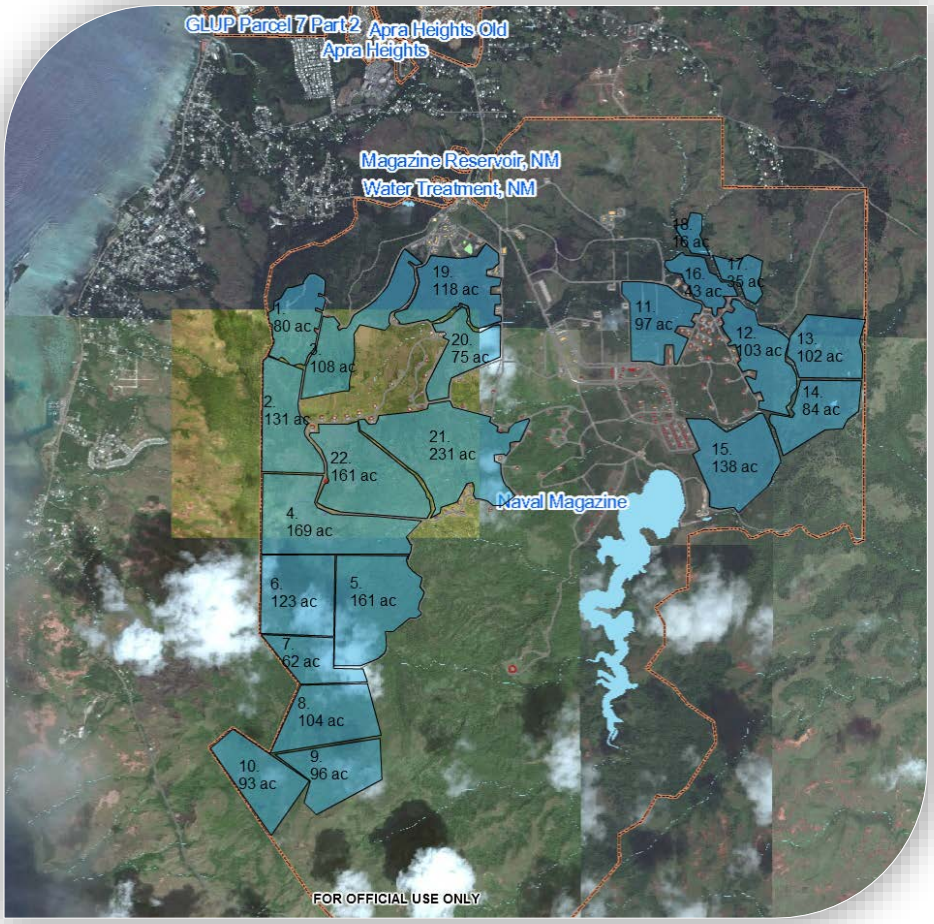

Figure 7. Map depicting areas that may be fenced on NMS. The section labeled "1. 80 ac." was fenced in FY18.

EPR: 1 RP MAR NBG Ungulate Fencing; 61755NR894

2019 JRM INRMP Reference: THM-2; 6-39

Firebreak Management Plan Implementation – NBG

Location: NMS **Period of Performance** AUG2018 – AUG2020

Project Objective

To implement the NBG Wildland Fire Management Plan. Specifically, to treat problem fuels (e.g. swordgrass (*Miscanthus floridulus*)) in strategic locations to disrupt the spread of wildland fires in savannah/ grasslands on NBG land.

The long-term goal is to have less flammable vegetation to allow uninterrupted land use that meets the military mission requirements. This project will implement specific management actions for Fire Management by planting and/or direct seeding of trees to create shaded fuel breaks and annual management of forested fuel breaks by mowing and chemical treatments of high-fuel load grasses.

Areas in Sasa Valley have previously been planted with acacia trees. Those areas will be under-planted with native species which will eventually replace the acacia.

Conservation Benefit: Protect native ecosystems that might otherwise be susceptible to wildfire damage. Protect against soil erosion which causes further damage. Over time the project will protect natural resources and listed species by reducing soil erosion which causes siltation of Guam's coral reefs.

FY19 Status

- This project was awarded as a contract in October 2018.
- The first round of tree planting has taken place in both the NMS and in Sasa Valley.
- A second round of planting will take place during the rainy season in 2020.
- The firebreak plantings will be completed in two separate areas. One planting is taking place in the Naval Magazine site along Firebreak 3, the other area is in the Sasa Valley Fuel Farm. The plantings are structured so that low lying vegetation such as *Scaevola sericea*, which is a shrub will be planted closest to any roadways or firelanes, followed by a medium height tree *Hibiscus tiliaceus*, the third tier will be native trees from the list above which will be planted behind the hibiscus.
- Tree plantings in Sasa Valley will take place in areas that were previously planted with acacia. The acacia will be thinned slightly, such that some trees will be removed to increase light infiltration. Eventually all acacia will be removed and

native species will be planted (Table 3). The areas to be planted are shown in Figures 8 and 9.

EPR: 1 RP MAR NBG Wildland Fire Management Plan (2015) Implementation through Habitat Management; 61755NR857

2019 JRM INRMP Reference: THM-3; 6-41

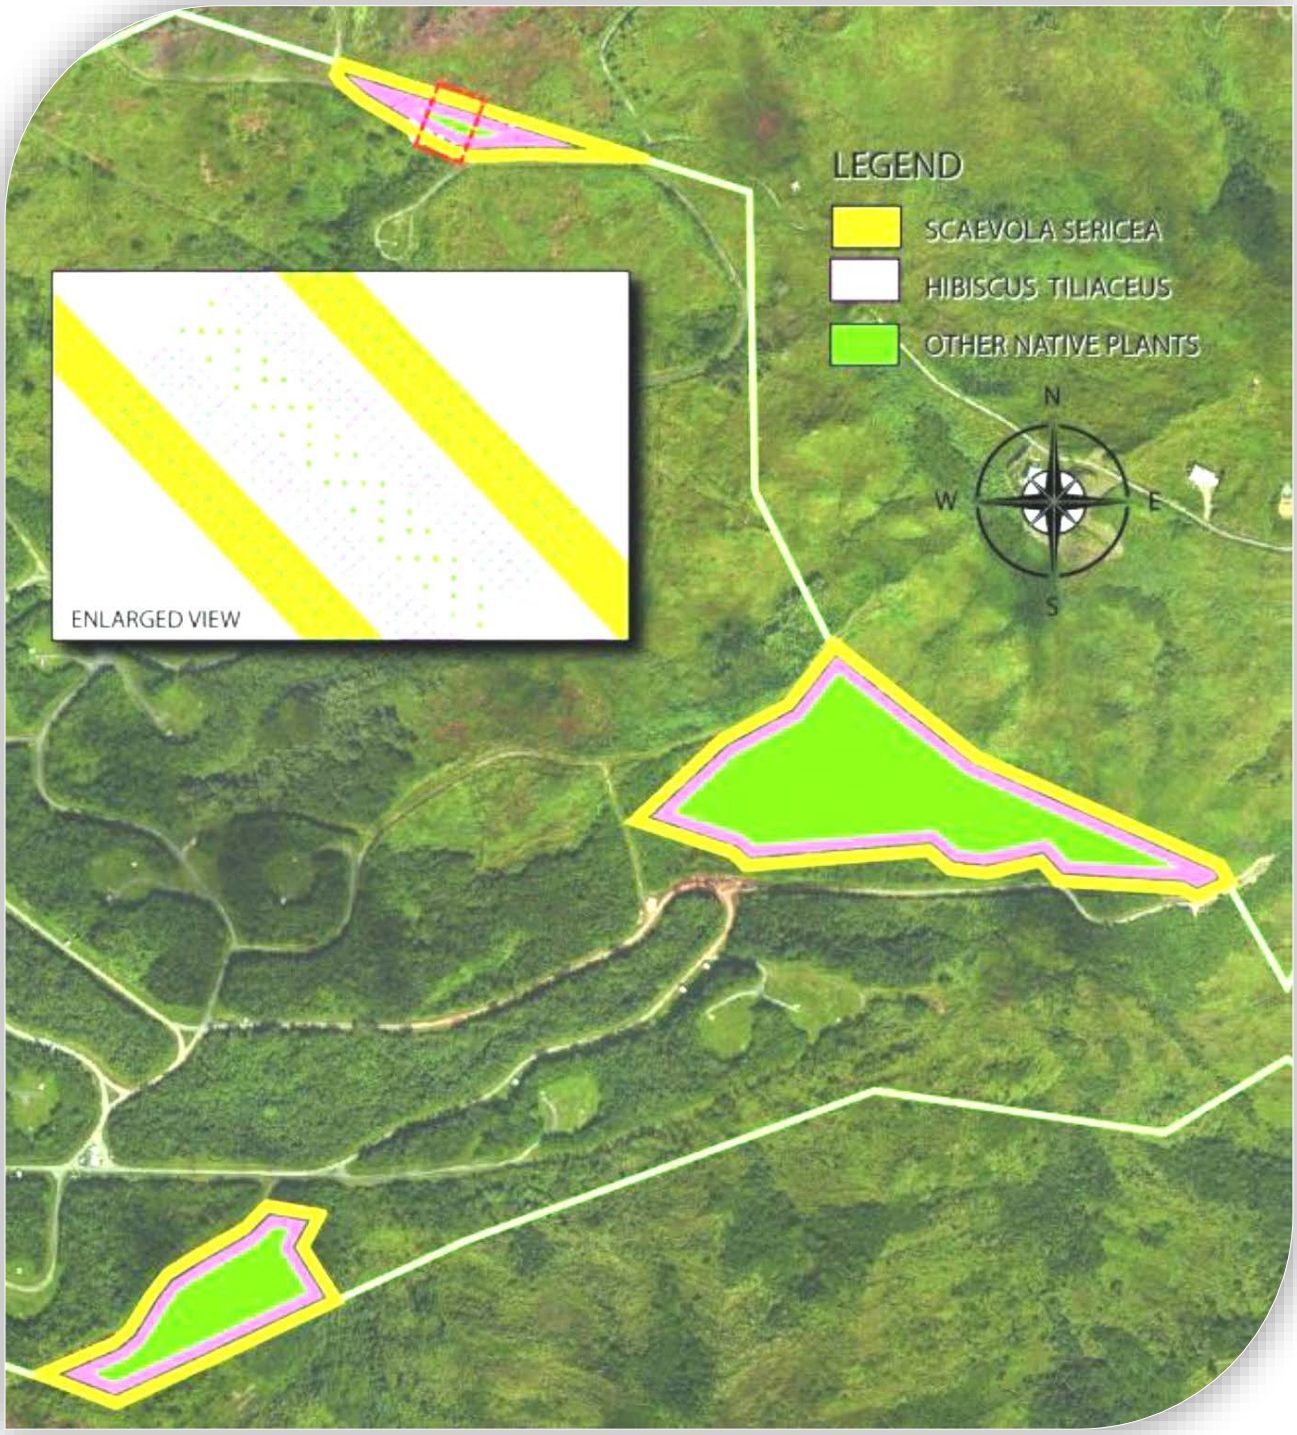

Figure 9. Map depicting areas within Sasa Valley that will be planted in native trees as a firebreak.

Range Fire Management Plan for Marine Corps Ranges on Guam

Location: NWF, AAFB **Period of Performance:** SEP2017 - SEP2020

Project Objective

The overall objective is to create a Range Fire Management Plan (RFMP) to reduce range wildfire potential, protect and enhance valuable natural and cultural resources, integrate applicable state and local permit and reporting requirements, and implement ecosystem management goals, sustainable training, and objectives already supported on existing Marine Corps installations.

The RFMP shall focus on the areas that will encompass and surround the Marine Corps ranges at Northwest Field and Anderson South.

Conservation Benefit

Provide plan to reduce the effects of fires by limiting their frequency, size, and severity to avoid or minimize impacts to listed species or recovery habitat while still allowing the USMC to maintain a high level of combat readiness.

FY19 Status

- Draft Guam fire management plan submittal reviewed by the government. Comments discussed with cooperator and revised draft is anticipated by end of October 2019.
- After resolution of comments, final draft will be submitted to USFWS for a 30-day review.

EPR: DPRI: Marine Corps Relocation 2017/2018 amendment to 2015 BO, Conservation Measures to Minimize the Effects of Fire.

Cetti Bay Watershed Terrestrial Monitoring

Location: Cetti Bay Watershed **Period of Performance:** SEP2017 - MAR2020

Project Objective

MILCON P-502 required compensatory mitigation for the unavoidable loss of coral reef functions and values for the construction of the Kilo Wharf expansion site at Naval Base Guam. The Cetti Bay reforestation project was negotiated as the compensatory mitigation for P-502. Roughly 300 acres were planted with Acacia trees for erosion and sediment load control. The plantings took place each year starting in 2007 and continuing until 2016 (Figure 10). The acacia trees at Cetti are at various stages of growth. This project is monitoring tree survivorship, erosion control and sediment loads in the reforestation site.

Fires have occurred annually in Cetti Bay throughout the lifetime of this project, the effects of which is reducing ground cover plants that normally control soil erosion, increasing deposition of eroded soil into Cetti Bay which harms corals, and threatening the survival of newly planted acacia trees which are more vulnerable when they are small in trunk diameter.

The project objective is to gage the efficacy of the acacia plantings in reducing the effects of fires in Cetti Bay and reducing the amount of soil that settles into Cetti Bay. The measures involved in addressing the project objective include survival and growth rates of the acacia trees, tree survival rates after a fire, and the amount of sediment reaching the bay from the two rivers that drain the Cetti watershed into the Bay.

Conservation Benefit

The project will establish how effective the acacia tree plantings are in improving Cetti Bay aquatic resources, given the environment and site history of annual fires.

FY 2019 Status

- Awarded as a cooperative agreement through the CESU network to UOG in September of 2017.
- Establish Trimble data library so that information can be directly downloaded into Navy GeoReadiness maps.
- 30 plots were selected for monitoring within the forested area.

- All 30 plots have been monitored. Data was collected on tree survivorship and growth. Vegetation structure was also recorded. Data collection is complete, but not yet submitted. Total amount of acres planted will also be tabulated.
- Turbidity probes were installed. One probe went into the watershed and two probes went into the bay. These probes will provide the baseline data set for runoff conditions before the trees have had a chance to mature (Figure 11).
- 2018 and 2019 fires within the restored/monitored area were recorded, tree survivorship in relation to size in burned areas was recorded.
- Turbidity data shows an average turbidity during the rainy season as 22 NTU (nephelometric turbidity units). Nephelometric is an instrument for measuring the concentration of suspended particulates in a liquid. This NTU results will be used as a baseline against future results.
- Tree growth data was collected to be used as a baseline for tree growth rate over time.
- Trees have an 80% survival rate in unburned areas.
- In burned areas from 2018 all trees with a diameter over one inch survived. Among trees with a diameter less than one inch only 50% of trees survived the fires.

Seed Collection from *Heritiera longipetiolata* and *Tabernaemontana rotensis*

Location: AAFB **Period of Performance:** OCT2018 - OCT2021

Project Objective

To collect seeds from federally endangered *Heritiera longipetiolata* and threatened *Tabernaemontana rotensis* identified within construction footprints associated with the Marine Corps Relocation.

Conservation Benefit

To minimize impacts of military construction activities to native ecosystems by collecting seeds from as many mature individuals as possible to preserve the genetic diversity of the species.

FY19 Status

- One (1) *Heritiera longipetiolata* is located within project footprints. It is a mature, seed-producing adult, and seeds have been collected from it.
- 214 *Tabernaemontana rotensis* are located within project footprints.

- Approximately 2/3 of the trees are mature and have the potential to seed.
- To date, approximately 25 individuals have produced seeds during the collection time (seeds collected from the ground are assigned to the nearest seed-producing tree, so an exact number cannot be determined).

EPR: DPRI: Marine Corps Relocation 2017/2018 amendment to 2015 BO, Conservation Measures to Contribute to the Recovery of Listed Species.

2019 JRM INRMP Reference: THM-3; 8-49

Forest Restoration in Area - Achae Point

Location: AAFB **Period of Performance:** SEP2017 – SEP2019

Project Objective

Restore native vegetation as a component to limestone forest rehabilitation and enhancement.

Background

The Achae Point Reforestation Project at Ritidian Point was started as collaborative effort between the AAFB and the US Fish and Wildlife Service (USFWS), Guam National Wildlife Refuge (GNWR). This Reforestation project was a multi-year project that included 1) constructing an ungulate proof fence, 2) collecting and growing native plant seeds, and 3) planting native trees important for endangered species recovery, specifically the Mariana fruit bat. In 2011, a chain link fence was constructed around a 1.5 acre Installation Restoration Program (IRP) site to exclude deer and feral pigs (Figure 12). Native tree seedlings were outplanted in November 2013, with a final count of 1,086 native trees outplanted in April of 2014.

In June of 2016 a brush fire occurred in and around the reforestation site and destroyed numerous trees within approximately one acre of the fenced area. An additional 860 native plants were planted in September 2016 within the fenced area in open burned areas.

Conservation Benefit

Enhance and restore habitats, reduce habitat fragmentation, increase populations of native species, and buffer protected areas.

FY19 Status

- A contract was awarded in 2017 to maintain the trees, weed, fertilize, and maintain the grass-free buffer around the fence line.
- A total of 75 native trees were outplanted in the summer of 2019. Currently there are 782 native plants within the site.
- A draft final report was submitted and will be finalized at the end of September.
- The maintenance of the Achae Point reforestation area was awarded to UOG as a Cooperative Agreement through the CESU network was awarded.
- In October 2019 management of the area will be turned over to UOG, Guam Plant Extinction Prevention Program (GPEPP) to include planting and maintaining listed plant species such as *Serianthes nelsonii* and *Heritiera longipetiolata*.

Figure 12. Location of the Achae Reforestation Site on Route 3A.

Vegetation Restoration for the HMU

Location: AAFB **Period of Performance:** AUG2016 – DEC2019

Project Objective
Implement vegetation restoration within the Habitat Management Unit (HMU) utilizing the 2017 HMU Vegetation Restoration Plan.

Conservation Benefit
Enhance and restore habitat and maintain or increase populations of threatened and endangered species, including those extirpated from Guam and potentially reintroduced within the HMU.

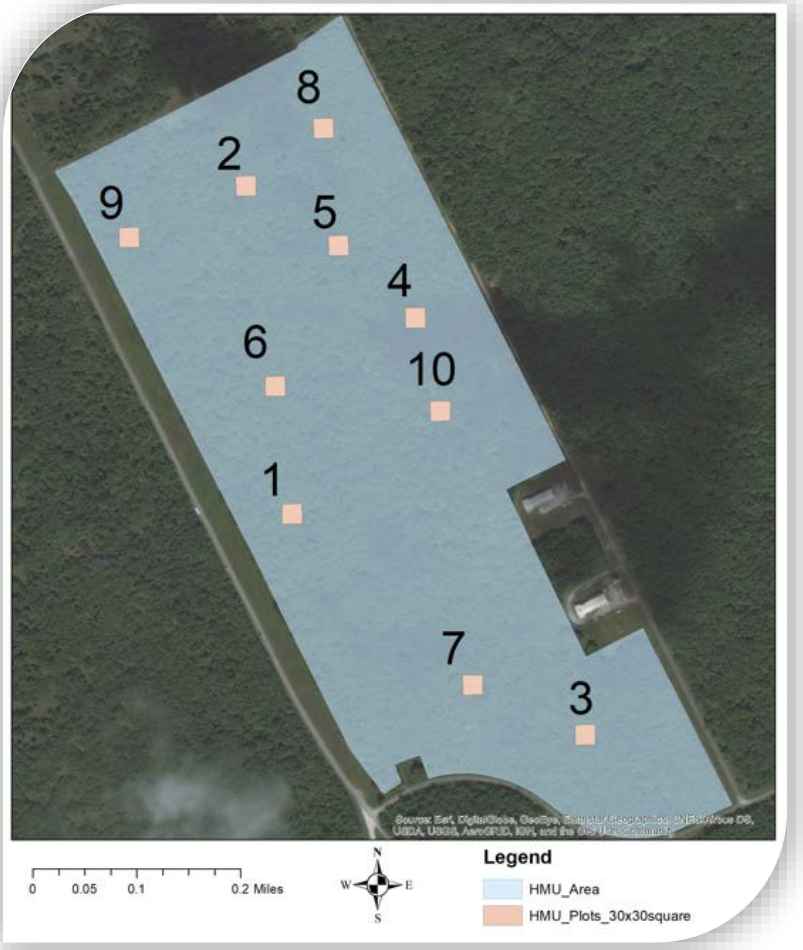

Figure 13. Proposed locations of experimental plots in the HMU.

FY19 Status

- Ten plots were established, including five (5) experimental and five (5) control plots, per the HMU Management Plan (Figure 13). Evaluation of plot size indicated 30 x 30 m plots needed (vs 50 x50 m plots).
- Mapping of vegetation within plots completed. Mapping of edge vegetation initiated.
- Greenhouse was established and native plants for restoration are growing in the greenhouse.
- Treatment of *Vitex parviflora* pending Section 7 consultation with USFWS.

EPR: 1 CR MAR AFB Native Forest Habitat Restoration; M5240NR067

2019 JRM INRMP Reference: THM-1; 9-68

Maintenance of Ungulate Exclosure – AAFB

Location: AAFB **Period of Performance:** OCT2018 – SEP2019

Project Objective

Annual fence line maintenance and repairs to maintain the efficacy of AAFB ungulate-free exclosures. This project includes 1) monthly inspections, which involves walking the fence-line encompassing multiple ungulate exclosures and conducting any repairs and 2) cutting and trimming the vegetation within 3 feet of each side of the fence monthly to reduce any damage to the fence.

Conservation Benefit

The routine maintenance and repair of ungulate exclosures will enhance the longevity of the ungulate barrier. Regular fence monitoring and repair also has the benefit of early detection to any possible immigration of ungulate into fenced eradicated areas. Monitoring, maintenance and repair all support the purpose of facilitating ungulate-free areas to enhance native forest ecosystem regeneration.

FY19 Status

- No new fences were constructed in FY19. The existing fence at Ritidian was removed/reconfigured under Live Fire Training Range Complex (LFTRC) requirements.
- "Tarague Triangle" ungulate exclosure was awarded in September 2019.

EPR: 2 BO MAR AAFB Maintenance of Ungulate Exclosure; M5240NR045

2019 JRM INRMP Reference: THM-1; 9-68

Northwest Field Ungulate Control Area Fencing and Eradication

Location: AAFB **Period of Performance:** SEP2019 – JUL2021

Project Objective

The project will install ungulate-proof fencing around the limestone plateau in the vicinity of the Live Fire Training Range Complex.

Conservation Benefit

Feral pigs and deer are among the most significant threats to sensitive limestone forests; ungulate removal will promote growth of native species and increased survival of threatened and endangered species.

FY19 Status

- Installation approval and cultural resource consultation completed in 2019.
- The Northwest Field exclosure (Figure 14) will be completed by July 2021.
- The contract for ungulate eradication for the Northwest Field (NWF) ungulate control area is expected to be awarded in FY21.

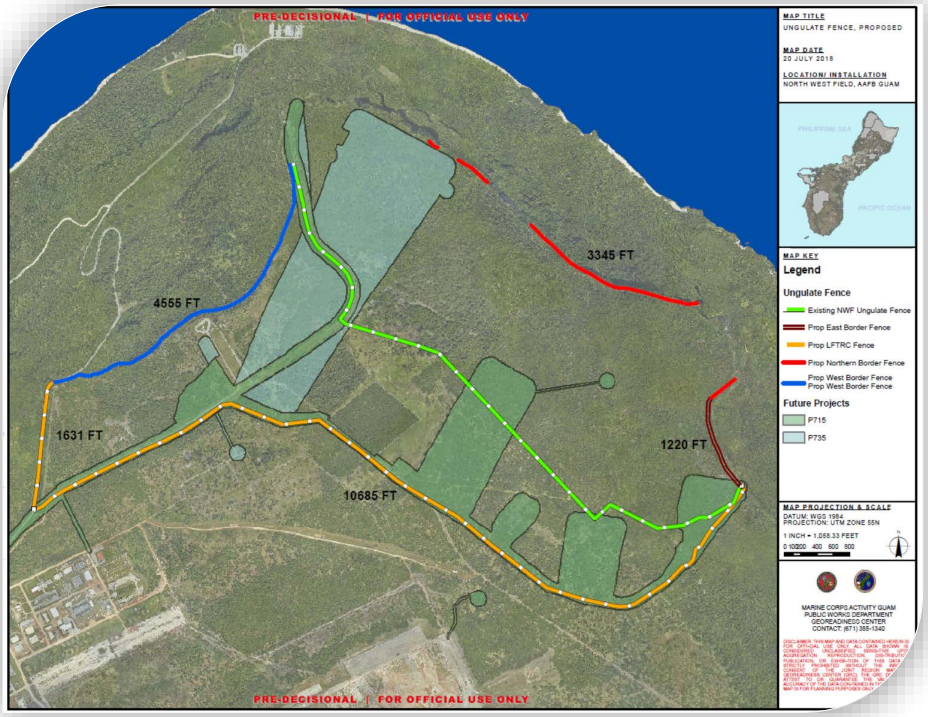

Figure 14. Location of Ungulate Exclusion Fence (Yellow/Blue/Red) Targeted for ungulate eradication at future USMC LFTRC at NWF, AAFB (Gaps are Sheer Cliff Areas).

2019 JRM INRMP Reference:

THM-1; 9-68

Ungulate Fencing – AAFB

Location: AAFB **Period of Performance:** OCT2018 – SEP2019

Project Objective

Construct ungulate fencing on AAFB to facilitate eradication of feral pigs and Philippine deer as well as prevent immigration of ungulates within fenced areas.

Conservation Benefit

Supports ungulate eradication goals within fenced areas of AAFB (Figure 15). Ungulate eradication facilitates the revitalization of native habitat that supports viable populations of native species, increases the biodiversity of native species, and contributes to the connectivity with surrounding communities in ways that support improved ecosystem functionality. Contributes to the goals of the Guam NWR as an overlay unit on AAFB.

FY19 Status

- Informal Section 7 Consultation for "Tarague Triangle" area was completed in May 2019.
- Tarague Triangle fence contract awarded in September 2019. Tarague Triangle ungulate fence will fence approximately 80 Acres within Tarague Basin of AAFB (Figure 19).

EPR: 1 RP MAR AAFB Ungulate Fencing; M5240NR043

2019 JRM INRMP Reference: THM-1; 9-68

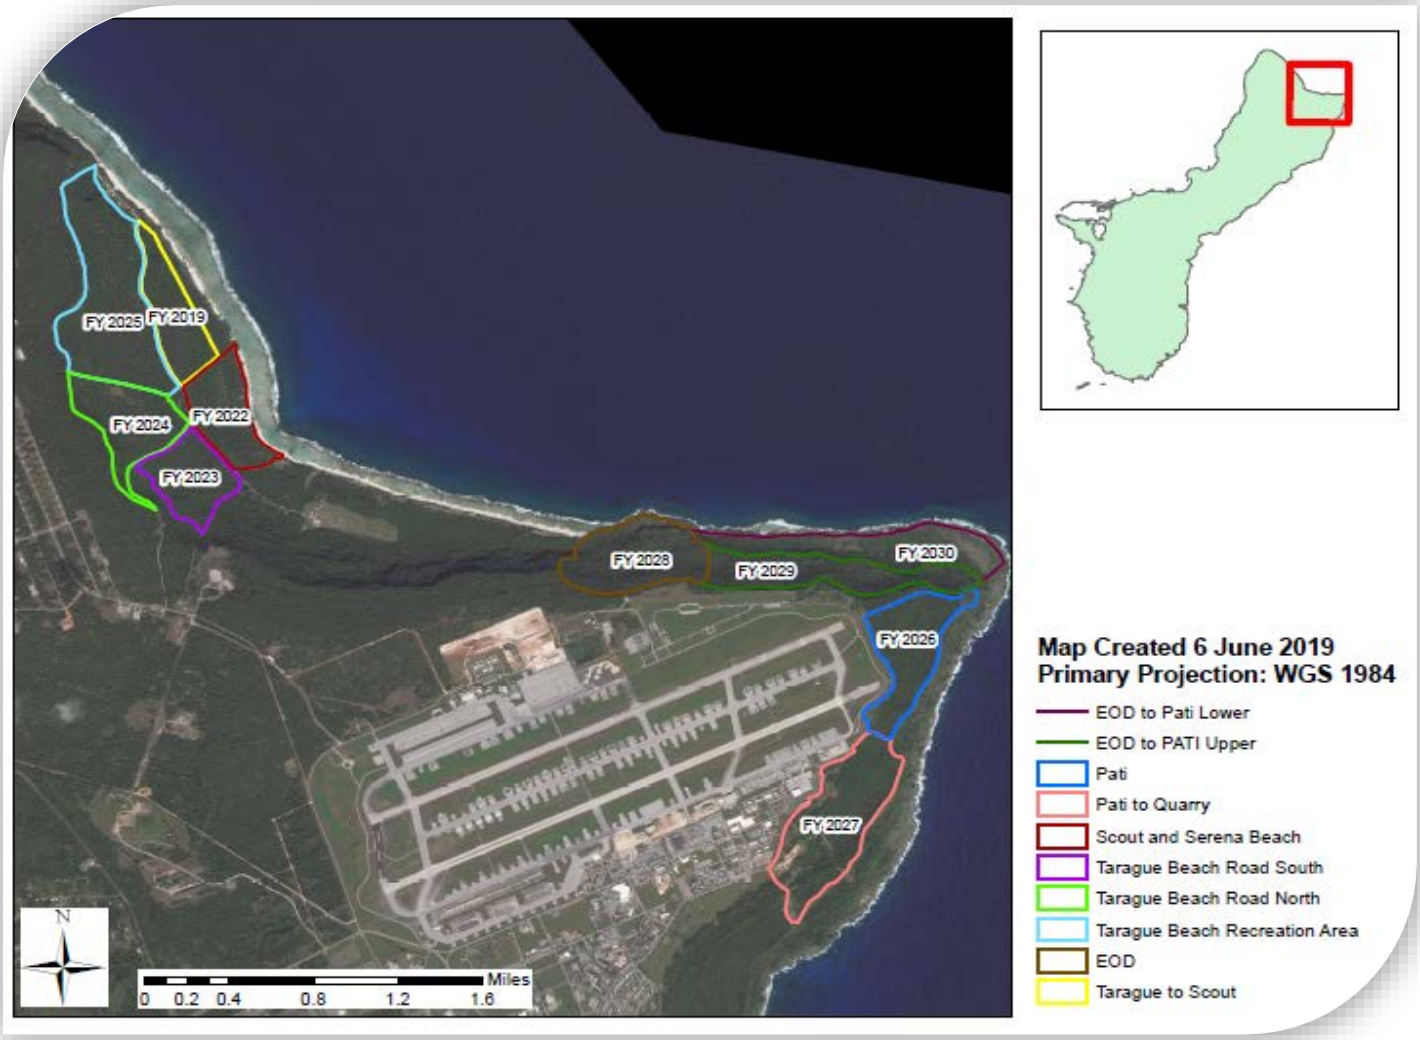

Figure 15. Map depicting areas of anticipated ungulate fencing at AAFB.

Ungulate Eradication and Control – AAFB

Location: AAFB **Period of Performance:** SEP2018 – SEP2019

Project Objective

Removal of feral pigs and Philippine deer from AAFB to protect and enhance native species and associated habitat.

Conservation Benefit

Enhance and restore habitats to increase populations of native species, particularly threatened and endangered species, as well as promote biodiversity of native plants.

Reduce ground disturbance from ungulates to improve soil stabilization, and reduce suitability of invasive plant species.

FY19 Status

- Coordinated with AAFB Volunteer Conservation Officer Program. As of September 2019 a total of 288 deer and 41 pigs were removed from AAFB (Figure 16).
- A Cooperative Agreement was awarded to White Buffalo Inc. in September 2019 for the collaring and tracking of 18 ungulates (9 deer, 9 pigs) on AAFB.
    - Data collected will be used to conduct spatial analysis for home range, pathways, and habitat selection and use, increasing effectiveness and efficiency of future ungulate control activities.
- Conducted 73 depredation events to support conservation as well as human health and safety on AAFB.
- Completed revisions to the AAFB Depredation SOP

EPR: 1 CP MAR AAFB Ungulate Eradication and Control; M5240NR069

Salvage and Transplantation of ESA-listed Orchids – NBG TS and AAFB

Location: NBG TS; AAFB **Period of Performance:** 2017 - 2021

Project Objective

To salvage and transplant federally threatened *Bulbophyllum guamense*, *Dendrobium guamense*, and *Tuberolabium guamense* identified within construction footprints associated with the Guam Relocation.

Conservation Benefit

To minimize impacts of military construction activities to native ecosystems by salvaging as many healthy individuals as possible and preserving the genetic diversity of each species.

FY19 Status

- *Bulbophyllum guamense*
  - 71 individuals have been identified, salvaged, and transplanted to the Forest Enhancement Area from project footprints on Finegayan.
  - 71 individuals survived at least 1 year after transplantation.
  - One individual was identified in AAFB in July 2019. It was salvaged and translocated to the Government nursery in September 2019.
- *Dendrobium guamense*
  - 21 individuals have been identified, salvaged, and transplanted to the Forest Enhancement Area from project footprints on Finegayan and Andersen South since 2017.
  - 18 individuals survived at least 1 year after transplantation.
- *Tuberolabium guamense*
  - 15,385 individuals have been identified in NBG Telecommunications Site and throughout AAFB since 2017.
  - 6,357 individuals have been salvaged and transplanted to the Forest Enhancement Area (Figure 17).

  - 4,826 individuals survived at least 1 year after transplantation.
- Survival criteria:
  - 2017 through 2019: New root growth
  - 2019 and all future projects: New root growth and root attachment to the new host tree

EPR: DPRI: Marine Corps Relocation 2017/2018 amendment to 2015 BO, Conservation Measures to Contribute to the Recovery of Listed Species.

Salvage and Transplantation of *Cycas micronesica* – NBG TS and AAFB

Location: NBG TS; AAFB **Period of Performance:** JUL2017 - JUL2021

Project Objective

To salvage and transplant federally threatened *Cycas micronesica* identified within construction footprints associated with the Guam Relocation.

Conservation Benefit

To minimize impacts of military construction activities to native ecosystems by salvaging as many healthy individuals as possible and preserving the genetic diversity of the species.

FY19 Status

- NBG Telecommunications Site
  - Cycads salvage was completed on 03 October 2018
  - Eight (8) cycads were identified within the construction area, but only six

(6) were considered healthy enough to potentially survive transplantation (Figure 20).
    - Six adult cycads were salvaged and transplanted to an area of the Forest Enhancement Area. Salvage and transplantation was completed on 03 October 2018. The cycads received maintenance and monitoring for 1 year until 03 October 2019.
    - Four (4) of the six are alive
        - Three are healthy
        - One has scale, but it is being treated with BioAdvance and is expected to survive. This individual is three trunks grafted together and actually produced a cone.
    - One of the six is confirmed dead.
    - One of the six is in very poor health and is not expected to survive despite efforts to fight off pests.
- Northwest Field, AAFB
    - Pup salvage was completed on 01 August 2019. 1,411 pups were salvaged (Figure 18).
    - Direct salvage and outplanting of 28 cycad trees is scheduled to occur place between 23 and 27 September 2019.
- Munitions Storage Area (MSA), AAFB
    - Five cycads were identified within the construction area, viability assessment pending.
    - A work plan to salvage the cycads is currently being drafted.
    - Pups and/or stem cuttings will be salvaged from viable cycads as soon as a work plan is approved. Pups and/or stem cuttings will receive maintenance and monitoring in a Government-approved nursery before being outplanted into the Forest Enhancement Area.
- Andersen South, AAFB
    - 27 cycads were identified within the construction area, but only eight were considered healthy enough to potentially survive transplantation.
    - Pups and stem cuttings were salvaged from eight cycads and transplanted to pots within a Government-approved nursery in September 2019 (Figure 19). Pups and/or stem cuttings will receive maintenance and monitoring in a Government-approved nursery before being outplanted into the Forest Enhancement Area.

Invasive Plant Control – NBG TS and AAFB

Location: NBG TS; AAFB **Period of Performance:** OCT2019 – OCT2020

Project Objective

This project intends to eradicate limited infestations of *Antigonon leptopus* and *Mimosa diplotricha* in the North Finegayan and Finegayan Forest Enhancement Sites.

Conservation Benefit

Invasive plants can outcompete native vegetation and interfere with restoration efforts for threatened and endangered species. Removal of invasive plants, particularly in new or smaller infestations where it may be possible to eradicate the invasive species from sensitive areas, will improve survivorship and growth of native plant species during future restoration efforts.

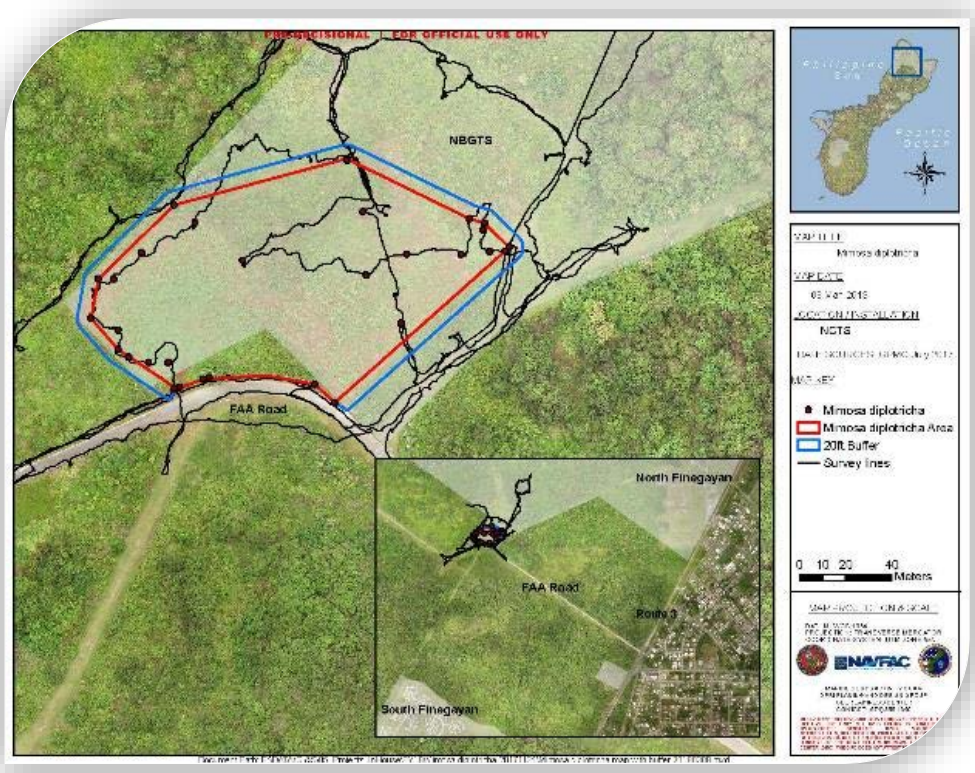

Figure 21. *Mimosa diplotricha* infestation site.

FY19 Status

- A request for proposal for this project was issued in September 2019. An award is expected in the first quarter of FY2020.

North Finegayan Forest Enhancement Site Ungulate Fencing and Eradication

Location: NBG TS; AAFB **Period of Performance:** SEP2019 – SEP2020

Project Objective

The project will install ungulate-proof fencing around the North Finegayan Forest Enhancement Site (NFFES) in 2 phases: the 407-acre Phase 1 and 272-acres in Phase 2.

Conservation Benefit

Feral pigs and deer are among the most significant threats to sensitive limestone forests; ungulate removal will promote growth of native species and increased survival of threatened and endangered species.

FY19 Status

- The North Finegayan FES Phase 1 exclosure (Figure 23) will be completed by October 2019.
- The contract for ungulate eradication in Phase 1 is expected to be awarded in the first quarter of FY20.
- The North Finegayan FES Phase 2 fencing project has been awarded and will begin in November 2019. Ungulate eradication timeline will depend on the duration of fence installation.

Figure 24. Location of Targeted Ungulate Eradication Areas of the North Finegayan Forest Enhancement Site.

North Haputo Ecological Reserve Area Ungulate Fencing

Location: NBG TS **Period of Performance:** AUG2019 – FEB2021

Project Objective

Approximately 165 acres of the Haputo Ecological Reserve Area (ERA) will be fenced to exclude deer and pigs that are damaging sensitive limestone forest habitats.

Conservation Benefit

The ungulate fence (Figure 25) will exclude deer and pigs that destroy native vegetation and contribute to erosion that harms nearshore reefs. Ungulate removal will promote growth of native species and increase survival of threatened and endangered species.

FY19 Status

- Contract was awarded in August 2019 to SRGI, Inc.

EPR: DPRI: 2015 Navy-USFWS Guam Micronesia Kingfisher MOA.

Terrestrial Exotic and Invasive Species Management

Developing a Framework for Coordinated Management of Vertebrate Restoration and Brown Treesnake Control on Guam

Location: JRM **Period of Performance:** SEP2019 – MAR2021

Project Objective

This project will consist of developing a decision-analytic framework to guide coordinated brown treesnake (BTS) control and vertebrate species restoration on Guam. The intent is to establish a collaborative process involving management agencies, stakeholders, and scientific experts and use a workshop model to bring these groups together for the purpose of framework development.

Conservation Benefit

This is an indirect way towards operational management decisions through a decision analysis process to engage in a more robust planning phase. This can include prioritization, management application, and collaboration to manage long-tern, costly complex conservation problems.

FY19 Status

- New funded project through an Interagency Agreement with United States Geological Survey (USGS) – Cooperative Research Unit (CRU): Washington University Extension starting in FY2019
- Project in early phases

Review, Evaluation, and Assessment of Reintroduction Programs as Related to Reintroduction of Guam Micronesian Kingfisher on Joint Region Marianas Lands

Location: JRM **Period of Performance:** JUL2019 – JAN2021

Project Objective

The Guam Micronesian Kingfisher (GMK) Reintroduction evaluation CESU will provide the following: 1) evaluation of reintroduction of GMK within limited (unbounded) BTS-controlled areas of Joint Region Marianas (JRM) lands, 2) review and evaluate other reintroduction programs on Department of Defense (DoD) lands to identify mission compatibility successes, and 3) evaluate reintroduction performance utilized within other reintroduction programs and provide recommendations for JRM performance criteria for future reintroduction programs with an emphasis on mission compatibility.

Conservation Benefit

The collation of success and failures of reintroduction programs, an assessment of JRM preparedness and capabilities will be vital to reducing risk and increasing success when considering reintroducing avian species in the future. This review, evaluation, and assessment will help to minimize the learning curve, improve reintroduction outcomes, and provide JRM guidance in planning its' conservation goals.

FY19 Status

- Awarded as a cooperative agreement through the CESU network to the University of Tennessee starting in FY2019
- Project in early phases of

EPR: 1 RP JRM Brown Tree Snake Eradication and Control to Support Recovery of ESA-Listed Birds; 61128NR202

2019 JRM INRMP Reference: TIS-3; 9-72

Implementation of the Regional Biosecurity Plan of Micronesia and Hawaii

Location: JRM **Period of Performance:** JUL2017 – SEP2019

Project Objective

Update Attachment M (DoD Biosecurity Recommendations) of the Regional Biosecurity Plan for Micronesia and Hawaii (hereafter: RBP), and implement various actions identified within the RBP aimed at: preventing the spread of invasive species into/out of JRM AOR; controlling, managing, and eradicating invasive and nuisance species on DoD lands within the JRM AOR; providing outreach and awareness to military personnel, contractors, and their respective dependents; and increasing coordination and collaboration with regional partners and DoD stakeholders regarding biosecurity and invasive species management.

Conservation Benefit

Protect native species, particularly those that are threatened and endangered from the threat of invasive species within the JRM AOR.

FY19 Status

- Attachment M of the RBP was coordinated and developed in FY19. In addition, a review of the document was completed for DoD across JRM AOR, Hawaii, DoD stakeholders in the Pacific, and PACOM.
- Aug 2018: Awarded contract modification to remove dead coconut trees and green waste piles in support of bio-sanitation mitigation measures against Coconut Rhinoceros Beetles (CRB) for NBG and AAFB.
- Delimitation surveys for LFA at Haputo Trailhead and planning for eradication in FY20. First treatment of pesticides administered in September of FY19.
- Purchasing of CRB sentinel traps and planning for placement across AAFB and NBG in FY20.
- Implementation of Quality Assurance/Quality Control (QA/QC) bio-sanitation inspections of military equipment and cargo (and non-military cargo moved on military conveyances) utilized via the Defense Support of Civil Authorities in support of emergency relief efforts for areas within the CNMI affected by Super Typhoon Yutu.
- Continued interagency coordination and consultation regarding invasive species

management and biosecurity concerns within the region.

Monitoring to Evaluate Effectiveness of HACCP Plan Implementation at Construction Sites

Location: JRM **Period of Performance:** N/A

Project Objective

Long-term monitoring program for terrestrial vegetation to aid in evaluating the success of implemented Hazard Analysis and Critical Control Points (HACCP) plans.

Conservation Benefit

To minimize the spread and effects of invasive plant species due to construction activities.

FY19 Status

- Ongoing previous FY contract awards for construction activities:
  - J-001B Finegayan Utilities and Site Improvements Phase 1
  - J-006 Apra Medical Clinic
  - J-007 Waterfront Head Quarters
  - J-200 IV Utilities
  - J-755 Urban Combat Training
  - P-102 Power Upgrade-Harmon.
  - P-103 Water Phase 2
  - P-295 Ordnance Ops.
  - P-715 Live-Fire Training Range Complex Known Distance Ranges
- Final Reports:
  - J-001B Finegayan Utilities and Site Improvements Phase 1 HACCP Baseline Survey Report
  - J-006 Apra Medical Clinic HACCP Baseline Survey Report
  - J-007 Waterfront Head Quarters HACCP Baseline Survey Report

Little Fire Ant (LFA), *Wasmannia auropunctata*, Surveys, Eradication, and Monitoring

Location: AAFB; NMS **Period of Performance:** SEP2017 – SEP2020

Project Objective

To eradicate LFA within Andersen South and the NMS to reduce impacts to native ecosystems and military readiness activities.

Conservation Benefit

Enhance and restore habitats by prevention of the spread of the invasive LFA.

FY19 Status

- CESU awarded in FY17 to University of Guam
- FY19 surveys for LFA conducted throughout AAFB Annex, with no positive detections (Figure 28).
- In FY19, LFA delimitation in the infested area of the NMS was completed (Figure 29).
- As of August 2019, two (2) of eight (8) scheduled treatments for LFA have been administered at NMS resulting in a decrease in LFA (Figure 30).
- Eradication of LFA at NMS is being closely coordinated with our resource partners at GovGuam Biosecurity, who are jointly treating the adjacent acacia forest and engaging the adjacent neighborhood with plans to commence treatment soon.

The green shaded area indicates a 20m wide buffer zone that will be treated along with the LFA infested areas in the interior of the sampling sites once the eradication effort is completed.

Invasive Species Management within the Joint Region Marianas Area of Responsibility

Location: JRM **Period of Performance:** SEP2016 – JUN2020

Project Objective

In support of Mariana Islands Training & Testing (MITT) activities, conduct baseline inventory of non-native species at training and cargo staging locations within the JRM AOR (Guam and Tinian); develop and implement long-term monitoring protocols for non-native species; develop and implement invasive species rapid response protocols; and develop and implement standard operating procedures for: the control and removal of high-risk invasive species; rapidly responding to the identification of invasive species; bio-sanitation standards along with quality assurance/quality control standards; and development of a programmatic pathway risk analysis for the movement of equipment and personnel between islands within the JRM AOR.

Conservation Benefit

Prevent the movement of invasive species into and out of Guam and the CNMI during training exercises.

FY19 Status

- June 2019: Option Year 2 (June 2019 – July 2020) cooperative agreement awarded to Colorado State University (CSU), Center for Environmental Management of Military Lands (CEMML).
- FY19: Bio-sanitation Quality Assurance/Quality Control (QA/QC) inspections conducted for invasive species on military training equipment departing Guam as part of two (2) major military training events and three (3) unit-level training events.
- July 2018: Option Year 1 staff which included a Project Manager, five (5) Field Biologists, one (1) Supervisory Entomologist, augmented in June 2019 to include five (5) Field Technicians and one (1) Crew Leader.
- Final Report for Base Year (September 2016 – June 2018) expected 30 November 2019.
- Final Report for Option Year 1 (June 2018 – June 2019) expected 15 December 2019.

BTS Control at Mariana Swiftlet Caves

Location: NBG; NMS **Period of Performance:** OCT2018 – Ongoing

Project Objective

Ongoing long-term BTS protection of the Mariana Swiftlet (*Aerodramus bartschi*). Protection consists of oral toxicants for BTS around the areas surrounding Mahlac, Fachi, and Maemong caves, NMS.

Conservation Benefit

Maintain or increase swiftlet population and enhance or restore habitat by reducing predation by BTS.

FY19 Status

- Ongoing project with United States Department of Agriculture- Wildlife Services (USDA-WS) and CSU.
- Service providers switched April 1, 2019 from USDA/WS to CEMML- CSU CEMML.
- Switched from a mix of BTS traps and toxicant bait tubes to 100% bait tubes.

EPR: 1 MAR NBG Mariana Swiftlet Population Protection: BTS Trapping; 61755NR834

2019 JRM INRMP Reference: TIS-2; 6-43

Maemong	33	52
Mahlac	42	81
Total	**105**	**182**

*# Bait Taken does not mean taken by a BTS as other animals may take the bait.
[$]USDA/WS Deployed 3510 baits; CEMML has deployed 1647 baits

Evaluation of Brown Treesnake control to improve management of Guam's remnant Mariana Swiftlet population

Location: NMS **Period of Performance:** SEP2018 – MAR2020

Project Objective

Estimate Mariana swiftlet (*Aerodramus bartschi*) population size derived from thermal videography recordings coupled with estimates of movement patterns in and out of the caves. Evaluate the effect of bait type (bird/mammal) on targeting snakes entering swiftlet caves to help inform capture efficacy and management strategies.

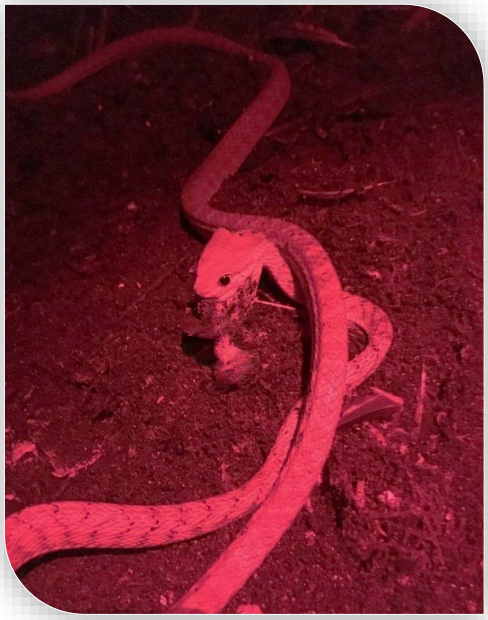

Figure 33: Female BTS consuming swiflet fledging on the ground in Mahlac Cave.

Conservation Benefit

As one of two remaining forest birds on Guam, protection of Mariana Swiftlets is an import conservation goal for JRM. Data gathered from the study will help in designing different methods or strategies for reducing BTS populations in and around occupied and unoccupied caves. Accurate counts of swiftlets will help improve reporting and understanding population dynamics to develop/refine management goals.

FY19 Status

- Bait preference trials are ongoing with inconclusive data at this time.
- Five visual searches yielded three (3) in cave BTS (Average SVL: 905mm).
- Thermal camera data has been collected; analysis is ongoing.
- Project is conducted through an Interagency Agreement with USGS – Fort Collins and USGS – Pacific Island Ecosystems Research Center (PIERC).

EPR: 1 RP JRM Brown Tree Snake Eradication and Control to Support Recovery of ESA-Listed Birds; 61128NR202

2019 JRM INRMP Reference: TIS-3; 6-43

Feral Pig Control – NBG

Location: NBG **Period of Performance:** OCT2015 – OCT2019

Project Objective

Eradicate feral pigs on NBG Main Base to protect habitat, particularly in sensitive areas of Orote Peninsula, the Camp Covington wetlands, and sea turtle nesting sites at Spanish Steps.

Conservation Benefit

Enhance and restore native habitats and increase populations of native species, particularly threatened and endangered species.

FY19 Status

- From 2013-2019, a total of 1432 pigs have been removed (see Table 6).
- A Cooperative Agreement was awarded to White Buffalo Inc. for pig eradication on NBG Main Base. Base year work commenced in November 2017 and finished in May 2018. A total of 467 pigs were removed.
- In 2019, an additional 26 pigs were removed from NBG Main Base.
- There are gaps between the ground and the security fence that allow pig immigration. These will be repaired in FY20.

EPR: 1 RP MAR NBG Ungulate Management Population Control; 61755NR807

2019 JRM INRMP Reference: TIS-6; 6-44

Table 6. Removal of feral pigs from NBG Main Base by fiscal year (FY2013-FY2019).

Pigs Removed	82	226	287	344	278	189	26	1432

Feral Dog and Cat Control and Management – NBG

Location: NBG; NMS **Period of Performance:** SEP2018 – SEP2020

Project Objective

Determine the population numbers of feral dogs and cats on the NMS and NBG Main Base. Trail cameras are utilized for a mark/re-sight methodology to estimate the feral dog and cat populations. Development of a management plan for the best method for feral dog and cat control, and implementation of that plan in the coming years.

Conservation Benefit

Control invasive species that directly or indirectly impact native species.

FY 19 Status

- NMS camera surveys completed by Sundance EA Inc. in FY2019.
- A total of 60 cameras were placed in NMS for surveys (see Figure 34).
- Feral dog population estimate is 58 dogs (95% confidence interval 53-74)
- Feral cat estimate is 13 cats (95% confidence interval 10-22).
- Contract awarded to Sundance EA Inc. for surveys on NBG Main Base for FY20. Surveys on NBG Main Base will be performed December 2019-March 2020.

Ungulate Management Population Control – NBG

Location: NBG; NMS; NBG TS **Period of Performance:** Recurring Annually

Project Objective

Conduct population surveys of the Guam Navy lands to determine locations and estimate numbers of feral animals, review accepted control measures Control ungulates in fenced and unfenced areas.

Conservation Benefit

Enhance and restore native habitats and increase populations of native species, particularly threatened and endangered species.

FY 19 Status

- Deer (22) and pigs (5) were removed by White Buffalo Inc. through a Cooperative Agreement from inside the first 80-acre fenced area on NMS in May 2018.
- Fence construction on the second fence in NMS is in progress, expected by Nov 2019; ungulate eradication will begin in early FY20.
- As part of ungulate control, approximately 30 male carabao were sterilized in 2018 and 2019.
- A total of 142 pigs were removed from NBG TS in March of 2019.

EPR: 1 RP MAR NBG Ungulate Management Population Control; 61755NR807

2019 JRM INRMP Reference: TIS-6; 6-44

Artificial Toxic Bait for Landscape-scale BTS Suppression – AAFB

Location: AAFB **Period of Performance:** JUL2018 – DEC2019

Project Objective

To further the development an artificial bait matrix that will have the same level of impact as dead neo-natal mice and deployable by aerial delivery. There is a transfer of pilot-scale bait production knowledge and capacity to National Wildlife Research Center (NWRC) facilities in Hilo, HI. Second, collaborate with USDA-Agricultural Research Service-Eastern Regional Research Center (USDA-ARS-ERRC) to refine the bait formulation to permit attachment of the artificial bait to the Automated Delivery System

(ADS) cartridge.

Conservation Benefit

Development of artificial bait to replace dead neo-natal mice is viewed as technological goal to help reduce overall cost and maintain the same level of impact to BTS populations. If costs to the bait component of the aerial delivery system can be achieve, cost saving could be used to expand the amount of landscape covered by toxicants. It has the potential for management actions to enhance and restore habitat, and to assist in potential reintroduction of kingfishers and other listed species to the wild on Guam.

Figure 35. Loss of fats from bait matrix.

FY19 Status

- Project conducted through an Interagency Agreement with USDA –NWRC
- Evaluation of adhesives is in progress
- Evaluating the impact of reducing amount of pork fat in the formulation
- Evaluating the acceptance of baits prepared with cheaper, natural triglyceride sources
- Field trials conducted in September 2019

EPR: No EPR - funded under the Guam Micronesian Kingfisher MOA.

2019 JRM INRMP Reference: TIS-2; 9-71

Evaluating Statistical Methods for Estimating Density of Invasive BTS from Camera Trapping Data – AAFB

Location: AAFB **Period of Performance:** SEP2018 – MAR2020

Project Objective

This project will evaluate several published models for their ability to provide robust estimates of BTS density by comparing know BTS populations numbers from Closed Population to results from analysis with the models. Data from 2015 will be used.

Conservation Benefit
Developing more robust monitoring is an important goal to help increase confidence in outcomes for landscape scale management for BTS. The ability to monitor suppressed BTS populations will be critical in determining success for reintroduction of avian populations. Low cost monitoring or robust population models can reduce costs and improve outcomes for propose reintroduction programs.

FY19 Status

- Project ongoing
- One of three test models demonstrates reasonable potential for evaluation
- No publishable data or information available at this time
- Project conducted through an Interagency Agreement with USGS –CRU: Washington University Extension

EPR: 1 RP JRM Brown Tree Snake Eradication and Control to Support Recovery of ESA-Listed Birds; 61128NR202

2019 JRM INRMP Reference: TIS-2; 9-71

Figure 36. A selected nocturnal digital image of a mouse-baited trap contact by a BTS that failed to result in a snake capture. The individual depicted stayed at the trap for 33 minutes before leaving the field of view for the camera trap.

Long-term known fate monitoring of large snakes in conjunction with Closed Population Eradication – AAFB

Location: AAFB **Period of Performance:** SEP2018 – MAR2020

Project Objective

Identify effective supplementary control tools for large snakes that are refractory to ADS treatments; genetically identify which snakes are producing offspring during ADS suppression; assist with snake collection (via visual surveys or trapping) for snake Known Fate research.

Conservation Benefit

It is known that very small and very large BTS are not as susceptible to current mouse baits. This project seeks to collect data to in Increase effectiveness of large BTS control that currently have limited susceptibility to aerial bait application. Collecting genetic data will help with population demography. The ability to target large BTS is a critical goal to enhance and restore habitat, and to assist in potential reintroduction of ESA listed species to the wild on Guam.

FY19 Status

- Data collection is ongoing
- 11/30 (37%) large BTS impacted by aerial drops post June 2019 drops
- No data or information available at this time for genetic component
- Project conducted through an Interagency Agreement with USGS – Fort Collins

EPR: 1 RP JRM Brown Tree Snake Eradication and Control to Support Recovery of ESA-Listed Birds; 61128NR202

2019 JRM INRMP Reference: TIS-2; 9-71

Monitoring of Reduction in Brown Treesnake Abundance during Eradication Activities in the Habitat Management Unit and Evaluation of Alternative Ground Baits for Large Brown Treesnakes

Location: AAFB **Period of Performance:** APR2018 – SEP2019

Project Objective

To evaluate BTS population levels after a series of eight aerial baiting within the HMU and continue monitoring populations before, during, and after the next proposed series of drops. Abundance of BTS will be measured through analysis of non-toxic bait, camera work, and analysis of the data. Additionally, a known-fate component will be conducted; BTS captured in the HMU will be radio-tagged and tracked. A bait trial for large BTS will be conducted to help assess the need for alternative baits for BTS not attracted by standard baits.

Conservation Benefit

To increase effectiveness of large BTS control that currently have limited susceptibility to aerial bait application to enhance and restore habitat, and to assist in potential reintroduction of ESA listed species to the wild on Guam. Determining the level of impact from landscape scale BTS control is an essential requirement to evaluate success and future investment when considering species restoration on Guam.

FY19 Status

- New agreement signed: September 2019 – March 2021 through an Interagency Agreement with USDA –NWRC.
- Cameras tested in August 2019; field deployment expected in October 2019.
- Large dose trials show large BTS can survive an initial dose of 80mg tablet but succumb to second dose on week later (Figure 38).
- Monitoring indicates an 80% reduce in BTS abundance after 8 drops (52,000 baits/55ha).

EPR: No EPR - funded under the Guam Micronesian Kingfisher MOA.

2019 JRM INRMP Reference: TIS-2; 9-71

Trial Eradication of BTS in the USGS Closed Population Facility (CPF) via Aerial Toxicants, Phases I and II

Location: AAFB **Period of Performance:** SEP2017 – MAR2019

Project Objective

Continue from Phase One monitoring BTS population structure and eradication efforts in Closed Population (CP); improve cost-efficacy of tools used to monitor rodent populations in conjunction with BTS population suppression; identify water sources that produce large biomass of invasive frog species on AAFB and reduce or eliminate their use for reproduction.

Conservation Benefit
As a small-scale experimental version of the HMU, CP aerial delivery project is collecting refined data and impacts to BTS to help inform impacts at the landscape level. The ability to identify refractory and emergent BTS is a critical goal to enhance and restore habitat, and to assist in potential reintroduction of ESA listed species to the wild on Guam. Monitoring prey populations will help devise better management strategies in support species recovery.

FY19 Status
- Project conducted through an Interagency Agreement with USGS – Fort Collins
- Phase I conclusions: aerial baiting may be more effective in dry season. CP BTS suppressed by 50% with BTS >1150 less susceptible.
- Approximately 37% (41/111) of the original CP BTS population remained after multiple applications of bait through Phase II
- Some recruitment of juveniles
- Limited to no rodent recovery observed
- Phase II report due end of 2019

EPR: No EPR - funded under the Guam Micronesian Kingfisher MOA.

2019 JRM INRMP Reference: TIS-2; 9-71

Estimation of Brown Treesnake Predation Threat Thresholds for Persistence of Reintroduced Birds on Guam – AAFB

Location: AAFB **Period of Performance:** SEP2019 – MAR2021

Project Objective
To evaluate the levels of snake suppression that might enable persistence of reintroduced birds under some acceptable level of BTS predation. It is unknown what snake density is tolerable when considering the reintroduction of avian species. The project will simulate nest contact rates with cameras and model the levels of nestling mortality that can be sustained while maintaining a stable or growing population of birds.

Conservation Benefit
It is widely recognized that eradication of BTS from Guam is not currently achievable, however, severe suppression is viewed favorably. Through considering avian species persistence in the presence of a suppressed BTS population it may help facilitate reintroductions in areas where management can be sustained and supported allowing for limited recovery of extirpated species.

FY19 Status
- New funded project through an Interagency Agreement with USDA –NWRC starting in FY19
- Project in early phases

EPR: No EPR - funded under the Guam Micronesian Kingfisher MOA.

2019 JRM INRMP Reference: TIS-3; 9-72

Habitat Management Unit Biomonitor Support and ESA Listed Species Identification Training

Location: AAFB **Period of Performance:** SEP2018 – JUN2019

Project Objective
To provide biomonitor support during aerial baiting project by the ADS, to observe for presence of Mariana Fruit Bat (*Pteropus mariannus mariannus*, Fanihi) and observe for take.

Conservation Benefit
Allow for the continuance of the ADS project while monitoring for the presence of fanihi per requirements of the USFWS.

FY19 Status
- HMU Biomonitor support ended June; last aerial baiting drops for fiscal year.
- 11 bats observed during September/October schedule drops, not interactions with helicopter occurred – all transient flights over the HMU.
- This project was conducted through a cooperative agreement with UOG – Center for Island Sustainability (CIS).

EPR: 1 RP JRM Brown Tree Snake Eradication and Control to Support Recovery of ESA-Listed Birds; 61128NR202

Using BTS Behavior and Movement to Refine Control on AAFB & for Improved Management of Native Forest Birds

Location: AAFB **Period of Performance:** SEP2019 – MAR2021

Project Objective

The goals of this project are to identify movement pathways used by BTS on AAFB, as well as estimate abundance of BTS in relation to resources important to birds. Better understanding of hotspots of BTS activity, travel pathways, and decision-making during foraging are critical to improve the coverage and efficacy of BTS control in a cost-effective manner.

Conservation Benefit

This project is one of four projects that will, collectively, further develop information on BTS behaviors related to predation and movement in the presence of abundant avian species. Additionally, population demographics that could be useful for supporting future avian restoration projects and controlling BTS in low density with competing food sources in the presence of control regimes.

FY19 Status

- New funded project through an Interagency Agreement with USGS – Fort Collins starting in FY2019
- Project in early phases

EPR: No EPR - funded under the Guam Micronesian Kingfisher MOA.

2019 JRM INRMP Reference: TIS-3; 9-72

Guam Micronesian Kingfisher MOA Program and Project Execution

Location: AAFB, NBG TS **Period of Performance:** JUN2015 - JUN2025

Project Objective

In order to secure and enhance durable habitat for future reintroduction efforts of kingfishers, the U.S. Department of the Navy (DON) and U.S. Fish and Wildlife Service (USFWS) entered into a Memorandum of Agreement (MOA) signed in 2015 that conserves and manages habitat suitable for the recovery of the Guam kingfisher.

Specifically, under the 2015 MOA, the DON agreed to designate 2,118 hectares (5,234 acres) to a status that will provide durable habitat protection needed to support native habitat restoration and land management for the survival and recovery of the kingfisher.

The DON analyzed a number of potential courses of action to implement the 2015 MOA, and selected a course of action to guide funding allocations as to direct positive, verifiable, and sustainable gains in terms of the condition of durable habitat.

Conservation Benefit

Durable habitat protection for 5,234 acres in northern Guam to benefit the survival and recovery of the kingfisher.

In addition, projects for active conservation will be implemented and integrated with JRM INRMP. Focal areas for projects include (with priority on focal area 2 and 3):

1. BTS control and suppression to facilitate the larger goal of suppressing snake population levels that will ultimately support kingfisher survival and recovery;
2. Support for BTS control and eradication methods development, focusing on tools and techniques needed for landscape level survival and recovery of the kingfisher;
3. Ungulate fencing and eradication;
4. Control or small mammalian predators;
5. Invasive plant control and eradication;
6. Native plant restoration;
7. Localized control of introduced invertebrates that may negatively impact kingfisher nesting/fledging.

FY19 Status

- Activities conducted/supported to date:
  - Development of three courses of action (COA), selection of a COA for further development of Draft 10 year plan.
  - Draft 10 year plan reviewed by DON.
  - Trial eradication within CP facility yields suppression models, but suggest need for long-term trial at scale (e.g. HMU) and optimization of monitoring tools.
  - ADS at operational level and additional ABMS winder increased bait production capacity
  - Artificial toxic bait field trials continue, seeking cheaper/reduced fat and better adhesive
  - Haputo T/E listed species survey, Haputo cultural resource surveys and base approvals completed for proposed North Haputo ERA ungulate control barrier.
- FY19 Projects awarded:
  - Focal Area 2:
    - USDA WS: Follow-on FY19 ADS bait application at HMU (completed June 2019) (Figure 39).
    - USGS: Optimizing Monitoring of Brown Treesnakes
    - USDA NWRC: Estimation of Brown Treesnake Predation Threat Thresholds for Persistence of Reintroduced Birds on Guam
    - USDA NWRC: Continuation of HMU Monitoring and Eradication Evaluation
  - Focal Area 3:
    - MCAG: North Haputo ERA Ungulate Control Barrier Construction (see standalone description)
- Next step: Plan development workshop in FY20 and project implementation.

EPR: DPRI: 2015 Navy-USFWS Guam Micronesia Kingfisher MOA.

Figure 39. GMK MOA-funded application of bait via ADS at HMU, AAFB.

Little Fire Ant (*Wasmannia auropunctata*) Surveys, Eradication, and Monitoring – AAFB

Location: AAFB **Period of Performance:** SEP2017 – SEP2020

Project Objective

Eradicate LFA within Andersen South to reduce impacts to native ecosystems and military readiness activities.

Conservation Benefit

Enhance and restore habitats by prevention of the spread of the invasive LFA.

FY19 Status

- Andersen South:
  - Total of six positive LFA site delineated.
  - Four sites eradication completed
  - Two sites awaiting eradication treatment
- Final Reports: Pending completion of work.

EPR: DPRI: Marine Corps Relocation 2017/2018 amendment to 2015 BO, Conservation Measures to Minimize the Effects of Invasive Species

2019 JRM INRMP Reference: TIS-5; 9-72

Evaluate visual searching versus bait tubes and camera surveillance as a low-density monitoring tool for BTS – AAFB and Rota, CNMI

Location: AAFB; Rota, CNMI **Period of Performance:** MAY2018 – NOV2019

Project Objective

Evaluate visual searching along minimally cleared transects versus trackless areas; evaluate visual searching versus bait tubes and camera surveillance as a low density monitoring tool for BTS (compare with USDA/NWRC); improve cost-efficacy of tools used to monitor small mammal populations in conjunction with BTS population suppression.

Conservation Benefit

This will assess specific monitoring tools inform current structures of BTS populations and their small mammal prey, improved demographic inform and levels of suppression will inform future conservation efforts. Rodent prey have been determined to have strong effects on efficacy of snake suppression; monitoring their populations is likely to improve efficacy

Figure 40. Evidence of rat from a chew card deployed in a high density rat area Rota, CNMI.

of individual landscape scale level applications. This project provide data to enhance and restore habitat, and to assist in potential reintroduction of ESA listed species to the wild on Guam.

FY19 Status

- Transect data collection on going; low numbers of BTS detected post aerial baiting
- Second season of small mammal monitoring in Rota
- Final report due JAN/FEB 2020

2019 JRM INRMP Reference: TIS-2; 9-71

Multi-species Barrier Development Phase I – NBG TS

Location: NBG TS **Period of Performance:** APR2018 – OCT2019

Project Objective

The primary objective of this project is to develop and evaluate a multispecies barrier fence, estimate and itemize annual and long-term maintenance methods and costs and provide recommendations for multispecies barrier based on a review of the existing literature, visiting other sites with vertebrate barriers, testing results, and cost analysis.

Conservation Benefit

Closed Population has demonstrated that BTS can be effectively excluded using barrier fences, with the caveat that these require significant labor for maintenance Little research has been undertaken to promote creation of areas free of multiple species of invasive or predatory vertebrates that would be suitable for reintroduction or recovery of Guam's native fauna and flora.

FY19 Status

- Activities conducted to date:
    - Review of the existing literature
    - Visited other sites (New Zealand) with vertebrate barriers

- Lab testing results

EPR: DPRI: Marine Corps Relocation 2017/2018 amendment to 2015 BO, Conservation Measures Brown Treesnake Control and Suppression.

Mariana Islands Training & Testing Biological Opinion Terms & Conditions 1.1 Compliance – CNMI

Location: CNMI **Period of Performance:** AUG2018 – SEP2022

Project Objective

To comply with the Mariana Islands Training & Testing (MITT) Biological Opinion (BO) Incidental Take Statement Terms and Conditions 1.1 (as amended 28 FEB 2016) to provide funding to the U.S. Fish & Wildlife Service for invasive vertebrate pest control to minimize the effect of take on the Micronesian megapode (*Megapodius laperouse*). DoD is not responsible for project implementation or the results thereof, per the MITT Biological Opinion (BO) amended Terms and Conditions 1.1.

Conservation Benefit

To ensure compliance with the Incidental Take Statement of the 2015 MITT BO to minimize the effect of take on the Micronesian megapode.

FY19 Status

- Interagency Agreement between Joint Region Marianas and the U.S. Fish & Wildlife Service established in August 2018.
- U.S Fish & Wildlife Service project currently in planning phase to implement Micronesian megapode habitat restoration on Aguiguan.

EPR: 2 BO MAR Mariana Islands Training and Testing (MITT) Implementation; 61128NR218

2019 JRM INRMP Reference: TIS-5; 9-72

Terrestrial Protected Species Management

Conservation Management of Listed Invertebrates

Location: JRM **Period of Performance:** JUL2018-DEC2019

Project Objective

To prepare a survey method protocol for ESA-listed snails that is statistically sound and applicable, to provide field and classroom training for natural resource staff and partners, and to create a snail ID field booklet.

Conservation Benefit

Identifying locations of ESA-listed snail species will allow for management actions to avoid and conserve locations of protected species and host plant species. The survey protocol will be coordinated with natural resource partners.

FY19 Status

- A Cooperative Agreement was awarded through the CESU network to UOG in July 2018. Deliverables include the survey protocol, field training, and a snail ID booklet (in coordination with USFWS).
- The Survey Protocol was reviewed by USFWS, DAWR and will be finalized in November 2019.
- The snail ID booklet is pending.
- Snail survey classroom and field training was conducted for JRM NR managers, USFWS, and DAWR biologists in June 2019.

Biomonitor Support for Natural Resource Management at Joint Region Marianas Area of Responsibility

Location: JRM AOR **Period of Performance:** JUL2019 – JAN2021

Project Objective

Provide biomonitor support to assist the Department of the Navy in natural resource management across lands under Joint Region Marianas AOR.

Conservation Benefit

Biomonitors will conduct surveys for threatened and endangered species, culturally valuable plant species, rare plants, and non-native/invasive species. Activities support the GMK MOA (2015) and the Biological Opinion for the Department of the Navy's Relocation of the U.S. Marine Corps from Okinawa to Guam and Associated Activities on Guam (USFWS, 2015, 2017, 2018).

FY19 Status

- Awarded as cooperative agreement through the CESU network to UOG-CIS on 29 July 2019.

EPR: DPRI: Marine Corps Relocation 2017/2018 amendment to 2015 BO, Conservation Measures to Contribute to the Recovery of Listed Species.

2019 JRM INRMP Reference: TPS-1; 7-55

Mariana Common Moorhen Surveys, Fena Reservoir

Location: NMS **Period of performance:** Recurring Annually

Project Objective

Monitor the population of Mariana Common Moorhen (*Gallinula chloropus guami*) at Fena Reservoir.

Conservation Benefit

Knowing presence and populations size will allow proper management of an endangered species.

FY 19 Status:

- Fena reservoir moorhen surveys have been discontinued due to no moorhen detections for an extended period of time (Figure 42). No moorhen have been observed at Fena during a survey since 2013. There were incidental sightings of single moorhen at the spillway from 2013-2015. The spillway is still monitored as it is part of the migratory bird monitoring program.
- Moorhen monitoring in other areas via trail camera is being considered for other ponds/wetlands.

EPR: 1 S MAR NBG Endangered Species Monitoring; 61755NR142

2019 JRM INRMP Reference: TPS-2; 5-89

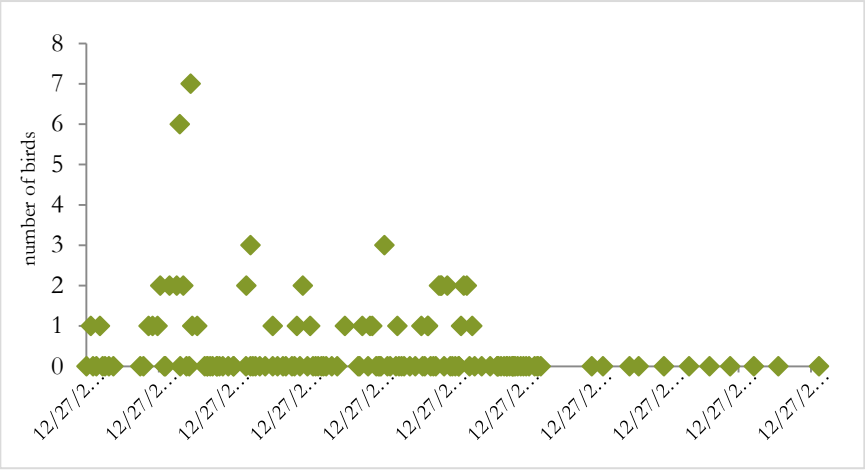

Figure 42. Summary of Observations of Mariana Common Moorhen at Fena Reservoir, NMS (FY07-FY18).

Sea Turtle Nesting Beach Habitat Enhancement – NBG

Location: NBG **Period of Performance:** Ongoing

Project Objective

To increase the likelihood of hatchling turtles successfully traversing strand vegetation at Spanish Steps to access the ocean and enhance natural regeneration of native strand vegetation by removal of invasive vegetation. To reduce predation of sea turtle nests by trapping and removal of monitor lizards (*Varanus indicus*).

Conservation Benefit

Enhance and restore habitat and in an effort to recover sea turtle populations.

FY 19 Status:

- Beach cleanups were performed on Dadi, Polaris and Gabgab beaches. Due to staffing change Spanish Steps beach did not have a cleanup this year.
- Non-native vegetation was removed from Spanish Steps beach in small increments during beach inspections for turtle activity or while checking monitor lizard traps.
- There were 208 trapping days in 2019 with zero lizards captured. Monitor lizard culling was conducted from August 2015-August 2018 at Spanish Steps beach. From 2015-2017 noose traps, pipe traps, gopher traps, A24 rat traps and active hunting captured has captured eight lizards. In 2017, Conibear Jaw traps were utilized (138 trap days) and captured five lizards. A total of 13 monitor lizards have been captured from 2015-2018. The size of the lizards has increased over time; mostly males were captured in 2017 and 2018. This implies a demographic shift as a result of trapping. Since males have larger home ranges than females, it's probable that the localized population was extirpated and males are now migrating into the area from elsewhere.
- 32 total activities (20 nests and 12 non-nesting emergences) have been observed at Spanish Steps (SS); SS was the only NBG beach which experienced activity this season.
- 15% (3 of 20) of nests were depredated by monitor lizards. This is an increase from 5.6% in 2018 but lower than the 65% of 2017.
- Regular monitoring for sea turtle activity of all NBG-managed beaches includes following locations: GabGab, San Luis, Dadi, Haputo, Tipalao, and Spanish Steps
- Intermittent monitoring for sea turtle activity occurred at Reserve Craft beach

prior to and during military training events
- "No Driving on Beach" signs and barriers were installed on Dadi beach barricades to protect sea turtle nesting areas.

EPR: 1 S MAR NBG Endangered Species Monitoring; 61755NR142

2019 JRM INRMP Reference: TPS-2; 5-89

Sea Turtle Surveys – NBG

Location: NBG; NBG TS **Period of Performance:** SEP2019 - SEP2020

Project Objective
- Conduct sea turtle surveys on NBG beaches.
- Conduct monitor lizard control in sea turtle nesting areas.

Conservation Benefit
- Monitor the sea turtle nesting population at NBG and protect sea turtle nesting beaches for the recovery of sea turtles.

FY19 Status
- Conducted 69 surveys at seven NBG beaches: Spanish Steps (1-3), Haputo, Double Reef, GabGab, Tipalao, San Luis, and Dadi.
- All nesting and Non-nesting emergences (NNEs) were documented from green turtles (*Chelonia mydas*); 20 nests and 12 NNEs at Spanish Steps from October 2018 through September 2019 (Figure 43 and Table 8).
- Monitor lizard (*Varanus indicus*) control ongoing; no captures in 208 trapping days; three nests (15%) were predated by monitor lizards, reduced from previous years.

Survey and Monitoring of Seagrass Bed at Dadi Beach

Location: NBG **Period of Performance:** SEP2017 – JAN2020

Project Objective

- Determine and document biodiversity of marine plants and macro-invertebrates.
- Determine the current health of the seagrass bed by quantifying the abundance of epiphytic plants on seagrass and the abundance and biodiversity of macro algae and any additional relevant information that may affect the ecosystem health of the seagrass bed.
- Capture temporal changes through in-water pictoral record of seagrass bed.

Conservation Benefit

- Increase habitat for ESA-listed species (e.g., sea turtles, listed corals, marine mammals, scalloped hammerhead shark).
- Support habitat areas of particular concern which align with Magnuson-Stevens Fishery Conservation Act for Essential Fish Habitat and the Marianas Fishery Ecosystem Plan.

FY19 Status

- Two dry season surveys and one wet season survey completed.
- One wet season survey remaining and will be completed by OCT19.
- No-cost extension until DEC19; final report expected by JAN20.

Restoration/Enhancement of Mariana Moorhen Habitat

Location: NBG; NMS **Period of Performance:** SEP2018 – SEP2020

Project Objective

To provide nesting platforms in ponds/wetlands where Mariana Common Moorhen (*Gallinula chloropus guami*) are known to occur. Platforms will be installed at two ponds on NMS, two ponds on the main Navy base and one pond at the old Barrigada golf course. To determine the viability for monitoring for moorhen presence via trail cameras.

Conservation Benefit

Improve nesting habitat for a listed species and increase population numbers on Guam. If successful the technique could be used in other areas with moorhen.

FY 19 Status

- A total of 32 platforms were installed in five ponds (see Figures 46 - 48).
- Four platforms at ponds 3, 4, and 5 were utilized for nesting by moorhen.
- In 2020 the platforms will continue to be monitored and trail cameras will be placed on 6 different ponds.
- Four of the ponds (1, 3, 4, and 5) are known to have moorhen present and two have had historic but not recent presence.

Figure 46. Map depicting the location Ponds 1 and 2 on NBG.

Mariana Swiftlet Recovery and Habitat Use

Location: NMS **Period of Performance:** SEP2018 – SEP2022

Project Objective

To provide an understanding of Mariana swiftlet (*Aerodramus bartschi*) habitat use, movement, reproductive success, and breeding site selection to inform management actions and meet specific objectives identified in the USFWS Recovery Plan for the Mariana Swiftlet.

Conservation Benefit

Implement actions for the recovery and potential down-listing of the Mariana Swiftlet.

FY19 Status

- Funding for the project began in September 2018.
- Purchasing of two camera thermal camera systems for in-cave monitoring.
- Tested in-cave thermal camera monitoring of movement and roosting of swiftlets with through an Interagency Agreement with USGS-Fort Collins sub-award to USGS PIERC.
- Collaboration with U.S. Army Engineer Research and Development Center to test thermal camera systems in FY19.
- Planning for FY20 banding, tracking, and in-cave nest monitoring for swiftlets.
- FY20 work will include:
    - Erecting telemetry towers on NMS to track swiftlet movements
    - Capturing and outfitting 30 swiftlets with telemetry transmitters
    - Monitoring reproductive success of swiftlets within caves on NMS
    - Measuring physical features of occupied versus unoccupied caves to assess breeding site selection

EPR: 1 RP MAR NBG Mariana Swiftlet Habitat Use; 61755NR303

2019 JRM INRMP Reference: TPS-4; 6-47

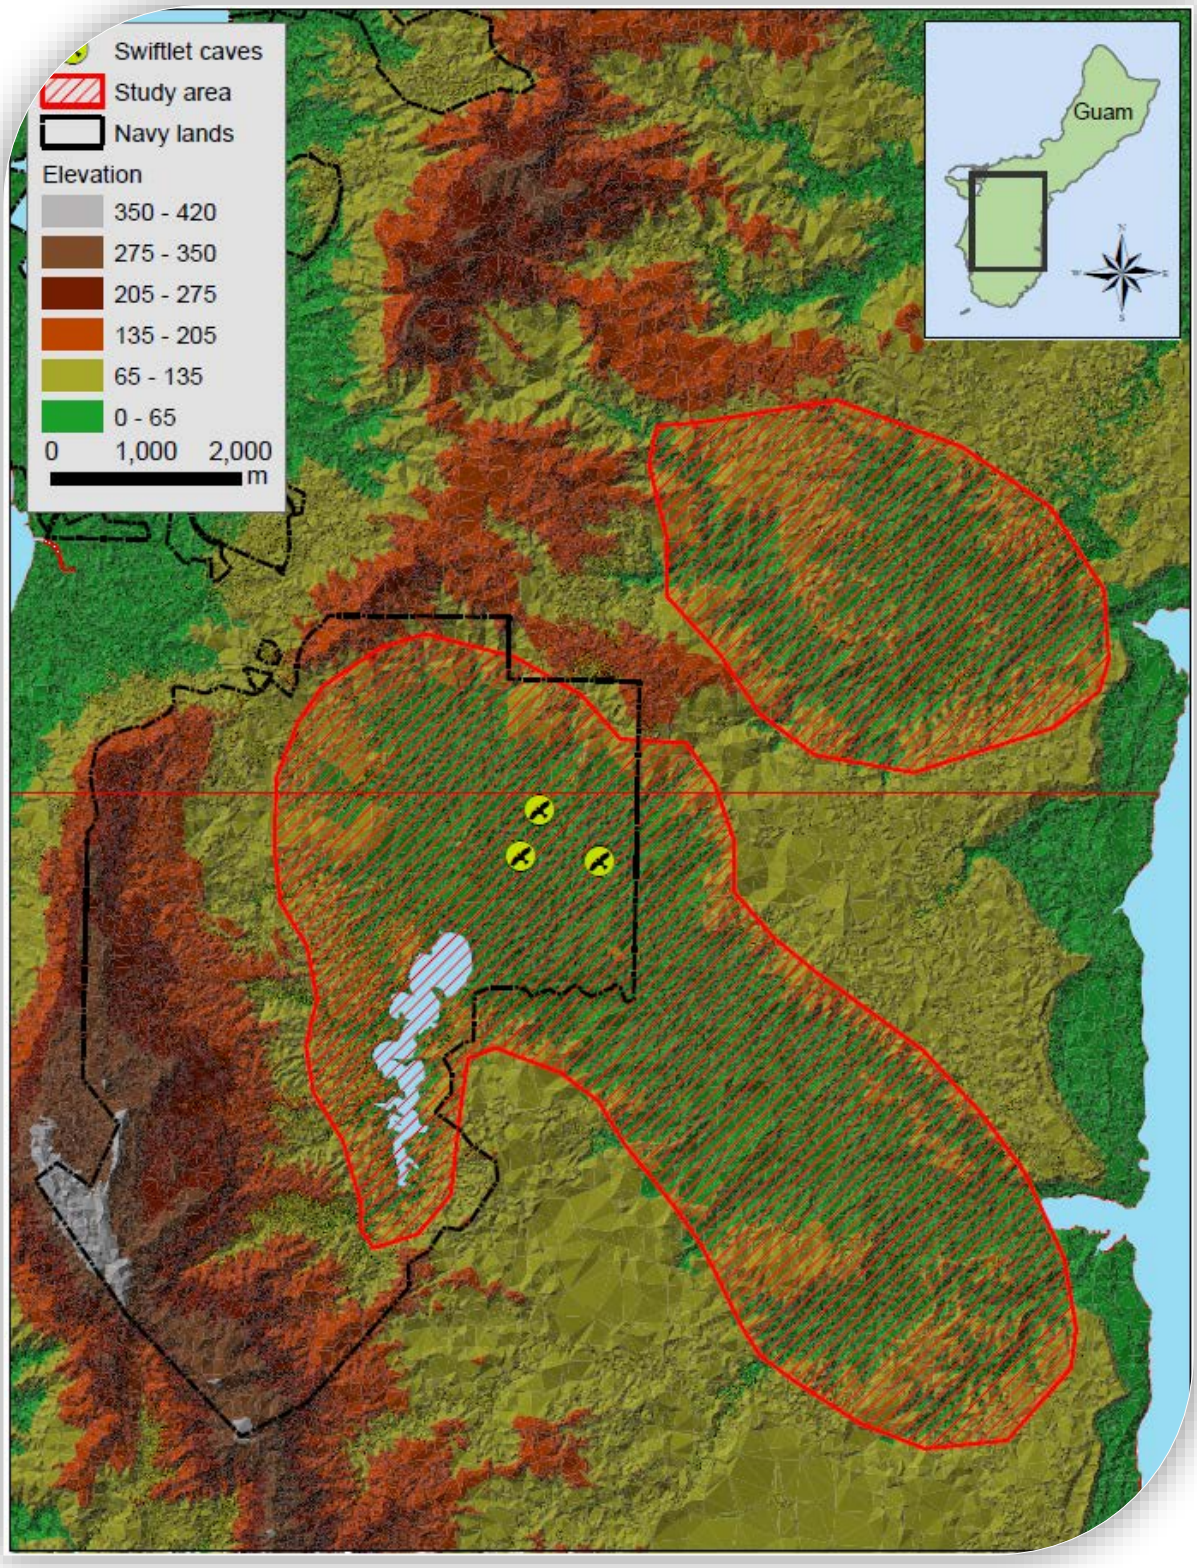

Figure 49. Three occupied swiftlet caves on the NMS and proposed study area for tracking swiftlet movement on the landscape of southern Guam.

Monitoring of Mariana Swiftlets

Location: NMS **Period of Performance:** Recurring annually

Project Objective

Monitor population trends of Mariana swiftlets (*Aerodramus bartschi*) at three caves on NMS.

Conservation Benefit

Monitoring to allow for management actions to enhance and restore habitat, reduce habitat fragmentation, buffer protected areas, and implement new conservation strategies.

FY 19 Status:

- Conducted quarterly surveys Maemong, at Mahlac, and Fachi totaling four (4) surveys at each cave
- Estimated population size of swiftlets on NMS in 2019 was 1,090 (Figures 50 - 53).

EPR: 1 S MAR NBG Endangered Species Monitoring; 61755NR142

Sea Turtle Monitoring, Protection, and Educational Outreach – AAFB

Location: AAFB **Period of Performance:** JUL2018 – DEC2019

Project Objective

- Organize and qualitatively and quantitatively analyze AAFB sea turtle data.
- Conduct sea turtle monitoring and record nesting activities.
- Provide protection of nesting beaches and active nests until hatchlings emerge.
- Conduct educational outreach for the public regarding sea turtles including two beach cleanup events.

Conservation Benefit

Implement recovery actions by: conducting long-term monitoring to determine population estimates and abundance; providing protection of sea turtles and their nesting habitats; and conducting outreach and education to the public regarding sea turtles and their habitats.

FY19 Status

- Nesting activity monitoring was awarded as a cooperative agreement through the CESU network to UOG, SeaGrant.
- During 2019, all nests up to August 31 have been on Explosive Ordnance Disposal (EOD) and Pati Beaches. There have been a total of 126 emergences, with 101 nests and 25 false crawls. There have been 3 events on Pati and 124 on EOD (Figure 55).
- As of August 2019 a total of 4 nesting turtles were PIT tagged, and of those 2 were additionally tagged with satellite tags.
- Clutch data was taken on previously marked nests that were located successfully either after the emergence of hatchlings or after 70 days incubation. Data from nest inventories estimated hatching and emergence success.
- During a nest inventory in August, 115 live hatchlings were found within a nest that had shown signs of hatching. After the inventory all hatchlings were observed safely entering the ocean (Photo 54).

- Project Final Report due December 2019.

EPR: 1 LC MAR AAFB Sea Turtle Monitoring; M5240CN037

2019 JRM INRMP Reference: TPS-1; 9-75

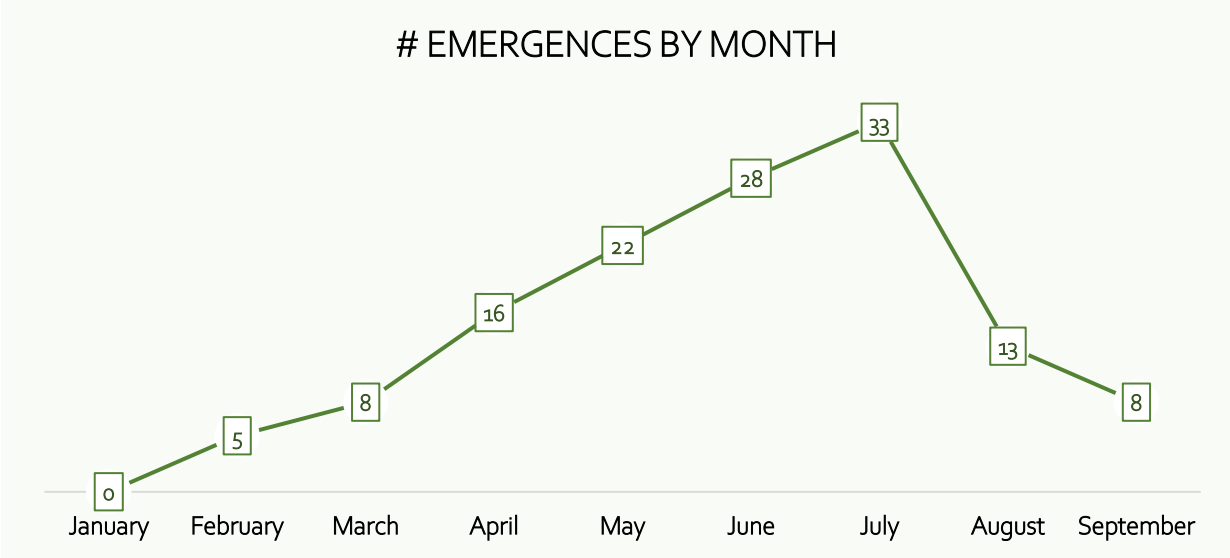

Figure 55. Total number of emergences by month for 2019, with peak activity from June to July.

Mariana Fruit Bat Monitoring – AAFB

Location: AAFB **Period of Performance:** FEB2018 – AUG2020

Project Objective

Conduct surveys for Mariana fruit bats (*Pteropus mariannus mariannus*) at AAFB as part of long-term population monitoring and to provide analysis on the effects aircraft overflights on the behavior of Mariana fruit bats at Pati Point.

Conservation Benefit

Monitoring will allow for management actions to enhance and restore habitat and increase efforts to recover Mariana fruit bat populations on Guam.

FY19 Status

- Addresses three of the recovery criteria in the 2009 U.S. Fish and Wildlife Service (USFWS) Draft Revised Recovery Plan for the Mariana Fruit Bat or Fanihi by implementing seven of the Recovery Actions outlined in the Draft Plan.
- Option Year 3 has just begun. This Option year will only have 1 base-wide survey, but will continue to allow UOG employees to participate in weekly surveys.
- Surveys have been done by installation personnel and UOG employees from February through May. More surveys are planned for late 2019.
- The Annual Base-wide Count occurred on May 17, 2019. This year 133 individuals took part, a 33% increase over the previous year. Preliminary data estimates about 50 fruit bats are present on AAFB (Table 9, Figure 56).
- Pati Point surveys continue to occur on a quarterly basis. There has been no sign of fruit bats present at the historic roost site.

EPR: 2 BO MAR AAFB Fruit Bat Monitoring; M5240CN041

2019 JRM INRMP Reference: TPS-2; 9-75

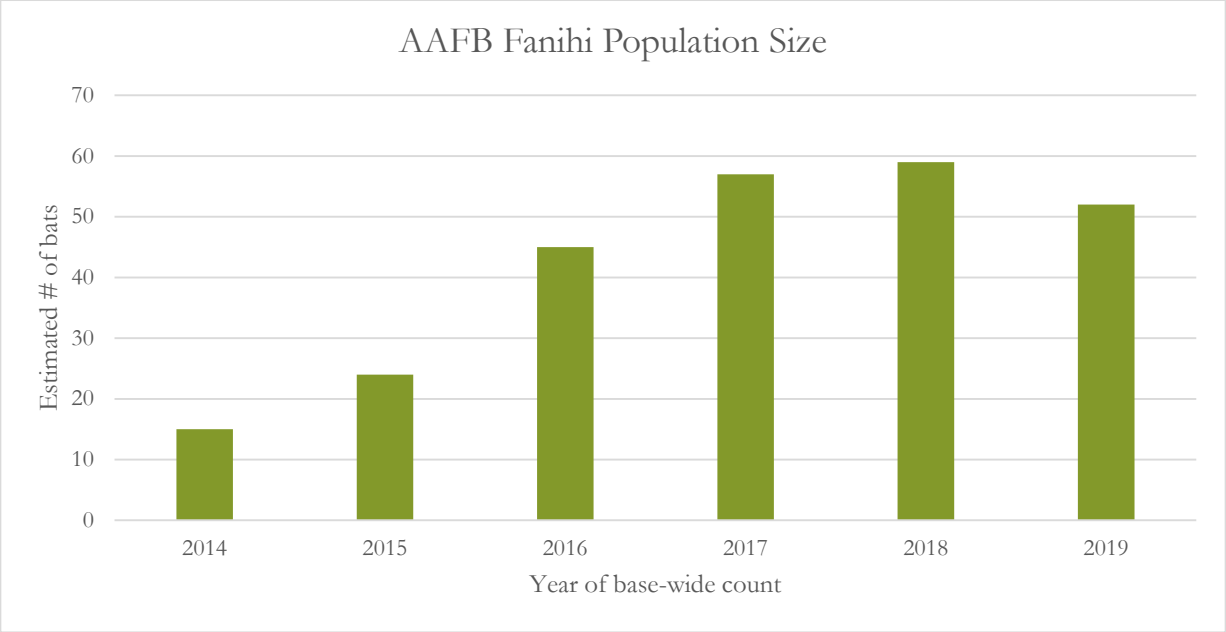

Figure 56. Estimations of AAFB Fruit Bat population size by year.

Serianthes nelsonii Monitoring and Management – AAFB

Location: AAFB **Period of Performance:** MAY2016 – OCT2017

Project Objective

Maintenance and monitoring of mature tree at Ritidian including seedlings and fence maintenance, monitoring and maintenance of outplanted seedlings, and nursery propagation and maintenance of seedlings.

Conservation Benefit

Implement recovery actions such as increasing populations, insuring against catastrophic events, and testing and implementing new conservation strategies.

FY19 Status

- Ritidian Tree- the mature tree at Ritidian remains stable despite the heartwood is 80% infected with the fungus *Ganoderma sp*., which is weakening the internal structure of the tree. In August of 2019 there were 24 seedlings within the enclosure and 404 seeds have been collected (Figure 57).
- Outplantings - Serianthes are being outplanted in two fenced cycad plots at Tarague and the Golf Course. There are 11 in the Tarague plot, with 4 being in very poor condition. The Golf Course plot contains 10 saplings with 2 in very poor condition. Further research is needed to determine the reason the Tarague plants are not doing as well as the Golf Course plants.
- GPEPP Rare Plant Nursery - In August of 2019 there were 35 seedlings in the nursery (Figure 58). Eight (8) saplings remain from a previous contract, three (3) from 2016, six (6) from 2017, and 35 from 2018.
- Tissue Culture - In August of 2019, ten (10) embryos were extracted from immature seeds. These are germinating in #2 media.
- In early September 2019 a kick-off meeting was held for the new option year of the project. Plans include air layering and maintenance of the Serianthes on the Guam National Wildlife Refuge. The Serianthes Management Plan will be updated and partners brought in for discussion.

EPR: 2 LC MAR AAFB *Serianthes nelsonii* Monitoring and Management; M5240CN039

2019 JRM INRMP Reference: TPS-5; 9-76

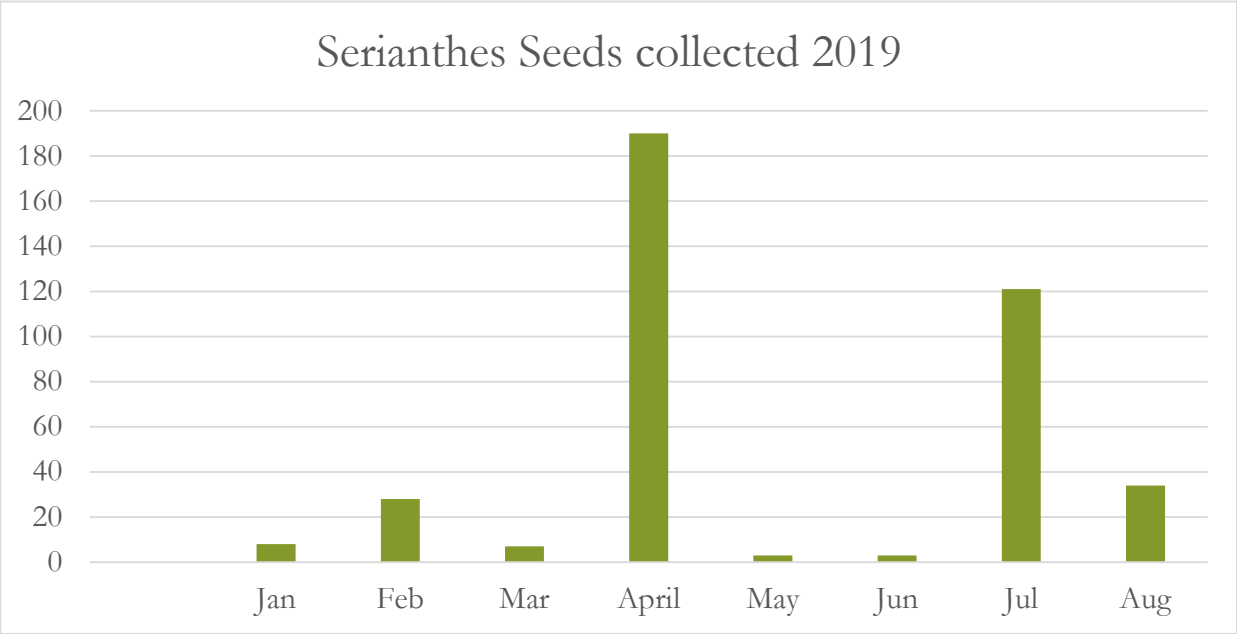

Figure 57. Serianthes seeds collected by month in 2019 on AAFB.

Figure 58. Seedlings planted in June were transplanted to 1 gallon root-maker pots.

Cycad Conservation – AAFB

Location: AAFB **Period of Performance:** SEP2017 – MAR2020

Project Objective

Maintenance and monitoring of five, 1-acre permanent fenced cycad (*Cycas micronesica*) plots (Achae Point, Ritidian Point, Tarague Basin, HMU, and Golf Course).

Conservation Benefit

Monitoring to allow for management actions to enhance and restore habitat; maintain or increase *Cycas micronesica* populations.

FY19 Status

- A new Cooperative Agreement through the CESU network was awarded to UOG on September 2017.
- UOG continues to monitor the Tarague, Ritidian Achae, Palms Golf Course, and NWF plots. The cycad plot at the HMU is no longer being monitored due to access issues and poor health of trees.
- On February 2018, UOG established unfenced plots adjacent to the existing cycad plots at Tarague, Ritidian Achae, Palms Golf Course, and Northwest Field to use as controls in order to gauge the effectiveness of conservation methods being implemented. The construction of the LFTRC will limit access to the NWF plot. As of August 2019 two new plots are being approved by Planning and Environmental at AAFB. One will be placed in Tarague Basin. A second site location was rejected due to cultural resource issues. GPEPP is currently searching for a suitable alternative site.
- Yearly data collection of cycads was conducted in the Tarague, Ritidian Achae, Palms Golf Course, and NWF plots. The data that were collected for each tree included: base circumferences; trunk circumference at 1.45 m; total height; number of leaves. Additional notes describe the overall assessment of each tree. Sticky traps are being deployed within the plots as part of a study to determine the seasonality of scale breeding. Crawler stage scales are captured by the sticky traps and can be counted (Figure 59).
- The Tarague plot fence is in good condition. Cycads are being treated with Merit and all vines and weeds removed from the trees. Sticky traps have found low densities of cycad crawlers. There are currently 19 seedlings in the plot, half of

which are infested with scale. These have been treated with Distance.

- The perimeter of the fence at the Ritidian Achae plot is heavily disturbed by ungulates. In August of 2019 a feral pig was found inside the plot and captured. A fence inspection found three places where pigs had dug underneath the chicken wire on the basal portion of the fence. These areas were tucked under enough rocks to prevent more pigs from entering. In August of 2019 there were fourteen female trees with maturing sporophylls, but no males with cones. Sticky traps show a similar number of crawlers as past months.
- The fence at NWF plot is in good condition. Sticky traps have showed low density of crawlers in August 2019. There is one seedling which was treated for scale.
- The fence at the Palms Golf Course plot is in good condition. Sticky traps are showing a higher density of crawlers compared to the other plots. As of August 2019 there were 6 female trees with sporophylls, although 3 appeared unfertilized/aborted. There were 2 males with cones.
- Merit, an insecticide containing the active ingredient imidacloprid was spread around the base of all cycads. Insecticides are applied to all cycads on all plots quarterly.
- Seedlings (Figure 60) within the Palms Golf Course and Tarague cycad plots show signs of scale infestation.

Tracking Movement of Micronesian Starlings and BTS on Andersen Air Force Base with an Automated Telemetry Tracking Network

Location: AAFB **Period of Performance:** SEP2019 – MAR2021

Project Objective

The goals of this project are to track the movement of Micronesian starlings (*Aplonis opaca*) and BTS on AAFB to identify areas of high use and routes of transit through automated telemetry towers, and document areas of high predation by BTS.

Conservation Benefit

This project is one of four projects that will, collectively, further develop information on BTS behaviors related to predation and movement in the presence of abundant avian species. Additionally, population demographics that could be useful for supporting future avian restoration projects and controlling BTS in low density with competing food sources in the presence of control regimes.

FY19 Status

- New funded project through an Interagency Agreement with USGS –PIERC starting in FY2019
- Project in early phases

EPR: 1 RP JRM Brown Tree Snake Eradication and Control to Support Recovery of ESA-Listed Birds; 61128NR202

2019 JRM INRMP Reference: TPS-6; 9-77

Evaluating and reducing BTS predation threat in urban Micronesian Starling Habitat – AAFB

Location: AAFB **Period of Performance:** SEP2019 – MAR2021

Project Objective

The project will evaluate control tools for urban BTS suppression in experimental high and low snake density plots. Also, monitor the relative abundance of BTS as a predation or dispersal threat via contact rates with baited camera devices. Overall this project will evaluate BTS control tools for suitability and efficacy in urban habitat, and use camera monitoring to index the decrease in Micronesian starling (*Aplonis opaca*) predation threat following snake removal.

Conservation Benefit

This project is one of four projects that will, collectively, further develop information on BTS behaviors related to predation and movement in the presence of abundant avian species. Additionally, population demographics that could be useful for supporting future avian restoration projects and controlling BTS in low density with competing food sources in the presence of control regimes.

FY19 Status

- New funded project through an Interagency Agreement with USDA –NWRC starting in FY2019
- Project in early phases

EPR: 1 RP JRM Brown Tree Snake Eradication and Control to Support Recovery of ESA-Listed Birds; 61128NR202

2019 JRM INRMP Reference: TPS-6; 9-77, TIS-3; 9-72

Monitoring Survival and Demography of Micronesian Starlings

Location: AAFB **Period of Performance:** JUL2019 – JAN2021

Project Objective

To monitor and analyze for Micronesian starling (*Aplonis opaca*) nest success and fledgling survival using telemetry, nest monitoring, and survey methods in relation to BTS control efforts. Through monitoring fledging survival and population recruitment efficacy of BTS control techniques can be assessed.

Conservation Benefit

This project is one of four projects that will, collectively, further develop information on BTS behaviors related to predation and movement in the presence of abundant avian species. Additionally, population demographics that could be useful for supporting future avian restoration projects and controlling BTS in low density with competing food sources in the presence of control regimes.

FY19 Status

- New cooperative agreement through the CESU network with Iowa State University (ISU)
- Survey for fledglings and juveniles in progress
- Installation of 21 new nest boxes
- No data or information available at this time

EPR: 1 RP JRM Brown Tree Snake Eradication and Control to Support Recovery of ESA-Listed Birds; 61128NR202

2019 JRM INRMP Reference: TPS-6; 9-77, TIS-3; 9-72

Salvage and Transplantation of *Partula radiolata* – NBG TS and AAFB

Location: AAFB **Period of Performance:** JAN2019 – JUL2020

Project Objective

To salvage and translocate federally endangered *Partula radiolata* identified within the construction footprint on Andersen South associated with the Guam Relocation.

Conservation Benefit

To minimize impacts of military construction activities to native ecosystems by salvaging as many healthy individuals as possible and preserving the genetic diversity of the species.

FY19 Status

- Snail surveys began in January 2019
- Over 75% of the project area at Andersen South has been surveyed for snails.
- *Partula radiolata* have been located in two main areas of the project area (Figure 61).
- All snails located within the project footprint will be translocated. To date, 645 snails have been translocated.

EPR: DPRI: Marine Corps Relocation 2017/2018 amendment to 2015 BO, Conservation Measures to Contribute to the Recovery of Listed Species.

2019 JRM INRMP Reference: TPS-1; 7-55

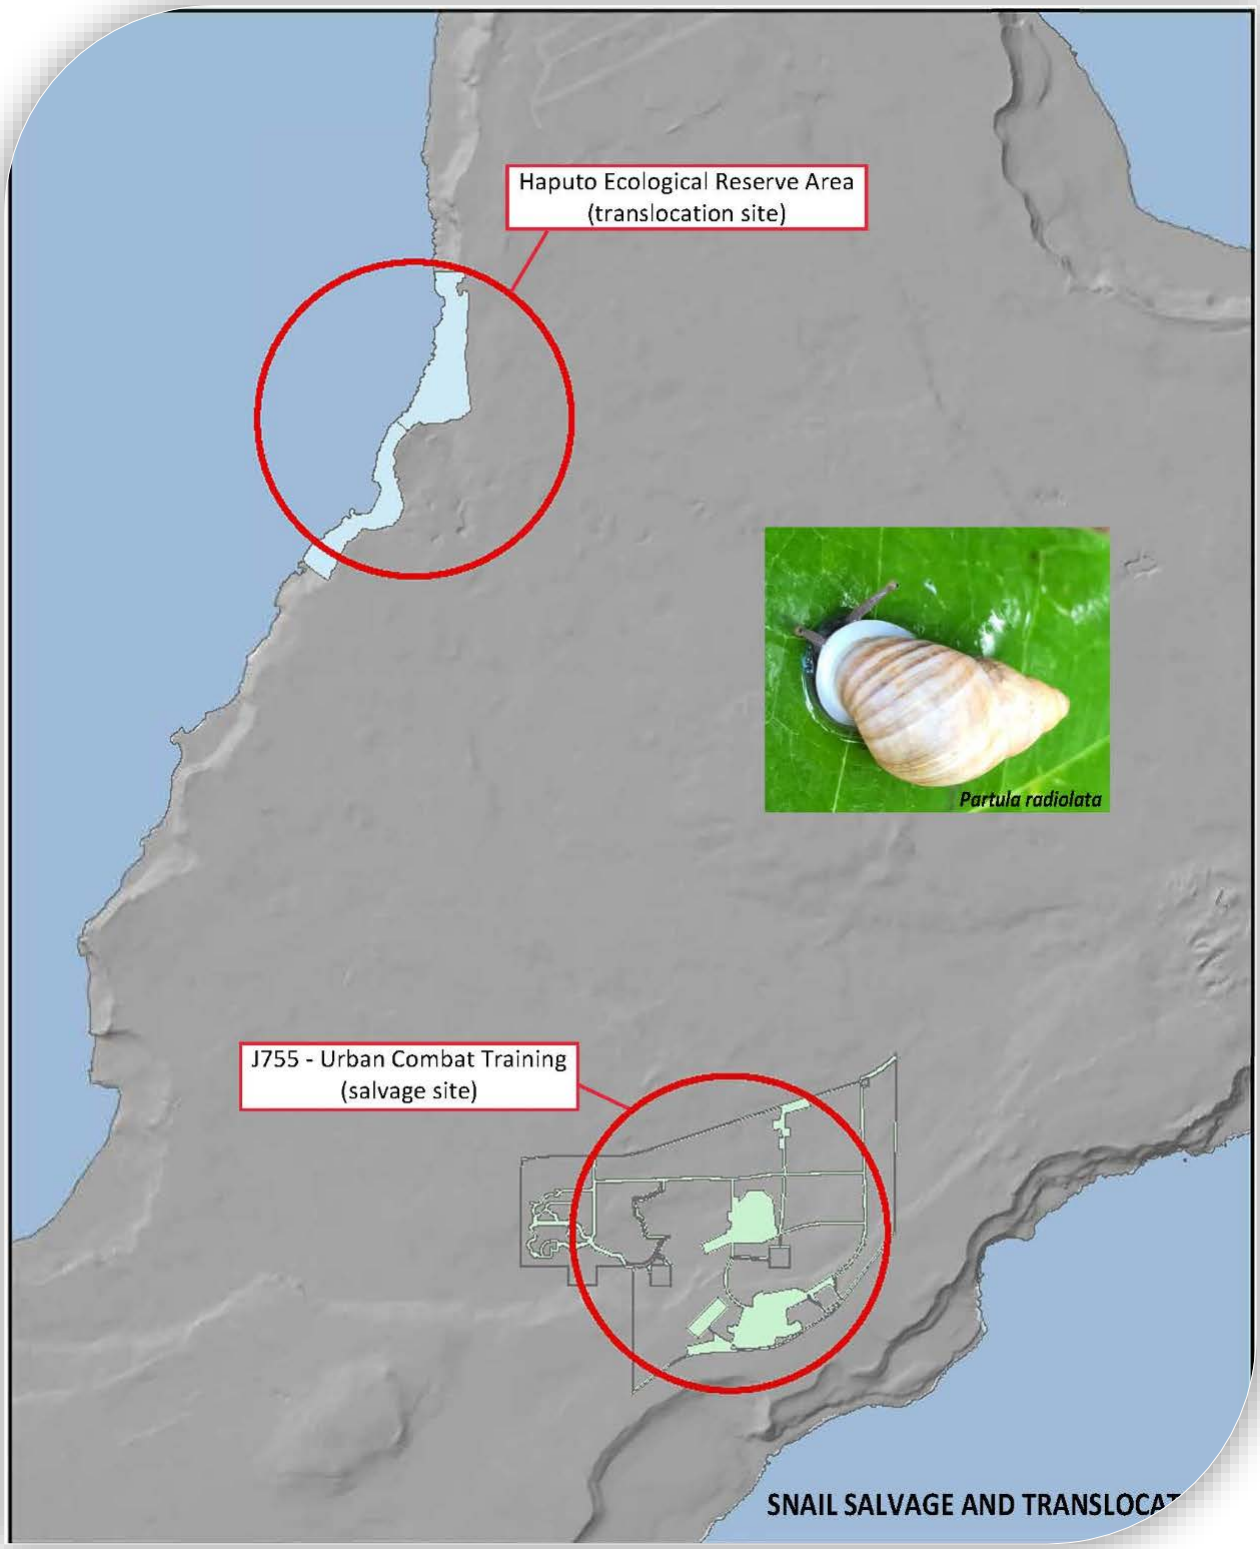

Figure 61. Map depicting locations of salvage and transplantation of *Partula radiola*.

Native Plant Seed Collection, Salvage, Storage, and Nursery Propagation for Forest Enhancement

Location: NBG TS **Period of Performance:** OCT2017 – OCT2022

Project Objective

The primary objective of this project is to provide native plant material for use in limestone forest enhancement projects in northern Guam by designing, installing, and operating a native plant nursery.

Conservation Benefit

To maintain a stock of healthy native plants ready to be used in forest enhancement planting. Native plant species from within DoD construction areas will be salvaged and propagated at the native plant nursery to maintain genetic diversity.

Figure 62. Native plant nursery at Finegayan.

FY19 Status

- Native plant nursery installed at Finegayan.
- Irrigation and water filtration system installed.
- Contractor received a 10(a)(1)(A) permit for collection of threatened and endangered species.
- Native plant seed collection - *Clayoxylon marianum, Syzygium thompsonii, Pongamia pinnata,* and *Psychotria hombroniana*.
- Seed transfers - 1,300 + seeds of *T. rotensis, H. longipetiolata, Meiogyne*

cylindrocarpa, S. thompsonii.

- Seed propagation - Began propagation of *T. rotensis* and *H. longipetiolata* seeds.
- Plant material collected - cuttings from *Procris pedunculata* and *Elatostema calcareum*.

EPR: DPRI: Marine Corps Relocation 2017/2018 amendment to 2015 BO, Conservation Measures that will Contribute to the Recovery of Listed Species.

Surveys for ESA-listed Plants, Treesnails, Butterflies and Butterfly Host Plants – NBG TS and NBG

Location: NMS; NBG TS **Period of Performance:** JUL2017 – JUL 2019

Project Objective
To document locations and estimate population densities of ESA-listed species on 887 hectares (2,191 acres) of NMS sites that are proposed ungulate exclusion areas and to document listed snail colonies at Haputo ERA, NBG TS.

Conservation Benefit
Identifying locations and population numbers of ESA-listed species will aid in fence construction and allow monitoring of populations after fence construction and ungulate eradication. Will also allow estimates for the total populations of ESA-listed species on NMS and Navy lands on Guam.

FY19 Status

- Project complete
- Using Distance transect methodology, densities and populations were estimated for ESA-listed species on 887 hectares (Figure 64 - 65).
- The number recorded species including those that population estimates could not be calculated are listed in the Table 10.
- Snail surveys at Haputo ERA documented 1,530 *Partula radiolata* and 136 *Partula gibba*. A previously unknown colony of *P. gibba* was also documented.

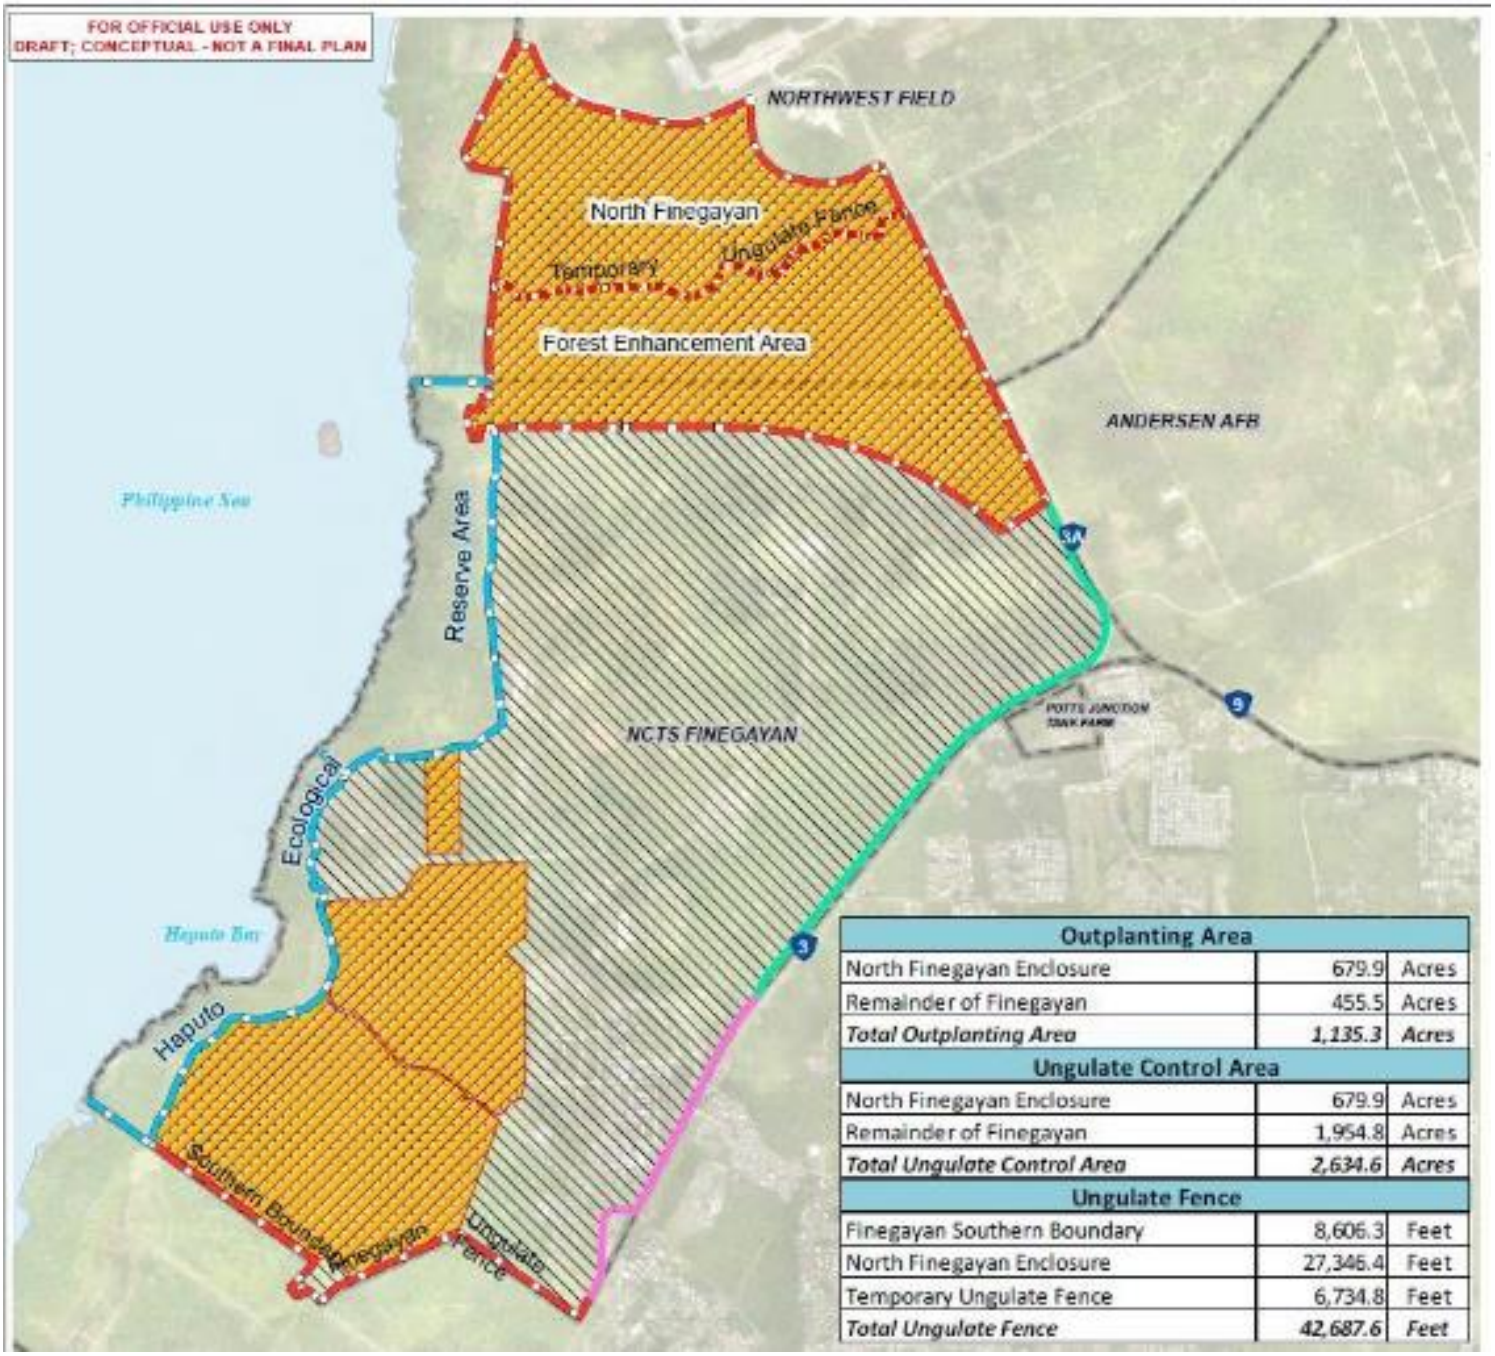
Comprehensive Baseline Vegetation Survey and Long Term Monitoring Plan for the Forest Enhancement Areas at Finegayan

Location: NBG TS; AAFB **Period of Performance:** SEP2018 – MAR2020

Project Objective

The project will complete an ecosystem vegetation baseline survey within the North Finegayan and Finegayan Forest Enhancement Sites. The survey and a suite of environmental data will be used to recommend treatment areas, identify sites appropriate for threatened and endangered plant species, develop long term monitoring protocols for the sites, and establish success criteria for enhancement efforts.

Conservation Benefit



The plan will inform forest enhancement efforts intended to restore limestone forests and improve degraded landscapes to better support native species, including threatened and endangered plants and animals.

FY19 Status

- CESU awarded to ISU in September 2018.
- Forest enhancement site transects and data collection completed. Reference site surveys will begin in late 2019.
- Final report expected March 2020.

EPR: DPRI: Marine Corps Relocation 2017/2018 amendment to 2015 BO, Conservation Measures to Contribute to the Recovery of Listed Species.

2019 JRM INRMP Reference: TPS-1; 7-55

Cycad Conservation – Tinian

Location: Tinian, CNMI **Period of Performance:** APR2019 – APR2020

Project Objective

To conserve representative plants of *Cycas micronesica* populations from Guam; ongoing project from 2007.

Conservation Benefit

Increase populations, insure against catastrophic events, and test and implement new conservation strategies.

FY19 Status

- Due to a contract award gap, contractors were not able to perform plot maintenance work from July 2018 through April 2019.
- The plots were subjected to Typhoon Mangkhut (September 2018) and Super Typhoon Yutu (October 2018).
- Post Typhoon Mangkhut and Super Typhoon Yutu evaluation showed approximately 70% survival.
- The project was awarded as a cooperative agreement to UOG in 2019. Initial evaluation after FY19 award, shows most survived. The Preliminary estimate appears close to what was found in the FY18 report.
- The lack of over story species has allowed understory species to grow quite rapidly, “burying” many of the cycad seedlings. Without regular maintenance, these trees will likely be overwhelmed by encroaching vegetation.
- During the August 26 – 29 site visit, scale was discovered on five of the 96 plants in Plot 12. Although brown scale has been documented previously, this scale is white and appears to be aulacaspis scale (*Aulacaspis yasumatsui*) (Figure 67).
- In addition to scale in this plot, three (3) plants were also discovered to have butterfly larva on newly emerging leaves.
- These larva appear to be the early instar stage of cycad blue butterfly larva (*Chilades pandava*) (Figure 68).

- All protective measures were taken to avoid contaminating the Tinian cycads. Tools used in Tinian were purchased new and stored on Tinian. All clothing and boots are thoroughly washed and frozen for at least 48 hours prior to transport from Guam to Tinian.
- Pesticides will be applied along with plot maintenance and inspection for scale and butterfly in other plots.

EPR: 1 CP MAR Conservation Management of Tinian Cycads; 61128NR162

2019 JRM INRMP Reference: TPS-1; 11-63

Figure 67. Larva (instar stage) of Cycad blue butterfly (*Chilades pandava*) was discovered on three plants in plot 12.

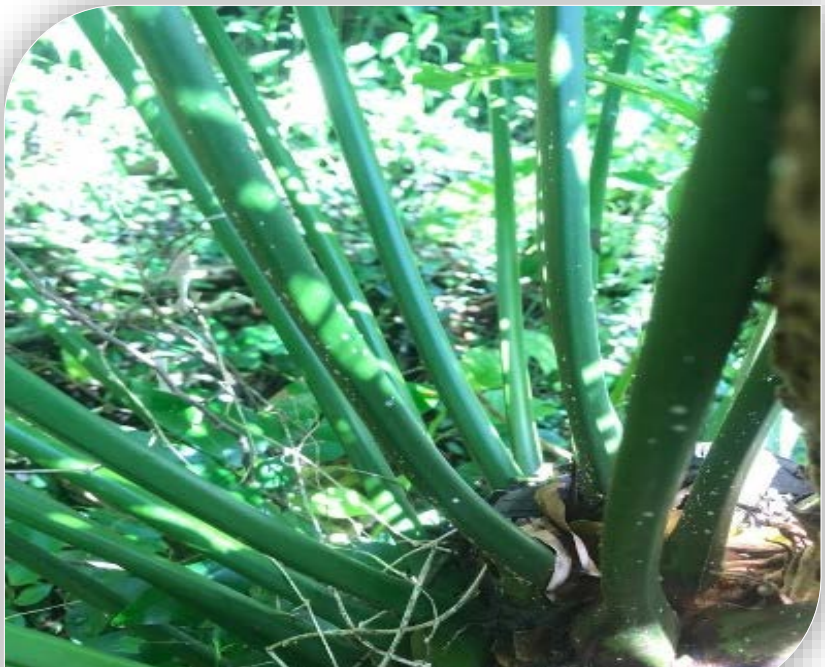

Figure 68. Cycad aulacaspis scale (*Aulacaspis yasumatsui*) was discovered on 5 plants in plot 12.

Beach Cleanups at Tinian Sea Turtle Nesting Beaches

Location: Tinian, CNMI **Period of Performance:** AUG2018 – SEP2019

Project Objective

Removal of marine debris from all sea turtle nesting beaches in the Military Lease Area (MLA) with particular attention to the windward beaches of Dangkulo, Chigit and Masalok where debris accumulates after storms. Cleanup would be conducted annually at a minimum and more frequently as needed.

Conservation Benefit

The removal of marine debris benefits sea turtles by preventing entanglements and allowing successful nest excavation and egg deposition.

FY19 Status

- Beach cleanups were conducted every four months, following storm events when marine debris tended to accumulate at an increased rate.
- A total of 1,807.5 lbs. of marine debris and trash were collected during three cleanup events.
- Marine debris was sorted into a total of 134 bags of recyclables (plastic, aluminum, glass) and non-recyclables (foam, footwear, fishing gear, etc).
- All bags of sorted marine debris were transported by rental trucks and charter vessels from Tinian, CNMI beaches to the Lower Base Refuse Transfer Station located on Saipan, CNMI for final disposal.
- A high density of marine debris was documented on windward, east-facing MLA beaches (ex. Dangkulo); while on leeward, west-facing beaches (ex. Chulu) litter from beach visitors and picnickers was observed in greater abundance.
- The top four materials collected by weight were plastics (63%), fishing gear (23%), footwear (7%), and glass (5.6%) (See Figures 69 - 71).

EPR: 1 RP MAR CNMI ESA and MBTA Species Management; 61128NR211

2019 JRM INRMP Reference: TPS-2; 11-64

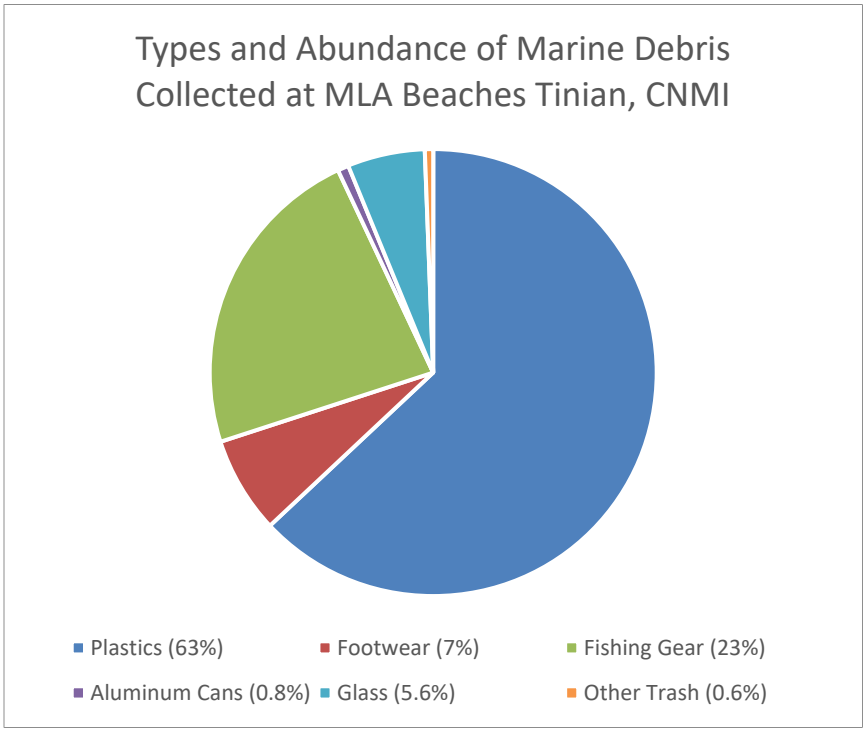

Figure 69. Types and abundance of collected marine debris at MLA beaches Tinian, CNMI.

Concrete barrier - Sea Turtle Conservation – CNMI

Location: Tinian, CNMI **Period of Performance:** SEP2018 - SEP2019

Project Objective

The intent of this contract is to fabricate, paint, transport and place, eighty (80), six foot concrete barriers to North Field, Military Leased Area, Tinian. Barriers will be placed on MLA beach access roads with input from CNMI resource partners on placement.

Conservation Benefit

Poaching and predation of sea turtle nests and recreational use of sea turtle nesting beaches have resulted in disturbance of habitat and illegal intentional take of these endangered species. Concrete barriers will prevent vehicles from disturbing nesting female turtles, their nests and nesting habitats.

FY19 Status

- Barriers are fabricated and painted. They are currently stored on FPA Corp lot (Figure 72).
- Awaiting concurrence from CNMI SHPO to deliver and place on North Field at the time of this report.
- Currently coordinating with CJCO, and CNMI, Bureau of Military Affairs regarding comments and suggestions for barrier placement on Tinian MLA beach access roads.

EPR: 1 RP MAR CNMI ESA and MBTA Species Management Tinian; 61128NR211

2019 JRM INRMP Reference: TPS-2; 11-64

Figure 72. Photo of concrete barriers fabricated for turtle nest protection.

Sea Turtle Surveys – Tinian

Location: Tinian, CNMI **Period of Performance:** OCT2018 - OCT2019

Project Objective

Ongoing monthly monitoring of sea turtle nesting activities on Tinian MLA beaches

Conservation Benefit

Collecting long-term trends of sea turtle nesting can determine population estimates and abundance on Tinian and throughout the region.

FY19 Status

- 38 nests and three (3) non-nesting emergences (NNEs) were observed on Tinian MLA beaches during 16 surveys between October14, 2018 – August 31, 2019 (Figure 73).
- Turtle activities occurred at Masålok, Dangkulo, Babui and Chulu beaches.
- It is estimated that Tinian MLA beaches supported a total of four nesting turtles during the 2019 season: Masålok (n=1) and Dangkulo #1, #4, #5 and #8 (n=4).
- Remaining nests for which hatching evidence was observed were inventoried; mean clutch size was 95 (n=19), hatch success was calculated to be 84% (n=19) while emergence success was not calculated at the time of this report.
- Final report will be available October 2019

EPR: 1 S RP MAR CNMI ESA and MBTA Species Management; 61128NR211

2019 JRM INRMP Reference: TPS-2; 11-64

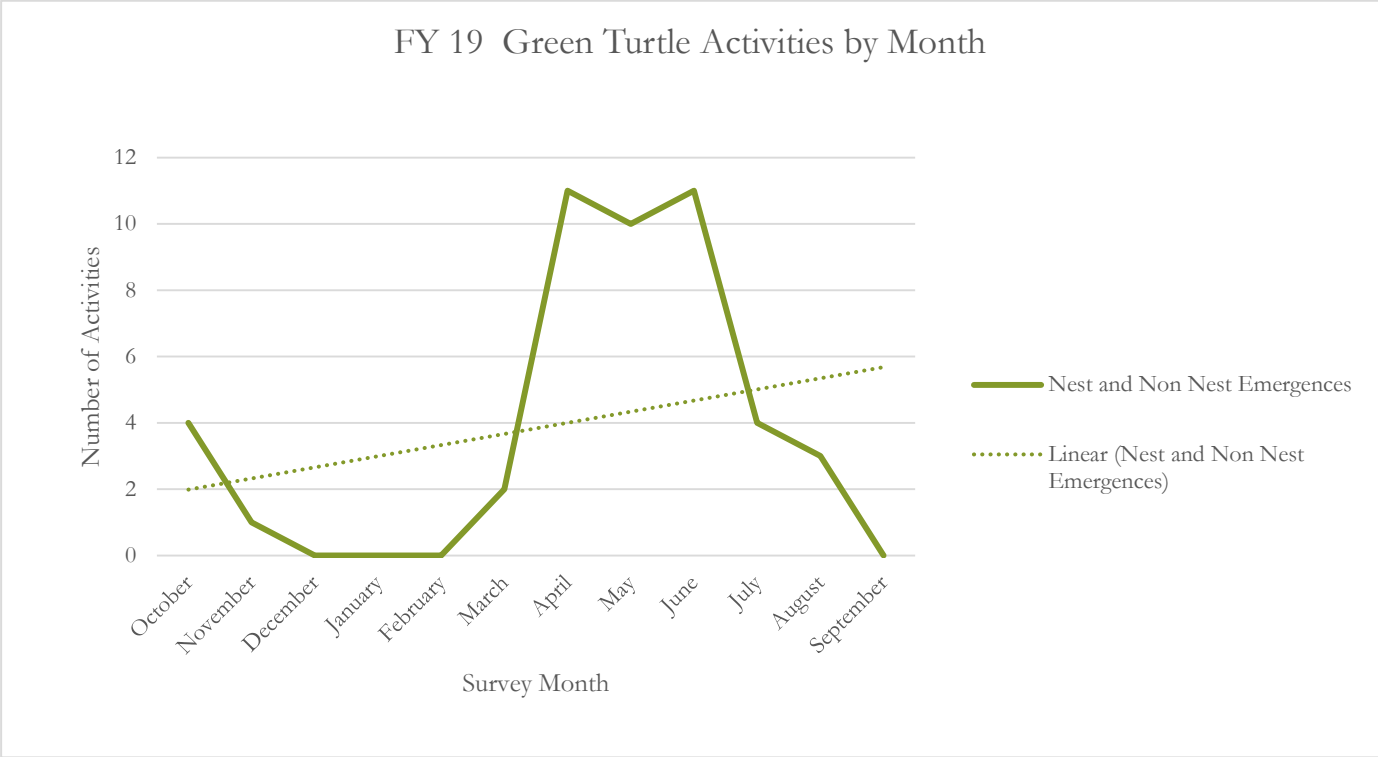

Figure 73. Frequency of MLA Tinian, CNMI green turtle nesting activities observed during monthly surveys for the period Oct 2018 to Sept 2019.

Mariana Common Moorhen Surveys – Tinian

Location: Tinian, CNMI **Period of Performance:** SEP2018 – SEP2019

Project Objective

Ongoing monitoring of nesting moorhens (*Gallinula chloropus guami*) at Hagoi and Bateha Wetlands in the Tinian MLA. (Previous Mariana Islands Range Complex [MIRC] BO Requirement, continued as an INRMP project).

Conservation Benefit

Monitor long-term trend of the moorhen population.

FY19 Status

- Four (4) surveys were conducted at Hagoi wetland quarterly between October 2018 and July 2019.

- The number of Mariana Common Moorhens detected per survey during the four surveys between October 2018 and July 2019 was 15 ± 10 SD (range 0-21) (Figure74).
- Eleven (11) active or old moorhen nests were observed at the Hagoi wetland between October 2018 and July 2019.
- No moorhen surveys were possible at the Bateha B-01 wetland in 2018-2019; nevertheless, ponded water was not observed in this wetland from an airplane on 2 and 10 August 2019.
    - Due to uprooted trees and vine growth following Super Typhoon Yutu, Bateha B-01 trail was impassable and presented a safety issue.
- Final report received September 2019

EPR: 1 S RP MAR CNMI ESA and MBTA Species Management; 61128NR211

2019 JRM INRMP Reference: TPS-3; 11-65

Tinian Forest Bird Monitoring and Assessment

Location: Tinian, CNMI **Period of Performance:** SEP2018 – FEB2020

Project Objective

Understand overall population status of forest birds of Tinian, especially the Tinian monarch and Micronesian megapode. Provide data to enable analyses of population trends over time of forest bird species on Tinian to enhance and conserve populations.

Conservation Benefit

Inform conservation and management actions for the Tinian monarch. Track the population status of the federally-endangered Micronesian megapode and other Tinian forest birds.

FY19 Status

- Awarded as a Cooperative Agreement to UoG through the CESU network in September 2018.
- Work will consist of:
    - Conducting surveys for forest birds on Tinian MLA using large-scale variable circular plot surveys.
    - Conducting Micronesian Megapode surveys.
    - Investigating the status and viability of the Tinian monarch, by assessing: 1) adult and juvenile survival, 2) reproductive success, 3) site fidelity, 4) habitat use and homerange size, and 5) potential limiting factors and applying predator control measures, if appropriate, to improve nesting success and juvenile and adult survival
    - Conducting vegetation sampling within Tinian monarch nesting habitat.
- Final report due in February 2020 (requested NCE will move this date to March 2021).

EPR: CHS MAR JRM Tinian Forest Bird Monitoring; EPR 61755NR303

2019 JRM INRMP Reference: TPS-4; 11-64

Monitoring for Micronesian Megapodes and Mariana Fruit Bats

Location: FDM **Period of Performance:** OCT2018 – SEP2019

Project Objective

To conduct Micronesian megapode (*Megapodius laperouse*) surveys along established trails and paths to use as an index of megapode population change over time; record Mariana fruit bats (*Pteropus mariannus mariannus*) observed during surveys, and conduct habitat ground surveys to monitor habitat change over time per the 2015 Mariana Islands Training and Testing (MITT) BO terms and conditions.

Conservation Benefit

To ensure compliance with the Incidental Take Statement of the 2015 MITT BO.

FY19 Status

- Survey conducted on April 12, 2019 at eight stations previously established and two new stations establish during this survey (Figure 75).
- Total of 20 megapodes were detected during survey effort. Eighteen birds detected at seven playback survey stations and two birds detected between stations No. 3 and No. 4 that were unresponsive to station playbacks (Table 11).
- No Mariana fruit bats observed while implementing megapode surveys.
- Vegetation photo points collected at megapode survey stations.
- Final survey report expected November 2019.

EPR: BO MAR Mariana Islands Training and Testing (MITT) Implementation; 61128NR218

2019 JRM INRMP Reference: TPS-1; 12-34

Migratory Bird Management

Migratory Bird Surveys – NBG

Location: NBG; NMS; NBG TS **Period of Performance:** recurring annually

Project Objective

To: (1) identify migratory bird species on NBG; (2) examine trends in abundance; (3) identify and quantify suitable habitat for migratory birds; and (3) examine habitat relationships of migratory birds.

Conservation Benefit

Monitor long-term trends of spatial and temporal distribution of migratory birds on NBG lands.

FY19 Status

- Migratory bird abundance was monitored at 20 sites on NBG between October 2018 and August 2019.
- 220 surveys conducted at 20 sites.
- 12 species were recorded with Pacific golden plovers accounting for 65% of migratory birds observed, ruddy turnstones 17%, whimbrels 12%, and all other species collectively accounted for 6% of observations. These findings are consistent with data from past years.
- Abundance was higher during September – April compared to May – August.
- Migrants used grass fields more often than shoreline or wetland habitats; however, habitat use varied among species.
- Navy plans to continue conducting migratory bird surveys on NBG and examine the relationship between habitat use and maintenance plans at grass fields.

EPR: 1 RP MAR CNMI ESA and MBTA Species Management (Key species Moorhen and Sea Turtles); 61128NR211

2019 JRM INRMP Reference: MIG-1; 5-90

Monitoring of MBTA-Listed Bird Species – FDM

Location: FDM **Period of Performance:** OCT2018 – SEP2019

Project Objective

To identify migratory bird species on FDM; examine trends in abundance; identify and quantify suitable habitat relationships of migratory birds. Monitor long-term trends of three booby species (Brown, Masked, Red-footed) on FDM via helicopter surveys.

Conservation Benefit

Provides information of bird species present and habitat usage to guide implementation of appropriate conservation practices.

FY19 Status

- No aerial surveys conducted in FY19 due to lack of commercial helicopter support in the CNMI.
- JRM continuing to explore options to continue monitoring long-term seabird trends for the three booby species.

EPR: 1 S MAR NBG Endangered Species Surveys; 61128NR211

2019 JRM INRMP Reference: MIG-1; 12-35

Terrestrial Natural Resources Educational Outreach

Biosecurity Outreach and Education on Guam

Location: JRM **Period of Performance:** AUG2019 – AUG2020

Project Objective

The project objective is to broadcast radio, television, and web public service announcements on Guam to educate the military personnel and contractors about invasive species and promote native species.

Conservation Benefit

Minimize the effects of invasive species by educating DoD and civilian populations through prevention. Provide awareness of introduced and invasive species, the impacts of invasive species on native species and ecosystems, and what can be done to prevent and control invasive species.

FY19 Status

- FY17: Targeted time period of broadcasts were between 0600-2200, including the nightly news television broadcast, with specific broadcasts coinciding with international events to be held on Guam to maximize viewers and listeners. Guam Department of Agriculture (GDOAg) biosecurity division reported 20+ calls were a direct result of TV/radio broadcasts.
- FY18: Targeted time period of television and radio broadcasts were between 0600-2200, including the nightly news television broadcast, with specific broadcasts coinciding with international and regional events to be held on Guam to maximize viewers and listeners. Social media video Public Service Announcements run between 1500-2400 on Guam. Final Report submitted in July 2019.
- FY19: Biosecurity Outreach contract awarded on 29 August 2019. DON working with GDOAg Biosecurity division to link social media page with video ads.

EPR: DPRI: Marine Corps Relocation 2017/2018 amendment to 2015 BO, Conservation Measures to Minimize the Effects of Invasive Species.

Outreach and Education – NBG

Location: NBG TS **Period of Performance:** AUG2019 - SEP2020

Project Objective

This project will develop, design, and produce/print custom outreach materials and educational signs for Public Works EV, Naval Base Guam.

Conservation Benefit

Avoid and minimize adverse impacts from recreational activities to ESA-listed species and other marine natural resources.

FY19 Status

Project was awarded in FY19. The project is expecting the following results:

- Replace educational signs including a fishing regulation sign and a seafood health advisory sign
- A Naval Facilities Engineering Command (NAVFAC) banner for use at outreach events
- Fishing regulation trifold brochure
- A trifold brochure that shows the location of mooring buoys for fishing boats as well as water safety.
- A 2019 Tide Chart Calendar, marine resources educational calendar

EPR: Listed Species Outreach Material; 61755NR306

Terrestrial Geographic Information Systems (GIS) and Data Management

Digital Orthography Lidar and Planimetric Data – CNMI

Location: FDM; Saipan; Tinian **Period of Performance:** SEP2018 - SEP2019

Project Objective

- Obtain aerial imagery of Tinian, Saipan, and FDM
- Obtain lidar data for bathymetric products at FDM

Conservation Benefit

- Increase habitat for ESA-listed species (e.g., corals, sea turtles, marine mammals).
- Support habitat areas of particular concern which align with Magnuson-Stevens Fishery Conservation Act for Essential Fish Habitat and the Marianas Fishery Ecosystem Plan.

FY19 Status

- GIS data capture (aerial imagery for Tinian, Saipan, and FDM; and lidar for FDM) completed JULY2019 and currently being analyzed.
- Executed no-cost extension until APR2020 due to Typhoon Yutu which hit the CNMI on OCT2018, postponing field work.

Marine Habitat Management

Water Quality Monitoring on Joint Region Marianas Submerged Lands – NBG

Location: NBG **Period of Performance:** SEP2018 - MAR2020

Project Objective

- Install, deploy, and maintain four conductivity-temperature-depth (CTD) mounting frames and four pH sensor mounting frames at four locations in Apra Harbor (e.g., Sasa Bay, Inner Harbor, Middle Harbor, and Outer Harbor), one CTD mounting frame and one pH sensor mounting frame at one location in Orote Peninsula ERA (e.g., Spanish Steps), one CTD mounting frame and one pH sensor mounting frame at one location in Haputo ERA (e.g., Double Reef), and one CTD mounting frame and one pH sensor mounting frame at one location in Naval Support AAFB (e.g., Pati Point Marine Preserve Area).
- Install, deploy, and maintain four CTD and four pH sensors at four locations in Apra Harbor (e.g., Sasa Bay, Inner Harbor, Middle Harbor, and Outer Harbor), one CTD and one pH sensor at one location in Orote Peninsula ERA (e.g., Spanish Steps), one CTD and one pH sensor at one location in Haputo ERA (e.g., Double Reef), and one CTD and one pH sensor at one location in AAFB (e.g., Pati Point Marine Preserve Area).
- Analyze water quality results, and examine the spatial and/or seasonal (temporal) variations in Apra Harbor, Orote Peninsula ERA, Haputo ERA, and AAFB.

Conservation Benefit

- Increase habitat for ESA-listed corals (e.g., *A. globiceps, A. retusa,* and *S. aculeata*)
- Support habitat areas of particular concern which align with Magnuson-Stevens Fishery Conservation Act for Essential Fish Habitat and the Marianas Fishery Ecosystem Plan

FY19 Status

- Abbreviated consultation (NOAA-NMFS) completed on 30MAY2019 and ACOE permits obtained 10 June 2019.
- CTD and pH sensors (Figures 78 - 79) deployed at Apra Harbor (e.g., Anchor Reef and Middle Shoals); Orote ERA (e.g., Blue Hole); Haputo ERA (e.g., Double Reef)

(Figure 80).

- CTD and pH sensors will be deployed at Inner Apra Harbor and Pati Point by OCT2019.

Evaluate Mangrove Functionality in the Atantano Watershed

Location: NBG **Period of Performance:** SEP2018 - SEP2021

Project Objective

- Conduct an ecological assessment of the terrestrial and marine environments within Abo Cove.
- Identify an area within Abo Cove for a mangrove restoration demonstration project.
- Design a restoration project suited for the Abo Cove shoreline.

Conservation Benefit

- Increase habitat for ESA-listed species (e.g., sea turtles and scalloped hammerhead shark).
- Support habitat areas of particular concern which align with Magnuson-Stevens Fishery Conservation Act for Essential Fish Habitat and the Marianas Fishery Ecosystem Plan.

FY19 Status

- Field work (terrestrial and marine surveys) completed DEC2018
- Draft final report submitted MAY2019
- Final report will be completed by CY19

EPR: CHS JRM Evaluate and Enhance Mangrove Functionality of the Atantano Watershed to Protect Essential Fish Habitat and Coral Reefs; 61128NR656

Coral Protection and Mooring Buoy Installation - NBG

Location: NBG **Period of Performance:** SEP2019 - SEP2020

Project Objective

- Determination of suitable anchor placement sites, procurement and assembly of apparatus, and installation of Shallow Water Mooring Systems (SWMS) within Apra Harbor, Orote Peninsula, and Outer Breakwater sites.
- Provide secure vessel attachment points at popular SCUBA/snorkel/fishing locations used by recreation and commercial boaters.

Conservation Benefit

- Increase habitat for ESA-listed corals (e.g., *A. globiceps, A. retusa*, and *S. aculeata*).
- Support habitat areas of particular concern which align with Magnuson-Stevens Fishery Conservation Act for Essential Fish Habitat and the Marianas Fishery Ecosystem Plan.

FY19 Status

- Installation of 20 mooring buoys complete (Figure 83).
- Annual maintenance and inspections required.

EPR: 1 CP MAR NBG Coral Protection Buoys; 61755NR849

2019 JRM INRMP Reference: MHM-1; 8-62

Figure 83. Map depicting locations of mooring buoys in and around Outer Apra Harbor, NBG.

Monitoring and Control of Acute Impacts on Coral Reefs in Outer Apra Harbor and Orote Peninsula and Haputo Ecological Reserve Areas (ERAs)

Location: NBG; NBG TS **Period of Performance:** SEP2017 - SEP2019

Project Objective

- Host crown of thorns starfish (COTS) training workshops for Navy EXWC and NBG Dive Locker divers, JRM/NBG Natural Resource Marine Specialists, and Guam. COTS Response Team partners lead by a COTS expert; one classroom and one in-water skills COTS training workshop to include overview of COTS ecology and history on Guam, pre-culling surveillance methods, culling guidelines, and post-culling monitoring techniques.
- Implement a monitoring program for the detection of coral stressors and COTS/marine nuisance species control within Outer Apra Harbor, and Orote and Haputo ERAs.

Conservation Benefit

- Increase habitat for ESA-listed corals (e.g., *A. globiceps*, *A. retusa*, and *S. auleata*).
- Support habitat areas of particular concern which align with Magnuson-Stevens Fishery Conservation Act for Essential Fish Habitat and the Marianas Fishery Ecosystem Plan.

FY19 Status

- COTS classroom and in-water skills training completed with NBG Dive Locker and NAVFAC Marianas Marine Resources SMEs on FEB2019.
- Pre-bleaching surveys completed JULY2019; Peak-bleaching and post-bleaching surveys currently ongoing.
- Exercised the 12-month option year to increase sampling effort.

EPR: 1 S MAR NBG Marine Ecosystem Monitoring and Coral Reef Indicators (CHS); 61755NR168

2019 JRM INRMP Reference: MHM-1; 5-98

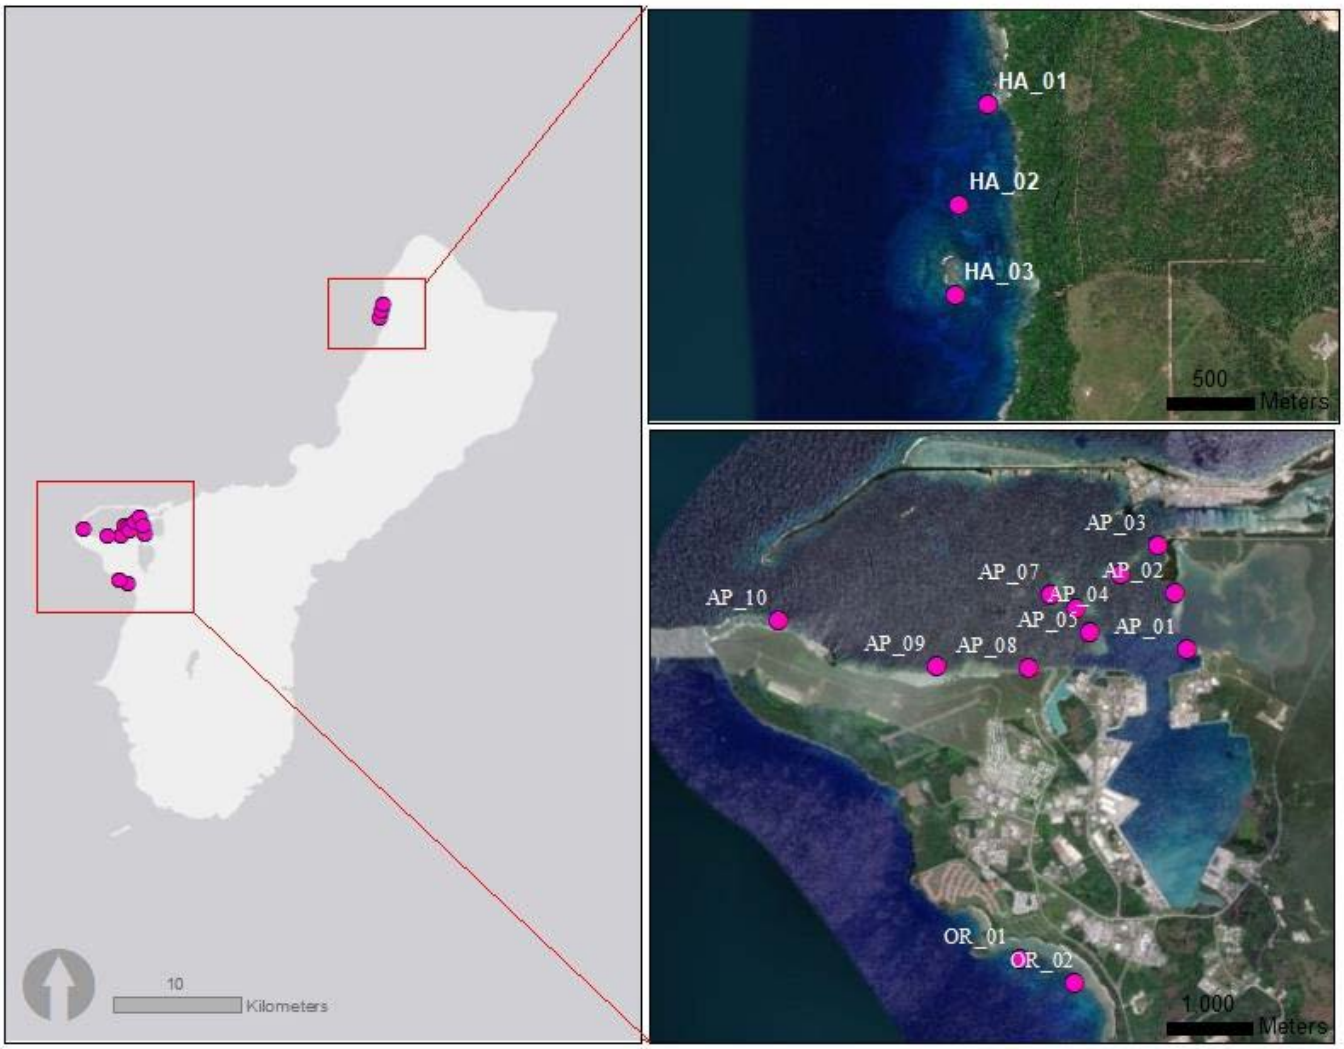

Figure 84. Map depicting survey sites at Apra Harbor, Orote ERA, and Haputo ERA.

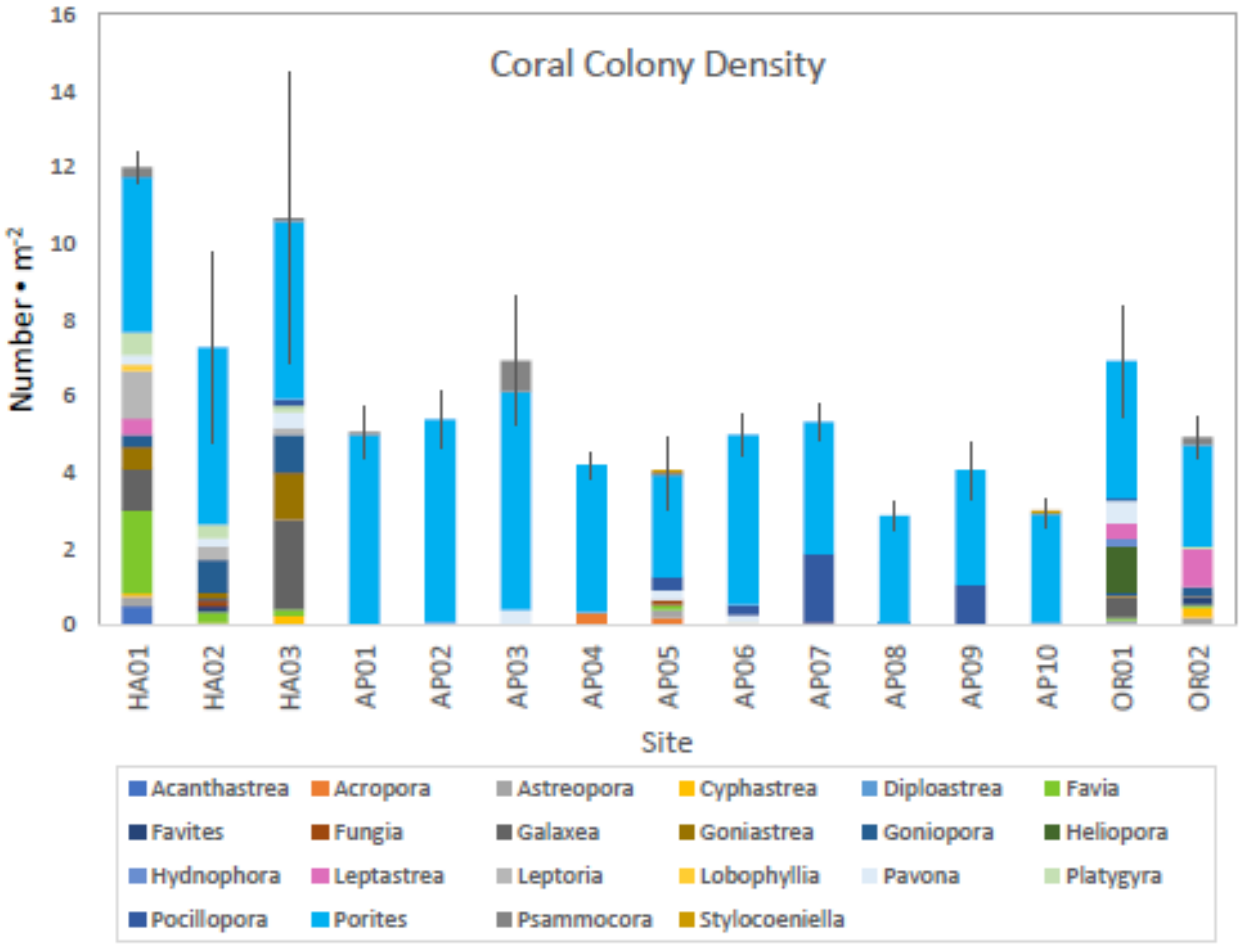

Figure 85. Mean coral colony density for each survey site. Error bars represent standard error for the overall coral density at each site.

FDM Fish Video Analyses – FDM

Location: FDM **Period of Performance:** SEP2018 - SEP2020

Project Objective

- Analyze twelve hours of fisheries videos using the appropriate desktop analysis software (e.g. VidSync or Image J).
- Submit a species list and species plot, number of observations/minimum abundance at six sites and estimate size class for fish assemblages if determinable, and comparisons of fish assemblages by site.

Conservation Benefit

- Increased habitat for ESA-listed corals (e.g. *A. globiceps*, *A. retusa*, and *S. auleata*).
- Support habitat areas of particular concern which align with Magnuson-Stevens Fishery Conservation Act for Essential Fish Habitat and the Marianas Fishery Ecosystem Plan.

FY19 Status

- Final report received AUG2019; final comments completed
- Final report will be available FY20

EPR: 1 S MAR JRM Marine Ecosystem Monitoring and Coral Reef Indicators (CHS); 61128NR168

2019 JRM INRMP Reference:
MHM-2; 12-40

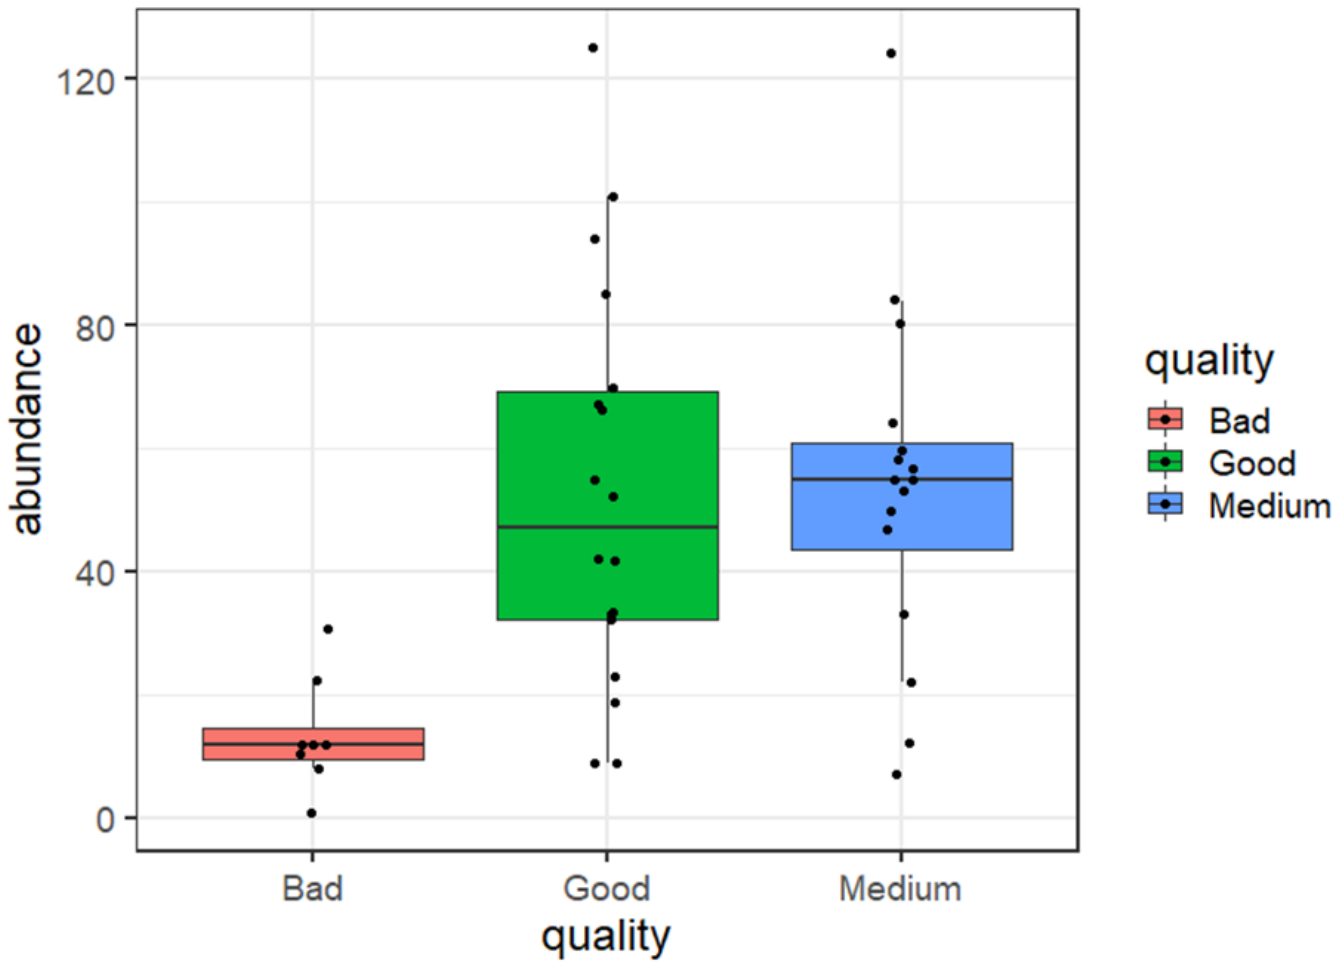

Figure 87. Total abundance of fish recorded per replicate video based upon the subjectively defined video quality.

Marine Protected Species Management

Sea Turtle Distribution and Habitat Use

Location: NBG **Period of Performance:** AUG2018 - SEP2021

Project Objective

- Conduct marine turtle surveys and in-water captures of green turtles (*Chelonia mydas*) and hawksbill turtles (*Eretmochelys imbricata*) in the nearshore waters of Guam and CNMI.
- Captured turtles are weighed, measured, biopsied, and tagged (i.e., flipper, PIT, satellite tracking) in an effort to expand our knowledge of the population demographics, population structure, and fine-scale habitat use of the turtles.
- Blood samples are also collected for two studies: 1) hormone analysis to determine population sex ratios, and 2) metabolite analysis to determine nutritional/feeding state.

Conservation Benefit

- To understand the movements of Guam and CNMI foraging populations of sea turtles to maintain or increase sea turtle populations and enhance and restore habitat.
- To collect data on the morphology and genetics of the nearshore sea turtle population.

FY19 Status

- This work is conducted through an Interagency Agreement (NMFS-PIC-18-007) between NOAA-PISF and JRM. The original agreement was from August 2016 – July 2019. The new agreement extends to September 2021.
- Twenty-four satellite tags were deployed on green and hawksbill turtles during small boat-based marine turtle surveys of Apra Harbor, Orote Point, Glass Breakwater, Dadi, and Tipalao conducted in 2016 through 2018.
- The small boat based surveys and deployed satellite tags provide information on general habitat use, home range, and core area for turtles tagged in each location.
- Deployed tags also record information on dive depth and temperature use which will be provided in the reports.

- In June 2019 a total of 12 satellite tags were deployed in the areas of Apra Harbor/Orote Point and Double Reef on foraging turtles (Table 12, Figure 88).
- A final report will be available in February 2020.

EPR: 1 S CP MAR NBG Sea Turtle Distribution and Habitat Use; 61755NR815

2019 JRM INRMP Reference:

Table 12. Summary of in-water survey effort, observations, captures, and satellite tags deployed in June 2019.

			Observations				**Captures**		**Sat. Tags**	
Date	**Island**	**Location**	***Cm***	***Ei***	***Unk***	***Cet.***	***Cm***	***Ei***	***Cm***	***Ei***
6/4	Guam	Apra Harbor/Orote Point	15	2	0	0	4	2	4	2
6/5	Guam	Apra Harbor/Orote Point	11	2	0	0	4	1	3	0
6/7	Guam	Double Reef	4	2	2	0	0	2	0	2
6/8	Guam	Double Reef/Haputo	6	2	0	0	1	0	1	0
6/9	Guam	Double Reef/Haputo	6	3	0	0	0	0	0	0
Totals			42	11	2	0	9	5	8	4
TURTLES			**55 observations**				**14 captures**		**12 sat. tags**	

Cm = green turtle (Chelonia mydas). Ei = hawksbill turtle (Eretmochelys imbricata).
Unk. = unknown turtle species (either Cm or Ei). No cetaceans (Cet.) were observed during these surveys.

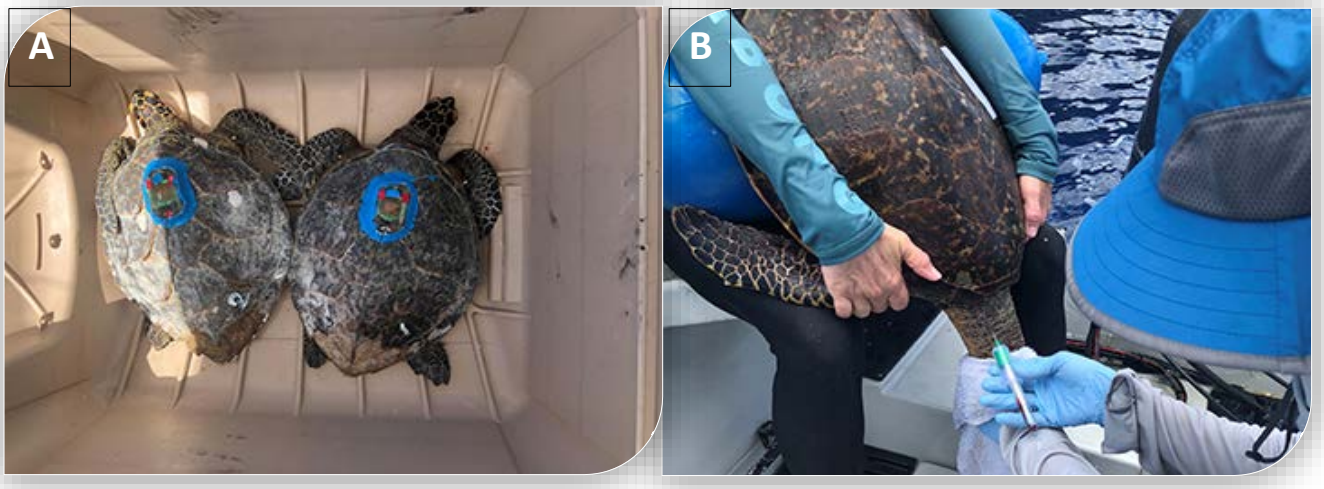

Figure 88. A: Two hawksbills captured and equipped with satellite tags at Double Reef, along the northwest coast of Guam. B: Drawing blood from a hawksbill turtle onboard the research vessel.

Detection of Scalloped Hammerhead Sharks in Apra Harbor and Adjacent Nearshore Waters using Environmental DNA (eDNA)

Location: NBG **Period of Performance:** SEP2017 - SEP2020

Project Objective

- Collect and filter marine water samples at five targeted locations within Apra Harbor and Orote ERA.
- Develop primers designed to amplify only scalloped hammerhead shark DNA.
- Assess ability to extract and detect shark DNA, and other threatened fish species (e.g., humphead wrasse and bumphead parrotfish) through targeted quantitative Polymerase Chain Reactions and metabarcoding analyses.
- Analyze eDNA results to determine the spatial and temporal presence of scalloped hammerhead sharks in Apra Harbor and Orote ERA.

Conservation Benefit

- Increase habitat for ESA-listed species (e.g., scalloped hammerhead shark).

- Support habitat areas of particular concern which align with Magnuson-Stevens Fishery Conservation Act for Essential Fish Habitat and the Marianas Fishery Ecosystem Plan.

FY19 Status

- Samples are being collected and preliminary eDNA is being extracted by the UOG Marine Lab; purified DNA samples are sent to James Cook University for analyses.
- Exercised option year one (12 months) to increase sample size(s) and complete analyses.

EPR: 1 S MAR NBG Scalloped Hammerhead Shark (*Sphyrna lewini*) Survey; 61755NR891

2019 JRM INRMP Reference: MPS-1; 8-65

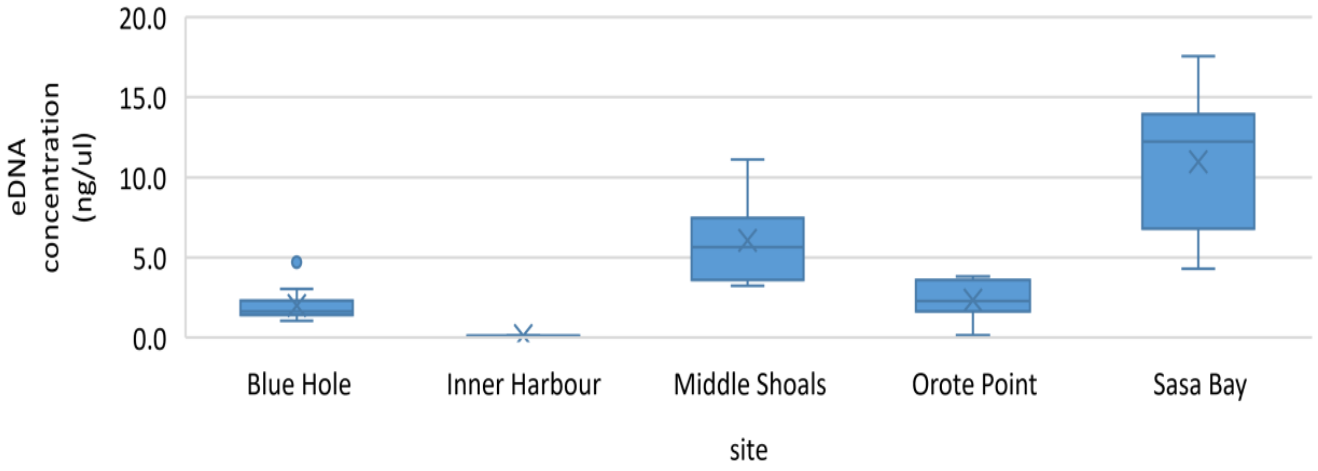

Figure 90. Mean total eDNA concentration for the Jul 2019 samples for each study site. Note: Inner Harbor samples were not collected in July.

Figure 91. Total eDNA concentration for each field sample (BH: Blue Hole, IH: Inner Harbor, MS: Middle Shoals, OP: Orote Point, SB: Sasa Bay) for the Apr 2019 samples for each study site.

Sea Turtle Aerial Surveys in FDM Nearshore Waters

Location: FDM **Period of Performance:** SEP2018 - MAR2020

Project Objective

- Design aerial transect surveys to determine sea turtle and marine mammal abundances and distributions in the nearshore waters surrounding FDM.
- Conduct aerial surveys for sea turtle and marine mammal identifications, abundances, and distributions in the nearshore waters surrounding FDM.
- Analyze sea turtle and marine mammal identifications, abundances, and distributions in the nearshore waters surrounding FDM.

Conservation Benefit

- Increase habitat for ESA-listed species (e.g., sea turtles and marine mammals).
- Support habitat areas of particular concern which align with Magnuson-Stevens Fishery Conservation Act for Essential Fish Habitat and the Marianas Fishery Ecosystem Plan.

FY19 Status

- Surveys were postponed due to Typhoon Yutu which hit the CNMI on OCT2018
- First successful survey completed on SEP2019.
- Continue with one survey per month; increase to two surveys per month by JAN2020.

EPR: CNMI Ecosystem and Protected Species Monitoring and Management: Sea Turtle Distribution and Habitat Use in FDM Nearshore Waters (emergent); 61128NR851

2019 JRM INRMP Reference: MPS-1; 12-41

Hafa Adai Resource Partners,

The FY19 JRM INRMP Guam Metrics Meetings will be held October 15 and 16 at the Outrigger Guam Resort in the Fort Santa Cruz Room from 8:00 am to 4:00 pm. Please see the attached draft agenda.

For those who cannot be present during the meetings, please use the following telecom information:

- Call-in number: 1-210-280-4353 or 1-866-423-7391, Participant Code: 4645531#

The FY19 JRM INRMP Project Summary Report, Metrics Partner Report, and project presentation slides are forthcoming.

Please forward this to anyone I may have missed. If you have any questions feel free to contact me. Thank you and I look forward to seeing you all soon!

Best,

Jennifer Cruce Horeg
Conservation Resources Program Manager
Joint Region Marianas - NAVFACMAR
(671) 339-2573

The Natural Resources Conservation Metrics is a DoD requirement to review and gather information on the Natural Resources Program and the Integrated Natural Resources Management Plan.
- Ensures each region or installation is preparing, maintaining, and implementing its Integrated Natural Resources Management Plan.
- Support Endangered Species Act (ESA) expenditure reporting to Congress and other media related data collection.
- Inform and contribute to information collected for the Defense Environmental Program Annual Report to Congress.
- Data collected during the Metrics informs DoD and Navy chains of command regarding the status of the Navy's Natural Resources Programs.

Signed By: jennifer.horeg@fe.navy.mil

Importance: High

Hello Resource Partners,

We would like to reschedule the FY19 JRM INRMP CNMI Metrics Meeting in Saipan on Thursday, 7 November 2019. I will send an update with the meeting location. The call-in number will be: 1-210-280-4353 or 1-866-423-7391, Participant Code: 4645531#

I have also attached the FY19 JRM INRMP Metrics Partner Reports for your review and input. Each year we provide an annual update to ensure that we are meeting our commitment to implement the goals and objectives of the INRMP. The Annual Metrics meeting evaluates performance in the following focus areas:

- INRMP Implementation
- Listed Species and Critical Habitat
- Sikes Act Cooperation (Partnership Effectiveness)
- Recreational Use and Access
- Team Adequacy
- Natural Resources Management (Ecosystem Integrity)
- INRMP (Natural Resources Program) Support of the Installation Mission

Our natural resources (NR) managers have input answers into our NR Metrics website. We kindly ask that you review these assessments, which are the attached FY19 JRM INRMP Metrics Partner Reports for Tinian and FDM, and provide us your input. The reports show all possible responses, with the NR managers responses provided. To meet our annual deadlines, I ask that you provide any feedback by COB Thursday 14 November. If you have any questions

please feel free to call or email me.

I realize how busy you all are with your own programs and appreciate any feedback you area able to provide. Thank you and hope to see you at the meeting!

Best,

Jennifer Cruce Horeg
Conservation Resources Program Manager

Good Afternoon Resource Partners,

Due to the potential impacts of Tropical Depression 22W and based on its current projection to be in the vicinity of the southern Mariana Islands on 21-22 Oct as a Category 1 typhoon, we have decided to postpone the Metrics meeting on 22 Oct. My apologies for any inconvenience this may have caused and we hope that if the storm does hit, it only impacts the Marianas

minimally.

We will be contacting our Partners for an alternative date.

Thank you.

v/r,

Mr. Dana T. Lujan

Subject: FY19 JRM INRMP CNMI Metrics Meeting - Call-in number: 1-210-280-4353 or 1-866-423-7391, Participant Code: 4645531#
When: Tuesday, October 22, 2019 8:30 AM-4:00 PM (UTC+10:00) Guam, Port Moresby.
Where: Saipan Army Reserve Center

Hafa Adai Resource Partners,

The meeting is still on schedule for Tuesday 22 October; however, the venue has been moved to the Saipan Army Reserve Center. I will provide presentation slides and an updated agenda prior to the meeting. Please let me know if you have any questions. Thank you and we look forward to seeing you soon!

Best,

Jennifer Cruce Horeg

Conservation Resources Program Manager

Joint Region Marianas - NAVFACMAR

(671) 339-2573

Hafa Adai Resource Partners,

The FY19 JRM INRMP CNMI Metrics Meetings will be held on Tuesday October 22 at the Hyatt Regency Saipan in the Chamolinian Room from 8:15 am to 4:00 pm. Please see the attached draft agenda.

For those who cannot be present during the meetings, please use the following telecom information:

- Call-in number: 1-210-280-4353 or 1-866-423-7391, Participant Code: 4645531#

The FY19 JRM INRMP Project Summary Report, Metrics Partner Report, and project presentation slides are forthcoming.

Please forward this to anyone I may have missed. If you have any questions feel free to contact me. Thank you and we look forward to seeing you all soon!

Best,

Jennifer Cruce Horeg

Conservation Resources Program Manager

Joint Region Marianas - NAVFACMAR

(671) 339-2573

The Natural Resources Conservation Metrics is a DoD requirement to review and gather information on the Natural Resources Program and the Integrated Natural Resources Management Plan.

- Ensures each region or installation is preparing, maintaining, and implementing its Integrated Natural Resources Management Plan.

- Support Endangered Species Act (ESA) expenditure reporting to Congress and other media related data collection.

- Inform and contribute to information collected for the Defense Environmental Program Annual Report to Congress.

- Data collected during the Metrics informs DoD and Navy chains of command

regarding the status of the Navy's Natural Resources Programs.

Subj: FISCAL YEAR 2020 NATURAL RESOURCES/INTEGRATED NATURAL RESOURCES MANAGEMENT PLAN METRICS SUMMARY REPORT

Ref: (a) OPNAV-M-5090.1
(b) OPNAVINST 5090.1E

Encl: (1) FY 2020 Natural Resources INRMP Metrics Results
(2) JRM INRMP Summary of FY20 Projects
(3) FY 2020 Natural Resources INRMP Metrics Invitation and Attendee List

1. In accordance with reference (a), Navy installations are required to submit an annual report summarizing the recent Natural Resources/Integrated Natural Resources Management Plan (INRMP) Metrics meeting and status of the INRMP.

2. The Fiscal Year (FY) 20 Joint Region Marianas (JRM) Natural Resources/INRMP Metrics meeting for Commonwealth of the Northern Mariana Islands (CNMI) resource partners was held virtually on September 18, 2020 and the JRM INRMP Metrics meeting for Guam resource partners was held virtually on September 22 and 23, 2020 via MS Teams. Enclosures (1) through (3) are provided for your review.

3. The Final 2019 JRM INRMP was finalized and signed by partner agencies (US Fish and Wildlife Service, National Marine Fisheries Service, Guam Department of Agriculture, and CNMI Department of Land and Natural Resources-Division of Fish and Wildlife) between June - August 2019. Annual updates are conducted each calendar year which began in 2020. A 5-year review for operation and effect will be conducted in 2024 per sections 670a-f of reference (b). The FY20 JRM INRMP Update will be completed and distributed by 31 January 2021.

4. Thank you for your participation in our Natural Resources/INRMP Metrics meeting and for your support of the JRM Natural Resources Program. If you have any questions, please contact Jennifer Horeg, Conservation Resources Program Manager, at 671-339-1275 or via e-mail at Jennifer.horeg@fe.navy.mil.

Geographic Information Systems (GIS) and Data Management 26
Digital Orthography Lidar and Planimetric Data – CNMI 26
Terrestrial Exotic and Invasive Species Management 27
Developing a Framework for Coordinated Management of Vertebrate Restoration and Brown Treesnake Control on Guam 27
Review, Evaluation, and Assessment of Reintroduction Programs as Related to Reintroduction of Guam Micronesian Kingfisher on Joint Region Marianas (JRM) Lands 28

Monitoring to Evaluate Effectiveness of HACCP Plan Implementation at Construction Sites 29
Implementation of the Regional Biosecurity Plan of Micronesia and Hawaii 30
Little Fire Ant (LFA), *Wasmannia auropunctata*, Surveys, Eradication, and Monitoring – Andersen South 31
Little Fire Ant (LFA), *Wasmannia auropunctata*, Surveys, Eradication, and Monitoring 32
Invasive Species Management within the Joint Region Marianas Area of Responsibility 41
Coconut Rhinoceros Beetle (CRB; *Oryctes rhinoceros*) Surveys, Interdiction, and Monitoring - Guam 44
BTS Control at Mariana Swiftlet Caves 46
Evaluation of BTS Control to Improve Management Of Guam's Remnant Mariana Swiftlet Population 47
Feral Dog and Cat Control and Management – NBG 49
Ungulate Management Population Control – NBG 51
Brown Treesnake Interdiction to Prevent the Spread Via the DOD Transportation Network Originating On Guam 52
Aerial Baiting Operations and Ground Support for Suppression in the HMU, Andersen AFB 54
Brown Treesnake Monitoring in HMU Post Aerial Delivery System Drops 56
Habitat Management Unit Biomonitor Support and ESA Listed Species Identification Training 57
Artificial Toxic Bait for Landscape-scale BTS Suppression – AAFB 58
Monitoring of Reduction in BTS Abundance during Eradication Activities in the HMU and Evaluation of Alternative Ground Baits for Large BTS 60
Assessment of BTS Fates after Toxicant Delivery to the Habitat Management Unit, AAFB ... 62
Monitoring Demographic and Ecological Effects of Sustained Automated Delivery System Treatment in The HMU, Andersen, AFB 64
Long-term known fate monitoring of large snakes in conjunction with Closed Population Eradication – AAFB..... 66

Evaluating Statistical Methods for Estimating Density of Invasive BTS from Camera Trapping Data – AAFB 68
Estimation of Brown Treesnake Predation Threat Thresholds for Persistence of Reintroduced Birds on Guam – AAFB 70
Using BTS Behavior and Movement to Refine Control on AAFB & for Improved Management of Native Forest Birds 71
Guam Micronesian Kingfisher Recovery Habitat MOA Program and Project Execution 73
Multi-species Barrier Development Phase I – NBG TS 74
Coconut Rhinoceros Beetle (CRB; *Oryctes rhinoceros*) Surveys, Interdiction, and Monitoring - CNMI 76
Marianas Islands Training & Testing Biological Opinion Terms & Conditions 1.1 Compliance – CNMI 78
Natural Resources Educational Outreach 79
Biosecurity Outreach and Education on Guam 79
Outreach and Education – NBG 81
JRM Natural Resources Stewardship Outreach & Public Engagement Program 83
Migratory Bird Management 84
Migratory Bird Surveys – NBG 84
Monitoring of MBTA-Listed Bird Species – FDM 85
Terrestrial Habitat Management 86
Listed Plant and Invertebrate Surveys 86
Threatened and Endangered Species Preconstruction Surveys 94
Forest Restoration Plan Implementation – NBG 98
Cetti Bay Watershed Terrestrial Monitoring 101
Ungulate Fencing – NBG 104
Firebreak Management Plan Implementation – NBG 105
Range Fire Management Plan for Marine Corps Ranges on Guam 107
Seed Collection from *Heritiera longipetiolata* and *Tabernaemontana rotensis* 108

Forest Restoration at Achae Point 110
Vegetation Restoration for the HMU 113
Maintenance of Ungulate Exclosures 116
Ungulate Fencing 117
Ungulate Eradication and Control 119
Northwest Field Ungulate Control Area Fencing and Eradication - AAFB 121
Salvage and Transplantation of ESA-listed Orchids – NBG TS and AAFB 122
Salvage and Transplantation of *Cycas micronesica* – NBG TS and AAFB 124
Invasive Plant Control – NBG TS and AAFB 128
North Finegayan Forest Enhancement Site Ungulate Fencing and Eradication 131
Haputo Ecological Reserve Area Ungulate Fencing 132
Implementation Plan for Phase I of the North Finegayan Forest Enhancement Site 133
Terrestrial Protected Species Management 135
Conservation Management of Listed Invertebrates 135
ESA-Listed Treesnail Monitoring - NBG 136
Biomonitor Support for Natural Resource Management at Joint Region Marianas Area of Responsibility 142
Sea Turtle Monitoring, Protection, and Educational Outreach - AAFB 143
Sea Turtle Nesting Beach Habitat Enhancement – NBG 146
Sea Turtle Surveys – NBG 148
Restoration/Enhancement of Mariana Moorhen Habitat 149
Monitoring of Mariana Swiftlets 152
Mariana Swiftlet Recovery and Habitat Use 156
Mariana Fruit Bat Monitoring - AAFB 158
Cycad Conservation - AAFB 160
Serianthes nelsonii Monitoring, Outplanting and Management - AAFB 164

Tracking Movement of Micronesian Starlings and BTS on Andersen Air Force Base with an Automated Telemetry Tracking Network 167
Evaluating and reducing BTS predation threat in urban Micronesian Starling Habitat – AAFB 169
Monitoring Survival and Demography of Micronesian Starlings 171
Salvage and Transplantation of *Partula radiolata* – NBG TS and AAFB 173
Native Plant Seed Collection, Salvage, Storage, and Nursery Propagation for Forest Enhancement 175
Comprehensive Baseline Vegetation Survey and Long Term Monitoring Plan for the Forest Enhancement Areas at Finegayan 177
Cycad Conservation – Tinian 179
Sea Turtle Nesting Surveys – Tinian 180
Beach Cleanups on the Tinian MLA 181
Concrete barrier - Sea Turtle Conservation – CNMI 182
Mariana Common Moorhen Surveys – Tinian 183
Tinian Forest Bird Monitoring and Assessment 184
Surveys for Micronesian Megapodes and Mariana Fruit Bats 185

Marine Habitat Management

Water Quality Monitoring on Joint Region Marianas Submerged Lands

Location: NBG **Period of Performance:** SEP2018 - DEC2020

Project Objective

- Install, deploy, and maintain four conductivity-temperature-depth (CTD) mounting frames and four pH sensor mounting frames at four locations in Apra Harbor (e.g., Sasa Bay, Inner Harbor, Middle Harbor, and Outer Harbor), one CTD mounting frame and one pH sensor mounting frame at one location in Orote Peninsula ERA (e.g., Spanish Steps), one CTD mounting frame and one pH sensor mounting frame at one location in Haputo ERA (e.g., Double Reef), and one CTD mounting frame and one pH sensor mounting frame at one location in Naval Support AAFB (e.g., Pati Point Marine Preserve Area).
- Install, deploy, and maintain four CTD and four pH sensors at four locations in Apra Harbor (e.g., Sasa Bay, Inner Harbor, Middle Harbor, and Outer Harbor), one CTD and one pH sensor at one location in Orote Peninsula ERA (e.g., Spanish Steps), one CTD and one pH sensor at one location in Haputo ERA (e.g., Double Reef), and one CTD and one pH sensor at one location in AAFB (e.g., Pati Point Marine Preserve Area).
- Analyze water quality results, and examine the spatial and/or seasonal (temporal) variations in Apra Harbor, Orote Peninsula ERA, Haputo ERA, and AAFB.

Conservation Benefit

- Increase habitat for ESA-listed corals (e.g., *A. globiceps, A. retusa,* and *S. aculeata*)
- Support habitat areas of particular concern which align with Magnuson-Stevens Fishery Conservation Act for Essential Fish Habitat and the Marianas Fishery Ecosystem Plan

FY20 Status

- Abbreviated consultation (NOAA-NMFS) completed on 30MAY2019 and ACOE permits obtained 10 June 2019.
- No-cost extension until DEC2020
- All CTD and pH sensors have been retrieved for maintenance
- Draft final report has been received and will be available OCT2020

Evaluate Mangrove Functionality in the Atantano Watershed

Location: NBG **Period of Performance:** SEP2018 - SEP2021

Project Objective

- Conduct an ecological assessment of the terrestrial and marine environments within Abo Cove.
- Identify an area within Abo Cove for a mangrove restoration demonstration project.
- Design a restoration project suited for the Abo Cove shoreline.

Conservation Benefit

- Increase habitat for ESA-listed species (e.g., sea turtles and scalloped hammerhead shark).
- Support habitat areas of particular concern which align with Magnuson-Stevens Fishery Conservation Act for Essential Fish Habitat and the Marianas Fishery Ecosystem Plan.

FY20 Status

- Field work (terrestrial and marine surveys) completed DEC2018
- Final report available

EPR: CHS JRM Evaluate and Enhance Mangrove Functionality of the Atantano Watershed to Protect Essential Fish Habitat and Coral Reefs; 61128NR656

Coral Protection and Mooring Buoy Installation - NBG

Location: NBG **Period of Performance:** SEP2019 - SEP2020

Project Objective

- Determination of suitable anchor placement sites, procurement and assembly of apparatus, and installation of Shallow Water Mooring Systems (SWMS) within Apra Harbor, Orote Peninsula, and Outer Breakwater sites.
- Provide secure vessel attachment points at popular SCUBA/snorkel/fishing locations used by recreation and commercial boaters.

Conservation Benefit

- Increase habitat for ESA-listed corals (e.g., *A. globiceps, A. retusa*, and *S. aculeata*).
- Support habitat areas of particular concern which align with Magnuson-Stevens Fishery Conservation Act for Essential Fish Habitat and the Marianas Fishery Ecosystem Plan.

FY20 Status

- Installation of 20 mooring buoys complete (Figure 83).
- Annual maintenance and inspections.

EPR: 1 CP MAR NBG Coral Protection Buoys; 61755NR849

2019 JRM INRMP Reference: MHM-1 (5-98); MHM-4 (5-100)

Monitoring and Control of Acute Impacts on Coral Reefs in Outer Apra Harbor and Orote Peninsula and Haputo Ecological Reserve Areas (ERAs)

Location: NBG; NBG TS **Period of Performance:** SEP2017 SEP2019

Project Objective

- Host crown of thorns starfish (COTS) training workshops for Navy EXWC and NBG Dive Locker divers, JRM/NBG Natural Resource Marine Specialists, and Guam. COTS Response Team partners lead by a COTS expert; one classroom and one in- water skills COTS training workshop to include overview of COTS ecology and history on Guam, pre-culling surveillance methods, culling guidelines, and post- culling monitoring techniques.
- Implement a monitoring program for the detection of coral stressors and COTS/marine nuisance species control within Outer Apra Harbor, and Orote and Haputo ERAs.

Conservation Benefit

- Increase habitat for ESA-listed corals (e.g., *A. globiceps*, *A. retusa*, and *S. aculeata*).
- Support habitat areas of particular concern which align with Magnuson-Stevens Fishery Conservation Act for Essential Fish Habitat and the Marianas Fishery Ecosystem Plan.

FY20 Status

- COTS classroom and in-water skills training completed with NBG Dive Locker and NAVFAC Marianas Marine Resources SMEs on FEB2019.
- Final report available

Survey and Monitoring of Seagrass Beds at Dadi Beach, NBG

Location: NBG **Period of Performance:** SEP2017 – JAN2020

Project Objective

- Designate permanent monitoring transect locations.
- Determine and document the biodiversity of marine plants and macroinvertebrates.
- Determine the current health of the seagrass bed by quantifying nutrient composition in seagrass blades and in sediments, the abundance of epiphytic plants on seagrass and the abundance and biodiversity of macroalgae and any additional relevant information that may affect the ecosystem health of the seagrass bed.

Conservation Benefit

- Increase habitat for ESA-listed species (e.g., sea turtles, *A. globiceps*, *A. retusa*, and *S. aculeata*) and marine mammals.
- Support habitat areas of particular concern which align with Magnuson-Stevens Fishery Conservation Act for Essential Fish Habitat and the Marianas Fishery Ecosystem Plan.

FY20 Status

- Final report available

EPR: 1 S MAR JRM Marine - Ecosystem Monitoring and Coral Reef Indicators (CHS); 61128NR168

Characterization of Marine Benthic Habitats in Outer Apra Harbor Guam

Location: NBG **Period of Performance:** SEP2019 - SEP2023

Project Objective

- Process existing remotely sensed imagery
- Collect in situ information for habitat model and map development
- Collect in situ information to evaluate habitat model performance and map accuracy
- Outreach

Conservation Benefit

- Increase habitat for ESA-listed species (e.g., sea turtles, *A. globiceps*, *A. retusa*, and *S. aculeata*) and marine mammals.
- Support habitat areas of particular concern which align with Magnuson-Stevens Fishery Conservation Act for Essential Fish Habitat and the Marianas Fishery Ecosystem Plan.

FY20 Status

- Interagency agreement established SEP2019
- Fieldwork was scheduled for JULY2020; postponed due to COVID-19

EPR: 1 CP MAR NBG Benthic Habitat and Coral Mapping and Management (CHS); 61755NR818

Marine Protected Species Management

Sea Turtle Distribution and Habitat Use

Location: NBG **Period of Performance:** AUG2018 - SEP2021

Project Objective

- Conduct marine turtle surveys and in-water captures of green turtles (*Chelonia mydas*) and hawksbill turtles (*Eretmochelys imbricata*) in the nearshore waters of Guam and CNMI.
- Captured turtles are weighed, measured, biopsied, and tagged (i.e., flipper, PIT, satellite tracking) in an effort to expand our knowledge of the population demographics, population structure, and fine-scale habitat use of the turtles.
- Blood samples are also collected for two studies: 1) hormone analysis to determine population sex ratios, and 2) metabolite analysis to determine nutritional/feeding state.

Conservation Benefit

- To understand the movements of Guam and CNMI foraging populations of sea turtles to maintain or increase sea turtle populations and enhance and restore habitat.
- To collect data on the morphology and genetics of the nearshore sea turtle population.

FY20 Status

This work is conducted through an Interagency Agreement (NMFS-PIC-18-007) between NOAA-PISF and JRM. The original agreement was from August 2016 – July 2019. The new agreement extends to September 2021.

- Twenty-four satellite tags were deployed on green and hawksbill turtles during small boat-based marine turtle surveys of Apra Harbor, Orote Point, Glass Breakwater, Dadi, and Tipalao conducted in 2016 through 2018.
- The small boat based surveys and deployed satellite tags provide information on general habitat use, home range, and core area for turtles tagged in each location.
- Deployed tags also record information on dive depth and temperature use which will be provided in the report
- In June 2019 a total of 12 satellite tags were deployed in the areas of Apra

- Harbor/Orote Point and Double Reef on foraging turtles (Table 1, Figure 11).

- In-water fieldwork scheduled in May and September 2020 has been postponed due to COVID-19 travel restrictions. When possible sea turtles nesting at Spanish Steps will be satellite tagged and tracked through this project.
- A final report was provided in January 2020

EPR: 1 S CP MAR NBG Sea Turtle Distribution and Habitat Use; 61755NR815

2019 JRM INRMP Reference: MPS-2 (5-103)

Table 1. Summary of in-water survey effort, observations, captures, and satellite tags deployed in June 2019.

			Observations				**Captures**		**Sat. Tags**	
Date	**Island**	**Location**	***Cm***	***Ei***	***Unk***	***Cet.***	***Cm***	***Ei***	***Cm***	***Ei***
6/4	Guam	Apra Harbor/Orote Point	15	2	0	0	4	2	4	2
6/5	Guam	Apra Harbor/Orote Point	11	2	0	0	4	1	3	0
6/7	Guam	Double Reef	4	2	2	0	0	2	0	2
6/8	Guam	Double Reef/Haputo	6	2	0	0	1	0	1	0
6/9	Guam	Double Reef/Haputo	6	3	0	0	0	0	0	0
Totals			42	11	2	0	9	5	8	4
TURTLES			**55 observations**				**14 captures**		**12 sat. tags**	

Cm = green turtle (Chelonia mydas). Ei = hawksbill turtle (Eretmochelys imbricata).
Unk. = unknown turtle species (either Cm or Ei). No cetaceans (Cet.) were observed during these surveys.

Figure 11. NOAA photos from June of 2019 field work. Top Left: NOAA researchers' work with the DAWR enforcement vessel/crew to transport captured turtles to the shore-based processing station. Top Right: Program collaborators working at the shore-based turtle processing station at Seaplane Ramp. Bottom Left: A green turtle equipped with a SPLASH satellite tag. Bottom Right: Release of a hawksbill turtle equipped with a satellite tag.

Detection of Scalloped Hammerhead Sharks in Apra Harbor and Adjacent Nearshore Waters using Environmental DNA (eDNA)

Location: NBG **Period of Performance:** SEP2017 - OCT2020

Project Objective

- Collect and filter marine water samples at five targeted locations within Apra Harbor and Orote ERA.
- Develop primers designed to amplify only scalloped hammerhead shark DNA.
- Assess ability to extract and detect shark DNA, and other threatened fish species (e.g., humphead wrasse and bumphead parrotfish) through targeted quantitative Polymerase Chain Reactions and metabarcoding analyses.
- Analyze eDNA results to determine the spatial and temporal presence of scalloped hammerhead sharks in Apra Harbor and Orote ERA.

Conservation Benefit

- Increase habitat for ESA-listed species (e.g., scalloped hammerhead shark).
- Support habitat areas of particular concern which align with Magnuson-Stevens Fishery Conservation Act for Essential Fish Habitat and the Marianas Fishery Ecosystem Plan.

FY20 Status

- Samples are being collected and preliminary eDNA is being extracted by the UOG Marine Lab; purified DNA samples are sent to James Cook University for analyses.
- Exercised option year one (12 months) to increase sample size and complete analyses.
- No-cost extension until OCT2020

EPR: 1 S MAR NBG Scalloped Hammerhead Shark (*Sphyrna lewini*) Survey; 61755NR891

2019 JRM INRMP Reference: MPS-1 (5-103)

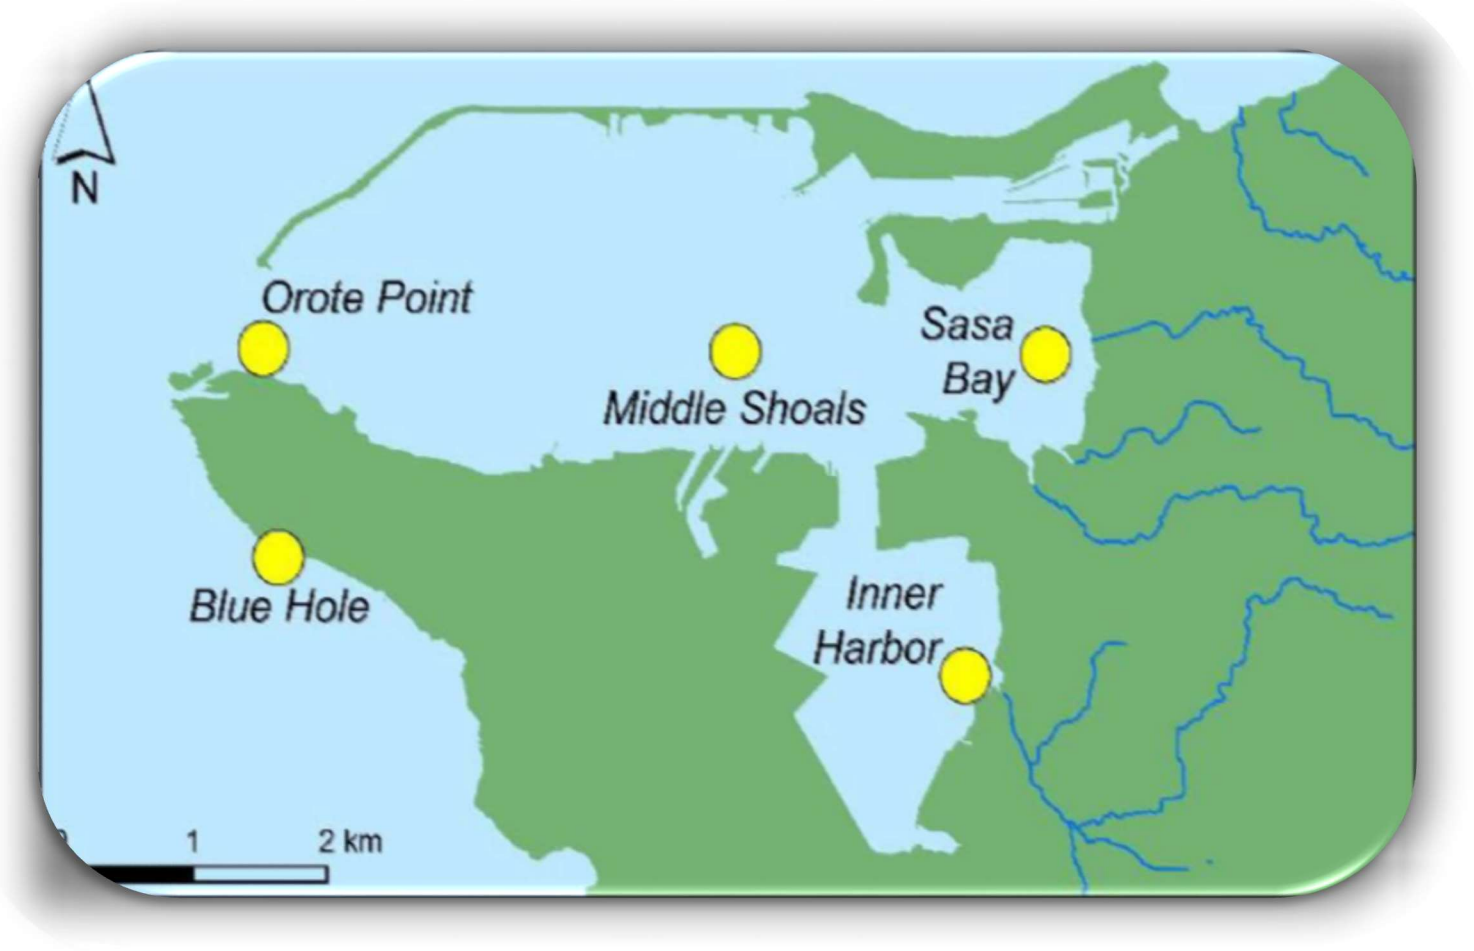

Figure 12. Proposed sampling locations for the detection of scalloped hammerhead eDNA within Apra Harbor and Orote ERA.

Sea Turtle Aerial Surveys in FDM Nearshore Waters

Location: FDM **Period of Performance:** SEP2018 - SEP2020

Project Objective

- Design aerial transect surveys to determine sea turtle and marine mammal abundances and distributions in the nearshore waters surrounding FDM.
- Conduct aerial surveys for sea turtle and marine mammal identifications, abundances, and distributions in the nearshore waters surrounding FDM.
- Analyze sea turtle and marine mammal identifications, abundances, and distributions in the nearshore waters surrounding FDM.

Conservation Benefit

- Increase habitat for ESA-listed species (e.g., sea turtles and marine mammals).
- Support habitat areas of particular concern which align with Magnuson-Stevens Fishery Conservation Act for Essential Fish Habitat and the Marianas Fishery Ecosystem Plan.

FY20 Status

- Surveys were postponed due to Typhoon Yutu which hit the CNMI on OCT2018
- First successful survey completed on SEP2019; continue with one survey per month; last survey on 27AUG2020
- No-cost extension until SEP2020
- Final report will be available SEP2020

EPR: CNMI Ecosystem and Protected Species Monitoring and Management: Sea Turtle Distribution and Habitat Use in FDM Nearshore Waters (emergent); 61128NR851

2019 JRM INRMP Reference: MPS-1 (12-41)

Geographic Information Systems (GIS) and Data Management

Digital Orthography Lidar and Planimetric Data – CNMI

Location: FDM; Saipan; Tinian **Period of Performance:** SEP2018 - SEP2020

Project Objective

- Obtain aerial imagery of Tinian, Saipan, and FDM
- Obtain lidar data for bathymetric products at FDM

Conservation Benefit

- Increase habitat for ESA-listed species (e.g., corals, sea turtles, marine mammals).
- Support habitat areas of particular concern which align with Magnuson-Stevens Fishery Conservation Act for Essential Fish Habitat and the Marianas Fishery Ecosystem Plan.

FY20 Status

- GIS data capture (aerial imagery for Tinian, Saipan, and FDM; and lidar for FDM) completed JULY2019 and all raw data received FEB2020.
- Coordinating with NOAA NCCOS on analyses.

EPR: 1 CP MAR JRM GIS Database Management; 61128NR200

2019 JRM INRMP Reference: TGIS-1 (11-69); TGIS-1 (12-36); MGIS-1 (11-78); MGIS-1 (12-43)

Terrestrial Exotic and Invasive Species Management

Developing a Framework for Coordinated Management of Vertebrate Restoration and Brown Treesnake Control on Guam

Location: JRM **Period of Performance:** SEP2019 – MAR2021

Project Objective

This project will consist of developing a decision-analytic framework to guide coordinated brown treesnake control and vertebrate species restoration on Guam. The intent is to establish a collaborative process involving management agencies, stakeholders, and scientific experts and use a workshop model to bring these groups together for the purpose of framework development.

Conservation Benefit

This is an indirect way towards operational management decisions through a decision analysis process to engage in a more robust planning phase. This can include prioritization, management application, and collaboration to manage long-tern, costly complex conservation problems.

FY20 Status

- Funded via an interagency agreement with USGS – CRU: Washington University Extension.
- Project in workshop phase – with discussions on site and species selection to develop a planning framework.
- Group members in DoN; CNMI DLNR; USFWS; USGS; UoG; DAWR; The Nature Conservancy; Massey University, New Zealand
- Final framework/guidance document anticipated April 2021

EPR: 1 RP JRM Brown Tree Snake Eradication and Control to Support Recovery of ESA-Listed Birds; 61128NR202

2019 JRM INRMP Reference: TIS-3; 9-72

Review, Evaluation, and Assessment of Reintroduction Programs as Related to Reintroduction of Guam Micronesian Kingfisher on Joint Region Marianas (JRM) Lands

Location: JRM **Period of Performance:** JUL2019 – JAN2021

Project Objective

The Guam Micronesian Kingfisher (GMK) Reintroduction evaluation CESU will provide the following: 1) evaluation of reintroduction of GMKI within limited (unbounded) BTS-controlled areas of JRM lands, 2) review and evaluate other reintroduction programs on Department of Defense (DoD) lands to identify mission compatibility successes, and 3) evaluate reintroduction performance criteria utilized within other reintroduction programs and provide recommendations for Joint Region Marianas performance criteria for future reintroduction programs with an emphasis on mission compatibility.

Conservation Benefit

The collation of success and failures of reintroduction programs, an assessment of JRM preparedness and capabilities will be vital to reducing risk and increasing success when considering reintroducing avian species in the future. This review, evaluation, and assessment will help to minimize the learning curve, improve reintroduction outcomes, and provide JRM guidance in planning its' conservation goals.

FY20 Status

- Agreement via CESU network to the University of Tennessee – Knoxville.
- Project in data gathering and compilation phase.
- Final framework/guidance document anticipated February 2021

EPR: 1 RP JRM Brown Tree Snake Eradication and Control to Support Recovery of ESA-Listed Birds; 61128NR202

2019 JRM INRMP Reference: TIS-3; 9-72

Monitoring to Evaluate Effectiveness of HACCP Plan Implementation at Construction Sites

Location: Various locations: AAFB, NBG, NBGTS, AAFB NWF
Period of Performance: Various, multiple project awards

Project Objective
Long-term monitoring program for terrestrial vegetation to aid in evaluating the success of implemented HACCP plans.

Conservation Benefit
To minimize the spread and effects of invasive plant species due to construction activities.

FY20 Status
Ongoing previous FY contract awards for construction activities:

- J-001B Finegayan Utilities and Site Improvements Phase 1
- J-006 Apra Medical Clinic
- J-007 Waterfront Head Quarters
- J-200 IV Utilities
- J-755 Urban Combat Training
- P-102 Power Upgrade-Harmon.
- P-103 Water Phase 2
- P-295 Ordnance Ops.
- P-715 Live-Fire Training Range Complex Known Distance Ranges

Results
No new species recorded on Guam

EPR: DPRI: Marine Corps Relocation 2017/2018 amendment to 2015 BO, Conservation Measures to Contribute to the Recovery of Listed Species.

Implementation of the Regional Biosecurity Plan of Micronesia and Hawaii

Location: JRM **Period of Performance:** JUL2017 – JUL2021

Project Objective

Update Attachment M (DoD Biosecurity Recommendations) of the Regional Biosecurity Plan for Micronesia and Hawaii (hereafter: RBP), and implement various actions identified within the RBP aimed at: preventing the spread of invasive species into/out of JRM AOR; controlling, managing, and eradicating invasive and nuisance species on DoD lands within the JRM AOR; providing outreach and awareness to military personnel, contractors, and their respective dependents; and increasing coordination and collaboration with regional partners and DoD stakeholders regarding biosecurity and invasive species management.

Conservation Benefit

Protect native species, particularly those that are threatened and endangered from the threat of invasive species within the JRM AOR.

FY20 Status

- The RBP Attachment M update was submitted to Navy HQ in December 2019 after reviews were completed by DoD across JRM AOR, Hawaii, DoD stakeholders in the Pacific, and PACOM.
- Implementation of Quality Assurance/Quality Control (QA/QC) bio-sanitation inspections of military equipment and cargo offloaded on Naval Base Guam in support of DoD COVID-19 medical relief efforts. Bio-sanitation inspections were conducted for two movements of military equipment and cargo going to Tinian for public works projects.
- Continued interagency coordination and consultation regarding invasive species management and biosecurity concerns within the region.

Little Fire Ant (LFA), *Wasmannia auropunctata*, Surveys, Eradication, and Monitoring – Andersen South

Location: Andy South **Period of Performance:** AUG2017 – AUG2021

Project Objective

To eradicate LFA within the Andersen South property to reduce impacts to native ecosystems and military readiness activities.

Conservation Benefit

Enhance and restore habitats by prevention of the spread of the invasive LFA.

FY20 Status

- On-going delimiting surveys for newly discovered Site 7 area of LFA at Andy South
- 5 of the 7 known LFA sites have been successfully eradicated at the Andy South property
- Helicopter eradication project awarded 30 August 2020 with University Of Guam
- Some of the helicopter eradication treatments to be scheduled in conjunction with USDA-APHIS BTS Bait Drops to increase cost efficiencies of projects

Little Fire Ant (LFA), *Wasmannia auropunctata*, Surveys, Eradication, and Monitoring

Location: DoD Lands on Guam **Period of Performance:** SEP2016 – JUL2021

Project Objective

To implement LFA Early Detection Surveys (EDS); control and eradicate LFA on DoD lands; coordinate and collaborate with resources partners; and provide outreach materials to reduce impacts to native ecosystems and military readiness activities.

Conservation Benefit

Enhance and restore habitats by prevention of the spread and establishment of the invasive LFA.

FY20 Status

Cooperative Agreement with University of Guam

- Naval Munitions Site - Eight (8) LFA insecticide treatments completed (June 2019 – February 2020) with post treatment monitoring July – September 2020 (Figures 17-18). Post treatment monitoring every 6 months for 2 years with border treatment.
- Eradication of LFA at NMS is being closely coordinated with our resource partners at GovGuam Biosecurity, who are jointly treating the adjacent acacia forest and engaging the adjacent neighborhood with plans to commence treatment soon.

Cooperative Agreement with Colorado State University Center for Environmental Management of Military Lands (CSU CEMML):

- Haputo ERA, NBG TS – Eight (8) LFA insecticide treatments completed (September 2019 – July 2020) with post treatment monitoring starting in August 2020 (Figure 19-20). Post treatment monitoring every 6 months for 2 years.
- LFA Early Detection Surveys initiated June 2019
    - 53 of 156 locations surveyed on AAFB (27) and NBG (26)
    - Three (3) LFA positive locations on NBG
    - Surveys conducted at South Finegayan site prior to construction of the COVID-19 expeditionary medical facility (No LFA detections)

- No LFA detected on AAFB

- Nimitz Hill, NBG – LFA detected in March 2020 at approximately 5 locations. Treatment initiated in April 2020 with three (3) of eight (8) insecticide treatments completed on 2.06 acres within the foot print of NBG sewer line replacement project (Figure 21). Delineation surveys pending funding approval.
- Dadi Beach, NBG – LFA detected in April 2020 on 9.95 acres with a treatment area of 14.5 acres (Figure 22). Eight (8) LFA insecticide treatments to start in October 2020.
- Polaris Point, NBG – LFA detected in June 2020 on 0.04 acres with a proposed treatment area 0.7 acres (Figure 23). Treatment pending funding approval.
- Developed LFA awareness signage for LFA infestation areas (Figure 24).

Invasive Species Management within the Joint Region Marianas Area of Responsibility

Location: JRM **Period of Performance:** SEP2016 – JUL2021

Project Objective

In support of Mariana Islands Training & Testing (MITT) activities, 1) conduct Early Detection Surveys (EDS) non-native species at training and cargo staging locations within the JRM AOR (Guam and CNMI (Tinian Ports, Military Leased Area, Rota Ports); 2) develop and implement standard operating procedures for the control and removal of high-risk invasive species; 3) develop and implement invasive species rapid response protocols; 4) develop and implement bio-sanitation standards along with quality assurance/quality control standards; and 5) development of a programmatic pathway risk analysis for the movement of equipment and personnel within the JRM AOR; and 6) targeting high risk invasive arthropod species for control and eradication.

Conservation Benefit

Prevent the movement and establishment of invasive species into and out of Guam and the CNMI during training exercises.

FY20 Status

Ongoing cooperative agreement Colorado State University (CSU), Center for Environmental Management of Military Lands (CEMML).

Early Detection Surveys Conducted

- All-Taxa Surveys – AAFB: 9 of 24 sites; NBG: 11 of 27 sites
- Weed Surveys – AAFB: 11 of 28 sites; NBG: 16 of 48 sites
- No All-Taxa or Weed Surveys conducted in the CNMI during this reporting period

Development of SOPs for the Control/Eradication of High-Risk Species

- Red Imported Fire Ant (RIFA, *Solenopsis invicta*)
- Coqui Frog (*Eleutherodactylus coqui)*
- Mile-a-minute vine (*Mikania micrantha*)

Invasive Species Rapid Response

- No rapid response events occurred during FY20
- Five CSU CEMML personnel BTS Rapid Response certified

Bio-sanitation QA/QC Control Inspections during Military Training Events

- Two major training events (Cope North 20 / Valiant Shield 20)
- Two unit level training events
- 100's of items inspected arrival and departure to meet AFPMB TG-31 standards
- Bio-material interceptions (plant material, soil, insects, spiders, tree frog, etc.)(Figure 26)

Development of a Programmatic Pathway Risk Analysis for Movements into the Mariana Islands and between Islands

- Ongoing data collection to support the risk analysis

New FY20 Cooperative Agreement awarded to CSU CEMML (Jul2020 – Jul2021)

Coconut Rhinoceros Beetle (CRB; *Oryctes rhinoceros*) Surveys, Interdiction, and Monitoring - Guam

Location: DoD Lands on Guam **Period of Performance:** SEP2016 – SEP2021

Project Objective

To implement CRB best management practices: 1) identify and remove breeding sites, 2) implement interdiction and sentinel trapping, and 3) implement CRB awareness; coordinate and collaborate with resources partners, and provide outreach materials to installation and military training participants to reduce impacts to native ecosystems and military readiness activities.

Conservation Benefit

Enhance and restore habitats by prevention of the spread and establishment of the invasive CRB.

FY20 Status

- CRB Best Management Practices
    - Colorado State University (CSU) Center for Environmental Management of Military Lands (CEMML) implementing CRB management
    - 111 dead palm trees and 41 green waste and/or mulch piles removed across NBG/AAFB at the start of the FY20
    - Received $100K USFS/DoD grant for Forest Pest Suppression to remove CRB breeding sites on NBG/AAFB
    - Conducted biannual CRB breeding site surveys on NBG/AAFB
    - 282 CRB sentinel/interdiction traps deployed on NBG and AAFB (August 2020) (Figure 27)
- Coordination with regional partners (GovGuam Dept. Ag. & CNMI DLNR)

(CSU CEMML)

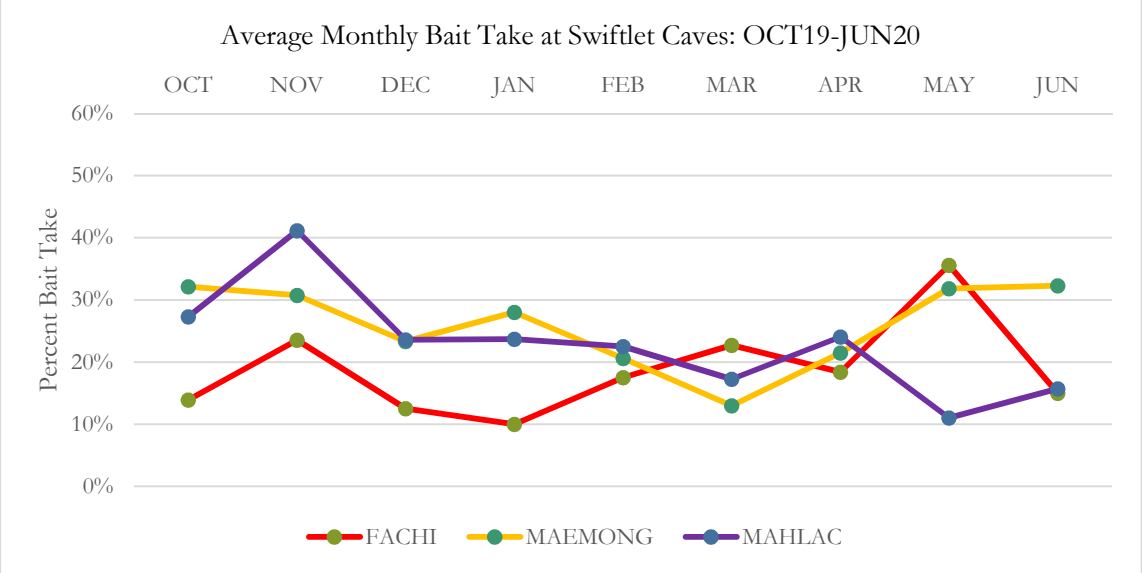
BTS Control at Mariana Swiftlet Caves

Location: NBG; NMS **Period of Performance:** OCT2018 – Ongoing

Project Objective



Ongoing long-term BTS protection of the Mariana Swiftlet (*Aerodramus bartschi*). Protection consists of oral toxicants for BTS around the areas surrounding Mahlac, Fachi, and Maemong caves, NMS.

Conservation Benefit

Maintain or increase swiftlet population and enhance or restore habitat by reducing predation by BTS.

FY20 Status

- Ongoing project with Center for Management of Military Lands (CEMML)
- 100% bait tubes since October 2019
- Baiting once per week to reduce disturbance
- 3710 baits deployed since October 2019
- Average annual toxicant take rate FY15-20 = 597 (13.9%)
- FY20 average bait take rate to date = 23%

*Bait Taken does not mean taken by a BTS as other animals may take the bait.

Figure 28. Average monthly bait take at Swiftlet caves.

EPR: 1 MAR NBG Mariana Swiftlet Population Protection: BTS Trapping
2019 JRM INRMP Reference: TIS-2; 6-43

Evaluation of BTS Control to Improve Management of Guam's Remnant Mariana Swiftlet Population

Location: NMS **Period of Performance:** SEP2018 – MAR2020

Project Objective

Estimate Mariana swiftlet (*Aerodramus bartschi*) population size derived from thermal videography recordings coupled with estimates of movement patterns in and out of the caves. Evaluate the effect of bait type (bird/mammal) on targeting snakes entering swiftlet caves to help inform capture efficacy and management strategies.

Conservation Benefit

As one of two remaining forest birds on Guam, protection of Mariana Swiftlets is an import conservation goal for JRM. Data gathered from the study will help in designing different methods or strategies for reducing BTS populations in and around occupied and unoccupied caves. Accurate counts of swiftlets will help improve reporting and understanding population dynamics to develop/refine management goals.

FY20 Status

- Funded with an interagency agreement with USGS – Fort Collins and USGS – Pacific Island Ecosystems Research Center (PIERC); project complete
- Five visual searches yielded three (3) in cave BTS (Average SVL: 905mm).
- Thermal counts appear lower than entrance counts but similar to counts with night vision goggles
- Diet history, snake size influence bait preference, and highlights the likely need for a multi-tool approach to BTS control

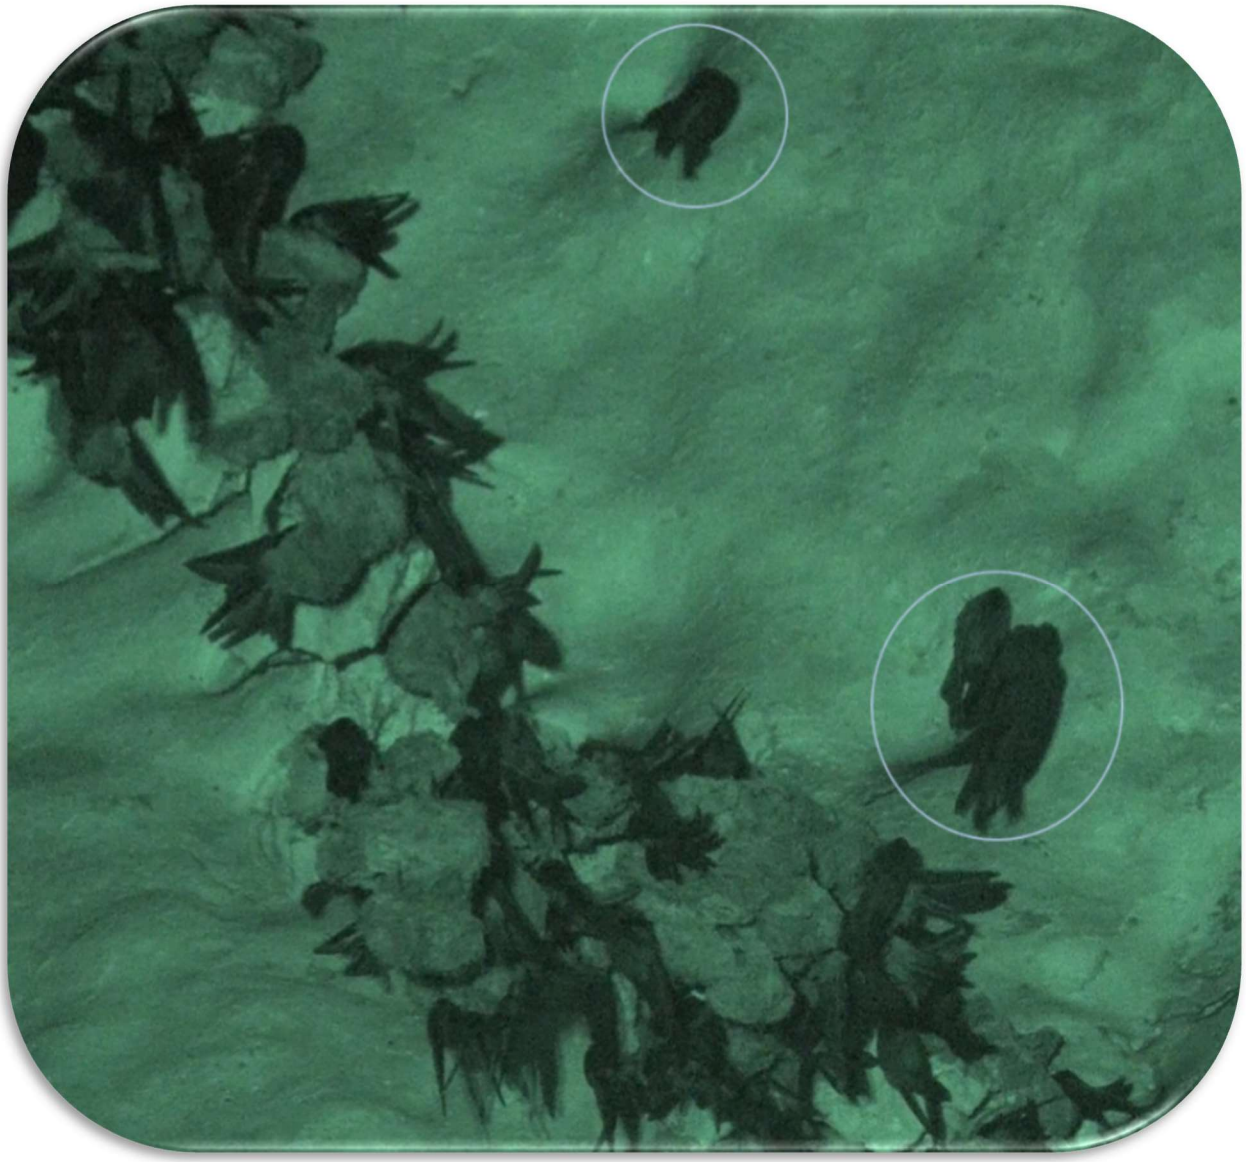


Figure 29. Night roosting swiftlets can be associated with nests (nesting adults and attenders) or roost away from the nest (non-nesting roosters [white circles])

EPR: 1 RP JRM BTS Eradication and Control to Support Recovery of ESA- Listed Birds; 61128NR202

2019 JRM INRMP Reference: TIS-3; 6-43

Feral Dog and Cat Control and Management – NBG

Location: NBG; NMS **Period of Performance:** SEP2018 – SEP2020

Project Objective

Determine the population numbers of feral dogs and cats on the NMS and NBG Main Base. Trail cameras are utilized for a mark/re-sight methodology to estimate the feral dog and cat populations. Development of a management plan for the best method for feral dog and cat control, and implementation of that plan in the coming years.

Conservation Benefit

Control invasive species that directly or indirectly impact native species.

FY 20 Status

- USDA will begin feral dog and cat control on NMS during September/October 2020
- NBG main base camera surveys completed by Sundance EA Inc. FY 2020.
- A total of 64 stations, 2 zones of 32 stations each, were sampled for 6 weeks for each zone (see Figure 30).
- There were not enough feral dog detections (4 individuals) for a population estimate
- Feral cat estimate is 34 cats (95% confidence interval 30- 50).
- Feral dog and cat control on NBG will proceed in FY 2021 and continue on NMS dependent on funding

EPR: CHS MAR NBG Feral Dog and Cat Control and Management; 61755NR358

Ungulate Management Population Control – NBG

Location: NBG; NMS; NBG T **Period of Performance:** AUG2019 – OCT2019

Project Objective

Conduct population surveys of the Guam Navy lands to determine locations and estimate numbers of feral animals, review accepted control measures, control ungulates in fenced and unfenced areas.

Conservation Benefit

Enhance and restore native habitats and increase populations of native species, particularly threatened and endangered species.

FY 20 No work was done for ungulate control; however, FY 19 work continued briefly into FY 2020

- Deer (10) and pigs (4) were removed by White Buffalo Inc. through a Cooperative Agreement from inside the second fenced area (60 acres) on NMS in August-October 2019.

EPR: 1 RP MAR NBG Ungulate Management Population Control; 61755NR807

2020 JRM INRMP Reference: TIS-6; 6-44

Brown Treesnake Interdiction to Prevent the Spread Via the DOD Transportation Network Originating On Guam

Location: JRM **Period of Performance:** OCT2019 – SEP2020

Project Objective

To prevent the spread of BTS to other Pacific islands including the CNMI and Hawaii, this JRM project is funded to conduct BTS control and interdiction efforts on Navy Base Guam (NBG) and Andersen AFB (AAFB) to prevent snakes from getting into the DoD transportation network. Methods include BTS trapping, toxicants, nighttime visual fence line searches, and canine inspections of outbound items. The BTS Interdiction program also supports training events occurring in the region that originate from Guam. Joint Region Marianas develops BTS control and interdiction plans for each training exercise that requires the movement of personnel and assets to the CNMI from Guam. Additional BTS inspections and control measures are implemented in the CNMI when determined necessary by the stakeholders.

