Mariana fruit bats are likely to be disturbed by project-related noise and disturbance. Low-level aircraft flights are likely to disturb roosting or transiting bats. All bats at the HMU during bait drop operations are likely to be startled and alarmed by aircraft noise. Bats exposed to high levels of noise disturbance, and to human disturbance may abandon their roost site at the HMU. They may move to other areas on Guam where habitat quality may not be as good, where BTS densities are likely to be higher, and where they are likely to be exposed to more disturbance. Project-related disturbance may cause any bat roosting or foraging within the north-Guam Action Area to relocate to Rota or to another island where they may be exposed to high levels of hunting and decreased food and habitat availability.

Direct injury or mortality due to aircraft strike or cartridges

Bats may be struck and injured or killed at their roost or in flight by falling bait cartridges or they may be struck in flight by bait-dispensing aircraft. In addition, the streamer connecting the internal and external components of the bait chamber may pose an entanglement hazard. There is no evidence of this type of interaction from any prior helicopter BTS baiting operations in areas that were also unoccupied by bats. The maximum application rate (120 baits/ha; 49 baits/ac) amounts to a spacing of 30 ft along each flight path, with 30-ft spacing between flight paths, or one bait for every 81 square meters. Loaded bait cartridges weigh approximately 0.5 oz and they will be dropped during daylight periods, after 0900, when bats may be roosting. In addition, bats are likely to relocate from the application area when noisy helicopter operations approach.

Air Strike and Rotor Wash Risk

Aerial application of baits will be made using an aircraft flying at approximately 82-246 ft at an air speed of approximately 50 to 70 knots. This low altitude could potentially result in collisions between the aircraft and bats and rotor wash disturbance of roosting bats. To minimize the likelihood of a bat aircraft strike, flights will be scheduled between 0900 and 1800, when bats may be roosting within the Action Area. While there remains a paucity of research on flight characteristics specific to Mariana fruit bats, related species of *Pteropus* bats are known to regularly travel at heights of 492 ft above the ground (Parsons et al. 2008). Documented flight speeds for *Pteropus* range between 27 to 15 to 35 knots (Epstein et al. 2009; Roberts et al. 2012); flight speeds average 18 knots in Madagascan flying foxes *P. rufus*, a slightly larger congener of the Mariana fruit bat (Oleksy et al. 2015). Downwash from the helicopter's spinning rotors can result in wind speeds in the upper tree canopy of 62 mph (Ryan, 2018).

Streamers and Cartridge Risks

Baits will be dropped along tight, GPS mapped 30-ft wide transects after 0900 when bat density within the HMU is expected to be very low. The 0.5 oz bait cartridges weigh approximately three to five percent of the 11.6 to 20.4 oz fruit bat body weight (Wiles 1987a). The cartridges are ejected horizontally, and fall only with the force of gravity. Streamers attached to the cartridge slow the cartridge's descent rate. The likelihood of a cartridge striking a bat is very low. In addition, because bats have relatively large bodies in relation to the small cartridge size and mass, a direct strike to a bat's body is unlikely to cause injury, reduced reproduction, or reduced survival. Because of the relatively light weight of the cartridges in relation to the bat's body size,

and the sparseness of the application, it is unlikely that direct strike of a bat by a bait cartridge would occur and cause injury or mortality. The likelihood of direct injury or mortality resulting from the proposed action is discountable.

The streamers may temporarily confuse bats bat because the bat may mistake the streamer for a leaf or branch. Because bats are large-bodied, the streamers are not expected to entangle bats or cause any other long-term adverse effects to the bat.

Injury or Mortality Due to Acetaminophen Bait Consumption

Extensive research and evaluation was required to develop and register acetaminophen as an oral toxicant for BTS (Brooks et al. 1998, p. 427; Savarie and Bruggers 1999, p. 417; Savarie et al. 2001, p. 356; Johnston et al. 2002, p. 3827). Acetaminophen is a commonly used human analgesic and is available without a prescription. Laboratory and field testing determined that 80 mg of acetaminophen (the equivalent of a human children's dose) is lethal to BTS (Johnston et al. 2002, p. 3828). DNM are suitable medium to house the toxicant and proved to be palatable to BTS (Savarie et al. 2001, p. 356; Shivik et al. 2002, p. 1062). Substantial information regarding environmental and human risk has been published (Bessems and Vermeulen 2001, p. 55; Johnston et al. 2002, p. 3827; Larson et al. 2005, p. 1364). In 2003, acetaminophen was registered by the EPA for use in controlling BTS on Guam (EPA Registration Number 56228-34). Use of acetaminophen under this label is regulated by the Federal Insecticide, Fungicide, and Rodenticide Act.

Acetaminophen has the potential to impact non-target wildlife species. Johnston et al. (2002) assessed the risks for primary and secondary poisoning of non-target wildlife associated with acetaminophen use in controlling BTS populations on Guam. Table 8 summarizes LD_{50} doses for non-target species (LD_{50} is the dose at which 50% of those organisms exposed to a chemical are expected to suffer mortality). Acute toxicity estimates greater than 0.5 exceed EPA's acute hazard threshold. The table provides an estimate of the number of acetaminophen baits a given species would need to consume in order to reach an LD_{50}-dose.

Toxicant baits will be dropped attached to DNM). Mariana fruit bats are frugivorous (fruit-eaters) and are thus inherently unlikely to attempt to ingest carrion (mouse carcass) baits. Further, acetaminophen baits are effective because BTS ingest the whole bait and therefore the entire tablet, and are terminally intoxicated before the bait can be regurgitated; even when baits are regurgitated, most BTS die (Nafus and Siers pers. comm.). The bats possess a highly developed sense of smell, so the smell of the bait is likely to ward them away from it. But, if a fruit bat were to orally investigate a bait, it would likely masticate the bait and encounter the bitter acetaminophen tablet, leading to refusal to ingest the toxicant (Yarmolinsky et al. 2009). Therefore the risk of Mariana fruit bat ingestion of acetaminophen and harm to the bats is reduced.

Table 8. Primary and secondary hazards to non-target wildlife associated with acetaminophen baits for controlling BTS (Johnson et al.2002, p. 3828).

species	acute toxicity estimate[a] (mg/kg)	food consumption rate (g of food/ g of body wt)	primary hazard		secondary hazard	
			acetaminophen dose[b] (μg/g)	hazard quotients[c]	acetaminophen dose[d] (μg/g)	hazard quotients[c]
Mammals						
house mouse (*Mus musculus*)	LD_{50} = 338[e]	0.15[m]	2400	7.12	132.2	0.39
Norway rat (*Rattus norvegicus*)	LD_{50} = 1944[f]	0.10[m]	1600	0.80	88.1	0.05
guinea pig (*Cavia cobaya*)	LD_{50} = 2620[g]	0.10[n]	1600	0.61	88.1	0.03

Beneficial Effects of the Proposed Action

The BTS is among the primary causes of the decline of Mariana fruit bats on Guam. In the absence of the proposed action, a population of Mariana fruit bats is not likely to persist at the HMU or on Guam. In the absence of the proposed action, BTS numbers will remain high on Guam and at the HMU bat roost site. The proposed action hopefully will facilitate the development and implementation of landscape-scale BTS suppression. By monitoring Mariana fruit bat responses to the experimental BTS control and monitoring activities, this project will assist in the refinement of bait drop procedures including seasonal and weather-related timing of drops. Future landscape-level implementation of BTS suppression, facilitated by the proposed action is likely to result in increases in the Mariana fruit bat population on Guam.

CUMULATIVE EFFECTS

Cumulative effects include the effects of future state, tribal, local, or private actions that are reasonably certain to occur in the action area considered in this Opinion. Future federal actions that are unrelated to the proposed action are not considered in this section because they require separate consultation pursuant to section 7 of the ESA. Ongoing development of private lands on Guam is resulting in permanent reduction in habitat for the Mariana fruit bat.

CONCLUSION

The Conclusion section is the final step in assessing the risk posed to species and critical habitat as a result of implementing the proposed action. In this section, we add the effects of the action and the cumulative effects to the status of the species and critical habitat, and the environmental baseline, to formulate our Biological Opinion as to whether the Proposed Action is likely to: (1) appreciably reduce the likelihood of both survival and recovery of the species in the wild by reducing its numbers, reproduction, or distribution; or (2) reduce the value of designated critical habitat for the conservation of the species.

Mariana fruit bats will be harassed as a result of aircraft noise and ground-operations of monitoring staff, but this adverse effect will be minimized because operations will be scheduled for daylight periods after 0900 when bats may be roosting within the action area. Because in many parts of their range, bats are exposed to poaching, the bats may be sensitive to the scent of humans conducting ground operations below their roost sites, even if humans are not working at the site at night when the bats are at their roost.

Each bat occupying the Action Area is likely to be adversely affected by one or more instances of non-lethal harassment due to aircraft and human disturbance resulting from the proposed action and they may abandon the HMU roost site during project implementation. Although the HMU project site is not currently known to be occupied by any roosting Mariana fruit bats (Mildenstein and Johnson 2017), the reduced BTS population may result in Mariana fruit bat preferential use of the HMU after project implementation begins. When these roosting Mariana fruit bats are forced to disperse from the HMU as a result of human disturbance, infant mortality may increase because dependent, non-volant pups that are too big for the mother to carry are likely to be abandoned. Forced dispersal may also negatively affect the reproductive potential of the population because access to mates is compromised (CNMI 2010, p. 7). Even without dispersal, high levels of stress from disturbance can disrupt reproductive cycles and lead to pregnancy miscarriage. Mariana fruit bats relocating to sites elsewhere on Guam and to sites on other islands may be exposed to lower habitat quality and greater human disturbance. However, in the absence of the proposed action, BTS would continue to occupy the HMU and harm any vertebrates, including Mariana fruit bats, occupying the conservation area.

Mariana fruit bats may be roosting within the Action Area where they may be exposed to noise and rotor wash from the project helicopter. There is a low risk Mariana fruit bats may be injured or killed by collision with the project helicopter, entanglement in bait cartridge streamers, and ingestion of acetaminophen. Although Mariana fruit bats are not scavengers, should a fruit bat orally investigate a bait, it would encounter the bitter acetaminophen tablet and refuse to ingest the toxicant.

The proposed action will reduce BTS densities in the HMU and facilitate future landscape-scale BTS suppression efforts on Guam. The proposed action and actions similar to it are necessary for the future recovery of Mariana fruit bats within the HMU, and on Guam. If aircraft delivery of BTS baits and ground crew actions become a common practice in the HMU and future snake-suppressed areas, the Mariana fruit bats could become habituated to the human disturbances so future population recovery would be expected to occur. Although few Mariana fruit bats currently occupy the HMU project site, there is the potential for Mariana fruit bats to preferentially roost at the HMU when BTS density is reduced as a result of the proposed action.

After reviewing the current status of the Mariana fruit bat, the environmental baseline of this species in the proposed project area, and the effects of the proposed action, including cumulative effects, it is the Service's Biological Opinion that the proposed aerial toxicant research project on AAFB, Guam is not likely to appreciably reduce the likelihood of the survival and recovery of the Mariana fruit bat in the wild. If successful, the BTS bait drop project may be expanded to other habitats in Guam, reducing BTS numbers and benefitting the Mariana fruit bat and other listed species impacted by BTS presence on Guam.

There is no designated critical habitat for the Mariana fruit bat within the Action Area of this project; therefore, critical habitat will not be destroyed or adversely affected.

INCIDENTAL TAKE STATEMENT

Section 9 of the Act and Federal regulations promulgated pursuant to section 4(d) of the Act prohibit the take of endangered or threatened species, respectively, without special exemption. Take is defined as to harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, or collect, or attempt to engage in any such conduct. Harm is further defined by the Service to include significant habitat modification or degradation that results in death or injury to listed species by significantly impairing behavior patterns which include, but are not limited to, breeding, feeding, or sheltering. Harass is defined by the Service as intentional or negligent actions that create the likelihood of injury to listed species to such an extent as to significantly disrupt normal behavior patterns which include, but are not limited to, breeding, feeding or sheltering. Incidental take is defined as take that is incidental to, and not the purpose of, carrying out an otherwise lawful activity. Under the terms of section 7(b)(4) and section 7(o)(2) of the Act, taking that is incidental to and not intended as part of the agency action is not considered a prohibited taking under the Act provided that such taking is in compliance with the terms and conditions of this Incidental Take Statement.

The measures described below are non-discretionary, and will be undertaken by the DON so that they become binding conditions in order for the exemption in section 7(o)(2) of the Act to apply. The Service has a continuing duty to regulate the activity covered by this incidental take statement. If the DON (1) fails to assume and implement the terms and conditions; or (2) fails to require any contractors to adhere to the terms and conditions of the incidental take statement through enforceable terms that are added to any permit or contract, then the protective coverage of section 7(o)(2) of the Act may lapse. In order to monitor the impact of incidental take, the Department of the Navy must report the progress of the action and its impact on the species to the Service as specified in the incidental take statement [50 CFR § 402.14(i)(3)].

Amount or Extent of Take

Incidental take in the form of harassment, injury and mortality of all Mariana fruit bats within the HMU and in the Action Area of northern Guam may occur as a result of the implementation of the proposed action. Due to the mobile nature of the fruit bats and the fact there is no confirmed roost site within the HMU or Action Area, it is not possible to quantify a specific number of Mariana fruit bats that would be incidentally taken. Therefore, the Service anticipates that all Mariana fruit bats that occur within, or transit through, the Action Area during project implementation may be incidentally taken in the form of harm or harassment, due to direct injury, disturbance during roosting or feeding activities, and possibly reduced reproductive success if disturbed during the pupping season.

Effect of the Take

In the accompanying Biological Opinion, the Service determined that this level of anticipated take is not likely to jeopardize the continued existence of the Mariana fruit bat in the wild. Because the control of the BTS is necessary for the conservation of the Mariana fruit bat, and

other listed species on Guam, the proposed action is expected to result in long-term benefits, with minimal short-term adverse effects.

Reasonable and Prudent Measures

The Service believes the following reasonable and prudent measures are necessary and appropriate to minimize impacts of incidental take of the Mariana fruit bat:

1. In order to avoid unauthorized effects, all personnel working on this project will be provided information on the Mariana fruit bat and its life history, as well as any other listed species that may occur in the project's Action Area.
2. Mariana fruit bat behavior, and any disturbance or injury to bats resulting from aerial and ground-based operations will be monitored to determine project-related take of the Mariana fruit bat and reported to the Service.

Terms and Conditions

In order to be exempt from the prohibitions of section 9 of the Act, the DON must comply with the following terms and conditions, which implement the Reasonable and Prudent Measure number one, described above and specified reporting requirements. These terms and conditions are nondiscretionary. In order to implement the Reasonable and Prudent Measures above, the DON will monitor incidental take resulting from the proposed project.

1. The DON must hold a meet with its employees prior to their field work on this project. The DON must provide specific instruction on the implementation of the proposed Conservation Measures and the Service's Reasonable and Prudent Measures, included in this Incidental Take Statement. Instructions specific to project personnel related to implementation of the Conservation Measures and Reasonable and Prudent Measures must be documented in writing. The DON is ultimately responsible for informing anyone working on this project of these requirements.

2. The DON will coordinate with the United States Air Force, the Service, Government of Guam vertebrate biologists, and United States Geological Survey natural resources personnel and subject matter experts to devise monitoring protocols to assess effects of air- and ground-based operations on bat activity. The DON must monitor and report to the Service the amount of incidental take that occurs in association with this project. This must be done through sufficient on-site inspections to determine if project related impacts have or would occur outside of the HMU bait drop area, as described in this BO. Monitoring reports must be submitted in January of each year during project implementation and a final report one year after the project is completed. The monitoring reports must include a summary of project actions implemented during the previous monitoring period, any unanticipated actions or delays in project completion, and any known incidental take of the Mariana fruit bat that has occurred and the circumstances of that take.

Upon locating a dead or injured Mariana fruit bat, during project implementation, the DON must immediately notify Service Law Enforcement at (671) 647-6064 and the Mariana's Island Team

at (671) 989-6743. The listed species should not be handled unless instructed to do so by Law Enforcement. If authorized, care must be taken in handling sick or injured specimens to ensure effective treatment and care and in handling dead specimens to preserve biological materials in the best possible state for later analysis of cause of death. In conjunction with the care of sick or injured endangered or threatened species or preservation of biological materials from a dead animal, the finder has the responsibility to ensure that evidence intrinsic to the specimen is not unnecessarily disturbed.

The Service believes that it would be impossible to detect and quantify the number of Mariana fruit bat individuals that may be incidentally taken as a result of the proposed project due to their mobile nature and lack of known roosting locations within the Action Area. Therefore, incidental take is authorized for all Mariana fruit bats within the boundaries of the HMU and other project related locations within the Action Area. The incidental take would be in the form of harm or harassment. The Reasonable and Prudent Measures, with their implementing Terms and Conditions, are designed to minimize the impact of the incidental take that might otherwise result from the proposed action. If, during the course of the action, the project affects a fruit bat in a manner that has not been anticipated in this Biological Opinion or if an unanticipated affect occurs outside of the Action Area, such incidental take represents new information requiring reinitiation of consultation and review of the reasonable and prudent measures provided. The DON must immediately halt project related activities and provide an explanation of the unanticipated causes of the taking to the Service in order to determine if reinitiation of this consultation is necessary.

CONSERVATION RECOMMENDATIONS

Section 7(a)(1) of the Act directs the DON, as well as other federal agencies, to utilize their authorities to further the purposes of the Act by carrying out conservation programs for the benefit of endangered and threatened species. Conservation recommendations are discretionary agency activities to minimize or avoid adverse effects of a proposed action on listed species or critical habitat, to help implement recovery plans, or to develop information.

The Service has no conservation recommendations for the DON concerning the conservation of the Mariana fruit bat at this time. In order for the Service to be kept informed of actions minimizing or avoiding adverse effects or benefitting listed species or their habitats, the Service requests notification of the implementation of any conservation recommendations by the DON.

REINITIATION STATEMENT

This concludes formal section 7 consultation on this action. As required in 50 CFR § 402.16, reinitiation of consultation is required where discretionary Federal agency involvement or control over the action has been retained (or is authorized by law) and if: (1) the amount or extent of incidental take is exceeded; (2) new information reveals effects of the agency action that may affect listed species in a manner or to an extent not considered in this opinion; (3) the agency action is subsequently modified in a manner that causes an effect to the listed species or critical habitat that was not considered in this opinion; or (4) a new species is listed or critical habitat designated that may be affected by this action. In instances where the amount or extent of incidental take is exceeded, any operations causing such take must cease pending reinitiation.

Thank you for your ongoing efforts to conserve threatened and endangered species. If you have any questions concerning this Biological Opinion, please contact Jacqueline Flores, Mariana Islands Team Manager at Jacqueline_Flores@fws.gov or (671) 787-6094.

Sincerely,

MICHELLE BOGARDUS

Mr. John F. Salas, Professional Engineer
Department of the Navy
Naval Facilities Engineering Command Marianas
PSC 455, Box 195
FPO AP 96540-2937

Dear Mr. Salas:

The U.S. Fish and Wildlife Service (Service) received your December 15, 2017 request for our concurrence with the your determination the proposed brown tree snake (BTS) (*Boiga irregularis*) control in the Habitat Management Unit (HMU), Andersen Air Force Base (AAFB), Guam may affect, but is not likely to adversely affect four threatened plant species (Fadang (*Cycas micronesica*), *Tabernaemontana rotensis*, Cebello halumtano (Siboyas halumtano, *Bulbophyllum guamense*), and *Tuberolabium guamense*) and three endangered tree snails ((Fragile tree snail (*Samoana fragilis*), Guam tree snail (*Partula radiolata*), and Humped tree snail (*Partula gibba*) (collectively, tree snails).

The Proposed Action entails the aerial application of acetaminophen for BTS suppression in the HMU, AAFB, Guam and associated ground-based field work. The HMU is a 135 ac interagency test site established for biological resource studies, including pilot control and monitoring programs for invasive species and forest restoration. BTS bait containing acetaminophen will be delivered over the HMU via the helicopter-mounted automated aerial delivery system. Ground-based BTS and rodent monitoring will occur up to two months prior to the aerial bait application operations. In addition, ground crews will monitor and implement ground-based BTS and rodent monitoring during aerial bait applications and for approximately one year following aerial BTS baiting operations. A complete description of the project is in the Project Description section of the accompanying Biological Opinion for BTS Control in the HMU, AAFB, Guam. The project's conservation measures including field staff education, surveys, markings, and implementation of buffer distances to avoid listed plants and tree snails outlined in the BA and incorporated into the project description by the DON during the section 7 consultation at the Service's recommendation, are designed to minimize the potential for the project to adversely affect the four endangered plants and three endangered tree snails.

Threatened Plants

Cycas micronesica plants usually grow in palm-like unbranched trunks with apical pinnate leaves (Hill 1994). *Cycas micronesica* is the only native gymnosperm in the Mariana Islands. Cycads are dioecious, and both sexes bear reproductive structures that are relatively massive amongst gymnosperms. *Cycas micronesica* occurs in limestone forests in Guam and Rota, with fewer occurrences in volcanic soils typical of southern Guam (Stone 1970 p. 65; Hill 1994). *Cycas micronesica* is threatened by a non-native insect, the cycad aulacaspis scale (*Aulacaspis yasumatsui*), that is thought to have been introduced on non-native horticultural nursery stock for landscape use (Terry and Marler 2005). The cycad aulacaspis scale has caused mortality of all life stages in *C. micronesica*, leading to reduced reproduction and recruitment into the population (Marler and Muniappan 2006). Additional threats include other pest species, loss and degradation of habitat, feral ungulate trampling, rooting, and herbivory, stochastic typhoon events, and the long-term effects of drought and climate change (USFWS 2015a). Within the HMU, *C. micronesica* occurs in small numbers with only eight individuals recorded and many recorded dead during plant surveys to document rare and valuable plants on Joint Region Marianas administered lands (GPEPP 2015).

Tabernaemontana rotensis occurs in forests with crevices of rough limestone (Raulerson and Rinehart 1991). Currently 23,325 individuals, many of which were at six locations on DoD properties are known to occur, including four occurrences in the HMU (GPEPP 2015; DON 2017). The *T. rotensis* in the HMU were individual trees with few or no seedlings found around the individuals (GPEPP 2015). On Guam, where frugivorous forest birds are extirpated or extinct, the distribution of *T. rotensis* seeds is limited and seedling establishment occurs within the vicinity of mature individuals, resulting in increased seedling competition, distribution of the plants is generally clumped. Clusters of the species on Guam are often comprised of a single adult and numerous seedlings (DON 2017). Threats to *T. rotensis* include habitat loss, non-native plants, herbivory, trampling, and rooting by invasive ungulates, typhoons, and limited spatial distribution and gene flow in the absence of frugivorous forest birds. Locations of *T. rotensis*, within the HMU are shown in Figure 1.

Bulbophyllum guamense is an epiphytic orchid which occurs in large mat-like formations high on branches of big trees, as well as on smaller trees of coastal lowland/limestone forests. Flowers are single, fleshy, and greenish-yellow in color (Raulerson & Rinehart 1992 p. 90). On Guam, *B. guamense* was found in the lower canopy of closed forests (about 10 ft or less) (Zarones et al. 2015). *Bulbophyllum guamense* has been observed in many native and non-native host tree species including: *Hernandia labyrinthica, Elaeocarpus joga, Premna serratifolia, Heritiera longipetiolata, Pisonia umbellifera, Persea americana, Vitex parviflora, Areca catechu, Eugenia* spp., *Ficus* spp., *Dypsis* spp. or *Pandanus tetorius,* as well as in dead trees (Zarones et al. 2015; JRM 2016; DON 2017). Typical to orchids in this genus, *B. guamense* has a carrion-like scent (Raulerson & Rinehart 1992 p. 90), and it is almost ever-blooming, as one flower drops, another replaces it until one is pollinated. Within the HMU, two occurrences of *B. guamense* have been recorded (see Figure 1).

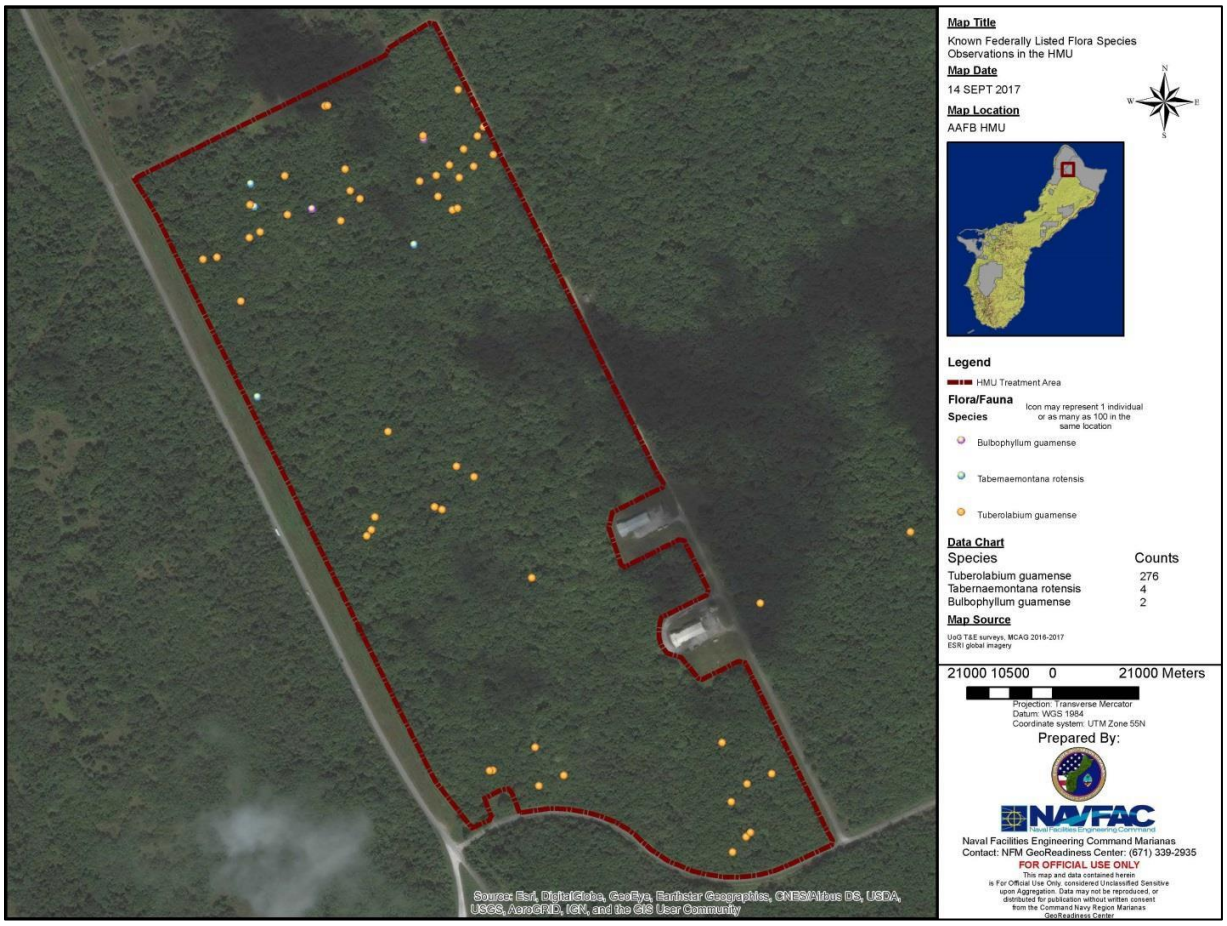

Figure 1. Locations of threatened plants within the Habitat Management Unit on Andersen Air Force Base, Guam (GPEPP 2015).

Tuberolabium guamense is a small orchid. Similar to other epiphytic orchids, *T. guamense* grows slowly and requires specific microclimates, which are found on the trunk, lower branches, and under the forest canopy. *Tuberolabium guamense* clings onto their host trees with a strong developed root system and uses the moisture in the air and organic debris caught in the crevices and bark of the host for nourishment (Tibbs 2008). At the time of listing in 2015, *T. guamense* was known from seven occurrences: one occurrence of one individual on Guam and six occurrences on Rota, in the forest ecosystem (Harrington et al. 2012, in litt.; Zarones et al. 2015) however, recent surveys for *T. guamense* on Guam DoD land parcels have revealed 12,595 occurrences, including 278 within the HMU (GPEPP 2015; DON 2017; see Figure 1). Within the HMU, *T. guamense* was most often found anywhere from 3 to 20 ft on *Vitex parviflora*. Of the surveys conducted on Guam, 82% occurred within secondary limestone forest and 17% within primary limestone forest (DON 2017). Threats to the species include habitat loss and degradation, impacts from invasive vines, and stochastic storm events (e.g., typhoons).

Effects of the Action to the Threatened Plants

Because the DON proposes to avoid field work within specified buffer distances around threatened plants, the proposed action's affect to a threatened plant's transpiration, growth rate, reproduction, and survival are expected to be insignificant. *Cycas micronesica* has a distinctive

growth form which is easily distinguished from other plants. *Tabernaemontana rotensis*, when not in bloom, may be difficult to distinguish from *Morinda citrifolia*, *Ficus prolixa*, *Ficus tinctoria*, and *Ochrosia oppositifolia*, which are all species known to occur in the HMU (GPEPP 2015, Mildenstein and Johnson 2017). However, when fruiting, *M. citrifolia* and *F. tinctoria* are easily distinguished from *T. rotensis* by their distinctive fruiting bodies. Pruning risks to *T. rotensis* would be avoided during transect establishment through the conservation measure requiring inspection of all vegetation to determine species status prior to pruning. Currently known locations of *T. rotensis* are available via spatial coordinates, and all personnel are required to be aware of these locations.

The risk of trampling *Tabernaemontana rotensis* seedlings during ground-based surveys using trackless transects would be minimized by the training and caution implemented during off-trail movements. *Tuberolabium guamense* and *B. guamense* are epiphytic orchids that are generally easy to identify and particularly so when in bloom. Orchids would be avoided during transect establishment and maintenance. Orchids also grow at a height that may naturally minimize impacts from ground-survey monitoring, in particular *B. guamense* is generally found 7 ft above the ground. *T. guamense* grows lower to the ground between two and 30 ft (L. Guttierez personal communication, 19 October 2017) but the identification training conservation measures would reduce the chance field personnel would contact or disturb these orchids. BTS bait streamers and canisters could brush against or land on the threatened plants; however, it is unknown if the weight of the bait could affect orchids or other species, and it is unlikely that the contact would cause reduced reproduction or survival above the level that would be considered significant. Rodents may be seed predators, feeding on the fruit of the threatened plants. Because the proposed action would not be conducted if rodent control response were unavailable, the proposed action is not expected to result in increased rodent damage to seeds of the threatened plants.

Because *Tabernaemontana rotensis* seeds are dispersed by frugivorous forest birds that were extirpated from Guam by the BTS, the proposed research project has the potential to contribute to the conservation of this tree species by facilitating future long-term BTS control and native bird reintroductions at the HMU (Siers and Savidge 2017) and in landscape-scale project sites on Guam. Because effects of the proposed action to the threatened plants are expected to be insignificant, and because the project has the potential to benefit *T. rotensis*, we concur with the DON's determination that the proposed action may affect, but is not likely to adversely affect *C. micronesica*, *T. rotensis*, *B. guamense*, or *Tuberolabium guamense*.

Tree Snails

The family Partulidae consists of approximately 120 species of snails in three genera (*Eua*, *Samoana* and *Partula*) endemic to the high islands of Oceania, many of which are restricted to a single island. *Partula* is the most diverse genus with approximately 92 species described; there are 23 *Samoana* species and four *Eua* species (Lee et al. 2014). Of the six partulid snail species described from the Mariana Islands, only three species remain: the Guam tree snail (*Partula radiolata*), humped tree snail (*Partula gibba*), and the fragile tree snail (*Samoana fragilis*). The three species were listed as endangered on October 1, 2015 (80 FR 59423). The Guam tree snail, humped tree snail, and fragile tree snail share similar life history characteristics and co-occur. Species in the Partulidae family are predominantly nocturnal, arboreal, herbivorous, slow

reproducing, and are relatively long-lived (Cowie 1992). Partulids feed primarily on a range of living, dead or decaying plant material (Cowie 1992 p. 167) and there is no clear obligate relationship with any particular type of tree or bush. The alien carnivorous flatworm (i.e. manokwari flatworm (*Platydemus manokwari*), predatory snail (i.e. rosy wolf snail (*Euglandina rosea*) and *Gonaxis* spp.) and rodent (particularly rat) predation significantly threaten tree snail persistence.

Partula radiolata shells are pale straw colored with darker axial rays and brown lines. Adults are 0.5 - 0.7 in. long, and 0.3 - 0.5 in. wide (Smith et al. 2008). Juveniles can be mistaken for the fragile tree snail. *Partula gibba* shells are chestnut brown to whitish-yellow, or purple with whorls of various shades of white or brown. Adults are 0.55 – 0.7 inches long and 0.39 - 0.7 inches wide (Smith et al. 2008). *Samoana fragilis* adults are 0.47 - 0.63 inches long and 0.39 - 0.47 inches wide. (Smith et al. 2008). Adults can be mistaken for juvenile Guam tree snails.

No listed tree snails were detected during a 4.5-hour survey for tree snails conducted along a 3,792-foot transect south down the center of the HMU on June 19, 2017, during a DON natural resources personnel exercise to train personnel in tree snail survey methods. During this training, the first 656 ft of the reconnaissance walk was dedicated to actively searching for snails spanning 30 to 40 minutes. The focus of the remainder of the transect was limited to observing and locating suitable snail habitat in the HMU (L. Gutierrez personal communication, October 18, 2017). A single weathered shell of *P. radiolata* was found (Figure 2). A previous BTS suppression effort at the HMU did not result in a measurable increase in the rodent population. However, if an undetected rodent increase occurred at the HMU in the past, prior to the listing of the tree snails, as a result of the previous BTS suppression effort, the HMU tree snail population may have been affected.

The HMU project site has not been thoroughly surveyed for tree snails, however biological field crews have been working in the area since 2013. USGS has conducted BTS visual surveys (2013-2015), bait tube surveys and rodent trapping were conducted by USDA WS from 2012-2015 (same crew responsible for discovery of tree snails at Andersen South) and GPEPP has conducted surveys for proposed (at the time) listed plant in 2015 at 33-ft intervals.
The HMU contains the type of native forest vegetation known to support the listed tree snails, so our assessment of potential project effects assumes the tree snails may be present at the project site. Tree snails occur in high-density clusters separated by unoccupied habitat. Fiedler (pers. comm, 2018) recorded what he considered to be an exceptionally high density of tree snails at Ritidian Point: 181 tree snails within a 538 square ft, and he reported 90 tree snails at another site.

In August 2016, Guam tree snails were discovered at Andersen South during field work for BTS bait tube monitoring for an experimental BTS suppression project conducted by USDA WS personnel (S. Siers personal communication; Siers 2016). Specimens were positively identified by University of Guam personnel, Dr. Curt Fiedler in February 2017 (DON 2017). In surveys conducted later in February 2017, DON personnel identified 36 live Guam tree snails (a density of 0.83 snails per ac) and 51 dead shells at the Andersen South location (Gutierrez and Quinata 2017). From July 2017 to May 2018, targeted surveys for listed tree snails on Guam resulted in at least five occurrences of inhabited forest edge sites including vines. (T. Mizerek pers. comm. 2018). The forest vegetation at Andersen South and at the sites surveyed is degraded, less intact

native forest than the forest habitat at the HMU project site. Variations in tree snail density and tree snail habitat preference are unknown. Because it is the only landscape-scale tree snail density information available, tree snail density known from the Andersen South project site was used to assess tree snail population size within the HMU. At a density of 0.83 snails/ac, the 135 ac HMU would be occupied by 113 listed tree snails (an average of one tree snail per 229.089 sq ft).

Figure 2. Known listed tree snail locations in the vicinity of the HMU, where a single weathered shell of *Partula radiolata* was found (DON 2017).

Vertical distribution of *Partula* species is likely to vary by species, snail age, and moisture as it does on Moorea, French Polynesia (Murray et al 1982). Surveys at Asan Memorial Park, Guam, indicated most *P. radiolata* were situated in vegetation above a height of 9.8 ft and average tree snail height ranged from 4.9 ft to 12.8 ft; *S. fragilis* and *P. radiolata* occurred at similar heights at Lost Pond (Fiedler 2018). *Partula radiolata* were measured up as high as 29.5 ft on a breadfruit tree and one *S. fragilis* was detected at 45.9 ft on Rota (Fiedler 2018). *Partula gibba* occur in the sub-canopy of mixed native forests with good understory and ground cover (Hopper & Smith 1992; Smith et al. 2008; Hadfield 2010).

The DON gathered the following information about the occurrence of tree snails on the ground from six local biologists who have worked with the local tree snails. University of Guam's Dr. Curt Fiedler estimated, based on his observations during the candidate species survey project, fewer than one percent of tree snails occupy the ground. Dusty Janeke, HDR, estimated one to two percent of tree snails may be on the ground at a given time. Jessica Gross, Lauren Gutierrez, Christiana Quinata, and Wien Winner have not observed tree snails on the ground (C. Cobb pers. comm. April 9, 2018).

Effects of the Action to the Endangered Tree Snails

Although tree snails may be dislodged from vegetation by falling BTS bait cartridges and ground crew movements, the fall to the ground is not expected to adversely affect tree snails because they regularly fall uninjured from vegetation. The two greatest project-related risks to tree snails are 1) the potential for BTS suppression to result in an increased rodent population (Wiewel et al. 2009), which would be expected to result in increased rodent predation of the tree snails (Hadfield et al. 1993; Hadfield and Saufler 2009); and 2) the trampling and crushing risk associated with project monitoring activities.

Within the Closed Population study area, a 12.4 ac site in NWF, an experimental BTS eradication conducted by USGS has been underway since March 2017. Rat sightings data (rats sighted per km surveyed), indicated an immediate rat increase following the first three toxicant applications in April – June 2017. This rat sighting increase also coinciding with the onset of the wet season. Rat sightings declined to zero in November 2017 and remained similar to pre-toxicant application sightings for the remainder of the survey period through January 2018 (Nafus et al. 2018).

The DON biologists agreed to implement the following conservation measures to support their determination that the proposed action may affect, but is not likely to adversely affect listed tree snails. If these measures are not implemented, the proposed action should be addressed in a formal consultation addressing adverse effects that could occur due to project-related rodent predation and field staff trampling:

1. The December 29, 2017, confirmation that rodent control would be conducted at the HMU if the BTS suppression action results in an increase in the rodent population and the April 19, 2018, confirmation that the proposed BTS control project would be put on hold if, for some reason, rodent control response operations became unavailable and;
2. The April 11, 2018, reduction of off-trail ground crew "events" from the 536 "events" (which would entail an estimated 1,574 miles of off-trail walking) proposed in the Biological Assessment to 406 "events" (an estimated 1,195 miles of off-trail walking) to minimize the potential for field staff foot falls to crush a tree snail.

These two aspects of the project, in addition to the DON's commitment to educate field staff to be vigilant for tree snails to minimize dislodging them or stepping on them during field work and to delineate and avoid any clusters of tree snails detected during project implementation are the primary basis for our assessment of project effects to the listed tree snails.

Dislodging tree snails from vegetation

Tree snails may be dislodged when field crews or falling bait canisters brush against or move leaves or stems occupied by a tree snail. Tree snails are known to fall when the leaf they are adhered to is dislodged from the tree or when, under stronger wind conditions such as a typhoon, the leaves or branches they are occupying are torn from the tree (Fiedler, 2018). The risk of tree snail exposure to non-native carnivorous flatworms, predatory snails, and rodents would be increased during periods when they are on the ground. Although feeding, breeding, and sheltering habitat is available on the ground, the tree snails are not known to spend a lot of time on the ground; any tree snail grounded by the proposed action would be expected to quickly return to the vegetation canopy, particularly during periods when the environment is moist. Guam's relatively high year-round humidity and rainfall is expected to facilitate tree snail movements. Because most grounded tree snails that have been observed to date are still adhered to the leaf or branch that fell from the tree and vegetation will not be cut or removed without a thorough search of the leaves and branches for tree snails, the project poses a low risk of grounding tree snails. Dislodged tree snails at the HMU or adjacent to the HMU, for instance, in the bait canister calibration drop area are not expected to be injured or killed by impact with the ground because dense vegetation, leaf litter, and soil are likely to cushion their fall. A tree snail grounded by project-related actions is expected to return uninjured to the vegetation.

Field staff will walk carefully through vegetation to minimize the likelihood of dislodging a tree snail, and if a tree snail is detected, the extent of the tree snail cluster will be delineated and the area will be avoided to further minimize the risk of ground personnel dislodging a tree snail. The risk ground personnel will dislodge tree snails is reduced because most tree snails occupy mid-story vegetation, above shoulder-height. Because tree snail surveys will be conducted prior to cutting any vegetation and vegetation occupied by a tree snail will not be cut, tree snails are not expected to be grounded on vegetation cut during project implementation.

Because the tree snails are less likely to occupy the upper tree canopy, and most snails occur below that zone, the tree snails are at a reduced risk of being dislodged by a falling bait canister. At the Andersen South BTS bait application site, 70 percent of baits lodged in the upper canopy, above the height where most tree snails occur, 20 percent fell to the mid-canopy, five percent fell to the ground, and five percent of the cartridges did not open successfully (Siers 2016). There is a low risk that a small number of tree snails (one, possibly more) may be dislodged from the tree canopy by falling BTS bait.

Trampling by Ground Personnel

The proposed field work will entail field personnel walking an estimated 1,195 miles conducting project work outside established trails or established transects. Because field personnel working outside of permanent transects and trails will walk parallel to each other, rather than single-file, the risk of trampling a dislodged tree snail is reduced. Based on the information gathered from local biologists (above), we conservatively assumed up to two percent of listed tree snails may occur on the ground. Because an estimated two percent or fewer of the estimated 113 listed tree snails that may occur in the HMU may occur on the ground and because field staff walking off-trail and off established transects will be limited to approximately 1,195 miles of off-trail walking, the likelihood of a tree snail being trampled as a result of the proposed action is

insignificant. The DON's commitment to survey any area where a tree snail is detected and to delineate the perimeter of the occupied area and avoid field work within the area known to be occupied by tree snails, the likelihood of trampling a tree snail is minimized.

The two greatest project-related risks to tree snails are the potential for BTS suppression to result in an increased rodent population, which would result in increased rodent predation of the tree snails, and the trampling and crushing risk associated with foot traffic of off-trail field work. The DON's commitment to put the proposed BTS control project on hold if rodent control response at the HMU became unavailable assures the project will not cause rodent predation of tree snails to increase. The DON's minimization of off-trail ground crew movements and commitment to survey and avoid any area where a tree snail is detected reduces the likelihood the project will result in trampling and crushing of a tree snail to a level that is insignificant. Although tree snails may be dislodged from vegetation by the proposed aerial application of BTS bait or by field staff movements, falls from the vegetation are a normal part of tree snail biology and the fall is not expected to result in tree snail injury or reduction in tree snail feeding, breeding, sheltering, or survival. The fall would have an insignificant effect on the tree snail. Therefore, we concur with DON's determination that the proposed action may affect, but is not likely to adversely affect *S. fragilis*, *P. radiolata*, or *P. gibba*.

As required in 50 CFR § 402.16, reinitiation of consultation is required where discretionary Federal agency involvement or control over the action has been retained (or is authorized by law) if new information reveals effects of the agency action that may affect listed species in a manner or to an extent not considered in this informal consultation; if the agency action is subsequently modified in a manner that causes an effect to the listed species or critical habitat that was not considered in this informal consultation; or if a new species is listed or critical habitat designated that may be affected by this action.

Thank you for your ongoing efforts to conserve listed species. If you have any questions or would like additional information, please contact Jacqueline Flores, Mariana Islands Team Manager (phone: (671) 989-6744, email: Jacqueline_Flores@fws.gov).

Sincerely,

Subject: Biological Opinion for the Removal of Ungulates from Haputo Ecological Reserve Area, Marine Corps Base Camp Blaz, Guam

Dear Mr Borja:

This document transmits the U.S. Fish and Wildlife Service's (Service) biological opinion (BO) based on our review of the proposed removal of Philippine deer (*Rusa mariana*) and feral pigs (*Sus scrofa*) from the Haputo Ecological Reserve Area (ERA), Marine Corps Base Camp Blaz (MCBCB), Guam, and effects of the action on the endangered Guam tree snail (*Partula radiolata*, akaleha') in accordance with section 7 of the Endangered Species Act (Act) of 1973, as amended (16 U.S.C. 1531 et seq.). We received the request for consultation March 10, 2022, via email from Senior Natural Resources Specialist Coralie Cobb, on behalf of the United States Marine Corps (USMC). The consultation addresses the possible effects of USDA APHIS Wildlife Services control of non-native invasive ungulates from Haputo ERA, at MCBCB, Guam, that is being conducted to conserve limestone forest habitat pursuant to the 2015 Guam Micronesian Kingfisher Memorandum of Agreement (GMK MOA).

This BO is based on information provided in your December 20, 2021, *Biological Evaluation for Ungulate Eradication at Haputo Ecological Reserve Area, Marine Corps Base Camp Blaz* and in meetings, telephone conversations, field investigations, and other sources of information. A complete record of this consultation is on file at the Pacific Islands Fish and Wildlife Office.

Additionally, in a December 20, 2021, letter, which we received January 4, 2022, you requested informal consultation for the eradication of ungulates at the Haputo ERA at MCBCB, Guam. In this letter you requested our concurrence with your determination the proposed action is not likely to adversely affect listed species including the threatened Mariana fruit bat (*Pteropus mariannus mariannus*, fanihi), *Bulbophyllum guamense* (wild onion, siboyas halumtanu, siboyan halom tano), *Cycas micronesica* (fadang), *Dendrobium guamense*, *Tabernaemontana rotensis*, *Tuberolabium guamense* and the endangered Mariana eight-spot butterfly (*Hypolimnas octocula marianensis*, ababbang, Libweibwogh), humped tree snail (*Partula gibba*, akaleha'), fragile tree snail (*Samoana fragilis*, akaleha' dogas), *Eugenia bryanii*, and *Heritiera longipetiolata* (ufa halumtanu, ufa halom tano), pursuant to section 7 of the ESA of 1973, as amended (16 U.S.C. 1531 et seq.). We concur with your determinations for these species. Our concurrence with your determination is detailed in Appendix A of this BO.

Consultation History

October 1, 2021: Naval Facilities Engineering Systems Command, Pacific (NAVFAC PAC) Senior Natural Resources Specialist Coralie Cobb, acting on behalf of the USMC, requested a meeting with the Service to discuss the project.

October 14, 2021: NAVFAC PAC Senior Natural Resources Specialist Coralie Cobb emailed a draft project biological evaluation to the Service. A call was held between Coralie Cobb, USDA APHIS Wildlife Services (Aaron Collins and Nicole Taylor), and the Service (Mariana Islands Geographic Team Leader Jacqueline Flores) to discuss the project and a second call was held with Coralie Cobb, Adrienne Loerzel, and Jacqueline Flores. The Service recommended minimization and avoidance measures, including biological surveys of the entire project site, and requested additional information about the project design.

October 20, 2021: Via email, the Service recommended additional avoidance and minimization measures, including surveys, be incorporated into project plans.

October 22, 2021: Via telephone, the Service's Fish and Wildlife Biologist Toni Mizerek and NAVFAC PAC Senior Natural Resources Specialist Coralie Cobb discussed the Service's recommended avoidance and minimization measures, including surveys.

November 1, 2021: NAVFAC PAC Senior Natural Resources Specialist Coralie Cobb, on behalf of the USMC, emailed a second draft project biological evaluation to the Service.

November 22, 2021: The Service emailed Mr. Albert T. Borja and NAVFAC PAC Senior Natural Resources Specialist Coralie Cobb to express concerns the project may affect and would be likely to adversely affect listed tree snails, the Mariana fruit bat, and the Mariana eight-spot butterfly.

January 4, 2022: The Service received, via email, a December 20, 2021- dated letter, from Mr. Albert T. Borja, requesting initiation of informal consultation for the eradication of ungulates at the Haputo ERA at MCBCB, Guam. The *Biological Evaluation of Ungulate Eradication at*

Haputo Ecological Reserve Area, Marine Corps Base Camp Blaz, dated December 20, 2021, was enclosed with the letter.

January 13, 2022: The Service (Fish and Wildlife Biologist Toni Mizerek) notified Mr. Albert T. Borja via email that we anticipated being unable to concur with the USMC's determination the proposed action was not likely to adversely affect the threatened and endangered species and inviting the USMC to coordinate with us to further refine the project design to minimize or avoid project effects to the listed tree snails and the Mariana fruit bat.

January 18 – February 16, 2022: The Service (Marianas Islands Geographic Team Manager Jacqueline Flores and Fish and Wildlife Biologists Toni Mizerek, Dawn Bruns and Lauren Taylor) attended several Microsoft Teams meetings and corresponded in email exchanges with the NAVFAC PAC Senior Natural Resources Specialist Coralie Cobb to discuss the potential for adverse project consequences to listed tree snails and to the Mariana fruit bat because the project design did not include pre-work surveys and the Service's recommended buffer distances for work near these species.

February 17, 2022: The Service recommended the U.S. Marine Corps provide an updated description of the proposed action, rescind the January 4, 2022 request for informal consultation, and request initiation of consultation.

February 18 – March 10, 2022: The Service's Fish and Wildlife Biologist Dawn Bruns and NAVFAC PAC Senior Natural Resources Specialist Coralie Cobb corresponded via Microsoft Teams, email, and telephone to further refine the project design to incorporate measures to minimize the potential for the project to affect the Mariana fruit bat and the tree snail species. Additional discussions entailed tree snail detection probabilities and the prevalence of tree snails in the lower vegetation and on the ground.

March 10, 2022: The Service received Senior Natural Resources Specialist Coralie Cobb's email on behalf of the USMC, requesting the January 4, 2022, request for initiation of consultation, be rescinded, and requesting initiation of section 7 consultation pursuant to the Endangered Species Act (ESA) of 1973 [16 U.S.C. 1531-1544 *et seq*.], as amended, to addresses the possible effects of ungulate removal from Haputo ERA, Guam, to threatened and endangered species.

March 11 - April 5, 2022: The Service's Fish and Wildlife Biologist Dawn Bruns and NAVFAC PAC Senior Natural Resources Specialist Coralie Cobb corresponded via Microsoft Teams, email, and telephone to further refine the project design to minimize potential project impacts to the Mariana fruit bat and the tree snail species, and to discuss new information about the occurrence of tree snails on the ground.

April 5, 2022: NAVFAC PAC Senior Natural Resources Specialist Coralie Cobb provided the Service's Fish and Wildlife Biologist Dawn Bruns with an updated description of the measures the project would incorporate to minimize potential project impacts to the Mariana fruit bat and listed tree snails.

April 11, 2022: The Service acknowledges initiation of formal consultation with the U. S. Marine Corps.

BIOLOGICAL OPINION

PROJECT DESCRIPTION

The approximately 346 invasive Philippine deer and 48 feral pigs within Haputo ERA, MCBCB, Guam, will be killed and removed from the site to stop them from trampling and feeding on native plant and animal species. The 284-acre (ac) (115-hectare (ha)) Haputo ERA, situated on the western edge of MCBCB, Guam (Figure 1), is dominated by native limestone forest. The site spans steep limestone cliffs between the sandy and cliff-faced shoreline and the upper plateau of northern Guam. Access to the lower areas of the site is primarily via a switchback hiking trail through a break in the cliff. Project activities will be conducted by U.S. Marine Corps civilian employees and Department of Defense (DoD) contractors, including U.S. Department of Agriculture, Wildlife Services. Ungulate eradication work is expected to take six months to complete and is planned to be completed prior to April 2023.

Ungulate eradication crews will subdivide the Haputo ERA with netting and capture or hunt out the ungulates from these areas while implementing measures to minimize project impacts to listed tree snails. In preparation for ungulate removal, crews will subdivide the ERA into smaller sections by attaching temporary netting (up to one meter (six feet) tall, with a lower lip to prevent ungulates from burrowing underneath) to existing trees. Project work will also include attaching 60 trail cameras to trees using nylon straps, and installation of traps (including coral traps and pig brig traps) and leg and neck snares baited with feed or scent lures. Ungulate control will be completed by driving the animals, using one to five people walking in parallel lines, through the sub-divided pockets. Each pocket will be checked with the assistance of trained hunting dogs, at least once, to verify the pocket is cleared of ungulates. Ungulates captured by snare, trap, or dog, will be dispatched by sharpshooters using quiet suppressed firearm or pneumatic rifles. Crews may use hand tools to cut understory vegetation where needed to create access where existing game trails and open spaces are not available. Spotlighting with bright lights may be used along the top of the cliff line to detect and shoot the deer at night. Portions of the temporary netting will be left in place until the entire site is cleared of ungulates to minimize re-colonization of previously-cleared pockets in the event another net fence fails during project implementation.

Tree Snail Avoidance Measures:

To reduce the potential for the eradication activities to result in the trampling and crushing of tree snails, tree snail survey and avoidance measures will be implemented as detailed below. All project field staff will undergo both classroom and field identification training for all listed species including listed tree snails. As detailed below, the majority of project work (all walking trails, vegetation removal, and areas for installation of equipment - netting/temporary fencing, cameras, snares, and traps) will be conducted with tree snail survey and avoidance protocols. Because tree snails may be downed and moved to new locations by strong winds, project activity, other than snail survey work, will not occur within the 7-day period after the project site

is affected by strong winds from a typhoon and the tree snail survey and avoidance measures will be re-done to detect and avoid tree snails in their new locations. As detailed below, hunting and ungulate removal will occur with care within areas known to be occupied by tree snails and limited walking by hunters and hunting dogs will occur where surveys for tree snails have not been done.

Project Activity Using Tree Snail Avoidance Measures: All areas that would be used for the project activities, including walking (other than hunts), vegetation removal, and installation of netting/temporary fencing, cameras, snares, and traps, will be surveyed, prior to commencement of field work, for tree snails. MCBCB bio monitors will conduct tree snail detection surveys using the standard prioritized search procedure (Fiedler 2019, entire) within all areas proposed for these project activities prior to the project work occurring in the area. Snail surveys will include 33-foot (ft) (10-meter (m)) buffers around these project work areas including adjacent areas where the project may result in vegetation or soil disturbance.

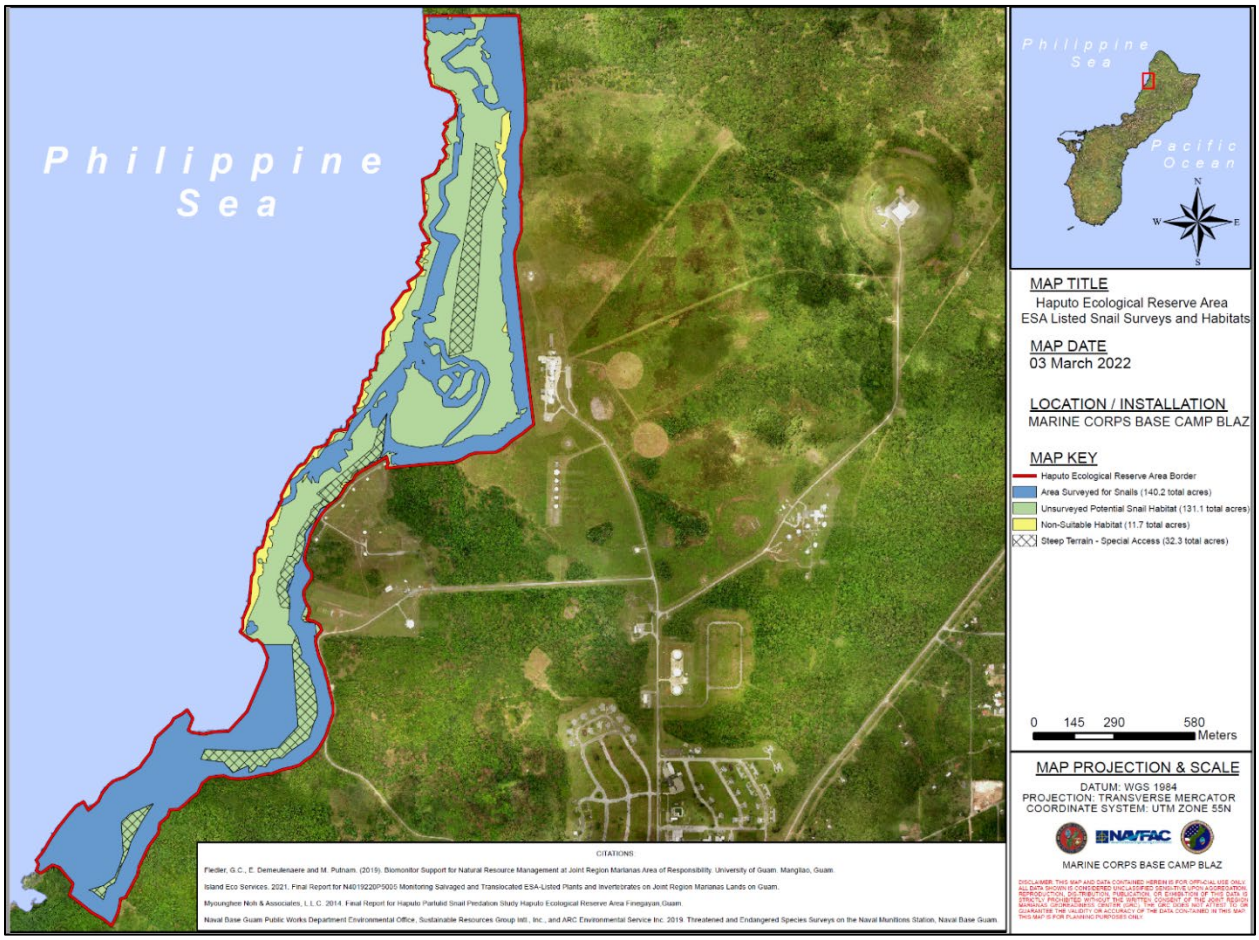

Figure 1. Haputo ERA, Guam map provided by NAVFAC (2022).

All areas occupied by a listed tree snail (including those detected in previous surveys with its edges confirmed by MCBCB bio monitors, new occupied areas found during the project snail surveys, and any new areas detected by other project staff during other project activity) will be cordoned off with temporary netting installed and maintained for the duration of the project at a

33-ft (10-m) distance from the occupied area (see below). All project work, with the limited exception detailed below, would be designed, or re-designed so it would occur outside the 33-ft (10-m) buffer protecting the tree-snail occupied area. None of the walking trails, vegetation removal, and areas for installation of equipment - netting/temporary fencing, cameras, snares, and trap project work or project vegetation or ground disturbance will occur within 33 ft (10 m) of any area known to, or found to, be occupied by a listed tree snail. In steep areas of cliff inaccessible for snail surveys (Figure 1), ungulates will be removed utilizing a snare or trap. The trap or snare location, and surrounding buffer areas will be surveyed by a MCBCB bio monitor prior to placement to ensure all activity related to the project, including ground disturbance resulting from the trap or snare, would not occur within 33-ft (10-m) of an area occupied by a listed tree snail.

Buffer netting details: Temporary project netting will be installed along a 33-ft (10-m) buffer around all areas known to or found to be occupied by tree snails to delineate the areas and prevent project activities from occurring near the tree snails. These nets will cordon off all areas previously known to be occupied by federally listed tree snails and any new areas found by MCBCB bio monitors to be occupied by federally listed tree snails. MCBCB bio monitors will accompany the eradication teams during the site preparation activities to assist them in delineating off areas that will be temporarily netted/fenced off to prevent trampling of snails.

Limited Ungulate Control Activities that Will Occur in Areas Occupied by Tree Snails and In Areas Not Surveyed for Tree Snails: Ungulate eradication personnel will take special care to avoid trampling tree snails in their work removing the ungulates from the areas known to be occupied by tree snails. In areas where the temporary project netting for tree snail-occupied areas are larger than an acre, the eradication team will install three sides of the temporary project netting and, with care given to each footstep, walk through the snail occupied space on a dry day to push ungulates out before securing the fourth side of the exclosure. In smaller areas, the smaller fences will not be closed until the area is confirmed to be free of ungulates.

Specific limited activity will occur within the portions of the site that remain unsurveyed for tree snails. The only project activities not implementing the tree snail surveys will be the off-trail, overland, ungulate shooting activities by eradication personnel and dogs. Ungulate shooting will occur in areas that are not pre-determined that will depend on the movements of the ungulates. The shooting and movement activities by eradication personnel and dogs that occurs where no tree snail surveys have been conducted would entail a maximum of 325 miles of human walking and 210 miles of dog movements. Ungulate drives, entailing 325 miles of hunters walking in unsurveyed areas, would be conducted slowly and methodically during daylight hours, to increase the likelihood hunting personnel may detect new tree snail colonies. Should a new tree snail colony be detected, the standard tree snail surveys would be conducted to delineate the perimeter of the new colony and the tree snail avoidance measures would be implemented to protect the newly-discovered tree snails. The total area that would be trampled by footfalls of hunters and dogs during the hunting activity in previously-unsurveyed areas would be less than four acres. To minimize footfalls in un-surveyed areas and to reduce impacts to native species, existing game trails that crisscross the project area and the project trails and fence lines previously surveyed for tree snails would be favored during this eradication work.

ACTION AREA

The action area is defined at (50 CFR 402.02) as "all areas to be affected directly or indirectly by the federal action and not merely the immediate area involved in the action." The Service has determined that the action area for this project is the Haputo ERA (see Figure 1).

ANALYTICAL FRAMEWORK FOR THE JEOPARDY ANALYSIS

Jeopardy Analysis Framework

In accordance with regulation (see 84 FR 44976), the jeopardy determination in this BO relies on the following four components:

1. The *Status of the Species*, which evaluates the species' current range-wide condition relative to its reproduction, numbers, and distribution; the factors responsible for that condition; its survival and recovery needs; and explains if the species' current range-wide population is likely to persist while retaining the potential for recovery or is not viable;

2. The *Environmental Baseline*, which evaluates the current condition of the species in the action area relative to its reproduction, numbers, and distribution absent the consequences of the proposed action; the factors responsible for that condition; and the relationship of the action area to the survival and recovery of the species;

3. The *Effects of the Action*, which evaluates all future consequences to the species that are reasonably certain to be caused by the proposed action, including the consequences of other activities that are caused by the proposed action, and how those impacts are likely to influence the survival and recovery role of the action area for the species; and

4. *Cumulative Effects*, which evaluates the consequences of future, non-Federal activities reasonably certain to occur in the action area on the species, and how those impacts are likely to influence the survival and recovery role of the action area for the species.

In accordance with policy and regulation, the jeopardy determination is made by evaluating the consequences of the proposed Federal action in the context of the species' current range-wide status, taking into account any cumulative effects, to determine if implementation of the proposed action is likely to cause an appreciable reduction in the likelihood of both the survival and recovery of the species in the wild. The key to making this finding is clearly establishing the role of the action area in the conservation of the species as a whole, and how the effects of the proposed action, taken together with cumulative effects, are likely to alter that role and the continued existence (i.e., survival) of the species.

STATUS OF THE SPECIES AND ENVIRONMENTAL BASELINE

Species Description

The Guam tree snail was federally listed as endangered on October 1, 2015 (80 FR 59423). Critical habitat designation for the species is in preparation. The Guam tree snail is a small land snail endemic to Guam. The shell is dextral with an obtuse spire and five whorls, and a pale straw color with darker axial rays and brown lines. The peristome is simple, thin, and white. Adult length is 0.5 to 0.7 inches (13 to 18 millimeters), and width 0.3 to 0.5 inches (8 to 13 millimeters) (Smith et al. 2008).

The Guam tree snail is part of the Partulidae family, which contains over 120 species distributed throughout the high volcanic islands of the tropical Pacific (Cowie 1992). Much of the family is extinct, and nearly all the extant species are considered critically endangered, endangered, or vulnerable under the definitions of the International Union for Conservation of Nature (IUCN 2022). The Guam tree snail was first described as *Bulimus (Partula) radiolatus* in 1846 and later renamed *Partula radiolata* in 1849 (Crampton 1925), which remains the accepted taxonomy for the species.

Life History

Little is known about the life history of the Guam tree snail. Land snails of the Partulidae family are generally slow-growing, long-lived, and slow-reproducing, producing between one and 10 eggs or juveniles in the brood pouch (Cowie 1992). Partulids are simultaneous hermaphrodites, having both male and female reproductive organs that are functional at the same time, and breeding may occur between unrelated individuals (outbreeding) or by self-fertilization (selfing) (Cowie 1992).

The Guam tree snail has historically been the most widespread and frequently encountered Partulid in Guam, and one hundred years ago Crampton noted the species occurred “almost everywhere in the island where suitable vegetation exists.” In Crampton’s (1925) study, colony size varied, even among uniform habitats; in the northern half of Guam, the species was more abundant in the west and relatively scarce in the east, while in the southern half of the island it was as abundant in the east as in the west. More than 2,000 individuals were collected across 37 sites in the 1920s (Crampton 1925). In 1989, resurveys found the Guam tree snail at only 9 of 34 of these sites, as well as at 7 of 13 new sites surveyed (Hopper and Smith 1992).

Partulids feed on live and decaying plant material, fungi, and microalgae (USFWS 2020). No clear obligate relationship with any vegetation has been identified for the Guam tree snail. No natural predators are known, but now extinct bird species of Guam may have fed on the Guam tree snail (Cowie 1992). The Guam tree snail lives primarily on the undersides of the leaves of many species of large-leaved plants including trees, shrubs, herbaceous plants, and occasionally ferns. The species’ preferred habitat is cool, shaded forest with high humidity and reduced air movement that prevents excessive water loss, and surveys have found individuals on both native and introduced plants (Smith et al. 2008; Lindstrom and Benedict 2014). The Guam tree snail typically is found in shaded vegetation including tree canopies more than 12 m (40 ft) high, degraded forests, and margins of forests or near water sources (Crampton 1925; Hopper and Smith 1992; Lindstrom and Benedict 2014). Increased mobility is associated with greater

humidity and precipitation. Tree snail movement is also facilitated by typhoons, which dislodge the leaves and branches carrying tree snails to adjacent locations (Fiedler pers. comm., 2018). When tree snails are dislodged from the host tree they retreat from the ground to return to the vegetation canopy (Fiedler pers. comm. 2018 and Holland, pers. comm. 2022). With the exception of post-typhoon periods when tree snails are found on leaves and branches dislodged by high winds, and when the leaf the snail is on dies and falls on the ground (Fiedler pers. comm. 2018), Guam tree snails are not known to spend time on the ground (Loerzel pers. comm. 2022, Holland pers. comm. 2022, Sischo pers. comm. 2022). A 325 acre survey in the Tarague Basin in 2020/2021 counted 5,760 *Partula radiolata* within a 9 acre portion of the Tarague (windward) site. The host plant on which *Partula radiolata* were observed was also recorded. Of the 2,458 host counts, only two observations were recorded on the ground (0.08 percent of the time)Rucinski (2021 (Table 2). No other survey has found a tree snail on the ground, though documentation of tree snail shells on the ground is common (Loerzel pers. comm. 2022, Holland pers. comm. 2022, Sischo pers. comm. 2022).

Sampled Guam tree snail populations have shown a very low degree of genetic heterogeneity, with no discernible colony specific or geographic patterns (Lindstrom and Benedict 2014). This indicates that Guam tree snails have limited ability to move between colonies, or that the sampled colonies have not been isolated long enough to form subpopulations (Lindstrom and Benedict 2014).

Status and Distribution

At the time of listing in 2015, there were no more than 26 colonies of Guam tree snails known, with between 10 and 150 individuals per colony. In 2020, the Guam tree snail was distributed across Guam in more than 50 locations, but populations at specific locations have likely fluctuated over the past century, and systematic comparisons of abundance over time has not been possible (USFWS 2020).

Threats

The following threats to the Guam tree snail contributed to its listing and continue to impact the ability of the species to recover.

Invasive Species Predation and Habitat Alteration: Persistence of the Guam tree snail is threatened by exposure to predation by ground-dwelling invertebrates, in particular the predatory invasive manokwari flatworm (*Platydemus manokwari*) (Holland 2014) and the arboreal little fire ant (*Wasmannia auropunctata*) (Vanderwoude, pers. comm. 2022; Richardson pers. comm. 2022; and Hawaii Invasive Species Council 2022). The non-native predatory land snails *Gonaxis quadriliteralis*, *G. kibwensiensi*, and *Euglandina rosea*, which are known to kill tree snails elsewhere in the Pacific, have also been documented on Guam (Holland 2014). The tree snail is also vulnerable to predation by arboreal rodents (less on Guam where rodent populations are suppressed by the brown treesnake), and trampling and predation by ungulates (Hopper and Smith 1992; USFWS 2020).Non-native ungulates graze upon the Guam tree snail's preferred host plants and profoundly impact the understory by clearing shrubs and trees, resulting in a drier

and hotter microhabitat unsuitable for the species (Smith et al. 2008) and by removing seed dispersers, the invasive brown treesnake also threatens the persistence of Guam tree snail habitat.

Introduced ungulates feed on, trample, and crush individual Guam tree snails and they trample or feed on seedlings, shoots, or young native plants before they can become established or tolerate herbivory and trampling. Ungulates were first introduced to the Mariana Islands by humans at least 500 years ago (De Freycinet and Barratt 2003). Pigs and deer are the biggest ungulate threats to Guam tree snail as they not only consume and trample individual snails, but they also change the structure of the forest habitat by making conditions unsuitable for regrowth by defoliating plants and destroying areas used for wallows (Wiles et al. 1999, 193-215). Since Guam tree snails prefer cool, shaded forest with high humidity and reduced air movement that prevents excessive water loss, (Smith et al. 2008; Lindstrom and Benedict 2014), areas impacted by ungulates are likely less hospitable for this species.

Invasive rodents and shrews have caused declines, and in some cases elimination, of island habitats (Cuddihy and Stone 1990). Rats feed on seeds, flowers, stems, leaves, roots, and other plant parts (Atkinson and Atkinson 2000) and can significantly affect regeneration of Guam tree snail's habitat. Introduced rats are responsible for the loss of vast lowland palm forests throughout Hawaii and on Rapa Nui because rats predated the flowers, seeds, and seedling palms, preventing them from regenerating (Hawaii DLNR 2020 and Hunt 2006). Rodents and the Asian house shrews (*Suncus murinus*) may also be predators of the Guam tree snail.

As a result of the introduction of the brown treesnake, the only remaining native avian frugivore on Guam is the Micronesian starling (*Aplonis opaca*) (Pollock et al. 2020). Almost three quarters of Guam's native trees were once dependent on birds to eat their fruits and disperse their seeds (Rogers et al. 2009; Rogers et al. 2017). Loss of seed dispersers on Guam has resulted in reduced recruitment, altered spatial distribution of native tree species, reduced species richness, and reduced forest regeneration on Guam in comparison to the other islands (Rogers et al. 2017). On Saipan, the median dispersal distance modeled by Rehm et al. (2019) for five bird species and 15 tree species was 184 feet (56 meters). In the absence of dispersal, seeds fall under the parent tree resulting in reduced connectivity between disjunct plants and reduced survival of seedlings due to conspecific competition (Nathan and Muller-Landau 2000). Elimination of seed dispersers has cascading effects on other trophic levels and can affect ecosystem stability (Perry and Morton 1999). The snake's elimination of seed dispersers is an indirect threat that negatively affects the habitats of the Guam tree snail.

Loss or degradation of habitat due to development: Guam tree snail's habitat has been substantially diminished in quality and quantity due to ongoing ungulate damage, the encroachment of invasive plants, and removal of habitat for agricultural, military, and urban development (80 FR 59424, October 1, 2015). Changes to the native forest understory particularly limit the persistence and size of extant Guam tree snail populations.

Habitat Loss due to Wildfire and Invasive Plants: Wildfire and invasive plants threaten the native species and ecosystems of Guam, and are both intentionally set (e.g., arson) or caused by altered fire regimes from alien species (80 FR 59424, October 1, 2015). Even in the absence of wildfire, invasive plants, such as vines and the legume *Leucaena leucocephala* (tangan-tangan),

crowd out native canopy trees, similarly creating a drier, less suitable understory (Hopper and Smith 1992).

Limited numbers: The low degree of genetic heterogeneity throughout the island (Lindstrom and Benedict 2014) increases the vulnerability of the Guam tree snail to extinction and may make the species more vulnerable to the effects of isolation, habitat fragmentation, and stochastic events, including disease and typhoons. The Guam tree snail is vulnerable due to having a limited number of remaining individuals. Species with small population sizes are at greater risk of extinction than species with large populations for the following reasons: a) reduced reproduction or inbreeding depression (Darwin 1859; Lacy 1997; Frankham 2005; and Crnokrak and Roff 1999); b) reduced levels of genetic variability, allele loss, due to bottlenecks, which can lead to reduced resiliency, especially in changing environments (Stebbins 1950); and c) extirpation of all remaining individuals of the species by a single catastrophic event such as a typhoon, drought, flood, or wildfire.

Overutilization: The collection of snail shells for trade threatens the persistence of the Guam tree snail (80 FR 59424, October 1, 2015).

Inadequacy of Existing Regulatory Mechanisms -Although the Guam tree snail is listed under the ESA and Guam ESA, Territorial law does not yet include protections for the species, leaving the species vulnerable to harm and harassment. In addition, local laws and interdiction efforts are inadequate to prevent intentional or accidental introduction of ungulates, the little fire ant, the manokwari flatworm and other non-native invasive species to Guam tree snail habitat.

Climate change: Climate change has the most direct impact on factors including more variable temperatures, more severe alternating periods of droughts and floods, and stronger typhoons. These changes can reduce the ability of an individual to survive, especially with additional anthropomorphic threats (USFWS 2015). The altered precipitation regimes and increased temperatures expected as a result of climate change could lead to the loss of native species that comprise the forest communities in which the Guam tree snail occurs. More frequent drought, flood, or typhoon events would affect understory microhabitat and Partulid food sources and exacerbate the effects of other threats. Further, damage or destruction of vegetation from typhoons modifies light availability and creates space for invasion by non-native pest and plant species (80 FR 59424, October 1, 2015). We anticipate the effects of climate change will further exacerbate the stress from the above listed threats, compounding the species vulnerability to habitat loss, predation, and limited numbers (USFWS 2015).

Environmental Baseline – Status of the Guam Tree Snail at Haputo ERA

Guam tree snail surveys have been completed over approximately half of the Haputo ERA (see Figure 1) and the snails are currently known to occur in patches within the site including areas where tree snails were translocated from Andersen South, Guam. Approximately 2,000 Guam tree snails have been detected in surveys of previously-known and new tree snail colonies at Haputo ERA. Surveyors detected 1,530 (ARC 2019)) Guam tree snails at the Haputo Beach tree snail colony and the number of snails detected at other locations of Haputo ERA are: Pugua

Point (31 snails), Double Reef (383 snails), South Haputo (2 snails) (Holland *et al,* 2014, 15-26), and Haputo fence line (30 snails, 0.4 snails/acre (Fiedler *et al*, 2019)).

Because the tree snail surveys did not include assessments of tree snail detection probability, there is considerable uncertainty regarding the number of tree snails in the action area. Because they would be within easy reach to surveyors, presumably detection probability is quite high for snails in the understory and on the ground while, however, due to limited visibility and backlighting during daytime snail surveys, Guam tree snail detection probability in overstory tree canopies is likely to be very low. No tree snails have been found on the ground at Haputo ERA. Detection probabilities for tree snail surveys is also likely to vary based on the level of search effort per acre searched. Tree snail detection probability can be as high as 39% when searchers spent a lot of effort searching very small areas, and as low as 1% when, such as in 2016, a tree snail is detected and snail presence is confirmed without implementation of a standardized search protocol (Rohrer 2016; Oahu Army tree snail survey information; Olmsted 2017, pers. comm. regarding Andersen South, Guam as cited in Department of the Navy 2017; Gary pers. comm. 2022; and Sischo, pers. comm. 2022). Detection of the approximately 2,000 Guam tree snails at Haputo ERA, with a 1% detection probability would mean there are actually 200,000 Guam tree snails within the surveyed areas of Haputo; a 4% detection probability would mean there are actually 50,000 tree snails. Application of a 39% detection probability would mean there are approximately 5,000 Guam tree snails living in the areas of Haputo ERA where the approximately 2,000 Guam tree snails were detected. Conservative assessment of the number of tree snails that were actually on the ground within the snail-surveyed areas of 0.08% of snails, indicates that there may have been between 4 and 160 Guam tree snails on the ground in the surveyed areas where surveyors detected zero snails on the ground. Because the detection probability of the Haputo ERA tree snails surveys was not assessed, there is considerable uncertainty regarding the number of Guam tree snails at Haputo ERA.

The Haputo ERA is vegetated by native limestone forest fringed by rocky and sand beach shoreline along the leeward side of northern Guam. Approximately 12 acres of the Haputo ERA are vegetated by bare coastal karst and short grassland areas, unsuitable for the Guam tree snail.

As detailed in the December 2021, Biological Evaluation, forest understory is heavily browsed by Philippine deer and pigs and large areas are devoid of all vegetation because of the approximately 346 deer and 48 pigs occupying the site. A very steep limestone outcrop cliff, largely inaccessible to humans and ungulates, runs along the length of the Haputo ERA (Figure 2).

The majority of tree snails at Haputo occur in a frequently studied patch of vegetation in the forest behind Haputo Beach, mainly in *Alocasia macrorrhiza* (taro) plants and in juvenile *Cocos nucifera* (coconut) leaves. The *Alocasia macrorrhiza* is a non-native mesic large-leaved plant that grows in a patch in the understory at Haputo Beach; 56% of the Guam tree snails counted at Haputo Beach by Holland et al. (2014) were found on *Alocasia macrorrhiza*. In surveys for tree snail predators within the tree snail colonies at Haputo, a relatively high density of predatory flatworms was found at the Pugua Point tree snail colony (13 worms observed per person-hour of survey), the team did not encounter any rat- or mouse-chewed native tree snail shells, and no live *Euglandina rosea* were found, but weathered shells of this predator were found. Predatory

rodents, flatworms, and wolf snails may occur on the ground at Haputo ERA. Ground predator exposure risks are likely to be sensitive to rainfall and moisture conditions.

Figure 2. Ungulate browse line at Haputo ERA (left, photo credit: Matthew Putnam) and limestone cliff (right, photo credit: Else Demeulenaere) (Photos from Fiedler *et al.* 2019).

EFFECTS OF THE ACTION

Nature of the Consequences

Because the approximately 400 ungulates at Haputo ERA are an ongoing threat to the Guam tree snails and their limestone forest habitat at Haputo ERA, the project's ungulate eradication action is among the most crucial conservation need for the Guam tree snail. Because there is considerable uncertainty regarding the number of Guam tree snails that may occur within those areas of the Haputo ERA where the standard tree snail survey and avoidance protocols will not be implemented, the risk that a field worker will trample a Guam tree snail cannot be discounted.

Risk of Trampling a Guam Tree Snail: Hunting personnel may trample and kill up to five Guam tree snails during those ungulate hunting activities that will occur within those portions of the Haputo ERA that have not been previously been surveyed for the Guam tree snail. The shooting and movement activities by eradication personnel and dogs that occurs where no tree snail survey and avoidance protocols are implemented at Haputo ERA would entail a maximum of 325 miles of human walking (with an associated 3.28 ac (1.32ha)) of footfall impact) and 210 miles of dog movements (with an associated 0.35 ac (0.14 ha) of dog footfall impact). In the absence of tree snail surveys and implementation of tree snail avoidance measures for field work in all areas of Haputo ERA, our risk assessment assumed tree snails are present in the unsurveyed areas. Because tree snails have not been detected on the ground at Haputo, the risk of tree snail trampling at this location may be lessened. However, because Guam tree snails have, at Tarague, been found on the ground (0.08% of them), and because tree snail detection probabilities may have been low in the previous surveys, our conservative estimate is that up to five Guam tree snail may be trampled as a result of the project activities.

Due to the likely prevalence of Guam tree snails within the unsurveyed work areas of Haputo ERA and given the lack of survey and avoidance implementation in these areas, there is a risk the proposed ungulate hunting work may result in the trampling and crushing death of a Guam tree snail. Footfall trampling the Guam tree snail on the karst limestone substrate of Haputo ERA would be likely to crush the tree snail's shell, resulting in fatal injury of the Guam tree snail.

Because the ungulate browsing pressure is extremely high at this site, cross-country pedestrian walking would usually be through areas devoid of understory leaves and branches. However, Guam tree snails may be dislodged from understory vegetation when the hunter's shoulders and equipment brush against understory vegetation occupied by a tree snail outside the areas where tree snail survey and avoidance precautions are in place. Additionally, the hunters would be pushing and tracking ungulates, so they would preferentially be walking in the trails and openings in the understory created by the site's significant ungulate population. There is also a risk the hunters may trample, as detailed above, the dislodged tree snail, though this risk is significantly diminished because hunters will push across the partitioned sites in side-by-side rather than single-file patterns. Because Guam tree snails have a hard protective shell and being dislodged from vegetation by wind and rain is a normal part of their behavior, any dislodged tree snails are not expected to be injured by the fall. During the time the project may cause a tree snail to be on the ground they could be exposed to predation by the flatworms that are known to occur at Haputo ERA (Holland et al 2014 p.26). Because of their brief time spent on the ground, project-dislodged tree snails are not expected to be affected by a ground predator as a result of the proposed action because any dislodged tree snail is expected to quickly return itself to the vegetation as they are known to do when they are dislodged by heavy rain and wind (Holland pers. comm. 2022).

Beneficial Consequences: The eradication of ungulates from the Haputo ERA will increase the likelihood of persistence of the Guam tree snail and by conserving the native limestone forest at that site, the project will benefit all native species in the area (USFWS. 2017). Ungulates not only consume understory and immature snail host plant species (both native and nonnative), but cause profound changes to the understory of forest habitats, which in turn affects tree snail populations (Smith et al. 2008; Smith 2013). In addition, ungulates may trample snails, and feral pigs may actively prey on snails. Removal of the ungulates from Haputo ERA and other snail habitat is among the highest priority conservation actions needed to conserve the Guam tree snail in the wild.

Cumulative Effects

Cumulative effects include the effects of future State, tribal, local or private actions that are reasonably certain to occur in the action area considered in this biological opinion. Future Federal actions that are unrelated to the proposed action are not considered in this section because they require separate consultation pursuant to section 7 of the Act.

The Haputo ERA is expected to continue to be a focal point for the conservation of the Guam tree snail and native limestone forest. Tree snail surveys are expected to continue to occur at the site.

Conclusion

After reviewing the current status of the Guam tree snail, the environmental baseline for the action area, the effects of the proposed action, and the cumulative effects, it is the Service's biological opinion that the action, as proposed, is not likely to jeopardize the continued existence of the Guam tree snail. The Service reached this conclusion based on the following information

described in the Effects of the Action section, above.

Although up to five Guam tree snails may be harmed by human disturbance and the trampled Guam tree snail is likely to be injured or killed, in the absence of project implementation, ungulates would continue to trample Guam tree snails and browse and graze the understory vegetation, preventing regeneration and persistence of the Guam tree snail's limestone forest habitat. The project's eradication of ungulates from the Haputo ERA would be beneficial to the long-term conservation of the Guam tree snail by restoring an ungulate-free area for the animal to occur. Project implementation is not likely to appreciably reduce the likelihood of both the survival and recovery of the Guam tree snail in the wild because the failure to implement the project would reduce the likelihood of persistence of the Guam tree snail at the Haputo ERA. Therefore, the action will be a net benefit to the species because it would restore ungulate-free habitat where a population of the Guam tree snail can be conserved.

INCIDENTAL TAKE STATEMENT

Section 9 of the Act and Federal regulation pursuant to section 4(d) of the Act prohibit the take of endangered and threatened species, respectively, without special exemption. Take is defined as to harass, harm, pursue, hunt, shoot, wound, kill, trap, capture or collect, or to attempt to engage in any such conduct. Harm is further defined by FWS to include significant habitat modification or degradation that results in death or injury to listed species by significantly impairing essential behavioral patterns, including breeding, feeding, or sheltering. Harass is defined by FWS as intentional or negligent actions that create the likelihood of injury to listed species to such an extent as to significantly disrupt normal behavior patterns which include, but are not limited to, breeding, feeding or sheltering. Incidental take is defined as take that is incidental to, and not the purpose of, the carrying out of an otherwise lawful activity. Under the terms of section 7(b)(4) and section 7(o)(2), taking that is incidental to and not intended as part of the agency action is not considered to be prohibited taking under the Act provided that such taking is in compliance with the terms and conditions of this incidental take statement.

The measures described below are non-discretionary and must be undertaken by the United States Marine Corps so that they become binding conditions of any grant or permit issued to the [applicant], as appropriate, for the exemption in section 7(o)(2) to apply. The United States Marine Corps has a continuing duty to regulate the activity covered by this incidental take statement. If the United States Marine Corps (1) fails to assume and implement the terms and conditions or (2) fails to require the (applicant) to adhere to the terms and conditions of the incidental take statement through enforceable terms that are added to the permit or grant document, the protective coverage of section 7(o)(2) may lapse. In order to monitor the impact of incidental take, the United States Marine Corps must report the progress of the action and its impact on the species to the Service as specified in the incidental take statement [50 CFR §402.14(i)(3)].

Amount or Extent of Take Anticipated

Based on our analysis presented in this Biological Opinion, the Service anticipates the following take may occur as a result of the proposed action:

1. The Service anticipates up to five Guam tree snails may be taken in the form of harm due to hunters walking 325 miles and 210 miles of dog movements within areas of the Haputo ERA project site where tree snail survey and avoidance measures are not implemented.

Effect of the Take

In the accompanying biological opinion, the Service determined that this level of anticipated take is not likely to jeopardize the continued existence of the Guam tree snail in the wild. Because control of ungulates is necessary for the conservation of the Guam tree snail, the proposed action is expected to result in the long-term benefits for the species.

Reasonable and Prudent Measures

The Service believes the following reasonable and prudent measure(s) are necessary and appropriate to minimize impacts of incidental take of the Guam tree snail:

1) Field crews will, where practicable, salvage any injured, dying, or freshly-dead individuals of the Guam tree snail they are made aware of.
2) The United States Marine Corps shall monitor and report on the level of incidental take of the Guam tree snail, including the number of miles walked in areas where tree snail survey and avoidance measures are not taken.

Terms and Conditions

In order to be exempt from the prohibitions of section 9 of the Act, the United States Marine Corps must comply with the following terms and conditions, which implement the reasonable and prudent measures described above and outline required reporting/monitoring requirements. These terms and conditions are non-discretionary.

Monitoring and Reporting

Report to the Pacific Islands Fish and Wildlife Office Field Supervisor in Honolulu Hawaii, the number and locations of any new colonies of the Guam tree snail detected during field work at Haputo ERA. If practicable include GPS points.

Report to the Pacific Islands Fish and Wildlife Office Field Supervisor in Honolulu Hawaii, all known instances of injury or death of a Guam tree snail. If practicable include GPS points and photos.

Salvage of species
The United States Marine Corps shall inform the Field Supervisor of the Service's Pacific Islands Fish and Wildlife Office in Honolulu, Hawaii, in writing of take of any federally listed species within three (3) working days. In case of injury or mortality of listed species for which take has occurred, please contact Guam Department of Agriculture, Division of Aquatics and Wildlife Resources at (671) 735-0294.

Designated Repositories: The depository designated to receive specimens of any threatened or endangered species killed is the Department of Agriculture, Division of Aquatics and Wildlife Resources, 163 Dairy Road Mangilao, Guam 96913 (telephone: (671) 735-0294). If the DAWR is not able to receive dead specimens, please contact the Bernice Pauahi Bishop Museum, 1525 Bernice Street, Honolulu, Hawaii, 96817 (telephone: 808/547-3511). If the Bernice Pauahi Bishop Museum does not wish to accession the specimens, the United States Marine Corps should contact the Service's Division Office of Law Enforcement in Honolulu, Hawaii (telephone: 808/861-8525; fax: 808/861-8515) for instructions on disposition.

Inform the Field Supervisor of the Service's Pacific Islands Fish and Wildlife office in writing within three (3) working days of any injured threatened or endangered species found and the actions taken as well as any disposition of dead listed species. Care must be taken in handling any dead or injured specimens of proposed or listed species to preserve biological material in the best possible state. In conjunction with the preservation of any dead specimens, the finder has the responsibility to ensure that evidence intrinsic to determining the cause of death of the specimen is not unnecessarily disturbed. The finding of dead or injured specimens does not imply enforcement proceedings pursuant to the ESA. This reporting requirement enables the Service to determine if take is reached or exceeded and to ensure that the terms and conditions are appropriate and effective.

The Service believes that no more than five Guam tree snails will be incidentally taken as a result of the proposed action. The reasonable and prudent measures, with their implementing terms and conditions, are designed to minimize the impact of incidental take that might otherwise result from the proposed action. If, during the course of the action, this level of incidental take is exceeded, such incidental take represents new information requiring reinitiation of this consultation and review of the reasonable and prudent measures provided. The Federal agency must immediately provide an explanation of the causes of such taking and review with the Service the need for possible modification of the reasonable and prudent measures.

Conservation Recommendations

Section 7(a)(1) of the Act directs Federal agencies to utilize their authorities to further the purposes of the Act by carrying out conservation programs for the benefit of endangered and threatened species. Conservation recommendations are discretionary agency activities to minimize or avoid adverse effects of a proposed action on listed species or critical habitat, to help implement recovery plans, or to develop information.

Conservation Recommendations

The Service recommends the standard tree snail survey and avoidance measures be completed over the entire ungulate removal project area to minimize trampling risks to the Guam tree snail.

Implement the biosecurity measures in Appendix B to avoid the spread of the little fire ant and other species to and within Haputo ERA.

In order for the Service to be kept informed of actions minimizing or avoiding adverse effects or benefitting listed species or their habitats, the Service requests notification of the implementation of any conservation recommendations.

Reinitiation Notice

This concludes formal consultation on the action(s) outlined in this biological opinion. As provided in 50 CFR § 402.16, reinitiation of formal consultation is required where discretionary Federal agency involvement or control over the action has been retained or is authorized by law and: (1) if the amount or extent of taking specified in the incidental take statement is exceeded; (2) if new information reveals effects of the action that may affect listed species or critical habitat in a manner or to an extent not previously considered; (3) if the identified action is subsequently modified in a manner that causes an effect to the listed species or critical habitat that was not considered in the biological opinion; or (4) if a new species is listed or critical habitat designated that may be affected by the identified action.

Thank you for your ongoing efforts to conserve threatened and endangered species. If you have any questions concerning this Biological Opinion, please contact Island Team Manager - Mariana Islands, Jacqueline Flores, at the letterhead address or by telephone at (671) 989-6744.

Sincerely,

Michelle D. Bogardus
Deputy Field Supervisor

APPENDIX A

NLAA Concurrence for Mariana Fruit Bat, Mariana Eight-Spot Butterfly, Two Tree Snail, and Seven Listed Plant Species

This appendix details the U.S. Fish and Wildlife Service's (Service) concurrence with your determination the proposed U.S. Marine Corps (Marine Corps) eradication of ungulates from Haputo Ecological Reserve Area (ERA), Marine Corps Base Camp Blaz (MCBCB), Guam, is not likely to adversely affect the threatened Mariana fruit bat (*Pteropus mariannus mariannus*, fanihi), *Bulbophyllum guamense* (wild onion, siboyas halumtanu, siboyan halom tano), *Cycas micronesica* (fadang), *Dendrobium guamense*, *Tabernaemontana rotensis*, *Tuberolabium guamense* and the endangered Mariana eight-spot butterfly (*Hypolimnas octocula marianensis*, ababbang, Libweibwogh), humped tree snail (*Partula gibba*, akaleha'), fragile tree snail (*Samoana fragilis*, akaleha' dogas), *Eugenia bryanii*, and *Heritiera longipetiolata* (ufa halumtanu, ufa halom tano), pursuant to section 7 of the Endangered Species Act (ESA) of 1973, as amended (16 U.S.C. 1531 et seq.). Our analysis is based on information provided in your December 20, 2021, letter and telephone conversations, field investigations, and other information in our records. A complete record of this consultation is on file at the Pacific Islands Fish and Wildlife Office.

Project Description:

The proposed action would remove non-native invasive ungulates from the Haputo ERA, Guam. A detailed description of the proposed action is contained in your December 20, 2021, *Biological Evaluation of Ungulate Eradication at Haputo Ecological Reserve Area, Marine Corps Base Camp Blaz*, which we received January 4, 2022. Additional minimization and avoidance measures which were incorporated into your project at the recommendation of our office, are detailed within the Project Description body of this Biological Opinion or summarized below.

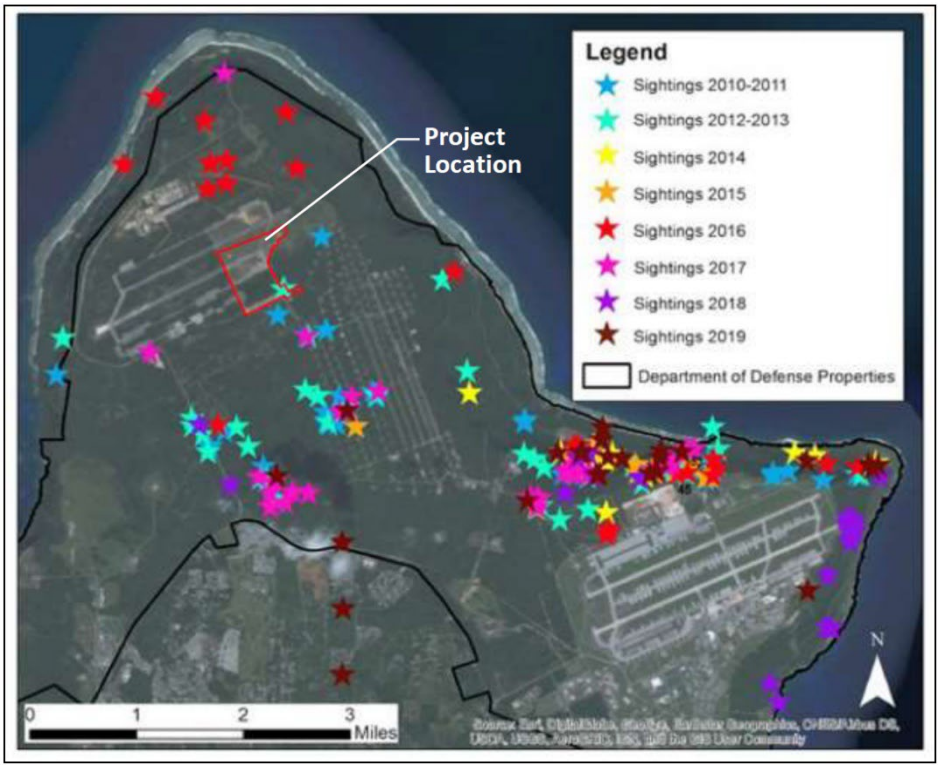
Avoidance and Minimization Measures:

Mariana Fruit Bat: Because the action area includes suitable habitat for the Mariana fruit bat, the project design incorporates the Service's standard recommended measures to reduce the likelihood the project may affect this sensitive species. The entire ERA and the surrounding forest within 150 meters of the ERA is visible from the cliff line; however, the structure of the tree canopy will usually prevent eradication teams from observing 492 feet (ft) 150 meters (m) when work is being conducted within the ERA. Prior to beginning each day's project activities, the eradication team will monitor the action area (ERA and surrounding area) for Mariana fruit bats from above the cliff line. Monitoring will be conducted again from within the individual pocket(s) or space(s) the eradication team is conducting work in that day. Monitoring will include looking for Mariana fruit bats flying to or from a roost, and visual surveys for roosting

bats. Should a diurnal roost be suspected in or adjacent to (within 492 ft (150 m) of the ERA, additional efforts to determine the location of the roost could include pre-dawn use of infrared sensors. No eradication activity will occur within 150 meters of a diurnal bat roost.

