Additional Topics

General Comments

Additonal Topics "Construction activities will bisect the site [EO 213], thereby impacting 158 DFHL plants over 0.59 ac situated witin the contruction limits...The remaining part of these sites not impacted by direct construction activities will be protected by interrelated and interdependent on-site conservation actions. Indirect effects from induced development will not occur because the proposed Bypass/SR 2047 (Borders Road) interchage is at a grade. Cumulative effects are not assumed to occur because the existing land use (single family residential) and proposed land development (low density residential) will, in effect, remain the same around Sites 24 and 25 [EO 213, in part] (Bassette 2003).

Additional Topics

General Comments
Additonal Topics "According to the City of Shelby's existing land use plan, Site 14 [EO 212] sits in an undeveloped tract of land. The city's land development plan proposes low-density residential development on this land parcel. Consequently, private development resulting in the loss of Site 14 would be considered a cumulative effect" (Bassette 2003).

Additional Topics

General Comments
Additonal Topics "B-3122: THis [NCDOT] project replaces Bridge No. 24 over an unnamed creek that crosses SR 1628 in Burke County. The project let date was February 2001 and construction was completed in August of that same year... The project permits do not authorize impacts to DFHL. The October field review indicated that no direct, indirect, or cumulative impacts to DFHL have occurred since project contruction (Bassette 2003).

EO ID 22215 **Subnational Scientific Name** *Hexastylis naniflora* **Shape_ID** 61396

Additonal Topics "...Construction activities associated with the Bypass exit/entrance ramps will impact the entire site...NCDOT proposes to protect Site 43 [EO 204, in part] through a conservation easement. However, if it is not possible to obtain a conservation easement, the entire site may incur indirect effects relating to the construction of the entrance and exit ramps associated with the existing US 74/proposed US 74 Bypass' eastern interchange. The site's existing land use is undeveloped. The City of Shelby's land development plan calls for low-density residential development in this area which may result in loss of Sire 43 [EO 204, in part]" (Bassette 2003).

Element Occurrence Report

EO ID 22214 **Subnational Scientific Name** *Hexastylis naniflora* **Shape_ID** 61391

Additonal Topics "Construction activities [associated with the proposed Shelby Bypass] will impact 0.59 ac of the total 1.11 ac site [EO 203, in part], and 110 of the site's 206 DFHL plants....Site 29 [EO 203, in part] appears to be undeveloped and just outside of the City of Shelby's land development plan. This site is not expected to incur direct or cumulative effects from induced development. However, because this site is situated within 400 ft of the mechanized clearing line, under a worst case scenario this entire site may experience indirect effects due to competition from invasive species" (Bassette 2003).

Buffalo Creek: Kings Mountain Reservoir: tributary E of US 180, BYP Sites 15-19 (Sub of 216).
NCDOT TIP: R-2707

Directions

Buffalo Creek: Kings Mountain Reservoir, tributary east of US 180, Proposed Shelby Bypass Sites 15, 16, 17, 18, and 19. This is a sub EO of Parent EO 216 (Wichmann 2005). "Located east of NC 180 and north of SR 2067 (Fairview Road), Site 15 [EO 199, in part] is found along the stream banks of an unnamed intermittent tributary to Kings Mountain Reservoir" (Bassette 2003). "Sites 16, 17, and 18: Located east of NC 180, north of SR 2067 (Fairview Road), and south of DFHL Site 15, 16, 17, and 18 are found near each other in a heavily wooded area. None of the three sites is associated with or located near a stream (Bassette 2003).

Additional Topics

General Comments

Additonal Topics "Site 15:...Approximately 67 DFHL plant and 0.4 ac of the 0.2 ac site fall under project's construction limits" (Bassette et. al 2003). "Sites 16, 17, and 18:...Site 16, which contains 13 DFHL plants over 0.053 ac, includes 0.03 ac of construction impacts to DFHL plants. Construction activities will eliminate all Sites 17 and 18, resulting in a loss of 4 plants over 0.001ac Site 17 and 54 plants over 0.049 ac at Site 18. Despite its size, Site 18 is a high quality site relative to other DFHL sites on the project" (Bassette et. al 2003).

Additional Topics

General Comments
Additonal Topics "According to the City of Shelby's existing land use plan, Site 12 sits in an undeveloped tract of land. The City's land development plant proposes low-density residential development on this land parcel. Consequently, private development resulting in the loss of Site 23 would be considered a cumulative effect" (Bassette et. al 2003).

General Comments
Additonal Topics "NCDOT proposes to protect Site 13 [EO 197] trough a conservation easement. However, if it is not possible to obtain a conservation easement, development as a result of the interchange is assumed to impact the site. Because Site 13 [EO 197] sits within approximately 1,200 ft from the proposed Shelby Bypass's interchange with NC 180 and NC 150 (Cherryville Road), this site is presumed to fall entirely under indirect effects" (Bassette 2003).

Survey Site

Survey Site Name
Buffalo Creek: Friendship Chapel and tributary to Catawba River (Sub of 216)
NCDOT TIP: R-2707

Directions

Buffalo Creek: Friendship Chapel and unnamed tributary to Buffalo Creek, located south-west of Friendship Chapel and south of SR 1926; NC DOT Proposed Shelby Bypass Sites 41 and 42. This is a sub EO of Parent EO 216 (Wichmann 2005). "Hwy 150 to Airport Road. Go N/NW on Airport Road to the railroad track. Walk west on the tracks about 200 yards and then head right to the stream, [plants] located on the west bank of the stream" (Lespinasse 2004).

OwnerInfo_BCD N

Additional Topics

General Comments The location described by Lespinasse in 2004 does not appear to be the same as the location reported by NCDOT. Based on her vague directions and Topozone map location, it was in the small draw to the east as seen in the USGS topo map (Amoroso 2015).

Additonal Topics Sites 41 and 42 [EO 196] will not have indirect or cumulative effects associated with the proposed Shelby Bypass (Bassette 2003).

Additional Topics

General Comments

Additonal Topics "The City of Shelby's existing land use plan dipicts this site as part of an undeveloped tract of land. The city's land development plan calls for commercial development at Site 12 [EO 194]. Consequently, the remaining portion of Site 12 [EO 194] will have cumulative impacts associated with the proposed Shelby Bypass. Shelby's future planned growth is assumed to cumulatively impact the rest of Site 12 [EO 194] not already impacted by indirect impacts. However, NCDOT proposes to obtain a conservation easement to protect Site 12 [EO 194]. Also note that portions of Site 10 [EO 194] and Site 11 [EO 194] not impacted by direct construction activities are presumed to be protected by interrelated and interdependent on-site conservation actions" (Bassette 2003). "...Road construction activities will impact 55 DFHL plants and 0.09 ac of the 365 DFHL plants found at the 0.6 ac Site 10. Site 11 will lose 3 plants and 0.01 ac from direct contruction activities" (Bassette 2003).

EO ID 22198 **Subnational Scientific Name** *Hexastylis naniflora* **Shape_ID** 61347

Management Comments As part of its conservation measures to offset the loss of Hexastylis naniflora plants in occupied habitat along TIP No. R-2707 (US 74 Shelby Bypass), the NC Department of Transportation acquired right-of-way to preserve in perpetuity H. naniflora specimens at Site 7 that will remain intact after incurring adverse direct and/or indirect (drainage) effects associated with construction of the Bypass project. This right-of-way that is protected in perpetuity also contains a protective buffer around the limits of the preserved occupied habitat of H. naniflora in order to minimize the potential adverse effects that may otherwise harm the protected site in the future.

EO ID 22197 **Subnational Scientific Name** *Hexastylis naniflora* **Shape_ID** 61343

Additonal Topics "Site 4 [EO 190] sits within industrial land use zones. Neither indirect effects due to induced development nor cumulative effects are predicted for this site because it is situated in a narrow (400 ft wide) strip of land between the footprint of the proposed US 74 Bypass and CSX rail line. Access into this piece of land will be limited due to the proposed Bypass and existing rail line. However, because this site is situated within 400 ft of the mechanized clearing line, under worst case scenario this entire site may have indirect effects due to competition from invasive species" (Bassette 2003).

Survey Date 2013-10-30

Last Observation Date 2013-10-30 **First Observation Date** 1994-05-11

EO Data 2013: 11,860 plants counted on 29-30 October by NCDOT biologists (NCDOT 2013).
2011: 14,488 plants counted on 5-6 &12-13 December by NCDOT biologists (NCDOT 2011).
2010: Total of 13,062 plants counted by NCDOT biologists on 29 and 30 September 2010 on the Bowman tract and the "original NCDOT site" [see documentation for map] (Herman 2010).
2009: 13,062 plants counted on 29-30 September by NCDOT biologists (NCDOT 2009)
More than 9,000 plants are within construction project area (DOT TIP: B-2119); 356 plants are expected to be impacted by construction activites in 1995; however, 9,000 plants are to be protected on-site in a 25 acre area (Wells 2006).
2004: Approximately 9,000 plants counted in the late fall or early winter 2004 using line transects; this includes the Bowman Tract and Murrays Mill (Wichmann per. com. Jared Gray 2005).
1995-1996: Over 1000 plants observed by Newberry in 1995-1996. Found on both sides of the creek. Extensive population with many large plants. The density is low making estimates of size difficult (Newberry 1996).
1994: Estimated 100-1000 plants in leaf and flower on 11 May, no counts made; multiple-aged stand; widespread throughout slope; widely scattered throughout area (Savidge 1994).

COSEWIC Status

More Land Y - Yes **More Protection** Y - Yes **TNC involvement**

Protection Comments NCDOT purchased 24.74 acres on May 1, 1996 and an additional 8.61 acres (Bowman Tract) on March 13, 2006 as a permanent conservation site for the species (Herman 2010). Murrays Mill and Bowman Tract (contiguous) are "going through purchase" by NC DOT - property boundaries will be sent to NHP after survey (Wichmann per. com. with Jared Gray on 6 December 2005). Land in or near this area was purchased as mitigation by NC DOT, details unknown (Wichmann 2005). Land purchased by NC DOT around Murrays Mill to be turned over to the Catawba County Historic Preservation Society (1994).

Additional Topics

General Comments The overall threat from invasive species is low on both Tract 1 and 2. The following invasive species were found throughout Murray's Mill Conservation Area: Elaeagnus umbellata, Ligustrum sinense, Lonicera japonica, Albizia julibrissin, Rosa multiflora (NCDOT 2013).

Additonal Topics EO is associated with NC DOT project B-2119. Part of Parent EO 096 having 37,800 plants prior to NCDOT impacts of which 356 plants are to be impacted and 6,000 are to be preserved on-site, as mitigation (HDR personnel 2005). Will be impacted by Bridge replacement (DOT 1994). This bridge project was subject to consultation with USFWS (ASNC log no. 4-2-95-102). The 1995 Biological Opinion (of non-jeopardy) issued by the Service was contingent upon purchase of approximately 29 acres at Murrays Mill for perpetual protection of the species. As of early 2006, NCDOT is working to acquire an additional parcel (the Bowman Tract) which will bring the total to approximately 34 acres in protective ownership (D. Herman, NCDOT, personal communication with C.Wells, USFWS, 8/2006) [C.Wells, 8/2006].

Survey Site Name
Broad River: Dills Creek, unnamed tributary south of Kudzu Rare Plant Site (sub EO of 099).
USFWS Flex Fund Monitoring Site 2 (in part)

Directions

Broad River: Dills Creek, unnamed tributary south of the Kudzu Rare Plant Site on the northeast side of Dills Creek. This is a sub EO of parent EO 099 (Wichmann 2005). 1st major tributary northeast of the Broad River, north of SR 1123 (Wichmann 2005). "take SR 1122 [N], 1.2 miles to [unnamed] road on left before you get to SR 1120 (on the right), old road goes across pature to head of stream, approximately 0.3 mile (see attached map)" (Padgett 2001). 0.2 mile south of SR 1122 at the head of a stream [directions from former subpopulation 2 of EO 010].

Separation Comments

This sub EO was formerly subpopulation 2 of EO 010 but has been separated into a separate sub EO since it is not within the Boundaries of the Kudzu Farm Rare Plant Site and is separated from EO 010 by a cleared field; All sub EOs are located within 2.0 kilometers of one another and are not separated by an area of persistently unsuitable habitat greater than 1.0 kilometer wide (Wichmann 2005). See map for details.

EO Development Details

Separation Distance Used **Separation Distance Type**

Separation Comments

All sub EOs are located within 2.0 Kilometers of one another and are not separated by an area of persistently unsuitable habitat greater than 1.0 kilometer wide (Wichmann 2005). See map for details. Parent EO 178 is approximately 1.5 air kilometers from EO 029, however the occurrences are separated by unsuitable habitat (ridge and town) greater than 1 kilometer wide and are therefore considered independent principal EOs (Wichmann and Franklin 2005).

EO Rank A - Excellent estimated viability **EO Origin Subrank**

EO Rank Date 2016-04-07
EO Rank Comments The rank was changed from A? to A rank to reflect the additional plants found and mapped during recent surveys. Some of the additional areas surveyed on 5 April 2016 occur in planted pines with some mixed hardwoods that allow enough of a suitable habitat for the plant to persist and do reasonably well (Padgett 2016).
EO Rank Specifications Version Used

Description

EO Type
General Description Slopes and stream corridors along the south side of the lake containing north-facing slopes and suitable habitat. The forests is a mixture of planted pines, moxed hardwoods, Dry-Mesic Mixed Hardwoods, and Mesic Mixed Hardwoods. Coves in some locations contain Kalmia latifolia, Rhododenron maximun and R. minus and form marginal Acidic Cove Forest.

EO ID 21645 **Subnational Scientific Name** *Hexastylis naniflora* **Shape_ID** 58421

Survey Date 2016-05-11
Last Observation Date 2016-05-11 **First Observation Date** 1977
EO Data 2016: 537 plants counted by Bloom on May 11, 2016 in monitoring plots in Sub EO 164. Bloom also re-delinated EO 164 and 163 with a revised total acreage of 5.67 acres. The extrapolated estimate of total plants in parent EO is 12,687 plants (Bloom 2016).
2015: 241 plants counted on 19-20 May in 0.24 acres of monitoring plots for sub EO 164. Estimated 5242 total plants covering the entire 5.21 acres (Padgett and Feldman 2015).
2014: Padgett counted 246 plants within monitoring plots on 20 May 2014 and estimated 5340 plants covering 5.21 acres of mapped area (Padgett 2014).
2013: In May 2013, Padgett and Israel counted 240 plants monitoring plots and estimated a total 2350 plants (Padgett 2013).
2012: 204 plants counted in 0.24-acre sample plot. Estimate of 1998 plants for entire population (Padgett 2012).
This is a parent EO of 7 sub EOs: 016, 107, 122, 163, 164, 165, and 166 (Wichmann 2005). See each sub EO for detailed EO data (Wichmann 2005).

Survey Date 2016-05-20

Last Observation Date 2016-05-20 **First Observation Date** 2005-03-30

EO Data 2016: 634 plants counted by Bloom on 20 May 2016 in 0.68 acres of monitoring plots in sub EOs 167 and 170. Bloom re-delinated the entire population (including all subEOs) to a total of 7.24 acres in 2016, with an estimated 6,750 plants in the entire population (Bloom 2016).
2015: 778 plants counted on 19 May 2015 in 0.68 acres of monitoring plots in sub EOs 167, 170, and 176. Estimated 6,400 total plants covering the entire 6.84 acres (Padgett and Feldman 2015).
2014: 797 counted plants within monitoring plots on 20 May 2014 and estimated 8000 plants covering 6.84 acres of mapped area (Padgett 2014).
2013: 780 plants counted from monitoring plots totaling 0.68 acre. Estimated population size for the entire population is 7846 plants (Padgett 2013).
2012: 638 plants counted in 0.68-acre sample plot. Estimate of 6418 plants in entire population. (Padgett 2012). This is a parent EO of 4 sub EOs: 167, 168, 169, and 170. See each sub EO for detailed EO data (Wichmann 2005).

Condition of EO Seedlings and vegetative reproduction evident (Renninger 2005).

Condition Rating

Size of EO 35 individuals counted (Bloom 2016). Failed to find (2012) 42 clumps over 0.39 acres (Renninger 2005).

Landscape Context Powerline right-of-way adjacent to site; invasives have easy access to heartleaf population (Renninger 2005).

EO Rank D - Poor estimated viability **EO Origin Subrank**

EO Rank Date 2016-05-18

EO Rank Comments EO rank is based on EO Rank Specs for this species (Wichmann 2005).

EO Rank Specifications Version Used

Description

EO Type

General Description MESIC MIXED HARDWOOD FOREST (PIEDMONT SUBTYPE) – This community is found on a west-facing slope above a 1st order tributary. The canopy consists of Fagus grandiflora, Carya tomentosa, Quercus rubra, and Liquidambar styraciflua. The shrub layer includes Kalmia latifolia, Ilex opaca, Amelanchier arborea, Rhododendron periclymenoides, Calycanthus floridus, Cornus florida, Rosa multiflora, and Elaeagnus umbellata. The herbaceous layer includes Mitchella repens, Polystichum acrostichoides, Parathelypteris noveboracensis, Arundinaria gigantea, and Hexastylis heterophylla. (Bloom 2016)
Medium quality; Dry-Mesic Oak-Hickory and Mesic Mixed Hardwood; associated species include: Hexastylis arifolia, Carya tomentosa [C. alba], Quercus falcata, Smilax glauca, Visis sp., Oxydendron arboretum; powerline right-of-way adjacent to site; invasives have easy access to heartleaf population (Renninger 2005).

EO Data This suboccurrence is included in the determination of total extrapolated acreage for USFWS Flex Fund Monitoring Site 2, although it was not surveyed.
2016: Bloom re-delinated the population and collected monitoring data in monitoring plots on 20 May 2016 (Bloom). See parent EO 176 for data.
2015: 778 plants counted on 19 May 2015 in 0.68 acres of monitoring plots in sub EOs 167, 170, and 176. Estimated 6,400 total plants covering the entire 6.84 acres (Padgett and Feldman 2015).
2014: Padgett counted 797 plants within monitoring plots for principal EO 176 on 20 May 2014 and estimated 8000 plants covering 6.84 acres of mapped area (Padgett 2014).
2013: Monitoring data is part of monitoring data for principle EO 176 (Padgett 2103).
2012: Padgett counted 367 plants for two permanent monitoring plots on 24 July 2013 (Padgett 2013). Padgett counted 351 plants for two permanent monitoring plots on 21 July 2012 (Padgett).
2005: 3,469 over 5.05 acres, seedlings and vegetative reproduction evident (Renninger 2005).

EO Rank Specifications Version Used

Description

EO Type

General Description Small streamhead and Mesic Mixed Hardwood; site is bisected by a dirt road; Hexa nan plant found on both sides of the road. Associated species found in streamhead area include: Osmunda cinnamomea, Thelypteris noveboracensis, Photinia pyrifolia [Aronia arbutifolia], Rhododendron pariclymenoides, Mitchella repens, Medeola virginiana, Osmunda regalis, Woodwardia areaolata, Chamaelirium luteum, Kalmia latifolia, Quercus alba, Smilax rotundifolia, Ilex Af. montana, Quercus falcata, Cornus florida, Prenanthes sp., Polygonatum biflorum, Euonymus americana, Liquidambar styraciflua, Liriodendron tulipifera (several small), Quercus montana, and Prunus serontina; Associated species found in the Mesic Mixed Hardwood area includes: Vitus rotundifolia, Chamaelirium luteum, Liquidambar styraciflua, Liriodendron tulipifera, Prenanthes sp., Prunus serontina, Mitchella repens, Maianthemum racemosum, Acer rubrum, Quercus phellos, and Vaccinium pallidum (Wichmann and Franklin 2005). Mesic Mixed Hardwood; medium quality; associated species: Quercus alba, Acer rubrum, Pinus serotina, Kalmia latifolia, Carya tomentosa [C. alba], Liriodendron tulipifera, Ilex opaca, Oxydendron arboretum, Polystichum acrostichoides, Tipularia discolor, Lonicera sempervirens (Renninger, 2005).

COSEWIC Status

More Land Y - Yes **More Protection** Y - Yes **TNC involvement**

Protection Comments EO is not located within a Registered/Dedicated Heritage Area, nor managed area (Wichmann 2005). Only Hexa nan population in the Yadkin River Basin; Small stream heads in this area need protection, conversion to peach orchards, ponds, etc. is a threat (Padgett 2005). Streamhead community with Hexa nan is uncommon (Wichmann 2005).

Separation Distance Used 2 Kilometers **Separation Distance Type** Suitable Habitat

Separation Comments

This sub EO is located very near EO 164, but the two are separated by US 221 and are therefore treated as two Sub EOs for data organization; All sub EOs are located within 2.0 Kilometers of one another and are not separated by an area of persistently unsuitable habitat greater than 1.0 kilometer wide (Wichmann 2005). See map for details.

Last Observation Date 2016-05-11 **First Observation Date** 2005-03-31

EO Data 2016: 537 plants counted by Sean Bloom in monitoring plots on 11 May 2016. (Bloom 2016).
2015: This suboccurrence is included in the determination of total extrapolated acreage for USFWS Flex Fund Monitoring Site 9, although it was not surveyed. 241 plants counted on 19-20 May in 0.24 acres of monitoring plots for sub EOs 016, 107, 163, 164, 165, and 166. Estimated 2360 total plants covering the entire 5.21 acres (Padgett and Feldman 2015).
2013: 2012 and 2013 data is part of the status survey monitoring data for Principle EO 177 (Padgett 2013). Padgett and Israel observed 240 plants in a permanent monitoring plot on 7 May 2013 (Padgett 2013).
2012: Padgett counted 204 plants for permant monitoring plot in July 2012 (Padgett 2012).
2005: 657 clumps over 0.6 acres in leaf and flower, seedling and vegetative reproduction evident (Renninger 2005).

Description

EO Type

Element Occurrence Report

EO ID 21395 **Subnational Scientific Name** *Hexastylis naniflora* **Shape_ID** 57136

General Description Mesic Mixed Hardwood Forest (Piedmont Subtype) – The slope has a canopy consisting of Liriodendron tulipifera, Quercus montana, Liquidambar styraciflua, and Quercus rubra. Other canopy trees include Prunus serotina and Sassafras albidum. The sub-canopy includes Cornus florida, Nyssa sylvatica, and Ilex opaca. The shrub layer is open but includes Kalmia latifolia, Rhododendron periclymenoides, and saplings of canopy trees. The herbaceous layer was sparse but included Uvularia sp., Mitchella repens, Polystichum acrostichoides, Parathelypteris noveboracensis, Chamaelirium luteum, and Tipularia discolor. (Bloom 2016)
LOW ELEVATION SEEP (TYPIC SUBTYPE) – Found between toe of slope and the tributary. Canopy is primarily Acer rubrum and Liquidambar styraciflua, but includes some Oxydendrum arboreum. The shrub layer includes Calycanthus floridus, Viburnum nudum var. nudum, Ilex montana, Aronia arbutifolia, and Vaccinium corymbosum. The herbaceous layer is dominated by Parathelypteris noveboracensis but also included Osmundastrum cinnamomeum, Osmunda spectabilis, and Lorinseria areolata. Other herbaceous plants that were less prevalent include Arisaema triphyllum and Mitchella repens. (Bloom 2016)
Mesic Mixed Harwood grading into Dry-Mesic Oak-Hickory; medium quality. Adjacent areas extensively logged and/or thinned. Associated species: Quercus alba, Pinus serotina, Liriodendron tulipifera, Ilex opaca, Quercus montana, Carya tomentosa [C. alba], Kalmia latifolia, Ligustrum sinense, Polystichum acrostichoides, Tipularia discolor, Lonicera japonica, and Smilax sp. (Renninger 2005).

EO Data This suboccurrence is included in the determination of total extrapolated acreage for USFWS Flex Fund Monitoring Site 2, although it was not surveyed.
2016: This sub occurrence was re-delineated on 11 May 2016 and is 2.38 acres (Bloom 2016).
2015: 241 plants counted on 19-20 May in 0.24 acres of monitoring plots for sub EOs 016, 107, 163, 164, 165, and 166. Estimated 2360 total plants covering the entire 2.35 acres (Padgett and Feldman 2015). This suboccurrence is included in the determination of total extrapolated acreage for USFWS Flex Fund Monitoring Site 9, although it was not surveyed.
2005: 657 clumps over 0.83 acres, in leaf and flower, seedlings and vegetative reproduction evident, only a few plants left in clearcut, majority in wetland (Renninger 2005).

Description

EO Type

General Description LOW ELEVATION SEEP (PIEDMONT/MOUNTAIN SPRINGHEAD SUBTYPE – Canopy is primarily Acer rubrum and includes Liriodendron tulipifera, Nyssa sylvatica, and less so Fraxinus pennsylvanica. The sub canopy is primarily Oxydendrum arboretum, Ilex opaca, and Nyssa sylvatica. The shrub layer is predominately Viburnum nudum var. nudum, Amelanchier arborea, Alnus serrulata, Vaccinium corymbosum, and Itea virginica. Much of the shrub layer is bound up with Smilax laurifolia and less often Smilax rotundifolia. The herbaceous layer is dominated by Parathelypteris noveboracensis but also included Arundinaria gigantea, Osmundastrum cinnamomeum, Osmunda spectabilis, and Lorinseria areolata. Other herbaceous plants that were less prevalent include Arisaema triphyllum, Medeola virginiana, and Mitchella repens. (Bloom 2016)
Wetland/streambank and clearcut; no associated NCHP natural community, medium quality; Associated species in wetland/streambank include: Acer rubrum, Liriodendron tulipifera, Ilex opaca, Ligustrum sinense, Smilax laurifolia, oxydendron arboretum, and Arundinaria gigantea; Associated species in clearcut include: Acer rubrum, Carya tomentosa, and Andropogon virginicus (Renninger 2005).

EO Rank Comments EO rank is based on EO Rank Specs for this species (Wichmann 2005).

EO Rank Specifications Version Used

Description

EO Type

General Description North facing slope...primarily of Mesic Mixed Hardwood Forest...Vegetation includes chestnut oak (Q. prinus), white oak, sourwood, mockernut hickory, red oak, strawberry bush, bellwort (Uvularia sessilifolia), blueberry, sassafras (Sassafras albidum), Solomon's seal (Polygonatum spp.), and smilax...It is possible that Hexastylis (particularly H. naniflora) habitat improves on the north side of SR 1473 as the slope is lower and closer to Miller Branch. However, extensive kudzu (Pueraria spp.) is growing along the road and continues down the slope; no Hexastylis plants were observed. Should the invasive species cross the road, it would be a serious threat to this population (HDR 2005).

Description

EO Type
General Description North-facing slope. "Vegetation along these slopes is representative of a Mesic Mixed Hardwood Forest, and is situated adjacent to a residence and Micol Creek. At this site, vegetation transitions from a mixed pine hardwood forest to pine forest as the slope turns to the west. The mixed hardwood forest includes a canopy containing mockernut hickory (Carya tomentosa), yellow poplar (Liriodendron tulipifera), northern red oak (Quercus rubra), and white pine (Pinus strobus). Rhododendron (Rhododendron sp.), mountain laurel (Kalmia latifolia), and sourwood (Oxydendrum arboreum) are prevalent at this site. In addition, an herb and vine layer is present including galax (Galax urceolata), partridge berry (Mitchella repens), and
smilax (Smilax sp.)" (Ref. U05HDR01NCUS).

EO Data 2016: 123 plants counted on 24 May 2016 in the entire 0.09 acre re-mapped (Bloom 2016).
2015: 188 plants counted on 14 April 2015 in the entire 0.2 acres mapped (Padgett 2015).
2014: Padgett counted a total of 183 plants in the summer of 2014 (Padgett 2014).
2013: Padgett counted 204 total plants on 16 July 2013 (Padgett 2013).
2012: 556 plants counted on 17 December (NCDOT 2012).
2012: This site was remapped in June of 2012 by James Padgett and Laura Gadd (NHP); James Padgett counted 256 plants on 19 June 2012. The site was timbered (clear cut) early spring of 2012.
2010: 535 total plants counted on 1 December 2010; 312 on the east side of the road and 223 on the west side (Hermann 2010).
2005: -- 334 Hexastylis plants were directly counted on this site; 325 on the east side of SR 1115 and 9 on the west side; plant density calculates to 1392 plants per acre (HDR 2005).
2003: 357 plants counted in 2003 by Tim Bassette, 189 on the west side and 357 on the east side (Hermann 2010).
2001: Approximately 546 plants in two areas: 357 counted over 0.41 ac along the east side of Camp Creek Road; 189 counted over 0.19 ac. along the west side of the road; 7 May 2001(Bassette 2003).

EO Rank D - Poor estimated viability **EO Origin Subrank**

EO Rank Date 2016-05-24

EO Rank Comments This EO rank was downgraded from a C rank due to the overall quality of the site (Padgett 2012). -- EO rank is based on EO Rank Specs for this species (Wichmann 2005).

EO Rank Specifications Version Used

Description

EO Type

General Description This site was clear cut in early spring of 2012 (Padgett 2012). -- "The site consists primarily of Mesic Mixed Hardwood Forest...the population found on the east side of SR 1125 is in a more evevated area dominated by white pine and mixed hardwoods...vegetation within this area includes sourwood, American holly (Ilex opaca), red maple (Acer rubrum), white oak (Q. alba), Virginia pine (P. virginiana), white pine, and mountain laurel. The herbaceouse and vine layer include blueberry (Vaccinium spp.), smilax, and grape vine (Vitis spp.).The west side of SR 1115 is lower...Vegetation includes more hardwoods and fewer pines that the east side of hte road. Red oak, American holly, white oak, mountain larurel, red maple, stawberry bush (Euounymus americanus), dogwood (Cornus florida), cranefly orchid (Tipularia discolor), and pipsissiwa (Chimaphila maculata) are common plants. This site is closer to Camp Creek and is moister than that on the east side of the road. Immediately adjacent to this site is an area that have been recently timbered. Portions of this site that are not included in the NCDOT ROW could be threatened by additional timbering activities (HDR 2005).

Additional Topics

General Comments

Additonal Topics NCDOT is responsible for monitoring this population per our agreement with USFWS as stated in the Lovelady Road BO. Much of this population, which includes the east and west side of SR 1115, is outside of the ROW (Hermann 2010). "This non-TIP NCDOT Division 12 road construction project.. may affect all of or portions of [EO 158]...Per a September 22, 2002 conversation with Trish Simon, NC Division 12 Environmentsal Officer, the project is estimated to directly impact approximately 20-30 DFHL plants. Project construction has also been delayed for at least a couple of years" (Bassette 2003).

Survey Date 2016-05-18

Last Observation Date 2016-05-18 **First Observation Date** 2005-03-24

EO Data 2016: 288 plants counted by Bloom on 18 May 2016 in 0.53 acre monitoring plot. Estimated 2,576 plants over entire 4.74 remapped acres in 2016 (Bloom 2106).
2015: 348 plants counted on 26 May 2015 in 0.53 acres of monitoring plots. Estimated 5,273 total plants covering the entire 8.03 acres (Padgett 2015).
2014: Padgett counted 324 plants within monitoring plots on 28 May 2014 and estimated 4,909 plants covering 8.03 acres of mapped area (Padgett 2014).
2013: Padgett and Israel counted 353 plants in permanent monitoring plots on 18 July 2013, and estimated the entire population to be 5348 plants covering an area of 8.03 acres (Padgett 2013).
2012: Site revisited in June 2012 by James Padgett and remapped. The site was revisited by James Padgett, Kimberly Israel, and Bryan Tompkins (USFWS) on 16 July, 2012. A permanent plot was installed and plants were counted with an extrapolated estimate of 4773 plants found to occurr on the site (Padgett 2012).
2006: Entire area estimated to contain over 2,500 rosettes in 2006, 160 of which were relocated (on-site) to areas not expected to be impacted from construction. Approximately 12 acres and at least 2,340 plants are to be permanently protected via a deed restriction or conservation easement [C. Wells, USFWS files and S&ME Biological Assessment.]
2005: Number unknown, "along stream corridors throughout the site" on 24 March 2005 (C. McRae and L. Beckstrom 2005).

Last Observation Date 2016-05-13 **First Observation Date** 1994

EO Data 2016: 973 plants counted by Bloom on 13 May 2016. Estimated 12,235 plants covering the entire 5.03 re-mapped acres (Bloom 2016).
2015: 978 plants counted by Padgett on 29 May 2015 in 0.4 acres of monitoring plots. Estimated 9,707 total plants covering the entire 3.97 acres (Padgett 2015).
2014: Padgett counted 967 plants within monitoring plots on 19 May 2014 and estimated 9,597 plants covering 3.97 acres of mapped area (Padgett 2014).
2013: Padgett and Israel visited monitoring plot and counted 983 plants in permanent plot on 07 July 2013 and estimated the total population size to be approximately 9756 plants (Padgett 2013).
2012: This site was visited and remapped in June of 2012 by James Padgett and Laura Gadd (NHP). The site was visited again in July and a permanent plot was placed in and 950 plants counted with a population estimate of 9429 plants was made by Padgett and Israel on 17 July 2012 (Padgett 2012).
2005: Pagdett estimated 1,500 plants (Padgett et. al 2005).
1994: Raynor noted that it occurs in abundance in 1994 (Rayner 1994).

Description

EO Type

General Description LOW ELEVATION SEEP (PIEDMONT/MOUNTAIN SPRINGHEAD SUBTYPE – Canopy is primarily Liriodendron tulipifera, but also includes Pinus echinata, Quercus alba, Liquidambar styraciflua, and Acer rubrum. The sub canopy is primarily Acer rubrum and Nyssa sylvatica. The shrub layer is predominately Ilex opaca, Kalmia latifolia, Viburnum nudum var. nudum, and Calycanthus floridus. Other shrubs found throughout are Amelanchier arborea, Vaccinium corymbosum, Rhododendron periclymenoides, Xanthorhiza simplicissima, and Itea virginica. Along the drier edges of the seep are individuals of Asimina triloba. Much of the shrub layer is bound up with Smilax laurifolia and less often with Smilax rotundifolia, Muscadinia rotundifolia, and Parthenocissus quinquefolia. The herbaceous layer is dominated by Parathelypteris noveboracensis, Osmundastrum cinnamomeum, Osmunda spectabilis, but also includes Polystichum acrostichoides, Viola primulifolia, Viola sororia, Arundinaria gigantea Lorinseria areolate, Arisaema triphyllum, Sagittaria latifolia, Medeola virginiana, Mitchella repens, and Microstegium vimineum. (Bloom 2016)
Boggy seep in low woods along stream with Thelypteris noveboracensis, Ilex opaca, Liquidambar styraciflua, Calycanthus floridus, Xanthorhiza simplicissima, Itea virginica, Euonumus americana, Medeola virginiana, Rhododendron pariclymenoides, Smilax rotundifolia, Quercus alba, Lirodendron tulipifera, Viburnum nudum, Arundinaria sp., Kalmia carolina, Osmunda cinnamomea, and Aronia arbutifolia (Franklin et al. 2005). Springhead swamp (Rayner 1994).

Additional Topics

General Comments The area around the monitoring plot is an intact and high quality natural community. However, impacts at the eastern end of the EO are causing some habitat degradation. The shrub layer is becoming heavily invaded by Ligustrum sinense and the herbaceous layer is quickly getting invaded by Microstegium vimineum. Additionaly a cleared hunting lane at the eastern end of the occurrence is of low severity and scope and of high immediacy (Bloom 2016).

Additonal Topics Threats observed: Invasive species (Ligustrum sinense and Microstegium vimineum) found at the eastern end of the EO and introduced by an old road cut. A cleared hunting lane also is a low threat to the population (Bloom 2016).

EO Data This suboccurrence is included in the determination of total extrapolated acreage for USFWS Flex Fund Monitoring Site 2, although it was not surveyed.
2015: 241 plants counted on 19-20 May in 0.24 acres of monitoring plots for sub EOs 016, 107, 163, 164, 165, and 166. Estimated 2360 total plants covering the entire 2.35 acres (Padgett and Feldman 2015).
2012: Wagner et. al. counted over 100 plants on 15 March 2012. (Wagner 2012).
2008: 239 plants counted by NCDOT in 2008 (NCDOT 2009, Fontaine 2009).
2005: Combined with sub EO 122, there were 554 clumps observed and counted in April 2005 by H W Lochner and Padgett (Padgett 2007).
2003: Approximately 250 clumps occurring over approximately 1 acre [includes EO 122] (Renninger 2003).

Survey Site

Survey Site Name
Broad River: New Bethel Plant Site (sub of 247).
Tate Conservation Easement Transplant site
NCDOT TIP: 2233 A and B

Directions

Broad River: Floyds Creek near Harris, unnamed tributary just east of US 221 and just north of the Clinchfield Railroad. This is a sub EO of Parent EO 247 (Wichmann 2005). Two sub-occurrences ([A] and [B]): [A], ravine just northeast of US 221, approximately 0.2 mile north of the Clinchfield Railroad (Wichmann 2005); "I-74 to US 221 south; travel south just past Jayne's Road, plants are in low area to east of 221" (Renniger 2005). [B], "Along and unamed tributary to Floydes Creek;approximately 2000' south of US 221 intersection with SR 1111; east of US 221 along creek to Railroad tracks; use Jayne's Rd (no SR) for access" (Renninger 2003). [Note: Transplant plots (EO 286) source feature currently overlaps area of native plants (EO 106). M. Buchanan (pers. comm. with S. Mason, 10 March 2009) advised to leave mapping this way because the native population may be patchy and the polygon provided by Padgett (2007) may not account for this and encompass the entire extent of the occurrence.]

Survey Date 2015-04-23

Last Observation Date 2015-04-23 **First Observation Date** 2003-05-15

EO Data 2015: 4547 plants counted on 23 April (NCDOT 2015).
2013: 1675 plants counted on 16 April (NCDOT 2013).
2012: Wagner et. al. observed over 3000 plants on 15 March 2012 (Wagner 2012).
2011: 3088 plants countedon 15 April (NCDOT 2011).
2010: 93 plants moved from the area to be impacted by the road project to the transplant area on this site on 27 January 2010 by NCDOT biologists (Fontaine 2010 - docmentation with EO 286). NCDOT staff propose to transplant 330 individuals that occur within the construction footprint to the Tate Conservation Easment during the winter of 2009-2010 (NCDOT 2009) [Relocated plants are tracked under EO 286].
2008: NCDOT staff, including Fontaine, observed at total of 2,326 plants at this site in 2008: 2104 plants were observed on both sides of the unnamed tributary of Floyd's Creek between the Chinchfield railroad tracks and Jaynes Road (SR-2287) on 22 April 2008: 222 plants (some in flower) were observed on 28 February 2008 along the ephemeral stream perpendicular to US-221 that feeds into the unnamed tributary (Fontaine 2008). Additional plant found along a small cove area between the original known localities along the unnammed tributary [sub occurance B] and the small clump of plants found along the highway (US 221) [sub occurance A]. Estimated 50-75 additional plants. This occurance was re-mapped to reflect this additional find (Padgett 2008).
2005: 641 clumps observed and counted on 20 April 2005 by H W Lochner and Padgett (Padgett 2007). Estimated between 200-500 plants seen (Padgett 2005).
2003: Sub-occurrence [A], 8 clumps, 4 seedlings over 0.02 acres; vegetative reporduction evident (Renninger 2003). Sub-occurrence [B], Approximately 250 individual clumps, in leaf and flower, seedlings and clonal/vegetative reproduction evident; flowers mostly disintegrated (Renninger 2003).