Conservation Benefit

Preventing the spread of BTS via the military transportation network keeps BTS on Guam and from establishing in other ecologically sensitive areas in the Pacific region where vulnerable island species would be susceptible to BTS predation.

FY20 Status

- Ongoing and enduring JRM requirement
- Interdiction support provided to COPE NORTH 2020 and Valiant Shield 2020
- 7 missed Inspection (99.99%)
- No BTS detections in outbound cargo

Table 2. BTS Take and K9 Inspections OCT2019 – JUL2020. * Trap nights = 304 days X number of traps, CPUE = number of BTS/total traps nights per installation.

	Number Traps	Trap Captures	Capture Per Unit Effort* (Trap Nights)	Spotlight Captures	Number Baits	Number Bait Takes	% Bait Take

EPR: Project is funded by facilities maintenance dollars, no conservation funding for this project.

2019 JRM INRMP Reference: TIS-1; 5-84, 6-42; 7-51, 8-50, 9-70

Aerial Baiting Operations and Ground Support for Suppression in the HMU, Andersen AFB

Location: JRM **Period of Performance:** JAN2020 – AUG2021

Project Objective

To provide operational helicopter support, to include a pilot, mechanic, and technical support, to support on-site monitoring of bait drops during 9 aerial baiting applications within the HMU, AAFB

Conservation Benefit

The advent of aerial baiting, demonstrates the potential for meaningful impacts on BTS populations at the landscape level. Dropping aerial baits in the HMU will provide data and insight into BTS responses to aerial baiting over time. Aerial baiting increases the amount of landscape that can be targeted for BTS suppression and control. Landscape level control would likely improve DoD conservation efforts in support of the recovery of listed species on JRM lands and assist with interdiction efforts.

FY20 Status

- Funded via an interagency agreement with USDA –WS; project ongoing
- Delayed due to COVID-19 – travel restrictions
- Three (3) drops in February 2019 = 19, 946 baits
- Further drops tentatively scheduled for October
- Constant quality assurance improvements

Figure 31. USDA/WS helicopter conducting aerial baiting transect over HMU, AAFB, Guam

EPR: 1 RP JRM BTS Eradication and Control to Support Recovery of ESA- Listed Birds; 61128NR202

2019 JRM INRMP Reference: TIS-1, TIS-2, TIS-3; 5-85, 6-43; 7-52, 8-50-51, 9-71

Brown Treesnake Monitoring in HMU Post Aerial Delivery System Drops

Location: JRM **Period of Performance:** NOV2019 – MAY2021

Project Objective

To collect data to monitor take rates of DNM between ADS drops using randomized bait tube transects, provide field tech support for data collection of field projects related to BTS surveillance studies, and to search for bait cartridges post drop to evaluate efficacy.

Conservation Benefit

The advent of aerial baiting, demonstrates the potential for meaningful impacts on BTS populations at the landscape level. Data collection of BTS responses between drops is an important need in evaluating overall effectiveness of aerial baiting. Aerial baiting increases the amount of landscape that can be targeted for BTS suppression and control. Landscape level control would likely improve DoD conservation efforts in support of the recovery of listed species on JRM lands and assist with interdiction efforts.

FY20 Status

- Funded via an Interagency Agreement with USDA–WS; project ongoing
- Supports ADS drop operations
- Constant quality assurance improvements
- No cost extension

Figure 32. Toxicant bait suspended on HMU barrier after drop.

EPR: No EPR - funded under the Guam Micronesian Kingfisher MOA.
2019 JRM INRMP Reference: TIS-1, TIS-2, TIS-3; 5-85, 6-43; 7-52, 8-50-51, 9-71

Habitat Management Unit Biomonitor Support and ESA Listed Species Identification Training

Location: AAFB **Period of Performance:** JAN20 – JAN2021

Project Objective

To provide biomonitor support during aerial baiting project by the ADS, to observe for presence of Mariana Fruit Bat (Pteropus mariannus mariannus, Fanihi) and observe for take.

Conservation Benefit

Allow for the continuance of the ADS project while monitoring for the presence of fanihi per requirements of the 2018 HMU ADS Biological Opinion.

FY20 Status

- Agreement via the CESU network with UOG – Center for Island Sustainability (CIS).
- HMU Biomonitor support on hold due to delay of aerial baiting drops.
- 2 bats observed over three scheduled drops (Feb 19, 22, and 25 2020), no interactions with helicopter occurred – all transient flights over the HMU. –
- 2 Trainings for ESA listed species surveys conducted with 18 attendees from resource partner agencies

EPR: 1 RP JRM BTS Eradication and Control to Support Recovery of ESA- Listed Birds; 61128NR202

2019 JRM INRMP Reference: TIS-2, TIS-3; 5-85, 6-43; 7-52, 8-50-51, 9-71

Artificial Toxic Bait for Landscape-scale BTS Suppression – AAFB

Location: AAFB **Period of Performance:** JUL2018 – DEC2019

Project Objective

To develop an artificial bait matrix with similar take rates as dead neo-natal mice and deployable by aerial delivery. To transfer bait production knowledge and capacity to National Wildlife Research Center (NWRC) facilities in Hilo, HI, collaborate with USDA-Agricultural Research Service-Eastern Regional Research Center (USDA-ARS-ERRC) to refine the bait formulation to permit attachment of the artificial bait to the Automated Delivery System (ADS) cartridge.

Conservation Benefit

Development of artificial bait to replace the standard dead neo-natal (DNM) mouse is significant technological goal to reduce overall cost and maintain the same level of impact to BTS populations. If the bait component of the aerial bait cartridge can be achieve, cost savings would keep costs lower but increase the amount of landscape covered by toxicants. Aerial baiting on a landscape scale is a critical tool to support recovery goals for listed species on Guam.

FY20 Status

- Funded via an interagency agreement with USDA–NWRC; project complete
- Artificial lipid formulation have high takes rates >75% - lower than mice (98%)
- Artificial baits last up to 14 days, mice (DNM) decompose in 5 days
- Re-funded to refine production, more field trials, test formulation/palatability, and toxicity.
- New period of performance SEP2020 – MAR2022

Table 3. Six baits used in trial to determine if cheaper sources of lipids could be used in the bait formulation.

Bait #	Artificial Mouse Fat	Mass of Pork Fat (g)	Per Unit Cost
BE-34	"Original"	210	$0.27
BE-37	Evening Primrose Oil (EPO) substitution	209	$0.11
BE-38	Natural fats substitution	209	$0.03
BE-36*	"Original"	0	$0.23
BE-39	Evening Primrose Oil (EPO) substitution	0	$0.10
BE-40*	Natural fats substitution	0	$0.03

***BE-36 and BE-40 demonstrated the highest take rates for artificial lipids at the lowest price points**

EPR: No EPR - funded under the Guam Micronesian Kingfisher MOA

2019 JRM INRMP Reference: TIS-1, TIS-2, TIS-3; 5-85, 6-43; 7-52, 8-50-51, 9-71

Monitoring of Reduction in BTS Abundance during Eradication Activities in the HMU and Evaluation of Alternative Ground Baits for Large BTS

Location: JRM **Period of Performance:** SEP2019 – MAR2021

Project Objective

To continue monitoring BTS population levels after a series of 12 aerial baiting within the HMU and continue monitoring populations before, during, and after the next proposed series of drops. Abundance of BTS will be measured through analysis of non-toxic bait take, cameras captures. Additionally, a known-fate component will be conducted; BTS captured in the HMU will be radio-tagged and tracked. A bait trial for large BTS will be conducted to help assess the need for alternative baits for BTS not attracted by standard baits, additionally, well-water is being monitored for acetaminophen percolation.

Conservation Benefit

To increase effectiveness of large BTS control that currently have limited susceptibility to aerial bait application to enhance and restore habitat, and to assist in potential reintroduction of ESA listed species to the wild on Guam. Determining the level of impact from landscape scale BTS control is an essential requirement to evaluate success and future investment when considering species restoration on Guam.

FY20 Status

- Funded via an interagency agreement with USDA –NWRC; project in progress
- Non-toxic bait takes show increase after prolonged intervals between drops
- No detection of acetaminophen in ground water

EPR: No EPR - funded under the Guam Micronesian Kingfisher MOA.

2019 JRM INRMP Reference: TIS-1, TIS-2, TIS-3; 5-85, 6-43; 7-52, 8-50-51, 9-71

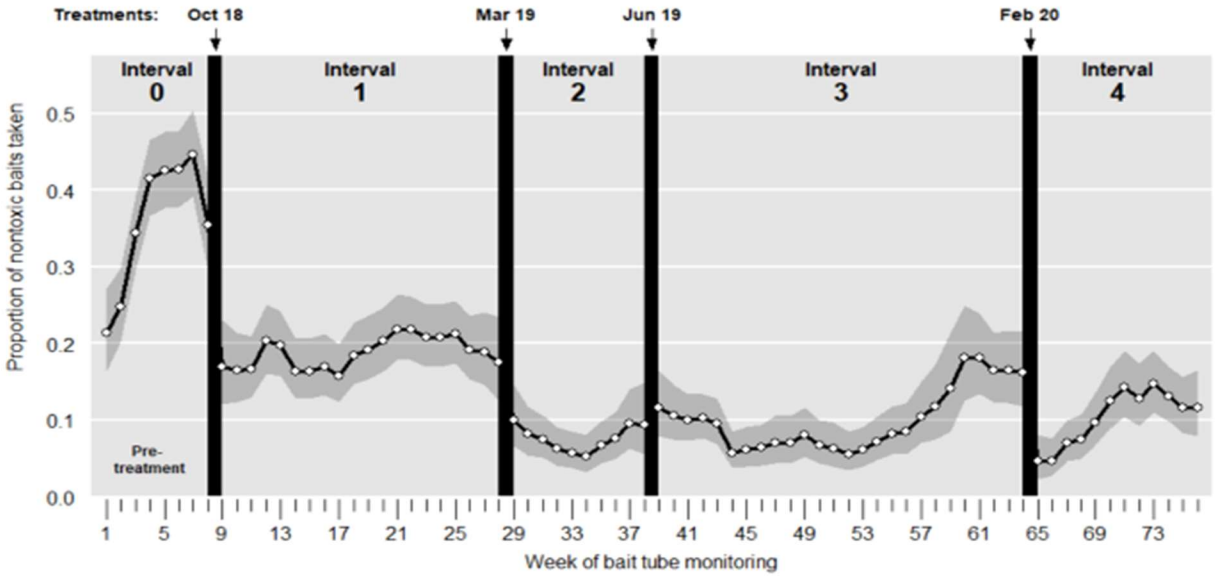

Figure 33. Weekly estimates of bait take rates, black bar represents a treatment period. The shaded area represents the 95% confidence interval for the estimate.

Assessment of BTS Fates after Toxicant Delivery to the Habitat Management Unit, AAFB

Location: AAFB; **Period of Performance:** MAY2018 – NOV2019

Project Objective

To determine the fate of known BTS based on demographics after a series of aerial baiting treatments in the HMU on AAFB. Two groups of BTS will be capture and have radio transmitters surgically implanted. Data will analyzed ad compared to previously collected data from a previous iteration of this project.

Conservation Benefit

Determining size-based susceptibility is essential for developing accurate demographic models to help inform suppression and eradication techniques. Moreover, identification of whether there is an upper threshold in susceptibility to ADS baits exists for large individuals will inform if complementary tools that better target large snakes are required during ADS application. Understanding the proportion of known individuals that are targeted by toxicants and their morphometrics prior to a toxicant drop is essential for methodological refinement and informing other suppression efforts. Understanding individual variation in susceptibility to ADS is also vital to prescribing toxicant application at an intensity and frequency that will result in effective suppression or eradication of BTS.

FY20 Status

- Funded via an interagency agreement with USGS – Fort Collins
- Some data lost due to problems with attaching transmitters
- 37% of tagged BTS (11/30) died post drop
- Size effect detected: smaller BTS (SVL $\leq$ 1040) showing higher death rate
- Data collection resumes after ADS drops in the HMU, estimated OCT2020
- Project complete□□new period of performance APR2020 – OCT2021

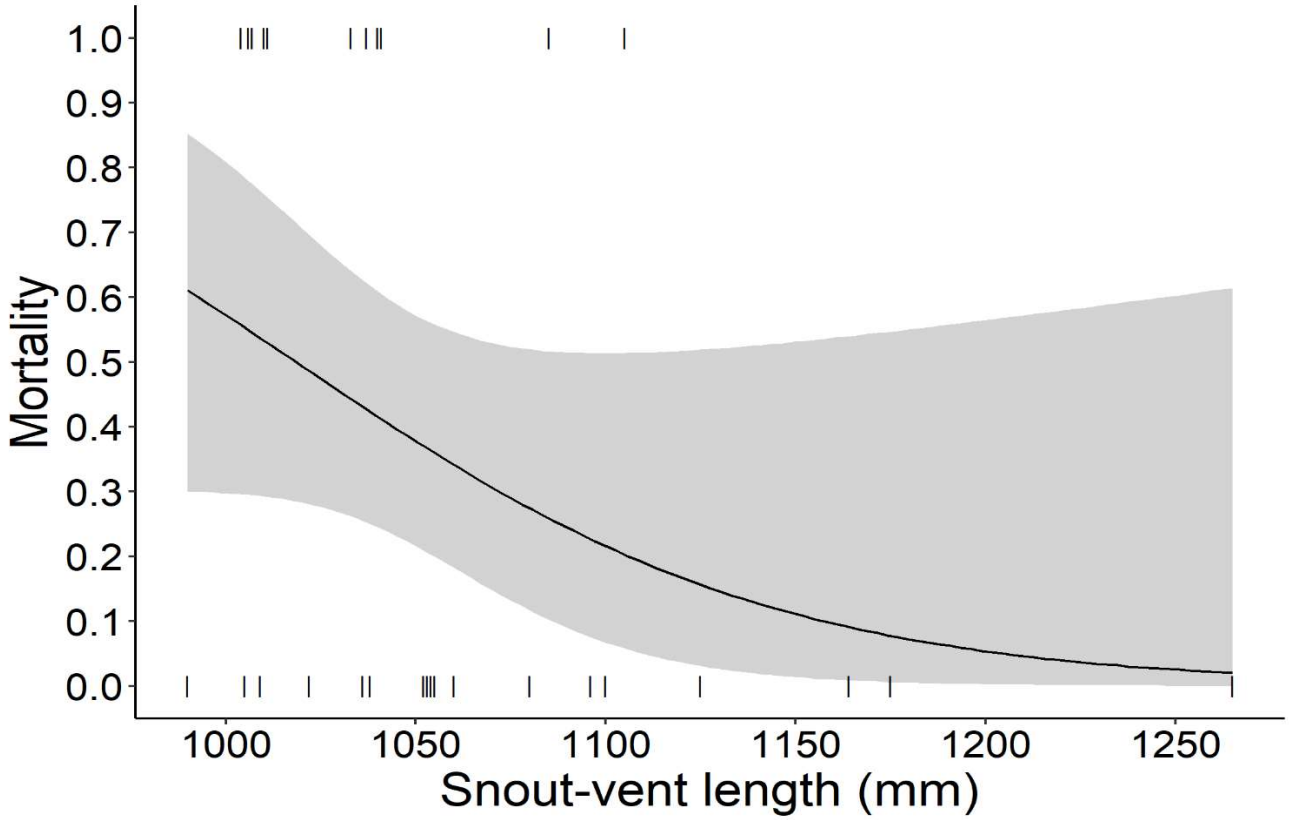

Figure 34. Effect of SVL on BTS mortality probabilities (lack line) surrounded by 95% confidence intervals (grey band) during two week treatment period. Tick marks indicate SVL of individual radio tagged snakes that survived (0.0) or died (1.0) during the treatment period (USGS-FORT).

EPR: 1 RP JRM BTS Eradication and Control to Support Recovery of ESA- Listed Birds; 61128NR202

2019 JRM INRMP Reference: TIS-2, TIS-3; 5-85, 6-43; 7-52, 8-50-51, 9-71

Monitoring Demographic and Ecological Effects of Sustained Automated Delivery System Treatment in The HMU, Andersen, AFB

Location: AAFB; **Period of Performance:** MAY2018 – NOV2019

Project Objective

Evaluate visual searching along minimally cleared transects versus trackless areas within 5 sub-plots; evaluate visual searching versus bait tubes and camera surveillance as a low density monitoring tool for BTS (compare with USDA/NWRC), and monitor demographic change in encounter frequency of BTS during visual searches.

Conservation Benefit

This will assess specific monitoring tools inform current structures of BTS populations and their small mammal prey, improved demographic inform and levels of suppression will inform future conservation efforts. Rodent prey have been determined to have strong effects on efficacy of snake suppression; monitoring their populations is likely to improve efficacy of individual landscape scale level applications. This project provide data to enhance and restore habitat, and to assist in potential reintroduction of ESA listed species to the wild on Guam.

FY20 Status

- Funded via an interagency agreement with USGS – Fort Collins
- Captures per unit effort (CPUE) declined across treatment periods
- Population structure shifted to smaller BTS after early drops
- Visual surveys and bait tube takes demonstrate decline in BTS population after baiting
- Size effect detected: smaller BTS (SVL $\leq$ 1040) showing higher death rate
- Project complete new period of performance APR2020 – OCT2021

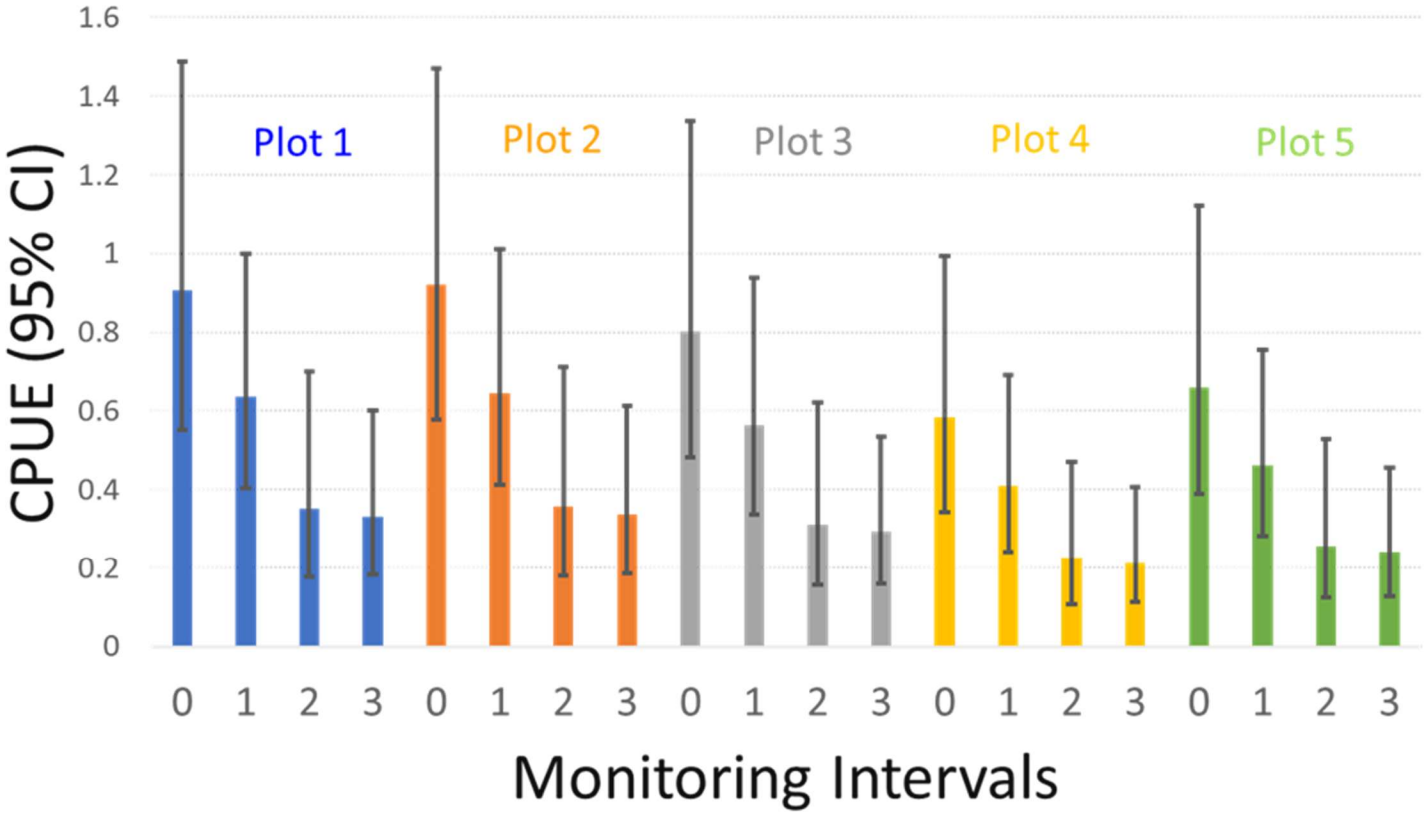

Figure 35. Habitat Management Unit (HMU, 55 ha) visual survey results for the 5 monitored sub plots over time (2018-2020). Automated Delivery System monitoring intervals are defined as: 0 = plot pre-toxicant treatment and numbers 1-4 indicate the time period immediately following the ordered toxicant treatments. Each plot shows a similar decline in snake captures over time.

Long-term known fate monitoring of large snakes in conjunction with Closed Population Eradication – AAFB

Location: AAFB **Period of Performance:** SEP2018 – MAR2020

Project Objective

Identify effective supplementary control tools for large snakes that are refractory to ADS treatments; genetically identify which snakes are producing offspring during ADS suppression; assist with snake collection (via visual surveys or trapping) for snake Known Fate research.

Conservation Benefit

It is known that very small and very large BTS are not as susceptible to current mouse baits. This project seeks to collect data to in Increase effectiveness of large BTS control that currently have limited susceptibility to aerial bait application. Collecting genetic data will help with population demography. The ability to target large BTS is a critical goal to enhance and restore habitat, and to assist in potential reintroduction of ESA listed species to the wild on Guam.

FY20 Status

- Funded via an interagency agreement with USGS – Fort Collins□□project complete
- Baits alone 10-15 years for eradication; additional tools halve the time required
- Potential maternal effect in offspring survivability maybe by size/health of offspring
- Smaller BTS more susceptible to baits; M/F BTS equally vulnerable

EPR: 1 RP JRM BTS Eradication and Control to Support Recovery of ESA- Listed Birds; 61128NR202

2019 JRM INRMP Reference: TIS-1, TIS-2, TIS-3; 5-85, 6-43; 7-52, 8-50-51, 9-71

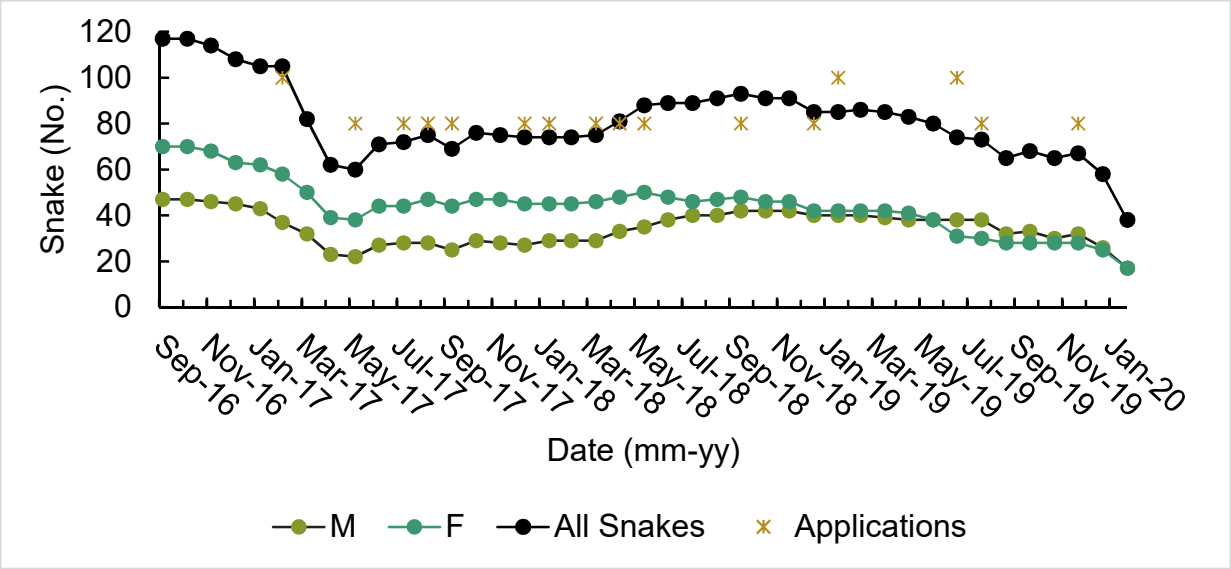

Figure 36. Population response of snakes to extended toxicant treatment in the 5 ha USGS Closed Population. USGS completed 20 applications across three years. The snake population was maintained at roughly 50% of the size prior to any treatments.

Evaluating Statistical Methods for Estimating Density of Invasive BTS from Camera Trapping Data – AAFB

Location: AAFB **Period of Performance:** SEP2018 – MAR2020

Project Objective

This project will evaluate several published models for their ability to provide robust estimates of BTS density by comparing know BTS populations numbers from Closed Population to results from analysis with the models. Data from 2015 will be used.

Conservation Benefit

Developing more robust monitoring is an important goal to help increase confidence in outcomes for landscape scale management for BTS. The ability to monitor suppressed BTS populations will be critical in determining success for reintroduction of avian populations. Low cost monitoring or robust population models can reduce costs and improve outcomes for propose reintroduction programs.

FY20 Status

- Funded via an interagency agreement with USGS –CRU; Washington University Extension project complete
- Current camera analysis methods poor at estimating BTS abundance.
- Current lure/bait methods bias the abundance estimate.
- Without ability to identify individual BTS, abundance estimation is a challenge.

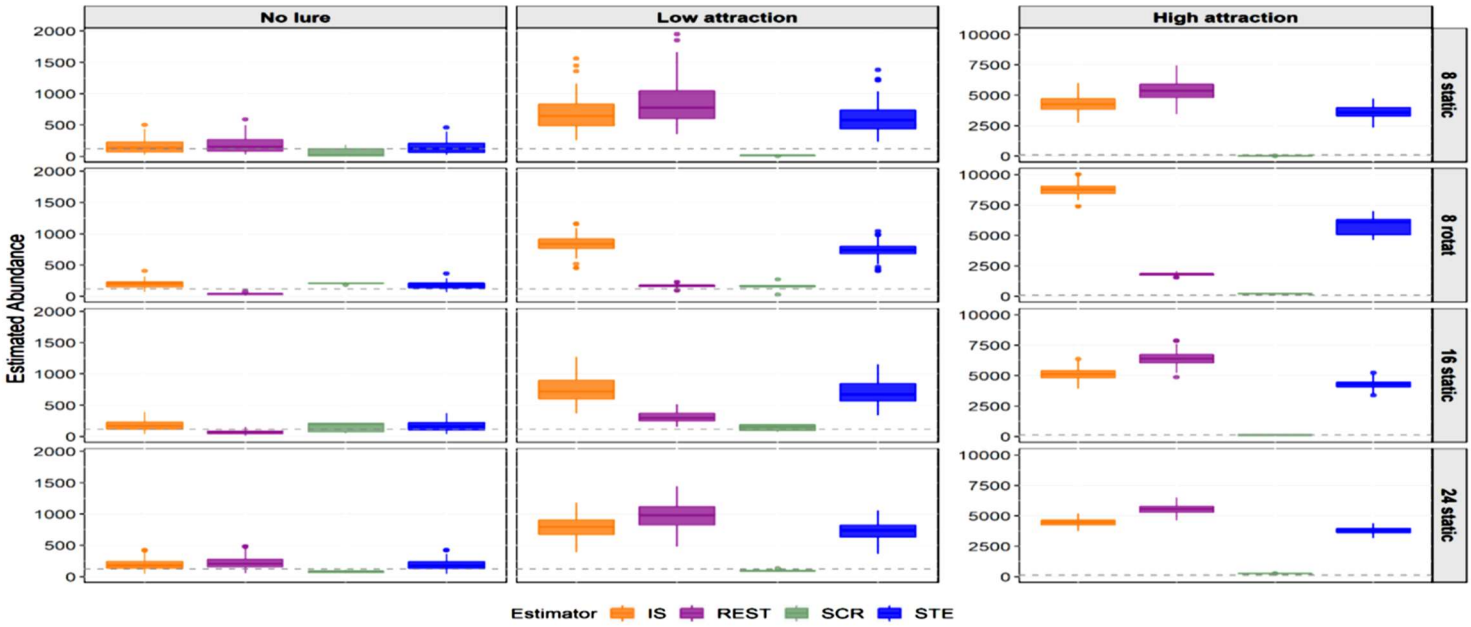

Figure 37. Comparison of estimator performance across each lure attraction (no, low, and high) and camera density (8 cameras rotating across 48 locations and 8, 16, and 24 static cameras) scenario. Boxplots of estimated snake abundance from 1000 simulations (except SCR unmarked models where only 5 simulations were used). Boxplots include median (darker line) abundance within the interquartile range (box), the range of values (whiskers), and outliers (points). True simulated abundance (120 snakes) is indicated as a dashed line.

EPR: 1 RP JRM BTS Eradication and Control to Support Recovery of ESA- Listed Birds; 61128NR202

Estimation of Brown Treesnake Predation Threat Thresholds for Persistence of Reintroduced Birds on Guam – AAFB

Location: AAFB **Period of Performance:** SEP2019 – MAR2021

Project Objective

To evaluate the levels of snake suppression that might enable persistence of reintroduced birds under some acceptable level of BTS predation. It is unknown what snake density is tolerable when considering the reintroduction of avian species. The project will simulate nest contact rates with cameras and model the levels of nestling mortality that can be sustained while maintaining a stable or growing population of birds.

Conservation Benefit

It is widely recognized that eradication of BTS from Guam is not currently achievable, however, severe suppression is viewed favorably. Through considering avian species persistence in the presence of a suppressed BTS population it may help facilitate reintroductions in areas where management can be sustained and supported allowing for limited recovery of extirpated species.

FY20 Status

- Funded via an interagency agreement with USDA –NWRC; project in progress
- Species accounts being compiled for modeling data

EPR: No EPR - funded under the Guam Micronesian Kingfisher MOA.

Using BTS Behavior and Movement to Refine Control on AAFB & for Improved Management of Native Forest Birds

Location: AAFB **Period of Performance:** SEP2019 – MAR2021

Project Objective

The goals of this project are to identify movement pathways used by BTS on AAFB, estimate abundance of BTS in relation to resources important to birds, and conduct a known-fate evaluation of BTS susceptibility to control based on size, sex, and food preference of snakes with radio-transmitters This project is one of four projects that will, collectively, further develop information on BTS behaviors related to predation and movement in the presence of abundant avian species.

Conservation Benefit

Better understanding of hotspots of BTS activity, travel pathways, and decision-making during foraging are critical to improve the coverage and efficacy of BTS control in a cost- effective manner. Additionally, population demographics that could be useful for supporting future avian restoration projects and controlling BTS in low density with competing food sources in the presence of control regimes. Knowledge of where snakes are located during foraging ensures that traps, bait tubes, and other lures used for snake suppression have the greatest impact by being placed where snakes occur naturally. The anticipated products include recommendations for spatial locations of control arrays to support cost-effective control of BTS on AAFB.

FY20 Status

- Funded via an interagency agreement with USGS –Fort Collins
- 70 BTS captured and tagged
- Data collection suspended for 8 weeks due to COVID-19
- Data collection has resumed

Guam Micronesian Kingfisher Recovery Habitat MOA Program and Project Execution

Location: NBG TS and AAFB **Period of Performance:** JUN2015 – JUN 2025

Project Objective

To ensure a sufficient amount of suitable recovery habitat is conserved in northern Guam to support the reintroduction and recovery of the Guam Micronesian kingfisher and allow DON to meet the purpose and need for the proposed action to relocate U.S. Marines to Guam.

Conservation Benefit

The DON will work cooperatively with the USFWS to identify, develop and implement specific management activities and projects on these 5,234 acres to support the following:

1) brown treesnake (BTS) control and suppression to facilitate the larger goal of suppressing snake population levels that will ultimately support kingfisher survival and recovery;
2) support for BTS control and eradication methods development, focusing on tools and techniques needed for landscape level survival and recovery of the kingfisher;
3) ungulate fencing and eradication;
4) control or small mammalian predators;
5) invasive plant control and eradication;
6) native plant restoration; and,
7) localized control of introduced invertebrates that may negatively impact kingfisher nesting/fledging.

FY20 Status

- South Haputo Ecological Reserve Area fence (116 acres); 8,300-foot linear fence; task order awarded August 2020. In sequence with North Haputo fence.
- Structured Decision-making Workshop – postponed, consider in FY21
- Continuation of HMU Monitoring for FY20 ADS Drops
- Closed Population Fence Refurbishment
    - Replace the entire outer mesh material
    - Coat the internal chain-link fence.

2019 JRM INRMP Reference: THM-1; 9-68

Multi-species Barrier Development Phase I – NBG TS

Location: NBG TS **Period of Performance:** APR2018 – OCT2019

Project Objective

The primary objective of this project is to develop and evaluate a multispecies barrier fence, estimate and itemize annual and long-term maintenance methods and costs and provide recommendations for multispecies barrier based on a review of the existing literature, visiting other sites with vertebrate barriers, testing results, and cost analysis.

Conservation Benefit

Closed Population has demonstrated that BTS can be effectively excluded using barrier fences, with the caveat that these require significant labor for maintenance Little research has been undertaken to promote creation of areas free of multiple species of invasive or predatory vertebrates that would be suitable for reintroduction or recovery of Guam's native fauna and flora.

FY20 Status

- Activities conducted to date:
  - Review of the existing literature
  - Visited other sites (New Zealand) with vertebrate barriers
  - Lab testing results

Figure 39. MSB Prototype at USGS Facility, AAFB.

Table 4. Summary table of brown treesnake arena trials.

Size class	Number of individuals	Number of trials	Number of Breaches	Number of breach attempts and height achieved on exclusion prototype wall			
					100cm	150cm	200cm

Coconut Rhinoceros Beetle (CRB; *Oryctes rhinoceros*) Surveys, Interdiction, and Monitoring - CNMI

Location: CNMI **Period of Performance:** SEP2016 – SEP2021

Project Objective

To implement CRB best management practices: 1) conduct CRB Early Detection Surveys in military training areas, 2) implement interdiction trapping during military exercises with cargo movements from Guam, 3) implement CRB awareness military personnel, and 4) implement CRB interdiction measures on Guam; and coordinate and collaborate with resources partners in the CNMI to prevent the movement of CRB to the CNMI via military cargo and transport while maintaining military readiness.

Conservation Benefit

Prevent the movement and establishment of CRB into the CNMI during military activities.

FY20 Status

- Conducted CRB Early Detection Surveys along roadways for CRB damaged coconut trees (Dec 2019)
    - No CRB damage detected
- Deployed and monitored CRB panels traps at North Field during Cope North exercise (Feb 2020) (Figure 40)
- Assisted CNMI DLNR CRB Interdiction Program in providing CRB tekken netting and panel trap supplies for Tinian and Rota Ports during Cope North 20 (Feb 2020)
- Provide military personnel with CRB awareness information and CRB sighting protocols during military training exercises (Dec 2019, Feb 2020)
- Biosecurity inspections were conducted on all cargo and equipment prior to transport from Guam to CNMI during military exercises to ensure all items were devoid of bio-material (including CRB)
- Coordinated CRB interdiction measures during Cope North 20 with CNMI natural resources partners

Marianas Islands Training & Testing Biological Opinion Terms & Conditions 1.1 Compliance – CNMI

Location: CNMI **Period of Performance:** AUG2018 – SEP2022

Project Objective

To comply with the Mariana Islands Training & Testing (MITT) Biological Opinion (BO) Incidental Take Statement Terms and Conditions 1.1 (as amended 28 FEB 2016) to provide funding to the U.S. Fish & Wildlife Service for invasive vertebrate pest control to minimize the effect of take on the Micronesian megapode (*Megapodius laperouse*). DoD is not responsible for project implementation or the results thereof, per the MITT Biological Opinion (BO) amended Terms and Conditions 1.1.

Conservation Benefit

To ensure compliance with the Incidental Take Statement of the 2015 MITT BO to minimize the effect of take on the Micronesian megapode.

FY19 Status

- Interagency Agreement between Joint Region Marianas and the U.S. Fish & Wildlife Service established in August 2018.
- U.S Fish & Wildlife Service project currently in planning/implementation phase to complete Micronesian megapode habitat restoration on Aguiguan.

Natural Resources Educational Outreach

Biosecurity Outreach and Education on Guam

Location: Various locations **Period of Performance:** SEPT 2020-SEPT 2021

Project Objective

The DON has initiated and will continue to implement a targeted, comprehensive outreach and education program for DoD and civilian populations for biosecurity focused on prevention.

Conservation Benefit

Minimize the effects of invasive species by educating DoD and civilian populations through prevention. Provide awareness of introduced and invasive species, the impacts of invasive species on native species and ecosystems, and what can be done to prevent and control invasive species.

FY20 Status

- Biosecurity outreach and education contract was awarded on 29 August 2019. Final report received August 2020. DON worked with Department of Agriculture Biosecurity division to link their homepage with video ads. The campaign yielded over 7,000+ clicks to the Department of Agriculture Biosecurity home page. Social media was the most successful component of the project. The completed views exceeded the requirements of the PWS.
- FY20 Biosecurity outreach and education contract scheduled award date 30 September 2020. DON to continue working with Department of Agriculture Biosecurity division to link their home page with video ads. Project to incorporate recommendations obtained via FY19 Final Report in an effort increase overall reach and effectiveness. Placement of ads to run on a 24-hour cycle for 7-days a week rather than only during certain timeframes.

Outreach and Education – NBG

Location: NBG **Period of Performance:** AUG2019 - SEP2020

Project Objective

This project will develop, design, and produce/print custom outreach materials and educational signs for Public Works EV, Naval Base Guam.

Conservation Benefit

Avoid and minimize adverse impacts from recreational activities to ESA-listed species and other marine natural resources.

FY20 Results

Project was awarded in FY19 and achieved the following results:

- Replace educational signs including a fishing regulation sign and a seafood health advisory sign
- A Naval Facilities Engineering Command (NAVFAC) canopy for use at outreach events
- Reprint the fishing regulation brochure, which contains mooring buoy locations.
- A trifold display for outreach events was developed (Figure 41). The display has interchangeable pictures and content, and can be tailored to match the outreach event.

JRM Natural Resources Stewardship Outreach & Public Engagement Program

Location: JRM AOR **Period of Performance:** AUG2020 - AUG2021

Project Objective

To develop materials and training enabling JRM Natural Resource (NR) managers to effectively and efficiently implement a NR stewardship engagement program. This program aims to better educate uniformed and civilian staff, their dependents, JRM contractors, and the general public in order to improve NR stewardship and awareness within the Area of Responsibility (AOR). The AOR includes DoD lands within Guam and the CNMI.

Conservation Benefit

The 2019 INRMP outlines JRM NR responsibility to reach as many uniformed and civilian staff, their dependents, and JRM contractors with focused, consumable environmental education and outreach. The development and production of NR education materials and training is a beneficial support to increasing awareness of T&E species, proper stewardship behavior, and threats to local ecosystems.

FY20 Results

- Project awarded AUG2020
- Kickoff completed 03SEPT2020

EPR:

2019 JRM INRMP Reference: TEDU-1; 5-91, MEDU-1; 5-104

Migratory Bird Management

Migratory Bird Surveys – NBG

Location: NBG; NMS; NBG TS **Period of Performance:** recurring annually

Project Objective

To: (1) identify migratory bird species on NBG; (2) examine trends in abundance; (3) identify and quantify suitable habitat for migratory birds; and (3) examine habitat relationships of migratory birds.

Conservation Benefit

Monitor long-term trends of spatial and temporal distribution of migratory birds on NBG lands.

FY20 Status

- Migratory bird abundance was monitored at 20 sites on NBG between August 2019 and August 2020.
- 11 species were recorded with Pacific golden plovers accounting for 53% of migratory birds observed, ruddy turnstones 21%, whimbrels 13%, and all other species collectively accounted for 13% of observations. These findings are consistent with data from past years.
- Abundance was higher during September – April compared to May –August.
- Migrants used grass fields more often than shoreline or wetland habitats; however, habitat use varied among species.
- Navy plans to continue conducting migratory bird surveys on NBG and examine the relationship between habitat use and maintenance plans at grass fields.

EPR: 1 RP MAR CNMI ESA and MBTA Species Management (Key species Moorhen and Sea Turtles); 61128NR211

2019 JRM INRMP Reference: MIG-1; 5-90

Monitoring of MBTA-Listed Bird Species – FDM

Location: FDM **Period of Performance:** OCT2019 – SEP2020

Project Objective

To identify migratory bird species on FDM; examine trends in abundance; identify and quantify suitable habitat relationships of migratory birds. Monitor long-term trends of three booby species (Brown, Masked, Red-footed) on FDM via helicopter surveys.

Conservation Benefit Provides information of bird species present and habitat usage to guide implementation of appropriate conservation practices.

FY20 Status

- Accompanied the sea turtle and marine mammal aerial surveys on January 2020 to determine the viability of conducting booby surveys from a fixed-wing aircraft.
- 475 Red-footed boobies were counted after several passes around the island. The speed of the aircraft (85-98 mph) only allowed for the counting of Red-footed boobies that contrast with trees and shrubs that they roost on.
- Masked and Brown boobies roost on the ground and not discernable from the ground.
- JRM continuing to explore options to continue monitoring long-term seabird trends for the three booby species.

EPR: 1 S MAR NBG Endangered Species Surveys; 61128NR211

2019 JRM INRMP Reference: MIG-1; 12-35

Terrestrial Habitat Management

Listed Plant and Invertebrate Surveys

Location: JRM **Period of Performance:** JUL2019– JAN2021

Project Objective

This purpose of this project is to conduct plant and invertebrate surveys and to implement management techniques to provide a conservation benefit to federally-listed threatened and endangered species under the Endangered Species Act (ESA).

Conservation Benefit

Identifying locations of ESA-listed plant and invertebrate species will allow for management actions to reduce habitat fragmentation, enhance and restore habitat, buffer protected areas, and implement new conservation strategies.

FY20 Status

- The final report for surveys conducted on DOD lands from October 2014 through July 2019 was provided in July 2020.
- A new cooperative agreement was awarded through the Cooperative Ecosystem Studies Units (CESU) Network to University of Guam (UOG) in July of 2019 to conduct surveys for plant and invertebrate surveys on all JRM lands and other lands on Guam and the Commonwealth of the Northern Mariana Islands (CNMI).

***Tuberolabium guamense* surveys on Non-DOD lands:**

- Surveys have been conducted for *Tuberolabium guamense* in support of the *Tuberolabium guamense* Species Action Plan (SAP), which was developed to increase our understanding of the range-wide status of the species, threats, and conservation actions that could lead to a potential change in the listing status. Surveys for *Tuberolabium guamense* have been conducted from November 2019 through July 2020 on non-DOD lands (primarily Government of Guam lands) at Bolanos Conservation Area, Mati Point, and the forested area near the Yigo Raceway (Figures 42 and 43).
- A total of 27,272 *Tuberolabium guamense* have been observed to date (Table 5).

Cycas micronesica	14
Dendrobium guamense	10
Tabernaemontana rotensis	1
Tuberolabium guamense	598

Figure 44. ESA-listed species recorded at J-200-II, AAFB.

<u>ESA-listed species surveys on Andersen Air Force Base (Northwest Field):</u>

- Transect surveys (5-10 m) for listed plants were conducted over an approximately 142 acre area adjacent to the HMU in AAFB from January through May 2020. A total of 123 mature *Cycas micronesica*, *Tuberolabium guamense* (7,575), and *Bulbophyllum guamense* (76). Host trees were *Vitex parviflora*, *Meiogyne cylndrocarpa, Ficus prolixa, Aglaia mariannensis, Morinda citrifolia, Ficus tinctorial,* and *Ochrosia oppositifolia* (Figure 45). Three (3) *Elatostema calcareum* plants were found, but no ESA-listed larvae were observed.
- Surveys are being conducted on approximately 80 acre area at Northwest Field. ESA-listed species found were *Tuberolabium guamense* (1,510), *Tabernaemontana rotensis* (10), and

Dendrobium guamense (4). No invertebrates were found during this survey. Surveys are still underway.

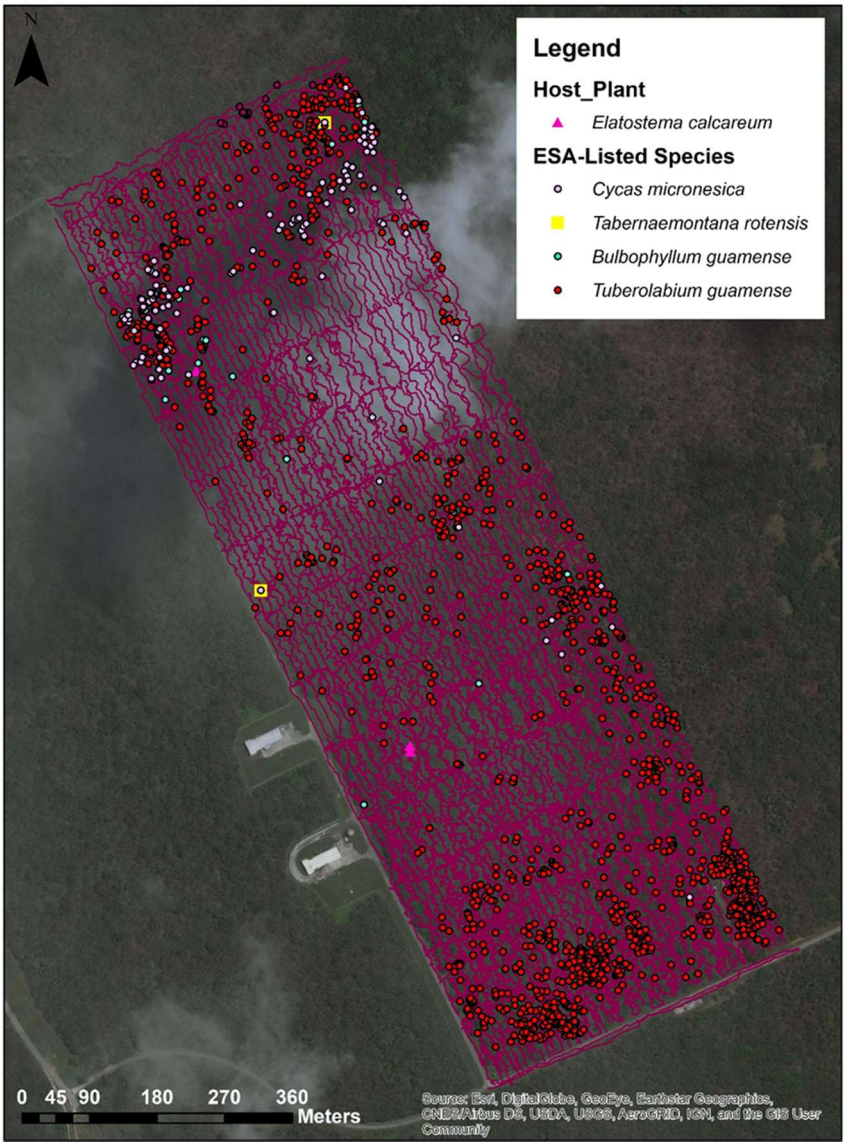

Figure 45. ESA-listed species recorded at the area adjacent to the HMU in AAFB.

<u>ESA-listed species surveys on Naval Munitions Site</u>:

- Transect surveys are ongoing in the Naval Base Guam Naval Munitions Site. Forest types include Vitex and Ravine forests. During July and August 2020 the following ESA-listed species were found: *Bulbophyllum guamense* (1,855)*, Cycas micronesica* (9)*, Dendrobium guamense* (990)*,* and *Tuberolabium guamense* (1,639) (Figure 46).

Threatened and Endangered Species Preconstruction Surveys

Location: JRM **Period of Performance:** various, multiple awards

Project Objective

Conduct preconstruction surveys prior to vegetation clearing and grubbing for construction and design related activities.

Conservation Benefit

To minimize impacts to specific listed species due to construction and design related activities.

FY20 Status

- Preconstruction fruit bat surveys ongoing for the following construction projects: J-001B, J-200-II, J-755, P-102, P-103, P250/P260, P295, and P-715.
- Preconstruction fruit bat surveys conducted for design-related project J-755 and P-735.
- Preconstruction ESA listed species surveys completed for J-001B, J-006, J-007, J-200-II, J-609, J- 755, P-102, P-103, P-290, P-295, P-296, P-715, P-735, P-103, and Haputo fence line.
- Preconstruction ESA listed species surveys on-going for Andersen South, P-608, and Forest Enhancement Site ungulate removal.
- Preconstruction ESA listed species survey completed for J-001B Forest Enhancement Fence Phase I and Phase II.

Forest Restoration Plan Implementation – NBG

Location: NMS **Period of Performance:** SEP2017 – DEC2019

Project Objective

- Restore native forest ecosystems within fenced areas where feral pigs, deer and carabao have been removed on the NMS.
- Propagate and plant and/or use direct seed techniques for reforestation following the recommendations of the Naval Base Guam (NBG) Forest Restoration Plan and the Conceptual Limestone Forest Restoration and Enhancement Plan (NAVFAC PAC 2018).
- Manage new plantings for a minimum of three years to ensure establishment.

Conservation Benefit

Increasing native forest habitats would improve native species survival, particularly threatened and endangered species enhance native habitat for listed animals, increase the biodiversity of native species, and contributes to the connectivity with surrounding communities in ways that support improved ecosystem functionality. It also contributes to the goals of the Guam NWR as an overlay unit the NMS.

FY20 Status

Work within Fence Unit #1

- Twenty research plots have been established in the NMS. Ten of the plots are within an ungulate exclosure area (Labeled 1 in Figure 50). Ten of the plots are in a control area where ungulates have access to them for comparison.
- Ground vegetation and tree surveys have taken place in all plots to set the baseline. Surveys have been periodically updated.
- Vitex trees (*Vitex parviflora*), which are the most common aggressive invasive tree in the research area were removed in the dry season of 2020. Trees were removed using the hack and squirt method. Trees were left to die in place, to minimize the immediate impact to the area.
- All vitex trees with orchids on them were left in place.

Work within Fence Unit #2

- New work was awarded for forest restoration within Fence Unit #2 in 2019.
- Restoration activities will include:
    - Phased removal of vitex trees throughout the fenced unit.
    - Experimental plots to record the effects of fencing on forest restoration

compared to unfenced areas
    - Measurements of the rate of natural tree regeneration
    - Measurements of planted seedling success
- Vitex will be removed in phases throughout Fence Unit #2, once an Section 7 consultation for orchids has been completed

EPR: 1 CP MAR NBG Native Forest Habitat Restoration; 61755NR856

Cetti Bay Watershed Terrestrial Monitoring

Location: Cetti Bay Watershed **Period of Performance:** SEP2017 - MAR2021

Project Objective

To gage the efficacy of the acacia plantings in reducing the effects of fires in Cetti Bay and reducing the amount of soil that settles into Cetti Bay. The measures involved in addressing the project objective include survival and growth rates of the acacia trees, tree survival rates after a fire, and the amount of sediment reaching the bay from the two rivers that drain the Cetti watershed into the Bay.

Conservation Benefit

The project will establish how effective the acacia tree plantings are in improving Cetti Bay aquatic resources, given the environment and site history of annual fires.

FY 2020 Status

- Awarded CESU network to UOG
- 522 acres planted originally, with some areas planted multiple times after initial plantings did not survive. Total net acres planted was 280 acres.
- Yearly survival rate was difficult to ascertain because adequate records and locations of the initial plantings do not exist. More information will follow.
- Cetti Bay has been subject to fires every year since the start of this project.
- The fires of 2019 were more intense and wider spread. Trees with a diameter less than one inch had a 5% survival rate. Trees with a diameter greater than one inch had a 71% survival rate.
- Turbidity measurements show overall differences between 2018 and 2019, possibly attributed to precipitation. 2018 average turbidity data for dry and wet season are 8.5 and 22 NTU. The data show a decrease in turbidity for 2019 dry and wet season 7.6 and 8.2 NTU.
- To remove precipitation as a cause for the difference in turbidity levels, turbidity as a function of precipitation was graphed for both 2018 and 2019 (Figure 52). The result shows that as precipitation increases turbidity increases. However, in 2019 the turbidity as a function of precipitation decreases slightly.
- Future measurements will determine if the decrease in sedimentation is random or an actual trend.

2019 JRM INRMP Reference: THM-2; 7-50

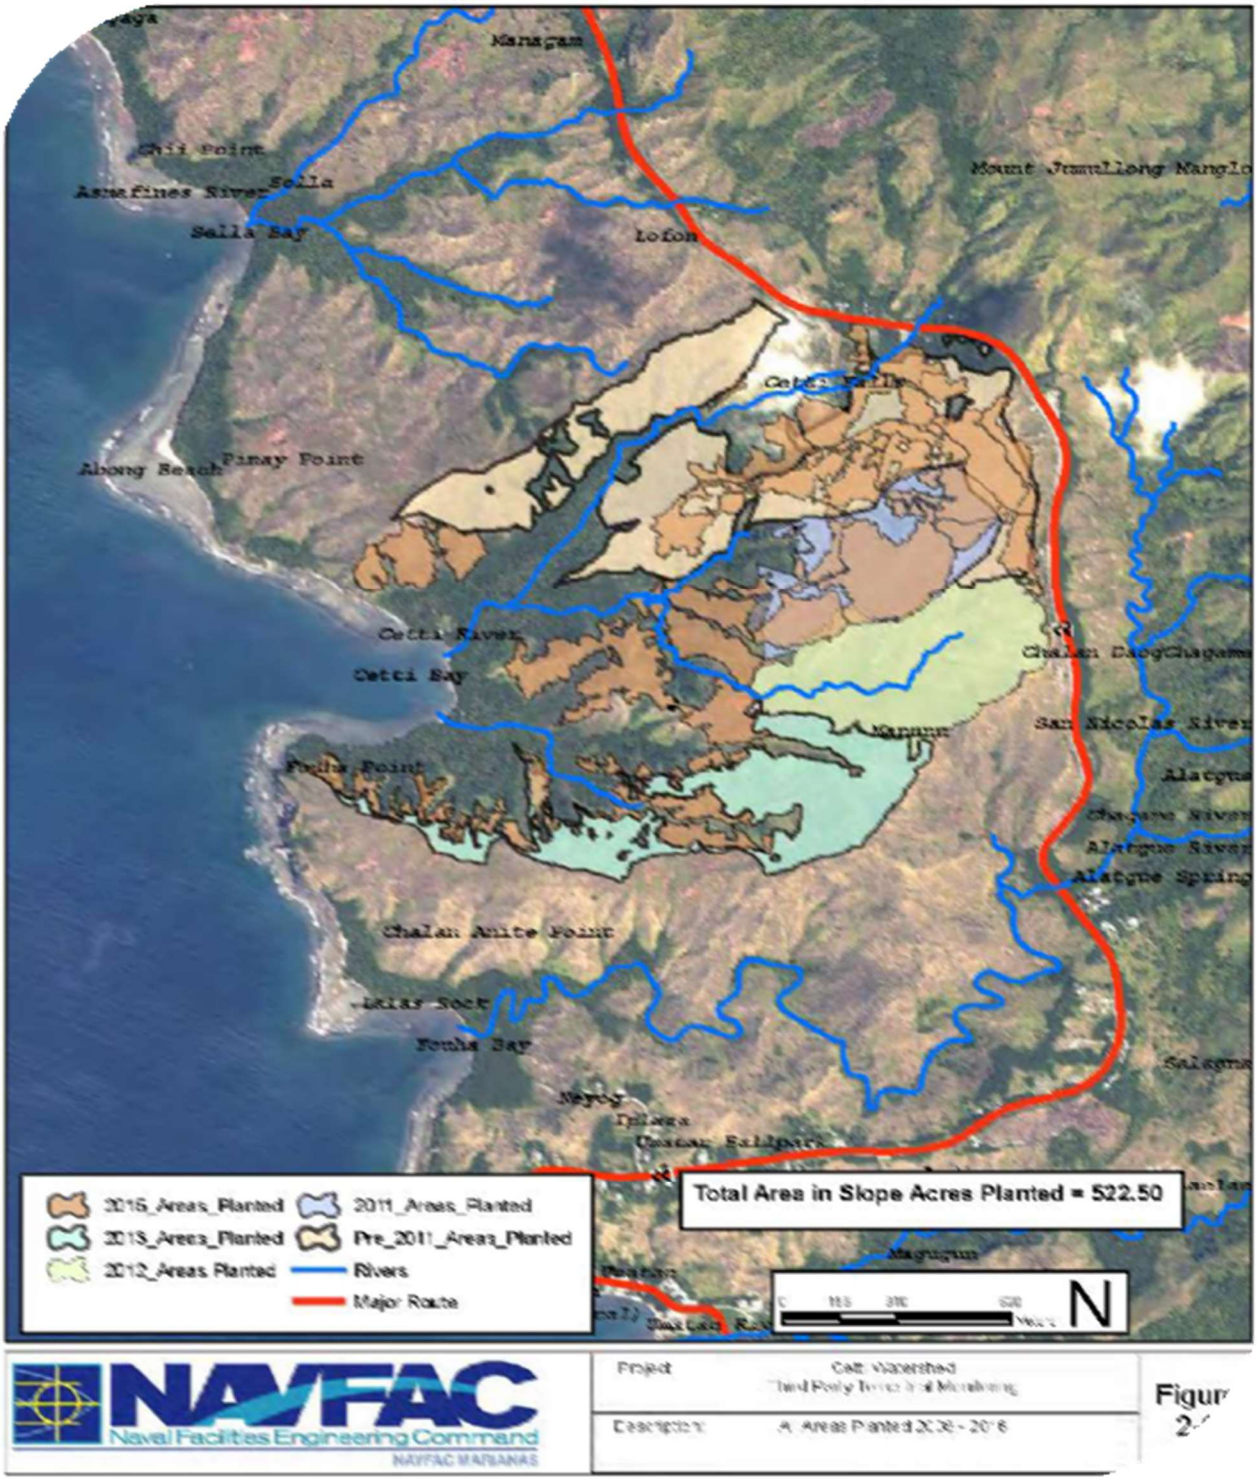

Figure 51. Map depicting the location of Cetti Bay Watershed and acacia plantings by year.

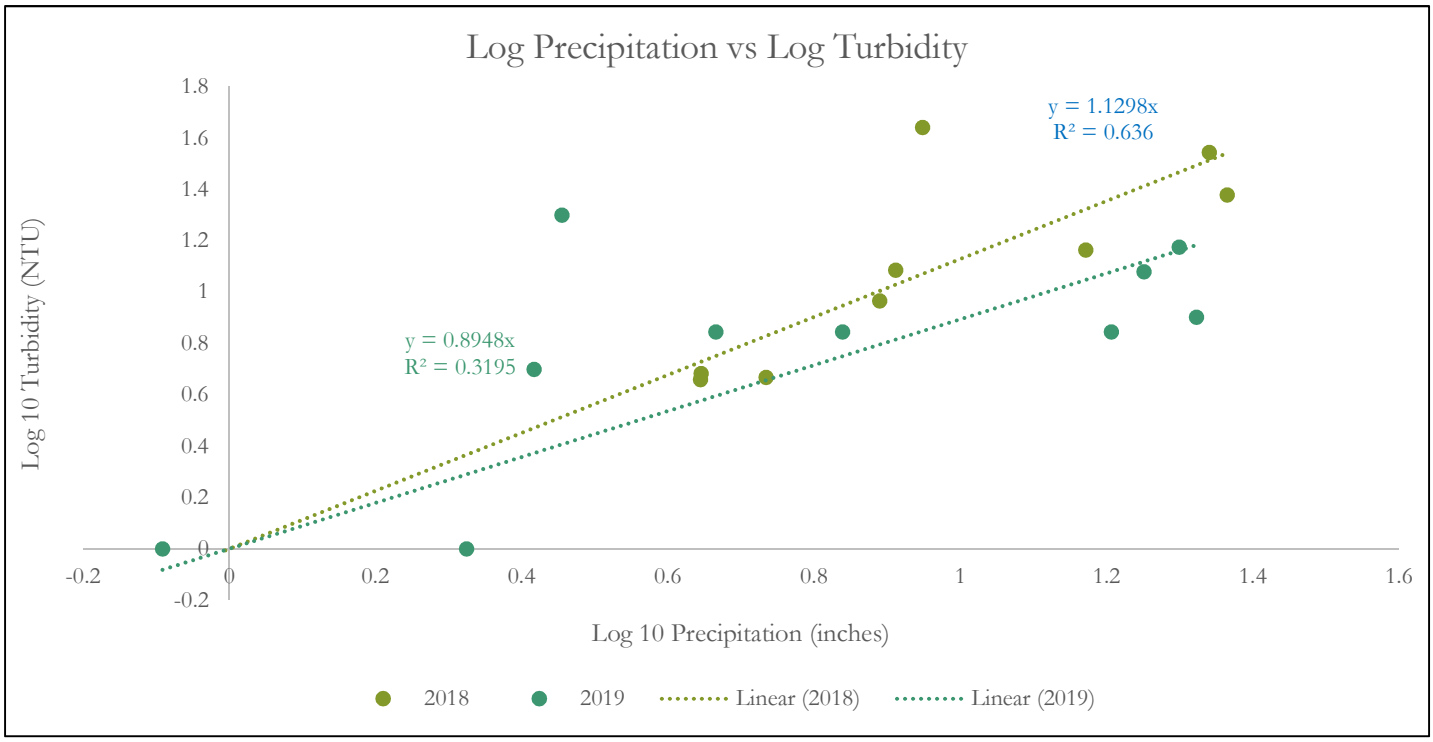

Figure 52. Comparison of turbidity levels as a function of precipitation between years 2018 and 2019. The data show a slight downward trend in turbidity levels.

Ungulate Fencing – NMS

Location: NMS **Period of Performance:** AUG2020 – AUG2021

Project Objective

Construction and maintenance of ungulate fencing on the Naval Munitions Site (NMS) to facilitate eradication of feral pigs, Philippine deer, and carabao and to prevent immigration into the fenced areas. The objective is to fence off native limestone and ravine forest on NMS and eradicate ungulates inside the fenced areas (Figure 53).

Conservation Benefit

Will allow native forest regeneration and recovery.

FY 20 Status

- An 80-acre fence (#1 in Figure 53) was constructed Jun 2017-February 2018.
- Construction of a second fence (#3 in Figure 53) began in August 2019 and was completed in December 2020.
- Contract awarded to Sustainable Resources Group (SRG) in FY2019 to construct third fence (#2 in Figure 53). Work will begin soon.

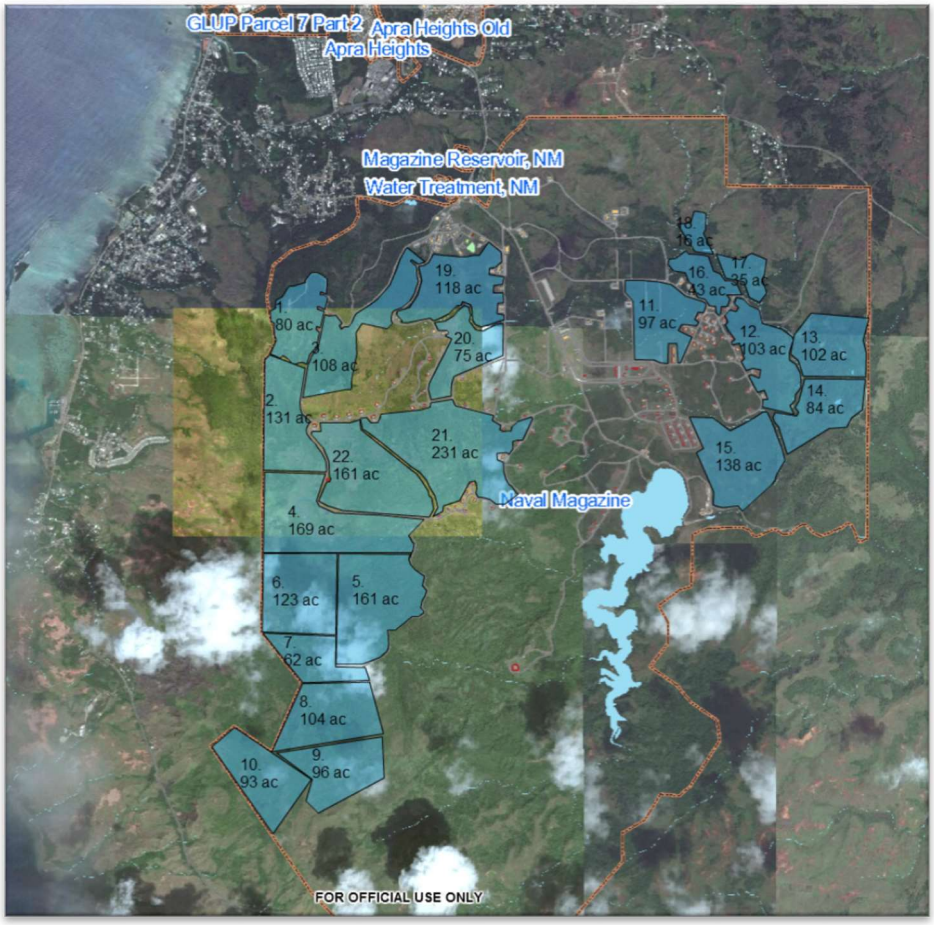

Figure 53. Map depicting areas that may be fenced on NMS. The section labeled "1. 80 ac." was fenced in FY18.

EPR: 1 RP MAR NBG Ungulate Fencing; 61755NR894

2020 JRM INRMP Reference: THM-2; 6-39

Firebreak Management Plan Implementation – NBG

Location: NMS **Period of Performance** AUG2018 – AUG2020

Project Objective

To implement the NBG Wildland Fire Management Plan. Specifically, to treat problem fuels (e.g. swordgrass (*Miscanthus floridulus*)) in strategic locations to disrupt the spread of wildland fires in savannah/ grasslands on NBG land.

The long-term goal is to have less flammable vegetation to allow uninterrupted land use that meets the military mission requirements. This project will implement specific management actions for Fire Management by planting and/or direct seeding of trees to create shaded fuel breaks and annual management of forested fuel breaks by mowing and chemical treatments of high-fuel load grasses.

This project took place in two areas.

- Areas in Sasa Valley have previously been planted with acacia trees were under-planted with native species. Eventually those trees will grow and replace the acacia with a native tree landscape.
- Naval Magazine Site along Firebreak No. 3. This area frequently experiences fires and is dominated by swordgrass. Planting in this area is designed to help disrupt fires in the area and help protect other projects adjacent to the area owned by Guam Department of Agriculture.

Conservation Benefit: Protect native ecosystems that might otherwise be susceptible to wildfire damage. Protect against soil erosion which causes further damage. Over time the project will protect natural resources and listed species by reducing soil erosion which causes siltation of Guam's coral reefs.

FY20 Status

- This project was awarded as a contract in October 2018.
- Tree planting has been completed in both the NMS and in Sasa Valley during both 2019 and 2020 rainy seasons.
- Phase 1 in the 2019 rainy season focused on fast growing shrubby species *Scaevola sericea* closest to the road. The medium height tree *Hibiscus tiliaceus* is planted the next layer further away.
- Low growing species were planted along the edge closest to the road to avoid a "fuel

ladder" effect that facilitates the ability of fires to jump over roads.

- Phase 2 in 2020 focused on planting native forest trees shown on Table 7. These trees were placed furthest from the road and firebreak.
- Tree plantings in Sasa Valley took place in areas that were previously planted with acacia. Eventually the acacia will be removed so that they can be replaced by Guam native species.
- In all, a total of 23,307 native trees seedlings were planted for this project.
- Some areas were planted by direct seeding. Areas were direct seeded to experimentally determine if this can be used as an alternative to avoid costly MEC (Munitions and Explosives of Concern) avoidance measures. MEC avoidance measures are costly and absorb the Navy's yearly capacity for restoration projects. The number of seeds planted in 2020 total 3,879.
- An additional firebreak project will be awarded in 2021.

Range Fire Management Plan for Marine Corps Ranges on Guam

Location: AAFB and Andy South **Period of Performance:** SEP2017 – SEP2021

Project Objective

Create a range fire management plan to reduce range/wildfire potential, protect and enhance natural and cultural resources, integrate applicable permit and reporting requirements and implement ecosystem management goals, sustainable training, and objectives already supported on existing Marine Corps installations.

Conservation Benefit

Management plan goal is to reduce the effects of fires by limiting their frequency, size, and severity while still allowing the USMC to maintain a high level of combat readiness. The fire management plan is being developed in accordance with a conservation measure in the Biological Opinion for the Marine Corps relocation program.

FY20 Status

- CESU awarded to Colorado State in Sept 2017.
- Final Plan expected in September of 2021.

EPR: DPRI: Marine Corps Relocation 2017/2018 amendment to 2015 BO, Conservation Measures to Minimize the Effects of Fire

2019 JRM INRMP Reference: THM-1; 9-68

Seed Collection from *Heritiera longipetiolata* and *Tabernaemontana rotensis*

Location: AAFB **Period of Performance:** OCT2018 - 2021

Project Objective

To collect seeds from federally endangered *Heritiera longipetiolata* and threatened *Tabernaemontana rotensis* identified within project footprints associated with the Guam Relocation.

Conservation Benefit

To minimize impacts of military construction activities to native ecosystems by collecting the seeds from as many mature individuals as possible and preserving the genetic diversity of the species.

FY20 Status

- 39 seeds have been collected from 2 of 5 mature *Heritiera longipetiolata* located within AAFB project footprints.
- 15 Heritiera longipetiolata seeds have germinated.
- 735 seeds have been collected from 19 of 136 mature *Tabernaemontana rotensis* located within AAFB project footprints.
- 560 *Tabernaemontana rotensis* seeds have germinated.

EPR: DPRI: Marine Corps Relocation 2017/2018 amendment to 2015 BO, Conservation Measures to Contribute to the Recovery of Listed Species.

2019 JRM INRMP Reference: THM-3; 8-49

Figure 56. ESA-listed species *Tabernaemontana rotensis* seeds

Forest Restoration at Achae Point

Location: AAFB **Period of Performance:** OCT2019 – JUL2020

Project Objective

Restore native vegetation component to limestone forest rehabilitation site.

Background

The Achae Point Reforestation Project at Ritidian Point was started as a collaborative effort between AAFB and US Fish and Wildlife Service, Guam National Wildlife Refuge (GNWR). This reforestation project was a multi-year project that included 1) constructing an ungulate exclusion fence 2) collecting and propagating native plant seeds, and 3) planting native trees important for endangered species recovery, specifically the Mariana fruit bat. In 2011, a chain link fence was constructed around a 1.5 acre Installation Restoration Program (IRP) site to exclude deer and feral pigs (Figure 57). Native tree seedlings were outplanted in November 2013, with a final count of 1,086 native trees outplanted in April of 2014.

In June of 2016 a brush fire occurred in and around the reforestation site and destroyed numerous trees within approximately one acre of the fenced area. An additional 860 native plants were planted in September 2016 (Figure 58) within the fenced area in open burned areas.

Conservation Benefit

Enhance and restore habitats, reduce habitat fragmentation, increase populations of native species, and buffer protected areas.

FY20 Status

- The contract to maintain the site ended in Sept 2019 and in Oct 2019 the maintenance work was added to the *Serianthes* Management Cooperative Agreement held by UOG/GPEPP.
- As of June 2020, there are 829 native plants within the site.
- Plans under the current cooperative agreement include planting and maintaining listed plant species such as *Serianthes nelsonii* and *Heritiera longipetiolata*.

Vegetation Restoration for the HMU

Location: AAFB **Period of Performance:** AUG2016 – DEC2020

Project Objective

Implement vegetation restoration within the Habitat Management Unit (HMU) utilizing the 2017 HMU Vegetation Restoration Plan.

Conservation Benefit

Enhance and restore habitat and maintain or increase populations of threatened and endangered species, including those extirpated from Guam and potentially reintroduced within the HMU.

FY20 Status

- Ten plots were established, including five (5) experimental and five (5) control plots, per the HMU Management Plan (Figure 59). Evaluation of plot size indicated 30 x 30 m plots needed (vs 50 x50 m plots). Mapping of vegetation within plots completed. Mapping of edge vegetation initiated.
- Mapping of vegetation within plots completed. Mapping of edge vegetation completed.
- A greenhouse was established and native plants for restoration are growing in the greenhouse.
- Treatment of *Vitex parviflora* was delayed due to listed orchid species being present on *Vitex*. A stopgap measure was instituted by treating those *Vitex* without listed orchids. A formal section 7 consultation will be initiated in the near future.
- Herbicide treatments began on *Vitex* and *Averrhoa bilimbi* in May and June of 2020.
- Outplantings within the plots were completed in April (Figure 60) using the following species: *Pandanus tectorius, Ixora triantha, Premna obtusifolia, Procris pedunculata,* and *Ochrosia mariannensis.*

Maintenance of Ungulate Exclosures

Location: AAFB **Period of Performance:** Oct 2019-Dec 2021

Project Objective

Annual fence line maintenance and repairs to maintain the efficacy of AAFB ungulate- free exclosures. This project includes 1) weekly inspections, which involves walking or driving the fence-line encompassing multiple ungulate exclosures and conducting any repairs and 2) cutting and trimming the vegetation within 3 feet of each side of the fence monthly to reduce any damage to the fence.

Conservation Benefit

The routine maintenance and repair of ungulate exclosures will enhance the longevity of the ungulate barrier. Regular fence monitoring and repair also has the benefit of early detection to any possible immigration of ungulates into fenced eradicated areas.

Monitoring, maintenance and repair all support the purpose of facilitating ungulate-free areas to enhance native forest ecosystem regeneration.

FY20 Status

- "Taragüe Triangle" ungulate exclosure completed August 2020.
- Cooperative agreement for weekly HMU fence inspections awarded Sept 2020.

EPR: 2 BO MAR AAFB Maintenance of Ungulate Exclosure; M5240NR045
EPR: 1 CR MAR AAFB BTS Barrier Maintenance in HMU; M52401000

2019 JRM INRMP Reference: THM-1; 9-68

Ungulate Fencing

Location: AAFB **Period of Performance:** Sept 2019 – Aug 2020

Project Objective

Construct ungulate fencing on AAFB to facilitate eradication of feral pigs and Philippine deer as well as prevent immigration of ungulates within fenced areas.

Conservation Benefit

Supports ungulate eradication goals within fenced areas of AAFB (Figure 61). Ungulate eradication facilitates the revitalization of native habitat that supports viable populations of native species, increases the biodiversity of native species, and contributes to the connectivity with surrounding communities in ways that support improved ecosystem functionality. Contributes to the goals of the Guam NWR as an overlay unit on AAFB.

FY20 Status

- Tarague Triangle fence contract awarded in September 2019 and completed in August 2020. Post ungulate eradication this area will provide for approximately 80 acres of conservation area for INRMP project implementation.
- Ungulate fencing 10 year plan, funding has been programmed.

EPR: 1 RP MAR AAFB Ungulate Fencing; M5240NR043

2019 JRM INRMP Reference: THM-1; 9-68

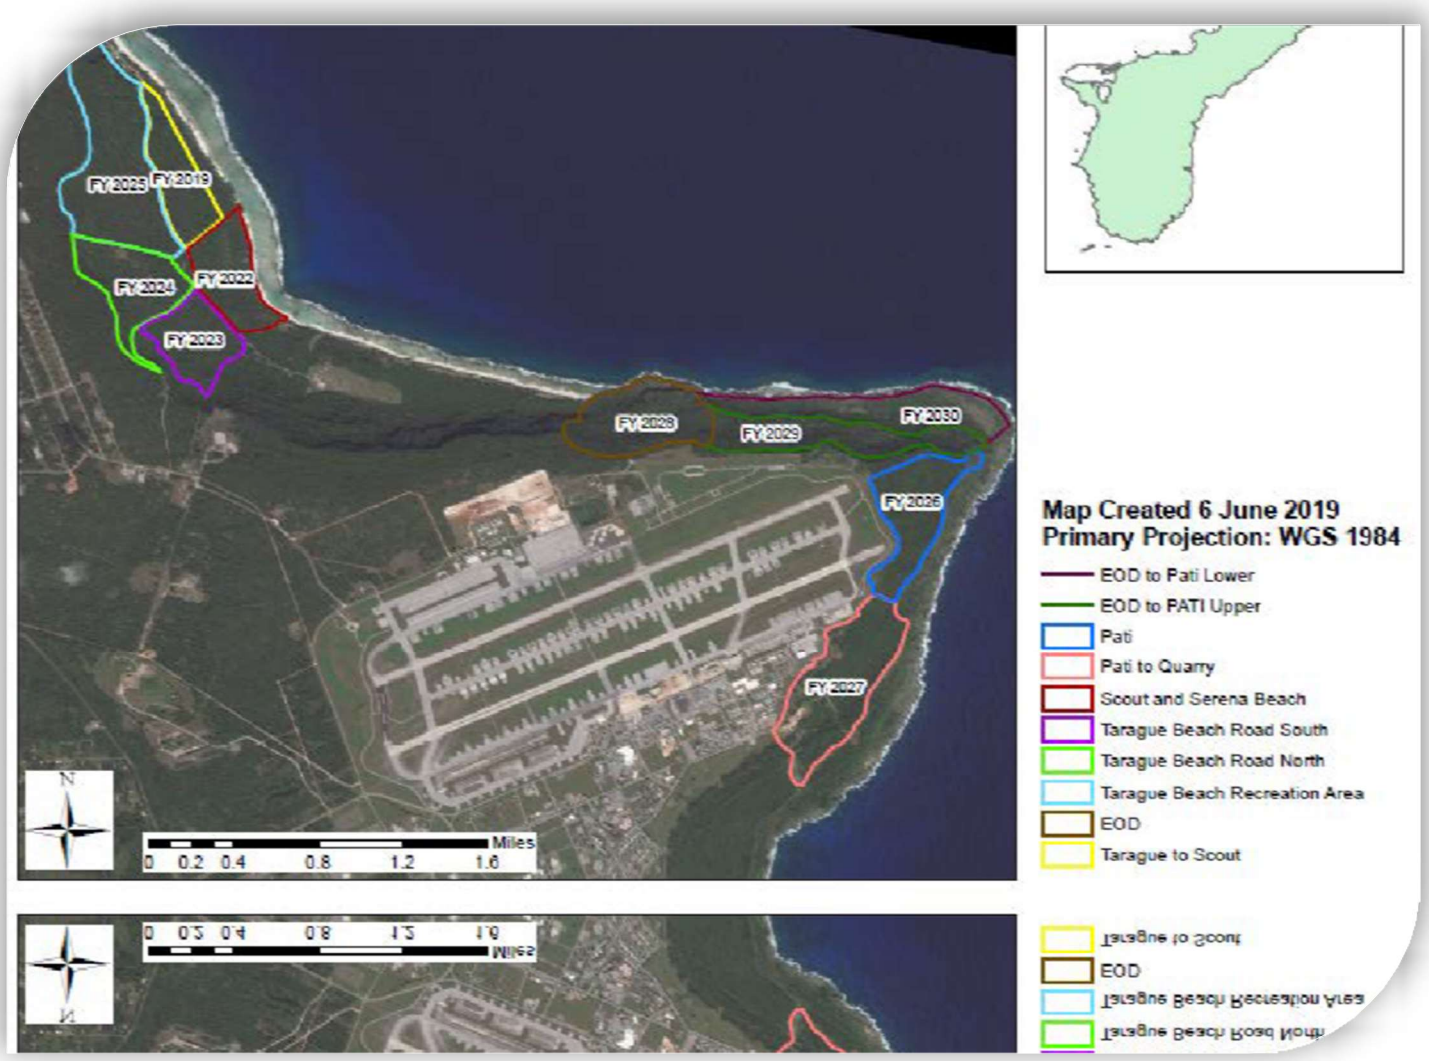

Figure 61. Map depicting areas of programmed ungulate fencing at AAFB.

Ungulate Eradication and Control

Location: AAFB **Period of Performance:** AUG 2019 – Dec 2021

Project Objective

Removal of feral pigs and Philippine deer from AAFB to protect and enhance native species and associated habitat.

Conservation Benefit

Enhance and restore habitats to increase populations of native species, particularly threatened and endangered species, as well as promote biodiversity of native plants. Reduce ground disturbance from ungulates to improve soil stabilization, and reduce suitability of invasive plant species.

FY20 Status

- Although driven by human health and safety, the AAFB Volunteer Conservation Officer Program (VCOs) conducted 77 depredation events to increase roadway safety and remove animals from recreation areas. Ecosystems will benefit from the removal of 404 deer and 77 pigs from AAFB as of July 2020 (Figure 62).
- A Cooperative Agreement was awarded to White Buffalo Inc. in September 2019 for the collaring and tracking of 18 ungulates (9 deer, 9 pigs) on AAFB. Data collected is being used to conduct spatial analysis for home range, pathways and habitat selection and use to increase effectiveness and efficiency of future ungulate control activities. 7 Collars are still active and will be used for judas deer/pigs
- Inter-Agency Agreement awarded July 2020 with USDA-WS for eradication within the Tarague Triangle fence area.
- Informal consultation underway for ungulate control outside of fenced areas on AAFB.

EPR: 1 CP MAR AAFB Ungulate Eradication and Control; M5240NR069

2019 JRM INRMP Reference: THM-1; 9-68

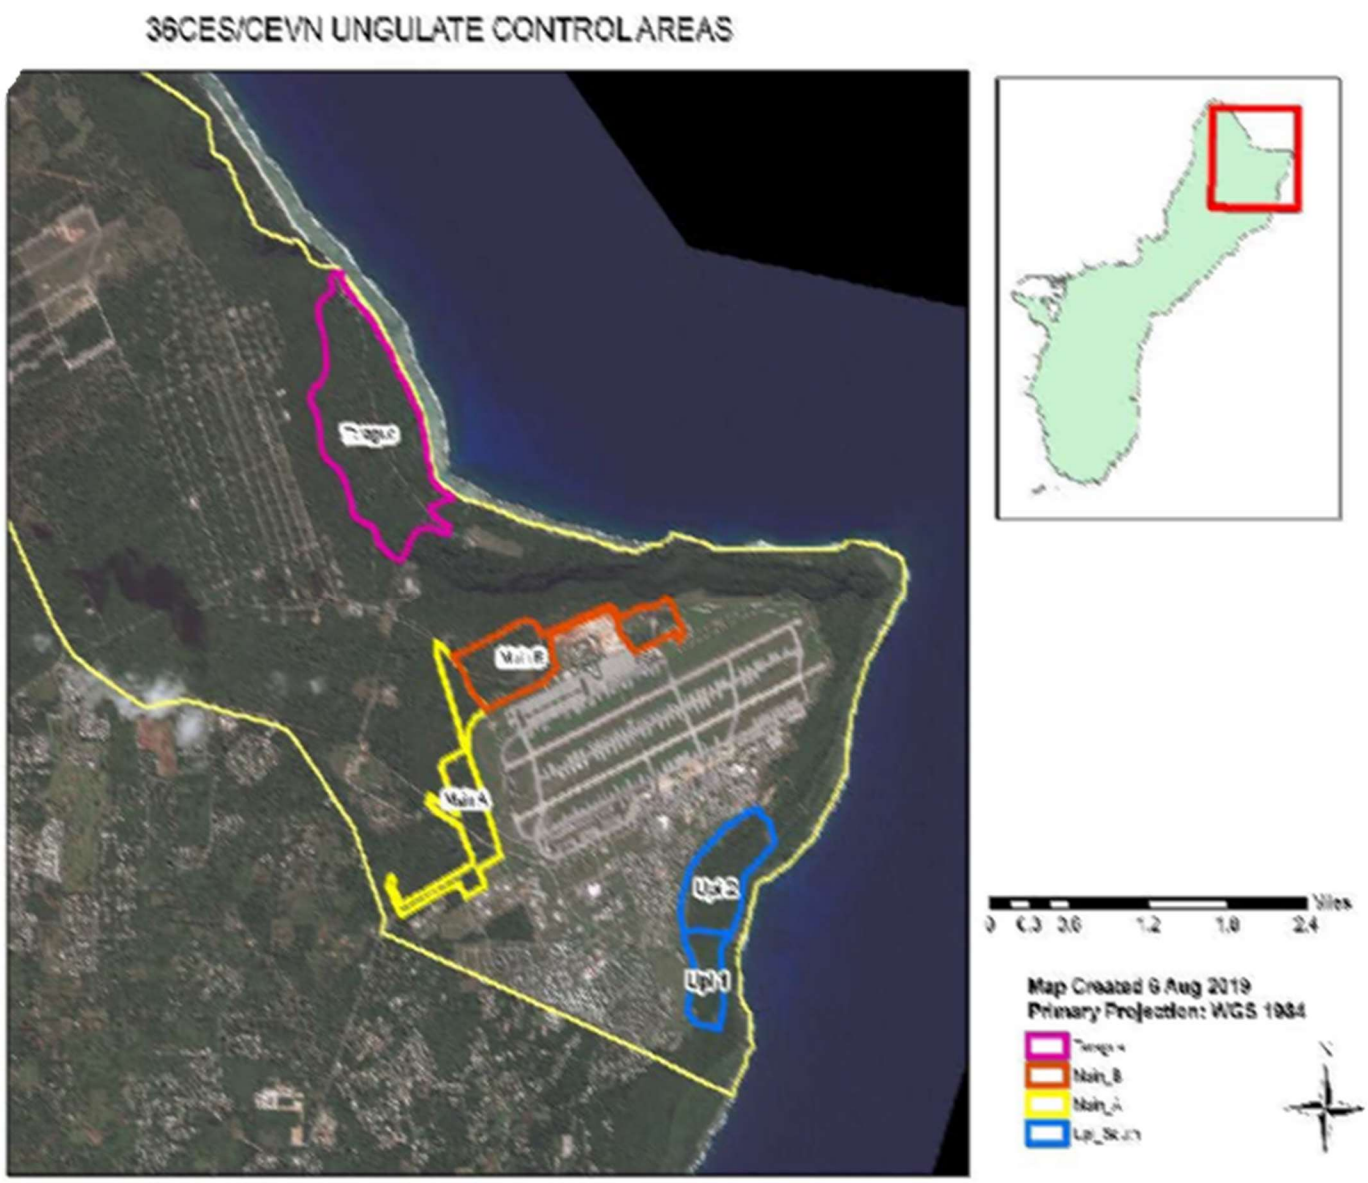

Figure 62. AAFB Depredation Areas Current as of 30 September 2020.

Northwest Field Ungulate Control Area Fencing and Eradication - AAFB

Location: AAFB **Period of Performance:** JUL2020-FEB2022

Project Objective

The project will install ungulate-proof fencing around the limestone plateau in the vicinity of the Live Fire Training Range Complex and subsequently eradicate pigs and deer from the exclosure.

Conservation Benefit

Feral pigs and deer are among the most significant threats to sensitive limestone forests; ungulate removal will promote growth of native species and increased survival of threatened and endangered species.

FY20 Status

- Fencing contract awarded and target completion is March 2021.
- USDA will begin population estimates concurrent with fence installation (Figure 63) and begin eradication immediately after fence closure.

EPR: DPRI: Marine Corps Relocation 2017/2018 amendment to 2015 BO, Conservation Measures to Minimize the Effects of Invasive Species.

INRMP FY2019 Reference:
THM-1; 9-68

Salvage and Transplantation of ESA-listed Orchids – NBG TS and AAFB

Location: NBG TS; AAFB **Period of Performance:** 2017 - 2021

Project Objective

To salvage and transplant federally threatened *Bulbophyllum guamense*, *Dendrobium guamense*, and *Tuberolabium guamense* identified within construction footprints associated with the Guam Relocation.

Conservation Benefit

To minimize impacts of military construction activities to native ecosystems by salvaging as many healthy individuals as possible and preserving the genetic diversity of each species.

FY20 Status

Bulbophyllum guamense

- 71 individuals have been identified, salvaged, and transplanted to the Forest Enhancement Area from project footprints on Finegayan.
- 71 individuals survived at least 1 year after transplantation.
- One individual was identified in AAFB in July 2019. It was salvaged and translocated to the Government nursery in September 2019.

Dendrobium guamense

- 21 individuals have been identified, salvaged, and transplanted to the Forest Enhancement Area from project footprints on Finegayan and Andersen South since 2017.
- 18 individuals survived at least 1 year after transplantation.

Tuberolabium guamense

- 15,385 individuals have been identified in NBG Telecommunications Site and throughout AAFB since 2017.
- 6,357 individuals have been salvaged and transplanted to the Forest Enhancement Area (Figure 64).
- 4,826 individuals survived at least 1 year after transplantation.
    - Survival criteria:
        - 2017 through 2019: New root growth
        - 2019 and all future projects: New root growth and root attachment to the new host tree

EPR: DPRI: Marine Corps Relocation 2017/2018 amendment to 2015 BO, Conservation Measures to Contribute to the Recovery of Listed Species.

2019 JRM INRMP Reference: THM-3; 8-49

Salvage and Transplantation of *Cycas micronesica* – NBG TS and AAFB

Location: NBG TS; AAFB **Period of Performance:** JUL2017 - JUL2021

Project Objective

To salvage and transplant federally threatened *Cycas micronesica* identified within construction footprints associated with the Guam Relocation.

Conservation Benefit

To minimize impacts of military construction activities to native ecosystems by salvaging as many healthy individuals as possible and preserving the genetic diversity of the species.

FY20 Status

- NBG Telecommunications Site
  - Six adult cycads were salvaged and transplanted to an area of the Forest Enhancement Area. Salvage and transplantation was completed on 03 October 2018. The cycads received maintenance and monitoring for 1 year until 03 October 2019 (Figure 65).
  - Four (4) of the six are alive, two of the six are confirmed dead.
- Northwest Field, AAFB
  - Pup salvage was completed on December 2019. 1,503 pups were salvaged. Currently, there are 28 alive pups being maintained and monitored in a Government-approved nursery, 22 of which have had new leaf emergence.
  - Direct salvage and outplanting of 27 cycad trees was conducted between October and November 2019. All 27 directly outplanted cycad trees continue to receive weekly maintenance and monitoring.
  - 17 cycad trees showed signs of long horn beetle damage. Screen barriers are being installed to prevent additional beetle damage (Figure 66).
  - Cycad seed collection was completed on 09 June 2020. 1,233 cycad seeds were collected. To date, 742 seeds are being maintained and monitored in the Government-approved nursery. 238 cycad seeds have radicle root emergence, 171 of which had leaf formation (Figure 67).
- Munitions Storage Area (MSA), AAFB
  - All Five cycads were identified within the construction area, were suitable to survive transplantation and/or salvage.
  - Nine pups and/or stem cuttings were salvaged from five cycads and transplanted to pots within a Government-approved nursery in December 2019. Pup and/or stem

cuttings continue to receive maintenance and monitoring until they are suitable for outplanting in the FES.

- Andersen South, AAFB
    - 27 cycads were identified within the construction area, but only eight were considered healthy enough to potentially survive transplantation.
    - Eight pups and stem cuttings were salvaged from six cycads and transplanted to pots within a Government-approved nursery in September 2019. Pups and/or stem cuttings continue to receive maintenance and monitoring until they are suitable for outplanting in the FES.

Invasive Plant Control – NBG TS and AAFB

Location: NBG TS; AAFB **Period of Performance:** SEPT2020 – MAR2022

Project Objective

This project intends to eradicate limited infestations of *Antigonon leptopus* and *Mimosa diplotricha* in the North Finegayan and Finegayan Forest Enhancement Sites.

Conservation Benefit

Invasive plants can outcompete native vegetation and interfere with restoration efforts for threatened and endangered species. Removal of invasive plants, particularly in new or smaller infestations where it may be possible to eradicate the invasive species from sensitive areas, will improve survivorship and growth of native plant species during future restoration efforts.

FY20 Status

- Prescribed burn for *M. diplotricha* conducted through a partnership with Guam Dept. of Agriculture as a training exercise.
- Follow on herbicide control to be awarded through a CESU in August 2020.

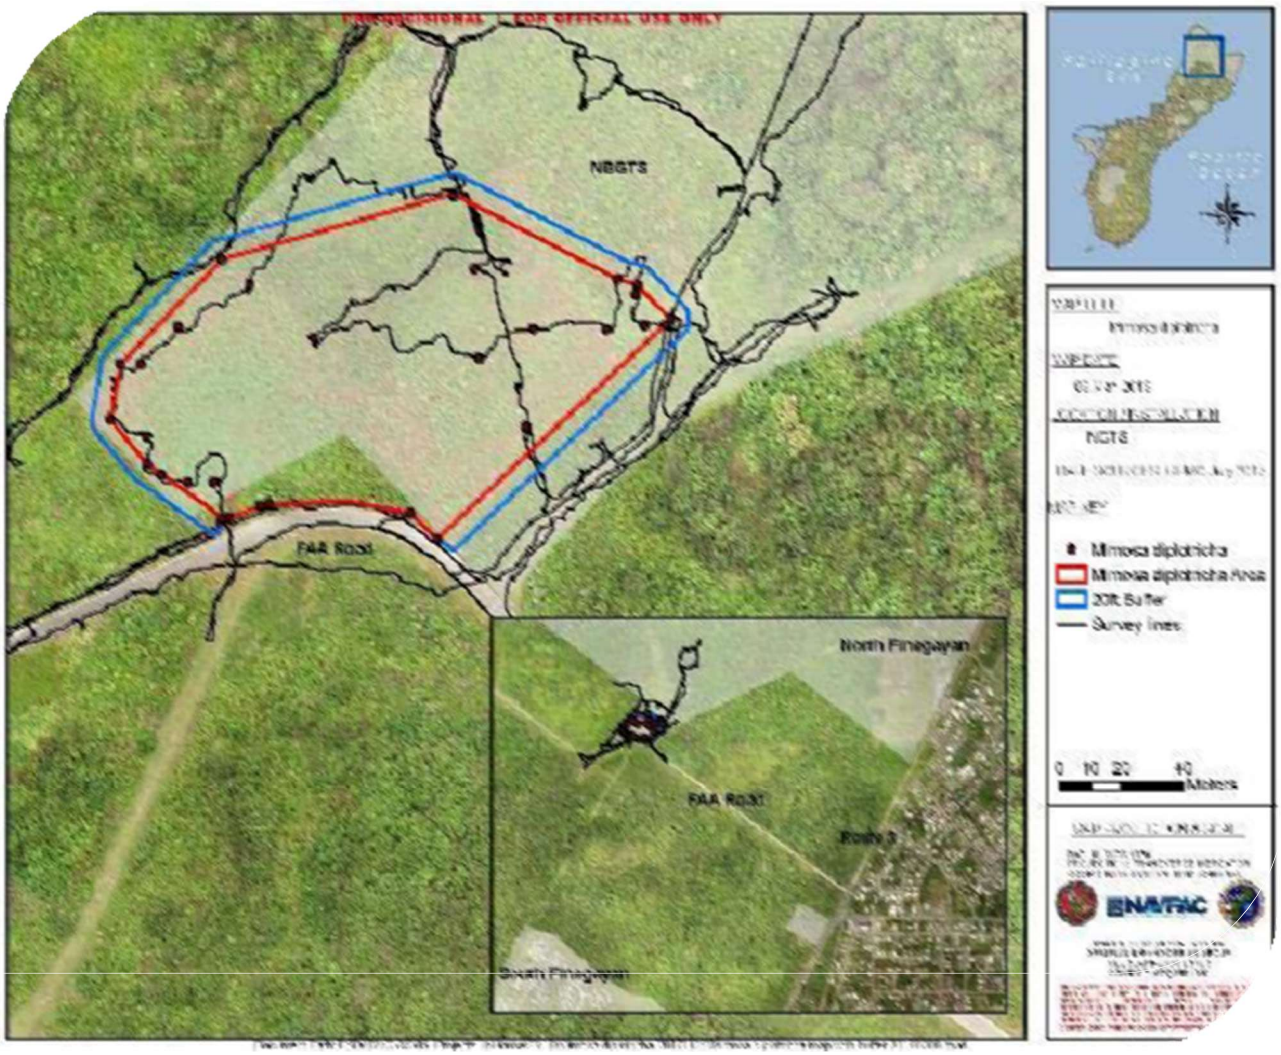

Figure 68. *Mimosa d.iplotricha* infestation site

North Finegayan Forest Enhancement Site Ungulate Fencing and Eradication

Location: NBG TS; AAFB **Period of Performance:** SEP2020 – SEP2022

Project Objective

The project will eradicate feral pigs and Philippine deer in both phases of the North Finegayan Forest Enhancement Site.

Conservation Benefit

Feral pigs and deer are among the most significant threats to sensitive limestone forests; ungulate removal will promote growth of native species and increased survival of threatened and endangered species.

FY20 Status

- The North Finegayan FES Phase 1 exclosure (Figure 70 and 71) was completed in March 2020. The Phase 2 fencing project is projected to be complete in the first quarter of FY21.
- The contract for ungulate eradication in Phase 1 was awarded in the second quarter of FY20.
- Phase 1 eradication is projected to be complete by September 2020, but the effort has been complicated by Covid-19 restrictions.

EPR: DPRI: Marine Corps Relocation 2017/2018 amendment to 2015 BO, Conservation Measures to Minimize the Effects of Invasive Species.

2019 JRM INRMP Reference: THM-33; 8-49

Figure 70. Ungulate fence

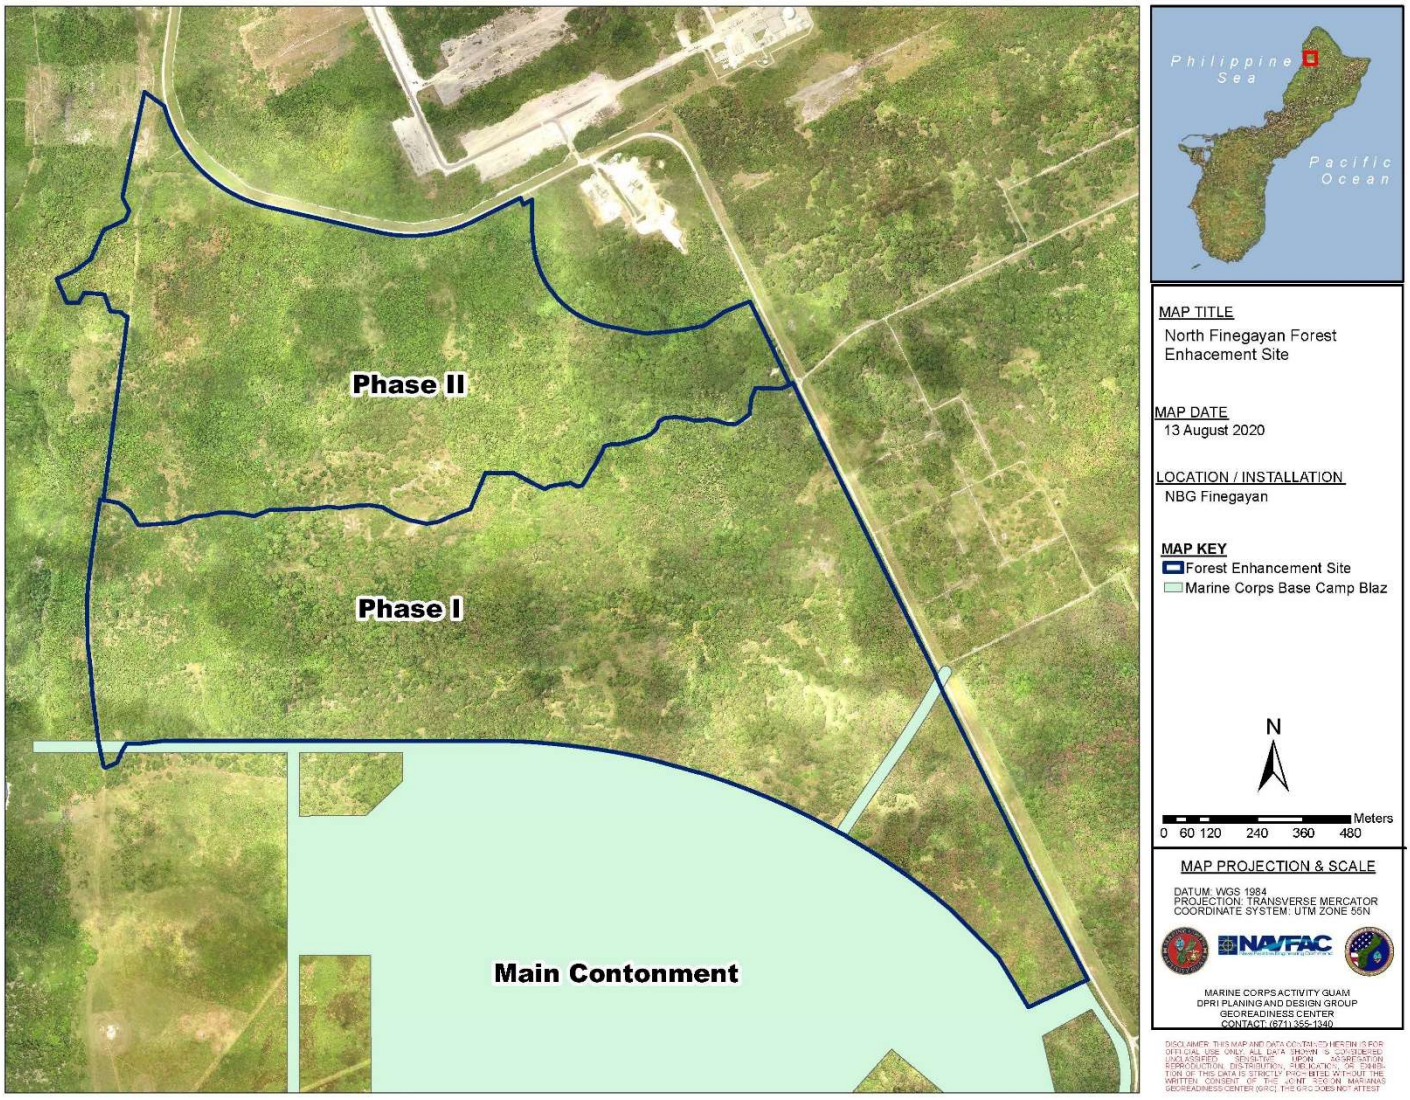

Figure 71. Location of Ungulate Eradication Areas of the North Finegayan Forest Enhancement Site.

Haputo Ecological Reserve Area Ungulate Fencing

Location: NBG TS **Period of Performance:** AUG2019 – FEB2021

Project Objective

Haputo Ecological Reserve Area will be fenced to exclude feral ungulates. The northern section will encompass 168 acres while the southern section encloses approximately 116 acres.

Conservation Benefit

The ungulate fence (Figure 72) will exclude deer and pigs that destroy native vegetation and contribute to erosion that harms nearshore reefs. Ungulate removal will promote growth of native species and increase survival of threatened and endangered species.

FY20 Status

- N. Haputo ERA fence contract was awarded in August 2019 to SRGI, Inc. Fence installation is pending.
- S. Haputo ERA fence contract was awarded in August 2020 to Sundance-EA.

EPR: DPRI: 2015 Navy-USFWS Guam Micronesia Kingfisher MOA.

Implementation Plan for Phase I of the North Finegayan Forest Enhancement Site

Location: NBG TS; AAFB **Period of Performance:** JUL2019 – JUL2020

Project Objective

The project will develop a site-specific plan for Phase 1 of the North Finegayan Forest Enhancement Site (Figure 73) to address regulatory compliance, infrastructure needs, invasive plant removal options, and sequencing for native species outplanting.

Conservation Benefit

Forest enhancement efforts will improve habitat for native species, including threatened and endangered plants and animals.

FY20 Status

- CESU awarded to UOG in July 2019.
- Plan delayed due to Comprehensive Baseline Report delay.
- Currently working on invasive tree control trials

EPR: DPRI: Marine Corps Relocation 2017/2018 amendment to 2015 BO, Conservation Measures to Contribute to the Recovery of Listed Species.

Terrestrial Protected Species Management

Conservation Management of Listed Invertebrates

Location: JRM **Period of Performance:** JUL2018-DEC2019

Project Objective

To prepare a survey method protocol for ESA-listed snails that is statistically sound and applicable, to provide field and classroom training for natural resource staff and partners, and to create a snail ID field booklet.

Conservation Benefit

Identifying locations of ESA-listed snail species will allow for management actions to avoid and conserve locations of protected species and host plant species. The survey protocol will be coordinated with natural resource partners.

FY20 Status

- A Cooperative Agreement was awarded through the CESU network to UOG in July 2018. Deliverables include the survey protocol, field training, and a snail ID booklet (in coordination with USFWS).
- Snail survey classroom and field training was conducted for JRM NR managers, USFWS, and DAWR biologists in June 2019.
- The Survey Protocol titled: “Biomonitor Support for Natural Resource Management Surveys at Joint Region Marianas Area of Responsibility (Partulid Snail Survey Methods)” was finalized in December 2019 and provided to resource partners.
- The snail ID field booklet is complete and printed copies are available.

ESA-Listed Treesnail Monitoring - NBG

Location: NBG; NMS **Period of Performance:** JUL2019– JAN2021

Project Objective

To collect baseline population, demographic and habitat data on ESA-listed treesnails: *Samoana fragilis*, *Partula gibba* and *Partula radiolata* at twelve different locations and to collect presence absence data on roadside edge habitat on two installations and a fuel pipeline.

Conservation Benefit

Identifying locations of ESA-listed snail species will allow for management actions to avoid and conserve locations of protected species.

FY20 Status

- A new cooperative agreement was awarded through the CESU Network to UOG in July of 2019 to conduct surveys for plant and invertebrate surveys on all JRM lands and other lands on Guam and the Commonwealth of the Northern Mariana Islands (CNMI).
- Roadside surveys along the Sinajana portion of the fuel pipeline were conducted with 2-meter search areas on either side of the access road. A total of 596 *Partula radiolata* were found at sites along both sides of the pipleline road (Figure 74) from March through May 2020. Roadside surveys at the Sasa Valley Fuel Farm were conducted from May through July. *Samoana fragilis* and *Partula radiolata* have been observed (Figure 75).
- Photo mark recapture (PMR) surveys have been conducted from May through August 2020 at Naval Base Guam Naval Munitions Site (Figure 76), Haputo Beach and Pugua Point (Figure 77), and San Luis Beach (Figure 78).

Biomonitor Support for Natural Resource Management at Joint Region Marianas Area of Responsibility

Location: JRM AOR **Period of Performance:** JUL2019 – JAN2021

Project Objective

Provide biomonitor support to assist the Department of the Navy in natural resource management across lands under Joint Region Marianas AOR.

Conservation Benefit

Biomonitors will conduct surveys for threatened and endangered species, culturally valuable plant species, rare plants, and non-native/invasive species. Activities support the GMK MOA (2015) and the Biological Opinion for the Department of the Navy's Relocation of the U.S. Marine Corps from Okinawa to Guam and Associated Activities on Guam (USFWS, 2015, 2017, 2018).

FY20 Status

- Awarded as cooperative agreement through the CESU network to UOG-CIS on 29 July 2019.

EPR: DPRI: Marine Corps Relocation 2017/2018 amendment to 2015 BO, Conservation Measures to Contribute to the Recovery of Listed Species.

2019 JRM INRMP Reference: TPS-1; 7-55

Sea Turtle Monitoring, Protection, and Educational Outreach - AAFB

Location: AAFB **Period of Performance:** JUL2018 – DEC2020

Project Objective

To implement management techniques and methodologies to monitor nesting sea turtles on AAFB. These methodologies include but are not limited to: collection of consistent data to determine population demographics, reduce mortality and increase natural survivorship, increase sea turtle awareness of AAFB units and beach stakeholders, and create/maintain a robust database for long-term monitoring data that can support future research and detect trends. Ensure active nests are protected until hatchlings emerge. Conduct two beach clean-ups and other educational outreach activities for public awareness regarding sea turtles.

Conservation Benefit

Implement recovery actions by conducting long-term monitoring to determine population estimates and abundance; provide protection of sea turtles and their nesting habitats; and conducting outreach and education to the public on sea turtles and their habitats.

FY20 Status

- Nesting activity monitoring awarded as a cooperative agreement through the CESU network to UOG and SeaGrant.
- During 2019, all nests were observed on Explosive Ordnance Disposal (EOD) and Pati Beaches only. During the 2020 nesting season nests have been recorded on all AAFB Beaches including Tarague, Scout, Sirena, Pati, and EOD. There have been a total of 106 emergences from August 2019 to present, with 84 nests and 22 false crawls (Figure 79) with an 88.7% emergence success.
- Since August 2019, four nesting turtles were Passive Transponder (PIT) tagged and one was satellite tagged. Figure 80 provides a map of the satellite tagged turtle and her movements.
- Clutch data was collected on previously marked nests located successfully either after the emergence of hatchlings or after 70 days incubation. Data from these nest inventories estimated hatching and emergence success.
- In July 2020, a nest inventory revealed a record of 135 live hatchlings within a nest which appeared to be in the process of hatching. All hatchlings were observed safely entering the ocean (Figure 81).

- Outreach events included the 2019 International Coastal Cleanup at the Tarague, Scout, and Serena Beaches, presentations to Notre Dame High School, Inarajan Middle School, Oceanview Middle School, WAVE Club, and in-brief with EOD personnel.
- Other outreach activities included public service announcements (PSA) posts and video. The video was filmed by Sea Grant for the purpose beach etiquette, sea turtle facts, and conservation of the species via the official Andersen Air Force Base Facebook page in conjunction with the Public Affairs Office. These PSA's specifically targeted military servicemen and their dependents.
- Project Final Report due December 2020.

Sea Turtle Nesting Beach Habitat Enhancement – NBG

Location: NBG **Period of Performance:** Ongoing

Project Objective

To increase the likelihood of hatchling turtles successfully traversing strand vegetation at Spanish Steps to access the ocean and enhance natural regeneration of native strand vegetation by removal of invasive vegetation. To reduce predation of sea turtle nests by trapping and removal of monitor lizards (*Varanus indicus*).

Conservation Benefit

Enhance and restore habitat and in an effort to recover sea turtle populations.

FY 20 Status:

- No beach cleanups were performed in 2020 due to both reduced staff and Covid-19 restrictions.
- Non-native vegetation and debris was removed from Spanish Steps beach in small increments during beach inspections for turtle activities.
- Monitor lizards were not culled in 2020, future plans are to place screens over the turtle eggs to stop predation. The change is due to new studies that provide compelling evidence that local monitor lizards are endemic to Guam.
- Screens were not used in 2020. Going forward with an expert has been hired who will accurately place screens over turtle eggs.
- Navy Base Guam is actively searching to fill the Marine Biologist position.
- Past monitor lizard activity included 208 trapping days in 2019 with zero lizards captured. Monitor lizard culling was conducted from August 2015-August 2018 at Spanish Steps beach. From 2015-2017 noose traps, pipe traps, gopher traps, A24 rat traps and active hunting captured has captured eight lizards. In 2017, Conibear Jaw traps were utilized (138 trap days) and captured five lizards. A total of 13 monitor lizards have been captured from 2015-2018. The size of the lizards has increased over time; mostly males were captured in 2017 and 2018. This implies a demographic shift as a result of trapping. Since males have larger home ranges than females, it's probable that the localized population was extirpated and males are now migrating into the area from elsewhere.
- In 2020 there were a total of 36 activities (32 nests and 2 non-nesting emergences) observed at Spanish Steps (SS); SS was the only NBG beach which experienced activity this season (Figure 82).

- The turtle activity will be updated in October, once a sea turtle expert has been brought on board who can verify whether the 36 turtle emergences are actual nesting activities.
- Predation activity will be determined when the certified turtle expert is brought on board
- Regular monitoring for sea turtle activity of all NBG-managed beaches includes following locations: GabGab, San Luis, Dadi, Haputo, Tipalao, and Spanish Steps
- Intermittent monitoring for sea turtle activity occurred at Reserve Craft Beach prior to and during military training events

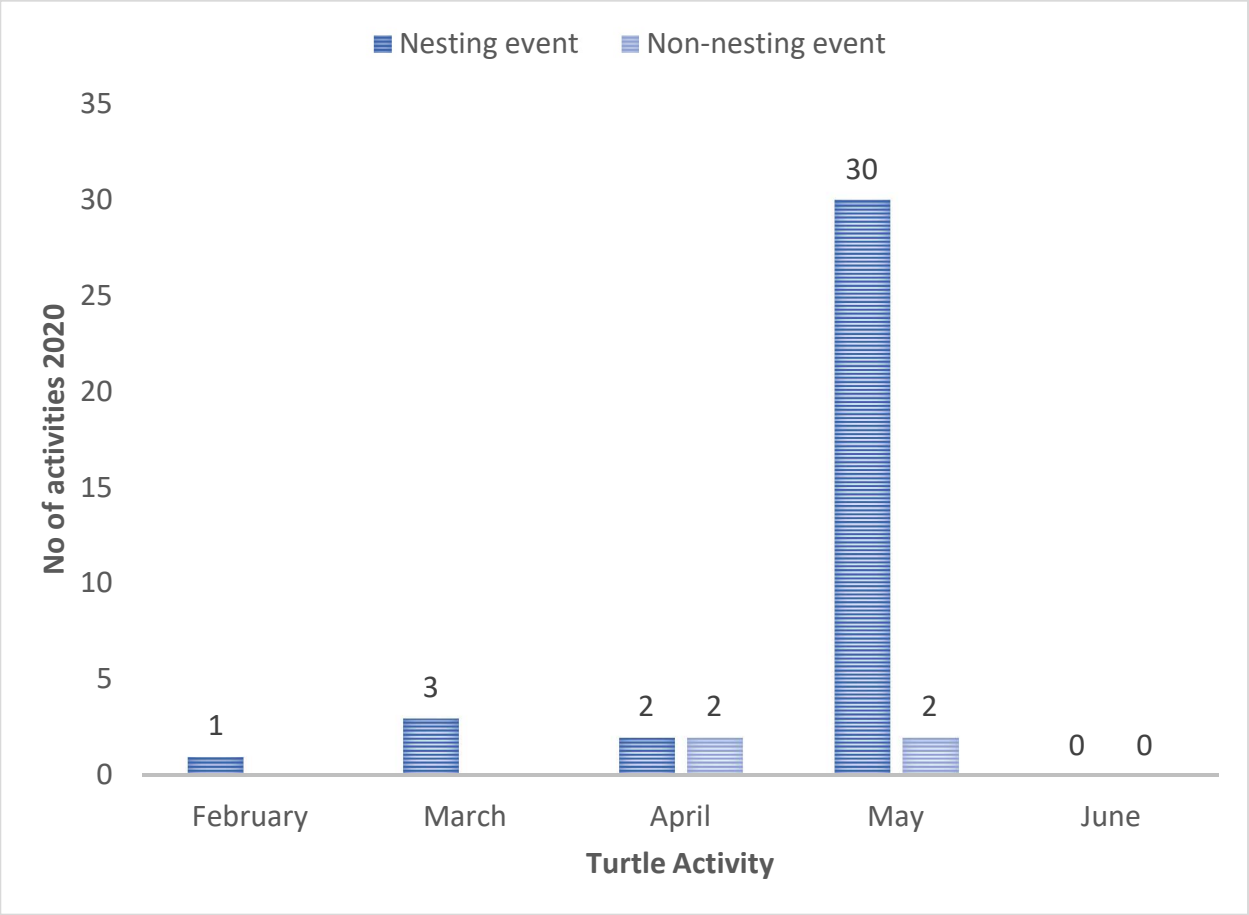

Figure 82. Summary of observations of sea turtle activities at Spanish Steps Beach, NBG (Feb 2020 – July 2020)

Sea Turtle Surveys – NBG

Location: NBG; NBG TS **Period of Performance:** AUG2020 - AUG2021

Project Objective

- Conduct sea turtle surveys on NBG beaches.
- Conduct monitor lizard control in sea turtle nesting areas.

Conservation Benefit

- Monitor the sea turtle nesting population at NBG and protect sea turtle nesting beaches for the recovery of sea turtles.

FY20 Status

- Contract awarded in August 2020.

EPR: 1 RP MAR NBG Green and Hawksbill Sea Turtle Nesting Habitat – Invasive Plant and Predator Control; 61755NR808

Restoration/Enhancement of Mariana Moorhen Habitat

Location: NBG; NMS **Period of Performance:** SEP2018 – SEP2020

Project Objective

To provide nesting platforms in ponds/wetlands where Mariana Common Moorhen (*Gallinula chloropus guami*) are known to occur. Platforms will be installed at two ponds on NMS, two ponds on the main Navy base and one pond at the old Barrigada golf course. To determine the viability for monitoring for moorhen presence via trail cameras.

Conservation Benefit

Improve nesting habitat for a listed species and increase population numbers on Guam. If successful the technique could be used in other areas with moorhen.

FY 20 Status

- Monitoring has shown the presence of moorhen on all ponds except for the Front Wetland near the NBG main gate.
- Activity has been recorded through both camera and direct observation.

Table 8: Results for June and July 2020 include the following:

Pond	Month	Observation
San Luis	June	Two moorhen are caught on camera, including one juvenile
San Luis	July	Moorhen are heard, but not seen nor caught on camera
Camp Covington	June	Up to two moorhen are seen at any one time
Camp Covington	July	Up to two moorhen seen in the upper T section at any one time Up to two moorhen and one juvenile seen at any one time in the lower T section. Nest platform appears to be used for sleeping only due to massive activity to and from another area of the pond
NBG Gate	June	No moorhen seen
NBG Gate	July	No moorhen seen
NMS Parsons RD	June	Up to two moorhen are seen at any one time
NMS Parsons RD	July	Up to two moorhen are seen at any one time

Along Fence Opposite NMS Fire Station	June	Up to three moorhen are seen at any one time. Two are adults and one juvenile
Along Fence Opposite NMS Fire Station	July	Up to three moorhen seen at any one time. Distance from cameras makes distinguishing adults versus juveniles difficult.
Radio Barrigada	June	Up to five moorhen seen at any one time, a mixture of adults and juvenile
Radio Barrigada	July	Up to three adult moorhen seen at any given time as well as two chicks- Platforms were already present on a sixth pond in Camp Covington.

Monitoring of Mariana Swiftlets

Location: NMS **Period of Performance:** Recurring annually

Project Objective
Monitor population trends of Mariana swiftlets (*Aerodramus bartschi*) at three caves on NMS.

Conservation Benefit
Monitoring to allow for management actions to enhance and restore habitat, reduce habitat fragmentation, buffer protected areas, and implement new conservation strategies.

FY 20 Status:

- Conducted quarterly surveys Maemong, at Mahlac, and Fachi. March 2020 count did not occur due to Covid-19 restrictions. A total of three (3) surveys occurred at each cave.
- Estimated population size of swiftlets on NMS in 2020 was 1,130 (Figures 88 - 92).

EPR: 1 S MAR NBG Endangered Species Monitoring; 61755NR142

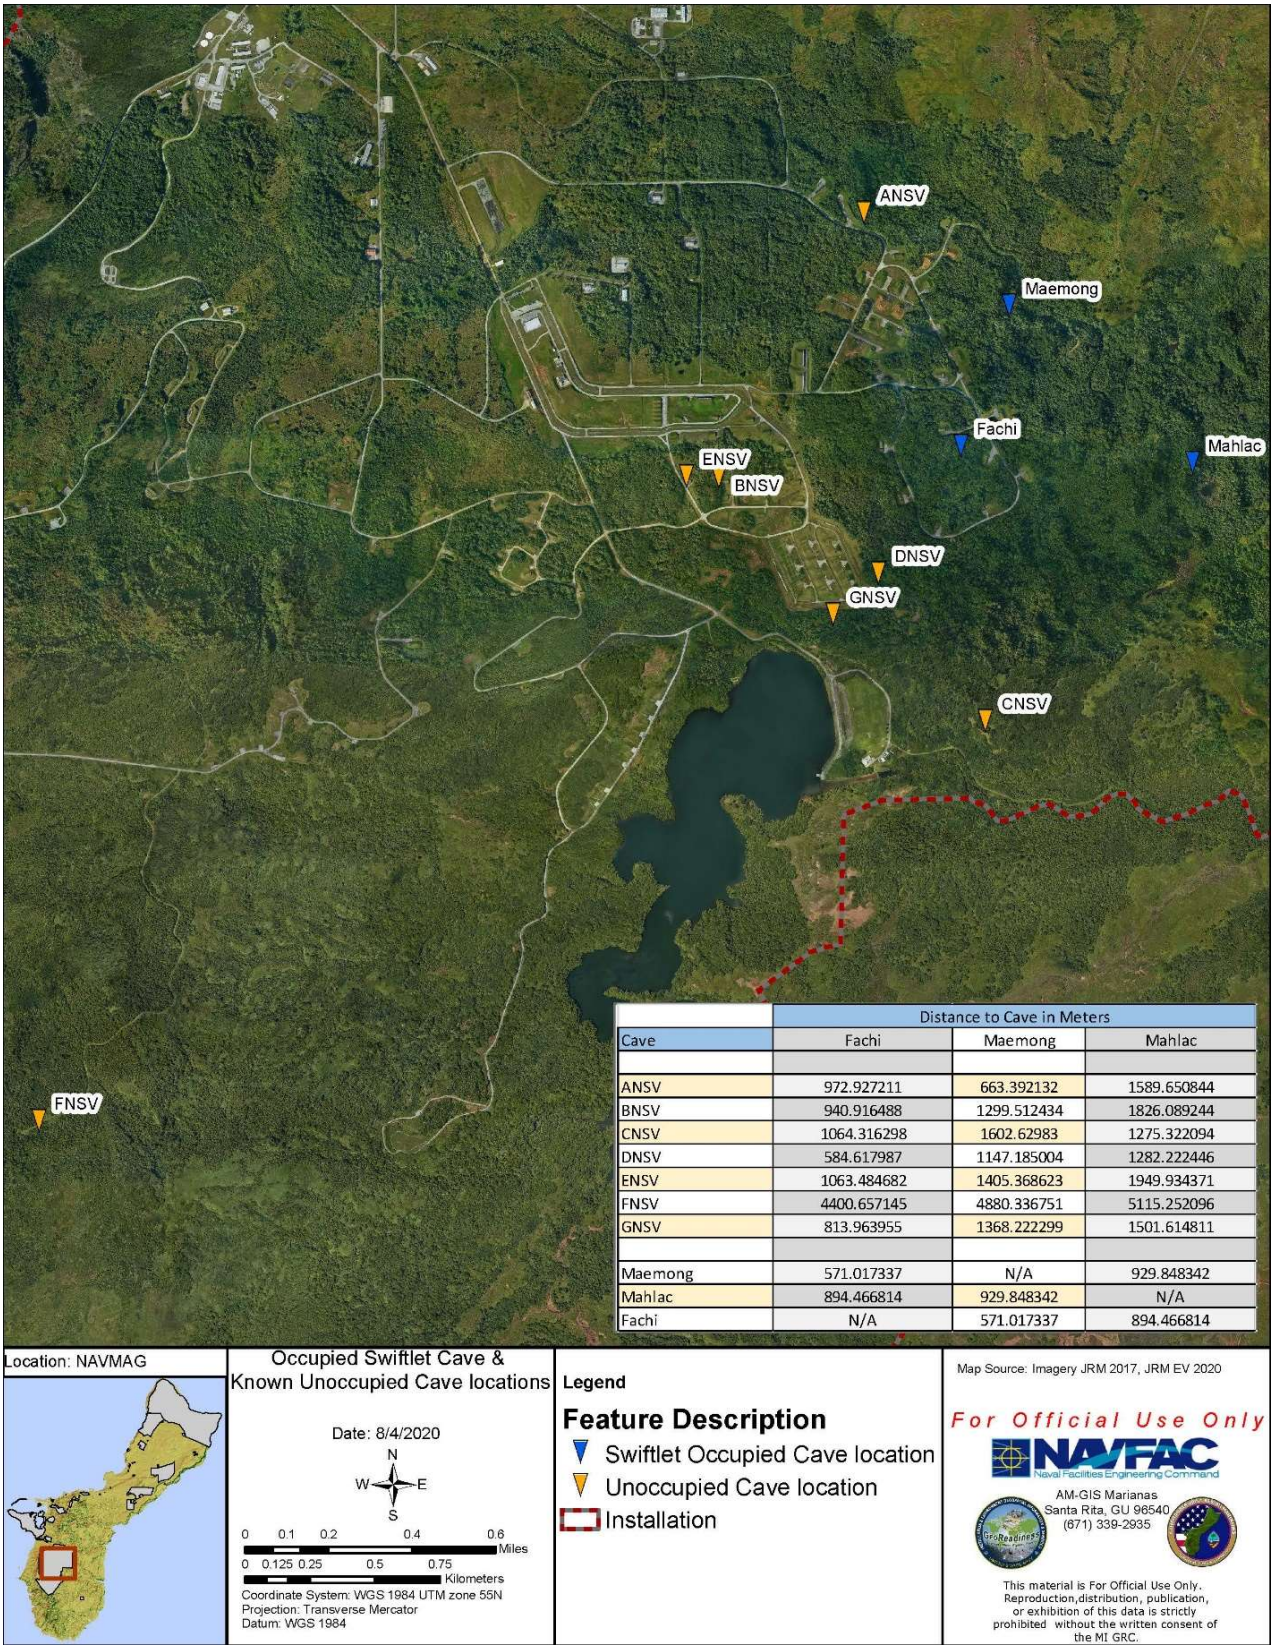
Mariana Swiftlet Recovery and Habitat Use

Location: NMS **Period of Performance:** SEP2018 – SEP2022

Project Objective

To provide an understanding of Mariana swiftlet (*Aerodramus bartschi*) habitat use, movement, reproductive success, and breeding site selection to inform management actions and meet specific objectives identified in the USFWS Recovery Plan for the Mariana Swiftlet.

Conservation Benefit



Implement actions for the recovery and potential down-listing of the Mariana Swiftlet.

FY19 Status

- IAA complete and in process for start of work by end of September 2020
    - Establish thermal camera system to visualize, map, and monitor roosting and nesting locations in occupied caves.
    - Monitor nesting activity and success
    - Estimate roosting population size.
    - Banding and radio tracking movement of adult swiftlets at caves and surrounding landscape
    - Develop low cost audio detectors to detect swiftlets prospecting of unoccupied caves.

Mariana Fruit Bat Monitoring - AAFB

Location: AAFB **Period of Performance:** FEB2018 – AUG2020

Project Objective

Conduct surveys for Mariana fruit bats (*Pteropus mariannus mariannus*) at AAFB as part of long-term population monitoring and to provide analysis on the effects of aircraft overflights and behavior of Mariana fruit bats at Pati Point.

Conservation Benefit

Monitoring will allow for management actions to enhance and restore habitat and increase efforts to recover Mariana fruit bat populations on Guam.

FY20 Status

- Addresses three of the recovery criteria in the 2009 U.S. Fish and Wildlife Service (USFWS) Draft Revised Recovery Plan for the Mariana Fruit Bat or Fanihi by implementing seven of the Recovery Actions outlined in the Draft Plan.
- The 7th Annual Base-wide Count occurred on August 7, 2020. This year 64 individuals participated. There were less people this year due to COVID-19 base access restrictions. Preliminary data suggest that a total of 34 sightings of AAFB, this year. Data collected from off-installation survey points is still pending analysis (Table 9, Figure 94).
- Pati Point surveys continue to occur on a quarterly basis. There has been no sign of fruit bats present at the historic roost site.
- An aggregate site was identified on 11 May 2020, above the cliff line south of CATM range. The number was initially estimated at 30-40 bats but was not counted so as not to disturb the roost. The location is visited ever 2-3 weeks to document occupancy and the site continues to be occupied.

EPR: 2 BO MAR AAFB Fruit Bat Monitoring; M5240CN041

2019 JRM INRMP Reference: TPS-2; 9-75

Table 9. Results of AAFB annual base-wide Mariana fruit bat counts from 2014-2019.

2016	25	45 - 64	5068 (28%)
2015	13	24 - 32	5245 (29.3%)
2014	8	14 - 20	5200 (29.3%)

***2020 Base-wide survey data analysis pending final results.**

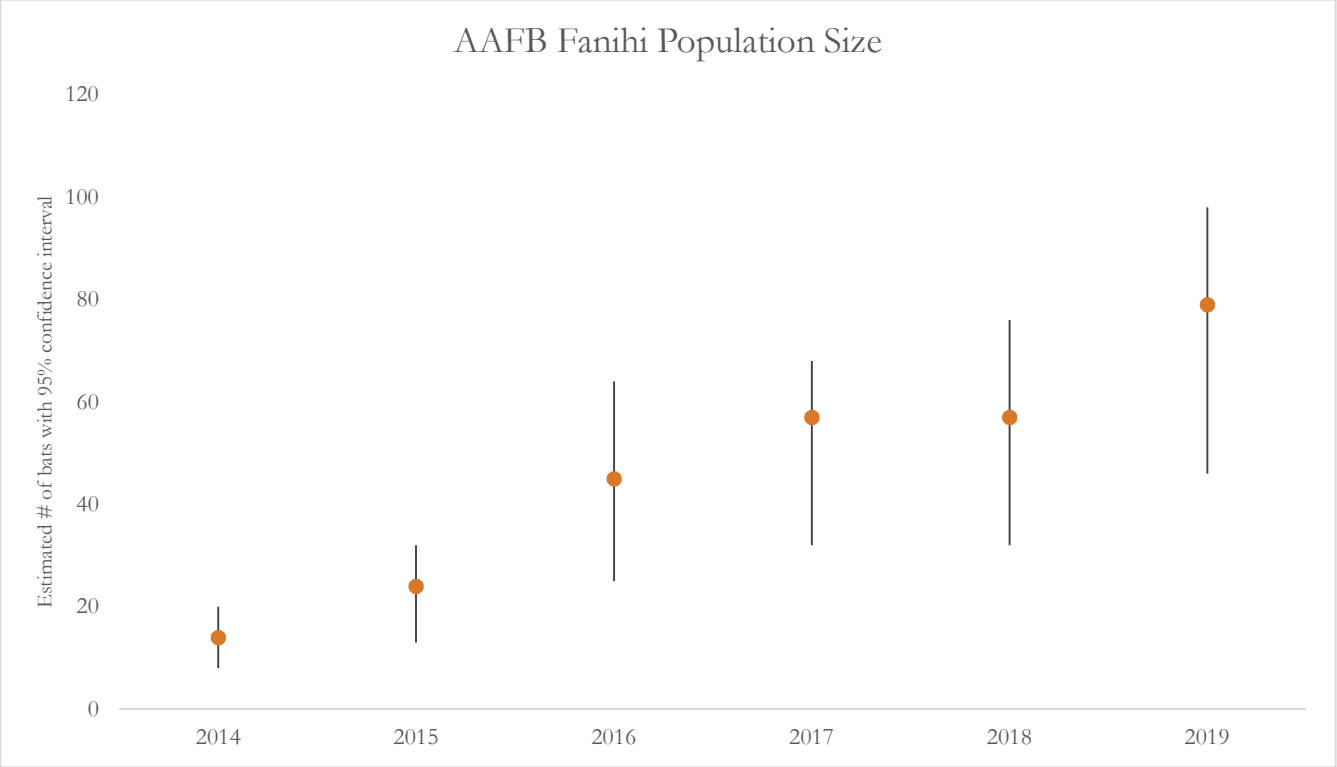

Figure 94. Estimations of AAFB Fruit Bat population size by year.

Cycad Conservation - AAFB

Location: AAFB **Period of Performance:** SEPT2017 – APR2021

Project Objective

Maintenance and monitoring of four, 1-acre, permanent fenced cycad (*Cycas micronesica*) plots (Achae Point, Ritidian, Tarague Basin, and Golf Course) (Figure 95).

Conservation Benefit

Research and monitoring on management actions that directly benefit *Cycas micronesica*. The intent is to identify which management actions most benefit the plant and if possible implement on a more broad scale.

FY20 Status

- A Cooperative Agreement through the CESU network was awarded to UOG on September 2017.
- UOG continues to monitor the Tarague, Achae, and Palms Golf Course plots. As of July 2020, the monitoring of the NWF plot was withdrawn due to impacts from the construction of the new Live Fire Training range that supports the USMC build-up. In addition, the cycad plot at the HMU is no longer monitored due to access issues and poor health of trees. Two new plots in Tarague Triangle will be used as substitutes for NWF and the HMU.
- UoG continues to monitor unfenced plots adjacent to existing cycad plots as controls in order to gauge the effectiveness of conservation methods being implemented.
- Yearly data collection of cycads includes: base circumferences; trunk circumference at 1.45 m; total height; number of leaves. Additional notes describe the overall assessment of each tree.
- Sticky traps are being deployed within the plots as part of a study to determine the seasonality of scale breeding. Crawler stage scales are captured by the sticky traps to be counted.
- A systemic pesticide (Merit®) is applied on a quarterly basis (every 3 months) to increase the trees' resilience to invasive insect pests, while seedlings are treated with direct application of Distance® to target scale infestations.
- Cycads with reproductive structures were more numerous in fenced plots than control plots (Figure 98).

Serianthes nelsonii Monitoring, Outplanting and Management - AAFB

Location: AAFB **Period of Performance:** MAY2016 – JULY2020

Project Objective

Maintenance and monitoring of mature *Serianthes nelsonii* tree in Northwest Field at Ritidian point, including in situ seedlings and fence maintenance, monitoring and maintenance of outplanted seedlings, and nursery propagation and maintenance of seedlings.

Conservation Benefit

Implementation of recovery actions such as increasing populations, insuring against catastrophic events, and testing and implementing new conservation strategies.

FY20 Status

- The mature tree at Ritidian remains stable though the heartwood is 80% infected with the fungus *Ganoderma sp*., which is weakening the internal structure of the tree. As of July 2020 there were 37 seedlings within the enclosure and a total of 1,113 seeds collected between August 2019 – July 2020 (Table 10).
- *Serianthes* have been outplanted in two fenced cycad plots on AAFB at Tarague basin (6 saplings) and the Palm's Golf Course (10 saplings). Four out of the 16 saplings are considered to be in poor health. Only five saplings are considered in good health, while the remaining seven were moderately healthy. Up to 20 saplings are planned for outplanting in 2020.
- As of July 2020 there were 145 seedlings in the GPEPP Rare Plant nursery (Figure 99). Seven (7) graft saplings remain from a previous contract, 2 non-graft saplings, 58 seedlings older than 1 year, and 78 seedlings less than 1 years old.
- As of July 2020, there were eleven (11) embryos extracted from immature seeds and germinated successfully in #2 media. Most of these have shed their leaflets and have some chlorosis since being transferred to a nutrient-rich solution. Another eight (8) mature seeds with underdeveloped embryos (flattened seeds that generally don't germinate in soil) were sown *in vitro* during July. So far, two of these are developing.
- A new Cooperative Agreement awarded through the CESU Network to UOG/GPEPP. The initial period of performance is from August 2020 through July 2021. Future plans include air layering, further outplanting within existing Cycad plots as well as the 3A Achae Point restoration site and providing support to the GNWR for their Serianthes outplantings.

Tracking Movement of Micronesian Starlings and BTS on Andersen Air Force Base with an Automated Telemetry Tracking Network

Location: AAFB **Period of Performance:** SEP2019 – MAR2021

Project Objective

The goals of this project are to track the movement of Micronesian starlings (*Aplonis opaca*) and BTS on AAFB to identify areas of high use and routes of transit through automated telemetry towers, and document areas of high predation by BTS. This project is one of four projects that will, collectively, further develop information on BTS behaviors related to predation and movement in the presence of abundant avian species.

Conservation Benefit

Tracking animals across the landscape over time can provide important information on habitat selection, resource needs, and factors influencing distribution and density. For a predator such as BTS, tracking movement can provide information on hunting patterns, dispersal potential, and identify areas that may be particularly susceptible to predation. Overlapping simultaneous movement from both predators and their prey can help identify areas of greatest contact, which may vary spatially and temporally. Additionally, population demographics that could be useful for supporting future avian restoration projects and controlling BTS in low density with competing food sources in the presence of control regimes.

FY20 Status

- Funded via an interagency agreement with USGS –PIERC
- Deployment delayed due to COVID-19
- Test network set up in progress

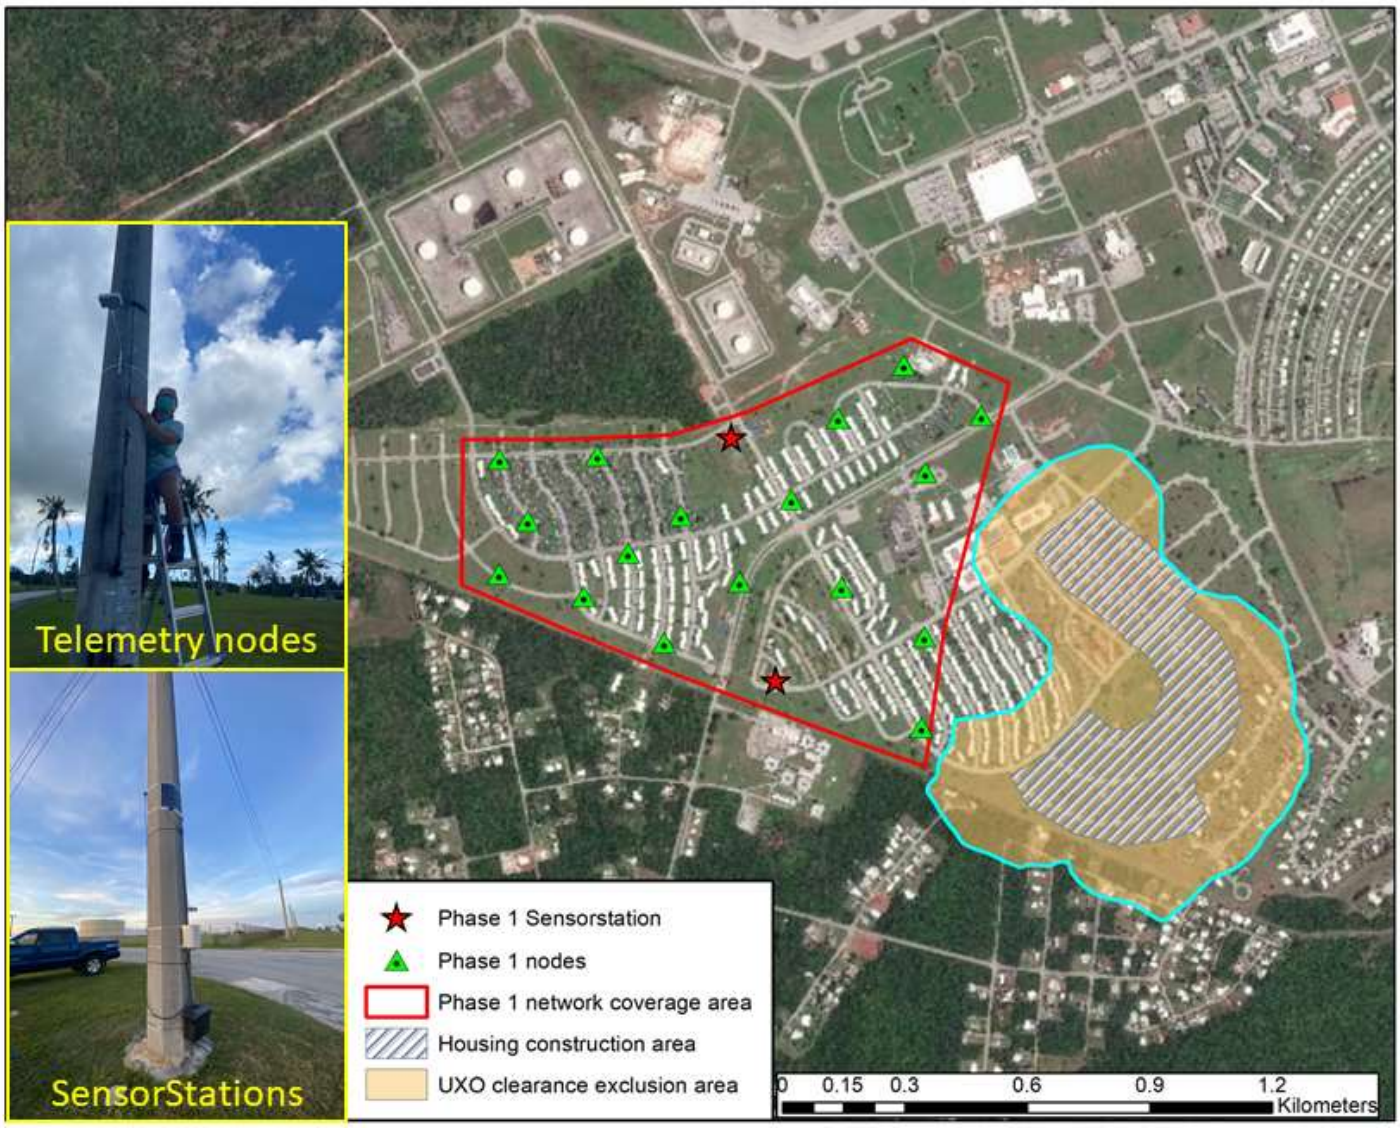

Figure 100. Telemetry network to monitor Sali and BTS, Andersen AFB. Image courtesy of USGS-PIERC.

2019 JRM INRMP Reference: TPS-6; 9-77

Evaluating and reducing BTS predation threat in urban Micronesian Starling Habitat – AAFB

Location: AAFB **Period of Performance:** SEP2019 – MAR2021

Project Objective

The project will evaluate control tools for urban BTS suppression in experimental high and low snake density plots. Also, monitor the relative abundance of BTS as a predation or dispersal threat via contact rates with baited camera devices. Overall this project will evaluate BTS control tools for suitability and efficacy in urban habitat, and use camera monitoring to index the decrease in Micronesian starling (*Aplonis opaca*) predation threat following snake removal. This project is one of four projects that will, collectively, further develop information on BTS behaviors related to predation and movement in the presence of abundant avian species.

Conservation Benefit

Recent work on AAFB has demonstrated that snakes in the housing area are having a pervasive impact on Micronesian Starling survival at all age classes. Snakes in these urban areas also constitute a greater risk for accidental export of live snakes to other vulnerable regions because shipments of household goods are routine. Additionally, previous research has shown that very large snakes, which pose the greatest predation and reproduction risk, are more often found in urban areas. For these reasons, it is important to begin to consider BTS risk mitigation in urban habitats. Contact rates can be interpreted as an index of relative abundance and as a proxy for the residual level of predation threat posed by BTS in snake-suppressed areas. Traditional tools for estimating BTS density and relative abundance are costly and impractical for long-term and broad-scale monitoring (e.g., mark-recapture) or provide no information on the snake (e.g., DNM bait tubes).

FY20 Status

- Funded via an interagency agreement with USDA –NWRC; project in progress
- 12 BTS caught tracked to date; 300 baits deployed (4% take rate)
- Different baits deployed: 10-15 g mouse, 10-15 g quail chick, 25-30 g mouse, 25-30 g chicken (chick)
- Difficulty in recovering BTS during the day – refugia underground or under urban structures

Monitoring Survival and Demography of Micronesian Starlings

Location: AAFB **Period of Performance:** JUL2019 – JAN2021

Project Objective

To monitor and analyze for Micronesian starling (*Aplonis opaca* [Sali]) nest success and fledgling survival using telemetry, nest monitoring, and survey methods in relation to BTS control efforts. Through monitoring fledging survival and population recruitment efficacy of BTS control techniques can be assessed. This project is one of four projects that will, collectively, further develop information on BTS behaviors related to predation and movement in the presence of abundant avian species

Conservation Benefit

The Micronesian Starling is a useful proxy for understanding Guam forest bird ecology in the presence in of BTS. Behavior, survivorship, and population demographics could be useful for supporting future avian restoration projects and controlling BTS in low density with competing food sources in the presence of control regimes.

FY20 Status

- Agreement via the CESU network with Iowa State University (ISU)
- Project Ongoing
- 35+ Sali banded to date in 2020
- Cats and BTS known causes of mortality
- Population still skewed to adults (Figure 102)

Salvage and Transplantation of *Partula radiolata* – NBG TS and AAFB

Location: Andersen South, Haputo ERA **Period of Performance:** JAN2019 – FEB2021

Project Objective

To salvage and translocate federally endangered *Partula radiolata* identified within the construction footprint on Andersen South associated with the Guam Relocation.

Conservation Benefit

To minimize impacts of military construction activities to native ecosystems by salvaging as many healthy individuals as possible and preserving the genetic diversity of the species.

FY20 Status

- Snail surveys took place from January 2019 to March 2020.
- *P. radiolata* were located in two main areas of the project footprint.
- 3,850 P. radiolata were salvaged from the project footprint and translocated to the Haputo Ecological Reserve Area.
- Bi-weekly snail monitoring takes place at Haputo Ecological Reserve Area to count the number of marked (i.e., translocated) and unmarked snails.

EPR: DPRI: Marine Corps Relocation 2017/2018 amendment to 2015 BO, Conservation Measures to Contribute to the Recovery of Listed Species.

2019 JRM INRMP Reference: TPS-1; 7-55

Figure 103. One of Two Locations on Andersen South where *P. radiolata* were located. All snails located were salvaged and translocated to Haputo ERA.

Native Plant Seed Collection, Salvage, Storage, and Nursery Propagation for Forest Enhancement

Location: NBG TS **Period of Performance:** OCT2017 – OCT2022

Project Objective

Collect salvaged native plant species and their seeds to propagate for use in limestone forest enhancement projects in Northern Guam. Design, install and operate a native plant nursery to maintain and provide healthy plant materials.

Conservation Benefit

To maintain a stock of healthy native plants ready to be used in forest enhancement planting. Native plant species from within DoD construction areas will be salvaged and propagated at the native plant nursery to maintain genetic diversity.

Figure 105. *Tabernaemontana rotensis* seedlings in the nursery.

FY20 Status

- Native plant nursery installed at Finegayan Dec 2018 – March 2019.
- Irrigation installed July 2019, water filtration system pending installation.
- 30 species of rare, high value, native, threatened and endangered plant species.
- Over 500 *T. rotensis* plants in propagation.
- Developed species-specific protocols for plant propagation and care
- Biosecurity program to manage pests, diseases and pathogens.
- FWS removed the requirement for Contractor to possess a 10(a)(1)(A) permit for collection of threatened and endangered species in June 2020.

2019 JRM INRMP Reference: TPS-1; 7-5

Figure 106. T. rotensis seed being prepared for water treatment before sowing.

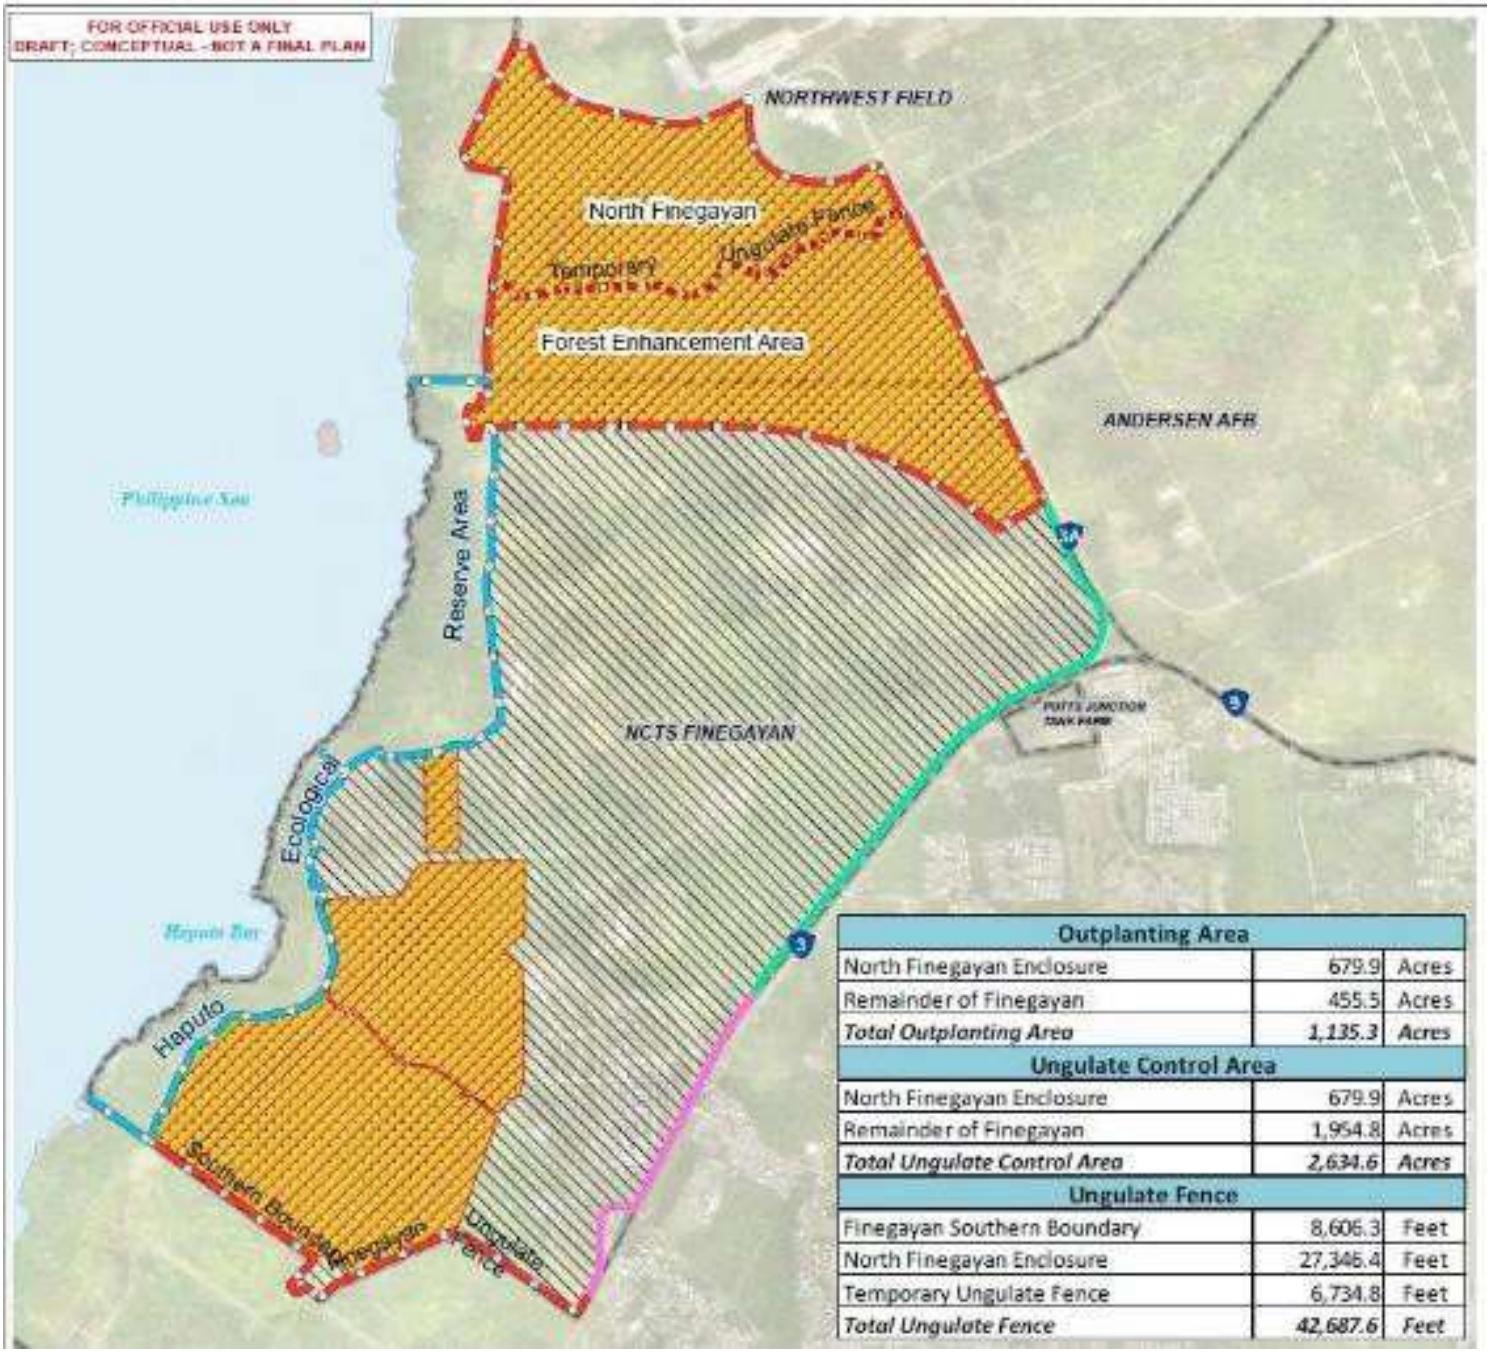
Comprehensive Baseline Vegetation Survey and Long Term Monitoring Plan for the Forest Enhancement Areas at Finegayan

Location: NBG TS; AAFB **Period of Performance:** SEP2018 – APR2020

Project Objective

The project will complete an ecosystem vegetation baseline survey within the North Finegayan and Finegayan Forest Enhancement Sites. The survey and a suite of environmental data will be used to recommend treatment areas, identify sites appropriate for threatened and endangered plant species, develop long term monitoring protocols for the sites, and establish success criteria for enhancement efforts.

Conservation Benefit



The plan will inform forest enhancement efforts intended to restore limestone forests and improve degraded landscapes to better support native species, including threatened and endangered plants and animals.

FY20 Status

- CESU awarded to ISU in September 2018.
- Draft report in August 2020.

EPR: DPRI: Marine Corps Relocation 2017/2018 amendment to 2015 BO, Conservation Measures to Contribute to the Recovery of Listed Species.

Figure 107. Map depicting North Finegayan and Finegayan Forest Enhancement Areas.

Cycad Conservation – Tinian

Location: Tinian, CNMI **Period of Performance:** APR2019 – APR2020

Project Objective

To conserve representative plants of *Cycas micronesica* populations from Guam; ongoing project from 2007.

Conservation Benefit

Increase populations, ensure resiliency to catastrophic events, and test and implement new conservation strategies.

FY20 Status

- The project continues to be implemented by UOG Plant Extinction Prevention Program. The current cooperative agreement was awarded in April 2020.
- As of November 2019, 990 live cycads were counted over the 24 plots for an estimated overall survival rate of 81%. Twelve plants were reproductive (had cones) during 2019. (Detailed health assessment results are in UOG 2019 annual report.)
- Plot clean-up from Super Typhoon Yutu and later storms required many visits and was finally completed in January 2020.
- Pesticide applications to control cycad scale and cycad blue butterfly started in January 2020 with subsequent applications in February and March. During the early March visit, UOG staff noted a reduction in the number of scale-infected plants from the previous month.
- Covid-19 travel restrictions have prevented any visits since March and the current status of plots/plants is unknown.
- Competing vegetation grows quite rapidly, “burying” many of the cycad seedlings. UOG is interested in hiring Tinian local help to maintain the plots.
- Established protocols prevent transfer of scale or other invasives between Guam and Tinian, and between Tinian plots.

EPR: 1 CP MAR Conservation Management of Tinian Cycads; 61128NR162

2019 JRM INRMP Reference: TPS-1; 11-63

Sea Turtle Nesting Surveys – Tinian

Location: Tinian, CNMI **Period of Performance:** JUN2020 - JUN2021

Project Objective

Ongoing monitoring of sea turtle nesting on Tinian MLA beaches.

Conservation Benefit

Long-term sea turtle nesting trends inform our understanding of the success and urgency of management efforts.

FY20 Status

- Contracting was delayed due to Covid-19 and other administrative issues. Contract award was made in June 2020.
- Twice monthly surveys began in July 2020 toward the end of the 2020 nesting season.
- Eighteen activities (16 nests; 2 non-nesting emergences) were recorded in July and August at Masålok, Dangkulo, and LamLam beaches. From 2009-2019, an average of 26 total nesting activities were recorded across Tinian MLA beaches annually.
- Six nests for which hatching evidence was observed were inventoried in July/August with a mean clutch size of 95, hatching success of 75%, and emergence success of 74%.

EPR: 1 S RP MAR CNMI ESA and MBTA Species Management; 61128NR211

2019 JRM INRMP Reference: TPS-2; 11-64

Beach Cleanups on the Tinian MLA

Location: Tinian, CNMI **Period of Performance:** JUN2020 – JUN2021

Project Objective

Removal of marine debris from all sea turtle nesting beaches in the Military Lease Area (MLA) with particular attention to the windward beaches of Dangkulo, Chiget and Masalok where debris accumulates after storms. Cleanup will be conducted annually at a minimum.

Conservation Benefit

The removal of marine debris benefits sea turtles by preventing entanglements and allowing successful nest excavation and egg deposition, and reduces the potential for ingestion of debris by seabirds.

FY20 Status

- Contracting was delayed due to Covid-19 and other administrative issues. Contract award was made in June 2020.
- The first FY20 cleanup targeted Masalok Beach on July 4th, removing 913 lbs of trash. Amount removed was similar to last year when 865 lbs were removed from Masalok, approximately half of the total removed from all MLA beaches in FY19 (1807 lbs).
- Masalok debris was sorted into a total of 40 bags of recyclables (plastic, aluminum, glass) and non-recyclables (foam, footwear, fishing gear, etc).
- All bags were transported from Tinian to the Lower Base Refuse Transfer Station located on Saipan, CNMI for final disposal.
- Beaches that collect little debris will be maintained on an ongoing basis. The next large-scale cleanup is scheduled for mid-October.

EPR: 1 RP MAR CNMI ESA and MBTA Species Management; 61128NR211

2019 JRM INRMP Reference: TPS-2; 11-64

Concrete barrier - Sea Turtle Conservation – CNMI

Location: Tinian, CNMI **Period of Performance:** ONGOING

Project Objective

The intent of this contract is to fabricate, paint, transport and place, eighty (80), six foot concrete barriers to North Field, Military Leased Area, Tinian. Barriers will be placed on MLA beach access roads with input from CNMI resource partners on placement.

Conservation Benefit

Poaching and predation of sea turtle nests and recreational use of sea turtle nesting beaches have resulted in disturbance of habitat and illegal intentional take of these endangered species. Concrete barriers will prevent vehicles from disturbing nesting female turtles, their nests and nesting habitats.

FY19 Status

- Barriers moved in OCT 2019. They are currently stored at NW field (Figure 108).
- Due to COVID-19 administrative shortfalls, comment solicitations from CNMI partners have not taken place

EPR: 1 RP MAR CNMI ESA and MBTA Species Management Tinian; 61128NR211

2019 JRM INRMP Reference: TPS-2; 11-64

Figure 108. Photo of concrete barriers fabricated for turtle nest protection.

Mariana Common Moorhen Surveys – Tinian

Location: Tinian, CNMI **Period of Performance:** Contract Pending

Project Objective

Ongoing monitoring of nesting moorhens (*Gallinula chloropus guami*) at Hagoi and Bateha Wetlands in the Tinian MLA. (Previous Mariana Islands Range Complex [MIRC] BO Requirement, continued as an INRMP project).

Conservation Benefit

Monitor long-term trend of the moorhen population.

FY19 Status

- Award Contract is pending.

EPR: 1 S RP MAR CNMI ESA and MBTA Species Management; 61128NR211

2019 JRM INRMP Reference: TPS-3; 11-65

Tinian Forest Bird Monitoring and Assessment

Location: Tinian, CNMI **Period of Performance:** SEP2018 – FEB2021

Project Objective

Understand overall population status of forest birds of Tinian, especially the Tinian monarch and Micronesian megapode. Provide data to enable analyses of population trends over time of forest bird species on Tinian to enhance and conserve populations.

Conservation Benefit

Inform conservation and management actions for the Tinian monarch. Track the population status of the federally-endangered Micronesian megapode and other Tinian forest birds.

FY19 Status

- Awarded as a Cooperative Agreement to UoG through the CESU network in September 2018.
- Work will consist of:
    - Conducting surveys for forest birds on Tinian MLA using large-scale variable circular plot surveys.
    - Conducting Micronesian Megapode surveys.
    - Investigating the status and viability of the Tinian monarch, by assessing: 1) adult and juvenile survival, 2) reproductive success, 3) site fidelity, 4) habitat use and home range size, and 5) potential limiting factors and applying predator control measures, if appropriate, to improve nesting success and juvenile and adult survival
    - Conducting vegetation sampling within Tinian monarch nesting habitat.
- Final report due in February 2020 (requested NCE will move this date to March 2021). Due to COVID-19 travel restrictions, contract may be extended further

EPR: CHS MAR JRM Tinian Forest Bird Monitoring; EPR 61755NR303

2019 JRM INRMP Reference: TPS-4; 11-64

Surveys for Micronesian Megapodes and Mariana Fruit Bats

Location: FDM **Period of Performance:** OCT2019 – SEP2020

Project Objective

To conduct Micronesian megapode (*Megapodius laperouse*) surveys along established trails and paths to use as an index of megapode population change over time; record Mariana fruit bats (*Pteropus mariannus mariannus*) observed during surveys, and conduct habitat ground surveys to monitor habitat change over time per the 2015 Mariana Islands Training and Testing (MITT) BO terms and conditions.

Conservation Benefit

To ensure compliance with the Incidental Take Statement of the 2015 MITT BO.

FY20 Status

- No Micronesian megapode or Mariana fruit bat surveys were conducted in FY20.
- The last FDM survey conducted on April 12, 2019 at ten playback stations.
  - 20 Micronesian megapodes detected.
  - No Mariana fruit bat detections.
- Surveys are conducted every two years. Next survey anticipated in the April/May 2021.

EPR: BO MAR Mariana Islands Training and Testing (MITT) Implementation; 61128NR218

2019 JRM INRMP Reference: TPS-1; 12-34

Hafa Adai Resource Partners,

After feedback from Partners, this is email is to confirm the dates for the FY20 Joint Region Marianas Natural Resources Metrics:

17 Sep: CNMI
22-23 Sep: Guam

Given the uncertainties of the COVID 19 situation, the meetings will be held virtually via video-conferencing. We will be providing more information next month.

Thank you.

v/r,

Dana

NOTE: I am currently teleworking. Temporary mobile number: (671)929-2145.

Subject: FY20 Joint Region Marianas Natural Resources Metrics

Hafa Adai Resource Partners,

I hope everyone is safe and healthy during these unprecedented times. We'd like to make everyone's calendar's for the FY20 Joint Region Marianas Natural Resource Metrics meetings and propose the following dates:

17 Sep: CNMI
22-23 Sep: Guam

We are planning to secure venues for in-person meetings, but will also plan contingencies for remote meetings given the unknowns with the COVID-19 pandemic. In addition, we recognize the telecommunications challenges that were experienced during the FY19 Natural Resource Metrics meetings and will continue to try and alleviate those challenges.

Please let us know if the dates provided above are problematic and we will try to accommodate. My POC for the Metrics is Jen Horeg.

Thank you and stay safe.

v/r,

Mr. Dana T. Lujan

Encl: (1) FY 2021 Natural Resources INRMP Metrics Results
(2) JRM INRMP Summary of FY21 Projects for Guam and CNMI
(3) FY 2021 Natural Resources INRMP Metrics Invitation and Attendee List

1. In accordance with reference (a), Navy installations are required to submit an annual report summarizing the recent Natural Resources/Integrated Natural Resources Management Plan (INRMP) Metrics meeting and status of the INRMP.

2. The Fiscal Year (FY) 21 Joint Region Marianas (JRM) Natural Resources/INRMP Metrics meeting for Commonwealth of the Northern Mariana Islands (CNMI) resource partners was held virtually on September 17 and October 8, 2021 and the JRM INRMP Metrics meeting for Guam resource partners was held virtually on September 22 and 23, 2021 via MS Teams. Enclosures (1) through (3) are provided for your review.

3. The Final 2019 JRM INRMP was finalized and signed by partner agencies (US Fish and Wildlife Service, National Marine Fisheries Service, Guam Department of Agriculture, and CNMI Department of Land and Natural Resources-Division of Fish and Wildlife) in June - August 2019. Annual updates are conducted each calendar year beginning in 2021 and a 5-year review for operation and effect will be conducted in 2024 per the OPNAVINST 5090.1E, reference (b), sections 670a-f. The FY21 JRM INRMP Update will be complete and distributed by 31 January 2021.

4. Thank you for your participation in our Natural Resources/INRMP Metrics meeting and for your support of the JRM Natural Resources Program. If you have any questions, please contact Jennifer Horeg, Natural Resources Program Supervisor, at Jennifer.horeg@fe.navy.mil or 671-339-1275.

MARINE HABITAT MANAGEMENT

Water Quality Monitoring on Joint Region Marianas Submerged Lands

Location: NBG and AAFB **Period of Performance:** JUN2021 – DEC2022

Project Objectives

- Install, deploy, and maintain four conductivity-temperature-depth (CTD) mounting frames (Figure 1) and four pH sensor mounting frames (Figure 2) at four locations in Apra Harbor (e.g., Sasa Bay, Inner Harbor, Middle Harbor, and Outer Harbor), one CTD mounting frame and one pH sensor mounting frame at one location in Orote Peninsula ERA (e.g., Spanish Steps), one CTD mounting frame and one pH sensor mounting frame at one location in Haputo ERA (e.g., Double Reef), and one CTD mounting frame and one pH sensor mounting frame at one location in Andersen Air Force Base (AAFB) (e.g., Pati Point Marine Preserve Area).
- Install, deploy, and maintain four CTD and four pH sensors at four locations in Apra Harbor (e.g., Sasa Bay, Inner Harbor, Middle Harbor, and Outer Harbor), one CTD and one pH sensor at one location in Orote Peninsula ERA (e.g., Spanish Steps), one CTD and one pH sensor at one location in Haputo ERA (e.g., Double Reef), and one CTD and one pH sensor at one location in AAFB (e.g., Pati Point Marine Preserve Area) (Figure 3).
- Analyze water quality results and examine the spatial and/or seasonal (temporal) variations in Apra Harbor, Orote Peninsula ERA, Haputo ERA, and AAFB.

Conservation Benefit

- Increase habitat for Endangered Species Act (ESA)-listed corals (e.g., *A. globiceps, A. retusa,* and *S. aculeata*)
- Support habitat areas of particular concern which align with Magnuson-Stevens Fishery Conservation Act for Essential Fish Habitat and the Marianas Fishery Ecosystem Plan

FY21 Status

- Final report available (2018-2020 data)
- FY21 CESU awarded to UOG WERI

EPR: CHS MAR JRM Monitoring and Control of Acute Impacts on Coral Reefs; 61128CN222

2019 JRM INRMP Reference: MHM-1 (5-98)

Figure 2. SeaFET sensor mounted on a stainless-steel frame.

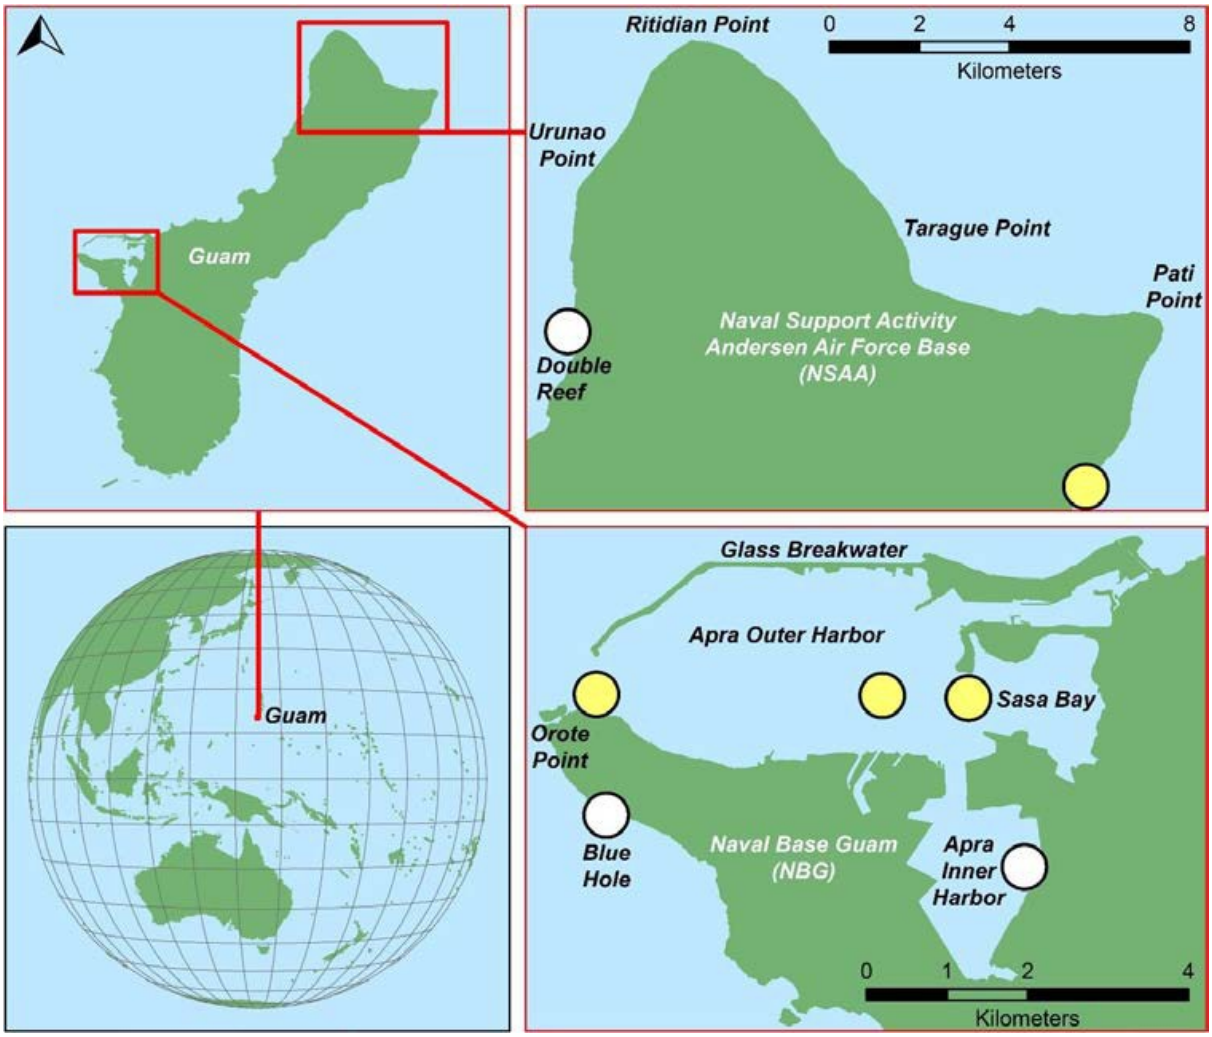

Figure 3. Deployment locations of water quality loggers. Yellow circles indicate sites for which previous water quality data is available and at which mounting frames are installed. White circles represent new monitoring stations.

Identification and Removal of Non-Permitted Buoys on JRM Submerged Lands

Location: NBG **Period of Performance:** SEP2020 - SEP2022

Project Objective

- Identify non-permitted buoys (NPBs) on JRM submerged lands
- Cross-reference NPBs with ACOE list of permitted buoys
- Remove all NPBs

Conservation Benefit

- Increase habitat for ESA-listed corals (e.g., *A. globiceps*, *A. retusa*, and *S. aculeata*).
- Support habitat areas of particular concern, which align with Magnuson-Stevens Fishery Conservation Act for Essential Fish Habitat and the Marianas Fishery Ecosystem Plan.

FY21 Status

- 26 total buoys ID (Figure 4); 19 of 26 are SWMS buoys installed in 2019 (ACOE permitted) at Outer Apra Harbor, Naval Base Guam (NBG)
- Approximately four (4) SWMS buoys lost

EPR: CHS MAR JRM Monitoring and Control of Acute Impacts on Coral Reefs; 61128CN222

2019 JRM INRMP Reference: MHM-1 (5-98); MHM-4 (5-100)

Figure 4. Map depicting locations of mooring buoys in and around Outer Apra Harbor, NBG.

Coral Bleaching and Crown of Thorns Seastar (COTS) Monitoring on JRM Submerged Lands

Location: NBG and AAFB **Period of Performance:** JUN2021 – DEC2022

Project Objective

- Host crown of thorns starfish (COTS) training workshops for Navy EXWC and NBG Dive Locker divers, JRM/NBG Natural Resource Marine Specialists, and Guam. COTS Response Team partners lead by a COTS expert; one classroom and one in-water skills COTS training workshop to include overview of COTS ecology and history on Guam, pre-culling surveillance methods, culling guidelines, and post-culling monitoring techniques.
- Implement a monitoring program for the detection of coral stressors and COTS/marine nuisance species control within Outer Apra Harbor, Orote and Haputo ERAs, and Pati Point (Firgure 5).

Conservation Benefit

- Increase habitat for ESA-listed corals (e.g., *A. globiceps, A. retusa, and S. aculeata*).
- Support habitat areas of particular concern, which align with Magnuson-Stevens Fishery Conservation Act for Essential Fish Habitat and the Marianas Fishery Ecosystem Plan.

FY21 Status

- FY21 CESU awarded to UOG Sea Grant

EPR: CHS MAR JRM Monitoring and Control of Acute Impacts on Coral Reefs; 61128CN222

2019 JRM INRMP Reference: MHM-1 (5-98)

Characterization of Marine Benthic Habitats in Outer Apra Harbor Guam and Haputo ERA

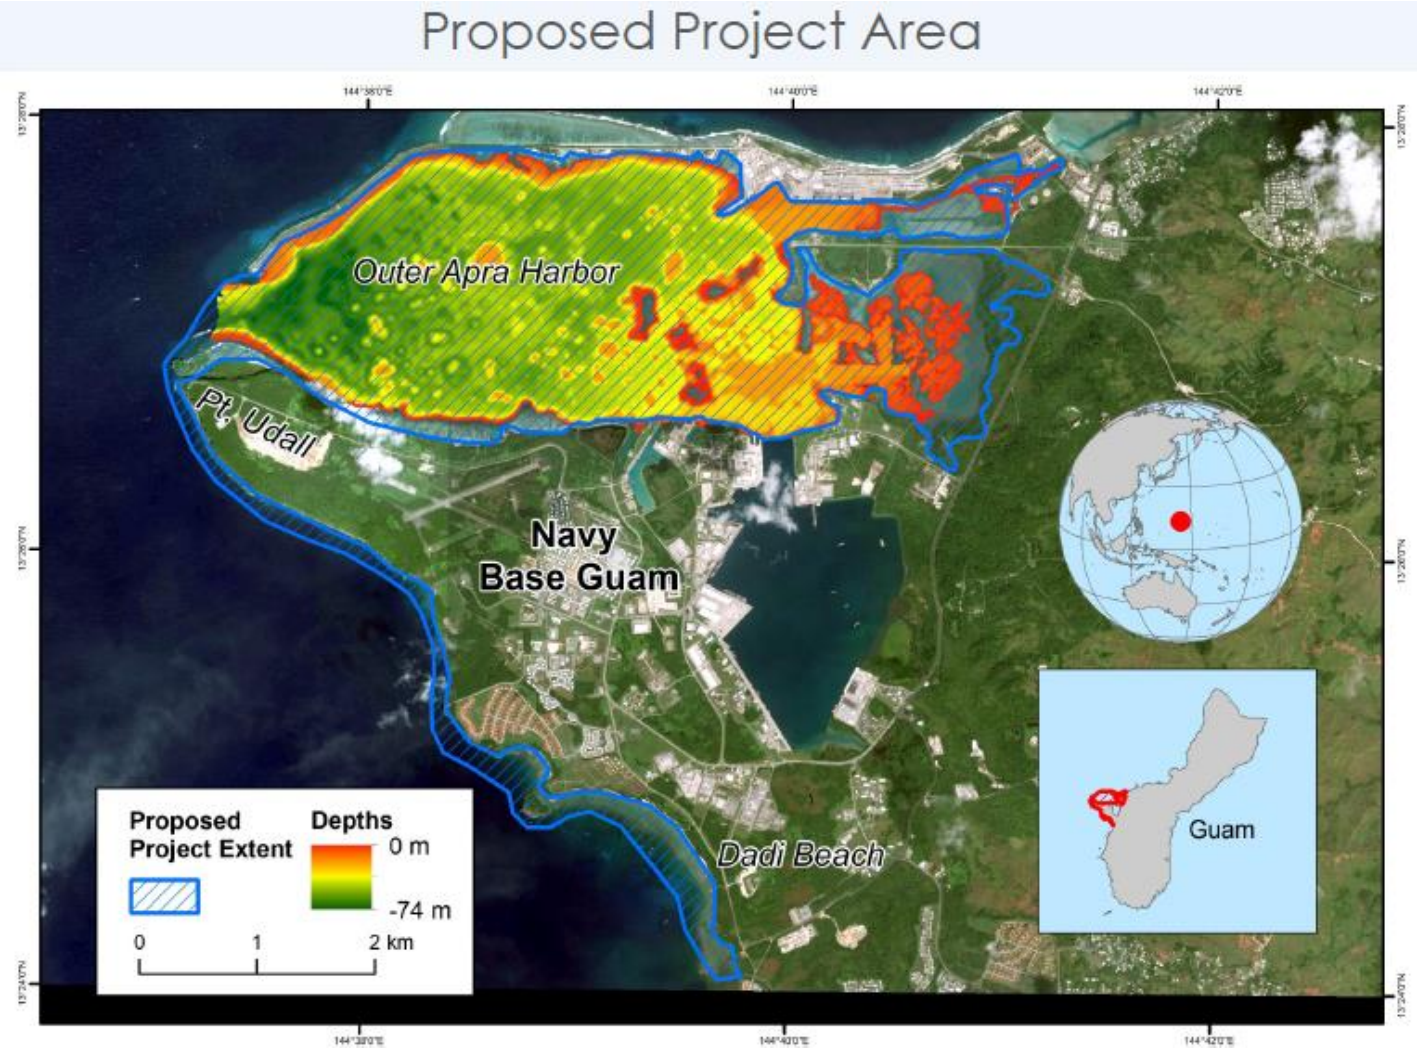
Location: Apra Harbor, Haputo ERA **Period of Performance** SEP2019 -SEP2023
JULY2020-SEP2023

Project Objectives

- Process existing remotely sensed imagery
- Collect in situ information for habitat model and map development
- Collect in situ information to evaluate habitat model performance and map accuracy
- Outreach

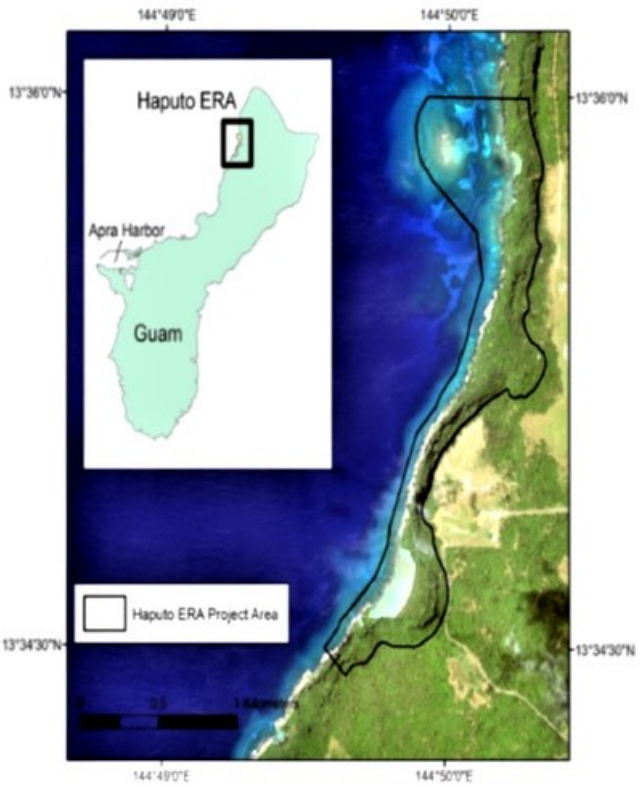
Conservation Benefit:

- Increase habitat for ESA-listed species and marine mammals
- Support habitat areas of particular concern with align with Magnuson-Stevens Fishery Conservation Act for Essential Fish Habitat and the Marianas Fishery



FY21 Status

- Interagency agreement established SEP2019
- Fieldwork was scheduled for JULY2020; postponed due to COVID-19



EPR: 1 CP MAR NBG Benthic Habitat and Coral Mapping and Management (CHS); 61755NR818

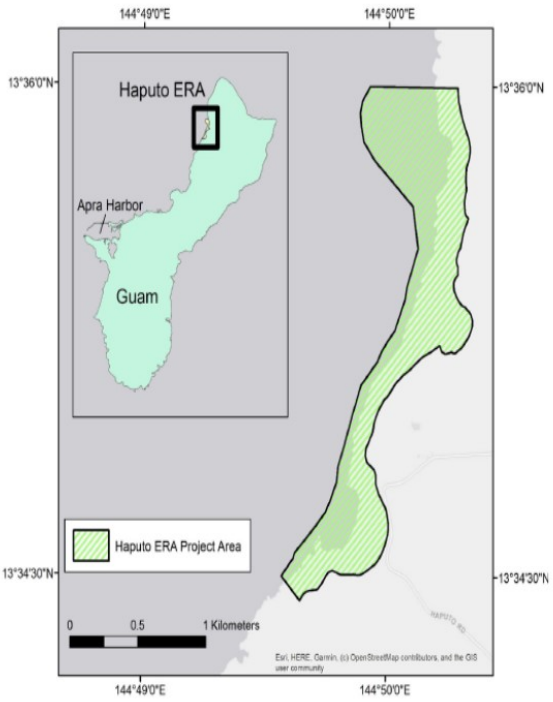
Figures 7- 14. Project proposed areas, habitat maps, biological cover types, & substrate types for project areas

Proposed Project Area

Haputo ERA:



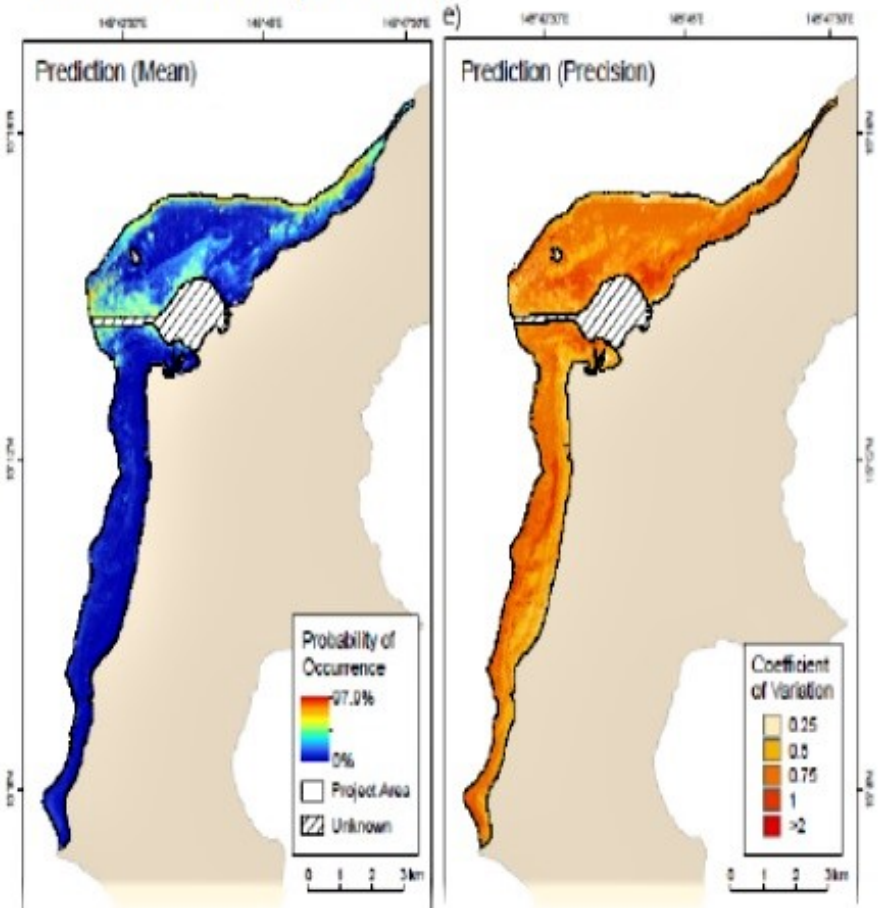
- ~1.25 km^2 area
- Submerged and terrestrial habitat

Remote Sensing Data:

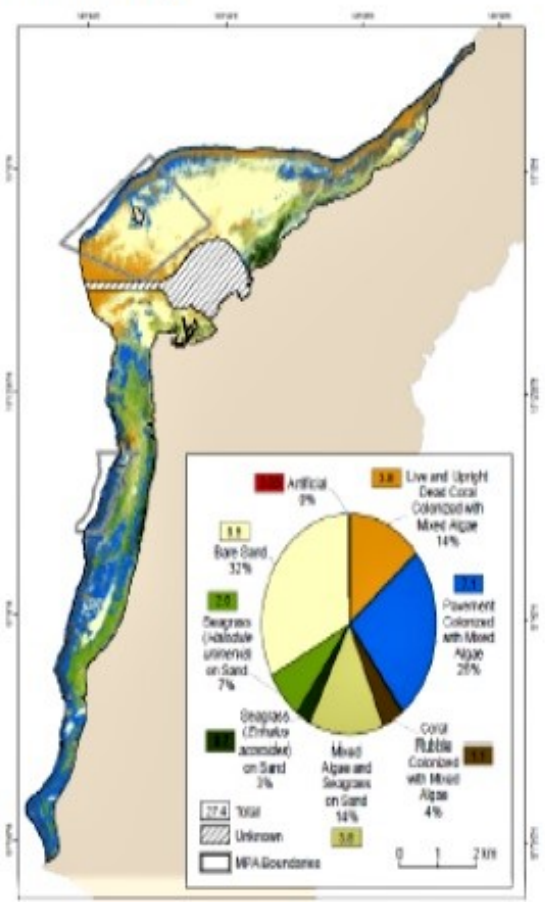
- **Multispectral Satellite Imagery**
- 2019 LiDAR coverage
- sUAS (pending permission??)

BENTHIC HABITATS for Haputo ERA

Proposed Project Area



Haputo ERA:

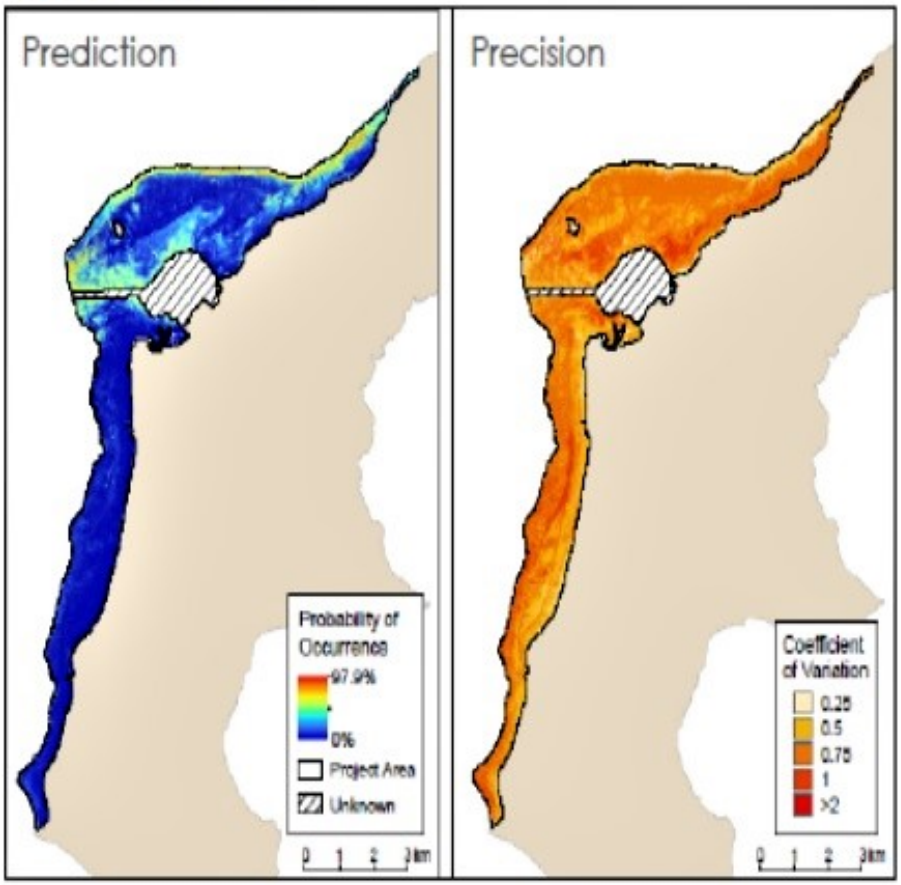


- ~1.25 km^2 area
- Submerged and terrestrial habitat

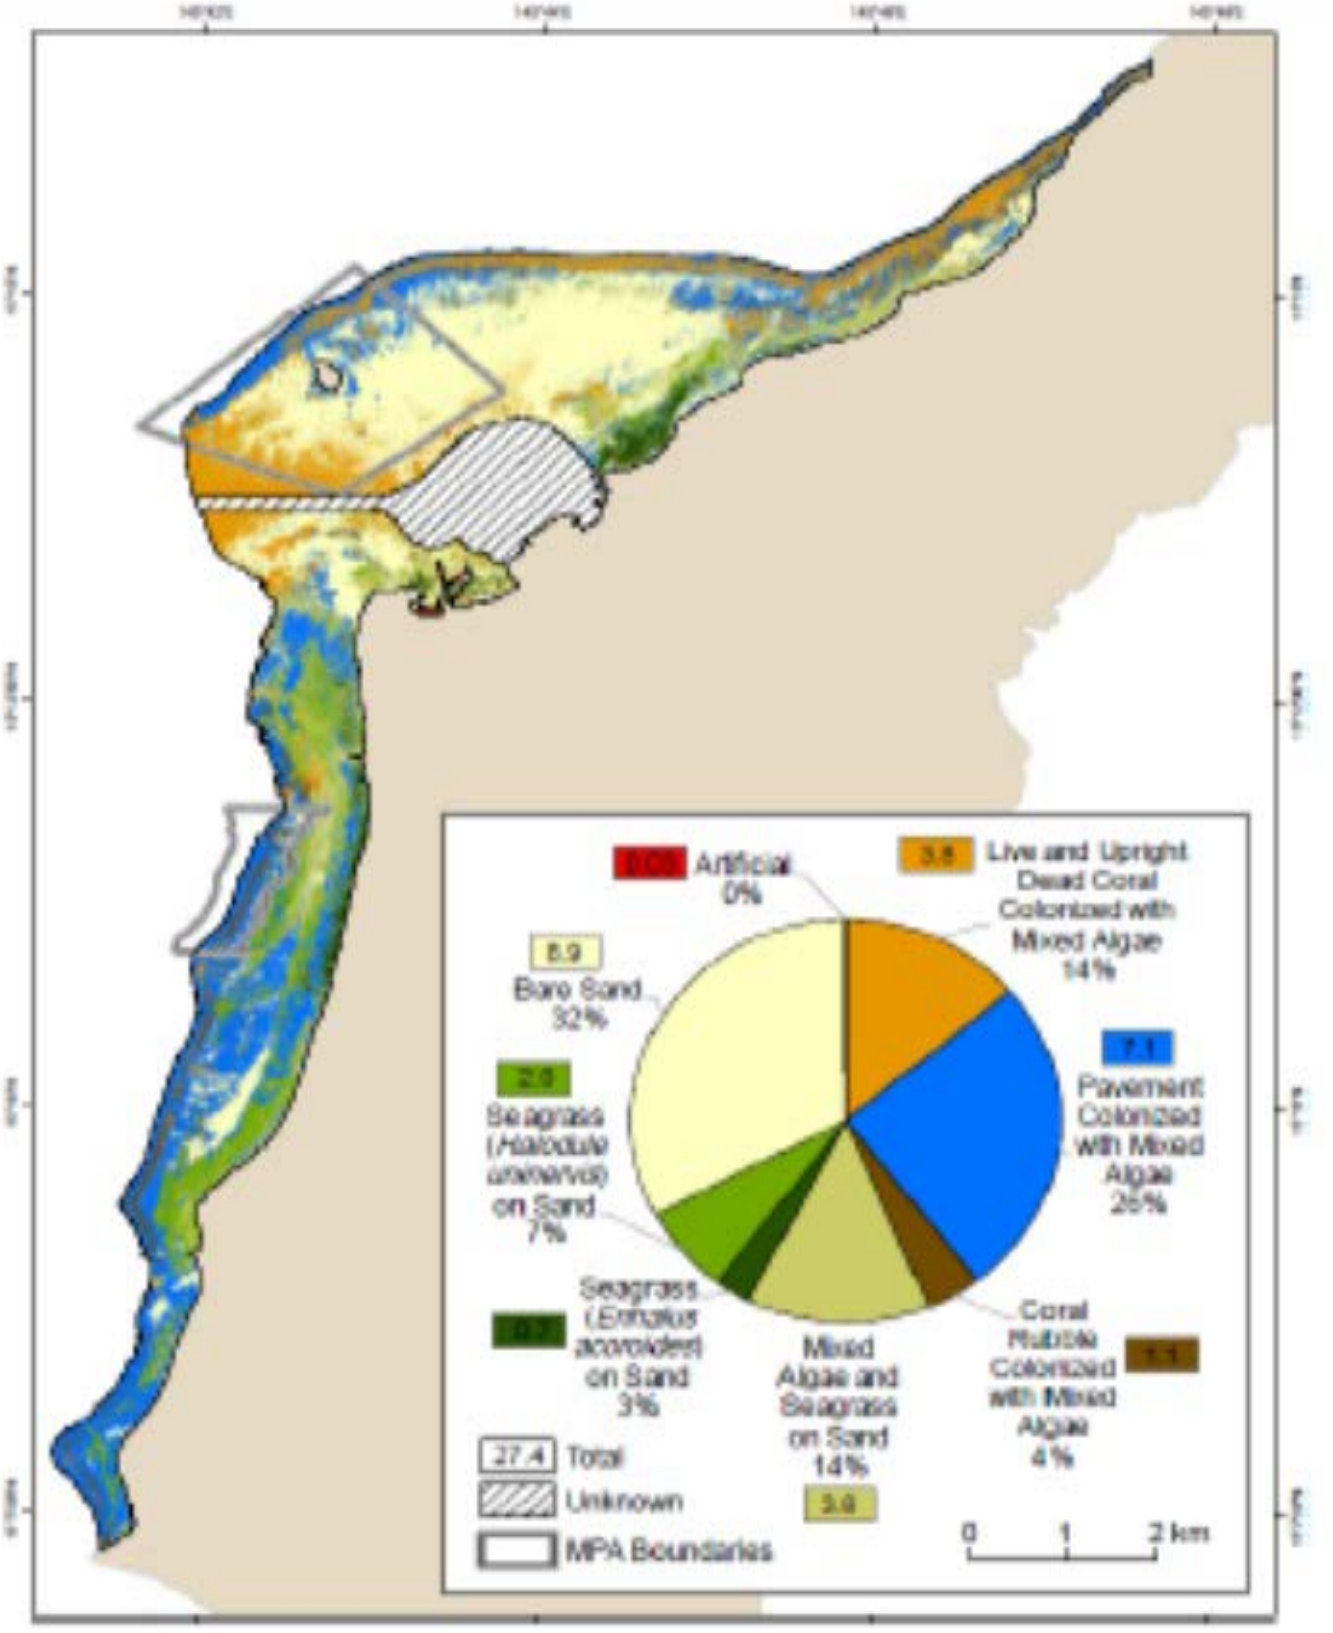
Proposed Products: (2) Habitat Predictions & Maps

Habitat Predictions (Live Coral)

Habitat Map



Proposed Habitat Types (16)



16 Habitat Types
(1 prediction for each type)

- 6 substrate
  - Live coral, All Species
  - Upright dead coral
  - Pavement
  - Coral rubble
  - Sand
  - Mud
- 10 biological cover
  - Live coral, all species
  - Live coral, *Isopora p.*
  - Live coral, Staghorn
  - Live coral, *Porites r.*
  - Live coral, Other
  - Seagrass, *Enhalus*
  - Seagrass, *Halodule*
  - Mixed algae
  - Mangrove
  - Bare

Example: Live Coral

Habitat Map (1)

Proposed Habitats: Biological Cover Types (10)

(1) Live Coral Reef (All species)

(2) Live Coral, *Isopora palifera*

(3) Live Coral, *Porites rus*

(4) Live Coral, Staghorn (*Acropora aspera, A. formosa, A. pulchra*)

(5) Live Coral, Other Species

(6) Seagrass, *Enhalus acoroides*

(7) Seagrass, *Halodule uninervis*

(8) Mixed Algae

(9) Bare

(10) Mangrove

Proposed Habitats: Substrate Types (6)

(1) Live Coral Reef, All species

(2) Upright Dead Coral Reef

(3) Pavement

(4) Coral Rubble

(5) Sand

(6) Mud

MARINE PROTECTED SPECIES MANAGEMENT

Sea Turtle Distribution and Habitat Use

Location: NBG **Period of Performance:** AUG2018 - SEP2022

Project Objective

- Conduct marine turtle surveys and in-water captures of green turtles (Chelonia mydas) and hawksbill turtles (Eretmochelys imbricata) in the nearshore waters of Guam and CNMI.
- Captured turtles are weighed, measured, biopsied, and tagged (i.e., flipper, PIT, satellite tracking) in an effort to expand our knowledge of the population demographics, population structure, and fine-scale habitat use of the turtles.
- Blood samples are also collected for two studies: 1) hormone analysis to determine population sex ratios, and 2) metabolite analysis to determine nutritional/feeding state.

Conservation Benefit

To understand the movements of Guam and CNMI foraging populations of sea turtles to maintain or increase sea turtle populations and enhance and restore habitat.
To collect data on the morphology and genetics of the nearshore sea turtle population.

FY21 Status

- This work is conducted through an Interagency Agreement (NMFS-PIC-18-007) between NOAA-PISF and JRM. The original agreement was from August 2016 – July 2019. The new agreement extends to September 2022.
- A final report was provided in January 2020
- Due to COVID travel constraints no work was conducted in FY21

EPR: 1 S CP MAR NBG Sea Turtle Distribution and Habitat Use; 61755NR815
2019 JRM INRMP Reference: MPS-2 (5-103)

Detection of Scalloped Hammerhead Sharks in Apra Harbor and Adjacent Nearshore Waters using Environmental DNA (eDNA)

Location: NBG **Period of Performance:** SEP2017 - OCT2020

Project Objective

- Collect and filter marine water samples at five targeted locations within Apra Harbor and Orote ERA.
- Develop primers designed to amplify only scalloped hammerhead shark DNA.
- Assess ability to extract and detect shark DNA, and other threatened fish species (e.g., humphead wrasse and bumphead parrotfish) through targeted quantitative Polymerase Chain Reactions and metabarcoding analyses.
- Analyze eDNA results to determine the spatial and temporal presence of scalloped hammerhead sharks in Apra Harbor and Orote ERA.

Conservation Benefit

- Increase habitat for ESA-listed species (e.g., scalloped hammerhead shark).
- Support habitat areas of particular concern, which align with Magnuson-Stevens Fishery Conservation Act for Essential Fish Habitat and the Marianas Fishery Ecosystem Plan.

FY21 Status

TERRESTRIAL EXOTIC AND INVASIVE SPECIES MANAGEMENT

Implementation of the Regional Biosecurity Plan of Micronesia and Hawaii

Location: JRM **Period of Performance**: AUG2020-JUL2021

Project Objective

Update Attachment M (DoD Biosecurity Recommendations) of the Regional Biosecurity Plan for Micronesia and Hawaii (hereafter: RBP), and implement various actions identified within the RBP aimed at: preventing the spread of invasive species into/out of Joint Region Marianas (JRM) Area of Responsibility (AOR); controlling, managing, and eradicating invasive and nuisance species on DoD lands within the JRM AOR; providing outreach and awareness to military personnel, contractors, and their respective dependents; and increasing coordination and collaboration with regional partners and DoD stakeholders regarding biosecurity and invasive species management.

Conservation Benefit

Protect native species, particularly those that are threatened and endangered from the threat of invasive species within the JRM AOR.

FY21 Status

- The RBP Attachment M update was submitted to Navy HQ in December 2019 after reviews were completed by DoD across JRM AOR, Hawaii, DoD stakeholders in the Pacific, and PACOM.
- Implementation of biosecurity arrival and pre-departure biosecurity inspections of non-training military equipment and cargo movements into/out of JRM AOR and movements to Tinian for Seabee public works projects. Twenty (20) non-training

biosecurity inspection events took place during this reporting period with seven pre-departure biosecurity events for items going to Tinian.

- Continued interagency coordination and consultation regarding invasive species management and biosecurity concerns within the region (CRB Working Group, LFA Working Group, GISC, GISAC, RISC, CNMI DLNR, Guam Biosecurity Division).

Little Fire Ant (LFA), *Wasmannia auropunctata*, Surveys, Eradication, and Monitoring

Location: DoD Lands on Guam **Period of Performance**: AUG2020 – JUL2021

Project Objective

To implement LFA Early Detection Surveys (EDS); control and eradicate LFA on DoD lands; coordinate and collaborate with resources partners; and provide outreach materials to reduce impacts to native ecosystems and military readiness activities.

Conservation Benefit

Enhance and restore habitats by prevention of the spread and establishment of the invasive LFA.

FY21 Status

Cooperative Agreement with Colorado State University, Center for Environmental Management of Military Lands (CSU CEMML):

- LFA Early Detection Surveys
    - 133 LFA surveys at 102 sites out of 149 total sites covering approximately 150 miles
    - AAFB: 55 LFA surveys at 40 sites out of 49 total sites
    - NBG: 71 LFA surveys at 56 sites out of 81 total sites
    - MCBCB: 6 LFA surveys at 6 sites out of 6 total sites
- Three (3) new LFA infestations detected along installation borders
    - NBG: Two (2) locations (Naval Base Guam Naval Munitions Site (NMS) Route 12)
    - AAFB: One (1) location (Housing fenceline)
- Two (2) LFA positive locations on NBG had ongoing treatment (Dadi Beach and NMS-Cross Island Road) during this reporting period.

- LFA redetected at Haputo Beach Trailhead during post-treatment monitoring in July 2021.
- Secured FY21 funding to implement LFA treatment at AAFB Housing Fence line, NMS-Route 12 (two locations), and Polaris Point Fence line

- LFA Infestation Status
    - NMS – Route 12, NBG, On January 25, 2021 LFA were detected at two locations along Route 12 fence line and across from NMS front gate with a total treatment area of 0.7 and 1.0 acres respectively (Figure 17-18). LFA treatment to begin during September 2021.
    - Housing Fence line, AAFB, On May 13, 2021 LFA detected along the housing fence line with a treatment area of 1.0 acres (Figure 19). LFA treatment to begin during September 2021.
    - Dadi Beach, NBG – LFA detected in April 2020 with a treatment area of 19.8 acres (Figure 20). Three of eight LFA eradication treatments completed.
    - NMS – Cross Island Road, NBG – LFA detected in 2017. Ongoing LFA border treatment on 3.0 acres and eradication of a 4.4 acre interior infestation (4 of 8 eradication treatments completed) (Figure 21).
    - Haputo Beach Trailhead, NBG TS – Eight (8) LFA insecticide treatments completed (September 2019 – July 2020). The third post treatment monitoring effort on June 5, 2021 detected LFA (Figure 22). LFA treatment area covers 0.5 acres that will begin during September 2021.
    - Polaris Point – Fence line, NBG – LFA detected in June 2020 with a treatment area of 3.1 acres (Figure 23). LFA treatment to begin during September 2021.

Little Fire Ant (LFA), *Wasmannia auropunctata*, Surveys, Eradication, and Monitoring – Andersen South

Location: Andersen South **Period of Performance:** AUG2017 - DEC2021

Project Objective

- To eradicate LFA within the Andersen South property to reduce impacts to native ecosystems and military readiness activities.

Conservation Benefit

Enhance and restore habitats by prevention of the spread of the invasive LFA.

FY21 Status

- 5 of the 8 known LFA sites have been successfully eradicated at the Andy South property
- Completion of the delimiting surveys at site 7
- On-going delimiting surveys for newly discovered site 8 snail area
- Delimiting surveys for LFA spread at sites 1, 6, 7 and 8
- On-going consultation with USFWS for helicopter eradication at site 1 and ground-based eradication of LFA from site 8 snail area
- On-going development of revised work plan to include ground-based treatments for newly discovered LFA sites and containment of the site 1 infestation
- On-going planning for the commencement of helicopter aerial treatments

Invasive Species Management within the Joint Region Marianas Area of Responsibility

Location: JRM **Period of Performance**: AUG2020 – JUL2021

Project Objective

In support of Mariana Islands Training & Testing (MITT) activities, 1) conduct Early Detection Surveys (EDS) non-native species at training and cargo staging locations within the JRM AOR (Guam and CNMI (Tinian Ports, Military Leased Area, Rota Ports); 2) develop and implement standard operating procedures for the control and removal of high-risk invasive species; 3) develop and implement invasive species rapid response protocols; 4) develop and implement bio-sanitation standards along with quality assurance/quality control standards; and 5) development of a programmatic pathway risk analysis for the movement of equipment and personnel within the JRM AOR; and 6) targeting high risk invasive arthropod species for control and eradication.

Conservation Benefit

Prevent the movement and establishment of invasive species into and out of Guam and the CNMI during training exercises.

FY21 Status

- Ongoing cooperative agreement CSU, CEMML
- Early Detection Surveys Conducted
    - All-Taxa Surveys – AAFB: 12 of 29 sites; NBG: 9 of 27 sites
    - Weed Surveys – AAFB: 11 of 28 sites; NBG: 27 of 47 sites
    - Tinian MLA – 1 of 3 All-Taxa sites and Weed Surveys conducted at North Field (runways, taxiways, Dankulo beach)
- Development of SOPs for the Control/Eradication of High-Risk Species
    - Little Fire Ant (LFA; *Wasmannia auropuncta*) revised
    - Yellow-jacket wasps (*Vespula pensylvanica* & *V. germanica*)

- Invasive Species Rapid Response
    - No rapid response deployment events occurred during FY21
    - Five CSU CEMML personnel BTS Rapid Response certified
- Bio-sanitation QA/QC Biosecurity Inspections during Military Training Events
    - Four major training events (>100 cargo items; Valiant Shield 20, Cope North 21, Forager 21, Freedom Banner 21)
    - Eight minor training events (25 – 100 cargo items)
    - Six unit level training events (<25 cargo items)
    - >3,000 items inspected during arrival and pre-departure biosecurity inspections to meet AFPMB TG-31 cleanliness standards
    - Bio-material interceptions (plant material, seeds, soil/gravel, insects, spiders/webs/eggs, wasp nests, dead frog, etc.)(Figure 25)
- Development of a Programmatic Pathway Risk Analysis for Movements into the Mariana Islands and between Islands
    - Ongoing data collection to support the risk analysis
- FY20 Cooperative Agreement with CSU CEMML ongoing (Jul2020 – Dec2021)

Coconut Rhinoceros Beetle (CRB; *Oryctes rhinoceros*) Surveys, Interdiction, and Monitoring - Guam

Location: DoD Lands on Guam **Period of Performance:** AUG2020 – JUL2021

Project Objective

To implement CRB best management practices: 1) identify and remove breeding sites, 2) implement interdiction and sentinel trapping, and 3) implement CRB awareness; coordinate and collaborate with resources partners, and provide outreach materials to installation and military training participants to reduce impacts to native ecosystems and military readiness activities.

Conservation Benefit

Enhance and restore habitats by prevention of the spread and establishment of the invasive LFA.

FY21 Status

- CRB Best Management Practices
- CSU CEMML implementing CRB management
- Conducted biannual CRB breeding site surveys on NBG/AAFB
- 287 CRB sentinel/interdiction traps deployed and serviced on NBG (143 traps) and AAFB (144 traps) starting in August 2020 through June 30, 2021. During this 10-month period a total of 9,197 CRB were captured (AAFB: 5,079 & NBG: 4,118;)(Figure 26)
- During the most recent trapping period (April to June 2021) at AAFB 130 of 141 traps had at least one CRB capture (92%) and at NBG 128 of 143 traps had at least one CRB capture (89%). Heat maps in Figures 27 - 28 depict CRB capture rates.
- Coordination with regional partners (USDA-PPQ, GovGuam Dept. Ag., & CNMI DLNR)

EPR: 2 BO MAR MITT Implementation; 61128NR218 CHS NISA MAR JRM Implementation of the Regional Biosecurity Plan; 61128NR860 USMC HQ MITT Biological Opinion Conservation Measures Implement (FY21 Non-EPR)

Brown Treesnake Interdiction to Prevent the Spread Via the DOD Transportation Network Originating On Guam

Location: JRM **Period of Performance:** OCT2020 – SEP2021

Project Objective

To prevent the spread of BTS (Figure 29) to other Pacific islands including the CNMI and Hawaii, this JRM project is funded to conduct BTS control and interdiction efforts (Figure 30) on NBG and AAFB to prevent snakes from getting into the DoD transportation network. Methods include BTS trapping, toxicants, nighttime visual fence line searches, and canine inspections of outbound items. The BTS Interdiction program also supports training events occurring in the region that originate from Guam. Joint Region Marianas develops BTS control and interdiction plans for each training exercise that requires the movement of personnel and assets to the CNMI from Guam. Additional BTS inspections and control measures implemented in the CNMI when determined necessary by the stakeholders.

Conservation Benefit

Preventing the spread of BTS via the military transportation network keeps BTS on Guam and from establishing in other ecologically sensitive areas in the Pacific region where vulnerable island species would be susceptible to BTS predation.

FY21 Status

- Ongoing and enduring JRM requirement
- Interdiction support provided to four (4) major exercises FY21: COPE NORTH/PACIRON/FORAGER/FREEDOM BANNER 2021
- 5 missed Inspection (99.999%)
- No BTS detections in outbound cargo
- Data from AUG2020-JUL2021

Figure 29. (a) BTS on AAFB fenceline;

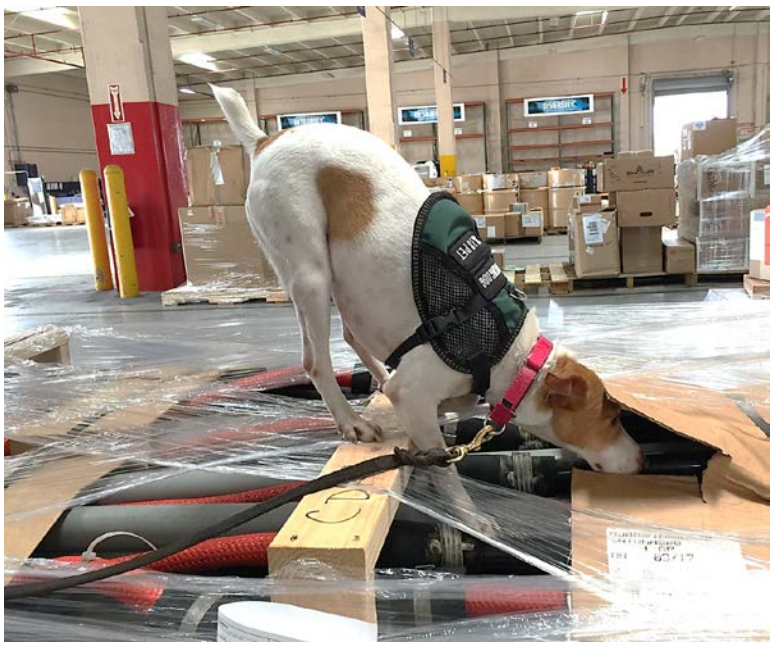

Figure 30. (b) USDA-WS BTS detector dog inspecting cargo at Warehouse 9, NBG.

Photos U.S. Navy, Guam

Brown Treesnake Control at Mariana Swiftlet Caves

Location: NBG; NMS **Period of Performance**: OCT2018 – Ongoing

Project Objective

To provide long-term protection for the Mariana Swiftlet (*Aerodramus bartschi*) from the BTS predation. Protection consists of oral toxicants for BTS around the areas surrounding Mahlac, Fachi, and Maemong caves, NMS.

Conservation Benefit

Protection from predation by BTS is focused on maintaining or increase swiftlet populations at the three occupied caves and enhance or restore habitat by reducing predation by BTS.

FY21 Status

- Ongoing project with CEMML
- 100% bait tubes since October 2019
- Baiting once per week to reduce disturbance
- 5380 baits deployed since August 2021
- Average annual toxicant take rate = 27% (1455/5380)

EPR: 1 RP NBG Mariana Swiftlet Population Protection; 67155NR834: BTS Trapping

2019 JRM INRMP Reference: TIS-2; 6-43

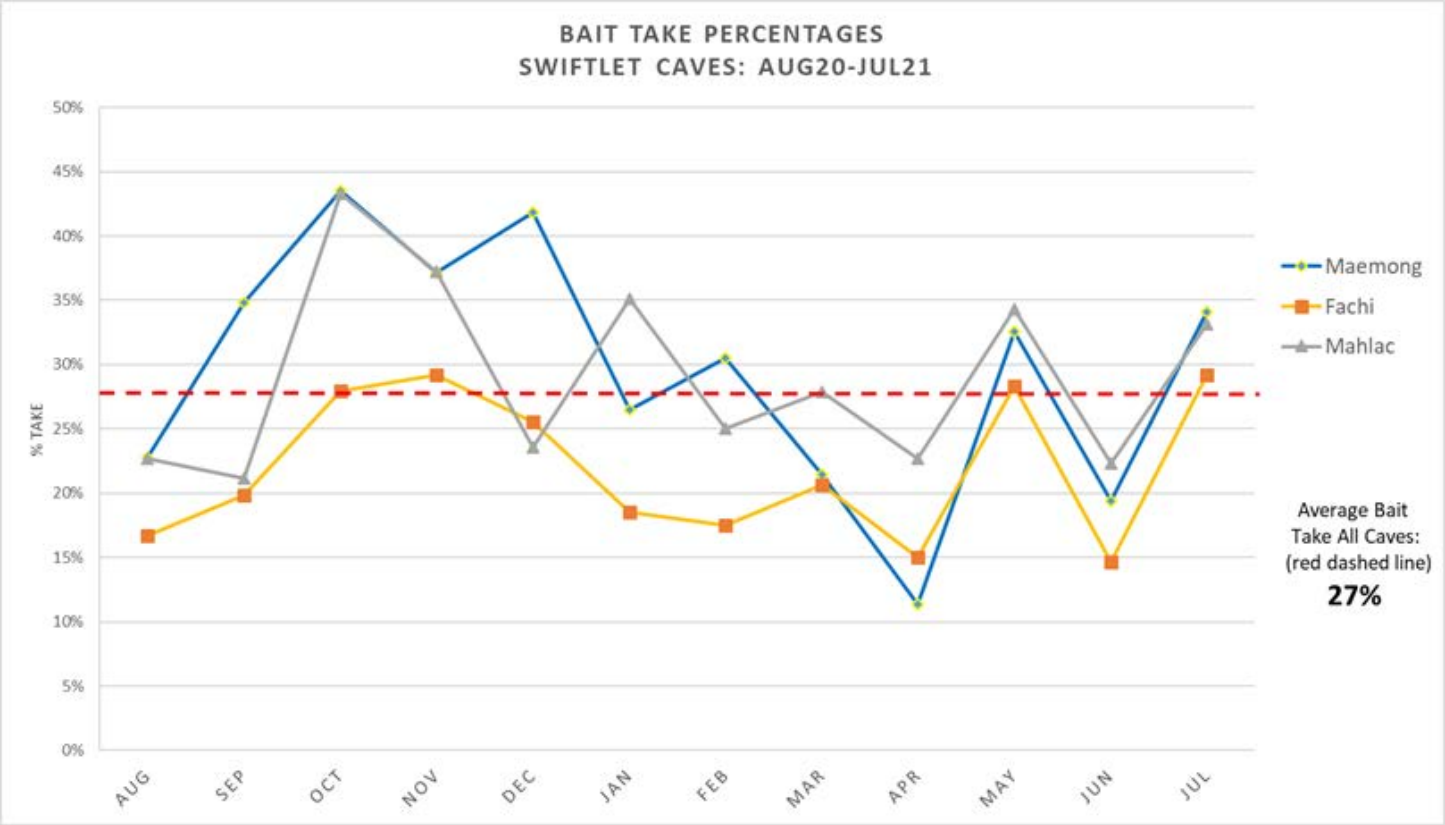

Figure 31. Monthly bait take percentages for swiftlet caves. Red dashed line is annual average bait take (27%).

Evaluation of Brown Treesnake Control via Bait Delivery around the Swiftlet Caves and Investigation of Brown Treesnake Control to Support Swiftlet Range Expansion

Location: NBG **Period of Performance:** SEP2020 – FEB2022

Project Objective

This project will assess the overall efficacy of current control around the swiftlet caves by evaluating trapping, hand captures, and visual surveys capture data. This project will evaluate data based on seasonality, demographic, and behavioral aspects of BTS. Snakes captures in and out of caves (occupied and unoccupied) will be tracked via transmitters to determine movement, and if there are any potential dietary preferences.

Conservation Benefit

Swiftlet protection is a long-term effort that helps support goals of the swiftlet recovery plan. Since mid-2018 it has been 100% toxicant-based control, and while slightly more effective than trapping the impacts to BTS have not been adequately assessed. Additionally, a better understanding of BTS population dynamics near a rich prey base needs to be improved. The data collected will contribute to understanding if there is any measurable impact from the current baiting methods on the BTS populations around the caves. Improved BTS population data will inform future conservation efforts for listed species on Guam.

FY21 Status

- Funded via an interagency agreement with USGS – Fort Collins.
- COVID delayed the start of data collection.
- 19 BTS captures in or near Maemong (10) and Mahlac (9) – transmitters have been inserted in nine (9) BTS.
- BTS captured inside caves larger than BTS outside the caves.

- No BTS captured outside the caves located inside the caves.

EPR: 1 RP NBG Mariana Swiftlet Population Protection: BTS Trapping; 67155NR834

2019 JRM INRMP Reference: TIS-2; 6-43

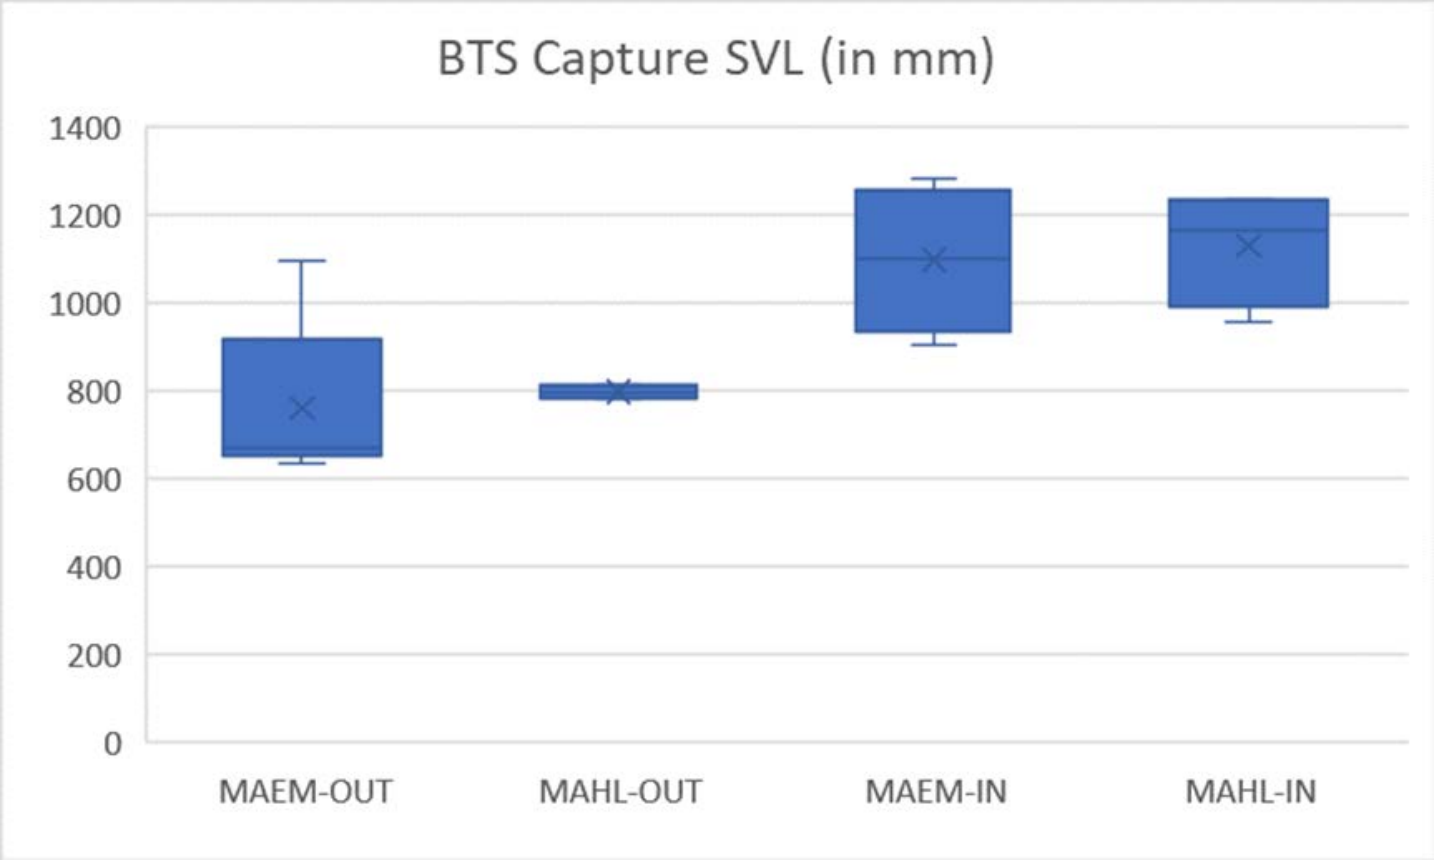

Figure 32. Box and Whisker plot showing snake capture sizes by site. MAEM = Maemong cave, MAHL = Mahlac cave, -IN = inside the cave, and -OUT = outside the cave. Note that though the sample sizes are small (four snakes captured inside each cave, for instance), snakes inside the cave are consistently large.

Aerial Baiting Operations and Ground Support for Suppression in the HMU, AAFB

Location: JRM **Period of Performance**: JAN2020 – JUL2021

Project Objective

To provide operational helicopter support, including a pilot, mechanic, technical support, and on-site monitoring of bait drops during aerial baiting applications within the HMU, AAFB.

Conservation Benefit

The development and performance of aerial delivery system for BTS suppression, demonstrates the potential for meaningful impacts on BTS populations at the landscape level. Dropping aerial baits in the HMU will provide data and insight into BTS responses to aerial baiting over time. Aerial baiting increases the amount of landscape that can be targeted for BTS suppression and control. Landscape level control would likely improve JRM conservation efforts in support of the recovery of listed species on JRM lands and assist with interdiction efforts.

FY21 Status

- Funded via an interagency agreement with USDA –WS; project ongoing
- 14-month delay between February 2020 and April 2021 due to COVID
- Six (6) treatments, eighteen, (18) applications since September 2018: >110,000 baits deployed (Figure 33)
- Six (6) applications, April 2021 and June 2021: 39,600 baits deployed
- Aerial Delivery System performs to specifications.
- Further three (3) drops proposed for November or December 2021
- No Cost Extension until July 2022

EPR: 1 RP JRM BTS Eradication and Control to Support Recovery of ESA-Listed Species; 61128NR202

2019 JRM INRMP Reference: TIS-1, TIS-2, TIS-3; 5-85, 6-43; 7-52, 8-50-51, 9-71

Figure 33. USDA-WS deploying brown treensnake baits over AAFB Habitat Management Unit. Photo U.S. Navy.

Habitat Management Unit Biomonitor Support and ESA-Listed Species Identification Training

Location: AAFB **Period of Performance**: JAN20 – JUL2021

Project Objective

To provide biomonitor support during aerial baiting project by the ADS, to observe for presence of Mariana Fruit Bat (*Pteropus mariannus mariannus*, Fanihi) and observe for take.

Conservation Benefit

Allow for the continuance of the ADS project while monitoring for the presence of fanihi per requirements of the 2018 HMU ADS Biological Opinion.

FY21 Status

- Agreement via the CESU network with UOG – Center for Island Sustainability (CIS).
- Zero (0) bats observed over six (6) scheduled drops, April and July, 2021
- Refresher trainings for ESA-listed species surveys conducted with 10 attendees from field support staff.

EPR: 1 RP JRM BTS Eradication and Control to Support Recovery of ESA-Listed Species; 61128NR202

2019 JRM INRMP Reference: TIS-2, TIS-3; 5-85, 6-43; 7-52, 8-50-51, 9-71

Evaluating the Effect of Bait Size and Species on Removal of Brown Treesnakes That Are Not Susceptible to ADS Control

Location: AAFB **Period of Performance:** JUL2020 – JAN2020

Project Objective

The project will evaluate a multi-tool/multi bait approach to eradicating a small, known population of BTS in the Closed Population (Closed Pop) area on AAFB. The project will use a phased approach continuing with replicating aerial baiting (suspending baits form vegetation); adding a perimeter of larger rodent and bird baits in bait tubes; and use live bird and rodent lures. The baits will have transmitters to track the fate of the snakes. The same approach will be taken within the interior of the Closed Pop to analyze for any spatial effects. As the population of BTS within the Closed Pop is known, following the impacts by the multi-tool approach to provide useful data towards improving BTS suppression and eradication within enclosures.

Conservation Benefit

Aerial baiting can distribute bait across the landscape quickly, but we still do not have enough data to state conclusively if eradication is achievable. Aerial baiting is the only method used to attempt suppression/eradication of BTS in the HMU. Data projections indicate aerial baiting alone may not be enough to meet the goal of eradication. This is, in part, due to a sub-set of the BTS population not consuming bait (too small/too large). The ability to better target all size classes of BTS with a complex of control tools could help achieve eradication within enclosures but also may provide a substantial benefit to recovery of listed species by severely suppression the population to allow population recruitment to stay ahead of predation.

FY21 Status

- Funded via an interagency agreement with USGS-FORT.
- Continuation of previously funded simulated aerial baiting 2018-19.

- Data collection is ongoing with two treatments complete so far.
- Population continues to decline over time for ~120 BTS to ~9-15 BTS

EPR: 1 RP JRM Brown Tree Snake Eradication and Control to Support Recovery of ESA-Listed Species; 61128NR202

2019 JRM INRMP Reference: TIS-2, TIS-3; TPS-6, 5-85, 6-43; 7-52, 8-50-51, 9-71, 9-77

'd' indicates start of live trapping.

Monitoring of Reduction in Brown Treesnake Abundance during Eradication Activities in the HMU and Evaluation of Alternative Ground Baits for Large Brown Treesnakes

Location: AAFB **Period of Performance:** SEP2019 – MAR2021

Project Objective

To continue monitoring BTS population levels after a series of 12 aerial bait drops within the HMU and continue monitoring populations before, during, and after the next proposed series of drops. Abundance of BTS will be measured through analysis of non-toxic bait take, cameras captures. The camera captures will help determine abundance and potential size-class of BTS less susceptible to aerial baiting. Captured BTS in the HMU will be radio-tagged and tracked for a known-fate component. A bait trial for large BTS will be conducted to help assess the need for alternative baits for BTS not attracted by standard baits, and well-water is being monitored for acetaminophen percolation.

Conservation Benefit

To increase effectiveness of large BTS control that currently have limited susceptibility to aerial bait application to enhance and restore habitat, and to assist in potential reintroduction of ESA-listed species to the wild on Guam. Determining the level of impact from landscape scale BTS control is an essential requirement to evaluate success and future investment when considering species restoration on Guam.

FY21 Status

- Funded via an interagency agreement with USDA –NWRC.
- Take rate before COVID break 5%; rates rose to 20% during COVID break.
- Camera platform accurate estimation of size of BTS “captured” in image.
- No detection of acetaminophen in ground water.

- Project period of performance extended to February 2022.

EPR: No EPR - funded under the Guam Micronesian Kingfisher MOA and EPR: 1 RP JRM Brown Tree Snake Eradication and Control to Support Recovery of ESA-Listed Species; 61128NR202

Assessment of BTS Fates after Toxicant Delivery to the Habitat Management Unit

Location: AAFB **Period of Performance:** APR2020 – OCT2021

Project Objective

To determine the fate of known BTS previously captured and marked with scale-clipping or radio transmitters. Two groups of BTS will be capture and will have radio transmitters surgically implanted. Individuals were followed before and after a series of aerial baiting treatments in the HMU on AAFB. Data based on survivorship and demographics to be analyzed and compared to previously collected data from previous iteration of this project, 2018-2021.

Conservation Benefit

Determining size-based susceptibility is essential for developing accurate demographic models to help inform suppression and eradication techniques. Moreover, identification of whether there is an upper threshold in susceptibility to aerial baiting exists for large individuals will inform development of BTS management strategies i.e., using other tools in combination with aerial baiting. Understanding the proportion of known individuals that are targeted by toxicants and their demographics prior to a toxicant drop is essential for methodological refinement and informing other suppression efforts. Understanding individual variation in susceptibility to aerial baiting is also vital to prescribing toxicant application at an intensity and frequency that will result in effective suppression or eradication of BTS.

FY21 Status

- Funded via an interagency agreement with USGS – Fort Collins.
- COVID delays reduced number of data points collected due to suspension baiting.
- 86% of tracked BTS survived aerial baiting treatments for April and July 2021.

