Here is the weekly update for last week. Ben New and Magoffin are starting to struggle and drop, which I expect will get worse as it get warmer and more vegetation greens up. For the most part the other ponds still look good. House pond is no longer overflowing, but its pretty full.

When I was measuring Snail Spring well, both last week and this week an interesting thing happened. The water was dropping so fast that I actually couldn't get a measurement (if i just left the sensor lower, the water would drop to that level, which is what I recorded). That makes me wonder if in the past when I thought the pump was on it actually wasn't...I don't know but it was crazy.