Monitoring Needs Comments Conservation Management Plan prepared by NCDOT includes monitoring and reporting 1-year, 3-year, and 5-year post-transplant (NCDOT 2009).

Research Needs Comments

EO Rank

EO Rank Factor Survey Data

Condition of EO Few invasives present (Fontaine 2009). Seedlings and clonal/vegetative reproduction evident; flowers mostly disintegrated (Renninger 2003).

Condition Rating

Size of EO 3000+ plants (2012). 2326 plants (2008). 641 clumps observed and counted on 20 April 2005 by H W Lochner and Padgett (Padgett 2007). About 250 (Renninger 2003).

Landscape Context Medium to high quality forest (Renninger) over more than 3 acres (Wichmann 2005).

EO Rank A - Excellent estimated viability **EO Origin Subrank**

EO Rank Date 2008-04-22

Element Occurrence Report

EO ID 20301 **Subnational Scientific Name** *Hexastylis naniflora* **Shape_ID** 48407

EO Rank Comments Changed to A, according to rank specs (2008). Moved back up from C to B once quantitative data was added (Padgett 2007). Downgraded from a B to a to C using current EO data and following current EO rank specs for this species (Wichmann 2005).

EO Rank Specifications Version Used

Description

EO Type

General Description Sub-occurrence [A], Dry-mesic Oak Hickory; high quality; Associated species: Quercus alba, Quercus rubra, Quercus coccinea, Quercus velutina, Carya tomentosa [C. alba], Pinus echinata, Oxydendron arboretum, Euonymus americana, Cornus florida, Liriodendron tulipifera, Lonicera sempervirens, Carex sp (Renninger 20005). Sub-occurrence [B], Mesic Mixed Forest grading into Basic Mesic Forest, medium to high quality, Pacolet soils; Associated species: red oak, white oak, strawberry bush, carpinus, sourwood; alluvial and lower to upper slope; Micro-relief: flat, concave, convex, and drop-off; moist to dry; filtered light (Renninger 2003).

Protection Comments Landowner along northeastern part of EO unwilling to enter into a conservation easement agreement with NCDOT (Bassette 2009). This population is expected to be protected with a conservation easement held by NC DOT as mitigation for impacts related to the widening of NC 221. The Tate family will retain ownership of the land (DOT 2009).

Additional Topics

General Comments NCDOT proposes to use this site as a repository for approximately 333 Hexastylis naniflora plants that will be displaced by the US 221 road widening project. These plants may come from EOs 076, 107, 113, 114,122, 172, 173, 174, and 175 (DOT 2009). 0.293 acres and 50 plants anticipated to be directly affected and 0.475 acres and 255 plants indirectly affected by this project (Fontaine 2009 - see Biological Assessment).

Additonal Topics The two sub occurences have been remapped and combined after additional plants were found between them (Padgett 2008). Sub-occurrence [A], "Along proposed US 221 widening corridor (NCDOT TIP# R2233A)" (Renninger 2005). Impacts associated with US 211 widening (R-2233A&B) to be determined" (HDR personnel 2005). Sub-occurrence [B], May be inpacted by US 221 widening (Renninger 2003). "impacts associated with US 211 widening (R-2233A&B) to be determined" (HDR personnel 2005).

Survey Date 2015-05-19

Last Observation Date 2015-05-19 **First Observation Date** 1981

EO Data 2016: Bloom counted 2552 plants on May 25 and June 15, 2016 in 2.29 acres of monitoring plots in sub EOs
2015: 3011 plants counted on 19 May 2015 in 2.29 acres of monitoring plots in sub EOs 37, 55, and 76. Estimated 32,000 total plants covering the entire 24.61 acres (Padgett and Feldman 2015).
2014: Padgett counted 3094 plants within monitoring plots on 19 and 20 May 2014 and estimated 33,300 plants covering 24.61 acres of mapped area (Padgett 2014).
2013: Padgett counted 3302 plants counted within monitoring plots May and on 17 July 2013 for estimated total of 35,000+ plants over 24.61 acres (Padgett 2013).
2012: 2551 plants counted in plots encompassing 2.29 total acres: sub-EOs 10, 37, 55, 75, 76, 79, 90, 121, and 181. Estimate of 27,415 plants over the 24.61-acre population area for those sub-EOs. (Padgett 2012).
This is parent EO that includes sub 17 EOs: 09, 10, 37, 52, 53, 55, 61, 62, 63, 75, 76, 79, 90, 121,172, 181, and 182 (Wichmann 2005). See sub EO records for detailed EO data.

Additional Topics

General Comments Relocation of plants from this occurrence occurred to permit expansion at the quary. At the request of Martin Marietta, negotiations were held with USFWS regarding the potential for transplanting the population. This action was approved verbally by USFWS on 23 May 2011 (HARP 2011).

EO Rank Date 2003-03-13
EO Rank Comments EO rank is based on EO Rank Specs for this species (Wichmann 2005).

EO Rank Specifications Version Used

Description

EO Type
General Description This site has been described as a Mixed Hardwood community along the mid-slope of the topographic position. The population also exists along a moist to dry moisture regime in a moderately filtered light intensity. Associated species found at survey site include: Quercus spp., Acer rubrum, Polystichum acrostichoides, Lonicera japonica, Smilax glauca and Pinus virginiana (Padgett 2003).

Additional Inventory Needed Comments

Population is questionable as it's flower size and plant morphology favor H. heterophylla rather than H. naniflora; site should be revisited to confirm as NC-DOT is planning bridge replacment here soon (Padgett 2005). Inventory should be contucted after bridge replacement to assess impacts (Wichmann 2005).

Pete Stafford, RKK (environmental consulting firm)

Survey Date 2013-05-15

Last Observation Date 2013-05-15 **First Observation Date** 2000-04-12

EO Data 2013: 617 plants counted on 15 May (NCDOT 2013).
2013-2012: Plants present in 2013 and 2012 at locations A, B, and C as indicated on map provided by NCDOT but made by Stafford; no quantitative data on the number of plants was included (NCDOT 2014).
2011: 731 plants counted on 3 November 2011 by NCDOT
2007: 128 clusters observed by NCDOT in 2007 (NCDOT 2009).
2006: 334 plants are within construction project area (TIP: B-3126); 184 plants are expected to be impacted by construction activites in 2006; 160 plants are to be protected on-site in an area where the acreage needs to be verified (Wells 2006).
2005: 353 individual plants counted by NCDOT staff in April 2005 (HDR and HARP personnel 2005). Site visited with NC-DOT and saw roughly 50-75 plants. The timing was a bit early and the population is questionable as it's flower size and plant morphology favor H. heterophylla rather than H. naniflora. Site should be revisited to confirm as NC-DOT is planning bridge replacment here soon (Padgett 2005).
2003: NCDOT construction impacts expected according to Bassette in 2003 (Bassette 2003).
2000: 50 individual plants, stems and leaves over approximately 0.4 acres observed by Beauregard on 12 April 2000 (Beauregard 2000).

Contacts

Contact ID	Individual Name	Institution Name	EO Contact Note

Monitoring Needs Comments NCDOT has committed to permanent protection and monitoring of at least 160 plants anticipated to remain (after construction) within the currently owned or expanded (through additional purchase) ROW (2006 Ammendment to the 2003 Biological Assessment, on file with USFWS Asheville Office) [C. Wells, 8/2006]. Site was subject to consultation with USFWS (worst-case scenario assumed, in that all Hexastylis plants were H. naniflora). If impacts exceed those anticipated in the 2006 Ammended Biological Opinion issued by FWS, consultation should be re-initiated (ASNC log no. 4-2-03-415, on file with USFWS Asheville Office) [C. Wells, 8/2006].

Research Needs Comments Future surveys should be conducted to assess extent of impacts due to NCDOT's bridge construction. [NCDOT committed to monitoring of this population in their 2006 Ammended Biological Assessment; C. Wells, 8/2006]

Description

EO Type

Element Occurrence Report

EO ID 20238 **Subnational Scientific Name** *Hexastylis naniflora* **Shape_ID** 48159

General Description Mesic Oak-Hickory Forest; medium quality. Forest cover types are fairly similar amongst the three subpopulations. The canopy is dominated by Quercus alba, Q. rubra, Carya glabra, Acer rubrum, Prunus serotina, Liriodendron tulipifera, and Pinus strobus. The understory consists of Carpinus caroliniana, Oxydendrum arboretum, Acer rubrum, Cornus florida, Ilex opaca. The shrub layer includes Kalmia latifolia, Leucothoe axillaris var. editorium, and Euonymus americanus. Woody vines included Bignonia capreolata, Vitis rotundifolia, and Toxicodendron radicans. The herb layer is sparse to moderately dense and includes Hexastylis naniflora, Goodyera pubescens, Aplectrum hyemale, Mitchella repens, Chimaphila maculata, Polystichum acrostichoides, Tiarella sp., and Desmodium nudiflorum (NCDOT 2011). A pasture runs along the north and south banks of creek and a side tributary along road; pasture south of creek recently logged, thick brush, grades into a more mature forest, plants occur under thick brush; pasture north of Creek thick with Ilex opaca and lacking other understory shrubs due to grazing, plants occur in areas safe from cattle, tree bases and along tributary. This population occurs with the following associated species: Betula nigra, Quercus alba, Prunus serotina, Carya glabra, Acer rubrum, Carpinus caroliniana, Leucothoe axillaris var. editorium, Vitis rotundifolia and Mitchella repens (Padgett 2005). Piedmont/Low Mountain Alluvial Forests with Betula nigra, Quercus alba, Prunus serotina, Carya glabra, Acer rubrum, Carpinus caroliniana, Leucothoe axillaris var editorium, Vitis rotundifola, Mitchella repens, Tiarella sp. (Beauregard 2000).

Additional Topics

General Comments Invasive species noted & degree of threat from invasive species: Lonicera japonica is prevalent in subpop A. Some Ligustrum sinense is present in subpopulation A. (NCDOT 2011).

Additonal Topics "B-3126 (EO 77) in Caldwell County was recently inventoried by NCDOT staff due to changes in project alignment. A total of 353 individual plants were counted in April 2005 and proposed project impacts have not yet been determined" (HDR personnel 2005). "B-3126...construction impacts to DFHL are expected if the bridge is replaced on a new alignment to the west of the existing bridge. Consequently, a Biological Conclusion of May Effect is likely to Adversely Affect was rendered for this project. The October 2001 review of the proposed project revealed no changes in land use. Furthermore, indirect or cumulative impacts to DFHL as a result of other development were not observed (Bassette 2003).

Survey Date 2010-12-21

Last Observation Date 2010-12-21 **First Observation Date** 1995-05-04

EO Data 2010: 1202 total plants counted on 20 and 21 December 2010: 423 plants counted at the 15th avenue site, 522 plants at the 1.54 acres SW1 site, and 25 plants at the 0.05 acre NW site on 20 December. 232 plants counted on 21 December at the 0.37 acre SW2 site (M. Haney 2015).
2001: A total of 10,700 plants were located in the construction project area (DOT TIP: U-2307C) in 2001; 5,400 were expected to be impacted by improvement activities. Verification of the current situation is needed, including the number of plants protected on-site (Wells 2006).
2005: NCDOT construction nearby, impacts needs to be determined (HDR personnel 2005).
2003: Small fragments of the original population on a steep hill near [NCDOT] project and along project's right-of-way limits, these fragments are unlikely to be impacted from future development due to their loction (Bassette 2003).
2001: A large number of plants seen when visited in 2001 (Padgett 2001).
1996: Over 1000 plants (Savidge 1996).

EO Rank Comments EO rank is based on EO Rank Specs for this species and available EO data (Wichmann 2005).

EO Rank Specifications Version Used

Description

EO Type

General Description SW1, SW2, and NW sites consists of medium quality Mesic Mixed Hardwood Forest (Piedmont subtype). Associated species include Platanus occidentalis, Quercus rubra, Quercus falcata, Quercus coccinea, Liriodendron tulipifera, Liquidambar styraciflua, Acer rubrum, Botrychium virginianum, Tipularia discolor, Asplenium platyneuron, Polystichum acrostichoides, Oxydendrum arboretum, Carya tomentosa, Prunus serotina, Pinus strobus, Pinus virginiana, Smilax sp., Cornus florida, Toxicodendron radicans, Nyssa sylvatica, Fagus grandifolia, Rubus sp., Quercus alba, Euonymus americanus, Quercus stellata, Vitis rotundifolia, Arundinaria gigantean, Juniperus virginiana, Lycopodium digitatum, Chimaphila maculata and Ilex opaca (Haney 2015).
 15th Ave site consists of medium quality Mesic Mixed Hardwood Forest (Piedmont subtype) which includes Kalmia latifolia, Fagus grandifolia, Cornus florida, Quercus rubra, Juniperus virginiana, Carpinus caroliniana, Carya tomentosa, Ilex opaca, Oxydendrum arboreum, Polystichum acrostichoides, Asplenium platyneuron, Quercus alba, Pinus virginiana, Tipularia discolor, Smilax sp., Euonymus americanus, Liquidambar styraciflua, Liriodendron tulipifera, Quercus coccinea, Acer rubrum, Quercus falcata, Nyssa sylvatica, Prunus serotina, Chimaphila maculata, Goodyera pubescens and Pinus strobus (Haney 2015). Steep hill and along right-of-way (Bassette 2003).

Additional Topics

General Comments Medium threat noted from Lonicera japonica at SW2. Moderately low risk from Lonicera japonica and Ligustrum sinense at SW1 and NW sites. Low degree of threat from Rosa multiflora, Ligustrum sinense, and Lonicera japonica at the 15th avenue site. (Haney 2015)

Additonal Topics "U-2307 ([Principal] EO 173 [sub EO 31]) was expected to have significant impacts on a large population of H. naniflora in Catawba County. It was expected that a population of 10,700 plants would be lessened by 5,400 as a direct result of the realignment of multi-lane road. Project construction is ongoing and records for this population are insufficient for field verification at this time. While this population loss was mitigated by the purchase of 25 acres at Murray's Mill, it is recommended that a follow-up survey is conducted at the project location to determine actual impacts after construction is completed" (HDR personnel, 2005). "U-2307C... was completed in December 1997...permits authorized impacts to the entire DFHL [Hexastlyis naniflora] population. The project affected all or portions of...[EO] 031...Upon reviewing the site, it was determined that the project's...population was not completly destroyed. Part of the...population situated outside of the project's righ-of-way has now been impacted by apparent clearing activities. Small fragments of the original DFHLpopulation currently exist ib a steep hill near the project as well as along the project's right-of-way limits. These small fragments are unlikely to be impacted from future development due to their locations (Bassette 2003).

Survey Date 2009-06

Last Observation Date 2009-06 **First Observation Date** 1981-05

EO Data 2009: Plants observed by Jones in January, April, and June 2009; no count made (Jones 2009).
2001: Large number of plants seen along steep slopes in April 2001 (Padgett pers. comm to Wichmann 2005).
2000: 177 plants total: 87 plants within project corridor and 90 plants outside of project corridor on 30 October 2000 (Bassette 2003).
1995: Newberry observed 20 plants in 1995 but noted that heavy tree fall had made the area hard to survey [east part of Newberry's occurrence overlaps EO 237] (Newberry 1996).
1981: Nearly 200 clumps total along steep slopes for this EO and EO 237; plants doing best around canopy openings; many seedlings seen, especially in light gaps (Gaddy 1981).

EO Data 2012: 748 plants were counted at population CC and 44 plants were counted at population DD on 28 March by NCDOT biologists (Bassette).
2011: The smallest sub-population right along the creek was visited in May 2011 by Padgett, with no plants being located at this site which had previously had 5-10 plants (Padgett 2015).
2008: 538 plants total observed at sites 2 (CC) and 3 (DD) by NCDOT biologists in April 2008 (Bassette 2009).
2003: 667 observed plants over 1.6 acres (HDR 2003). 707 plants observed [estimated] by NC DOT (Bassette 2003).
2001: Subpop 1: Fewer than 200 clumps observed in a 600 by 600 foot area, with buds on 4 February (Padgett 2001); Subpop 2: Estimate of 200 plants in bud on 6 March in Dry-Mesic Hardwood Forest (Oakley 2001).

Monitoring Needs Comments

Research Needs Comments

EO Rank

EO Rank Factor Survey Data

Condition of EO Population CC appears to be in excellent condition. Plant counts here have increased since the 2008-2009 surveys. Many robust rosettes are present at this location. The amount of downed debris in the mid slope portion of this population may have masked
plants resulting in a conservative talley (Bassette 2015). Plants seen in flower along the confluence of Sandy Run Creek and Broad River in 2002 and 2003 (Padgett 2003). With buds on 4 February (Padgett 2001).

Condition Rating

Size of EO 538 plants at two sites (2008). 707 plants observed by NC DOT (Bassette 2003).Subpop 3: Estimated around 300 plants (Padgett 2001). Subpop 1: Fewer than 200 clumps (Padgett 2001); Subpop 2: Estimate of 200 (Oakley 2001).

Landscape Context

EO Rank A - Excellent estimated viability **EO Origin Subrank**

Survey Site Name
Broad River: Dills Creek, Kudzu Rare Plant Site (This is a sub EO of 099).
Kudzu Cow Farm (per Gaddy, 1981; in part)
USFWS Flex Fund Monitoring Site 2 (in part)

Directions

Broad River: Dills Creek, Kudzu Farm Rare Plant Site: This is a sub EO of parent EO 099 (Wichmann 2005). In three suboccurrences: Suboccurrence A: SR 1122, about 0.8 road mile west of its intersection with SR 1111, along ravine draining into a tributary of Dills Creek; Suboccurrence B (former Subpopulation 1): Creekhead [east of triburary to Dills Creek], [located] approx 0.2 [air] mile south[southeast] of SR 1122, where road [SR 1112] crosses a small stream [tributary of Dills Creek], plants were found growing on banks of an eroded creek, hanging off the steep banks; Suboccurrence C: Ravine west of tributary to Dills Creek, located about 0.2 air mile southwest of SR 1122, from where SR 1112 cross a small tributary of Dills Creek (Wichmann 2005).

Kimberly Israel, NHP

Survey Date 2014-05-20

Last Observation Date 2014-05-20 **First Observation Date** 1981-05

EO Data All sites combined: Padgett counted 3,094 plants within monitoring plots of Parent EO 99 on 19 and 20 May 2014 and estimated 33,300 plants covering 24.61 acres of mapped area. Of the total, 388 plants were counted within the permant plot located at Sub EO 10 (Padgett 2014).
2013: Monitoring data is part of monitoring data for Principle EO 99 (Padgett 2013). 438 plants counted in monitoring plot at Sub EO 10 representing 10% of the population, by Padgett and Israel on 17 July 2013, for an estimate of 4000+ plants in the site.
2012: 186 plants were counted in permant plots by Padgett on 17 July 2012 after remapping and installing permant plot. Plant counts may have been low due ot the recent timber thinning and weedy growth (Padgett 2012).
2005: 500-750 plants estimated on May 2005 (Padgett 2005).
2001: Estimated 700 clumps plus single and double leaves present from the head of the stream to 120-150 yards downstream, plants in leaf and flower on 27 March (Padgett 2001).
1995: Gaddy's Cow Farm Site: 200-300 plants estimated at this site by Newberry in 1995 (Newberry 1996).
1981: About 200-300 plants growing on banks of eroding creek, hanging off steep banks; exceptionally vigorous, with 10-15 flowers on many plants, perhaps fertilized by cultivated field above site (Gaddy 1981).

EO ID 17372 **Subnational Scientific Name** *Hexastylis naniflora* **Shape_ID** 20287

Survey Date 2012
Last Observation Date 2005-03-05 **First Observation Date** 1981
EO Data 2012: Padgett visited the site and observed plants in 2012, however plants were not counted or estimated (Padgett 2015).
2005: Padgett estimated 500 plants estimated in the ravine on 05 March 2005 (Padgett 2005).
1995: Newberry estimated the population to be about 500-600 plants in 1995 (Newberry 1996).
1981: Over 1000 clumps over a 10 acre area; plants located within the ravine and on a bluff, but no plants were found along the creek (Gaddy, 1981). One of the largest known populations (Gaddy 1981).

Description

EO Type
General Description Dry Oak-Hickory Forest community in a moderately sloping ravine. Associated species include Quercus falcata, Quercus alba, Pinus echinata, Pinus virginiana, Oxydendrum arboreum, Cornus flordia, Polystichium acrostichoides, and Kalmia latifolia. Cut-over located to the west. (Padgett 2005). Ravine and bluff, with cut-over to mature canopy of Pinus echinata, Quercus alba, Liriodendron; Shrub layer of Kalmia.

EO Type
General Description Quercis alba, Quercis coccinea, Liriodendron tulipifera, Acer rubrum in canopy. Cornus flordia, Oxydendrum arboreum in the understory. Kalmia latifolia is thick in the shrub layer. Herbs included Goodyeara pubescens, Polystichium acrostichoides, Prenanthes sp., Sanicula sp., Chimaphilia maculata, and others (Padgett 2001). Associated with Kalmia latifolia, very high quality community with little disturbance (Savidge 1998).

Additional Topics

General Comments

Additonal Topics "B-2816 (EO 46) is a bridge replacement project that was slightly realigned and determined not to impact the Hexastylis population. However, the recent field visit showed that the previously mapped portion of the population no longer existed, possibly due to adjacent landowner maintenance such as bush hogging. Additionally, a new trail was cut through the site where some plants were found, and possibly contributed to the population disturbance. It appeared as though effects from the 2004 hurricane season activity also played a role in the degradation of site integrity and quality. It is estimated that only 50 plants remain at this site, as opposed to the thousand or more that was previously documented by NCDOT and NCNHP in 1998 and 2001" (HDR and HARP personnel, 2005). "B-2816: Situated along SR 1908, the project replaces Bridge No. 230 over Buffalo Creek...this project may affect all of or portions of [EO 046]...environmental permits associated with B-2816 do not authorize any impacts to DFHL near the bridge. An alternative that avoided direct impact to the DFHL population was chosen. The October 2001 field review indicated that no direct, indirect, or cumulative impacts have occurred on the DFHL population locations near the project" (Bassette 2003). The bridge replacement project was moved and will not affect this occurrence (1998).

Description

EO Type
General Description Subpop 1: remnant bluff, with transmission line clearing at the top and high, steep creek bank at the bottom. Plant community is Mesic Mixed Hardwood Forest or Piedmont/Coastal Plain Heath Bluff. other species include Kalmia latifolia, Quercus sp., Carpinus, Halesia carolina, Amelanchier arborea, Xanthorhiza simplissima, Oxydendrum, Cornus florida, PInus virginicus, Heuchera americana, Carya cordiformis, Hepatica americana, ilex opaca, Epigaea repens, Polystichum, Mitchella repens, Leucothoe axillaris, anisostichus capreolata, Gelsemium sempervirens, Smilax glauca, Thalictrum thalictroides (Murrell & Kelly 1993).

Min. Elevation	700.00	**feet**	213.00	**meters**
Max. Elevation	720.00	**feet**	219.00	**meters**
Observed Area	2.50	**acres**	1.01	**hectares**

Additional Topics

General Comments Jim Matthews (UNCC) gave a verbal report that this species had been found in this vicinity by Tom Jones (Gardner-Webb). It is not clear whether this E.O. is the same site as the one Jones observed. Notes on the verbal report are included with this E.O. in the manual file.

EO ID 14983 **Subnational Scientific Name** *Hexastylis naniflora* **Shape_ID** 17898

Survey Date 2013-06-06

Last Observation Date 2013-06-06 **First Observation Date** 1995-03-21

EO Data 2013: 234 plants counted in 2.3 acres on 6 June 2013 (Stafford for NCDOT 2013).
2011: 60 observed by NCDOT on 03 March 2011 in their ROW; the remainder of the occurrence [number of plants not reported] was noted to be outside of the ROW (NCDOT 2014).
2007: 42 plants observed by NCDOT on 22 March 2007 in the right-of-way. Overpass construction removed some trees, altering the habitat (NCDOT 2009).
2005: More than 1,000 plants are within construction project area (DOT TIP: U-2528AA); 619 plants are expected to be impacted by construction activites in 2005. However, 250 plants were reported to be protected on-site, but only 1 plant was found during 2005. Verification of the situation is needed, including the number of plants protected on-site (Wells 2006). 1 plant found during field checks, 250 plant are thought to be preserved in additonal ROW purchased at this site (HDR personnel 2005).
2003: Impacted by NCDOT project U-23907C and/or private landowner, portion of EO still present, portion of EO are gone (Bassette 2003).
1995: Over 1000 plants observed by Savidge on 21 March 1995 (SAVIDGE 1996).

EO Rank D - Poor estimated viability **EO Origin Subrank**

EO Rank Date 2011-03-03

EO Rank Comments EO rank is based on EO Rank Specs for this species; downgraded from an AB to a D based on EO data from Spring 2005 (Wichmann 2005).

EO Rank Specifications Version Used

Description

EO Type

General Description Medium quality Dry-Mesic Oak-Hickory Forest with a canopy dominated by Pinus taeda, Quercus alba, Q. rubra, Carya glabra, Acer rubrum, Liriodendron tulipifera, and Fagus grandifolia. The understory consists of Juniperus virginiana, Pinus taeda, Carpinus caroliniana, Oxydendron arboreus, Acer rubrum, Cornus florida, Ilex opaca. The shrub layer includes Rhododendron sp., and Rubus sp. Woody vines include Vitis rotundifolia, Smilax sp., and Toxicodendron radicans. The herb layer is sparse to moderately dense and includes Hexastylis naniflora, Goodyera pubescens, and Tipularia discolor. (Stafford for NCDOT 2013). NC DOT right-of-way (HDR personnel 2005). NORTH-FACING SLOPE GRADING TO SMALL STREAM (SAVIDGE 1996).

Additional Topics

General Comments Invasive species present include Lonicera japonica, Ligustrum sinense, Albizia julibrissin. (Stafford 2013).

Additonal Topics This project was subject to consultation with USFWS (ASNC log no. 4-2-95-102), and a Biological Opinion was written in 1995 for impacts relating to NCDOT's road work. The ammended BO anticipated direct impacts to 619 plants, but the Service anticipated that the site would ultimately be lost through indirect impacts. Murray's Mill was purchased as off-site mitigation. [C.Wells, 8/2006]. "U-2528AA (EO 32) involves a new highway interchange where impacts to approximately 619 plants were anticipated. A portion of the mitigation was provided for this site through the Murray's Mill purchase and conservation of 25 acres of a H. naniflora population. During the recent field visit, it was discovered that much of the surrounding habitat had been disturbed through logging operations and/or project impacts. While only one plant was found during field checks, 250 plants are thought to be preserved in additional ROW purchased at this site" (HDR personnel 2005). "U-252AA...Construction completed June 2003...may have affected all or portions of [EO] 032...Results of the October 2001 survey indicate that the only DFHL impacts on this project occurred as a result of direct construction activities...indirect impacts were not observed, it is anticipated that such impacts could eventually occur from development along the interchange. Based on October 24, 2002 conversation with Trish Simon, the plants in Quad D (SE quadrant) are still present and a protective fence has been placed around them. NCDOT did not disturb Quad A (NE quadrant) according to road project's permits and plans, but the property owner has since cleared the area for future development. The plants in Quadrant A (NE quad) are now gone. Quad B (NW quadrant) was already stressed before construction was started due to logging and these plants are gone. The population on other side of the original on-ramp had been cleared by the landowner for future development" (Bassette 2003).

Survey Date 2016-05-24

Last Observation Date 2016-05-24 **First Observation Date** 1995-03-21

EO Data 2016: Bloom counted 1472 plants in 1.79 acres of monitoring plots on 24 May 2016, and estimated 50,000+ plants occuring in the entire 62 acres of mapped area (Bloom 2016).
2014: Padgett counted 1718 plants within monitoring plots on 25 June 2014 and estimated 58,000+ plants covering 65 acres of mapped area (Padgett 2014).
2013: Padgett and Israel counted 1715 within monitoring plots on 18 July 2013 and estimated 17,000+ plants covering 18-acre population area, and 61,000+ plants for 65-acre mapped area (Padgett 2013).
2012: 1015 plants counted in 1.8-acre sample plot in 2012. Estimate of 10,150 plants for 18-acre population area. (Padgett 2012).
2006: Population apparently doing very well (plants not counted) on 28 April 2006, observed by Franklin and Moye (Franklin 2006).
2005: An approximate total of 98,789 individuals were calculated, at 6 sub-populations, using 1/100 acre sampling plots. Plants at site 8 were directly counted. Surveys made in October and November 2004; confirmation of species made in April 2005 by Matthews (HDR 2005, Bassette 2009) [this is likely an over-estimate resulting from a calculation of density per acre (Wichmann and Padgett 2005)].
2002: 800-1200 plants in flower on 5-8-2002 (Padgett 2002).
1995: More than 1000 plants counted on lower to upper slopes in an area 1-2 miles long (Savidge 1996).

EO Data 2013: 4719 plants counted in 6.6 acres on 5 June 2013 (Stafford 2013).
2011: A total of 5032 plants were counted over 6.6 acres on 3 November and 12-13 December 2011; 3425 in 4.24 acres north of Tate Blvd and 1607 in 2.36 acres south of Tate Blvd (Gregory 2011)
2001: Field review by NCDOT on October 2001: population along the south side of Tate Boulevard intact and may have slightly expanded outside of the originally delineated boundaries, populations along the north side of Tate Boulevard appeared to have been slightly impacted along the parking lot of a newly constructed building. Few DFHL [Hexastylis naniflora] existed along the north side of Tate Boulevard before the building was constructed (Bassette 2003).
1996: Between 50 and 500 plants present. Identification verified by G. Newberry (Savidge & Bain 1996).

Description

EO Type

General Description High quality Dry-Mesic Oak-Hickory Forest occurring both north and south of Tate Boulevard. The canopy is dominated by Quercus alba, Q. rubra, Carya glabra, Acer ruburm, Liriodendron tulipifera, and Fagus grandifolia. The understory consists of Carpinus caroliniana, Oxydendron arboreum, Acer rubrum, Cornus florida, Ilex opaca. The shrub layer includes Rhododendron sp., Rubus sp., and Euonymus americanus. Woody vines inlcude Vitis rotundifolia, Smilax sp., and Toxicodendron radicans. The herb layer is sparse to modeately dense and includes Hexastylis naniflora, Goodyera pubescens, Polystichum acrostichoides, and Mitchella repens. (Stafford 2013).
North facing slope, plants located about mid-slope grading to small creek draining to Miller Branch. Associated species inlcude Kalmia latifolia, Goodyera pubescens, Chimaphila maculata, Quercus alba, and Pinus strobus.

Additional Topics

General Comments The following invasive species were noted as low threast: Lonicera japonica, Ligustrum sinense, and Albizia julibrissin. Hedera helix was noted as a moderate threat. (Stafford 2013)

Additonal Topics NCDOT implemented avoidance/minimization for U-2414A and reduced the road from four-lane divided to five lanes, which resulted in the construction limits remaining outside of the forested areas where H. naniflora was known to exist (NCDOT 2014).
"U-2307 (EO 179 [sub EO 30]) was expected to have significant impacts on a large population of H. naniflora in Catawba County. It was expected that a population of 10,700 plants would be lessened by 5,400 as a direct result of the realignment of multi-lane road. Project construction is ongoing and records for this population are insufficient for field verification at this time. While this population loss was mitigated by the purchase of 25 acres at Murray's Mill, it is recommended that a follow-up survey is conducted at the project location to determine actual impacts after construction is completed" (HDR personnel, 2005).
"U-2414A .. may affect all or portions of...[EO 030]...Results of the NCDOT's October 2001 field review revealed that the DFHL [Hexastylis naniflora] population along the south side of Tate Boulevard is intact and may have slightly expanded outside of the originally delineated boundaries. However, DFHL [Hexastylis naniflora] populations along the north side of Tate Boulevard appeared to have been slightly impacted along the parking lot of a newly constructed Home Builders Association building. Note that few DFHL [Hexastylis naniflora] existed along the north side of Tate Boulevard before the building was constructed" (Bassette 2003).

Directions

Monitoring data below is a subset of monitoring data for Parent EO 99 (Padgett 2013). Site visited and the plants counted in the three permeant monitoring plots by Padgett and Israel on 17 July 2013. Total number of plants counted was 1748 (Padgett 2013)Site renamed and three permanent plots installed and the plant counted. A total of 759 plants were counted in the three monitoring plots on 2012-09-06 (Padgett 2013). Broad River: Brice Rare Plant Site. This is a sub EO of Principal EO 099. This sub EO is comprised of 3 sub-occurrences located along the 3 unnamed tributaries contained within the Brice Rare Plant Site: Sub-EO (A) Western-most tributary; Sub-EO (B) Middle tributary; Sub-EO (C) Eastern-most tributary. See map for details (Wichmann 2005). Approx. 3.5 miles south-southeast of Harris, NC along the southern part of Rutherford County just across the Broad River. Site is bisected by CSX railroad. (Padgett 2003).

EO Data Approximately 60 clumps counted, probably more; less than 50% flowering. Plants are scattered throughout SNHA on north-facing slope (Franklin et al. 2005). Only 50 plants or so seen on 30 July in leaf in partial survey of areas within 0.35 mile of Westview Church (Oakley 2002). Vigorous population consisting of many large clumps at the base of trees and younger plants on the slope face 4 June (Newberry & Huysmasn 1997).

Survey Date 2007

Last Observation Date 2007 **First Observation Date** 1993-08-06

EO Data 2007: 296 clusters observed at Site 4 by NCDOT in 2007 (NCDOT 2009).
2005: Estimate approximately 250 plants, 150 counted on 12 May 2005 (Franklin et al. 2005). Only one subpopulation (subpopulation A/site 4) remaining after construction of US 321 Bypass (Wichmann 2005).
2005: Approximately 20,000 plants in 3 separate areas [includes sub EO 019 (Wichmann 2005)]; heathly population prior to construction of US 321 Bypass south of Hickory, during field-checking, it was discovered that this site may have been significantly impacted (HDR personnel, 2005).
1995/1996: Newberry reported the following conditons in 1995/1996: Site 4-- Building of the road destroyed about 100 plants of the original 200; 133 plants from site 3 planted here so total number of plants present is about 200; Site 5-- destroyed by construction of the road (Newberry 1996). A total of 14,443 plants, scattered between EOs 19 and 20, were located in the construction project area (NCDOT 321) in 1995; more than 3,235 were expected to be impacted by improvement activities. Verification of the current situation is needed, including the number of plants protected on-site (Wells 2006).
1993: Subpop A (site 4): "approximately 500 plants"; Subpop B (site 5): "12 plants" (Currie 1993). Subpop A [site 4]=about 500-1000 plants (average 12 plants/100 sqm) over 0.5 acre; Subpop B [site 5] =12 plants over 10-100 sqm; in leaf & flower (Corda 1993).

EO ID 13542 **Subnational Scientific Name** *Hexastylis naniflora* **Shape_ID** 16457

General Description Fairly mature Dry-mesic Oak Hickory Forest dominated by Quercus alba and Oxydendron arboretum; sub-canopy dominated buy Cornus florida and Acer rubrum; understory dominated by Carya ssp., Fagus grandifolia, Vaccinium sp., and Quercus spp.; herbaceous layer dominated by Polygonatum biflorum and Rhododendron Af. pariclymenoides. Other species present include: Vaccinium pallidum, Punus serotina, Dioscorea villosa, Lespedeza sp, Quercus lyrata, Euonymus americana, Carya alba, Quercus phellos, Nyssa sylvatica, Vitis rotundifolia, Ilex opaca, Mitchella repens, Amelanchier (juveniles), Juniperus virginiana, Uvularia sessilifolia, Quercus velutina, Quercus falcata, Chionanthus virginicus, Uvularia perfoliata, Polystichum acrostichoides, Violia hastata, Thalictrum thalictroides, Aureolata laevigata, Gallium sp., Carpinus caroliniana, Scutellaria elliptica, Scuttelaria sp., Carex sp., Hustonia tenuifolia, Sanicula Af. canadensis, and Quercus stellata (Franklin et al. 2005). Subpop A(site 4): "in relatively good condition"; Subpop B (site 5): "consists of a high to-medium quality wetland area (Currie 1993).Subpop A [site 4] =adjacent to dry creek bed dominated by a mixed hardwood stand; disturbed from Hurricane Hugo blowdowns; shrub growth rank; dry, mid to lower slope, filtered light/shaded. Subpop B [site 5]=on northwest-facing slope adjacent to a floodplain.

Min. Elevation	880.00	**feet**	268.00	**meters**
Max. Elevation	900.00	**feet**	274.32	**meters**
Observed Area	1.50	**acres**	0.61	**hectares**

Protection Comments May have been used as a mitigation site for US-321 Bypass, flags marking plants, NCDOT needs to be contacted for details regarding this EO (Franklin and Wichmann 2005). "The Department of Transportation (DOT) will try to acquire in fee title additional righ-of-way at three of the five population sites [includes EO 020 (Wichmann 2005)] (approximately 1 acre at Site 1, 3 acres near Sites 2 and 3, and 1 acre at Site 4[EO 020]). A minimum of 1 site will be aquired within existing project right-of-way, If only one site is acquired on-site, the DOT, after consulting with the Service [FWS], will aquire at least one high quality Hexastylis naniflora site elsewhere in North Carolina (Currie 1993).

Additonal Topics

Some plants protected in conservation easments outside of construction zones at site1(EO 019 sub pop 1) and 4 (sub pop A) (Wichmann Aug. 2005, per. comm. with J. Gray NC DOT)."EO 185 (Old EO 19/20) is a large population that was surveyed prior to the construction of the US 321 Bypass south of Hickory. It was a healthy population in three separate areas that consisted of approximately 20,000 H. naniflora plants. During field-checking, it was discovered that this site may have been significantly impacted. However, much of the site is on private property and separated by a new NCDOT ROW fence which prevented access. According to old survey maps, it is possible that road construction for US 321 and private logging on some of the north-facing slopes have likely impacted the population. Because this site is such a large percentage of the known H. naniflora numbers, it is strongly recommended that NCDOT conduct a comprehensive survey to determine population viability" (HDR personnel, 2005). "Approximately 20,000 plants [including EO 019], unknown number impacted, some preserved in ROW (HDR personnel, 2005). "This project will directly impact 9.0 acres of the total 11.0 acres within the project corridor that contain Hexastylis naniflora [includes EO 019 (Wichmann 2005)]. Sites 3 [EO 019] and 5 [subpop B] will be completely eliminated. Other direct and indirect impacts from this project include disturbance from construction activities that may lead to increased erosion of downslope areas and degradation of Hexastylis naniflora habitat" (Currie 1993). Proposed construction of road project is planned over sites (Corda 1993).