- Size effect detected, smaller BTS (SVL < 1136) showing higher death rate (Figure 36).

EPR: 1 RP JRM BTS Eradication and Control to Support Recovery of ESA-Listed Species; 61128NR202

2019 JRM INRMP Reference: TIS-2, TIS-3; 5-85, 6-43; 7-52, 8-50-51, 9-71

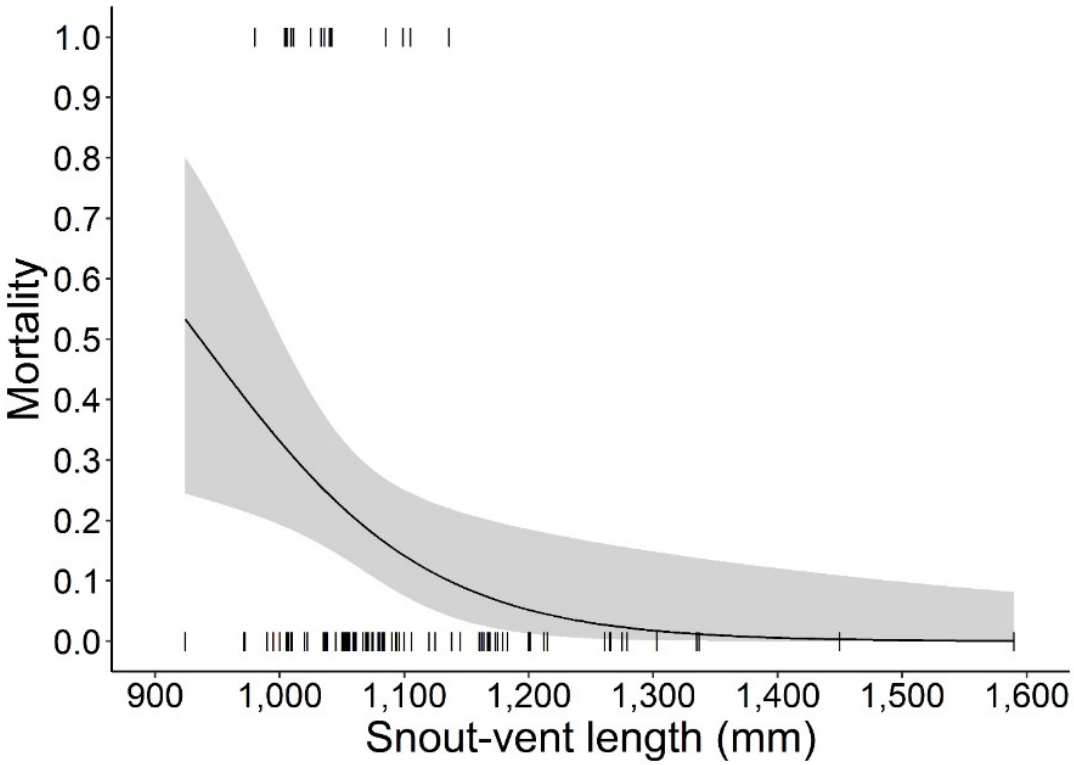

Figure 36. The effect of snout-vent length (SVL) on BTS (N = 89) mortality probabilities (black line) surrounded by 95% confidence intervals (gray band) during the 2-week treatment periods for Treatments 3, 4, and 5 on AAFB, Guam, USA. Tick marks indicate the snout-vent length of individual radio-tagged snakes that survived (0.0) or died (1.0) during the treatment periods. Note the pronounced decline in mortality of snakes from 1,000 to 1,150 mm SVL and the overall low mortality for individuals greater than 1,150 mm SVL. Snakes ranging from 980-1136 SVL (N = 16) died during treatments and all snakes greater than 1,136 mm SVL (N = 26) survived.

Monitoring Demographic and Ecological Effects of Sustained Automated Delivery System Treatment in the Habitat Management Unit

Location: AAFB **Period of Performance:** APR2020 – NOV2021

Project Objective

The project seeks to evaluate visual searching along minimally cleared transects versus trackless areas within 5 sub-plots of the HMU and compare visual searching versus bait tubes and camera surveillance as a low-density monitoring tools for BTS and monitor demographic change in encounter frequency of BTS during visual searches before and after aerial baiting in the HMU.

Conservation Benefit

Monitoring for BTS after aerial baiting is an important method for evaluating impacts to a target population of snakes. Assessing and using effective monitoring tools for targeted BTS populations and their small mammal prey (rodents) are important for adaptive management. Rodent prey have been determined to have strong effects on efficacy of snake suppression; monitoring their populations is likely to improve efficacy of individual landscape-scale level applications. Improved demographic information and levels of suppression will inform future conservation efforts for listed species on Guam.

FY21 Status

- Funded via an interagency agreement with USGS – Fort Collins.
- Captures per unit effort (CPUE) declined at similar rates across all sub-plots (Figure 37).
- Visual surveys and bait tube takes correlate strongly as means of detecting declines in BTS population after baiting.

- Sub-sampling will be effective for monitoring.
- No significant rodent detections.
- Data from April and July 2021 drops not available at this time.

EPR: 1 RP JRM BTS Eradication and Control to Support Recovery of ESA-Listed Species; 61128NR202

2019 JRM INRMP Reference: TIS-2, TIS-3; 5-85, 6-43; 7-52, 8-50-51, 9-71

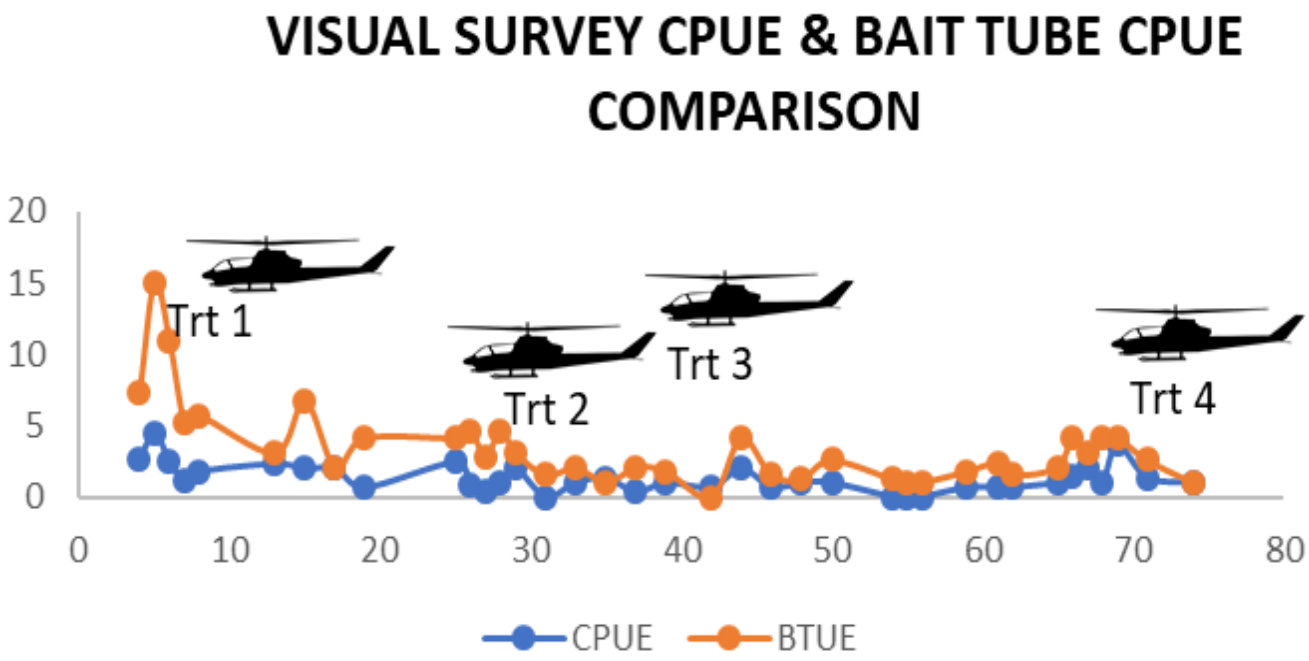

Figure 37. Catch-per-unit effort (CPUE) for nocturnal visual surveys (blue) and bait tubes (orange) over time (when both methods occurred within the same week). Automated Delivery System (ADS) treatment events are depicted with arrow. CPUE of bait tubes was much greater than CPUE from visual surveys. The correlation between the two sampling methods was strong and significant ($r = 0.731$; prob > $|r|$ = <0.0001).

Artificial Toxic Bait for Landscape-scale Brown Treesnake Suppression: Refinement and Capacity

Location: AAFB **Period of Performance**: SEP2020 – FEB2022

Project Objective

This project will further develop the program for artificial BTS bait production (Figure 38) focusing on improving efficacy, automate production, and increase capacity for bait production and testing. Other objectives include evaluating the form of the bait for production, how to integrate acetaminophen into the bait, integration of artificial bait into bait cartridge assembly, scaling up production, how to deter invertebrates, establish a testing facility to trial formulations, and testing genetic susceptibility of birds to acetaminophen (enzyme testing). This project will collaborate with experts from USDA-ARS; the Oak Ridge Institute for Science and Education (ORISE), NWRC Hawai'i; and researchers at Clemson University, South Carolina.

Conservation Benefit

Further development and improvement of artificial bait to replace the standard dead neo-natal (DNM) mouse is an important technological goal. It will reduce overall cost and maintain the same level of impact to BTS populations as the DNM. If the bait component of the aerial bait cartridge can be achieved, cost savings would keep costs lower but potentially increase the amount of landscape that covered by toxicants. Aerial baiting on a landscape scale is an important tool that can support recovery goals for listed species in Guam.

FY21 Status

- COVID restrictions limited USDA-ARS efforts related to scaling bait production.
- To scale capacity and efficiency specialized equipment may be necessary.
- Data collection for genetic susceptibility, invertebrate deterrence, is ongoing.
- Facility is online for lab grade testing.

EPR: No EPR - funded under the Guam Micronesian Kingfisher MOA

Comparing Take of Mice and Artificial Brown Treesnake Baits from Operational Bait Tubes and Extension of Brown Treesnake Threat Reduction Monitoring in the Habitat Management Unit

Location: AAFB **Period of Performance:** SEP2020 – FEB2022

Project Objective

The project will conduct an evaluation incorporating artificial baits with camera verification of species taking baits. Bait tubes will be in current operational locations on AAFB. Alternating dead neo-natal mouse (DNM) baits and artificial bait will be deployed in the same transect. Cost savings will be evaluated by comparing the traditional operational schedule (every 2-3 days) while replacing artificial baits every 14 days. Metrics will be, a) cost per tube per unit time, including costs of bait acquisition, preparation, and deployment; and b) cost per bait consumed by a snake. The project will characterize the level of non-target bait takes for both DNM and artificial baits by identifying species and frequency of take with cameras. The project also supports further camera-based data collection in the HMU post aerial baiting.

Conservation Benefit

Previously funded artificial bait studies have confirmed their attractiveness to BTS and can be produced at a lower cost than purchasing DNM. Past testing has been in controlled environments or in limited field trials. Directly testing bait in an operational setting and with DNM mice as alternative will help provide greater certainty of viability for artificial baits. The operational use of artificial baits has the potential to reduce cost if aerial baiting is scaled-up and support other operational uses of acetaminophen-based toxicant. The use of acetaminophen-based toxicant is an important tool for managing BTS on a landscape scale to support recovery goals for listed species on Guam.

FY21 Status

- Funded via an interagency agreement with USDA-NWRC.
- Potential quality control problem with artificial bait separating after sealed in pouch.
- Artificial baits last longer in the field but appear less attractive.
- DNM changed every 2-3; artificial bait every 14 days or when taken.

Using Brown Treesnake Behavior and Movement to Refine Control on AAFB & for Improved Management of Native Forest Birds

Location: AAFB **Period of Performance:** SEP2019 – MAR2021

Project Objective

This project seeks to understand movement pathways and habitat preferences of BTS on AAFB with abundant prey present, estimate abundance of BTS in relation to resources important to birds, and conduct known-fate evaluation of BTS susceptibility to control based on size, sex, and food preferences of snakes. This project is one of four projects that, collectively, will further develop information on BTS behaviors related to predation and movement in the presence of abundant avian species.

Conservation Benefit

Better understanding of hotspots of BTS activity, travel pathways, and decision-making during foraging are critical to improve the coverage and efficacy of BTS control in a cost- effective manner Knowledge of BTS movements and behaviors can help determine BTS management strategies for maximizing snake suppression within critical conservation and transportation sites. The anticipated products include recommendations for spatial locations of control arrays to support cost-effective control of BTS on AAFB or in conjunction with future restoration projects.

FY21 Status

- Funded via an interagency agreement with USGS –Fort Collins
- 1172 trees marked and surveyed – Casurina and Ficus species had highest capture per unit effort for BTS.
- 230 BTS captured and tagged, 95 unique recaptures.
- Potential impact of artificial light added to analysis for new PoP.
- Some moderate habitat separation by BTS and Sali.
- Period of performance extended through February 2023.

EPR: No EPR - funded under the Guam Micronesian Kingfisher MOA. Refunded through 1 RP JRM Brown Treesnake Eradication and Control to Support Recovery of ESA-Listed Species; 61128NR202.

Paired study plots include two forest edge plots (green text boxes; Plot A, predicted high snake abundance; Plot C, predicted low snake density) and two interior plots (blue text boxes; Plot B, predicted high snake abundance; Plot D, predicted low snake density). Catch per unit effort is included at the plot level

Tracking Movement of Micronesian Starlings and Brown Treesnakes on AAFB with an Automated Telemetry Tracking Network

Location: AAFB **Period of Performance:** SEP2019 – MAR2021

Project Objective

The goal of this project is to track the movement of Micronesian starlings (*Aplonis opaca*, Sali) and BTS on AAFB to identify areas of high use and routes of transit through a network automated telemetry towers, and to document areas where BTS and Sali may interact. This project is one of four projects that, collectively, will further develop information on BTS behaviors related to predation and movement in the presence of abundant avian species.

Conservation Benefit

Tracking animals across the landscape over time can provide important information on habitat selection, resource needs, and factors influencing distribution and density. For a predator such as BTS, tracking movement can provide information on hunting patterns, dispersal potential, and identify areas that may be particularly susceptible to predation. Overlapping simultaneous movement from both predators and their prey can help identify areas of greatest contact, which may vary spatially and temporally. Additionally, population demographics that could be useful for supporting future avian restoration projects and controlling BTS in low density with competing food sources in the presence of control regimes.

FY21 Status

- Funded via an interagency agreement with USGS –PIERC
- 85 network nodes arrayed across the landscape, eight base stations collect data
- Good data collection for Sali, problems with tags for BTS
- More data needed to improve analytic software
- Period of performance renewed through July 2022.

Evaluating and Reducing Brown Treesnake Predation Threat in Urban Micronesian Starling Habitat

Location: AAFB **Period of Performance:** SEP2019 – MAR2021

Project Objective

This project will evaluate BTS control tools for suitability and efficacy in urban habitat, and use camera monitoring to index the decrease in Micronesian starling (*Aplonis opaca*, Sali) predation threat following snake removal. BTS suppression will occur in experimental high and low snake density plots and monitor the relative abundance of BTS via contact rates with baited camera devices. This project is one of four projects that, collectively, will further develop information on BTS behaviors related to predation and movement in the presence of abundant avian species.

Conservation Benefit

Studies have indicated that snakes in the AAFB housing area have a detrimental impact on Micronesian Starling survival in all age classes. Snakes in urban areas also constitute a greater risk for accidental export of live snakes to other vulnerable regions because of routine shipments of household. Additionally, research has shown that very large snakes, which pose the greatest predation and reproduction risk, are more often found in urban areas. Contact rates can be interpreted as an index of relative abundance and as a proxy for the residual level of predation threat posed by BTS in snake-suppressed areas. Traditional tools for estimating BTS density and relative abundance are costly and impractical for long-term and broad-scale monitoring (e.g., mark-recapture) or provide no information on the snake (e.g., DNM bait tubes).

FY21 Status

- Funded via an interagency agreement with USDA –NWRC.
- Phase I: Non-toxic bait deployment.
- 482 baits with radio transmitters deployed: 20 baits taken by BTS (4.1%).

- Phase II: Toxic bait deployed in high/low BTS density areas and concentrations of Sali nest boxes.
- 16,000 deployed, 289 (1.68%) baits taken by BTS.
- Indications that acetaminophen is safely deployable in urban areas.
- Period of performance renewed through February 2023.

Replacement and repair of the USGS Closed Population Mesh to Maintain Viability as a Study Site for Brown Treesnake Management

Location: AAFB **Period of Performance:** JUL2020 – DEC2021

Project Objective

The goal of this project is to replace the mesh on the USGS Closed Population unit on AAFB. The mesh has decayed beyond the point where patching and painting can sustain the integrity of the barrier. This increases the risk of BTS movement through the barrier both ways and thus, impacting ongoing data collection. The project will replace the entire outer mesh material, as well as use and anti-rust coating for the mesh and internal chain-link fence.

Conservation Benefit

The USGS Closed Population facility was constructed in 2004 and functions as a study site to improve understanding of the effects of ungulate exclusion, BTS control tool efficacy, BTS behavior under controlled condition, and numerous other studies that have helped refine implementation of management programs for BTS. The loss of the Closed Population as an operational site would eliminate the only study plot that is large enough to replicate approximate conditions for understanding landscape-level condition but small enough to conduct projects under controllable conditions and enumerate the BTS population. Such long-term project management and data collection allows for in depth understanding of the effects of BTS control tools and methods.

FY21 Status

- Funded via an interagency agreement with USGS –FORT.
- Primarily will replace the mesh and coat with anti-rust treatment.
- Contract awarded for fence refurbishment starting September 2021.
- Anticipated completion December 2021.

EPR: No EPR - funded under the Guam Micronesian Kingfisher MOA.

2019 JRM INRMP Reference: TIS-2, TIS-3; TPS-6, 5-85, 6-43; 7-52, 8-50-51, 9-71

Optimized Monitoring for Brown Treesnakes

Location: Washington State/Guam **Period of Performance:** APR2020 – OCT2021

Project Objective

This project will simulate the movement of snake populations under various ecological conditions and the interactions based on available data from previous USGS-FORT studies. The project will develop a simulation and analytical framework that will analyze detection data from different monitoring strategies; evaluate the resulting estimates of monitoring metrics; and plot efficiency against cost, with cost data developed from a cost model informed by estimated labor and materials costs associated with BTS monitoring programs. The project will also gather data from a controlled-environment study looking at PIT tag readers as a means for identifying known snakes (PIT tagged) pre- and post-aerial baiting as a means for monitoring.

Conservation Benefit

Developing improved, refined monitoring methods is an important goal to help increase confidence in outcomes for landscape-scale management for BTS. Monitoring goals might include determining the density of BTS, the presence of BTS, or identification of characteristics of individuals that have evaded ongoing management effort. The ability to monitor suppressed BTS populations will be critical in determining success for reintroduction of avian populations. Low-cost monitoring or robust population models can reduce costs and improve outcomes for propose reintroduction programs.

FY21 Status

- Funded via an interagency agreement with USGS-CRU.
- Testing of modified PIT tag reader conducted at USGS-FORT, Potts Junction.
- Analysis of data is ongoing with some emphasis on standardizing the data and analytical parameters e.g., time, size class.

Trial Restoration and Probabilistic Evaluation of Vertebrate Reintroduction Techniques Using Species Traits in a Barrier Undergoing a Brown Treesnake Eradication

Location: AAFB **Period of Performance:** SEP2020 – FEB2022

Project Objective

The project seeks to develop a conceptual demographic model for reintroduction strategies. Using three unlisted native lizard species *Nactus pelagicus* (Pacific slender-toed gecko), *Perochirus ateles* (Micronesian saw-tailed gecko), *Gehyra oceanica* (Oceania gecko) the objective sis develop a predictive response model to BTS predation based on species traits e.g., reproduction, habitat preference, behaviors, sensitivity to predation, etc. Once a model is built, a release strategy will be developed for hard and soft releases in plots controlled and uncontrolled for BTS. Success to be defined under the following two criteria: evidence of reproduction (juvenile lizards detected) and persistence of the species > 6 months following release.

Conservation Benefit

For reintroductions to occur, managers on Guam will need to understand if species 1) require snake eradication to establish or what level of suppression is required for establishment to occur; and 2) snake abundance thresholds that support persistence of prey species. Some of these metrics are likely to be dependent on the desirability of the species as a prey item and therefore their sensitivity to snake abundance. The use of native lizards presents a relatively safe species to study and inform decisions. In a system with numerous unknowns, their benefits include only small areas to establish populations, are not a federally listed species, have species with high variation in sensitivity to BTS predation, and furthermore may be used as a monitoring metric/tool to evaluate BTS suppression actions and inform reintroduction goals.

FY21 Status

- Funded via an interagency agreement with USGS – Fort Collins.
- Start delayed by COVID.
- Gecko demographic modeling in progress.
- Gecko release into Closed Population and control site expected Sept-Nov 2021.
- No substantive data to report at this time.

EPR: 1 RP JRM Brown Treesnake Eradication and Control to Support Recovery of ESA-Listed Species; 61128NR202

Developing a Framework for Coordinated Management of Vertebrate Restoration and Brown Treesnake Control on Guam

Location: JRM **Period of Performance:** SEP2019 – MAR2021

Project Objective

This project consisted of developing a decision-analytic framework to guide coordinated BTS control and vertebrate species restoration in Guam. The project brought together a group of subject matter experts to collaborate in building a decision model. The group were from management agencies, regulators, stakeholders, and scientific experts and used a workshop model to together for the purpose of framework development.

Conservation Benefit

This is an indirect way towards operational management decisions through a decision analysis process to engage in a more robust planning phase. This can include prioritization, management application, problem solving, evaluate specific action, and collaboration to manage long-term, costly complex conservation problems. The process should help reduce real-time problems and provide a more structured approach to addressing conservation challenges.

FY21 Status

- Funded via an interagency agreement with USGS – CRU: Washington University Extension.
- Group members from DoN; CNMI DLNR; USFWS; USGS; UoG; DAWR; The Nature Conservancy; Massey University, New Zealand
- Project complete, final report pending – September 2021
- Phase II funded to focus on specific sites and species.
- New Period of Performance September 2021 – March 2023

EPR: 1 RP JRM Brown Tree Snake Eradication and Control to Support Recovery of ESA-Listed Species; 61128NR202

2019 JRM INRMP Reference: TIS-3; 9-72

Estimation of Brown Treesnake Predation Threat Thresholds for Persistence of Reintroduced Birds on Guam

Location: AAFB **Period of Performance**: SEP2019 – MAR2021

Project Objective

To evaluate the levels of snake suppression that might enable persistence of reintroduced birds under some acceptable level of BTS predation. It is unknown what snake density is tolerable when considering the reintroduction of avian species. The project will simulate nest contact rates with cameras and model the levels of nestling mortality that can be sustained while maintaining a stable or growing population of birds.

Conservation Benefit

It is widely recognized that eradication of BTS from Guam is not currently achievable; however, severe suppression is viewed favorably. Through considering avian species persistence in the presence of a suppressed BTS population it may help facilitate reintroductions in areas where management can be sustained and supported allowing for limited recovery of extirpated species.

FY21 Status

- Funded via an interagency agreement with USDA –NWRC
- All bird species would recover without BTS present; potentially up to 10 years to reach stability.
- All bird species recovery vulnerable to BTS presence at differing level, favoring larger birds; no other limiting factors considered.
- Significant initial suppression with long-term active management required.
- Project complete.

EPR: No EPR - funded under the Guam Micronesian Kingfisher MOA.

2019 JRM INRMP Reference: TIS-2, TIS-3; 5-85, 6-43; 7-52, 8-50-51, 9-71

Boxplots display the quantiles and range of output from 200 simulated populations. (a) Annual growth rate was calculated in four consecutive five-year intervals (e.g., 0-5, 6-10 years). (b) Annual fertility (number of young fledged per year), (c) net reproductive rate, (d) life expectancy (in years), (e) generation time (in years), (f) survival probability to adulthood (black outline) shown together with survival probability to first reproduction (color-coded outline), and (g) age of first reproduction (in years).

Feral Dog and Cat Control and Management on NBG and NMS

Location: NBG **Period of performance:** SEP2020 – SEP2021

Project Objectives

- Commence live trapping of target feral animals (roadside)
- Develop efficiencies of trapping activities

Conservation benefit

Control of invasive species includes wild, free-roaming or feral animals (dogs and cats) that directly or indirectly impact native species or their habitats

FY21 Status

In FY19, trail camera studies were conducted to determine population of feral dogs and cats on NBG and NMS, determining population estimates. An Implementation Plan for Feral Dog and Cat Control on NBG Lands was completed in 2020. USDA-WS began conducting control operations in fall 2020 within Zones established during population studies (trail camera studies) completed in 2019. A total of four (4) trapping sessions were completed, with each trapping session having 280 trap nights (20 traps over 14 nights). A total of nine (9) feral dogs and five (5) feral cats were removed from the NMS during FY21 control operations (Figure 49). Open property boundaries allow continuous immigration of dogs and cats, however. Future efforts will focus on wetland habitats occupied by the Mariana common moorhen, to quantify and reduce potential stressors of the sensitive resource.

EPR: 61755NR358

2019 JRM INRMP Reference: TIS-2, TIS-3; 5-85, 6-43; 7-52, 8-50-51, 9-71

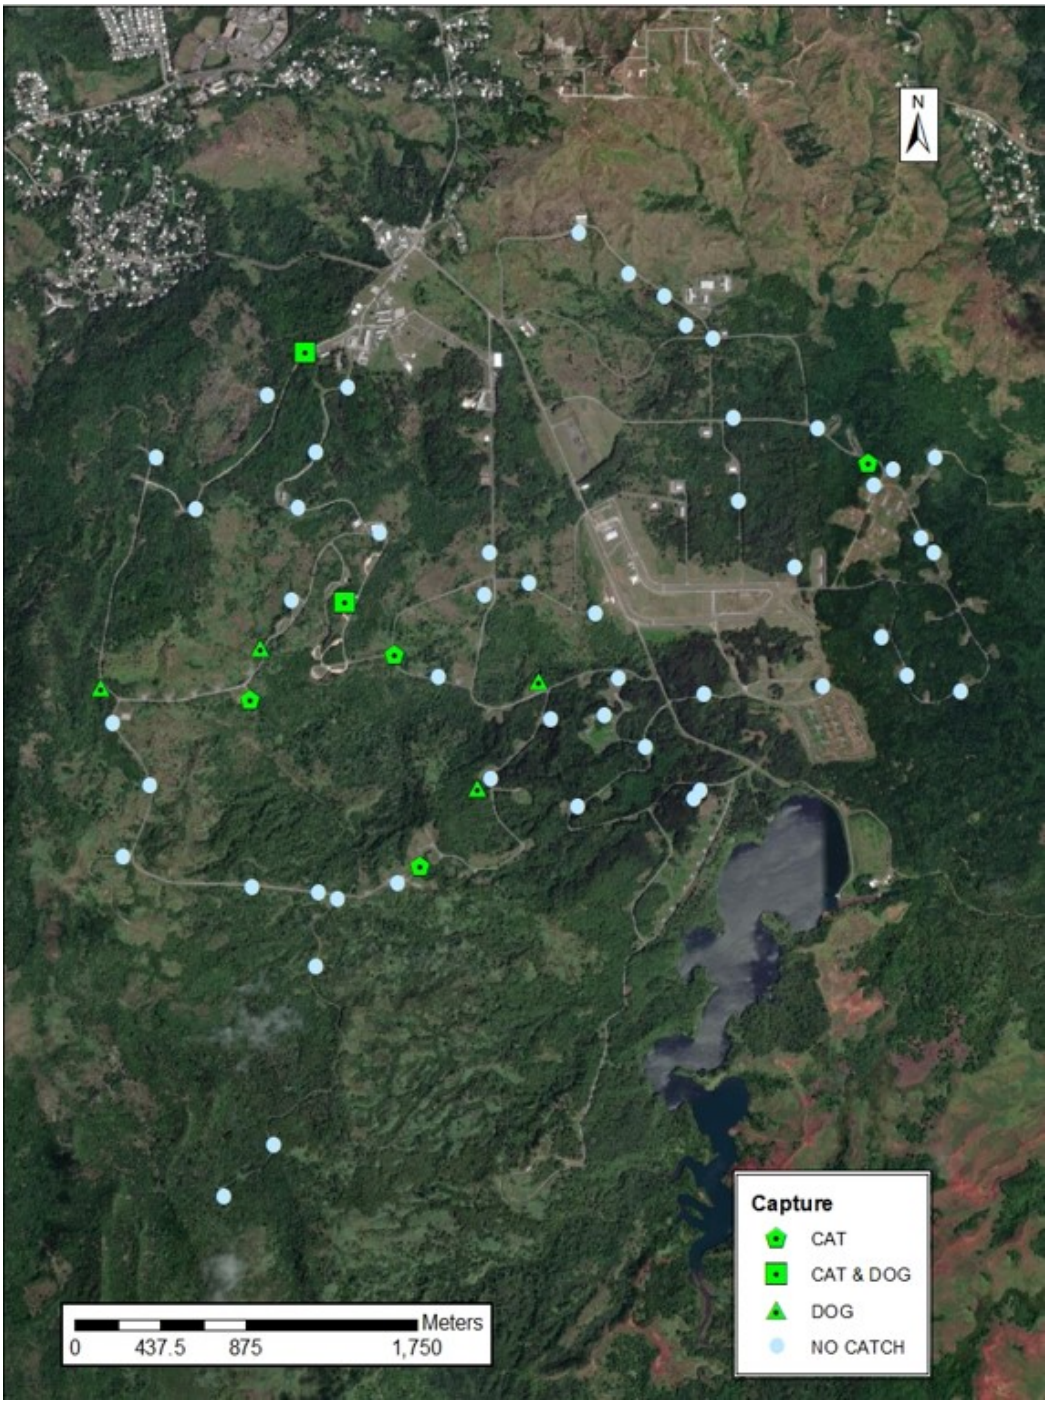

Figure 49. Locations of feral dog and cat removal on NMS.

Ungulate Management Population Control on NBG-Administered Lands

Location: NBG **Period of performance:** July 2021- December 2023

Project Objectives

- Following installation of ungulate fencing on NMS, work to eradicate ungulates within enclosures
- Conduct population control in at-large NBG-administered lands
- Sterilize Water buffalo (*Bubalus bubalis*, Carabao) on NMS to limit breeding

Conservation benefit

Enhance and restore native habitats and increase populations of native species, particularly threatened and endangered species.

FY21 Status

The main goals of the ungulate management program are control, eradication and research related to feral pigs (Figure 42), Philippian deer and/or caribou on JRM AOR. Ungulates are controlled in unfenced areas and eradicated within fenced enclosures (no immigration). Additionally, carabou population control consists of sterilization of the male breeding population. Prior to 2018, periodic feral pig control operations were conducted by USDA-WS on NBG Main Base. In 2018, services were then contracted with White Buffalo Inc. (WBI) for NBG Main Base control and NMS ungulate fence #1 eradication. Construction of conservation fence #2 was not yet complete when WBI de-mobilized. In FY21, WBI was again contracted for a period of 18 months. Tasks include eradication in NMS fence #2 and fence #3 and #4 (construction not complete), additional control work on NBG Main Base, Polaris Point, as well as contracted services on AAFB.

EPR: 61755NR807

AAFB Invasive Plant Species Monitoring and Control

Location: AAFB **Period of Performance:**

Project Objective

Conduct surveys to document the spread of invasive plant species.

Conservation Benefit

Knowledge of which invasive species are dominant and most likely to spread further.

FY21 Status

- Resampling of 517 plots previously sampled in 2018.
- Plots are circular and 100 square meters in size.
- All trees with DBH >2cm, identified to species and measured for DBH. Trees <2cm identified to species, not measured for DBH.
- All herbaceous species identified.
- Species composition, density, and non-native to native percentages will be documented.
- Fieldwork complete and analyses is presently being performed.

Figure 51. Location of Vegetation Plots

Monitoring to Evaluate Effectiveness of HACCP Plan Implementation at Construction Sites

Location: AAFB, NBG, NBGTS, AAFB NWF **Period of Performance:** Multiple

Project Objective

- Long-term monitoring program for terrestrial vegetation to aid in evaluating the success of implemented HACCP plans.

Conservation Benefit

To minimize the spread and effects of invasive plant species due to construction activities.

FY21 Status

Ongoing previous FY contract awards for construction activities:

- J-755 Urban Combat Training
- P-103 Water Well Field
- P-295 Ordnance Ops
- P-715 Live-Fire Training Range Complex Known Distance Ranges
- P-735 Multi-Purpose Machine Gun Range

Newly awarded

- P-296 Ordnance Ops Admin Facility
- P-290 Earth Covered Magazines (MSA)
- P-103 Water Well Field (modification)

Completed previous FY contract awards for construction activities:

- J-001B Finegayan Utilities and Site Improvements Phase 1
- J-006 Apra Medical Clinic
- J-007 Waterfront Headquarters
- P-102 Power Upgrade Harmon

Results

- No new species recorded in Guam as a result of on-going construction activities

EPR: DPRI: Marine Corps Relocation 2017 amendment to 2015 BO, Conservation Measures to Minimize the Effects of Invasive Species.

NATURAL RESOURCES EDUCATION AND OUTREACH

Outreach and Education – NBG

Location: NBG **Period of Performance:** AUG2021 - AUG2022

Objectives

Develop, design, and produce custom outreach materials for use by Public Works EV and NBG to educate incoming military personnel, their families, and civilian employees on the importance of conserving and protecting natural resources on NBG and their role in acting appropriately to conserve threatened and endangered species. Outreach can be in the form of educational signs in sensitive areas, educational handouts such as brochures or calendars, and outreach events.

Conservation Benefit

Educational material provides military and civilian personnel and base visitors the ability to understand their role in protecting Guam resources. When NBG personnel are aware of sensitive resources, it not only protects those resources, but it also improves relationships among communities on and off base.

FY21 Status

For the past year, all NBG outreach activities have been organized in-house. This past fiscal year, NBG hosted the release of Shelly the sea turtle at GabGab beach (Figure 52 - 53), where she had been found and rescued in December 2019. Shelly was rescued by the Guam department of Agriculture and with the help of Underwater World she was brought back to full health. Shelly's release back into her home was attended by a group of military personnel who kept their distance to minimize stress to the turtle. Attendees learned about sea turtle rescue, rehabilitation and being proactive if they see

turtles in stress. The experience will promote interest in sea turtles amongst the young people present.

NBG also hosted a beach cleanup at Spanish Steps (Figure 54 - 55), which is the most active beach on NBG for sea turtle nesting during the nesting season. Due to the sensitivity of the location, participation was limited to Internal Navy Natural Resources personnel. The purpose of the cleanup was to maintain the beach and ensure that the movement of future hatchling turtles to Apra Harbor was not impeded by trash. The event was held in May 2021, during daylight hours when turtles are not actively laying eggs. All activity was limited to the beach area, and all participants were instructed to avoid going into the vegetation where turtle nests were potentially located. The result of the cleanup was the removal of 25 bags of trash.

A new outreach contract was awarded for the 2021 to 2022 fiscal year. The project is still in the planning phase. Once complete the outcome will be a new informational tide calendar for public distribution, and five (5) educational signs. The signs will cover; the Ecological Reserve Area, the purpose of the reserve area along with regulations and behavioral rules, and the locations of the reserve areas; Rip current safety for general awareness; Fishing regulations on NBG; Coconut Crab information and protection on Navy property.

Biosecurity Outreach and Education on Guam

Location: Various locations **Period of Performance:** SEPT 2020-SEPT 2021

Project Objective

The DON has initiated and will continue to implement a targeted, comprehensive outreach and education program for DoD and civilian populations for biosecurity focused on prevention.

Conservation Benefit

Minimize the effects of invasive species by educating DoD and civilian populations through prevention. Provide awareness of introduced and invasive species, the impacts of invasive species on native species and ecosystems, and what can be done to prevent and control invasive species.

FY21 Status

- FY20 Biosecurity outreach and education contract was awarded on 20 September 2020
- DON worked with Department of Agriculture Biosecurity division to link their homepage with social media ads
- Completed views exceeded the requirements of the PWS, except for the 30-second view requirements
- Social media efforts included Google ads in addition to YouTube, Facebook and Instagram
- FY21 Biosecurity Outreach and Education on Guam contract scheduled award date 15 September 2021
- DON to continue collaborating with Department of Agriculture Biosecurity division
- Project to incorporate recommendations obtained from FY20 Final Report in an effort increase overall reach and effectiveness.

- Placement of ads to run on a 24-hour cycle for 7-days a week rather than only during certain timeframes.
- Increase in view requirements for the 15-second ads and decrease in view requirements for the 30-second ads.

EPR: DPRI: Marine Corps Relocation 2017/2018 amendment to 2015 BO, Conservation Measures to Minimize the Effects of Invasive Species.

JRM Natural Resources Stewardship Outreach & Public Engagement Program

Location: JRM AOR **Period of Performance**: AUG2020 - AUG2021

Project Objective

To develop materials and training enabling JRM Natural Resource (NR) managers to effectively and efficiently implement a NR stewardship engagement program. This program aims to better educate uniformed and civilian staff, their dependents, JRM contractors, and the general public in order to improve NR stewardship and awareness within the AOR. The AOR includes DoD lands within Guam and the CNMI.

Conservation Benefit

The 2019 INRMP outlines JRM NR responsibility to reach as many uniformed and civilian staff, their dependents, and JRM contractors with focused, consumable environmental education and outreach. The development and production of NR education materials and training is a beneficial support to increasing awareness of T&E species, proper stewardship behavior, and threats to local ecosystems.

FY21 Results

- Swag materials produced
- Planned dissemination of swag materials throughout JRM AOR by DEC 2021
- Training and Outreach presentations created and delivered
- Project finalized AUG 2021

2019 JRM INRMP Reference: TEDU-1; 5-91, MEDU-1; 5-104

PACFLT Funded JRM Natural Resources Stewardship Outreach & Public Engagement Program

Location: JRM **Period of Performance:** SEP2020 - OCT2021

Project Objective

Improve NR stewardship and awareness within DoD lands within Guam and the CNMI

FY21 Results

- Planned expansion of outreach to CNMI
- Development of Stewards of the Sea branded sustainable products
- Continued implementation of Young Environmental Stewards (YES!) youth educational program
- Art contest for YES! logo
- Rash guards and stickers for YES! participants produced with logos from art contest

MIGRATORY BIRD MANAGEMENT

Migratory Bird Surveys on NBG-Administered Lands

Location: NBG **Period of performance:** AUG2020- JUL2021; ongoing

Objectives

Conduct monthly bird surveys on NBG-administered lands

Examine trends in abundance and habitat preference of migratory birds

Conservation benefit

To improve long-term understanding of species protected by the MBTA and their preferred habitats and migratory patterns, in support of military readiness, and to avoid and minimize impacts to migratory birds.

FY21 Status

Migratory bird abundance was monitored at 20 sites on NBG between August 2020 and July 2021, for a total of 265 in-house surveys. Twice monthly surveys are conducted from September through April; single surveys are conducted May-August. A total of 23 unique species were recorded from a total of eight (8) families (Table 2). Plovers, sandpipers and snipes accounted for 79% of all migratory birds observed. Pacific golden plovers *(Pluvialis fulva)* were the most abundant (49%). Abundance was higher October- April compared to May- September (Figure 56). Migrants used grass fields and paved surfaces more often than shoreline or wetland habitats; however, habitat use varied among species. Navy plans to continue conducting migratory bird surveys on NBG.

TERRESTRIAL HABITAT MANAGEMENT

Listed Plant and Invertebrate Surveys

Location: JRM **Period of Performance:** AUG2019- JUL2021

Project Objective

This purpose of this project is to conduct plant and invertebrate surveys and to implement management techniques to provide a conservation benefit to ESA-listed threatened and endangered species under the Endangered Species Act.

Conservation Benefit

Identifying locations of ESA-listed plant and invertebrate species will allow for management actions to reduce habitat fragmentation, enhance, and restore habitat, buffer protected areas, and implement new conservation strategies.

FY21 Status

- An FY21 MOD added locations to survey for ESA-listed plants and invertebrates in Andersen South and NBG for plant and invertebrate surveys as well as continue ongoing survey efforts on all JRM lands and other lands on Guam.
- *Tuberolabium guamense* surveys on non-DOD lands:
    - Surveys have been conducted for *Tuberolabium guamense* in support of the *Tuberolabium guamense* Species Action Plan (SAP), which was developed to increase our understanding of the range-wide status of the species, threats, and conservation actions that could lead to a potential change in the listing status. Surveys for *Tuberolabium guamense* have been conducted from November 2019 through July 2021 on non-DOD lands (primarily Government of Guam lands) at Bolanos Conservation Area, Mati Point, and the forested area near the Yigo Raceway (Table 3 and Figure 58).
- A total of 28,451 *Tuberolabium guamense* have been observed to date (Table 4).

Table 3. ESA-listed species recorded during non-DOD lands at the Bolanos Conservation Area, Mati Point, and the forested area near the Yigo Raceway from November 2019 through July 2021.

All Non-DoD

- ESA-listed species surveys on AAFB:
  - In October 2020 surveys at Tarague basin area near the CATM range began and are ongoing.
  - 404 acres surveyed through July 2021. *Cycas micronesica* (6,931), *Tabernaemontana rotensis* (218), *Partula radiolata* (5,670), and *Hypolimnas octocula mariannensis* (1034 eggs, 60 larvae, 30 chrysallids, and 9 adults) were found

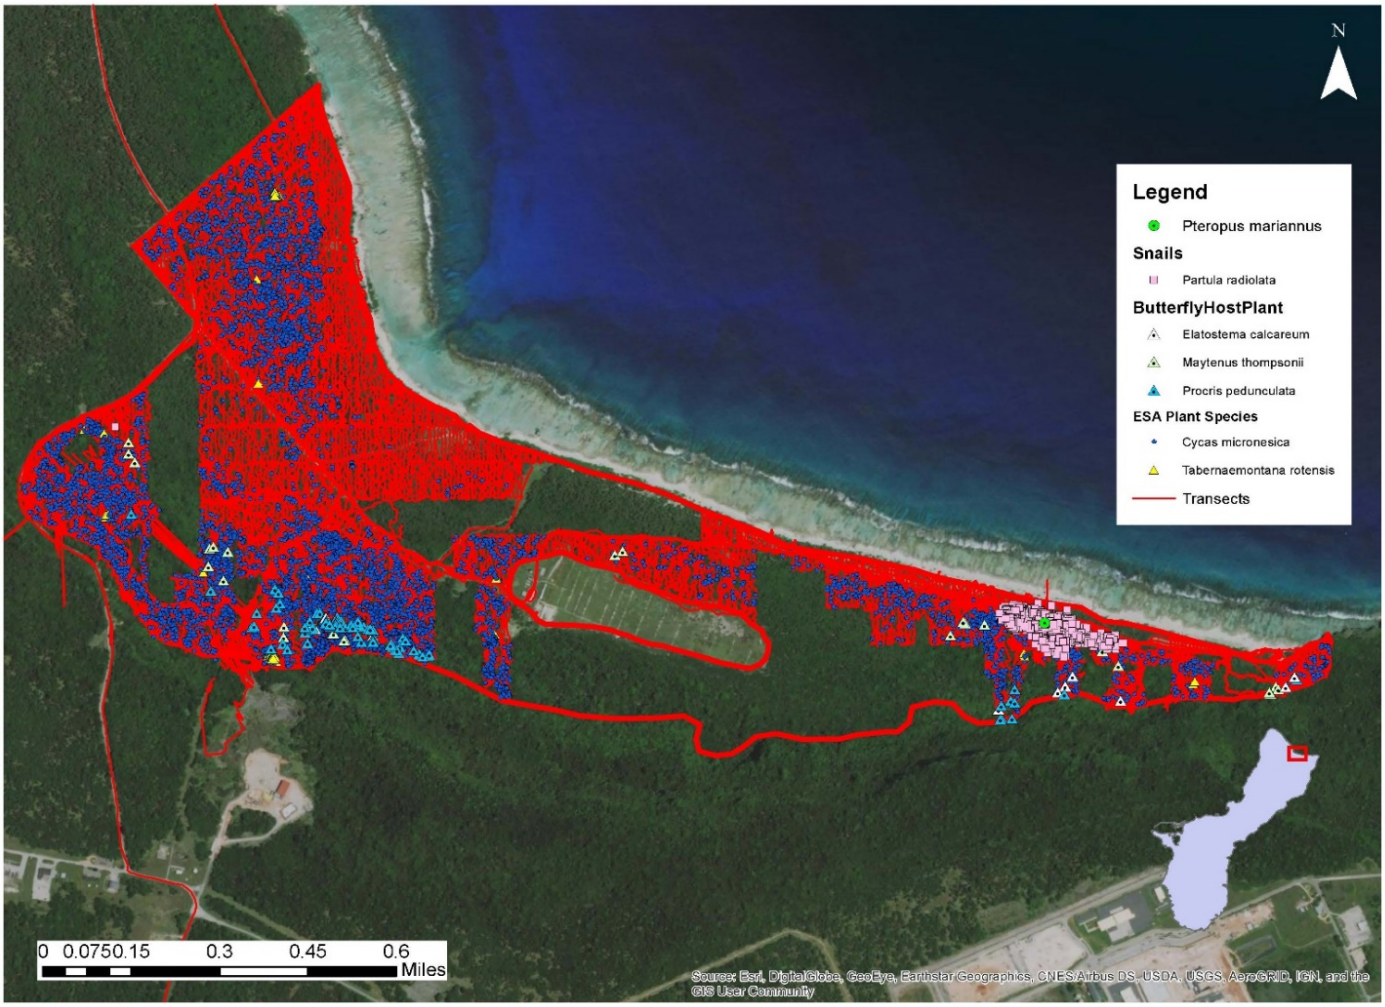

Figure 57. ESA listed species found through July 2021 at Taragüe basin near the CATM range.

- ESA-listed species surveys on AAFB (Northwest Field):
    - Transect surveys (10 m) for listed plants were conducted over approximately 1,285 acres from January 2020 through July 2021. A total of 662 mature *Cycas micronesica, Tuberolabium guamense* (17,527), *Dendrobium guamense* (24), *Tabernaemontana rotensis* (43) and *Bulbophyllum guamense* (176). Host trees were *Vitex parviflora*, *Meiogyne cylndrocarpa, Ficus prolixa, Aglaia mariannensis, Morinda citrifolia, Ficus tinctorial*, and *Ochrosia oppositifolia* (Figure 58). Three (3) *Elatostema calcareum* plants were found, but no ESA-listed larvae were observed. Surveys are still underway.

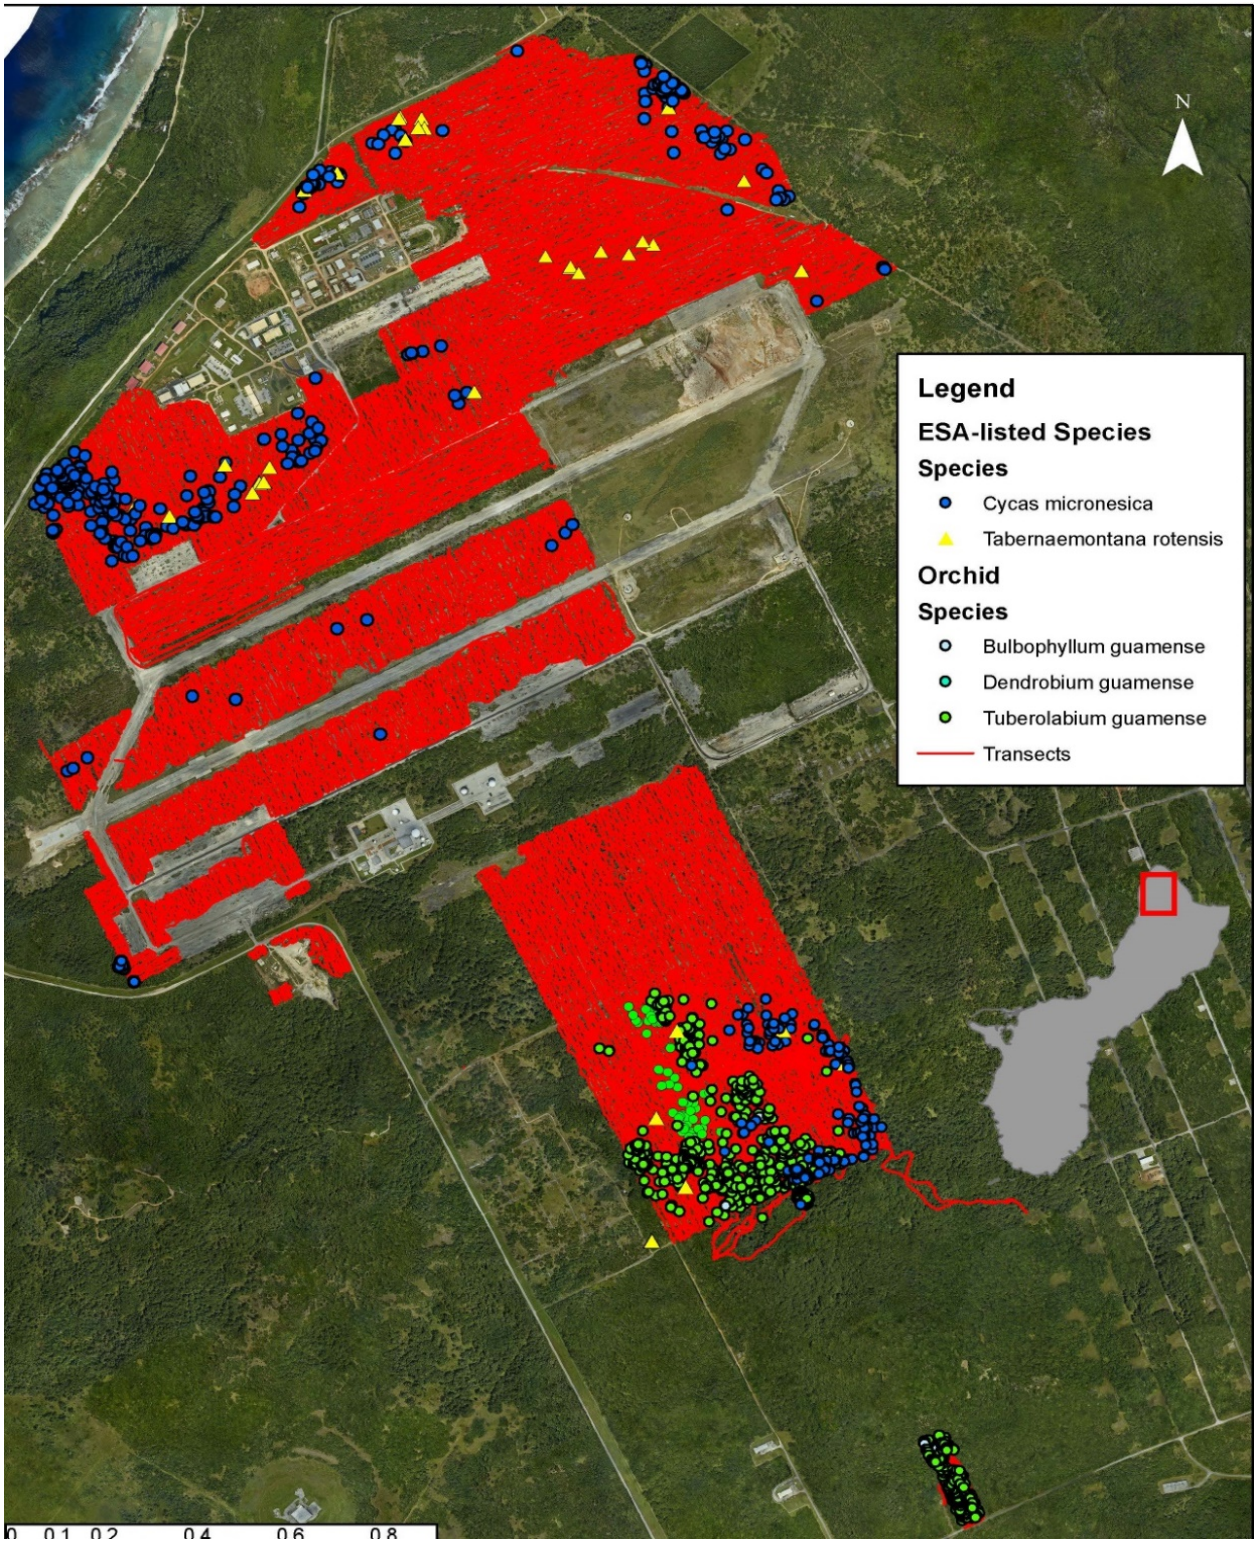

Figure 58. ESA-listed species found through July 2021 at Northwest Field

ESA-listed species surveys on NMS:

- Transect surveys are ongoing in the NMS (Figure 59). Forest types include Vitex and Ravine forests. From July 2020 through July 2021, 227 acres have been surveyed and the following ESA-listed species were found*: Bulbophyllum guamense* (5,113), *Cycas micronesica* (36), *Dendrobium guamense* (2,660), *Tabernaemontana rotensis* (2), *Tuberolabium guamense* (3,063*), Partula radiolata* (1), and *Samoana fragilis* (1,896) (Figure 59).
- Transect surveys in a separate 100-acre site on NMS are ongoing. Through July 2021 approximately 20 acres have been surveyed. ESA-listed species occurring in the area included*: Bulbophyllum guamense* (46), *Cycas micronesica* (35), *Dendrobium guamense* (18), and *Tabernaemontana rotensis* (10).

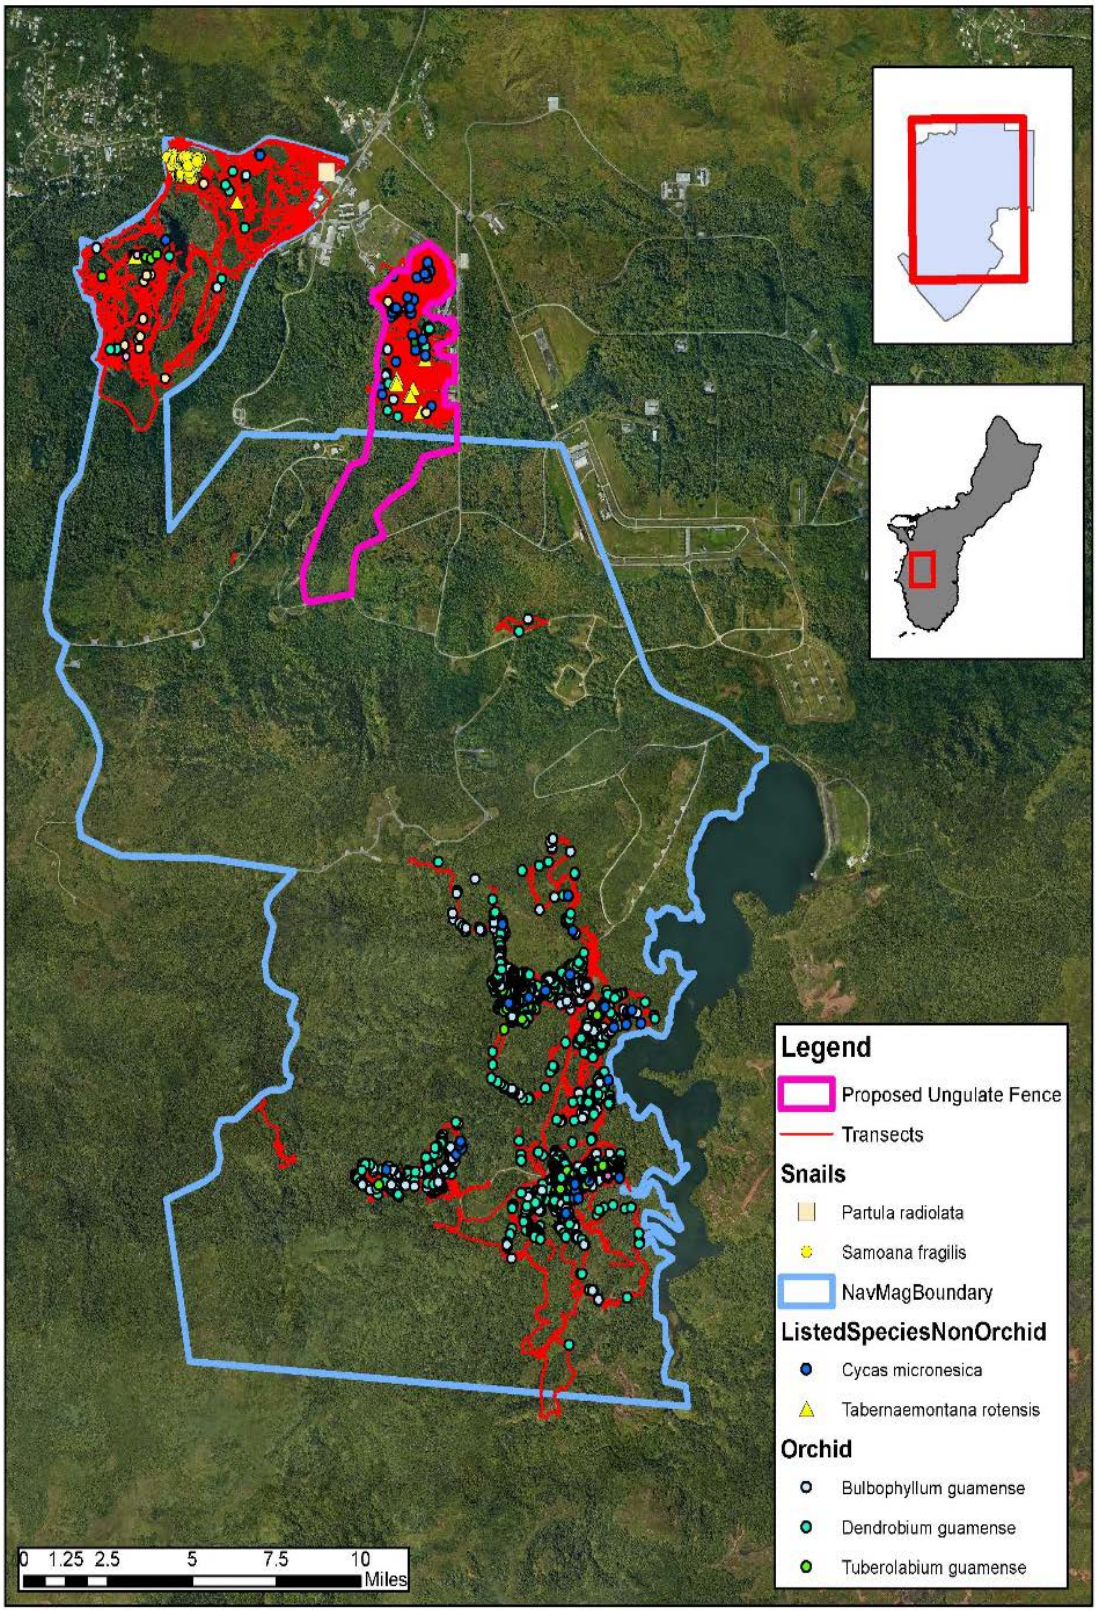

Figure 59. ESA-listed species found through July 2021 at NMS.

- ESA-listed species surveys on Andersen South (Figure 60):
    - About 400 acres have been surveyed in Andersen South. ESA-listed species found include: *Cycas micronesica* (43), *Dendrobium guamense* (2), *Tabernaemontana rotensis* (31), and *Partula radiolata* (150).

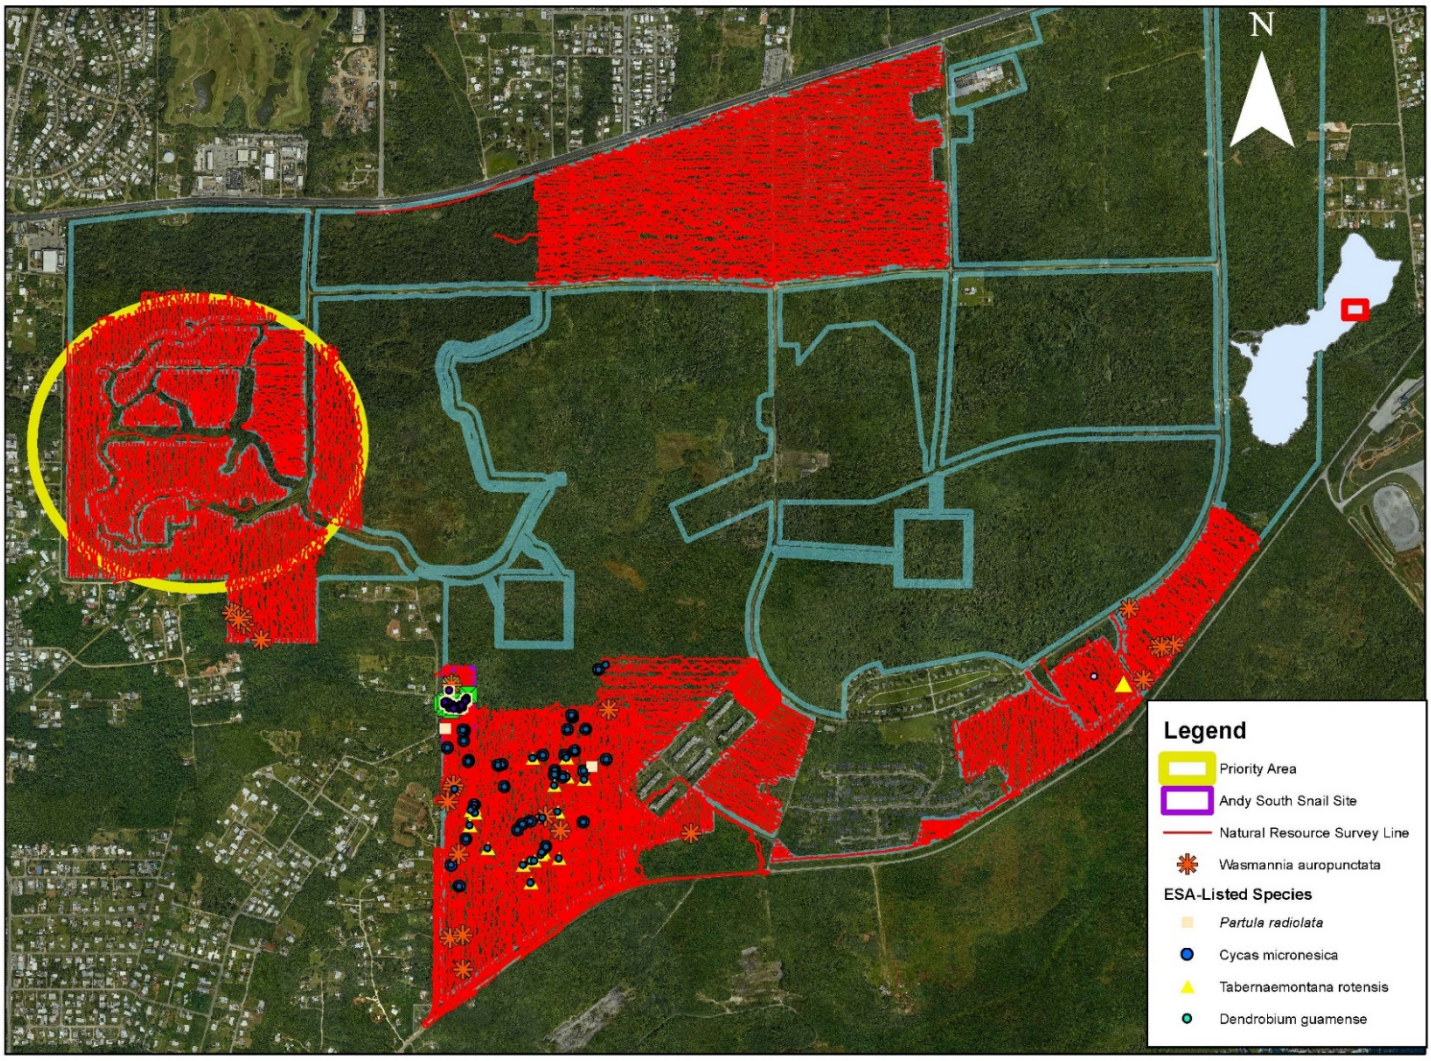

Figure 60. ESA-listed species found through July 2021 at Andersen South.

EPR: Listed plant surveys, Propagation, planting, and Establishment in the Wild; 61128NR209 and 1 S JRM AAFB - Monitoring and Surveys for Listed Tree Snails, Butterfly, Plants; M5240CN048

2019 JRM INRMP Reference: THM-2; 6-39, TPS-5; 9-77

Listed Plant and Invertebrate Surveys - NBG-Administered Lands

Location: NBG **Period of performance:** JUL2020- AUG2021

Project Objectives

- To collect baseline population, demographic and habitat data on ESA-listed plants, butterfly host plants, and treesnails (*Samoana fragilis*, *Partula gibba* and *Partula radiolata)*

Conservation benefit

Identifying locations of ESA-listed plant and snail species will allow for management actions to avoid and conserve locations of protected species

FY21 Status

FY 21 survey locations included 384 acres on Orote Peninsula and Sasa Valley Fuel Farm. Surveys on Orote Peninsula included north facing ridges in the Spanish Steps (28 acres) and San Luis beach (77 acres) regions. Surveys at Sasa Valley Fuel Farm included a total of 279 acres. Surveys utilized parallel fixed transects at 5-10 meters depending on terrain and habitat.

A total of 4,806 *Partula radiolata* were found at San Luis and Spanish Steps (Table 4), completed by January 2021. Surveys at the Sasa Valley Fuel Farm were conducted from February through July, 2021. *Samoana fragilis* (669 individuals) and *Partula radiolata* (2,799 individuals) were observed.

ESA-listed plants and butterfly host plants were also documented (Table 4 and Figure 61). Interestingly, a new population of *Tinospora homosepala* was identified at Sasa Valley Fuel Farm. The population will be monitoring for phenology to determine if there female individuals, since the plant is dioecious (male and female flowers occur on separate plants). Other interesting documentation was *Eugenia bryanii* at Spanish

Steps, as well as butterfly host plants *Procris pendunculata* (332 at San Luis; 90 at Spanish Steps) and *Elatostema calcareum* (44 at Spanish Steps).
Under separate contract with the University of Guam, Photo Mark Recapture (PMR) surveys were conducted in 2020 at NMS, Haputo Beach and Pugua Point, and San Luis Beach. Results and reporting are pending completion.

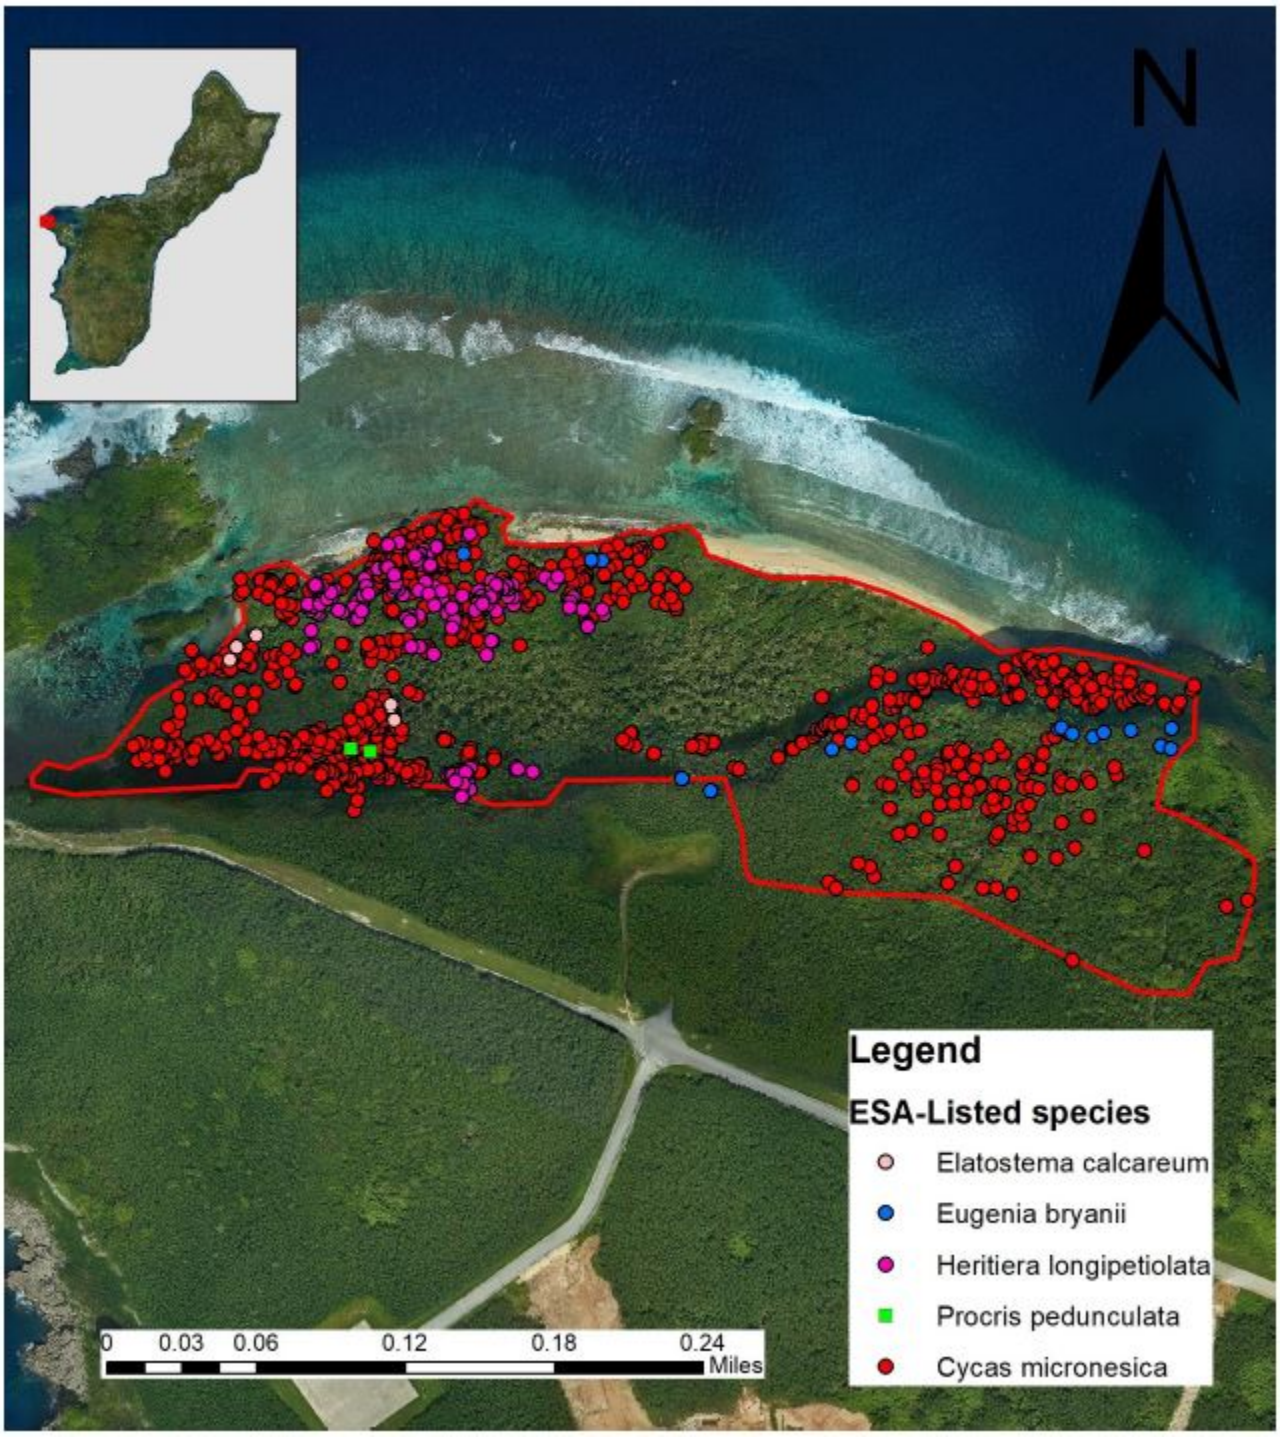

Figure 61. Location of ESA-listed species recorded at Spanish Steps on NBG.

Listed Plant and Invertebrate Surveys, NBG-Administered Lands

Location: NBG **Period of performance:** JUL2020- OCT2021

Objectives

- To collect baseline demography (life history) data on ESA-listed orchids (*Bulbophyllum guamense, Dendrobium guamense* and *Tuberolabium guamense)*

Conservation benefit

Identifying locations of ESA-listed snail species will allow for management actions to avoid and conserve locations of protected species

FY21 Status

Numerous surveys for orchids are regularly conducted on JRM AOR lands, primarily determining presence and absence of the focal species. Using known orchid locations from surveys density and population estimates from 2018 and 2019, a life history study was initiated to track the individual fate of ESA-listed orchids in FY21. The project developed a data dictionary for capturing numerous variables, with intent to measure growth, fecundity and survivorship of the orchids at the genet level. The project will help track the fate of individual genet-level populations. Over 500 orchids were documented on 300 host trees; 64 host trees were inside ungulate-protected areas and 236 host trees were outside of ungulate-protected areas on the NMS. Data was collected once during the dry season and again for all orchids in the wet season. The project will help further our understanding of the demographics of Guam's rare orchids to better pursue management, conservation, recovery of the species.

Threatened and Endangered Species Preconstruction Surveys

Location: JRM **Period of Performance:** various, multiple awards

Project Objective

Conduct preconstruction surveys prior to vegetation clearing and grubbing for construction and design related activities.

Conservation Benefit

To minimize impacts to specific listed species due to construction and design related activities.

FY21 Status

- Preconstruction fruit bat surveys ongoing for the following construction projects: J-001B, J-755, P296, and P-715.
- Preconstruction ESA-listed species surveys completed for J-001B, J-609, J- 755, P-103, P-187, P-290, P-296, P-608, P-715, P-735, North Finegayan Forest Enhancement Site fence line, and Haputo fence line.

EPR: DPRI: Marine Corps Relocation 2017/2018 amendment to 2015 BO, Conservation Measures to Contribute to the Recovery of Listed Species.

2019 JRM INRMP Reference: THM-2; 6-39, TPS-5; 9-77

Forest Restoration Plan Implementation – NBG

Location: NMS **Period of Performance:** SEP2017 – DEC2019

Project Objectives

- Restore native forest ecosystems within fenced areas where feral pigs, deer and carabao have been removed on the NMS.
- Propagate and plant and/or use direct seed techniques for reforestation following the recommendations of the Naval Base Guam (NBG) Forest Restoration Plan and the Conceptual Limestone Forest Restoration and Enhancement Plan (NAVFAC PAC 2018).
- Manage new plantings for a minimum of three years to ensure establishment.

Conservation Benefit

Increasing native forest habitats would improve native species survival, particularly threatened and endangered species enhance native habitat for listed animals, increase the biodiversity of native species, and contributes to the connectivity with surrounding communities in ways that support improved ecosystem functionality. It also contributes to the goals of the Guam NWR as an overlay unit the NMS.

FY21 Status

Work within Fence Unit #1

Fenced Unit #1 contains approximately 80 acres. Within which twenty research plots have been established in the NMS. Ten of the plots are within an ungulate exclosure area. Ten additional plots are within a control area where ungulates have access for comparison. This allows for comparison of vegetation regrowth in areas with and without ungulates. Baseline data for plant diversity was taken in 2019, to show what the forested area was like before being fenced. Another survey is planned in the future to show the changes in plant diversity and abundance. Vitex trees were removed from half the plots as shown in figure 62. The plots with the green dots are the ones where

the vitex has been removed. The plots have been planted with local plants species to ascertain whether survival rates where better inside the fence versus outside the fence. The plantings were completed in 2020. Figure 65 shows the survival of plants a year after planting, data taken in 2021. Red indicates dead plants, yellow indicates missing plants and white indicates plants that are alive. Rows 1 through 150 are within the fenced area. Rows 150 and beyond are in the control area which is outside of the fence. Those plots have exposure to ungulate predation. Most of those plants are missing (yellow).

Work within Fence Unit #2

Fence Unit #2 encompasses approximately 70 acres. The purpose of the project is to remove invasive trees and replace them with native limestone forest species. The first phase of the project was to fence the area to remove ungulates and their influence on forest regeneration. The second phase was to have a complete catalogued inventory of listed species on the site. Plots are to be set up within the fenced unit for the purpose of measuring changes in the forest understory.

The third phase is to remove vitex trees in a phased manor. Vitex removal will be done by wounding the tree and treating the wound with herbicides, then leaving the dying tree in place. Nursery grown native species will be planted in the understory of removed vitex.

A full inventory of listed species was completed at the site. All individuals were catalogued, and coordinates stored. Some results are below:

Figure 63 shows the locations of both vitex and listed species in the survey at FRU 2. A total of 743 vitex was encountered during this survey. The project goal is to remove all these trees. The first phase is to remove vitex in plots where orchids are not present. Some plots will be located where orchids are nearby and might be affected by minor

changes in light and moisture due to dying vitex. Those orchids will be monitored to determine the impacts if any of tree removal.

Survey resulting in the following:

- 41 Bulbophyllum guamense
    - 9 found on V. parviflora
    - 32 found on other host trees
- 291 Dendrobium guamense
    - 99 on V. parviflora
    - 192 on other host trees
- 2,316 Tuberlabium guamense
    - 1,438 on Vitex parviflora
    - 878 found on other host trees
- 77 Micronesian cycads Cycas micronesica

Cetti Bay Watershed Terrestrial Monitoring

Location: Cetti Bay Watershed **Period of Performance**: SEP2017 - MAR2021

Project Objective

To gage the efficacy of the acacia plantings in reducing the effects of fires in Cetti Bay and reducing the amount of soil runoff that settles into Cetti Bay. The measures involved in addressing the project objective include measuring the survival and growth rates of the planted acacia trees, tree survival rates after a fire, and the amount of sediment reaching the bay from the two rivers that drain the Cetti watershed into the Bay.

Conservation Benefit

The project will establish how effective the acacia tree plantings are in improving Cetti Bay aquatic resources, given the environment and site history of annual fires.

FY 2021 Status

- New contract to measure success at Cetti is in the works and will be awarded mid-September.
- The ecological conditions of the reef were to be studied in 2020, but due to covid the contractor was not able to complete them. An inventory of coral communities was taken (figure 70).

EPR: USACE Permit, NBG Reforestation Site, Cetti Bay; 61755NR896

2019 JRM INRMP Reference: THM-2; 6-39, TPS-5; 9-77

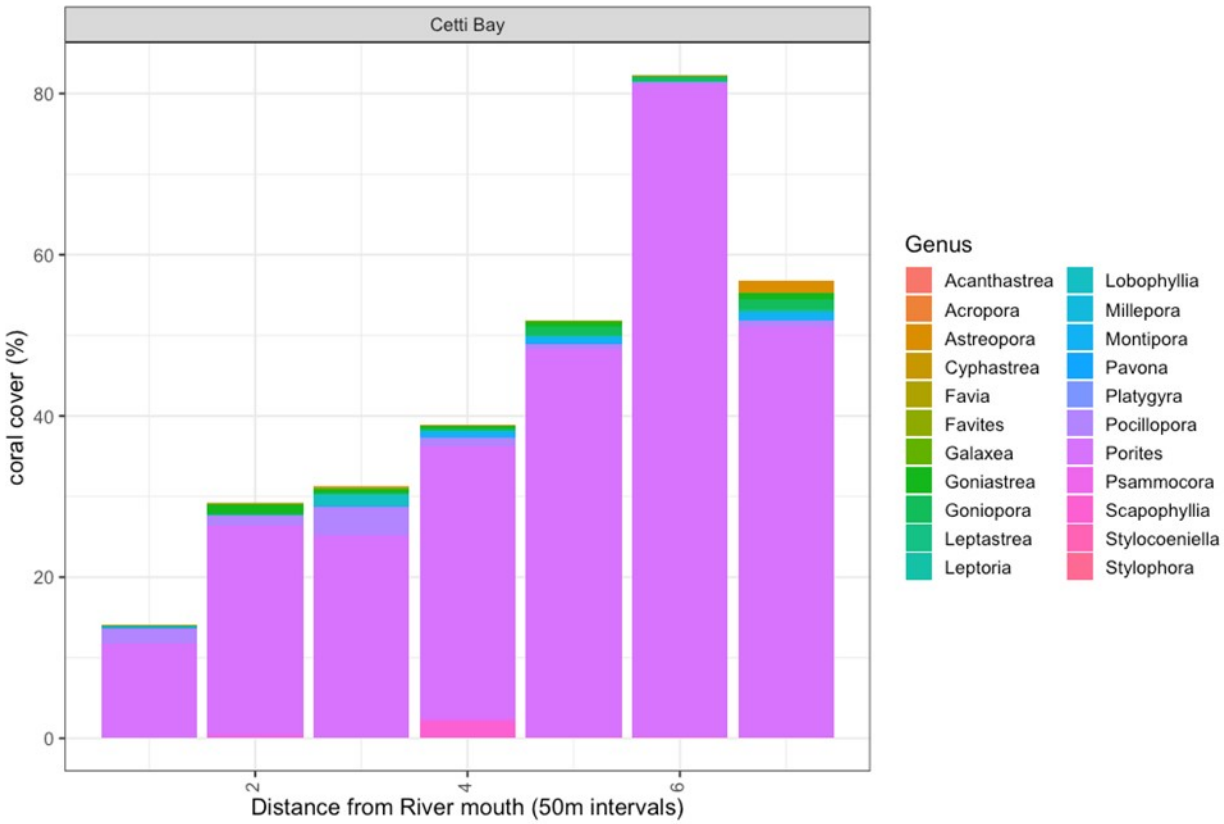

Figure 70. Inventory of coral communities in Cetti Bay in terms of distance from river mouth

Firebreak Management Plan Implementation – NBG

Location: NMS **Period of Performance**: SEP 2021 – SEP2022

Project Objective

- To implement the NBG Wildland Fire Management Plan.
- Specifically, to treat problem fuels (e.g., swordgrass (Miscanthus floridulus)) in strategic locations to disrupt the spread of wildland fires in savannah/ grasslands on NBG land.
- The long-term goal is to have less flammable vegetation to allow uninterrupted land use that meets the military mission requirements. These projects implement specific management actions for Fire Management by planting and/or direct seeding of trees to create shaded fuel breaks and annual management of forested fuel breaks by mowing and chemical treatments of high-fuel load grasses.

FY21 Status

- Nothing to report from 2020-2021 fiscal year
- A new contract is set to be awarded September 2021

This contract will represent the first phase of creating a firebreak. The intent of breaking the process of planting firebreaks into phases it to ensure better survival of planted trees. The first phase of the project will include several rounds of sword grass suppression to initially reduce the biomass of sword grass. Follow up suppression will reduce a portion of the sword grass seed bank. Erosion control measures will be added to the site, such as straw wattles to catch loose soils. Wattles will be treated with local seeds to encourage soil stabilization and native plants.

EPR:

2019 JRM INRMP Reference: THM-2; 6-39

Marianas Basemap

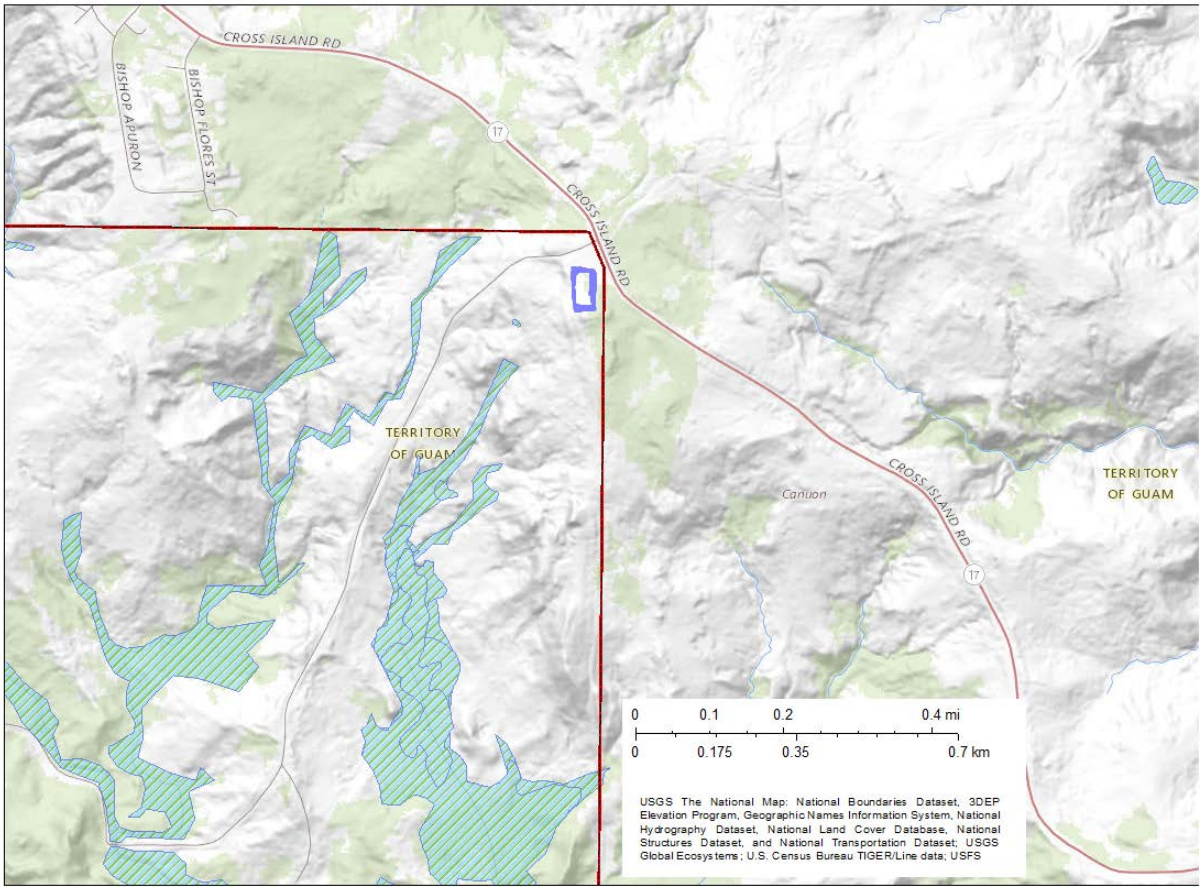

Figure 71 – Base Map of Firebreak Area and close up of planned treatment area

Figure 72 – Example of Fire Break Wattle

Erosion Control – NBG

Location: NMS **Period of Performance**: AUG 2020 – SEP2023

Project Objective

The objective of this procurement is to obtain services for planting native grasses and savanna shrubs to in areas prone to erosion. The goal of this project is to stabilize soils in erosion prone areas that wash into waterways. The secondary goal is to protect Guam's coral reefs by reducing the sediment loads in the coastal drainage system that deposit the sediments into coastal waters, and to increase the amount of native plant communities on Guam.

FY21 Status

Project is in the planning stage, but outplanting will start September 2021. The work will be performed on the erosion scars in an area south of Fena Reservoir (figure 73). These areas contribute most of the erosion into Imong River, the scars themselves are a difficult environment to establish plants (figure 75). Due to the difficult nature of these areas to plant, soil stabilization will be accomplished by a combination of plantings located strategically around the erosion scar and straw wattles that can catch the soil and hold it in place. The straw wattles will additionally be experimentally seeded with plants to further hold the soil while establishing plants.

Ungulate Fencing on NBG NMS

Location: NBG **Period of performance:** Recurring Annually

Project Objectives

- The primary objective is to construct a fence barrier to exclude ungulates (Philippine deer, pigs and carabao) on NMS to facilitate conservation efforts

Conservation benefit

The installation effort facilitates the revitalization of native habitats that support viable populations of native and ESA-listed species, increases biodiversity, and promotes ecosystem health. Ungulate fence construction is the first step of the applied ecosystem approach to resource management, as defined in the INRMP.

FY21 Status

Ungulates introduced to Guam include feral pig (*Sus scrofa*), Philippine deer (*Cervus mariannus*) and Asiatic water buffalo or carabao (*Bubalus bubalis*). These ungulates currently cause significant impacts to native habitats (i.e. wetlands, native limestone forest) on the NMS. Construction of ungulate fences and eradication of ungulates works to reverse degradation of habitats and increase populations of native species, particularly ESA-listed species.

In FY21, ungulate fence #4 (Parsons Road Conservation Fence #4) was contracted (Table 5). The fence focuses on protection and enhancement of approximately 60 acres of habitat in central NMS. The area was selected due to its unique wetland habitat, periodically supporting Mariana common moorhen, as well as providing a canvas for forestry projects and conservation of ravine forests. The location provides logistical efficiencies for a variety of conservation projects in an area heavily impacted by feral pigs, Philippine deer and carabao. Once constructed, the north side of the fence will connect to ungulate fence #5.

EPR: 1 RP MAR NBG Ungulate Fencing; 61755NR894

2019 JRM INRMP Reference: THM-2; 6-39

Table 5. Ungulate Fencing Unit Construction Overview – NMS.

Range Fire Management Plan for Marine Corps Ranges on Guam

Location: AAFB and Andy South **Period of Performance**: SEP2017 – SEP2021

Project Objective

Create a range fire management plan to reduce range/wildfire potential, protect and enhance natural and cultural resources, integrate applicable permit and reporting requirements and implement ecosystem management goals, sustainable training, and objectives already supported on existing Marine Corps installations.

Conservation Benefit

Management plan goal is to reduce the effects of fires by limiting their frequency, size, and severity while still allowing the USMC to maintain a high level of combat readiness. The fire management plan is being developed in accordance with a conservation measure in the Biological Opinion for the Marine Corps relocation program.

FY21 Status

- CESU awarded to Colorado State in Sept 2017.
- Final Plan expected in September of 2021.

EPR: DPRI: Marine Corps Relocation 2017/2018 amendment to 2015 BO, Conservation Measures to Minimize the Effects of Fire

2019 JRM INRMP Reference: THM-1; 9-68

Seed Collection from *Heritiera longipetiolata* and *Tabernaemontana rotensis*

Location: AAFB **Period of Performance**: OCT2018 - 2021

Project Objective

To collect seeds from federally endangered *Heritiera longipetiolata* and threatened *Tabernaemontana rotensis* identified within project footprints associated with the Guam Relocation.

Conservation Benefit

To minimize impacts of military construction activities to native ecosystems by collecting the seeds from as many mature individuals as possible and preserving the genetic diversity of the species.

FY21 Status

- 54 seeds have been collected from 3 of 5 mature *Heritiera longipetiolata* located within AAFB project footprints.
- 15 *Heritiera longipetiolata* seeds have germinated.
- 1,396 seeds have been collected from 19 of 136 mature *Tabernaemontana rotensis* located within AAFB project footprints.
- 945 *Tabernaemontana rotensis* seeds have germinated.

EPR: DPRI: Marine Corps Relocation 2017/2018 amendment to 2015 BO, Conservation Measures to Contribute to the Recovery of Listed Species.

2019 JRM INRMP Reference: THM-3; 8-49

Forest Restoration at Achae Point

Location: AAFB **Period of Performance:** JUL2021 – JUL2022

Project Objective

Restore native vegetation component to limestone forest rehabilitation site.

Conservation Benefit

Enhance and restore habitats, reduce habitat fragmentation, increase populations of native species, and buffer protected areas.

FY21 Status

- The Cooperative Agreement specifically for the site ended in Sept 2019 and in Oct 2019 the maintenance work was added to the *Serianthes* management Cooperative Agreement.
- As of July 2021, there are a total of 1,026 multi-species native plants within the site and we are utilizing Treeplotter GIS software for managing data (Figure 77).
- Outplanting of *Serianthes nelsonii* seedlings began, and we installed new cages and insect barriers that provide shading and protection to the young trees (Figure 78).
- An irrigation system has been installed on-site for efficient watering of plants.

Original EPR: 1 CR MAR AFB Native Forest Habitat Restoration; M5240NR067
EPR (under Serianthes Management): 2 LC MAR AAFB *Serianthes nelsonii* Monitoring and Management; M5240CN039

2019 JRM INRMP Reference: THM-1; 9-68

Figure 78. Serianthes nelsonii seedlings outplanted at Achae Restoration Site on Route 3A.

Vegetation Restoration for the Habitat Management Unit (HMU)

Location: AAFB **Period of Performance:** JUL2021 – JUL2022

Project Objective

- Implement vegetation restoration within the Habitat Management Unit (HMU) utilizing the 2017 HMU Vegetation Restoration Plan.

Conservation Benefit

Enhance and restore habitat and maintain or increase populations of threatened and endangered species, including those extirpated from Guam and potentially reintroduced within the HMU.

FY21 Status

- Five (5) experimental, 30-meter x 30-meter interior plots and 9, 20-meter by 10-meter edge plots.
- Herbicide treatments (hack and squirt method) completed on *Vitex parviflora, Spathodea campanulata* and *Averrhoa bilimbi* on interior and edge plots.
- Outplantings on interior plots, used the following species: *Pandanus tectorius, Ixora triantha, Premna obtusifolia, Procris pedunculata*, and *Ochrosia mariannensis*.
- Outplantings on edge plots used: *Aglaia mariannensis, Glochidion marianum, Hibiscus tiliaceus, Melanolepis multiglandulosa, Ochrosia mariannensis, Pandanus dubius, Pandanus tectorius, Procris pedunculata, Timonius nitidus, Wikstroemia elliptica.*
- Edge plot outplantings planted in a “tiered” plan, with shorter species in the front.
- In FY22 a 1-acre plot will be cleared of *Vitex*, *Spathodea* and *Averrhoa*, and outplanted with native trees, species to be determined but want to include *Artocarpus mariannensis* and *Ficus prolixa* as both are preferred by bats.
- Hope to experiment with outplanting *Ficus prolixa* directly on *Vitex*.

Ungulate Fencing

Location: AAFB **Period of Performance:** SEP2019 – AUG2020

Project Objective

- Construct ungulate fencing on AAFB to facilitate eradication of feral pigs and Philippine deer as well as prevent immigration of ungulates within fenced areas.

Conservation Benefit

Supports ungulate eradication goals within fenced areas of AAFB (Figure 81). Ungulate eradication facilitates the revitalization of native habitat that supports viable populations of native species, increases the biodiversity of native species, and contributes to the connectivity with surrounding communities in ways that support improved ecosystem functionality. Contributes to the goals of the Guam NWR as an overlay unit on AAFB.

FY21 Status

- Tarague Triangle fence completed in August 2020. Post ungulate eradication completed in August 2021, with 15 deer and 56 pigs removed. The area is presently being monitored with trail cameras in case ungulates were missed during eradication. This area will provide for approximately 80 acres (32 hecatars) of conservation area for INRMP project implementation and sites for mitigation associated with military construction projects.
- Ungulate fencing 10-year plan, funding has been programmed.
- FY22 funds for constructing second Tarague Triangle Fence.

EPR: 1 RP MAR AAFB Ungulate Fencing; M5240NR043

2019 JRM INRMP Reference: THM-1; 9-68

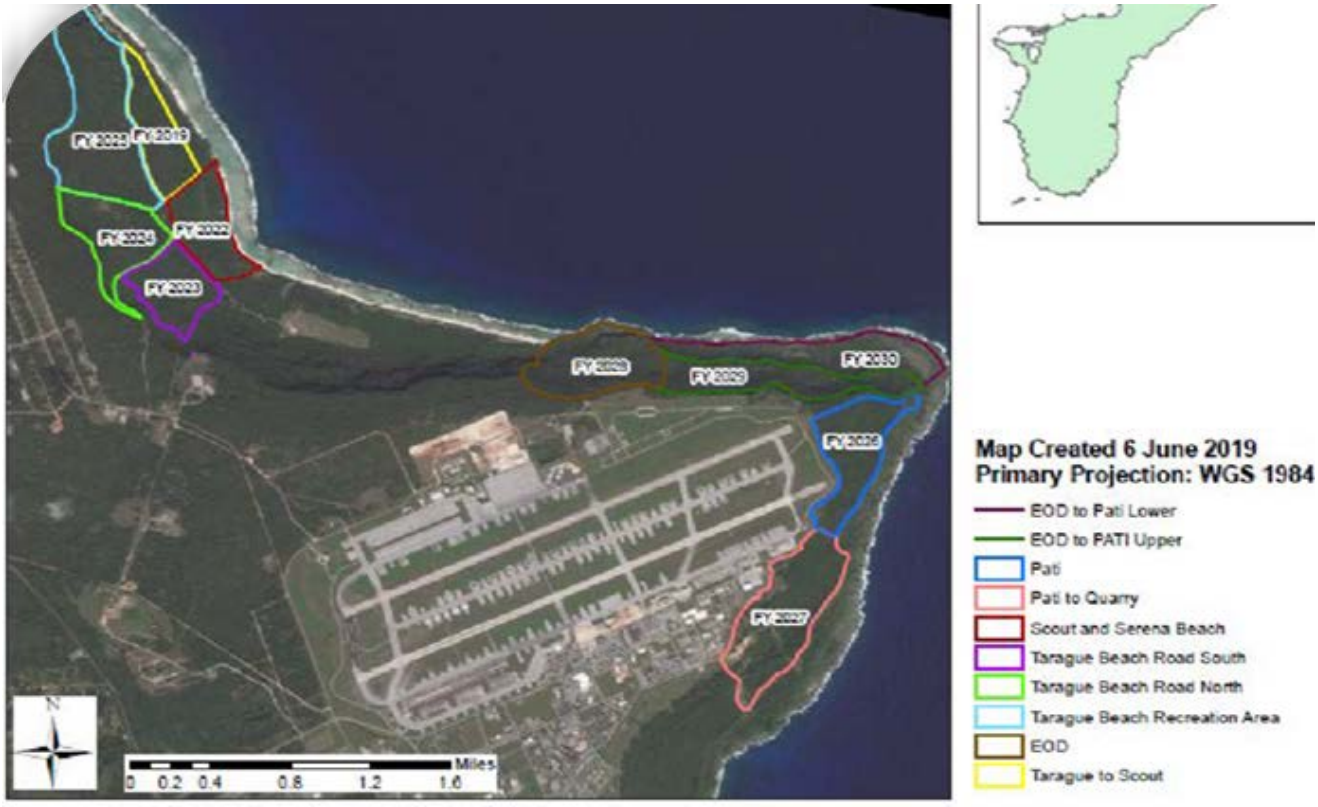

Figure 81. Map depicting areas of programmed ungulate fencing at AAFB.

Ungulate Eradication and Control

Location: AAFB **Period of Performance:** AUG2019 – DEC2021

Project Objective

- Removal of feral pigs and Philippine deer from AAFB to protect and enhance native species and associated habitat.

Conservation Benefit

Enhance and restore habitats to increase populations of native species, particularly threatened and endangered species, as well as promote biodiversity of native plants. Reduce ground disturbance from ungulates to improve soil stabilization and reduce suitability of invasive plant species.

FY21 Status

- Although driven by human health and safety, the AAFB Volunteer Conservation Officer Program (VCOs) conducted depredation hunts to increase roadway safety and remove animals from recreation areas.
- Ecosystems will benefit from the removal of 417 deer and 191 pigs from AAFB as of May 2021 (Figure 82).
- Pig trapping by USDA Wildlife Services throughout the base removed 132 pigs as of June 2021
- Plans in FY22 includes (1) Expanding depredation hunts through a cooperative agreement with White Buffalo, Inc. to remove deer and pigs from the Northwest Field area of AAFB; and (2) Recreational hunting in non-fenced areas will begin soon.

EPR: 1 CP MAR AAFB Ungulate Eradication and Control; M5240NR069

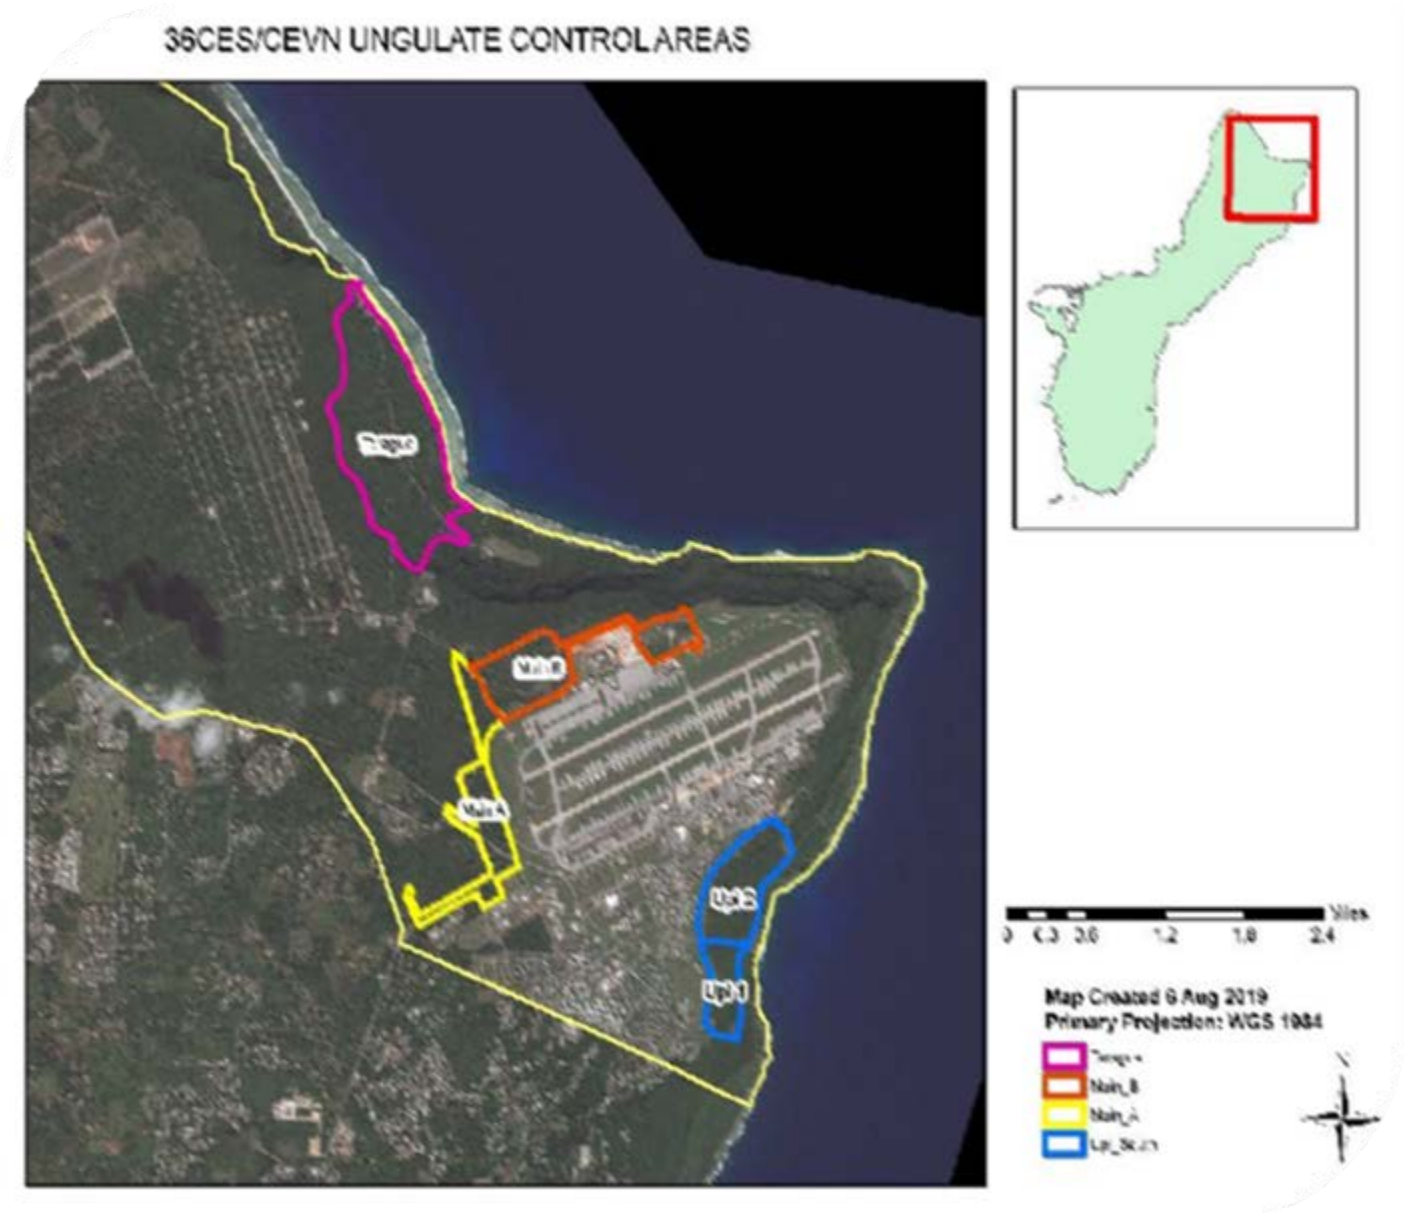

Figure 82. Current AAFB Depredation Areas.

Maintenance of Ungulate Exclosures

Location: AAFB **Period of Performance:** OCT2019 - DEC2021

Project Objective

Annual fence line maintenance and repairs to maintain the efficacy of AAFB ungulate-free exclosures. This project includes 1) weekly inspections, which involves walking or driving the fence-line encompassing multiple ungulate exclosures and conducting any repairs and 2) cutting and trimming the vegetation within 3 feet of each side of the fence monthly to reduce any damage to the fence.

Conservation Benefit

The routine maintenance and repair of ungulate exclosures will enhance the longevity of the ungulate barrier. Regular fence monitoring and repair also has the benefit of early detection to any possible immigration of ungulates into fenced eradicated areas. Monitoring, maintenance and repair all support the purpose of facilitating ungulate-free areas to enhance native forest ecosystem regeneration.

FY21 Status

- Cooperative agreement for weekly HMU inspections awarded September 2020 with added inspections for Tarague fence to be awarded Sept 2021.
- Repairs and replacement of HMU fence section awarded July 2021.

EPR: 2 BO MAR AAFB Maintenance of Ungulate Exclosure; M5240NR045
EPR: 1 CR MAR AAFB BTS Barrier Maintenance in HMU; M52401000

2019 JRM INRMP Reference: THM-1; 9-68

Northwest Field Ungulate Control Area Fencing and Eradication - AAFB

Location: AAFB **Period of Performance:** JUL2020-FEB2022

Project Objective

The project will install ungulate-proof fencing around the limestone plateau in the vicinity of the Live Fire Training Range Complex and subsequently eradicate pigs and deer from the exclosure.

Conservation Benefit

Feral pigs and deer are among the most significant threats to sensitive limestone forests; ungulate removal will promote growth of native species and increased survival of threatened and endangered species.

FY21 Status

Fencing contract awarded and target completion is September 2021.
USDA began population estimates in March 2021 and began removals in August 2021.

EPR: DPRI: Marine Corps Relocation 2017/2018 amendment to 2015 BO, Conservation Measures to Minimize the Effects of Invasive Species.

Salvage and Transplantation of ESA-listed Orchids – NBG TS and AAFB

Location: NBG TS; AAFB **Period of Performance:** 2017 - 2022

Project Objective

To salvage and transplant federally threatened *Bulbophyllum guamense, Dendrobium guamense,* and *Tuberolabium guamense* identified within construction footprints associated with the Guam Relocation.

Conservation Benefit

To minimize impacts of military construction activities to native ecosystems by salvaging as many healthy individuals as possible and preserving the genetic diversity of each species.

FY21 Status

Bulbophyllum guamense

- One individual salvaged on March 2021 and transplanted to the FES is undergoing 12 months of monitoring.
- All of the 71 individuals that were identified, salvaged, and transplanted to the Forest Enhancement Site (FES) from project footprints on Finegayan survived at least 1 year after transplantation.
- One individual in the Government nursery undergoing maintenance & monitoring, plans to outplant to FES sometime in 2021.

Dendrobium guamense

- Five (5) individuals salvaged on March 2021 and transplanted to the FES is undergoing 12 months of monitoring.
- Sixteen (16) individuals salvaged on August 2021 and transplanted to the FES is undergoing 12 months of monitoring.

- Eighteen (18) of the 21 individuals that were identified, salvaged, and transplanted to the Forest Enhancement Area from project footprints on Finegayan and Andersen South since 2017 survived at least 1 year after transplantation.

Tuberolabium guamense

- 173 individuals salvaged on March 2021 and transplanted to the FES is undergoing 12 months of monitoring.
- 170 individuals salvaged on August 2021 and transplanted to the FES is undergoing 12 months of monitoring.
- 76 individuals salvaged on August 2021 and transplanted to the FES is undergoing 12 months of monitoring.
- 15,385 individuals have been identified in NBG Telecommunications Site and throughout AAFB since 2017.
- 4,826 of the 6,357 individuals that were salvaged and transplanted to the Forest Enhancement Area survived at least 1 year after transplantation.

EPR: DPRI: Marine Corps Relocation 2017/2018 amendment to 2015 BO, Conservation Measures to Contribute to the Recovery of Listed Species.

Salvage and Transplantation of *Cycas micronesica* – NBG TS and AAFB

Location: NBG TS; AAFB **Period of Performance:** various, multiple awards

Project Objective

To salvage and transplant federally threatened *Cycas micronesica* identified within construction footprints associated with the Guam Relocation.

Conservation Benefit

To minimize impacts of military construction activities to native ecosystems by salvaging as many healthy individuals as possible and preserving the genetic diversity of the species.

FY21 Status

NBG Telecommunications Site

- Four of the six adult cycads salvaged and transplanted to an area of the Forest Enhancement Site survived pass the 1-year maintenance and monitoring period.
- Quarterly monitoring on-going via cooperative agreement through the CESU network to Island Eco Services

Northwest Field, AAFB

- Pup salvage was completed in December 2019. Of the 1,503 pups salvaged, 22 survived pass the 1-year maintenance and monitoring period and were transferred to the Government nursery for continued maintenance until outplanting to the FES.
- 22 of the 27 direct salvage and outplanting trees survived pass the 1-year maintenance and monitoring period. Quarterly monitoring on-going via cooperative agreement through the CESU network to Island Eco Services.
- 1,690 cycad seeds were collected. To date, 900 seeds are being maintained and monitored in the Government or Government-approved nursery. 325 seeds have

leaf emergence. 129 of these seedlings have survived pass the 1-year maintenance and monitoring period and were transferred to the Government nursery for continued maintenance until outplanting to the FES (Figure 84).

Munitions Storage Area (MSA), AAFB

- Seven of the nine pups and/or stem cuttings salvaged from five cycads and transplanted to pots within a government-approved nursery survived pass the 1 year maintenance and monitoring period. These cycads are being maintained in the Government nursery until outplanting to the FES.
- In March 2021, three pups and/or stem cuttings were salvaged from two cycads and transplanted to pots within a government-approved nursery and are undergoing 1 year of maintenance and monitoring.

Andersen South, AAFB

- Four of the eight pups and stem cuttings salvaged from six cycads and transplanted to pots within a government-approved nursery survived pass the 1-year maintenance and monitoring period. These cycads are being maintained in the Government nursery until outplanting to the FES (Figure 85).
- In August 2021, 10 pups and/or stem cuttings were salvaged from four cycads and transplanted to pots within a government-approved nursery and are undergoing 1 year of maintenance and monitoring.

Salvage and Transplantation of *Cycas micronesica* – MSA-1 Igloo Project (P-3105, Phase 3)

Location: MSA-1, AAFB **Period of Performance:** DEC2020 - TBD

Project Objective

Objective is to meet the special conditions and success criteria stated in the USFWS Biological Opinion Ref: 01EPIF00-2019-F-0012. To salvage, propagate, and out plant the federally threatened *Cycas micronesica* and *Tabernaemontanae rotensis* identified within the construction footprint of the Munitions Storage Area (MSA-1) Igloo Project, P-3105 Phase 3 (Figure 86).

Conservation Benefit

To minimize impacts of military construction activities to native ecosystems by salvaging as many individuals of *C. micronesica* and *T. rotensis* as possible and preserving the genetic diversity of the species.

FY21 Status

- Salvaging of Cycas micronesica and Tabernaemontana rotensis
- Total of 556 cycad plant materials were salvaged from Blocks 1 through 5 and completed on 19 April 2021 (Table 9) as part of P-3105.
- 54 seeds were collected from *T. rotensis* trees located on Block 5.
- Contractor's Plant Nursery
- As of July 2021, a total of 147 cycad plant parts have initiated root growth.
- As of July 2021, (18) seeds of *T. rotensis* have germinated.
- Contractors will continue to maintain the salvaged cycads until they are ready for outplanting in the AAFB fenced plots.

Invasive Plant Control – NBG TS and AAFB

Location: NBG TS; AAFB **Period of Performance:** SEP2020 – MAR2022

Project Objective

This project intends to eradicate limited infestations of *Antigonon leptopus* and *Mimosa diplotricha* in the North Finegayan and Finegayan Forest Enhancement Sites, as well as conduct trials to determine options for control of *Mikania micrantha*.

Conservation Benefit

Invasive plants can outcompete native vegetation and interfere with restoration efforts for threatened and endangered species. Removal of invasive plants, particularly in new or smaller infestations where it may be possible to eradicate the invasive species from sensitive areas, will improve survivorship and growth of native plant species during future restoration efforts.

FY21 Status

- *M. diplotricha* site re-burned by poachers, with additional buffer areas burned during a controlled burn exercise by Guam Dept. of Agriculture.
- *A. leptopus* cut at the base before herbicide application.
- Targeted herbicide applications monthly at both sites.
- *M. micrantha* plots established and various herbicide/mechanical control combinations are being tested (Figure 90).

EPR: DPRI: Marine Corps Relocation 2017/2018 amendment to 2015 BO, Conservation Measures to Minimize the Effects of Invasive Species.

North Finegayan Forest Enhancement Site Ungulate Fencing and Eradication

Location: NBG TS; AAFB **Period of Performance:** SEP2020 – SEP2022

Project Objective

The project will eradicate feral pigs and Philippine deer in both phases of the North Finegayan Forest Enhancement Site.

Conservation Benefit

Feral pigs and deer are among the most significant threats to sensitive limestone forests; ungulate removal will promote growth of native species and increased survival of threatened and endangered species.

FY21 Status

- The North Finegayan FES Phase 1 exclosure (Figure 91) was completed in March 2020 with eradication completed in October 2020. 323 deer and 85 pigs were removed.
- The Phase 2 fence was completed in August 2021, with eradication beginning immediately after closure.
- Phase 2 eradication is targeted for completion in October 2021.

EPR: DPRI: Marine Corps Relocation 2017/2018 amendment to 2015 BO, Conservation Measures to Minimize the Effects of Invasive Species.

2019 JRM INRMP Reference: THM-33; 8-49

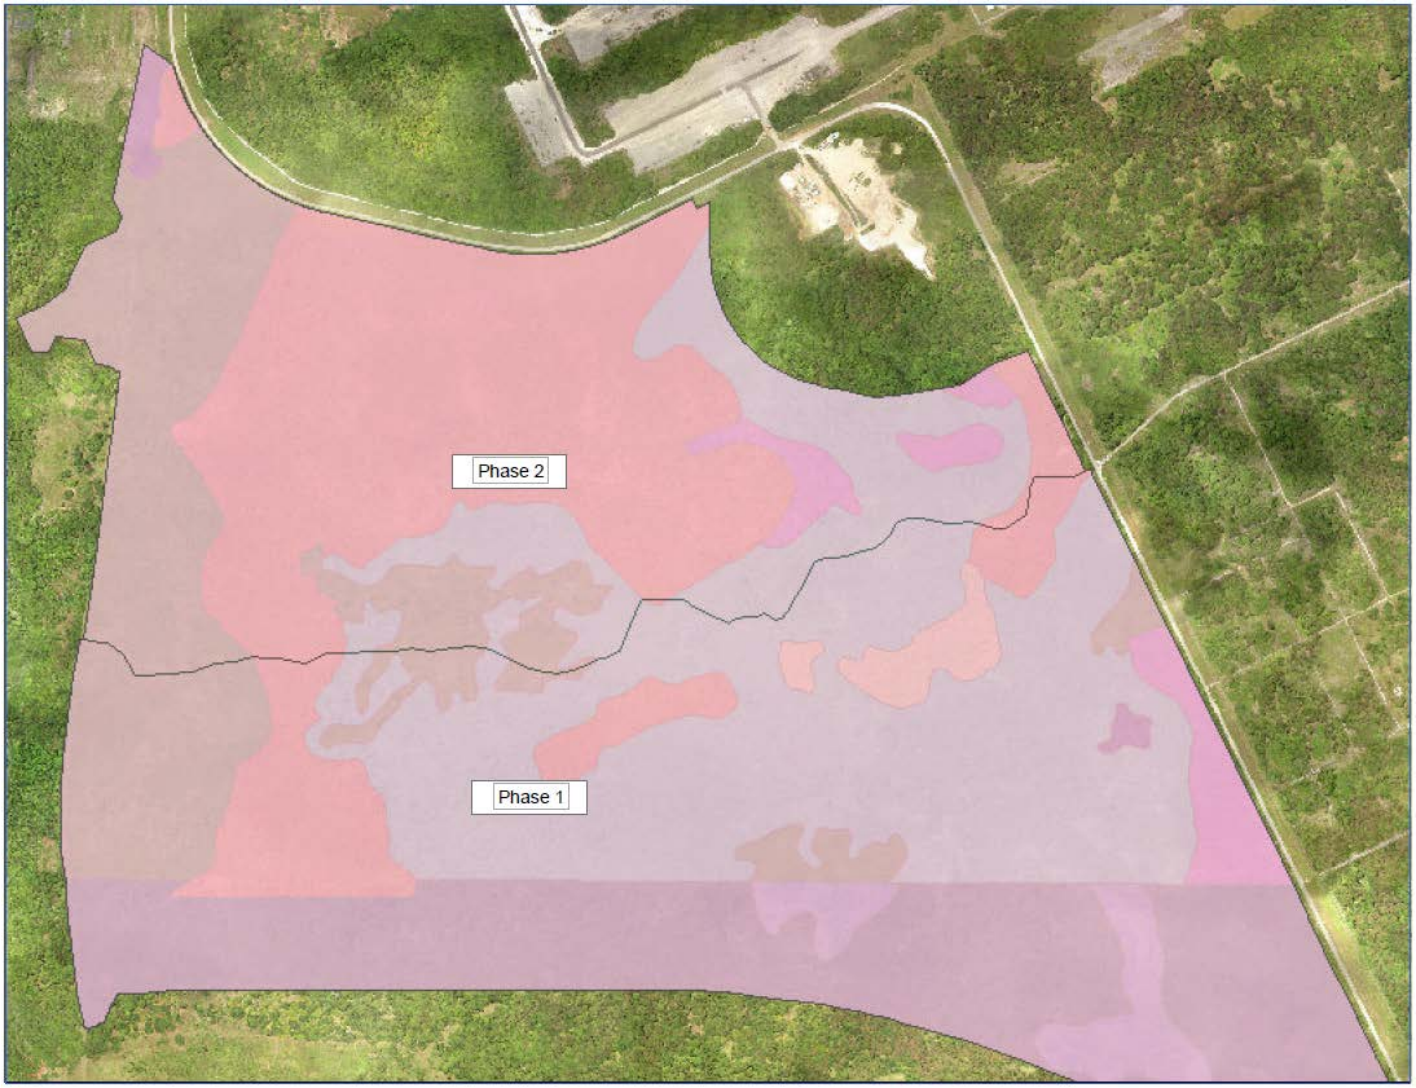

Figure 91. Ungulate fence

Haputo Ecological Reserve Area Ungulate Fencing

Location: NBG TS **Period of Performance:** AUG2019 – Mar2022

Project Objective

Haputo Ecological Reserve Area will be fenced to exclude feral ungulates. The northern section will encompass 168 acres while the southern section encloses approximately 116 acres.

Conservation Benefit

The ungulate fence (Figure 92) will exclude deer and pigs that destroy native vegetation and contribute to erosion that harms nearshore reefs. Ungulate removal will promote growth of native species and increase survival of threatened and endangered species.

FY21 Status

- N. Haputo ERA fence installation is ongoing. Target completion is March 2022.
- S. Haputo ERA fence installation is expected to be complete in October 2021.
- Eradication for the southern fence will begin in FY22.

EPR: DPRI: 2015 Navy-USFWS Guam Micronesia Kingfisher MOA.

2019 JRM INRMP Reference: THM-2; 8-48

Figure 92. Haputo Ecological Reserve Area ungulate fence alignment.

Implementation Plan for the North Finegayan Forest Enhancement Site

Location: NBG TS; AAFB **Period of Performance:** JUL2019 – JAN2022

Project Objective

The project will develop a site-specific plan for Phase 1 of the North Finegayan Forest Enhancement Site (Figure 93) to address regulatory compliance, infrastructure needs, invasive plant removal options, and sequencing for native species outplanting. An irrigation study and implementation plan for Phase 2 will also be developed.

Conservation Benefit

Forest enhancement efforts will improve habitat for native species, including threatened and endangered plants and animals.

FY21 Status

- Draft final implementation plan under review.
- Currently working on invasive tree control trials
- Irrigation study and Phase 2 plan development began in August 2021.

EPR: DPRI: Marine Corps Relocation 2017/2018 amendment to 2015 BO, Conservation Measures to Contribute to the Recovery of Listed Species.

TERRESTRIAL PROTECTED SPECIES MANAGEMENT

Biomonitor Support for Natural Resource Management at Joint Region Marianas Area of Responsibility

Location: JRM AOR **Period of Performance:** JUL2019 – JUL2022

Project Objective

Provide biomonitor support to assist the Department of the Navy in natural resource management across lands under JRM AOR.

Conservation Benefit

Biomonitors will conduct surveys for threatened and endangered species, culturally valuable plant species, rare plants, and non-native/invasive species (Figure 94). Activities support the GMK MOA (2015) and the Biological Opinion for the Department of the Navy's Relocation of the U.S. Marine Corps from Okinawa to Guam and Associated Activities on Guam (USFWS, 2015, 2017, 2018).

FY21 Status

- Awarded as cooperative agreement through the CESU network to UOG-CIS on 29 July 2019.

EPR: DPRI: Marine Corps Relocation 2017/2018 amendment to 2015 BO, Conservation Measures to Contribute to the Recovery of Listed Species.

2019 JRM INRMP Reference: TPS-1; 7-55

Figure 94. Biomonitor conducting survey for T&E species.

Monitoring Salvaged and Translocated ESA-listed Plants and Invertebrates on JRM Lands on Guam

Location: JRM **Period of Performance:** SEP 2020-2021

Project Objective

Monitor and maintain salvaged and translocated plants and invertebrate species listed under the ESA (16 USC 1531 et seq.) located at the Forest Enhancement Area and the Haputo Ecological Reserve Area at Naval Base Guam Telecommunication Site (NBGTS) and the Northwest Field Ungulate Control Area at AAFB.

Conservation Benefit

Monitoring to allow for management actions to enhance and restore habitat, reduce habitat fragmentation, buffer protected areas, and implement new conservation strategies.

FY21 Status

- Monitoring and maintenance began Sept 2020 and is ongoing.
- Monitoring and maintenance of *Cycas micronesica*:
    - 29 of 33 *C. micronesica* alive through July 2021. All plants free of pests except for one. Most in good condition and a few plants have put out reproductive structures.

Figure 95 - 96. Translocated *Cycas micronesica* being monitored and maintained.

- Monitoring of ESA-listed orchids:
    - Monitoring of orchids is ongoing. Flowering and fruiting was documented throughout the translocated populations for both *Bulbophyllum guamense* and *Tuberolabium guamense*. New *T. guamense* seedlings have been noted.

Figure 97. Translocated *Tuberolabium guamense* with open seed pod.

- Monitoring of butterfly host plants:
    - Most recent monitoring found 12 eggs and a chrysalis on the host plants. Previous monitoring noted 69 eggs, 1 larva, 4 chrysallids, and 2 adults.

Figures 98 – 101. Various life stages of *Hypolimnas octocula mariannensis* found on translocated butterfly host plants being monitored.

- Monitoring of *Partula radiolata*:
    - Full comprehensive count coming in September 2021. Multiple monitoring events found many empty *P. radiolata* shells on the ground under debris and rocks. *P. radiolata* and *P. gibba* are found at the site closer to the ocean and only *P. radiolata* found at the other site.

Figure 102. Translocated *Partula radiolata* being monitored at Haputo

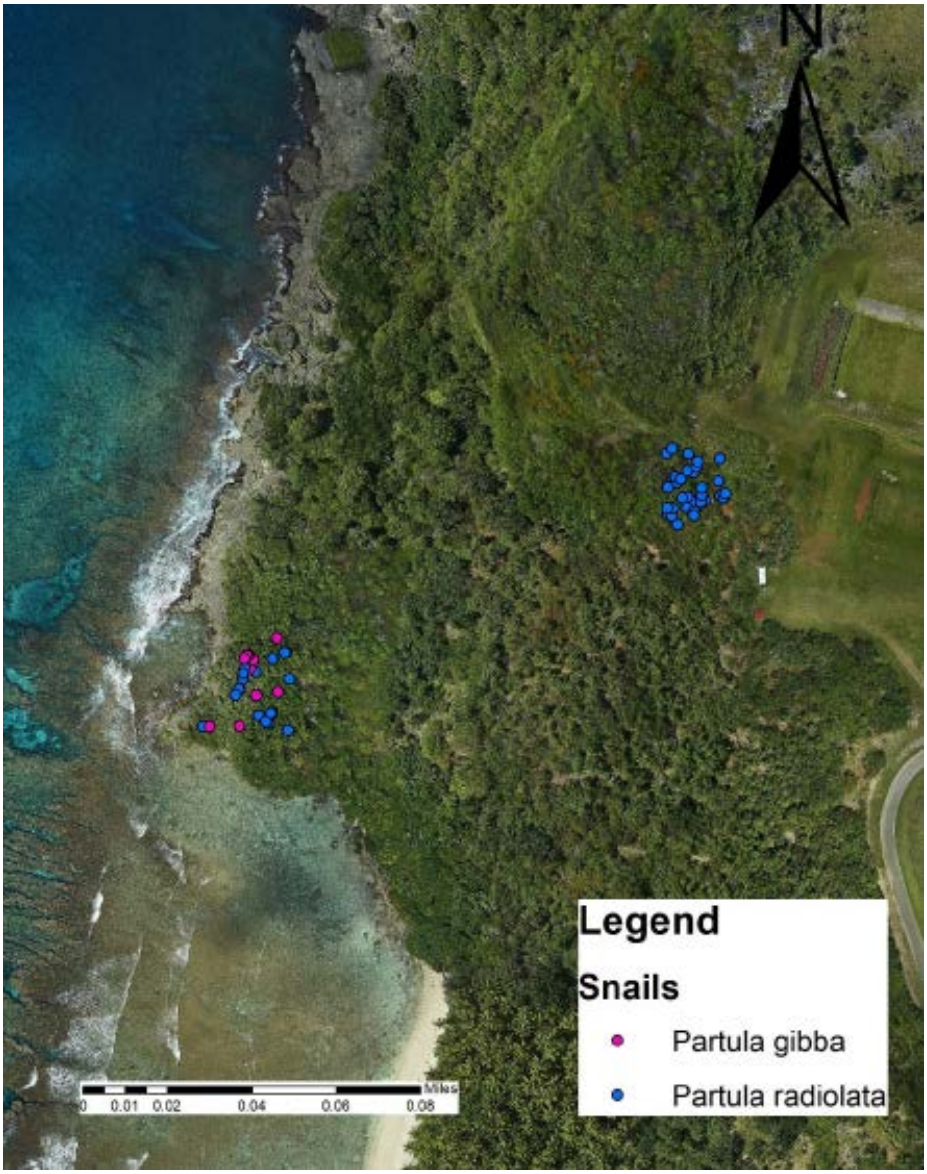

Figure 103. Locations of ESA-listed snail species being monitored at translocation sites near Haputo.

EPR: Listed plant surveys, Propagation, planting, and Establishment in the Wild; 61128NR209

2019 JRM INRMP Reference: THM-2; 6-39, TPS-5; 9-77

Salvage and Transplantation of *Partula radiolata* – NBG TS and AAFB

Location: Andersen South, Haputo ERA

Period of Performance: JAN2019 – FEB2021

Project Objective

To salvage and translocate federally endangered *Partula radiolata* identified within the construction footprint on Andersen South associated with the Guam Relocation.

Conservation Benefit

To minimize impacts of military construction activities to native ecosystems by salvaging as many healthy individuals as possible and preserving the genetic diversity of the species.

FY21 Status

- Snail surveys took place from January 2019 to March 2020.
- *P. radiolata* were located in two main areas of the project footprint.
- 3,850 *P. radiolata* were salvaged from the project footprint and translocated to the Haputo Ecological Reserve Area.
- Bi-weekly snail monitoring completed Haputo Ecological Reserve Area to count the number of marked (i.e., translocated) and unmarked snails.
- Quarterly monitoring on-going via cooperative agreement through the CESU network to Island Eco Services.

EPR: DPRI: Marine Corps Relocation 2017/2018 amendment to 2015 BO, Conservation Measures to Contribute to the Recovery of Listed Species.

2019 JRM INRMP Reference: TPS-1; 7-55

Native Plant Seed Collection, Salvage, Storage, and Nursery Propagation for Forest Enhancement

Location: NBG TS **Period of Performance**: OCT2017 – OCT2022

Project Objective

Collect salvaged native plant species and their seeds to propagate for use in limestone forest enhancement projects in Northern Guam. Design, install and operate a native plant nursery to maintain and provide healthy plant materials.

Conservation Benefit

To maintain a stock of healthy native plants ready to be used in forest enhancement planting. Native plant species from within DoD construction areas will be salvaged and propagated at the native plant nursery to maintain genetic diversity.

FY21 Status

- Native plant nursery installed at Finegayan Dec 2018 – March 2019.
- Irrigation installed July 2019, water filtration system pending installation.
- 30 species of rare, high value, native, threatened and endangered plant species.
- Over 500 *T. rotensis* plants in propagation.
- Developed species-specific protocols for plant propagation and care
- Biosecurity program to manage pests, diseases and pathogens.
- FWS removed the requirement for Contractor to possess a 10(a)(1)(A) permit for collection of threatened and endangered species in June 2020.

2019 JRM INRMP Reference: TPS-1; 7-5

Figure 104. *Tabernaemontana rotensis* seedlings in the nursery.

Monitoring of Butterfly Host Plant Sites and Tarague Snail Colony

Location: AAFB **Period of Performance:** AUG2020 – AUG2022

Project Objective

Collect baseline data on listed butterfly and snail populations.

Conservation Benefit

Monitoring will allow for management actions to enhance and restore habitat and increase efforts to recover listed butterfly and snail populations in Guam.

FY21 Status

- 4 plots in Tarague snail colony have been sampled by mark recapture during the dry season (data is pending analyses) and rainy season sampling upcoming.
- The snail colony has been delineated and covers an approximate area of 3 hectares. Surveys are ongoing with the southeast corner of the colony's location to be covered soon.
- Butterfly host plants at 3 sites are monitored twice a month for eggs, larvae or adult presence. There is also one alternate site identified.
- Butterfly host plant sites are monitored with trail cameras to document ungulate browsing.
- Project was delayed due to COVID, SOW modifications and staffing issues. Data collection began in March for snails and June for butterflies.
- Preliminary data is showing high levels of butterfly egg parasitism, possibly ~70%. The Exact numbers are hampered by not knowing how long the eggs (hatched or parasitized) and chrysalids last in one spot. Double counting is a possibility.
- Deer herbivory on host plants has yet to be documented.

EPR: Monitoring and Surveys for Listed Tree Snails, Butterflies, and Plants; M5240CN048

JRM *Serianthes nelsonii* Propagation, Outplanting, and Maintenance

Location: JRM **Period of Performance**: JUL2021-2022

Project Objective

This project is to propagate, outplant, and maintain subpopulations of the federally endangered *Serianthes nelsonii* (tree) on Joint Region Marianas (JRM) managed lands.

Conservation Benefit

Increasing the number of *Serianthes* trees would improve species survival, enhance native habitat, increase the biodiversity of native species, and contributes to the connectivity with surrounding communities in ways that support improved ecosystem functionality.

FY21 Status

- Cooperative agreement with University of Guam awarded late July 2021. Propagation of seeds and outplanting planning meetings ongoing.

EPR: 1 RP MAR JRM *Serianthes nelsonii* Propagation, Outplanting, and Maintenance; 61128NRSNI

2019 JRM INRMP Reference: TPS-5; 9-76

Serianthes nelsonii Monitoring, Outplanting and Management - AAFB

Location: AAFB **Period of Performance:** New CESU July 2021 – July 2022

Project Objective

Maintenance and monitoring of mature *Serianthes nelsonii* tree in Northwest Field at Ritidian point, including in situ seedlings and fence maintenance, monitoring and maintenance of outplanted seedlings, and nursery propagation and maintenance of seedlings.

Conservation Benefit

Implementation of recovery actions such as increasing populations, insuring against catastrophic events, and testing and implementing new conservation strategies.

FY21 Status

- The mature tree at Ritidian remains stable and is visited on a weekly basis. As of July 2021, there were 66 seedlings within the fence enclosure, and a total of 2,609 seeds collected from January 2020 to July 2021 (Table 10).
- Use of insect barriers, floating row covers on seedlings and an insect screened shade house have resulted in the production of a very healthy set of seedlings for outplanting after just one year in the nursery (Figure 109).
- Up to 50 new *Serianthes* saplings are planned for 2021 and will be placed at the Route 3A Reforestation site and Golf Course plot. As of July 2021, there were 64 seedlings in the rare plant nursery.
- The use of air root pruning in rootbuilder pots are producing excellent fibrous root systems, which should result in improved establishment at the outplanting sites.

Serianthes nelsonii Propagation, Outplanting, and Maintenance

Location: NBGTS **Period of Performance:** Pending Contract Award

Project Objective

Propagate, Outplant, and Maintain *Serianthes nelsonii* in the Forest Enhancement Area at NBGTS.

Conservation Benefit

It is a requirement under Conservation Measures for the 2017/2018 amendment to 2015 Biological Opinion of the Marine Corps Relocation.

FY 21 Status

- Pending contract award

EPR: DPRI: Marine Corps Relocation 2017/2018 amendment to 2015 BO, Conservation Measures to Contribute to the Recovery of Listed Species

2020 JRM INRMP Reference: TPS-5; 9-76

Cycas micronesica Conservation

Location: AAFB **Period of Performance:** MAY2021 - MAY2022

Project Objective

Maintenance and monitoring of six, 1-acre, permanent fenced cycad (*Cycas micronesica*) plots (Achae Point, Ritidian, Tarague Basin, Golf Course, Tarague North, and Tarague South) (Figure 110).

Conservation Benefit

Research and monitoring on management actions that directly benefit *Cycas micronesica*. The intent is to identify which management actions most benefit the plant and if possible, implement on a broader scale.

FY21 Status

- Recent June 2020 study indicates cycad pollen can remain viable under refrigeration for at least 2 years. May be a new method to preserve genetic diversity (Figure 111) through manual pollination efforts.
- Two new cycad plots (Tarague Triangle North and South) were established inside the Tarague Triangle ungulate exclosure.
- Installed skirt fencing reinforcing the existing perimeter fences of three cycad plots (Achae, Golf Course, Tarague Basin) to fortify from ungulates. (Figure 112)
- A systemic pesticide treatment (Merit®) continues to be applied on a quarterly basis (every 3 months) to increase the trees' resilience to invasive insect pests, while seedlings are treated with direct applications of Distance® to target scale infestations. Treatment continues to show that cycad health is preserved in the managed plots versus the control plots.
- 298 cycad seedlings are monitored and maintained in situ and ex situ. No new seedlings have survived in the areas outside of the managed plots.

Green and Hawksbill Sea Turtle Nesting Habitat – Invasive Plant and Predator Control

Location: NBG **Period of performance:** SEP2020 – SEP2021

Project Objectives

- Conduct sea turtle surveys on NBG beaches
- Monitor sea turtle nesting areas
- Conduct predator control

FY21 Status

The goal of this annually recurring project is to protect and enhance the sea turtle nesting population on NBG beaches. Between October 2020 and July 2021, the following beaches were monitored: Spanish Steps, Gab Gab, San Luis, Tipalao, Dadi, Reserve Craft, Polaris Point, Family and Haputo. Monitoring methods included visual surveys along beach transects and installation of trail cameras near nests. Turtle nesting activities were observed solely at Spanish Steps. On various days, monitor lizards and ghost crabs were observed at nesting locations. Over the ten-month period, the excavation of nearly 40 nests determined mean clutch size (n=66), mean hatch success (66%), mean emergence success (65%), and clutch size (range: 3 to 117). The wide range in clutch size, relatively low mean hatch success and emergence success, and the depredation of monitor lizards and ghost crabs demonstrate the recurring need to monitor NBG beaches and conduct predator control.

Sea Turtle Monitoring, Protection, and Educational Outreach - AAFB

Location: AAFB **Period of Performance:** JUL2018 – DEC2021

Project Objective

To implement management techniques and methodologies to monitor nesting sea turtles on AAFB. These methodologies include but are not limited to: collection of consistent data to determine population demographics, reduce mortality and increase natural survivorship, increase sea turtle awareness of AAFB units and beach stakeholders, and create/maintain a robust database for long-term monitoring data that can support future research and detect trends. Ensure active nests are protected until hatchlings emerge. Conduct two beach clean-ups and other educational outreach activities for public awareness regarding sea turtles.

Conservation Benefit

Implement recovery actions by conducting long-term monitoring to determine population estimates and abundance; provide protection of sea turtles and their nesting habitats; and conducting outreach and education to the public on sea turtles and their habitats.

FY21 Status

- Nesting activity monitoring awarded as a cooperative agreement through the CESU network to UOG and SeaGrant.
- During 2019, all nests were observed on Explosive Ordnance Disposal (EOD) and Pati Beaches only. Since 2020, nests have been recorded on all AAFB Beaches including Tarague, Scout, Sirena, Pati, and EOD. There has been a total of 225 emergences from August 2020 to present, with 172 nests and 53 false crawls (Figure 113) with an 88.9% emergence success. This is the highest recorded number of emergences ever recorded on AAFB.

- Since August 2020, seven nesting turtles were Passive Transponder (PIT) tagged and none were satellite tagged. Figure 114 provides a map of the most recently satellite tagged turtle and her movements.
- Clutch data was collected on previously marked nests located successfully either after the emergence of hatchlings or after 70 days incubation. Data from these nest inventories estimated hatching and emergence success.
- In July 2020, a nest inventory revealed a record of 135 live hatchlings within a nest which appeared to be in the process of hatching. All hatchlings were observed safely entering the ocean (Figure 115).
- Outreach events included the February 2021 EOD Beach clean-up in preparation for nesting season, presentations to Notre Dame High School, Inarajan Middle School, Oceanview Middle School, WAVE Club, and in-brief with key stakeholders such as EOD personnel, Outdoor Recreation, Security Forces, and the Marine Patrol Conservation Volunteer Program.
- Other outreach activities included public service announcements (PSA) via the AAFB Facebook Page and the development and installation of new full color “Sea Turtle Nesting Beach” signs throughout the AAFB Beaches.
- Project Final Report due December 2021.

Population Surveys and Restoration/Enhancement of Mariana Moorhen Habitat

Location: NBG **Period of performance:** Recurring Annually

Project Objectives

Conduct periodic monitoring of Mariana Common Moorhen (*Gallinula chloropus guami*) To install and monitor nesting platforms in ponds/wetlands where Mariana Common Moorhen habitat is suitable for occupancy.

Conservation benefit

Improve nesting habitat, quantify predators, and work toward goal of increasing the moorhen population in Guam. Techniques utilize goals of applied conservation and understanding of stressors and habitat use within important primary and secondary wetlands on DoD property.

FY21 Status

Monitoring has shown the presence (visual or auditory) of moorhen on all focal wetlands. Activity has been recorded through direct observation and protocol species surveys in coordination with DAWR. Many platforms installed in FY19 are experiencing various levels of deterioration but are still periodically being utilized by moorhen in most areas. During the dry season in FY21, additional wetlands were monitored for moorhen presence and as potential locations for applied conservation efforts (Table 11). Secondary wetlands, located in the remote regions of the NMS, recorded abundant presence of moorhen during FY21.

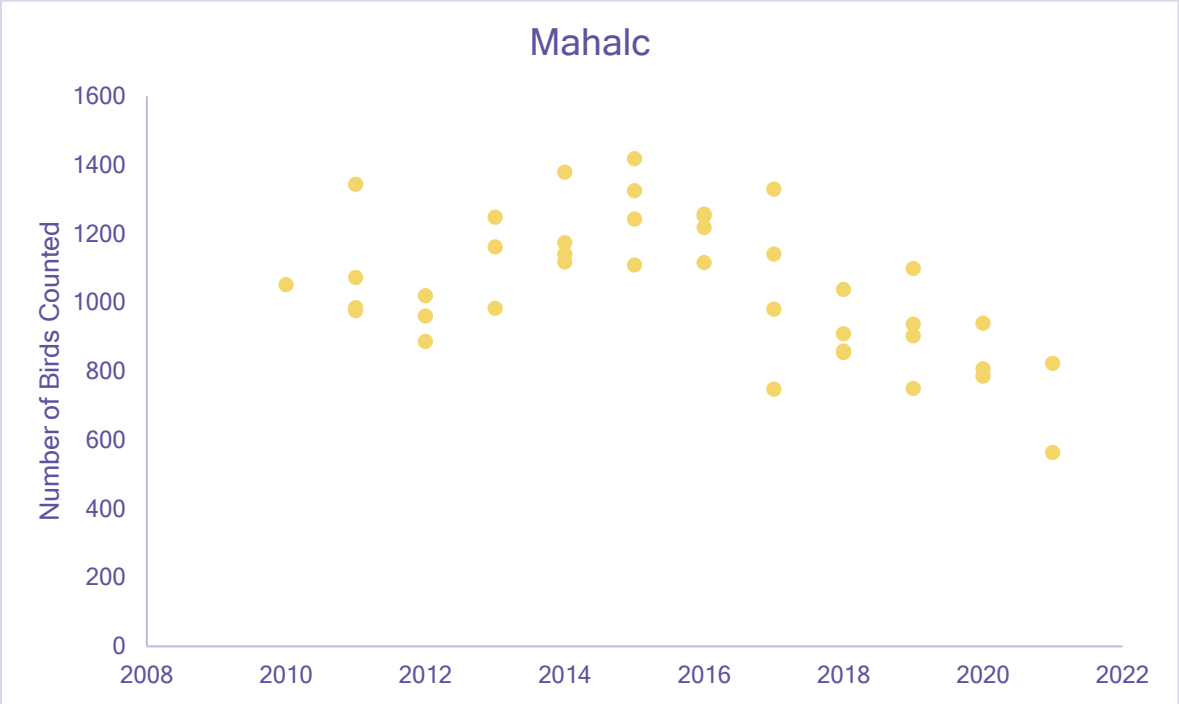
Monitoring of Mariana Swiftlets

Location: NMS **Period of Performance:** Recurring annually

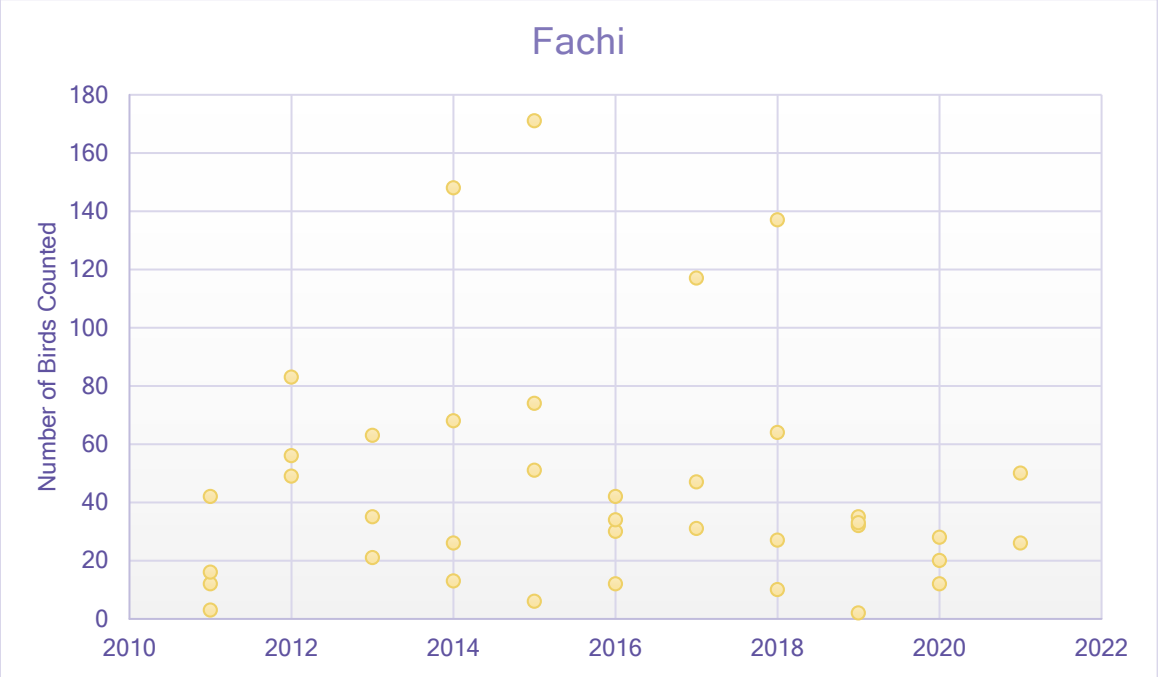
Project Objective

Monitor population trends of Mariana swiftlets (*Aerodramus bartschi*) at three caves on NMS.

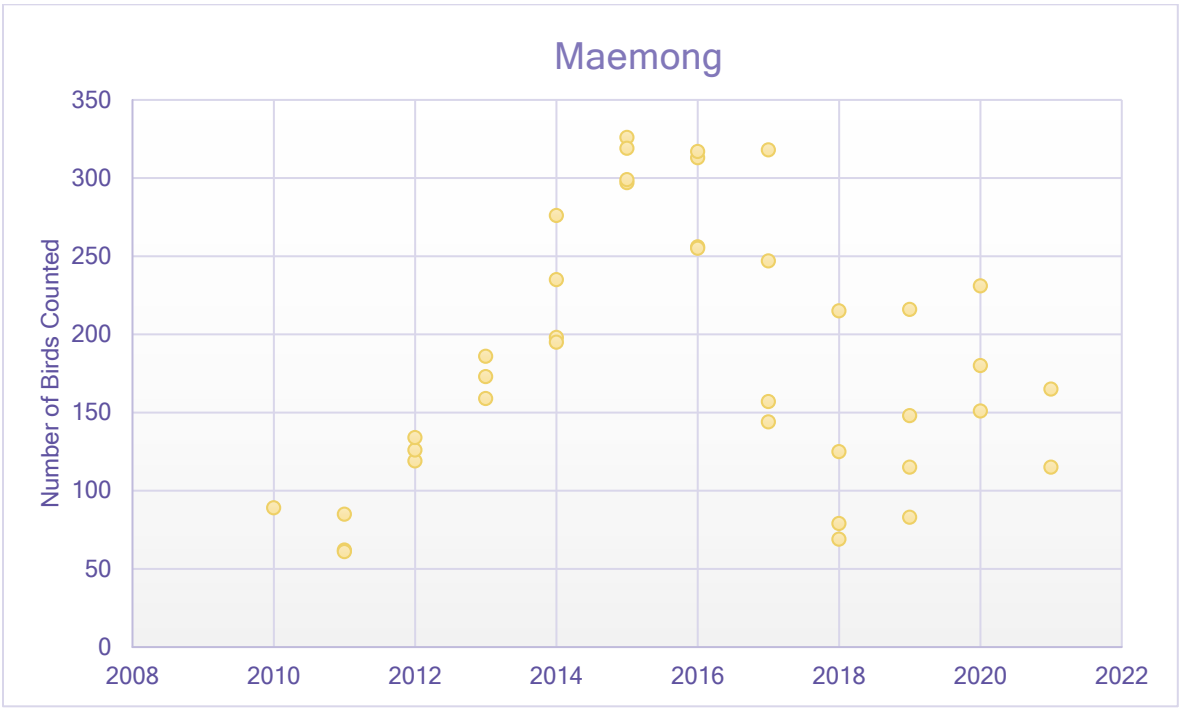
Conservation Benefit



Monitoring to allow for management actions to enhance and restore habitat, reduce habitat fragmentation, buffer protected areas, and implement new conservation strategies.



FY 21 Status



- Conducted swiftlet surveys at the three swiftlet caves on NMS Maemong, at Mahlac, and Fachi. A total of three (3) surveys occurred at each cave.
- Estimated population size of swiftlets on NMS in 2021 was 931 (Figures 117 - 120). Numbers of birds counted are down from the previous year (1031).

Figures 117 - 120. Estimated Population Size of Swiftlets on NMS from individual caves and totaled together.

Mariana Swiftlet Recovery and Habitat Use

Location: NMS **Period of Performance:** ASAP – SEP2022

Project Objective

To provide an understanding of Mariana swiftlet (*Aerodramus bartschi*) habitat use, movement, reproductive success, and breeding site selection to inform management actions and meet specific objectives identified in the USFWS Recovery Plan for the Mariana Swiftlet.

FY21 Status

- COVID Delays
- 1 of 2 MIPRs issued to begin work ASAP
- Establish thermal camera system to visualize, map, and monitor roosting and nesting locations in occupied caves.
- Monitor nesting activity and success
- Estimate roosting population size.
- Banding and radio tracking movement of adult swiftlets at caves and surrounding landscape
- Develop low-cost audio detectors to detect swiftlets prospecting of unoccupied caves.

EPR: 1 RP MAR NBG Mariana Swiftlet Habitat Use; 61755NR303

2019 INRMP References: TPS-4; 6-47

Monitoring Survival and Demography of Micronesian Starlings

Location: AAFB **Period of Performance:** JUL2019 – JAN2021

Project Objective

To monitor and analyze for Micronesian starling (*Aplonis opaca*, Sali) nest success and fledgling survival using telemetry, nest monitoring, and survey methods in relation to BTS control efforts. Through monitoring fledging survival and population recruitment efficacy of BTS control techniques are assessed based on population responses. This project is one of four projects that, collectively, will further develop information on BTS behaviors related to predation and movement in the presence of abundant avian species

Conservation Benefit

The Micronesian Starling is a useful proxy for understanding Guam forest bird ecology in the presence in of BTS. Behavior, survivorship, and population demographics could be useful for supporting future avian restoration projects and controlling BTS in low density with competing food sources in the presence of control regimes.

FY21 Status

- Agreement via the CESU network with Iowa State University (ISU)
- 292 Sali banded 2019-21
- Cats and BTS remain primary causes of mortality
- Indications suppression of BTS reduces number of fledglings killed by BTS
- Population still skewed to adults
- Period of performance renewed through February 2022

Mariana Fruit Bat Monitoring - AAFB

Location: AAFB **Period of Performance:** JAN2021 – DEC2021

Project Objective

Conduct surveys for Mariana fruit bats (*Pteropus mariannus mariannus*) at AAFB as part of long-term population monitoring and to provide analysis on the effects of aircraft overflights and behavior of Mariana fruit bats at Pati Point.

Conservation Benefit

Monitoring will allow for management actions to enhance and restore habitat and increase efforts to recover Mariana fruit bat populations in Guam.

FY21 Status

- Addresses three of the recovery criteria in the 2009 U.S. Fish and Wildlife Service (USFWS) Draft Revised Recovery Plan for the Mariana Fruit Bat or Fanihi by supporting the implementation of seven of the Recovery Actions outlined in the Draft Plan.
- The 7th Annual Base-wide Count occurred on August 7, 2020. Participants totaled 64 with 33 sightings on AAFB. Data suggests that the population appears to be increasing.
- A roost site believed to be located above the cliff line just south of the CATM range. The site was identified on 11 May 2020 with an estimated 30-40 bats, but population counts have not been conducted.
- Performing habitat quality surveys and bat sign/scat surveys to identify foraging areas.

EPR: 2 BO MAR AAFB Fruit Bat Monitoring; M5240CN041

2019 JRM INRMP Reference: TPS-2; 9-75

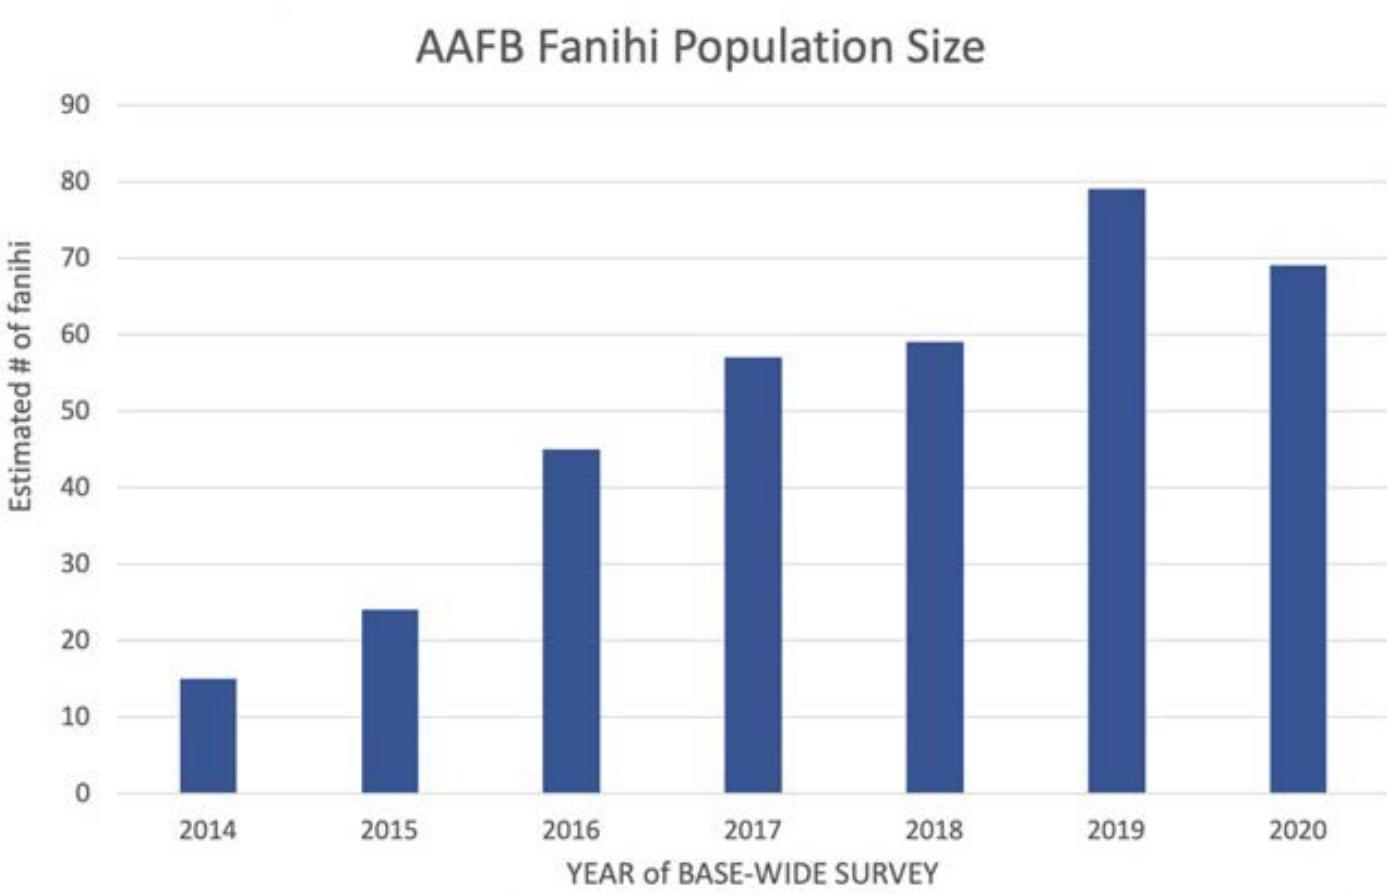

Figure 123. Estimations of AAFB Fruit Bat population size by year.

NMS Mariana Fruit Bat Monitoring – Naval Munitions Site (NMS) NBG and Tinian Military Leased Areas (MLA)

Location: NMS and MLA **Period of Performance:** JAN 2021 - AUG 2021

Project Objective

Conduct annual surveys for Mariana fruit Bats (*Pteropus mariannus marianuus*) on NMS and Tinian MLA. Search for fruit bat aggregating locations. If aggregations or new colony locations are detected, roost counts will commence in accordance with established survey protocols. If changes in roost locations, colony size, or movement are detected, investigate potential threats or stressors that may be causing disturbance.

Conservation Benefit

Management strategies and actions of the INRMP to protect and conserve Mariana fruit bats include protection and enhancement of their forested habitats, control and suppression of BTS, continued monitoring of bat populations, and control of wildland fires and ungulates. Monitoring allows for management actions to enhance and restore habitat, reduce habitat fragmentation, buffer protected areas, implement new conservation strategies, and avoid and minimize impacts to fruit bats.

FY21 Status

- NMS Surveys conducted on March 18, 2021 with ten (10) fruit bats observed; March 26, 2021 with zero (0) bats observed; and Aug 6, 2021 with fifteen (15) fruit bats observed.
- The last known counts on NMS was during the island wide bat count in 2019.
- No Tinian MLA surveys conducted FY21 due to COVID-19 travel restrictions.

MARINE PROTECTED SPECIES MANAGEMENT

Sea Turtle Aerial Surveys in FDM Nearshore Waters

Location: FDM

Period of Performance: SEP2018 - SEP2020; AUG2020 – FEB2022

Project Objective

- Design aerial transect surveys to determine sea turtle and marine mammal abundances and distributions in the nearshore waters surrounding FDM.
- Conduct aerial surveys for sea turtle and marine mammal identifications, abundances, and distributions in the nearshore waters surrounding FDM.
- Analyze sea turtle and marine mammal identifications, abundances, and distributions in the nearshore waters surrounding FDM.

Conservation Benefit

- Increase habitat for ESA-listed species (e.g., sea turtles and marine mammals).
- Support habitat areas of particular concern, which align with Magnuson-Stevens Fishery Conservation Act for Essential Fish Habitat and the Marianas Fishery Ecosystem Plan.

FY21 Status

- Final report available (2018-2020 data)
- FY21 CESU awarded to UOG Sea Grant

TERRESTRIAL EXOTIC AND INVASIVE SPECIES MANAGEMENT

Implementation of the Regional Biosecurity Plan of Micronesia and Hawaii

Location: JRM **Period of Performance:** AUG2020-JUL2021

Project Objective

Update Attachment M (DoD Biosecurity Recommendations) of the Regional Biosecurity Plan for Micronesia and Hawaii (hereafter: RBP), and implement various actions identified within the RBP aimed at: preventing the spread of invasive species into/out of Joint Region Marianas (JRM) Area of Responsibility (AOR); controlling, managing, and eradicating invasive and nuisance species on DoD lands within the JRM AOR; providing outreach and awareness to military personnel, contractors, and their respective dependents; and increasing coordination and collaboration with regional partners and DoD stakeholders regarding biosecurity and invasive species management.

Conservation Benefit

Protect native species, particularly those that are threatened and endangered from the threat of invasive species within the JRM AOR.

FY21 Status

- Implementation of biosecurity arrival and pre-departure biosecurity inspections of non-training military equipment and cargo movements into/out of JRM AOR and movements to Tinian for Seabee public works projects. Twenty (20) non-training biosecurity inspection events took place during this reporting period with seven pre-departure biosecurity events for items going to Tinian.
- Continued interagency coordination and consultation regarding invasive species management and biosecurity concerns within the region (CRB Working Group, LFA Working Group, GISC, GISAC, RISC, CNMI DLNR, Guam Biosecurity Division).

EPR: CHS NISA MAR JRM Implementation of the Regional Biosecurity Plan; 61128NR860

Invasive Species Management within the Joint Region Marianas Area of Responsibility

Location: JRM **Period of Performance:** AUG2020 – JUL2021

Project Objective

In support of Mariana Islands Training & Testing (MITT) activities, 1) conduct Early Detection Surveys (EDS) non-native species at training and cargo staging locations within the JRM AOR (Guam and CNMI (Tinian Ports, Military Leased Area, Rota Ports); 2) develop and implement standard operating procedures for the control and removal of high-risk invasive species; 3) develop and implement invasive species rapid response protocols; 4) develop and implement bio-sanitation standards along with quality assurance/quality control standards; and 5) development of a programmatic pathway risk analysis for the movement of equipment and personnel within the JRM AOR; and 6) targeting high risk invasive arthropod species for control and eradication.

Conservation Benefit

Prevent the movement and establishment of invasive species into and out of Guam and the CNMI during training exercises.

FY21 Status

Ongoing cooperative agreement Colorado State University (CSU), Center for Environmental Management of Military Lands (CEMML).

Early Detection Surveys Conducted

- Tinian MLA – 1 of 3 All-Taxa sites and Weed Surveys conducted at North Field (runways, taxiways, Dankulo beach)
- All-Taxa Surveys – AAFB: 12 of 29 sites; NBG; 9 of 27 sites
- Weed surveys – AAFB: 11 of 28 sites; NBG: 27 of 47 sites

Invasive Species Rapid Response

- No rapid response deployment events occurred during FY21

Development of SOPs for the Control/Eradication of High-Risk Species

- Little Fire Ant (LFA; Wasmannia auropuncta) revised
- Yellow-jacket (*Vespula penyslvanica & V. germanica*)

Bio-sanitation QA/QC Biosecurity Inspections during Military Training Events

- Four major training events (>100 cargo items; Valiant Shield 20, Cope North 21, Forager 21, Freedom Banner 21)
- Eight minor training events (25 – 100 cargo items)
- Six unit level training events (<25 cargo items)
- >3,000 items inspected during arrival and pre-departure biosecurity inspections to meet AFPMB TG-31 cleanliness standards
- Bio-material interceptions (plant material, seeds, soil/gravel, insects, spiders/webs/eggs, wasp nests, dead frog, etc.)(Figure 3).

Development of a Programmatic Pathway Risk Analysis for Movements into the Mariana Islands and between Islands

- Ongoing data collection to support the risk analysis

Marianas Islands Training & Testing Biological Opinion Terms & Conditions

1.1 Compliance – CNMI

Location: CNMI **Period of Performance:** AUG2018 – SEP2022

Project Objective

To comply with the Mariana Islands Training & Testing (MITT) Biological Opinion (BO) Incidental Take Statement Terms and Conditions 1.1 (as amended 28 FEB 2016) to provide funding to the U.S. Fish & Wildlife Service for invasive vertebrate pest control to minimize the effect of take on the Micronesian megapode (*Megapodius laperouse*). DoD is not responsible for project implementation or the results thereof, per the MITT Biological Opinion (BO) amended Terms and Conditions 1.1.

Conservation Benefit

To ensure compliance with the Incidental Take Statement of the 2015 MITT BO to minimize the effect of take on the Micronesian megapode.

FY21 Status

- Interagency Agreement between Joint Region Marianas and the U.S. Fish & Wildlife Service established and funding issued in August 2018.
- U.S Fish & Wildlife Service project currently in implementation phase for Micronesian megapode habitat restoration on Aguiguan.

EPR: 2 BO MAR Mariana Islands Training and Testing (MITT) Implementation; 61128NR218

2019 JRM INRMP Reference: TPS-1; 12-34

Coconut Rhinoceros Beetle (CRB; *Oryctes rhinoceros*) Surveys, Interdiction, and Monitoring - CNMI

Location: CNMI **Period of Performance:** AUG2020 – JUL2021

Project Objective

To implement CRB best management practices:

- Conduct CRB Early Detection Surveys in military training areas,
- Implement interdiction trapping during military exercises with cargo movements from Guam,
- Implement CRB awareness military personnel, and
- Implement CRB interdiction measures on Guam; and coordinate and collaborate with resources partners in the CNMI to prevent the movement of CRB to the CNMI via military cargo and transport while maintaining military readiness.

Conservation Benefit

Prevent the movement and establishment of CRB into the CNMI during military activities.

FY21 Status

- Conducted CRB Early Detection Surveys along roadways in the Military Leased Area on Tinian for CRB damaged coconut trees (Jul/Aug 2021)
    - No CRB damage detected
- Conducted surveys for dead coconut trees within the Tinian MLA
- Deployed and monitored CRB panels traps at North Field during Forager 2021 exercise (Jul/Aug 2020)
- Assisted CNMI DLNR CRB Interdiction Program in providing CRB tekken netting trap supplies and pheromone packets to supplement CRB trapping efforts around the Tinian International Airport during military training events (Jul/Aug 2021)
- Provide military personnel with CRB awareness information and CRB sighting protocols during military training exercises conducted in the CNMI (Jul/Aug 2021)
- Pre-departure biosecurity inspections were conducted on all cargo and equipment prior to transport from Guam to CNMI during military exercises to ensure all items were devoid of bio-material (including CRB)
- Coordinated CRB interdiction measures during FY21 exercises on Tinian with CNMI natural resources partners

EPR: 2 BO MAR Mariana Islands Training and Testing (MITT) Implementation; 61128NR218

TERRESTRIAL PROTECTED SPECIES MANAGEMENT

Cycad Conservation – Tinian

Location: Tinian, CNMI **Period of Performance:** APR2020 – APR2021

Project Objective

To conserve representative plants of *Cycas micronesica* populations from Guam (ongoing project from 2007).

Conservation Benefit

Increase populations, ensure resiliency to catastrophic events, and test and implement new conservation strategies.

FY21 Status

- The project continues to be implemented by UOG Plant Extinction Prevention Program.
- The April 2021 health assessment recorded a slight increase in survival rate from 2019 to 2021 (85%) compared to 2017-2019 (81%). ~850 live cycads remain over the 24 plots.
- While the cycad scale infestation has spread to half of the plots and contributed to mortality, the highest mortality occurred in savannah plots where there was little scale infestation.
- No management was conducted April-December 2020 due to Covid-related travel issues. Management resumed with a CNMI-based contractor conducting vegetation clearing starting in January 2021 and application of a systemic pesticide (Merit) in March 2021.
- The current cooperative agreement was awarded to UOG in May 2021. An entomologist was added to the UOG project team to consult on pest management options. UOG is seeking a new CNMI-based partner to implement the fieldwork.
- Established protocols prevent transfer of scale or other invasive species between Guam and Tinian, and between Tinian plots.

EPR: 1 CP MAR Conservation Management of Tinian Cycads; 61128NR162

Sea Turtle Nesting Surveys – Tinian

Location: Tinian, CNMI **Period of Performance**: JUN2020 - JUN2021

Project Objective

Ongoing monitoring of sea turtle nesting on Tinian MLA beaches.

Conservation Benefit

Long-term sea turtle nesting trends inform our understanding of the success and urgency of management efforts.

FY21 Status

- Biweekly surveys resumed July 3, 2020.
- Tinian MLA beaches supported an estimated 3 nesting Green Sea Turtles (GST) during the 2020 nesting season, and 3 GST during the 2021 nesting season thus far. (Figure 9)
- A total of 33 nests and eight non-nesting emergences (all GST) were recorded during the performance period. From 2009-2019, an average of 26 total nesting activities were recorded across Tinian MLA beaches annually. (Figure 10)
- Nests were recorded at all beaches except Chiget. Tidal inundation was the primary threat impacting hatching success of 26% of nests.

EPR: 1 S RP MAR CNMI ESA and MBTA Species Management; 61128NR211

2019 JRM INRMP Reference: TPS-2; 11-64

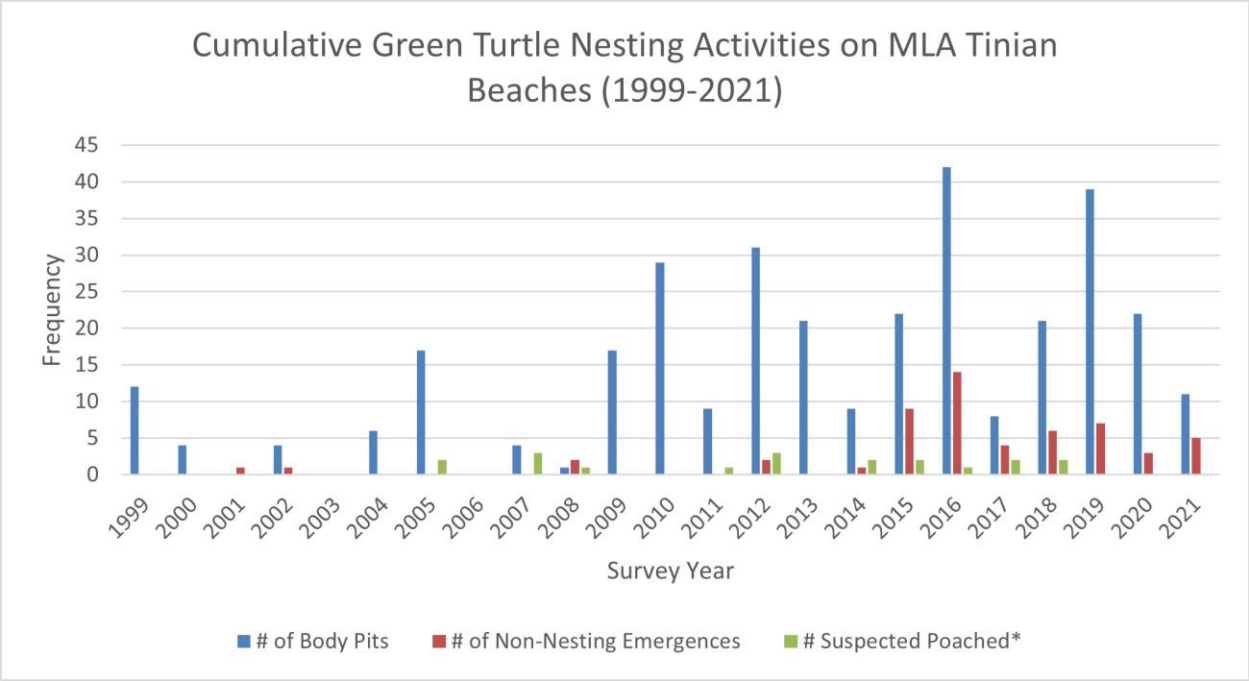

Figure 8. GST Nesting Activities on MLA Tinian Beaches (1999-2021)

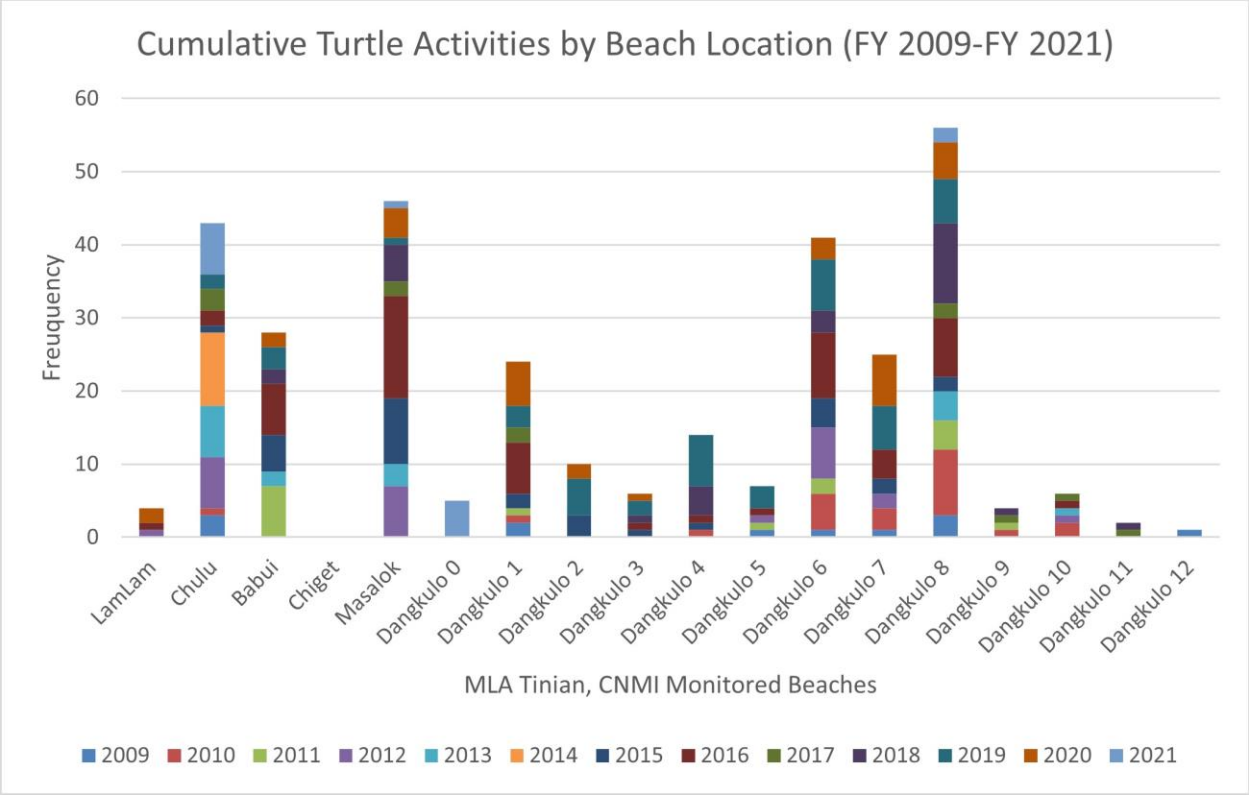

Figure 9. Turtle Activities by Beach Locations (2009-2021)

Beach Cleanups on the Tinian MLA

Location: Tinian, CNMI **Period of Performance:** JUN2020 – JUN2021

Project Objective

Removal of marine debris from all sea turtle nesting beaches in the Military Lease Area (MLA). Cleanup is conducted at least annually.

Conservation Benefit

The removal of marine debris benefits sea turtles by preventing entanglements and allowing successful nest excavation and egg deposition, and reduces the potential for ingestion of debris by seabirds.

FY21 Status

- A total of 5,789 lbs of debris were removed from 18 MLA beaches during five cleanup events.
- The top four materials collected by weight were plastic (67.3%), fishing gear (22.0%), footwear (4.9%), and glass (4.0%).
- All bags were transported from Tinian to the Lower Base Refuse Transfer Station located on Saipan, CNMI for final disposal.

Concrete barrier - Sea Turtle Conservation – CNMI

Location: Tinian, CNMI **Period of Performance:** ONGOING

Project Objective

The intent of this contract is to fabricate, paint, transport and place, eighty (80), six foot concrete barriers to North Field, Military Leased Area, Tinian. Barriers will be placed on MLA beach access roads with input from CNMI resource partners on placement.

Conservation Benefit

Poaching and predation of sea turtle nests and recreational use of sea turtle nesting beaches have resulted in disturbance of habitat and illegal intentional take of these endangered species. Concrete barriers will prevent vehicles from disturbing nesting female turtles, their nests and nesting habitats.

FY21 Status

- Barriers moved in OCT 2019. They are currently stored at NW field.
- Indo-PACOM Liaison officer last communicated with Tinian Mayor's office in June 2021. Awaiting Mayor's review.

EPR: 1 RP MAR CNMI ESA and MBTA Species Management Tinian; 61128NR211

2019 JRM INRMP Reference: TPS-2; 11-64

Surveys for Micronesian Megapodes and Mariana Fruit Bats

Location: FDM **Period of Performance:** OCT2020 – SEP2021

Project Objective

- To conduct Micronesian megapode (*Megapodius laperouse*) surveys along established trails and paths to use as an index of megapode population change over time;
- Record Mariana fruit bats (*Pteropus mariannus mariannus*) observed during surveys, and
- Conduct habitat ground surveys to monitor habitat change over time per the 2015 Mariana Islands Training and Testing (MITT) BO terms and conditions.

Conservation Benefit

To ensure compliance with the Incidental Take Statement of the 2015 MITT BO.

FY21 Status

- Survey conducted on April 25, 2021 at nine stations previously established and two new stations established during this survey (Figure 5).
- A total of nine (9) Micronesian megapodes were detected during the playback survey effort on 11 survey stations.
- No Mariana fruit bats observed while conducting megapode surveys.
- Vegetation photo points collected at 7 of 11 survey stations.
- Final survey reports expected in December 2021.

EPR: BO MAR Mariana Islands Training and Testing (MITT) Implementation; 61128NR218

2019 JRM INRMP Reference: TPS-1; 12-34

Mariana Common Moorhen Surveys – Tinian

Location: Tinian, CNMI **Period of Performance:** SEP2020-AUG2021

Project Objective

Ongoing monitoring of moorhens (*Gallinula chloropus guami*) at Hagoi and Bateha wetlands in the Tinian MLA. (Previous Mariana Islands Range Complex [MIRC] BO Requirement, continued as an INRMP project).

Conservation Benefit

Long-term population trends inform our understanding of the success and urgency of management efforts.

FY21 Status

- Four surveys were conducted at Lake Hagoi in 2021. Total detected moorhen were 23 in January, 10 in March, 13 in May, and 18 in July with water present during all surveys (Table 2, Figure 13 and 14).
- Five total nests and 6 total eggs were observed at Lake Hagoi during March and May surveys.
- Long-term population trend at Hagoi appears to be stable.
- Two surveys were conducted at the Bateha wetlands in January and July. No water was present during either survey and no moorhens were detected.
- A new cooperative agreement was established in August 2021 that substantially expands the project scope.

Tinian Forest Bird Monitoring and Assessment

Location: Tinian, CNMI **Period of Performance:** SEP2018 – MAR2022

Project Objective

Monitor forest bird populations with a focus on Tinian monarch and Micronesian megapode. Conduct basic ecological studies of Tinian monarch to guide future management strategies.

Conservation Benefit

Long-term population trends inform our understanding of the success and urgency of management efforts. Tinian monarch research will enable effective and efficient management for Tinian monarch.

FY21 Status

- Field data collection commenced in February 2021.
- Forest bird VCP surveys were conducted on the MLA at 123 stations across 5 transects in May/June 2021. Data analysis is pending.
- Two Micronesian megapode playback surveys were completed at 34 stations in limestone forest on the MLA in May/June 2021. No megapodes were detected.
- Tinian monarch research as of July 31, 2021:
    - 89 birds banded
    - Ongoing monitoring of 50 territories in three habitat types
    - 15 nests found. Of these, four nests are active. Three successfully fledged. Six nests failed due to predation by cat, rat, or Mariana kingfisher. One nest failed for unknown reason, and one nest was abandoned.
    - Vegetation surveys (paired plots) completed at 11 nests
    - Telemetry will begin fall 2021

MIGRATORY BIRD MANAGEMENT

Monitoring of MBTA-Listed Bird Species – FDM

Location: FDM **Period of Performance:** OCT2020 – SEP2021

Project Objective

To identify migratory bird species on FDM; examine trends in abundance; identify and quantify suitable habitat relationships of migratory birds. Monitor long-term trends of three booby species (Brown, Masked, Red-footed) on FDM via aerial surveys.

Conservation Benefit

Provides information of bird species present and habitat usage to guide implementation of appropriate conservation practices.

FY21 Status

- No aerial seabird surveys conducted during this reporting period.
- JRM continuing to explore options to continue monitoring long-term seabird trends for the three booby species.
- During Micronesian megapode surveys on April 25, 2021, nesting Sooty terns and juvenile Sooty terns were observed on the ground along the eastern cliff line, the three species of booby were observed on island and in flight, and species observed in flight: Greater frigatebird, Oriential partincole, Pacific reef-heron, Brown noddy, Black noddy, and White tern.

NATURAL RESOURCES EDUCATION AND OUTREACH

JRM Natural Resources Stewardship Outreach & Public Engagement Program

Location: JRM AOR **Period of Performance:** AUG2020 - AUG2021

Project Objective

To develop materials and training enabling JRM Natural Resource (NR) managers to effectively and efficiently implement a NR stewardship engagement program. This program aims to better educate uniformed and civilian staff, their dependents, JRM contractors, and the general public in order to improve NR stewardship and awareness within the Area of Responsibility (AOR). The AOR includes DoD lands within Guam and the CNMI.

Conservation Benefit

The 2019 INRMP outlines JRM NR responsibility to reach as many uniformed and civilian staff, their dependents, and JRM contractors with focused, consumable environmental education and outreach. The development and production of NR education materials and training is a beneficial support to increasing awareness of T&E species, proper stewardship behavior, and threats to local ecosystems.

FY21 Results

- Swag materials produced
- Planned dissemination of swag materials throughout JRM AOR by DEC 2021
- Training and Outreach presentations created and delivered
- Project finalized AUG 2021

2019 JRM INRMP Reference: TEDU-1; 5-91, MEDU-1; 5-104

PACFLT Funded JRM Natural Resources Stewardship Outreach & Public Education Program

Location: JRM AOR **Period of Performance:** AUG2020 - AUG2021

Project Objective

Improve NR stewardship and awareness within DoD lands within Guam and the CNMI

Conservation Benefit

The development and production of NR education materials and training is a beneficial support to increasing awareness of T&E species, proper stewardship behavior, and threats to local ecosystems.

FY21 Results

- Planned expansion of outreach to CNMI
- Development of Stewards of the Sea branded sustainable products
- Continued implementation of Young Environmental Stewards youth educational program
- Held art contest for YES! logo
- Rash guards and stickers for YES! participants produced with logos from art contest

Subject: FY21 Joint Region Marianas Natural Resources Metrics - September 2021

Hafa Adai Resource Partners,

I hope you are all doing well! I would like to get the FY21 Joint Region Marianas Natural Resource Metrics meetings on your calendars for the following dates:

16 Sep: CNMI
22-23 Sep: Guam

We are planning to have the meetings be available in person and virtually. More information regarding the venues and agenda will be provided prior to the meetings.

Thank you and we look forward to seeing everyone again.

Best,

Jennifer Cruce Horeg
Conservation Resources Program Manager

Subj: FISCAL YEAR 2022 NATURAL RESOURCES/INTEGRATED NATURAL RESOURCES MANAGEMENT PLAN METRICS SUMMARY REPORT

Ref: (a) OPNAV-M-5090.1

Encl: (1) JRM INRMP Summary of FY22 Projects for Guam and CNMI
(2) FY 2022 Natural Resources INRMP Metrics Results
(3) FY 2022 Natural Resources INRMP Metrics Invitation and Attendee List

1. In accordance with reference (a), Navy installations are required to submit an annual report summarizing the recent Natural Resources/Integrated Natural Resources Management Plan (INRMP) Metrics meeting and status of the INRMP enclosure (1). The Natural Resources/INRMP Metrics summary scores presented in enclosure (2) are generated from the Navy Conservation website to reflect current status of INRMP execution.

2. The Fiscal Year (FY) 22 Joint Region Marianas (JRM) Natural Resources/INRMP Metrics meeting for Commonwealth of the Northern Mariana Islands (CNMI) resource partners was held at the Pacific Islands Club in Saipan on September 15, 2022 and the JRM INRMP Metrics meeting for Guam resource partners was held at the Hyatt Regency Guam on September 21 and 22, 2022 enclosure (3).

3. The Final 2019 JRM INRMP was completed and signed by partner agencies (U.S. Fish and Wildlife Service, National Marine Fisheries Service, Guam Department of Agriculture, and CNMI Department of Land and Natural Resources-Division of Fish and Wildlife) in June through August 2019. Annual updates are conducted each calendar year beginning in 2020 and a 5-year review for operation and effect will be conducted in 2024 per the OPNAVINST 5090.1E, reference (b), sections 670a-f. The FY22 JRM INRMP update will be completed and distributed in March 2023.

4. Thank you for your participation in our Natural Resources/INRMP Metrics meeting and for your support of the JRM Natural Resources Program. If you have any questions, please contact Jennifer Horeg, Natural Resources Program Supervisor, at 671-339-1275 or via e-mail at Jennifer.a.horeg.civ@us.navy.mil.

MARINE HABITAT MANAGEMENT

JRM Marine Invasive Species Management Plan (JRM MISMP)

Location: JRM AOR **Period of Performance:** OCT 2022 – SEP 2023

Project Objective

To develop standard operating procedures (SOP) and protocols to avoid and minimize: (1) the spread of new marine invasive species (MIS) into the Department of Defense (DoD) submerged lands within the JRM Area of Responsibility (AOR), and (2) the transfer of any MIS from DoD submerged lands within the JRM AOR to the Pacific region.

Conservation Benefit

The development of SOPs and protocols for a MISMP shall support natural resource managers to monitor, detect, respond, control, eradicate, and prevent the risk of MIS incursions into, out of, and within the JRM AOR, thus maintaining marine biodiversity and ecosystem functions within JRM's AOR.

FY22 Status

- Awarded August 22, 2022

EPR: 61128NR168: Ecosystem Monitoring and Coral Reef Indicators

2019 JRM INRMP Reference: MIS-1; 5-102, MIS-2; 5-102, MIS-1; 8-64, MIS-2; 8-65, MIS-1; 9-88, MIS-2; 9-88, MIS-1; 11-75, MIS-2; 11-75

Water Quality Monitoring on JRM Submerged Lands

Location: JRM AOR **Period of Performance:** JUN2021 – Ongoing

Project Objective

To quantify the conductivity, temperature, depth, pH, chlorophyll A, dissolved oxygen, nitrate, and phosphate concentrations in shallow reef systems.

Conservation Benefit

These quantitative data will assist in determining the parameters associated with climate change that may be impacting coral reefs in order to avoid, minimize or mitigate potential adverse effects to the marine resources within these areas, especially marine protected species.

FY22 Status

- Ongoing project with the UOG WERI
- Fieldwork was delayed due to COVID-19
- Sensor deployment is ongoing for Guam and will be completed by SEP 2022
- Sensor deployment is planned for OCT 2022

EPR: CHS MAR JRM Monitoring and Control of Acute Impacts on Coral Reefs; 61128CN222

2019 JRM INRMP Reference: MIS-2; 8-65, MHM-1; 8-62, MHM-2; 8-63, MHM-3; 8-63, MGIS-1; 8-68, MHM-1; 11-73, MHM-2; 11-74, MHM-3; 11-74, MIS-2; 11-75, MPS-1; 11-76

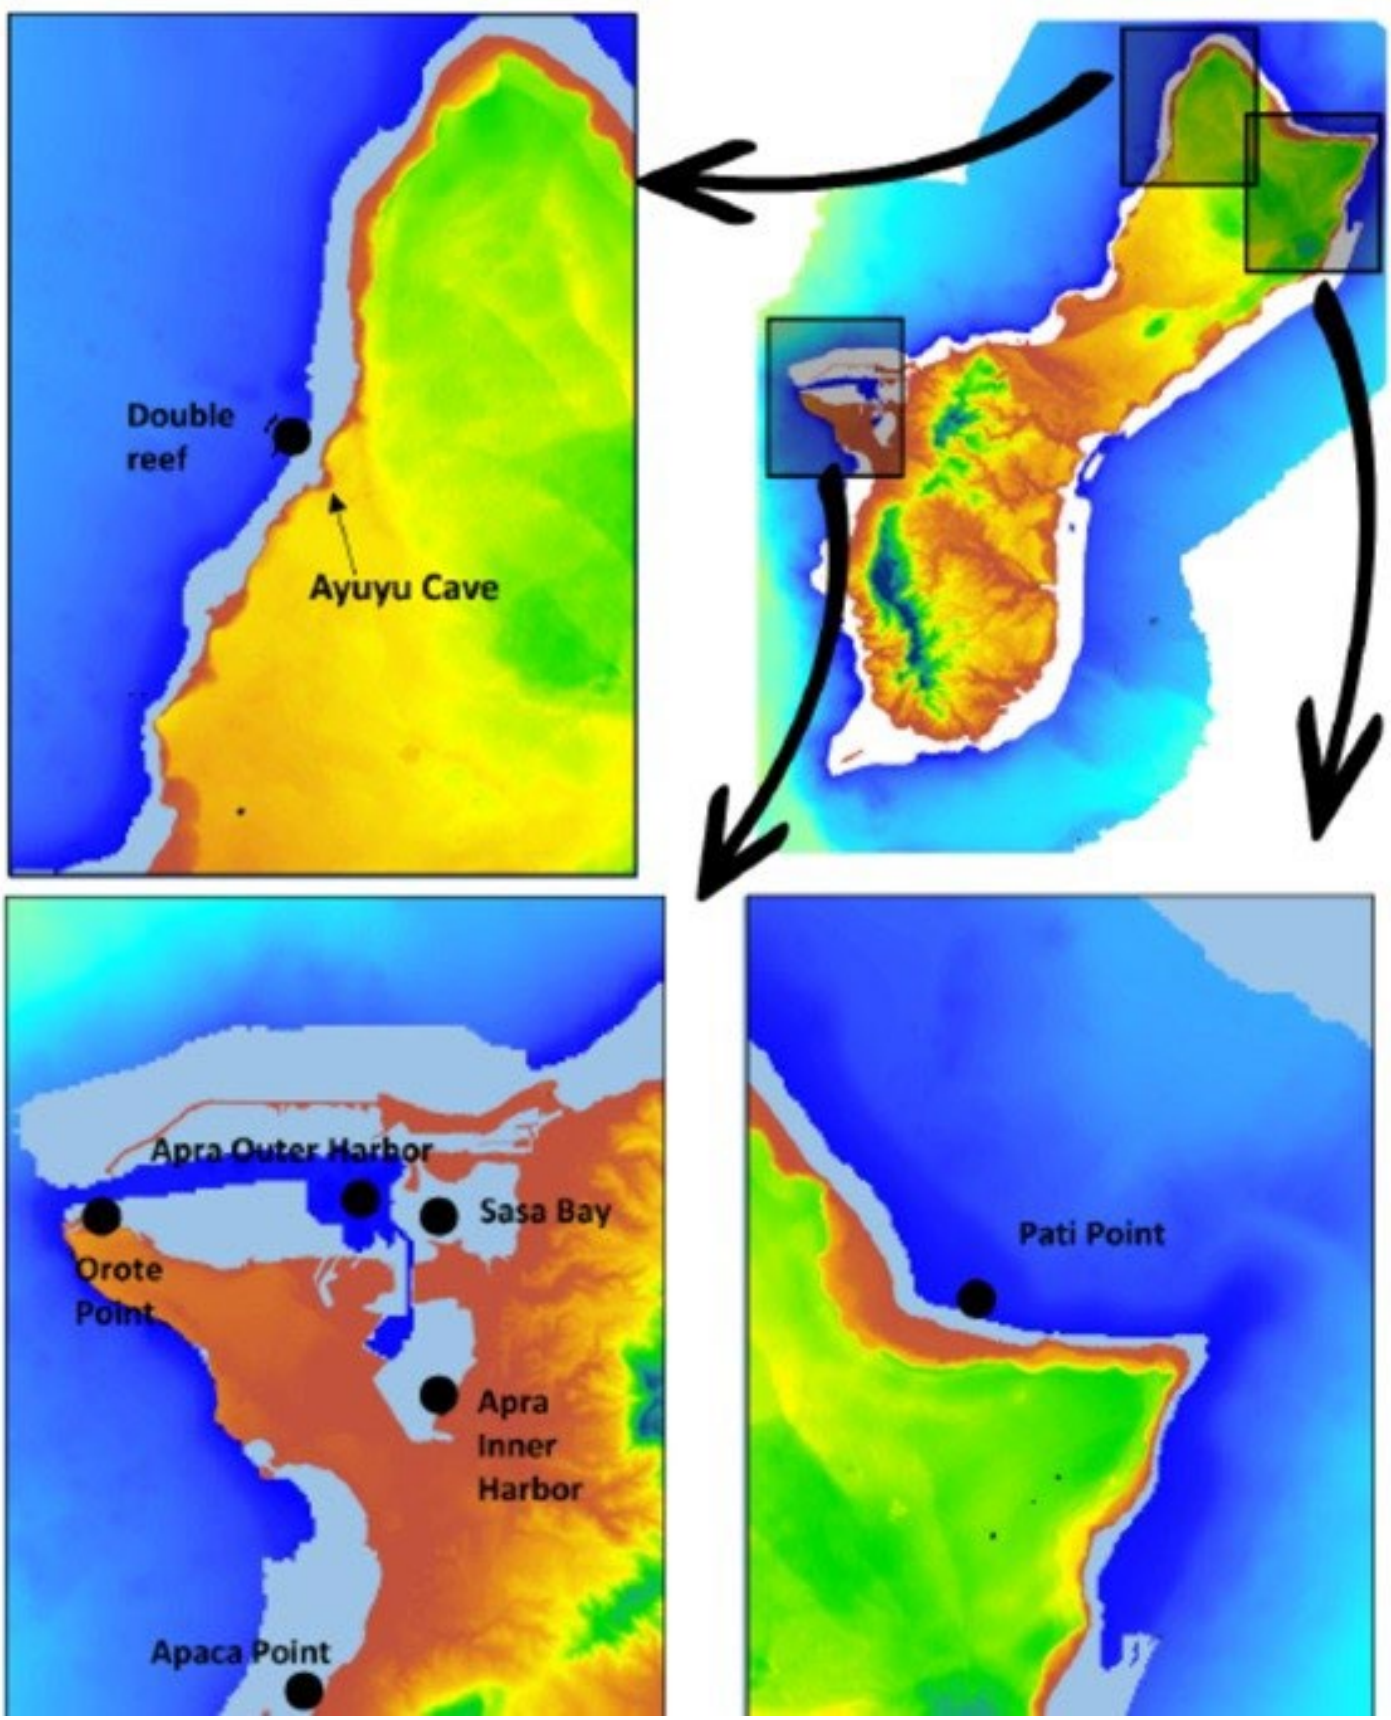

Figure 1. Proposed deployment locations of water quality sensors in JRM submerged lands, Guam.

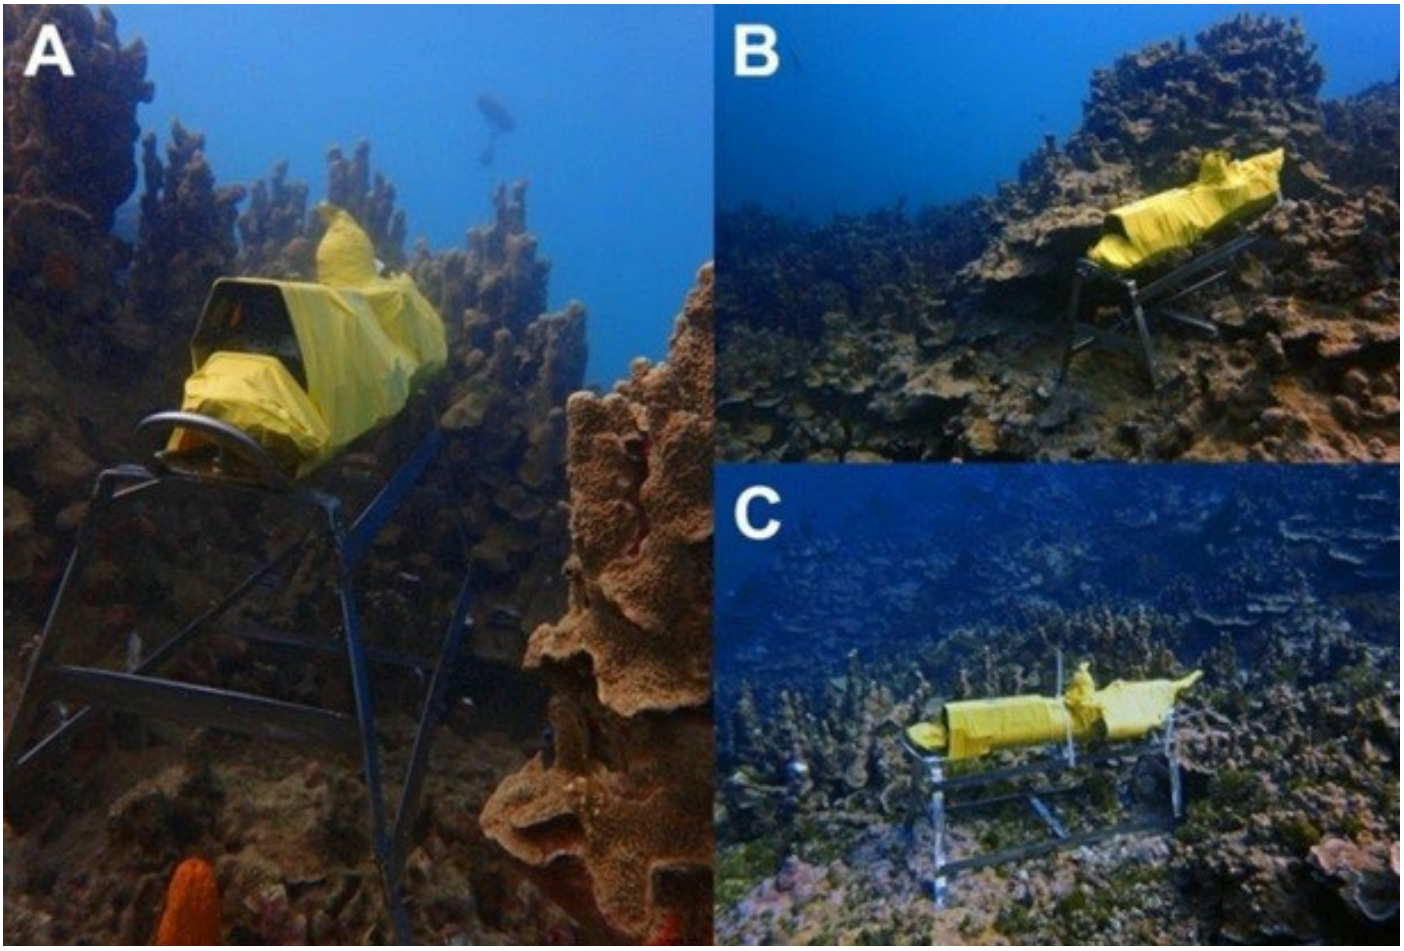

Figure 2. In 2014, several SeaBird water quality sensors (model 19plus V2) were deployed and installed on a (stainless steel) mounting frame in Apra Harbor, Guam (A = Anchor Reef; B = Middle Shoals; C = Orote Point). For this proposed action, the same methodology will be employed.

Figure 3. A CTD sensor mounted on a stainless steel frame. The mounting frame will be installed on the benthic substrate so that the sensor can be easily retrieved for data acquisition and servicing, and also prevents physical contact with the benthic substrate.

Identification and Removal of Non-Permitted Buoys on JRM Submerged Lands

Location: NBG **Period of Performance:** JUL2020 - SEP2022

Project Objective

To identify, locate, and remove the non-permitted buoys (NPBs) in JRM submerged lands.

Conservation Benefit

The identification, location, and removal of NPBs will allow individuals to use authorized (i.e., USACE-permitted) moorings in order to avoid, minimize or mitigate potential adverse effects to the marine resources within these areas, especially marine protected species.

FY22 Status

- Ongoing project with the Navy Information Warfare Center
- Fieldwork was delayed due to COVID-19; completed in July 2021
- 26 total buoys were located (10 in Orote ERA and 16 in the harbor); of the 19 Shallow Water Mooring System (SWMS) buoys deployed in 2019 , 14 were located and five were not located.

EPR: CHS MAR JRM Monitoring and Control of Acute Impacts on Coral Reefs; 61128CN222

2019 JRM INRMP Reference: MIS-2; 8-65, MHM-1; 8-62, MHM-2; 8-63, MHM-3; 8-63, MGIS-1 8-68

Figure 7. A possible NPB in Apra Harbor, Guam showing extensive damage to the surrounding benthos.

Figure 8. A possible NPB in Apra Harbor, Guam showing extensive damage to the surrounding benthos.

Coral Bleaching and Crown of Thorns Seastar (COTS) Monitoring on JRM Submerged Lands

Location: JRM AOR **Period of Performance:** JUN2021 – Ongoing

Project Objective

To quantify the coral bleaching and abundance distribution of COTS, and if necessary conduct COTS culling.

Conservation Benefit

These quantitative data will assist in determining the parameters associated with coral bleaching and COTS outbreak events that may be impacting coral reefs in order to avoid, minimize or mitigate potential adverse effects to the marine resources within these areas, especially marine protected species.

FY22 Status

- Ongoing project with the UOG Sea Grant Office
- Fieldwork was delayed due to COVID-19; fieldwork is ongoing for Guam
- COTS workshop hosted on March 21-22, 2022; consisted on classroom and in-water training; participants from state, federal, and NGO participants

EPR: CHS MAR JRM Monitoring and Control of Acute Impacts on Coral Reefs; 61128CN222

2019 JRM INRMP Reference: MIS-2; 8-65, MHM-1; 8-62, MHM-2; 8-63, MHM-3; 8-63, MGIS-1; 8-68, MHM-1 11-73, MHM-2; 11-74, MHM-3; 11-74, MIS-2; 11-75, MPS-1; 11-76

Characterization of Marine Benthic Habitats in Outer Apra Harbor Guam and Haputo ERA

Location: NBG; MCBCB **Period of Performance** SEP2019 – Ongoing

Project Objective

To provide habitat predictions and maps of submerged lands (i.e., coral reef) in Outer Apra Harbor and Haputo ERA using a variety of GIS data (e.g., lidar, side scan, multibeam, aerial imagery, etc.) and underwater photos and videos.

Conservation Benefit:

Identification and characterization of the marine benthic habitats will inform military training and testing, as well as the consultations with regulatory agencies, in order to avoid, minimize or mitigate potential adverse effects to the marine resources within these areas, especially marine protected species.

FY22 Status

- Ongoing project with the NOAA NCCOS
- Fieldwork completed May 1-13, 2022 at Outer Apra Harbor and Haputo ERA
- A drop camera, mapping grade global positioning system (GPS) and ultra-short baseline (USBL) equipment were used to collect 24 MP photographs, HD video, and location data at over 500 sites throughout the project areas.
- Ground control points (GCPs) were recorded at ~20 locations in the project areas on land
- Data acquisition complete and analyses ongoing

EPR: 1 CP MAR NBG Benthic Habitat and Coral Mapping and Management (CHS); 61755NR818

2019 JRM INRMP Reference: MIS-2; 8-65; MHM-1; 8-62, MHM-2; 8-63, MHM-3; 8-63, MGIS-1; 8-68

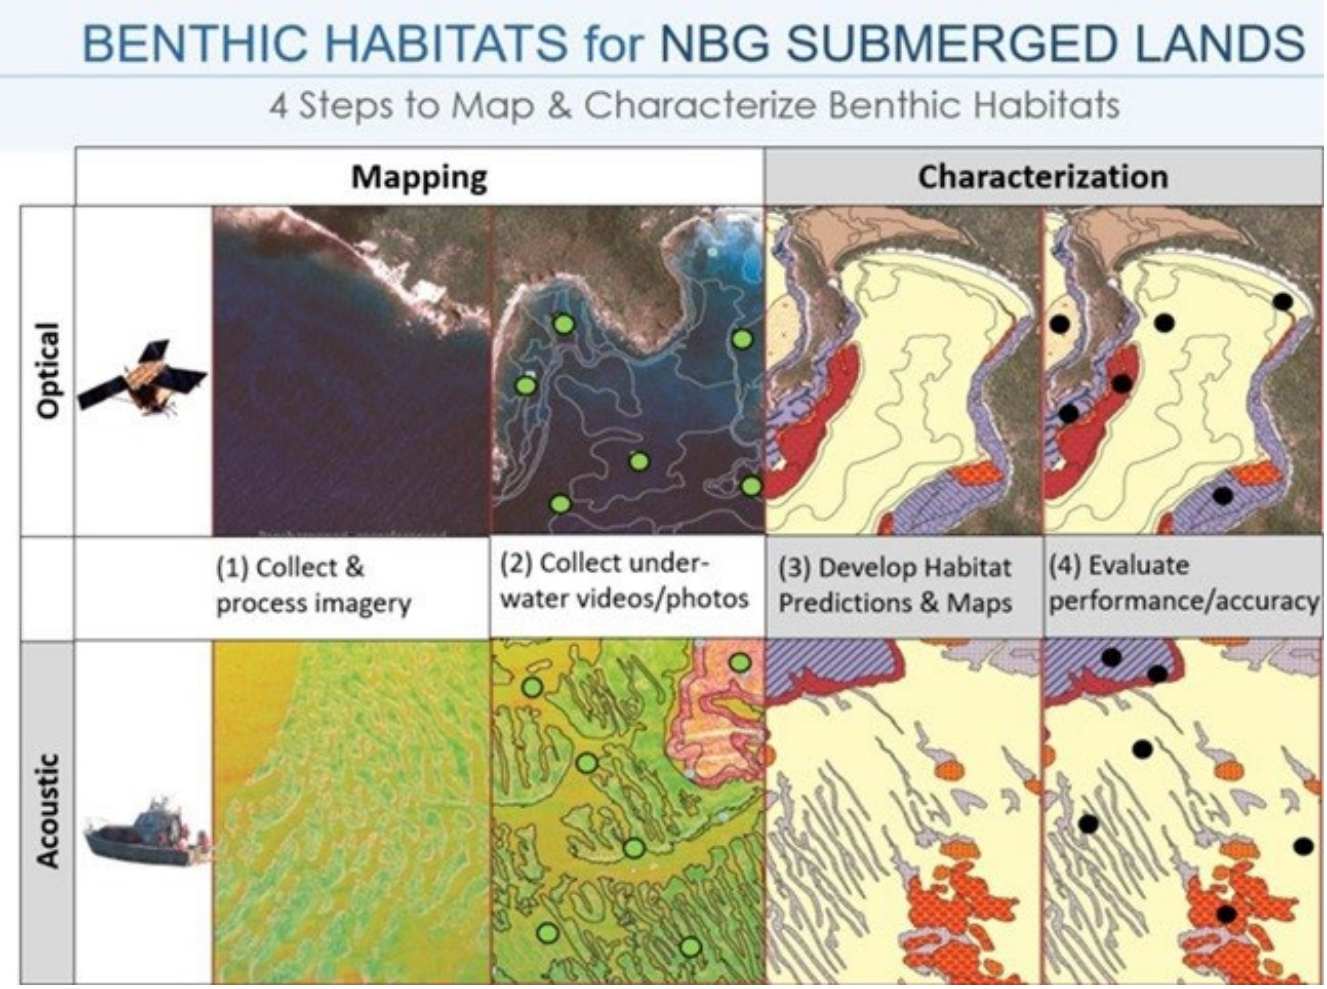

Figure 9. The process of mapping and characterizing benthic habitats in Outer Apra Harbor and Haputo ERA.

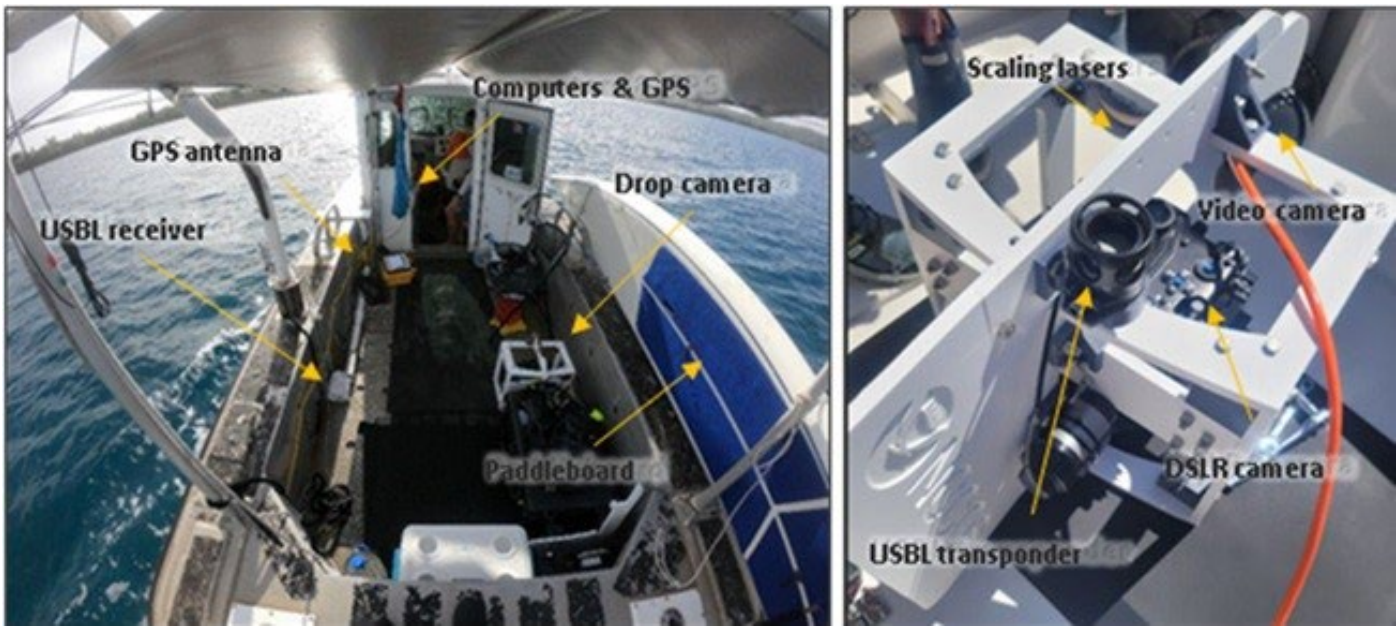

Figure 10. (Left) Vessel set up and (right) drop camera used to collect information about benthic habitats in/around Haputo ERA and NBG. The drop camera was designed and 3D printed by NOAA NCCOS, and included DSLR camera (for high resolution photographs), video camera (for real-time feed), USBL (for underwater positioning), GPS (for above water positioning) and lasers (spaced at 10cm for scaling).

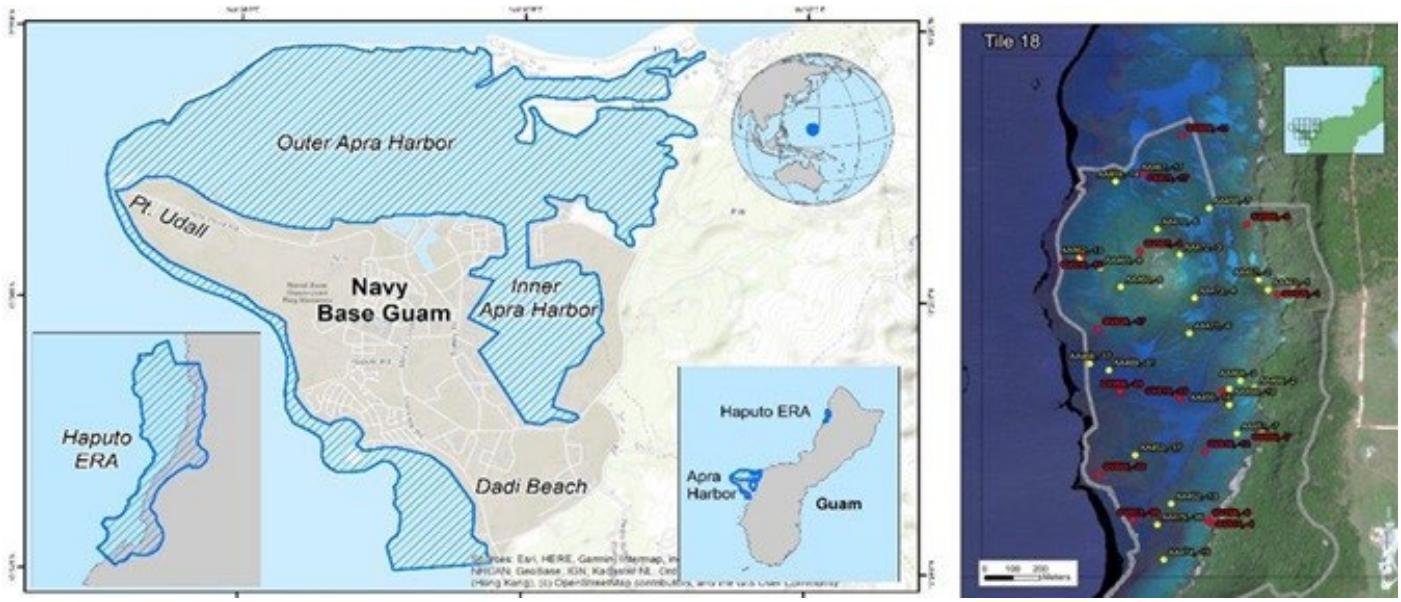

Figure 11. (Left) Map showing location of field work (blue hatched areas), including NBG and Haputo ERA. (Right) Map showing a subset of sites photographed in/around Haputo ERA.

Figure 13. Giant Triton (*Charonia tritonis*) eating a sea star (*Linckia laevigata*) in Outer Apra Harbor, Guam.

MARINE PROTECTED SPECIES MANAGEMENT

Sea Turtle Distribution and Habitat Use

Location: NBG **Period of Performance:** AUG2018 - SEP2022

Project Objective

In an effort to protect and enhance sea turtle population in the marine waters of Navy-submerged lands, JRM entered a multi-year interagency agreement with NOAA NMFS. The goal of this project is to understand the distribution and habitat use of sea turtles on Navy-submerged lands. Information generated from the project will inform management actions to protect sea turtles and be used to assess potential impacts from proposed actions within Navy-submerged lands.

Conservation Benefit

The conservation benefits of project are to (a) sustain and enhance the sea turtle population; (b) maintain sea turtle species range and distribution; and (c) increase the use of adaptive management techniques for sea turtles.

FY22 Status

- Local participation from DAWR, USFWS, Sea Grant, JTS
- In-water surveys/capture occurred in Jul 2022
- 11 green/hawksbill sea turtles satellite-tagged
- Data analyses expected in Oct 2022
- Multi-year report to be submitted in CY 2023

EPR: 1 S CP MAR NBG Sea Turtle Distribution and Habitat Use; 61755NR815

2019 JRM INRMP Reference: MPS-2; 5-103

Table 1. Summary of turtle observations, captures and satellite tag deployments between 2015 and 2022.

	Turtle Encounters	
Survey Year	Observerd + Captured	Satellite-Tagged

TERRESTRIAL EXOTIC AND INVASIVE SPECIES MANAGEMENT

Monitoring to Evaluate Effectiveness of HACCP Plan Implementation at Construction Sites

Location: MCBCB; NBG; AAFB **Period of Performance:** Multiple

Project Objective

Monitor terrestrial vegetation to aid in evaluating the success of implemented HACCP plans. The goal is to minimize the spread and effects of invasive plant species due to construction activities.

Conservation Benefit

Invasive species are among the greatest threats to Guam's native habitats and listed species. HACCP plans are an operational tool to minimize the spread of invasive species between sites and to prevent new introductions.

FY22 Status

- Ongoing projects for construction activities:
- J001B Finegayan Utilities and Site Improvements Phase 1
- J-006 Apra Medical Clinic
- J-007 Waterfront Head Quarters
- J-609 Apra Embark Facility
- J-755 Urban Combat Training
- P-103 Water Well Field
- P-290 Earth Covered Magazines
- P-295 Ordnance Ops.
- P-296 Ordnance Ops. Admin Facility

- P-715 Live-Fire Training Range Complex Known Distance Ranges
- P-735 Machine Gun Range

Reference: Guam Relocation Biological Opinion

Figure 16. All MCBCB construction sites have washdown areas to reduce risks of spreading invasive species.

Implementation of the Regional Biosecurity Plan of Micronesia and Hawaii (RBP) - Guam

Location: JRM AOR **Period of Performance**: AUG2021 - Ongoing

Project Objective

Implement priority actions from the RBP aimed at: 1) Preventing the spread of invasive species within and in/out of JRM Area of Responsibility (AOR); 2) Foster regional coordination and collaboration; 3) Invasive species management and control; and 4) Strengthening capacity for biosecurity.

Conservation Benefit

Protection of native species, particularly those that are threatened and endangered, from the threat of invasive species within the JRM AOR.

FY22 Status

- Implement arrival and/or pre-departure biosecurity inspections of non-training military equipment and cargo movements into/out of JRM AOR to ensure Armed Forces Pest Management Board Technical Guide No. 31 (AFPMB TG-31) cleanliness standards, therefore devoid of biomaterial.
- Movements included Navy Mobile Construction Battalion (NMCB) cargo and equipment to/from Tinian and Palau for Navy public works projects.
    - Colorado State University Center for Environmental Management of Military Lands (CSU CEMML) conducted arrival and pre-departure biosecurity cleanliness inspections and USDA-WS conducted pre-departure BTS canine inspections.
    - Eleven (11) pre-departure biosecurity and Brown treesnake inspection events on Guam for cargo and equipment movements to Tinian (5) and Palau (6). One pre-departure biosecurity inspection event on Tinian for cargo and

equipment movement to Guam and one arrival biosecurity inspection event for cargo and equipment arriving from Palau.

- Continued interagency coordination and consultation regarding invasive species management and biosecurity concerns within the region (CRB Working Group, LFA Working Group, GISC, GISAC, RISC, CNMI DLNR, Guam Biosecurity Division, CGAPS).

EPR: CHS NISA MAR JRM Implementation of the Regional Biosecurity Plan; 61128NR860

2019 JRM INRMP Reference: TIS-4; 5-85, TIS-5; 6-44, TIS-5; 7-53, TIS-4; 8-51, TIS-6; 9-73, TIS-1; 11-62, TIS-1; 12-32

Invasive Species Management within the Joint Region Marianas Area of Responsibility - Guam

Location: JRM AOR **Period of Performance**: AUG2021 – Ongoing

Project Objective

In support of Mariana Islands Training & Testing (MITT) activities:
1) Conduct Early Detection Surveys (EDS) non-native species at training and cargo staging locations within the JRM AOR (Guam and CNMI (Military Leased Area);
2) Develop and implement standard operating procedures for the control and removal of high-risk invasive species;
3) Develop and implement invasive species rapid response protocols;
4) Develop and implement bio-sanitation standards along with quality assurance/quality control standards via biosecurity inspections;
5) Development of a programmatic pathway risk analysis for the movement of equipment and personnel within the JRM AOR; and
6) Targeting high-risk invasive arthropod species for control and eradication.

Conservation Benefit

Prevent the movement and establishment of invasive species into and out of Guam and the CNMI during training exercises.

FY22 Status

- Ongoing cooperative agreement CSU CEMML.
- Early Detection Surveys Conducted
    - All-Taxa Surveys – AAFB: 9 of 32 sites; NBG: 10 of 30 sites
    - Weed Surveys – AAFB: 5 of 29 sites; NBG: 27 of 34 sites
- Development of SOPs for the Control/Eradication of High-Risk Species
    - Little Fire Ant (LFA; *Wasmannia auropuncta*) Revised
    - Lollipop Climber (*Diplocyclus palmatus*) Draft

  - Mile-a-Minute vine (*Mikania mircantha*) Draft
  - Greenhouse frog (*Eleutherodactylus planirostris*) Draft
  - Greater Banded Hornet (*Vespa tropica*) Draft in progress
- Invasive Species Rapid Response
  - Thirteen (13) CSU CEMML personnel USGS BTS Rapid Response certified
  - Assisted Guam Biosecurity Division with initial monitoring effort at Won Pat International Airport after a Coqui frog was intercepted at the Saipan International Airport (September 2021)
  - Monitoring and manual removal of Lollipop Climber at AAFB (Figure 17)
  - Monitoring and manual removal of Itch grass (*Rottboellia cochinchinensis*) clump at NBG Mainbase (Figure 18)
  - Pellitory (*Parietaria judaica*) detected at on NBG Mainbase with control pending University of Guam species confirmation (Figure 19)
  - Pencil cactus (Euphorbia tirucalli) removal and monitoring at AAFB Northwest Field (Figure 20)
- Bio-sanitation QA/QC Biosecurity Inspections during Military Training Events
  - Four (4) major training events (>100 cargo items; Forager 21, 31st MEU, Cope North 22, Valiant Shield 22)
  - Seven (7) minor training events (25 – 100 cargo items)
  - Seven (7) unit level training events (<25 cargo items)
  - >5,500 items inspected during arrival and pre-departure biosecurity inspections to meet AFPMB TG-31 cleanliness standards
  - Bio-material interceptions (plant material, seeds, soil/gravel, insects, spiders/webs/eggs, wasp nests, dead frog, etc.)(Figure 21)
- Development of a Programmatic Pathway Risk Analysis for Movements into the Mariana Islands and between Islands
- Ongoing data collection to support the risk analysis

Coconut Rhinoceros Beetle (CRB; *Oryctes rhinoceros*) Surveys, Interdiction, and Monitoring - Guam

Location: JRM AOR **Period of Performance:** AUG2021 – Ongoing

Project Objective

To implement CRB best management practices: 1) identify and remove breeding sites, 2) implement interdiction and sentinel trapping, and 3) implement CRB awareness; coordinate and collaborate with resources partners, and provide outreach materials to installation and military training participants to reduce impacts to native ecosystems and military readiness activities.

Conservation Benefit

Prevention of the spread and establishment of the invasive CRB to other locations within and outside of the JRM AOR.

FY22 Status

- CSU CEMML implementing CRB best management practices
    - Breeding Site Identification
    - Biannual breeding site surveys in urbanized areas of AAFB and NBG: November 2021 & May 2022 (Figures 22 – 23).
        - AAFB – Potential sites identified: 676 NOV & 756 MAY
        - NBG – Potential sites identified: 141 NOV & 144 MAY
- Interdiction/Sentinel Trapping
    - CRB black panel traps serviced biweekly on AAFB (144 traps) and NBG (143 traps), since August 2020
    - CRB Tekken netting traps serviced biweekly on AAFB (50 traps), since April 2021
    - Over 19,400 CRB captured over the past 22-month period (AAFB: 11,637 & NBG: 7,765; Figure 24)

  - During the most recent trapping period (April to June 2022) at AAFB 107 of 138 traps activated had at least one CRB capture (77%; Figure 22) and at NBG 118 of 143 traps had at least one CRB capture (82%; Figure 23).
- Coordination with regional partners (USDA-PPQ, GovGuam Dept. Ag., CNMI DLNR, Hawaii Dept. Ag.)

Little Fire Ant (LFA), *Wasmannia auropunctata*, Surveys, Eradication, and Monitoring - Guam

Location: JRM AOR **Period of Performance**: AUG2021- Ongoing

Project Objective

To implement LFA Early Detection Surveys (EDS); control and eradicate LFA on DoD lands: coordinate and collaborate with resources partners; and provide outreach materials to reduce impacts to native ecosystems and military readiness activities.

Conservation Benefit

Enhance and restore habitats by prevention of the spread and establishment of the invasive LFA.

FY22 Status

- Ongoing Cooperative Agreement with CSU CEMML:
- LFA Early Detection Surveys
    - 129 LFA surveys at 84 sites out of 133 total sites covering approximately 108 miles (Figures 25 - 27)
    - AAFB: 28 surveys at 20 sites out of 49 total sites (38.1 miles)
    - NBG: 92 surveys at 58 sites out of 81 total sites
    - MCBCB: 9 LFA surveys at 6 sites out of 6 total sites
- New LFA Infestation Detections
    - Four (4) new infestations detected along installation borders and one (1) infestation within installation borders (Figures 25 - 27).
    - AAFB: Northwest Field Hunter's Shack
    - NBG NMS: Firebreak Road #3, Cross Island Road West Drainage
    - MCBCB: Haputo Beach trail bottom
- LFA Infestations Status

- Twelve (12) known LFA locations (not including Andersen South locations) on AAFB (2), MCBCB (2), NBG (3), and NBG NMS (5) (Table 2).
- Ongoing border treatment occurring at five (5) locations, pending eradication efforts at three (3) locations, delineation pending at two (2) locations, and post eradication monitoring occurring at two (2) locations (Table 2).

Eradication of Little Fire Ant within Skaggs Urban Training Complex

Location: MCBCB **Period of Performance:** SEP2017 – SEP2022

Project Objective

Delimit targeted LFA infestations at Skaggs before implementing eradication protocols to eradicate these ants. Post-treatment monitoring will evaluate treatment effectiveness.

Conservation Benefit

Little fire ants pose significant threats to listed species. Eradication will benefit the species directly as well as the habitat that supports them.

FY22 Status

- Cooperative agreement with University of Guam subcontract Colorado State University
- Conduct new delimiting surveys from 2020/1 data points to determine current infestation boundaries for sites 6, 7, 8 and 1
- New cooperative agreement with Colorado State University

DPRI: Marine Corps Relocation 2017/2018 amendment to 2015 BO, Conservation Measures to Contribute to the Recovery of Listed Species

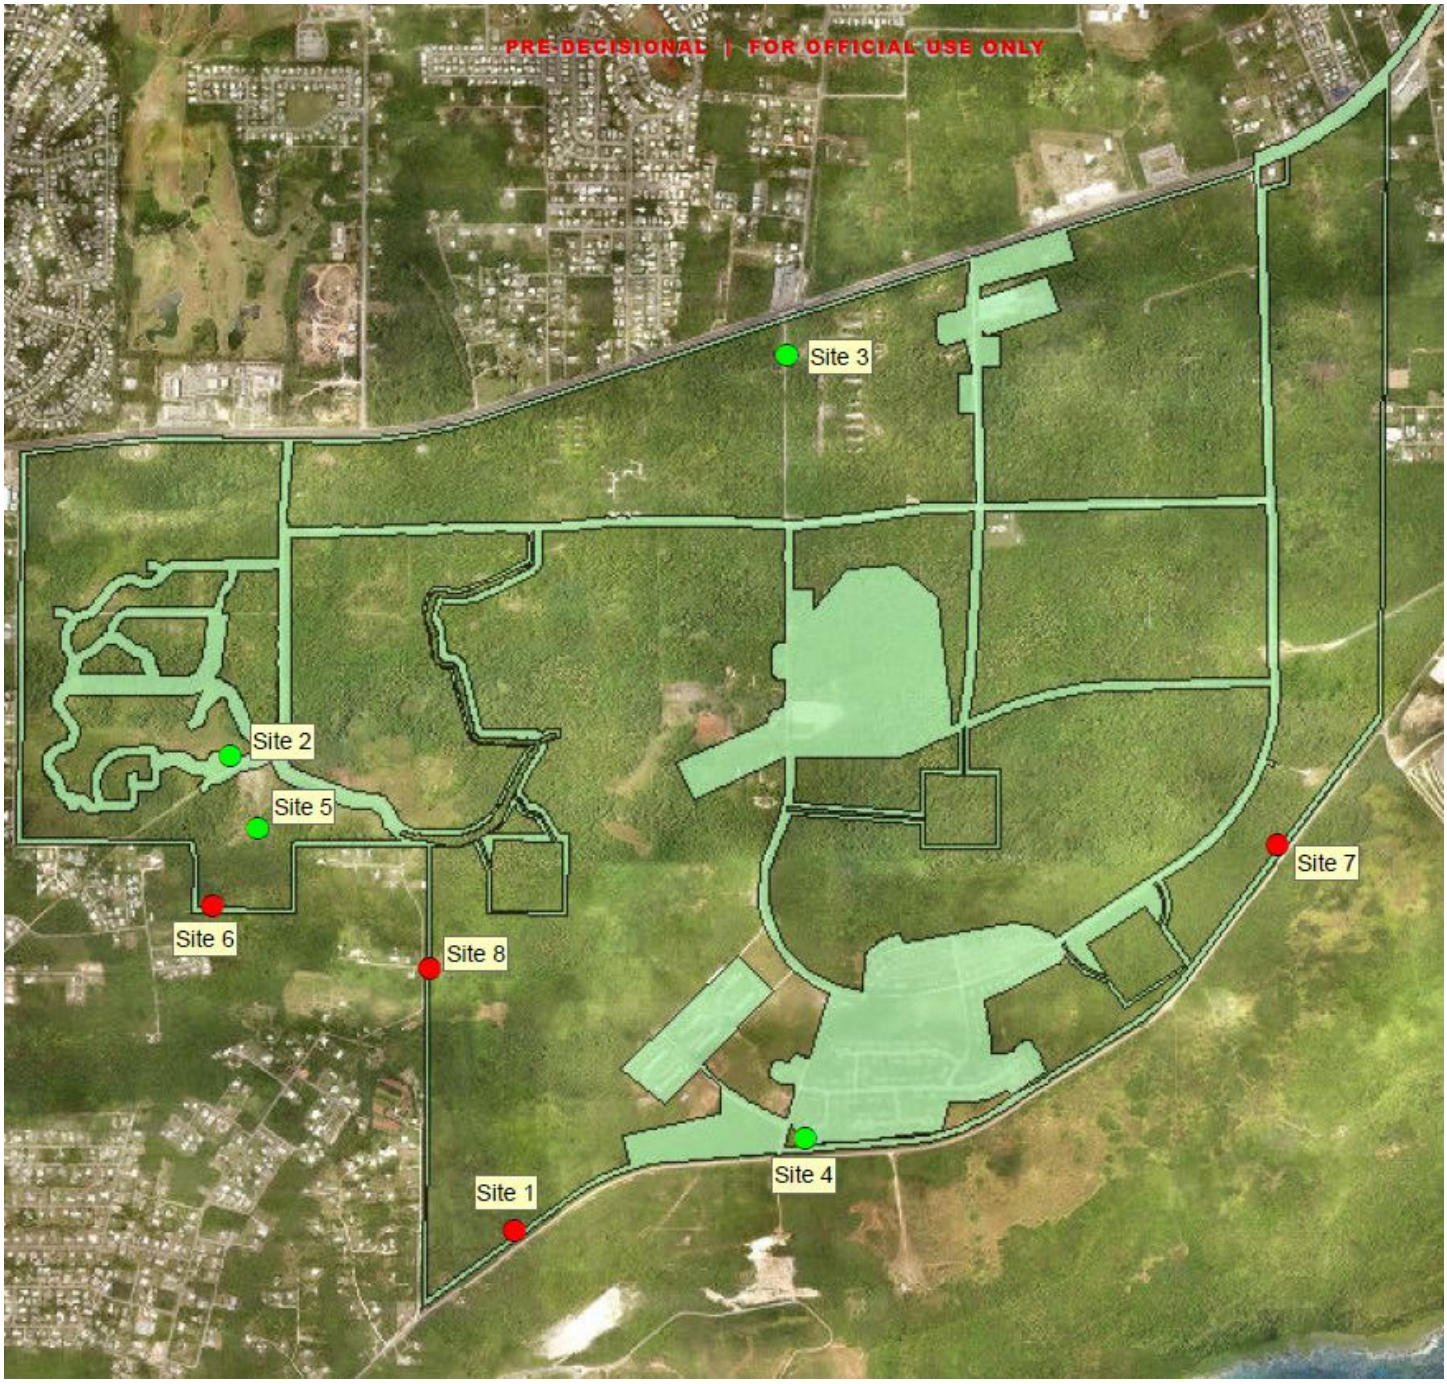

Figure 28. Efforts to eradicate little fire ants from the Skaggs Urban Training Complex are complicated by re-infestation from off-installation properties.