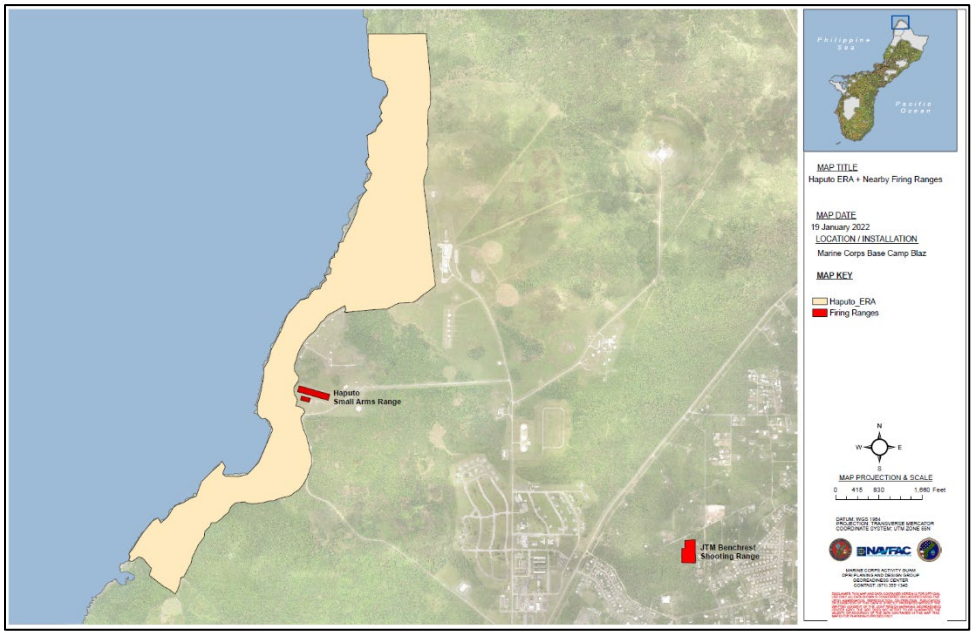
Almost all ungulate eradication activities within the ERA will be conducted during daylight hours, when Mariana fruit bats are more likely to be at a diurnal roost and less likely to be within or traversing the project site to forage. Limited night operations (spotlighting for ungulates during removal activities) will occur only on the upper cliff line in open areas outside forest habitat. Night operations will be occur no more than approximately 8 hours per month. Should any transiting or foraging Mariana fruit bats be observed during any type of project work, day or night, the project work will be postponed until the Mariana fruit bat has left the area of its own volition.

Tree snails: Minimization and avoidance measures detailed in the Biological Opinion Project Description, above, for the Guam tree snail, will also be taken to avoid trampling of the humped tree snail and the fragile tree snail.



Mariana eight-spot butterfly and the listed plants: All project field staff will undergo both classroom and field identification training for all listed plants and butterfly host plants. To minimize the potential for the project to adversely affect a listed plant or butterfly host plant, no project-related soil disturbance (including soil disturbance by an ungulate in a snare) or vegetation cutting or other disturbance will occur within 10 ft (3 m) of a listed plant or 20 ft (6 m) from a butterfly host plant and personnel will not walk within 1 m (3 ft) of any such plant. Biomonitors will pre-survey all project areas other than the 325 miles of off-trail walking hunters will do outside surveyed areas, to identify the locations of listed plants and butterfly host plants so the locations of project items including nets, snares, and traps, can be modified to maintain buffer distances. Known Mariana eight-spot butterfly host plant locations are on large boulders or other areas that will be avoided during project work. Areas known to or found to be occupied by listed plants or butterfly host plants will be marked with visibility flagging or sectioned off with netting to ensure project actions maintain the avoidance buffers. Ungulate drives, entailing 325 miles of hunters walking in unsurveyed areas, would be conducted slowly and methodically during daylight hours, to ensure personnel are able to avoid walking near any previously unsurveyed listed plants and butterfly host plants.

Consequences of the Proposed Action:



Mariana fruit bat:

The Mariana fruit bat has not been sighted within or transiting the project area, but bats are known from coastal sites north and south of the project site, and inland from the project area (Appendix A, Figure 1). The occurrence of the Mariana fruit bat at Haputo ERA may be influenced by the proximity of a small arms live-fire shooting range on the plateau above the site

(Appendix A, Figure 2).

Appendix A, Figure 1. Mariana fruit bat sightings from 2010 to 2019 at Andersen Air Force Base with proposed THAAD ADP project footprint indicated in red (U.S. Navy 2019).

Appendix A, Figure 2. Proximity of a live-fire shooting range to the Haputo ERA (NAVFAC 2022).

Mariana fruit bats are a large-bodied colonial tree-roosting species. Mariana fruit bats are at their roost during the day and they forage at night on fruits, nectar, pollen, and some leaves from at least 45 different plant species.

Colonies established by one or more bats can consist of fewer than 20 individuals or they can grow to over 1,000 individuals (Guilbert and Mullin 2020). A day roost occupied by one or more female bats is considered a maternal colony. Generally maternal colonies are occupied by a harem of bats – a single male with multiple females. Breeding occurs year-round. Bachelor colonies and solitary male bat roosts are also common. The mother bat carries its bat pups until they become too heavy. When these young bats that are not well developed enough to fly on their own, they are left at the maternal roost when the parents forage at night. Non-volant Mariana fruit bats are vulnerable at their day roost and foraging habitat to predation by the brown treesnake, disturbance by the little fire ant (Vanderwoude, pers. comm. 2022; Richardson pers. comm. 2022; and Hawaii Invasive Species Council 2022), and human disturbance and adult bats are vulnerable to harassment from these threats. When the Mariana fruit bat on its day roost is startled or alarmed by disturbance including human scent and noise it takes flight from its roost. Prolonged or severe disturbance results in abandonment of the roost. It can take months for bats to return to an abandoned root, if they return at all. Because some members of the public still consider the Mariana fruit bat to be a delicacy and a valued gift to persons of importance, these bats are vulnerable to poaching when they are outside of areas that are actively protected by law enforcement.

The eradication of ungulates from native limestone forest habitat will increase the persistence of the Mariana fruit bat's habitat on Guam. Ungulates cause profound changes to the understory of forest habitats. The high densities of feral ungulates in northern Guam dramatically alters forests and destroys native forest habitat. The proposed removal of ungulates from the Haputo ERA will improve the future condition of the area's limestone forest habitat for native species including the Mariana fruit bat.

To avoid human scent and other human disturbance to the sensitive bat, should one or more be found at the project site, the project design incorporates a 150-m (492-ft) buffer around the Mariana fruit bat. Because project activity will cease if a Mariana fruit bat is detected within 150 m (492 ft) of the project activity, impacts to the bat are expected to be extremely unlikely to occur. Because adverse effects are extremely unlikely to occur, they are **discountable** and therefore not likely to adversely affect the Mariana fruit bat.

Humped tree snail and fragile tree snail:

The humped tree snail is known from three locations at Haputo ERA: 108 snails were detected at Haputo and Pugua Point in the 2013 snail surveys (Lindstrom *et al* 2014), 88 humped tree snails were found in 2021, at a tree snail translocation site, and an additional 136 naturally-occurring humped tree snails were detected at the Haputo Beach tree snail colony and the southern area of

the Haputo ERA (ARC 2019, p. 22). A total of 43 fragile tree snails have been detected at Haputo ERA (3 were detected in the 2013 (Lindstrom *et al* 2014), one was found at Pugua Point (Holland 2014, p. 15), and a new, previously-unknown tree snail colony, containing 30 fragile tree snails, was found during pre-construction surveys for the Haputo ungulate fence (Fiedler *et al* 2019). Approximately half of the Haputo ERA has been surveyed for tree snails (NAVFAC 2022, see Biological Opinion Figure 1); no individual of either species has been found living on the ground. The humped tree snail and fragile tree snail may occur in one or more small tree snail colonies within the unsurveyed areas of Haputo where project hunters would walk 325 miles conducting ungulate eradication work.

The eradication of ungulates from the Haputo ERA will increase the likelihood of persistence of the tree snails and by conserving the native limestone forest at that site, the project will benefit all native species in the area (USFWS. 2017). Ungulates not only consume understory and immature snail host plant species (both native and nonnative), but cause profound changes to the understory of forest habitats, which in turn affects tree snail populations (Smith et al. 2008; Smith 2013). In addition, ungulates may trample snails, and feral pigs may actively prey on snails. Removal of the ungulates from Haputo ERA and other snail habitat is among the highest priority conservation actions needed to conserve listed tree snails in the wild.

Because there are expected to be very few humped tree snails and fragile tree snails within the areas of Haputo ERA where pre-work surveys and avoidance measures will not be conducted, and because zero, to a very small number, of these snails would be expected to be on the ground. The risk of the approximately 4 acres of footfall occurring on a tree snail is extremely low. The likelihood of a humped tree snail or fragile tree snail being trampled is extremely unlikely because there are not expected to be any tree snails on the ground within the small area of footfalls of the hunters. Because adverse effects are extremely unlikely to occur, they are **discountable** and therefore the project is not likely to adversely affect the humped tree snail and the fragile tree snail.

Mariana eight-spot butterfly and seven listed plants (Bulbophyllum guamense, *Cycas micronesica*, *Dendrobium guamense*, *Tabernaemontana rotensis*, *Tuberolabium guamense*, *Eugenia bryanii*, and *Heritiera longipetiolata*):

The listed plants and the Mariana eight-spot butterfly's host plants are vulnerable to physical injury and soil compaction, which could reduce their survival, reproductive success, or reproductive effort. Project risks to these species are reduced because all project field staff will undergo both classroom and field identification training for all listed plants and butterfly host plants and no project-related soil disturbance (including soil disturbance by an ungulate in a snare) or vegetation cutting or other disturbance will occur within 3 m (10 ft) of a listed plant or butterfly host plant and staff will not walk within 1 m (3 ft) of any such plant.

The eradication of ungulates from the Haputo ERA will increase the likelihood of persistence of the Mariana eight-spot butterfly and the seven listed plants and their native limestone forest habitat. Ungulates not only consume understory and immature listed plants and butterfly host plants, they cause profound changes to the understory of forest habitats, which in turn affects tree snail populations (Smith et al. 2008; Smith 2013). Removal of the ungulates from Haputo ERA is among the highest priority conservation actions needed to conserve these listed species in the wild.

Because of the project's implementation of measures to keep buffer distances for all activities to prevent project interactions with listed plants and butterfly host plants, the likelihood of a listed plant or butterfly host plant being affected by this project is extremely unlikely. Because adverse effects are extremely unlikely to occur, they are **discountable** and therefore the project is not likely to adversely affect the Mariana eight-spot butterfly, *Bulbophyllum guamense*, *Cycas micronesica*, *Dendrobium guamense*, *Tabernaemontana rotensis*, *Tuberolabium guamense*, *Eugenia bryanii*, and *Heritiera longipetiolata*.

Conclusion

Based on the proposed action, our analysis indicates consequences of the proposed action, to the Mariana fruit bat, humped tree snail, fragile tree snail, Mariana eight-spot butterfly, and *Bulbophyllum guamense*, *Cycas micronesica*, *Dendrobium guamense*, *Tabernaemontana rotensis*, *Tuberolabium guamense*, *Eugenia bryanii*, and *Heritiera longipetiolata* are discountable as described above. **The Service therefore concurs with your determination that the removal of ungulates from Haputo ERA may affect, but is not likely to adversely affect these species.** Unless the project description changes, or new information reveals that the proposed project may affect listed species in a manner or to an extent not considered, or a new species is listed or critical habitat designated that may be affected by the proposed action, no further action pursuant to section 7 of the ESA is necessary.

APPENDIX B: BIOSECURITY PROTOCOLS

Biosecurity Protocols

- Ensure all work vehicles, machinery, and equipment are cleaned, inspected by its user, and found free of mud, dirt, debris and organisms prior to entry into and exit from the action area.
    - Vehicles, machinery, and equipment must be thoroughly pressure washed in a designated cleaning area (designated by the responsible land manager) and visibly free of mud, dirt, plant debris, insects, frogs (including frog eggs) and other vertebrate species such as rats, mice and non-vegetative debris. A hot water wash is preferred. Areas of particular concern include bumpers, grills, hood compartments, areas under the battery, wheel wells, undercarriage, cabs, and truck beds (truck beds with accumulated material (intentionally placed or fallen from trees) are prime sites for accidental transport of invasive species).
    - The interior and exterior of vehicles, machinery, and equipment must be free of garbage and food. The interiors of vehicles and the cabs of machinery must be vacuumed clean. Floor mats will be sanitized with a solution of at least 70-percent isopropyl alcohol or a freshly mixed 10-percent bleach solution.
    - Any machinery, vehicles, equipment, or other supplies found to be infested with ants (or other invasive species) must not enter action area. Treatment is the responsibility of the equipment or vehicle owner and operator.
- **Little Fire Ants**: Ensure all work personnel clothing and skin, and all vehicles, machinery, and equipment are inspected for invasive ants prior to moving to the project site and prior to moving from areas occupied by the little fire ant into areas where the ant does not occur.
    - Ensure a visual inspection for little fire ants (*Wasmannia auropunctata*) is conducted prior to entry into action area or movement within the project site, from previously or currently ant-occupied areas, into areas where the ant does not occur.
    - Hygiene is paramount but even the cleanest vehicle may transport little fire ant. Place insect bait into refillable tamper resistant bait stations. Note larger vehicles, such as trucks, may require multiple stations. Monitor bait stations frequently (every week at a minimum) and replace bait as needed. If the station does not have a sticker to identify the contents, apply a sticker listing contents of the station. Refer to the Hawaii Ant Lab's little fire ant fact sheet, which can be downloaded here: https://littlefireants.com/wp-content/uploads/02a-LFA-Fact-Sheet_v2.5_May2020.pdf.
    - Do not use any machinery, vehicles, equipment, or other supplies found to be infested with ants (or other invasive species) or used in an area infested by ants, for any type of project work until it is sanitized and re-tested following a resting period of at least 24 hours. Infested vehicles must be sanitized following recommendations by the Hawaii Ant Lab (http://www.littlefireants.com) or other ant control expert and in accordance with all State and Federal laws. Treatment is the responsibility of the equipment or vehicle owner and operator.
- Keep all base yards and staging areas inside and outside natural areas and native habitat free of invasive species.

- Ensure base yards and staging areas are inspected at least weekly for invasive species and any invasive found is to be removed immediately. Pay particular attention to where vehicles are parked overnight, keeping areas within 30-feet of vehicles free of debris. Parking on pavement and not under trees, while not always practical, is best.
- Project vehicles or equipment stored outside the action area, such as a private residence, are to be kept in a pest-free area as defined by the onsite land or project manager.
- Ensure all cutting tools, including machetes, chainsaws, and loppers are sanitized to remove visible dirt and other contaminants prior to entry into action area and prior to the movement of the tool from an area occupied or formerly known to be occupied by the little fire ant, into an area where the ant is not known to occur. Sanitized using a solution of >70% isopropyl alcohol or a freshly mixed 10% bleach solution. One minute after sanitizing, you may apply an oil based lubricant to chainsaw chains or other metallic parts to prevent corrosion.
- Vehicles, machinery, and equipment must be cleaned as described above.

- Safety note for individuals working in the action area:
  - Little fire ants nest in trees. If you are under a tree and that tree is bumped or somehow stressed, the threat response of the ants is to fall from the leaves and sting the person under the tree. If you are subject to an ant attack, do not panic. The ants are extremely small, but their stings are painful, so make sure you remove all ants from your body and clothing. The stings produce inch long welts that are itchy and painful, and can last for weeks.
  - Treat stings as you would other insect stings. In some persons, stings can produce life threatening reactions. Stocking antihistamine in the first aid kit is a reasonable precaution.

Jeffrey Laitila
36 CES/CEV Flight Chief
Andersen AFB Guam
Unit 14007
APO AP 96543-4007

Dear Mr. Laitila:

This document transmits the U.S. Fish and Wildlife Service's (USFWS or Service) biological opinion (BiOp) based on our review of the U.S. Department of the Navy (DON) proposed construction and operation of 48 earth-covered magazines (ECMs), also referred to as munition storage igloos, within the Munition Storage Area (MSA) I located on Andersen Air Force Base (AAFB), Guam, and its effects on the threatened Mariana Fruit bat (*Pteropus mariannus mariannus*), *Cycas micronesica*, and *Tabernaemontana rotensis* (Table 1) in accordance with section 7 of the Endangered Species Act (ESA) of 1973, as amended (16 U.S.C. 1531 et seq.). Your Biological Assessment (BA), containing sufficient information for the Service to complete this formal consultation was received on April 21, 2020.

This BiOp is based on information provided in the April 21, 2020 BA, previous correspondence between the Service, Air Force and DON, and information in Service files. A complete consultation record is on file at the Pacific Islands Fish and Wildlife Office (PIFWO).

Table 1: Species considered in this biological opinion.

Common Name	Latin Name	Listing Status	Critical Habitat	Effect Determination
Mariana Fruit Bat	*Pteropus mariannus mariannus*	T	NA	Likely to adversely affect
NA	*Cycas micronesica*	T	NA	Likely to adversely affect
NA	*Tabernaemontana rotensis*	T	NA	Likely to adversely affect

Consultation History

10/10/2018. USFWS received BA and request for formal consultation via email.

10/25/2018. DON and USFWS meet to discuss BA. USFWS to send comments on BA.

11/8/2018. USFWS sent a letter acknowledging the information necessary to initiate formal consultation was included in the October 10 letter and BA. Letter identified information requested to add/clarify the detail in the BA. Consultation number 01EPIF00-2019-F-0012 assigned to the project.

11/29/2018. DON submitted revised BA to USFWS with the requested information from the 11/8/2018 USFWS letter via email.

12/12/2018. USFWS-DON teleconference to discuss outstanding issues and BA revision.

12/13/2018. DON provides Mariana fruit bat (fanihi) survey methodology for Habitat Management Unit (HMU) via email.

12/14/2018. USFWS reviews and approves fanihi survey methodology via email.

12/19/2018. USFWS sends clarification regarding 10(a)(1)(A) permit requirement for potential handling of snails via email.

1/31/2019. USFWS-DON teleconference to discuss outstanding issues.

2/7/2019. USFWS provides DON with a draft snail survey protocol via email.

2/8/2019. DON seeks direction from AAFB leadership on whether to pause consultation until snail surveys are completed (email).

2/21/2019. USFWS sends email pausing consultation retroactive to 2/8/2019 (see above).

3/6/2019. DON acknowledges receipt of 2/21/2019 email and indicates AAFB is pursuing modification of University of Guam (UOG) contract for snail surveys (telephone conversation). Pending funding process, surveys expected to be completed by the end of April.

4/25/2019. USFWS requests clarification on status of consultation and use of Tarague Triangle fence via email.

6/26/2019. USFWS requests update on status of consultation.

7/15/2019. USFWS requests update on status of consultation.

7/15/2019. DON reports that snail and cycad survey contract have been awarded and are about to begin.

9/16/2019. DON email states cycad and snail surveys near completion and revised BA is expected by the end of the month.

9/20/2019. DON email requests call or meeting with USFWS.

10/2019. DON submits revised BA with snail survey report submitted to USFWS (version 3).

11/20/2019. USFWS provides comments on BA (version 3).

1/27/2020. DON submits revised BA (version 4).

2/25/2020. USFWS provides comments on BA (version 4).

3/23/2020. USFWS provides recommendations for cycad pup collection, nursery growth, and outplanting.

4/09/2020. DON and USFWS teleconference to discuss updates to draft BA.

4/21/2020. DON submits final BA for USFWS review.

4/28/2020. USFWS letter acknowledging initiation of formal consultation with DON.

BIOLOGICAL OPINION

Description of Proposed Action

The 36th Wing (WG) Commander proposes to construct new munitions storage facilities and infrastructure upgrades in MSA I. The action incudes building 48 ECMs within a 51-acre construction footprint. The ECMs will be arranged side by side along 5th to 8th Streets between C Avenue and E Avenue. The DON has chosen this arrangement because it reduces operational impacts to existing ECMs and does not require the need to demolish operating munitions storage units.

Other alternatives have been analyzed and eliminated from detailed evaluation in the Draft Environmental Assessment (EA) due to the current 36th WG munitions storage capacity deficit (DON 2018). Natural resources including protected species are just one environmental media analyzed in the DON's Draft EA. Demolishing ECMs that are operational without immediate replacement would cause a storage shortfall. In order to upgrade or replace any one of the existing storage magazines, the munitions in that existing magazine (and possibly surrounding magazines) would have to be temporarily relocated for safety purposes. No other location on AAFB can safely accommodate a temporary relocation of munitions from the existing ECMs. The only safe option would be to temporarily store munitions at an installation other than AAFB during renovation or construction periods. The 36th WG would not be able to meet their current mission requirements if their existing capabilities were further reduced by temporarily storing munitions at other installations.

Layout of the Munition Storage Facilities

The magazine storage area consists of ECMs arranged in rows linked together by a network of roads. A grassy buffer area approximately 20 feet surrounds each magazine. The area beyond the buffer is highly fragmented forest that separates rows of munitions magazines. The land area

shows signs of past land grading. Historically, the area was impacted by agroforestry, small-scale agriculture, and military use during World War II (Cardno 2017).

The proposed Hayman-style ECMs would be used to store up to 500,000 pounds of munitions. The 48 ECMs would be arranged in various clusters with 8 ECMs along 8th Street, 2 along 7th Street, 25 along 6th Street, and 13 along 5th Street. Each magazine would be 81 feet long by 25 feet wide for an area of 2,400 square feet. The walls and roof are designed to be covered in a minimum of 24 inches of fill with a topping of shotcrete to prevent plant growth and erosion. Access to the storage area would be provided through a pair of blast-resistant structural steel access doors. Each ECM would have a concrete apron connecting it to the roadway. Spacing between each ECM would be approximately 50 feet, and a buffer area of 50 feet will be spaced around each cluster. This buffer area will be cleared of vegetation, graded for water drainage, and managed for grass cover. The total area to be cleared to create a grassy buffer zone will be 21 acres. Total area of impact for all the construction will be 51 acres.

Existing access roads from 5th to 8th Streets are in poor condition and will be improved with pavement. New roads will be 24 feet wide with 2 foot shoulders and constructed of asphaltic concrete. Concrete aprons 24 feet long and 26 feet wide will connect the ECMs to the road. A staging area to hold equipment and materials for the construction phase is also planned. It will clear 1.6 acres of previously disturbed shrub and grassy area near the northern corner of 5th Street and D Avenue.

A utility connection line will provide communication and electrical service to all of the storage units. The line will connect each ECM and other clusters of magazines by underground utility corridor duct banks or trench. The duct banks would be 2 to 4 feet (60 to 122 m) deep and 6 feet (1.8 m) wide with a cleared area of 6 feet (1.8 m) for back hoe. Total width of the corridor will be a 12 feet (3.6 m) wide path. Some of these lines are sited through forest along Avenue D and will require clearing. A pad-mounted transformer and new building with standby generator will be constructed at the intersection of 5th Street and D Avenue.

Site Preparation and Construction Activities

During site preparation, surface vegetation will be cleared and grubbed (i.e., roots and stumps extracted), and the ground will be excavated for the storage unit flooring. Ground disturbance during construction will include site grading to establish positive drainage control and creation of a perimeter mound to control runoff. Best management practices for soil erosion and sedimentation control will be implemented in accordance with project-specific drainage and erosion control plans. ECMs is planned to be constructed in three phases starting with 20 ECMs roughly along D Avenue, 16 ECM along 5th and 6th Street, and 12 ECMs along 6th Street. Project construction is planned to begin in March 2021.

Night construction will not occur as part of this project and all noise generating construction will end approximately 30 minutes before sunset.

Best Management Practices

DON will implement the following efforts as best management practices (BMP) to avoid and minimize impacts to ESA-listed species that occur within the project footprint.

1. To prevent environmental stressors on the listed plants, plant assessments and collection of plant material will be conducted by an authorized biologist before any construction related vegetation clearing or site preparation. Once all the (plant) material is collected, the DON will approve the site for vegetation clearing or site preparation.
2. ESA-listed plants within 10 feet of the construction perimeter will be clearly flagged to prevent any unnecessary disturbance from construction.
3. During site preparation and prior to any clearing and grubbing of surface vegetation, the construction perimeter will be clearly marked to prevent encroachment into adjacent areas with ESA-listed plants.
4. Silt fences or straw wattles will be used to prevent soil erosion into adjacent areas with ESA-listed plants. Dust screens will be installed at the project boundary if ESA-listed plants are within 10 feet from the project boundary. The dust screens will be used to shield protect, screen, and create a buffer for the ESA-listed plants.
5. DON will implement a contractor education program to ensure contractor personnel are informed of the biological resources in the project area, including invasive species, special-status species, avoidance measures, and reporting requirements in the project area. DON staff will provide the contractors a natural resources orientation with special focus on *C. micronesica*, *T. rotensis*, and Mariana fruit bat to ensure construction personnel are aware of these species and avoid inadvertent impacts due to lack of awareness of resource presence, sensitivities, and protective measures (see Appendix A in the BA for pamphlets and natural resource training material related to coconut rhinoceros beetle (*Cocos nucifera*) (CRB) and little fire ant (*Wasmannia auropunctata*) (LFA).
6. In areas where noise, light or human activity from construction of the proposed action would result in excessive noise, light or human activity above the ambient level, construction contractor personnel will be required to survey within line of sight (up to 150 m) of construction activities for bats prior to the start of a day's construction activities. If a fruit bat is present within the 150 meter buffer, construction work generating noise, light or human activity above the ambient levels will be postponed until the bat(s) has left the area and the DON will be notified to assess the situation. The construction contractor will document bat surveys in the daily logs.
7. DON staff will examine the condition of listed plant species within 10 feet of the construction perimeter during construction activities and document any adverse effects to the plants within that buffer. DON will contact the Service if new information reveals effects of the action that may adversely affect the listed plants in a manner or to an extent not previously considered. DON will inspect the contractors work to ensure that these BMPs are implemented for the entire duration of the project. DON staff will conduct random, unannounced inspections monthly and document the results in a log.
8. The DON will provide project specific work plans to the Service for inclusion in the consultation file.

Conservation Measures-General

The project's Conservation Measures are designed to avoid or minimize project effects to listed species and their habitats or to contribute to the recovery of a listed species. Conservation Measures are considered part of the proposed action and are vital to determining the scope of the proposed action. Implementation of Conservation Measures is required under the terms of the proposed action.

1. An authorized biologist will conduct and oversee all plant Conservation Measures. The authorized biologist must have relevant experience at a comparable level of responsibility in projects of similar size, scope and complexity and must have the following minimum qualifications:
    a. A bachelor's degree with an emphasis in botany, horticulture, ecology, or a related science;
    b. At least 100 documented hours of experience conducting propagation, translocation, transplantation, pest control, and monitoring of the aforementioned species or a closely related species; and
    c. Applicant must provide contact information of three references familiar with their work related to b (above).
2. Prior to salvage DON's authorized biologist will conduct surveys for ESA-listed plants to determine the health status of plants that cannot be avoided in the construction footprint. These additional surveys, referred to as pre-construction surveys, will verify the occurrence of federally listed species in the construction footprint and evaluate them for salvage and transplantation. An assessment will be conducted to determine how many individuals can be salvaged through either collection of seeds (*C. micronesica* and *T. rotensis*) or basal shoots (*C. micronesica*). DON's authorized biologist will pursue seed germination and plant division to meet transplanting success targets.
3. Plant propagation will occur at nurseries that follow the Hawaii Rare Plant Restoration Group "Phytosanitation Standards and Guidelines."
4. All salvaged plants will be transplanted in vegetation plots. AAFB Environmental Flight will choose up to five vegetation plots for the transplantation of salvaged individuals. These vegetation plots will be mixed native limestone forest with an ungulate-proof fence and ungulate-free. DON's authorized biologist will choose transplanting locations within habitat suitable to support cycads. The sites must receive environmental approval from the 36th Wing Commander prior to award of a contract to conduct the salvage and transplant activities. DON will submit the description of the locations to the Service once the sites are approved.
5. The DON will maintain the ungulate fences around these plots and conduct weed removal (mechanically, manually, or by herbicide) to enhance the existing native forest. Invasive species within a 20-foot radius around salvaged plants will be removed and maintained to ensure no more that 15 percent of vegetation is invasive species within the plots.

6. The DON will submit an annual report to the Service one year after the BiOp is rendered and each year thereafter until the project and associated conservation measures are complete. The conservation measures will be complete once the number of plants meeting the success criteria, defined in the DON's BA, has been achieved. The report will summarize the type of activities (e.g., health status of plants, propagation, transplantation, etc.) conducted on each species and the status of transplantation efforts. It will include the number of cycads basal shoots and seeds collected from each healthy adult, mature cycad and the number of *T. rotensis* seeds collected, propagation methods (number seeds germinated), survival rate, and the number of plants meeting the success criteria. DON will also include information on bat monitoring within line of sight (up to 150 m) of construction activities.
7. If it is determined that a contractor has violated any of the DON's proposed conservation measures, the DON will provide an on-site biological monitor during all further construction actions to insure no further incidences occur.

Conservation Measures for Specific Species

Cycas micronesica

The DON has proposed the following methods for salvage, propagation, and outplanting (transplanting from the nursery to a conservation site) of *C. micronesica*:

1. Efforts will be made to salvage as many cycad basal shoots as possible that are deemed healthy and suitable for salvage. An authorized biologist with the qualifications described above would make the determination of "health." Cycad basal shoot health is based on a variety of factors including extent of cycad aulacaspis scale (*Aulacaspis yasumatsui*) infestation/damage and current health condition of the parent plant.
2. Basal shoots that are approximately 1.7 inches in diameter (golf ball size) and larger will be considered for salvage (EA Engineering 2019).
3. Prior to salvage of the basal shoots, pesticides will be applied to treat cycad scale and cycad blue butterfly (*Chilades pandava)* larvae.
4. Cycads will be visually inspected for LFA before salvage and transplant. If LFA are observed, LFA Management Procedures will be followed (See Appendix A in BA).
5. Basal shoots will be removed from the main trunk to maintain as much of the root mass as possible. All pups will be placed in an appropriate pot for the pup's size and promote drainage.
6. Basal shoots will be tagged prior to removal from the parent plant. The tags will consist of a unique alphanumeric aluminum tag, which will be secured to the individual pots.
7. A pressure washer may be used to remove any remaining debris, loose plant material, and pests (i.e. cycad scale).
8. During transportation, basal shoots will be covered for protection from sun and wind exposure.
9. Once transported to a nursery, commercial root-promoting hormone may be applied to the stem followed by the remaining treatments: fungicide and insecticide applied in accordance with label directions and applicable regulations and law.

10. Each basal shoot will be potted in plastic pots with well-drained potting media such as pumice, perlite or sand and/or soilless and placed in the nursery. Salvaged basal shoots will be processed and transplanted in the nursery within one week of salvage.
11. Cycads will be evaluated monthly or more frequently depending on the conditions of the plants to determine growth and status. Any disease outbreak or significant loss of individuals under nursery conditions should be reported to the Service to allow DON and the Service to work together to ensure the success of nursery propagation of cycads.
12. Salvaged cycad basal shoots/seeds will be propagated in a nursery until an authorized biologist determines they are suitable for transplanting.
13. After transplantation, maintenance will include watering, weeding, fertilizer, pest control, support structures and/or plant protection until the plants show stem growth of at least 1.0 cm as measured below the base of the existing leaves (fronds) since planting in the wild.
14. Salvaged cycads (basal shoots or seeds) will be monitored and maintained until a minimum of 95 genetically different individuals have been established in the wild, showing stem growth of at least 1.0 cm as measured below the base of the existing leaves (fronds) since planting in the wild, and plants will be weaned of maintenance for a period of six months since planting for natural up take of nutrients and water.
15. The 95 individuals is based on: (1) the health of the plants within the project footprint, (2) the ability to safely salvage the basal shoots or seeds, (3) whether or not the basal shoot would survive transplantation, or (4) whether the plant produces seed. An authorized biologist will make the determination of "health."

Tabernaemontana rotensis

1. The DON has proposed to salvage and propagate enough *T. rotensis* seeds to ensure a minimum of six genetically distinct individuals meet or exceed success criteria described in #2 below. This minimum number is based on the assumption that there will be at least six mature, adult *T. rotensis* trees producing seeds at the time of collection. If seeds cannot be collected from within the project footprint prior to being removed (i.e., if the trees do not produce seeds), plant cuttings will be collected from the project footprint or seeds will be collected from individuals within the action area. A seed collection site consisting of 53 *T. rotensis* trees has been identified outside the project footprint but within the action area.
2. Once collected, seeds of *T. rotensis* will be cultivated in a plant nursery for propagating and subsequent transplanting. An authorized biologist will determine when plants are ready for transplanting and plant them into the vegetation plots. Monitoring will be done monthly or more frequently depending on the conditions of the plants to record growth and health status. Maintenance will be conducted depending on environmental conditions and plant needs, these include watering, weeding, pest removal, and plant protection. The DON's success criteria for *T. rotensis* transplanting is the plants must be between 2 and 3 feet tall, leaves remain turgid on the plant, individuals produce apical stem growth, and plants will be weaned of maintenance for a period of six months.

Action Area

The action area is defined at (50 CFR 402.02) as "all areas to be affected directly or indirectly by the federal action and not merely the immediate area involved in the action." The DON has determined that the action area for this project is AAFB, which is located on the northern tip of Guam on a limestone plateau occupying approximately 14,000 acres. The Service has reviewed this proposed action area and determined that since it includes areas where no effects to listed species are expected to occur the action area is, instead, the project footprint with an additional buffer of 150 meters. This accounts for possible bat disturbance, edge effects, and all five proposed outplanting sites (Achae Point, Tarague Basin, Tarague Triangle, Palms Golf Course, and 3A Outplanting). The entire action area is a total of 274 acres, including the project footprint, 150 meter buffer, and outplanting sites each totaling 51, 216, and 7 acres, respectively. The proposed ECMs would be constructed within MSA I, which is located northwest of AAFB's airfield and southeast of Northwest Field. The project footprint is within MSA I and includes a 51-acre construction footprint of 48 ECMs and related construction activities (Figure 1). No designated critical habitat occurs within the action area.

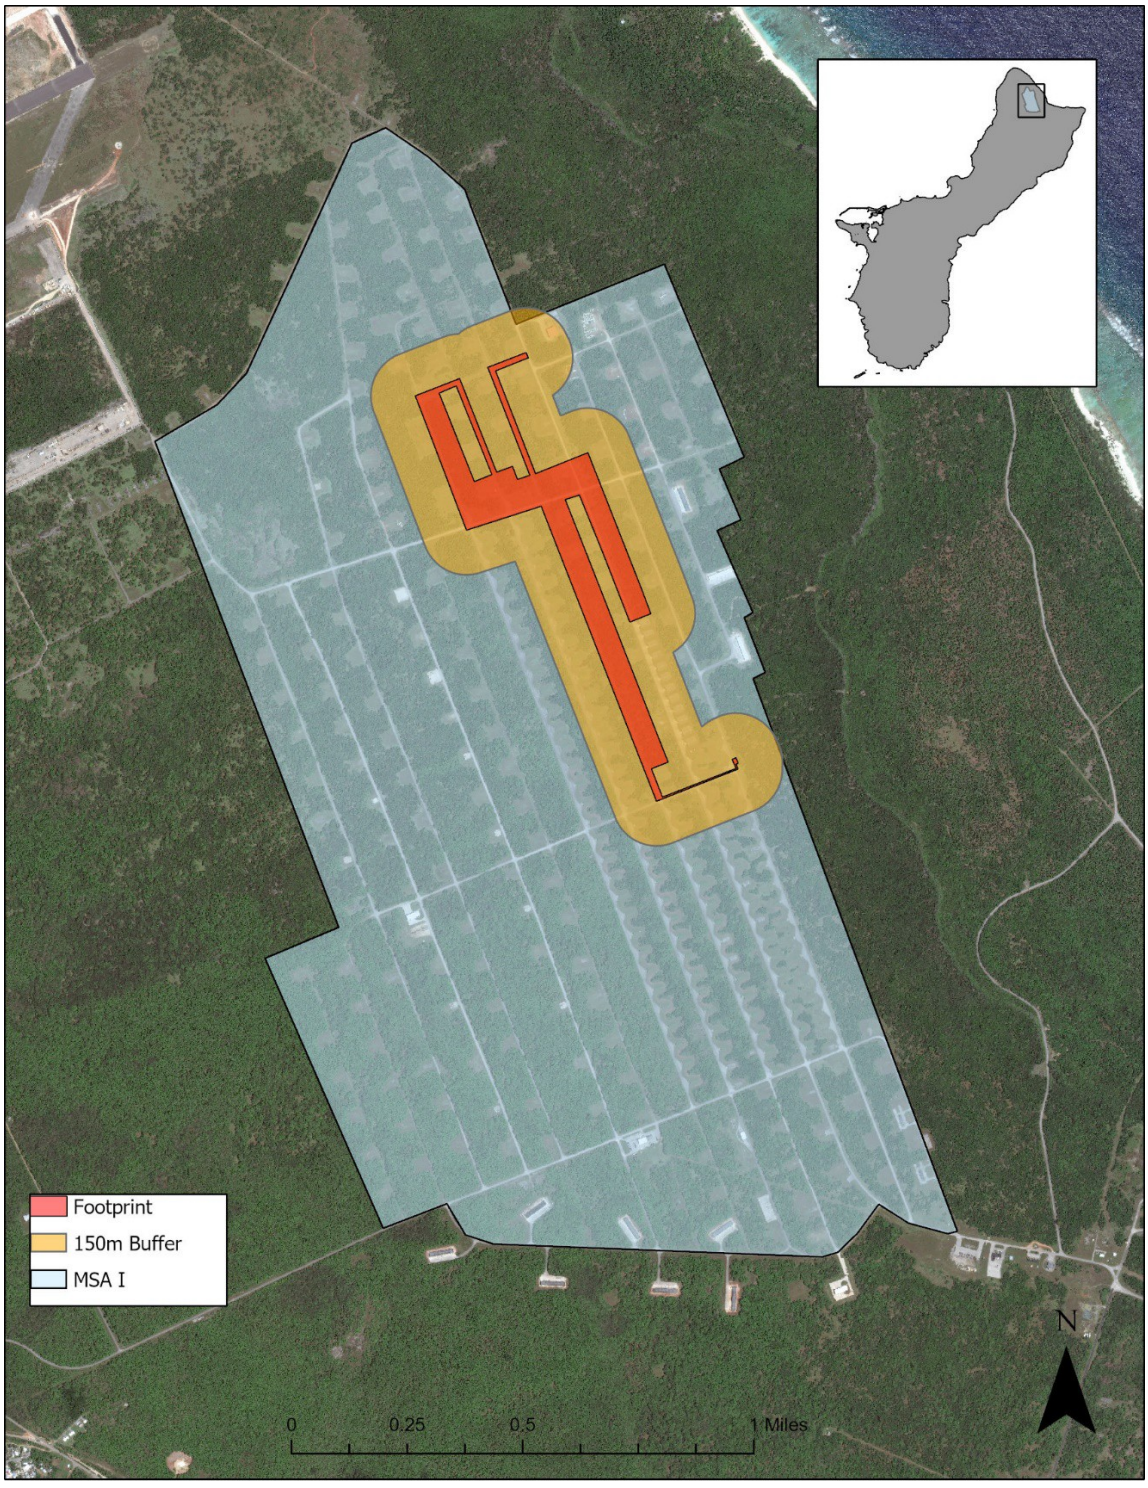

Figure 1: Layout of the Igloo site including MSA I, project footprint, and 150 meter action area buffer. Figure does not include proposed outplanting sites.

Analytical Framework for the Jeopardy/Adverse Modification Analysis

Jeopardy Analysis Framework

In accordance with regulation (see 84 FR 44976), the jeopardy determination in this BiOp relies on the following four components:

1. The *Status of the Species*, which evaluates the species' current range-wide condition relative to its reproduction, numbers, and distribution; the factors responsible for that condition; its survival and recovery needs; and explains if the species' current range-wide population is likely to persist while retaining the potential for recovery or is not viable;
2. The *Environmental Baseline*, which evaluates the current condition of the species in the action area relative to its reproduction, numbers, and distribution absent the consequences of the proposed action; the factors responsible for that condition; and the relationship of the action area to the survival and recovery of the species;
3. The *Effects of the Action*, which evaluates all future consequences to the species that are reasonably certain to be caused by the proposed action, including the consequences of other activities that are caused by the proposed action, and how those impacts are likely to influence the survival and recovery role of the action area for the species; and
4. *Cumulative Effects*, which evaluates the consequences of future, non-Federal activities reasonably certain to occur in the action area on the species, and how those impacts are likely to influence the survival and recovery role of the action area for the species.

In accordance with policy and regulation, the jeopardy determination is made by evaluating the consequences of the proposed Federal action in the context of the species' current range-wide status, taking into account any cumulative effects, to determine if implementation of the proposed action is likely to cause an appreciable reduction in the likelihood of both the survival and recovery of the species in the wild. The key to making this finding is clearly establishing the role of the action area in the conservation of the species as a whole, and how the effects of the proposed action, taken together with cumulative effects, are likely to alter that role and the continued existence (i.e., survival) of the species.

Status of the Species

Status of Mariana Fruit Bat

Species Description

The Mariana fruit bat was listed as endangered in 1984, but was reclassified to threatened on January 6, 2005, when it was determined that all fruit bats on Guam and throughout the Commonwealth of the Northern Mariana Islands (CNMI) comprise a single subspecies (70 FR 1190). The Mariana fruit bat is the only fruit bat species under U.S. jurisdiction. In 2004, critical

habitat for the fruit bat was designated at the Guam National Wildlife Refuge (GNWR) in the Ritidian Unit (69 FR 62944).

The Mariana fruit bat is a medium-sized fruit bat in the family Pteropodidae, and weighs between 0.73 lb to 1.27 lb (331 g to 577 g). Male Mariana fruit bats are slightly larger than females. The underside (abdomen) is black to brown with gray hair interspersed that creates a grizzled appearance. The shoulders (mantle) and sides of the neck are bright golden brown, but may be paler in some individuals. The head varies from brown to dark brown. The well-formed, rounded ears and large eyes give the face a canine appearance (USFWS 2010).

The paleotropical genus *Pteropus* is represented by approximately 63 species distributed across the Indian Ocean, Southern Asia, Australia, and in Oceania as far east as the Cook Islands (Almeida et al. 2014 p. 83). Most species in the genus *Pteropus* occur on islands or in coastal areas (Almeida et al. 2014 p. 84). Four species in the genus *Pteropus* are extinct and 38 species (60 percent of the genus) are considered critically endangered, endangered, threatened, near threatened, or vulnerable under the definitions of the IUCN (IUCN 2017). One of the four extinct species, *P. tokudae*, occurred only on Guam and has not been detected since 1968 (Bonaccorso et al. 2008; USFWS 2010).

Flannery (1995) and Simmons (2005) consider the Mariana fruit bat as one of two subspecies of fruit bats restricted to the Mariana Archipelago, with the Mariana fruit bat inhabiting the islands from Guam to Saipan and *P. mariannus paganensis* occurring on Pagan and Alamagan islands. However, subsequent genetic analysis conducted by Brown et al. (2011) indicate no genetic differentiation among islands within the Mariana Archipelago and that the bats on these islands, currently classified as two subspecies, should be managed as a single subspecies, *P. mariannus mariannus* (p. 940). In addition to the Mariana fruit bat, there are several other subspecies of *P. mariannus* endemic to other archipelagos, including the Caroline Islands and the Palau Archipelago (Brown et al. 2011 p. 934).

Life History

Mariana fruit bats, similar to other bats in the Pteropodidae family, do not use laryngeal echolocation, instead relying primarily on vision and smell to avoid obstacles and locate food sources (Almeida et al. 2014). Mariana fruit bats vocalize readily within colonies and when roosting. The diet of the Mariana fruit bat is comprised of fruits, nectar, pollen, and some leaves from at least 45 different plant species (Mildenstein & Johnson 2017). Rapid digestion and metabolism of food makes these animals reliant on forest habitat with diverse food resources available throughout the year (USFWS 2010). Mariana fruit bats use several forest types for foraging, roosting, and breeding, including native primary and secondary limestone forest, volcanic (or ravine) forest, old coconut plantations, and groves of *Casuarina equisetifolia* (Rice & Taisacan 1988; Worthington et al. 2001 p. 137; Wiles & Johnson 2004 p. 589, 591). Most Mariana fruit bats roost during the day in maternity colonies at sites to which they show a high level of fidelity (unless disturbed). A small proportion of Mariana fruit bats, usually males, roost alone or in small groups called bachelor colonies. Within colonies, Mariana fruit bats typically group themselves into harems (one male and 2-15 females) or bachelor groups (predominantly males) (Wiles 1987a).

Population Dynamics

Population demographic information for the Mariana fruit bat is limited. Based on three years of field observations on Guam similar to other Pteropodidae species, female Mariana fruit bats rear up to one pup annually (USFWS 2010) and likely have a gestation period of approximately 4.6 to 6.3 months (Pierson & Rainey 1992 pp. 1–17). Many *Pteropus* species typically do not give birth until 18 months of age (Pierson & Rainey 1992 pp. 1–17; McIlwee & Martin 2002 p. 76). Lifespan of substantially larger species, *P. alecto*, in Australia is four to five years, with a maximum of eight years (Vardon & Tidemann 2000).

Based on this demographic information, several authors have suggested that *Pteropus* bats have a low maximum population growth rate and thus a slow rate of recovery when a population is diminished (Pierson & Rainey 1992 p. 76; McIlwee & Martin 2002). Table 1 provides current population estimates per island and other demographic data (Mildenstein & Johnson 2017 p. 20).

Table 2: Mariana fruit bat population estimates and density by island

Island	Forest Habitat (ha)	No. of Bats	Density
Andersen, N. Guam	25,711	45	0.00
Rota	6,663	4,149	0.62
Aguiguan	302	50	0.17
Tinian	6,481	< 25	0.00
Saipan	5,355	< 50	0.01
Farallon de Medinilla	< 1	< 5	--
Anatahan	N/A	150	--
Sarigan	169	157	0.93
Guguan	170	226	1.33
Alamagan	485	86	0.18
Pagan	1,971	1,017	0.52
Agrihan	2,336	858	0.37
Asuncion	316	573	1.81
Maug	48	11[1]	

[1]Insufficient data available

Status and Distribution

The Mariana fruit bat is endemic to the Mariana Archipelago. The Mariana Archipelago extends across 459 nautical miles (nm) and is comprised of the U.S. Territory of Guam and 14 islands constituting the CNMI. The Mariana fruit bat is found on all 15 islands within the Marianas, except for Uracas, the northernmost island (Wiles et al. 1989 p. 69). The Mariana fruit bat is currently thought to be extirpated from Tinian (USFWS 2014). A single Mariana fruit bat was photographed on Farallon de Medinilla on two occasions, in 1996 and in 2008 (DON 2013 pp. 4–123).

Mariana fruit bats in general are strong fliers and highly mobile and small groups have been observed flying over the ocean between islands (Wiles & Glass 1990 p. 2; Wiles & Johnson

2004 p. 593). Distances between are: Guam to Rota, 32.3 NM; Rota to Aguijan, 42.1 NM; Aguijan to Tinian, 4.9 NM; Tinian to Saipan, 2.7 NM; Saipan to Farallon de Medinilla, 45.9 NM; and Saipan to Anatahan, 64.3 NM. In the remaining northern Marianas, interisland distances range from 15.7 NM to 54.0 NM. All islands have a maximum elevation ranging from 551 feet to 3,166 feet with the exception of Farallon de Medinilla, which has a maximum elevation of 266 ft. All islands are visible in clear weather from the tops of adjacent islands (Wiles & Glass 1990 p. 1).

Distribution of occupied Mariana fruit bat roost sites have fluctuated sharply in the southern islands. Fluctuations are attributed to variations in survey methods, coverage, and movements of Mariana fruit bats between islands (USFWS 2010). Initial observations of Mariana fruit bats in the southern islands (Aguiguan, Tinian, and Saipan) in 1983 and 1984 revealed populations of less than 25 to 50 Mariana fruit bats on each island. Mariana fruit bat numbers increased to about 75 to 100 individuals on Saipan in 1986 and to about 300 individuals on Aguiguan by 1988 (Wiles & Glass 1990 p. 2). Mariana fruit bats on Rota are believed to move periodically among the southern islands, and thus Rota is considered to be important to the long-term stability of the species in the southern part of the Marianas (Wiles & Glass 1990 p. 2; Wiles et al. 1995).

Historic numbers of Mariana fruit bats on Guam have been between 400 and 800 since 1984, but have since been decreasing. By the early 1980s nearly all Mariana fruit bats on Guam lived in Northern Guam in a single colony, which occasionally divided into several smaller aggregations (Wiles & Glass 1990 p. 2; Mildenstein & Johnson 2017 p. 25).

Survey data in the northern islands (Anatahan, Sarigan, Guguan, Alamagan, Pagan, and Agrihan; excluding Asuncion and Maug, which were not surveyed during this time period), indicate a 40 percent decline in Mariana fruit bat numbers between 1983 and 2000 (USFWS 2010). In the Service's 2014 5-year review, Mariana fruit bats were found to be stable or declining throughout most of their range; the only exception being on Rota where populations were increasing since 2008 due to increased enforcement of wildlife regulations (USFWS 2014).

Threats

Illegal hunting, loss of native forest, predation by the brown tree snake (*Boiga irregularis*) (BTS) on Guam, and the increased risk of extirpation or extinction of small, fragmented populations are the most significant threats to the survival of the Mariana fruit bat (USFWS 2014). These current known and potential threats are discussed below.

Threats:

- Loss or Degradation of Habitat:
    - Human development is a factor in habitat loss on all inhabited southern islands and on northern islands with military activity.
    - Feral ungulates and Philippine sambar deer (*Rusa marianna*) degrade habitat on many of the islands in the Marianas Archipelago. The successful eradication of feral ungulates from Sarigan and Anatahan suggests that similar projects may succeed on other islands. However, once grazing and browsing pressure is

removed, the potential invasion of native forest by non-native plants may be a more difficult and long-term recovery issue.

- Human Disturbance:
    - Illegal hunting is a threat to Mariana fruit bats throughout its range. Although law enforcement activity has increased since 2009 (CNMI -DLNR 2008; CNMI-DLNR 2009a, 2009b, 2010), illegal hunting of Mariana fruit bats on Rota continues and will likely resume to historical levels unless consistent, effective law enforcement efforts in tandem with education and outreach programs continue. Mariana fruit bats appear to be declining on Tinian, Saipan and Guam, and illegal hunting is thought to have greatly contributed to the decimation or decline of those populations (Wiles & Payne 1986; Wiles & Glass 1990; Sheeline 1991; Stinson et al. 1992; Esselstyn et al. 2006). As with Rota, recovery of the Mariana fruit bat on human-inhabited islands will not likely be possible without strong education programs combined with effective control of illegal hunting.
- Non-native Snake Predation:
    - BTS prey on non-volant young left at the roost during the night, thus preventing the recruitment of young bats into the breeding population. Effective control of BTS is among the actions that must be achieved before the Mariana fruit bat population on Guam can recover. The interdiction, control, and ultimate eradication of BTS on Guam are the focus of major, ongoing projects, and the Mariana fruit bat is likely to benefit from these efforts in the long term across the archipelago. This prognosis would change drastically if the BTS were to become established widely throughout the archipelago.
- Stochastic Events:
    - Typhoons and volcanic eruptions result in mortality, reduced population viability, and habitat loss. Natural disasters can be especially damaging to the viability of smaller Mariana fruit bat populations (e.g., on Guam, Saipan, Aguiguan, and Maug). The significant loss of habitat on Anatahan after the volcanic eruption in 2003 resulted in the loss of a substantial Mariana fruit bat population that has not yet recovered.

<u>Mariana Fruit Bat Recovery Criteria</u>

A draft revised recovery plan for the Mariana fruit bat (USFWS 2010) addressed actions needed for the survival and recovery needs of the Mariana fruit bat. New information indicates that, to meet recovery objectives, stable or increasing fruit bat subpopulations should, at a minimum, be distributed on the islands that currently have extant populations (USFWS 2010). Actions that reduce or eliminate the potential for self-sustaining populations of resident Mariana fruit bats on Guam may hamper or preclude recovery of the species. The reduction or elimination of this potential may take many forms: degradation or loss of habitat and resources required by the fruit bat for foraging, roosting, and reproduction; increased exposure of fruit bats to illegal hunting and other sources of human disturbance; and introduction of non-native predators that prey upon fruit bats. In order for the Mariana fruit bat's population to recover on Guam, sufficient amounts of functional habitat will need to be protected and restored on Guam (USFWS 2010).

Guam contains a large proportion of the remaining native limestone forest in the southern inhabited Mariana Islands, and most of that habitat is located within Department of Defense (DoD) lands. Habitat loss and degradation, illegal hunting, predation by non-native predators, and human disturbance currently impact fruit bats. If threat levels increase within Mariana fruit bat habitat, it may further inhibit the potential for the species to recover.

Survival and Recovery Needs

Before the Mariana fruit bat is considered for delisting, the Service proposes that stable or increasing populations should exist on three of the five southern islands (Saipan, Tinian, Aguiguan, Rota, and Guam), and six of the northern islands where Mariana fruit bats have persisted historically (Anatahan, Sarigan, Guguan, Alamagan, Pagan, Agrihan, Asuncion, and Maug (USFWS 2010). Of the six northern islands that require stable or increasing numbers, two of these must include Pagan, Anatahan, or Agrihan. Since publication of the draft revised recovery plan (USFWS 2010), new information on the Mariana fruit bat has resulted in changes to how we look at recovery for the species. We now consider recovery in terms of stable or increasing subpopulations of sufficient size distributed across Guam and the Mariana Islands. To meet recovery objectives, stable or increasing Mariana fruit bat subpopulations should at a minimum be distributed on the islands that currently have extant populations (USFWS 2010). The final version of the Mariana fruit bat recovery plan is currently in review, and recovery criteria stated here may change upon completion of the final plan.

Of the six northern islands, the only evidence for a possibly increasing population is on Asuncion (USGS 2010 p. 33). Of the five southern islands, only Rota has achieved an increasing population. Although a conservation area containing some important habitat for Mariana fruit bats was established on Rota (USFWS 2011 p. 1), there is not currently enough protected Mariana fruit bat habitat on Rota, Guam, Tinian, or Saipan to support substantial population recovery on any of those islands. Even if sufficient habitat is set aside in conservation to support recovery of populations, controlling illegal hunting may continue to be a challenge that limits recovery of the species (USFWS 2014).

Status of the *Cycas micronesica*

Species Description

Cycas micronesica (fadang in Chamorro) was federally listed as threatened under the ESA on October 1, 2015. No critical habitat has been designated for this species. A recovery plan for *C. micronesica* has not been completed.

Cycas micronesica is part of the Cycadaceae family, which contains only one genus, *Cycas*, a very ancient genus of trees dating back to the Jurassic period. Ninety-eight *Cycas* species are described, and 75 species (77 percent of the genus) are considered critically endangered, endangered, threatened, near threatened, or vulnerable under the definitions of the (IUCN 2017). All *Cycas* species are restricted to the equatorial regions.

Cycas micronesica is a palm-like plant, usually unbranched tree with a thick trunk. Adult stem lengths reach 8m, rarely to 12m, and 14-25 cm in diameter with pinnate leaves 150-180 cm long (Hill 1994).

Life History

Cycas micronesica is the only native gymnosperm in the Mariana Islands. Cycads are dioecious, and both sexes bear reproductive structures that are relatively massive amongst gymnosperms (e.g. conifers). *Cycas micronesica* occurs in limestone forests in Guam and Rota, with fewer occurrences in volcanic soils typical of southern Guam (Stone 1970 p. 65; Hill 1994). Few studies exist that describe cycad natural history and ecology in the Mariana Islands, and much of the current literature is focused on its decline and effects from introduced pests. However, *C. micronesica* (identified as *C. circinalis* at the time) is a food source for the Mariana fruit bat, which feed on its fruits (Wiles & Fujita 1992 p. 27), as well as for the Chamorro people, who process the fruits to rid the naturally-occurring toxins (Whiting 1963).

Cycas micronesica emits chemical cues to attract specialist insects for pollination (Schneider et al. 2002); however, there is also evidence of wind as a pollen vector in open areas or forested areas with some wind on Guam (Terry et al. 2009 p. 96; Hamada et al. 2015).

Population Dynamics

At the time of listing, there were fewer than 516,000 individuals on Guam (Marler 2013). This number does not distinguish between successfully reproducing adults and juveniles (Marler 2013), which, because of the effects of the cycad aulacaspis scale, implies that the number of extant individuals that can successfully reproduce is much lower.

Within Guam's AAFB, over 257,000 individuals were documented in July 2013; however, the population structure was dominated by adults with little recruitment and declining reproductive success (Marler 2014). In a separate survey, an unquantified number of *C. micronesica* individuals were found at 11 sites across Guam, some of which were on AAFB (Harrington et al. 2012). Between March 2015 and January 2017, natural resources personnel from the Marine Corps Activity Guam conducted surveys, which identified 19,852 mature individuals (DON 2017).

Status and Distribution

Cycas micronesica is known historically from Guam, Rota, Palau (politically the independent Republic of Palau) and Yap (geographically part of the Caroline Islands; politically part of the Federated States of Micronesia (Hill 2004; Hill et al. 2004) and has been outplanted on Tinian (NAVFACMAR 2016). In a 2002 forest inventory on Guam, prior to the introduction of *A. yasumatsui*, *C. micronesica* was the most abundant tree detected with over 1.5 million individuals counted on island (Donnegan et al. 2004 p. 16). In 2013 population estimates for Guam was down to 516,000 and 111,500 on Rota. Outside of the Marianas 300,000 were estimated on Yap, and 2,500 on Palau. Currently, there are no updated population numbers for Yap and Palau, but estimates for Guam and Rota are 344,000 and 52,000, respectively. These

estimates signify a decline of 33.3 percent on Guam and 53.4 percent on Rota, since 2013. As of February 2016, the total outplanted experimental population on Tinian was 903, half of which were small and required continued maintenance (NAVFACMAR 2016). The latest projections estimate a complete extirpation of *C. micronesica* from the island of Guam by 2032 if current rates of mortality continue unabated (Marler & Krishnapillai 2020).

Threats

The following threats to the species contributed to its listing or were identified subsequent to listing and continue to be an issue in the ability of the species to recover.

- Loss or degradation of habitat due to:
    - Development, urbanization, agriculture, as well as wild or incidental fire;
    - Non-native plants, trees, shrubs, and vines that compete with *C. micronesica* for space; and,
    - Non-native ungulates that degrade remaining forest habitats through herbivory and physical damage.
- Low population number from:
    - A lack of recruitment into the population on Guam that is currently dominated by adults increases the vulnerability of the species and challenges its ability to increase or maintain a population structure.
- Non-native pest species including:
    - *A. yasumatsui* which is an introduced cycad specialist armored scale insect that is the most significant threat and primary driver of mortality of all life stages (Marler & Muniappan 2006 p. 3, Marler & Krishnapillai 2020; Marler 2014). As of January 2013, *C. micronesica* mortality reached 92 percent on Guam, and cycads on Rota are experiencing a similar fate from the cycad aulacaspis scale (Marler 2013). *A. yasumatsui* has also invaded Palau; however the effects of the invasion on *C. micronesica* have not yet been determined. A specialist scale predator beetle, *Rhyzobius lophanthae*, was introduced purposefully to treat the *A. yasumatsui* outbreak with some positive results (Marler & Lawrence 2012 pp. 234–238). A number of other insects, including the cycad blue butterfly and a native longhorn beetle that bore cycad stems (*Dihammus marianarum*), also contribute to declining health and mortality in Guam cycad populations (Marler & Muniappan 2006 p. 3; Marler & Lawrence 2012 pp. 238–240).
- Reduction of resiliency if:
    - Unhealthy trees are not able to withstand or recover from damage caused by high winds and rains of typhoons (Hirsh & Marler 2002) if their natural resilience has decreased due to chronic *A. yasumatsui* damage.

Survival and Recovery Needs

In order to recover *C. micronesica*, individuals of this species need to be protected throughout its range. To promote population stability, *C. micronesica* populations should consist of a minimum 200 individuals and have age classes consisting of seedlings, juveniles, and adult plants (HPPRCC 2011). Expanded trials with biocontrol, especially targeting *A. yasumatsui*, should be

considered to help stabilize the population (Marler & Lawrence 2012 p. 240). In addition, future invasions from other pests must be prevented (Marler & Lawrence 2012 p. 240). Feral pigs and introduced deer are also threats through herbivory and physical damage, further compounding effects from insects (Marler & Lawrence 2012 p. 238); therefore, ungulate control and fencing restoration sites are also crucial steps in managing cycad populations.

Status of the *Tabernaemontana rotensis*

Species Description

Tabernaemontana rotensis (no common name) is currently listed as threatened (USFWS 2015). No critical habitat has been designated for this species. A recovery plan for *T. rotensis* has not been completed.

Tabernaemontana rotensis is in the dogbane family, Apocynaceae, which includes trees, shrubs, herbs, stem succulents, and vines. The family contains 366 genera, and the *Tabernaemontana* genus consists of 103 species (The Plant List 2013). *Tabernaemontana rotensis* is a small to medium-sized (8-10 m tall) tree with leaves that are thin, light green, opposite, and 15-30 cm long (Stone 1970). Flowers are white, elongate, slender, and branch from the tree. *Tabernaemontana rotensis* produce conspicuous orange fruit that are twinned or single and beaked (UOG 2007 p. 6; GPEPP 2015 p. 22).

Life History

Tabernaemontana rotensis occurs in forests with crevices of rough limestone (Raulerson & Rinehart 1991 p. 94) and are able to colonize sites that occur in full sun or in deep shade (UOG 2007 p. 16). The species has primarily been found in areas of little to no slope (<15 percent) (UOG 2007; JRM 2016). *Tabernaemontana rotensis* has been found in forest habitats most often co-occurring with *C. micronesica*; however, *T. rotensis* were not found in areas that were dominated by non-native tree species (UOG 2007).

Tabernaemontana rotensis populations typically flower in August through October, followed by the production of immature or orange fruit (UOG 2007 p. 23). During this time, 40 to 80 percent of trees were found to have at least some flowering occur every month (UOG 2007). The fruit of *T. rotensis* reaches full size of 1.6 inches, approximately 30 to 35 days after flowering. Fruit is mature after approximately 90 days, when it has turned from green to bright orange and splits open and exposes seeds (UOG 2007).

Seed dispersal of *T. rotensis* is dependent on birds and therefore a lack of frugivore bird species on Guam has resulted in limited spatial distribution of *T. rotensis*. Today, *T. rotensis* is generally found clumped within confined areas, as seedling establishment is restricted to within the vicinity of the parent tree (UOG 2007). This phenomenon does not support seedling recruitment, as seedlings develop in extreme competition with one other, and many of them become stunted and die (UOG 2007).

In typhoon conditions, *T. rotensis* develops a synchronized pulse of flowering about one month after the typhoon. This pulse of flowering leads to a mast seeding event about four months after a typhoon (UOG 2007 p. 29). This species may behave like a pioneer species since germination and seedling emergence have been shown to be maximized in full sun conditions (i.e., after typhoon damage) (UOG 2007).

Population Dynamics

In a study specific to AAFB, the species occurred in clumped patches within 256 sites across the base (UOG 2007). The population structure of over 21,000 individuals included emerging seedlings, young juveniles, and reproductive mature individuals with an extensive canopy size. The species was observed in northern Guam in the following areas: Ritidian Point, Pati Point, the Habitat Management Unit (HMU), and central and southeast edge of AAFB (UOG 2007; JRM 2016). At least five individuals of *T. rotensis* also occur within the GNWR. At the time of listing, *T. rotensis* was known from six occurrences on Guam and nine individuals on Rota (80 FR 59423). Individuals on Rota varied in size between 0.5 m and 6 m (1.6 ft. to 19.7 ft.) spread across the western, southern, and eastern parts of the island (CNMI-DLNR 2015).

Since the time of listing, additional surveys have identified and tagged 196 total individuals (88 of which were mature) at two locations outside of DoD property (GPEPP 2015). A total of 23,325 individuals have been identified at six locations on DoD property, over 85 percent of which are on AAFB (DON 2017).

Status and Distribution

Tabernaemontana rotensis is endemic to Guam and Rota and was suggested to be restricted to limestone forest habitat (Stone 1970). It was originally noted as very rare needing seed cultivation or cuttings to assure the existence of the species (Stone 1970).

Threats

The following threats to the species contributed to its listing or were identified subsequent to listing and continue to be an issue in the ability of the species to recover.

- Loss or degradation of habitat due to:
    - Wildfire, urbanization, and agricultural development;
    - Non-native plants and non-native ungulates that further degrade remaining forest habitats;
    - Spatial distribution when many individuals are growing in close proximity throughout AAFB. This aggregated pattern increases the vulnerability of the population, especially at sites with less than 15 percent slope that are suitable for human development.
- Low population numbers and lack of recruitment and dispersal are due to:
    - Restrictions to the spatial extent and distribution of bird populations on Guam.
    - Clustered populations exhibit less genetic diversity, becoming less resilient to evolutionary changes (UOG 2007).

- Clustered populations are more vulnerable to stochastic events causing a disproportionate species effect (extreme events or disease), thus the become more prone to extinction pressures (UOG 2007).
- Forest degradation due to typhoons which may require multiple years to regenerate.
- The lack of a viable seed bank for natural regeneration.

Survival and Recovery Needs

In order to recover *T. rotensis*, the remaining individuals of this species need to be protected on Guam and Rota. *Tabernaemontana rotensis* populations should have age structures consisting of seedlings, juveniles, and adult plants. Ungulate and invasive species control should be implemented throughout its range. On Guam, restoring areas with this species' natural dispersers (e.g., native frugivore birds) would expand the distribution of the *T. rotensis* population into new habitat niches, niches that would have likely been naturally occupied by the *T. rotensis* population prior to the loss of seed dispersal on Guam. Outplanting or relocation of wild seedlings within protect areas would help increase their abundance and distribution on Guam and Rota.

Environmental Baseline

Regulations implementing the ESA (50 CFR 402.02) define the environmental baseline as the past and present impacts of all federal, state, or private actions and other human activities in the action area. Also included in the environmental baseline are the anticipated and/or ongoing impacts of all proposed federal projects in the action area that have undergone Section 7 consultation, and the impacts of state and private actions which are contemporaneous with the consultation in progress.

Status of the Species within the Action Area

Mariana Fruit Bat

The habitat within the action area consists of both primary and secondary limestone forest and *Vitex* dominated forest as described by the Guam Plant Extinction Prevention Program (GPEPP) (2017). Limestone forest habitat contain trees suitable for bat roosting and feeding, namely *Elaeocarpus, Tristiropsis,* and *Artocarpus*. All are present within the action area (GPEPP 2017). *Vitex* dominated forest is less desirable, but may provide roosting habitat. Fruit bats are highly mobile and while they have been documented flying over the action area, there are no records of bats actively roosting or foraging in the action area. It is reasonable to assume that fruit bats have occasionally utilized the area to roost or feed.

Cycas micronesica

As of 2019, 473 *C. micronesica* were estimated to occur within the project footprint (DON 2020, GPEPP 2019). This number does not include cycad individuals growing immediately adjacent to,

but outside of, the project footprint. Within the five proposed outplanting sites (Achae Point, Tarague Basin, Tarague Triangle, Palms Golf Course, and 3A), there are at least 412 total cycads (GPEPP 2019). The proposed action is expected to remove the existing plants within the project footprint through land clearing. Surveys of the MSA by GPEPP (2017) showed the highest density of cycads within the MSA occurs within the project footprint (32.1 to 37.7 *C. micronesica* per acre) proposed for clearing. When considering *C. micronesica* counted in 2017, the action area includes an estimated minimum 481 additional *C. micronesica*, 86 of which are within the 10 foot buffer of the project footprint. Project BMP's recommend all listed plants within this buffer be protected during construction, but they will be further exposed to threats, such as typhoon damage, predation, and parasitism, once the project is complete (Laurance 2008, Marler 2020). The action will not physically remove any plants outside of this footprint, but they will be further fragmented, subjecting the remaining population to a likely decline in condition (Laurence 2008, Laurance & Curran 2008, Marler 2020). *C. micronesica* are generally considered adapted for consistent typhoons (Hintz & Marler 2002), but presence of introduced ungulates (e.g. deer and pigs) and novel predators such as cycad scale greatly reduce the survivability after storm impacts (Marler 2012). Of the *C. micronesica* within the project footprint, 2019 surveys estimated approximately 92 of the plants were classified as being in good condition, 285 in fair condition, and 96 in poor condition (DON 2020). No condition index was provided for plants outside of the footprint, surveyed in 2017 (GPEPP).

Tabernaemontana rotensis

In a 2019 survey of the project footprint, 22 *T. rotensis* were counted, most of which were seedlings (GPEPP 2019). Only the Tarague Basin and Golf Course proposed outplanting sites contain *T. rotensis*, each with about 50 trees, no information on age structure was provided (Diebel, pers. com. 2020). Specific numbers on adult and seedling plants were not provided in the survey, but a 2017 survey of a similar plot within the MSA showed roughly half (53 percent) of the *T. rotensis* in the plot were seedlings (GPEPP 2017). The proposed action will result in the removal of all 22 individuals from the project footprint and an overall population decline of 0.094 percent (DON 2020).

Factors affecting species environment within the action area

Habitat loss and degradation, predation by non-native predators, and human disturbance are the primary factors affecting Mariana fruit bats within the action area. Brown tree snakes can be found within every habitat type on the island of Guam and are present within the action area. If a bat roosted within the action area, it would be susceptible to predation by BTS. AAFB functions as one of the most active military airfields in the Western Pacific with an average of 21 daily take-off and landing events (Diebel, pers. com. 2020). Noise generated by these activities reduces the likelihood that Mariana fruit bats utilize the existing habitat for roosting and feeding, although the vegetation types preferred by the bats is present.

Several possible outplanting sites (Achae Point, Tarague Basin, and Palms Golf Course) currently function as study plots for a long-term cycad study performed by GPEPP on AAFB (GPEPP 2019). GPEPP biologists survey cycads within these plots regularly, as well as apply pesticides to control pest species. If *C. micronesica* are outplanted in study plots they must be

separated from the cycads in the GPEPP study and must not be included in cycad research data collected. If bats are roosting or feeding when biologists enter the study plots it may result in disturbance to the bats, but this disturbance is not expected to alter the bat's behavior enough to rise to the level of injury. Biologists are required to vacate the site if bats are seen in the study plots and they are prohibited from returning until the bats leave on their own volition.

The cycad scale and other cycad predators are present in every *C. micronesica* population on Guam, including the action area. The *C. micronesica* already present within the proposed outplanting sites are receiving treatments of pesticide to help alleviate scale infestations and increase recruitment of seedlings in the population. Those cycads proposed for clearing within the project footprint are receiving no treatment for scale. The site experiences little to no recruitment of seedlings and surveys show one-fifth of the population to be in poor condition.

Effects of the Action

Factors to be considered

Proximity of the Action

The proposed 48 new ECMs fall within the MSA on AAFB, located on the northernmost portion of Guam. AAFB is home to half of the remaining limestone forest on Guam. Native [limestone] forest is considered the preferred habitat type of the Mariana fruit bat, based on the availability of roosting and foraging habitat, *C. micronesica*, and *T. rotensis,* (USFWS 2014, Cibrian-Jaramillo 2010, UOG 2007). For analysis, the Service is using primary and secondary limestone forest types as a proxy for preferred habitat, although it should be noted that this is likely an overestimation of actual functional habitat for these species (Almeida-Gomes 2016). The action area comprises 151.7 acres of primary and secondary limestone forest, representing 1.2 percent of this habitat type on Guam and 2.3 percent on AAFB. Of the 151.7 acres contained in the action area, 31.1 acres falls within the project footprint and will be removed entirely. This represents 0.24 percent of the limestone forest on Guam and 0.47 percent of the limestone forest on AAFB.

Distribution

Fruit bats are occasionally observed as far south as the Naval Magazine, in central Guam, but most sightings occur in the north (USFWS 2014). The proposed munition igloos will be situated approximately 4.7 miles from Pati Point, the last known maternal fruit bat colony on Guam. Colony surveys at Pati Point have been in consistent decline since 2005 and have yielded low bat numbers, between 0 and 10, since 2009. Between 2015 and 2016 a colony of 112 fruit bats were observed in the HMU on AAFB, but since August of 2016, fruit bat aggregations have not been observed at this site.

Cycas micronesica occurs across Guam with the highest density on AAFB (USFWS 2014). Populations of *C. micronesica* occur across Guam, although the distribution and health of these populations is patchy (USFWS 2020, Cibrian-Jaramillo 2010).

The majority of *T. rotensis* on Guam exists within the borders of AAFB and approximately nine individuals are located on GNWR.

Timing

Once started, construction is expected to last for an estimated 42 months (March 2021-September 2024) and will start at 0600 hours and stop no later than 1800 hours, or 30 minutes prior to sunset, whichever comes first. After construction is complete, very little active disturbance is expected. Although the construction itself will result in the loss of *C. micronesica* and *T. rotensis* individuals, this will be restricted to the action of ground clearing during site preparation.

Nature of the Consequences

The action will remove 22 genetically distinct individuals of *T. rotensis* and 473 *C. micronesica* from the environment. If the individual plants are not replaced, the action will result in a population decline of 0.14 percent of the known population of *C. micronesica* and 0.1 percent for *T. rotensis* on the island of Guam (DON 2020). No take of Mariana fruit bats is expected, although activity and noise associated with the action would likely disturb bats in the action area.

Since the action results in clearing of the project footprint, that habitat will be lost to bats in the future.

Duration

1) Short-term (pulse) consequences: Construction activities will result in disturbance to bats present in the action area during construction. Bats may be disturbed by noise and subsequently discouraged from utilizing the area's resources. Once construction has completed these disturbances will no longer be present.
2) *C. micronesica* pups and both *C. micronesica* and *T. rotensis* seeds will be collected prior to habitat clearing. Once that is complete all *C. micronesica* and *T. rotensis* within the project footprint will be destroyed.
3) Long-term (press) consequence: Existing habitat within the project footprint for all listed species will be converted to cleared or developed area.
4) Permanent (threshold) Consequence: The clearing of *C. micronesica* and *T. rotensis* followed by construction of new permanent structures, leaves no opportunity for future recruitment of these species resulting in no replacement within the footprint. Since habitat will be completely lost, the action area is not likely to function as a roosting or feeding area for Mariana fruit bat, indefinitely.

Disturbance Frequency

The action will take place in five phases: the removal of *C. micronesica* pups and seeds and *T. rotensis* seeds, clearing and construction of the ECMs, propagation of the harvested pups and seeds, outplanting of the propagated material, and maintenance of outplanted material. Harvesting of the *C. micronesica* pups has potential to negatively impact the mother plant, but

since all individual *C. micronesica* will be destroyed during construction, this is not a concern. Clearing and construction will occur between March 2021 and April 2024. During this period, all plants will be removed and bats may be disturbed, if in the area. Plant propagation will continue until the pups and seeds are hardy enough to be outplanted in the wild (~1 year or more). Outplanting of the propagated material will be brief and will likely disturb topsoil in areas where plants are placed, but this will be a short-lived disturbance. Maintenance of the planted individuals will involve supplemental watering and applications of pesticide to control pests of *C. micronesica*. Maintenance activities are expected to continue until plants achieve the DON's proposed success criteria for each species after being outplanted, which is expected to take less than two years.

Analyses for consequences of the action

Beneficial consequences – The DON is proposing to collect *C. micronesica* seeds and pups, as well as *T. rotensis* seeds from the project footprint before habitat clearing occurs. The pups and seeds will be propagated under nursery conditions until an authorized biologist determines they are suitable for outplanting. The individuals will then be outplanted in at least one, and up to five, fenced, ungulate-free conservation sites. The DON will provide supplemental water and fertilizer to the outplanted individuals and apply pesticide to control pest invasions. The plants will be cared for and monitored until they achieve at least 1.0 centimeter of stem growth in the wild, as measured from the base of existing leaves (fronds). Removal of invasive species from the proposed outplanting sites will potentially result in an increase in use of the area(s) by the Mariana fruit bat. If the outplanted *C. micronesica* and *T. rotensis* reach sexual maturity, they will contribute to the genetic diversity and overall population numbers of each of these species.

Adverse consequences – The proposed action will likely result in the disturbance of all Mariana fruit bats that use the habitat within and immediately adjacent to the project footprint during construction. Fruit bats could also be disturbed during use of habitat adjacent to the project area once construction is complete. However, such disturbance during and after construction would be expected to be short term and intermittent and not likely to cause a significant disruption of their breeding, feeding, and sheltering behavior. Therefore, the disturbance of Mariana Fruit bats within the action area is not likely to rise to the level of injury to the bat and therefore would not meet the definition of harass.

Clearing of the project footprint will result in the destruction of all *C. micronesica* and *T. rotensis* within the project footprint. This will result in a reduction in the overall number of sexually mature individuals of each species by 377 of the good or fair *C. micronesica* and 22 *T. rotensis*. Genetic representation will also be reduced due to the removal of these individuals. A total of approximately 481 *C. micronesica* fall within the 150 meter buffer of the project footprint including 86 within the first 10 feet. The land clearing opens these individuals to future disturbance by typhoons as well as higher susceptibility to parasitism and predation.

Cycad pups and seeds collected and propagated/grown in the nursery environment, then outplanted into protected habitat may provide a replacement of up to 95 *C. micronesica* and 6 *T. rotensis.* However, there are already populations of *C. micronesica* within the five outplanting sites and two *T. rotensis* sites (Tarague Basin and Golf Course). In addition, the success criteria

of minimal growth of the outplanted individuals at the outplanting sites, rather than the replacement of sexually mature individuals, leaves significant uncertainty in whether the outplanted individuals will grow to a point that they contribute to the long-term recovery population or genetic diversity of the overall listed plant populations.

Species' response to the proposed action

Construction related disturbance and normal use of the project area post-construction is not expected to result in injury or death of any Mariana fruit bats.

As stated above, the proposed action would result in the direct loss of 473 *C. micronesica* and 22 *T. rotensis* from these species overall populations, and a possible 481 *C. micronesica* damaged or lost due to indirect (edge) effects. Some amount of genetic diversity would also be lost. The destruction of up to 473 cycads and 22 *T. rotensis*, plus the possible indirect effects to an additional 86 cycads, would not affect the growth and survival of individuals of these species outside of the project's action area. However, the population trend for *C. micronesica* is in steep decline in recent years due to the *A. yasumatsui* scale and other pest species. The combination of existing threats, plus projects such as the action, are pushing *C. micronesica* toward a point in which the species will no longer be recoverable. While the current impacts only represent a minimum 0.062 percent of the range-wide population of *C. micronesica*, continuing to impact this species without fully offsetting those impacts is not sustainable.

Cumulative Effects

Cumulative effects include the effects of future State, tribal, local or private actions that are reasonably certain to occur in the action area considered in this BiOp. Future Federal actions that are unrelated to the proposed action are not considered in this section because they require separate consultation pursuant to section 7 of the Act.

The Service is not aware of any future state, tribal, local, or private actions that are reasonably certain to occur within the action area at this time; therefore, no cumulative effects are anticipated.

Conclusion

After reviewing the current status of the threatened Mariana fruit bat (*Pteropus mariannus*), threatened *Cycas micronesica*, and threatened *Tabernaemontana rotensis*, the environmental baseline for the action area, the effects of the proposed construction and operation of 48 ECMs within MSA I, located on AAFB, Guam, and the cumulative effects, it is the Service's Biological Opinion that the action, as proposed, is not likely to jeopardize the continued existence of the Mariana fruit bat, *C. micronesica*, or *T. rotensis.* There is no designated critical habitat within the action area; therefore, there will be no affect to critical habitat.

The Service reached this conclusion based on the following information described in the Effects of the Action section, above.

- Mariana fruit bats have not been observed roosting or feeding in the project footprint, where the clearing of land will occur, so it is assumed this is not a loss of functional habitat for the bats. No take of Mariana fruit bats is expected to occur because disturbance of the bat during and after construction is not expected to rise to the level of injury. The level of disturbance within the possible outplanting vegetation plots or transplantation of individuals is limited to biologists working in the forest plots.
- In areas where noise, light or human activity from construction of the proposed action would result in excessive noise, light or human activity above the ambient level, construction contractor personnel will be required to survey within line of sight (up to 150 m) of construction activities for bats prior to the start of a day's construction activities. Construction work generating noise, light or human activity above the ambient levels will be postponed until the bat(s) has left the area. The construction contractor will document bat surveys in the daily logs.
- Based on most recent estimates, the action is expected to remove 0.068 percent of the existing *C. micronesica* across its native range and 0.14 percent of the cycads on Guam. Considering just the cycads in good condition on Guam, 0.067 percent will be removed. Although this fraction seems minimal, *C. micronesica* has been in a state of decline since introduction of the *A. yasumatsui* scale in 2003. The current Guam population experienced an initial decline of 92 percent in the years following scale introduction. Between 2013 and 2020, cycad populations have declined by a further 33.3 percent. The continued loss of *C. micronesica* individuals from the population without adequate offset is likely to have significant consequences to the species as a whole and could result in the extirpation of the species on Guam within the next 15 years.
- An additional 481 *C. micronesica* fall within the 150-meter action area buffer and at least 86 of those are within the 10 foot BMP buffer of the cleared footprint. All of these plants will be subjected to increased fragmentation as a result of the action and a portion are expected to succumb to future stressors, such as typhoons, predation, and parasitism, because of increased exposure to the forest edge. When all of these plants are taken into account, the estimated loss to the population on Guam doubles from 0.14 to 0.28 percent. If just the 86 in the 10 foot buffer are added, 0.16 percent of the *C. micronesica* on Guam will be lost.
- The DON has proposed to salvage a minimum of 95 genetically unique individuals and ensure their survival in ungulate-proof fenced plots within AAFB. The 95 individuals is based on: (1) the health of the plants within the project footprint, (2) the ability to safely salvage the basal shoots or seeds, (3) whether or not the basal shoot would survive transplantation, or (4) whether the plant produces seed. The lead biologist will make the determination of "health." If these outplantings are successful, the reduction of *C. micronesica* will fall to 0.040 percent across their native range and 0.082 percent on Guam. The DON is not following nursery growth and outplanting recommendations provided by the Service on March 23, 2020, so outplanted individuals are not considered as an offset to the plants being removed.
- Outplantings will occur in up to five proposed vegetation plots on AAFB. These plots already contain a minimum 412 *C. micronesica*, which are maintained by the GPEPP as

*C. micronesic*a study sites. The addition of 95 new individuals is not expected to harm the plants already present across these plots, but the increase in individuals does not benefit the cycad populations at the outplant sites beyond increasing the genetic diversity. If outplanting is successful and the outplants reach sexual maturity, the result will be beneficial by providing increased local genetic diversity and support for the survival and recovery of the species.

- The proposed action will result in the removal of 22 *T. rotensis* from the project footprint, representing a range wide reduction of approximately 0.094 percent. The DON has proposed to replace a minimum of six genetically distinct *T. rotensis*, grown from seeds or cuttings and planted in up to five vegetation plots on AAFB. Accounting for the replacement of these six individuals the population wide reduction is reduced to 0.070 percent.
- Two of the five proposed outplanting plots, Tarague Basin and Golf Course, already contain a combined 100 *T. rotensis* (50 each), but if these sites are used, outplanting activities are not expected to harm existing trees. If outplanting is successful and the plants reach sexual maturity, the result will be beneficial by providing increased local genetic diversity.

INCIDENTAL TAKE STATEMENT

Section 9 of the ESA and Federal regulation pursuant to section 4(d) of the ESA prohibit the take of endangered and threatened species, respectively, without special exemption. Take is defined as to harass, harm, pursue, hunt, shoot, wound, kill, trap, capture or collect, or to attempt to engage in any such conduct. Harm is further defined by the Service to include significant habitat modification or degradation that results in death or injury to listed species by significantly impairing essential behavioral patterns, including breeding, feeding, or sheltering. Harass is defined by the Service as intentional or negligent actions that create the likelihood of injury to listed species to such an extent as to significantly disrupt normal behavior patterns which include, but are not limited to, breeding, feeding or sheltering. Incidental take is defined as take that is incidental to, and not the purpose of, the carrying out of an otherwise lawful activity. Under the terms of section 7(b)(4) and section 7(o)(2), taking that is incidental to and not intended as part of the agency action is not considered to be prohibited taking under the ESA provided that such taking is in compliance with the terms and conditions of this incidental take statement.

The measures described below are non-discretionary, and must be undertaken by the DON for the exemption in section 7(o)(2) to apply. The DON has a continuing duty to regulate the activity covered by this incidental take statement. If the DON: (1) fails to assume and implement the terms and conditions; or (2) fails to require contractors to adhere to the terms and conditions of the incidental take statement through enforceable terms that are added to the contract document, the protective coverage of section 7(o)(2) may lapse. In order to monitor the impact of incidental take, the DON must report the progress of the action and its impact on the species to the Service as specified in the incidental take statement. [50 CFR §402.14(i)(3)] Sections 7(b)(4) and 7(o)(2) of the ESA generally do not apply to listed plant species. However, limited protection of listed plants from take is provided to the extent that the ESA prohibits the removal and reduction to

possession of Federally listed endangered plants or the malicious damage of such plants on areas under Federal jurisdiction, or the destruction of endangered plants on non-Federal areas in violation of State law or regulation or in the course of any violation of a State criminal trespass law.

Amount or Extent of Take Anticipated

The Service does not anticipate the proposed action will incidentally take any Mariana fruit bats.

Effect of the take

In the accompanying BiOp, the Service determined that this level of anticipated take is not likely to result in jeopardy to the Mariana fruit bat.

Reasonable and Prudent Measures

The Service has determined that no Reasonable and Prudent Measures are necessary to minimize the potential for Mariana fruit bat incidental take.

Terms and Conditions

In order to be exempt from the prohibitions of section 9 of the ESA, the DON must comply with the following reporting and monitoring requirements.

The DON must monitor the implementation of the project to a sufficient degree to ensure that disturbance of Mariana fruit bats does not rise to the level of harass or harm, resulting in injury or death through the alteration of normal feeding roosting, and breeding behaviors. The DON will implement systematic searches for Mariana fruit bat colonies in all areas of suitable habitat within the action area. If a maternity colony is found, the DON will notify the Service per the Reinitiation Notice.

Upon locating a dead or injured specimen, immediately notify the Service's Law Enforcement Office at 671-647-6064 and PIFWO's Marianas Field Office at 671-989-6743. Care must be taken in handling any dead or injured specimens of proposed or listed species to preserve biological material in the best possible state. In conjunction with the preservation of any dead specimens, the finder has the responsibility to ensure that evidence intrinsic to determining the cause of death of the specimen is not unnecessarily disturbed. The finding of dead or injured specimens does not imply enforcement proceedings pursuant to the ESA. This reporting requirement enables the Service to determine if take is reached or exceeded and to ensure that the terms and conditions are appropriate and effective.

The Service believes that no incidental take of the Mariana fruit bat will result from the proposed action. If, during the course of the action, non-intentional harassment of Mariana fruit bats utilizing habitat in the action area results in injury or death of one or more individual fruit bats, such incidental take represents new information requiring reinitiation of consultation and review of the reasonable and prudent measures provided. The DON must immediately provide an

explanation of the causes of the taking and review with the Service the need for possible modification of the reasonable and prudent measures.

Conservation Recommendations

Section 7(a)(1) of the ESA directs Federal agencies to utilize their authorities to further the purposes of the ESA by carrying out conservation programs for the benefit of endangered and threatened species. Conservation Recommendations are discretionary agency activities to minimize or avoid adverse effects of a proposed action on listed species or critical habitat, to help implement recovery plans, or to develop information.

The Service recommends the DON continue to implement their comprehensive BTS interdiction program to ensure that military activities, including the transport of civilian and military personnel and equipment to and from Guam, do not contribute to the spread of the BTS to other islands or regions. The BTS interdiction requirements are specified in DoD instructions (i.e., *36 Wing Instruction 32-7004, BTS Control Plan and JTREGMARIANASINST 5090.10A, BTS Control and Interdiction*).

Reinitiation Notice

This concludes formal consultation on the action(s) outlined in this BiOp. As provided in 50 CFR § 402.16, reinitiation of formal consultation is required where discretionary DON involvement or control over the action has been retained or is authorized by law and: (1) if taking of a Mariana fruit bat occurs; (2) if new information reveals effects of the action that may affect listed species in a manner or to an extent not previously considered; (3) if the identified action is subsequently modified in a manner that causes an effect to the listed species or critical habitat that was not considered in the BiOp; or (4) if a new species is listed or critical habitat designated that may be affected by the identified action.

Sincerely,

KATHERINE MULLETT

Subject: Biological Opinion for Relay Ground Station-Asia (RGS-A), Marine Corps Base Camp Blaz, Guam

Dear Mr Borja:

This document transmits the U.S. Fish and Wildlife Service's (Service) biological opinion based on our review of the proposed construction and operation of the Relay Ground Station-Asia (RGS-A), Marine Corps Base Camp Blaz, Guam, and its effects on the threatened *Cycas micronesica* (fadang), and *Tabernaemontana rotensis* in accordance with section 7 of the Endangered Species Act (Act) of 1973, as amended (16 U.S.C. 1531 et seq.). The proposed RGS-A will be part of a worldwide system of "Overhead Persistent Infrared" satellite ground stations. RGS-A will provide communication links for United States Space Force (USSF) between space-based assets and a ground station in Guam. The US Marine Corps requested formal consultation on August 9, 2022.

This biological opinion is based on information provided in the biological assessment dated August 2022, Microsoft Teams conversations and emails of September 12, 19, 26, October 3, 11, and 24, and November 2 and 17, 2022, between the Service's Mariana Islands Team Manager, Jacqueline Flores, and biologists Dawn Bruns, Tyler Willsey, Lauren Taylor, and Toni Mizerek, and you and your biologist Lauren Gutierrez, field investigations, and other sources of information. A complete administrative record of this consultation is on file at our office. The biological assessment included a request for Service concurrence with a "not likely to adversely affect" determination for the Mariana fruit bat (*Pteropus mariannus mariannus*, fanihi). The US Marine Corps determined the proposed action is not likely to adversely affect the

federally Mariana fruit bat because project construction will not occur when a Mariana fruit bat is within 150-m (492-ft) of the project site. Because project activity will cease if a Mariana fruit bat is detected within 150 m (492 ft) of the project activity, impacts to a bat are expected to be extremely unlikely to occur. Because adverse effects are extremely unlikely to occur, they are **discountable** and therefore not likely to adversely affect the Mariana fruit bat. Additional details are summarized in Appendix A of this biological opinion.

On July 5, 2022, the U.S. District Court of the Northern District Court of California vacated the 2019 regulations implementing section 7 of the Endangered Species Act (ESA). On September 21, 2022, the Ninth Circuit Court of Appeals granted a request to stay the U.S. District Court of Northern California's July 5, 2022, order that vacated the 2019 ESA regulations. As a result, the 2019 regulations are again in effect, and the Service has relied upon the 2019 regulations in rendering this biological opinion. However, because the outcome of the legal challenges to 2019 ESA Regulations is still unknown, we considered whether our substantive analyses and conclusions in this consultation would have been different if the pre-2019 regulations were applied. Our analysis included the prior definition of "effects of the action," among other prior terms and provisions. We considered all the “direct and indirect effects” and the “interrelated and interdependent activities” when determining the “effects of the action.” As a result, we determined the substantive analysis and conclusions would have been the same, irrespective of which regulations applied.

CONSULTATION HISTORY

August 9, 2022: The US Marine Corps requested initiation of consultation.

September 7, 2022: The Service confirmed initiation of consultation.

September 12, 2022 through November 17, 2022: The US Marine Corps and the Service held weekly Microsoft Teams conversations and exchanged emails to further refine the RGS-A conservation measures. The Service’s Mariana Islands Team Manager, Jacqueline Flores, and biologists Dawn Bruns, Tyler Willsey, Lauren Taylor, and Toni Mizerek, participated in this coordination with you and your biologist Lauren Gutierrez and Sheeka Tareyama.

October 17, 2022: The Service transmitted a DRAFT of this Biological Opinion to the US Marine Corps.

October 30, 2022: The US Marine Corps provided comments on the October 17, 2022, Draft of this Biological Opinion.

BIOLOGICAL OPINION

Description of Proposed Action

The proposed RGS-A complex will involve construction and operation of radar and antenna facilities within a 26.2 acres (ac) 10.6 hectare (ha) area adjacent to an existing telecommunications site within Camp Blaz, Guam. Off-site conservation of *Cycas micronesica*, and *Tabernaemontana rotensis* will occur at existing greenhouse facilities and within the approximately 10-ac (4 ha) block in the northwest corner of the ungulate-free limestone forest of the Caiguat Forest Enhancement Area, north of the RGS-A construction site (Figure 1). Because the project configuration is being reassessed to work to further reduce impacts to listed species, the final project footprint may be smaller than the 26.2 ac (11 ha) project footprint detailed here. Construction is scheduled for 2023 and the facility is scheduled to be fully-operational in 2025.

The proposed action entails the construction and operation of six approximately 76-foot (ft) (23.2-meter (m)) diameter inflatable radome facilities with attached antenna control facilities, lower equipment rooms, and Ground Terminal Equipment shelter facilities with a 50-ft (15.2-m) area cleared around each radome. Sixteen additional equipment structures will house power, communications, air conditioning, and fire protection equipment. Three generators within these structures will be fed by three, 12,000-gallon (45,425-liter) fuel storage tanks. Two Future Communications System (or similar) antennas, a parking area, and paved pathways will be constructed within the site. A fence will enclose these facilities and a 225-square ft (21-square m) entrance control building will be outside the fence. A 427-ft (130-m) length of road, 66-ft (9-m) wide section of existing road will be rerouted away from the facility.

During long-term operations, security personnel will be posted at the entrance control facility full-time. The site will be visited for maintenance and inspection as needed. Grass and brush cutting will be conducted inside and outside the perimeter fence. Downward-facing security lighting will be on from dusk to dawn. The backup generator will operate at irregular intervals during power failures. The facility will otherwise be operated remotely.