Survey Date 2007

Last Observation Date 2007 **First Observation Date** 1993-08-06

EO Data 2014: Gray reported in 2014 for that supop 1 was divided by US-321 construction and that it will be monitored in 2015; also, subpop 2 was extirpated due to construction; subpop 3 is extirpated at this site but plants from it were moved to Saranac Lake Preserve in SC in the 1990s (NCDOT 2014).
2007: 144 clusters observed at Site 1 by NCDOT in 2007 (NCDOT 2009).
1995/1996: Newberry reported the following conditons in 1995/1996: Site 1-- 100 plants remain north of the "new road" and none south of the road, site had 1000 plants prior to construction; Site 2-- no data reported; Site 3-- no plants remain, plants moved to Saranac Lake Presereve, SC and Site 4 (EO 020), site had 250-300 plants prior to construction (Newberry 1996). 20,000 plants [includes EO 020 (Wichmann 2005)] prior to NCDOT impact, unknown number impacted by US-321 Bypass (HDR personnel 2005). A total of 14,443 plants, scattered between EOs 19 and 20, were located in the construction project area (NCDOT 321) in 1995; more than 3,235 were expected to be impacted by improvement activities. Verification of the current situation is needed, including the number of plants protected on-site (Wells 2006).
1993: "Thousands of individuals seen at sites 1 through 3 [sub-populations A, B and C]" (Currie 1993).
Subpop A [site 1] =about 1000 plants (average 5.2 plants/100 sq ft) over 5.1 acres; Subpop B [site 2] =about 1000 plants (average 3.2/100 sq ft) over 3.7 acres; subpop C [site 3] =about 1000 plants (average 2/100 sq ft) over 3.7 acres; in leaf, flower & some fruit (Corda 1993).

Description

EO Type

General Description Area (35.68445105, -81.34436801) full of weedy species, much of the area has been planted in pines and the drainage is thick with Toxicodenron radicans, Rosa multiflora, Diphasiastrum digitatum [Lycopodium flabelliforme], etc. (Franklin and Wichmann 2005). "Relatively good condition" (Currie 1993). Subpop A [site 1]=mature beech stand with occasional white pine; partly disturbed from fallen trees (Hurricane Hugo); Dry, mid to lower slope, open. Subpop B [site2] =Area dominated by mixed hardwoods; dry, lower to upper slope, open/filtered light. Subpop C [site3] =cut-over mixed hardwood/pine-dominated canopy; shrub growth rank; steep slope; dry, lower to upper slope, open/filtered light (Corda 1993).

Last Observation Date 2012-04-11 **First Observation Date** 2001-03-06

EO Data 2012: 11,446 total plants: 3550 plants estimated at site L1, 1923 plants estimated at site L2, and 3302 plants estimated at Site II by NCDOT biologists on 10 April 2012. 2671 plants counted at site M by NCDOT biologists on 10-11 April 2012 (Bassette 2015).
2012: Site visited with USFWS, NCDOT , and ASU 15 March 2012 (Padgett 2012) -- Wagner et. al. observed over 1000 plants on 15 March 2012. Plants growing on top of rocks in very shallow soil (Wagner 2012).
2009: Plants observed by Jones in January, April, and June 2009; no count made (Jones 2009).
2009: An additional 3,349 plants counted at site II of Broad River Tract on 20 and 21 April 2009 by NCDOT biologists (Bassette 2009). 3,920 observed by NC DOT personnel (Bassette 2003).
2001:Over 2000 estimated plants along steep north and northwest-facing slopes (Padgett 2001).Vigorous population estimated at 500-1000 plants in leaf and bud on 6 March (Oakley 2001).

Survey Site

Survey Site Name
South Fork Catawba River: Indian Creek, Cat Square Site (Sub EO of EO 098).
Bell's Cat Square Site (per Gaddy, 1981)
Cat Square Heartleaf Forest

Directions

South Fork Catawba River, Indian Creek west of Cat Square. Gaddy (1981) named site "(Bell's) Cat Square Site" in his status survey for NC PCP/USFWS, in reference to one of Bell's two 1957 herbarium specimens from this area (NCU 176118), which Bell describes as "0.4 miles west from Cat's Square". Bell's second 1957 herbarium specimen (NCU 176117) states it was from a location 1.2 miles west of Cat's Square. Gaddy was unable to find the species in this second location (further west) in 1981, but did re-locate the species 0.4 miles west of Cat Square (the presumed location of NCU 176118). NCNHP sub EO 002 refers to specimen NCU 176117, sub EO 003 refers to NCU 176118. Both are sub EOs of Parent EO 98 [C. Wells, 2006].Rich deciduous forest and stream banks 0.4 mile west of Cat Square (Bell 1957).

Description

EO Type

General Description Community type present is Mesic Mixed Hardwood Forest (Piedmont subtype). This site shows evidence of clear-cutting in the past. All of the trees seem to be even aged and are about the same size. The herb layer is sparse. It appears the this site has been left alone to recover from the logging activity. The canopy is dominated by Liriodendron tulipifera. (Matthews et al 2002). Boggy to mesic creekhead, with Liriodendron, Acer rubrum, Ilex opaca, Osmunda cinnamomea. Area was cut over about 1970 and is very dense.

Survey Date 2011-05-02

Last Observation Date 2011-05-02 **First Observation Date** 1998-05-18

EO Data 2012: present, report pending from NCDOT .
2011: 1,235 clusters counted on 2 May 2011 by Frazer, Bassett, Burroughs and Gray within entire NCDOT mitigation site in 2011 (NCDOT 2014).
2005: 4,262 plants are within construction project area (TIP: B-2937); 324 plants are expected to be impacted by construction activities in 2005; 4,262 plants are to be protected on-site in a 2.7 acre area (Wells 2006). Approximately 4,262 plants were found [extrapolated from sampling 15 circular plots, 1/100 acre in size]; in addition, more than 60 plants were observed north of the old road alignment near the banks of Little Gunpowder Creek outside of NCDOT's property (2005-05);
2000: 1,836 plants estimated by NCDOT staff prior [2000?] to any impacts [from bridge replacement] occurring; 175 plants transplanted to an approximate 2.7 acre permanent conservation easement adjacent to site in November 2000; after three years, Padgett estimates that 68% survived (HDR and HARP personnel 2005).
2000-2003: This is an excellent viable population with over 500 plants located in this easement. This site has one of the only transplanted populations in North Carolina where 175 plants were transplanted from areas to be impacted by bridge replacement before the bridge was replaced (Padgett 2005).
2002: 68% of the transplanted individuals survived as of April 2002, despite drought conditions (Murrell in NCDOT 2009).
2000: In November 2000, 175 individuals were relocated from the right of way of a NCDOT bridge construction site at Little Gunpowder Creek to an adjacent conservation easement (NCDOT 2009).
1998: Between 501 and 1000 plants in a 10-100 square-meter area, densely spaced; in flower on 18 May 1998 (Savidge 1998).

Contacts

Contact ID	Individual Name	Institution Name	EO Contact Note

Monitoring Needs Comments This site should be visited and the transplant area monitored. The transplants are all flagged (Padgett 2005). NCDOT work at this site was subject to consultation with USFWS (ASNC log no. 4-2-98-147), and the Biological Opinion anticipated impacts to 324 plants, which would be minimized through transplant. NCDOT also commited to 5 years of monitoring at this site in their Biological Assessment [C. Wells, 8/2006].

Research Needs Comments Live plants at Appalachian State University Greenhouse. Plants were collected during the transplant in November of 2000 (Padgett 2005).

Additional Topics

General Comments

Additonal Topics "B-2937 (EO 44) is a bridge replacement and road realignment that was completed in 2003. The population was estimated at 1,846 plants by NCDOT staff prior to any impacts occurring. According to James Padgett (via email communication), 175 plants were transplanted from the construction area into an approximate 2.7-acre permanent conservation easement adjacent to the site in November 2000. After three years of monitoring by Padgett, 68% had survived (Padgett, 2004). In May 2005, HDR/HARP visited this site and sampled fifteen 1/100 acre plots. There were approximately 4,262 total H. naniflora plants found on this site yielding a density of 1,567 per acre. In addition, more than 60 plants were observed north of the old road alignment near the banks of Little Gunpowder Creek outside of NCDOT's property" (HDR personnel 2005). This site has one of the only transplanted populations in North Carolina where 175 plants were transplanted before the bridge was replaced; transplants are all flagged (Padgett 2005). Direct construction impacts related to [NCDOT Project] B-2937; 2.68 ac of additional right-of way purchased for a perpetual conservation easement which was expected to protect approximately 1,522 plants (based on species density with the impact area) (Bassette 2003).

Broad River: Richardson Creek, tributary east of SR 1111 and north of Hayes Lake (Sub EO of EO 099). USFWS Flex Fund Monitoring Site 2 (in part)

Directions

Broad River: Richardson Creek, tributary east of SR 1111 and north of Hayes Lake. This is a sub EO of parent EO 099 (Wichmann 2005). Subpopulation 1[A] is east of Jack McKinney Road (SR 1111) About 0.9 mile north of the Broad River on two small springs which fork into a pond which drains into Richardson Creek (Padgett 2001). Subpopulation 2 [See EO 079] is off of SR 1115 south of Harris approximately 0.3 mile behind Riverside Church on north facing slope of unnamed tributary of Richardson Creek. Subpopulation 3 [B] Is 0.1 mile north of subpopulation 1 along a spring (Padgett 2002).

Separation Comments

This EO is comprised of two sub-occurrences which are located east of SR 1111 and west of Richardson Creek; former subpopulation 3 of this EO is now sub EO 079 and is located east of Richardson Creek; EO 055 and EO 079 are sub EOs of principal EO 099; all sub EOs are located within 2.0 kilometers of one another and are not separated by an area of persistently unsuitable habitat greater than 1.0 kilometer wide (Wichmann 2005).

Survey Date 2016-05-25

Last Observation Date 2016-05-25 **First Observation Date** 2001-04-01

EO Data 2015: 3011 plants counted by Padgett and Feldman on 19 May 2015 in 2.29 acres of monitoring plots in sub EOs 37, 55, and 76. Estimated 32,000 total plants covering the entire 24.61 acres (Padgett and Feldman 2015).
2014: Padgett counted 3094 plants within monitoring plots for principal EO 99 on 19 and 20 May 2014 and estimated 33,300 plants covering 24.61 acres of mapped area (Padgett 2014).
2013: Monitoring Data is part monitoring data for Principle EO 99 (Padgett 2013). 1116 plants counted by Padgett and Israel on 7 May 2013 (Padgett 2013).
2012: 1309 plants were counted by Padgett and Israel on 16 July 2012 (Padgett 2012). Area impacted by logging in summer of 2005 (Padgett 2005).
2001: Subpopulation 3 [b]: more than 50 single leafs and clumps of leaves observed along 50-75 feet of spring; in bud on 2 february, seedlings present (Padgett 2002). Subpopulation 1[a]: 100-200 clumps plus single and double leaves occur along 200 feet of each springhead; not many young plants present; Subpopulation 2 [See EO 079]: 200-300 clumps along 100 yard of the stream; high flower numbers and seedling numbers especially in the cutover portion of the site; both populations have plants in leaf and flower on 1 April (Padgett 2001).

Description

EO Type

General Description Subpopulation 3 [B]: Mixed Hardwood community on an upland flat along a moist to dry moisture regime, with moderately filtered to shady light conditions. Associated species found at the survey site include: Acer rubrum, Liriodendron tulipifera, Quercus alba, Viburnum spp., Cornus florida, and several ferns spp. (Padgett 2002). Subpopulation 1[A]: mesic hardwood community including Fagus grandifolia, Pinus virginica, Polystichum acrostichoides and Lonicera japonica. Area was cutover about 25 years ago. Subpopulation 2 [See EO 079]: Mesic hardwood cove community including Quercus alba, Sanguinaria canadensis, Polystichum acrostichoides, and Hepatica americana. Part of the area was cutover in the past 5 years (Padgett 2001).

Additional Topics

General Comments

Additonal Topics Landowner has logged parts of the tract where some of this EO is present. A 100 foot buffer was left along stream corridor where this EO occurs. Parts of the EO was impacted along slopes away from the stream on a north-facing slope that was logged. The plants persist after the logging in the impacted area. It is not known wheither the species can survive clear-cutting events in the long term. Known populations occurring in clearcuts seem to thrive after clearcutting for a short time, then decline rapidly (Padgett 2005).

Additional Topics

General Comments In Newberry (1996), she reports the location as "Claremont Street"; I think this is an error it should be Clarence Street in the town of Claremont because Newberry indicates the property owner, Mr. Deal, lives at "4344 Clarence Street, Claremont, NC" and there is no Claremont Street in this whole area - not near where Newberry has it mapped nor where NHP has it mapped. Also, 4344 Clarence Steet does not exist; however, a Sylvia Deal has owned 4355 Clarence St. since 1993, but this is not near where Newberry has her occurrence mapped on the topo in the report, nor is it southwest of Shiloh as Newberry indicates in the location. It is west of Murray's Mill Pond though, consistant with part of Newberry's discription. 1993 and 1998 aerials do not indicate habitat where Newberry has this occurrence. Did not change NHP mapping to match where Newberry indicates the occurrece on her topo; occurrence remains mapped to Clarence Street (Mason 2009).

Description

EO Type
General Description This site occurs in a small wooded area between a maintained meadow (below cemetary to Shiloh Methodist Church) and Murray's Mill Lake. The wooded area along the lake was fairly immature with numerous tree species present as sapplings. Various Quercus ssp. and Acer rubrum are dominant (Padgett 2005).

EO ID 7324 **Subnational Scientific Name** *Hexastylis naniflora* **Shape_ID** 10240

Survey Date 2005
Last Observation Date 2005 **First Observation Date** 1994-06
EO Data This suboccurrence is included in the determination of total extrapolated acreage for USFWS Flex Fund Monitoring Site 2, although it was not surveyed.
2015: Padgett and Feldman counted 3011 plants on 19 May 2015 in 2.29 acres of monitoring plots in sub EOs 37, 55, and 76. Estimated 32,000 total plants covering the entire 24.61 acres of EO 99 (Padgett and Feldman 2015).
2005: Site visited and remapped. Counts estimates for the site have the population at around 230-250 plants (Padgett). Estimated between 100-150 plants seen on April 12, 2005 (Padgett 2005).
1996: 150 plants estimated by Newberry in 1995 or 1996 [year not reported] (Newberry 1996).
1994: About 150 plants seen in June 1994 (Newberry 1994).

Contact ID	Individual Name	Institution Name	EO Contact Note

Monitoring Needs Comments
Research Needs Comments J. E. Padgett collected flower and leaf materials from this site in 2001 for graduate research at ASU.

EO Rank

EO Rank Factor Survey Data

Condition of EO Fair condition.
Condition Rating
Size of EO Mapped at 0.43 acres. Count estimates from 2015 put the population between 230-250 plants (Padgett). -- Between 100-150 plants (Padgett 2005). About 150 plants seen (Newberry 1994).
Landscape Context Poor overall landscape context with a cabin now along the stream near the population and a lake below the site (Padgett).

EO Rank C - Fair estimated viability **EO Origin Subrank**
EO Rank Date 2015-05-19
EO Rank Comments EO rank based on EO rank specs for this species (Wichmann 2005).
EO Rank Specifications Version Used

Description

EO Type
General Description Dry-Mesic Oak-Hickory Forest community located on a gently sloping porton of a small unnamed stream near pastures. Dominate canopy speices include Quercus alba, Quercis coccinea, Quercis falcata, Loiriodendron tulipifera. The understory is comprised of Cornus flordia, Oxydendrum arboreum, and Acer rubrum. Shrubs include Kalmia latifolia, Euoynmous americanus, Vaccinium arboreum and Vaccinium pallidum. Vines such as Vitis rotundifolia, Toxicodendron radicans Lonicera japonica, and Smilax glauca are present. Herbs include Hexastylis naniflora, Goodyeara pubescens, Elephantopus tomentosa, Chimaphila maculata, and Mitchella repens (Padgett 2005). Laurel thicket above small stream in Broad River drainage (Newberry 1994).

Additional Topics

General Comments A 1957 herbarium specimen from Bell (NCU 176117) states it was collected from a location 1.2 miles west of Cat's Square. Gaddy (1981) was unable to find the species at this location in 1980 and 1981, and regarded it as possibly extirpated. Gaddy did re-locate the species 0.4 miles west of Cat Square (the presumed location of NCU 176118, mapped as NCHP sub EO 003). [C. Wells, 2006].

Survey Date 2005-05
Last Observation Date 2005-05 **First Observation Date** 1977
EO Data 2005: Less than 100 plants seen along two small unnamed streams; less than 50 plants seen along one of the streams, recent ATV use in the area has trampled some plants (Padgett 2005). Fewer than 50 plants seen (Padgett 2001).
2000: Partial survey, area not throughly seached; 4 clumps observed by Kranyik on 25 March 2000 (Kranyik 2000).
1995: 75-100 plants estimated by Newberry in 1995 (Newberry 1996).
1981: 50-75 plants found in boggy areas along small stream and on slopes along eastern margin of outcrop; seed production excellent; good population of seedlings present (Gaddy 1981).

Additional Topics

General Comments
Additonal Topics Bridge replacement appears to have impacted this population, few plants seen in 2005; construction was underway at time of visit, plants were not marked; bottom portion of the south facing slope impacted by construction and temporary fencing (Franklin and Wichmann 2005). Bridge replacement should not impact these plants, they are well outside the Right of Way (1998).

Broad River: Sandy Run Creek, SW of SR 1164 (Sub EO of EO 097)

Directions

Broad River: Sandy Run Creek, south west of SR 1164. This is a sub EO of Parent EO 097 (Wichmann 2005). On the southeast side of Sandy Run Creek about 1.5 miles northwest of Boiling Springs, on the southwest side of SR 1164 (Murrell & Kelly 1993). Also located on the next bluff south (second bluff south of SR-1164), on east side of Sandy Run Creek (Newberry 1996) [See Additional Topics for further discussion on this second site].

Additional Topics

General Comments Newberry (1996) reports the exact same locality information as Murrell and Kelly (1993) and notes they discovered the occurrence in 1993 but she maps the occurrence one bluff south of where Murrell and Kelly (1993) show it on their map. Strangely, the coordinate Newberry (1996) reports ([redacted]) falls within the Murrell and Kelly (1993) site; however, the source of this coordinate is not reported - unclear if Newberry generated it during her survey. Padgett confirmed he located plants at the Murrell and Kelly (1993) site in 2002 and that its location has been correctly digitized (pers. comm. to S. Mason, 22 April 2009). Padgett will visit the location Newberry indicated on her map to survey for plants; for now both locations are mapped in the NHP database under this EO (Mason 2009).

EO ID 5089 **Subnational Scientific Name** *Hexastylis naniflora* **Shape_ID** 8005

Survey Date 2002
Last Observation Date 2002 **First Observation Date** 1981-05
EO Data Padgett observed less than 20 plants scattered down slope to creek; few flowers, no seedlings seen during spring of 2001 and 2002 (Padgett 2005). Newberry observed 200-300 plants in ravine on east side of SR-1552 in 1996, just south of old home site. There was much trash in the upper portion of the population (Newberry 1996). LeGrand reported in 1989 that the site is still wooded (LeGrand 1989). LESS THAN 10 CLUMPS PRESENT OVER 16 SQM OBSERVED BY GADDY IN MAY 1981; NO SEED PRODUCTION NOTED; NO SEEDLINGS OF ANY AGE SEEN; FLOWERS AT THIS SITE WERE EXCEPTIONALLY SMALL (GADDY 1981).

EO Data 2010: Site 1: Additional survey work along unnamed north to south flowing tributary of Third Creek found plants in flower on 3/21/2010 on both the north and south sides of U. S. highway 64. There is an estimated 30-50 plants on the south side of the highway and 75-100 plants north of the highway (Padgett 2010).
2010: Site 2: 50-75 clumps found in hardwoods on wooded slopes along unnamed tributary of Third Creek. In flower on March 21, 2010 (Padgett 2010).
2010: Site 3: 50-75 clumps found in hardwoods on wooded slopes along unnamed tributary of Third Creek. In flower on 3-21-2010 (Padgett 2010).
2005: Site 1: 78 plants counted: 11 flowering, 5 vegetative, plant occur mostly on the slope, not much on ridge by creek (Franklin and Wichmann 2005).
2002: Site 1: 100-200 plants seen along small stream and along ridge on 10 October (Padgett 2002). 50-75 plants occurring along the ridge for 300 feet. flowering sparsely on 5 April (Padgett 2002).

Contacts

Contact ID	Individual Name	Institution Name	EO Contact Note

Monitoring Needs Comments J. E. Padgett conducted NCVS on site on 10-2-2002 (Padgett 2005).
Much of the occurrence located along US Highway 64 resides within the NCDOT road right-of-way (Padgett 2010).

Research Needs Comments J.E. Padgett (ASU) is doing PCR and RAPD DNA work with Hexastylis naniflora (2001).

EO Rank

EO Rank Factor Survey Data

Condition of EO Fair overall condition.

Condition Rating

Size of EO Less than 200 plants estimated (Padgett 2010) -- 78 counted (2005), 100-200 (2002).

Landscape Context Mixed hardwoods over sandy loam soil to disturbed community with Ligustrum (Padgett 2002).

EO Rank C - Fair estimated viability **EO Origin Subrank**

EO Rank Date 2010-03-21

EO Rank Comments C-rank given due to its regional location (only known Yadkin River Basin site) within the known populations, as well as additional plants located within this site (Padgett 2010) -- This site might requre a higher site ranking. It is the only site in Alexander County and the only site in the Yadkin River Drainage to date (Padgett 2005). Sites 2 and 3 are CD ranked (Padgett 2010).

EO Rank Specifications Version Used

Description

EO Type

General Description Mixed hardwoods over sandy loam soil to disturbed community with Ligustrum. Associated species include Quercus alba, Ligustrum, Thalictrum thalictroides, Ilex opaca, Hepatica americana. There is a fence going through the area and past disturbance may be due to past cattle presence (Padgett 2002).

Broad River: Richardson Creek, tributary about 0.9 mile up stream from its confluence with the Broad River (Sub EO of 099).

Directions

Broad River: Richardson Creek, unnamed tributary on the east side of the creek, approximately 0.9 stream mile north of its confluence with the Broad River. This is a Sub EO of Parent EO 099 (Wichmann 2005). Along the north-facing ridge of a tributary to Richardson Creek west of SR 1115, 0.5 mile south of Riverside Church.

Survey Site

Survey Site Name
Broad River: Big Horse Creek, Parris Tract (north) (Sub EO of EO 099).
USFWS Flex Fund Monitoring Site 2 (in part)

Directions

Broad River: Big Horse Creek, Parris Tract (north). This is a sub EO of parent EO 099 (Wichmann 2005). Two sub-occurrence [sub-occurrence B is now EO 172 (Wichmann 2005)] along unnamed tributaries to Big Horse Creek. The primary occurrence (A) occurs on the east [and west] side of US Highway 221 approximately 1.2 miles south of the Broad River. The secondary occurrence (B) [now EO 172 (Wichmann 2005)] is approximately 1.0 miles south of the Broad River (M. Franklin 2004). [(A)] along an unammed tributary to Big Horse Creek, approximately 2000' south of the intersection of US 221 and SR 1113 (Hick's Crossroad); east and west of US 221 (Renninger 2003). [(B) now EO 172]: east side of US 221 approximately 2000' north of the SC state line and approximately 3000' south of intersection of SR 1113 and US 221; along unnamed tributary to Big Horse Creek (Renninger 2003).

Survey Date 2015-05-19

Last Observation Date 2015-05-19 **First Observation Date** 2004-05-03

EO Data 2015: 3011 plants counted on 19 May 2015 in 2.29 acres of monitoring plots in sub EOs 37, 55, and 76. Estimated 32,000 total plants covering the entire 24.61 acres (Padgett and Feldman 2015).
2014: Padgett counted 3094 plants within monitoring plots for principal EO 99 on 19 and 20 May 2014 and estimated 33,300 plants covering 24.61 acres of mapped area (Padgett 2014).
2013: Site visited and population delineated on 14 June 2012 by Padgett and Gadd (Padgett 2013).
2012: Wagner et. al. counted about 35 plants on 12 March 2012. Most plants on site budding but not yet in full bloom. Plants close to creek bed heavily impacted by siltation from 221 widening project. Plants up slope not as heavily impacted. Last count of plants before highway construction was 130 plants. (Wagner 2012).
2010: 4 plants moved from the area to be impacted by the road project to the transplant area at the Tate conservation easement (EO 286) on 27 January 2010 by NCDOT biologists (Fontaine 2010 - docmentation with EO 286).
2007: 135 clumps counted and observed in March and April 2005 by H W Hochner (Padgett 2007).
2004: A: (primary site) 200-300 rosettes occurring on both north and south sides of the drainage (the majority of the population is on the north side). The population covers approximately 4100 SQM. Approximately one half of the individuals seen were flowering. B [see EO 172]:(secondary site) 9 rosettes occurring on south side of the drainage. The population covers approximately 100 SQM. 5 rosettes were flowering (M. Franklin and J. Padgett 2004).
2003: A: Approximately 20 clumps (10 on each side of US 221), in leaf and flower; seedlings and vegatative evidence of reproduction; a few plants seen on south-facing bank (Renninger 2003). B[see EO 172]: Approxitately 75-100 clumps in 0.232 acres, in leaf and flower; seedlings and colonial vegetative evidence of reproduction;

Description

EO Type

Element Occurrence Report

EO ID 3553 **Subnational Scientific Name** *Hexastylis naniflora* **Shape_ID** 6469

General Description The occurrence is within a Dry Oak-Hickory Forest of high quality along the mid- to lower slopes of two unnamed drainages. The topography is concave, moisture is moist to dry (probably varying seasonally) and site is shaded. Associated species include Quercus alba, Q. phellos, Carya glabra, C. tomentosa, Acer rubrum, Cornus florida, Castanea pumila, Kalmia latifolia, Rhododendron sp., Sassafras albidum, Mitchella repens, Uvularia sp., Epigea repens, Viola sp., Goodyera pubescens, Sanguinaria canadense, Lonicera japonica, Lonicera sempervirens, Osmunda cinnamomea, Asplenium platyneuron, Polystichum acrostichoides, Carex sp., and Panicum sp. (M. Franklin and J. Padgett 2004). [Sub-occurrence A], Mesic Mixed hardwood grading into Dry Mesic Oak Hickory, medium quality to low quality. [Sub-occurrence B], Mesic Mixed Hardwood along mid- to lower slope; Pacolet Soils; medium quality; NE to E facing slopes (mainly); Topoography flat and convex; Moisture is moist to dry; Site is filtered sun/shade; Associated species include: Cary, Liriodendron, Quercus alba, Kalmia, Carpinus, cinnamon fern (Renninger 2003).

EO Rank BC - Good or fair estimated viability **EO Origin Subrank**

EO Rank Date 2005-05-05

EO Rank Comments Rank was upgraded from a C to a BC based on rank specifications for the species; BC was chosen to reflect large (greater than 1 acre), high quality (SNHA) forest in which this EO occurs and to account for the fact that the number of clumps listed in EO data was estimated (Wichmann 2005). BASED ON RANK SPECIFICATIONS DETERMINED WITH USFWS.

EO Rank Specifications Version Used

Description

EO Type

General Description The northern sub-population (on the west facing slope east of the sharp bend in the river) is in a more mature forest, with many large trees, including a sourwood > 18" dbh. Young to mature mesic hardwoods on moderate northwest facing slope with Liriodendron, Fagus, Acer rubrum, Halesia tetraptera, Polystichum acrostichoides, MItchella repens Maianthemum recemosum, Polygonatum biflorum, and others (Oakley 2002).

Protection Comments During a site visit with one of the landowners, Don Dedmond, in 2005, Franklin and Padgett asked Mr. Dedmond if he thought about formally protecting the site. He indicated that he did not plan to develop the site and that he was interested in conservation, but that he was not interested in formal conservation agreements or in selling the land (Franklin 2005). Mr. Dedford owns the portion of the site that was not recently clearcut.

Plants cover roughly 30-40 percent (5208.5 to 6944.6 meters squared) of the entire 4.29 acre (17361.6 meters squared) site (Padgett 2005).

EO Development Details

Separation Distance Used 1 Kilometers **Separation Distance Type** Unsuitable Habitat

Separation Comments

All sub EOs area located within 2.0 Kilometers of one another and are not separated by an area of persistently unsuitable habitat greater than 1.0 kilometer wide (Wichmann 2005). See map for details. The landfill isolates this site from possible unknown populations and habitat found upstream along Buffalo Creek as well as possible sites and habitats upstream along Long Creek (Padgett 2005).

EO Data 2016: An estimated 250 clumps were observed in two stream bluff areas totalling an estimated 1.25 acres on 3 August 2016. Plants and habitat appear in good condition (Tuttle 2016).
2005: 300 to 400 estimated plants along slopes and flats along or near Long Creek. Observed by Padgett on 12 January 2005. Plants are viable and healthy (Padgett 2005).
1996: 250 to 300 plants multiple aged, stable and prolifically flowering (Newberry 1996).

Monitoring Needs Comments

Research Needs Comments

EO Rank

EO Rank Factor Survey Data

Condition of EO B - This site has been preserved apart from the landfill and the habitat is intact. The plants appeared to be very healthy with nice good sized clumps. Disturbance has been limited to the landfill and along a road near Long Creek which comes out near the bottom of the landfill. The site is further protected by a wire fence around most of the known population (Padgett 2005)..

Condition Rating

Size of EO B - This site is a good averaged size population of Hexastylis naniflora. The most recent estimated count of individuals places the numbers of clumps around 400 (Padgett 2005)..

Landscape Context B - The relative quality of this site is hampered by its proximity to the landfill as well as to other structures, clearings and roads adjacent and associated with this site. The landfill isolates this site from possible unknown populations and habitat found upstream along Buffalo Creek as well as possible sites and habitats upstream along Long Creek (Padgett 2005).

EO Rank B - Good estimated viability **EO Origin Subrank**

EO Rank Date 2016-03-08

EO Rank Comments

EO Rank Specifications Version Used

Description

EO Type

General Description Moist, moderately steep slopes adjacent to Long Creek and an intermittent drainage area that drains into Long Creek. Canopy dominated by Quercus alba and Liriodendron tulipifera with other oak, hickory, and hardwood species also present in the canopy, subcanopy, and shrub layers. Habitat quality is good, although these two stream bluff areas seem small and fairly isolated within the surrounding landfill property. (Tuttle 2016).
Mesic Mixed Hardwood Forest. with Fagus grandifolia, Ilex opaca, Prunus serotina, Vaccinium spp., Polystichum acrostichoides, Tipularia discolor, Cornus florida, Vitus spp, Smilax spp, Carpinus caroliniana, Lonicera japonica, Pinus taeda, Mitchella repens, Chimaphila masculata, Juniperus virginiana, Acer rubrum, Quercus rubra, Lyquidambar styraciflua, Liriodendron tulipifera, Pinus virginiana, Quercus alba (Huysman 1996). The slope above the creek contains a very diverse collection of spring ephemerals (Newberry 1996).

Protection Comments The area has been designated as Special Protected Environmental Area by Cleveland County.

MA/Ownership

Managed Area

MA ID	Managed Area Name	Managed Area Type	Contained	Auto-calculated

More Management Y - Yes

Management Comments Recommendation of border species by G. Newberry should be considered (Padgett 2005). --G. Newberry recommends planting a protective border of trees such as locust, pine, or red maple on the upslope edge adjacent to the landfill to protect the slope from runoff and edge species such as Lonicera or kudzu.

Ownership

Owner Type	Owner Name	Owner Note
Local government	CLEVELAND COUNTY	

Owner Comments Contact at the Cleveland County Landfill is Sam Lockridge, 704-447-8204. (Tuttle 2016).

OwnerInfo_BCD Y

Additional Topics

General Comments Invasive species present include Microstegium vimineum, Pueraria lobata, and Ligustrum sinense. These are not abundant on the bluff areas or where H. naniflora occurs, but they are abundant or dominant in areas adjacent to the species' habitat or elsewhere on the landfill property. Area of suitable habitat may include the larger area mapped previously for this EO. This survey confirmed the northern streamside boundary of the population and suitable habitat; at this northern streamside boundary is a small, grassy roadcut to the stream, and Microstegium vimineum overwhelmingly dominates the herbaceous layer in the forest north of this roadcut. (Tuttle 2016)

Additonal Topics Geology : CZbg - Biotite gneiss and schist- Inequigranular, locally abundant potassic feldspar and garnet; interlayered and gradational with calc-silicate rock, sillimanite-mica schist, mica schist, and amphibolite. Contains small masses of granitic rock

Survey Date 2016-05-13

Last Observation Date 2016-05-13 **First Observation Date** 1992-1993

EO Data 2016: 212 plants counted by Bloom on 13 May 2016. Estimated 1459 plants covering the entire remapped 1.39 acres (Bloom 2016).
2015: 211 plants counted by Padgett on 19 May 2015 in 0.14 acres of monitoring plots. Estimated 1700 total plants covering the entire 1.17 acres (Padgett 2015).
2014: Padgett counted 213 plants in permanent monitoring plots on 19 May 2014 and estimated a total of 1780 plants over 1.17 acres (Padgett 2014).
2013: Padgett counted 211 plants in permanent monitoring plots on 16 July 2013 and estimated a total of 1763 plants over 1.17 acres (Padgett 2013).
2012: 208 plants counted in 0.14-acre sample plot in 2012. Estimate of 1738 plants total. (Padgett 2012). This site was revisited by James Padgett and Laura Gadd (NHP) and remapped in June 2012.
900 counted, probably at least 1,000 plants (Franklin and Padgett 2005). 150-200 plants observed by Newberry in 1995 or 1996 (Newberry 1996). Stovall and Murdock disovered this occurrence in 1992 or 1993 (reported in Newberry 1996).

Element Occurrence Report

EO ID 385 **Subnational Scientific Name** *Hexastylis naniflora* **Shape_ID** 3301

General Description LOW ELEVATION SEEP (PIEDMONT/MOUNTAIN SPRINGHEAD SUBTYPE – Canopy is primarily Acer rubrum and Liriodendron tulipifera, but also includes Nyssa sylvatica and Fraxinus pennsylvanica. The sub canopy is primarily Acer rubrum, Ilex opaca, Carpinus caroliniana, and saplings of Fraxinus pennsylvanica and Fagus grandiflora. The shrub layer is predominately Viburnum nudum var. nudum, Vaccinium corymbosum, Rhododendron periclymenoides, Lindera benzoin, and Calycanthus floridus. Other shrubs found throughout are Amelanchier arborea and Itea virginica. Much of the shrub layer is bound up with Smilax laurifolia and less often with Smilax rotundifolia, Muscadinia rotundifolia, and Parthenocissus quinquefolia. The ground and many of the trees are covered with vines of Decumaria barbara. The herbaceous layer is dominated by Parathelypteris noveboracensis, Osmundastrum cinnamomeum, Osmunda spectabilis, and Lorinseria areolate. The herbaceous layer also includes Polystichum acrostichoides, Viola sororia, Arundinaria gigantea, Arisaema triphyllum, Medeola virginiana, Mitchella repens, and Microstegium vimineum. There were also a number of Trillium rugelii found in fruit.(Bloom 2016)
Nice Piedmont Boggy Streamhead (?) with Pinus virginiana, Quercus alba, Liriodendron tulipifera, Ilex opaca, Nyssa sylvatica, Carex lurida, C. intumescens var. intumescens, C. atlantica, C. debilis, Polystichum acrostichoides, Xanthorhiza simplicissima, Mitchella repens, Thelypteris noveboracensis, Fagus grandiflora, Vaccinum corymbosum, Ilex opaca, Microstegium vimineum, Rhododendron Af. periclymenoides, Toxicodendron radicans, Platanus occidentalis, Viola sororia [V. papilionaceae], Calycanthus floridus, Sassafrass albidum, Uvularia perfoliata, and Vitis rotundifolia (Franklin et al. 2005). Piedmont bog, shrubby, near cow pasture, cows have access to site, logging has recently occurred (1993).

This presentation was given to HQ on Aug 30, 2019 by Byron Hamilton with the RO. Rebekah was on the call to answer questions following the presentation. These are Rebekah's notes to prepare for Q&A.

We started the SSA process by sending Dear Interested Party letters to those that we thought would be interested or have information to share about the species – January 10, 2018. We sent 78 emails and 6 letters. We received 3 responses.

We first engaged our experts during a kick-off call and presentation in January of 2018. This was followed by elicitation questions and review of the SSA during each phase of the writing process.

NCNHP was incredibly involved in the process and provided input that helped shape the SSA. SCHTP declined to participate on the expert team citing that they had not worked with the species in many years and weren't sure what additional information they could contribute to the process. They did provide us with heritage data and they were asked to participate in the peer review process.

We sent the SSA to seven potential peer reviewers on May 11. Peer review officially ended on June 4. To date we have received no comments.

<u>Other notes</u>
Have timeline
Who responded – David Brown (Corps related projects), Jennifer Robertson (quarry site and ski lake), and Gill Newberry (differences between HENA and HEHE)
Have elicitation questions

<u>The HENA Team</u>
Core Team

Mike Marshall is with the Atlanta RO and is our lead writer.
I am a part of the Core Team.
Mark Endries is a GIS Analyst in our Asheville ES Field Office and completed all of the GIS modeling you see in the SSA.
Stephanie DeMay is with Texas A&M University's Natural Resources Institute and she provide additional review of the SSA.
Byron Hamilton and Drew Becker are our project managers and they provided support from the RO.
Expert Team
Suzanne Mason – Conservation Data Manager with NCNHP
Jame Amoroso – Conservation Information Specialist with the NCNHP
Laura Robinson – Botanist with the NHP and author or co-author of the NCNHP report referenced in the SSA
Dr. Matt Estep – Assistant Professor in the Department of Biology at ASU with a focus on Evolutionary Genetics and Genomics

Peer Review
We sent the SSA to seven potential peer reviewers on May 11, 2018.

Wesley Knapp – Western Regional Ecologist and Botanist with the NCNHP
Tim Bassette – Environmental Program Consultant with the NCDOT
Dr. Gillian Newberry - retired botanist from USC-Upstate
Dr. Doug Rayner – Professor of Biology at Wofford College with an emphasis on botany and ecology
Dr. Chick Gaddy – field-trained naturalist and consulting biologist
Dr. Zack Murrell – Professor and chair of the Biology Department at ASU focusing on plant systematics, speciation and hybridization, Southern Appalachian floristics and biogeography
Herrick Brown – Assistant Botanist at the SC Heritage Trust Program

All of the individuals chosen has worked closely with the species at some point during their careers. Peer review ended on June 4, 2018 and we have received no comments to date.

