Here is the weekly update from 13-17 Jan 2020. In general, ponds maintain constant levels with the exception of those ponds associated with wells undergoing pressure monitoring as water is continually turned on and off to these ponds. Pond flow data was not included as Survey 1,2,3 continues to present challenges to collecting this data. Well tape measurements in general show decreasing depth to water. Transducer data at Hay Hollow is presented at mean monthly and weekly pressure and depth to water. Trends in this data are likely better analyzed using hydrology models
