Hello Christopher and Kimberly,

I apologize for not sending an update for a while. Latest report is that there have been no changes to the den location. UAF guys did another UAS overflight, we have not received that footage yet. Will pass on to you when we get it.

I just sent the message below to the Endicott team reminding them of the impending road closure during den emergence. We discussed this at length several months ago and they were putting plans in place to be prepared. I don't anticipate any issues and with the PBI camera set up we'll be able to monitor the situation closely.

Let me know if you have any questions.

Subject: Bear den report 2-21

Good afternoon,

No changes in the bear den area, and I still haven't seen the drone footage from last week's overflight, but I have emailed Nils about that...

The attached pics were taken at about 8:45am.

Today's weather at the time of the obs: ambient temp approx. -21 deg F, with 5-10 mph winds from the S/SE the wind chill made it feel about -40. I also included a pic of the sun as it was just starting to rise above the horizon.

Once again, I could not pick up a definitive heat signature.

Please let me know if there is anything else that I can do or provide.

Have a good day.

Thanks,

Chuck Bartlett