Other notes
Floristics – study of the plants in a specific area

HENA was listed as threatened in 1989. At the time of listing, there were 24 known populations in 8 counties. This included approx. 5,000 individuals. Residential and industrial development was cited as the main threat. (Counties: SC – Chero, Green, Spart and NC – Clev, Cata, Burk, Ruth, Linc)

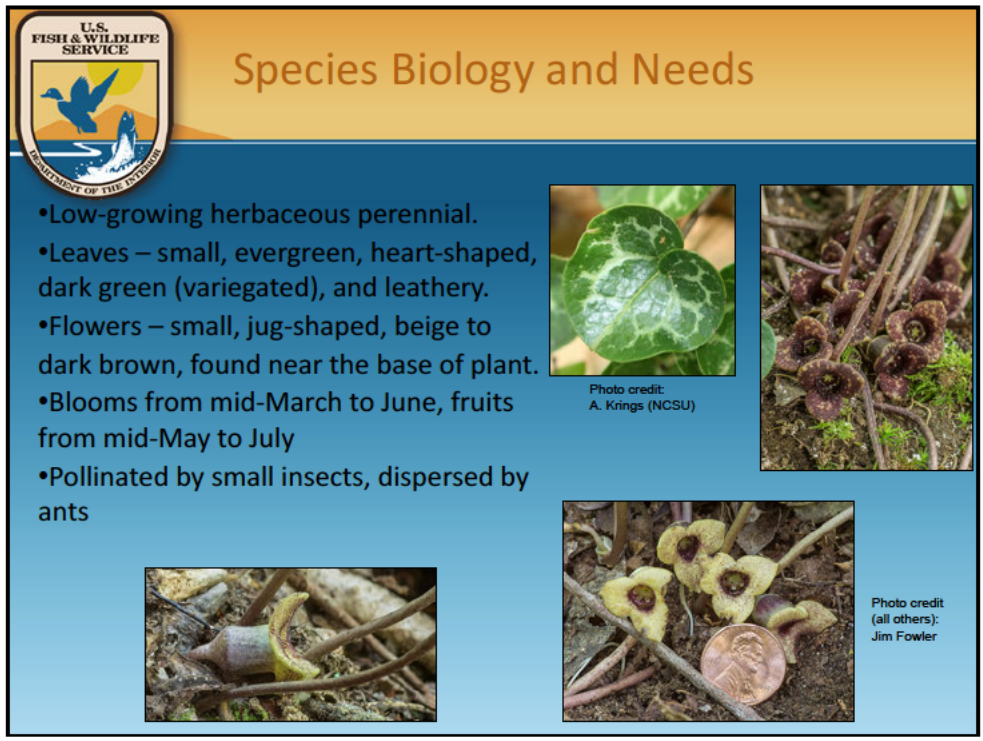
A recovery outline was developed in 1989. And, the outline indicated the draft plan would be completed by FY91. However, a Recovery Plan was never complete. The lack of Recovery Plan was what initially triggered this SSA; however, a significant amount of recovery has occurred. (There were attempts at Recovery Plans or Criteria by others – James Padgett, Gill Newberry, and NHP)

A 5-YR Review was finalized in 2011.

A Range-wide Status Report was finalized in 2016.

The SSA was initiated in January of 2018 and there are now 119 populations in 13 counties totaling more than 300,000 individuals.

<u>Other notes</u>
At the time of listing - Other threats cited in the listing rule include conversion of habitat to pasture or small ponds, timber harvesting, and cattle grazing.



A 5-YR Review was finalized in 2011 (initiated in 2005). Known populations jumped to 108 and the range expanded to 12 counties. (Counties added: NC – Alex, Cald, Ired, Polk). The 5-YR Review recommended working with partners to collect data capable of depicting status and

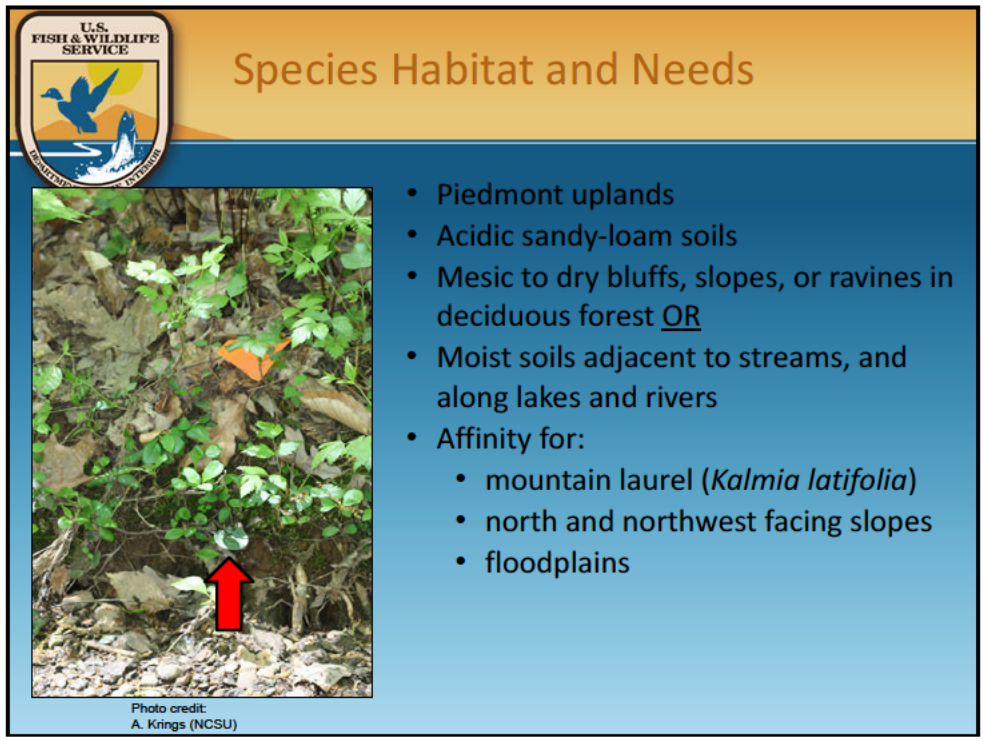
trends in HENA at focal sites (over 1,000 individuals). As a result, in 2012, the NCNHP initiated a status survey under a USFWS Flex Fund Grant to delineate and monitor some of the largest known populations previously identified by the USFWS to be important for recovery.

This effort produced a Range-wide Status Report, and a Comprehensive Review and Monitoring Report in 2016. The known populations increased to 113 populations and one additional county was added to the range. This included an estimate of approximately 300,000 individuals. (County added: NC – Gast)

The SSA was initiated in 2018 and 6 more populations were added for a total of 119 populations in 13 counties.

Fed government actions began when Section 12 of the ESA directed the secretary of the Smithsonian Institute to prepare a report of those plants considered to be TE or extinct. The report was presented to Congress in Jan of 1975. In July of 1975, the Service published a notice which formally accepted the report as a petition. By doing so, the FWS acknowledged the intention to review the status of those plant taxa named in the report. HENA was included. In June of 1976, the FWS published a proposed rule to determine that 1,700 vascular plants were endangered. HENA was included. The proposal was withdrawn in 1979 as a result of an amendment to the act. Another amendment in 1982 had all prior petitions treated as new. From 1983 to 1987, HENA was warranted but precluded by other listing actions. In 1988 there was a proposal to list HENA as threatened. Listed in 1989.

HENA is a low-growing, herbaceous plant in the Birthwort Family (Aristolochiaceae). Height of the plant rarely exceeds 15cm. The plant can have 1-40+ leaves. Leaves are heart-shaped, dark green with variegation, and leathery. They are 4-5 cm long and supported by a long, thin petiole.



Flowers are clustered at the base of the plant and often covered by leaf litter. They are small and jug shaped with no petals. Flowers have a wide range of coloring from beige to dark brown.

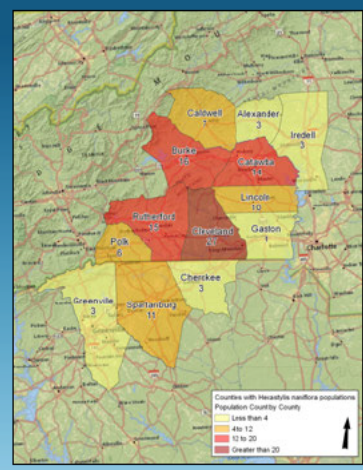
HENA is evergreen and blooms from Mid-March to June. The flower is pollinated by small insects. Fruits are produced from mid-May to July. Studies has shown that ants are one method of seed dispersal.

<u>Other notes</u>
Aristolochiaceae – Birthwort Family – 7 genera and 590 species of mostly tropical woody vines
Common in birthworts – 3-lobed calyx tube with 3 united sepals and no petals, perennial herbs and vines, typically broad leaves with red, purple, or brown flowers, fruit is a dry capsule that releases seeds when ripe
Another example is Dutchman's pipe (Aristolochia macrophylla)
Collectively the sepals are called the calyx. The outermost whorl of parts that form a flower. Sepals typically function as protection for the flower in bud and support petals when in bloom.
3 united sepals form a 3-lobed calyx tube. The calyx tube opening is typically 5mm or less but can be up to 7mm.
Underground rhizome.
Fruits are a dry capsule that releases seeds when ripe.

Not a ton of research done on pollination or dispersal
Ant pollination study Gaddy 1986
Flies, wasps, and thripes – Otte 1977
50% of plant lineage is ant dispersed – Lengyel 2010
Jones 2014 – insects play a significant role but even without them, flowers managed to produce a partial seed set.
The species in the Heterophylla complex are the most closely related and is it recognized that there is considerable morphological overlap (ex. HEHE has a calyx tube 7-14mm).

We are aware of one demographic study that took place from 1990-1991 in Spartanburg County, SC. The study found that there was a survival rate of approx. 96% over the two field seasons with highest mortality occurring in plants with <4 leaves and plants located highest on the slope. Percentage of flowering plants average 70% with the highest frequency of flowering occurring in the floodplain. Additionally, plants located in the floodplain were generally larger than plants located on adjacent slopes.

There are two types of habitat noted within Piedmont uplands with acidic soils – mesic to dry bluffs, slopes, and ravines AND moist soils adjacent to creeks, streamheads, and rivers. Literature indicates an association with mountain laurel, and an affinity for north facing slopes and floodplains.

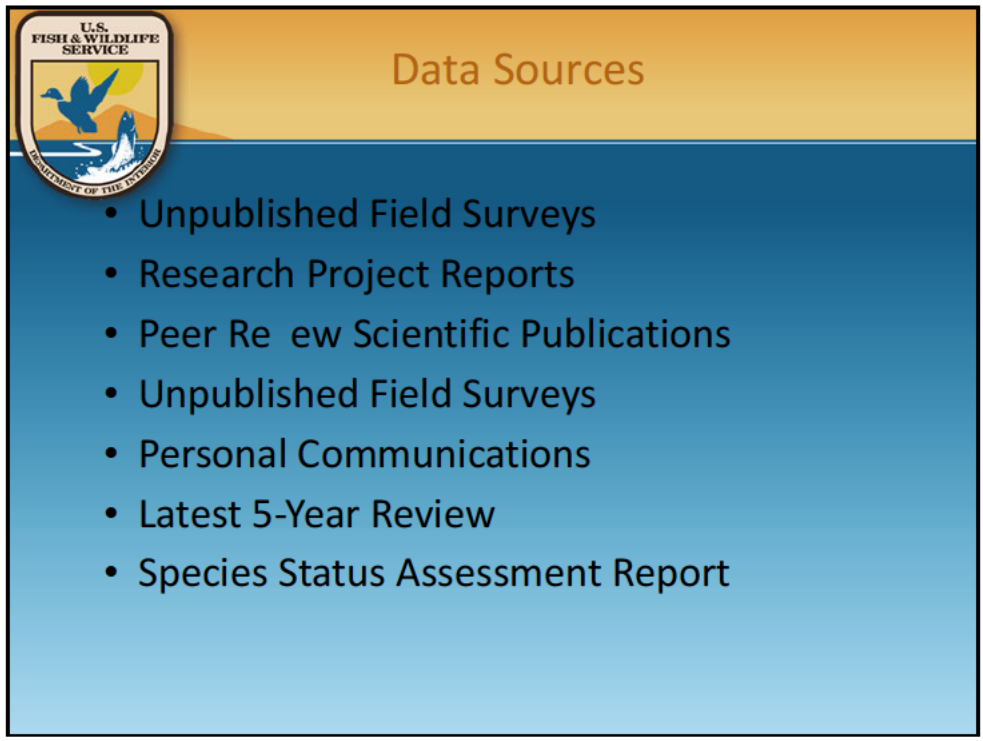


Other notes

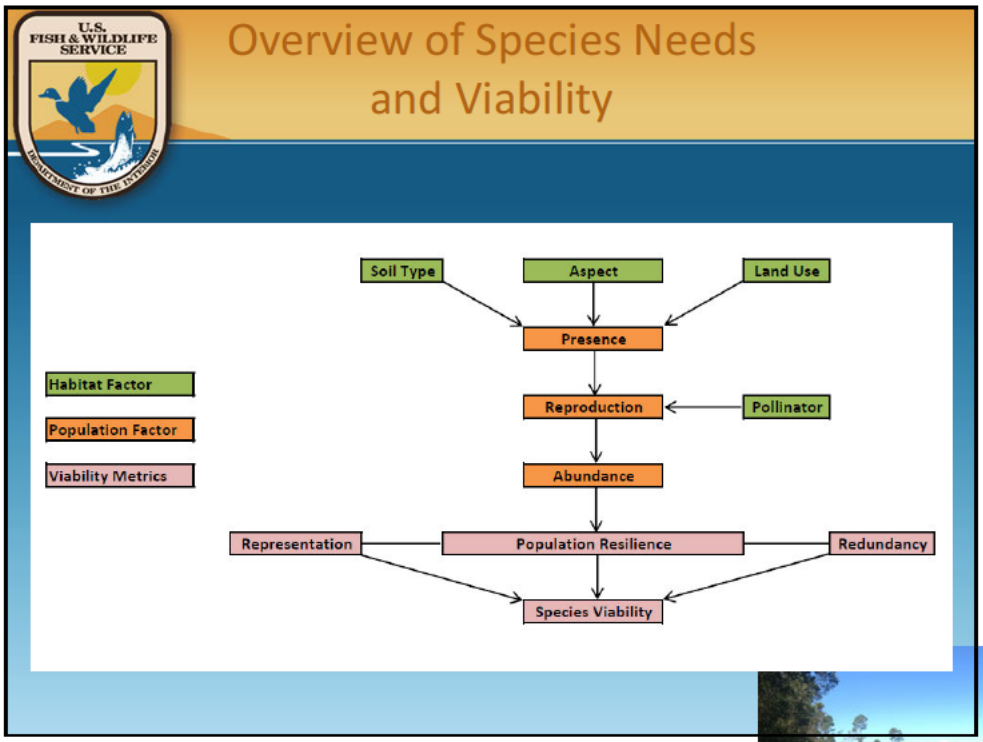
Mesic – a habitat containing a moderate amount of moisture.

What we knew about habitat preferences in the beginning changed and expanded as a result of the Habitat Model that we did but this is a list of what we knew when we started.

Species Biology and Needs



- Distribution
  - – Endemic to the region of western NC and upstate SC
- Historical
  - – 24 extant pops (one extirpated
- Current
  - – 2018, 119 pops across 13 counties in two states



HENA was listed as threatened in 1989. At the time of listing, there were 24 known populations in 8 counties. This included approx. 5,000 individuals. (Counties: SC – Chero, Green, Spart and NC – Clev, Cata, Burk, Ruth, Linc)

The SSA was initiated in January of 2018 and there are now 119 populations in 13 counties totaling more than 300,000 individuals. (Counties added: NC – Alex, Cald, Gast, Ired, Polk).

From "Recommendations for HQ Briefings" - *Map*: where is the species found? Share what we know about its range. Be prepared for questions about whether the species could be found in more places where surveys have not been conducted.

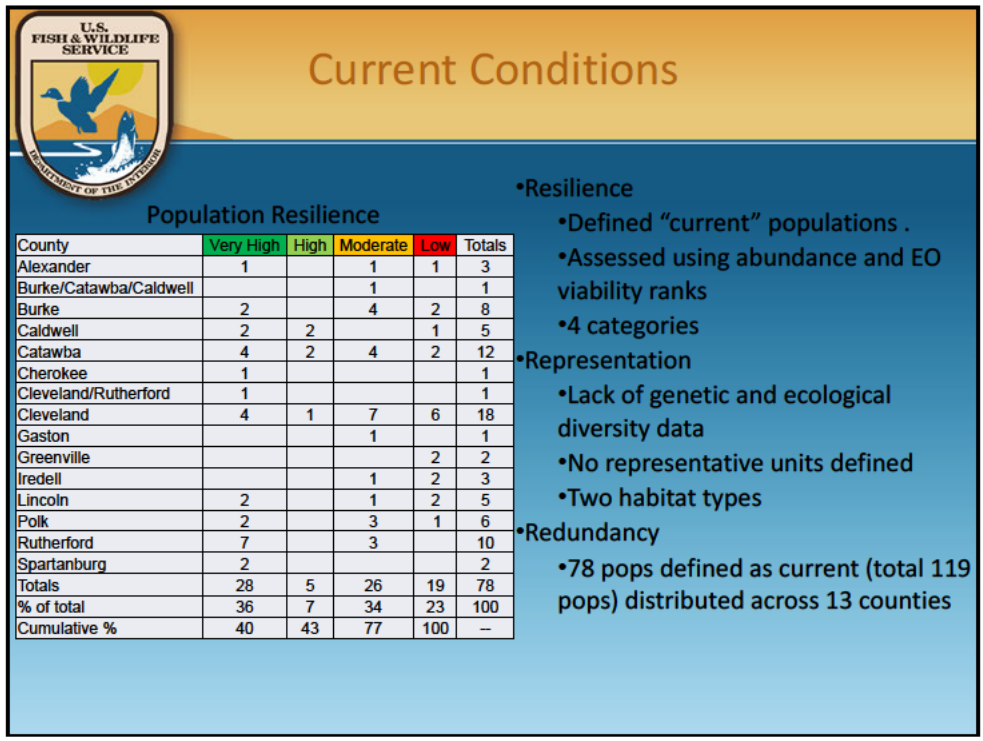
Habitat Model – Land Cover Data, SLEUTHs data, other habitat factor data (i.e. soils)
USGS National Climate Change Viewer



This is a conceptual diagram showing how we get to a resilient population and what the species needs to be resilient. Abundance is the driving factor when we talk about resilience for HENA. If we step that back, abundance requires presence of individuals and reproduction with reproduction requiring the small insect pollinator. Presence is tied back to habitat factors – acidic sandy loam soils, north-northwest facing slopes, and forested land use.

<u>Other notes</u>

This represents what we knew about the species when we started. As mentioned earlier, we learn more about habitat during development of the Habitat Model.

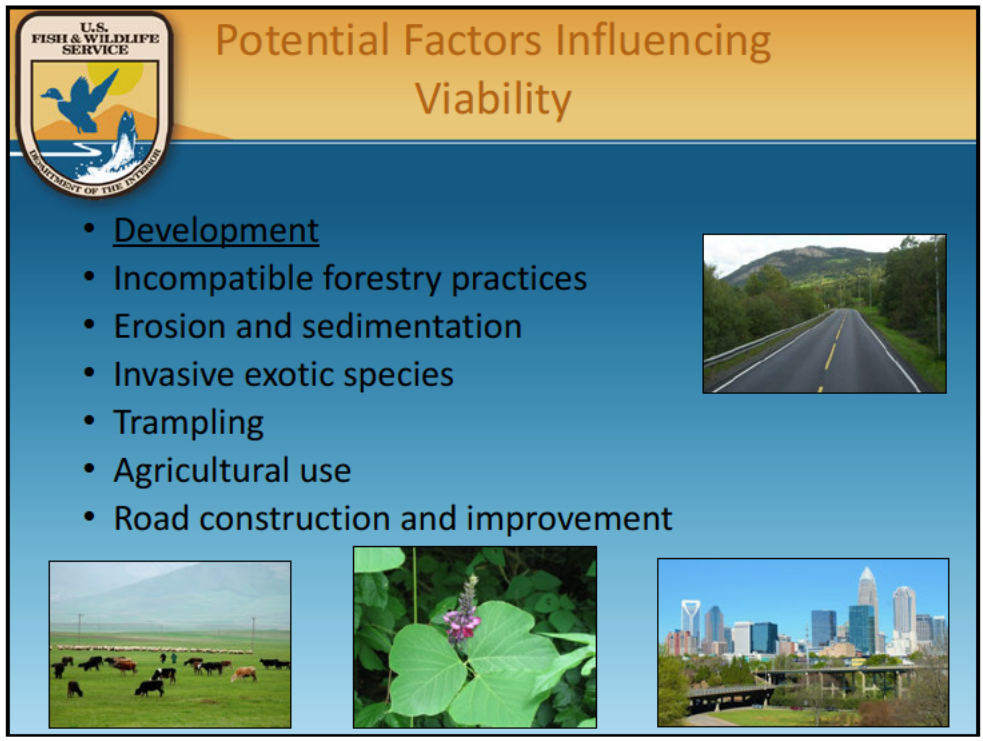
To assess current conditions, the first thing we did was to determine which populations would be included in our analysis. The element occurrence data from the Heritage programs includes a wide range of years since the species was last observed at a given location (1964-2017), data and reports suggest the species consists of 119 populations, but some of that data is outdated and some sites haven't been seen in many years. For the purposes of this SSA, we took a conservative approach and only used element occurrences that were observed since 2005. We picked 2005 because this was consistent with a natural break in the data that coincides with the initiation of the last 5-YR Review and it is consistent with the current populations that were used for the habitat model. So, based on our criteria, there are 78 populations that we define as current for purposes of the SSA. It is important to note that many of the populations that we excluded from our analysis likely still persist on the landscape.

Resilience

To determine overall resilience for populations we defined as current, we used known abundance and viability ranks from Heritage Program data as a starting point. The Heritage Program viability rankings are primarily based on abundance as well, but habitat condition (vegetation community and structure) and landscape context (extent of suitable habitat and physical factors) are also considered. Using the Heritage program data, we developed four resilience ranks from low to very high. The table to the left shows a break down of the 78 populations by County and resilience rank. The bottom of that table shows % totals and cumulative %. 43% of populations are high or very high, and 77% of populations are moderate to very high.

Representation

We do not have the genetic and ecological diversity data to characterize representation for



Hexastylis naniflora so we did not delineate representative units for the species. However, we do note that there are two habitat types across the range. One is the mesic to dry bluffs, slopes, and ravines and two is moist soils adjacent to creeks and streams.

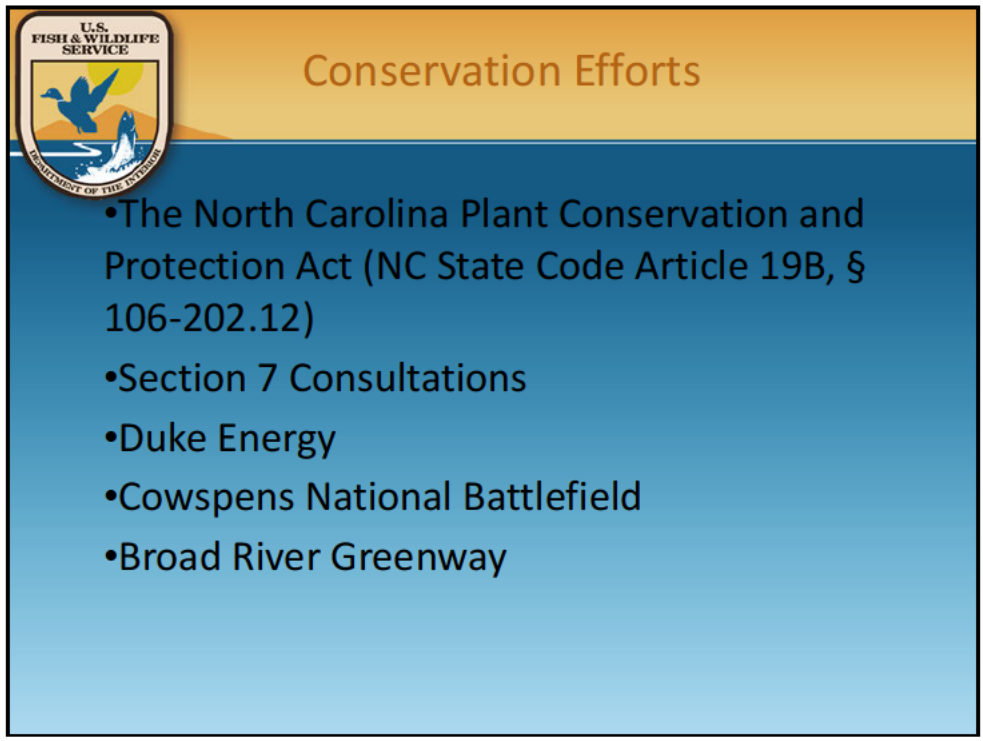
Redundancy

Although Hexastylis naniflora is an upper Piedmont endemic, there are 78 populations defined as current distributed across 13 counties and two habitat types. This is a conservative estimate since the Heritage program data identifies 119 populations across the 13 counties observed from 1964 to 2017.

If asked:

Very high—populations with >1,000 individuals; very high probability of persistence for 20-30 years at or above the current population size.
High—populations with 500-1,000 individuals; moderate-high probability of persistence for 20-30 years at or above the current population size.
Moderate—populations with 100-500 individuals; low probability of persistence for 20-30 years at or above the current population size.
Low—populations with <100 individuals; low probability of persistence for 20-30 years at or above the current population size, and moderate-high probability of extirpation.

There are several factors that influence the viability of HENA. Development was listed as the primary threat in the listing package and that is still the primary threat today. A large number of known populations occur near expanding urban areas and are threatened by residential, commercial, and industrial development. Most if not all of the threats listed could be linked back to development.



Other notes

Threat of development has either occurred or is reasonably foreseeable in approx. 37% of known population (NCNHP 2010)

Of those populations, all or portions of 50% had been adversely impacted by activities requiring ESA Section 7 consultation with the USFWS

Road and bridge improvement projects are the most recurrent source of habitat destruction

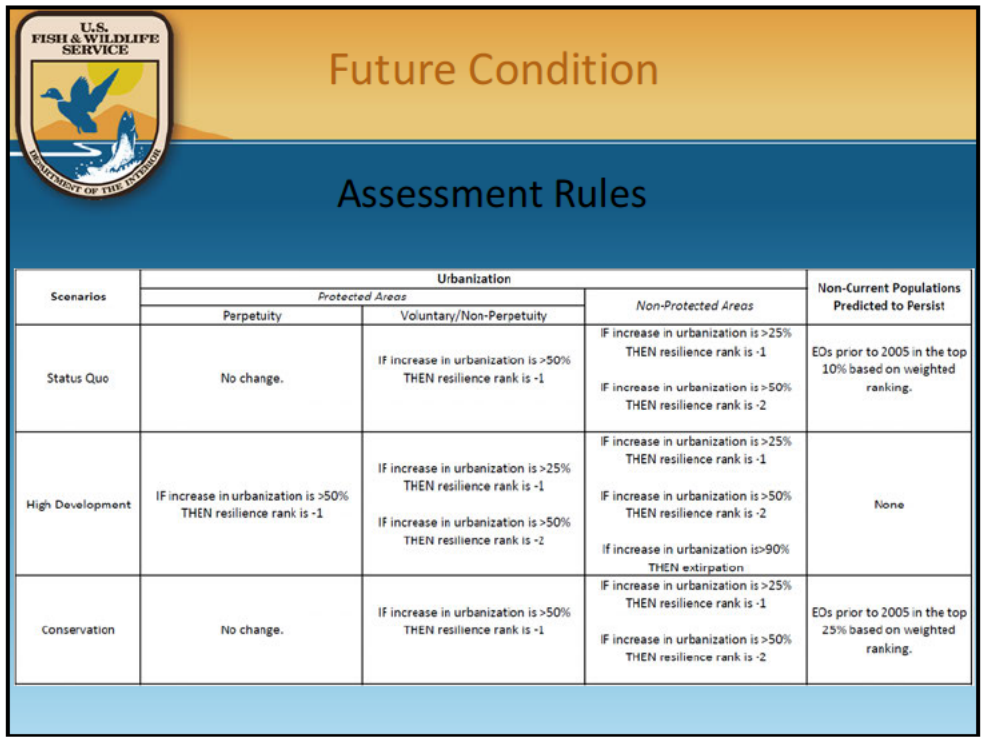
Ten of the 27 largest populations (containing more than 1,000 rosettes) have been the subject of Section 7 consultations between the USFWS and the NCDOT (NCNHP 2010)

Add to list: Registered Heritage Areas, State Heritage Preserves, Conservation Easements, Deed Restrictions.

Protection status for the 78 populations identified as current was determined as a part of the SSA. Twenty-four populations, at least in part, are protected in perpetuity, 18 populations, at least in part, are voluntarily protected or protected but not in perpetuity, 34 populations are not protected, and two populations have an unknown status. Several populations are afforded permanent protection through fee title ownership by conservation partners. These sites include NCDOT mitigation sites at Murrays Mill and the Broad River Greenway. Other sites in permanent protection include the Catawba Lands Conservancy's Rhyne Preserve, the Cleveland County Landfill, Cowpens National Battlefield, and Peters Creek South Carolina State Heritage Preserve. NCNHP holds four voluntary Registry Agreements with private landowners for the purpose of protecting *Hexastylis naniflora*. These sites are the Parris Heartleaf Registered Heritage Area (RHA), the New Hope Springhead (Barefield) RHA, the Catawba County Wildlife Club RHA, and the Smith Cliff/Henry Fork RHA. Some populations are protected through conservation easements held by various partners. These include populations at the New Bethel Rare Plant Site, held by NCDOT. The Foothills Conservancy of NC holds a conservation easement at Peaked Top Rare Plant Site, and The Nature Conservancy holds a conservation easement at Jacob Fork West Corridor.

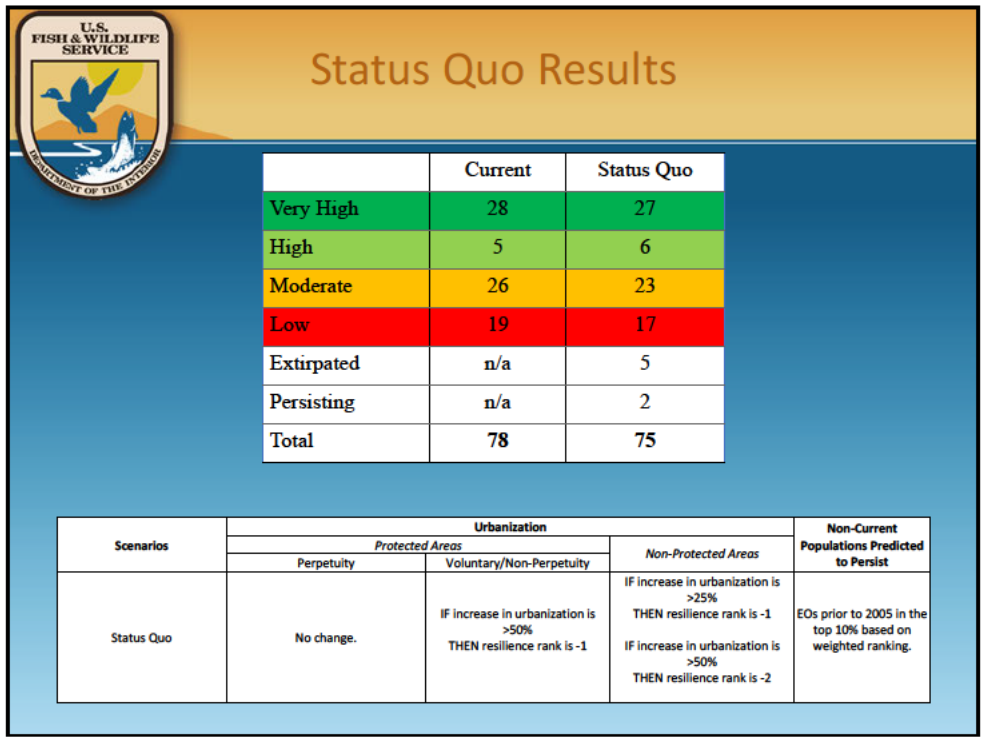
NC Plant Conservation and Protection Act and SC State Code of Regulations Part 123§200-204. The North Carolina Plant Conservation and Protection Act (NC State Code Article 19B, § 106-202.12) provides limited protection from unauthorized collection and trade of plants listed under that statute. However, this statute does not protect the species or its

habitat from destruction in conjunction with development projects or otherwise legal activities. Plant species are afforded even less protection in South Carolina, where they are protected only from disturbance where they occur on those properties owned by the state and specifically managed as South Carolina Heritage Preserves (SC State Code of Regulations Part 123 § 200-204).



Future Conditions

- Development of Future Scenarios
  - Primary threat = Development
  - Persistence of populations (pre-2005)
  - Assessment to 2040
- Three Scenarios
  - Status Quo
  - High Development
  - Targeted Conservation

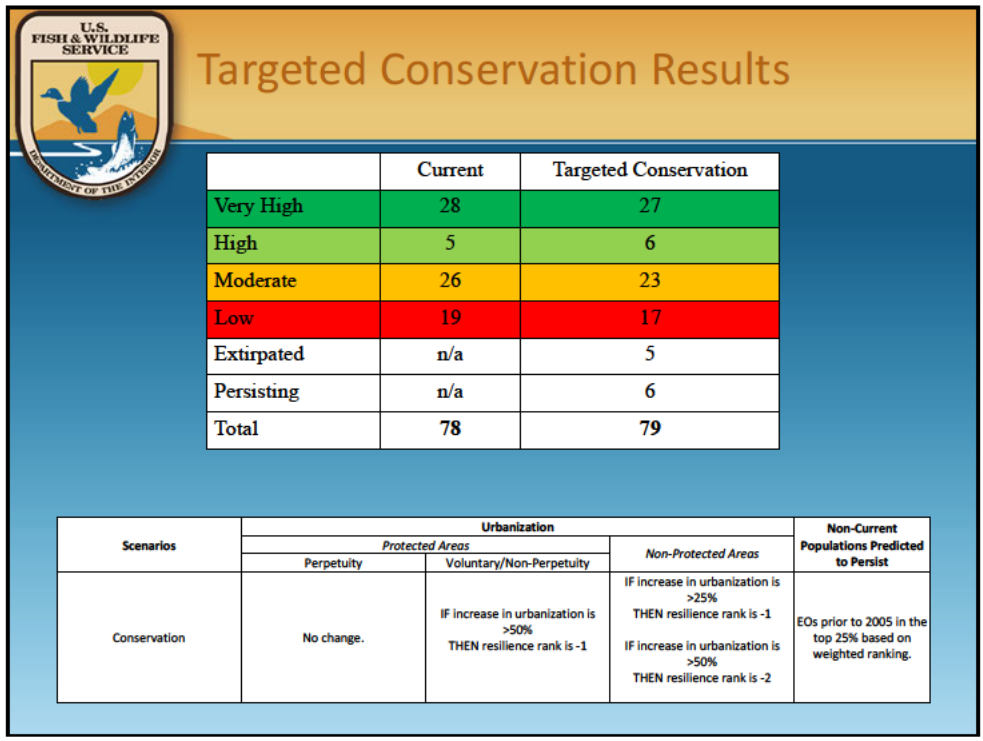


In developing our future scenarios, we wanted to make sure we addressed development and urbanization since that is the largest threat to the species. Because populations are known to persist for many years, we wanted to also estimate the number of populations, not defined as current, that are still on the landscape. We chose an assessment timeframe to 2040 – this was chosen based on what we know about longevity of the species, expert input, precision of predictive models that show future development, and uncertainty about future conditions.

The three scenarios are: Status Quo, High Development, and Targeted Conservation. We believe that these three scenarios represent a range of possibilities that capture uncertainty about the future.

Scenarios	Urbanization			Non-Current Populations Predicted to Persist
	Protected Areas		*Non-Protected Areas*	
	Perpetuity	Voluntary/Non-Perpetuity		
Status Quo	No change.	IF increase in urbanization is >50% THEN resilience rank is -1	IF increase in urbanization is >25% THEN resilience rank is -1 IF increase in urbanization is >50% THEN resilience rank is -2	EOs prior to 2005 in the top 10% based on weighted ranking.
High Development	IF increase in urbanization is >50% THEN resilience rank is -1	IF increase in urbanization is >25% THEN resilience rank is -1 IF increase in urbanization is >50% THEN resilience rank is -2	IF increase in urbanization is >25% THEN resilience rank is -1 IF increase in urbanization is >50% THEN resilience rank is -2 If increase in urbanization is>90% THEN extirpation	None
Conservation	No change.	IF increase in urbanization is >50% THEN resilience rank is -1	IF increase in urbanization is >25% THEN resilience rank is -1 IF increase in urbanization is >50% THEN resilience rank is -2	EOs prior to 2005 in the top 25% based on weighted ranking.

Here are our assessment rules for each scenario. These are generally set up as IF-THEN statements. We assume that there will be a range of impacts from urbanization that are related to the % increase in urban development and we assume that a few populations will be persisting on the landscape depending on the scenario. So, if there is a certain % increase in urbanization/development, then resilience decreases by a certain amount.



For the Status Quo scenario, we assumed there is no change in resilience for sites protected in perpetuity, we assumed a drop in resilience category if voluntarily protected sites and non-protected sites reached the thresholds in the table. And, we assumed that only those non-current populations that ranked in the top 10% of our ranking would be persisting on the landscape. The results are shown in the table. This scenario results in 5 extirpations and 2 persisting populations for a total of 75 populations in 2040.

High Development Results

	Current	High Development
Very High	28	27
High	5	4
Moderate	26	25
Low	19	16
Extirpated	n/a	6
Persisting	n/a	0
Total	**78**	**72**

Scenarios	Urbanization			Non-Current Populations Predicted to Persist
	Protected Areas		*Non-Protected Areas*	
	Perpetuity	Voluntary/Non-Perpetuity		
High Development	IF increase in urbanization is >50% THEN resilience rank is -1	IF increase in urbanization is >25% THEN resilience rank is -1 IF increase in urbanization is >50% THEN resilience rank is -2	IF increase in urbanization is >25% THEN resilience rank is -1 IF increase in urbanization is >50% THEN resilience rank is -2 If increase in urbanization is>90% THEN extirpation	None

For the High Development scenario, we assumed a drop in resilience category if any sites reached the thresholds in the table. And, we assumed no non-current populations would persist on the landscape. This scenario results in 6 extirpations for a total of 72 populations in 2040.

	Current	Targeted Conservation
Very High	28	27
High	5	6
Moderate	26	23
Low	19	17
Extirpated	n/a	5
Persisting	n/a	6
Total	**78**	**79**

Scenarios	Urbanization			Non-Current Populations Predicted to Persist
	Protected Areas		*Non-Protected Areas*	
	Perpetuity	Voluntary/Non-Perpetuity		
Conservation	No change.	IF increase in urbanization is >50% THEN resilience rank is -1	IF increase in urbanization is >25% THEN resilience rank is -1 IF increase in urbanization is >50% THEN resilience rank is -2	EOs prior to 2005 in the top 25% based on weighted ranking.

For the Targeted Conservation scenario, we assumed the no change in resilience for sites protected in perpetuity, we assumed a drop in resilience category if voluntarily protected sites and non-protected sites reached the thresholds in the table. And, we assumed that only those non-current populations that ranked in the top 25% of our ranking would be persisting on the landscape. The results are shown in the table. This scenario results in 5 extirpations and 6 persisting populations for a total of 79 populations.

Viability Summary

	Current	Status Quo	High Development	Targeted Conservation
Very High	28	27	27	27
High	5	6	4	6
Moderate	26	23	25	23
Low	19	17	16	17
Extirpated	n/a	5	6	5
Persisting	n/a	2	0	6
Total	**78**	**75**	**72**	**79**

This is a table that shows all scenarios. The chart shows the data represented graphically.

Urban development is predicted to have negative impacts on several of the current populations under all of our scenarios and all scenarios have extirpations. However, the loss of resilience and extirpations is offset by several populations were found to persist in the Status Quo and Targeted Conservation scenarios. In all scenarios, the majority of the populations in 2040 are of at least moderate resilience.