Two-way communications with satellites and space vehicles will result in low-level electromagnetic radiation being emitted from the site. The antennas can transmit on L, S, and Q bands to space vehicles. The L-Band refers to a part of the microwave band of the electromagnetic spectrum covering frequencies from 1 to 2 gigahertz; the S-Band covers frequencies from 2 to 4 gigahertz; and the Q-Band covers frequencies from 36 to 46 gigahertz. The beams used for transmitting earth-to-satellite signals are highly directional, similar to the beam from a flashlight with the most concentrated area of the beam related to the diameter of the antenna dish. These antennas will transmit at various angles of inclination, depending on where the space vehicles are located with a minimum height of 15 ft (6 m) above ground level.

Figure 1. Location of the potential RGS-A project footprint and the off-site conservation area in the northwest corner of the Caiguat Forest Enhancement Area (labeled North Finegayan Forest Enhancement Site).

The following conservation measures are specific to the action and promote the continued existence of *Tabernaemontana rotensis* and *Cycas micronesica*, their pollinators, seed dispersers and habitat. Conservation Measures are considered part of the Proposed Action. Conservation measures included in the proposed action are intended to avoid, minimize, or offset the effects of an action and are considered like other portions of the action and do not require any additional demonstration of binding plans (50 CFR § 402.14 (g)(8))

1) DON will employ qualified biologists(s) to support and conduct Conservation Measures identified in this BA. Qualified biologist is defined as:
    a. A person who has successfully completed a full four-year course of study at an

accredited college or university leading to a bachelor's or higher degree, which includes a major field (24 semester hours) of study in biological sciences, wildlife biology, botany, natural resource management, environmental sciences, or related disciplines appropriate to this position, and

b. A combination of at least 100 documented hours of experience conducting propagation or transplantation of the aforementioned species or closely related species, and
c. Documented one year of experience with monitoring/maintenance of tropical plant species to include pest and nutritional management.

2) In order to validate the above information, potential qualified biologist(s) will provide to the DON contact information of three references familiar with their work related to b and c (above).
3) The DON has completed pre-construction surveys to identify all listed plant species prior to the commencement of construction activities. Over a period of six days in April 2021 (7, 9, 14, 21, 23, and 28 April) and three days in August 2021 (13,19, and 30 August), biological surveys were conducted to detect the presence of ESA-listed species and host plants within the construction footprint. If the project construction does not occur within 3 years of the 2021, biological surveys, these surveys will be re-done prior to construction implementation.
    a. As detailed in species-specific conservation measures below, if pre-construction surveys identify a listed plant species present in the construction area and the individuals cannot be avoided, healthy plant material will be salvaged or available seeds will be collected, propagated and outplanted into suitable protected areas (fenced, ungulate free). The selected area for outplanting is the Caiguat Forest Enhancement Area (see Figure 1).
4) If the *Tabernaemontana rotensis* plant is within the final project footprint, the following conservation measures will be taken to offset the effect of the removal of that individual from the population. If the individual plant and the intact forest to the north of the plant can be avoided during project implementation, left intact, and no clearing occurs within 10 feet (ft) (3 meters (m)) of the plant's location, the following conservation activities would not be undertaken.
    a. Seeds or stem cuttings will be collected from the *T. rotensis* plant growing within the area proposed for development. This material will be propagated in a greenhouse, and the propagules will be outplanted to preserve the genetics of the individual within the project footprint. The outplanting site will be treated for pests and invasive species for one year following outplanting and the plants will be monitored for an additional six months beyond the maintenance period.

5) *Cycas micronesica* conservation: The DON commits to ensure the *C. micronesica* population, 20 years from now, will not be reduced as a result of the proposed action. The DON will collect seed or cuttings from plants in the project footprint or adjacent areas to propagate, outplant, and conserve the plants in an off-site conservation site at the northwest corner of the nearby Caiguat Forest Enhancement Area.

   In the absence of the proposed action, the *C. micronesica* population in the project area would be expected to decline at a rate of between 5.8 and 13.2 percent. In our design of this *C. micronesica* conservation measure, we conservatively anticipate the lower 5.8% decline. The DON will collect seed and, where appropriate, salvage pups and stem cuttings, from the healthy/appropriate plants within the project footprint, propagate, and outplant these individuals to the approximately 10-ac (4 ha) area in the northwest corner of the Caiguat Forest Enhancement Area (see Figure 1). Salvage of plant material for cycads would be dependent on salvage work method feasibility (e.g., safety and site-specific conditions) and sufficient plant health to support transplantation survival. Seed collection, rather than salvage of plant material, is expected to be the primary conservation method used.

   The number of plants that are outplanted and the level of on-the-ground long-term effort taken to protect these plants from invasive invertebrates and other pests, will depend on the number of plants impacted in the project footprint and the mortality experienced by the outplanted plants. There is some uncertainty regarding the final project footprint and the number of *C. micronesica* that will be permanently removed as a result of the action. At maximum, 74 *C. micronesica* are within the project area and an additional two *C. micronesica* are within 10 ft (3 m) of that footprint. At the project development phase, the number (**"X" number in Table 1, below)** of genetically-distinct affected *C. micronesica* will be determined by the Department of the Navy and reported to the Service. This **"X" number** will be used to populate an updated table with numbers of plants, based on the percentages in Table 1. In addition, the level of invertebrate and invasive plant control that may be needed to achieve these targets is uncertain.

   The DON commits to ensure the number of genetically-distinct plants in Year 20, is the same as the number of plants we currently expect there would have been in the absence of the project. To achieve this, trajectories of plant survival were used to develop interim benchmarks at project years 5, 10, and 15. During the years leading up to the benchmark 5, 10, 15, and 20 years, the survival of the outplanted plants will be assessed and the need for any additional long-term field maintenance will be assessed. If survival rates are lower than anticipated and, even with field maintenance actions, the percent of plants is

on a trajectory to fall short of the expected trend-lines used to design this conservation measure, additional seed collection, propagation, and outplanting will be conducted to ensure the years 5, 10, 15, and 20 benchmark numbers are achieved. Seeds collected for this propagation activity would come from wild plants growing adjacent to the RGS-A project footprint; any such seed collection outside the project footprint would entail collection of no more than ten percent of any individual plant's seeds.

Identification tags will accompany outplanted *Cycas micronesica* as well as GPS sub-meter coordinates for the *C. micronesica* locations during the 20 years. *Cycas micronesica* outplanted for this project will not be interspersed with other construction site *C. micronesica* outplantings. Outplanted *C. micronesica* will be considered living/surviving when they show full crown development, no visible sign of nutrient deficiencies, and no visible sign of stem rot/decay.

Table 1. RGS-A *Cycas micronesica* Conservation Commitment with Project Year 5, 10, 15, and 20, Benchmark Percentage of Genetically Distinct Plants Remaining in the Wild in Relation to the Baseline Percentage Expected to Remain in the Absence of the Proposed Action.

YEAR / Approximate Project Year		**Baseline - Percent of *Cycas micronesica* in the proposed development area expected to persist in the absence of the proposed action (with 5.8% ongoing population decline)**	RGS-A Conservation Commitment: **Percent of the X-number of Cycas micronesica occurring in 2021** (to be determined during project construction, at maximum 76 plants, fewer if project footprint is smaller) that had to be removed (or within 10-feet of the project vegetation clearing footprint) that survive (having been propagated/outplanted/conserved) or occur from additional augmentation at the off-site conservation area	
			Maximum %	**Minimum %**
2021

6) The DON will implement a contractor education program to ensure that construction contractor personnel are informed of the biological resources in the project area, including invasive species, special-status species, avoidance measures, and reporting requirements. The measure is intended to prevent inadvertent effects to terrestrial biological resources due to lack of awareness of resource presence, habitat requirements, and protective measures. The DON will conduct regular (e.g., monthly) construction site inspections for conservation measure implementation.
7) DON will ensure that all construction activities will occur within the limits of construction to prevent additional habitat loss. Limits of construction must be shown on contract plans and specifications and physically demarcated in the field prior to any vegetation clearing. This measure is intended to prevent additional habitat loss. The measure will be implemented during pre-construction and construction.
8) Per OPNAV M-5090.1 §12-3.9, the DON will specify housekeeping and vehicle cleanliness measures in contractor environmental plans to reduce the likelihood of spread of invasive species within the construction area. To the extent practicable and to be performed in conjunction with stormwater pollution prevention practices, cargo and vehicles will be inspected upon entry to the construction site and high-pressure wash-down will be performed to reduce organic material and mud from leaving or entering the

jobsite. Dirty vehicles, equipment or cargo shall be cleaned of dirt, debris, organisms, weeds and other material before they enter the jobsite and discarded material will be tested, packaged or treated before disposal. Green waste will be reused on-base to the greatest extent practicable and will be managed to reduce Coconut Rhinoceros Beetle and Little Fire Ant spread or breeding.

9) To avoid potential impacts to limestone forest plant pollinators and seed dispersers, outdoor lighting will be minimized, and construction work will not occur within 150 m (492 ft) of a Mariana fruit bat roost. When a Mariana fruit bat is seen flying or foraging within 150 m (492 ft) of construction activity, work will pause until the bat has left the area. The DON will implement a contractor education program to ensure that construction contractor personnel are shown how to identify, respond, and report a Mariana fruit bat sighting.

   Additional pre-construction biomonitor surveys for Mariana fruit bats and bat roost sites will be conducted up to one week prior to the onset of vegetation clearing. Any pause in work beyond seven days in vegetation clearing will trigger additional surveys. These surveys will follow JRM protocols (USFWS 2009).

   All construction and maintenance work is expected to occur during daytime hours. Although the Navy does not expect night work to occur the following conservation measures will be implemented should unforeseen night construction or exterior maintenance work be required:

   - A dusk biomonitor survey following JRM protocol (USFWS 2009); and
   - When installing permanent lights, and if appropriate for antiterrorism force protection or airspace safety criteria, the DON will use downward-facing, shielded or full cut-off lens lights (with the lowest lumens necessary). Properly shielded or full-cutoff lens illumination can only be seen below the horizontal plane at the fixture height. To avoid vertical glare and illumination of forest habitats, should temporary lighting be needed for nighttime work, only downward-facing, full cutoff-off lens lights or fully-shielded lights will be used.

Action Area

The action area is defined (50 CFR 402.02) as “all areas to be affected directly or indirectly by the federal action and not merely the immediate area involved in the action.” The Service has determined that the action area for this project is the project footprint, and the offsite conservation area in the northwest corner of the Caiguat Forest Enhancement Area (both shown in Figure 1).

Analytical Framework for the Jeopardy Analysis

In accordance with regulation (see 84 FR 44976), the jeopardy determination in this Biological Opinion relies on the following four components:

1) The *Status of the Species*, which evaluates the species' current range-wide condition relative to its reproduction, numbers, and distribution; the factors responsible for that condition; its survival and recovery needs; and explains if the species' current range-wide population is likely to persist while retaining the potential for recovery or is not viable;
2) The *Environmental Baseline*, which evaluates the current condition of the species in the action area relative to its reproduction, numbers, and distribution absent the consequences of the proposed action; the factors responsible for that condition; and the relationship of the action area to the survival and recovery of the species;
3) The *Effects of the Action*, which evaluates all future consequences to the species that are reasonably certain to be caused by the proposed action, including the consequences of other activities that are caused by the proposed action, and how those impacts are likely to influence the survival and recovery role of the action area for the species; and
4) *Cumulative Effects*, which evaluates the consequences of future, non-Federal activities reasonably certain to occur in the action area on the species, and how those impacts are likely to influence the survival and recovery role of the action area for the species.

In accordance with policy and regulation, the jeopardy determination is made by evaluating the consequences of the proposed Federal action in the context of the species' current range-wide status, taking into account any cumulative effects, to determine if implementation of the proposed action is likely to cause an appreciable reduction in the likelihood of both the survival and recovery of the species in the wild. The key to making this finding is clearly establishing the role of the action area in the conservation of the species as a whole, and how the effects of the proposed action, taken together with cumulative effects, are likely to alter that role and the continued existence (i.e., survival) of the species.

Status of the Species

Cycas micronesica

Species Description
Cycas micronesica was listed as threatened on October 1, 2015 (80 FR 59424). No critical habitat has been designated for the species.

Cycas micronesica is a palm-like tree, usually unbranched with a thick trunk. Adult stems range from 26 to 39 ft (8 to 12 m) in length and 5 to 10 inches (13 to 25 centimeters) in diameter. The leaves, 3 to 6.5 ft (1 to 2 m) long, are glossy, pinnate, and restricted to the top of the trunk (Stone 1970, p. 65; Raulerson and Rinehart 1991, p. 4; Hill 1994, p. 556).

The species *Cycas micronesica* (formerly *Cycas circinalis*) is part of the Cycadaceae family, which contains only one genus, *Cycas*, a very ancient genus of trees dating back to the Jurassic period. *Cycas micronesica* is known from Guam, Rota, and Tinian (the Tinian population being outplanted) in the Mariana Islands, Yap in the Federated States of Micronesia, and the Republic of Palau.

Life History

Cycas micronesica is the only native gymnosperm in the Mariana Islands. *Cycas micronesica* occurs in limestone forests in Guam and Rota, with fewer occurrences in volcanic soils typical of southern Guam (Stone 1970, p. 65; Hill 1994, p. 556). *Cycas micronesica* is also observed in coastal strands (Harrington et al. 2012, p. 14). The fruit of *Cycas micronesica* has been identified as a food source for the Mariana fruit bat (*Pteropus mariannus mariannus*) (Wiles and Fujita 1992, p. 27), as well as for the CHamoru, who, after first processing to rid the naturally occurring toxins, use them to make flour (Whiting 1963, pp. 276–277).

Cycads are dioecious, and both sexes bear reproductive structures that are relatively massive amongst gymnosperms. The average age at sexual maturity of naturally occurring *Cycas micronesica* plants has not been documented, however, reproductive parts appeared after three years on trees propagated in a nursery (GPEPP 2021, p. 40). Male trees bear an elongated, upright cone in the center of the leaves, with the woolly scales of the cone producing pollen. When the pollen is mature the cone is very strongly scented. The female trees also produce a central cone-like structure that opens outward to reveal individual soft, woolly, tan leaves that are deeply lobed and toothed and bear ovules in notches along the margins. If the ovules are fertilized by pollen, glossy, large, hard-shelled brown seeds develop on the leaves (Raulerson and Rinehart 1991, p. 4). Many plants reach the pollination phase between April and early August (Hamada et al. 2015, p. 527). *Cycas micronesica* emits chemical cues to attract specialist insects for pollination, primarily of the genus Anatrachyntis (Lepidoptera: Cosmopterigidae) (Schneider et al. 2002, p. 282; Terry et al. 2009, p. 95), but there is also evidence of wind as a pollen vector in Guam in open or forested areas (Terry et al. 2009, p. 96; Hamada et al. 2015, entire).

Cycas micronesica can also reproduce vegetatively (USFWS 2020a, p. 5) and can be propagated by seeds, basal suckers, vegetative offsets (i.e., cycad pups), and cuttings. Cibrian-Jaramillo et al. (2010, pp. 2373–2374) suggested *Cycas micronesica* seeds may disperse by floating on rivers and streams. Cycads pups, which may or may not have natural root growth while on the parent tree, may be salvaged and propagated (DON 2019, p. 12). Concave spots on young plants between 12 and 18 months old can be cut out and planted, similar to the eyes on potatoes (Raulerson and Rinehart 1991, p. 4).

The species is considered long-lived and plants may live up to 40 years (Marler et al. 2010).

Population Dynamics

Populations of *Cycas micronesica* were known historically from Guam, Rota, Yap, and Palau (Hill 2004, p. 556; Hill et al. 2004, p. 280) and the species has been outplanted on Tinian (NAVFAC Marianas 2016, p. 18). In a 2002 forest inventory on Guam, prior to the unintentional introduction of the devastating Cycad aulacaspis scale (*Aulacaspis yasumatsui*), *Cycas micronesica* was the most abundant tree detected, with over 1.5 million individuals counted on island (Donnegan et al. 2004, p. 16). In 2009, sampling at 24 locations across Guam identified 18 genetic populations by analyzing genetic connectivity throughout the island (Cibrian-Jaramillo et al. 2010, pp. 2373–2375). Populations were found in both volcanic and calcareous coralline soils. The Ritidian population was the most geographically isolated in the north, with almost no immigrants from nearby populations, while the most genetically diverse were found in the south, in Talofofo and Nasa. In another survey, an unquantified number of *Cycas micronesica* individuals were found at 11 sites across Guam, some of which were on Andersen Air Force Base (Harrington et al. 2012, entire).

In 2013, over 257,000 individuals were documented on Andersen Air Force Base, but in a population structure dominated by adults with little recruitment and declining reproductive success (Marler 2014, entire). Between March 2015 and January 2017, natural resources personnel from Marine Corps Activity Guam (now Marine Corps Base Camp Blaz) conducted surveys in Guam which identified 19,852 mature *Cycas micronesica* (DON 2017, p. 82).

At the time of listing in 2015, there were fewer than 516,000 individuals on Guam (80 FR 59424, October 1, 2015, p. 59434). This number did not distinguish between successfully reproducing adults and juveniles, and due to the effects of cycad aulacaspis, it is likely that the number of extant individuals that could successfully reproduce was much lower. The population estimate for Rota was 111,500 individuals; outside of the Marianas, approximately 300,000 were estimated on Yap, and 2,500 on Palau (80 FR 59424, October 1, 2015, p. 59434).

The spatial distribution of the species has become more isolated in time and less continuous as habitat loss and fragmentation have acted as barriers to seed and pollen dispersal. In 2015, there were an estimated 15 to 20 populations across Guam, Rota, Yap, and Palau with no more than four populations on any one island or island group (80 FR 59424, October 1, 2015, p. 59435). By spatially comparing populations based on the most recent genetic study (Cibrian-Jaramillo et al. 2010, entire) and targeted surveys, we now assume there are approximately 21 distinct populations of *Cycas micronesica* spread throughout forested areas of Guam. Recent surveys outside of Guam have not been extensive, and the number of known populations for Rota, Palau, and Yap have not been revised since the time of listing. *Cycas circinalis* has been identified on Pagan (Pratt 2011, p. 54) and because of unstable nomenclature is likely to be *Cycas micronesica*. However, this has not been verified.

Status and Distribution

In 2002, the Forest Inventory and Analysis Program estimated the Guam island-wide cycad population using 46 permanent field plots serving as a baseline. In 2012, cycad populations were

re-monitored to detect change since 2002. In the 10 years between field studies, the population estimate decreased from 1,571,556 to 624,000 individuals (range including sampling error: 382,000-866,000) (Donnegan et al. 2004 p. 16; Lazaro et al. 2013, p. 7). This represents an average annual rate of decline of 8.1% (5.8%-13.2%) (Figure 2).

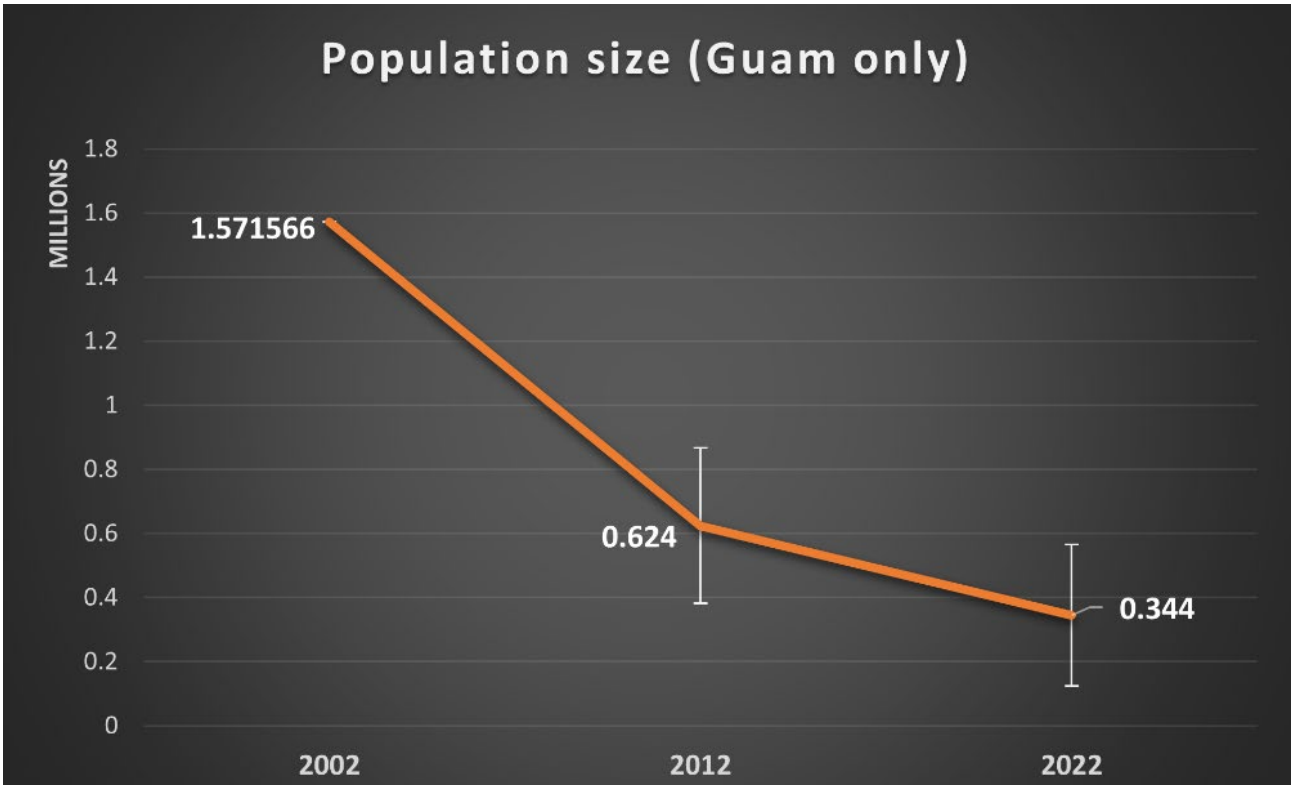

Figure 2. *Cycas micronesica* population decline on Guam (estimated from Donnegan et al. 2004; Lazaro et al. 2013).

The 2020 population estimates signify a total decline of 33.3 percent on Guam and 53.4 percent on Rota since 2013, primarily the result of cycad aulacaspis and loss of habitat through development. We estimate a total of 32 populations of *Cycas micronesica*—approximately 396,133 individuals in the wild in the Mariana Islands and fewer than 290,950 individuals in Yap and Palau—for a total of no more than 687,083 individuals across the range of the species (USFWS 2020a, p. 13). The population estimates for Palau and Yap made at the time of listing remain the most recent (80 FR 59424, October 1, 2015, p. 59434). The latest projections include the possible complete extirpation of *C. micronesica* from Guam by 2032 if the current rate of mortality continues unabated (Marler and Krishnapillai 2020, p. 7). Applying the 8.1% average annual rate of decline, the 2022, number of C. micronesica on Guam is approximately 290,529.

In February 2016, the total outplanted experimental population of *Cycas micronesica* on Tinian was 903, half of which was small and required continued maintenance (NAVFAC Marianas 2016, p. 11). Cycad aulacaspis scale and another introduced pest, cycad blue butterfly (*Chilades*

pandava), were detected in August 2019, and cycad aulacaspis had spread to half of the plots by April 2021 (NAVFAC Marianas 2021a, p. 18). Ongoing maintenance of the outplanted plants includes systematic pesticide application and vegetation management, although the highest mortality is being observed in plots with little cycad aulacaspis infestation. As of April 2021, there were approximately 850 live cycads in the Tinian plots (NAVFAC Marianas 2021, p. 18).
Table 2: The 2020 Estimates of the Range-Wide Number of Populations and Individuals of *Cycas micronesica*.

Island	Estimated Number of Populations	Estimated Number of Individuals
Guam	21	344,000 (123,000–538,000)
Rota	4	< 52,133
Palau	4	< 2,500
Yap	3	< 288,450
Total	**32**	**396,133 (Guam and Rota) + < 290,950 (Palau and Yap)**

Threats
The following threats to *Cycas micronesica* contributed to its listing or were identified after listing and continue to impact the ability of the species to recover.

Disease and pests: Cycad aulacaspis scale, a cycad specialist insect scale, is the most significant threat to the recovery of *Cycas micronesica* and the primary driver of mortality at all life stages, limiting reproduction and recruitment of individuals into the population (Marler and Muniappan 2006, p. 3; Marler 2014, p. 1; Marler and Krishnapillai 2020, entire). *C. micronesica* mortality from cycad aulacaspis reached 92 percent in Guam by 2012 (Marler and Lawrence 2012, p. 1). Other invertebrates, such as the leaf miner *Erechthias* species, the cycad blue butterfly, and the native longhorn beetle, *Dihammus marianarum*, also contribute to declining health and mortality of individuals in Mariana Islands cycad populations (Marler 2013, entire).

Loss or degradation of habitat: The conversion of land for agriculture and urban development continues to reduce and degrade the amount of habitat available for *Cycas micronesica* in the Mariana Islands; 21 percent of Guam and 6 percent of Rota is now developed land unsuitable for the species (Spies et al. 2019, p. 6). Ongoing military expansion and training is also reducing the availability or suitability of habitat for *Cycas micronesica*. The establishment of Marine Corps Base Camp Blaz will result in the loss of approximately 1,219 ac (493 ha) of limestone forest and 613 ac (248 ha) of herbaceous scrub in Guam (USFWS 2017, p. 17). A large population of *Cycas micronesica* was found on Andersen Air Force Base where a live fire training range complex is under construction as part of the Marine Corps relocation. Live fire may cause damage to individuals within and outside of the training range, and ordnance poses a wildfire risk in the area (80 FR 59424, October 1, 2015, p. 59469).

Non-native plants: Invasive plants compete with *Cycas micronesica* for space and convert native plant communities to non-native dominated communities, degrading native habitats through a

variety of processes that modify light availability, soil-water regimes, nutrient cycling, and fire regimes (80 FR 59424, October 1, 2015, p. 59456).

Invasive animals: Non-native ungulates trample vegetation, cause erosion, graze to the point of clearing understory vegetation, and prevent regeneration by eating seeds and seedlings. The species most impacting *Cycas micronesica* by herbivory are feral pigs (*Sus scrofa*) and Philippine deer (*Cervus mariannus*) (USFWS 2020a, p. 11). Plant regeneration is also impacted by rats, which eat most plant parts (80 FR 59424, October 1, 2015, p. 59455). The introduction of the brown treesnake (*Boiga irregularis*) to Guam caused the loss or severe reduction of most native bird species that dispersed seeds or pollinated native plants (80 FR 59424, October 1, 2015, p. 59456) and has had a cascading effect on the health of the island's forests. Biocontrol or other methods of targeting introduced pests, especially cycad aulacaspis, must be developed to stabilize the population, and future invasions from other pests must be prevented (Marler and Lawrence 2012, p. 240). Because physical damage and herbivory from feral pigs and deer compound the effects of insect pests (Marler and Lawrence 2012, p. 238), ungulate control and fencing restoration sites are also crucial steps in managing *Cycas micronesica* populations.

Low population numbers: A lack of recruitment into the *Cycas micronesica* populations in Guam that are currently dominated by adults increases the vulnerability of the species and challenges its ability to maintain or expand a viable population structure (Cibrian-Jaramillo et al. 2010, p. 2373; Marler and Lawrence 2012, p. 237).

Fire: Fires threaten native species and ecosystems of the Mariana Islands, particularly in Guam, and are both intentionally set, e.g., arson, or caused by altered fire regimes due to alien species (80 FR 59424, October 1, 2015, p. 59457). Wildfires burn an annual average of 1.6 to 2.4 percent of the land area in the Northern Mariana Islands and 2.8 to 4.0 percent of land area of Guam (Minton 2006, p. 23; Dendy 2019 in litt., Trauernicht and Kunz 2019, p. 1; FSRD 2022, p. 3). In 2021, a total of 177 wildfires burned approximately 3,624 ac (1,467 ha) of land in Guam (FSRD 2022, p. 3).

Stochastic events and climate change: The Mariana Islands lie in the world's most prolific typhoon basin. Unhealthy trees are less able to withstand or recover from damage caused by the high winds and rains of typhoons (Hirsh and Marler 2002, pp. 600–602) particularly if the tree's natural resilience has been impaired by chronic cycad aulacaspis scale. Further, the damage or destruction of vegetation from typhoons modifies light availability and creates space for invasion by non-native pest and plant species that compete for space, water, and nutrients, and alter basic water and nutrient cycling processes (80 FR 59424, October 1, 2015, p. 59458). While the impacts of climate change on *Cycas micronesica* are not well understood, climate change has had impacts in the tropical Pacific generally. Anticipated weather regime changes are likely to be one of the direct climate change impacts to *Cycas micronesica* and could also exacerbate the effects of other threats (80 FR 59424, October 1, 2015, p. 59458).

Tabernaemontana rotensis

Species Description
Tabernaemontana rotensis was listed as threatened on October 1, 2015 (80 FR 59424). No critical habitat has been designated for the species.

Tabernaemontana rotensis is a small to medium-sized tree ranging in height from 26 to 33 ft (8 to 10 m) with light green leaves that are thin, opposite, and 6 to 12 inches (15 to 30 centimeters) long. Flowers are white, elongate, slender, and branch from the tree (Stone 1970, p. 485). *Tabernaemontana rotensis* is in the dogbane family, Apocynaceae, and is a genetically distinct species endemic to Guam and Rota in the Mariana Islands (Harbaugh Reynaud 2012, p. 11).

Life History
A long-lived perennial tree, *Tabernaemontana rotensis* occurs in limestone forests and is most often found co-occurring with other native plants (UOG 2007, p. 11). The species can colonize sites with a range of light conditions from full sun to deep shade and has primarily been found in areas of little to no slope, i.e., with less than a 15 percent gradient (UOG 2007, p. 10; JRM and UOG 2016, p. 5).

While the average age of sexual maturity of naturally occurring *Tabernaemontana rotensis* plants has not been documented, propagated nursery plants were seen flowering after one year for trees reaching a height of 4 ft (1.2 m) (GPEPP 2019, in litt., p. 3). *Tabernaemontana rotensis* populations typically flower from August through October, during which 40 to 80 percent of trees are found to have at least some flowering occurring every month (UOG 2007, p. 23). Germination and seedling emergence have been shown to be maximized in full sun conditions, such as after typhoon damage. About one month after a typhoon the species develops a synchronized pulse of flowering which leads to a mass seeding event approximately four months post-typhoon (UOG 2007, p. 21).

Following flowering, *Tabernaemontana rotensis* trees produce conspicuous beaked orange fruits that are either single or twinned. The fruits reach full size around 1 inch (3 centimeters) long, 30 to 35 days after flowering. Fruit is mature at around 90 days, when it turns from green to orange, splits open, and exposes the seeds (UOG 2007, p. 6, 24).

There is little data on the pollinators of *Tabernaemontana rotensis*, although seed dispersal of the species is thought to be dependent on birds. The eradication of most pollinators and frugivorous bird species in Guam by invasive species has restricted the spatial distribution of *Tabernaemontana rotensis* so that the trees are generally found clumped in confined areas, with seedling establishment limited to fruit that falls in the vicinity of the parent tree. As a result, seedlings develop in extreme competition with each other, and many become stunted and die (UOG 2007, p. 14).

Population Dynamics

The species *Tabernaemontana rotensis* is known historically from Guam and Rota. At the time of listing in 2015, the number of documented individuals had increased to seven naturally occurring populations comprised of more than 21,000 seedlings, immature trees, and reproductive, mature trees on Guam, and nine trees on Rota (80 FR 59424, October 1, 2015, p. 59438). Most of the *Tabernaemontana rotensis* on Guam were found in clustered populations on Andersen Air Force Base with an average of 80, but up to 850, individuals per site (UOG 2007, p. 9). Thirty *Tabernaemontana rotensis* trees had also been outplanted on Rota (80 FR 59424, October 1, 2015, p. 59438). Surveys on Guam have continued to document mature trees and seedlings throughout military lands, as well as in the Anao Conservation Area, Ipan, and the Guam National Wildlife Refuge, Ritidian Unit (USFWS 2020b, p. 9−10). As of 2020, an estimated 15,510 naturally occurring plants remain within eight populations on Guam and as scattered individuals across Rota (USFWS 2020b, p. 1-15). In 2000, two mature trees were known on Rota and 167 seedlings, immature trees, and mature, reproductive trees were found at five sites on Guam, including at Andersen Air Force Base and the Guam National Wildlife Refuge (65 FR 35025, June 1, 2000, p. 35027). By 2004, there were at least eight *T. rotensis* trees known on private lands on Rota, and at least 250 trees on Guam (69 FR 1560, January 9, 2004, p. 1560).

While reproducing individuals are frequently observed in *Tabernaemontana rotensis*, the lack of adequate seed dispersal has meant that there is a reduced recruitment of mature individuals into the population in Guam.

Status and Distribution

Our 2020 population estimate shows an increase in the number of *Tabernaemontana rotensis* populations known since 2015, but a decline in the overall number of individuals. This population estimate of 15,341 naturally occurring individuals across eight sites in Guam and six sites in Rota (USFWS 2020b, p. 10) primarily reflects a decrease in the number of individuals reported at Andersen Air Force Base, where the majority of the species has been observed. On Guam, six populations are located in the northern half of the island and two populations are located in the southern half. Individuals on Rota are spread out across the island.

Subsequent surveys performed from late 2019 through 2021 found an additional 86 individuals at Andersen Air Force Base and Naval Base Guam Naval Munitions Site, and 54 individuals in the vicinity of the Bolanos Conservation Area and Yigo Raceway (NAVFAC Marianas 2021b, pp. 109−110, 112, 114). Some of these detections are on or near lands slated for development or other projects and have not yet been incorporated into the population estimate for the species.

Threats

The following threats to *Tabernaemontana rotensis* contributed to its listing or were identified after listing and continue to impact the ability of the species to recover.

Loss or degradation of habitat: The conversion of land for urban development and agriculture continues to reduce and degrade the amount of suitable habitat available for *Tabernaemontana rotensis* in the Mariana Islands; 21 percent of Guam and 6 percent of Rota is now developed land (Spies et al. 2019, p. 6). *Tabernaemontana rotensis* typically grows on flat terrain with little to no slope, land which is also particularly suited to development. Ongoing military expansion and training is also reducing the availability or suitability of habitat for *Tabernaemontana rotensis*. The establishment of Marine Corps Base Camp Blaz will result in the loss of approximately 1,219 ac (493 ha) of limestone forest in Guam (USFWS 2017, p. 17). A large population of *Tabernaemontana rotensis* was found on Andersen Air Force Base where a live fire training range complex is under construction for the military expansion. Live fire can cause damage to individuals within and outside of the training range, and there is potential for the ordnance to cause wildfires in the area (80 FR 59424, October 1, 2015, p. 59469).

Fire: Fires threaten native species and ecosystems of the Mariana Islands, particularly in Guam, and are both intentionally set, e.g., arson, or caused by altered fire regimes due to alien species (80 FR 59424, October 1, 2015, p. 59457). In 2021, a total of 177 wildfires burned approximately 3,624 ac (1,467 ha) of land in Guam (FSRD 2022, p. 3).

Non-native plants: Invasive plants compete with *Tabernaemontana rotensis* for space and convert native plant communities to non-native dominated communities, degrading limestone forests through a variety of processes that modify light availability, soil-water and fire regimes, and nutrient cycling (80 FR 59424, October 1, 2015, p. 59456). *Tabernaemontana rotensis* is rarely found co-occurring with non-native species (UOG 2007, p. 11).

Invasive animals: Non-native ungulates trample and damage vegetation, graze often to the point of clearing understory vegetation, cause erosion, and prevent regeneration by eating seeds and seedlings. The species most impacting *Tabernaemontana rotensis* by herbivory are feral pigs (*Sus scrofa*), Philippine deer (*Cervus mariannus*), and water buffalo (*Bubalus bubalis*) (USFWS 2020, p. 12). Plant regeneration is also impacted by rats, which eat most plant parts (80 FR 59424, October 1, 2015, p. 59455). The introduction of the brown treesnake (*Boiga irregularis*) to Guam caused the loss or severe reduction of most native bird species that dispersed seeds or pollinated native plants (80 FR 59424, October 1, 2015, p. 59456). This lack of seed dispersal has resulted in clustered populations of *Tabernaemontana rotensis*, which compete for space and sunlight, exhibit less genetic diversity, are less resilient to evolutionary changes (UOG 2007, p. 28), and are more vulnerable to stochastic events and extinction from other threats.

Stochastic events and climate change: The Mariana Islands lie in the world's most prolific typhoon basin. Damage and destruction of vegetation from typhoons modifies light availability and creates space for invasion by non-native species that compete for space and alter basic water and nutrient cycling processes (80 FR 59424, October 1, 2015, p. 59458). All populations of *Tabernaemontana rotensis* except at three locations on Guam have low resiliency due to low numbers of individuals. While the impacts of climate change on *Tabernaemontana rotensis* are not well understood, climate change has had impacts in the tropical Pacific generally.

Anticipated weather regime changes are likely to be one of the direct climate change impacts to *Tabernaemontana rotensis* and could also exacerbate the effects of other threats (80 FR 59424, October 1, 2015, p. 59458).

Environmental Baseline

Regulations implementing the ESA (50 CFR 402.02) define the environmental baseline as the past and present impacts of all federal, state, or private actions and other human activities in the action area. Also included in the environmental baseline are the anticipated and/or ongoing impacts of all proposed federal projects in the action area that have undergone Section 7 consultation, and the impacts of state and private actions which are contemporaneous with the consultation in progress.

General Environmental Baseline

The project footprint is not within an area slated for protection from ungulates or other site-specific conservation action. The site is currently protected to some extent from incursion of invasive species pursuant to two active Department of the Navy formal consultations, *Biological Opinion for the Department of Navy's Relocation of the U.S. Marine Corps from Okinawa to Guam and Associated Activities on Guam*, 2015 (01EPIF00-2015-F-0025) and *Reinitiation of the 2015 Biological Opinion on the Department of the Navy's Relocation of U.S. Marine Corps from Okinawa to Guam and Associated Activities on Guam*, 2017 (01EPIF00-2016-F-0185).

The Caiguat Forest Enhancement Area is among the native limestone forest areas that will be conserved long-term in relation to the above-listed Biological Opinions and the *Memorandum of Agreement between the Department of the Navy and the U.S. Fish and Wildlife Service Regarding Conservation of Guam Micronesian Kingfisher Recovery Habitat in Northern Guam* (2015, as amended). The area will be kept free of ungulates and experimental brown treesnake suppression will occur within the site.

Environmental Baseline: *Cycas micronesica*

Status of the species within the action area: There are 74 *Cycas micronesica* within the 26.2 ac (10.6 ha) area within which vegetation clearing and RGS-A development may occur and there are an additional two *C. micronesica* within 10 ft (3 m) of this area (Figure 3). *Cycas micronesica* density within the northwest corner of the Caiguat Forest Enhancement Area is currently low to medium (Gutierrez *pers. comm.* 2022). *Cycas micronesica* used to be the most common understory tree in the region's limestone forests (Stone 1970, p. 65; Raulerson and Rinehart 1991, p. 4; Donnegon et al. 2004, p. 19).

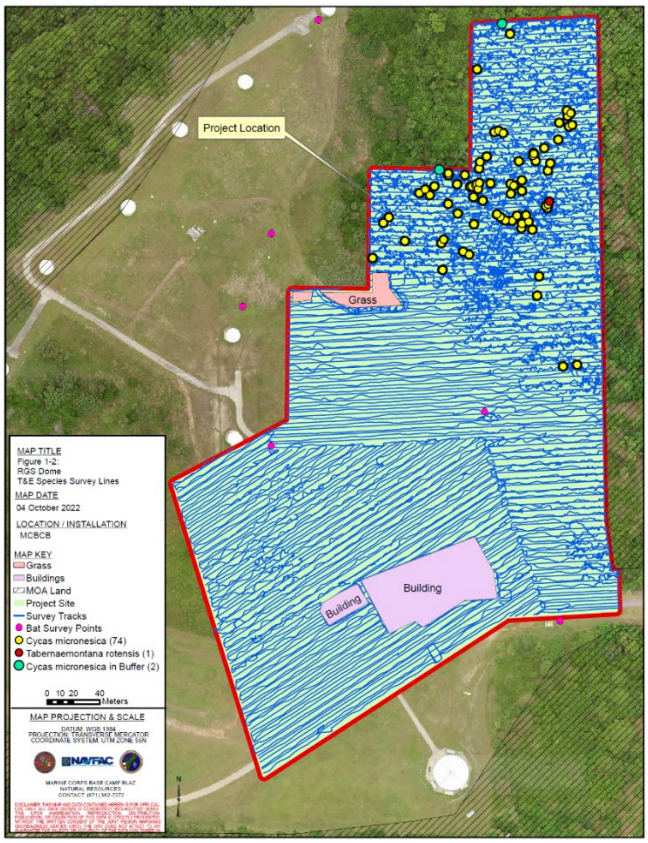

Figure 3. Location of *Cycas micronesica* plants within the area that may be cleared for RGS-A development.

Factors affecting species environment within the action area: The *Cycas micronesica* population within the action area are likely to be experiencing the same dramatic declines occurring throughout the species' range on Guam. Estimates from the Forest Inventory and Analysis Program on Guam (Donnegan et al. 2004 p. 16 and Lazaro et al. 2013 p. 7) indicate an estimated average 8.1% (5.8%-13.2%) rate of decline for *C. micronesica*, primarily due to cycad aulacaspis scale and development but the contribution of each has not been quantified. *Cycas micronesica* recruitment is extremely low due to high seedling mortality due to the scale insect and other threats, including ungulates. The current high rates of population decline due to threats other than development are likely to continue to affect the cycads at the RGS-A project footprint and Caiguat Forest Enhancement Area until an effective cycad aulacaspis scale biocontrol can be developed and implemented. In the absence of the proposed action and inability to determine a rate of decline independent of development, the 76 *C. micronesica* plants within the RGS-A project area are expected to continue to decline at an average annual rate of 8.1%. However, this rate of decline would be lower without accounting for development, thus the expected number for replacement should be higher. Five years from now, only 45 of the 76 cycads would be expected to persist at the project area, and seedling recruitment would not be expected to be successful. The senescing cycad population at the project site is expected to continue to decline to fewer than 13 plants in the next 20 years. The most optimistic, 5.8%, annual continued decline

of the *C. micronesica* population in the project footprint in the absence of the proposed action (53 of the 76 plants remaining in year 5, 39 plants in year 10, 29 plants in year 15, and only 22 plants remaining in year 20), is shown in Table 3. The plants surviving to year 20 are expected to be old; this population is expected to continue to experience very low levels seedling recruitment due to invertebrate and ungulate damage. Therefore, the plants in the project footprint living to year 20 are expected to be nearing the end of their life spans at that time.

Table 3: Baseline number (and % of the 2021 population) of *Cycas micronesica* expected to persist in the project footprint, and within 10 ft (3 m) of the project footprint, in the absence of the proposed action with anticipated continued 5.8% annual decline.

YEAR / Approximate Project Year		Baseline - Number of Cycads expected to persist in the proposed development area in the absence of the proposed action: 74 genetically distinct cycads in project footprint (2021) and an additional 2 cycads within 10 feet of the project footprint (anticipated continued annual decline of 5.8%)	Baseline - Percent of *Cycas micronesica* in the proposed development area expected to persist in the absence of the proposed action (with 5.8% ongoing population decline)
2021		76	
2022		72	
2023	1	67	
2024	2	64	
2025	3	60	
2026	4	56	
2027	5	53	70%
2028	6	50	
2029	7	47	
2030	8	44	
2031	9	42	
2032	10	39	52%
2033	11	37	
2034	12	35	
2035	13	33	
2036	14	31	
2037	15	29	38%
2038	16	28	
2039	17	26	
2040	18	24	
2041	19	23	
2042	20	**22**	**29%**

The 74 *C. micronesica* within the potential project footprint were assessed individually by the DON. The condition of the plants is summarized in Table 4. Just over half the plants were affected by cycad aulacapsis scale. Nine female plants were in seed and 14 individuals had vegetative propagules at the time of the survey.

Table 4. The condition of the 74 *Cycas micronesica* remaining within the project footprint at the time of the 2021 survey (DON 2022, p. 4-6).

Total Number of Cycads	74
Number of Males	3
Number of Females	13
Number of Females with Seeds	9
Number of Unknown Sex	58
Cycads with Vegetative Propagules (total number of propagules)	14 (33)
Cycads with Scale	40
Cycads with Butterfly Damage	18
Cycads with Longhorn Beetle Damage	9

Environmental Baseline: *Tabernaemontana rotensis*

Status of the species within the action area: There is one *Tabernaemontana rotensis* within the area that may be affected by the project (see Figure 3). This *T. rotensis* tree is a mature individual exhibiting healed stem damage, leaf drop and was flowering but fruits or seedlings were not observed (DON 2022, p. 4-7). *Tabernaemontana rotensis* occur throughout the Caiguat Forest Enhancement Area; there are an unknown number of *T. rotensis* within the northwest corner of the site where plants for this project will be outplanted (Gutierrez, pers. comm. 2022).

Factors affecting species environment within the action area: *Tabernaemontana rotensis* within the project footprint are exposed to ungulate browsing and, due to the plant's seed dispersers by brown treensnakes, the plant's seedlings would be expected to continue to experience very low survival rates due to a failure to disperse seeds away from the parent tree.

Effects of the Action

General Effects: The project will result in the permanent removal of up to 26.2 ac of vegetation, including approximately 7 ac of native limestone forest. Edge effects, including changes in microclimate, increased exposure to damaging winds during typhoons, and increases in dust are expected to occur in the forest habitats adjacent to vegetation cleared for the RGS-A. At the Caiguat Forest Enhancement Area, *Cycas micronesica* and *Tabernaemontana rotensis* plants grown from material collected at the project footprint will be planted and conserved. Conservation actions will include control of threats including weeds and invertebrates. Each stressor and benefit caused by the proposed action may have consequences to these listed plants. The consequences of the proposed action on the species are discussed below.

Beneficial and Adverse Consequences of the Proposed Action on the on *Cycas micronesica*

Species' response to a proposed action

The RGS-A's *Cycas micronesica* project is designed to ensure the maintenance of the long-term baseline number of genetically-distinct *C. micronesica* in the wild based on our current estimates of the population's continued decline. Twenty years from now the RGS-A's implementation of

C. micronesica conservation measures are likely to ensure there are the same number of genetically-distinct *C. micronesica* in the wild as there would have been in the absence of the project without intervention such as ungulate and invertebrate control. In the short-term, project implementation would result in a reduction in the number of *C. micronesica* in the wild. A comparison of the baseline *C. micronesica* population decline, compared to the commitments of the RGS-A conservation action, are shown in Table 5.

During project year 1, when the land is cleared, the *C. micronesica* plant material collected from the site will be in propagation and not yet outplanted. Additionally, there may be a small, temporary project-caused reduction in the number of *C. micronesica* in the wild during years 2 through 19. In year 20, the number of plants propagated and conserved in the conservation area will likely be the same as, or more than, the number of plants that would have persisted within the RGS-A construction site in the absence of RGS-A implementation.

Table 5. Long-term conservation commitments by RGS-A to establish a cohort of *Cycas micronesica* at the Caiguat Forest Enhancement Area in comparison to the anticipated continued decline of the *C. micronesica* within the project footprint if the RGS-A was not implemented.

YEAR / Approximate Project Year		Baseline - Number of Cycads expected to persist in the proposed development area in the absence of the proposed action: 74 genetically distinct cycads in project footprint (2021) and an additional 2 cycads within 10 feet of the project footprint (anticipated continued annual decline of 5.8%)	Baseline - Percent of *Cycas micronesica* in the proposed development area expected to persist in the absence of the proposed action (with 5.8% ongoing population decline)	Effects of the RGS-A Action - Number of propagated/outplanted Cycas micronesica living at the off-site conservation area (these numbers are based on worst-case scenario of a large project footprint affecting all 76 C. micronesica; proportionally fewer individuals will be outplanted and conserved if the project footprint affects fewer plants)			
				Minimum # (if all 76 are affected)	Minimum % of the 2021 number	Maximum #	Maximum % of the 2021 number
2021		76					
2022		72					
2023	1	67					
2024	2	64					
2025	3	60					
2026	4	56					
2027	5	53	70%	35	46%	53	70%
2028	6	50					
2029	7	47					
2030	8	44					
2031	9	42					
2032	10	39	52%	30	39%	39	52%
2033	11	37					
2034	12	35					
2035	13	33					
2036	14	31					
2037	15	29	38%	26	34%	29	38%
2038	16	28					
2039	17	26					
2040	18	24					
2041	19	23					
2042	20	**22**	**29%**	**22**	**29%**	**22**	**29%**

The RGS-A's implementation of propagation and outplanting of *C. micronesica* plants, during this current period when the species is otherwise experiencing very low levels of recruitment due to these serious threats, is expected to result in the development of a small but important cohort of younger plants. In the absence of the proposed action, and unless a control for cycad aulacaspis scale is developed and implemented to boost recruitment, most of the plants that would remain within the project footprint in 20 years would be nearing the end of their 40-year lifespans.

The short-term removal of up to 74 individuals within the project footprint in addition to the potential reduced survival of the 2 individuals near the project area would constitute a loss of 0.02 percent of Guam's estimated 290,529 remaining *Cycas micronesica*. The temporary reduction of the local population by 76 individuals would not disrupt the reproduction, distribution, or number of plants in the local *C. micronesica* population. The short-term loss of these plants would be offset, in the long-term, by the collection of seed and plant materials from the plants within and adjacent to the project footprint and the outplanting and long-term conservation of these plants at the nearby Caiguat Forest Enhancement Area. The RGS-A would continue to conduct long-term conservation of the plants at the off-site conservation area, such as weed and invertebrate control to ensure long-term persistence of the *C. micronesica* or additional seed collection, propagation, and outplanting would occur if needed to ensure 5-year benchmark number of plants are achieved to stay on track to ensure the species baseline in project year 20 is not reduced as a result of the project. The RGS-A project is likely to ensure the number of *C. micronesica* in the wild in project year 20 will be the same as it would have been in the absence of the RGS-A development. The RGS-A's implementation of propagation and outplanting of *Cycas micronesica* plants, during this current period when the species is otherwise experiencing very low levels of recruitment due to these serious threats, is expected to result in the development of a small but important cohort of younger plants. In the absence of the proposed action, and unless a control for cycad aulacaspis scale is developed and implemented to boost recruitment, the plants that would be expected to remain within the project footprint in 20 years would be nearing the end of their 40-year lifespans.

The distribution of *Cycas micronesica* plants would be unchanged as a result of the RGS-A, since the plant's population spans across the landscape on all sides of the project site. The project would not result in fragmentation of the plant population or appreciable reductions in plant pollinator dispersal, so it would not interfere with reproduction or connectivity of the plant population.

In summary, these impacts are not likely to create a change in the *Cycas micronesica* ability to survive and recover. The proposed action would not be expected, directly or indirectly, to reduce appreciably the likelihood of the survival and recovery of *C. micronesica* in the wild by reducing the reproduction, numbers, or distribution of this species.

Beneficial and Adverse Consequences of the Proposed Action on the on *Tabernaemontana rotensis*

Species' response to a proposed action

Land clearing for the RGS-A may result in permanent removal of one adult *Tabernaemontana rotensis* plant. If the *T. rotensis* plant ends up being within the project footprint, seeds or stem cuttings will be collected from the *T. rotensis* will be propagated in a greenhouse, and the propagules will be outplanted to the Caiguat Forest Enhancement Area and treated for pests and invasive species for one year following outplanting. There is an unknown likelihood these small *T. rotensis* plants outplanted and conserved for only one year will survive to maturity. Therefore, the RGS-A implementation may result in the permanent loss of up to one *T. rotensis* from the population on Guam.

If the individual plant and the intact forest to the north of the plant can be avoided during project implementation, left intact, and no clearing occurs within 10 ft of the plant's location, the propagation and outplanting will not occur. The plant would be left intact where it may be injured or killed as a result of the adjacent land clearing. Ground disturbance due to use of heavy equipment may injure the plant's roots. The injury to the roots may reduce the plant's survival by reducing its ability to collect water and nutrients from the soil or it may increase the plant's exposure to pathogens. The removal of nearby forest vegetation may increase the plant's exposure to typhoon winds, increasing the plant's vulnerability to being injured in a wind storm. Dust from project construction may temporarily settle on the plant's leaves, reducing its photosynthetic productivity. The likelihood of plant survival increases with any increase in the buffer distance, if any, the RGS-A is ultimately able to give the wild *T. rotensis* plant.

As of 2020, an estimated 15,510 naturally occurring plants remain within eight populations on Guam (USFWS 2020 l, p. 1-15). Should one individual *Tabernaemontana rotensis* plant occur as a result of the RGS-A, it would result in a permanent .0066% reduction of the *T. rotensis* population on Guam. This reduction would not significantly impact the population because the one plant affected constitutes a small part of the relatively large local plant population. The distribution of plants would be unchanged, since the plant's population spans across the landscape on all sides of the project site, and the project would not result in fragmentation of the plant population. As such, loss of the plant would not interfere with connectivity of the plant population.

In summary, the permanent loss of one *Tabernaemontana rotensis* plant is not likely to result in a change to the species ability to survive and recover. The proposed action would not be expected, directly or indirectly, to reduce appreciably the likelihood of the survival and recovery of *T. rotensis* in the wild by reducing the reproduction, numbers, or distribution of this species.

Cumulative Effects

Cumulative effects include the effects of future State, tribal, local or private actions that are reasonably certain to occur in the action area considered in this biological opinion. Future Federal actions that are unrelated to the proposed action are not considered in this section because they require separate consultation pursuant to section 7 of the Act.

The Service is not aware of any future state, tribal, local, or private actions that are reasonably certain to occur within the action area at this time; therefore, no cumulative effects are anticipated.

Conclusion

After reviewing the current status of C*ycas micronesica* and *Tabernaemontana rotensis*, the environmental baseline for the action area, the effects of the proposed RGS-A action, and the cumulative effects, it is the Service's biological opinion that the RGS-Action, as proposed, is not likely to jeopardize the continued existence of C. *micronesica* or *T. rotensis*.

Conservation Recommendations

Section 7(a)(1) of the Act directs Federal agencies to utilize their authorities to further the purposes of the Act by carrying out conservation programs for the benefit of endangered and threatened species. Conservation recommendations are discretionary agency activities to minimize or avoid adverse effects of a proposed action on listed species or critical habitat, to help implement recovery plans, or to develop information.

To prevent the spread of invasive species during project implementation, implement the pertinent sections of the Biosecurity Protocols detailed in Appendix B of this Biological Opinion.

In order for the Service to be kept informed of actions minimizing or avoiding adverse effects or benefitting listed species or their habitats, the Service requests notification of the implementation of any conservation recommendations.

Reinitiation-Closing Statement

This concludes formal consultation on the action(s) outlined in this biological opinion. As provided in 50 CFR § 402.16, reinitiation of formal consultation is required where discretionary Federal agency involvement or control over the action has been retained or is authorized by law and: (1) if the amount or extent of taking specified in the incidental take statement is exceeded; (2) if new information reveals effects of the action that may affect listed species or critical habitat in a manner or to an extent not previously considered; (3) if the identified action is subsequently modified in a manner that causes an effect to the listed species or critical habitat that was not considered in the biological opinion; or (4) if a new species is listed or critical

habitat designated that may be affected by the identified action.

We appreciate your cooperation and assistance in helping us prepare this biological opinion. If you have any questions about this consultation, please contact Mariana Islands Geographic Team Manager Jacqueline Flores of my staff at jacqueline_flores@fws.gov.

Sincerely,

Michelle D. Bogardus
Assistant Field Supervisor
Pacific Islands Fish and Wildlife Office

APPENDIX A

NLAA Concurrence for Mariana Fruit Bat

This appendix details the U.S. Fish and Wildlife Service's (Service) concurrence with your determination the proposed implementation of the RGS-A project at Marine Corps Base Camp Blaz (MCBCB), Guam, is not likely to adversely affect the threatened Mariana fruit bat (*Pteropus mariannus mariannus*, fanihi) pursuant to section 7 of the Endangered Species Act (ESA) of 1973, as amended (16 U.S.C. 1531 et seq.). Our analysis is based on information provided in your August 2022, Biological Assessment and email and MS Teams conversations, field investigations, and other information in our records. A complete record of this consultation is on file at the Pacific Islands Fish and Wildlife Office.

Project Description:

The proposed action is detailed in the Department of the Navy's *Final Biological Assessment for Construction of Relay Ground Station-Asia at Marine Corps Base Camp Blaz, Guam*, dated August 2022. Additional minimization and avoidance measures which were incorporated into your project at the recommendation of our office, are detailed within the Project Description body of this Biological Opinion or summarized below.

Avoidance and Minimization Measures:

Mariana Fruit Bat: Because the action area includes suitable habitat for the Mariana fruit bat, the project design incorporates the Service's standard recommended measures to reduce the likelihood the project may affect this sensitive species. Construction work will not occur within 150 m (492 ft) of a Mariana fruit bat roost and when a Mariana fruit bat is seen flying or foraging within 150 m (492 ft) of construction activity, work will pause until the bat has left the area. The DON will implement a contractor education program to ensure that construction contractor personnel are shown how to identify, respond, and report a Mariana fruit bat sighting.

Additional pre-construction biomonitor surveys for Mariana fruit bats and bat roost sites will be conducted up to one week prior to the onset of vegetation clearing. Any pause in work beyond seven days in vegetation clearing will trigger additional surveys. These surveys will follow JRM protocols (USFWS 2009).

All construction and maintenance work is expected to occur during daytime hours. Although the Navy does not expect night work to occur the following conservation measures will be implemented should unforeseen night construction or exterior maintenance work be required:

- Up to one week prior to night work a dusk biomonitor survey following JRM protocol (USFWS 2009); and
- When installing permanent lights, and if appropriate for antiterrorism force protection or airspace safety criteria, the DON will use downward-facing,

shielded or full cut-off lens lights (with the lowest lumens necessary). Properly shielded or full-cutoff lens illumination can only be seen below the horizontal plane at the fixture height. To avoid vertical glare and illumination of forest habitats, should temporary lighting be needed for nighttime work, only downward-facing, full cutoff-off lens lights or fully-shielded lights will be used.

Consequences of the Proposed Action:

Mariana Fruit Bat Biology:

Mariana fruit bats are a large-bodied colonial tree-roosting species. Mariana fruit bats are at their roost during the day and they forage at night on fruits, nectar, pollen, and some leaves from at least 45 different plant species. Colonies established by one or more bats can consist of fewer than 20 individuals or they can grow to over 1,000 individuals (Guilbert and Mullin 2020, p. 1). A day roost may be occupied by one or more bats. Generally maternal colonies are occupied by a harem of bats – a single male with multiple females. Breeding occurs year-round. Bachelor colonies and solitary male bat roosts are also common. The mother bat carries its bat pups until they grow to be too heavy. When these young bats that are not well developed enough to fly on their own, they are left at the maternal roost when the parents forage at night. Non-volant Mariana fruit bats are vulnerable at their day roost and foraging habitat to predation by the brown treesnake, disturbance by the little fire ant (Vanderwoude, pers. comm. 2022; Richardson pers. comm. 2022; and Hawaii Invasive Species Council 2022), and human disturbance and adult bats are vulnerable to harassment from these threats. When the Mariana fruit bat on its day roost is startled or alarmed by disturbance including human scent and noise it takes flight from its roost. Prolonged or severe disturbance results in abandonment of the roost. It can take months for bats to return to an abandoned roost, if they return at all. Because some members of the public still consider the Mariana fruit bat to be a delicacy and a valued gift to persons of importance, these bats are vulnerable to poaching when they are outside of areas that are actively protected by law enforcement.

Although in the recent past, Mariana fruit bats have been sighted at coastal sites north and south of the project site, and inland from the project area, Mariana fruit bats are not known to currently be roosting, feeding or transiting within more than 150 m (492-ft) of the project site.

Effects of the Action:

Construction activity has the potential to startle or alarm roosting, foraging, and transiting Mariana fruit bats. Such disturbance would be expected to cause abandonment of breeding, roost abandonment, abandonment of a foraging site, and avoidance of the construction area. These changes in behavior could reduce the animal's reproductive success or survival. To avoid human disturbance to the sensitive bat, the project design incorporates a 150-m (492-ft) stop-work buffer around any roosting, foraging, or transiting Mariana fruit bat.

Because the Mariana fruit bat has not previously been detected within 150 m (492-ft) of the project site and project activity will cease if a Mariana fruit bat is detected within 150 m (492 ft) of the project activity, impacts to the bat are expected to be extremely unlikely to occur. Because adverse effects are extremely unlikely to occur, they are **discountable** and therefore not likely to adversely affect the Mariana fruit bat.

Conclusion

Based on the proposed action, our analysis indicates consequences of the proposed action, to the Mariana fruit bat is discountable as described above. **The Service therefore concurs with your determination that the RGS-A project may affect, but is not likely to adversely affect the Mariana fruit bat.** Unless the project description changes, or new information reveals that the proposed project may affect listed species in a manner or to an extent not considered, or a new species is listed or critical habitat designated that may be affected by the proposed action, no further action pursuant to section 7 of the ESA is necessary.

APPENDIX B: BIOSECURITY PROTOCOLS

1. Ensure all work vehicles, machinery, and equipment are cleaned, inspected by its user, and found free of mud, dirt, debris and organisms prior to entry into and exit from the action area.
    a. Vehicles, machinery, and equipment must be thoroughly pressure washed in a designated cleaning area (designated by the responsible land manager) and visibly free of mud, dirt, plant debris, insects, frogs (including frog eggs) and other vertebrate species such as rats, mice and non-vegetative debris. A hot water wash is preferred. Areas of particular concern include bumpers, grills, hood compartments, areas under the battery, wheel wells, undercarriage, cabs, and truck beds (truck beds with accumulated material (intentionally placed or fallen from trees) are prime sites for accidental transport of invasive species).
    b. The interior and exterior of vehicles, machinery, and equipment must be free of garbage and food. The interiors of vehicles and the cabs of machinery must be vacuumed clean. Floor mats will be sanitized with a solution of at least 70-percent isopropyl alcohol or a freshly mixed 10-percent bleach solution.
    c. Any machinery, vehicles, equipment, or other supplies found to be infested with ants (or other invasive species) must not enter action area. Treatment is the responsibility of the equipment or vehicle owner and operator.
2. **Little Fire Ants**: Ensure all work personnel clothing and skin, and all vehicles, machinery, and equipment are inspected for invasive ants prior to moving to the project site and prior to moving from areas occupied by the little fire ant into areas where the ant does not occur.
    a. Ensure a visual inspection for little fire ants (*Wasmannia auropunctata*) is conducted prior to entry into action area or movement within the project site, from previously or currently ant-occupied areas, into areas where the ant does not occur.
    b. Hygiene is paramount but even the cleanest vehicle may transport little fire ant. Place insect bait into refillable tamper resistant bait stations. Note larger vehicles, such as trucks, may require multiple stations. Monitor bait stations frequently (every week at a minimum) and replace bait as needed. If the station does not have a sticker to identify the contents, apply a sticker listing contents of the station. Refer to the Hawaii Ant Lab's little fire ant fact sheet, which can be downloaded here: https://littlefireants.com/wp-content/uploads/02a-LFA-Fact-Sheet_v2.5_May2020.pdf.
    c. Do not use any machinery, vehicles, equipment, or other supplies found to be infested with ants (or other invasive species) or used in an area infested by ants, for any type of project work until it is sanitized and re-tested following a resting period of at least 24 hours. Infested vehicles must be sanitized following recommendations by the Hawaii Ant Lab (http://www.littlefireants.com) or other ant control expert and in

accordance with all State and Federal laws. Treatment is the responsibility of the equipment or vehicle owner and operator.

3. Keep all base yards and staging areas inside and outside natural areas and native habitat free of invasive species.
    a. Ensure base yards and staging areas are inspected at least weekly for invasive species and any invasive found is to be removed immediately. Pay particular attention to where vehicles are parked overnight, keeping areas within 30-feet (ft) (9 m) of vehicles free of debris. Parking on pavement and not under trees, while not always practical, is best.
    b. Project vehicles or equipment stored outside the action area, such as a private residence, are to be kept in a pest-free area as defined by the onsite land or project manager.
    c. Ensure all cutting tools, including machetes, chainsaws, and loppers are sanitized to remove visible dirt and other contaminants prior to entry into action area and prior to the movement of the tool from an area occupied or formerly known to be occupied by the little fire ant, into an area where the ant is not known to occur. Sanitized using a solution of >70% isopropyl alcohol or a freshly mixed 10% bleach solution. One minute after sanitizing, you may apply an oil based lubricant to chainsaw chains or other metallic parts to prevent corrosion.
    d. Vehicles, machinery, and equipment must be cleaned as described above.
4. Safety note for individuals working in the action area:
    a. Little fire ants nest in trees. If you are under a tree and that tree is bumped or somehow stressed, the threat response of the ants is to fall from the leaves and sting the person under the tree. If you are subject to an ant attack, do not panic. The ants are extremely small, but their stings are painful, so make sure you remove all ants from your body and clothing. The stings produce inch long welts that are itchy and painful, and can last for weeks.
    b. Treat stings as you would other insect stings. In some persons, stings can produce life threatening reactions. Stocking antihistamine in the first aid kit is a reasonable precaution.

Mr. Albert T. Borja
Installation Environmental Program Director
Marine Corps Base Camp Blaz
PSC 488 Box 105
FPO AP 96537-0149

Dear Mr. Borja:

This document transmits the U.S. Fish and Wildlife Service's (Service) biological opinion (BO) based on our review of the U.S. Department of the Navy proposed construction and operation of a firefighter training facility located at Marine Corps Base Camp Blaz (MCBCB), Finegayan, Guam, and its effects on the Mariana fruit bat (fanihi, *Pteropus mariannus mariannus*) in accordance with section 7 of the Endangered Species Act (Act) of 1973, as amended (16 U.S.C. 1531 *et seq*.). Your request for formal consultation was received on May 3, 2023.

This biological opinion is based on information provided in the May 2, 2023, formal biological evaluation, a Microsoft Teams conference call of March 27, 2023, email correspondence, field investigations, and other sources of information. A complete administrative record of this consultation is on file at our office.

Consultation History

February 9, 2023: The U.S. Department of the Navy requested initiation of informal consultation, and the Service confirmed receipt of the request.

March 1, 2023: The Service provided comments on the informal consultation request and biological evaluation.

March 27, 2023: Microsoft Teams conference call with Naval Facilities Engineering Command (NAVFAC) Pacific Senior Natural Resources Specialist Coralie Cobb, and Mariana Islands Team Manager Jacqueline Flores and Fish and Wildlife Biologists Dawn Bruns and Lauren Taylor of the Service, to discuss unavoidable adverse effects of the action to the Mariana fruit bat.

March 29, 2023: The U.S. Marine Corps transmitted a draft formal consultation request and biological evaluation to the Service.

April 5, 2023, through April 26, 2023: U.S. Marine Corps provided additional project details and effects analysis for the Mariana fruit bat in the biological evaluation in response to Service comments.

May 3, 2023: U.S. Marine Corps requested initiation of formal consultation.

May 17, 2023: The Service transmitted a letter to the U.S. Marine Corps acknowledging initiation of formal consultation and confirming all information required to initiate consultation was provided in the consultation request or otherwise accessible for consideration and reference. ECOSphere number 2023-0081810 was assigned to the project.

August 10, 2023: The Service transmitted the Draft Biological Opinion to the Department of the Navy.

August 21, 2023, The Department of the Navy provided the Service with comments on the Draft Biological Opinion.

BIOLOGICAL OPINION

Description of Proposed Action

The proposed action includes construction and operation of a firefighter training facility (FFTF) to encompass approximately 8 acres (ac) (3.2 hectares [ha]) on the former Andersen Softball Field site on MCBCB, adjacent to Route 3 and the base security gate (Figure 1). The FFTF will involve construction of four training facilities within this previously developed area: an approximately 6-ac (2.4-ha) paved emergency vehicle operator course; a six-story enclosed firefighter training tower; 11 firefighter training mockups; and a two-story, 2,500 square foot (ft) (232 square meter [m]) enclosed observation/control facility. Firefighter training mockups—to practice skills such as fire extinguishing and search and rescue—will be constructed on a paved 2-ac (0.8-ha) area and will include props such as vehicles, a drafting pit, a horizontal tank, a dumpster, portable fire extinguishers, simulated electrical powerlines, fuel storage, and a structural collapse area. The observation/control facility will have a video camera system to monitor the entire FFTF and will control the capabilities of the on-site propane gas (fire mockup fuel), communication, mechanical, electrical, and public address speaker systems. The proposed action also includes installation of an approximately 10,000 gallon (gal) (37,854 liter [l]) aboveground propane tank and an approximately 21,000 gal (79,494 l) aboveground water tank. An 8-ft (2.4-m) security fence (non-barbed wire) will be installed along the FFTF perimeter. The access road and parking lot will be resurfaced. Exterior building lighting and floodlights will be shielded to reduce impacts to wildlife.

During construction, the existing softball field, appurtenant structures, and some adjacent tennis courts will be demolished, and the area will be graded and grubbed. Most construction will occur during the daylight hours of 6 a.m. to 3:30 p.m. but nighttime work may be required. Construction is expected to take two years beginning in 2024.

Figure 1: FFTF on Marine Corps Base Camp Blaz, Guam project footprint including construction, operations, security fencing and facility parking area.

The FFTF will be used approximately once per month for training exercises and maintenance throughout the estimated 25-year lifespan of its operations at MCBCB. Most training events will take place between 6 a.m. and 3:30 p.m. for approximately three hours and will involve up to 28

people and ten vehicles (including fire engines). Nighttime training events of the same magnitude are expected to occur approximately once per quarter (four times a year) and will conclude by approximately 9 p.m.

During daytime training exercises a public address system of approximately 90 to 100 decibels (dB) will be used to instruct participants and may also be used in nighttime training, such as during an emergency. Fire extinguishing training will use burning hay and wood pallets, smoke machines, and propane gas in the mockups to produce visible flames and smoke. Burning hay (anticipated volume 50 lbs [22.7 kilograms] per event) or wood pallets (3–5 pallets per event) will only be used inside the training tower to minimize the risk of wildfire. Fire extinguishing training outside of the building will be restricted to paved areas and will utilize propane gas in props such as the dumpster mockup, and domestic water for fire suppression.

The following conservation measures are incorporated into the proposed action:

1. The U.S. Marine Corps will ensure that all construction activities will occur within the limits of construction to prevent additional habitat loss. Limits of construction must be shown on contract plans and specifications and physically demarcated in the field prior to any vegetation clearing. This measure is intended to prevent additional habitat loss. The measure will be implemented during pre-construction and construction.
2. Pre-construction surveys for Mariana fruit bats will be conducted by a qualified biologist the day before and the day of vegetation clearing of Mariana fruit bat habitat.
    a. Qualified biologist is defined as a person who has successfully completed a full four-year course of study in an accredited college or university leading to a bachelor's or higher degree, which includes a major field (24 semester hours) of study in biological sciences, wildlife biology, botany, natural resource management, environmental sciences, or related disciplines appropriate to this position or an appropriate combination in education and experience, and a minimum of 100 documented hours conducting Mariana fruit bat surveys or monitoring, or conducting these activities for closely related species.
3. Construction contractors will be trained by a qualified biologist to identify Mariana fruit bats and conduct visual observations of the project footprint at the start of each day when noise generating equipment will be used. If Mariana fruit bats are observed prior to the start of work in the project footprint, work will be postponed until the Mariana fruit bat has left the area of its own volition. If bats enter the project footprint after the start of construction, work will continue.
4. Operators of the FFTF will be trained by a qualified biologist to identify Mariana fruit bats and conduct visual observations of the project footprint prior to use of the facility. If Mariana fruit bats are observed prior to the start of training, work will be postponed until the Mariana fruit bat has left the area of its own volition. If bats enter the project footprint after the start of training, work will continue.
5. Changes to the night sky resulting from operations-related nighttime lighting will be minimized through the use of shielded outdoor lights to protect Mariana fruit bats.
6. Per OPNAV M-5090.1 §12-3.9, the U.S. Marine Corps will specify housekeeping and vehicle cleanliness measures in contractor environmental plans to reduce the likelihood

of spread of invasive species within the construction area. To the extent practicable and to be performed in conjunction with stormwater pollution prevention practices, cargo and vehicles will be inspected upon entry to the construction site and high-pressure wash-down will be performed to reduce organic material and mud from leaving or entering the jobsite. Dirty vehicles, equipment, or cargo shall be cleaned of dirt, debris, organisms, weeds, and other material before they enter the jobsite and discarded material will be tested, packaged, or treated before disposal. Green waste will be reused on base to the greatest extent practicable and will be managed to reduce coconut rhinoceros beetle (*Oryctes rhinoceros*) and little fire ant (*Wasmannia auropunctata*) spread or breeding.

Action Area

The action area is defined at 50 CFR 402.02 as "all areas to be affected directly or indirectly by the federal action and not merely the immediate area involved in the action." The Service has determined that the action area for this project is includes all areas within 492 ft (150 m) from the outermost perimeter of the project footprint that may be exposed to human disturbance from project activities. The action area is shown in Figure 2.

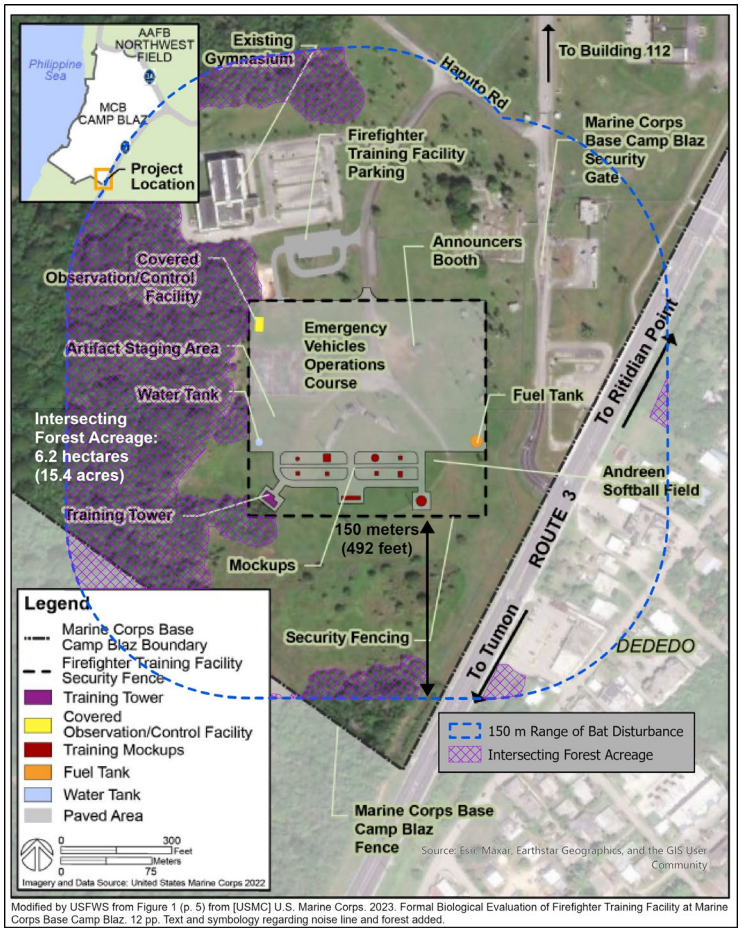

Figure 2: Project action area perimeter (blue dashed line).

Mariana fruit bat habitat within 492 bt (150 m) of the project footprint is highlighted in the purple cross-hatched areas in Figure 2.

Analytical Framework for the Jeopardy Analysis

Jeopardy Analysis Framework

In accordance with regulation (see 84 FR 44976), the jeopardy determination in this Biological Opinion relies on the following four components:

1. The *Status of the Species*, which evaluates the species' current range-wide condition relative to its reproduction, numbers, and distribution; the factors responsible for that condition; its survival and recovery needs; and explains if the species' current range-wide population is likely to persist while retaining the potential for recovery or is not viable;

2. The *Environmental Baseline*, which evaluates the current condition of the species in the action area relative to its reproduction, numbers, and distribution absent the consequences of the proposed action; the factors responsible for that condition; and the relationship of the action area to the survival and recovery of the species;

3. The *Effects of the Action*, which evaluates all future consequences to the species that are reasonably certain to be caused by the proposed action, including the consequences of other activities that are caused by the proposed action, and how those impacts are likely to influence the survival and recovery role of the action area for the species; and

4. *Cumulative Effects*, which evaluates the consequences of future, non-Federal activities reasonably certain to occur in the action area on the species, and how those impacts are likely to influence the survival and recovery role of the action area for the species.

In accordance with policy and regulation, the jeopardy determination is made by evaluating the consequences of the proposed Federal action in the context of the species' current range-wide status, taking into account any cumulative effects, to determine if implementation of the proposed action is likely to cause an appreciable reduction in the likelihood of both the survival and recovery of the species in the wild. The key to making this finding is clearly establishing the role of the action area in the conservation of the species as a whole, and how the effects of the proposed action, taken together with cumulative effects, are likely to alter that role and the continued existence (i.e., survival) of the species.

Status of the Mariana fruit bat

Species description

The Mariana fruit bat was listed as endangered in 1984, but later reclassified to threatened when it was determined that all fruit bats throughout Guam and the Commonwealth of the Northern Mariana Islands (CNMI) comprise a single endemic subspecies (70 FR 1190, January 6, 2005). In 2004, critical habitat for the fruit bat was designated at the Guam National Wildlife Refuge (GNWR) in the Ritidian Unit (69 FR 62944, October 28, 2004).

The Mariana fruit bat is a medium-sized fruit bat in the family Pteropodidae with dark brown to black leathery wings and a wingspan of 34 to 43 in (86 to 109 centimeters). Individuals weigh between 0.73 and 1.27 lbs (330 and 577 grams) and male Mariana fruit bats are slightly larger than females. The abdomen is black to brown with gray hair interspersed, creating a grizzled appearance. The mantle and sides of the neck are bright golden brown but can be paler in some individuals, and the head is a brown to dark brown. The well-formed, rounded ears and large eyes give the face a canine appearance (USFWS 2009, p. 4).

The paleotropical genus *Pteropus* is represented by approximately 63 species distributed across the Indian Ocean, Southern Asia, Australia, and Oceania, as far east as the Cook Islands (Almeida et al. 2014, p. 83). Six species of *Pteropus* are extinct while 42 species are considered critically endangered, endangered, threatened, near threatened, or vulnerable under the definitions of the International Union for Conservation of Nature and Natural Resources (IUCN 2021). Most *Pteropus* fruit bats occur on islands or in coastal areas (Almeida et al. 2014, p. 84). Although it was previously thought that two subspecies of fruit bat may have inhabited the Mariana Islands (Flannery 1995, p. 266; Simmons 2005, p. 340), subsequent genetic analyses conducted by Brown et al. (2011) and Mildenstein and Mills (2013) indicate *Pteropus mariannus mariannus* is a single subspecies. In addition to the Mariana fruit bat, there are subspecies of *Pteropus mariannus* endemic to other island chains, including the Caroline Islands and the Palau archipelago (Brown et al. 2011, p. 934).

Life history

Mariana fruit bats do not use laryngeal echolocation, instead relying on vision and smell to avoid obstacles and locate food sources (Almeida et al. 2014, p. 83). The diet of the Mariana fruit bat is comprised of fruit, nectar, pollen, and some leaves from at least 45 different plant species (Mildenstein and Johnson 2017, pp. 38–41). The bats rapidly digest and metabolize food and rely on forest habitat with diverse food resources to be available throughout the year (USFWS 2009, p. vii). The foraging behavior of the Mariana fruit bat has not specifically been assessed, but bats in similar habitat are known to visit two to five fruit trees per night, making five to seven flights of 492 to 2,625 ft (150 to 800 m) between the fruit trees, for an estimated maximum nightly travel distance of 0.6524 to 2.485 miles (mi) (1.05 to 4 kilometers [km]). During their nights away from their day roost tree, fruit bats can also fly for longer periods in search of new food sources and spend long periods roosting in trees other than fruit trees (Morrison 1980, pp. 22–24). Mariana fruit bats use several forest types for foraging, roosting, and breeding, including native primary and secondary limestone forests, volcanic or ravine forests, old coconut

plantations, and groves of *Casuarina equisetifolia* (Glass and Taisacan 1988, pp. 11–12; Worthington et al. 2001, p. 137; Wiles and Johnson 2004, pp. 589–591), and may also use grasslands with trees (Wiles and Johnson 2004, p. 590).

Most Mariana fruit bats roost during the day at sites to which they show a high level of fidelity, unless disturbed. A small proportion of Mariana fruit bats, usually males, roost alone or in small groups called bachelor colonies. Colonies established by one or more bats can grow to over 1,000 individuals. A day roost occupied by one or more female bats is considered a maternal colony. Within maternal colonies, Mariana fruit bats typically group themselves into harems of one male and 2–15 females (Wiles 1987, p. 93). Mariana fruit bats vocalize readily within colonies and when roosting.

Population dynamics

Based on three years of field observations on Guam, female Mariana fruit bats were observed to rear up to one pup annually, with a gestation period of approximately 4.6 to 6.3 months (Pierson and Rainey 1992, p. 1; USFWS 2009, p. 17). Many *Pteropus* species typically do not give birth until 18 to 24 months of age (Pierson and Rainey 1992, p. 1; McIlwee and Martin 2002, p. 79). The age of sexual maturity is not known for *Pteropus mariannus mariannus* but mating and the presence of nursing young have been observed year-round (Perez 1972, p. 145; Wiles 1987, p. 94). The mother bat carries her bat pups until they become too heavy. When the non-volant young bats are not yet well developed enough to fly on their own, they are left at the maternal roost when the parents forage at night.

The natural lifespan of the Mariana fruit bat is also unknown, but evidence suggests *Pteropus* species are long-lived, with lifespans of 10 to over 20 years recorded (McIlwee and Martin 2002, p. 80). Based on this demographic information, several authors have suggested that *Pteropus* bats have a low maximum population growth rate and thus a slow rate of recovery when populations are diminished (Pierson and Rainey 1992, p. 13; McIlwee and Martin 2002, p. 91).

Status and distribution

Our 2020 population estimate for the Mariana fruit bat of between 3,500 and 4,000 individuals suggested the species was stable overall throughout its range (USFWS 2020, p. 4). The Mariana fruit bat has been found on all the Mariana Islands except for Uracas, the northernmost island (Wiles et al. 1989, p. 69). While the species has been thought to be extirpated from Tinian (USFWS 2020, p. 4), a fruit bat was sighted on the island in 2022 (NAVFAC Marianas 2022, p. 23). Similarly, while there have been anecdotal sightings of fruit bats in Farallon de Medinilla in recent years, the last recorded sightings were in the 1970s (Wiles et al 1989, p. 71). Mariana fruit bats are strong fliers and highly mobile, and small groups have been observed flying over the ocean between islands (Wiles and Glass 1990, entire; Wiles and Johnson 2004, p. 593). Distribution of occupied roost sites has fluctuated greatly in the southern islands and may be attributed to not only variations in survey methods and coverage, but also movements of fruit bats between islands. Surveys are sporadic on most islands except Rota and Guam, which are now surveyed annually.

Other than a few isolated periods of increase, Mariana fruit bats have been declining on Guam since the early 1900s (Wiles 1987, entire; USFWS 2009, pp. 6–8). By the 1980s, most Mariana fruit bats on the island lived in a single colony in northern Guam which occasionally divided into smaller aggregations (Wiles and Glass 1990, p. 2; Mildenstein and Johnson 2017, p. 25). From 1981 to 2008, fruit bat population estimates were made by the Guam Division of Aquatic and Wildlife Resources (DAWR) via opportunistic counts at known roosting locations on Andersen Air Force Base (AAFB; Mildenstein and Johnson 2017, p. 23). By 1995, nearly all of Guam's remaining fruit bats occurred at Pati Point on AAFB (Wiles et al. 1995, p. 39). Fruit bat abundance at Pati Point has declined since annual surveys began in 2005, and, by 2010, regular clustering of bats at the site had become unreliable. In 2006, the only known maternal colony on Guam was located at Pati Point and had less than 100 individuals (Mildenstein and Johnson 2017, p. 25). By 2010, the Pati Point colony no longer existed (SWCA 2013, p. 30), and no other colonies were known on Guam.

From 2010 to 2013, SWCA Environmental Consultants performed fruit bat surveys on AAFB consisting of pre-dawn, timed (2 to 3 hour) visual surveys at 83 forested locations and direct colony counts at historical colony locations within AAFB (SWCA 2013, entire). Since 2014, a collaborative monitoring effort between the University of Guam and AAFB has produced simultaneous, multi-observer (>80), base wide counts yielding annual abundance estimates of Mariana fruit bats on AAFB. Compilations of Pati Point fruit bat survey data are shown in Figures 3 and 4.

A total of 64 bats were detected within the 6,541 ac (2,647 ha) of Andersen Air Force Base that was surveyed in 2021. Searches cover all areas where, based on visual sightings of flying bats, bat occurrence is suspected. Possibly due to increased search effort over recent years, for most years, there has been an annual increase in the number of bats detected. Preliminary findings from the 2022 AAFB surveys report another increase in the number of bats detected, and a potentially cyclic migration of bats between Rota and Guam in 2021 and 2022 (NAVFAC Marianas 2022, pp. 212–213).

In January and February of both years the number of bats detected on AAFB increased—to an estimated 200 bats in 2021 and to 1,300 bats in 2022—after which numbers decreased to lower year-round numbers in March and April. In addition, both individual bats, and a colony of approximately 40 bats, have been detected near Cross Island Road and on Cocos Island off southern Guam in recent years (USFWS 2021, p. 24).

Our current estimate of Mariana fruit bats on Guam is at least 122 bats during non-peak months (USFWS 2020, p. 4), and approximately 1,300 bats during what may be a peak and temporary annual increase during a peak time of year.

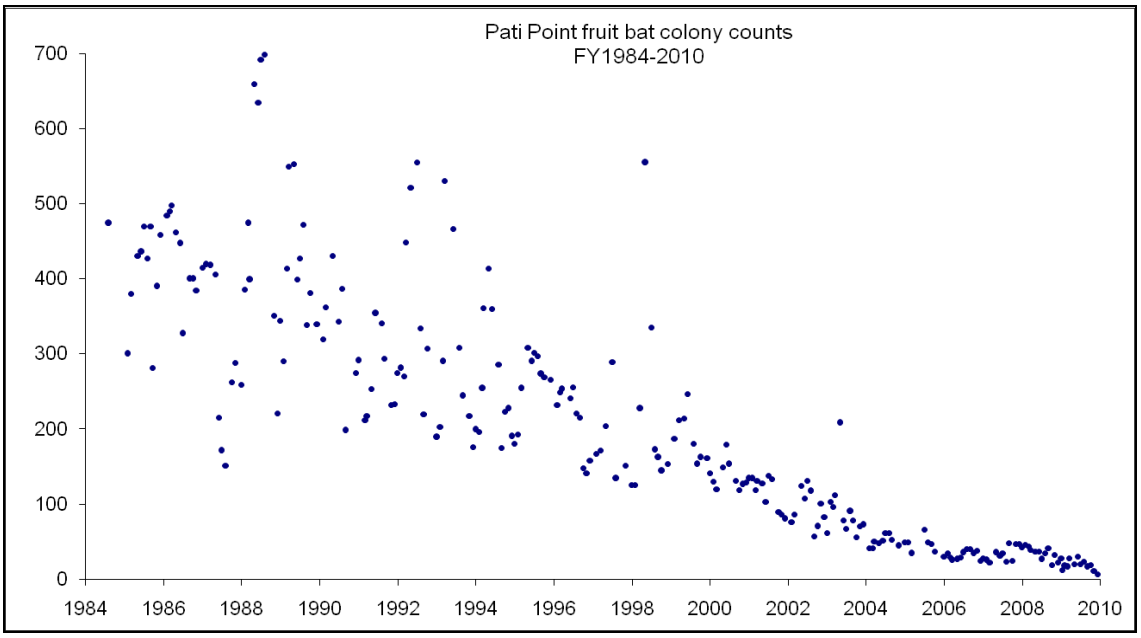

Figure 3. Mariana fruit bats counted at the Pati Point colony, AAFB, Guam: 1984 to 2010 (DAWR unpublished data).

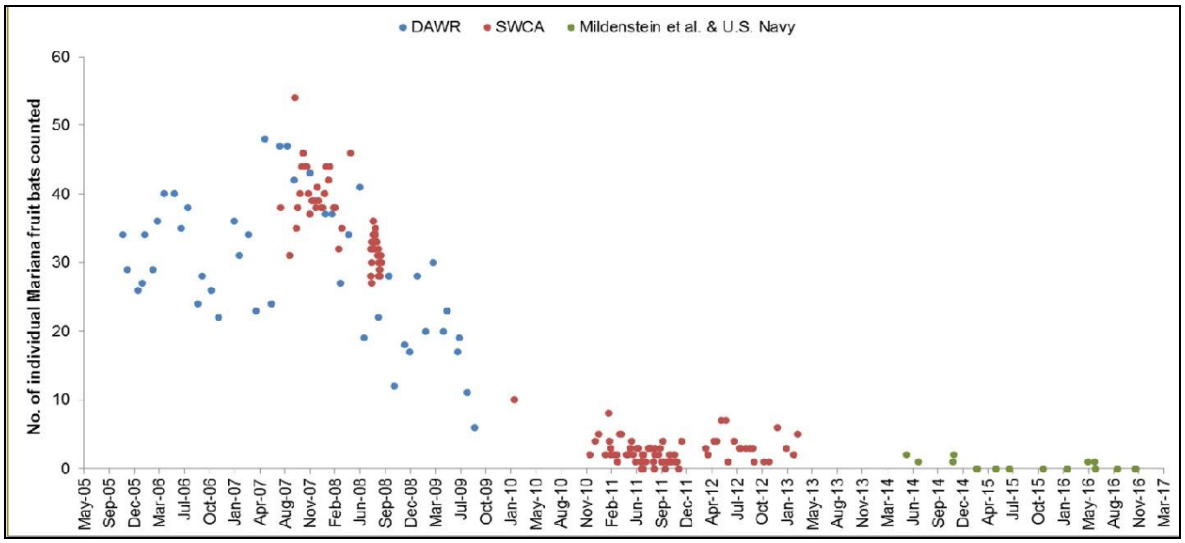

Figure 4. Mariana fruit bat colony counts at the Pati Point colony, AAFB, Guam: October 2005 to September 2009; December 2010 to December 2011; March 2012 to March 2013; and May 2014 to November 2016 (Mildenstein and Johnson 2017).

The largest Mariana fruit bat population is in Rota. From 2012 to 2019, Rota's population averaged between 2,500 and 3,000 bats, with peaks after major typhoons (DFW 2019, entire); our 2020 estimate was approximately 3,000 individuals (USFWS 2020, p. 4). The fruit bats in Rota are thought to move periodically among the southern islands, and Rota is considered important to the long-term stability of the species (Wiles and Glass 1990, p. 6; Wiles et al. 1995,

p. 41). In 2014, when Mariana fruit bats were found to be stable or declining throughout most of their range, Rota's fruit bat populations had increased due to increased enforcement of anti-poaching regulations at maternal colonies (USFWS 2014, p. 2).

Initial observations of Mariana fruit bats in Aguiguan, Tinian, and Saipan in 1983 and 1984 revealed populations of less than 25 to 50 individuals on each island. Species numbers increased to an estimated 75 to 100 individuals in Saipan in 1986 and 300 individuals in Aguiguan by 1988 (Wiles and Glass 1990, p. 2). Survey data in the northern islands of Anatahan, Sariguan, Guguan, Alamagan, Pagan, and Agrihan showed a 40 percent decline in Mariana fruit bat numbers between 1983 and 2000 (USFWS 2009, p. 11). There is evidence for a possibly increasing population on Asuncion (Valdez 2010, p. 33), last surveyed in 2010, and Alamagan. The Alamagan population increased from 86 bats in 2010 to an estimated 385 bats in 2017 in 3 colonies (Murray et al. 2018, entire). Around 249 bats were estimated on Guguan in 2016 (Liske-Clarke et al. 2016, p. 25).

Threats

The following threats to the Mariana fruit bat contributed to its listing and continue to impact the ability of the species to recover.

Loss and degradation of habitat: The degradation and loss of primary and other forest habitats from ungulate damage, the encroachment of invasive plants, military activities, conversion to agriculture, and economic development has substantially diminished available habitat for fruit bats in the Mariana archipelago (USFWS 2009, p. 33; USFWS 2014, p. 3). The degradation of intact native forests particularly limits the persistence and population size of the fruit bat because these forests provide essential foraging and roosting resources that may not otherwise be found in nonnative and agricultural habitats. In Guam's remaining native forests, ungulate browsing has been shown to reduce the presence and recruitment of breadfruit, an important food for fruit bats, as ungulates consume both fallen fruit and seedlings (Wiles 2005, entire). Economic development has caused habitat loss and fragmentation on all inhabited southern islands, and all islands with military activity, which has reduced the opportunities for bats to shift the location of their roost sites and foraging activities in response to human disturbance (USFWS 2009, p. 31). The quality of bat habitat is further degraded by the presence of invasive predators and human disturbance. Mariana fruit bats are expected to be vulnerable at their roosts and in foraging habitat to predation by the brown treesnake (*Boiga irregularis*), disturbance from little fire ants (*Wasmannia auropunctata*), and human disturbance. When a roosting or foraging Mariana fruit bat is startled or alarmed by a disturbance, including detecting human movements, human scent, brown treesnakes, little fire ants, and noise, it is likely to have a stress response and take flight to move away from the disturbance. Prolonged or severe disturbance can cause roost abandonment.

Nonnative snake predation: Brown treesnakes prey on non-volant young left at the roost during the night and reduce the recruitment of young bats into the breeding population. Effective control of the invasive brown treesnake must be achieved for the Mariana fruit bat population on Guam to recover (Wiles 1987, p. 94). Efforts to interdict, control, and ultimately eradicate the snake are ongoing.

Poaching: Illegal hunting has long threatened the persistence of the Mariana fruit bat throughout its range, particularly in Rota. Because of access controls on military installations, Mariana fruit bats on and in the vicinity of MCBCB and neighboring AAFB are afforded some relief from poaching. The presence of increased law enforcement activity has been shown to positively impact population numbers but has not eliminated poaching (USFWS 2014, p. 3). Hunting has greatly contributed to the decimation or decline of fruit bat populations in Rota, Saipan, and Guam (Wiles and Payne 1986, entire; Wiles and Glass 1990, pp. 2–4; Sheeline 1991, pp. 6–7; Stinson et al. 1992, entire; Esselstyn et al. 2006, entire). Monitoring of illegal hunting and law enforcement on the northern islands are limited.

Stochastic events: Typhoons and volcanic eruptions result in mortality, reduced population viability, and habitat loss. Natural disasters can be especially damaging to the viability of smaller Mariana fruit bat populations such as those on Guam, Saipan, Aguiguan, and Maug. The significant loss of habitat on Anatahan after a volcanic eruption in 2003 caused the loss of a substantial Mariana fruit bat population that is not known to have recovered.