Feral Dog and Cat Control

Location: NMS **Period of performance:** SEP2021 - Ongoing

Project Objective

Remote sensing, live trapping and removal of target feral animals in sensitive habitats (remote wetlands).

Conservation benefit

The conservation benefits of the project are to a) protect and preserve habitats needed for sensitive species conservation and to b) provide response to incipient invasive and nuisance species populations to ensure no loss of moorhen species range.

FY22 Status

- IAA with USDA APHIS-WS
- Identify and remove feral cats and dogs in NMS wetlands
- Remote camera deployment identified 8 cats and 14 dogs
    - 5 cats removed/transferred to GAIN
    - 2 monitor lizards captured
- Future efforts
    - Remove lizards from habitat
    - Document stomach contents
- Continuous immigration due to open property boundaries
- USDA-APHIS WS report pending

Brown Treesnake Interdiction to Prevent the Spread Via the DOD Transportation Network Originating On Guam

Location: JRM **Period of Performance:** AUG2021 – JUL2022

Project Objective

To prevent the spread of BTS to other Pacific islands including the CNMI and Hawaii, this JRM project is funded to conduct BTS control and interdiction efforts on Navy Base Guam (NBG) and Andersen AFB (AAFB) to prevent snakes from getting into the DoD transportation network. Methods include BTS trapping, toxicants, nighttime visual fence line searches, and canine inspections of outbound items. The BTS Interdiction program also supports training events occurring in the region that originate from Guam. Joint Region Marianas develops BTS control and interdiction plans for each training exercise that requires the movement of personnel and assets to the CNMI from Guam. Additional BTS inspections and control measures are implemented in the CNMI when determined necessary by the stakeholders.

Conservation Benefit

Preventing the spread of BTS via the military transportation network keeps BTS on Guam and from establishing in other ecologically sensitive areas in the Pacific region where vulnerable island species would be susceptible to BTS predation.

FY22 Status

- Ongoing and enduring JRM requirement
- Interdiction support provided to X military exercises during FY2022
- Traps on AAFB and NBG re-spaced to 30m
- 6 missed Inspections (99.99%)
- No BTS detections in outbound cargo

EPR: Project is funded by facilities maintenance dollars, no conservation funding for this project.

2019 JRM INRMP Reference: TIS-1; 5-84, TIS-1; 6-42; TIS-1; 7-51, TIS-1; 8-50, TIS-1; 9-70

Brown Treesnake Control at Mariana Swiftlet Caves

Location: NBG; NMS **Period of Performance**: OCT2018 – Ongoing

Project Objective

To provide long-term sustained protection for the Mariana Swiftlet (*Aerodramus bartschi*) from brown treensnake (BTS) predation. Protection consists of ground-based oral toxicants for BTS around the areas surrounding Mahlac, Fachi, and Maemong caves, Naval Munitions Site (NMS).

Conservation Benefit

Protection from BTS predation is focused on maintaining or increase swiftlet populations at the three occupied caves and enhance or restore habitat by reducing predation by BTS.

FY22 Status

- Ongoing project - renewed annually
- Testing camera traps for estimating BTS bait take
- Baiting remains once per week to reduce disturbance
- 5313 baits deployed since August 2021
- Average annual toxicant take rate = 36% (1925/5313)

EPR: 1 RP NBG Mariana Swiftlet Population Protection; 67155NR834: BTS Trapping

2019 JRM INRMP Reference: TIS-3; 6-43, TPS-4; 6-47

Developing a Framework for Coordinated Management of Vertebrate Restoration and Brown Treesnake Control on Guam

Location: JRM **Period of Performance:** SEP2021 – MAR2023

Project Objective

This project consisted of furthering the development of a decision-analytic framework to guide brown treesnake management and vertebrate species restoration on Guam. The project builds on the subject matter experts previous efforts building a decision model. The group are from management agencies, regulators, stakeholders, and scientific experts and uses a workshop model to for the purpose of framework development.

Conservation Benefit

The decision model will help with planning for future conservation management decisions through an analytical process to enhance the planning phase. This includes prioritization, management application, problem solving, evaluating specific actions, and collaboration to manage costly, complex long-term conservation problems. The process should provide a more structured approach to addressing conservation challenges.

FY22 Status

- Questionnaire for expert response under development
- Workshop planned for late 2022
- Experts from federal, territorial, universities, and non-governmental organizations.

EPR: 1 RP JRM Brown Tree Snake Eradication and Control to Support Recovery of ESA-Listed Species; 61128NR202

2019 JRM INRMP Reference: TIS-3; 9-71

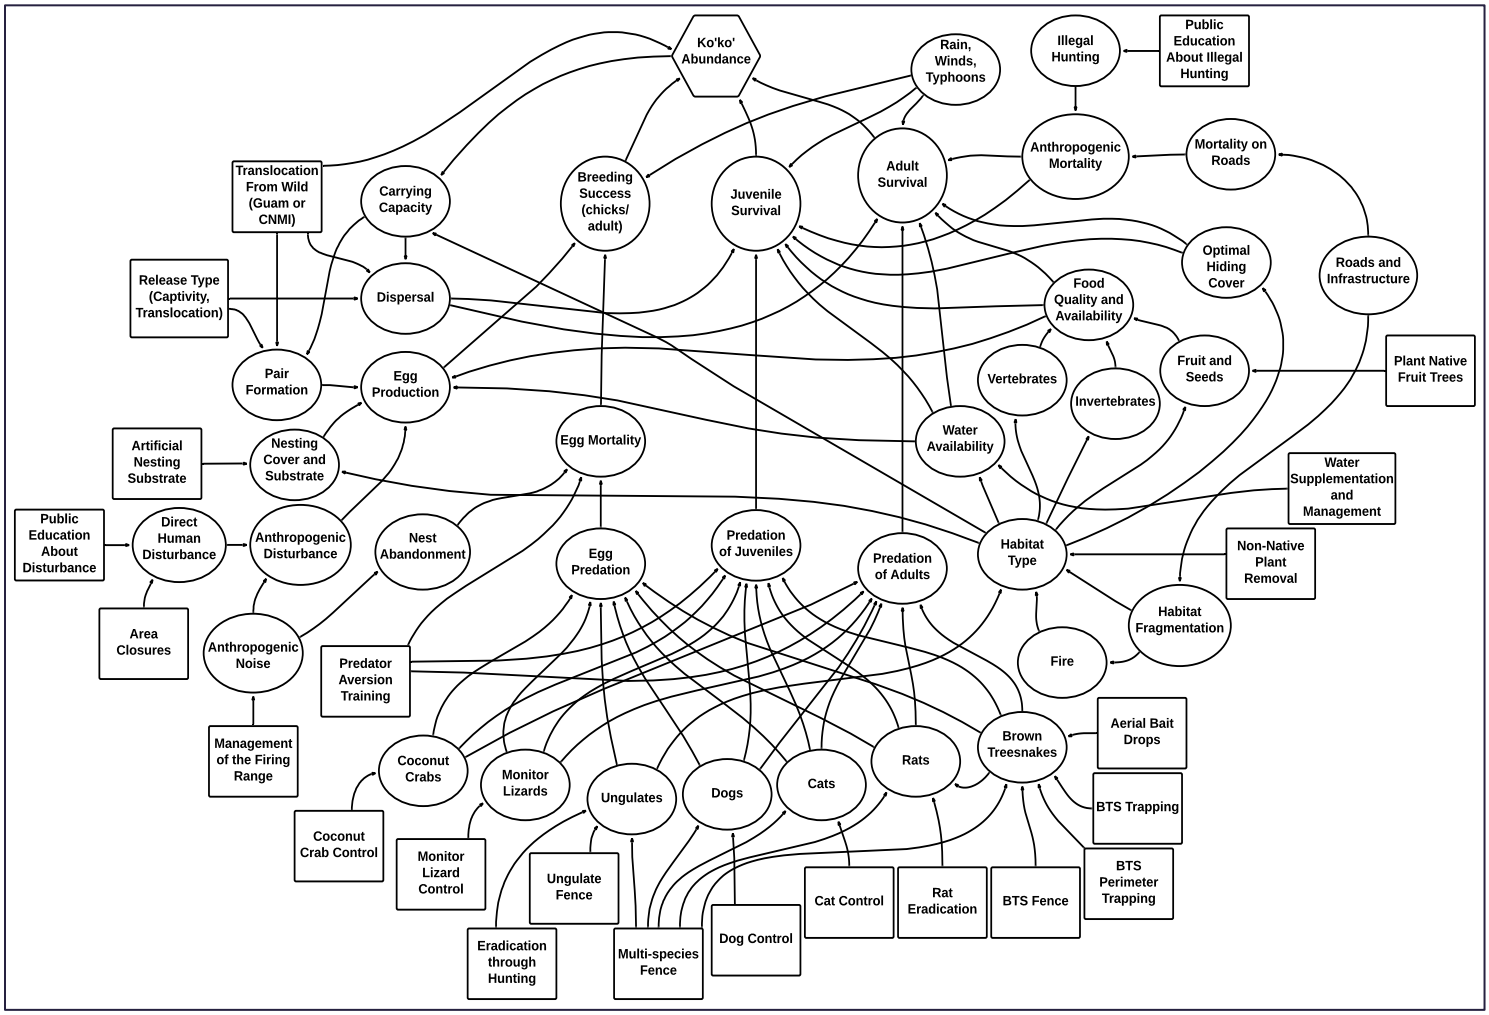

Figure 31. Full Ko'ko' influence diagram incorporating the species-specific management actions (boxes) that may be important to the objective of Ko'ko' abundance (hexagon, top center) via demographic processes (circles). Management actions indirectly influence the objective through various hypothesized processes and dynamics (ovals).

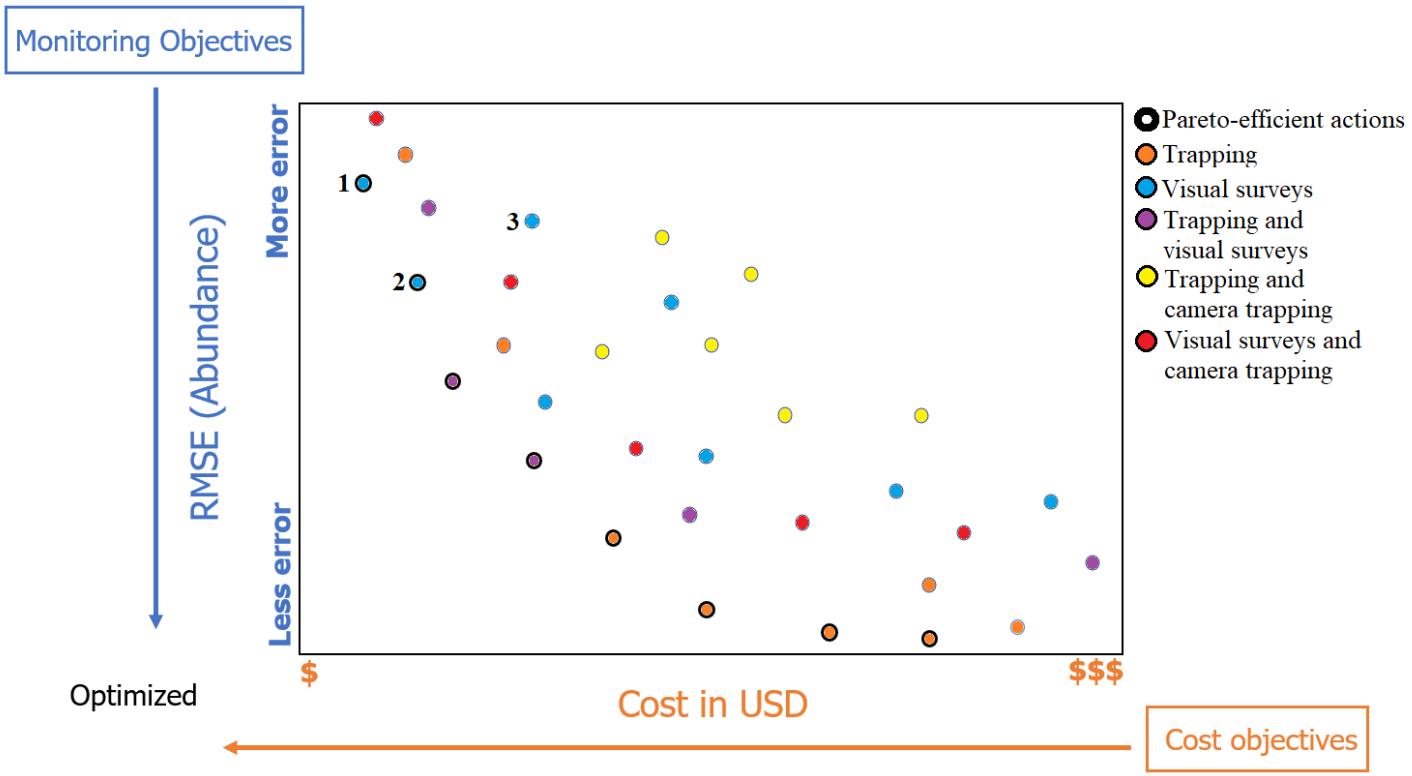
Dynamic Monitoring and Management of Brown Treesnakes

Location: JRM **Period of Performance:** JAN2022 – JUN2024

Project Objective

This project seeks to identify a suite of combined *monitoring* and *management* alternatives for managers depending on the status of a target brown treesnake (BTS) population before and after treatments. With further objects of identifying thresholds where *monitoring methods* and *management efforts* shift in efficacy based on the existing/remaining population of BTS in a targeted management area. The project will also create a cost model and application to assess the cost of monitoring and management actions

Conservation Benefit



Landscape-scale BTS management is predicted to incur substantial costs. Planning and management at scales of hundreds of hectares will require new tools and methods to plan and assess management efforts. The dynamic modeling for monitoring and management for BTS could help with cost efficient management and assist with a structured approach to BTS management decision making.

FY22 Status

- Data sets from previous BTS projects being collated analyzed.
- Initial modeling simulations being conducted.
- Analysis Costs and time related to methods and results help identify optimal scenarios.

EPR: 1 RP JRM Brown Tree Snake Eradication and Control to Support Recovery of ESA-Listed Species; 61128NR202

2019 JRM INRMP Reference: TIS-3; 9-71

1. Visual surveys conducted on 14 transects for 30 days.
2. Visual surveys conducted on 27 transects for 15 days.
3. Visuals surveys conducted on 27 transects for 30 days. This scenario is more expensive to carry out and does not result in a gain in precision in abundance (i.e., does not reduce RMSE), making it an inefficient option.

Figure 32. Hypothetical graph demonstrating potential optimized points where methods are assumed to be efficient (an optimized BTS management method [both device and cost]) based on management's choice of monitor technique.

Replacement and repair of the USGS Closed Population Mesh to Maintain Viability as a Study Site for Brown Treesnake Management

Location: AAFB **Period of Performance:** JUL2020 – DEC2021

Project Objective

This project is to replace the mesh on the Closed Population unit on AAFB. The mesh has decayed beyond the point where patching and painting can sustain the integrity of the barrier. This increases the risk of brown treesnake (BTS) movement through the barrier both ways, and thus, impacts ongoing data collection. The project will replace the entire outer mesh material, as well as application of an anti-rust coating for the mesh and internal chain-link fence.

Conservation Benefit

The USGS Closed Population (CP) facility was constructed in 2004 and function and provides a study site to improve understanding of BTS population dynamics/demographics, BTS control tool efficacy, and numerous other studies that have helped refine implementation of management programs for BTS. The loss of integrity (allowing BTS in and out of the CP) of the fence would impact current and future studies large enough to replicate approximate conditions for understanding landscape-level condition but small enough to conduct projects under controllable conditions, and enumerate the BTS population. Such long-term project management and data collection allows for in depth understanding of the effects of BTS control tools and methods.

FY22 Status

- Project start delayed by COVID-19, contracting issues, supply change delays.
- Refurbishment of mesh in progress.
- Anticipated completion September 2022.

EPR: No EPR - Guam Micronesian Kingfisher MOA funds.

2019 JRM INRMP Reference: TIS-2, 5-85, TIS-3; 5-85, TIS-2; 6-42, TIS-3; 6-43; TIS-2; 7-52, TIS-3; 7-52, TIS-2; 8-50, TIS-3; 8-51, TIS-2; 9-71, TIS-3; 9-71; TPS-6; 9-77

Using BTS Behavior and Movement to Refine Control on AAFB & for Improved Management of Native Forest Birds

Location: AAFB **Period of Performance:** AUG2021 – JAN23

Project Objective

This project continues studying movement pathways and habitat preferences of brown treesnakes (BTS) on AAFB with abundant prey present, estimate abundance of BTS in relation to resources important to birds, and conduct known-fate evaluation of BTS susceptibility to control based on size, sex, and food preferences of snakes. This project is one of four projects that, collectively, will further develop information on BTS behaviors related to predation and movement in the presence of abundant avian species.

Conservation Benefit

Better understanding of hotspots of BTS activity, travel pathways, and decision-making during foraging are critical to improve the coverage and efficacy of BTS control in a cost- effective manner. Knowledge of BTS movements and behaviors can help determine BTS management strategies for maximizing snake suppression within critical conservation and transportation sites.

FY22 Status

- 76 individual snakes were radio tracked (123 snakes during entire project)
- 110 BTS captured and tagged, 37 unique recaptures (465 snakes captured and tagged during the entire project)
- Automated telemetry array collecting fine-scale activity data
- BTS smaller home ranges; move shorter distances compared to other areas
- BTS have strong foraging associations with specific tree species (*Casuarina* and *Ficus*) and Sali are most at risk when roosting in these trees.

EPR: 1RP JRM Brown Tree Snake Eradication and Control to Support Recovery of ESA-Listed Species; 61128NR202.

2019 JRM INRMP Reference: TIS-2, 5-85, TIS-3; 5-85, TIS-2; 6-42, TIS-3; 6-43; TIS-2; 7-52, TIS-3; 7-52, TIS-2; 8-50, TIS-3; 8-51, TIS-2; 9-71, TIS-3; 9-71

Tracking Movement of Micronesian Starlings and Brown Treesnakes on AAFB with an Automated Telemetry Tracking Network

Location: AAFB **Period of Performance:** JAN2022 – FEB2023

Project Objective

This project continues tracking the movement of Micronesian starlings (*Aplonis opaca* [Sali]) and BTS on AAFB to identify areas of high use and routes of transit through a network automated telemetry towers, and to document areas where BTS and Sali may interact. This project is one of four projects that, collectively, will further develop information on BTS behaviors related to predation and movement in the presence of abundant avian species.

Conservation Benefit

Tracking animals across the landscape over time can provide important information on habitat selection, resource needs, and factors influencing distribution and density. For a predator such as BTS, tracking movement can provide information on hunting patterns, dispersal potential, and identify areas that may be particularly susceptible to predation. Overlapping simultaneous movement from both predators and their prey can help identify areas of greatest contact, which may vary spatially and temporally. Additionally, population demographics that could be useful for supporting future avian restoration projects and controlling BTS in low density with competing food sources in the presence of control regimes.

FY22 Status

- 94 network nodes arrayed across the landscape, seven (7) bases stations collect data
- Cellular tracking network has continuously operated since 2019
- Improved accuracy of tracking with multiple, daily signals of Sali and BTS

- Good alignment between cellular network, satellite, and traditional telemetry data points.

Source: USGS-PIERC

Evaluating and Reducing Brown Treesnake Predation Threat in Urban Micronesian Starling Habitat

Location: AAFB **Period of Performance:** AUG2021 – JAN2023

Project Objective

The project continues to evaluate control tools for urban BTS suppression in experimental high and low snake density plots. Also, monitor the relative abundance of BTS as a predation or dispersal threat via contact rates with baited camera devices. Overall this project will evaluate BTS control tools for suitability and efficacy in urban habitat, and use camera monitoring to index the decrease in Micronesian starling (*Aplonis opaca*) predation threat following snake removal. This project is one of four projects that will, collectively, further develop information on BTS behaviors related to predation and movement in the presence of abundant avian species.

Conservation Benefit

Previous studies on AAFB have demonstrated that snakes in the housing area are having a pervasive impact on Micronesian Starling survival at all age classes. Snakes in these urban areas also constitute a greater risk for accidental export of live snakes to other vulnerable regions because shipments of household goods are routine. Additionally, previous research has shown that very large snakes, which pose the greatest predation and reproduction risk, are more often found in urban areas. For these reasons, it is important to begin to consider BTS risk mitigation in urban habitats. Contact rates can be interpreted as an index of relative abundance and as a proxy for the residual level of predation threat posed by BTS in snake-suppressed areas. Traditional tools for estimating BTS density and relative abundance are costly and impractical for long-term and broad-scale monitoring (e.g., mark-recapture) or provide no information on the snake (e.g., DNM bait tubes).

FY22 Status

- Current phase of project will compare mice and bird baits
- Strong relationship between captures and forest edges
- BTS captures lower in areas of high bird presence
- Trapped BTS smaller than BTS captured after eating Micronesian starlings
- Some BTS overestimate ability to consume prey

EPR: 1 RP JRM BTS Eradication and Control to Support Recovery of ESA- Listed Birds

2019 JRM INRMP Reference: TIS-2, 5-85, TIS-3; 5-85, TIS-2; 6-42, TIS-3; 6-43; TIS-2; 7-52, TIS-3; 7-52, TIS-2; 8-50, TIS-3; 8-51, TIS-2; 9-71, TIS-3; 9-71

Evaluation of BTS Control via Bait Delivery around the Swiftlet Caves and Investigation of BTS Control to Support Swiftlet Range Expansion

Location: NMS **Period of Performance:** SEP2020 – FEB2022

Project Objective

This project will assess the current control around the swiftlet caves by evaluating trapping, hand captures, and visual surveys capture data. This project will evaluate data based on seasonality, demographic, and behavioral aspects of brown treesnakes (BTS). Snakes captures in and out of caves (occupied and unoccupied) will be tracked via transmitters to determine movement, and if there are any potential dietary preferences.

Conservation Benefit

Swiftlet protection is a long-term effort that helps support goals of the swiftlet recovery plan. Since mid-2018 it has been 100% toxicant-based control, and while slightly more effective than trapping, the impacts to BTS have not been adequately assessed. Additionally, a better understanding of BTS population dynamics near a rich prey base needs to be improved. The data collected will inform future BTS management strategies in and around the swiftlets cave. Improved BTS population data will inform future conservation efforts for listed species on Guam.

FY22 Status

- 31 one-hour surveys in occupied caves (56 surveys during entire project)
- 10 snakes were radio tracked around caves (23 snakes during entire project)
- BTS captured inside swiftlet caves are larger than individuals captured outside of caves
- No BTS observed inside caves not occupied by Swiftlets
- Project renewed: SEP2022-MAR2024

EPR: 1 RP NBG Mariana Swiftlet Population Protection: BTS Trapping; 67155NR834

Aerial Baiting Operations and Ground Support for Suppression in the HMU, AAFB

Location: AAFB **Period of Performance**: MAR2022 – AUG2023

Project Objective

To provide operational helicopter support, including a pilot, mechanic, technical support, and post-drop data collection and monitoring of bait drops during aerial baiting applications within the Habitat Management Unit (HMU), AAFB.

Conservation Benefit

The development and performance of aerial delivery system for BTS suppression, demonstrates the potential for meaningful impacts on BTS populations at the landscape level. Dropping aerial baits in the HMU will provide data and insight into BTS responses to aerial baiting over time. Aerial baiting increases the amount of landscape targeted for BTS suppression and control. Landscape level control would likely improve JRM conservation efforts in support of the recovery of listed species on JRM lands and assist with interdiction efforts.

FY22 Status

- Aerial baiting recommenced MAY2022 (3 applications; 19,800 baits)
- New aerial baiting cycle commenced AUG2022; two bait applications every three (3) months instead of 3 applications every four (4) months
- Next two (2) applications in NOV2022
- Zero (0) fruit bats observed before or during aerial baiting operations
- Automated co-pilot module for bait in test phase

EPR: 1 RP JRM BTS Eradication and Control to Support Recovery of ESA- Listed Species; 61128NR202/ GMKI MOA Funds

Aerial and Ground-Based Brown Treesnake Control on Fenced and Unfenced Landscapes to Evaluate Suppression and Eradication Feasibility

Location: AAFB; MCBCB **Period of Performance:** SEP2022 – JAN2024

Project Objective

To provide operational and logistical helicopter, technical support, ground-based brown treesnake control (BTS), and monitoring of aerial baiting application impacts within the Northern Forest Enhancement Site (N-FES), Marine Corps Base Camp Blaz (MCBCB), and the Habitat Management Unit (HMU), Andersen Air Force Base (AAAFB). The project will use a multi-tool approach towards eradication in the HMU, and determine achievable levels of suppression in an unfenced area (N-FES).

Conservation Benefit

The development and performance of aerial delivery system for BTS suppression, demonstrates the potential for meaningful impacts at the landscape level, however, studies are showing that a multi-tool approach is likely necessary to remove larger snakes. Eradication in the HMU would create a BTS free environment to support future vertebrate conservation efforts. Determining levels of suppression in an unfenced area will provided insights in the feasibility of true landscape-scale management for BTS. Landscape level control would likely improve JRM conservation efforts in support of the recovery of listed species on JRM lands and assist with interdiction efforts.

FY22 Status

- Newly funded FY22 project.
- Multi-agency project: USGS-PIERC, USDA-NWRC, USDA-WS
- Long-term, multi-phased project (3+ years)

- Aerial baiting begins February 2023
- 14 treatments each - HMU & N-FES - through May 2024

EPR: No EPR - Guam Micronesian Kingfisher MOA funds.

2019 JRM INRMP Reference: TIS-2, 5-85, TIS-3; 5-85, TIS-2; 6-42, TIS-3; 6-43; TIS-2; 7-52, TIS-3; 7-52, TIS-2; 8-50, TIS-3; 8-51, TIS-2; 9-71, TIS-3; 9-71

Artificial Toxic Bait for Landscape-scale Brown Treesnake Suppression: Refinement and Capacity

Location: AAFB **Period of Performance**: SEP2020 – FEB2022

Project Objective

This project will further develop the program for artificial BTS bait production focusing on improving efficacy, automate production, and increase capacity for bait production and testing. Other objectives include evaluating the form of the bait for production, how to integrate acetaminophen into the bait, integration of artificial bait into bait cartridge assembly, scaling up production, how to deter invertebrates, establish a testing facility to trial formulations, and testing genetic susceptibility of birds to acetaminophen (enzyme testing). This project will collaborate with experts from USDA-ARS; the Oak Ridge Institute for Science and Education (ORISE), NWRC Hawai'i; and researchers at Clemson University, South Carolina.

Conservation Benefit

Further development and improvement of artificial bait to replace the standard dead neo-natal (DNM) mouse is an important technological goal. It will reduce overall cost and maintain the same level of impact to BTS populations as the DNM. If the bait component of the aerial bait cartridge can be achieved, cost savings would keep costs lower but potentially increase the amount of landscape that is covered by toxicants. Aerial baiting on a landscape scale is an important tool that can support recovery goals for listed species on Guam.

FY22 Status

- Testing facility established on Guam
- Very low acceptance of bait with integrated acetaminophen
- Ants can be deterred; maggots can reduce bait access to BTS
- Genetic susceptibility to acetaminophen varies across bird species

- Project complete, final report pending.

EPR: No EPR - funded with Relocation BO funds

2019 JRM INRMP References: TIS-2, 5-85, TIS-3; 5-85, TIS-2; 6-42, TIS-3; 6-43; TIS-2; 7-52, TIS-3; 7-52, TIS-2; 8-50, TIS-3; 8-51, TIS-2; 9-71, TIS-3; 9-71

Comparing Take of Mice and Artificial Brown Treesnake Baits from Operational Bait Tubes and Extension of Brown Treesnake Threat Reduction Monitoring in the Habitat Management Unit

Location: AAFB **Period of Performance:** SEP2020 – FEB2022

Project Objective

The project conducted an evaluation incorporating artificial baits with camera verification of species taking baits. Bait tubes were placed in current operational locations on AAFB. Alternating dead neo-natal mouse (DNM) baits and artificial bait were deployed in the same transect. Cost savings were evaluated by comparing the traditional operational schedule (every 2-3 days) while replacing artificial baits every 14 days. Metrics evaluated included, a) cost per tube per unit time, including costs of bait acquisition, preparation, and deployment; and b) cost per bait consumed by a snake. The project characterized the level of non-target bait takes for both DNM and artificial baits by identifying species and frequency of take with cameras. The project also supports further camera-based data collection in the HMU post aerial baiting.

Conservation Benefit

Previously funded artificial bait studies have confirmed their attractiveness to BTS and can be produced at a lower cost than purchasing DNM. Past testing has been in controlled environments or in limited field trials. Directly testing bait in an operational setting and with DNM mice as alternative will help provide greater certainty of viability for artificial baits. The operational use of artificial baits has the potential to reduce cost if aerial baiting is scaled-up and support other operational uses of acetaminophen-based toxicant. The use of acetaminophen-based toxicant is an important tool for managing BTS on a landscape scale to support recovery goals for listed species on Guam.

FY22 Status

- Bait comparison project suspended as baits failed in the field
- Final report pending

Trial Restoration and Probabilistic Evaluation of Vertebrate Reintroduction Techniques Using Species Traits in a Barrier Undergoing a BTS Eradication

Location: AAFB **Period of Performance:** SEP2020 – FEB2022

Project Objective

The project seeks to develop a conceptual demographic model for reintroduction strategies. Using three unlisted native lizard species *Nactus pelagicus* (Pacific slender-toed gecko), *Perochirus ateles* (Micronesian saw-tailed gecko), *Gehyra oceanica* (Oceania gecko) the objective is to develop a predictive response model to BTS predation based on species traits e.g., reproduction, habitat preference, behaviors, sensitivity to predation, etc. Once a model is built, a release strategy will be developed for hard and soft releases in plots controlled and uncontrolled for BTS. Success to be defined under the following two criteria: evidence of reproduction (juvenile lizards detected) and persistence of the species > 6 months following release.

Conservation Benefit

For reintroductions to occur, managers on Guam will need to understand if species 1) require snake eradication to establish or what level of suppression is required for establishment to occur; and 2) snake abundance thresholds that support persistence of prey species. Some of these metrics are likely to be dependent on the desirability of the species as a prey item and therefore their sensitivity to snake abundance. The use of native lizards presents a relatively safe species to study and inform decisions. In a system with numerous unknowns, their benefits include only small areas to establish populations, are not a federally listed species, have species with high variation in sensitivity to BTS predation, and could be used as a monitoring metric/tool to evaluate BTS suppression actions and inform reintroduction goals.

FY22 Status

- First batch of geckos released in September 2021
- Some indication of higher survivorship of geckos released in suppressed CP site versus control plot
- Substantial data delayed at this time due to changes at USGS-FORT
- Final report pending

Evaluating the Effect of Bait Size and Species on Removal of BTS That Are Not Susceptible to ADS Control

Location: AAFB **Period of Performance:** JUL2020 – JAN2022

Project Objective

The project will evaluate a multi-tool/multi bait approach to eradicating a small, known population of BTS in the Closed Population area on AAFB. The project will use a phased approach continuing with replicating aerial baiting (suspending baits from vegetation); adding a perimeter of larger rodent and bird baits in bait tubes; and use live bird and rodent lures. The baits will have transmitters to track the fate of the snakes. The same approach will be taken within the interior of the Closed Population to analyze for any spatial effects. As the population of BTS within the Closed Population is known, following the impacts by the multi-tool approach to provide useful data towards improving BTS suppression and eradication within enclosures.

Conservation Benefit

Aerial baiting can distribute bait across the landscape quickly but we still do not have enough data to state conclusively if eradication is achievable. Aerial baiting is the only method used to attempt suppression/eradication of BTS in the HMU. Data projections indicate aerial baiting alone may not be enough to meet the goal of eradication. This is, in part, due to a sub-set of the BTS population not consuming bait (too small/too large). The ability to better target all size classes of BTS with a complex of control tools could help achieve eradication within enclosures but also may provide a substantial benefit to recovery of listed species by severely suppressing the population to allow population recruitment to stay ahead of predation.

FY22 Status

- Preference for bird over rodent detected; size less of a factor
- High levels of non-target bait take, insects etc.

- Substantial data delayed at this time due to changes at USGS-FORT
- Final report pending

EPR: 1 RP JRM Brown Tree Snake Eradication and Control to Support Recovery of ESA-Listed Species; 61128NR202

2019 JRM INRMP Reference:

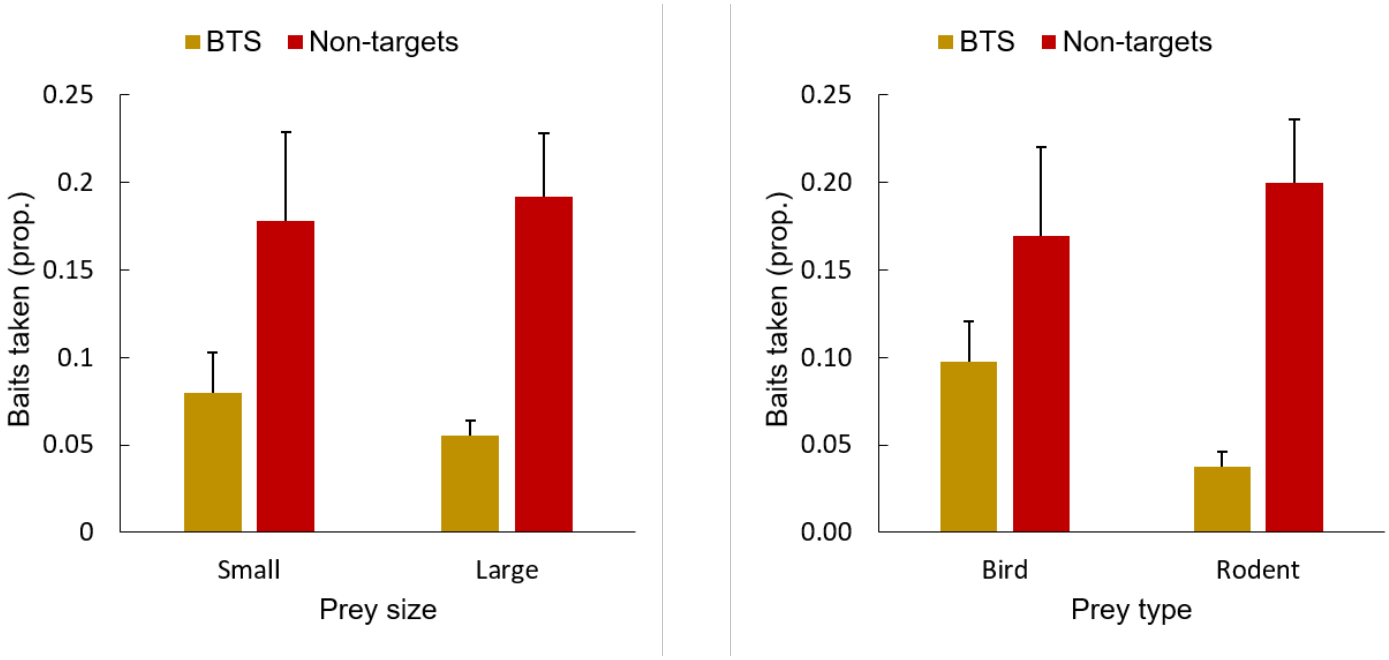

Figure 42: a) The proportion of bait-tube baits monitored with cameras taken by brown treesnakes (BTS) or non-target species by prey species type; b) The proportion of bait-tube baits monitored with cameras taken by brown treesnakes (BTS) or non-target species by prey size.

Identifying & Refining Tools for Landscape-scale Detection, Removal, and Monitoring of Brown Treesnakes

Location: AAFB **Period of Performance**: AUG2022 – JAN2024

Project Objective

The project develops and evaluates tools and methods for BTS control and monitoring including improving the effectiveness and reducing the costs of tools for BTS suppression and monitoring. Tasks include a) Evaluate whether abiotic factors such as moonlight, temperature, humidity, and rainfall affect BTS activity levels; b) Assess whether BTS produce recognizable images in thermographic cameras and can improve detection in the environment; c) evaluate a variety of market available cameras to help standardize technology and reduce costs; d) continue genetic evaluation of acetaminophen impacts to avian species.

Conservation Benefit

Brown treesnakes are difficult to detect and manage. Current standard tools i.e., visual surveys, camera traps can be improved with improve/alternate technology e.g., thermal, infra-red, night-vision, however, this technology needs to be properly evaluated to determine suitability and methods improvement. Deploying multiple cameras in the field is expensive and finding low-cost models with similar image quality is an important cost reduction. Data are available on abiotic factors such as moonlight, humidity, and rainfall, but the influence of these factors on BTS activity has not been evaluated. Knowing movement related to weather and moonlight could help refine management techniques. Collecting further data on acetaminophen impacts to avian species is important to improving predictions to which bird species on Guam may be sensitive to acetaminophen, where testing potential species for reintroduction is not feasible.

FY22 Status

- New project for FY22
- No data available at this time

AAFB Invasive Plant Species Monitoring and Control

Location: AAFB **Period of Performance:** OCT2020 – SEP2021

Project Objective

Conduct surveys to document the spread of invasive plant species.

Conservation Benefit

Knowledge of which invasive species are dominant and most likely to spread further.

FY22 Status

- Project complete, data analysis is ongoing
- Resampled 534 plots previously sampled in 2008
- Plots are circular and 100 square meters in size
- Diversity declined by a small amount
- Tree mostly decreased with some exceptioins
- DBH on average increased on species that were examined
- Possibly regrowth and succession after typhoons in the early to mid-2000s
- Trend also exists in the HMU with some differences
- Dominant trees on AAFB - *Meiogyne cylindrocarpa (Guamia), Aglaia mariannensis, Ochosia mariannensis, Vitex parviflora and Ochrosia oppisitifolia (Neisosperma)*
- *Triphasia triofolia* and *Cestrum diurnum* increasing in numbers

Invasive Plant Control MCBCB

Location: MCBCB **Period of Performance**: AUG2020 – FEB2023

Project Objective

Control limited infestations of *Antigonon leptopus* and *Mimosa diplotricha* in the Finegayan and Caiguat Forest Enhancement Sites.

Conservation Benefit

Invasive plants are a significant threat to Guam's native habitats. Removal of these invasive plant populations will improve the immediate area and reduce the likelihood of further spread of these weeds into the rest of the conservation site.

FY22 Status

- Mechanical and chemical removal of plants continued through FY22
- Period of performance has been extended to continue control of the infestations in an effort to achieve eradication

DPRI: Marine Corps Relocation 2017/2018 amendment to 2015 BO, Conservation Measures to Contribute to the Recovery of Listed Species

NATURAL RESOURCES EDUCATION AND OUTREACH

Outreach and Education – NBG

Location: NBG **Period of Performance:** JUL2021 - JUN2022; New Award SEP2022

Project Objective

Develop, design, and produce custom outreach materials for use by Public Works EV and NBG to educate incoming military personnel, their families, and civilian employees on the importance of conserving and protecting natural resources.

Conservation Benefit

Educational material provides military and civilian personnel and base visitors the ability to understand their role in protecting Guam resources.

FY22 Status

- Production and Distribution of one thousand 1000 2022 Marine Tide Calendars
- Replacement of five (5) rip current, fishing regulation, coconut crab, rules, and general area signs for Haputo Ecological Reserve
- Procurement of nine (9) informational “Off Limits” signs to be used ecologically sensitive areas on NBG and NMS
- Additional project awarded 09SEP2022 for the production of 3 to 5 minute outreach video

EPR: Listed Species Outreach Material; 61755NR306

2019 JRM INRMP Reference: TEDU-1; 5-91, MEDU-1; 5-104

Biosecurity Outreach and Education on Guam

Location: Islandwide **Period of Performance:** AUG2021 – AUG2022

Project Objective

Implement a targeted, comprehensive outreach and education program for DoD and civilian populations to highlight biosecurity issues and focus on prevention of new species introductions.

Conservation Benefit

Invasive species are among the greatest threats to Guam's native habitats and listed species. Raising awareness of biosecurity practices will help prevent new species becoming established on island.

FY22 Status

- Biosecurity outreach PSAs broadcast via radio, television and social media platforms
- Continued collaboration with Department of Agriculture's Biosecurity Division
- Final report submittal pending
- Recommendations provided in the FY21 final report will be considered to improve overall reach and effectiveness in FY22
- FY22 project scheduled to award September 2022

JRM Natural Resources Stewardship Outreach & Public Engagement Program

Location: JRM **Period of Performance**: AUG2021 – Ongoing; New Award SEP2022

Project Objective

To develop outreach products to effectively and efficiently implement a NR stewardship engagement program. This program aims to better educate uniformed and civilian staff, their dependents, JRM contractors, and the general public in order to improve NR stewardship and awareness within JRM AOR.

Conservation Benefit

The development and production of NR education materials and training is a beneficial support to increasing awareness of T&E species, proper stewardship behavior, and threats to local ecosystems.

FY22 Results

- Ongoing production of Environmental Stewardship Website
- Ongoing production of outreach swag items to support Tinian Art Contest and Turtle Educational Outreach Project
- Ongoing update of Public Access Plan site descriptions and photos
- Ongoing 360 degree camera photos of 3 Public Access Plan sites to be featured on Environmental Stewardship Website
- Projected completion of tasks by 31OCT2022
- New project awarded 09SEP2022 for the production of 3 to 5 minute outreach video

EPR: 61128NR962 JRM Natural Resources Stewardship Outreach and Public Engagement Program

PACFLT Funded JRM Natural Resources Stewardship Outreach & Public Engagement Program

Location: JRM **Period of Performance:** SEP2020 - Ongoing

Project Objective

Improve NR stewardship and awareness within JRM AOR.

Conservation Benefit

The development and production of NR education materials and training is a beneficial support to increasing awareness of T&E species, proper stewardship behavior, and threats to local ecosystems.

FY22 Results

- Ongoing implementation and expansion of Young Environmental Stewards (YES!) youth educational program
- Ongoing CNMI outreach initiative in conjunction with EPR 61128NR962 JRM Natural Resources Stewardship Outreach and Public Engagement Program
- Distribution of 4 T&E species themed reusable shopping bags at installations, various DOD events, and public outreach events on Guam.
- Production and delivery of Nature Journals and Passport interactive materials estimated for OCT2022
- Ongoing development of Sea Turtle interactive classroom game

EPR: NA- Funding from PACFLT Stewards of the Sea Initiative

MIGRATORY BIRD MANAGEMENT

Migratory Bird Surveys on NBG-Administered Lands

Location: NBG; NMS **Period of performance:** SEP2021 – AUG2022; Ongoing

Project Objective

Conduct monthly bird surveys on NBG-administered lands; examine trends in abundance and habitat preference of migratory birds.

Conservation benefit

To improve long-term understanding of species protected by the MBTA and their preferred habitats and migratory patterns, in support of military readiness, and to avoid and minimize impacts to migratory birds.

FY22 Status

- Bird abundance was monitored at 15 NBG/NMS sites
- Bi-monthly surveys during nesting season
- 95 in-house surveys conducted
- Common occurrence of plovers, sandpipers and snipes
- Migrants prefer grass fields and paved surfaces

EPR: In-house only

2019 JRM INRMP Reference: MIG-1; 5-90, MIG-1; 6-48

TERRESTRIAL HABITAT MANAGEMENT

Threatened and Endangered Species Preconstruction Surveys

Location: MCBCB; NBG; AAFB **Period of Performance:** Ongoing, multiple awards

Project Objective

Conduct pre-construction surveys prior to vegetation clearing to minimize impacts to listed species.

Conservation Benefit

The preconstruction surveys ensure listed species are not harmed by construction projects. Healthy individuals may be moved to long-term conservation sites, preserving genetic variety within listed species populations.

FY22 Status

Ongoing projects for construction activities:

- J001B Finegayan Utilities and Site Improvements Phase 1
- J-006 Apra Medical Clinic
- J-007 Waterfront Head Quarters
- J-200 IV Utilities
- J-755 Urban Combat Training
- P-102 Power Upgrade-Harmon
- P-103 Water Phase 2
- P-290 Earth Covered Magazines
- P-295 Ordnance Ops.
- P-715 Live-Fire Training Range Complex Known Distance Ranges
- P735 Machine Gun Firing Range
- P-745 Guam National Wildlife Refuge

Listed Plant and Invertebrate Surveys 1

Location: NMS; AAFB; Off-DoD **Period of Performance:** AUG2019- Ongoing

Project Objective

To conduct surveys for ESA-listed plant and invertebrates. Information collected adds to the baseline data for each the species.

Conservation Benefit

Identifying locations of ESA-listed plant and invertebrate species will allow for management actions to reduce habitat fragmentation, enhance and restore habitat, buffer protected areas, and implement new conservation strategies.

FY22 Status

- Acres surveyed AAFB (89), NMS (178), Andy South (1099), Off-DoD (295)
- Species found: *Bulbophyllum guamense, Cycas micronesica, Dendrobium guamense, Eugenia bryanii, Tabernaemontana rotensis, Tuberolabium guamense, Hypolimnas octula mariannensis, Partula radiolata, Elatostema calcareum, Procris pendunculata*

Tree Density Study

Location: NMS **Period of performance:** JUL2020- MAR2022

Project Objective

Conduct forestry surveys to better understand tree density and diversity within select NMS study sites.

Conservation benefit

The conservation benefits of the project are (a) ensure self-sustaining, resilient populations to maintain and increase native species and diversity, and (b) ensure self-sustaining, resilient populations to include the use of novel techniques in the adaptive management of tree populations.

FY22 Status

- Study included 14 NMS survey locations
- Point quarter survey methodology
- 60 different tree species recorded
- 1,266 trees/ha/14 locations (95% CI)
- *Ficus prolixa* densest at 2 sites (43 individuals/ha)
- Undergoing data analysis

EPR: 1 S MAR NBG Endangered Species Monitoring; 61755NR142

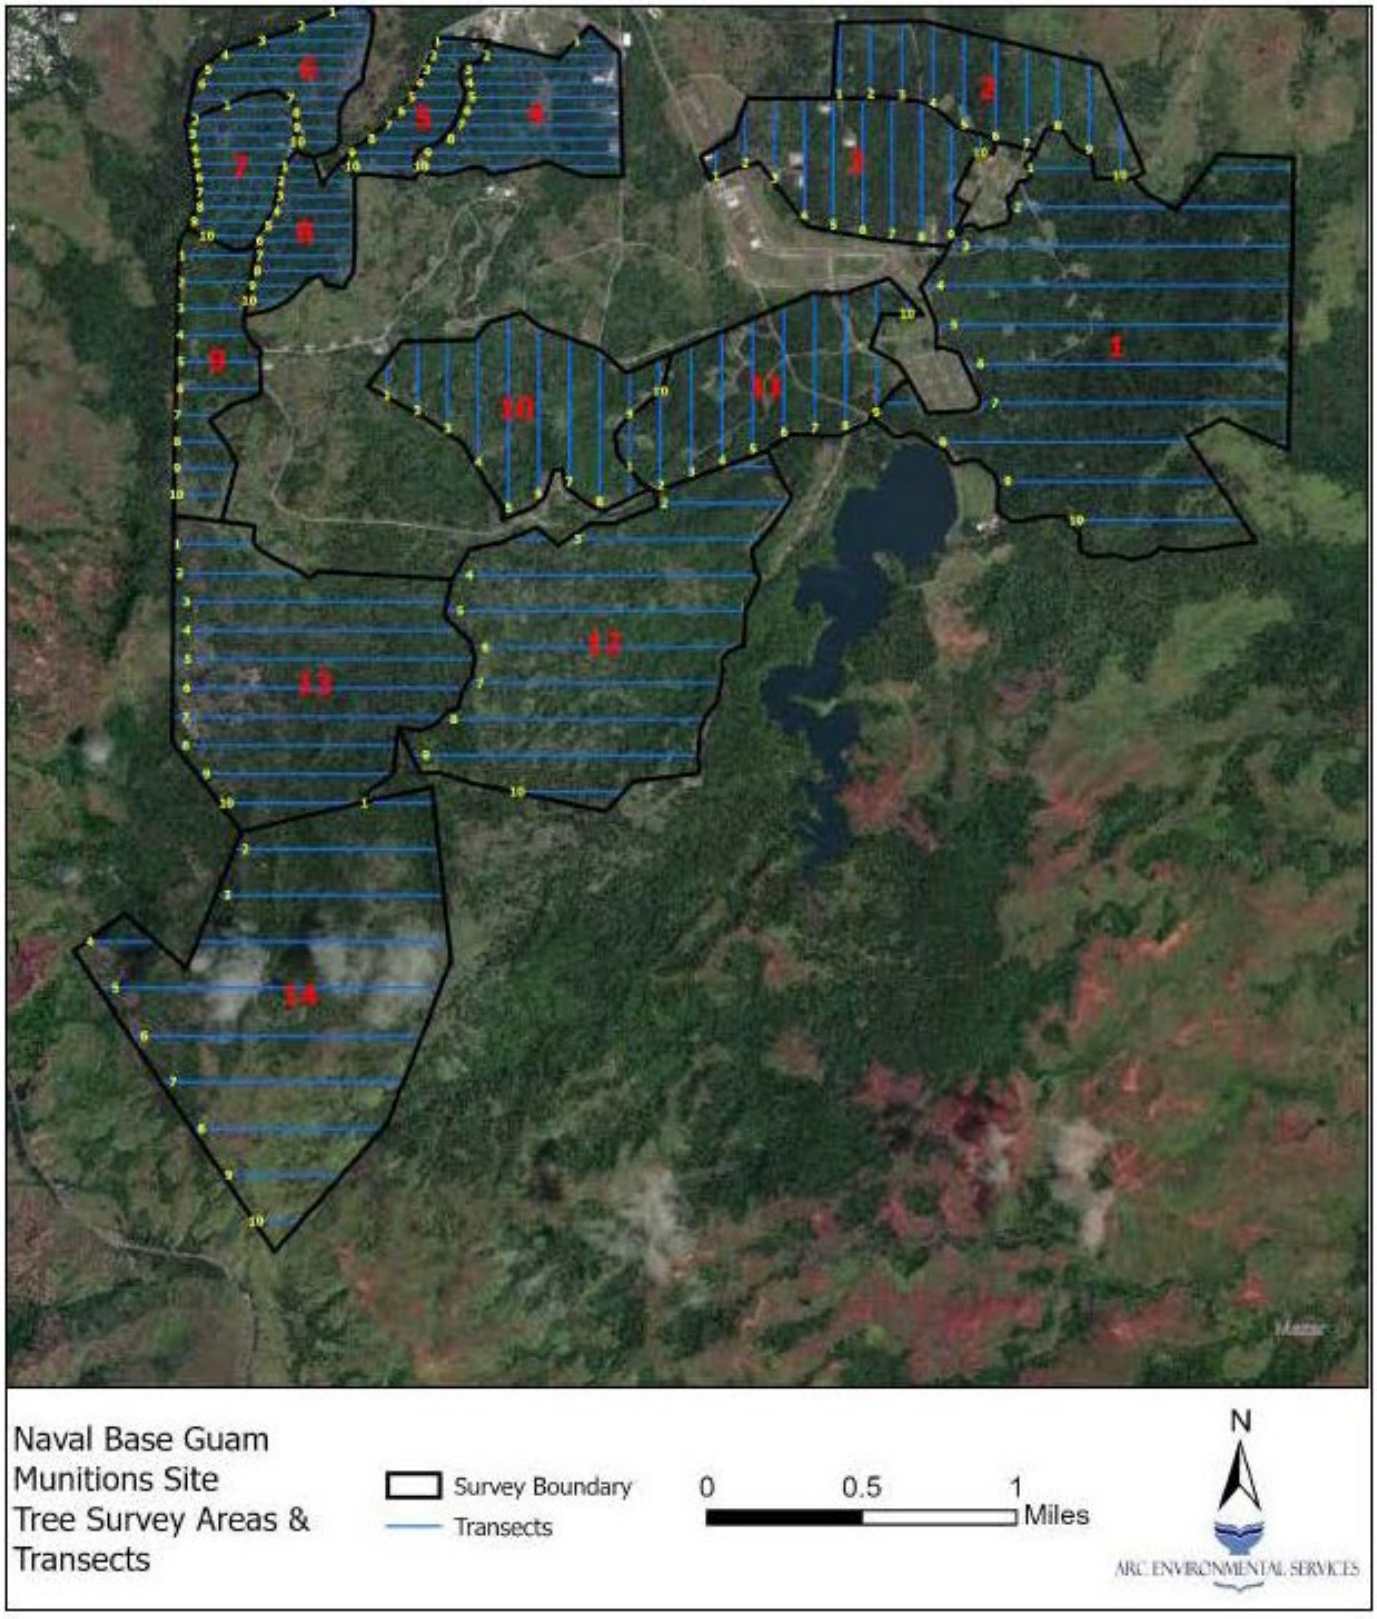

Figure 60. NMS tree monitoring locations in to determine density and diversity

Orchid Survivorship

Location: NMS **Period of performance:** JUL2020- MAR2022

Project Objective

Conduct re-occurring surveys of ESA-listed orchids to document life history data.

Conservation benefit

The conservation benefits of the project will ensure self-sustaining, resilient populations to include the use of novel monitoring techniques in the adaptive management of orchid populations.

FY22 Status

- Monitor orchids at 3 NMS survey locations
- 300 individual trees monitored
- Track individual fate/ life history data
- Ongoing data analysis/ comparisons
    - Wet season vs dry season
- Inside and outside fenced areas

EPR: 1 S MAR NBG Endangered Species Monitoring; 61755NR142

2019 JRM INRMP Reference: TPS-1; 6-46

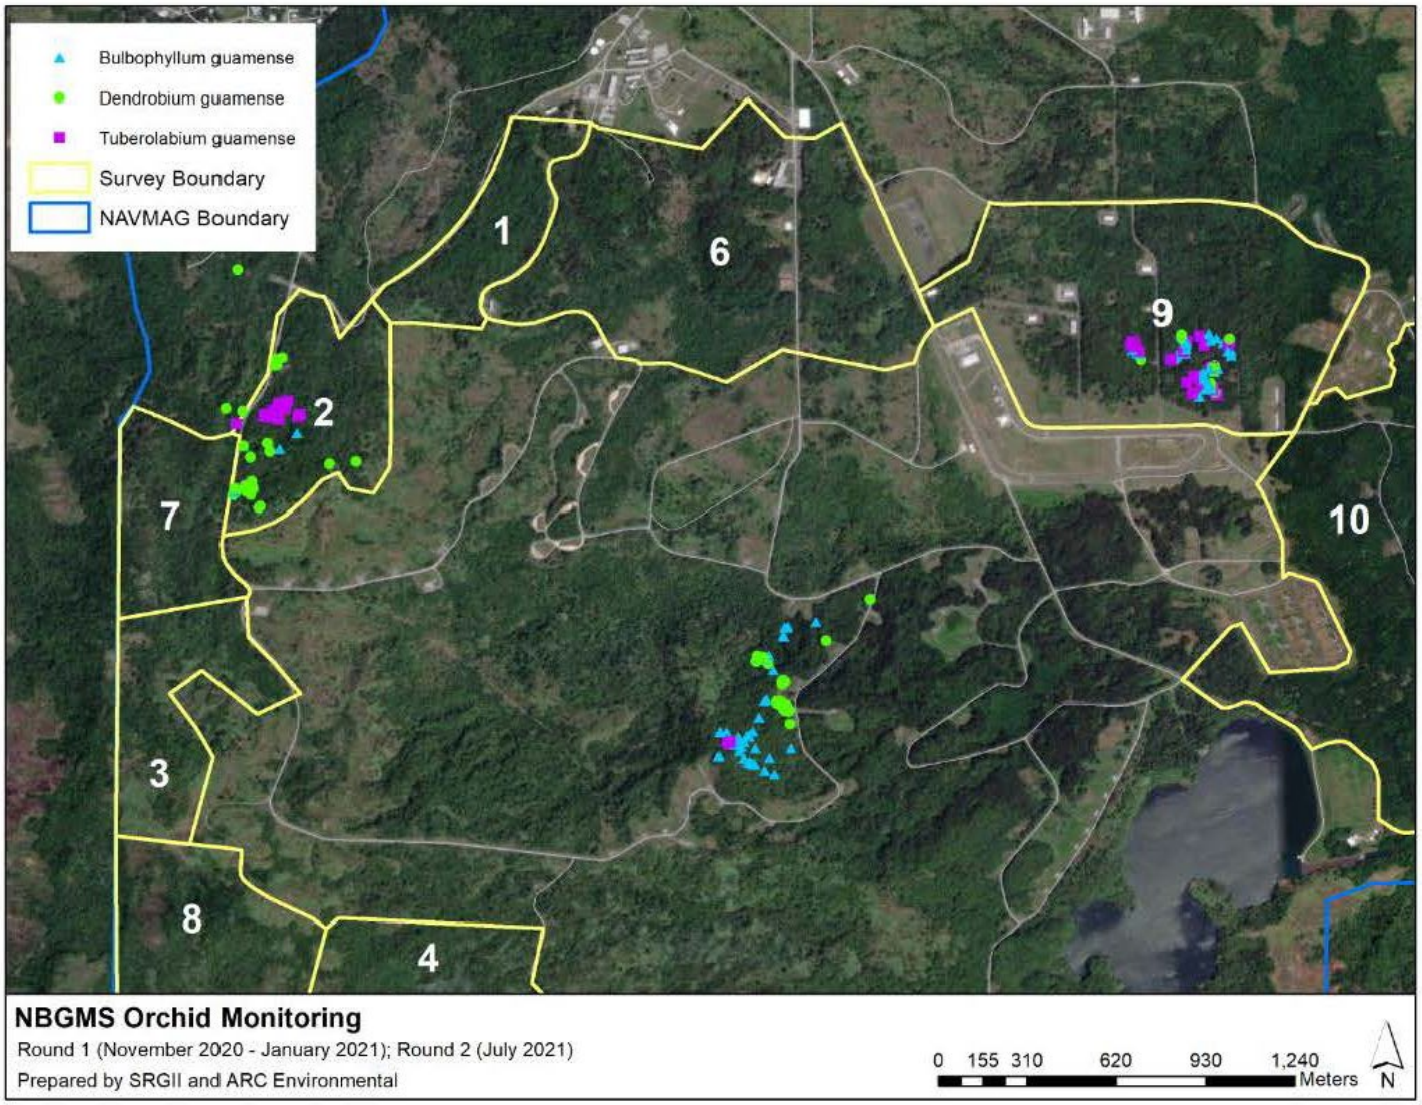

Figure 61. NMS orchid monitoring locations.

Forest Restoration Plan Implementation - NBG

Location: NMS **Period of Performance:** SEP2017 – DEC2022

Project Objective

Restore native forest ecosystems within fenced areas where feral pigs, deer and carabao have been removed on the NMS.

Conservation Benefit

The conservation benefits of the project will ensure self-sustaining, resilient populations to include the use of novel monitoring techniques in the adaptive management of forest resources.

FY22 Status

- Established monitoring plots inside and outside fenced areas
- Treat Vitex and monitor canopy light levels
- Propagate and outplant native species
- Establish experimental seeding plots

EPR: 1 S MAR NBG Endangered Species Monitoring; 61755NR142

2019 JRM INRMP Reference: THM-2; 6-39

Table 8. Survival rates of species found inside and outside fenced forest restoration unit

Location	Species	Survival
Inside	*G. mariannae*	Alive = 21 (70%)
		Dead = 9 (30%)
	I. bijuga	Alive = 18 (60%)
		Dead = 12 (40%)
	I. triantha	Alive = 23 (77%)
		Dead = 7 (23%)
	M. multiglandulosa	Alive = 13 (43%)
		Dead = 17 (57%)
	P. pedunculata	Alive = 0 (3%)
		Dead = 30 (97%)
Outside	*M. cylindrocarpa*	Alive = 1 (6%)
		Dead = 16 (94%)
	I. bijuga	Alive = 0 (0%)
		Dead = 30 (100%)
	I. triantha	Alive = 0 (0%)
		Dead = 30 (100%)
	M. multiglandulosa	Alive = 0 (0%)
		Dead = 30 (100%)
	P. pedunculata	Alive = 0 (0%)
		Dead = 30 (100%)

Forest Restoration Plan Implementation- Forest Restoration Unit (FRU) 2

Location: NMS **Period of Performance:** SEP2017 – DEC2022

Project Objective

To manage invasive species within the FRU 2 and restore native habitat.

Conservation Benefit

Increasing native forest habitats would improve native species survival, particularly threatened and endangered species, enhance native habitat for listed animals, increase the biodiversity of native species, and contributes to the connectivity with surrounding communities in ways that support improved ecosystem functionality. It also contributes to the goals of the Guam NWR as an overlay unit the NMS.

FY22 Status

- Monitoring plot locations and initial measurements
- Development of Biological Assessment to conduct Vitex removal ongoing

EPR: 61755NR856 SIKES MAR NBG Native Forest Habitat Restoration – Climate

2019 JRM INRMP Reference: THM-2; 6-39

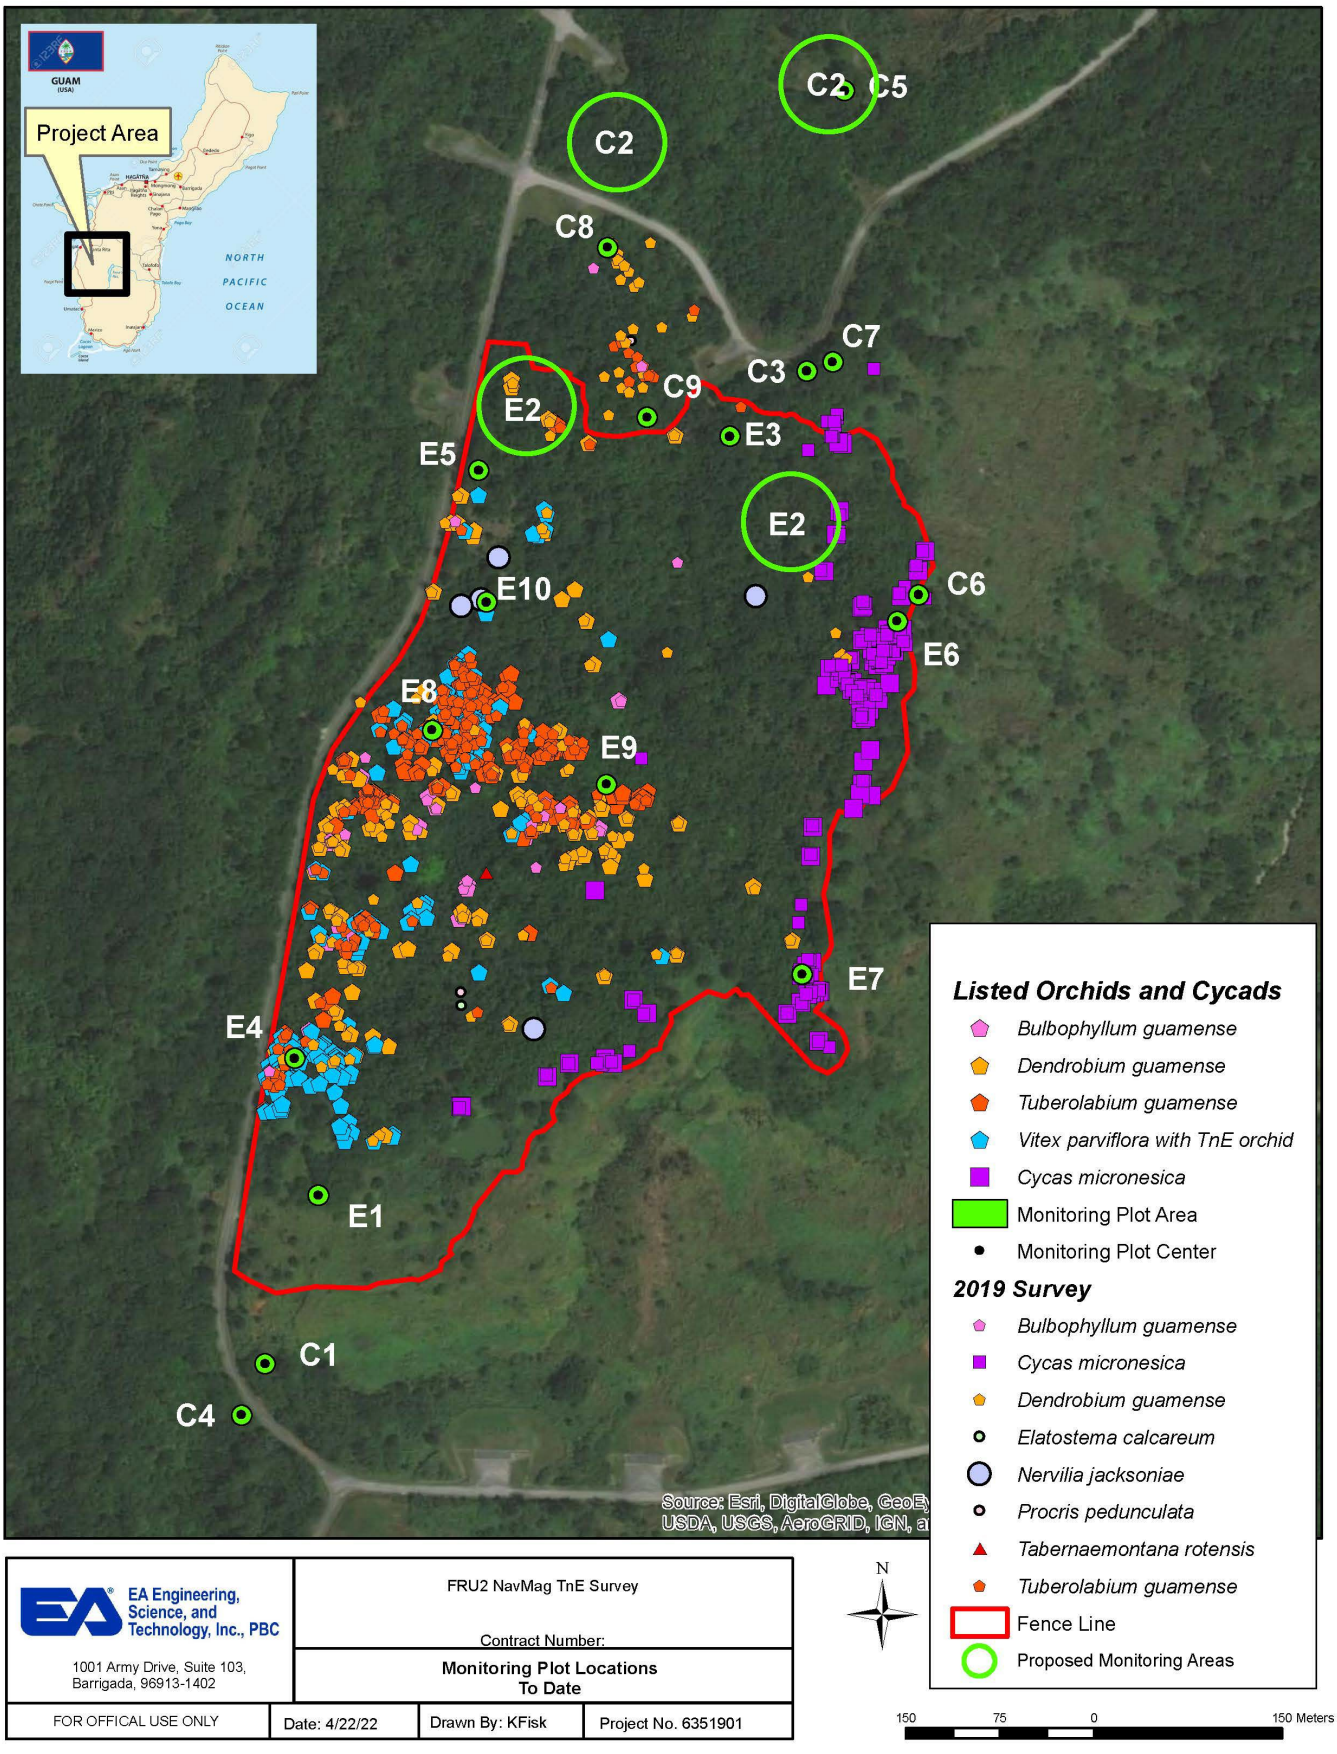

Figure 62. Monitoring plot locations

Forest Restoration at Achae Point

Location: AAFB **Period of Performance:** JUL2021 – Ongoing

Project Objective

Restore native vegetation component to limestone forest rehabilitation site.

Conservation Benefit

Enhance and restore habitats, reduce habitat fragmentation, increase populations of native species, and buffer protected areas.

FY22 Status

- 56 *Serianthes nelsonii* saplings outplanted to the Route 3A plot
- Protective cages are regularly repaired; winds frequently tear the protective screens and expose the trees to harmful pests
- Water for *S. nelsonii* saplings needs to be hauled in frequently and is very labor intensive
- Total of 1082 native plant species outplanted at the Route 3A plot as of July 2022
- Monitoring and maintenance of the 56 *S. nelsonii* saplings and future forest restoration work moved from *S. nelsonii* Cooperative Agreement to the Vegetation Restoration Cooperative Agreement

EPR: 1 CR MAR AFB Native Forest Habitat Restoration; M5240NR067

2021 JRM INRMP Reference: THM-1; 9-68

Figure 63. Serianthes nelsonii sapling outplanted at Route 3A

Vegetation Restoration for the Habitat Management Unit (HMU)

Location: AAFB **Period of Performance:** JUL2021 – JUL2022

Project Objective

Implement vegetation restoration within the Habitat Management Unit (HMU) utilizing the 2017 HMU Vegetation Restoration Plan.

Conservation Benefit

Enhance and restore habitat and maintain or increase populations of threatened and endangered species, including those extirpated from Guam and potentially reintroduced within the HMU.

FY22 Status

- Ongoing project with UOG CESU
- Experimental edge plots and 30m x 30m plots being monitored.
- Experimental 1 acre plot has begun and is successful
- Outplanted species will include species to increase habitat quality for Marianas fruit bats, e.g., *Artocarpus mariannensis* and *Ficus* sp.
- For the coming year will do 20-30, 1 acre plots
- Formal Section 7 consultation will be initiated
- Complete reforestation can be completed in 5-7 years

EPR: 1 CR MAR AAFB Native Forest Habitat Restoration; M5240NR067

2019 JRM INRMP Reference: THM-1; 9-68

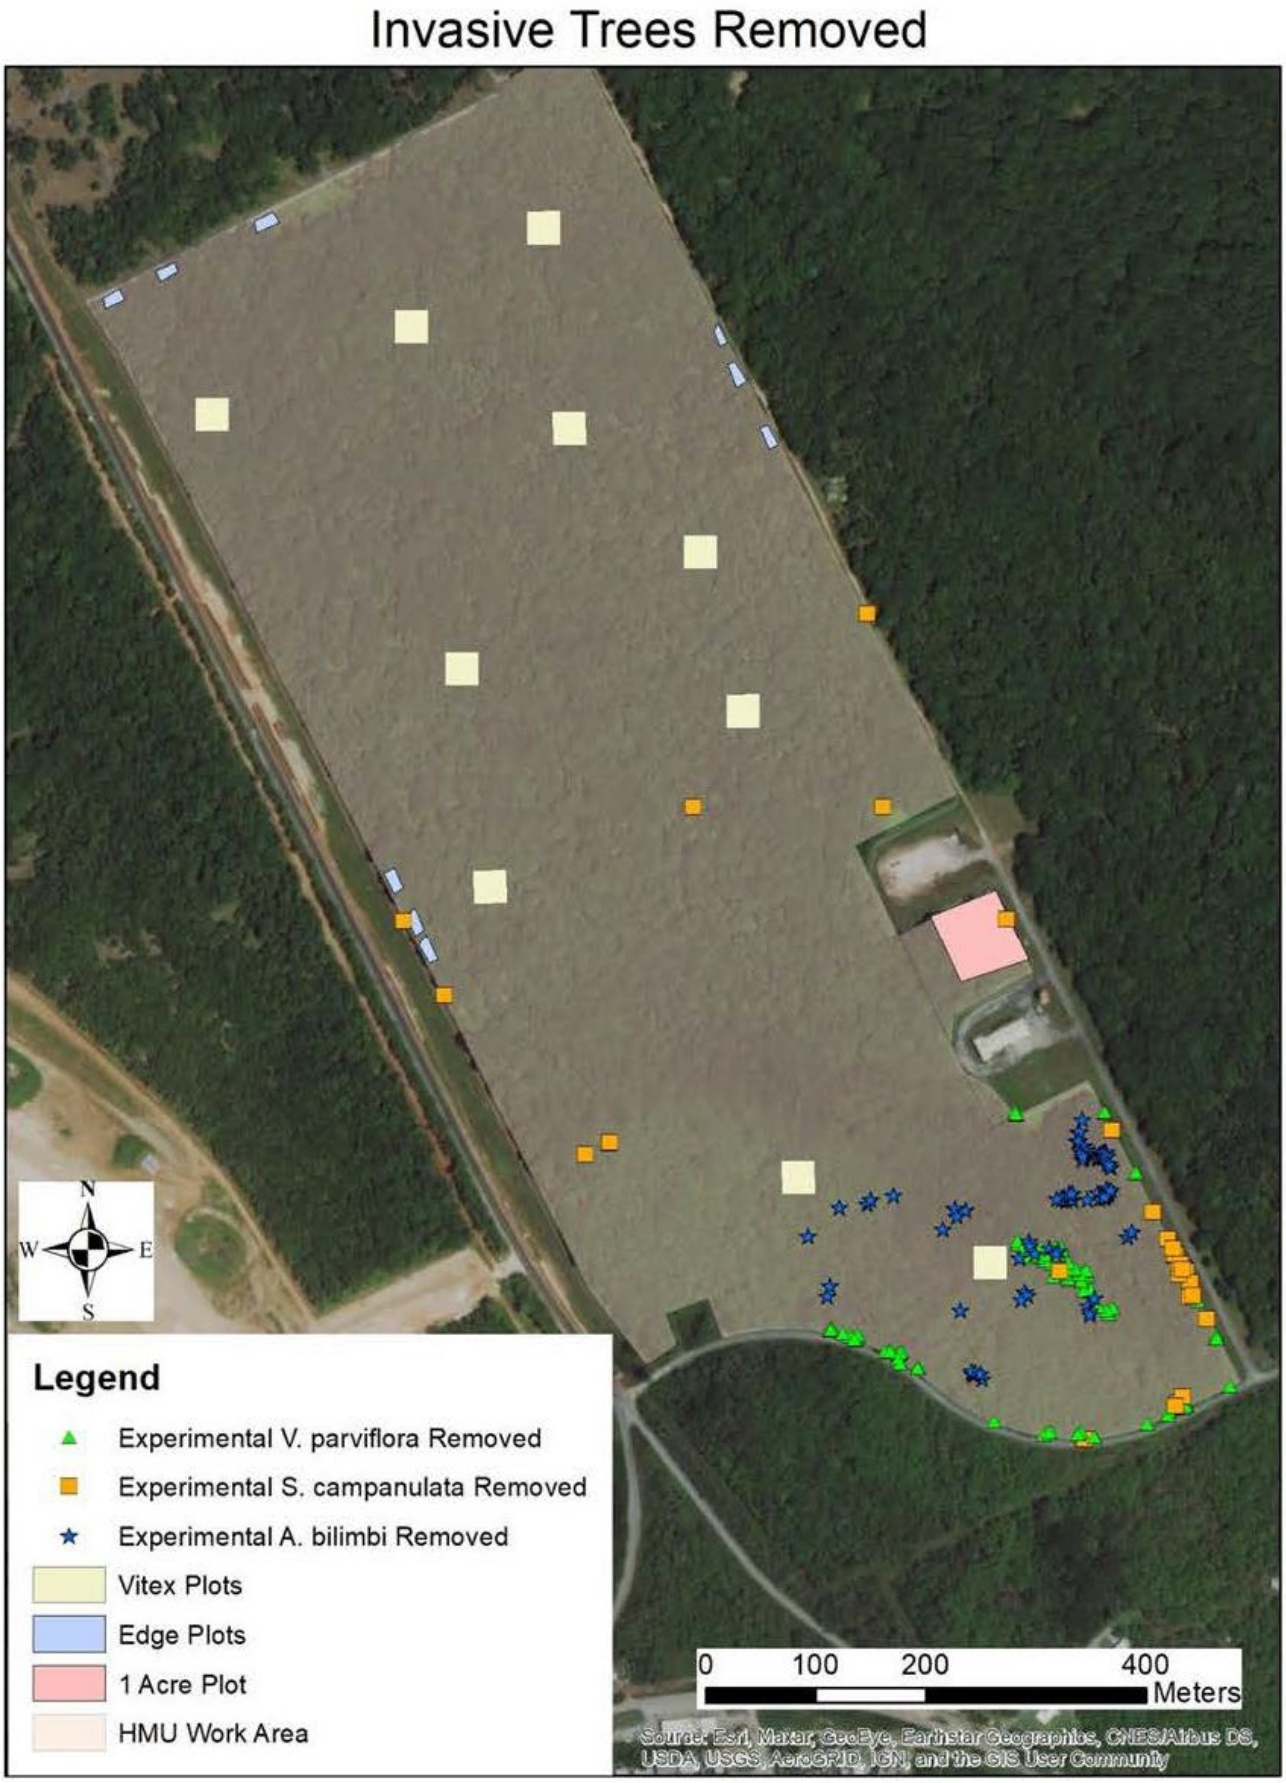

Figure 64. HMU experimental plots

Implementation Plan for Caiguat Forest Enhancement Site

Location: MCBCB **Period of Performance**: JUL2019 – JAN2023

Project Objective

Develop site specific plans for the Caiguat FES Phase 1 and 2, as well as the Finegayan Forest Enhancement Site.

Conservation Benefit

The plan will streamline regulatory compliance, provide guidance on species selection and outplanting design, and develop invasive plant removal options that are applicable to future forest enhancement projects.

FY22 Status

- Phase 1 plan in review
- Phase 2 plan in development
- Planning efforts for Finegayan FES began in FY2022

DPRI: Marine Corps Relocation 2017/2018 amendment to 2015 BO, Conservation Measures to Contribute to the Recovery of Listed Species

Reference: Guam Relocation Biological Opinion

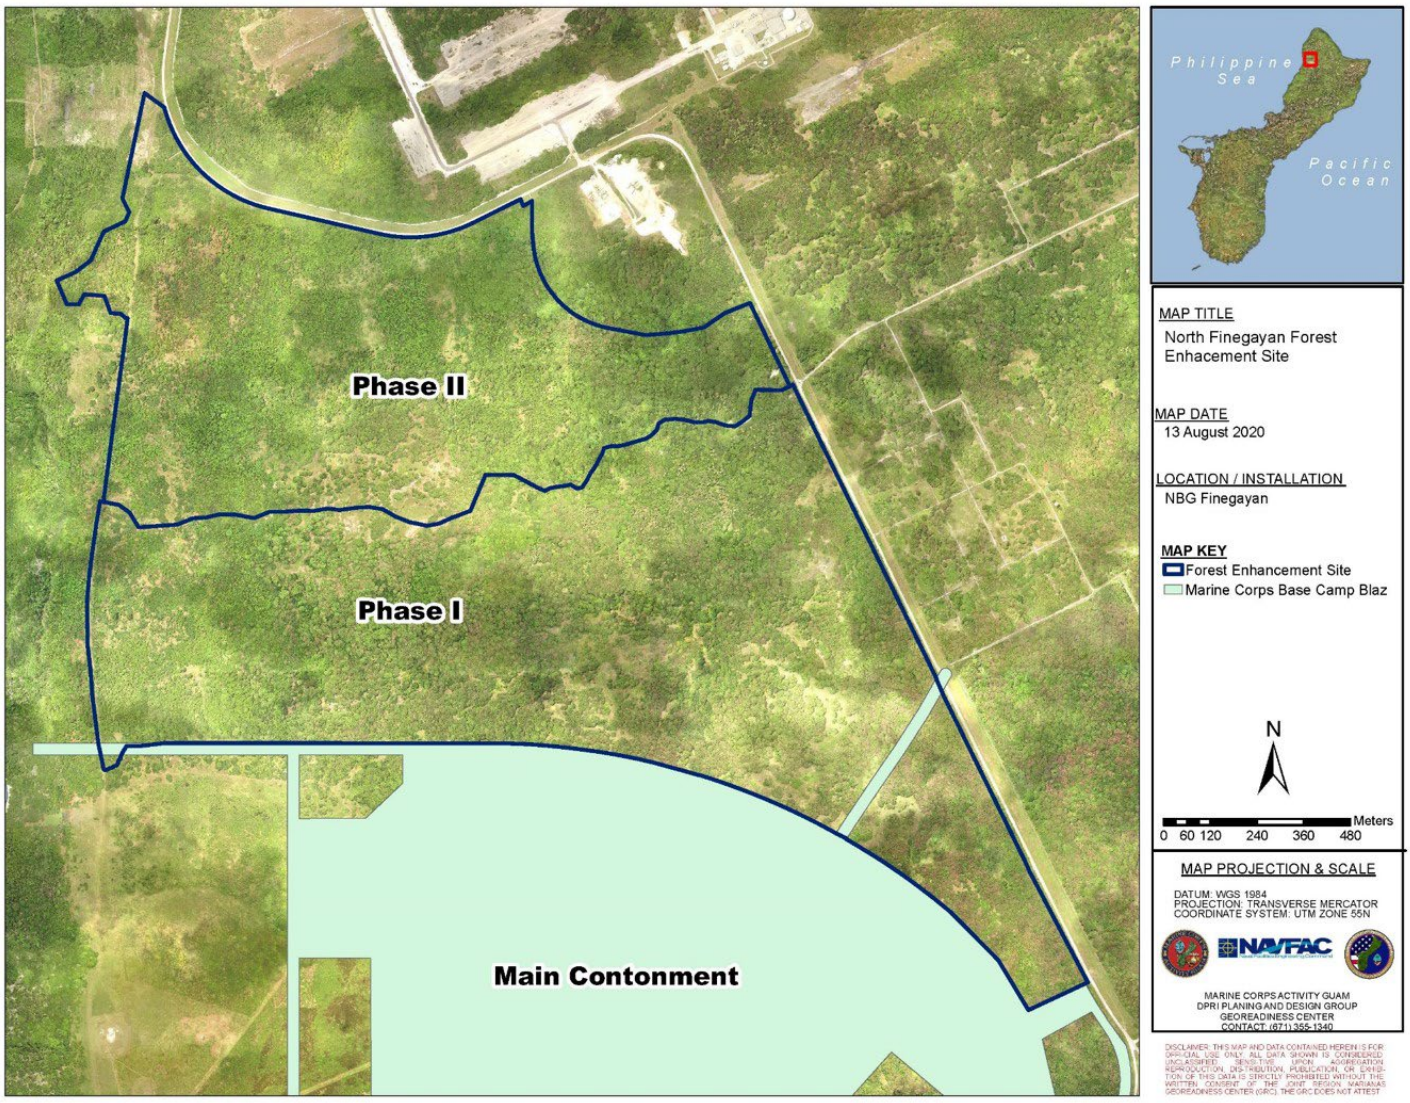

Figure 66. The North Finegayan Forest Enhancement Site (FES) has been renamed the Caiguat FES to reflect place names from historic maps.

Irrigation and access for Caiguat Forest Enhancement Site

Location: MCBCB **Period of Performance**: SEP2021 – MAR2023

Project Objective

Complete full surveys for listed species within Caiguat FES, and create access pathways and irrigation backbones for future outplanting work in the site.

Conservation Benefit

The Caiguat FES will have large-scale invasive plant removal and native plant outplanting. This project will facilitate future work in the site by providing access and water to support maintenance and monitoring.

FY22 Status

- Surveys for federally listed plants, snails and butterflies completed for Caiguat FES Phase 1
- Surveys for Phase 2 are planned to begin 2023
- Irrigation and access path plans for Phase 1 are under review, with installation expected to begin in September 2022
- Design and installation of Phase 1 access and irrigation anticipated to begin in 2Q FY23

DPRI: Marine Corps Relocation 2017/2018 amendment to 2015 BO, Conservation Measures to Contribute to the Recovery of Listed Species

Reference: Guam Relocation Biological Opinion

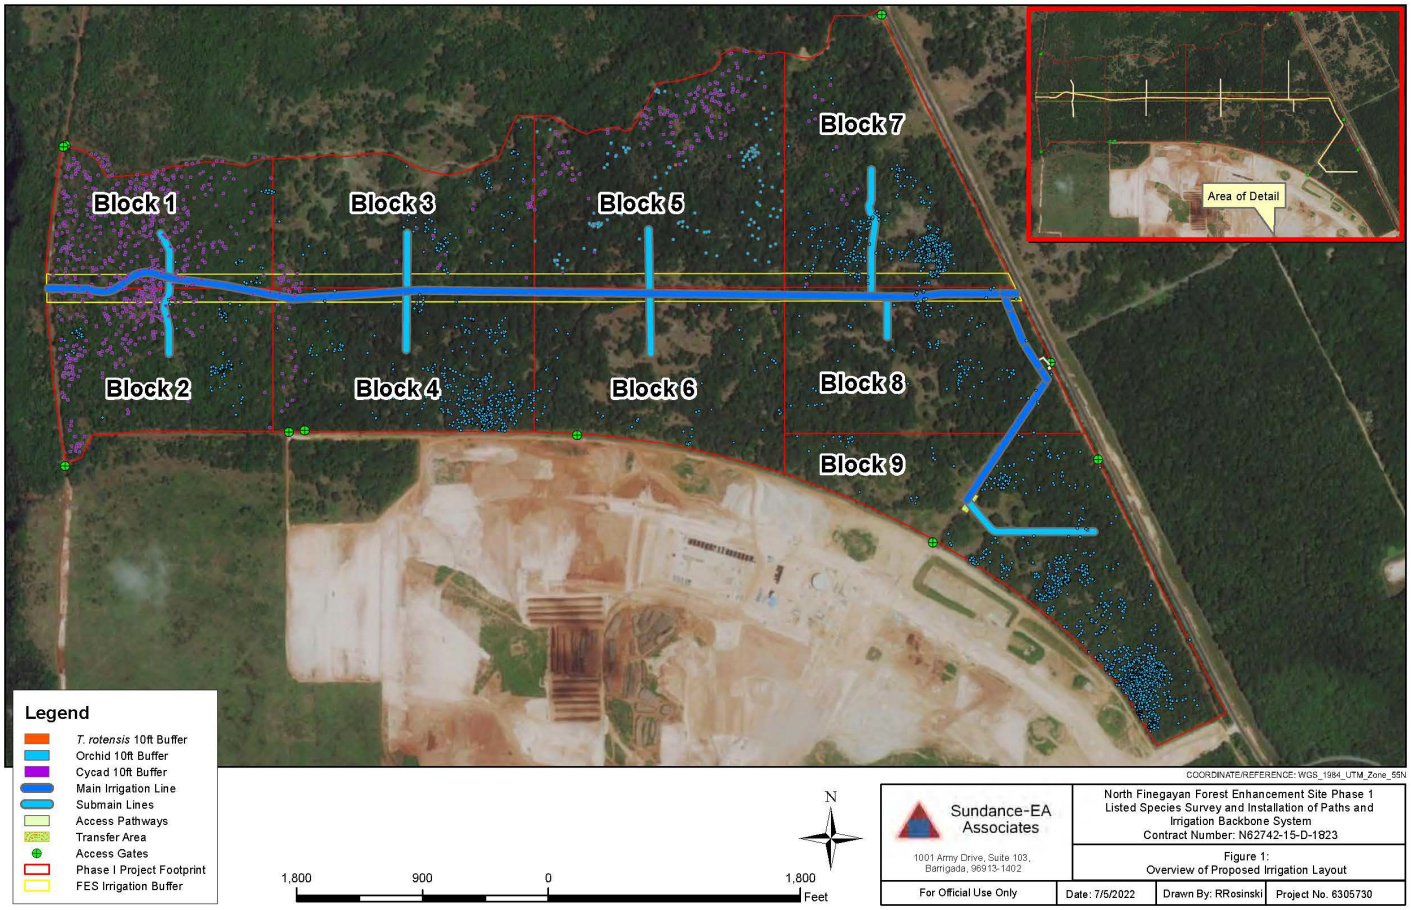

Figure 67. Proposed layout for irrigation and access paths in Caiguat FES Phase 1

Cetti Bay Watershed Terrestrial Monitoring

Location: NMS **Period of Performance**: MAR2022 - MAR2024

Project Objective

Annual survivorship and growth rate monitoring of acacia plantings and to document soil runoff and stream turbidity within the Cetti Bay Watershed.

Conservation Benefit

Monitoring will facilitate understanding of the effectiveness of the ridge to reef concept. The effort will detail how effective the acacia tree plantings are in improving Cetti Bay watershed and, ultimately the health of marine resources, given the environment and site history of annual fires.

FY22 Status

- UoG completed a 3-year study in 2022
- Average area of *Acacia* basal increased
- 58.8% (or, 2,313 m) forested area.
- -0.5 mm average erosion (n=4 sites)
- FY22 monitoring contract awarded

EPR: USACE Permit, NBG Reforestation Site, Cetti Bay; 61755NR896

2019 JRM INRMP Reference: THM-2; 6-39

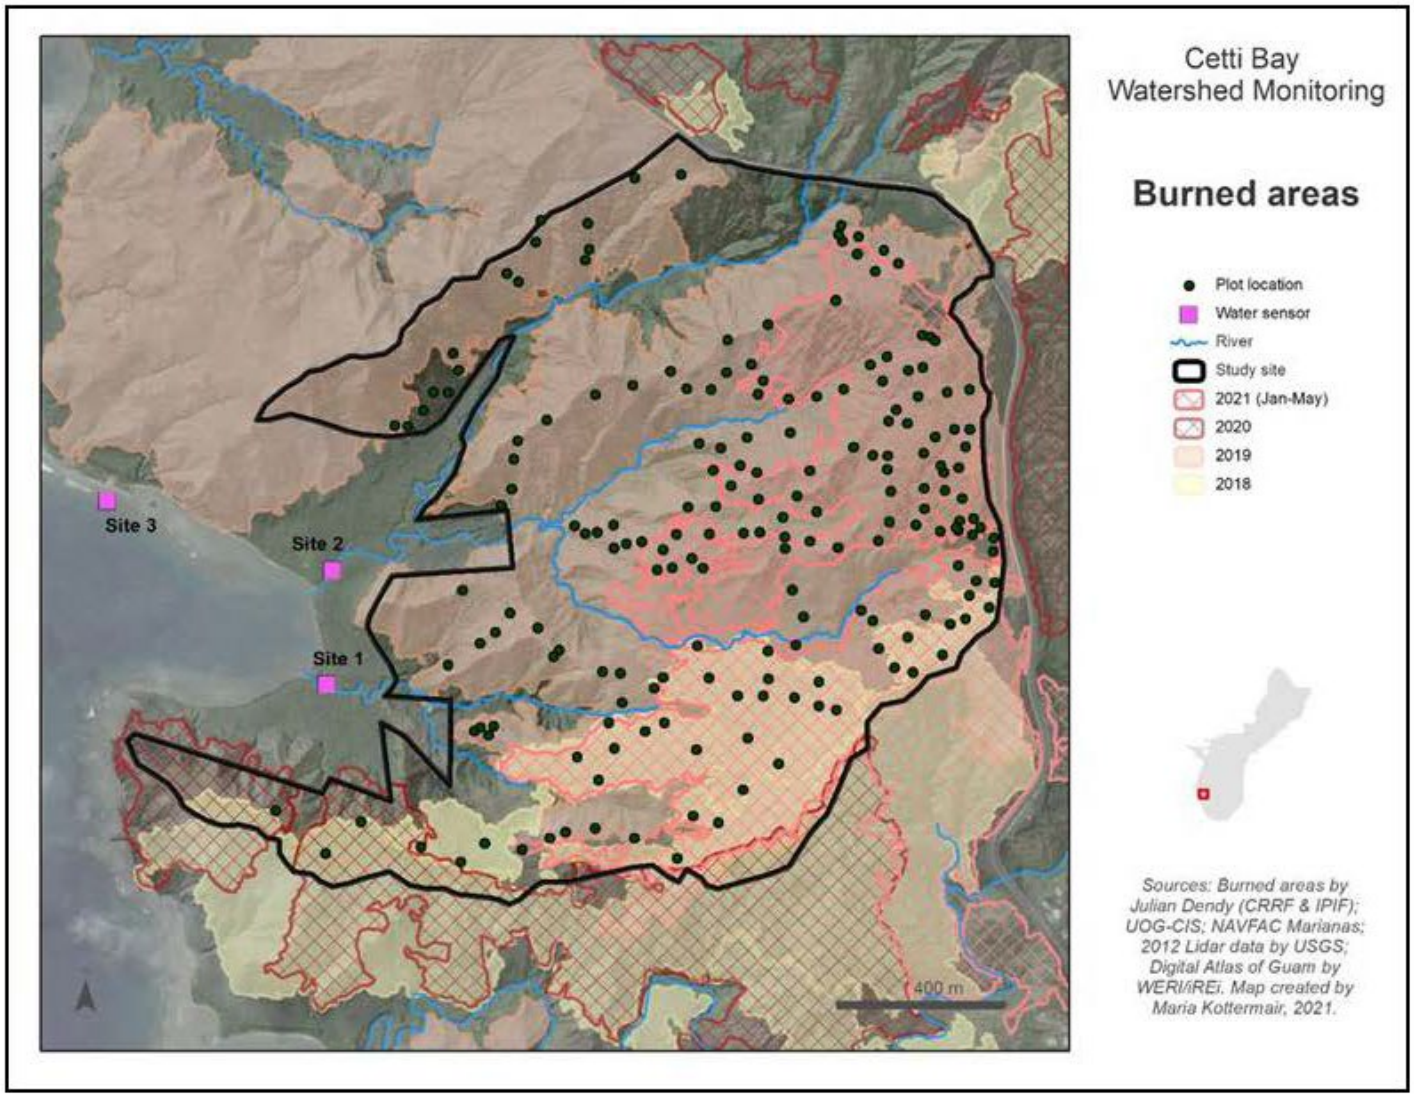

Figure 68. A map of the tree monitoring plots and burned areas in the Cetti watershed each year.

Fire Management Plan Implementation - NBG

Location: NMS **Period of Performance**: SEP 2021 – SEP2022

Project Objective

Protect natural resources on NMS by reducing habitat degradation (*i.e.* soil erosion and vulnerability to invasive plant establishment) resulting from wildland fires.

Conservation Benefit

Controlling fuels (*i.e.* swordgrass) in strategic locations creates buffers/ fuel breaks and protects sensitive natural resource areas and enhances existing conservation areas.

FY22 Status

- 5 acre fuel treatment parcel was identified for management, adjacent to NMS Fire Break 5 and Cotal Forest Reserve in eastern NMS. The site is part of Fire Management Unit #1.
- Treatment of fuels include initial, mechanical removal of flammable grasses followed by chemical treatment (herbicide applications) to limit re-sprouting.
- Future use of site may support *Acacia* or other native savannah out-plantings.

EPR: 1 RP MAR NBG Wildland Fire Management Plan (2015) Implementation through Habitat Management; 61755NR857

2019 JRM INRMP Reference: THM-3; 6-41

Figure 69. Project location for implementing NBG Fire Management Plan fuels reduction. Swordgrass targeted for control is hashed area; small patches are orange dots.

Soil and Water Conservation - NBG

Location: NMS **Period of Performance**: AUG 2020 – SEP2023

Project Objective

Maintain, protect, and enhance water quality and contain/minimize runoff into watersheds and ultimately marine waters.

Conservation Benefit

Stabilization of soils in erosion prone areas reduces sediment runoff into watersheds and benefits supports a ridge-to-reef ecosystem approach. Identification and stabilization of areas with high erosion rates will ultimately reduce sediment loads that drain to coastal waters and minimize potential impacts to coral reefs.

FY22 Status

- Outplantings focus on south of Fena Reservoir
- 62% success rate (n=72,000 shrubs planted)
- Successful taxa include *Pandanus* spp., and *Calophyllum inophyllum.*
- *Hibiscus tiliaceus*, *Morinda citrifolia*, and *Scavola taccada* are heavily browsed, driving low success rates
- 86% success rate of *Vetiveria zizanoides* (n>10,000 plugs)
- Project constraints
    - Available planting area
    - Browse pressure
    - Mobilization

EPR: CHS JRM NBG Soil and Water Conservation: stabilization of eroding streambanks and cliff/ravine; 61755NR832

2019 JRM INRMP Reference: THM-1; 6-39

Figure 71. Example of vetiver grass plantings in project location.

Range Fire Management Plan for Marine Corps Ranges on Guam

Location: MCBCB **Period of Performance**: SEP2017 – SEP2021

Project Objective

Develop a range fire management plan to reduce wildfire potential to protect natural and cultural resources, integrate applicable permit and reporting requirements, and implement ecosystem management goals, sustainable training, and objectives already supported on existing Marine Corps installations.

Conservation Benefit

The fire management plan provides operational and management guidance to minimize the risk of fire to limestone forest habitats and the species that depend upon them.

FY22 Status

- Draft document was submitted to FWS for review
- DON is currently addressing FWS comments

DPRI: Marine Corps Relocation 2017/2018 amendment to 2015 BO, Conservation Measures to Contribute to the Recovery of Listed Species

Reference: Guam Relocation Biological Opinion

Figure 72. Mushroom found on site.

Fuels Management at Mason Live Fire Training Range Complex

Location: MCBCB **Period of Performance**: Pre-award

Project Objective

Eliminate tall grasses and similar non-native vegetation to reduce the risk of fire spreading in the range complex.

Conservation Benefit

Control of invasive grasses will reduce the risk of fire impacting limestone forest areas of the range complex. Removal of these grasses also will allow native limestone forest species to re-establish in areas that have become dominated by grasses.

FY22 Status

- Pending award; target award date is September 2022

DPRI: Marine Corps Relocation 2017/2018 amendment to 2015 BO, Conservation Measures to Contribute to the Recovery of Listed Species

2019 JRM INRMP Reference: THM-3; 6-41, THM-1; 9-68

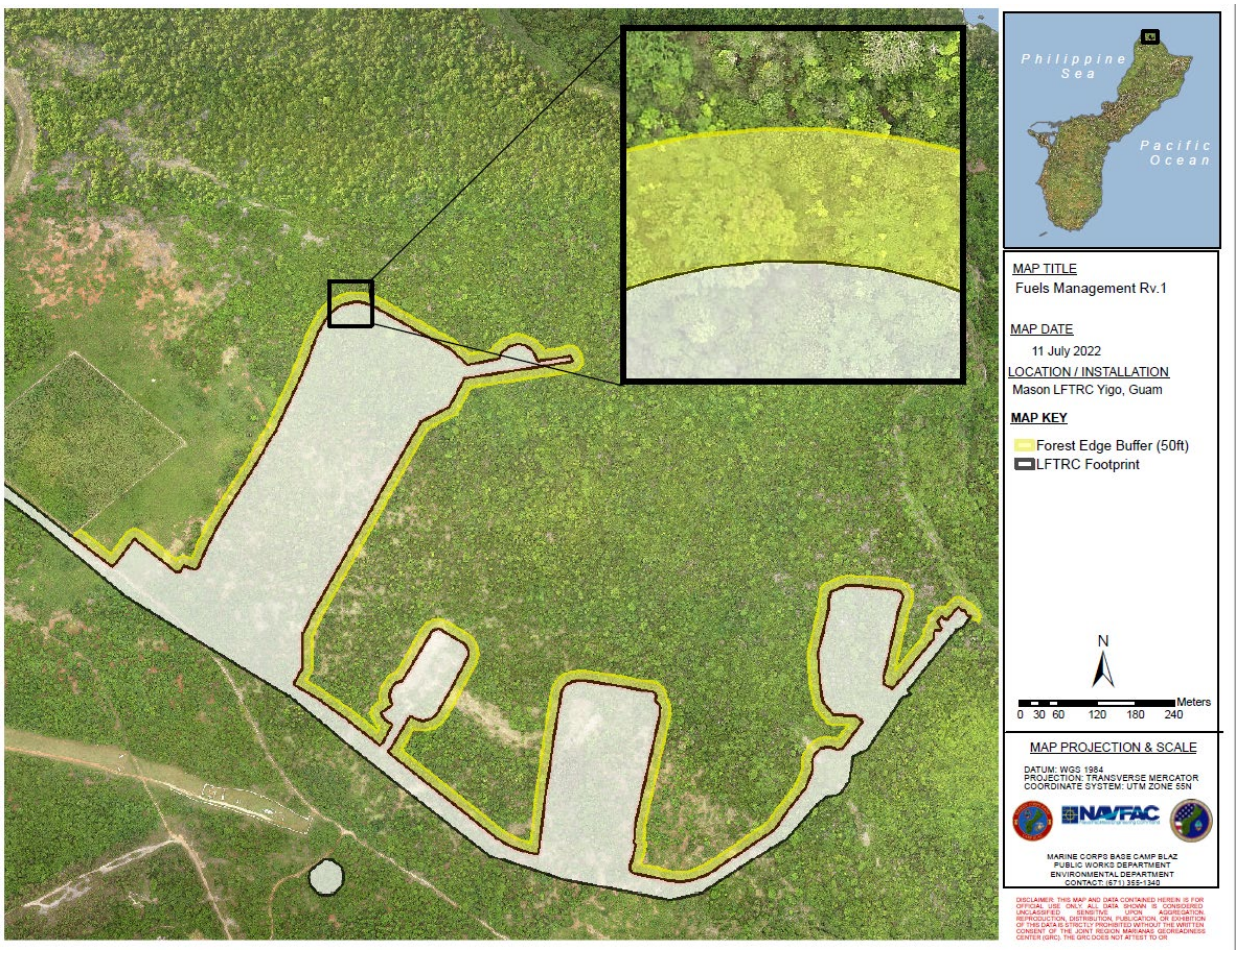

Figure 74. Map depicting fuels management areas within the Mason LFTRC.

Ungulate Fencing on NBG - NMS

Location: NMS **Period of performance:** SEP2021 - Ongoing

Project Objective

The objective is to protect and manage sufficient habitats by securing and managing unprotected areas or rare or unique habitats.

Conservation benefit

The installation effort facilitates the revitalization of native habitats that support viable populations of native and ESA-listed species, increases biodiversity, and promotes ecosystem health. Ungulate fence construction is the first step of the applied ecosystem approach to resource management, as defined in the INRMP.

FY22 Status

- NMS ungulate fence #4 construction underway
    - Enclosed area approximately 70 acres
- Quarterly monitoring of NMS ungulate fence CEMML
- Ungulate monitoring and removal, as needed (e.g. breaches)
- 455 acres constructed and contracted

EPR: 1 RP MAR NBG Ungulate Fencing; 61755NR894

2019 JRM INRMP Reference: THM-2; 6-39

FY23-24	Eastern NMS	TBD/ Maemong River Fence	TBD	TBD

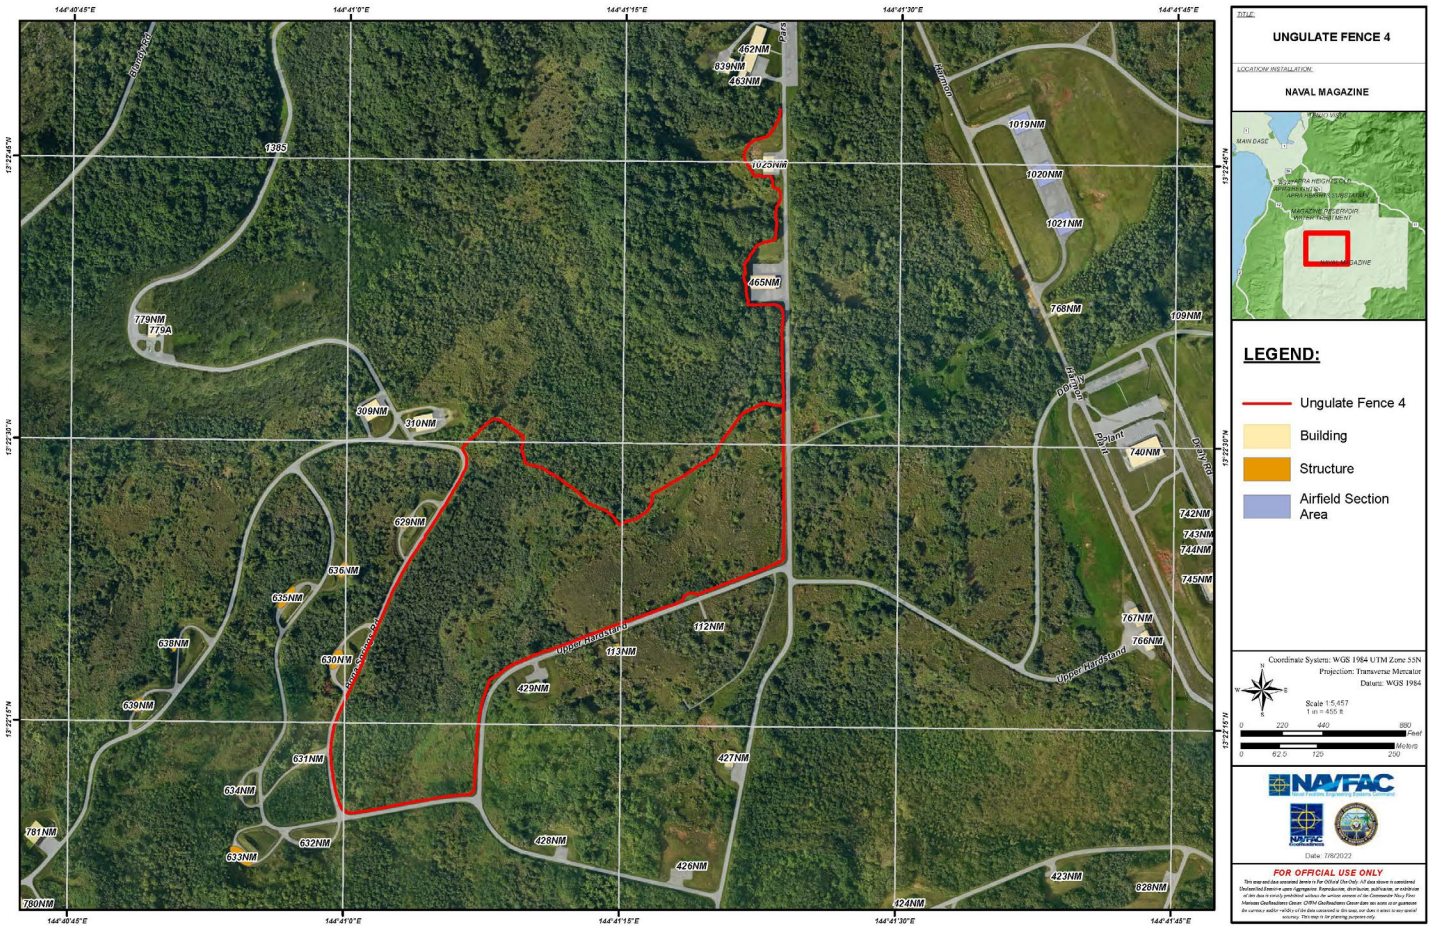

Figure 75. NMS ungulate fence #4 location

Ungulate Control and Eradication on NBG-Administered Lands

Location: NBG; NMS **Period of performance:** SEP2021 - Ongoing

Project Objective

Maintain or enhance ecological function and diversity through control and eradication of established invasive species, particularly ungulates.

Conservation benefit

To allow for multiple INRMP projects to commence, reducing a primary stressor from multiple habitats and ESA-listed species.

FY22 Status

- Pig trapping
  - Removed 34 on NBG Camp Covington
  - Removed 36 removed on PP
- Canine detection dogs and net partition
  - Removed 3 pigs NMS Alifan CF #1 (breach)
  - Removed 41 deer on NBG CF #2
- Sterilization of 6 carabao (n=76)

Table 10. Ungulate control density estimates on NBG.

	Alifan Conservation Fence #1	NMS Conservation Fence #2	Naval Base Guam	Polaris Point

Figure 76. FY21 Ungulate control and eradication locations on NBG.

Ungulate Fencing – AAFB

Location: AAFB **Period of Performance:** SEP2019 – AUG2020

Project Objective

Construct ungulate fencing on AAFB to facilitate eradication of feral pigs (*Sus scrofa*) and Philippine deer (*Rusa marianna*) as well as prevent immigration of ungulates within fenced areas.

Conservation Benefit

Supports ungulate eradication goals within fenced areas (Figure 76). Ungulate eradication facilitates the revitalization of native habitat that supports viable populations of native species, increases the biodiversity of native species, and contributes to the connectivity with surrounding communities in ways that support improved ecosystem functionality. Contributes to the goals of the Guam NWR as an overlay unit on AAFB.

FY22 Status

- Notice to Proceed for Tarague Basin Conservation Area II fence received July 2022
- Shall enclose approximately 74 acres (30 hectares) of conservation area
- Plans in FY23 includes (1) complete the construction by June 2023
- (2) Initiate ungulate eradication will upon completion (3) FY23 funds for constructing second Tarague Basin Conservation Area II fence

EPR: 1 RP MAR AAFB Ungulate Fencing; M5240NR043

2019 JRM INRMP Reference: THM-1; 9-68

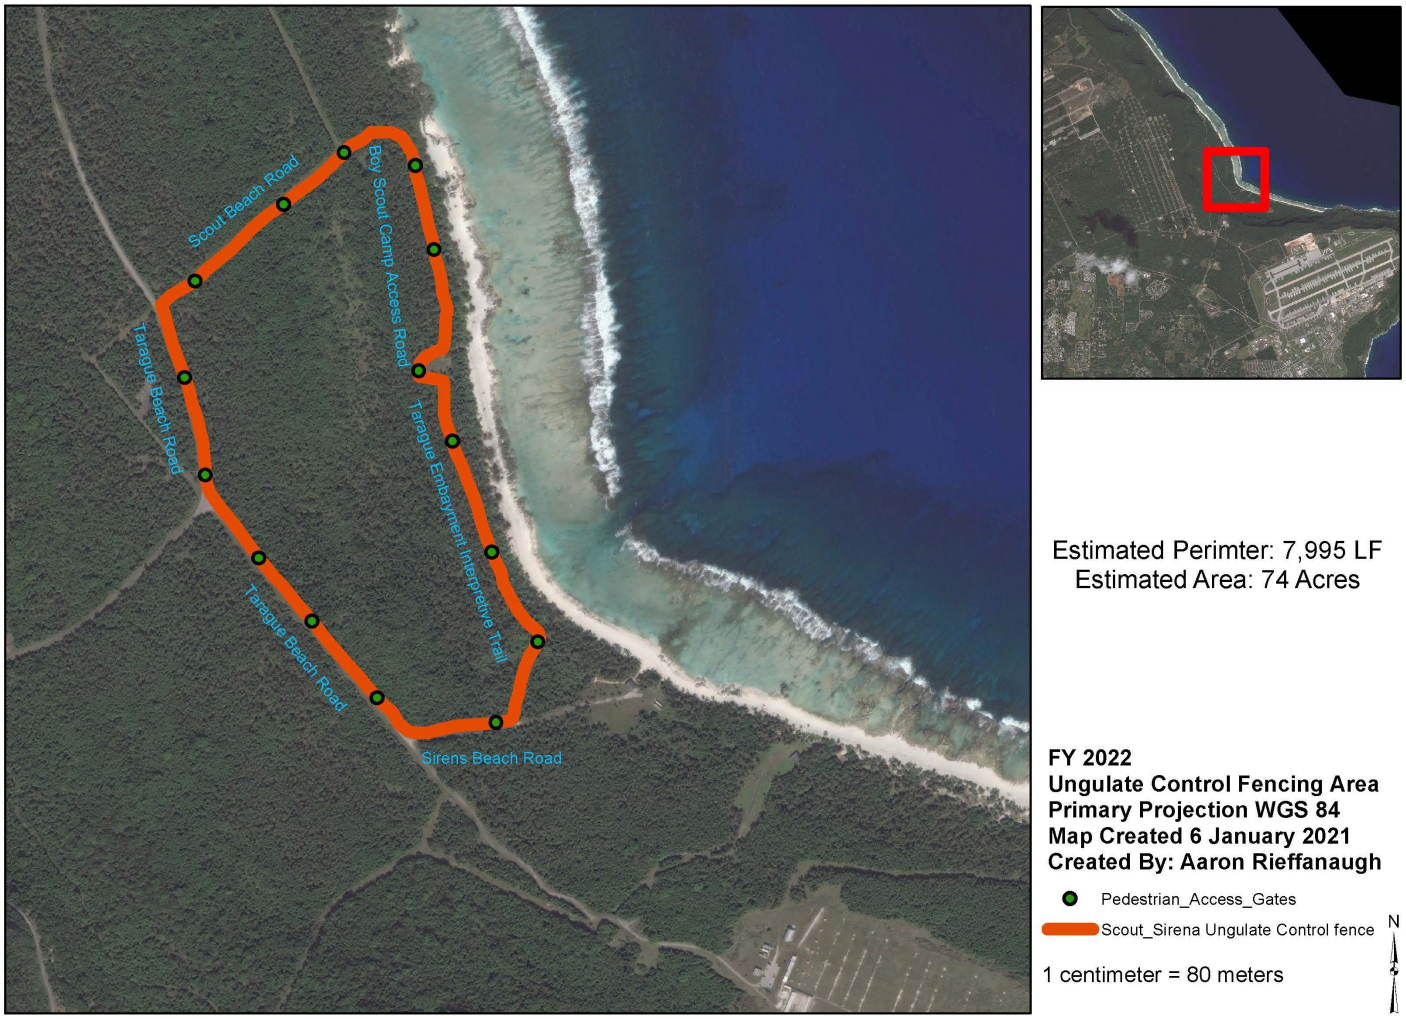

Figure 77. Taragüe Basin Conservation Area Fence II.

Maintenance of Ungulate Exclosures

Location: AAFB **Period of Performance:** AUG2021 – JUL2022

Project Objective

Maintain a three foot buffer, clear of vegetation, on each side of the fence to reduce the possibility of damage. Conduct inspections quarterly and immediately after any high wind events (≥39 mph or ≥34 knots wind speed) on foot or via vehicle where applicable. Perform minor maintenance and repairs to prevent ingress of fence as needed.

Conservation Benefit

The routine maintenance and repair of ungulate exclosures will enhance the longevity of the ungulate barrier. Regular fence monitoring and repair also has the benefit of early detection to any possible immigration of ungulates into fenced eradicated areas. Monitoring, maintenance and repair all support the purpose of facilitating ungulate-free areas to enhance native forest ecosystem regeneration.

FY22 Status

- Cooperative agreement for clearing, monitoring and maintenance of ungulate fence at Tarague Basin Conservation Area awarded July 2022
- Vegetation has been removed within the three foot buffer along the fence-line
- All minor repairs have been completed
- No major damages have been reported as yet
- Plans in FY23 include (1) continue status quo for maintenance and monitoring (2) add the FY22 fence to the maintenance/monitoring cooperative agreement

EPR: 2 BO MAR AAFB Maintenance of Ungulate Exclosure; M5240NR045

Monitor Ungulate Populations with Trail Camera Distance Sampling

Location: AAFB **Period of Performance:** OCT2021 – SEP2022

Project Objective

Develop an efficient monitoring method utilizing trail cameras to capture data and analyze using distance sampling methodology in order to estimate ungulate densities and monitor the populations on AAFB.

Conservation Benefit

This will allow the assessment of the efficacy of ungulate control programs; what percentage of the population is being removed on an annual basis and assess recolonization rates after ungulate control in unfenced areas. Frequency and intensity of ungulate control in unfenced areas can then be decided upon.

FY22 Status

- Method development performed by Pacific Islands Ecosystems Research Center
- Data collected and undergoing analysis at present

EPR: 1 CP MAR AAFB Ungulate Eradication and Control; M5240NR069

2021 JRM INRMP Reference: THM-1; 9-68

Figure 79. Trail camera photo showing distance marking flags and deer. The deer is between 2m and 3m from the camera.

Ungulate Eradication and Control

Location: AAFB **Period of Performance:** AUG2021 – JUL2022

Project Objective

To remove feral pigs (*Sus scrofa*) and Philippine deer (*Rusa marianna*) from AAFB to reduce risk to mission activities, human safety, protection of government property and natural resources conservation with a focus on the DoD mission.

Conservation Benefit

Enhance and restore habitats to increase populations of native species, particularly threatened and endangered species, as well as promote biodiversity of native plants. Reduce ground disturbance from ungulates to improve soil stabilization and reduce suitability of invasive plant species.

FY22 Status

- Ungulate Management Program removed a total of 1,658 deer and 318 pigs from Main A/B, MSA 1, NWF, Tarague and Upi (Figure 79)
- Volunteer Conservation Officer program and other Depredation teams removed 1284 deer and 107 pigs
- White Buffalo, Inc. removed 374 deer and 171 pigs from Main A/B, NWF and Tarague Basin
- Pig trapping by USDA Wildlife Services removed 40 pigs from August – December 2021
- Plans in FY23 includes (1) continue status quo for ungulate removal (2) work with the Command to reopen recreational hunting on base to eligible personnel

EPR: 1 CP MAR AAFB Ungulate Eradication and Control; M5240NR069

2019 JRM INRMP Reference: THM-1; 8-69

Maintenance of BTS Barrier at the HMU

Location: AAFB **Period of Performance:** AUG2021 – JUL2022

Project Objective

Monitoring and maintenance of the Brown Tree Snake Barrier in order to maintain its efficacy. Project includes: 1) Inspections, via walking or driving, weekly and immediately after any high wind events (≥39 mph or ≥ 34 knots wind speed). 2) Maintaining three-foot vegetation buffer on each side of the fence. 3) Removing any type of objects (praying mantis egg cases, mud wasp nests, dried slugs, crabs, chunks of mud, vines, etc.) that have adhered to the exterior of the barrier wall. 4) Conducting minor maintenance and repairs as needed. 5) Conducting barrier wall replacement and painting of vertical (lower) and upper (bulge) mesh sections due to damage or corrosion and pressure-wash sections of the mesh and concrete base. (Figure 80)

Conservation Benefit

The routine maintenance and repair of the BTS barrier shall enhance the longevity of its efficacy. Monitoring, maintenance and repair all support the purpose of facilitating BTS-free areas to protect Mariana fruit bat (*Pteropus mariannus*) pups and possible future reintroduction of other endangered bird species.

FY22 Status

- Vegetation has been removed within the three foot buffer along the fence-line
- All foreign objects that were attached to the barrier wall were removed
- All minor repairs have been completed, no major damages have been reported as yet
- Approximately 1,237 lf of the barrier wall was replaced/painted (blue line), 142 lf of the upper bulge section was replaced/painted (yellow line), and 2,800 lf of the barrier wall was power-washed (red line)

- Plans in FY23 include (1) continue status quo for maintenance and monitoring; (2) scope maintenance of vegetation above 20 ft.; (3) scope more fence to power-wash and/or replace

EPR: 1 CR MAR AAFB BTS Barrier Maintenance in HMU; M52401000

Haputo Ecological Reserve Area Ungulate Fencing and Eradication

Location: MCBCB **Period of Performance**: AUG2019 – Ongoing

Project Objective

Eradicate pigs and deer from the 280-acre Haputo ERA.

Conservation Benefit

Pigs and deer dramatically change Guam's native vegetation and damage habitats needed for federally listed species as well as other native species. Ungulate-proof fencing and eradication of pigs and deer will promote forest regrowth, promote biodiversity, and protect limestone forest habitat important to many native species.

FY22 Status

- Southern Haputo ERA fence completed in FY2022, while northern section fence is ongoing
- Southern fence open on the northern end so animals are not fully enclosed during preparation for eradication
- Eradication expected to begin after protective measures to safeguard listed snail and butterfly populations are installed; target date is Sept 2022

EPR: Guam Micronesia Kingfisher MOA

2019 JRM INRMP Reference: THM-2; 8-48

Figure 82. Fencing ties into natural karst barriers at the southern edge of the Haputo Ecological Reserve Area.

Figure 83. All ungulate control teams must be trained to identify snails like this partulid, as well as listed plant species and bats, before they can work in the Haputo ERA.

Mason Live Fire Training Range Complex Ungulate Control Area Fencing and Eradication

Location: MCBCB **Period of Performance**: JUL2020 – Ongoing

Project Objective

Eradicate pigs and deer from the 600 acre Mason LFTRC at Northwest Field after ungulate-proof fencing is installed.

Conservation Benefit

Pigs and deer dramatically change Guam's native vegetation and damage habitats needed for federally listed species as well as other native species. Ungulate-proof fencing and eradication of pigs and deer will promote forest regrowth, promote biodiversity, and protect limestone forest habitat important to many native species.

FY22 Status

- 4.1 miles of fence completed in March 2022
- Population studies within the LFTRC are ongoing with another round of pig collaring completed in July 2022
- Active removals are ongoing with 6 pigs and 158 deer removed as of July 2022

DPRI: Marine Corps Relocation 2017/2018 amendment to 2015 BO, Conservation Measures to Contribute to the Recovery of Listed Species

Reference: Guam Relocation Biological Opinion

Figure 84. Vegetation at the LFTRC is showing signs of recovery after decades of heavy ungulate pressure.

Figure 85. USDA is conducting a study using collared feral pigs to understand the way pigs use the forest and adjacent spaces.

Caiguat Forest Enhancement Site Ungulate Eradication

Location: MCBCB **Period of Performance**: MAR2020 – OCT2021

Project Objective

Eradicate pigs and deer from the 670-acre Caiguat Forest Enhancement Site.

Conservation Benefit

Pigs and deer dramatically change Guam's native vegetation and damage habitats needed for federally listed species as well as other native species. Ungulate-proof fencing and eradication of pigs and deer will promote forest regrowth, promote biodiversity, and protect limestone forest habitat important to many native species.

FY22 Status

- Caiguat FES is split into a roughly 400-acre southern section and 270-acre northern area
- Pig and deer eradication for the 270-acre section was completed in October 2021 with 331 deer and 46 pigs removed from the site

DPRI: Marine Corps Relocation 2017/2018 amendment to 2015 BO, Conservation Measures to Contribute to the Recovery of Listed Species

Reference: Guam Relocation Biological Opinion

Figure 86. Ifit seedlings are recruiting in the Caiguat Forest Enhancement Site now that ungulates have been removed.

Multi-Species Barrier Construction at Finegayan Forest Enhancement Site

Location: MCBCB **Period of Performance**: Ongoing

Project Objective

Facilitate control of brown tree snakes, rats and cats for the 180-acre northern Finegayan Forest Enhancement Site. The project is currently in final design stages.

Conservation Benefit

BTS are recognized as the major obstacle to re-introduction of native bird species that have been extirpated from Guam. Control of BTS and other predators such as rats and cats is a critical step in efforts to reintroduce these birds to the island's forests.

FY22 Status

- Engineers working with natural resource specialists to finalize design for the barrier
- Some site preparation work, including listed species surveys within the barrier footprint and geotech work, completed in FY22

DPRI: Marine Corps Relocation 2017/2018 amendment to 2015 BO, Conservation Measures to Contribute to the Recovery of Listed Species

Seed Collection from *Heritiera longipetiolata* and *Tabernaemontana rotensis*

Location: AAFB **Period of Performance**: OCT2018 - 2021

Project Objective

To collect seeds from federally endangered *Heritiera longipetiolata* and threatened *Tabernaemontana rotensis* identified within project footprints associated with the Guam Relocation.

Conservation Benefit

To minimize impacts of military construction activities to native ecosystems by collecting the seeds from as many mature individuals as possible and preserving the genetic diversity of the species.

FY21 Status

- 54 seeds have been collected from 3 of 5 mature *Heritiera longipetiolata* located within AAFB project footprints.
- 15 *Heritiera longipetiolata* seeds have germinated.
- 1,396 seeds have been collected from 19 of 136 mature *Tabernaemontana rotensis* located within AAFB project footprints.
- 945 *Tabernaemontana rotensis* seeds have germinated.

Reference: Guam Relocation Biological Opinion

Guam Relocation BO Implementation, J-001B T&E Salvage and Transplantation

Location: MCBCB **Period of Performance**: JUN2017 – Ongoing

Project Objective

To determine the number of federally listed plants present within the J-001B Area F project footprint, salvage the specimens deemed healthy and suitable for salvage, translocate those specimens to the FES (either directly or after a period of care in a nursery), and ensure the survival of at least 50% of the genetic diversity of the individuals of each species salvaged.

Conservation Benefit

Protection of genetic diversity of the *Tuberolabium guamense*, *Dendrobium guamense*, and *Bulbophyllum guamense*, which are the federally listed species that were located within J-001B Area F project footprint.

FY22 Status

- Ongoing CTO on NR MAC
- Orchids
    - *Tuberolabium guamense*, *Dendrobium guamense*, and *Bulbophyllum guamense* that were transplanted to the FES the previous fiscal year were maintained and monitored from August 2021 through July 2022.
    - Contractor currently meeting survival criteria of >50% of genetic specimens.

Reference: Guam Relocation Biological Opinion

Guam Relocation BO Implementation, P-103 T&E Salvage and Transplantation

Location: AAFB **Period of Performance**: JUN2020 – Ongoing

Project Objective

To determine the number of federally listed plants present within the P-103 project footprint, salvage the specimens deemed healthy and suitable for salvage, translocate those specimens to the FES (either directly or after a period of care in a nursery), and ensure the survival of at least 50% of the genetic diversity of the individuals of each species salvaged.

Conservation Benefit

Protection of genetic diversity of *Cycas micronesica*, *Tuberolabium guamense*, *Dendrobium guamense*, and *Bulbophyllum guamense*, which are the federally listed species that were located within the P-103 project footprint.

FY22 Status

- Ongoing CTO on NR MAC
- Cycads
    - 62 apical stems and pups salvaged from 28 genetically unique individuals in October 2021.
    - Stems and pups were monitored and maintained in a nursery through July 2022.
    - Contractor currently meeting survival criteria of >50% of genetic specimens.
- Orchids
    - 2,450 *Tuberolabium guamense*, 3 *Dendrobium guamense*, and 101 *Bulbophyllum guamense* were salvaged and translocated to the FES between October and December 2021.
    - Orchids were maintained and monitored through July 2022.

- Contractor currently meeting survival criteria of >50% of genetic specimens.

Reference: Guam Relocation Biological Opinion

Guam Relocation BO Implementation, P-290 T&E Salvage and Transplantation

Location: AAFB **Period of Performance**: APR2021 – Ongoing

Project Objective

To determine the number of federally listed plants present within the P-290 project footprint, salvage the specimens deemed healthy and suitable for salvage, transplant those specimens to the FES, and ensure the survival of at least 50% of the genetic diversity of the individuals of each species salvaged.

Conservation Benefit

Protection of genetic diversity of *Cycas micronesica* and *Tuberolabium guamense*, which are the federally listed species that were located within the P-290 project footprint.

FY22 Status

- Ongoing CTO on NR MAC
- Cycads
    - 12 apical stems and pups salvaged from 5 genetically unique individuals in August 2021.
    - Stems and pups were monitored and maintained in a nursery through July 2022.
    - Contractor currently meeting survival criteria of >50% of genetic specimens.
- Orchids
    - 85 *Tuberolabium guamense* were salvaged and transplanted to the FES in August 2021.
    - Orchids were maintained and monitored through July 2022.
    - Contractor currently meeting survival criteria of >50% of genetic specimens.

Reference: Guam Relocation Biological Opinion

Guam Relocation BO Implementation, P-296 T&E Salvage and Transplantation

Location: AAFB **Period of Performance**: MAR2021 – Ongoing

Project Objective

To determine the number of *Cycas micronesica* within the P-296 project footprint that were healthy and suitable for salvage, salvage the specimens, transplant them to containers and care for them for 12 months in a nursery, and ensure the survival of at least 50% of the genetic diversity of the individuals salvaged.

Conservation Benefit

Protection of genetic diversity of *Cycas micronesica*, which is the federally listed species that was located within the P-296 project footprint.

FY22 Status

- Completed CTO on NR MAC
- Cycads
    - 3 pups salvaged from 2 genetically unique individuals were maintained and monitored in a nursery and transferred to Government custody in March 2022.
    - Contractor met survival criteria of >50% of genetic specimens.

DPRI: Marine Corps Relocation 2017/2018 amendment to 2015 BO, Conservation Measures to Contribute to the Recovery of Listed Species

2019 JRM INRMP Reference: n/a, Guam Relocation BO Requirement.

Guam Relocation BO Implementation, P-735 T&E Salvage and Transplantation

Location: AAFB **Period of Performance**: OCT2017 – Ongoing

Project Objective

To determine the number of federally listed plants present within the P-735 project footprint, salvage the specimens deemed healthy and suitable for salvage, transplant those specimens to the FES, and ensure the survival of at least 50% of the genetic diversity of the individuals of each species salvaged.

Conservation Benefit

Protection of genetic diversity of *Heritiera longipetiolata*, *Tabernaemontana rotensis*, *Tuberolabium guamense*, *Dendrobium guamense*, and *Bulbophyllum guamense*, which are the federally listed species that were located within the P-735 project footprint.

FY22 Status

- Ongoing CTO on NR MAC
- Orchids
    - 190 *Tuberolabium guamense* and 18 *Dendrobium guamense* were salvaged and transplanted to the FES in August and September 2021.
    - Orchids were maintained and monitored through July 2022.
    - Contractor currently meeting survival criteria of >50% of genetic specimens.
- Seed Collection
    - 68 *Tabernaemontana rotensis* monitored for seed production; 212 seeds collected in FY22.
    - 6 *Heritiera longipetiolata* monitored for seed production; 24 seeds collected in FY22.
    - All trees were cleared from project footprint in May 2022; this work element is complete.

Reference: Guam Relocation Biological Opinion

Listed plant species salvage and transplantation

Location: MCBCB **Period of Performance**: JUN2017 – Ongoing (multiple awards)

Project Objective

Identify federally listed plants present within buildup construction footprints, salvage healthy individuals suitable for translocation, and move these individuals to long-term conservation areas.

Conservation Benefit

The project protects the genetic diversity of federally listed plant populations with individuals that occurred in construction sites. The long-term conservation areas that received these individuals also support many other listed and native plants and animals.

FY22 Status

- All projects currently meeting survival criterion of >50% survival of genetic specimens
- J-001B: *Tuberolabium guamense*, *Dendrobium guamense*, and *Bulbophyllum guamense* were transplanted in the Forest Enhancement Site in FY21 and have been monitored through July 2022
- P-735: 190 *Tuberolabium guamense* and 18 *Dendrobium guamense* were transplanted in the Forest Enhancement Site in August and September 2021 and monitored through July 2022
- P-735: 68 *Tabernaemontana rotensis* monitored for seed production, with 212 seeds collected in FY22
- P-735: 6 *Heritiera longipetiolata* monitored for seeds, with 24 seeds collected in FY22
- P-103: 62 apical stems and pups salvaged from 28 genetically unique *Cycas micronesica* individuals in October 2021 and monitored in nursery through July 2022

- P-103: 2,450 *Tuberolabium guamense*, 3 *Dendrobium guamense*, and 101 *Bulbophyllum guamense* translocated to the FES between October and December 2021, with maintenance and monitoring through July 2022
- P-296: 3 *Cycas micronesica* pups from 2 genetically unique individuals maintained and monitored in nursery and transferred to Government custody in March 2022
- P-290: 12 apical stems and pups from 5 genetically unique *Cycas micronesica* individuals salvage in August 2021, with monitoring and maintenance in nursery through July 2022
- P-290: 85 *Tuberolabium guamense* salvaged and transplanted in the FES in August 2021, with maintenance and monitoring ongoing through July 2022

Salvage and Transplantation of *Cycas micronesica* – MSA-1 Igloo Project (P-3105, Phase 3)

Location: MSA-1, AAFB **Period of Performance:** DEC2020 - TBD

Project Objective

Objective is to meet the special conditions and success criteria stated in the USFWS Biological Opinion Ref: 01EPIF00-2019-F-0012. To salvage, propagate, and out plant the federally threatened *Cycas micronesica* and *Tabernaemontanae rotensis* identified within the construction footprint of the Munitions Storage Area (MSA-1) Igloo Project, P-3105 Phase 3.

Conservation Benefit

To minimize impacts of military construction activities to native ecosystems by salvaging as many individuals of *C. micronesica* and *T. rotensis* as possible and preserving the genetic diversity of the species.

FY22 Status

- Second consecutive Annual Report submitted to US Fish & Wildlife Service on July 2022, in compliance with the Biological Opinion
- Daily monitoring for the Marianas fruit bat conducted prior to start of every work day
- Environmental protection measures installed around the construction site also inspected every work day
- 238 *Cycas micronesica* and 16 *Tabernaemontana rotensis* at Contractor's plan nursery as of July 2022
- Anticipated date of outplanting – June 2023
- Five sites on AAFB and one on Naval Magazine assessed as potential outplanting sites: Route 3A, Achae, Tarague Traingle, Tarague Basin, Golf Course, and Fence #4.

TERRESTRIAL PROTECTED SPECIES MANAGEMENT

Biomonitor Support for Natural Resource Management at JRM Area of Responsibility

Location: MCBCB **Period of Performance**: JUL2020 – JUN2023

Project Objective

Provide biomonitor support to assist the Department of the Navy in natural resource management across lands under Joint Region Marianas AOR.

Conservation Benefit

Biomonitors conduct surveys for federally listed species, culturally valuable plants, rare plants, and non-native/invasive species. Activities support the GMKMOA (2015) and the Biological Opinion for the Department of the Navy's Relocation of the U.S. Marine Corps from Okinawa to Guam and associated activities.

FY22 Status

- Biomonitors provided support for biosecurity projects, forest enhancement, ungulate eradication, and outplanting projects

DPRI: Marine Corps Relocation 2017/2018 amendment to 2015 BO, Conservation Measures to Contribute to the Recovery of Listed Species

Reference: Guam Relocation Biological Opinion

Figure 90. University of Guam biomonitor Ami Shull checks a project's demarcation lines.

Monitoring of Tree Snails

Location: NBG; NMS **Period of Performance:** SEP2019 - Ongoing

Project Objective

Conduct photo mark recapture (PMR) studies of partulids to determine population estimates

Conservation Benefit

The conservation benefits of the project will ensure self-sustaining, resilient populations to include the use of novel monitoring techniques in the adaptive management of forest resources.

FY22 Status

- Development of PMR capacity and protocol
- Monitoring sites:
    - Haputo (now MCBCB)
    - Pugua Point
    - San Luis
    - NMS
    - Sasa Valley
- Wet season and dry season monitoring
- Up to 5 “capture” events

EPR: 1 S MAR NBG Endangered Species Monitoring; 61755NR142

	Pugua Point	40.07	41.06	

ESA-Listed Snail Survey and Monitoring

Location: NMS; MCBCB **Period of Performance:** AUG2022 – 2023

Project Objective

To delineate and monitor known ESA-listed snail colonies at one site in NBGNMS (*Samoana fragilis)* and one at MCBCB (*Partula gibba*).

Conservation Benefit

Delineation and counts help make management decisions in the areas where the snails occur. Data collected during monitoring efforts will enhance what is known for each of the species and aid in tracking population changes.

FY22 Status

- Contract awarded in August 2022
- Initial survey and follow on monitoring

EPR: 61128NR203 CP JRM Conservation Management of ESA-listed Invertebrates

Figure 92. Monitoring locations for S. fragilis.

Monitoring Salvaged and Translocated ESA-listed Plants and Invertebrates on JRM Lands on Guam

Location: MCBCB **Period of Performance:** SEP 2020-2022

Project Objective

Monitor and maintain salvaged and translocated plants and invertebrate species listed under the Endangered Species Act (ESA) (16 USC 1531 et seq.) located at the Forest Enhancement Area, Northwest Field, and the Haputo Ecological Reserve Area at Marine Corps Base Camp Blaz (MCBCB).

Conservation Benefit

Monitoring to allow for management actions to enhance and restore habitat, reduce habitat fragmentation, buffer protected areas, and implement new conservation strategies.

FY22 Status

- Epiphytic Orchids: quarterly monitoring, about 30% reproducing, new seedlings
- Cycads: monthly monitoring of 30 trees, coning events, seeds
- 8-Spot Butterfly: quarterly monitoring, all life stages observed
- *Partula radiolata*: quarterly monitoring, juveniles and adults observed (ranging from 37-100 and 64-329 individuals at two sites), many empty shells (range 0-71), *P. gibba* also observed in one site (up to 95 individuals)

Figure 96. Hypolimnas octocula mariannensis

Native Plant Seed Collection, Salvage, Storage, and Nursery Propagation for Forest Enhancement

Location: MCBCB **Period of Performance**: OCT2017 – APR2023

Project Objective

Collect native plant material to propagate for use in limestone forest enhancement projects.

Conservation Benefit

More than 30 species of rare, high value, native, and listed species have been raised in the nursery, providing additional information about these species and developing methods to successfully grow these plants for outplanting.

FY22 Status

- Nursery contractor is working closely with outplanting contractors to move plants into Caiguat Forest Enhancement Site
- Project extended until April 2023

DPRI: Marine Corps Relocation 2017/2018 amendment to 2015 BO, Conservation Measures to Contribute to the Recovery of Listed Species

Reference: Guam Relocation Biological Opinion

Figure 97. Plants are propagated and maintained in the native plant nursery until they are ready for outplanting.

Monitoring of Butterfly Host Plant Sites and Tarague Snail Colony

Location: AAFB **Period of Performance:** AUG2020 – AUG2022

Project Objective

Monitor populations of the listed snail *Partula radiolata* and the Marianas eight-spot butterfly (*Hypolimnas octocula marianensis*).

Conservation Benefit

Collect baseline data on population abundances for snails and the numbers of eggs, larva, chrysalids and adults for butterflies.

FY22 Status

- Ongoing project with UOG CESU
- Population abundances estimated for snails on 4 mark recapture plots in rainy and dry seasons
- Monitor 3 plots for: butterfly egg, larvae, chrysalids, and adults; performed twice a month for a little over a year
- Trail cams monitored butterfly plots for herbivory; however, no herbivory documented
- Snail numbers declined in wet season
- Butterfly eggs appear to be parasitized in high numbers
- Does not appear to be a distinct breeding season for butterflies; each site is unique

Transplantation of Federally Listed Species at the Forest Enhancement Area

Location: MCBCB **Period of Performance**: SEP2020 – SEP2022

Project Objective

Transplantation and maintenance *Cycas micronesica*, *Tabernaemontana rotensis*, *Heritiera longipetiolata*, and *Bulbophyllum guamense* into the FES. Revegetate and maintain berms at Northwest Field with Mariana 8-spot butterfly host plants, *Procris pedunculata* and *Elatostema calcareum*.

Conservation Benefit

Transplantation of *T. rotensis, H. longipetiolata, B. guamense* will help increase their abundance and distribution. The planting of butterfly host plants at berms within NWF will increase the number of host plants available and improve habitat connectivity.

FY22 Status

- Over 900 *Tabernaemontana rotensis* and 15 *Heritiera longipetiolata* trees have been transplanted in the FES.
- Planning efforts for the transplantation of *Cycas micronesica* began in Q4 FY22 and anticipated outplanting is Q2 FY23.

JRM *Serianthes nelsonii* Propagation, Outplanting, and Maintenance

Location: AAFB **Period of Performance**: JUL2021-2023

Project Objective

This project is to propagate, outplant, and maintain subpopulations of the federally endangered *Serianthes nelsonii* (tree) on Joint Region Marianas (JRM) managed lands.

Conservation Benefit

Increasing the number of *Serianthes* trees would improve species survival, enhance native habitat, increase the biodiversity of native species, and contributes to the connectivity with surrounding communities in ways that support improved ecosystem functionality.

FY22 Status

- 60 seedlings propagated
- Outplanting planned for AAFB

EPR: 1 RP MAR JRM *Serianthes nelsonii* Propagation, Outplanting, and Maintenance; 61128NRSNI

2019 JRM INRMP Reference: TPS-5; 9-77

Figure 105. Serianthes seedlings

Figure 106 - 107. Serianthes nursery structure

Serianthes nelsonii Monitoring, Outplanting and Management - AAFB

Location: AAFB **Period of Performance:** JUL2020 - Ongoing

Project Objective

Maintenance and monitoring of mature *Serianthes nelsonii* tree in Northwest Field at Ritidian point, including in situ seedlings and fence maintenance, monitoring and maintenance of outplanted seedlings, and nursery propagation and maintenance of seedlings.

Conservation Benefit

Implementation of recovery actions such as increasing populations, insuring against catastrophic events, and testing and implementing new conservation strategies.

FY22 Status

- *S. nelsonii* mature tree at Ritidian Point remains stable; visited on a weekly basis for monitoring and maintenance
- 98 seedlings and saplings naturally growing under the mature tree
- A total of 56 *S. nelsonii* saplings maintained at Route 3A
- 84 total seedlings and saplings being prepared for eventual outplanting
- Approximately 459 seeds collecting from mature tree
- 2,795 total seeds in storage by University of Guam
- 149 seeds distributed to Marine Corps Base Camp Blaz

EPR: 2 LC MAR AAFB *Serianthes nelsonii* Monitoring and Management; M5240CN039

2019 JRM INRMP Reference: TPS-5; 9-77

Figure 109. Serianthes nelsonii seedlings at the GPEPP nursery

Figure 110. Serianthes nelsonii sapling at the GPEPP nursery

Serianthes nelsonii Propagation, Outplanting, and maintenance at Forest Enhancement

Location: MCBCB **Period of Performance:** AUG2022 – AUG2026

Project Objective

Propagate, outplant, and maintain 100 seedlings of the endangered tree species *Serianthes nelsonii* (*S. nelsonii*) from seed previously collected from the mature *S. nelsonii* tree located on AAFB.

Conservation Benefit

While no critical habitat has been designated for this species, the current population estimate is less than forty mature trees on Rota and one mature tree on Andersen Air Force Base (AAFB). The propagation and outplanting of *S. nelsonii* is particularly important for maintaining the genetic diversity within this species.

FY22 Status

- To date, 131 seeds obtained from UOG *S. nelsonii* storage lab (13 seedlings underdeveloped growth, 10 seedlings died, 2 no germination)
- Planning efforts to begin outplanting seedlings into the Forest Enhancement began in Q4 FY22. Anticipated outplanting start is Q1 FY23.

Cycas micronesica Conservation

Location: AAFB **Period of Performance:** MAY2021 - Ongoing

Project Objective

Maintenance and monitoring of six, 1-acre, permanent fenced cycad (*Cycas micronesica*) plots (Achae Point, Ritidian, Tarague Basin, Golf Course, Tarague North, and Tarague South).

Conservation Benefit

Research and monitoring on management actions that directly benefit *Cycas micronesica*. The intent is to identify which management actions most benefit the plant and if possible, implement on a broader scale.

FY22 Status

- All trees in managed plots continue to be treated with Merit
- Potential sites for future cycad plots investigated in 2022; healthy cycad trees observed growing in an un-fenced area at Tarague Beach
- Approximately 139 seedlings growing at the three Andersen cycad plots (Ritidian, Tarague Basin, and Golf Course) as of May 2022.
- 217 total seedlings stored at University of Guam
- USFWS and Dr. Cave looking into potential biocontrol for the cycad scale; coordinated with Toni Mizerek from USFWS and hosted Dr. Ronald Cave on a visit to cycad plots at AAFB

Green and Hawksbill Sea Turtle Nesting Habitat

Location: NBG **Period of performance:** AUG2021 – AUG2022

Project Objective

In an effort to protect and enhance sea turtle nesting population on NBG, suitable habitats are monitored and protected throughout the year. Data collected through regular surveys determine hatching success, emergence success and effectiveness of predator control measures, as well as identify threats to nests (e.g. tidal inundation, roots of invasive vegetation; and marine debris). Understanding the spatial and temporal distribution of sea turtle activity ensures their nesting habitat is maintained.

Conservation Benefit

The conservation benefits of project are to (a) sustain and enhance the sea turtle population; (b) maintain sea turtle species range and distribution; and (c) increase the use of adaptive management techniques for sea turtles.

FY22 Status

- 49 surveys between SEP 2021 to AUG 2022
- 31 nests at SS; 3 nests at Dadi
- Clutch size range: $\tilde{x}$ = 83; range (43-106)
- Hatching success: $\tilde{x}$ = 86
- Emergence success: $\tilde{x}$ = 76
- 100% of nests protected with screens
- Removed greater amount of invasive vines (60 lbs)
- Increased number of beach clean-ups (3)

EPR: 1 RP MAR NBG Green and Hawksbill Sea Turtle Nesting Habitat – Invasive Plant and Predator Control; 61755NR808

Sea Turtle Monitoring, Protection, and Educational Outreach - AAFB

Location: AAFB **Period of Performance:** JUL2018 - Ongoing

Project Objective

To implement management techniques and methodologies to monitor nesting sea turtles on AAFB. These methodologies include but are not limited to: collection of consistent data to determine population demographics, reduce mortality and increase natural survivorship, increase sea turtle awareness of AAFB units and beach stakeholders, and create/maintain a robust database for long-term monitoring data that can support future research and detect trends.

Conservation Benefit

Implement recovery actions by conducting long-term monitoring to determine population estimates and abundance; provide protection of sea turtles and their nesting habitats; and conducting outreach and education to the public on sea turtles and their habitats.

FY22 Status

- Nests recorded on all AAFB beaches including Tarague, Scout, Sirena, Pati, and EOD
- Total 158 emergences from August 2021 to present; 132 nests and 36 false crawls
- 4 nesting turtles Passive Transponder (PIT) tagged, none satellite tagged; few tagged during early morning survey work after being discovered sleeping on the beach
- Clutch data collected on previously marked nests located successfully after 70 days incubation; hatching and emergence success 88% and 86.1% respectively
- New activities include installation of trail cameras on EOD Beach to capture female nesting activity and hatchling emergence footage

- Outreach events: January 2022 beach clean-up in preparation for nesting season, from Taragüe to EOD Beach; presentations to various local public schools and community events; in-briefs with key stakeholders such as EOD, Outdoor Rec, Security Forces, and Marine Patrol
- Other outreach activities: installation of new full color “No Vehicle Driving on the Beach” at the entrance to EOD beach, one of our busiest nesting beaches.
- Project Final Report due December 2022

Sea Turtle Nesting Monitoring at MCB Camp Blaz

Location: NBG **Period of Performance:** PRE-AWARD

Project Objective

Conduct regular monitoring for sea turtle nests at Haputo Beach.

Conservation Benefit

Monitoring for nests will minimize impacts to nesting turtles from and provide information about turtle nesting success.

FY22 Status

- Pending award

EPR: 1 CP MAR NBG Sea Turtle Distribution and Habitat Use; 61755NR815

2019 JRM INRMP Reference: TPS-1; 9-75; MPS-2 (5-103)

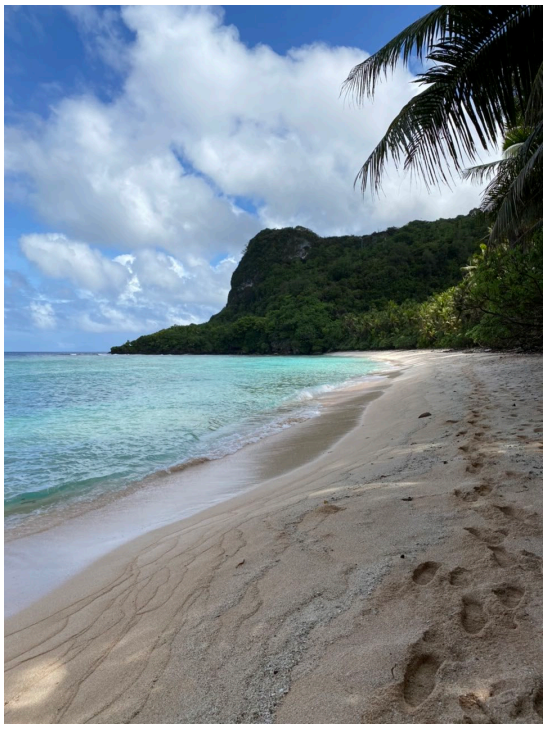

Figure 117. Biologists will begin a new contract to monitor Haputo Beach for turtle nests in September 2022.

Monitoring of Mariana Swiftlets

Location: NMS **Period of Performance:** AUG2021 - Ongoing

Project Objective

Monitor population trends of Mariana swiftlets (*Aerodramus bartschi*) at three caves on NMS: (Maemong, Mahlac, and Fachi).

Conservation Benefit

The conservation benefits will ensure self-sustaining, resilient populations of native species and prohibit loss of current species range.

FY22 Status

- Quarterly counts conducted (Table 14)
- Removed vegetation from Mahlac cave entrance

EPR: 1 S MAR NBG Endangered Species Monitoring; 61755NR142

2019 JRM INRMP Reference: TPS-4; 6-47

Mariana Swiftlet Recovery and Habitat Use

Location: NMS **Period of Performance:** MAR2022 – MAR2024

Project Objective

To provide an understanding of Mariana swiftlet (*Aerodramus bartschi*) habitat use, movement, reproductive success, and breeding site selection to inform management actions and meet specific objectives identified in the USFWS Recovery Plan for the Mariana Swiftlet.

Conservation Benefit

To ensure self-sustaining, resilient populations of native species and prohibit loss of current species range.

FY22 Status

- MAR2022 and AUG2022 field visits conducted for the collection of data via:
    - Thermal camera system to visualize, map, and monitor roosting and nesting
    - Visual cave entrance count of individuals
    - Radio tracking of adult swiftlets at caves and surrounding landscape
        - 10 individuals MAR2022
        - 20 individuals AUG2022
    - Deployment of AudioMoth acoustic loggers to detect prospecting of unoccupied caves
    - Deployment of AudioMoth acoustic loggers at two entrances of Fachi cave to determine preference of use
- Project Extension to SEP2024 with additional funding
- Cave entrance vegetation survey ongoing

Monitoring Survival and Demography of Micronesian Starlings

Location: AAFB **Period of Performance:** JUL2019 – JAN2021

Project Objective

To monitor and analyze for Micronesian starling (*Aplonis opaca* [Sali]) nest success and fledgling survival using telemetry, nest monitoring, and survey methods in relation to BTS control efforts. Through monitoring fledging survival and population recruitment efficacy of BTS control techniques can be assessed. This project is one of four projects that will, collectively, further develop information on BTS behaviors related to predation and movement in the presence of abundant avian species

Conservation Benefit

The Micronesian starling is a useful proxy for understanding Guam forest bird ecology in the presence in of BTS. Behavior, survivorship, and population demographics could be useful for supporting future avian restoration projects and controlling BTS in low density with competing food sources in the presence of control regimes.

FY22 Status

- 455 Micronesian starling fledglings tagged during project period of performance
- 47% of fledgling suffered mortality: BTS/cats/other causes
- 22% fledgling survived 2019-2022
- Larger than average BTS (M&F) consuming Micronesian starlings in housing areas
- Project renewed (final year): MAR2022 – FEB2023

Mariana Fruit Bat Monitoring - AAFB

Location: AAFB **Period of Performance:** JAN2021 – Ongoing

Project Objective

Conduct surveys for Mariana fruit bats (*Pteropus mariannus mariannus*) at AAFB as part of long-term population monitoring and to provide analysis on the effects of aircraft overflights and behavior of Mariana fruit bats at Pati Point.

Conservation Benefit

Monitoring will allow for management actions to enhance and restore habitat and increase efforts to recover Mariana fruit bat populations in Guam.

FY22 Status

- Addresses three of the recovery criteria in the 2009 US Fish and Wildlife Service (USFWS) Draft Revised Recovery Plan for the Mariana Fruit Bat or Fanihi by implementing seven of the Recovery Actions outlined in the Draft Plan
- 9th Annual Base-wide Count on 1 July, 2022; data presently being analyzed
- Data shows increasing trend
- Consistent flyway and roost area identified
- Pati Point surveys continue on quarterly basis; no sign of fruit bats present at the historic site
- Large temporary population increases document in last 2 years; assumption that these are migrants from Rota
- Population increase of approx. 200 bats in 2021, approx. 1300 bats in 2022
- Increases happened January/February time frame; numbers went down again in March/April
- Distinct possibility that this is a frequent occurrence not noticed in the past

EPR: 2 BO MAR AAFB Fruit Bat Monitoring; M5240CN041

2019 JRM INRMP Reference: TPS-2; 9-75

Table 16. AAFB Bat count results

Year	# Bats Counted	AAFB Fanihi Estimate: (flight – area)	Area Sampled acres (% of AAFB habitat)
2021	64	108-123	8635 (59%)
2020	33	69 - 92	5269 (36%)
2019	46	79 - 98	7307 (47%)
2018	32	57 - 76	6233 (41%)
2017	32	57 - 68	6125 (34%)
2016	25	45 - 64	5068 (28%)
2015	13	24 - 32	5245 (29.3%)
2014	8	14 - 20	5200 (29.3%)

***2022 Base-wide survey data analysis pending final results.**

***2021 count had more stations near the known flyway.**

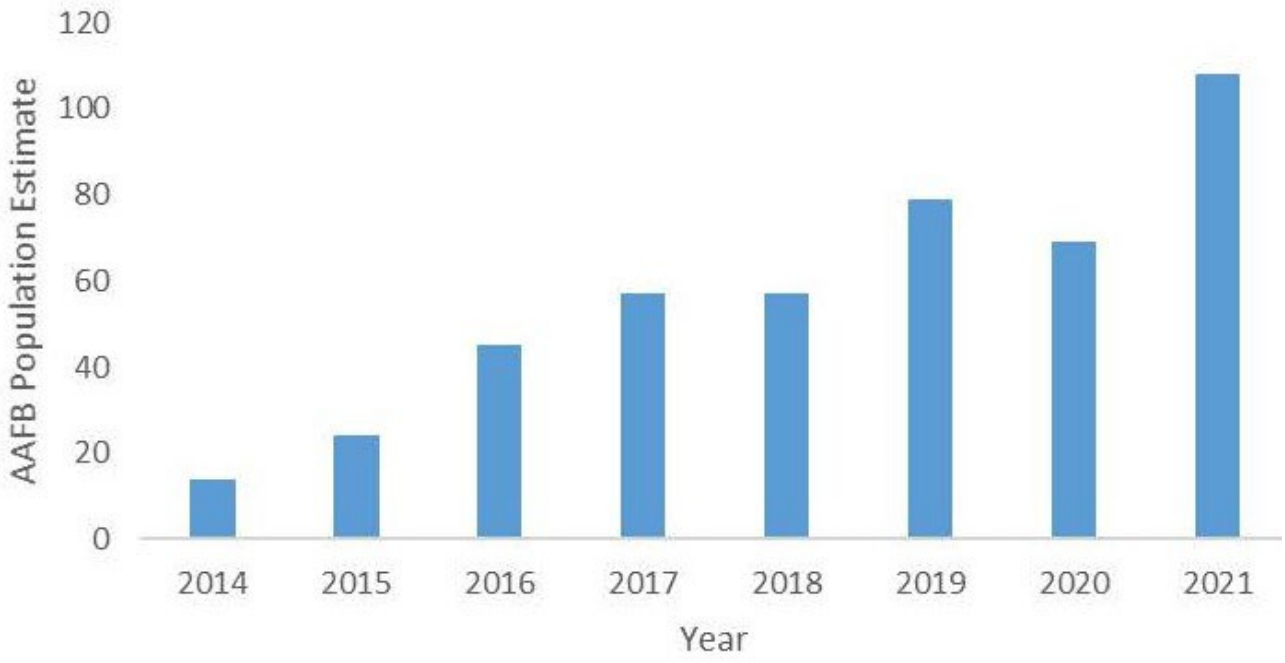

Figure 120. AAFB Bat Population Estimates

Survey and Monitoring of Mariana Fruit Bats on Marine Corps Base Camp Blaz

Location: MCBCB **Period of Performance**: Pre-award

Project Objective

Implement systematic searches for Mariana fruit bat colonies, on a semi-annual basis, in all areas of suitable habitat within MCBCB Mason Live Fire Training Range Complex.

Conservation Benefit

Surveys will help minimize impacts and monitor for potential Mariana fruit bat at the MCBCB Mason LFTRC.

FY22 Status

- Pending award

DPRI: Marine Corps Relocation 2017/2018 amendment to 2015 BO, Conservation Measures to Contribute to the Recovery of Listed Species

Reference: Guam Relocation Biological Opinion

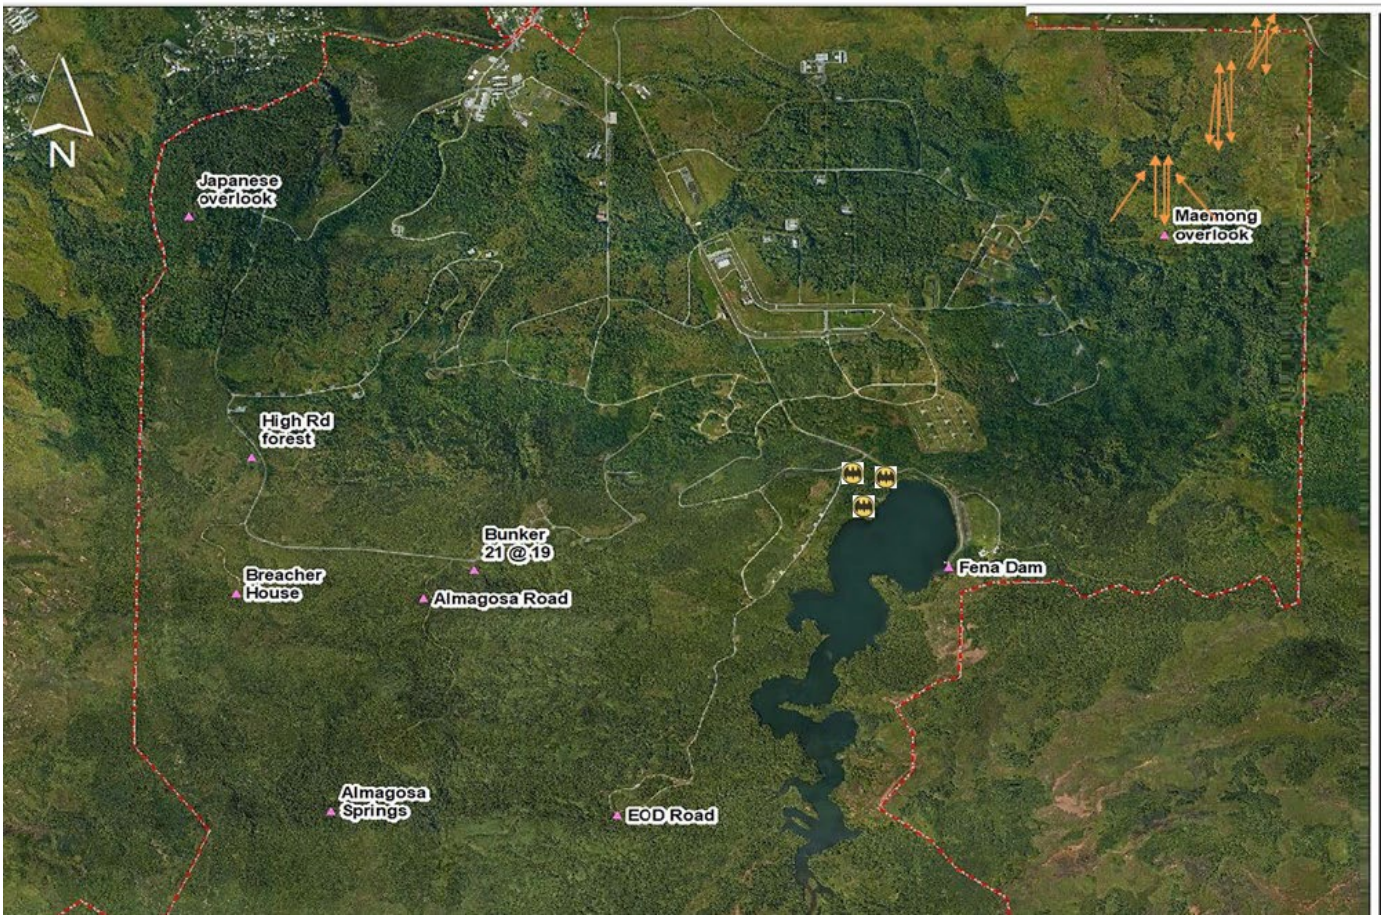
Mariana Fruit Bat Monitoring – NMS and Tinian MLA

Location: NMS; MLA **Period of Performance:** AUG2021 - JUL2022

Project Objective

Conduct annual surveys for Mariana fruit Bats (*Pteropus mariannus marianuus*) on NMS and Tinian MLA. Search for fruit bat aggregating locations. If aggregations or new colony locations are detected, roost counts will commence in accordance with established survey protocols. If changes in roost locations, colony size, or movement are detected, investigate potential threats or stressors that may be causing disturbance.

Conservation Benefit



Management strategies and actions of the INRMP to protect and conserve Mariana fruit bats include protection and enhancement of their forested habitats, control and suppression of BTS, continued monitoring of bat populations, and control of wildland fires and ungulates. Monitoring allows for management actions to enhance and restore habitat, reduce habitat fragmentation, buffer protected areas, implement new conservation strategies, and avoid and minimize impacts to fruit bats.

FY22 Status

- Naval Munitions Site Survey conducted Aug 6, 2021
- Last known counts on NMS was during the island wide bat count in 2019
- Tinian MLA surveys conducted July 28, 2022. No fruit bat observed.

MARINE HABITAT MANAGEMENT

JRM Marine Invasive Species Management Plan (JRM MISMP)

Location: JRM AOR **Period of Performance:** AUG 2022 – OCT 2023

Project Objectives

To develop standard operating procedures (SOP) and protocols to avoid and minimize: (1) the spread of new marine invasive species (MIS) into the Department of Defense (DoD) submerged lands within the JRM Area of Responsibility (AOR), and (2) the transfer of any MIS from DoD submerged lands within the JRM AOR to the Pacific region.

Conservation Benefit

The development of SOPs and protocols for a MISMP shall support natural resource managers to monitor, detect, respond, control, eradicate, and prevent the risk of MIS incursions into, out of, and within the JRM AOR, thus maintaining marine biodiversity and ecosystem functions within JRM's AOR.

FY22 Status

- Awarded August 22, 2022

EPR: 61128NR168: Ecosystem Monitoring and Coral Reef Indicators

2019 JRM INRMP Reference: MIS-1; 5-102, MIS-2; 5-102, MIS-1; 8-64, MIS-2: 8-65, MIS-1; 9-88, MIS-2; 9-88, MIS-1; 11-75, MIS-2; 11-75

Water Quality Monitoring on JRM Submerged Lands

Location: JRM AOR **Period of Performance:** JUN2021 – Ongoing

Project Objectives

To quantify the conductivity, temperature, depth, pH, chlorophyll A, dissolved oxygen, nitrate, and phosphate concentrations in shallow reef systems. In 2014, several SeaBird water quality sensors (model 19plus V2) were deployed and installed on a (stainless steel) mounting frame in Apra Harbor, Guam (A = Anchor Reef; B = Middle Shoals; C = Orote Point). For this proposed action, the same methodology will be employed.

Conservation Benefit

These quantitative data will assist in determining the parameters associated with climate change that may be impacting coral reefs in order to avoid, minimize or mitigate potential adverse effects to the marine resources within these areas, especially marine protected species.

FY22 Status

- Ongoing project with the UOG WERI
- Fieldwork was delayed due to COVID-19
- Sensor deployment is ongoing for Guam and will be completed by SEP 2022
- Sensor deployment on the Tinian MLA submerged lands is planned for OCT 2022
    - The mounting frame will be installed on the benthic to be easily retrieved for data acquisition and servicing, as well as preventing physical contact with the benthic substrate.

2019 JRM INRMP Reference: MIS-2; 8-65, MHM-1; 8-62, MHM-2; 8-63, MHM-3; 8-63, MGIS-1; 8-68, MHM-1; 11-73, MHM-2; 11-74, MHM-3; 11-74, MIS-2; 11-75, MPS-1; 11-76

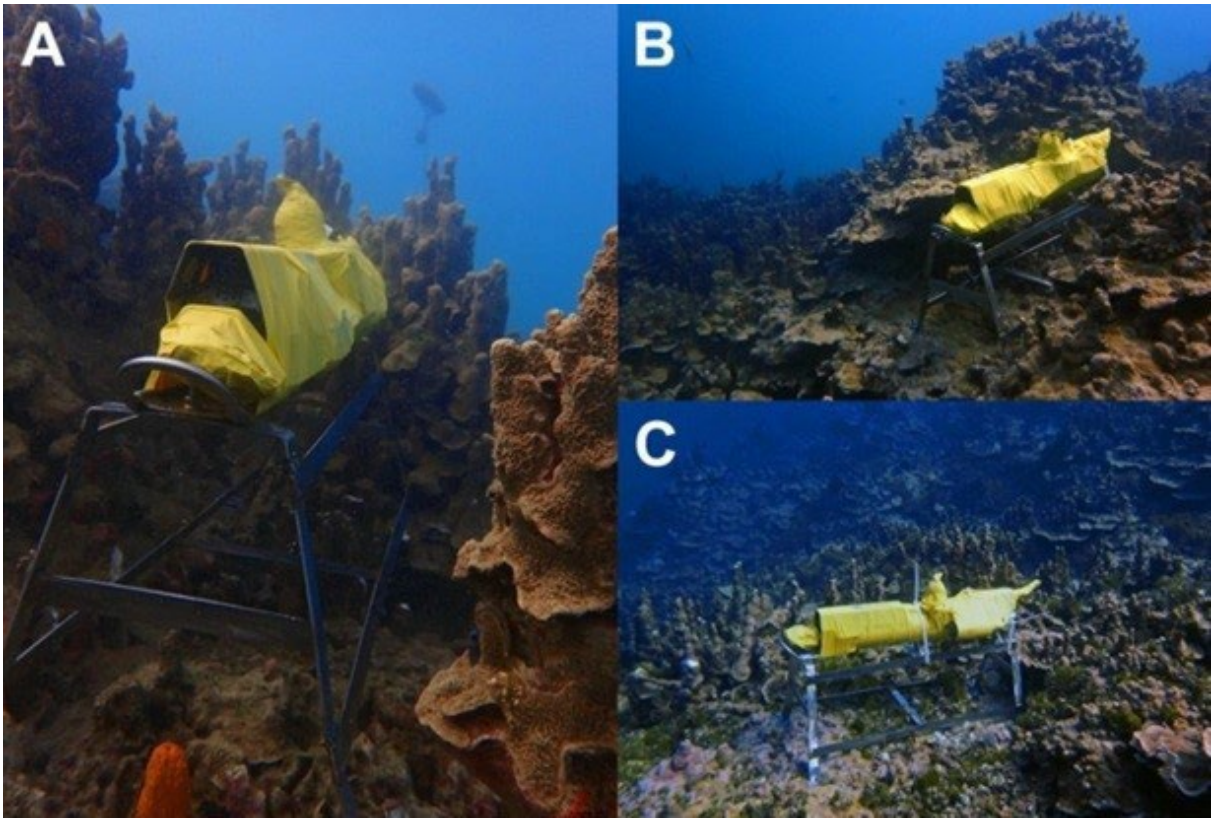

Figure 1. Intalled SeaBird water quality sensors (model 19plus V2)

Figure 2. A CTD sensor mounted on a stainless steel frame.

Coral Bleaching and Crown of Thorns Seastar (COTS) Monitoring on JRM Submerged Lands

Location: JRM AOR **Period of Performance:** JUN2021 – Ongoing

Project Objective

To quantify the coral bleaching and abundance distribution of COTS, and if necessary conduct COTS culling.

Conservation Benefit

These quantitative data will assist in determining the parameters associated with coral bleaching and COTS outbreak events that may be impacting coral reefs in order to avoid, minimize or mitigate potential adverse effects to the marine resources within these areas, especially marine protected species.

FY22 Status

- Ongoing project with the UOG Sea Grant Office
- Fieldwork was delayed due to COVID-19; fieldwork is ongoing for Tinian
- COTS workshop hosted on March 21-22, 2022; consisted on classroom and in-water training; participants from state, federal, and NGO participants

EPR: CHS MAR JRM Monitoring and Control of Acute Impacts on Coral Reefs; 61128CN222

MARINE PROTECTED SPECIES MANAGEMENT

Sea Turtle Aerial Surveys in Farallon de Medinilla (FDM)

Nearshore Waters

Location: FDM CNMI **Period of Performance**: SEP 2020 – Ongoing

Project Objective

To identify, locate, and quantify the abundance distributions of sea turtles and marine mammals in FDM nearshore waters.

Conservation Benefit

The identification, location, and population data of the marine megafauna will help identify the spatial and temporal trends associated with these populations, which will inform military training and testing, as well as the consultations with regulatory agencies, in order to avoid, minimize or mitigate potential adverse effects to the marine resources within these areas, especially marine protected species.

FY22 Status

- Ongoing project with the UOG Sea Grant Office
- Fieldwork was delayed due to COVID-19 and scheduling is continuing to be challenging due to aircraft availability.
- Last survey completed on June 30, 2021

EPR: CHS MAR JRM Monitoring and Control of Acute Impacts on Coral Reefs; 61128CN222

2019 JRM INRMP Reference: MPS1 (12-41); MGIS 1 (12-43)

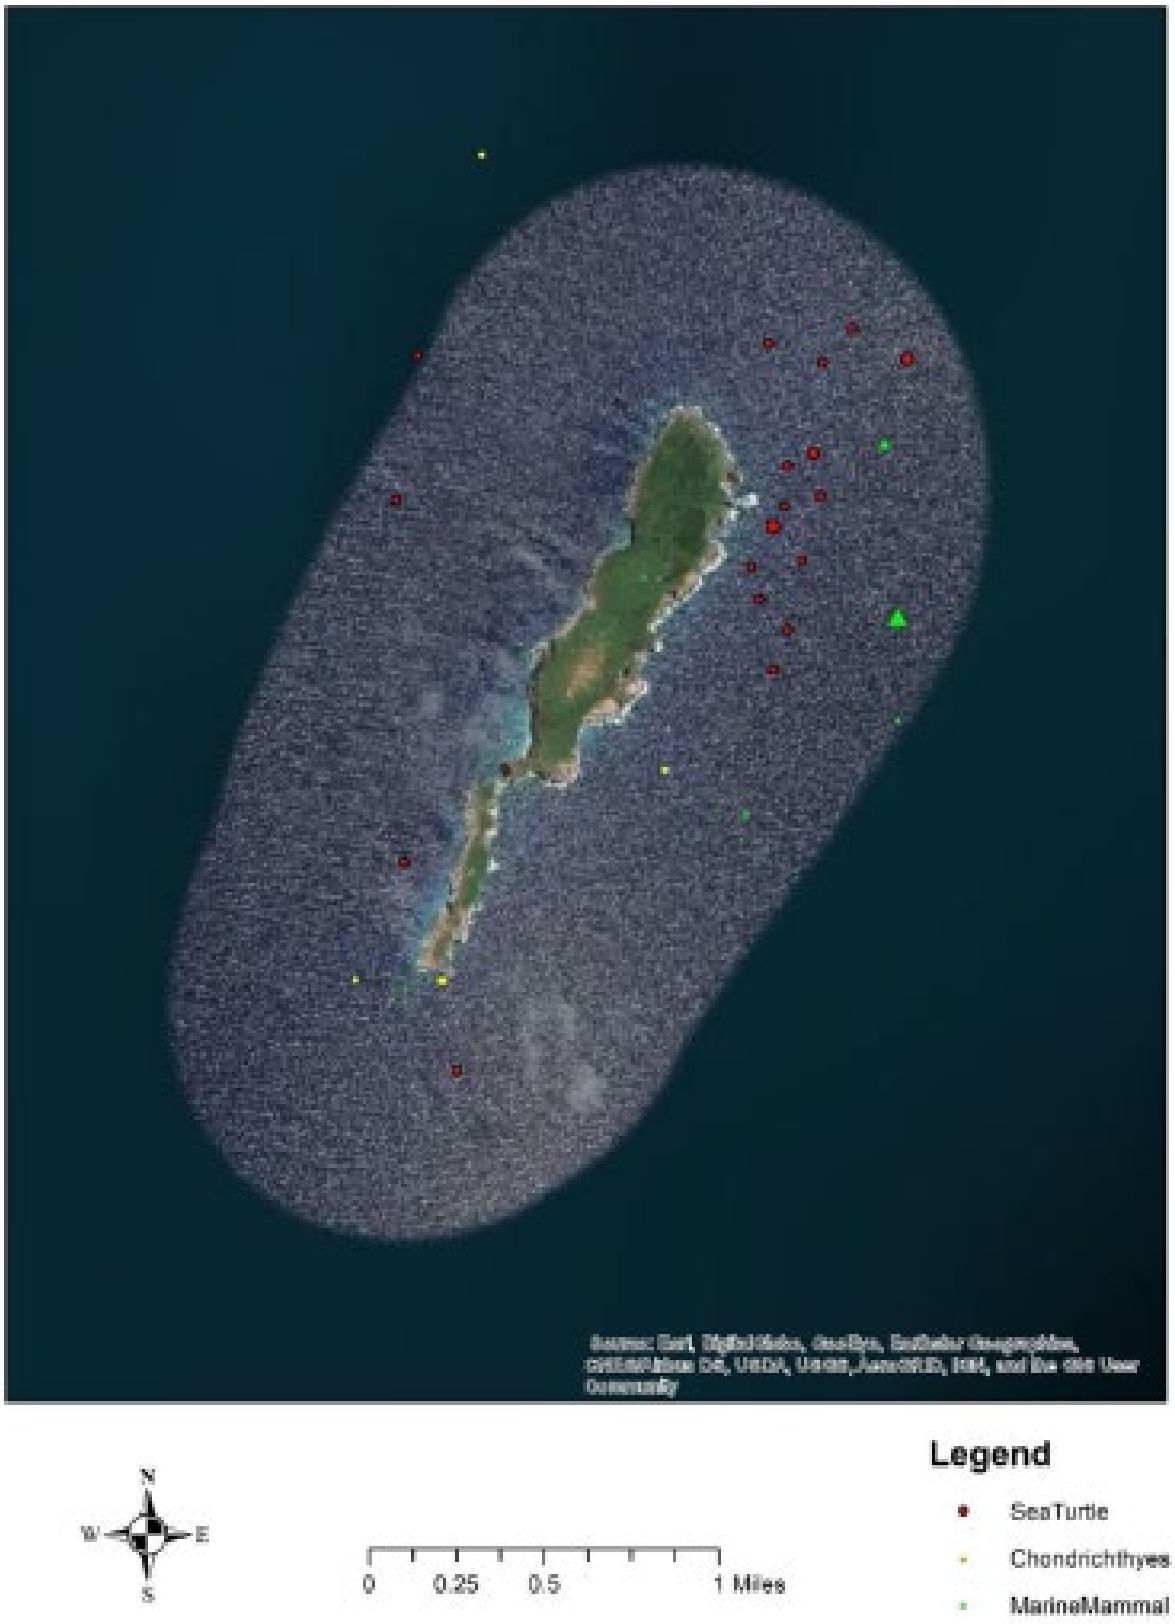

Figure 5. In 2018, marine megafuna were identified in FDM nearshore waters (NAVFAC 2020).

TERRESTRIAL EXOTIC AND INVASIVE SPECIES MANAGEMENT

Implementation of the Regional Biosecurity Plan of Micronesia and Hawaii (RBP) – CNMI

Location: JRM **Period of Performance:** AUG2021-Ongoing

Project Objective

Implement priority actions from the RBP aimed at: 1) Preventing the spread of invasive species within and in/out of JRM Area of Responsibility (AOR); 2) Foster regional coordination and collaboration; 3) Invasive species management and control; and 4) Strengthening capacity for biosecurity.

Conservation Benefit

Protection of native species, particularly those that are threatened and endangered, from the threat of invasive species within the JRM AOR.

FY22 Status

- Implement arrival and/or pre-departure biosecurity inspections of non-training military equipment and cargo movements to and from the CNMI to ensure Armed Forces Pest Management Board Technical Guide No. 31 (AFPMB TG-31) cleanliness standards, therefore devoid of biomaterial.
- Movements included Navy Mobile Construction Battalion (NMCB) cargo and equipment to/from Tinian to support Seabee public works projects.
    - Colorado State University Center for Environmental Management of Military Lands (CSU CEMML) conducted arrival and pre-departure biosecurity cleanliness inspections and USDA-WS conducted pre-departure BTS canine inspections.

  - Five (5) pre-departure biosecurity and Brown treesnake inspection events on Guam for cargo and equipment movements to Tinian. One pre-departure biosecurity inspection event on Tinian for cargo and equipment movement to Guam.
- Continued interagency coordination and consultation regarding invasive species management and biosecurity concerns within the region (CRB Working Group, LFA Working Group, GISC, GISAC, RISC, CNMI DLNR, Guam Biosecurity Division, CGAPS).

EPR: CHS NISA MAR JRM Implementation of the Regional Biosecurity Plan; 61128NR860

Invasive Species Management within the Joint Region Marianas Area of Responsibility - CNMI

Location: JRM **Period of Performance:** AUG2021 – Ongoing

Project Objective

In support of Mariana Islands Training & Testing (MITT) activities:
1) Conduct Early Detection Surveys (EDS) for non-native species at training and cargo staging locations within the JRM AOR (Guam and CNMI (Military Leased Area);
2) Develop and implement standard operating procedures for the control and removal of high-risk invasive species;
3) Develop and implement invasive species rapid response protocols;
4) Develop and implement bio-sanitation standards along with quality assurance/quality control standards via biosecurity inspections; and
5) Development of a programmatic pathway risk analysis for the movement of equipment and personnel within the JRM AOR

Conservation Benefit

Prevent the movement and establishment of invasive species into and out of Guam and the CNMI during training exercises.

FY22 Status

- Ongoing cooperative agreement with CSU CEMML.
- Early Detection Surveys Conducted
    - Tinian MLA – 3 of 4 All-Taxa Survey sites; 16 of 16 Weed Surveys; and Little fire ant (LFA) conducted at five locations (no LFA detections; Figure 5)
    - All-Taxa Surveys – AAFB: 9 of 32 sites; NBG: 10 of 30 sites
    - Weed Surveys – AAFB: 5 of 29 sites; NBG: 27 of 34 sites

- Development of SOPs for the Control/Eradication of High-Risk Species
    - Little Fire Ant (LFA; *Wasmannia auropuncta*) Revised
    - Lollipop Climber (*Diplocyclus palmatus*) Draft
    - Mile-a-Minute vine (*Mikania mircantha*) Draft
    - Greenhouse frog (*Eleutherodactylus planirostris*) Draft
    - Greater Banded Hornet (*Vespa tropica*) Draft in progress
- Invasive Species Rapid Response
    - Thirteen (13) CSU CEMML personnel USGS BTS Rapid Response certified
    - Assisted Guam Biosecurity Division with initial monitoring effort at Won Pat International Airport after a Coqui frog was intercepted at the Saipan International Airport (September 2021)
- Bio-sanitation QA/QC Biosecurity Inspections during Military Training Events
    - One major training event (>100 cargo items; Cope North 22)
    - One minor training event (25 – 100 cargo items; Valiant Shield 22)
    - One unit level training event (<25 cargo items: Nodal Lighting 22)
    - >290 items inspected during arrival and pre-departure biosecurity cleanliness inspections to meet AFPMB TG-31 cleanliness standards
    - Bio-material interceptions (plant material, seeds, soil/gravel)
- Development of a Programmatic Pathway Risk Analysis for Movements into the Mariana Islands and between Islands
    - Ongoing data collection to support the risk analysis

EPR: 2 BO MAR Mariana Islands Training and Testing (MITT) Implementation; 61128NR218

Coconut Rhinoceros Beetle (CRB; *Oryctes rhinoceros*) Surveys, Interdiction, and Monitoring – CNMI (Tinian)

Location: JRM **Period of Performance:** AUG2021 – Ongoing

Project Objective

To implement CRB best management practices: 1) Conduct CRB Early Detection Surveys in military training areas, 2) Implement interdiction trapping during military exercises with cargo movement from Guam to Tinian North Field, 3) implement CRB awareness for military personnel, and 4) Implement CRB interdiction measures on Guam and coordinate and collaborate with resources partners in the CNMI to prevent the movement of CRB to the CNMI via military cargo and transport while maintaining military readiness.

Conservation Benefit

Prevention of movement and establishment of CRB into the CNMI during military training activities.

FY22 Status

- Conducted CRB Early Detection Surveys along roadways in the Military Leased Area on Tinian for CRB damaged coconut trees (February/June 2022)
- No CRB damaged coconut trees detected
- Deployed and monitored CRB panel traps at North Field during Cope North 2022 and Valiant Shield 2022 (February/June 2022)
- Provide military personnel with CRB awareness information and sighting protocols during military training exercises conducted in the CNMI.

- Pre-departure biosecurity inspections were conducted on all cargo and equipment prior to transport from Guam to the CNMI during military exercises to ensure all items were devoid of bio-material (including CRB)
- Communicated CRB interdiction measures during FY22 exercises on Tinian with CNMI natural resources partners
- Coordination with regional partners (USDA-PPQ, GovGuam Dept. Ag., CNMI DLNR, Hawaii Dept. Ag.)

Marianas Islands Training & Testing Biological Opinion Terms & Conditions 1.1 Compliance – CNMI

Location: CNMI **Period of Performance:** AUG2018 – SEP2022

Project Objective

To comply with the Mariana Islands Training & Testing (MITT) Biological Opinion (BO) Incidental Take Statement Terms and Conditions 1.1 (as amended 28 FEB 2016) to provide funding to the U.S. Fish & Wildlife Service for invasive vertebrate pest control to minimize the effect of take on the Micronesian megapode (*Megapodius laperouse*). DoD is not responsible for project implementation or the results thereof, per the MITT Biological Opinion (BO) amended Terms and Conditions 1.1.

Conservation Benefit

To ensure compliance with the Incidental Take Statement of the 2015 MITT BO to minimize the effect of take on the Micronesian megapode.

FY22 Status

- Interagency Agreement between Joint Region Marianas and the U.S. Fish & Wildlife Service established and funding issued in August 2018.
- U.S Fish & Wildlife Service project currently in implementation phase for Micronesian megapode habitat restoration on Aguiguan.

EPR: 2 BO MAR Mariana Islands Training and Testing (MITT) Implementation; 61128NR218

2019 JRM INRMP Reference: TPS-1; 12-34

TERRESTRIAL PROTECTED SPECIES MANAGEMENT

Mariana Fruit Bat Population Monitoring

Location: Tinian MLA **Period of Performance**: NA

Project Objective

To monitor Mariana fruit bat (*Pteropus mariannus mariannus*/fanihi) abundance and habitat use on the Tinian MLA.

Conservation Benefit

Knowledge of MLA occurrence and use patterns permits implementation of disturbance avoidance measures, and the ability to target habitat protection or enhancement measures.

FY22 Status

- 1st annual broad-scale survey through NAVFAC/CNMI DFW partnership conducted July 28, 2022
- No fanihi were detected during July 2022 survey
- Incidental report of a fanihi sighting south of Hagoi in March 2022

EPR: 1 RP MAR JRM Mariana Fruit Bat Monitoring; 61128NRFBM

2019 JRM INRMP Reference: TPS-7; 11-67

Figure 7. Tinian MLA 2022 fanihi survey locations.

Conservation of Listed Invertebrates

Location: Tinian MLA **Period of Performance**: MAR2022 – MAR2023

Project Objective

Overall objective is to conserve and manage humped tree snail (*Partula gibba*) populations on the Tinian MLA. Specific objective is to determine if snails continue to occupy the Dump Coke site.

Conservation Benefit

Monitoring results inform decisions regarding the need or urgency for management. If snails are located during this search effort, the next step is to discuss management options.

FY22 Status

- Contract awarded March 2022
- No snails have been detected at the Dump Coke sites since they were first detected in June 2013.
- Monthly site searches began in July 2022 – no snails detected after two of six planned visits

EPR: 1 CP JRM Conservation Management of ESA-listed Invertebrates; 61128NR203

2019 JRM INRMP Reference: TPS-5; 11-66

Figure 8. Locations and ranges of Dump Coke humped tree snail populations, June 2013. Reprinted from NAVFAC 2014.

Tinian Forest Bird Monitoring

Location: Tinian MLA **Period of Performance**: MAR2022 – MAR2023

Project Objective

To monitor native forest bird populations with a focus on Tinian monarch (*Monarcha takatsukasae*) and Micronesian megapode (*Megapodius laperouse laperouse*)

Conservation Benefit

Monitoring informs management decisions for conservation of native bird populations. Declining trends may indicate a need for more focused management. Tinian monarch, a single-island endemic species, and ESA-listed Micronesian megapode warrant greater attention.

FY22 Status

- Agreement extension – additional Micronesian megapode survey in 2023
- 2021 VCP survey key findings:
    - "…the landbird community in the Military Lease Area appears to be dynamic and resilient." (USGS)
    - Compared to densities from Camp et al 2012 overlapping regions:
        - White-throated ground dove (*Gallicolumba xanthonura*), Mariana fruit dove (*Ptilinopus roseicapilla*), Micronesian myzomela (*Myzomela rubratra*), Tinian monarch, and bridled white-eye (*Zosterops conspicillatus*) increased
        - Mariana kingfisher (*Todiramphus albicilla*) and rufous fantail (*Rhipidura rufifrons*) decreased
        - Micronesian starling (*Aplonis opaca*) was similar
    - Higher density of bridled white-eye (*Zosterops conspicillatus saypani*) compared to other islands/times

EPR: CHS MAR JRM Tinian Forest Bird Monitoring; 61755NR303

2019 JRM INRMP Reference: TPS-4; 11-65

Figure 9. Location of 2021 MLA survey transects and Camp et al. 2012 regions.

Tinian Monarch Research

Location: Tinian MLA **Period of Performance**: MAR2022 – MAR2023

Project Objective

To conduct basic ecological studies of Tinian monarch (*Monarcha takatsukasae*)

Conservation Benefit

Knowledge of basic Tinian monarch (*Monarcha takatsukasae*) biology and ecology will enable effective and efficient management strategies. Results will guide development of future predator control and/or forest restoration and enhancement measures.

FY22 Status

- Phase 1 complete; 261 birds banded, 151 nests + veg paired plots
- Preparation complete for Phase 2 – telemetry

Preliminary results from MAR2021-MAR2022:

- Survivorship, home range size, incubation period, and nestling development similar to previous findings
- Nesting success rate 55%
- Rat predation - primary cause of nest failure across all nesting stages
- Nests typically under a closed ~4 meter canopy and near a large 11-12 meter tree
- Most common nest trees: *Aglaia mariannensis*, *Ficus tinctoria* in native limestone forest and secondary vegetation; *Bauhinia monandra* in tangantangan forest
- First interim report received May 2022. Next report due spring 2023.

EPR: CHS MAR JRM Tinian Forest Bird Monitoring; 61755NR303

2019 JRM INRMP Reference: TPS-4; 11-65

Table 1. Comparison of habitat characteristics at Tinian monarch nest sites and paired plots.

	Nest sites				
	% bare ground	% leaf litter	% rocks	% plant cover	% canopy cover
Native	5	47	8	40	94
Secondary	2	51	9	38	93
Tangan	2	55	1	42	90
Grand Total	3	51	7	40	93
	Paired plots				
	% bare ground	% leaf litter	% rocks	% plant cover	% canopy cover
Native	2	34	8	56	81
Secondary	1	35	4	60	77
Tangan	1	40	2	58	85
Grand Total	1	35	5	58	80

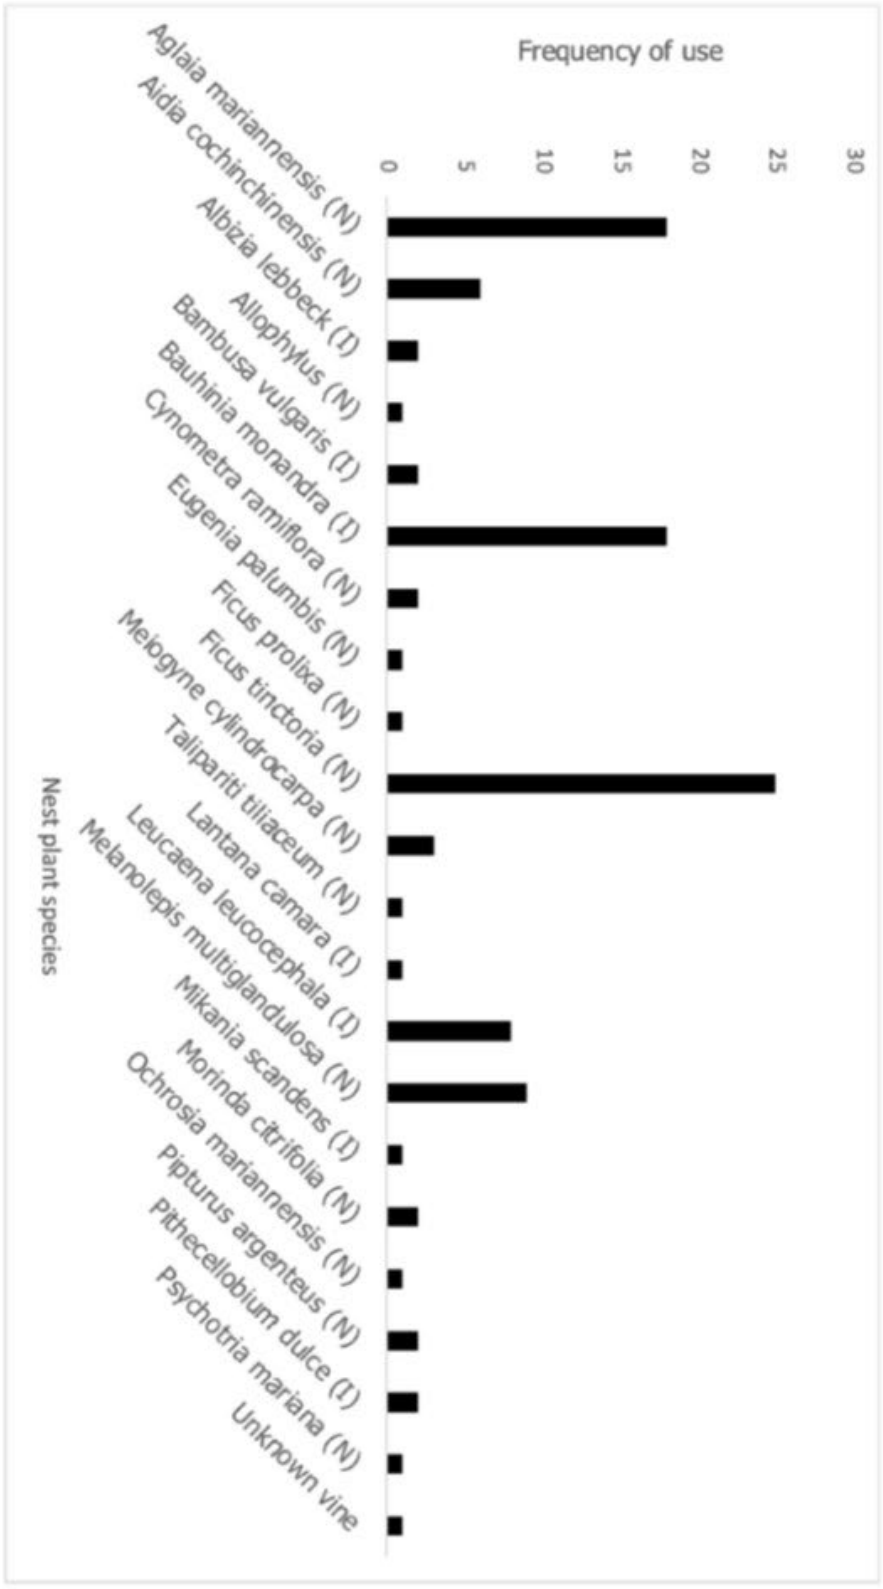

Figure 5. Frequency distribution of Tinian monarch nest plant species across three habitat types in the Military Lease Area on Tinian between 19 March 2021 and 1 March 2022. Habitat types included native limestone forest, secondary vegetation, and tangantangan forest. N = native; I = Introduced.

Figure 12. Tinian monarch nest tree species frequency distribution through Feb 2022.

Mariana Common Moorhen Conservation and Management

Location: Tinian MLA **Period of Performance**: AUG2021 – FEB2024

Project Objective

Monitor and investigate Mariana common moorhen (*Gallinula chloropus guami*) populations and habitat use on the Tinian MLA. Communicate and coordinate with conservation partners.

Conservation Benefit

Monitoring informs management decisions for conservation of moorhen populations. Basic ecological research underpins effective management strategies. Effective communication with partners enhances moorhen conservation and recovery efforts on Tinian and range-wide.

FY22 Status

- Lake Hagoi quarterly monitoring ongoing
- Hagoi population trend continues to appear stable
- Bateha wetlands surveyed in August
- Vegetation surveys completed in August
- DFW-led working group established
- Report will be available summer 2023

EPR: 1 S RP MAR CNMI ESA and MBTA Species Management; 61128NR211

2019 JRM INRMP Reference: TPS-3; 11-65

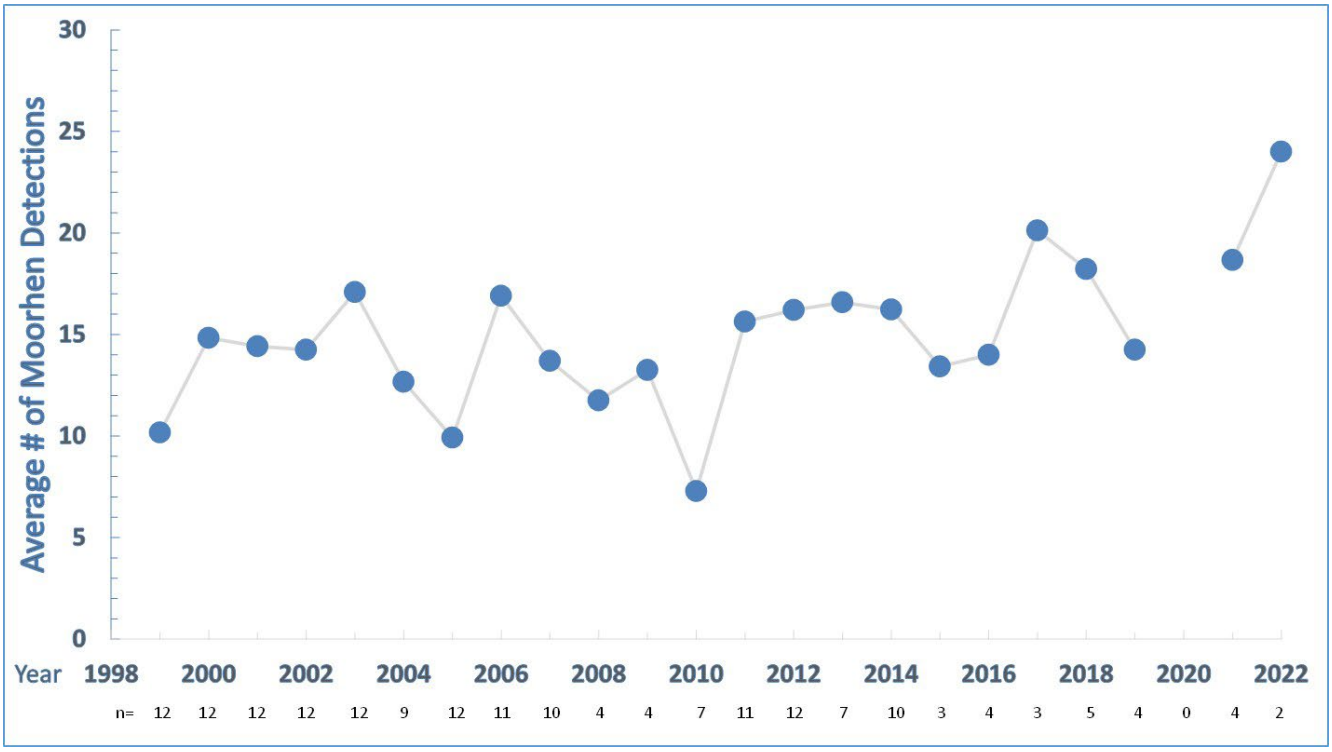

Figure 13. Lake Hagoi average number of Mariana Common Moorhen detections, 1999-2022

Monitoring for Sea Turtle Nesting Activity

Location: Tinian MLA **Period of Performance**: JUN2021 – JUN2022

Project Objective

Maximize sea turtle nesting opportunities and success on all Tinian MLA beaches

Conservation Benefit

Monitoring informs sea turtle conservation and management decisions.

FY22 Status

- Final report for JUN2021-JUN2022 in review
- 34 nests, 8 non-nesting emergences
- Tidal inundation impacted 7% of nests
- 28 nest inventories were conducted: mean clutch size 86; hatch success 77%, emergence success 75%
- New contract awarded JUL2022 – twice monthly surveys ongoing

EPR: 1 S RP MAR CNMI ESA and MBTA Species Management; 61128NR211

2019 JRM INRMP Reference: TPS-2; 11-64

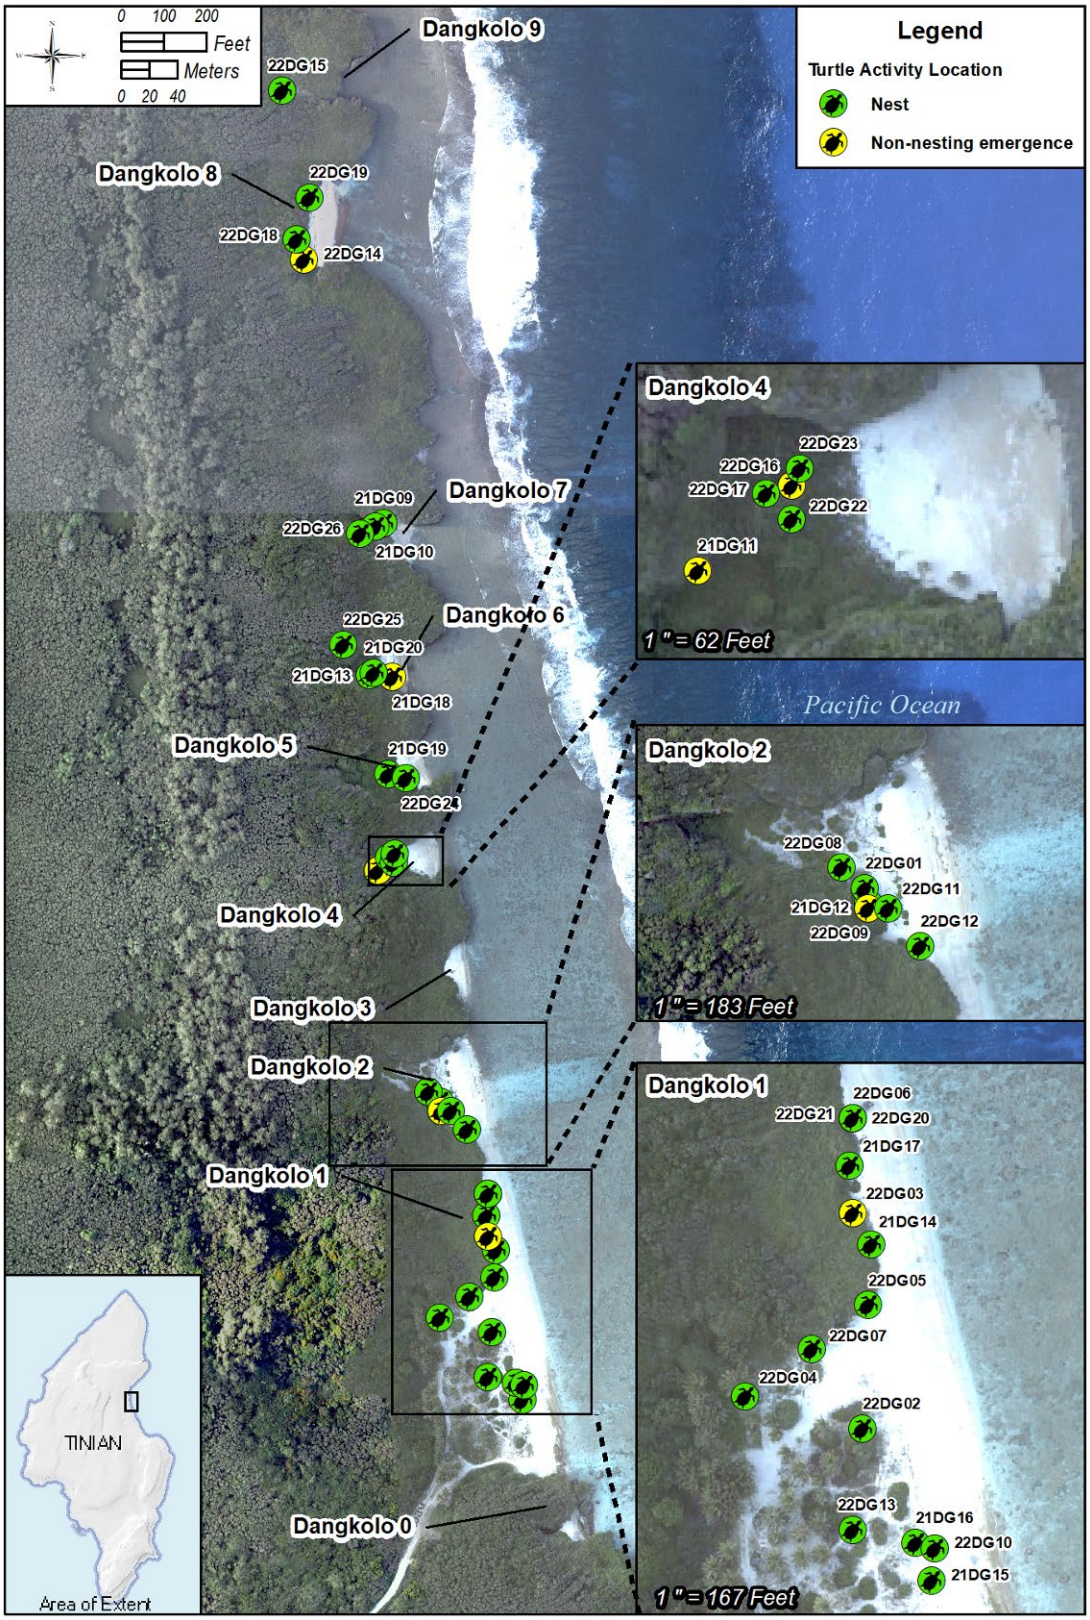

Figure 14. Dangkulo beach, Tinian green turtle nest and non-nesting emergence locations documented between July 8, 2021 and June 18, 2022.

Figure 15. Masålok beach, Tinian green turtle nesting and non-nesting emergence locations documented between July 8, 2021 and June 18, 2022.

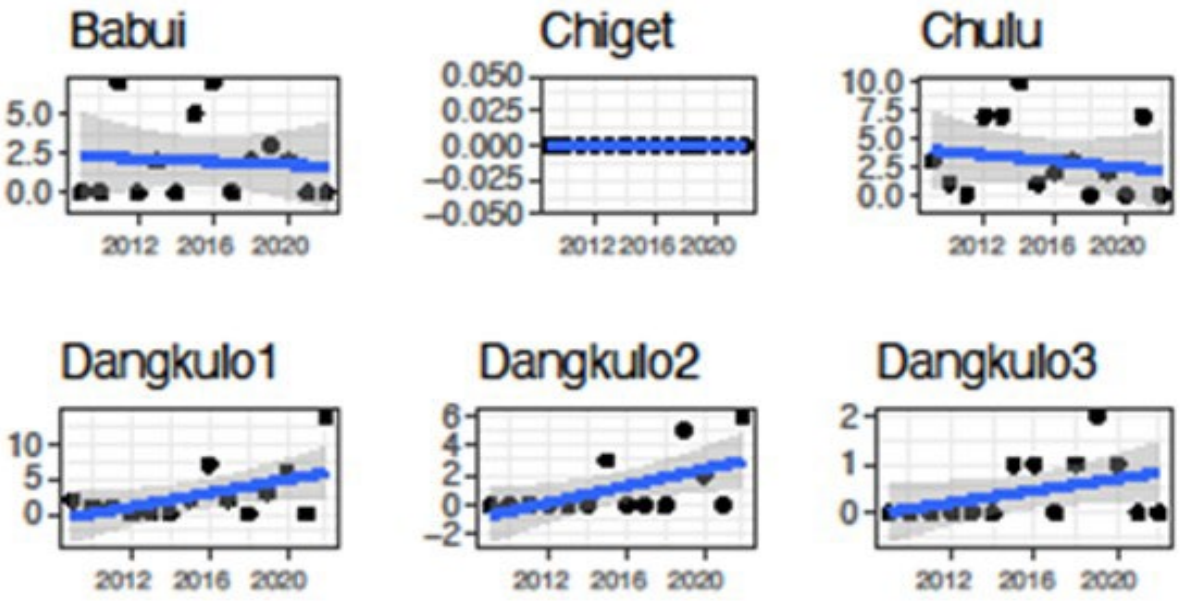

Figure 16. Nesting activity trend for 6 Tinian MLA beaches, 2009-2022

Beach Cleanups on the Tinian MLA

Location: Tinian MLA **Period of Performance**: JUN2021 – JUN2022

Project Objective

Removal of marine debris from all MLA beaches annually to enhance successful sea turtle nesting.

Conservation Benefit

The removal of marine debris reduces entanglements and allows successful nest excavation and egg deposition. Secondary benefits accrue to other marine species and ecosystems, and in goodwill with the Tinian public.

FY22 Status

- 3,103 lbs of debris removed from 18 MLA beaches (~half the weight of previous year)
- Plastic comprised 69.5% of debris collected by weight
- Final report in review
- New contract awarded JUL2022

EPR: 1 RP MAR CNMI ESA and MBTA Species Management; 61128NR211

2019 JRM INRMP Reference: TPS-2; 11-64

Figure 17. Before and after cleanup of Dangkulo pocket beach #7, June 6, 2022. Photo: Jessy's Tag Services

Conservation of Tinian *Cycas micronesica* Plantings

Location: Tinian MLA **Period of Performance**: MAY2022 – MAY2023

Project Objective

To conserve representative plants of Micronesian cycad (*Cycas micronesica*) populations from Guam.

Conservation Benefit

Micronesian cycads on Tinian provide an assurance population which enhances species resiliency to catastrophic events. The Tinian population is suitable for cycad studies and testing of new management strategies.

FY22 Status

- Maintenance of Tinian cycad plots continued
- Annual health assessment data collected
- 35 cycads at 6 tourist sites outside of plots as of February 2022; Mt Lasso Overlook only tourist site w/*Aulacaspis* scale
- No scale predators found in plots during Feb 2022 survey
- Ongoing coordination with partners, including multiple reports in last year with relevance to Tinian:
    - Oct 2021, “Tinian MLA Fadang Ex Situ Population Strategy Evaluation”, NAVFACMAR
    - Mar 2022, “Report to the U.S. Fish and Wildlife Service-Pacific Islands Division on a visit to Guam March 3-17, 2022”, University of Florida
    - Apr 2022, “Monitoring Cycad Aulacaspis Scale (CAS), *Aulacaspis yasumatsui*, Infesting *Cycas micronesica* in the Tinian Conservation Plots Using Sticky Traps”, University of Guam
- Final report due early 2023

EPR: 1 CP MAR Conservation Management of Tinian Cycads; 61128NR162

2019 JRM INRMP Reference: TPS-1; 11-64

CONSERVATION LAW ENFORCEMENT PROGRAM

Location: Tinian MLA **Period of Performance**: NA

Project Objective

To establish a conservation law enforcement program for the Tinian MLA.

Conservation Benefit

A conservation law enforcement program will detect and deter unauthorized activity that negatively affects natural resources (terrestrial and marine) on the Tinian MLA.

FY22 Status

- Solicited a conservation law enforcement needs assessment contract
- No award was made due to insufficient funding
- Will be re-solicited in FY23

EPR: SIKES MAR JRM Conservation Law Enforcement Program; 61128NR589

2019 JRM INRMP Reference: TLAW-1; 11-69

NATURAL RESOURCES EDUCATION AND OUTREACH

JRM Natural Resources Stewardship Outreach & Public Engagement Program

Location: JRM **Period of Performance**: AUG2021 – Ongoing; New SEP2022

Project Objective

To develop outreach products to effectively and efficiently implement a natural resources (NR) stewardship engagement program. This program aims to better educate uniformed and civilian staff, their dependents, JRM contractors, and the general public in order to improve NR stewardship and awareness within JRM AOR.

Conservation Benefit

The development and production of NR education materials and training is a beneficial support to increasing awareness of Threatened and Endangered species, proper stewardship behavior, and threats to local ecosystems.

FY22 Results

- Ongoing production of Environmental Stewardship Website
- Ongoing production of outreach swag items to support Tinian Art Contest and Turtle Educational Outreach Project
- Ongoing update of Public Access Plan (PAP) site descriptions and photos
- Ongoing 360 degree camera photos of 3 PAP sites to be featured on Environmental Stewardship Website
- Projected completion of tasks by 31OCT2022
- New project awarded 09SEP2022 for the production of 3 to 5 minute outreach video for use across JRM AOR

EPR: 61128NR962 JRM Natural Resources Stewardship Outreach and Public Engagement Program

2019 JRM INRMP Reference: TEDU-1; 5-91, MEDU-1; 5-104

PACFLT Funded JRM Natural Resources Stewardship Outreach & Public Engagement Program

Location: JRM **Period of Performance:** SEP2020 - Ongoing

Project Objective

Improve natural resources (NR) stewardship and awareness within JRM AOR.

Conservation Benefit

The development and production of NR education materials and training is a beneficial support to increasing awareness of T&E species, proper stewardship behavior, and threats to local ecosystems.

FY22 Results

- Ongoing implementation and expansion of Young Environmental Stewards (YES!) youth educational program
- Ongoing CNMI outreach initiative in conjunction with EPR 61128NR962 JRM Natural Resources Stewardship Outreach and Public Engagement Program
- Distribution of 4 T&E species themed reusable shopping bags at installations, various DoD events, and public outreach events on Guam.
- Production and delivery of Nature Journals and Passport interactive materials estimated for OCT2022
- Ongoing development of sea turtle interactive classroom game

EPR: NA- Funding from PACFLT Stewards of the Sea Initiative

2019 JRM INRMP Reference: TEDU-1; 5-91, MEDU-1; 5-104

Subject: FY22 Joint Region Marianas Natural Resources Metrics - September 2022

Hafa Adai Resource Partners,

I would like to kindly request your participation in the FY22 Joint Region Marianas Natural Resource Metrics meetings. We will be holding in-person meetings on the following dates:

15-16 Sep: CNMI
21-22 Sep: Guam

More information regarding the venues and agenda will be provided as we get closer to the meeting dates.

Please mark your calendars and have a great summer!

Jennifer Cruce Horeg
Natural Resources Program Supervisor / Section 7 Lead
Naval Facilities Engineering Systems Command Marianas (NAVFACMAR)

Subj: FISCAL YEAR 2023 NATURAL RESOURCES/INTEGRATED NATURAL RESOURCES MANAGEMENT PLAN METRICS SUMMARY REPORT

Ref: (a) OPNAV-M-5090.1

Encl: (1) JRM INRMP Summary of FY23 Projects for Guam and CNMI
(2) FY 2023 Natural Resources INRMP Metrics Results
(3) FY 2023 Natural Resources INRMP Metrics Invitation and Attendee List

1. In accordance with reference (a), Navy installations are required to submit an annual report summarizing the recent Natural Resources/Integrated Natural Resources Management Plan (INRMP) Metrics meeting and status of the INRMP in enclosure (1). The Natural Resources/INRMP Metrics summary scores presented in enclosure (2) are generated from the Navy Conservation website to reflect current status of INRMP execution.

2. The Fiscal Year (FY) 23 Joint Region Marianas (JRM) Natural Resources/INRMP Metrics meeting for Commonwealth of the Northern Mariana Islands (CNMI) resource partners was held at the Hyatt Regency Saipan on September 14, 2023 and the JRM INRMP Metrics meeting for Guam resource partners was held at the Hyatt Regency Guam on September 20 and 21, 2023 in enclosure (3).

3. The Final 2019 JRM INRMP was completed and signed by partner agencies (U.S. Fish and Wildlife Service, National Marine Fisheries Service, Guam Department of Agriculture, and CNMI Department of Land and Natural Resources-Division of Fish and Wildlife) in June through August 2019. Annual updates are conducted each calendar year beginning in 2020 and a 5-year review for operation and effect will be conducted in 2024 per the OPNAVINST 5090.1E, reference (b), sections 670a-f. The FY22 JRM INRMP update was completed and distributed in March 2023.

4. Thank you for your participation in our Natural Resources/INRMP Metrics meeting and for your support of the JRM Natural Resources Program. If you have any questions, please contact Jennifer Horeg, Natural Resources Program Supervisor, at 671-339-1275 or via e-mail at Jennifer.a.horeg.civ@us.navy.mil.

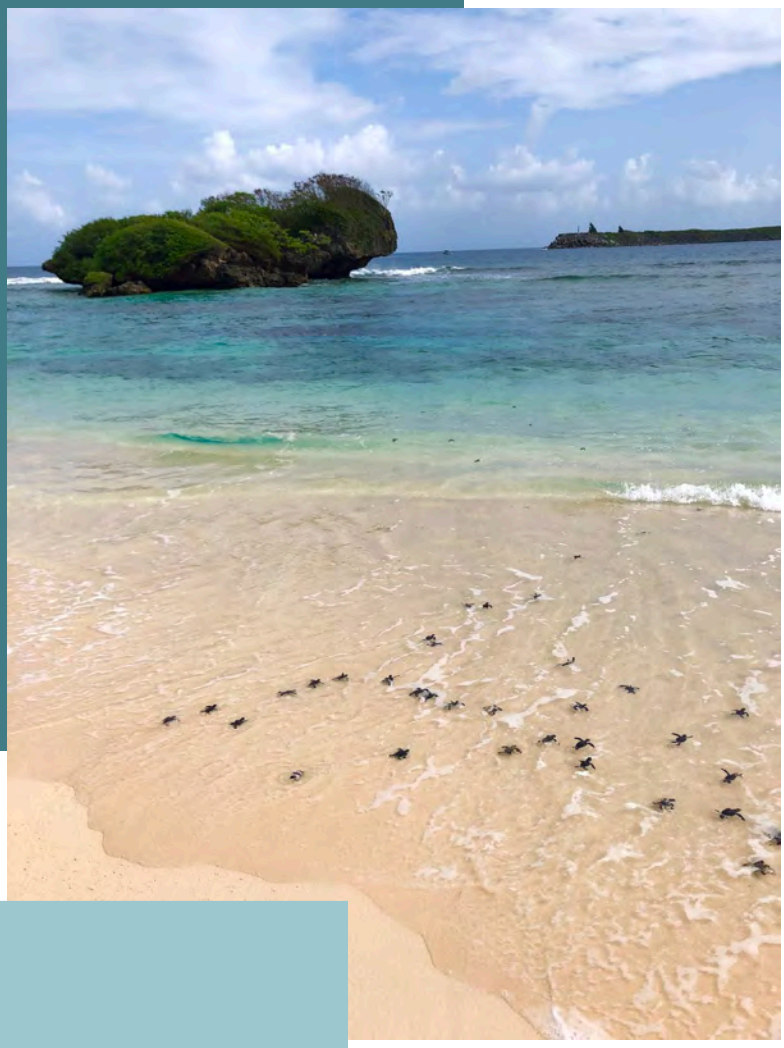
2023 Natural Resources Annual Report: OVERALL SCORE SUMMARY

Summary Score



Focus Area	Score
1 - Natural Resources Management	0.64
2 - Listed Species Critical Habitat	0.77
3 - Recreation Use and Access	0.68
4 - Sikes Act Cooperation	0.88
5 - Team Adequacy	0.77
6 - INRMP Implementation	0.89
7 - Support of Installation Mission	0.66
Overall Score Summary (Farrallon de Medinilla FDM, NB Guam, Tinian MLA, NSA ANDERSEN)	0.76

- The Navy Conservation Website is the tool used to collect data
- Scoring and Weighting
  - INRMP Implementation Focus Area
    - Red = 0-50% , Yellow = 50%-75%, Green = 75%-100%

  - Remaining 6 Focus Areas
    - Key questions have higher weighted values to influence the total score
    - The score of each Focus Area is a “weighted average”
  - The final score of Focus Area is expressed as a decimal value between 0 and 1.
    - Not a percentile measurement
    - Red = 0.0 to 0.33, Yellow = 0.34 to 0.66, Green = 0.67 to 1.0

Release of 50 green sea turtle hatchlings at Spanish Steps beach.

MARINE HABITAT MANAGEMENT

JRM Marine Invasive Species Management Plan (JRM MISMP)

Location: JRM AOR **Period of Performance:** AUG2022 – OCT2023

Project Objective

To develop standard operating procedures (SOP) and protocols to avoid and minimize: (1) the spread of new marine invasive species (MIS) into the Department of Defense (DoD) submerged lands within the JRM Area of Responsibility (AOR), and (2) the transfer of any MIS from DoD submerged lands within the JRM AOR to the Pacific region.

Conservation Benefit

The development of SOPs and protocols for a MISMP shall support natural resource managers to monitor, detect, respond, control, eradicate, and prevent the risk of MIS incursions into, out of, and within the JRM AOR, thus maintaining marine biodiversity and ecosystem functions within JRM's AOR.

FY23 Status

- Resource partners provided comments and feedback on draft chapters
- Revisions for Draft Final JRM MISMP copy currently ongoing
- Final JRM MISMP document scheduled to be completed by OCT 2023

EPR: 1 S MAR JRM Marine Ecosystem Monitoring and Coral Reef Indicators (CHS); 61128NR168

2019 JRM INRMP Reference: MIS-1; 5-102, MIS-2; 5-102, MIS-1; 8-64, MIS-2; 8-65, MIS-1; 9-88, MIS-2; 9-88, MIS-1; 11-75, MIS-2; 11-75

Water Quality Monitoring on JRM Submerged Lands

Location: JRM AOR **Period of Performance:** JUN2021 – NOV2023

Project Objective

To quantify the conductivity, temperature, depth, pH, chlorophyll A, dissolved oxygen, nitrate, and phosphate concentrations in shallow reef systems. This project aims to provide water quality data for the JRM submerged lands, Guam.

Conservation Benefit

These quantitative data will assist in determining the parameters associated with climate change that may be impacting coral reefs in order to avoid, minimize or mitigate potential adverse effects to the marine resources within these areas, especially marine protected species.

FY23 Status

- Ongoing project with UOG WERI
- Retrieved five (5) sensors from Apra Harbor after Typhoon Mawar to assess impacts on coastal water quality
- Will retrieve three (3) sensors from Inner Harbor, Ayuyu Cave, and Pati Point when weather permits to assess impacts of Typhoon Mawar
- Weekly water sampling at five (5) rivers – Sasa, Laguas, Aguada, Atantano, and Namo – measuring DO concentrations, temperature, pH, total inorganic dissolved nitrogen, and total suspended solids.
- All sensors will be redeployed after data retrieval and maintenance

EPR: EO 13751 MAR JRM Monitoring and Control of Acute Impacts on Coral Reefs – Climate; 61128CN222: Coral Habitat Enhancement

2019 JRM INRMP Reference: MIS-2; 8-65, MHM-1; 8-62, MHM-2; 8-63, MHM-3; 8-63, MGIS-1; 8-68, MHM-1; 11-73, MHM-2; 11-74, MHM-3; 11-74, MIS-2; 11-75, MPS-1; 11-76

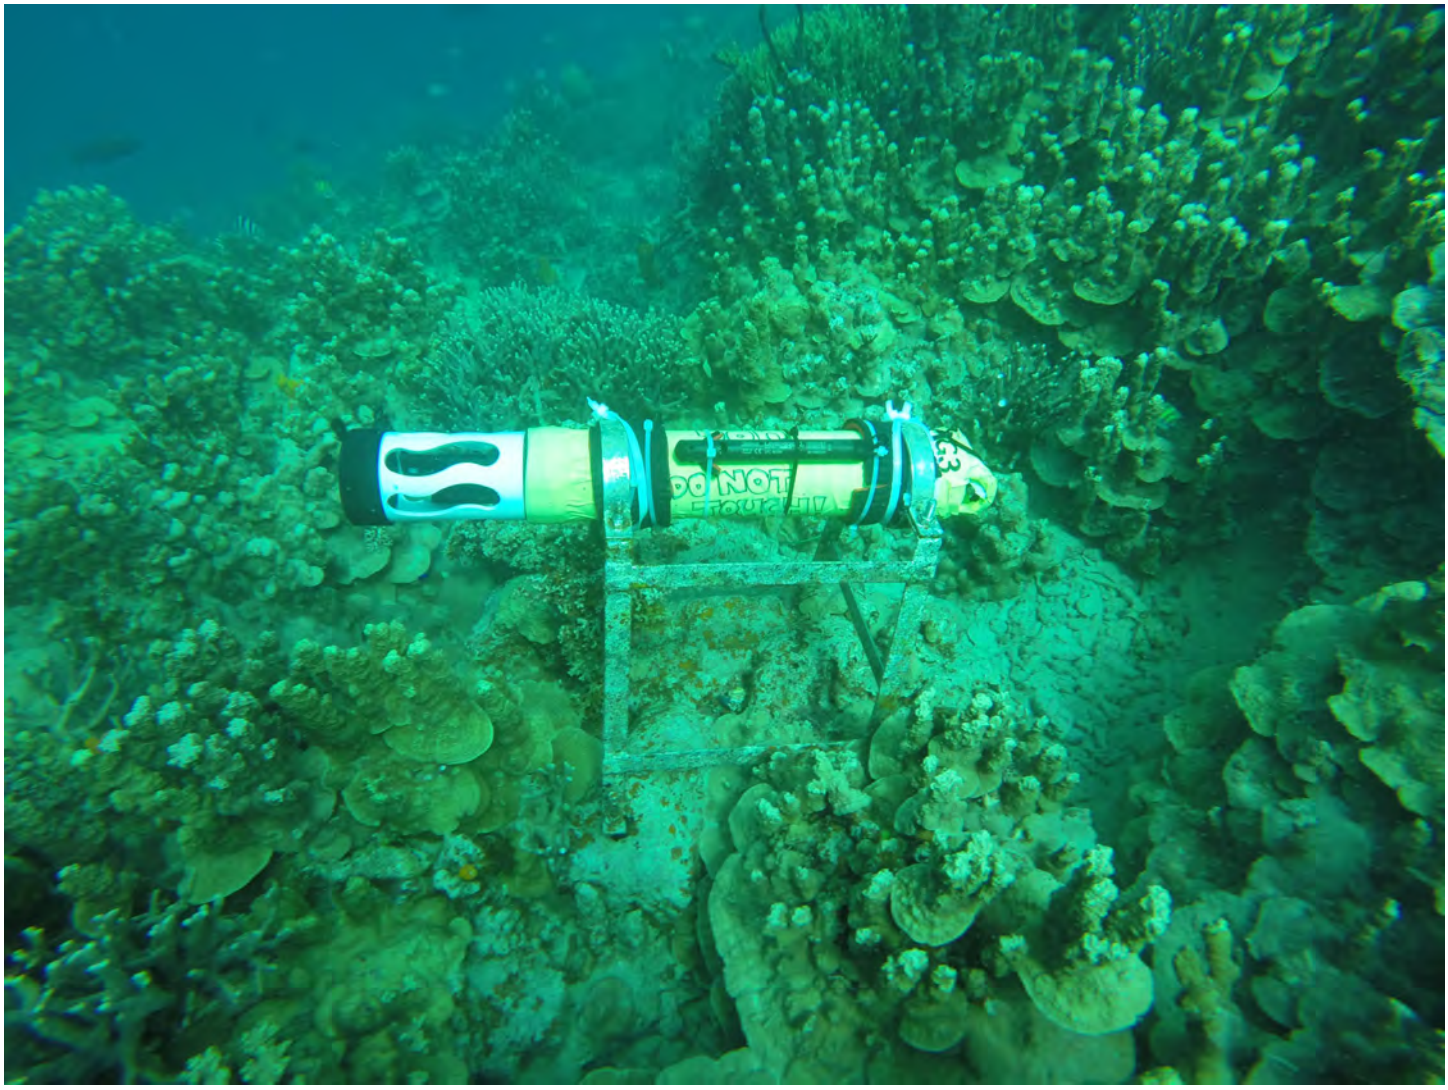

Figure 2. Example of the OTT HydroMet HL7 water quality sensor installed at Apra Harbor, Guam (Photo by Dr. Chris Yeo, UOG WERI).

Identification and Genetic Analysis of Endangered Species Act Listed Corals on Joint Region Marianas Submerged Lands in Guam

Location: NBG **Period of Performance:** AUG2023 - Ongoing

Project Objective

To identify the locations of corals, protected under the Endangered Species Act (ESA); precisely mark the location of the corals; determine the health, size, and morphology of ESA-listed corals; characterize the substrate of the corals; and conduct genetic analyses to confirm the coral identifications in JRM submerged lands in Guam.

Conservation Benefit

Mitigate damages to ESA-listed corals on JRM submerged lands in Guam, provide the best available scientific data for ESA-listed coral locations, assist with the annual updates for the JRM Integrated Natural Resources Management Plan (INRMP), and allow for critical habitat exemptions for ESA-listed species.

FY23 Status

- Awarded in AUG 2023 to Naval Information Warfare Center, Pacific (NIWC Pacific)

EPR: EO 13751 MAR JRM Monitoring and Control of Acute Impacts on Coral Reefs – Climate; 61128CN222: Coral Habitat Enhancement

2019 JRM INRMP Reference: MIS-2; 8-65, MHM-1; 8-62, MHM-2; 8-63, MHM-3; 8-63, MGIS-1; 8-68, MHM-1; 11-73, MHM-2; 11-74, MHM-3; 11-74, MIS-2; 11-75, MPS-1; 11-76

Identification and Removal of Non-Permitted Buoys on JRM Submerged Lands

Location: NBG **Period of Performance:** JUL2020 - SEP2023

Project Objective

To identify, locate, and remove the non-permitted buoys (NPBs) in JRM submerged lands.

Conservation Benefit

The identification, location, and removal of NPBs will allow individuals to use authorized (i.e., USACE-permitted) moorings in order to avoid, minimize or mitigate potential adverse effects to the marine resources within these areas, especially marine protected species.

FY23 Status

- Ongoing project with Navy Information Warfare Center
- Fieldwork completed in MAY 2023
- Final deliverables expected before SEP 2023

EPR: EO 13751 MAR JRM Monitoring and Control of Acute Impacts on Coral Reefs – Climate; 61128CN222: Coral Habitat Enhancement

2019 JRM INRMP Reference: MIS-2; 8-65, MHM-1; 8-62, MHM-2; 8-63, MHM-3; 8-63, MGIS-1 8-68

Figure 6. A possible NPB in Apra Harbor, Guam showing extensive damage to the surrounding benthos.

Coral Bleaching and Crown of Thorns Starfish (COTS) Monitoring on JRM Submerged Lands

Location: JRM AOR **Period of Performance:** JUN2021 – NOV2023

Project Objective

To quantify the coral bleaching and abundance distribution of COTS, and if necessary conduct COTS culling.

Conservation Benefit

These quantitative data will assist in determining the parameters associated with coral bleaching and COTS outbreak events that may be impacting coral reefs in order to avoid, minimize or mitigate potential adverse effects to the marine resources within these areas, especially marine protected species.

FY23 Status

- Ongoing project with UOG Sea Grant
- Fieldwork delayed due to Typhoon Mawar

EPR: EO 13751 MAR JRM Monitoring and Control of Acute Impacts on Coral Reefs – Climate; 61128CN222: Coral Habitat Enhancement

2019 JRM INRMP Reference: MIS-2; 8-65, MHM-1; 8-62, MHM-2; 8-63, MHM-3; 8-63, MGIS-1; 8-68, MHM-1; 11-73, MHM-2; 11-74, MHM-3; 11-74, MIS-2; 11-75, MPS-1; 11-76

Characterization of Marine Benthic Habitats in Outer Apra Harbor Guam and Haputo ERA

Location: NBG; MCBCB **Period of Performance** SEP2019 – MAR2024

Project Objective

To provide habitat predictions and maps of submerged lands (i.e., coral reef) in Outer Apra Harbor and Haputo ERA using a variety of GIS data (e.g., lidar, side scan, multibeam, aerial imagery, etc.) and underwater photos and videos.

Conservation Benefit:

Identification and characterization of the marine benthic habitats will inform military training and testing, as well as the consultations with regulatory agencies, in order to avoid, minimize or mitigate potential adverse effects to the marine resources within these areas, especially marine protected species.

FY23 Status

- Ongoing project with NOAA NCCOS
- Developed draft habitat predictions and map
- Draft habitat predictions and map review planned for SEP2023
- NCE planned for MAR2024 for final deliverables

Ecosystem Monitoring and Coral Reef Indicators

Location: JRM AOR **Period of Performance:** SEP2018 – SEP2023

Project Objective

In an effort to enhance coral habitat, the objective of this project is to monitor and track changes in the health of corals at the ten long-term monitoring stations in Outer Apra Harbor and nearshore waters off Orote Peninsula. Through field surveys and data analyses, coral cover, coral species richness, coral predation, and coral community health were determined. The results of this project will be compared to prior year data at the ten stations. Trends observed will guide conservation and management strategies to improve coral habitat.