Given the number of populations across each scenario, redundancy remains similar to current conditions.

Although we did not delineate representative units, we do not believe the scenarios predict declines in species representation because the populations in each scenario occur in both habitats known for the species.

Gary Peeples. Media release has been drafted (in May).

Purpose – The purpose of the post-delisting monitoring plan is to verified that dwarf-flowered heartleaf doesn't become at risk of extinction after protections of the Act have been removed.

Basis of Plan - We prepared this plan with input from the North Carolina Natural Heritage Program (NCNHP) and the North Carolina Department of Transportation (NCDOT) and the plan is based largely on monitoring methods developed in 2012 during a field coordination meeting with NCNHP, NCDOT, and the Service. NCNHP and NCDOT have monitored 25 of the largest populations for at least five years to collect baseline data.

Monitoring Methods – Plots or complete census. For plots, each monitored population will be delineated with a GPS, randomly established plots from 2012 will be revisited (plots established to cover approx. 10% of the population), counts will be extrapolated to determine an estimate population size. For small sites where it is practical, a complete census will be done.

Frequency and Durations – Monitoring will begin during the first full growing season (March – May) following the publication of a final. Monitoring will occur within at least 12 of the 25 previously monitored populations. Monitoring will be conducted on a two-year cycle in which at least 6 sites are monitored each year for six years (each site receives three complete monitoring cycles).

Response Trigger - After a monitoring period of six years, all years of data, including baseline data from 2012-2016, will be analyzed for trends and factors that may be influencing the population (e.g., threats). From this analysis, it will be possible to categorize observations into one of three possible outcomes which will guide the path forward – stay the course; extend

monitoring period and increase monitoring intensity, implement management; or initiate a formal status review to determine if relisting is appropriate.

Estimated Funding Requirements – Currently, NHP estimates 6 years of monitoring for 12 sites (each cycle is 2 years and 6 sites) would be $36,600. DOT could not provide a cost estimate for 6 years and 12 sites but indicated if would be significantly higher than the NHP estimate.

Climate Change – To assess the effects of climate change on HENA, we used the USGS National Climate Change Viewer –this viewer takes the full datasets of 30 climate models and scales it down to a county level in the US. It also uses two different greenhouse gas emission scenarios – we chose to use the more extreme of the two (representative concentration pathway 8.5, which assumes emission will continue to rise uncheck through the end of this century leading to an equivalent radiative force of 8.5 watts per meter squared). Using the tool we calculated projected mean changes comparing 1981-2010 to 2005-2049 for max temp, precipitation, soil storage, and evaporative deficit. And, we did this for all counties were HENA occurs. Results – all counties will be subject to higher temperature (annual mean inc of 2.9F), slightly higher precipitation (annual mean increase of 0.2 inches per month), and slight decrease in soil storage (annual mean decrease of 0.1 inch), no change in evaporative deficit. Because the average annual increase in precipitation is predicted to be only slightly higher, the loss in soil storage is likely primarily the result of higher predicted temperatures.

Although climate change could negatively impact HENA, the species has traits that help it be resilient.
-Long-lived species – two studies that compare life-history traits and vulnerability of plants in relation to climate patterns concluded that long-lived species should be less influenced by climate-driven increases in demographic variability.
-There is evidence that seeds are disperse by ants. Ants can disperse seeds to new locations where habitat may be better and ants are known to bury seeds – which some studies have shown to protect them from fire and drought – two conditions made worse by climate change.
-Apparent tolerance to fire – a wildlife, presumably brought on by or at least made worse by drought, burned portions of one of the largest known populations in 2009. Later observations suggest that the species wasn't harmed by the fire. Additionally, the NPS is using prescribed

fire to manage sites at Cowpens NB. Monitoring data there shows that burning has had no adverse effects of growth or flowering.
-Habitat variability – two known and varied habitats (dry bluffs and slopes, and moist soils adj to streams). The variation provides species representation in drier and wetter habitat. This shows the species ability to adapt to different environmental conditions that could be brought on by climate change.

We know that climate change is almost certain to affect HENA and habitat in NC and SC, but we are uncertain about specific effects. Based on what we know and traits mentioned, we have no direct evidence that climate change has had an adverse impact to date and we don't believe it will be a significant threat in the future.

Invasive Species - Invasive, exotic plants were identified as a threat at the time of listing; however, the threat may not be as significant as once thought. The NCNHP monitored 13 populations of *Hexastylis naniflora* and assessed threats at each population. Their results show that, of monitored sites, only 9 percent of populations (one of 11) where invasive, exotic species are present are also in decline, indicating the species has at least some capacity to withstand the presence of invasive, exotic species. The invasive, exotic plant threat posed at many of the largest populations is low (NCNHP 2016, pp. 8, 17–20); and the number of populations under conservation ownership with management has increased.
Therefore, we do not believe that competition from invasive, exotic species will be a significant threat in the foreseeable future.

[Invasive, exotic plant species occur across the range of this species. Plants such as English ivy (*Hedera helix*), Chinese privet (*Ligustrum sinense*), Japanese honeysuckle (*Lonicera japonica*), and Japanese stiltgrass (*Microstegium vimineum*)are known at several sites that contain *Hexastylis naniflora* (Service 2011, p. 15). Invasive, exotic species were identified as a threat at 8 of 10 North Carolina populations monitored by NCNHP (Robinson and Padgett 2016, pp. 17–19). The eight populations include four stand-alone EOs and four parent EOs with 19 sub-EOs. Of the four stand-alone EOs, one has an invasive threat rank of B (moderate to severe, imminent threat for a significant portion (20–60 percent) of the population, occurrences, or area), two have a rank of F (low severity threat for most or a significant proportion of population, occurrences, or area), and one has a rank of G (low severity threat for a small proportion of population, occurrences, or area). Of the 19 sub-EOs, 9 have invasive, exotic species identified as a threat. Of the nine sub-EOs, one has an invasive threat rank of A (moderate to severe, imminent threat for most (more than 60 percent) of population, occurrences, or area), four have a rank of B (moderate to severe, imminent threat for a significant portion (20–60 percent) of the population, occurrences, or area), two have a rank of E (moderate to severe threat for a small proportion of population, occurrences, or area), and two have a rank of G (low severity threat for a small proportion of population, occurrences, or area). The one stand-alone EO and five sub-EOs with the highest threat ranks (A and B) are located in three populations. Based on the most recent monitoring data, one is increasing, one is stable, and one is decreasing (Robinson and Padgett 2016, p. 11).

Invasive, exotic species were identified as a threat at all (three) South Carolina populations monitored by NCNHP, and all sites had an invasive threat rank of F (low severity threat for most or a significant proportion of population, occurrences, or area) (Robinson and Padgett 2016, p. 20). Based on the most recent monitoring data, all populations are stable (Robinson

and Padgett 2016, p. 11).

In short, the data indicate that *Hexastylis naniflora* populations can persist and increase in the presence of invasive, exotic species. Despite the long-term presence of invasive, exotic plants, from 2012 to 2016, there were no changes in the severity of threats observed in the field from these species significant enough to elevate the threat ranks of *Hexastylis naniflora* populations evaluated (NCNHP 2016, p. 8).]

Development – Three tools used to evaluate the three scenarios…Maxent, SLUETH, additive weighting. Development is predicted to have a negative impact on several current populations under all scenarios. However, the majority of populations evaluated are expected to remain on the landscape in 2040 at a level of at least moderate resiliency. Given the high numner of populations across each scenario, redundancy remains similar, and although we did not define representative units we will expect species to be present in varied habitats across the range.

Rebekah

The Columbia office of the Heritage Program has not been involved with the species in some time. That would have been Mary Bunch, preserve manager, in the Clemson office. She is now retired and replaced by Pat Cloninger. CloningerP@dnr.sc.gov . I think the new tract Herrick is referring to may be under negotiation which typically remains confidential until acted upon by the SC Heritage Trust Board. Pat can advise.

Subject: RE: [Scpca] Hexastylis naniflora in SC

Rebekah,

Jill (Gillian) Newberry formerly of USC Upstate in Spartanburg was quite active with this species. There was some recent activity involving property outside of Travelers Rest, SC and adjacent to Blackwell and Bunched Arrowhead preserves that involved some scrutiny for occurrences of this species. Indeed we found the answers on some specimens at USCS available here: http://sernecportal.org/portal/collections/list.php?taxa=Hexastylis%20naniflora&thes=1&type=1&state=south%20carolina&db=all&page=1

I've granted your user account permission to view all of the details and the specimen images where

you'll see the coordinate values (on some as the metadata are not fully developed on many).

I can work to get you what SC Heritage has so far in Biotics for this species.

Also, you might try Zack Murrell at App State U, I know he has had an interest in this species and you may be able to convince him to fast track the digitization of any specimens he has (they don't currently appear to be available in the SERNEC portal).

Best,
Herrick

Subject: [Scpca] Hexastylis naniflora in SC

Hi Everyone,

I am the species lead for Hexastylis naniflora and I work out of the FWS Asheville Field Office. I am seeking information about H. naniflora populations in SC. I have thorough information for Cowpens, Peters Creek Heritage Preserve, and Blalock Res; but, not much in the way of current information for other SC populations. Any information regarding the following would be very helpful:

- Who is working on H. naniflora in SC? And, what have you been up to?
- Does anyone have information on the following sites:

  Cherokee Creek near Cowpens (last Heritage update 2004)

  Spartanburg Water System Preserve (last Heritage update 2001)

  Claggett site in Raintree subdivision (last Heritage update 1991)

  UT to Spivey Creek (last Heritage update 1991)

Peters Creek Heartleaf Site/Saranac Lake Subdivision (last Heritage update 1991)

- Other than sites I've mentioned, does anyone have information of other large and/or high ranked and/or preserved populations in SC?
- Anything else that can help me get up to speed on H. naniflora in SC?

Thank you and please feel free to email me directly.

Rebekah,

I'm the President of Naturaland Trust, the land trust in Greenville that works to protect special places in the SC Piedmont and SC's Blue Ridge Mountains. We are interested in Hexastylis naniflora and seek to protect properties that include it. I'm also a volunteer with the SC Native Plant Society. I'm copying Jeff Beacham, the former state president, because, as set out below, he and I have worked on a couple of projects involving it, and also our current state president, Lisa Lord. I'm also an attorney with the Southern Environmental Law Center, and sometimes the various projects overlap.

Here are some projects we've been involved in:

1. Peters Creek. Naturaland Trust acquired a parcel (about one acre, as I recall) that bisected the trail and the creek in the Peters Creek Heritage Trust Preserve, to protect the Preserve. We have not thoroughly checked that property, but we aren't aware of any HN on it.

2. We are currently working with SC DNR to try to acquire property next to the Blackwell Heritage Trust Preserve in Travelers Rest, SC. That preserve was established to protect the bunched arrowhead. There was a proposal to intensively develop an adjacent 56 acres. That proposal has now been withdrawn, and DNR has applied for a USFWS grant to acquire the property. We have found HN on that property, as well as bunched arrowhead. The Heritage Trust manager for our area has surveyed the property and has a count of the HN populations on that property.

   In addition, there is property adjacent to the Preserve and the proposed development property owned by a conservation-minded person, Johnny Stone. Some years ago, he enrolled some of his property in the Heritage Trust Program because of the presence of bunched arrowhead. We found HN on his property, in addition to the bunched arrowhead, and in close proximity to it.

   We did not survey the Blackwell HTP for HN, but it is possible there are some HN populations on the existing HTP.

3. Jeff Beacham and I and others have worked to try to deal with the storm water on the site of Gateway Elementary School in Travelers Rest. The campus of that school includes an undeveloped woodland that is braided with seeps and streams, which include the bunched arrowhead. Stormwater has impacted the bunched arrowhead in the woodland. We have found HN on that property, as well.

4. In the course of checking on mitigation activities in the area for SELC, I ran across a subdivision in Greer, Boulder Creek, where the developer was required to put aside land because of the presence of HN on it. Jeff and I have met with the Homeowners Association and visited the site. There are populations of HN on the property, and the properties in question have been put aside. The HOA was unaware of the plants, however, until we contacted them and met with them. The mitigation requirements required the developer to put in place a plan with the HOA for the long term protection of the plant, which had not been done. I am sure the HOA would be happy for you to come and see the plant.

   This mitigation was done under a Biological Opinion for HN done by the USFWS. It would be good if you could survey the USFWS records for any other BiOps for HN, and we could check on their status, too. Attached are some of the documents related to this one.

   There are also other plants on neighboring properties upstream and downstream of these mitigation properties. I wrote the property owners seeking to purchase those portions, but have never heard back. If you wanted to pursue them, that would be great, too!

5. Finally, if you know of any other opportunities to preserve and protect populations of this plant, let us know. We would be happy and pleased to work with you on the effort. I am particularly interested in the subdivision populations you mentioned. If you could send me information on those sites and if they are in our area, we could visit them and see what's up. There may be opportunities to protect the plants and/or acquire properties for protection.

FILE

Ms. Laura Belanger
Environmental Permitting Consultants
PO Box 3744
Greenville, SC 29608

Re: Boulder Creek Subdivision
Greenville County, South Carolina
FWS Log No: 2006-I-0420

Dear Ms. Belanger:

The U.S. Fish and Wildlife Service (Service) has reviewed the proposal for Boulder Creek (Jordan Road) Subdivision. The subject property is located on Jordan Road in Greenville County, South Carolina. The following comments are provided in accordance with section 7 of the Endangered Species Act (Act), as amended (16 U.S.C. 1531-1543).

Extant populations of the endangered *Hexastylis naniflora* have been identified on the proposed property along two of the creeks within the project boundary. No direct impacts to the population are anticipated. The developers of this site are aware of the H. naniflora population and assume responsibility for maintaining suitable habitat conditions for the species. As per our discussion on the March 27, 2006, site visit and follow-up letter from Laura Belanger dated March 28, 2006, a 25-foot protective buffer will be fenced and maintained in restrictive covenant to protect both populations. Twice annual monitoring will be conducted for the two years of construction, with monitoring reports submitted to the Service's Charleston Field Office. At the completion of construction, the final monitoring report will include detailed information regarding long-term monitoring and protection plans of the two *Hexastylis* populations.

Based on information provided, proposed conservation measures for the on-site population of *Hexastylis naniflora*, it is the opinion of the Service that the proposed action is not likely to adversely affect listed species.

Your interest in ensuring the protection of endangered species is appreciated. If you have further questions or require additional information, please contact Lora Zimmerman of this office at (843) 727-4707 ext. 226. In future correspondence concerning this project, please reference FWS Log No. 2006-I-0420.

Sincerely,

Catherine D. Duncan
Acting Field Supervisor

Environmental Permitting Consultants, Inc.

US Fish and Wildlife Service
Charleston Field Office
176 Croghan Spir Road
Suite 200
Charleston, SC 29407

March 28, 2006

Attention: Lora Zimmerman

Dear Ms. Zimmerman,

This letter is in regards to the Boulder Creek NWP permit application submitted to Les Parker at the US Army Corps of Engineers January 30, 2006. The property contains two populations of *Hexastylis naniflora*. The first population is located in the far southwestern corner of the property and the second population is located near the southernmost property boundary.

As per our site meeting on March 27, 2006, propose to do the following:

- Place a 25 foot protective buffer around each population of *Hexastylis naniflora.*
- Include these buffered areas in the restrictive covenants proposed for the project.
- Place protective fencing around the populations of *Hexastylis naniflora.*
- Monitor the populations for two years, submitting to FWS four letter reports with photos documenting the populations.
- Upon completetion of construction and formation of the Homeowners Association, hosting a meeting with the Homeowners Association making them aware of the *Hexastylis naniflora* populations, potential impacts to the populations and how they can be avoided, and the terms of the restrictive covenants.

The populations and their approximate locations are provided in Figure 2 of the Protected Species Habitat Assessment preformed by Environmental Permitting consultants in January 2006. Please feel free to contact me (864) 271-3040 regarding any questions or concerns.

Sincerely,

Laura H. Belanger

I am the species lead for Hexastylis naniflora and I work out of the FWS Asheville Field Office. I am seeking information about H. naniflora populations in SC. I have thorough information for Cowpens, Peters Creek Heritage Preserve, and Blalock Res; but, not much in the way of current information for other SC populations. Any information regarding the following would be very helpful:

- Who is working on H. naniflora in SC? And, what have you been up to?
- Does anyone have information on the following sites:

  Cherokee Creek near Cowpens (last Heritage update 2004)
  Spartanburg Water System Preserve (last Heritage update 2001)
  Claggett site in Raintree subdivision (last Heritage update 1991)
  UT to Spivey Creek (last Heritage update 1991)
  Peters Creek Heartleaf Site/Saranac Lake Subdivision (last Heritage update 1991)

- Other than sites I've mentioned, does anyone have information of other large and/or high ranked and/or preserved populations in SC?
- Anything else that can help me get up to speed on H. naniflora in SC?

Thank you and please feel free to email me directly.

Rebekah,

Jill (Gillian) Newberry formerly of USC Upstate in Spartanburg was quite active with this species. There was some recent activity involving property outside of Travelers Rest, SC and adjacent to Blackwell and Bunched Arrowhead preserves that involved some scrutiny for occurrences of this species. Indeed we found the answers on some specimens at USCS available here:

http://sernecportal.org/portal/collections/list.php?taxa=Hexastylis%20naniflora&thes=1&type=1&state=south%20carolina&db=all&page=1

I've granted your user account permission to view all of the details and the specimen images where you'll see the coordinate values (on some as the metadata are not fully developed on many).

I can work to get you what SC Heritage has so far in Biotics for this species.

Also, you might try Zack Murrell at App State U, I know he has had an interest in this species and you may be able to convince him to fast track the digitization of any specimens he has (they don't currently appear to be available in the SERNEC portal).

Best,

Herrick

On Thu, Nov 30, 2017 at 11:03 AM, Frank Holleman <fholleman@selcnc.org> wrote:
Rebekah,

I'm the President of Naturaland Trust, the land trust in Greenville that works to protect special places in the SC Piedmont and SC's Blue Ridge Mountains. We are interested in Hexastylis naniflora and seek to protect properties that include it. I'm also a volunteer with the SC Native Plant Society. I'm copying Jeff Beacham, the former state president, because, as set out below, he and I have worked on a couple of projects involving it, and also our current state president, Lisa Lord. I'm also an attorney with the Southern Environmental Law Center, and sometimes the various projects overlap.

Here are some projects we've been involved in:

1. Peters Creek. Naturaland Trust acquired a parcel (about one acre, as I recall) that bisected the trail and the creek in the Peters Creek Heritage Trust Preserve, to protect the Preserve. We have not

thoroughly checked that property, but we aren't aware of any HN on it.

2. We are currently working with SC DNR to try to acquire property next to the Blackwell Heritage Trust Preserve in Travelers Rest, SC. That preserve was established to protect the bunched arrowhead. There was a proposal to intensively develop an adjacent 56 acres. That proposal has now been withdrawn, and DNR has applied for a USFWS grant to acquire the property. We have found HN on that property, as well as bunched arrowhead. The Heritage Trust manager for our area has surveyed the property and has a count of the HN populations on that property.

In addition, there is property adjacent to the Preserve and the proposed development property owned by a conservation-minded person, Johnny Stone. Some years ago, he enrolled some of his property in the Heritage Trust Program because of the presence of bunched arrowhead. We found HN on his property, in addition to the bunched arrowhead, and in close proximity to it.

We did not survey the Blackwell HTP for HN, but it is possible there are some HN populations on the existing HTP.

3. Jeff Beacham and I and others have worked to try to deal with the storm water on the site of Gateway Elementary School in Travelers Rest. The campus of that school includes an undeveloped woodland that is braided with seeps and streams, which include the bunched arrowhead. Stormwater has impacted the bunched arrowhead in the woodland. We have found HN on that property, as well.

4. In the course of checking on mitigation activities in the area for SELC, I ran across a subdivision in Greer, Boulder Creek, where the developer was required to put aside land because of the presence of HN on it. Jeff and I have met with the Homeowners Association and visited the site. There are populations of HN on the property, and the properties in question have been put aside. The HOA was unaware of the plants, however, until we contacted them and met with them. The mitigation requirements required the developer to put in place a plan with the HOA for the long term protection of the plant, which had not been done. I am sure the HOA would be happy for you to come and see the plant.

This mitigation was done under a Biological Opinion for HN done by the USFWS. It would be good if you could survey the USFWS records for any other BiOps for HN, and we could check on their status, too. Attached are some of the documents related to this one.

There are also other plants on neighboring properties upstream and downstream of these mitigation properties. I wrote the property owners seeking to purchase those portions, but have never heard back. If you wanted to pursue them, that would be great, too!

5. Finally, if you know of any other opportunities to preserve and protect populations of this plant, let us know. We would be happy and pleased to work with you on the effort. I am particularly interested in the subdivision populations you mentioned. If you could send me information on those sites and if they are in our area, we could visit them and see what's up. There may be opportunities to protect the plants and/or acquire properties for protection.

Rebekah,

To my knowledge Hexastylis naniflora records are not in our current backlog. We prioritized all of the Megapetition species and some other Federally listed ones a couple of years ago so that all of those should be as up-to-date as possible. It's more likely that no one has looked or observations have not been reported.

Herrick,

Thanks for the clarification. That was my understanding but I just wanted to make sure. The data was exported recently but the last observation dates are showing age. Does that mean that no one has looked in a while, observers didn't report their data to Heritage, or there is a backlog of data to be entered? Or, all of the above?

Subject: [Scpca] Hexastylis naniflora in SC

Hi Everyone,

I am the species lead for Hexastylis naniflora and I work out of the FWS Asheville Field Office. I am seeking information about H. naniflora populations in SC. I have thorough information for Cowpens, Peters Creek Heritage Preserve, and Blalock Res; but, not much in the way of current information for other SC populations. Any information regarding the following would be very helpful:

- Who is working on H. naniflora in SC? And, what have you been up to?
- Does anyone have information on the following sites:

  Cherokee Creek near Cowpens (last Heritage update 2004)

  Spartanburg Water System Preserve (last Heritage update 2001)

  Claggett site in Raintree subdivision (last Heritage update 1991)

  UT to Spivey Creek (last Heritage update 1991)

  Peters Creek Heartleaf Site/Saranac Lake Subdivision (last Heritage update 1991)

- Other than sites I've mentioned, does anyone have information of other large and/or high ranked and/or preserved populations in SC?
- Anything else that can help me get up to speed on H. naniflora in SC?

Thank you and please feel free to email me directly.

Hope the information proves helpful.

Yes. That's me. Thank you for the kind words!

Have a good Christmas if we don't talk again -

Janie

Hi Janie,

Thank you so much! This is wonderful information.

Do you run the NameThatPlant website? That's one of my favorite sites and I recommend it to people often.

Thanks,

On Wed, Nov 29, 2017 at 4:10 PM, Janie Marlow <webmaster@namethatplant.net> wrote:
Hi Rebekah -

There is a population of *H. naniflora* in the woods behind Gateway Elementary School in Travelers Rest in Greenville County (as well as some Sagittaria fasciculata). I don't know exactly where on the property it is, but I am copying Jeff Beacham <jeffbeacham@gmail.com>, who worked with the school on a project to restore the construction-disrupted water supply to the Bunched Arrowhead population.

Jeff also discovered a population of *H. naniflora* in Cherokee County in 2013. I don't know if this is the population that you are already aware of or not; I know that he notified SC DNR at the time.

H. naniflora also exists on some other SPACE (Spartanburg Area Conservancy) properties in Spartanburg County.
I am copying Frederick Parrish <fmpiii@bellsouth.net>, who is familiar with the flora of SPACE properties.

I am also copying Gill Newberry <gnewberry@charter.net>, who is now retired but has worked extensively on H. naniflora over the years).

Hope this helps -

Hey Rebekah,
No problem. 864 590 6943 is my cell.
I'm way better in person than on the phone due to stuttering. I txt fine.
Do you want to walk these Hexastylis sites?
Let me know.

Fred

Hi Fred,

I'm sorry we didn't get to catch up on Friday. Our office was closed due to the snow. Also, I realized, I don't have your phone number. Can you send me the best phone number to reach you? Also, if a particular day this week is better, please let me know. All of my field days have been canceled this week so I'm flexible.

Thank you!

Hey Rebekah ,

That is perfect.
Andrew Waters is a personable guy who took Mary Walter's place as ex. Director of SPACE.
Lora High is his fundraiser and my good friend. She's a ball of fire.
I was Mary's assistant for 12 years. We had fun.
I have all kinds of info for you about who, what and where.
My family owns The Nooks, on Reasonover Rd in Cedar Mt. NC. We have the mountain bog, I think you came there for an inventory and met my brother, Tom Dashiell, and cousin, Caroline? I would have been there but something came up.
Gotta run my daughter to the bus, will finish this today!

United States Department of the Interior

FISH AND WILDLIFE SERVICE
Asheville Field Office
160 Zillicoa Street Suite #B
Asheville, North Carolina 28801

January 10, 2018

Dear Dwarf-flowered Heartleaf Partner:

The dwarf-flowered heartleaf (*Hexastylis naniflora*) is a threatened species that is endemic to the upper Piedmont region of western North Carolina and upstate South Carolina. In 1989, the U.S. Department of Interior listed the dwarf-flowered heartleaf as a threatened species. A Recovery Plan for the species was never completed. However, over the last 29 years, the U.S. Fish and Wildlife Service (Service) has worked closely with partners to make significant progress toward recovery of the species. The Service is initiating a Species Status Assessment (SSA) to aid in determining the appropriateness of reclassifying the species. In the event that the SSA does not support reclassification, the SSA would be used to inform the development of a Recovery Plan.

The Service's new SSA framework is intended to generate a highly integrated, explicit, and scientifically based approach to evaluate the biological and conservation status of a species. The dwarf-flowered heartleaf SSA will begin with a compilation of the best available information on the species (taxonomy, life history, and habitat) and its ecological needs at the individual, population, and/or species levels. Next, the SSA will describe the current condition of dwarf-flowered heartleaf habitat and demographics, and the probable explanations for any past or ongoing changes in these parameters. Finally, the SSA forecasts the species response to probable future scenarios of environmental conditions and conservation efforts.

The SSA is intended to inform regulatory and policy decision, but be developed independently from any such decision. The Service will ultimately provide a public notification of the finding in the *Federal Register*. Any associated proposed rulemakings would include an opportunity for the public to review and comment.

The Service will accept new information throughout this process, although it would be most helpful if provided by February 10, 2018. Information should be submitted to:

Rebekah Reid
Asheville Ecological Services Field Office
U.S. Fish and Wildlife Service
160 Zillicoa Street, Suite B
Asheville, North Carolina 28801
Email and Phone: rebekah_reid@fws.gov, (828) 258-3939 x238

All data and information submitted to the Service, including names and addresses, will become part of the administrative record.

Thank you for your interest in the conservation of threatened and endangered species. Please do not hesitate to contact Rebekah Reid at the phone number or email listed above with any questions or if you would like additional information regarding dwarf-flowered heartleaf.

Sincerely,

Project Leader

Importance:	High

Good morning all,

I've put together a set of elicitation questions for our technical team which will help guide important aspects of the SSA. I'd like to send these out by the end of the day today, so if you get a chance to look these over before I send out, I'd appreciate it. I'd give folks 1-week to answer and return to me.

Thanks a bunch!

Mike

DWARF-FLOWERED HEARTLEAF ELICITATION QUESTIONS

Below is an overview of the questions we are asking for your expert feedback on. Each question is elaborated on in a new page below with information I've gleaned from the literature and reports. Please record your answers and insights on the following pages and return to me via email by Friday, January 26. Thank you! - Mike

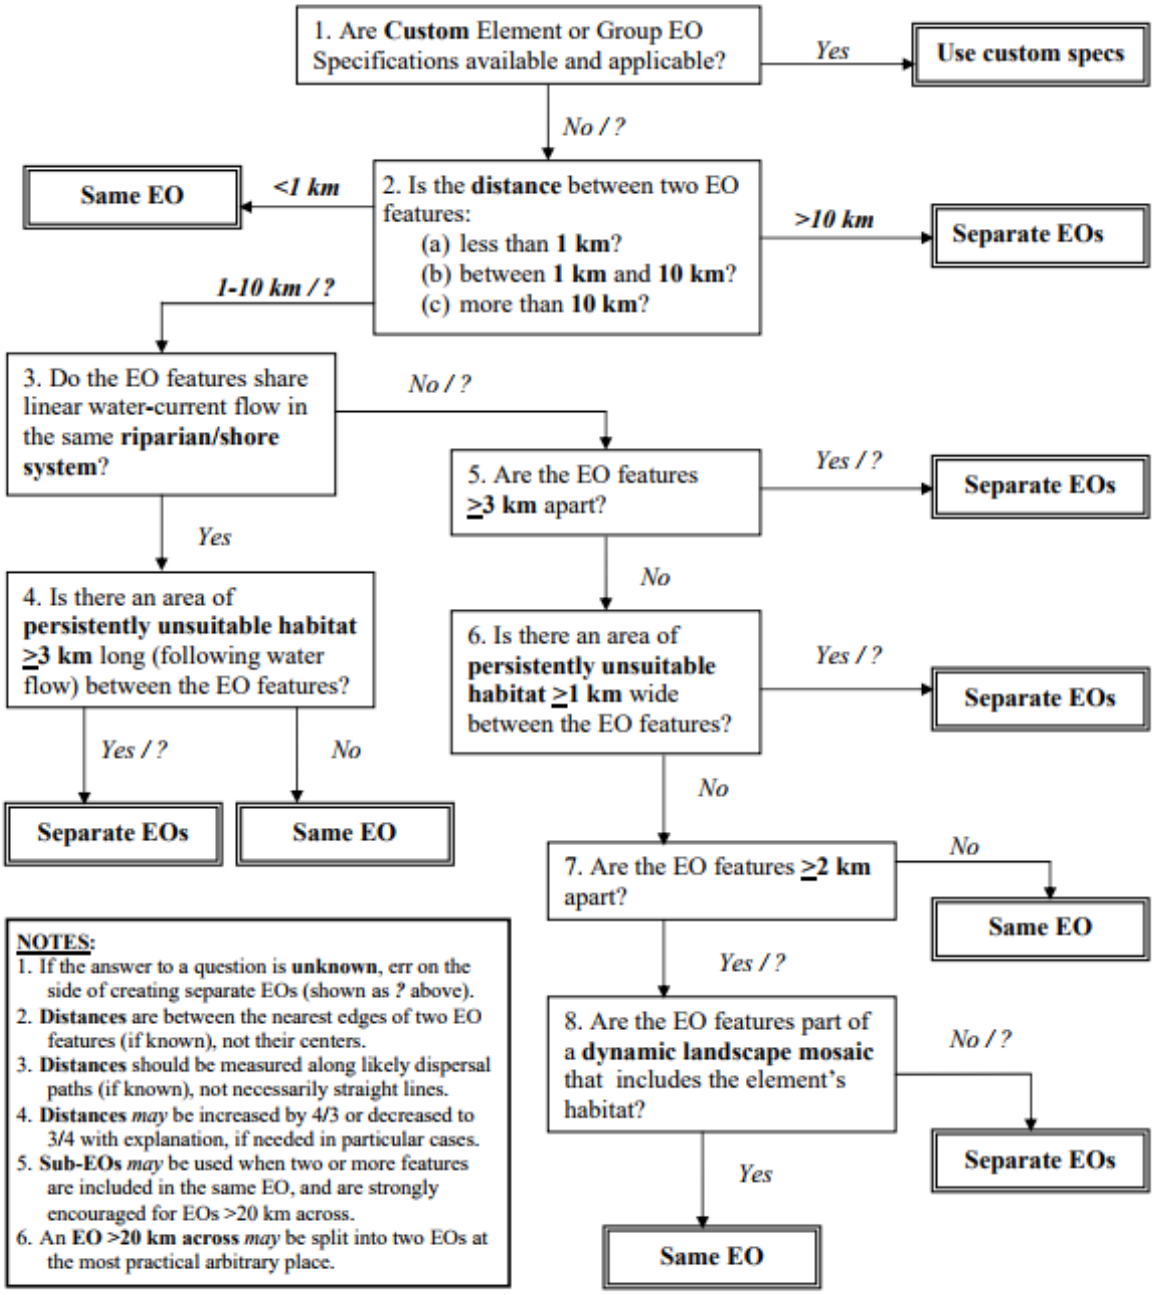
1. How would you suggest delineating populations for this species?

2. What factors are important for characterizing resilience for this species? These include population factors (e.g. population size/density) and habitat factors (e.g. soil type, canopy cover).

3. How would you suggest delineating representative units for this species?

4. In thinking about future scenarios and viability of this species, what are the most pertinent risk factors to consider (e.g. development, invasive species, climate change)?

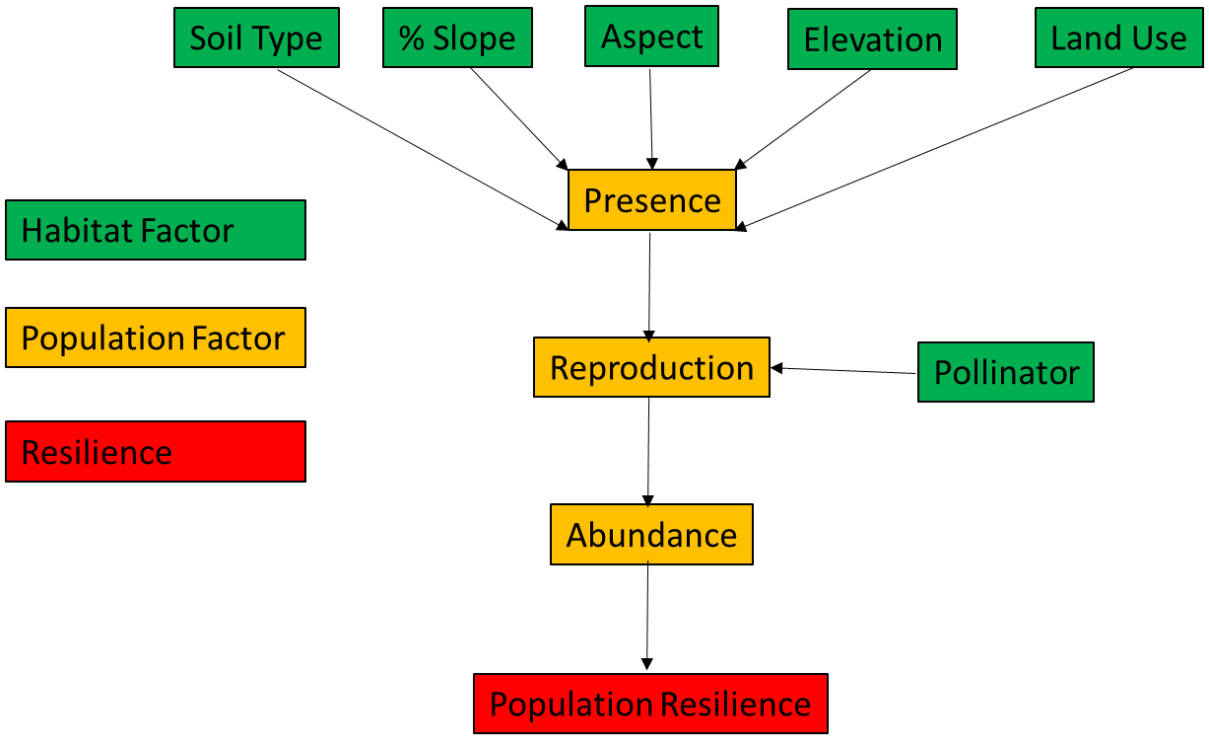
5. Based on the primary risk factors identified in question #4, what do you think an appropriate future time frame to project future conditions might be?



1. How would you suggest delineating populations for this species?

Under the 3 R's framework (resilience, redundancy, and representation), resilience is measured at the scale of a population, and resilient populations are then scaled up to assess redundancy and representation for the whole species. Because the population is the basic unit, it is important to define what constitutes a population. Recently, a "population" was defined based on NatureServe's separation distance criteria for a plant species of 1 km between separate populations/element occurrences. Pasted on the following page is their decision tree (full document here: http://www.natureserve.org/library/deliminting_plant_eos_Oct_2004.pdf). This seems to be the standard for this species and is used in NCNHP reports and the 5-year review. 1 km is the default separation distance, which they recommend altering if additional information or species characteristics warrant it. As of 2016, the combined databases of the NCNHP and SCNDNR contain 239 Element Occurrence Records (EORs) for *H. naniflora* (NCNHP2016, SCDNR 2016). These EORs depict roughly 113 locations which are sufficiently geographically distinct to be regarded as proxies for populations of the species

Based on the Natureserve guidelines or other information currently known, would you suggest using a criterion other than 1 km of separation between distinct populations? If so, what information is that based on (e.g. dispersal vectors or distances, pollinator behavior, genetic results)?



Answer:

Figure 1. Habitat-based Plant Element Occurrence Delimitation Guidance, 1 October 2004

2. What factors are important for characterizing resilience for this species? These include population factors (e.g. population size/density) and habitat factors (e.g. soil type, canopy cover).

These are the factors that we will use for each population to determine its resilience (whether it is a resilient vs. not resilient classification, or low-medium-high resilience, or some other kind of ranking). Based on the literature, there seem to be a few logical factors to include in the SSA (see influence diagram below). To the extent possible, some of these factors would be used in a model to quantify, to the extent possible, current and future condition of the species, and ultimately viability.

Potential habitat seems to be based on a few factors: soil type (occur in 4 soil types, mainly Pacolet sandy loam), % slope (8-10%), aspect (prefer north facing), elevation (199-415 m), and land use (i.e. deciduous forest).

The main population factor driving resilience of a given population seems to be population size. Given habitat is available and the species is present, reproduction must occur for a population to grow, and that is at least partly influenced by presence of pollinators, which seem to be mainly ants.

Other considerations: connectivity for cross-pollination/seed dispersal (distance from nearest neighbor population); Protected- either protected conservation land or some kind of landowner agreement.

Based on your knowledge of the species biology and needs. Feel free to select the most important ones from my preliminary list, please add any important things I missed, and by all means argue against anything on my list or otherwise that isn't an important contributor. While there are many factors that interact to influence populations, our goal is narrow it down to the most important factors for our assessment.

Answer:

3. How would you suggest delineating representative units for this species?

Representation refers to the species ability to adapt to changing environmental conditions, and can also be thought of as diversity. This can be genetic diversity and/or diversity in habitat types, life history traits, or other characteristics that could be indicative of underlying genetic diversity.

For dwarf-flowered heartleaf, one could argue that here are no representative units, that there is only one "type". Support for this idea is the limited range of the species. Other ideas might stem from some of the genetic analyses for the species, indicating some type of latitudinal variation. The STRUCTURE analysis provides strong evidence that populations in the southern part of the range of *H. naniflora* are not subject to significant hybridization pressures, whereas populations in the southeast portion of the range appear to by hybridizing with *H. minor* and populations in the northern portion of the range appear to form a hybrid swarm with *H. heterophylla* and *H. minor*. Would this suggest representative units for the species based on a north-south-southeast split? Where might that split be mapped for purposes of the SSA? Watersheds? Basins?

Given your expertise and experience, would you suggest delineating different representative units for the species? If so, how? Alternately, would you suggest there is only one "type" across the species range? If so, why?