Environmental Baseline

Regulations implementing the ESA (50 CFR 402.02) define the environmental baseline as the past and present impacts of all federal, state, or private actions and other human activities in the action area. Also included in the environmental baseline are the anticipated and/or ongoing impacts of all proposed federal projects in the action area that have undergone Section 7 consultation, and the impacts of state and private actions which are contemporaneous with the consultation in progress.

Status of the species within the action area

The majority of the Mariana fruit bat population on Guam has been detected in northern Guam in and about Andersen Air Force Base due to annual surveys being conducted in these areas. Only recently has DAWR and other military installations such as Marine Corps Base Camp Blaz and Naval Magazine Guam assisted with annual island-wide surveys for the Mariana fruit bat outside of Andersen Air Force Base on Guam. Figure 5 shows the geographic distribution of detections made during the annual counts on Andersen Air Force Base from 2014 to 2020 in relation to the location of the FFTF project site (there are no survey stations within the action area). Since 2020, high bat activity and a roosting colony have been reported approximately six miles north of the action area. Additionally, the 2021 and 2022 surveys documented an increased presence of bats relative to prior years' results (NAVFAC Marianas 2022, pp. 212–213). Regular sightings have not been reported in the action area since 1994 (Mildenstein and Johnson 2017, p. 31); however, there was a recent observation of a Mariana fruit bat flying along Route 3 (which passes through the action area) by a NAVFAC environmental staff member (as reported in the biological evaluation).

The 15 ac (6 ha) of bat habitat within the action area constitutes 0.06% of the total Mariana fruit bat habitat on Guam. Mariana fruit bat habitat within the action area consists of secondary and degraded limestone forest comprised of a mixed community of native and nonnative trees,

suitable for bat roosting, feeding, breeding, transiting, resting, and day roosting. Dominant nonnative trees in the limestone forest within the action area include *Vitex parviflora*, *Leucaena leucocephala* (tangan tangan), and *Carica papaya* (papaya—a preferred fruit of the Mariana fruit bat [Mildenstein and Johnson 2017, p. 39]), which established in the area likely due to past clearing activities and encroachment from developed areas (NAVFAC Marianas 2019, p. 8-12). Native roost tree species *Aglaia mariannensis* and *Neisosperma oppositifolia* (USFWS 2009, p. 14) occur in the limestone forest in the action area, as well as possibly isolated *Cocos nucifera* (coconut) trees (NAVFAC Marianas 2019, p. 8-12). Approximately 0.1 ac (0.04 ha) of forest vegetation will be cleared in the project footprint, while the remaining 9.2 ac (3.72 ha) of the project footprint is previously developed land. A gymnasium, public road, and other private development are also within the developed portion of the action area.

Mariana fruit bats are highly mobile and known to fly the length of Guam. Due to the proximity of high bat activity, and the availability of foraging and roosting resources in the action area, it is reasonable to conclude that individual, or groups of, Mariana fruit bats occur in the action area and will occupy the limestone forest to roost or forage during the project term. During non-peak bat activity, we estimate up to 122 bats occupy Guam. The most recent reported survey data shows these numbers increase during January and February; based on this data, we estimate up to 1,300 bats occupy Guam during these months of peak bat activity.

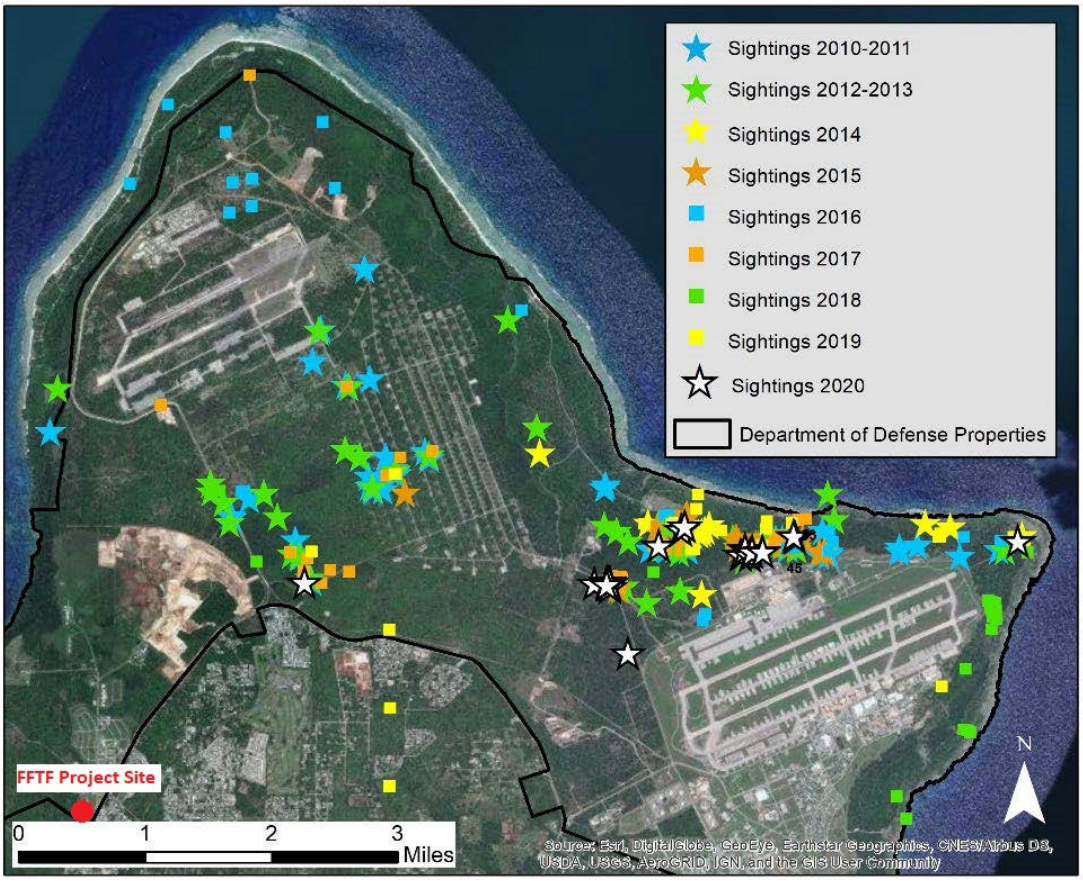

Figure 5: Mariana fruit bat sightings 2014 to 2020 (Department of the Air Force (2021), with the FFTF project site shown with red dot.

Factors affecting species environment within the action area

The primary factors affecting Mariana fruit bats in the action area are loss and degradation of habitat and nonnative snake predation. Brown treesnakes are found within every habitat type on Guam and are present within the action area. Any bat roosting in the action area would be expected to be susceptible to predation by the brown treesnake.

The action area spans Department of Defense (DoD) terrestrial lands managed by Joint Region Marianas. Ongoing habitat restoration made to forest habitat within and adjacent to the action area will improve habitat quality, increase the abundance of resources for bats, and may decrease the number of nonnative species, creating a more favorable environment for Mariana fruit bat feeding, sheltering, and breeding. In particular, brown treesnake suppression, little fire ant control, ungulate fencing and eradication, and limestone forest restoration in the nearby Haputo Ecological Reserve and Caiguat Forest Enhancement Area are expected to increase use of these areas by bats. The project site is not slated for future restoration, and it is more than 492 ft (150 m) away from any such area. However, due to the action area's close proximity to sites where invasive species are being removed to encourage Mariana fruit bat occurrence, bat foraging use of the forest within the action area may be up to two times higher than the bat's average usage of

similar habitat on Guam. Due to the nearby proximity of conservation areas, where threats to the Mariana fruit bat are expected to be controlled, the action area is expected to receive an estimated double the bat visitation rate than similar habitat where invasive species threats are uncontrolled.

The FFTF project footprint is located within the MCBCB main cantonment boundary on land administered by the DoD. MCBCB is currently under construction as part of the Department of the Navy's relocation of U.S. Marine Corps personnel from Okinawa, Japan to Guam. Post-completion of the project, the Department of the Navy expects that the population on Guam will increase by approximately 7,400 people, increasing the need for additional infrastructure throughout the island. Because of the relocation, approximately 1,219 ac (493 ha) of limestone forest in the vicinity of the FFTF project site has already been permanently modified, which has reduced the amount of available and suitable forest habitat for Mariana fruit bats in the north of Guam, and increased the importance of remaining intact forest in the action area to the species. The full effects of the relocation project are analyzed in the *Reinitiation of the 2015 Biological Opinion on the Department of the Navy's Relocation of U.S. Marine Corps from Okinawa to Guam and Associated Activities on Guam* (USFWS 2017).

Effects of the Action to the Mariana fruit bat

Factors considered in construction and operation of the FFTF that can impact the Mariana fruit bat are vegetation clearing, artificial lighting, smoke, wildfire risk, noise, and human disturbance. Effects to the bat from most of these factors are likely to be avoided, except for effects from noise and human disturbance.

Vegetation clearing

The FFTF will primarily be constructed on a previously developed site covered with grasses and a softball field, with 0.1 ac (0.04 ha) of degraded limestone forest to be permanently cleared. In 2017 there were approximately 27,096 ac (10,965 ha) of fruit bat forest habitat on Guam (USFWS 2017, p. 92). The amount of forest habitat is expected to have decreased since 2017 due to development. During site preparation the implementation biosecurity protocols described in the **Description of Proposed Action** will greatly reduce the risk of invasive species introduction so that adverse effects from invasive species beyond the project footprint are not likely. Project-related permanent removal of 0.1 ac (0.04 ha) of bat habitat would not appreciably reduce Mariana fruit bat conservation potential on Guam.

Artificial lighting

All temporary construction lighting and permanently installed artificial lighting utilized at the project site will be shielded to avoid impacts to foraging and roosting Mariana fruit bats in the action area. The Mariana fruit bat is not likely to be exposed to artificial lighting from the project.

Smoke and wildfire risk

Hay and wood pallets ignited in training exercises that will create smoke when burned, and from which loft burning embers can spark wildfire in the adjacent forest vegetation, will be used only in the indoor training tower. Because the fires ignited as part of the action are restricted to the training tower within the paved area of the FFTF, smoke and embers are unlikely to travel into adjacent vegetation and the risk of wildfire is minimized. Similarly, because burning hay and wood pallets will be used only in the indoor training tower, the Mariana fruit bat is unlikely to be exposed to concentrated smoke during training exercises.

Noise and human disturbance

All bats within 492 ft (150 m) of activities are likely to be startled or alarmed by project-related noise and human scent. For the duration of the disturbance, foraging habitat in the area is removed and bats are likely to avoid the area. Noise levels above ambient forest sounds can cause stress reactions, including increases in active thermoregulation, maintenance, locomotion, and alertness. Stress reactions caused by human disturbance such as the activities in the proposed action increase energetic demands, disrupt hormonal balance, and force relocation, which can sometimes be to lower quality habitat (Klose et al. 2006, p. 347; DFW 2010, p. 7).

Actions such as the proposed action have the potential to disperse bats into areas outside these protected lands increase their exposure to additional human disturbance including poaching. All of these factors can lead to reduced time foraging, sheltering, or breeding. Due to the close proximity of attractive conservation habitat, bats disturbed at the project site are most likely to move to the nearby suitable, higher-quality habitat. Survival, reproductive effort, and reproductive success are not expected to be reduced as a result of the disturbance caused by the proposed action. Mariana fruit bat take in the form of harm or harassment is likely as a result of project-related noise and human disturbance.

The public address system speakers are expected to be the loudest component of firefighter training events and are estimated to reach 100 dB. Information on the siting or style of the public address system is not yet known. Therefore, to determine the extent of noise effects of the action, we conservatively assessed the potential placement of speakers from all points on the FFTF perimeter fencing and treated the speakers as an omnidirectional point source from which sound radiates in all directions evenly. This scenario also depicts a free field condition, that is, there are no obstructions to sound travel. However, it is likely the forest vegetation will interfere with sound travel to some extent. Using the inverse square law, every doubling of distance away from the sound source will decrease sound intensity by 6 dB. Based on these conditions, the sound of the public address system will attenuate to 58 dB, within the ambient sound range of limestone forest, at approximately 420 ft (128 m) from the point source, i.e., the speakers. Construction equipment noise can reach 110 dB (OSHA 2011, p. 7) and is projected to attenuate at a similar, or slightly greater, distance than the public address system, in all directions from the construction footprint. These scenarios depict a free field condition, that is, there are no obstructions to sound travel. However, it is likely the forest vegetation will interfere with sound travel to some extent.

The range of human disturbance and noise from construction and operation of the FFTF to bats in shown in Figure 2 (the Action Area map) within the blue dashed line, at 492 ft (150 m) from the project footprint. The 15 ac (6 ha) of impacted forest habitat for the Mariana fruit bat inside this action area is shown as purple crosshatching, which is 0.06 percent of total fruit bat forest habitat on Guam (USFWS 2017, p. 92). Construction noise and human disturbance is a long-term, but not permanent, effect of the project to Mariana fruit bats in the action area. Operational noise from training events will be intermittent, occurring on average one to two times a month, and thus is considered an intermittent but ongoing effect to Mariana fruit bats in the action area. The life expectancy of the FFTF is 25 years.

Project noise and human activity are expected to prevent Mariana fruit bats from establishing a maternal roost within the 15 ac (6 ha) of bat habitat for the 27-year duration of the project. This loss of potential maternal roost habitat is not expected to result in reduced reproductive effort by the Mariana fruit bats because they are expected to roost in nearby sites better suited to support their successful breeding. In 2020, the Service estimated the Mariana fruit bat population to be stable, i.e., not exhibiting an increasing or declining trend; therefore, we calculated the number of bats that would be adversely affected by the proposed action using the current population sizes of 122 bats during non-peak periods, 1,300 bats during peak periods, and a total population on Guam and Rota of 3,000 bats (USFWS 2020, p. 4).

In the 25 years following construction, human activity at the FFTF will occur two times per month, affecting only 0.06 percent of the bat's habitat on Guam. During non-peak bat occurrence periods we expect up to 3 instances of bat harm or harassment due to project disturbance in the 15 ac (6 ha) of affected forest habitat. During peak bat activity periods, when Guam's bat population increases, we expect 32 incidents of bat harm or harassment to result from the project. These numbers are simply calculated based on the total number of bats and total amount of the bat's forest habitat on Guam, incorporating a factor of 2x to account for a two-fold increase in bat occurrence in the project's action area, due to its close proximity to conservation areas that are expected to be occupied by colonies of bats during the period of project implementation, and because double the number of bats occur in the vicinity of the action than in bat habitat elsewhere on Guam.

Bats that smell the scent of a human, hears project noise, or see sees movement of the construction workers or firefighters working in the project footprint are expected to have a stress response during foraging and resting activities. Overall, the action is expected to result in up to 36 instances of Mariana fruit bat harm or harassment during the 27-year project period. Almost all of these instances of harm or harassment are expected to occur during the two years of construction because human disturbance at the site may be frequent and for long durations. The project's impacts to the bat are expected to be considerably reduced during the 25-year operational period because human presence at the site will be so limited in frequency and duration. In most instances, solitary bats are expected to be affected, but multiple instances of harm or harassment may occur simultaneously when more than one bat is in the action area when the human disturbance occurs.

The stress response is expected to include causing these bats to leave the action area. Stress hormones and elevated metabolisms caused by the human disturbance are expected to be temporary and not cause permanent injury to the animal. Increased food intake is expected to be needed by these bats to offset the physiological impacts of the stress response and the additional energy expended due to their expected hastened departure from the area. Due to the close proximity of the action area to areas that are expected to be attractive conservation habitat, the bats disturbed by the proposed action are expected to move to the nearby suitable, higher-quality habitat. Physiological stress hormone impacts to their bodies are expected to be non-lethal. Survival, reproductive effort, and reproductive success are not expected to be reduced as a result of the disturbance caused by the proposed action.

Cumulative Effects

Cumulative effects include the effects of future state, tribal, local, or private actions that are reasonably certain to occur in the action area considered in this biological opinion. Future Federal actions that are unrelated to the proposed action are not considered in this section because they require separate consultation pursuant to section 7 of the Act.

Off-installation private development along Route 3 in the town of Dededo are situated along the eastern edge of the action area, within 492 ft (150 m) of the project footprint. Outdoor human activities and outdoor lighting fixtures in this area are expected to continue to adversely affect any Mariana fruit bat that may occupy the small patches of forest and forest edge habitat in the eastern half of the action area, away from the larger forested areas on the west side of the action area (see Figure 2).

Effects to the bat are expected to be similar in nature to the impacts of the proposed action. Effects to any bat that may occur within the small patches of forest and forest edges in the eastern half of the action area due to disturbance from the existing private development in Dededo are expected to occur during day and night periods spanning all days and years addressed in this consultation. The private development currently, and for the duration of the proposed action, is likely to cause stress responses in any bat that occurs within the forest patches and edges in the eastern half of the action area, in addition to reducing the likelihood of Mariana fruit bat roosting and reproducing in those areas.

Conclusion

After reviewing the current status of the Mariana fruit bat, the environmental baseline for the action area, the effects of the proposed two years of construction and 25 years of operation of the firefighter training facility on Marine Corps Base Camp Blaz, Guam, and the cumulative effects, it is the Service's biological opinion that the action, as proposed, is not likely to jeopardize the continued existence of the Mariana fruit bat. The Service reached this conclusion based on the following information, which is detailed in the **Effects of the Action** and **Cumulative Effects** sections, above.

Mariana fruit bat take in the form of harm or harassment is likely as a result of project-related noise and human disturbance. The action is expected to result in up to 36 instances of Mariana fruit bat harm or harassment during the 27-year project period. Stress reactions caused by project-related human disturbance will adversely affect the fruit bats by increasing energetic demands, disrupting hormonal balance, and forced relocation. The private development along the east edge of the action area, currently, and for the duration of the proposed action, is likely to cause similar and ongoing impacts to any bat using forest patches in the east half of the action area (see Figure 2). Project disturbance, taken together with cumulative effects, will result in reduced time foraging, sheltering, or breeding by bats that occur in the action area during human disturbances. Due to the close proximity of attractive conservation habitat, bats disturbed at the project site are most likely to move to the nearby suitable, higher-quality habitat. Survival, reproductive effort, and reproductive success are not expected to be reduced as a result of the disturbance caused by the proposed action and the cumulative effects.

Project-related permanent removal of 0.1 ac (0.04 ha) of bat habitat would not appreciably reduce the number of bats the remaining habitat on Guam can support. The 15 ac (6 ha) of Mariana fruit bat habitat that will be disturbed by project activities, accounts for 0.06 percent of the bat's habitat on Guam. The degradation and loss of use of this habitat is not expected to result in reduced survival or reproductive effort by the Mariana fruit bats because they are expected to move away to forage and roost in nearby higher-quality habitat. The permanent removal of bat habitat, and the intermittent human disturbance to bats within the action area, would not appreciably reduce Mariana fruit bat conservation potential on Guam. For these reasons, the proposed action is not likely to reduce appreciably the likelihood of the survival and recovery of the Mariana fruit bat in the wild.

INCIDENTAL TAKE STATEMENT

Section 9 of the Act and Federal regulation pursuant to section 4(d) of the Act prohibit the take of endangered and threatened species, respectively, without special exemption. Take is defined as to harass, harm, pursue, hunt, shoot, wound, kill, trap, capture or collect, or to attempt to engage in any such conduct. Harm is further defined by FWS to include significant habitat modification or degradation that results in death or injury to listed species by significantly impairing essential behavioral patterns, including breeding, feeding, or sheltering. Harass is defined by FWS as intentional or negligent actions that create the likelihood of injury to listed species to such an extent as to significantly disrupt normal behavior patterns which include, but are not limited to, breeding, feeding or sheltering. Incidental take is defined as take that is incidental to, and not the purpose of, the carrying out of an otherwise lawful activity. Under the terms of section 7(b)(4) and section 7(o)(2), taking that is incidental to and not intended as part of the agency action is not considered to be prohibited taking under the Act provided that such taking is in compliance with the terms and conditions of this incidental take statement.

The measures described below are non-discretionary and must be undertaken by the U.S. Department of the Navy so that they become binding conditions of any grant or permit issued to any applicant, as appropriate, for the exemption in section 7(o)(2) to apply. The U.S. Department

of the Navy has a continuing duty to regulate the activity covered by this incidental take statement. If the U.S. Department of the Navy (1) fails to assume and implement the terms and conditions or (2) fails to require the (applicant) to adhere to the terms and conditions of the incidental take statement through enforceable terms that are added to the permit or grant document, the protective coverage of section 7(o)(2) may lapse. In order to monitor the impact of incidental take, the U.S. Department of the Navy must report the progress of the action and its impact on the species to the Service as specified in the incidental take statement [50 CFR §402.14(i)(3)].

Amount or Extent of Take Anticipated

The Service anticipates the proposed action may result in 36 instances of Mariana fruit bat take, in the form of harm or harassment. Human disturbance during two years of construction and two days per month of human occupancy of the proposed facility may cause a temporary stress response to Mariana fruit bats occurring within the small areas of forest within 492 ft (150 m) of the project footprint. The bats are expected to recover from the physiological impacts of project-caused stress responses. No reduction in survival or reproduction are expected to occur as a result of the proposed action.

Effect of the take

In the accompanying biological opinion, the Service determined that this level of anticipated take is not likely to result in jeopardy to the Mariana fruit bat in the wild.

Reasonable and Prudent Measures

Reasonable and Prudent Measures serve to minimize the impacts of anticipated take on listed species, and to establish (through terms and conditions) the requirements for the monitoring of take levels to ensure timely reinitiation of consultation if anticipated take levels are exceeded. The Service believes the following Reasonable and Prudent Measures are necessary and appropriate to minimize and monitor the impacts of incidental take on the Mariana fruit bat:

The Department of the Navy shall monitor the level of incidental take of the Mariana fruit bat.

Terms and Conditions

In order to be exempt from the prohibitions of section 9 of the Act, the U.S. Department of the Navy must comply with the following terms and conditions, which implement the reasonable and prudent measures described above and outline required reporting/monitoring requirements. These terms and conditions are non-discretionary.

Monitoring and Reporting
Report annually to the Pacific Islands Fish and Wildlife Office Field Supervisor in Honolulu, Hawaii, the number of Mariana fruit bats sighted within 492 ft (150 m) of the project footprint,

whether or not the bat seemed to leave the area as a result of the human activity, and the nature of the human activity at the time of the bat sighting.

The Service believes that no more than 36 instances of incidental take of a Mariana fruit bat will occur as a result of the proposed action. This means that while the site is occupied by humans, there are expected to be no more than 36 sightings of a Mariana fruit bat within 492 ft (150 m) of the project footprint during the 27-year project period. The reasonable and prudent measures, with their implementing terms and conditions, are designed to minimize the impact of incidental take that might otherwise result from the proposed action. If, during the course of the action, this level of incidental take is exceeded, such incidental take represents new information requiring reinitiation of this consultation and review of the reasonable and prudent measures provided. The Federal agency must immediately provide an explanation of the causes of such taking and review with the Service the need for possible modification of the reasonable and prudent measures.

Section 7(a)(1) of the Act directs Federal agencies to utilize their authorities to further the purposes of the Act by carrying out conservation programs for the benefit of endangered and threatened species. Conservation recommendations are discretionary agency activities to minimize or avoid adverse effects of a proposed action on listed species or critical habitat, to help implement recovery plans, or to develop information.

Conservation Recommendations
The Service recommends our standard Mariana fruit bat avoidance measures be implemented throughout project implementation. Avoid human activity within 492 ft (150 m) of a transiting or feeding Mariana fruit bat. During all project work, monitor the project site and areas within 492 ft (150 m) of project activity for the Mariana fruit bat and if a bat moves into the area, delay work until the animal(s) has left the area of its own accord.

In order for the Service to be kept informed of actions minimizing or avoiding adverse effects to, or benefitting, listed species or their habitats, the Service requests notification of the implementation of any conservation recommendations.

Reinitiation Notice

This concludes formal consultation on the actions outlined in this biological opinion. As provided in 50 CFR § 402.16, reinitiation of formal consultation is required where discretionary Federal agency involvement or control over the action has been retained or is authorized by law and: (1) if the amount or extent of taking specified in the incidental take statement is exceeded; (2) if new information reveals effects of the action that may affect listed species or critical habitat in a manner or to an extent not previously considered; (3) if the identified action is subsequently modified in a manner that causes an effect to the listed species or critical habitat that was not considered in the biological opinion; or (4) if a new species is listed or critical habitat designated that may be affected by the identified action.

Thank you for your ongoing efforts to conserve threatened and endangered species. If you have

any questions concerning this Biological Opinion, please contact Lauren Taylor, Fish and Wildlife Biologist, at the letterhead address or by telephone at (808) 792-9528.

Sincerely,

Michelle Bogardus
Deputy Field Supervisor

F2 Implementation and Tracking Table for Biological Opinions and Associated Conservation Measures

This page intentionally left blank.

Requirement	Location	Title	Project BO/BA/BE Date	Mariana fruit bat	Mariana swiftlet	Mariana common moorhen	Mariana crow	Micronesian kingfisher	Guam rail	Micronesian Megapode	Nightingale Reed-warbler	Serianthes nelsonii	Green sea turtle	Hawksbill sea turtle	Scalloped hammerhead	ESA Corals	EFH	Eugenia bryanii	Hedyotis megalantha	Heritiera longipetiolata	Phyllanthus saffordii	Psychotria malaspinae	Solanum guamense	Tinaspora homosepala	Bulbophyllum guamense	Cycas micronesica	Dendrobium guamense	Maesa walkeri	Nervilia jacksoniae	Tabernaemontana rotensis	Tuberolabium guamense	Mariana eight-spot butterfly	Guam tree snail	Humped tree snail	Fragile tree snail	Conservation Measure (One Per Row)
Section 7 formal	AAFB	Establishment of an Intelligence, Surveillance, Reconnaissance, and Strike (ISR/Strike) Operational Capability	3-Oct-06	x			x	x	x																											100% inspection rate by United States (U.S.) Department of Agriculture (USDA)/Wildlife Services for all Air Force cargo leaving Guam (funding should be secured at least 18 months in advance): a. Program sufficient funding annually b. Evaluate effectiveness of BTS interdiction program c. USDA/WS to provide monthly reports of inspection program to Department of Defense (DoD), Air Force, etc. and to be reviewed at the annual BTS meeting in Honolulu, HI.
Section 7 informal	AAFB	Taragues Beach Improvement Project, Andersen Air Force Base, Guam	1-May-08	x	x		x	x	x				x	x																						Adjacent habitat, that is not to be impacted, will be temporarily delineated by orange construction fencing to keep personnel and equipment from damaging the habitat. Signs will be posted indicating that no one is allowed past that boundary. All signs and temporary fencing will be removed from the site after completion of the project.
Section 7 informal	AAFB	Taragues Beach Improvement Project, Andersen Air Force Base, Guam	1-May-08	x	x		x	x	x				x	x																						All project-related materials and equipment (dredges, barges, backhoes, etc.) will be cleaned of pollutants prior to use.
Section 7 informal	AAFB	Taragues Beach Improvement Project, Andersen Air Force Base, Guam	1-May-08	x	x		x	x	x				x	x																						No project-related materials (fill, revetment rock, pipe, etc.) will be stockpiled in the water (intertidal zones, reef flats, stream channels, wetlands, etc.) or where they could be washed into the water from adverse weather or tidal conditions.
Section 7 informal	AAFB	Taragues Beach Improvement Project, Andersen Air Force Base, Guam	1-May-08	x	x		x	x	x				x	x																						All debris removed from the environment will be disposed of at an approved upland landfill site.
Section 7 informal	AAFB	Taragues Beach Improvement Project, Andersen Air Force Base, Guam	1-May-08	x	x		x	x	x				x	x																						No contamination (trash or debris disposal, alien species introductions, etc.) of adjacent terrestrial or marine/aquatic environments (reef flats, channels, open ocean, stream channels, wetlands, etc.) shall result from project-related activities.
Section 7 informal	AAFB	Taragues Beach Improvement Project, Andersen Air Force Base, Guam	1-May-08	x	x		x	x	x				x	x																						The project applicant will prepare and implement a Hazard Analysis and Critical Control Point (HACCP) plan to prevent the introduction and spread of non-native species. The Service can provide guidance and training regarding HACCP planning.
Section 7 informal	AAFB	Taragues Beach Improvement Project, Andersen Air Force Base, Guam	1-May-08	x	x		x	x	x				x	x																						The project applicant shall ensure that any materials exported from Guam are thoroughly searched for brown treesnake presence prior to leaving the island.
Section 7 informal	AAFB	Installation and Operation of a Cellular Communications Tower with an Ultra-high Frequency Conventional Repeater	17-Nov-08	x			x	x	x																											No contamination (trash or debris disposal, alien species introduction, etc.) of adjacent terrestrial or marine/aquatic environments will result from project-related activities.
Section 7 informal	AAFB	Remedial cleanup actions at the Installation Restoration Program (IRP) site 15-Landfill 20, Main Base Operable Unit	25-Feb-09	x			x	x	x																											No contamination (i.e., trash or debris disposal) or introduction of non-native species to adjacent terrestrial environments will result from project-related activities.
Section 7 informal	AAFB	First Reinitiation - Beddown of Training and Support Initiatives at Northwest Field	6-Mar-09	x			x	x	x																											No contamination (i.e., trash or debris disposal) or introduction of non-native species to adjacent terrestrial environments will result from project-related activities.
Section 7 informal	AAFB	Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA or Superfund) 42 U.S.C. §9601 et seq. (1980) site inspections at multiple munitions response areas	7-May-09	x			x	x	x																											A Hazard Analysis and Critical Control Point Plan (or similar plan) will be prepared and implemented to ensure that no new (i.e., those species not already present at each of the individual sites) non-native invasive species are introduced or become established at or adjacent to these sites.
Section 7 informal	AAFB	Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA or Superfund) 42 U.S.C. §9601 et seq. (1980) site inspections at multiple munitions response areas	7-May-09	x			x	x	x																											No contamination (i.e., trash or debris disposal) or introduction of non-native species to adjacent terrestrial environments will result from project-related activities.
Section 7 informal	AAFB	Proposed construction of a brown tree snake barrier at the Habitat Management Unit (HMU), and construction of five well sites.	29-May-09	x			x	x	x																											An AAFB biologist or environmental flight personnel will ensure that both sides of the barrier are maintained as frequently as necessary to exclude vegetation within a minimum of 3 feet of the barrier to prevent snakes from climbing and breaching the barrier.
Section 7 informal	AAFB	Second Reinitiation - Beddown of Training and Support Initiatives at Northwest Field	11-Sep-09	x			x	x	x																											No contamination (i.e., trash or debris disposal) or introduction of non-native species to adjacent terrestrial environments will result from project-related activities.
Section 7 informal	AAFB	Third Reinitiation - Beddown of Training and Support Initiatives at Northwest Field	16-Mar-10	x			x	x	x																											No contamination (i.e., trash or debris disposal) or introduction of non-native species to adjacent terrestrial environments will result from project-related activities.
Section 7 informal	AAFB	Anti-Terrorism, Force Protection Perimeter Fence, Andersen Air Force Base	11-May-10	x			x	x	x																											No contamination (i.e., trash or debris disposal) or introduction of non-native species to adjacent terrestrial environments will result from project-related activities.

Requirement	Location	Title	Project BO/BA/BE Date	Mariana fruit bat	Mariana swiftlet	Mariana common moorhen	Mariana crow	Micronesian kingfisher	Guam rail	Micronesian Megapode	Nightingale Reed-warbler	Serianthes nelsonii	Green sea turtle	Hawksbill sea turtle	Scalloped hammerhead	ESA Corals	EFH	Eugenia bryanii	Hedyotis megalantha	Heritiera longipetiolata	Phyllanthus saffordii	Psychotria malaspinae	Solanum guamense	Tinaspora homosepala	Bulbophyllum guamense	Cycas micronesica	Dendrobium guamense	Maesa walkeri	Nervilia jacksoniae	Tabernaemontana rotensis	Tuberolabium guamense	Mariana eight-spot butterfly	Guam tree snail	Humped tree snail	Fragile tree snail	Conservation Measure (One Per Row)
EFH	NBG	Maintenance Dredging of Delta, Echo, Victor, and X-Ray Wharves	12-Apr-11														x																			
Section 7 informal	AAFB	Electrical Upgrades at Tarague Beach, Andersen Air Force Base, Guam	17-Nov-11	x			x	x	x			x	x	x																					The contractor will develop a Hazard Analysis Critical Control Point Plan to minimize and avoid potential contamination from gear brought on site.
Section 7 informal	AAFB	Consultation Regarding the Proposed Short-Range Approach Lighting System for Runway 06L and Vegetation Clearing in the Runway Clear Zone, Andersen Air Force Base	15-May-12				x	x	x																										The Contractor will develop a Hazard Analysis Critical Control Point Plan to minimize and avoid potential contamination from gear brought on site.
Section 7 informal	AAFB	Consultation Regarding the Proposed Short-Range Approach Lighting System for Runway 06L and Vegetation Clearing in the Runway Clear Zone, Andersen Air Force Base	15-May-12				x	x	x																										No contamination of the adjacent terrestrial environment of trash or invasive species will result from project-related activities.
EFH	NBG	X-Ray Wharf Improvements, Naval Base Guam	28-Jan-14														x																			
Section 7 formal	AAFB	Establishment of an Intelligence, Surveillance, Reconnaissance, and Strike (ISR/Strike) Operational Capability	3-Oct-06	x			x	x	x																										1 week prior to clearing and during the first week of construction/clearing, the AF will have a qualified biologist survey the proposed project area and areas within 150 meters (492 feet) of the proposed project site at night and during the day to determine if Mariana fruit bats are present. (If Mariana fruit bats are present in the surveyed area, the Air Force will notify the Service and the Guam Division of Aquatic and Wildlife resources within 2 business days of their observation and construction will be postponed until the bats have left the area and the agencies have been notified.
Section 7 formal	AAFB	Establishment of an Intelligence, Surveillance, Reconnaissance, and Strike (ISR/Strike) Operational Capability	3-Oct-06	x			x	x	x																										Actively seek DoD funding for applied research efforts by USDA/Wildlife Services for development of: a. aerial broadcast techniques for toxicants b. artificial lures and attractants for brown treesnake (BTS) c. more cost-effective strategies for control or elimination of BTS
Section 7 formal	AAFB	Establishment of an Intelligence, Surveillance, Reconnaissance, and Strike (ISR/Strike) Operational Capability	3-Oct-06	x			x	x	x																										Air Force develop and implement measures to control brown treesnakes at a landscape level on Andersen AFB (AAFB) to support recovery efforts for Mariana fruit bat, the Mariana crow, the Guam Micronesian kingfisher, and the Guam rail.
Section 7 formal	AAFB	Establishment of an Intelligence, Surveillance, Reconnaissance, and Strike (ISR/Strike) Operational Capability	3-Oct-06	x			x	x	x																										Air Force eradicates ungulates and implements a native tree reforestation program throughout Andersen AFB to support the recovery of the Mariana fruit bat, the Mariana crow, and the Guam Micronesian kingfisher.
Section 7 formal	AAFB	Establishment of an Intelligence, Surveillance, Reconnaissance, and Strike (ISR/Strike) Operational Capability	3-Oct-06	x			x	x	x																										Air Force will monitor the status of Mariana fruit bats observed within the project site to ensure no additional take of Mariana fruit bats occurs due to construction activities - a qualified biologist must monitor the status of Mariana fruit bats that utilize the Aircraft Staging Area facility area (at a min. of every other day) until 1 year after construction/clearing in Aircraft Staging Area site is completed. The specific methodology utilized for monitoring will be developed by the Adaptive Management Team with input from appropriate species experts 1 year prior to the start of clearing activity at the site. The monitoring methodology should include attempting to capture, mark, and attach a radio transmitter to bats that utilize the Aircraft Staging Area at least 1 month prior to construction/clearing at the project sites. - A report summarizing the methods and results of the monitoring efforts shall be sent to the Service's Pacific Islands Fish and Wildlife Office within 3 months after monitoring is completed. Results will include maps of where individuals were observed before, during, and after construction/clearing.
Section 7 formal	AAFB	Establishment of an Intelligence, Surveillance, Reconnaissance, and Strike (ISR/Strike) Operational Capability	3-Oct-06	x			x	x	x																										Basewide vegetation survey.

Requirement	Location	Title	Project BO/BA/BE Date	Mariana fruit bat	Mariana swiftlet	Mariana common moorhen	Mariana crow	Micronesian kingfisher	Guam rail	Micronesian Megapode	Nightingale Reed-warbler	Serianthes nelsonii	Green sea turtle	Hawksbill sea turtle	Scalloped hammerhead	ESA Corals	EFH	Eugenia bryanii	Hedyotis megalantha	Heritiera longipetiolata	Phyllanthus saffordii	Psychotria malaspinae	Solanum guamense	Tinaspora homosepala	Bulbophyllum guamense	Cycas micronesica	Dendrobium guamense	Maesa walkeri	Nervilia jacksoniae	Tabernaemontana rotensis	Tuberolabium guamense	Mariana eight-spot butterfly	Guam tree snail	Humped tree snail	Fragile tree snail	Conservation Measure (One Per Row)
Section 7 formal	AAFB	Establishment of an Intelligence, Surveillance, Reconnaissance, and Strike (ISR/Strike) Operational Capability	3-Oct-06	x			x	x	x																											Develop Adaptive Management Strategy - DAWR, FWS, DoD. Written plan that will be incorporated or attached to the Andersen Integrated Natural Resources Management Plan (INRMP), and that addresses each mitigation action: a. time frame for completing implementation phase b. identification of priority actions c. methods to minimize/avoid impacts to listed species d. define success for each minimization measure e. methods for monitoring, data tracking, analysis and feed back f. cost estimate – from EPR web g. methods to increase listed species
Section 7 formal	AAFB	Establishment of an Intelligence, Surveillance, Reconnaissance, and Strike (ISR/Strike) Operational Capability	3-Oct-06	x			x	x	x																											During Mariana crow breeding season, the Air Force will increase the ground tracks altitude to at least 305 meters.
Section 7 formal	AAFB	Establishment of an Intelligence, Surveillance, Reconnaissance, and Strike (ISR/Strike) Operational Capability	3-Oct-06	x			x	x	x																											Fence 200 ha (494 ac) Habitat Management Unit (which includes 3400 meters/11,155 feet of fence) to exclude ungulates, BTS, and repel cats a. Eradicate ungulates, BTS and other predators from HMU b. Plant native forage trees bats and crows
Section 7 formal	AAFB	Establishment of an Intelligence, Surveillance, Reconnaissance, and Strike (ISR/Strike) Operational Capability	3-Oct-06	x			x	x	x																											Fenced vegetation plots for fruit bats and crows fenced plots, each 50m square, within the fenced ungulate exclosures a. Planted with native species important to bats and crows, species to be determined by availability b. Control of herbaceous vegetation c. Fenceline maintenance d. Quarterly monitoring for outplanting success
Section 7 formal	AAFB	Establishment of an Intelligence, Surveillance, Reconnaissance, and Strike (ISR/Strike) Operational Capability	3-Oct-06	x			x	x	x																											Funding research projects to refine BTS control techniques with the goal of decreasing mortality of bats.
Section 7 formal	AAFB	Establishment of an Intelligence, Surveillance, Reconnaissance, and Strike (ISR/Strike) Operational Capability	3-Oct-06	x			x	x	x																											Increase patrols by security personnel and conservation officers near all Mariana fruit bat roost sites that are established after the roost site at Pati Point is abandoned.
Section 7 formal	AAFB	Establishment of an Intelligence, Surveillance, Reconnaissance, and Strike (ISR/Strike) Operational Capability	3-Oct-06	x			x	x	x																											Management plan for ungulate control to include: a. Ungulate eradication, depredation and recreational hunting b. Focused on eradication within exclosures and reduction of ungulate densities in non-fenced areas. c. Control and monitoring techniques will be clearly defined in the control plan. d. Ungulate movement studies using radio telemetry or other technologies
Section 7 formal	AAFB	Establishment of an Intelligence, Surveillance, Reconnaissance, and Strike (ISR/Strike) Operational Capability	3-Oct-06	x			x	x	x																											Minimize and avoid impacts of the proposed construction and operation of the Aircraft Staging Area on Mariana fruit bats.
Section 7 formal	AAFB	Establishment of an Intelligence, Surveillance, Reconnaissance, and Strike (ISR/Strike) Operational Capability	3-Oct-06	x			x	x	x																											Minimize, avoid, and/or offset the impacts of increased aircraft operations on Mariana fruit bats.
Section 7 formal	AAFB	Establishment of an Intelligence, Surveillance, Reconnaissance, and Strike (ISR/Strike) Operational Capability	3-Oct-06	x			x	x	x																											No construction activities will occur at night (i.e., between sunset and sunrise).
Section 7 formal	AAFB	Establishment of an Intelligence, Surveillance, Reconnaissance, and Strike (ISR/Strike) Operational Capability	3-Oct-06	x			x	x	x																											Noise study for bats and crows: a. Monitor impacts of aircraft overflights on nesting crows b. Monitor impacts of aircraft overflights on roosting bats
Section 7 formal	AAFB	Establishment of an Intelligence, Surveillance, Reconnaissance, and Strike (ISR/Strike) Operational Capability	3-Oct-06	x			x	x	x																											Notification to the USFWS Pacific Islands Fish and Wildlife Office of any injured Mariana fruit bat or Mariana crow found and the actions taken within 3 working days.
Section 7 formal	AAFB	Establishment of an Intelligence, Surveillance, Reconnaissance, and Strike (ISR/Strike) Operational Capability	3-Oct-06	x			x	x	x																											Remove and transplant approximately 1,500 *Tabernaemontana rotensis* saplings from ISR/Strike area before construction. a. Transplant to outside of construction area b. Collect seeds for outplanting

Requirement	Location	Title	Project BO/BA/BE Date	Mariana fruit bat	Mariana swiftlet	Mariana common moorhen	Mariana crow	Micronesian kingfisher	Guam rail	Micronesian Megapode	Nightingale Reed-warbler	Serianthes nelsonii	Green sea turtle	Hawksbill sea turtle	Scalloped hammerhead	ESA Corals	EFH	Eugenia bryanii	Hedyotis megalantha	Heritiera longipetiolata	Phyllanthus saffordii	Psychotria malaspinae	Solanum guamense	Tinaspora homosepala	Bulbophyllum guamense	Cycas micronesica	Dendrobium guamense	Maesa walkeri	Nervilia jacksoniae	Tabernaemontana rotensis	Tuberolabium guamense	Mariana eight-spot butterfly	Guam tree snail	Humped tree snail	Fragile tree snail	Conservation Measure (One Per Row)
Section 7 formal	AAFB	Establishment of an Intelligence, Surveillance, Reconnaissance, and Strike (ISR/Strike) Operational Capability	3-Oct-06	x			x	x	x																											Shielded lights will be used on the outside of the Aircraft Staging Area.
Section 7 formal	AAFB	Establishment of an Intelligence, Surveillance, Reconnaissance, and Strike (ISR/Strike) Operational Capability	3-Oct-06	x			x	x	x																											The Air Force lease Aguiguan from the Commonwealth of the Northern Mariana Islands and eradicate goats on the island to help support Mariana fruit bat populations and offset the loss of Mariana fruit bats on Guam.
Section 7 formal	AAFB	Establishment of an Intelligence, Surveillance, Reconnaissance, and Strike (ISR/Strike) Operational Capability	3-Oct-06	x			x	x	x																											The Air Force shall inform the Field Supervisor of the Service's Pacific Islands Fish and Wildlife Office in Honolulu, Hawaii in writing of take of any federally listed species within three working days. - the depository designated to receive specimens of any Mariana fruit bats and crows that are killed is the B.P. Bishop Museum.
Section 7 formal	AAFB	Establishment of an Intelligence, Surveillance, Reconnaissance, and Strike (ISR/Strike) Operational Capability	3-Oct-06	x			x	x	x																											The Air Force will implement the BTS control measures being developed at Mariana fruit bat roosts. The implementation of this measure will be part of the Adaptive Management Strategy and will be developed with us to ensure this measure does not adversely impact Mariana fruit bats.
Section 7 formal	AAFB	Establishment of an Intelligence, Surveillance, Reconnaissance, and Strike (ISR/Strike) Operational Capability	3-Oct-06	x			x	x	x																											The Air Force will modify its public hunting program to ensure that public hunting does not occur near any Mariana bat roosts.
Section 7 formal	AAFB	Establishment of an Intelligence, Surveillance, Reconnaissance, and Strike (ISR/Strike) Operational Capability	3-Oct-06	x			x	x	x																											The Air Force will monitor the number of Mariana fruit bats at all roost sites to ensure no additional take of Mariana fruit bats occurs due to aircraft operations associated with the prospective project. - A qualified biologist must monitor the number of Mariana fruit bats at all roost sites until 1 year after the proposed ISR/Strike is fully implemented. Monitoring will occur at a minimum of once a week except after a typhoon event occurs on Rota when monitoring will occur at a minimum of 3 times a week, for 8 weeks after a typhoon, to more accurately monitor potential migration of bats between Rota and Guam. The specific methodology utilized for monitoring will be developed by the Adaptive Management Team with input from appropriate species experts 1 year prior to the increase in aircraft operations (FY09). The monitoring should include direct counts of Mariana fruit bats at roost sites utilizing a spotting scope at an appropriate distance to avoid impacts to the bats. - Reports summarizing the methods and results of the monitoring efforts shall be sent to the Service's Pacific Islands Fish and Wildlife Office every 4 months until the monitoring is completed. Results will include a table of count results and weekly summary of the number of aircraft operations (by aircraft type) over occupied roost sites.
Section 7 formal	AAFB	Establishment of an Intelligence, Surveillance, Reconnaissance, and Strike (ISR/Strike) Operational Capability	3-Oct-06	x			x	x	x																											The Air Force will provide financial assistance to the Service's Law Enforcement Office in Honolulu, Hawaii, to help pay for the travel costs of sending a special agent to Rota after a typhoon to reduce the incidences of illegal hunting on Rota.
Section 7 formal	AAFB	Establishment of an Intelligence, Surveillance, Reconnaissance, and Strike (ISR/Strike) Operational Capability	3-Oct-06	x			x	x	x																											The hiring of a Wildlife Management Specialist to carry out day to day field operations of the conservation program. a. Oversight of barrier construction at mitigation sites b. Coordinator and AF point of contact for ungulate eradication efforts c. Day to day recreational hunt and depredation point of contact d. Fenceline reconnaissance for maintenance needs e. Day to day coordination with FWS and other resource agencies
Section 7 formal	AAFB	Establishment of an Intelligence, Surveillance, Reconnaissance, and Strike (ISR/Strike) Operational Capability	3-Oct-06	x			x	x	x																											Ungulate exclosures: 3 areas approximately 254 ha (701 ac) above Ritidian Point a. fence using suitable posts and materials sufficient to prevent ungulate incursion and withstand Guam's environment b. To be give a special conservation designation with no “incompatible activities” occurring within c. Maintenance
Section 7 formal	AAFB	Establishment of an Intelligence, Surveillance, Reconnaissance, and Strike (ISR/Strike) Operational Capability	3-Oct-06	x			x	x	x																											Ungulate movement studies using radio telemetry or other technologies to be incorporated into the Ungulate Control Plan.

Requirement	Location	Title	Project BO/BA/BE Date	Mariana fruit bat	Mariana swiftlet	Mariana common moorhen	Mariana crow	Micronesian kingfisher	Guam rail	Micronesian Megapode	Nightingale Reed-warbler	Serianthes nelsonii	Green sea turtle	Hawksbill sea turtle	Scalloped hammerhead	ESA Corals	EFH	Eugenia bryanii	Hedyotis megalantha	Heritiera longipetiolata	Phyllanthus saffordii	Psychotria malaspinae	Solanum guamense	Tinaspora homosepala	Bulbophyllum guamense	Cycas micronesica	Dendrobium guamense	Maesa walkeri	Nervilia jacksoniae	Tabernaemontana rotensis	Tuberolabium guamense	Mariana eight-spot butterfly	Guam tree snail	Humped tree snail	Fragile tree snail	Conservation Measure (One Per Row)
EFH	NBG	Kilo Wharf Extension, Apra Harbor, Guam	4-Jun-07														x																			Designate marine areas (e.g., areas with coral density greater than 5 percent mapped as zones 7-9 in the Draft EIS) to be protected on all construction drawings.
EFH	NBG	Kilo Wharf Extension, Apra Harbor, Guam	4-Jun-07														x																			Require contractor to avoid impacting these designated coral reef areas.
EFH	NBG	Kilo Wharf Extension, Apra Harbor, Guam	4-Jun-07														x																			The barge used in the construction of the mooring island(s) would establish anchoring points outside coral reef areas.
EFH	NBG	Kilo Wharf Extension, Apra Harbor, Guam	4-Jun-07														x																			A barge anchoring system that prevents anchor lines from damaging the coral reef community shall be developed and implemented by the construction contractor, subject to Navy approval.
EFH	NBG	Kilo Wharf Extension, Apra Harbor, Guam	4-Jun-07														x																			If chain is required to provide additional stability for the mooring lines, it would be placed on the fossilized reef platform or other non-coral reef areas to avoid scouring coral reef communities.
EFH	NBG	Kilo Wharf Extension, Apra Harbor, Guam	4-Jun-07														x																			Materials and construction equipment for the construction mooring island would be transported to the site in a manner that avoids contact with the coral reef.
EFH	NBG	Kilo Wharf Extension, Apra Harbor, Guam	4-Jun-07														x																			Work barge and scow would be relocated to a safe mooring location in advance of extreme weather conditions (specific condition of readiness to be predetermined by the Navy) to avoid damaging the coral reef and other habitats.
EFH	NBG	Kilo Wharf Extension, Apra Harbor, Guam	4-Jun-07														x																			If required during the construction period, ammunition ship bow anchors to be placed only on sand and rubble areas.
EFH	NBG	Kilo Wharf Extension, Apra Harbor, Guam	4-Jun-07														x																			No blasting would be performed.
EFH	NBG	Kilo Wharf Extension, Apra Harbor, Guam	4-Jun-07														x																			Silt containment devices would be employed as part of the BMPs used for reducing unavoidable turbidity during dredging operations. Precautions would be taken to ensure that the curtains do not encircle turtles when put in place. If a turtle should enter the curtained area, work would be paused and the curtain would be lowered until the turtle voluntarily leaves.
EFH	NBG	Kilo Wharf Extension, Apra Harbor, Guam	4-Jun-07														x																			If a sea turtle is sighted ncar any project activity, and should that activity have a potential to adversely affect the turtle, the action would be paused or modified to avoid any adverse effect. Construction personnel would be informed of the protected nature of these animals and procedures that would be employed should a sea turtle enter a construction area. For example, if a small boat operator sees that the vessel is approaching a sea turtle, the boat's speed would be reduced, the boat would be turned, or other actions would be taken to avoid the turtle.
EFH	NBG	Kilo Wharf Extension, Apra Harbor, Guam	4-Jun-07														x																			Construction-related materials that may pose an entanglement hazard to sea turtles would be removed from the project site if not actively being used and/ or at the conclusion of construction.
Section 7 informal	AAFB	Vegetation Control and Removal within the Flightline Project	7-Jun-07	x	x	x	x	x	x																											Conduct surveys prior to clearing.
Section 7 informal	AAFB	Vegetation Control and Removal within the Flightline Project	7-Jun-07	x	x	x	x	x	x																											No clearing should be accomplished when species are present.
Section 7 informal	AAFB	Vegetation Control and Removal within the Flightline Project	7-Jun-07	x	x	x	x	x	x																											No work should be conducted at night.
Section 7 informal	NBG	Kilo Wharf Extension, Apra Harbor, Guam	29-Jun-07										x	x																						A fuel or other petroleum product spill contingency plan is in place and the Navy maintains materials for cleaning spills nearby within Apra Harbor.
Section 7 informal	NBG	Kilo Wharf Extension, Apra Harbor, Guam	29-Jun-07										x	x																						All construction personnel will be informed of listed turtles in the harbor and required protocols when turtles enter the construction area.
Section 7 informal	NBG	Kilo Wharf Extension, Apra Harbor, Guam	29-Jun-07										x	x																						Appropriate tension of vessel anchor lines to avoid coral damage and entanglement with turtles.
Section 7 informal	NBG	Kilo Wharf Extension, Apra Harbor, Guam	29-Jun-07										x	x																						BMPs to minimize coral damage include anchoring vessels in sandy bottoms, designated areas by the Navy and resource agencies, and beyond designated coral zones.
Section 7 informal	NBG	Kilo Wharf Extension, Apra Harbor, Guam	29-Jun-07										x	x																						During construction, the Navy will implement existing protocols and best management practices (BMPs) to reduce potential in-water impacts to sea turtles in the project vicinity.

Requirement	Location	Title	Project BO/BA/BE Date	Mariana fruit bat	Mariana swiftlet	Mariana common moorhen	Mariana crow	Micronesian kingfisher	Guam rail	Micronesian Megapode	Nightingale Reed-warbler	Serianthes nelsonii	Green sea turtle	Hawksbill sea turtle	Scalloped hammerhead	ESA Corals	EFH	Eugenia bryanii	Hedyotis megalantha	Heritiera longipetiolata	Phyllanthus saffordii	Psychotria malaspinae	Solanum guamense	Tinaspora homosepala	Bulbophyllum guamense	Cycas micronesica	Dendrobium guamense	Maesa walkeri	Nervilia jacksoniae	Tabernaemontana rotensis	Tuberolabium guamense	Mariana eight-spot butterfly	Guam tree snail	Humped tree snail	Fragile tree snail	Conservation Measure (One Per Row)
Section 7 informal	NBG	Kilo Wharf Extension, Apra Harbor, Guam	29-Jun-07										x	x																						If a sea turtle is sighted near any project activity, and should that activity have a potential to adversely affect the turtle, the action will be paused or modified to avoid any adverse effect. Personnel will be informed of the protected nature of these animals and procedures that would be employed should a turtle enter a construction area.
Section 7 informal	NBG	Kilo Wharf Extension, Apra Harbor, Guam	29-Jun-07										x	x																						Implementation of spill contingency plan procedures for any accidental spill of fuel, hydraulic fluids, and petroleum products.
Section 7 informal	NBG	Kilo Wharf Extension, Apra Harbor, Guam	29-Jun-07										x	x																						Monitoring for sea turtles by vessel observers during barge and tug boat operations.
Section 7 informal	NBG	Kilo Wharf Extension, Apra Harbor, Guam	29-Jun-07										x	x																						NMFS staff will be immediately notified when sea turtle injury(ies) occur during construction operations.
Section 7 informal	NBG	Kilo Wharf Extension, Apra Harbor, Guam	29-Jun-07										x	x																						No blasting will be performed.
Section 7 informal	NBG	Kilo Wharf Extension, Apra Harbor, Guam	29-Jun-07										x	x																						Postponing or halting operations to allow turtles to leave the area.
Section 7 informal	NBG	Kilo Wharf Extension, Apra Harbor, Guam	29-Jun-07										x	x																						Project-related debris that may pose an entanglement hazard to sea turtles will be removed from the project site if not actively being used and/or at the conclusion of construction.
Section 7 informal	NBG	Kilo Wharf Extension, Apra Harbor, Guam	29-Jun-07										x	x																						Silt curtains will be deployed as part of the best management practices used ofr reducing turbidity. Precautions will be taken to ensure that the silt curtains do not encircle turtles when put in place. Should, however, a turtle enter the curtained area, work would be paused until the turtle voluntarily leaves.
Section 7 informal	NBG	Kilo Wharf Extension, Apra Harbor, Guam	29-Jun-07										x	x																						Slow vessel speeds to avoid turtles.
Section 7 informal	NBG	Kilo Wharf Extension, Apra Harbor, Guam	29-Jun-07										x	x																						The Navy will mitigate for the direct loss of corals and sea turtle forage areas from the wharf expansion activities. Mitigation may include the reforestation of 500 acres in the Ceti Bay watershed in southern Guam. Anticipated activities include monitoring of implemented mitigation and achievement of performance goals, including coral restoration.
Section 7 informal	AAFB	Operation and Maintenance ofthe North Runway Approach Lights	19-Feb-08	x			x	x	x																											All maintenance of the lights and access areas, other work or deliveries will begin no earlier than one hour after sunrise or 7 am, which ever is later. This will ensure that the majority of bats that were out foraging at night have returned to the roosting area for the day.
Section 7 informal	AAFB	Operation and Maintenance ofthe North Runway Approach Lights	19-Feb-08	x			x	x	x																											All maintenance will be completed 1 hour before sunset or at 4:30 pm, which ever is earlier, so that the bats are not disturbed while foraging at night. No night time work will occur. Any requests to work at night with lighting must be coordinated with the Service.
Section 7 informal	AAFB	Operation and Maintenance ofthe North Runway Approach Lights	19-Feb-08	x			x	x	x																											All unused materials and waste will be removed from the job site and disposed of properly. Material must be removed without damage to adjacent areas, including native forest. Any damage resulting from removal shall be repaired.
Section 7 informal	AAFB	Operation and Maintenance ofthe North Runway Approach Lights	19-Feb-08	x			x	x	x																											The job site will be maintained free of waste, trash, debris, and rubbish caused by maintenance and operations personal. This will help deter the attraction of predators and poachers.
Section 7 informal	AAFB	Operation and Maintenance ofthe North Runway Approach Lights	19-Feb-08	x			x	x	x																											Security patrols will occur along the cliffline to ensure that no poaching of the bat colony occurs. If unauthorized personnel are found they will be escorted out of the area and prosecuted if poaching occurred.
Section 7 informal	AAFB	Operation and Maintenance ofthe North Runway Approach Lights	19-Feb-08	x			x	x	x																											Restore and maintain the graded area with non-invasive plant material and low growing native forest species. This will limit invasion of surrounding native forest by non-native species; may provide foraging habitat for the three listed species; and ensure lighting needs are not compromised. Quarterly inspections will occur to evaluate the presence of non-native invasive plant species and to remove any when detected. Once native species are established, the Air Force will coordinate with the Service to determine the duration of the invasive plant monitoring and control program.
Section 7 informal	AAFB	Operation and Maintenance ofthe North Runway Approach Lights	19-Feb-08	x			x	x	x																											Lights should be shielded such that when the lights are on, they are visible by aircraft but not on the ground.
Section 7 informal	NBG	Construction and operation of two anemometer towers	7-Mar-08	x	x	x																														No lighting will be added to the towers because they are less than 200 feet high.

Requirement	Location	Title	Project BO/BA/BE Date	Mariana fruit bat	Mariana swiftlet	Mariana common moorhen	Mariana crow	Micronesian kingfisher	Guam rail	Micronesian Megapode	Nightingale Reed-warbler	Serianthes nelsonii	Green sea turtle	Hawksbill sea turtle	Scalloped hammerhead	ESA Corals	EFH	Eugenia bryanii	Hedyotis megalantha	Heritiera longipetiolata	Phyllanthus saffordii	Psychotria malaspinae	Solanum guamense	Tinaspora homosepala	Bulbophyllum guamense	Cycas micronesica	Dendrobium guamense	Maesa walkeri	Nervilia jacksoniae	Tabernaemontana rotensis	Tuberolabium guamense	Mariana eight-spot butterfly	Guam tree snail	Humped tree snail	Fragile tree snail	Conservation Measure (One Per Row)
Section 7 informal	NBG	Construction and operation of two anemometer towers	8-Mar-08	x	x	x																														Bird diverters constructed from white, 25-millimeter polyvinyl tape, will be used on all guy wires. The polyvinyl tape should be cut into 2-meter segments, folded in half over the wire, and attached using zip ties every 10 meters along each guy wire. Zip ties should be resistant to ultra-violet light so that maintenance is reduced. Bird diverters will remain in working order for the life of the anemometer towers. This increased guy wire visibility should reduce the likelihood of bird and fruit bat collisions with towers.
Section 7 informal	NBG	Construction and operation of two anemometer towers	9-Mar-08	x	x	x																														Post-construction monitoring will be conducted at each of the proposed towers during the period of operation. Bird diverters should minimize the likelihood of injury to both the fruit bat and birds; however, this mechanism has not been specifically tested on fruit bats. Monitoring will help to demonstrate if any listed species or seabird has collided with the tower or guy wires.
Section 7 informal	NBG	Construction and operation of two anemometer towers	10-Mar-08	x	x	x																														Changed circumstances such as hurricanes, major storms, fire, and other such events could alter the timing of the surveys. If the anemometer towers are not accessible as a result of storm events or road conditions, the surveys should continue as soon as is safety permits. The Navy will coordinate with the Service on such changed circumstances as soon as possible.
Section 7 informal	NBG	Construction and operation of two anemometer towers	11-Mar-08	x	x	x																														All project staff and consultants will be trained by the project lead on how to handle any downed wildlife or carcasses found anywhere within the project area.
Section 7 informal	NBG	Construction and operation of two anemometer towers	12-Mar-08	x	x	x																														
Section 7 informal	AAFB	Tarague Beach Improvement Project, Andersen Air Force Base, Guam	1-May-08	x	x		x	x	x				x	x																						No activities will occur at night so that crows, bats, and sea turtles are not disturbed. All work will be conducted between 8:00 am and 4:00 pm.
Section 7 informal	AAFB	Tarague Beach Improvement Project, Andersen Air Force Base, Guam	1-May-08	x	x		x	x	x				x	x																						To avoid impacts to nesting crows, one week prior to clearing vegetation, a qualified biologist will survey the proposed project site and adjacent areas to determine if crows are present. If crows are nesting (male/female) within30D ill (984 £1) of the project site, clearing and other activities within 300 m (984 ft) of the nest will be postponed until the breeding attempt is completed, resulting in either successful fledging or nest failure.
Section 7 informal	AAFB	Tarague Beach Improvement Project, Andersen Air Force Base, Guam	1-May-08	x	x		x	x	x				x	x																						To avoid impacts to roosting bats, a qualified biologist will survey the project area and areas within 150 m (492 £1) of these proposed project sites to determine ifbats are present. Ifbats are observed within 150 m (492 ft) of the project site, activities will be delayed within 150 m (492 ft) of the bates) until the bates) have left thg arga. This survey should be completed one week prior to clearing vegetation at a site.
Section 7 informal	AAFB	Tarague Beach Improvement Project, Andersen Air Force Base, Guam	1-May-08	x	x		x	x	x				x	x																						To avoid impacts to sea turtle nests, nesting adults, and hatchlings, AAFB will contact Guam Division ofAquatic and Wildlife Resources (DAWR) to determine the sighting of the storage shed to avoid known nests and during construction shed so that equipment will avoid any known nests. AAFB will have DAWR on site during construction so that in the unlikely event that a turtle nest is discovered while excavating for the shed, immediate on-site advice can be provided to protect the nest. If a nest is discovered during excavation, excavation will stop, AAFB will contact the Service to re-initiate consultation and AAFB will immediately work with DAWR to protect the nest.
Section 7 informal	AAFB	Tarague Beach Improvement Project, Andersen Air Force Base, Guam	1-May-08	x	x		x	x	x				x	x																						To avoid impacts to sea turtle nests, nesting adults, and hatchlings, AAFB will prohibit recreational driving on the beach. Pole barriers have already been installed to prevent vehicle access. Additional signs will be posted and violators may be fined. Security forces will assist with the no vehicle policy.

Requirement	Location	Title	Project BO/BA/BE Date	Mariana fruit bat	Mariana swiftlet	Mariana common moorhen	Mariana crow	Micronesian kingfisher	Guam rail	Micronesian Megapode	Nightingale Reed-warbler	Serianthes nelsonii	Green sea turtle	Hawksbill sea turtle	Scalloped hammerhead	ESA Corals	EFH	Eugenia bryanii	Hedyotis megalantha	Heritiera longipetiolata	Phyllanthus saffordii	Psychotria malaspinae	Solanum guamense	Tinaspora homosepala	Bulbophyllum guamense	Cycas micronesica	Dendrobium guamense	Maesa walkeri	Nervilia jacksoniae	Tabernaemontana rotensis	Tuberolabium guamense	Mariana eight-spot butterfly	Guam tree snail	Humped tree snail	Fragile tree snail	Conservation Measure (One Per Row)
Section 7 informal	AAFB	Tarague Beach Improvement Project, Andersen Air Force Base, Guam	1-May-08	x	x		x	x	x				x	x																						A sea turtle monitoring program will be established and implemented by AAFB. The program should be approved by the Service and DAWR and will incorporate a person walking the entire beach from sunrise to approximately 8 am to search for crawls and other evidence of sea turtle use. When crawls or evidence of turtle use is detected, DAWR should be contacted immediately. The location ofthe potential nest site will be documented with GPS coordinates and the nest marked, if necessary. The sea turtle monitor will also look for evidence of beach erosion and document the source of the erosion.
Section 7 informal	AAFB	Tarague Beach Improvement Project, Andersen Air Force Base, Guam	1-May-08	x	x		x	x	x				x	x																						AAFB will install sea turtle lighting where lighting is necessary, which will involve the replacement of existing fixtures or bulbs. Lights have already been angled toward the cliff and away from the ocean. This will reduce the direct and ambient lighting of the beach habitats within and adjacent to the project site. Security lighting should be turned off five days prior to an expected nest hatching and remain off five days after hatching.
Section 7 informal	AAFB	Tarague Beach Improvement Project, Andersen Air Force Base, Guam	1-May-08	x	x		x	x	x				x	x																						AAFB has implemented and will request annual sea turtle awareness training (or upon hiring ofnew staff or new volunteers) for all lifeguards and beach patrol personnel that work the Tarague Beach Area.
Section 7 informal	AAFB	Tarague Beach Improvement Project, Andersen Air Force Base, Guam	1-May-08	x	x		x	x	x				x	x																						AAFB hired a beach patrol person to assist with enforcement of guidelines for the Tarague Beach area.
Section 7 informal	AAFB	Tarague Beach Improvement Project, Andersen Air Force Base, Guam	1-May-08	x	x		x	x	x				x	x																						No insecticides will be used around forested habitats, so that swiftlet prey items are not affected.
Section 7 informal	AAFB	Tarague Beach Improvement Project, Andersen Air Force Base, Guam	1-May-08	x	x		x	x	x				x	x																						AAFB will prohibit the free movement of pets in beach habitats. Personnel and beach users will be instructed not to encourage (feed) feral cats in the area.
Section 7 informal	AAFB	Tarague Beach Improvement Project, Andersen Air Force Base, Guam	1-May-08	x	x		x	x	x				x	x																						AAFB will provide sturdy animal-proof garbage containers to prevent the invasion of house mice and their predators.
Section 7 informal	AAFB	Tarague Beach Improvement Project, Andersen Air Force Base, Guam	1-May-08	x	x		x	x	x				x	x																						AAFB will restrict beach access each night to prevent harassment and mortality of bats and sea turtles.
Section 7 informal	AAFB	Tarague Beach Improvement Project, Andersen Air Force Base, Guam	1-May-08	x	x		x	x	x				x	x																						AAFB has minimized the project footprint to reduce overall impacts to beach, coastal, and forest habitats.
Section 7 informal	AAFB	Tarague Beach Improvement Project, Andersen Air Force Base, Guam	1-May-08	x	x		x	x	x				x	x																						Heavy equipment will not be used for grading. No track vehicles are allowed and only vehicles with rubber tires will be used.
Section 7 informal	AAFB	Tarague Beach Improvement Project, Andersen Air Force Base, Guam	1-May-08	x	x		x	x	x				x	x																						Understory vegetation on the beach has already been cleared. Sea turtles use understory vegetation, particularly vines, shrubby grasses and shrubs as a cue to determine appropriate areas for nesting. Without these cues, the turtles continue to head inland to nest which increase their energy use, may discourage nesting, exposes the adults to predators and other risks, and exposes any hatchlings to increased predation and stress try to reach the water. Therefore, no additional tree, shrub, grass or ground cover removal will occur north of the parking lot and vines will be allowed to grow back under the tree canopy and onto the beach.
Section 7 informal	AAFB	Tarague Beach Improvement Project, Andersen Air Force Base, Guam	1-May-08	x	x		x	x	x				x	x																						Within the area proposed for clearing, trees larger than 10 centimeters (4 inches) in diameter at breast height (DBH) will not be disturbed, other than coconut and ironwood trees. Trees of this size and greater are appropriate for bat roosts and foraging, crow nests and foraging, and represent habitat for the kingfisher and rail. Selected coconut trees will be relocated at the project site and twelve young Daok trees (Calophyllum inopyllum) will be planted on site. Coconut seedlings will be planted within the power line easement. Where feasible, AAFB will plant native vegetation species used by bats, crows, rails, kingfishers.

Requirement	Location	Title	Project BO/BA/BE Date	Mariana fruit bat	Mariana swiftlet	Mariana common moorhen	Mariana crow	Micronesian kingfisher	Guam rail	Micronesian Megapode	Nightingale Reed-warbler	Serianthes nelsonii	Green sea turtle	Hawksbill sea turtle	Scalloped hammerhead	ESA Corals	EFH	Eugenia bryanii	Hedyotis megalantha	Heritiera longipetiolata	Phyllanthus saffordii	Psychotria malaspinae	Solanum guamense	Tinaspora homosepala	Bulbophyllum guamense	Cycas micronesica	Dendrobium guamense	Maesa walkeri	Nervilia jacksoniae	Tabernaemontana rotensis	Tuberolabium guamense	Mariana eight-spot butterfly	Guam tree snail	Humped tree snail	Fragile tree snail	Conservation Measure (One Per Row)
Section 7 informal	AAFB	Taragues Beach Improvement Project, Andersen Air Force Base, Guam	1-May-08	x	x		x	x	x				x	x																						The project applicant will prepare and implement an erosion control and restoration plan to control short-term and long-term erosion and sedimentation effects. The plan will includle all the necessary local jurisdiction requirements regarding erosion control and will implement Best Management Practices (BMPs) for erosion and sediment control as required. Work will be curtailed during adverse weather or tidal conditions to prevent erosion. Existing erosion from the parking lot will be stopped and an appropriate mechanism should be used to ensure additional erosion from the parking lot does not occur.
Section 7 informal	AAFB	Taragues Beach Improvement Project, Andersen Air Force Base, Guam	1-May-08	x	x		x	x	x				x	x																						All vehicle parking will be restricted to previously determined areas or existing roads. Necessary vehicles belonging to the biological monitors and construction supervisors will be parked at the nearest point on existing access roads.
Section 7 informal	AAFB	Taragues Beach Improvement Project, Andersen Air Force Base, Guam	1-May-08	x	x		x	x	x				x	x																						Erosion control devices will be monitored on a weekly basis and augmented as necessary ifnewerosionpointsarediscovered. In the event ofpendingstorms,erosioncontrol devices will be inspected to ensure that such devices are in place and are functional. If erosion control devices are found to be non-functional, they will be fixed within 24 hours. Monitoring and maintenance of erosion control devices and adjacent disturbed areas will continue during and immediately after significant storm events.
Section 7 informal	AAFB	Taragues Beach Improvement Project, Andersen Air Force Base, Guam	1-May-08	x	x		x	x	x				x	x																						The stockpiling of any materials, during project implementation, will be located a minimum of 50 meters away from buffer zones or areas of potential runoff. All stockpiles will be removed or covered and protected with soil stabilization measures, and a temporary perimeter sediment barrier, prior to the onset of precipitation.
Section 7 informal	AAFB	Taragues Beach Improvement Project, Andersen Air Force Base, Guam	1-May-08	x	x		x	x	x				x	x																						Stockpiles of "cold mix" asphalt materials will be placed on and covered with plastic or comparable material prior to the onset of precipitation.
Section 7 informal	AAFB	Taragues Beach Improvement Project, Andersen Air Force Base, Guam	1-May-08	x	x		x	x	x				x	x																						Any soil exposed near water as part ofthe project shall be protected from erosion (with plastic sheeting, filter fabric, etc.) after exposure and stabilized as soon as practicable (with vegetation matting, hydroseeding, etc.).
Section 7 informal	AAFB	Taragues Beach Improvement Project, Andersen Air Force Base, Guam	1-May-08	x	x		x	x	x				x	x																						The project applicant will prepare a spill prevention and clean-up plan. Spill control BMP's will be implemented anytime chemicals and/or hazardous substances are stored or used on the projects. Employees shall be educated in proper material handling, spill prevention, and clean-up. Clean-up materials shall be on-site and located near material storage and use.
Section 7 informal	AAFB	Taragues Beach Improvement Project, Andersen Air Force Base, Guam	1-May-08	x	x		x	x	x				x	x																						Dedicated fueling areas and refueling practices will be designated and a contingency plan to control petroleum products accidentally spilled during the project shall be developed. If possible, dedicated refueling 'areas will be located at least 50 meters from any buffer zones, aquatic habitats, or habitats supporting listed species. The fueling areas will have signs posted designating the area and listing BMPs for fueling. Drip pans, absorbent pads, and containment booms shall be stored on-site, if appropriate, to facilitate the cleanup of accidental petroleum releases.
Section 7 informal	AAFB	Taragues Beach Improvement Project, Andersen Air Force Base, Guam	1-May-08	x	x		x	x	x				x	x																						A litter control program shall be instituted at the entire project site. All workers ensure their food scraps, paper wrappers, food containers, cans, bottles, and other trash from the project area are deposited in covered or closed trash containers. The trash containers shall be removed from the project area at the end of each working day.
Section 7 informal	AAFB	Taragues Beach Improvement Project, Andersen Air Force Base, Guam	1-May-08	x	x		x	x	x				x	x																						All tools, gear, and construction scrap will be removed upon completion of work in order to prevent the attraction of non-native pests (i.e., rats).
Section 7 informal	AAFB	Taragues Beach Improvement Project, Andersen Air Force Base, Guam	1-May-08	x	x		x	x	x				x	x																						All onsite personnel will receive instruction regarding the browntree snake and what to do in case of a sighting.
Section 7 informal	AAFB	Taragues Beach Improvement Project, Andersen Air Force Base, Guam	1-May-08	x	x		x	x	x				x	x																						All BMPs and conservation measures will be made available on the project site and will be reviewed with all workers. This includes species and habitat specific measures, the erosion control plan, spill prevention and control plan, and HACCP plan.

Requirement	Location	Title	Project BO/BA/BE Date	Mariana fruit bat	Mariana swiftlet	Mariana common moorhen	Mariana crow	Micronesian kingfisher	Guam rail	Micronesian Megapode	Nightingale Reed-warbler	Serianthes nelsonii	Green sea turtle	Hawksbill sea turtle	Scalloped hammerhead	ESA Corals	EFH	Eugenia bryanii	Hedyotis megalantha	Heritiera longipetiolata	Phyllanthus saffordii	Psychotria malaspinae	Solanum guamense	Tinaspora homosepala	Bulbophyllum guamense	Cycas micronesica	Dendrobium guamense	Maesa walkeri	Nervilia jacksoniae	Tabernaemontana rotensis	Tuberolabium guamense	Mariana eight-spot butterfly	Guam tree snail	Humped tree snail	Fragile tree snail	Conservation Measure (One Per Row)
Section 7 informal	AAFB	Tarague Beach Improvement Project, Andersen Air Force Base, Guam	1-May-08	x	x		x	x	x				x	x																						A qualified biologist approved by the Service and DAWR (biological monitor) will train all project staff regarding the presence of listed species and the importance of avoiding impacts to these species and their habitat, habitat sensitivity, and required practices before the start of construction. The training shall include the general measures that are being implemented to conserve these species as they relate to the project, the penalties for non-compliance, and the boundaries of the project area.
Section 7 informal	AAFB	Tarague Beach Improvement Project, Andersen Air Force Base, Guam	1-May-08	x	x		x	x	x				x	x																						Upon completion of all worker education described above, workers will sign a form stating that they attend the training and understand and will implement all the conservation measures and protection measures. Training shall be conducted in languages other than English, as appropriate.
Section 7 informal	AAFB	Tarague Beach Improvement Project, Andersen Air Force Base, Guam	1-May-08	x	x		x	x	x				x	x																						Kiosks will be posted to describe the sensitive species and their habitats and appropriate ways that individuals can use the project area without damaging resources.
Section 7 informal	AAFB	Paving of Munitions Storage Area 1, Andersen Air Force Base, Guam	3-Nov-08	x			x	x	x																											All on-site personnel will receive instruction regarding endangered species and the brown treesnake *(Boiga irregularis),* and what to do in case of a sighting.
Section 7 informal	AAFB	Paving of Munitions Storage Area 1, Andersen Air Force Base, Guam	3-Nov-08	x			x	x	x																											A litter-control program will be instituted; all trash will be bagged and disposed of offsite at the end of each day.
Section 7 informal	AAFB	Paving of Munitions Storage Area 1, Andersen Air Force Base, Guam	3-Nov-08	x			x	x	x																											All tools, gear, construction scrap, and vegetation clippings will be removed upon completion of work in order to prevent the attraction of non-native pests (i.e., rats).
Section 7 informal	AAFB	Paving of Munitions Storage Area 1, Andersen Air Force Base, Guam	3-Nov-08	x			x	x	x																											All work will be conducted between the hours of7:00 am and 4:00pm. No activities will occur at night.
Section 7 informal	AAFB	Paving of Munitions Storage Area 1, Andersen Air Force Base, Guam	3-Nov-08	x			x	x	x																											Existing disturbed areas will be used for staging and equipment storage; therefore, no habitat will be removed.
Section 7 informal	AAFB	Paving of Munitions Storage Area 1, Andersen Air Force Base, Guam	3-Nov-08	x			x	x	x																											Habitat adjacent to the roadway that is not to be trimmed, pruned, or cut will be temporarily delineated by orange construction fencing to keep personnel and equipment from damaging the habitat. Signs will be posted indicating that no one is allowed past the boundary. All signs and temporary fencing will be removed from the site after completion of the project.
Section 7 informal	AAFB	Paving of Munitions Storage Area 1, Andersen Air Force Base, Guam	3-Nov-08	x			x	x	x																											Immediately prior to vegetation trimming, pruning or cutting, a biologist or environmental flight personnel will examine the vegetation, including a 150-meter buffer area around the subject vegetation, for Mariana fruit bats. If individual bats are found roosting within 150-meter buffer area, the area will be avoided until the bat leaves of its own volition.
Section 7 informal	AAFB	Paving of Munitions Storage Area 1, Andersen Air Force Base, Guam	3-Nov-08	x			x	x	x																											Immediately prior to vegetation trimming, pruning, or cutting, a biologist or environmental flight personnel will examine the vegetation, including a 300-meter buffer area around the subject vegetation, for Mariana crows. If a male/female nesting crow pair are found within 300-meter buffer area, the area will be avoided until the crows have completed the breeding attempt, resulting in either successful fledging or nest failure.
Section 7 informal	AAFB	Paving of Munitions Storage Area 1, Andersen Air Force Base, Guam	3-Nov-08	x			x	x	x																											Some trees or shrubs may be pruned or removed where they overlay the roadway. Trees larger than 10 centimeters (4 inches) in diameter at breast height (DBH) will not be removed. Trees of this size and greater are appropriate for bat roosts and foraging, crow nests and foraging, and represent habitat for the kingfisher and rail.
Section 7 informal	AAFB	Installation and Operation of a Cellular Communications Tower with an Ultra-high Frequency Conventional Repeater	17-Nov-08	x			x	x	x																											All onsite personnel will receive instruction from AAFB environmental flight personnel regarding endangered species and BTS and what to do in case of a sighting.
Section 7 informal	AAFB	Installation and Operation of a Cellular Communications Tower with an Ultra-high Frequency Conventional Repeater	17-Nov-08	x			x	x	x																											A litter-control program will be implemented during construction. All trash will be bagged and disposed of offsite at the end of each day.
Section 7 informal	AAFB	Installation and Operation of a Cellular Communications Tower with an Ultra-high Frequency Conventional Repeater	17-Nov-08	x			x	x	x																											All antenna transmission lines will be attached to the concrete pole and all electrical power lines will be run underground.
Section 7 informal	AAFB	Installation and Operation of a Cellular Communications Tower with an Ultra-high Frequency Conventional Repeater	17-Nov-08	x			x	x	x																											All construction work will begin just after dawn and will end prior to dusk, between the hours of7:00 am and 4:00 pm. No activities will occur at night.

Requirement	Location	Title	Project BO/BA/BE Date	Mariana fruit bat	Mariana swiftlet	Mariana common moorhen	Mariana crow	Micronesian kingfisher	Guam rail	Micronesian Megapode	Nightingale Reed-warbler	Serianthes nelsonii	Green sea turtle	Hawksbill sea turtle	Scalloped hammerhead	ESA Corals	EFH	Eugenia bryanii	Hedyotis megalantha	Heritiera longipetiolata	Phyllanthus saffordii	Psychotria malaspinae	Solanum guamense	Tinaspora homosepala	Bulbophyllum guamense	Cycas micronesica	Dendrobium guamense	Maesa walkeri	Nervilia jacksoniae	Tabernaemontana rotensis	Tuberolabium guamense	Mariana eight-spot butterfly	Guam tree snail	Humped tree snail	Fragile tree snail	Conservation Measure (One Per Row)
Section 7 informal	AAFB	Installation and Operation of a Cellular Communications Tower with an Ultra-high Frequency Conventional Repeater	17-Nov-08	x			x	x	x																											All tools, gear, and construction scrap will be removed upon completion of work in order to prevent the attraction of non-native pests (i.e., rats).
Section 7 informal	AAFB	Installation and Operation of a Cellular Communications Tower with an Ultra-high Frequency Conventional Repeater	17-Nov-08	x			x	x	x																											No chemicals will be used onsite.
Section 7 informal	AAFB	Installation and Operation of a Cellular Communications Tower with an Ultra-high Frequency Conventional Repeater	17-Nov-08	x			x	x	x																											No guy wires or lighting will be used on the monopole.
Section 7 informal	AAFB	Installation and Operation of a Cellular Communications Tower with an Ultra-high Frequency Conventional Repeater	17-Nov-08	x			x	x	x																											No staging areas or access roads will be constructed. Existing roads and disturbed areas will be used.
Section 7 informal	AAFB	Installation and Operation of a Cellular Communications Tower with an Ultra-high Frequency Conventional Repeater	17-Nov-08	x			x	x	x																											Only grass and scrub/shrub vegetation will be cleared. No forest vegetation will be removed.
Section 7 informal	AAFB	Installation and Operation of a Cellular Communications Tower with an Ultra-high Frequency Conventional Repeater	17-Nov-08	x			x	x	x																											The air conditioning system running at maximum power will have noise levels of 66 A-weighted decibels from a distance of 5 feet or less.
Section 7 informal	AAFB	Remedial cleanup actions at the Installation Restoration Program (IRP) site 15-Landfill 20, Main Base Operable Unit	25-Feb-09	x			x	x	x																											All on-site personnel will receive instruction from AAFB environmental flight personnel regarding endangered species and brown treesnake (*Boiga irregularis*) and what to do in case of a sighting.
Section 7 informal	AAFB	Remedial cleanup actions at the Installation Restoration Program (IRP) site 15-Landfill 20, Main Base Operable Unit	25-Feb-09	x			x	x	x																											A litter-control program will be implemented during construction. All trash will be bagged and disposed of off-site at the end of each day.
Section 7 informal	AAFB	Remedial cleanup actions at the Installation Restoration Program (IRP) site 15-Landfill 20, Main Base Operable Unit	25-Feb-09	x			x	x	x																											All construction work will begin just after dawn and will end prior to dusk, between the hours of 7:00 am and 4:00 pm. No activities will occur at night.
Section 7 informal	AAFB	Remedial cleanup actions at the Installation Restoration Program (IRP) site 15-Landfill 20, Main Base Operable Unit	25-Feb-09	x			x	x	x																											All tools, gear, and construction scrap will be removed upon completion of work in order to prevent the attraction of non-native pests (i.e., rats).
Section 7 informal	AAFB	Remedial cleanup actions at the Installation Restoration Program (IRP) site 15-Landfill 20, Main Base Operable Unit	25-Feb-09	x			x	x	x																											Although not anticipated, if a roosting bat is present, workers will not conduct any activities within a 150 meter radius around the bat until the bat leaves on its own volition. Inspections will be completed by AAFB biologists.
Section 7 informal	AAFB	Remedial cleanup actions at the Installation Restoration Program (IRP) site 15-Landfill 20, Main Base Operable Unit	25-Feb-09	x			x	x	x																											Although not anticipated, if nesting crows are detected, workers will avoid the nesting crows by 300 meters until the nest has fledged or has been abandoned. Inspections will be completed by AAFB biologists.
Section 7 informal	AAFB	Remedial cleanup actions at the Installation Restoration Program (IRP) site 15-Landfill 20, Main Base Operable Unit	25-Feb-09	x			x	x	x																											No new staging areas or access roads will be constructed. Existing roads and disturbed areas will be used. Silt fencing will be installed and maintained until the ground is vegetated to prevent erosion from occurring off-site.
Section 7 informal	AAFB	Remedial cleanup actions at the Installation Restoration Program (IRP) site 15-Landfill 20, Main Base Operable Unit	25-Feb-09	x			x	x	x																											The area will be backfilled with clean coral material and restoration of disturbed areas, by planting native trees, will occur at the site. Liquid Fence Deer and Rabbit Repellent will be applied around the tree bases to deter ungulate foraging.
Section 7 informal	AAFB	Remedial cleanup actions at the Installation Restoration Program (IRP) site 15-Landfill 20, Main Base Operable Unit	25-Feb-09	x			x	x	x																											The presence ofthe bat or crow will be reported to the U.S. Fish and Wildlife Service and Guam Division of Aquatic and Wildlife Resources immediately, but the location of the bat will not be revealed to any other outside party.
Section 7 informal	AAFB	Remedial cleanup actions at the Installation Restoration Program (IRP) site 15-Landfill 20, Main Base Operable Unit	25-Feb-09	x			x	x	x																											Vegetative debris will be left on site for natural decomposition.
Section 7 informal	AAFB	First Reinitiation - Beddown of Training and Support Initiatives at Northwest Field	6-Mar-09	x			x	x	x																											All onsite personnel will receive instruction from AAFB environmental flight personnel regarding endangered species and brown treesnake (*Boiga irregularis*) and what to do in case of a sighting.
Section 7 informal	AAFB	First Reinitiation - Beddown of Training and Support Initiatives at Northwest Field	6-Mar-09	x			x	x	x																											A litter-control program will be implemented during construction. All trash will be bagged and disposed of offsite at the end of each day.

Requirement	Location	Title	Project BO/BA/BE Date	Mariana fruit bat	Mariana swiftlet	Mariana common moorhen	Mariana crow	Micronesian kingfisher	Guam rail	Micronesian Megapode	Nightingale Reed-warbler	Serianthes nelsonii	Green sea turtle	Hawksbill sea turtle	Scalloped hammerhead	ESA Corals	EFH	Eugenia bryanii	Hedyotis megalantha	Heritiera longipetiolata	Phyllanthus saffordii	Psychotria malaspinae	Solanum guamense	Tinaspora homosepala	Bulbophyllum guamense	Cycas micronesica	Dendrobium guamense	Maesa walkeri	Nervilia jacksoniae	Tabernaemontana rotensis	Tuberolabium guamense	Mariana eight-spot butterfly	Guam tree snail	Humped tree snail	Fragile tree snail	Conservation Measure (One Per Row)
Section 7 informal	AAFB	First Reinitiation - Beddown of Training and Support Initiatives at Northwest Field	6-Mar-09	x			x	x	x																											A qualified biologist will survey the project site and a 150-meter buffer zone around the project site, each morning, prior to any vegetation clearing. If a roosting bat is present, workers will not conduct any activities, including vegetation removal within the 150-meter buffer radius until the bat leaves on its own volition.
Section 7 informal	AAFB	First Reinitiation - Beddown of Training and Support Initiatives at Northwest Field	6-Mar-09	x			x	x	x																											All conservation measures identified in the prior Beddown Project informal consultation (Service File No. 2006-1-0281) will still be implemented as described in the prior consultation.
Section 7 informal	AAFB	First Reinitiation - Beddown of Training and Support Initiatives at Northwest Field	6-Mar-09	x			x	x	x																											All construction work will begin just after dawn and will end prior to dusk, between the hours of 7:00 am and 4:00 pm. No activities will occur at night.
Section 7 informal	AAFB	First Reinitiation - Beddown of Training and Support Initiatives at Northwest Field	6-Mar-09	x			x	x	x																											All tools, gear, and construction scrap will be removed upon completion of work in order to prevent the attraction of non-native pests (i.e., rats).
Section 7 informal	AAFB	First Reinitiation - Beddown of Training and Support Initiatives at Northwest Field	6-Mar-09	x			x	x	x																											Although not anticipated, if nesting crows are detected, workers will avoid the crows by 300 meters.
Section 7 informal	AAFB	First Reinitiation - Beddown of Training and Support Initiatives at Northwest Field	6-Mar-09	x			x	x	x																											Native landscape vegetation will be planted on the facility's grounds at completion of the construction of the buildings. The contractor will select vegetation from the list of recommended vegetation provided by the Guam Department of Agriculture, Forestry Division.
Section 7 informal	AAFB	First Reinitiation - Beddown of Training and Support Initiatives at Northwest Field	6-Mar-09	x			x	x	x																											No chemicals will be used on site.
Section 7 informal	AAFB	First Reinitiation - Beddown of Training and Support Initiatives at Northwest Field	6-Mar-09	x			x	x	x																											No new staging areas or access roads will be constructed. Existing roads and disturbed areas will be used.
Section 7 informal	AAFB	First Reinitiation - Beddown of Training and Support Initiatives at Northwest Field	6-Mar-09	x			x	x	x																											The presence of the bat or crow will be reported to the Service and the Guam Division of Aquatic and Wildlife Resources immediately, but the location of the bat or crow will not be revealed to any other outside party.
Section 7 informal	AAFB	Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA or Superfund) 42 U.S.C. §9601 et seq. (1980) site inspections at multiple munitions response areas	7-May-09	x			x	x	x																											All on-site personnel will receive instruction from AAFB environmental flight personnel regarding endangered species and the BTS and what to do in case of a sighting.
Section 7 informal	AAFB	Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA or Superfund) 42 U.S.C. §9601 et seq. (1980) site inspections at multiple munitions response areas	7-May-09	x			x	x	x																											A litter-control program will be instituted; all trash will be bagged and disposed of offsite at the end of the each day.
Section 7 informal	AAFB	Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA or Superfund) 42 U.S.C. §9601 et seq. (1980) site inspections at multiple munitions response areas	7-May-09	x			x	x	x																											A qualified biologist will survey the project site and a 150-meter buffer zone around the project site, each morning, prior to any vegetation clearing. If a roosting bat is present, workers will not conduct any activities, including vegetation removal within the 150-meter buffer radius until the bat leaves on its own volition.

Section 7 informal	AAFB	Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA or Superfund) 42 U.S.C. §9601 et seq. (1980) site inspections at multiple munitions response areas	7-May-09	x			x	x	x																											No new staging areas or access roads will be constructed. Existing roads and disturbed areas will be used.

Requirement	Location	Title	Project BO/BA/BE Date	Mariana fruit bat	Mariana swiftlet	Mariana common moorhen	Mariana crow	Micronesian kingfisher	Guam rail	Micronesian Megapode	Nightingale Reed-warbler	Serianthes nelsonii	Green sea turtle	Hawksbill sea turtle	Scalloped hammerhead	ESA Corals	EFH	Eugenia bryanii	Hedyotis megalantha	Heritiera longipetiolata	Phyllanthus saffordii	Psychotria malaspinae	Solanum guamense	Tinaspora homosepala	Bulbophyllum guamense	Cycas micronesica	Dendrobium guamense	Maesa walkeri	Nervilia jacksoniae	Tabernaemontana rotensis	Tuberolabium guamense	Mariana eight-spot butterfly	Guam tree snail	Humped tree snail	Fragile tree snail	Conservation Measure (One Per Row)
Section 7 informal	AAFB	Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA or Superfund) 42 U.S.C. §9601 et seq. (1980) site inspections at multiple munitions response areas	7-May-09	x			x	x	x																											Once the site investigations are complete, the contractor will provide AAFB with recommendations for each site (i.e., further investigation, removal actions, remedial actions, presumptive remedies, administrative actions, or no further action.) For those sites where any other action (other than no further action) may occur, AAFB will initiate consultation with the Service to evaluated any additional adverse affects that may occur from the proposed action. Because each of the possible recommendations (other than no further action) may involve vegetation removal, any new request for consultation will include a native vegetation restoration plan.
Section 7 informal	AAFB	Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA or Superfund) 42 U.S.C. §9601 et seq. (1980) site inspections at multiple munitions response areas	7-May-09	x			x	x	x																											Roots of the vegetation will remain in place and will not be damaged so that vegetation growth can occur.
Section 7 informal	AAFB	Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA or Superfund) 42 U.S.C. §9601 et seq. (1980) site inspections at multiple munitions response areas	7-May-09	x			x	x	x																											The presence of the bat or crow will be reported to the Service and the Guam Division of Aquatic and Wildlife Resources immediately, but the locaton of the bat or crow will not be revealed to any other outside party.
Section 7 informal	AAFB	Proposed construction of a brown tree snake barrier at the Habitat Management Unit (HMU), and construction of five well sites.	29-May-09	x			x	x	x																											8. A biologist from the Guam Division of Aquatic and Wildlife Resources will accompany AAFB and contractor personnel to coordinate regarding large trees that are proposed for removal as part of HMU perimeter clearing, to identify possible means to avoid removal of these trees.
Section 7 informal	AAFB	Proposed construction of a brown tree snake barrier at the Habitat Management Unit (HMU), and construction of five well sites.	29-May-09	x			x	x	x																											1. All work will be conducted between the hours of 7:00 am and 4:00 pm. No activities will occur at night.
Section 7 informal	AAFB	Proposed construction of a brown tree snake barrier at the Habitat Management Unit (HMU), and construction of five well sites.	29-May-09	x			x	x	x																											3. A litter-control program will be instituted; all trash will be bagged and disposed of offsite at the end of the each day.
Section 7 informal	AAFB	Proposed construction of a brown tree snake barrier at the Habitat Management Unit (HMU), and construction of five well sites.	29-May-09	x			x	x	x																											4. All on-site personnel will receive instruction regarding endangered species and what to do in case of a sighting.
Section 7 informal	AAFB	Proposed construction of a brown tree snake barrier at the Habitat Management Unit (HMU), and construction of five well sites.	29-May-09	x			x	x	x																											2. All tools, gear, construction scrap, and vegetation clippings will be removed upon completion of work in order to prevent the attraction on non-native pests (i.e., rats).
Section 7 informal	AAFB	Proposed construction of a brown tree snake barrier at the Habitat Management Unit (HMU), and construction of five well sites.	29-May-09	x			x	x	x																											5. Existing developed areas (delineated on the project map provided with the May 26, 2009 request for consultation) will be used for staging and equipment storage and temporary laydown of cut vegetation prior to disposal. Vegetation clearing will be minimized as much as possible.
Section 7 informal	AAFB	Proposed construction of a brown tree snake barrier at the Habitat Management Unit (HMU), and construction of five well sites.	29-May-09	x			x	x	x																											6. Immediately prior to vegetation trimming, pruning or cutting, a biologist or environmental flight personnel will examine the vegeration, including a 150-meter buffer area around the subject vegetation, for Mariana fruit bats. If individual bats are found roosting within 150-meter buffer area, the area will be avoided until the bat leaves of its own volition.
Section 7 informal	AAFB	Proposed construction of a brown tree snake barrier at the Habitat Management Unit (HMU), and construction of five well sites.	29-May-09	x			x	x	x																											7. Immediately prior to vegetation trimming, pruning or cutting, a biologist or environmental flight personnel will examine the vegeration, including a 300-meter buffer area around the subject vegetation, for Marianacrows. If a male/female nesting crow pair are found within 300-meter buffer area, the area will be avoided until the crows have completed the breeding attempt, resulting in either successful fledging or nest failure.
Section 7 informal	AAFB	Proposed construction of a brown tree snake barrier at the Habitat Management Unit (HMU), and construction of five well sites.	29-May-09	x			x	x	x																											9. Once constructed, an AAFB biologist or environmental flight personnel will patrol the outside of the barrier weekly by vehicle, twice per month on foot for chain link sections, and at least every three months on foot for concrete sections, to inspect the fence for damage and detect and remove mantis egg cases or other attached items that could compromise the smoothness of the barrier surface and allow snakes to climb over. Personnel from the U.S. Geological Survey Brown Treesnake Program will train AAFB personnel in maintenance techniques.

