Here is data with 2008 and 2015 data included....for all years, take the beginning/end months with a grain of salt as I don't have complete months.

Here is a graph I threw together tonight to show changes in depth and pressure for Hay Hollow Upstream. The confidence intervals are standard deviation to show variations in monthly means. This is using transducer data, I thought about adding 2014 (5 years ago) and 2009 (10 years ago), for comparison. Would Bill find something like this useful?