Conservation Benefit

The conservation benefits of project include: (a) ensure self-sustaining resilient populations to maintain and increase native species and diversity; (b) ensure self-sustaining resilient populations to include the use of novel techniques in adaptive management of “target” species populations; and (c) no net loss of current species range.

FY23 Status

- Field surveys at 10 permanent sites in OAH
- Benthic characterization
- Assessment of coral community
- OAH dominated by single species, Porites rus (71%, n=10)
- Sediment accumulation dominant at eastern sites
- Competition with macroalgae and sponges at western sites
- Pending final report and data synthesis

Incident Response Plan to Coral Reef Damage

Location: JRM AOR **Period of Performance:** JUL2023 – SEP2024

Project Objective

In an effort to effectively and proactively manage NBG marine habitat, the objective of this project is develop protocols for immediate assessment and response to reef damage caused by unanticipated. This project is focused on reef damage that may result from small and large vessel groundings, anchor drops, and marine debris, with the potential to include a plan for impacts due to chemical discharges or underwater neutralization of unexploded ordinance. This project will involve discussions with key stakeholders, both federal and local, and will culminate with an in-person workshop to present the components of the Incident Response Plan.

Conservation Benefit

The conservation benefits of project include: (a) improve stewardship of natural resources at NBG by integrating conservation program requirements; (b) ensure compliance with all applicable federal and territorial laws, regulations, policies, and legal decisions; and (c) protect and manage sufficient marine habitat needed for species conservation.

FY23 Status

MARINE PROTECTED SPECIES MANAGEMENT

Sea Turtle Distribution and Habitat Use

Location: NBG **Period of Performance:** AUG2018 - Ongoing

Project Objective

In an effort to protect and enhance sea turtle population in the marine waters of Navy-submerged lands, JRM entered a multi-year interagency agreement with NOAA NMFS. The goal of this project is to understand the distribution and habitat use of sea turtles on Navy-submerged lands. Information generated from the project will inform management actions to protect sea turtles and be used to assess potential impacts from proposed actions within Navy-submerged lands.

Conservation Benefit

The conservation benefits of project are to (a) sustain and enhance the sea turtle population; (b) maintain sea turtle species range and distribution; and (c) increase the use of adaptive management techniques for sea turtles.

FY23 Status

- Local participation from DAWR, USFWS, Sea Grant, JTS
- Final report pending satellite tracking results
- Entered into new Interagency Agreement AUG 2023 focused on northern Guam and Tinian

TERRESTRIAL EXOTIC AND INVASIVE SPECIES MANAGEMENT

Implementation of the Regional Biosecurity Plan of Micronesia and Hawaii (RBP) - Guam

Location: JRM AOR **Period of Performance**: AUG2022 - Ongoing

Project Objective

Implement priority actions from the RBP aimed at: 1) Preventing the spread of invasive species within and in/out of JRM Area of Responsibility (AOR); 2) Foster regional coordination and collaboration; 3) Invasive species management and control; and 4) Strengthening capacity for biosecurity.

Conservation Benefit

Protection of native species, particularly those that are threatened and endangered, from the threat of invasive species within the JRM AOR.

FY23 Status

- Implement arrival and/or pre-departure biosecurity inspections of non-training military equipment and cargo movements into/out of JRM AOR to ensure Armed Forces Pest Management Board Technical Guide No. 31 (AFPMB TG-31) cleanliness standards, therefore devoid of biomaterial. Biosecurity inspections conducted by Colorado State University Center for Environmental Management of Military Lands (CSU CEMML) and pre-departure Brown treesnake (BTS) canine inspection conducted by USDA-Wildlife Services (WS).
    - Movements included Navy Mobile Construction Battalion (NMCB) cargo and equipment to/from Tinian and Palau for Navy public works projects.
        - Eight (8) pre-departure biosecurity and BTS inspection events on Guam for cargo and equipment movements to Tinian.
        - One (1) pre-departure biosecurity inspection event on Tinian for cargo and equipment movement to Guam.
        - Six (6) pre-departure biosecurity and BTS inspection events on Guam for cargo and equipment movements to Palau.
    - U.S. Air Force prepositioned equipment to/from Saipan.
        - One (1) pre-departure biosecurity and BTS inspection event on Guam for equipment movement to Saipan.
    - Rotational units and/or unit deployments.
        - Twelve (12) arrival/pre-departure biosecurity inspection events on Guam.
- Early Detection Surveys Conducted
    - All-Taxa Surveys – AAFB: 10 of 32 sites (Figure 11); NBG: 5 of 30 sites (Figure 12)

  - Weed Surveys – AAFB: 3 of 29 sites; NBG: 4 of 34 sites
  - Tinian MLA – 5 of 5 All-Taxa Survey sites (including LFA, no detections)
- Continued interagency coordination and consultation regarding invasive species management and biosecurity concerns within the region (CRB Working Group, LFA Working Group, GISC, GISAC, RISC, CNMI DLNR, Guam Biosecurity Division, CGAPS).

Little Fire Ant (LFA), *Wasmannia auropunctat*a, Surveys, Eradication, and Monitoring - Guam

Location: JRM AOR **Period of Performance**: AUG2022- Ongoing

Project Objective

To implement LFA Early Detection Surveys (EDS); control and eradicate LFA on DoD lands: coordinate and collaborate with resources partners; and provide outreach materials to reduce impacts to native ecosystems and military readiness activities.

Conservation Benefit

Enhance and restore habitats by prevention of the spread and establishment of the invasive LFA.

FY23 Status

- Ongoing Cooperative Agreement with CSU CEMML:
- LFA Early Detection Surveys
    - Andersen AFB (AAFB): 19 surveys covering 29.6 miles (Figure 13)
    - Naval Base Guam (NBG): 18 surveys covering 12.0 miles (Figure 14)
    - Marine Corps Base Camp Blaz (MCBCB): 2 surveys covering 1.9 miles (Figure 15)
- New LFA Infestation Detections
    - Three (3) new infestations detected along installation borders and two (2) new infestations within installation borders (Figures 13-15).

Coconut Rhinoceros Beetle (CRB; *Oryctes rhinoceros*) Surveys, Interdiction, and Monitoring - Guam

Location: JRM **Period of Performance:** AUG2022 – Ongoing

Project Objective

To implement CRB best management practices: 1) identify and remove breeding sites, 2) implement interdiction and sentinel trapping, and 3) implement CRB awareness; coordinate and collaborate with resources partners, and provide outreach materials to installation and military training participants to reduce impacts to native ecosystems and military readiness activities.

Conservation Benefit

Prevention of the spread and establishment of the invasive CRB to other locations within and outside of the JRM AOR.

FY23 Status

- CSU CEMML implementing CRB best management practices
- Breeding Site Identification
    - Biannual breeding site surveys in urbanized areas of Andersen AFB Mainbase (AAFB), AAFB Northwest Field (NWF) and Naval Base Guam (NBG) Mainbase: November 2022 (Table 2, Figures 16 - 18)
    - Typhoon Mawar delayed the second breeding site survey until September 2023
- Interdiction/Sentinel Trapping
    - CRB black panel traps serviced biweekly on AAFB Mainbase (144 traps) and NBG (143 traps), since August 2020 and AAFB Northwest Field (NWF) (21 traps), since September 2023
    - CRB Tekken netting traps serviced biweekly on AAFB (50 traps), since April 2021
    - During this reporting period (August 2022 to July 2023), 6,728 CRB have been capture in panel traps and Tekken netting traps (AAFB Mainbase: 4,057, AAFB NWF: 499, NBG: 2,172; Figures (19 - 21)
    - Approximately 25,000 CRB have been captured over the past 3-years (Figure 21)
- Coordination with regional partners (USDA-PPQ, GovGuam Dept. Ag., CNMI DLNR, Hawaii Dept. Ag.)

Gray line indicates cumulative panel trap capture totals (~25,000).

Little Fire Ant Perimeter Monitoring/Control and Eradication at MCBCB UTC, Guam

Location: MCBCB, UTC **Period of performance:** AUG2022 – Ongoing

Project Objective

Delimit targeted Little Fire Ant (LFA) infestations within MCBCB Urban Training Complex (UTC). Implement eradication protocols to eradicate this invasive species. Conduct post-treatment monitoring to evaluate treatment effectiveness. Implement early detection and rapid response (EDRR) surveys for long-term monitoring of the UTC perimeter.

Conservation Benefit

LFA pose significant threats to listed species. Eradication will benefit listed species directly as well as the habitat that supports them.

FY23 Status

- Awarded new Cooperative Agreement with Center for Environmental Management of Military Lands (CEMML)
- Delimited three (3) known sites (6,7, and 1) and two (2) new sites (9 and 10)
- Ongoing delineation surveys at known site 8 and implementation of informal consultation BO
- Commenced treatments at sites 6, 7, 9, 10, and perimeter of 1
- Awarded option year 1 (OY1) Cooperative Agreement modification

EPR: MCBCB Project

2019 JRM INRMP Reference: TIS-4

Feral Dog and Cat Control

Location: NMS **Period of performance:** SEP2021 - Ongoing

Project Objective

Remote sensing, live trapping and removal of target feral animals in sensitive habitats (remote wetlands).

Conservation benefit

The conservation benefits of the project are to a) protect and preserve habitats needed for sensitive species conservation and to b) provide response to incipient invasive and nuisance species populations to ensure no loss of moorhen species range.

FY23 Status

- IAA with USDA APHIS-WS
- Identify and remove feral cats and dogs in NMS wetlands
- Remote camera deployment identified 4 cats and 2 dogs
    - 3 cats removed/transferred to GAIN
    - 7 monitor lizards captured
- Current/Ongoing efforts
    - Remove lizards from habitat
    - Document stomach contents
- Continuous immigration due to open property boundaries
- USDA-APHIS WS report pending

Brown Treesnake Interdiction to Prevent the Spread Via the DOD Transportation Network Originating On Guam

Location: JRM **Period of Performance:** AUG2022 – Ongoing

Project Objective

To prevent the spread of BTS to other Pacific islands including the CNMI and Hawaii, this JRM project is funded to conduct BTS control and interdiction efforts on Navy Base Guam (NBG) and Andersen AFB (AAFB) to prevent snakes from getting into the DoD transportation network. Methods include BTS trapping, toxicants, nighttime visual fence line searches, and canine inspections of outbound items. The BTS Interdiction program also supports training events occurring in the region that originate from Guam. Joint Region Marianas develops BTS control and interdiction plans for each training exercise that requires the movement of personnel and assets to the CNMI from Guam. Additional BTS inspections and control measures are implemented in the CNMI when determined necessary by the stakeholders.

Conservation Benefit

Preventing the spread of BTS via the military transportation network keeps BTS on Guam and from establishing in other ecologically sensitive areas in the Pacific region where vulnerable island species would be susceptible to BTS predation.

FY23 Status

- Ongoing and enduring JRM requirement
- Interdiction support provided to four large military exercises inspecting over 1,400 items during FY2022
- Four missed inspections
- No BTS detected in outbound cargo

EPR: Project is funded by facilities maintenance dollars, no conservation funding for this project.

2019 JRM INRMP Reference: TIS-1; 5-84, TIS-1; 6-42; TIS-1; 7-51, TIS-1; 8-50, TIS-1; 9-70

Brown Treesnake Control at Mariana Swiftlet Caves

Location: NBG; NMS **Period of Performance**: OCT2018 – Ongoing

Project Objective

To provide long-term sustained protection for the Mariana Swiftlet (*Aerodramus bartschi*) from BTS predation. Protection consists of maintaining BTS control devices (bait tubes laden with toxicant-laced dead mouse baits) situated along transects that are 10 m apart at varying distances around swiftlet-occupied caves: Mahlac, Fachi, and Maemong.

Conservation Benefit

Project activities address two of the recovery criteria in the Amendment to the Recovery Plan for Mariana Islands Population of the Vanikoro Swiftlet (*Aerodramus vanikorensis bartschi*) (USFWS 2019) by protecting and managing roosting and nesting habitat and managing predation by BTS.

FY23 Status

- Ongoing project - renewed annually
- 30, 33, and 43 bait tubes at Fachi, Maemong, and Mahlac respectively
- Plan is to incorporate in-cave BTS removal efforts
- Concurrent project evaluating spatial configuration and baiting technique

EPR: 1 RP NBG Mariana Swiftlet Population Protection; 67155NR834: BTS Trapping

2019 JRM INRMP Reference: TIS-3; 6-43, TPS-4; 6-47

Developing a Framework for Coordinated Management of Vertebrate Restoration and Brown Treesnake Control on Guam

Location: JRM **Period of Performance:** SEP2021 – MAR2023

Project Objective

Furthering the development of a decision-analytic framework to guide BTS management and vertebrate species restoration on Guam. The project builds on the subject matter experts previous efforts building a decision model. The group are from management agencies, regulators, stakeholders, and scientific experts and uses a workshop model for the purpose of framework development.

Conservation Benefit

The decision model will help with planning for future conservation management decisions through an analytical process to enhance the planning phase. This includes prioritization, management application, problem solving, evaluating specific actions, and collaboration to manage costly, complex long-term conservation problems. The process should provide a more structured approach to addressing conservation challenges.

FY23 Status

- Pending status from Principle Investigator (USGS-CRU)
- Pending final report

EPR: 1 RP JRM Brown Tree Snake Eradication and Control to Support Recovery of ESA-Listed Species; 61128NR202

2019 JRM INRMP Reference: TIS-3; 9-72

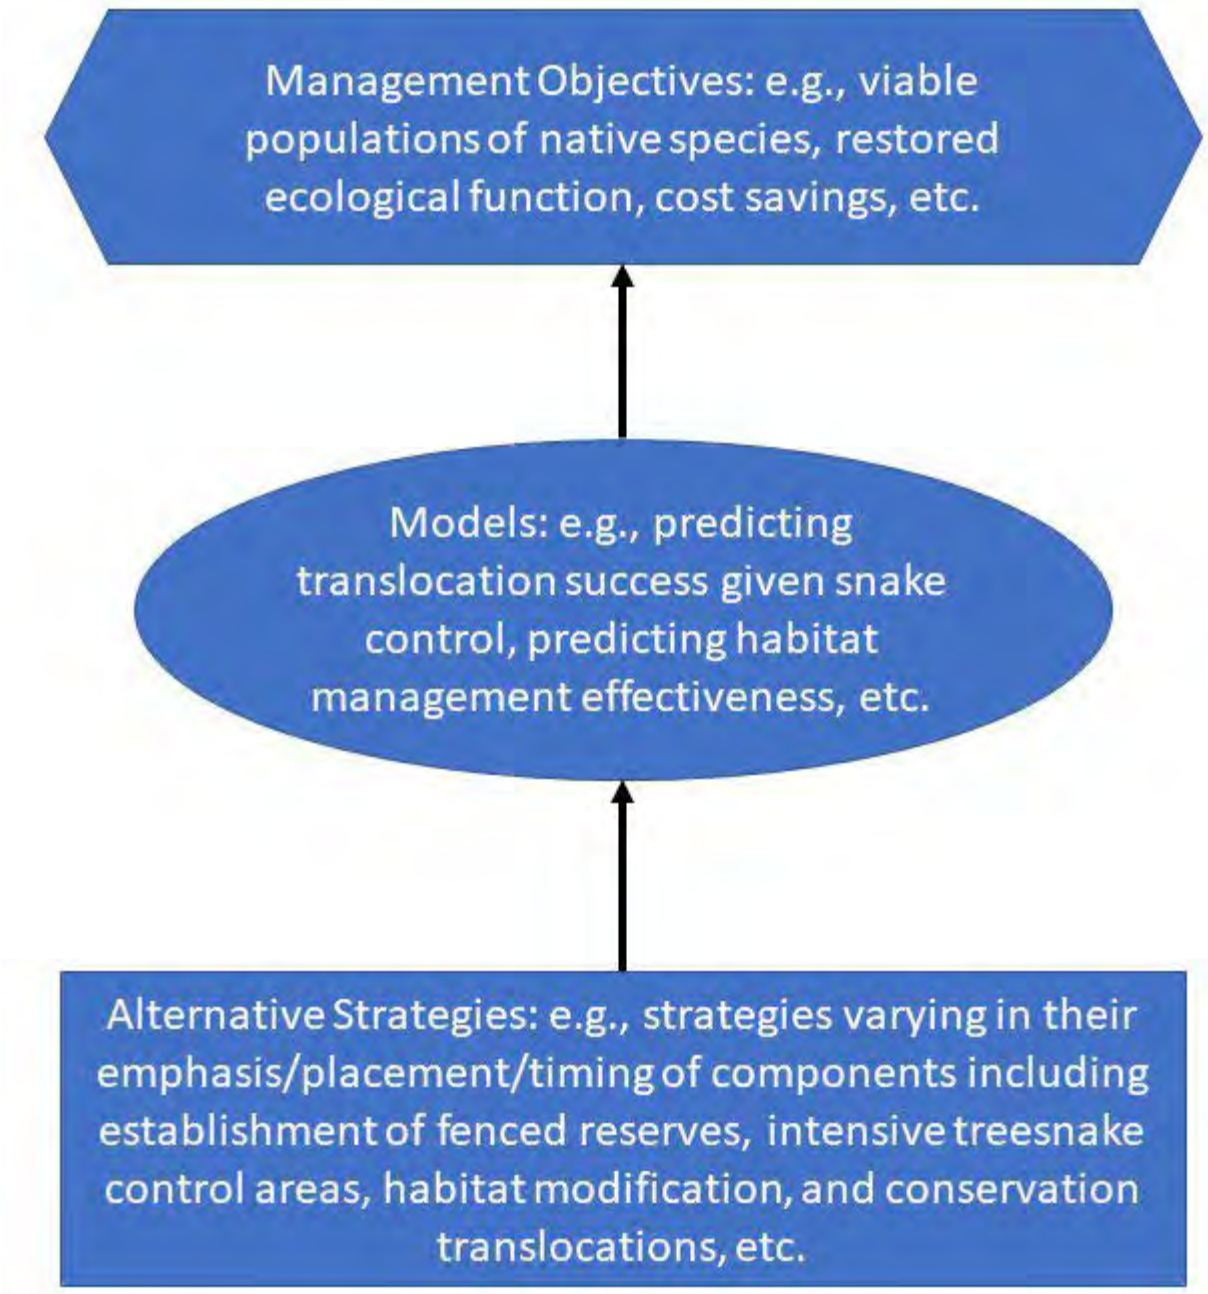

Figure 30. The three main components that form the core of a decision-analytic framework. These components include alternative strategies, models, and management objectives.

Dynamic Monitoring and Management of BTS

Location: JRM **Period of Performance:** JAN2022 – JUN2024

Project Objective

To identify a suite of combined monitoring and management alternatives for managers depending on the status of a target BTS population before and after treatments. With further objects of identifying thresholds where monitoring methods and management efforts shift in efficacy based on the existing/remaining population of BTS in a targeted management area. The project will also create a cost model and application to assess the cost of monitoring and management actions.

Conservation Benefit

Landscape-scale BTS management is predicted to incur substantial costs. Planning and management at scales of hundreds of hectares will require new tools and methods to plan and assess management efforts. The dynamic modeling for monitoring and management for BTS could help with cost efficient management and assist with a structured approach to BTS management decision making.

FY23 Status

- Collated and analyzed data sets from previous BTS projects (2009-2021)
- Developed an individual-based model (IBM)
- Consulting with experts about the model's realism and utility

EPR: 1 RP JRM Brown Tree Snake Eradication and Control to Support Recovery of ESA-Listed Species; 61128NR202

2019 JRM INRMP Reference: TIS-3; 9-72

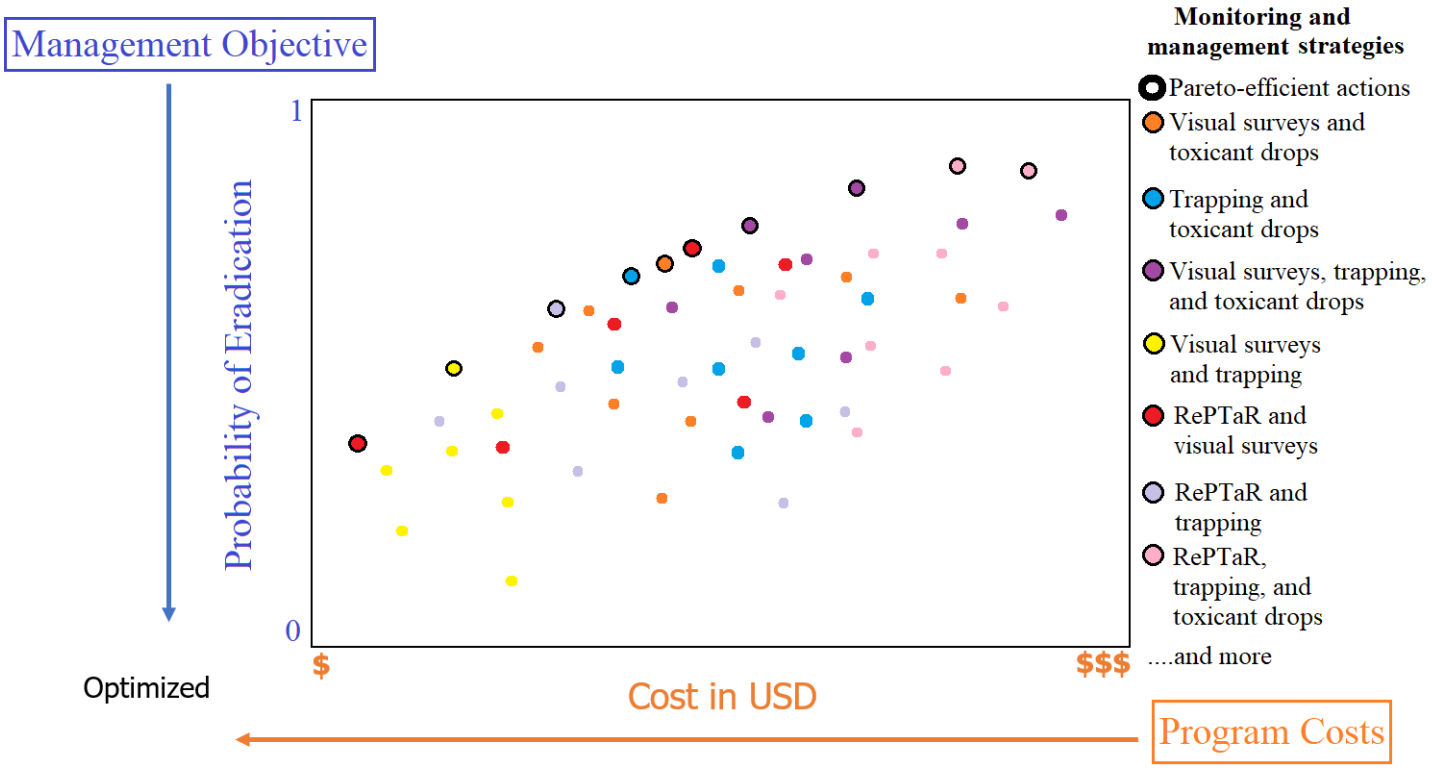

Figure 31. Hypothetical example of results from analysis of integrated monitoring and management strategies. The strategies that represent the best management outcome for a given cost, or the lowest cost for a given management outcome, are the Pareto-efficient strategies (bolded points).

Adaptive Management of BTS to Support Landscape-scale Suppression for Vertebrate Recovery Goals

Location: JRM **Period of Performance:** SEP2022 – MAR2024

Project Objective

To determine if the baiting program at the swiftlet-occupied caves are effective at suppressing the BTS population around the cave and whether integrating chick bait into the program may reduce BTS captures in the cave. Tasks include: 1) determining whether an alternative bating structure expands the suppression zone surrounding swiftlet caves; 2) comparing BTS take rates of chick and mouse baits staged in close proximity to caves, including a specific investigation of bait take by snakes known to have entered caves; 3) monitoring a subset of bait stations fitted with camera traps at set distances along transects from cave openings to measure relative take rates of baits; and 4) conducting in-cave visual surveys to detect decline in BTS captures through time.

Conservation Benefit

Swiftlet protection is a long-term effort that helps support goals of the swiftlet recovery plan. Since mid-2018 it has been 100% toxicant-based control, and while slightly more effective than trapping, the impacts to BTS have not been adequately assessed. Additionally, a better understanding of BTS population dynamics near a rich prey base needs to be improved. The data collected will inform future BTS management strategies in and around the swiftlets cave. Improved BTS population data will inform future conservation efforts for listed species on Guam.

FY23 Status

- Currently baits alter between chicks and mice
- 20 bait tube stations are being monitored per cave

EPR: 1 RP NBG Mariana Swiftlet Population Protection: BTS Trapping; 67155NR834

2019 JRM INRMP Reference: TIS-2; 6-43

Tracking Movement of Micronesian Starlings and Brown Treesnakes on AAFB with an Automated Telemetry Tracking Network

Location: AAFB **Period of Performance:** JAN2022 – JUN2023

Project Objective

To track the movement of Micronesian starlings (Aplonis opaca [Sali]) and BTS on AAFB to identify areas of high use and routes of transit through a network of automated telemetry towers, and to document areas where BTS and Sali may interact. This project is one of four projects that, collectively, will further develop information on BTS behaviors related to predation and movement in the presence of abundant avian species.

Conservation Benefit

Tracking animals across the landscape over time can provide important information on habitat selection, resource needs, and factors influencing distribution and density. For a predator such as BTS, tracking movement can provide information on hunting patterns, dispersal potential, and identify areas that may be particularly susceptible to predation. Overlapping simultaneous movement from both predators and their prey can help identify areas of greatest contact, which may vary spatially and temporally. Additionally, population demographics that could be useful for supporting future avian restoration projects and controlling BTS in low density with competing food sources in the presence of control regimes.

FY23 Status

- Tracked 35 BTS for a median of 61 days and a median of nearly 60,000 detections per individual
- Estimated that the BTS tracked predated large (Sali size) animals 1.4 times every 30 days
- Tracked 65 Sali fledglings for 2 days
- Pending final report

Evaluating and Reducing Brown Treesnake Predation Threat in Urban Micronesian Starling Habitat

Location: AAFB **Period of Performance:** SEP 2019- JAN 2023

Project Objective

To evaluate and understand the effects of suppression of BTS on Micronesian Starling survival and habitat use on AAFB and to develop a strategy for urban BTS control to improve biosecurity and human quality of life. Tasks include: 1) assessing bait and lure preference in urban areas and 2) performing intensive, sustained removal of BTS in experimental plots, to test the effects of lethal BTS control on the survival of Micronesian starling fledglings. This project is one of four projects that will, collectively, further develop information on BTS behaviors related to predation and movement in the presence of abundant avian species.

Conservation Benefit

Previous studies on AAFB have demonstrated that snakes in the housing area are having a pervasive impact on Micronesian Starling survival at all age classes. Snakes in these urban areas also constitute a greater risk for accidental export of live snakes to other vulnerable regions because shipments of household goods are routine. Additionally, previous research has shown that very large snakes, which pose the greatest predation and reproduction risk, are more often found in urban areas. For these reasons, it is important to begin to consider BTS risk mitigation in urban habitats.

FY23 Status

- Final Report provided June 2022
- No difference among take rates for bait types
- Little human or non-target risk from acetaminophen baiting
- Chicken chick and rodent baits used for removal efforts (2020-2021)
- Iowa State found no statistical indication of increased survival time in treated vs untreated areas

EPR: 1 RP JRM BTS Eradication and Control to Support Recovery of ESA- Listed Birds

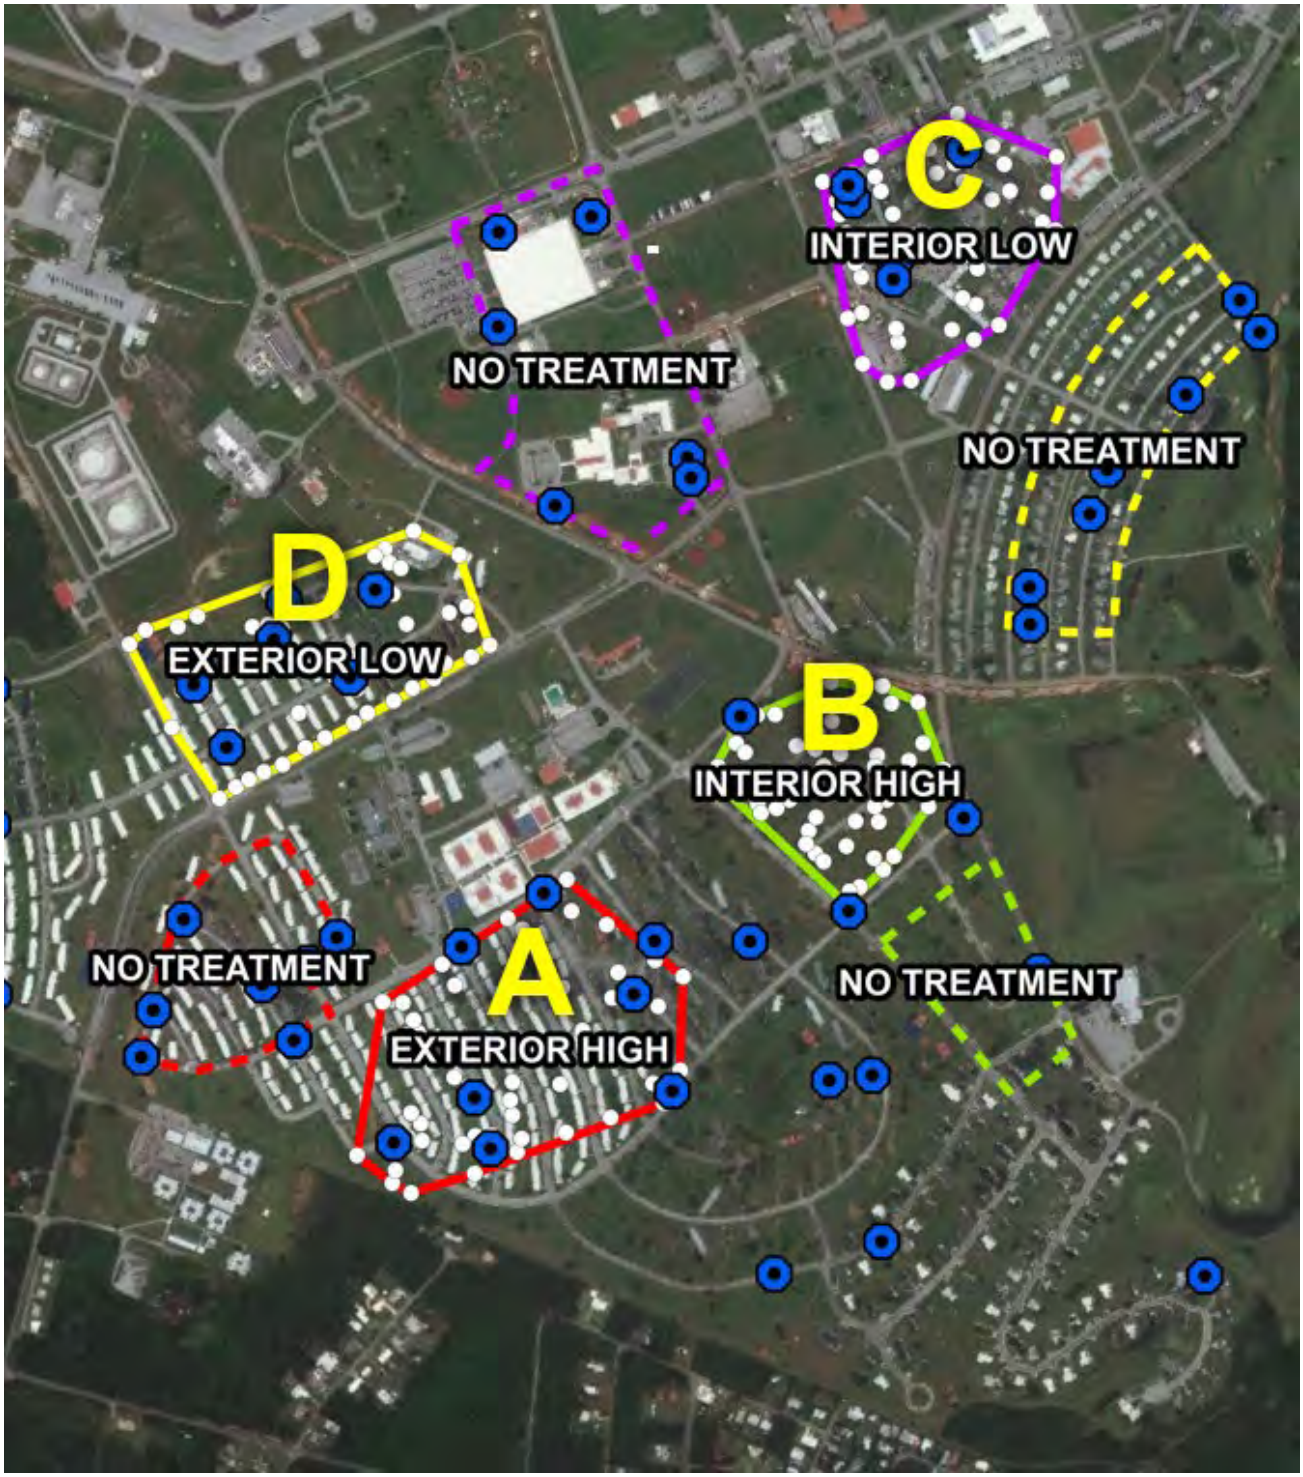

Figure 35. Locations of plots treated with acetaminophen (solid borders) and matched untreated control plots (dashed borders). Plots were characterized by combinations of two factors: High or Low snake density and Interior or Exterior location with respect to forested boundaries. Plots were assigned letters A-D for convenience of reference. White points within treatment areas depict locations of 50 bait tubes per plot. Blue points represent locations of Micronesian Starling artificial nest boxes. Source: USDA-NWRC

Spatial and temporal interactions of Brown Treesnakes and the endangered Mariana Swiftlet on the Naval Munitions Site (NMS)

Location: NMS **Period of Performance:** SEP2023 – FEB2025

Project Objective

To determine predation pressure, as well as gain a practical understanding of how snakes access nests, setting the stage for better control efforts targeted at BTS in and around occupied swiftlet caves. Tasks include: 1) Develop and deploy camera system in swiftlet caves to document spatial and temporal interactions of BTS and swiftlets. 2) Develop computer vision algorithms for detection of BTS in caves recorded by camera system. 3) Map locations of key BTS and swiftlet interactions and estimate predation pressure. 4) Create 3-Dimensional digital maps of NMS caves.

Conservation Benefit

Project activities address two of the recovery criteria in the Amendment to the Recovery Plan for Mariana Islands Population of the Vanikoro Swiftlet (Aerodramus vanikorensis bartschi) (USFWS 2019) by protecting and managing roosting and nesting habitat and managing predation by BTS.

FY23 Status

- New project for FY23
- USGS-PIERC is in the process of updating USFWS Recovery Permit
- Coordinating with USGS and CEMML to obtain info on spatial locations of snakes during in-cave searches
- No data available at this time

EPR: 1 RP NBG Mariana Swiftlet Population Protection; 67155NR834

2019 JRM INRMP Reference: TIS-2; 6-43.

Aerial Baiting Operations and Ground Support for Suppression in the HMU, AAFB

Location: AAFB **Period of Performance**: MAR2022 – AUG2023

Project Objective

To provide operational helicopter support, including a pilot, mechanic, technical support, and post-drop data collection and monitoring of bait drops during aerial baiting applications within the Habitat Management Unit (HMU), AAFB.

Conservation Benefit

The development and performance of aerial delivery system for BTS suppression, demonstrates the potential for meaningful impacts on BTS populations at the landscape level. Dropping aerial baits in the HMU will provide data and insight into BTS responses to aerial baiting over time. Aerial baiting increases the amount of landscape targeted for BTS suppression and control. Landscape level control would likely improve JRM conservation efforts in support of the recovery of listed species on JRM lands and assist with interdiction efforts.

FY23 Status

- Two bait applications every three (3) months
- 108 bait tube transects for a total of 1,080 bait tubes
- Live lure contact rates with camera platforms
- Two (2) fruit bats observed before baiting operations and zero (0) during aerial baiting operations

Aerial and Ground-Based Brown Treesnake Control on Fenced and Unfenced Landscapes to Evaluate Suppression and Eradication Feasibility

Location: AAFB; MCBCB **Period of Performance:** SEP2022 – JAN2024

Project Objective

To provide ground-based brown treesnake control (BTS) and monitoring of aerial baiting application impacts within the Northern Forest Enhancement Site (N-FES), Marine Corps Base Camp Blaz (MCBCB), and the Habitat Management Unit (HMU), Andersen Air Force Base (AAAFB). The project will use a multi-tool approach towards eradication in the HMU, and determine achievable levels of suppression in an unfenced area (N-FES).

Conservation Benefit

The development and performance of aerial delivery system for BTS suppression, demonstrates the potential for meaningful impacts at the landscape level, however, studies are showing that a multi-tool approach is likely necessary to remove larger snakes. Eradication in the HMU would create a BTS free environment to support future vertebrate conservation efforts. Determining levels of suppression in an unfenced area will provided insights in the feasibility of true landscape-scale management for BTS. Landscape level control would likely improve JRM conservation efforts in support of the recovery of listed species on JRM lands and assist with interdiction efforts.

FY23 Status

- Multi-agency project: USGS-PIERC, USDA-NWRC, USDA-WS
- Typhoon Mawar halted field work in HMU
- Established 4 km of transects in NFES for trapping and surveys
- Completed baseline (pre-treatment) data collection
- Commenced aerial baiting at NFES on Aug 7 and Aug 10

EPR: No EPR - Guam Micronesian Kingfisher MOA funds.

2019 JRM INRMP Reference: TIS-1, TIS-2, TIS-3; 5-85, 6-43; 7-52, 8-50-51, 9-71

The red polygon indicates the boundary of the Caiguat study area and the yellow polygon delineates the 60-ha aerial baiting area. White lines indicate the 4 transects loops. Triangles indicate snake locations pre-typhoon, and circles indicate locations post-typhoon. Source USGS-PIERC/USDA-NWRC.

Trial Restoration and Probabilistic Evaluation of Vertebrate Reintroduction Techniques Using Species Traits in a Barrier Undergoing a BTS Eradication

Location: AAFB **Period of Performance:** SEP2020 – APR2023

Project Objective

Project seeks to develop a conceptual demographic model for reintroduction strategies. Using three unlisted native lizard species *Nactus pelagicus* (Pacific slender-toed gecko), *Perochirus ateles* (Micronesian saw-tailed gecko), and *Gehyra oceanica* (Oceania gecko), the objective is to develop a predictive response model to BTS predation based on species traits e.g., reproduction, habitat preference, behaviors, sensitivity to predation, etc. Once a model is built, a release strategy will be developed for hard and soft releases in plots controlled and uncontrolled for BTS. Success is to be defined under the following two criteria: evidence of reproduction (juvenile lizards detected) and persistence of the species > 6 months following release.

Conservation Benefit

For reintroductions to occur, managers on Guam will need to understand if species 1) require snake eradication to establish or what level of suppression is required for establishment to occur and 2) snake abundance thresholds that support persistence of prey species. Some of these metrics are likely to be dependent on the desirability of the species as a prey item and therefore their sensitivity to snake abundance. The use of native lizards presents a relatively safe species to study and inform decisions. In a system with numerous unknowns, their benefits include only small areas to establish populations, are not a federally listed species, have species with high variation in sensitivity to BTS predation, and could be used as a monitoring metric/tool to evaluate BTS suppression actions and inform reintroduction goals.

FY23 Status

- Utilized simulation model to evaluate viability of re-introduction strategies
- Controlled BTS (2017-2023); Translocated lizards (2021-2022)
- Introduces concept of “functional eradication”
- Oceania gecko persisted 19 months after release, Green anole persisted 17 months after release, and Pacific slender toed gecko only persisted 5 months after release

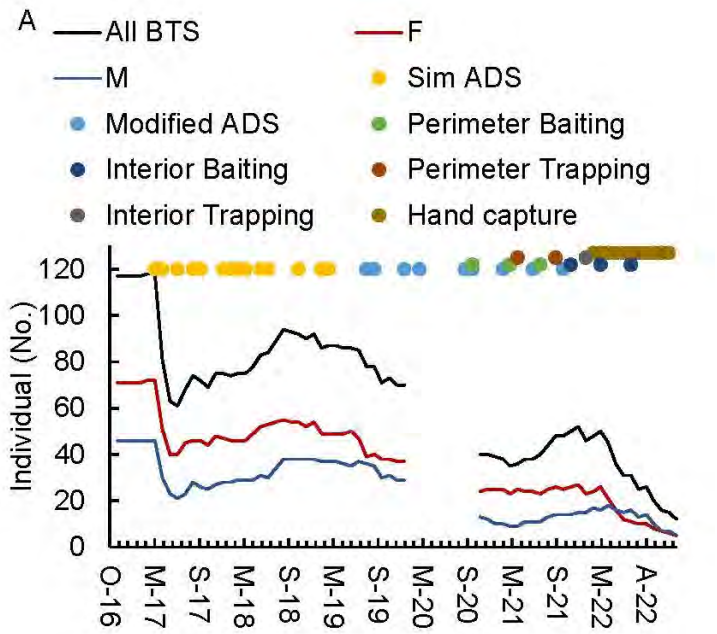
Evaluating the Effect of Bait Size and Species on Removal of BTS That Are Not Susceptible to ADS Control

Location: AAFB **Period of Performance:** JUL2020 – SEP2022

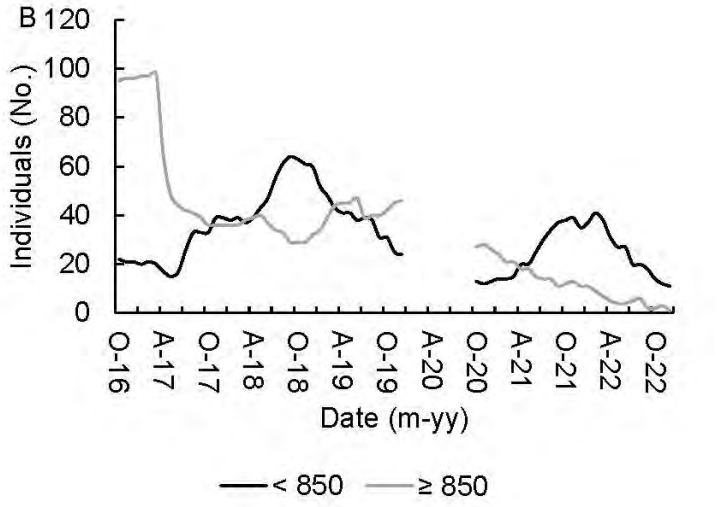
Project Objective

To evaluate a multi-tool/multi bait approach to eradicating a small, known population of BTS in the Closed Population area on AAFB. The project will use a phased approach continuing with replicating aerial baiting (suspending baits form vegetation); adding a perimeter of larger rodent and bird baits in bait tubes; and use live bird and rodent lures. The baits will have transmitters to track the fate of the snakes. The same approach will be taken within the interior of the Closed Pop to analyze for any spatial effects. As the population of BTS within the Closed Pop is known, following the impacts by the multi-tool approach to provide useful data towards improving BTS suppression and eradication within enclosures.

Conservation Benefit



Aerial baiting can distribute bait across the landscape quickly but we still do not have enough data to state conclusively if eradication is achievable. Aerial baiting is the only method used to attempt suppression/eradication of BTS in the HMU. Data projections indicate aerial baiting alone may not be enough to meet the goal of eradication. This is, in part, due to a sub-set of the BTS population not consuming bait (too small/too large). The ability to better target all size classes of BTS with a complex of control tools could help achieve eradication within enclosures but also may provide a substantial benefit to recovery of listed species by severely suppressing the BTS population to allow population recruitment to stay ahead of predation.



FY23 Status

- Utilized multiple tools for BTS eradication effort (2016-2022)
- Reduced BTS by 95% (117 individuals to an estimated population size of 6)
- ADS greatest rate of removal per days of treatment
- Target removals not met until live avian lures were deployed
- Evaluated functional prey response following predator control

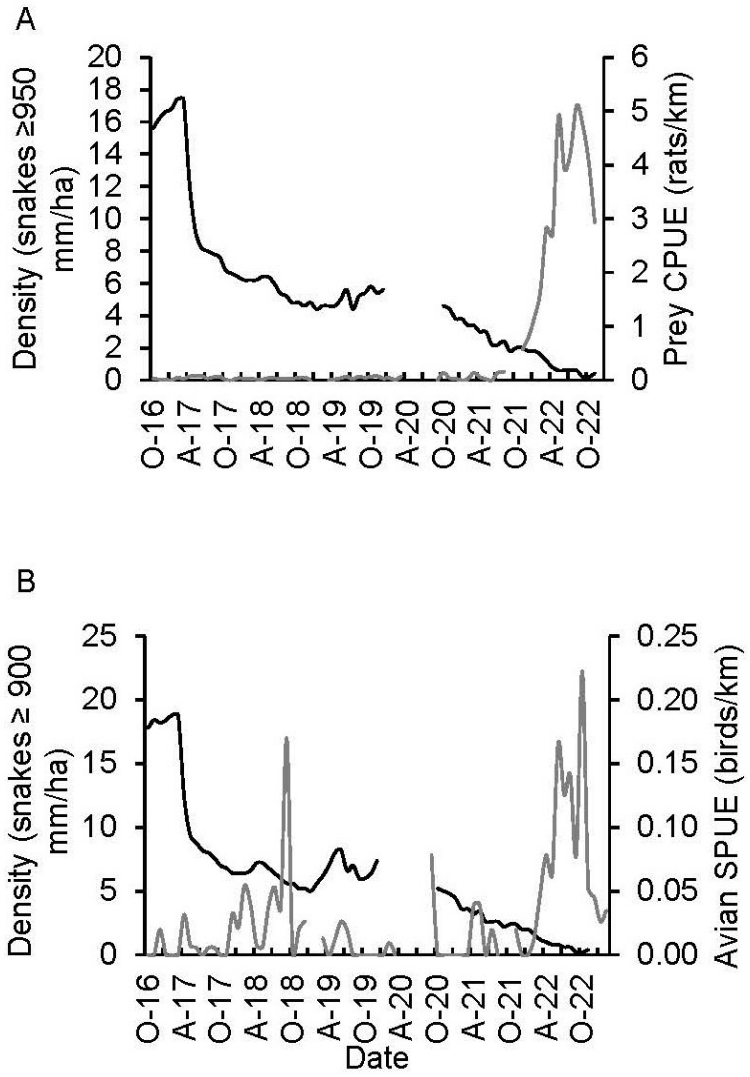

Figure 39. A) The number of total, male, or female BTS (A) and the number of specific size classes (B), including juvenile snakes (< 850 mm snout vent length (SVL, mm), control tool susceptible snakes (≥ 850 mm SVL), and reproductively mature (≥ 1050 mm SVL) snakes in a 5-ha enclosure from October 2016 – December 2022 at monthly intervals. Throughout the course of the period the population was subjected to a series of management actions to remove snakes that increased in complexity including simulating the Aerial Delivery System (sADS), a modified version of the ADS with larger ground baits (mADS), placement of mixed species (rodent and bird) toxic baits in bait canisters during perimeter and then interior placement, live trapping using mouse and finch lures during perimeter then interior placement, followed by hand capture during nocturnal surveys. b) The density of BTS by specified snout-vent length (SVL) in a 5-ha enclosure from October 2016 – November 2022 relative to the number of rats (A) or birds (B) counted (CPUE) during nocturnal surveys in the enclosure over the same period of time. Weekly surveys yielded snake counts throughout a 6-year removal program that cycled through three phases of control to determine if avian recovery in an area enclosed by a snake barrier could yield avian recovery. Source: USGS-PIERC

Identifying & Refining Tools for Landscape-scale Detection, Removal, and Monitoring of Brown Treesnakes

Location: AAFB **Period of Performance**: AUG2022 – JAN2024

Project Objective

To evaluate tools and methods for BTS control and monitoring including improving the effectiveness and reducing the costs of tools for BTS suppression and monitoring. Tasks include 1) evaluating whether abiotic factors such as moonlight, temperature, humidity, and rainfall affect BTS activity levels; 2) assessing whether BTS produce recognizable images in thermographic cameras and can improve detection in the environment; 3) evaluating a variety of market available cameras to help standardize technology and reduce costs; 4) continuing genetic evaluation of acetaminophen impacts to avian species.

Conservation Benefit

Brown treesnakes are difficult to detect and manage. Current standard tools i.e., visual surveys, camera traps can be improved with improve/alternate technology e.g., thermal, infra-red, night-vision, however, this technology needs to be properly evaluated to determine suitability and methods improvement. Deploying multiple cameras in the field is expensive and finding low-cost models with similar image quality is an important cost reduction. Data are available on abiotic factors such as moonlight, humidity, and rainfall, but the influence of these factors on BTS activity has not been evaluated. Knowing movement related to weather and moonlight could help refine management techniques. Collecting further data on acetaminophen impacts to avian species is important to improving predictions to which bird species on Guam may be sensitive to acetaminophen, where testing potential species for reintroduction is not feasible.

FY23 Status

- Hired personnel and purchased equipment
- Commenced evaluating effects of weather and moonlight on movement of fed and unfed snakes
- Commenced gene expression for metabolism of acetaminophen in non-target birds

EPR: No EPR number, funded with DPRI funds for Marine Relocation

2019 JRM INRMP Reference: TIS-2, TIS-3; TPS-6, 5-85, 6-43; 7-52, 8-50-51, 9-71, 9-77.

Figure 40. Twelve wide-angle trail cameras acquired for comparison

Optimization and evaluation of ground-based Brown Treesnake removal tools

Location: AAFB **Period of Performance**: JUN2023 – NOV2024

Project Objective

To evaluate and adapt existing and new BTS control and monitoring tools. Tasks include 1) adaptation and optimization of cage traps with live lures; 2) evaluation of a self-resetting multi-kill trap; 3) evaluation of a nontarget-proof bait station; and 4) presentation of an alternative ground-based toxic bait station (hanging bait station).

Conservation Benefit

Current tools for ground-based management of BTS i.e., standard traps with mouse lures and PVC-tube bait stations can be enhanced with improved/alternate technology e.g., traps with live bird lures, elevated traps, self-resetting multi-kill traps, and nontarget-proof bait stations however, this technology needs to be properly evaluated to determine performance and effectiveness. If effective, new inexpensive control tools could be adopted to increase nontarget exclusion and BTS capture rates. Live trapping is labor intensive, as they need to be visited regularly to remove snakes for euthanasia, while kill traps automate immediate euthanasia and reset for future kills. Additionally, nontarget consumption of baits in PVC tubes negatively impacts BTS control efforts, by interfering with baits making them unavailable for BTS and by increasing uncertainty in the numbers of snakes removed when consumption by a BTS can't be confirmed.

FY23 Status

- New project for FY23
- No data available at this time

EPR: 1 RP JRM Brown Tree Snake Eradication and Control to Support Recovery of ESA-Listed Species; 61128NR202

2019 JRM INRMP Reference: TIS-2, TIS-3; TPS-6, 5-85, 6-43; 7-52, 8-50-51, 9-71, 9-77.

When to declare eradication: Evaluating search effort required to declare eradication if detection is density dependent

Location: MCBCB **Period of Performance**: JUN2023 – NOV2024

Project Objective

To complete the eradication in Closed Population (CP) and determine the level of search time or effort required to declare a bounded, forested area eradicated. Tasks include: 1) Continuing snake removal efforts in CP and monitoring reintroduction outcomes; 2) Quantifying whether capture probability is density dependent; and 3) Determining search effort required to declare eradication in low density locations.

Conservation Benefit

Data will be essential in informing managers when they can declare BTS eradication based on a pre-determined level of acceptable risk in making an incorrect decision. There has been a significant investment in assessing whether BTS eradication can occur within bounded areas, such as the Habitat Management Unit, using ADS in combination with other suppression techniques. However, a major hurdle for managing BTS remains within their low capture probabilities. Whether eradication is possible or not, a matter that will be important in the final assessment of feasibility is the duration and intensity of monitoring required to declare eradication a success.

FY23 Status

- New project for FY23
- Complimentary OIA proposal to introduce sterilized snakes to tests strategies for control in a snake-suppressed landscape with high prey availability
- No data available at this time

NATURAL RESOURCES EDUCATION AND OUTREACH

Natural Resources Education and Outreach at NBG

Location: NBG Period of Performance: AUG2023 – AUG2024

Project Objective

This project focuses on education, outreach, and awareness to DoD uniformed staff and civilian staff, their dependents, contractors, school students, and the general public. The objectives are to develop, design, and produce customized outreach folders, stickers, posters, and booklets for use and distribution on NBG. The goal is for targeted audiences to be informed of protected marine species on JRM-submerged lands at NBG, including *Acropora globiceps*, oceanic whitetip shark (*Carcharhinus longimanus*), scalloped hammerhead shark (*Sphyrna lewini*), green turtle (*Chelonia mydas*), and hawksbill turtle (*Eretmochelys imbricata*). Educational materials will include: species characteristics, behavior, and habitat; conservation measures; federal and local regulations; and/or best practices.

Conservation Benefit

The conservation benefit of this project is to ensure no loss of marine species range, particularly those protected on JRM-administered lands at NBG. This project supports the USMC Relocation 2017 BO, which contains amendments to the 2015 BO (USFWS 2017).

FY23 Status

- POP: AUG 2023 to AUG 2024
- Promote environmental education and awareness
- Focus on ESA-listed marine species
- Target audience: DoD personnel, families, contractors, students
- Design, develop: posters, booklets, stickers, folders

EPR: Threatened and Endangered Species Outreach Signage; 61755NR305; Listed Species Outreach Materials; 61755NR306

Outreach and Education – NBG

Location: NBG **Period of Performance:** SEP 2022 - Ongoing

Project Objective

Develop, design, and produce custom outreach materials for use by Public Works EV and NBG to educate incoming military personnel, their families, and civilian employees on the importance of conserving and protecting natural resources.

Conservation Benefit

Educational material provides military and civilian personnel and base visitors the ability to understand their role in protecting Guam resources.

FY23 Status

- NRMAC FY2022 with Sundance EA (awarded end of FY2022)
  - 60% completed with production of 2 to 4 minute outreach video for use across JRM AOR
  - No Cost Extension through December 2023 to account for delays from Typhoon Mawar

EPR: Listed Species Outreach Material; 61755NR306

2019 JRM INRMP Reference: TEDU-1; 5-91, MEDU-1; 5-104

JRM Natural Resources Stewardship Outreach & Public Engagement Program

Location: JRM **Period of Performance**: VARIOUS

Project Objective

To develop outreach products to effectively and efficiently implement a NR stewardship engagement program. This program aims to better educate uniformed and civilian staff, their dependents, JRM contractors, and the general public in order to improve NR stewardship and awareness within JRM AOR.

Conservation Benefit

The development and production of NR education materials and training is a beneficial support to increasing awareness of T&E species, proper stewardship behavior, and threats to local ecosystems.

FY23 Results

- Closed FY2022 CESU with Micronesian Conservation Coalition
  - Completed Public Access Plan (PAP) site descriptions and photos
  - Completed 360 degree camera photos of 3 PAP sites to be featured on Environmental Stewardship Website
  - Final report available
- NRMAC FY2022 with Sundance EA (awarded end of FY2022)
  - 60% completed with production of 2 to 4 minute outreach video for use across JRM AOR
  - No Cost Extension through December 2023 to account for delays from Typhoon Mawar
- New CESU Awarded AUG2023 to UOG SeaGrant
  - Continuing production of Environmental Stewardship Website
  - Continuing production of outreach swag items to support Tinian Art Contest and Turtle Educational Outreach Project
  - Planning and Implementation of Tinian Art Contest and Turtle Educational Outreach Project

EPR: 61128NR962 JRM Natural Resources Stewardship Outreach and Public Engagement Program

PACFLT Funded JRM Natural Resources Stewardship Outreach & Public Engagement Program

Location: JRM **Period of Performance:** SEP2020 - Ongoing

Project Objective

Improve NR stewardship and awareness within JRM AOR.

Conservation Benefit

The development and production of NR education materials and training is a beneficial support to increasing awareness of T&E species, proper stewardship behavior, and threats to local ecosystems.

FY23 Results

- Ongoing implementation and expansion of Young Environmental Stewards (YES!) youth educational program
- Ongoing CNMI outreach initiative in conjunction with EPR 61128NR962 JRM Natural Resources Stewardship Outreach and Public Engagement Program
- Native Terrestrial Species and Migratory Bird Nature Journals and Passports delivered OCT2022
- Final version of Invasive Terrestrial Nature Journal and Passport approved JUL2023, currently in production
- Marine Invasive Species Nature Journal and Passport in draft review
- Ongoing development of sea turtle interactive classroom game

EPR: NA- Funding from PACFLT Stewards of the Sea Initiative

MIGRATORY BIRD MANAGEMENT

Migratory Bird Surveys on NBG-Administered Lands

Location: NBG; NMS **Period of performance: SEP2022 – AUG2023**

Project Objective

Conduct monthly bird surveys on NBG-administered lands; examine trends in abundance and habitat preference of migratory birds.

Conservation benefit

To improve long-term understanding of species protected by the MBTA and their preferred habitats and migratory patterns, in support of military readiness, and to avoid and minimize impacts to migratory birds.

FY23 Status

- Bird abundance was monitored at 18 NBG/NMS sites
- Bi-monthly surveys during nesting season
- 45 in-house surveys conducted
- Common occurrence of golden plovers, ruddy turnstones, brown noddies, and whimbrels.
- Migrants prefer grass fields and paved surfaces

EPR: In-house only

2019 JRM INRMP Reference: MIG-1, 5-90; MIG-1, 6-48; MIG-1, 7-40

TERRESTRIAL HABITAT MANAGEMENT

Carbon Stock Assessment, Restoration Planning, and Monitoring of Ecosystems at NBG

Location: NMS, NBG **Period of Performance:** JUL2023 – JUL2028

Project Objective

This project focuses on assessing and understanding baseline and long-term carbon storage of upland vegetation, wetlands, mangroves along the coastline, and seagrass at NBG. This project covers the carbon sequestration element of prior and ongoing terrestrial habitat management actions to enhance watershed habitats, particularly through the installation of vegetation in an effort to reduce runoff/siltation and protect the reef. The expected outcomes of this project include: total carbon stock estimates by ecosystem/habitat type; carbon stock change over five years by habitat type; spatial extent, health, biodiversity and productivity of seagrass; and habitat suitability model for seagrass beds to inform restoration.

Conservation Benefit

The conservation benefits of project include: (a) protect and manage sufficient habitats by identifying landscapes and nearshore habitat needed for species conservation; (b) maintain ecological function, services, and diversity through management focused on maintaining and restoring marine and terrestrial ecosystems; and (c) ensure self-sustaining, resilient populations to include the use of novel techniques in the adaptive management of species populations.

FY23 Status

- Interagency Agreement with USGS WERC
- POP: JUL 2023 to JUL 2028
- SEP/OCT 2023: Planning/scoping meeting
- Carbon storage: upland vegetation, mangroves, seagrass
- Seagrass monitoring and restoration plan

EPR: Soil and Water Conservation: Erosion Management – Carbon Sequestration; 61755NR832

Listed Plant and Invertebrate Surveys 1

Location: NMS; AAFB; Off-DoD **Period of Performance:** AUG2019- Ongoing

Project Objective

To conduct surveys for ESA-listed plant and invertebrates. Information collected adds to the baseline data for each the species.

Conservation Benefit

Identifying locations of ESA-listed plant and invertebrate species will allow for management actions to reduce habitat fragmentation, enhance and restore habitat, buffer protected areas, and implement new conservation strategies.

FY23 Status

- Acres surveyed AAFB NWF(173), NBGNMS (110), South FES (187), South Taguac (135)
- Species found: *Bulbophyllum guamense, Cycas micronesica, Dendrobium guamense, Tabernaemontana rotensis*, and *Tuberolabium guamense*

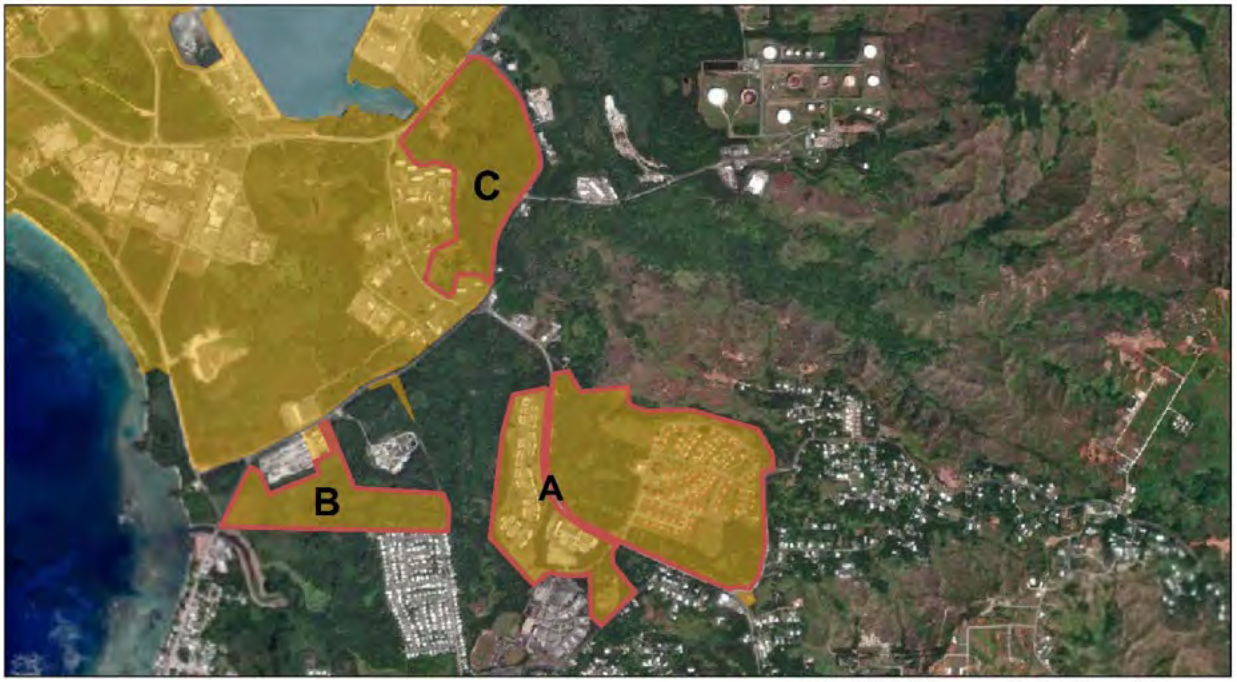
Listed Plant and Invertebrate Surveys 2

Location: NMS **Period of performance:** JUL2023 - 2024

Project Objective

To conduct surveys for ESA-listed plant and invertebrates. Information collected adds to the baseline data for each the species.

Conservation benefit



Identifying locations of ESA-listed plant and invertebrate species will allow for management actions to reduce habitat fragmentation, enhance and restore habitat, buffer protected areas, and implement new conservation strategies.

FY23 Status

- Surveys ongoing in NBG at Apra Heights (118 acres), Tenjo Vista (209 acres), NBG main base (92 acres), and NBGNMS training area (208 acres)
- Additional monitoring of naturally occurring ESA-listed epiphytic orchids at NBGNMS that were previously monitored in wet and dry seasons in 2020-2021

EPR: Listed plant surveys, Propagation, planting, and Establishment in the Wild; 61128NR209 (Surveys at all locations except Tenjo Vista and orchid monitoring) and 1 S MAR NBG MBTA and ESA-Listed Species Surveys; 61755NR142 (surveys at Tenjo Vista)

Forest Restoration Plan Implementation- Forest Restoration Unit (FRU) 2

Location: NMS **Period of Performance:** SEP2017 – DEC2022

Project Objective

To manage invasive species within the FRU 2 and restore native habitat.

Conservation Benefit

Increasing native forest habitats would improve native species survival, particularly threatened and endangered species, enhance native habitat for listed animals, increase the biodiversity of native species, and contributes to the connectivity with surrounding communities in ways that support improved ecosystem functionality. It also contributes to the goals of the Guam NWR as an overlay unit the NMS.

FY23 Status

- Final report received December 2022

EPR: SIKES MAR NBG Native Forest Habitat Restoration – Climate; 61755NR856

2019 JRM INRMP Reference: THM-2; 6-39

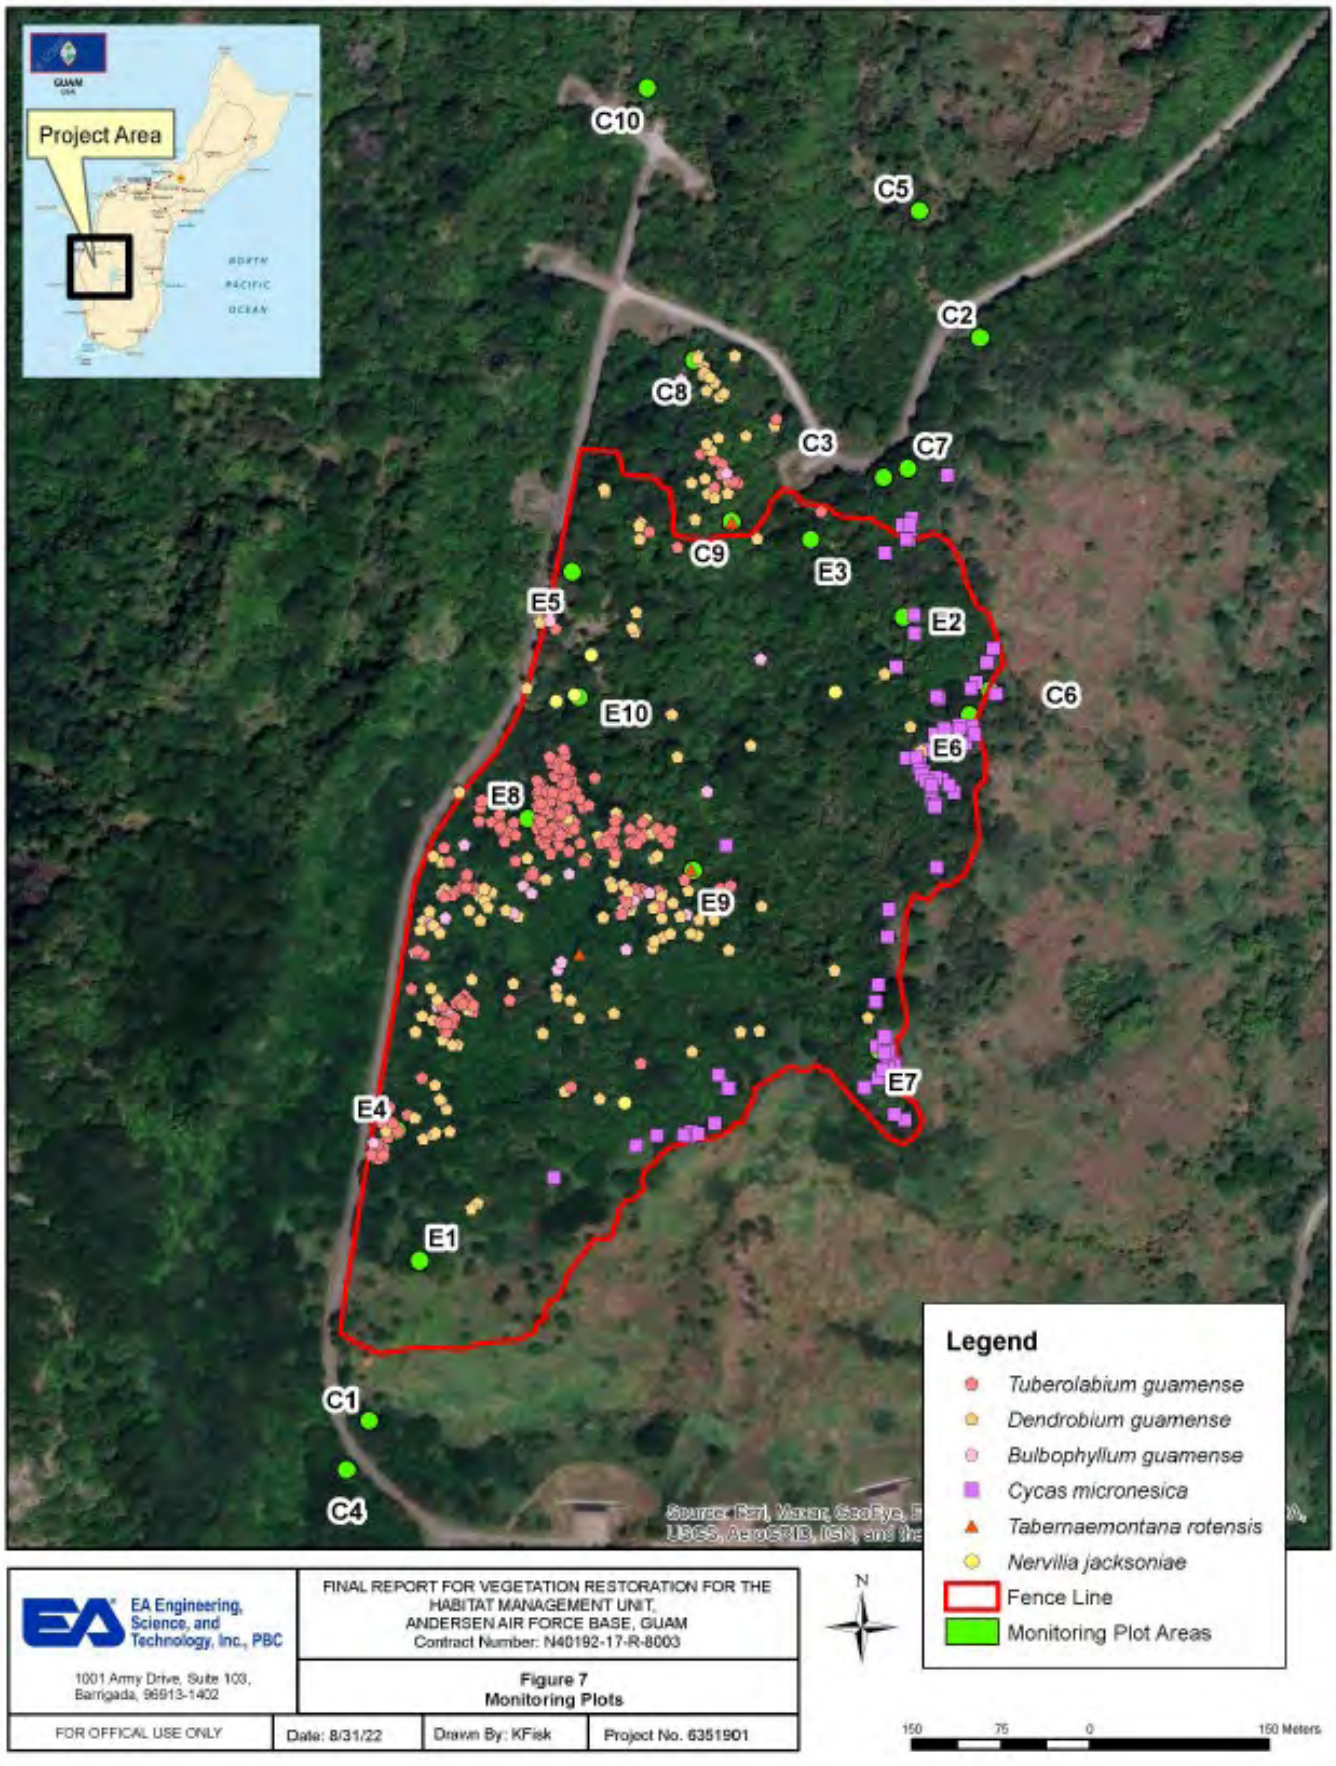

Figure 50. Monitoring plot locations

Vegetation Restoration on NBGNMS

Location: AAFB **Period of Performance:** JUL2023 - 2024

Project Objective

To reduce invasive species within the Forest Restoration Unit 2 (FRU2) and increase native plant species

Conservation Benefit

Increasing native forest habitats would improve native species survival, particularly threatened and endangered species, enhance native habitat for listed animals, increase the biodiversity of native species, and contributes to the connectivity with surrounding communities in ways that support improved ecosystem functionality. It also contributes to the goals of the Guam NWR as an overlay unit the NMS.

FY23 Status

- Project awarded in July 2023
- Seed collection and propagation ongoing

EPR: SIKES MAR NBG Native Forest Habitat Restoration – Climate; 61755NR856

2021 JRM INRMP Reference: THM-2; 6-39

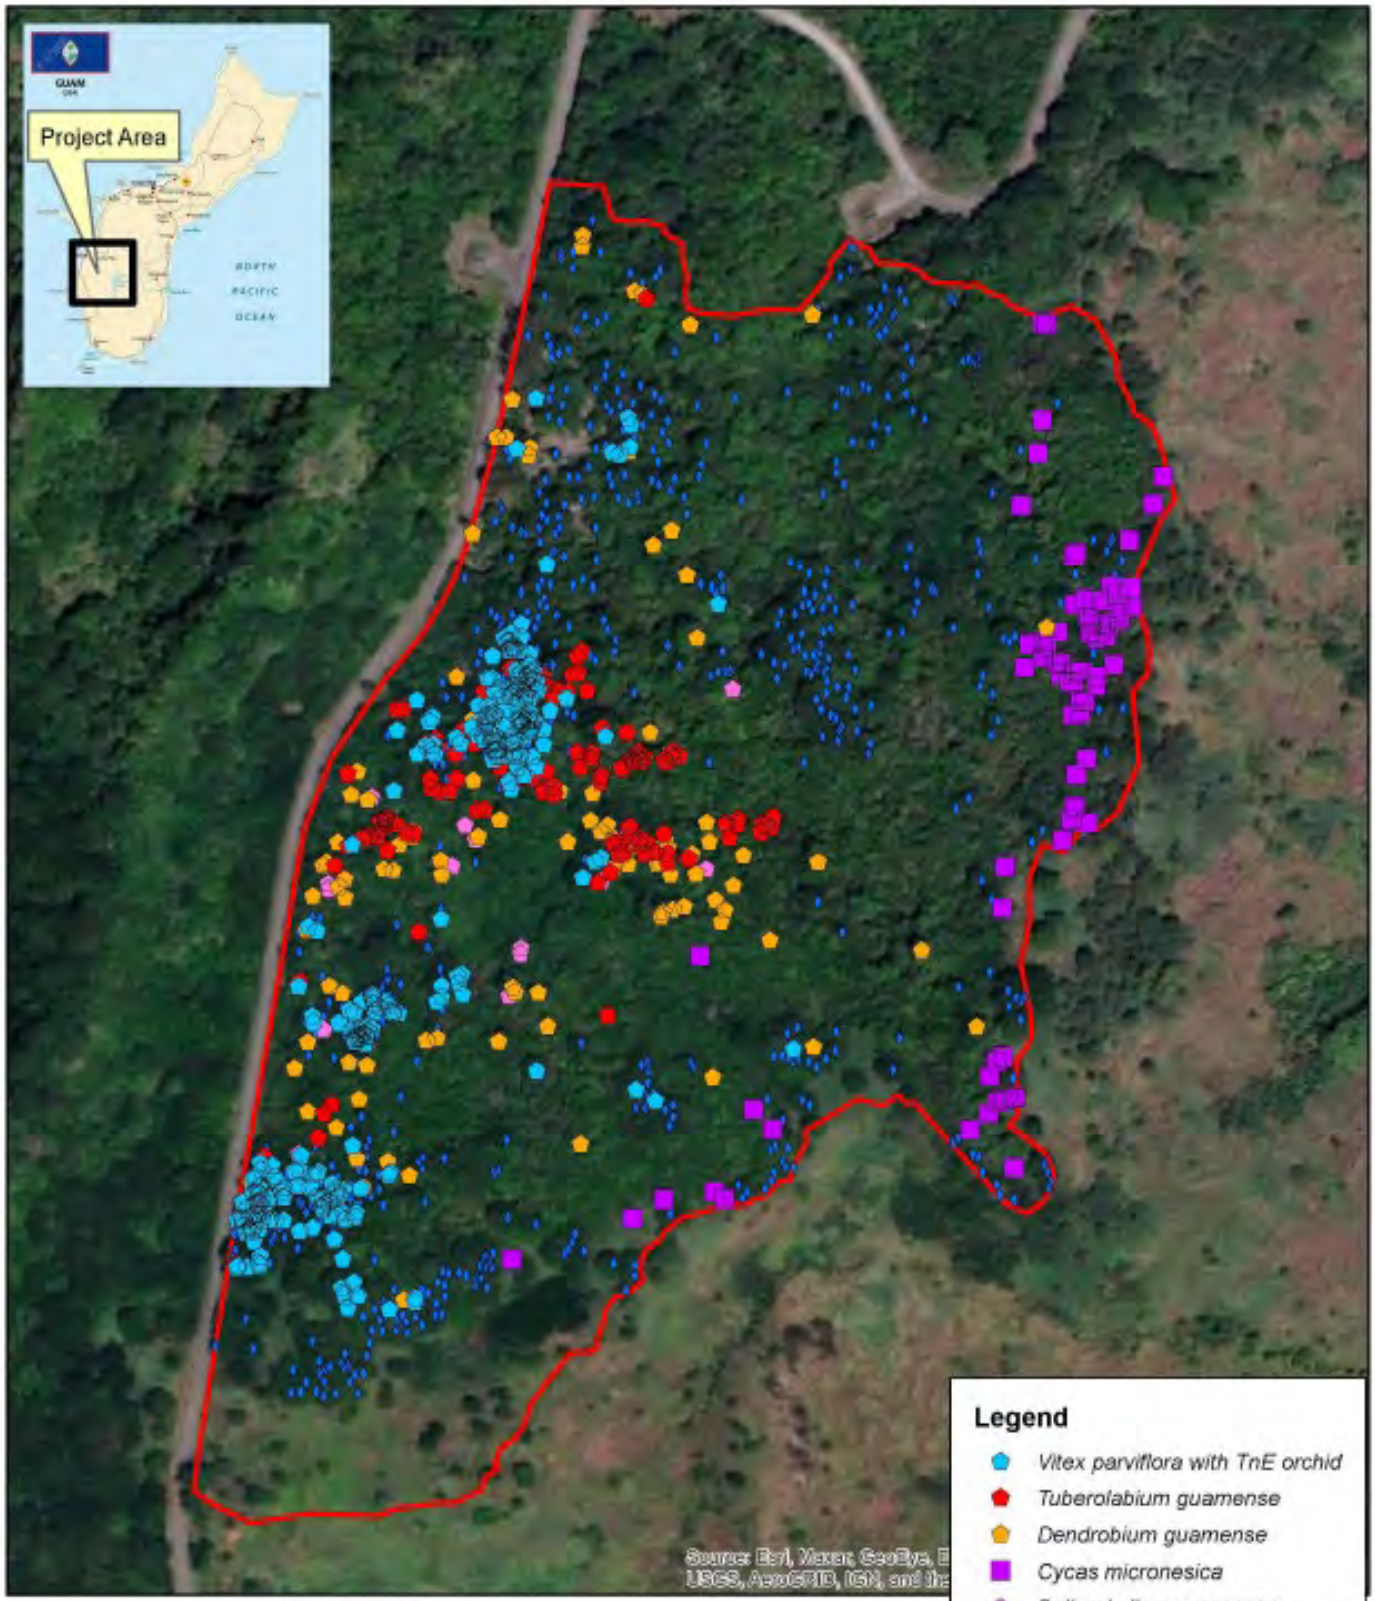

Figure 51. FRU2

Forest Restoration at Achae Point

Location: AAFB **Period of Performance:** JUL2022 – Ongoing

Project Objective

Restore native vegetation component to limestone forest rehabilitation site.

Conservation Benefit

Enhance and restore habitats, reduce habitat fragmentation, increase populations of native species, and buffer protected areas.

FY23 Status

- 27 *Serianthes nelsonii* trees out of 56 total have survived typhoon, 20 were severely damaged but alive, 9 were declared lost.
- Typhoon uprooted / destroyed 70% of existing native plants
- Perimeter fence was not damaged, site will receive MILCON outplantings
- Soil samples analyzed at UOG lab for determining best nutrient application

EPR: 1 CR MAR AFB Native Forest Habitat Restoration; M5240NR067

2021 JRM INRMP Reference: THM-1; 9-6

Figure 52. Forest Restoration before Typhoon Mawar

Figure 53. Forest Restoration post Typhoon Mawar

Vegetation Restoration for the Habitat Management Unit (HMU)

Location: AAFB **Period of Performance:** JUL2022 - JUL2023

Project Objective

Implement vegetation restoration within the Habitat Management Unit (HMU) utilizing the 2017 HMU Vegetation Restoration Plan.

Conservation Benefit

Enhance and restore habitat and maintain or increase populations of threatened and endangered species, including those extirpated from Guam and potentially reintroduced within the HMU.

FY23 Status

- Ongoing project with UOG CESU.
- Experimental edge plots and 30m x 30m plots being monitored.
- Experimental 1 acre plot is being monitored.
- Initiated restoration on 21, 1 acre plots.
- Out planted species includes species to increase habitat quality for Marianas fruit bats, e.g. *Artocarpus mariannensis* and *Ficus* sp
- Number of Vitex removed varied with the plot due to presence of listed orchid species and percentage of native trees present. This ensures optimum survival of orchid transplants and native tree out-plantings.
- Initiation of pre - formal section 7 consultation discussions with FWS for transplanting listed orchid species from non-native to native trees.
- Complete reforestation can be completed in 3-5 years.
- Removal of Triphasia, Cestrum and excess coconut trees will be implemented this year in Tarague fenced areas.
- Assessment of damage to out-plantings from Typhoon is ongoing but it appears that survival rates were roughly 77%.

EPR: 1 CR MAR AAFB Native Forest Habitat Restoration; M5240NR067

2019 JRM INRMP Reference: THM-1; 9-68

Fire Management Plan Implementation - NBG

Location: NMS **Period of Performance**: SEP 2021 – SEP2022

Project Objective

Protect natural resources on NMS by reducing habitat degradation (*i.e.* soil erosion and vulnerability to invasive plant establishment) resulting from wildland fires.

Conservation Benefit

Controlling fuels (*i.e.* swordgrass) in strategic locations creates buffers/ fuel breaks and to protects sensitive natural resource areas and enhance existing conservation areas.

FY23 Status

- Identified 5 acre fuel treatment parcel
  - Adjacent to NMS Fire Break 5 and Cotal Forest Reserve
  - Site part of Fire MU #1
- Fuels Treatments:
  - Initial, mechanical removal of flammable grasses
  - Chemical/herbicide applications to limit re-sprouting
- Final Report received: June 2023
- Future site use: support Acacia/native savannah out-plantings

EPR: 1 RP MAR NBG Wildland Fire Management Plan (2015) Implementation through Habitat Management; 61755NR857

2019 JRM INRMP Reference: THM-3; 6-41

Soil and Water Conservation - NBG

Location: NMS **Period of Performance**: AUG 2020 – SEP2023

Project Objective

Maintain, protect, and enhance water quality and contain/minimize runoff into watersheds and ultimately marine waters.

Conservation Benefit

Stabilization of soils in erosion prone areas reduces sediment runoff into watersheds and benefits supports a ridge-to-reef ecosystem approach. Identification and stabilization of areas with high erosion rates will ultimately reduce sediment loads that drain to coastal waters and minimize potential impacts to coral reefs.

FY23 Status

- Stabilize soil and improve quality of terrestrial plant habitats
- Reduce sediment loads that drain into the ocean
- Focus on south of Fena Reservoir
- Shrubs: 60% survival rate (n=2,310 planted)
- Vetiver grass slips: 63% survival rate (n=10,380 planted)
- Lessons learned

EPR: CHS JRM NBG Soil and Water Conservation: stabilization of eroding streambanks and cliff/ravine; 61755NR832

2019 JRM INRMP Reference: THM-1; 6-39

Ungulate Fencing on NBG-Administered Lands

Location: NMS **Period of performance:** SEP2021 - Ongoing

Project Objective

The objective is to protect and manage sufficient habitats by securing and managing unprotected areas or rare or unique habitats.

Conservation benefit

The installation effort facilitates the revitalization of native habitats that support viable populations of native and ESA-listed species, increases biodiversity, and promotes ecosystem health. Ungulate fence construction is the first step of the applied ecosystem approach to resource management, as defined in the INRMP.

FY23 Status

- UF #3 construction postponed due to Category 4 Typhoon Mawar
  - Enclosed area approx. 64 acres.
- UF #4 construction completed (FEB 2023)
  - Enclosed area approx. 70 acres
- UF #5 construction to begin SEP 2023
  - Enclosed area will be approx. 150 acres
- Quarterly monitoring of NMS ungulate fence
  - CEMML and White Buffalo inspections following Typhoon
  - Breaches temporarily patched
  - Fallen trees removed from fenceline
  - Ungulate monitoring and removal, as needed
- As of Sept 1, 2023, 455 acres constructed and contracted

EPR: 1 RP MAR NBG Ungulate Fencing; 61755NR894

2019 JRM INRMP Reference: THM-2; 6-39

Ungulate Control and Eradication on NBG-Administered Lands

Location: NBG; NMS **Period of performance:** SEP2021 - Ongoing

Project Objective

Maintain or enhance ecological function and diversity through control and eradication of established invasive species, particularly ungulates.

Conservation benefit

To allow for multiple INRMP projects to commence, reducing a primary stressor from multiple habitats and ESA-listed species.

FY23 Status

- Late start in FY23 due to Category 4 Typhoon Mawar
- Methods: Canine detection dogs and net partition
  - Re-clearing of UF #1 and #2 (AUG 2023)
  - Re-clearing of UF #4 (SEP 2023)
- Removed one carabao from UF #4 (AUG 2023)

EPR: 1 RP MAR NBG Ungulate Management Population Control; 61755NR807

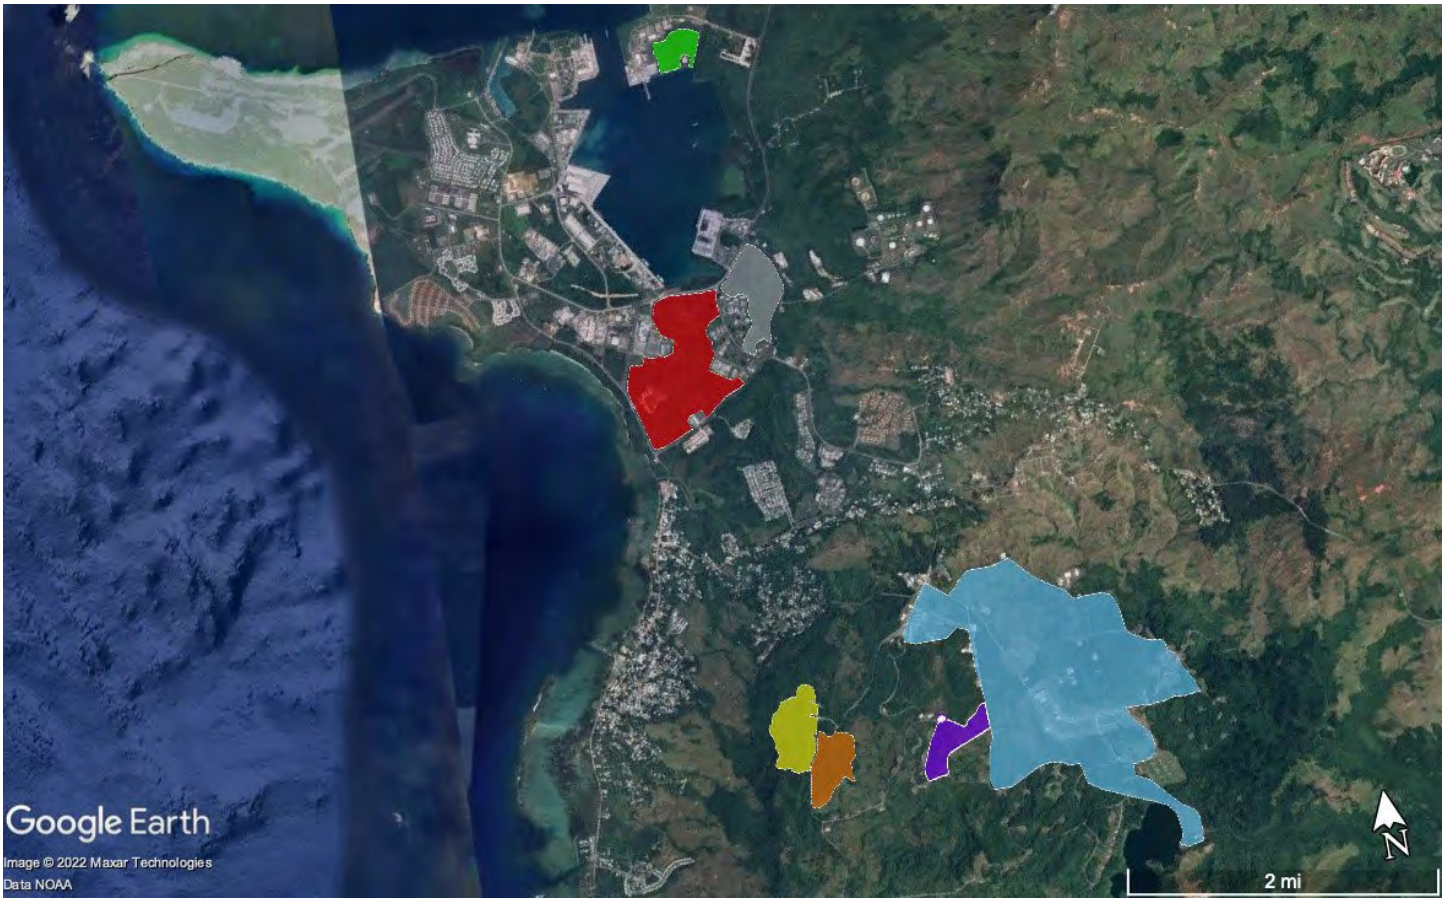

Figure 64. FY21 Ungulate control and eradication locations on NBG.

Ecological Monitoring In Ungulate Exclusion Plots

Location: NBG **Period of Performance:** JUL2023 – AUG2024

Project Objectives

Monitor herpetofauna and insect/invertebrate fauna in ungulate free fenced areas and suitable control areas on NMS. Design and implement surveys to monitor change in gecko, skink and brown treesnake populations over time. Detect any change in insect/invertebrate communities.

Conservation Benefit

The conservation benefits of this project are to ensure self-sustaining, resilient populations to maintain and increase native species and diversity; using novel techniques in the adaptive management of “target” species populations; reintroduce extirpated species; and with no loss of current species range.

FY23 status

- Monitor changes to herpetofauna and insect/invertebrate fauna inside ungulate free fenced areas and suitable control areas on the NMS. At present, this will be the Forest Restoration Unit 2 (FRU 2) on the NMS
- Document changes in the vegetation, reptile, and insect/invertebrate communities in ungulate free fenced areas, areas to be fenced in future years and areas where ungulate control work is ongoing, on Naval Munitions Station at Navy Base Guam (NMS).
- Project was funded and awarded. Waiting for kickoff meeting.

2019 JRM INRMP Reference: THM-1 (5-83)

Figure 65: Map depicting Naval Munitions Station, Navy Base Guam

Figure 66. FRU-2 occupies an estimate of 73 acres of land in the NMS

Ungulate Fencing

Location: AAFB **Period of Performance:** AUG2022 – JUL2023

Project Objective

Construct ungulate fencing on AAFB to facilitate eradication of feral pigs (*Sus scrofa*) and Philippine deer (*Rusa marianna*) as well as prevent immigration of ungulates within fenced areas.

Conservation Benefit

Supports ungulate eradication goals within fenced areas (Figure 76). Ungulate eradication facilitates the revitalization of native habitat that supports viable populations of native species, increases the biodiversity of native species, and contributes to the connectivity with surrounding communities in ways that support improved ecosystem functionality. Contributes to the goals of the Guam NWR as an overlay unit on AAFB.

FY23 Status

- Tarague II fence completed May 2023, eradication work in progress.
- Encloses approximately 74 acres (30 hectares) of conservation area.
- Fence sustained damages due to typhoon Mawar. Patches have been installed to prevent any ungulate ingress.
- Tarague III fence was postponed due to typhoon Mawar
- Plans in FY24 includes (1) reinitiate Tarague fence III with FY24 funds
- (2) Complete full repairs to Tarague fences I and II

EPR: 1 RP MAR AAFB Ungulate Fencing; M5240NR043

2019 JRM INRMP Reference: THM-1; 9-68

Figure 67. Tarague Basin Conservation Area Fence II.

Monitor Ungulate Populations with Trail Camera Distance Sampling

Location: AAFB **Period of Performance:** OCT2021 – OCT2022

Project Objective

Develop an efficient monitoring method utilizing trail cameras to capture data and analyze using distance sampling methodology in order to estimate ungulate densities and monitor the populations on AAFB.

Conservation Benefit

This will allow the assessment of the efficacy of ungulate control programs; what percentage of the population is being removed on an annual basis and assess recolonization rates after ungulate control in unfenced areas. Frequency and intensity of ungulate control in unfenced areas can then be decided upon.

FY23 Status

- Performed by Pacific Islands Ecosystems Research Center, 39 cameras deployed for 2-3 months.
- Analyze data using distance sampling methodology, produce density estimates and estimate the ungulate populations on AAFB
- Deer density estimates were 0.54/ha (0.18-1.05) above the cliff line and 0.49 (0.20-1.08) in the Tarague basin.
- Pig density estimates were 0.66/ha (0.21-1.73) above the cliff line and 0.20/ha (.05-0.82) in the Tarague basin.
- These densities extrapolate to base population estimates of 2,057 deer (701-4,055) and 2,382 pigs (753-6,345).
- We believe that the deer density is a little low and true density would be at the higher end of the confidence interval. We base this in number of deer harvested the previous year in FY21 (1035) and the number of deer harvested in FY 22 (1898).
- The estimates can be improved along with precision if more camera stations are sampled (either at same time or moving cameras to other stations) or with 2 cameras per station.
- On AAFB, deploying cameras for 2 weeks should ensure enough detections (~60 for each species) for analyses. This would be longer if moving cameras to the other stations.
- The method is viable for deer and pig population monitoring on AAFB and will be used to assess the efficacy of the base ungulate control programs.
- Anticipate doing trail camera distance sampling for ungulates every 2-3 years, subject to funding.

EPR: 1 CP MAR AAFB Ungulate Eradication and Control; M5240NR069

2021 JRM INRMP Reference: THM-1; 9-68

Figure 68. Trail Cam Footage

Ungulate Eradication and Control

Location: AAFB **Period of Performance:** AUG2022 – JUL2023

Project Objective

To remove feral pigs (*Sus scrofa*) and Philippine deer (*Rusa marianna*) from AAFB to reduce risk to mission activities, human safety, protection of government property and natural resources conservation with a focus on the DoD mission.

Conservation Benefit

Enhance and restore habitats to increase populations of native species, particularly threatened and endangered species, as well as promote biodiversity of native plants. Reduce ground disturbance from ungulates to improve soil stabilization and reduce suitability of invasive plant species.

FY23 Status

- Ungulate Management Program removed a total of 1,471 deer and 275 pigs from Main A/B, MSA 1, NWF, Tarague and Upi (Figure XX)
- Volunteer Conservation Officer program and other Depredation teams removed 1228 deer and 160 pigs
- White Buffalo, Inc. removed 243 deer and 115 pigs from Main A/B, NWF and Tarague Basin
- Plans in FY24 includes (1) continue status quo for ungulate removal (2) work with the Command to reopen recreational hunting on base to eligible personnel

Maintenance of Ungulate Exclosures

Location: AAFB **Period of Performance:** AUG2022 – JUL2023

Project Objective

Maintain a three-foot buffer, clear of vegetation, on each side of the fence to reduce the possibility of damage. Conduct inspections quarterly and immediately after any high wind events (≥39 mph or ≥34 knots wind speed) on foot or via vehicle where applicable. Perform minor maintenance and repairs to prevent ingress of fence as needed.

Conservation Benefit

The routine maintenance and repair of ungulate exclosures will enhance the longevity of the ungulate barrier. Regular fence monitoring and repair also has the benefit of early detection to any possible immigration of ungulates into fenced eradicated areas. Monitoring, maintenance and repair all support the purpose of facilitating ungulate-free areas to enhance native forest ecosystem regeneration.

FY23 Status

- Vegetation was removed along the three-foot buffer and minor repairs were completed until typhoon Mawar. Typhoon Mawar toppled many trees (majority being Cocos nucifera) inside of the Tarague I/II enclosures. Fallen tress damaged the perimeter fences in multiple places as represented in the maps. All of the fallen trees have been trimmed back and the damaged areas have been plugged to not allow ungulate ingress at least.
- Plans in FY24 include (1) complete clearing of fallen trees and branches along fence line; (2) complete all of the fence repair work; (3) continue status quo for maintenance and monitoring

EPR: 2 BO MAR AAFB Maintenance of Ungulate Exclosure; M5240NR045

2021 JRM INRMP Reference: THM-1; 9-68

Figure 71. Tarague Basin Conservation Area Fence I

Maintenance of BTS Barrier at the HMU

Location: AAFB **Period of Performance:** AUG2022 – JUL2023

Project Objective

Monitoring and maintenance of the Brown Tree Snake Barrier in order to maintain its efficacy. Project includes: 1) Inspections, via walking or driving, weekly and immediately after any high wind events (≥39 mph or ≥ 34 knots wind speed). 2) Maintaining three-foot vegetation buffer on each side of the fence. 3) Removing any type of objects (praying mantis egg cases, mud wasp nests, dried slugs, crabs, chunks of mud, vines, etc.) that have adhered to the exterior of the barrier wall. 4) Conducting minor maintenance and repairs as needed. 5) Conducting barrier wall replacement and painting of vertical (lower) and upper (bulge) mesh sections due to damage or corrosion and pressure-wash sections of the mesh and concrete base. (Figure 80)

Conservation Benefit

The routine maintenance and repair of the BTS barrier shall enhance the longevity of its efficacy. Monitoring, maintenance and repair all support the purpose of facilitating BTS-free areas to protect Mariana fruit bat (*Pteropus mariannus*) pups and possible future reintroduction of other endangered bird species.

FY23 Status

- All of the monitoring and maintenance requirements were completed until typhoon Mawar. Typhoon Mawar toppled hundreds of Vitex parviflora inside of the HMU enclosure. Fallen tress damaged the perimeter fence in multiple places as represented in the map. A majority of the fallen trees have been trimmed back and the damaged areas have been plugged to not allow ungulate ingress at least.
- Plans in FY24 include (1) complete clearing of fallen trees and branches along fence line; (2) complete all of the fence repair work; (3) continue status quo for maintenance and monitoring

EPR: 1 CR MAR AAFB BTS Barrier Maintenance in HMU; M52401000

Figure 72. HMU fence replacement and power-washing

TERRESTRIAL PROTECTED SPECIES MANAGEMENT

ESA-Listed Snail Survey and Monitoring

Location: NMS; MCBCB **Period of Performance:** AUG2022 – NOV2023

Project Objective

To delineate and monitor known ESA-listed snail colonies at one site in NBGNMS (*Samoana fragilis)* and one at MCBCB (*Partula gibba*).

Conservation Benefit

Delineation and counts help make management decisions in the areas where the snails occur. Data collected during monitoring efforts will enhance what is known for each of the species and aid in tracking population changes.

FY23 Status

- Baseline survey completed
- Follow on monitoring completed (photo mark recapture plots)
- Photo mark recapture analysis on going
- Final report expected Oct 30 2023

EPR: CP JRM Conservation Management of ESA-listed Invertebrates; 61128NR203

2019 JRM INRMP Reference: TPS-2, 6-46; TPS-1, 8-54

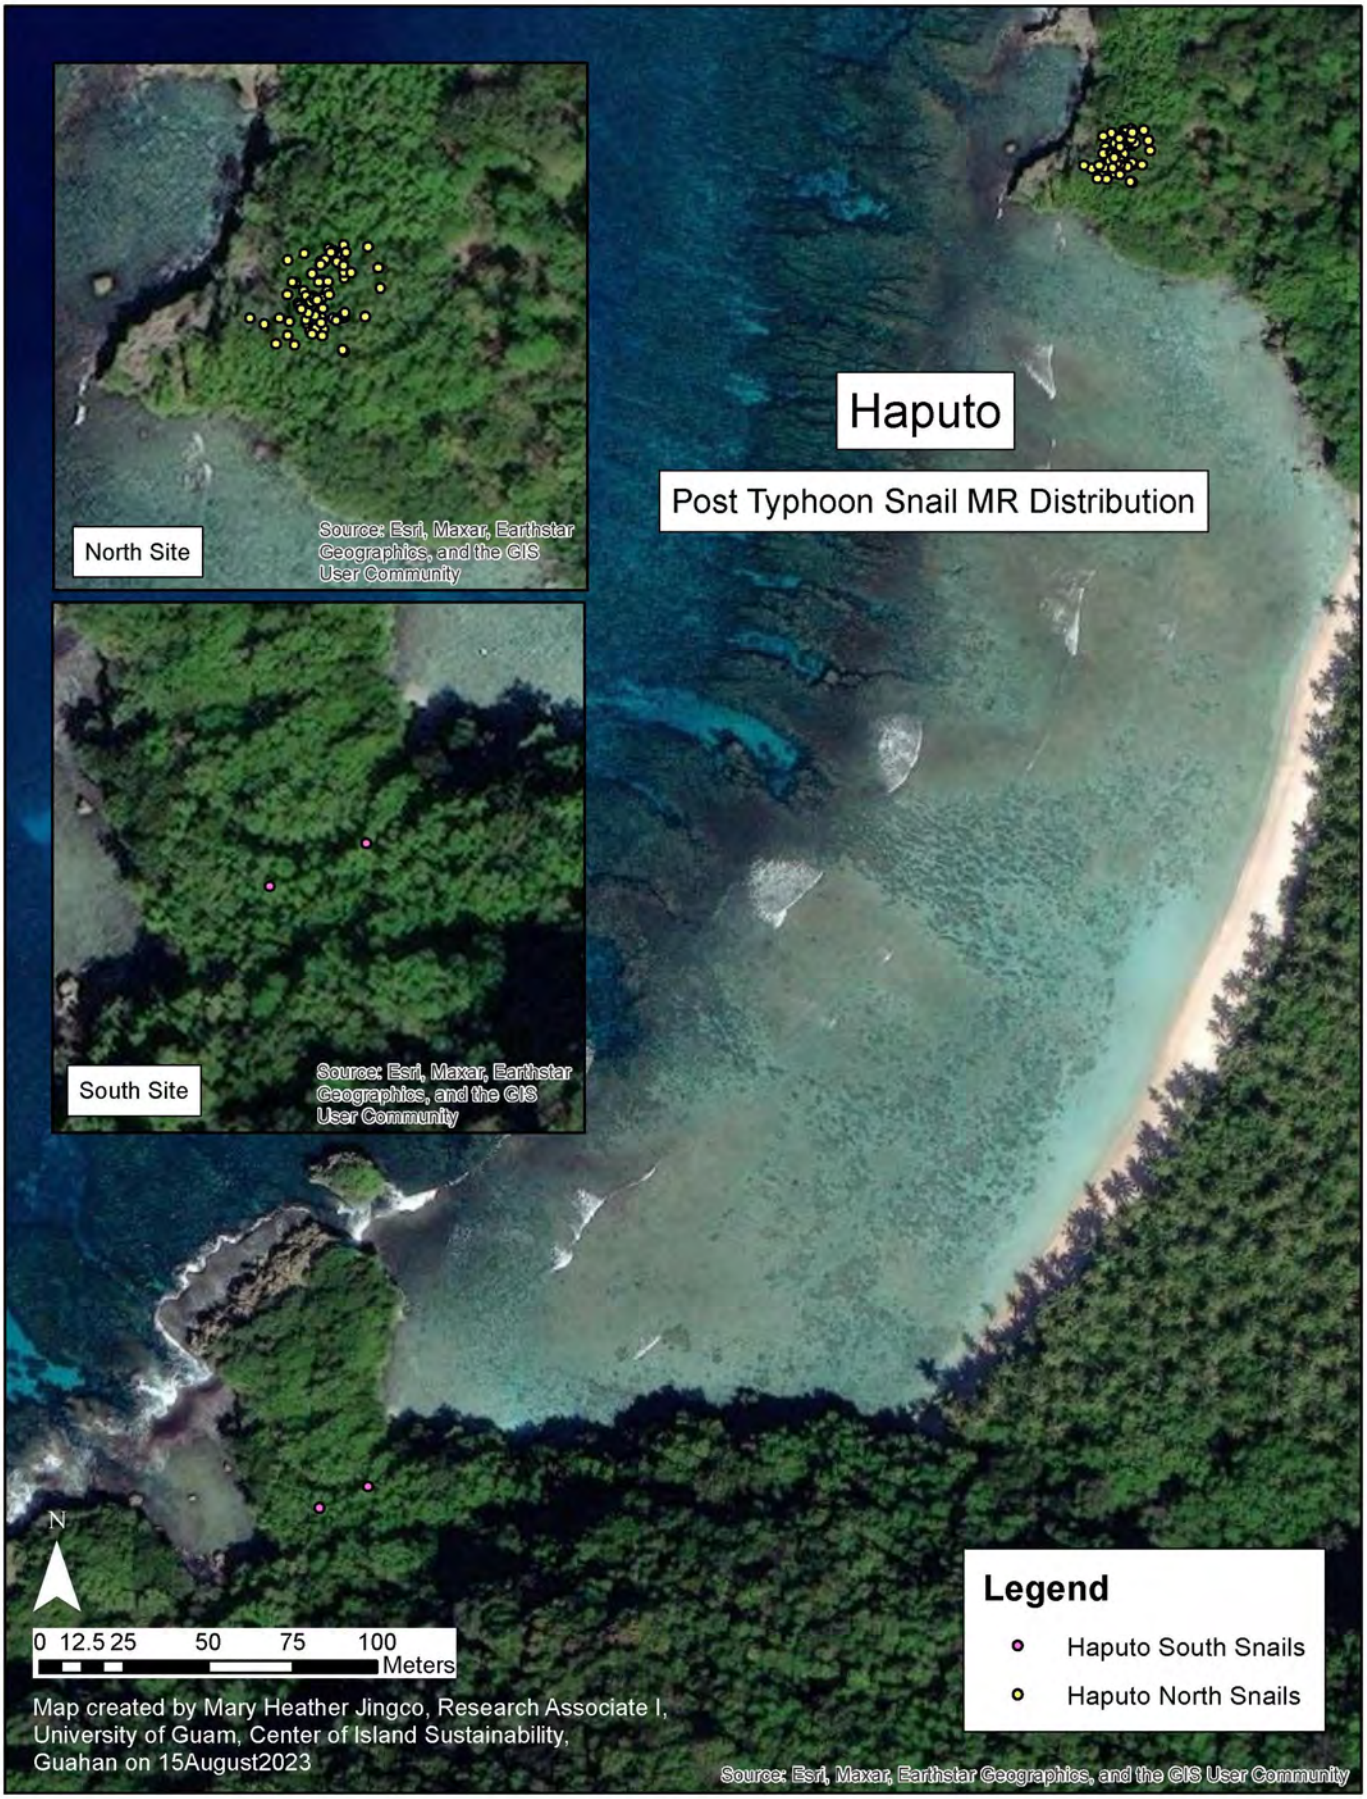

Figure 73. Haputo Plots Post Typhoon

Figure 74. Naval Magazine Plots Post Typhoon

Mariana Eight Spot Butterfly Rear and Release

Location: MCBCB **Period of Performance:** DEC2022 - 2023

Project Objective

Rear and release *Hypolimnas octocula marianensis* at as many sites as feasible on the JRM AOR

Conservation Benefit

Increased numbers of *Hypolimnas octocula marianensis* as well as life history data collected during rearing and post release monitoring activities.

FY23 Status

- USFWS permit application in progress

EPR: CP JRM Conservation Management of ESA-listed Invertebrates; 61128NR203

2019 JRM INRMP Reference: TPS-2, 6-46; TPS-1, 8-54

Monitoring of Butterfly Host Plant Sites and Tarague Snail Colony

Location: AAFB **Period of Performance:** AUG2022 – AUG2023

Project Objective

Monitor populations of the listed snail *Partula radiolata* and the Marianas eight-spot butterfly (*Hypolimnas octocula marianensis*).

Conservation Benefit

Collect baseline data on population abundances for snails and the numbers of eggs, larva, chrysalids and adults for butterflies.

FY23 Status

- Ongoing project with UOG CESU.
- Population abundances estimated for snails on 4 mark recapture plots in rainy and dry seasons at the Tarague colony.
- A snail colony was documented at the AAFB golf course and 3 mark recapture plots are now being monitored. The colony covers 4,339 square meters. The initial population estimate is 30,984 (26,682-35,305) snails.
- The Tarague snail colony has had a large decline which has somewhat stabilized. Predatory flat worms are suspected as the reason for the decline.
- There are very few snail recaptures between seasons. This points to either high mortality and reproduction rates, high movement (horizontal and vertical) or some combination of these.
- Typhoon effects on snail number appear to have been minor.

- Three plots monitored for, butterfly egg, larvae, chrysalids and adults. There was a break in monitoring this year but resumed in April.
- Typhoon effected butterfly numbers and reproduction by defoliation and/or elimination of host plants. However some areas retained host plants due to protective terrain.
- Butterfly eggs appear to be parasitized in high numbers.
- Does not appear to be a distinct breeding season for butterflies. Each site is unique.

Native Plant Propagation and Carbon Sequestration

Location: NBGNMS **Period of Performance**: JUL2023 - 2027

Project Objective

Conduct a baseline assessment of the forest's current carbon stocks and sequestration potential. Collect, propagate, and outplant species native to the Marianas. Monitor and maintain outplantings while verifying the carbon sequestration performance of the forest over time.

Conservation Benefit

Ecosystem benefits include increased species diversity and richness, erosion reduction, and increased wildlife habitat. Tree plantings also have the long-term benefit of capturing CO2 from the atmosphere.

FY23 Status

- Contract awarded in July 2023
- Initial carbon stock assessment in September
- Seed collection and propagation for plantings

EPR: SIKES MAR Forest Restoration and Monitoring Native Ecosystems – Climate; 61128NR210

2019 JRM INRMP Reference: THM-3; 8-49

Figure 80. Restoration location

JRM *Serianthes nelsonii* Propagation, Outplanting, and Maintenance

Location: AAFB **Period of Performance**: JUL2021-2024

Project Objective

This project is to propagate, outplant, and maintain subpopulations of the federally endangered *Serianthes nelsonii* (tree) on Joint Region Marianas (JRM) managed lands.

Conservation Benefit

Increasing the number of *Serianthes* trees would improve species survival, enhance native habitat, increase the biodiversity of native species, and contributes to the connectivity with surrounding communities in ways that support improved ecosystem functionality.

FY23 Status

- 60 seedlings propagated now nearly 10 feet tall
- Outplanting planned for AAFB in September
- Vegetative propagation of the Ritidian mature tree

EPR: 1 RP MAR JRM *Serianthes nelsonii* Propagation, Outplanting, and Maintenance; 61128NRSNI

2019 JRM INRMP Reference: TPS-5; 9-77

Figure 81. Serianthes seedlings

Serianthes nelsonii Outplanting and Monitoring within Joint Region Marianas Area of Responsibility

Location: NWF, MCBCB **Period of Performance**: JUL2023-2024

Project Objective

Monitor and maintain the mature S. nelsonii tree located on Marine Corps Base Camp Blaz, including the seedlings and saplings growing underneath the mature tree and maintenance of the ungulate exclosure fence surrounding the site of the mature S. nelsonii tree.

Conservation Benefit

Continue to protect and conserve the last mature reproducing S. nelsonii tree on Guam and provide future opportunity for outplanting in the Forest Enhancement Areas on Camp Blaz through husbandry of salvaged seedlings.

FY23 Status

- Mod#4 was awarded on July 2023
- Mod includes:
- Maintain and monitor S. nelsonii tree and seedlings
- Maintain S. nelsonii exclosure fence
- Seed collection, processing, and storage
- Salvage geminated seedlings; grow in nursery

EPR: 2 LC MAR AAFB Serianthes nelsonii Monitoring and Management; M5240CN039

2019 JRM INRMP Reference: TPS-5; 9-76

Figure 82. A *Serianthes nelsonii* seedling beneath the adult tree at the MCBCB LFTRC.

Cycas micronesica Conservation

Location: AAFB **Period of Performance:** MAY2021 - Ongoing

Project Objective

Maintenance and monitoring of six, 1-acre, permanent fenced cycad (*Cycas micronesica*) plots (Achae Point, Ritidian, Tarague Basin, Golf Course, Tarague North, and Tarague South).

Conservation Benefit

Research and monitoring on management actions that directly benefit *Cycas micronesica*. The intent is to identify which management actions most benefit the plant and if possible, implement on a broader scale.

FY23 Status

- 613 C. micronesica seeds collected for ex-situ propagation, 190 seeds germinated at UOG nursery between June 2022 to June 2023.
- UOG plant nursery has 328 cycad seedlings survive typhoon, 4 were lost
- UOG field plots had 36 cycad trees knocked down and 346 cycads severely defoliated.
- Majority of defoliated cycads grew new shoots and leaves by July 2023.
- Coordinated with Dr. Patrick Griffith (Montgomery Botanical Center) and Ben Deloso (Missouri Botanical Garden) for genetic fingerprinting

EPR: 3 SAR JRM, AAFB – *Cycas micronesica* Management for Conservation; M5240NR061

Cycad Monitoring and Management – Pollination and Propagation

Location: AAFB **Period of Performance:** MAR2023 - 2024

Project Objective

Study reproduction of *Cycas micronesica* to include DNA analysis, hand pollination, seed harvest, and propagation protocols

Conservation Benefit

Better understanding of pollination and propagation will increase efficiency of producing more plants for reintroduction into the forest.

FY23 Status

- DNA markers that can be used to sex *C. micronesica* plants was confirmed.
- Pollen collection, storage, and viability studies ongoing

EPR: 1 CP JRM AAFB Conservation of *Cycas micronesica*; M5240NR061

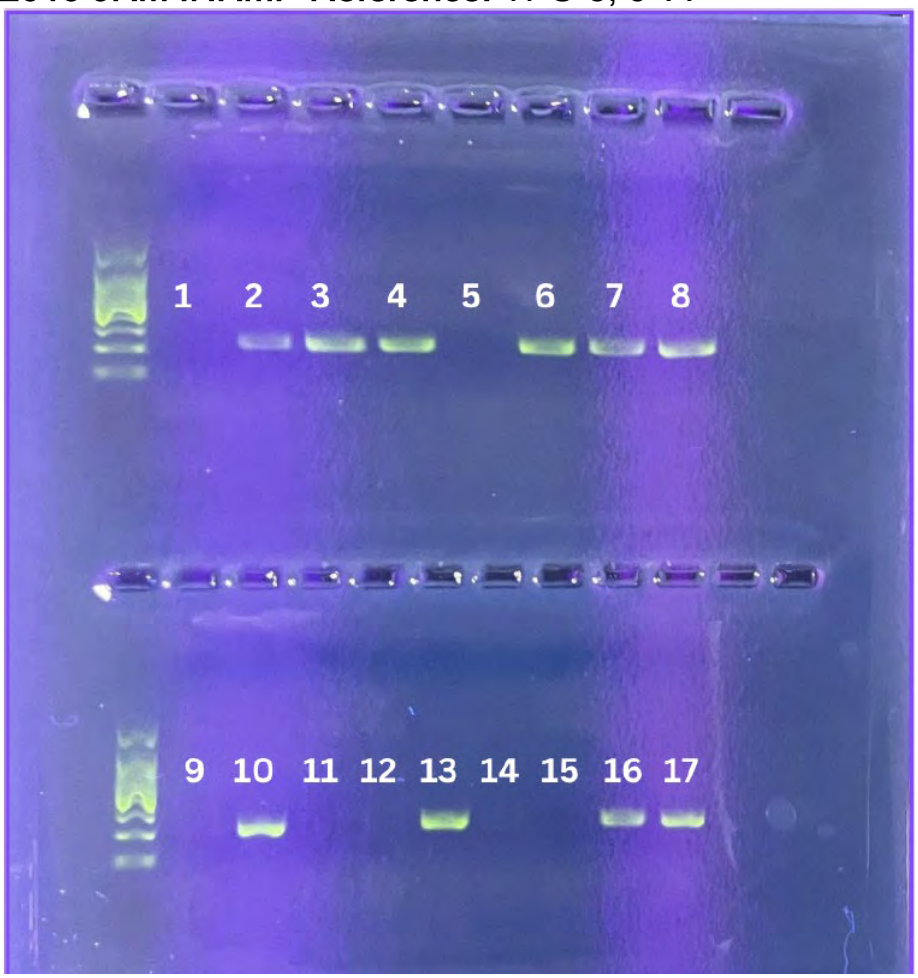

Figure 87. Cycad DNA results

Green and Hawksbill Sea Turtle Nesting Habitat

Location: NBG **Period of performance:** AUG2022 – AUG2023

Project Objective

In an effort to protect and enhance sea turtle nesting population on NBG, suitable habitats are monitored and protected throughout the year. Data collected through regular surveys determine hatching success, emergence success and effectiveness of predator control measures, as well as identify threats to nests (e.g. tidal inundation, roots of invasive vegetation; and marine debris). Understanding the spatial and temporal distribution of sea turtle activity ensures their nesting habitat is maintained.

Conservation Benefit

The conservation benefits of project are to (a) sustain and enhance the sea turtle population; (b) maintain sea turtle species range and distribution; and (c) increase the use of adaptive management techniques for sea turtles.

FY23 Status

- Located, protected, and evaluated sea turtle nests
- Maintained data on hatching and emergence success
- Monitor lizard control with wire mesh
- Removed invasive vegetation (12 lbs)
- Released 50 trapped hatchlings
- At least 10 nests washed away (Typhoon Mawar)

EPR: 1 RP MAR NBG Green and Hawksbill Sea Turtle Nesting Habitat – Invasive Plant and Predator Control; 61755NR808

2019 JRM INRMP Reference: TPS-2; 5-89

Table 10. Green sea turtle nest inventories.

Nest Inventories

	Clutch Size	Hatching Success (%)	Emergence Success (%)
FY 21	85	51.7	51.0
FY 22	79	59.4	54.3
FY 23	75	93.1	82.8

Sea Turtle Monitoring, Protection, and Educational Outreach - AAFB

Location: AAFB **Period of Performance:** JUL2023 - Ongoing

Project Objective

To implement management techniques and methodologies to monitor nesting sea turtles on AAFB. These methodologies include but are not limited to: collection of consistent data to determine population demographics, reduce mortality and increase natural survivorship, increase sea turtle awareness of AAFB units and beach stakeholders, and create/maintain a robust database for long-term monitoring data that can support future research and detect trends.

Conservation Benefit

Implement recovery actions by conducting long-term monitoring to determine population estimates and abundance; provide protection of sea turtles and their nesting habitats; and conducting outreach and education to the public on sea turtles and their habitats.

FY23 Status

- Total 161 emergences from August 2022 to present; 108 nests and 53 false crawls.
- 11 nesting females have been flipper tagged and 1 was satellite tagged in an effort by both UOG Sea Grant and NOAA researcher/PhD student Josefa Munoz.
- New activities include Munoz's research on AAFB involving rigorous night surveys to tag all encountered nesting turtles, collecting skin samples for genetic analysis, deploying data loggers during oviposition, and sample hatchling skin tissue to determine genetic lineage.
- A total of 14 nests were lost during Typhoon Mawar as the egg chambers were unable to be located due to compacted sand and flattening of the nesting patterns. Those nests are no longer being monitored and status has been deemed "Unknown."
- 6 nests laid pre-typhoon completed nest inventories with 3 being successful and 3 unsuccessful. In the unsuccessful nests, only a few shredded pieces of shells were located, therefore hatching and emergence success rates are unknown.
- Clutch data collected on previously marked nests located successfully after 70 days incubation; hatching and emergence success 88% and 86.1% respectively.
- Outreach events: September 2022 International Coastal Cleanup and April 2023 Earth Day EOD Beach Cleanup; presentations to local public schools and community events (over 1,500 in attendance); in-briefs with key stakeholders such as EOD, Outdoor Rec, Security Forces, and Marine Patrol.
- Project Final Report due December 2023.

Sea Turtle Nesting Beach Monitoring within Joint Region Marianas Area of Responsibility

Location: NWF, MCBCB **Period of Performance:** SEP2022 – MAR2024

Project Objective

Monitor Haputo Beach for signs of green sea turtle or hawksbill turtle nesting. Collect nesting data including egg count, hatching rates, and emergence. Install education signage within Haputo Ecological Reserve Area.

Conservation Benefit

Understand sea turtles' use of Haputo Beach for nesting. Protect and enhance nesting beaches.

FY23 Status

- Contract awarded in September 2022 for 12 months of monitoring, data collection, and installation of educational signage
- First monitoring event in January 2023; one old nest was found
- No other nests found since initial monitoring event
- Six weekly monitoring events were missed due to Typhoon Mawar

EPR: 1 CP MAR NBG Sea Turtle Distribution and Habitat Use; 61755NR815

2019 JRM INRMP Reference: TPS-1; TPS-2; TEDU-1

Monitoring of Mariana Swiftlets

Location: NMS **Period of Performance:** AUG2021 - Ongoing

Project Objective

Monitor population trends of Mariana swiftlets (*Aerodramus bartschi*) at three caves on NMS: (Maemong, Mahlac, and Fachi).

Conservation Benefit

The conservation benefits will ensure self-sustaining, resilient populations of native species and prohibit loss of current species range.

FY23 Status

- Quarterly counts conducted
- Removed vegetation from Maemong entrance
- Currently partnering with DAWR Biologists on update of SOP for quarterly counts

EPR: 1 S MAR NBG Endangered Species Monitoring; 61755NR142

2019 JRM INRMP Reference: TPS-4; 6-47

Table 12. Swiftlet Counts for FY2023

Mariana Swiftlet Recovery and Habitat Use

Location: NMS **Period of Performance:** MAR2022 – MAR2024

Project Objective

To provide an understanding of Mariana swiftlet (*Aerodramus bartschi*) habitat use, movement, reproductive success, and breeding site selection to inform management actions and meet specific objectives identified in the USFWS Recovery Plan for the Mariana Swiftlet.

Conservation Benefit

To ensure self-sustaining, resilient populations of native species and prohibit loss of current species range.

FY23 Status

- Deployed high resolution thermal and near infrared (NIR) cameras at roost locations and cave entrances
    - Reviewing footage to estimate roosting population sizes in Mahalac and Maemong for April 2019, November 2019, March 2022, and November 2022, April 2023
        - 2-4 days of video recorded from each cave to assess roost site occupancy over a 24 hour period for multiple days
    - Ongoing analyzation of imagery from Fachi April 2019 and April 2023
        - Fachi cave was too flooded for access during our other visits).
    - Expected report on roost population size from April 2019-April 2023 in Q4
    - Ongoing refining of computer vision algorithm parameters, expected development of cave entrance population counts by the end of Q5
    - Future comparison of cave entrance and roost site counts to come to assess agreement between approaches
- Deployed low-power, time-lapse thermal and NIR cameras to visualize roost locations and nests within caves over time for the purpose of documenting the roosts/nests, seasonal roosting changes, and BTS interaction/control changes
    - Tested new fully functional prototype in April 2023
    - Generated hundreds of hours of video, assessment ongoing
- Deployed time-lapse thermal and/or NIR cameras to estimate breeding periods and nesting success
    - Ongoing development of automated approaches to record long periods of nesting behavior without manual review
    - BTS detected by the cameras, which can help in assessing predation risks to nesting and roosting birds
- Identify movement patterns within caves and surrounding landscapes using lightweight radio transmitters
    - 10 individuals March 2022 tracked to assess techniques and safety

        - Tracked for 2 – 3 weeks with antennae at cave entrances and below the roost
    - 20 individuals August 2022
    - 30 individuals April 2023
        - Begin inquiry into movement away from the caves
    - Preliminary assessment of our in-cave tracking indicates a highly variable pattern of activity, both among individuals and within individuals from day to day.
- Tracking movement of swiftlets across the landscape
    - 30 individuals tracked April 2023
        - To evaluate the feasibility of tracking birds away from the caves across the landscape, we placed several automated (24/7) tracking stations in multiple places on the Naval Munition Site where we thought birds may fly.
        - These locations included areas along Firebreak 3 Road and areas around Fena Reservoir.
        - Based on preliminary analysis of radio signals received, we detected multiple individuals at these landscape tracking stations, with directional antennas indicating birds are flying outside of the NMS boundaries.
        - Future work to determine where birds leaving the Naval Magazine lands are flying to will help to understand what areas are needed to support the swiftlet colonies on Naval lands.

Monitoring Survival and Demography of Micronesian Starlings

Location: AAFB **Period of Performance:** MAR2022 – FEB2023

Project Objective

To monitor and analyze for Micronesian starling (*Aplonis opaca* [Sali]) nest success and fledgling survival using telemetry, nest monitoring, and survey methods in relation to BTS control efforts. Through monitoring fledging survival and population recruitment efficacy of BTS control techniques can be assessed. This project is one of four projects that will, collectively, further develop information on BTS behaviors related to predation and movement in the presence of abundant avian species.

Conservation Benefit

The Micronesian Starling is a useful proxy for understanding Guam forest bird ecology in the presence in of BTS. Behavior, survivorship, and population demographics could be useful for supporting future avian restoration projects and controlling BTS in low density with competing food sources in the presence of control regimes.

FY23 Status

- Monitored 70 nest boxes & 43 natural nests (2019-2022)
- Monitored 461 fledglings [100 fledglings (22%) alive at the end of the monitoring period; 291 confirmed mortalities (52%); 71 fledglings (16%) with unknown fate]
- 54% of mortalities due to BTS, 30% due to cats
- Population estimates ranged from 1442 to 1969 (mean=1685)
- No statistical indication of increased survival time in BTS treated vs untreated areas
- Future work: nest box maintenance, annual surveys, and cat control

Mariana Fruit Bat Monitoring - AAFB

Location: AAFB **Period of Performance:** JAN2022 – DEC2023

Project Objective

Conduct surveys for Mariana fruit bats (*Pteropus mariannus mariannus*) at AAFB as part of long-term population monitoring and to provide analysis on the effects of aircraft overflights and behavior of Mariana fruit bats at Pati Point.

Conservation Benefit

Monitoring will allow for management actions to enhance and restore habitat and increase efforts to recover Mariana fruit bat populations in Guam.

FY23 Status

- Addresses three of the recovery criteria in the 2009 U.S. Fish and Wildlife Service (USFWS) Draft Revised Recovery Plan for the Mariana Fruit Bat or Fanihi by implementing seven of the Recovery Actions outlined in the Draft Plan.
- The 10th Annual Base-wide Count occurred on 18 August, 2023. Data is presently being analyzed.
- Data shows an increasing trend.
- A consistent AAFB roost area and flyway still being utilized even after typhoon.
- Pati Point surveys continue to occur on a quarterly basis. There has been no sign of fruit bats present at the historic roost site.
- In the last 3 years large temporary population increases, in the Jan./Feb. to Mar/Apr time frame, have been documented, with the assumption that these are migrants from Rota.
- In 2021 the population increase was ~200 bats, in 2022 it was ~1300 bats and in 2023 it was ~150 bats.
- There is the distinct possibility that this is a frequent occurrence that was not noticed in the past.
- Sign transect monitoring has begun. Transects are 300 meters long and 3 meters wide. Number of transects might need to be increased.
- While not on DoD lands, it is noteworthy that there is now a large colony in south/central Guam with ~270 bats (unofficial count by T. Mildenstein). It is quite possible that there is movement of bats between AAFB and the central Guam colony.

Mariana Fruit Bat Monitoring – NMS

Location: NMS **Period of Performance:** AUG2022 – MAY2024

Project Objective

To conduct a large-scale Mariana fruit Bat (*Pteropus mariannus marianuus*) population count to monitor changes and population trends on the NMS; to perform and analyze habitat quality and bat sign surveys; and to maintain a database and map of all fruit bat sightings.

Conservation Benefit

The project addresses three of the recovery criteria in the US Draft Revised Recovery Plan for the Mariana Fruit Bat or Fanihi (USFWS 2009) by implementing seven of the Recovery Actions outlined in the Draft Plan. The results of the project promote fanihi recovery by: using monitoring to identify fanihi conservation priorities, establishing a method of determining when population recovery criteria are met, and building local support for fanihi conservation. It is anticipated that results from this project will be incorporated in the next revisions of the Recovery Plan.

FY23 Status

- Conducted large scale NMS survey on Dec 16, 2022
- 7 observation stations: 5 on NMS and 2 along Cross Island Road
- 50 bat observations (25 outside NMS, 25 inside NMS)
- 2019: 0 observations , 2020: 4 observations, 2021: 14 Observations

MARINE HABITAT MANAGEMENT

Joint Region Marianas Marine Invasive Species Management Plan (JRM MISMP)

Location: Guam & Tinian MLA **Period of Performance:** AUG22 – OCT2023

Project Objectives

To develop standard operating procedures (SOP) and protocols to avoid and minimize: (1) the spread of new marine invasive species (MIS) into the Department of Defense (DoD) submerged lands within the JRM Area of Responsibility (AOR), and (2) the transfer of any MIS from DoD submerged lands within the JRM AOR to the Pacific region.

Conservation Benefit

The development of SOPs and protocols for a MISMP shall support natural resource managers to monitor, detect, respond, control, eradicate, and prevent the risk of MIS incursions into, out of, and within the JRM AOR, thus maintaining marine biodiversity and ecosystem functions within JRM's AOR.

FY23 Status

- Resource partners provided comments and feedback on draft chapters
- Revisions for Draft Final JRM MISMP copy currently ongoing
- Final JRM MISMP document scheduled to be completed by OCT 2023

EPR: 1 S MAR JRM Marine Ecosystem Monitoring and Coral Reef Indicators (CHS); 61128NR168

2019 JRM INRMP Reference: MIS-1; 5-102, MIS-2; 5-102, MIS-1; 8-64, MIS-2: 8-65, MIS-1; 9-88, MIS-2; 9-88, MIS-1; 11-75, MIS-2; 11-75

Identification and Removal of Non-Permitted Buoys on Joint Region Marianas

Location: JRM & Tinian MLA **Period of Performance:** AUG2023 – Ongoing

Project Objectives

To remove non-permitted buoys (NPBs) on Joint Region Marianas (JRM) submerged lands in Tinian, Commonwealth of the Northern Mariana Islands (CNMI). Primary objectives will be to identify NPBs, survey seafloor/coral reef resources in the immediate vicinity of the identified buoys, and remove the NPBs on JRM submerged lands in Tinian.

Conservation Benefit

Mitigates further damage to the marine resources and assists with navigational requirements occurring on, or around JRM submerged lands. It reduces adverse impacts from commercial and recreational boating to coral reef habitat due to improper vessel anchoring within JRM submerged lands.

FY23 Status

- Awarded to Naval Information Warfare Center Pacific (NIWC Pacific)
- Kick-off meeting planned for Nov 2023

Water Quality Monitoring on JRM Submerged Lands

Location: Tinian MLA & Harbor **Period of Performance:** JUN2021 – Ongoing

Project Objectives

To quantify the conductivity, temperature, depth, pH, chlorophyll A, dissolved oxygen, nitrate, and phosphate concentrations in shallow reef systems. This project aims to provide water quality data for the Tinian Harbor and Tinian MLA.

Conservation Benefit

This quantitative data will assist in determining the parameters associated with climate change that may be impacting coral reefs in order to avoid, minimize, or mitigate potential adverse effects to the marine resources within these areas, especially marine protected species and habitats.

FY23 Status

- Ongoing project with UOG WERI
- ESA and EFHA document prepared for NOAA
- Trained subcontractor to maintain sensors, retrieve collected data, and provide retrieve data to UOG WERI
- NAVFAC NR specialist conducted weekly water sampling activities in Tinian Harbor from December 2022 to February 2023; weekly reports submitted to CNMI BECQ/DEQ
- UOG WERI conducted water quality tests, statistical analyses, and prepared water quality and sediment report
- Nation Wide Permit #5 acquired from Army Corps of Engineers (USACE)
- Five (5) sensors undergoing maintenance
- CNMI DFW permit request to deploy sensors in Tinian Harbor
- Completed sensors to be installed in Tinian MLA (2 sites) and Tinian Harbor (3 sites)

Coral Bleaching and Crown of Thorns Starfish (COTS) Monitoring on JRM Submerged Lands

Location: CNMI **Period of Performance:** JUN2021 – NOV2023

Project Objective

To quantify the coral bleaching and abundance distribution of COTS, and if necessary conduct COTS culling.

Conservation Benefit

These quantitative data will assist in determining the parameters associated with coral bleaching and COTS outbreak events that may be impacting coral reefs in order to avoid, minimize or mitigate potential adverse effects to the marine resources within these areas, especially marine protected species.

FY23 Status

- Ongoing project with UOG Sea Grant
- Fieldwork delayed due to shipping delays from Typhoon Mawar
- 4 sites on Tinian west side surveyed NOV-DEC 2022
- COTS Training Workshop conducted at Northern Marianas College MAR 2023
- 3 sites surveyed MAR 2023 – Long Beach, Unai Babui, and Unai Chulu
- Tinian Harbor sites planned for future surveys

EPR: 1 S MAR JRM Marine Ecosystem Monitoring and Coral Reef Indicators (CHS); 61128NR168

2019 JRM INRMP Reference: MIS-1; 5-102, MIS-2; 5-102, MIS-1; 8-64, MIS-2: 8-65, MIS-1; 9-88, MIS-2; 9-88, MIS-1; 11-75, MIS-2; 11-75

MARINE PROTECTED SPECIES MANAGEMENT

Sea Turtle Aerial Surveys in Farallon de Medinilla (FDM)

Nearshore Waters

Location: FDM, CNMI **Period of Performance**: AUG2020 – FEB2024

Project Objective

To design and conduct aerial transect surveys to determine sea turtle and marine mammal identification, abundances, and distributions in the nearshore waters surrounding FDM. To analyze sea turtle and marine mammal identification, abundances, and distributions; and examine spatial and/or temporal (seasonal) variations in the nearshore waters surrounding FDM.

Conservation Benefit

Provide baseline data on the abundance and distribution of sea turtles and marine mammals such that mission-essential training activities can be conducted to avoid and/or minimize potential impacts to these species and/or their habitat. These metrics can be modeled to help improve conservation and management actions to protect sea turtles inhabiting the nearshore waters surrounding FDM.

FY23 Status

- Ongoing project with UOG Sea Grant
- October 2022 survey yielded 50+ turtle sightings on west side of Saipan, four whales at FDM, two whales between FDM and Saipan, and no turtle sightings at FDM or east side of Saipan
- Surveys delayed due to Typhoon Mawar relief efforts performed by the airlines

TERRESTRIAL EXOTIC AND INVASIVE SPECIES MANAGEMENT

Implementation of the Regional Biosecurity Plan of Micronesia and Hawaii (RBP) – CNMI

Location: JRM **Period of Performance:** AUG2022-Ongoing

Project Objective

Implement priority actions from the RBP aimed at: 1) Preventing the spread of invasive species within and in/out of JRM Area of Responsibility (AOR); 2) Foster regional coordination and collaboration; 3) Invasive species management and control; and 4) Strengthening capacity for biosecurity.

Conservation Benefit

Protection of native species, particularly those that are threatened and endangered, from the threat of invasive species within the JRM AOR.

FY23 Status

- Implement arrival and/or pre-departure biosecurity inspections of non-training military equipment and cargo movements to and from the CNMI and inter-island movements to ensure Armed Forces Pest Management Board Technical Guide No. 31 (AFPMB TG-31) cleanliness standards, therefore devoid of biomaterial. Biosecurity inspections conducted by Colorado State University Center of Environmental Management of Military Lands (CSU CEMML) and pre-departure Brown treesnake (BTS) conducted by USDA-Wildlife Services (WS).
    - Navy Mobile Construction Battalion (NMCB) cargo and equipment to/from Tinian to support Seabee public works projects.

        - Eight (8) pre-departure biosecurity and BTS inspection events on Guam for movement to Tinian.
        - One pre-departure biosecurity inspection event on Tinian for movement to Guam
    - U.S. Air Force prepositioned equipment to/from Saipan.
        - One (1) pre-departure biosecurity and BTS inspection event on Guam for equipment movement to Saipan.
    - Farallon de Medinilla (FDM) Operational Range Clearance.
        - One (1) pre-departure biosecurity inspection event on Saipan for equipment movement to FDM.
- Early Detection Surveys (EDS) Conducted
    - Tinian MLA – 5 of 5 All-Taxa Survey sites (including LFA, no detections) (Figure 6)
    - All-Taxa Surveys – AAFB: 10 of 32 sites; NBG: 5 of 30 sites
    - Weed Surveys – AAFB: 3 of 29 sites; NBG: 4 of 34 sites
- Continued interagency coordination and consultation regarding invasive species management and biosecurity concerns within the region (CRB Working Group, LFA Working Group, GISC, GISAC, RISC, CNMI DLNR, Guam Biosecurity Division, CGAPS).

EPR: CHS NISA MAR JRM Implementation of the Regional Biosecurity Plan; 61128NR860

Coconut Rhinoceros Beetle (CRB; *Oryctes rhinoceros*) Surveys, Interdiction, and Monitoring – CNMI (Tinian)

Location: JRM **Period of Performance:** AUG2022 – Ongoing

Project Objective

To implement CRB best management practices: 1) Conduct CRB Early Detection Surveys in Tinian MLA, 2) Implement interdiction/sentinel trapping in MLA, 3) implement CRB awareness for military personnel, and 4) Implement CRB interdiction measures on Guam and coordinate and collaborate with resources partners in the CNMI to prevent the movement of CRB to the CNMI via military cargo and transport.

Conservation Benefit

Prevention of movement and establishment of CRB into the CNMI during military training activities.

FY23 Status

- Deployed 24 CRB panel traps within the Tinian MLA in February 2023 and 9 CRB panel traps at the Tinian Divert construction site in May 2023 for long-term early detection monitoring on a monthly basis (Figure 7)
    - No CRB captures to date
- Provide military personnel with CRB awareness information and sighting protocols
- Pre-departure biosecurity inspections were conducted on all cargo and equipment prior to transport from Guam to the CNMI during military exercises to ensure all items were devoid of bio-material (including CRB)
- Coordination with regional partners (USDA-PPQ, GovGuam Dept. Ag., CNMI DLNR, Hawaii Dept. Ag.)

EPR: CHS NISA MAR JRM Implementation of the Regional Biosecurity Plan; 61128NR860

TERRESTRIAL PROTECTED SPECIES MANAGEMENT

Mariana Fruit Bat Population Monitoring

Location: Tinian MLA **Period of Performance**: MAY2022 – Ongoing

Project Objective

To monitor Mariana fruit bat (*Pteropus mariannus mariannus*/fanihi) abundance and habitat use on the Tinian MLA.

Conservation Benefit

Knowledge of fanihi occurrence in the MLA and use patterns permits implementation of disturbance avoidance measures, and the ability to target habitat protection or enhancement measures.

FY23 Status

- 2nd annual island-wide fanihi count through NAVFAC/CNMI DFW partnership conducted March 9, 2023
- Two NAVFAC/DFW outreach events held in association with the annual count
- Bat colony found on MLA in May 2023; 52 bats counted in June
- Three transects were established to identify signs or evidence of fanihi presence such as dropping or ejecta

EPR: 1 RP MAR JRM Mariana Fruit Bat Monitoring; 61128NRFBM

2019 JRM INRMP Reference: TPS-7; 11-67

Figure 5. Tinian island-wide 2023 fanihi count participants

Conservation of Listed Invertebrates

Location: Tinian MLA **Period of Performance**: MAR2022 – MAR2023

Project Objective

Overall objective is to conserve and manage humped tree snail (*Partula gibba*) populations on the Tinian MLA. Specific objective is to determine if snails continue to occupy the Dump Coke site.

Conservation Benefit

Monitoring results inform decisions regarding the need or urgency for management.

FY23 Status

- Adult and juvenile humped tree snails detected at North Dump Coke site
- No snails detected at South Dump Coke site
- Final report “Endangered Snail Monitoring on the Tinian MLA”, March 2023

EPR: 1 CP JRM Conservation Management of ESA-listed Invertebrates; 61128NR203

2019 JRM INRMP Reference: TPS-5; 11-66

Figure 9. Adult *Partula gibba* at North Dump Coke site, November 2022.

Tinian Forest Bird Monitoring

Location: Tinian MLA **Period of Performance**: MAR2022 – MAR2023

Project Objective

To monitor native forest bird populations with a focus on Tinian monarch (*Monarcha takatsukasae*) and Micronesian megapode (*Megapodius laperouse laperouse*)

Conservation Benefit

Monitoring informs management decisions for conservation of native bird populations. Understanding trends of the Tinian monarch, a single-island endemic species, and ESA-listed Micronesian megapode will indicate if there is a need for more focused management.

FY23 Status

- Micronesian megapode survey conducted May 2023; no megapodes detected.
- Final report "2023 Micronesian Megapode (Megapodius laperouse laperouse) Playback Surveys in the Tinian Military Lease Area", June 2023

EPR: CHS MAR JRM Tinian Forest Bird Monitoring; 61755NR303

2019 JRM INRMP Reference: TPS-4; 11-65

Figure 10. Micronesian megapode playback survey transects, Tinian MLA.

Tinian Monarch Research

Location: Tinian MLA **Period of Performance**: MAR2022 – Ongoing

Project Objective

To conduct ecological studies of Tinian monarch (*Monarcha takatsukasae*)

Conservation Benefit

Knowledge of Tinian monarch biology and ecology will enable effective and efficient management strategies. Results will guide development of future predator control and/or forest restoration and enhancement measures.

FY23 Status

- Preliminary results from MAR2022-MAY2023:
- Mean home range size 0.37 ha (range 0.14-1.10ha, n=25)
- Breeding density 3.85 pairs/ha native limestone forest; 3.1 pairs/ha secondary forest; 1.92 pairs/ha tangantangan
- Adult annual survivorship, 61% (n=162)
- Artificial nest and replica eggs prepped for future rat predation mitigation study
- Final report “Breeding Biology and Habitat Use of the Tinian Monarch (*Monarcha takatsukasae*)”, May 2023
- New Cooperative Agreement awarded to University of Washington in August 2023

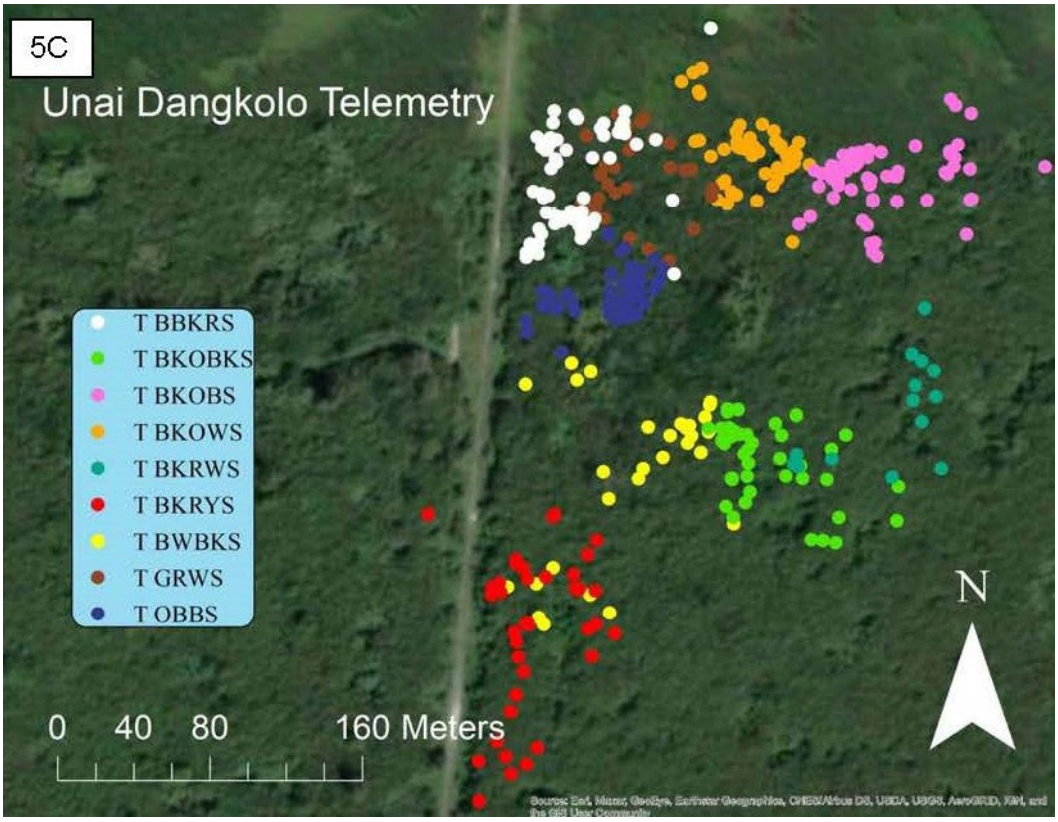

Figure 12. Telemetry points in tangantangan forest habitat (panel 5C). Each color represents a tracked male monarch.

Mariana Common Moorhen Conservation and Management

Location: Tinian MLA **Period of Performance**: AUG2021 – Ongoing

Project Objective

Monitor and investigate Mariana common moorhen (*Gallinula chloropus guami*) populations and habitat use on the Tinian MLA. Communicate and coordinate with conservation partners.

Conservation Benefit

Monitoring informs management decisions for conservation of moorhen populations. Basic ecological research underpins effective management strategies. Effective communication with partners enhances moorhen conservation and recovery efforts on Tinian and range-wide.

FY23 Status

- Lake Hagoi and Bateha wetlands quarterly monitoring ongoing
- Hagoi population trend continues to be stable
- No moorhen detected at Bateha wetlands in FY23
- Hagoi vegetation classification in progress

EPR: 1 S RP MAR CNMI ESA and MBTA Species Management; 61128NR211

2019 JRM INRMP Reference: TPS-3; 11-65

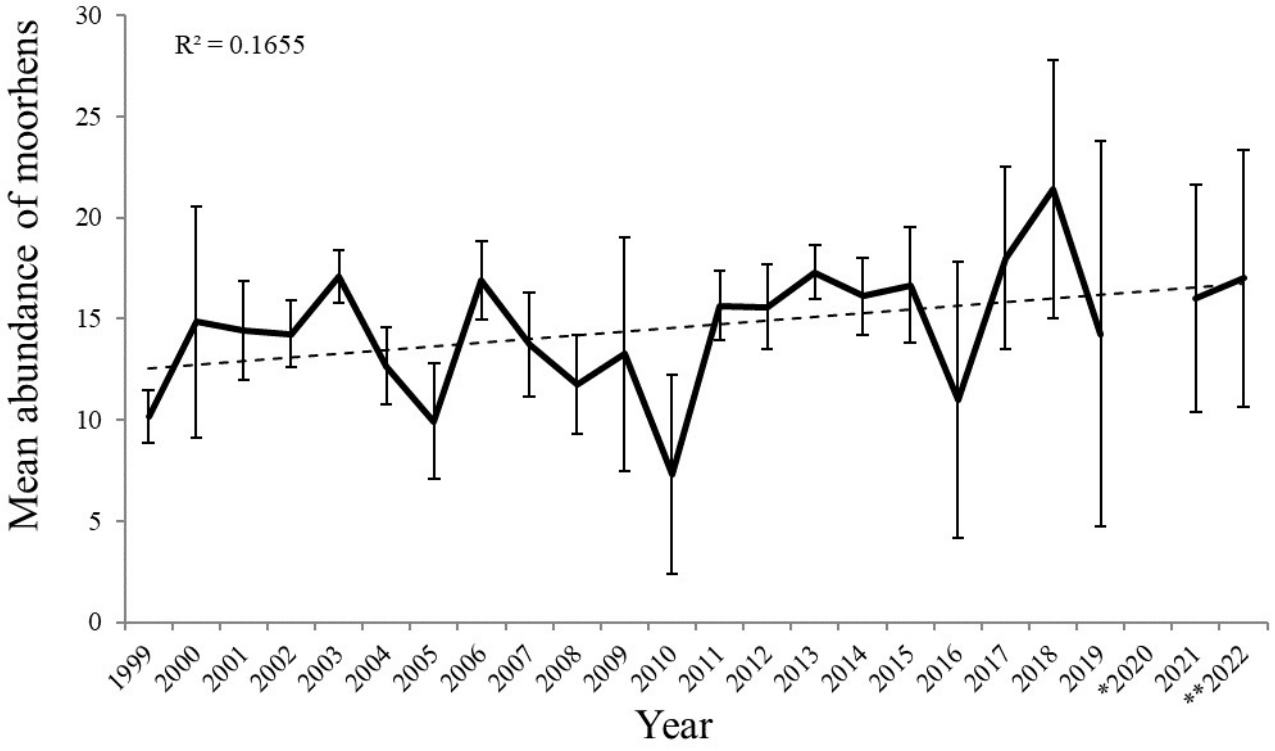

Figure 13. Mean abundance of Mariana Common Moorhen at Lake Hagoi, 1999-2022.

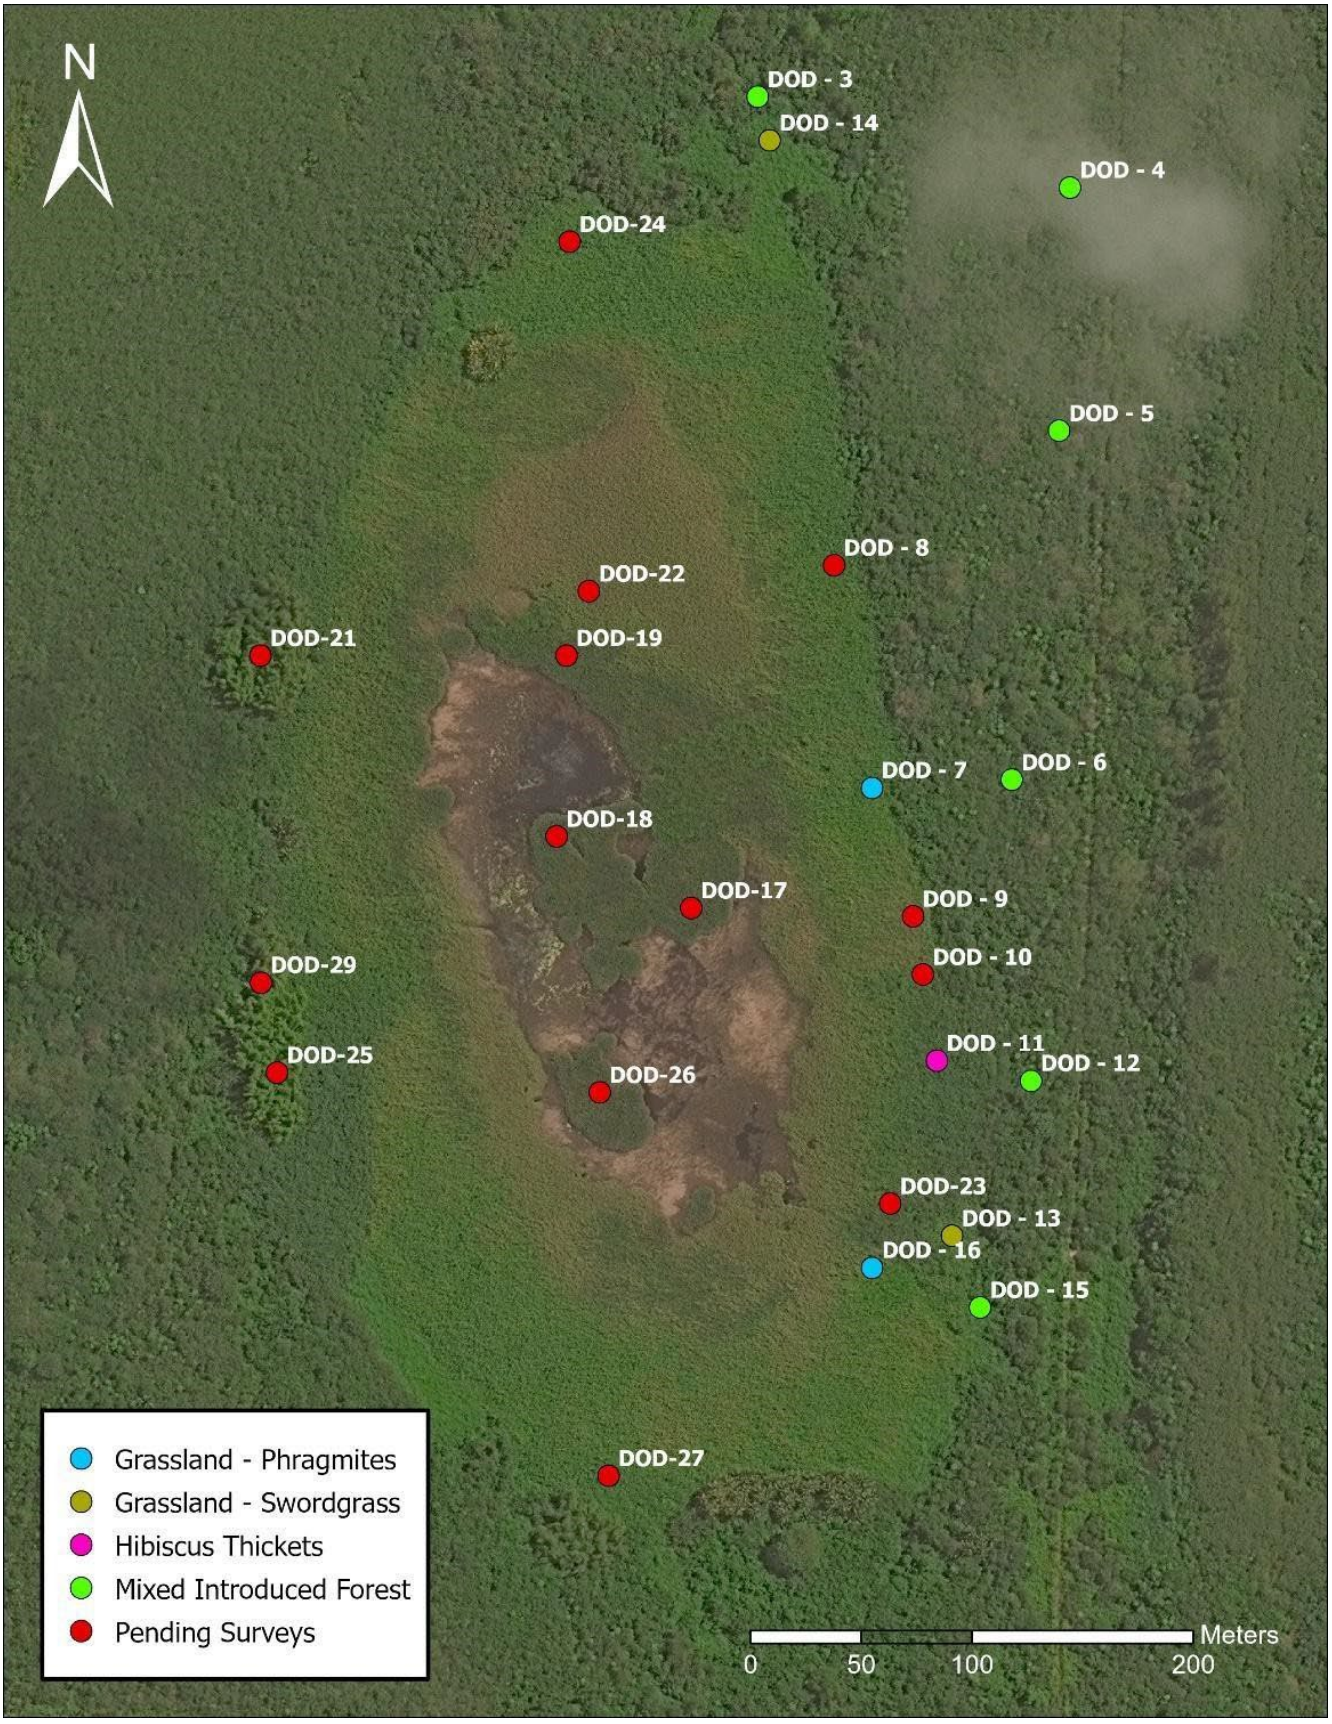

Figure 14. Lake Hagoi vegetation survey progress through Dec 31, 2022.

Sea Turtle Nesting Beach Monitoring and Management

Location: Tinian MLA **Period of Performance**: JUN2021 – Ongoing

Project Objective

Maximize sea turtle nesting opportunities and success on all Tinian MLA beaches

Conservation Benefit

Monitoring provides a measure of success and informs sea turtle conservation and management decisions. Removal of marine debris reduces entanglements and allows successful nest excavation and egg deposition. Secondary benefits accrue to other marine species and ecosystems, and in goodwill with the Tinian public.

FY23 Status

- Twice monthly nesting beach surveys ongoing
- 2,938 lbs of debris removed from 18 MLA beaches
- 2022 results:
- 35 nests, 7 non-nesting emergences
- Tidal inundation impacted 2 nests
- 36 nest inventories were conducted: mean clutch size 80, hatch success 87%, emergence success 85%

EPR: 1 S RP MAR CNMI ESA and MBTA Species Management; 61128NR211

2019 JRM INRMP Reference: TPS-2; 11-64

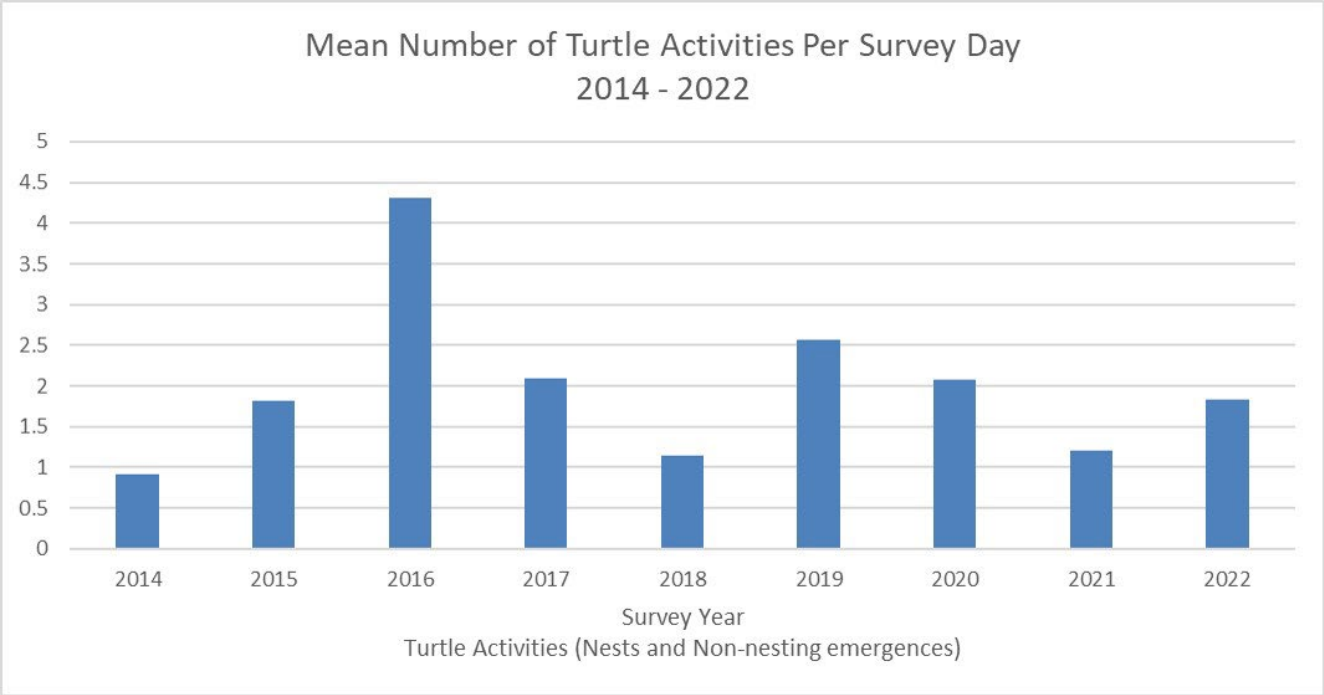

Figure 15. Tinian MLA Green Sea Turtle nesting activity trend, 2014-2022.

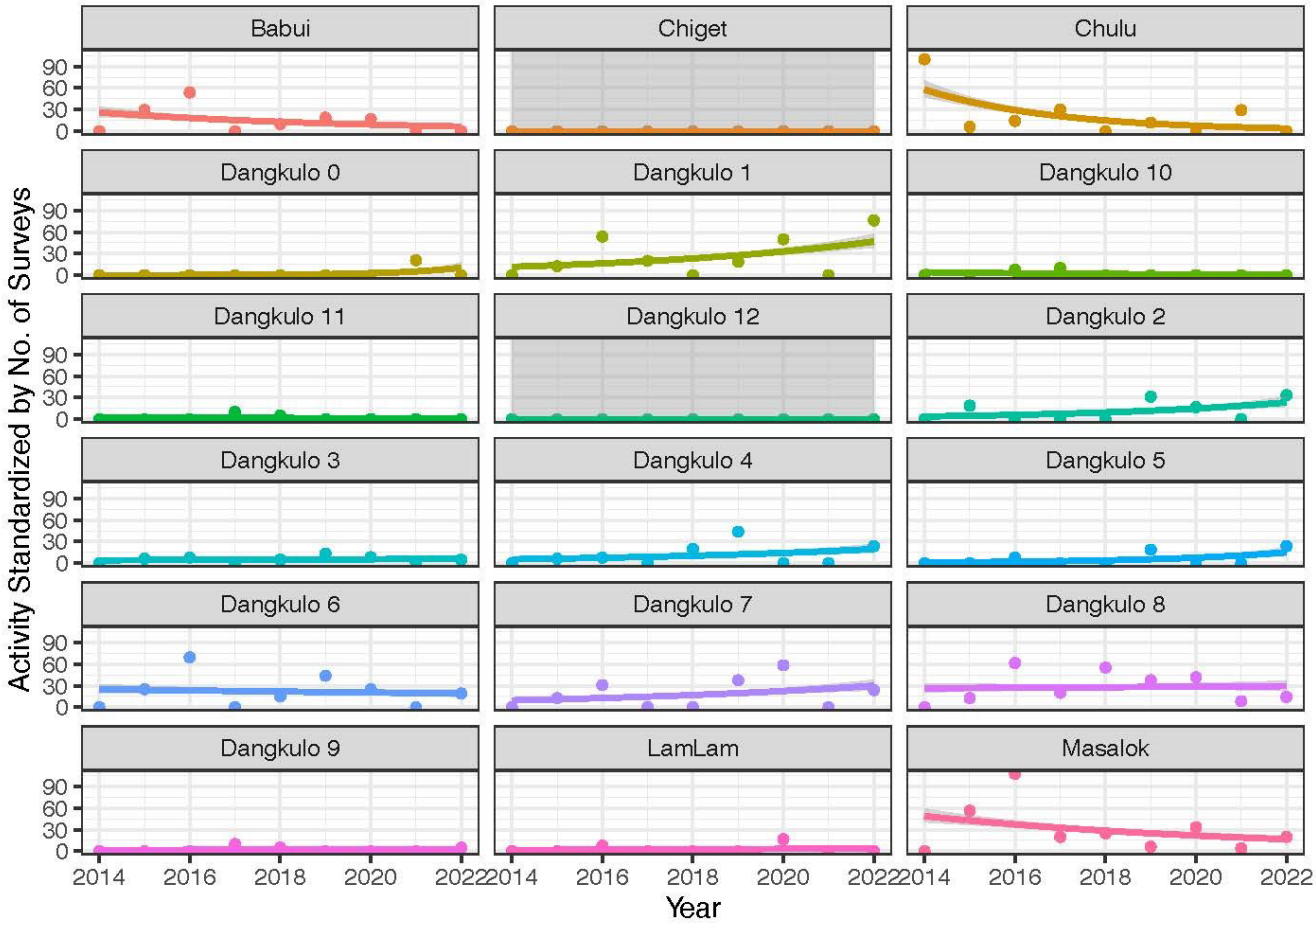

Figure 16. Tinian MLA Green Sea Turtle nesting activity comparison by beach, 2014 - 2022

Conservation of Tinian *Cycas micronesica*

Location: Tinian MLA **Period of Performance**: FEB2023 - Ongoing

Project Objective

To conserve representative plants of Micronesian cycad (*Cycas micronesica*) populations from Guam.

Conservation Benefit

Micronesian cycads on Tinian provide an assurance population which enhances species resiliency to catastrophic events. The Tinian population is suitable for cycad studies and testing of new management strategies.

FY23 Status

- New Cooperator (CEMML) as of February 2023; monthly monitoring and management ongoing.
- As of June 2023, 184 live plants in plots; 60 plants with cycad scale
- 33 ornamentals at 6 sites; 6 plants with cycad scale at 2 sites (Army Hospital and North Field)
- First record of a cycad scale predator on Tinian, February 2023
- UOG Final report “Cycad Monitoring and Management on Joint Region Marianas Area of Responsibility-Tinian Military Lease Area”, January 2023
- NAVFAC in-house report “Status of Ornamental Fadang on the Tinian Military Lease Area”, December 2022

EPR: 1 CP MAR Conservation Management of Tinian Cycads; 61128NR162

2019 JRM INRMP Reference: TPS-1; 11-64

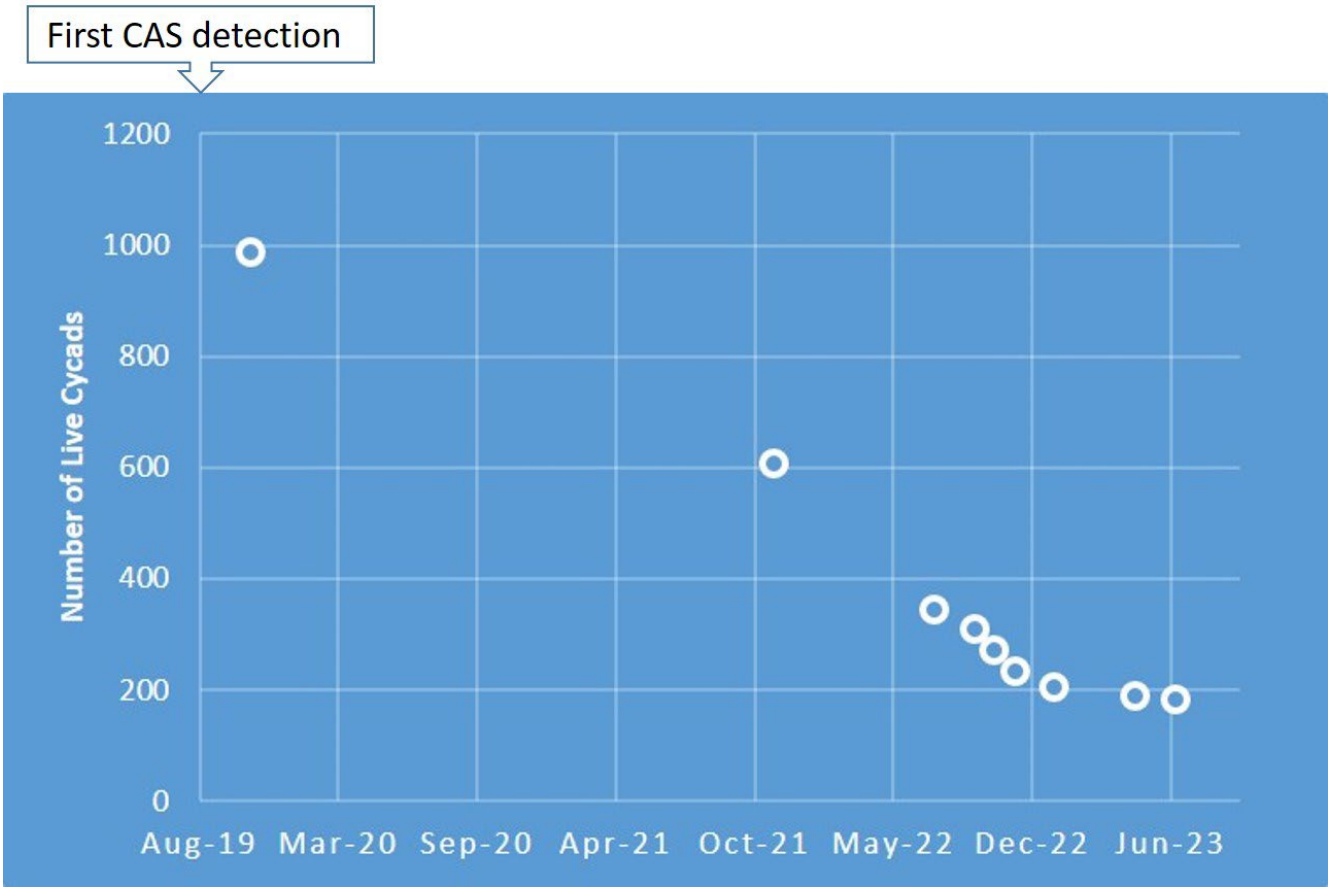

Figure 17. Decline in the number of live Micronesian cycads in the Tinian MLA plots since arrival of cycad Aulacaspis scale.

Forest Enhancement

Location: Tinian MLA **Period of Performance**: AUG2023 - Ongoing

Project Objective

To enhance and restore native forest habitat on Tinian to benefit native flora and fauna including the Tinian monarch and protected species.

Conservation Benefit

Forest restoration and enhancement is an ecosystem-level approach that creates habitat to directly benefit native limestone forest-associated species.

FY23 Status

- Cooperative Agreement awarded to University of Washington in August 2023

EPR: SIKES MAR NBG Tinian Native Forest Enhancement for Listed Species – Climate; 61755NR839

2019 JRM INRMP Reference: THM-1; 11-61

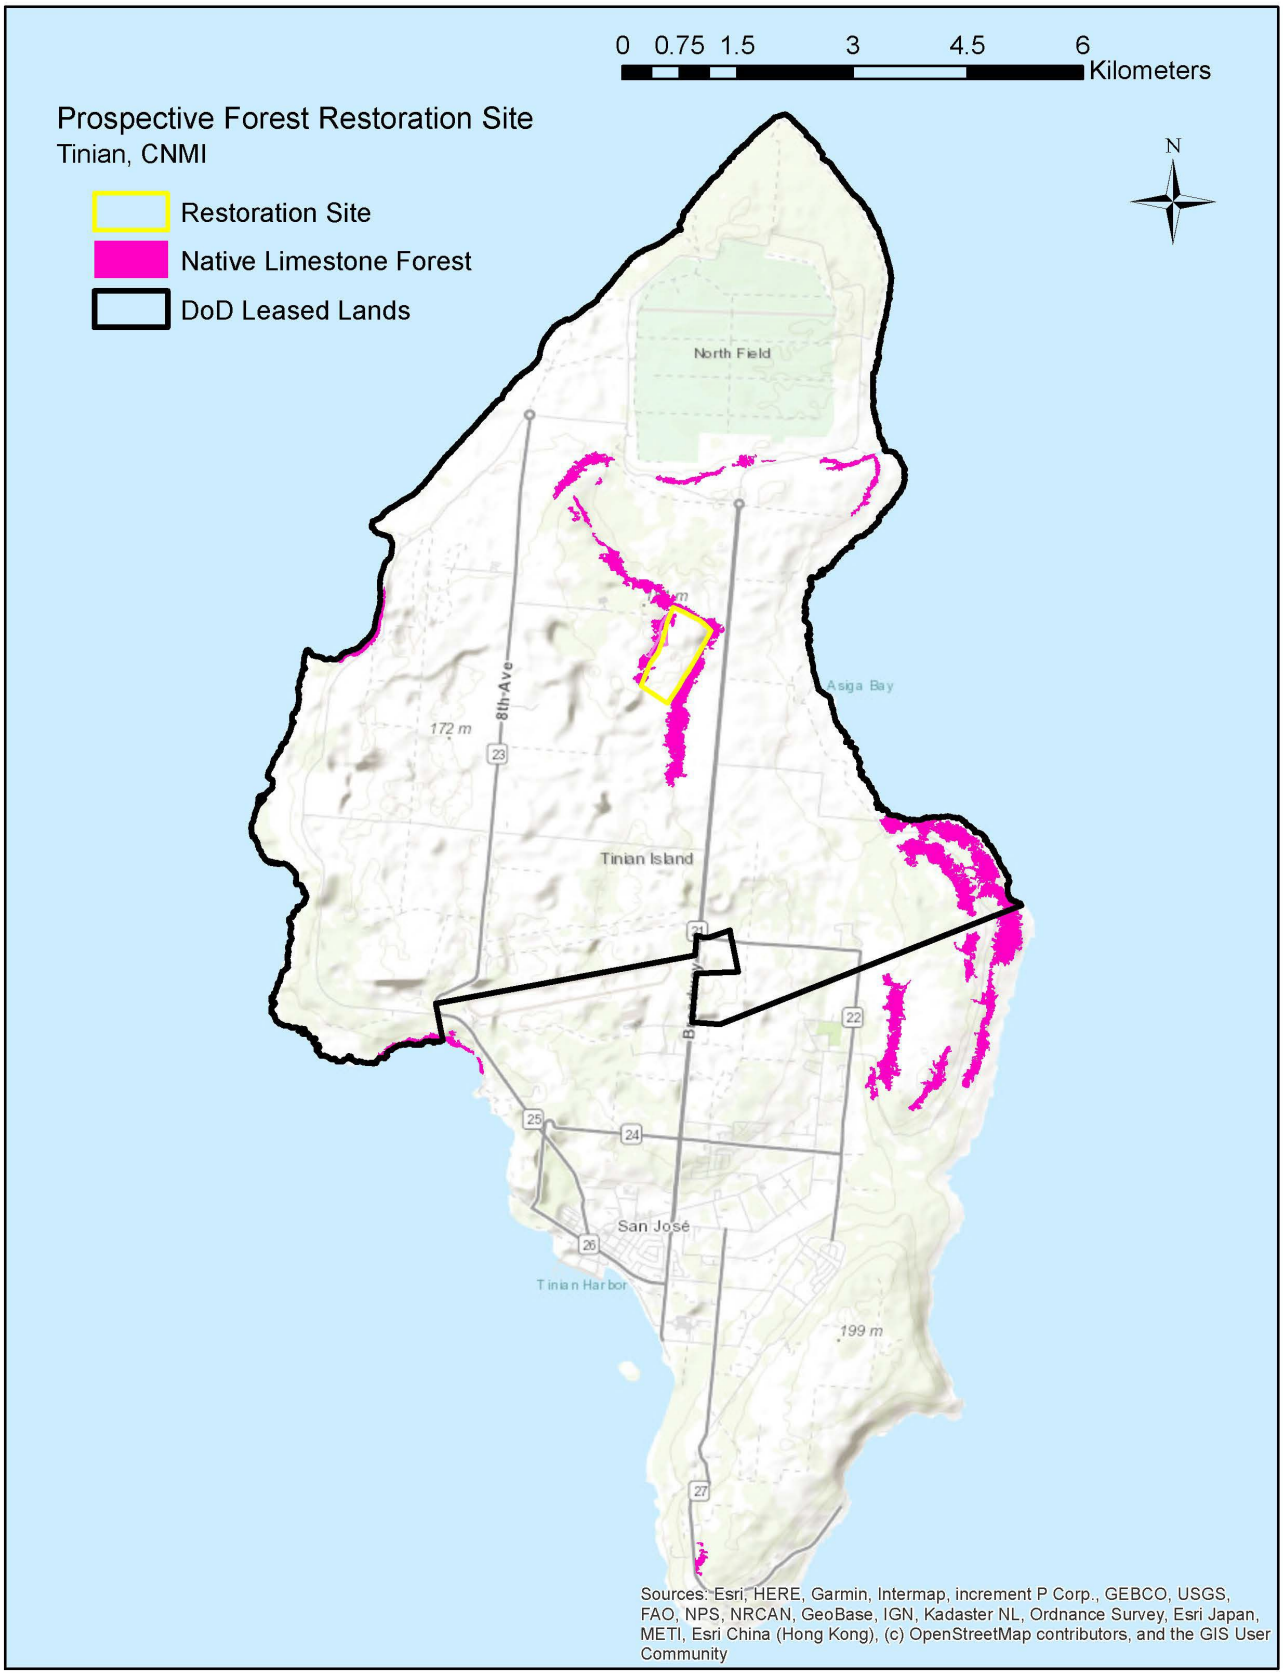

Figure 18. Prospective Forest Restoration Site, Tinian MLA. Final project boundary TBD.

MIGRATORY BIRD MANAGEMENT

Monitoring of MBTA-Listed Bird Species

Location: FDM **Period of Performance**: OCT2022 – SEP2023

Project Objective

To monitor the distribution and abundance of MBTA-listed birds on FDM.

Conservation Benefit

Interactions between training activities and MBTA-listed birds can be minimized.

FY23 Status

- Ground-based counts conducted from three survey stations, May 2023
- Count Totals: Masked Booby, 90; Brown Booby, 123; Red-footed Booby, 147

EPR: 1 RP MAR CNMI ESA and MBTA Species Management; 61128NR211

2019 JRM INRMP Reference: MIG-1; 12-35

TERRESTRIAL NATURAL RESOURCES LAW ENFORCEMENT

Conservation Law Enforcement Program

Location: Guam; Tinian MLA **Period of Performance**: AUG2023 - Ongoing

Project Objective

To establish a conservation law enforcement program for JRM Guam installations and the Tinian MLA.

Conservation Benefit

A conservation law enforcement program will detect and deter unauthorized activity that negatively affects natural resources (terrestrial and marine) on JRM Guam installations and the Tinian MLA.

FY23 Status

- Contract for needs assessment awarded AUG2023

EPR: SIKES MAR JRM Conservation Law Enforcement Program; 61128NR589

2019 JRM INRMP Reference: TLAW-1; 11-69

NATURAL RESOURCES EDUCATION AND OUTREACH

JRM Natural Resources Stewardship Outreach & Public Engagement Program

Location: JRM **Period of Performance**: AUG2022 - Ongoing

Project Objective

To develop outreach products to effectively and efficiently implement a natural resources (NR) stewardship engagement program. This program aims to better educate uniformed and civilian staff, their dependents, JRM contractors, and the general public in order to improve NR stewardship and awareness within JRM AOR.

Conservation Benefit

The development and production of NR education materials and training is a beneficial support to increasing awareness of Threatened and Endangered species, proper stewardship behavior, and threats to local ecosystems.

FY23 Status

- Closed FY2022 CESU with Micronesian Conservation Coalition
    - Final report available
- New CESU Awarded AUG2023 to UOG SeaGrant
    - Continuing production of Environmental Stewardship Website
    - Continuing production of outreach swag items to support Tinian Art Contest and Turtle Educational Outreach Project

EPR: 61128NR962 JRM Natural Resources Stewardship Outreach and Public Engagement Program

2019 JRM INRMP Reference: TEDU-1; 5-91, MEDU-1; 5-104

PACFLT Funded JRM Natural Resources Stewardship Outreach & Public Engagement Program

Location: JRM **Period of Performance:** SEP2020 - Ongoing

Project Objective

Improve NR stewardship and awareness within JRM AOR.

Conservation Benefit

The development and production of NR education materials and training is a beneficial support to increasing awareness of T&E species, proper stewardship behavior, and threats to local ecosystems.

FY23 Status

- Ongoing implementation and expansion of Young Environmental Stewards (YES!) youth educational program
- Ongoing CNMI outreach initiative in conjunction with EPR 61128NR962 JRM Natural Resources Stewardship Outreach and Public Engagement Program
- Native Terrestrial Species and Migratory Bird Nature Journals and Passports delivered OCT2022
- Final version of Invasive Terrestrial Nature Journal and Passport approved JUL2023, currently in production
- Marine Invasive Species Nature Journal and Passport in draft review
- Ongoing development of sea turtle interactive classroom game

EPR: NA- Funding from PACFLT Stewards of the Sea Initiative

Subject: FY23 Joint Region Marianas Natural Resources Metrics - September 2023

Hafa Adai Resource Partners,

I would like to kindly request your participation in the FY23 Joint Region Marianas Natural Resource Metrics meetings. We will be holding in-person meetings on the following dates:

14 Sep: CNMI
20-21 Sep: Guam

More information regarding the venues and agenda will be provided as we get closer to the meeting dates.

Please mark your calendars and have a great summer!

Best,

Jennifer Cruce Horeg
Natural Resources Program Supervisor / Section 7 Lead
Naval Facilities Engineering Systems Command Marianas (NAVFACMAR)

Table E.1-1. Mammals Recorded on JRM Sites and within Nearshore Waters

Common Name(s)/ Chamorro Name	*Scientific Name*	*Federal Status*	*Guam Status*	*CNMI Status*	*Island*	*Origin*	*Occurrence*
Common bottlenose dolphin/Tuninos	*Tursiops truncatus*	MMPA	--	--	Guam Tinian FDM	N	Y
Cuvier's beaked whale/ Tuninos	*Ziphius cavirostris*	MMPA	SOGCN	--	Guam Tinian FDM	N	Y Y P

Notes: Chamorro names from Government of Guam (GovGuam) (2009), Liske-Clark (2015), U.S. Fish and Wildlife Service (2015).

Key: Name

*The Chamorro alphabet does not recognize the letter 'C'. *Carabao is the English common name for the Asiatic Water Buffalo, spelled as 'Karabao' in Chamorro. Chamorro names from GovGuam (2009), Liske-Clark (2015), USFWS (2015).

Status (Federal, GovGuam, and Commonwealth of the Norther Marianas Islands [CNMI])

-- = not listed; E = listed as endangered under the federal Endangered Species Act (ESA) or by GovGuam; T = listed as threatened under the ESA or by GovGuam; T-E = listed as threatened/endangered by CNMI government; D-MMPA = listed as depleted under the Marine Mammal Protection Act; SOGCN = listed as Species of Greatest Conservation Need by GovGuam or CNMI Government.

Origin

N = native; Nn = non-native, introduced; V = vagrant.

Occurrence

-- = Not possible due to absence of habitat/food resources; Y = yes, known to occur; P = potential for occurrence; PU = potential for occurrence, but unlikely; Ex = extirpated.

Occurrences are approximated to Joint Region Marianas (JRM)-administered submerged lands, but some fishery-based and acoustic-based records have imprecise locations.

(1)Humpback whale Western North Pacific Distinct Population Segment (DPS).

Land hermit crab/ Umang	*Coenobita brevimanus*	--	--	--	Guam Tinian	N	Y
Land crab, red-claw crab/Panglao	*Cardisoma carnifex*	--	--	SOGCN	Tinian	N	Y
Land crab/Panglao	*Discoplax hirtipes*	--	--	--	Tinian	N	Y
Mangrove crab/ Panglao	*Scylla serrata*	--	--	--	Guam	N	Y
Flatworms							
New Guinea flatworm/ Tagulan tano	*Platydemus manokwari*	--	--	--	Guam Tinian	Nn	Y
Butterflies (Chamorro = Ababang)							
Brown skipper	*Badamia exclamationis*	--	--	--	Guam	N	Y
Common migrant, lemon emigrant	*Catopsilia pomona*	--	--	--	Guam Tinian	N	Y
Plains cupid or cycad blue	*Luthrodes pandava*	--	--	--	Guam Tinian	Nn	Y
Monarch	*Danaus plexippus*	--	--	--	Guam	N	Y
Banana skipper	*Erionota thrax*	--	--	--	Guam Tinian	Nn	Y
Blue-banded king crow	*Euploea eunice*	--	--	--	Guam Tinian	N	Y
Three-spot grass yellow	*Eurema blanda*	--	--	--	Guam Tinian	N	Y
Guardian or Malaysian eggfly	*Hypolimnas anomala*	--	--	--	Guam Tinian	N	Y
Blue moon or great eggfly	*Hypolimnas bolina*	--	--	--	Guam Tinian	N	Y
Mariana eight-spot butterfly	*Hypolimnas octocula marianensis*	E	--	--	Guam	N	Y
Bean butterfly	*Lampides boeticus*	--	--	--	Guam	N	Y
Common evening brown	*Melanitis leda*	--	--	--	Guam	N	Y
Common mormon or black citrus swallowtail	*Paplio polytes*	--	--	--	Guam Tinian	Nn	Y
Grassdart	*Taractrocera ziclea*	--	--	--	Guam	Nn	Y
Mariana wandering butterfly	*Vagrans egistina*	E	SOGCN	SOGCN	Guam	N	Ex
Lesser grass blue	*Zizina otis*	--	--	--	Guam	N	Y
Tiny grass blue	*Zizula hylax*	--	--	--	Guam	N	Y
Wasps							
Tropical paper wasp/Gonggong	*Polistes stigma*	--	--	--	Guam Tinian	N	Y
Erythrina gall wasps/Gonggong	*Quadrastichus erythrinae*	--	--	--	Guam	Nn	Y
Greater banded hornet/ Gonggong	*Vespa tropica*	--	--	--	Guam	Nn	Y
Other Insects							
Weevil/None	*Acythopeus burkhartorum*	--	--	--	Guam	Nn	Y

Table E.4-1. Terrestrial Invertebrates Observed on JRM Sites

*Common Name(s)/ Chamorro Name**	*Scientific Name*	*Federal Status*	*Guam Status*	*CNMI Status*	*Island*	*Origin*	*Occurrence*
Cycad aulacaspis scale/None	*Aulacaspis yasumatsui*	--	--	--	Guam	Nn	Y
Longhorn beetle/None	*Dihammus marianarum*	--	--	--	Guam	N	Y
Leaf miner/None	*Erechthias* sp.	--	--	--	Guam	Nn	Y
Stem-boring moth/ Babali	*Melittia oedipus*	--	--	--	Guam	Nn	Y
Coconut rhinoceros beetle/None	*Oryctes rhinoceros*	--	--	--	Guam	Nn	Y
Scarab beetle/None	*Protaetia orientalis*	--	--	--	Guam	Nn	Y
Scarab beetle/None	*Protaetia pryeri*	--	--	--	Guam	Nn	Y
Guam karst katydid/None	*Salomona guamensis*	--	--	--	Guam	N	Y
Little fire ant/None	*Wasmannia auropunctata*	--	--	--	Guam	Nn	Y
Land Snails							
Giant African snail/Akaleha	*Achatina fulica*	--	--	--	Guam Tinian	Nn	Y
American lined tree snail/Akaleha	*Drymaeus multilineatus*	--	--	--	Guam	Nn	Y
Rosy wolf snail/ Akaleha	*Euglandina rosea*	--	--	--	Guam Tinian	Nn	Y
None/Akaleha	*Gonaxis* sp.	--	--	--	Guam	Nn	Y
Cinnamon bun snail/ Akaleha	*Satsuma succincta*	--	--	--	Guam	Nn	Y
Tree Snails							
Humped tree snail/Akaleha	*Partula gibba*	E	E, SOGCN	SOGCN	Guam Tinian	N	Y
Lanford's tree snail/ Akaleha	*Partula langfordi*	E			CNMI		P
Guam tree snail/ Akaleha	*Partula radiolata*	E	E, SOGCN	--	Guam	N	Y
Mount Alifan tree snail/Akaleha	*Partula salifana*	--	E	--	Guam	N	Ex
Fragile tree snail/ Akaleha	*Samoana fragilis*	E	E, SOGCN	SOGCN	Guam	N	Y
Cinnamon bun snail/ Akaleha	*Satsuma mercatoria*	--	--	--	Guam	Nn	Y

Notes: [1] Many more species are known from JRM lands, but this table highlights only the species or groups specifically mentioned in regulatory contexts. If JRM projects are developed that differentially affect other specific species, these will be added to the table for planning and tracking.
[2] Chamorro names from GovGuam (2009) and USFWS (2015).

Key: Status (Federal, GovGuam, and CNMI)
-- = not listed; E = endangered under the federal Endangered Species Act (ESA) or by GovGuam; T = listed as threatened under the ESA or by GovGuam; T-E = listed as threatened/endangered by CNMI government; SOGCN = Species of Greatest Conservation Need.
Origin
N = native; Nn = non-native, introduced.
Occurrence
-- = Not possible due to absence of habitat/food resources; Y = yes, known to occur; P = potential for occurrence; PU = potential for occurrence, but unlikely; Ex = extirpated.

E.5 – Terrestrial Plants

Table E.5-1. Plants Observed on JRM Sites[1]

Common Name(s)/ Chamorro Name[2]	*Scientific Name*	*Federal Status*	*Guam Status*	*CNMI Status*	*Island*	*Origin*	*Occurrence*
Mallow/Matbas	*Abutilon indicum*	--	--	--	Guam Tinian FDM	Nn	Y
Formosan koa/ Sosugi or Boiffuring	*Acacia confusa*	--	--	--	Guam Tinian	Nn	Y
None/None	*Achyranthes canescens*	--	--	--	Guam FDM	N	Y
Golden leather fern, swampfern or marsh fern/Langayao	*Acrostichum aureum*	--	--	--	Guam	N	Y
None/Mapunyao	*Aglaia mariannensis*	--	--	--	Guam Tinian	N	Y
None/Sumak or Suma	*Aidia cochinchinensis*	--	--	--	Guam Tinian	N	Y
Siris tree/Tronkon kalakas	*Albizia lebbeck*	--	--	--	Guam Tinian	Nn	Y
Giant taro/Piga	*Alocasia macrorrhizos*	--	--	--	Guam	Nn	Y
Slender amaranth/None	*Amaranthus viridis*	--	--	--	Guam Tinian FDM	Nn	Y
Custard apple/None	*Annona reticulata*	--	--	--	Guam Tinian	Nn	Y
Chain-of-love vine, coral creeper vine/Flores kadena	*Antigonon leptopus*	--	--	--	Guam Tinian	Nn	Y
Betelnut palm/None	*Areca catechu*	--	--	--	Guam Tinian	Nn	Y
Seedless Breadfruit/Lemai	*Artocarpus altilis*	--	--	--	Guam Tinian	Nn	Y
Seeded breadfruit/Dukduk	*Artocarpus mariannensis*	--	--	--	Guam Tinian	N	Y
Giant reed/None	*Arundo donax*	--	--	--	Guam	Nn	Y
Bird's nest fern/Galak Dangkulo, Galak	*Asplenium nidus*	--	--	--	Guam	Nn	Y
Pickle tree/None	*Averrhoa bilimbi*	--	--	--	Guam Tinian	Nn	Y
Common bamboo/Piao or Piao Palaoan	*Bambusa vulgaris*	--	--	--	Guam Tinian	Nn	Y
Fish kill tree/Puting	*Barringtonia asiatica*	--	--	--	Guam	Nn	Y
None/Langaasag or Putat	*Barringtonia racemosa*	--	--	--	Guam	N	Y
Spanish needles/None	*Bidens pilosa*	--	--	--	Guam Tinian	Nn	Y
None/Gausali	*Bikkia tetrandra*	--	--	--	Guam Tinian FDM	N	Y
None/Dafao	*Boerhavia albiflora*	--	--	--	FDM	N	Y
None/Dafao	*Boerhavia repens*	--	--	--	FDM	N	Y
Buffalo grass/None	*Brachiaria mutica = Urochloa mutica*	--	--	--	Guam	Nn	Y

Table E.5-1. Plants Observed on JRM Sites[1]

Common Name(s)/ Chamorro Name[2]	*Scientific Name*	*Federal Status*	*Guam Status*	*CNMI Status*	*Island*	*Origin*	*Occurrence*
None/Siboyas halumtano	*Bulbophyllum guamense*	T	--	--	Guam	N	Y
None/Qualitay, kualitai	*Callicarpa candicans*	--	--	--	Guam Tinian FDM	N	Y
Alexandrian laurel or Palomaria or Mastwood/Daog or Daok	*Calophyllum inophyllum*	--	--	--	Guam Tinian FDM	N	Y
Ilangilang	*Cananga odorata*	--	--	--	Guam	Nn	Y
Spiny caper/Atkaparas	*Capparis cordifolia*	--	--	--	Guam Tinian FDM	N	Y
Marianne Caper/Atkaparas	*Capparis mariana*	--	--	--	Guam Tinian	N	Y
Caper/Atkaparas	*Capparis spinosa*	--	--	--	Guam Tinian FDM	Nn	Y
Papaya/None	*Carica papaya*	--	--	--	Guam Tinian FDM	Nn	Y
Ironwood/Gagu or Gago	*Casuarina equisetifolia*	--	--	--	Guam Tinian	N	Y
None/None	*Ceratopteris thalictroides*	--	--	--	Guam	N	Y
None/Chiute	*Cerbera dilatata*	--	--	--	Guam Tinian	N	Y
Inkberry/Tintan-china	*Cestrum diurnum*	--	--	--	Guam Tinian	N	Y
Burr grass/None	*Cenchrus echinatus*	--	--	--	Guam	Nn	Y
Siam weed or jack-in-the-bush/None	*Chromolaena odorata*	--	--	--	Guam Tinian	Nn	Y
Glory bower/None	*Clerodendrum inerme*	--	--	--	Guam	Nn	Y
Ivy Gourd/None	*Coccinia grandis*	--	--	--	Guam	Nn	Y
Coconut palm/Trunkon niyok	*Cocos nucifera*	--	--	--	Guam Tinian FDM	Nn	Y
None/None	*Coelogyne guamensis*	--	--	--	Guam	N	Y
Crinum lily/Piga-palayi	*Crinum asiaticum*	--	--	--	FDM	N	Y
Tree fern/Satsa	*Cyathea lunulata*	--	E, SOGCN	--	Guam	N	Y
None/Fadang	*Cycas micronesica*	T	SOGCN	--	Guam Tinian	N	Y
Bermuda grass/None	*Cynodon dactylon*	--	--	--	Guam Tinian FDM	Nn	Y
None/Gulos	*Cynometra ramiflora*	--	--	--	Guam Tinian	N	Y
Smallflower Umbrella Sedge/None	*Cyperus difformis*	--	--	--	Guam	Nn	Y
None/None	*Cyperus javanicus*	--	--	--	FDM	N	Y
None/None	*Cyperus ligularis*	--	--	--	Guam	Nn	Y

Table E.5-1. Plants Observed on JRM Sites[1]

Common Name(s)/ Chamorro Name[2]	*Scientific Name*	*Federal Status*	*Guam Status*	*CNMI Status*	*Island*	*Origin*	*Occurrence*
Flame tree/Atbut or Arbol-del-Fuego	*Delonix regia*	--	--	--	Guam Tinian	Nn	Y
None/None	*Dendrobium guamense*	T	--	--	Guam Tinian	N	Y
None/None	*Dendrocnide latifolia*	--	--	--	Guam Tinian	N	Y
None/None	*Digitaria gaudichaudii*	--	--	--	Guam FDM	N	Y
None/None	*Digitaria radicosa*	--	--	--	FDM	Nn	Y
None/Otot or Otug	*Discocalyx megacarpum*	--	--	--	Guam	N	Y
None/None	*Egeria densa*	--	--	--	Guam	N	Y
None/Joga	*Elaeocarpus joga*	--	--	--	Guam Tinian	N	Y
None/None	*Elatostema calcareum*	--	--	--	Guam Tinian	N	Y
Coral tree/Gaogao	*Erythrina variegata* var. *orientalis*	--	--	--	Tinian	N	Y
None/Aagan or aabang	*Eugenia bryanii*	E	--	--	Guam	N	Y
None/Agatelang or Aghotoleng	*Eugenia palumbis*	--	--	--	Guam Tinian	N	Y
Beach cherry/Aagan or aabang	*Eugenia reinwardtiana*	--	--	--	Guam Tinian FDM	N	Y
Garden spurge/ Golandrina	*Euphorbia hirta*	--	--	--	Guam Tinian FDM	Nn	Y
Blinding tree/None	*Excoecaria agallocha*	--	--	--	Guam FDM	N	Y
None/None	*Fagraea berteriana*	--	--	--	Guam	N	Y
Banyan/Nunu	*Ficus prolixa*	--	--	--	Guam Tinian	N	Y
Dyer's fig/Hodda	*Ficus tinctoria*	--	--	--	Guam Tinian	N	Y
Banyan/Trunkon taotaomona	*Ficus* spp.	--	--	--	Guam Tinian FDM	N	Y
Tropical fimbry/None	*Fimbristylis cymosa*	--	--	--	Guam Tinian FDM	N	Y
False Rattan/ Beyuko halomtano	*Flagellaria indica*	--	--	--	Guam	N	Y
None/None	*Glochidion marianum*	--	--	--	Guam Tinian	N	Y
Cotton/Algodon	*Gossypium hirsutum*	--	--	--	FDM	Nn	Y
None/None	*Meiogyne cylindrocarpa*	--	--	--	Guam Tinian	N	Y
Zebrawood/Panao	*Guettarda speciosa*	--	--	--	Guam Tinian	N	Y
None/Pau dedu	*Hedyotis laciniata*	E	--	--	Guam	N	Y
None/Pau dedu	*Hedyotis megalantha*	E	--	--	Guam	N	Y

Table E.5-1. Plants Observed on JRM Sites[1]

Common Name(s)/ Chamorro Name[2]	*Scientific Name*	*Federal Status*	*Guam Status*	*CNMI Status*	*Island*	*Origin*	*Occurrence*
None/Ufa halumtano	*Heritiera longipetiolata*	E	E, SOGCN	--	Guam Tinian	N	Y
Lantern tree/None	*Hernandia nymphaeifolia*	--	--	--	Guam	Nn	Y
None/Nonag	*Hernandia sonora*	--	--	--	Guam Tinian	N	Y
Tangle-head/None	*Heteropogon contortus*	--	--	--	Guam FDM	Nn	Y
Sagisi palm/None	*Heterospathe elata*	--	--	--	Guam	Nn	Y
None/None	*Hydrilla verticillata*	--	--	--	Guam	Nn	Y
Swamp morning glory/None	*Ipomoea aquatica*	--	--	--	Guam Tinian	Nn	Y
Beach morning glory/Alalag-tasi	*Ipomoea pes-caprae*	--	--	--	Guam Tinian FDM	N	Y
Morning glory/None	*Ipomoea triloba*	--	--	--	Guam Tinian	Nn	Y
None/Ifit	*Intsia bijuga*	--	--	--	Guam Tinian	N	Y
None/None	*Ixora triantha*	--	--	--	Guam Tinian	N	Y
Lantana/None	*Lantana camara*	--	--	--	Guam Tinian	Nn	Y
None/Lesaga	*Lepturus repens*	--	--	--	Guam FDM	N	Y
Hedge acacia/Tangantangan	*Leucaena leucocephala*	--	--	--	Guam Tinian FDM	Nn	Y
None/None	*Luisia teretifolia*	--	--	--	Guam	N	Y
Cat's tail or Disciplina/None	*Lycopodium phlegmaria var. longifolium*	--	--	T-E	Guam	N	Y
None/Pengua	*Macaranga thompsonii*	--	--	--	Guam Tinian	N	Y
None/Chopak	*Mammea odorata*	--	--	--	Guam Tinian	N	Y
None/None	*Maesa walkeri*	T	--	--	Guam	N	Y
Mango/Mangga	*Mangifera indica*	--	--	--	Guam Tinian	Nn	Y
None/Luluhut	*Maytenus thompsonii*	--	--	--	Guam Tinian	N	Y
Guinea Grass/None	*Megathyrsus maximus = Panicum maximum*	--	--	--	Guam Tinian	Nn	Y
Alum/None	*Melanolepis multiglandulosa*	--	--	--	Guam Tinian	N	Y
Melastoma/Gafao	*Melastoma malabathricum*	--	--	--	Guam Tinian	N	Y
None/Sayafe	*Melochia villosissima*	--	--	--	Guam FDM	N	Y
Bitter vine, mile-a-minute vine/None	*Mikania micrantha*	--	--	--	Guam	Nn	Y

Table E.5-1. Plants Observed on JRM Sites[1]

Common Name(s)/ Chamorro Name[2]	*Scientific Name*	*Federal Status*	*Guam Status*	*CNMI Status*	*Island*	*Origin*	*Occurrence*
Climbing hempweed/None	*Mikania scandens*	--	--	--	Guam Tinian	Nn	Y
None/Gulo	*Millettia pinnata*	--	--	--	Guam Tinian FDM	N	Y
Giant sensitive plant or Nila grass/Singbiguin sasa	*Mimosa diplotricha*	--	--	--	Guam Tinian	Nn	Y
Sensitive plant/Betguen sosa	*Mimosa pudica*	--	--	--	Guam Tinian	Nn	Y
Wild sea daisy/None	*Melanthera biflora*	--	--	--	Guam FDM	Nn	Y
None/Faniok	*Merrilliodendron megacarpum*	--	SOGCN	--	Guam Tinian	N	Y
Swordgrass/Neti	*Miscanthus floridulus*	--	--	--	Guam	N	Y
Indian mulberry/Lada	*Morinda citrifolia*	--	--	--	Guam Tinian FDM	N	Y
None/Seyaihagon or Maisa ulu	*Nervilia jacksoniae*	T	--	--	Guam	N	Y
None/Seyaihagon or Maisa ulu	*Nervilia platychila*	--	--	--	Guam	N	Y
Nypa palm/Nipa	*Nypa fruticans*	--	--	--	Guam	Nn	Y
Lipstick Tree/Langiti	*Ochrosia mariannensis*	--	--	--	Guam Tinian	N	Y
None/Fagot	*Ochrosia (=Neisosperma) oppositifolia*	--	--	--	Guam Tinian	N	Y
None/None	*Oldenlandia strigulosa*	--	--	--	Guam Tinian FDM	Nn	Y
St. Thomas lidpod/None	*Operculina turpethum* var. *ventricosa*	--	--	--	Guam Tinian FDM	Nn	Y
Screw pine/Pahong	*Pandanus dubius*	--	--	--	Guam Tinian	N	Y
Textile Screwpine/Akgak	*Pandanus tectorius*	--	--	--	Guam Tinian	N	Y
Kodo Millet/None	*Paspalum distichum*	--	--	--	Tinian	N	Y
Corky passionflower/None	*Passiflora suberosa*	--	--	--	Guam	Nn	Y
None/Nigas	*Pemphis acidula*	--	--	--	Guam Tinian	Nn	Y
Mission grass	*Pennisetum polystachion*	--	--	--	Guam Tinian	Nn	Y
Elephant grass	*Pennisetum purpureum*	--	--	--	Guam Tinian	Nn	Y
Tall reed/karriso	*Phragmites karka*	--	--	--	Guam	N	Y
Fly-Roost/Maigo-lalo	*Phyllanthus amarus*	--	--	--	Guam Tinian FDM	Nn	Y

Table E.5-1. Plants Observed on JRM Sites[1]

Common Name(s)/ Chamorro Name[2]	*Scientific Name*	*Federal Status*	*Guam Status*	*CNMI Status*	*Island*	*Origin*	*Occurrence*
Safford's Leafflower/None	*Phyllanthus saffordii*	E	--	--	Guam	N	Y
Wild cape gooseberry/ Tomate chaca	*Physalis angulata*	--	--	--	Guam Tinian FDM	Nn	Y
Bay rum tree/None	*Pimenta racemosa*	--	--	--	Guam	Nn	Y
None/Umumu	*Pisonia grandis*	--	--	--	Guam Tinian FDM	N	Y
Madras thorn/None	*Pithecellobium dulce*	--	--	--	Tinian	Nn	Y
None/None	*Pluchea indica*	--	--	--	Guam Tinian	N	Y
None/Mamaka	*Polygonum minus*	--	--	--	Guam	N	Y
None/None	*Polypodium punctatum*	--	--	--	Guam Tinian	N	Y
None/Pepega	*Polyscias grandifolia*	--	--	--	Guam Tinian	N	Y
None/None	*Portulaca australis*	--	--	--	FDM	Nn	Y
Sea purslane/None	*Portulaca lutea*	--	--	--	Guam Tinian FDM	Nn	Y
Purslane/Botdolagas	*Portulaca oleracea*	--	--	--	Guam Tinian FDM	Nn	Y
Curly-leaf pondweed/None	*Potamogeton crispus*	--	--	--	Guam	Nn	Y
False elder/Ahgao	*Premna obtusifolia*	--	--	--	Guam Tinian	N	Y
None/Ahgao	*Premna serratifolia*	--	--	--	Guam FDM	N	Y
None/None	*Procris pedunculata*	--	--	--	Guam	N	Y
None/ Aplokating-palaoan	*Psychotria malaspinae*	E	--	--	Guam	N	P
None/Aploghating or Aplokhating	*Psychotria mariana*	--	--	--	Guam Tinian	N	Y
Blackweed/Yerbas babui	*Ruellia blechum*	--	--	--	Guam Tinian FDM	Nn	Y
Blackweed/Yerbas babui	*Ruellia prostrata*	--	--	--	?	Nn	Y
Wild sugarcane/Cana dulce	*Saccharum spontaneum*	--	--	--	Guam	N	Y
Half flower, beach naupaka/Nanaso	*Scaevola taccada*	--	--	--	Guam Tinian	N	Y
Bulrush/None	*Schoenoplectus litoralis*	--	--	--	Guam Tinian	N	Y
Nutrush/None	*Scleria polycarpa*	--	--	--	Guam	N	Y
None/None	*Senna alata*	--	--	--	Guam Tinian	Nn	Y

Table E.5-1. Plants Observed on JRM Sites[1]

Common Name(s)/ Chamorro Name[2]	*Scientific Name*	*Federal Status*	*Guam Status*	*CNMI Status*	*Island*	*Origin*	*Occurrence*
Fire tree/Hayun lago	*Serianthes nelsonii*	E	E, SOGCN	T-E	Guam	N	Y
Seaside purslane/Chara	*Sesuvium portulacastrum*	--	--	--	Guam Tinian FDM	N	Y
None/Biringenas halumtano	*Solanum guamense*	E	--	--	Guam Tinian	N	PU
Yellow necklacepod/Bangil	*Sophora tomentosa*	--	--	--	Guam	N	Y
African tulip tree/Apar	*Spathodea campanulata*	--	--	--	Guam Tinian	Nn	Y
Creeping Oxeye or Singapore Daisy/None	*Sphagneticola trilobata*	--	--	--	Guam	Nn	Y
Indian snakeweed/None	*Stachytarpheta indica*	--	--	--	Guam Tinian	Nn	Y
False verbena/None	*Stachytarpheta jamaicensis*	--	--	--	Guam Tinian FDM	Nn	Y
None/None	*Stachytarpheta urticifolia*	--	--	--	Guam Tinian	Nn	Y
None/Abubo	*Stictocardia tiliifolia*	--	--	--	Guam Tinian	N	Y
Beach hibiscus/Pago	*Taliparti (=Hibiscus) tiliaceum*	--	--	--	Guam Tinian FDM	N	Y
Cuban Pink Trumpet Tree or White Cedar/None	*Tabebuia pallida*	--	--	--	Guam Tinian	Nn	Y
None/None	*Tabernaemontana rotensis*	T	SOGCN	--	Guam	N	Y
Teak/None	*Tectona* spp.	--	--	--	Guam	Nn	Y
Tropical almond tree/None	*Terminalia catappa*	--	--	--	Guam Tinian	N	Y
None/None	*Tetrastigma pubinerve*	--	--	--	Guam	Nn	Y
Willdenow's maiden fern/None	*Thelypteris interrupta*	--	--	--	Guam	N	Y
None/None	*Thelypteris warburgii*	--	--	--	Guam	N	Y
Portia tree/None	*Thespesia populnea*	--	--	--	Guam Tinian	N	Y
None/None	*Tinospora homosepala*	E	--	--	Guam	N	Y
Tree heliotrope/Hunik	*Tournefortia argentea*	--	--	--	Guam Tinian	N	Y
Limeberry/None	*Triphasia trifolia*	--	--	--	Guam Tinian	Nn	Y
None/None	*Tristiropsis acutangula*	--	--	--	Guam Tinian	N	Y
None/None	*Tuberolabium guamense*	T	--	--	Guam	N	Y
Para grass/None	*Urochloa muticum*	--	--	--	Guam Tinian	Nn	Y

Table E.5-1. Plants Observed on JRM Sites[(1)]

Common Name(s)/ Chamorro Name[(2)]	*Scientific Name*	*Federal Status*	*Guam Status*	*CNMI Status*	*Island*	*Origin*	*Occurrence*
Creeping panic grass/None	*Urochloa reptans*	--	--	--	Guam Tinian FDM	N	Y
Bladderwort/None	*Utricularia* spp.	--	--	--	Guam	N, Nn	Y
Molave tree/None	*Vitex parviflora*	--	--	--	Guam Tinian	Nn	Y
Beach sunflower/Masigsig	*Wedelia biflora*	--	--	--	Guam Tinian FDM	N	Y

Notes: [(1)] Many more species are known from JRM lands, but this table highlights only the species or groups specifically mentioned in regulatory contexts. If JRM projects are developed that differentially affect other specific species, these will be added to the table for planning and tracking.

[(2)] Chamorro names from GovGuam (2009), USFWS (2015), and Topping et al. (1975).

Key: Status (Federal, GovGuam, and CNMI)

-- = not listed; E = endangered under the federal Endangered Species Act (ESA) or by GovGuam; T = listed as threatened under the ESA or by GovGuam; T-E = listed as threatened/endangered by CNMI government; SOGCN = Species of Greatest Conservation Need.

Origin

N = native; Nn = non-native, introduced.

Occurrence

Note: Many more species are known from JRM waters, but this table highlights only the species or groups specifically mentioned in regulatory contexts. If JRM projects are developed that differentially affect other specific species, these will be added to the table for planning and tracking.

Key: Status (Federal, GovGuam, and CNMI)

-- = not listed; T = listed as threatened under the ESA or by GovGuam; SOGCN = Species of Greatest Conservation Need.

(1) Chamorro names from GovGuam (2009), Kerr (1990), Kerr (2012), and Topping et al. (1975).

(2) *Pavona diffluens* is present on Tinian (DON 2017) and Guam. The NMFS Final Listing Determination specifically states that the listing applies to the species called *P. diffluens* in the Indian Ocean and Red Sea (NMFS 2014). The Final Listing Determination stated that corals fitting the description of *P. diffluens* in the Pacific are a different species. The specimens observed on Tinian were rare, and were conspicuously identifiable as the *Pavona* described from Guam in Randall & Meyers (1983). There is insufficient morphological evidence to make a distinction between the "local*" P. diffluens* and the ESA Threatened *P. diffluens*, consequently it is not considered to be subject to the ESA.

Origin

N = native; Nn = non-native, introduced.

Occurrence

-- = Not possible due to absence of habitat/food resources; Y = yes, known to occur; P = potential for occurrence; PU = potential for occurrence, but unlikely; Ex = extirpated.

Subject: Biological Opinion on the Establishment and Operation of an Intelligence, Surveillance, Reconnaissance, and Strike Capability Project on Andersen Air Force Base, Guam

Dear Lieutenant Colonel Ridilla:

This document transmits the U.S. Fish and Wildlife Service's (Service) biological opinion based on our review of the U.S. Air Force's (Air Force) proposed Establishment and Operation of an Intelligence, Surveillance, Reconnaissance, and Strike Capability (ISR/Strike) project on Andersen Air Force Base (AFB), Guam. This opinion addresses the effects of the proposed action on the endangered Mariana crow (*Corvus kubaryi*) and the threatened Mariana fruit bat (*Pteropus mariannus mariannus*) in accordance with section 7 of the Endangered Species Act (ESA) of 1973, as amended (16 USC 1531, et seq.). Although the endangered Guam Micronesian kingfisher (*Halcyon cinnamomina cinnamomina*), and Guam rail (*Gallirallus owstoni*) are extirpated from Guam, they are addressed in this opinion based on the requirements identified in the Cooperative Agreement between the Air Force and Service for the establishment and management of the Guam National Wildlife Refuge (Air Force and Service 1994). As stated in our June 21, 2006, letter, this formal consultation was initiated on May 22, 2006.

This biological opinion is based on the following information: 1) the Air Force's March 2006 Biological Assessment (BA) (Air Force 2006a) and April, May, and June supplements; 2) the Air Force's April 2006 Draft Environmental Impact Statement (EIS) (Air Force 2006b); 3) peer-reviewed articles and gray literature; 4) information in our files; and 5) meeting notes and correspondence associated with this consultation. A complete administrative record of this consultation is on file in the Service's Pacific Islands Fish and Wildlife Office in Honolulu, Hawaii.

TAKE PRIDE® IN AMERICA

Consultation History

December 13, 2004: The Air Force briefed the Service on the proposed ISR/Strike project and other Air Force projects on Andersen AFB at the Service's Pacific Islands Fish and Wildlife Office.

March 22, 2005: The Air Force sent the Service a letter requesting technical assistance on the proposed ISR/Strike and Northwest Field Beddown projects. This letter was not received by the Service until August 30, 2005 (see below).

May 18, 2005: The Air Force published a Notice of Intent to prepare a draft EIS for the proposed ISR/Strike project in the *Federal Register*.

June 24, 2005: The Service sent the Air Force a letter with comments on the May 18, 2005, Notice of Intent.

August 30, 2005: The Service received an August 25, 2005, letter from the Air Force requesting guidance on whether to proceed with formal or informal consultation on the proposed ISR/Strike project. This letter also included a copy of the Air Force's March 22, 2005, letter and a copy of the *Field Studies Survey Report, Vegetation Community Mapping, AAFB, Guam* which contained information on the vegetation in the proposed project area (Air Force 2005).

September 28, 2005: The Service met with the Air Force at the Service's Pacific Islands Fish and Wildlife Office to discuss the status of the proposed ISR/Strike project and whether formal or informal consultation was appropriate.

September 30, 2005: The Service sent the Air Force a letter requesting additional information regarding the status of listed species and vegetation community composition and structure within the project areas.

October 30, 2005: The Air Force's natural resource personnel at Andersen AFB sent an electronic mail message to the Service requesting our review of the proposed vegetation survey methodology. On November 4, 2005, we replied to the Air Force's electronic mail message with suggestions for survey methods within the project area for listed species.

February 13, 2006: The Service received an electronic mail message from the Air Force requesting informal comments on the February 2006 Draft BA for the ISR/Strike project. On February 28, 2006, we sent an electronic mail message to the Air Force containing informal comments on the February 2006 Draft BA for the ISR/Strike project.

March 23, 2006: The Service received a March 22, 2006, letter from the Air Force requesting formal consultation on the proposed ISR/Strike project. This letter included the March 2006 BA of the proposed project.

April 21, 2006: The Service sent a letter to the Air Force confirming receipt of its March 22, 2006, request for formal consultation, and requested additional information on potential project impacts to listed species in order to initiate the consultation.

May 2, 2006: The Service met with the Air Force at the Service's Pacific Islands Fish and Wildlife Office to discuss project impacts and avoidance and minimization measures to reduced impacts to listed species.

May 10, 2006: The Service participated in a conference call with the Air Force and its contractors to discuss potential noise impacts to listed species from increased aviation operations at Andersen AFB.

May 12, 2006: The Air Force published a Notice of Availability in the *Federal Register* for the April 2006 Draft EIS for the proposed ISR/Strike project.

May 22, 2006: The Service received the Air Force's May 19, 2006, letter providing the additional information on noise analyses and potential aircraft accidents we requested in our April 21, 2006, letter.

June 2, 2006: The Service sent the Air Force an electronic mail message requesting additional information and clarification regarding aviation noise and flight tracks in the vicinity of listed species territories.

June 12, 2006: The Air Force sent us an electronic mail message containing supplementary information on aviation noise and flight tracks requested on June 2, 2006.

June 22, 2006: The Service sent the Air Force a letter indicating that the information required for the consultation was complete and that formal consultation had been initiated on May 22, 2006. The letter also stated that consultation would be completed on October 4, 2006.

July 19, 2006: The Air Force sent an electronic mail message to the Service requesting that the biological opinion be completed within 90 days of initiation due to conflicts with the project schedule.

August 1, 2006: The Service met with the Air Force and its contractors at the Service's Pacific Islands Fish and Wildlife Office to discuss the timeline for the formal consultation, impacts to listed species, and conservation measures. The Service agreed to expedite the completion of the biological opinion.

August 4, 2006: The Service sent the Air Force an electronic mail message requesting inclusion of additional avoidance and minimization measures associated with construction activities for the ISR/Strike project.

August 10, 2006: The Service sent the Air Force an electronic mail message inquiring whether the proposed brown treesnake (*Boiga irregularis*) control conservation measure could be

modified to include research and development of appropriate snake control measure for the Mariana fruit bat colony.

August 14, 2006: The Air Force sent the Service electronic mail messages agreeing to consider the proposed modification of the brown treesnake control conservation measure and avoidance and minimization measures for project construction activities discussed in our August 4 and 10 electronic mail messages.

August 17, 2006: The Service and the Air Force exchanged electronic mail messages regarding proposed measures to minimize and avoid potential impacts associated with the Mariana fruit bat colony abandoning Pati Point due to the proposed project.

August 31, 2006: The Service solicited comments from the Air Force via electronic mail on the "Description of the Proposed Action" for this Biological Opinion. The Air Force and Service exchanged electronic mail messages to finalize this project description on September 7, 12 to 15, and 19, 2006.

BIOLOGICAL OPINION

Description of Proposed Action

The Air Force is proposing to establish an Intelligence, Surveillance, Reconnaissance, and Strike Operational Capability at Andersen AFB, Guam (Figure 1). The objective of the ISR/Strike project is to achieve pre-engagement battle space awareness, locate and identify critical adversary movement, achieve assured success through air dominance, and deliver decisive effects via persistent and precise application of air and space power over the next decade (Table 1). The following project description is a summary of construction activities, aircraft operations, anticipated personnel increases, and conservation measures as presented in the BA (Air Force 2006a), Draft EIS (Air Force 2006b), and correspondence and meetings with Air Force personnel.

Facilities and Construction

Facility construction will begin in fiscal year (FY) 2007. Sixty-seven construction projects are included in the proposed action. Most of these projects will occur on previously developed land on the main portion of Andersen AFB and are not expected to impact listed species on Guam. However, the increase in personnel, goods, and cargo associated with these projects may impact listed species outside of Guam (see "Personnel Increases" below). Of the proposed construction projects, only the Aircraft Staging Area, Commercial Entry Gate, and Truck Inspection Facility are expected to impact listed species on Guam (Figure 2). These three projects are described in detail below. For additional information on the other construction projects associated with this proposed action, see the associated Draft EIS (Air Force 2006b).

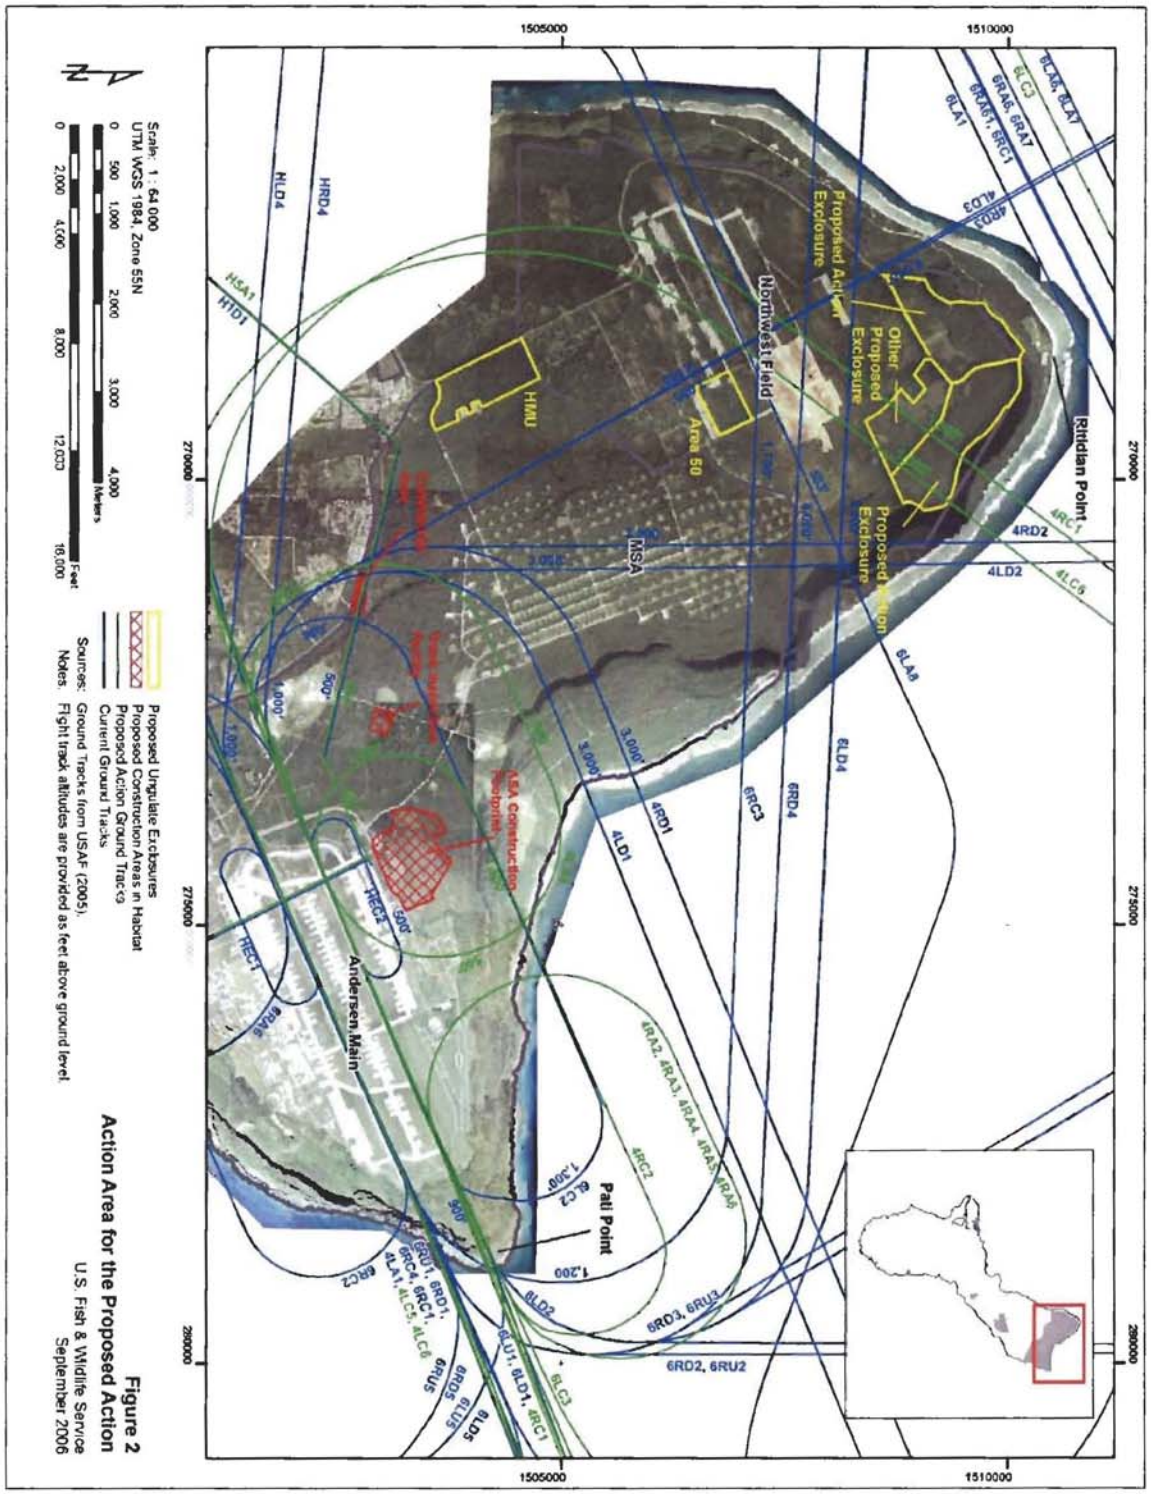

Figure 2
Action Area for the Proposed Action
U.S. Fish & Wildlife Service
September 2006

The Aircraft Staging Area includes approximately 23 different facilities, taxiways, and aircraft parking aprons constructed to support F-22 or F-15E aircraft operations. Construction of the Aircraft Staging Area is expected to begin in FY10 and is expected to be completed after FY17 (see Table 1). Up to 48 fighter aircraft will be stored at the facility, and operational activity at the facility is expected to occur throughout the day and night. Approximately 74 hectares (ha) (184 acres [ac]) of vegetation will be cleared for the Aircraft Staging Area facilities and road construction (Table 2).

Table 2. Estimated Quantity of Vegetation to be Cleared as Part of the ISR/Strike Project

Vegetation Type	Cleared Area	
	Hectares	Acres
Aircraft Staging Area		
Neisosperma - Macaranga Forest	1.4	3.5
Guamia - Premna Forest	9.0	22.2
Guamia Forest	16.9	41.8
Aglaia – Guamia Forest	20.5	50.7
Hibiscus - Leucaena Shrub	6.0	14.8
Herbaceous Scrub	12.6	31.1
Aircraft Staging Area Subtotal	66.4	164.1
Commercial Entry Gate		
Guamia Forest	0.2	0.5
Vitex - Elaeocarpus Forest	1.8	4.4
Hibiscus - Leucaena Shrub	0.5	1.2
Herbaceous Scrub	1.0	2.5
Commercial Entry Gate Subtotal	3.5	8.6
Truck Inspection Facility		
Guamia Forest	0.5	1.2
Hibiscus - Leucaena Shrub	0.7	1.7
Herbaceous Scrub	2.8	6.9
Truck Inspection Facility Subtotal	4.0	9.9
Total All Facilities	**73.9**	**182.6**

The proposed Commercial Entry Gate and Truck Inspection Facility will be constructed in FY09 and FY10 (see Table 1). The Commercial Entry Gate will be constructed along Route 9 to allow for commercial and contractor vehicles to enter the base on the west side of Andersen main (see Figure 2). The Entry Gate will require a paved entry with gate, security fence, and small facility for security personnel. The amount of vegetation that will be cleared for the Entry Gate equates to 4 ha (9 ac). The Truck Inspection Facility will be constructed east of the Commercial Entry Gate for the purpose of inspecting vehicles and material delivered to the base (see Figure 2). The amount of vegetation that will be cleared for the Truck Inspection Facility is approximately to 4 ha (10 ac).

The existing road connecting the proposed Commercial Entry Gate and Truck Inspection Facility will be repaved to a width of 7 meters (m); 24 feet (ft) with 1-m (3-ft) shoulders on each side, for a total width of 9 m (31 ft). Because the existing road corridor can accommodate proposed road modifications, vegetation clearing within the existing road corridor will be minimal and limited

to removal of herbaceous or shrubby vegetation. Street lights will be installed along the road between the Commercial Entry Gate and the Truck Inspection Facility. The street lights will be hooded and illuminated only when the Commercial Entry Gate is in operation.

Aircraft Operations

At full implementation, the proposed ISR/Strike project will base 12 KC-135 tanker aircraft and four unmanned aerial vehicles (UAV) at Andersen AFB. As many as 48 fighter aircraft (F-22A and F-15E) and six bombers (comprising B-1, B-2, and B-52 bombers) will be rotated from other Air Force bases to Andersen AFB. The rotational period for aircraft (and personnel) will be 120 days. The 70 permanently based and rotational aircraft associated with the proposed ISR/Strike project will increase the amount of aircraft at Andersen AFB to 84. Currently, the number of aircraft rotating through Andersen AFB is between 12 and 24, depending on the rotation schedule.

Table 3 lists the projected annual and average daily airfield operations for ISR/Strike aircraft at Andersen AFB, as well as baseline current operations, and reflects the total recurring airfield operations condition after the proposed ISR/Strike project is fully established. Operations for the ISR/Strike aircraft include mission arrivals and departures as well as training sortie arrivals and departures, and closed pattern operations (closed pattern consists of two airfield operations [*i.e.*, one takeoff and one landing accomplished as a touch and go]).

Fighter aircraft flights will occur 240 days per year. Each of the 48 rotational fighter aircrews will fly 72 sorties per year, for a total of 3,456 annual sorties, or an average of 14.4 sorties per flying day. Eighty percent of the fighter operations will be accomplished by F-22 aircraft, and 20 percent will be accomplished by F-15Es. About 30 percent of the training sorties will be accomplished after dark (between 30 minutes after sunset and 30 minutes before sunrise). It is estimated that about 5 percent of the sorties and airfield operations flown during darkness (*i.e.*, 5 percent of 30 percent, or 1.5 percent) will occur between 2200 and 0700, the period known as "environmental nighttime." Depending on the current rotation schedule, between zero and 12 fighter aircraft will rotate through Andersen AFB.

Based Tanker KC-135 aircrews will fly four sorties per day, 240 days per year from Andersen AFB. A typical sortie will include a departure from the base, aerial refueling of receiver aircraft, and an arrival at the base followed by an average of 60 to 90 minutes of instrument approach and closed pattern training before termination. It is estimated that about 13 percent of airfield operations for the tankers will occur during nighttime. Depending on the current rotation schedule, tanker aircraft rotating through Andersen AFB number between four and six.
The UAVs will fly one sortie per day, 220 days per year from Andersen AFB. A typical sortie will include departing from the base, conducting its mission or training, and then returning to the base. A closed pattern will be flown on approximately half of the sorties. It is estimated that about 15 percent of airfield operations for the UAVs will occur during nighttime. Currently, no UAVs are based at Andersen AFB.

Table 3. Current and Proposed Action Annual and Average Daily Airfield Operations on Andersen AFB.

Rotational bomber aircrews will fly two sorties per day, 240 days per year from Andersen AFB. Ten percent of the bomber operations will be accomplished by B-2 aircraft, and 45 percent will be accomplished by B-1 and B-52 bombers. A typical sortie will include a departure from the base, weapons training at a range/training airspace complex, low level terrain avoidance procedures training, anti-ship mining operations, and an arrival at Andersen AFB followed by two closed patterns before termination. It is estimated that about 13 percent of airfield operations for the bombers will occur during nighttime. Since 1990, there has been a persistent rotational presence of bombers at Andersen AFB. Currently, six bombers rotate through Andersen AFB.