Answer:

4. In thinking about future scenarios and viability of this species, what are the most pertinent risk factors to consider (e.g. development, invasive species, climate change (temp, precip, etc))?

> For the SSA, we will define a set of possible future scenarios, and assess what future resilience, redundancy, and representation might look like under those scenarios. What are the most important factors to consider that could influence species viability now and into the future that we need to consider when defining future scenarios?

Answer:

5. Based on the primary risk factors identified in question #4, what do you think an appropriate future time frame to project future conditions might be?

When we project populations into the future under different scenarios, we will need to be explicit about how far into the future we are projecting. Based on the risk factors identified above, *HENA* life history/generation times, uncertainty associated with the risk factors and *HENA* responses to them, over what time frame do you think we can reasonably predict future population conditions?

Hi Mike,

So sorry for the delay. I am squashed by this cold/flu thing I've been fighting. The questions look good to me. I seem to remember having a conversation with NHP about the population definitions and separation distances. I think we talked about a 2km default that they used. Unfortunately, my notes are at work and I'm at home. It doesn't change the question but I'll be interested in hearing their population definitions and their interpretation of the NatureServe guidelines.

Provided there is no shutdown, I plan on returning to the office on Monday. Should we use the same call-in/passcode for the call?

Everyone have a great weekend!

Hello Technical Team!

First, I want to thank everyone for joining the kick-off call. I thought it was quite productive. On that call, I mentioned sending some elicitation questions out to the technical team in order to ensure species expert input into the drafting of the SSA for HENA. I have attached a questionnaire to this email. Please take a look and answer the questions to the best of your ability by next Friday (1/26/18).

I am currently drafting the Species Biology and Species Needs portions of the SSA, and should have that wrapped up by 1/29/18 for your review, though the elicitation questions will help in that drafting, so if you could get me your answers asap, I'd greatly appreciate it.

Thanks, and have a great weekend!

Mike

Figure 1. Habitat-based Plant Element Occurrence Delimitation Guidance, 1 October 2004

2. What factors are important for characterizing resilience for this species? These include population factors (e.g. population size/density) and habitat factors (e.g. soil type, canopy cover).

These are the factors that we will use for each population to determine its resilience (whether it is a resilient vs. not resilient classification, or low-medium-high resilience, or some other kind of ranking). Based on the literature, there seem to be a few logical factors to include in the SSA (see influence diagram below). To the extent possible, some of these factors would be used in a model to quantify, to the extent possible, current and future condition of the species, and ultimately viability.

Potential habitat seems to be based on a few factors: soil type (occur in 4 soil types, mainly Pacolet sandy loam), % slope (8-10%), aspect (prefer north facing), elevation (199-415 m), and land use (i.e. deciduous forest).

The main population factor driving resilience of a given population seems to be population size. Given habitat is available and the species is present, reproduction must occur for a population to grow, and that is at least partly influenced by presence of pollinators, which seem to be mainly ants.

Other considerations: connectivity for cross-pollination/seed dispersal (distance from nearest neighbor population); Protected- either protected conservation land or some kind of landowner agreement.

Based on your knowledge of the species biology and needs. Feel free to select the most important ones from my preliminary list, please add any important things I missed, and by all means argue against anything on my list or otherwise that isn't an important contributor. While there are many factors that interact to influence populations, our goal is narrow it down to the most important factors for our assessment.

Answer:

3. How would you suggest delineating representative units for this species?

Representation refers to the species ability to adapt to changing environmental conditions, and can also be thought of as diversity. This can be genetic diversity and/or diversity in habitat types, life history traits, or other characteristics that could be indicative of underlying genetic diversity.

For dwarf-flowered heartleaf, one could argue that here are no representative units, that there is only one "type". Support for this idea is the limited range of the species. Other ideas might stem from some of the genetic analyses for the species, indicating some type of latitudinal variation. The STRUCTURE analysis provides strong evidence that populations in the southern part of the range of *H. naniflora* are not subject to significant hybridization pressures, whereas populations in the southeast portion of the range appear to by hybridizing with *H. minor* and populations in the northern portion of the range appear to form a hybrid swarm with *H. heterophylla* and *H. minor*. Would this suggest representative units for the species based on a north-south-southeast split? Where might that split be mapped for purposes of the SSA? Watersheds? Basins?

Given your expertise and experience, would you suggest delineating different representative units for the species? If so, how? Alternately, would you suggest there is only one "type" across the species range? If so, why?

Answer:

4. In thinking about future scenarios and viability of this species, what are the most pertinent risk factors to consider (e.g. development, invasive species, climate change (temp, precip, etc))?

> For the SSA, we will define a set of possible future scenarios, and assess what future resilience, redundancy, and representation might look like under those scenarios. What are the most important factors to consider that could influence species viability now and into the future that we need to consider when defining future scenarios?

Answer:

5. Based on the primary risk factors identified in question #4, what do you think an appropriate future time frame to project future conditions might be?

When we project populations into the future under different scenarios, we will need to be explicit about how far into the future we are projecting. Based on the risk factors identified above, *HENA* life history/generation times, uncertainty associated with the risk factors and *HENA* responses to them, over what time frame do you think we can reasonably predict future population conditions?

Notes on the status of populations of *Hexastylis naniflora*

Jan 20, 2018

I have been observing and studying populations of *Hexastylis naniflora* in North and South Carolina for the past thirty years.

In the Tryon area of N C and in Greenville and Spartanburg Counties of SC Dwarf Flowered Heartleaf can be found on north-facing slopes along steams usually associated with stands of *Kalmia*. In Catawba county of North Carolina, the *Hexastylis* populations are probably *Hexastylis heterophylla*. The differences between *H. naniflora* and *H. heterophylla* are as follows:

H. naniflora	*H. heterophylla*
Leave rounded without terminal tip	Leaves larger, heart-shaped often with terminal tip
Flowers less than 1 cm long	Flowers more than 1 cm long
Flowers as long as broad	Flowers longer than broad

The SC populations of *H. naniflora* are showing some decline due to drought stress on the upper slopes.

Preserve have been set up to protect large population at Peter Creek, Saranac like SPACE preserve, Lake Blalock, and along the Pacolet River at USC Upstate. A few smaller populations are also under some protection.

There is no doubt that these two species are closely related and may be varieties of the same species.

However, I feel that before it is delisted that a DNA analysis be done comparing the NC and SC populations. This will add much light to the distinctiveness of these two populations.

I have included photos of plants that are unquestionably *H. naniflora*. These were all taken from plants in the Pacolet drainage, Tryon NC.

I hope this information helps with your reevaluation of this species.

I will be in Iceland until January 30. I will check my e-mail when I return. My phone (which has an answering machine) is 864-579-4471.

Thank you for your concern for the diversity of our upstate.

Sincerely,

Gillian Newberry

Hi Mike,

Attached are NHP's responses to the elicitation questions. Some of my answers refer to a previous report which I have also included with my reply.

Please let me know if you have any questions. NCNHP appreciates the opportunity to participate in this process.

Thank you,
Jame

Hello Technical Team!

First, I want to thank everyone for joining the kick-off call. I thought it was quite productive. On that call, I mentioned sending some elicitation questions out to the technical team in order to ensure species expert input into the drafting of the SSA for HENA. I have attached a questionnaire to this email. Please take a look and answer the questions to the best of your ability by next Friday (1/26/18).

I am currently drafting the Species Biology and Species Needs portions of the SSA, and should have that wrapped up by 1/29/18 for your review, though the elicitation questions will help in that drafting, so if you could get me your answers asap, I'd greatly appreciate it.

Thanks, and have a great weekend!

Mike

Current Species Status

Hexastylis naniflora (Dwarf-flowered Heartleaf) was federally listed as threatened by the U.S. Fish and Wildlife Service (USFSW) in 1989 under the Endangered Species Act of 1973. At the time of federal listing, there were only 24 known populations across its range in North and South Carolina. It was estimated that the total number of individuals across the range was only approximately 5,000 (USFWS 2010). However, even with its limited range in North and South Carolina, *Hexastylis naniflora* is not as rare as once thought, and many populations have been discovered since listing. In 2010, the USFWS recognized 108 total populations, with the number of populations containing over 1,000 individuals (sometimes counted as "clumps" or rosettes) having increased from 3 in 1989 to 27 (USFWS 2010).

In 2012, the N.C. Natural Heritage Program (NCNHP) initiated a status survey under a USFWS Flex Fund Grant to monitor and delineate some of the largest known populations, previously identified by USFWS to be important for recovery efforts. These monitoring data, coupled with populations monitored by the N.C. Department of Transportation (NCDOT) under Section 7 consultations, would provide consistent baseline population data to help assess the status and trends of the species (USFWS 2010, Robinson and Padgett 2016). As part of this study, NCNHP reviewed all element occurrences (EOs) and determined that there are an estimated 113 total populations (91 in NC and 22 in SC) (North Carolina Natural Heritage Program [NCNHP] 2016, South Carolina Department of Natural Resources [SCDNR] 2016). Thus, the total number of known extant populations has increased more than four-fold (from 24 to 113) since the species was first listed. In 2010 it was estimated that 27 populations contained at least 1,000 rosettes. That number is now estimated to be 26 populations, based on updated information and more accurate mapping of EOs in the database. Many of these large populations with over 1,000 individuals are estimated to have tens of thousands of individuals (NCNHP 2016).

For the purpose of this report, the term "population" refers to parent EOs and all associated subEOs within them, as delineated by the N.C. Natural Heritage Program, using NatureServe mapping standards. Appendix B1 describes how numerous small, site-specific locations have been aggregated into proxies for 113 populations across North and South Carolina, as modeled and described by the USFWS in the 2010 five-year review (USFWS 2010). This process was used to reevaluate the estimated number of populations using current 2016 data (NCNHP 2016, SCDNR 2016).

Species Biology

Description

Hexastylis naniflora is a low-growing herbaceous plant in the Aristolochiaceae family. It was first described by Blomquist (1957) in his revision of the North American members of the genus *Hexastylis*. The plant has heart-shaped, evergreen leaves that are dark green, leathery, and approximately 4-5 inches long. The leaves are supported by a long, thin petiole that extends from a subsurface rhizome. The flowers are jug-shaped, usually beige to dark brown or purple, and flower in mid-March to early June. The flowers are small and inconspicuous and are found near the base of the leaf stems, often buried in leaf litter (USFWS 1989). Characteristics that distinguish it from other *Hexastylis* species are found in floral structures and pollen characters (Gaddy 1987, Padgett 2004, Niedenberger 2010). *H. naniflora* has a smaller calyx tube orifice, which is typically 5mm or less (sometimes up to 7mm) and the ovary is half-inferior, rather than superior (Blomquist 1957, Gaddy 1987, Padgett 2004, HDR 2005). Pollen surface features have also been shown to be an effective character to identify *H. naniflora*, as it has a microporate surface and, unlike any other *Hexastylis* species, lacks gemmae entirely (Padgett 2004, Niedenberger 2010).

Taxonomic classifications

There have been considerable disagreements on the generic distinctiveness of *Hexastylis* and *Asarum* (Barringer 1993 and Kelly 1997, 1998, 2001). However, a recent phylogeny estimate using chloroplast genes supports that *Hexastylis* is a monophyletic clade and therefore should be recognized as a genus (Niedenberger 2010). Additionally, most North American publications recognize *Hexastylis* at the generic level (Flora of North America 1997, Weakley 2015). There are currently no known proposed changes in taxonomy that would affect the continued legal status of *H. naniflora* under the Endangered Species Act.

Genetics and genetic variation

Analyses on ecology, morphology, soil chemistry, pollen, and molecular genetics have been evaluated for *Hexastylis naniflora* to determine the boundaries within the *Hexastylis heterophylla* complex, which consists of *H. heterophylla*, *H. minor*, and *H. naniflora* (Murrell 2015, Wagner 2013, Niedenburger 2010, USFWS 2010, Murrell et al. 2007, Padgett 2004). These analyses supported the continued recognition of these taxa as well-defined, discrete species. As previously mentioned, scanning electron microscopy (SEM) consistently distinguished *H. naniflora* from other members of the *H. heterophylla* complex based on pollen characteristics (Padgett 2004, Niedenburger 2010). However, previous efforts to obtain consistently distinct genetic banding patterns using Inter Simple Sequence Repeats (ISSRs) were unsuccessful at distinguishing *H. naniflora* from other members of this group (Murrell et al. 2007, USFWS 2010).

Field observations demonstrate that there are some populations of *H. naniflora* with morphological characteristics that do not fit within the range of published values for key traits, overlapping with values for *H. heterophylla* or *H. minor* (Weakley 2015, USFWS 2010, Murrell et al. 2007, Gaddy 1987). These populations with overlap in key characteristics were the focus of a genetic analysis conducted at Appalachian State University (ASU) through funding provided by NCDOT (Murrell 2015). In some populations, floral characteristics are highly variable, which suggests the potential for hybridization or individuals with highly variable flower size and shape (Murrell 2015). Additionally, no vegetative characters were previously known to consistently distinguish *Hexastylis naniflora* from other close relatives. Given the difficulties with field identification of the species, particularly when not in flower, this study sought to develop a microsatellite library of molecular markers to resolve variation in populations of *H. naniflora* and apply the markers to populations with highly variable characters, as identified by NCDOT biologists. The morphological and micromorphological information from those variable populations were compared to molecular results with morphological, micromophological, and distributional data to determine genetic structure, biological boundaries, and placement of putative hybrids or intermediate populations of *H. naniflora* (Murrell 2015).

The preliminary findings of this study suggest that populations in the southern range of *Hexastylis naniflora* exhibit a more uniform genetic pattern, with some possible hybridization with *H. minor*. Populations in the northern part of the range appear to have hybridized with both *H. heterophylla* and *H. minor*, although there are still individuals with "pure" *H. naniflora* genotypes in the northern range (Murrell 2015). It is critical to note that although these data provide anecdotal evidence of hybridization with the *Hexastylis heterophylla* group, intraspecific variation may be caused by forces other than hybridization, such as convergent morphological evolution (Dobzhansky 1937), or the species is in the process of speciation and this study shows a case of incomplete speciation (Murrell 2015), and/or other environmental factors are at play (Wagner 2013). On May 11, 2016 a meeting was held with USFWS, NCNHP, NCDOT, and ASU to discuss the status of *H. naniflora* and the current work being conducted among the agencies (Amoroso 2016). Based on discussions during this meeting, the results of this study reported by ASU to NCDOT in 2015 are preliminary. Dr. Matt Estep (ASU) provided additional preliminary

results to NCNHP in May 2016, showing which populations were sampled, sample size, and percent of samples that show evidence of hybridization, and hybridizing with which species (Table A1, Appendix A). ASU continues to work towards a more definitive explanation of the variation in the *H. heterophylla* complex (Murrell 2015, Amoroso 2016). Decisions on the legal status of this species should not be made based on the preliminary results of this study before the analysis is completed and a peer-reviewed publication is available.

Distribution and habitat

Although *Hexastylis naniflora* is restricted in range, it is not as rare as once thought (USFWS 2010, NCNHP 2016). This species occurs in the upper piedmont of North and South Carolina. In North Carolina, it is found in Alexander, Burke, Caldwell, Catawba, Cleveland, Gaston, Iredell, Lincoln, Polk, and Rutherford Counties. In South Carolina, it is in Cherokee, Greenville, and Spartanburg Counties (Figure A1, Appendix A). *Hexastylis naniflora* occurs on piedmont uplands on acidic sandy-loam soils that are very deep and moderately permeable (Gaddy 1981, 1987). Typical habitats for this species include mesic to dry bluffs, slopes, or ravines in deciduous forests that are frequently associated with *Kalmia latifolia* (Padgett 2004, Weakley 2015, USFWS 2015), or in moist soils adjacent to creeks, streamheads, or along lakes and rivers. Plants have been observed to grow larger and have more frequent flowering in floodplains along rivers, lakes, and streams (Newberry 1993).

Wagner (2013) conducted a habitat suitability study to quantify the habitat requirements for *Hexastlyis naniflora*, which may be used for helping identify *H. naniflora* when not in flower (relative to other *Hexastylis* species habitat preferences), find new populations, or identify suitable sites for transplants. A model was created to predict habitat suitability to determine how many EOs are found within habitat considered fair to excellent. Based on the model, the strongest habitat correlations were that the slope aspect was north-facing, soil type is Pacolet sandy loam, elevation was between 230-260m, percent slope is 8-10%, and land use is deciduous forest (Wagner 2013).

There are little data on the response to fire by *Hexastylis naniflora*, however, prescribed burns have been conducted within the population at Cowpens National Battlefield in Cherokee County SC. Preliminary data at this site and recent annual monitoring data of this population support the theory that moderate controlled burns do not negatively affect this population (Walker et al. 2009). Additionally, a dormant season wildfire in Caldwell County did not show evidence of negative impacts to a population in Caldwell County (USFWS 2010). Fire suppression could be a hazard to *H. naniflora* by allowing fire intolerant, nonnative and invasive plants to thrive, as well as the accumulation of thick duff or leaf litter that may shade low growing species (Wagner 2013).

Demographics

As reported by the USFWS (2010), there has been a single effort to collect demographic-level data (survivorship and recruitment of tagged individuals) for *H. naniflora*. This effort was conducted in 1990-1991, within a portion of the Peters Creek population (Newberry 1993). This study showed a 96.1% survival rate over these two seasons, with 50% of the mortality occurring in plants located at the highest position on the forested slope (away from the adjacent floodplain). Mortality was highest in small plants with fewer than four leaves. Plant size was variable, with the largest plant bearing 45 leaves and 33 flowers, and situated in the floodplain. Plants located in the floodplain were generally larger than those on adjacent slopes. The percentage of flowering plants averaged 70%, with the highest frequency of flowering occurring among plants situated in the floodplain (USFWS 2010).

Abundance

As of 2016, the combined databases of the NCNHP and SCNDNR contain 239 Element Occurrence Records (EORs) for *H. naniflora* (NCNHP2016, SCDNR 2016). These EORs depict roughly 113 locations which are sufficiently geographically distinct to be regarded as proxies for populations of the species (Appendix B1). Thus, the total number of populations has increased more than four-fold (from 24 to 113) since the species was listed in 1989.

At this time, the largest known populations have been monitored by NCNHP and NCDOT. The estimates for entire populations are based on a consistent monitoring methodology developed by NCDOT, USFWS, and NCNHP with monitoring plots representing roughly 10% of a population. Populations were delineated to get a more accurate boundary and size of the area occupied. All rosettes are counted annually in each monitoring plot to estimate an extrapolated population size, based on the number and density in the plots. As a result of these efforts, better estimates of population sizes for the largest known populations are available, compared to when the last five-year review was completed in 2010 (Robinson and Padgett 2016).

The 113 EORs have been estimated to contain anywhere from a single rosette to over 100,000 rosettes. Table A2 (Appendix A) was created to replicate the same format and population data as Table B2 of the most recent USFWS five-year review of *H. naniflora* (USFWS 2010), for comparison of changes since 2010. Table A2 summarizes the largest occurrences of *H. naniflora*, with the size of the population based on the number of rosettes it was last estimated to contain. The number of populations estimated to contain over 1,000 rosettes is 26. This is approximately 23% of the total known populations and many of these populations contain well over 1,000 individuals.

There are, however, 13 populations (12% of all known) that are simply known to be extant, with no available estimate of population size (NCNHP 2016, SCDNR 2016). If the most recent population estimates for each EOR are compiled across years of observation, the 113 populations could conservatively be estimated to contain a collective total of more than 300,000 rosettes (NCNHP 2016, SCDNR 2016). An updated scorecard of all *H. naniflora* populations in North Carolina is included in Appendix B2.

Trends, threats, and protection measures

Population trends

The long-term trend is measured as the degree of change in population size, extent of occurrence, area of occupancy, or viability over approximately 200 years. The short-term trend reflects changes over approximately 10 years (Faber-Langednoen et al. 2012). Since there are no population data available as far back as 200 years, the long-term trend is unknown. As stated in the five-year review in 2010, the short-term trend is difficult to assess, as the observations across populations were grossly different, with incomparable levels of survey effort among years prior to 2012 (e.g., a complete census one year, followed by a coarse estimate the next, or still some other method). In many cases, one or more persons familiar with the site have questioned the degree to which the observations accurately reflect actual trends as opposed to incomparable counts/estimates (USFWS 2010). However, from 2012-2016, NCNHP conducted systematic annual surveys of thirteen of the largest populations across the range. For these surveys, populations of *H. naniflora* were delineated with a GPS and polygons were mapped during the first and last year (2012 and 2016) of the study to improve the mapping accuracy and spatial extent of the populations and to monitor any changes over the course of the project. At least one randomly placed monitoring plot was established within each population to capture and sample approximately 10% of the population (Robinson and Padgett 2016). This data set across five years, coupled with monitoring data

from NCDOT, may be used to estimate short-term trends and can be used as baseline data for determining trends in the future.

In 2009, NCDOT committed to provide the USFWS with updated status information for all or portions of 12 populations estimated to contain over 1,000 rosettes (Table A2, Appendix A). NCDOT monitoring efforts include USFWS population numbers 2, 4, 5, 7, 8, 9, 10, 11, 12, 13, and 23 in Table A2. Population 14, First Broad River: Crooked Run Creek (EO 157), was determined to be too far away from the roadside to be protected within the right-of-way, and NCDOT stopped monitoring it in 2010 (Bassette 2016). Therefore, the number of populations NCDOT is now monitoring is 11. This monitoring commitment was part of a conservation measure associated with a formal Endangered Species Act Section 7 consultation for adverse effects to *H. naniflora* (USFWS 2009). Most of these 11 populations were expected to be adversely affected by road widening projects previously subject to formal Section 7 consultations with USFWS (USFWS 2010). The adverse effects were minimized through relocation of plants and/or commitments to provide on-site protections to plants remaining within NCDOT rights-of-way following construction (USFWS 2010). In some cases, populations (or portions of them) were purchased as off-site conservation measures (these are also listed in Table A2, Appendix A). As a result of commitments pledged over many years of formal Section 7 consultations with the USFWS, NCDOT now protects more populations (or significant portions of them) than any other conservation partner throughout the range of *H. naniflora*. There is still a need to verify that plants are protected by NCDOT in roadside rights-of-way and the manner of protection. It is critical to obtain updates on the number of plants remaining post-construction, the survival of transplanted individuals, the number of rosettes protected within ROWs, and/or the number of rosettes protected via off-site land purchases in order to assess completely the status and trends of *H. naniflora* populations. NCDOT has contracted much of the survey work over the past five years and has sent reports for some of the populations (Table A2, Appendix A). We are currently awaiting updates for several of these sites monitored by NCDOT.

The Foothills Landfill in Caldwell County (USFWS population number 3, EO 227) has been routinely monitored since 2005. This population was adversely affected by activities requiring Endangered Species Act Section 7 consultation with the Service (USFWS, 2003). The Section 7 process resulted in minimization of impacts, permanent protection (through a conservation easement on 260 acres) of unaffected portions of the *H. naniflora* population, and long-term monitoring of the species within permanently protected areas for the life of the landfill (30 years) (USFWS 2010). Monitoring is conducted using 0.1-acre sample plots distributed throughout the population, in which all rosettes have been counted during the 2005, 2006, 2009, and 2014 field seasons (Golder Associates 2005, 2006, 2009, 2014). In 2014, extrapolating the densities within these plots to the larger delineated area of occupied habitat yielded 16,463 rosettes. This is a decline from the estimated 23,340 rosettes in 2009, and 30,780 rosettes in 2006. Although this population is still robust and considered of excellent viability, more information is needed on the possible threats within this population to determine the cause of the decline.

Three South Carolina populations estimated to contain over 1,000 rosettes were addressed by Section 7 consultations with other agencies: Cowpens National Battlefield, Blalock Reservoir, and Peters Creek Heritage Preserve (USFWS 2010). All or significant portions of these populations are subject to protective ownership (Table A2 and A3, Appendix A). During 2012-2016, NCNHP conducted monitoring at these sites to better estimate the area occupied and populations size and trends.

At Cowpens National Battlefield (Cherokee County, SC), the *Hexastylis naniflora* population was estimated to contain some 10,180 rosettes in 2005 (USFWS 2010). During surveys in 2012-2016, the population had some fluctuation in numbers, but remained relatively stable during the five years of monitoring. However,

the estimated number of rosettes in 2016 was 2,823 rosettes, significantly lower than last estimated in 2005 (Robinson and Padgett 2016). The National Park Service has conducted prescribed burns within portions of the *H. naniflora* population subject to formal and subsequent informal consultation with the USFWS (USFWS 2010, Walker et al. 2009). The scope of the prescribed burning activity increased to encompass the majority of this *H. naniflora* population (USFWS 2010). Preliminary data suggested that burning has had no adverse effects upon growth or flowering (Walker et al. 2009). However, USFWS has registered concerns over the limited scope of this two-season monitoring effort and has requested a continuation of monitoring to ensure that this large population is not adversely affected by this experimental management approach (USFWS 2010). There has been little information on the response of *H. naniflora* to fire, although anecdotal observation from a population in Caldwell County, North Carolina suggests that the species was not appreciably harmed by a dormant season wildfire that spread through a portion of that population in the winter of 2009 (USFWS 2010). Given the decline in population size estimate from 2005 to 2016, fires that are too frequent may be detrimental.

Blalock Reservoir (Spartanburg County, SC) was once widely regarded as the single largest population of the species, with over 11,000 rosettes estimated in 1997 (USFWS 2010). In 2006, the entire population was reported to consist of only 1,400 rosettes (Newberry, 2006). Since that estimate, the Spartanburg Water System conservation area was established to protect *H. naniflora* that has been affected twice by illegal encroachments from adjacent landowners (USFWS 2010, Newberry 2009). *H. naniflora* rosettes were affected or destroyed in both instances: in 2006, 35 rosettes were presumed destroyed (UWFWS 2010), and in 2009 an estimated 576 plants were presumed destroyed (Newberry 2009). Both instances involved adjacent landowners felling trees and/or harvesting timber within areas of occupied habitat (USFWS 2010). At the time of the 2010 USFWS five-year review, it was feared that this population only contained approximately 1,000 rosettes (USFWS 2010). The Blalock Reservoir population was included in the five-year monitoring by NCNHP. The estimated size of the population, based on extrapolated numbers from monitoring plots and the population boundaries, was 3,505 in 2016. In 2012, there were over 4,000 rosettes estimated. The population remained relatively stable during the five-year monitoring efforts (Robinson and Padgett 2016). Therefore, the population is larger than last estimated in 2006, but has experienced overall declines since 1997, despite protection efforts.

The Biological Opinion for the Blalock Reservoir expansion also included an off-site conservation measure for Spartanburg Water System to provide financial assistance to support restoration work within the Peters Creek Heritage Preserve (USFWS 2001). At this time, it has not been confirmed that this has occurred. The South Carolina Department of Natural Resources (SCDNR) Management Plan for Peters Creek briefly alludes to some wetland restoration having been conducted on site (SCDNR 2006) but it is unclear whether the restoration work had any effect on the *H. naniflora* population (USFWS 2010). The Peters Creek population was estimated to contain more than 5,000 rosettes in 1991, but fewer than 2,500 rosettes in 2006 (USFWS 2010). This population was included in the five-year monitoring efforts by NCNHP. The most recent estimate in 2016 was 3,306 rosettes, but in 2015 there were an estimated 5,467 rosettes. As mentioned in the final monitoring report (Robinson and Padgett 2016), it is possible that the 2016 South Carolina estimates may be slightly lower than previous years because of the timing of surveys. They were completed in the first week of March, which is the typically the best time to observe flowering of *Hexastylis naniflora*. However, it was discovered early in the study during years with a very cold spring, plants hadn't fully emerged until late spring or early summer, and early surveys could skew the monitoring results. As a result, most of the subsequent monitoring was done in May and June with the exception of the South Carolina sites in 2016. Therefore, the reduction of numbers of the South Carolina sites in 2016, compared to previous years, may reflect that not all plants had emerged in early March. Despite this

reduction in 2016, the overall numbers of rosettes estimated at Peters Creek Preserve in recent years have been close to numbers estimated in 1991.

Based on the results of the five-year monitoring efforts completed in 2016, nine out of thirteen populations remain stable during the five years of data collection (Robinson and Padgett 2016). The largest known population, Broad River: Henson's Creek, Brice, & Sandy Mush Outcrop (EO 099, USFWS population number 20) in Rutherford County, NC, is estimated to have over 100,000 rosettes (Robinson and Padgett 2016). This large population consists of many scattered subpopulations on private property; two of the subpopulations are protected as a Registered Heritage Area.

Two of the thirteen populations increased in numbers from 2012-2016: Cliffside Steam Station and Broad River: Floyds Creek, Long Branch. The Cliffside Steam Station (USFWS population number 15; Table A2, Appendix A) is protected with a voluntary agreement with Duke Energy and was estimated to contain over 39,000 rosettes in 2016. The Broad River: Floyds Creek, Long Branch population (USFWS population number 22, EO 177) is not at all protected, but was last estimated to consist of over 12,000 individuals in 2016 (Robinson and Padgett 2016).

Based on the results of recent surveys and a review of all known populations of *Hexastylis naniflora*, the overall short-term trend over approximately 30 years is estimated to be declining 10-30%. This is estimated by a combination of documented declines of some populations, while many others appear to be remaining relatively stable, and some have increased.

Population threats

Hexastylis naniflora occurs in the western Piedmont of North and South Carolina. Many populations occur in rapidly growing urban areas with expanding suburbs of Charlotte, NC, to the east; Hickory, NC, to the north; and Greenville and Spartanburg, SC, to the south. At the time of listing, it was determined that the species was most threatened by habitat loss due to the conversion of land to residential, commercial, and industrial use in these areas. Threats were assessed for populations monitored by NCNHP during 2012-2016 (Robinson and Padgett 2016). All EORs were also reviewed in 2016 for other documented threats to populations. In addition to threats associated with residential, commercial, and industrial development, other documented threats include habitat loss from land conversion to agricultural use, timber harvest, hydrological alterations from the damming of ponds, impacts from grazing cattle, ORV damage, trampling from foot traffic, invasive species, highway or road improvements, and erosion or siltation (NCNHP 2016, Robinson and Padgett 2016).

Reassessment of Grank and Srank

In 2016, NCNHP reviewed the Grank (Global rank) and Srank (Subnational rank) of *Hexastylis naniflora* using the NatureServe rank calculator, version 3.186 (Faber-Langendoen et al. 2012). The NatureServe rank calculator was developed to ensure status ranks were accurate and consistent, based on current data. The calculator is based on 8 core status rank factors relevant to risk assessments of extinction or extirpation, including categories of rarity, trends, and threats. Rarity is evaluated by the species' range extent, area of occupancy, number of extant occurrences, and number of occurrences of good or excellent viability (see NHP EO rank specifications, defined in Appendix B3). The trend category includes estimate for short-term and long-term trends. Long-term trend is the degree of past directional change in population size, extent of occurrence, area of occupancy, or viability over approximately 200 years. Short-term trends reflect changes over approximately 10 years (Faber-Langednoen et al. 2012). Threats are evaluated and given a rank based on severity, immediacy, and scope of the threat. The factors are scaled and weighted depending on their impact on the risk (Faber-Langendoen et al. 2012). The calculator is in

the form of an Excel spreadsheet, but all factors entered into the calculator are also entered and saved in the Element Global Ranking (EGR) form and Element Subnational Ranking (ESR) form in the NCNHP Biotics database.

Hexastlys naniflora was previously ranked G3S3. Using the NatureServe calculator and current data, these ranks were confirmed to be G3S3 in 2016. For the global range of *H. naniflora*, the range extent is estimated to be approximately 6,500 square km. The area of occupancy is measured by number of 4km square grids and is estimated to cover approximately 1,968 km^2. There are approximately 90 extant occurrences with 33 occurrences of good to excellent viability. The long-term trend is unknown without sufficient information going back 200 years; however, the short-term trend, over approximately 30 years, is estimated to be declining 10-30%, due to the balance of documented declines in some populations and other populations remaining stable. The overall threat impact is calculated to be Medium, based on a combination of all known threats and the scope, severity, and immediacy. The threats assessment from the rank calculator is shown in Appendix B4. The Element Global Ranking (EGR) report and Element Subnational Ranking (ESR) report is shown in Appendix B5 for *Hexastylis naniflora*.

After receiving the preliminary genetic data from ASU, we reran the Srank and Grank, excluding the twenty populations with 50% or higher percent of possible hybridization, and the calculation revealed no change based on the preliminary data.

Ongoing conservation efforts

A total of 21 populations across the range are fully or partially protected. Eighteen populations are protected in North Carolina. This is approximately 21% of the occupied area (43 out of 201 subEOs) in North Carolina. Three out of 22 populations in South Carolina, or approximately 14% of occupied area (3 out of 22 populations), are protected. The 21 total populations are at least partially protected by fee title ownership by conservation partners, conservation easements, deed restrictions, or voluntary landowner agreements. Voluntary landowner agreements consist of Registered Heritage Areas, which are voluntary conservation agreements between the landowner and NCNHP to preserve the natural area and biological diversity of the property. All protected populations of *Hexastylis naniflora* are listed in Table A3 of Appendix A.

Some populations counted as protected or that were anticipated to be protected in the 2010 five-year review (USFWS 2010) include sites that are in roadside rights-of-way where NCDOT pledged permanent protection through Section 7 consultation (USFWS 2010). Many of these sites, however, still need confirmation that they are indeed protected by NCDOT (Table A2, Appendix A). Several populations are afforded permanent protection through fee title ownership by conservation partners. These sites include NCDOT mitigation sites at Murrays Mill and the Broad River Greenway Mitigation site. Other sites in permanent protection include the Catawba Lands Conservancy's Rhyne Preserve, the Cleveland County Landfill, Cowpens National Battlefield, and Peters Creek South Carolina State Heritage Preserve. NCNHP holds four voluntary Registry Agreements with private landowners for the purpose of protecting *Hexastylis naniflora*. These sites are the Parris Heartleaf Registered Heritage Area (RHA), the New Hope Springhead (Barefield) RHA, the Catawba County Wildlife Club RHA, and the Smith Cliff/Henry Fork RHA. Some populations are protected through conservation easements held by various partners. These include populations at the New Bethel Rare Plant Site, held by NCDOT. The Foothills Conservancy of NC holds a conservation easement at Peaked Top Rare Plant Site, and The Nature Conservancy holds a conservation easement at Jacob Fork West Corridor.

Recovery

Proposed recovery strategy
The recovery strategy for *Hexastylis naniflora* involves protection and management of known sites of the species, including addressing immediate threats, such as exotic invasive species, as needed. In order to help recover this plant and grow the numbers of viable populations in the wild, efforts should be made to reduce threats to known populations and secure protection of large sites with good viability.

Proposed recovery goal
The ultimate recovery goal is to remove (delist) this species from the Federal List of Endangered and Threatened Plants (50 CFR 17.12) by ensuring the long-term viability of the species in the wild.

Proposed recovery criteria
The recovery criteria below are based on are the proposed criteria written by James Padgett (2004).

Hexastylis naniflora will be considered recovered when ten healthy populations are self-sustaining within its historical distribution and that the locality of those populations contains substantial genetic variability among them. If these conditions are met this species should no longer meet the criteria or definition of a Threatened species as outlined in the Endangered Species Act of 1973. A population that reproduces and is large enough to maintain genetic variability to survive and respond to natural changes in the habitat and environment will meet the criteria as a population healthy enough to receive protection. *Hexastylis naniflora* should be considered for delisting when the following criteria are met:

1. Of the 113 populations of *H. naniflora* known to exist, at least fifteen should be afforded protection, with at least ten populations considered permanently protected.
2. Management of the fifteen protected populations should be done in cooperation with the landowners and the necessary government agencies, and that all such actions should be documented to ensure future protection of those sites.
3. Protection is sought for new populations that are found, when possible, especially if they fall into locations where genetic variability might be of concern.
4. For populations already in protection, ensure that any future human encroachments or natural threats are managed to safeguard their long-term viability.

Actions needed:
1. Regularly monitor sites under protection and those of excellent viability to ensure stable population trends.
2. Implement management practices at protected sites and populations of excellent viability.
3. Complete genetic analysis to determine whether hybridization is occurring within the populations.
4. Encourage voluntary protection and stewardship through media and educational efforts for the public.

[1]This table was replicated in the same format and populations as Table B.2 from the most recent USFWS five-year Review of *Hexastylis naniflora* (USFWS 2010) for comparison of changes since the time of the five-year review. Populations that are not believed to contain over 1,000 rosettes but were included in the original Table B.2 are included here, but the "NHP EO rank" and in the "Latest estimate of population size" reflects the smaller size.

[2] In the case of partially protected populations, the column "NHP EO numbers" indicates the specific portions of the population afforded protection in bold font.

[3]NHP EO numbers use the following format: Principal EO.SubEO. Only one number is listed if it is a stand-alone principal EO.

[4]NHP EO rank specifications are defined in Appendix B2. In cases involving principal/sub EOs, only the rank for the principal EO is given.

[5] EO ranks with two letters indicate a degree of uncertainty within the range provided (e.g. a rank of "AB" indicates possibly excellent to good viability).

[6]Population that is currently estimated to have over 1,000 rosettes that was not known to be large populations in 2010 have been added to this table.