Requirement	Location	Title	Project BO/BA/BE Date	Mariana fruit bat	Mariana swiftlet	Mariana common moorhen	Mariana crow	Micronesian kingfisher	Guam rail	Micronesian Megapode	Nightingale Reed-warbler	Serianthes nelsonii	Green sea turtle	Hawksbill sea turtle	Scalloped hammerhead	ESA Corals	EFH	Eugenia bryanii	Hedyotis megalantha	Heritiera longipetiolata	Phyllanthus saffordii	Psychotria malaspinae	Solanum guamense	Tinaspora homosepala	Bulbophyllum guamense	Cycas micronesica	Dendrobium guamense	Maesa walkeri	Nervilia jacksoniae	Tabernaemontana rotensis	Tuberolabium guamense	Mariana eight-spot butterfly	Guam tree snail	Humped tree snail	Fragile tree snail	Conservation Measure (One Per Row)
Section 7 informal	AAFB	Proposed construction of a brown tree snake barrier at the Habitat Management Unit (HMU), and construction of five well sites.	29-May-09	x			x	x	x																											11. Once constructed, an AAFB Wildlife Management Specialist, coordinating with member of the AAFB Adaptive Management Team, will develop and implement methods and schedules to remove snakes and ungulates from the HMU.
Section 7 informal	AAFB	Proposed construction of a brown tree snake barrier at the Habitat Management Unit (HMU), and construction of five well sites.	29-May-09	x			x	x	x																											The area within the exclosure will be maintained in perpetuity as a special use conservation area, with vegetation control, maintenance and repairs as needed to prevent ingress (as described in #9 above) and forest restoration as needed to improve bat and crow habitat, as stated on page 2-21 of the Environmental Assessment for Beddown of Training and Support Initiatives at Northwest Field, AAFB.
Section 7 informal	NBG	Water Line Replacement Between Fena Reservoir and the Fena Water Treatment Plant	10-Aug-09	x			x	x	x																											Upon the completion of the water pipeline repair, the dirt pile will be levelled over the site and seeded with grass to stabilize the soil.
Section 7 informal	NBG	Water Line Replacement Between Fena Reservoir and the Fena Water Treatment Plant	10-Aug-09	x			x	x	x																											At the beginning of the following wet season in June 2010, a variety of native forest species present on the Naval Ordnance Site will be planted to reforest the site (see initiation email for details). The restoration plan (ie., species composition, planting density, monitoring, etc.) will follow the guidelines in the "Cetti Watershed Reforestation Implementation Plan" dated December 2008.
Section 7 informal	NBG	Water Line Replacement Between Fena Reservoir and the Fena Water Treatment Plant	10-Aug-09	x			x	x	x																											Fencing will be provided to protect seedlings from browsing, or protector tubes will be used on each sapling if fencing is precluded by permits.
Section 7 informal	AAFB	Second Reinitiation - Beddown of Training and Support Initiatives at Northwest Field	11-Sep-09	x			x	x	x																											All onsite personnel will receive instruction from AAFB environmental flight personnel regarding endangered species and brown treesnake (*Boiga irregularis*) and what to do in case ofa sighting.
Section 7 informal	AAFB	Second Reinitiation - Beddown of Training and Support Initiatives at Northwest Field	11-Sep-09	x			x	x	x																											A litter-control program will be implemented during construction. All trash will be bagged and disposed of offsite at the end ofeach day.
Section 7 informal	AAFB	Second Reinitiation - Beddown of Training and Support Initiatives at Northwest Field	11-Sep-09	x			x	x	x																											A qualified biologist or environmental flight personnel will survey the project site and a 1 50-meter buffer zone around the project site, each morning, prior to any vegetation clearing. Ifa roosting bat is present, workers will not conduct any activities, including vegetation removal within the 150-meter buffer radius until the bat leaves on its own volition.
Section 7 informal	AAFB	Second Reinitiation - Beddown of Training and Support Initiatives at Northwest Field	11-Sep-09	x			x	x	x																											All conservation measures identified in the prior Beddown Project informal consultation (Service File No. 2006-1-0281 and 2009-1-0112) will still be implemented as described in the prior consultations.
Section 7 informal	AAFB	Second Reinitiation - Beddown of Training and Support Initiatives at Northwest Field	11-Sep-09	x			x	x	x																											All construction work will begin just after dawn and will end prior to dusk, between the hours of 8:00 am and 4:30 pm. No activities will occur at night.
Section 7 informal	AAFB	Second Reinitiation - Beddown of Training and Support Initiatives at Northwest Field	11-Sep-09	x			x	x	x																											All tools, gear, and construction scrap will be removed upon completion of work in order to prevent the attraction of non-native pests (i.e., rats).
Section 7 informal	AAFB	Second Reinitiation - Beddown of Training and Support Initiatives at Northwest Field	11-Sep-09	x			x	x	x																											All vegetation planted in the area, including the utility corridor, will be selected from the Guam Division of Forestry approved list of native and endemic species.
Section 7 informal	AAFB	Second Reinitiation - Beddown of Training and Support Initiatives at Northwest Field	11-Sep-09	x			x	x	x																											All vegetation removed will be burned and excess topsoil will be taken to the quarry.
Section 7 informal	AAFB	Second Reinitiation - Beddown of Training and Support Initiatives at Northwest Field	11-Sep-09	x			x	x	x																											Although not anticipated, ifnesting crows are detected, workers will avoid the crows by 300 meters.
Section 7 informal	AAFB	Second Reinitiation - Beddown of Training and Support Initiatives at Northwest Field	11-Sep-09	x			x	x	x																											No chemicals will be used onsite.
Section 7 informal	AAFB	Second Reinitiation - Beddown of Training and Support Initiatives at Northwest Field	11-Sep-09	x			x	x	x																											No staging areas or access roads will be constructed. Existing roads and disturbed areas will be used.
Section 7 informal	AAFB	Second Reinitiation - Beddown of Training and Support Initiatives at Northwest Field	11-Sep-09	x			x	x	x																											No trees that are considered essential to the recovery ofthe bat, crow, kingfisher, and rail will be removed for the BDOCF area.
Section 7 informal	AAFB	Second Reinitiation - Beddown of Training and Support Initiatives at Northwest Field	11-Sep-09	x			x	x	x																											The presence of the bat or crow will be reported to the Service and the Guam Division of Aquatic and Wildlife Resources immediately, but the location ofthe bat or crow will not be revealed to any other outside party.

Requirement	Location	Title	Project BO/BA/BE Date	Mariana fruit bat	Mariana swiftlet	Mariana common moorhen	Mariana crow	Micronesian kingfisher	Guam rail	Micronesian Megapode	Nightingale Reed-warbler	Serianthes nelsonii	Green sea turtle	Hawksbill sea turtle	Scalloped hammerhead	ESA Corals	EFH	Eugenia bryanii	Hedyotis megalantha	Heritiera longipetiolata	Phyllanthus saffordii	Psychotria malaspinae	Solanum guamense	Tinaspora homosepala	Bulbophyllum guamense	Cycas micronesica	Dendrobium guamense	Maesa walkeri	Nervilia jacksoniae	Tabernaemontana rotensis	Tuberolabium guamense	Mariana eight-spot butterfly	Guam tree snail	Humped tree snail	Fragile tree snail	Conservation Measure (One Per Row)
Section 7 informal	AAFB	Second Reinitiation - Beddown of Training and Support Initiatives at Northwest Field	11-Sep-09	x			x	x	x																											To minimize impacts to adjacent habitat, blaze orange construction fencing will be used to delineate the construction site and signs will be posted indicating no one is allowed beyond the barriers to prohibit personnel or equipment from damaging the habitat. These barriers will be removed upon project completion.
Section 7 informal	AAFB	Third Reinitiation - Beddown of Training and Support Initiatives at Northwest Field	16-Mar-10	x			x	x	x																											All onsite personnel will receive instruction from AAFB environmental flight personnel regarding endangered species and brown treesnake (*Boiga irregularis*) and what to do in case of a sighting.
Section 7 informal	AAFB	Third Reinitiation - Beddown of Training and Support Initiatives at Northwest Field	16-Mar-10	x			x	x	x																											A litter-control program will be implemented during construction. All trash will be bagged and disposed of offsite at the end of each day.
Section 7 informal	AAFB	Third Reinitiation - Beddown of Training and Support Initiatives at Northwest Field	16-Mar-10	x			x	x	x																											A qualified biologist or environmental flight personnel will survey the project site and a 1 50-meter buffer zone around the project site, each morning, prior to any vegetation clearing. If a roosting bat is present, workers will not conduct any activities, including vegetation removal within the 150-meter buffer radius until the bat leaves on its own volition.
Section 7 informal	AAFB	Third Reinitiation - Beddown of Training and Support Initiatives at Northwest Field	16-Mar-10	x			x	x	x																											All conservation measures identified in the prior Beddown Project informal consultation (Service File No. 2006-1-0281 and 2009-1-0112, and 2009-I-0294) will still be implemented as described in the prior consultations.
Section 7 informal	AAFB	Third Reinitiation - Beddown of Training and Support Initiatives at Northwest Field	16-Mar-10	x			x	x	x																											All construction work will begin just after dawn and will end prior to dusk, between the hours of 7:00 am and 4:30 pm. No activities will occur at night.
Section 7 informal	AAFB	Third Reinitiation - Beddown of Training and Support Initiatives at Northwest Field	16-Mar-10	x			x	x	x																											All tools, gear, and construction scrap will be removed upon completion of work in order to prevent the attraction of non-native pests (i.e., rats).
Section 7 informal	AAFB	Third Reinitiation - Beddown of Training and Support Initiatives at Northwest Field	16-Mar-10	x			x	x	x																											Although not anticipated, if nesting crows are detected, workers will avoid the crows by 300 meters.
Section 7 informal	AAFB	Third Reinitiation - Beddown of Training and Support Initiatives at Northwest Field	16-Mar-10	x			x	x	x																											Native landscape vegetation will be planted on the facility's grounds at completion of the construction of the buildings. The contractor will select vegetation from the list of recommended vegetation provided by the Guam Department of Agriculture, Forestry Division.
Section 7 informal	AAFB	Third Reinitiation - Beddown of Training and Support Initiatives at Northwest Field	16-Mar-10	x			x	x	x																											No chemicals will be used onsite.
Section 7 informal	AAFB	Third Reinitiation - Beddown of Training and Support Initiatives at Northwest Field	16-Mar-10	x			x	x	x																											No new staging areas or access roads will be constructed. Existing roads and disturbed areas will be used.
Section 7 informal	AAFB	Third Reinitiation - Beddown of Training and Support Initiatives at Northwest Field	16-Mar-10	x			x	x	x																											The presence of the bat or crow will be reported to the Service and the Guam Division of Aquatic and Wildlife Resources immediately, but the location ofthe bat or crow will not be revealed to any other outside party.
Section 7 informal	AAFB	Anti-Terrorism, Force Protection Perimeter Fence, Andersen Air Force Base	11-May-10	x			x	x	x																											Coordination with the Service and the Guam Division of Aquatic and Wildlife Resources will be sought to develop a multi-year ungulate control plan in FYI 0. The plan will be designed to guide AAFB ungulate eradication, depredation, and recreational hunting issues managed by the proposed Wildlife Management Specialist. Consultants, with appropriate and recognized experience, will be used to develop the plan. The plan will be implemented by the proposed AAFB Wildlife Management Specialist, conservation officers, and other management stakeholders. Control and monitoring techniques will be clearly defined in the ungulate control plan.
Section 7 informal	AAFB	Anti-Terrorism, Force Protection Perimeter Fence, Andersen Air Force Base	11-May-10	x			x	x	x																											All construction work will begin just after dawn and will end prior to dusk, between the hours of 7:00 am and 5:00pm. No activities will occur at night.
Section 7 informal	AAFB	Anti-Terrorism, Force Protection Perimeter Fence, Andersen Air Force Base	11-May-10	x			x	x	x																											Construction of the fence and access road construction is limited to Route 3A and the adjacent utility corridor. No new staging areas or access roads will be constructed.

Requirement	Location	Title	Project BO/BA/BE Date	Mariana fruit bat	Mariana swiftlet	Mariana common moorhen	Mariana crow	Micronesian kingfisher	Guam rail	Micronesian Megapode	Nightingale Reed-warbler	Serianthes nelsonii	Green sea turtle	Hawksbill sea turtle	Scalloped hammerhead	ESA Corals	EFH	Eugenia bryanii	Hedyotis megalantha	Heritiera longipetiolata	Phyllanthus saffordii	Psychotria malaspinae	Solanum guamense	Tinaspora homosepala	Bulbophyllum guamense	Cycas micronesica	Dendrobium guamense	Maesa walkeri	Nervilia jacksoniae	Tabernaemontana rotensis	Tuberolabium guamense	Mariana eight-spot butterfly	Guam tree snail	Humped tree snail	Fragile tree snail	Conservation Measure (One Per Row)
Section 7 informal	AAFB	Anti-Terrorism, Force Protection Perimeter Fence, Andersen Air Force Base	11-May-10	x			x	x	x																										One week prior to clearing, the proposed project site and adjacent areas will be surveyed (by a biologist approved by the Service and the Guam Division of Aquatic and Wildlife Resources). If crows are nesting within 300 meters of the project site, construction/clearing activities within 300 meters of the nest will be postponed until the breeding attempt is completed, resulting in either successful fledging or nest failure.
Section 7 informal	AAFB	Anti-Terrorism, Force Protection Perimeter Fence, Andersen Air Force Base	11-May-10	x			x	x	x																										One week prior to clearing, the Air Force will have a biologist (approved by the Service and Guam Division of Aquatic and Wildlife Resources) survey areas within 150 meters of the proposed project site to determine if Mariana fruit bats are in the area. If Mariana fruit bats are observed within 150 meters of the project site, construction within 150 meters of the animal will be delayed until the bat(s) have left the area.
Section 7 informal	AAFB	Anti-Terrorism, Force Protection Perimeter Fence, Andersen Air Force Base	11-May-10	x			x	x	x																										The presence of the bat or crow will be reported to the Service and the Guam Division of Aquatic and Wildlife Resources immediately, but the location of the bat or crow will not be revealed to any other outside party.
Section 7 informal	AAFB	Anti-Terrorism, Force Protection Perimeter Fence, Andersen Air Force Base	11-May-10	x			x	x	x																										Where feasible, native vegetation species used by bats, crows, rails and kingfishers will be planted. Species include ahgao, fadang, yoga, faniok, fagot and umumu.
Section 7 informal	AAFB	Anti-Terrorism, Force Protection Perimeter Fence, Andersen Air Force Base	11-May-10	x			x	x	x																										No chemicals will be used on site.
Section 7 informal	AAFB	Anti-Terrorism, Force Protection Perimeter Fence, Andersen Air Force Base	11-May-10	x			x	x	x																										A litter-control program will be implemented during construction. All trash will be bagged and disposed of offsite at the end of each day.
Section 7 informal	AAFB	Anti-Terrorism, Force Protection Perimeter Fence, Andersen Air Force Base	11-May-10	x			x	x	x																										All tools, gear, and construction scrap will be removed upon completion of work in order to prevent the attraction of non-native pests (i.e., rats).
Section 7 informal	AAFB	Anti-Terrorism, Force Protection Perimeter Fence, Andersen Air Force Base	11-May-10	x			x	x	x																										All onsite personnel will receive instruction to immediately kill any brown treesnakes (*Boiga irregularis*) found on the property.
Section 7 informal	AAFB	Anti-Terrorism, Force Protection Perimeter Fence, Andersen Air Force Base	11-May-10	x			x	x	x																										Adjacent habitat, that is not to be impacted, will be temporarily delineated by orange construction fencing to keep personnel and equipment from damaging the habitat. Signs will be posted indicating that no one is allowed past that boundary. All signs and temporary fencing will be removed from the site after completion of the project.
Section 7 informal	AAFB	Anti-Terrorism, Force Protection Perimeter Fence, Andersen Air Force Base	11-May-10	x			x	x	x																										All project staff will be trained by a qualified biologist regarding the presence of listed species and the importance of avoiding impacts to these species and their habitat, habitat sensitivity, and required practices before the start of construction.
Section 7 informal	NBG	Maintenance Dredging of Delta, Echo, Victor, and X-Ray Wharves	10-Mar-11										x	x																					A contingency plan to control petroleum products accidentally spilled during the project has been developed. Appropriate materials to contain and clean potential spills will be stored and readily available at the work site.
Section 7 informal	NBG	Maintenance Dredging of Delta, Echo, Victor, and X-Ray Wharves	10-Mar-11										x	x																					A contingency plan will be in place for the removal and adequate securing of equipment in the event of approaching storms.
Section 7 informal	NBG	Maintenance Dredging of Delta, Echo, Victor, and X-Ray Wharves	10-Mar-11										x	x																					A plan will be developed and implemented to prevent construction debris from entering or remaining in the marine environment during the project.
Section 7 informal	NBG	Maintenance Dredging of Delta, Echo, Victor, and X-Ray Wharves	10-Mar-11										x	x																					All project-related materials and equipment placed in the water will be free of pollutants. The project manager and the heavy equipment operator will perform daily pre-work equipment inspections for cleanliness and leaks. All heavy equipment operations will be postponed or halted should a leak be detected, and will not proceed until the leak is repaired and equipment cleaned.
Section 7 informal	NBG	Maintenance Dredging of Delta, Echo, Victor, and X-Ray Wharves	10-Mar-11										x	x																					All work will cease if sea turtles enter within 50 yards of the work area.
Section 7 informal	NBG	Maintenance Dredging of Delta, Echo, Victor, and X-Ray Wharves	10-Mar-11										x	x																					Competent observers will be designated to visually survey the marine areas adjacent to the proposed action for protected species.

Requirement	Location	Title	Project BO/BA/BE Date	Mariana fruit bat	Mariana swiftlet	Mariana common moorhen	Mariana crow	Micronesian kingfisher	Guam rail	Micronesian Megapode	Nightingale Reed-warbler	Serianthes nelsonii	Green sea turtle	Hawksbill sea turtle	Scalloped hammerhead	ESA Corals	EFH	Eugenia bryanii	Hedyotis megalantha	Heritiera longipetiolata	Phyllanthus saffordii	Psychotria malaspinae	Solanum guamense	Tinaspora homosepala	Bulbophyllum guamense	Cycas micronesica	Dendrobium guamense	Maesa walkeri	Nervilia jacksoniae	Tabernaemontana rotensis	Tuberolabium guamense	Mariana eight-spot butterfly	Guam tree snail	Humped tree snail	Fragile tree snail	Conservation Measure (One Per Row)
Section 7 informal	NBG	Maintenance Dredging of Delta, Echo, Victor, and X-Ray Wharves	10-Mar-11										x	x																						Dredging will commence using a ramp-up technique at the start of each work day or following a break of more than 30 minutes. Dredging will commence with slow and deliberate deployment of the bucket to the bottom for the first several cycles to alert protected species and allow them an opportunity to vacate the area prior to full-intensity operations.
Section 7 informal	NBG	Maintenance Dredging of Delta, Echo, Victor, and X-Ray Wharves	10-Mar-11										x	x																						If a vessel is approached by a marine mammal or turtle, the engine will be put in neutral and the animal allowed to pass.
Section 7 informal	NBG	Maintenance Dredging of Delta, Echo, Victor, and X-Ray Wharves	10-Mar-11										x	x																						Marine mammals and sea turtles will not be encircled or trapped between multiple vessels or between vessels and the shore.
Section 7 informal	NBG	Maintenance Dredging of Delta, Echo, Victor, and X-Ray Wharves	10-Mar-11										x	x																						No dredging will be conducted after dark unless that work has proceeded uninterrupted since at least 1 hour prior to sunset, and no protected species have been observed near the 50-yard safety range for that work.
Section 7 informal	NBG	Maintenance Dredging of Delta, Echo, Victor, and X-Ray Wharves	10-Mar-11										x	x																						No marine mammals or sea turtles may be within 50 yards of dredging operations. All dredging will be postponed or halted until the animals have voluntarily moved beyond 50 yards.
Section 7 informal	NBG	Maintenance Dredging of Delta, Echo, Victor, and X-Ray Wharves	10-Mar-11										x	x																						No one on site or associated with this project will attempt to feed, touch, ride, or otherwise intentionally interact with any protected species.
Section 7 informal	NBG	Maintenance Dredging of Delta, Echo, Victor, and X-Ray Wharves	10-Mar-11										x	x																						Observers will remain continuously alert for protected species starting 60 minutes prior to commencement of dredging through 30 minutes after shut-down. Resumption of work following a break of 30 minutes or more requires a 60 minute pre-work area visual search.
Section 7 informal	NBG	Maintenance Dredging of Delta, Echo, Victor, and X-Ray Wharves	10-Mar-11										x	x																						Reduce vessel speed to 5 knots or less when piloting vessels in the proximity of sea turtles. If practicable, reduce vessel speed to 5 knots or less when piloting vessels in areas of known or suspected turtle activity.
Section 7 informal	NBG	Maintenance Dredging of Delta, Echo, Victor, and X-Ray Wharves	10-Mar-11										x	x																						Should a sheen be observed on the water surface, Absorbent pads will be used to remove the petroleum product prior to removing the silt containment structures.
Section 7 informal	NBG	Maintenance Dredging of Delta, Echo, Victor, and X-Ray Wharves	10-Mar-11										x	x																						Turbidity and siltation from project-related work will be minimized and contained through the appropriate use of effective silt containment devices and the curtailment of work during adverse tidal and weather conditions. Silt curtains will completely enclose dredging operations.
Section 7 informal	NBG	Maintenance Dredging of Delta, Echo, Victor, and X-Ray Wharves	10-Mar-11										x	x																						When piloting vessels, vessel operators shall alter course to remain at least 100 yards from whales, and at least 50 yards from other marine mammals and sea turtles.
Section 7 informal	NBG	Maintenance Dredging of Delta, Echo, Victor, and X-Ray Wharves	10-Mar-11										x	x																						Whenever possible fueling of project-related vehicles and equipment will take place at least 50 feet away from the water.
Section 7 informal	NBG	Maintenance Dredging of Delta, Echo, Victor, and X-Ray Wharves	10-Mar-11										x	x																						With the exception of dredging, all in-water work will be postponed or halted when protected species are within 50 feet of the proposed work, and will only begin/resume after the animals have voluntarily departed the area.
Section 7 informal	AAFB	Detonation of Two Unexploded Ordinances at Andersen Air Force Base	5/15/2011									x																								The existing ungulate exclosure fence around the last remaining mature *Serianthes nelsonii* on Guam will be reconstructed and regularly maintained. Half ofthe materials have been ordered.
Section 7 informal	AAFB	Detonation of Two Unexploded Ordinances at Andersen Air Force Base	5/15/2011									x																								The site will be monitored monthly for new saplings, non-native plant removal and fence maintenance. Data will be collected on seedling survival, insect damage, seed collection.
Section 7 informal	AAFB	Detonation of Two Unexploded Ordinances at Andersen Air Force Base	5/15/2011									x																								Any surviving saplings will be enclosed in protective, insect netting.
Section 7 informal	AAFB	Detonation of Two Unexploded Ordinances at Andersen Air Force Base	5/15/2011									x																								AAFB will continue to work with the Guam Plant Extinction Program to monitor the tree and seedlings.
Section 7 informal	AAFB	Detonation of Two Unexploded Ordinances at Andersen Air Force Base	5/15/2011									x																								AAFB will continue to coordinate with GNWR and the University of Guam to monitor and protect the Tarague saplings. University of Guam currently has a research permit.
Section 7 informal	AAFB	Detonation of Two Unexploded Ordinances at Andersen Air Force Base	5/15/2011									x																								AAFB will monitor the vegetation at the blast sites a minimum oftwice a year and remove all invasive species to encourage native limestone forest regeneration. Recovery will be documented and shared with the Service upon request.

Requirement	Location	Title	Project BO/BA/BE Date	Mariana fruit bat	Mariana swiftlet	Mariana common moorhen	Mariana crow	Micronesian kingfisher	Guam rail	Micronesian Megapode	Nightingale Reed-warbler	Serianthes nelsonii	Green sea turtle	Hawksbill sea turtle	Scalloped hammerhead	ESA Corals	EFH	Eugenia bryanii	Hedyotis megalantha	Heritiera longipetiolata	Phyllanthus saffordii	Psychotria malaspinae	Solanum guamense	Tinaspora homosepala	Bulbophyllum guamense	Cycas micronesica	Dendrobium guamense	Maesa walkeri	Nervilia jacksoniae	Tabernaemontana rotensis	Tuberolabium guamense	Mariana eight-spot butterfly	Guam tree snail	Humped tree snail	Fragile tree snail	Conservation Measure (One Per Row)
EFH	NBG	Maintenance Dredging of Romeo, Sierra, Tango, and Uniform Wharves	10-Jun-11														x																		A contingency plan to control petroleum products accidentally spilled during the project has been developed. Appropriate materials to contain and clean potential spills will be stored and readily available at the work site.
EFH	NBG	Maintenance Dredging of Romeo, Sierra, Tango, and Uniform Wharves	10-Jun-11														x																		A contingency plan will be in place for the removal and adequate securing of equipment in the event of approaching storms.
EFH	NBG	Maintenance Dredging of Romeo, Sierra, Tango, and Uniform Wharves	10-Jun-11														x																		A plan will be developed and implemented to prevent construction debris from entering or remaining in the marine environment during the project.
EFH	NBG	Maintenance Dredging of Romeo, Sierra, Tango, and Uniform Wharves	10-Jun-11														x																		All project-related materials and equipment placed in the water will be free of pollutants. The project manager and the heavy equipment operator will perform daily pre-work equipment inspections for cleanliness and leaks. All heavy equipment operations will be postponed or halted should a leak be detected, and will not proceed until the leak is repaired and equipment cleaned.
EFH	NBG	Maintenance Dredging of Romeo, Sierra, Tango, and Uniform Wharves	10-Jun-11														x																		Dredging will commence using a ramp-up technique at the start of each work day or following a break of more than 30 minutes. Dredging will commence with slow and deliberate deployment of the bucket to the bottom for the first several cycles to alert protected and other species and allow them an opportunity to vacate the area prior to full-intensity operations.
EFH	NBG	Maintenance Dredging of Romeo, Sierra, Tango, and Uniform Wharves	10-Jun-11														x																		No in-water work will be conducted during the peak coral spawning period. (This period covers July 15 through August 5 for hard corals during the 2011 calendar year, NMFS PIRO HCD Guam Field Office will be consulted for spawning dates beyond 2011 if needed.)
EFH	NBG	Maintenance Dredging of Romeo, Sierra, Tango, and Uniform Wharves	10-Jun-11														x																		Should a sheen be observed on the water surface, Absorbent pads will be used to remove the petroleum product prior to removing the silt containment structures.

Section 7 informal	NBG	Maintenance Dredging of Romeo, Sierra, Tango, and Uniform Wharves	30-Jun-11										x	x																						When piloting vessels, vessel operators shall alter course to remain at least 100 yards from whales, and at least 50 yards from other marine mammals and sea turtles.
Section 7 informal	NBG	Maintenance Dredging of Romeo, Sierra, Tango, and Uniform Wharves	30-Jun-11										x	x																						Whenever possible fueling of project-related vehicles and equipment will take place at least 50 feet away from the water.
Section 7 informal	NBG	Maintenance Dredging of Romeo, Sierra, Tango, and Uniform Wharves	30-Jun-11										x	x																						With the exception of dredging, all in-water work will be postponed or halted when protected species are within 50 feet of the proposed work, and will only begin/resume after the animals have voluntarily departed the area.
Section 7 formal	NBG	Sumay Cove Repair and Modernization	11-Aug-11										x	x																						A contingency plan will be in place for the removal and adequate securing of equipment in the event of approaching storms.
Section 7 formal	NBG	Sumay Cove Repair and Modernization	11-Aug-11										x	x																						A plan will be developed and implemented to prevent construction debris from entering or remaining in the marine environment during the project.
Section 7 formal	NBG	Sumay Cove Repair and Modernization	11-Aug-11										x	x																						All construction project-related materials and equipment placed in the water will be free of pollutants. The project manager and heavy equipment operators will perform daily pre-work equipment inspections for cleanliness and leaks. All heavy equipment operations will be postponed or halted should a leak be detected, and will not proceed until the leak is repaired and equipment cleaned. This information is written into the construction contract conditions.
Section 7 formal	NBG	Sumay Cove Repair and Modernization	11-Aug-11										x	x																						Biological observations will be made using binoculars during daylight hours. If pile-driving commences during daylight hours, pile driving may continue into nighttime hours provided there has been no interruption in activity (NMFS, 2007).
Section 7 formal	NBG	Sumay Cove Repair and Modernization	11-Aug-11										x	x																						Contractors are required to have and to implement a contingency plan to control and contain toxic spills, including petroleum products. Appropriate materials to contain and clean potential spills will be maintained and readily available at the work site.
Section 7 formal	NBG	Sumay Cove Repair and Modernization	11-Aug-11										x	x																						Contractors will be informed of ESA laws: no attempt should be made to feed, touch, ride or otherwise intentionally interact with any ESA-listed sea turtles.

Requirement	Location	Title	Project BO/BA/BE Date	Mariana fruit bat	Mariana swiftlet	Mariana common moorhen	Mariana crow	Micronesian kingfisher	Guam rail	Micronesian Megapode	Nightingale Reed-warbler	Serianthes nelsonii	Green sea turtle	Hawksbill sea turtle	Scalloped hammerhead	ESA Corals	EFH	Eugenia bryanii	Hedyotis megalantha	Heritiera longipetiolata	Phyllanthus saffordii	Psychotria malaspinae	Solanum guamense	Tinaspora homosepala	Bulbophyllum guamense	Cycas micronesica	Dendrobium guamense	Maesa walkeri	Nervilia jacksoniae	Tabernaemontana rotensis	Tuberolabium guamense	Mariana eight-spot butterfly	Guam tree snail	Humped tree snail	Fragile tree snail	Conservation Measure (One Per Row)
Section 7 formal	NBG	Sumay Cove Repair and Modernization	11-Aug-11										x	x																					Fueling of construction project-related vehicles and equipment will take place at least 50 feet away from the water, preferably over an impervious surface. With respect to construction equipment (barges), that cannot be fueled out of the water spill prevention booms will be employed to contain any potential spills. Any fuel spilled will be cleaned up immediately.
Section 7 formal	NBG	Sumay Cove Repair and Modernization	11-Aug-11										x	x																					If a sea turtle or other listed species is found injured within the vicinity of the action area, all in water piling driving construction activities shall cease immediately, regardless of their effect to the noted. The contractor will report to the Navy all incidents of known or possible project-related turtle injuries and any incidents of obvious behavioral disturbance. The Navy will continue to report any turtle stranding events to Shaun Wusstig, Guam Department of Agriculture Division of Aquatics and Wildlife Resources, coordinate on the identification of species, possible cause of physical harm, and disposition of remains if needed.
Section 7 formal	NBG	Sumay Cove Repair and Modernization	11-Aug-11										x	x																					If approached by a sea turtle within Apra Harbor, construction related vessel operators will put the engine in neutral and allow the animal to pass.
Section 7 formal	NBG	Sumay Cove Repair and Modernization	11-Aug-11										x	x																					No pile driving will be conducted after dark unless that work has proceeded uninterrupted since at least one hours prior to sunset, and no protected species have been observed near the perspective safety range for that work.
Section 7 formal	NBG	Sumay Cove Repair and Modernization	11-Aug-11										x	x																					Pile driving observers shall remain continuously alert for protected species starting 30 minutes prior to the commencement of work through 30 minutes after shut-down. This includes any break in operations expected to last an hour or less. Resumption of work following a break of an hour or more requires a 60 minute pre-work area search.
Section 7 formal	NBG	Sumay Cove Repair and Modernization	11-Aug-11										x	x																					Pile driving will commence work using soft-start or ramp-up techniques at the start of each work day or following a break of more than 30 minutes. Pile driving will employ a slow increase in hammering to alert species and allow them an opportunity to vacate the area prior to full-intensity operations.
Section 7 formal	NBG	Sumay Cove Repair and Modernization	11-Aug-11										x	x																					Preliminary shutdown safety zones corresponding to where sea turtles could be injured or harassed would be established at 50 yards from the construction work.
Section 7 formal	NBG	Sumay Cove Repair and Modernization	11-Aug-11										x	x																					Prior to the start of pile driving activity, the safety zone will be monitored for 60 minutes to ensure it is clear of sea turtles. Pile driving will not commence until the observers have declared the safety zone clear of sea turtles. If a sea turtle is found within the safety zone, pile driving of the segment will be delayed until either the animals have been visually confirmed beyond the impact zone or 30 minutes have passed without re-detection of the animal.
Section 7 formal	NBG	Sumay Cove Repair and Modernization	11-Aug-11										x	x																					Sea turtles should not be encircled or trapped between multiple vessels or between vessels and the shore.
Section 7 formal	NBG	Sumay Cove Repair and Modernization	11-Aug-11										x	x																					Should a sheen be observed on the water surface, Absorbent pads will be used to remove the petroleum product prior to removing the silt containment structures.
Section 7 formal	NBG	Sumay Cove Repair and Modernization	11-Aug-11										x	x																					SPLs will be monitored/recorded on the first day of pile driving activity to ensure that turtles are not present within the 50 yard safety zone. The contractor will record all turtle sightings that occur during the proposed project. Information collected will include: species, gender, relative size, and any recognizable individual characteristics if possible to discern; time, location and approximated distance from the observer to the turtle; turtle behavior; any impact the sighting had on work activities such as delays, shutdowns, and whether the turtle was at a sufficient distance that work continued. A report of all observations will be delivered to the Navy and to NOAA in a post-construction report within six weeks of project completion.

Requirement	Location	Title	Project BO/BA/BE Date	Mariana fruit bat	Mariana swiftlet	Mariana common moorhen	Mariana crow	Micronesian kingfisher	Guam rail	Micronesian Megapode	Nightingale Reed-warbler	Serianthes nelsonii	Green sea turtle	Hawksbill sea turtle	Scalloped hammerhead	ESA Corals	EFH	Eugenia bryanii	Hedyotis megalantha	Heritiera longipetiolata	Phyllanthus saffordii	Psychotria malaspinae	Solanum guamense	Tinaspora homosepala	Bulbophyllum guamense	Cycas micronesica	Dendrobium guamense	Maesa walkeri	Nervilia jacksoniae	Tabernaemontana rotensis	Tuberolabium guamense	Mariana eight-spot butterfly	Guam tree snail	Humped tree snail	Fragile tree snail	Conservation Measure (One Per Row)
Section 7 formal	NBG	Sumay Cove Repair and Modernization	11-Aug-11										x	x																					The contractor will record all turtle sightings that occur during the proposed project. Information collected will include: species, gender, relative size, and any recognizable individual characteristics if possible to discern; time, location and approximated distance from the observer to the turtle; turtle behavior; any impact the sighting had on work activities such as delays, shutdowns, and whether the turtle was at a sufficient distance that work continued. A report of all observations will be delivered to the Navy and to NOAA in a post-construction report within six weeks of project completion.
Section 7 formal	NBG	Sumay Cove Repair and Modernization	11-Aug-11										x	x																					The project manager shall designate competent observers to survey the marine areas adjacent to the proposed action for ESA-listed sea turtle species. A minimum of two observers will be posted at each pile driving site. Multiple teams may be required if pile driving is occurring at multiple locations at the same time. Observers will be posted along the sea walls and will focus on the majority of their attention on the area within 50-yard range with periodic scans beyond 50 yards to maintain situational awareness. If a turtle is seen in the water, the mandatory shutdown zone set at 50 yards. App project personnel will be tasked with reporting sea turtles if they are observed in the area.
Section 7 formal	NBG	Sumay Cove Repair and Modernization	11-Aug-11										x	x																					Turbidity and siltation from project-related work will be minimized and contained through the appropriate use of effective silt containment devices and the curtailment of work during adverse tidal and weather conditions. Silt curtains will completely enclose the operations.
Section 7 formal	NBG	Sumay Cove Repair and Modernization	11-Aug-11										x	x																					When piloting construction related vessels within Apra Harbor, construction related vessel operators shall alter course to remain at least 50 yards from sea turtles.
Section 7 formal	NBG	Sumay Cove Repair and Modernization	11-Aug-11										x	x																					Within Apra Harbor, reduce construction related vessel speed to 10 knots of less when piloting vessels in the proximity of sea turtles. If practicable, reduce construction related vessel speed to 5 knots or less when piloting vessels in areas of known of suspected sea turtle activity.
EFH	NBG	Sumay Cove Repair and Modernization	23-Aug-11														x																		A contingency plan will be in place for the removal and adequate securing of equipment in the event of approaching storms.
EFH	NBG	Sumay Cove Repair and Modernization	23-Aug-11														x																		A plan will be developed and implemented to prevent construction debris from entering or remaining in the marine environment during the project.
EFH	NBG	Sumay Cove Repair and Modernization	23-Aug-11														x																		All construction project-related materials and equipment placed in the water will be free of pollutants. The project manager and heavy equipment operators will perform daily pre-work equipment inspections for cleanliness and leaks. All heavy equipment operations will be postponed or halted should a leak be detected, and will not proceed until the leak is repaired and equipment cleaned. This information is written into the construction contract conditions.
EFH	NBG	Sumay Cove Repair and Modernization	23-Aug-11														x																		Contractor will cease any activities that result in sediment/pollutant discharges during July 15, 2011, through August 5, 2011, the primary coral spawning events each year for scleractinian corals. NMFS PIRO HCD Guam Field Office will be consulted for information on spawning dates for 2012 and 2013, if necessary.
EFH	NBG	Sumay Cove Repair and Modernization	23-Aug-11														x																		Contractors are required to have and to implement a contingency plan to control and contain toxic spills, including petroleum products. Appropriate materials to contain and clean potential spills will be maintained and readily available at the work site.
EFH	NBG	Sumay Cove Repair and Modernization	23-Aug-11														x																		Fueling of construction project-related vehicles and equipment will take place at least 50 feet away from the water, preferably over an impervious surface. With respect to construction equipment (barges), that cannot be fueled out of the water spill prevention booms will be employed to contain any potential spills. Any fuel spilled will be cleaned up immediately.

Section 7 informal	NBG	Increased Brown Treesnake Control at Mahlac Cave on Naval Base Guam, Munitions Site, Guam	7-Nov-11		x																														Efforts will be made to conduct activities outside the cave entrances as appropriate (i.e. preparation of equipment).
Section 7 informal	NBG	Increased Brown Treesnake Control at Mahlac Cave on Naval Base Guam, Munitions Site, Guam	7-Nov-11		x																														No smoking will occur at the project site.
Section 7 informal	NBG	Increased Brown Treesnake Control at Mahlac Cave on Naval Base Guam, Munitions Site, Guam	7-Nov-11		x																														The number of people inside the cave during installation and maintenance of BTS control devices will be limited to one. The number of people inside the cave during visual searches will be limited to two.
Section 7 informal	NBG	Increased Brown Treesnake Control at Mahlac Cave on Naval Base Guam, Munitions Site, Guam	7-Nov-11		x																														Upon arrival at the caves, personnel will sit quietly outside the cave for five minutes to minimize disturbance created during approach.
Section 7 informal	NBG	Increased Brown Treesnake Control at Mahlac Cave on Naval Base Guam, Munitions Site, Guam	7-Nov-11		x																														While inside the cave personnel will minimize movement and move cautiously.
Section 7 informal	AAFB	Electrical Upgrades at Tarague Beach, Andersen Air Force Base, Guam	17-Nov-11	x			x	x	x			x	x	x																					Each morning during the construction period, a qualified biologist will survey for bats within 150 meters (492 feet) of the site. If a bat is observed in the area, construction will not begin until the individual leaves the area of its own volition. This conservation measure is intended to reduce potential noise impacts to solitary roosting bats.
Section 7 informal	AAFB	Electrical Upgrades at Tarague Beach, Andersen Air Force Base, Guam	17-Nov-11	x			x	x	x			x	x	x																					All construction work will begin after sunrise, conclude prior to sunset, and occur between the hours of 0700 and 1730. No activities will occur at night.
Section 7 informal	AAFB	Electrical Upgrades at Tarague Beach, Andersen Air Force Base, Guam	17-Nov-11	x			x	x	x			x	x	x																					Adjacent habitat that is not to be impacted will be temporarily delineated by orange construction fencing or flagging tape to keep personnel and equipment from damaging the habitat. Signs will be posted indicating that no one is allowed past the boundary. All signs and temporary fencing will be removed from the site after project completion.
Section 7 informal	AAFB	Electrical Upgrades at Tarague Beach, Andersen Air Force Base, Guam	17-Nov-11	x			x	x	x			x	x	x																					No staging areas or access roads will be constructed. All vehicle parking will be restricted to previously determined areas or existing roads. No vehicles will be operated or allowed on the beach.
Section 7 informal	AAFB	Electrical Upgrades at Tarague Beach, Andersen Air Force Base, Guam	17-Nov-11	x			x	x	x			x	x	x																					No contamination (trash or debtis disposal. alien species introductions, etc.) of adjacent terrestrial environment will result from project-related activities.
Section 7 informal	AAFB	Electrical Upgrades at Tarague Beach, Andersen Air Force Base, Guam	17-Nov-11	x			x	x	x			x	x	x																					A litter control program will be implemented during construction. All trash will be bagged and disposed of offsite at the end of each day.
Section 7 informal	AAFB	Electrical Upgrades at Tarague Beach, Andersen Air Force Base, Guam	17-Nov-11	x			x	x	x			x	x	x																					All tools, gear, and construction scrap generated from this project will be removed upon completion of work to prevent the attraction of invasive pests.
Section 7 informal	AAFB	Electrical Upgrades at Tarague Beach, Andersen Air Force Base, Guam	17-Nov-11	x			x	x	x			x	x	x																					The applicant will develop and implement an Environmental Protection Plan addressing erosion control and measures to avoid contamination of adjacent aquatic habitats. The Service will be provided a copy of this plan once it is complete.
Section 7 informal	AAFB	Electrical Upgrades at Tarague Beach, Andersen Air Force Base, Guam	17-Nov-11	x			x	x	x			x	x	x																					One week prior to and again immediately before construction, trained personnel from either AAFB or DAWR will conduct a thorough survey of the beach for the presence of sea turtles or nesting activity within 100 meters (492 feet) of the project site. If a recent nest is identified, construction will be delayed until the hatchlings have vacated the nest.
EFH	NBG	Victor Wharf and Sierra Wharf Repairs	28-Nov-11														x																			A plan will be developed and implemented to prevent construction debris from entering or remaining in the marine environment during the project.

Requirement	Location	Title	Project BO/BA/BE Date	Mariana fruit bat	Mariana swiftlet	Mariana common moorhen	Mariana crow	Micronesian kingfisher	Guam rail	Micronesian Megapode	Nightingale Reed-warbler	Serianthes nelsonii	Green sea turtle	Hawksbill sea turtle	Scalloped hammerhead	ESA Corals	EFH	Eugenia bryanii	Hedyotis megalantha	Heritiera longipetiolata	Phyllanthus saffordii	Psychotria malaspinae	Solanum guamense	Tinaspora homosepala	Bulbophyllum guamense	Cycas micronesica	Dendrobium guamense	Maesa walkeri	Nervilia jacksoniae	Tabernaemontana rotensis	Tuberolabium guamense	Mariana eight-spot butterfly	Guam tree snail	Humped tree snail	Fragile tree snail	Conservation Measure (One Per Row)
Section 7 informal	NBG	Victor Wharf and Sierra Wharf Repairs	28-Nov-11										x	x																						A plan will be developed and implemented to prevent construction debris from entering or remaining in the marine environment during the project.
Section 7 informal	NBG	Victor Wharf and Sierra Wharf Repairs	28-Nov-11										x	x																						All in-water work will be postponed or halted when protected species are within 50 feet of the proposed work, and will only begin/resume after the animals have voluntarily departed the area.
Section 7 informal	NBG	Victor Wharf and Sierra Wharf Repairs	28-Nov-11										x	x																						All in-water work will cease if sea turtles enter within 50 yards of the work area.
Section 7 informal	NBG	Victor Wharf and Sierra Wharf Repairs	28-Nov-11										x	x																						All project-related materials and equipment placed in the water will be free of pollutants. The project manager will perform daily pre-work equipment inspections for cleanliness and leaks. All heavy equipment operations will be postponed or halted should a leak be detected, and will not proceed until the leak is repaired and equipment cleaned.
EFH	NBG	Victor Wharf and Sierra Wharf Repairs	28-Nov-11														x																			All project-related materials and equipment placed in the water will be free of pollutants. The project manager will perform daily pre-work equipment inspections for cleanliness and leaks. All heavy equipment operations will be postponed or halted should a leak be detected, and will not proceed until the leak is repaired and equipment cleaned.
EFH	NBG	Victor Wharf and Sierra Wharf Repairs	28-Nov-11														x																			Appropriate materials to contain and clean potential spills will be stored and readily available at the work site.
Section 7 informal	NBG	Victor Wharf and Sierra Wharf Repairs	28-Nov-11										x	x																						Appropriate materials to contain and clean potential spills will be stored and readily available at the work site.
Section 7 informal	NBG	Victor Wharf and Sierra Wharf Repairs	28-Nov-11										x	x																						Competent observers will be designated to visually survey the marine areas adjacent to the proposed action for protected species.
EFH	NBG	Victor Wharf and Sierra Wharf Repairs	28-Nov-11														x																			Containment/catchment devices will be used to prevent concrete chips and debris from dispersing into the water during repair work on the wharves.
Section 7 informal	NBG	Victor Wharf and Sierra Wharf Repairs	28-Nov-11										x	x																						No in-water work will be conducted after dark unless that work has proceeded uninterrupted since at least 1 hour prior to sunset, and no protected species have been observed near the 50-yard safety range for that work.
Section 7 informal	NBG	Victor Wharf and Sierra Wharf Repairs	28-Nov-11										x	x																						No marine mammals or sea turtles may be within 50 yards of dredging operations. All in-water activities will be postponed or halted until the animals have voluntarily moved beyond 50 yards.
Section 7 informal	NBG	Victor Wharf and Sierra Wharf Repairs	28-Nov-11										x	x																						No one on site or associated with this project will attempt to feed, touch, ride, or otherwise intentionally interact with any protected species.
EFH	NBG	Victor Wharf and Sierra Wharf Repairs	28-Nov-11														x																			Should a sheen be observed on the water surface, absorbent pads will be used to remove the petroleum product prior to removing the silt containment structures.
Section 7 informal	NBG	Victor Wharf and Sierra Wharf Repairs	28-Nov-11										x	x																						Should a sheen be observed on the water surface, absorbent pads will be used to remove the petroleum product prior to removing the silt containment structures.
EFH	NBG	Victor Wharf and Sierra Wharf Repairs	28-Nov-11														x																			Whenever possible fueling of project-related vehicles and equipment will take place at least 50 feet away from the water.
Section 7 informal	NBG	Victor Wharf and Sierra Wharf Repairs	28-Nov-11										x	x																						Whenever possible fueling of project-related vehicles and equipment will take place at least 50 feet away from the water.
Section 7 informal	NBG	Erosion Repairs Along San Luis, Naval Base Guam	10-Apr-12										x	x																						A contingency plan to control petroleum products accidentally spilled during the project has been developed. Appropriate materials to contain and clean potential spills will be stored and readily available at the work site.
Section 7 informal	NBG	Erosion Repairs Along San Luis, Naval Base Guam	10-Apr-12										x	x																						A contingency plan will be in place for the removal and adequate securing of equipment in the event of approaching storms.
Section 7 informal	NBG	Erosion Repairs Along San Luis, Naval Base Guam	10-Apr-12										x	x																						A plan will be developed and implemented to prevent construction debris from entering or remaining in the marine environment during the project.
Section 7 informal	NBG	Erosion Repairs Along San Luis, Naval Base Guam	10-Apr-12										x	x																						All in-water work will be postponed or halted when protected species are within 50 yards of the proposed work, and will only begin/resume after the animals have voluntarily departed the area.

Requirement	Location	Title	Project BO/BA/BE Date	Mariana fruit bat	Mariana swiftlet	Mariana common moorhen	Mariana crow	Micronesian kingfisher	Guam rail	Micronesian Megapode	Nightingale Reed-warbler	Serianthes nelsonii	Green sea turtle	Hawksbill sea turtle	Scalloped hammerhead	ESA Corals	EFH	Eugenia bryanii	Hedyotis megalantha	Heritiera longipetiolata	Phyllanthus saffordii	Psychotria malaspinae	Solanum guamense	Tinaspora homosepala	Bulbophyllum guamense	Cycas micronesica	Dendrobium guamense	Maesa walkeri	Nervilia jacksoniae	Tabernaemontana rotensis	Tuberolabium guamense	Mariana eight-spot butterfly	Guam tree snail	Humped tree snail	Fragile tree snail	Conservation Measure (One Per Row)
Section 7 informal	NBG	Erosion Repairs Along San Luis, Naval Base Guam	10-Apr-12										x	x																						All objects will be lowered to the bottom in a controlled manner with the use of equipment that effect positive control over the rate of decent.
Section 7 informal	NBG	Erosion Repairs Along San Luis, Naval Base Guam	10-Apr-12										x	x																						All project-related materials and equipment placed in the water will be free of pollutants. The project manager and the heavy equipment operator will perform daily pre-work equipment inspections for cleanliness and leaks. All heavy equipment operations will be postponed or halted should a leak be detected, and will not proceed until the leak is repaired and equipment cleaned.
Section 7 informal	NBG	Erosion Repairs Along San Luis, Naval Base Guam	10-Apr-12										x	x																						All work will cease if sea turtles enter within 50 yards of the work area.
Section 7 informal	NBG	Erosion Repairs Along San Luis, Naval Base Guam	10-Apr-12										x	x																						Competent observers will be designated to visually survey the marine areas adjacent to the proposed action for protected species.
Section 7 informal	NBG	Erosion Repairs Along San Luis, Naval Base Guam	10-Apr-12										x	x																						If a vessel is approached by a marine mammal or turtle, the engine will be put in neutral and the animal allowed to pass.
Section 7 informal	NBG	Erosion Repairs Along San Luis, Naval Base Guam	10-Apr-12										x	x																						Marine mammals and sea turtles will not be encircled or trapped between multiple vessels or between vessels and the shore.
Section 7 informal	NBG	Erosion Repairs Along San Luis, Naval Base Guam	10-Apr-12										x	x																						No in-water will be conducted after dark unless that work has proceeded uninterrupted since at least 1 hour prior to sunset, and no protected species have been observed near the 50-yard safety range for that work.
Section 7 informal	NBG	Erosion Repairs Along San Luis, Naval Base Guam	10-Apr-12										x	x																						No marine mammals or sea turtles may be within 50 yards of in-water operations. All in-water activities will be postponed or halted until the animals have voluntarily moved beyond 50 yards.
Section 7 informal	NBG	Erosion Repairs Along San Luis, Naval Base Guam	10-Apr-12										x	x																						No one on site or associated with this project will attempt to feed, touch, ride, or otherwise intentionally interact with any protected species.
Section 7 informal	NBG	Erosion Repairs Along San Luis, Naval Base Guam	10-Apr-12										x	x																						Reduce vessel speed to 5 knots or less when piloting vessels in the proximity of sea turtles. If practicable, reduce vessel speed to 5 knots or less when piloting vessels in areas of known or suspected turtle activity.
Section 7 informal	NBG	Erosion Repairs Along San Luis, Naval Base Guam	10-Apr-12										x	x																						Should a sheen be observed on the water surface, absorbent pads will be used to remove the petroleum product prior to removing the silt containment structures.
Section 7 informal	NBG	Erosion Repairs Along San Luis, Naval Base Guam	10-Apr-12										x	x																						Special attention will be given to verify that no sea turtles are in the area where equipment, anchors, or materials are expected to contact the substrate before that equipment may enter the water.
Section 7 informal	NBG	Erosion Repairs Along San Luis, Naval Base Guam	10-Apr-12										x	x																						Turbidity and siltation from project-related work will be minimized and contained through the appropriate use of effective silt containment devices and the curtailment of work during adverse tidal and weather conditions. Silt curtains will completely enclose in-water operations.
Section 7 informal	NBG	Erosion Repairs Along San Luis, Naval Base Guam	10-Apr-12										x	x																						When piloting vessels, vessel operators shall alter course to remain at least 100 yards from whales, and at least 50 yards from other marine mammals and sea turtles.
Section 7 informal	NBG	Erosion Repairs Along San Luis, Naval Base Guam	10-Apr-12										x	x																						Whenever possible fueling of project-related vehicles and equipment will take place at least 50 feet away from the water.
Section 7 informal	AAFB	Consultation Regarding the Proposed Short-Range Approach Lighting System for Runway 06L and Vegetation Clearing in the Runway Clear Zone, Andersen Air Force Base	15-May-12				x	x	x																											All construction work will begin after sunrise and will conclude prior to sunset (between 0700 and 1730 hours). No activities will occur at night.
Section 7 informal	AAFB	Consultation Regarding the Proposed Short-Range Approach Lighting System for Runway 06L and Vegetation Clearing in the Runway Clear Zone, Andersen Air Force Base	15-May-12				x	x	x																											Adjacent habitat that will not be impacted will be temporarily delineated by orange construction fencing or flagging tape to keep personnel and equipment from damaging the habitat. Signs will be posted indicating that no one is allowed past the boundary. All signs and temporary fencing will be removed from the site after project completion.
Section 7 informal	AAFB	Consultation Regarding the Proposed Short-Range Approach Lighting System for Runway 06L and Vegetation Clearing in the Runway Clear Zone, Andersen Air Force Base	15-May-12				x	x	x																											No staging areas or access roads will be constructed. Existing roads and disturbed areas will be used for staging and access.

Requirement	Location	Title	Project BO/BA/BE Date	Mariana fruit bat	Mariana swiftlet	Mariana common moorhen	Mariana crow	Micronesian kingfisher	Guam rail	Micronesian Megapode	Nightingale Reed-warbler	Serianthes nelsonii	Green sea turtle	Hawksbill sea turtle	Scalloped hammerhead	ESA Corals	EFH	Eugenia bryanii	Hedyotis megalantha	Heritiera longipetiolata	Phyllanthus saffordii	Psychotria malaspinae	Solanum guamense	Tinaspora homosepala	Bulbophyllum guamense	Cycas micronesica	Dendrobium guamense	Maesa walkeri	Nervilia jacksoniae	Tabernaemontana rotensis	Tuberolabium guamense	Mariana eight-spot butterfly	Guam tree snail	Humped tree snail	Fragile tree snail	Conservation Measure (One Per Row)
Section 7 informal	AAFB	Consultation Regarding the Proposed Short-Range Approach Lighting System for Runway 06L and Vegetation Clearing in the Runway Clear Zone, Andersen Air Force Base	15-May-12				x	x	x																											A litter control program shall be instituted at the entire project site. All workers will ensure their food scraps, paper wrappers, food containers, cans, bottles, and other trash from the project area are deposited in covered or closed trash containers. The trash containers shall be removed from the project area at the end of each working day.
Section 7 informal	AAFB	Consultation Regarding the Proposed Short-Range Approach Lighting System for Runway 06L and Vegetation Clearing in the Runway Clear Zone, Andersen Air Force Base	15-May-12				x	x	x																											All construction scrap, debris, tools and leftover materials will be cleaned from the site upon project completion to prevent the attraction of invasive pests.
Section 7 informal	AAFB	Consultation Regarding the Proposed Short-Range Approach Lighting System for Runway 06L and Vegetation Clearing in the Runway Clear Zone, Andersen Air Force Base	15-May-12				x	x	x																											Prior to vegetation clearing, an approved biologist will survey for Mariana fruit bats or Mariana crows within 300 meters of the site to verify their presence/absence. If a bat or crow is observed in the area clearing will not begin until the individual leaves the area of their own volition.
Section 7 informal	AAFB	Installation of an Ungulate Exclosure Fence at Ritidian Point	7/3/2012	x			x	x	x			x																								To avoid the removal of high value tree species, final placement of the fence will be flagged by Environmental Flight staff prior to construction.
Section 7 informal	AAFB	Installation of an Ungulate Exclosure Fence at Ritidian Point	7/3/2012	x			x	x	x			x																								There is a potential for Mariana fruit bats to be present in the project area. One week prior to project execution. the proposed project site and adjacent areas will be surveyed by a qualified biologist to determine if bats arc present. If bats are observed within 492 feet (150 meters) of the project site. All activities will be delayed until the animal(s) have left the area of their own volition.
Section 7 informal	AAFB	Installation of an Ungulate Exclosure Fence at Ritidian Point	7/3/2012	x			x	x	x			x																								Herbicide will be used and applied according to AAFB standards for pesticide use.
Section 7 informal	AAFB	Installation of an Ungulate Exclosure Fence at Ritidian Point	7/3/2012	x			x	x	x			x																								A litter control program will be instituted by the contractor at the project site and enforced by Environmental Flight staff.
Section 7 informal	AAFB	Installation of an Ungulate Exclosure Fence at Ritidian Point	7/3/2012	x			x	x	x			x																								All construction scrap, debris, tools, and leftover materials will be cleaned from the site upon project completion.
Section 7 informal	AAFB	Installation of an Ungulate Exclosure Fence at Ritidian Point	7/3/2012	x			x	x	x			x																								Adjacent forested areas that are not impacted will be temporarily delineated to prevent personnel and equipment from damaging important wildlife habitat. Signs will be posted indicating that no one is allowed past that boundary. All signs will be removed from the site after completion of the project.
Section 7 informal	AAFB	Installation of an Ungulate Exclosure Fence at Ritidian Point	7/3/2012	x			x	x	x			x																								Before start of construction, all project personnel will be briefed by the Environmental flight staff regarding the presence of listed species and the importance of avoiding impacts to these species and their habitat.
Section 7 informal	NBG	Repair of Glass Breakwater North, Naval Base Guam	27-Dec-12										x	x																						A contingency plan to control petroleum products accidentally spilled during the project has been developed. Appropriate materials to contain and clean potential spills will be stored and readily available at the work site.
Section 7 informal	NBG	Repair of Glass Breakwater North, Naval Base Guam	27-Dec-12										x	x																						A contingency plan will be in place for the removal and adequate securing of equipment in the event of approaching storms.
Section 7 informal	NBG	Repair of Glass Breakwater North, Naval Base Guam	27-Dec-12										x	x																						All in-water work will be postponed or halted when protected species are within 50 yards of the proposed work, and will only begin/resume after the animals have voluntarily departed the area.
Section 7 informal	NBG	Repair of Glass Breakwater North, Naval Base Guam	27-Dec-12										x	x																						All project-related materials and equipment placed in the water will be free of pollutants. The project manager and the heavy equipment operator will perform daily pre-work equipment inspections for cleanliness and leaks. All heavy equipment operations will be postponed or halted should a leak be detected, and will not proceed until the leak is repaired and equipment cleaned.
Section 7 informal	NBG	Repair of Glass Breakwater North, Naval Base Guam	27-Dec-12										x	x																						All work will cease if sea turtles enter within 50 yards of the work area.
Section 7 informal	NBG	Repair of Glass Breakwater North, Naval Base Guam	27-Dec-12										x	x																						Competent observers will be designated to visually survey the marine areas adjacent to the proposed action for protected species.
Section 7 informal	NBG	Repair of Glass Breakwater North, Naval Base Guam	27-Dec-12										x	x																						Construction debris will be prevented from entering or remaining in the marine environment during the project.

Section 7 informal	NBG	Re-Initiation of Informal Section 7 for Increased Brown Treesnake Control at Mahlac Cave on Naval Base Guam, Munitions Site, Guam	4-Apr-13		x																															Efforts will be made to conduct activities outside the cave entrances as appropriate (i.e. preparation of equipment).
Section 7 informal	NBG	Re-Initiation of Informal Section 7 for Increased Brown Treesnake Control at Mahlac Cave on Naval Base Guam, Munitions Site, Guam	4-Apr-13		x																															Observers will use night vision and headlamps with red lenses.
Section 7 informal	NBG	Re-Initiation of Informal Section 7 for Increased Brown Treesnake Control at Mahlac Cave on Naval Base Guam, Munitions Site, Guam	4-Apr-13		x																															The Navy will take the same measures identified in the initial consultation to minimize disturbance to swiftlets.
Section 7 informal	NBG	Re-Initiation of Informal Section 7 for Increased Brown Treesnake Control at Mahlac Cave on Naval Base Guam, Munitions Site, Guam	4-Apr-13		x																															The number of people inside the cave during visual searches will be limited to two.
Section 7 informal	NBG	Re-Initiation of Informal Section 7 for Increased Brown Treesnake Control at Mahlac Cave on Naval Base Guam, Munitions Site, Guam	4-Apr-13		x																															While inside the cave personnel will minimize movement and move cautiously.
Section 7 informal	NBG	Vegetation Removal at Spanish Steps, Naval Base Guam	15-Apr-13																																	All work will cease if sea turtles (adults or hatchlings) are observed within the project site.
Section 7 informal	NBG	Vegetation Removal at Spanish Steps, Naval Base Guam	15-Apr-13																																	Competent observers will be designated to visually survey the project site for sea turtle nesting activity prior to commencement of work each day.
Section 7 informal	NBG	Vegetation Removal at Spanish Steps, Naval Base Guam	15-Apr-13										x	x																						Debris, materials, and trash will be prevented from remaining on the beach or entering the marine environment during the project.
Section 7 informal	NBG	Vegetation Removal at Spanish Steps, Naval Base Guam	15-Apr-13																																	No artificial lighting will be used and no work will be conducted after dark.
Section 7 informal	NBG	Vegetation Removal at Spanish Steps, Naval Base Guam	15-Apr-13										x	x																						No ground work will occur within 3 meters of sea turtle nests or body pits.
Section 7 informal	NBG	Vegetation Removal at Spanish Steps, Naval Base Guam	15-Apr-13										x	x																						No one on site or associated with this project will attempt to touch or otherwise intentionally interact with any protected species (including sea turtle nests).
Section 7 informal	NBG	Vegetation Removal at Spanish Steps, Naval Base Guam	15-Apr-13										x	x																						Removal of vegetation will occur between 1 July and 28 February, outside of peak nesting season (1 March – 30 June).
Section 7 informal	NBG	Construction of Radome Antennas, Naval Base Guam Telecommunications Site	20-Jun-13	x																																A litter control program will be implemented at the project site. Construction debris and trash will be prevented from entering or remaining on site or in adjacent areas to the project site.

Requirement	Location	Title	Project BO/BA/BE Date	Mariana fruit bat	Mariana swiftlet	Mariana common moorhen	Mariana crow	Micronesian kingfisher	Guam rail	Micronesian Megapode	Nightingale Reed-warbler	Serianthes nelsonii	Green sea turtle	Hawksbill sea turtle	Scalloped hammerhead	ESA Corals	EFH	Eugenia bryanii	Hedyotis megalantha	Heritiera longipetiolata	Phyllanthus saffordii	Psychotria malaspinae	Solanum guamense	Tinaspora homosepala	Bulbophyllum guamense	Cycas micronesica	Dendrobium guamense	Maesa walkeri	Nervilia jacksoniae	Tabernaemontana rotensis	Tuberolabium guamense	Mariana eight-spot butterfly	Guam tree snail	Humped tree snail	Fragile tree snail	Conservation Measure (One Per Row)
Section 7 informal	NBG	Construction of Radome Antennas, Naval Base Guam Telecommunications Site	20-Jun-13	x																																Adjacent forested areas that are not impacted from the proposed action will be temporarily delineated by orange construction fencing or flagging tape to keep personnel and equipment from damaging the habitat. All flagging and temporary fencing will be removed from the site after project completion.
Section 7 informal	NBG	Construction of Radome Antennas, Naval Base Guam Telecommunications Site	20-Jun-13	x																																All construction work will begin after dawn and will end prior to dusk; no activities will occur at night.
Section 7 informal	NBG	Construction of Radome Antennas, Naval Base Guam Telecommunications Site	20-Jun-13	x																																All equipment, materials, debris, and vegetation clippings will be removed upon completion of work.
Section 7 informal	NBG	Construction of Radome Antennas, Naval Base Guam Telecommunications Site	20-Jun-13	x																																All on-site personnel will receive instruction regarding ESA-listed species and what to do in case of sightings.
Section 7 informal	NBG	Construction of Radome Antennas, Naval Base Guam Telecommunications Site	20-Jun-13	x																																No new staging areas or access roads will be constructed. Existing roads and disturbed areas will be used.
Section 7 informal	NBG	Construction of Radome Antennas, Naval Base Guam Telecommunications Site	20-Jun-13	x																																The presence of any ESA-listed species will be reported to the Service and Guam Division of Aquatic and Wildlife Resources within 48 hours, but the location of species will not be revealed to any other outside party.
Section 7 informal	NBG	Construction of Radome Antennas, Naval Base Guam Telecommunications Site	20-Jun-13	x																																To avoid impacts to roosting bats, a qualified biologist will survey the project site and areas within 150 meters of the site to determine if Mariana fruit bats are in the area. This survey will be completed one week prior to clearing vegetation at a site.
Section 7 informal	NBG	Construction of Radome Antennas, Naval Base Guam Telecommunications Site	20-Jun-13	x																																Work will be postponed or halted if Mariana fruit bats are observed within 150 meters of the project site and will only begin/resume after the bat(s) have voluntarily departed the area.
Section 7 formal	NBG	X-Ray Wharf Improvements, Naval Base Guam	16-Aug-13										x	x																						A contingency plan to control and contain toxic spills, including petroleum products, will be developed. Appropriate materials to contain and clean potential spills will be stored and readily available at the work site.
EFH	NBG	X-Ray Wharf Improvements, Naval Base Guam	16-Aug-13														x																			A contingency plan to control and contain toxic spills, including petroleum products, will be developed. Appropriate materials to contain and clean potential spills will be stored and readily available at the work site.
Section 7 formal	NBG	X-Ray Wharf Improvements, Naval Base Guam	16-Aug-13										x	x																						A contingency plan will be in place for the removal and adequate securing of equipment in the event of approaching storms.
EFH	NBG	X-Ray Wharf Improvements, Naval Base Guam	16-Aug-13														x																			A contingency plan will be in place for the removal and adequate securing of equipment in the event of approaching storms.
Section 7 formal	NBG	X-Ray Wharf Improvements, Naval Base Guam	16-Aug-13										x	x																						A plan will be developed and implemented to prevent construction debris from entering or remaining in the marine environment during the project.
EFH	NBG	X-Ray Wharf Improvements, Naval Base Guam	16-Aug-13														x																			A plan will be developed and implemented to prevent construction debris from entering or remaining in the marine environment during the project.
Section 7 formal	NBG	X-Ray Wharf Improvements, Naval Base Guam	16-Aug-13										x	x																						All project-related materials and equipment placed in the water will be free of pollutants. The project manager and the heavy equipment operator will perform daily pre-work equipment inspections for cleanliness and leaks. All heavy equipment operations will be postponed or halted should a leak be detected, and will not proceed until the leak is repaired and equipment cleaned.
EFH	NBG	X-Ray Wharf Improvements, Naval Base Guam	16-Aug-13														x																			All project-related materials and equipment placed in the water will be free of pollutants. Section 7 formal	NBG	X-Ray Wharf Improvements, Naval Base Guam	16-Aug-13										x	x																						Competent observers will be designated to visually survey the marine areas within and adjacent to the project footprint for protected species.
Section 7 formal	NBG	X-Ray Wharf Improvements, Naval Base Guam	16-Aug-13										x	x																						Construction activities that result in sediment/pollutant discharges (dredging and pile driving) will cease during the primary coral spawning events each year for scleractinian corals. NMFS PIRO HCD Guam Field Office will be consulted for information on spawning dates.

Requirement	Location	Title	Project BO/BA/BE Date	Mariana fruit bat	Mariana swiftlet	Mariana common moorhen	Mariana crow	Micronesian kingfisher	Guam rail	Micronesian Megapode	Nightingale Reed-warbler	Serianthes nelsonii	Green sea turtle	Hawksbill sea turtle	Scalloped hammerhead	ESA Corals	EFH	Eugenia bryanii	Hedyotis megalantha	Heritiera longipetiolata	Phyllanthus saffordii	Psychotria malaspinae	Solanum guamense	Tinaspora homosepala	Bulbophyllum guamense	Cycas micronesica	Dendrobium guamense	Maesa walkeri	Nervilia jacksoniae	Tabernaemontana rotensis	Tuberolabium guamense	Mariana eight-spot butterfly	Guam tree snail	Humped tree snail	Fragile tree snail	Conservation Measure (One Per Row)
EFH	NBG	X-Ray Wharf Improvements, Naval Base Guam	16-Aug-13														x																			Construction activities that result in sediment/pollutant discharges (dredging and pile driving) will cease during the primary coral spawning events each year for scleractinian corals. NMFS PIRO HCD Guam Field Office will be consulted for information on spawning dates.
Section 7 formal	NBG	X-Ray Wharf Improvements, Naval Base Guam	16-Aug-13										x	x																						Construction related vessels will be operated at 10 knots or less in areas of known or suspected turtle activity. If practicable, speed of construction related vessel will be reduced to 5 knots or less.
Section 7 formal	NBG	X-Ray Wharf Improvements, Naval Base Guam	16-Aug-13										x	x																						Fueling of construction project related vehicles and equipment will take place at least 50 feet away from the water, preferably over an impervious surface. With respect to construction equipment (e.g., dredging barges) that cannot be fueled out of the water, spill prevention booms will be employed to contain any potential spills. Any fuel spilled will be cleaned up immediately.
EFH	NBG	X-Ray Wharf Improvements, Naval Base Guam	16-Aug-13														x																			Fueling of construction project-related vehicles and equipment will take place at least 50 feet away from the water, preferably over an impervious surface. With respect to construction equipment (e.g., dredging barges) that cannot be fueled out of the water, spill prevention booms will be employed to contain any potential spills. Any fuel spilled will be cleaned up immediately.
Section 7 formal	NBG	X-Ray Wharf Improvements, Naval Base Guam	16-Aug-13										x	x																						If approached by a sea turtle within Apra Harbor, construction related vessel operators will put the engine in neutral and allow the animal to pass.
Section 7 formal	NBG	X-Ray Wharf Improvements, Naval Base Guam	16-Aug-13										x	x																						No marine mammals or sea turtles may be within 50 yards of pile driving and dredging operations. All pile driving and dredging will be postponed or halted until the animals have voluntarily moved beyond 50 yards.
Section 7 formal	NBG	X-Ray Wharf Improvements, Naval Base Guam	16-Aug-13										x	x																						No one on site or associated with this project will attempt to feed, touch, ride, or otherwise intentionally interact with any protected species.
Section 7 formal	NBG	X-Ray Wharf Improvements, Naval Base Guam	16-Aug-13										x	x																						No pile driving or dredging will be conducted after dark unless that work has proceeded uninterrupted since at least 1 hour prior to sunset, and no protected species have been observed near the 50-yard safety range for that work.
Section 7 formal	NBG	X-Ray Wharf Improvements, Naval Base Guam	16-Aug-13										x	x																						Pile driving and dredging will commence using a ramp-up technique at the start of each work day or following a break of more than 30 minutes or longer. Pile driving will employ a slow increase in hammering, whereas dredging will commence with slow and deliberate deployment of the bucket or chisel to the bottom for the first several cycles to alert protected species and allow them an opportunity to vacate the area prior to full-intensity operations.
EFH	NBG	X-Ray Wharf Improvements, Naval Base Guam	16-Aug-13														x																			Pile driving will commence work using soft-start or ramp-up techniques at the start of each work day or following a break of more than 30 minutes. Pile driving will employ a slow increase in hammering to alert marine species and allow them an opportunity to vacate the area prior to full-intensity operations.
Section 7 formal	NBG	X-Ray Wharf Improvements, Naval Base Guam	16-Aug-13										x	x																						Project related vessel operators to maintain constant vigilance for, and avoid all marine mammals and sea turtles while piloting their vessels. This must include the tug and scow operators that would transit between the inner harbor and the ODMDS.
Section 7 formal	NBG	X-Ray Wharf Improvements, Naval Base Guam	16-Aug-13										x	x																						Sea turtles should not be encircled or trapped between multiple vessels or between vessels and the shore.
Section 7 formal	NBG	X-Ray Wharf Improvements, Naval Base Guam	16-Aug-13										x	x																						Transportation of dredged material to G-ODMDS will only occur when weather and sea state conditions will not interfere with safe transportation and will not create risk or spillage, leak, or other loss of dredged material in transit. No disposal vessel trips will be initiated when the National Weather Service has issued a gale warning for local waters during the time period necessary to complete dumping operations.

Requirement	Location	Title	Project BO/BA/BE Date	Mariana fruit bat	Mariana swiftlet	Mariana common moorhen	Mariana crow	Micronesian kingfisher	Guam rail	Micronesian Megapode	Nightingale Reed-warbler	Serianthes nelsonii	Green sea turtle	Hawksbill sea turtle	Scalloped hammerhead	ESA Corals	EFH	Eugenia bryanii	Hedyotis megalantha	Heritiera longipetiolata	Phyllanthus saffordii	Psychotria malaspinae	Solanum guamense	Tinaspora homosepala	Bulbophyllum guamense	Cycas micronesica	Dendrobium guamense	Maesa walkeri	Nervilia jacksoniae	Tabernaemontana rotensis	Tuberolabium guamense	Mariana eight-spot butterfly	Guam tree snail	Humped tree snail	Fragile tree snail	Conservation Measure (One Per Row)

Section 7 formal	NBG	X-Ray Wharf Improvements, Naval Base Guam	16-Aug-13										x	x																						Turbidity and siltation from project related work will be minimized and contained through the appropriate use of effective silt containment devices and the curtailment of work during adverse tidal and weather conditions. Silt curtains will completely enclose dredging and pile driving operations to the maximum extent practicable.
EFH	NBG	X-Ray Wharf Improvements, Naval Base Guam	16-Aug-13														x																			Turbidity and siltation from project related work will be minimized and contained through the appropriate use of effective silt containment devices and the curtailment of work during adverse tidal and weather conditions. Silt curtains will completely enclose dredging and pile driving operations to the maximum extent practicable.
Section 7 formal	NBG	X-Ray Wharf Improvements, Naval Base Guam	16-Aug-13										x	x																						When piloting vessels, vessel operators shall alter course to remain at least 100 yards from whales, and at least 50 yards from other marine mammals and sea turtles. When dumping the scow at the ODMDS, a 100 yard standoff for all protected marine species will be maintained.
Section 7 formal	NBG	X-Ray Wharf Improvements, Naval Base Guam	16-Aug-13										x	x																						With the exception of pile driving and dredging, all in-water work will be postponed or halted when protected species are within 50 feet of the proposed work, and will only begin/resume after the animals have voluntarily departed the area.
Section 7 formal	NBG	X-Ray Wharf Improvements, Naval Base Guam	16-Aug-13										x	x																						With the exception of pile driving and dredging, observers will visually survey the project area each day beginning 30 minutes prior to the start of work, and repeated frequently throughout the day.
Section 7 formal	NBG	X-Ray Wharf Improvements, Naval Base Guam	9-Jan-14										x	x																						
Section 7 informal	NBG	Vegetation Removal at Fena Reservoir, Naval Base Guam	3-Apr-14	x	x	x																														A litter control program will be implemented at the project site. Construction debris and trash will be prevented from entering or remaining on site or in adjacent areas to the project site.
Section 7 informal	NBG	Vegetation Removal at Fena Reservoir, Naval Base Guam	3-Apr-14	x	x	x																														A qualified biologist will conduct a survey of the project site to determine if ESA-listed species are in the area. This survey will be completed one week prior to cutting and removal of vegetation at the site. Any observations of ESA-listed species, including nests, will be reported to the Service prior to construction activity. A qualified biologist will continue to survey the site at two-week intervals throughout the duration of the project.
Section 7 informal	NBG	Vegetation Removal at Fena Reservoir, Naval Base Guam	3-Apr-14	x	x	x																														All construction work will begin after dawn and will end prior to dusk; no activities will occur at night.
Section 7 informal	NBG	Vegetation Removal at Fena Reservoir, Naval Base Guam	3-Apr-14	x	x	x																														All equipment, materials, debris, and vegetation clippings will be removed upon completion of work.
Section 7 informal	NBG	Vegetation Removal at Fena Reservoir, Naval Base Guam	3-Apr-14	x	x	x																														All on-site personnel will receive instruction regarding ESA-listed species and actions to take in case of sightings.
Section 7 informal	NBG	Vegetation Removal at Fena Reservoir, Naval Base Guam	3-Apr-14	x	x	x																														No new staging areas or access roads will be constructed. Existing roads and disturbed areas will be used.
Section 7 informal	NBG	Vegetation Removal at Fena Reservoir, Naval Base Guam	3-Apr-14	x	x	x																														Prior to conducting work each day the site will be visually surveyed at and around planned project activities for the presence of ESA-listed species.
Section 7 informal	NBG	Vegetation Removal at Fena Reservoir, Naval Base Guam	3-Apr-14	x	x	x																														The Navy will continue to maintain vigilance for ESA-listed species while conducting maintenance and will use data from regular surveys (point counts and transects) performed by qualified biologists in the project area. If moorhen nests are observed the Navy will avoid conducting maintenance in that area and notify USFWS.
Section 7 informal	NBG	Vegetation Removal at Fena Reservoir, Naval Base Guam	3-Apr-14	x	x	x																														The Navy will use qualified biologists prior to executing this project to assure no moorhen nests are present within the project footprint.

Requirement	Location	Title	Project BO/BA/BE Date	Mariana fruit bat	Mariana swiftlet	Mariana common moorhen	Mariana crow	Micronesian kingfisher	Guam rail	Micronesian Megapode	Nightingale Reed-warbler	Serianthes nelsonii	Green sea turtle	Hawksbill sea turtle	Scalloped hammerhead	ESA Corals	EFH	Eugenia bryanii	Hedyotis megalantha	Heritiera longipetiolata	Phyllanthus saffordii	Psychotria malaspinae	Solanum guamense	Tinaspora homosepala	Bulbophyllum guamense	Cycas micronesica	Dendrobium guamense	Maesa walkeri	Nervilia jacksoniae	Tabernaemontana rotensis	Tuberolabium guamense	Mariana eight-spot butterfly	Guam tree snail	Humped tree snail	Fragile tree snail	Conservation Measure (One Per Row)
Section 7 informal	NBG	Vegetation Removal at Fena Reservoir, Naval Base Guam	3-Apr-14	x	x	x																														The presence of any ESA-listed species will be reported to the Service within 48 hours, but the location of species will not be revealed to any other outside party.
Section 7 informal	NBG	Vegetation Removal at Fena Reservoir, Naval Base Guam	3-Apr-14	x	x	x																														Vegetation along the south edge of the spillway, where Mariana common moorhen have been observed in the past, will be selectively cut targeting overhanging vegetation that obstructs view of the spillway. Ground cover will be preserved whenever possible in this area.
Section 7 informal	NBG	Vegetation Removal at Fena Reservoir, Naval Base Guam	3-Apr-14	x	x	x																														Work will be postponed or halted if Mariana common moorhen are observed within 50 yards (150 feet) of the project activities and will only begin/resume after the moorhen have voluntarily departed the area.
Section 7 informal	NBG	Vegetation Removal at Fena Reservoir, Naval Base Guam	3-Apr-14	x	x	x																														Work will be postponed or halted if Mariana fruit bats are observed within 150 yards (450 feet) of the project activities and will only begin/resume after the bat(s) have voluntarily departed the area.
EFH	NBG	Romeo Wharf Reparis	13-Aug-14														x																			A contingency plan to control and contain toxic spills, including petroleum products, will be developed. Appropriate materials to contain and clean potential spills will be stored and readily available at the work site.
EFH	NBG	Romeo Wharf Reparis	13-Aug-14														x																			A contingency plan will be in place for the removal and adequate securing of equipment in the event of approaching storms.
EFH	NBG	Romeo Wharf Reparis	13-Aug-14														x																			A plan will be developed and implemented to prevent construction debris from entering or remaining in the marine environment during the project.

Section 7 informal	NBG	Romeo Wharf Reparis	10-Sep-14										x	x																						With the exception of pile driving and dredging, observers will visually survey the project area each day beginning 30 minutes prior to the start of work, and repeated frequently throughout the day.
Section 7 formal	Marianas	MILITARY TRAINING ACTIVITIES IN THE MARIANA ISLANDS TRAINING AND TESTING STUDY AREA: TERRESTRIAL SPECIES AND HABITATS	20-Feb-15	x	x	x				x	x		x	x																						1. Upon completion of the MIRC Reinitiation BO and other pending consultations, Navy will update the COMNAVMARIANASINST 3500.4A to reflect the language contained in these Biological Opinions applicable to range users. Navy will also finalize a new Joint Region COMNAVMAR Brown Treesnake instruction which will contain the Brown Treesnake Control and Interdiction Requirements. These efforts shall be prepared in coordination with the Service and other stakeholder agencies.
Section 7 formal	Marianas	MILITARY TRAINING ACTIVITIES IN THE MARIANA ISLANDS TRAINING AND TESTING STUDY AREA: TERRESTRIAL SPECIES AND HABITATS	20-Feb-15	x	x	x				x	x		x	x																						2. Training activities will undergo a pathway risk analysis as a tool to improve programmatic efficiency while preventing the spread or introduction of BTS.
Section 7 formal	Marianas	MILITARY TRAINING ACTIVITIES IN THE MARIANA ISLANDS TRAINING AND TESTING STUDY AREA: TERRESTRIAL SPECIES AND HABITATS	20-Feb-15	x	x	x				x	x		x	x																						3. The Navy, in compliance with Public Law 110-417, [Division A], title III, Section 316, October 14, 2008, 122 Statute 4410 and per DoD Transportation Regulations, Chapter 505 protocols, is committed to implementing 100% inspection of all aircraft and all cargo/equipment leaving Guam via vessel or aircraft for an off-island destination with trained brown treesnake personnel and qualified canine detection teams. The skills and standards required to certify a canine inspection team as "qualified" will be agreed upon mutually by DoD and the Service. These teams may be supplemented with qualified personnel to meet 100 percent inspection goals for training activities.
Section 7 formal	Marianas	MILITARY TRAINING ACTIVITIES IN THE MARIANA ISLANDS TRAINING AND TESTING STUDY AREA: TERRESTRIAL SPECIES AND HABITATS	20-Feb-15	x	x	x				x	x		x	x																						3a. <u>Missed Brown Treesnake Inspections</u> - In the event military units, vehicles, or equipment accidentally leave Guam without inspection, as soon as possible, the Navy will notify the qualified brown treesnake interdiction program and the destination port or airport authorities. Navy will work with the destination authority(ies) to resolve the issue. Urgency of notification is a priority so that rapid response or other actions can be implemented to reduce risk, if warranted.
Section 7 formal	Marianas	MILITARY TRAINING ACTIVITIES IN THE MARIANA ISLANDS TRAINING AND TESTING STUDY AREA: TERRESTRIAL SPECIES AND HABITATS	20-Feb-15	x	x	x				x	x		x	x																						3b. <u>Tactical Approach Exercises/Events</u> - To the maximum extent practicable, the Navy will route inbound personnel and cargo for tactical approach exercises (that require an uninterrupted flow of events) directly to CNMI training locations to avoid Guam seaports and airfields to the extent possible. If Guam cannot be avoided for tactical approaches, the Navy will work with the U.S. Fish and Wildlife Service to identify and implement appropriate interdiction methods at the receiving port (Rota, Saipan or Tinian). Methods may include redundant inspections or other interdiction actions, such as multiple inspections or barrier use on Guam. In addition, tactical approach exercises will involve only cargo/equipment that has not originated from areas containing a brown treesnake population or will be 100 percent inspected by qualified brown treesnake canine detection programs.

Requirement	Location	Title	Project BO/BA/BE Date	Mariana fruit bat	Mariana swiftlet	Mariana common moorhen	Mariana crow	Micronesian kingfisher	Guam rail	Micronesian Megapode	Nightingale Reed-warbler	Serianthes nelsonii	Green sea turtle	Hawksbill sea turtle	Scalloped hammerhead	ESA Corals	EFH	Eugenia bryanii	Hedyotis megalantha	Heritiera longipetiolata	Phyllanthus saffordii	Psychotria malaspinae	Solanum guamense	Tinaspora homosepala	Bulbophyllum guamense	Cycas micronesica	Dendrobium guamense	Maesa walkeri	Nervilia jacksoniae	Tabernaemontana rotensis	Tuberolabium guamense	Mariana eight-spot butterfly	Guam tree snail	Humped tree snail	Fragile tree snail	Conservation Measure (One Per Row)
Section 7 formal	Marianas	MILITARY TRAINING ACTIVITIES IN THE MARIANA ISLANDS TRAINING AND TESTING STUDY AREA: TERRESTRIAL SPECIES AND HABITATS	20-Feb-15	x	x	x				x	x		x	x																					3c. Administrative/Logistic Movements - The Navy is committed to implementing redundant inspections after discussions with appropriate stakeholders. Redundant inspections include inspections on Guam and at the receiving ports (Rota, Saipan or Tinian) for administrative and logistical movements within the MITT action area that do not require a tactical approach to complete the training requirements. It is anticipated that redundant inspections would utilize existing quarantine and inspection protocols at receiving ports in the CNMI to the extent possible. However, should inspection coverage be inadequate, the Navy will provide inspection teams to fully implement quarantine and inspection protocols. Appropriate stakeholders include, but are not limited to the U.S. Fish and Wildlife Service to ensure the inspections are adequate to reduce risks to trust resources, receiving jurisdictions and their supporting agencies with expertise in invasive species control, and other inspection authorities as needed to ensure inspection methods are current and revised as new techniques, technology, or data become available.
Section 7 formal	Marianas	MILITARY TRAINING ACTIVITIES IN THE MARIANA ISLANDS TRAINING AND TESTING STUDY AREA: TERRESTRIAL SPECIES AND HABITATS	20-Feb-15	x	x	x				x	x		x	x																					3d. Movements Involving Farallon de Medinilla (FDM) - The Navy will consider all movements between Guam and FDM as tactical in nature and work with appropriate stakeholders to determine the appropriate interdiction methods required for aircraft, personnel, and equipment/gear movements. All aircraft and equipment/gear will be 100 percent inspected prior to departing Guam. Additional interdiction measures on Guam may be required after discussions with appropriate stakeholders. Training operations that go from Guam to Saipan and then FDM will require canine inspection on Saipan or other BTS inspection as mutually agreed upon by the DoD and the Service. For training that starts on Guam and goes directly to FDM, visual inspections for BTS will be conducted by military or UXO personnel upon arrival on FDM.
Section 7 formal	Marianas	MILITARY TRAINING ACTIVITIES IN THE MARIANA ISLANDS TRAINING AND TESTING STUDY AREA: TERRESTRIAL SPECIES AND HABITATS	20-Feb-15	x	x	x				x	x		x	x																					4. The Navy will establish snake-free quarantine areas (barriers) as deemed necessary by the Navy and U.S. Fish and Wildlife Service for cargo/equipment traveling from Guam to CNMI and locations outside of the MITT action area. Barriers will be used if the volume of cargo/equipment/vehicle movement out-paces the available canine inspection capacity or BTS quarantine capacity. The snake-free quarantine areas will be subject to: (1) multiple day and night searches with appropriately trained interdiction canine teams, (2) snake trapping, and (3) visual inspection for snakes. Standard operating procedures will be developed based on the barrier size needed for the training event(s). Temporary barriers will be constructed and maintained in a manner that assures the efficacy of the barrier and that staff maintaining and constructing the temporary barriers will receive training related to this activity prior to construction and operation. Barrier specifications as well as the qualifications of BTS barrier maintenance and management staff will be mutually agreed upon by DoD and the Service.

Requirement	Location	Title	Project BO/BA/BE Date	Mariana fruit bat	Mariana swiftlet	Mariana common moorhen	Mariana crow	Micronesian kingfisher	Guam rail	Micronesian Megapode	Nightingale Reed-warbler	Serianthes nelsonii	Green sea turtle	Hawksbill sea turtle	Scalloped hammerhead	ESA Corals	EFH	Eugenia bryanii	Hedyotis megalantha	Heritiera longipetiolata	Phyllanthus saffordii	Psychotria malaspinae	Solanum guamense	Tinaspora homosepala	Bulbophyllum guamense	Cycas micronesica	Dendrobium guamense	Maesa walkeri	Nervilia jacksoniae	Tabernaemontana rotensis	Tuberolabium guamense	Mariana eight-spot butterfly	Guam tree snail	Humped tree snail	Fragile tree snail	Conservation Measure (One Per Row)
Section 7 formal	Marianas	MILITARY TRAINING ACTIVITIES IN THE MARIANA ISLANDS TRAINING AND TESTING STUDY AREA: TERRESTRIAL SPECIES AND HABITATS	20-Feb-15	x	x	x				x	x		x	x																						5. Navy will (1) coordinate closely with the Service1 and the CNMI Department of Land and Natural Resources staff on planning for training activities in the CNMI; (2) coordinate with the other DoD action agencies implementing the MITT program and the Service to identify the inspection and interdiction requirements for MITT program-related training activities, including the number of trained quarantine officers and canine detection teams required to ensure that the inspection and interdiction requirements for MITT program-related training activities can be met; (3) coordinate with the Service on the inspection and interdiction requirements identified by the Navy prior to the implementation of the exercise or training activity; and (4) identify the support that the Navy will need to provide for the inspections and develop plans to ensure that inspection personnel are available and all requirements are met. 1 Currently, the Service point-of-contact (POC) for these planning activities in the CNMI Brown Tree Snake Program Coordinator (Coordinator). If the agency affiliation of the Coordinator changes, the Service shall formally designate a new Service POC and adivse the DON and other DoD action agencies associated withthe MITT Program within 10 working days.
Section 7 formal	Marianas	MILITARY TRAINING ACTIVITIES IN THE MARIANA ISLANDS TRAINING AND TESTING STUDY AREA: TERRESTRIAL SPECIES AND HABITATS	20-Feb-15	x	x	x				x	x		x	x																						6. Navy will utilize ongoing adaptive management to improve methods for BTS rapid response, including detection of low-density snake populations using all technologies as they become available. The Navy will annually review BTS rapid response needs with the Service to mutually determine if refined methods need to be implemented; the Navy will support such refinement based on that mutual agreement. Support for this adaptive management approach will include financial support subject to Congressional funding guidelines and restrictions. All parties acknowledge financial suppport is subject to the availability of funds, and no provision herein shall be interpreted to require obligation of payment of funds in violation of the Anti-Deficiency Act, 31 U.S.C Section 1341.
Section 7 formal	Marianas	MILITARY TRAINING ACTIVITIES IN THE MARIANA ISLANDS TRAINING AND TESTING STUDY AREA: TERRESTRIAL SPECIES AND HABITATS	20-Feb-15	x	x	x				x	x		x	x																						7. MITT action proponents will provide support for BTS rapid response associated with a BTS sighting with the JRM AOR related to MIRC training activities subject to this consultation.
Section 7 formal	Marianas	MILITARY TRAINING ACTIVITIES IN THE MARIANA ISLANDS TRAINING AND TESTING STUDY AREA: TERRESTRIAL SPECIES AND HABITATS	20-Feb-15	x	x	x				x	x		x	x																						8. The Navy will provide brown treesnake awareness briefings for all military and contractor personnel prior to all MITT training activities. Brown treesnake awareness briefings will be scaled to the type of training activity to take place. Awareness materials may consist of a brown treesnake educational video and distribution of brown treesnake information and personal inspection guidelines. Awareness briefs will emphasize that brown treesnake awareness must extend through the chain of command from the Commanding Officer to the individual military service member.
Section 7 formal	Marianas	MILITARY TRAINING ACTIVITIES IN THE MARIANA ISLANDS TRAINING AND TESTING STUDY AREA: TERRESTRIAL SPECIES AND HABITATS	20-Feb-15	x	x	x				x	x		x	x																						9. Joint Region Marianas (JRM) will assure that "Area Training" coordinates meetings for BTS interdiction on all training activities for the training execution phase and an after-action review phase. If a snake is found during training, the Navy policy is to kill the snake and is reported to Navy Environmental Staff.
Section 7 formal	Marianas	MILITARY TRAINING ACTIVITIES IN THE MARIANA ISLANDS TRAINING AND TESTING STUDY AREA: TERRESTRIAL SPECIES AND HABITATS	20-Feb-15	x	x	x				x	x		x	x																						10. The Navy will invite the Service to participate in the development of regional standard operating procedures and exercise planning to better meet BTS management needs associated with MITT training.