Personnel, Household Goods, Equipment, and Aircraft Movement

When fully established, the ISR/Strike capability will increase the population at Andersen AFB by about 3,000 people when combining the additional military, Air Force civilian and contractor, personnel and dependents. The additional 3,000 people on Andersen AFB associated with the proposed ISR/Strike project will increase the base population to approximately 8,900 people. Because of the shortage of skilled labor on Guam, off-base personnel will be expected to increase temporarily to as many as 1,800 workers during construction periods.

It is expected that 650 permanently assigned personnel will be at Andersen AFB for two or three years at a time. Based on a three-year assignment duration, about 220 of the permanently assigned personnel and associated dependents will depart Andersen AFB and Guam by commercial air carrier flights that use Guam International Airport (see Figure 1). The majority of household goods belonging to the permanently assigned personnel will be transported in cargo ships out of Apra Harbor. Based on three rotations per year (each 120 days), and 48 fighters, 6 bombers, and 1,250 personnel per rotation, it is estimated that 3,750 personnel will rotate to/from Andersen AFB annually. Rotational personnel will also travel to and from Guam by contract commercial aircraft.

Conservation Measures

During the consultation process, the Service and the Air Force worked cooperatively to develop ways to reduce impacts to listed species, specifically the Mariana fruit bat, Mariana crow, Guam Micronesian kingfisher, and Guam rail. The Air Force included conservation measures as part of the proposed action to reduce impacts resulting from the establishment of the proposed ISR/Strike project. The conservation measures correspond to recovery actions outlined in the draft revised Mariana crow (USFWS 2005a) and Guam Micronesian kingfisher (USFWS 2004a) recovery plans and the Guam rail (USFWS 1990a) and Mariana fruit bat (USFWS 1990b) recovery plans. All conservation measures that involve activities on the Refuge Overlay unit will be coordinated with Guam National Wildlife Refuge staff. The following descriptions of the conservation measures for the proposed ISR/Strike project are summarized from the associated Draft EIS (Air Force 2006b). For the purposes of this biological opinion, the conservation measures are grouped into six categories - additional staffing for the conservation program, habitat improvement measures, studies and research, brown treesnake interdiction and control, avoidance and minimization measures, and monitoring.

Additional Staffing – The Air Force will hire a Wildlife Management Specialist by FY08 to carry out day-to-day field operations of the Andersen AFB conservation program. The wildlife management specialist will be supported by other environmental program staff, as well as a number of volunteer conservation officers. The assigned duties of the wildlife management specialist will include: a) oversight of barrier construction in sites detailed in this document; b) acting as coordinator and Andersen AFB point of contact for ungulate eradication efforts; c) day-to-day management of the Andersen AFB recreation ungulate hunting and depredation programs; d) fenceline reconnaissance for maintenance needs; and e) day-to-day coordination with the Service and other resource agencies.

Habitat Improvement – The Air Force adjusted the construction footprint within the Aircraft Staging Area to reduce clearing within areas of relatively intact forest. Adjusting the footprint precludes the clearing of an 8-ha (20-acre) pocket of relatively high quality forest, containing potential Mariana fruit bat, Mariana crow, and Guam Micronesian kingfisher habitat.

Coordination with the Service and the Guam Division of Aquatic and Wildlife Resources will be sought to develop a multi-year ungulate control plan in FY08. The plan will be designed to guide Andersen AFB ungulate eradication, depredation, and recreational hunting issues managed by the proposed Wildlife Management Specialist. Consultants, with appropriate and recognized experience, will be used to develop the plan. The plan will be implemented by the proposed Andersen AFB Wildlife Management Specialist, conservation officers, and other management stakeholders. The plan will focus on successful implementation of ungulate eradication within the ungulate exclosure areas (see below) and the reduction of ungulate densities in non-fenced areas. Control and monitoring techniques will be clearly defined in the ungulate control plan.

To offset the loss of habitat from clearing and aircraft operations associated with the proposed action, two areas totaling approximately 200 ha (494 ac) will be fenced to prevent incursion of deer and pigs. Construction of the ungulate exclosure fence will begin in FY10 and be completed by FY13 (see Table 1). An eradication program will be managed by the Wildlife Management Specialist within exclosure areas. The intent of exclosure fencing is to facilitate forest regeneration by eliminating ungulate browsing pressure, so emergent canopy species may be replaced by saplings. Final placement of the exclosure units will be coordinated with the Service (Guam National Wildlife Refuge and Ecological Services) and Guam Division of Aquatic and Wildlife Resources. Further, the Andersen AFB General Plan will be modified to include a special conservation designation for the exclosure areas after the units are finalized. Assuming that cliff lines can serve as effective barriers to ungulate entry, cliff lines will not be fenced. Leveraging cliff lines as barriers will reduce forest clearing and disturbance necessary for fence construction. The proposed exclosure fencing will involve construction of 3,400 m (11,155 ft) of fenceline, using suitable posts and fencing material sufficient to prevent ungulate incursion and to withstand Guam's environmental conditions (*e.g.*, sea spray, high winds, humidity).

The Air Force proposes to reduce impacts to *Tabernaemontana rotensis*, a rare tree species. There are at least 15 locations containing approximately 1,000 *T. rotensis* trees within the ISR/Strike area. The majority of the trees are saplings, and the remaining are mature trees. *Tabernaemontana rotensis* saplings respond well to transplanting. Prior to construction (FY10),

a landscaping crew will remove the saplings and transplant them outside the project area(s). At the same time, a landscaping crew will collect *T. rotensis* seeds for outplanting outside the project area. This will offset the impacts to *T. rotensis* individuals from construction operations within the project areas.

Vegetation plots containing native tree species utilized by Mariana fruit bats and Mariana crows will be established within ungulate exclosure units by FY11. This conservation measure will contribute to existing foraging habitat with native trees important to the Mariana fruit bat and Mariana crow. The finalized list of tree species will be dependent on commercial nursery or herbarium stocks, and will be coordinated with the Service, Guam Division of Aquatic and Wildlife Resources forestry personnel, University of Guam herbarium personnel, and the U.S. Department of Agriculture Natural Resources Conservation Service field office. Supplemental protective fencing to prevent browse pressure within foraging plots will line the perimeter of the foraging plots. Additional management actions within these plots will include herbaceous vegetation control, fenceline maintenance, and quarterly monitoring of outplanting success. The goal of this conservation measure is to improve habitat outside the ISR/Strike project areas for Mariana fruit bats and Mariana crows.

Studies and Research – The Air Force has also committed to a base-wide vegetation survey, funded to begin in FY07. This survey will characterize vegetation composition and structure throughout the forested areas of Andersen AFB. Vegetation surveys of habitat areas for the Mariana fruit bat, Mariana crow, and Guam Micronesian kingfisher will be conducted to target management resources for species recovery.

Ungulate management on Andersen AFB will be enhanced by information obtained by ungulate movement studies. This could be done through radio telemetry or newer technologies and specific research related to ungulate management may be suggested in the aforementioned multi-year ungulate control plan to be developed in FY08. Outside experts may need to be contracted by the Air Force to conduct this work but the Air Force's proposed Wildlife Management Specialist will provide technical support for such research activities, including anesthetizing deer and pigs for radio tagging. The proposed Wildlife Management Specialist may also provide technical assistance for dressing of carcasses for stomach content analysis or wildlife disease studies.

In an effort to increase survivorship of Mariana fruit bat pups at the Pati Point colony, the Air Force proposed to provide funding to trap or bait brown treesnakes at the Pati Point roost site. However, due to concern about the efficacy of current control techniques for the proposed effort and the potential impacts of human disturbance, the Air Force will not be undertaking this project using currently available control techniques. Instead, the Air Force will be consulting with the U.S. Department of Agriculture – Animal, Plant, Health Inspection Service – Wildlife Service's National Wildlife Research Center Headquarters in Fort Collins, Colorado to determine the most effective and least disruptive control strategies. Resulting research requirements will be finite projects that will assist in the development or refinement of snake control techniques that will assist in management of Mariana fruit bat roosts through the adaptive management strategy (see "Avoidance and Minimization Measures" below). The scope of work for this effort will be reviewed annually by Andersen Air Force and Service staff with in put from the Guam Division

of Aquatic Wildlife Resources staff and U.S. Department of Agriculture – Animal, Plant, Health Inspection Service – Wildlife Services Operations staff. Rapid implementation of brown treesnake research products by management agencies for Mariana fruit bat conservation efforts on Guam is the focus of this effort. The Department of Defense has been funding applied research for brown treesnake control via U.S. Department of Agriculture – Animal, Plant, Health Inspection Service – Wildlife Service's National Wildlife Research Center since 1992.

Brown Treesnake Interdiction and Control – To prevent brown treesnakes from leaving Guam in any Air Force cargo, vehicles, munitions, household goods, and other items the Air Force will program for and facilitate a 100 percent inspection rate for all of these items departing Guam from Andersen AFB or other sites on Guam where they are staged for departure from Guam (see Appendix C of Air Force 2006b). The Air Force will implement this effort by providing funds to support sustained brown treesnake trapping, capture, and toxicant use efforts by the U.S. Department of Agriculture – Wildlife Services (Wildlife Services) in the vicinity of sites where Andersen AFB cargo, munitions, vehicles, and other items are staged, stored, or packed prior to departing Guam. To insure that adequate funding is available for the 100 percent inspection rate during periods of peak movement of Air Force cargo, vehicles, munitions, household goods, and other items shipped from Guam, the Air Force will develop a mechanism, with Wildlife Services and the Service, that will forecast and program funding with the Air Force's or Andersen AFB's annual budgeting cycle to ensure adequate funding is available for Wildlife Services to maintain a 100 percent inspection level for these items at least 18 months in advance. Also, to insure that the orders to inspect cargo meet the Department of Defense's Defense Transportation Regulations, Chapter 505 protocols of these regulations (Appendix 1) will be incorporated into the Andersen AFB 36 WG Instruction 32-7004, Brown Tree Snake Management. (Appendix C of Air Force 2006b).

The Air Force will also actively seek sustained Department of Defense funding for applied research efforts by the U.S. Department of Agriculture- Wildlife Services-National Wildlife Research Center related to brown treesnake control. The applied research efforts will focus on: 1) developing aerial broadcast techniques for toxicants; 2) development of artificial lures and attractants for brown treesnakes; and 3) development of more cost-effective strategies to control or eliminate brown treesnakes in quarantine and field situations. The research scope and direction of these efforts will be determined by the Air Force, Service, Wildlife Services Operations, and Wildlife Services-National Wildlife Research Center staff through annual and multi-year plans with discrete, finite applied goals. These efforts are expected to increase the effectiveness of the brown treesnake interdiction program, support large-scale snake control programs for listed species, and may reduce the cost of brown treesnake control on Guam.

Finally, to evaluate the effectiveness of the inspection program, the Air Force will have Wildlife Services provide monthly reports on their operations. In addition, the Air Force will review the status of the inspection program quarterly with the Service and Wildlife Services and at the annual brown treesnake meeting in Honolulu, Hawaii. The monthly reports will provide details on which cargo was inspected or un-inspected, potential level of risk of cargo type, and where the cargo was shipped (mainland United States, United States Territories, and Hawaii). The report will also provide a simple explanation of why specific cargo shipments were missed and document all snake detections by canines or other high risk incidents. This report will be

submitted to the Service, Air Force (Pacific Air Forces, Andersen AFB Commander, and Environmental Flight), State of Hawaii(Department of Agriculture and Department of Land and Natural Resources), Commonwealth of the Northern Mariana Islands (Division of Fish and Wildlife), and Air Force Cooperators.

Avoidance and Minimization Measures – To avoid and/or minimize potential project impacts to the Mariana fruit bat and Mariana crow, the Air Force has incorporated the following measures into its project:

- To avoid impacts to nesting Mariana crows, the Air Force will initiate construction activities at the Aircraft Staging Area, Commercial Entry Gate, Truck Inspection Facility, and Ungulate Exclosure areas; and conduct ungulate eradication in the Ungulate Exclosure areas and the Vegetation Assessment outside the Mariana crow breeding season (October to April). In addition, one week prior to clearing vegetation and conducting ungulate eradication, the Air Force will have a biologist (approved by the Service and the Guam Division of Aquatic and Wildlife Resources) survey the proposed project site and adjacent areas to determine if Mariana crows are in the area. If crows are nesting within 300 m (984 ft) of the project site, construction/clearing activities and ungulate eradication within 300 m (984 ft) of the nest will be postponed until the breeding attempt is completed, resulting in either successful fledging or nest failure. The Air Force will also coordinate with the Guam Division of Aquatic and Wildlife Resources during the Vegetation Assessment to postpone vegetation sampling within 300 m (984 ft) of a Mariana crow nesting until the breeding attempt is completed.
- To avoid impacts to foraging Mariana fruit bats, the Air Force will only allow construction activities at the Aircraft Staging Area, Commercial Entry Gate, Truck Inspection Facility, and Ungulate Exclosure areas during the day. In addition, hooded lights will be used outside the Aircraft Staging Area, Commercial Entry Gate and Truck Inspection Facility, and for all streetlights along roads connecting these facilities.
- To avoid impacts to roosting Mariana fruit bats, the Air Force will have a biologist (approved by the Service and Guam Division of Aquatic and Wildlife Resources) survey the Aircraft Staging Area, Commercial Entry Gate, Truck Inspection Facility, and Ungulate Exclosure area and areas within 150 m (492 ft) of these proposed project sites to determine if Mariana fruit bats are in the area. If Mariana fruit bats are observed within 150 m (492 ft) of the project site, construction will be delayed within 150 m (492 ft) of the bat(s) until the bat(s) have left the area.
- To minimize impacts to Mariana fruit bats on Guam if the Pati Point colony roosting location is abandoned for other on-base locations, the Air Force will: 1) increase security patrols utilizing conservation officers and/or base security around newly established roost sites to decrease the likelihood of illegal hunting; 2) close public hunting areas near new roost sites to limit access and decrease the likelihood of illegal hunting; and 3) implement the brown treesnake control, utilizing measures developed for use at roost sites, at newly established roost sites to increase breeding success.
- To minimize impacts to Mariana fruit bats from Rota that may migrate to Guam after a typhoon event on Rota, the Air Force will provide travel assistance for a Service Special Agent to go to Rota after a typhoon event to decrease the likelihood of illegal hunting on Rota.

- To avoid potential impacts to Mariana crows nesting under ground tracks below 305 m (1,000 ft), the Air Force has agreed to increase the altitude of those ground tracks to at least 305 m (1,000 ft) during the Mariana crow breeding season (October to April).

To avoid, minimize, and/or offset potential unknown impacts to any listed species during the life of the project, the Air Force will develop an Adaptive Management Strategy that will incorporate the conservation measures described here and any additional measures that may be needed. The goals of this Adaptive Management Strategy are to minimize and avoid project impacts to listed species and maintain and increase listed species populations on Andersen AFB, including reestablishing Guam Micronesian kingfishers and Guam rails. A formalized written strategy will include the following: a) time frame for completing its implementation phase; b) identification of priority actions; c) methods for minimizing and/or avoiding impacts to listed species; d) definitions of success for proposed impact minimization, avoidance, and offsetting measures; e) methods for monitoring, data tracking, analysis and feedback; f) a cost estimate for plan implementation; and g) a methodology to increase listed species population on Guam.

This formal strategy will be developed by the Air Force and will include an Adaptive Management Team consisting of Air Force, Service (Ecological Services and the Guam National Wildlife Refuge), and Guam Division of Aquatic and Wildlife Resources biologists familiar with the species and their conservation. The Adaptive Management Team will use data collected from the research and monitoring to evaluate impacts caused by the proposed activities and identify additional measures to minimize, avoid, and/or offset those impacts. Potential management measures that may be included in the strategy are: 1) aircraft noise reduction (*e.g.*, modifying ground track location and flight profile of aircraft without creating a flight hazard or noncompliance with the aircraft flight manual and potential efforts to increase populations), 2) threat removal (*e.g.*, controlling brown treesnake populations at Mariana fruit bat roost sites, Mariana crow nests, and Mariana crow breeding territories, and preventing illegal Mariana fruit bat hunting on Andersen AFB), 3) population enhancement (*e.g.*, supporting on-base aspects of Mariana crow aviculture enhancement and reintroduction efforts for listed species), and 4) efforts to establish and maintain Mariana fruit bat, Mariana crow, Guam Micronesian kingfisher, and Guam rail populations on Guam.

The Adaptive Management Team will review the progress of the Adaptive Management Strategy annually, and make recommendations to the Air Force as to needed modifications. The Adaptive Management Team may also advise that sections of the written strategy reviewed and improved by appropriate species and conservation experts. The Service and Adaptive Management Team will approve the basic written strategy as well as subsequent changes to ensure it meets the goals of avoidance, minimization, and species recovery efforts. The approved strategy will be incorporated or attached to the Andersen AFB Integrated Natural Resources Management Plan. The Plan's formal updates carry the Service as a signatory under the Sikes Act Improvement Amendments.

The Adaptive Management Team will be formed by February 1, 2007, and will communicate regularly at first to formalize the strategy and then meet annually to evaluate monitoring and research activities. The formal Adaptive Management Strategy is scheduled for completion by September 2007 and will be revised as needed prior to implementation of Phase 2 (approximately September 2013) and Phase 3 (approximately September 2016) of the proposed project.

Monitoring – The Air Force will conduct a multi-year program to monitor Mariana fruit bats and Mariana crows. The goals of this program will be to monitor the status of Mariana fruit bats and Mariana crows and evaluate project impacts on these two species. This program will involve: 1) monitoring Mariana fruit bat numbers at the Pati Point roost site and any additional roost sites established if the Pati Point site is abandoned, 2) monitoring impacts of aircraft overflights on Mariana fruit bats at the Pati Point roost site, 3) monitoring the status of fruit bat(s) that utilize the Aircraft Staging Area site before and after construction, and 4) monitoring impacts of aircraft overflights on Mariana crow nesting success. All monitoring will be conducted by a properly credentialed biologist(s) and final selection will be coordinated with the Service and Guam Division of Aquatic and Wildlife Resources.

The specific methodology utilized for the monitoring will be developed and incorporated into the formal Adaptive Management Strategy by the Adaptive Management Team with input from appropriate species and conservation experts as needed. Additionally, the Service will have final approval of the methodology and actual implementation to ensure the techniques avoid and/or minimize impacts ("take" per the Endangered Species Act) to listed species. Monitoring Mariana fruit bat responses to aircraft overflights will begin prior to the proposed south runway repair project and the first phase of the proposed increase in aircraft operations (FY09) to obtain baseline data on bat responses and will continue, at a minimum, until the project is fully implemented. The Mariana fruit bat(s) utilizing the Aircraft Staging Area site will be monitored prior to clearing the site in FY 08 (see Table 1) and for at least one year after clearing is completed. Mariana crow nest monitoring will begin prior to the first phase of the proposed increase in aircraft operations (FY09) to obtain baseline data on crow responses and will continue, at a minimum, until the proposed project is fully implemented. As noted above, the Adaptive Management Team will use the data collected from these monitoring efforts to evaluate impacts caused by the proposed activities and identify additional measures to minimize, avoid, and/or offset those impacts.

Status of the Species

Mariana Fruit Bat

Species Description – The Mariana fruit bat or flying fox, known as "fanihi" in Chamorro, is a medium-sized fruit bat in the family *Pteropodidae* that weighs 330 to 577 grams (0.66 to 1.15 pounds). Males are slightly larger than females. The underside (abdomen) is black to brown with gray hair interspersed that creates a grizzled appearance. The shoulders (mantle) and sides of the neck are bright golden brown, but may be paler in some individuals. The head varies from brown to dark brown. The well-formed, rounded ears and large eyes give the face a canine appearance.

Listing Status – The Guam population of the Mariana fruit bat was listed as endangered in 1984 (USFWS 1984). However, in 2005 the subspecies was listed as threatened throughout the Mariana archipelago and downlisted to threatened on Guam (USFWS 2005b). On October 28, 2004, approximately 152 ha (376 ac) were designated as critical habitat for the Mariana fruit bat on Guam (USFWS 2004b). All critical habitat for the species is found on the fee simple portion of the Guam National Wildlife Refuge (see Figure 2).

Historic and Current Distribution – This subspecies of *Pteropus mariannus* is endemic to the Mariana archipelago, where it is found on most of the 15 major islands. To the best of our knowledge, there are no records of fruit bats on Uracas, and fruit bats have been observed only once on Farallon de Medinilla.

No known historical records exist to document the status of the Mariana fruit bat prior to the 20th century. Surveys on most or all islands in the archipelago were conducted in 1983 (Wiles, *et al.* 1989), 2000 (Cruz, *et al.* 2000a-f), and 2001 (Johnson 2001). The relatively isolated northern islands support the majority of the fruit bats in the archipelago, but because of their remote location, these islands have not been surveyed as frequently as the southern islands (*i.e.,* Saipan, Tinian, Aguiguan, and Rota). Individual surveys have been conducted on several of the southernmost islands at relatively frequent intervals (*e.g.,* Kessler 2000; Worthington, *et al.* 2001; Wiles and Johnson 2004). Because of the similarity of the methods used by Wiles and others (1989) and Cruz and others (2000a-f), we considered only these two multi-island surveys for purposes of comparison (Table 4). A conservative interpretation of these data indicates a 37 percent decline in fruit bat numbers between 1983 and 2000 among the six northern islands surveyed in both years. The majority of this decline was recorded on two of the three largest northern islands, Anatahan and Pagan, which together harbored roughly 70 percent of the archipelago's fruit bats in the 1980s (Wiles, *et al.* 1989).

On Guam, the sighting of fruit bats was considered to be "not...uncommon" in the 1920s (Crampton 1921). Woodside (1958) reported that in 1958, the Guam population was estimated to number no more than 3,000, although the method used to make this estimate is not known. This estimate had dropped to between 200 and 750 animals by 1995 (Wiles, *et al.* 1995; Wiles 1996). The most recent surveys on Guam put the bat population at fewer than 50 individuals (Aguon, C., pers. comm. 2006).

Ecology – During the day, Mariana fruit bats roost in colonies of a few to over 800 animals (Wiles 1987a; Pierson and Rainey 1992; Worthington and Taisacan 1995). Bats are typically grouped into harems (one male and two to 15 females) or bachelor groups (predominantly males). Some single males reside at the colony's periphery (Wiles 1987a). On Guam, the average estimated sex ratio in one colony varied from 37.5 to 72.7 males per 100 females (Wiles 1982a).

Table 4. Summary of Mariana Fruit Bat Survey Results: Minimum Estimates[1]

Island	Area Sq. mi (Sq. km)	Estimated Number of Bats 1983[2]	Estimated Number of Bats 2000[3]
Maug	0.8 (2.0)	<25	not surveyed
Asuncion	2.9 (7.4)	400	not surveyed
Agrihan	18.3 (47.4)	1,000	1,000
Pagan	18.4 (47.7)	2,500	1,500
Alamagan	4.3 (11.0)	0	200
Guguan	1.5 (4.0)	400	350
Sarigan	1.9 (5.0)	125	200
Anatahan	12.5 (32.3)	3,000	1,000
Subtotal (Northern Islands) [Subtotal six islands]		7,450 [7,025]	[4,250]
Saipan	47.5 (122.9)	<50	not surveyed
Tinian	39.3 (101.8)	<25	not surveyed
Aguiguan	2.7 (7.0)	<10	150-200
Rota	37.0 (95.7)	800-1,000	not surveyed
Guam	212.0 (549.0)	425-500	not surveyed
Subtotal (Southern Islands)		1,310-1,585	insufficient data
TOTAL (All Islands)		**8,760-9,035**	**insufficient data**

[1] *Two of the northern islands are not included in Table 3: Uracas, the most northerly, where fruit bats are not known to occur; and Farallon de Medinilla, where fruit bats have been observed on only one occasion.*

[2] *Wiles, et al. 1989. Dates: August 17-September 10, 1983; 1-4 days/island. Count methods: Evening dispersal counts at colonies; evening station counts of solitary fruit bats.*

[3] *Cruz, et al. 2000a-f. Dates: June 4-August 16, 2000; 7-9 days/island. Count methods: Evening dispersal counts at colonies, evening and morning station counts of solitary fruit bats.*

Reproduction in Mariana fruit bats has been observed year-round on Guam (Perez 1972; Wiles 1983) and on Rota; individual females have a single offspring each year (Pierson and Rainey 1992). Wiles (1987a) found no apparent peak in births on Guam, but a peak may occur in May and June on Rota (Glass and Taisacan 1988). Although specific data for the Mariana fruit bat are lacking, female bats of the family *Pteropodidae* have one offspring per year, generally are not sexually mature until at least 18 months of age, and have a gestation period of four to six months (Pierson and Rainey 1992). The average lifespan of this species is unknown; the longevity of a similar species in Australia is four to five years, with a maximum of eight years (Vardon and Tidemann 2000).

Roost sites are an important aspect of the Mariana fruit bat's biology because they are used for sleeping, grooming, breeding, and intra-specific interactions (USFWS 1990b). Published reports of roost sites on Guam indicate these sites occur in mature limestone forest and are found within 100 m (328 ft) of 80 to 180 m (262 to 591 ft) tall clifflines (USFWS 1990b). On Guam, Mariana fruit bats prefer to roost in mature *Ficus* spp. and *Mammea odorata* trees, but will also

roost in other tree species such as *Casuarina equisetifolia*, *Macaranga thompsonii*, *Guettarda speciosa*, and *Neisosperma oppositifolia* (Wheeler and Aguon 1978; Wiles 1981, 1982b). On other islands in the Mariana archipelago, Mariana fruit bats have been observed in secondary forest and *Casuarina equisetifolia* groves (Glass and Taisacan 1988, Worthington and Taisacan 1996, Worthington, *et al.* 2001). Factors involved in roost site selection are not clear, but data from Guam indicate that some sites may be selected for their inaccessibility by humans and, thus, limited human disturbance. Fruit bats will abandon roost sites if disturbed and have been reported to move to new locations up to ten kilometers (km) (six miles [mi]) away (USFWS 1990b).

Several hours after sunset, bats depart their roost sites to forage for fruit and other native and non-native plant materials such as leaves and nectar (USFWS 1990a). This species feeds on a variety of plant material but is primarily frugivorous (Wiles and Fujita 1992). Specifically, Mariana fruit bats forage on the fruit of at least 28 plant species, the flowers of 15 species, and the leaves of two plant species (Wiles and Fujita 1992). Some of the plants used for foraging include *Artocarpus* sp., *Carica papaya*, *Cycas circinalis*, *Ficus* spp., *Pandanus tectorius*, *Cocos nucifera*, and *Terminalia catappa*. Many of these plant species are found in a variety of forested habitats on Guam, including limestone, ravine, coastal, and secondary forests (Stone 1970; Raulerson and Rhinehart 1991). Little is known about their nightly movements, but fruit bats have been observed foraging as far as 12 km (7 mi) from known roosting sites on Guam (Wiles, *et al.* 1995).

Threats – The primary threats to the Mariana fruit bat throughout its range are habitat destruction and modification and illegal hunting (USFWS 2005b). In addition, predation by brown treesnakes threatens the Mariana fruit bat on Guam (USFWS 2005b).

Mariana Crow

Species Description – The Mariana crow, known as "aga" in Chamorro, is a forest dwelling crow in the family *Corvidae*. Males and females look outwardly similar but, on average, females (242 grams [8.5 ounces]) weigh less than males (256 grams [9.0 ounces]; Baker 1951). The adult Mariana crow is black with brown eyes, a slender, black bill, and short visible nasal bristles. With the exception of the occasional brown gloss to its tail, the immature Mariana crow resembles an adult.

Listing Status – The Mariana crow was listed as endangered in 1984 (USFWS 1984). On October 28, 2004, approximately 152 ha (376 ac) were designated as critical habitat for the Mariana crow on Guam, and 2,552 ha (6,033 ac) were designated on Rota (USFWS 2004b). All critical habitat for the species on Guam is found on the fee simple portion of the Guam National Wildlife Refuge (see Figure 2).

Historic and Current Distribution – The Mariana crow is endemic to the two southernmost islands of the Mariana archipelago, Rota and Guam. In 1976, Mariana crows were considered relatively common and widely distributed on Rota (Pratt, *et al.* 1979). The first island-wide survey for the species on Rota in 1982 resulted in a population estimate of 1,318 individuals (Engbring, *et al.* 1986). Subsequent surveys in 1995 and 1998 indicate the population had

declined to 592 individuals and 234 breeding adults, respectively (Fancy, *et al.* 1999; Plentovich, *et al.* 2005).

Mariana crows were once considered abundant and widely distributed throughout Guam (Baker 1951). However, by the mid-1960s, Mariana crows had disappeared from the southern region of Guam, and by the mid-1970s, they were absent from central Guam (Jenkins 1983). By 1981, the population was restricted to northern Guam and consisted of less than 400 individuals (Engbring and Ramsey 1984). Ten years later, in 1991, fewer than 50 individuals were found on Guam (Wiles, *et al.* 1995). Between 1997 and 2003, 26 Mariana crows were translocated from Rota and released on Guam (USFWS 2005a). Currently, the Guam population consists of 11 individuals (Quitigua, J., pers. comm. 2006).

Ecology – Mariana crows are omnivorous and forage at all heights in the forest and on the ground. They have been observed to feed on a variety of native and non-native invertebrates, reptiles, young rats, and bird eggs, as well as on the foliage, buds, fruits, and seeds of at least 26 plant species (Jenkins 1983; Tomback 1986; Michael 1987; USFWS 2005a). Mariana crows likely breed year round. However, peak nesting occurs between August and February on Rota (Morton, *et al.* 1999) and October and April on Guam (Morton 1996). Both parents generally participate in building the nest, incubating the eggs, and rearing the chicks through fledging (Morton, *et al.* 1999). Nest construction typically takes a week and the incubation and nestling periods are approximately from 21 to 23 days and 36 to 39 days, respectively (Morton, *et al.* 1999). Clutch sizes range from one to four eggs, and the number of nestlings average 1.42 (n=50; Morton, *et al.* 1999). In general, Mariana crows only produce a single brood a year but nest failure and other factors lead to multiple nest attempts. On Rota, 32 pairs constructed an average of two nests a year and nested up to seven times in one season (Morton, *et al.* 1999). After fledging, Mariana crows will typically remain in family groups until the following breeding season, but fledgling attendance can vary from 99 to 537 days (Morton, *et al.* 1999).

Historically, the distribution of Mariana crows among habitats was similar on Guam and Rota. Crows were known to use secondary, coastal, ravine, and agricultural forests, including coconut plantations (Seale 1901; Stophet 1946; Marshall 1949; Baker 1951; Jenkins 1983), but all evidence indicates they were most abundant in native limestone forests (Michael 1987; Morton, *et al.* 1999). Mariana crow nests on Guam have been found in 11 tree genera, all but one of which are native, but most nests are located high in emergent *Ficus* spp. or *Elaeocarpus joga* trees (Morton 1996; Aguon, C., Guam Division of Aquatic and Wildlife Resources, unpubl. data). On Rota, crows primarily use both mature and secondary limestone forests (Morton, *et al.* 1999). Of 156 nest sites on Rota, 39 percent and 42 percent were in mature and secondary limestone forest, respectively (Morton, *et al.* 1999). Of 161 nest trees found during 1996-99, 63 percent were of four species: fagot, *Eugenia reinwardtiana*, *Intsia bijuga*, and *Premna obtusifolia* (Morton, *et al.* 1999). Individual nest trees averaged 16.9 centimeters (6.7 inches) diameter at breast height and 8.7 m (28.5 ft) high. Canopy cover over nest sites averaged 93 percent and was never less than 79 percent. Nests were located at least 290 m (950 ft) from the nearest road and 62 m (203 ft) from the nearest forest edge, in areas with forest canopy cover that averaged 93 percent. The distances from edges strongly suggest that nesting crows are sensitive to disturbance by humans (Morton, *et al.* 1999).

On Rota, Morton, *et al.* (1999) found that breeding crows on six study areas averaged one pair per 22 ha (50 ac) of forested habitat, and each territory was dominated by native forest. Pair densities ranged from one per 37 ha (91 ac) in relatively fragmented forest, to as high as one pair per 12 ha (30 ac) in mostly intact limestone forest along a coastal terrace. Territories were aggressively defended from July through January, although established pairs occupied these areas throughout the year.

Threats – The primary threats to the Mariana crow throughout its range are habitat destruction and modification, predation by introduced predators like the brown treesnake, and human persecution (USFWS 2005a).

Guam Micronesian Kingfisher

Species Description – The Guam Micronesian kingfisher, known as "sihek" in Chamorro, is a sexually dimorphic forest kingfisher in the family *Alcedinidae* (Baker 1951). The adult male has a cinnamon-brown head, neck, upper back, and under parts. The lower back, lesser and underwing coverts, and scapular feathers are greenish-blue and the tail is blue. The feet and iris of the eye are brown and the bill is black except for some white at the base of the lower mandible. The female resembles the adult male, but the upper breast, chin, and throat are paler and the remaining underparts and underwing lining are white instead of cinnamon. Males weigh between 51 and 64 grams (1.8 to 2.3 ounces), and females weigh between 58 and 76 grams (2 to 2.7 ounces; Baker 1951, Jenkins 1983).

Listing Status – The Guam Micronesian kingfisher was listed as endangered in 1984 (USFWS 1984). On October 28, 2004, approximately 152 ha (376 ac) were designated as critical habitat for the Guam Micronesian kingfisher on Guam (USFWS 2004b). All critical habitat for this subspecies is found on the fee simple portion of the Guam National Wildlife Refuge (see Figure 2).

Historic and Current Distribution – This subspecies of *Halcyon cinnamomina* is endemic to Guam. The other two subspecies occur on the islands of Pohnpei (*H. cinnamomina reichenbachii*) and Palau (*H. cinnamomina pelwensis*). The Guam Micronesian kingfisher was considered "fairly common" and occurred throughout forested areas on Guam in 1945 (Baker 1951). Populations in southern and central Guam disappeared by the 1980s (Jenkins 1983) and only 3,023 individuals were recorded in 1981 in northern Guam (Engbring and Ramsey 1984). This population subsequently declined rapidly, and by 1985 only 30 individuals were recorded on Guam (Marshall 1989). This subspecies was believed extinct in the wild by 1988 (Wiles, *et al.* 2003).

Between 1984 and 1986, 29 Guam Micronesian kingfishers were captured and sent to zoological institutions in the mainland Unites States (Hutchins, *et al.* 1996). As of August 2006, the captive population included 77 individuals in 12 captive breeding institutions (International Species Information System 2006).

Ecology – Guam Micronesian kingfishers feed both on invertebrates and small vertebrates, including insects, segmented worms, hermit crabs, skinks, geckoes, and possibly other small vertebrates (Marshall 1949; Baker 1951; Jenkins 1983). This species typically forages by

perching motionless on exposed perches and swooping down to capture prey on the ground (Jenkins 1983). Guam kingfishers will also capture prey from foliage and have been observed gleaning insects from tree bark (Maben 1982).

This subspecies nests in cavities, and breeding activity appears to be concentrated from December to July (Marshall 1949; Baker 1951, Jenkins 1983). Nests have been reported in a variety of trees, including *Ficus* spp., *Cocos nucifera*, *Artocarpus* spp., *Pisonia grandis*, and *Tristiropsis obtusangula* (Baker 1951; Jenkins 1983; Marshall 1989). Pairs may excavate their own nests in soft trees, arboreal termitaria (the nests of termites [*Nasutitermes* spp.]), arboreal fern root masses, or they may utilize available natural cavities such as broken tree limbs (Jenkins 1983; Marshall 1989). Jenkins (1983) observed that some excavated cavities were never used as nesting sites, which suggests that the process of excavating nest sites may be important in pair-bond formation and maintenance.

Both male and female Guam Micronesian kingfishers incubate eggs and brood and feed nestlings (Jenkins 1983). Clutch sizes from wild populations (n=3) were either one or two eggs (Baker 1951; Jenkins 1983; Marshall 1989) and clutch sizes of one to three eggs have been reported in the captive population (Bahner, *et al.* 1998). Incubation, nestling, and fledgling periods for populations of Guam Micronesian kingfishers in the wild are unknown. However, incubation and nestling periods of captive birds averaged 22 and 33 days, respectively (Bahner, *et al.* 1998).

Jenkins (1983) reported that the Guam Micronesian kingfishers nested and fed primarily in mature, secondary growth, and, to a lesser degree, in scrub limestone forest. It was also found in coastal strand vegetation containing coconut palm as well as riparian habitat. However, Jenkins (1983) reported it was probably most common along the edges of mature limestone forest. Few data exist about specific kingfisher nest sites in the wild, but in one study in northern Guam, 16 nest sites were correlated with closed canopy cover and dense understory vegetation. In this study, nest cavities were excavated in the soft, decaying wood of large, standing dead trees averaging 43 centimeters (17 inches) in diameter (Marshall 1989). Research on the Pohnpei Micronesian kingfisher indicates that an area of approximately 8 to10 ha (20 to 25 ac) of mixed forest and open area may be needed to support a pair of kingfishers (Kesler 2006). Kesler (2006) also noted that at least part of this territory included mature forest. However, it should be noted that Micronesian kingfisher territories may differ from Pohnpei Micronesian kingfisher territories due to differences in forest structure on Guam and Pohnpei (Mueller-Dombois and Fosberg 1998).

Threats – The primary threats to the Guam Micronesian kingfisher are habitat destruction and modification, predation by brown treesnakes, and limited population growth in the captive population (USFWS 2004a).

Guam Rail

Species Description – The Guam rail, known as "koko" in Chamorro, is a flightless rail in the family *Rallidae*. Males and females look outwardly similar but, on average, females (212 grams [8 ounces]) weigh less than males (241 grams [9 ounces]; Jenkins 1979). The head, neck, and eye stripe of the Guam rail are brown, and the eyebrow, lower neck and upper breast are grey.

Their lower breast, abdomen, under tail coverts, and tail are blackish with white barrings. Their legs, feet, and iris are brown and their bill is grey.

Listing Status – The Guam rail was listed as endangered in 1984 (USFWS 1984). No critical habitat for this species has been designated.

Historic and Current Distribution – The Guam rail is endemic to Guam. This species was once distributed throughout Guam, but by 1981 the population was reduced to approximately 2,300 birds and only existed in northern Guam (Engbring and Ramsey 1984; USFWS 1990a). In 1983, it was estimated that fewer than 100 individuals remained, and it was considered extinct in the wild by 1987 (Witteman, *et al.* 1990). In 2003, 129 individuals were in captivity in zoological institutions and Guam Division of Aquatic and Wildlife Resources captive propagation facilities (Lynch, C., pers. comm. 2003). Efforts to establish an experimental population on the island of Rota have been underway since 1989 (Beauprez and Brock 1999a). The current population on Rota is estimated to be between 40 and 70 individuals (Wenninger, P., pers. comm. 2005) but it is not self sustaining and requires annual reintroductions.

Ecology – Guam rails are territorial ground nesters that breed year-round (Jenkins 1979; USFWS 1990a); however, peak breeding may occur during the rainy season (July through November) (Perez 1968). Clutches typically consist of three to four eggs, and broods range from one to four chicks (Jenkins 1979). Guam rails are omnivorous but appear to prefer animal matter over vegetable foods (Jenkins 1979). They have been known to eat gastropods, skinks and geckos, insects, carrion, seeds, and palm leaves (Jenkins 1979). This species is primarily believed to prefer secondary vegetation, though it was found in all habitats except wetlands, though savanna and mature forest may have been marginal habitats (Jenkins 1979; USFWS 1990a ; Wenninger, P., pers. comm. 2006).

Threats – The primary threats to the Guam rail are predation by brown treesnakes and feral cats (*Felis cattus*) (USFWS 1984; 1990a). Predation by brown treesnakes is believed to be the primary factor in the decline of the species on Guam, and high snake populations on Guam still threaten recovery efforts there. However, feral cat predation has been found to be a major obstacle to efforts to establish an experimental population on Rota and to re-establish a population on Guam (Beauprez and Brock 1999a,b).

Environmental Baseline

The action area for the proposed project includes the proposed sites for facility construction and renovation and all the areas on Andersen AFB covered under the flight lines of aircraft included in the proposed project (see Figure 2). Also, because Mariana fruit bats are believed to fly back and forth between Guam and Rota (Wiles and Glass 1990; Esselstyn, *et al.* 2006), individuals in the Mariana fruit bat population on Rota are also included in the action area since these bats may be impacted by the proposed action if they migrate to Guam.

Status of Species in Action Area

Mariana fruit bat - Currently, the Mariana fruit bat colony at Pati Point consists of approximately 30 to 40 individuals (Aguon, C., pers. comm. 2006). The colony has declined severely since the early 1980s when approximately 500 bats were observed at the colony (Wiles 1987a). An unknown number of single bats, potentially juveniles and/or bachelors, roost in forests on Andersen AFB. The bat population on Rota is approximately 550 individuals (Esselstyn, *et al.* 2006). Esselstyn and others (2006) estimated that approximately 100 Mariana fruit bats may have migrated between Rota and Guam after a typhoon in December 2002. Wiles and Glass (1990) estimated that between 225 and 300 have moved between Rota and Guam due to human disturbance or other factors.

As stated in the "Status of the Species" section above, Mariana fruit bats utilize limestone and coastal forest and coconut plantations for foraging and roosting. A detailed assessment of the available Mariana fruit bat habitat on Guam has not been completed. However, using the Donnegan and others (2004) vegetation survey of Guam, limestone forest and plantation forest contain components that Mariana fruit bats utilize for foraging and roosting and may be potential habitat for this species. In 2002, the Service identified approximately 5,803 ha (14,338 ac) in northern Guam as essential habitat for the Mariana fruit bat (USFWS 2002). Utilizing the recent vegetation assessment (Donnegan, *et al.* 2004), it is estimated that approximately 4,867 ha (12,026 ac) of potential Mariana fruit bat habitat is located within these essential habitat areas. Approximately 3,848 ha (9,508 ac) of this habitat is located on Andersen AFB.

Mariana crow – Only 11 Mariana crows are known to occur on Guam, and all are located on Andersen AFB (Quitugua, J., pers. comm. 2006). Nine individuals (four territorial pairs) are located within the Munitions Storage Area, and two individuals (one territorial pair) are located in the northern part of the base near the Guam National Wildlife Refuge (see Figure 3). All of these Mariana crows are located below the flight paths for aircraft associated with this proposed action. However, none of the Mariana crows are located near the proposed Aircraft Staging Area, Commercial Gate, or Truck Inspection Facility areas.

As stated in the "Status of the Species" section above, Mariana crows utilize limestone, secondary, coastal, ravine, and agricultural forests for foraging and nesting. Again, Donnegan and others (2004) vegetation survey of Guam indicates limestone forest and plantation forest contain components that Mariana crows utilize for foraging and nesting and may be potential habitat for this species. In 2002, the Service identified approximately 5,075 ha (12,540 ac) in northern Guam as essential habitat for the Mariana crow (USFWS 2002). Utilizing the recent vegetation assessment (Donnegan, *et al.* 2004), it is estimated that approximately 4,360 ha (10,774 ac) of potential Mariana crow habitat is located within these essential habitat areas. Approximately 3,848 ha (9,508 ac) of this habitat are located on Andersen AFB.

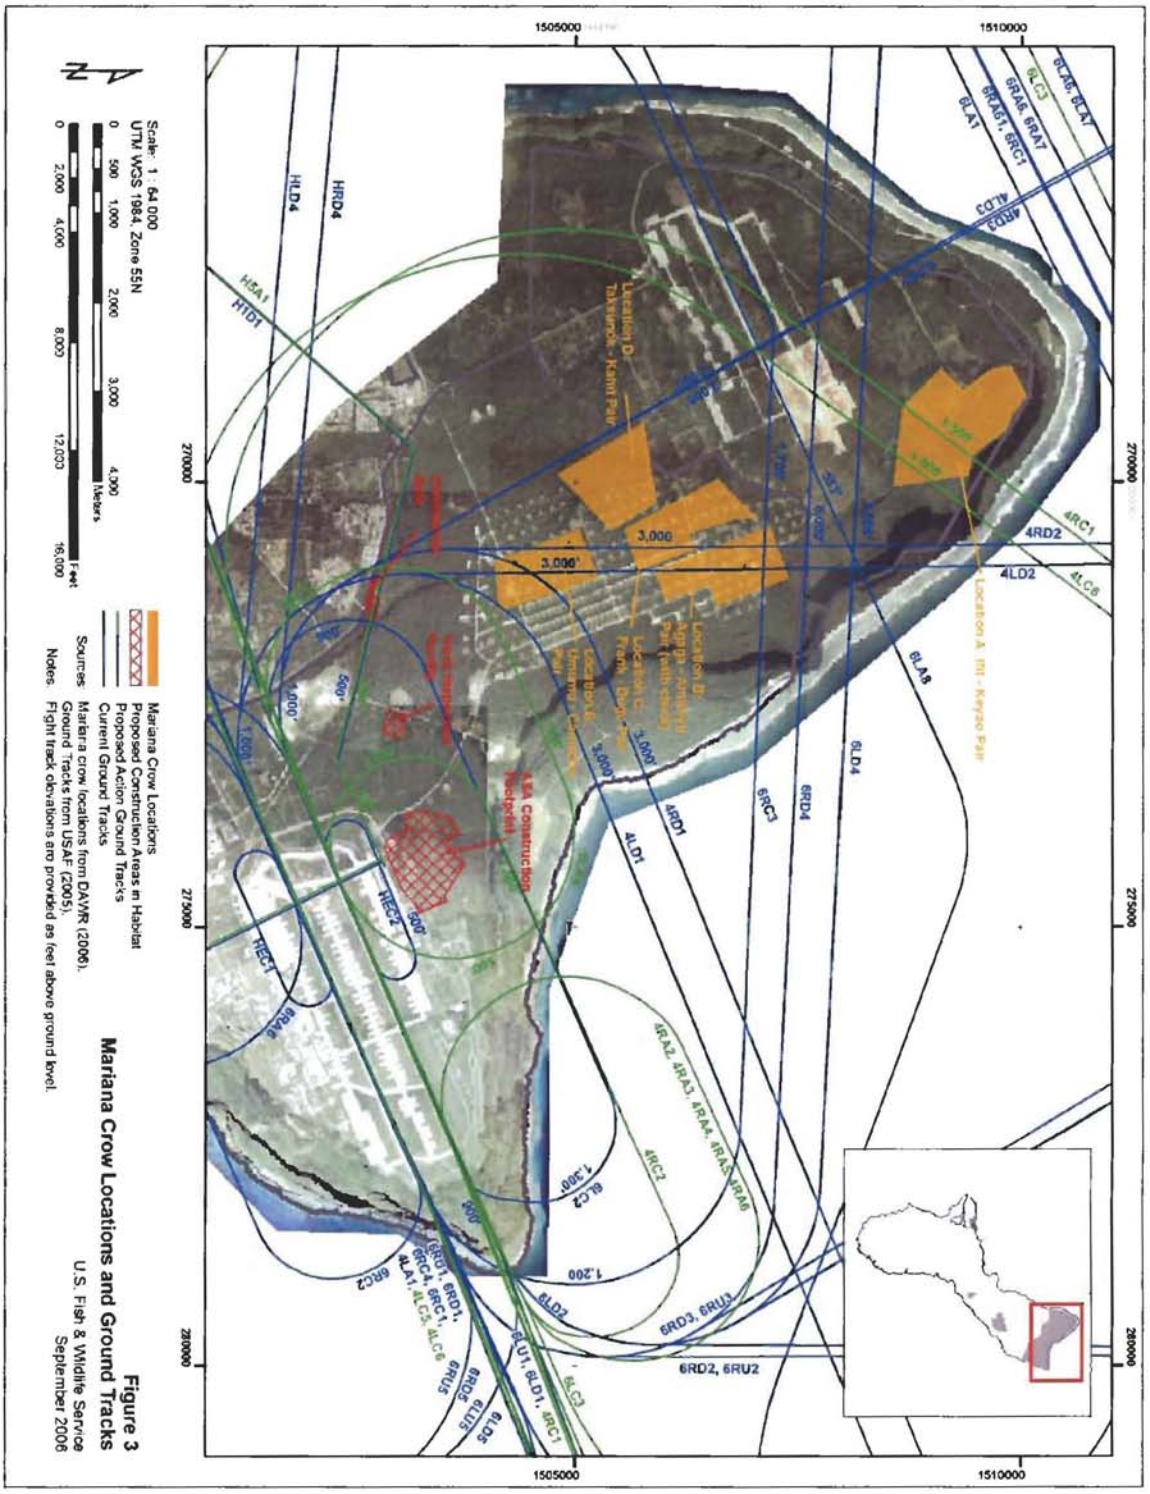

Figure 3
Mariana Crow Locations and Ground Tracks
U.S. Fish & Wildlife Service
September 2006

Guam Micronesian kingfisher – The Guam Micronesian kingfisher is currently extinct in the wild and is not found in the action area. However, habitat required to support the recovery of the species is located within the action area. As stated in the "Status of the Species" section above, Guam Micronesian kingfishers are believed to utilize mature limestone forest, secondary forests, and coastal forests dominated by coconut trees for foraging and nesting. A detailed assessment of the available Guam Micronesian kingfisher habitat on Guam has not been completed. However, Donnegan and others (2004) vegetation survey of Guam indicates limestone forest and plantation forest contain components that Guam Micronesian kingfishers utilize for nesting and may be potential breeding habitat for this species. In 2002, the Service identified approximately 5,803 ha (14,338 ac) in northern Guam as essential habitat for the Guam Micronesian kingfisher (USFWS 2002). Utilizing the recent vegetation assessment (Donnegan, *et al.* 2004), it is estimated that approximately 4,867 ha (12,026 ac) of potential Guam Micronesian kingfisher breeding habitat is located within these essential habitat areas. Approximately 3,848 ha (9,508 ac) of this habitat are located on Andersen AFB.

Guam rail – The Guam rail is currently extinct in the wild and is not found in the action area. However, habitat required to support the recovery of the species is located within the action area. As stated in the "Status of the Species" section above, Guam rails are believed to prefer secondary vegetation and forest edges for foraging and nesting. The Donnegan and others (2004) vegetation survey of Guam, indicates limestone forest, scrub forest, limestone scrub forest, and urban cultivated contain components that Guam rails may utilize for foraging and nesting and may be potential habitat for this species. Utilizing the available vegetation, it is estimated that approximately 4,926 ha (20,738 ac) of potential Guam rail habitat is available in northern Guam on the Guam National Wildlife Refuge overlay land. Approximately 3,872 ha (16,301 ac) of this habitat are located on Andersen AFB.

Threats to the Species in Action Area

Many of the threats to the Mariana fruit bat, Mariana crow, Guam Micronesian kingfisher, and Guam rail in the action area are similar. Therefore, to avoid repetition, these threats are divided into two general categories with information on how each threat impacts each species.

Habitat Loss and Degradation – Mariana fruit bat, Mariana crow, and Guam Micronesian kingfisher habitat within the action area is being impacted by feral ungulates, invasive weeds and insects, and typhoons. On Andersen AFB, densities of Philippine deer (*Cervus mariannus*) and feral pigs (*Sus scrofa*) were estimated at 1.8 deer per ha (0.8 deer per acre) and 0.4 pigs per ha (0.2 pigs per acre), some of the highest densities recorded in the world (Knutson and Vogt, unpubl. manuscript). These introduced ungulates are suspected of significantly impacting native floral communities on Andersen AFB by consuming seeds, fruits, and foliage, ingesting or trampling seedlings, and promoting the spread of introduced weeds (Wiles, *et al.* 1999; Wiles 2005). These impacts as well as damage to forests on the base from naturally occurring typhoons and introduced weeds and insects, are degrading the quality of the remaining forest. How this degradation impacts how these forests can sustain Mariana fruit bat, Mariana crow, and Guam Micronesian kingfisher populations is unknown.

Habitat for the Mariana fruit bat, Mariana crow, Guam Micronesian kingfisher, and Guam rail on Andersen AFB will also be impacted by the Air Force's development of a training area in the

Northwest Field area of the base. The Air Force (2006c) estimates 26 ha (64 ac) of potential Mariana fruit bat, Mariana crow, and Guam Micronesian kingfisher habitat will be lost as a result of the training area construction. The Air Force also expects a total of 137 ha (330 ac) of potential Mariana fruit bat, Mariana crow, and Guam Micronesian kingfisher habitat may be indirectly impacted by intense training activities and clearing at the training facility. Once the new training area is operational, it is expected that the amount of habitat remaining for the Mariana fruit bat, Mariana crow, and Guam Micronesian kingfisher on Andersen AFB will be 4,571 ha (11,295 ac), 4,223 ha (10,435 ac), and 4,571 ha (11,295 ac), respectively. The Guam rail prefers secondary habitat; therefore, the habitat for this species may increase.

Predation – Brown treesnake predation is the primary factor in the decline of the Mariana crow, Guam Micronesian kingfisher, and Guam rail (USFWS 1990a, 2004a, 2005a). Brown treesnake predation on juvenile Mariana fruit bats may also be an important factor in the poor recruitment of this species on Guam (Wiles 1987a; USFWS 2005b). Snake densities within the action area are not known specifically. However, density estimates for snakes over 800 millimeters (31 inches) snout-vent length in tangantangan (*Leucaena leucocephala*) scrub forest on Guam range from 20 to 60 snakes per ha (nine to 26 snakes per acre), while densities in grassland, ravine forest, or native forest vegetation types range from 10 to 20 snakes per ha (four to 9 snakes per ac) (Rodda, *et al.* 1999). These high snake densities continue to hamper recovery efforts for the Mariana fruit bat, Mariana crow, Guam Micronesian kingfisher, and Guam rail.

In addition to impacts from brown treesnakes, the Mariana fruit bat population in the action area may also be impacted by illegal hunting of adult bats, and Guam rail recovery is limited by feral cat populations in the action area. Illegal hunting at the Pati Point fruit bat colony has not been noted in the last decade. However, opportunistic hunting of solitary bats roosting throughout Andersen AFB is believed to occur in conjunction with legal hunting of feral ungulates (Brooke, A., pers. comm. 2005). Predation of Guam rails by feral cats has been found to be a problem on Rota and Guam (Beauprez and Brock 1999a, b; Wenninger, P., pers. comm. 2006). Experimental reintroduction efforts on Guam determined that cat predation was a major limiting factor to recovery efforts (Beauprez and Brock 1999b; Wenninger, P., pers. comm. 2006).

Conservation Needs of the Species in the Action Area

Due to the similarity in threats to the Mariana fruit bat, Mariana crow, Guam Micronesian kingfisher, and Guam rail, many of their conservation needs in the action area overlap. Therefore, to avoid repetition, these needs are summarized below for all species.

Reduce Predation – As noted above, brown treesnake predation is considered a primary factor in the decline of the Mariana fruit bat, Mariana crow, Guam Micronesian kingfisher, and Guam rail on Guam. Therefore, large-scale control and/or eradication of brown treesnakes is essential for these species to recover. Guam rail recovery is also limited by feral cat predation on Guam, and large-scale cat control will also be needed to help recover this species. Illegal hunting of Mariana fruit bats is also a major factor in their decline and will need to be controlled to help recover this species. Potential measures for reducing and/or eliminating illegal hunting are increased protection of Mariana fruit bat roosting colonies and individual bats by limiting access to roost sites and foraging areas and increased efforts by law enforcement to reduce illegal hunting.

Protect and Increase Habitat – Habitat loss and degradation are believed to be important factors in the decline of the Mariana fruit bat, Mariana crow, and Guam Micronesian kingfisher (USFWS 2004a; 2005 a,b). Protection of the remaining habitat for these species is needed along with efforts to increase the quality of the remaining habitat. Due to the high populations of feral pigs and deer, control and/or eradication of these feral ungulates will help improve the quality of the remaining habitat in the action area. Preventing and controlling introduced insect pests and weeds will also increase the quality of the remaining habitat. Reforestation of degraded areas will also improve the amount of habitat available to support the eventual recovery of these species.

Reintroduction – The recovery criteria for the Mariana crow, Guam Micronesian kingfisher, and Guam rail call for establishing populations of each species in northern Guam (USFWS 1990a, 2004a, 2005a). The Guam Micronesian kingfisher and Guam rail are both extinct in the wild on Guam and will need to be reestablished in northern Guam through reintroduction efforts. The low population of Mariana crows on Guam also requires that additional Mariana crows be translocated from Rota to Guam to help reestablish a stable population in northern Guam.

Ongoing Conservation Actions for the Species in the Action Area

In conjunction with the proposed Northwest Field training facility, the Air Force will construct a 54-ha (133-ac) ungulate exclosure and eradicate ungulates to increase the quality of the habitat for Mariana fruit bats, Mariana crows, and Guam Micronesian kingfishers (Air Force 2006c). The Air Force will also set aside approximately 60 ha (148 ac) of forested land in a new experimental habitat management unit (Air Force 2006c). A brown treesnake exclosure will be constructed around this area and ungulates and other introduced predators will be eradicated from this site to help support listed species recovery efforts on Guam. The Air Force will also be initiating the same native foraging tree planting, ungulate management plan, and Wildlife Management Specialist hiring described in the conservation measures for this project (see Air Force (2006c) and "Project Description" for more information about these measures).

Brown treesnake control measures are currently being undertaken in the Munitions Storage Area on Andersen AFB and around individual Mariana crow nests to help conserve this species. Brown treesnake barriers are currently being applied to all nest trees to limit predation of Mariana crow eggs and chicks (Aguon, *et al.* 2002; Quitigua, J., pers. comm. 2006). Large-scale control of brown treesnakes within the Munitions Storage Area utilizing traps and toxicants has been underway since 2000. This area is currently utilized for releasing hand-reared Mariana crows back into the wild.

The Guam Division of Aquatic and Wildlife Resources is actively managing the remaining Mariana crows on Guam to increase the population. Mariana crows have been released on Guam since approximately 1997 (USFWS 2005a). Eggs were collected on Rota, hand-reared on Guam, and released into the wild on Guam until 2003. Currently, eggs are collected from nesting crows on Guam, hand-reared, and later released on Guam (Quitigua, J., pers. comm. 2006).

Effects of the action

Facilities and Construction

The construction, maintenance, and operation of the proposed Aircraft Staging Area, Commercial Entry Gate, and Truck Inspection Facility are expected to have both direct and indirect impacts on the Mariana fruit bat, Mariana crow, Guam Micronesian kingfisher, Guam rail, and/or their habitats. Direct impacts include habitat loss in areas cleared for construction of the proposed facilities. Indirect impacts include the reduced use of habitat adjacent to the proposed facilities due to auditory and visual disturbance associated with their construction, operation, and maintenance. Many studies have demonstrated that certain species will avoid areas where human disturbance is present (Klein, *et al.* 1995; Reijnen, *et al.* 1995; Gill 1996; Gill, *et al.* 1996; de la Torre, *et al.* 2000; Dyer. *et al.* 2001). The extent of this indirect habitat loss is expected to vary based on the activities at each facility, the quality of habitat adjacent to the proposed facilities, the availability of suitable habitat in other areas, and tolerance of each species to different types of auditory and visual disturbance (Rodgers and Smith 1995; Gill, *et al.* 2001). An assessment of potential direct and indirect loss of habitat for each species is presented below.

Mariana Fruit Bat – Based on the vegetation assessment for the proposed project and the habitat requirements of the Mariana fruit bat, approximately 58 ha (143 ac) of potential foraging and roosting habitat will be lost due to the construction of facilities. Approximately 48 ha (118 ac) of the foraging and roosting habitat is found in the proposed Aircraft Staging Area site while the remaining 10 ha (25 ac) is in the Commercial Entry Gate and Truck Inspection Facility areas.

No studies on Mariana fruit bat habitat use in relation to human disturbance have been conducted. Species may react to human disturbance in a manner similar to how they react to predation risk (Frid and Dill 2002). Therefore, Mariana fruit bat shifts in habitat use based on perceived threats may occur due to the species' history of being hunted (Kitchen, *et al.* 2000; Kilgo, *et al.* 1998). Observations by biologists on Guam indicate that foraging Mariana fruit bats can be fairly tolerant of human disturbance at night if they are not being actively bothered (Wiles, G., pers. comm. 2006). However, this tolerance can vary based upon the type and extent of the disturbance (Wiles, G., pers. comm. 2006) as has been reported in other species (Lafferty 2001; Rees, *et al.* 2005).

Mariana fruit bats primarily forage at night (see "Species Status" above). All construction and maintenance for the proposed facilities will occur during the day and the Commercial Entry Gate and Truck Inspection Facility will only be operational during the day. In addition, the Air Force will be installing shielded lights at the proposed facilities to reduce potential impacts of lighting on foraging bats. Therefore, these activities and proposed facilities are not expected to have severe impacts on foraging Mariana fruit bats, except post-typhoon when food resources may be limited and bats forage during the day (Pierson, *et al.* 1996). Therefore, significant impacts to foraging bats are only expected to occur from the operation of the Aircraft Staging Area facility, which will include aircraft entering and leaving the facility, vehicles, and personnel working in the area.

Observations of foraging individuals indicate that Mariana fruit bats are likely to avoid areas within 100 m (328 ft) of the Aircraft Staging Area facility due to the aircraft noise and moderate human activity at night (Wiles, G., pers. comm. 2006). Currently foraging habitat for the species is available to the north, east, and west of the Aircraft Staging Area facility and approximately 80 ha (197 ac) of potential foraging habitat (*i.e.*, limestone forest; Donnegan, et *al.* 2004) could be impacted by the operation of the facility.

In addition, to foraging habitat, roosting habitat is also expected to be impacted by the construction, maintenance, and operation of the Aircraft Staging Area, Commercial Entry Gate, and Truck Inspection Facility. Observations of roosting bats near construction activities indicate that bats were not disturbed by activities 150 m (492 ft) away from the roost site (Janeke, D., pers. comm. 2006). Currently roosting habitat for the species is available to the north, east, and west of the proposed Aircraft Staging Area site and approximately 93 ha (231 ac) of potential roosting habitat (*i.e.*, limestone forest; Donnegan *et al.* 2004) could be impacted by the operation of the facility. In addition, approximately 35 ha (86 ac) of potential roosting habitat (*i.e.*, limestone forest; Donnegan *et al.* 2004) could be impacted at the Commercial Entry Gate (19 ha, 48 ac) and Truck Inspection Facility (15 ha, 38 ac).

Of the proposed facilities, only the proposed Aircraft Staging Area is known to be occupied by Mariana fruit bats at this time (see "Environmental Baseline" above). Currently, this area is the foraging territory of a female Mariana fruit bat. Since this territory will be cleared as part of the proposed project it is expected that this bat will be forced to establish a new foraging territory in another area. This change in territory may affect the bats reproductive output for the year and/or effect its foraging success until it establishes a new territory. Therefore, we expect that this bat will be adversely impacted by the direct loss of approximately 48 ha (118 ac) of foraging habitat. This adverse impact is expected to result in take through harassment. To help minimize this impact and avoid potential take by killing the bat during clearing, the Air Force will only construct the facilities during the day and will coordinate with the Guam Division of Aquatic and Wildlife Resources and the Guam National Wildlife Refuge to conduct surveys of the project site and adjacent area the week prior to construction/clearing and during construction/clearing to determine if Mariana fruit bats are present in the action area. If Mariana fruit bats are found within 150 m (492 ft) of the project site, the Air Force will postpone construction within 150 m (492 ft) of the bat until the bat has left the area.

In summary, we expect 58 ha (143 ac) of foraging and roosting habitat will be unavailable to the species due to the proposed facilities (Table 4). Approximately 48 ha (118 ac) of the habitat that will be lost includes the known foraging territory of a female Mariana fruit bat. Loss of this habitat is expected to result in take through harm of the female fruit bat. In addition to direct loss of habitat, approximately 80 ha (197 ac) of potential foraging and 128 ha (317 ac) of potential roosting habitat may also be indirectly impacted due to human disturbance and may reduce the quantity of habitat available to support recovery of the species (see Table 4).

Table 4. Estimated Direct and Indirect Habitat Loss for Listed Species Associated with ISR/Strike Project.

Species	Habitat Type	Direct Loss		Indirect Loss		Total Loss	
		Hectares	Acres	Hectares	Acres	Hectares	Acres
Mariana Fruit Bat	Foraging	58	143	80	197	138	340
	Roosting	58	143	128	317	186	460
Mariana Crow	Foraging	58	143	147	363	201	506
	Nesting	58	143	147	363	201	506
Guam Micronesian kingfisher	Foraging	58	143	135	334	193	477
	Nesting	58	143	101	249	159	392
Guam Rail	Nesting and Foraging	23	57	-[1]	-	23	57

[1] *Indirect habitat loss was not calculated for the Guam rail due to lack of information on potential impacts of human disturbance on habitat use.*

Mariana Crow – Based on the vegetation assessment for the proposed project and the habitat requirements of the Mariana crow, approximately 58 ha (143 ac) of potential foraging and nesting habitat will be lost due to the construction of the proposed facilities. Approximately 48 ha (118 ac) of foraging and nesting habitat is found in the proposed Aircraft Staging Area site while the remaining 10 ha (25 ac) is found in both the Commercial Entry Gate and Truck Inspection Facility areas.

No studies on Mariana crow habitat use in relation to human disturbance have been conducted. However, observations of nesting on Guam and Rota indicate some tolerance of human activities (Morton, *et al.* 1999; Dicke, B., pers. comm. 2005). For example, Mariana crow nests were on average 290 m (n=75, range 25-1,454 m [950 ft, range 82-4,770 ft]) away from paved or graded roads, but only 62 m (n=77, range 0-210 m [203 ft, range 0-689 ft]) from the nearest forest edge on Rota (Morton, *et al.* 1999). Effects of disturbance on Mariana crow foraging are not known; however, their tolerance for human disturbance during foraging may be greater than their tolerance while nesting. Because tolerance of disturbance is affected by the type, duration, and occurrence of the disturbance (Lafferty 2001; Rees, *et al.* 2005) we expect it to vary between the proposed Aircraft Staging Area, Commercial Entry Gate, and Truck Inspection Facility.

Operation activities at the Aircraft Staging Area facility include aircraft entering and leaving the facility, vehicles, personnel working in the area, and lights. This activity is expected to occur during the day and night. Due to the level of disturbance, we expect at a minimum, all habitat within 300 m (984 ft) of the Aircraft Staging Area facility will not be utilized for nesting. Some of this area may be utilized for foraging, but the extent is unknown at this time. Currently, potential foraging and nesting habitat for this species is available to the north, west, and east of the proposed facility; therefore, approximately 135 ha (334 ac) of potential nesting habitat will be impacted by operations of the Aircraft Staging Area facility.

Activities at the Commercial Entry Gate and Truck Inspection Facility will include vehicles entering and leaving and personnel working in the area during the day. No activity is expected at night. Because the level of visual disturbance is high but the auditory disturbance is lower due to the lack of aircraft, we expect that all potential nesting habitat within 60 m (198 ft) of these facilities will not be utilized by nesting Mariana crows. This distance from this disturbance is

less due to the potential cover the intervening forest provides nesting birds from visual disturbance. We therefore calculated approximately 12 ha (29 ac) of potential Mariana crow nesting habitat will be indirectly impacted by the Commercial Entry Gate and Truck Inspection Facility.

As noted in the "Environmental Baseline" section above, the proposed project sites for each facility are not currently known to be occupied by Mariana crows. However, as added measures to help avoid any potential impacts to Mariana crows if the status of the species in the action area should change, the Air Force will initiate construction outside the Mariana crow breeding season (October to April). In addition, the Air Force will coordinate with the Guam Division of Aquatic and Wildlife Resources and the Guam National Wildlife Refuge to conduct surveys of the project site and adjacent area the week prior to construction/clearing and during construction/clearing to determine if Mariana crows are present in the action area. If Mariana crows are nesting within 300 m (984 ft) of the project site, the Air Force will postpone construction within 300 m (984 ft) of the nest until the breeding attempt is completed (*e.g.*, fledging or nest failure).

In summary, we expect 58 ha (143 ac) of potential foraging and nesting habitat will be impacted and unavailable to the species due to the proposed facilities (see Table 4). In addition to direct loss of habitat, approximately 147 ha (363 ac) of potential foraging and nesting habitat will also be indirectly impacted due to human disturbance and made unavailable to support the species (see Table 4). The proposed action areas for the Aircraft Staging Area, Commercial Entry Gate, and Truck Inspection Facility and the areas adjacent to these sites are not currently occupied by Mariana crows. Therefore, we do not expect any adverse effects of the proposed facilities to the population currently found on the base.

Guam Micronesian Kingfisher – Based on the vegetation assessment for the proposed project and the habitat requirements of the Guam Micronesian kingfisher, approximately 58 ha (143 ac) of potential nesting habitat and approximately 74 ha (183 ac) of potential foraging habitat will be lost due to the proposed project. Approximately 48 ha (118 ac) of the nesting and 66 ha (164 ac) of the foraging habitat is found in the proposed Aircraft Staging Area site while the remaining nesting and foraging habitat is found in the Commercial Gate and Truck Inspection Facility areas.

No studies on Micronesian kingfisher habitat use in relation to human disturbance have been conducted. However, anecdotal observations of disturbance impacts on Pohnpei Micronesian kingfisher (*Halcyon cinnamomina reichenbachii*) habitat are available. Dr. Dylan Kesler (pers. comm. 2006) notes that Pohnpei Micronesian kingfishers were sensitive to the presence of human traffic within 100 m (328 ft) when foraging. Nests were also typically 50 to 100 m (164 to 328 ft) away from forest edges, roads, and houses. The impact of noise, like jet aircraft noise, is unknown. However, disturbance distances may be greater due to the impacts of noise on vocalizations (Patricelli and Blickley 2006; Kesler, D., pers. comm. 2006). Based on this information, we estimate that potential foraging and nesting habitat (*i.e.*, limestone forest, urban cultivated) (Donnegan, *et al.* 2004) within 100 m (328 ft) of each facility may be impacted. This is equal to approximately 101 ha (249 ac) of nesting and 135 ha (334 ac) of foraging habitat.

In summary, we expect 58 ha (143 ac) of potential nesting and 74 ha (183 ac) of potential foraging habitat will be impacted and unavailable to support the species due to the proposed facilities (see Table 4). We also estimate that approximately 101 ha (249 ac) of potential nesting and 135 ha (334 ac) of potential foraging habitat may be indirectly impacted by noise (see Table 4). The Guam Micronesian kingfisher is currently extinct in the wild. Therefore, we do not expect any adverse effects of the proposed facilities to individual Guam Micronesian kingfishers.

Guam Rail – Based on the vegetation assessment for the proposed project and the habitat requirements of the Guam rail, approximately 23 ha (57 ac) of potential nesting and foraging habitat will be lost due to the proposed project. Approximately 19 ha (46 ac) of the nesting and foraging habitat is found in the proposed Aircraft Staging Area site while the remaining nesting and foraging habitat is found in the Commercial Entry Gate and Truck Inspection Facility areas.

No studies on Guam rail habitat use in relation to human disturbance have been conducted. The Guam rail is a secretive species, but observations by Paul Wenninger (pers. comm. 2006), the Guam rail biologist for the Guam Division of Aquatic and Wildlife Resources, indicate that rails are tolerant of some human disturbance if sufficient cover is available. This tolerance may vary based on the type, intensity and duration of the disturbance (*e.g.*, aircraft noise versus vehicle traffic) but no information is available to determine if this is the case. Due to the lack of information, we have not calculated indirect habitat loss.

In summary, we expect 23 ha (57 ac) of potential nesting and foraging habitat will be impacted and unavailable to support the recovery of the species due to the construction of the proposed facilities (see Table 4). We did not calculate potential indirect impacts of human disturbance on breeding and foraging habitat (see above for explanation). The Guam rail is currently extinct in the wild. Therefore, we do not expect any adverse effects of the proposed facilities to individual Guam rails.

Aircraft Operations

The proposed project will increase aircraft operations around Andersen AFB, which will increase auditory and visual disturbance to Mariana fruit bats and Mariana crows. In addition, increased air traffic could also lead to a higher incidence of aircraft strikes or an increased chance that an aircraft could crash and impact the Mariana fruit bat colony at Pati Point or a Mariana crow nest. Guam Micronesian kingfishers and Guam rails may also be impacted by increased aircraft operations. However, because these species are extinct in the wild and no studies on aircraft impacts on these species are available or possible, the impacts of these operations are not addressed in this biological opinion. Therefore, only the potential effects of increased aircraft operations on Mariana fruit bats and Mariana crows are described below.

Aircraft Disturbance – Studies on the impacts of aircraft overflights to wildlife have been primarily limited to work on ungulates (*e.g.*, Krausman, *et al.* 1998; Maier, *et al.* 1998; Frid 2003; Landon *et al.* 2003; Krausman *et al.* 2004; Lawler *et al.* 2005) birds of prey (*e.g.*, Andersen, *et al.* 1989; Watson 1993; Trimper, *et al.* 1998; Delaney, *et al.* 1999; Palmer, *et al.* 2003), and waterbirds (*e.g.*, Ward, *et al.* 1999; Conomy, *et al.* 1998 a,b; Komenda-Zehnder, *et al.* 2003). These studies report a wide range of reactions to overflights depending on the biology of the species, its previous exposure to overflights, whether the species is breeding, the type of

aircraft, the altitude of the aircraft, and the lateral distance between aircraft and the species. The variability in these reactions and their specific circumstances make it difficult to be certain how a particular species, such as the Mariana fruit bat or Mariana crow, will react to aircraft overflights. However, there are two broad generalizations about the effects of overflights on wildlife that can be used to help assess potential impacts on the Mariana fruit bat and Mariana crow.

First, individuals with previous exposure to aircraft overflights may display less reaction to overflights then individuals without previous exposure (Andersen, *et al.* 1989, Conomy, *et al.* 1998b). This reduced reaction is believed to be a sign that these individuals have habituated to these overflights. This habituation, however, may be individual or species specific. For example, Conomy and others (1998b) found that black ducks (*Anas rubripes*) became habituated to aircraft noise with continued exposure while wood ducks (*Aix sponsa*) did not become habituated. In addition, the degree of disturbance to which a species can habituate may also be limited (National Park Service 1994).

The second generalization is that an individual's reaction to an overflight may be reduced when the aircraft is farther away then when it is closer (Watson 1993; Delaney, *et al.* 1999; Ward, *et al.* 1999; Komenda-Zehnder, *et al.* 2003). This distance may depend on the species, the type of aircraft, and other variables, so no set standard can be developed for all species. However, once determined for a species, it could be used as a measure to minimize or avoid impacts to that species.

Mariana Fruit Bat

The majority of the fruit bat population on Guam is located in one colony at Pati Point below the north runway of Andersen AFB. The Air Force assessments of flight operations over this area indicate that the number of daily flight operations will increase from approximately two operations to 54 operations. The average daily sound levels for this area will increase from 66 A weighted decibel levels (dBA) to 83 dBA, and the maximum sound levels will increase from 116 dBA to 122 dBA.

Information on the effects of overflights on Mariana fruit bats is primarily limited to a study by Morton (1996) and anecdotal observations by Wiles (1991, 1993, 1994). Behavioral observations collected by Morton (1996) before and after several overflights over the colony indicate that as much as 42 percent of the colony flushed from their roosts and flew for up to five minutes before returning to roost. Morton (1996) also observed that activity 30 minutes after the overflight increased significantly as more bats were alert, agonistic, or moving instead of resting. Sound information gathered at a site adjacent to the colony during overflights ranged from 51 to 116 dBA. Morton (1996) also noted that all overflights that elicited flushing were from four engine aircraft (B-1, C-5, C-141, KC-135, Boeing 747) and not fighter aircraft. However, anecdotal observations by other biologists reported in Morton (1996) and Wiles (1991, 1994) indicate that Mariana fruit bats do respond to fighter aircraft. Wiles (1991, 1994) also notes some circumstantial evidence that the bat colony may have abandoned a former colony site on the east side of Pati Point due to increased aircraft operations associated with training missions. However, no direct correlation can be made.

Since Andersen AFB has been active since 1945, Mariana fruit bats at the Pati Point colony have been exposed to aircraft overflights, and Morton (1996) theorized that they may be habituated, to some degree, to overflights. However, as noted above, bats were still observed flushing from their roosts and reacting to the overflights and may have even abandoned a roost site due to increased aircraft operations associated with training exercises. How Mariana fruit bats will react to an increase in aircraft operations at Andersen AFB due to the proposed project is uncertain. Eventual habituation to overflights and no long-term adverse impacts to Mariana fruit bats is a possible outcome. Alternatively, if bats continue to react to all overflights that may occur it is possible that this could lead to chronic stress which could have long-term impacts on their survival (*e.g.*, reproductive and immune system suppression [Wingfield, *et al.* 1997; Tilbrook, *et al.* 2000]). It is also possible that the colony site will be abandoned due to the increase in aircraft disturbance and be forced to move to another area on Guam or go to the neighboring island of Rota.

Abandonment of roost sites has been observed previously on Guam. From approximately 1981 to 1994, multiple roost sites in northern Guam, including the current site at Pati Point, were abandoned for various reasons, including poor weather conditions (*e.g.*, typhoons), human disturbance (*e.g.*, illegal hunting), and potential disturbance from fighter aircraft training (Wiles 1981, 1983, 1985, 1986, 1987c, 1989, 1990, 1991, 1992, 1994). After abandoning their roost, these bats would often re-form into a colony or colonies at a new roost location or locations after a short period (Wiles 1985). These alternate roost sites were all located along the cliffline in northern Guam on Andersen AFB, though small groups were also observed in other areas. Between 1981 and 1994, some roost sites, including the current site, were reused and abandoned multiple times depending on the level of disturbance or other factors (Wiles 1981, 1983, 1985, 1986, 1987c, 1989, 1990, 1991, 1992, 1994).

Gill and others (2001) noted that the decision of whether an individual moves away from disturbance at their current location is dependent on the quality of the current site, distance to and quality of other suitable sites, the relative risk of predation or density of competitors at different sites, and the investment an individual has made to a site. To assess the likelihood of bats abandoning the current roost site, we examined each of these factors.

The current colony site has been used consistently since 1994 and has been considered a favored site since at least 1981 (Wiles 1987c, 1999). Therefore, we expect this site is currently a high-quality site. However, this quality is expected to change as aircraft operations increase due to the increased number of aircraft flying over the site. The observations of the Mariana fruit bat colony during and immediately after overflights noted above indicate that bats decreased the amount of time they were resting and became more active, for at least a short period, during and after an overflight. At current operation levels, see above, this reaction may occur twice a day. After the proposed project is fully implemented, it could occur as many as 54 times a day (*i.e.*, once per flight operation). This is expected to decrease the quality of this site for fruit bats because it will reduce the amount of time available for the bats to conduct their normal functions of sleeping, grooming, breeding, and intra-specific interactions at the site. This decrease in quality could be sufficient for the bats at this roost site to abandon the roost site.

As noted earlier, alternate roost sites have been utilized along the cliffline at Pati Point and to the west and northwest of Pati Point. The quality of these alternate sites is unknown and is likely dependent on the availability of roost trees at the site and level of human disturbance. We have no information that would indicate that roost trees would not be available at all of these sites or at potential new roost sites. Therefore, we expect roost trees will be available at some sites. Based on the available information, the only change in human disturbance from previous conditions at previous roost sites and the forests along the cliffline are increased aircraft operations. The largest increase in aircraft operations is expected in the areas near the runway; therefore, alternate roost sites to the west and northwest of Pati Point should experience lower aircraft operations than the Pati Point site. Based on this information, we expect that suitable alternate roost sites, other than the Pati Point site, may be available.

No other colonies exist on Guam, so no competition exists for alternate sites. The two main sources of predation for the Mariana fruit bat are illegal hunting and brown treesnake predation of juveniles. It is unlikely that Mariana fruit bats will perceive a difference in the likelihood of predation by brown treesnakes, because the predation events probably occur when the bats are foraging and not at the roost site. Illegal hunting has been observed at many of the alternate roost sites in the past, but it is not known if the bats at the current site have experienced these events. The reuse of sites after poaching events indicates, however, that past experience may not be a major factor in selecting roosts. Therefore, it is uncertain how bats will perceive the likelihood of illegal hunting. The majority of the areas to the west and northwest of Pati Point are undeveloped and probably do not experience a significant level of human activity. However, bats may avoid roosting near Tarague Beach, the rifle and explosive ordnance range, main airfield, and roads connecting these areas because of the level of human activity at these sites and perceived predation risks. Finally, Mariana fruit bats are colonial and therefore do not exert a large amount of energy or time in defending and establishing a new colony site.

Based on the available information we believe the current roost site will likely be abandoned due to the proposed action. This is because: 1) the increase in aircraft operations will reduce the quality of the current site for normal roosting due to increases in bat activity levels throughout the day; 2) alternate sites of sufficient quality are available to the west and northwest of Pati Point; and 3) the current colony site, and other roost sites, have been abandoned in the past due to human disturbance and other factors. This abandonment will, in turn, have several adverse impacts on the Mariana fruit bat population.

First, we believe the bats at the current site will likely move to alternate roost sites to the west and northwest of Pati Point. The records of abandonment of Mariana fruit bats from Guam indicate that the bats have always moved to alternate sites on Guam, primarily roost sites along the northern cliffline. Therefore, we expect the bats to remain on Guam and not migrate to Rota. Because the cliffline areas to the west and northwest of Pati Point are near public hunting areas and roads, we believe these areas are more accessible to humans and therefore, bats roosting in these areas may be subject to illegal hunting. This illegal hunting would likely result in loss of individuals and cause the new roost site to eventually be abandoned. This impact may also be cumulative because roost sites established after an illegal hunting may also be susceptible to illegal hunting because they are expected to be established to the west and northwest of Pati Point. In addition to illegal hunting, juvenile bats may be left behind at roost sites that are

abandoned because they are too heavy for their mother to support. This is also expected to have cumulative adverse impacts on the bat population if each new roost site is abandoned.

The numerical impact of the abandonment of the current roost site on the Guam Mariana fruit bat population is difficult to access due to uncertainties in how many juvenile bats might be abandoned, how many bats might be taken by illegal hunting, and how often illegal hunting and abandonment might occur. Lemke (1992) reported that the preferred method of hunting bats involves approaching a roost and firing buckshot at the colony several times before the bats leave the site. Each shot could kill several bats; therefore, we expect one poaching event may cause the death or injury of at least nine individuals (*i.e.*, three shots and three bats taken per shot). Several incidents of illegal hunting at roost sites along the cliffline in northern Guam occurred between 1981 and 1994 (Wiles 1981, 1983, 1985, 1986, 1987c, 1989, 1990, 1991, 1992, 1994). Therefore, we expect at least two illegal hunting events could occur after the bats abandon the current roost site. Between 10 and 20 percent of the female Guam bats had young (Wiles 1987c, 1989, 1990), and of the female bats on Rota with young, approximately 10 to 14 percent had large young (Wiles 1987c, 1990). Therefore, if we assume half the current population (40 animals) is female, 20 percent of the females have young, and 14 percent are large young that cannot be carried, approximately one juvenile could be left behind when a roost site is abandoned. If three roost sites are abandoned, then up to three juvenile bats could be adversely impacted.

In addition to the Mariana fruit bats at the Pati Point colony, bats from Rota may fly to Guam from Rota after typhoon events due to increased illegal hunting on Rota and/or reduced food availability due to impacts of the storm on fruit bat habitat (Wiles and Glass 1990; Stinson, *et al.* 1992; Pierson, *et al.* 1996; Esselstyn, *et al.* 2006). The first evidence of potential movement of Mariana fruit bats from Rota to Guam occurred in 1979 when a Mariana fruit bat colony of about 225-250 bats was first observed at Pati Point (Wiles 1987a; Wiles and Glass 1990). For several years prior to 1979 the population was estimated to be less than 50 animals (Wheeler and Aguon 1978). In 1981, bat numbers at Pati Point increased from 240 bats to 508 bats, presumably due to hunting activity on Rota (Wiles 1987a; Wiles and Glass 1990). Temporary increases in Mariana fruit bat numbers at the Pati Point colony after typhoons hit Rota were observed in January to May 1988 (Wiles and Glass 1990) and in December 2002 to January 2003 (Esselstyn, *et al.* 2006). The bats that move from Rota to Guam may not have previous exposure to overflights and may be more susceptible to disturbance from overflights. These bats could then move to other areas on Guam or back to Rota where they may be exposed to increased poaching pressure and/or reduced food availability due to the impacts of tropical storms on food resources.

In summary, we believe that the abandonment of the Pati Point roost site by Mariana fruit bats is likely to occur due to the increased aircraft operations under the proposed action. Mariana fruit bats have abandoned the site previously for various reasons and a former roost site at east Pati Point may have been abandoned due to aircraft activity. We expect the current Pati Point colony would relocate to a new site or sites to the west and/or northwest of Pati Point due to the previous use of these areas as roost sites, although the exact location(s) are uncertain due to changes in the forest structure over the past two decades. Due to the accessibility of roost sites to the west and northwest of Pati Point, we believe that one of the new colonized roost sites

could be abandoned because of human disturbance and other factors. In total, we expect up to two roosts to be abandoned and three juveniles and 18 adults to be killed due to the proposed project.

We also believe that Mariana fruit bats that have migrated from Rota to Guam after a typhoon will also be disturbed by increased aircraft activities at Pati Point and will prematurely return to Rota (less than one month after a storm). We believe these bats will be exposed to illegal hunting and/or poor habitat conditions on Rota which could lead to the death of at least nine individuals. We expect this will only occur after a severe storm on Rota and when aircraft operations have increased. We also expect this to only occur while the Pati Point roost site is occupied by bats from Guam because this species is gregarious and previous observations of bats from Rota were noted with existing colonies of bats from Guam. Based on the proposed timeline for the project (see Table 1) and average number of typhoons for Guam over a ten-year period, we believe this is only likely during approximately eight years of the project. Based on the timeframe and annual likelihood of a storm affecting both Guam and Rota (37 years out of the last 50 years) we believe this could occur up to six times. Utilizing estimates of illegal hunting provided above, we believe that up to 36 bats from Rota could be killed by the proposed action.

Mariana Crow

Currently, nine of the remaining 11 Mariana crows on Guam are located in the Munitions Storage Area on Andersen AFB. One pair is also located to the northeast of Northwest Field runways. Information on ground tracks provided by the Air Force indicates that 13 ground tracks pass over or near these locations (see Figure 3). Assessments of altitudes and sound levels for the loudest aircraft that utilize these ground tracks indicate 12 of the flight paths will be at or above 305 m (1,000 ft) above ground level. One ground track over the northern end of the Munitions Storage Area (6LA8, see Figure 3), an approaching flight path for a C-5, is 169 m (553 ft) above ground level. Maximum sound levels for the different flight paths ranged from 70 to 111 dBA, the maximum sound level was for the C-5 aircraft over the lowest above ground level flight path discussed above. Assessments of aircraft operations over or immediately adjacent to the areas currently occupied by Mariana crows indicate operations will increase between 0 and 0.40 times per day under the proposed action. Assessments of operations over unoccupied areas but near occupied areas indicate operations will increase 1.92 and 2.74 times per day along the 6LA6 and 6LD4 ground tracks, respectively, under the proposed action (see Figure 3).

Morton (1996) conducted a study on the potential impact of aircraft overflights on Mariana crows from 1994 to 1995. He found no evidence that aircraft overflights contributed directly to nest abandonment or nest failure during the study. In fact, one nest was constructed within 1 km (0.6 mi) of the north runway during a large aircraft training exercise (Tandem Thrust). However, Morton (1996) did report three observations of Mariana crows reacting to aircraft. One observation was of alarm calling and an increase in vigilant, alert, and standing behavior from an adult attending a nest after an unknown aircraft (76-92 dBA, >305 m [1,000 ft] above ground level) flew over the nest. Another observation was of a Mariana crow returning to a nest while an unidentified cargo aircraft flew overhead. The adult remained standing at the nest and alarm calling for the duration of the overflight (approximately two minutes). No sound levels or altitude was reported for the aircraft. The final observation was of a pair of Mariana crows

responding to six F-16s and four KC-135s (≤86 dBA, no altitude reported) departing the base. The pair was observed alarm calling and flying for 12 minutes after the overflights.

In addition to these observations, Morton (1996) also summarized previous observations of Mariana crow and aircraft interactions by other biologists on Guam. The most severe of these interactions was a pair leaving their nest several times in response to a helicopter flying less than or equal to 120 m (400 ft) above the ground. Other observations also included adults flushing from the nest and leaving eggs unattended. In general, the observations of Mariana crows flushing from nests were all due to aircraft below 305 m (1,000 ft) above the ground (see Table 12 of Morton 1996). Mariana crows reacting to aircraft by alarm calling and other minor behaviors were for aircraft above this elevation.

Based on the available information, Morton (1996) concluded that adverse impacts to nesting Mariana crows could occur and recommended that aircraft be restricted to above 305 m (1,000 ft) above ground level over forested areas used by Mariana crows to minimize these impacts. Other studies on nesting bird responses to aircraft indicate that this distance from the nest had only minor impacts to nest success (Andersen, *et al.* 1989; Watson 1993; Delaney, *et al.* 1999; Palmer, *et al.* 2003). For example, Palmer and others (2003) noted subtle differences in male and female peregrine falcon nest attendance due to jet aircraft overflights less than 300 m (984 ft), but it was not enough to affect productivity.

In general, the altitudes of the ground tracks over the current distribution of Mariana crows are at or above the recommended altitude, except for one. Therefore, we do not predict adverse impacts from aircraft along these ground tracks. In addition, the information provided by the Air Force indicates there will only be small increases (less than one a day) in flight operations over these areas. Therefore, we do not expect any adverse impacts from increased flight operations over these areas.

Currently, one ground track near the Mariana crow's current distribution is below the recommended 305 m (1,000 ft) altitude and is utilized by aircraft arriving at Andersen AFB. In addition, several ground tracks located near the ends and northwest side of the runways are below the recommended altitude but are outside the current distribution of Mariana crows. In addition, several ground tracks outside the Mariana crows' current distribution will experience moderate (2 a day) to large (35 a day) increases in aircraft operations which may impact Mariana crow nesting if they move into these areas before the project is fully implemented. Aircraft utilizing these ground tracks may impact Mariana crows nesting below it and cause Mariana crows to not utilize potential breeding habitat under these ground tracks due to aircraft disturbance. To avoid impacts to the current Mariana crow population, the Air Force has agreed to increase the altitude along the ground track for arriving aircraft to the north of the Munitions Storage Area during the Mariana crow breeding season (October to April). Also, because the proposed project is expected to develop over a long period, the Air Force has agreed to develop an Adaptive Management Strategy to avoid, minimize, and/or offset potential impacts to nesting Mariana crows as the project is implemented over time (see "Project Description" above). This strategy will be developed and implemented prior to initiation of Phase 1 of the proposed project when increased air operations are expected. The Service has approval of the Adaptive

Management Strategy to assure implementation of the plan by the Air Force will avoid, minimize, and/or offset impacts to the Mariana crows.

In summary, we expect no adverse impacts to nesting Mariana crows due to the proposed project. The Air Force will avoid utilizing flight lines below 305 m (1,000 ft) during the breeding season (October to April) and will develop an Adaptive Management Strategy with measures to avoid, minimize, and/or offset potential impacts to Mariana crows.

Aircraft Strikes and Crashes – Increased aircraft operations at Andersen AFB could lead to potential aircraft collisions with Mariana crows and Mariana fruit bats as well as provide the potential for an aircraft crash to impact these species. No aircraft collisions with Mariana crows have been reported, but in 1982, a WC-130H struck a fruit bat while departing Andersen AFB at 1815, just after sunset (reported in Morton 1996). No subsequent collisions with Mariana fruit bats have been reported. Sodhi (2002) reported that bird strikes typically occur four to six times per 10,000 aircraft movements. Approximately 54 percent of the bird strikes on military aircraft occur in or near airfields, and 56 percent occur at less than 300 m (984 ft) above the ground (Neubauer 1990). An assessment of the flight tracks for the base indicate that aircraft collisions with Mariana fruit bats and Mariana crows are likely to occur when aircraft are arriving or departing the airfield. Currently Mariana crows are not found in this area so the potential for impact is insignificant. The Mariana fruit bat colony is situated almost directly below the north runway, so the likelihood of collision is higher for this species as they exit and return to their roost site after sunset and before dawn, respectively (USFWS 1990b). Estimates of aircraft operations from the north runway indicate that they are expected to increase by 3.8 operations a day 30 minutes after sunset and 30 minutes before sunrise. Therefore, the increase in operations during the several hour time period when bats are moving to and from the roost site is expected to be lower than 3.8. Because, no collisions between fruit bats and aircraft have been reported since 1982, the bat population is currently small, the expect increase in aircraft operations is small, and the earlier finding that bats are expected to abandon the Pati Point roost site prior to the full increase in aircraft operations under the proposed project (see "Aircraft Disturbance" above) it appears unlikely that collisions would occur; therefore, we believe this impact to be discountable.

An Air Force study found that 61 percent of all aircraft accidents were related to landing operations and 39 percent occurred during takeoff (Air Force 1999). This study also found that fighter and trainer aircraft accounted for 80 percent of the accidents, with large aircraft and helicopters accounting for the remaining 20 percent. The Air Force defines five categories of aircraft flight mishaps; the most relevant is an aircraft crash, which is defined as a Class A mishap due to destruction of the aircraft or damage beyond economical repair. The 10-year average Class A mishap rate for each aircraft associated with the proposed action is 2.04 mishaps every 10 years for F-15s, 0.09 mishaps every 10 years for KC-135s, 2.40 mishaps every 10 years for B-1s, 0.00 mishaps every 10 years for B-2s, and 0.41 mishaps every 10 years for B-52s (Air Force 2006b). No data are available for the Global Hawk UAV or the F-22 (Air Force 2006b).

It is not possible to predict the precise location of an aircraft accident. However, the Air Force (2006b) evaluated the likelihood of an F-15 fighter crashing into the Pati Point colony by using the 10-year average Class A mishap rate for a fighter (2.04); its definable impact area (2.73 ac);

the size of the accident potential zone containing the colony (344 ac); and the percent of accidents within that accident zone (10.1 percent). It is estimated that 0.005 fighter accidents would occur annually in the accident potential zone containing the colony. It is also estimated that the impact area for a fighter crash would equate to approximately 0.6 percent of the accident potential zone. The Mariana fruit bat colony is also limited to an area of several acres in the accident potential zone. Therefore, we conclude that the likelihood of an aircraft crashing directly into the Pati Point colony as a result of the proposed action is very low. The likelihood of an aircraft crashing near the Pati Point colony and adversely impacting the colony as a result of the proposed action is also minimal but a contingency plan will be addressed in the Adaptive Management Strategy.

Personnel, Household Goods, Equipment, and Aircraft Movement

The brown treesnake was believed to have been introduced to Guam in the late 1940s in military goods (Savidge 1987; Rodda, *et al.* 1992). This introduced predator became established on the island and is believed to have caused extirpation of most of the native birds on Guam (Savidge 1987), as well as many other native and non-native animal species (Fritts and Rodda 1998). The snake is an excellent disperser, stowing away in ships and aircraft leaving Guam (Fritts 1988). Efforts are currently being undertaken to prevent snakes from leaving Guam. However, all outgoing cargo and vessels from Guam currently are not fully inspected, and brown treesnakes are found at destinations served from Guam several times a year (Fritts, *et al.* 1999). As a result, brown treesnakes originating from Guam have been recorded in locations as diverse as the neighboring Commonwealth of the Northern Mariana Islands, Hawaii, Diego Garcia, Federated States of Micronesia, Republic of the Marshall Islands, Spain, Texas, and Oklahoma (Fritts, *et al.* 1999; Tummons 2005). Recently, it was also determined that the brown treesnake is now established on the Island of Saipan (Colvin, *et al.* 2005). If the brown treesnake is established elsewhere, similar impacts to those recorded on Guam's wildlife may occur.

The increase in aircraft operating and/or rotating from Andersen AFB is expected to result in an increase in Air Force personnel, household goods, equipment, and cargo coming and going from Guam. Due to the high populations of brown treesnakes on Guam (Rodda, *et al.* 1999) and increased traffic leaving Guam, it is expected that the likelihood of snakes being transported off island to any areas where Air Force goods, cargo, and equipment are transported will also be increased. For example, Hickam AFB on the Island of Oahu, Hawaii is expected to receive Air Force goods, cargo, and equipment from Guam. The endangered Oahu elepaio (*Chasiempis sandwichensis ibidis*) is endemic to the Island of Oahu and is one species that will be susceptible to brown treesnake predation if it became established there.

To prevent the accidental transportation of brown snakes from Guam in Air Force goods, cargo, and equipment, the Air Force will program for and facilitate a 100 percent inspection rate for all cargo, vehicles, munitions, household goods, and other items departing Guam from the Andersen AFB or other sites on Guam where these items are staged for departure (see "Project Description" for additional information). In addition, the Air Force has agreed to develop a mechanism with Wildlife Services and the Service to ensure that funding is available to consistently sustain the 100 percent inspection rate, adequately support sustained brown treesnake trapping, capture, and toxicant use by Wildlife Services in the vicinity of all Air Force items leaving Guam, and will actively seek sustained funding to support applied brown treesnake

research efforts (see "Project Description" above). Due to these efforts, we believe that the potential adverse impacts of the proposed action on listed species found outside Guam (*e.g.*, Oahu elepaio) are insignificant or discountable.

Conservation Measures

Habitat Improvement – The Air Force will eradicate pigs and deer from two ungulate exclosures that incorporate approximately 200 ha (494 ac) of land near the northern tip of Guam to offset the loss of habitat from the proposed project (see Figure 2). In addition, the Air Force will develop a plan to reduce pig and deer populations in non-fenced areas on the base, outplant tree species utilized for foraging by Mariana fruit bats and Mariana crows within the ungulate exclosures, and hire a Wildlife Management Specialist to administer these programs (see "Project Description" above). These proposed measures are expected to increase the quality of existing habitat for the Mariana fruit bat and Mariana crow and habitat for the Guam Micronesian kingfisher which will help offset the impacts the proposed project on these species. The Guam rail primarily utilizes secondary growth areas and is not expected to be negatively or positively impacted by these activities. The proposed ungulate exclosure areas are expected to remove approximately 0.1 ha (0.2 ac) of potential Mariana fruit bat, Mariana crow, Guam Micronesian kingfisher, and Guam rail habitat. However, the expected increase in habitat quality within these areas will offset the loss of habitat for the Mariana fruit bat, Mariana crow, and Guam Micronesian kingfisher. In addition to habitat loss, the proposed exclosures will be constructed within the territory of one Mariana crow pair and an area that may be utilized by foraging Mariana fruit bats. The process of eradicating ungulates (*e.g.*, gunfire) within these exclosures could disturb nesting Mariana crows and foraging Mariana fruit bats. To avoid or minimize these potential impacts, the Air Force will schedule ungulate eradication in the exclosures during the day and outside the Mariana crow breeding season (October to April) or when Mariana crows are not nesting within 300 m (984 ft) of the exclosure. Based on these measures we conclude that these proposed habitat improvement activities will not adversely affect listed species.

Studies and Research – The Air Force will conduct a vegetation assessment of Andersen AFB and determine brown treesnake control strategies to develop and implement techniques to avoid, minimize, and/or offset impacts of the proposed project on listed species (see "Project Description" above). The vegetation assessment and brown treesnake control strategies could potentially disturb nesting Mariana crows or roosting Mariana fruit bats if researchers are in the area. However, the Air Force has agreed to avoid nesting Mariana crows by conducting the research in crow territories outside the breeding season (October to April) or not conducting research within 300 m (984 ft) of an active nest. The Air Force will also ensure that all snake control strategies will avoid impacts to the Mariana fruit bat colony at Pati Point. In addition, the outcome of these research efforts will be used to benefit these species. Therefore, we do not expect any adverse impacts associated with the brown treesnake control strategies and vegetation assessment.

Brown Treesnake Interdiction and Control – The Air Force will program for and facilitate a 100 percent inspection rate for all cargo, vehicles, munitions, household goods, and other items leaving Guam from Andersen AFB or other sites on Guam where these items are staged for departure (see "Project Description" and for additional information). In addition, the Air Force

has agreed to develop a mechanism with Wildlife Services and the Service to ensure that funding is available to consistently sustain the 100 percent inspection rate, adequately support sustained brown treesnake trapping, capture, and toxicant use by Wildlife Services in the vicinity of all Air Force items leaving Guam, and actively seek sustained funding to support applied brown treesnake research efforts (see "Project Description" above). Mariana crows and Mariana fruit bats may be disturbed by brown treesnake control activities. However, the majority of these activities are occurring in and around developed areas (*e.g.,* airports, cargo holding areas) where Mariana crows and Mariana fruit bats are not expected to occur. Therefore, we expect no adverse effects from these proposed activities on listed species.

Minimization and Avoidance Measures – The Air Force will develop an Adaptive Management Strategy and to implement various measures to avoid, minimize, and/or offset potential project impacts to listed species (see "Project Description" above). The goals of this Adaptive Management Strategy are to minimize and avoid project impacts to listed species and maintain and increase listed species populations on Andersen AFB. Potential management measures that may be included in the Adaptive Management Strategy are: 1) aircraft noise reduction (*e.g.*, modifying ground track location and flight profile of aircraft without creating a flight hazard or noncompliance with the aircraft flight manual and potential efforts to increase populations), 2) threat removal (*e.g.*, controlling brown treesnake populations at Mariana fruit bat roost sites, Mariana crow nests, and Mariana crow breeding territories, and preventing illegal Mariana fruit bat hunting on Andersen AFB), 3) population enhancement (*e.g.*, supporting Mariana crow aviculture enhancement and reintroduction efforts for listed species), and 4) efforts to establish and maintain Mariana fruit bat, Mariana crow, Guam Micronesian kingfisher, and Guam rail populations on Guam. The Adaptive Management Strategy will be developed by the Air Force and will include an Adaptive Management Team, which includes the Service, and the Service will have approval regarding changes to the Adaptive Management Strategy to ensure it meets the goals of the consultation. Because the nature of these measures is to reduce, avoid, and/or offset adverse impacts, we expect no adverse impacts to occur from these actions.

Monitoring – The Air Force will conduct a multi-year program to monitor Mariana fruit bats and Mariana crows. The goals of this program are to monitor the status of Mariana fruit bats and Mariana crows and evaluate project impacts on these two species (see "Project Description" above). The specific methodology utilized for the monitoring will be developed and incorporated into the Adaptive Management Strategy by the Adaptive Management Team with input from appropriate species and conservation experts as needed. Because the Service will have final approval for all techniques used in monitoring, we expect no adverse impacts to occur from these actions.

Cumulative effects

Cumulative effects include the effects of future Territory of Guam, local, or private actions that are reasonably certain to occur in the action area considered in this biological opinion. Future Federal actions unrelated to the proposed action are not considered in this section because they require separate consultation pursuant to section 7 of the ESA. The Service is unaware of any cumulative effects in the project area that may impact Mariana fruit bats, Mariana crows, Guam Micronesian kingfishers, and Guam rails.

Conclusion

After reviewing the current status, the environmental baseline, the effects of the proposed action, and the cumulative effects, it is our biological opinion that the implementation of the proposed action discussed herein is not likely to jeopardize the continued existence of the Mariana fruit bat, Mariana crow, Guam Micronesian kingfisher, Guam rail, and other off-site species listed under the ESA. This conclusion is based on the following factors for each species.

Mariana Fruit Bat

1) The Service's finding of no jeopardy in this biological opinion for the Mariana fruit bat is based in large part on the conservation measures described in the proposed project. Measures that will offset adverse impacts include: 1) ungulate eradication in approximately 200 ha (494 ac) of potential Mariana fruit bat foraging and roosting habitat; 2) reducing ungulate populations on the base outside the proposed exclosure; 3) outplanting of native tree species utilized by foraging Mariana fruit bats; 4) development and implementation of measures to control brown treesnakes at roost site; 5) providing travel assistance for law enforcement on Rota after typhoons; and 6) protecting roost sites from illegal hunting by limiting access.
2) Although 1 Mariana fruit bat will be harmed, 21 bats will be killed, and 2 bat colonies will be harassed on Guam and 36 bats on Rota (or 6 premature re-migrations to Rota) will be killed by actions discussed in this biological opinion, the potential effects on Mariana fruit bats have been minimized by incorporating measures to minimize disturbance, injury, and death to Mariana fruit bats due to the proposed activities.
3) Additional actions that may be necessary to avoid, minimize, and/or offset potential project impacts on the Mariana fruit bat and to maintain or increase their population will be developed and implemented through the Adaptive Management Strategy and will be based on the best available science with approval by the Service.
4) The Air Force actions described in this biological opinion are not anticipated to compromise the conservation and recovery process described for the Mariana fruit bat in the Guam population recovery plan (USFWS 1990b) and designation of critical habitat on Guam (USFWS 2004b). Recovery of the Mariana fruit bat is based on: a) protection of sufficient habitat to support viable populations in the Mariana archipelago, b) eliminating illegal hunting, c) preventing the accidental introduction of brown treesnakes to other islands in the Mariana archipelago, and d) eradicating brown treesnakes on Guam and Saipan. The proposed conservation measures are expected to assist with brown treesnake control efforts and help minimize illegal hunting. The proposed action is expected to result in direct and indirect loss of up to approximately 186 ha (460 ac) of potential Mariana fruit bat habitat in northern Guam. Estimates of current forest cover based on Donnegan and others (2004) within the area identified as essential habitat by the Service (USFWS 2002; 2004b) are approximately 4,730 ha (11,687 ac). This loss of habitat (up to four percent) associated with the proposed action is expected to be partially offset by the Air Force's proposed ungulate control and eradication activities and other measures to avoid impacts to roosting and foraging Mariana fruit bats. In addition, the Guam population currently makes up approximately two percent of the total Mariana fruit bat population and four percent of the population in the southern islands (*i.e.,* Guam, Rota, Aguiguan, Tinian, and Saipan). Consequently, the Service has determined that the

adverse effects to the Mariana fruit bat that may result from the proposed project will not contribute to an appreciable reduction in the likelihood of survival and recovery of the Mariana fruit bat throughout its range.

Mariana Crow

1) The Service's finding of no jeopardy in this biological opinion for the Mariana crow is based in large part on the conservation measures described in the proposed project. Measures that will offset adverse impacts include: 1) eradicating ungulates in approximately 200 ha (494 ac) of Mariana crow foraging and nesting habitat; 2) reducing ungulate populations on the base outside the proposed exclosure; and 3) outplanting native tree species utilized by foraging Mariana crows.
2) The effects on Mariana crows have been reduced and avoided by incorporating measures to minimize disturbance to Mariana crows from the proposed activities.
3) Additional actions that may be necessary to avoid, minimize, and/or offset potential project impacts on the Mariana crow and to maintain or increase their population will be developed and implemented through the Adaptive Management Strategy and will be based on the best available science with approval by the Service.
4) The Air Force actions described in this biological opinion are not anticipated to compromise the conservation and recovery process described for the Mariana crow in the draft revised recovery plan (USFWS 2005a) and designation of critical habitat on Guam and Rota (USFWS 2004b). Recovery of the Mariana crow is based on: a) maintaining a population of Mariana crow consisting of 75 territorial pairs on Rota and northern and southern Guam; b) sufficient habitat to sustain populations on Rota and northern and southern Guam; c) preventing the accidental introduction of brown treesnakes to Rota; d) sufficient control of brown treesnakes and other predators to achieve population goals; and e) resolution of Mariana crow and landowner conflicts. The proposed conservation measures are expected to assist with brown treesnake control efforts and improve the quality of existing habitat on Guam. The proposed action is also expected to result in a direct and indirect loss of up to approximately 205 ha (507 ac) of Mariana crow habitat in northern Guam. Estimates of current forest cover based on Donnegan and others (2004) within the area identified as essential habitat by the Service (USFWS 2002, 2004b) are approximately 4,223 ha (10,435 ac). Therefore, approximately 4,018 ha (9,928 ac) of essential Mariana crow habitat will not be affected by the proposed project. Utilizing the maximum Mariana crow territory size reported by Morton and others (1999; 37 ha) on Rota, we estimate that sufficient habitat to support 75 territorial Mariana crow pairs will still be available in northern Guam. In addition, this loss of five percent of the available habitat is expected to be partially offset by the Air Force's proposed ungulate control and eradication activities so total impacts may be less. No take of Mariana crows is expected as a result of the proposed action. Consequently, the Service has determined that the effects to the Mariana crow that may result from the proposed project will not contribute to an appreciable reduction in the likelihood of survival and recovery of the Mariana crow.

Guam Micronesian Kingfisher

1) The Service's finding of no jeopardy in this biological opinion for the Guam Micronesian kingfisher is based in part on the conservation measures described in the proposed

project. Measures that will offset adverse impacts include ungulate eradication in approximately 200 ha (494 ac) of potential Guam Micronesian kingfisher foraging and nesting habitat, reducing ungulate populations on the base outside the proposed exclosure, and the Air Force's continued support for reintroducing Guam Micronesian kingfishers to Andersen AFB.

2) The Guam Micronesian kingfisher is currently extinct in the wild and no take is expected as a result of the proposed project.

3) The Air Force actions described in this biological opinion are not anticipated to compromise the conservation and recovery process described for the Guam Micronesian kingfisher in the revised recovery plan (USFWS 2004a) and designation of critical habitat on Guam (USFWS 2004b). Recovery of the Guam Micronesian kingfisher is based on: a) maintaining two subpopulations (one in northern Guam and one in southern Guam) consisting of 1,000 individuals, b) sufficient habitat to sustain subpopulations in northern and southern Guam, and c) sufficient control of brown treesnakes and other predators to achieve population goals. The proposed conservation measures are expected to assist with brown treesnake control efforts and improve the quality of existing habitat on Guam. The proposed action is also expected to result in direct and indirect loss of up to approximately 159 ha (393 ac) of potential Guam Micronesian kingfisher breeding habitat in northern Guam. Estimates of current forest cover and potential Guam Micronesian kingfisher breeding habitat based on Donnegan and others (2004) within the area identified as essential habitat by the Service (USFWS 2002, 2004b) are approximately 4,730 ha (11,687 ac). Therefore, approximately 4,571 ha (11,295 ac) of essential Guam Micronesian kingfisher breeding habitat will not be affected by the proposed project. Utilizing the Micronesian kingfisher pair territory sizes reported by Kesler (2005) for cooperatively breeding (11 ha; 27 ac) and non-cooperatively breeding (8 ha, 20 ac) kingfishers on Pohnpei and average density reported by Engbring and Ramsey (1984; 0.38 per ha, 0.15 per ac) on Guam, we estimate that sufficient essential habitat to support 1,000 Guam Micronesian kingfishers will still be available in northern Guam. In addition, the four percent loss of potential habitat is expected to be partially offset by the Air Force's proposed ungulate control and eradication activities so total impacts may be less. No take of Guam Micronesian kingfishers is expected as a result of the proposed action. Consequently, the Service has determined that the effects to the Guam Micronesian kingfisher that may result from the proposed project will not contribute to an appreciable reduction in the likelihood of survival and recovery of the Guam Micronesian kingfisher.

Guam Rail

1) The Service's finding of no jeopardy in this biological opinion for the Guam rail is based in part on the Air Force's continued support for reintroducing Guam rails to Andersen AFB.

2) The Guam rail is currently extinct in the wild on Guam and no take is expected as a result of the proposed project.

3) The Air Force actions described in this biological opinion are not anticipated to compromise the conservation and recovery process described for the Guam rail in the recovery plan (USFWS 1990a). Recovery of the Guam rail is based on: a) maintaining

two subpopulations (one in northern Guam and one in southern Guam) consisting of 1,000 individuals; and b) sufficient control of brown treesnakes and other predators to achieve population goals. The Guam rail prefers secondary habitat, which is widely available in northern and southern Guam (Jenkins 1979; Donnegan, *et al.* 2004). Therefore, the direct loss of approximately 23 ha (57 ac) of potential Guam rail habitat is not expected to contribute to an appreciable reduction in the likelihood of survival and recovery of the Guam rail.

Off-site Species

The Service's finding that adverse impacts to species listed under the ESA found outside of Guam are discountable is based the Air Force's commitment to program for and facilitate an 100 percent inspection rate for all cargo, vehicles, munitions, household goods, and other items leaving Guam from Andersen AFB or other sites on Guam where these items are staged for departure from Guam (see "Project Description" for additional information). In addition, the Air Force has agreed to develop a mechanism to ensure that funding is available to consistently sustain the 100 percent inspection rate, adequately support sustained brown treesnake trapping, capture, and toxicant use by Wildlife Services in the vicinity of all Air Force items leaving Guam, and actively seek sustained funding to support applied brown treesnake research efforts (see "Project Description" above).

INCIDENTAL TAKE STATEMENT

Section 9 of the ESA and federal regulations pursuant to Section 4(d) of the ESA prohibit the take of endangered or threatened species, respectively, without special exemption. Take is defined as harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, or collect, or attempt to engage in any such conduct. Harm is further defined by the Service to include significant habitat modification or degradation that results in death or injury to listed species by significantly impairing essential behavioral patterns, including, breeding, feeding, or sheltering. Harass is defined by the Service as intentional or negligent actions that create the likelihood of injury to listed species to such an extent as to significantly disrupt normal behavior patterns, which include, but are not limited to, breeding, feeding, or sheltering. Incidental take is defined as take that is incidental to, and not the purpose of, carrying out an otherwise lawful activity. Under the terms of Section 7(b)(4) and Section 7(o)(2), taking that is incidental to and not intended as part of the agency action is not considered a prohibited taking under the ESA, provided such taking is in compliance with the terms and conditions of this Incidental Take Statement.

The measures described below are non-discretionary, and must be undertaken by the Air Force so they become binding conditions of the proposed project for the exemption in Section 7(o)(2) of the ESA to apply. The Air Force has a continuing duty to regulate the activity covered by this Incidental Take Statement. If the Air Force (1) fails to assume and implement the terms and conditions; or (2) fails to require the applicant to adhere to the terms and conditions of the Incidental Take Statement through enforceable terms added to the permit or grant document, the protective coverage of Section 7(o)(2) of the ESA may lapse. To monitor the impact of incidental take, the Air Force must report the progress of the action and its impact on the species to the Service as specified in the Incidental Take Statement [50 CFR 402.14(i)(3)].

Amount or Extent of Take Anticipated

The Service will not refer the incidental take of any migratory bird for prosecution under the Migratory Bird Treaty Act of 1918, as amended (16 USC §703-712) if such take is in compliance with the terms and conditions specified herein.

This biological opinion anticipates the following forms of incidental take:

1. The Service anticipates that take of one Mariana fruit bat foraging territory will occur in the form of harm as a result of clearing and construction of the Aircraft Staging Area facility.

2. The Service anticipates that take of 2 Mariana fruit bat colonies and 21 Mariana fruit bats on Guam and 36 Mariana fruit bats from Rota (or 6 premature re-migrations to Rota) will occur in the form of harassment and death as a result of aircraft disturbance associated with overflights and subsequent illegal hunting impacts.

3. The Service anticipates that no take of Mariana crows, Guam Micronesian kingfishers, or Guam rails will occur from the proposed action.

Effect of the Take

The Service has determined in this biological opinion that this level of anticipated take is not likely to jeopardize the continued existence of the Mariana fruit bat.

Reasonable and Prudent Measures

The Service believes the following reasonable and prudent measures are necessary and appropriate to minimize impacts of incidental take of the Mariana fruit bat:

1. Minimize and avoid impacts of the proposed construction and operation of the Aircraft Staging Area on Mariana fruit bats.
2. Minimize, avoid, and/or offset the impacts of increased aircraft operations on Mariana fruit bats.

Terms and Conditions

To be exempt from the prohibitions of Section 9 of the ESA, the Air Force must comply with the following terms and conditions, which implement the reasonable and prudent measures described above and specify reporting requirements. These terms and conditions are non-discretionary.

1. Minimize and avoid impacts of the proposed construction and operation of the Aircraft Staging Area on Mariana fruit bats.
    a. One week prior to clearing and during the first week of construction/clearing, the Air Force will have a biologist (whose selection will be coordinated with the Service and Guam Division of Aquatic and Wildlife Resources) survey the proposed project area and areas within 150 m (492 ft) of the proposed project site at night and during the day to determine if Mariana fruit bats are present. If Mariana fruit bats are observed in the project area, the Air Force will notify the Service and the Guam Division of Aquatic and Wildlife Resources within two (2) days of their observation, and construction will be postponed until these bats have left the area and the Service and the Guam Division of Aquatic and Wildlife Resources have been notified.
    b. No construction activities will occur at night (*i.e.*, between sunset and sunrise).
    c. Shielded lights will be used on the outside of the Aircraft Staging Area.
    d. The Air Force will monitor the status of Mariana fruit bats observed within the project site to ensure no additional take of Mariana fruit bats occurs due to construction activities.
        i. A qualified biologist (whose selection will be coordinated with the Service and Guam Division of Aquatic and Wildlife Resources) must monitor the status of the Mariana fruit bat(s) that utilize the Aircraft Staging Area facility area (at a minimum of every other day) until one (1) year after the construction/clearing in Aircraft Staging Area site is completed. The specific methodology utilized for monitoring will be developed by the Adaptive Management Team with input from appropriate species experts one (1) year prior to the start of clearing activity at the site. The monitoring methodology should include attempting to capture, mark, and attach a radio transmitter to bats that utilize the Aircraft Staging Area at least one (1) month prior to construction/clearing at the project sites. The capture and monitoring of all bats will be conducted by a qualified

biologist (whose selection will be coordinated with the Service and Guam Division of Aquatic and Wildlife Resources), and all activities will be coordinated with the Guam Division of Aquatic and Wildlife Resources and the Guam National Wildlife Refuge.

ii. A report summarizing the methods and results of the above monitoring efforts shall be sent to the Service's Pacific Islands Fish and Wildlife Office (300 Ala Moana Blvd., Room 3-122, Box 50088, Honolulu, Hawaii 96850) within three (3) months after monitoring is completed. Results will include maps of where individuals were observed before, during, and after construction/clearing.

2. Minimize, avoid, and/or offset the impacts of increased aircraft operations on Mariana fruit bats.

   a. The Air Force will increase patrols by security personnel and conservation officers near all Mariana fruit bat roost sites that are established after the roost site at Pati Point is abandoned.

   b. The Air Force will modify its public hunting program to ensure that public hunting does not occur near any Mariana bat roosts.

   c. The Air Force will provide financial assistance to the Service's Law Enforcement Office in Honolulu, Hawaii, to help pay for the travel costs of sending a special agent to Rota after a typhoon to reduce the incidences of illegal hunting on Rota.

   d. The Air Force will implement the brown treesnake control measures being developed at Mariana fruit bat roosts. The implementation of this measure will be part of the Adaptive Management Strategy and will be developed with us to ensure this measure does not adversely impact Mariana fruit bats.

   e. The Air Force will monitor the number of Mariana fruit bats at all roost sites to ensure no additional take of Mariana fruit bats occurs due to aircraft operations associated with the proposed project.

      i. A qualified biologist (whose selection will be coordinated with the Service and Guam Division of Aquatic and Wildlife Resources) must monitor the number of the Mariana fruit bats at all roost sites until one (1) year after the proposed ISR/Strike is fully implemented. Monitoring will occur at a minimum of once a week except after a typhoon event occurs on Rota when monitoring will occur at a minimum of three times a week, for eight (8) weeks after the typhoon, to more accurately monitor potential migration of bats between Rota and Guam. The specific methodology utilized for monitoring will be developed by the Adaptive Management Team with input from appropriate species experts one (1) year prior to the increase in aircraft operations (FY09). The monitoring methodology should include direct counts of Mariana fruit bats at roost sites utilizing a spotting scope at an appropriate distance to avoid impacts to the bats.

ii. Reports summarizing the methods and results of the above monitoring efforts shall be sent to the Service's Pacific Islands Fish and Wildlife Office (300 Ala Moana Blvd., Room 3-122, Box 50088, Honolulu, Hawaii 96850) every four (4) months until the monitoring is completed. Results will include a table of count results and weekly summary of the number of aircraft operations (by aircraft type) over occupied roost sites.

The Air Force shall inform the Field Supervisor of the Service's Pacific Islands Fish and Wildlife Office in Honolulu, Hawaii in writing of take of any federally listed species within three (3) working days. The depository designated to receive specimens of any Mariana fruit bats and Mariana crows that are killed is the B.P. Bishop Museum, 1525 Bernice Street, Honolulu, Hawaii, 96817 (telephone: 808/547-3511). If the B.P. Bishop Museum does not wish accession to the specimens, the permittee should contact the Service's Division of Law Enforcement in Honolulu, Hawaii (telephone: 808/861-8525; fax: 808/861-8515) for instructions on disposition. The Service's Pacific Islands Fish and Wildlife office (telephone: 808/792-9400) will also be informed within 3 working days of any injured Mariana fruit bats and Mariana crows found and the actions taken.

CONSERVATION RECOMMENDATIONS

Section 7(a)(1) of the ESA directs Federal agencies to utilize its authority to further the purposes of the ESA by carrying on conservation programs for the benefit of endangered and threatened species. Conservation recommendations are discretionary agency activities to minimize or avoid adverse effects of a proposed action on listed species or critical habitat, to help implement recovery plans, or to develop information.

The Service provides the following conservation recommendations:

a. Recovery of the Mariana fruit bat is dependent on establishing viable populations of Mariana fruit bats in the southern Mariana archipelago. The Island of Aguiguan is currently uninhabited and could support a large Mariana fruit bat population if sufficient habitat is available. Currently the island is being modified by browsing pressure form goats. We recommend that the Air Force lease Aguiguan from the Commonwealth of the Northern Mariana Islands and eradicate goats on the island to help support Mariana fruit bat populations and offset the loss of Mariana fruit bats on Guam.

b. Recovery of the Mariana fruit bat, Mariana crow, Guam Micronesian kingfisher, and Guam rail is dependent on reducing and/or eliminating brown treesnakes in northern Guam. We recommend that the Air Force develop and implement measures to control brown treesnakes at a landscape level on Andersen AFB to support recovery efforts for these species.

c. Recovery of the Mariana fruit bat, Mariana crow, and Guam Micronesian kingfisher is dependent upon having sufficient habitat to support these species in northern Guam. We recommend that the Air Force eradicate ungulates and implement a native tree reforestation program throughout Andersen AFB to support the recovery of these species.

In order for the Service to be kept informed of actions minimizing or avoiding adverse effects or that benefit listed species or their habitats, the Service requests notification of the implementation of any conservation recommendation.

REINITIATION-CLOSING STATEMENT

This concludes formal section 7 consultation on this action. As required by 50 CFR § 402.16, reinitiation of consultation is required where discretionary Federal agency involvement or control over the action has been retained (or is authorized by law) and if: 1) the amount or extent of incidental take is exceeded; 2) new information reveals effects of the agency action that may affect listed species in a manner or to an extent not considered in this opinion(*e.g.*, Mariana crows are taken as a result of the action or brown treesnakes become established in Hawaii as a result of Air Force activities associated with this proposed action); 3) the agency action is subsequently modified in a manner that causes an effect to the listed species that was not considered in this biological opinion (*e.g.*, conservations measures like 100 percent brown treesnake interdiction are not implemented); or 4) a new species is listed or critical habitat designated that may be affected by this action. In instances where the amount or extent of incidental take is exceeded, any operations causing take must cease pending reinitiation.

As stated in the conclusion of the "Effects of the Action on Listed Species" section (above), the Service's finding of no jeopardy is based in large part on the conservation measures built into the project by the Air Force. Should there be a failure to carry out any or all of the described measures, or if the measures are not effective, or if these measures are modified in any way beyond that accepted by the Service, reinitiation of consultation will be required. We appreciate your cooperation and assistance in helping us prepare this biological opinion. If you have further questions concerning this biological opinion, please contact Fish and Wildlife Biologist Fred Amidon or Consultation Coordinator Patrice Ashfield, of this office at (808) 792-9400.

Sincerely,

Patrick Leonard
Field Supervisor

Appendix 1
Department of Defense Transportation Regulations 505 and 506

CHAPTER 505

AGRICULTURAL CLEANING AND INSPECTION REQUIREMENTS

A. SCOPE

1. This chapter prescribes procedures, assigns responsibilities, and defines requirements for the prevention of the introduction of agricultural pests into the US by the DOD. Destructive pests such as gypsy moths, brown tree snakes, several varieties of snails, and other species can hitchhike on military equipment and personal effects. Foreign soil attached to equipment can harbor pests and animal diseases. These pests can cause immense damage to America's natural resources, destroy crops, and disrupt the export of agricultural commodities.
2. Foreign agricultural restrictions are specified by country in appropriate chapters of this regulation, however the same general responsibilities of DOD activities for the prevention of agricultural pest movements apply to export shipments from the US to foreign countries as well as on imports to the US.

B. POLICY

It is the policy of the DOD that all organizations and personnel involved in the movement of DOD-sponsored cargo, personal property, and accompanied baggage will take those steps necessary to prevent the spread of agricultural pests from one location to another. This includes movement not only across national borders, but any movement that has the potential to introduce invasive species to a new area. It includes shipments from DOD installations and vendor locations by both military and commercial carriers.

C. RESPONSIBILITIES

1. Office of the Deputy Under Secretary of Defense (Environmental Security) (DUSD (ES)) is responsible for furnishing technical guidance and recommendations to the DOD on means of preventing the return of quarantine pests and organisms that may disrupt agriculture and the natural ecosystem.
2. USDA APHIS is responsible to provide guidance, informational materials, and to conduct training for DOD personnel. APHIS will provide personnel to assist in pre-clearances and to train DOD personnel for inspection, cleaning, and disinfecting of material and personnel. APHIS and the DOD will establish reimbursable agreements as required to accomplish this mission. APHIS is the final authority on the pest risk status of material.
3. Unit commanders are responsible for ensuring that the requirements specified in this chapter are met and that procedures are followed to prevent agricultural pests from entering the US when that unit is returning personnel and/or equipment to the US.
4. Port and transportation commanders will ensure that the requirements specified in this chapter are met and that procedures are followed. They will not allow the movement of cargo or cargo containers from their facilities unless they are apparently free of soil, pest infestation, and prohibited agricultural items.

D. REQUIREMENTS

1. All personnel involved in the movement of ships, aircraft, personnel, cargo (including ordnance), containers, packing material, POVs, personal property and Army/Air Force/Navy Post Office (APO/FPO) mail will assure the following requirements are satisfied prior to that movement:

   a. Baggage. Baggage of all crew, passengers, or troops will be presented for inspection by USDA officers or designees. Commanders must ensure crew, passengers and troops are instructed not to carry prohibited plant and animal material. Foot and web gear of all personnel is also required to be soil and pest free.

   b. Cargo. Cargo will not be loaded aboard any conveyance in a foreign country, for movement to the US, unless it is free of animal and plant contamination or pest infestations as required by the USDA.

   c. Packing Material. All wood packing material, dunnage, pallets and crating, must be soil and bark free and apparently free of pest infestations.

   d. Stores. Stores and in-flight meals are prohibited entry into the US and must be disposed or safeguarded IAW with USDA requirements upon entry.

   e. Garbage. Garbage will be placed in tight, leak proof, covered containers and disposed of following port procedures authorized by, or under surveillance of the USDA representative. Disposal facilities to incinerate or sterilize must be available before military conveyances will be allowed landing or docking at a US base or port.

   f. Containers and Pallets. Cargo containers/pallets will not be stored directly on bare ground unless provisions are made to clean the containers/pallets of soil and pests before movement.

2. Detailed cleaning and inspection procedures can be found in the Armed Forces Pest Management Board Technical Guide No. 31, Contingency Retrograde Washdowns: Cleaning and Inspection Procedures. This document is available on the following web site URL: http://www.afpmb.org/pubs/tims/tim31.htm.

E. REQUEST FOR MCI-E PROGRAMS FOR AGRICULTURAL INSPECTIONS

APHIS allows for MCI-E programs at selected bases in the US. These bases are usually remote from local APHIS offices or receive low risk conveyances or shipments. In these programs, APHIS trains and certifies local DOD personnel to do inspections for APHIS. If a base commander is interested in establishing a program, the local APHIS should be contacted at USDA APHIS PPQ, Port Operations, 4700 River Rd., Riverdale, Md. 20737-5000. Telephone number: 301 734-8295. APHIS HQ can supply contact telephone numbers.

F. ARMED FORCES PEST MANAGEMENT BOARD

The Armed Forces Pest Management Board (AFPMB) was established by DOD Directive 4715.1, Environmental Security, and operates under DOD Instruction 4150.7, DOD Pest Management Program. The AFPMB recommends policy, provides guidance, and coordinates the exchange of information on all matters related to pest management throughout the DOD. This board has representation of each of the military departments and the DLA. As such, this permanently staffed organization is an important source of assistance related to the prevention of movement of invasive species, especially incidents involving quarantine, fumigation, dis-insectization, etc. Their web site is located at the following URL: http://www.acq.osd.mil/afpmb/. In the event that quarantine becomes necessary, additional guidance is provided in Air Force Instruction (AFI) 48-104/AR 40-12/Secretary of the Navy Instruction 6210.2A/, Quarantine Regulations of the Armed Forces.

CHAPTER 506

DOD PRE-CLEARANCE PROGRAM CUSTOMS AND AGRICULTURE INSPECTIONS

A. POLICY

1. The MCI program from OCONUS shore-based locations has been cancelled and is no longer recognized by the USCS. However, the USCS will support pre-clearance for major unit redeployments in conjunction with FTX or contingencies. This chapter outlines the policy and procedures to conduct those pre-clearance operations.

2. To effectively and efficiently conduct redeployment operations for exercises, contingencies, or other special airlift/sealift operations, theater Commanders may request USCS and USDA pre-clearance for redeployments of units, their equipment and sustaining supplies. Timelines for pre-clearance of redeployments should be established during the planning phase of the exercise or concurrently with the deployment phase during crisis action planning for a contingency. The theater Commander and the component commands involved in the redeployment must ensure that there are adequate facilities available for pre-clearance operations and work with the Services to identify military law enforcement personnel to be trained as CBCAs. Costs incurred by implementing provisions of this section (e.g., transportation, per diem, overtime charges) will normally be borne or furnished in kind by the requesting Service or Agency. If the supported command determines that pre-clearance of redeploying cargo and passengers will enhance mission effectiveness, the following request procedure must be followed.

B. PROCEDURES FOR REQUESTING PRE-CLEARANCE

1. The supported unit will submit requests for pre-clearance processing to the office of the appropriate theater command's Customs, Agriculture, and Border Clearance Staff Coordinator. Theater directives will prescribe procedures for processing such requests within the responsible unified command.

2. Requests must include, as a minimum:

   a. The dates, times, and places of departure from foreign country.

   b. Date, time, and proposed place of CTUS arrival.

   c. The number and type of aircraft or ships.

   d. The number of passengers, and amount and type of cargo, to include vehicles and other unit equipment.

   e. Identification of all en route stops between the foreign departure point and the CTUS port of entry, and whether the border clearance integrity of the aircraft or ship will be maintained during those stops. If pre-clearance integrity cannot be maintained, pre-clearance authority is lost.

3. Requests should be electronically transmitted, to the appropriate theater command as part of the initial planning of the redeployment, but not later than 75 days prior to the execution. The theater Customs, Agriculture, and Border Clearance Staff Coordinator will forward the approved request to USTRANSCOM/J5-LT, Scott AFB, IL not less than 60 days prior to the first movement. USTRANSCOM/J5-LT will coordinate with the USCS for support.

4. The responsible unified command Customs, Agriculture, and Border Clearance Coordinator will review the requests. The review will include an assessment of the capability of the theater

command to accommodate the request for pre-clearance. In those instances where the unified command determines contingency or exercise pre-clearance can not be accommodated or is not cost effective, the unit will be required to return to the CTUS through a predetermined CTUS port of entry where US border clearance can be accomplished.

5. Approval of pre-clearance requests under the provisions of this section does not negate any requirements for the carrier to ensure that entry is accomplished at an established CTUS port of entry. This port of entry may be a Regular or Limited Foreign Clearance Base, an international commercial airport or seaport of entry, or any other airport or seaport where a FIS capability exists or can be arranged for on an exception basis. (Refer to DOD 4500.54-G, DOD Foreign Clearance Guide, North and South America, for United States of America aircraft entry requirements (http://www.fcg.pentagon.mil).)

6. If use of any CTUS port of entry other than those regularly staffed by FIS personnel is planned, the requesting organization or carrier operator is responsible for coordinating necessary requirements with the appropriate Customs Management Center or Port Directors office of the USCS, USDA, and other US border clearance agencies.

C. TRAINING AND CERTIFICATION OF CBCAS

1. The theater Commander and the Service component will coordinate the request to the appropriate Service for sourcing of military law enforcement personnel to act as CBCAs for the duration of the redeployment. Personnel should be E-4 and above.

2. Training will be provided and approved by USCS and USDA.

3. Training may be accomplished in the CONUS or at an overseas location, if necessary.

4. Upon successful completion of the training, USCS and USDA will provide certification for trainees.

5. Trained personnel will be appointed on orders as CBCAs by the sponsoring Service component command. Orders should include an effective termination date.

6. USCS and USDA will provide advisors to oversee actual pre-clearance operations.

D. RESPONSIBILITIES OF CBCAS

1. CBCAs are responsible for:

   a. Performing their duties IAW this regulation and US and/or foreign country border clearance requirements.

   b. Inspecting and certifying that DOD-owned materiel, personal property, and passengers are acceptable for entry into the US. If contraband is discovered during the inspection process, the CBCA is to notify proper legal authority.

   c. Representing the commander in performance of inspections, and ensuring that the documentation for which they are responsible accompanies all shipments or personnel.

   d. Ensuring that customs/border clearance violations are expeditiously reported to the appropriate legal authority or military agency for disposition.

   e. Conducting all inspections and examinations in a professional, expeditious, and courteous manner.

   f. CBCAs will not, under any circumstances, collect or accept duty payments.

E. PRE-CLEARANCE REQUIREMENTS

1. CBCAs, in conjunction with USCS/USDA personnel, will inspect all crews, troops, passengers, and their accompanied baggage, professional equipment, issued weapons, cargo and aircraft prior to departure from overseas bases (airfields/ports) when the planned destination is the CTUS. To expedite clearance upon redeployment to the CTUS:

   a. Accompanied baggage and professional equipment excess to immediate personal needs will be inspected in the presence of the member by a CBCA /USCS team one or two days prior to unit redeployment. The baggage will then be secured and held in a sterile area from the time of the inspection until arrival at the US port of entry.

   b. The CBCA/USCS team will inspect hand-carried baggage at the time passengers are processed into a sterile area for isolation until actual departure. If a sterile area is not available, the CBCA/USCS team will inspect the personnel and hand-carried baggage at the ocean or air terminal immediately prior to embarkation. If someone who has been inspected and is waiting in the sterile area finds it necessary to depart the area, that person must undergo a new inspection when they return to the sterile area.

   c. The CBCA/USCS team will inspect unit equipment prior to its being loaded on the ship or aircraft to insure the equipment meets USCS and USDA border clearance requirements. The redeploying unit will ensure that personal property, such as footlockers, is readily identified and retains its individual integrity distinct from military cargo during shipment.

   d. Personal customs declarations will be completed while en-route.

2. Immediately upon completion of the inspection/examination, DD Form 2855, U.S. Military Preclearance Program, Figure 506-1, will be properly executed, authenticated by official stamp and signature, and securely affixed to the outside of each container/vehicle/equipment inspected/examined. The CBCA or USCS/USDA inspector will accomplish the execution and attachment of the label. This form is to be used only for cargo that has been pre-inspected and certified by CBCA/USCS/USDA personnel at OCONUS locations as part of an exercise or contingency operation IAW Chapter 505 and 506 of this regulation and meets USCS and USDA CONUS pre-clearance entry requirements. DD Form 2855 can be found at http://www.doir.whs.mil/forms/DD2855.PDF.

U.S. MILITARY PRECLEARANCE PROGRAM

AUTHORIZED USE ONLY IN ACCORDANCE WITH DOD 4500.9-R, PART V, CHAPTERS 505 AND 506

The U.S. Government property to which this label has been affixed meets the entry requirements of U.S. Customs and U.S. Agriculture.

F. PRE-CLEARANCE COORDINATION AND COMMUNICATION

1. Coordination with, and notification of affected organizations of actual pre-cleared passengers, baggage and cargo shipments is critical to the successful implementation of the pre-clearance program for exercises, contingencies, or other special airlift/sealift operations. At a minimum, the following communications must occur after pre-clearance operations have been approved.

   a. Upon approval and agreement of the USCS and USDA to support pre-clearance operations, the theater command customs and border clearance coordinator will notify affected organizations using the message format shown in Figure 506-2.

   b. Airlift and sealift schedulers will keep the USCS and USDA notified of redeployment routing and schedules as soon as they are developed. USCS and USDA will notify regional and local port directors to notify of pre-cleared status of passengers, baggage, cargo, and/or conveyance to expedite Port of Embarkation (POE) procedures.

1.  US CUSTOMS/AGRICULTURE PRECLEARANCE OPERATIONS HAVE BEEN COORDINATED AND
APPROVED FOR (NAME OF EXERCISE OR OPERATION) IAW DOD 4500.9-R, DEFENSE
TRANSPORTATION REGULATION, PART V.

2.  POLICY AND PROCEDURES OUTLINED IN DOD 4500.9-R, PART V, CHAPTERS 505 AND 506
APPLY.

3.  USCS ADVISORS WILL BE DEPLOYED TO (LOCATION) FROM (DATE) TO (DATE) TO
SUPERVISE PRE-CLEARANCE ACTIVITIES.

4.  AERIAL AND WATER PORTS SHOULD SET UP STERILE AREAS TO STORE PRE-CLEARED
BAGGAGE AND CARGO PRIOR TO REDEPLOYMENT.

5.  REQUEST AIRLIFT AND SEALIFT SCHEDULERS NOTIFY USCS AND USDA OF FLOW SCHEDULES
AND ROUTINGS TO AVOID UNNECESSARY RE-INSPECTIONS IN CONUS.