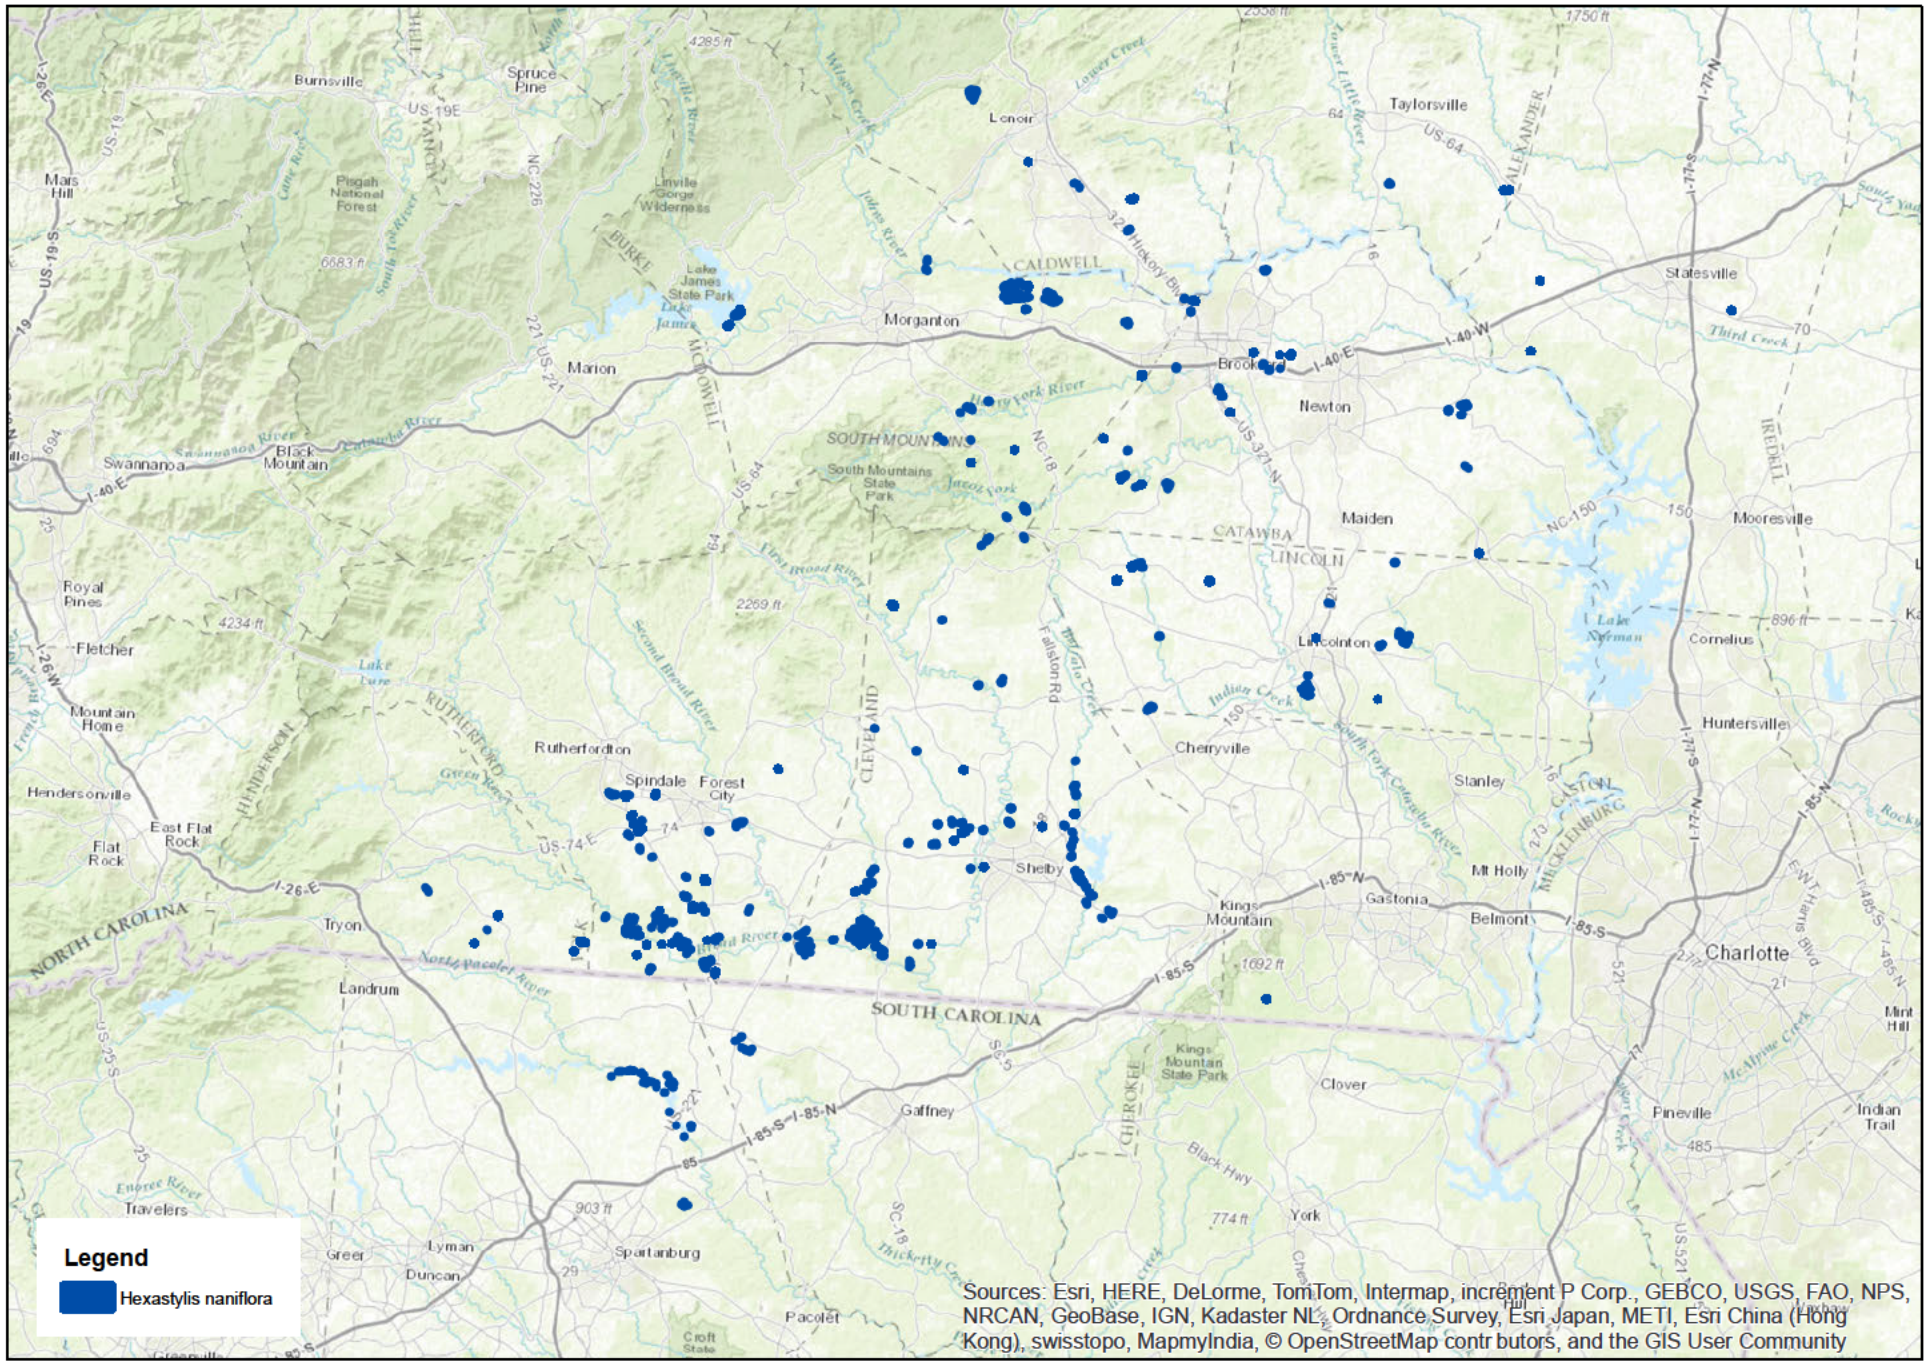

Table A3: Protected populations of *Hexastylis naniflora* on managed areas in North and South Carolina.

Parent EO	Sub EO	EO Rank	County	Site	Managed area	Owner	Nature of Protection

Figure A1: Range of *Hexastylis naniflora*

Appendix B1: Principal- and Sub-Element occurrence records and populations as defined for the purposes of this review (USFWS 2010).

This appendix and methodology was originally written as Appendix C.1 in the U.S. Fish and Wildlife Service five-year review for *Hexastylis naniflora* (USFWS 2010). For this review, NCNHP sought to utilize the same methodology as was previously used, so that data can be compared consistently. As stated in the USFWS five-year review, "many of those working with *Hexastylis naniflora* have used the terms "sub site," "site," "location," "occurrence" (often, but not always, in reference to Natural Heritage Program Element Occurrence Records), and "population" interchangeably, while others have aggregated sites into populations according to subjective criteria which have never been explicitly defined. This has generated considerable discrepancies among sources with respect to the number of known populations within a given area (or across the species' range), to the extent that numbers are not comparable from one source to the next. The tendency to treat each location as a separate population also artificially inflates the actual number of populations known. This review attempts to avoid this problem by refraining from the use of the term "population" unless accompanied by clearly defined criteria for aggregating smaller areas ("sites," "locations," or "occurrences") into "populations."" (USFWS 2010)

"When the species was federally listed in 1989, there were a total of 22 NHP element occurrence (EO) records in the combined databases of the NC and SC Heritage Programs (NCNHP and SCDNR, respectively). Four of the populations known and addressed in the 1989 Federal Register listing notice had not yet been assigned EO numbers by the Natural Heritage Programs in 1989." (USFWS 2010)

In 2016, there are a total of 293 NHP EO records for *Hexastylis naniflora* in the databases managed by NCNHP and SCDNR. However, this number does not accurately represent the number of populations of the species, because in some instances discrete EOs have been mapped in very close proximity to one another, whereas in other cases a single EO may consist of more than one spatially discrete aggregation of plants. "In recent years, NatureServe and its member Natural Heritage Programs have devised mapping standards to balance the need for fine-scale, highly site-specific EO records (required for monitoring and management) with the need to aggregate these records in meaningful units of conservation interest that may approximate biological populations." (NatureServe 2002) "Since USFWS does not maintain its own database of known locations of *Hexastylis naniflora*, it regards the NHP databases as the best repository for this information." (USFWS 2010)

During 2015-2016, NCNHP reviewed all NC EOs of *Hexastylis naniflora*, making mapping revisions where necessary, to improve all records in accordance with NatureServe mapping protocols. As of August 2016, NCNHP has 27 parent EOs and another 64 stand-alone EOs of *Hexastylis naniflora*. "Principal or stand-alone EOs can be thought of as proxies for populations in the absence of species-specific information on pollination and dispersal distances. For purposes of this review, we regard these 27 parent and 64 extant stand-alone EO records as 91 populations of the species in North Carolina.

As of 2016, SCDNR has not yet aggregated its records for the species into principal and stand-alone EOs. As a result, the 59 records currently mapped for the species in South Carolina often include several records

in sufficiently close proximity to one another that they should be considered a single population. Applying a buffer of 2 km (the default and minimum separation distance according to NatureServe's data standard) to these records reveals a maximum of 22 spatially discrete aggregations of sites in South Carolina. These aggregations separated by 2 km are regarded as 22 populations for the purposes of this review (USFWS 2010).

Therefore, for the purposes of this review, the current range of *Hexastylis naniflora* has been defined as consisting of (91 +22=) 113 spatially discrete populations of the species.

Appendix B3: NC Natural Heritage Program (NCNHP) Element Occurrence Rank Specifications for *Hexastylis naniflora*

"A" Rank Specifications (excellent viability)
An A-ranked population of *Hexastylis naniflora* should have more than 500 clumps (rosettes) occurring in greater than one acre of high quality forest such as Dry-Mesic Oak Hickory Forest or Mesic Mixed Hardwood Forest.

"B" Rank Specifications (good viability)
A B-ranked population of *Hexastylis naniflora* should have 200-500 clumps (rosettes) occurring in greater than one acre of high quality forest such as Dry-Mesic Oak Hickory Forest or Mesic Mixed Hardwood Forest - OR - more than 500 clumps occurring in less than one acre of high quality forest or on land impacted by human disturbance such as logging, grazing, mowing, etc.

"C" Rank Specifications (fair viability)
A C-ranked population of *Hexastylis naniflora* should have 100-200 clumps (rosettes) occurring in greater than one acre of high quality forest such as Dry-Mesic Oak Hickory Forest or Mesic Mixed Hardwood Forest - OR - 200- 500 clumps occurring in less than one acre of high quality forest or on land impacted by human disturbance such as logging, grazing, mowing, etc.

"D" Rank Specifications (poor viability)
A D-ranked population of *Hexastylis naniflora* should have fewer than 100 clumps (rosettes) occurring in greater than one acre of high quality forest such as Dry-Mesic Oak Hickory Forest or Mesic Mixed Hardwood Forest - OR - less than 200 clumps occurring in less than one acre of high quality forest or on land impacted by human disturbance such as logging, grazing, mowing, etc.

"E" Rank Specifications (extant)
An E-ranked population of *Hexastylis naniflora* is an occurrence that has recently been verified as still existing, but sufficient information for the factors used to estimate viability has not yet been obtained.

"H" Rank Specification (historical)
An H-ranked population of *Hexastylis naniflora* lacks recent field information verifying the continued existence of the occurrence. In the absence of known disturbance and with the habitat still extant, H is generally recommended for occurrences that have not been reconfirmed for approximately 30 or more years.

"F" Rank Specification (failed to find)
An F-ranked population of *Hexastylis naniflora* has not been found despite a search by an experienced observer at a time and under conditions appropriate for the Element at a location where it was previously reported, but the occurrence still might be confirmed to exist at that location with additional field survey efforts. For occurrences with vague locational information, the search must include areas of appropriate habitat within the range of locational uncertainty.

"X" Rank Specification (failed to find)
An X-ranked population of *Hexastylis naniflora* is considered destroyed based on adequate surveys by one or more experienced observers at times and under conditions appropriate for the species at the occurrence location, or other persuasive evidence indicates that the species no longer exists there or that the habitat has been destroyed to such an extent that it can no longer support the species.

“U” Rank Specification (failed to find)
A U-ranked population of *Hexastylis naniflora* cannot be assigned a rank due to lack of sufficient information on the occurrence or the species identification has not been confirmed.

Rank Specifications Justification
The unit of measurement for population size in this species is "clump" (rosette). EO size (as quantified by number of clumps or rosettes) is the primary rank factor. Condition of habitat (vegetation community and structure) and Landscape context (extent of suitable habitat and physical factors) are also incorporated secondarily. The species thrives most in undisturbed habitat. However, disturbed lands, that have been logged, grazed, mown, or converted to pasture, orchards, or tree plantations have been found to support remnant patches of *Hexastylis naniflora*. The extent to which this species can withstand disturbance is unknown. Populations in disturbed habitat are considered at risk, with relatively poor viability (C or D). Care should be taken when estimating population size, as population estimates have been found to vary widely from the number counted in population censuses. Specifications are based on largest known populations and expert opinion (including James Padgett, Carolyn Wells, Misty Buchanan (formerly Franklin), and Brenda Wichmann).

Appendix B4: *Hexastylis naniflora* threats assessment summary.

Data extracted from the NatureServe Rank Calculator version 3.186 (Faber-Langendoen et al. 2012) for *Hexastylis naniflora* Global rank.

NatureServe calculator number	Threat	Impact (calculated)		Scope	Severity	Timing	Comments
1	Residential & commercial development	D	Low	Small (1-10%)	Moderate (11-30%) population decline	High (continuing)	Direct & indirect impacts from development
2.2	Wood & pulp plantations	D	Low	Small (1-10%)	Moderate (11-30%) population decline	High (continuing)	Incompatible forestry practices
2.3	Livestock farming & ranching	N/A	Not in timeframe	Small (1-10%)	Slight (1-10%) population decline	Low (long term)	Trampling by cattle
3.2	Mining & quarrying	N/A	Not in timeframe	Small (1-10%)	Slight (1-10%) population decline	Low (long term)	2 occurrences moved due to quarry expansion
4.1	Roads & railroads	D	Low	Restricted (11-30%)	Moderate (11-30%) population decline	High (continuing)	Impacts from road construction, but some of the work is mitigated.
6.1	Recreational activities	N/A	Negligible	Negligible (<1%)	Negligible or <1% population decline	Moderate (short term)	Foot traffic and ORV use
8.1	Invasive nonnative species	C-D	Medium-Low	Restricted - Large (11-70%)	Moderate (11-30%) population decline	High (continuing)	Data show a scope of less than 10% of populations with invasive species, but we believe this threat is considerably unreported.
9.4	Garbage & solid waste	D	Low	Small (1-10%)	Slight (1-10%) population decline	Moderate (short-term)	Dumping on occurrences
11.5	Storms & flooding	D	Low	Small (1-10%)	Slight (1-10%) population decline	Moderate (short-term)	Siltation/erosion

Based on the NatureServe Calculator, the overall threat impact = C (Medium).

Appendix B5:

Element Global Ranking (EGR) Report

Scientific Name Hexastylis naniflora **Element ID** **15335**

Common Name: **Dwarf-flowered Heartleaf**

Global Rank: G3

Subntl. Rank: S3

IDENTIFIERS

Scientific Name: ***Hexastylis naniflora***

Subnational Common Name: Dwarf-flowered Heartleaf

Concept Reference Short Citation: Kartesz 1994

Exemplary Site: Lower Broad River/Sandy Run Natural Areas

POPULATION and EOs

Number of EOs: D=81-300

Comments: In 2016, there were 113 parent or stand-alone EORs in North and South Carolina for Hexastylis naniflora.

Number of EOs with Good Viability: D=Some (13-40) occurrences with Excellent or Good viability

Comments: 30-35 parent or 13 stand-alone EOs of Excellent or Good viability (2016).

Number of Protected EOs: CD

Comments: As of 2016, 10 on managed areas in NC, with several more on NCDOT rights-of-way, awaiting confirmation of protection by NCDOT, 3 protected sites in South Carolina.

Population Size: G=100,000-1,000,000 individuals

Comments: In 2016, the estimated number of rosettes exceeds 300,000 in North and South Carolina, based on recent monitoring of the largest populations.

RANGE

Range Extent: E=5,000-20,000 sq. mi.

Comments: The current reported range is Alexander, Burke, Caldwell, Catawba, Cleveland, Gaston, Iredell, Lincoln, Polk, and Rutherford counties, North Carolina (2016).

Area of Occupancy: E=26-125 4-km2 grid cells

Linear Distancy of Occupancy:

Comments: The total area of occupancy using 4 km sq grid cells is 1,968 sq km, or 123 grid cells.

TREND

Short-Term Trend: Decline of 10-30%

Comments: Estimated decline of 10-30%, with impacts from highway projects, however, other populations appear to be relatively stable, given other observed threats and new sites are still being found (Robinson 2016).

Long-Term Trend: Unknown

Comments:

THREATS

Scope: **Severity:** **Immediacy:**

Threat: C=Medium overall threat impact

Comments: Threats to this species occur at low to moderate levels and include agricultural threats such as incompatible forestry practices and disturbance from cattle, impacts from transportation improvements to roads and highways, damage from recreational activities including foot traffic and ORV use, invasive plant species, residential and commercial development, and siltation and erosion resulting from severe weather.

DWARF-FLOWERED HEARTLEAF ELICITATION QUESTIONS

Below is an overview of the questions we are asking for your expert feedback on. Each question is elaborated on in a new page below with information I've gleaned from the literature and reports. Please record your answers and insights on the following pages and return to me via email by Friday, January 26. Thank you! - Mike

1. How would you suggest delineating populations for this species?

2. What factors are important for characterizing resilience for this species? These include population factors (e.g. population size/density) and habitat factors (e.g. soil type, canopy cover).

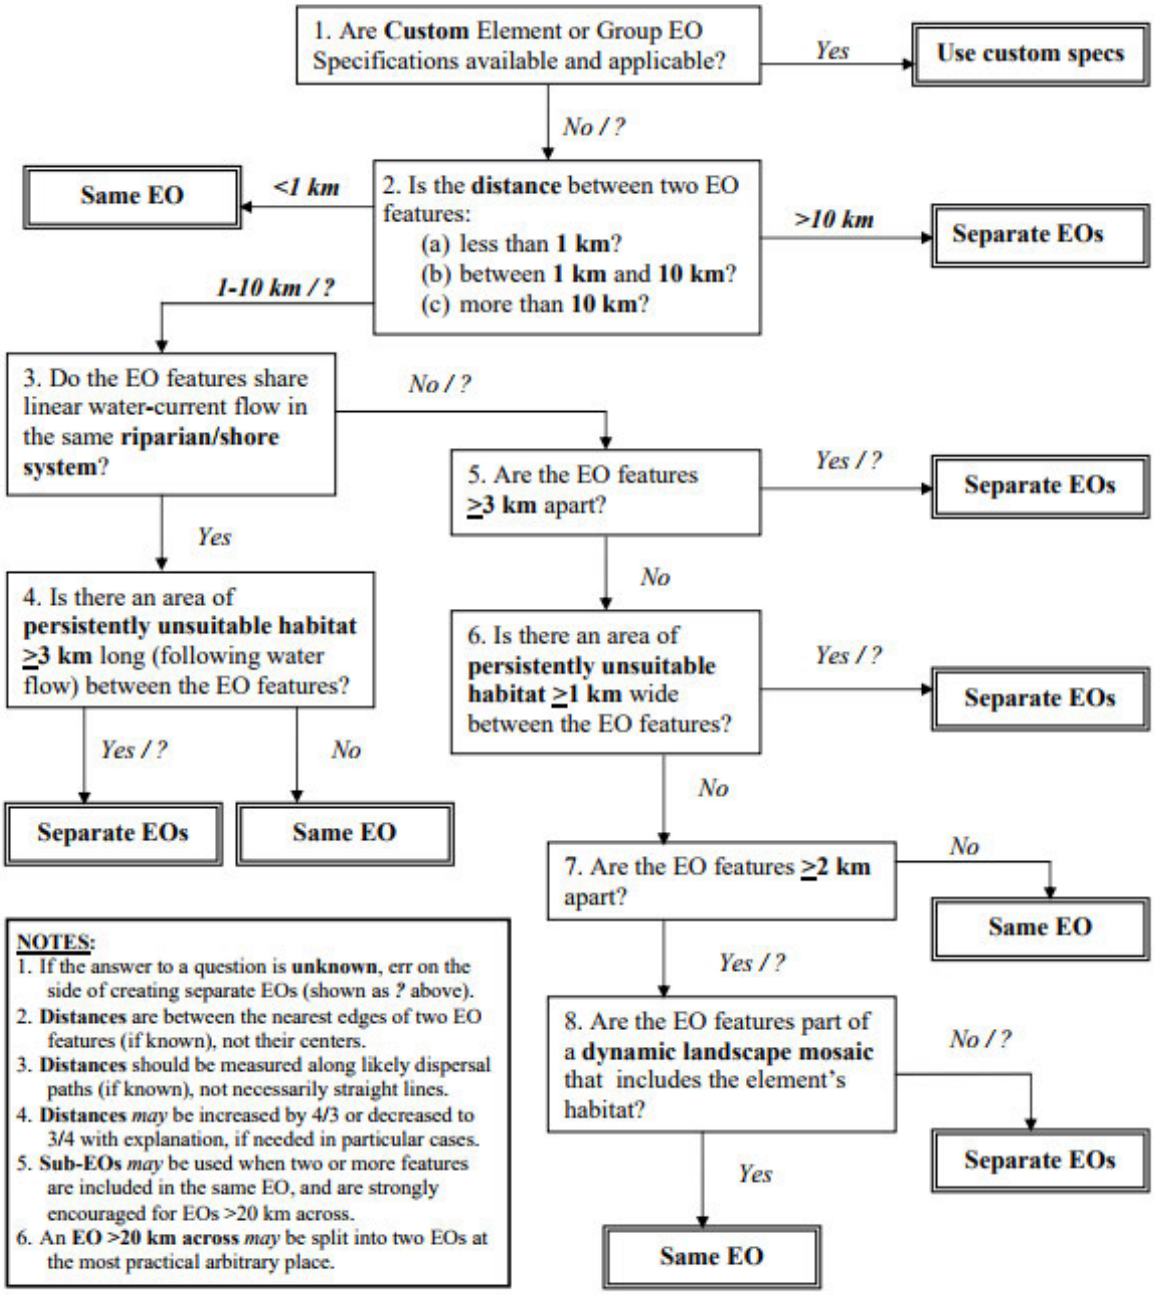
3. How would you suggest delineating representative units for this species?

4. In thinking about future scenarios and viability of this species, what are the most pertinent risk factors to consider (e.g. development, invasive species, climate change)?

5. Based on the primary risk factors identified in question #4, what do you think an appropriate future time frame to project future conditions might be?

1. How would you suggest delineating populations for this species?

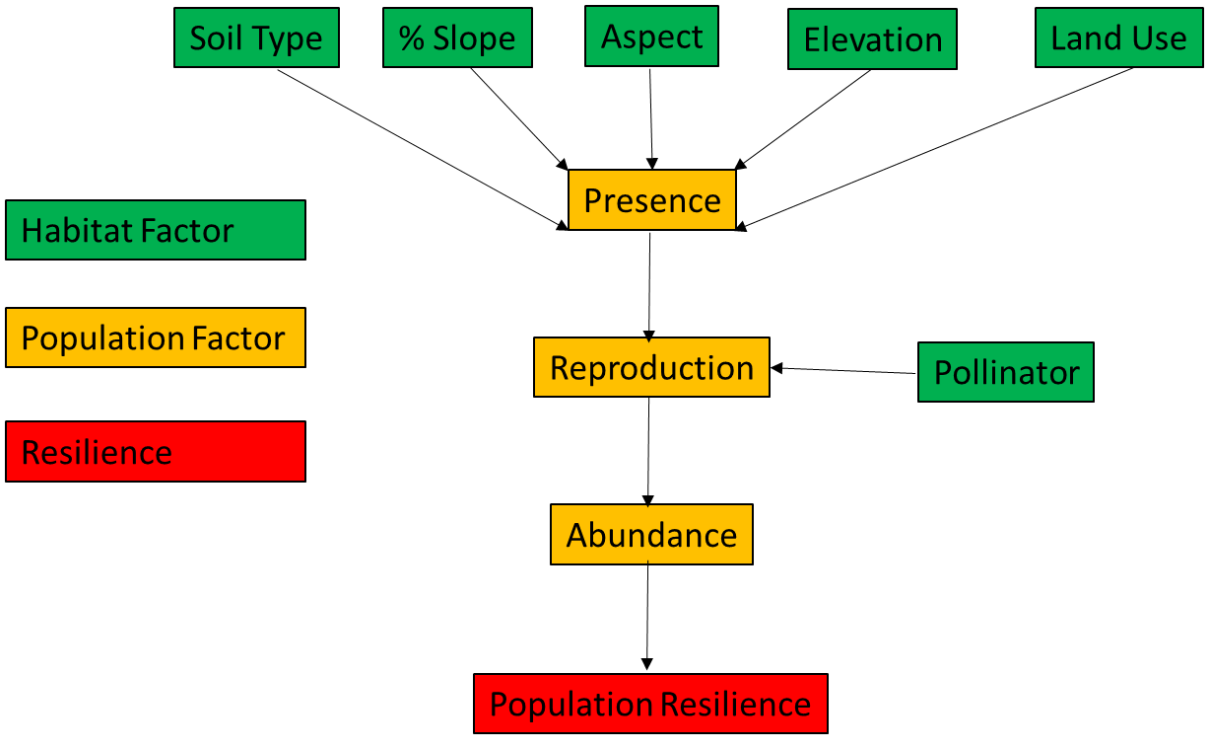
Under the 3 R's framework (resilience, redundancy, and representation), resilience is measured at the scale of a population, and resilient populations are then scaled up to assess redundancy and representation for the whole species. Because the population is the basic unit, it is important to define what constitutes a population. Recently, a "population" was defined based on NatureServe's separation distance criteria for a plant species of 1 km between separate populations/element occurrences. Pasted on the following page is their decision tree (full document here: http://www.natureserve.org/library/deliminting_plant_eos_Oct_2004.pdf). This seems to be the standard for this species and is used in NCNHP reports and the 5-year review. 1 km is the default separation distance, which they recommend altering if additional information or species characteristics warrant it. As of 2016, the combined databases of the NCNHP and SCNDNR contain 239 Element Occurrence Records (EORs) for *H. naniflora* (NCNHP2016, SCDNR 2016). These EORs depict roughly 113 locations which are sufficiently geographically distinct to be regarded as proxies for populations of the species



Based on the Natureserve guidelines or other information currently known, would you suggest using a criterion other than 1 km of separation between distinct populations? If so, what information is that based on (e.g. dispersal vectors or distances, pollinator behavior, genetic results)?

Answer:

As part of the NatureServe Network, NCNHP uses the NatureServe Guidelines. The term "population" refers to parent Element Occurrence records (Eos) and all associated subEOs within them, as delineated by the N.C. Natural Heritage Program. In general occurrences are considered separate when 2 km or more suitable habitat distance separates them, and when 1 km unsuitable habitat separates locations. In some circumstances, less than 1 km separates populations as when a major highway like I-74 occurs between locations or when occurrences are in separate watersheds. Comments on separation distances are recorded for each record as data are added or updated.



NCNHP procedures are outlined in more detail in the 2016 Dwarf-flowered Heartleaf (*Hexastylis naniflora*) Range-wide Status Report, Appendix B1 B1 (enclosed with email response).

Figure 1. Habitat-based Plant Element Occurrence Delimitation Guidance, 1 October 2004

2. What factors are important for characterizing resilience for this species? These include population factors (e.g. population size/density) and habitat factors (e.g. soil type, canopy cover).

These are the factors that we will use for each population to determine its resilience (whether it is a resilient vs. not resilient classification, or low-medium-high resilience, or some other kind of ranking). Based on the literature, there seem to be a few logical factors to include in the SSA (see influence diagram below). To the extent possible, some of these factors would be used in a model to quantify, to the extent possible, current and future condition of the species, and ultimately viability.

Potential habitat seems to be based on a few factors: soil type (occur in 4 soil types, mainly Pacolet sandy loam), % slope (8-10%), aspect (prefer north facing), elevation (199-415 m), and land use (i.e. deciduous forest).

The main population factor driving resilience of a given population seems to be population size. Given habitat is available and the species is present, reproduction must occur for a population to grow, and that is at least partly influenced by presence of pollinators, which seem to be mainly ants.

Other considerations: connectivity for cross-pollination/seed dispersal (distance from nearest neighbor population); Protected- either protected conservation land or some kind of landowner agreement.

Based on your knowledge of the species biology and needs. Feel free to select the most important ones from my preliminary list, please add any important things I missed, and by all means argue against anything on my list or otherwise that isn't an important contributor. While there are many factors that interact to influence populations, our goal is narrow it down to the most important factors for our assessment.

Answer:

The factors used for NCNHP rank specifications are similar to the ones mentioned for Resilience. I have included the rank specifications here:

Rank Specifications Justification

The unit of measurement for population size in this species is "clump" (rosette). EO size (as quantified by number of clumps or rosettes) is the primary rank factor. Condition of habitat (vegetation community and structure) and Landscape context (extent of suitable habitat and physical factors) are also incorporated secondarily. The species thrives most in undisturbed habitat. However, disturbed lands, that have been logged, grazed, mown, or converted to pasture, orchards, or tree plantations have been found to support remnant patches of *Hexastylis naniflora*. The extent to which this species can withstand disturbance is unknown. Populations in disturbed habitat are considered at risk, with relatively poor viability (C or D). Care should be taken when estimating population size, as population estimates have been found to vary widely from the number counted in population censuses. Specifications are based on largest known populations and expert opinion (including James Padgett, Carolyn Wells, Misty Buchanan (formerly Franklin), and Brenda Wichmann).

NCNHP procedures are outlined in more detail in the 2016 Dwarf-flowered Heartleaf (*Hexastylis naniflora*) Range-wide Status Report, Appendix B1 (enclosed with email response).

3. How would you suggest delineating representative units for this species?

> Representation refers to the species ability to adapt to changing environmental conditions, and can also be thought of as diversity. This can be genetic diversity and/or diversity in habitat types, life history traits, or other characteristics that could be indicative of underlying genetic diversity.
>
> For dwarf-flowered heartleaf, one could argue that here are no representative units, that there is only one "type". Support for this idea is the limited range of the species. Other ideas might stem from some of the genetic analyses for the species, indicating some type of latitudinal variation. The STRUCTURE analysis provides strong evidence that populations in the southern part of the range of *H. naniflora* are not subject to significant hybridization pressures, whereas populations in the southeast portion of the range appear to by hybridizing with *H. minor* and populations in the northern portion of the range appear to form a hybrid swarm with *H. heterophylla* and *H. minor*. Would this suggest representative units for the species based on a north-south-southeast split? Where might that split be mapped for purposes of the SSA? Watersheds? Basins?
>
> Given your expertise and experience, would you suggest delineating different representative units for the species? If so, how? Alternately, would you suggest there is only one "type" across the species range? If so, why?

Answer:

NCNHP has used hydrologic units to separate occurrences that are less than 2 km apart, but are not within the same stream drainage, however unsuitable habitat also exists in those cases. In informal review of mapped records, the close association of occurrences to hydrology leads to speculation about HENA's biological relationship to watersheds and river basins (see figure below of a section of the Upper Broad River hydrology layer over-lain with HENA features).

NCNHP does document results of genetic work on the species within EO records when the work indicates uncertainty about the identity of the plants at the location. The genetic work referred to in the question is preliminary and may not be appropriate to base a decision on until it is peer-reviewed.

There is uncertainty if there is one type, and there may be only one as Master's thesis research from Padgett (2004) and Niedenberger (2010) indicate that the pollen morphology of HENA is unique. Without comparison of pollen in conjunction with genetic analysis of those individuals, a north-south-southeast split may not be appropriate based on preliminary genetic work alone. For the purposes of the SSA, splitting at the watershed or basin level would be appropriate.

Padgett, J. E. 2004. Biogeographical, ecological, morphological, and micromorphological analyses of the species in the Hexastylis heterophylla complex. M.S. thesis. Appalachian State University, Boone, NC.

Niedenberger, B.A. 2010. Molecular phylogeny and comparative pollen morphology of the genus Hexastylis (Aristolochiaceae). M.S. thesis. Appalachian State University, **B**oone, NC.

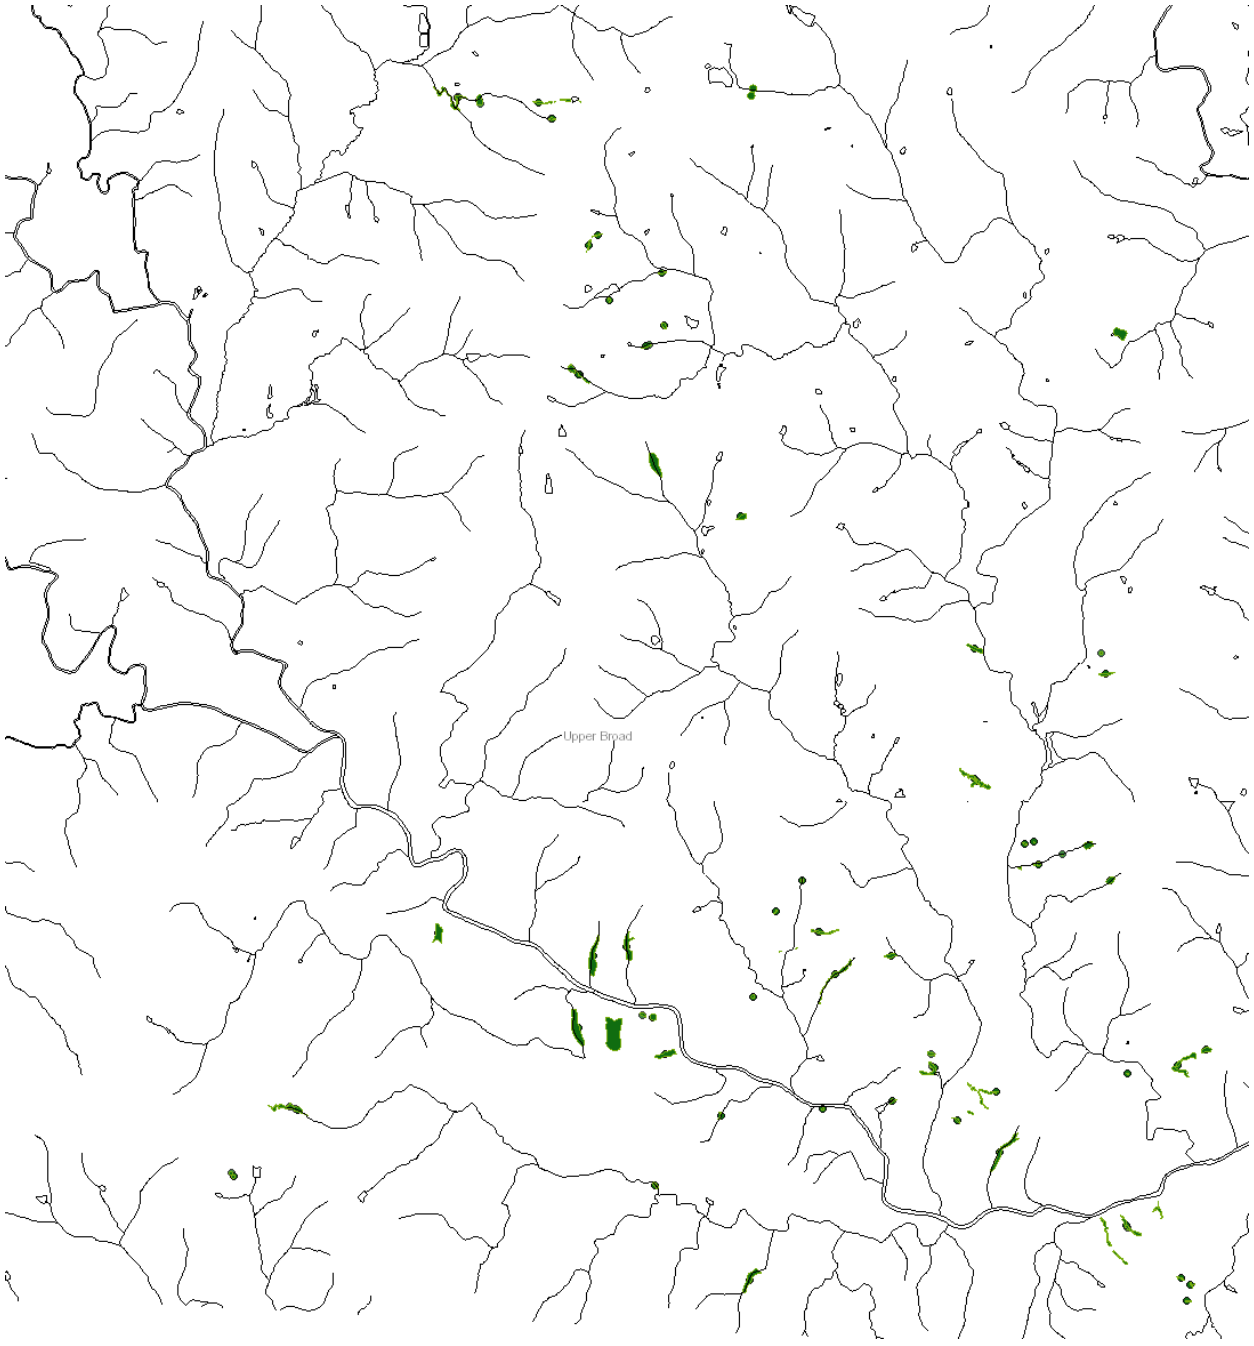


Figure of Hexastylis naniflora records along the Upper Broad River hydrological layer (NCNHP 2018-01)

4. In thinking about future scenarios and viability of this species, what are the most pertinent risk factors to consider (e.g. development, invasive species, climate change (temp, precip, etc))?

> For the SSA, we will define a set of possible future scenarios, and assess what future resilience, redundancy, and representation might look like under those scenarios. What are the most important factors to consider that could influence species viability now and into the future that we need to consider when defining future scenarios?

Answer:
Threats to this species occur at low to moderate levels and include agricultural threats such as incompatible forestry practices and disturbance from cattle, impacts from transportation improvements to roads and highways, damage from recreational activities including foot traffic and ORV use, invasive plant species, residential and commercial development, and siltation and erosion resulting from severe weather.

NCNHP procedures are outlined in more detail in the 2016 Dwarf-flowered Heartleaf (*Hexastylis naniflora*) Range-wide Status Report, Appendix B4 (enclosed with email response).

5. Based on the primary risk factors identified in question #4, what do you think an appropriate future time frame to project future conditions might be?

When we project populations into the future under different scenarios, we will need to be explicit about how far into the future we are projecting. Based on the risk factors identified above, *HENA* life history/generation times, uncertainty associated with the risk factors and *HENA* responses to them, over what time frame do you think we can reasonably predict future population conditions?

Thank you so much Jame and crew!