Requirement	Location	Title	Project BO/BA/BE Date	Mariana fruit bat	Mariana swiftlet	Mariana common moorhen	Mariana crow	Micronesian kingfisher	Guam rail	Micronesian Megapode	Nightingale Reed-warbler	Serianthes nelsonii	Green sea turtle	Hawksbill sea turtle	Scalloped hammerhead	ESA Corals	EFH	Eugenia bryanii	Hedyotis megalantha	Heritiera longipetiolata	Phyllanthus saffordii	Psychotria malaspinae	Solanum guamense	Tinaspora homosepala	Bulbophyllum guamense	Cycas micronesica	Dendrobium guamense	Maesa walkeri	Nervilia jacksoniae	Tabernaemontana rotensis	Tuberolabium guamense	Mariana eight-spot butterfly	Guam tree snail	Humped tree snail	Fragile tree snail	Conservation Measure (One Per Row)
Section 7 formal	Marianas	MILITARY TRAINING ACTIVITIES IN THE MARIANA ISLANDS TRAINING AND TESTING STUDY AREA: TERRESTRIAL SPECIES AND HABITATS	20-Feb-15	x	x	x				x	x		x	x																						11. Prior to each exercise that involves the movement of equipment and troops between islands, a pathway risk analysis will be conducted and biosecurity protocols confirmed by the DoD (JRM). Implementation of biosecurity protocols will be a requirement for training. An adaptive management review of risk analyses and biosecurity protocols will be conducted periodically with the Service. Initially, this adaptive management review will include the development of Standard Operating Protocols (SOPs) for biosecurity by the DoN in support of training activities covered under the MITT program. These DON biosecurity SOPs will be reviewed by the Service when initially developed. Once the MITT program is implemented, MITT program-related SOPs will be reviewed with the Service annually.
Section 7 formal	Marianas	MILITARY TRAINING ACTIVITIES IN THE MARIANA ISLANDS TRAINING AND TESTING STUDY AREA: TERRESTRIAL SPECIES AND HABITATS	20-Feb-15	x	x	x				x	x		x	x																						12. In coordination with the Service, the DoD action agencies implementing MITT activities will establish a contractual agreement for adequate rapid response capabilities with appropriate agencies having invasive species rapid response expertise and technology within three months of the Service's issuance of this Biological Opinion. The contracted services will focus on control and eradication of introduced non-established, non-native invasive species sighted in the vicinity of: (1) DoD MITT training areas, and (2) DoD areas and facilities used for the staging, storage and movement of MITT personnel, cargo, and MITT-associated vehicles (e.g., planes, trucks, and vessels). Priority should be given to non-native invasive species that pose a high risk of being transported elsewhere due to MITT-related training actions. This arrangement will be in place until superseded by a regional rapid response plan. Monitoring will consist of the established protocols for USDA inspections, personnel awareness during pre-event preparations, and self-inspections. As noted above, an adaptive management review of risk analyses and biosecurity protocols will be conducted periodically with the Service. The regional rapid response plan discussed refers to the full implementation of a comprehensive Emergency Response Plan for Guam and the CNMI in association with the Regional Biosecurity Plan (RBP) for Micronesia and Hawaii. The RBP is discussed further in the MIRC re-initiation / MITT Biological Opinion.
Section 7 formal	Marianas	MILITARY TRAINING ACTIVITIES IN THE MARIANA ISLANDS TRAINING AND TESTING STUDY AREA: TERRESTRIAL SPECIES AND HABITATS	2015	x	x	x				x	x		x	x																						13. All personnel involved in MIRC/MITT training will be responsible for conducting self-inspections to avoid potential introductions of invasive species to Guam and the CNMI. Troops will inspect all gear and clothing (e.g., boots, bags, weapons, and clothing) for soil accumulations, seeds, invertebrates, and vertebrates).
Section 7 formal	Marianas	MILITARY TRAINING ACTIVITIES IN THE MARIANA ISLANDS TRAINING AND TESTING STUDY AREA: TERRESTRIAL SPECIES AND HABITATS	2015	x	x	x				x	x		x	x																						14. Navy will adhere to AFPMB Technical Guide 31 protocols on vehicle/equipment washdown procedures and other APHIS PPQ inspection procedures for deployments and redeployments.
Section 7 formal	Marianas	MILITARY TRAINING ACTIVITIES IN THE MARIANA ISLANDS TRAINING AND TESTING STUDY AREA: TERRESTRIAL SPECIES AND HABITATS	20-Feb-15	x	x	x				x	x		x	x																						15. The Navy will locate ground-disturbing training activities on previously disturbed sites whenever possible.
Section 7 formal	Marianas	MILITARY TRAINING ACTIVITIES IN THE MARIANA ISLANDS TRAINING AND TESTING STUDY AREA: TERRESTRIAL SPECIES AND HABITATS	20-Feb-15	x	x	x				x	x		x	x																						16. The Navy will ensure that all training areas, including transit routes necessary to reach training areas, are clearly identified or marked. Vehicular activities will be restricted to designated and previously identified areas.
Section 7 formal	Marianas	MILITARY TRAINING ACTIVITIES IN THE MARIANA ISLANDS TRAINING AND TESTING STUDY AREA: TERRESTRIAL SPECIES AND HABITATS	20-Feb-15	x	x	x				x	x		x	x																						17. The Navy will continue to control erosion through the "Site Approval Process," whereby the Navy environmental program reviews each proposed project for its erosion potential and involves the designated installation Natural Resource Specialist in the process.
Section 7 formal	Marianas	MILITARY TRAINING ACTIVITIES IN THE MARIANA ISLANDS TRAINING AND TESTING STUDY AREA: TERRESTRIAL SPECIES AND HABITATS	20-Feb-15	x	x	x				x	x		x	x																						18. The Navy will continue to manage erosion in accordance with the applicable storm water pollution prevention plan at each training location.

Requirement	Location	Title	Project BO/BA/BE Date	Mariana fruit bat	Mariana swiftlet	Mariana common moorhen	Mariana crow	Micronesian kingfisher	Guam rail	Micronesian Megapode	Nightingale Reed-warbler	Serianthes nelsonii	Green sea turtle	Hawksbill sea turtle	Scalloped hammerhead	ESA Corals	EFH	Eugenia bryanii	Hedyotis megalantha	Heritiera longipetiolata	Phyllanthus saffordii	Psychotria malaspinae	Solanum guamense	Tinaspora homosepala	Bulbophyllum guamense	Cycas micronesica	Dendrobium guamense	Maesa walkeri	Nervilia jacksoniae	Tabernaemontana rotensis	Tuberolabium guamense	Mariana eight-spot butterfly	Guam tree snail	Humped tree snail	Fragile tree snail	Conservation Measure (One Per Row)
Section 7 formal	Marianas	MILITARY TRAINING ACTIVITIES IN THE MARIANA ISLANDS TRAINING AND TESTING STUDY AREA: TERRESTRIAL SPECIES AND HABITATS	20-Feb-15	x	x	x				x	x		x	x																						19. The Navy will prohibit off-road vehicle use except in designated off-road areas or on established trails.
Section 7 formal	Marianas	MILITARY TRAINING ACTIVITIES IN THE MARIANA ISLANDS TRAINING AND TESTING STUDY AREA: TERRESTRIAL SPECIES AND HABITATS	20-Feb-15	x	x	x				x	x		x	x																						20. The Navy will comply with existing policies and management activities to conserve soils, including requirements and restrictions outlined in the Marianas Training Handbook.
Section 7 formal	Marianas	MILITARY TRAINING ACTIVITIES IN THE MARIANA ISLANDS TRAINING AND TESTING STUDY AREA: TERRESTRIAL SPECIES AND HABITATS	20-Feb-15	x	x	x				x	x		x	x																						21. FDM: The Navy will continue to implement targeting and access restrictions, such as: (1) no targeting of the northern Special Use Area (north of the No Fire Line) and no targeting of the narrow land bridge, (2) only targeting Impact Areas 1, 2, and 3 during air-to-ground bombing exercises and air-to-ground missile and gunnery exercises; Impact Area 1 (closest to the northern Special Use Area) is for inert ordnance only, and (3) personnel are not authorized on FDM without approval from JRM Operations.
Section 7 formal	Marianas	MILITARY TRAINING ACTIVITIES IN THE MARIANA ISLANDS TRAINING AND TESTING STUDY AREA: TERRESTRIAL SPECIES AND HABITATS	20-Feb-15	x	x	x				x	x		x	x																						22. FDM: Live cluster weapons/scatterable munitions, fuel air explosives, incendiary munitions, depleted uranium rounds, or bombs greater than 2,000 pounds will be prohibited. It should be noted that some spotting charges use small amounts of phosphorous but are not main constituents of munitions dropped on FDM. In addition, smoke markers will be used during some direct action activities for targeting.
Section 7 formal	Marianas	MILITARY TRAINING ACTIVITIES IN THE MARIANA ISLANDS TRAINING AND TESTING STUDY AREA: TERRESTRIAL SPECIES AND HABITATS	20-Feb-15	x	x	x				x	x		x	x																						23. FDM: Nesting sea turtles are not expected; however, it is possible that a sea turtle may be basking on beaches or resting in holes or caves. If a sea turtle is seen on a beach by participating aircraft, training will be altered until the sea turtle leaves the beach and nearby waters.
Section 7 formal	Marianas	MILITARY TRAINING ACTIVITIES IN THE MARIANA ISLANDS TRAINING AND TESTING STUDY AREA: TERRESTRIAL SPECIES AND HABITATS	20-Feb-15	x	x	x				x	x		x	x																						24. Saipan: Training in the Marpi Maneuver Area is expected to be infrequent and limited to pedestrian land navigation training.
Section 7 formal	Marianas	MILITARY TRAINING ACTIVITIES IN THE MARIANA ISLANDS TRAINING AND TESTING STUDY AREA: TERRESTRIAL SPECIES AND HABITATS	20-Feb-15	x	x	x				x	x		x	x																						24a. Saipan: Training in the Marpi Maneuver Area - Training will be limited to open areas (i.e., grasslands; no forest or mixed shrub and scrub habitats) to minimize impacts to nightingale reed-warblers, Mariana fruit bat, and Micronesian megapodes.
Section 7 formal	Marianas	MILITARY TRAINING ACTIVITIES IN THE MARIANA ISLANDS TRAINING AND TESTING STUDY AREA: TERRESTRIAL SPECIES AND HABITATS	20-Feb-15	x	x	x				x	x		x	x																						24b. Saipan: Training in the Marpi Maneuver Area - There will be no digging in the soil or cutting of vegetation along the southern border of the Marpi Maneuver Area in the mixed limestone forest. No ground disturbance or vegetation removal of any kind is permitted in this area to avoid impacts to the Micronesian megapode and Mariana fruit bat. Vegetation removal would be limited to the maintenance of existing bivouac areas. No new bivouac areas are proposed. Maneuver units will remain tactical and not establish support camps. This measure is designed to minimize potential impacts associated with ground maneuvers on the Micronesian megapode. No habitat will be removed for any training activity on Saipan.
Section 7 formal	Marianas	MILITARY TRAINING ACTIVITIES IN THE MARIANA ISLANDS TRAINING AND TESTING STUDY AREA: TERRESTRIAL SPECIES AND HABITATS	20-Feb-15	x	x	x				x	x		x	x																						24c. Saipan: Training in the Marpi Maneuver Area - Smoking is not permitted during training activities and fire-safe-portable receptacles for cigarette butts are used during periods of rest between training activities. No fires are permitted during bivouac activities.
Section 7 formal	Marianas	MILITARY TRAINING ACTIVITIES IN THE MARIANA ISLANDS TRAINING AND TESTING STUDY AREA: TERRESTRIAL SPECIES AND HABITATS	20-Feb-15	x	x	x				x	x		x	x																						24d. Saipan: Training in the Marpi Maneuver Area - If other areas are needed for training, the Navy will contact the Service regarding the need for reinitiation of this biological opinion.
Section 7 formal	Marianas	MILITARY TRAINING ACTIVITIES IN THE MARIANA ISLANDS TRAINING AND TESTING STUDY AREA: TERRESTRIAL SPECIES AND HABITATS	20-Feb-15	x	x	x				x	x		x	x																						24e. Saipan: Training in the Marpi Maneuver Area - All training activities that involve ground maneuvers in the Saipan Marpi Maneuver Area will be consistent with the fire management plan included in COMNAVMARIANASINST 3500.4A.

Requirement	Location	Title	Project BO/BA/BE Date	Mariana fruit bat	Mariana swiftlet	Mariana common moorhen	Mariana crow	Micronesian kingfisher	Guam rail	Micronesian Megapode	Nightingale Reed-warbler	Serianthes nelsonii	Green sea turtle	Hawksbill sea turtle	Scalloped hammerhead	ESA Corals	EFH	Eugenia bryanii	Hedyotis megalantha	Heritiera longipetiolata	Phyllanthus saffordii	Psychotria malaspinae	Solanum guamense	Tinaspora homosepala	Bulbophyllum guamense	Cycas micronesica	Dendrobium guamense	Maesa walkeri	Nervilia jacksoniae	Tabernaemontana rotensis	Tuberolabium guamense	Mariana eight-spot butterfly	Guam tree snail	Humped tree snail	Fragile tree snail	Conservation Measure (One Per Row)
Section 7 formal	Marianas	MILITARY TRAINING ACTIVITIES IN THE MARIANA ISLANDS TRAINING AND TESTING STUDY AREA: TERRESTRIAL SPECIES AND HABITATS	20-Feb-15	x	x	x				x	x		x	x																						25. Saipan: JRM will coordinate with CNMI-DLNR to determine the latest species locations as necessary prior to training actions. If a training exercise cannot be modified to avoid impacts on listed ESA species, the Navy will contact the Service as required by Section 7 of the ESA prior to conducting the training exercise. If CNMI-DLNR is not able to assist with best available data or surveys, Joint Region Marianas will provide in-house or contracted subject matter experts to conduct surveys if necessary.
Section 7 formal	Marianas	MILITARY TRAINING ACTIVITIES IN THE MARIANA ISLANDS TRAINING AND TESTING STUDY AREA: TERRESTRIAL SPECIES AND HABITATS	20-Feb-15	x	x	x				x	x		x	x																						26. Tinian: All training activities that involve ground maneuvers on Tinian Military Lease Area will be consistent with the fire management plan included in COMNAVMARIANASINST 3500.4A.
Section 7 formal	Marianas	MILITARY TRAINING ACTIVITIES IN THE MARIANA ISLANDS TRAINING AND TESTING STUDY AREA: TERRESTRIAL SPECIES AND HABITATS	20-Feb-15	x	x	x				x	x		x	x																						27. Tinian: The Navy will locate ground-disturbing training activities on previously disturbed sites whenever possible. Training areas, including transit routes necessary to reach training areas will be clearly marked. On Tinian, vehicular activities will be restricted to designated and previously identified areas.
Section 7 formal	Marianas	MILITARY TRAINING ACTIVITIES IN THE MARIANA ISLANDS TRAINING AND TESTING STUDY AREA: TERRESTRIAL SPECIES AND HABITATS	20-Feb-15	x	x	x				x	x		x	x																						28. Tinian: The Navy will implement training restrictions at Unai Chulu, Unai Babui, and Unai Dankulo to avoid and minimize effects to sea turtles:
Section 7 formal	Marianas	MILITARY TRAINING ACTIVITIES IN THE MARIANA ISLANDS TRAINING AND TESTING STUDY AREA: TERRESTRIAL SPECIES AND HABITATS	20-Feb-15	x	x	x				x	x		x	x																						28a. Tinian: Training Restrictions - Unai Chulu, Unai Babui, and Unai Dankulo will not be designated as landing zones for mechanized amphibious vehicles at this time. Should mechanized amphibious vehicles (AAV and LCAC) landings on those beaches become necessary, Navy will reinitiate consultation for those activities.
Section 7 formal	Marianas	MILITARY TRAINING ACTIVITIES IN THE MARIANA ISLANDS TRAINING AND TESTING STUDY AREA: TERRESTRIAL SPECIES AND HABITATS	20-Feb-15	x	x	x				x	x		x	x																						28b. Tinian: Unai Chulu, Unai Babui, and Unai Dankulo - Biologists trained in identifying sea turtle nests will survey landing beaches no more than six hours prior to the first non-mechanized craft landing or use of other beach landing equipment that is part of a training event that requires use of the beach. Any potential sea turtle nests will be flagged and avoided by landing craft and personnel, vehicles (including non-mechanized water craft) and equipment. The buffer zone will have a radius of 6 meters (20 feet) from the edge of the nesting activity (area disturbed by the turtle) to ensure complete avoidance. Use of a beach monitor during the training event and turtle-friendly lighting will avoid impacts to nesting females.
Section 7 formal	Marianas	MILITARY TRAINING ACTIVITIES IN THE MARIANA ISLANDS TRAINING AND TESTING STUDY AREA: TERRESTRIAL SPECIES AND HABITATS	20-Feb-15	x	x	x				x	x		x	x																						28c. Tinian: Unai Chulu, Unai Babui, and Unai Dankulo - If an active nest has been discovered, night-training will not occur after 50 days of incubation until the nest has hatched OR a buffer (9 meters [30 feet] wide) from the active nest to the water will be in place to avoid any potential impacts to sea turtle hatchlings trying to reach the ocean. If an active nest has been discovered, night-training will not occur once a prehatch hole is detected. (A pre-hatch hole indicates that the nest will hatch that evening.) Evening training may resume five days after the pre-hatch hole is discovered.
Section 7 formal	Marianas	MILITARY TRAINING ACTIVITIES IN THE MARIANA ISLANDS TRAINING AND TESTING STUDY AREA: TERRESTRIAL SPECIES AND HABITATS	20-Feb-15	x	x	x				x	x		x	x																						28d. Tinian: Unai Chulu, Unai Babui, and Unai Dankulo - For any training on beaches at night during the sea turtle nesting season, only turtle-friendly lighting will be used. No lighting will be used in the vicinity of nests that are past 50 days of incubation.
Section 7 formal	Marianas	MILITARY TRAINING ACTIVITIES IN THE MARIANA ISLANDS TRAINING AND TESTING STUDY AREA: TERRESTRIAL SPECIES AND HABITATS	20-Feb-15	x	x	x				x	x		x	x																						29. Tinian: Improvements to any beaches to facilitate training will be coordinated with the Service if the action may affect listed species.
Section 7 formal	Marianas	MILITARY TRAINING ACTIVITIES IN THE MARIANA ISLANDS TRAINING AND TESTING STUDY AREA: TERRESTRIAL SPECIES AND HABITATS	20-Feb-15	x	x	x				x	x		x	x																						30. Tinian: On Tinian, Hagoi and adjacent areas are designated as a “No Training Area.” No ground disturbance or vegetation removal of any kind is permitted in this area. This measure is designed to avoid impacts associated with ground training activities on the Mariana common moorhen. Training also does not occur in the Bateha or Mahalang wetlands areas.

Requirement	Location	Title	Project BO/BA/BE Date	Mariana fruit bat	Mariana swiftlet	Mariana common moorhen	Mariana crow	Micronesian kingfisher	Guam rail	Micronesian Megapode	Nightingale Reed-warbler	Serianthes nelsonii	Green sea turtle	Hawksbill sea turtle	Scalloped hammerhead	ESA Corals	EFH	Eugenia bryanii	Hedyotis megalantha	Heritiera longipetiolata	Phyllanthus saffordii	Psychotria malaspinae	Solanum guamense	Tinaspora homosepala	Bulbophyllum guamense	Cycas micronesica	Dendrobium guamense	Maesa walkeri	Nervilia jacksoniae	Tabernaemontana rotensis	Tuberolabium guamense	Mariana eight-spot butterfly	Guam tree snail	Humped tree snail	Fragile tree snail	Conservation Measure (One Per Row)
Section 7 formal	Marianas	MILITARY TRAINING ACTIVITIES IN THE MARIANA ISLANDS TRAINING AND TESTING STUDY AREA: TERRESTRIAL SPECIES AND HABITATS	20-Feb-15	x	x	x				x	x		x	x																						31. Tinian: Aircraft overflights are restricted over Tinian wetland areas (Hagoi, Mahalang, and Bateha). If aircraft must fly over wetlands during training exercises, the aircraft must maintain a minimum altitude of 1,000 feet (305 meters) AGL. This measure is designed to minimize visual and noise disturbance for Mariana common moorhens, and to reduce the potential for aircraft strike.
Section 7 formal	Marianas	MILITARY TRAINING ACTIVITIES IN THE MARIANA ISLANDS TRAINING AND TESTING STUDY AREA: TERRESTRIAL SPECIES AND HABITATS	20-Feb-15	x	x	x				x	x		x	x																						32. Tinian: On Tinian, training does not occur in limestone forests, found within the Tinian MLA along ridgelines associated with Mount Lasso (see COMMNAVMARIANAS 3500.4A, Figure 5-2). This measure is designed to avoid impacts associated with ground training activities on the Micronesian megapode. Vegetation removal would be limited to the maintenance of existing bivouac areas. No new bivouac areas are proposed. Maneuver units will remain tactical and not establish support camps. This measure is designed to minimize potential impacts associated with ground maneuvers on the Micronesian megapode.
Section 7 formal	Marianas	MILITARY TRAINING ACTIVITIES IN THE MARIANA ISLANDS TRAINING AND TESTING STUDY AREA: TERRESTRIAL SPECIES AND HABITATS	20-Feb-15	x	x	x				x	x		x	x																						33. Tinian: Aircraft overflights are restricted over limestone forest areas of Tinian, which are found within the Tinian MLA along ridgelines in the Mount Lasso area. If aircraft must fly over limestone forests during training exercises, the aircraft must maintain a minimum altitude of 1,000 feet (305 meters) AGL. This measure is designed to minimize visual and noise disturbance of Micronesian megapodes and fruit bats and to reduce the potential for aircraft strike (see COMNAVMARIANASINST 3500.4A, Figure 5-2.
Section 7 formal	Marianas	MILITARY TRAINING ACTIVITIES IN THE MARIANA ISLANDS TRAINING AND TESTING STUDY AREA: TERRESTRIAL SPECIES AND HABITATS	20-Feb-15	x	x	x				x	x		x	x																						Tinian: Fire Prevention - No live-fire or tracer rounds will be used on Tinian except with the use of bullet traps. Use of pyrotechnics, flares, blank fire, and other potential fire-starting activities must be conducted on existing cleared runways and in accordance with the Fire Prevention Plan. The area authorized for open fires and pyrotechnics is restricted to the North Field and West Field on hardtop surfaces only (except for actual emergency signaling).
Section 7 formal	Marianas	MILITARY TRAINING ACTIVITIES IN THE MARIANA ISLANDS TRAINING AND TESTING STUDY AREA: TERRESTRIAL SPECIES AND HABITATS	20-Feb-15	x	x	x				x	x		x	x																						35. Tinian: Cooking by individuals is not authorized in outdoor training areas (except for heating tabs and mechanisms in "meals ready to eat"). Large scale training exercises may include field kitchens in North Field in areas authorized for open fire.
Section 7 formal	Marianas	MILITARY TRAINING ACTIVITIES IN THE MARIANA ISLANDS TRAINING AND TESTING STUDY AREA: TERRESTRIAL SPECIES AND HABITATS	20-Feb-15	x	x	x				x	x		x	x																						36. Tinian: North Field's existing runways and taxiways act as fire breaks and fire access roads, and the vegetation is primarily characterized by tangantangan (*Leucaena leucocephala*) thickets. Standard Operating Procedures for all exercises include fire response measures that must be implemented.
Section 7 formal	Marianas	MILITARY TRAINING ACTIVITIES IN THE MARIANA ISLANDS TRAINING AND TESTING STUDY AREA: TERRESTRIAL SPECIES AND HABITATS	20-Feb-15	x	x	x				x	x		x	x																						37. Tinian: To date, no wildland fire has been ignited from MIRC training activities on Tinian (or on other DoD lands in the Mariana Islands). However, to further minimize risk and augment military fire response efforts, the Tinian Fire Department maintains a 300-gallon pump truck and fire crew to respond to wildland fires. The Tinian Fire Department also maintains a 750-gallon pumper truck and crew in San Jose to respond to and provide fire service for the southern Tinian and backup Crash-Fire-Rescue support to West Field. The Navy will request the use of Tinian Fire Department assets for major exercises. The request will be made through the West Field command post. The Navy will maintain airfield crash-fire-rescue equipment and crews at North Field for the duration of the exercise. Any military related fires will be controlled prior to the loss of any wetland or native limestone forest habitat is burned. Any military related fires in tangantangan will be controlled prior to the loss of five acres tangantangan habitat.

Requirement	Location	Title	Project BO/BA/BE Date	Mariana fruit bat	Mariana swiftlet	Mariana common moorhen	Mariana crow	Micronesian kingfisher	Guam rail	Micronesian Megapode	Nightingale Reed-warbler	Serianthes nelsonii	Green sea turtle	Hawksbill sea turtle	Scalloped hammerhead	ESA Corals	EFH	Eugenia bryanii	Hedyotis megalantha	Heritiera longipetiolata	Phyllanthus saffordii	Psychotria malaspinae	Solanum guamense	Tinaspora homosepala	Bulbophyllum guamense	Cycas micronesica	Dendrobium guamense	Maesa walkeri	Nervilia jacksoniae	Tabernaemontana rotensis	Tuberolabium guamense	Mariana eight-spot butterfly	Guam tree snail	Humped tree snail	Fragile tree snail	Conservation Measure (One Per Row)
Section 7 formal	Marianas	MILITARY TRAINING ACTIVITIES IN THE MARIANA ISLANDS TRAINING AND TESTING STUDY AREA: TERRESTRIAL SPECIES AND HABITATS	20-Feb-15	x	x	x				x	x		x	x																						38. Rota: No training activities will occur near or within critical habitat, habitat occupied by listed species, or other habitats designed for conservation use. If such activities are planned in the future, the Navy will consult with the USFWS pursuant to section 7 of the ESA. Prior to planning exercises on Rota, MIRC Operations (OPS) will coordinate with appropriate local officials on Rota to determine the latest status of species (e.g., species locations). MITT training will be planned such that ESA species will be avoided in accordance with the "areas to be avoided" map provided by USFWS. In May 2014, USFWS provided a map that represents all areas to be avoided that could be occupied by ESA-listed species at any time throughout the year. This map was overlaid with proposed training locations, critical habitat, and other conservation areas resulting in MITT Biological Assessment Figure 3-1 (August 2014). Green shaded areas represent all areas that could be occupied by ESA-listed species at any time throughout the year. These areas are not proposed for training.
Section 7 formal	Marianas	MILITARY TRAINING ACTIVITIES IN THE MARIANA ISLANDS TRAINING AND TESTING STUDY AREA: TERRESTRIAL SPECIES AND HABITATS	20-Feb-15	x	x	x				x	x		x	x																						39. Rota: Aircraft overflights on Rota, with the exception of landings and takeoffs as part of training exercises (landings, takeoffs, and insertion events at the Rota International Airport), are prohibited below 1,000 feet (305 meters) AGL and within 1,000 feet of coastlines.
Section 7 formal	Marianas	MILITARY TRAINING ACTIVITIES IN THE MARIANA ISLANDS TRAINING AND TESTING STUDY AREA: TERRESTRIAL SPECIES AND HABITATS	20-Feb-15	x	x	x				x	x		x	x																						40. Rota: Activities that involve aircraft training primarily occur on Guam. Rota will only be used when other locations on Guam or the CNMI are not available, use of these locations is not practical, and/or the training mission requirements cannot be met without the use of Rota.
Section 7 formal	Marianas	MILITARY TRAINING ACTIVITIES IN THE MARIANA ISLANDS TRAINING AND TESTING STUDY AREA: TERRESTRIAL SPECIES AND HABITATS	20-Feb-15	x	x	x				x	x		x	x																						41. Guam: "No Wildlife Disturbance" and "No Training Areas" are designated on Naval Base Guam Orote Point, Naval Base Guam Munitions Site, and Andersen AFB Tarague Beach. Vegetation removal would be limited to maintaining existing bivouac areas. No new bivouac areas are proposed in the MITT BA. Maneuver units will remain tactical and not establish support camps.
Section 7 formal	Marianas	MILITARY TRAINING ACTIVITIES IN THE MARIANA ISLANDS TRAINING AND TESTING STUDY AREA: TERRESTRIAL SPECIES AND HABITATS	20-Feb-15	x	x	x				x	x		x	x																						42. Guam: All training activities that involve ground maneuvers on Guam will be consistent with the fire management plan included in COMNAVMARIANASINST 3500.4A. DoD will continue to implement the following restrictions at all action areas on Andersen Air Force Base:
Section 7 formal	Marianas	MILITARY TRAINING ACTIVITIES IN THE MARIANA ISLANDS TRAINING AND TESTING STUDY AREA: TERRESTRIAL SPECIES AND HABITATS	20-Feb-15	x	x	x				x	x		x	x																						42a. Guam: AAFB - No vegetation clearing except: maintenance required to keep paved surfaces, landing zones, and the drop zones in a safe and useable condition and for bivouac purposes in the bivouac area. Tree species greater than 4-inches in diameter used for foraging, roosting, or nesting of bats and crows will not be removed.
Section 7 formal	Marianas	MILITARY TRAINING ACTIVITIES IN THE MARIANA ISLANDS TRAINING AND TESTING STUDY AREA: TERRESTRIAL SPECIES AND HABITATS	20-Feb-15	x	x	x				x	x		x	x																						42b. Guam: AAFB - Motorized vehicles shall be driven only on prepared surfaces, in the drop zone and landing zones as required and only rubber-tired vehicles will be allowed; no digging is allowed except in the Northwest Field bivouac area; and no harassment or killing of native wildlife is allowed.
Section 7 formal	Marianas	MILITARY TRAINING ACTIVITIES IN THE MARIANA ISLANDS TRAINING AND TESTING STUDY AREA: TERRESTRIAL SPECIES AND HABITATS	20-Feb-15	x	x	x				x	x		x	x																						42c. Guam: AAFB - Use of pyrotechnics and other incendiary devices is limited to paved surfaces, ground pits, or ceramic-lined rooms.
Section 7 formal	Marianas	MILITARY TRAINING ACTIVITIES IN THE MARIANA ISLANDS TRAINING AND TESTING STUDY AREA: TERRESTRIAL SPECIES AND HABITATS	20-Feb-15	x	x	x				x	x		x	x																						43. Guam: AAFB - Helicopter overflights as part of training activities are prohibited below 1,000 feet (305 meters) above ground level (AGL) over Northwest Field north of the South Runway. This measure is designed to minimize visual disturbance and acoustic noise impacts on foraging or roosting Mariana fruit bats in the Northwest Field area. The satellite tracking station located at Northwest Field also has a flight restriction of 2,500 feet (760 meters) AGL within 1 nautical mile of the station.
Section 7 formal	Marianas	MILITARY TRAINING ACTIVITIES IN THE MARIANA ISLANDS TRAINING AND TESTING STUDY AREA: TERRESTRIAL SPECIES AND HABITATS	20-Feb-15	x	x	x				x	x		x	x																						44. Guam: AAFB - Overflights as part of training activities along all Andersen AFB clifflines are prohibited below 1,000 feet (305 meters) AGL.

Requirement	Location	Title	Project BO/BA/BE Date	Mariana fruit bat	Mariana swiftlet	Mariana common moorhen	Mariana crow	Micronesian kingfisher	Guam rail	Micronesian Megapode	Nightingale Reed-warbler	Serianthes nelsonii	Green sea turtle	Hawksbill sea turtle	Scalloped hammerhead	ESA Corals	EFH	Eugenia bryanii	Hedyotis megalantha	Heritiera longipetiolata	Phyllanthus saffordii	Psychotria malaspinae	Solanum guamense	Tinaspora homosepala	Bulbophyllum guamense	Cycas micronesica	Dendrobium guamense	Maesa walkeri	Nervilia jacksoniae	Tabernaemontana rotensis	Tuberolabium guamense	Mariana eight-spot butterfly	Guam tree snail	Humped tree snail	Fragile tree snail	Conservation Measure (One Per Row)
Section 7 formal	Marianas	MILITARY TRAINING ACTIVITIES IN THE MARIANA ISLANDS TRAINING AND TESTING STUDY AREA: TERRESTRIAL SPECIES AND HABITATS	20-Feb-15	x	x	x				x	x		x	x																						45. Guam: NBGMS - Helicopter overflights as part of training activities are restricted throughout the Naval Base Guam Munitions Site below 500 feet (150 meters) AGL. Fixed-wing aircraft are restricted below 1,000 feet (305 meters) AGL as part of training activities.
Section 7 formal	Marianas	MILITARY TRAINING ACTIVITIES IN THE MARIANA ISLANDS TRAINING AND TESTING STUDY AREA: TERRESTRIAL SPECIES AND HABITATS	20-Feb-15	x	x	x				x	x		x	x																						46. Guam: NBGMS - Riparian wetlands are dispersed throughout the Southern Land Navigation Area and recent surveys have detected moorhens in this area. No maneuver and navigation training will occur in riparian wetlands in this area, in accordance with COMNAVMARIANASINST 3500.4A (Table 3-4, pg. 38 and Fig 3-10, pg. 40).
Section 7 formal	Marianas	MILITARY TRAINING ACTIVITIES IN THE MARIANA ISLANDS TRAINING AND TESTING STUDY AREA: TERRESTRIAL SPECIES AND HABITATS	20-Feb-15	x	x	x				x	x		x	x																						47. Guam: NBG - Continuance of amphibious landing standard operating procedures; observation of normal harbor navigation rules, pre-exercise surveys for presence of sea turtles no more than six hours prior to an exercise, directing landing crafts to areas determined to be clear of sea turtles and sea turtle nests, restoration of beach topography using hand tools after exercises, monitoring of landing sites during night-time landing activities). These include:
Section 7 formal	Marianas	MILITARY TRAINING ACTIVITIES IN THE MARIANA ISLANDS TRAINING AND TESTING STUDY AREA: TERRESTRIAL SPECIES AND HABITATS	20-Feb-15	x	x	x				x	x		x	x																						47a. Guam: NBG - The Navy implements restrictions on landings and launches at beach and boat ramp locations to minimize impacts to sea turtles and their habitats.
Section 7 formal	Marianas	MILITARY TRAINING ACTIVITIES IN THE MARIANA ISLANDS TRAINING AND TESTING STUDY AREA: TERRESTRIAL SPECIES AND HABITATS	20-Feb-15	x	x	x				x	x		x	x																						47b. Guam: NBG - The Navy maintains restrictions on landings and launches, such as the use of the concrete boat ramp at Sumay Cove which is across from potential sea turtle nesting habitat.
Section 7 formal	Marianas	MILITARY TRAINING ACTIVITIES IN THE MARIANA ISLANDS TRAINING AND TESTING STUDY AREA: TERRESTRIAL SPECIES AND HABITATS	20-Feb-15	x	x	x				x	x		x	x																						47c. Guam: NBG - The Navy implements speed restrictions to avoid creating wakes; the use of the Sumay Cove ramp avoids and minimizes effects to sea turtle nesting sites.
Section 7 formal	Marianas	MILITARY TRAINING ACTIVITIES IN THE MARIANA ISLANDS TRAINING AND TESTING STUDY AREA: TERRESTRIAL SPECIES AND HABITATS	20-Feb-15	x	x	x				x	x		x	x																						47d. Guam: NBG - Currently, training does not occur on other Guam beaches that support sea turtles. Should the Navy decide to use other Guam beaches for amphibious landings, the Navy will implement appropriate measures.
Section 7 formal	Marianas	MILITARY TRAINING ACTIVITIES IN THE MARIANA ISLANDS TRAINING AND TESTING STUDY AREA: TERRESTRIAL SPECIES AND HABITATS	20-Feb-15	x	x	x				x	x		x	x																						48 Guam: Andersen AFB - The USAF implements training and operation restrictions at the Combat Arms Training and Marksmanship (CATM) range adjacent to Tarague Beach, Andersen AFB to minimize effects to sea turtles and Mariana fruit bat.
Section 7 formal	Marianas	MILITARY TRAINING ACTIVITIES IN THE MARIANA ISLANDS TRAINING AND TESTING STUDY AREA: TERRESTRIAL SPECIES AND HABITATS	20-Feb-15	x	x	x				x	x		x	x																						48a. Guam: Andersen AFB - Night-training occurs at the CATM range; therefore night-lighting is installed. The lighting configuration at this location is maintained with four flood lights, located below the tree canopy level that are directed inland and parallel to the coast. Lighting in this configuration will avoid impacts to nesting and hatching sea turtles and Mariana fruit bats.
Section 7 formal	Marianas	MILITARY TRAINING ACTIVITIES IN THE MARIANA ISLANDS TRAINING AND TESTING STUDY AREA: TERRESTRIAL SPECIES AND HABITATS	20-Feb-15	x	x	x				x	x		x	x																						48b. Guam: Andersen AFB - The CATM range allows for training with small arms, inert mortars to 60 millimeter, and 40 millimeter grenade launchers. These weapons do not produce percussive force and no weapons that produce percussive force can be used at this facility.
Section 7 formal	Marianas	MILITARY TRAINING ACTIVITIES IN THE MARIANA ISLANDS TRAINING AND TESTING STUDY AREA: TERRESTRIAL SPECIES AND HABITATS	28-Feb-16	x	x	x				x	x		x	x																						1.1 Terms & Conditions (Revised) - The DoD action agencies for the MITT program shall provide funding, not to exceed $1.77 million, for invasive vertebrate pest control to be implemented by the Service to minimize the effect of take on the Micronesian megapode. The Service will be responsible for identifying where invasive vertebrate pest control will be conducted; complying with all applicable legal requirements and obtaining required approvals; providing DoD with an implementation plan and associated budget; implementing the control action; and responding to related media inquiries. Except for providing the necessary funding, DoD is not responsible for project implementation or the results thereof, and failure to implement the control project or achieve the desired results will no be a cause for reinitiation.

Requirement	Location	Title	Project BO/BA/BE Date	Mariana fruit bat	Mariana swiftlet	Mariana common moorhen	Mariana crow	Micronesian kingfisher	Guam rail	Micronesian Megapode	Nightingale Reed-warbler	Serianthes nelsonii	Green sea turtle	Hawksbill sea turtle	Scalloped hammerhead	ESA Corals	EFH	Eugenia bryanii	Hedyotis megalantha	Heritiera longipetiolata	Phyllanthus saffordii	Psychotria malaspinae	Solanum guamense	Tinaspora homosepala	Bulbophyllum guamense	Cycas micronesica	Dendrobium guamense	Maesa walkeri	Nervilia jacksoniae	Tabernaemontana rotensis	Tuberolabium guamense	Mariana eight-spot butterfly	Guam tree snail	Humped tree snail	Fragile tree snail	Conservation Measure (One Per Row)
Section 7 formal	Marianas	MILITARY TRAINING ACTIVITIES IN THE MARIANA ISLANDS TRAINING AND TESTING STUDY AREA: TERRESTRIAL SPECIES AND HABITATS	20-Feb-15	x	x	x				x	x		x	x																						2.1 Terms & Conditions: FDM - The DoD action agencies for the MITT program shall establish a formal protocol for the timing and implementation of megapode surveys on FDM in coordination with and the approval of the Service within 180 days of issuance date of the accompanying Opinion.
Section 7 formal	Marianas	MILITARY TRAINING ACTIVITIES IN THE MARIANA ISLANDS TRAINING AND TESTING STUDY AREA: TERRESTRIAL SPECIES AND HABITATS	20-Feb-15	x	x	x				x	x		x	x																						2.2 Terms & Conditions - FDM: The DoD action agencies for the MITT program shall conduct surveys for the Micronesian megapode along trails or paths that have been established during target refurbishment and operational range clearance activities. The results of these surveys shall be used as an index of megapode population change over time due to take impacts on FDM caused by the proposed action. Mariana fruit bats observed during surveys shall be recorded.
Section 7 formal	Marianas	MILITARY TRAINING ACTIVITIES IN THE MARIANA ISLANDS TRAINING AND TESTING STUDY AREA: TERRESTRIAL SPECIES AND HABITATS	20-Feb-15	x	x	x				x	x		x	x																						2.3 Terms & Conditions - FDM: The DoD action agencies for the MITT program shall establish an appropriate monitoring protocol for ground surveys in conjunction with range maintenance activities on FDM to monitor megapode and bat habitat changes over time on FDM, and for reporting the results of this analysis in coordination with and the approval of the Service within 180 days of the issuance date of the accompanying Opinion.
Section 7 formal	Marianas	MILITARY TRAINING ACTIVITIES IN THE MARIANA ISLANDS TRAINING AND TESTING STUDY AREA: TERRESTRIAL SPECIES AND HABITATS	20-Feb-15	x	x	x				x	x		x	x																						2.4 Terms & Conditions - The DoD action agencies for the MITT program shall provide the results of surveys and the change in habitat on FDM and concisely discuss the successes and challenges of implementing all the avoidance, minimization and conservation measures and terms and conditions listed in the Biological Opinion in an annual report submitted to the Service. The report also shall include the changes to the no impact area as a result of the accidental bombing and destroyed targets entering this area. The report is due at the end of the calendar year, December 31st, for the life of the project.
Section 7 formal (consultation in progress - CMs are tentative)	Guam	Re-Initiation of Consultation regarding the Proposed Military Relocation to Guam	7-Jul-05	x	x		x	x	x			x	x	x																						Brown Treesnake Research and Suppression - The DON has initiated support for large-scale, long-term efforts to refine methods for BTS control that will reduce the snake population on a landscape level more cost-effectively and increase the efficacy of capturing snakes in low-density situations. In early FY12, the DON coordinated with the USFWS, USDA, and U.S. Geological Survey (USGS) on priority BTS research projects. The development of a bait formulation for BTS suppression was determined to be the highest priority research need. The USDA National Wildlife Research Center (NWRC) was funded for a multi-year project by the DON at the start of FY13 to implement the bait formulation research. The DON will continue to fund selected research/design projects identified as priorities in the Brown Treesnake Technical Working Group Strategic Plan that are compatible with the military mission on Guam for up to 10 years from the start of main cantonment construction. Dependent upon the success of current experimental suppression activities within the Habitat Management Unit (HMU) or identification of an effective alternate technology, the DON will install a BTS barrier to exclude BTS from approximately 160 acres (65 ha). If the DON is successful at eradicating BTS within the 160 acres, the DON will install a second BTS barrier to exclude BTS from approximately 300 acres (121 ha). In response to decreased BTS densities, the rodent and feral cat population is expected to increase. In order to address this anticipated increase the DON will implement rodent and feral cat control. Rodent control would benefit recovery habitat as rodents consume seeds. Feral cat control would benefit the recovery of endangered birds as cats predate on native birds. The BTS fence areas are also areas proposed for forest enhancement.
Section 7 informal	Marianas	Informal Consultation on Mariana Islands Training and Testing Program Affects to Eighteen Newly-Listed Species, Guam and Tinian	10-Jun-16															x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	Guam: Training areas, including transit routes necessary to reach training areas, are clearly identified and marked. Vehicular activities will be restricted to designated and previously identified areas.

Guam Micronesian Kingfisher Memorandum of Agreement (June 2015) and Modification to Guam Micronesian Kingfisher Memorandum of Agreement (December 2015)

This page intentionally left blank.

MEMORANDUM OF AGREEMENT

Between

THE DEPARTMENT OF THE NAVY
And
THE U.S. FISH AND WILDLIFE SERVICE

Regarding

CONSERVATION OF GUAM MICRONESIAN KINGFISHER RECOVERY HABITAT
In
NORTHERN GUAM

I. PARTIES

This Memorandum of Agreement (MOA) is entered into by and between the Department of the Navy (DON) and the U.S. Fish and Wildlife Service (USFWS), hereinafter referred to as "the Parties."

II. PURPOSE AND SCOPE

A. The purpose of this MOA is to ensure that:

1. A sufficient amount of suitable survival and recovery habitat (hereinafter "habitat") is conserved and managed in accordance with federal agency obligations under section 7(a) of the Endangered Species Act, 16 U.S.C. § 1536(a) in northern Guam to support the reintroduction and recovery of the Guam Micronesian kingfisher (hereinafter "kingfisher"); and

2. The DON can meet the purpose and need for the proposed action to relocate U.S. Marines to Guam (hereinafter "Guam Military Relocation") in accordance with its responsibilities under Title 10 of the U.S.C.

B. The provisions of this MOA will inform the Parties' respective present and future mitigation actions and decisions under section 7(a) of the Endangered Species Act (16 U.S.C. § 1531 et seq.), including those mitigation actions and decisions under subsection 7(a)(2) currently pending regarding the DON's proposed relocation of U.S. Marines to Guam as discussed in paragraph.IV.E below.

III. AUTHORITY

A. Section 7(a) of the Endangered Species Act (ESA), 16 U.S.C. § 1536(a)

B. Section 101 of the Sikes Act, 16 U.S.C. § 670a (as amended)

C. Title 10 U.S.C. § 5063

D. This MOA neither modifies existing agency authorities nor reduces, expands, or transfers any of the respective statutory or regulatory authorities and responsibilities of the Parties.

IV. BACKGROUND

A. Private and public development on Guam has reduced the amount of potentially available habitat for the kingfisher to a point where it has created uncertainty regarding whether there will be a sufficient amount habitat preserved for the future reintroduction and ultimate recovery of the kingfisher on Guam which supports the entire native range of the species.

B. The endangered kingfisher is currently extirpated on Guam. The USFWS has depicted "survival and recovery habitat" for the kingfisher on Guam in Figure 1 (hereinafter "kingfisher habitat"). The Parties agree that conservation of habitat of sufficient quality and quantity to support the reintroduction and ultimate recovery of the endangered kingfisher is needed on Guam.

C. The Parties have a responsibility under the ESA to conserve and protect endangered species.

D. The USFWS currently estimates that approximately 11,512 acres of habitat for the kingfisher is needed across all of northern Guam to support its survival and recovery in the wild. The USFWS has identified approximately 14,997 acres of potential kingfisher habitat in northern Guam, of which approximately 10,742 acres are located on lands currently under the custody and control of the Department of Defense (DoD) (Figure 1). The USFWS estimates that 8,178 acres of these 10,742 acres need to be conserved in northern Guam to provide reasonable certainty that sufficient habitat for the species will remain available for reintroduction and recovery of the kingfisher. The Parties further agree that lands in northern Guam not currently under the custody and control of DoD are also required to support the reintroduction and ultimate survival of the kingfisher in the wild.

E. The DON is proposing to relocate approximately 5,000 Marines as part of the Guam Military Relocation. This proposal is central to the U.S. Government's rebalancing of forces in the Pacific. The purpose and need for the proposed action is to ensure that the relocated Marines are organized, trained, and equipped as mandated in section 5063 of Title 10 of the U.S.C., to satisfy individual live-fire training requirements, and to establish an operational U.S. Marine Corps (USMC) presence in Guam in

accordance with April 2012 adjustments to the May 2006 United States-Japan Roadmap for Realignment Implementation.

F. The Guam Military Relocation would result in the clearing of approximately 1,015 acres of kingfisher habitat in northern Guam on lands currently under the custody and control of DoD. In addition, the USFWS estimates that an additional 319 acres will be indirectly impacted by the proposed action thereby resulting in a total impact to kingfisher habitat of approximately 1,334 acres in northern Guam.

V. GENERAL PROVISIONS

A. The USFWS has determined that approximately 8,178 total acres are required on lands currently under the custody and control of DoD in northern Guam to provide sufficient habitat for the reintroduction and eventual recovery of the kingfisher (Figure 2). To facilitate kingfisher conservation goals, the DON agrees to designate approximately 5,234 acres under the custody and control of the DoD in northern Guam as identified on Figure 3, to a status that will provide durable habitat protection needed to support native habitat restoration and land management for the survival and recovery of the kingfisher. These 5,234 acres have been identified by the USFWS as habitat for the kingfisher and needed to offset impacts of the Guam Military Relocation. The Parties recognize that the designation of the 5,234 acres under this paragraph may also provide a conservation benefit to other Federally-listed species with similar habitat requirements (e.g. Mariana crow, Mariana fruit bat).

B. Consistent with the Joint Region Marianas (JRM) Integrated Natural Resources Management Plan (INRMP) developed in accordance with section 101 of the Sikes Act, the DON agrees to actively restore native habitat and manage, in collaboration with the USFWS, the 5,234 acres identified in Figure 3 consistent with DoD's obligations under the 7(a) of the ESA and the Sikes Act to benefit the survival and recovery of the kingfisher. The DON will work cooperatively with the USFWS to identify, develop and implement specific management activities and projects on these 5,234 acres to support the following: 1) brown treesnake (BTS) control and suppression to facilitate the larger goal of suppressing snake population levels that will ultimately support kingfisher survival and recovery; 2) support for BTS control and eradication methods development, focusing on tools and techniques needed for landscape level survival and recovery of the kingfisher, 3) ungulate fencing and eradication; 4) control of small mammalian predators; 5) invasive plant control and eradication; 6) native plant restoration; and, 7) localized control of introduced invertebrates that may negatively impact kingfisher nesting/fledging. The DON has funded and initiated a number of projects to support the seven focal activities identified above. The DON agrees to continue these activities with items (2) and (3) prioritized for continued funding.

C. The JRM INRMP will be completed by DON within 365 days of signing of the MOA. This timeline is contingent upon the USFWS providing its specific concerns with the 2013 draft INRMP to the DON within 45 days of the signing of this MOA. Any delay by the USFWS in providing comments to the DON will result in a corresponding

extension of this 365-day time period. In accordance with the Sikes Act, the DON will coordinate with the USFWS on specific INRMP projects and goals. Such coordination will include, but is not limited to, the annual INRMP review.

D. Recognizing the importance of DoD's mission in northern Guam, within 120 days of the signing of the Record of Decision (ROD) for the Guam Military Relocation, the DON may, in collaboration with the USFWS, identify an alternative configuration for the 5,234 acres of habitat identified in Figure 3 as necessary to enable the DoD to meet its national defense requirements. While the DON anticipates that the 5,234 acres identified in Figure 3 will enable DoD to meet its requirements, DoD must conduct a thorough assessment to ensure current and future military requirements are appropriately considered. The revised map (acreage) must total at least 5,234 acres and be derived from areas identified in Figure 2 and provide contiguous landscape and connected forested habitat corridors. If an alternative configuration is not defined within 120 days of the signing of the ROD, the Parties agree to default to the acreage identified in Figure 3.

E. DON will provide durable habitat protection for the 5,234 acres identified in Figure 3 or as modified in subparagraph V.D. However, should an emerging national defense requirement dictate that some of the aforementioned 5,234 acres be cleared or otherwise made unsuitable for kingfisher survival and recovery, in coordination with the USFWS, the DON will identify and substitute habitat of equal or greater quality, as determined by the USFWS, to replace the impacted habitat. If habitat of equal or greater quality cannot be identified, then additional acreage suitable for kingfisher survival and recovery will be placed in durable protection to offset the loss of higher quality habitat. The amount of habitat will be determined based on the kingfisher mitigation framework developed using the best available information at that time. The Parties recognize that any substituted habitat must provide contiguous landscape and connected forest habitat corridors. The DON commits to rigorously exploring other alternatives to support an emerging national defense requirement and will only use lands within the 5,234 acres to meet the requirement if absolutely necessary.

F. For the land identified on Figure 3 (or as amended via the process described in subparagraph V.D of this MOA), the USFWS requires enhanced management activity to ensure this habitat supports reintroduction of the kingfisher. Accordingly, starting in Fiscal Year (FY) 2016, the DON commits to provide an additional $2 million per year of funding above execution year INRMP funding levels (as adjusted for inflation) for the next ten years, subject to Congressional authorization and appropriation. This additional funding will be used to support projects that fall within one of the seven focal activities identified under subparagraph V.B of this MOA, according to priorities established jointly by DON and the USFWS. Upon expiration of this ten-year period (FY 2026), the Parties mutually agree to reassess progress of recovery efforts. If, following this assessment, the USFWS determines that it remains possible to recover the kingfisher on Guam, the DON commits to extend the additional $2 million per year in funding for another five years. Subsequently, the Parties will reassess the progress of recovery efforts every five years. So long as the USFWS determines that it remains

possible to recover the kingfisher on Guam, and until the kingfisher is delisted, every five years the DON and USFWS will identify activities and a schedule of implementation that the USFWS determines are sufficient to conserve and enhance the habitat needed to support the survival and recovery of the kingfisher on these 5,234 acres. The DON will implement these activities, dedicating $2 million annually in accordance with the JRM INRMP. The Parties recognize that the level of funding may vary depending on the activities to be implemented in a given year, but will not exceed $2 million annually. The Parties may also subsequently modify, as necessary, the focal activities identified in subparagraph V.B of this MOA to be implemented on the 5,234 acres.

G. If the provisions of subparagraphs V.A to F of this MOA are not implemented as described herein, barring mutual agreement by the Parties, the Guam Military Relocation section 7 ESA consultation will require re-initiation. In addition, nothing in this MOA is intended to affect the responsibility of the USFWS and DON to re-initiate consultations pursuant to 50 CFR § 402.16, or the re-initiation regulation then applicable.

H. If new scientific information indicates the amount or extent of habitat needed for the survival and recovery of the kingfisher is different than identified herein, as determined by the USFWS, the Parties will revise this MOA in accordance with paragraph VI of this MOA.

I. The DON will maintain management authority on kingfisher habitat on Guam under the custody and control of DoD unless DoD transfers management authority to another military service, in which case the responsibilities under this MOA that apply to DON shall transfer to the military service that assumes land management authority.

J. In accordance with established security procedures to grant access to military facilities, USFWS staff shall be provided reasonable access to kingfisher habitat identified on lands under the custody and control of the DoD. DON commits to working with the USFWS to help streamline the security approval process.

VI. MODIFICATIONS, INTERPRETATIONS, ENFORCEABILITY AND TERMINATION

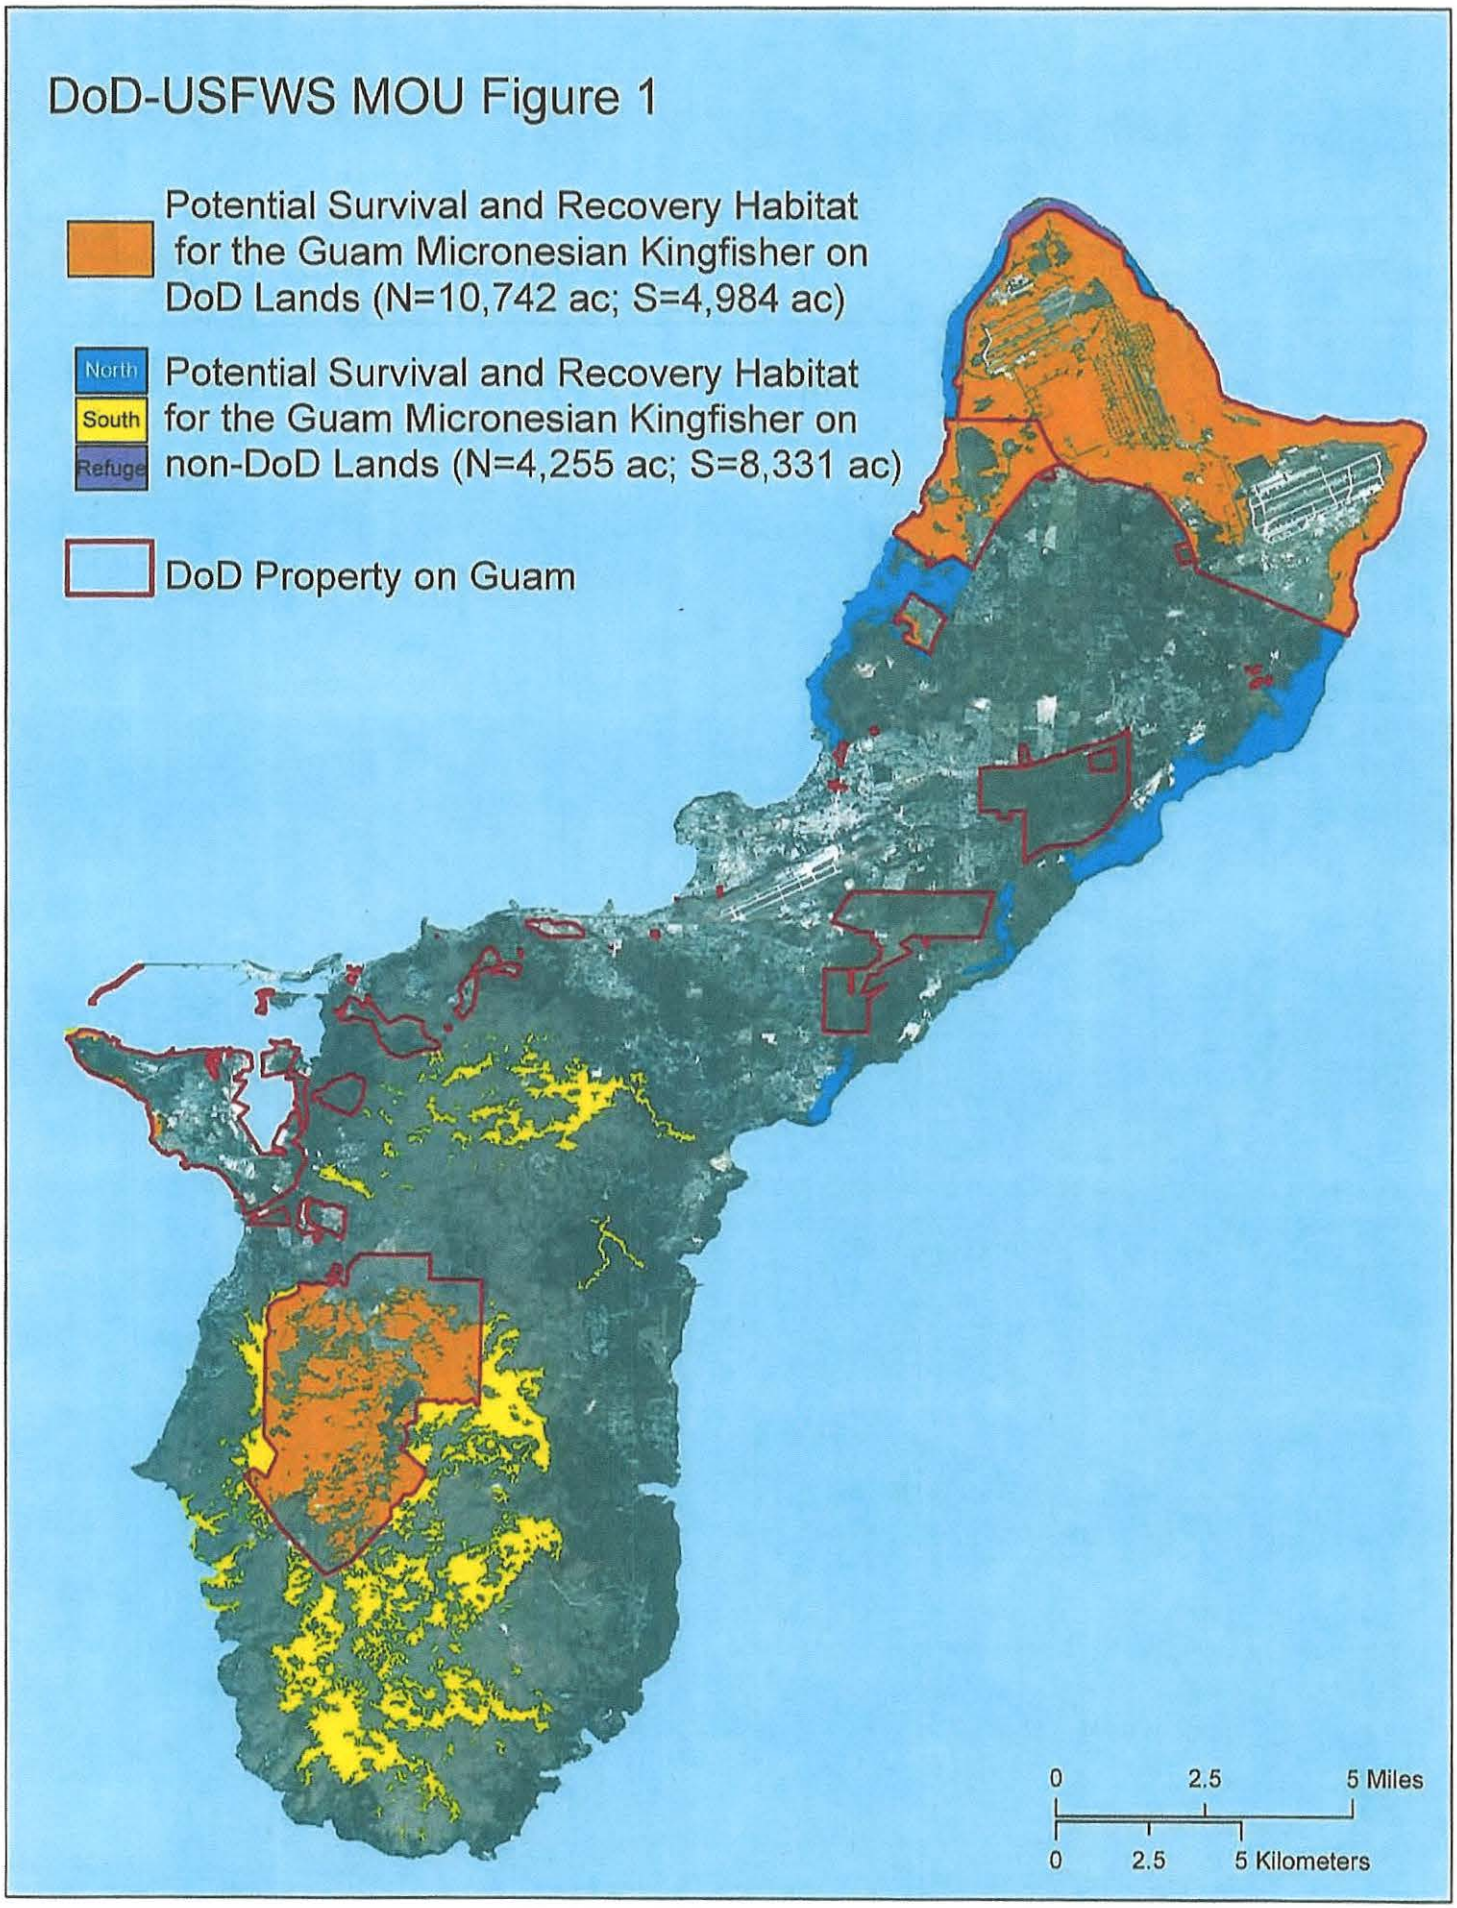
A. Changes and/or modifications to this MOA may be made at any time upon mutual written consent of the Parties. With regard to both Parties, no oral statement by any person and no written statement by anyone other than the undersigned, or an authorized representative as designated in writing, shall be interpreted as modifying or otherwise affecting the terms of this MOA.

B. This MOA shall be deemed null and void in its entirety if any one of the following events occurs: 1) Both Parties revoke the agreement in writing; 2) the DON does not sign a ROD with the currently identified preferred alternative in the Final Biological Assessment regarding the DON's proposed Guam Military Relocation as discussed in

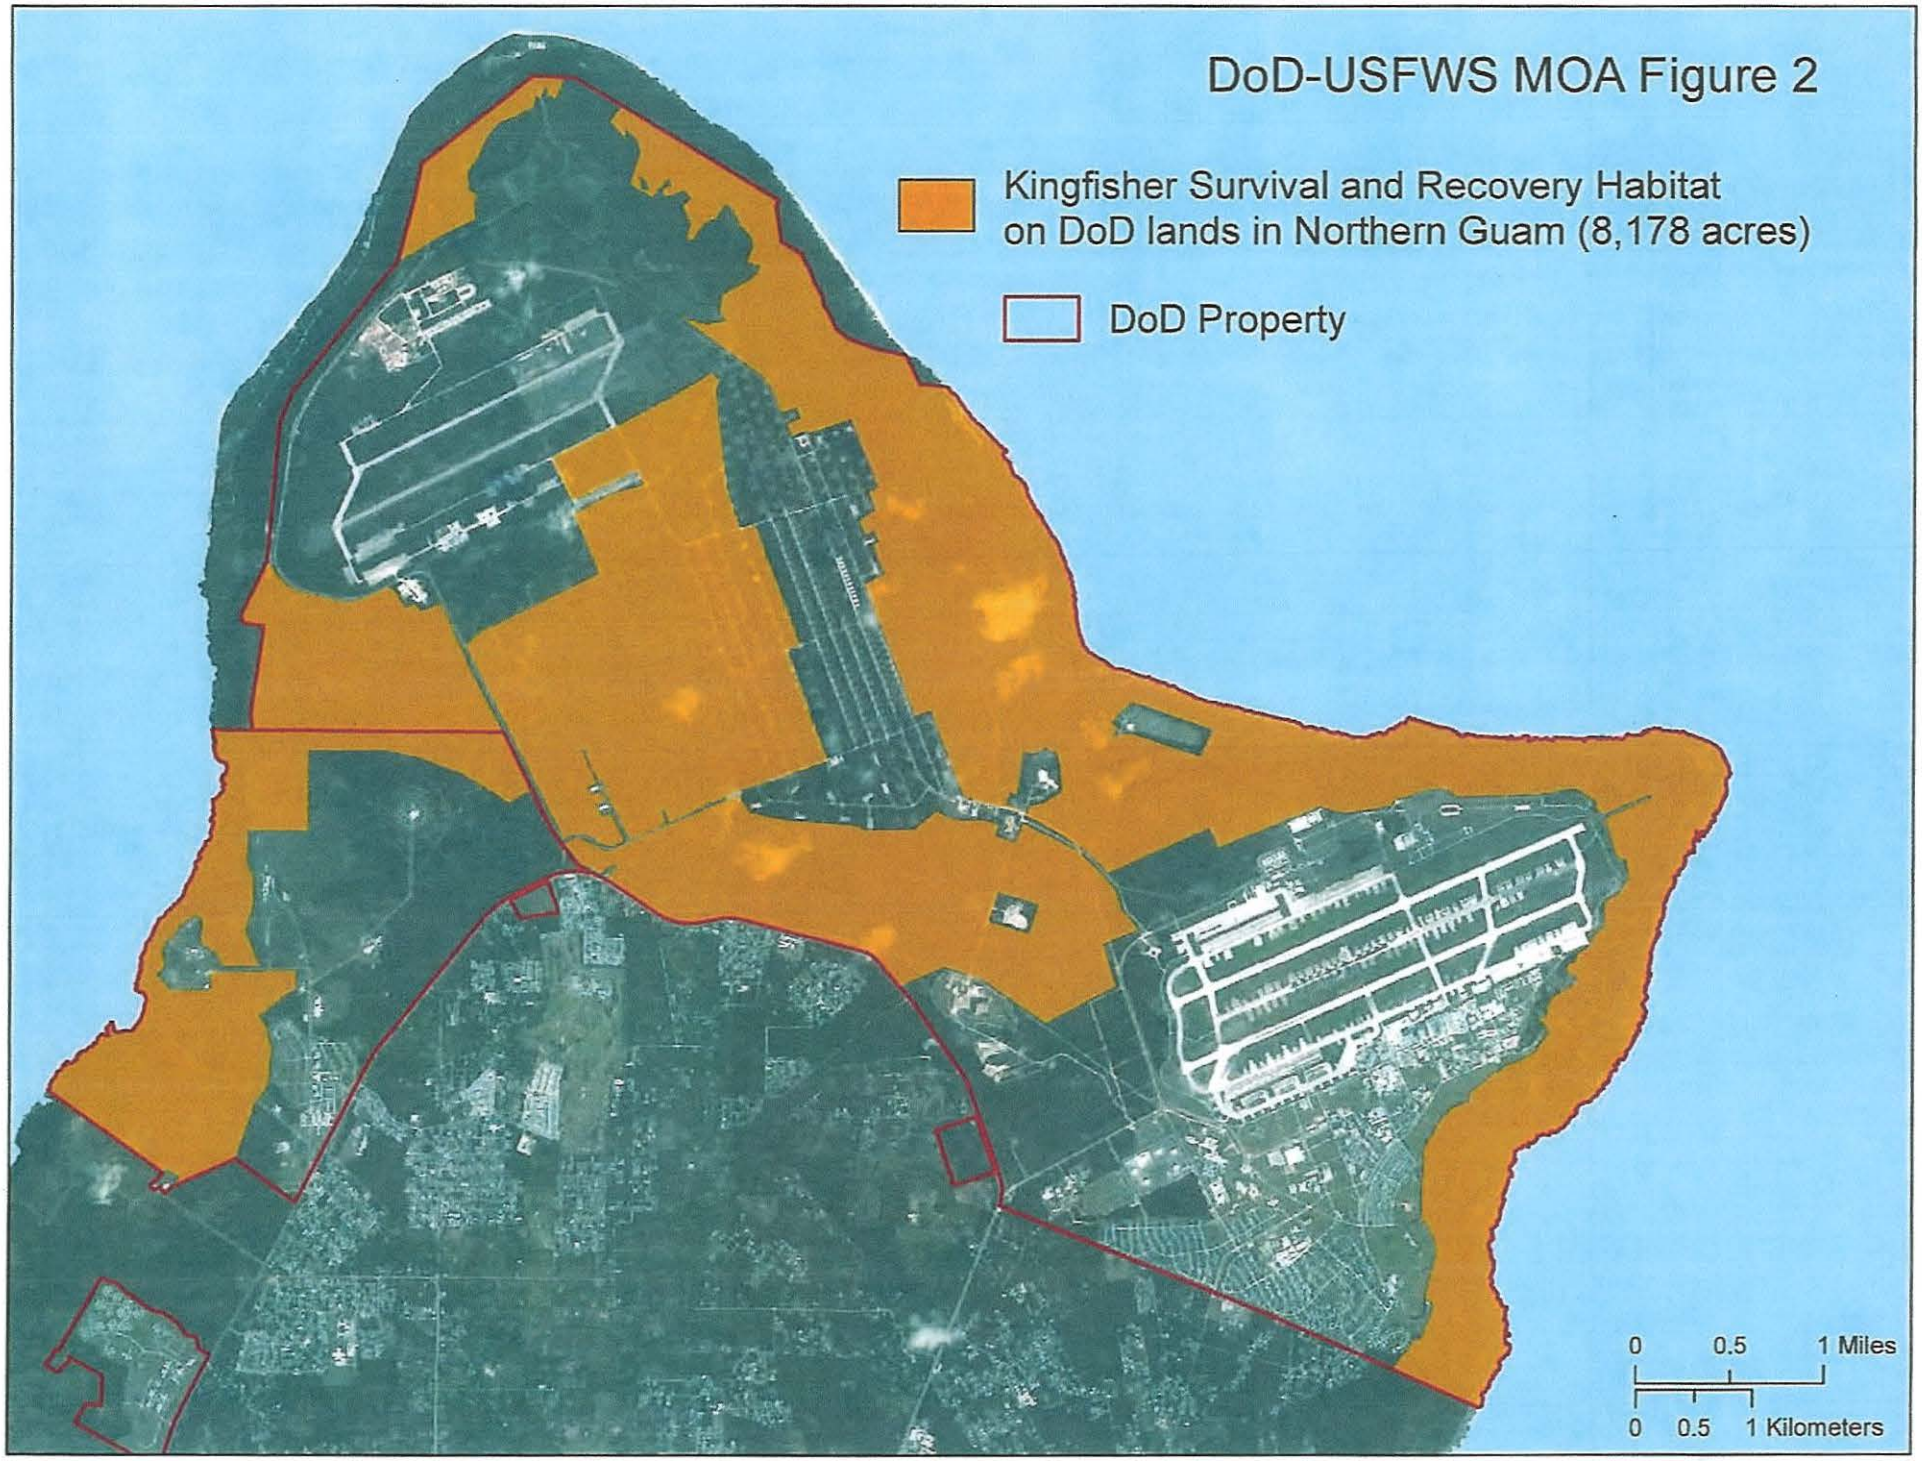
paragraph IV.E of this MOA; or 3) the USFWS determines that the kingfisher is no longer viable for reintroduction on Guam.

C. The Parties understand and agree that performance by the DON of any of the terms of this MOA is subject to the availability of appropriated funds. Nothing herein shall constitute nor be considered to constitute an obligation or expenditure of funds in advance of or in excess of a proper appropriation by the Congress of the United States or otherwise be in violation of the Anti-Deficiency Act, 31 U.S.C. § 1341 et seq.

D. This MOA shall not be construed to create any private right, privilege, remedy, claim or cause of action against the Parties for or by any person or entity.



VII. RESOLUTION OF DISAGREEMENTS



The Parties shall consult with one another to resolve issues at staff levels and elevate disputes through the respective organizational levels only if necessary. Notification of potential areas of disagreement by either agency should be in writing. If there is no resolution at the staff level, either agency may elevate the issue to the appropriate official within each agency or department.

MODIFICATION TO MEMORANDUM OF AGREEMENT

BETWEEN

THE DEPARTMENT OF THE NAVY

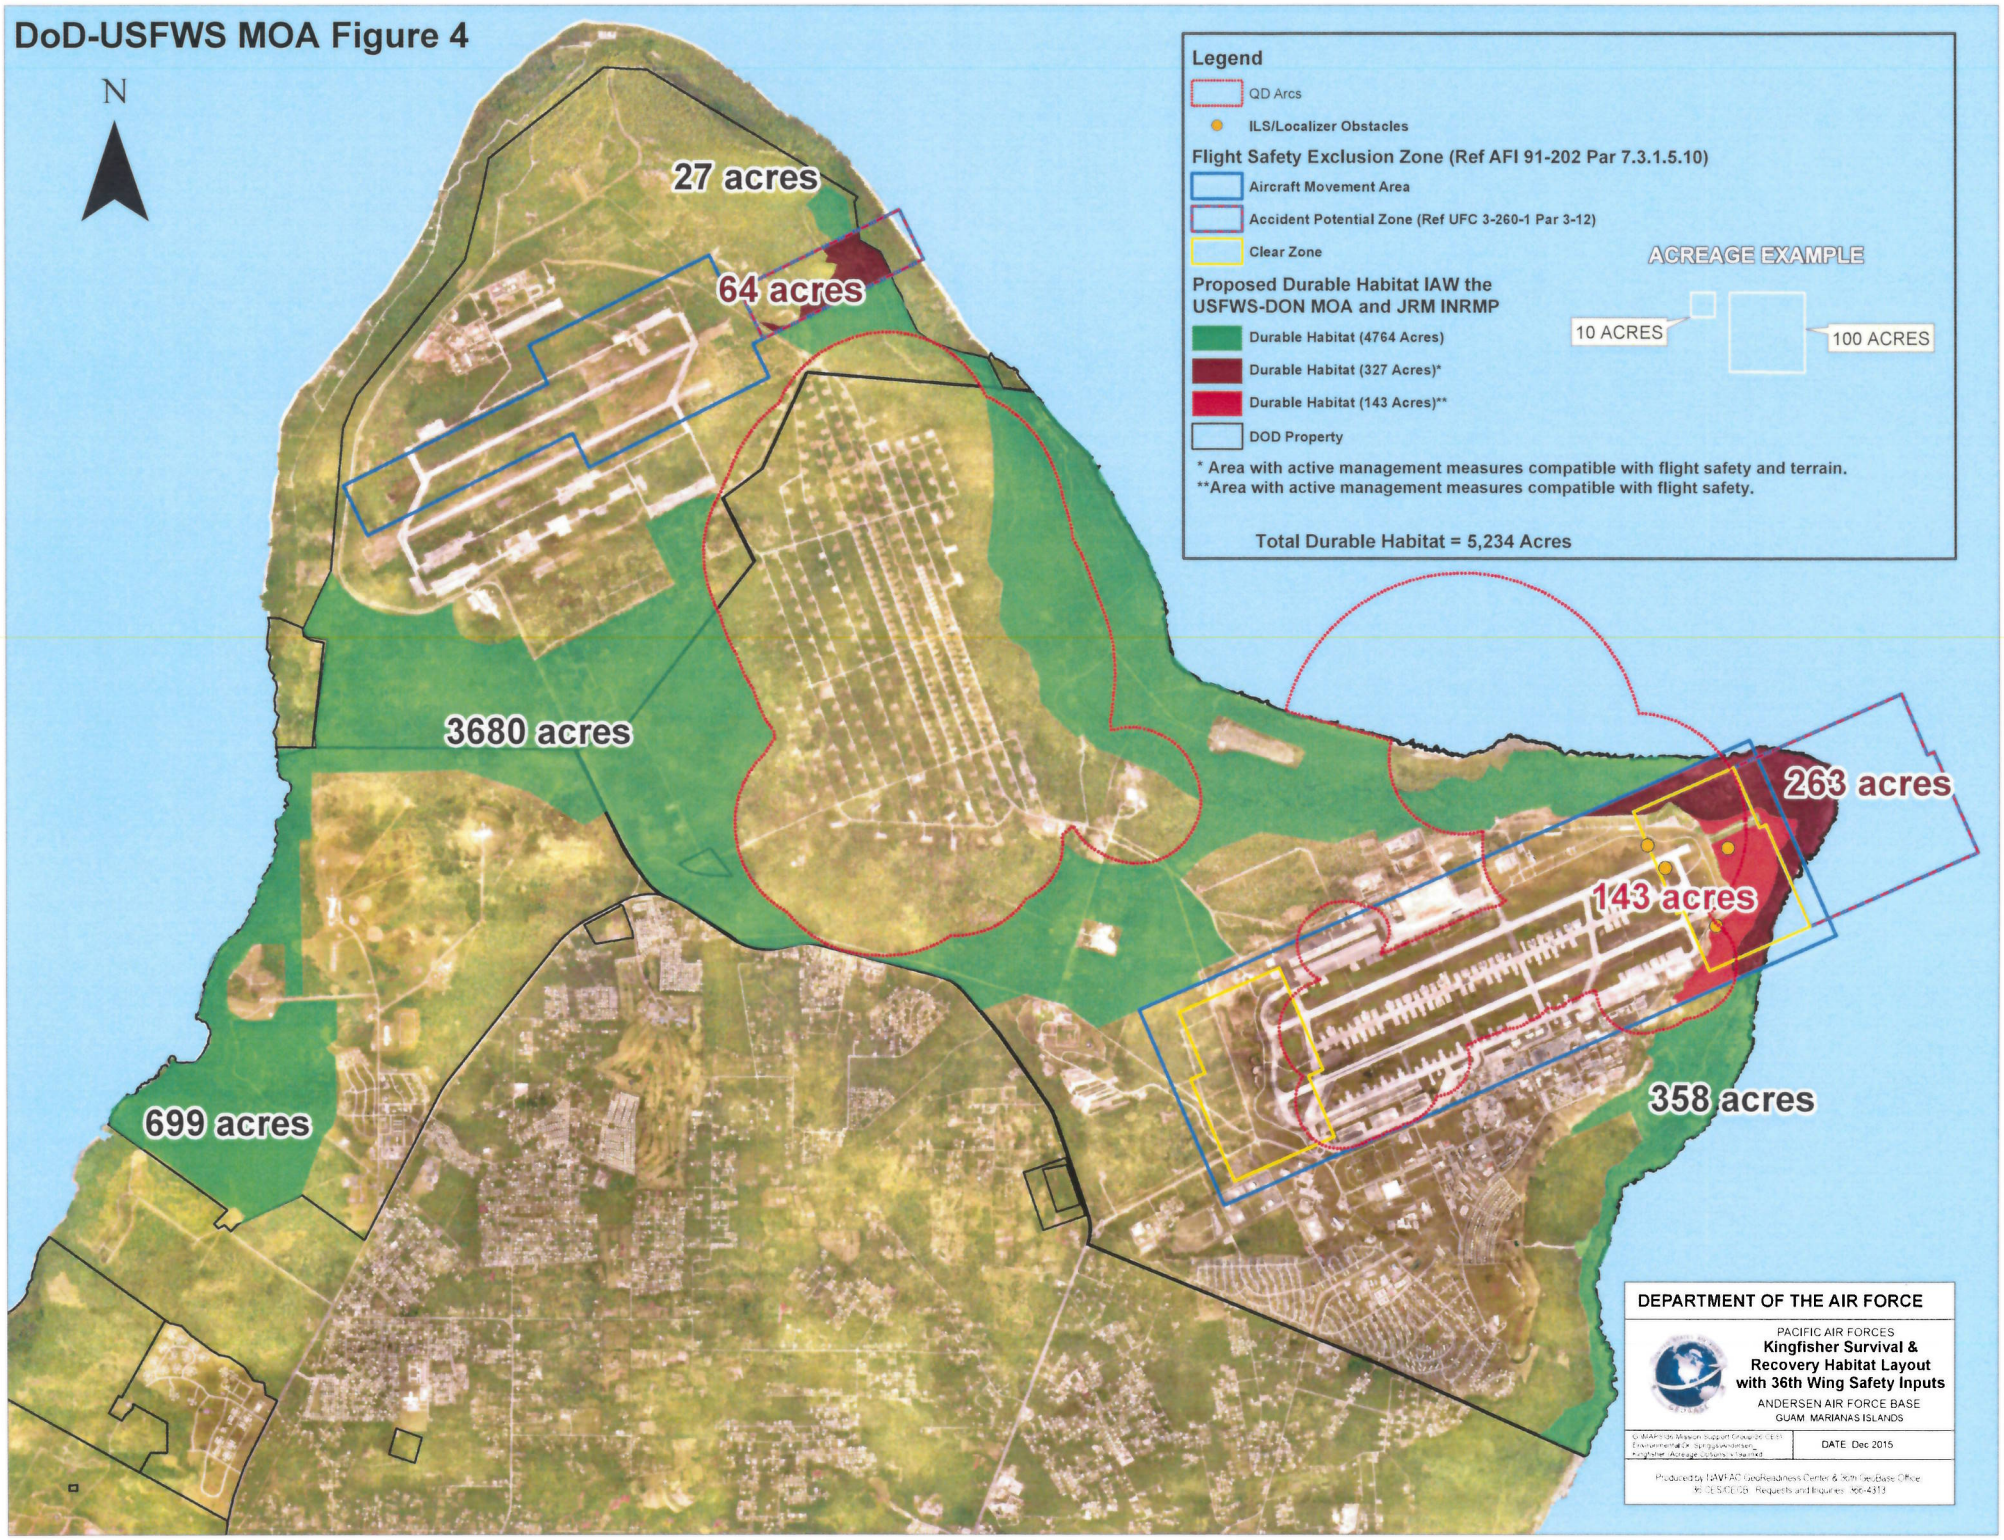
AND

THE U.S. FISH AND WILDLIFE SERVICE

Subj: DESIGNATION OF ALTERNATIVE CONFIGURATION FOR GUAM MICRONESIAN KINGFISHER RECOVERY HABITAT IN NORTHERN GUAM

Ref: (a) Memorandum of Agreement (MOA) between the Department of the Navy (DON) and the U.S. Fish and Wildlife Service (USFWS) regarding Conservation of Guam Micronesian Kingfisher (GMK) Recovery Habitat in Northern Guam signed 11 June 2015

1. In accordance with subparagraph V.D. of reference (a) regarding identification of an alternative configuration for the 5,234 acres of habitat for the recovery and survival of the GMK in northern Guam, the DON and USFWS mutually agree to the revised map (acreage) provided as Figure 4.



2. The alternative configuration designates 5,234 acres to a status that will provide durable habitat protection needed for the kingfisher and needed to offset impacts of the Guam Military Relocation.

3. This revised map (acreage) hereby replaces habitat designated in Figure 3 of reference (a).

Final

Environmental Assessment

Joint Region Marianas Integrated Natural Resources Management Plan for

Joint Region Marianas-administered and Leased Lands On Guam, Tinian, and Farallon de Medinilla

June 2019

Prepared for:
Joint Region Marianas

This page intentionally left blank.

enhancement projects on Guam and Tinian that are aimed at protecting and restoring priority native habitats for the benefit of the Mariana fruit bat. Also planned are continued fruit bat population monitoring on AAFB to maintain and identify habitat relationships. No adverse effect to the Mariana fruit bat would occur under the Proposed Action.

Long-term, beneficial impacts would be expected for native bird populations as a result of implementation of the Proposed Action. There would be long-term, beneficial impacts especially on Guam where native bird populations were decimated by the introduction of the brown treesnake (*Bioga irregularis*) after World War II. Management activities associated with implementation of the 2019 JRM INRMP would contribute to survival and recovery of protected bird species, provide valuable information to inform management actions to facilitate population persistence and expansion, and help examine long-term population trends and changes in the wetland habitat. In addition to surveys for listed birds, surveys would be conducted every five years on Tinian to document long-term trends in density and abundance of native forest and Migratory Bird Treaty Act-listed bird populations. No adverse effects to native birds would occur under the Proposed Action.

Reptile populations would benefit from baseline monitoring and adaptive management that contributes to improved habitat conditions. Many of the terrestrial management projects would have indirect benefits for native reptiles, and a number of the management projects were developed particularly for native reptile conservation.

Long-term, beneficial impacts would be expected for native invertebrate populations as a result of implementation of the Proposed Action. Many of the terrestrial management projects would have indirect benefits for native invertebrates. A number of the management projects were developed particularly for native invertebrate conservation, including actions to conduct tree snail and butterfly surveys to identify the locations of unknown populations; locate, protect, and propagate native invertebrate host plants; conduct studies that assess the impacts of parasitoids, and develop methods for their control.

Therefore, implementation of the Proposed Action would not result in significant adverse impacts to terrestrial biological resources.

Marine Biological Resources. The 2019 JRM INRMP management projects would have indirect, long-term, beneficial impacts to marine flora and fauna through implementation of management strategies and actions aimed at protecting habitat diversity, maintaining healthy coral reefs, and enhancing habitat. The 2019 JRM INRMP aims at controlling populations of invasive marine species, controlling erosion, mapping benthic communities, restoring coral reefs, and monitoring and adaptively managing marine ecosystems on JRM-administered and leased submerged lands. As maintaining a high level of habitat diversity that does not conflict with the military mission is a priority of this INRMP, implementation of the 2019 JRM INRMP would result in improved marine habitat conditions.

The 2019 JRM INRMP management actions are consistent with the directives of EO 13089, *Coral Reef Protection*. ESA-listed coral species that may occur in the area include *Acropora globiceps*, *Acropora retusa*, and *Seriatopora aculeata*. To the extent that these species occur, they may benefit from survey data that better define their distributions and the habitat conditions that support them. In addition, surveys help to identify locations where (a) impacts can be avoided or reduced or (b) opportunities may exist to enhance the habitat of local populations. Insofar as only beneficial effects would occur, there would be no significant adverse impacts on corals.

Fish populations and essential fish habitat (EFH) would benefit from baseline monitoring and adaptive management that contributes to improved habitat conditions. No adverse effect to EFH would occur under the Proposed Action. One ESA-listed fish species, the scalloped hammerhead shark (*Sphyrna lewini*), may occur in waters of the study area, although documented occurrences are few. Beneficial impacts could affect scalloped hammerhead and other fish species of concern, including humphead wrasse (*Cheilinus undulatus*) and bumphead parrotfish (*Bolbometopon muricatum*), as a result of the new environmental deoxyribonucleic acid study to detect the occurrence and habitat use of these species in Apra Harbor. Given only beneficial, if

any, effects to this species, there would be no significant adverse impacts on the scalloped hammerhead shark.

All five species of sea turtles that may occur in the study area are ESA-listed but only two, the green turtle (*Chelonia mydas*) and hawksbill turtle (*Eretmochelys imbricata*), are reasonably likely to occur in areas affected by the Proposed Action. Under the 2019 JRM INRMP, extensive monitoring and protective management of nesting beaches within JRM-administered and leased lands and submerged lands would have potentially beneficial effects to sea turtles. An existing project on sea turtle distribution and habitat use on JRM-administered submerged lands around Guam, using satellite tags, has the potential to inform beneficial management actions for sea turtles in water.

The most common marine mammals that occur in the waters within 3 miles (4.8 kilometers) of the coastline are spinner dolphins (*Stenella longirostris*), bottlenose dolphins (*Tursiops truncatus*), and pantropical spotted dolphins (*Stenella attenuata*). Several other species, including ESA-listed sperm whales (*Physeter macrocephalus*) and humpback whales (*Megaptera novaeangliae*), have been infrequently encountered and/or usually occur farther offshore. The Proposed Action includes the continuation of annual marine mammal surveys off Guam and the CNMI. The 2016 surveys resulted in encounters with the aforementioned species as well as rough-toothed dolphins (*Steno bredanensis*), short-finned pilot whales (*Globicephala marcrorhynchus*), and dwarf sperm whales (*Kogia sima*). Satellite tags were deployed on sperm and short-finned pilot whales as well as a pantropical spotted dolphin (Hill et al. 2017). Data from these surveys indirectly benefits marine mammals by enabling more informed assessments of the potential effects of DoD training activities.

Therefore, implementation of the Proposed Action would not result in significant adverse impacts to marine biological resources.

Land Use. As required by the Sikes Act (as amended) and DoD Instruction 4715.03, the 2019 JRM INRMP was developed in a manner that ensures that there would be no net loss of the capability of installations to support military missions and future mission requirements. The 2019 JRM INRMP is consistent with current land use plans and policies of JRM-administered and

leased lands as well as for any planned military uses. Implementation of the 2019 JRM INRMP would not adversely affect the short-term or long-term use of land for military activities.

Ecosystem management is emphasized in the 2019 JRM INRMP (see Section 3.1) because the DoD recognizes that the mission of the JRM is inextricably linked to local, regional, and global ecological integrity and that sustaining ecosystem integrity is the best way to protect biodiversity, ensure sustainable use, and minimize the effort and cost of management. Thus, implementing the 2019 JRM INRMP would result in long-term, beneficial impacts on military use of JRM-administered and leased lands and public use of surrounding areas, by ensuring that healthy and self-sustaining natural resources such as clean water, stable soils and beaches, and naturally-vegetated areas continue to be available to support the use of JRM-administered and leased lands and future growth and development of JRM-administered and leased lands and surrounding areas.

Implementing some of the management projects identified in the 2019 JRM INRMP and associated management plans to conserve or restore habitat or other natural areas would occur in priority areas that are compatible with operational and training needs.

There are no planned activities associated with the 2019 JRM INRMP that would result in undue safety risks or otherwise threaten public health or safety, or conflict with planning criteria established to ensure the safety and protection of human life and property on and surrounding JRM-administered and leased lands. No impacts on coastal zone management would occur from implementation of the Proposed Action. Therefore, implementation of the Proposed Action would not result in significant impacts to land use.

Submerged Land Use. As required by the Sikes Act (as amended) and DoD Instruction 4715.03, the 2019 JRM INRMP was developed in a manner that ensures that there would be no net loss of the capability of installations to support military missions and future mission requirements. As such, the 2019 JRM INRMP is consistent with submerged land use plans and policies of JRM-administered and leased submerged lands and the ongoing and planned military uses of those sites, and implementation of the 2019 JRM INRMP would not adversely affect the short-term or long-term use of land for military activities.

Maintaining healthy marine communities for listed and native species on submerged lands would potentially relieve some of the restrictions of military training and in-water activities (e.g., military construction, routine maintenance/repair of in-water facilities) on submerged lands by minimizing costs and mitigation requirements, avoiding work-around solutions, and preventing delays in activities due to regulatory compliance processes.

Implementing some of the management projects identified in the 2019 JRM INRMP and associated management plans to conserve or restore habitat or other natural areas would occur in priority areas that are compatible with operational and training needs.

There are no planned activities associated with the 2019 JRM INRMP for submerged lands that would result in undue safety risks or otherwise threaten public health or safety or conflict with planning criteria established to ensure the safety and protection of human life and property on and surrounding JRM-administered and leased submerged lands.

Implementation of the Proposed Action would not result in significant impacts to submerged land use.

Socioeconomics. The Proposed Action primarily relates to resource management and includes no direct or indirect population attractors. Since no population increase would be induced by the Proposed Action, no housing or public services impacts would be expected. Similarly, while there may be some local expenditures related to resource management actions included in the Proposed Action, noticeable economic benefits would not be anticipated, and any economic or financial impacts would be less than significant.

No access restrictions to areas currently used for recreation are proposed. Therefore, no adverse impacts associated with recreation are anticipated. Management projects proposed in the 2019 JRM INRMP would likely have the effect of improving the sustainability of fishing on both Guam and Tinian, allowing for improved quality of this form of recreation over a longer period. Likewise, such management projects would also improve the long-term quality of fishing for purposes of subsistence. This improvement would tend to reduce the portion of incomes

required to be spent on food and allow for those with no financial means of better obtaining food to live off the land.

Therefore, implementation of the Proposed Action would not result in significant impacts to socioeconomics.

Environmental Justice. EO 12898, *Federal Actions to Address Environmental Justice in Minority Populations and Low-income Populations* requires that "each Federal Agency shall make achieving environmental justice part of its mission by identifying and addressing, as appropriate, disproportionately high and adverse human health effects on its programs, policies, and activities on minority populations and low-income populations" (59 Federal Register 1994).

The Proposed Action would not substantially affect human health or the environment. No significant impacts were identified for resources relating to the human environment. Therefore, implementation of the Proposed Action would not cause disproportionately high and adverse human health or environmental effects on any minority or low-income populations. There may be beneficial effects on the long-term sustainability of subsistence activities, which would tend to primarily benefit those with low or no incomes.

Public Involvement: The Final 2019 JRM INRMP EA is an appendix (Appendix I) to the Final 2019 JRM INRMP. The Navy circulated the November 2018 Draft INRMP and Draft EA for a 30-day public review in Guam from November 14 to December 13, 2018. The documents were available for review by interested parties at the Nieves M. Flores Memorial Library, 254 Martyr Street, Hagatna, Guam; Dededo Public Library, West Santa Barbara Avenue, Dededo, Guam; and on the website at www.jrminrmp.com. In anticipation of the 30-day public review period in Guam, the Navy published Notices of Availability in printed journals and online websites of the Guam Daily Post and the Guam Pacific Daily News on November 9, 2018. The Notice of Availability remained advertised on the Guam Daily Post website from November 9 through December 9, 2018.

As a result of the damages experienced within the CNMI from Super Typhoon Yutu, the Navy postponed the public review within the CNMI to allow for recovery efforts. The Navy circulated the February 2019 Draft JRM INRMP and Draft EA for a 30-day public

review in the CNMI from February 15 to March 16, 2019. The documents were available for review by interested parties at the Joeten-Kiyu Public Library, Insatto Street, Saipan; Tinian Public Library, San Jose, Tinian; and on the website at www.jrminrmp.com. In anticipation of the 30-day public review period in the CNMI, the Navy published Notices of Availability in printed journals and online websites of the Saipan Tribune on February 12, 2019 and the Marianas Variety on February 13, 2019. The Notice of Availability remained advertised on the Saipan Tribune website from February 12 through March 11, 2019.

The Navy provided the public with an e-mail address, a physical address, and an online submission form to submit public comments. Comments on the Draft EA received by the Navy between November 14, 2018 and March 16, 2019 and responses to comments are provided in Appendix A of the EA.

Finding: Based on the information gathered during the preparation of this EA and the analysis presented; and coordination with U.S. Fish and Wildlife Service, National Marine Fisheries Service, Guam Department of Agriculture, CNMI Department of Lands and Natural Resources, Guam Bureau of Statistics and Plans, CNMI Bureau of Environmental and Coastal Quality; and completion of a public involvement process, the Commander, Joint Region Marianas has determined that the proposed action will have no significant impacts on the quality of the human environment or generate significant controversy.

The EA prepared by the Navy addressing this action is on file and interested parties may obtain a copy of the Final EA and Finding of No Significant Impact from Naval Facilities Engineering Command Marianas/Joint Region Marianas, PSC 455, Box 211, FPO AP 96540-1000, Attention ENV Conservation and Planning.

Abstract

Designation:	Environmental Assessment
Title of Proposed Action:	Joint Region Marianas Integrated Natural Resources Management Plan
Project Location:	Joint Region Marianas-administered and Leased Lands on Guam, Tinian, and Farallon de Medinilla
Lead Agency for the EA:	Department of the Navy
Affected Region:	Territory of Guam and the Islands of Tinian and Farallon de Medinilla within the Commonwealth of the Northern Mariana Islands
Action Proponent:	Joint Region Marianas
Point of Contact:	Dana Lujan Naval Facilities Engineering Command Marianas/Joint Region Marianas PSC 455, Box 211, FPO AP 96540-1000
Date:	June 2019

The United States Department of the Navy has prepared this Environmental Assessment in accordance with the National Environmental Policy Act, as implemented by the Council on Environmental Quality regulations and the Department of the Navy regulations for implementing the National Environmental Policy Act. The Proposed Action would implement the 2019 Joint Region Marianas Integrated Natural Resources Management Plan on Joint Region Marianas-administered and leased lands on Guam, Tinian, and Farallon de Medinilla. This Environmental Assessment evaluates the potential environmental impacts associated with the Proposed Action and the No Action Alternative on the following resource areas: geology, topography, and soils; water resources; cultural resources; terrestrial biological resources; marine biological resources; land use; submerged land use; socioeconomics; and environmental justice. This Environmental Assessment appears as an appendix and refers frequently to resource descriptions in the main body of the Joint Region Marianas Integrated Natural Resources Management Plan.