6.  ADDITIONAL INSTRUCTIONS:

7.  POC IS (NAME, ORGANIZATION, TELEPHONE NUMBER, DSN & COMMERCIAL).
```

Figure 506-2. Sample Customs and Agriculture Pre-clearance Announcement Message

G. REQUESTS FOR CUSTOMS AND AGRICULTURE PRE-CLEARANCE

1. USCS and USDA, in cooperation with the DOD, will pre-clear cargo and passengers returning to the CTUS. This pre-clearance program is available for redeployments from major exercises or contingencies. Pre-cleared exercises will require little or no USCS or APHIS inspection into the US. Pre-clearance will lessen the contraband and pest risk and expedite the movement of personnel and equipment into the US. If the supported command determines that pre-clearance of redeploying cargo and passengers will enhance mission effectiveness, the following request procedure must be followed:

   a. The supported unit will submit requests for USDA pre-clearance processing to USDA HQ, APHIS PPQ, Port Operations, 4700 River Rd., Riverdale, Md. 20737-5000, telephone number: 301 734-8295. For USCS, coordinate requests through HQ USTRANSCOM TCJ-5/LTC. Defense Switched Network (DSN): 312 779-1985, Commercial: 618 229-1985 for coordination. Theater directives will prescribe procedures for processing such requests within the responsible unified command (see paragraph G.3. for United States European Command (USEUCOM) requirements).

   b. Requests must include, as a minimum: (1) the date, time, and place of overseas departure; (2) date/time of CTUS arrival; (3) the number and type of aircraft or ships; (4) the number of passengers and amount and type of cargo, to include vehicles and other unit equipment; (5) identification of all en route stops between the overseas departure point and the CTUS port of entry; and whether the border clearance integrity of the aircraft or ship will be maintained.

   c. Requests should be electrically transmitted, to the appropriate theater command as part of the initial planning of the redeployment, but not later than 45 days prior to the execution. Theater commands will forward the approved request to APHIS HQ not less than 30 days prior to the first movement. Direct contact with APHIS HQ is authorized. USTRANSCOM/J5-LT will assist with coordination as needed.

   d. Approval of pre-clearance requests under the provisions of this section does not negate any requirements for the carrier to ensure that entry is accomplished at an established CTUS port of entry. This port of entry may be a Regular or Limited Foreign Clearance Base, an international commercial airport or seaport of entry, or any other airport or seaport where a FIS capability exists or can be arranged for on an exception basis.

   e. If use of any CTUS port of entry other than those regularly staffed by FIS personnel is planned, the requesting organization or carrier operator is responsible for coordinating necessary requirements with USCS and APHIS HQ.

2. Agreements must be in place to support USCS and APHIS advisors conducting pre-clearance duties in conjunction with returning personnel and equipment from contingencies and training exercises. The agreement will include provisions for overtime fees, car rental, transportation to/from site, per diem, and lodging entitlements.

3. USEUCOM Procedures. USEUCOM, with the cooperation of in-theater USDA representatives has established a pre-clearance program to enforce USDA requirements and have made agricultural pre-clearances mandatory. If exercise redeployments are originating in the USEUCOM AOR, the supporting unit should contact the EUCOM Customs/Agriculture Executive Agent (HQ USAREUR/ECJ1-CEA) directly to coordinate for pre-clearance assistance. Their web site URL is: http://www.hqusareur.army.mil/opm/customs.htm.

H. AGRICULTURE PRE-CLEARANCE PROCEDURES

1. Ships, aircraft, personnel, cargo (including ordinance) packing material, POVs, personal effects, and APO/FPO mail must be free of prohibited and restricted plants, animals, and plant and animal products when returned to the US.
2. Inspectors: USDA inspectors, or trained and certified CBCA or MCI-E inspectors will conduct these inspections.
3. Training: USDA will conduct training for DOD personnel. The DOD will be responsible for providing reimbursement for training in OCONUS sites. The USDA will fund routine training of MCI-E or other designees in the US.
4. Facilities: Inspections must be conducted in natural or well-lighted areas. Cleaning and disinfecting must be conducted in areas approved by USDA or designees. Commodities or equipment that have been approved for return to US must be stored in such a manner as to prevent re-infestation by pests or contaminants. USDA officers or designees must approve these areas.
5. Reporting: Numbers of inspection, cleaning and disinfecting should be reported, through the chain of command, to DUSD (ES) and APHIS. APHIS and DUSD (ES) must be informed of interceptions of significant pests. APHIS will assist in the identification of pests.
6. During exercises, unit moves, deployments, redeployments, or other special airlift/sealift operations, CBCAs, in conjunction with USCS/USDA personnel, will inspect all crews, troops, passengers, and their accompanied baggage, professional equipment, issued weapons, cargo and aircraft prior to departure from overseas bases (airfields/ports) when the planned destination is the CTUS. To expedite clearance upon redeployment to the CTUS:
    a. Accompanied baggage and professional equipment excess to immediate personal needs will be inspected in the presence of the member by an CBCA/APHIS team one or two days prior to unit redeployment. The baggage will then be secured and held in a sterile area from the time of the inspection until arrival at the US port of entry.
    b. The CBCA/APHIS team will inspect hand-carried baggage at the time passengers are processed into a sterile area for isolation until actual departure. If a sterile area is not available, the CBCA/APHIS team will inspect the personnel and hand-carried baggage at the ocean or air terminal immediately prior to embarkation. If someone who has been inspected and is waiting in the sterile area finds it necessary to depart the area, that person must undergo a new inspection when they return to the sterile area.
    c. The CBCA/APHIS team will inspect unit equipment prior to its being loaded on the ship or aircraft to insure the equipment meets USCS and USDA border clearance requirements. The redeploying unit will ensure that personal property, such as a footlocker, is readily identified and retains its individual integrity distinct from military cargo during shipment.
    d. DD Form 2855, Figure 506-1, is authorized to be used only for cargo that has been pre-inspected and certified by CBCA/USCS/USDA personnel at OCONUS locations as part of an exercise or contingency operation IAW Chapter 505 and 506 of this regulation and meets USCS and USDA CONUS pre-clearance entry requirements.
7. Some exercises may be pre-cleared for APHIS and not for US Customs. In these circumstances, US Customs clearance may be required upon arrival in the US. Personnel and equipment should not require additional APHIS inspection. APHIS always retains the right to do integrity checks in the US.
8. Any after action reports should include input from APHIS.

I. AIRBORNE TROOPS

Procedures described above are applicable to airborne troop movements with an airdrop upon return to the CTUS so long as the airdrops have been coordinated with USCS director in the district involved. The annotated customs declaration of these personnel must be provided to a member of the aircrew, preferably the aircraft commander, prior to the airdrop. The CBCA/USCS team will advise the aircrew member that the declarations must be turned over to USCS inspectors at the port of entry for the aircraft.

MAY 19 2006

Lieutenant Colonel Marvin W. Smith, Jr.
Department of the Air Force
36th Civil Engineer Squadron (PACAF)
Unit 14007
APO AP 96543-4007

Subject: Request for Informal Section 7 Consultation for the Beddown of Training and Support Initiatives at Northwest Field Project on Andersen Air Force Base, Guam

Dear Lieutenant Colonel Smith:

We received your letter and biological assessment dated March 17, 2006, on April 13, 2006, requesting our concurrence with your finding that the proposed Beddown of Training and Support Initiatives at Northwest Field Project may affect, but is not likely to adversely affect any federally listed species on Andersen Air Force Base, Guam. Species that may be affected include the endangered Mariana crow (*Corvus kubaryi*), Guam rail (*Gallirallus owstoni*), and Guam Micronesian kingfisher (*Halcyon cinnamomina cinnamomina*) and the threatened Mariana fruit bat (*Pteropus mariannus mariannus*). The Air Force has determined that the proposed project will have no effect on the endangered tree, *Serianthes nelsonii*.

On May 2, we met with the Air Force to obtain additional information about the proposed project and discuss potential direct and indirect impacts to listed species. The following week we participated in a conference call to further address measures to reduce noise impacts to the Mariana crow. On May 12, 2006, we received the supplemental data we requested on the proposed project from Mr. Jonathan Wald. Due to the timing of the receipt of the requested materials, Mr. Jonathan Wald extended our 30-day timeline to May 19, 2006.

The Air Force is proposing to relocate the Rapid Engineer Deployable Heavy Operations Repair Squadron (Red Horse) and its Silver Flag training unit, the Pacific Air Force (PACAF) Security Forces Commando Warrior training program, and the Combat Communications squadron to Andersen Air Force Base. As part of this relocation, an administrative area, Field Training Exercise (FTX) site, and bivouac area will be constructed in the Northwest Field area of the base and utilized for these training programs (Figure 1). Approximately 47 hectares (116 acres) of vegetation will be cleared for the construction of facilities, roads, a Defensive Fighting Position (DFP) line, entry control points, base defense operations centers, sector command posts, and a bivouac training area. The proposed training activities are described below by program:

TAKE PRIDE® IN AMERICA

a) Red Horse – Approximately 160 students will take part in heavy equipment training, including ground disturbance, in the proposed bivouac area and adjacent quarry four times a year beginning in 2009. Each training session will last from seven to ten days and students will reside in the proposed bivouac area. Ground disturbing activities during training will occur only within the quarry. To simulate operating equipment during combat operations, ground-burst-simulators will be set off one time per training session within a two hour period and blank ammo will be fired occasionally throughout the training session.

b) Silver Flag – Approximately 166 students will take part in simulated military deployment and airfield recovery training, involving heavy equipment, twelve times a year beginning in 2012. Each training session is expected to last seven days and will include approximately five days of training in the administrative area and two days training in the FTX area. Heavy equipment operation and drilling activities would occur only on existing paved surface and the quarry. To simulate an enemy attack on an airfield, ground-burst-simulators, smoke grenades, small arms blank ammunition, and an 18-kilogram cratering charge will be used during a 24-hour base recovery exercise between the DFP line and the airfield. All smoke grenades and ground-burst simulators will be set off on paved surfaces and the 18-kilogram cratering charge will be detonated in the same area along the paved taxiway/aircraft parking area of the airfield for all training exercises. None of the weapons will be fired continuously during the exercise, but once or twice during the 24-hour training period there will be a one to two hour period of intense firing. One cratering charge will be detonated every 15 calendar days (once a training session) for a total of 25 detonations a year. In addition, firefighters from the unit will undergo structural fire training within a metal structural training building, in which several live fires would be extinguished, within the administrative area. Either wood/paper products or a propane-fired system in a ceramic-lined room would be used within the building.

c) PACAF Security Forces Commando Warrior – Approximately 150 students will take part in electronic system security, expeditionary Air Force predeployment, simulations instructor, non-lethal weapons, close precision engagement, and anti-terrorism level II/ expeditionary anti-terrorism skills training ten times a year beginning in 2009. Each training session is expected to last 18 days and will include several days of academic training and culminates in a 72-hour FTX involving approximately 88 students. The proposed training is expected to occur throughout the FTX area but will be focused along the DFP line. To simulate defense of the airfield and DFP, munitions (blank ammunition, hand grenade fuses, explosive simulators, ground-burst-simulators, hand grenade simulators, surface trip flares, smoke grenades, surface to air simulators, slap flares, illumination rounds, and marking cartridges) will be used during the 72-hour training period. None of the weapons will be fired continuously during the exercise, but once or twice during the training period there will be one to two hour periods of intense firing. Ground-burst-simulators will only be set off in pits constructed along the defensive fighting position line and all vehicle traffic will be restricted to unpaved roads and trails.

d) Combat Communications – Students will take part in training to build and complete communications sites from the ground up and defend these sites from assault beginning in 2011. This training will involve academic and FTX training and combat communications personnel will participate in air base defense training with either PACAF Security Forces Commando Warrior or Silver Flag organizations. Therefore, the use of munitions will correspond with PACAF Security Forces Commando Warrior or Silver Flag training described above.

Historically, the proposed project area was utilized by the endangered Mariana crow, Guam rail, and Guam Micronesian kingfisher and the threatened Mariana fruit bat. The endangered tree, *Serianthes nelsonii*, is not located within any of the construction or training areas for this project. However, one individual was found within the ungulate exclusion area (see Habitat Enhancement below). The Guam rail and Guam Micronesian kingfisher no longer occur at the project site, however, the site contains potential breeding and foraging habitat for these two species. Therefore, they were included in this consultation pursuant to the Cooperative Agreement between the U.S. Air Force and the U.S. Fish and Wildlife Service for establishment and management of the Guam National Wildlife Refuge, dated March 10, 1994.

The Mariana crow population on Guam currently consists of approximately eleven individuals, primarily within the Munitions Storage Area on Andersen Air Force Base. During surveys for the proposed project, a Mariana crow was observed in the proposed FTX area, but no crow pairs have been reported nesting in the area recently. However, recent communications with the Guam Division of Aquatic and Wildlife Resources indicate that a Mariana crow pair may have established a territory to the northeast of the project area. The Mariana fruit bat population consists of less than 50 individuals. Recent surveys of the main colony indicate only 26 bats persist at this location; however, small numbers of individual bats do roost in other locations in northern and southern Guam. The main Mariana fruit bat colony is located over nine kilometers from the project area and Mariana fruit bats were not observed during the project survey period. However, bats have been observed in areas adjacent to the project site and a Guam National Wildlife Refuge employee observed a bat flying from the project area in February 2006 indicating bats may use this area for foraging.

The proposed project is expected to have the following potential impacts on these listed species and/or their habitats: (1) direct loss of potential breeding, foraging, and/or roosting habitat through vegetation clearing for construction of the administrative area, FTX site, and bivouac area; (2) increased auditory and visual disturbance during construction and maintenance of the training areas; and (3) increased auditory and visual disturbance during training, especially combat simulation exercises. In order to minimize and avoid these potential project impacts to federally listed species, the Air Force is proposing to undertake the following measures:

a) Habitat Enhancement – To offset the loss of potential breeding and foraging habitat from the proposed action, the Air Force is proposing to construct a 54 hectare (113 acre) ungulate exclosure to the northeast of the proposed FTX area and assist with completing a pig, deer, and brown treesnake barrier around a 22 hectare (54 acre) habitat management unit located near Potts junction. The Air Force is proposing to develop and implement an ungulate control plan to remove deer and pigs from these areas and to

reduce ungulate populations in non-fenced areas to promote natural forest regeneration. In addition, the Air Force is proposing to establish five 50-square meter plots in the ungulate control exclosure for outplanting native tree species utilized by foraging Mariana fruit bats and Mariana crows. The goal of these outplantings is to offset the loss of native tree species utilized by foraging Mariana fruit bats and Mariana crows lost during vegetation clearing for the proposed project.

b) Post-Typhoon Training Schedule – After a typhoon event, when food resources for the Mariana crow and Mariana fruit bat may be reduced, the Air Force will coordinate with this office and the Guam Division of Aquatic and Wildlife Resources to determine if training schedules should be modified or reduced. In addition, to avoid training impacts on crow nesting after a typhoon event, the Air Force has developed three conditions that will modify training activities. First, if crows are nesting between the 114 unweighted peak noise level (dBP) cratering (approximately 1,800 meters from the noise source) and 104 dBP small arms fire (approximately 500 meters from the noise source) noise contours (Figure 1) and typhoon event occurred with two to three months of the training, no cratering charges will be detonated. Second, if crows are nesting between the 114 dBP cratering and 104 dBP small arms fire noise contours and typhoon event occurred with one to two months of the training, no cratering charges will be detonated and no M2, M115A, and M116A munitions will be used. Finally, if crows are nesting within the 104 dBP small arms fire noise contour and a typhoon event occurred within 1 month of the training, no training will occur (see Figure 1).

c) Mariana Crow Nesting and Training Schedule – To avoid potential impacts to nesting Mariana crows, the Air Force has developed three conditions that will modify the proposed training activities. First, if crows are nesting between the 114 dBP and 118 dBP cratering charge noise contours (see Figure 1), no cratering charges will be detonated. Second, if crows are nesting between the 118 dBP cratering and 110 dBP small arms fire noise contours, no cratering charges will be detonated and no M2, M115A, and M116A munitions will be used. Finally, if crows are nesting within the 110 dBP small arms fire noise contour, no FTX training will occur. In addition, the Air Force will initiate the first training program outside the Mariana crow breeding season (October – April) to limit training impacts on crows that may have initiated breeding prior to the training (see Figure 1).

d) Construction Schedule – To avoid potential impacts to the Mariana crow and Mariana fruit bats during construction, the beginning of the construction will be initiated outside the Mariana crow breeding season (October – April) and no construction will occur at night.

e) Monitoring – To better assess potential project impacts on nesting Mariana crows and in order to develop adaptive management techniques for the training program, the Air Force will develop and initiate a nest monitoring program in coordination with this office and the Guam Division of Aquatic and Wildlife Resources. This program will be initiated prior to the proposed training program in order to gather baseline information.

The increase in the shipment of goods from Guam due to personnel and activities associated with the proposed project would increase the likelihood that brown treesnakes (*Boiga irregularis*) may be transported from Guam to other locations. The introduction of this highly invasive snake to other islands would be devastating to native fauna, particularly listed species. As part of the proposed action, the Air Force has committed to 100-percent inspection of all outbound cargo, supplies, household goods, and aircraft from Guam for brown treesnake interdiction. This action is extremely critical for reducing the risk of brown treesnakes being moved off of Guam from Air Force activities. We concur that the complete implementation of the proposed brown treesnake interdiction program reduces the action area to the island of Guam since the risk of snake movement has been adequately minimized.

We have reviewed all information provided and concur with your finding that the proposed project is not likely to adversely affect the Guam rail, Guam Micronesian kingfisher, Mariana crow, and Mariana fruit bat. The *Serianthes nelsonii* located within the ungulate exclosure area will benefit from fencing and ungulate removal. As stated earlier, the Guam rail and Guam Micronesian kingfisher are currently not extant on Guam, though efforts continue to reestablish wild populations on the island. We anticipate there will be some level of disturbance to these species due to construction and training activities. However, research on military training noise impacts on the endangered red-cockaded woodpecker (*Picoides borealis*) and Oahu elepaio (*Chasiempis sandwichensis ibidis*) and threatened bald eagle (*Haliaeetus leucocephalus*) indicate that impacts are minimal if the disturbance is a sufficient distance away and the species has previous exposure to the disturbance events (Stalmaster and Kaiser 1997, Brown *et al.* 1999, VanderWerf and Ebisu 2000, Delaney *et al.* 2002). For example, Delaney and others (2002) reported that red-cockaded woodpeckers on Fort Stewart, Georgia, did not flush from the nest when noise sources were over 152 meters (500 feet) away from the nest.

Therefore, impacts from the proposed project have been minimized due to the following measures: 1) training modification measures for reducing noise disturbance to nesting Mariana crows based on the distance of nests from training activities; 2) the relatively short duration of these disturbance events; 3) the availability of sufficient habitat to support listed species' life history requirements outside the impact area; and 4) scheduling of construction and training to avoid disturbance to listed species. Disturbance associated with training could become significant after a typhoon event when foraging resources for the Mariana fruit bat and Mariana crow may be limited. However, the Air Force's proposed measures to coordinate with this office and the Guam Division of Aquatic and Wildlife Resources after a typhoon event to evaluate changes in the training schedule and limit training based crow nest locations and the amount of time that has passed after a typhoon are expected to avoid these potential impacts.

We appreciate your efforts to conserve endangered species. If you have any questions please contact Fred Amidon, Fish and Wildlife Biologist, by phone at 808-792-9400.

Sincerely,

Patrick Leonard
Field Supervisor

Subject: Reinitiation of Informal Section 7 Consultation Regarding Beddown of Training and Support Initiatives at Northwest Field, Andersen Air Force Base, Guam
Andersen Air Force Base, Guam

Dear Mr. Littlejohn:

This letter is in response to an electronic mail (email) received on February 10, 2009, requesting reinitiation of section 7 consultation for the beddown of training and support initiatives at Northwest Field, Andersen Air Force Base (AAFB), Guam (Beddown Project). At issue are the potential effects of the proposed project on the threatened Mariana fruit bat (*Pteropus mariannus mariannus*) (bat) and the endangered Mariana crow (*Corvus kubaryi*) (crow), endangered Guam rail (*Gallirallus owstoni*) (rail), and endangered Guam Micronesian kingfisher (*Halcyon cinnamomina cinnamomina*) (kingfisher). Although the rail and kingfisher are extirpated in the wild from Guam, they must be considered in consultation requests on AAFB due to the requirements identified in the Cooperative Agreement between the U.S. Air Force and the U.S. Fish and Wildlife Service (Service) or the establishment and management of the Guam National Wildlife Refuge (Air Force and Service 1994).

The findings and recommendations in this consultation are based on: (1) your letter dated February 11, 2009, received by email on February 10, 2009; (2) the May 19, 2006, informal consultation for the Beddown Project, and (3) other information available to us. A complete administrative record is on file in our office. This response is in accordance with section 7 of the Endangered Species Act of 1973 (Act), as amended (16 U.S.C. 1531 *et seq.*).

TAKE PRIDE® IN AMERICA

Project Description
The original Beddown Project consisted of relocating the Rapid Engineer Deployable Heavy Operations Repair Squadron (Red Horse) and its Silver Flag training unit, the Pacific Air Force (PACAF) Security Forces Commando Warrior training program, and the Combat Communications squadron to Andersen Air Force Base. As part of this relocation, an administrative area, Field Training Exercise (FTX) site, and bivouac area will be constructed in the Northwest Field area of the base and utilized for these training programs. Approximately 47 hectares (116 acres) of vegetation will be cleared for the construction of facilities, roads, a Defensive Fighting Position (DFP) line, entry control points, base defense operations centers, sector command posts, and a bivouac training area. See the informal consultation for a full description of the original Beddown Project (Service File No. 2006-I-0281).

The reinitiation is necessary as the project description has been slightly modified. Specifically the military working dog facility and Commando Warrior Military Operations in Urban Terrain (MOUT) facility were both evaluated within the Beddown Project; however, the size of the project footprint was underestimated and did not include infrastructure to support these facilities (i.e., parking lots, building grounds, dog exercise and training yards, corridors between MOUT buildings, and access roads). Therefore, the proposed project will remove an additional 1.06 hectares (2.6 acres) of habitat to accommodate the proposed infrastructure footprint within the project description. Habitat to be removed includes: hibiscus scrub community vegetation (0.65 hectare, 1.61 acre); secondary mixed limestone forest community (0.24 hectare, 0.6 acre); and hibiscus scrub, secondary mixed limestone forest, mixed herbaceous scrub community (0.15 hectare, 0.37 acre).

Conservation Measures
The following conservation measures are designed to avoid or minimize effects to the bat and habitat for the bat, crow, kingfisher, and rail. These conservation measures are considered part of the project description. Any changes to, modifications of, or failure to implement these conservation measures may result in a need to reinitiate this consultation.

1. All conservation measures identified in the prior Beddown Project informal consultation (Service File No. 2006-I-0281) will still be implemented as described in the prior consultation.

2. All construction work will begin just after dawn and will end prior to dusk, between the hours of 7:00 am and 4:00 pm. No activities will occur at night.

3. No new staging areas or access roads will be constructed. Existing roads and disturbed areas will be used.

4. No chemicals will be used on site.

5. No contamination (i.e., trash or debris disposal) or introduction of non-native species to adjacent terrestrial environments will result from project-related activities.

6. A litter-control program will be implemented during construction. All trash will be bagged and disposed of offsite at the end of each day.

7. All tools, gear, and construction scrap will be removed upon completion of work in order to prevent the attraction of non-native pests (i.e., rats).

8. All onsite personnel will receive instruction from AAFB environmental flight personnel regarding endangered species and brown treesnake (*Boiga irregularis*) and what to do in case of a sighting.

9. Native landscape vegetation will be planted on the facility's grounds at completion of the construction of the buildings. The contractor will select vegetation from the list of recommended vegetation provided by the Guam Department of Agriculture, Forestry Division.

10. A qualified biologist will survey the project site and a 150-meter buffer zone around the project site, each morning, prior to any vegetation clearing. If a roosting bat is present, workers will not conduct any activities, including vegetation removal within the 150-meter buffer radius until the bat leaves on its own volition.

11. Although not anticipated, if nesting crows are detected, workers will avoid the crows by 300 meters.

12. The presence of the bat or crow will be reported to the Service and the Guam Division of Aquatic and Wildlife Resources immediately, but the location of the bat or crow will not be revealed to any other outside party.

Species Affected

Bats utilize limestone and coastal forest and coconut plantations for foraging and roosting. Crows were known to use secondary, coastal, ravine, and agricultural forests, including coconut plantations for foraging and nesting. The forest located within Northwest Field provides essential habitat for the bat and crow. The action area and surrounding forest has been used for foraging and roosting of individual bats, and foraging and nesting of crows.

The project footprint includes and is surrounded by an area of forest that is essential to the survival and recovery of the bat, crow, kingfisher, and rail. While the additional vegetation clearing that will be completed is small, it contributes to and exacerbates the overall decline of essential habitat on AAFB (see Table 1). However, the conservation measures are designed to improve existing essential habitat for the bat, crow, kingfisher, and rail in nearby areas on AAFB and prevent the spread of non-native invasive species. Vegetation clearing will not occur within 150 meters of an individual bat or 300 meters of an individual crow to minimize affects from human disturbance to the individual.

Summary

Based on the above information, we have determined that the additional removal of 1.06 hectare (2.6 acres) of vegetation may affect, but is not likely to adversely affect the Mariana fruit bat, Mariana crow, Guam Micronesian Kingfisher, or Guam rail. Unless the project description changes, or new information reveals that the effects of the proposed action may affect a listed species or its habitat in a manner or to an extent not considered, or a new species or critical habitat is designated that may be affected by the proposed action, no further action pursuant to the Act is necessary.

If you have questions regarding this consultation, please contact Holly Herod, Fish and Wildlife Biologist, at 808-792-9400.

Sincerely,

Christy Russell

Subject: Second Reinitiation of Informal Section 7 Consultation for the Beddown of Training and Support Initiatives at Northwest Field, Andersen Air Force Base, Guam

Dear Mr. Littlejohn:

This letter is in response to an electronic mail (email) received on August 26, 2009, requesting reinitiation of section 7 consultation for the beddown of training and support initiatives at Northwest Field, Andersen Air Force Base (AAFB), Guam (Beddown Project). At issue are the potential effects of the proposed project on the threatened Mariana fruit bat (*Pteropus mariannus mariannus*) (bat) and the endangered Mariana crow (*Corvus kubaryi*) (crow), endangered Guam rail (*Gallirallus owstoni*) (rail), and endangered Guam Micronesian kingfisher (*Halcyon cinnamomina cinnamomina*) (kingfisher). Although the rail and kingfisher are extirpated in the wild from Guam, they must be considered in consultation requests on AAFB due to the requirements identified in the Cooperative Agreement between the U.S. Air Force and the U.S. Fish and Wildlife Service (Service) or the establishment and management of the Guam National Wildlife Refuge (Air Force and Service 1994).

The findings and recommendations in this consultation are based on: (1) your letter dated August 26, 2009, received by email on August 25, 2009; (2) the May 19, 2006, informal consultation for the Beddown Project; (3) the March 6, 2009, reinitiation of the informal consultation for the Beddown Project; and (4) other information available to us. A complete administrative record is on file in our office. This response is in accordance with section 7 of the Endangered Species Act of 1973 (Act), as amended (16 U.S.C. 1531 *et seq*.).

Project Description

The original Beddown Project consisted of relocating the Rapid Engineer Deployable Heavy Operations Repair Squadron (Red Horse) and its Silver Flag training unit, the Pacific Air Force

TAKE PRIDE® IN AMERICA

Security Forces Commando Warrior training program, and the Combat Communications squadron to Andersen Air Force Base. As part of this relocation, administrative buildings, Field Training Exercise site, and bivouac area will be constructed in the Northwest Field area of the base and utilized for these training programs. Approximately 116 acres (47 hectares) of habitat within the Guam National Wildlife Refuge Overaly will be cleared for the construction of facilities, roads, a Defensive Fighting Position line, entry control points, base defense operations centers, sector command posts, and a bivouac training area. See the informal consultation for a full description of the original Beddown Project (Service File No. 2006-I-0281).

The first reinitiation was necessary as the size of the project footprint was underestimated and did not include infrastructure to support the military working dog facility and Commando Warrior Military Operations in Urban Terrain facility (Service File No. 2009-I-0112). These activities resulted in the additional removal of 2.6 acres (1.06 hectare) of habitat within the Guam National Wildlife Refuge Overlay.

The second reinitiation was requested to accommodate further changes to the project description. Specifically, the original project included a Small Unit Training area. However, the proposed size of the original Small Unit Training area is too small to meet the minimum requirements for troop training. Therefore, additional land use is necessary (Table 1). The obstacle course that was proposed in the original consultation will not be constructed in a separate location and will instead use the Small Unit Training Area in order to minimize forest clearing in multiple areas. Additionally, two Individual Tactics and Training lanes were requested in the original consultation. Again, the size of this footprint is too small to meet training requirements and an increase is necessary. The Base Defense Operations Control Facility (BDOCF) also requires additional area to meet mission needs. However, the training at the BDOCF is tactical in nature and the intent is not to clear the entire area but rather to allow flexibility with the location and to maneuver through the forest. A utility corridor is also needed for the BDOCF for a communications line. Once the utility lines are in place the corridor will be re-planted with native species. Lastly, the access road from Highway 3A is no longer needed. The proposed changes in this reinitiation will increase the loss of habitat within the Guam National Wildlife Refuge Overlay by approximately 0.9 acres (0.3 hectares).

Table 1. Summary of habitat impacts in acres (hectares) from the proposed reinitiation and the original consultation.

Facility Name	Original Consultation 2006-I-0281	Second Reinitiation 2009-I-0294
Obstacle Course	1.5 (0.6)	0
Highway 3A Access Corridor	2.1 (0.8)	0
Small Unit Training Site	1.2 (0.5)	2.7 (1.1)
Individual Tactics and Training Lane 1	0.05 (0.02)	0.5 (0.2)
Individual Tactics and Training Lane 2	0.05 (0.02)	0.3 (0.1)
BDOCF Communications Line Corridor	0	0.6 (0.2)
BDOCF Site Flexibility	0	1.7 (0.7)
Total	4.9 (2.0)	5.8 (2.3)

Conservation Measures

The following conservation measures are designed to avoid or minimize effects to the bat and habitat for the bat, crow, kingfisher, and rail. These conservation measures are considered part

of the project description. Any changes to, modifications of, or failure to implement these conservation measures may result in a need to reinitiate this consultation.

1. All conservation measures identified in the prior Beddown Project informal consultation (Service File No. 2006-I-0281 and 2009-I-0112) will still be implemented as described in the prior consultations.

2. All construction work will begin just after dawn and will end prior to dusk, between the hours of 8:00 am and 4:30 pm. No activities will occur at night.

3. No staging areas or access roads will be constructed. Existing roads and disturbed areas will be used.

4. No trees that are considered essential to the recovery of the bat, crow, kingfisher, and rail will be removed for the BDOCF area.

5. All vegetation removed will be burned and excess topsoil will be taken to the quarry.

6. No contamination (i.e., trash or debris disposal) or introduction of non-native species to adjacent terrestrial environments will result from project-related activities.

7. A litter-control program will be implemented during construction. All trash will be bagged and disposed of offsite at the end of each day.

8. No chemicals will be used onsite.

9. All tools, gear, and construction scrap will be removed upon completion of work in order to prevent the attraction of non-native pests (i.e., rats).

10. All vegetation planted in the area, including the utility corridor, will be selected from the Guam Division of Forestry approved list of native and endemic species.

11. To minimize impacts to adjacent habitat, blaze orange construction fencing will be used to delineate the construction site and signs will be posted indicating no one is allowed beyond the barriers to prohibit personnel or equipment from damaging the habitat. These barriers will be removed upon project completion.

12. All onsite personnel will receive instruction from AAFB environmental flight personnel regarding endangered species and brown treesnake (*Boiga irregularis*) and what to do in case of a sighting.

13. A qualified biologist or environmental flight personnel will survey the project site and a 150-meter buffer zone around the project site, each morning, prior to any vegetation clearing. If a roosting bat is present, workers will not conduct any activities, including vegetation removal within the 150-meter buffer radius until the bat leaves on its own volition.

14. Although not anticipated, if nesting crows are detected, workers will avoid the crows by 300 meters.

15. The presence of the bat or crow will be reported to the Service and the Guam Division of Aquatic and Wildlife Resources immediately, but the location of the bat or crow will not be revealed to any other outside party.

Species Affected
Bats utilize limestone and coastal forest and coconut plantations for foraging and roosting. Crows were known to use secondary, coastal, ravine, and agricultural forests, including coconut plantations for foraging and nesting. The forest located within Northwest Field provides essential habitat for the bat and crow. The action area and surrounding forest has been used for foraging and roosting of individual bats, and foraging and nesting of crows.

The project footprint includes and is surrounded by an area of forest that is essential to the survival and recovery of the bat, crow, kingfisher, and rail. While the additional vegetation clearing that will be completed is small, it contributes to and exacerbates the overall decline of essential habitat on AAFB (see Table 2). Vegetation clearing will not occur within 150 meters of an individual bat or 300 meters of an individual crow to minimize affects from human disturbance to the individual.

Summary
Based on the above information, we have determined that the additional removal of 0.9 acres (0.3 hectares) of vegetation may affect, but is not likely to adversely affect the Mariana fruit bat, Mariana crow, Guam Micronesian Kingfisher, or Guam rail. Unless the project description changes, or new information reveals that the effects of the proposed action may affect a listed species or its habitat in a manner or to an extent not considered, or a new species or critical habitat is designated that may be affected by the proposed action, no further action pursuant to the Act is necessary.

The Beddown project in its entirety will result in a loss of approximately 120 acres (49 hectares) in addition to other projects planned and proposed for AAFB. We are very concerned about the incremental loss of essential habitat within the Guam National Wildlife Refuge Overlay due to actions implemented by AAFB since much of the loss that has occurred and is proposed to occur is avoidable. We recommend that AAFB coordinate with our office to develop a programmatic consultation that evaluates routine, temporary, and permanent vegetation clearing in order to minimize future impacts to essential habitat and streamline future project activities.

The programmatic consultation will facilitate section 7 consultation for AAFB while ensuring that AAFB does not preclude the survival of these threatened and endangered species. If you have questions regarding this consultation, please contact Holly Herod, Fish and Wildlife Biologist, at 808-792-9400.

Sincerely,

Loyal Mehrhoff
Field Supervisor

Subject: Third Reinitiation of Informal Section 7 Consultation for the Beddown of Training and Support Initiatives at Northwest Field, Andersen Air Force Base, Guam

Dear Mr. Littlejohn:

This letter is in response to an electronic mail (email) received on February 10, 2009, requesting reinitiation of section 7 consultation for the Beddown of Training and Support Initiatives at Northwest Field, Andersen Air Force Base (AAFB), Guam (Beddown Project). At issue are the potential effects of the proposed project on the threatened Mariana fruit bat (*Pteropus mariannus mariannus*) (bat) and the endangered Mariana crow (*Corvus kubaryi*) (crow), endangered Guam rail (*Gallirallus owstoni*) (rail), and endangered Guam Micronesian kingfisher (*Halcyon cinnamomina cinnamomina*) (kingfisher). Although the rail and kingfisher are extirpated in the wild from Guam, they must be considered in consultation requests on AAFB due to the requirements identified in the Cooperative Agreement between the U.S. Air Force and the U.S. Fish and Wildlife Service (Service) or the establishment and management of the Guam National Wildlife Refuge (Air Force and Service 1994).

The findings and recommendations in this consultation are based on: (1) electronic mail exchanges between February 1, 2010, and February 25, 2010; (2) the March 6, 2009, reinitiation of the informal consultation for the Beddown Project (Service File No. 2009-I-0012); (3) the September 11, 2009, reinitiation of the informal consultation for the Beddown Project (Service File No. 2009-I-0294); (4) the May 19, 2006, informal consultation for the Beddown Project

TAKE PRIDE® IN AMERICA

(Service File No. 2006-I-0281); (5) the 2006 Draft Environmental Assessment Beddown of Training and Support Initiatives at Northwest Field; and (6) other information available to us. A complete administrative record is on file in our office. This response is in accordance with section 7 of the Endangered Species Act of 1973 (Act), as amended (16 U.S.C. 1531 *et seq.*).

Project Description

The original Beddown Project consisted of relocating the Rapid Engineer Deployable Heavy Operations Repair Squadron (Red Horse) and its Silver Flag training unit, the Pacific Air Force (PACAF) Security Forces Commando Warrior training program, and the Combat Communications squadron to AAFB. As part of this relocation, an administrative area, Field Training Exercise (FTX) site, and bivouac area will be constructed in the Northwest Field area of the base and utilized for these training programs. Approximately 116 acres (47 hectares) of vegetation will be cleared for the construction of facilities, roads, a Defensive Fighting Position line, entry control points, base defense operations centers, sector command posts, and a bivouac training area. See the informal consultation for a full description of the original Beddown Project (Service File No. 2006-I-0281).

The first reinitiation was necessary as the size of the project footprint was underestimated and did not include infrastructure to support the military working dog facility and Commando Warrior Military Operations in Urban Terrain facility (Service File No. 2009-I-0112). These activities resulted in the additional removal of 2.6 acres (1.1 hectares) of habitat within the Guam National Wildlife Refuge Overlay.

The second reinitiation was requested to accommodate further changes to the project description. The proposed size of the original Small Unit Training, Two Individual Tactics and Training Lanes, and The Base Defense Operations Control Facility (BDOCF) areas were too small to meet the minimum requirements for troop training. A utility corridor was also needed for the BDOCF for a communications line. Therefore, additional land use was necessary. The proposed changes in this reinitiation increased the loss of habitat within the Guam National Wildlife Refuge Overlay by approximately 0.9 acres (0.4 hectares).

The third reinitiation is necessary as the project description has been slightly modified again. The proposed expansion of the bivouac training area originally removed 15 acres of vegetation to the west of the existing Red Horse quarry area. According to the map on Page 3-43 in the Environmental Assessment, approximately 1.9 acres (0.8 hectares) directly west of the quarry was to be left intact. Vegetation in the area has since been removed to expand existing quarry operations. Therefore, the bivouac footprint has been modified to be 13.1 acres (5.3 hectares) of vegetation and the quarry expanded by 1.9 acres. The proposed project will offset the habitat loss from the quarry expansion by excluding the removal of 1.9 acres on the western boundary of the proposed bivouac training area. The vegetation communities of both plots are secondary limestone forest, dominated by *Vitex pariflora*. The proposed changes in this reinitiation will result in an equal exchange of land (i.e., 1.9 acres lost to the quarry and 1.9 acres of land will remain intact that was previously authorized for removal) within the Guam National Wildlife Refuge Overlay.

TAKE PRIDE® IN AMERICA

Conservation Measures

The following conservation measures are designed to avoid or minimize effects to the bat and habitat for the bat, crow, kingfisher, and rail. These conservation measures are considered part of the project description. Any changes to, modifications of, or failure to implement these conservation measures may result in a need to reinitiate this consultation. All conservation measures identified in the prior Beddown Project informal consultations (Service File No. 2006-I-0281, 2009-I-0112, 2009-I-0294) will still be implemented as described in the prior consultations. No additional habitat will be removed that is not authorized. AAFB must check all boundaries prior to any clearing to ensure they are correct.

1. All construction work will begin just after dawn and will end prior to dusk, between the hours of 7:00 am and 4:00 pm. No activities will occur at night.

2. No new staging areas or access roads will be constructed. Existing roads and disturbed areas will be used.

3. No chemicals will be used on site.

4. No contamination (i.e., trash or debris disposal) or introduction of non-native species to adjacent terrestrial environments will result from project-related activities.

5. A litter-control program will be implemented during construction. All trash will be bagged and disposed of offsite at the end of each day.

6. All tools, gear, and construction scrap will be removed upon completion of work in order to prevent the attraction of non-native pests (i.e., rats).

7. All onsite personnel will receive instruction from AAFB environmental flight personnel regarding endangered species and brown treesnake (*Boiga irregularis*) and what to do in case of a sighting.

8. Native landscape vegetation will be planted on the facility's grounds at completion of the construction of the buildings. The contractor will select vegetation from the list of recommended vegetation provided by the Guam Department of Agriculture, Forestry Division.

9. A qualified biologist will survey the project site and a 150-meter buffer zone around the project site, each morning, prior to any vegetation clearing. If a roosting bat is present, workers will not conduct any activities, including vegetation removal within the 150-meter buffer radius until the bat leaves on its own volition.

10. Although not anticipated, if nesting crows are detected, workers will avoid the crows by 300 meters.

11. The presence of the bat or crow will be reported to the Service and the Guam Division of Aquatic and Wildlife Resources immediately, but the location of the bat or crow will not be revealed to any other outside party.

Species Affected
Bats utilize limestone and coastal forest and coconut plantations for foraging and roosting. Crows were known to use secondary, coastal, ravine, and agricultural forests, including coconut plantations for foraging and nesting. The forest located within Northwest Field provides essential habitat for the bat and crow. The action area and surrounding forest has been used for foraging and roosting of individual bats, and foraging and nesting of crows.

The project footprint includes and is surrounded by an area of forest that is essential to the survival and recovery of the bat, crow, kingfisher, and rail. Vegetation clearing contributes to and exacerbates the overall decline of essential habitat on AAFB. However, the conservation measures are designed to improve existing essential habitat for the bat, crow, kingfisher, and rail in nearby areas on AAFB and prevent the spread of non-native invasive species. Vegetation clearing will not occur within 150 meters of an individual bat or 300 meters of an individual crow to minimize affects from human disturbance to the individual.

Summary
Based on the above information, we have determined that not clearing 1.9 acres of habitat at the bivouac area for the 1.9 acres already cleared at Red Horse quarry may affect, but is not likely to adversely affect the Mariana fruit bat, Mariana crow, Guam Micronesian Kingfisher, or Guam rail. AAFB must contact our office prior to any new clearing and verbally discuss the measures implemented so that no unauthorized habitat removal occurs. Unless the project description changes, or new information reveals that the effects of the proposed action may affect a listed species or its habitat in a manner or to an extent not considered, or a new species or critical habitat is designated that may be affected by the proposed action, no further action pursuant to the Act is necessary.

If you have questions regarding this consultation, please contact Jodi Charrier, Fish and Wildlife Biologist, at 808-792-9400.

Sincerely,

Christa Russell

Subject: Biological Opinion for the Joint Guam Program Office Relocation of the U.S. Marine Corps from Okinawa to Guam and Associated Activities on Guam and Tinian

Dear Ms. Sumida:

This document represents the U.S. Fish and Wildlife Service's (Service) Biological Opinion (Biological Opinion) on the effects of the Joint Guam Program Office Relocation of the U.S. Marine Corps from Okinawa to Guam and related infrastructure construction and training actions on Guam and Tinian (JGPO) to the endangered and threatened species listed in Table 1. This Biological Opinion was prepared in accordance with section 7 of the Federal (Act) of 1973, as amended (16 USC 1531 *et seq.*). The U.S. Department of the Navy (DoN) was the designated lead Federal agency for this consultation. The DoN's January 4, 2010, request for formal consultation and a Biological Assessment were received on January 6, 2010. Actions by the U.S. Army (Army) and U.S. Air Force (Air Force), and interdependent actions by the Federal Highway Administration and the Army Corps of Engineers, outlined in the Project Description section of this Biological Opinion, are also addressed in this consultation. Training operations addressed in the Mariana Island Range Complex (MIRC) Biological Opinion (USFWS 2010, 96 pp.) which will not utilize new facilities developed as a result of the proposed action are not addressed in this Biological Opinion.

In addition, pursuant to the requirements identified in the Cooperative Agreement between the Air Force, DoN, and the U.S. Fish and Wildlife Service for the establishment and management of the Guam National Wildlife Refuge (U.S. Air Force and USFWS 1994, p. 6; DoN and USFWS 1994, p. 6), we have provided coordination regarding potential impacts to the Guam National Wildlife Refuge Overlay from the proposed project. This consultation reviews anticipated impacts to the listed species and their terrestrial habitats, including recovery habitat, on Guam and Tinian. In this consultation, recovery habitat is defined as the habitat that is currently suitable to support the recovery of listed species. Recovery habitat is defined separately for each species (see Status and Baseline section).

TAKE PRIDE® IN AMERICA

Table 1. Threatened and endangered species addressed in this Biological Opinion and their geographic occurrence within the action area.

Common Name	Scientific Name	Listing Status	Island Occurrence	
			Guam	Tinian
DoN Likely to Adversely Affect Determinations Reviewed				
Guam Micronesian kingfisher (sihek)	*Todiramphus [=Halcyon] cinnamominus cinnamominus*	Endangered	Historical	
Guam rail (koko)	*Gallirallus owstoni*	Endangered	Historical	
Mariana common moorhen (pulattat)	*Gallinula chloropus guami*	Endangered	Current	Current
Mariana crow (aga)	*Corvus kubaryi*	Endangered	Current	
Mariana fruit bat (fanihi)	*Pteropus mariannus mariannus*	Threatened	Current	Current
DoN Not Likely to Adversely Affect Determinations Reviewed				
Mariana swiftlet (chachaguak)	*Aerodramus bartschi*	Endangered	Current	
Micronesian megapode	*Megapodius laperouse*	Endangered	Historical	Current
Green turtle (green sea turtle)	*Chelonia mydas*	Threatened	Current	Current
Hawksbill turtle (hawksbill sea turtle)	*Eretmochelys imbricata*	Endangered	Current	Current

Your January 4, 2010, letter, as updated by your staff (Cobb, pers. comm. 2010a, Cobb, pers. comm. 2010b), requested our concurrence with your determination that the subject action is not likely to adversely affect the Mariana swiftlet, the Micronesian megapode, the green turtle, or the hawksbill turtle (collectively referred to as sea turtles) pursuant to section 7 of the Act. Our assessments of project impacts to these species are addressed in the Not Likely to Adversely Affect Review section of this document.

This Biological Opinion is based on information contained in the Biological Assessment (DoN 2010a, 268 pp. plus Appendices) and other sources cited herein. A complete decision record for this consultation is on file at the Service's Pacific Islands Fish and Wildlife Office.

1.0 CONSULTATION HISTORY

August 15, 2007. DoN and Service biologists met to discuss the possible DoN training in the northern Marianas Islands to include: Saipan, Tinian, Rota, Pagan and Agiguan. Discussions included the need for baseline information on the listed species on these islands and how those surveys would be accomplished.

September 21, 2007. A meeting was held at the Service's Pacific Islands Fish and Wildlife Office with DoN to discuss the proposed project and MIRC training issues.

February 8, 2008. Agency meeting with Environmental Protection Agency, National Marine Fisheries Service and the Service to discuss the National Environmental Policy Act (NEPA) process for this project and the issues that should be included in their Draft Environmental Impact Statement (DEIS).

February 12, 2008. At a JGPO Partnering Session on Guam, the DoN (Vanessa Pepi, Joe Hautzenroder, and Karen Sumida), Service (Earl Campbell, Michael Molina and Patrice Ashfield), Marines (Mary Hassel) and the DoN's consultant (Ed Lynch) met to discuss the brown treesnake (*Boiga irregularis*) issue and the responsibilities of the DoD to ensure proper snake interdiction.

March 28, 2008. The Service received a request from the DoN to initiate informal consultation on the proposed action.

May 2, 2008. The Service sent a letter to the DoN initiating informal consultation for the proposed action, confirming the species list, and providing additional information.

July 7, 2008. There was a DoN-sponsored JGPO Master Plan presentation by Marvan Wakabayashi with Holly Herod, Earl Campbell and Patrice Ashfield (Service) and Vanessa Pepi (DoN) in attendance.

January 7, 2009. Earl Campbell, Patrice Ashfield and Holly Herod (Service) met with Scott Vogt and Vanessa Pepi (DoN) and Glenn Metzler and Rick Spaulding (DoN contractors) regarding biological surveys and JGPO. At this meeting it was stated that temporary housing was part of the action.

March 3, 2009. DoN (Lisa Fiedler and Vanessa Pepi) and Service (Earl Campbell, Holly Herod and Patrice Ashfield) met to discuss the DEIS and Lisa asked for "show stoppers." Patrice commented on the need for a brown treesnake biosecurity plan prior to initiation of consultation. We also discussed impacts to habitat on Tinian and a restoration ratio of 4:1 was recommended to the DoN to offset their impacts to an already existing mitigation site.

November 17, 2009. The Service received a draft copy of the Biological Assessment for the proposed project for preliminary review.

November 25, 2009. Holly Herod (Service), Vanessa Pepi, Coralie Cobb (DoN) and Andrea VonBurg Hall (DoN contractor) met to discuss the consultation and specifically reviewed: previous consultations; the DEIS; initiation timelines; ongoing DoD projects; lack of conservation measures in the biological assessment; and tracking for mitigation and conservation measures.

December 7, 2009. Holly Herod (Service) held meeting with Vanessa Pepi (DoN) and Coralie Cobb (DoN) to discuss the consultation, specifically: updates on the DEIS review as applicable to the formal consultation and future meeting schedules.

December 8-10, 2009. Holly Herod (Service) sent emails to Coralie Cobb (DoN) containing comments on the draft Biological Assessment.

December 17, 2009. Holly Herod (Service) met with Coralie Cobb (DoN) to discuss the guidance for the proposed project and a framework for the analysis.

December 22, 2009. Holly Herod (Service) sent email to Coralie Cobb (DoN) containing suggestions for conservation measures, and Guam Micronesian kingfisher and Mariana crow habitat analyses. Holly Herod and Coralie Cobb met to discuss the status of the the proposed project consultation, specifically: the need for a definition of survival and recovery; existing habitat needed for recovery; conservation measures; inclusion of conservation measures for candidate species; and a resource map.

December 29, 2009. Holly Herod (Service) sent email to Coralie Cobb (DoN) containing draft definitions of habitat needed for survival and recovery of Guam Micronesian kingfisher and Mariana crow. Earl Campbell (Service), Daniel Clark (Service), Jeff Herod (DoN), and Vanessa Pepi (DoN) met to discuss the Service concerns with the DEIS, Micronesia Biosecurity Plan, and biosecurity.

January 6, 2010. The DoN formally requested initiation of formal consultation on the proposed action and provided a final Biological Assessment, dated January 2010, to the Service. Coralie Cobb (DoN) sent email to Earl Campbell (Service) to discuss invasive species for the Guam Military relocation on Tinian. Holly Herod (Service) met with Coralie Cobb (DoN) and Kristine Kutscher (contractor DoN) to discuss the initiation and the proposed project status, specifically: initiation of formal consultation; scheduling meetings for invasive species discussions; conservation measures; changes to the project footprint to minimize impacts; and mapping of recovery habitat.

January 11, 2010. Holly Herod (Service) sent an email to Coralie Cobb (DoN) requesting clarification regarding the construction of a stormwater pond for the decontamination training.

January 12, 2010. Coralie Cobb (DoN) sent multiple emails to Holly Herod (Service) containing responses to biological assessment comments and questions, additional questions, and impacts to recovery habitat. Coralie Cobb, Kristine Kutscher (DoN), Fred Amidon (Service) and Holly Herod met to discuss the status of the consultation, specifically: the Service requested a new project map to facilitate review; the need for a review of the classified portion of the DEIS;

comments on the DEIS as they relate to the section 7 consultation; and recovery habitat needs. Coralie Cobb, Kristine Kutscher, Jeff Herod (DoN) and Earl Campbell (Service) met to discuss invasive species issues pertaining to the biological assessment.
January 13-25, 2020. Holly Herod (Service) and Coralie Cobb (DoN) exchanged multiple emails regarding maps, timeline, the Biological Assessment and the Guam International Raceway.

February 1, 2010. Holly Herod (Service) sent Vanessa Pepi (DoN) an email to alert DoN that illegal action may be occurring at the "Detachment 5 Quarry" on Andersen Air Force Base. Anne Brooke (DoN) sent Holly Herod (Service) email confirming situation at "Detachment 5 Quarry AAFB" was being investigated.

February 2, 2010. Holly Herod (Service) reviewed the classified portion of the DEIS as it pertains to the section 7 consultation. Holly Herod met with Vanessa Pepi (DoN), Coralie Cobb (DoN), and Kristine Kutscher (DoN contractor) to discuss recovery habitat thresholds and the DoN policy for reintroduction of listed species. Coralie Cobb (DoN) sent Holly Herod (Service) an email containing additional clarification regarding the biological assessment

February 5, 2010. The Service sent a letter to the DoN acknowledging initiation of formal consultation on the proposed action. In addition, Coralie Cobb (DoN) informed Holly Herod (Service) that the DoN had modified its effects determination for the Mariana common moorhen from "no effect" to "not likely to adversely affect."

February 8-9, 2010. Holly Herod (Service) sent Coralie Cobb (DoN) multiple emails requesting clarification for: training and construction actions at Tinian, Route 15 ranges; main cantonment Naval Base Guam; Naval Munitions Site; Andersen Main Base; Northwest Field; general training on Guam; and clarification questions regarding the commercial port.

February 9, 2010. Coralie Cobb (DoN) sent Holly Herod (Service) email containing a revised project description for Naval Base Guam and Tinian training.

February 10, 2010. Holly Herod (Service) sent Coralie Cobb (DoN) emails requesting clarification regarding construction at: general locations on Guam, Andersen South, Route 15, Andersen Main Base, and Northwest Field. Holly Herod met with Coralie Cobb and Kristine Kutscher (DoN contractor) to discuss the status of the proposed project, specifically: additional information needed; conservation measures; and mapping of the proposed action within recovery habitat. Earl Campbell (Service), Josh Fisher (Service), Coralie Cobb (DoN), Jeff Herod (DoN), and Kristine Kutscher (DoN contractor) met to discuss biosecurity aspects of the project.

February 11, 2010. Holly Herod (Service) met with Vanessa Pepi, Coralie Cobb, and Kyle Fujimoto (DoN) to go over Service concerns with the classified portion of the DEIS and discuss language that could be incorporated in to the unclassified biological opinion.

February 12, 2010. Holly Herod (Service) and Coralie Cobb (DoN) met to define details and timelines for conservation measures for the proposed project. Earl Campbell and Josh Fisher (Service) discussed biosecurity aspects of the project with Jeff Herod (DoN) via conference call.

February 17, 2010. Holly Herod (Service) emailed Coralie Cobb (DoN) a request for clarification of additional conservation measures within the biological assessment and an update of additional conservation measures and interrelated, interdependent, and cumulative effects. February 18, 2010. Holly Herod (Service) and Coralie Cobb (DoN) met to review the proposed project status. The DoN provided a revised map of project footprint in recovery habitats. The Service also requested security fence variances similar to those proposed for the anti-terrorism, force protection fence for Andersen Air Force Base. Coralie Cobb provided draft information regarding the cumulative impacts.

February 19, 2010. Holly Herod (Service) asked Coralie Cobb (DoN) if aviation training could be moved from the Talafofo basin to the Ugum basin. Vanessa Pepi (DoN) emailed Holly Herod (Service) a draft version of the interrelated, interdependent, and cumulative effects analysis. Coralie Cobb (DoN) emailed additional information.

February 21, 2010. Coralie Cobb (DoN) emailed Holly Herod (Service) concurrence for pre-construction surveys for Mariana common moorhen for applicable road projects on Guam.

February 22, 2010. Coralie Cobb (DoN) emailed Holly Herod (Service) additional information regarding the Andersen South training; Naval Munitions Site, Main Cantonment, and Naval Base Guam construction project descriptions. Holly Herod emailed Vanessa Pepi (DoN) to request additional clarification regarding the commercial port and invasive species conservation measures. Jeff Herod (DoN) provided a response regarding existing invasive species measures at the commercial port. Holly Herod met with Coralie Cobb to review the consultation status, specifically: the Service requested a presentation regarding the project description and conservation measures as it relates to invasive species; issues with the commercial ports, and wetland impacts on Tinian.

February 23, 2010. Vanessa Pepi (DoN) sent multiple emails regarding population counts of Mariana fruit bat at Pati Point, Guam.

February 23-25, 2010. Holly Herod (Service) emailed Coralie Cobb (DoN) draft summaries of species status, baseline, and conservation measures for sea turtles; Micronesian megapode; Mariana common moorhen; Mariana swiftlet; a habitat analysis for *Serianthes nelsonii*, and information concerning the Mariana eight-spot butterfly, a candidate species. Holly also requested additional information for the outdoor recreation area and clarification of the preferred alternative for firing ranges on Tinian. Earl Campbell (Service), Jeff Herod (DoN), Coralie Cobb, and Kristine Kutscher (contractor DoN) met to discuss biosecurity issues related to the formal consultation.

February 24-25, 2010. Coralie Cobb (DoN) sent multiple emails to Holly Herod (Service) to: indicate that wetlands on Tinian could be avoided during construction and pre-construction surveys would be implemented; provide clarification on the Andersen South project description, Guam landfill and other non-action area specific projects; the Army Missile Defense Task Force; Northwest Field; and Naval Munitions Site project description. Information was also provided for the Ecological Reserve Area at Ritidian Point and Almagosa Springs.

February 26, 2010. Coralie Cobb (DoN) sent multiple emails to Holly Herod (Service) to provide information regarding the outdoor recreation area; Andersen South; Route 15; and a table quantifying impacts to recovery habitat. Coralie Cobb and Holly Herod exchanged emails regarding the location of the Tinian firing ranges. Coralie Cobb and Kristine Kutscher (DoN contractor) attended a meeting with Holly Herod to review project status. At the meeting the DoN provided the Service with official statements regarding interrelated, interdependent, and cumulative impacts; a list of documents regarding biosecurity and invasive species, and an electronic copy of all these documents.

February 28, 2010. Holly Herod (Service) sent multiple emails to Coralie Cobb (DoN) regarding: habitat impact assessment for Guam Micronesian kingfisher and Mariana crow; the follow up items from the February 26 meeting; and a revised draft of the introduction, consultation history, project description. Coralie Cobb emailed Holly Herod official positions related to the ports, invasive species, and conservation measures to address invasive species risk.

March 1, 2010. Holly Herod (Service) emailed Coralie Cobb (DoN) indicating that the DoN official position for the ports does not address all the risks from the proposed project to listed species. Holly Herod and Coralie Cobb met to gain understanding of the positions of both agencies. Coralie Cobb provided additional information via email. Fred Amidon (Service) exchanged emails with Rick Spaulding (contractor DoN) regarding the status of Mariana swiftlets and Mariana crow data.

March 2, 2010. Fred Amidon (Service) provided Coralie Cobb (DoN) with GIS shapefiles of recovery habitat for the Guam Micronesian kingfisher, Mariana crow, and Mariana fruit bat. Coralie Cobb (DoN) provided Holly Herod (Service) edits to the conservation measures.

March 3, 2010. Coralie Cobb (DoN) emailed Holly Herod (Service) information regarding worker housing, permits, and the DoN feral animal policy. Holly Herod, Coralie Cobb, and Kristine Kutscher (DoN contractor) met to discuss endangered species reintroduction language, candidate species, and invasive species risks at the ports.

March 4, 2010. Coralie Cobb (DoN) emailed Holly Herod (Service) the invasive species meetings consultation history to date; information regarding Andersen Main Base, Northwest Field, and the Route 15 Range complex; and candidate butterfly information.

March 5, 2010. Coralie Cobb (DoN) emailed Holly Herod (Service) with an update on the commercial ports. Holly Herod emailed Coralie Cobb to alert the DoN that a new revision to the Guam Micronesian kingfisher recovery habitat analysis was completed which indicated that the threshold for habitat loss has been exceeded.

March 6, 2010. Coralie Cobb (DoN) emailed Holly Herod (Service) edits to the draft project description and draft conservation measures.

March 8, 2010. Kristine Kutscher (DoN contractor) emailed Holly Herod (Service) the Route 15 Range complex project description. Vanessa Pepi (DoN), Anne Brooke (DoN), and Holly Herod (Service) exchanged emails regarding Area 50.

March 9, 2010. Holly Herod (Service) emailed Russell Littlejohn (Air Force) regarding the size of the Artero property. Holly Herod (Service) emailed Coralie Cobb (DoN) a revised impact assessment for the Mariana crow and Guam Micronesian kingfisher to account for cumulative impacts. Coralie Cobb provided Holly Herod with a summary of the proposed Ecological Reserve Areas.

March 10, 2010. Holly Herod (Service) emailed Coralie Cobb (DoN) maps depicting recovery habitat for the Guam rail and *Serianthes nelsonii* and a table of habitat available. Holly Herod emailed Coralie Cobb to indicate that a cumulative impact analysis may need to be completed for the Guam rail and request ungulate fencing to finish the antiterrorism-force protection fence from Andersen Air Force Base down through the Guam National Wildlife Refuge and from the Base down to the ocean by the Anao Conservation Area.

March 11, 2010. Holly Herod (Service) met with Coralie Cobb (DoN) to go over the project description and conservation measures. Coralie Cobb requested additional information regarding the Guam Micronesian kingfisher recovery habitat analysis. Coralie Cobb, Vanessa Pepi (DoN), and Jeff Herod (DoN) presented the project description and conservation measures (to date) to the Service (Earl Campbell, Loyal Mehrhoff, Marilet Zablan, Patrice Ashfield, Dawn Greenlee, Jodi Charrier, Gina Shultz, Pat Sousa, and Holly Herod).

March 12, 2010. Jeff Herod (DoN) provided information to Patrice Ashfield (Service) and Earl Campbell (Service) regarding inspection and quarantine practices currently implemented by the DoN. Holly Herod (Service), Dawn Greenlee (Service), and Coralie Cobb (DoN) met to finish reviewing the project description, conservation measures, and preliminary effects analysis for the draft biological opinion. Dawn Greenlee (Service) emailed Coralie Cobb (DoN) an example of a forest restoration that would also serve as a fuelbreak and provided telephone conversation records regarding shipping routes from Guam. Holly Herod (Service) emailed Coralie Cobb (DoN) the peer review comments related to the Guam Micronesian kingfisher and Guam rail recovery habitat analyses.

March 15, 2010. Russell Littlejohn (Air Force) emailed Holly Herod (Service) the Air Force position regarding the Artero property. Holly Herod (Service) emailed Coralie Cobb (DoN) methods used to calculate the number of juvenile Guam Micronesian kingfishers needed to support recovery goals. Holly Herod (Service) requested a copy of the March 11, 2010, presentation from Coralie Cobb (DoN). Coralie Cobb emailed Holly Herod regarding the potential use of tracers.

March 16, 2010. Holly Herod (Service) forwarded shapefiles of the Guam rail recovery habitat to Coralie Cobb (DoN). Holly Herod sent multiple emails to Coralie Cobb a list of outstanding issues for the consultation; providing a biological opinion completed for another species that was extirpated in the wild; and requesting the GIS shapefiles for the proposed project footprint.

March 17, 2010. Holly Herod (Service) emailed Coralie Cobb a second list of outstanding issues for the consultation and provided a revised preliminary draft of the project description and conservation measures for review and comment. Holly Herod also emailed Coralie Cobb and Vanessa Pepi (DoN) to gauge interest in a recovery crediting type program for Mariana fruit bat

and Mariana crow habitat on Guam. Rick Spaulding (contractor, DoN) provided the Service with line, point, and polygon GIS shapefiles of project components.

March 31, 2010. Dawn Greenlee, Fred Amidon, and Marilet Zablan (Service) met with Coralie Cobb and Angela Anders (DoN) to discuss Guam Micronesian kingfisher recovery habitat requirements.

April 1, 2010. Kerry Wells (DoN contractor) provided Dawn Greenlee (Service) with GIS polygons delineating areas within which vegetation clearing may occur as a result of DoD construction projects. Dawn Greenlee (Service) corresponded with Victor Torres (GIS Manager, Bureau of Statistics and Plans, Office of the Governor of Guam) and Victor provided the Service with GIS data layers delineating current land use zoning for northern and central Guam in addition to an image depicting land use zoning in southern Guam.

April 4, 2010. Dawn Greenlee (Service) sent Coralie Cobb (DoN) estimates of anticipated habitat loss based on civilian development information received from the DoN and Government of Guam and an assessment of wildfire impacts based on an analysis of historical aerial photographs.

April 6, 2010. Dawn Greenlee, Earl Campbell, Patrice Ashfield (Service) met with Coralie Cobb (DoN) to discuss biosecurity aspects of the project. Dawn Greenlee and Coralie Cobb also met to further refine estimates of ongoing development and wildfire impacts to forest habitats.

April 7, 2010. The Service sent a letter to the DoN discussing the status of this consultation and concerns regarding biosecurity measures and loss of recovery habitat on Guam likely to be caused by the proposed action. Coralie Cobb (DoN) sent Holly Herod (Service) email concerning duration of road and bridge construction from Federal Highways Administration projects due to the proposed project. Holly Herod (Service) met with Coralie Cobb and Kristine Kutscher (DoN contractor) to discuss the status of the proposed project, specifically: new DoD projects; reiteration of the need for reintroductions on DoD lands; interrelated actions; and footprints of proposed magazines.

April 7, 2010. The Service provided a letter to the DoN to acknowledge that at the conclusion of the 90-day formal consultation period, two aspects of the project, biosecurity and recovery habitat loss, require additional refinement.

April 8, 2010. Coralie Cobb (DoN) provided Dawn Greenlee (Service) with information regarding anticipated future non-project related population growth on Guam.

April 12, 2010. Kerry Wells (DoN contractor) provided Dawn Greenlee (Service) with GIS data delineating anticipated project-related noise levels. Dawn Greenlee (Service) forwarded information from Earl Campbell (Service) regarding recommended brown treesnake interdiction measures for the ports of Guam and for receiving ports.

April 14, 2010. Dawn Greenlee (Service) forwarded information from Earl Campbell (Service) regarding recommended brown treesnake interdiction measures for Guam and receiving ports.

April 16, 2010. The Service sent a letter informing the DoN that increased transportation through Guam ports without adequate brown treesnake interdiction could adversely affect listed species in the CNMI, Hawaii, and the continental United States. The letter outlined biosecurity measures to minimize the range and scope of project impacts to listed species. In addition, the letter summarized the Service's preliminary analysis of project impacts to recovery habitat and made mention of interagency progress to finalize language describing future reintroduction of listed species to DoD lands.

April 21, 2010. Dawn Greenlee (Service) received a revised Project Description from Coralie Cobb (DoN) which incorporated revisions to the approximately 30 items the DoN and Service had been coordinating on during the 90-day formal consultation period. The brown treesnake interdiction measures recommended in our April 16, 2010, letter were not incorporated into the Project Description.

April 28, 2010. Dawn Greenlee (Service) transmitted modifications to the DoN's endangered species reintroduction paragraph of the Project Description to Coralie Cobb (DoN) for the DoN's consideration. Fred Amidon (Service) and ornithologist Dylan Kesler (University of Missouri) completed their correspondence regarding data upon which the Service's Guam Micronesian kingfisher recovery habitat assessment is based.

May 13, 2010. Loyal Mehrhoff, Gina Shultz, Marilet Zablan, Patrice Ashfield, and Larry Salata (via telephone) (Service) met with Captain Chandler, Coralie Cobb, Vanessa Pepi and their staff (DoN) to discuss brown treesnake interdiction for project-related induced population growth on Guam. The Service informed DoN that the Pacific Islands Fish and Wildlife Office's preliminary analysis indicated project impacts may appreciably reduce the likelihood of both the survival and recovery of at least four species in addition to adversely impacting critical habitat on Rota and Oahu. The Service provided DoN with information regarding measures (Reasonable and Prudent Alternatives) that would avoid such brown treesnake effects.

May 21, 2010. Via conference call, DoN (Donald Schregardus, Ronald Borro, and others), the U.S. Department of Interior (Eileen Sobeck), the Service (Mike Roy, Loyal Mehrhoff, Barbara Maxfield, Marilet Zablan, Earl Campbell, Patrice Ashfield, Dawn Greenlee, Ken Foote), and the Council for Environmental Quality (Horst Greczmiel) discussed incorporation of addition of brown treesnake interdiction measures to minimize potential project impacts to listed species in the CNMI, Hawaii, and continental United States. DoN requested that the Service postpone issuance of the draft Biological Opinion to enable development and incorporation of additional biosecurity measures into the project.

May 28, 2010. Dawn Greenlee (Service) transmitted the latest version of the Project Description to Coralie Cobb (DoN) for DoN to review and refine.

June 17, 2010. Via email and telephone, the DoN (Donald Schregardus), Council for Environmental Quality (Horst Greczmiel), U.S. Department of Interior (Eileen Sobeck), and Service (Loyal Mehrhoff) agreed upon a conceptual framework for the DoN's implementation of brown treesnake interdiction.

June 21, 2010. Dawn Greenlee (Service) received an updated Project Description from Coralie Cobb (DoN). The brown treesnake interdiction language in the Project Description was inconsistent with the conceptual framework agreed upon via email on June 17, 2010.

June 24, 2010. The Service (Loyal Mehrhoff, Earl Campbell, and Dawn Greenlee) met with DoN (Coralie Cobb, Vanessa Pepi, and Jennifer Farley) to discuss the brown treesnake interdiction aspect of the proposed project.

June 29, 2010. Loyal Mehrhoff (Service) emailed Coralie Cobb and Vanessa Pepi (DoN) an assessment of outstanding aspects of the Project Description and the status of the Biological Opinion.

July 2, 2010. The Service (Loyal Mehrhoff, Earl Campbell, and Dawn Greenlee) met with DoN (Coralie Cobb and Patrick Chee) to refine the brown treesnake interdiction sections of the Project Description.

July 6, 2010. The Service (Loyal Mehrhoff, Earl Campbell, and Dawn Greenlee) met with DoN (Coralie Cobb) to refine the brown treesnake interdiction sections of the Project Description and to discuss modifications to the Project Description suggested by Guam Refuge Manager Joseph Schwagerl.

July 7 and 9, 2010. Coralie Cobb (DoN) discussed aspects of the DoN's proposed brown treesnake interdiction measures via telephone with Earl Campbell and Dawn Greenlee (Service).

July 12, 2010. Coralie Cobb (DoN) emailed the Project Description to the Service after incorporating brown treesnake interdiction aspects of the project finalized via telephone with Earl Campbell and Dawn Greenlee (Service). The Project Description did not include previously agreed-upon DoN funding of two biologists on Rota to conserve the Mariana crow and the Mariana fruit bat.

July 19, 2010. Dawn Greenlee (Service) emailed Coralie Cobb (DoN) to request additional information about DoN deletion of project funding Mariana crow and Mariana fruit bat conservation on Rota.

July 20, 2010. Coralie Cobb (DoN) emailed Dawn Greenlee (Service) to confirm DoN intends to delete the Rota biologist conservation measure.

July 29, 2010. The Service (Loyal Mehrhoff, Marilet Zablan, Earl Campbell, and Dawn Greenlee) met with the DoN (Karen Sumida, Coralie Cobb, Vanessa Pepi, and Jennifer Farley) to discuss the significance of the DoN's removal of funding for the two Rota biologists from the proposed project. In the meeting, DoN staff presented information indicating the duration of DoN implementation of a number of other long-term conservation measure may not be accurately described in the Project Description.

July 30, 2010. Karen Sumida (DoN) confirmed via email that the DoN would be unable to fund the Rota biologist positions for more than five years.

August 2, 2010. Loyal Mehrhoff (Service) responded to Karen Sumida's (DoN) email to provide alternatives to long-term funding of the two Rota biologists.

August 13, 2010. DoN (Don Chandler, Vanessa Pepi, Coralie Cobb, and Jennifer Farley) met with the Service (Loyal Mehrhoff, Marilet Zablan, Patrice Ashfield, Earl Campbell, and Dawn Greenlee) to refine the details of the DoN's assurance of funding for two biologists on Rota.

August 19, 2010. DoN (Coralie Cobb) provided the Service (Dawn Greenlee) with final modifications to the Project Description via email and telephone.

September 7, 2010. The Service provided the DoN with a Draft Biological Opinion.

2.0 BIOLOGICAL OPINION

2.1 PROJECT DESCRIPTION

In furtherance of an agreement with the Government of Japan, the DoN plans to relocate 8,000 Marine Corps personnel and 9,000 dependents from Okinawa to Guam by a target completion date of 2014. Additional facilities and infrastructure will be developed on Guam to accommodate berthing for a visiting aircraft carrier and an Army Air and Missile Defense Task Force. Additional military activities will take place on nearby Tinian Island, in the Commonwealth of the Northern Mariana Islands (CNMI). The relocation is estimated to temporarily increase Guam's population by approximately 79,000 (44%) by 2014. This number will decrease to about 33,000 residents after construction is completed (19% overall increase). Each component of the Proposed Action will require new and updated facilities and infrastructure improvements to support proposed training, operations, and quality of life. The project will be implemented as described in the "Biological Assessment of Potential Effects on USFWS-listed Species from Guam and Tinian Military Relocation" (DoN 2010a, 268 pp.) (Biological Assessment), the "Final Environmental Impact Statement/Overseas Environmental Impact Statement for Guam and CNMI Military Relocation: Relocating Marines from Okinawa, Visiting Aircraft Carrier Berthing, and Army Air and Missile Defense Task Force" (DoN 2010b, 10 vol.), and other correspondence in the administrative record for the proposed project, as refined in this Project Description.

The DoD has a long history of success in preventing the dispersal of the brown treesnake from Guam in its transport of personnel and cargo. After publication of the DEIS, various agencies within the U.S. Department of Interior (DoI) expressed concern regarding the adequacy of brown treesnake interdiction efforts in response to the relocation of Marine Corps forces to Guam. DoN agrees that it will fund the increase of current federally funded brown treesnake interdiction measures (in Guam, CNMI, and Hawaii) where the increase is related to direct, indirect and induced-growth caused by the Marine Corps relocation to Guam. That funding will continue and become part of the DoN's current brown treesnake interdiction funding under authority of the Brown Tree Snake Control and Eradication Act. The DoI agrees that it is not DoN's responsibility to fund increased interdiction measures that are identified more than one year after the end of the fiscal year in which both Marine Corps relocation construction undertaken to implement the proposed relocation decisions made in the Record of Decision (ROD) for the "Environmental Impact Statement/Overseas Environmental Impact Statement for Guam and CNMI Military Relocation: Relocating Marines from Okinawa, Visiting Aircraft Carrier Berthing, and Army Air and Missile Defense Task Force" has ended and the permanent non-transient Marine Corps military units relocated as a result of decisions made in that ROD have concluded their relocation to Guam. For the purposes of this Project Description, interdiction is defined as: "to hinder, prohibit, or prevent the brown treesnake from becoming established in new locations by conducting inspection and suppression processes."

The DoD will be using an adaptive project management approach to adjust the schedule for implementation of the various components of the Proposed Action. These adjustments are expected to reduce the peak population and other impacts currently identified for 2014 and spread some of these impacts into other years. This adaptive management approach may reduce

the magnitude of project effects, but is not expected to eliminate the project effects discussed in this Biological Opinion.

The Guam and Tinian training areas are currently used by the DoD for actions addressed in previous biological opinions such as the February 22, 2010, "Biological Opinion for the Mariana Islands Range Complex, Guam and the Commonwealth of the Northern Mariana Islands 2010-2015" (USFWS 2010, 96 pp.) (MIRC) and the October 3, 2006, "Biological Opinion on the Establishment and Operation of an Intelligence, Surveillance, Reconnaissance, and Strike Capability Project on Andersen Air Force Base, Guam" (USFWS 2006a, 73, 63 pp. + Appendix) (ISR Strike).

This Project Description outlines the construction and use of new facilities on Guam and Tinian as well as increased use of existing facilities. The Proposed Action will not conflict with prior section 7 consultations. Included in the proposed action are conservation measures that will be implemented to avoid and minimize impacts of facilities construction and operation to listed species.

2.1.1 CONSTRUCTION AND OPERATIONS ON GUAM INSTALLATIONS

Training areas, offices, housing, utility and road networks, and other facilities will be constructed and operated on the following properties on Guam: Andersen Air Force Base including the Northwest Field, Naval Munitions Site, Naval Computer and Telecommunications Station Finegayan, Naval Base Guam, Andersen South, Route 15 Range Complex and the Naval Munitions Site. Road and utility improvements will also be completed in areas adjacent to DoD installations. The footprint within which these DoD construction projects will be completed is shown in Figure 1. Construction projects are summarized by DoD property and measures that will be taken during construction in all areas are outlined.

<u>Construction Implementation at all Sites on Guam</u>

Construction will typically occur between 6 a.m. and 5 p.m. Heavy equipment will be used on project sites to clear and grade to prepare sites for building construction. Conservation measures including contractor education, inspection of construction equipment and supplies to ensure they are free of invasive species, and biological monitoring to ensure project impacts to listed species are avoided and impacts to their habitats do not occur outside of the designated project area (described in more detail in the conservation measures section of this Project Description) will be implemented.

Andersen Air Force Base

There are two airfields on Andersen Air Force Base: Andersen Air Force Base airfield with its north ramp and south ramp runways and Andersen Northwest Field. The proposed development will augment existing facilities and training areas on this installation. Wells and waterlines will be developed on Andersen Air Force Base to upgrade water capacity to provide potable water to the new facilities.

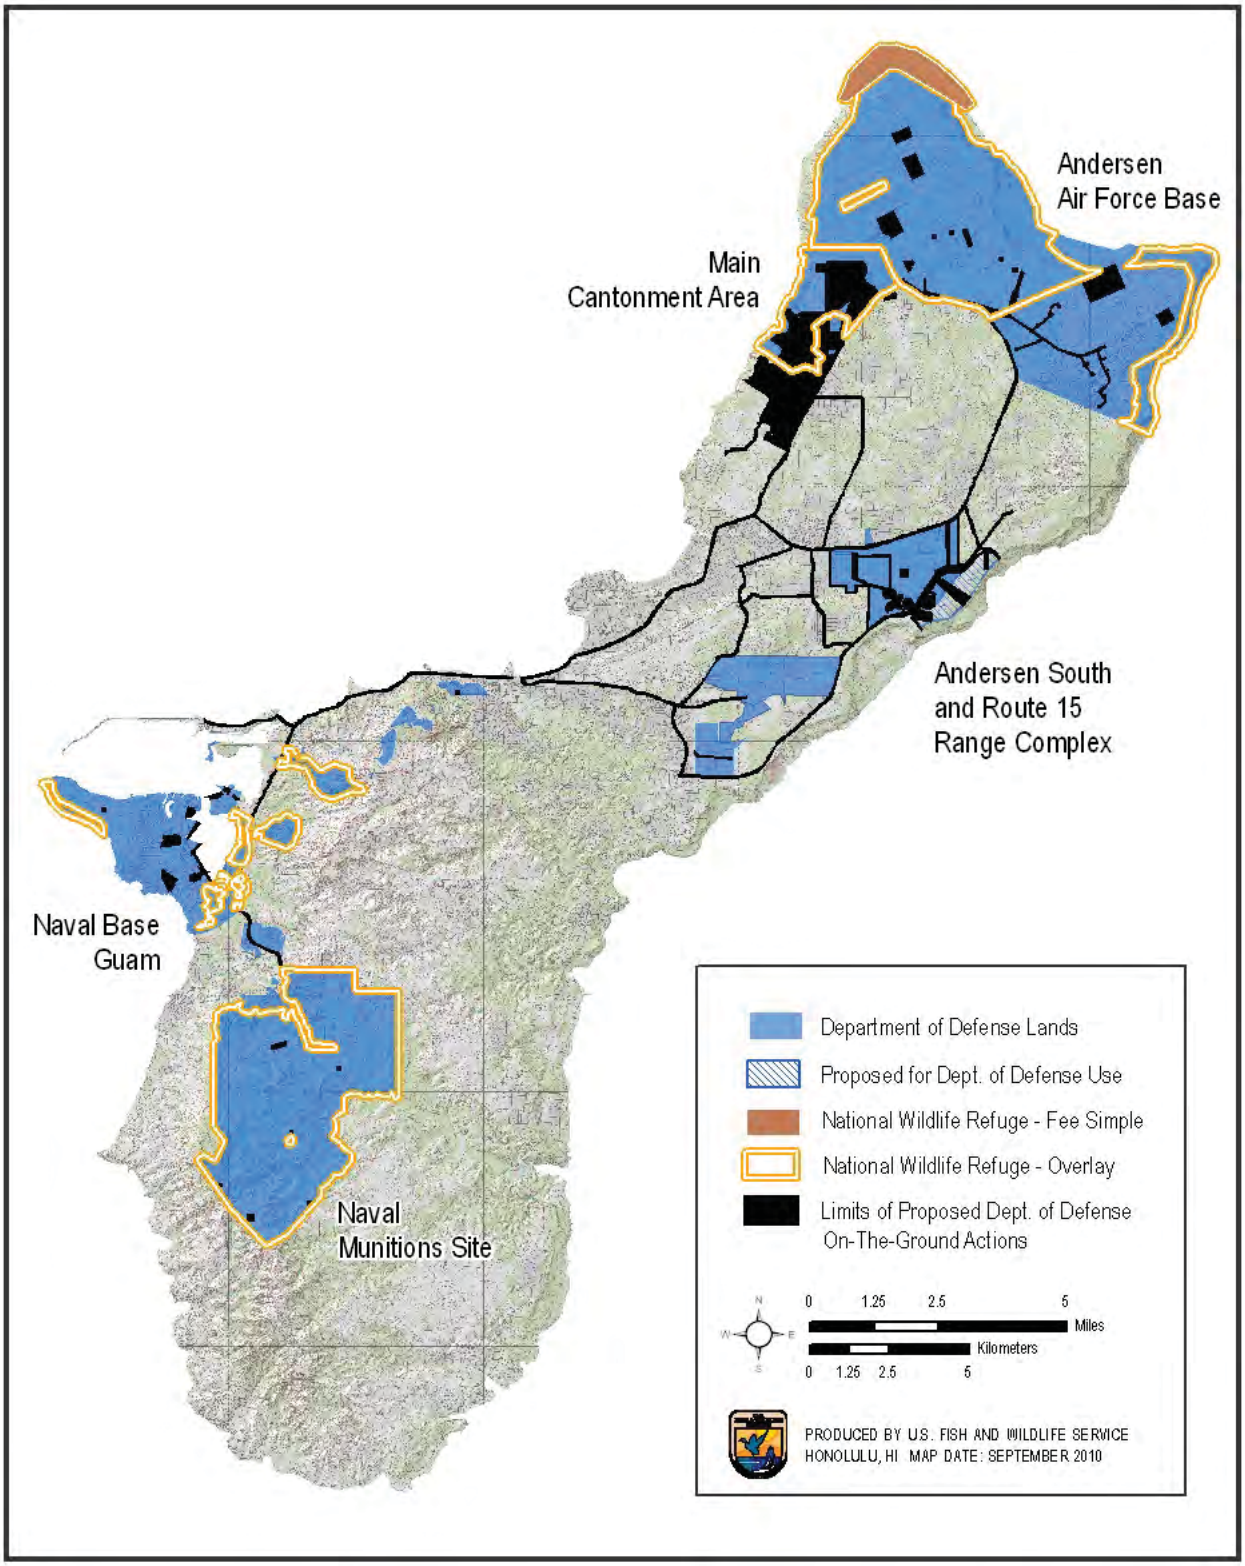

Figure 1. Location of proposed construction and infrastructure improvements on Guam.

Andersen Air Force Base Construction

Air combat element beddown facilities, an air mobility campus air embarkation location, earth-covered magazines, and associated buildings, a new north gate and access road with associated facilities, biosecurity facilities, water lines, and wells will be constructed (Figure 2). The U.S. Forest Service's 2002 vegetation map (U.S. Forest Service 2002) indicates the construction footprint for Andersen Main Base is approximately 7.5 acre (ac) (3.03 hectare (ha)) of primary limestone forest, 92 ac (37.1 ha) of disturbed limestone forest, 23.3 ac (9.41 ha) Scrub/Scrub-Forest, 9.7 ac (3.91 ha) Vitex-Closed Canopy/Sparse Canopy, 0.6 ac (.242 ha) of tangantangan and 254 ac (102.6 ha) of developed land. Of the project footprint within Andersen Main Base 230 ac (93.2 ha) is located within the Guam National Wildlife Refuge Overlay.

At Andersen Northwest Field, three Army missile defense task force weapons emplacement sites and eight earth-covered magazines will be developed. Missile defense task force facilities will be constructed within three fenced areas. The project footprint extends 30 ft (9.1 m) outside the fences because vegetation will be cleared in this area to provide for site security. Development of these sites will include construction of facilities and roads, and development of electromagnetic radiation hazard areas. Existing roads will be used to access the sites and utilities will be connected to the project site along already existing disturbed areas. A total of 129.1 ac (52.1 ha) is within the project footprint of the three weapons emplacement sites. The U.S. Forest Service's 2002 vegetation map (U.S. Forest Service 2002) indicates approximately 2.1 ac (0.8 ha) of limestone forest, 21 ac (8.5 ha) of disturbed limestone forest, 66 ac (27 ha) of scrub or scrub forest, 12 ac (4.8 ha) of *Vitex*-closed canopy or sparse canopy, 2.0 ac (0.8 ha) coconut grove, and 26 ac (11 ha) of developed lands are within the project footprint. One hundred and one ac (41 ha) are within the Guam National Wildlife Refuge Overlay.

One of the proposed weapons emplacement sites overlaps with a location known as "Area 50," which is a patch (42.2 ac, (17.1 ha)) of limestone forest and mixed limestone forest. Area 50 has been used in the past to examine reintroduction of Guam rail, ungulate removal, and brown treesnake suppression. The proposed project will infringe upon Area 50, and will remove approximately (13.2 ac, (5.3 ha)) of the mixed limestone forest. The Service and the DoN considered other alternatives for the locations of the weapons emplacement sites, including the three alternatives presented in the DEIS and a minor modification to the preferred alternative. All alternatives resulted in increased habitat loss and fragmentation over the existing preferred alternative. As a result of project development, only 28.5 ac (11.5 ha) of vegetation will remain undisturbed within Area 50.

A total of 12 earth-covered magazines will be constructed in the existing Andersen Air Force Base Munitions Storage Area 1 at Andersen Air Force Base: six of the new earth-covered magazines will support Marine Corps ground combat training occurring in the northern part of Guam and six will support the Air Combat Element operations at Andersen Air Force Base airfield. The earth-covered magazines will be sited to allow for storage and use of Class/Division 1.1 munitions at a minimum 250,000 lb net explosive weight. The earth-covered magazine will include 2,000-square-foot (ft) (186-square-meter (m)) physical capacity in addition to structural and protective features and earth covering. Each earth-covered magazine

will include two square 150-ft (46-m) wide concrete pads, both with an additional 50- by 100-ft (15- by 30-m) overhang developed areas.

Andersen Air Force Base Operations

The facilities constructed at Andersen Air Force Base north and south ramps will be used by 12 permanently stationed MV-22 helicopters and will accommodate the loading of additional transient aircraft listed in Table 2. These aircraft will conduct training and operational flights (sorties) including the following: field carrier landing practice, familiarization-instrument, Marine air ground task force, tactical air operations center, and routine operations, will occur in association with the air mobility campus and the air combat element. A training event consists of one aircraft performing a take-off, a training evolution, and a landing. These training operations will occur on airfields in current use by similar aircraft (Table 3) such as those addressed in the MIRC Biological Opinion (USFWS 2010, 96 pp.).

Table 2. Proposed aircraft loading (DoN 2010b, vol 2, p. 2-91).

Element	*Number*	*Type*
Permanent stationed: Rotary wing	12	PCS (12) MV-22 (Assault Transport)
Fixed wing	12	F/A-18
Transients: Rotary wing	12	MV-22 Transport (Osprey)
	3	UH-1 Multipurpose Utility (Huey)
	6	AH-1 Attack (Super Cobra)
	4	CH53E
Fixed wing	2	KC-130
	24	F/A-18
	4-6	F-4 (visiting Allied Forces)

Table 3. Anticipated total flight operations at Andersen Air Force Base resulting from previous projects with the addition of the proposed action (Czech and Kester 2008 as cited in DoN 2010b, vol 2, p. 2-91).

Aircraft Type	**Anticipated Total Aircraft Operations per Year Andersen Air Force Base**			
	Previously Addressed	**JGPO Project**	**Total**	**% Increase**
Helicopter	19,029	19,489	38,518	102%
Jet/Propeller	25,697	6,424	32,121	25%

The new air combat element facilities will be used for aircraft operations, maintenance of MV-22 tilt rotor aircraft, and training and support functions. The air combat element facilities will also be used for Marine air control group training. Marine air control group training involves coordination of air command, control, and defense units and the tactical air operations center. Training entails the operation of air traffic control radar and radio frequency emitters and facilities consisting of shelters, a portable tower, and electrical power sources. Tactical air operations center training involves the establishment and dismantling of these facilities within a

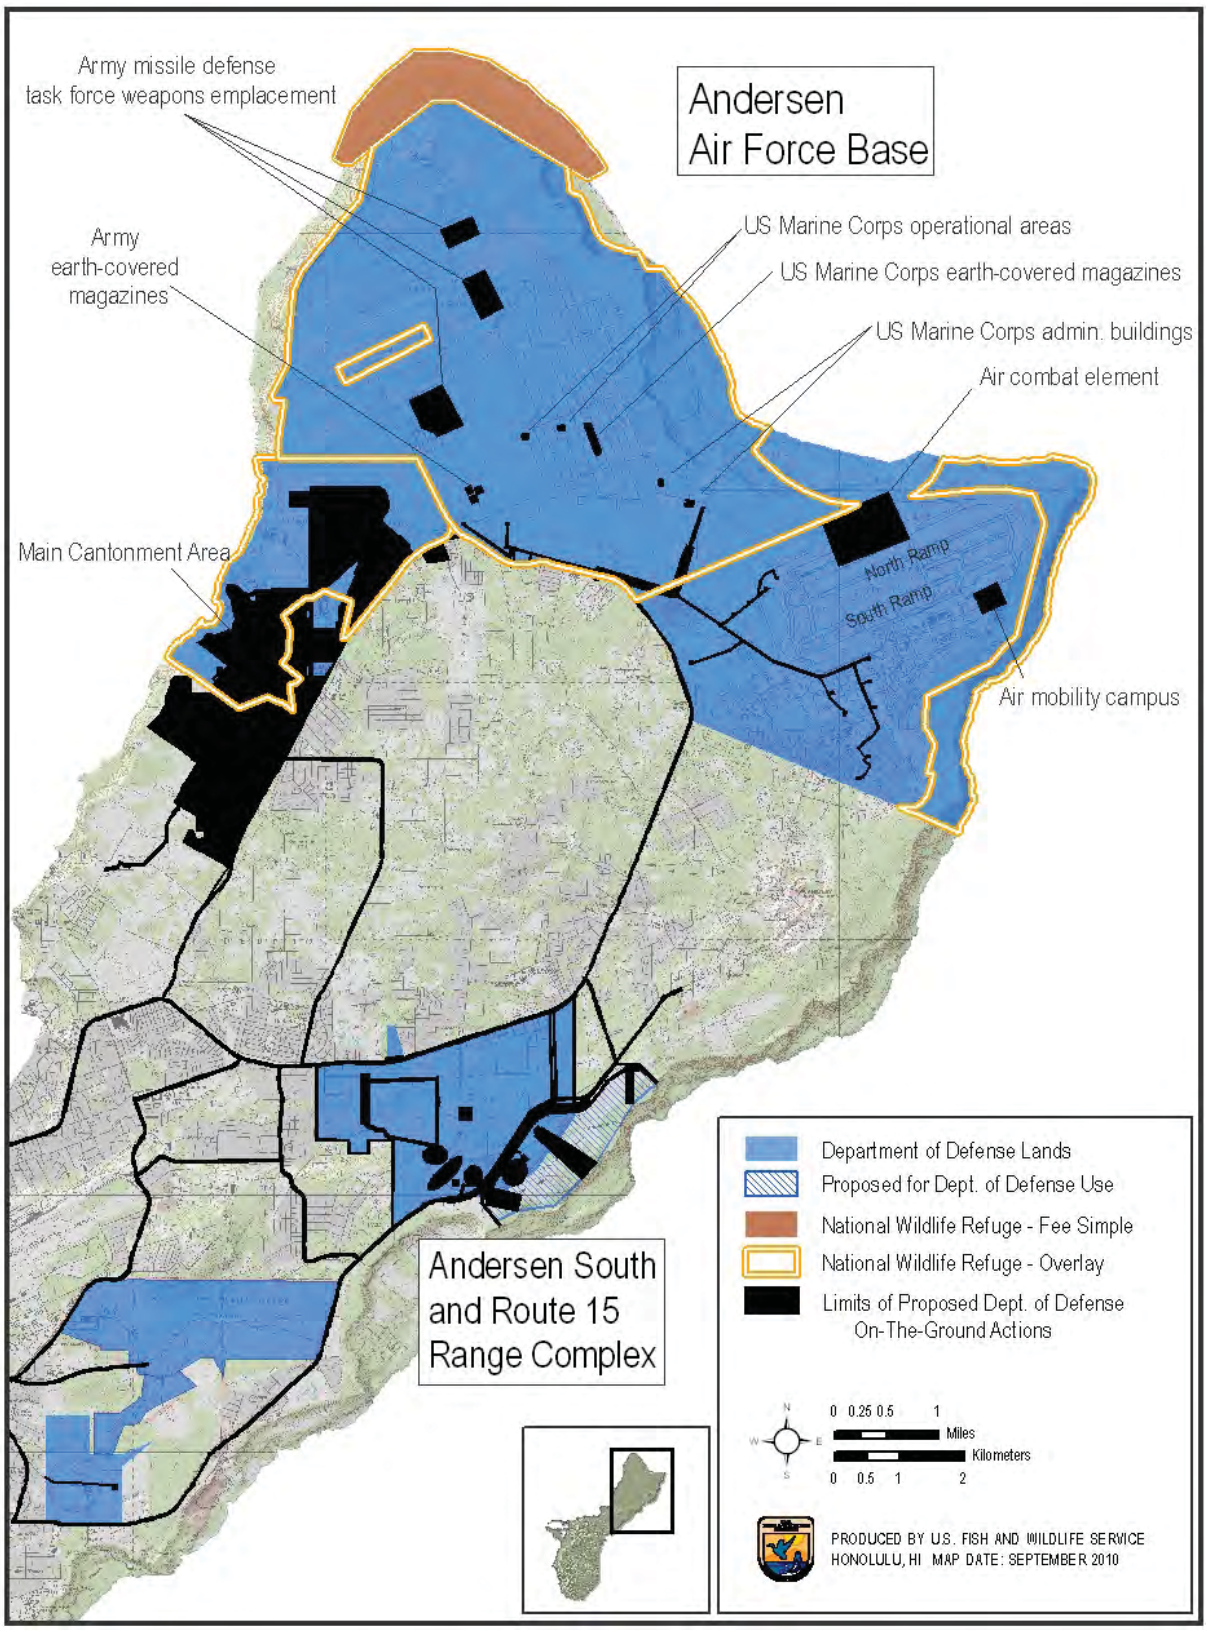

Figure 2. Project footprint at Andersen Air Force Base and other areas of northern Guam within which vegetation clearing will occur.

96-hour period. Training includes use of various emitters and sensors which need to be de-conflicted with other electronic equipment operating in the area. To minimize the constraints it puts on airspace availability, radar equipment, which generates strong electromagnetic radiation fields, will be operated for no more than one hour at a time. The air combat element beddown facilities will operate 24 hours per day and 7 days per week. Staffing levels will be contingent on surge and operational requirements of the air combat element facilities. Traffic will include government-owned vehicles, personal-owned vehicles, and shuttle buses from the proposed Main Cantonment area.

Approximately 1,000 annual field carrier landing practice and 79 familiarization-instrument flight events are proposed for Andersen Main Base. Field carrier landing practice operations entail one or more aircraft flying at a low altitude in almost circular patterns and involves landing on a simulated aircraft carrier during the day and, using night-vision goggles, at night. Familiarization-instrument training, including autorotation and simulated engine-out approaches will occur on the improved airfields with the support of aircraft rescue and fire fighting facilities. Rotary-wing aircraft operations will occur at the Andersen Air Force Base airfields and in various proposed training areas on Guam and Tinian. Fixed-wing aircraft operations will occur only in the immediate airfield environment of Andersen Air Force Base. Aircraft will then leave this area to conduct activities within established training areas of the MIRC or other locations as described under MIRC (USFWS 2010, 96 pp.). Air traffic at the air combat element beddown and North Ramp will include helicopter, vertical lift aircraft, fixed-wing, and unmanned aircraft arrivals and departures.

In addition, a new air embarkation site will be built to serve as the passenger terminal for Andersen Air Force Base and temporary cargo storage. Air embarkation and disembarkation refers to the loading and unloading of passengers or cargo to and from aircraft. The passenger facilities are comparable to those of a small airport: luggage handling, waiting area, and ticket and documentation area. Cargo is staged for loading to aircraft or disbursement to warehouses or individual commands. Currently the Air Force has air embarkation facilities at South Ramp of the airfield. Once the new facility is built, the existing facility will be closed. The site will operate 24 hours per day and 7 days per week.

Actions in the Northwest Field area of Andersen Air Force Base will include new training and Army Missile Defense Task Force activities. New training will occur in Northwest Field on existing runways, drop zones, and non-vegetated areas. Specifically, 125 confined area landing, 95 external load, 114 helicopter insertion- extraction, 1,000 field carrier landing practice, and 79 familiarization-instrument training will occur annually. Training associated with the Army Missile Defense Task Force will occur in Northwest Field. These actions will result in clearing of vegetation within the project footprint area as well as periodic generation of loud noise. The details of the Army Air and Missile Defense Task Force activities, such as frequency of noise generation are classified and therefore they are not presented in this Project Description.

The project will result in noise levels in excess of 60 dB over the Guam landscape. Northern Guam will be periodically exposed to noise levels in excess of 93 dB PK15. Peak sound levels are the calculated peak noise level, without frequency weighting, expected to be exceeded by 15 percent of all events that might occur.

Proposed Main Cantonment Area

The proposed Main Cantonment area will be constructed within the Naval Computer and Telecommunications Station Finegayan, the former Federal Aviation Administration (FAA) site, and the South Finegayan area.

Proposed Main Cantonment Area Construction
Headquarters, administrative support facilities, family housing, bachelor's quarters, temporary lodging, education facilities, quality of life facilities, base operations, maintenance facilities, warehouses, equipment and vehicle storage, hazardous material storage, engineer equipment and decontamination facility, field and classroom training ranges, an indoor small arms range, roads, gates, and utilities will be developed within 2,303 ac (932 ha) in the proposed Main Cantonment area.

A 450-ac (182-ha) outdoor recreation area will be established along the northern edge of the proposed Main Cantonment area, entirely within the Guam National Wildlife Refuge Overlay area. A picnic area will be developed within existing shrub and grassland habitat and a designated nature trail will be established and maintained. Approximately 385 ac (155.5 ha) within the outdoor recreation area are secondary limestone forest and 65 ac (26.3 ha) of shrub and grassland habitat (U.S. Forest Service 2002).

Proposed Main Cantonment Area Operations

Within the proposed Main Cantonment area, training will occur at the following facilities: battle staff training and simulation complex, combined arms staff trainer, Marine air ground task force integrated systems training center, audio-visual simulation training support facility, general purpose auditorium, obstacle and confidence courses, hand-to-hand combat pit, rappelling tower, gas chamber, combat training tank (pool), and the engineer equipment and decontamination station (DoN 2010a, p. 27-90). Training at these locations will occur at facilities constructed as part of the proposed action (see proposed Main Cantonment area construction above). Maneuver area training will occur at designated training areas within the proposed Main Cantonment area and will include crews (groups of two to three individuals), fire teams (smallest unit of infantry, typically four or fewer individuals; not having to do with fire starting or control), and squad drills (a group of 8 to 12 individuals) practicing gun drills (non-firing), formations, and camouflage. Limited training (i.e., compass navigation by fire teams) may occur within the outdoor recreation area.

Indoor Small Arms Range. The indoor small arms range, which is proposed to be located at Naval Computer and Telecommunications Station Finegayan, will be for 5.56 mm and 9 mm firing training. The facility will have no external surface danger zone and is treated for planning as a normal structure. This range will be used for pistol and M4 exercises. The range will also be suitable for scenario and combat shooting training, and for use by military police. Training conducted within the small arms range is indoor and will not result in additional impacts (beyond construction as described above) to listed species or their habitats and will not be analyzed within this Biological Opinion.

Andersen South and Route 15 Range Complex

Andersen South and the Route 15 Range complex are adjacent to each other on the northeastern coast of Guam. Approximately 921 ac (373 ha) of land east of Route 15 will be acquired for the development of the Route 15 ranges. The Guam International Raceway is located on a portion of the land.

Andersen South and Route 15 Range Complex Construction

The proposed project will result in the construction of a military operations in urban terrain training area, a portion of which will be a modular unit and another will be reconstructed from the existing unit; a logistics and administration area; a convoy course; an advanced motor vehicles operators course; an aviation training landing zone; an aviation and maneuver area landing zone; Pioneer Road; other range roads; a perimeter fence; main, secondary, and range road gates; and the realignment of Route 15 at Andersen South. The new firing range complex will be located adjacent to and east of Andersen South and Route 15. The complex will include perimeter security fencing; range access roads; range control towers; range maintenance buildings for administration, maintenance and storage, and automated target storage and maintenance; a breacher house; a shooting house; a known distance range; a pistol range; a square-bay range; an unknown distance range; a machine gun range; a hand grenade range; and a hand grenade house. Parking and utilities will also be within the project footprint of the Route 15 Range complex.

The construction footprint for both Andersen South and the Route 15 Range Complex is a total of 328.1 ac (132.6 ha) and consists of approximately 18.9 ac (7.6 ha) of primary limestone forest, 152.4 ac (61.6 ha) of disturbed limestone forest, 73.2 ac (29.6 ha) of shrub and grassland, 7.7 ac (3.1 ha) of tangantangan and 75.9 ac (30.7 ha) of developed land.

Andersen South and Route 15 Range Complex Operations

Convoy operations, maneuver training for military operations in urban terrain, and general maneuver and air-ground operations will vary, but may occur up to 5 days per week, 45 weeks per year, day and night. The maximum estimate is approximately 250 to 300 Marines will participate in maneuver training at Andersen South each week, for a total annual throughput of 11,250 to 13,500 Marines. Convoy operations will typically consist of 7 to 10 vehicles (e.g., high mobility multipurpose wheeled vehicles) traveling in tandem along an established course.

Military operations in urban terrain includes transporting units to Andersen South by helicopter or vehicle, maneuvering toward the military operations in urban terrain complex on foot or in vehicle, and engaging in integrated training at the military operations in urban terrain complex. Military operations in urban terrain at the reconstructed training area (also referred to as the urban embassy component) will consist of 24 or more, multi-story concrete structures to simulate at least four city blocks. The modular military operations in urban terrain (also referred to as the rural military operations in urban terrain) will consist of movable components that can be stacked and grouped into a number of configurations to present tactical situations to be overcome by training units. This modular military operations in urban terrain will consist of shipping

containers that will be assembled on site to simulate a more rural village or set of suburban buildings located outside the core urban area. Forklifts or cranes will be used to reconfigure the modules of the military operations in urban terrain to add variety and diversity to training. The proposed military operations in urban terrain complex will include live-fire ranges, including a breacher and shooting house that will be used for forced-entry training, and a hand grenade range and house. These will be suitable for units or organizations of up to 800 Marines at a time, and will be used daily by 40 to 750 personnel. The military operations in urban terrain will operate day and night; night operations will comprise an estimated 15% of all operations. The military operations in urban terrain will be used by organizations based on Guam, transients, and visiting regional allied forces. Units using the military operations in urban terrain may bivouac in the vicinity, or arrive and depart daily.

Typically, dry runs and individual skills training will occur prior to the military operations in urban terrain exercise, which will involve fire teams (smallest unit of infantry, typically four or fewer individuals; not having to do with fire starting or control), and squad drills (a group of 8 to 12 individuals). Types of weapons that will be authorized for use at the military operations in urban terrain will include M16, M4, M249, and M240. Blanks, simulators, smoke grenades, diversionary devices (improvised explosive devices and booby traps that release smoke when activated), special effects small arms marking system (similar to paintball), and multiple integrated laser engagement system (small laser receivers scattered over the uniform of an individual soldier, which detect when the soldier has been shined by another soldier's firearm laser) are used instead of ammunition and explosives that would be used in a real combat situation.

Tactical motor vehicle operator training is a continuous requirement for Marine units. The proposed advanced motor vehicle operations course will consist of a route along which a series of obstacles will be placed for driver trainees to negotiate. This will include obstacles simulating terrain features such as narrow bridges, serpentine courses, brake modulation blocks, river crossing, side slope, pot holes, curb and ditch crossing, humps (similar to moguls on a ski slope), and narrow urban driving. The obstacles are connected with unpaved roads. The capacity of the advanced motor vehicle operations course facility will range from 25 to 60 personnel and will be used for individual, section, squad, or platoon training. An estimated 20 drivers per week will train at the advanced motor vehicle operations course, primarily with high mobility multipurpose wheeled vehicles. At two drivers per vehicle, an estimated 10 high mobility multipurpose wheeled vehicles will use the course during training events. Training activities will result in increased noise and wildfire threat.

Convoy training consists of simulated threats and tactical scenarios to train in various defensive techniques. This area of Andersen South is currently used by the Air Force for expeditionary airfield and military operations in urban terrain training which has similarities to the proposed maneuver area training. The convoy training course is 2.5 mi (4 km) and will use existing and new roadways (see Andersen South construction above) within areas identified for the maneuver training space. All existing roads will be open to motor vehicle use associated with maneuver area training; this will primarily be wheeled vehicles, but occasionally a tracked vehicle may be used in maneuver area training at Andersen South. The area will continue to support Air Force training, while also accommodating Marine Corps training requirements. Access to the site will

be by vehicle or air lift. Air lifts will typically involve two to four CH-53 helicopters dropping off and picking up personnel twice a week.

Andersen South will support landing zones for aviation training and include helicopter support team training for ground units. Personnel train in rappelling from the helicopter and procedures that will be used in inserting and extracting troops via helicopter at combat locations. The air operation events associated with this air-ground training will typically consist of a pass for orientation, followed by a downwind approach, hovering at 30 ft (9 m) above ground level for approximately one minute at a designated landing zone and a departure. Since the maneuver area aviation training operations will be a component of training to meet the aviation training requirements, they are also described below under aviation training. Helicopter-insertion extraction activities include fast rope, rappelling, helocasting, and parachute operations. Helicopter insertion-extraction training operations will involve one pass for landing zone orientation, followed by an approach of the landing zone, hovering at approximately 30 ft (9 m) above ground level for approximately one minute, and then departing the landing zone. During each training event, approximately three helicopter insertion-extraction operations will be conducted at one or more closely located landing zones. Approximately 114 helicopter insertion- extraction events will occur at Andersen South per year. Confined area landing, external loads, and maneuver lift (see descriptions above) training will also occur on Andersen South at a frequency of 125, 63, and 720 events per year, respectively.

On Guam, east of Route 15, training will be conducted at six new ranges and additional facilities constructed for the proposed project (see Route 15 Range Complex Construction above): pistol range, square-bay range, unknown distance range, known distance range, machine gun range, hand grenade range, hand grenade house, breacher house, and a shooting house. The six ranges and additional facilities comprise one training range complex at Route 15. The Route 15 training range complex will operate 7 days per week, 24 hours per day, approximately 45 weeks per year with the highest use generally being between 6 a.m. and 10 p.m. Tracers and illumination rounds may be used at Andersen South training ranges during periods of low fire danger. An estimated 15% of the operations at the pistol, square-bay, unknown distance, and machine gun ranges will occur at night. Tables 4 and 5 list the daily and annual proposed munitions use at these ranges based on maximum implementation of existing training requirements. The number of personnel training on the range complex could vary between 70 and 250 individuals. The majority of personnel will arrive in buses, while some will arrive in personal vehicles. Up to company size units will use the range at one time (approximately 150 people, requiring 4 buses, and 10 cars). Range management, including maintenance, accounts for up to 4 weeks per year that the range complex may not be available for use.

Route 15 Range Complex range maintenance will be periodically conducted, in accordance with all applicable regulations, by sifting the expended rounds from the soil on site, placing the soil immediately back on the berm, containing and transporting the expended rounds to a local recycling contractor or smelter. Soils will be monitored to ensure a neutral pH level (6 to 8) is maintained.

Known Distance Rifle Range. The 5.56 mm rifle known distance range is proposed to be used to train personnel on the skills necessary to identify, engage, and hit stationary targets in a static array from a known distance.

Table 4. Daily and annual use of proposed demolition and explosive ranges.

Range	*Explosive or Munition*	*Typical Use Estimate*			*Ammunition Expenditure Estimates*		
		Crews or Personnel	*Hours*	*Days Per Yr*	*Busy Day*		*Annual*
					Day	*Night*	
Demolition	TNT (<20 pound)	80	0800-1600	48	10 lb	0	500 lb
	C-4	20	0800-1600	48	20 lb	0	682 lb
	Other (20 pound TNT equiv.)	20	0800-1600	48	40 lb	0	1,920 lb
Breacher and Shooting House	TNT (0.25 pound)	40	0800-1200 1900-2200	36	5	1	300
Hand Grenade	M67 Fragmentation Grenade	54	0800-1600	70	54	0	3,780
Hand Grenade House	M67 Fragmentation Grenade	26	0800-1600	70	26	0	1,820

Pistol Range. The proposed 9 mm pistol range will provide for 25 firing points and a 50-yard (yd) (46-m) square-bay range for multi-purpose use and conversion to use for M4. A known distance firing range is where Marines shoot (typically rifles) at targets located at designated distances.

Square-Bay Range. The square-bay range is proposed to be used for 9 mm pistol and 5.56 mm rifle training and is a known distance firing range.

Unknown Distance Range. The 5.56 mm rifle unknown distance range is proposed to be used as a firing range where the distance between firing points and targets varies.

Machine Gun Range. Typical operations at the machine gun range is proposed to involve the firing of .50-cal., 7.62 mm, and MK19 40 mm training practice munitions. Guns will be mounted on vehicles, tripods, and bipods.

Hand Grenade Range. The M67 fragmentation hand grenade range is proposed to operate as an open practice throwing field with various targets and throwing positions.

Hand Grenade House. The hand grenade house is proposed as an open structure made of ballistic concrete or other bullet absorbing material where training occurs with fragmentation grenades to simulate grenade use in an urban environment.

Table 5. Daily and annual use of proposed small arms outdoor qualification ranges (DoN 2010b, vol 2, p.2-57).

Range	Weapon	Ammunition Type	Typical Use Estimate			Ammunition Expenditure Estimates		
			Crews or Personnel	Hours	Days Per Yr[(a)]	Busy Day[(b)] Day	Busy Day[(b)] Night[(c)]	Annual[(d)]
KD	Rifle	5.56mm	250	0800-1200 1900-2200	200	10,000	2,250	2,450,000
Pistol	Pistol (M9)	9mm	100	0800-1200 1900-2200	225	7,000	3,000	2,250,000
Nonstandard Small Arms Range	Rifle	5.56mm	125	0800-1600 1900-2200	225	4,523	2,227	1,518,750
	Pistol	9mm	25	0800-1600 1900-2200	225	4,500	750	1,181,250
MRF Range	Rifle	5.56mm	64	0800-1600 1900-2200	225	5,440	750	1,392,750
Machine Gun	MMG	7.62mm	32	0800-1600	225	4,000	2,400	920,000
	HMG	.50 cal	32	0800-1600	225	4,000	2,400	340,000
	HMG	40mm TP	32	0800-1600	225	1,120	480	82,000
							Total	**10,134,750**

Legend: cal = caliber, mm = millimeters, HMG = heavy machine gun, MMG = medium machine gun.
Notes:

(a) The figures for number of days of use are determined from estimated down time for maintenance and weather. Typical use is estimated at 5 days/week, 45 weeks/year for most ranges and 5 days/week, with the exception of the KD range that is adjusted to account for weather (i.e., if 1 or 2 days of training at the KD range is lost due to weather, the whole week is rescheduled; scheduling of the other ranges is more flexible). Range use would occur periodically throughout the year, with no predictably busy or non-use periods.

(b) The estimates for the KD, Pistol, Nonstandard, and MRF ranges are based on the maximum number of shooters per day who could make use of each proposed range (calculated by multiplying the number of firing points or lanes by the number of firing relays), firing the number of rounds prescribed for a standard string of fire. This estimate is consistent with the munitions allocation for the relocated AIP units. For the machine gun range, the AIP munitions allocation is considerably less than the range capacity.

(c) Night refers to non-daylight hours that are generally 1900-0600 on Guam. Range use is not expected to extend beyond 2200 (2200-0700 is considered nighttime for community noise analysis)

(d) The annual numbers of rounds expended are consistent with the AIP munitions allocation.

Breacher House Training. The breacher house operations, is proposed to be located in Andersen South will be integrated into the military operations in urban terrain. The shooting house is a standard two-story enclosed structure used for various types of training in forced entry, including in the use of small explosive charges (less than 0.25 pounds of trinitrotoluene, commonly known as TNT).

Shooting House Training. Shooting house operations, which are proposed to be located in Andersen South, are conducted in an enclosed structure and provide training in close-quarter skills, like room clearing and hallway navigation. No explosives are used; however, live-fire training operations with the 5.56 mm rifle will be authorized at the facility.

Naval Base Guam

Naval Base Guam is located along the southern side of Apra Harbor on the western coast of Guam. The civilian Port of Guam flanks the northern side of the Harbor (Figure 3).

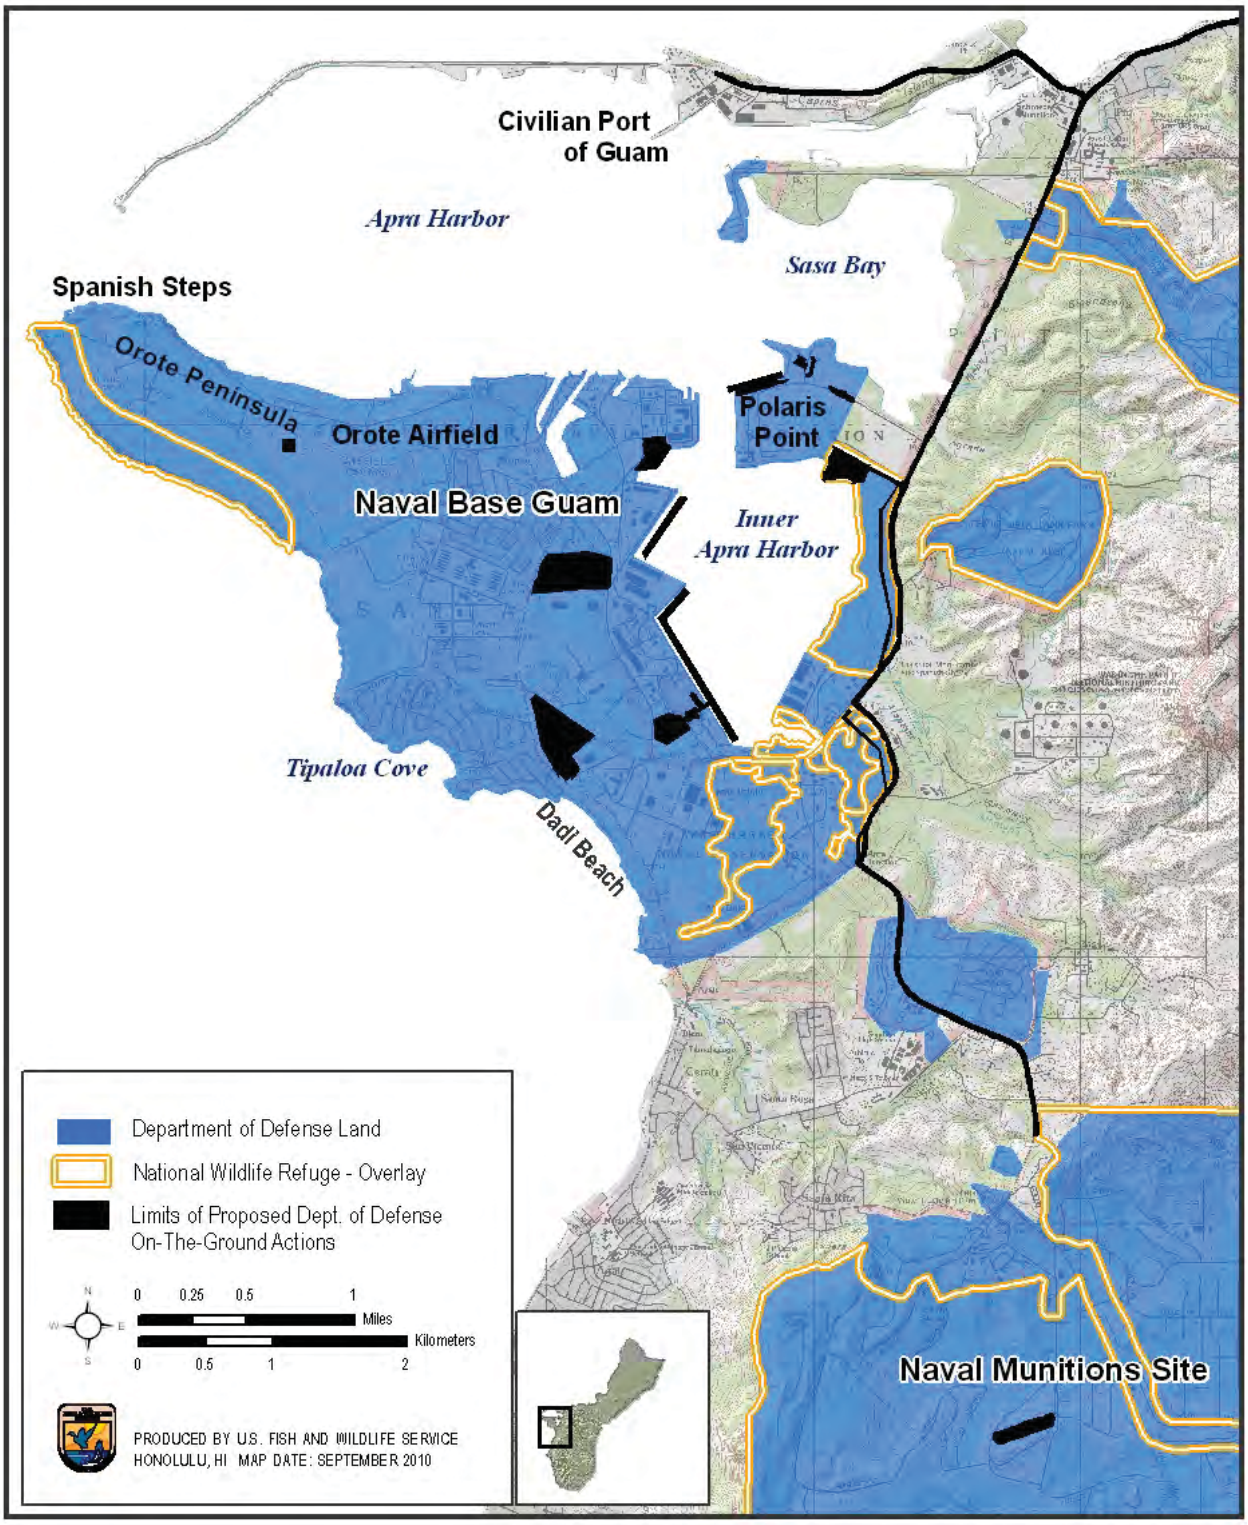

Figure 3. Location of proposed infrastructure and facilities development in the Apra Harbor area.

Naval Base Guam Construction Projects

In-water ship berthing and embarkation areas, staging areas, an amphibious craft laydown area, a military working dog kennel relocation, a medical and dental clinic, washdown facilities, brown treesnake barriers, and quarantine areas will be developed at Naval Base Guam. In addition, a United States Coast Guard berthing and crew support building will be relocated to an area that is not currently forested. The military working dog kennel will be relocated from its existing site to a new site on Naval Base Guam. The proposed project location is in an existing laydown area for base maintenance with existing access roads and utility tie-ins. Associated with the aircraft carrier berthing at Naval Base Guam are the shore-side facilities (recreation, gathering, laundry, waiting for transportation, and food and beverage sales), staging areas, new buildings, and parking. The Apra Branch Medical and Dental Clinic will be built on a previously disturbed area that is currently vacant. The Morale, Welfare, and Recreation area will be developed to provide food and beverage booths, seating for 500 people, 40 phone bank seats, 100 stalls for visitor and rental car parking, portable restrooms, laundry facilities, temporary lighting, and trash dumpsters.

All facilities will have security lights mounted on buildings or steel poles. Lighting along the wharves will consist of 1,000-watt high pressure sodium floodlights mounted on new or existing poles. Lighting will be shielded and aimed such that the majority of the illumination will be directed towards the wharf deck, extending over water approximately 100 ft (30.5 m). All actions related to development and improvement of waterfront facilities will occur in currently paved or landscaped areas. All utility distribution lines and ductwork will be located underground, generally within existing utility corridors.

The DoN will develop permanent and temporary washdown, quarantine, and inspection areas at arrival areas on Guam at Apra Harbor (ship and amphibious vehicle loading and unloading) and Andersen Air Force Base (DoN 2010a, p. 70) as follows.

1. A washdown, quarantine, and inspection facility will be built at Apra Harbor within 600 ft (183 m) of Victor Wharf to reduce the risk of exposure to invasive species after leaving the clean, biosecure area. During construction, invasive species and debris will be removed from the site. Prior to operation, the biosecure area will be inspected and will only begin operations when the area is invasive species-free. These facilities will provide vehicle cargo quarantine, inspection, and storage areas. These areas will be constructed with a brown treesnake barrier and active trapping for brown treesnakes will occur. These facilities will provide a pre-wash down area, vacuum equipment, wash racks (raised platforms with ramps at either end that facilitate cleaning and inspection of undercarriages), an inspection building, and fenced area that will meet the requirements for the use of inspection dogs and a cargo loading and inspection area. Specifically, these facilities will be built in a designated paved area with a wash down area and sufficient space for segregating “clean” from “dirty” equipment, cargo, and vehicles. The areas will be surrounded by brown treesnake barriers following specifications received from the Service: The barriers will be 4.5 ft (1.4m) tall; made from pre-cast concrete with an outward projecting lip to deter snakes; the barriers will have only two gates providing one-way flow of traffic through the site; each gate made from sliding chain-link with fabric barriers to prevent snake ingress and egress.

2. When in Apra Harbor, the vehicles and equipment unloaded or loaded onto a ship will be inspected and receive a wash down on arrival and departure to prevent introduction of any pest or invasive species that may present a potential threat to agriculture, public health, or the natural resources of Guam or other Pacific Islands. All wash downs will be conducted and supervised by trained personnel in accordance with Armed Forces Technical Guide 31. U.S. Department of Agriculture (USDA) personnel may participate in inspections and brown treesnake inspections will be conducted with involvement of USDA Animal and Plant Health Inspection Service (APHIS) personnel. Vehicles will be inspected (internally and externally) prior to passing into the biosecure area. The water used to wash vehicles will be captured and circulated through filters to prevent pests from spreading. All waste on board ships will continue to be steam sterilized prior to disposal in regulated landfills in accordance with base operating procedures.

3. Supplies for the Coast Guard Cutters are delivered to the wharves from existing DoN supply warehouses where all supplies and material have undergone required USDA inspections upon arrival and before being transferred out of the warehouse and onto a U.S. Coast Guard ship. The U.S. Coast Guard ships will not be offloading supplies onto Guam from other locations (DoN 2010a, p. 79).

4. Truck traffic at the wharf will be required to re-supply ships (DoN 2010a, p. 85). Trucks may be from DoN Supply or direct from commercial vendors. Equipment to move cargo will be brought to the wharf as needed. When an aircraft carrier is not berthed, the Port Operations building will be used for storage. All equipment and cargo will go through inspection procedures prior to being brought into "clean" areas or being loaded on to ships, regardless of vendor.

5. A washdown, quarantine, and inspection facility will also be built at the amphibious vehicle laydown area in Apra Harbor to reduce the risk of exposure to invasive species after leaving the clean, biosecure area. This facility will be adjacent to the shore so that amphibious craft can drive into the washdown, quarantine, and inspection facility. This facility will be built to the specifications described above for Victor Wharf with modifications to accommodate amphibious vehicles, specifically: the laydown area will have dedicated ramps for landing craft air cushion and amphibious assault vehicles in the quarantine area.

6. Typically, the Amphibious Task Force will arrive fully supplied to meet all training requirements or will be replenished as needed prior to training in the CNMI. If cargo is loaded or unloaded, inspection is required as described above for Victor Wharf. Cargo will be loaded and unloaded in the laydown area which will be of sufficient size to segregate "clean" from "dirty" cargos. If there is a training mission on Guam, the trucks drive off the ships' stern ramps. Other cargo may be offloaded by mobile crane. After inspection, cargo may be temporarily stored in a "clean" material handling equipment at the waterfront.

7. There are several projects in Apra Harbor. For all facilities, the DoN will attempt to include USDA APHIS at the earliest possible time to plan for brown treesnake

inspections. Planning for cargo storage will include considerations of the length of time for storage, risk of brown treesnake or other invasive species, and origin and destination of cargo. These considerations need to be vetted through the Biological Monitor (detailed in subsequent sections of the Project Description) and this staff person will coordinate with other partners. Permanent barriers and moveable brown treesnake barriers will be used as the situation dictates.

8. The DoN will develop permanent and temporary quarantine and inspection areas at a new Air Embarkation and Disembarkation area at Andersen Main Base to load and unload passengers and cargo from aircraft (DoN 2010a, p. 62-63). USDA APHIS will be included in the design of this facility as early as possible to assist with planning. This facility will be surrounded by a brown treesnake barrier built to the specifications described above and will have inspection and quarantine areas to separate "clean" from "dirty" areas such that all aircraft, baggage, equipment, and cargo are 100% inspected upon arrival and 100% inspected upon departure. The aircraft carrier berthing will bring up to 59 aircraft to Guam that may beddown at Andersen Air Force Base. All transient aircraft will follow all existing invasive species inspection protocols, including brown treesnake protocols (DoN 2010a, p. 83).

The total terrestrial project footprint at Naval Base Guam is 288 ac (116.9 ha). Approximately 12 ac (4.9 ha) of scrub forest, 51 ac (21 ha) of shrub and grassland, 34 ac (14 ha) of tangantangan forest, and 191 ac (77 ha) of developed land will be used for the construction of these features. Of the 288-ac (116.9-ha) project footprint, 12 ac (4.8 ha) is located with the Guam National Wildlife Refuge Overlay.

Naval Base Guam Operations

All amphibious training operations and conservation measures are assessed under the MIRC Biological Opinion (USFWS 2010, 96 pp.). Though new facilities will be constructed due to the proposed project, no additional amphibious training will occur in undisturbed areas, either new or increased frequency or tempo is proposed under the proposed project. Therefore, amphibious training will not be analyzed within this Biological Opinion.

New aviation training, called external load, will occur at Orote Airfield on Naval Base Guam. The training requires access to pre-positioned cargo for practice, and ground access is needed for ground support team personnel. External loads cannot be carried across public roads or populated areas. External load training operations will involve one pass for landing zone orientation, followed by an approach of the landing zone, hovering approximately 30 ft (9 m) above ground level for approximately one minute while the ground support team attaches a load (e.g., concrete block, items in a cargo net, or a vehicle), departure of the landing zone vicinity with the load in tow, flying with the load in an arc, then returning to the landing zone with the load, and hovering for approximately 30 seconds while the ground support team retrieves the equipment, and then departing the landing zone vicinity. During each event, these operations will typically involve five repeated attachments and detachments of external loads at the same landing zone where the ground support team is positioned. Ground support teams will include up to 40 personnel at one time and will support landing zone operations. Approximately 10 to 12

wheeled vehicles (e.g., high mobility multipurpose wheeled vehicles) will be used by these teams.

There are no listed species or recovery habitat near Orote Airfield that will be affected by external load training. External load training will involve pick up and return from the same location on Guam, thereby reducing the risk of transporting invasive species. Therefore, external load training at Orote Airfield will not be analyzed within this Biological Opinion. No other new training is proposed for the Naval Base Guam.

Naval Munitions Site

The Naval Munitions Site is an 8,789 ac (3,557 ha) area in southern Guam dominated by limestone forest, ravine forest, and savanna vegetation. The Fena Valley Reservoir is located along the eastern side of the Naval Munitions Site. A system of existing roads and munitions storage facilities occupy approximately one-third of the Naval Munitions Site. Unimproved roads provide limited access to the mountainous southern half of the site.

Naval Munitions Site Construction

Eleven munitions storage magazines, four aviation training landing zones, one aviation and maneuver landing zone and an access road from Route 2 to the southern portion of the Naval Munitions Site will be developed (Figure 4). Unimproved, unpaved, helicopter landing zones will be developed and maintained in the Naval Munitions Site. Vegetation within the landing zones will be kept clear with the use of portable equipment. Heavy equipment and other ground-based vehicles will not be used outside existing and proposed developed areas in the southern Naval Munitions Site.

The construction footprint is a total of 43.6 ac (17.6 ha) and consists of approximately 17.1 ac (6.9 ha) of ravine forest, 24.0 ac (9.7 ha) of shrub or grassland savanna, and 2.5 ac (1.0 ha) of developed land. Of the 43.6 ac (17.6 ha) of land needed for construction at the Naval Munitions Site, 39 ac (15.8 ha) is located within the Guam National Wildlife Refuge Overlay.

Naval Munitions Site Operations

Company-level patrolling, jungle training, land navigation, and air-ground operations will occur on 5 to 7 consecutive days, 12 weeks per year, day and night, for a total annual throughput at the Naval Munitions Site of 1,440 Marines. Sixteen events are authorized under the MIRC Biological Opinion (USFWS 2010, 96 pp.), the number of days and weeks described above represent an increase of training events per year due to the proposed project (revised total of 28 events per year). This site is rural and rugged and is currently designated as the Southern Land Navigation Area, supporting foot land navigation training primarily for special forces personnel (USFWS 2010, 96 pp.). Access to the Naval Munitions Site for training will occur via helicopter transport operations at proposed landing zones. Approximately eight CH-53 (heavy-lift transport helicopters) lifts will be required for a company-level training event. Personnel, hand-carried supplies, and equipment will typically be airlifted to the site on a Monday and lifted out on Friday of the same week. No other roads will be established and no vehicles will be used within

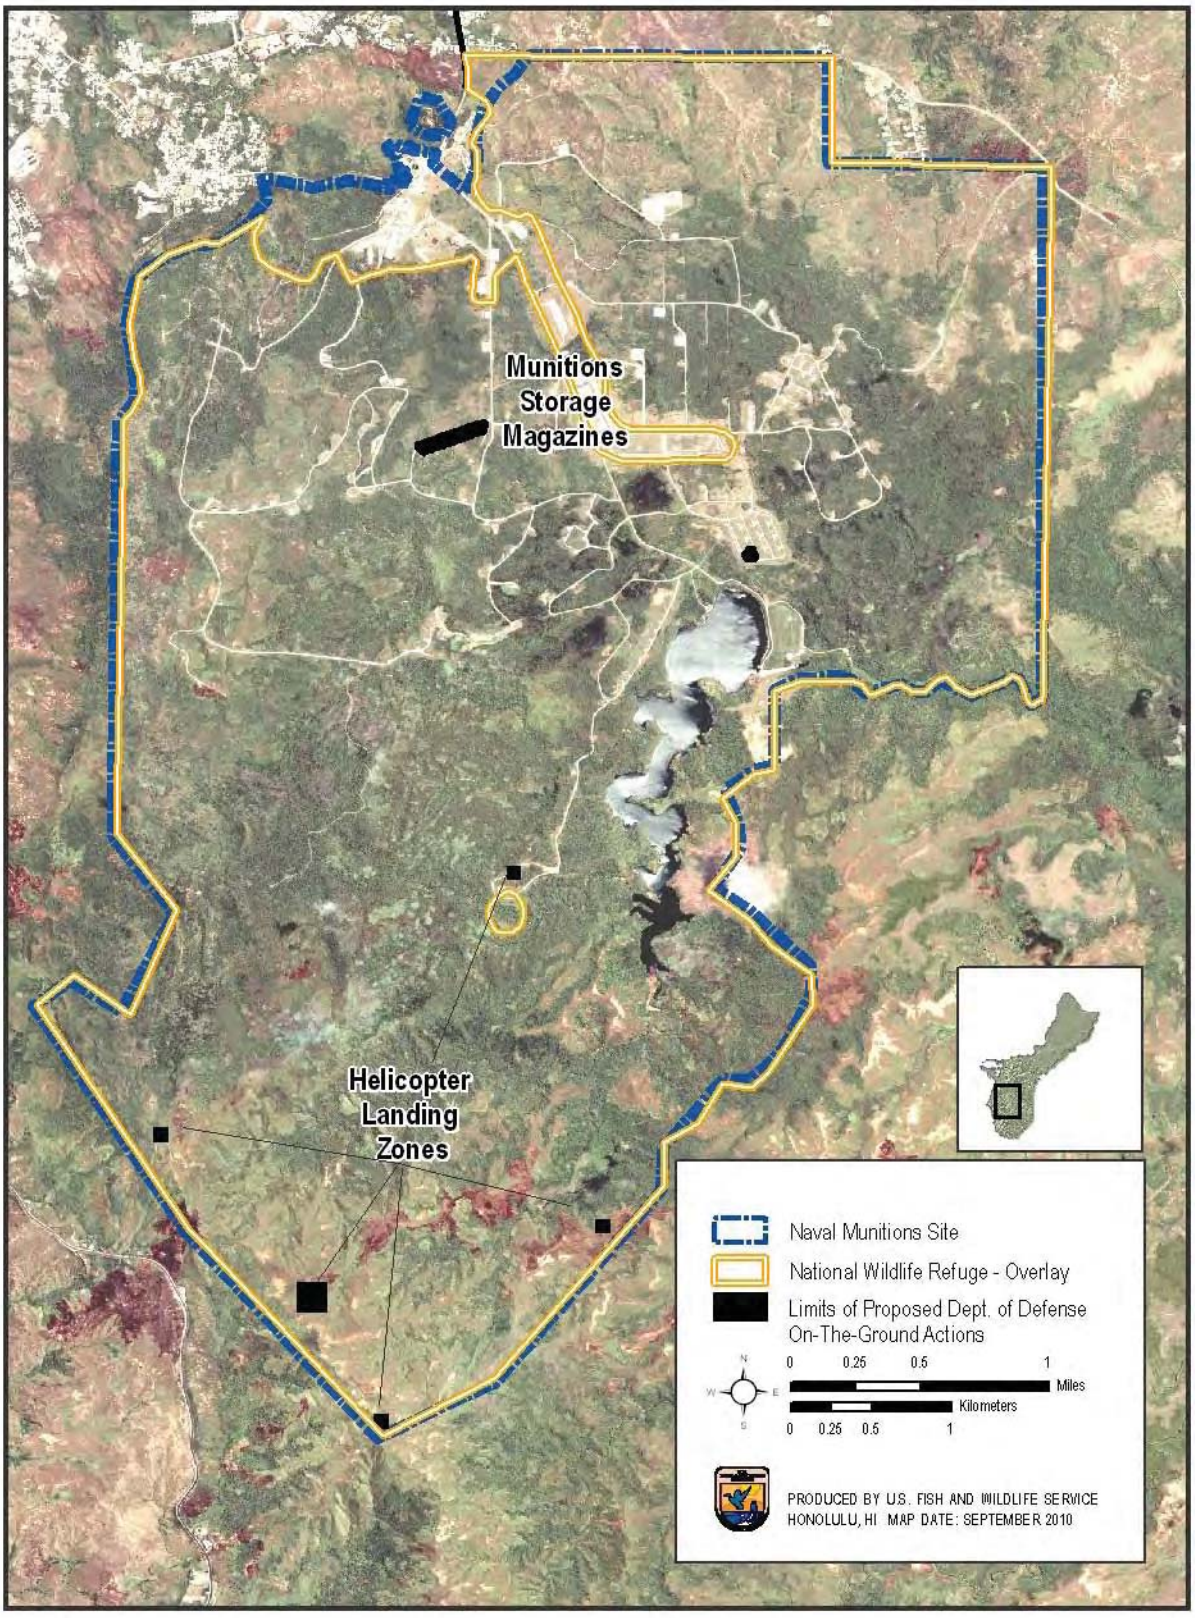

Figure 4. Project footprint for the proposed access road, helicopter landing zones and munitions storage facility at the Naval Munitions Site.

the training site. The access road will have an associated parking area that will be periodically mowed to allow for parking and to reduce fuel loading and potential for fires. Foot trails will be established within the southern portion of the Naval Munitions Site due to repeated use during maneuver training.

Terrain flight, ground threat reaction, defensive maneuvering, confined area landing, and external load training will occur at the Naval Munitions Site. No other training at the Naval Munitions Site is included in the proposed project. Terrain flights require a route with varying terrain for night flight with night-vision goggles, at 50 to 200 ft (15 to 61 m) above ground level. Training for terrain flights will occur only within the southern portion of the Naval Munitions Site, south of the southern extent of Fena Reservoir. Aircraft will leave Andersen Air Force Base and transit to southern Guam using standard military flight procedures (i.e., greater than 1,000 ft [305 m] above ground level). Aircraft may fly over land or over water on their way to the Naval Munitions Site. A typical training event may involve an aircraft leaving Andersen Air Force Base, moving to the east over the ocean, traveling along the coast at an altitude greater than 1,000 ft (305 m) until approximately the Talofofo River, and then flying up the river to the Naval Munitions Site still at an altitude equal to or greater than 1,000 ft (305 m). Flights may go up the Ugum River at altitudes of 1,000 ft (305 m) or greater above ground level until they reach 9,843 ft (3,000 m) from the mouth of the river at Highway 4 and then flights may conduct low-level terrain flights. Once the aircraft crosses into the Naval Munitions Site below Fena Reservoir (training restriction line), pilots will then be authorized to conduct low-level (50 to 200 ft (15 to 61 m) above ground level) terrain flights within the southern Naval Munitions Site. Low-level flights will not occur over the munitions bunkers, the main Naval Munitions Site, the area to the east of the munitions bunkers, over Fena Reservoir, or over the Almagosa Springs.

Ground threat reaction training requires a tactical flight maneuver area or route (similar to terrain flight routes) where ground-based electromagnetic radiation threat simulators may be placed. Defensive maneuvers are also conducted along a route over land or water. Differing helicopter types (AH-1, CH-53E, UH-1) and the MV-22 tilt rotor aircraft, will be used to conduct terrain flights, ground threat reaction, and defensive maneuvers training; however, terrain flights training operations are low altitude tactics and the ground threat reaction and defensive maneuvers training is conducted more in a tactical navigation area than along a route. Ground threat reaction is also low-altitude training like terrain flights, while defensive maneuver training is higher in altitude (equal to or greater than 1,000 ft [305 m] above ground level). Approximately 100 terrain flights, 94 ground threat reaction, 94 defensive maneuvers, and 1,104 maneuver lift flights per year will occur in the Naval Munitions Site.

Confined area landing training operations will also occur at the Naval Munitions Site. Confined area landing training consists of one pass of the landing zone for orientation, a downwind approach, followed by the landing, and takeoff. To meet qualification requirements, confined area landing training events typically will have five associated operations. Typically, a number of different, closely located landing zones, will be used during the training event. There will be approximately 125 confined area landing training operations per year at the Naval Munitions Site. Approximately 63 external load training operations will also occur at the Naval Munitions Site and are described under “Naval Base Guam Operations”.

Figure 5 delineates areas on Guam that will be impacted by project-related training and aircraft noise greater than 60 dB.

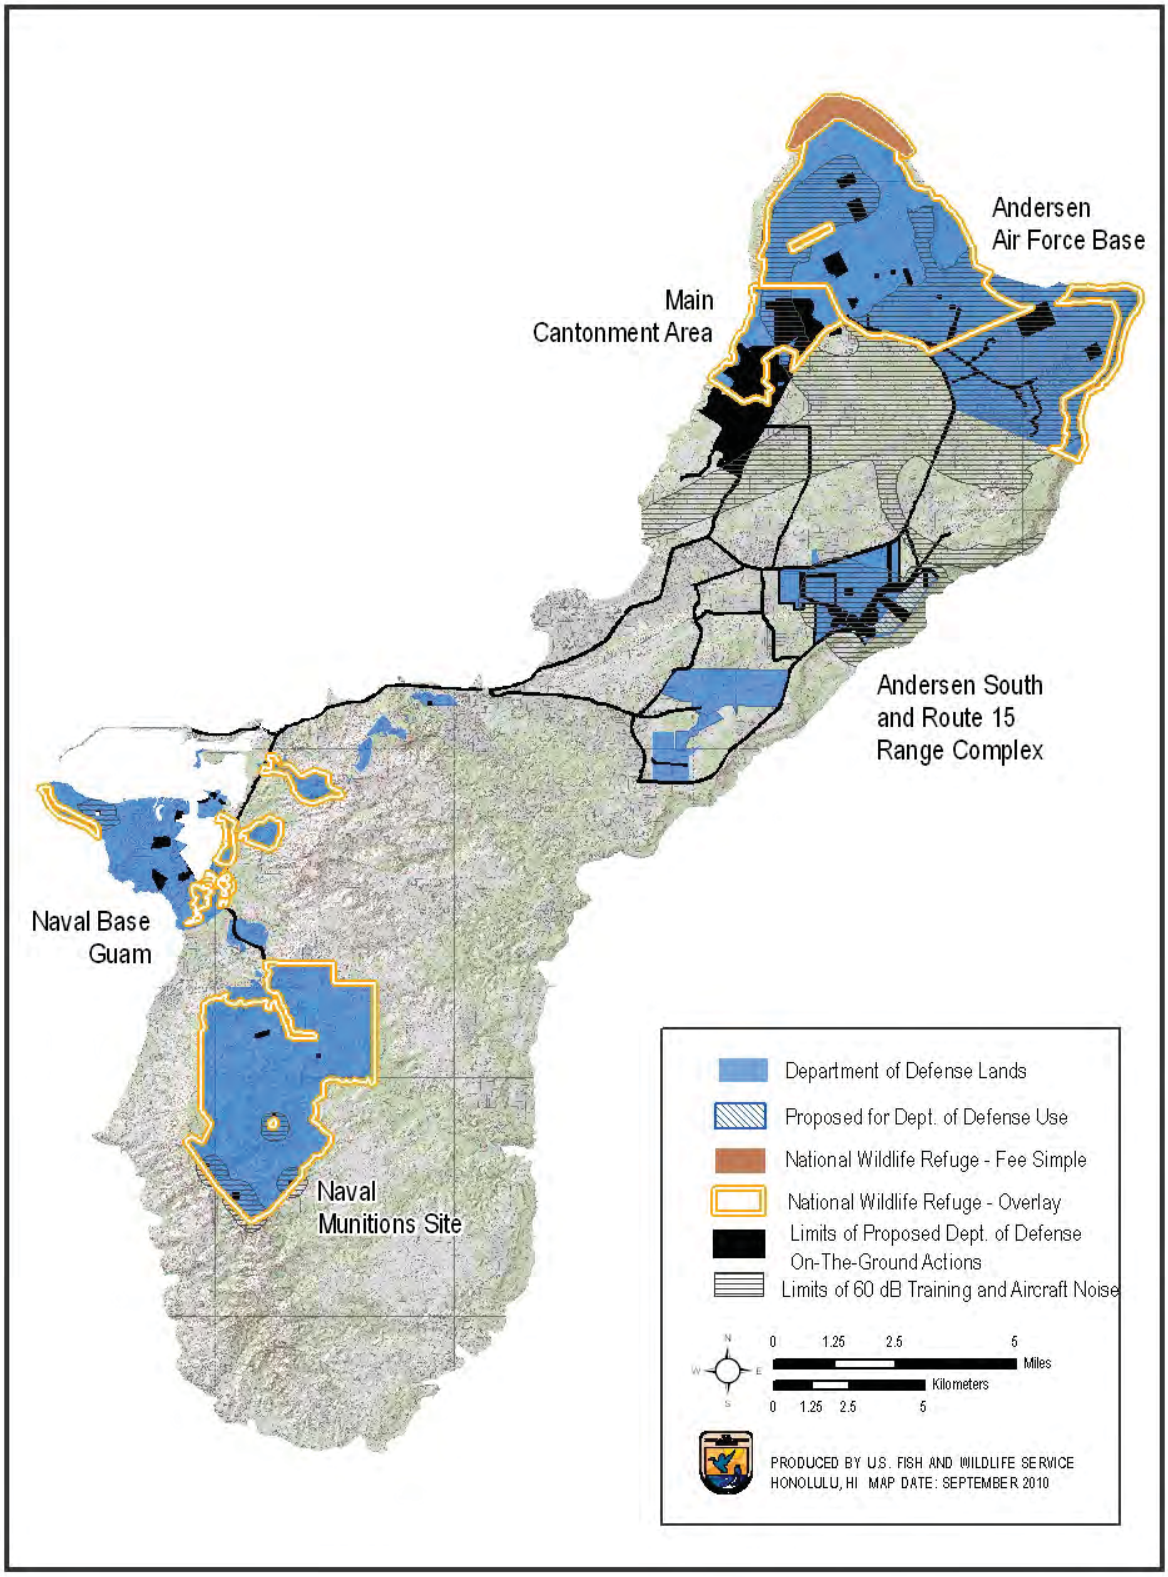

Figure 5. Anticipated project training and aircraft noise footprint (greater than 60 dB) on Guam.

Power Grid

To support the estimated power demands associated with implementation of the proposed action, up to five existing permitted Guam Power Authority turbines (Yigo, Dededo No. 1, Dededo No. 2, Marbo, and Macheche) will be upgraded and maintained by the Guam Power Authority to increase system capacity and support interim-load demands for DoD and civilian population requirements. In addition, there will be upgrades to existing transmission and distribution lines and the potential addition of new lines on existing structures. All ground-disturbing activities will occur in previously developed areas within existing power corridors and at existing power stations.

Wastewater

The proposed action may entail refurbishing and upgrading Guam's Northern District Wastewater Treatment Plant primary treatment capacity. The Guam Waterworks Authority or a private entity will accept the additional military buildup and civilian related flows and loads in the short term, with phased implementation of a long-term solution to construct a final wastewater facility with more advanced secondary treatment (as deemed necessary by the U.S. Environmental Protection Agency Region IX). Currently there are no plans to construct the wastewater treatment plant on DoD-controlled land. Therefore, it is anticipated that should the wastewater treatment plant require construction, the plant would be located on Government of Guam lands or private lands secured by the Government of Guam. In either instance Guam officials will control the underlying land use and permit decisions associated with the siting of such facility.

Although no direct military buildup will occur in central Guam under the proposed action, there is a requirement in a Stipulated Order issued to Guam Water Authority to refurbish the effluent pump station at the Hagatna wastewater treatment plant to address sewage overflows and non-compliance. This project has been delayed due to lack of funding, so DoD is negotiating with the Government of Japan to determine if they can finance the needed refurbishment to ensure the increase in wastewater flows from the construction workforce and the military buildup–induced population residing in the area can be accommodated. Buildup-induced population is the population growth that will occur from immigration to Guam because of new jobs that will support commercial and industrial activities on Guam (not including military, DoD civilians, their dependants or construction workers) (DoN 2010a, p. 16). In addition, there will be upgrades to existing wastewater collection lines on DoD property and the addition of new lines along existing corridors or within areas proposed for construction (e.g., proposed Main Cantonment) both on DoD property and off-base along existing Guam Water Authority utility easements that are addressed under those DoD proposed actions.

All other ground-disturbing activities will occur in previously disturbed areas within existing utility corridors. No other construction will occur in recovery habitat and none will be removed to upgrade or add transmission and distribution lines or the upgrade system capacity. Therefore, except as it pertains to conservation measures, we will not consider the wastewater upgrades further within this Biological Opinion.

Roadways

The proposed road projects on Guam will enable and improve roadway connectivity, capacity, and pavement strength for military construction and deployment in support of the proposed project. Some of these road projects will be funded by DoD pursuant to the Defense Access Roads program. The projects that are not funded will be the responsibility of the Government of Guam Department of Public Works or the Federal Highways Administration. Logistical routes for construction-related transport will connect the Port of Guam with Naval Base Guam, Andersen Air Force Base, the proposed Main Cantonment, the Naval Munitions Site, and existing concrete batch plants, rock quarries, and precast concrete panel fabrication sites associated with the military buildup on the island.

In addition to improvements to the construction routes, increased traffic associated with the presence of the military personnel and their dependents will require roadway modifications. As a result of the recent transportation and traffic studies on the island of Guam, 50 individual road projects have been proposed. These consist of 42 off-base projects and eight intersection improvement projects at military gates. The 42 off-base projects are comprised of five types of roadway projects: intersection improvements, bridge replacement, pavement strengthening (combined with roadway widening at some locations), roadway widening, and new road construction.

Thirty-five of these projects will either occur within previously developed areas of Guam such as residential and commercial areas, or they will not entail impacts to woody vegetation or other natural resources potentially utilized by listed species (for instance, pavement strengthening will not require any additional disturbance to areas outside of the existing roadbed). Because of their proximity to the proposed Main Cantonment area, the improvements to Naval Computer and Telecommunications Station Finegayan to Route 9, and a new commercial gate at Naval Computer and Telecommunications Station Finegayan, are considered to be within the proposed Main Cantonment area below. Roadway relocation and realignment for Route 15 is evaluated described in the Andersen South section of this Project Description. A new road will be constructed in the proposed Main Cantonment area and these impacts are included in the Main Cantonment section. Route 3 to Andersen Air Force Base North gate and Andersen Air Force Base North gate to Route 1 (Main Gate) are described under Andersen Main Base. The remaining two projects, Agana Bridge 1 Replacement and Four Bridge Replacements (Atantano, Laguas, Sasa, and Fonte), occur along Route 1 and have the potential to impact wetland habitat. None of these are within the Guam National Wildlife Refuge Overlay. The Atantano wetlands are secondary habitat as identified in the recovery plan for the Mariana common moorhen (USFWS 1992, p. 5-10). Conservation measures have been included to ensure wetland habitat function and value are not altered.

2.1.2 CONSTRUCTION AND OPERATIONS ON TINIAN

Tinian Construction

The construction of four new ranges (platoon battle course, automated combat pistol and multipurpose firearms qualification course, rifle known distance range, and field firing range)

and associated infrastructure (e.g., assembly and briefing areas, parking, portable sanitary facilities) will occur on Tinian (Figure 6). No construction is needed to accommodate the controlled access points, range flags, or surface danger zone observation points.

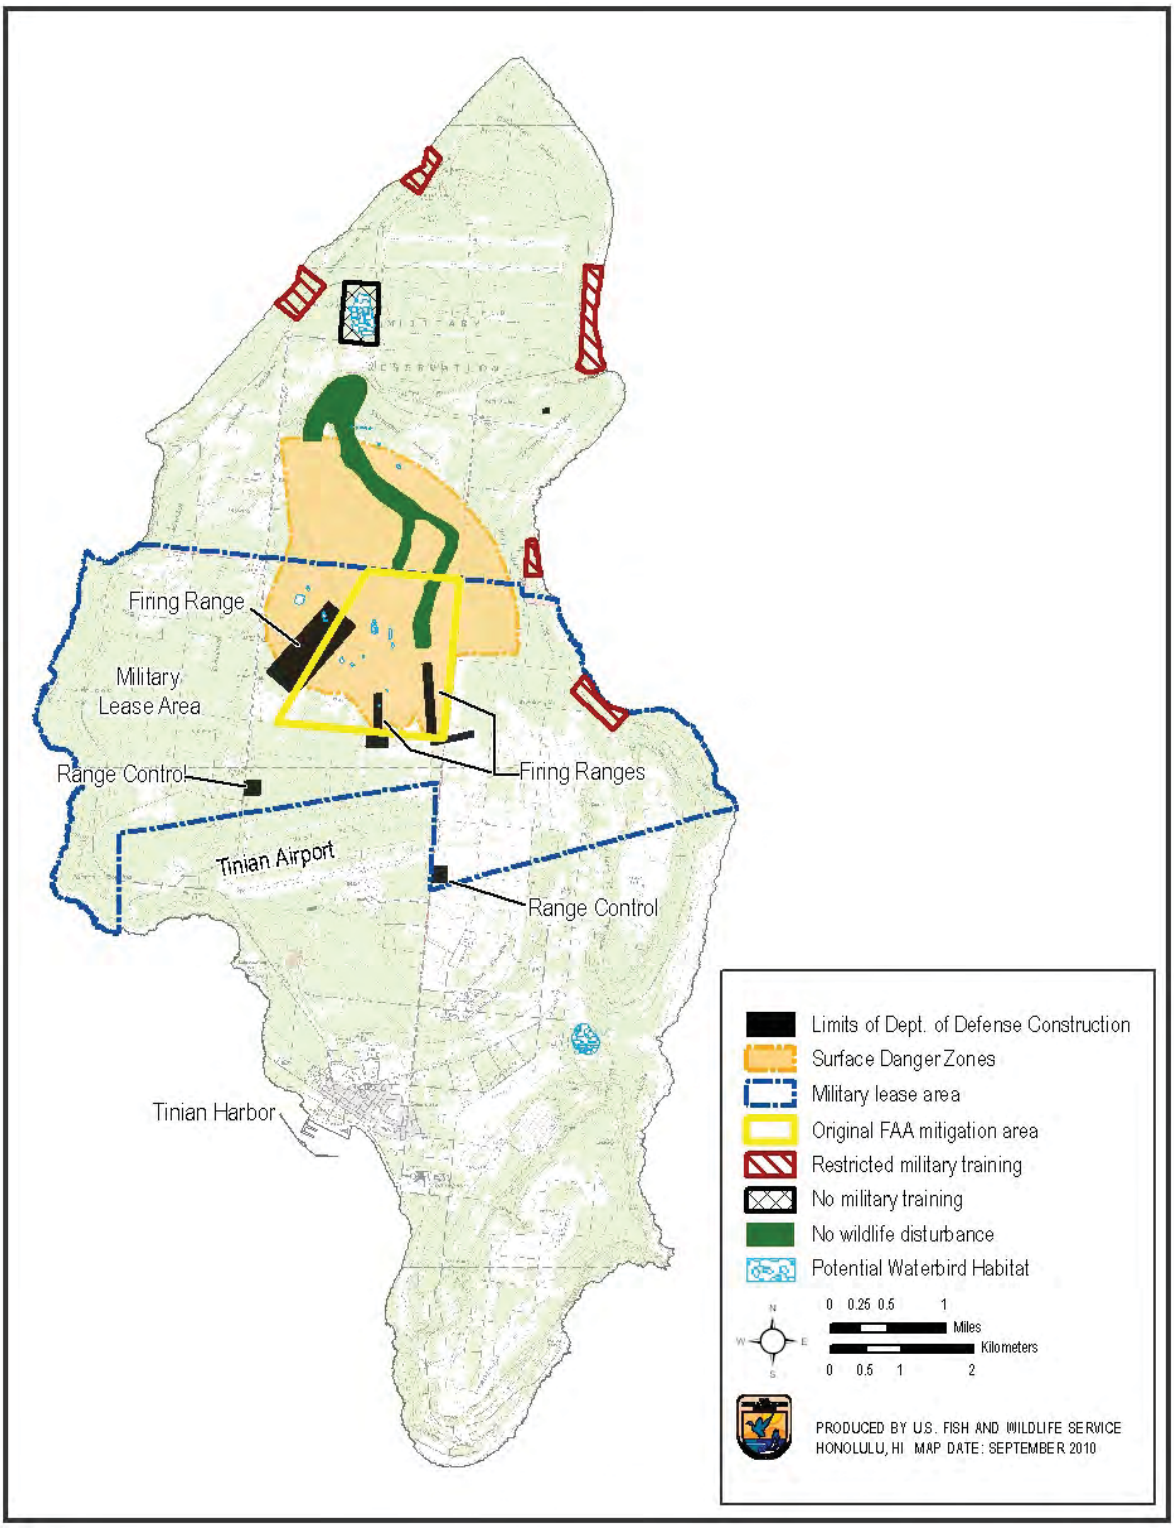

Figure 6. New training ranges and range control facilities proposed on Tinian.

Approximately 241 ac (98 ha) of vegetation will be cleared to accommodate the new training ranges. Currently, 176 ac (71 ha) of mixed introduced forest, 62 ac (25 ha) of other shrub and grass, 2 ac (1 ha) of tangantangan, 1 ac (0.4 ha) of urban/built-up, and 0.3 ac (0.1 ha) of native limestone forest occur within the project clearing footprint.

The biological assessment (DoN 2010a) identified 0.3 ac (0.1 ha) of potential wetland habitat within the footprint of the platoon battle course. After additional investigation, the depressions were determined to be sinks rather than seasonal wetlands and no wetland vegetation or soils were present. However, the DoN will work with planners to avoid sighting the footprint of the platoon battle course within the area of potential wetlands.

Construction will typically occur between 6 a.m. and 5 p.m. Heavy equipment will be used on all project sites to clear and grade to prepare sites for building construction.

Construction of the proposed Tinian ranges, including a 328-ft (100-m) buffer around each range footprint, will result in the disturbance to 241 ac (98 ha) of vegetation within a mitigation area established by the FAA, leaving 675 ac (273 ha) of this FAA mitigation area remaining.

Training Ranges - Tinian

The proposed action includes live-fire weapons training in the Tinian Military Lease Back Area. Training will occur at the platoon battle course, and automated combat pistol and multipurpose firearms qualification course, a rifle known distance range, and a field firing range. All training will be considered "expeditionary," in that the Marines will bring all necessary equipment to the ranges (including supplies and ammunition), bivouac onsite, and remove all equipment following completion of the training activities. Tracers or fire igniting devices may be used on Tinian ranges. The transport of 200 to 400 Marines to Tinian from Guam for the proposed one week per month company-level training exercises will be via aircraft between Andersen Air Force Base and Tinian International Airport.

The following procedures will be in place prior to personnel arrival on Tinian:

a) Training activity will be scheduled and notice provided in newspapers or otherwise posted at least one week prior to training event. The focus of the public notice efforts will be on Tinian and Saipan.

b) Biosecurity training will be completed through informal coordination with Service, USDA, Guam Division of Aquatic and Wildlife Resources and CNMI Division of Fish and Wildlife, through the regional training authority one week prior to the training event. All materials, equipment (including personell and vehicles), and supplies will be inspected less than 48 hours prior to departure and loaded onto the aircraft. If necessary, inspected equipment may be stored in a "clean" area up to 48 hours, prior to departure. An area is considered "clean" of brown treesnakes if the area is enclosed by a permanent or temporary snake barrier and successful snake suppression is in place.

c) Environmental and cultural resources briefings will be completed and aircraft and ships cargo will be inspected prior to departure from Guam following existing standard operating procedures.

d) Aircraft and ships cargo will be inspected prior to departure from Guam following existing standard operating procedures.

The following procedures will be in place after arrival on Tinian and prior to any movement or training begins:

a) Vehicles and equipment will be subject to brown treesnake inspection protocols on the airfield apron upon arrival.

b) All military related cargoes (construction and training equipment, vehicles, materials, and supplies) will be inspected by USDA APHIS and determined to be clean prior to leaving the quarantine and inspection areas for training on Tinian.

Construction Implementation at all Sites on Tinian

Rifle Known Distance Range. The 5.56 mm rifle known distance range will be used to train personnel on the skills necessary to identify, engage, and hit stationary targets in a static array from a known distance.

Automated Combat Pistol/Multipurpose Firearms Qualification Course. This range will be designed to meet training and qualification requirements with 9 mm and .45 caliber weapons (combat pistols and revolvers) and used to train and test personnel on the skills necessary to identify, engage, and hit stationary infantry targets.

Platoon Battle Course. The platoon battle course will be used to train and test platoons, either mounted or dismounted, on the skills necessary to conduct tactical movement techniques, detect, identify, engage, and defeat stationary and moving armor and infantry targets in a tactical array. Targets will not be fully automated and will not have the capability to execute computer driven or scored training scenarios. This course will provide the capacity for small units up to approximately 40 personnel to train in tactical scenarios, engaging targets at varying distances and angles while moving. Weapons that will be used on this range are those found at the platoon level, which are 5.56 mm carbines and rifles and squad automatic weapons (i.e., M249 light machine gun).

Field Firing Range. This range will be designed to support training target engagement techniques with the rifle, including identifying, engaging, and hitting stationary infantry targets. This will be a scored range with automated targets for use with the 5.56 mm rifle, but also will be suitable for the M4 carbine and squad automatic weapons (i.e., M249 light machine gun).

Activities within the Range Footprint. All firing of weapons occurs within the range footprint as defined. Within this space, ground disturbing activities may take place to maintain line of sight between firing points (i.e., location where weapons are discharged) and targets, and to place

target mechanisms below ground level for protection. Bullet backstops, usually of earth, are located behind the targets. Access ways are maintained to the targets for small vehicles for installation and retrieval of target mechanisms after use. Grading may be required during initial construction, to provide lines of sight, depending on the terrain. To properly maintain the range berms, which capture expended munitions, the Marine Corps will periodically shut down the range, to clear it of expended munitions.

Grass cutting and landscape maintenance is required to keep range lines of sight and access intact, but does not usually require the entire site be cleared. A perimeter road may be built to also serve as a fire break. Other range maintenance will be periodically conducted, in accordance with all applicable regulations, by sifting the expended rounds from the soil on site, placing the soil immediately back on the berm, containing and transporting the expended rounds to a local recycling contractor or smelter. Soils will be monitored to ensure a neutral pH level (6 to 8) is maintained.

Table 6 provides an estimate of the annual range utilization under a typical range use scenario for each of the ranges proposed at Tinian based on maximum implementation of existing training requirements.

Table 6. Proposed daily and annual use of small arms qualification ranges on Tinian (DoN 2010b, vol. 3, p. 11-23).

Range	*Weapon*	*Ammunition Type*	*Typical Use Estimate*			*Ammunition Expenditure Estimates*		
			Crews or Personnel	*Hours*	*Days Per Yr*[a]	*Busy Day*[b]		*Annual*[d]
						Day	*Night*[c]	
Known Distance	Rifle	5.56 mm	100	8:00 -12:00 7:00- 9:00	80	12,000	0	960,000
Automated Combat Pistol/ Military Police Firearms Qualification	Pistol (M9)	9 mm	100	8:00-10:00 7:00- 9:00	60	3,750	1,250	300,000
	45	.45caliber	50	8:00-10:00 7:00- 9:00	20	3,750	1,250	100,000
Platoon Battle Course	Rifle	5.56 mm	120	8:00-4:00 7:00- 1:00	80	6,750	2,250	720,000
	SAW	5.56 mm	40	8:00-4:00 7:00- 1:00	80	2,250	750	240,000
Field Firing Range	Rifle	5.56 mm	120	8:00-4:00 7:00- 1:00	80	9,000	3,000	960,000
							Total	**3,280,000**

Legend: mm = millimeters; SAW = Squad Assault Weapon.

Notes:

[a] The figures for number of days of use are determined based on an estimated use of the ranges up to 16 weeks per year (1 week per month plus 1 additional week per quarter), 5 days per week. Range use would occur periodically throughout the year, with no predictably busy or non-use periods.

[b] Estimates based on the maximum number of shooters per day who could make use of each proposed range (calculated by multiplying the number of firing points or lanes by the number of firing relays), firing the number of rounds prescribed for a standard string of fire. This estimate is consistent with the ammunition allocation for the relocated Agreed Implementation Plan units.

[c] Night refers to non-daylight hours that are generally 7:00 p.m. – 6:00 a.m. on Tinian.

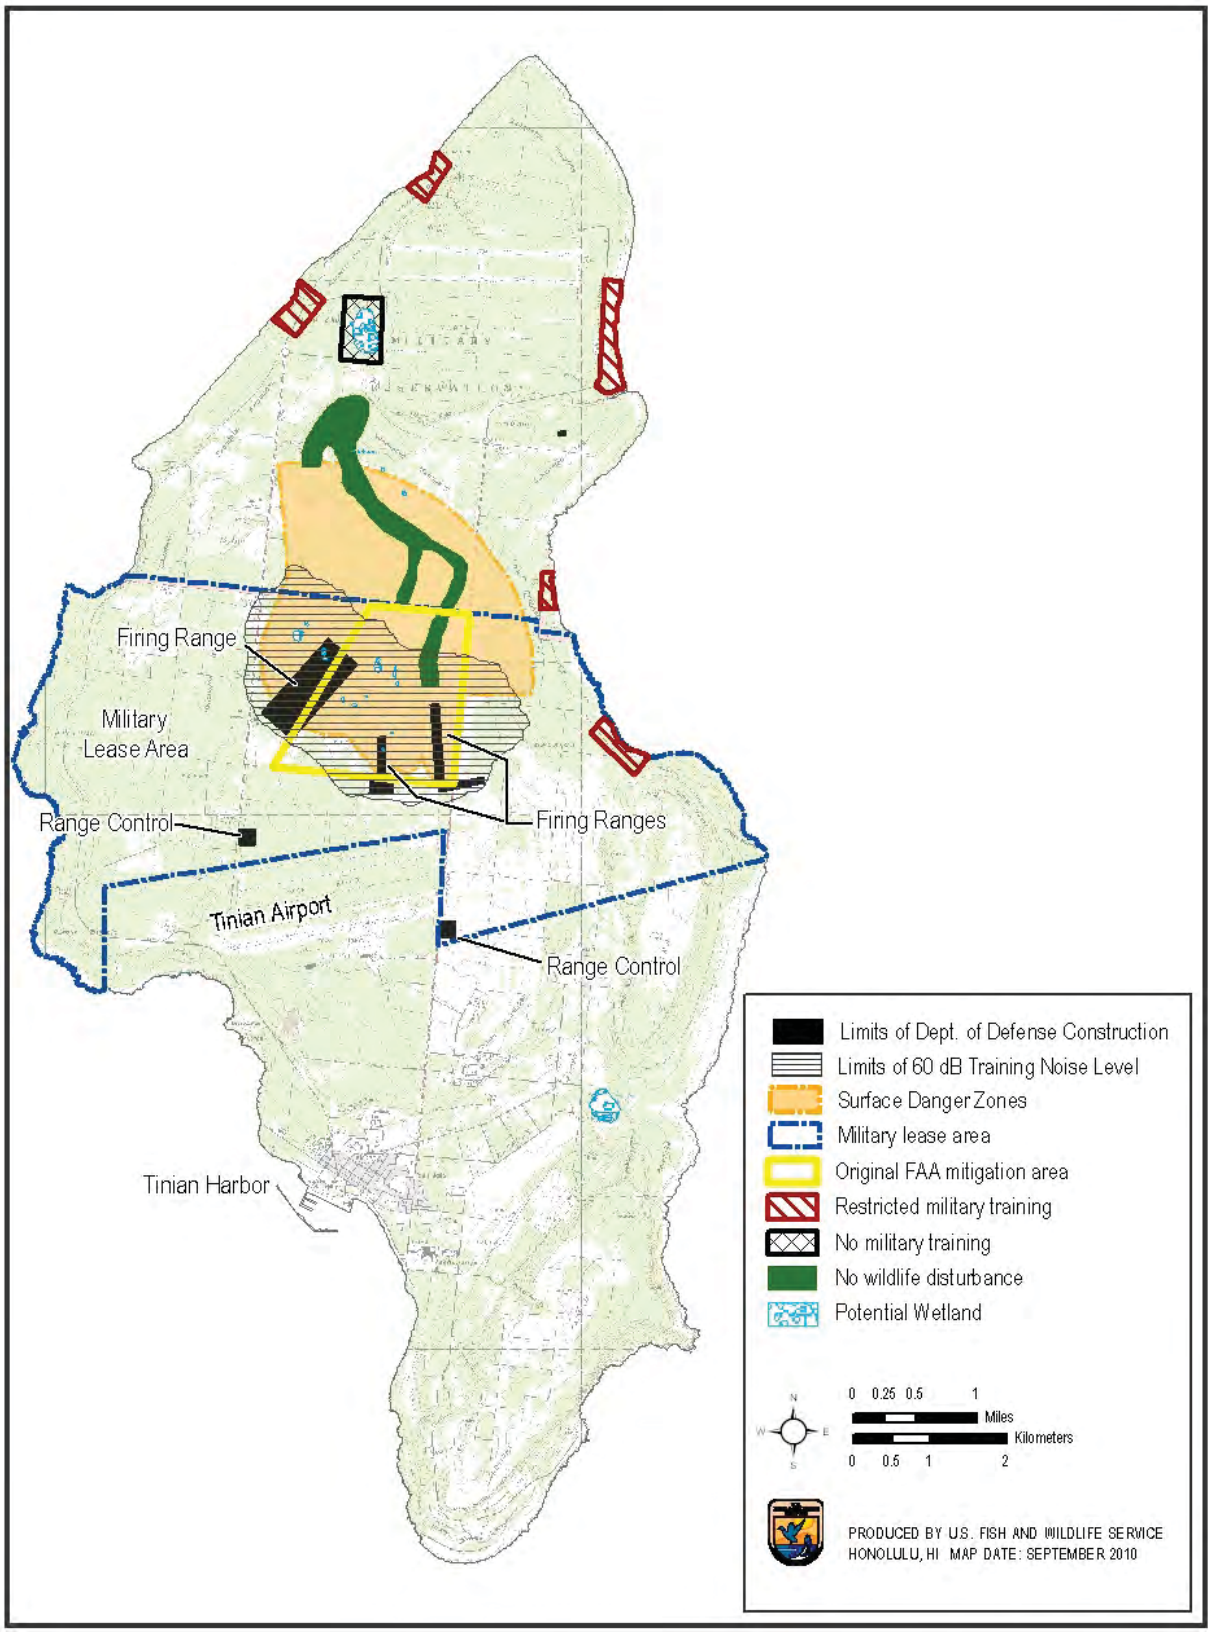

Figure 7. Noise footprint for proposed live-fire training exercises on Tinian.

The ranges as proposed will be used by up to 400 military personnel at a time. Ranges will primarily be used during daylight hours; however, some training is required during nighttime hours, typically between the hours of 7 p.m. and 6 a.m. Figure 7 delineates the approximate areas that will be impacted by noise resulting from weapons use at the training ranges.

Activities outside the Range Footprint on Tinian. Outside the range footprint, activities will include those required for assembling the personnel undergoing training, parking vehicles, issuing ammunition, and passing orders and instruction. A typical one-week long training exercise on Tinian will entail 200 to 400 personnel flying to Tinian, transporting any larger items via barge, setting up a billeting area within the Military Lease Area, and traveling each day by foot or bus to the firing ranges. Sanitary facilities will be provided through portable means. Range targets will be operated on batteries, but a portable range generator or solar-battery system may be utilized to operate the tower. For safety reasons, the public will be excluded from areas within the surface danger zones while training is being conducted.

The range training area will need to be secured and cleared of non-participating personnel during live-firing to avoid the potential for injury from ricochet or misdirected shots. Therefore, range flag poles (on which red flags will be flown during range operations), and controlled access points will be established to allow closure of land access to all or portions of the range training area and associated surface danger zones, depending on the firing conditions. Guards will be stationed on perimeter roads to form controlled access points and range control personnel will survey the area for unauthorized people. No facilities or ground-disturbing activities are required for establishment of the range flags, controlled access points, or range observation points.

The transport of 200 to 400 Marines to Tinian from Guam for the proposed one week per month company-level training exercises will be via aircraft between Andersen Air Force Base and Tinian International Airport. If equipment is moved by barge, a single barge will be able to carry the equipment necessary to support the training evolution. The DoN will utilize the existing single individual and canine conducting all brown treesnake interdiction activities on Tinian. The current brown treesnake interdiction quarantine facility is surrounded by a typhoon proof snake barrier. This facility is adequate for the current import rate of cargo proposed for movement onto Tinian. All military related cargoes (construction and training equipment, vehicles, materials, and supplies) from the proposed project will be inspected by USDA APHIS and determined to be clean prior to leaving the quarantine and inspection areas for work or training on Tinian and for shipment off Tinian.

2.1.3 INTERRELATED AND INTERDEPENDENT CIVILIAN ACTIONS

Housing, infrastructure, and facilities for that are indirectly related to the proposed action are addressed in this section. The acquisition of the Route 15 range area, resulting in the relocation of the Guam International Raceway, as well as the relocation of cattle leases in areas slated for development of firing ranges on Tinian are also interrelated to the proposed action.

Temporary Workforce Housing

The Guam Land Use Commission recently issued a new resolution which specifically addresses zoning for temporary workforce housing and requires all temporary workforce housing to be placed in areas designated at "light industrial" (Guam Land Use Commission 2009, 12 pp.). Housing capacity for 2,000 to 18,000 temporary construction workers was approved in April 2010 for a 250-ac (101-ha) parcel in North Tumon, near Two Lovers Point. Although the parcel was previously disturbed, intact limestone forest occurs on the sites adjacent to the planned housing area. Existing housing and housing which could be retrofitted on and off installations in northern and southern Guam are also likely to be used (Table 7).

Table 7. Anticipated locations for temporary construction worker housing (DoN 2010b, vol. 2, p. 16-89).

Development of Housing, and Facilities: Non-Construction Worker Civilians

During the construction period, an anticipated estimated 16,988 off-island workers will move to Guam to fill non-Federal, non-construction jobs, such as teachers and food service workers in areas adjacent to development of construction worker housing. The DoN refers to this population increase as "indirect" or "induced" growth (Table 8).

In addition to the construction worker and indirect or induced jobs associated with the construction period, approximately 22,968 Federal jobs will be created on Guam, of which 1,836

will be filled by civilian Federal employees (DoN Briefing, March 8, 2010). After construction is completed, the service industry and other support jobs will shrink to a level of approximately 4,482 individuals. The 1,836 civilian Federal employees (and their dependents) and the 4,482 non-Federal employees (and their dependents) will live in areas outside the installations for the duration of project implementation.

Table 8. Anticipated human population increase on Guam resulting from the proposed project (DoN 2010b, vol. 1, page ES – 8).

Notes: [1] DoD population includes military personnel, DoD civilian workers and dependents from off-island.
[2] The Navy rows do not include increases from the transient presence of aircraft carrier crew with its CSG.
[3] Population figures do not include Guam residents who obtain employment as a result of the proposed actions.

Civilian employees and the longer-term induced jobs will be situated in a manner more closely related to the current civilians whose move to Guam was military-related (U.S. Census Bureau, 2000). The geographic distribution of the anticipated indirect/induced population increase resulting from the project is shown in Figure 8.

Additional jobs will be created as an indirect result of the construction period staffing buildup. They include public service workers such as teachers as well as restaurant and other service industry positions. As the DoD facilities are constructed, jobs for permanent DoD civilian employees will be filled (refer to Table 8).

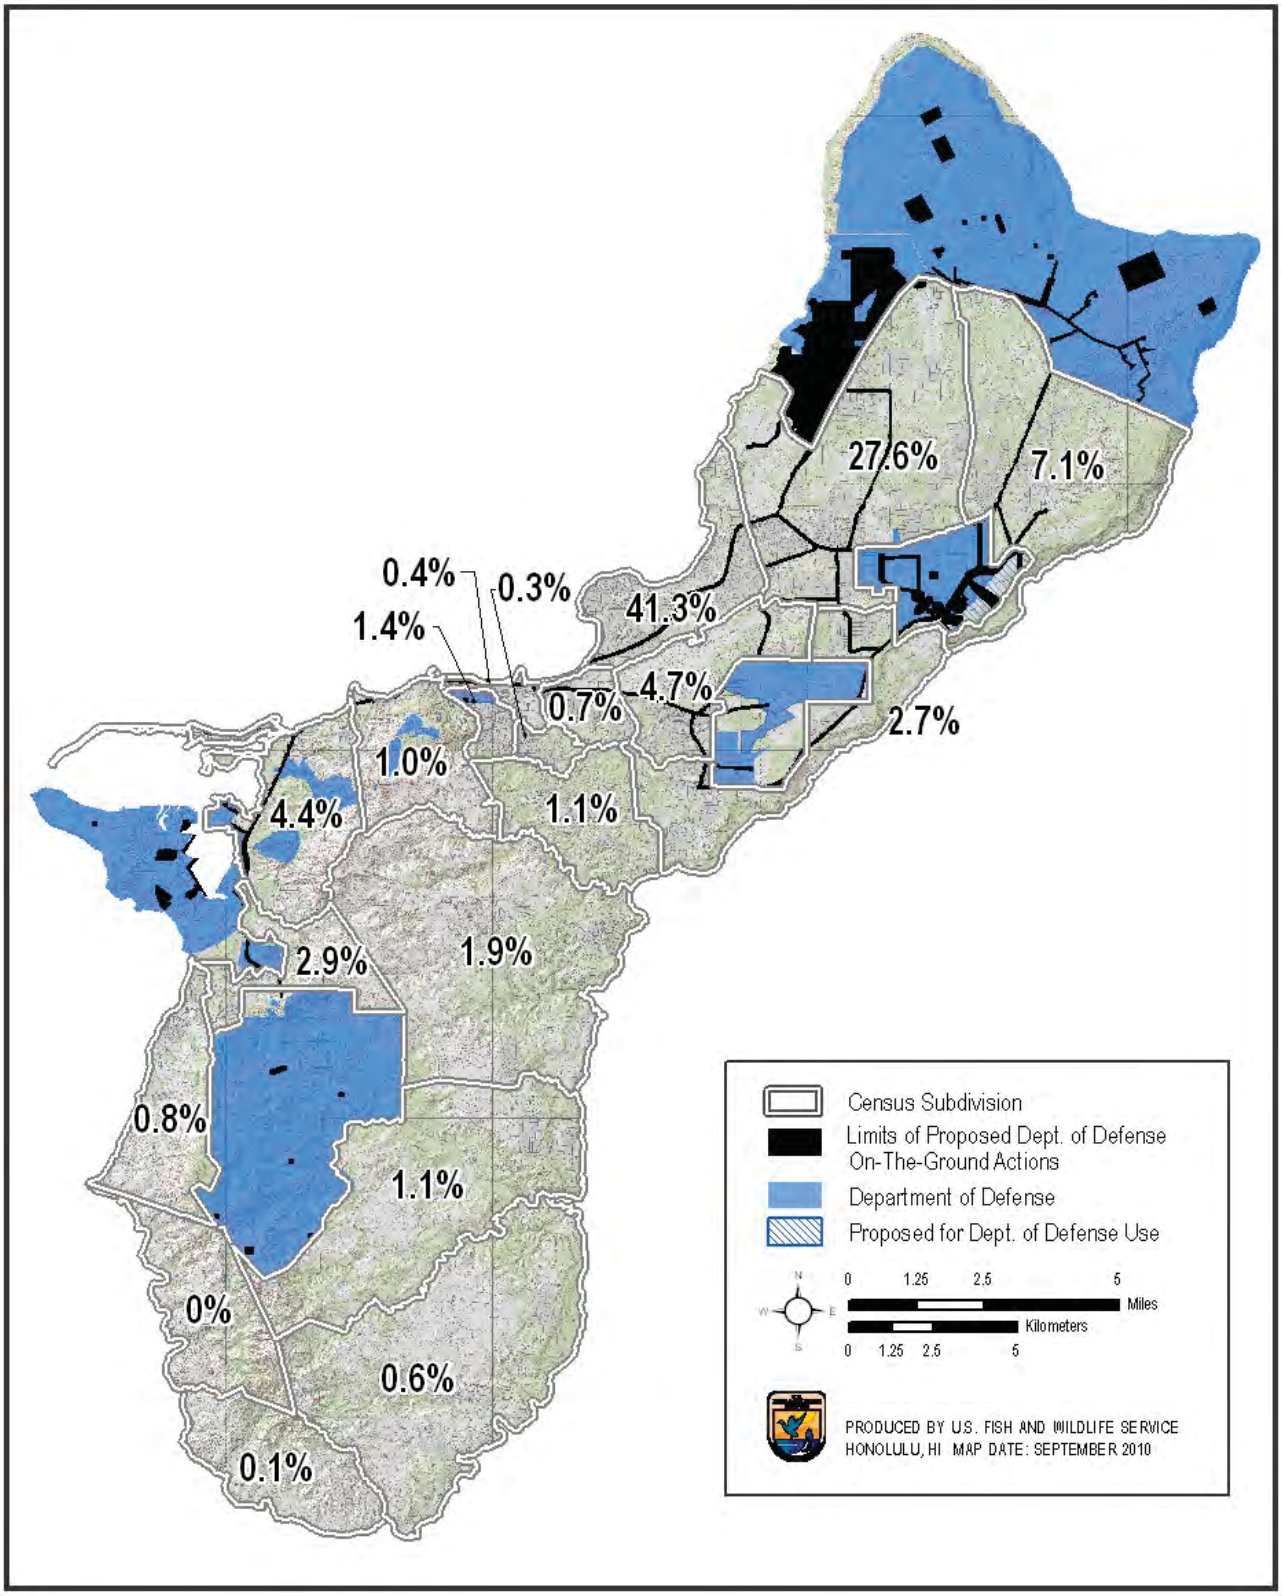

Figure 8. Estimated geographic distribution of the indirect/induced human population increase resulting from the project, derived from information in Table 8 and U.S. Census Bureau (2010) data.

Relocation of the Guam International Raceway

Acquisition of private and Chamorro Land Trust and the Ancestral Lands Commission lands will be necessary for DoD's development of the Route 15 Range Complex. A non-profit organization operates the Guam International Raceway on the northernmost portion of the proposed training range complex. In the event DoD acquires or leases the land, the Guam International Raceway would have to decide whether to continue operation in another location. If it continues operations it may be eligible for relocation assistance from DoD pursuant to the Uniform Assistance and Real Property Acquisition Polices Act of 1970. If eligible, DoD would provide relocation assistance in the form of advisory services, and some specific financial assistance related to a move, but would not fund the physical relocation of the operations of the Guam International Raceway. Selection of any new raceway location would be subject to land use decisions by the Government of Guam. Should the Guam International Raceway decide to continue operations at an alternate location and be eligible for relocation assistance from DoD, DoN will work with Government of Guam land use and natural resource officials to ensure that project impacts to recovery habitat are minimized in any relocation effort.

Solid Waste

Under the proposed action, the currently unimproved DoN Landfill at Naval Base Guam will be used until the new Layon Landfill is completed by Government of Guam in 2011. The proposed project will use the Layon Landfill and the DoN landfill for disposal of all DoD solid waste. The existing DoN Landfill has the potential for providing 10 years of capacity based on the computed demand, assuming a landfill height of 54 ft (16 m) and completion of minor operational improvements such as reducing the daily cover and using larger compaction equipment to achieve greater densities.

In northern Guam, new facilities will be constructed and existing facilities will receive increased use at Andersen Air Force Base, including the Northwest Field Naval Munitions Site, the proposed Main Cantonment area at Naval Computer and Telecommunications Station Finegayan, Naval Base Guam, Andersen South and the proposed Route 15 Range Complex. Construction and operational uses on each installation are described below, followed by information applicable to construction on all Guam installations and to the construction of infrastructure and utilities on and adjacent to the installations.

Relocation of the Tinian Cattle Leases

The DoN formerly proposed to terminate all subleases in the leaseback area to accommodate the new training ranges. To minimize impacts from terminating all subleases, the DoN has revised its Project Description and will only terminate subleases in the leaseback area that are within the footprint of the proposed ranges. The relocation of these leases will be under the control of the CNMI government as they are responsible for non-Federal land use decisions on Tinian.

2.1.5 CONSERVATION MEASURES TO MINIMIZE AND OFFSET PROJECT IMPACTS

The project's conservation measures are designed to avoid or minimize project impacts to listed species and their habitats or to contribute to the recovery of a listed species. The conservation measures include those that were proposed in the biological assessment and the Final EIS (including the best management practices (DoN 2010b vol. 7, pp 2-4 to 2-23) (duplicated in Appendix A of this Biological Opinion)). Highlights of these conservation measures, in addition to updated descriptions of conservation measures that were modified during the formal consultation period are described below. Conservation measures are considered part of the proposed action and they will be implemented in full. Any changes to, modifications of, or failure to implement these conservation measures may result in a need to reinitiate this consultation. Modifications to aspects of the conservation measures described, that provide protection equal to or greater than the protection afforded by the measure as it is proposed in this Project Description may be substituted for those provided in this Biological Opinion with the Service's written concurrence. The conservation measures will be implemented prior to or concurrent with construction unless otherwise stated.

General Conservation Measures to Contribute to the Recovery of Listed Species

1. The DoN conservation measures are intended to support re-introduction of native endangered or threatened species on DoD lands on Guam consistent with species recovery plans. In further support of such recovery efforts, the DoN intends to actively participate in recovery committees for endangered or threatened species on Guam. When the DoN and Service mutually agree the constraints to reintroduction of native threatened or endangered species on DoD lands on Guam have been minimized to a point that a feasible and successful re-introduction of the affected species is more probable than not, the DoN will work with the Service to develop a re-introduction plan and supporting programmatic biological opinion that ensures such re-introduction efforts are consistent with the species recovery plans and the military mission on Guam.

2. The DoN will fund the development and implementation (if determined feasible) of Guam Micronesian kingfisher introduction plan(s) on islands other than Guam. The DoN will work with the species experts, regulatory agencies and local governments to determine appropriate islands for a managed introduction with the goal of full release. In order for DoN to be able to fund the project, the island(s) shall be either U.S. territories or U.S. protectorates. The plan(s) will include selection of a minimum of one island for introduction with the goal of implementing actions on three suitable islands, identifying and controlling threats to endangered birds on each of these islands prior to introduction; habitat management, and specific introduction targets to ensure source populations are not harmed by removing birds while introducing birds in high enough numbers to contribute to self-sustaining populations. The management of introduced populations will be conducted by DoN-funded biologists. The introduction of a wild kingfisher population outside of Guam might be more viable than one reintroduced directly from captivity to Guam because it could be established in habitat that has not been compromised by brown treesnakes. The overall goal of the action is to develop three

self-sustaining populations that will complement captive populations and buffer captive and existing populations against stochastic events in the interim and long-term to allow for "wild" individuals to be reintroduced to Guam if and when native ecosystems on Guam are restored to support a viable population. Funds for planning and implementation will be released within 24 months of initiation of clearing affected recovery habitat within the proposed Main Cantonment. If this conservation measure is not feasible, DoN will work with the Service to develop a comparable conservation measure to benefit the Guam Micronesian kingfisher.

3. The DoN will hire two additional DoN biologists to implement conservation and recovery actions on Guam National Wildlife Refuge Overlay lands and ensure conformance with requirements within this Biological Opinion (DoN 2010a, p. 130). The DoN will meet with the Service (Ecological Services and Refuges) at the beginning of the fourth quarter of each fiscal year to review progress and mutually identify priorities and specific actions for the coming fiscal year. Actions should be targeted to on-the-ground conservation actions (or steps needed to prepare for on-the-ground actions) identified in Integrated Natural Resources Management Plans, recovery plans, five-year status reviews, Comprehensive Wildlife Conservation Strategy, or other actions identified as priorities for natural resources management. The job announcements for the DoN Overlay Refuge biologists will be provided to the Office of Personnel Management within six months of the start of construction actions within Guam National Wildlife Refuge Overlay. The two biologists are proposed because of the increased workload due to the new projects. Goals for the biologists include ungulate removal, forest enhancement, establishing fire management plans, etc.

4. DoN will ensure funding for two biologists on Rota for a 12-year period, beginning in FY11 to conserve the Mariana crow and the Mariana fruit bat. Initially the two biologists will be DoN contractors and as soon as possible DoN will work with Office of Management and Budget to ensure a budget-based transfer is completed to enable the Service to fund two Senior Fish and Wildlife Biologists (e.g., Service Fish and Wildlife Biologists with experience implementing complex projects; experience in the CNMI/Guam and familiarity with threatened and endangered species in the Pacific Islands) for the remainder of the 12-year period.

5. The DoN will hire two DoN Conservation Law Enforcement Officers to increase security on DoN lands and prevent poaching. The DoN will sign a Memorandum of Agreement such that these law enforcement officers can assist Service law enforcement officers (on Guam and all islands within the CNMI) with violations under the Act, Lacey Act, Migratory Bird Treaty Act, and Convention on International Trade in Endangered Species (CITES). The DoN will hire the two law enforcement officers within the first two years after the initiation of construction within recovery habitat in the proposed Main Cantonment area or Andersen Air Force Base as this is when large fluxes in population will begin to occur (DoN 2010a, p. 16). Ongoing objectives will include elimination of poaching on DoD land.

6. To assist in understanding long-term trends in habitat and vegetation on Guam and Tinian, the DoN will re-evaluate and re-structure the existing vegetation monitoring and anchor points that have been established on Guam and Tinian to provide information necessary for long-term habitat monitoring associated with DoD natural resources management efforts (DoN 2010a, p. 135). The purpose of the vegetation monitoring is to track the effects of ungulate removal, identify potential invasive plants and document the effects of training on the vegetation. This has been an ongoing project. The monitoring locations will change as a result of the project and subsequently through adaptive management. Construction areas and trails used during training will be monitored. If incipient populations of invasive species are detected, an eradication strategy will be developed and implemented.

7. The Ungulate Management Plan will be finalized by the DoN for DoD lands on Guam to include specific management and control of ungulates. The objective of the Ungulate Management Plan (in progress) is to improve habitat quality for special status species, reduce erosion, and reduce habitat degradation on DoD lands. Implementation of the plan will begin within one year of plan finalization (DoN 2010a, p. 129). The Service will be provided a 30-day period, from the date of receipt of the draft Ungulate Management Plan, to provide comments and recommendations for the DoN's consideration. The initial phase of management will entail significant effort; sustained maintenance and control will require less ongoing effort.

8. To develop a better understanding of baseline populations and long-term ecological processes of sea turtles in the waters of Guam, Saipan, Tinian and Rota, the DoN in conjunction with relevant Federal resource agencies will develop and implement a joint investigation on sea turtle population abundance estimates, demographic information, near-shore habitat use, baseline populations, and long-term population parameters (DoN 2010a, p. 134). The DoN funded study is proposed to include a long-term foraging habitat and mark-recapture program combined with laparoscope examinations to acquire necessary abundance estimates as well as growth, reproductive status, and sex ratio information essential for adequate population demographic modeling. A long-term, in-water study will provide valuable information regarding near-shore foraging habitat use, and combined with applied research techniques including sonic (or acoustic) tags, satellite telemetry, and genetic analysis will provide greater insight into foraging ecology, migratory movements and connectivity of sea turtles within the greater Western Pacific region. This measure will begin within the first two years of construction activities (DoN 2010a, p. 16).

Site-Specific Conservation Projects: Outdoor Recreation Area, Ecological Reserve Areas, and Habitat Restoration

DoN will implement the following conservation projects on Guam:

1. The DoN will establish an outdoor recreation area at the proposed Main Cantonment area to protect native vegetation and will limit recreation to designated trails, picnic tables, interpretive panels, benches, and barbeque pits. The area will also serve to direct recreation away from sensitive habitats near and within the Haputo Ecological Reserve Area (i.e., beaches, cliffline forests). Designated trails will be in place and off-trail training or recreation may not be allowed. Recreation is intended to be passive and not alter the habitat such that it would become unsuitable for supporting listed species. Development of the outdoor recreation area will begin within one year of initiation of construction on the proposed Main Cantonment area or Andersen Air Force Base. The outdoor recreation area will be implemented prior to new training within the Proposed Main Cantonment.

2. Four proposed Ecological Reserve Areas, a Route 15 Range Conservation Area, and proposed wetland and forest restoration project areas, shown in Figure 9, are summarized by installation, below.

<u>Andersen Air Force Base</u>

1. The DoN will submit a proposal to create the Ritidian Point Ecological Reserve Area to protect native limestone forest habitats in northern Guam that are recovery habitats for the Mariana crow, Guam Micronesian kingfisher, Mariana fruit bat, and *Serianthes nelsonii*. The Ritidian Point Ecological Reserve Area is proposed to be contiguous with and incorporate the areas protected under the ISR Strike Biological Opinion (USFWS 2006a, 73 pp.) and Northwest Field (USFWS 2006b, 7 pp.) consultations. Long-term management of the Ecological Reserve Area will be added to the Integrated Natural Resources Management Plan. By incorporating the previous mitigation areas into the Ritidian Point Ecological Reserve Area, this measure will ensure compliance with the prior consultations as the mitigation areas have not been formally designated as protected. The entire Ritidian Point Ecological Reserve Area will be approximately 781 ac (316 ha) of habitat for listed species, of which 601 ac (243 ha) were required by the ISR Strike Biological Opinion and Northwest Field consultations. This proposal to designate an area as an Ecological Reserve Area will be initiated no later than six months from start of construction associated with the proposed action. If the submitted proposal is not approved, DoN will work with the Service to develop an alternate conservation measure (or measures) to provide equal or greater conservation benefit.

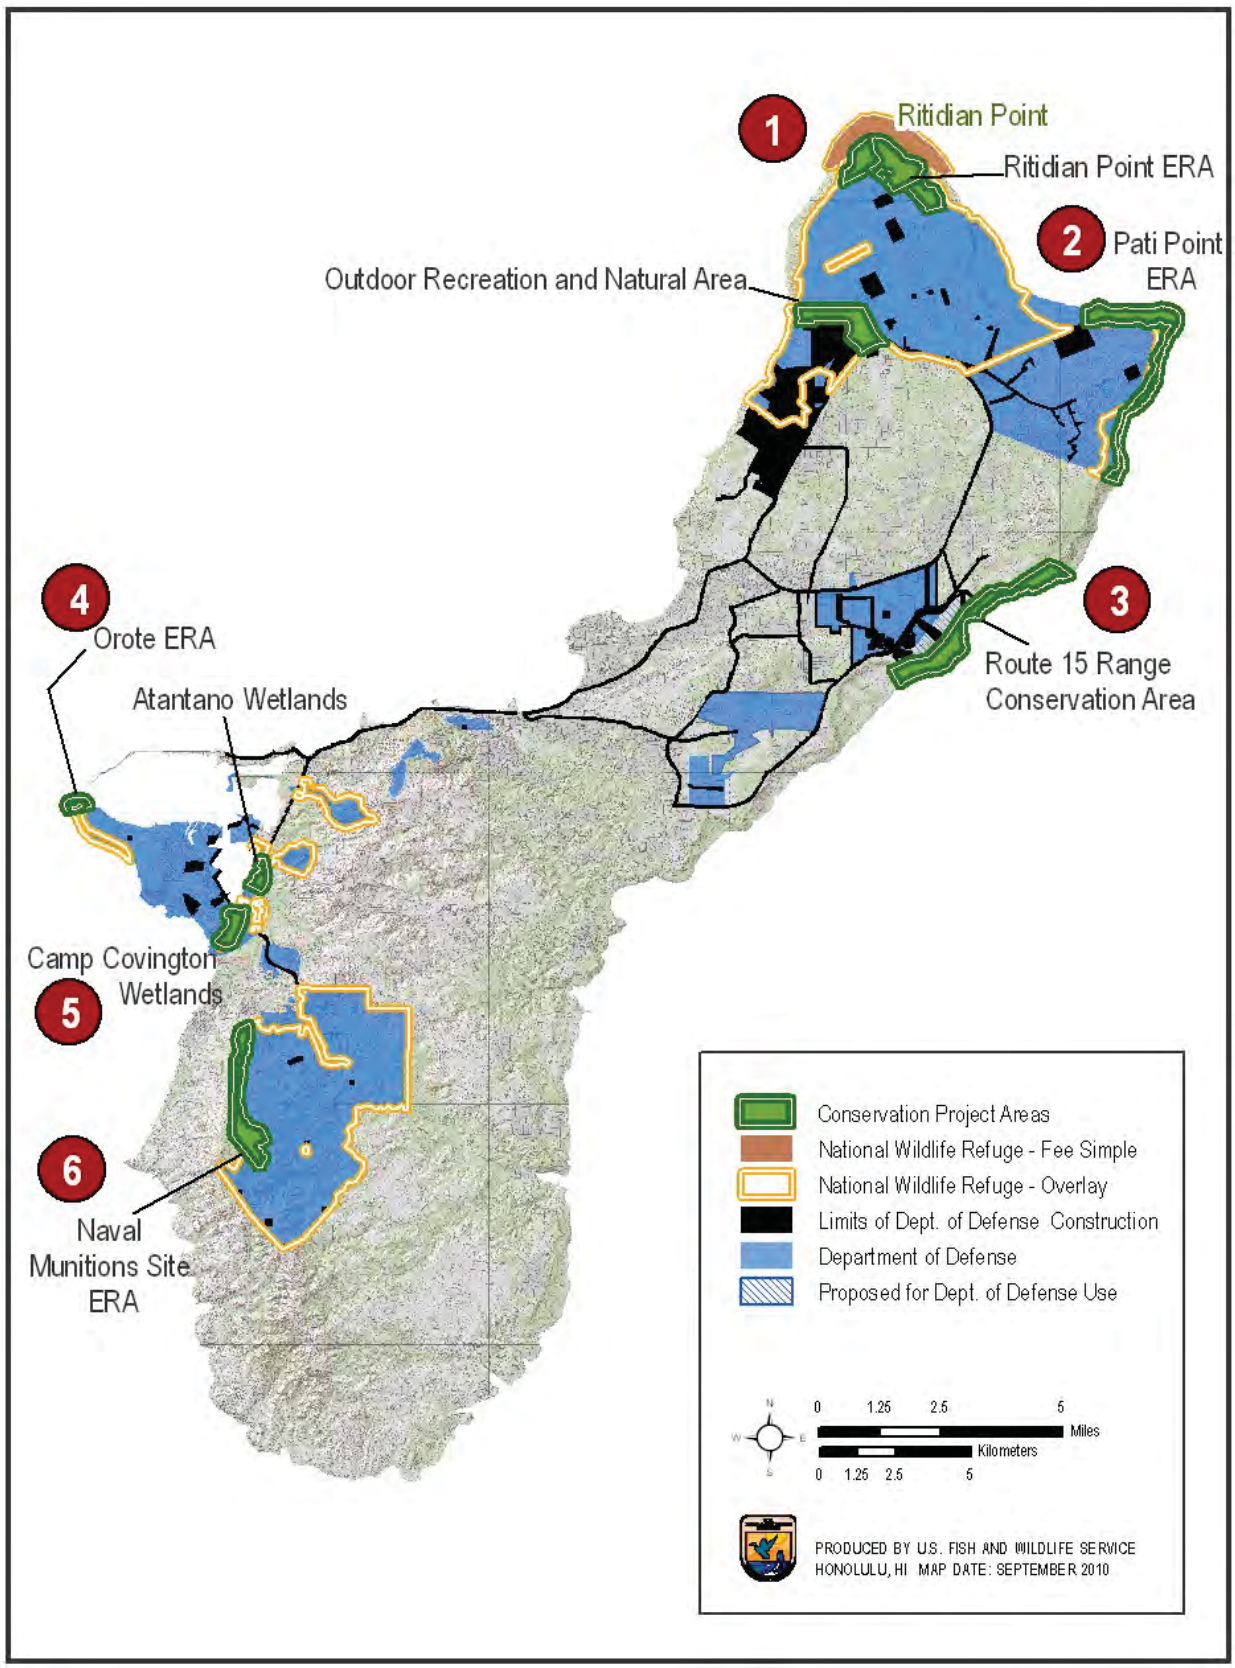

Figure 9. Proposed Ecological Reserve Areas and wetland restoration project sites.

2. The DoN will submit a proposal to Chief of Naval Operations N45 to create the Pati Point Ecological Reserve Area to protect native limestone forest habitats in northern Guam which are recovery habitats for the Mariana crow, Guam Micronesian kingfisher, *Serianthes nelsonii,* and Mariana fruit bat. The new Ecological Reserve Area is proposed to include approximately 713 ac (289 ha) of habitat for listed species and will be situated in an area previously designated as the Pati Point Natural Area and it lies within the Guam National Wildlife Refuge overlay. This measure will be implemented prior to any clearing or construction related to the potable water system, air mobility campus, air embarkation area, or the air combat element, or when flight operations under the proposed action increase (anticipated 2014, DoN 2010a, p. 62), whichever comes first. If the submitted proposal is not approved, DoN will work with the Service to develop an alternate conservation measure (or measures) to provide equal or greater conservation benefit.

3. The DoN will fund research on the Mariana fruit bat. The long-term goal is to develop guidelines to be used in recovery and sustainable management of fruit bats on different islands. Research will include, but is not limited to, demographic information used in population viability analysis (age of sexual maturity, timing and frequency of births, survivorship, longevity, adult and juvenile dispersal and frequency of inter-island movements); carrying capacity (quantification of habitat quality, density by habitat type, and habitat availability); island-wide population surveys throughout the range; estimates of predation by brown treesnakes and hunters; identification of any other population-limiting factors (DoN 2010a, p. 135). This project will be funded within one year of clearing or construction related to the potable water system, air mobility campus, air embarkation area, or the air combat element, or when flight operations under the proposed action increase (anticipated 2014, DoN 2010a, p. 62), whichever comes first.

Andersen South and Route 15 Range Complex

To the maximum extent practical, the DoN will coordinate with the Government of Guam to conserve the limestone forest habitat on Government of Guam lands spanning from the area east of the proposed ranges on Route 15, north, to the Government of Guam's existing Anao Conservation Area. The area is zoned as "Park/Open Space" in the North and Central Guam Land Use Plan (Government of Guam, 2009 pp. 2-14). These lands are recovery habitat for the Mariana crow, Guam Micronesian kingfisher, *Serianthes nelsonii*, and Mariana fruit bat. The intention is to develop a continuous band of protected area from the Andersen Air Force Base at the Pati Point Ecological Reserve Area through Government of Guam's Anao Conservation Area south to the proposed Route 15 Range Complex. This will involve working with Government of Guam to designate the Anao Conservation Area as protected in perpetuity and then developing a Cooperative Agreement or Memorandum of Understanding on joint natural resources management to benefit listed species and their habitats in the entire area. The proposed conservation area will be approximately 850 ac (344 ha) of habitat for listed species in addition to the Anao Conservation Area. Coordination will be initiated prior to any proposed construction on Andersen South or Route 15. If the submitted proposal is not approved, DoN

will work with the Service to develop an alternate conservation measure (or measures) to provide equal or greater conservation benefit.

Naval Base Guam

1. The DoN will submit a proposal to Chief of Naval Operations N45 to expand the existing Orote Ecological Reserve Area to encompass Orote Island (seabird nesting habitat), Adotgan Point, and the Spanish Steps area that supports sea turtle nesting (DoN 2010a, p. 125) on Naval Base Guam. The expansion will add approximately 32 ac (13 ha) of terrestrial habitat to the Orote Ecological Reserve Area. The proposal for the expansion of the Ecological Reserve Area will be initiated within the first year of construction activities at Naval Base Guam. If the submitted proposal is not approved, DoN will work with the Service to develop an alternate conservation measure (or measures) to provide equal or greater conservation benefit.

2. No proposed project related construction or training actions will occur at the Camp Covington wetlands (DoN 2010a, p. 130). A restoration plan will be developed for the Camp Covington wetlands in an effort to increase suitable habitat for the Mariana common moorhen. If Camp Covington is deemed unsuitable for wetland enhancement or restoration, the Atantano wetlands will be evaluated for restoration potential. The wetland enhancement will begin concurrently with the new aviation training (i.e., Terrain Flights) over the Talafofo River basin and the Naval Munitions Site. This measure will also be implemented prior to highway improvements to bridges along Route 1 or training in the southern Naval magazine from the proposed project, whichever occurs first. If neither wetland is deemed suitable for restoration, the DoN will work with the Service to develop an alternate conservation measure (or measures) to provide equal or greater conservation benefit.

Naval Munitions Site

1. The DoN will submit a proposal to Chief of Naval Operations N45 to create the Naval Munitions Site Ecological Reserve Area to conserve native limestone forest habitats in southern Guam which are recovery habitats for the Mariana crow, Guam Micronesian kingfisher, and Mariana fruit bat (DoN 2010a, p. 125). The new Ecological Reserve Area will be added to the Integrated Natural Resources Management Plan. The proposed Ecological Reserve Area will encompass approximately 553 ac (234 ha) of habitat for listed species. This measure will be initiated prior to initiation of project related construction or training in the southern Naval magazine, whichever occurs first. If the submitted proposal is not approved, DoN will work with the Service to develop an alternate conservation measure (or measures) to provide equal or greater conservation benefit.

2. The DoN will implement forest enhancement and restoration in the Naval Munitions Site. A minimum of 8.9 ac (3.6 ha) will be restored. Enhancement and restoration will occur in areas contiguous with existing recovery habitats to increase the overall amount of recovery habitat within southern Guam. A forest restoration and

enhancement plan will be prepared by a qualified forester/plant ecologist who has knowledge of Guam's forest ecosystems. The goal of the forest enhancement is to increase the habitat suitability for native wildlife species. Forest enhancement and restoration will begin prior to implementation of any construction or training activities in the Naval Munitions Site and will follow the guidelines below.

In savanna areas, forest restoration and enhancement will include non-native species eradication or control and:

a) establish greenbelts of *Acacia* spp. to fix soil nitrogen, build soil quality, and limit the spread of wildland fires;

b) extend greenbelts to become contiguous forest areas with recovery habitats;

c) underplant *Acacia* spp. with native species; and

d) reduce *Acacia* spp. after native species are established.

3. On Overlay Refuge lands and adjacent DoD lands the objective would be to achieve and maintain low numbers of non-native feral mammals (cats, (*Felis catus*), dogs (*Canus lupus*), and ungulates).

4. The DoN will work with the Government of Guam to investigate the feasibility of restoring habitat within the Bolanos Conservation Area. If habitat restoration is determined to be feasible, the DoN may choose to restore habitat such that over the long-term it is restored into recovery habitat.

5. If the DoN decides that additional restoration is feasible, the DoN will work with the Service to develop a recovery crediting program (or similar assurances) for these sites, if applicable.

Site-Specific Conservation Measures to Minimize Impacts of Construction and Training on Guam and Tinian

1. Due to environmental, biological, cultural, or safety factors, there must be flexibility to where each individual facility is physically located within the project footprint. Within a project area footprint as described above in the Project Description, construction will occur within the limits of construction shown in the Project Description's figures. As site specific plans for construction projects are developed, to the maximum extent practical, the DoN will minimize overall habitat loss, within these limits of construction, by incorporating language and a map into the site plans that identifies environmentally sensitive areas. DoN will further encourage contractors to avoid or minimize their impacts. Under no circumstances shall equipment or personnel move outside the designated construction zone (including staging areas) and into native vegetation. Contractors working on the proposed

project will be responsible for all materials and labor for the repair of all unauthorized vegetation damage and will be required to replace any damaged vegetation onsite and provide maintenance and monitoring in accordance with the landscape requirements.

2. The DoN will hire two full-time biological monitors during the construction phase. The Biological Monitors shall be responsible for oversight of avoidance, minimization, mitigation, and conservation measure implementation by the construction contractors for projects associated with the proposed action. Additionally, the Biological Monitors will provide training, review, and guidance on Hazard Analysis Critical Control Point (HACCP) plan development, implementation, and revision during the construction phase of the buildup on Guam. The Biological Monitor shall ensure that construction remains within the limits of construction and that sensitive resources are avoided, unless otherwise specified in this Project Description. These positions will be filled and implemented prior to initiation of construction within recovery habitat on the proposed Main Cantonment area or Andersen Air Force Base.

3. The Biological Monitors will also:

   a) assist with the implementation, review and compliance at project sites, conduct site visits and provide expert knowledge to contractors and workers. They will be familiar with goods that need to be certified, inspection techniques, and reporting requirements for HACCP and sanitation procedures.

   b) assist with the preparation of site plans and specifications for each construction package.

   c) assist with the review of construction specifications and provide assistance with incorporating environmental laws, best management practices, and standardized procedures into the construction project specifications supporting this action.

   d) review practices and provide revisions to contract specifications to ensure they are in compliance with legally enforceable environmental policies with particular attention being paid to the prevention, control, and minimization of moving of non-native invasive species inter- and intra-island.

   e) one week prior to any clearing of vegetation, the Biological Monitor will survey the delineated limits of construction to determine if any listed species are present. The Biological Monitor will have experience in the identification of listed species by sight, sound, and nesting behaviors.

      i. If Mariana crows are nesting within 984 ft (300 m) of the project site, the work must be postponed until conclusion of the nesting event (65 days to build the nest, incubate eggs, and fledge the juveniles, Morton et al. 1999, pp.12-17).

ii. If a Mariana fruit bat is present within 492 ft (150 m) of the project site, the work must be postponed until the bat has left the area.

iii. If nesting Mariana common moorhen are present, clearing and construction will be postponed until the chicks have fledged. If work stops for more than one week, pre-construction surveys should be repeated to ensure that no birds have begun nesting.

iv. If Micronesian megapodes are present within 492 ft (150 m) of the project site, the work must be postponed until the megapode has left the area. If megapodes are nesting within 984 ft (300 m) of the project site, on Tinian, the work must be postponed and the Service contacted immediately as no nesting is known to occur there.

v. The presence of a listed species will be reported to the Service and Guam Division of Aquatic and Wildlife Resources or CNMI Division of Fish and Wildlife within 48 hours, but the location of species will not be revealed to any other outside party.

f) will ensure that the construction contractor has clearly staked the project limits and the boundary remains in place throughout construction. The Biological Monitor will accurately map and prepare monitoring reports documenting actual impacts of proposed project construction.

g) such advice and technical expertise provided by the Biological Monitor shall not relieve contractors of their liabilities for compliance with relevant resource protection laws and regulations, including the Act.

4. Prior to the initiation of construction, a contractor education program will be implemented by the DoN to ensure that contractors and construction personnel are informed of the biological resources associated with this project. This program will focus on resource protection; construction contractor identification of sensitive resource areas in the field (e.g., areas delineated on maps and by flags or fencing), environmentally responsible construction practices and protection measures, protocol to resolve conflicts that may arise at any time during the construction process, and ramifications of non-compliance.

5. For any clearing of vegetation that is adjacent to or contiguous with recovery habitat, the perimeter and 98.4 ft (30 m) into the habitat will be surveyed to identify vegetation community composition. This survey will be repeated six months and at one year after vegetation removal to ensure effectiveness of HACCP implementation (clean equipment, supplies, and materials) during construction activities. If new non-native, invasive species are detected, the DoN will notify the Service and the DoN will develop and implement an eradication plan or control effort to prevent infestation.

6. For the minimization of potential impacts to sea turtles and fruit bats, lighting will be designed to meet minimum safety, anti-terrorism, and force protection requirements. To the maximum extent practical, hooded lights will be used at all new roads and facilities proposed for construction and use within sea turtle land-based habitat and Mariana fruit bat habitat.

   Lighting associated with the Andersen South and Route 15 Range Complex ranges will be installed at parking and administrative facilities (DoN 2010a, p. 44). The actual ranges will not have lights. "Night-adapted" lights will be installed in the briefing and bleacher areas. Night-adapted lighting uses bulbs in red or other spectrums that allow a person's eyes to remain adapted to low light or night conditions while still providing enough light for work and safety. Illumination of forest, coastline, or beach will be consistent with range safety and security requirements and kept to an absolute minimum including the shielding of lights and directing lighting away from the forest or other wildlife habitat.

7. Appropriate, native and non-invasive species will be planted in all new landscapes upon completion of proposed construction activities. Plants to be used will be selected from a list of recommended plants identified in the consolidated landscape plan (Naval Facilities Engineering Command, Pacific, in prep.) that incorporates the information in the Architectural Compatibility and Base Design Standards, Andersen Air Force Base, Guam (June 2006), Marianas Region Architectural and Construction Standards, Commander U.S. Naval Forces, Marianas and the Installation Appearance Plan, Commander U.S. Naval Forces Marianas (September 2007) into one plan. Recommendations from the plan include, but are not limited to:

   a) use of at least 50% native species for all landscaping projects.

   b) at least 50% of the plants used should be native species when existing landscape plants need to be replaced.

   c) use of a clumping strategy of several individual plants together whenever possible to increase survival of plants during typhoons.

   d) planting during the wet season between June and September to allow plants to become established before the dry season in January and May.

8. The monitoring and reporting of project implementation will be addressed by Naval Facilities Engineering Command Pacific and Naval Facilities Engineering Command Marianas as part of their natural resources management programs.

Site-Specific Conservation Measures to Minimize Impacts of Construction on Guam

Proposed Main Cantonment Area

At the proposed Main Cantonment Area, the engineer equipment and decontamination training area includes the construction of a water runoff control pond. A wash-down pad and oil-water separator will be installed to ensure hazardous materials are not washed into the pond (DoN 2010a, pp. 38-39). The pond will be a small, rock-lined pit with a drainage sump and constructed such that it does not serve as an attractant for the endangered Mariana common moorhen or other shore or sea birds. Though the soils are porous limestone, the pond will have steep sloping sides and vegetation will be mowed or removed so that foraging and nesting habitat is not created. A Biological Monitor will survey the water runoff control pond to ensure that the completed project does not serve as an attractant for the endangered Mariana common moorhen. The Biological Monitor shall survey the area for one year post-construction after all rainfall events sufficient to allow ponding in the area, to determine if it is an attractant.

Naval Base Guam

1. At Naval Base Guam, dredged material will be used as "Beneficial Reuse" like backfill for the proposed action construction projects (DoN 2010a, p.73).

Site-Specific Conservation Measures to Minimize Impacts of Training on Guam

1. A Fire Management Plan will be prepared to address the potential for fires on proposed new ranges at Route 15 and other proposed new training areas. The Fire Management Plan will address the training, and the new live-fire ranges in one comprehensive Fire Management Plan. The Fire Management Plan will include protocols for monitoring fire conditions and adjusting training as needed (e.g., firing may be disallowed under certain fire conditions), location and management of fuels reductions (DoN 2010a, p. 36), fire breaks, fire fighting roads, fire fighting water systems, burn hazard assessment response, on-call helicopter fire suppression, protocols for using units to be briefed by range control on requirements suitable to the conditions of the day, and protocols that will be implemented should a fire occur (e.g., specifying how the range will shut down and fire suppression actions will be taken). In particular, the Fire Management Plan will provide guidance and direction to ensure fires do not encroach into vegetated areas that can be used by the bat, kingfisher, crow, rail, or moorhen. The Service will be provided a 30-day review period, from the date of receipt of the draft Fire Management Plan, to provide comments and recommendations for the DoN's consideration. The Fire Management Plan will be completed and fully operational (implemented) whenever training occurs at the new firing ranges on Guam.

2. The outdoor recreation area on the proposed Main Cantonment area may be used for compass navigation. No other training will occur within the outdoor recreation area.

3. Other than the new access road, no new roads will be established in the Southern Land Navigation Area and no vehicles will be used within the training site (DoN 2010a, p. 32). Foot trails will be established within the southern portion of the Naval Munitions Site due to repeated use during of the area for maneuver training; however, no large woody vegetation (greater than 4 in or 10 cm) will be removed during training. Prior to training exercises, personnel will inspect themselves and their equipment.

4. Overflights at low levels may result in Bird Aircraft Strike Hazard impacts. To avoid bird strike and noise impacts to Mariana common moorhen and Mariana swiftlet, all aviation training will be conducted so that flights will approach the southern portion of the Naval Munitions Site over the Talafofo River watershed and Fena Reservoir at heights of 1,000 ft (305 m) or greater above ground level. Flights may go up the Ugum River at altitudes of 1,000 ft (305 m) or greater above ground level until they reach 9,843 ft (3,000 m) from the mouth of the river at Highway 4 and then flights may conduct low-level terrain flights. Low-level training flights (DoN 2010a, p. 54) will be restricted to the southernmost portion of the Naval Munitions Site (DoN 2010a, p. 35) where swiftlets and moorhen are not commonly present. As addressed in Chapter 6, Volume 2 of the DEIS, noise will not be above ambient levels.

5. Route 15 Range Complex range berms will contain non-invasive herbaceous vegetation, and other engineering controls to manage stormwater runoff and control erosion.

6. New aviation training at Northwest Field will follow all previous flight restrictions identified in the MIRC (USFWS 2010a, 96 pp.) and ISR Strike (USFWS 2006a, 73 pp.). There will be no operations when Mariana crows are nesting (November through April) and no flights below 1,000 ft (305 m) above ground level, with the exception of landing zones (DoN 2010a, p. 52).

7. After a training event on Guam is complete, vehicles and equipment will return to the wharf or airfield, be inspected and washed prior to being loaded on to the ships or flying off-island (DoN 2010a, p. 75).

8. Consistent with the MIRC BO, the DoD will maintain 328-ft (100-m) no training buffers around the known Mariana swiftlet nesting caves (e.g., Mahlac Cave, Fachi Cave, Maemong Cave) in the Naval Munitions Site and will continue to trap brown treesnake within areas surrounding the swiftlet caves.

<u>Site-Specific Conservation Measures to Minimize Impacts of Construction on Tinian</u>

1. The proposed placement of ranges will decrease the amount of land for conservation set out in the "Dedication of Tinian Military Retention Area Land for Wildlife Conservation". This agreement was a conservation measure within the biological opinion for improvements to the Tinian International Airport (USFWS 1998a, 17 pp.) and was integral to the delisting of the Tinian monarch (USFWS 2004a, 7 pp.). The agreement established a 936-ac (379-ha) mitigation area for the protection of "endangered and threatened wildlife, particularly the Tinian monarch" with the provision that it is the right of the U.S. military to "use the

premises for low-impact military training and for other purposes that do not disrupt the habitat and living conditions of the Tinian monarch." The agreement further states "In the event of a national emergency or other condition requiring the use of this land for military purposes, the United States shall retain the right to unilaterally withdraw all, or any portion of, the respective leasehold lands that are designated the Conservation Area, for national defense purposes." The DoN has elected to not withdraw all the lands from the mitigation area and instead withdraw only a portion for the new firing ranges.

The DoN in coordination with the FAA and the Service would revise the existing FAA Mitigation Area to encompass the central escarpment associated with Mt. Laso to protect some of the largest remaining areas of intact native limestone forest on Tinian (Figure 10).

Proposed ranges would result in the loss of 261 ac (106 ha) of the original 937-ac (379-ha) FAA Mitigation Area leaving 675 ac (273 ha) of the original FAA Mitigation Area remaining. The new revised area would encompass a total of 1,214 ac (491 ha), or an addition of 539 ac (218 ha), a greater than 2:1 replacement of the area lost due to the proposed ranges (DoN 2010a, p. 131). This revised and larger area would serve as important habitat for listed species (e.g., Micronesian megapode, Mariana fruit bat) and the delisted Tinian monarch, in particular increasing the acreage of native limestone forest, mixed introduced forest, and tangantangan within the proposed expanded FAA Mitigation Area. This measure will be implemented prior to construction of new ranges on Tinian.

The DoN will further minimize impacts to listed and other native species on Tinian by developing and implementing a Native Forest Enhancement Plan within the "FAA Mitigation Area" (DoN 2010a, p. 133). The Native Forest Enhancement Plan will focus on improving the quality of native forest habitat and result in the conversion of non-native habitats into native forest types for the benefit of listed species and will be completed at least one year prior to the proposed onset of construction on Tinian. Implementation of the plan will begin prior to constructing new ranges on Tinian.

2. The platoon battle course is being sited in areas not known to be use for breeding by the Mariana common moorhen and all construction will begin during the dry season, if possible, so that noise impacts to Mariana common moorhen are minimized.

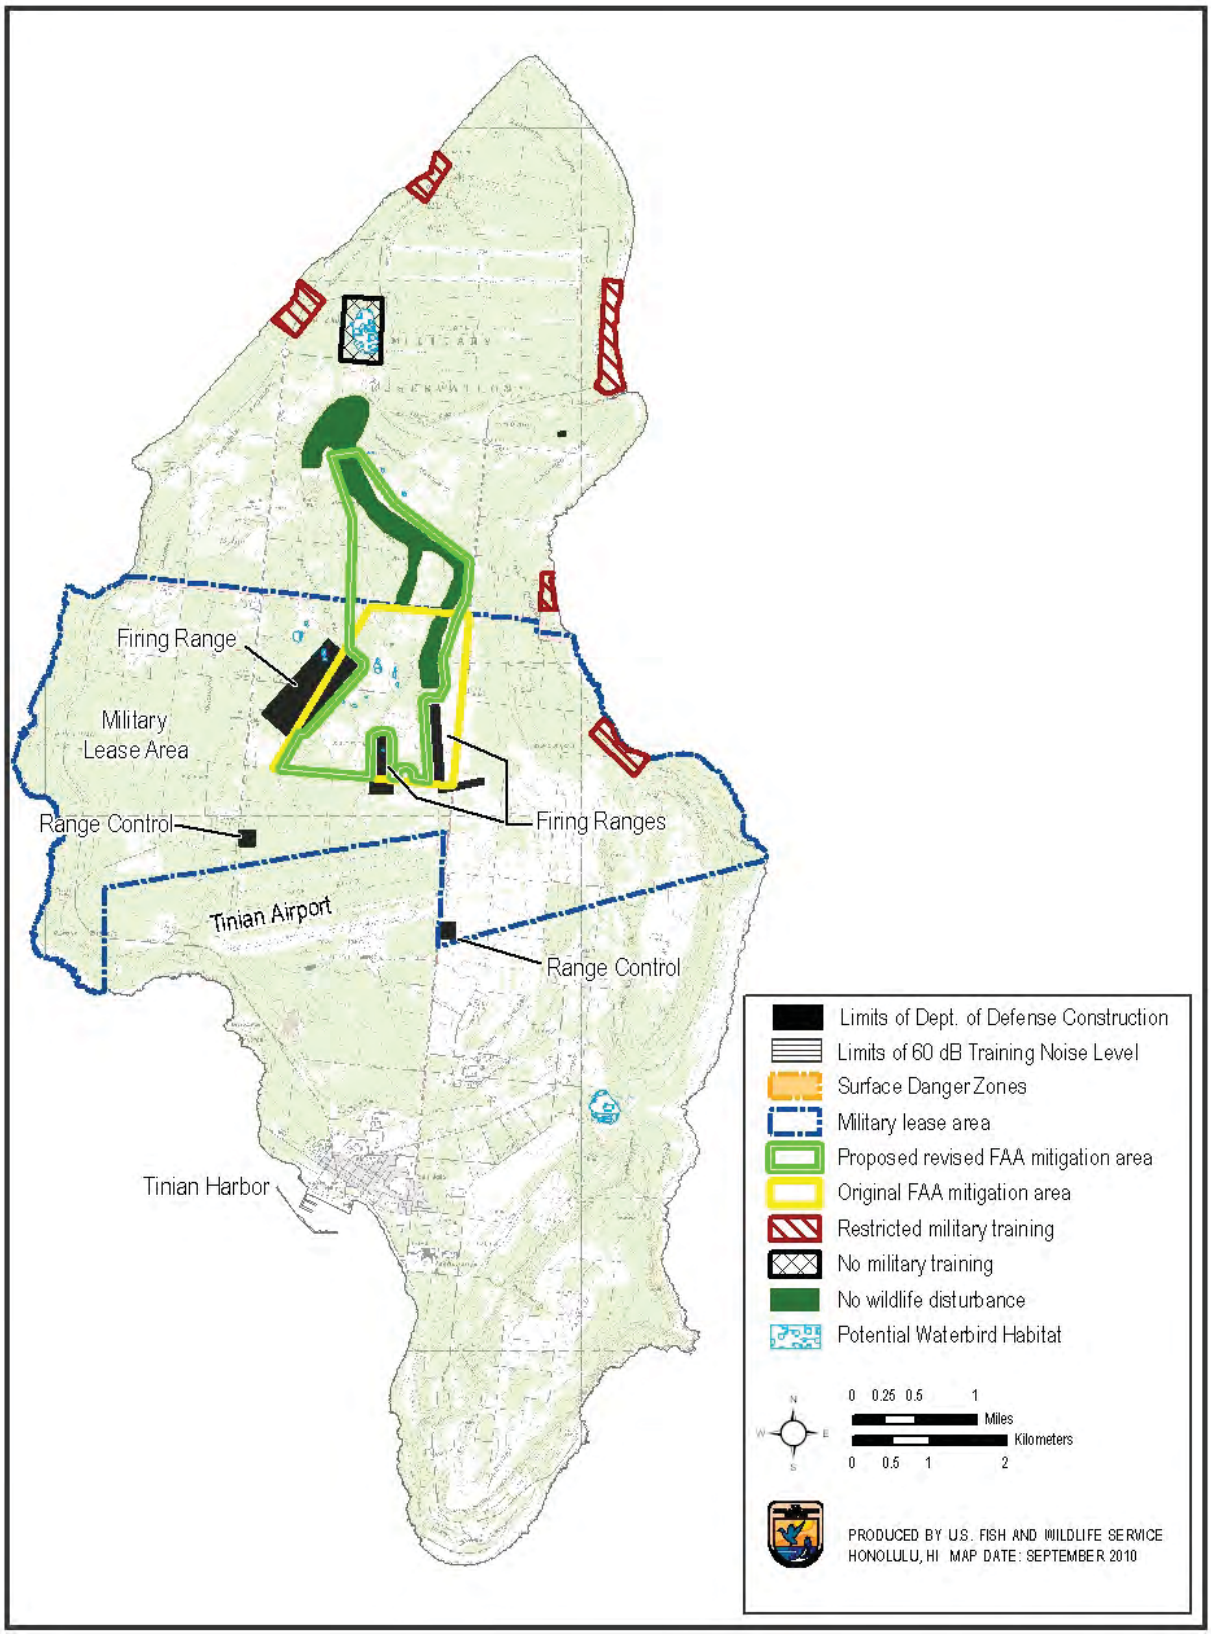

Figure 10. Revised FAA mitigation area on Tinian.

Site-Specific Conservation Measures to Minimize Impacts of Training on Tinian

1. A Fire Management Plan will be prepared to address the potential for fires on Tinian as the result of live-fire training activities on the proposed ranges (DoN 2010a, p. 129). The Fire Management Plan will address the training, and the new live-fire ranges in one comprehensive Fire Management Plan. The Fire Management Plan will include protocols for monitoring fire conditions and adjusting training as needed (e.g., firing may be disallowed under certain fire conditions), location and management of fuel reductions (DoN 2010a, p. 36), fire breaks, fire fighting roads, fire fighting water systems, burn hazard assessment response, on-call helicopter fire suppression, protocols for using units to be briefed by range control on requirements suitable to the conditions of the day, and protocols that will be implemented should a fire occur (e.g., specifying how the range will shut down and fire suppression actions will be taken). In particular, the Fire Management Plan will provide guidance and direction to ensure fires do not encroach into vegetated areas that can be used by the bat, megapode, or moorhen. The Service will be provided a 30-day period, from the date of receipt of the draft Fire Management Plan, to provide comments and recommendations for the DoN's consideration. The Fire Management Plan will be completed and fully operational (implemented) whenever training occurs at the new firing ranges on Tinian (DoN 2010a, pp. 133-134).

2. The berms on the ranges will contain non-invasive herbaceous vegetation, and other engineering controls to manage stormwater runoff and control erosion.

Conservation Measures to Minimize Impacts of Infrastructure and Indirect/Induced Civilian Development

1. To minimize the impacts from increased recreational beach use due to the increase in population anticipated from the proposed project (DoN 2010a, p. 16), the DoN, in cooperation with Service and Guam Division of Aquatic and Wildlife Resources, will undertake an educational program to inform military and civilian personnel about sea turtle nesting and the potential impacts to the species from nest disturbance and direct harassment of sea turtles (in the marine and terrestrial environment), beach disturbance, etc. (DoN 2010a, p. 134). In addition to signage near beaches on DoD property describing the legal requirements regarding sea turtles, the DoN will provide and distribute brochures and other educational materials at DoD facilities, including Morale, Welfare and Recreation facilities, beach picnic areas, trail heads, dive shops, and other DoD locations where potential recreational beach users may frequent to remind them of land-based impacts to sea turtles. Education and outreach will begin within the first two years of construction activities and continue throughout the construction phase until two years after completion of major construction activities (i.e., worker population has left Guam) (DoN 2010a, p. 16).

2. On Tinian, there is not expected to be an increase in recreational beach use by civilians and military personnel. However, the DoN, in cooperation with Service and the CNMI sea turtle program, will undertake an educational program to inform military and civilian personnel about sea turtle nesting and the potential impacts to the species from nest

disturbance and direct harassment of sea turtles (in the marine and terrestrial environment), beach disturbance, etc. The DoN will prepare and distribute brochures describing the legal requirements regarding sea turtles to potential recreational beach users to remind them of land-based impacts to sea turtles. In addition, information on sea turtles will be included as part of the environmental briefings associated with the range training on Tinian (DoN 2010a, p. 116). Education and outreach will begin within the first two years of construction activities on Tinian and continue as long as DoN training occurs on Tinian.

3. *Security Fencing and Other Habitat Loss Minimization*. Prior to any on-the-ground clearing for security fence construction, DoN will review each construction action to determine if the issuance of a waiver to reduce stand-off distances for security fencing is possible (consistent with security requirements) allowing a reduction in the amount of recovery habitat lost due to the proposed construction. Waiver requests must first be processed through the Commander Naval Installations Command and DoD for approval. If a waiver will reduce the amount of recovery habitat lost, consistent with underlying security requirements, the DoN will follow the approved processes and request the waiver reductions in standoff distances for fencing, if approved.

Roadways.

1. DoN will work with the U.S. Department of Transportation and Guam Public Works Department to ensure road and bridge work will be designed, to the maximum extent practical, that wetland impacts are minimized up and downstream of the site such that habitat for listed species is not negatively impacted (i.e., permanently altering habitat such that the moorhens will no longer use it) due to the improvements.

2. Pre-construction surveys will be completed one week prior to the onset of work by a biologist experienced in the identification of the Mariana common moorhen by sight and vocalizations and experienced with implementation of Service protocol survey methodology to ensure that no nesting moorhens are present. If nesting moorhens are present, clearing and construction will be postponed until the chicks have fledged. If work stops for more than one week, pre-construction surveys will be repeated to ensure that no moorhens have begun nesting (Takara 2010).

3. Bridge and road construction and improvements at the Atantano and other wetland areas adjacent to Route 1 on Guam will occur when moorhen are not nesting at or near (within 984 ft (300 m)) the project site to avoid effects to moorhen (Takara 2010).

4. Wetland habitat enhancement or restoration to benefit the moorhen may occur at Camp Covington. If Camp Covington is deemed unsuitable for wetland enhancement or restoration, the Atantano wetlands will be evaluated for restoration potential.

Conservation Measures to Minimize the Impacts of Invasive Species

Micronesia Biosecurity Plan

1. To address pathways and encourage a more holistic approach to managing invasive species, as part of the proposed action, the DoN has funded and is a participating agency in the development of the Micronesia Biosecurity Plan. Individual activities for various species will continue, but the DoN and others agree it is more efficient to manage pathways and prescribe corrective measures for a suite of species which will be monitored at discrete control points through time. The Micronesia Biosecurity Plan is much greater and is applicable to all agencies in Micronesia and will provide a platform for coordination and integration of inter-agency invasive species management efforts such as control, interdiction, eradication, and research.

2. DoN has contracted with the National Invasive Species Council to develop and coordinate risk assessments and prepare the Micronesia Biosecurity Plan in cooperation with USDA Wildlife Services, USDA APHIS Plant and Protection and Quarantine, USDA APHIS Veterinary Services; U.S. Geological Survey (USGS) Biological Resources Discipline; Naval Facilities Engineering Command, Pacific; Smithsonian Environmental Research Center.

3. The approach for the Micronesia Biosecurity Plan will involve risk assessments to provide decision support and corrective actions that integrate techniques involving exclusion, detection, eradication, and control of non-native and invasive organisms that can be readily implemented into standard operating procedures, training instructions, and applied best management practices related to supporting and completing construction projects and infrastructure repairs. Many of these techniques already exist and are being implemented. The risk assessments will identify and prioritize hazards and risks for species, pathways, and vectors which could include, but are not limited to, non-native species, construction equipment, training materials, personal protective equipment, foot traffic, vehicles and vessels, and shipping/packing material. The outcomes from the risk assessments will be corrective measures, monitoring techniques, and best management practices to avoid and minimize the introduction of non-native invasive species to Guam, the CNMI, and other Pacific Islands.

4. The Micronesia Biosecurity Plan is a long-term strategy that incorporates two components: a risk analysis of various pathways, vectors, and species associated with the importation to and exportation from Guam to other areas of Micronesia, and a multi-tiered implementation plan which prescribes corrective actions and identifies invasive species, pathways, and vectors which were identified as posing a risk. Risk assessments will result in information that could be incorporated into a multi-tiered protection system including pre-departure inspection or certification of goods and transport, inspection at the port of entry, post-admittance monitoring, rapid response eradication of incipient invasive species incursions, and control of invasive species. An outline for the risk analysis has been completed and a final risk analysis is anticipated in March 2011. The implementation plan will be drafted and finalized in April 2011.

5. Until the Micronesia Biosecurity Plan is finalized, pathway analysis may be used as a tool to improve programmatic efficiency. Methods such as HACCP or similar procedures will be used to conduct pathway analysis as applied to aspects of interdiction for brown treesnake and other potential invasive species. The USDA and Service have experience in conducting pathway analysis and have offered to assist the DoN in the development of these actions.

6. The DoN will implement biosecurity measures as described below, to ensure that risk from transporting invasive species to or from Guam and the CNMI is controlled.

General Biosecurity Measures

Existing levels of federally funded brown treesnake interdiction efforts will be increased, as necessary, to address increases in outbound civilian cargo exports to U.S. states and territories resulting from the proposed action. In order to guide the level of brown treesnake interdiction efforts, an iterative process employing adaptive management techniques will be used. The DoN commits to convening a working group to identify a system of reporting, monitoring and threshold metrics that can be used to guide the appropriate level of brown treesnake interdiction associated with the Marine Corps relocation effort. The prospective working group members will include representatives from DoI-Office of Insular Affairs, USDA APHIS Wildlife Services, Hawaii Department of Agriculture, Government of Guam, CNMI, the Service, and USGS Biological Resources Discipline. The DoN will initiate discussions with prospective working group members within 90 days of the Record of Decision. The working group will serve as a subgroup to the Civil Military Coordination Council (Council). The Council implements Adaptive Program Management for the proposed action as described in the "Environmental Impact Statement/Overseas Environmental Impact Statement for Guam and CNMI Military Relocation: Relocating Marines from Okinawa, Visiting Aircraft Carrier Berthing, and Army Air and Missile Defense Task Force."

1. The working group will serve in an advisory capacity to facilitate efficient and effective brown treesnake interdiction efforts. The working group will meet, at a minimum, on a biannual basis. If an issue arises that warrants immediate attention, the working group will convene via electronic mail or telephone. If timing does not allow for engaging the working group, the DoN and Service will coordinate to develop an agreed-upon response.

2. The DoN will provide the Service and the working group with annual reports detailing brown treesnake interdiction measures on Guam and the CNMI and anticipated levels of future DoD construction activity associated with the Marine Corps realignment efforts. The working group will advise the Council on brown treesnake interdiction efforts relative to the construction tempo and sequencing associated with the Marine Corps realignment construction effort. Following completion of the construction phase of the project, the Brown Treesnake Working Group will function as a mechanism to monitor the brown treesnake interdiction program.

3. The DoN will develop a biosecurity program to be employed throughout the construction phase of the military buildup. The program will have terrestrial and aquatic resources response

capabilities. The DoN's Biosecurity program will address non-native, invasive species issues on DoD property within Guam and the CNMI. DoN will work with partners to develop newspaper, radio, and television public service messages and website and education materials for the public and DoN describing non-native invasive species, their impacts to native species, what can be done for their prevention and control, and training. The Biosecurity program will work to control and eradicate existing non-native plants and animals. DoD will support opportunities to work collaboratively through Memorandums of Understanding or Memorandums of Agreement with the local government, which will afford improved biosecurity for both DoD and the community as a whole. The Biosecurity progam will include cross training for non-native invasive plant and animal species where inspection and rapid response techniques have been developed. The Biosecurity program will be initiated prior to initiation of construction within recovery habitat on the proposed Main Cantonment area or Andersen Air Force Base.

In addition, biosecurity program efforts will:

a) establish a process for the DoN to determine rapid response situations identifying when and how, to transfer long-term control efforts to when applicable. This will be part of the Biosecurity Response Team Operations Manual (to be developed as part of this action), which will be modeled after the National Park Service Exotic Plant Management Teams Operations Manual (2002). The Biosecurity Team Operations Manual will be developed within one year of filling the Biosecurity Team.

b) Biosecurity Team members will participate in regional and local invasive species work groups (i.e., Regional Invasive Species Council, Guam Invasive Species Committee, Coconut Rhinoceros Beetle Incident Command, Brown Tree Snake Working Group, and other invasive species specific groups) throughout Micronesia. These groups provide opportunities for cross-training, technology transfer, and sharing of current issues with a specific species or region. These venues also provide for the Teams to report on activities to partners.

c) assist existing federally-funded brown treesnake rapid response teams to enable coverage of each brown treesnake detection incident in CNMI and Hawaii. The DoN will support USGS Biological Resources Discipline to develop procedures and protocols that will support rapid response team actions for a brown treesnake detection incident. DoN personnel will be trained on rapid response procedures or the DoN may retain agreements with trained, local pest control contractors or cooperating partner agencies that would assist in the response actions. DoN support for rapid response actions would be subject to a Memorandum of Understanding that will be initiated within 180 days of the Record of Decision. Implementation of brown treesnake rapid response is currently provided for pursuant to the MIRC Biological Opinion. If the action is not funded pursuant to the MIRC Biological Opinion in the future, alternate sources of funding would be secured to ensure implementation of this rapid response conservation measure.

4. There will be two Biological Monitors that will provide training, review, and guidance on HACCP plan development, implementation, and revision during the construction phase of the buildup on Guam.

5. The DoN's contracts will include requirements for the contractor to perform certain tasks to prevent the inadvertent movement of non-native, invasive species from the project site to other locations. Cleaning of vehicles and equipment will take place off-site to the greatest extent possible. If washing must occur on site, designated bermed wash areas must be used to prevent wash water contact with storm water, creeks, rivers, and other water bodies.

6. The contractor shall provide documentation that supports prevention, worker awareness, and control of non-native invasive and pest species in the project area and efforts to prevent the movement of non-native invasive species to areas outside the project area, whether in a purposeful or inadvertent manner. The contractor is responsible for ensuring that their employees receive applicable environmental and occupational health and safety training, and keep up to date on regulatory required specific training for the type of work to be conducted onsite. This may include, but is not limited to HACCP planning, species- (e.g., brown treesnake and coconut rhinoceros beetle) specific information, regulated pest list, threatened and endangered species information, and proper washdown and inspection techniques for equipment. Vehicle hygiene, that is vehicle washdown and inspection for soil and other material, is required to prevent the inadvertent movement of non-native invasive species from the project site to other locations. The Contractor is required to establish appropriate facilities that comply with all environmental laws and regulations, provide training for proper vehicle hygiene, and promptly take corrective and preventative actions for noncompliance. All large dumpsters without lids shall be inspected by the Biological Monitor for non-native invasive species prior to movement of the dumpster off the project site.

7. The DoN will work with partners to develop, prioritize, and implement eradication and control projects that target non-native invasive lizard species. As an example, eradication or suppression of non-native invasive lizard species to reduce prey for brown treesnake could be implemented in the Ecological Reserve Areas. These types of management actions will be implemented within one year of establishing the Ecological Reserve Area.

8. The DoN will work with partners to develop, prioritize, and implement non-native rodent control (suppression) on Guam for conservation and human health and safety concerns. As an example, suppression of rodents to reduce prey for brown treesnakes or prevent rodent explosions after control of brown treesnakes could be implemented in the Ecological Reserve Areas.

9. The DoN will work with partners to develop, prioritize, and implement eradication and control projects that target non-native insect and invertebrate species for conservation and human health and safety concerns. As an example, eradication or suppression of non-native flatworms could be implemented in the Ecological Reserve Areas to reduce predation of snails.

10. To prevent the spread of coconut rhinoceros beetle, the DoN will include specifications in contracts for inspections and proper re-use or disposal of vegetation within coconut rhinoceros

beetle quarantine area. The biosecurity measures would ensure that yard waste and vegetation debris is not harboring coconut rhinoceros beetle or the waste is treated prior to re-use or movement off construction site.

11. To fully support the National Defense Reauthorization Act of 2009, the DoN will establish a DoD (i.e., representatives from the Navy, Marine Corps, Army, and Air Force) Brown Tree Snake Working Group to establish and implement a comprehensive program to control and, to the extent practicable, eradicate brown treesnake from military facilities in Guam. Implementation of this activity is ongoing and long-term. The DoN will assist with coordination of funding, planning, and streamlining implementation of DoN brown treesnake projects on Guam. Additional actions include, but are not limited to:

a) committing to implement inspections and quarantine procedures at new facilities;

b) actively participating in the Brown Tree Snake Working Group and work with partners to develop, prioritize, and implement projects that target landscape-level brown treesnake suppression, interdiction and control for human health and safety and provide areas with low snake densities. The DoN will support implementation and monitoring of efficacy for current techniques that address Integrated Pest Management and landscape-level brown treesnake control in Ecological Reserve Areas and other DoN priority areas;

c) expanding the existing environmental education program for new personnel arrivals (personnel undergoing Permanent Change of Station). The current program includes on-line testing and a brown treesnake factsheet;

d) funding the development of methods to eradicate or significantly suppress brown treesnake island-wide. As part of the proposed action, the DoN will provide funding for brown treesnake research and suppression throughout the construction phase.

<u>Biosecurity Measures Specific to Training Actions</u>

The following measures pertain to training and training cargo movement:

1. 100% inspection of all outgoing cargo on vessels and aircraft from Guam with trained quarantine officers and dog detection teams, which could be supplemented by other pest control expertise with appropriate USDA APHIS brown treesnake detection training and oversight to meet 100% inspection goals for large scale training activities;

2. in the event military units, vehicles, and equipment accidentally leave Guam without inspection the DoN will as soon as possible notify their inspection contractor and the point of destination port or airport authorities and work with the destination port to resolve the issue. Urgency of notification is a priority so that rapid response or other actions can be implemented to reduce risk;

3. the DoN will route inbound personnel and cargo for tactical approach exercises that require an uninterrupted flow of events directly to CNMI training locations to avoid

Guam seaports and airfields. If Guam cannot be avoided, the DoN in cooperation with USDA shall identify and the DoN will implement appropriate interdiction methods that may include repeated inspections or other interdiction methods as agreed to by USDA and the DoN. Additionally, tactical approach exercises will involve only cargo equipment that has not originated from areas containing a brown treesnake population or will be 100% inspected by certified brown treesnake canine programs. If the USDA develops performance standards for this activity, the DoN will adopt those standards, provided they are compatible with military mission;

4. the DoN is committed to implementing repeated inspections. Repeated inspections include inspections on Guam and at the receiving jurisdiction for administrative and logistical movements that do not require a tactical approach to complete the training requirements. It is anticipated that repeated inspections will utilize existing quarantine and inspection protocols at receiving ports;

5. the DoN will also establish snake-free quarantine areas for cargo traveling from Guam to the CNMI and other locations. These brown treesnake sterile areas will be subject to: multiple day and night searches with appropriately trained interdiction canine teams; snake trapping, and visual inspection for snakes. Temporary (i.e., movable) barriers may be preferable to permanent exclosures because of the variable sizes needed for various training activities. The DoN will use OPNAVINST 5090.10A for standard operating procedures for temporary barrier construction and use. Standard operating procedures will ensure that temporary barriers are constructed and maintained in a manner that assures the efficacy of the barrier tool and that staff maintaining and constructing the temporary barriers will receive training related to this activity prior to construction. Review of standard operating procedures will be conducted in cooperation with the USGS Biological Resources Discipline, and the USDA APHIS. The DoN and other appropriate parties will meet, if necessary, to resolve concerns such that the protocols ensure risk is adequately minimized;

6. working in collaboration with the USDA APHIS, DoN will decide how best to implement the Brown Treesnake Control Plan (BTS TWG 2009, 37 pp.) relevant to DoD actions;

7. adherence to DoN Instruction 5090.7, which calls for individual troops to be responsible for conducting self inspections to avoid potential introductions of invasive species to Guam and the CNMI. Troops will inspect all gear and clothing (e.g., boots, bags, weapons, pants) for soil accumulations, seeds, invertebrates, and vertebrates. The intent of this measure is to minimize the potential risks and subsequent effects associated with transport of troops and personnel to Guam and to CNMI from areas that contain species that are not native to Guam and Tinian terrestrial habitats;

8. each action will undergo a pathway risk analysis as a tool to improve programmatic efficiency while preventing the spread or introduction of invasive species. Actions at risk of transporting invasive species will have prevention tasks identified and implemented to reduce risk. Methods such as HACCP planning (see http://www.haccp-nrm.org) may be utilized to conduct pathway analysis;

9. the DoN will invite the Service to participate in the development of regional standard operating procedures and exercise planning to better meet invasive species management needs associated with proposed training. Current procedures can be found in 5090.10A "Brown Tree Snake Control and Interdiction Plan" (DoN 2005, 28 pp.);

10. the DoN representative will assure that "Area Training" coordinates meetings for brown treesnake interdiction on all training activities for the training execution phase and an after action review phase. If a snake is found during training, the DoN policy is to kill the snake and report it to DoN Environmental staff;

Biosecurity Measures Specific to Civilian Sector Transportation

DoN agrees that it will fund the increase of current federally funded brown treesnake interdiction measures (in Guam, CNMI, and Hawaii) where the increase is related to direct, indirect and induced-growth caused by the Marine Corps relocation to Guam. The objectives include the following:

i. maintain inspection levels consistent with current inspection regimes of all outgoing cargo, containers, aircraft, and vessels from Guam bound for the U.S. or U.S. territories with trained quarantine officers and dog detection teams, which could be supplemented by other pest control expertise with appropriate USDA APHIS brown treesnake detection training and oversight;

ii. maintain brown treesnake suppression on Guam at all commercial cargo staging, packing, handling and trans-shipment facilities handling outbound cargo for the U.S. or U.S territories;

iii. maintain brown treesnake suppression around commercial port and airport facilities on Guam;

iv. maintain current reporting systems that track outbound cargo and vessels bound for the U.S. or U.S. territories;

v. maintain current levels of brown treesnake inspection and quarantine for arriving cargo, containers, aircraft, and vessels at recipient sites with established federally funded interdiction programs;

vi. maintain current brown treesnake detection and monitoring at recipient sites with established federally funded interdiction programs.

Procedures for brown treesnake interdiction efforts are described in the USDA APHIS WS Containment Plan for Guam (pages 1 - 18), USDA APHIS WS Canine Standard Operating Procedures (pages 22 - 30), draft BTS Control Plan (December 2009), and the 2009 USDA APHIS WS canine interdiction report. One of the goals of the current interagency Brown Treesnake Working Group is 100% interdiction to prevent the brown treesnake from dispersing to other locations. The 2009 USDA APHIS WS canine interdiction report, CNMI DoI Office of Insular Affairs Grant Project Narrative Status Report ((July thru December 2009), and Semi-

Annual BTS Hawaii Department of Agriculture (July thru December 2009) are outlines of current interdiction effort on Guam, CNMI and Hawaii.

The FY10 level of funding for the Federal interagency brown treesnake interdiction effort on Guam, CNMI, and Hawaii and 2010 transportation levels associated with outbound cargo from Guam for the U.S. or U.S. territories will be used as the baseline. For 2011, the Service and DoN will jointly evaluate existing programs and determine the appropriate level of effort based on the FY10 Federal funding levels. Future adjustments in brown treesnake interdiction efforts will be determined based upon forecasts of the tempo and sequencing associated with the Marine Corps realignment construction effort, provided from the Council and other available sources, and the ability of current and previous years' efforts to maintain objectives related to the proposed action.

Biosecurity Measures Specific to Non-Training Actions

For non-training actions (i.e., routine operations, construction, etc.) the DoN implements actions identified in DoN instructional manuals and participates in work groups and collaborative efforts that focus on the prevention, control, and eradication of non-native invasive species on Guam and in the Pacific. The DoN implements recommended management actions for non-native invasive species of plants and animals. Non-native invasive species management includes but is not limited to snakes, deer, pigs, rats, lizards, goats, and plants with 100% inspection rate as the goal for brown treesnake. Examples of DoN invasive species management include, but are not limited to:

1. participation in the design, siting, installation, and operational use of brown treesnake barriers and gates for quarantine purposes on DoN lands;

2. incorporation of language in to new contracts for quarantine, inspection, and invasive species prevention measures. Examples include specific language for HACCP plan development and review, landscaping practices for native species, prohibition of feeding feral animals;

3. dedicated support for large-scale, long-term efforts to refine methods for brown treesnake control that will reduce snake populations on a landscape level more cost-effectively and to increase the efficacy of capturing snakes in low-density situations;

4. participation in coconut rhinoceros beetle control efforts by maintaining sentinel buckets and incorporation of biosecurity measures into DoN projects that generate yard waste and vegetation debris;

5. coordination with experts and implementation of actions to protect cycads from the scale insects and incorporation of biosecurity measures into projects or training events that will be moving into and out of areas infected by the invasive scale insect;

6. enforcement of the Chief of Naval Operations policy letter of January 10, 2002, on preventing feral cat and dog populations on DoN property;

7. mapping of non-native invasive plants and incorporating biosecurity measures into projects or training events that move into and out of areas within invasive weeds that are not prevalent elsewhere.

2.2 ACTION AREA

The action area encompasses the areas within which the action is likely to produce stressors that have direct or indirect adverse consequence to listed resources. The action entails DoD construction and training on Guam and Tinian (Figure 11). Interrelated and interdependent civilian actions on Guam and Tinian including development and modifications to the locations of existing civilian activities will indirectly result from the action. These actions will result in stressors including habitat loss and noise on Guam and Tinian.

Figure 11. The action area encompasses the Mariana Archipelago Islands of Guam and Tinian.

2.3 NOT LIKELY TO ADVERSELY AFFECT REVIEW

Your January 4, 2010, letter, as updated by your staff (Cobb, pers. comm. 2010a, Cobb, pers. comm. 2010b), requested our concurrence with your determination that the subject action is not likely to adversely affect the Mariana swiftlet, Micronesian megapode, and the green sea turtle or hawksbill sea turtle (collectively referred to as sea turtles) pursuant to section 7 of the Act. The following sections summarize our review of anticipated project effects to these species.

Mariana Swiftlet

Mariana Swiftlet Biology and Occurrence in the Action Area
The following section summarizes Mariana swiftlet population status and biology based on the information available to the Service. The Mariana swiftlet is endemic to Guam and the four southern islands of CNMI (Cruz et al. 2008, p. 233). A population also became established on Oahu, Hawaii, between 1962 and 1965 (Wiles and Woodside 1999, p. 57). Most historical information on the species comes from Guam, where it was reported as being common and the third most abundant species seen during roadside counts, but declined to approximately its current levels by the late 1970s (USFWS 1991b, p. 7). The total number of Mariana swiftlets occurring within its historical range is approximately 6,800 individuals and it currently occurs on Guam (in three known caves within the Naval Munitions Site), Aguiguan (in nine known caves), and Saipan (ten known caves), and is considered extirpated from Tinian and Rota (Cruz et al. 2008, pp. 235–236; Grimm 2008, p. 1; Service 1991b, pp. 8, 13–14; Engbring et al. 1986, pp. 58–59).

The current estimate of the Mariana swiftlet population on Guam is 1,150 birds (Grimm 2008, p. 1). Monthly swiftlet counts at Mahlac cave fluctuated between 150 and 500 between 1984 and 1999, but have since increased to approximately 950 in 2008 (Grimm 2008, p. 1) (Figure 12). Similarly, the number of swiftlets observed at Maemong cave increased from 4 to 100 between 2004 and 2008 (Grimm 2008, p. 1) (Figure 13). The number of swiftlets observed at Fachi cave has fluctuated widely, but the count has never exceeded 100 (Grimm 2008, p. 1) (Figure 14).

Figure 12. Monthly Mariana swiftlet counts at Mahlac Cave, Guam, 1984–2008 (Grimm 2008, p. 5).

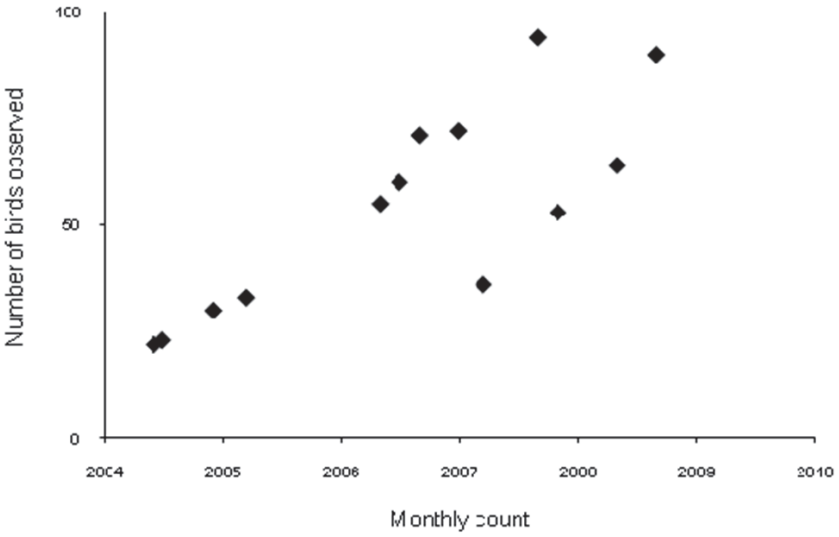

Figure 13. Monthly Mariana swiftlet counts at Maemong Cave, Guam, 2004–2008 (Grimm 2008, p. 6).

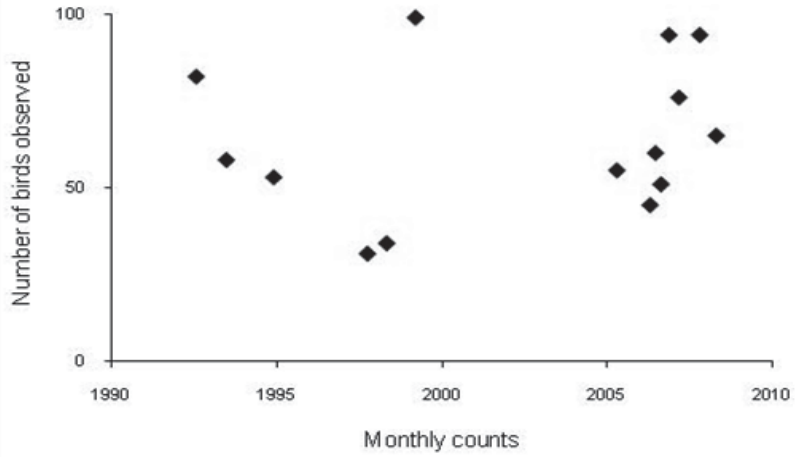

Figure 14. Monthly Mariana swiftlet counts at Fachi Cave, Guam, 1992–2008 (Grimm 2008, p. 5).

The species nests and roosts in limestone caves with the following characteristics: entrances typically a minimum of 2 m (6.2 ft) high; chambers with dark zones; and fresh air (USFWS 1991b, p. 2). Mariana swiftlets capture prey while flying, and foraging has been observed to occur over a wide variety of habitat types but they appear to favor ridge crests and open grassy savanna areas (USFWS 1991b, p. 6). Most birds leave their cave at dawn and return at sunset, but often return from foraging to roost in caves during the day. An analysis of swiftlet guano collected from occupied caves on Saipan found that the remains of flying ants (*Formicidae*) were common, as were the remains of beetles (*Coleoptera*) (Kershner et al. 2007). Kershner et al. (2007) speculated that Mariana swiftlets use a foraging strategy of seeking out pulses in insects and that such dense concentrations of prey could be important resources to swiftlets. Eggs are

laid in cup-shaped nests made of moss and saliva attached to cave walls or ceilings. A single egg is laid, usually between January and July. Swiftlets navigate through the darkest portions of caves using echolocation (Vogt and Williams 2004).

Threats to the Mariana Swiflet

The restricted distribution of Mariana swiftlets, along with its small population size and dependence on caves, makes the species vulnerable to threats. The causes for the decline of Mariana swiftlets are mostly unknown, but human disturbance, predation, pesticides, and disease have all been hypothesized as having a role. Swiftlets have been documented to flush or fail to enter their caves when humans are near or within their caves (Wiles and Woodside 1999, pp. 57, 61). Their sensitivity to human presence has resulted in injuries to chicks and adults and could result in damage to eggs (Wiles and Woodside 1999, p. 61). Sources of human disturbance have included Japanese soldiers during World War II, guano mining, hunters, hikers, and vandalism. While the introduction of brown treesnake is known to have caused the extirpation of many bird species in Guam and CNMI, it is not known whether it has significantly affected swiftlets. Brown treesnake predation on Mariana swiftlets is considered to be a regular event and only those birds able to find nest or roost sites on high, smooth walls and ceilings are able to avoid snake predation. The use of pesticides such as DDT has been suspected of causing the decline of swiftlet populations on Guam (Diamond 1984, p. 452), but the concentrations of pesticide residues found in swiftlet guano have not supported this hypothesis (Grue 1985, p. 301). On Saipan, non-native cockroaches are known to destroy swiftlet nests by consuming the saliva that holds the nests to the walls or ceilings (Cruz et al. 2008, p. 242). Savidge (1986, p. 9) investigated the role of disease in the decline of birds on Guam and found that there is no evidence that it has played a significant role. The typhoons that frequently occur in the area may cause periodic declines in swiftlet populations, but are not expected to threaten the species as a whole since the species has survived numerous such events during its evolutionary history (USFWS 1991b, p. 22).

Effects of the Action – Mariana Swiftlet

The current estimate of the Mariana swiftlet population on Guam is 1,150 birds (Grimm 2008, p. 1). On Guam, all three of the caves currently occupied by Mariana swiftlets are located within the Naval Munitions Site, and none of the proposed project stressors will occur near those caves. However, new aviation training flight paths are proposed over the Talafofo River watershed, the primary foraging area for swiftlets on Guam, and over the Naval Munitions area (refer to Figure 17 in the General Effects section). Flights may also occur over the Ugum River watershed that supports swiftlet foraging near the mouth of the river. Foraging by most members of the swift family (Apodidae) is likely limited to 328 ft (100 m) above the tree canopy because of the reduction in insect prey above that level (Chantler 1999, p. 402). Tree canopy height plus 328 ft (100 m) is expected to be well below 1,000 ft (305 m) above ground level, thereby reducing risk of bird/wildlife aircraft strike hazard but noise generated by the aircraft may still affect swiftlet foraging behavior, as has been documented in other species (refer to general effects, noise section). To avoid noise impacts and bird/wildlife aircraft strike hazard risks, all aviation training will be conducted such that flights approach the southern portion of the Naval Munitions Site over the Talafofo River watershed and Fena Reservoir at heights of 1,000 ft (305 m) or greater above ground level. Flights may go up the Ugum River at altitudes of 1,000 ft (305 m) or greater above ground level until they reach 9,843 ft (3,000 m) from the mouth of the river at

Highway 4 and then low-level terrain flights may begin. Otherwise, low-level training flights (DoN 2010a, p. 54) will be restricted to the southernmost portion of the Naval Munitions Site (DoN 2010a, p. 35) where swiftlets are not commonly present.

Because the proposed project will avoid Mariana swiftlet cave habitat, and because the proposed approach of aircraft will be higher than foraging Mariana swiftlets, we concur with your determination that the proposed action is not likely to adversely affect the Mariana swiftlet.

Micronesian Megapode

Micronesian Megapode Biology and Occurrence in the Action Area
The following section summarizes the population status and biology of the Micronesian megapode in the action area. Although the Micronesian megapode is endemic to Guam, CNMI, and Palau, currently megapodes from Micronesia and Palau are considered different races of the same species, *M. l. laperouse* and *M. l. senex*, respectively (USFWS 1998b, p. 4–5). Populations on Guam and Rota are considered extirpated (USFWS 1998b, p. 3; Stinson 1992, p. 220; Amidon 2009, pers. comm.). The population on Anatahan also appears to have been extirpated due to recent and ongoing volcanic activity (Kessler 2006, p. 3; Kessler 2009, pers. comm.). Based upon surveys conducted during the past decade, we have estimated the total population of the Micronesian megapode to be a minimum of 1,585 individuals (USFWS 2009a, p.124; Vogt 2009, p. 3).

Although Micronesian megapodes were not detected on Tinian during 2008 (USFWS 2009a, p. 124), proposed training areas on Tinian support foraging and roosting habitat for the Micronesian megapode (DoN 2009, pp. 3.11–26, 3.11–44). Incidental reports and regular sightings (1995 to 2005) of the Micronesian megapode on Tinian indicates that either a small but persisting population of Micronesian megapodes exists on Tinian or that Micronesian megapodes routinely use habitats on Tinian when flying between Aguiguan and Tinian or Tinian and Saipan (USFWS 1998b, pp. 10, 18; DoN 2009, p. 3.11–44). Due to the presence of suitable habitat and the occasional but routine observations of Micronesian megapodes on Tinian, we have determined that the Micronesian megapode is at least transient and reasonably certain to occur within the Military Lease Area on Tinian.

Micronesian megapodes can use a variety of habitat types. Typically, native and secondary forest are considered the primary habitats for foraging while nesting may occur in forests, open fields, cinder and ash fields, and coastal strand edges with sand substrates. The Micronesian megapode is omnivorous and forages under ferns, branches, and leaf litter on the forest floor and in trees within bird's nest ferns (*Asplenium nidus*) (Glass and Aldan 1988, p. 142). Diet includes seeds and other plant matter, beetles, ants, ant larvae, and other insects and crabs (Glass and Aldan 1988, p. 142; Pratt et al. 1980, p. 121; Stinson 1992, p. 230). Territory size was estimated between 2.47 ac (one ha) and approximately 9.4 ac (3.8 ha) depending on habitat type (Glass and Aldan 1988, pp. 141–142; Service 2009a, p. 124 and 126). Dispersal between islands of the CNMI is not well documented.

The reproductive cycle of the Micronesian megapode is not well understood. Megapodes, including the Micronesian megapode, do not incubate their nests with their own body heat.

Instead, megapodes will construct burrows or mounds on beaches and cinder fields, or at geothermal sites. Breeding has been observed (eggs, chicks, and juveniles) on Anatahan, Sarigan, Guguan, Pagan, Agrihan, and Maug during all months except October, November, and December (USFWS 1998b, pp. 6–7 and references within; Amidon 2009, pers. comm.). The absence of breeding activity in October, November, and December is more likely a reflection of the lack of surveys during these months, and difficulty in finding megapodes during traditional avian surveys (Amidon 2009, pers. comm.).

Threats to the Micronesian Megapode

The initial (20th century) declines in the Micronesian megapode populations in the southern islands of the archipelago (Guam, Rota, Aguiguan, Tinian, and Saipan) resulted from a combination of hunting, habitat loss and destruction, and the introduction of alien species (e.g., alien plant species and ungulates) that degraded native habitat (Vogt and Williams 2004, p. 22; Service 1998b, pp. 35–39). Current threats to the Micronesian megapode's habitat include military activities, urbanization, agriculture, and other forms of development manifesting themselves as habitat loss, fragmentation, or degradation of forest habitat; and direct disturbance of megapodes by noise, increased traffic, and/or physical intrusion on foraging and nest sites.

Effects of the Action - Micronesian Megapode

The Micronesian megapode is distributed from the more populated, southern Mariana Islands of Tinian and Saipan with the largest portion of its population of approximately 1,600 individuals occurring on several human uninhabited, Northern Mariana Islands (see Figure 17 in the General Effects section). While no megapodes are expected to be within the project footprint, the DoN has agreed to complete pre-construction surveys to ensure megapodes will be avoided during construction. Megapodes are expected to avoid the ranges after construction; however, they could use the surrounding forest areas. We anticipate no harm to megapodes from the operation and maintenance of the ranges as megapodes are known to tolerate other loud noises associated with military training (USFWS 2010). The DoN has proposed to minimize habitat impacts to Micronesian megapode on Tinian from the construction of firing ranges in the "FAA Mitigation Area" by adding some additional lands to the north. The additional land is comprised of native limestone forest and areas of tangantangan where megapodes were typically sighted between 1995 and 2005. The mitigation area will also receive management (native forest restoration in areas of non-native habitat) to benefit the Micronesian megapode as well as other native species. Megapodes are not expected to be breeding on Tinian; therefore clearing the forest habitat for ranges is not expected to affect megapode reproduction. The DoN will also terminate cattle grazing leases within the footprint of the new range complex. The DoN has proposed conservation measures to work with the government of CNMI to make sure the new cattle leases are not granted within habitat for listed species.

The Micronesian megapode no longer occurs on Guam, and its population on Tinian is considered to be transient or very small. Because of the population status of this species in the action area, and because of the minimization and offsetting measures implemented by the DoN described above, we concur with your determination that the proposed project is not likely to adversely affect the Micronesian megapode.

Sea Turtles

In addition to increases in human population, the project will result in development and installation of lights in the vicinity of the shoreline. Conservation measures to conserve sea turtles, including those summarized below will be implemented to minimize the action's potential effects on sea turtles:

1. To minimize recreational impacts to sea turtle adults, nests, and hatchlings and to prevent impacts to their nesting habitats from increased recreational beach use resulting from project-related population increases (DoN 2010a, p. 16), the DoN, in cooperation with USFWS and Guam Division of Aquatic and Wildlife Resources, will develop and implement sea turtle educational programs. These programs will inform military and civilian personnel about sea turtle nesting and the potential impacts to the species such as nest disturbance, harassment, and beach disturbance (DoN 2010a, p. 134). In addition to establishing signage near beaches describing the legal requirements regarding sea turtles, the DoN will develop and distribute sea turtle conservation brochures and other educational materials at military Morale, Welfare and Recreation facilities, beach picnic areas, trail heads, dive shops, and other locations where potential recreational beach users may frequent. Education and outreach will begin within the first two years of construction activities and continue throughout the construction phase until two years after completion of major construction activities (DoN 2010a, p. 16).

2. Reduce outdoor recreational impacts to sensitive beach areas at Haputo Ecological Reserve Area by establishing an outdoor recreation area in upland areas adjacent to the Main Cantonment Area on the Naval Computer and Telecommunications Station Finegayan.

3. On Tinian, the DoN, in cooperation with Service and the CNMI sea turtle program, will undertake an educational program to inform military and civilian personnel about sea turtle nesting and the potential impacts to the species such as nest disturbance, harassment, and beach disturbance. The DoN will prepare and distribute brochures describing the legal requirements regarding sea turtles to potential recreational beach users. In addition, information on sea turtles will be included as part of the environmental briefings associated with training on Tinian (DoN 2010a, p. 116). Education and outreach will begin within the first two years of construction activities on Tinian and continue for as long as DoN training occurs on Tinian.

4. The DoN will submit a proposal to Chief of Naval Operations N45 to expand the existing Orote Ecological Reserve Area to encompass Orote Island, Adotgan Point, and the Spanish Steps areas that support sea turtle nesting on Naval Base Guam (DoN 2010a, p. 125).

5. To develop a better understanding of baseline populations and long-term ecological processes of marine turtles in the waters of Guam, Saipan, Tinian and Rota, the DoN, in conjunction with relevant federal resource agencies will develop and implement a joint investigation of sea turtle population abundance estimates, demography, near-shore habitat use, baseline population size, and long-term changes in population parameters

(DoN 2010a, p. 134). The project will include a long-term study of foraging habitat use and growth rate, a mark-recapture program to estimate sea turtle abundance, laparoscopic examinations to determine reproductive status and gender, and completion of demographic modeling. A long-term, in-water study will provide valuable information regarding near-shore foraging habitat use, and combined with applied research techniques including sonic (or acoustic) tags, satellite telemetry, and genetic analysis will provide greater insight into foraging ecology, migratory movements and connectivity of sea turtles within the greater Western Pacific region. This measure will begin within the first two years of construction activities (DoN 2010a, p. 16). Once details of this action are finalized, the DoN will coordinate with the Service to secure any permits necessary to address handling of the sea turtles.

6. The DoN has proposed a number of conservation measures to reduce the risk of introduction, spread, and establishment of non-native invasive species due to the proposed project actions (described in the Project Description section of this Biological Opinion).

The Service and the National Marine Fisheries Service (NMFS) share Federal coordination responsibilities for sea turtles pursuant to section 7 of the Act. The Service addresses all issues involving sea turtles using terrestrial habitats; NMFS addresses sea turtles and their habitats in the marine environment. Therefore, we only reviewed the proposed action for its potential impacts on eggs, hatchlings, nesting, and basking sea turtles, addressing sea turtles on land and their shoreline habitat.

Sea Turtle Biology and Occurrence on Guam and Tinian

The following section summarizes sea turtle biology based on the information in recovery plans and five-year status reviews developed by the NMFS and Service (NMFS and USFWS 1998a, 95 pp.; 1998b, 95 pp.; 2007a, 105 pp.; 2007b, 93 pp). Sea turtles are highly migratory, globally distributed, and generally found in tropical and subtropical waters along continental coasts and islands between 30° north and 30° south latitude and, to a lesser extent, in subtropical waters with temperatures above 20° C. The geographic range of sea turtles includes the Caribbean Sea, Atlantic, Pacific, and Indian Oceans and associated bodies of water.

Sea turtles bury their eggs in the sand in upper areas of oceanic beaches. Reproductive maturity occurs at ages ranging from 20 to 50 years and varies by species. Female sea turtles have high site fidelity to their hatching (natal) beaches, returning close to their own hatching site to lay their nests. Females may nest multiple times over a given nesting season. Nesting seasons typically occur at semi-regular intervals, with inter-nesting intervals ranging between two to more than five years depending on the species. Hatchlings emerge 45 to 90 days after a nest is laid. Emerging hatchlings navigate toward the water using visual cues; they move toward the brighter horizon and away from darker silhouettes formed by dune line, tree lines, or cliff walls (Tuxbury and Salmon 2005, p. 312). In addition to nesting, green turtles may also use beaches to haul out and bask, although this behavior has never been documented in Guam or the CNMI (Kelly, 2009, pers. comm.; Wusstig 2009, pers. comm.).

Green turtle

Numbers of breeding green turtle populations in Hawaii, Australia, and Japan are increasing (Chaloupka et al. 2008, p. 299; NMFS and Service 2007a, p. 13) and numbers of turtles nesting on Guam have been stable (NMFS and Service 2007a, p. 13). Green sea turtles are regularly recorded in the waters in Guam and the Commonwealth of the Northern Mariana Islands (CNMI) (Kolinski et al. 2004, p. 110; Kolinski et al. 2001, p. 55; Kolinski et al. 2006, p. 509). Individuals have been detected around most of the northern islands within the CNMI (Ilo and Manglona 2002, p. 4), although in lesser abundance than in the southern islands (Kolinski et al. 2005, p. 290). Approximately 1,000 to 2,000 green turtles inhabit island reef areas in Guam and the southern CNMI (Kolinski et al. 2004, pp. 98, 111). In 1995 and 2001 (Tinian), 1999 (Saipan), and 2003 (Rota), the majority of individuals observed in the surrounding waters were juveniles or sub adults (Kolinski et al. 2001, pp. 59, 66; Kolinski et al. 2004, p. 107; Kolinski et al. 2006, pp. 514, 517; Pultz et al. 1999, p. 92).

Green turtles are known to nest on the following Guam beaches: Adotgan Dangkolo, Adotgan Dikiki, Waterfront Annex of Naval Base Guam, Kilo Wharf area, Spanish Steps, Cocos Island, Asiga Bay, Nomnia area, Deley Beach, Turtle Cove to Togcha Beach, Tagachan Beach, Andersen Air Force Base (Tarague Beach, Sirena Beach, Pati Point), Jinapsan Beach, Cetti Bay, Sella Bay, Inarajan Beach, Acho Bay, Guam National Wildlife Refuge, Haputo area, Urano area, Tumon Bay, and Cabras area (Sea Plane Beach) (Wusstig 2009, pers. comm.; Grimm and Farley 2008, p. 1). Nesting activity on Guam occurs throughout the entire year with a peak in nesting between April and July (Grimm and Farley 2008, p. 1). Nesting has been known to occur from January through mid-July on Tinian (Pultz et al. 1999, p. 86). Sea turtles nest infrequently on Guam and Tinian (Kolinski et al. 2001, p. 59; Pultz et al. 1999, pp. 84, 87; Kolinski et al. 2004, p. 113; Grimm and Farley 2008, p. 3). Hatching success of these nests was 84% and approximately 93% of the hatchlings emerged successfully (Wusstig 2009, pers. comm.). Incubation periods on Guam are known to be approximately 50 and 90 days (Grimm and Farley 2008, p. 1).

Green turtles are likely to nest on all Tinian beaches (Pultz et al. 1999, p. 85). On Tinian, mean clutch size of 91 eggs, an incubation period of 62 days, and hatching success for successful nests of 89% has been recorded (Pultz et al. 1999, p. 85).

Hawksbill turtle

The status of breeding hawksbill turtles is generally decreasing globally; however, there has been a recent increase in reproductive effort within the Atlantic Ocean basin and at one location (Hawaii) in the Pacific Ocean basin (NMFS and Service 2007b, pp. 19-20 and references within).

Hawksbill turtles are frequently sighted in the near-shore waters surrounding Guam (Grimm and Farley 2008, p. 1). On Guam, the population is thought to be declining, and fewer than ten females are expected to nest per season (NMFS and Service 2007b, p. 19). Hawksbill turtles were reported nesting in June and July at Tarague Beach, Guam; however, this is based on only one year of data (Wusstig 2009, pers. comm.). Between 1991 and 1994, hawksbill turtles nested in Sumay Marina, Guam, during varying months including October, December, February, and March (Wusstig 2009, pers. comm.). An average of 55 days (51 to 58 days; 4 nests) was

documented from the time of nest discovery to nest hatch. Clutch sizes ranged from 81 to 121 eggs. Hatchling data is incomplete; however, one clutch of 121 eggs produced 70 hatchlings. In 2008, four incomplete nesting attempts at Adotgan Dikiki, Guam, were attributed to the hawksbill turtle (Grimm and Farley 2008, p. 3). The most recent documented hawksbill turtle nest was in 2009, when four nests, believed to be from the same female, were found (Wusstig 2009, pers comm.).

Although anecdotal information suggests that hawksbill nesting occurred historically within the CNMI, no nesting activity has been documented there in recent years (Kelly 2009, pers. comm.). This species was not observed on Tinian during marine and terrestrial surveys between 1999 and 2003 (Kolinski et al. 2004, p. 110; Kolinski et al. 2001, p. 55; Kolinski et al. 2006, p. 509). As described for the green turtle above, hawksbill turtles also recruit to foraging grounds that may be hundreds or thousands of kilometers from their natal beaches (Bowen 1995, p. 532) and as such the CNMI may support only a foraging population of hawksbill turtles.

Potential Threats to Sea Turtles – Nesting Environment

Threats to the green turtle on nesting grounds, as outlined in their recovery plan (NMFS and Service 1993), are representative of those also faced by hawksbill turtles. Storm events, including typhoons, may destroy nests because of flooding or piling of eroded sand on the nest site. Beach erosion due to wave action may decrease the availability of suitable nesting habitats and result in a decline in the nesting rate. A number of non-native and native predators dig into nests and prey upon incubating eggs, while some predators, including birds, may take hatchlings just prior to or during their emergence from nests.

Human crowding of nesting beaches can disturb nesting females and prevent laying of eggs. Flashlight use, beach fires, and artificial lighting on human structures may deter females from coming up onto a beach or may disorient hatchlings as they emerge from nests and try to find the sea (Witherington and Martin 1996, p. 4-5). Emerging hatchlings may respond to the effects of artificial lighting by causing hatchlings to move in the wrong direction (*misorientation*) and/or interfere with their overall ability to orient (*disorientation*), which causes hatchlings to move in circles attempting to orient in the correct direction. Both behaviors can result in hatchling mortality through exhaustion, dehydration, predation, and other causes (Mann 1977, p. 54; Witherington and Martin 1996, p. 4-5).

An increased human presence may lead to an increase in the presence of domestic pets (which can depredate nests) and may lead to an increase in litter (which may attract wild predators). Trampling can increase sand compaction, which may damage nests or hatchlings. Humans may also introduce exotic vegetation in conjunction with beach development that can overrun nesting habitat or make the substrate unsuitable for digging nest cavities.

An increase in human population often relates to an increase in coastal development. Construction on or in the vicinity of sea turtle nesting beaches can result in sand compaction, beach erosion, and increase in direct and ambient light pollution. The rate of habitat loss because of erosion and escarpment may be increased when humans attempt to stabilize the shoreline, either through re-nourishment or through placement of hard structures, such as sea walls or pilings. Off-road vehicle traffic also contributes to habitat loss through erosion, especially

during high tides or on narrow beaches where driving is often concentrated on the high beach and fore dune.

One of the most substantial threats to nesting sea turtles in the Pacific Islands remains the illegal poaching of adults and eggs (NMFS and USFWS 1998a). The direct harvest of adult nesting females can increase the rate of local extinction. Harvesting of eggs reduces the chance that recruitment will replace the reduced breeding population.

Effects of the Action – Sea Turtles

The proposed project construction, operation, and maintenance of facilities on Guam and Tinian will have no direct impact on sea turtle basking and nesting habitat on either island. However, recreational beach use is expected to increase on Guam and Tinian due to the increase in military and civilian populations.

Temporary lighting used during approximately 18 months of harbor dredging and permanent increases in lighting in Apra Harbor resulting from the proposed project may affect sea turtle nesting and hatchling sea turtles. Project lights are expected to be visible from some of the sea turtle nesting beaches of the Spanish Steps. However, currently these sections of the beach already have significant lighting impacts from the commercial port that exists to the northeast of the nesting area. In the beach's current condition, we believe that some nesting females may be deterred from nesting at this location, and emerging hatchlings may become *misoriented* as they attempt to move from their nest to the water. Because a dark cliff runs behind and to the sides of the Spanish Steps nesting sites, current lighting conditions are not likely to result in *disorientation* of hatchlings moving from the nest to the water. The darkened cliffs at Spanish Steps beaches create a silhouette and make it likely that emerging hatchlings will be able to orient towards the water. Once in the water they are likely to navigate toward the existing artificial lights across Apra Harbor, east-northeast of the nesting beaches.

Despite the fact that the proposed project will likely increase the overall lighting in the Apra Harbor, this increase is not likely to result in an increase in adverse effects to nesting females and emerging hatchlings because the current light pollution is already severe and the darkened cliff line along the shore will continue to minimize the impact of the lights and the likelihood hatchlings will be disoriented. Because the project will result in increased lighting east of the nesting beaches, the hatchlings are likely to be drawn across the beach toward the east, in addition to being drawn toward the east-northeast. Because the Spanish Steps area beaches are narrow, the resulting increase in the hatchling's travel distance to water would be less than a maximum of 250 ft (76 m). Because sea turtle nesting beaches are commonly wider than 250 ft (76 m), we do not anticipate the increased travel distance would result in decreased hatchling survival.

Sea turtle nests on Guam and Tinian could be crushed or dug up by recreational beach users and their pets. To minimize potential recreational impacts to sea turtles, the DoN has proposed to protect nesting beaches on Orote Island and Adotgan Point through Ecological Area Reserve expansion and to reduce outdoor recreational beach use impacts by establishing an outdoor recreation area at an upland site adjacent to the Main Cantonment Area, and by developing and implementing sea turtle education and outreach programs at beaches on Guam and Tinian. The DoN's public education program will reduce the likelihood that recreational beach users and

their pets will crush or dig up sea turtle nests or expose them to artificial lights. Because the project will avoid direct impacts to sea turtle habitat, increased lighting in Apra Harbor will not be likely to result in adverse effects to hatchlings at Spanish Steps beaches, and recreational impacts to sea turtle nests will be unlikely as a result of DoN's public education program, we concur with your determination that the proposed project may affect, but is not likely to adversely affect, green or hawksbill turtles.

2.3 STATUS AND ENVIRONMENTAL BASELINE OF THE SPECIES

Introduction

This section presents the biological and ecological information relevant to formulating the Service's Opinion covering one threatened bat species and six endangered bird species (see Table 1). These listed species are either present within the action area on DoD-owned or leased lands, government lands, and private lands and/or their recovery depends on aforementioned lands.

We provide an overview of threats that impact some or all of the species evaluated in this Biological Opinion, and then we discuss life history, habitat, distribution, abundance, threats, conservation needs, and other factors necessary for survival of these species as the basis for analyses in later sections of this Biological Opinion. In the the "environmental baseline" descriptions, we summarize this species information within the action area. Demographic data are utilized where available to generally indicate whether the number of individuals of a species is increasing, decreasing, or stable.

Threats to listed species in the Marianas include small population sizes, habitat fragmentation, predation by non-native vertebrates and invertebrates, browsing by feral ungulates, fire, and tropical storms. Human hunting and harassment negatively impact the population status of several listed species in the Marianas. Below we provide an overview of these threats and their effects to species.

General Threats

Small Population Size

Listed species in the Marianas generally have restricted distributions and few populations, and these populations usually also have a low number of individuals. Threats, such as the brown treesnake, will exacerbate the inherent risks of small populations to further increase the risk of extirpation and extinction of the listed species addressed in this Biological Opinion.

Species that are endemic to single islands are inherently more vulnerable to extinction than species with a broad distribution because of the increased risk of genetic bottlenecks, random demographic fluctuations, and localized catastrophes such as tropical storms and disease outbreaks (Mangel and Tier 1994, p. 607; Pimm et al. 1988, p. 757). These problems are further magnified when the number of populations is small and restricted to a very small geographic area, and when the number of individuals is very small. Populations with these characteristics face an increased likelihood of stochastic extinction due to changes in demography, the environment, genetics, or other factors (Gilpin and Soulé 1986, pp. 24-34).

Small, isolated populations often exhibit reduced levels of genetic variability, which diminishes the species' capacity to adapt and respond to environmental changes, thereby decreasing the probability of long-term persistence (e.g., Barrett and Kohn 1991, p. 4; Newman and Pilson

1997, p. 361). The problems associated with small population size and vulnerability to random demographic fluctuations or natural catastrophes are further magnified by synergistic interactions with other threats, such as those discussed below.

Small populations are more vulnerable than large populations to extirpation from naturally occurring events (environmental stochasticity), reduced reproductive vigor (demographic stochasticity), or a combination of both factors (Dennis et al. 1991; Schemske et al. 1994). Demographic stochasticity refers to the variability in population growth rates arising from random differences among individuals in survival and reproduction within a season. Environmental stochasticity refers to variation in birth and death rates from one season to the next in response to weather, disease, competition, predation, or other factors external to the population. The limited gene pools of small populations also may decrease reproductive vigor through the loss of genetic variation resulting from inbreeding, accumulation of deleterious mutations, and genetic drift. Reduced genetic variability in a population thus results in a decline to both individual fitness and population viability, and resilience to environmental change.

According to our current understanding of conservation biology, demographic and environmental variation, including catastrophic occurrences (such as flooding or fire), are important determinants of population extinction (Menges 1990; Mangel and Tier 1994; Schemske et al. 1994). A general pattern of population collapse has been documented for a wide range of plant and animal species with small population sizes (Dennis et al. 1991; Schemske et al. 1994; Morris et al. 1999; Menges 2000). According to this pattern some species in the action area are already in a phase of quasi-extinction (quasi-extinction refers to a specified population threshold considered too low for species survival). The numbers of individuals of some species is so low, environmental or demographic stochasticity alone could result in extirpation. Quasi-extinct species have a high background risk of extinction and any additional threats, such as training-related wildfire or increased predation due to brown treesnake introduction, could eliminate expectation of their long-term persistence.

Dennis et al. (1991) developed statistical methods for estimating growth rates and quasi-extinction probabilities for populations of several endangered bird and animal species based on 15 to 40 years of time-series monitoring data. Results predicted that, without intensive management, the Yellowstone grizzly bear population, Kirtland warbler, California condor, and Puerto Rican parrot would decrease to 10 or fewer reproducing adults in 13 to 109 years. Graphical representations of population trends for these species indicate the general pattern of population collapse except for the parrot. The number of Puerto Rican parrots is increasing, but solely due to release of captive-reared birds, protection of juveniles, and intensive habitat management; the breeding population has remained nearly constant, and effects of environmental catastrophes like hurricanes were not considered in the model. For plants, Burgman et al. (2001) defined quasi-extinction risk as a 0.1 % probability of decline below 50 adult individuals over 50 years, and used this criterion to determine a species' background probability of persistence.

The factors that caused a species' extinction are often unknown (Gurevitch and Padilla 2004). Norton (1991) was able to document these factors for *Trilepidea adamsii*, an endemic New Zealand mistletoe species. *Trilepidea adamsii* is now presumed extinct due to interacting factors of habitat loss, limited distribution, reduced seed dispersal, overcollection, and browsing by the

non-native brushtailed possum (*Trichosurus vulpecula*). In the United States, the heath hen (*Tympanuchus cupido cupido*) was driven to extinction by a combination of catastrophes including fire, harsh winter weather, predation, and disease (cited in Mangel and Tier 1994). Catastrophes combined with other kinds of environmental fluctuation have been associated with extinction of the great auk (*Pinguinus impennis*) and with the severe population decrease of the Laysan duck (*Anas laysanensis*) and short-tailed albatross (*Phoebastria albatrus*) (cited in Mangel and Tier 1994).

Factors that contribute to demographic and environmental stochasticity in the action area include naturally occurring events such as drought, catastrophic events such as tropical storms and wildfire, competition from non-native invasive plants, predation and herbivory by non-native animals, trampling and uprooting by feral ungulates, disease, and human persecution.

Habitat Modification

The species addressed in this consultation are currently impacted by habitat fragmentation and degradation by ungulates, fire, and tropical storms. Habitat degradation is the primary cause of extinction and endangerment of wildlife (Groom and Vynne 2006, p.173). Habitat degradation and loss is caused by various human activities including: agriculture, mining, forestry, fisheries, aquaculture, groundwater extraction, fires, infrastructure development, dams, urbanization, industry, pollution (including light, noise, and toxic chemicals), and changes in community and ecosystem structure due to invasive species (Groom and Vynne 2006, p. 174). Habitat fragmentation is a change in habitat configuration with the remaining habitat occurring in patches among areas of non-habitat (Noss et al. 2006, p. 213) and can result from the activities listed above.

When habitats are impacted, edges (a type of habitat fragmentation) are created. Edges form the boundary of a habitat and have different properties than the habitat itself. For example, edges often have different microclimate patterns which are drier, less shaded, and warmer than forest interiors. Edge habitats are generally areas of increased predation and the entry point for invasive vegetation, pests, and pathogens to encroach within native habitats (Noss et al. 2006, p. 228). Habitat degradation, fragmentation, and loss can result in localized extinctions, shifts in community composition (including increases in invasive species), increased predation, and can result in suitable habitat becoming unsuitable due to pollution, invasive species, physical size (for species that are area-sensitive), or barriers blocking access to habitats (including distance or lack of corridors and stepping stones, etc.) (Noss et al. 2006, 38 pp.; Groom and Vynne 2006, p. 174).

