Here is the weekly update for SBNWR.

Notably, Ben New pond level up after managing inflow across the four Hackberry ponds, this is important as a stable breeding shiner population was found at this pond. Cobble and Magoffin continue to have strong outflow.

Middle well data logger did not function appropriately so no data was recovered.

Both Snail springs (E and W) are flowing. The west spring, fed by Snail Spring well, needs continual maintenance to keep water flowing to Snail Spring Box.