This page intentionally left blank.

EXECUTIVE SUMMARY

ES.1 Proposed Action

The United States (U.S.) Department of the Navy (DON) is proposing to revise the 2013 Joint Region Marianas (JRM) Integrated Natural Resources Management Plan (INRMP). Both the 2013 JRM INRMP and the 2019 JRM INRMP provide natural resources management projects for JRM properties for all Naval and Air Force installations on Guam and JRM leased lands on Tinian and Farallon de Medinilla (FDM). The Proposed Action includes continuing some existing natural resources management projects conducted on JRM-administered lands under the current 2013 JRM INRMP, along with new management projects appropriate for managing the natural resources under current environmental conditions and challenges. All management projects would be integrated and implemented in the context of mission support needs in the region. Natural resources management on JRM-administered lands would also be integrated with other disciplines, programs, and planning beyond the scope of traditional fish and wildlife management on U.S. Navy and Air Force installations.

ES.2 Purpose of and Need for the Proposed Action

The purpose of an INRMP is to implement an ecosystem-based conservation program that provides for conservation and rehabilitation of natural resources in a manner that is consistent with the military mission, integrates and coordinates all natural resources management activities, provides for sustainable multipurpose uses of natural resources, and provides for public access for use of natural resources subject to public safety and military security considerations. The purpose of revising the JRM INRMP is to meet statutory requirements under the Sikes Act (as amended) to manage natural resources given the constant changing environmental challenges and changes in military mission.

The need for the Proposed Action is to provide a comprehensive, adaptive natural resources management approach for all properties under JRM. Both the INRMP and the natural resources management programs that it supports must meet the Department of Defense (DoD) and DON policy and guidance that collectively require a plan and management approach consistent with mission support (as defined in 10 U.S. Code [USC] Section 5062), multipurpose use, integration, ecosystem- or landscape-level management, and environmental compliance and stewardship objectives.

ES.3 Alternatives Considered

Proposed Action: The Proposed Action is to implement the 2019 JRM INRMP, consistent with the military use of the JRM-administered lands considered in this Environmental Assessment (EA) and the goals and objectives established in the Sikes Act (as amended). The goal of the 2019 JRM INRMP is to utilize adaptive management to maintain long-term ecosystem health and minimize impacts to natural resources consistent with the operational and training requirements of the DoD's mission. The 2019 JRM INRMP has been developed to ensure consistent management of resources on Guam and within the Commonwealth of the Northern Mariana Islands (CNMI) and to comply with federal, territory, commonwealth, and local standards, as applicable. The INRMP would be reviewed annually and no less than every 5-years for operation and effect as required by Section 670a of the Sikes Act.

No Action Alternative: The No Action Alternative to the Proposed Action would be to continue management as characterized in the 2013 JRM INRMP. This alternative represents the status quo.

ES.4 Summary of Environmental Resources Evaluated in the EA

This EA includes an analysis of potential environmental impacts associated with the Proposed Action and the No Action Alternative. The environmental resource areas analyzed in this EA include: geology, topography, and soils; water resources; cultural resources; terrestrial biological resources; marine biological resources; land use; submerged land use; and socioeconomics and environmental justice. The study area for each resource analyzed may differ due to how the Proposed Action interacts with or impacts the resource.

ES.5 Summary of Potential Environmental Consequences of the Action Alternatives and Major Mitigating Action

Table ES-1 provides a tabular summary of the potential impacts to the resources associated with each of the alternative actions analyzed.

ES.6 Public Involvement

The 2019 JRM INRMP Draft EA was an appendix (Appendix I) to the Draft 2019 JRM INRMP. The Navy circulated the November 2018 Draft INRMP and Draft EA for a 30-day public review in Guam from November 14 to December 13, 2018. The documents were available for review by interested parties at the Nieves M. Flores Memorial Library, 254 Martyr Street Hagatna, Guam; Dededo Public Library, West Santa Barbara Avenue, Dededo, Guam; and on the website at www.jrminrmp.com. In anticipation of the 30-day public review period in Guam, the Navy published Notices of Availability in printed journals and online websites of the Guam Daily Post and the Guam Pacific Daily News on November 9, 2018. The Notice of Availability remained advertised on the Guam Daily Post website from November 9 through December 9, 2018.

As a result of the damages experienced within the CNMI from Super Typhoon Yutu, the Navy postponed the public review within the CNMI to allow for recovery efforts. The Navy circulated the February 2019 Draft INRMP and Draft EA for a 30-day public review in the CNMI from February 15 to March 16, 2019. The documents were available for review by interested parties at the Joeten-Kiyu Public Library, Insatto Street, Saipan; Tinian Public Library, San Jose, Tinian; and on the website at www.jrminrmp.com. In anticipation of the 30-day public review period in the CNMI, the Navy published Notices of Availability in printed journals and online websites of the Saipan Tribune on February 12, 2019 and the Marianas Variety on February 13, 2019. The Notice of Availability remained advertised on the Saipan Tribune website from February 12 through March 11, 2019.

The Navy provided the public with an email address, a physical address, and an online submission form to submit public comments. Comments on the Draft EA received by the Navy between November 14, 2018 and March 16, 2019 and responses to comments are provided in Appendix A of this EA.

Table ES-1 Summary of Potential Impacts to Resource Areas

Resource Area	*No Action Alternative*	*Proposed Action*
Geology, Topography, and Soils	Continued implementation of the 2013 JRM INRMP would result in some beneficial impacts through the reduction in soil erosion, reduction in invasive vegetation, and an increase in native reforestation on JRM-administered lands; however, the 2013 JRM INRMP does not address soil conditions in their current state. Continued implementation of the 2013 JRM INRMP without updates to the comprehensive soil erosion and control plan and to the long-term, ecosystem-based plans for restoring and maintaining forests and other areas could result in continued erosion and minor to moderate adverse impacts on soils. In addition, the No Action Alternative does not address the current ungulate (i.e., hoofed mammals such as pigs, deer, and carabao [*Bubalus bubalis*]) populations found on JRM-administered lands; thus, ground disturbances and soil erosion caused by ungulates would continue which would have adverse impacts on soils and increased erosion.	Implementation of the 2019 JRM INRMP would have long-term, beneficial reduction in soil erosion from implementation of updated erosion control practices and ecosystem-based management plans for restoring and maintaining forests and other areas. Eroded areas would be identified and revegetated to reduce erosion. Control and eradication of ungulates would reduce digging and destruction of vegetation caused by those animals.
Water Resources	Continued implementation of the 2013 JRM INRMP would result in beneficial impacts to water resources by minimizing operational impacts on wetlands, maximizing native floral and faunal diversity of wetlands, and managing for no net loss of wetlands. These plans would include the restoration and maintenance of ecosystem processes, such as sustainable revegetation and soil production, which would improve water quality, promote the flow of surface waters into wetlands, and reduce flooding by increasing groundwater recharge and reducing surface water flow rates.	Implementation of the 2019 JRM INRMP would have long-term, beneficial impacts on surface water quality and aquatic habitats from rehabilitation of surface waters and from actions to reduce erosion, such as the control of ungulates and restoration of disturbed areas. There would be no direct, adverse impacts on wetlands and floodplains.
Cultural Resources	Continued implementation of the 2013 JRM INRMP would result in adverse impacts on cultural resources and culturally important medicinal plants since the No Action Alternative does not properly address the current ungulate populations on JRM-administered lands; thus, the high abundance of ungulates and degradation of forests and other areas could continue.	Implementation of the 2019 JRM INRMP would have no adverse impacts on cultural resources, including historic properties (as defined by Section 106 of the National Historic Preservation Act). Long-term, beneficial impacts on cultural resources could occur from implementation of updated actions such as those that seek to protect native forests (i.e., ungulate control). These actions would protect habitats in which culturally important plants are found and prevent or reduce degradation of historical landmarks.

Table ES-1 Summary of Potential Impacts to Resource Areas

Resource Area	*No Action Alternative*	*Proposed Action*
Terrestrial Biological Resources	Continued implementation of the 2013 JRM INRMP would result in some beneficial impacts on terrestrial biological resources on JRM-administered lands. However, because the 2013 JRM INRMP considered under this alternative does not address all current adverse conditions on JRM-administered lands, some natural habitats, such as native forests, would continue to decline in quality and complexity and some plant and animal species would continue to be adversely affected by those conditions. For example, the No Action Alternative does not include an updated plan to reduce ungulate populations on JRM sites; thus, degradation of native forest would continue and adversely affect recovery of threatened and endangered species. In addition, the 2013 JRM INRMP does not provide adequate management for the species listed under the federal Endangered Species Act in October 2015.	Implementation of the 2019 JRM INRMP would have beneficial impacts on terrestrial vegetation and wildlife, including newly protected species, from the implementation of updated long-term, ecosystem-based management plans to restore and enhance habitat for native species, control non-native species, and monitor native plant and animal populations.
Marine Biological Resources	Continued implementation of the 2013 JRM INRMP would result in some beneficial impacts on marine biological resources on JRM-administered submerged lands. However, because the 2013 JRM INRMP considered under this alternative does not address all current adverse conditions on JRM-administered submerged lands, some marine habitats would continue to decline in quality and complexity and some species would continue to be adversely affected by those conditions. For example, the No Action Alternative does not include a discussion on climate change and the effects of coral bleaching; thus, degradation of reef habitat would continue and adversely affect recovery of threatened and endangered species.	Implementation of the 2019 JRM INRMP would have beneficial impacts on marine flora and fauna, including protected species, from the implementation of long-term, ecosystem-based management plans to restore and enhance habitat for native species and control non-native species.
Land Use	Continued implementation of the 2013 JRM INRMP would be compatible with existing land uses. Therefore, no significant impacts would occur with implementation of the No Action Alternative.	Implementation of the 2019 JRM INRMP was developed in a manner that ensures no net loss of the capability of installations to support military missions and future mission requirements, and is therefore consistent with current land use plans and policies of JRM-administered and leased lands as well as for any planned military uses.

Table ES-1 Summary of Potential Impacts to Resource Areas

Resource Area	*No Action Alternative*	*Proposed Action*
Submerged Land Use	Continued implementation of the 2013 JRM INRMP would be compatible with existing submerged land uses. Therefore, no significant impacts would occur with implementation of the No Action Alternative.	There would be no adverse impacts to submerged land use with the implementation of the 2019 JRM INRMP. Potential beneficial impacts due to increased knowledge of marine resources could lead to lifting of restrictions on military operations.
Socioeconomics	No change in social or economic conditions or use of public services would occur with continued implementation of the 2013 JRM INRMP.	No change in social or economic conditions or use of public services would occur with the implementation of the 2019 JRM INRMP. There would be a significant positive impact to the sustainability of recreational fishing opportunities.
Environmental Justice	No adverse and disproportional impacts on minority or low-income populations would occur with continued implementation of the 2013 JRM INRMP.	No adverse and disproportional impacts on minority or low-income populations would occur with the implementation of the 2019 JRM INRMP.

Key: INRMP = Integrated Natural Resources Management Plan; JRM = Joint Region Marianas.

1 Purpose of and Need for the Proposed Action

1.1 Introduction

The United States (U.S.) Department of the Navy (hereinafter, referred to as the DON) proposes to implement the Joint Region Marianas (JRM) Integrated Natural Resources Management Plan (INRMP) on JRM-administered and leased lands on Guam, Tinian, and Farallon de Medinilla (FDM). The purpose of an INRMP is to implement an ecosystem-based conservation program that provides for conservation and rehabilitation of natural resources in a manner that is consistent with the military mission, integrates and coordinates all natural resources management activities, provides for sustainable multipurpose uses of natural resources, and provides for public access for use of natural resources subject to public safety and military security considerations. As described in detail in Section 1.4 of this EA and Section 1.1 of the 2019 JRM INRMP, the purpose of the 2019 JRM INRMP is as follows:

- help natural resource managers on each installation to more effectively manage natural resources to ensure installation lands remain available and in good condition to support the military mission
- conserve and rehabilitate natural resources on lands managed by each installation
- support sustainable multipurpose use of the resources and public access, subject to safety requirements and military security, to military installations to facilitate the use of those natural resources
- participate, as appropriate, in regional ecosystem initiatives
- preclude designation of critical habitat

As discussed in Chapter 1, *Overview*, of the 2019 JRM INRMP, the goal of the INRMP is to utilize adaptive management to maintain long-term ecosystem health and minimize impacts to natural resources consistent with the operational requirements of the Department of Defense's (DoD's) mission. DON is required to ensure ecosystem management is the basis for all management of its lands (Sikes Act, as amended [16 U.S. Code {USC} 670a]; DoD Instruction 4715.03). It is also a goal of the 2019 JRM INRMP to provide a conservation benefit to federally listed species by providing adequate special management and protections.

The Navy has prepared this Environmental Assessment (EA) in accordance with the National Environmental Policy Act (NEPA), as implemented by the Council on Environmental Quality (CEQ) regulations (Title 40, Code of Federal Regulations [CFR], Parts 1500-1508) and DON regulations (32 CFR 775) for implementing NEPA.

All natural resources management projects listed in the 2019 JRM INRMP were reviewed and assessed for potential impact by subject matter experts; however, NEPA analysis was conducted on the collective effect of management projects relevant to each resource rather than at a management project-specific level. For example, non-invasive, pedestrian vegetation surveys were reviewed, assessed, and considered as part of the collective effect of the INRMP but are not specifically analyzed in this EA.

1.2 Background

The 2019 JRM INRMP considered in this EA is a revision of the 2013 JRM INRMP (JRM 2013), which had updated and combined the previous INRMPs for Naval Base Guam (NBG) (DON 2009), Andersen Air Force Base (AFB) (U.S. Air Force [USAF] 2009), Tinian, and FDM (DON 2010a). The 2019 JRM INRMP was developed based on a thorough review of the previously mentioned INRMPs, review of new data pertaining to these sites, and detailed discussions with Naval Facilities Engineering Command (NAVFAC) Marianas, JRM, installation personnel, partner agencies, and various INRMP stakeholders. Table 1-1 lists the major sections in the 2019 JRM INRMP along with page numbers for ease of reference. The 2019 JRM INRMP strives to allow for coordination of region-wide environmental management with the installation plans and activities and provides explicit goals and objectives to which natural resources management projects will contribute. Additional details are provided in Section 1.1 of the 2019 JRM INRMP.

1.3 Location and Description of Joint Region Marianas Installations

As discussed in Chapter 2, *Military Mission and Overview of History and Land Use*, of the 2019 JRM INRMP, the Mariana Islands includes Guam and the Commonwealth of the Northern Mariana Islands (CNMI), both of which are sovereign (self-governing) U.S. territories. Fourteen islands (including Tinian and FDM) along with the territorial waters and submerged lands immediately north of Guam comprise the CNMI (Figure 1-1). DoD supports Naval and Air Force activities on Guam and in the CNMI to maintain operational readiness—maintaining the ability of units to respond to regional threats and to protect interests of the U.S. and its allies.

Guam is located in the Western Pacific Ocean and is situated approximately 3,700 miles (5,955 kilometers) west/southwest of Hawaii and 1,560 miles (2,511 kilometers) southeast of Japan. Guam is the southernmost and largest island of the Mariana Islands Archipelago (Figure 1-1). The island is approximately 30 miles (48 kilometers) long by 4 to 8 miles (6 to 13 kilometers) wide and has a total area of approximately 209 square miles (541 square kilometers). JRM sites are located throughout the island and include both NBG and Andersen AFB sites (Figure 1-2). NBG consists of a number of installations on Guam, but the primary properties are: Main Base, Naval Munitions Site (NMS), Telecommunications Site (TS), Tenjo Vista and Sasa Valley tank farms, and Naval Computer and Telecommunications Station (NCTS) Barrigada (Figure 1-2). Andersen AFB's primary properties include Main Base and Andersen South (Figure 1-2). Figure 1-3 depicts JRM-administered submerged lands around Guam that are addressed in the 2019 JRM INRMP.

Tinian is the fourth island, from south to north, in the Mariana archipelago (Figures 1-1 and 1-4). It is located 100 miles (161 kilometers) north-northeast of Guam and approximately 3 miles (8 kilometers) southwest of Saipan. Tinian is roughly 12 miles (20 kilometers) long and 6 miles (8 kilometers) wide at its widest point and has a total land area of 39 square miles (101 square kilometers).

FDM is the sixth island, from south to north, and is the northernmost island of the southern volcanic arc of the Mariana archipelago (Figures 1-1 and 1-5). It is located approximately 70 miles (113 kilometers) northeast of Tinian and 182 miles (293 kilometers) northeast of Guam. FDM is approximately 1.7 miles (2.8 kilometers) long and 0.3 miles (0.5 kilometers) wide at its widest point and covers approximately 221 acres (89 hectares). FDM is an uninhabited island and is difficult to access, except by helicopter.

The Overlay Refuge is a group of land areas that were established in 1994 and provide a commitment by DON and the U.S. Fish and Wildlife Service (USFWS) to engage in a coordinated program centered on the protection of threatened and endangered species and other native flora and fauna, the maintenance of native ecosystems, and the conservation of native biological diversity in cooperation with Guam Division of Aquatic and Wildlife Resources (Guam DAWR), recognizing that the primary purpose of lands within the Overlay Refuge is to support the national defense mission of DON. The Andersen AFB Overlay Unit in northern Guam covers approximately 10,159 acres (4,111 hectares), and the DON Overlay Unit in southern Guam covers approximately 11,534 acres (4,668 hectares). Coordination between the USFWS and the DON occurs as necessary to comply with NEPA and installation statutes and regulations.

The Haputo Ecological Reserve Area (ERA) and Orote Peninsula ERA were established in 1984 to preserve native terrestrial and marine habitats for the purpose of protecting genetic diversity and fostering scientific research and education (NAVFAC Marianas 2011) (Table 1-2 and Figure 1-2).

The 2019 JRM INRMP addresses natural resources management on those lands and nearshore areas that are owned by the U.S. and administered by JRM or used by JRM via license, permit, or lease for which JRM has been assigned management responsibility and that contain significant natural resources. Chapters 4 and 10 in the 2019 JRM INRMP provide overviews of the physical and biological environments on Guam and the CNMI, respectively. Detailed descriptions of current operations and land use and the physical and biological environments for each JRM installation or parcel are provided in Chapters 5 through 9, 11, and 12 of the 2019 JRM INRMP (*Note*: some NBG parcels are combined with other small parcels in Chapter 7 for simplicity). The JRM-administered lands and submerged lands addressed in the 2019 JRM INRMP are identified in Table 1-2 and are shown in Figures 1-1 through 1-5.

1.3.1 Naval Base Guam – Main Base

NBG Main Base is discussed in detail in Chapter 5, *Naval Base Guam Main Base*, of the 2019 JRM INRMP. This installation is the U.S. Navy's operations center and is located on the southwest coast of Guam around Apra Harbor, including the Orote Peninsula. The U.S. Navy shares Apra Harbor with the Port Authority of Guam. The commercial port is Guam's lifeline, serves as the regional transshipment hub for the Micronesian region, and functions as the shipping and receiving point for containers designated for DoD installations on Guam. The primary function of NBG Main Base is to support fleet units and operational forces of the Fifth and Seventh Fleets. It serves as the forward deployment base and logistics hub for operations in Asia and the Western Pacific; it is the main distribution center for material, personnel, and munitions that support sea, land, and air forces (Commander, Navy Installations Command 2016; NBG 2016).

The 3,455-acre (1,398-hectare) NBG Main Base consists of several sites controlled and administered by JRM, including the Main Base cantonment (3,114 acres [1,260 hectares]), Glass Breakwater (40 acres [17 hectares]), Polaris Point (253 acres [102 hectares]), and Drydock Island (48 acres [19 hectares]) (see Figure 1-2). NBG also includes 30,867 acres (12,491 hectares) of submerged lands, which are discussed in detail in Section 5.3 of the 2019 JRM INRMP. The U.S. Coast Guard (USCG) controls 14 acres (6 hectares) at Victor Wharf in Inner Apra Harbor as shown on Figure 5-1 of the 2019 JRM INRMP.

NBG hosts several key tenant commands such as the Commander, Submarine Squadron Fifteen, Coastal Riverine Group 1, Naval Special Warfare Unit One, and the USCG Sector Guam. It supports 28 other tenant commands and is the home base to dozens of Pacific Command, U.S. Pacific Fleet, and Seventh Fleet units. Camp Covington is also located within NBG Main Base and supports Naval Mobile Construction Battalions (SeaBees) (Commander, Navy Installations Command 2016; NBG 2016). Refer to Section 2.2.2 of the 2019 JRM INRMP for further details on NBG's mission and tenants.

Navy-controlled lands at Apra Harbor have land uses ranging from industrial to recreational. Shore-based support includes warehouses, power, water, sewage treatment, fuel transfer, and other facilities. NBG Main Base also supports military housing areas, schools, medical and dental facilities, recreational facilities, food services, and Navy commissaries and exchanges. In addition, Main Base provides facilities and infrastructure to support biosecurity inspection and interdiction requirements for cargo and personnel leaving NBG via ship, including an office and kennel for canine brown treesnake (BTS) (*Boiga irregularis*) detection teams.

Training activities at NBG Main Base include beach landings, riverine training, small unit maneuvers, rappelling, helicopter insertion and extraction, field exercises, small arms and pistol marksmanship, stress control training, and fire and maneuver training. Training activities within Apra Harbor include explosive ordnance disposal, deep water mine countermeasures, helicopter paradrops, helicopter cast and recovery, drown-proofing, heliborne firebucket (offload), helicopter search and rescue, and diving/swimming. Table 5-2 and Figure 5-1 in the 2019 JRM INRMP provide a summary of training areas associated with NBG Main Base and the offshore waters.

Approximately 506 acres (205 hectares) of Overlay Refuge lands are designated on NBG Main Base (see Table 1-2 and Figure 1-2) and were originally identified as providing important habitat for federal Endangered Species Act (ESA)-listed species (e.g., Mariana crow [*Corvus kubaryi*], Guam Micronesian kingfisher [*Todiramphus cinnamominus*], Mariana common moorhen [*Gallinula chloropus guami*]) as well as other Guam native species. Of this acreage, 159 acres (64 hectares) are located on the southern

portion of Orote Peninsula (including the Orote Peninsula ERA), with the remaining acreage associated with wetland areas to the east and south of Inner Apra Harbor (i.e., Atantano, Abo Cove, and Camp Covington wetlands). The Overlay Refuge lands on Orote Peninsula consist primarily of limestone native forest, limestone degraded forest, and limestone coastal scrub, which encompass 77 acres (31 hectares). The Overlay Refuge also contains an approximately 62 acres (25 hectares) of tangantangan (*Leucaena leucocephala*) vegetation. For more details on the Overlay Refuge lands located on NBG Main Base, refer to Section 5.1.6.1 of the 2019 JRM INRMP.

On the south side of Orote Peninsula is the Orote Peninsula ERA, which is discussed in detail in Section 5.1.6.2 of the 2019 JRM INRMP. The Orote Peninsula ERA protects two areas or land with a total of 163 acres (66 hectares) of habitat. The first unit consists of 30 acres (12 hectares) of remnant native limestone forest that provide habitat for native forest species. The second unit is a 133-acre (54-hectare) marine unit that provides nursery for marine species of commercial and recreational fishery value.

Refer to Section 5.1 of the 2019 JRM INRMP for further details on Apra Harbor assets and uses, Inner Apra Harbor assets and uses, training areas, explosive safety quantity distance arcs, and special conservation areas.

1.3.2 Naval Base Guam – Naval Munitions Site

NMS is discussed in detail in Chapter 6, *Naval Base Guam Naval Munitions Site*, of the 2019 JRM INRMP. It is located on mountainous terrain in south-central Guam and encompasses approximately 8,645 acres (3,499 hectares) (see Figures 1-2 and 1-3). NMS provides support through receiving, renovating, maintaining, storing, and issuing ammunition, explosives, and expendable ordnance materials to units of the Pacific Fleet operating in the Western Pacific. Managed by Navy Munitions Command, Pacific East Asia Division, Unit Guam, the installation has the primary responsibility of providing ordnance support for the Seventh and Fifth Fleets and is the lone transportation service for point-to-point ammunition hauling between military installations on Guam. Magazines at NMS provide more than 250,000 square feet (23,226 square meters) of storage space for ordnance materials (NAVFAC Marianas 2013).

Fena Valley Reservoir, a 2.3 billion gallon man-made lake, lies entirely within the boundaries of NMS and currently serves as the primary source of water for NBG. The reservoir provides 10 to 12 million gallons per day to DON and Guam Waterworks Authority (SWCA and Tom Nance Water Resource Engineering 2007). Excess water surplus to Navy requirements flows over the spillway into the Maagas River. NAVFAC Marianas operates the Fena Water Treatment Plant located just below the downstream toe of the dam. Detailed information about the reservoir is provided in Section 6.2.2.1 of the 2019 JRM INRMP.

NMS supports ground and air-ground training, primarily for Special Forces personnel, within the 3,357-acre (1,359-hectare) Southern Land Navigation Area and the 508-acre (206-hectare) Northern Land Navigation Area (see Figure 6-1 in the 2019 JRM INRMP). As outlined in the 2014 Mariana Islands Training and Testing (MITT) Biological Assessment, training activities that occur on NMS include the following:

- combat search and rescue
- urban warfare training, noncombatant evacuation operations/humanitarian assistance operations/disaster relief operations
- personnel insertion/extraction

- parachute insertion and embassy reinforcement
- direct action (combat close quarters)
- direct action (breaching)
- intelligence, surveillance, and reconnaissance
- urban warfare training, maneuver (convoy and land navigation)
- field exercise training and force protection
- anti-terrorism
- land demolitions (unexploded ordnance) discovery/disposal

Future training activities, as part of the Guam Military Relocation, include maneuver training (convoy and land navigation), combat search and rescue, and field training exercises. These training activities will occur in the Southern and Northern Land Navigation Areas (DON 2017). Additional details on duration and frequency of these activities appear in the 2010 Guam Military Relocation Environmental Impact Statement (EIS)/Overseas EIS (OEIS) and the 2015 MITT EIS/OEIS.

The majority of NMS is designated as Overlay Refuge (see Table 1-2 and Figure 1-2). The Government of Guam (GovGuam)-designated 2,854-acre (1,155-hectare) Bolanos Conservation Area and 662-acre (244-hectare) Cotal Conservation Area lie immediately adjacent to the southern and northern borders of NMS (see Figure 1-2).

Refer to Section 6.1 of the 2019 JRM INRMP for further details on assets and uses, training areas, explosive safety quantity distance arcs, and special conservation areas.

1.3.3 Naval Base Guam – Telecommunications Site

NBG TS, formerly known as the NCTS Finegayan and Communications Annex Finegayan, is discussed in detail in Chapter 8, *Naval Base Guam Telecommunications Site*, of the 2019 JRM INRMP. It is located on the northwestern coast of the island and provides multispectral connectivity, NetOps, and information assurance to Navy, Joint, and Coalition forces on Guam and the Western Pacific and Indian Oceans. The mission of NBG TS, a subordinate command of the Naval Computer and Telecommunications Area Master Station, Pacific, is to provide continuous global and universal communications services to fleet units, shore activities, and joint forces.

NBG TS totals 2,412 acres (976 hectares) of terrestrial lands and 11,241 acres (4,549 hectares) of submerged lands. The U.S. Navy owns lands within the boundaries of NBG TS and owns submerged lands off NBG TS out to a distance of 3 miles (4.8 kilometers) from the coast.

NBG TS operates communications systems including radio frequency systems and terrestrial-based fiber optic cables. This area is designated and maintained as a radio frequency quiet zone for a minimum of a 1-mile (1.6-kilometer) radius. NBG TS provides base level communications to all Navy and other authorized users at all Navy facilities on Guam. Base level communications include all facilities and services required to support electromagnetic dissemination; transmission or reception of voice, data, and video; and integrated telecommunications within the confines of a post, camp, station, base, installation, headquarters, or metropolitan area to include local interconnect trunks to the first serving commercial central office or military long-haul or tactical gateway.

Land uses on JRM-administered lands at NBG TS include telecommunications operations, community support, administrative functions, training, recreation, and conservation. Telecommunications antennas and related equipment require open areas to prevent interference. Shore-based support includes military housing, power distribution, food services, recreational and related facilities, as well as conservation of coastal limestone forests and fringing reefs within the Haputo ERA. NBG TS is also the primary site for the U.S. Marine Corps personnel associated with the relocation of the U.S. Marine Corps to Guam.

The lands and coastal waters of NBG TS are used for military training. Training within NBG TS includes urban warfare training, personnel insertion/extraction, humanitarian assistance/disaster relief operations, and embassy reinforcement exercises (USFWS 2015a). These activities may include the use of existing trails for inland maneuvers and Military Operation in Urban Terrain (MOUT) and the use of rifle and pistol ranges at the North Range. A Surface Danger Zone associated with these small arms ranges extends out over the submerged lands of Guam off Haputo Point (see Figure 8-1 in the 2019 JRM INRMP). Notices are sent out ahead of time to provide advance notice of when the ranges will be in use. Surface Danger Zone closures for the range on NBG TS are communicated in advance of the scheduled range closure through the issuance of Notices to Airmen and Notices to Mariners, as applicable.

The Haputo ERA protects a total of 252 acres (102 hectares) of habitat: 180 acres (73 hectares) of native forest with relatively few non-native species that extend from the water to the cliff line and 72 acres (29 hectares) of marine waters extending out from the mean lower water line, which includes the Double Reef area (see Table 1-2 and Figure 1-2). While the emphasis of the Haputo ERA is on conservation of natural resources, it also provides benefits to and protection of cultural resources. The terrestrial unit of the Haputo ERA is located within the 2,097-acre (849-hectares) Overlay Refuge lands (see Figure 1-2).

In 2015, 699 acres (283 hectares) of NBG TS lands were designated as recovery habitat for the endangered Guam Micronesian kingfisher under a Memorandum of Agreement (MOA) between the DON and the USFWS (DON and USFWS 2015a, 2015b). These lands encompass the forested cliffline of the entire western coastal portion of NBG TS and some forested areas in the northern and southern portions of the installation (see Figure 1-2).

Refer to Section 8.1 of the 2019 JRM INRMP for further details on NBG TS assets and uses, training areas, and special conservation areas.

1.3.4 Naval Base Guam – Sasa Valley and Tenjo Vista Tank Farms

Sasa Valley and Tenjo Vista Tank Farms are discussed in detail in Chapter 7, *Apra Heights, Sasa Valley and Tenjo Vista Tank Farms, Naval Computer and Telecommunications Station Barrigada, Barrigada Transmitter Site, and Andersen South*, of the 2019 JRM INRMP. Located east of Marine Corps Drive (Route 1) and south of the village of Piti, the Sasa Valley (428 acres [173 hectares]) and Tenjo Vista (231 acres [93 hectares]) tank farms provide storage, transfer, and pumping capability for petroleum, oil, and lubricants (POL) for both the DON and USAF (refer to Figure 7-6 of the 2019 JRM INRMP). Defense Fuel Support Point Guam operates both tank farms. Tenjo Vista Tank Farm houses thousands of gallons of F-76 military diesel fuel in seven underground storage tanks. The Sasa Valley Tank Farm is comprised of a lower and upper complex. The lower complex includes administration and security, a pump house, electrical substation, seven POL tanks, a truck fueling station, and supporting POL

processing equipment. The upper complex includes 20 underground storage tanks with a combined storage capacity of approximately 42 million gallons (159 million liters):

- six tanks store JP-8 jet fuel for Andersen AFB
- six tanks store JP-5 aircraft fuel for Navy aircraft carriers
- three tanks store F-76 diesel fuel for Navy vessels
- five tanks store marine fuel oil for Navy vessels

JP-8 fuel is pumped to Andersen AFB, while the other products are delivered via gravity flow to other Guam Defense Logistics Agency Defense Energy Support Center facilities/piers. The tank farms are directly connected to Delta and Echo piers, located on Drydock Island in Outer Apra Harbor, to support Navy fueling operations (NAVFAC Marianas 2015a, b; NBG 2016).

With the exception of the administration area at the main entrance to the Sasa Valley Tank Farm, all of the remaining lands within the Sasa Valley and Tenjo Vista Tank Farms are Overlay Refuge lands (see Table 1-2 and Figure 1-2).

1.3.5 Naval Base Guam – Naval Computer and Telecommunications Station Barrigada

NCTS Barrigada is discussed in detail in Chapter 7, *Apra Heights, Sasa Valley and Tenjo Vista Tank Farms, Naval Computer and Telecommunications Station Barrigada, Barrigada Transmitter Site, and Andersen South*, of the 2019 JRM INRMP. The 1,366-acre (553-hectare) site supports high-frequency transmitting activities for all DoD activities on Guam. A 1.2-mile (2-kilometer) radius electromagnetic radiation protection zone is designated around the transmitting antennas at NCTS Barrigada to preclude electromagnetic radiation problems. It is also the headquarters for the Space and Naval Warfare Systems Center Pacific Detachment Guam and the Army Reserve Center and supports military training operations. A MOUT area, the former Fleet Hospital warehouse, and the now closed Admiral Nimitz Golf Course are also located at NCTS Barrigada (refer to Figure 7-11 of the 2019 JRM INRMP) (NBG 2016). For the time being, the golf course is closed and is designated as an archaeological area while DON conducts cultural resource consultations with the Guam State Historic Preservation Officer in accordance with the National Historic Preservation Act (NHPA).

Military training activities that have occurred and currently occur on NCTS Barrigada are associated with previous Mariana Islands Range Complex (MIRC) operations (Commander, U.S. Pacific Fleet [COMPACFLT] 2010) and current MITT operations (COMPACFLT 2014, 2015a), which have replaced all MIRC activities. Military training activities that currently occur on NCTS Barrigada include the following (COMPACFLT 2014):

- urban warfare training
- noncombatant evacuation/humanitarian assistance/disaster relief operation
- personnel parachute insertion/extraction
- maneuver (convoy, land navigation)
- force protection

1.3.6 Apra Heights

Apra Heights is discussed in detail in Chapter 7, *Apra Heights, Sasa Valley and Tenjo Vista Tank Farms, Naval Computer and Telecommunications Station Barrigada, Barrigada Transmitter Site, and Andersen*

South, of the 2019 JRM INRMP. Located southeast of NBG Main Base and north of NMS on Route 5, this complex (243 acres [98 hectares]) comprises two family housing neighborhoods (Apra View and Apra Palms), community support facilities, and the Santa Rita Naval Administrative/Office Complex.

1.3.7 Andersen Air Force Base

Andersen AFB is discussed in detail in Chapter 9, *Andersen Air Force Base*, of the 2019 JRM INRMP. Andersen AFB was opened in 1944 as a B-29 staging base during World War II and served as a Strategic Air Command base until 1992, when it was realigned under Pacific Air Forces to support operations in the Asia and South Pacific regions. Since 2009, it has been jointly operated with NBG under the JRM military command. Andersen AFB is a strategically located forward main operating base and is vital to the security of the U.S. Its mission is expanding to support the defense strategy specified in the 2001 Quadrennial Defense Review and the 2003 Defense Planning Guidance. This defense strategy calls for the military to "deter forward" by stationing or deploying forces to five critical regions of the world: Europe, Middle East, Southwest Asia, Northeast Asia, and East Asian Littoral (e.g., region stretching from south of Japan through Australia and into the Bay of Bengal). Under this defense strategy, Andersen AFB serves as a main operating base to conduct and support operations in the East Asian Littoral region due to its long runways, vast ramp space, and large fuel storage capacity. The 36th Wing is the host unit to USAF, U.S. Army, DON (U.S. Navy and U.S. Marine Corps) active forces, along with USAF Reserve and Air National Guard. The Wing's mission is to provide the highest quality peacetime and wartime support from its strategic Pacific location. Guam serves as a stopping point for numerous aircraft enroute to Japan, Korea, and other Indo-Asia Pacific locations. Andersen AFB was chosen as the site for family housing as well as a Live-fire Training Range Complex as specified in the 2015 Record of Decision (ROD) for the Final Supplemental EIS for Guam and CNMI Military Relocation (DON 2015b). The U.S. Army maintains its Terminal High-altitude Area Defense (THAAD) ballistic missile defense battery on Guam on Northwest Field of Andersen AFB.

Andersen AFB is located in Yigo at the northern tip of Guam (see Figure 1-2). Andersen AFB totals 15,400 acres (6,232 hectares) of terrestrial lands and 37,869 acres (15,325 hectares) of submerged lands. The U.S. Navy owns lands within the boundaries of Andersen AFB and owns submerged lands off Andersen AFB out to a distance of 3 miles (4.8 kilometers) from the coast except for a portion of the water surrounding the Guam National Wildlife Refuge. The main operations area of Andersen AFB is in the eastern third of the installation at approximately 500 feet (152 meters) above sea level. This area includes the main active airfield and an array of operations, maintenance, and community support facilities. The central third of the installation is a Munitions Storage Area. The western third is Northwest Field, which was a World War II-era airfield used for fixed-wing aircraft and is currently used for helicopter training, various field exercises, and bivouacs. A potable water well field on Andersen AFB, south and southeast of the Munitions Storage Area, is proposed for development as a result of the Guam Military Relocation.

Approximately 10,158 acres (4,111 hectares) of Overlay Refuge lands are designated on Andersen AFB (see Figure 1-2), are currently managed by JRM, and have been identified as providing important habitat for federal ESA-listed threatened and endangered species (e.g., Mariana fruit bat [*Pteropus mariannus mariannus*], Mariana crow, Guam Micronesian kingfisher, Guam rail [*Gallirallus owstoni*], and the fire tree [*Serianthes nelsonii*]), as well as other Guam native species. The Overlay Refuge lands on Andersen AFB consist primarily of limestone native forest, limestone degraded forest, limestone coastal scrub

(77 acres [31 hectares] or 49 percent [%]), and approximately 62 acres (25 hectares) (or 39%) of tangantangan vegetation.

The Andersen AFB Marine Resources Preserve shown in Figure 1-2 was established in 1993 to protect the coastal resources surrounding the northeastern portion of the base (Andersen AFB 1995). Adjacent to the Marine Resources Preserve is the Pati Point Natural Area, which serves to protect the resources feeding into the marine environment (see Figure 1-2). The GovGuam established Pati Point Marine Preserve in 1999, citing 15 years of research that showed a decline in fish stocks in the area (National Oceanic and Atmospheric Administration 2009). Pati Point Marine Preserve covers nearly the same areas as the Andersen AFB Marine Preserve (4,819 acres [1,950 hectares]) and the Pati Point Natural Area (713 acres [288 hectares]).

Refer to Section 9.1 of the 2019 JRM INRMP for further details on Andersen AFB assets and uses, training areas, explosive safety quantity distance arcs, and other special conservation areas. The special conservation areas include the following:

- fenced ungulate (i.e., hoofed mammals such as pigs, deer, and carabao) exclosures, designed to enhance native habitat through the removal and exclusion of Philippine deer (*Rusa marianna*) and feral pigs (*Sus scrofa*)
- Habitat Management Unit, an enclosed 148-acre [60-hectares] parcel of land established to enhance native habitat based on the 2002 Area 50 Restoration Plan and used by various agencies as a test site for control and monitoring programs for removal of invasive species and habitat restoration
- recovery habitat for the Guam Micronesian kingfisher, 5,234 acres (2,118 hectares) of habitat that will be protected such that the land is suitable for the Guam Micronesian kingfisher on Andersen AFB and NBG TS

1.3.8 Andersen South

Andersen South is discussed in detail in Chapter 7, *Apra Heights, Sasa Valley and Tenjo Vista Tank Farms, Naval Computer and Telecommunications Station Barrigada, Barrigada Transmitter Site, and Andersen South*, of the 2019 JRM INRMP. Historically, Andersen South was used for family housing and barracks and includes a wastewater pump station and a water booster pump station, along with water tanks and an electrical substation that are not currently being used. There are installation restoration (clean-up) sites and water production wells with wellhead clearance buffers in the area. The vacant family housing and barracks areas in the southern portion of the parcel and north of Route 15 (refer to Figure 7-16 of the 2019 JRM INRMP) have been used for humanitarian operations, staging, bivouac, equipment inspection, and small unit tactics, including MOUT training.

Andersen South includes an 80-acre (32-hectare) parcel located in the northeastern area of the site that was deeded in 1992 from DoD to the GovGuam for development of a Guam Public School System High School (refer to Figure 7-16 of the 2019 JRM INRMP). There are conditions in the 30-year quit claim deed that limit the use to educational facilities, require no impact on the water lens or water wells in the vicinity, and provide that if conditions are not met, the land could revert to the federal government. The school was never developed; portions of the site were leased to civilians for crop production and one 10-acre (4-hectare) parcel is currently under lease in the western area of the property (DON 2010b). The lease can be terminated at USAF discretion when a military use for the area is identified.

As part of the ROD for the Guam and CNMI Military Relocation action (DON 2010c, 2015a, b), the construction of facilities and infrastructure to support military training operations at Andersen South will be implemented. Construction of proposed facilities is expected to begin in fiscal year 2019. Additional discussion, including a summary of the proposed facilities and military training operations within the new Andersen South Training Complex, is provided in Section 7.4.1 of the 2019 JRM INRMP.

1.3.9 Barrigada Transmitter Site

Barrigada Transmitter Site (previously known as Air Force Barrigada or Air Force Communications Annex Barrigada) is discussed in detail in Chapter 7, *Apra Heights, Sasa Valley and Tenjo Vista Tank Farms, Naval Computer and Telecommunications Station Barrigada, Barrigada Transmitter Site, and Andersen South*, of the 2019 JRM INRMP. The 432-acre (175-hectare) complex supports a next-generation, high-resolution weather radar system that is operated by Andersen AFB (see Figure 1-2).

1.3.10 Tinian Military Lease Area

JRM leased lands on Tinian are discussed in detail in Chapter 11, *Tinian Military Lease Area*, of the 2019 JRM INRMP. The northern two thirds of the island of Tinian is leased to the federal government and is excluded from the CNMI coastal zone by covenant. The area is designated the Military Lease Area (MLA) and is divided into the Exclusive Military Use Area (EMUA) and the Lease Back Area (LBA). Most existing military training activities are limited to lands within the EMUA. DoD training on Tinian is conducted in five general mission areas: Air Warfare, Sea Warfare, Undersea Warfare, Land Warfare, and Amphibious Warfare. Training conducted in these mission areas occurs to ensure the readiness of the U.S. Navy, U.S. Marine Corps, USAF, U.S. Army, USCG, and the U.S. military readiness partners.

The Tinian MLA is controlled and managed by DON and is approximately 15,347 contiguous acres (6,211 hectares) north of the Tinian International Airport (West Field) (see Figure 1-4). The EMUA is approximately 7,577 acres (3,066 hectares) in the northern section of the MLA and the LBA includes approximately 7,770 acres (3,145 hectares) in the central section of the island. There are no permanent military installations in the EMUA, and it is open to the public for recreational and other purposes when not being used for training. The International Broadcasting Bureau's Philippines Transmitting Station uses 777 acres (314 hectares) of the EMUA. The International Broadcasting Bureau is operated by the U.S. Information Agency (DON 2010b) and supports day-to-day operations of Voice of America and provides transmission and technical support to non-military U.S. broadcasting services. The LBA is jointly used for both military and non-military activities.

In 1999, the DON dedicated the Existing Tinian Military Retention Land for Wildlife Conservation – also known as Federal Aviation Administration Mitigation Area – as a conservation area for the Tinian monarch (*Monarcha takatsukasae*) to mitigate for past expansions of the Tinian International Airport (West Field) (Government of CNMI and U.S. of America 1999) (see Figure 1-4). This was done in cooperation with USFWS, CNMI Division of Fish and Wildlife (DFW), and the Federal Aviation Administration. The cooperative agreement allows the military to use the Federal Aviation Administration Mitigation Area for low-impact training that will not adversely modify habitat.

Refer to Section 11.1 of the 2019 JRM INRMP for further details on Tinian assets and uses, training areas, and special conservation areas.

1.3.11 Farallon de Medinilla

FDM is the Pacific Fleet's only U.S.-controlled range available for live-fire training. It is discussed in detail in Chapter 12, *Farallon de Medinilla*, of the 2019 JRM INRMP. The island has served as a bombing range since 1971, both for live- and inert-fire bombing. It supports activities such as surface-to-ground and air-to-ground Gunnery Exercise, Bombing Exercise, Missile Exercise, Fire Support, and Precision Weapons (U.S. Navy 2009).

FDM is under lease by the DoD from the CNMI. The lease agreement with the CNMI allows DoD use of the island until the year 2075. DON controls and manages access to and training on FDM. There are no designated special conservation areas for terrestrial resources on FDM; however, the No-fire Area at the northern tip of the island serves as a de-facto conservation area (see Figure 1-5). A limited archaeological reconnaissance survey of the island was conducted in 1996 and no archaeological sites or isolated non-modern artifacts were discovered.

Refer to Section 12.1 of the 2019 JRM INRMP for further details on FDM uses and training areas.

1.4 Purpose of and Need for the Proposed Action

The purpose of the Proposed Action is to implement the revised JRM INRMP to include species listed under the ESA since 2013 (Table 1-3) and to implement an approach for natural resources management on JRM-administered lands that is consistent with the Sikes Act (as amended) as well as the most recent DoD and DON policy and guidance regarding INRMPs.

The need for the Proposed Action is to provide a comprehensive, adaptive natural resources management approach for all properties under JRM. Both the INRMP and the natural resources management programs that it supports must meet DoD and DON policy and guidance that collectively require a plan and management approach consistent with mission support (as defined in 10 USC Section 5062), multipurpose use, integration, ecosystem- or landscape-level management, and environmental compliance and stewardship objectives.

> 10 USC Section 5062: "The Navy shall be organized, trained, and equipped primarily for prompt and sustained combat incident to operations at sea. It is responsible for the preparation of naval forces necessary for the effective prosecution of war except as otherwise assigned and, in accordance with integrated joint mobilization plans, for the expansion of the peacetime components of the Navy to meet the needs of war."

1.5 Scope of Environmental Analysis

This EA includes an analysis of potential environmental impacts associated with the Proposed Action and the No Action Alternative. The environmental resource areas analyzed in this EA include: geology, topography, and soils; water resources; cultural resources; terrestrial biological resources; marine biological resources; land use; submerged land use; and socioeconomics and environmental justice. The study area for each resource analyzed may differ due to how the Proposed Action interacts with or impacts the resource.

Table 1-3 Species Listed under the ESA since 2013

Common Name/ Chamorro Name[(1)]	*Scientific Name*	*Federal Status*
Reptiles		
Green turtle/Haggan betde	*Chelonia mydas*	E[(2)]
Slevin's skink/ Gualiek halom tano	*Emoia slevini*	E
Invertebrates		
Humped tree snail/Akaleha	*Partula gibba*	E
Guam tree snail/Akaleha	*Partula radiolata*	E
Fragile tree snail/Akaleha	*Samoana fragilis*	E
Mariana eight-spot butterfly/Ababbang	*Hypolimnas octocula marianensis*	E
Coral/Acho tasi	*Acropora globiceps*	T
Coral/Acho tasi	*Acropora retusa*	T
Coral/Acho tasi	*Seriatopora aculeata*	T
Fish		
Oceanic whitetip shark/Haluu	*Carcharhinus longimanus*	T
Giant manta ray/Afula or Hafula or Fanihen tasi	*Manta birostris*	T

1.6 Key Documents

Key documents are sources of information incorporated into this EA. Documents are considered key because they refer to similar actions, analyses, or impacts that may apply to this Proposed Action. CEQ guidance encourages incorporating documents by reference. Documents incorporated into this EA by reference in part or in whole include the following:

- *Mariana Islands Range Complex Final Environmental Impact Statement/Overseas Environmental Impact Statement* (COMPACFLT 2010). Published May 2010, the MIRC EIS/OEIS evaluated impacts associated with the military services conducting training in the Mariana Islands (inclusive of Guam and the CNMI). The ROD supports conducting current, emerging, and future military training and research, development, test, and evaluation activities in the MIRC, while enhancing training resources through investment in the MIRC (COMPACFLT 2010). Training, including non-live-fire, within the MIRC involves ranges, training areas, facilities, and Special Use Airspace over Tinian, Saipan, FDM, and Rota, as well as Guam.
- *Guam and Commonwealth of the Northern Mariana Islands Military Relocation Final Environmental Impact Statement*: Relocating Marines from Okinawa, Visiting Aircraft Carrier Berthing, and Army Air and Missile Defense Task Force (DON 2010b). The EIS was published in July 2010 and the ROD was signed in September 2010. The EIS addressed impacts of relocating Marines from Okinawa to Guam, the construction of four ranges (three small arms ranges and an infantry platoon battle course) on Tinian, and conducting training operations on Tinian.
- *Mariana Islands Range Complex Airspace Environmental Assessment/Overseas Environmental Assessment* (DON 2013a). Published in June 2013, the MIRC EA/Overseas EA analyzed potential environmental impacts relevant to the proposed modifications to training airspace and sea space in the MIRC. The proposed action is to maximize public awareness of hazardous military training activities and to optimize safety and training efficiency through the establishment of new Special Use Airspace throughout the MIRC and the modification of existing Special Use Airspace and the establishment of a new Surface Danger Zone at FDM.
- *Integrated Natural Resources Management Plan for Joint Region Marianas Environmental Assessment* (DON 2013b). Published in June 2013, the EA analyzed potential environmental impacts associated with implementation of the proposed 2013 JRM INRMP (JRM 2013). A Finding of No Significant Impact was signed in July 2013.
- *Mariana Islands Training and Testing Final Environmental Impact Statement/Overseas Environmental Impact Statement* (COMPACFLT 2015a). Published in May 2015, the EIS/OEIS evaluated impacts associated with supporting and conducting current, emerging, and future training and testing activities in the MITT study area, which is made up of the MIRC, additional areas on the high seas, and a transit corridor where training and testing activities may occur. The ROD supports meeting current and future DON and DoD training and testing requirements, including the use of active sonar and explosives within the study area (COMPACFLT 2015b).
- *Guam and Commonwealth of the Northern Mariana Islands Military Relocation (2012 Roadmap Adjustments) Supplemental Environmental Impact Statement* (DON 2015a). A Supplemental EIS to the Guam and CNMI Military Relocation Final EIS was published in July 2015 (DON 2015a) and a ROD was signed in August 2015 (DON 2015b). This Supplemental EIS modified many aspects of the previously approved 2010 Guam and CNMI Military Relocation Final EIS (DON 2010b), including the establishment on Guam of a Live-fire Training Range Complex, a cantonment area,

a family housing area, and associated infrastructure to support the relocation of a substantially reduced number of Marines and dependents; there were no changes addressed for the Tinian portion of the original proposed action.

- *Divert Activities and Exercises, Commonwealth of the Northern Mariana Islands Final Environmental Impact Statement* (USAF 2016). Published in September 2016, the Final EIS analyzed environmental impacts associated with improving an existing airport or airports and associated infrastructure in the Mariana Islands in support of expanding mission requirements and to achieve divert capabilities in the Western Pacific. The USAF signed the ROD for the Divert Exercises and Activities initiative on December 7, 2016, selecting the Tinian International Airport, Tinian alternative, and, specifically the North Option, as described in the Final EIS.
- *Environmental Assessment for Terminal High-Altitude Area Defense (THAAD) Permanent Stationing in Guam* (U.S. Army 2015). Published in 2015, the THAAD EA analyzed the impacts of the ballistic missile defense battery and an associated cargo drop zone training area permanently located at Northwest Field, Andersen 19 AFB, and Guam. The battery is under the direction of the U.S. Army Space and Missile Defense 20 Command/Army Forces Strategic Command.

1.7 Relevant Laws and Regulations

The DON has prepared this EA based upon federal and state laws, statutes, regulations, and policies pertinent to the implementation of the Proposed Action, including the following:

- NEPA (42 USC Sections 4321–4370h), which requires an environmental analysis for major federal actions that have the potential to significantly impact the quality of the human environment
- Sikes Act, as amended (16 USC 670a)
- Fish and Wildlife Coordination Act (16 USC 661-666c)
- Coast and Geodetic Survey Act of 1947 (33 USC Section 883 et seq.)
- CEQ Regulations for Implementing the Procedural Provisions of NEPA (40 CFR parts 1500–1508)
- Navy regulations for implementing NEPA (32 CFR part 775), which provides Navy policy for implementing CEQ regulations and NEPA
- Archaeological Resources Protection Act (16 USC Section 470aa-mm)
- Comprehensive Environmental Response, Compensation, and Liability Act (42 USC Section 9601 et seq.)
- Clean Air Act (42 USC Section 7401 et seq.)
- Clean Water Act (CWA) (33 USC Section 1251 et seq.)
- Rivers and Harbors Act (33 USC Sections 10 and 407)
- Coastal Zone Management Act (CZMA) (16 USC Section 1451 et seq.)
- NHPA (54 USC Section 306108 et seq.)
- ESA (16 USC Section 1531 et seq.)
- National Invasive Species Act (16 USC Section 4701)
- Magnuson-Stevens Fishery Conservation and Management Reauthorization Act (16 USC Section 1801 et seq.)
- Marine Mammal Protection Act (MMPA) (16 USC Section 1361 et seq.)

- Migratory Bird Treaty Act (MBTA) (16 USC Sections 703–712)
- Federal Insecticide, Fungicide, and Rodenticide Act (7 USC Section 136 et seq.)
- Resource Conservation and Recovery Act (42 USC Section 6901 et seq.)
- Toxic Substances Control Act (15 USC Sections 2601–2629)
- Executive Order (EO) 11988, *Floodplain Management*
- EO 12898, *Federal Actions to Address Environmental Justice in Minority Populations and Low-income Populations*
- EO 13045, *Protection of Children from Environmental Health Risks and Safety Risks*
- EO 13089, *Coral Reef Protection*
- EO 13112, *Invasive Species*
- EO 13751, *Safeguarding the Nation from the Impacts of Invasive Species*
- Guam Pesticide Act (Guam Code Section 57120 et seq.)

A description of the Proposed Action's consistency with these laws, policies, and regulations, as well as the names of regulatory agencies responsible for their implementation, is presented in Chapter 6, *Other Considerations Required by National Environmental Policy Act* (Table 6-1).

1.8 Public and Agency Participation and Intergovernmental Coordination

Regulations from the CEQ direct agencies to involve the public in preparing and implementing their NEPA procedures.

The Navy prepared this Draft EA to inform the public of the Proposed Action and to allow the opportunity for public review and comment. The Draft EA review period for Guam and the CNMI was scheduled for November 14 to December 13, 2018. The Navy postponed the public review within the CNMI to allow for recovery efforts resulting from Super Typhoon Yutu but proceeded with the public review period in Guam. The Guam review period began with a public notice published in printed editions and online websites of the Guam Pacific Daily News and the Guam Daily Post on November 9, 2018 indicating the availability of the November 2018 Draft EA, the date by which comments must be received, the Navy point of contact, and the locations where public review copies were available for review by interested parties. An online public notice remained advertised on the Guam Daily Post website from November 9 through December 9, 2018. The November 2018 Draft EA along with the November 2018 Draft INRMP were available for review by interested parties from November 14 to December 13, 2018 at the Nieves M. Flores Memorial Library, 254 Martyr Street Hagatna, Guam; Dededo Public Library, West Santa Barbara Avenue, Dededo, Guam; and on the JRM INRMP website at www.jrminrmp.com.

The Navy then provided a 30-day public review period for the residents of the CNMI from February 15 to March 16, 2019. The CNMI review period began with a public notice published in printed editions and online websites of the Saipan Tribune on February 12, 2019 and the Marianas Variety on February 13, 2019 indicating the availability of the February 2019 Draft EA, the date by which comments must be received, the Navy point of contact, and the locations where public review copies were available for review by interested parties. An online public notice remained advertised on the Saipan Tribune website from February 12 through March 11, 2019. The February 2019 Draft EA along with the February 2019 Draft INRMP were available for review by interested parties from February 15 to March 16, 2019 at the

Joeten-Kiyu Public Library, Insatto Street, Saipan; Tinian Public Library, San Jose, Tinian; and on the JRM INRMP website at www.jrminrmp.com.

During the development of the Proposed Action, the Navy coordinated or consulted with the USFWS, including the Guam National Wildlife Refuge, the National Oceanic and Atmospheric Administration National Marine Fisheries Service (NMFS), other resource management agencies, and the territorial and commonwealth fish and wildlife agencies, which for Guam is Guam DAWR and for Tinian and FDM is the CNMI DFW. A Coastal Consistency Determination was prepared and submitted to the Guam Bureau of Statistics and Plans, Coastal Management Program. A CZMA determination will also be submitted to the CNMI Bureau of Environmental and Coastal Quality.

Section 7 of the ESA directs all federal agencies to work to conserve endangered and threatened species and to use their authorities to further the purposes of the ESA. Section 7 of the ESA is the mechanism by which federal agencies ensure the actions they take, including those they fund or authorize, do not jeopardize the existence of any federal ESA-listed species. If the Proposed Action is implemented, DON will coordinate with the USFWS and NMFS to engage in section 7 consultations for specific projects that may affect listed species.

The Navy will also perform project-specific consultations with the Guam State Historic Preservation Officer and CNMI Historic Preservation Officer as needed before implementing specific proposed natural resource management actions described in the 2019 JRM INRMP.

This page intentionally left blank.

2 Proposed Action and the No Action Alternative

2.1 Introduction

This chapter describes the alternatives that are evaluated in this Environmental Assessment (EA). The Proposed Action under consideration is to implement the 2019 Joint Region Marianas (JRM) Integrated Natural Resources Management Plan (INRMP), consistent with the military use of the JRM-administered lands and the goals and objectives established in the Sikes Act (as amended). As required by National Environmental Policy Act (NEPA) regulations, a No Action Alternative is also analyzed. The No Action Alternative under consideration would continue the implementation of the 2013 JRM INRMP (Department of the Navy [DON] 2013a). The No Action Alternative is evaluated to compare the outcomes of implementing the Proposed Action, versus continuing current practices.

2.2 Screening Factors

NEPA's implementing regulations provide guidance on the consideration of alternatives to a federally proposed action and require rigorous exploration and objective evaluation of reasonable alternatives. Only those alternatives determined to be reasonable and to meet the purpose and need require detailed analysis.

Potential alternatives that meet the purpose and need were evaluated against the following screening factors:

- be based on the principles of ecosystem management
- provide for sustainable multipurpose use of natural resources
- maintain compliance with relevant environmental regulations
- provide for public access for use of natural resources subject to safety and military security considerations
- establish specific natural resources management objectives and timeframes for the Proposed Action
- prevent loss in the capability of military lands to support the military mission of the installation

2.3 Alternatives Carried Forward for Analysis

Based on the reasonable alternative screening factors and meeting the purpose and need for the Proposed Action, only the No Action Alternative and the Proposed Action were carried forward and are analyzed in this EA. The Proposed Action in itself encompasses consideration of a wide variety of resource management projects (i.e., alternate actions) that can be implemented in the future, depending on environmental conditions and ecological considerations at the time. Many of these projects were addressed in the EA for the 2013 JRM INRMP, are currently being conducted, and will likely continue. Also, all resource management projects in the 2019 JRM INRMP would result in beneficial effects to area resources, as "good environmental stewardship" is the purpose of the INRMP.

In addition, early participation in the development of the Proposed Action by the United States (U.S.) Fish and Wildlife Service (USFWS); the National Oceanic and Atmospheric Administration National Marine Fisheries Service (NMFS); the Guam Department of Agriculture, Division of Aquatic and Wildlife Resources (Guam DAWR); and the Commonwealth of the Northern Mariana Islands (CNMI) Division of

Fish and Wildlife (DFW) ensured coordination among these parties on the natural resources management goals, objectives, and projects that are stated in the 2019 JRM INRMP. For these additional reasons, only the Proposed Action and the No Action Alternative were carried forward for detailed analysis in this EA.

2.3.1 No Action Alternative

Under the No Action Alternative, the Proposed Action would not occur and natural resources would continue to be managed as characterized in the 2013 JRM INRMP for Naval Base Guam (NBG), Andersen Air Force Base (AFB), and JRM leased lands on Tinian and Farallon de Medinilla (FDM); JRM would continue to implement applicable regulatory requirements. This alternative represents the status quo. The No Action Alternative would not meet the purpose and need for the Proposed Action since the management goals, objectives, projects, strategies, and actions from the 2013 JRM INRMP do not take into account current conditions. A key difference between the No Action Alternative and the Proposed Action is that the latter provides focused management of newly listed species under the Endangered Species Act (ESA). Other key differences include enhanced partner agency engagement and coordination, current state of the science, and improved terrestrial and marine resource management strategies that address changing environmental conditions. However, as required by NEPA, the No Action Alternative is carried forward for analysis in this EA. The No Action Alternative will be used to analyze the consequences of not undertaking the Proposed Action and will serve to establish a comparative baseline for analysis.

2.3.2 Proposed Action (Preferred Alternative)

The Proposed Action is to implement the 2019 JRM INRMP, consistent with the military use of the JRM-administered lands considered in this EA and (consistent with the requirements of) the Sikes Act (as amended). The 2019 JRM INRMP has been developed to ensure consistent management of resources on Guam and within the CNMI and to comply with applicable federal, territory, commonwealth, and local standards, as applicable. For an outline of the 2019 JRM INRMP, see Table 1-1 above.

As described in greater detail in Section 1.1 of the 2019 JRM INRMP, the goal of the 2019 JRM INRMP is to utilize adaptive management to maintain long-term ecosystem health and minimize impacts to natural resources consistent with the operational requirements of the Department of Defense's (DoD's) mission. The DON is required to ensure ecosystem management is the basis for all management of its lands (Sikes Act, as amended [16 U.S. Code {USC} 670a]; DoD Instruction 4715.03; DoD Manual 4715.03).

To achieve the goals and objectives of the 2019 JRM INRMP, resource-specific strategies and actions have been developed to guide natural resources management on JRM-administered lands and submerged lands (see Section 3.3 of the 2019 JRM INRMP for a list of goals and objectives). In addition, the 2019 JRM INRMP includes actions to address commitments with ESA section 7 consultations (informal and formal) including, but not limited to the following actions:

- JRM will ensure all military and contractor personnel receive brown treesnake (BTS) awareness briefings prior to all Mariana Islands Training and Testing (MITT) training activities.
- During training activities on NBG Main Base, NBG TS, and Andersen AFB, personnel will establish snake-free quarantine areas (barriers) as deemed necessary for cargo/equipment traveling from Guam to CNMI and locations outside of the MITT action area.

- On JRM-administered and leased lands on Guam and Tinian, vegetation removal shall be limited to the maintenance of existing bivouac areas that do not contain listed species or habitat. No new bivouac areas are proposed under MITT. Maneuver units will remain tactical and not establish support camps.
- JRM will maintain invasive species rapid response to control and eradicate introduced non-established, non-native, invasive species sighted in the vicinity of DoD training areas and facilities used for staging, storage, and movement of military personnel, cargo, and vehicles associated with training activities.
- Andersen AFB personnel will ensure flood lights at the Andersen AFB Combat Arms Training and Marksmanship range are maintained below the tree canopy level and directed inland and parallel to the coast. Lighting in this configuration will avoid impacts to nesting and hatching sea turtles and Mariana fruit bats.
- JRM natural resources staff will conduct baseline and long-term monitoring for invasive species in training areas and at locations used for staging and movement of military cargo and vehicles on Guam and Tinian to identify newly established and/or high-risk species.
- For tactical training exercises, to the maximum extent practicable, operations personnel will ensure inbound personnel and cargo are routed directly to the CNMI. If Guam cannot be avoided for tactical approaches, JRM will work with USFWS to identify and implement appropriate interdiction methods such as multiple, redundant inspections and barrier use on Guam. In addition, JRM will ensure tactical approach exercises will involve only cargo/equipment that has not originated from areas containing a BTS population or will be 100 percent (%) inspected by qualified BTS canine detection programs.
- Operations personnel will ensure training operations that go from Guam to Saipan and then FDM via aircraft will obtain required canine inspection on Saipan or other BTS inspection as mutually agreed upon by JRM and USFWS.

A summary of all proposed management projects for all JRM-administered lands and the conservation drivers for each can be found in Section 13.9 of the 2019 JRM INRMP.

It is also the intent of the 2019 JRM INRMP to provide a conservation benefit to federally listed species and their designated critical habitats under the ESA and preclude critical habitat designation on JRM-administered and leased lands by providing adequate special management and protections. Pursuant to section 4(a)(3)(B)(i) of the ESA, the Secretaries of the Departments of Interior and Commerce are prohibited from designating as critical habitat any lands or other geographical areas owned or controlled by the DoD, or designated for its use, that are subject to an INRMP prepared pursuant to section 670a of the Sikes Act (DoD Manual 4715.03). In accordance with USFWS Special Management Criteria, adequate special management may be provided by an INRMP that addresses the maintenance and improvement of habitat (and/or essential features) important to the species and manages for the long-term conservation of the species. Three criteria are used to determine if such special management or protections are provided: (1) there is a conservation benefit, (2) there are assurances that the management plans will be implemented, and (3) there are assurances that the conservation efforts will be effective (USFWS 2015b). Additional detail on how these three criteria would be met is provided in Chapter 3, *Environmental Management Strategy and Mission Sustainability*, of the 2019 JRM INRMP.

As described in greater detail in Section 1.2 of the 2019 JRM INRMP, the INRMP would be reviewed on an annual and a 5-year basis. If the 5-year INRMP review for operation and effect results in major revisions to INRMP, such as the addition of management projects to address newly listed species, JRM would solicit public review and comments through the NEPA process in the form of an EA to evaluate the new INRMP. Annual reviews would include discussions of the INRMP to ensure that necessary changes are made consistently, such as changes based on adaptive management with respect to ongoing projects or new data regarding species or habitats.

Finally, Table 2-1 summarizes the resources benefitted by strategies and actions described in the INRMP for each installation or parcel of land. Benefits of implementing the Proposed Action include but are not limited to the following:

- helping natural resource managers more effectively manage natural resources to ensure installation lands remain available and in good condition to support the military mission
- implementing projects designed with specific goals and objectives in mind for management of natural resources under the current environment
- implementing projects designed with the conservation of species listed under the ESA since 2013
- better integrating the INRMP with current JRM planning documents and regional conservation strategies and priorities
- improving integration of the natural resources program with current JRM activities
- improving the efficiency to managing natural resources and INRMP implementation
- precluding designation of critical habitat

3 Affected Environment

This chapter presents a description of the environmental resources and baseline conditions that could be affected by the implementation of any of the alternatives. These resources include: geology, topography, and soils; water resources; cultural resources; terrestrial biological resources; marine biological resources; land use; submerged land use; socioeconomics; and environmental justice.

Other potentially relevant environmental resource areas were initially considered for analysis, but in compliance with the National Environmental Policy Act (NEPA), the Council on Environmental Quality (CEQ), and Department of the Navy (DON) guidelines, the potential impacts to the following resource areas were considered negligible or non-existent so they were not analyzed in detail in this EA:

- Air Quality: The Proposed Action Alternative and No Action Alternative do not include burning of vegetation, substantially increased use of fossil fuels, or other actions that would cause an increase in harmful air emissions.
- Visual Resources: The Proposed Action Alternative and No Action Alternative would not adversely change views of or from Joint Region Marianas (JRM)-administered lands, and improving ecosystem health on those lands could result in a long-term improvement in the views of natural areas in the region.
- Airspace: The Proposed Action Alternative and No Action Alternative would not affect, or be affected by, the use of DON military airspace or adjacent civilian airspace.
- Noise: The Proposed Action Alternative and No Action Alternative would have no impact on the current noise levels that would occur on or adjacent to JRM-administered lands. Any noise emissions from the Proposed Action Alternative or No Action Alternative would be temporary and transient, limited to the duration of the action.
- Infrastructure: Infrastructure and utilities would not be modified or affected during implementation of the Proposed Action Alternative or No Action Alternative.
- Transportation: The Proposed Action Alternative and No Action Alternative would not change traffic volume or traffic patterns on or in the vicinity of JRM-administered lands.
- Public Health and Safety: No safety risks are expected during implementation of the Proposed Action Alternative or No Action Alternative. Risks associated with ungulate control and other management projects would be minimized by following protocols in required Health and Safety Plans.
- Hazardous Materials and Wastes: Hazardous materials and wastes are regulated on JRM-administered and leased lands on Guam and the Commonwealth of the Northern Mariana Islands (CNMI) by a combination of mandated laws and regulations promulgated by the United States (U.S.) Environmental Protection Agency (USEPA), Guam Environmental Protection Agency (Guam EPA), and the CNMI Bureau of Environmental and Coastal Quality, Division of Environmental Quality, Hazardous and Solid Waste Management Branch, and the Department of Defense (DoD) itself. Implementation of the Proposed Action Alternative or No Action Alternative would not change this.

3.1 Geology, Topography, and Soils

This discussion includes geology, topography, and soils. The geology of an area may include bedrock materials, mineral deposits, and fossil remains. The principal geological factors influencing the stability of structures are soil stability and seismic (i.e., earthquake) properties. Topography, the arrangement of the natural and artificial physical features of an area, is typically described with respect to the elevation, slope, and surface features found within a given area. Soil refers to unconsolidated earthen materials overlying bedrock or other parent material. Soil structure, elasticity, strength, shrink-swell potential, and potential for soil erosion determine the ability for the ground to support structures and facilities. Soils are typically described in terms of their type, slope, physical characteristics, and relative compatibility or limitations with regard to particular construction activities and types of land use.

3.1.1 Regulatory Setting

The USEPA Region 9 gives the Guam EPA the authority to enforce portions of federal statutes via a Memorandum of Agreement (MOA). Under this MOA, an Environmental Protection Plan (EPP) is required for projects at the discretion of the Guam EPA Administrator. EPPs are specifically identified in 22 Guam Annotated Regulations, Division II, Chapter 10, Section 10103.C.5(d). EPPs would include management measures, such as erosion and sedimentation control, vegetation, wildlife resource protection measures, dust control, solid and hazardous waste management and disposal procedures, a nutrient management plan, an integrated pest management strategy/plan, a confined animal facilities management plan, an irrigation water management plan, personnel safety procedures, work site maintenance, and typhoon contingency plans, as necessary, depending on the work, project, activity and facility function.

Military construction projects are required to follow Unified Facilities Criteria 3-310-04 Seismic Design for Buildings, which contains specifications for limiting seismic liquefaction, which occurs when unconsolidated soil or sand is converted into a suspension during an earthquake, and ground shaking effects (U.S. Army Corps of Engineers [USACE] 2007).

Government of Guam (GovGuam) has established a Soils and Water Conservation Program as defined in Chapter 26 of Title 17 of the Guam Code Annotated, as authorized by Public Law 28-179. The program is administered by the University of Guam. This regulation promotes the Territory of Guam's soil and water conservation policy in an effort to prevent erosion and water management problems; conserves and improves the use of the Territory's land and water resources; establishes Soil and Water Conservation Districts; and affirms the University of Guam's role as the Territory's lead soil conservation agency. Conservation programs are also administered by the Guam Waterworks Authority and Guam EPA. Chapter 10 of Title 22 of the Guam Administrative Rules and Regulations requires appropriate permitting for activities that concern the control of operations that may bring about erosion, sedimentation, and soil degradation; the obtaining of permits; and the approval of Erosion and Sediment Control Plans. The regulations also provide rules relative to methods of soil-related activities to prevent erosion or other degradation of the soil.

The CNMI Earthmoving and Erosion Control program is responsible for establishing certain minimum standards and requirements as determined by the Division necessary for controlling nonpoint source runoff from human related activities, such as land clearing. The Northern Mariana Islands Administrative Code Chapter 65-30, Sections 65-30-101; Permit Requirements state, "No person shall commence or

continue any earthmoving activity including grading, filling, or clearing of vegetation without a Department of Environmental Quality Earthmoving and Erosion Control Permit issued in accordance with the regulation."

3.1.2 Affected Environment

Overview descriptions of the geology, topography, and soils found on Guam and the CNMI are included in Chapters 4 and 10, respectively, and detailed descriptions of the geology, topography, and soils found on each JRM installation are included in Chapters 5 through 9, 11, and 12 of the 2019 JRM Integrated Natural Resources Management Plan (INRMP). For the descriptions of the geology, topography, and soils associated with the Proposed Action refer to the following INRMP sections by area:

- 4.2 - Guam
- 5.2.1 - NBG Main Base
- 6.2.1 - Naval Munitions Site (NMS)
- 7.1.2 - Apra Heights
- 7.2.2 - Sasa Valley and Tenjo Vista Tank Farms
- 7.3.2 - NCTS Barrigada and Barrigada Transmitter Site
- 7.4.2 - Andersen South
- 8.2.1 - NBG Telecommunications Site (TS)
- 9.2.1 - Andersen Air Force Base (AFB)
- 10.2 - CNMI
- 11.2.1 - Tinian Military Lease Area (MLA)
- 12.2.1 - Farallon de Medinilla (FDM)

3.2 Water Resources

This discussion of water resources includes groundwater, surface water, marine waters, wetlands, and floodplains.

Groundwater is water that flows or seeps downward and saturates soil or rock, supplying springs and wells. Groundwater is used for water consumption, agricultural irrigation, and industrial applications. Groundwater properties are often described in terms of depth to aquifer, aquifer or well capacity, water quality, and surrounding geologic composition. Sole source aquifer designation provides limited protection of groundwater resources that serve as drinking water supplies.

Surface water resources generally consist of wetlands, lakes, rivers, and streams. Surface water is important for its contributions to the economic, ecological, recreational, and human health of a community or area. The total maximum daily load is a regulatory term in the federal Clean Water Act (CWA) that describes the maximum amount of a substance, such as a pollutant, that can be assimilated by a water body without causing damage to that body of water. A water body can be deemed impaired if it fails to meet water quality standards.

Marine waters typically include estuaries, waters seaward of the historic height of tidal influence, and offshore waters with high salt content. Marine water quality would be described as the chemical and physical composition of the water as affected by natural conditions and human activities. Additionally, marine waters may include an area within a National Marine Sanctuary requiring an action proponent to avoid adverse water quality impacts in order to prevent damage to resources within the sanctuary.

Wetlands are jointly defined by USEPA and USACE as "those areas that are inundated or saturated by surface or groundwater at a frequency and duration sufficient to support, and that under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions." Wetlands generally include "swamps, marshes, bogs, and similar areas."

Floodplains are areas of low-level ground present along rivers, stream channels, large wetlands, or coastal waters. Floodplain ecosystem functions include natural moderation of floods, flood storage and transport, groundwater recharge, and nutrient cycling. Floodplains also help to maintain water quality and are often home to a diverse array of plants and animals. In their natural vegetated state, floodplains slow the rate at which the incoming movement of water over the land reaches the main water body. Floodplain boundaries are most often defined in terms of frequency of inundation, that is, the 100-year and 500-year flood. Maps that outline floodplains are produced by the Federal Emergency Management Agency and provide a basis for comparing the area of the Proposed Action to the floodplains.

3.2.1 Regulatory Setting

The Safe Drinking Water Act (SDWA) is the federal law that protects public drinking water supplies throughout the nation and U.S. territories. Under the SDWA, the USEPA sets standards for drinking water quality. Groundwater quality and quantity are regulated under several statutes and regulations, including the SDWA.

The CWA establishes federal limits, through the National Pollutant Discharge Elimination System (NPDES) program, on the amounts of specific pollutants that can be released into surface waters to restore and maintain the chemical, physical, and biological integrity of the water. The NPDES program regulates the discharge of point (e.g., end of pipe) and nonpoint sources (e.g., stormwater) of water pollution.

The Guam and CNMI NPDES stormwater programs require construction site operators engaged in clearing, grading, and excavating activities that disturb one acre or more to obtain coverage under an NPDES Construction General Permit for stormwater discharges. Construction or demolition that necessitates an individual permit also requires preparation of a Notice of Intent to discharge stormwater and a Stormwater Pollution Prevention Plan that is implemented during construction. As part of the 2010 Final Rule for the CWA, titled *Effluent Limitations Guidelines and Standards for the Construction and Development Point Source Category*, activities covered by this permit must implement non-numeric erosion and sediment controls and pollution prevention measures.

Wetlands are currently regulated by USACE under Section 404 of the CWA as a subset of all "Waters of the U.S." Waters of the U.S. are defined as (1) traditional navigable waters, (2) wetlands adjacent to navigable waters, (3) non-navigable tributaries of traditional navigable waters that are relatively permanent where the tributaries typically flow perennially or have continuous flow at least seasonally (e.g., typically 3 months), and (4) wetlands that directly border on such tributaries under Section 404 of the CWA, as amended, and are regulated by USEPA and USACE. The CWA requires that Guam and the CNMI establish a Section 303(d) list to identify impaired waters and establish total maximum daily loads for the sources causing the impairment.

Section 404 of the CWA authorizes the Secretary of the Army, acting through the Chief of Engineers, to issue permits for the discharge of dredge or fill into wetlands and other waters of the U.S. Any discharge of dredge or fill into waters of the U.S. requires a permit from the USACE.

Section 438 of the Energy Independence and Security Act establishes stormwater design requirements for development and redevelopment projects. Under these requirements, federal facility projects larger than 5,000 square feet must "maintain or restore, to the maximum extent technically feasible, the predevelopment hydrology of the property with regard to the temperature, rate, volume, and duration of flow."

Section 10 of the Rivers and Harbors Act provides for USACE permit requirements for any in-water construction. USACE and some states require a permit for any in-water construction including construction of piers, wharfs, bulkheads, pilings, marinas, docks, ramps, floats, moorings, and like structures; construction of wires and cables over the water, and pipes, cables, or tunnels under the water; dredging and excavation; any obstruction or alteration of navigable waters; construction of riprap, revetments, groins, breakwaters, and levees; and transportation of dredged material for dumping into ocean waters.

The Coastal Zone Management Act (CZMA) of 1972 provides assistance to states, in cooperation with federal and local agencies, for the development of land and water use programs in coastal zones. Actions occurring within the coastal zone commonly have several resource areas that may be relevant to the CZMA. The CZMA regulatory setting discussion is presented in Section 3.6.1.

Executive Order (EO) 11990, *Protection of Wetlands,* requires that federal agencies adopt a policy to avoid, to the extent possible, long- and short-term adverse impacts associated with destruction and modification of wetlands and to avoid the direct and indirect support of new construction in wetlands whenever there is a practicable alternative.

EO 11988, *Floodplain Management*, requires federal agencies to avoid to the extent possible the long- and short-term adverse impacts associated with the occupancy and modification of floodplains and to avoid direct and indirect support of floodplain development unless it is the only practicable alternative. Flood potential of a site is usually determined by the 100-year floodplain, which is defined as the area that has a one percent (%) chance of inundation by a flood event in a given year.

3.2.2 Affected Environment

Overview descriptions of the water resources (surface water and groundwater) found on Guam and the CNMI are included in Chapters 4 and 10, respectively, and detailed descriptions of the water resources found on each JRM installation or parcel of land are included in the "Hydrology" sections of Chapters 5 through 9, 11, and 12 of the 2019 JRM INRMP. For the descriptions of the water resources associated with the Proposed Action refer to the following INRMP sections:

- 4.3 - Guam
- 5.2.2 - NBG Main Base
- 6.2.2 - NBG NMS
- 7.1.3 - Apra Heights
- 7.2.3 - Sasa Valley and Tenjo Vista Tank Farms
- 7.3.3 - NCTS Barrigada and Barrigada Transmitter Site

- 7.4.3 - Andersen South
- 8.2.2 - NBG TS
- 9.2.2 - Andersen AFB
- 10.3 - CNMI
- 11.2.2 - Tinian MLA
- 12.2.2 - FDM

3.3 Cultural Resources

This discussion of cultural resources includes prehistoric and historic archaeological sites; historic buildings, structures, and districts; and physical entities and human-made or natural features important to a culture, a subculture, or a community for traditional, religious, or other reasons. Cultural resources on Guam and the CNMI can be divided into three major categories:

- Archaeological resources (prehistoric and historic) are locations where human activity measurably altered the earth or left deposits of physical remains.
- Architectural resources include standing buildings, structures, landscapes, and other built-environment resources of historic or aesthetic significance.
- Traditional cultural properties may include archaeological resources, structures, neighborhoods, prominent topographic features, habitat, plants, animals, and minerals that Native Chamorro or other groups consider essential for the preservation of traditional culture.

3.3.1 Regulatory Setting

Cultural resources are governed by other federal laws and regulations, including the National Historic Preservation Act (NHPA), Archeological and Historic Preservation Act, and the Archaeological Resources Protection Act of 1979. Federal agencies' responsibility for protecting historic properties is defined primarily by Sections 106 and 110 of the NHPA. Section 106 requires federal agencies to take into account the effects of their undertakings on historic properties. Section 110 of the NHPA requires federal agencies to establish—in conjunction with the Secretary of the Interior—historic preservation programs for the identification, evaluation, and protection of historic properties. Cultural resources also may be covered by state, local, and territorial laws.

3.3.2 Affected Environment

Cultural resources listed in the National Register of Historic Places (NRHP) or eligible for listing in the NRHP are "historic properties" as defined by the NHPA. The list was established under the NHPA and is administered by the National Park Service on behalf of the Secretary of the Interior. The NRHP includes properties on public and private land. Properties can be determined eligible for listing in the NRHP by the Secretary of the Interior or by a federal agency official with concurrence from the applicable State Historic Preservation Office. A NRHP-eligible property has the same protections as a property listed in the NRHP. The historical properties include archaeological and architectural resources.

Descriptions of cultural resources on JRM-administered lands can be found in the following:

- Final Supplemental Environmental Impact Statement (EIS) Guam and CNMI Military Relocation (2012 Roadmap Adjustments)

- Final EIS Guam and CNMI Military Relocation: Relocating Marines from Okinawa; Visiting Aircraft Carrier Berthing
- Army Air and Missile Defense Task Force Volume 2: Marine Corps Relocation – Guam, Chapter 12 – Cultural Resources (Joint Guam Program Office 2010a)
- Army Air and Missile Defense Task Force Volume 3: Marine Corps Relocation – Training on Tinian, Chapter 12 – Cultural Resources (Joint Guam Program Office 2010b)
- 2015 Final Integrated Cultural Resources Management Plan (ICRMP) Andersen AFB, Guam
- 2015 Final ICRMP CNMI
- 2015 Final ICRMP Naval Base Guam (NBG) (Naval Facilities Engineering Command [NAVFAC] Marianas 2015a, b, c)

Cultural management projects listed in the 2015 ICRMP for JRM-administered lands that include digging require an analysis to evaluate if any other resources, including biological resources, are affected by the management project. Cultural dig permits require staff working on the management projects to complete an Endangered Species Act (ESA) training and conduct monitoring for listed species during the dig.

3.4 Terrestrial Biological Resources

Terrestrial biological resources include living, native, or naturalized plant and animal species and the habitats within which they occur. Plant associations are referred to generally as vegetation, and animal species are referred to generally as wildlife. Habitat can be defined as the resources and conditions present in an area that support a plant or animal.

Within this EA, terrestrial biological resources are divided into two major categories: (1) terrestrial vegetation and (2) terrestrial wildlife. Threatened, endangered, and other special status species are discussed in their respective categories.

3.4.1 Regulatory Setting

Special status species for the purposes of this assessment are those species listed as threatened or endangered under the federal ESA and avian species afforded federal protection under the Migratory Bird Treaty Act (MBTA).

The purpose of the ESA is to conserve the ecosystems upon which threatened and endangered species depend and to conserve and recover listed species. Section 7 of the ESA requires action proponents to consult with the U.S. Fish and Wildlife Service (USFWS) to ensure that their actions are not likely to jeopardize the continued existence of federal ESA-listed threatened and endangered terrestrial species or result in the destruction or adverse modification of designated critical habitat. Critical habitat cannot be designated on any areas owned, controlled, or designated for use by the DoD where an INRMP has been developed that, as determined by the Department of Interior Secretary, provides a benefit to the species subject to critical habitat designation.

The National Invasive Species Act of 1996 was primarily developed to regulate the release of ballast water carried by ships to prevent invasive species from entering inland waters. It also requires a Task Force to develop and implement a comprehensive program to control the invasive brown treesnake

(BTS) on Guam, which was introduced to the island during World War II and has directly devastated the native fauna.

Migratory and most native-resident bird species are protected under the MBTA, and their conservation by federal agencies is mandated by EO 13186, *Migratory Bird Conservation*. Under the MBTA, it is unlawful by any means or in any manner to pursue, hunt, take, capture, kill; attempt to take, capture, or kill; or possess migratory birds or their nests or eggs at any time, unless permitted by regulation. The 2003 National Defense Authorization Act gave the Secretary of the Interior authority to prescribe regulations to exempt the Armed Forces from the incidental taking of migratory birds during authorized military readiness activities. The final rule authorizing the DoD to take migratory birds in such cases includes a requirement that the Armed Forces must confer with the USFWS to develop and implement appropriate conservation measures to minimize or mitigate adverse effects of a Proposed Action if the action will have a significant negative effect on the sustainability of a population of a migratory bird species.

EO 13112, *Invasive Species*, was signed in 1999 to prevent the introduction and spread of invasive species and to support efforts to control and eradicate invasive species already established. In particular, it established the National Invasive Species Council. EO 13751, *Safeguarding the Nation from the Impacts of Invasive Species*, amended EO 13112 to clarify operations of the Council; expand its membership; incorporate considerations of human and environmental health, climate change, and technological advancements; and to continue coordinated federal prevention and control efforts related to invasive species.

3.4.2 Affected Environment

Forty-six terrestrial species that occur on Guam, Tinian, and FDM are listed as either threatened or endangered by the USFWS, GovGuam, or CNMI Division of Fish and Wildlife (DFW) (Table 3-1). Overview descriptions of the terrestrial biological resources found on Guam and the CNMI are included in Chapters 4 and 10, respectively, and detailed descriptions of the terrestrial biological resources found on each JRM installation are included in Chapters 5 through 9, 11, and 12 of the 2019 JRM INRMP. For the descriptions of the terrestrial biological resources associated with the Proposed Action, refer to the following INRMP sections:

- 4.4 - Guam
- 5.2.3 through 5.2.5 - NBG Main Base
- 6.2.3 through 6.2.5 - NBG NMS
- 7.1.4 through 7.1.6 - Apra Heights
- 7.2.4 through 7.2.6 - Sasa Valley and Tenjo Vista Tank Farms
- 7.3.4 through 7.3.6 - NCTS Barrigada and Barrigada Transmitter Site
- 7.4.4 through 7.4.6 - Andersen South
- 8.2.3 through 8.2.5 - NBG TS
- 9.2.3 through 9.2.5 - Andersen AFB
- 10.4 - CNMI
- 11.2.3 through 11.2.5 - Tinian MLA
- 12.2.3 through 12.2.5 – FDM

Table 3-1 Occurrence of Federal, GovGuam, and CNMI ESA-listed Threatened and Endangered and MBTA-listed Terrestrial Species on JRM-administered and Leased Lands on Guam and the CNMI

Common Name/ Chamorro Name[1]	*Scientific Name*	*Federal Status*	*GovGuam Status*	*CNMI Status*	*Habitat*	*Island*	*Occurrence*

3.5 Marine Biological Resources

Marine biological resources include the flora (vegetation) and fauna (invertebrates, fish, turtles, and marine mammals) that live all or a significant part of their lifecycle within the marine environment, as well as the habitat resources and conditions that support these organisms. Table 3-2 lists all special status marine species in the study area; all are animals and are discussed under the faunal group that includes ESA-listed species.

3.5.1 Regulatory Setting

Special status marine species include ESA-listed species and marine mammals, all of which are protected under the ESA and/or Marine Mammal Protection Act (MMPA).

The purpose of the ESA is to conserve the ecosystems upon which threatened and endangered species depend and to conserve and recover listed species. Section 7 of the ESA requires action proponents to consult with the National Oceanic and Atmospheric Administration National Marine Fisheries Service (NMFS) to ensure that their actions are not likely to jeopardize the continued existence of federal ESA-listed threatened and endangered marine species or result in the destruction or adverse modification of designated critical habitat. According to ESA 4(a)(3)(b), critical habitat cannot be designated on any areas owned, controlled, or designated for use by the DoD where an INRMP has been developed that, as determined by the Department of Commerce Secretary, provides a benefit to the species subject to critical habitat designation.

All marine mammals are protected under the provisions of the MMPA. The MMPA prohibits any person or vessel from "taking" marine mammals in the U.S. or the high seas without authorization. The MMPA defines "take" to mean, "to harass, hunt, capture, or kill or attempt to harass, hunt, capture, or kill any marine mammal."

Table 3-2 Occurrence of Federal, GovGuam, and CNMI ESA-listed Threatened and Endangered Marine Species within JRM-administered Submerged Lands around Guam and the CNMI

The Magnuson-Stevens Fishery Conservation and Management Act provides for the conservation and management of fisheries. Under the Act, essential fish habitat (EFH) consists of the waters and substrate needed by fish to spawn, breed, feed, or grow to maturity. Lead federal agencies are required to evaluate the effects of proposed actions on EFH and to consult with NMFS if there would be an adverse effect to EFH.

In addition to preventing the introduction of invasive species into inland waters from the release of ballast water, the National Invasive Species Act of 1996 is also intended to protect marine waters from invasive species introductions.

EO 13112, *Invasive Species*, and EO 13751, *Safeguarding the Nation from the Impacts of Invasive Species,* provide not only for efforts against terrestrial invasive species, but for marine invasive species as well.

EO 13089, *Coral Reef Protection*, requires federal agencies whose actions affect U.S. coral reef ecosystems to provide for the implementation of measures needed to research, monitor, manage, and restore affected ecosystems, including, but not limited to, measures reducing impacts from pollution, sedimentation, and fishing.

3.5.2 Affected Environment

Overview descriptions of the marine biological resources found surrounding Guam and the CNMI are included in Chapters 4 and 10, respectively, and detailed descriptions of the marine biological resources found surrounding each JRM installation are included in Chapters 5, 8, 9, 11, and 12 of the 2019 JRM INRMP in the following INRMP sections:

- 4.5 - Guam
- 5.3.3.4 through 5.3.8 - NBG Main Base
- 8.3.4 through 8.3.7 - NBG TS
- 9.3.4 through 9.3.7 - Andersen AFB
- 10.5 - CNMI
- 11.3.4 through 11.3.7 - Tinian MLA
- 12.3.4 through 12.3.7 - FDM

3.6 Land Use

This discussion of land use includes current and planned uses and the regulations, policies, or zoning that may control the proposed land use. The term land use refers to real property classifications that indicate either natural conditions or the types of human activity occurring on a parcel. Two main objectives of land use planning are to ensure orderly growth and compatible uses among adjacent property parcels or areas. However, there is no nationally recognized convention or uniform terminology for describing land use categories. As a result, the meanings of various land use descriptions, labels, and definitions vary among jurisdictions. Natural conditions of property can be described or categorized as unimproved, undeveloped, conservation or preservation area, and natural or scenic area. There is a wide variety of land use categories resulting from human activity. Descriptive terms often used include residential, commercial, industrial, agricultural, institutional, and recreational.

3.6.1 Regulatory Setting

In many cases, land use descriptions are classified in installation master planning and local zoning laws. Office of the Chief of Naval Operations Instruction (OPNAVINST) 11010.40 establishes an encroachment management program to ensure operational sustainment that has direct bearing on land use planning on installations. Additionally, the joint instruction OPNAVINST 11010.36C and Marine Corps Order 11010.16 provides guidance for administering the Air Installation Compatible Use Zone program, which recommends land uses that are compatible with noise levels, accident potential, and obstruction clearance criteria for military airfield operations. OPNAVINST 3550.1A and Marine Corps Order 3550.11 provide guidance for a similar program, Range Air Installation Compatible Use Zone. This program includes range safety and noise analyses and provides land use recommendations that will be compatible with Range Compatibility Zones and noise levels associated with military range operations.

Through the CZMA of 1972, Congress established national policy to preserve, protect, develop, restore, or enhance resources in the coastal zone. This Act encourages coastal states and territories to properly manage use of their coasts and coastal resources, prepare and implement coastal management programs, and provide for public and governmental participation in decisions affecting the coastal zone. To this end, CZMA imparts an obligation upon federal agencies whose actions or activities affect any land or water use or natural resource of the coastal zone to be carried out in a manner consistent to the maximum extent practicable with the enforceable policies of federally approved state coastal management programs. However, federal lands, which are "lands the use of which is by law subject solely to the discretion of the federal government, its officers, or agents," are statutorily excluded from the State's "coastal uses or resources." If, however, the proposed federal activity affects coastal uses or resources beyond the boundaries of the federal property (i.e., has spillover effects), the CZMA Section 307 federal consistency requirement applies. As a federal agency, DON is required to determine whether its proposed activities would affect the coastal zone. This takes the form of a consistency determination, a negative determination, or a determination that no further action is necessary.

3.6.2 Affected Environment

Detailed descriptions of the land use found on each JRM installation are included in Chapters 5 through 9, 11, and 12 of the 2019 JRM INRMP. For the descriptions of land uses associated with the Proposed Action refer to the following INRMP sections:

- 5.1 - NBG Main Base
- 6.1 - NMS
- 7.1.1 - Apra Heights
- 7.2.1 - Sasa Valley and Tenjo Vista Tank Farms
- 7.3.1 - NCTS Barrigada and Barrigada Transmitter Site
- 7.4.1 - Andersen South
- 8.1 - NBG TS
- 9.1 - Andersen AFB
- 11.1 - Tinian MLA
- 12.1 - FDM

3.7 Submerged Land Use

Submerged land(s) refers to a special condition of jurisdictional control that is related to the "land beneath navigable waters." Generally, this is considered those lands between the low and high-tide line and out to 3 miles (4.8 kilometers) from the jurisdictional (mean high-tide) line of the state, as outlined in the Conveyance of Submerged Lands to Territories (48 U.S. Code [USC] Chapter 15).

3.7.1 Regulatory Setting

The Territorial Submerged Lands Act (48 USC Section 1705 et seq.) provided for the conveyance of submerged lands extending 3 miles (4.8 kilometers) seaward from the line of mean high-tide owned by the U.S. to Guam. Public Law 113-34 (September 17, 2013) added the Northern Mariana Islands to the Territorial Submerged Lands Act. The Act established federal law that recognizes the rights of states to jurisdictional authority over their coastlines and territorial waters. This authority is often referred to as the "jurisdictional waters." While this Act provides jurisdictional authority for submerged lands to the states, the U.S. Federal Branch (i.e., DoD) still reserves executive privilege to supersede the state's authority, particularly when it concerns issues of national security or public safety. Jurisdictional authority of submerged lands for CNMI falls under the purview of the CNMI Bureau of Environmental and Coastal Quality. However, this is not applicable to those submerged lands adjacent to the MLA on Tinian and around FDM as they are under the jurisdictional control of the U.S. government.