<u>Habitat Fragmentation</u>

The ecological integrity of the remaining native forest in the Mariana Islands is threatened by development, agriculture, and the long-term ecological impacts of ungulates, invasive plants, and, on Guam, the brown treesnake. Over the past several centuries, the Marianas have lost much of the native forest to agriculture and growing human population, economic development, and military activities (USFWS 2009a, p. 27).

Habitat fragmentation and alteration have been implicated in reduced species richness, avian abundance, productivity, and even food supply (Blake and Karr 1987, VanderWerf 1993, Burke and Nol 1998, Trine 1998, Porneluzi and Faaborg 1999, Coulter 2005). Bayne and Hobson (2001) found that female ovenbirds (*Seiurus aurocapillus*) avoid edges, such that males with territories further from edges had a greater probability of attracting a mate. Burke and Nol (2000) studied nesting success of five species of songbirds in south-central Ontario and found that for four of five species, adult female reproductive success was at or above replacement levels in large forest fragments and continuous forest and below replacement levels in small forest fragments. Herkert et al. (2003) found that nest predation of four grassland species was highest in the small (<250 ac (<100 ha)) and lowest in large (>2,500 ac (>1,000 ha)) prairie fragments. Fort and Otter (2004) studied the effect of habitat disturbance on reproduction of black-capped chickadees (*Poecile atricapillus*) and found that overall, birds nesting in disturbed habitats experienced lower nest success than those breeding in undisturbed habitats. Hagen et al. (1996) also found ovenbirds had lower pairing success in fragmented habitat and suggest this may be a result of behavioral dysfunction resulting from abnormally high densities.

Introduced Ungulates

Non-native ungulate species that occur in the Marianas include pigs (*Sus scrofa*), goats (*Capra hircus*), Philippine deer (*Cervus mariannus*), and Asiatic water buffalo (*Bubalis bubalis*). In the Marianas ungulates have caused severe damage to forests by browsing on plants, causing erosion, inhibiting plant growth and regeneration, and facilitating the establishment of invasive plants, which can impede forest regeneration by displacing or smothering native species (USFWS 2009a, p. 27). Although Guam is dominated by native forest, Wiles (2005) documented a rapid decline in the native breadfruit due to a combination of mortality of mature trees from typhoons and a lack of recruitment caused by deer and pig foraging on fallen fruit and seedlings.

These introduced pigs are extremely destructive and have both direct and indirect impacts on native plant communities. While rooting in the soil in search of invertebrates and plant material, pigs directly impact native plants by disturbing and destroying vegetative cover, and trampling plants and seedlings. They may also reduce or eliminate plant regeneration by damaging or eating seeds and seedlings.

Pigs are a major vector for the establishment and spread of competing invasive non-native plant species, by dispersing plant seeds on their hooves and coats as well as through the spread of their feces (Diong 1982, pp. 169-170), and by fertilizing the disturbed soil with their feces (Matson 1990, p. 245; Siemann et al. 2009, p. 547). Pigs feed preferentially on the fruits of many non-native plants, such as banana poka (*Passiflora tarminiana*) and strawberry guava (*Psidium cattleianum*), spreading the seeds of these invasive species through their feces as they travel in search of food. In addition, rooting pigs contribute to erosion by clearing vegetation and creating large areas of disturbed soil, especially on slopes (Smith 1985, pp. 190, 192, 196, 200, 204, 230–231; Stone 1985, pp. 254–255, 262–264; Medeiros et al. 1986, pp. 27–28; Scott et al. 1986, pp. 360–361; Tomich 1986, pp. 120–126; Cuddihy and Stone 1990, pp. 64–65; Aplet et al. 1991, p. 56; Loope et al. 1991, pp. 1–21; Gagne and Cuddihy 1999, p. 52).

On Guam, feral pigs are distributed island wide, and densities may be as high as 238 pigs per square mi (110 pigs per square km). As has been documented in other locations, wallowing, rooting, and trampling are common in most forested areas and can be locally severe (Conry 1988, p. 27).

Feral goats defoliate vegetation, trample roots and seedlings, cause erosion, and promote the invasion of alien plants. They are able to forage in extremely rugged terrain and have a high reproductive capacity (Clarke and Cuddihy 1980, p. C-20; van Riper and van Riper 1982, pp. 34-35; Tomich 1986, pp. 153-156; Cuddihy and Stone 1990, p. 64). A study of goat predation on a native koa (*Acacia koa*) forest on the island of Hawaii showed that grazing pressure by goats can cause the eventual extripation of koa because it is unable to reproduce (Spatz and Mueller-Dombois 1973, p. 874). If the number of goats remains high, mature trees will eventually die and with them, the root systems that support suckers and vegetative reproduction. An exclosure analysis demonstrated that release from goat pressure by fencing resulted in a rapid recovery in height, growth, and numbers of vegetative resprouts of koa (Spatz and Mueller-Dombois 1973, p. 873). Another study at Puuwaawaa on the island of Hawaii demonstrated that prior to management actions in 1985, regeneration of endemic shrubs and trees in the goat-grazed area was almost absent, contributing to the invasion of the forest understory by exotic grasses and weeds. After the removal of grazing animals in 1985, koa and ohia (*Metrosideros* spp.) seedlings were observed germinating by the thousands (Hawaii Department of Land and Natural Resources 2002, p. 52). Based on a comparison of fenced and unfenced areas, it is clear that goats can devastate native ecosystems. There can be up to an estimated 2 goats per 2.5 ac (1 (ha) in areas in Hawaii (Kessler 2008, pers. comm.).

On Guam, Philippine deer were introduced in the 1770s, and are distributed throughout the island. Heavy browsing pressure has been documented, even at relatively low densities (Conry 1988, p. 27). High densities, and the gregarious habits of carabao, have resulted in habitat damage such as mud wallows, broad trails, vegetation trampling, and tracks. Some areas are so heavily trampled that ground cover has been denuded and soil erosion scars and slumping are evident (Conry 1988, pp. 27-28).

Wildfire Conversion of Forest to Savanna in Southern Guam

Although there is ongoing debate regarding the formation of savanna areas in Guam (Hunter-Andersen 2009 and Athens and Ward 2004), savanna areas are enlarging into previously forested areas as a result of human-caused wildfires. Over a three-year period from 2000 through 2003, 2,020 arson fires burned 6,000 ac (2,400 ha) in Guam and of the approximately 750 wildfires burning each year on Guam, approximately 80% are caused by arson (Wildland Fire Prevention and Education Team Final Report, 2003, as cited in Neill and Rea 2004, p. 6-7). The average annual number of fires reported on non-DoN land increased from 612 during the 1979 through 1989 period to an average of 786 during the 1991 through 2002 period (an increase of approximately 27%). This increase may be due to improved fire reporting. The total area burned per year by these fires dropped by approximately 35% in the 1991 through 2002 period, compared with annual acreage burned in the 1979 through 1989 period.

To estimate the rate of historical forest conversion to savanna, Greenlee (2010) delineated areas which appeared to be dominated by forest vegetation in 1975 aerial photographs which are no longer forested in recent infrared imagery and estimated that 1,119 ac (453 ha) of forest has been converted to savanna in southern Guam since 1975 (Figure 15). This estimate indicates the average rate of forest loss in southern Guam is approximately 37 ac/year (15 ha/year).

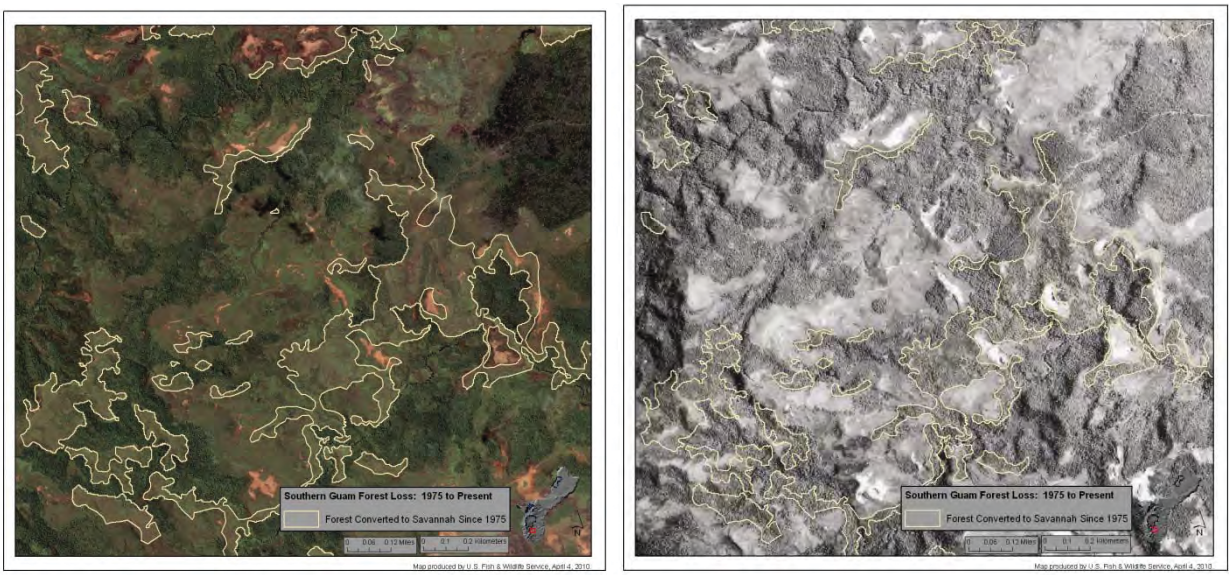

Figure 15. Savanna areas that were forested in 1975 are outlined in 2005 (left) and 1975 (right) aerial photographs.

Southern Guam's savanna and burned forest areas are dominated by 6-ft (2-m) tall swordgrass (*Miscanthus floridulus*) with an estimated 19 tons/ac (43 tonne/ha) fuel loading (Neill and Rea 2004, p. 3). These tall stands of grass do not contain habitat essential for the feeding, breeding, and sheltering of the Guam Micronesian kingfisher, Mariana crow, Mariana fruit bat and they are not suitable for regeneration of the endangered tree *Serianthes nelsonii*. Furthermore, proximity to savanna areas increases fire threat to the forest habitats which are necessary for the recovery of these listed species.

Habitat Destruction and Modification by Hurricanes and Typhoons

Typhoons are a common occurrence in the Marianas. Guam has been affected by typhoons in 37 of the last 50 years (USFWS 2005c p. 32). Supertyphoons (with wind gusts of over 240 km (150 mi) per hour) occur approximately once every five years. Hurricanes occur in the Hawaiian Islands at a much lower frequency. Typhoons and hurricanes have both direct and indirect effects on birds and bats. Direct effects include loss of nests, eggs, and nestlings and direct mortality of bats and their young. Indirect effects include the loss or reduction of food resources and nesting and roosting sites; increased predation and hunting due to loss of cover or altered foraging behavior; and long-term habitat changes. Typhoons and hurricanes adversely impact native habitat by destroying native vegetation, opening the canopy and thus modifying the availability of light, and creating disturbed areas conducive to invasion by non-native pest species (Asner and Goldstein 1997, p. 148; Harrington et al. 1997, pp. 539-540). Because many

plant and animal species persist in low numbers, and in restricted ranges, natural disasters such as hurricanes can be particularly devastating (Mitchell et al. 2007, p. 4-3). Supertyphoons fragment and decrease the suitability of existing habitat, and exacerbate the effects of introduced plants and ungulates (USFWS 2005c p. 34). Following a typhoon, forest canopies may be disrupted, facilitating the establishment and spread of introduced plants.

Avian Diseases

The importance of avian malaria and pox on native forest birds in the Marianas is uncertain due to lack of formal studies (USFWS 2007a, p. 20). Research on the role of avian disease in the decline of native forest birds on Guam did not identify disease as an important factor (USFWS 2007a, p. 20). However, the presence of avian disease has been noted in white-eye populations on Saipan and Tinian (USFWS 2007a, p. 20).

The most prevalent disease affecting waterbirds is avian botulism (USFWS 2005a). It is caused by a toxin produced by anaerobic bacteria (*Clostridium botulinum*) in stagnant water. It may reappear at affected locations annually and can affect all waterbirds, causing paralysis and eventual death.

Predation

The Marianas

A serious threat to listed species in the Mariana archipelago is the potential for the establishment of the brown treesnake on additional islands in the Mariana archipelago. The brown treesnake was found to be the main cause of the decline of the native forest birds on Guam as it opportunistically preys upon eggs, nestlings, and adult birds (Conry 1988, Savidge 1986, 1987). Extirpations of all but two resident forest avian species in southern Guam occurred within 27 to 32 years after accidental introduction of the brown treesnake. In northern Guam, the average time for the bird populations to decline by 90% was 8.9 years (Wiles et al. 2003). Because the ecosystems on Saipan, Rota, and Tinian are biologically similar to that of Guam, establishment of a brown treesnake population on these other islands would be likely to have consequences similar to those of Guam, (Brown Tree Snake Working Group 2009). Equipment and materials (*e.g.*, for construction) shipped from Guam to Saipan, Rota, or Tinian have the potential to carry, and therefore, spread brown treesnakes to areas throughout the island, increasing the ability of the snake to establish itself island-wide.

There have been 77 credible sightings of brown treesnakes on Saipan since 1982. These sightings have resulted in eleven captures of live brown treesnakes, eight of which were in the vicinity of the seaport or airport and three were in the interior of the island (Hawley 2007, pers. comm.). Evidence of an established or recruiting population of brown treesnakes is lacking for Saipan; however, the snake has been found there (Rodda and Savidge 2007). Brown treesnakes have also been reported on Tinian (9 sightings), and three dead brown treesnakes have been found in cargo delivered to Rota (Hawley 2007, pers. comm.).

The extent of the threat posed by introduced predators, aside from the brown treesnake, in the Mariana Islands is under debate (*e.g.*, Amar 2004, Sachtleben 2005, VanderWerf et al. 2007). There is evidence that the threat posed by the suite of introduced predators is high (Mosher 1999, Mosher 2006) and warrants further study. For example, Mosher (2006) found that out of 28 active nightingale reed-warbler nests that failed, 75% failed due to predation: 15 from rats, 1 from a feral cat, and 5 due to unknown predator(s). Rat predation has been documented to reduce reproductive success and contribute to the decline and extinction of avian species in other areas including island ecosystems (Atkinson 1985, Lindsey et al. 1999, Thibault et al. (2002), Tomich 1986, VanderWerf 2001a, VanderWerf and Smith 2002).

The black drongo (*Dicrurus macrocercus*) was intentionally introduced to Rota in the 1930s and naturally colonized Guam in the 1960s (USFWS 2007a, p. 21). Black drongos are primarily insectivorous, but have been observed eating small birds. Research concluded that black drongo predation of listed species could have an impact on already reduced populations, but that they are not a primary cause of species decline (USFWS 2007a, p. 21).

Climate Change

The information currently available on the effects of global climate change does not allow precise estimates of the location and magnitude of effects. Consequently, the exact nature of the impacts of global climate change and increasing temperatures on listed species addressed in this Biological Opinion are unknown.

We currently do not have a good understanding of how the globally predicted effects of climate change may impact the Mariana Islands. The Center for Island Climate Adaptation and Policy at the University of Hawaii has produced a summary of how Hawaii's climate is changing (Fletcher 2010). This summary is the most current assessment available. Guam and Tinian are expected to have climate change effects similar to those in Hawaii, but the effects on birds may be somewhat less from an overall perspective (North American Bird Conservation Initiative 2010, p. 4). Fletcher (2010, p. 1) identifies six changes to Hawaii's climate that have already occurred:

1. Increased air temperature. The global average temperature has risen by approximately 0.74^{o}C (1.33^{o} F) in the past 100 years (Trenberth and Josey 2007, p. 237). According to modeling projections, global average temperature is expected to rise, even if carbon emissions remain at current levels (IPCC 2007, p. 13). In the Hawaiian Islands, the difference between average high temperatures and average low temperatures is decreasing, resulting in a warmer environment, especially at higher elevations and at night (Giambelluca et al. 2008, p. 2). An analysis of over 80 years of weather station data in the Hawaiian Islands indicates that: (1) higher elevations (above 800 m (2625 ft)) have warmed at a higher rate per decade than lower elevations; (2) warming is lower in summer and greater in winter when compared to annual trends; and, (3) minimum temperature is increasing, especially at higher elevations. The average ambient temperature (at sea level) is projected to increase by 1 to 6^{o}C (2.0 to 11.5^{o}F) by 2100 (Karl et al. 2009, p. 24). This change will increase monthly average temperatures in the Hawaiian Islands from 25^{o}C to 30^{o}C (77^{o}F to 86^{o}F). However, actual observations in the Hawaiian Islands indicate that the rate of increase at low elevation is below the observed global temperature rise per decade (Trenberth and Josey 2007, p. 252;

Meehl et al. 2005). The physical impact of higher temperatures on most listed species has not yet been calculated. However, we do expect increases in the distribution of avian malaria as higher elevation transition from being cool and unsuitable for malaria to warmer and suitable for malaria (Benning et al. 2002, pp. 14246 and 14248).

2. Increased sea surface temperatures. Sea temperature in the Hawaiian Islands has increased and future increases may have negative effects on coral reefs (Jokiel and Brown 2004, p. 1636) and other systems. For the listed species addressed in this Biological Opinion, effects that damage reefs may increase the effects of storms on coastal wetlands and habitat.

3. Decreased rainfall and stream flow. Oki (2004, p. 4) has noted long-term evidence of decreased precipitation and stream flow in the Hawaiian Islands, based upon evidence collected by stream gauging stations. This long-term drying trend, coupled with existing ditch diversions and periodic El Niño-caused drying events, has created a pattern of severe and persistent stream dewatering events. Future changes in precipitation and the forecast of those changes are highly uncertain because they depend, in part, on how the El Niño-La Niña weather cycle (a disruption of the ocean atmospheric system in the tropical Pacific having important global consequences for weather and climate) might change (Hawaii Climate Change Action Plan 1998, pp. 2–10). Initial modeling of future precipitation around 2100 indicates that the dry season may see a 5% increase in precipitation and the wet season seeing a 5-10% decrease in precipitation (Timm and Diaz 2009, p. 4279).

4. Increased rainfall intensity. Heavy rain events have increased during the period from 1958 and 2007 by approximately 12% (Fletcher 2010, p. 3). This could have implications for endangered species by increasing the flooding of habitat, increasing landslide events that affect habitat, increased mortality of nestlings, and reduced reproductive output.

5. Increased sea levels. Current sea level rise in Hawaii is close to 0.6 inches (in (1.5 centimeters (cm)) per decade (Fletcher 2010, p. 3). Future sea level rise may reach one meter (three ft) by 2100 (Vermeer and Rahmstorf 2009, p. 12236).

6. Ocean acidification. The ocean around Hawaii is apparently acidifying at a rate similar to the rest of the Pacific (Dore et al. 2009, p. 12236). Ocean acidification may have significant direct effects on a number of marine ecosystems (Fletcher 2010, p. 4). For the listed species in this Biological Opinion, the primary effect may be reduced coral reef structure, which could, in turn, increase the effects of storms on coastal wetlands and habitat.

Environmental changes that may affect these species are expected to include habitat loss or alteration and changes in disturbance regimes (e.g. storms and hurricanes), in addition to direct physiological stress caused by increased temperatures. The probability of a species going extinct as a result of these factors increases when its range is restricted, habitat decreases, and population numbers decline (Intergovernmental Panel on Climate Change 2007, p. 8). The listed species addressed in this Biological Opinion have limited ranges, restricted habitat requirements, small population sizes, and low numbers of individuals. Therefore, we would expect these species to be particularly vulnerable to projected environmental impacts that may result from

changes in climate, and subsequent impacts to their habitats (e.g., Pounds et al. 1999, pp. 611–612; Still et al. 1999, p. 610; Benning et al. 2002, pp. 14,246 and 14,248).

Species-Specific Status and Baseline

Status of the Guam Micronesian Kingfisher

Species Description

The Guam Micronesian kingfisher, known in the Chamorro language as "sihek," is a subspecies of kingfisher endemic to Guam. Other subspecies, *Todiramphus* [=*Halcyon*] *c. pelewensis* and *T. c. reichenbachii*, exist on Palau (Republic of Palau) and Pohnpei (Federated States of Micronesia), respectively. The Guam subspecies is a small, sexually dimorphic forest kingfisher (Baker 1951, pp. 227–228). The adult male has a cinnamon-brown head, neck, upper back, and underparts. A black line extends around the back of the neck and the eye ring is black.

Listing Status

The Guam Micronesian kingfisher was listed as endangered in 1984 (USFWS 1984, 9 pp.). A five-year status review was completed in 2008 (USFWS 2008a, 17 pp.) and a revised recovery plan for the Guam Micronesian kingfisher was completed in 2008 (USFWS 2008a, 117 pp.). Critical habitat for this species was designated on October 28, 2004.

Historical and Current Distribution

The Guam Micronesian kingfisher was considered "fairly common" and occurred throughout forested areas on Guam in 1945 (Baker 1951, p. 229). Populations in southern and central Guam disappeared by the 1960s (Jenkins 1983, p. 25) and 3,023 individuals were recorded in 1981 in northern Guam (Engbring and Ramsey 1984, p. 34). This population subsequently declined rapidly, and by 1985, fewer than 30 individuals were recorded on Guam (Marshall 1989, p. 210) and the taxon was considered extirpated from the wild by 1988 (Wiles et al. 2003, p. 1,354). Between 1984 and 1986, 29 Guam Micronesian kingfishers were captured and sent to zoological institutions in the mainland United States (Hutchins et al. 1996, p. 4). Currently the captive population consists of approximately 101 individuals in 19 captive rearing facilities (Bahner 2010, pers. comm.).

Ecology

Guam Micronesian kingfishers feed on invertebrates and small vertebrates, including insects, segmented worms, hermit crabs, skinks, geckoes, and possibly other small vertebrates (Marshall 1949, p. 210; Baker 1951, pp. 228–229; Jenkins 1983, p. 23). The species typically forages by perching motionless on exposed branches or telephone lines and swooping down to capture prey off the ground with their bill (Jenkins 1983, p. 24). They will also capture prey off nearby foliage and have been observed gleaning insects from bark (Maben 1982, p. 78).
The Guam Micronesian kingfisher nests in cavities, and breeding activity appears to be concentrated from December to July (Baker 1951, p. 228; Jenkins 1983, p. 24). Nests have been

reported in a variety of trees, including *Ficus* spp., *Cocos nucifera*, *Artocarpus* spp., *Pisonia grandis*, and *Tristiropsis obtusangula* (Baker 1951, p. 228; Jenkins 1983, p. 24; Marshall 1989, p. 475). Pairs may excavate their own nests in soft trees, arboreal termitaria (the nests of termites [*Nasutitermes* spp.]), arboreal fern root masses, or they may utilize available natural cavities such as broken tree limbs (Jenkins 1983, p. 24; Marshall 1989, p. 474). Jenkins (1983, p. 23) observed that some excavated cavities were never used as nesting sites, which suggests that the process of excavating nest sites may be important in pair-bond formation and maintenance.

Both male and female Guam Micronesian kingfishers incubate eggs, and brood and feed nestlings (Jenkins 1983, p. 24). Clutch sizes from wild populations (n=3) were either one or two eggs (Baker 1951, p. 228; Jenkins 1983, p. 24) and clutch sizes of one to three eggs have been reported in the captive population (Bahner, et al. 1998, p. 21). Incubation, nestling, and fledgling periods for populations of Guam Micronesian kingfishers in the wild are unknown. However, incubation and nestling periods of captive birds averaged 22 and 33 days, respectively (Bahner, et al. 1998, p. 21).

Jenkins (1983, pp. 22–23) reported that the Guam Micronesian kingfishers nested and fed primarily in mature, secondary growth, and, to a lesser degree, in scrub limestone forest. It was also found in coastal strand vegetation containing coconut palm as well as riparian habitat. However, Jenkins (1983, p. 22) reported it was probably most common along the edges of mature limestone forest. Few data exist about specific kingfisher nest sites in the wild, but in one study in northern Guam, 16 nest sites were correlated with closed canopy cover and dense understory vegetation. In this study, nest cavities were excavated in the soft, decaying wood of large, standing dead trees averaging 17 in (43 cm) in diameter (Marshall 1989, p. 475). Research on the Pohnpei Micronesian kingfisher indicates that the average home range size is 29.58 ac (6.28 ha) while the average territory size was 20 ac (8.1 ha; Kesler and Haig 2007a, pp. 386–387). Kesler and Haig (2007b, pp. 769–770) found that kingfisher home ranges on Pohnpei consisted of mixed forest and open areas and at least part of this area included mature forest. However, it should be noted that Guam Micronesian kingfisher territories may differ from Pohnpei Micronesian kingfisher territories due to differences in forest structure (Mueller-Dombois and Fosberg 1998, pp. 269–275, 288–291).

Threats

Primary threats to kingfishers include: low productivity in captive propagation; incremental habitat loss due to development and fire; habitat degradation from feral ungulate browsing and trampling; and predation risk from brown treesnake which currently limits reintroduction to Guam (USFWS 2008a, pp. 16–26). Currently, high density of brown treesnakes is the primary factor preventing the kingfisher's survival and recovery on Guam. The continual loss and degradation of habitat for the kingfisher from development and feral ungulates are also factors limiting recovery of the species on Guam.

Conservation Needs of the Species

The recovery plan (USFWS 2008a) calls for a total population of 2,000 adults on Guam within two subpopulations of 1,000 adults each. These subpopulations would also include juveniles which are needed to replace adults that are lost; however, juveniles are not explicitly included in the recovery plan's population criteria. One subpopulation should be in northern Guam, while the second subpopulation should be in southern Guam to reduce the risk of a second extirpation event due to random, stochastic events. Each subpopulation must have brown treesnakes and other predators controlled to a level where a sustainable kingfisher population is feasible and habitat to support this population level must be protected and managed. In the interim, Guam Micronesian kingfishers may also need to be established in the wild on other islands outside their native range to reduce the detrimental consequences of long-term captivity. In the future, the ability to translocate wild birds versus captive birds to Guam should increase success of their survival on Guam.

The 2002, proposal to designate critical habitat for the species identified essential habitat (USFWS 2002, 34 pp.). In 2006, the U.S. Forest Service completed the first island-wide assessment of landcover on Guam (Liu and Fischer 2006, p. 14). Because this assessment represents the best available information for landcover on Guam we used these data to assess the amount of potential recovery habitat for the Guam Micronesian kingfisher on Guam.

The recovery plan identifies that at least 1,000 adult birds in northern Guam, and at least 1,000 adult birds in southern Guam, are needed as one criterion for recovery. The ability of these subpopulations to sustain themselves is dependent on the vital rates (e.g., breeding success, adult and juvenile survival) of these subpopulations. If, for example, breeding success is very poor then additional breeding pairs may be needed to produce the number of juveniles needed to sustain the adult population. This in turn could mean that additional adults are needed to sustain the 1,000 adults considered necessary to reach the recovery criteria. Therefore, prior to using the recovery population criteria and space requirements to estimate acreage required for recovery, we first need to determine the number of juveniles and adults, specifically breeding pairs, needed to maintain a subpopulation of 1,000 adults. These estimates are:

1. Juvenile Population Requirements – A sustainable population of 1,000 adult Guam Micronesian kingfishers requires that a floater population of juveniles be present to replace adults that succumb to mortality. Population modeling for kingfishers on Pohnpei indicates that the adult and juvenile survival rate is approximately 58% and 37%, respectively (Kesler and Haig 2007c, p. 525). We compiled adult and juvenile survival rates of 57 avian species from available sources (Kikkawa and Wilson 1983, p. 191; Robertson et al. 1994, p. 1083; Brook and Kikkawa 1998, p. 493; Saether and Bakke 2000a, pp. 1–3; Nicoll et al. 2004, p. 544; Armstrong et al. 2005, p. 164; Brown et al. 2006, p. 456; Ha et al. 2008, p. 5) and calculated a mean adult (71%) and juvenile (42%) survival rate. We used the mean because Guam Micronesian kingfishers are in the middle of what Saether and Bakke (2000b, pp. 650–651) call a "fast-slow" spectrum (Kesler and Haig 2007c, p. 527). Based on the survival rates above, approximately 690 juveniles would be needed to maintain a population of 1,000 adult kingfishers.

2. Breeding Pair Population Requirements – We used reproductive success information from the Pohnpei kingfisher population (1.7 breeding attempts per year, nestling survival 53%, eggs per clutch = 2, Kesler and Haig 2007c, p. 525) to estimate the number of territorial pairs needed to sustain an adult population of 1,000 individuals. If 690 juveniles are needed to sustain the adult population then 383 pairs would have to breed to produce 690 juveniles a year. This means that 766 of the 1,000 adult kingfishers must be breeders and that a minimum of 383 territories must occur in both northern and southern Guam.

3. Non-paired Adult Population – As noted above, a minimum of 383 core pairs would be needed in both northern and southern Guam to maintain a population of 1,000 adults. The remaining 234 adults in both northern and southern Guam may be breeders or non-breeders. However, because kingfisher home ranges overlap and estimating space requirements for each unpaired kingfisher would require additional complexity, we assumed that the remaining adults were paired.

4. Total Population Requirements – Based on the assessments above, a total of 500 pairs (1,000 adults/2 = 500 pairs) would be needed in both northern and southern Guam to meet recovery criteria. In addition, a population of at least 690 juveniles would be needed to replace adults lost from the population in both northern and southern Guam.

Kesler and Haig (2007a, p. 387) reported that the mean territory size for the Pohnpei Micronesian kingfisher was 20 ac (8.1 ha). The territory size estimate defines the core area that is utilized by a kingfisher pair. However, it does not include all of the area utilized by an individual bird to meet its resource requirements throughout its lifetime. In addition, D. Kesler noted that the territory size estimate is related to home range estimates, which can vary depending on computation method (see Mitchell 2007, pp.1–7, for details). Based on the recommendation of D. Kesler and space use requirement calculations using home range estimates for adult territories, we determined 25 ac (10 ha) as the approximate amount of area required by a pair of Guam Micronesian kingfishers. This acreage is consistent with the estimate used in the Service's 2004, final designation of critical habitat for this species (USFWS 2004b, 46 pp).

In addition to space requirements for territory holders, juvenile kingfishers require space to forage and roost. However, Kesler and Haig (2007a, p. 386) found that juvenile home ranges typically overlapped with those of adults, except for prospecting forays. Therefore, we assumed that the space required by juvenile kingfishers was contained within the 25 ac (10 ha) required for a territorial pair.

Typhoon Impacts to Recovery Habitat

Typhoon data for Guam collected since 1959 indicates that on average four typhoon events (sustained winds greater than or equal to 74 mi per hour (119 km per hour)) could occur each decade (U.S. Navy, Typhoon Joint Warning Center, pers. comm. 2010). Typhoons can cause a wide range of damage to forests (Brokaw and Walker 1991, p. 442) and, if the damage is severe

(e.g., tree uprooting and trunk snapping), could limit the availability of appropriate nesting trees for Guam Micronesian kingfishers. These forests are expected to regenerate after the storm event; however, these storms likely will lead to an extended temporary loss of habitat. In other words, regenerated habitat should eventually be available for a breeding pair to move into if the availability of appropriate habitat within their current territory is diminished due only to damage from a typhoon event.

The amount of regenerated habitat is dependent on the type of damage caused by the storm, the amount of forest impacted by the storm, the time required for the forest to recuperate from the damage from the storm, and the number of storms that occur during that recuperation period. The research required to provide good estimates of all of this information has not been conducted in the Mariana Islands. Therefore, only rough estimates are possible until this information is obtained.

Typhoons can cause defoliation, loss and damage to branches, and snapping and uprooting of stems (Brokaw and Walker 1991, p. 442) which can all impact Micronesian kingfisher habitat. However, of these impacts, the snapping and uprooting of trees is likely to require the longest time for recovery and could have the most impact on long-term kingfisher breeding success. For example, the loss of trees of sufficient size for breeding could limit breeding until appropriate trees were available. Therefore, an assessment of extent of stem snapping and uprooting from typhoons would be important for determining habitat needed to offset impacts from typhoons.

Data on tree snapping and uprooting from storms in the Mariana Islands is limited. Hirsh and Marier (2002, p.598) assessed damage to *Cycas micronesica* trees on Guam after supertyphoon Paka and found that 10% of the trunks had snapped and 2% of the trees were uprooted from the storm. Wiles (2005, p. 514) assessed damage to *Artocarpus mariannensis* after supertyphoon Paka and found that 5.8% of the trunks had snapped and 2.5% were knocked down. Wiles (1991, 1998) also described forest damage associated with typhoon Russ and supertyphoon Paka. In general, Wiles (1991, p. 120) reported that the majority of the trees impacted by typhoon Russ were defoliated, but that few branches were broken and that uprooted and broken trees were uncommon. More severe damage to trees was reported for Paka but it was not quantified (Wiles 1998, p. 103). Donnegan et al. (2004, pp. 27-28), in their assessment of forest resource on Guam, found that approximately 26% of the trees they sampled were damaged and 7% of the damaged trees had broken trunks. Only 36% of the damage was related to typhoons and other weather events so not all trees with broken trunks were related to typhoons. In addition, the damage was not specific to any one typhoon or weather event. Published information on the percentage of trees uprooted and with snapped stems is more widely available outside the Mariana Islands. In the Caribbean, trunk snapping and uprooting rates ranged from 3 to 39% depending on the storm, island, and tree sizes measured (Brokaw and Walker 1991, p. 443). In Samoa, Elmquist et al. (1994, p.387) reported uprooting and trunk snapping percentages from 16 to 67 in trees greater than or equal to 5 cm diameter at breast height from cyclones Ofa and Val. While in Madagascar, Birkinshaw (2007, p. 19) reported that 14% of the living trees greater than or equal to 10 cm diameter at breast height were either uprooted or had snapped trunks due to cyclone Hudah.

Clearly the extent of damage is highly variable and some of this variability may be related to the size, species, location, and previous disturbance history of a tree may affect the level of damage inflicted (Ostertag et al. 2005, pp. 18-22). Because typhoon events are common and the native species on Guam are likely to be typhoon adapted (Stone 1970, p. 14, Wiles 2005, p. 517) the uprooting and trunk breakage rates for Guam are likely to be on the lower end of the impact spectrum. This is consistent with damage estimates provided by Hirsh and Mariar (2002) and Wiles (2005) for two species on Guam as well as the estimates of damaged trees from Donnegan et al. (2004). Therefore, we used the 7% damage estimate from Donnegan et al. (2004) as our estimate of the percentage of forest likely to be severely impacted by a typhoon and thus, not usuable for Micronesian kingfisher breeding habitat until it recovered. It is likely that this may be an overestimate as damage estimates provided by Hirsh and Mariar and Wiles were for a supertyphoon and the estimate by Donnegan et al. (2004) includes non-weather sources of damage. However, the Donnegan et al. estimate provides a multi-species and island-wide assessment of potential damage. In addition, as the intensity of typhoons is expected to increase due to climate change (Webster et al. 2005, p. 1846; Emanuel et al. 2008, p. 365) we believe that this estimate is appropriate.

The amount of forest impacted by each typhoon event is dependent on the intensity of the storm, its distance from the island, its direction, previous impacts to the forest, and the topography of the island (Brokaw and Walker 1991, pp. 442-445; Boose et al. 1994, pp. 377-389). With such variability it is impossible to accurately predict how much forest will be impacted by each typhoon. However, utilizing estimates from a range of storm intensities could provide some general guidelines. Wiles (1991, pp.120–122; 1998, pp. 103–107) provided overviews of impacts on natural resources on Guam from two typhoons, typhoon Russ (1990; maximum 120 mph sustained winds) and supertyphoon Paka (1997; 150 mph sustained winds and gusts up to 185 mph). Wiles did not identify the amount of forested area impacted by each typhoon but did describe which areas were impacted. When these areas were mapped using GIS and compared to available forest, we estimated that 3% of the forest on Guam was impacted by typhoon Russ and 14% was impacted by supertyphoon Paka. These are extremely rough estimates of damage, as the Wiles reports appeared to focus on particular areas of interest and not all forest resources on the island. However, they do provide an estimate of potential typhoon impacts on Guam. Donnegan et al. (2004, pp.27-28), in their assessment of forest resource on Guam, found that approximately 26% of the trees they sampled were damaged and 36% of the damage was related to weather events, like typhoons. Therefore, 9.5% of the trees sampled showed signs of storm damage (Donnegan et al. 2004). Though not specific to any particular storm it does provide a cumulative estimate based on the likely impacts of multiple recent storms. Because this estimate includes a wide range of damage and the likely effects of multiple storms we decided to round up the 9.5% estimate to 10% and use it as the estimated area of forest impacted by each typhoon. This estimate falls close to the average extent of damage (8.5%) from supertyphoon Paka and typhoon Russ estimated by Wiles (1991, 1998), although it is closer to the high end and may be an overestimate for each storm. However, erring on the high end is reasonable as climate change models predict that typhoon intensity will increase (Webster et al. 2005, p. 1846; Emanuel et al. 2008, p. 365).

While natural regeneration of the forest is expected to occur after a typhoon event, calculations of recovery habitat needed must take into account that a portion of the habitat will be non-

functional for Guam Micronesian kingfisher for an extended period of time. Unfortunately, tree growth rate data are not available for the Mariana Islands so forest regeneration time is uncertain. In addition, typhoons create disturbance in the forest which leads to increased growth for some species after the disturbance event (Vandermeer et al. 1997, pp. 154-157). Therefore, there is a great deal of uncertainty in how long it would take for a forest in the Mariana Islands to recuperate from typhoon damage. Franklin (2003) reported on annual growth rates of trees in Tonga, an island with likely similar conditions to other Pacific Islands, including the Mariana Islands. Therefore, we used the average maximum growth rate for the species assessed by Franklin (2003, p. 672) to estimate average growth for Guam after a storm (1.01 cm a year), with the assumption that these maximum growth rates would reflect increased growth after a typhoon. Kingfisher nest chamber diameters were on average 5 in (13 cm, Kesler and Haig 2005, p. 191) so a tree would need to have a larger diameter. We used 8 in (20 cm) as the minimum diameter for a kingfisher nest tree. Because average growth is estimated to be approximately 1 cm a year we expect it would take 20 years for a forest to recuperate from a typhoon and be sufficient for kingfisher breeding. This estimate may be conservative based on available information on *Artocarpus atilis* and *Cocos nucifera* annual growth (Chan and Elevitch 2006, p. 11; Ragone 2006, p. 7). The growth rates of these two species indicate that they may be sufficient size for a kingfisher cavity (i.e., at least 6 m tall and 20 cm diameter; Marshall 1989) in 12 to 15 years. However, growth rates of native forest species may differ from the growth rates of these two agricultural species and so we used the longer duration.

Typhoon data collected since 1959 (U.S. Navy, Joint Typhoon Warning Center, pers. comm. 2010) indicates that on average there were 1.6 supertyphoons and 6 typhoons over a 20-year period. Therefore, over the 20-year period we would expect for a forest to regenerate there would be 7.6 typhoon events of varying magnitude. Each of these severe typhoons would impact approximately 10% of the available forest on the island and 7% of that forest is damaged to such an extent that it is no longer kingfisher habitat. Therefore, if there were 29,310 ac (11,861 ha) of forest for kingfisher recovery, approximately 2,931 ac (1,186 ha) could be impacted by a typhoon and 205 ac (83 ha) would be impacted to such an extent that it would no longer be kingfisher habitat. If typhoons were to occur on average 7.6 times over a 20-year period then 1,559 ac (630 ha) of additional forest across the island of Guam or 780 ac (316 ha) of additional forest in northern and southern Guam would be needed for Micronesian kingfishers to use while the previously damaged forest regenerates.

Based on the above assessment, a minimum total of 13,134 ac (5,2315 ha) of appropriate habitat in northern Guam and 13,134 ac (5,2315 ha) in southern Guam would be needed to recover the species on Guam. This includes 12,355 ac (5,000 ha) for territorial adults and juveniles and 780 ac (316 ha) to buffer habitat loss due to severe typhoons. These calculations are subject to change as a function of additional or revised information on recovery goals for the Guam Micronesian kingfisher.

Ongoing Conservation Actions

The Guam Micronesian kingfisher is currently protected under Guam and Federal law. The captive population is currently managed in 17 captive breeding institutions with the intent of increasing the captive population and maintaining genetic diversity (Bahner and Bier 2007, p. 1)

for eventual reintroduction back into the wild. In conjunction with the Northwest Field training facility and ISR Strike Projects, the Air Force is working toward construction of ungulate exclosures around and eradicating ungulates from approximately 627 ac (254 ha) of forested and disturbed land to increase the quality of the habitat for the Guam Micronesian kingfisher and other listed species (USFWS 2006a, pp. 12, 29). The Air Force was also to set aside approximately 148 ac (60 ha) of forested land in a new experimental habitat management unit (USFWS 2006a, p. 29). A brown treesnake barrier is proposed for construction around this habitat management unit to help support listed species recovery efforts on Guam. The Air Force was also to initiate native foraging tree planting and other conservation actions (USFWS 2006a, p. 12 and U.S. Air Force 2006, pp. 2-36 to2-39). The ungulate management plan for non-fenced areas is being drafted (Cobb, pers. comm. 2010c).

Environmental Baseline for the Guam Micronesian Kingfisher

Status of the Species in the Action Area

The Guam Micronesian kingfisher is extirpated from the wild and is therefore not currently found in the action area. However, habitat required to support the reintroduction and recovery of the species is located within the action area and impacts to this habitat could impact the recovery of the kingfisher on Guam.

As stated in the "Status of the Species" section above, Guam Micronesian kingfishers utilized a wide variety of forested habitats including limestone, coastal strand with coconuts, and ravine forests (Jenkins 1983, pp. 22–23). However, Guam Micronesian kingfishers were most abundant in limestone forest (Jenkins 1983, p. 22). The Forest Service vegetation map of Guam includes the following forest types: 1) Limestone Forest, 2) Ravine Forest, 3) Palma Brava Grove, 4) Scrub Forest, 5) Leucaena Stand, 6) Casuarina Thicket, 7) Acacia Plantation, and 8) Coconut Plantation (Liu and Fischer 2006, pp. 5–7). Of these forest types, only Limestone Forest, Ravine Forest, Coconut Plantation, and Palma Brave Grove were considered likely habitat to support Guam Micronesian kingfisher recovery.

Guam Micronesian kingfishers previously nested in Limestone Forest (Marshall 1989, p. 474). Ravine Forest is found in the areas where kingfishers were reported in southern Guam prior to the 1970s (Drahos 2002, p. 421). This forest type includes some mature native forest (primarily near Fena Reservoir) and coconut trees which have been utilized for nesting (Jenkins 1983, p. 24). Coconut Plantation includes abandoned coconut groves and, as noted above, coconut trees were used for nesting. No information is available on use of Palma Brava Groves by kingfishers. However, Stone (1970, p. 140) states that *Heterospathe elata* (palma brava) typically have a diameter of 8 in (20 cm) which is larger than a kingfisher cavity (5 in (13 cm)); (Kesler and Haig 2005, p. 191) and so kingfishers may use dead or dying palma brava for nesting.

Leucaena Stand, Casuarina Thicket, and Acacia Plantation are dominated by *Leucaena leucocephala*, *Casuarina equisetifolia*, and *Acacia confusa*, respectively (Liu and Fischer 2006, p. 6). None of these tree species are known to be utilized for nesting by Guam Micronesian Kingfishers (USFWS 2008a, p. 11). Therefore, these forest types were not included as potential habitat even though these forest types could be used for foraging. Finally, Scrub Forest is considered disturbed forest dominated by *Artocarpus atilis*, *Cocos nucifera*, and *Leucaena*

leucocephala trees, clumps of *Bambusa vulgaris*, agricultural fields and patches, pastures, scrub vegetation, and home sites (Liu and Fischer 2006, p. 6). While Guam Micronesian kingfishers have utilized *Artocarpus atilis* and *Cocos nucifera* trees for nesting, the landcover map does not discriminate between forests with these tree species and agricultural fields, pastures, and home sites which are not likely to contain appropriate trees for nesting. Therefore, we did not include Scrub Forest as a potential recovery habitat for the Guam Micronesian kingfisher. This may lead to an underestimate of potential habitat; however, our analysis errs on the side of the species and we will not include it unless more detailed data on landcover becomes available and it is warranted to do so.

Micronesian kingfisher home ranges on Pohnpei encompassed nearly all forested areas and edges and some home ranges included extensions to include particular forest features (Kesler and Haig 2007b, p. 769). Pohnpei Micronesian kingfisher dispersal distances on Pohnpei ranged from 561 to 4,501 ft (171 to 1,372 m) while mean prospecting movements ranged from 253 to 1,407 ft (77 to 429 m; Kesler and Haig 2007a, pp. 385, 389). We therefore expect that a wide range of different sized forest patches could be included in a territory and that a territory could include multiple patches. We also expect that kingfishers can disperse up to 4,501 ft (1,372 m) to isolated patches that are large enough for a potential territory and can move reasonable distances (1,407 ft, 429 m) to explore neighboring areas. However, we also expect there may be patches which are too small and far away from other patches to be included in a territory due to the effort it would require a pair holder to defend.

Specific information on how far a territory holder will travel to defend a territory is not available. Therefore, we considered how far a territory holder would have to move to defend a circular and rectangular territory and used the average of those estimates as the distance a kingfisher might move between patches to defend a 25-ac (10-ha) territory. The resulting distances a territory holder would have to move to defend a circular and rectangular territory were between 591 to 1,640 ft (180 and 500 m), with an average of 1,115 ft (340 m). We then assumed any forest patch less than 25 ac (10 ha) within 1,115 ft (340 m) of a 25 ac (10 ha) or greater patch could be part of a territory. In addition, we also assumed that a series of patches that were within a cluster totaling at least 25 ac (10 ha) and contained within the 1,115 ft (340 m) of the center were potential habitat. All other patches less than 25 ac (10 ha) were considered too small and isolated for a kingfisher territory.

Based on the information and assumptions discussed above, we estimate there are 15,822 ac (6,403 ha) of potential recovery habitat in northern Guam and 13,488 ac (5,458 ha) in southern Guam. As noted above under “Conservation Needs of the Species”, a minimum total of 13,134 ac (5,2315 ha) of appropriate habitat in northern Guam and 13,134 ac (5,2315 ha) in southern Guam would be needed to recover the species on Guam. A total of 286 ac (116 ha) of recovery habitat currently exists within the 376-ac area designated as critical habitat for this species.

Threats in the Action Area

Habitat Loss and Degradation

Guam Micronesian kingfisher habitat within the action area is impacted by feral ungulates, invasive weeds and insects, fire and typhoons. On Andersen Air Force Base, densities of Philippine deer and feral pigs were estimated at 0.8 deer per ac (1.8 deer per ha) and 0.2 pigs per ac (0.4 pigs per ha), some of the highest densities recorded in the world (Knutson and Vogt 2003, p. 4). These introduced ungulates are suspected of significantly impacting native floral communities on Guam by consuming seeds, fruits, and foliage, ingesting or trampling seedlings, and promoting the spread of introduced weeds (Wiles et al. 1999, p. 193; Wiles 2005, pp. 514–515). These impacts as well as damage to forests on the base from naturally occurring typhoons and introduced weeds and insects, are degrading the quality of the remaining forest. How this additional degradation will impact the suitability of forests on Guam for the Micronesian kingfisher is unknown. Habitat loss resulting from human-caused wildfires, including conversion of forest to grassland, is detailed in the General Status and Baseline section.

Habitat for the Guam Micronesian kingfisher is also being impacted by the Air Force's development of a training area in the Northwest Field area of the base and their Intelligence, Surveillance, Reconnaissance, and Strike Capability Project. Once these projects are fully completed, it is expected that the amount of habitat remaining for Guam Micronesian kingfisher in northern Guam will be 15,822 ac (6,403 ha) in the north.

Predation by Brown Treesnakes

Brown treesnake predation is the primary factor that caused the extirpation of the Guam Micronesian kingfisher (USFWS 2008a, p. 39). Snake densities are not known specifically; however, densities appeared to level off in the 1990s to around 20 individuals per ac (50 per ha) in favorable habitats (Rodda and Savidge 2007, p. 315). These high snake densities continue to hamper recovery efforts for the Guam Micronesian kingfisher.

Conservation Needs in the Action Area

As noted above, brown treesnake predation is considered a primary factor in the decline of the Guam Micronesian kingfisher. Therefore, large-scale control and/or eradication of brown treesnakes are essential for this species to be successfully reintroduced and to recover. Habitat loss and degradation are believed to be important threats to the recovery of the Guam Micronesian kingfisher (USFWS 2008a, pp. 17–19). Protection of the remaining habitat for this species is needed along with efforts to increase the quantity of appropriate habitat and quality of the remaining habitat. Due to the high populations of feral pigs and deer, control and/or eradication of these feral ungulates would help improve the quality of the remaining habitat in the action area. Preventing and controlling introduced insect pests and weeds will also increase the quality of the remaining habitat. Wildfire impacts to forest habiat in southern Guam are significant; increased support for fire suppression program development in Guam is needed to minimize conversion of forest to grassland. Reforestation of degraded areas would also improve the amount of habitat available to support the eventual recovery of these species.

Finally, the recovery criteria for the Guam Micronesian kingfisher include establishing a population in northern and southern Guam (USFWS 2008a, p. 43). The Guam Micronesian kingfisher is extirpated from the wild on Guam and will need to be reestablished through reintroduction efforts.

Ongoing Conservation Actions in the Action Area

As noted in "Ongoing Conservation Actions" in the species Status section above, the Air Force was to construct ungulate exclosures around and eradicate ungulates from forested areas in the Northwest Field area of Andersen Air Force Base to increase the quality of the habitat for the Guam Micronesian kingfisher and other listed species. The Air Force was also to set forested land near the Potts Junction area as an experimental habitat management unit with a brown treesnake barrier.

Relationship of the Action Area to the Survival and Recovery of the Guam Micronesian Kingfisher

As discussed above under the "Conservation Needs of the Species" section above, a total of 13,257 ac (5,365 ha) of appropriate habitat in northern Guam and 13,257 ac (5,365 ha) in southern Guam would be needed to recover the species. Andersen Air Force Base, Naval Computer Telecommunications Station Finegayan, the former FAA site, and areas south of Route 15 in northern Guam, and the Naval Munitions Site in southern Guam were believed to be occupied by the Guam Micronesian kingfisher prior to its extirpation from the wild (Jenkins 1983, p. 21; Drahos 2002, p. 421). Much of the habitat for the species is currently found on DoD facilities in northern and southern Guam and the species cannot be recovered without this habitat. Therefore, an action which reduces the amount of available habitat could preclude the recovery of the species.

Status of the Guam Rail

Species Description

The Guam rail is a flightless rail that is endemic to Guam. It is approximately 28 cm (11 in) in total length (Pratt et al. 1987). Head, neck, and eye stripes are brown with rufous-tipped feathers on sides of neck; throat and upper breast are near gray; short wings are dark with brownish spots and barred with white; lower breast, abdomen, under-tail coverts, and tail are blackish with white barrings; bill is gray; long legs and dark feet are brown; and irises are red. Females are similar in appearance but slightly smaller than the males (Baker 1951).

Listing Status

The Guam rail was emergency listed as endangered on April 11, 1984. On August 27, 1984, the final rule listing the Guam rail as endangered along with two bats and six other birds was published. A nonessential experimental population was proposed on Rota on June 19, 1989 and the final rule published on October 30, 1989. A recovery plan covering native forest birds of

Guam and Rota was prepared in 1990. Critical habitat has not been designated for the Guam rail.

Historical and Current Distribution

This species was once distributed throughout Guam, but by 1981 the population was reduced to approximately 2,300 individuals and only existed in northern Guam (Engbring and Ramsey 1984, p. 28). In 1983, estimates of population size indicated that fewer than 100 individuals remained on Guam and 22 individuals were moved to captive propagation facilities (Haig and Ballou 1995, p. 446). The Guam rail was believed to have been extirpated in the wild on Guam by 1987 (Wiles et al. 1995, p. 38) and is now found only in captivity and in an experimental population on Rota (Wenninger 2008, pers. comm.). As of June 2008, there are approximately 158 Guam rail in captivity on Guam and in mainland zoological institutions (USFWS 2008b, p. 5).

Efforts to establish a nonessential experimental population on the island of Rota have been underway since 1989 (Beauprez and Brock 1999a). As of June 2008, a total of 918 Guam rail were released on Rota as part of an effort to establish an experimental population on that island (Witteman and Beck 1990; Beck 1991; Brock and Beck 1995; Beauprez and Brock 1996; 1997; 1998; 1999a; Medina and Aguon 2000, p. 176; Wenninger 2008, pers. comm.). Breeding has been documented and Guam rail have been observed several years post-release in some regions of the island (Wenninger 2008, pers. comm.). In 2007, approximately 60 to 80 Guam rail were believed to be persisting in the Duge and Apanon areas of Rota (Wenninger 2007, pers. comm.). However, additional releases and intensive cat control is needed as cat predation is believed to be the primary factor preventing the establishment of a self-sustaining population on Rota.
In addition to releases on Rota, there have been two releases of Guam rail on Guam since the species was listed. In 1998, 16 Guam rail were released in Area 50 in northern Guam (Beauprez and Brock 1999b). A temporary brown treesnake barrier was constructed around Area 50 and snake populations in the barrier were reduced through snake control. Breeding was documented; however, the small population was believed to have been extirpated by feral cats and other predators (Beauprez and Brock 1999b). In 2003, a total of 44 Guam rail were released in a snake-reduced area of the Northwest Field Naval Munitions Area on Andersen Air Force Base (Wenninger 2008, pers. comm.). Of the Guam rails released with radio transmitters attached (n = 26), over 80% were preyed upon by feral cats (Wenninger 2008, pers. comm.). Efforts to reduce cat predation were limited due to difficulty obtaining approval to control cats in the area. No Guam rails are believed to be persisting in the wild on Guam at this time (Wenninger 2008, pers. comm.).

Ecology

Guam rails are omnivorous and forage on the ground for skinks, geckos, insects, snails, and carrion, as well as seeds and palm leaves (Jenkins 1979, p. 405). Guam rails may nest year-round laying 3 to 4 eggs in shallow nests of leaves and grass on the ground (Jenkin 1979, p. 406). Incubation is 21 days (Beck 1985, unpubl. data as cited in Service 1990a p.9) with both sexes sharing in the nesting duties. In captivity, rails reproduced for the first time at 5 months of age and in at least one case, laid a second clutch while still feeding 3-week old chicks (Beck 1990).

Perez (1969 as cited in Service 1990a p.9) suggested a peak breeding period during the rainy season (May–Oct). The extremely precocial young hatch asynchronously and leave the nest within 24 hours of hatching to forage with the aid of their parents (Jenkins 1979). Observations of radio-tagged individuals indicated that the species prefers edge habitats, especially grassy or secondary vegetation areas which provide good cover (Wenninger 2008, pers. comm.). All observations of breeding by wild individuals over the last decade have also been associated with edge habitats or secondary vegetation on Rota and Guam (Beauprez and Brock 1999a; 1999b; Wenninger 2008, pers. comm.).

Guam rails were predominately found in scrubby secondary growth areas and the edges of mixed forest areas (Jenkins 1979, Engbring and Ramsey 1984). Jenkins (1979) reports that they were seldom observed in the interior of mature limestone forests or savanna areas and did not occur in wetlands. As Guam was probably mostly limestone forest before the arrival of man (Fosberg 1960), the rail may have become more common after much of the mature forest had been converted to scrubby second-growth or mixed forest (Engbring and Ramsey 1984).

The U.S. Forest Service vegetation map of Guam includes the following vegetation types: (1) Limestone Forest, (2) Ravine Forest, (3) Palma Brava Grove, (4) Scrub Forest, (5) Leucaena Stand, (6) Casuarina Thicket, (7) Acacia Plantation, (8) Coconut Plantation, (9) Savanna Complex, (10) Strand Vegetation, (11) Other Shrubs and Grasses, (12) Agricultural Field, (13) Urban Builtup, (14) Urban Cultivated, (15) Barren Land, and (16) Wetlands (Liu and Fischer 2006). Of these vegetation types, only Scrub Forest, Other Shrubs and Grasses, and Urban Cultivated were considered primary Guam rail habitat because they include shrubby edge habitat. The remaining forested areas were excluded because rails were less common in interior forested areas.

Rails are believed to use the edges of these vegetation types; however, these areas are likely bordered by secondary scrub, shrub, and urban cultivated vegetation types which are included. Savanna complex was also not included though they may use the edge of this habitat type. Wetlands and barren lands were not included because the available data does not list these vegetation types as being used by rails. Guam rails may utilize agricultural fields; however, there was no data available indicating they use such areas. Finally, areas classified as Urban Builtup were excluded because rails were not reported in urban areas and these areas likely do not contain appropriate habitat for the species.

Threats

While the loss of habitat likely played a part in the extirpation of the Guam rail from Guam, the primary reason is believed to be from predation by cats and brown treesnakes. These are the two known threats that preclude the successful reestablishment of Guam rail on Guam. Of the released Guam rail with radio transmitters, over 80% were preyed upon by feral cats (Wenninger 2008, pers. comm.). Birds released in Area 50 were believed to have been extirpated by feral cats and other predators (Beauprez and Brock 1999b). See the Brown Treesnake section in General Effects for additional information regarding the effect of the snake on birds.

Conservation Needs of the Species

The primary conservation needs of the species are (1) habitat conservation; (2) intensive cat and snake control; and (3) reintroduction of the species to protected areas.

No information is available on the average size of a Guam rail territory. Similar species, such as the Lord Howe woodhen (*Gallirallus sylvestris*), have an average territory size of 2.4-10 ac (1–4 ha) (NSW National Parks and Wildlife Service 2002), while the weka (*Gallirallus australis*), another rail species of conservation concern, has an average territory size of 5 or 12 ac (2 or 5 ha) depending on location (Beauchamp 1987). Assuming the territory of the Guam rail is similar to the maximum territory size of the weka, patches smaller than 25 ac (10 ha) (the average territory size of two weka pairs [12 ac (5 ha) x 2]) and over 0.6 mile (mi) (1 kilometer (km)) away from the nearest patch are likely too small and isolated to be viable habitat for rail recovery. Conversely, assuming the territory of the Guam rail is similar to the minimum Lord Howe woodhen territory size, patches less than 2.5 ac (1 ha) and over 410 ft (125 m) (the approximate radius of a 12-ac (5-ha) territory) from the nearest patch above 2.5 ac (1 ha) are considered too small and isolated to be viable habitat for rail recovery. Finally, any patch completely isolated from the nearest patch by lands classified as Urban Builtup (excluding roads) by the U.S. Forest Service is considered too isolated to be viable rail habitat due to the potential for urban developed areas to impede movement of rails.

The interim recovery objectives for downlisting the Guam rail from endangered to threatened call for 1,000 birds in northern Guam and 1,000 birds in southern Guam (total = 2,000 individuals; Service 1990b). No criteria were defined for delisting. Trail et al. (2009) recently proposed that a minimum viable population target of 5,000 individuals is an appropriate target for species conservation. If we consider the entire rail population on Guam as one unit, then we would need 5,000 rails to achieve recovery (delisting).

Engbring and Ramsey (1984) estimated Guam rail densities between 0.07 and 0.33 birds per ha on Guam in 1981. Weka had densities ranging from 0.3 to 0.8 birds per ha (Beauchamp 1987) while the Cocos buff-banded rails (*Gallirallus philippensis andrewsi*) typically had densities from 4 to 9 birds per ha (Reid and Hill 2005). Guam rail and weka densities both reflected species undergoing population declines. Therefore, their density estimates may not reflect the potential densities that could be obtained from a recovered population. However, because the maximum Guam rail density overlaps with the weka estimates it does serve as a sound conservative estimate of potential densities until further data are collected.

Therefore, to meet the population goal of 5,000 individuals on Guam we would need 41,184 ac (16,667 ha) (5,000 birds/0.3 birds per ha) of appropriate habitat on Guam. In addition, to meet the downlisting criteria of 1,000 birds in both northern and southern Guam 8,236 ac (3,333 ha) (1,000 birds/0.3 birds per ha) of appropriate habitat would be needed in both northern and southern Guam.

Ongoing Conservation Actions

Efforts are underway to release Guam rails on Cocos Island because rats have not been observed (Vice 2010b, pers. comm.) since rodent eradication operations were completed during March–April 2009 (Lujan et al. 2010 in prep), and monitor lizards continue to be removed. A rail release date has not been established but has been proposed for October or November 2010 (Vice 2010a, pers. comm.). See the Brown Treesnake section in General Effects for additional information regarding ongoing snake control.

Environmental Baseline for the Guam Rail

Status of the Species in the Action Area

There are currently no Guam rails on Guam in the wild. They have been extirpated from the wild. There are currently only captive-reared rails remaining in captivity on Guam.

Threats in the Action Area

Habitat Loss and Degradation

As stated in the "Threats" section of the Guam rail Status section above, though the primary threats to Guam rail are brown treesnakes and cats, the loss of suitable habitat resulting from development may affect the ability of the species to recover. Currently, there are an estimated 24,698 ac (9,995 ha) of Guam rail recovery habitat available in the north of Guam and 24,866 ac (10,063 ha) in the south.

Conservation Needs in the Action Area

Intensive snake and cat control is needed in the action area to make it suitable for a Guam rail reintroduction.

Ongoing Conservation Actions in the Action Area

See Brown Treesnake section in General Effects for a discussion of ongoing conservation actions.

Relationship of the Action Area to the Survival and Recovery of the Guam Rail

Recovery of the species on Guam will depend on the reestablishment of a wild population on Guam and sufficient habitat to support a recovered population. The action area overlaps habitat that may be necessary for the recovery of the species.

Status of the Mariana Common Moorhen

Species Description

The Mariana common moorhen is a duck-like slate gray waterbird with a chicken-like bill and broad red shield on the forehead (Pratt et al. 1987, p. 128, Service 1991a, p. 2). They are an obligate (limited to a particular habitat) wetland species. They are generally secretive and utilize all areas of a wetland, even foraging and swimming in open water, though their feet are not webbed (Pratt et al. 1987, p. 128). This subspecies is endemic to the Mariana archipelago and is a member of the cosmopolitan common moorhen species (*Gallinula chloropus*) that has subspecies in North America, Eurasia, the North Pacific, and South America (American Ornithologists' Union 1984). It is thought to have a New World origin (Hartert 1898, Baker 1951, Ripley 1977). The sexes are similar in appearance, though females have a smaller frontal shield (Baker 1951, p. 127, Service 1991a, p. 2). Immature birds are browner than the adult, with duller legs, and a smaller frontal shield that is pale yellow or brown (Pratt et al. 1987, p. 128, Service 1991a, p. 2).

Listing Status

The Mariana common moorhen was federally listed as an endangered species in 1984 (USFWS 1984). The recovery plan for the Mariana common moorhen was finalized in 1991 (USFWS 1991a, 55 pp.). A five-year status review completed in 2009 determined that the Mariana common moorhen still meets the definition of endangered (USFWS 2009b, p. 9). No critical habitat has been designated for this species.

Historical and Current Distribution

The Mariana common moorhen occurred historically on the islands of Guam, Tinian, Saipan, and Pagan (Baker 1951, p. 127, Service 1991a, p. 2, Stinson et al. 1991, p. 38). Archaeological evidence also indicates they were present on Rota between 1,500–2,000 years ago (Butler 1988). The Mariana common moorhen may have been extirpated from Rota due to human-related loss of wetlands, elimination of wetlands due to sea-level changes, hunting, or introduced predators (Becker and Butler 1988, Steadman 1992, Stinson et al. 1991, p. 42). The Mariana common moorhen is believed to be extirpated from Pagan due to the volcanic eruption in May 1981, and destruction of vegetation by feral ungulates (Stinson et al. 1991, pp. 41–42). Artificial wetlands (ponds for a wastewater treatment plant and a golf course) were constructed on Rota in 1994, and were subsequently colonized by a small number of adults, chicks, and juveniles (Worthington 1998, p. 414). Surveys completed in 2001 indicate the Mariana common moorhen population had declined on Tinian and Guam since 1991 when surveys were previously conducted (Stinson et al. 1991, p. 40, Takano and Haig 2004a, pp. 247–248 and 249). The most recent survey information indicates there are approximately 90 Mariana common moorhen on Guam, 154 on Saipan, 41 on Tinian, and only two individuals on Rota (Takano and Haig 2004a, p. 247 (Table 9)).

Although a complete census has not been completed since 2004, the number of Mariana common moorhens has recently decreased at the Fena Valley reservoir, in southern Guam, potentially due

to the loss of *Hydrilla verticillata,* a wetland plant used as a nesting substrate, as a result of eutrophication of the lake after a typhoon (Brooke, 2007). While it is possible that the birds moved to other wetlands and the Guam population has not declined overall, comprehensive surveys on Guam would be needed to determine the impact of the loss of habitat at Fena Lake to the population.

Table 9. Estimated population sizes of the Mariana common moorhen in the Mariana Islands.

	Service 1991a	Stinson et al. 1991*	Takano and Haig 2004a (mean)
Guam	100 – 200	100 – 125	90 (88)
Rota	0 (Pre-historic: Present 1,500-2,000 years ago**)	0	2***
Tinian	20 – 125	100	41 (36)
Saipan	60 – 120	100	154 (122)
Pagan	0 (Present prior to 1981)	0	0
Total	180 – 265	300 – 400	287

* Number includes juveniles and estimates of areas that weren't surveyed, see Takano and Haig (2004a).
** Becker and Butler (1988 cited in Stinson et al. 1991).
*** see also Worthington (1998).

Ecology

Habitat

The Mariana common moorhen prefers wetlands with diverse, non-persistent, emergent vegetation containing deep and shallow water areas with equal areas of vegetation cover and open water (Ritter and Savidge 1999, p. 286, Stinson et al. 1991, p. 39). This species avoids wetlands with dense vegetation monocultures such as sites dominated by *Phragmites karka* (Ritter and Savidge 1999, pp. 285–286). Edge and emergent vegetation is used for breeding, nest building, and escape cover (Ritter 1994, p. 129, Service1991a, p. 17). Primary habitats (as defined in the recovery plan) include: Agana marsh, Fena Valley reservoir, and the Naval Station Marsh, Guam ; Lake Hagoi on Tinian; and Lake Susupe, Puntan Muchot, and Garapan wetlands on Saipan (USFWS 1991a, pp. 4–16). Several secondary wetland habitats were identified on Guam and Saipan; only one secondary wetland (Magpo) on Tinian was considered important for the recovery of the species (USFWS 1991a, pp. 4–16). Mariana common moorhen that occur on all the Mariana Islands are the same subspecies and there is no difference in habitat use or other aspects of their ecology, except that because there are river systems on Guam, they also use river systems there (Takano and Haig 2004b, p. 661). Many permanent wetlands are impacted by the presence of introduced tilapia (*Oreochromis mossambicus*) which is believed to degrade habitat for wetland birds by depleting the invertebrate prey base used by these birds (Marshall and Worthington 1996, USFWS 2005). Small seasonal wetlands are therefore considered important to this species.

Home Range

During a study in 2000 to 2001, adult Mariana common moorhens were radio-marked on Guam and Saipan to determine home range and movement patterns (Takano 2003, p. 30, Takano and Haig 2004b, p. 656). During the dry season, birds mostly remained in a single wetland and little interisland movement was detected. During the wet season however, inter- and intra-island movements increased (Takano 2003, pp. 50–54, Takano and Haig 2004b, pp. 657–660). Home range estimates on Guam averaged 7.7 ± 11.9 ac (SD) (3.1 ± 4.8 ha) and did not differ significantly between the sexes; however, during the dry season females exhibited significantly smaller mean core areas than males (Takano 2003, p. 48, Takano and Haig 2004b, pp. 658–661). Takano and Haig (2004b, p. 661) also found that rivers are important for the Mariana common moorhen on Guam and the use of rivers increased in the wet season.

Feeding Habits

The food habitats of the Mariana common moorhen have not been thoroughly examined but it is likely they are similar to that of other subspecies of the common moorhen, which appear to be opportunistic feeders. Mariana common moorhens feed on plant and animal matter in or near wetlands (USFWS 1991a). Seale (1901, p. 31) found grass, insects, and larvae in the stomachs of the Mariana common moorhen on Guam. Pratt et al. (1987, p. 128) reported that Mariana common moorhen eat mollusks and plants. The Hawaiian common moorhen (*Gallinula chloropus sandvicensis*) is reported to feed on algae, aquatic insects, and mollusks as well as other invertebrates and seeds (Schwartz and Schwartz 1949, Service 2005a, p. 23).

Life Cycle

Little is known about the reproduction of the Mariana common moorhen (USFWS 1991a, p. 17); they are considered socially monogamous (Takano 2003, p. 4). Marshall (1949, p. 219) believes the birds nest year–round. Nests have been constructed in *Scirpus litoralis*, *Panicum muticum*, and *Cyperus* spp. (Ritter 1994, p. 128, Service 1996, p. 7). Clutch size for Mariana common moorhens varies between 1 to 6 eggs (Ritter 1994, p. 129, Service 1996, p. 23). Birds often nest multiple times in a year and juveniles from early broods are known to stay on their natal territory and help rear siblings from later broods (Ritter 1994, p. 130, Takano 2003, pp. 4–5).

Threats

The threats affecting this species are discussed in Section I, Reasons for Declines and Current Threats, of the recovery plan (USFWS 1991a, p. 19). Currently, the main two threats to the Mariana common moorhen are: (1) loss and degradation of wetland habitat, including filling, alteration of hydrology, invasion of habitat by non-native plants, and unrestricted grazing of domestic and feral ungulates; and 2) predation by introduced species (USFWS 1991a, p. 19, Service 1996, pp. 11–12). The impacts of disease are not known at this time but botulism is responsible for the loss of many waterbirds in Hawaii, including the Hawaiian common moorhen (USFWS 2005a, p. 49). Other natural or manmade factors that threaten the species are environmental contaminants, fires, and global climate change. Overutilization may have been a threat in the past in the form of hunting as the Mariana common moorhen was historically used

as a food item by the local Chamorro people. Although hunting of the species is not currently legal, poaching may be a problem (USFWS 1991a, p. 19); hunting is known to have occurred in 1977 (Drahos 2002, p. 264).

Habitat Loss

Wetland habitat on Guam, Saipan, Tinian, Rota, and Pagan is declining in area and habitat quality. According to the 1983 National Wetland Inventory maps for the CNMI there were approximately 740 ac (300 ha) of wetlands (although this figure apparently does not include some wetland types) on Saipan, Tinian, Rota, and Pagan; wetlands occupied less than 2% of the total land area of the CNMI (Burr et al. 2005). The 1983 National Wetland Inventory maps for Guam indicate that there were approximately 5,000 ac (2,023 ha) of wetlands at that time, or slightly less than 4% of the total land area of Guam (Guam EPA 2008). Undated anecdotal reports indicate that there used to be three times as many wetlands in the CNMI as occur now (Burr et al. 2005). Guam has more wetlands and a wider variety of wetland types than does the CNMI, and although it is difficult to quantify the extent of loss, significant losses of wetlands have occurred on Guam as well (Wiles and Ritter 1993, pp. 129–133).

The condition of remaining wetlands in the Mariana Islands is generally poor for a number of reasons, including filling, dredging, altered hydrology, invasive introduced plants, introduced vertebrate predators, ungulate disturbance, fires, erosion, pollution, and even volcanic activity (Stinson 1993, pp. 276–277, Wiles and Ritter 1993, pp. 129–133). Reports indicate that many of Guam's natural wetlands are becoming heavily invaded by the *Phragmites karka* reed (Ritter and Savidge 1999, Takano and Haig 2004b). Lake Hagoi is also subject to encroachment by *P. karka* and *Scirpus litoralis* (USFWS 1996, p. 11). Many wetlands on Saipan are also overgrown with vegetation, particularly *P. karka* (Marshall pers. comm. 2007). Permanent wetlands on Saipan and Guam are also impacted by the presence of tilapia (*Oreochromis mossambicus*) which is believed to degrade habitat for wetland birds by depleting the invertebrate prey base used by these birds (Marshall and Worthington 1996, p. 48, Service 2005a, pp. 82–83, Stinson 1993, p. 42). Development and implementation of a plan is essential to secure and manage the wetlands necessary for the recovery of this species. The ability to secure and protect wetlands is made more difficult due to the fact that in the CNMI, only those of Chamorro descent may own lands. However, the National Park Service has leased lands at American Memorial Park on Saipan which includes the last mangrove wetland on Saipan, and it is possible to develop cooperative agreements with private landowners. For example, the Guam Division of Aquatic and Wildlife Resources is interested in working on a Safe Harbor Agreement for the Guam rail (*Gallirallus owstoni*). The CNMI government has also considered the possibility of establishing a wetland mitigation bank (Gilman 1997).

Predation

A number of different predators impact the Mariana common moorhen throughout its range. Monitor lizards (*Varanus indicus*) were recorded in Lake Hagoi, Tinian during Mariana common moorhen nest searches (USFWS 1996, p. 12). The extent of predation on the Mariana common moorhen by monitor lizards is unknown, but monitor lizards are opportunistic and omnivorous, eating small mammals, insects, other lizards, birds, and eggs (McCoid and Witteman 1993; Vogt,

2006, pers. comm.). In the Mariana Islands, monitor lizard predation has been confirmed on Mariana common moorhen eggs, Micronesian megapodes, and a yellow bittern (*Ixobrychus sinensis*) chick in a nest in a coconut tree (Vogt 2006, pers. comm.). Rats (*Rattus* spp.) are also suspected of preying on eggs (USFWS 1996, p. 12). Additionally, it is possible feral dogs and cats may prey on birds in some areas (USFWS 1991a, p. 19, Stinson et al. 1992, p. 42).

According to Wiles et al. (2003, pp. 1356 and 1357–1358), the Mariana common moorhen population appeared to show little if any decline in northern Guam when other species disappeared or declined significantly, but it was noted that systematic surveys and quantitative documentation were lacking, so the actual impacts of the brown treesnake on the Mariana common moorhen are unknown. Takano and Haig (2004a, p. 249) found that Mariana common moorhens are subject to heavy egg and chick loss on Fena Reservoir and they believe that the brown treesnake is a major predator of Mariana common moorhen eggs and chicks on Guam. Eggs disappeared at night with no egg shell fragments and two brown treesnakes were observed swimming on Fena Reservoir at night (Takano and Haig 2004a, p. 249). The Mariana common moorhen is a medium to large bird, susceptible to snake predation only in the egg stage or when very young and of small body size.

Conservation Needs

Only interim recovery objectives were identified in the recovery plan due to a lack of data necessary to fully understand the needs of viable populations of this species (USFWS 1991a, p. 21). The primary task is to promote the survival of the species by providing stable, productive habitat throughout the historical Mariana common moorhen range. This entails 1) securing and managing all primary habitats to maximize the habitat conditions; 2) maintaining the secondary habitats as wetlands or creating new wetlands for those that are lost; and 3) minimizing mortality from predation, poaching, and other factors including human disturbance. Recovery needs also include determining basic biological and population data to further refine recovery actions. Downlisting criteria included protecting and managing 600 ac (240 ha) of suitable wetland habitat on Guam, 300 ac (120 ha) on Saipan, and 75 ac (30 ha) on Tinian. Population threshold numbers for downlisting include: 600 adult birds on Guam, 75 on Tinian, and 300 on Saipan (USFWS 1991a, pp. iii–iv).

Managing vegetation and water levels and controlling predators would improve the quality of wetlands and the number of Mariana common moorhens that can be supported (Ritter and Savidge 1999, p. 287, Ritter and Sweet 1993, p. 687, Service 1996, pp. 11–12, Worthington 1998, p. 416). Takano and Haig (2004b, p. 661) suggest that protecting rivers on Guam would be important to the survival of the species. Conducting regular surveys and monitoring would also allow better assessment of how populations are doing, and indicate if additional management is needed in some areas. Additional research is needed on the ecology of the species, particularly regarding impacts to reproductive success, population growth, impacts of predators, and carrying capacity of habitats.

Conservation Actions

On Guam, the developers of Manenggon Hills Resort agreed to construct 50 wetlands on the property to benefit the Mariana common moorhen (Ritter and Sweet 1993, p. 686). One of the wetlands was completed in January 1992, and by August of that year, adults and chicks were detected in the vicinity of the new wetland (Ritter and Sweet 1993, p. 687). Two adults were also detected the following January (Ritter and Sweet 1993, p. 687), possibly indicating continued use of the site.

Susupe Wetland on Saipan is regulated under CNMI Public Law #2-51 for the protection, restoration, and preservation of freshwater wetlands, habitat and species (Stinson 1993). The Service Recovery Land Acquisition provided funds to the CNMI Department of Lands and Natural Resources to purchase 9.5 ac (3.8 ha) of habitat along Lake Susupe, (Henry 2007, pers. comm.). The site is one of the only known large, freshwater wetlands in the CNMI. The lake and potholes in this area are known to be important habitat for the Mariana common moorhen.

Costco Park Wetland Mitigation Pond on Saipan was created for wetland mitigation under the Clean Water Act of 1972 to mitigate the wetland impacts from the Costco development (Williams 2008, pers. comm.). The wetland cannot maintain open water (a requirement of the applicants permit issued by the U.S. Army Corps of Engineers) without annual clearing and dredging to remove abundant reeds (*Phragmites* spp). The endangered Mariana common moorhen utilizes the wetland as do other native species, including the nightingale reed-warbler. A few other wetlands have been created or modified on Saipan as mitigation for take of other wetlands and impacts to the Mariana common moorhen, including Annie's pond (seasonal) and an area at Lower Base (Falig pond) (Marshall 2010, pers. comm.).

Environmental Baseline for the Mariana Common Moorhen

Status of the Species in the Action Area

Current Distribution

Table 9 above includes summaries of the current estimated populations of the Mariana common moorhen on Guam and Tinian. In addition to the survey information summarized in the Status of the Species section, the following sections provide details regarding the current distribution of the species in the action area.

Guam

Most recent survey information indicates there are approximately 90 Mariana common moorhen on Guam (Takano and Haig 2004a, p. 247). Wetlands that are important to the Mariana common moorhen on Guam include Agana Swamp, Yling River, and Fena Valley Reservoir, as well as various water treatment ponds (Stinson et al. 1991, p. 39, Takano 2003, p. 71). Many of the wetlands utilized by the Mariana common moorhen on Guam are ephemeral. Wetlands as a whole on Guam have been reduced in size and habitat quality (Stinson et al. 1991, p. 40).

On Guam, Mariana common moorhens use Fena Reservoir, an approximately 203-ac (82-ha) wetland located within the Naval Munitions Site (see Figure 4). Fena Reservoir is used more in the dry season (January through May) than the wet season (October through December) when Mariana common moorhens typically disperse to other wetlands or rivers on Guam (Ritter and Savidge 1999, p. 286; Takano and Haig 2004b, p. 656). Recent survey data indicate the number of Mariana common moorhen routinely detected at Fena Reservoir during the dry season (when maximum abundance is anticipated) has declined since surveys were initiated in 1987 (Brooke and Grimm 2008, p. 3). Though surveys have been sporadic since 2004, breeding and recruitment appear to be low to nonexistent at Fena Reservoir, as the last nest was detected during January 2004, and the last juveniles were detected in July 2005 (Brooke and Grimm 2008, pp. 1–3). Recently (April 2009), only six Mariana common moorhens were observed at Fena Reservoir (Eggleston 2009, p. 1). The reduced numbers of Mariana common moorhens and the lack of breeding and recruitment at Fena Reservoir have been hypothesized to correlate with the loss of *Hydrilla verticillata*, a non-native invasive aquatic plant that forms extensive mats, which was used as foraging and nesting habitat by the moorhen (Brooke and Grimm 2008, pp. 1–2). Mariana common moorhens also use other scattered sites in the Naval Munitions Site, sites along the Talafofo and Ugum River basins, and Naval Base Guam.

Tinian

The most recent survey information indicates there are approximately 41 Mariana common moorhen on Tinian (Takano and Haig 2004a, p. 247). Tinian's limited wetland areas include Lake Hagoi, Makpo (or Magpo) Swamp, Bateha Wetland, and the Mahalang Wetlands (USFWS 1996, p. 2). Lake Hagoi and the Mahalang Wetlands are located within the Navy Exclusive Military Use Area, and Bateha Wetland is located in the Navy Military Lease Area (USFWS 1996, p. 2). Magpo Wetland has been heavily degraded for many years through drainage of water by the village and no longer supports Mariana common moorhens (Marshall 2010, pers. comm.). Mariana common moorhens are occasionally reported at the Mahalang and Bateha Wetlands (USFWS 1996, p. 6). Lake Hagoi supports the largest population of the Mariana common moorhen on Tinian (USFWS 1996). Most past estimates there have been between 25 and 100 birds (Engbring et al. 1986, Stinson et al. 1991, p. 41, Takano 2003, p. 70). There were an estimated 41 birds on Tinian in 2004 (Takano and Haig 2004a, p. 247), compared to 75 (Stinson et al. 1991, p. 41) and 50 (USFWS 1996, p. 10) birds in past count efforts. Takano and Haig (2004a, pp. 247–248) found fewer birds on Tinian in 2004 than previous surveyors found, and they believe their survey methods produced more accurate counts than past surveys by minimizing counting errors due to inter-island movements between islands (Takano and Haig 2004a, p. 248).

On Tinian, an index survey of Mariana common moorhen at Lake Hagoi shows variability in counts by year, which likely reflects changing conditions, such as the amount of water in the lake, but overall the average population counts by year were similar to surveys conducted between 1999 and 2007 (Vogt 2008, p. 3). The greatest number of Mariana common moorhens seen at Lake Hagoi was 46 birds in 2002; 26 birds were found in 2001, and since then counts have ranged from 0 to 23 birds (Vogt 2008, p. 3). Nest and egg production have been and continue to remain low, which may be the result of predation by monitor lizards (Vogt 2008, p. 9). The secondary wetlands on Tinian are not routinely monitored for the presence or abundance

of Mariana common moorhen. Overall, the current numbers of Mariana common moorhens on Tinian appear to be lower than they were in the past.

Threats in the Action Area

The main threats to the species on Guam and Tinian are wetland loss and degradation, and predation by alien species. In addition, other natural and human-caused factors threaten the species, including disease, fire, environmental contaminants, and climate change. Threats are described for each site in the "Current Distribution" section, above.

Conservation Needs in the Action Area

Conservation needs include securing (protecting) and managing wetland habitat on Guam and Tinian (including minimizing human disturbance of wetlands); predator control, particularly preventing the introduction of the brown treesnake to Tinian; monitoring; and research to help better manage the species and its habitat (USFWS 1991a, pp. 23–39). Control of invasive plants such as *Phragmites karka, Scirpus litoralis* and invasive tilapia fish are also necessary to improve habitat availability for the Mariana common moorhen. Development and implementation of a program to secure and manage the Guam wetlands is necessary for the recovery of this species.

Ongoing Conservation Actions in the Action Area

Ongoing conservation actions in the action area include construction of a small number of wetlands on Guam.

Relationship of the Action Area to the Survival and Recovery of the Mariana common moorhen

In order to recover the Mariana common moorhen, the recovery plan criteria (USFWS 1991a, pp. iii–iv and 21–22) require stable populations of 600 birds on Guam and 75 birds on Tinian. In addition, a total of 600 ac (240 ha) of suitable wetland habitat must be protected and managed on Guam and 75 ac (30 ha) must be protected on Tinian. At this time, none of these goals have been met, and declines of the Mariana common moorhen have occurred on Guam and Tinian (Takano and Haig 2004a, pp. 247 and 249). Maintaining connectivity among multiple island wetlands throughout the year is important to the recovery of this species (Takano and Haig 2004a, p. 661). The continued loss and degradation of wetlands these islands will likely have a negative impact on the Mariana common moorhen. For example, a loss of the wetlands on Tinian could decrease the ability of the species to disperse through this area to utilize wetlands on Guam when needed. Both Guam and Tinian are believed to be important in supporting seasonal populations of the Mariana common moorhen.

Status of the Mariana Crow

Species Description

The Mariana crow, known as "aga" in Chamorro, is a small forest crow and is the only member of the genus *Corvus* occurring in Micronesia (Jenkins 1983, p. 25). Black in color, the adult Mariana crow has a dark-green gloss to its head, neck, and back, and a bluish tint to the tail. During molt, a short gray feather-base is visible around the body and neck region and grows lighter toward the head. The Mariana crow has brown eyes, a slender, black bill, and short visible nasal bristles. On average, females weigh less (8.5 oz [242 g], n = 11) than males (9.0 oz [256 g], n = 5) (Baker 1951, p. 245), although otherwise the sexes are outwardly similar. With the exception of the occasional brown gloss to its tail, the immature Mariana crow closely resembles the adult bird.

There are no genetic or morphological differences documented between the Mariana crow on Rota and Guam. Prior to the disappearance of the native Mariana crow population from Guam (the last known bird of Guam origin was observed in 2001), preliminary genetic studies indicated that the Rota population was most likely a genetic subset of the Guam population (Tarr and Fleischer 1999, p. 946–947). Genetic diversity is therefore lower than it was a decade ago and is lower than that of mainland corvids, presumably due to the highly restricted natural range of the Mariana crow (Tarr and Fleischer 1999, p. 945).

Listing Status

The Mariana crow was federally listed as endangered on August 27, 1984 (USFWS 1984, 9pp). A five-year status review was completed in 2007 (USFWS 2005c, 4 pp.) and a draft revised recovery plan for the Mariana crow was completed in 2005 (USFWS 2005c). Approximately 376 ac (152 ha) were designated as critical habitat for the Mariana crow on Guam and 6,033 ac (2,552 ha) were designated on Rota in 2004 (USFWS 2004b, 46 pp).

Historical and Current Distribution

The Mariana crow is known historically only from the islands of Rota and Guam (Baker 1951, p. 245). In 1976, Mariana crows were considered relatively common and widely distributed on Rota (Pratt et al. 1979, p. 234). The first island-wide survey for crows on Rota was conducted in 1982, and resulted in a population estimate of 1,318 individuals (Engbring et al. 1986, p. 95). Subsequent surveys in 1995 and 1998 indicated the population had declined to 592 individuals and 234 breeding adults, respectively (Fancy et al. 1999, p. 3; Plentovich et al. 2005, p. 211). Mariana crows were also once considered abundant and widely distributed throughout Guam (Baker 1951, p. 246). However, by the mid-1960s, Mariana crows had disappeared from the southern region of Guam, and by the mid-1970s, they were absent from central Guam (Jenkins 1983, p. 32). By 1981, the population was restricted to northern Guam and consisted of less than 400 individuals (Engbring and Ramsey 1984, p. 30). Ten years later, in 1991, fewer than 50 individuals were found on Guam (Wiles et al. 1995, p. 34). Currently, the population is estimated to be approximately 60 breeding pairs and 24 non-breeding individuals on Rota and two male birds on Guam.

Ecology

Mariana crows were known to use secondary, coastal, ravine, and agricultural forests, including coconut plantations (Baker 1951, p. 246; Jenkins 1983, p. 25), but all evidence indicates they were most abundant in native limestone forests (Michael 1987; Morton et al. 1999, p. 22). Nesting occurs in closed canopy forests in native tree species that are on average 6.7 in (17 cm) in diameter at breast height and 25.6 ft (7.8 m) high, and away from forest edges [i.e., greater than 735 ft (224 m) from the nearest road] (Ha et al., unpubl. manuscript, p. 8). All nest trees recorded on Rota are native (USFWS 2005c, p. 16). Breeding likely occurs all year on Rota, while peak nesting activity generally occurs between August and February (USFWS 2005c, p. 18). Crows are omnivorous and their diet include insects, skinks, geckos, juvenile rats, bird eggs, foliage, fruit, seeds, and buds (S. Plentovich, Service, unp. data).

On Rota, Morton, et al. (1999, pp. 22–24) found that breeding crows on six study areas averaged one pair per 50 ac (22 ha) of forested habitat, and each territory was dominated by native forest. Pair densities ranged from one per 91 ac (37 ha) in relatively fragmented forest, to as high as one pair per 30 ac (12 ha) in mostly intact limestone forest along a coastal terrace. Territories were aggressively defended from July through January, although established pairs occupied these areas throughout the year.

Life History

Mariana crows breed year-round on Rota. During a three-year period (1996 to 1999), Morton and coworkers (1999) observed nest initiation as early as July 31 and fledging as late as May 22. Peak nesting activity occurs from August through February, but the timing can vary considerably depending on typhoon activity during the previous breeding season (see section below on typhoons). In contrast, breeding activity in the remnant crow population on Guam was truncated, apparently due to nest predation, poor physiological vigor of the few remaining adults, and egg nonviability. In recent years (1998 to 2007), nesting by Mariana crows on Guam was recorded only from October into mid-April (Morton 1996, pp. 12–17; USFWS 2005c, p. 18).

A minimum of 65 days is necessary to build the nest, incubate the eggs, and rear the brood through fledging (Morton et al. 1999, p. 12–17). Both parents generally participate in all aspects of breeding, although the female incubates most of the time. Nest construction typically takes a week to complete by both parents and develops through three stages with progressively smaller-diameter nest materials: platform, cup, and nest lining (Morton 1996, Lusk and Taisacan 1996). The incubation period is 21 to 23 days, and the nestling period is 36 to 39 days (Morton et al. 1999). Mariana crows will often reinitiate the nest cycle within 2 weeks after abandoning an empty nest, and within 4 weeks after losing a clutch or brood (Service 2005c, p. 18).

The percentage of nests that produced fledglings between 1996 and 2006 varied from 12% to 50% and Mayfield estimates of nest success ranged from 13% to 41% (Ha et al. 2008). Mean clutch size, number of nestlings, and number of fledglings for nests monitored between 1996 and 2006 was 2.59 ± 0.08 standard error (SE), 1.42 ± 0.06 SE , and 1.28 ± 0.07 SE, respectively (Ha et al. 2008; Berry 2008, pers. comm.). Large clutches (four eggs) have been observed on Rota, but not on Guam. This occurred most frequently (seven of eight observed nests) during the year

immediately following supertyphoon Paka (December 1997). During that year (1998), one female even deposited a second four-egg clutch immediately after losing her first clutch of four eggs (Morton et al. 1999).

Although Mariana crows generally produce only a single brood per year; however, nest failure and other factors lead to multiple nest attempts each breeding season. From 1996 to 1999, 32 crow pairs on Rota constructed a mean of 2.2 nests per year (SE = 0.14, n = 78), with one pair building as many as 7 nests in one season (Morton et al. 1999, p. 13). However, not all nests resulted in egg-laying. On average, Rota pairs produced about one nest per year that advanced to the level of egg deposition. Of 148 nests with known fates over a three-year period, 18% were only partially constructed, 13% were abandoned after completion, 4% had inviable clutches, 28% were depredated, and 16% were destroyed by typhoons; the remaining 22% fledged young (Morton et al. 1999, p. 12–18). Similarly, on Guam, crow pairs have been known to attempt nesting seven times in one season (Morton 1996). However, nest failures on Rota in more recent years have been attributed to premature abandonment (either as a result of predators or human-induced disturbance), interference by unmated males (due to skewed sex ratios), black drongo mobbing, and possibly senescence (*i.e.*, poor physiological vigor and infertility) (Morton 1996; National Research Council 1997).

Mariana crows typically produce from zero to one brood a year, exceptions have been documented. One pair on Rota successfully fledged and raised two broods of singletons in one breeding season; in contrast, another pair tended a single juvenile for 18 months, skipping an entire breeding season (Morton et al. 1999, pp. 17–18). This latter consequence of an extended parental attendance period is not uncommon in Mariana crow. Over a three-year study period, 4 of 30 pairs were deemed nonbreeders during at least one year because of the extended dependence of the previous season's juveniles (Morton et al. 1999, pp. 18–20).

After fledging, Mariana crows will typically remain in family groups until the following breeding season, a period that averaged 241 days (SE = 33, median 197 days) for 15 banded family groups (Morton et al. 1999, pp. 18–20). However, the period of parental attendance after fledging varies widely, from 99 to 537 days. Recruitment into the adult population is low. Of 19 crows that were banded as juveniles on Rota, 4 (21%) were known to be alive at age of entry into the adult cohort (3.5 years old). Assuming that all birds not resighted died, roughly 1 in 5 fledglings made it into the adult cohort (Morton et al. 1999, pp. 18–20).

Survival to one year of age for male and female crows banded on Rota between 1990 and 2006 was 36.8 and 54.1%, respectively (Ha et al. 2008). Annual survivorship for adult male and female crows was 80.6 and 76.1%, respectively. Male first year survivorship was significantly lower than female first year survivorship, but the reason for this difference is currently unknown. An assessment of dispersal distances for male and female aga did not indicate any significant difference between the sexes (Ha and Ha 2010, p. 47). In general, first year survival was lower then estimates reported for stable populations of Amercian crow (*Corvus brachyrhynchos*) in California (68%; Caffrey 1992) but similar to those reported for the Hawaiian crow (*Corvus hawaiiensis*; 43%; National Research Council 1992). Adult survivorship estimates were between those reported for the Hawaiian crow (70%; National Research Council 1992) and American crow (97% for females and 93% for males; Caffrey 1992).

Threats to the Species

Primary threats to the Mariana crow throughout its range are habitat destruction and modification, predation by introduced predators such as cats, rats, mangrove monitor lizards (*Varanus indicus*), and brown treesnakes, human persecution, typhoons, and reproductive and small population problems (USFWS 1984, p. 33883–33884, Service 2005c, pp. 22–34). Factors that may have had an impact on Mariana crow are: brown treesnake, disease, nutritional deficiencies, contaminants, and harassment by and competition with introduced species such as the black drongo.

Severity of threats differs between Guam and Rota. Brown treesnake predation is believed to be the overriding factor in the decline of Mariana crow on Guam (USFWS 2005c, p. 39). Habitat degradation due to grazing by feral ungulates and range expansion of invasive plants are also factors (USFWS 2005c, pp. 27–29). On Rota, habitat loss and degradation in concert with predation by introduced predators are likely the primary causes of pronounced population declines. However, other factors such as human persecution, habitat degradation from typhoons and wildfire (see General Status and Baseline section) and reproductive problems associated with small populations adversely impact the species and its habitat.

Conservation Needs of the Species

The draft revised recovery plan for the Mariana crow calls for three stable ($\lambda \geq 1.0$ for 10 consecutive years) populations of 75 territorial pairs each (one on Rota; one in northern Guam; and one in southern Guam) (USFWS 2005c), sufficient habitat to support these pairs (see below); brown treesnake and other predator control, brown treesnake interdiction efforts to prevent establishment of brown treesnakes on Rota, and efforts to resolve landuse conflicts (USFWS 2005c, pp. 48–50). The Rota crow population needs to increase to a point where it is robust enough to support translocations to Guam when suitable conditions are present. In the interim, translocations to other islands in the Mariana archipelago, population supplementation on Rota through a captive rear and release program, or establishment of a captive population may be necessary to conserve the species.

The draft revised recovery plan (USFWS 2005c) identifies areas needed for recovery on Guam and the 2002 proposal to designate critical habitat for the species identified essential habitat (USFWS 2002, pp. 34). In 2006, the U.S. Forest Service completed the first island-wide assessment of landcover on Guam (Liu and Fischer 2006, pp. 14). Because this assessment represents the best available information for landcover on Guam we used this data to assess the amount of potential recovery habitat for the Mariana crow on Guam.

Mariana crow territory sizes on Rota ranged from 29.7 to 91.4 ac (12 to 37 ha) with an average territory size of 54.4 ac (22 ha) (Morton et al. 1999, p. 22). In general, fragmented and degraded habitats tend to have larger crow territories (USFWS 2005c, p. 15). Ungulate populations on Guam appear to be impacting regeneration of some native tree species which, along with typhoon impacts and human habitat modification, may be degrading the remaining forested areas (Wiles et al. 1996, p. 234; Perry and Morton 1999, pp. 133-137; Ritter and Naugle 1999, p. 279; Wiles 2005, pp. 514-519). In addition, the available land cover information for the island is very

general and does not distinguish between degraded and non-degraded areas. Therefore, a conservative estimate of the required amount of forested area to support a pair of Mariana crows would be 91 ac (37 ha). If the goal is to have 75 territorial pairs in northern and southern Guam then approximately 6,857 ac (2,775 ha) of appropriate forested habitat would be required in both northern and southern Guam for recovery. The draft revised recovery plan for Mariana crow has not been finalized and recovery goals are subject to revision as well.

In addition, a sustainable population of breeders requires that a floater population of unmated adults and juveniles be present to replace pair members that succumb to mortality. Population modeling on Rota indicates that the adult and juvenile mortality rate is approximately 20% and 50%, respectively (Ha et al. 2008, p. 5). These mortality rates indicate that approximately 40% of the adult breeding population would need to be in non-breeding crows in order to replace breeding adults. Therefore, 75 territorial pairs would require a floater population of at least 60 individuals. Each of these birds would require space to forage and roost. The home range requirements of a non-breeding Mariana crow are not known at this time. However, in general, non-breeding birds share territories with one or several breeding pairs (Zack and Stutchbury 1992, p. 198). Therefore, we assumed that the floaters would utilize areas within pair territories and as the number of non-breeders is not greater than the number of pairs then the space required by floaters would be included in the pair territories.

Typhoon Impacts to Recovery Habitat

Typhoon data for Guam collected since 1959 indicates that on average four typhoon events (sustained winds greater than or equal to 74 mi per hour (119 km per hour)) could occur each decade (U.S. Navy, Typhoon Joint Warning Center, pers. comm. 2010). Typhoons can cause a wide range of damage to forests (Brokaw and Walker 1991, p. 442) and, if the damage is severe (e.g., tree uprooting and trunk snapping), could limit the availability of appropriate nesting trees for Mariana crows. These forests are expected to regenerate after the storm event. However, these storms likely will lead to an extended temporary loss of habitat. In other words, regenerated habitat should eventually be available for a breeding pair to move into if the availability of appropriate habitat within their current territory is diminished due only to damage from a typhoon event.

The amount of recovery habitat suitable for Mariana crow breeding available at any one time is dependent on the type of damage caused by the typhoon, the amount of forest impacted by the typhoon, the time required for the forest to recuperate from the typhoon damage, and the number of typhoons that occur during that recuperation period. The research required to provide good estimates of all of this information has not been conducted in the Mariana Islands. Therefore, only rough estimates are possible until this information is obtained.

Typhoons can cause defoliation, loss and damage to branches, and snapping and uprooting of stems (Brokaw and Walker 1991, p. 442) which can all impact Mariana crow habitat. However, of these impacts, the snapping and uprooting of trees is likely to require the longest time for recovery and could have the most impact on long-term crow breeding success. For example, the loss of trees of sufficient size for breeding could limit breeding until appropriate trees were

available. Therefore, an assessment of extent of stem snapping and uprooting from typhoons would be important for determining habitat needed to offset impacts from typhoons.

Data on tree snapping and uprooting from storms in the Mariana Islands is limited. Hirsh and Marier (2002, p.598) assessed damage to *Cycas micronesica* trees on Guam after supertyphoon Paka and found that 10% of the trunks had snapped and 2% of the trees were uprooted from the storm. Wiles (2005, p. 514) assessed damage to *Artocarpus mariannensis* after supertyphoon Paka and found that 5.8% of the trunks had snapped and 2.5% were knocked down. Wiles (1991, 1998) also described forest damage associated with typhoon Russ and supertyphoon Paka. In general, Wiles (1991, p. 120) reported that the majority of the trees impacted by typhoon Russ were defoliated, but that few branches were broken and that uprooted and broken trees were uncommon. More severe damage to trees was reported for Paka but it was not quantified (Wiles 1998; p. 103). Donnegan et al. (2004, pp.27-28), in their assessment of forest resource on Guam, found that approximately 26% of the trees they sampled were damaged and 7% of the damaged trees had broken trunks. Only 36% of the damage was related to typhoons and other weather events so not all trees with broken trunks were related to typhoons. In addition, the damage was not specific to any one typhoon or weather event. Published information on the percentage of trees uprooted and with snapped stems is more widely available outside the Mariana Islands. In the Caribbean, trunk snapping and uprooting rates ranged from 3 to 39% depending on the storm, island, and tree sizes measured (Brokaw and Walker 1991, p. 443). In Samoa, Elmquist et al. (1994, p.387) reported uprooting and trunk snapping percentages from 16 to 67 in trees greater than or equal to 5 cm diameter at breast height from Cyclones Ofa and Val. While in Madagascar, Birkinshaw (2007, p. 19) reported that 14% of the living trees greater than or equal to 10 cm diameter at breast height were either uprooted or had snapped trunks due to Cyclone Hudah.

Because typhoon events are common and the native species on Guam are likely to be typhoon adapted (Stone 1970, p. 14, Wiles 2005, p. 517) the uprooting and trunk breakage rates for Guam are likely to be on the lower end of the impact spectrum. This is consistent with damage estimates provided by Hirsh and Mariar (2002) and Wiles (2005) for two species on Guam as well as the estimates of damaged trees from Donnegan et al. (2004). Therefore, we used the 7% damage estimate from Donnegan et al. (2004) as our estimate of the percentage of forest likely to be severely impacted by a typhoon and thus, not usuable for Mariana crow habitat until it recovered. It is likely that this may be an overestimate of average damage as damage estimates provided by Hirsh and Mariar and Wiles were for a supertyphoon and the estimate by Donnegan et al. (2004) includes non-weather sources of damage. However, as the intensity of typhoons is expected to increase due to climate change (Webster et al. 2005, p. 1846; Emanuel et al. 2008, p. 365) we believe this estimate is appropriate.

The amount of forest impacted by each typhoon event is dependent on the intensity of the storm, its distance from the island, its direction, previous impacts to the forest, and the topography of the island (Brokaw and Walker 1991, pp. 442-445; Boose et al. 1994, pp. 377-389). With such variability it is impossible to accurately predict how much forest will be impacted by each typhoon. However, utilizing estimates from a range of storm intensities could provide some general guidelines.

Wiles (1991, pp.120–122; 1998, pp. 103–107) provided overviews of impacts on natural resources on Guam from two typhoons, typhoon Russ (1990; maximum 120 mph sustained winds) and supertyphoon Paka (1997; 150 mph sustained winds and gusts up to 185 mph). Wiles did not identify the amount of forested area impacted by each typhoon but did describe which areas were impacted. When these areas were mapped using GIS and compared to available forest, we estimated that 3% of the forest on Guam was impacted by typhoon Russ and 14% was impacted by supertyphoon Paka. These are extremely rough estimates of damage, as the Wiles reports appeared to focus on particular areas of interest and not all forest resources on the island. However, they do provide an estimate of potential typhoon impacts on Guam. Donnegan et al. (2004, pp.27-28), in their assessment of forest resource on Guam found that approximately 26% of the trees they sampled were damaged and 36% of the damage was related to weather events, like typhoons. Therefore, 9.5% of the trees sampled showed signs of storm damage (Donnegan et al. 2004). Alhough not specific to any particular storm it does provide a cumulative estimate based on the likely impacts of multiple recent storms. Because this estimate includes a wide range of damage and the likely effects of multiple storms we decided to round up the 9.5% estimate to 10% and use it as the estimated area of forest impacted by each typhoon. This estimate falls close to the average extent of damage (8.5%) from supertyphoon Paka and typhoon Russ estimated from Wiles (1991, 1998), although it's closer to the high end and may be an overestimate for each storm. However, erring on the high end is reasonable as climate change models predict that typhoon intensity will increase (Webster et al. 2005, p. 1846; Emanuel et al. 2008, p. 365).

While natural regeneration of the forest is expected to occur after a typhoon event, calculations of recovery habitat needed must take into account that a portion of the habitat will be non-functional for Guam Micronesian kingfisher for an extended period of time. Tree growth rate data are not available for the Mariana Islands so forest regeneration time is uncertain. However, Franklin (2003) reported on annual growth rates of trees in Tonga, an island with likely similar conditions to other Pacific Islands, including the Mariana Islands. Typhoons create disturbance in the forest which leads to increased growth for some species after the disturbance event (Vandermeer et al. 1997, pp. 154-157). Therefore, we used the average maximum growth rate for the species assessed by Franklin (2003, p. 672) to estimate average growth for Guam after a storm (1.01 cm a year). The average diameter at breast height of a Mariana crow nesting tree was 7 in (17 cm; Ha et al., in review, p. 8). Therefore, it would take approximately 18 years (17/1.01 = 18) for a tree to grow to a size large enough for an average Mariana crow nest tree. We then used 18 years as the timeframe for Mariana crow breeding habitat regeneration on Guam.

Typhoon data collected since 1959 (U.S. Navy, Joint Typhoon Warning Center, pers. comm. 2010) indicates that on average there were 1.4 super typhoons and 5.1 typhoons over an 18 year period. Therefore, over the 18 year period we would expect for a forest to regenerate there would be 6.5 typhoon events of varying magnitude. Each of these severe typhoons would impact approximately 10% of the available forest on the island and 7% of that forest would be damaged to such an extent that it would no longer be crow habitat. Therefore, if there were 26,650 ac (10,785 ha) of forest for crow recovery, approximately 2,665 ac (1,078 ha) could be impacted by a typhoon and 186 ac (75 ha) would be impacted to such an extent that it would no longer serve as crow recovery habitat. If typhoons were to occur on average 7.6 times over a 20-year period

then 1,212 ac (491 ha) of additional forest across the island of Guam or 606 ac (245 ha) of additional forest in northern and southern Guam would be needed for Mariana crows to use while the previously damaged forest regenerates.

Based on the above assessment, a minimum total of 7,463 ac (3,020 ha) of appropriate habitat in northern Guam and 7,166 ac (2,900 ha) in southern Guam would be needed to recover the species on Guam. This includes 6,857 ac (2,775 ha) of habitat for breeding pairs and floater juveniles and 606 ac (245 ha) to buffer potential temporary habitat loss due to typhoons.

Ongoing Conservation Actions

Between 1997 and 2003, a total of 31 Mariana crows were translocated from Rota and released on Guam (USFWS 2009a, pp. 42–44). Currently, the Guam population consists of only two male crows (Quitigua 2009, pers. comm.). Translocated crows were carefully monitored and, in general, did not breed successfully and had low survivorship. Also, in conjunction with the Northwest Field training facility and Intelligence, Surveillance, Reconnaissance, and Strike Capability Projects, the Air Force was to construct ungulate exclosures around and eradicate ungulates from approximately 627 ac (254 ha) of forested and disturbed land to increase the quality of the habitat for the Mariana crow and other listed species (USFWS 2006a, pp. 12, 29). The Air Force was also to set aside approximately 148 ac (60 ha) of forested land in a new experimental habitat management unit (USFWS 2006a, p. 29). A brown treesnake barrier is proposed for construction around this habitat management unit to help support listed species recovery efforts on Guam. The Air Force was also to initiate native foraging tree planting and other conservation actions (USFWS 2006a, p. 12 and U.S. Air Force 2006, pp. 2-36 to2-39). The ungulate management plan for non-fenced areas is being drafted (Cobb, pers. comm. 2010c).

On Rota, funding was provided to construct a brown treesnake containment barrier at the Rota port. The land was identified for the barrier but construction has not been initiated (Hawley 2009, pers. comm.). Efforts also continue to address land use conflicts associated with agricultural homesteads on the island. Finally, research is also being conducted to better understand the factors causing the population decline on Rota.

Environmental Baseline for the Mariana Crow

Status of the Species in the Action Area

Only two male Mariana crows are currently known to exist on Guam; both individuals are located on Andersen Air Force Base (Navy 2010, p. 237).

As mentioned above, Mariana crows were known to use a variety of habitats, but all evidence indicates they were most abundant in native forests. The Forest Service vegetation map of Guam includes the following forest types: 1) Limestone Forest, 2) Ravine Forest, 3) Palma Brava Grove, 4) Scrub Forest, 5) Leucaena Stand, 6) Casuarina Thicket, 7) Acacia Plantation, and 8) Coconut Plantation (Liu and Fischer 2006, pp. 5–7). Of these forest types, only Limestone Forest and Ravine Forest are considered likely habitat to support Mariana crow recovery. Palma Brava Grove, Leucaena Stand, Casuarina Thicket, Acacia Plantation, and Coconut Plantation are

dominated by non-native *Heterospathe elata*, *Leucaena leucocephala*, *Casuarina equisetifolia*, *Acacia confusa*, and *Cocos nucifera*, respectively (Liu and Fischer 2006, pp. 5–7). None of these tree species are known to be used for nesting by Mariana crows (USFWS 2005c, p. 16). Therefore, these forest types were not included as potential habitat even though these forest types could be used for foraging. Finally, Scrub Forest is considered disturbed forest dominated by *Artocarpus atilis*, *Cocos nucifera*, and *Leucaena leucocephala* trees, clumps of *Bambusa vulgaris*, agricultural fields and patches, pastures, scrub vegetation, and home sites (Liu and Fischer 2006, p. 6). None of the woody species listed for this forest type are known to be used for nesting by Mariana crows and the inclusion of open areas (e.g., agricultural fields, pastures, home sites) and scrub vegetation in this forest type indicates that it may not be viable breeding habitat for the species. Therefore, we did not include Scrub Forest as potential recovery habitat for the Mariana crow.

Mariana crows can use small patches of forest for nesting (Morton et al. 1999, p. 20–22). However, data collected on the Rota population indicates that the species typically nests in forest interiors far from edges, roads, and human habitation (Morton et al. 1999, p. 20-22; Ha et al., in review, p. 8). Therefore, not all forest patches would likely be used for nesting by Mariana crows. To account for this we developed criteria for determining whether a forest patch was considered potential Mariana crow breeding habitat. We considered any forest patch less than 91 ac (37 ha; the maximum territory size for a pair [Morton et al. 1999, p. 22]) and over 0.8 mi (1.3 km), the median dispersal distance (n=14) from natal to breeding nest on Rota (Ha and Ha, 2010, p. 47), away from the nearest patch too small and isolated to be viable crow habitat. In addition, all patches less than 30 ac (12 ha; the minimum territory size on Rota [Morton et al. 1999, p. 22]) and 1,148 ft (350 m; the approximate radius of a 91 ac [37 ha] territory) from the nearest patch above 30 ac (12 ha) were considered too isolated and small to be crow habitat. Finally, any patch less than 91 ac (37 ha) and separated from the nearest patch by lands classified as Urban Builtup or Urban Cultivated (excluding roads) by the Forest Service was considered too isolated to be viable crow habitat because Mariana crows have been observed to be sensitive to human disturbance (USFWS 2005c, pp. 30–31). It should be noted that these criteria incorporate the available information on crow nest distances from roads and buildings. However, some modifications were required to account for the use of the Munitions Storage Area, an area heavily bisected by roads, by Mariana crows in the 1980s and 1990s (Engbring and Ramsey 1984, p. 30; Wiles et al. 1995, p. 34). Types of disturbance may vary among the islands which could lead to differences in habitat use. For example, human persecution may be a factor in the Mariana crow decline on Rota while it is not considered an important factor on Guam (USFWS 2005c, pp. 30-31). Additional research is needed so these criteria may be modified as more information becomes available.

Based on the above assessment, we estimate there are approximately 14,831 ac (6,002 ha) of potential recovery habitat for the Mariana crow in northern Guam and 11,819 ac (4,783 ha) in southern Guam. As noted above under “Conservation Needs of the Species”, a minimum total of 7,463 ac (3,020 ha) of appropriate habitat in northern Guam and 7,166 ac (2,900 ha) in southern Guam would be needed to recover the species. The draft revised recovery plan for the Mariana crow has not been finalized and recovery goals are subject to revision as well.

Threats to the Species in the Action Area

Habitat loss due to military development is a threat to the Mariana crow on Guam. Habitat for the Mariana crow in the action area is being altered by the Air Force's development of a training area in the Northwest Field area of the base and their Intelligence, Surveillance, Reconnaissance, and Strike Capability Project. Once these projects are fully completed, it is expected that the amount of habitat remaining for Mariana crow in northern Guam will be 14,812 ac (5,994 ha).

Much of the remaining forest has also been severely degraded by introduced Philippine deer, feral pigs, and feral Asiatic water buffalo (*Bubalus bubalis*), that were introduced to Guam in the 1600s and 1700s (Conry 1988, Wiles et al. 1999). These introduced ungulates are suspected of significantly impacting native floral communities on Guam by consuming seeds, fruits, and foliage, ingesting or trampling seedlings, and promoting the spread of introduced weeds (Wiles et al. 1999, p. 193; Wiles 2005 pp. 514–515). Philippine deer and feral pigs are found throughout Guam. On Andersen Air Force Base, densities of Philippine deer and feral pigs were estimated at 0.8 deer per ac (1.8 deer per ha) and 0.2 pigs per ac (0.4 pigs per ha), some of the highest densities recorded in the world (Knutson and Vogt 2003, p.4). Feral Asiatic water buffalo are found predominately on the Ordnance Annex and surrounding non-Navy lands in southern Guam, where the population is estimated to be at least 50–60 animals (Brooke 2007, pers. comm.).

Predation by Brown Treesnakes

Brown treesnake predation is the primary factor in the decline of the Mariana crow on Guam (USFWS 2005c, p. 39). Snake densities within the action area are not known specifically; however, densities appeared to level off in the 1990s to around 20 individuals per ac (50 per ha) in favorable habitats (Rodda and Savidge 2007, p. 315). These high snake densities continue to hamper recovery efforts for the Mariana crow.

Human Persecution

Human persecution may be a source of mortality for adult and juvenile crows. Unfortunately, the level of human persecution, as well as the motivation behind it, is poorly understood.

Conservation Needs of the Species in the Action Area

In addition to the overall conservation needs identified above in the section above that discusses the general baseline conditions within the Mariana Islands, the following actions are necessary for the conservation of the Mariana crow. On Guam, large-scale control and/or eradication of brown treesnakes is essential for crow recovery on Guam. Additional conservation needs include protection of habitat from anthropogenic losses, grazing by feral ungulates, invasion of introduced plants, and loss of pollinators such as the Mariana fruit bat. Population intervention via the establishment of an additional population on another island and/or a captive population is necessary at this time.

Ongoing Conservation Actions for the Species in the Action Area

The "Ongoing Conservation Actions" section of the Mariana crow Status of the Species section details ongoing efforts to conserve the species within the action area.

Relationship of the Action Area to the Survival and Recovery of the Mariana Crow

The draft revised recovery plan for the Mariana crow calls for three stable ($\lambda \geq 1.0$ for 10 consecutive years) populations of 75 territorial pairs each (one on Rota; one in northern Guam; and one in southern Guam) (USFWS 2005c).

Status of the Mariana Fruit Bat

Species Description

The Mariana fruit bat is a medium-sized bat in the family Pteropodidae that weighs 0.66 to 1.15 lb (330 to 577 g) and has a forearm length ranging from 5.3 to 6.1 in (13.4 to 15.6 cm). The underside (abdomen) is colored black to brown, with gray hair interspersed, creating a grizzled appearance. The shoulders (mantle) and sides of the neck are usually bright golden brown, but may be paler in some individuals. The head varies from brown to dark brown. The well-formed and rounded ears and large eyes give the face a canine appearance; medium and large members of the genus *Pteropus* are often called flying foxes.

Listing Status

The Guam population of the Mariana fruit bat was federally listed as endangered in 1984 (USFWS 1984, p. 33,881). In 2005, the Mariana fruit bat was listed as threatened throughout the Mariana archipelago and reclassified from endangered to threatened on Guam (USFWS 2005b, pp. 1,190–1,191). A five-year status review was completed in 2007 for this species (USFWS 2007b, 4 pp.). A draft revised recovery plan for the Mariana fruit bat was completed in 2009 (USFWS 2009c, xiv + 83 pp.). Critical habitat was designated for this species on October 28, 2004 (USFWS 2004b, 46 pp).

Historical and Current Distribution

The Mariana fruit bat is endemic to the Mariana archipelago (Guam and the CNMI), where it is found on most of the fifteen major islands. General population data are available but should be considered with caution because survey methods have varied by island, and data for all of the islands north of Anatahan are 10 years old. Based on the best information currently available, the total population of the Mariana fruit bat is estimated to be approximately 6,810 to 6,930 animals. The following represents the species' known distribution and estimated number of individuals: Guam (fewer than 20); Rota (1,200–1,400); Aguiguan (40 to 60); Tinian (transient bats only); Saipan (50); Farallon de Medinilla (transient, only one bat has been observed); Anatahan (1,000); Sarigan (300 to 400); Guguan (550); Alamagan (100); Pagan (1,500); Agrihan (1,000); Asuncion (800); Maug (50) (Brooke 2010, pers. comm., Boland pers. comm. 2009;

Brooke 2008, p. 1 and references cited therein; Brooke 2009, p. 1; CNMI Division of Fish and Wildlife 2000b, p. 4; CNMI Division of Fish and Wildlife 2000c, p. 35; Johnson 2001, p. 19; DoN 2009, p. 89; Wiles and Johnson 2004, p. 585). There are no known records of Mariana fruit bats on Uracas (as Farallon de Pajaros in Wiles et al. 1989, p. 69). Initial impressions of information gathered in field surveys in 2010 indicate Mariana fruit bat numbers may be lower in the northern islands of the Mariana Islands than previously estimated (Amidon pers. comm. 2010). Reliable trend information does not exist for the entire population; the following sections detail trends on individual islands, where this information is available.

Ecology

The Mariana fruit bat uses several forest types for foraging, roosting, and breeding, including native primary and secondary limestone forest, volcanic (or ravine) forest, old coconut plantations, and groves of *Casuarina equisetifolia* (Glass and Taisacan 1988, pp. 6–13; Worthington et al. 2001, pp. 137–138; Wiles and Johnson 2004, pp. 589–591). Although Mariana fruit bats have been observed to feed on introduced and cultivated food plants and roost in non-native tree species, non-native species make up only a small fraction of the plants they use (Wiles 1987a p. 94); they are thus reliant on native forest and its constituent species. Several hours after sunset, bats depart their daytime roost sites to forage for fruit and other native and non-native plant materials such as leaves and nectar (USFWS 1990b, p. 8). At least 21 plant species are used as food sources by the Mariana fruit bat; of these, 17 are native species found principally in native forest (Wiles 1987a, p. 94; Service 1990b, pp. 7–8). Native forest and tree species are preferred for roosts; Wiles (1987a, p. 94) described six bat roost sites on Guam, all within native limestone forest. Major roost trees included *Ficus* spp. and *Neisosperma oppositifolia*. On Rota, fruit bats used at least eight native tree species for roosting (Glass and Taisacan 1988, p. 13). *Pteropus* bats are strong fliers and traverse long distances (Eby 1991, p. 554; Wiles and Johnson 2004, p. 593 and references cited therein).

Fruit bats are important components of tropical forest ecosystems because they disperse seeds of their forage plants widely and thereby help maintain forest diversity and contribute to plant regeneration following typhoons and other catastrophic events (Cox et al. 1991). The Mariana fruit bat likely flies between islands in the archipelago, although the frequency and regularity of interisland transits are unknown (Wiles and Glass 1990, pp. 2–4; Wiles and Johnson 2004, p. 593 and references cited therein). This and other species in the genus *Pteropus* often travel several or many km each night from their roosts in search of food resources such as fruit and flowers (Nelson 2003, Mildenstein et al. 2005, p. 98; p. 81–82; Janeke 2006, p. 51).

Life History

Mariana fruit bats are highly colonial, and most animals roost during daylight in colonies in one or several adjacent large trees. Grooming, breeding, and other important social interactions as well as sleeping take place in the colonies (USFWS 1990b, p. 8). Some colonial roosts are composed of harems (one male and as many as 15 female), others are composed of bachelor males (Wiles 1987, pp. 93–94). Some bats roost solitarily or in smaller groups (Wiles and Johnson 2004, p. 589). Data from Guam indicate that some roost sites may be selected for their inaccessibility by humans and, thus, limited human disturbance (Wiles et al. 1995. p. 39). Fruit

bats will abandon roost sites if disturbed and have been reported to move to new locations as far as 6 mi (10 km) away (USFWS 1990b, p. 9).

Reproduction in Mariana fruit bat may occur throughout the year (Glass and Taisacan 1988, p. 6). Female fruit bats typically raise only a single pup each year (Pierson and Rainey 1992 p. 1). Therefore it is likely that population growth, and hence recovery following a decline, would be slow (Pierson and Rainey 1992, p. 1–2; McIlwee and Martin 2002). Fruit bat pups are flightless and females carry them until they become too heavy (Eby 1991, pp. 547–548; Esselstyn et al. 2006, p. 535). Once the juveniles are too large to carry, they are left at their roost at night while the majority of adult bats leave the roost to forage (Eby 1991, p. 548). These juveniles are still flightless and have not weaned or begun to forage on their own (Eby 1991, p. 548).

Threats

The initial (20th century) declines in the Mariana fruit bat in the southern islands of the archipelago (Guam, Rota, Aguiguan, Tinian, and Saipan) resulted from a combination of hunting with firearms, habitat loss and destruction, and the introduction of alien species (e.g., alien plant species and ungulates) that degraded native habitat (USFWS 2009c, p. 5–11, see Table 3 and references cited therein). Current and ongoing threats include illegal hunting, loss and degradation of native forest, predation by the brown treesnake, and the increased extirpation risk owing to the high vulnerability of very small populations to chance environmental catastrophes and demographic shifts (USFWS 2009c, p. 19). Military activities, uurbanization, and other forms of development also are a threat to the Mariana fruit bat because they result in loss, fragmentation, or degradation of forest habitat; direct disturbance of bats by noise, lights, or physical intrusion on roost sites; and/or increased likelihood of introductions of the brown treesnake or other predators to islands where they do not occur now. Mariana fruit bats evolved in the presence of typhoons, the principal natural disturbance in the archipelago, but today these storms are a threat to the species because they can exacerbate the effects of the anthropogenic threats listed above (USFWS 2009c, p. 34).

Conservation Needs of the Species

Re-establishing and maintaining a widely distributed, robust population of the Mariana fruit bat requires several broad categories of actions (USFWS 2009c), pp. xi–xii, 37–38). Habitat protection and enhancement on islands where bats occur now is needed to ensure adequate resources for foraging and roosting are present to support growing bat numbers as the species recovers. Additionally, habitat restoration and protection on islands where bats do not currently or regularly occur is necessary to fill gaps in distribution and facilitate interisland movement.

Effective control of unlawful hunting throughout the archipelago through outreach, education, and enforcement measures is required, especially on Rota, which harbors a relatively large number of bats and where hunting pressure is high and chronic. Brown treesnake control on Guam and Saipan is needed to protect the few bats left on Guam and minimize the impact of treesnakes on Saipan. Most importantly, interdiction to prevent the brown treesnake from dispersing to other islands is imperative to prevent predation from affecting fruit bats elsewhere in the archipelago. Finally, continued research and monitoring in necessary to improve our

knowledge of the Mariana fruit bat's biology, ecology, and population status and trend in response to threats and conservation actions.

Ongoing Conservation Actions

Efforts to minimize hunting and trade of the Mariana fruit bat as well as efforts to monitor and study the species are ongoing. The Mariana fruit bat is fully protected from hunting under Guam, CNMI, and federal law, but this important conservation action is not adequately enforced, and illegal hunting continues (USFWS 2009c, p. 19–26 and references cited therein). In January 1990, declines in bat populations throughout Micronesia resulted in the reclassification of *Pteropus mariannus* from Appendix II to Appendix I of CITES. This reclassification was an effort to control shipments of other subspecies from Palau, Yap, and Kosrae into the Mariana Islands and to encourage exporting countries to conserve their bat populations. Enforcement of CITES regulations, outreach by the Service and the governments of Guam and the CNMI, and Palau's change in political status to one of free association with the United States resulted in the termination of all legal *Pteropus* imports into the Marianas in 1994. CITES protection has been highly successful and very few illegal shipments of bats now enter Guam and the CNMI (Wiles and Brooke 2010).

Since the 1970s, surveys of Mariana fruit bat populations have been conducted on various islands and at variable intervals by the Guam Division of Aquatic and Wildlife Resources (DAWR) and CNMI Division of Fish and Wildlife. Personnel at these agencies, the Guam National Wildlife Refuge, the DoN, and research institutions have conducted studies to obtain information about the ecology, life history, movements, and take by hunters of this species (USFWS 2009c, p. 35). Some outreach and education efforts directed toward conservation of the Mariana fruit bat are underway in Guam and the CNMI (see the discussion below under Environmental Baseline).

Other projects in Guam and the CNMI may not specifically address bat conservation, but indirectly benefit the species. Examples of such projects include: the designation of conservation status for Guguan, Asuncion, and Maug, the three northernmost islands of the CNMI; locally legislated conservation lands in the CNMI Sabana Conservation Area and on Guam; the establishment of Guam National Wildlife Refuge at Ritidian Point and the overlay refuges on most military lands on Guam; ungulate eradications on Sarigan and Anatahan; ongoing, multi-agency research and management to control brown treesnakes on Guam; and research and recovery implementation for other listed species in the Marianas, for example the Mariana crow, the Rota white-eye, and the nightingale reed-warbler (USFWS 2009c, p. 35).

Environmental Baseline for the Mariana Fruit Bat

Status of the Species in the Action Area

Guam

Other than a few isolated periods of increase, fruit bats have been in long-term decline on Guam (USFWS 2009c, pp. 6–7 and references cited therein), in response to a combination of threats. Fruit bats had ceased to be common on Guam by the early 1930s (Coultas 1931), probably owing more to the introduction of firearms and improved hunting efficiency than to wholesale habitat loss (Wiles 1987b, p. 154). Guam currently supports a small, remnant population of Mariana fruit bats in a single colony at Pati Point on Andersen Air Force Base (Brooke 2008, p. 2). This colony has declined sharply since the early 1980s when approximately 500 bats were observed there (Wiles 1987b; Figure 16). The most recent surveys at this colony, now located in the Natural Area at Pati Point, have yielded counts of fewer than 20 bats (Brooke 2010, pers. comm.; Guam Division of Aquatic and Wildlife Resources 2010, unpublished data).

During the late 1980s and the 1990s, numbers of Mariana fruit bats on Guam remained in the range of several hundred animals with occasional spikes to nearly a thousand bats. Presumably these spikes reflected temporary immigration events from Rota (Wiles 1987b, p. 151; Wiles et al. 1995, p. 39; Wiles 1996, p. 2; Wiles 1998, p. 3). Individual bats have been detected at multiple locations within the proposed project action area on Guam, including all of Andersen Main Base and Northwest Field, the Main Cantonment area (referred to as Naval Computer and Telecommunications Station (NCTS) Finegayan in the source documents), and the Naval Munitions Site (DoN 2009, pp. 71–71, 89; Brooke 2008, p. 1). No bats were detected in Andersen South or at the Route 15 Range complex area (DoN 2010a, p. 177). Sightings of bats in the Naval Munitions Site and the Main Cantonment Area are limited to a few individuals flying during daytime or low light conditions (Brooke 2008, p. 1). While these sightings are not representative of a population count, it is unlikely that large numbers of bats are using these areas (Brooke 2008, p. 1; Wiles 1987b, pp. 153–156).

The effect on the Mariana fruit bat of ongoing and increased noise resulting from increased jet aircraft and helicopter use of the main runways at Andersen Air Force Base were analyzed in the ISR Strike Biological Opinion (USFWS 2006a). In that consultation, we expected that noise effects would adversely affect the Mariana fruit bat to the extent that the nearby Pati Point colony would be abandoned by the 21 bats estimated to remain there in 2006. We determined that fruit bats relocating from Pati Point to other, less-protected areas on the island likely would be shot opportunistically by hunters (USFWS 2006a, p. 49). In the ISR Strike Biological Opinion, we concluded that the remaining fruit bats on Guam would be taken as a result of the proposed action, but that this take would not jeopardize the continued overall existence of the Mariana fruit bat (USFWS 2006a, pp. 49–52). Most recent information indicates the Mariana fruit bats at the Pati Point colony have moved farther east, into the natural area, and their numbers have dwindled to ten (Cobb pers. comm. 2010b).

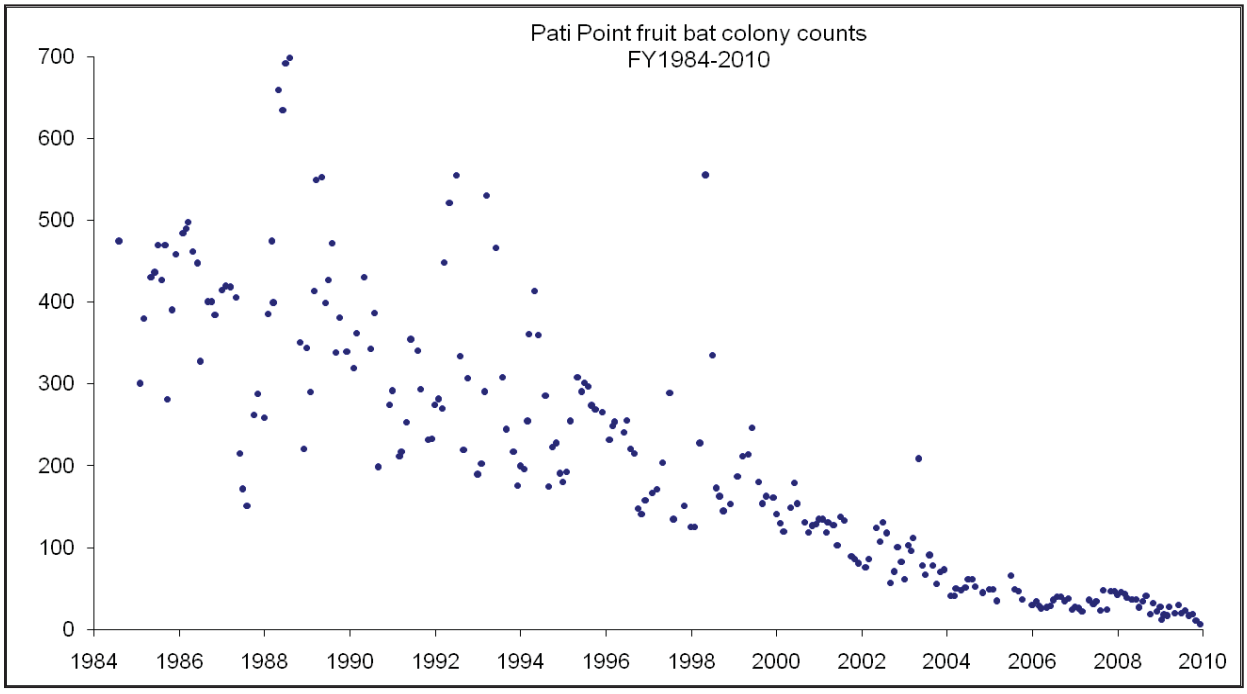

Figure 16. Mariana fruit bats counted at the Pati Point colony, 1984 to present. Guam Division of Aquatic and Wildlife Resources, unpublished data.

Tinian

Mariana fruit bats are thought to be transient on Tinian and have been observed in the Kastiyu Forest (Lemke 1984, p. 5), the cliff line forest near Maga, and flying over the island (DoN 2009, p. 72). Habitat use is generally restricted to the native limestone forest on the island.

Threats in the Action Area

Habitat Loss and Degradation on Guam and Tinian

Over the past several centuries, the southern Marianas have lost most of their original native forest, primarily to agriculture, growing human populations, economic development, and military activities (Bowers 1950, pp. 29–59; Fosberg 1960, pp. 36–37). Although significant portions of the land area on the islands in the action area may be considered fruit bat habitat (Guam = 48% and Tinian = 64% Service 2009c, Table 4), most or all of this area today is undergoing chronic degradation by a combination of feral ungulates and invasive weeds and insects (USFWS 2009c, Table 3 and references cited therein). Introduced ungulates in particular are suspected of significantly degrading native floral communities by consuming seeds, fruits, and foliage, ingesting or trampling seedlings, and promoting the spread of introduced weeds (Rice 1992; Wiles 2005, p. 519). For example, although Guam is dominated by native forest, Wiles (2005) recently documented a rapid decline in the native breadfruit, an important bat food, in the remaining native forest on the northern end of the island. This decline was attributed to a combination of mortality of mature trees in the wake of several severe typhoons and a lack of recruitment caused by deer and pig foraging on fallen fruit (with seeds) and seedlings. The

densities of deer and feral pigs on northern Guam are among the highest recorded in the world. The specific impacts of this degradation on habitat quality for fruit bats have not been quantified.

Habitat for the Mariana fruit bat on Guam has also been lost as a result of the Air Force's development of a training area in the Northwest Field area of the base. The Air Force (2006) estimated 64 ac (26 ha) of potential Mariana fruit bat habitat would be lost as a result of the training area construction and that a total of 330 ac (137 ha) of potential Mariana fruit bat habitat might be indirectly affected by intense training activities and clearing at the training facility. A total of 29,308 ac (11,860 ha) of Mariana fruit bat recovery habitat remains on Guam.

Hunting on Guam and Tinian

Guam: Today, although few bats remain on Guam, they are probably still hunted opportunistically on private property when they transit the island, and by deer hunters or poachers on Andersen Air Force Base and other military lands on northern Guam near the last remaining colonial roost (Guam National Wildlife Refuge, unpublished data, 2005).

Tinian: In 1987, there was a report of nearly 90 bats shot and killed on Tinian from a colony that roosted on the island briefly (Sutterfield 1998, pers. comm.). We have no recent reports of fruit bats being shot on Tinian.

Predation by Brown Treesnakes on Guam and Tinian

Guam: The brown treesnake is believed to adversely affect fruit bat recruitment on Guam. Predation by brown treesnakes has caused the decline, extirpation, or extinction of most landbird species on Guam (Savidge 1987, Wiles et al. 2003) and is probably responsible for decreases in recruitment of young bats observed in the island's low remaining numbers of bats (Wiles 1987a). Although only two or three cases of snake predation have been reported (e.g., Wiles 1983, p. 14), the snake is considered capable of preying on non-volant young bats (USFWS 1990b, pp. 14–15). Data collected at the island's last remaining colony from 1982 to 2006 indicated a consistent pattern wherein small pups were routinely recorded with their mothers, but medium-sized young are much rarer and large young are virtually absent (Wiles 1987b; G. Wiles, unpubl. data; Janeke 2006, pers. comm.). Most observations were made in areas where native forest bird populations had collapsed, indicating the establishment of high densities of brown treesnakes; in contrast, for several months in 1983, after the colony moved to a new location where native birds persisted, sizable numbers of larger pups were detected, strongly suggesting predation by treesnakes was responsible for the absence of larger juveniles at the original site (Wiles 2007, pers. comm.).

Noise

No studies exist of the impact of noise on fruit bats, but the general impacts of noise on wildlife described above in the "General Effects" section likely apply to fruit bats as well. Within the action area, significant impacts of noise are probably restricted to Guam and aircraft are the chief source of this threat. Observations of foraging individuals indicate that Mariana fruit bats are likely to avoid areas within (328 ft) 100 m of the Aircraft Staging Area facility on Andersen Air Force Base because of the aircraft noise and moderate human activity at night (Wiles 2006, pers.

comm.). Approximately 197 ac (80 ha) of foraging habitat for the species north, east, and west of the Aircraft Staging Area facility are likely to be affected by aircraft noise at the facility. Ongoing and anticipated noise resulting from jet aircraft and helicopter use of the main runways at Andersen Air Force Base, resulting from actions addressed ISR Strike Biological Opinion was expected to result in the loss, due to harassment from aircraft noise, and the death, due to exposure to human disturbance resulting from the colony's move from the Natural Area at Pati Point to less protected areas, of the 21 Mariana fruit bats known to occur on Guam in 2006 (USFWS 2006a, p. 49).

Other Human Disturbance

No studies of Mariana fruit bat habitat use in relation to human disturbance have been conducted, but the selection of roost sites in remote areas on islands inhabited by humans, where bats are hunted, suggests that these animals are sensitive to human presence. Wild animals may react similarly to human disturbance and predators (Frid and Dill 2002). Therefore Mariana fruit bat shifts in habitat use may occur as a result of the species' history of being hunted (Kitchen and Gese 2000, p. 854; Kilgo et al. 1998, p. 1361). Observations by biologists on Guam indicate that foraging fruit bats can be fairly tolerant of human disturbance at night if they are not harassed (Wiles 2006, pers. comm.); however, this tolerance can vary based upon the type and extent of the disturbance (Wiles 2006, pers. comm.) as has been reported in other species (Lafferty 2001, p. 315; Rees, et al. 2005, p. 370). On Rota, the presence and sound of people in close proximity to fruit bat roosts (i.e., not only the discharge of firearms and direct mortality caused by illegal hunters) are thought to have played a role in the abandonment of roosts over the past several years (Boland 2010a, pers. comm.).

Natural Disturbance – Typhoons

Evidence suggests that severe typhoons usually do not directly kill fruit bats at their roost sites (Lemke 1992; Esselstyn et al. 2006; Wiles and Brooke 2010; Wiles 1987b), but as noted above, the synergistic effect on Mariana fruit bats of illegal hunting and severe storms is well documented on Rota (e.g., Stinson et al. 1992 and Esselstyn et al. 2006). Severe storms can alter fruit bat foraging and roosting behavior by decimating food resources, removing protective foliage cover, temporarily modifying forest structure, and changing vegetation composition, especially by facilitating encroachment of non-native species (Lemke 1992). Loss of food resources can drive bats to forage closer to areas of human activity in daylight hours, thereby increasing their vulnerability to illegal hunting (Craig and Taisacan 1994; Pierson et al. 1996).

Conservation Needs in the Action Area

In addition to the overall conservation needs identified above and in the section describing general threats to species in the action area, the following summarizes actions needed to conserve the Mariana fruit bat on Guam and Tinian.

Illegal hunting of Mariana fruit bats is a major factor in their overall decline, and hunting must be controlled to halt this decline. Potential measures for reducing or eliminating illegal hunting are increased protection of Mariana fruit bat roosting colonies and individual bats by limiting

access to roost sites and foraging areas, outreach and education to improve public understanding of this threat, and increased efforts by law enforcement to prosecute illegal hunters.

Guam and Tinian both harbor tracts of native forest, but we do not know if these are sufficient to support self-sustaining numbers of Mariana fruit bats. Because fruit bat numbers on these islands are very low or declining as a result of threats such as hunting, noise, brown treesnake predation, and other human-caused disturbances, we have insufficient data to estimate with confidence how much forest is necessary to support fruit bat recovery. Nonetheless, we do know that fruit bats require forested areas much larger than the immediate vicinity of colonial roost sites for foraging, sheltering, and reproduction. Therefore, conservation of the remaining forest habitat and restoration of additional habitat in areas where threats are controlled are necessary for the recovery of the species.

Ongoing Conservation Actions in the Action Area

Several outreach projects have been implemented or are underway to improve public awareness of the threats faced by the Mariana fruit bat and increase participation by local communities in conservation activities. In Guam, "Espiritun i Fanihi" took place on May 1, 2010. This was a locally-sponsored, one-day festival to celebrate the wildlife of the Mariana Islands, with special emphasis on the Mariana fruit bat (Defley 2010, pers. comm.). In addition, CNMI Division of Fish and Wildlife has leased a British Broadcasting Corporation documentary about fruit bat ecology and conservation entitled "Flying Foresters" and scheduled showings in schools and other public venues in the CNMI and on Guam, along with a video produced on Rota entitled "Fanihi: A Cultural Digest" that uses interviews to explore the cultural and ecological ramifications of the decline of Mariana fruit bats on Rota (Boland 2010b).

Relationship of the Action Area to the Survival and Recovery of the Mariana Fruit Bat

The *Draft Revised Recovery Plan for the Mariana Fruit Bat or Fanihi* includes the following criterion (one of seven) for evaluating the progress of the species toward recovery:

> "The total size of the fanihi population has increased…and stable or increasing subpopulations of sufficient size to avoid… risks associated with very small populations are distributed among the Mariana Islands so that the probability of the fanihi's persistence over 100 years is high (at least 90%).
>
> To meet this criterion, we propose that stable or increasing fanihi subpopulations should be distributed as follows: three of the five southern islands (Saipan, Tinian, Aguiguan, Rota, and Guam), and six of the eight islands north of Saipan where fanihi have persisted historically…" (USFWS 2009c, p. 40–41). The recovery criteria may change as a result of recently completed public review and appropriate additional analysis for the revised recovery plan.

Actions that reduce or eliminate the potential for islands in the archipelago to harbor self-sustaining numbers of resident fruit bats, as specified above, thus may hamper or preclude recovery of the species. The reduction or elimination of this potential may take many forms:

degradation or loss of habitat and resources required by the fruit bat for foraging, roosting, and reproduction; increased exposure of fruit bats to illegal hunting; introduction of non-native predators that prey upon fruit bats; or human disturbance.

We regard both of the islands in the action area as potentially important to the recovery of the Mariana fruit bat because, owing to the precarious status of the fruit bat currently on all five of the southern islands, it is not clear now which or how many of these five islands are now, or will be, the best candidates for meeting the criterion described above. The threats described above—habitat loss and degradation, illegal hunting, predation by non-native predators, and human disturbance—all affect the Mariana fruit bat to some extent on one or more of the islands in the action area. An appreciable change for the worse in any of these threats on Guam or Tinian may make one or more islands increasingly inhospitable for resident fruit bats and ultimately reduce the likelihood of meeting this recovery criterion.

2.4 EFFECTS OF THE ACTION

General Effects

The following section discusses the likely impacts of the proposed action on habitat and wildlife in general. That analysis is followed by an assessment of how those impacts are likely to affect the listed species presented in Table 1.

Exposure Analysis Approach

The Service has developed an analysis framework for Section 7 consultations that incorporates the general structure, primary concepts, and nomenclature of the U.S. Environmental Protection Agency's ecological risk assessment framework (USFWS 2005). Factors causing adverse effects or impacts are called "stressors" and beneficial effects are called benefits. In this approach, the Service determines the listed resources that will be exposed to the proposed action's stressors and benefits by evaluating the location, timing, duration, frequency, and intensity of potential exposure to each stressor and benefit and identifying the physical, chemical, and biotic features that will be directly and indirectly exposed. Then the causal relationships between sources of stressors and benefits and the response of listed resources are analyzed. The exposure analysis also estimates future changes in the abundance or distribution of listed species expected to result from exposure to stressors and benefits.

Habitat Loss, Degradation, and Fragmentation

Habitat degradation is one of the primary causes of extinction and endangerment of wildlife (Groom and Vynne 2006, p.173). Habitat degradation and loss is caused by various human activities including: agriculture, mining, forestry, fisheries, aquaculture, groundwater extraction, fires, infrastructure development, dams, urbanization, industry, pollution (including light, noise, and toxic chemicals), and changes in community and ecosystem structure due to invasive species (Groom and Vynne 2006, p. 174). Habitat fragmentation is a change in habitat configuration with the remaining habitat occurring in patches among areas of non-habitat (Noss et al. 2006, p. 213) and can occur via the activities listed above. When vegetation is affected by activities, edges (a type of habitat fragmentation) are created. Edges form the boundary of a habitat and have differing properties than the habitat itself. For example, edges often have different microclimate patterns which are drier, less shaded, and warmer than forest interiors. Edge habitats are generally areas of increased predation and the entry point for invasive vegetation, pests, and pathogens to encroach within native habitats (Noss et al. 2006, p. 228). Habitat degradation, fragmentation, and loss can result in localized extinctions, shifts in community composition (including increases in invasive species), increased predation, and can result in suitable habitat becoming unsuitable due to pollution, invasive species, physical size (for species that are area-sensitive), or barriers blocking access to habitats (including distance or lack of corridors and stepping stones, etc.) (Noss et al. 2006, 38 pp.; Groom and Vynne 2006, p. 174).

Habitat suitable for the survival and recovery of the Guam Micronesian kingfisher, Guam rail, Mariana crow, and Mariana fruit bat has been identified on Guam. In addition, we determined the threshold level of recovery habitat needed in northern and southern Guam (Amidon 2010a, b,

c, and Bruegmann 2010) to support the reproduction, numbers, and distribution of self-sustaining populations of these species as described in recovery plans.

Forest habitat will be removed as a result of project actions and additional development that will occur because of the project. Facilities construction, roadways, and training activities proposed by DoD will impact habitats on Guam and Tinian. Effects of the action under consultation are analyzed together with the effects of other activities that are interrelated to, or interdependent with, that action. An interrelated activity is an activity that is part of the proposed action and depends on the proposed action for its justification. An interdependent activity is an activity that has no independent utility apart from the action under consultation. Impacts to recovery habitat resulting from project vegetation clearing within the project footprint and within areas that will be developed as an indirect result of the project are summarized in the text below and in Table 10.

Table 10. Anticipated loss of listed species recovery habitat on Guam resulting from project-related development.

Construction Worker Housing

At the peak of construction, an estimated 18,347 construction worker jobs will be filled. Housing for construction workers is addressed in the "DoD Development of Infrastructure and Construction Worker Housing on Guam" section of the Project Description. Housing capacity for 2,000 to 18,000 temporary construction workers is planned for a 250 ac (101 ha) parcel in North Tumon, near Two Lovers Point. Although the parcel was previously disturbed, intact limestone forest occurs on the sites adjacent to the planned housing area. Existing housing and housing (on and off installations) that could be retrofit in northern and southern Guam is also likely to be used. Recovery habitat does not occur within the proposed construction worker housing areas.

Guam International Raceway Relocation

Purchase of private and Chamorro Land Trust and the Ancestral Lands Commission lands will be necessary for DoD's development of the Andersen South and Route 15 Range Complex. A non-profit organization operates the Guam International Raceway on the northernmost portion of the proposed training range complex. In the event DoD acquires the land, the Guam International Raceway would have to decide whether to continue operation in another location. If it chose to continue operations it may be eligible for relocation assistance from DoD pursuant to the Uniform Assistance and Real Property Acquisition Polices Act of 1970. If eligible, DoD would provide relocation assistance in the form of advisory services, and some specific financial assistance related to a move, but would not fund the physical relocation of the operations of the Guam International Raceway. Selection of any new raceway location would be subject to land use decisions by the Government of Guam. Should the Guam International Raceway decide to continue operations at an alternate location and be eligible for relocation assistance from DoD, DoD will work with Government of Guam land use and natural resource officials to ensure that project impacts to recovery habitat are minimized in any relocation effort.

DoD Civilian Employee and Indirect/Induced Development

During the construction period, an additional estimated 16,988 off-island workers will move to Guam to fill non-Federal non-construction jobs such as teacher and food service worker in areas adjacent to construction worker housing. The DoN refers to this population increase as "indirect" or "induced" growth (see Table 3). Induced development during the construction period will be geographically influenced by proposed construction worker housing sites.

After construction is completed, the service industry and other support jobs will shrink to a level of approximately 4,482. Approximately 1,836 civilian Federal employees (and their dependents) and the 4,482 non-Federal employees (and their dependents) will live in areas outside the installations, for the duration of project implementation. Civilian Federal employees and the longer-term induced jobs are likely to be similar to other civilians whose move to Guam was military-related (U.S. Census Bureau, 2000). The geographic distribution of the anticipated indirect/induced population increase resulting from the project is shown, by U.S. Census Subdivision, in Figure 8.

We derived the area that will be developed by the new civilian population within each U.S. Census Subdivision on Guam by calculating the current development footprint per person within each Census subdivision and applying that to the Census subdivision's anticipated increase in population. Based on the U.S. Forest Service 2002 land cover map (U.S. Forest Service 2002), and 2000 U.S. Census Bureau data (U.S. Census Bureau, 2000), we calculated that the area developed within the Census subdivisions ranges from 0.63 to 0.70 ac (0.25-0.28 ha) per person. Using the population increases described in the Project Description and summarized above, we calculated the total area of anticipated project-related civilian development within each Census subdivision. We applied this anticipated new development evenly across areas zoned for development based on current Government of Guam land use plans (Government of Guam 2009, p. 2-14 and 2007, p.1) on slopes less than 30% and calculated anticipated impacts of development resulting from the indirect/induced population (Table 10).

Wildfire

Military training with live-fire and incendiary materials, bivouacing with campfires, cigarette smoking, and vehicular malfunctions can result in the ignition of wildfires. Fires can lead to a variety of direct, indirect, and interrelated affects to wildlife and their habitats. Between 1991 and 2002, an average of 28 fires per year burned on DoN lands on Guam. This is approximately double the average annual number of fires burning on DoN lands from 1979 to 1989. Burned acreage on DoN lands was approximately 425 ac per year (172 ha per year) during this period of time, and remained approximately the same, at an average of 429 ac per year (174 ha per year) during the 1991 through 2002 period. Arson and debris burning account for approximately 70% of fires and 87% of area burned on DoN lands from 1979 to 2002. Smoking (8%), unknown (3%), and miscellaneous causes (including children, campfires, and equipment) account for approximately 4% of fires on DoN lands on Guam (Nelson 2009, Ch. 3 p. 4).

Direct effects to birds from fires are not routinely documented (Epanchin et al. 2002, p. 139). However, eggs, nestlings, ground nesting birds and flightless birds (including waterfowl during wing molt) are susceptible to fire (Erwin and Stasiak 1979, pp. 247-248). In general, adult birds fly away from fire (Vogl 1973, p. 336; Erwin and Stasiak 1979, p. 248), although some species have been documented to purposely forage near the fire line (Smallwood et al. 1982, p. 171; Erwin and Stasiak 1979, p. 248; Vogl 1973, p. 336). Epanchin et al. (2002, p. 141) noted direct mortality of white ibis (*Eudocimus albus*) after a wildfire in the Everglades. They hypothesized that the fire moved quickly through the area and suggested that the ibis may have been trapped by low overhead smoke or smoke inhalation, purposely foraging close to the fire line, or seeking refuge from the smoke and flames (Epanchin et al. 2002, p. 141). Smoke inhalation can also adversely affect birds as smoke can result in irritation and inflammation of the respiratory tract. In a severe case documented for a captive bird, smoke inhalation (from multiple kitchen fires) caused wheezing, respiratory distress, weakness, infections, behavioral changes (including decreased vocalization and activities), inability to coordinate voluntary muscle movements, collapse, and eventually death (Simone-Freilicher 2008, pp. 138-145).

Fire can indirectly affect endangered and threatened species by changing physical and biological characteristics of the area, which subsequently results in secondary habitat degradation and loss of forage base. Physical features that will be exposed to heat and flames include soil structure

and microclimate conditions. Fire will increase soil temperatures, alter soil moisture holding capacity, and modify soil rainfall infiltration (DeBano et al. 1979, pp. 2-7; Wells et al. 1979, p. 17; Neary et al. 2005, p. 2). These physical features will be indirectly exposed to post-fire erosion and alterations of light and shade, temperature, humidity, and wind as a result of vegetation destruction (Rice 1973, p. 30). Light levels, temperatures, and wind speeds will increase with destruction of canopy plants, and relative humidity will decrease (DeBano et al. 1979, p. 4; Rothermel and Rinehart 1983, p. 5; Hoffmann et al. 2003, p. 4-4). Because vegetation cover affects erosion rate, soil erosion may occur after fire except where rapid establishment of non-native invasive grasses are prevalent. Grass invasion may occur following removal of shrub and tree canopy (D'Antonio and Vitousek 1992, p. 63; Tunison et al. 2001, pp. 123-126). Chemical features that will be exposed to heat, flames, smoke, and ash include soil nutrients and water, which will be indirectly exposed to post-fire changes in content and cycling rates. Soil nutrient availability will be altered through volatilization of certain elements to the atmosphere in smoke (e.g., carbon, nitrogen, and sulfur), conversion to more available forms in the ash (e.g., potassium, phosphorus, and divalent cations), wind dispersal of the ash, and surface erosion (Clayton 1976, p. 162, 164; Agee 1993, pp. 160-163).

Biotic features of the habitat that will be exposed to heat, flames, smoke, and ash include all living organisms in the exposure area, litter layers on the forest floor, organic matter within the surface soil horizon, and seeds within the litter and surface soil. Soil invertebrates will be directly exposed to injury or death, and seeds, litter, and organic matter will be directly exposed to destruction and loss (Kinnaird and O'Brien 1998, p. 955). These effects in turn will indirectly expose soils to long-term changes in fertility and structure as a result of changes in decomposition and nutrient cycling processes, changes in nutrient and water retention by organic matter, increased nutrient losses in runoff and leaching, and changes in net primary production due to loss of leaf area and photosynthesis (Kinnaird and O'Brien 1998, p. 955).

To minimize the indirect effects to listed species resulting from fire impacts on their recovery habitats, the DoN proposes to develop and implement a comprehensive fire management plan. The fire management plan will be prepared to minimize fire threat associated with existing and proposed actions on Guam. The DoN's fire management program will be developed to achieve the objective that DoD training actions will not result in fire impacts to vegetated areas that can be used by the Mariana fruit bat, Guam Micronesian kingfisher, Mariana crow, Guam rail, or Mariana common moorhen. Additionally, the stationing of additional large helicopters on Guam may facilitate increased DoN contributions to the suppression of fires threatening forest habitat on Guam. Although the DoN's fire management plan may minimize fire impacts by instituting fire prevention, detection, and suppression programs as well as implementing landscape-level fuel modifications in the Naval Munitions Site.

National Wildlife Refuge Overlay

A total of 621 ac (251 ha) of the proposed action's project footprint within Guam National Wildlife Refuge Overlay boundaries are in the areas that were proposed as critical habitat for the Guam Micronesian kingfisher, Mariana crow, and Mariana fruit bat (67 FR 63738-63764). These areas were excluded from critical habitat designation pursuant to the Sikes Act (16 USC 670a-670o, 74 Stat. 1052, Public Law 86-797), as amended.

Noise

Overview of Noise Resulting From the Proposed Action

The proposed training activities will result in noise from the use of a variety of vehicles (construction equipment, fixed-wing aircraft, helicopters, trucks, tanks, and other convoy vehicles) and weapons (small arms, demolitions, and other ammunition), and loud voices. Noise greater than 60 dB resulting from project actions will occur in portions of listed species' ranges (Figure 17). Noise levels greater than 93 dB will occur only in limited areas in the immediate vicinity of airfields, landing zones, and construction sites. In addition, loud noise, resulting from actions in the Andersen Air Force Base Northwest Field area that are not specified due to their classified nature, will periodically occur in northern Guam.

Noise resulting from weapons training and aircraft on Guam and Tinian will frequently impact areas occupied by listed species (see Figure 17). Noise levels in recovery habitat in these areas will also be increased as a result of the proposed action. Increased jet and helicopter aircraft traffic at Andersen Air Force Base will regularly expose the Mariana fruit bat to high levels of noise. Portions of the recovery habitat for the Guam Micronesian kingfisher, Guam rail, Mariana crow, and Mariana fruit bat are in areas where elevated noise from jet and helicopter aircraft traffic will occur. Helicopter operations will expose Mariana crow, Mariana fruit bat, and Mariana common moorhen individuals to periods of elevated noise. Training use of weapons including demolitions and small arms at the Andersen South and Route 15 Range Complex will expose cliff areas not currently known to be used by listed species, to elevated noise. The Mariana common moorhen and Mariana fruit bat will be exposed to noise from small arms training on Tinian where loud noise resulting from training will impact approximately one-third of the forested FAA mitigation site.

Overview of Noise Impacts to Animal Physiology and Behavior

We established 60 dB and 93 dB as two thresholds of biological significance based on our review of impacts of noise to similar species. Noise levels above 60 dB have been found to affect acoustic communication, breeding biology, survival of eggs and young, and non-auditory bird and mammal physiology (Bunnell et al. 1981, Burger 1983, Brown 1990, Awbrey and Hunsaker 1997, Mock and Tavares 1997, Delaney et al. 1999, South San Francisco Ferry Terminal Project EA 2003, and as reviewed in Dooling and Popper 2007, p. 25 and pp. 33-34). Noise levels above 93 dB may temporarily or permanently affect hearing (reviewed in Dooling and Popper 2007, 74 pp.). In addition to noise level, the frequency and regularity of the noise also affect species sensitivity. The physiological and behavioral effects of military, aircraft, and vehicle noise to wildlife have been investigated numerous times with mixed results due to differences in wildlife sensitivity and habituation to noise (VanderWerf et al. 2000, p. 3). The following information is summarized from Larkin et al. (1996, p. 21-52), unless otherwise stated, and is meant to provide an overview of the types of avian responses to military and aircraft noise that have been documented.

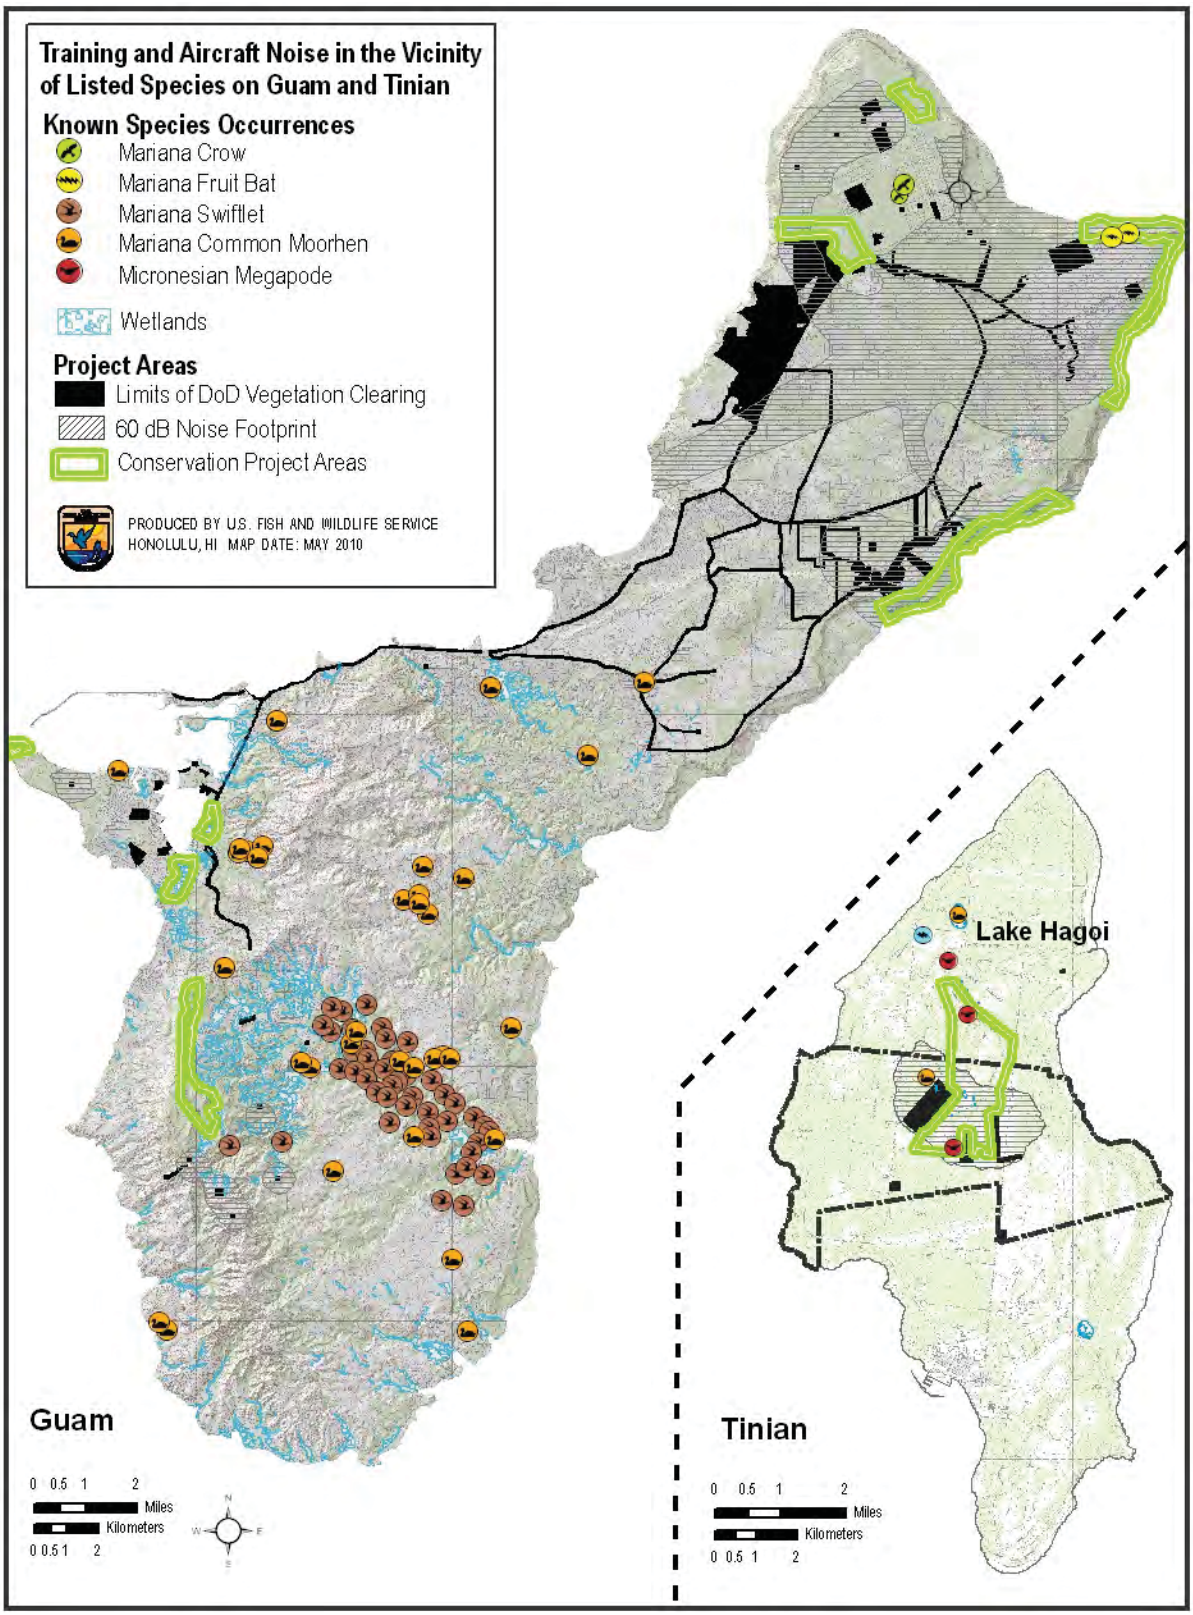

Figure 17. Project training and aircraft noise in the vicinity of wetlands and populations of listed species.

Responses to noise can vary among individuals as a result of habituation where after a period of exposure to a stimulus, an animal stops responding to the stimulus. In general, a species can often habituate to human-generated noise when the noise is not followed by an adverse impact. Even when a species appears to be habituated to a noise, the noise may produce a metabolic or stress response (increased heart rate results in increased energy expenditure) though the response may or may not lead to changes in overall energy balance. Anthropogenic noise disturbance is known to alter animal behavioral patterns and lead to population declines (Barber et al. 2009, p. 181). Species that are commonly hunted often demonstrate behavioral (e.g., flushing, startle response) or physiological responses (e.g., increased heart rates, increased respiration rates) to gunshot sounds Larkin et al. (1996, p. 21-52). Incubating herring gulls (*Larus argentatus*) and great black-backed gulls (*L. marinus*) habituated to the continual presence of humans except when they perceived a human walking directly toward their nests (Burger and Gochfeld 1981, pp. 242-267). On Farallon de Medinilla, Micronesian megapodes flushed in response to humans (Lusk et al. 2000, p. 29). Upon flushing, the birds called and flew 30 to 50 m before dropping back into thick vegetation (Lusk et al. 2000, p. 29).

Continuous or repetitive very loud noise appears to cause stress and structural damage in the ear and could be harmful when animals are already under metabolic stress. Sound levels over 85 dBA are considered harmful to inner ear hair cells; 93 to 95 dBA is considered unsafe for prolonged periods; and extreme damage occurs as a result of brief exposure to 140 dBA (Hamby 2004 and reviewed in Dooling and Popper 2007, 74 pp.). Hearing loss in birds is difficult to characterize because birds, unlike mammals, regenerate inner ear hair cells, even after substantial loss (Corwin and Cotanche 1988, pp. 1,772-1,774; Stone and Rubel 2000, pp. 11,714-11,721). Mammal recovery from metabolic ear stress can often occur after ten hours post loud impulse noise, even before ear structures are fully recovered. Repeated trauma may prolong the course of hearing sensitivity recovery. Longer-term recovery from hearing loss is generally expected in birds due to cell regeneration; however, lifelong hearing loss (threshold shifts) can occur in birds.

Very loud noise, even if the noise is short in duration, can result in tympanum rupture, bone fracture, other damage to the ear, and deterioration of brain cells. These impulse noises can cause physical damage at lower intensity than continuous or rapidly-repeating noises due to the ear reflex mechanism. For example, common canaries (*Serinus canaria*) exposed to continuous loud noises experienced changes in hearing thresholds, especially at high frequencies (Larkin et al. 1996, p. 30, and references within). A study with budgerigars (*Melopsittacus undulates*) indicated that a permanent threshold shift (lifelong hearing loss) was experienced at low frequencies only and nearly absent at higher frequencies (Larkin et al. 1996, p. 30, and references within). Many birds appear to tolerate noise that can cause pain in humans, for example: seabirds at airports, wild turkeys (*Meleagris gallopavo*) near a rocket testing plant in Florida, and ospreys (*Pandion haliaetus*) at the Naval Surface Warfare Center, Dahlgren (Larkin et al. 1996, p. 31, and references within).

Noise from small arms is unlikely to affect animals in terms of hearing loss; however, those species that are commonly hunted will likely demonstrate behavioral (e.g., flushing, startle response) or physiological responses (e.g., increased heart rates, increased respiration rates). Blast noise from artillery and other detonations includes shock waves. Red-cockaded woodpeckers (*Picoides borealis*) successfully raised young near an active bombing range in

Mississippi; while other birds at other sites did not. Oahu elepaio (*Chasiempis sandwichensis ibidis*) did not respond in statistically significant or biologically meaningful ways to noise generated by training with 155 and 105 mm howitzers, 60 and 81 mm mortars, hand grenades, and demolition of unexploded ordinance (VanderWerf et al. 2000, pp. 18-19). Prairie falcons (*Falco mexicanus*) responded to blasts from ongoing civilian construction where the nests sites were not normally exposed to blasting; however, one northern harrier (*Circus cyaneus*) appeared to preferentially hunt near a location where 24-pound bombing occurred. Anecdotal observations indicate the burrowing owl (*Athene cunicularia floridana*) continues to be persistent at Eglin Air Force Base on a bombing range where a variety of ordnance (rockets, missiles, and bombs including the MOAB [a 21,700-pounds massive ordnance air blast bomb]) has been used over the last 24 years (Hagedorn 2009, pers. comm.).

Noise from helicopters is complex and wildlife response may depend on the model of the helicopter. Touch-and-go landings, bombing runs, helicopter sorties, and artillery practice are impulse activities that repeat at short enough intervals to constitute a continuous exposure. In a literature review of waterfowl response to aircraft, avian response to aircraft was (cautiously) generalized as more intense with helicopters than fixed-wing aircraft, and stronger with slower fixed-wing aircraft than fast fixed-wing aircraft (Plumpton 2006, p. 3-1, 3-2). Increasing horizontal distance resulted in lower response than increasing altitude (Plumpton 2006, p. 3-1, 3-2). Raptors have varied behaviors in response to helicopters and responded similarly to explosions: by remaining on a nest, flushing from an area, and attacking the helicopter. American black ducks (*Anas rubripes*) reacted to 39% of military aircraft overflights on their first day of exposure, but after two weeks they responded only 6% of the time (Conomy et al. 1998, pp. 1,135-1,142). However, wood ducks (*Aix sponsa*) in the same study continued to respond to aircraft noise (Conomy et al. 1998, pp. 1,135-1,142). Survival of captive black duck chicks was lower in a noisy area than control area; however adults were largely unaffected. Sandhill cranes (*Grus canadensis*) were noted to stay on their nests when helicopter activity was within 131 ft (40 m) above them and bald eagles remained on their nests until helicopters approached closely (distance not defined). On Farallon de Medinilla, adult birds (presumably various species of seabirds) flushed from their nests in response to helicopter landings; however, some returned to their nests within 15 minutes after the disturbance stopped (Lusk et al. 2000, p. 32).

Vehicles also differ from one another in sound and appearance. Vehicle noise impacts to wildlife are difficult to quantify as other factors (emissions, topography, and vegetation, etc.) generally confound analyses. Vegetation and topography can reduce vehicle traffic noise. In one study, when traffic increased, burrowing owls exhibited alert responses or moved, although these behaviors did not result in changes to nesting productivity. A study of sandhill cranes noted that the birds nested within 13 ft (4 m) of a road, while in a study of off-road vehicles, birds (species not defined) flushed and flew distances of 2.0 mi (3.2 km) at the sound of approaching vehicles. As summarized in Larkin et al. (1996, 107 pp.) other studies have noted species-specific decreases in breeding densities close to roads.

As described above, noise can produce a variety of physiological impacts and behavioral responses in wildlife. The response to noise not only affects an individual but can affect the overall population as well. Hearing impairment, both temporary and permanent, can decrease

viability or reproductive success particularly when mate attraction and territory protection depend on calling or singing. Hearing impairment can also decrease the ability to detect and warn others of predators. Behavioral responses (startle response, alert or alarm response, and flushing) to noise are often examined as these response actions result in: birds expending excess energy that is not directed towards reproduction; nest exposure increasing the risk of predation, nest cooling or nest heating which can result in egg and juvenile mortality; or accidently kicking eggs or juveniles out of the nest. Behavioral responses can also include lower breeding densities in suitable habitats that are subject to noise; therefore, suitable habitat may become otherwise unsuitable due to noise. Wildlife response to noise may also be more intense at night, if the species rely more on auditory cues than visual cues at night. Additionally, young animals may be more susceptible to hearing loss from noise exposure than adults; however, an experiment with common canaries did not show a differential response with age (Larkin et al. 1996, p. 25, 30 and references within).

Invasive Species

Implementation of the proposed project is likely to increase the risk of introducing or spreading non-native terrestrial and aquatic invasive species including plants, animals, and microbes. Pathways associated with anthropogenic activities have a relative risk of introducing and dispersing non-native invasive species. Hulme et al. (2008, 14 pp.) described three broad mechanisms for non-native species introductions: importation as a commodity (e.g., purposeful importation as biocontrol, pet trade), arrival via transport vector, and natural dispersal. Of these mechanisms, Hulme et al. (2008, 14 pp.) further described a framework for introductions that is supported by six principal pathways of which two could potentially occur via the implementation of JGPO: contaminant of a specific commodity and stowaway (independent of a commodity, like ballast water or airfreight). The pathways of contaminant and stowaway include, but are not limited to species transported via: construction equipment, personal protective equipment, delivery of supplies, materials, goods, foot traffic, vehicles or vessel traffic. Invasive species introduced as contaminants and stowaways could occur as a result of inadequate sanitation and inspection during and prior to movement. The repeated or routine movement of equipment and people increases the risk of introduction and establishment of a non-native invasive species.

The results that follow the introduction and spread of a non-native invasive species can be difficult to predict (Courchamp et al. 2003, 37 pp.); however, there is scientific documentation of the impacts to threatened and endangered species due to invasive species. Studies suggest that the threats and impacts related to invasive species are second only to the impacts from habitat destruction (Wilcove et al. 1998, p. 609). Non-native invasive species could have impacts that alter the existing terrestrial ecosystem and may then expand out into adjacent areas after the initial introduction. Impacts that have been documented for non-native invasive species generally include direct predation; habitat alteration; illness, injury, or death due to disease; and competition for resources. The types of impacts are determined by characteristics of the native species as well as the non-native species. Below we have provided examples of impacts from non-native invasive species (mammals, reptiles, invertebrates, and disease) introductions to avian and other species to highlight the risk and potential impacts from accidental invasive species introductions.

Introduced rats have affected island wildlife. During field trials on the uninhabited island of Surprise Island, New Caledonia, Caut et al. (2008, p. 434) documented predation by the black rat (*Rattus rattus*) on ground-nesting seabirds. The authors noted a dietary shift in the rats when seabird eggs and chicks were not present. As the abundance in seabird eggs and chicks declined, predation by black rats shifted to skinks, sea turtles, and insects (Caut et al. 2008, 10 pp).

On Guam, the non-native invasive brown treesnake has been documented as a predator on various species of vertebrates. Wiles et al. (2003, 11 pp.) examined bird data from Guam and stated that 22 out of 25 species of birds were affected by the brown treesnake. Of these species, 17 of the 18 native bird species were severely impacted, and 12 species have been extirpated from Guam. In addition, Wiles et al. (2003, pp. 1,355-1,356) provided reference to observations of Mariana swiftlet predation by brown treesnakes on Guam as a regular event. The brown treesnake has been linked to the extirpation or extinction of numerous bird, bat, and reptile species on Guam (Fritts and Rodda 1998, p. 114).

Another example of a non-native invasive species with documented impacts to avifauna is the red imported fire ant (*Solenopsis invicta*). The northern bobwhite quail (*Colinus virginianus*) is a ground-nesting and ground-foraging bird in North America. Allen et al. (1995, 8 pp.) describe impacts from red imported fire ant observed during field experiments with northern bobwhite quail in Texas. Red imported fire ant preyed upon pipping chicks. Other impacts to chicks included weight loss from exposure to red imported fire ant venom. Red imported fire ants also affect insect communities through competition which indirectly affected the diet of northern bobwhite quail resulting in lowered fitness of chicks and adult females (Allen et al. 1995, pp. 632, 636 and references within).

Mosquitoes have also been associated with the decline of biodiversity of species, especially birds. Specific accounts and historical documentation of the introduction and spread of mosquitoes and various bird diseases in the Hawaiian Islands was covered earlier in great detail by Warner (1968, 20 pp.), Benning et al. (2002, 4 pp.), and Atkinson and LaPointe (2009, 14 pp.). In particular, the vectors (differing mosquito species) and avian diseases are illustrated by authoritative accounts and field trials. Warner (1968, p. 116) discusses the ability for certain bird species to inhabit higher elevations (i.e., above 600 m) where it is mosquito-free and thus allows some bird species to persist. Juliano and Lounibos (2005, 24 pp. and references within) provide an overview of mosquito species, invasiveness, pathways for introduction, and associated impacts of these species on human and wildlife populations.

It is important to understand that the "risk" of introduction and establishment of invasive species is highly variable across taxa and habitats. Identifying and analyzing risk for all the species that could be moved via JGPO-related activities is not practicable. Instead, a more efficient approach is to address pathways where numerous species from different taxa may be inadvertently introduced and implement prescriptive measures to control risks from the pathways. A pathway risk assessment will provide a structure for assessing where the greatest "risk" for a non-native species introduction occurs and locations where managing ingress or egress of these species is most efficient for control. Pathways must be controlled because repetition of an action has a direct effect on propagule pressure which as stated above increases the likelihood of a species to become established.

Military Ports

Listed species and their habitats are subject to the risk of effects from the introduction and spread of existing and novel invasive species via the proposed action. To reduce the risk of introduction and spread of non-native, invasive species, the DoN has proposed to implement a variety of conservation measures for all training actions. In addition, the DoN has agreed to implement multiple conservation measures at all military ports to ensure that all vehicles (including automobiles, watercraft, and aircraft), cargo, equipment, and supplies are inspected and quarantined if storage is necessary prior to entering other areas on Guam and prior to leaving for any other ports under U.S. jurisdiction.

In particular, the DoN has targeted specific actions to prevent the spread of the brown treesnake from Guam to other islands including 100% inspection of outgoing vessels and aircraft, quarantine areas, research to enhance snake detection procedures, and environmental education of all personnel. The DoN will also require each individual service member (or other employee or contractor associated with range maintenance activities, biological surveys, etc.) to complete self-inspections (including equipment and gear) to avoid movement of invasive species between different islands and within different areas of the same island.

The DoN will also conduct a pathway analysis for each activity (or type of activity training, range maintenance, etc.) conducted under the proposed project to determine and implement appropriate risk avoidance procedures. The DoN will develop Standard Operating Procedures for each activity (or type of activity) that incorporate the appropriate risk avoidance procedures and will conduct after action reviews to assess and revise Standard Operating Procedures and avoidance procedures to ensure the risks from invasive species introductions are addressed.

Habitats used for training and those near construction areas will be monitored for incipient populations of invasive species. Biosecurity program teams will be established to eradicate incipient populations and implement control actions for previously established species. The DoN will actively seek agreements with other Federal and non-Federal agencies to implement rapid response and other control actions on their lands. Additionally, the DoN commits to implement a biosecurity program that will further reduce or eliminate risk of transporting invasive species via proposed project activities.
We anticipate that the above conservation measures proposed by the DoN will minimize the risk of introduction or spread of invasive species from military ports and adverse effects to listed species to the extent that incidental take of listed species is not likely to occur because these measures are comprehensive, are known to be effective, and they will be implemented to the degree that will avoid gaps in the interdiction program. Furthermore, many of the proposed conservation measures are designed to eliminate or control existing invasive species thereby improving the habitat for listed species.

Invasive Species Interdiction for Commercial Air Transport

Military and civilians associated with the proposed project (i.e., contractors, dependants, workers) and their cargos may be transported to and from Guam using commercial airlines. As described above, the transport of people and cargo is a pathway for the introduction and spread

of invasive species. Commercial flights from the A.B. Won Pat Guam International Airport serve multiple destinations from Guam. Of these destinations, only four destinations support listed species under the jurisdiction of the U.S.: Oahu, Saipan, Tinian, and Rota. Current airport biosecurity and inspections include: inspections of arrival passengers by Guam Customs and Quarantine Agency and outbound passengers to Honolulu go through customs inspection upon arrival in Honolulu by U.S. Customs and Border Protection. USDA APHIS Wildlife Services inspects outbound cargo (commercial and DoD) as prioritized by the agency for the presence of brown treesnakes (Vice and Engeman 2000, p. 106). In addition, all luggage containers are inspected upon arrival by customs officials and importation of plants, fruits, and animals are restricted without proper documentation from the point of origin (http://ns.gov.gu/cumstoms.html). The Hawaii Department of Agriculture and the CNMI Brown Treesnake Program have historically conducted canine and visual brown treesnake inspection of aircraft and cargo arriving in these locations. The Hawaii Department of Agriculture's canine inspection program is currently not in operation due to State funding shortfalls. The U.S. Department of Interior Office of Insular Affairs is providing funding to Hawaii Department of Agriculture to re-hire three canine inspector positions and purchase working dogs to ensure coverage of current level of commercial aircraft and air cargo arriving from Guam. The CNMI Brown Treesnake Program currently has an adequate number of inspectors and working dogs for current levels of commercial aircraft and air cargo arriving from Guam.

U.S. Department of Agriculture APHIS Plant Protection and Quarantine is authorized to prevent the introduction or dissemination of animal and plant diseases and pests on all ships, aircraft, and their cargo, and baggage arriving in the U.S. from any place outside, or moving from Hawaii, Guam, Puerto Rico, the Virgin Islands, or other territories and commonwealths of the U.S. to the Continental U.S. or between such areas. When inspection discloses items prohibited or restricted by USDA, quarantine regulations reveals a plant or animal pest, or there is reason to presume such a pest is present, the inspector will require action to prevent the dissemination of the pest or take action to dispose of the prohibited or restricted item.

Invasive Species Interdiction for Commercial Sea Transport

The Jose D. Leon Guerrero Commercial Port is administered by the Port Authority. The Port Authority is part of the Government of Guam and operates as a semi-public organization. Since its construction in 1969, the seaport has remained largely unchanged. With many areas near capacity or unusable, expansion of the seaport's facilities and equipment upgrades would create operational efficiencies and maximize Seaport capacity. Prior to the announcement of the proposed military relocation, seaport improvements and expansion were under consideration; however, the military relocation created an additional impetus to implement planning studies and improvements to service the anticipated construction work and additional population.

In August 2007, work began to update the seaport's master plan. The recommendations and updates address future expansion and development based on typical commercial growth, as well as the impending military buildup. A final draft seaport master plan was completed in April 2008 that updated the master plan and set the road map for upgrading the port facilities. The seaport master plan was approved by the Guam Legislature in December 2009. The master plan calls for nearly $200 million in capital improvement upgrades to the seaport facilities. The

modernization program would address both Guam's expected growth without the proposed action and the anticipated increase in cargo volume resulting from the proposed action.

The initial upgrades to the seaport include the demolition of older facilities, reconfiguration of laydown areas, and traffic and security improvements to accommodate increased cargo flow. Longer term improvements, including pier refurbishment, construction of new deep draft piers, and dredging to support such construction, have yet to be programmed. Any planned improvements would be required to comply with Guam and Federal environmental protection laws, including, but not limited to, the Endangered Species Act, Clean Water Act, and the National Environmental Policy Act.

The Port of Guam Master Plan (Port Authority of Guam, 2007) calls for development of new facilities to handle increased customs and agriculture inspection requirements. It is anticipated that increased customs and agricultural inspection requirements will be coordinated through both Guam and relevant Federal officials, including the USDA. The DoD will work with the Port and relevant Guam and Federal inspection authorities to address required inspection of cargo that pass through the Port. The increased inspection associated with civilian population growth will be a function of Port of Guam planning, implementation, and coordination with relevant Guam and Federal customs and inspection authorities.

Military personnel and civilians associated with the proposed project (i.e., contractors, dependants, workers) and their cargos may be transported to and from Guam using commercial seaport. As described above, the transport of passengers and cargo is a pathway for the introduction and spread of invasive species. Due to the Merchant Marine Act of 1920 (P.L. 66-261, as amended, also known as the Jones Act or Cargo Preference Act), international shippers are not authorized to leave the Port of Guam and move directly to other U.S. ports unless the ship is under a U.S. flag, constructed in the U.S., owned by U.S. citizens, and crewed wholly by U.S. citizens, or has an exemption (i.e., certain national emergencies, strategic interests) (see Merchant Marine Act of 1920). Generally, any shipping from Guam must go to another country prior to arriving in the U.S. Typical shipping routes from Guam travel to different ports in China or Taiwan and then travel to the mainland and on to Hawaii. Ships may go directly from Guam to Rota, Tinian, or Saipan. To our knowledge, only Matson meets the requirements of the Merchant Marine Act of 1920 and can ship from Guam to any U.S. shipping port.

Brown Treesnake

The proposed DoN action will increase the number of people on Guam. Both project-related construction and increased population will add to the volume of cargo and people traveling to and from Guam. Project-related increases to the populations of the CNMI are expected to be minor to modest. In addition to air travel directly related to people moving to Guam, there is also an anticipated increase in business and recreational travel from Guam to other regional destinations.

Guam's seaport is expecting an increase of up to 84% in cargo container traffic from 103,000 to 190,000 containers per year moving through the port during peak construction (Port Authority of Guam 2007). Containers are not retained on Guam, but are shipped out either with new cargo in

them (25%) or empty (75%). Much cargo is packed outside of the Port of Guam by freight forwarding or packaging facilities. Empty containers are stored both at the Port of Guam and at sites outside the Port. Shipping traffic via air and sea from Guam to Hawaii and the continental U.S. is assumed to increase proportionally to the overall rate of shipping to/from Guam due to the proposed action.

The primary commercial air route between Guam and the continental U.S. is via Honolulu, Hawaii. Regional commercial air traffic includes daily direct commercial airline service between Guam and Honolulu, and thrice-weekly service between Guam and Honolulu that stops at four to five islands along the way. Dedicated air cargo flights occur between Guam and Honolulu on an as-needed basis. The primary export on these flights is fish; however, additional space on the plane can be used for other cargo when needed. Commercial air service to the CNMI from Guam occurs through two regularly scheduled routes; a direct flight to Saipan, and a less frequent route that stops on the island of Rota prior to arriving on Saipan. Tinian receives regular air service from Saipan.

Increases in the rate of air and sea traffic between Guam and the CNMI are anticipated; however, data on this is limited. Cargo and containers arriving in the CNMI are shipped or transshipped from the Port of Guam. Cargo containers and vessels originating from Guam go through the Port of Saipan, however direct shipments to Tinian and Rota have occurred. Continental Micronesia, the dominant air carrier in the region, reported in 2008 that it was already seeing an increase in traffic due to the proposed action (Hensel 2008 p. 1-3).

Brown Treesnake Minimization Measures and Actions

Effective interdiction of brown treesnakes on Guam, the CNMI, and Hawaii is critical to preventing the spread of this species. The DoD has committed to fund the increase of current federally funded brown treesnake interdiction measures (in Guam, CNMI, and Hawaii) for the commercial sector where the increase is related to direct, indirect and induced-growth caused by the subject action. The timeframe of this commitment spans the construction phase as well as the post-construction phase of this project. Brown treesnake interdiction measures for the commercial sector include but are not limited to snake inspection, suppression and rapid response. The DoD has also committed to snake inspection (100% as a goal), snake suppression, construction of snake barriers and brown treesnake rapid response to support military training and non-training actions.
The DoD will utilize an iterative process of adaptive program management to determine the specific levels of brown treesnake interdiction required for the civilian sector. The DoD will convene a working group to identify a system of reporting, monitoring and threshold metrics that can be used to ensure current levels of brown treesnake interdiction are met. Perspective working group members include DOI Office of Insular Affairs, USDA APHIS Wildlife Services, Hawaii Department of Agriculture, the Government of Guam, the Commonwealth of the Northern Mariana Islands, the Service, and the U.S. Geological Service. During the construction phase of this action the working group will serve as a distinct subgroup of the Civil Military Coordination Council. Following the completion of construction, the federally-mandated Brown Tree Snake Working Group will serve the role of the Council.

The DoD's commitment to provide sustained brown treesnake research funding throughout the construction phase of this project will assist in the development of methods to eradicate or significantly suppress this pest island-wide. The refinement of existing control techniques and development of new ones will be required to successfully reintroduce listed species on Guam. Sustained, landscape-scale brown treesnake suppression on DoD and other lands is critical for the reintroduction of the Guam Micronesian kingfisher and Guam rail. This level of brown treesnake suppression would likely result in increased reproductive success and survival for the Mariana common moorhen and Mariana fruit bat on Guam. Measures developed by the DoD to eradicate or significantly suppress brown treesnakes on Guam can also be applied to reducing the risk of the brown treesnakes spreading to other locations.

Biosecurity Measures and Actions

The DOD has committed to establishment of a biosecurity program throughout the construction phase of the military build-up. This team, if adequately staffed, has the potential of reducing the risk of invasive species establishment and spread on DoD property within Guam and the CNMI. DoD has also committed to support opportunities for the biosecurity program to work collaboratively with local governments through Memorandums of Understanding or Memorandums of Agreement. This is critical because invasive species spread isn't limited by the human artifact of property or water body ownership.

Other Conservation Measures Associated with the Action

In addition to measures to minimize the risk of brown treesnake transfer from Guam, the proposed action also includes other measures that are intended to offset adverse project effects to listed species:

Reintroduction of Listed Species to DoN Lands

Recovery habitat remaining on DoN lands comprises a substantial percentage of the total habitat available for the recovery of the Guam Micronesian kingfisher, Guam rail, Mariana crow, and Mariana fruit bat. The DoD proposed conservation measures are intended to support re-introduction of native endangered or threatened species on DoD lands on Guam consistent with species recovery plans. In further support of such recovery efforts, the DoN intends to actively participate in recovery committees for endangered or threatened species on Guam. The DoN will work with the Service to develop a re-introduction plan and supporting programmatic biological opinion that ensures such re-introduction efforts are consistent with the species recovery plans and the military mission on Guam. The reintroduction plan will include mutually-agreed upon criteria for initiating the reintroduction of endangered and threatened species on DoN lands.

Development of Wild Populations to Complement Captive Programs

The DoN development and implementation of a Guam Micronesian kingfisher introduction plans for one to three islands in the CNMI (other than Guam) will facilitate the recovery of this species by enabling the maintenance of more natural breeding, feeding, and sheltering behaviors in

individuals to be reintroduced to Guam than would develop in captivity. Development of self-sustaining wild populations of this species will complement captive populations by buffering these populations against stochastic events. The DoN's goal is to develop three self-sustaining Guam Micronesian kingfisher. These breeding populations would become a source for future reintroductions to Guam. Implementation of introduction targets will ensure captive populations are not harmed by removing birds and that birds will be introduced in high enough numbers to contribute to self-sustaining populations. There is some uncertainty regarding the likelihood of success of the proposed project because approval from cooperating governments has not been secured.

Landscape-Scale Ungulate Management

The DoN's preparation and implementation of a Navy Joint Region Marianas ungulate management plan addressing the control and potential eradication of ungulates on DoD lands managed by Naval Facilities Engineering Command Marianas on Guam will minimize future degradation of forest habitat resulting from ungulates. The proposed action includes the development of an ungulate management plan as well as implementation of a long-term program and methods for a sustained reduction of ungulates on DoN lands. Eradication is the goal; however, if eradication is not feasible, ungulate control will be implemented with the goal of sustained suppression to levels that allow for forest regeneration and self-sustaining populations of native animals. The DoN will request the Service's review and comments regarding the draft ungulate management plan.

Ungulate removal will significantly benefit listed species on Guam. On Guam, feral pigs are distributed island wide, and densities may be as high as 238 pigs per square mi (110 pigs per square km). As has been documented in other locations, wallowing rooting, and trampling are common in most forested areas and can be locally severe (Conry 1988, p. 27). Ungulates cause severe damage to forests by directly affecting forest vegetation and by facilitating the establishment of invasive plants, which can impede forest regeneration by outcompeting native seedlings (USFWS 2009a, p. 27). As an example, Wiles (2005) documented a rapid decline in native breadfruit trees due to mortality of mature trees from typhoons and a lack of recruitment caused by deer and pig foraging on fallen fruit and seedlings.

Establishment and Management of Ecological Reserve Areas

Under the proposed action, four new ecological reserve areas, an additional conservation area, an outdoor recreation area, and wetland restoration areas (within which training will be limited), will be submitted to Chief of Naval Operations N45 for approval. Ecological Reserve Areas will be protected from development and, to varying extents, from training and recreational impacts. If the Ecological Reserve Areas do not come to fruition, alternate conservation projects will be developed in coordination with the Service to ensure conservation to listed species addressed in this Biological Opinion are equal to or greater than those we assessed in our preparation of this document.

The DoN will create the Ritidian Point Ecological Reserve Area to protect native limestone forest habitats in northern Guam that are recovery habitats for the Mariana crow, Guam

Micronesian kingfisher, and the Mariana fruit bat. The new Ritidian Point Ecological Reserve Area will be contiguous with and incorporate the areas protected under the ISR Strike Biological Opinion (USFWS 2006a, 73 pp.) and Northwest Field (USFWS 2006b, 7 pp.) consultations.

The DoN will submit a proposal to Chief of Naval Operations N45 to create the Pati Point Ecological Reserve Area to encompass native limestone forest habitats in northern Guam which are recovery habitats for the Mariana crow, Guam Micronesian kingfisher, and Mariana fruit bat (DoN 2010a, p. 125). The new Ecological Reserve Area will contain approximately 713 ac (289 ha) of habitat for listed species.

The DoN will coordinate with the Government of Guam to protect the limestone forest habitat on Government of Guam lands spanning from the area east of the proposed ranges on Route 15, north, to the Government of Guam's existing Anao Conservation Area. These lands contain recovery habitat for the Mariana crow, Guam Micronesian kingfisher, and Mariana fruit bat. The intention is to develop a continuous band of protected area from the Andersen Air Force Base at the Pati Point Ecological Reserve Area through Government of Guam's Anao Conservation Area south to the proposed Route 15 Range Complex. This will involve working with Government of Guam to designate the Anao Conservation Area as protected in perpetuity and then developing a Cooperative Agreement or Memorandum of Understanding on joint natural resources management to benefit listed species and their habitats in the entire area.

The DoN will submit a proposal to Chief of Naval Operations N45 to expand the existing Orote Ecological Reserve Area to encompass Orote Island (seabird nesting habitat), Adotgan Point, and the Spanish Steps area that supports sea turtle nesting (DoN 2010a, p. 125) on Naval Base Guam. The expansion will add approximately 32 ac (13 ha) of terrestrial habitat to the Orote Ecological Reserve Area.

No proposed action-related construction or training actions will occur at the Camp Covington wetlands. A restoration plan will be developed for the Camp Covington wetlands. This action is likely to attract Mariana common moorhen from Fena Reservoir, where habitat has declined in quality. If Camp Covington is deemed unsuitable for wetland enhancement or restoration, the Atantano wetlands will be evaluated for restoration potential.

The DoN will submit a proposal to Chief of Naval Operations N45 to create the Naval Munitions Site Ecological Reserve Area to protect native limestone forest habitats in southern Guam which are recovery habitats for the Mariana crow, Guam Micronesian kingfisher, and Mariana fruit bat (DoN 2010a, p. 125).

The DoN will implement forest enhancement and restoration in the Naval Munitions Site. A minimum of 8.9 ac (3.6 ha) will be restored. Enhancement and restoration will occur in areas contiguous with existing recovery habitats (instead of within) to increase the overall baseline of recovery habitat within southern Guam. Forest enhancement prescriptions and plans will be prepared by a qualified forester/plant ecologist who has knowledge of Guam's forest ecosystems. The goal of the forest enhancement is to increase the habitat suitability for native wildlife species. In savanna areas, forest restoration will include non-native species eradication or control and will establish greenbelts of *Acacia* spp. (e.g., *Acacia confusa*) to fix soil nitrogen,

build soil quality, and limit impact of grass fires to forest areas, extend greenbelts to become continuous forest areas with recovery habitats, under-plant *Acacia* spp. with native species; and reduce *Acacia* spp. after native species are established. In existing native or mixed native forests, enhancement and restoration will incorporate removal of non-native feral mammals (cats, dogs, and ungulates) with the goal of eradication. If eradication is not feasible, control of these animals will be implemented with the goal of suppressing non-native mammals to levels that allow for forest regeneration and self-sustaining populations of native animals. Forest restoration will facilitate recovery of the Guam Micronesian kingfisher, Mariana crow, and the Mariana fruit bat.

The DoN will investigate the feasibility of restoring habitat within the Bolanos Conservation Area. If habitat restoration is determined to be feasible, the DoN may choose to restore habitat such that over the long-term it is restored into recovery habitat. If the DoN decides to implement restoration, they will work with the Service to develop a recovery crediting program (or similar assurances) for the site. These actions, if implemented, will benefit the Mariana common moorhen.

Modification to the Boundary of the FAA Mitigation Area on Tinian

On Tinian, under the proposed action, the DoN proposes to alter the boundaries of the existing FAA Mitigation Area to include some of the largest tracts of limestone forest remaining on the island, and to develop and implement a plan to enhance the native forest within the Mitigation Area. Approximately one half of the original FAA Mitigation Area will be exposed to training-related noise louder than 93 dB as a result of the proposed action.

Two DoN Biologists to Conserve Guam National Wildlife Refuge

Under the proposed action, the DoN will hire two additional DoN biologists to implement conservation and recovery actions on Guam National Wildlife Refuge Overlay lands and ensure conformance with requirements described in this Biological Opinion. The DoN will meet with the Service (Ecological Services and Refuges) at the beginning of the fourth quarter of each fiscal year to review progress and mutually identify priorities and specific actions for the coming fiscal year. This action will contribute significantly to the completion of conservation measures in the Integrated Natural Resources Management Plans, recovery plans, five-year status reviews, Comprehensive Conservation Plans, State Wildlife Plans, or other actions identified as priorities for natural resources management. These actions will facilitate the recovery of the Guam Micronesian kingfisher, Guam rail, Mariana common moorhen, and the Mariana fruit bat.

Funding for Two Service Biologists on Rota

DoN will ensure funding for two biologists on Rota for a 12-year period, beginning in FY11 to conserve the Mariana crow and the Mariana fruit bat. Initially the two biologists will be DoN contractors and as soon as possible DoN will work with Office of Management and Budget to ensure a budget-based transfer is completed to enable the Service to fund two Senior Fish and Wildlife Biologists for the remainder of the 12-year period. Actions will be targeted to on-the-ground recovery actions (or steps needed to prepare for on-the-ground actions). These actions

will strive to reverse recent declines in Mariana crow and Mariana fruit bat numbers on Rota to facilitate the recovery of these species. Conservation of the Mariana crow population on Rota would facilitate future reintroductions of this species to Guam.

Law Enforcement Officers

Under the proposed action, the DoN will hire two DoN Conservation Law Enforcement Officers to increase security on DoN lands and prevent poaching. The DoN will sign a Memorandum of Agreement such that these law enforcement officers can assist Service law enforcement officers (on Guam and all islands within the CNMI) with violations under the Federal, Lacey Act, Migratory Bird Treaty Act, and Convention on International Trade in Endangered Species (CITES). The efforts of these two Conservation Law Enforcement Officers is expected to prevent future impacts of poaching on Mariana fruit bats on DoD lands.

Roving security in the Naval Munitions Site will reduce the likelihood of illegal events (e.g., poaching and illegal fires) occurring on the installation. This action will result in significant reductions in the rate of forest conversion to savanna in the Naval Munitions Site. Conservation of limestone and ravine forest in southern Guam is necessary to ensure the recovery of the Guam Micronesian kingfisher and the Mariana crow.

Research and Monitoring

Under the proposed action, the DoN will fund research to collect demographic information on the Mariana fruit bat in the Marianas Archipelago, including data on age at sexual maturity, survivorship, longevity, frequency of inter-island movements using DNA testing, and evaluate the status of Mariana fruit bat subspecies throughout the species' range. This action will benefit the Mariana fruit bat by filling gaps in our knowledge of fruit bat demography, movements, and phylogeography.

Species-Specific Effects of the Action

Effects of the Action – Guam Micronesian Kingfisher

The Guam Micronesian kingfisher is endemic to Guam and is believed to have been extirpated from the wild in 1988 (Wiles et al. 2003, p. 1354). Currently the captive population consists of approximately 101 individuals in 19 captive rearing facilities (Bahner 2010, pers. comm.). Low productivity in the captive population, incremental habitat loss due to development and wildfires, habitat degradation from feral ungulate browsing and trampling, and predation risk from the brown treesnake are all limiting the re-establishment and recovery of this species in the wild (USFWS 2008a, pp. 16-26).

Habitat Loss and Degradation Due to Project Impacts

As described under Status and Baseline there are approximately 15,822 ac (6,403 ha) and 13,488 ac (5,458 ha) of recovery habitat in northern and southern Guam, respectively, for the Guam Micronesian kingfisher (Figure 18). Approximately 1,520 ac (615 ha) of this recovery habitat in northern Guam and 4 ac (2 ha) in southern Guam will be cleared as a direct result of the proposed action. In addition, approximately 353 ac (143 ha) in northern Guam and 6 ac (2 ha) in southern Guam are expected to be removed due to indirect or induced development impacts of the proposed action. A total of approximately 1,883 ac (762 ha) of Guam Micronesian recovery habiatat will be permanently lost due to the proposed action which will reduce the available habitat for recovery of this species to only 1,158 ac (469 ha) above the minimum required to allow for potential recovery (see Table 10). The proposed action will result in the permanent loss of habitat that could have supported approximately 188 Guam Micronesian kingfisher territorial pairs once other threats are controlled.

To meet recovery goals for the Guam Micronesian kingfisher on Guam, a minimum of 13,134 ac (5,315 ha) are needed in northern Guam and 13,134 ac (5,315 ha) are needed in southern Guam (refer to the Status and Baseline section for additional details). Therefore, after implementation of the proposed project (including interrelated and interdependent effects) we expect there to be enough potential recovery habitat remaining on Guam to support recovery of the Guam Micronesian kingfisher. However, only an estimated 815 ac (330 ha) in northern Guam and 343 ac (139 ha) will remain in southern Guam once project actions are considered. Recovery goals for the Guam Micronesian kingfisher are subject to revision as the recovery plan is being revised currently.

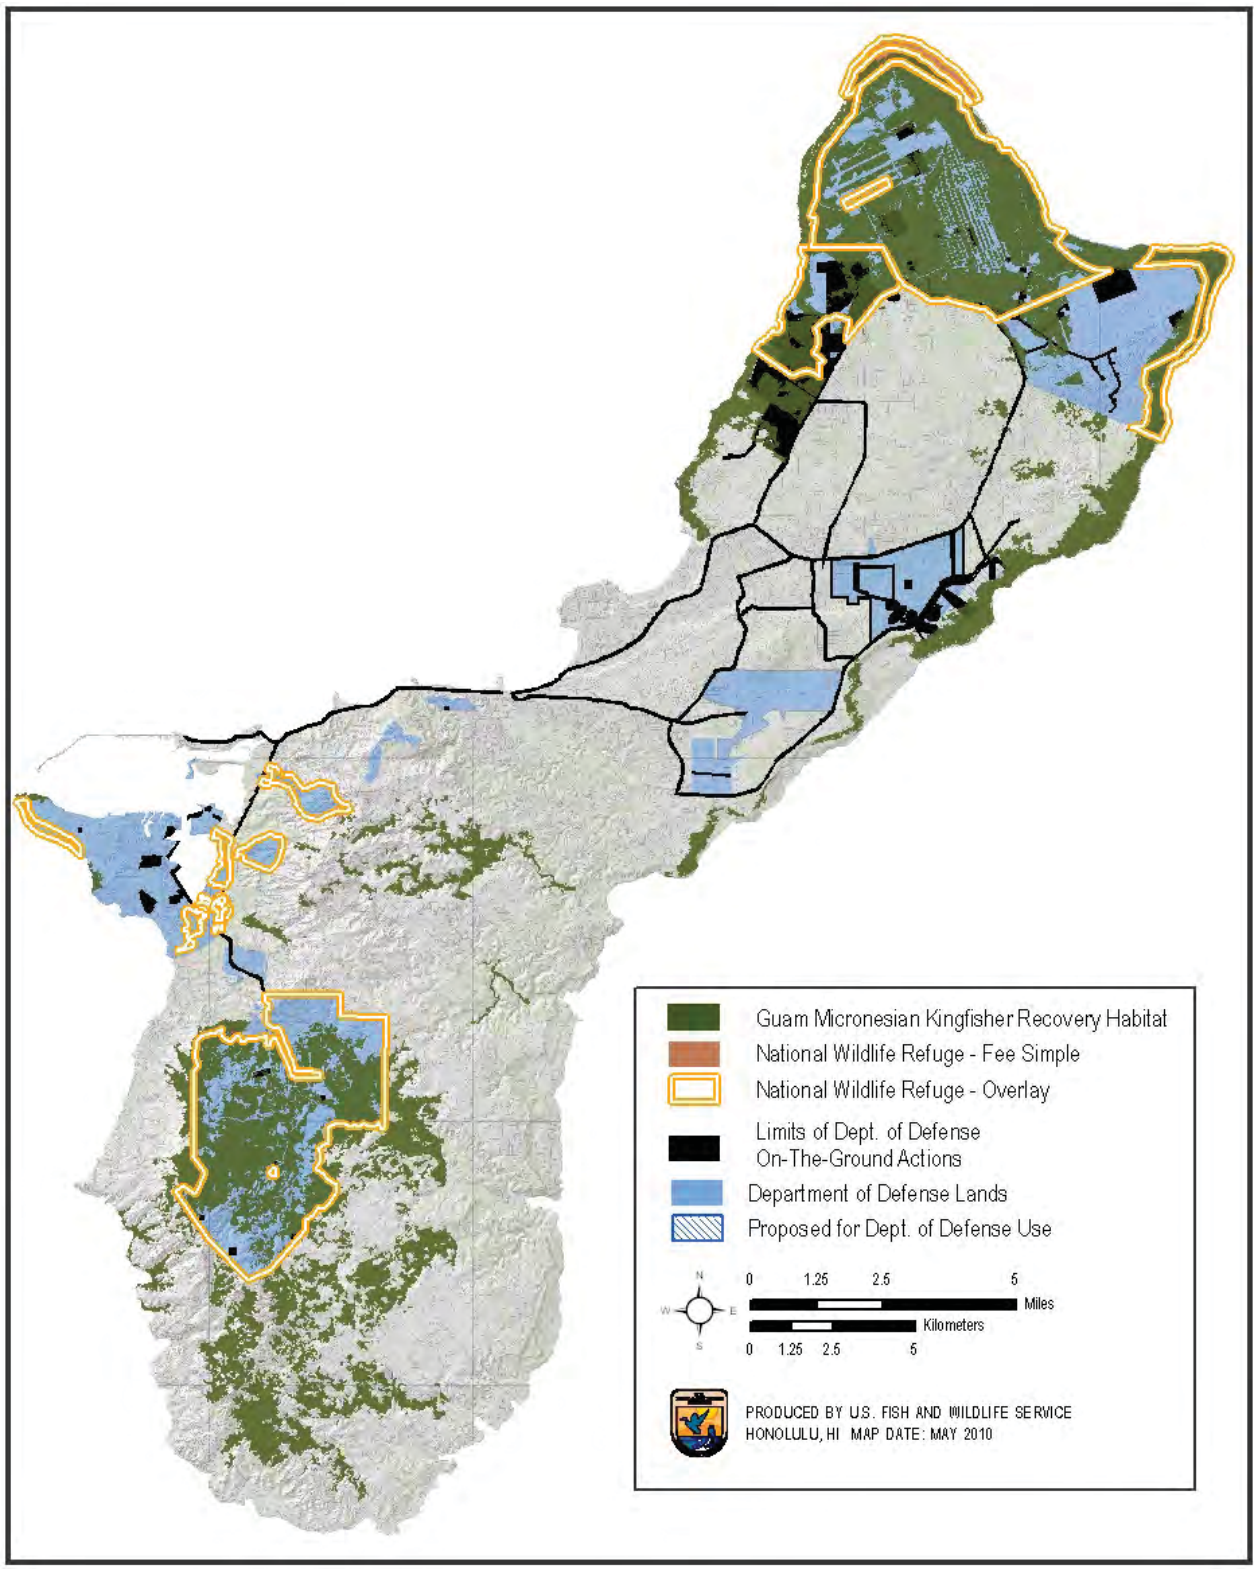

Figure 18. Distribution of recovery habitat for the Guam Micronesian kingfisher.

Impacts of Proposed Action-Related Fires

Because the DoN's fire management plan will be developed to provide guidance and direction to ensure fires do not encroach into recovery habitat for the Guam Micronesian kingfisher, we anticipate that no additional recovery habitat will be lost due to wildfires igniting as a result of project training. Although the DoN's fire management plan may also minimize fire impacts by instituting fire prevention, detection, and suppression programs as well as implementing landscape-level fuel modifications in the Naval Munitions Site, the beneficial effects of this DoN action are difficult to assess because these projects have not been adopted by DoN at this time. DoN helicopters, known to be of great assistance on wildfires elsewhere in the Pacific, may help minimize fire impacts to forest areas and substantially reduce the estimated 37 ac (15 ha) annual rate of recovery habitat loss in southern Guam (detailed in the general Status and Environmental Baseline section above).

Conservation Measures to Benefit the Guam Micronesian Kingfisher

Recovery habitat remaining on DoD lands composes a substantial percentage of the total habitat available for the recovery of the Guam Micronesian kingfisher. The DoN's conservation measures are intended to support reintroduction of native endangered or threatened species on DoD lands on Guam consistent with species recovery plans. In further support of such recovery efforts, the DoN intends to actively participate in recovery committees for endangered or threatened species on Guam. The DoN will work with the Service to develop a reintroduction plan and supporting programmatic biological opinion that ensures such reintroduction efforts are consistent with the species recovery plans and the military mission on Guam. The reintroduction plan will include long-term criteria for initiating the reintroduction of endangered and threatened species on DoN lands.

Under the proposed action the DoN has committed to provide sustained funding for the development of methods to eradicate or significantly suppress brown treesnakes island-wide to facilitate the recovery of listed species on Guam (see General Effects section). If successful, landscape-level implementation of brown treesnake suppression on DoN and other lands will facilitate reintroduction of the Guam Micronesian kingfisher by reducing brown treesnake numbers. This in turn is expected to reduce nest predation and mortality of juveniles and adult kingfishers which is essential to the successful reestablishment of the Guam Micronesian kingfisher on Guam.

In addition, the DoN has proposed the following habitat management and protection measures (see General Effects section): (1) create four Ecological Reserve Areas; (2) enhance forests on the Naval Munitions Site using ungulate suppression and *Acacia* spp. greenbelts; (3) prepare and implement an ungulate management plan for DoN-managed lands; and (4) create unidentified conservation areas that adjoin conservation areas identified for protection by the Air Force under the ISR Strike Biological Opinion (DoN 2010a, pp. 125-131). The Ecological Reserve Areas include potential Guam Micronesian kingfisher habitat and may provide some protection to these areas. The expanded Anao Conservation Area includes potential recovery habitat for the Guam Micronesian kingfisher and, if protected and managed, could provide some benefit to the species. The additional conservation areas on Andersen Air Force Base could be beneficial; however,

their location and management objectives have not been identified so potential benefit to the kingfisher cannot be assessed at this time. Finally, the enhancement of forests and conversion of savannah areas to *Acacia* on the Naval Munitions Site may provide some benefit to the kingfisher by reducing fire impacts to remaining recovery habitat and moving toward restoration of recovery habitat for this species. The DoN has proposed to restore or enhance a minimum of 8.9 ac (3.6 ha) of forest within the Naval Munitions Site. However, the full extent of this benefit cannot be assessed because the DoN has not identified the additional amount of forest to be managed. We therefore conclude that there may be some benefit to existing kingfisher habitat through these conservation measures but we cannot assess the extent to which new habitat will be created.

Finally, the DoN will also fund the development and implementation of a Guam Micronesian kingfisher introduction plan(s) to islands other than Guam (see General Effects). The overall goal of the action is to develop self-sustaining wild population(s) that will complement captive populations currently in zoological institutions, and buffer captive and other wild populations against stochastic events in the interim and allow for "wild" individuals to be reintroduced to Guam if and when native ecosystems on Guam are restored to support a viable population. If successful (i.e., appropriate islands are identified, associated governments approve of the release, and the releases are successful), this action is expected to improve the status of the species and bring it closer to recovery.

Summary

The Guam Micronesian kingfisher is currently extirpated from the wild, therefore no take is expected as a result of the action. However, we have determined that the proposed project will adversely affect the Guam Micronesian kingfisher by removing areas of recovery habitat which, in the absence of the project, would have remained intact to provide for the feeding, breeding, and sheltering of this species. The amount of habitat remaining after completion of the proposed project will be above the minimum threshold currently estimated to be necessary for the recovery of the species on Guam.

The DoN's proposed habitat management and protection measures will help protect and enhance some of the available Guam Micronesian kingfisher habitat on DoD and Government of Guam lands. The DoN's development and implementation of landscape-level brown treesnake eradication/control measures will be beneficial to the Guam Micronesian kingfisher because in the absence of this action, the recovery habitat is not in a suitable condition to support the reintroduction and survival of the species because of the abundance of the brown treesnake.

Once the DoN develops and implements landscape-level brown treesnake suppression, and works with the Service to develop a reintroduction plan, the substantial percentage of Guam Micronesian kingfisher recovery habitat remaining on Navy lands will be available for the reintroduction of the Guam Micronesian kingfisher. Additionally, the establishment of a wild kingfisher population outside of Guam will help safeguard the species and provide wild kingfishers for release on Guam.

Effects of the Action – Guam Rail

The Guam rail was once distributed throughout Guam, but significant population declines, resulting primarily from habitat loss and predation by the brown treesnake and feral cats, resulted in their extirpation from Guam by 1987 (Wiles et al. 1995, p. 38). The Guam rail is now found only in captivity and in one experimental population on Rota consisting of between 60 to 80 birds (Wenninger 2008, pers. comm.). The Rota population is a designated non-essential experimental population under section 10 of the Act. As of June 2008, there were approximately 158 Guam rail in captivity on Guam and in mainland zoological institutions (USFWS 2008b, p. 5). Because the Guam rail is extirpated from the wild on Guam, no adverse effects to individual rails are expected to be caused by the proposed action.

Recovery of the species on Guam will depend on the re-establishment of a wild population on Guam and sufficient habitat to support a recovered population, as summarized in the Status and Baseline section. Project impacts to recovery habitat, effects of brown treesnake introduction to Rota, and beneficial effects of project conservation measures are detailed below.

Habitat Loss and Degradation Caused by the Proposed Action

There are approximately 24,698 ac (9,995 ha) and 24,886 ac (10,063 ha) of recovery habitat in northern and southern Guam, respectively, for the Guam rail. Approximately 1,219 ac (493 ha) of potential recovery habitat in northern Guam and 98 ac (40 ha) in southern Guam will be developed within the project vegetation clearing footprint as a direct result of the proposed action (Figure 19).

In addition, approximately 1,795 ac (726 ha) of Guam rail recovery habitat in northern Guam and 550 ac (223 ha) in southern Guam are expected to be cleared through indirect or induced development impacts of the action. Therefore, there will be 21,684 ac (8,775 ha) of potential recovery habitat in northern Guam and 24,218 ac (9,801 ha) in southern Guam remaining after implementation of the proposed project. As detailed in the Status and Baseline for the Guam rail, it is estimated that 8,236 ac (3,333 ha) of recovery habitat is necessary on Guam to support Guam rail populations needed to meet downlisting criteria and an estimated minimum of 41,184 ac (16,668 ha) of recovery habitat must be conserved on Guam to enable the recovery of the Guam rail. After implementation of development directly and indirectly related to the proposed project, there will be 4,718 ac (1,908 ha) of recovery habitat on Guam beyond that which is minimally necessary to support the minimum Guam rail population size required to meet recovery goals. Therefore, after implementation of the proposed project (including interrelated and interdependent actions) there will be enough potential recovery habitat remaining on Guam to support recovery of the Guam rail. Recovery goals for the Guam rail are subject to revision as the recovery plan is being revised currently.

Because the Guam rail utilizes shrubby vegetation and edges, fires caused by training in the vicinity of the Andersen South and Route 15 Range Complex and other training areas are not expected to result in loss of habitat for the Guam rail.

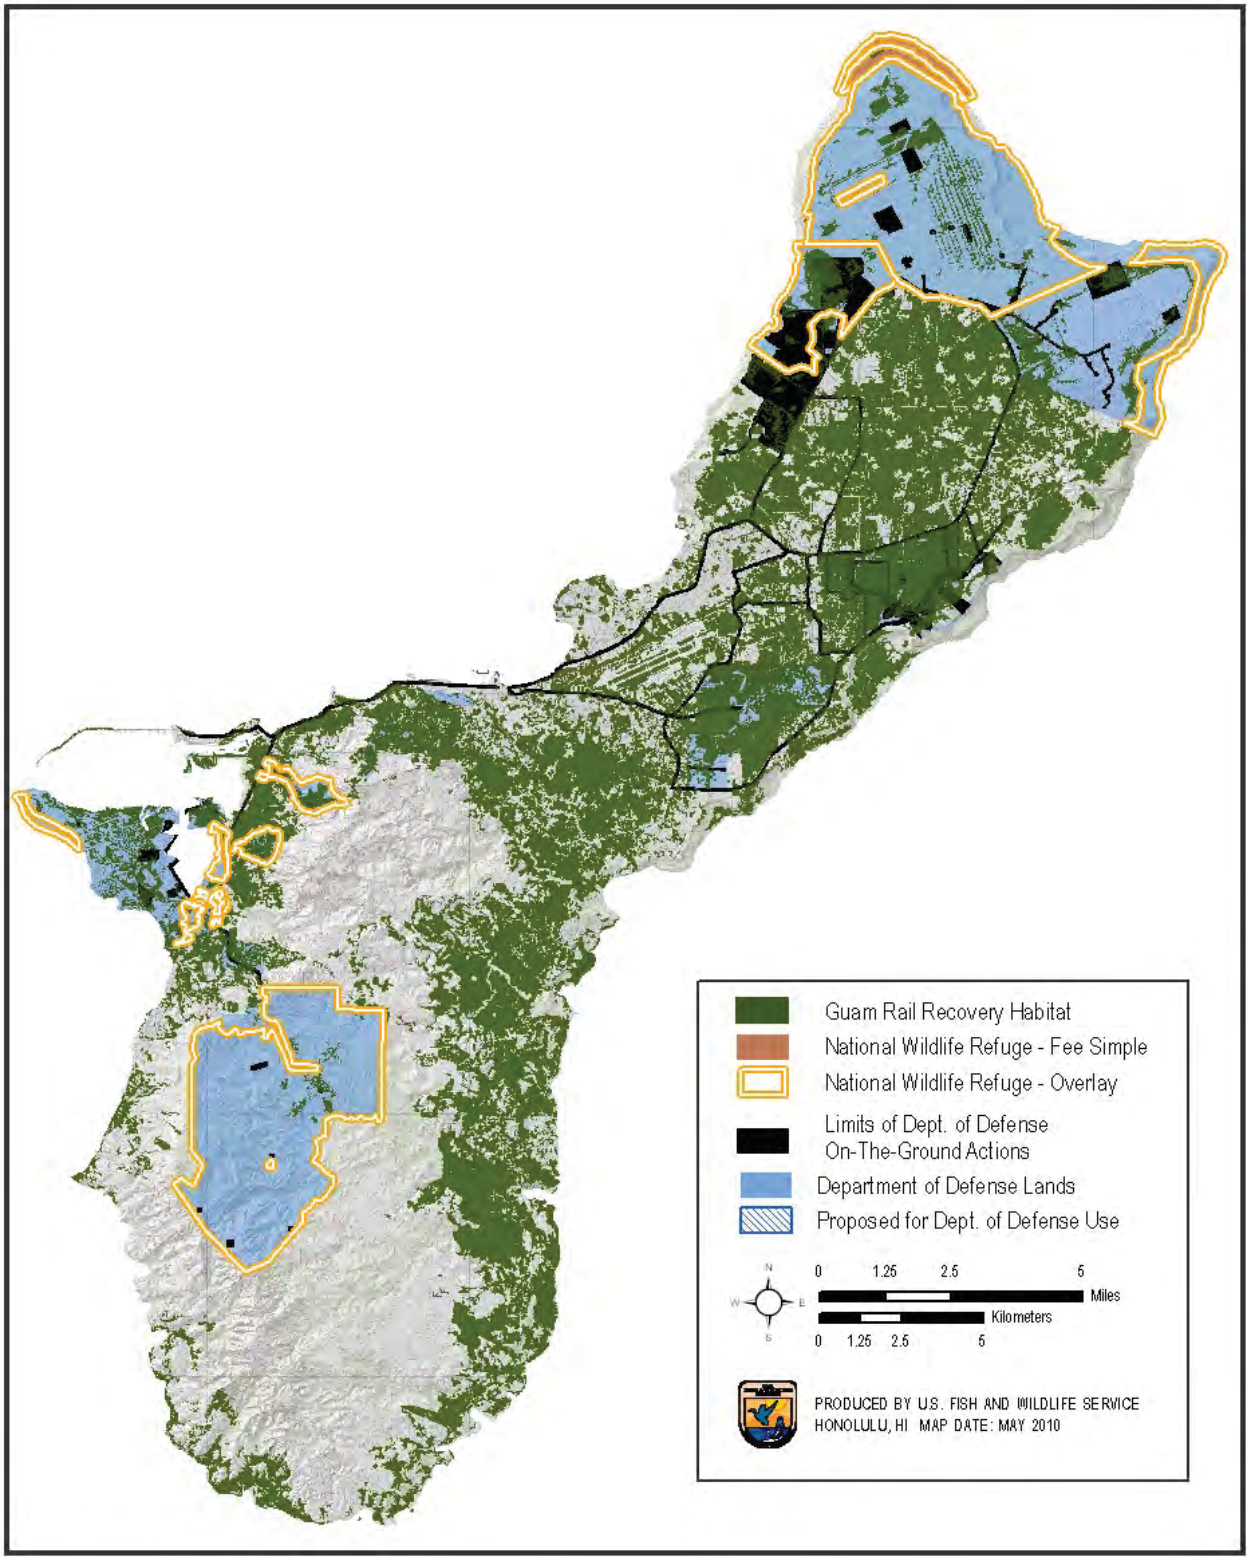

Figure 19. Distribution of Guam rail recovery habitat.

Conservation Measures to Benefit the Guam Rail

Recovery habitat remaining on DoD lands comprises a substantial percentage of the total habitat available for the recovery of the Guam rail. The DoN's proposed conservation measures are intended to support reintroduction of native endangered or threatened species on DoD lands on Guam consistent with species recovery plans. In further support of such recovery efforts, the DoN intends to actively participate in recovery committees for endangered or threatened species on Guam.

The DoN has committed to provide sustained funding throughout the construction phase of the project for the development of methods to eradicate or significantly suppress brown treesnakes island-wide to facilitate the recovery of listed species on Guam. If successful, landscape-level implementation of brown treesnake suppression on DoD and other lands will facilitate reintroduction of the Guam rail. This in turn is expected to reduce the rate of nest predation and adult bird mortality.

In addition, the DoN has proposed the following habitat management and protection measures under the proposed project: (1) submission of proposals to create four Ecological Reserve Areas; (2) finalize and implement an ungulate management plan for DoN-managed lands; and (3) hire two additional Overlay Refuge biologists to implement conservation and recovery actions on Guam National Wildlife Refuge Overlay lands in addition to two Conservation Law Enforcement Officers to increase security on DoN lands and prevent poaching. The Ecological Reserve Areas include potential Guam rail habitat and may provide some benefit to the species. The objective of the Ungulate Management Plan (in progress) is to improve habitat quality for special status species including the Guam rail. Improvement of Guam rail habitat will have long-term benefits for this species.

Summary

Although the proposed action will result in a permanent loss of available habitat for Guam rails on Guam, there will still remain an adequate amount of habitat to provide for recovery of the species. The DoN's proposed increased ungulate management, habitat management and protection of 2,929 acres (four Ecological Reserve Areas and a cooperative conservation agreement with the Government of Guam at Anao) of native vegetation may help protect and enhance some of the available Guam rail habitat on DoD and Government of Guam lands. The proposed conservation facilities at Finegayan will increase public awareness of the conservation needs of this species and will therefore provide a conservation benefit to the Guam rail and its habitat. In addition, the two additional Overlay Refuge biologists funded by DoN will implement conservation and recovery actions on Guam National Wildlife Refuge Overlay lands and the two Conservation Law Enforcement Officers hired by DoN will increase security on DoN lands and prevent poaching. The DoN's development and implementation of brown treesnake eradication and control measures coupled with their biosecurity program to eradicate incipient populations of invasive species will facilitate the potential reintroduction of the Guam rail to DoD and non-DoD lands on Guam.

Effects of the Action - Mariana Common Moorhen

Most recent survey information indicates there are approximately 90 Mariana common moorhens on Guam, 154 birds on Saipan, 41 individuals on Tinian, and only two individuals on Rota (Takano and Haig 2004a, p. 247). The number of Mariana common moorhens has declined at Fena Reservoir on Guam since these surveys were conducted due to habitat degradation resulting from eutrophication thought to have resulted from a typhoon (A. Brooke, pers. comm., U.S. Navy, 2007). The number of Mariana common moorhens at Lake Hagoi on Tinian has varied (Vogt 2008, p. 3), but the number of birds at that site appears to be declining (Engbring et al. 1986, pp. 121-122, Stinson et al. 1991, p. 41, Takano 2003, p. 70, Takano and Haig 2004a, pp. 246-247). All Mariana common moorhen populations are threatened by habitat loss and degradation, predation by introduced predators, human disturbance, and stochastic disturbances. Recovery of the species will require wetland restoration, predator control, and implementation of other coordinated conservation measures.

Habitat Loss and Degradation Caused by the Proposed Action

Under the proposed action, conservation measures will be implemented to minimize the impacts of project construction and training to wetlands on Guam and Tinian. To minimize the likelihood the proposed action will result in the introduction and establishment of invasive species, which may further reduce the quality of Mariana common moorhen habitat, the DoN will implement the Micronesia Biosecurity Plan, invasive species monitoring, and rapid response efforts.

Conservation measures have also been incorporated into construction actions to minimize impacts to wetlands. Although road and bridge improvements will occur in the vicinity of the Atantano wetlands, which serve as secondary recovery habitat for the Mariana common moorhen, preconstruction surveys by a qualified biologist will be completed to ensure impacts to nesting Mariana common moorhen are avoided. Road and bridge work (see Figure 1) will also be designed such that permanent impacts that would make the habitat unsuitable for recovery of the Mariana common moorhen do not occur up- or downstream of the road and bridge work. No construction or training actions related to the proposed project will occur at the Camp Covington wetlands. The DoN has committed to designing project-related retention ponds and stormwater collection areas to ensure these water bodies do not attract Mariana common moorhen. None of the other construction project areas associated with the proposed action on Guam currently support wetland habitat used by the Mariana common moorhen. Civilian development may result in reductions in the distribution and quality of wetlands in the CNMI used by this species. Changes in hydrology resulting from future increases in Guam's human population may reduce water levels in wetlands utilized by the Mariana common moorhen. Runoff from developed areas may result in decreases in the abundance of food for the Mariana common moorhen.

The vegetation clearing project footprint on Tinian does not overlap with Lake Hagoi or Magpo. However, the proposed construction, operation, and maintenance of the platoon battle course will occur near the Bateha wetland system, which is known to support the Mariana common moorhen (DoN 2010a, p. 180). The Bateha Wetland was surveyed nine times between August 1994 and May 1995. A single moorhen was visually recorded in October, and a total of three audio

detections were recording during two separate surveys in November. In December, one subadult was also recorded at this wetland. Based on these surveys, the Service conservatively estimated the number of moorhens using the Bateha Wetland to be no more than four birds (USFWS 1996, p. 6). Surveys conducted in 2003 did not detect Mariana common moorhen at the Bateha Wetland (USGS 2003, p. 66). The DoN has proposed to either build the range during the dry season to avoid disturbance to nesting Mariana common moorhens at the Bateha wetlands or, if nesting Mariana common moorhen are present, to postpone clearing and construction until the chicks have fledged. The Biological Assessment for the proposed action indicates that 0.3 ac (0.1 ha) of the platoon battle coarse will be constructed in an area previously mapped as a wetland. After additional investigation, the depressions were determined to be sinks rather than seasonal wetlands and no wetland vegetation or soils were present. The DoN will work with planners to avoid sighting the footprint of the platoon battle course within wetland areas. Range construction will entail clearing and grubbing and these depressions be filled. No Mariana common moorhen habitat will occur within the range footprints after construction. The range footprint areas will be mowed, herbicided, or otherwise treated and will be unsuitable for Mariana common moorhen use. Earthen backstops around the firing ranges and targets will minimize the introduction of lead and other ammunition components into waterbird habitat. Range maintenance will include sifting soil to remove lead and other contaminants.

The DoN will terminate cattle grazing leases within the footprint of the new range complex on Tinian and will work with CNMI representatives to minimize relocation of the leases into areas serving as habitat for listed species.

Noise Impacts Associated with Increased Training Activities

New aviation training, including low-level helicopter flights will occur at the Naval Munitions Site, south of Fena Reservoir, Talafofo, and Ugum River basins. As detailed in the General Effects section above, noise from helicopter and fixed-wing overflights may mask predator approaches and mating calls or startle birds and cause them to flush. Overflights at low-levels may also result in bird aircraft strike impacts. To avoid noise impacts and aircraft strike risks to the Mariana common moorhen, all aviation training will be conducted such that flights approach the southern portion of the Naval Munitions Site over the Talafofo River watershed and Fena Reservoir at heights of 1,000 ft (305 m) or greater above ground level. Flights may go up the Ugum River at altitudes of 1,000 ft (305 m) or greater above ground level until they reach 9,843 ft (3,000 m) from the mouth of the river at Highway 4 and south of this point flights may conduct low-level terrain flights. Low-level training flights (DoN 2010a, p. 54) will be restricted to the southernmost portion of the Naval Munitions Site (DoN 2010a, p. 35) where the Mariana common moorhen is not commonly present.

On Tinian, noise levels over Lake Hagoi resulting from small arms training are not expected to exceed 60 dB (see Figure 17 in the General Effects section), however, portions of the Bateha wetlands system are close enough to the training ranges that they will be exposed to noise louder than 60 dB. This noise from firing range training may mask Mariana common moorhen mating calls and may startle or alarm the birds and cause them to minimize their use of the sinks in the training range vicinity. Birds exposed to training-related noise would be likely to shelter in dense vegetation or disperse to less disturbed areas such as Lake Hagoi. Mariana common

moorhens have been documented to halt vocalizations during routine overflights (estimated height of 800 to 1000 ft; 244 to 305 m above ground level) of small airplanes above Lake Hagoi (USFWS 1996, p. 9). Conversely, the moorhens have increased vocalizations, including loud shrieks and honks in response to gun shots (USFWS 1996, p. 9). Neither of these responses appears to have resulted in changes to breeding or alteration of predation rates (Vogt 2008, pp. 2-5). Furthermore, breeding has not been observed in the small wetlands adjacent to the proposed firing range location, so we do not anticipate breeding would be affected by the proposed action. Because the number of Mariana common moorhen on Tinian is low, habitat is not currently limiting their reproductive success or survival on the island. However, because they are seasonal wetlands lacking fish, the Bateha wetlands have a higher quality and quantity of food than Lake Hagoi. Because the noise associated with the proposed action will result in reduced Mariana common moorhen use of the high quality foraging area, the effects of the project constitute a significant disruption of their feeding.

Conservation Measures on Guam

Ungulates severely degrade wetland habitat and brown treesnake predation reduces reproductive success of the Mariana common moorhen so measures to reduce ungulate access to wetlands and measures to suppress the brown treesnake will benefit the Mariana moorhen. DoD's preparation and implementation of a Navy Joint Region Marianas ungulate management plan for the control and potential eradication of ungulates on lands managed by Naval Facilities Marianas on Guam and DoN development and implementation of installation- and landscape-level brown treesnake suppression on Guam will be beneficial to the Mariana common moorhen. To further benefit the Mariana common moorhen, the DoN will enhance or restore habitats at the Camp Covington wetlands and may restore habitat at the Atantano wetlands as well.

Summary

The DoN has incorporated measures to minimize project construction and training impacts to Mariana common moorhen habitat on Guam and Tinian. DoD measures to minimize the spread of invasive species and to control ungulates will result in improvements to the quality of Mariana common moorhen habitat on Guam. DoD efforts to minimize ungulate impacts and to develop measures to complete landscape-level brown treesnake suppression will also be beneficial to the Mariana common moorhen on Guam. Construction and live-fire training at Tinian ranges will expose the Bateha wetlands system to noise levels above 60 dB. The Bateha wetlands are richer in food sources than Tinain's Lake Hagoi because the seasonal wetlands lack fish, which compete with the moorhen for food. Although surveys indicate only four or fewer Mariana common moorhen are found at the Bateha wetlands, the noise associated with the proposed action will result in reduced Mariana common moorhen use of the high quality foraging area, constituting a significant disruption of their feeding. Mariana common moorhen is not known to breed in these seasonal wetlands. Changes in reproduction and survival of the Mariana common moorhen are not expected to result due to implementation of the proposed action.

Effects of the Action – Mariana Crow

Historically, Mariana crows were considered relatively common and widely distributed on Rota (Pratt et al. 1979, p. 234) and Guam (Baker 1951, p. 246). Currently, as a result of habitat loss, hunting, and predator impacts, only approximately 60 breeding pairs and 24 non-breeding individuals occur on Rota and two male individuals remain on Guam (refer to the Status and Baseline section). Recovery goals include the establishment of at least three stable populations consisting of a minimum of 75 territorial pairs at each of three sites: Rota, northern Guam, and southern Guam.

The populations are threatened by habitat loss and degradation (caused by humans, cyclones, and wildfire, and other disturbances), predation by introduced species, human persecution, and stochastic and genetic affects caused by a small population. On Guam, the Mariana crow is threatened by brown treesnake predation, habitat loss and degradation, and the inability of the remaining crows to find mates and reproduce. Juvenile crows are particularly susceptible to the brown tree snake because they feed on the forest floor. In addition, recovery of the species on Guam requires that additional individuals be re-introduced to the island, and that sufficient habitat (with no brown treesnakes) is available to support a recovered population. The ability to translocate Mariana crows on military land in the future is essential for the recovery and survival of the species.

<u>Habitat Loss and Degradation Caused by the Proposed Action</u>

Guam's two remaining Mariana crows are likely to forage within areas mapped for project footprint development (Schwagerl pers. comm. 2010). The DoN will conduct surveys for listed species one week prior to the clearing of vegetation to ensure no crows are in the area. Because the crow population is so low, adequate habitat for these two birds occurs outside the project footprint (as detailed below). Therefore, the loss of foraging habitat within their home range is not expected to adversely affect these individuals.

As described in the Status and Baseline section above, there is approximately 26,650 ac (10,785 ha) of recovery habitat on Guam for the Mariana crow. Approximately 14,831 ac (6,002 ha) of Mariana crow recovery habitat remains in northern Guam and 11,819 ac (4783 ha) of recovery habitat occurs in southern Guam. The proposed project footprint will result in the clearing of 1,518 ac (614 ha) of Mariana crow recovery habitat in northern Guam and 4 ac (2 ha) in southern Guam, for a total of 1,522 ac (616 ha) of recovery habitat loss (Figure 20, see Table 10). Indirect development resulting from the proposed project will result in the permanent loss of 313 ac (127 ha) of recovery habitat in northern Guam and 6 ac (2 ha) in southern Guam.

We calculate there will be 13,001 ac (5,261 ha) in northern Guam and 11,810 ac (4,779 ha) in southern Guam for a total of 24,802 ac (10,037 ha) of Mariana crow recovery habitat remaining on Guam after implementation of the proposed action and the civilian development occurring as a result of the action (see Table 10). The project will have resulted in the permanent loss of approximately approximately 12% of current Mariana crow recovery habitat in northern Guam and less than one percent in southern Guam. The acreage lost as a result of the project will total

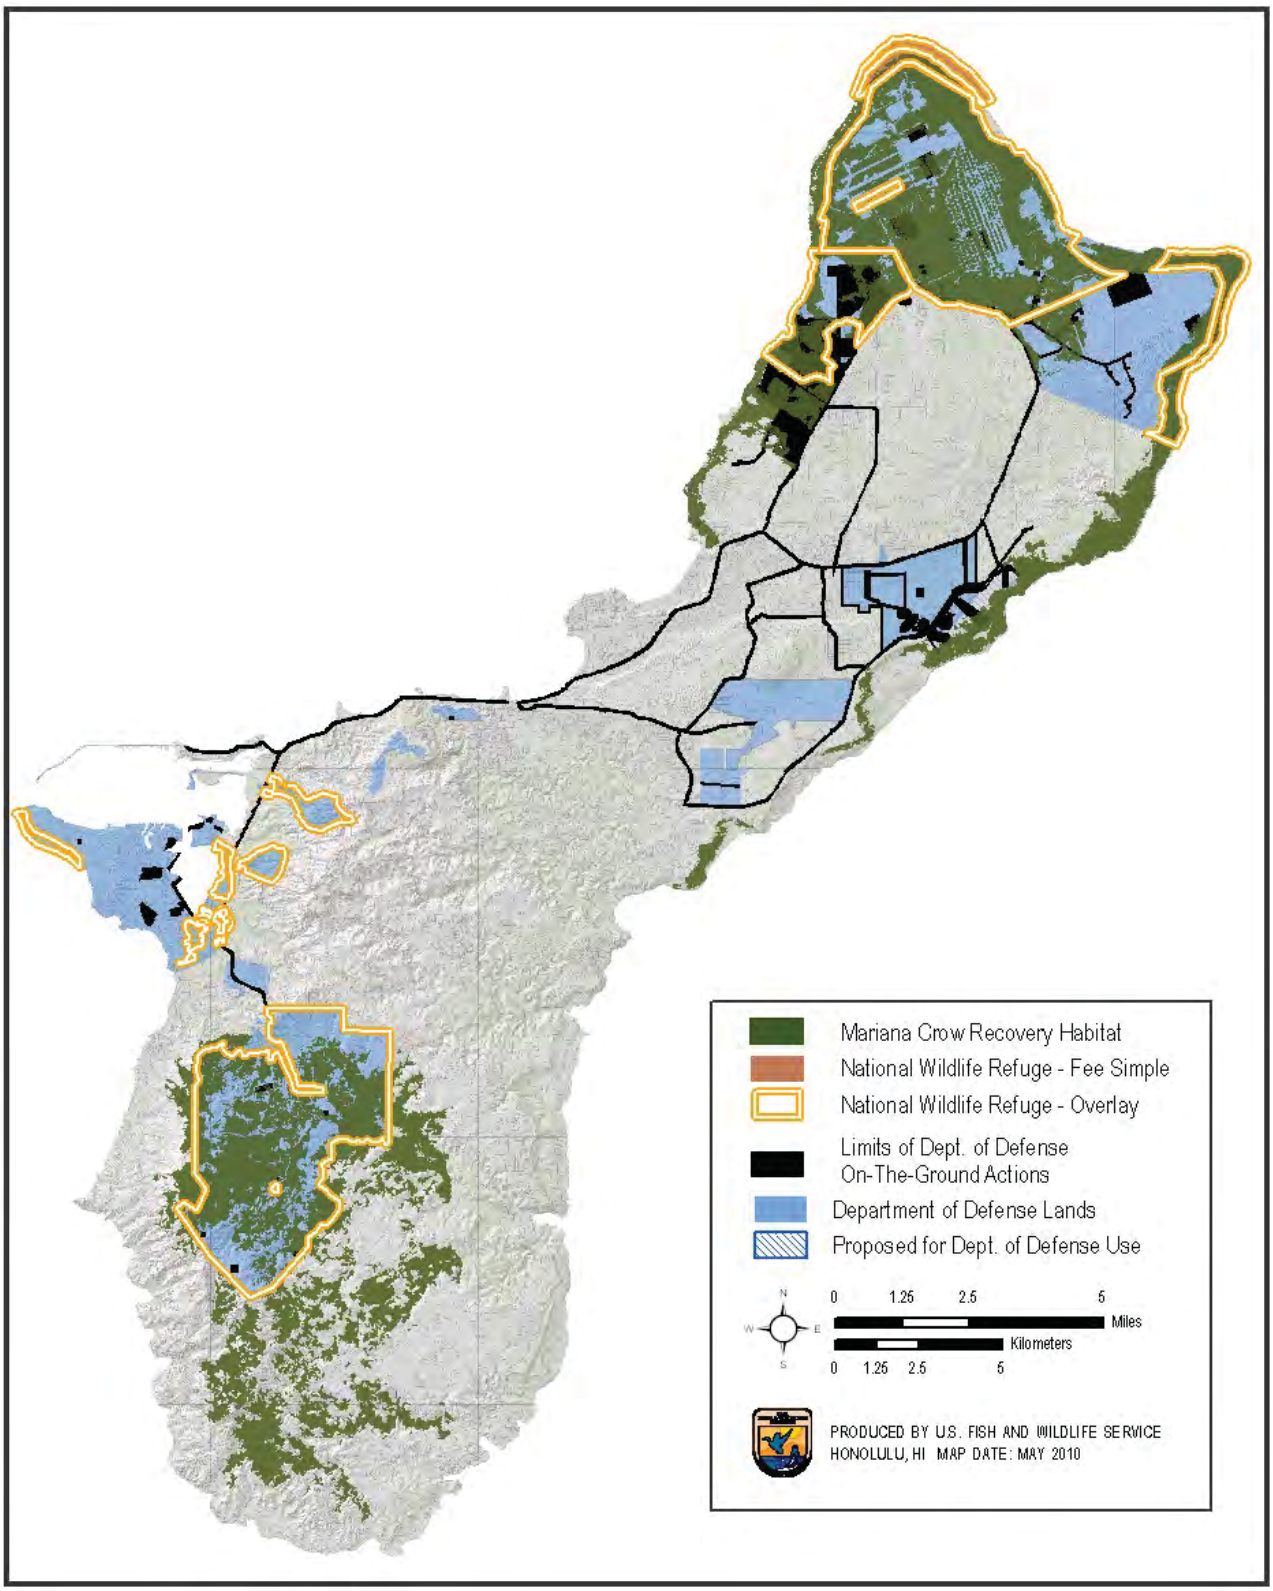

Figure 20. Distribution of Mariana crow recovery habitat on Guam.

approximately 1,841 ac (745 ha) of recovery habitat that could have supported approximately 50 territorial Mariana crow pairs. This action will reduce the available habitat for recovery of the species to only 9,885 ac (4,000 ha) above the minimum required to allow for potential recovery. After project-related development is completed, there will be only 5,538 ac (2,241 ha) of recovery habitat remaining in northern Guam above that necessary to support the minimum number of Mariana crows needed to recovery the species. In southern Guam, completion of project-related development will result in only approximately 4,347 ac (1,759 ha) of available recovery habitat above the minimum needed to support the population size required just to meet recovery goals. Recovery goals for the Mariana crow are subject to revision as the recovery plan is being revised currently.

Noise Impacts Associated with Increased Training Activities on Guam

Noise associated with baseline aircraft operations at Andersen Air Force Base currently extends over areas that contain suitable nesting and foraging habitat for the Mariana crow. Under the proposed action, the total area of Mariana crow habitat on Guam would be subjected to an approximately 30% increase in the frequency of noise levels greater than 60 dB. The majority of this increase would occur within the 60-70 dB noise contours and it would be generated by Marine Corps F/A-18D jet aircraft in the vicinity of Andersen Air Force Base runways.

A general description of physiological and behavioral impacts of noise to wildlife is presented in the "General Effects" section above. Morton (1996, p. 81) conducted a study on the potential impact of aircraft overflights on Mariana crows from 1994 to 1995. He found no evidence that aircraft overflights contributed directly to nest abandonment or nest failure during the study. In fact, one nest was constructed within 1 km (0.6 mi) of the north runway during a large aircraft training exercise (Tandem Thrust). However, Morton (1996, p. 61) did report three observations of Mariana crows reacting to aircraft. One observation was of alarm calling and an increase in vigilant, alert, and standing behavior from an adult attending a nest after an unknown aircraft (76-92 dBA, > 1,000 ft (305 m) above ground level) flew over the nest. Another observation was of a Mariana crow returning to a nest while an unidentified cargo aircraft flew overhead. The adult remained standing at the nest and alarm calling for the duration of the overflight (approximately two minutes). No sound levels or altitude was reported for the aircraft. The final observation was of a pair of Mariana crows responding to six F-16s and four KC-135s (≤ 86 dBA, no altitude reported) departing the base. The pair was observed alarm calling and flying for 12 minutes after the overflights. In addition to these observations, Morton (1996, pp. 60-61) also summarized previous observations of Mariana crow and aircraft interactions by other biologists on Guam. The most severe of these interactions was a pair leaving their nest several times in response to a helicopter flying less than or equal to 400 ft (120 m) above the ground. Other observations also included adults flushing from the nest and leaving eggs unattended. In general, the observations of Mariana crows flushing from nests were all due to aircraft below 1,000 ft (305 m) above the ground (Morton 1996, p. 61). Mariana crows reacting to aircraft by alarm calling and other minor behaviors occurred when aircraft were above this elevation. Recent studies on reproductive success of the Mariana crow on Rota indicate that noise and human disturbance may play a more prominent role in nest failure and therefore the decline of the species than these previous studies indicated (J. Ha, pers. comm. 2010).

The DoD's proposed conservation measures require that no helicopter or fixed-wing aircraft fly below 1,000 ft (305 m) above Munitions Storage Area 1 and that no helicopters fly below 1,000 ft (305 m) above the ground over the areas north of the south runway at Northwest Field of Andersen Air Force Base. The proposed action will increase the frequency and duration of aircraft noise on Guam and the increased noise may affect the behaviors of Mariana crows in the area. However, we do not expect that these affects will significantly affect the reproductive success or survival of the two male crows in the action area. We do not expect these male crows to breed. Therefore, avoidance behaviors and alarm calling associated with low flying aircraft are not expected within the areas currently utilized by crows. Alarm behaviors were noted for aircraft above 1,000 ft (305 m), however, we expect that these behaviors will only have temporary impacts on the foraging, roosting, and sheltering behaviors and will not result in harm for the two male crows. At this time, we do not have enough information regarding noise impacts to the Mariana crow to assess noise impacts to the suitability of Mariana crow recovery habitat.

Fire Impacts to Mariana Crow Habitat on Guam

Because the Fire Management Plan will be developed to provide guidance and direction to ensure fires do not encroach into recovery habitat for the Mariana crow, we anticipate that no additional recovery habitat will be lost due to wildfires igniting as a result of project training. Although the DoN's fire management plan may also minimize fire impacts by instituting fire prevention, detection, and suppression programs as well as implementing landscape-level fuel modifications in the Naval Munitions Site, the beneficial effects of this DoN action are difficult to assess because these projects have not been adopted by DoN at this time. Landscape-level DoN actions (such as fire suppression support by large DoN helicopters) may substantially reduce the estimated 37 ac (15 ha) annual rate of recovery habitat loss in southern Guam (see "General Effects" section above).

Project Conservation Measures to Benefit the Mariana Crow

The DoN's proposed increased ungulate management, forest habitat restoration and protection of 2,929 acres (four Ecological Reserve Areas and a cooperative conservation agreement with the Government of Guam at Anao) of native vegetation will help protect and enhance some of the available Mariana crow habitat on DoD and Government of Guam lands. The proposed conservation facilities at Finegayan will increase public awareness of the species and will help minimize human impacts to the Mariana crow and its habitat. In addition, DoN is proposing to hire two additional Overlay Refuge biologists to implement conservation and recovery actions on Guam National Wildlife Refuge Overlay lands and two Conservation Law Enforcement Officers to increase security on DoN lands and prevent poaching. The DoN's development and implementation of brown treesnake eradication and control measures coupled with a biosecurity program to suppress/eradicate incipient populations of invasive species as well as respond to new invasions will facilitate the potential reintroduction of the Mariana crow to DoD lands on Guam. In addition, by assuring 12-years of funding for two biologists on Rota the DoN's action will be very beneficial to the Mariana crow on Rota in addition to increasing the likelihood this population will be conserved to serve as a source for future reintroductions of this species to Guam.

Summary

The proposed action will adversely affect the Mariana crow by permanently clearing areas of recovery habitat which, in the absence of the project, would have remained intact to provide for the feeding, breeding, and sheltering of this species. Following completion of the proposed action, there will be a minimally adequate amount of habitat remaining for the recovery of the species on Guam. The best available information indicates project-related noise will not further reduce the amount of recovery habitat suitable for this species' breeding, feeding and sheltering. The DoN's proposed habitat management and protection measures could help protect and enhance some of the available Mariana crow habitat on DoD and Government of Guam lands. The DoN's development and implementation of landscape-level brown treesnake eradication/control measures will be beneficial to the Mariana crow because in the absence of this action, the recovery habitat is not in a suitable condition to support the survival of the species due to current snake abundance on Guam. Once the DoN develops and implements landscape-level brown treesnake suppression program, and works with the Service to develop a reintroduction plan, a substantial percentage of recovery habitat remaining on DoN lands will be available for the reintroduction of the Mariana crow on Guam. By ensuring 12 years of funding for two biologists on Rota, the DoN will contribute to the conservation of an important Mariana crow population.

Effects of the Action – Mariana Fruit Bat

Of the estimated 6,610 to 6,930 total Mariana fruit bat individuals, fewer than 20 occur on Guam (Brooke, 2010 pers. comm.; Boland 2009, pers. comm.; Brooke 2008, p. 1 and references cited therein; Brooke 2009, p. 1; CNMI Division of Fish and Wildlife 2000b, p. 4; CNMI Division of Fish and Wildlife 2000c, p. 35; Johnson 2001, p. 19; DoN 2009, p. 89; Wiles and Johnson 2004, p. 585). The low and declining number of bats on Guam are threatened by brown treesnake predation on non-volant juveniles, habitat loss and degradation of native forests, hunting, and noise and other human disturbance (USFWS 2009b).

The island of Tinian, albeit seldom used by fruit bats currently, provides roosting and foraging habitat important for connectivity of fruit bat populations among the southern islands in the Marianas. The chief threats to Mariana fruit bats on Tinian are the loss and degradation of native forests (on which transient bats depend for roosting and foraging), hunting, and military training and other human activities that could harass bats roosting on the island or preclude them from roosting (USFWS 2009b).

The recovery criteria in the "Draft Revised Recovery Plan for the Mariana Fruit Bat or Fanihi" (USFWS 2009b) indicate that recovery of the Mariana fruit bat will require development and maintenance of subpopulations of sufficient size to avoid genetic and demographic risks associated with small populations. Two of the criteria for achieving recovery goals are (1) that three of the five southern islands (Saipan, Tinian, Aguiguan, Rota, and Guam) support stable or increasing subpopulations of Mariana fruit bat (USFWS 2009b, pp. 40-41), and (2) that habitat sufficient to support these populations must be restored or protected on these the islands. Refer to the discussion in "Relationships of the Action Area to the Survival and Recovery of the

Mariana Fruit Bat" in the Environmental Baseline section above, for a full explanation of the importance of Guam and all of the southern Mariana Islands in meeting the recovery criterion for distribution of the Mariana fruit bat. Re-establishing and maintaining a widely distributed, robust metapopulation of Mariana fruit bat in the Mariana Islands is critical to the long-term persistence of the species. The strategy for achieving the distribution and long-term population stability involves several broad categories of actions: unlawful hunting of Mariana fruit bat must be effectively controlled throughout the archipelago; habitat on islands where Mariana fruit bats occur must be protected and enhanced, and habitat where Mariana fruit bats do not currently or regularly occur must be protected or restored to facilitate movement of bats among islands and address existing or incipient disjunctions in the Mariana fruit bat's distribution; and brown treesnakes must be controlled on Guam and Saipan, and most importantly, must be prevented from dispersing to other islands.

Preconstruction surveys will be implemented to ensure no bats are occupying the vegetation to be removed. The proposed action will result in the loss of Mariana fruit bat habitat and increases in noise levels within portions of fruit bat habitat, which will adversely affect the Mariana fruit bat as described in the following section.

Habitat Loss and Degradation Caused by the Proposed Action

Approximately 1,520 ac (615 ha) of Mariana fruit bat recovery habitat is within the limits of DoN construction in northern Guam and an additional 4 ac (2 ha) are within the project areas in southern Guam. An additional 353 ac (143 ha) of recovery habitat is likely to be cleared as a result of indirect/induced civilian development in northern Guam and 6 ac (2 ha) will be impacted by such development in southern Guam (see Table 10). We cannot provide a quantitative estimate of recovery habitat necessary to support Mariana fruit bat recovery because we do not have sufficient data to quantify the relationship between sustainable population size and areal extent of habitat suitable for breeding, roosting, and foraging. We do know, however, that Mariana fruit bats and other species in the genus *Pteropus* often make transits of several to many mi (km) each night from their roosts to forage on resources that are distributed patchily in space and time, such as fruit and flowers (Nelson 2003, pp. 81-82; Mildenstein et al. 2005, p. 98; Janeke 2006, p. 51). In addition, although most Mariana fruit bats occupy colonial roosts, some bats roost (always or intermittently) alone or in small groups away from colonial roosts (Wiles and Johnson 2004, Janeke 2006, pp. 31-37). Therefore, Mariana fruit bats rely on forest areas much larger than colonial roost sites to meet their requirements for survival and reproduction, and all of the remaining native forest on Guam may be used by the Mariana fruit bat.

Guam

As described in the "Status of the Species" section, we assume the same amount of recovery habitat calculated for the Guam Micronesian kingfisher for the Mariana fruit bat because both species rely on forest types dominated by a variety of native trees, including native primary and secondary limestone forest, volcanic (or ravine) forest, and old coconut plantations. We do not have sufficient information to quantify the relationship between a sustainable population size and the aerial extent of habitat suitable for breeding, roosting, and foraging to determine the extent of habitat necessary to conserve the Mariana fruit bat. The amount of recovery habitat currently

available for the kingfisher and fruit bat was determined using high resolution landcover data (Liu and Fischer 2006) that yielded a refined identification and delineation of cover types than data available when critical habitat was proposed for these species (USFWS 2002).

As described in the "Status of the Species" section, there are approximately 29,308 ac (11,860 ha) of recovery habitat available on Guam for the Mariana fruit bat (Figure 21). Approximately 1,520 ac (615 ha) of potential recovery habitat in northern Guam and 5 ac (2 ha) in southern Guam will be cleared within the project vegetation clearing footprint as a direct result of the proposed action. Preconstruction surveys will be implemented to ensure no bats are occupying the vegetation to be removed. Once facilities are constructed, fruit bats are expected to avoid the developed areas because they will not contain suitable habitat.

In addition, approximately 204 ac (83 ha) of recovery habitat in northern Guam and 3.0 ac (1.2 ha) in southern Guam are expected to be cleared through indirect or induced development impacts of the proposed action. Therefore, there will be 13,853 ac (5,606 ha) of potential recovery habitat in northern Guam and 13,722 ac (5,553 ha) in southern Guam remaining after implementation of the proposed project (see Table 10). Landscape-level DoN actions to minimize fire impacts to forest areas may substantially reduce the estimated 37 ac (15 ha) annual rate of recovery habitat loss in southern Guam (refer to "General Effects" section above).

As noted in the species status and baseline discussion above, we do not know enough about fruit bat habitat use or carrying capacity to estimate how many fruit bats can be supported by the amount of recovery habitat remaining after implementation of the proposed action. Based on the information we have regarding these aspects of the species' biology, sufficient habitat likely will remain to support a self-sustaining subpopulation of fruit bats after the project is completed on Guam.

Tinian

The proposed new training ranges will not be constructed in native limestone forest habitats within the Tinian action area, and bats are unlikely to use the non-native tangantangan habitat that will be removed. Preconstruction surveys will be implemented to ensure no bats are occupying the vegetation to be removed. Once ranges are constructed, fruit bats are expected to avoid the training areas because they would contain no suitable habitat.

No effects that cause a significant disruption of Mariana fruit bat feeding, roosting, or breeding behavior on Tinian are anticipated because bats are transient on Tinian and will be avoided if present during construction. Native limestone forest, preferred by fruit bats, will be avoided, albeit not in the areas where fruit bats have been observed on the island (DoN 2009). The DoN has proposed conservation measures to work with the CNMI to situate the leases outside of habitat for listed species.

Noise Impacts Associated with Increased Training Activities

On Guam, the Marine Corps-related training and construction activities at the Naval Munitions Site, Andersen South, or Route 15 Range complex will produce loud noise. Any individual bats

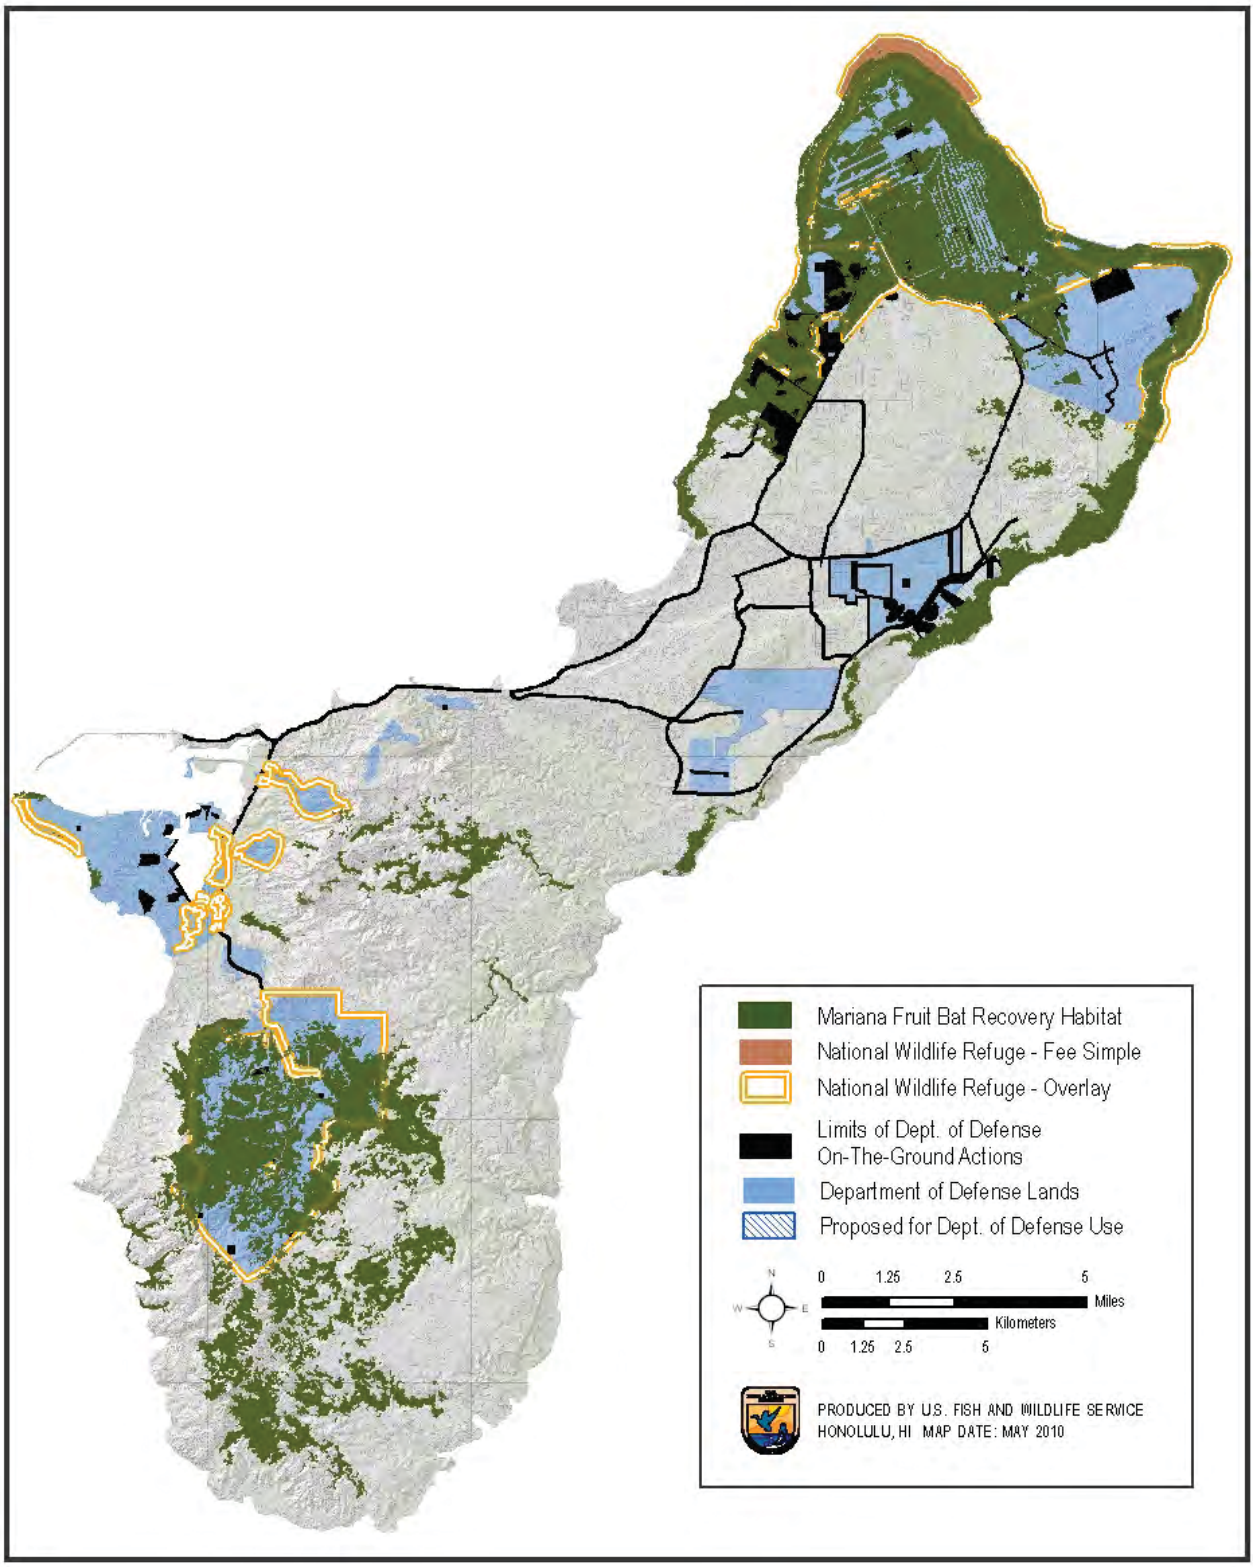

Figure 21. Distribution of recovery habitat for the Mariana fruit bat on Guam.

flushed from roosts in these areas are likely to be capable of flying to another area outside the disturbance zone. Solitary bats flushed as a result of project noise may travel to another area where the likelihood of poaching or harassment is greater overall than it is on DoD lands. Flight restrictions will limit low-level flights over much of the Naval Munitions Site and this will minimize adverse noise impacts to the bat in this area.

The adverse impacts of noise caused by the proposed action on the Mariana fruit bat at Pati Point on Andersen Air Force Base are expected to be substantial. Based on the documented effects of noise on wildlife (described above in the "General Effects" section) and the best available information about the response of Mariana fruit bats to aircraft noise and about the previous abandonment of fruit bat roosts on Guam (see analysis in Service 2006a, pp. 35-39 and references cited therein), we believe the current roost site in the Natural Area at Pati Point on Andersen Air Force Base will likely be abandoned by the few bats remaining there as a result of the proposed action.

Noise effects were reviewed under the ISR Strike Biological Opinion (USFWS 2006a) and were determined to adversely affect the Mariana fruit bat to the extent that the remaining colony site would be abandoned. Ongoing and anticipated noise resulting from jet aircraft and helicopter use of the main runways at Andersen Air Force Base (actions analyzed in the ISR Strike Biological Opinion) was expected to result in the incidental take of the remaining bats on Guam, due to harassment from aircraft noise (USFWS 2006a, p. 49). In addition, harassed bats moving to less protected areas were expected to be lost to opportunistic hunting (USFWS 2006a).

The proposed JGPO project will increase jet traffic by approximately 25% and will approximately double the number of (relatively quieter) helicopter operations. These training flights will adversely affect the Mariana fruit bat. Any remaining bats at the Pati Point-area colony are likely to abandon that site as a result of project-related noise. This is because: (a) the increase in aircraft operations will further reduce the quality of the current site for normal roosting by further increasing bat activity levels throughout the day; (b) alternate sites of sufficient quality are available to the west and northwest of Pati Point and on the Island of Rota; and (c) the current colony site, and other roost sites, have been abandoned in the past because of human disturbance and other factors. Because noise from the ISR Strike Biological Opinion and this Biological Opinion will occur contemporaneously, it would not be possible to attribute the take to a single project.

This abandonment will, in turn, have several adverse impacts on Guam's fruit bats. First, we believe the bats at the current site will likely move to alternate roost sites. The records of abandonment of Mariana fruit bats from Guam indicate that the bats have always moved to alternate sites on Guam, usually along the northern cliffline. Therefore, we expect the bats to remain on Guam and not migrate to Rota. Next, because the cliffline areas to the west and northwest of Pati Point are near public hunting areas and roads, we believe these areas are more accessible to humans and bats roosting in these areas would be vulnerable to illegal hunting. This illegal hunting would likely result in loss of individuals and cause the new roost site to eventually be abandoned. This impact may also be cumulative; roost sites established subsequently in the same general region may also be susceptible to illegal hunting. Finally, in addition to illegal hunting, juvenile bats may be left behind at abandoned roost sites because they

are too heavy for their mother to carry. These abandoned juveniles are likely to die of starvation or predation by brown treesnakes. This sequence of events is expected to have cumulative adverse impacts to the bat population if each new roost site is abandoned.

Mariana fruit bats are known to migrate from Rota to Guam periodically following typhoons because illegal hunting of bats often increases to exploit the bats' vulnerability on these occasions (refer to "Environmental Baseline" section above). We believe these temporary migrants to Guam also will be disturbed by the project-related increased aircraft activities at Pati Point and this will cause them to return to Rota prematurely (less than one month after a storm). We believe these bats will be exposed to illegal hunting and/or poor habitat conditions upon their return Rota. We expect that these circumstances will occur only after a severe storm on Rota and when aircraft operations have increased on Guam. We also expect this to occur only while the Pati Point roost site in the Natural Area is occupied by bats from Guam because fruit bats are gregarious and bats from Rota have previously been noted to be present in existing colonies of bats from Guam.

On Tinian, loud noise resulting from training will impact approximately one-third of the forested FAA mitigation site, reducing the suitability of this area for Mariana fruit bat roosting (see Figure 17 in the General Effects section above). However, we do not expect the noise to result in reduced reproductive success or other significant impacts to individuals on Tinian because bats are transient on Tinian and are not known to breed there.

Conservation Measures to Benefit the Mariana Fruit Bat

The DoN has proposed several conservation actions to benefit the Mariana fruit bat. The DoN's commitment to develop measures to control brown treesnake on a landscape level and to implement these measures on DoD installations and island-wide on Guam will provide protected areas for the Mariana fruit bat population to increase. Of the bat recovery habitat remaining on Guam after implementation of the proposed project, the majority is owned by DoD, and the DoN has proposed to restore or enhance (through ungulate removal and reforestation if necessary) a minimum of 8.9 ac (3.6 ha) that will benefit the bat on DoD lands

The DoN's increased ungulate management, forest habitat restoration, and protection four Ecological Reserve Areas and a cooperative conservation agreement with the Government of Guam at Anao will help protect and enhance some of the available Mariana fruit bat habitat on DoD and Government of Guam lands.

The DoN will hire two DoN Conservation Law Enforcement Officers to increase security on DoN lands and prevent poaching. The increase in conservation law enforcement on Guam is expected be very beneficial to the Mariana fruit bat.

And in order to benefit the fruit bat throughout its range, the DoN will also fund research to fill gaps in our knowledge of fruit bat demography, movements, and phylogeography and will ensure funding for two additional biologists to conduct fruit bat management and conservation activities on Rota. The long-term goal is to develop guidelines to be used in recovery and sustainable management of fruit bats on different islands. Research may include but is not