3.7.2 Affected Environment

Detailed descriptions of the submerged land use found on each JRM installation are included in Chapters 5, 8, 9, 11, and 12 of the 2019 JRM INRMP. For the descriptions of submerged land uses associated with the Proposed Action refer to the following INRMP sections:

- 5.3.1 - NBG Main Base
- 8.1 and 8.3.1 - NBG TS
- 9.3.1 - Andersen AFB
- 10.5 - CNMI
- 11.3.1 - Tinian MLA
- 12.3.1 - FDM

3.8 Socioeconomics

Socioeconomics is generally defined as the study of the interrelation between social behavior and economics. Socioeconomic analyses typically address issues such as population, demographics, business activity, employment, and income. Impacts to these fundamental socioeconomic components can also influence other systemic issues such as housing, the provision of public services (e.g., emergency services, education, and health services), cultural issues, and the general quality of life in a community. Due to the nature of the Proposed Action, the primary subject of socioeconomic analysis is recreational activity.

3.8.1 Regulatory Setting

The CEQ regulations implementing NEPA state that when economic or social effects and natural or physical environmental effects are interrelated, the Environmental Assessment (EA) would discuss these effects on the human environment (40 Code of Federal Regulations [CFR] Section 1508.14). The CEQ

regulations further state that the "human environment shall be interpreted comprehensively to include the natural and physical environment and the relationship of people with that environment." In addition, 40 CFR 1508.8 states that agencies need to assess not only direct effects but also "aesthetic, historic, cultural, economic, social, or health" effects. Following from these regulations, the socioeconomic analysis in this EA evaluates how elements of the human environment, such as population, employment, housing, and public services, might be affected by the Proposed Action.

There are military-specific federal regulations (10 USC Section 2391) and DoD Directives (3030.01 and 5410.12) that address the issue of what is a significant impact to communities due to changes in military programs.

3.8.2 Affected Environment

As of the 2010 Census, the population of Guam was 158,358, the median age in 2010 was 29.5 years old, and the average household size was 3.67 persons per household. Median household income on Guam, in 2010, was $48,247 and 19% of families had incomes below the poverty line (U.S. Census 2010a).

As of the 2010 Census, the population of Tinian was 3,136, the median age in 2010 was 32.3 years old, and the average household size was 3.21 persons per household. Median household income on Tinian, in 2010, was $24,470 and 34% of families had incomes below the poverty line (U.S. Census 2010b).

Examples of important recreational activities on Guam and Tinian include hunting, fishing, and gathering (both food and medicinal plants). Detailed descriptions of recreational resources found on each JRM installation are included in Chapters 5 through 9, 11, and 12 of the 2019 JRM INRMP. Hunting, fishing, and gathering activities on Guam and Tinian are often also done to supplement income (through, for instance, gathering and selling boonie peppers [*Capsicum frutescens*] on Tinian), for subsistence, and for cultural purposes, such as providing food for family gatherings.

3.9 Environmental Justice

USEPA defines environmental justice as the fair treatment and meaningful involvement of all people regardless of race, color, national origin, or income with respect to the development, implementation, and enforcement of environmental laws, regulations, and policies (USEPA 2017).

3.9.1 Regulatory Setting

Consistent with EO 12898, *Federal Actions to Address Environmental Justice in Minority Populations and Low-income Populations* (February 11, 1994), DON's policy is to identify and address any disproportionately high and adverse human health or environmental effects of its actions on minority and low-income populations.

3.9.2 Affected Environment

According to the 2010 Census, the largest ethnic groups on Guam were Chamorro (37.7% of the population) and Filipino (26.3% of the population). The largest ethnic groups on Tinian were Chamorro (37.3% of the population) and Filipino (30.3% of the population). Due to the ethnic minority composition of the populations of Guam and Tinian, all portions of both islands are considered environmental justice areas.

4 Environmental Consequences

This chapter presents an analysis of the potential direct and indirect effects of each alternative on the affected environment. The following discussion elaborates on the nature of the characteristics that might relate to resources. "Significant," as used in National Environmental Policy Act (NEPA), requires considerations of both context and intensity. "Context" means that the significance of an action must be analyzed in several contexts, such as society as a whole (e.g., human, national), the affected region, the affected interests, and the locality. Significance varies with the setting of a proposed action. For instance, in the case of a site-specific action, significance would usually depend on the effects in the locale rather than in the world as a whole. Both short- and long-term effects are relevant. Intensity refers to the severity or extent of the potential environmental impact, which can be thought of in terms of the potential amount of the likely change. In general, the more sensitive the context, the less intense a potential impact needs to be in order to be considered significant. Likewise, the less sensitive the context, the more intense a potential impact would be expected to be significant. Impacts can be beneficial or adverse.

4.1 Geology, Topography, and Soils

2019 Joint Region Marianas (JRM) Integrated Natural Resources Management Plan (INRMP) Management Actions That Would Benefit Soils:

- monitor for soil erosion on JRM-administered lands
- rehabilitate degraded soils
- develop and implement erosion control best management practices (BMPs)
- remove invasive vegetation
- reforestation of native forests
- establish fuel breaks
- develop and implement long-term watershed and forest management plans
- implement ungulate management plans
- implement fire management plans

Geology, topography, and soils are analyzed in terms of drainage, erosion, prime farmland, land subsidence, beach stability and erosion, and seismic activity. The analysis of geology considers impacts to unique geologic features and examines potential impacts related to seismic events. The analysis of topography considers changes to topography and slope stability. The analysis of soils focuses on the area of soils that would be disturbed, the potential for erosion of soils from construction areas, and the potential for eroded soils to become pollutants in downstream surface water during storm events. BMPs are identified to minimize soil impacts and prevent or control pollutant releases into stormwater. The potentially affected environment for geology, topography, and soils includes all JRM-administered and leased lands on Guam, Tinian, and Farallon de Medinilla (FDM). Impacts may be adverse or beneficial.

4.1.1 Evaluation Criteria

Protection of unique geological features, the location of facilities and structures in relation to potential geologic hazards, alteration to topography, and minimization of soil erosion are considered in order to evaluate potential impacts of a Proposed Action on geology, topography, and soils. Impacts on soils would be significant if they were to change the soil composition, structure, or function. Generally, adverse impacts can be avoided or minimized if proper construction techniques, erosion control measures, and structural engineering designs are incorporated into project development.

4.1.2 No Action Alternative

The No Action Alternative would result in continued management as characterized in the 2013 JRM INRMP. The 2013 JRM INRMP does not involve the construction or siting of facilities that would impact geologic hazards, and no activities proposed as part of 2013 JRM INRMP would adversely impact unique geologic features or alter topography.

Continued implementation of the 2013 JRM INRMP would result in some beneficial reduction in soil erosion and sedimentation on JRM-administered lands. Objectives of the 2013 INRMP for watershed management include maintaining stable soils; reducing runoff, erosion, and gully formation; and revegetating areas with bare soils. To achieve these objectives, BMPs would continue to be implemented to reduce soil erosion and sedimentation. As part of that effort, existing sites where erosion is a problem would be rehabilitated, soil conditions would continue to be monitored, and control measures would continue to be implemented during construction and at other times when soil is exposed.

However, the 2013 JRM INRMP does not include an update to readdress soils in their current condition and to evaluate new strategies and actions. For example, the 2013 JRM INRMP includes implementation of long-term, ecosystem-based management plans for the Overlay units on Naval Base Guam (NBG), Andersen Air Force Base (AFB), and in JRM-administered submerged lands in Sumay Cove and Apra Harbor; however, it does not include an action to update the plans to include stabilization and restoration of new areas of erosion. Without updates to the long-term ecosystem-based plans for restoring and maintaining forests and other areas, there could be continued erosion and minor to moderate adverse impacts on soils. In addition, the No Action Alternative does not address the current ungulate populations found on JRM sites; thus, ground disturbances and soil erosion caused by ungulates would continue.

4.1.3 Proposed Action (Preferred Alternative)

The study area for the analysis of effects to geology, topography, and soils associated with the Proposed Action includes all JRM-administered and leased lands on Guam, Tinian, and FDM.

4.1.3.1 Effects on Geology, Topography, and Soils

Geology. The 2019 JRM INRMP does not include plans to construct facilities or conduct activities as part of the INRMP that would adversely affect unique geologic features or impact geologic hazards.

Topography. The 2019 JRM INRMP does not include plans to construct facilities or conduct activities as part of the INRMP that would adversely affect topography or increase the risk of landslides.

Soils. Implementation of the 2019 JRM INRMP would result in a long-term, beneficial reduction in soil erosion on JRM-administered lands as it adopts management projects to benefit current soil and erosion conditions. Beneficial management actions for soils include but are not limited to the following:

- manage all natural resources with a long-term goal of restoring and enhancing habitats for native species, including listed species, over the next 30-50 years
- protect native habitat diversity
- maximize use of regionally native plant species and avoid introduction of invasive, exotic species in revegetation projects

- enhance habitat for native species by removing invasive vegetation and replacing with native vegetation
- maintain and enhance vegetation community structure, functionality, and species diversity
- develop and implement ungulate management plans

To successfully carry out these management projects, existing and innovative soil management strategies and actions would be implemented and advanced beyond those in the 2013 JRM INRMP, which address current conditions. Soil erosion monitoring would allow for appropriate time efficient solutions to control, rehabilitate, or protect soil and vegetation. Reforestation of native forests would be implemented to maximize use of regionally native plant species and avoid introduction of invasive, exotic species in revegetation projects. This would enhance habitat for native species by removing invasive vegetation and replacing with native vegetation. The conversion of non-native tree species, which require understory clearing, to native tree species will ultimately reduce fuel loads within the forest and eliminate the need to clear the understory.

In addition, the 2019 JRM INRMP would expand the establishment of shaded fuel breaks in areas where non-fire fuel reduction (e.g., mechanical cutting and herbicide applications) have proven effective as a temporary solution. A shaded fuel break is a forest management strategy used for mitigating the threat of wildfire in areas where natural fire regimes have been suppressed, leading to a dangerous buildup of combustible vegetation. Constructing a shaded fuel break is the process of selectively thinning and removing more flammable understory vegetation while leaving the majority of larger, more fire tolerant tree species in place. The resulting reduction in wildfires would decrease the amount of exposed soils after fires and lead to a decrease in the potential for erosion.

As part of the long-term watershed and forest management plans associated with the 2019 JRM INRMP, BMPs would be implemented to reduce soil erosion and sedimentation. As part of that effort, existing sites where erosion is a problem would be rehabilitated, soil conditions would be monitored, and control measures would be implemented during construction and at other times when soil is exposed. Long-term management of ungulates would decrease exposed soils and the rate of erosion. As such, additional erosion control BMPs would be established, including the management and control of invasive ungulate species by installing and maintaining perimeter fencing around designated areas at several installations.

The long-term management projects proposed in the 2019 JRM INRMP would rehabilitate soils and increased implementation of BMPs would prevent or minimize soil erosion and sedimentation. Management projects also include long-term plans to restore natural processes, such as sustained reproduction of native vegetation on areas damaged by high densities of ungulates or otherwise having exposed soils. Therefore, implementation of the proposed 2019 JRM INRMP would result in long-term, beneficial impacts through the reduction in soil erosion, ungulate control, reduction in invasive vegetation, and an increase in native reforestation on JRM-administered lands.

4.2 Water Resources

2019 JRM INRMP Management Actions That Would Benefit Water Resources:

- identify and develop measures to reduce impacts on streams
- conduct water resources monitoring that assesses water quality
- develop and implement long-term watershed and forest management plans
- develop and implement erosion control BMPs
- implement ungulate management plans
- identify and characterize wetlands on JRM-administered lands
- ensure consistency of wetland mapping across JRM-administered lands

The analysis of water resources looks at the potential impacts on surface water (including wetlands and floodplains), groundwater, and marine waters. The analysis of surface water quality considers the potential for impacts that may change the water quality, including both improvements and degradation of current water quality. The impact assessment of wetlands considers the potential for impacts that may change the local hydrology, soils, or vegetation that support a wetland. The analysis of floodplains considers if any new construction is proposed within a floodplain or may impede the functions of floodplains in conveying floodwaters. Groundwater analysis focuses on the potential for impacts to the quality, quantity, and accessibility of the water. Marine waters analysis includes potential changes to physical and chemical characteristics. Impacts may be adverse or beneficial.

4.2.1 Evaluation Criteria

The evaluation of impacts on water resources is based on how an action might affect water availability, quality, and use; damage or improve wetlands; and increase or decrease the risk of flooding. An action could have significant negative impacts on water resources if it were to do one or more of the following:

- substantially reduce water availability or supply to existing users
- substantially and adversely affect water quality
- endanger public health by creating or worsening health hazards
- threaten or damage unique hydrologic characteristics
- violate established laws or regulations adopted to protect water resources

The significance of impacts on wetlands is based on the amount of wetland acreage affected and how an activity would affect the functions and values of wetlands. Impacts on wetland resources are considered significant if high-value wetlands would be adversely affected or if wetland acreage is lost.

Impacts on floodplains would be considered significant if the action increased the potential for or severity of flooding.

4.2.2 No Action Alternative

Under the No Action Alternative, the Proposed Action would not occur and there would be no change to baseline water resources. The No Action Alternative does not include any actions that require filling or otherwise adversely modifying wetlands, nor does it include the construction of facilities or other actions in floodplains that would reduce the flow of floodwaters or increase the severity of flooding.

Projects identified in the 2013 JRM INRMP would continue to be implemented, including those required by laws and regulations to protect waters, wetlands, and floodplains. Implementation of the 2013 JRM INRMP includes management projects and associated strategies for minimizing operational impacts on wetlands, maximizing native floral and faunal diversity of wetlands, and managing for no net loss of wetlands. Implementing these wetlands management projects would result in long-term, beneficial impacts.

Long-term, beneficial impacts on wetlands also would be expected following the implementation of long-term, ecosystem-based management plans for the Overlay units on NBG, Andersen AFB, and in JRM-administered submerged lands. These plans would include the restoration and maintenance of ecosystem processes, such as sustainable revegetation and soil production, which would improve water quality, promote the flow of surface waters into wetlands, and reduce flooding by increasing groundwater recharge and reducing surface water flow rates.

4.2.3 Proposed Action (Preferred Alternative)

The study area for the analysis of effects to water resources associated with the Proposed Action includes all JRM-administered and leased lands on Guam, Tinian, and FDM.

4.2.3.1 Effects on Water Resources

Surface Water. The Proposed Action establishes goals, objectives, and projects that would have long-term, beneficial impacts on surface water resources through management of natural resources. Some surface waters on Guam have high sediment loads caused by erosion in forests, savannahs, and other upland areas. The 2019 JRM INRMP describes rehabilitation of unstable rivers or stream reaches on JRM-administered lands, implementation of an Erosion and Sedimentation Control Plan, development of long-term management plans to restore ecosystem health on refuge Overlay units, and other actions. Beneficial management actions for water resources include but are not limited to the following:

- maintain, protect, and enhance water quality and contain/minimize runoff into marine waters
- work with other Guam, Commonwealth of the Northern Mariana Islands (CNMI), and federal partners to prioritize watershed restoration activities to protect key coral reef areas that have been identified as resistant or resilient to disturbance
- identify and develop measures to reduce impacts on streams
- conduct water resources monitoring that assesses water quality
- develop and implement long-term watershed and forest management plans
- conduct reforestation of native forests
- develop and implement erosion control BMPs
- implement ungulate management plans
- identify and characterize wetlands on JRM-administered lands
- ensure consistency of wetland mapping across JRM-administered lands

These management actions would reduce soil erosion, increase vegetation cover, and monitor water quality and would result in long-term, beneficial impacts by improving the quality of surface waters on JRM-administered lands and reducing sediment pollution in surface and coastal waters.

The 2019 JRM INRMP does not include any actions that require filling or otherwise adversely modifying wetlands. Nor does it include the construction of facilities or other actions in floodplains that would reduce the flow of floodwaters or increase the severity of flooding. The goals, objectives, and projects associated with the 2019 JRM INRMP would reduce soil erosion, increase vegetation cover, and monitor water quality resulting in long-term, beneficial impacts by improving the wetland quality on JRM-administered lands. Therefore, implementation of the Proposed Action would not result in significant impacts to surface water resources.

Groundwater. The goals, objectives, and projects identified under surface waters would also result in beneficial impacts to groundwater quality. Implementation of the 2019 JRM INRMP does not include any actions that would reduce water availability to current users, affect unique hydrologic characteristics, or violate laws or regulations that protect water resources. Therefore, implementation of the Proposed Action would not result in significant impacts to groundwater resources.

Marine Water. The goals, objectives, and projects identified under surface waters would also result in beneficial impacts to marine water quality, especially in areas of southern Guam where substantial amounts of erosion results in sediment discharge to nearshore waters. The 2019 JRM INRMP does not include any construction in marine waters or actions that would degrade marine water quality. Therefore, implementation of the Proposed Action would not result in significant impacts to marine water resources.

4.3 Cultural Resources

2019 JRM INRMP Management Actions That Would Benefit Cultural Resources:

- ungulate control resulting in reduction of damage to historic landmarks and culturally important plants
- native forest enhancement and restoration resulting in reduction of damage to historic landmarks and culturally important plants

Analysis of potential impacts to cultural resources considers both direct and indirect impacts. Direct impacts may be the result of physically altering, damaging, or destroying all or part of a resource; altering characteristics of the surrounding environment that contribute to the importance of the resource; introducing visual, atmospheric, or audible elements that are out of character for the period the resource represents (thereby altering the setting); or neglecting the resource to the extent that it deteriorates or is destroyed. Indirect impacts are those that may occur as a result of the completed project by altering characteristics of the surrounding environment through the introduction of visual or audible elements that are out of character for the period the property represents. An example of an indirect impact is increased vehicular or pedestrian traffic in the vicinity of the property. Impacts may be adverse or beneficial.

4.3.1 Evaluation Criteria

The methods for identifying, evaluating, and mitigating impacts on cultural resources have been established through federal laws and regulations including the National Historic Preservation Act (NHPA) and Archaeological Resources Protection Act. Under those regulations, a project is considered to affect a historic property if it alters the property's integrity or the characteristics that make the property eligible for inclusion on the National Register of Historic Places (NRHP). Adverse impacts can be direct or indirect and include physical destruction, damage, or alteration of all or part of the resources; alteration of the

character of the surrounding environment that contributes to the resource's qualifications for the NRHP; introduction of visual, audible, or atmospheric elements that are out of character with the resource; neglect of the resource resulting in its deterioration or destruction; and transfer, lease, or sale of the property without adequate and legally enforceable restrictions or conditions to ensure long-term preservation of the property's historic significance (36 Code of Federal Regulations [CFR] 800).

4.3.2 No Action Alternative

Under the No Action Alternative, the Proposed Action would not occur and there would be no change to cultural resources. Because the 2013 JRM INRMP considered under this alternative does not address all current adverse conditions on JRM-administered lands, or does so at a smaller scale than is currently needed, some adverse impacts on cultural resources and culturally important medicinal plants caused by the high abundance of ungulates and degradation of forests and other areas would continue. Therefore, some impacts to cultural resources may result with implementation of the No Action Alternative.

4.3.3 Proposed Action (Preferred Alternative)

The study area for the analysis of effects to cultural resources associated with the Proposed Action includes all JRM-administered and leased lands on Guam and Tinian. Natural resources management projects proposed in the 2019 JRM INRMP do not include actions incompatible with the management and protection of cultural resources on JRM-administered lands. Further, natural resource management projects would not significantly impact any identified historic properties.

4.3.3.1 Effects on Cultural Resources

Prehistoric and Historic Sites. Implementation of management projects in the 2019 JRM INRMP would benefit cultural resources on JRM-administered and leased lands on Guam, Tinian, and FDM. JRM will consult on any proposed activities in the 2019 JRM INRMP that have the potential to affect cultural resources. Management actions that would benefit prehistoric and historic sites include but are not limited to the following:

- management and control of invasive ungulate populations
- enhancement and restoration of native forest
- protection of the Orote Peninsula Ecological Reserve Area (ERA) within NBG Main Base and the Haputo ERA within NBG TS

Ungulates can damage prehistoric and historic sites by trampling and rooting. Therefore, by eradicating them from JRM-administered lands, archaeological sites will not incur as much damage as they did previously. Lands that are established as ERAs include characteristics or outstanding ecological, geological, and scenic features or processes. These areas are preserved, which will benefit and protect prehistoric and historic sites within their boundary.

Architectural Sites. Architectural sites are typically located within developed areas on JRM-administered lands. Further, natural resource management projects would not adversely affect any identified architectural sites. Therefore, implementation of the management projects identified in the 2019 JRM INRMP would have no potential to cause effects on architectural sites and are covered by Section 106 of the NHPA.

Traditional Cultural Properties. Implementation of management projects in the 2019 JRM INRMP would benefit cultural resources on JRM-administered and leased lands on Guam, Tinian, and FDM. JRM will consult on any proposed activities in the 2019 JRM INRMP that have the potential to affect cultural resources. Management actions that would benefit traditional cultural properties include but are not limited to the following:

- management and control of invasive ungulate species
- enhancement and restoration of native forest

Controlling invasive flora and fauna species would allow culturally important medicinal plants species, such as *Maytenus thompsonii*, to be restored. Ungulates reduce the distribution and abundance of native species and increase the abundance of invasive plant species. Native forest enhancement will result in management of ecosystems that provide habitat for culturally important plants and animals.

Therefore, implementation of the Proposed Action would have beneficial impacts within the Area of Potential Effect, the geographic area or areas within which an undertaking may directly or indirectly cause alterations in the character or use of historic properties. The Area of Potential Effect is influenced by the scale and nature of an undertaking and may be different for different kinds of effects caused by the undertaking as defined in 36 CFR 800.16(d).

4.4 Terrestrial Biological Resources

Terrestrial biological resources include living, native, or naturalized plant and animal species that live on land and the habitats within which they occur. Plant associations are referred to generally as vegetation, and animal species are referred to generally as wildlife. Habitat can be defined as the resources and conditions present in an area that support a plant or animal.

2019 JRM INRMP Management Actions That Would Benefit Terrestrial Biological Resources:

- baseline and long-term monitoring of native forest habitat, invasive species, wildlife populations, and habitat use would have long-term, beneficial impacts in identifying trends over time, their causes, and management projects to reduce stressors to terrestrial species and habitats
- improve ungulate management to reduce impacts to native vegetation
- update outreach and education programs to reduce human disturbance of all currently federally listed species and their habitats

Within this Environmental Assessment (EA), terrestrial biological resources are divided into two major categories: (1) terrestrial vegetation and (2) terrestrial wildlife. Threatened, endangered, and other special status species are discussed in their respective categories.

This analysis focuses on wildlife or vegetation types that are important to the function of the ecosystem or are protected under federal or state law or statute. Impacts may be adverse or beneficial.

4.4.1 Evaluation Criteria

The factors considered to determine the significance of impacts on terrestrial biological resources include (1) the importance (i.e., legal, commercial, recreational, ecological, or scientific) of biological resources, (2) the proportion of plant and animal populations and habitat that would be affected relative to its occurrence in the region, (3) the sensitivity of populations and habitat to proposed activities, and (4) the duration of ecological impacts. Impacts on biological resources are considered

significant if species or habitats of concern are adversely affected over relatively large areas, or disturbances cause reductions in population size or distribution of protected or sensitive species.

4.4.2 No Action Alternative

Under the No Action Alternative, natural resources would continue to be managed as characterized in the 2013 JRM INRMP, and JRM would continue to implement applicable regulatory requirements. Ongoing INRMP projects may result in minor, temporary, and non-significant disturbance to some terrestrial species, but would have beneficial impacts in identifying trends and their causes, and implementing management to reduce stressor effects, including human disturbance of species and habitats. However, because the 2013 JRM INRMP considered under this alternative does not address all current adverse conditions on JRM-administered lands, or does so at a smaller scale than is currently needed, some natural habitats, such as native forests, will decline in quality and complexity from new stressors, and some plant and animal species would continue to be adversely affected by those conditions without management updates. Forest ecosystem function, regeneration, and species diversity will be incrementally more expensive and difficult to address as stressors are allowed to continue. In addition, the 2013 JRM INRMP does not address management of species that occur on JRM-administered lands that were newly listed under the Endangered Species Act (ESA) in October 2015. As a result, some plant and animal species would continue to be adversely affected by those conditions. Therefore, some impacts to terrestrial biological resources may result with implementation of the No Action Alternative.

4.4.3 Proposed Action (Preferred Alternative)

The study area for the analysis of effects to terrestrial biological resources associated with the Proposed Action includes all JRM-administered and leased lands on Guam, Tinian, and FDM. Under the Proposed Action, the 2019 JRM INRMP would be implemented, superseding the previous INRMP and resulting in updated monitoring and adaptive management of terrestrial biological resources within the study area. The goal of the INRMP is to utilize adaptive management to maintain long-term ecosystem health and minimize impacts to natural resources consistent with the operational requirements of the Department of Defense's (DoD's) mission.

Thirty-four federally threatened and endangered species potentially occur in multiple locations in varying densities of the study area of the Proposed Action (see Table 3-1 and the baseline sections of the INRMP referenced above in Section 3.4.2). Table 2-1 includes a full list of management projects that address species-specific objectives, strategies, and monitoring criteria for threatened, endangered, and other special status species from the 2019 JRM INRMP. Some projects target multiple listed species found in Table 3-1 through ecosystem-wide projects, such as forest recovery and enhancement, while other projects include actions for regular species-specific surveys to assess status and inform management actions (e.g., the Mariana fruit bat and Mariana swiftlet [*Aerodramus bartschi*]). In addition, ESA section 7 consultations would be conducted, as appropriate, with the United States (U.S.) Fish and Wildlife Service (USFWS) before project implementation. Therefore, implementation of the Proposed Action would not result in significant impacts to special status terrestrial species.

The immediate direct effects of INRMP projects may include minimal, temporary, and non-significant disturbance of some terrestrial species and their habitats during monitoring and management projects,

for example, due to vehicular movement and noise, handling/tagging individuals, or the reactions of terrestrial species to human presence. These effects would be brief, localized to small areas, and inconsequential to individuals, populations, or habitats.

The long-term effects of INRMP projects – monitoring and adaptive management – would be beneficial, enabling the status of local populations and habitats to be tracked over time, facilitating stressor identification and importance, identifying and implementing appropriate measures to reduce stressor effects within the DoD's areas of control, promoting the awareness and protection of sensitive species and habitats by the local human populations, and contributing to the sustainment and recovery of terrestrial biological resources.

For example, the implementation of the Regional Biosecurity Plan for Micronesia and Hawaii and conservation measures from the Biological Opinion for the MITT Program (2015 MITT BO), which include species risk assessments and development and implementation of BMPs and quality assurance/quality control protocols, would decrease the likelihood of introducing species into the transportation network. The development of standard operating procedures for early detection and rapid response would eradicate or mitigate spread of any potential introductions. Therefore, implementation of the Proposed Action would result in significant positive impacts to biological resources. Additional discussion of effects to terrestrial biological resource categories is provided below.

4.4.3.1 Effects on Terrestrial Biological Resource

Terrestrial Vegetation

Goals of the 2019 JRM INRMP include reducing and controlling populations of invasive plant and animal species, controlling erosion, revegetating areas (including native forest restoration), and monitoring and adaptively managing ecosystems on JRM-administered lands. Long-term, beneficial impacts would be expected for terrestrial vegetation through implementation of various management projects in the 2019 JRM INRMP aimed at protecting and enhancing native habitat and species diversity and maintaining healthy vegetation communities. Beneficial management actions for terrestrial vegetation include but are not limited to the following:

- implementing terrestrial resource surveys and management plans at NBG Main Base and Andersen AFB
- reducing the acreage of badlands on NMS by planting vetiver grass (*Vetiveria zizanioides*) buffer strips along the base of barren hills
- rehabilitating and restoring degraded areas on NMS through implementation of the 2015 NBG Wildlands Fire Management Plan
- erecting and/or maintaining ungulate exclusion fencing on NMS and Andersen AFB to allow native vegetation propagation and growth
- monitoring changes to the terrestrial ecosystem caused by military activities on FDM to inform adaptive management over time
- implementing appropriate recommendations within the Regional Biosecurity Plan that will reduce the risk of introduction and spread of invasive species on NBG Main Base

Long-term, beneficial impacts would also be expected for protected plant species (e.g., *Cycas micronesica, Dendrobium guamense,* the fire tree, etc.). Management of terrestrial threatened and

endangered plant species on JRM-administered lands includes implementing programs to protect species from threats such as ungulate disturbance or predation by invasive insects. The following are examples of management actions that have been designed to protect existing and support the propagation and growth of ESA-listed plant species:

- conducting pre-construction surveys for federal ESA-listed species within construction footprints and translocating listed plant species or their seeds
- conducting surveys to document distribution and abundance of ESA-listed plants
- updating threatened and endangered species population distribution maps and Geographic Information System databases with data used to inform adaptive management of listed species
- conducting monthly monitoring of the mature fire tree at Ritidian Point and all other fire trees planted on Andersen AFB
- protecting ESA-listed plants against ungulates, invasive insects, and typhoons

Terrestrial Wildlife

Mammals. Long-term, beneficial impacts would be expected for the Mariana fruit bat, a federal and local ESA-listed endangered species and the only native terrestrial mammal to occur on JRM-administered lands. Many of the terrestrial management projects will have indirect benefits for the Mariana fruit bat (see Table 2-1). For example, one terrestrial invasive species management project will attempt to identify minimum thresholds of brown treesnake (BTS) suppression to support conditions conducive to threatened and endangered species persistence and recovery. A number of the management projects were developed particularly for Mariana fruit bat conservation. These include forest enhancement projects on Guam and Tinian that are aimed at protecting and restoring priority native habitats for the benefit of the Mariana fruit bat. Also planned are continued fruit bat population monitoring on Andersen AFB to maintain and identify habitat relationships. No adverse effect to native mammals would occur under the Proposed Action.

Birds. Long-term, beneficial impacts would be expected for native bird populations as a result of implementation of the Proposed Action. There would be long-term, beneficial impacts especially on Guam where the native bird population was decimated by the introduction of the BTS after World War II. BTS suppression on JRM-administered lands and the development of BTS free zones on Guam as well as BTS interdiction for Tinian and FDM will contribute to survival and recovery of protected bird species. One management project would look at the optimum levels of BTS suppression and control measures needed to reduce mortality before the reintroduction of the Guam Micronesian kingfisher using Micronesian starlings (*Aplonis opaca*) as a surrogate species, which would increase the probability of a successful reintroduction of the extirpated kingfisher. This project would also support the expansion of Micronesian starlings on Guam. Mariana swiftlet surveys would help examine long-term population trends on NMS. In addition, reproductive success, cave site selection, movement studies, and BTS control actions will provide valuable information to inform management actions to facilitate swiftlet population persistence and expansion. Micronesian megapode (*Megapodius laperouse*) surveys on Tinian and FDM would help examine long-term population trends and changes in habitat on the islands. Navy funded studies to collect basic natural history data of the Tinian monarch on Tinian, including timing of nesting, hatching success rate, habitat use, territory size, site fidelity, and adult and juvenile survival, will improve management capability in JRM leased lands by 2021. Similarly, monitoring moorhen at Lake Hagoi in the Tinian Military Lease Area (MLA) would help examine long-term

population trends and changes in the wetland habitat. No adverse effects to native birds would occur under the Proposed Action. In addition to surveys for listed birds, surveys will be conducted every five years on Tinian to document long-term trends in density and abundance of native forest and MBTA-listed bird populations.

Reptiles. Reptile populations would benefit from baseline monitoring and adaptive management that contributes to improved habitat conditions. Many of the terrestrial management projects will have indirect benefits for native reptiles (see Table 2-1). Forest enhancement projects on Guam and Tinian are aimed at protecting and restoring priority native habitats for the benefit of native skinks and geckos. A number of the management projects were developed particularly for native reptile conservation. Management projects on NMS and Andersen AFB to survey for the Guam ESA-listed moth skink (*Lipinia noctua*) and Pacific slender-toed gecko (*Nactus pelagicus*) would improve the understanding of their distributions, thus improving the ability to protect them. Predator control and beach habitat enhancement on NBG Main Base, NBG TS, Andersen AFB, and Tinian MLA to improve sea turtle nest success would protect sea turtle populations.

Invertebrates. Long-term, beneficial impacts would be expected for native invertebrate populations, including tree snails, butterflies, and land crabs as a result of implementation of the Proposed Action. Many of the terrestrial management projects will have indirect benefits for native invertebrates (see Table 2-1). Forest enhancement projects on Guam and Tinian are aimed at protecting and restoring priority native habitats. ESA-listed tree snails, such as the Guam tree snail (*Partula radiolata*) or the humped tree snail (*Partula gibba*), would benefit from the restoration of limestone native and coastal forests, which are characteristic of the shaded and humid conditions they require to thrive. The federal ESA-listed Mariana eight-spot butterfly (*Hypolimnas octocula marianensis*) relies on two native host plants (*Procris pedunculata* and *Elatostema calcareum*), and forest enhancement would provide more habitat for these host plants. Ungulate control and eradication projects will have benefits on ESA-listed tree snails and butterflies since a reduction in damage to host plants will increase availability of potential habitat. Ungulate control and eradication projects will also benefit other invertebrate species as well. It is speculated that feral pigs predate on small and young native land crabs, such as the land hermit crab (*Coenobita brevimanus*) and coconut crabs (*Birgus latro*); therefore, ungulate control and eradication would potentially have a benefit to populations of land crabs, which are omnivores and detritivores important for forest ecosystem function. A number of the management projects were developed particularly for native invertebrate conservation, including actions to conduct tree snail and butterfly surveys to identify new locations; locate, protect, and propagate native invertebrate host plants; and conduct studies that assess the impacts of parasitoids and develop methods for their control.

4.5 Marine Biological Resources

Marine biological resources include living, native, or naturalized aquatic algae, plant and animal species, and the marine habitats within which they occur, such as coral reefs or sea grass beds.

Within this EA, marine biological resources are divided into two major categories: (1) marine flora and (2) marine fauna. Threatened, endangered, and other special status species are discussed in their respective categories.

2019 JRM INRMP Management Actions That Would Benefit Marine Biological Resources:

- increased knowledge of movement patterns and habitat use of threatened and endangered species
- protection of essential fish habitat (EFH)
- monitoring and control of acute impacts to coral reefs
- implementation of a conservation law enforcement program in order to minimize restrictions on military operations and comply with federal regulations
- development and implementation of a Marine Invasive Species Management Plan

The study area for the analysis of effects to marine biological resources associated with the INRMP includes the JRM-administered submerged lands adjacent to Guam, NBG Main Base, NBG TS, Andersen AFB, the Tinian MLA, and FDM. The analysis of impacts to marine biological resources focuses on resources that are subject to regulatory protection or are otherwise of greatest importance and public concern, and considers both the direct (immediately resulting from the action) and indirect (removed in space and/or time but likely to occur as a result of intermediary processes) impacts of the Proposed Action. Impacts may be adverse or beneficial.

4.5.1 Evaluation Criteria

The factors considered to determine the significance of impacts on marine biological resources include (1) the importance (i.e., legal, commercial, recreational, ecological, or scientific) of biological resources, (2) the proportion of plant and animal populations and habitat that would be affected relative to its occurrence in the region, (3) the sensitivity of populations and habitat to proposed activities, and (4) the duration of ecological impacts. Impacts on marine biological resources are considered significant if species or habitats of concern are adversely affected over relatively large areas or disturbances cause reductions in population size or distribution of protected or sensitive species.

4.5.2 No Action Alternative

Under the No Action Alternative, natural resources would continue to be managed as characterized in the 2013 JRM INRMP, and JRM would continue to implement applicable regulatory requirements. Ongoing INRMP projects may result in minor, temporary, and non-significant disturbance to some marine species but would have beneficial impacts in identifying trends and their causes and implementing management to reduce stressor effects, including human disturbance of species and habitats. However, because the 2013 JRM INRMP considered under this alternative does not address all species currently ESA-listed as threatened or endangered, current adverse conditions on JRM-administered submerged lands and some natural habitats, such as coral reefs, would continue to decline in quality and complexity. As a result, some plant and animal species would continue to be adversely affected by those conditions. Therefore, some impacts to marine biological resources may result with implementation of the No Action Alternative.

4.5.3 Proposed Action (Preferred Alternative)

The study area for the analysis of effects to marine biological resources associated with the Proposed Action includes all marine waters that extend 3 miles (4.8 kilometers) out from JRM-administered lands. Under the Proposed Action, the 2019 JRM INRMP would be implemented, superseding the previous INRMP and resulting in updated monitoring and adaptive management of marine biological resources within the study area.

The immediate direct effects of INRMP projects may include minimal, temporary, and non-significant disturbance of some marine species during monitoring and management projects, for example due to vessel movement and noise, handling/tagging individuals, or the reactions of marine species to human presence. These effects would be brief, localized to small areas, and inconsequential to individuals, populations, or habitats.

The long-term effects of INRMP projects – monitoring and adaptive management – would be beneficial, enabling the status of local populations and habitats to be tracked over time, facilitating stressor identification and importance, identifying and implementing appropriate measures to reduce stressor effects within the DoD's areas of control, promoting the awareness and protection of sensitive species and habitats by the local human populations, and contributing to the sustainment and recovery of marine biological resources. In particular, the Marine Invasive Species Management Plan, which would be developed and implemented under the Proposed Action, would establish a watch list of invasive species, develop standard operating procedures for early detection and rapid response, and develop BMPs for contractors and military personnel to prevent and mitigate introductions of new marine invasive species. The development and implementation of this management plan would provide a direct benefit to marine resources. Additional discussion of effects to marine biological resource categories is provided below.

4.5.3.1 Effects on Marine Biological Resources

Marine Flora

INRMP management projects would have indirect, long-term, beneficial impacts to marine flora through implementation of management strategies and actions aimed at protecting habitat diversity, maintaining healthy coral reefs, and enhancing habitat. Beneficial management actions for marine flora include but are not limited to the following:

- monitoring to establish baseline conditions and support the adaptive management of seagrass beds at Dadi Beach, NBG Main Base
- marine resource surveys and management plans at NBG Main Base, NBG TS, and Andersen AFB
- water quality monitoring to define baseline conditions and stressor impacts to reef habitats at NBG Main Base, NBG TS, and Andersen AFB
- reviewing and updating as necessary Hull Husbandry and Ballast Water standards

The 2019 JRM INRMP aims at controlling populations of invasive marine species, controlling erosion, mapping benthic communities, restoring coral reefs, and monitoring and adaptively managing marine ecosystems on JRM-administered submerged lands. As maintaining a high level of habitat diversity that does not conflict with the military mission is a priority of this INRMP, implementation of the 2019 JRM INRMP would result in improved marine habitat conditions.

Marine Fauna

Invertebrates. Beneficial impacts to marine invertebrates and coral reef ecosystems, in particular, would result from the same actions identified above for marine flora. Additional management actions include but are not limited to the following:

- monitoring to detect invasive species and reef damage due to crown-of-thorns seastar (*Acanthaster planci*), *Terpios* sponges, coral diseases, and coral bleaching events
- promoting reef-safe sunscreens
- enforcing marine natural resource laws
- collecting, maintaining, and sharing of Geographic Information Systems data with resource agencies

The INRMP management actions are consistent with the directives of Executive Order (EO) 13089, *Coral Reef Protection*.

ESA-listed coral species that may occur in the area include *Acropora globiceps*, *Acropora retusa*, and *Seriatopora aculeata*. Occurrences of these species are described in Section 3.5.2. To the extent that these species occur, they may benefit from survey data that better define their distributions and the habitat conditions that support them. In addition, surveys help to identify locations where (a) impacts can be avoided or reduced or (b) opportunities may exist to enhance the habitat of local populations. Insofar as only beneficial effects would occur, there would be no significant adverse impacts on corals.

Fish. Fish populations and essential fish habitat (EFH) would benefit from baseline monitoring and adaptive management that contributes to improved habitat conditions. No adverse effect to EFH would occur under the Proposed Action.

One ESA-listed fish species, the scalloped hammerhead shark (*Sphyrna lewini*), may occur in waters of the study area (see Table 3-2), although documented occurrences are few. Beneficial impacts could accrue to scalloped hammerhead and other fish species of concern, including humphead wrasse (*Cheilinus undulatus*) and bumphead parrotfish (*Bolbometopon muricatum*), as a result of the new environmental deoxyribonucleic acid study to detect the occurrence and habitat use of these species in Apra Harbor. Given only beneficial, if any, effects to this species, there would be no significant adverse impacts on the scalloped hammerhead shark.

Turtles. All five species of sea turtles that may occur in the study area are ESA-listed but only two, the green turtle (*Chelonia mydas*) and hawksbill turtle (*Eretmochelys imbricata*), are reasonably likely to occur in areas affected by the Proposed Action. Under the 2019 JRM INRMP, extensive monitoring and protective management of nesting beaches within JRM-administered lands would occur. These actions and their beneficial effects are described under terrestrial biological resources. An existing project on sea turtle distribution and habitat use on JRM-administered submerged lands around Guam, using satellite tags, has potential to inform beneficial management actions for sea turtles in water.

Marine Mammals. The most common marine mammals that occur in the waters of the study area (within 3 miles of the coastline) are spinner dolphins (*Stenella longirostris*), bottlenose dolphins (*Tursiops truncatus*), and pantropical spotted dolphins (*Stenella attenuata*). Several other species, including ESA-listed sperm whales (*Physeter macrocephalus*) and humpback whales (*Megaptera novaeangliae*), have been infrequently encountered and/or usually occur farther offshore (see baseline

sections of the INRMP referenced above in Section 3.5.2). The Proposed Action includes the continuation of annual marine mammal surveys off Guam and the CNMI. The 2016 surveys resulted in encounters with the aforementioned species as well as rough-toothed dolphins (*Steno bredanensis*), short-finned pilot whales (*Globicephala marcrorhynchus*), and dwarf sperm whales (*Kogia sima*). Satellite tags were deployed on sperm and short-finned pilot whales as well as a pantropical spotted dolphin (Hill et al. 2017). Data from these surveys indirectly benefits marine mammals by enabling more informed assessments of the potential effects of DoD training activities.

4.6 Land Use

2019 JRM INRMP Management Action That Would Benefit Land Use:

- ecosystem management would result in long-term, beneficial impacts to ecosystem integrity and, therefore, could lead to a reduction of restrictions on military operations

The location and extent of a proposed action needs to be evaluated for its potential effects on a project site and adjacent land uses. Factors affecting a proposed action in terms of land use include its compatibility with on-site and adjacent land uses, restrictions on public access to land, or change in an existing land use that is valued by the community. Other considerations are given to proximity to a proposed action, the duration of a proposed activity, and its permanence. Impacts may be adverse or beneficial.

4.6.1 Evaluation Criteria

The significance of impacts on land use is evaluated primarily by considering the compatibility of an action with existing land uses and conditions. The Proposed Action could have a significant land use impact if it would result in any of the following:

- conflict with the military missions of JRM-administered lands
- be inconsistent or in noncompliance with land use plans or policies
- preclude existing land use
- preclude continued use or occupation of an area
- be incompatible with adjacent land use to the extent that public health or safety is threatened
- conflict with planning criteria established to ensure the safety and protection of human life and property

4.6.2 No Action Alternative

Under the No Action Alternative, the Proposed Action would not occur and there would be no change to land use. Continued implementation of the 2013 JRM INRMP would be compatible with existing land uses. Therefore, no significant impacts would occur with implementation of the No Action Alternative.

4.6.3 Proposed Action (Preferred Alternative)

The study area for land use analyses for the Proposed Action is defined as lands on Guam, Tinian, and FDM administered or leased by JRM.

4.6.3.1 Effects on Land Use

Existing and Planned Land Use. As required by the Sikes Act and DoD Instruction 4715.03, the 2019 JRM INRMP was developed in a manner that ensures that there would be no net loss of the capability of installations to support military missions and future mission requirements. As such, the 2019 JRM INRMP is consistent with current land use plans and policies of JRM-administered lands as well as for any planned military uses.

Ecosystem management is emphasized in the 2019 JRM INRMP (see Section 3.1) because the DoD recognizes that the mission of the JRM is inextricably linked to local, regional, and global ecological integrity and that sustaining ecosystem integrity is the best way to protect biodiversity, ensure sustainable use, and minimize the effort and cost of management. Thus, implementing the 2019 JRM INRMP would result in long-term, beneficial impacts on military use of JRM-administered lands and public use of surrounding areas, by ensuring that healthy and self-sustaining natural resources such as clean water, stable soils and beaches, and naturally vegetated areas continue to be available to support the use of JRM-administered lands and future growth and development of JRM-administered lands and surrounding areas.

Conservation Areas. The special conservation areas within JRM-administered lands are discussed in detail in each installation chapter of the 2019 JRM INRMP. Implementing management projects identified in the 2019 JRM INRMP and associated management plans to conserve or restore habitat or other natural areas would occur in priority areas that are compatible with operational and training needs. This could potentially cause long-term, minor, adverse impacts on planned use of lands. For example, protecting threatened and endangered species and restoring their habitat could require limiting activities in areas where Mariana fruit bats roost or forage on Andersen AFB in the future. In addition, restoring and maintaining the long-term health of forested areas and other ecosystems could require temporary or long-term restrictions in forests that are being restored after long-term damage by ungulates.

Public Health and Safety. There are no planned activities associated with the 2019 JRM INRMP that would result in undue safety risks or otherwise threaten public health or safety, or conflict with planning criteria established to ensure the safety and protection of human life and property on and surrounding JRM-administered lands. No impacts on coastal zone management would occur from implementation of the Proposed Action. Therefore, implementation of the Proposed Action would not result in significant impacts to land use.

4.7 Submerged Land Use

2019 JRM INRMP Management Action That Would Benefit Submerged Land Use:

- potential beneficial impacts due to increased knowledge of marine resources leading to lifting of restrictions on military operations

The location and extent of a proposed action needs to be evaluated for its potential effects on a project site and adjacent submerged land uses. Factors affecting a proposed action in terms of submerged land use include its compatibility with on-site and adjacent submerged land uses, restrictions on public access to land, or change in an existing submerged land use that is valued by the community. Other considerations are

given to proximity to a proposed action, the duration of a proposed activity, and its permanence. Impacts may be adverse or beneficial.

4.7.1 Evaluation Criteria

The significance of impacts on submerged land use is evaluated primarily by considering the compatibility of an action with existing submerged land uses and conditions. The Proposed Action could have a significant submerged land use impact if it would result in any of the following:

- conflict with the military missions of JRM-administered submerged lands
- be inconsistent or in noncompliance with submerged land use plans or policies
- preclude existing submerged land use
- preclude continued use or occupation of an area
- be incompatible with adjacent submerged land use to the extent that public health or safety is threatened
- conflict with planning criteria established to ensure the safety and protection of human life and property

4.7.2 No Action Alternative

Under the No Action Alternative, the Proposed Action would not occur and there would be no change to submerged land use. Continued implementation of the 2013 JRM INRMP would be compatible with existing submerged land uses. Therefore, no significant impacts would occur with implementation of the No Action Alternative.

4.7.3 Proposed Action (Preferred Alternative)

The study area for submerged land use analyses for the Proposed Action is defined as those lands between the low and high-tide line and extend 3 miles (4.8 kilometers) offshore from JRM-administered and leased lands on Guam, Tinian, and FDM.

4.7.3.1 Effects on Submerged Land Use

Existing and Planned Land Use. As required by the Sikes Act and DoD Instruction 4715.03, the 2019 JRM INRMP was developed in a manner that ensures that there would be no net loss of the capability of installations to support military missions and future mission requirements. As such, the 2019 JRM INRMP is consistent with submerged land use plans and policies of JRM-administered submerged lands and the ongoing and planned military uses of those sites, and implementation of the 2019 JRM INRMP would not adversely affect the short-term or long-term use of land for military activities.

The general strategy for managing marine resources in the 2019 JRM INRMP includes a general progression of knowledge through the implementation of a series of marine habitat studies and the follow-on management of the effects of stressors or threats on these resources. Maintaining healthy marine communities for listed and native species on submerged lands would potentially relieve some of the restrictions of military training and in-water activities (e.g., military construction, routine maintenance/repair of in-water facilities) on submerged lands by minimizing costs and mitigation requirements, avoiding work-around solutions, and preventing delays in activities due to regulatory compliance processes.

Ecosystem management is emphasized in the 2019 JRM INRMP because the DoD recognizes that the mission of JRM is inextricably linked to local, regional, and global ecological integrity, and that sustaining ecosystem integrity is the best way to protect biodiversity, ensure sustainable use, and minimize the effort and cost of management. Thus, implementing the 2019 JRM INRMP would result in long-term, beneficial impacts on military use of JRM-administered submerged lands and public use of surrounding areas, by ensuring that healthy and self-sustaining natural resources, such as clean water, stable soils and beaches, and naturally vegetated areas continue to be available to support the use of JRM-administered submerged lands and future growth and development of JRM-administered submerged lands and surrounding areas.

Conservation Areas. Sections 5.1.6, 8.1.4, and 9.1.5 of the 2019 JRM INRMP discuss in detail the marine special conservation areas within JRM-administered submerged lands. Implementing management projects identified in the 2019 JRM INRMP and associated management plans to conserve or restore habitat or other natural areas would occur in priority areas that are compatible with operational and training needs. This could potentially cause long-term, minor, adverse impacts on planned use of submerged lands. For example, restoration activities to protect key coral reef areas could require limiting activities in areas. In addition, restoring and maintaining the long-term health of ecosystems could require temporary or long-term restrictions.

Public Health and Safety. There are no planned activities associated with the 2019 JRM INRMP for submerged lands that would result in undue safety risks or otherwise threaten public health or safety or conflict with planning criteria established to ensure the safety and protection of human life and property on and surrounding JRM-administered submerged lands.

Implementation of the Proposed Action would not result in significant impacts to submerged land use.

4.8 Socioeconomics

Analysis of impacts to socioeconomics is focused on the effects of the alternatives on population, income, economic activity, tax revenue, and housing. Impacts may be adverse or beneficial.

2019 JRM INRMP Management Action That Would Benefit Socioeconomics:

- improved access to fishing for recreation and subsistence

4.8.1 Evaluation Criteria

Impacts are expected to primarily relate to recreational opportunities. As such, impacts would be considered significant if access is completely restricted to any area that is prominently used for recreational purposes.

4.8.2 No Action Alternative

Under the No Action Alternative, the Proposed Action would not occur and there would be no change to the socioeconomics of the local area. Therefore, no significant impacts would occur with implementation of the No Action Alternative.

4.8.3 Proposed Action (Preferred Alternative)

The study area for socioeconomic analyses for the Proposed Action is defined as Guam and Tinian.

4.8.3.1 Effects on Socioeconomics

Population and Public Services. The Proposed Action primarily relates to resource management and includes no direct or indirect population attractors. Since no population increase would be induced by the Proposed Action, no housing or public services impacts would be expected.

Economy. Similarly, while there may be some local expenditures related to resource management actions included in the Proposed Action, noticeable economic benefits would not be anticipated, and any economic or financial impacts would be less than significant.

Recreation. No access restrictions to areas currently used for recreation are proposed. Therefore, no adverse impacts associated with recreation are anticipated. Management projects proposed in the INRMP would likely have the effect of improving the sustainability of fishing on both Guam and Tinian, allowing for improved quality of this form of recreation over a longer period.

Subsistence Activity. In addition to improving the long-term quality of fishing for recreational purposes, management projects would improve the long-term quality of fishing for purposes of subsistence. This improvement would tend to reduce the portion of incomes required to be spent on food and better allow for those with no financial means of obtaining food to live off the land.

4.9 Environmental Justice

This analysis focuses on the potential for a disproportionate and adverse exposure of specific off-base population groups to the projected adverse consequences discussed in the previous sections of this chapter.

2019 JRM INRMP Management Action That Would Benefit Environmental Justice:

- improved quality of fishing for subsistence, which would disproportionately benefit low-income residents

4.9.1 Evaluation Criteria

Adverse impacts to environmental justice are identified where significant impacts to the human environment are determined in resource areas that relate to the human environment. Resources considered include: water resources, socioeconomics, land and submerged land use, and cultural resources.

4.9.2 No Action Alternative

Under the No Action Alternative, the Proposed Action would not occur and there would be no effect to environmental justice. Therefore, no significant impacts would occur with the implementation of the No Action Alternative.

4.9.3 Proposed Action (Preferred Alternative)

The study area for environmental justice analysis for the Proposed Action is defined as Guam and Tinian.

4.9.3.1 Effects on Environmental Justice

No significant impacts were identified for resources relating to the human environment. Therefore, implementation of the Proposed Action would not cause disproportionately high and adverse human health or environmental effects on any minority or low-income populations. As described in Section 4.8,

there may be beneficial effects on the long-term sustainability of subsistence activities, which would tend to primarily benefit those with low or no incomes.

4.10 Summary of Potential Impacts to Resources and Impact Avoidance and Minimization

A summary of the potential impacts associated with the action alternative and the No Action Alternative is presented in Table 4-1.

Table 4-1 Summary of Potential Impacts to Resource Areas

Resource Area	*No Action Alternative*	*Proposed Action*
Geology, Topography, and Soils	Continued implementation of the 2013 JRM INRMP would result in some beneficial impacts through the reduction in soil erosion, reduction in invasive vegetation, and an increase in native reforestation on JRM-administered lands; however, the 2013 JRM INRMP does not address soil conditions in their current state. Continued implementation of the 2013 JRM INRMP without updates to the comprehensive soil erosion and control plan and to the long-term, ecosystem-based plans for restoring and maintaining forests and other areas could result in continued erosion and minor to moderate, adverse impacts on soils. In addition, the No Action Alternative does not address the current ungulate (i.e., hoofed mammals such as pigs, deer, and carabao [*Bubalus bubalis*]) populations found on JRM-administered lands; thus, ground disturbances and soil erosion caused by ungulates would continue which would have adverse impacts on soils and increased erosion.	Implementation of the 2019 JRM INRMP would have long-term, beneficial reduction in soil erosion from implementation of updated erosion control practices and ecosystem-based management plans for restoring and maintaining forests and other areas. Eroded areas would be identified and revegetated to reduce erosion. Control of ungulates would improve soils by reducing digging and destruction of vegetation by those animals.
Water Resources	Continued implementation of the 2013 JRM INRMP would result in beneficial impacts to water resources by minimizing operational impacts on wetlands, maximizing native floral and faunal diversity of wetlands, and managing for no net loss of wetlands. These plans would include the restoration and maintenance of ecosystem processes, such as sustainable revegetation and soil production, which would improve water quality, promote the flow of surface waters into wetlands, and reduce flooding by increasing groundwater recharge and reducing surface water flow rates.	Implementation of the 2019 JRM INRMP would have long-term, beneficial impacts on surface water quality and aquatic habitats from rehabilitation of surface waters and actions to reduce erosion, such as the control of ungulates and restoration of disturbed areas. There would be no direct, adverse impacts on wetlands and floodplains.

Table 4-1 Summary of Potential Impacts to Resource Areas

Resource Area	*No Action Alternative*	*Proposed Action*
Cultural Resources	Continued implementation of the 2013 JRM INRMP would result in adverse impacts on cultural resources and culturally important medicinal plants. The No Action Alternative does not properly address the current ungulate populations on JRM-administered lands; thus, the high abundance of ungulates and degradation of forests and other areas could continue.	Implementation of the 2019 JRM INRMP would have no adverse impacts on cultural resources, including historic properties (as defined by Section 106 of the National Historic Preservation Act). Long-term, beneficial impacts on cultural resources could occur from implementation of updated actions such as those that seek to protect native forests (i.e., ungulate control). These actions would protect habitats in which culturally important plants are found and prevent or reduce degradation of historical landmarks.
Terrestrial Biological Resources	Continued implementation of the 2013 JRM INRMP would result in some beneficial impacts on terrestrial biological resources on JRM-administered lands. However, because the 2013 JRM INRMP considered under this alternative does not address all current adverse conditions on JRM-administered lands, some natural habitats, such as native forests, would continue to decline in quality and complexity, and some plant and animal species would continue to be adversely affected by those conditions. For example, the No Action Alternative does not include an updated plan to reduce ungulate populations on JRM sites; thus, degradation of native forest would continue and adversely affect recovery of threatened and endangered species. In addition, the 2013 JRM INRMP does not provide adequate management for the species listed under the federal Endangered Species Act in October 2015.	Implementation of the 2019 JRM INRMP would have beneficial impacts on terrestrial vegetation and wildlife, including newly protected species, from the implementation of updated long-term, ecosystem-based management plans to restore and enhance habitat for native species, prevent and control non-native species, and monitor native plant and animal populations.

Table 4-1 Summary of Potential Impacts to Resource Areas

Resource Area	*No Action Alternative*	*Proposed Action*
Marine Biological Resources	Continued implementation of the 2013 JRM INRMP would result in some beneficial impacts on marine biological resources on JRM-administered submerged lands. However, because the 2013 JRM INRMP considered under this alternative does not address all current adverse conditions on JRM-administered submerged lands, some marine habitats would continue to decline in quality and complexity, and some species would continue to be adversely affected by those conditions. For example, the No Action Alternative does not include a discussion on climate change and the effects of coral bleaching; thus, degradation of reef habitat would continue and adversely affect recovery of threatened and endangered species.	Implementation of the 2019 JRM INRMP would have beneficial impacts on marine wildlife, including protected species, from the implementation of long-term, ecosystem-based management plans to restore and enhance habitat for native species and prevent and control non-native species.
Land Use	Continued implementation of the 2013 JRM INRMP would be compatible with existing land uses. Therefore, no significant impacts would occur with implementation of the No Action Alternative.	Implementation of the 2019 JRM INRMP was developed in a manner that ensures no net loss of the capability of installations to support military missions and future mission requirements, and is therefore consistent with current land use plans and policies of JRM-administered and leased lands as well as for any planned military uses.
Submerged Land Use	Continued implementation of the 2013 JRM INRMP would be compatible with existing submerged land uses. Therefore, no significant impacts would occur with implementation of the No Action Alternative.	There would be no adverse impacts to submerged land use with the implementation of the 2019 JRM INRMP. Potential beneficial impacts due to increased knowledge of marine resources could lead to lifting of restrictions on military operations.
Socioeconomics	No change in social or economic conditions or use of public services would occur with continued implementation of the 2013 JRM INRMP.	No change in social or economic conditions or use of public services would occur with the implementation of the 2019 JRM INRMP. There would be a significant positive impact to the sustainability of fishing opportunities.
Environmental Justice	No adverse and disproportional impacts on minority or low-income populations would occur with continued implementation of the 2013 JRM INRMP.	No adverse and disproportional impacts on minority or low-income populations would occur with the implementation of the 2019 JRM INRMP.

Key: INRMP = Integrated Natural Resources Management Plan; JRM = Joint Region Marianas.

5 Cumulative Impacts

This section (1) defines cumulative impacts; (2) identifies the scope of cumulative impacts analysis; (3) describes past, present, and reasonably foreseeable actions relevant to cumulative impacts; and (4) evaluates potential cumulative impacts caused by the Proposed Action in combination with past, present, and reasonably foreseeable actions.

5.1 Definition of Cumulative Impacts

The approach taken in the analysis follows the objectives of the National Environmental Policy Act (NEPA), Council on Environmental Quality (CEQ) regulations, and CEQ guidance. Cumulative impacts are defined in 40 Code of Federal Regulations (CFR) 1508.7 as "the impact on the environment that results from the incremental impact of the action when added to the other past, present, and reasonably foreseeable future actions regardless of what agency (federal or non-federal) or person undertakes such other actions. Cumulative impacts can result from individually minor but collectively significant actions taking place over a period of time."

In addition, CEQ and the United States (U.S.) Environmental Protection Agency (USEPA) have published guidance addressing implementation of cumulative impacts analyses: "Guidance on the Consideration of Past Actions in Cumulative Effects Analysis" (CEQ 2005) and "Consideration of Cumulative Impacts in USEPA Review of NEPA Documents" (USEPA 1999). CEQ guidance entitled *Considering Cumulative Impacts Under NEPA* (CEQ 1997) states that cumulative impacts analyses should "…determine the magnitude and significance of the environmental consequences of the proposed action in the context of the cumulative impacts of other past, present, and reasonably foreseeable actions...identify significant cumulative impacts…[and]…focus on truly meaningful impacts."

Cumulative impacts are most likely to arise when a relationship or synergism exists between a proposed action and other actions occurring or expected to occur in a similar location or during a similar period. Actions overlapping with, or in close proximity to, a proposed action would be expected to have more potential for a relationship than those more geographically separated. Similarly, relatively concurrent actions would tend to offer a higher potential for cumulative impacts. To identify cumulative impacts, an analysis needs to address the following three fundamental questions:

- Does a relationship exist such that affected resource areas of the proposed action might interact with the affected resource areas of past, present, or reasonably foreseeable actions?
- If one or more of the affected resource areas could be expected to interact, would the interaction increase the magnitude of impacts already identified as associated with the proposed action or lead to additional impacts not previously identified as associated with the proposed action?
- If impacts of increased magnitude or new impacts are identified, then what is the overall magnitude of the cumulative impacts?

5.2 Scope of Cumulative Impacts Analysis

The scope of the cumulative impacts analysis involves both the geographic extent of the effects and the period in which the effects could be expected to occur. For this 2019 Joint Region Marianas (JRM) Integrated Natural Resources Management Plan (INRMP) Environmental Assessment (EA), the study

area bounds the geographic extent of the analysis. In general, the study area will include those areas previously identified in Chapter 4 for the respective resource areas. The time frame for cumulative impacts centers on the timing of the Proposed Action.

Another factor influencing the scope of cumulative impacts analysis involves identifying other actions to consider. Beyond determining the geographic scope and time frame for the actions interrelated with the proposed action, the analysis employs the measure of "reasonably foreseeable" to include or exclude potential future actions. For the purposes of this analysis, public documents prepared by federal, state, and local government agencies form the primary sources of information regarding reasonably foreseeable actions. Documents used to identify other actions include notices of intent for Environmental Impact Statements (EISs) and EAs, management plans, land use plans, and other planning related studies.

5.3 Past, Present, and Reasonably Foreseeable Actions

To determine which projects to include in the cumulative impacts analysis, a preliminary determination was made as to whether a relationship exists between resource areas of the Proposed Action and a set of past, present, or reasonably foreseeable actions. If no such potential relationship was determined to exist, the project was not carried forward into the cumulative impacts analysis. In accordance with CEQ guidance (CEQ 2005), actions considered but excluded from further cumulative impacts analysis are not catalogued here, as the intent is to focus the analysis on the meaningful actions relevant to informed decision-making. Past, present, or reasonably foreseeable actions that were carried forward into this cumulative impacts analysis are listed in Table 5-1 and briefly described in Sections 5.3.1 and 5.3.2.

Table 5-1 Cumulative Action Evaluation

Action	*Location*	*NEPA Analysis Completed*
Past Actions		
Establishment and Operation of an Intelligence, Surveillance, Reconnaissance, and Strike Capability (*pending full implementation*)	Guam	Environmental Impact Statement and Record of Decision
Terminal High-altitude Area Defense Permanent Stationing on Guam	Guam	Finding of No Significant Impact
Present and Reasonably Foreseeable Future Actions		
Global Climate Change	Guam, CNMI	
Invasive Species	Guam, CNMI	
Beddown of Training and Support Initiatives at Northwest Field	Guam	Finding of No Significant Impact
Guam Military Relocation (2012 Roadmap Adjustments)	Guam, CNMI	Supplemental Environmental Impact Statement and Record of Decision
Pacific Air Forces Divert Marianas	CNMI	Environmental Impact Statement and Record of Decision
Mariana Islands Testing and Training	Guam, CNMI	Environmental Impact Statement and Record of Decision
Commonwealth of the Northern Mariana Islands Joint Military Training	Guam, CNMI	Public Draft Environmental Impact Statement
Construction of Munitions Storage Igloos at Andersen Air Force Base	Guam	Draft Environmental Assessment
Plumeria Resort	CNMI	Non-NEPA Impact Assessment

Key: CNMI = Commonwealth of the Northern Mariana Islands; NEPA = National Environmental Policy Act.

5.3.1 Past Actions

Establishment and Operation of an Intelligence, Surveillance, Reconnaissance, and Strike Capability (pending full implementation): This project involved the establishment of an Intelligence, Surveillance, Reconnaissance, and Strike and aerial refueling capabilities at Andersen Air Force Base (AFB) as part of the Pacific Command's Global Strike Task Force Initiative. Specific components of this action include 3 Global Hawk unmanned aerial Intelligence, Surveillance, Reconnaissance aircraft; 12 aerial refueling aircraft; 4 Global Hawk RQ-4 unmanned aerial vehicles (Global Hawk); and support personnel at Andersen AFB. Additionally, 48 fighter and 6 bomber aircraft and support personnel rotate to Andersen AFB from installations in the 50 states. Approximately 3,000 additional military, civilian, and contractor personnel are required to support this action. Facility construction, addition, and alteration projects took place to support the action. The Final EIS was published in November 2006 (71 Federal Register 67864) and a Record of Decision (ROD) was signed on January 12, 2007 (72 Federal Register 2871).

Terminal High-altitude Area Defense Permanent Stationing on Guam: The U.S. Army decided to maintain the Terminal High-altitude Area Defense (THAAD) ballistic missile defense battery at Northwest Field of Andersen AFB. As a secondary, connected action to the expeditionary deployment and proposed permanent stationing of the THAAD battery on Guam, the U.S. Army also expanded the Northwest Field cargo drop zone training area that is encumbered by THAAD operations.

5.3.2 Present and Reasonably Foreseeable Actions

Global Climate Change: Although the plant and animal communities found on Guam and in the Marianas are adapted for tropical weather patterns (i.e., wet and dry seasons), increases in the intensity and frequency of storms as well as increases in the occurrence and durations of droughts may negatively affect the ability for native species to recover from these events. Changes in temperature, rainfall, and wind patterns will likely change the distribution of vegetation and wildlife and the size of associated populations. The effects of global climate change may contribute to cumulative impacts on water, terrestrial biological, marine biological, and land use resource areas.

Invasive Species: Despite biosecurity measures, transportation between Guam, the Commonwealth of the Northern Mariana Islands (CNMI), and elsewhere poses a constant risk of introducing invasive species. These accidental but inevitable introductions may have the potential to increase negative impact to terrestrial and marine resources on an ongoing basis, irrespective of any JRM action. JRM activities and resources will be adversely affected by these invasions, even when they are not due to JRM actions.

Beddown of Training and Support Initiatives at Northwest Field: This project establishes the relocation of a Rapid Engineer Deployable Heavy Operations Repair Squadron Engineer of mobile engineering forces, the Pacific Air Force Commando Warrior training program, the Pacific Air Force SILVER FLAG training program, and a Combat Communication Squadron and its training program at the same location.

Guam Military Relocation (2012 Roadmap Adjustments): In September 2010, the Department of the Navy (DON) signed a ROD regarding the 2010 Final EIS for the Guam and CNMI Military Relocation. In April 2012, the U.S.-Japan Security Consultative Committee jointly announced an adjustment to the previous plans for the Guam Military Relocation. In accordance with these "2012 Roadmap Adjustments," the Department of Defense (DoD) adopted a new force posture in the Pacific providing for a materially smaller and reconfigured Marine Corps force on Guam. The DON prepared this Final

Supplemental EIS for the purpose of supplementing the portions of the 2010 Final EIS regarding the establishment on Guam of a Live-fire Training Range Complex, a cantonment area, a family housing area, and associated infrastructure to support the relocation of a substantially reduced number of Marines and dependents than was previously analyzed. The DON's preferred alternative is to construct and operate the proposed cantonment at the Naval Base Guam (NBG) Telecommunications Site (TS) at Finegayan, the proposed family housing on Andersen AFB, and the proposed Live-fire Training Range Complex at Northwest Field on Andersen AFB. For purposes of mitigation, the DON entered into a Memorandum of Agreement (MOA) with the U.S. Fish and Wildlife Service (USFWS) to ensure a sufficient amount of suitable survival and recovery habitat is conserved in northern Guam to support the reintroduction and recovery of the Guam Micronesian kingfisher. DON agreed to develop and implement specific management projects that support control, suppression, and eradication of invasive species, such as brown treesnake (BTS), ungulates, mammalian predators, and invertebrates, that negatively impact kingfisher nesting and fledging. Many of the projects listed in the 2019 JRM INRMP support the requirements of the Guam Micronesian kingfisher MOA.

Pacific Air Force Divert Marianas: Pending approval of the Federal Aviation Administration, the U.S. Air Force (USAF) will construct facilities and infrastructure needed to achieve divert capabilities in the Western Pacific and will conduct military exercises in the Military Lease Area (MLA) on Tinian. Facilities to be constructed include but are not limited to a parking apron north of the Tinian International Airport, a cargo pad, maintenance facilities, access roads, and a fuel storage tank system.

Mariana Islands Testing and Training: DON has developed a plan to maintain military readiness training and research, development, testing, and evaluation activities. The Mariana Islands Training and Testing (MITT) EIS/Overseas EIS (OEIS) is a follow-on study to the Mariana Islands Range Complex (MIRC) EIS/OEIS. The ROD for the MIRC was published in July 2010, and the ROD for the MITT was published in July 2015. The MITT supports the renewal of regulatory permits and authorizations, addresses training and testing not covered under existing permits and authorizations, and identifies those permits and authorizations necessary to support force structure changes and emerging training and testing requirements, including those associated with new platforms and weapons systems. A Supplemental EIS is underway to assess the potential environmental impacts associated with ongoing military readiness activities.

The MITT study area includes the existing MIRC, additional areas on the high seas, and a general transit corridor between Hawaii and MITT where training and testing activities may occur. The MIRC is the only major DON range complex in the MITT study area. Since the MITT study area is predominantly ocean, Guam, Tinian, and FDM represent a small part of the total area. Increased training tempo is proposed for the submerged lands that underlie warning area W-517 located south of Guam and small arms firing areas are proposed west of Agat Bay and the Haputo Point area.

Commonwealth of the Northern Mariana Islands Joint Military Training: The proposed action is to establish a series of live-fire ranges, training courses, and maneuver areas within the CNMI to reduce existing joint service training deficiencies and meet the U.S. Pacific Command Service Components' unit level and combined level military training requirements in the Western Pacific. The proposed action would take place on the islands of Tinian, Pagan, and potentially Saipan. A unit level Range and Training Area on Tinian and combined level Range and Training Area on Pagan would be established to meet the

purpose and need. One of the Tinian action alternatives would involve establishing an Airport Surveillance Radar and Remote Transmitter/Receiver at Saipan International Airport.

There are three Tinian unit level training action alternatives, primarily distinguished by varying real estate interests outside of the MLA and the level of utilization of the Port of Tinian, the Tinian International Airport, and the Saipan International Airport. The No Action Alternative on Tinian would allow currently authorized training to continue in addition to the previously approved development and use of four live-fire ranges on Tinian. There are two Pagan combined level training action alternatives, primarily distinguished by size of maneuver areas and the corresponding size of the High Hazard Impact Area. A Public Draft EIS/OEIS was published in 2015 for the CNMI Joint Military Training (CJMT) action, and a Revised Draft EIS/OEIS is planned.

Construction of Munitions Storage Igloos at Andersen Air Force Base: The construction of an additional 48 Hayman-style munitions storage igloos in Munitions Storage Area I at Andersen AFB is proposed to reduce the current existing munitions storage capacity shortfall and to enable 36th Wing's mission requirements under Title 10 U.S. Code Section 8062. The new igloos would require lighting and electrical support, intrusion detection system, ventilation, reinforced concrete foundation, rated 7-bar construction, floor slabs, columns, beams, and lightning protection system. Supporting facilities would include site development, utilities and connections, road improvements, and loading aprons. Project construction would occur between 2019 and 2021.

Plumeria Resort: The construction of this luxury, commercial resort would take place on 372 acres (151 hectares) on Tinian, approximately 1.5 miles (2.4 kilometers) north of central San Jose Village and approximately 0.5 mile (0.8 kilometer) south of the West Tinian Airport runway. The proposed site is bisected diagonally by 8th Avenue. The property borders the shoreline on the Philippine Sea, the Commonwealth Utilities Corporation power plant to the south, with San Jose Village to the southeast, and the Tinian International Airport to the north, with a "panhandle" extending along the shoreline cliffs.

As planned, facilities would be constructed in a phased development process; there would be three phases that would take four years each to complete. Phase 1 would be developed from 2015 to 2019, Phase 2 would be developed from 2019 to 2023, and Phase 3 would be developed from 2023 to 2027. The labor requirement for the construction phase of the project is anticipated to require approximately 2,000 workers for the entire work under Phase 1. Under Phases 2 and 3, it is anticipated that the project would require 1,000 construction workers.

Upon completion in 2027, the resort is planned to consist of two hotels with a total of 1,966 hotel rooms, 3,389 service apartments, 557 staff dorm rooms, 100 Very Important Person Villas, a golf course and golf club with associated amenities, a casino, a cultural center/museum, a health clinic, and a wide variety of retail shopping options, including a farmers market complex. Average daily population at the resort, including staff and guests, is anticipated to be 3,178 staff and 5,731 guests (total 8,909 people).

5.4 Cumulative Impacts Analysis

Where feasible, the cumulative impacts were assessed using quantifiable data; however, for many of the resources included for analysis, quantifiable data is not available and a qualitative analysis was undertaken. In addition, where a published analysis of potential environmental effects for reasonably

foreseeable actions is not available, assumptions were made regarding the potential impacts of those actions. The analytical methodology presented in Chapter 4, which was used to determine potential impacts to the various resources analyzed in this document, was also used to determine cumulative impacts.

5.4.1 Geology, Topography, and Soils

The geographic study area includes the terrestrial sites proposed for the Proposed Action and adjacent lands. Significant impacts to geology, topography, and soils would result from the implementation of the past, present, and reasonably foreseeable actions within the region of influence. Although the long-term trend in the health of geology, topography, and soils would not be improved by cumulative impacts, the benefits from implementation of the 2019 JRM INRMP would help mitigate and reduce this trend.

5.4.2 Water Resources

The geographic study area includes the terrestrial sites proposed for the Proposed Action and adjacent lands. Past, present, and reasonably foreseeable actions generally increase demands on water resources and reduce available water quality and quantity in and around the project areas. Although the long-term trend in the health of water resources would not be improved by cumulative impacts, the benefits from implementation of the 2019 JRM INRMP would help mitigate and reduce this trend.

5.4.3 Cultural Resources

The geographic study area includes archaeological resources, architectural resources, traditional cultural properties found on JRM-administered lands, coastal zones, and marine waters proposed for the preferred alternative. Although significant impacts to cultural resources would result from the implementation of the past, present, and reasonably foreseeable actions within the region of influence, implementation of the 2019 JRM INRMP would provide an overall beneficial impact to cultural resources.

5.4.4 Terrestrial Biological Resources

The geographic study area includes the JRM-administered lands proposed for the Proposed Action and adjacent lands. Climate change, invasive species, and past, present, and future human activities, both civilian and military, will continue to impose stressors on terrestrial biological resources within the areas of INRMP projects. Such effects are reduced by regulatory protection, such as the Endangered Species Act (ESA) for at-risk species. As a result of construction activities associated with the implementation of projects such as the Guam Military Relocation, CJMT, and the Plumeria resort, there would be a cumulative loss of forest habitat for several listed species (e.g., Guam Micronesian kingfisher, Guam rail, Mariana crow, Mariana fruit bat, *Cycas micronesica*, and fire tree). The Plumeria resort would also produce a cumulative loss of green turtle nesting beach habitat on Tinian at the Leprosarium pocket beaches due to construction activities, increased human activity in the area, and lighting disorientations. Although the long-term trend in the health of terrestrial biological resources would be reduced by cumulative impacts, the benefits from implementation of the 2019 JRM INRMP would help mitigate that reduction.

5.4.5 Marine Biological Resources

The geographic study area for marine biological resources includes the ocean waters and bottom substrates up to 3 miles (4.8 kilometers) offshore of JRM-administered lands. Climate change as well as past, present, and future human activities, both civilian and military, will continue to impose stressors on marine biological resources within the areas of INRMP projects. Such effects are reduced by regulatory protection: for threatened and endangered species under the ESA; for coral reefs and other essential fish habitat (EFH) under the Magnuson-Stevens Fishery Conservation and Management Act; and for marine mammals under the Marine Mammal Protection Act (MMPA). These statutes and their associated regulations include resource monitoring that enables better detection of trends, emerging threats, and the consequences of regulatory actions. As a result, the regulatory framework continually adjusts, mitigating the potential for cumulative impacts. The establishment of marine protected areas in the Mariana Islands, as well as the relative isolation of some islands and locations from human activities, contributes to the buffering of marine resources from cumulative impacts.

Nevertheless, as civilian and military activities increase within the region, continued incremental degradation of the marine environment is likely to occur as a result of land-based sources of pollution, overfishing, and diffuse disturbance (noise and visual presence) from human activity. Erosion of terrestrial sediments caused by activities conducted under present and reasonably foreseeable actions could cause detectable and potentially significant cumulative impacts to marine resources via the stressors of sedimentation and turbidity. Consequences of cumulative turbidity to marine resources most frequently manifest as decreased resilience. Implementation of the JRM Erosion and Sedimentation Control Plan, and related measures, may incidentally mitigate turbidity stressors unrelated to the JRM actions.

To the extent that marine populations and communities remain resilient to natural and anthropogenic perturbations, significant cumulative impacts will be avoided. When the combined effects of such stressors and global warming, which is associated with coral bleaching events, overwhelm the capacity of local populations and communities to recover (i.e., they remain in a perpetually disturbed condition), a significance threshold will have been crossed. This does not appear to be the case at present, as coral reef ecosystems in the region as a whole retain their natural diversity and productivity.

The 2019 JRM INRMP would have beneficial (i.e., localized, temporary, non-damaging) impacts on marine biological resources. Although the long-term trend in the health of marine biological resources may be down, the benefits from implementation of the 2019 JRM INRMP would help to improve this trend.

5.4.6 Land Use

The geographic study area includes the terrestrial sites for the Proposed Action and adjacent lands. Past, present, and reasonably foreseeable actions generally increase activities, change land uses, or increase restrictions on land use in and around the project areas. The Guam Military Relocation and CJMT projects tend to increase activities, change land uses, or increase restrictions on land use. Impacts to land use would result from the implementation of the past, present, and reasonably foreseeable actions within the study area. While the additional land use restrictions associated with the 2019 JRM INRMP would add to these impacts, the goal of the 2019 JRM INRMP is to utilize adaptive management to maintain long-term ecosystem health and minimize impacts to natural resources consistent with the

operational and training requirements of the DoD's mission. As such, any adverse cumulative impact would be caused primarily by the past, present, and reasonably foreseeable actions rather than by implementation of the 2019 JRM INRMP.

5.4.7 Submerged Land Use

The geographic study area includes the marine sites proposed for the Proposed Action and adjacent submerged lands. Although past, present, and reasonably foreseeable actions would be consistent with the Guam Submerged Lands Management Plan (Naval Facilities Engineering Command [NAVFAC] Marianas 2007), Haputo Ecological Reserve Area (ERA) Management Plan (NAVFAC Marianas 2010b), Orote ERA Management Plant (NAVFAC Marianas 2010c), and the CNMI Coastal Resources Management Program, impacts to submerged land use would result due to increased federal submerged land uses and restrictions. While the additional restrictions associated with the 2019 JRM INRMP would add to these impacts, the goal of the 2019 JRM INRMP is to utilize adaptive management to maintain long-term ecosystem health and minimize impacts to natural resources consistent with the operational and training requirements of the DoD's mission. As such, any adverse cumulative impact would be primarily caused by the past, present, and reasonably foreseeable actions rather than by implementation of the 2019 JRM INRMP.

5.4.8 Socioeconomics

The geographic study area includes Guam and Tinian. Past, present, and reasonably foreseeable actions generally reduce land available on these islands for public recreation and food gathering. The Guam Military Relocation and CJMT projects tend to increase federal land uses and restrict public access to areas used for recreation and food gathering. For Guam, significant impacts to recreation, due to restrictions to access, were identified in the ROD for the Guam Military Buildup. The socioeconomic benefits associated with the 2019 JRM INRMP would decrease the impacts to recreation that result from the Guam Military Buildup. On Tinian, the CJMT project could result in impacts related to socioeconomics, primarily caused by access restrictions. The 2019 JRM INRMP proposes no additional access restrictions on Tinian. As such, any adverse cumulative impact to socioeconomics would be caused primarily by the past, present, and reasonably foreseeable actions rather than by implementation of the 2019 JRM INRMP.

5.4.9 Environmental Justice

The geographic study area includes Guam and Tinian. The Guam Military Relocation and CJMT projects might interact with the Proposed Action to bring about cumulative impacts. The Guam Military Buildup ROD does not identify impacts to environmental justice and none are identified in association with the 2019 JRM INRMP. Therefore, no cumulative impacts to environmental justice are anticipated.

6 Other Considerations Required by National Environmental Policy Act

6.1 Consistency with Other Federal, State, and Local Laws, Plans, Policies, and Regulations

In accordance with 40 Code of Federal Regulations (CFR) Section 1502.16(c), analysis of environmental consequences shall include discussion of possible conflicts between the Proposed Action and the objectives of federal, regional, state, and local land use plans, policies, and controls. Table 6-1 identifies the principal federal and state laws and regulations that are applicable to the Proposed Action, and provides how compliance with these laws and regulations would be accomplished.

Table 6-1 Principal Federal and State Laws Applicable to the Proposed Action

Federal, State, Local, and Regional Land Use Plans, Policies, and Controls	*Status of Compliance*
National Environmental Policy Act; Council on Environmental Quality National Environmental Policy Act implementing regulations; Navy procedures for implementing National Environmental Policy Act	Complies (Environmental Assessment prepared)
Sikes Act (as amended)	Complies
Fish and Wildlife Coordination Act	Complies
Coast and Geodetic Survey Act of 1947	Complies
Clean Air Act	Complies (does not exceed *de minimis* levels)
Clean Water Act	Complies
Rivers and Harbors Act	Complies
Coastal Zone Management Act	Complies
National Historic Preservation Act	Complies (consultation in progress)
Endangered Species Act	Complies (consultation in progress)
Magnuson-Stevens Fishery Conservation and Management Reauthorization Act	Complies
Marine Mammal Protection Act	Complies
Migratory Bird Treaty Act	Complies
Bald and Golden Eagle Protection	NA
Comprehensive Environmental Response and Liability Act	Complies
Emergency Planning and Community Right-to-know Act	Complies
Federal Insecticide, Fungicide, and Rodenticide Act	Complies
Resource Conservation and Recovery Act	Complies
Toxic Substances Control Act	Complies
Farmland Protection Policy Act	Complies
Executive Order 11988, *Floodplain Management*	Complies
Executive Order 12088, *Federal Compliance with Pollution Control Standards*	Complies
Executive Order 12114, *Environmental Effects Abroad of Major Federal Actions* (Department of the Navy implementing regulation 32 Code of Federal Regulations part 287)	NA
Executive Order 12898, *Federal Actions to Address Environmental Justice in Minority Populations and Low-income Populations*	Complies
Executive Order 13045, *Protection of Children from Environmental Health Risks and Safety Risks*	Complies
Executive Order 13089, *Coral Reef Protection*	Complies

Table 6-1 Principal Federal and State Laws Applicable to the Proposed Action

Federal, State, Local, and Regional Land Use Plans, Policies, and Controls	*Status of Compliance*
Executive Order 13112 and 13751, *Safeguarding the Nation from the Impacts of Invasive Species*	Complies
Executive Order 13175, *Consultation and Coordination with Indian Tribal Governments*	NA
Executive Order 13693, *Planning for Federal Sustainability in the Next Decade*	NA
Executive Order 13766, *Expediting Environmental Reviews and Approvals For High Priority Infrastructure Projects*	NA
Executive Order 13807, *Establishing Discipline and Accountability in the Environmental Review and Permitting Process for Infrastructure*	NA

Key: NA = not applicable.

6.2 Irreversible or Irretrievable Commitments of Resources

Resources that are irreversibly or irretrievably committed to a project are those that are used on a long-term or permanent basis. This includes the use of non-renewable resources, such as metal and fuel and natural or cultural resources. These resources are irretrievable in that they would be used for this project when they could have been used for other purposes. Human labor is also considered an irretrievable resource. Another impact that falls under this category is the unavoidable destruction of natural resources that could limit the range of potential uses of that particular environment.

Implementation of the Proposed Action would involve human labor; the consumption of relatively small amounts of fuel, oil, and lubricants for vehicles; and the use of small amounts of construction materials (e.g., for fences) and ammunition (e.g., for ungulate control). Implementing the Proposed Action, however, would not result in significant irreversible or irretrievable commitment of resources.

6.3 Unavoidable Adverse Impacts

This Environmental Assessment (EA) has determined that the alternatives considered would not result in any significant impacts. Implementing the alternatives could result in the following unavoidable environmental impacts:

- minimal, temporary, localized, and non-significant disturbance of some terrestrial and marine species and their habitats during monitoring and management projects
- short-term, minor impacts to land use due to restrictions on operations in conservation and restoration areas

6.4 Relationship between Short-term Use of the Environment and Long-term Productivity

National Environmental Policy Act (NEPA) requires an analysis of the relationship between a project's short-term impacts on the environment and the effects that these impacts may have on the maintenance and enhancement of the long-term productivity of the affected environment. Impacts that narrow the range of beneficial uses of the environment are of particular concern. This refers to the possibility that choosing one development site reduces future flexibility in pursuing other options, or that using a parcel of land or other resources often eliminates the possibility of other uses at that site.

In the short-term, effects to the human environment with implementation of the Proposed Action would be minimal (see Section 6.3, above). In the long-term, there would be beneficial impacts to geology, topography, and soils; water resources; cultural resources; terrestrial biological resources; marine biological resources; land use; submerged land use; and socioeconomics. The Proposed Action would not result in any impacts that would significantly reduce environmental productivity or permanently narrow the range of beneficial uses of the environment.

8 List of Preparers

This Environmental Assessment (EA) was prepared collaboratively between the Department of the Navy (DON) and contractor preparers.

Department of the Navy

Dana Lujan (EV2/Naval Facilities Engineering Command [NAVFAC] Marianas)
Responsible for: Overall Program Management

Charles Sayon (NAVFAC Marianas)
Responsible for: Contracting Officer's Representative/Project Manager

MJ Mazurek (NAVFAC Marianas)
Responsible for: Terrestrial resources support and document review

Noah Burrell (NAVFAC Marianas)
Responsible for: Natural resources support and document review

Stephen Mosher (NAVFAC Marianas)
Responsible for: Natural resources support and document review

Marc Hall (NAVFAC Marianas)
Responsible for: Natural resources support and document review

Maria Santos (NAVFAC Marianas)
Responsible for: Natural resources support and document review

Hilary Goodwin (NAVFAC Marianas)
Responsible for: Marine resources support and document review

Andres J. Reyes (NAVFAC Marianas)
Responsible for: Marine resources support and document review

Michael Doherty (NAVFAC Headquarters)
Responsible for: Environmental planning support and document review

Tammy Conkle (NAVFAC Headquarters)
Responsible for: Natural resources support and document review

Jennifer Oelke-Farley (NAVFAC Headquarters)
Responsible for: Natural resources support and document review

Nicole Pak (NAVFAC Headquarters)
Responsible for: Document review

Wayne Van Scoyoc (NAVFAC Headquarters)
Responsible for: Document review

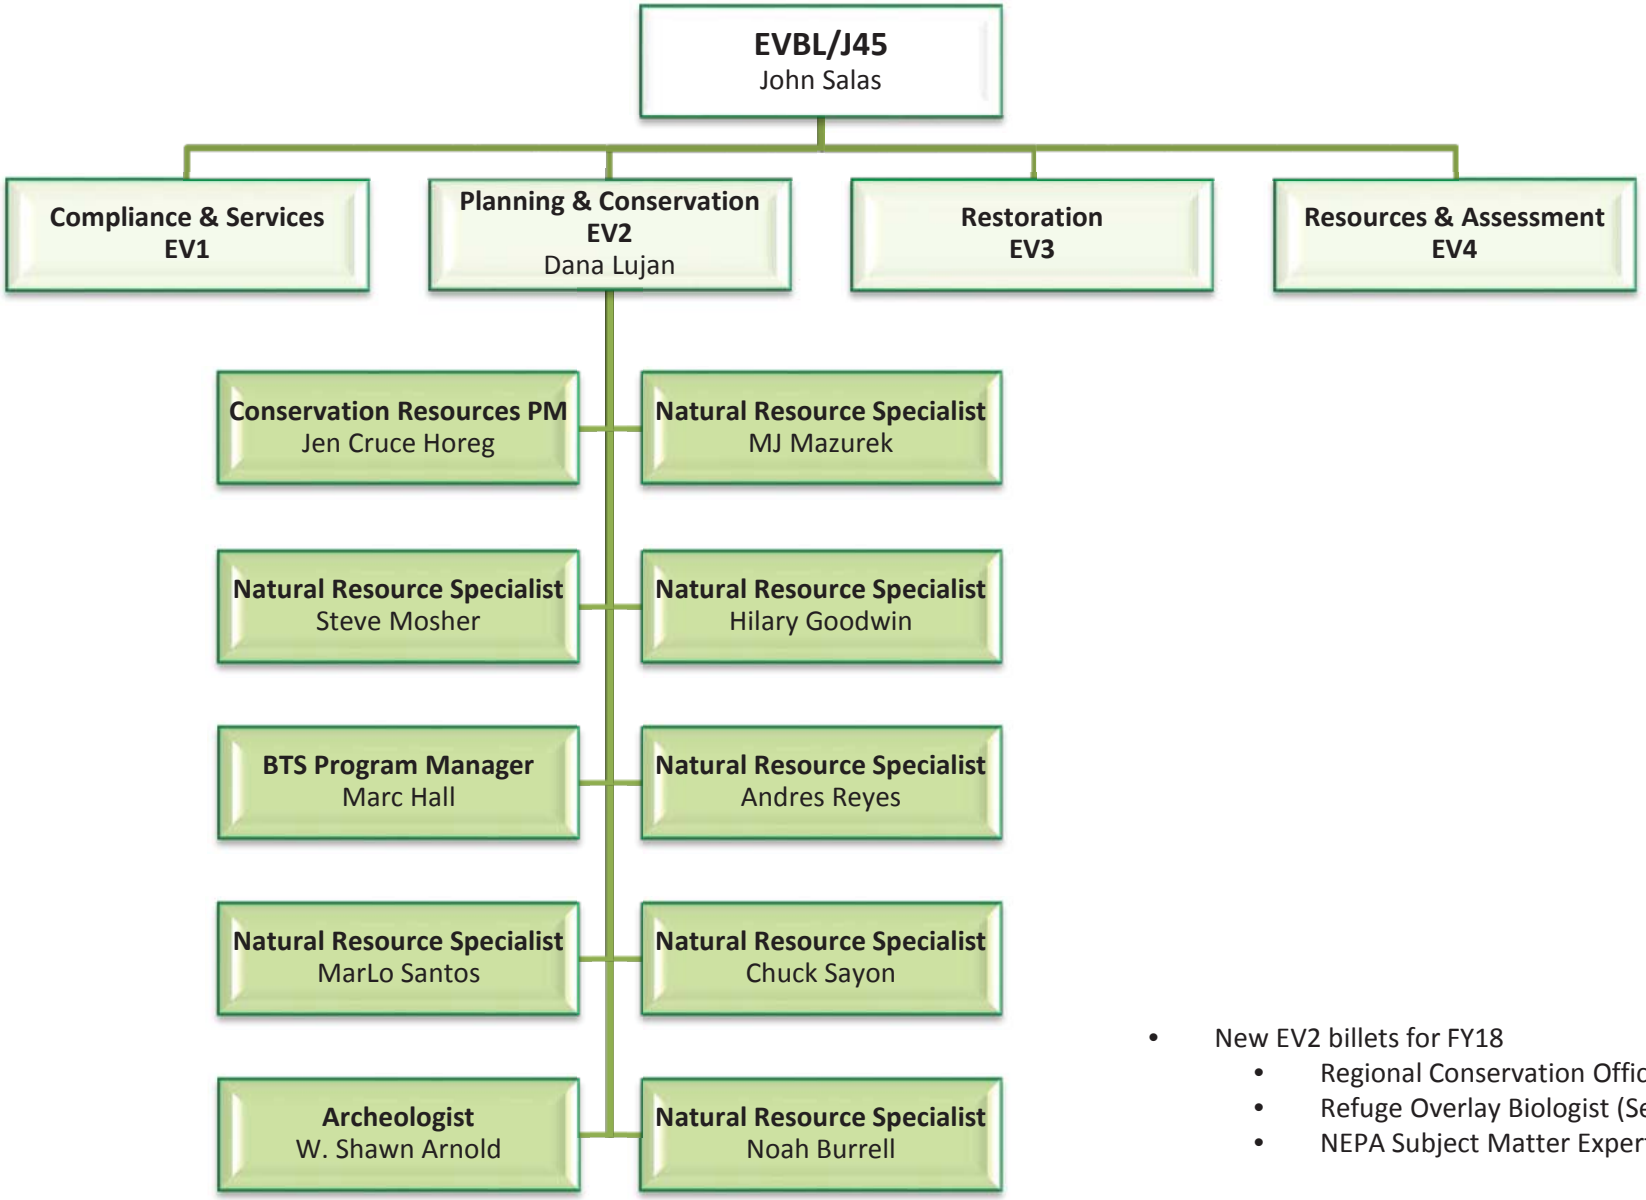
COMMENTERS: Public	
COMMENT RESPONDER: JRM, Cardno	**DATE OF COMMENTS**:15 November through 16 March 2019



Item #	*Date of Comment*	*Method of Submission*	*Document*	*Commenter/ Organization, as applicable*	*Email*	*Phone Number*	*Street Address*	*State/ Territory*	*Comment/Recommended Changes*	*Response to Comment (Requested edits made or incorporated)*
1	12/12/2018	Email (dana.lujan@fe.navy.mil)	JRM INRMP and JRM INRMP EA	Arlene Pangelinan PIRO HCD	arlene.pangelinan@noaa.gov	808-725-5082			NMFS PIRO HCD has no substantive comments on Version 5 of the draft JRM INRMP for the Guam components. Navy sufficiently addressed concerns for the Guam installations and sets up a reasonable marine management program. Regarding project implementation, Navy acknowledged our concerns for actual implementation of a few project during the recent INRMP metrics meetings and are working to address those issues. Although we do not have specific comments on EA, we concur with the EA's finding that the 2018 JRM INRMP will provide additional benefit to marine resources and NOAA trust resources. Thanks for the opportunity to comment on the draft JRM INRMP and EA. Sincerely, Arlene Pangelinan	Thank you for your comment. The development of the JRM INRMP was a collaborative effort with our Resource Partners. The DON appreciates the extensive support from our Resource Partners.
2	12/12/2018	Email (W-GU-NAVFAC-EV2-GS@fe.navy.mil)	JRM INRMP and JRM INRMP EA	William Fife					To Whom It May Concern, I support the US military and our national security, but not at the expense of our environment and culture. Bombing/live-fire practice has no place in the CNMI--at least not on Tinian and Pagan. PLEASE DO NOT DESTROY THE ENVIRONMENT HERE!!! It is a beautiful place that my family has made home. There is no environmental recovery from military testing, and we do NOT want that here!! Please find another place to bomb. Thank you, William Fife	Thank you for your comment. The INRMP is the Navy's planning document for management of its natural resources.