Really appreciate you getting this to me. I am heavily leaning on that report as I write the SSA up....kudos on an exemplary report, in my opinion!

I plan on sending out the first section for review on Monday. When you get to review the various sections of the report, you can flag areas and suggest more detailed edits at that point....these questions are designed to make sure I'm on the right track, so to speak, and ensure the experts are tied into the process. You're answers are extremely useful as I try to tie this all together.

Have a great weekend!

Mike

Hello Technical Team!

First, I want to thank everyone for joining the kick-off call. I thought it was quite productive. On that call, I mentioned sending some elicitation questions out to the technical team in order to ensure species expert input into the drafting of the SSA for HENA. I have attached a questionnaire to this email. Please take a look and answer the questions to the best of your ability by next Friday (1/26/18).

I am currently drafting the Species Biology and Species Needs portions of the SSA, and should have that wrapped up by 1/29/18 for your review, though the elicitation questions will help in that drafting, so if you could get me your answers asap, I'd greatly appreciate it.

Thanks, and have a great weekend!

Mike

FYI...Matt E. also sent his answers to me....everyone has responded! I'll upload those answers to google drive for folks to look over. My plan is to send out the first sections for review on Monday. I've revised based on Rebekah's comments and our Core Team discussion...I'll look to include the maps we discussed if possible in that Monday draft. Here are the 3 maps (2 we discussed) that I'd love to include if you could Mark....

The distribution map (shaded counties of occurrence, with some way of showing how many EOs are within those counties)

Updated map for the 3 species occurence/co-occurrence that did not include Iredell county

Based on Rebekah's comment...I totally agree that a map that shows soil layers and distribution....possibly soil layers within their range that are suitable for occupancy highlighted....basically show potential distribution of the species based on suitable soil types.

Thanks!

Mike

Hi Matt,

I have a request for you....in your answers you mention a possible new species and provided a "heat" map of boundaries....you mention you could provide GPS coordinates....that would be fantastic! Not sure how we will incorporate all of this into the SSA, but would like to bring all of the data to the table. If you have shapefiles of any sort that would be fantastic.

Thanks!

Mike

Subject: Additional Info on EO Ranks from NHP
Date: Friday, February 2, 2018 11:51:47 AM
Attachments: HENA Range-wide Status Report EO RANK SPECS (August 2016).pdf
Importance: High

Mike,

I spoke with Jame about EO Ranks.

In an ideal world, the EO Rank would be updated with the last observance (so those two dates would be consistent). However, there may be a good reason for the discrepancy or it may have just been overlooked (Jame's comment was that they are only human). She asked me to pull out the discrepancies and she'd take a look. I'm working on that. Right now, it looks like maybe a third have that discrepancy.

There are EO Rank Specifications for HENA. This was in the back of the Range-wide Status Report and I missed it. I've pulled it out of the main document so we now all have easy access (see attached). Notice an A-ranked EO has >500 individuals...we talked about 1,000 as the magic number yesterday because of the previous reports but we may want to reconsider.

NCNHP did go through SCNHP's EO data and came up with 22 populations. Jame knows that a 2km buffer was used but she also thinks that habitat may have also been considered. That may account for the 18 vs 22 for SC - some of the larger aggregation of points may have had separations due to unsuitable habitat. Laura Robinson was the one to go through that data. If we want specifics, we will have to wait for her to return from maternity leave (sometime mid-February).

I've been playing phone tag with SCNHP but I did get this info in an email:

> The 100-or-1000 meter buffers are there to represent how exact (or inexact) we think a location might be, whereas the "30 meters" I mentioned yesterday is a minimum separation distance – i.e., in terms of distance, what should separate one occurrence record (of the same species) from the next? This is up to the biologist, but for plant observations we usually use a minimum distance of 30 meters.
>
> The confidence buffer and the separation distance are related in that, say, it wouldn't make sense to talk about a less-than-30-meter separation if you weren't confident that your GPS readings were accurate within 15 meters. But other separation considerations include – how stationary is the organism? at what scale is the biologist assessing population?
>
> I'm not sure how well any of this corresponds with NatureServe practices -- with no data manager on staff, we've been improvising!

I'm thinking we will just have to go with what we have for the SC data. NCNHP came up with 22 populations and I'm sure they have justification beyond just the 2km buffer so I'm

comfortable with that.

I'll be in touch with any updated rank dates for the table. Thanks and have a great weekend!

Appendix B3: NC Natural Heritage Program (NCNHP) Element Occurrence Rank Specifications for *Hexastylis naniflora*

"A" Rank Specifications (excellent viability)
An A-ranked population of *Hexastylis naniflora* should have more than 500 clumps (rosettes) occurring in greater than one acre of high quality forest such as Dry-Mesic Oak Hickory Forest or Mesic Mixed Hardwood Forest.

"B" Rank Specifications (good viability)
A B-ranked population of *Hexastylis naniflora* should have 200-500 clumps (rosettes) occurring in greater than one acre of high quality forest such as Dry-Mesic Oak Hickory Forest or Mesic Mixed Hardwood Forest - OR - more than 500 clumps occurring in less than one acre of high quality forest or on land impacted by human disturbance such as logging, grazing, mowing, etc.

"C" Rank Specifications (fair viability)
A C-ranked population of *Hexastylis naniflora* should have 100-200 clumps (rosettes) occurring in greater than one acre of high quality forest such as Dry-Mesic Oak Hickory Forest or Mesic Mixed Hardwood Forest - OR - 200- 500 clumps occurring in less than one acre of high quality forest or on land impacted by human disturbance such as logging, grazing, mowing, etc.

"D" Rank Specifications (poor viability)
A D-ranked population of *Hexastylis naniflora* should have fewer than 100 clumps (rosettes) occurring in greater than one acre of high quality forest such as Dry-Mesic Oak Hickory Forest or Mesic Mixed Hardwood Forest - OR - less than 200 clumps occurring in less than one acre of high quality forest or on land impacted by human disturbance such as logging, grazing, mowing, etc.

"E" Rank Specifications (extant)
An E-ranked population of *Hexastylis naniflora* is an occurrence that has recently been verified as still existing, but sufficient information for the factors used to estimate viability has not yet been obtained.

"H" Rank Specification (historical)
An H-ranked population of *Hexastylis naniflora* lacks recent field information verifying the continued existence of the occurrence. In the absence of known disturbance and with the habitat still extant, H is generally recommended for occurrences that have not been reconfirmed for approximately 30 or more years.

"F" Rank Specification (failed to find)
An F-ranked population of *Hexastylis naniflora* has not been found despite a search by an experienced observer at a time and under conditions appropriate for the Element at a location where it was previously reported, but the occurrence still might be confirmed to exist at that location with additional field survey efforts. For occurrences with vague locational information, the search must include areas of appropriate habitat within the range of locational uncertainty.

"X" Rank Specification (failed to find)
An X-ranked population of *Hexastylis naniflora* is considered destroyed based on adequate surveys by one or more experienced observers at times and under conditions appropriate for the species at the occurrence location, or other persuasive evidence indicates that the species no longer exists there or that the habitat has been destroyed to such an extent that it can no longer support the species.

“U” Rank Specification (failed to find)
A U-ranked population of *Hexastylis naniflora* cannot be assigned a rank due to lack of sufficient information on the occurrence or the species identification has not been confirmed.

Rank Specifications Justification
The unit of measurement for population size in this species is "clump" (rosette). EO size (as quantified by number of clumps or rosettes) is the primary rank factor. Condition of habitat (vegetation community and structure) and Landscape context (extent of suitable habitat and physical factors) are also incorporated secondarily. The species thrives most in undisturbed habitat. However, disturbed lands, that have been logged, grazed, mown, or converted to pasture, orchards, or tree plantations have been found to support remnant patches of *Hexastylis naniflora*. The extent to which this species can withstand disturbance is unknown. Populations in disturbed habitat are considered at risk, with relatively poor viability (C or D). Care should be taken when estimating population size, as population estimates have been found to vary widely from the number counted in population censuses. Specifications are based on largest known populations and expert opinion (including James Padgett, Carolyn Wells, Misty Buchanan (formerly Franklin), and Brenda Wichmann).

CAUTION: External email. Do not click links or open attachments unless verified. Send all suspicious email as an attachment to report.spam@nc.gov.

Jame,

Attached is spreadsheet that show HENA EO records with a discrepancy between EO rank date and last observed date. There are two scenarios represented in the table:

- EO rank date older than last observe date
- Last observe date older than EO rank date

Our questions are:

- In the case of EO rank date older than last observe date - Can we assume an EO rank date consistent with last observed date even if it is listed as older? Example EO14 - The last observed date was 2009 and the EO rank date is 2001. Can we assume 2009 for an updated

EO rank date?

- In the case of last observe date older than EO rank date - We can assume the EO rank date is accurate and maybe desk updated?

Thank you and have a great weekend!

Importance: High

Hi Rebekah,

Thanks for the info....very helpful. I'm using the spreadsheets with the data you provided to come up with a clean spreadsheet that shows only those populations for which the last observed/detection was no more than 10 years ago....this will change the narrative for number of populations, which is totally fine. Seems, as we discussed, the estimated number of populations came from data spread out over 20-30 years....we discussed not being too confident about the species actually being present, or especially abundance estimates that were older than 10 years...I will just be explicit about how the historical narrative on populations came from a wide time frame, but for the purposes of the SSA, we only focus on recent detections for the current condition of the species. As an example of what the estimates would be....for North Carolina, we go down from 90-something populations to 63....SC will be in the single digits. This is still a lot of populations, and the model will indicate there is a lot more available habitat that may or may not be occupied, but is suitable....will also point out that there are likely more populations at previous EO locations, but we did not want to include in the SSA analysis.

As for categorizing resilience based on population size....it seems the EO ranks consider threats, surrounding matrix, habitat and population numbers....because >1,000 plants is mentioned in many of the reports, I'd like to capture that....I'm thinking something like:

>1,000 plants = very high

500-1,000 = high

100-500 = moderate

<100 = low

This of course will be vetted through the experts via review of the SSA, and probably another round of elicitations. We will also discuss the subset of populations for which we have growth rate/trajectory data, but because we won't have this for every population, I think we stick with population size as an indicator of the resilience of a population.

Hope that all makes sense! Have a great weekend!

Mike

Thanks, Mike. That all sounds good. I like the population size break down and will be interested to see what our experts think. Once you have the spreadsheet for current populations settled, send it my way. I will need to go through the spatial data and get it to Mark for the model. SC was supposed to send me data for their preserves but I haven't received it yet. I've reminded them again. My hope is that the preserve data is more current than what is in the SC EO data and we can add a few more populations to our list of current populations for SC. We'll see...

Thanks!

Good morning!

I've attached 2 spreadsheets to this email (for North and South Carolina). Within these files, I have created a separate sheet labeled "Populations Only", in which I took only the populations that have been detected within the last 10 years.....those populations then got a resilience ranking based on population size based off of the rules:

>1,000 plants = very high

500-1,000 = high

100-500 = moderate

<100 = low

Rebekah....a few notes: for NC pops...I wasn't sure if a population was made up of multiple EOs, if the population number was an additional EO...for example, if the population was labeled 100.000, and it was composed of 100.20, 100.21, and 100.22, is there just 3 EOs (20, 21, and 22), or are there 4 EOs (20, 21, 22, and 100)....I went with there only being 3 EOs, but all the data is preserved on the new sheet. Also, for SC...there are 2 populations at the end that I don't have EOs for....no problem, except for being able to spatially delineate these for the model, etc....

Have a look....hopefully I haven't made any big mistakes!

Thanks,

Mike

> Thanks, Mike. That all sounds good. I like the population size break down and will be interested to see what our experts think. Once you have the spreadsheet for current populations settled, send it my way. I will need to go through the spatial data and get it to Mark for the model. SC was supposed to send me data for their preserves but I haven't received it yet. I've reminded them again. My hope is that the preserve data is more current than what is in the SC EO data and we can add a few more populations to our list of current populations for SC. We'll see...

> Thanks for the info....very helpful. I'm using the spreadsheets with the data you provided to come up with a clean spreadsheet that shows only those populations for which the last observed/detection was no more than 10 years ago....this will change the narrative for number of populations, which is totally fine. Seems, as we discussed, the estimated number of populations came from data spread out over 20-30 years....we discussed not being too confident about the species actually being present, or especially abundance estimates that were older than 10 years...I will just be explicit about how the historical narrative on populations came from a wide time frame, but for the purposes of the SSA, we only focus on recent detections for the current condition of the species. As an example of what the estimates would be....for North Carolina, we go down from 90-something populations to 63....SC will be in the single digits. This is still a lot of populations, and the model will indicate there is a lot more available habitat that may or may not be occupied, but is suitable....will also point out that there are likely more populations at previous EO locations, but we did not want to include in the SSA analysis.
>
> As for categorizing resilience based on population size....it seems the EO ranks consider threats, surrounding matrix, habitat and population numbers....because >1,000 plants is mentioned in many of the reports, I'd like to capture that....I'm thinking something like:

> This of course will be vetted through the experts via review of the SSA, and probably another round of elicitations. We will also discuss the subset of populations for which we have growth rate/trajectory data, but because we won't have this for every population, I think we stick with population size as an indicator of the resilience of a population.

it may have just been overlooked (Jame's comment was that they are only human). She asked me to pull out the discrepancies and she'd take a look. I'm working on that. Right now, it looks like maybe a third have that discrepancy.

There are EO Rank Specifications for HENA. This was in the back of the Range-wide Status Report and I missed it. I've pulled it out of the main document so we now all have easy access (see attached). Notice an A-ranked EO has >500 individuals...we talked about 1,000 as the magic number yesterday because of the previous reports but we may want to reconsider.

NCNHP did go through SCNHP's EO data and came up with 22 populations. Jame knows that a 2km buffer was used but she also thinks that habitat may have also been considered. That may account for the 18 vs 22 for SC - some of the larger aggregation of points may have had separations due to unsuitable habitat. Laura Robinson was the one to go through that data. If we want specifics, we will have to wait for her to return from maternity leave (sometime mid-February).

I've been playing phone tag with SCNHP but I did get this info in an email:

> The 100-or-1000 meter buffers are there to represent how exact (or inexact) we think a location might be, whereas the "30 meters" I mentioned yesterday is a minimum separation distance – i.e., in terms of distance, what should separate one occurrence record (of the same species) from the next? This is up to the biologist, but for plant observations we usually use a minimum distance of 30 meters.
>
> The confidence buffer and the separation distance are related in that, say, it wouldn't make sense to talk about a less-than-30-meter separation if you weren't confident that your GPS readings were accurate within 15 meters. But other separation considerations include – how stationary is the organism? at what scale is the biologist assessing population?
>
> I'm not sure how well any of this corresponds with NatureServe practices -- with no data manager on staff, we've been improvising!

I'm thinking we will just have to go with what we have for the SC data. NCNHP came up with 22 populations and I'm sure they have justification beyond just the 2km buffer so I'm comfortable with that.

I'll be in touch with any updated rank dates for the table. Thanks and have a great weekend!

2	**29.000^**	A	Island Creek Heath Bluff	50,541	>1000	2016	2016		Burk	N	Extrapolated estimate. NHP Comp Review and Mont Report.
3	**31.000*^**	C?	NCDOT TIP: R-2824	1,062	>1000	2010	2001		Cata	N	No formal protection throughout all sites that comprise this occurrence. Small portions of sites NW, SW1 and SW2 are found as a roadside population in right-of-way. DOT monitors. 1,202 plants in 2011. Per 2015 draft report, there are now 1,062 plants.
4	**32.000***	D	NCDOT TIP R-2824	457	100-500	2013	2011		Cata	N	The northern subpopulation of the occurrence (76 plants) is situated within the existing DOT ROW of I-40. This portion of the occurrence is a roadside population that is not under formal protection from a binding agreement. Other plants in population are outside of the ROW. DOT monitors. Per draft 2015 report, there are 72 plants in the ROW. 457 plants counted in 2015 DOT survey.
5	**44.000*^**	AB	Little Gunpowder Creek Rare Plant Site 1	617	500-1000	2015	2011		Cald	Y	The DOT purchased a combined 2.68 acers as a perpetual CE for the species. The two easements are the Wallace and Church Conservation Easements. Has management plan been developed? 2011 survey included only an estimate of plants in CE (1,054)? Do we know the number of plants in the CE now? Last monitoring report indicates that 321 will be widened. Does CE prevent impacts to plants from widening? YES (TB 9/21/2017). Tim will send updated monitoring report with 2015 counts. 390 under protection? Presences noted in 2015. 617 plants counted at sites 38, 39, 43, and 44 in 2012.
6	**77.000***	CD	Little Gunpowder Creek Rare Plant Site 2	699	500-1000	2013	2007		Cald	Y	DOT monitors. Three subpops - B is entirely in ROW, A and C are partially in ROW. Per the Amended Biological Opinion, NCDOT agreed to protect 90 plants within Subpopulation C by acquiring additional right-of-way. No other plants were agreed to be protected. However, additional right-of-way was acquired on the west side of Deal Mill Road for a stream mitigation project. In so doing, additional plants were thereby protected. (After conducting monitoring in 2013, it was determined that 37 plants from Subpopulation B and 52 plants from Subpopulation A are also under protection. In addition, 201 plants in Subpopulation C now exist within the expanded right-of-way, and therefore are also under protection.) Plants in ROW as of 2013 total 617. Per 2015 Draft monitoring report, there are now 699 plants. ROW acquired for formal protection.
7	**87.000**	D	Catawba River: Lower Creek: Miller Creek	0	<100	2011	2011		Cald	N	55 plants dug by HARP on 04 November 2011 and relocated to EO 294 (Bud Geitner Park), few plants left, likely extirpated by Quarry expansion

Thanks, Mike.

I'll take a look. Sounds like you got it right with the EOs. In your example, the population as a whole (represented by 100) includes three sub-pops (20, 21, and 22). 100 is the placeholder but does not (should not) have population size data on its' own.

Thanks, Mike. That all sounds good. I like the population size break down and will be interested to see what our experts think. Once you have the spreadsheet for current populations settled, send it my way. I will need to go through the spatial data and get it to Mark for the model. SC was supposed to send me data for their preserves but I haven't received it yet. I've reminded them again. My hope is that the preserve data is more current than what is in the SC EO data and we can add a few more populations to our list of current populations for SC. We'll see...

Thanks!

> 500-1,000 = high
>
> 100-500 = moderate

<100 = low

This of course will be vetted through the experts via review of the SSA, and probably another round of elicitations. We will also discuss the subset of populations for which we have growth rate/trajectory data, but because we won't have this for every population, I think we stick with population size as an indicator of the resilience of a population.

Hope that all makes sense! Have a great weekend!

Hi Frank,

I wanted to follow-up on two sites you mentioned - Gateway Elementary and Boulder Creek. Can you tell me, when was the last time you saw plants at these locations? And, can you send me coordinates or drop a pin on Google maps for the location of these sites? I'm pretty sure I found Gateway on the map but I can't find Boulder Creek.

Thank you for all your help.

> I'm the President of Naturaland Trust, the land trust in Greenville that works to protect special places in the SC Piedmont and SC's Blue Ridge Mountains. We are interested in Hexastylis naniflora and seek to protect properties that include it. I'm also a volunteer with the SC Native Plant Society. I'm copying Jeff Beacham, the former state president, because, as set out below, he and I have worked on a couple of projects involving it, and also our current state president, Lisa Lord. I'm also an attorney with the Southern Environmental Law Center, and sometimes the various projects overlap.
>
> Here are some projects we've been involved in:
>
> 1. Peters Creek. Naturaland Trust acquired a parcel (about one acre, as I recall) that bisected the trail and the creek in the Peters Creek Heritage Trust Preserve, to protect the Preserve. We have not thoroughly checked that property, but we aren't aware of any HN on it.

2. We are currently working with SC DNR to try to acquire property next to the Blackwell Heritage Trust Preserve in Travelers Rest, SC. That preserve was established to protect the bunched arrowhead. There was a proposal to intensively develop an adjacent 56 acres. That proposal has now been withdrawn, and DNR has applied for a USFWS grant to acquire the property. We have found HN on that property, as well as bunched arrowhead. The Heritage Trust manager for our area has surveyed the property and has a count of the HN populations on that property.

In addition, there is property adjacent to the Preserve and the proposed development property owned by a conservation-minded person, Johnny Stone. Some years ago, he enrolled some of his property in the Heritage Trust Program because of the presence of bunched arrowhead. We found HN on his property, in addition to the bunched arrowhead, and in close proximity to it.

We did not survey the Blackwell HTP for HN, but it is possible there are some HN populations on the existing HTP.

3. Jeff Beacham and I and others have worked to try to deal with the storm water on the site of Gateway Elementary School in Travelers Rest. The campus of that school includes an undeveloped woodland that is braided with seeps and streams, which include the bunched arrowhead. Stormwater has impacted the bunched arrowhead in the woodland. We have found HN on that property, as well.

4. In the course of checking on mitigation activities in the area for SELC, I ran across a subdivision in Greer, Boulder Creek, where the developer was required to put aside land because of the presence of HN on it. Jeff and I have met with the Homeowners Association and visited the site. There are populations of HN on the property, and the properties in question have been put aside. The HOA was unaware of the plants, however, until we contacted them and met with them. The mitigation requirements required the developer to put in place a plan with the HOA for the long term protection of the plant, which had not been done. I am sure the HOA would be happy for you to come and see the plant.

This mitigation was done under a Biological Opinion for HN done by the USFWS. It would be good if you could survey the USFWS records for any other BiOps for HN, and we could check on their status, too. Attached are some of the documents related to this one.

There are also other plants on neighboring properties upstream and downstream of these mitigation properties. I wrote the property owners seeking to purchase those portions, but have never heard back. If you wanted to pursue them, that would be great, too!

5. Finally, if you know of any other opportunities to preserve and protect populations of this plant, let us know. We would be happy and pleased to work with you on the effort. I am particularly interested in the subdivision populations you mentioned. If you could send me information on those sites and if they are in our area, we could visit them and see what's up. There may be opportunities to protect the plants and/or acquire properties for protection.

Subject: [Scpca] Hexastylis naniflora in SC

Hi Everyone,

I am the species lead for Hexastylis naniflora and I work out of the FWS Asheville Field Office. I am seeking information about H. naniflora populations in SC. I have thorough information for Cowpens, Peters Creek Heritage Preserve, and Blalock Res; but, not much in the way of current information for other SC populations. Any information regarding the following would be very helpful:

- Who is working on H. naniflora in SC? And, what have you been up to?
- Does anyone have information on the following sites:

  Cherokee Creek near Cowpens (last Heritage update 2004)

  Spartanburg Water System Preserve (last Heritage update 2001)

  Claggett site in Raintree subdivision (last Heritage update 1991)

  UT to Spivey Creek (last Heritage update 1991)

  Peters Creek Heartleaf Site/Saranac Lake Subdivision (last Heritage update 1991)

- Other than sites I've mentioned, does anyone have information of other large and/or high ranked and/or preserved populations in SC?
- Anything else that can help me get up to speed on H. naniflora in SC?

Thank you and please feel free to email me directly.

Mike,

Check this out. I've added/updated info for NC in blue on the spreadsheet. I identified a few more "current" EOs. I've added them at the bottom so that you can incorporate them as you see fit (wasn't sure if they were intentionally not included).

I did not have any changes for the SC sheet. I heard back from the preserve manager from SC. All she could find was one, 2006 report for one of the preserves so that doesn't really help. I'm am working on getting more specific location data for the Gateway Elementary and Boulder Creek.

Let me know if you think the NC list looks good. Thanks.

Populations	EO Number	EO Rank	Site Name	Number of Plants	Total estimated plants	Last Observed	Rank Date	Resilience Category	County	Protection	Notes
1	**23.000^**	A	Mill Creek Forest and Seep	1,733	>1000	2016	2015		Polk	N	NHP Comp Review and Mont Report.
2	**29.000^**	A	Island Creek Heath Bluff	50,541	>1000	2016	2016		Burk	N	Extrapolated estimate. NHP Comp Review and Mont Report.
3	**31.000*^**	C?	NCDOT TIP: R-2824	1,062	>1000	2010	2001		Cata	N	No formal protection throughout all sites that comprise this occurrence. Small portions of sites NW, SW1 and SW2 are found as a roadside population in right-of-way. DOT monitors. 1,202 plants in 2011. Per 2015 draft report, there are now 1,062 plants.
4	**32.000***	D	NCDOT TIP R-2824	457	100-500	2013	2011		Cata	N	The northern subpopulation of the occurrence (76 plants) is situated within the existing DOT ROW of I-40. This portion of the occurrence is a roadside population that is not under formal protection from a binding agreement. Other plants in population are outside of the ROW. DOT monitors. Per draft 2015 report, there are 72 plants in the ROW. 457 plants counted in 2015 DOT survey.
5	**44.000*^**	AB	Little Gunpowder Creek Rare Plant Site 1	617	500-1000	2015	2011		Cald	Y	The DOT purchased a combined 2.68 acers as a perpetual CE for the species. The two easements are the Wallace and Church Conservation Easements. Has management plan been developed? 2011 survey included only an estimate of plants in CE (1,054)? Do we know the number of plants in the CE now? Last monitoring report indicates that 321 will be widened. Does CE prevent impacts to plants from widening? YES (TB 9/21/2017). Tim will send updated monitoring report with 2015 counts. 390 under protection? Presences noted in 2015. 617 plants counted at sites 38, 39, 43, and 44 in 2012.
6	**77.000***	CD	Little Gunpowder Creek Rare Plant Site 2	699	500-1000	2013	2007		Cald	Y	DOT monitors. Three subpops - B is entirely in ROW, A and C are partially in ROW. Per the Amended Biological Opinion, NCDOT agreed to protect 90 plants within Subpopulation C by acquiring additional right-of-way. No other plants were agreed to be protected. However, additional right-of-way was acquired on the west side of Deal Mill Road for a stream mitigation project. In so doing, additional plants were thereby protected. (After conducting monitoring in 2013, it was determined that 37 plants from Subpopulation B and 52 plants from Subpopulation A are also under protection. In addition, 201 plants in Subpopulation C now exist within the expanded right-of-way, and therefore are also under protection.) Plants in ROW as of 2013 total 617. Per 2015 Draft monitoring report, there are now 699 plants. ROW acquired for formal protection.
7	**87.000**	D	Catawba River: Lower Creek: Miller Creek	0	<100	2011	2011		Cald	N	55 plants dug by HARP on 04 November 2011 and relocated to EO 294 (Bud Geitner Park), few plants left, likely extirpated by Quarry expansion

	178.310	A	Megalliard Creek Slopes; Lake Rhodhiss	1,500 2,000		2016	2016		Burk	Y	Tract is part of an application to CWMTF from the Town of Valdese to protect as a park (2016). The property will be a combination of conservation land, greenway, and town park. We have had discussions with them about designing the park and activities in a way that least impacts the stream buffers and natural heritage values (specifically DFHL). I'm in the process of drafting contracts and expect the Town to purchase the property and record a conservation easement on stream buffers and natural heritage areas before end of January 2018 (end of purchase contract with current owner) Nancy Guthrie 9/25/2017. Verify in January 2018.	NHP

Importance: High

Jeff Beacham and I visited the site on November 28, 2016 at Boulder Creek. The plants were there.

I'm not sure when I last visited Gateway, but my guess is about 6 months ago, and saw the plants.

You can find the location of Gateway Elementary on the website of the Greenville school district.

Attached is the USFWS file on Boulder Creek, which I think will give you what you need.

Thanks!

I'm copying Jeff Beacham, the former state president, because, as set out below, he and I have worked on a couple of projects involving it, and also our current state president, Lisa Lord. I'm also an attorney with the Southern Environmental Law Center, and sometimes the various projects overlap.

Here are some projects we've been involved in:

1. Peters Creek. Naturaland Trust acquired a parcel (about one acre, as I recall) that bisected the trail and the creek in the Peters Creek Heritage Trust Preserve, to protect the Preserve. We have not thoroughly checked that property, but we aren't aware of any HN on it.

2. We are currently working with SC DNR to try to acquire property next to the Blackwell Heritage Trust Preserve in Travelers Rest, SC. That preserve was established to protect the bunched arrowhead. There was a proposal to intensively develop an adjacent 56 acres. That proposal has now been withdrawn, and DNR has applied for a USFWS grant to acquire the property. We have found HN on that property, as well as bunched arrowhead. The Heritage Trust manager for our area has surveyed the property and has a count of the HN populations on that property.

In addition, there is property adjacent to the Preserve and the proposed development property owned by a conservation-minded person, Johnny Stone. Some years ago, he enrolled some of his property in the Heritage Trust Program because of the presence of bunched arrowhead. We found HN on his property, in addition to the bunched arrowhead, and in close proximity to it.

We did not survey the Blackwell HTP for HN, but it is possible there are some HN populations on the existing HTP.

3. Jeff Beacham and I and others have worked to try to deal with the storm water on the site of Gateway Elementary School in Travelers Rest. The campus of that school includes an undeveloped woodland that is braided with seeps and streams, which include the bunched arrowhead. Stormwater has impacted the bunched arrowhead in the woodland. We have found HN on that property, as well.

4. In the course of checking on mitigation activities in the area for SELC, I ran across a subdivision in Greer, Boulder Creek, where the developer was required to put aside land because of the presence of HN on it. Jeff and I have met with the Homeowners Association and visited the site. There are populations of HN on the property, and the properties in question have been put aside.

The HOA was unaware of the plants, however, until we contacted them and met with them. The mitigation requirements required the developer to put in place a plan with the HOA for the long term protection of the plant, which had not been done. I am sure the HOA would be happy for you to come and see the plant.

This mitigation was done under a Biological Opinion for HN done by the USFWS. It would be good if you could survey the USFWS records for any other BiOps for HN, and we could check on their status, too. Attached are some of the documents related to this one.

There are also other plants on neighboring properties upstream and downstream of these mitigation properties. I wrote the property owners seeking to purchase those portions, but have never heard back. If you wanted to pursue them, that would be great, too!

5. Finally, if you know of any other opportunities to preserve and protect populations of this plant, let us know. We would be happy and pleased to work with you on the effort. I am particularly interested in the subdivision populations you mentioned. If you could send me information on those sites and if they are in our area, we could visit them and see what's up. There may be opportunities to protect the plants and/or acquire properties for protection.

Subject: [Scpca] Hexastylis naniflora in SC

Hi Everyone,

I am the species lead for Hexastylis naniflora and I work out of the FWS Asheville Field Office. I am seeking information about H. naniflora populations in SC. I have thorough information for Cowpens, Peters Creek Heritage Preserve, and Blalock Res; but, not much in the way of current information for other SC populations. Any information regarding the

following would be very helpful:

- Who is working on H. naniflora in SC? And, what have you been up to?
- Does anyone have information on the following sites:

  Cherokee Creek near Cowpens (last Heritage update 2004)

  Spartanburg Water System Preserve (last Heritage update 2001)

  Claggett site in Raintree subdivision (last Heritage update 1991)

  UT to Spivey Creek (last Heritage update 1991)

  Peters Creek Heartleaf Site/Saranac Lake Subdivision (last Heritage update 1991)

- Other than sites I've mentioned, does anyone have information of other large and/or high ranked and/or preserved populations in SC?
- Anything else that can help me get up to speed on H. naniflora in SC?

Thank you and please feel free to email me directly.

PO Box 3744
Greenville, SC 29608

Re: Boulder Creek Subdivision
Greenville County, South Carolina
FWS Log No: 2006-I-0420

Dear Ms. Belanger:

The U.S. Fish and Wildlife Service (Service) has reviewed the proposal for Boulder Creek (Jordan Road) Subdivision. The subject property is located on Jordan Road in Greenville County, South Carolina. The following comments are provided in accordance with section 7 of the Endangered Species Act (Act), as amended (16 U.S.C. 1531-1543).

Extant populations of the endangered *Hexastylis naniflora* have been identified on the proposed property along two of the creeks within the project boundary. No direct impacts to the population are anticipated. The developers of this site are aware of the H. naniflora population and assume responsibility for maintaining suitable habitat conditions for the species. As per our discussion on the March 27, 2006, site visit and follow-up letter from Laura Belanger dated March 28, 2006, a 25-foot protective buffer will be fenced and maintained in restrictive covenant to protect both populations. Twice annual monitoring will be conducted for the two years of construction, with monitoring reports submitted to the Service's Charleston Field Office. At the completion of construction, the final monitoring report will include detailed information regarding long-term monitoring and protection plans of the two *Hexastylis* populations.

Based on information provided, proposed conservation measures for the on-site population of *Hexastylis naniflora*, it is the opinion of the Service that the proposed action is not likely to adversely affect listed species.

Your interest in ensuring the protection of endangered species is appreciated. If you have further questions or require additional information, please contact Lora Zimmerman of this office at (843) 727-4707 ext. 226. In future correspondence concerning this project, please reference FWS Log No. 2006-I-0420.

Sincerely,

Catherine D. Duncan

Environmental Permitting Consultants, Inc.

US Fish and Wildlife Service
Charleston Field Office
176 Croghan Spir Road
Suite 200
Charleston, SC 29407

March 28, 2006

Attention: Lora Zimmerman

Dear Ms. Zimmerman,

This letter is in regards to the Boulder Creek NWP permit application submitted to Les Parker at the US Army Corps of Engineers January 30, 2006. The property contains two populations of *Hexastylis naniflora*. The first population is located in the far southwestern corner of the property and the second population is located near the southernmost property boundary.

As per our site meeting on March 27, 2006, propose to do the following:

- Place a 25 foot protective buffer around each population of *Hexastylis naniflora.*
- Include these buffered areas in the restrictive covenants proposed for the project.
- Place protective fencing around the populations of *Hexastylis naniflora.*
- Monitor the populations for two years, submitting to FWS four letter reports with photos documenting the populations.
- Upon completetion of construction and formation of the Homeowners Association, hosting a meeting with the Homeowners Association making them aware of the *Hexastylis naniflora* populations, potential impacts to the populations and how they can be avoided, and the terms of the restrictive covenants.

The populations and their approximate locations are provided in Figure 2 of the Protected Species Habitat Assessment preformed by Environmental Permitting consultants in January 2006. Please feel free to contact me (864) 271-3040 regarding any questions or concerns.

Sincerely,

Laura H. Belanger

Thank you.

I found Gateway on the map and it is surrounded on three sides by wooded area. Is the dwarf-flowered heartleaf throughout the wooded area or in just one location? Unfortunately, I can't see many landscape features in the wooded area on the aerial. We are running a GIS model and the closer we can get to an exact location the better.

Some years ago, he enrolled some of his property in the Heritage Trust Program because of the presence of bunched arrowhead. We found HN on his property, in addition to the bunched arrowhead, and in close proximity to it.

We did not survey the Blackwell HTP for HN, but it is possible there are some HN populations on the existing HTP.

3. Jeff Beacham and I and others have worked to try to deal with the storm water on the site of Gateway Elementary School in Travelers Rest. The campus of that school includes an undeveloped woodland that is braided with seeps and streams, which include the bunched arrowhead. Stormwater has impacted the bunched arrowhead in the woodland. We have found HN on that property, as well.

4. In the course of checking on mitigation activities in the area for SELC, I ran across a subdivision in Greer, Boulder Creek, where the developer was required to put aside land because of the presence of HN on it. Jeff and I have met with the Homeowners Association and visited the site. There are populations of HN on the property, and the properties in question have been put aside. The HOA was unaware of the plants, however, until we contacted them and met with them. The mitigation requirements required the developer to put in place a plan with the HOA for

the long term protection of the plant, which had not been done. I am sure the HOA would be happy for you to come and see the plant.

This mitigation was done under a Biological Opinion for HN done by the USFWS. It would be good if you could survey the USFWS records for any other BiOps for HN, and we could check on their status, too. Attached are some of the documents related to this one.

There are also other plants on neighboring properties upstream and downstream of these mitigation properties. I wrote the property owners seeking to purchase those portions, but have never heard back. If you wanted to pursue them, that would be great, too!

5. Finally, if you know of any other opportunities to preserve and protect populations of this plant, let us know. We would be happy and pleased to work with you on the effort. I am particularly interested in the subdivision populations you mentioned. If you could send me information on those sites and if they are in our area, we could visit them and see what's up. There may be opportunities to protect the plants and/or acquire properties for protection.

Subject: [Scpca] Hexastylis naniflora in SC

Hi Everyone,

I am the species lead for Hexastylis naniflora and I work out of the FWS Asheville Field Office. I am seeking information about H. naniflora populations in SC. I have thorough information for Cowpens, Peters Creek Heritage Preserve, and Blalock Res; but, not much in the way of current information for other SC populations. Any information regarding the following would be very helpful:

- Who is working on H. naniflora in SC? And, what have you been up to?
- Does anyone have information on the following sites:

  Cherokee Creek near Cowpens (last Heritage update 2004)

  Spartanburg Water System Preserve (last Heritage update 2001)

  Claggett site in Raintree subdivision (last Heritage update 1991)

  UT to Spivey Creek (last Heritage update 1991)

  Peters Creek Heartleaf Site/Saranac Lake Subdivision (last Heritage update 1991)

- Other than sites I've mentioned, does anyone have information of other large and/or high ranked and/or preserved populations in SC?
- Anything else that can help me get up to speed on H. naniflora in SC?

Thank you and please feel free to email me directly.

Importance: High

We saw it in the woods directly behind the school, where there is a collection of braided seeps and streams. It was close to the streams. It is possible that it is throughout the woods; we haven't done a survey.

There are also other water features in all those woods, and we haven't surveyed them in any systematic way.

Thank you.

I found Gateway on the map and it is surrounded on three sides by wooded area. Is the dwarf-flowered heartleaf throughout the wooded area or in just one location? Unfortunately, I can't see many landscape features in the wooded area on the aerial. We are running a GIS model and the closer we can get to an exact location the better.

I'm not sure when I last visited Gateway, but my guess is about 6 months ago, and saw the plants.

You can find the location of Gateway Elementary on the website of the Greenville school district.

Attached is the USFWS file on Boulder Creek, which I think will give you what you need.

Thanks!

Hi Frank,

I wanted to follow-up on two sites you mentioned - Gateway Elementary and Boulder Creek. Can you tell me, when was the last time you saw plants at these locations? And, can you send me coordinates or drop a pin on Google maps for the location of these sites? I'm pretty sure I found Gateway on the map but I can't find Boulder Creek.

Thank you for all your help.

Rebekah,

I'm the President of Naturaland Trust, the land trust in Greenville that works to protect special places in the SC Piedmont and SC's Blue Ridge Mountains. We are interested in Hexastylis naniflora and seek to protect properties that include it. I'm also a volunteer with the SC Native Plant Society. I'm copying Jeff Beacham, the former state president, because, as set out below, he and I have worked on a couple of projects involving it, and also our current state president, Lisa Lord. I'm also an attorney with the Southern Environmental Law Center, and sometimes the various projects overlap.

Here are some projects we've been involved in:

1. Peters Creek. Naturaland Trust acquired a parcel (about one acre, as I recall) that bisected the trail and the creek in the Peters Creek Heritage Trust Preserve, to protect the Preserve. We have not thoroughly checked that property, but we aren't aware of any HN on it.

2. We are currently working with SC DNR to try to acquire property next to the Blackwell Heritage Trust Preserve in Travelers Rest, SC. That preserve was established to protect the bunched arrowhead. There was a proposal to intensively develop an adjacent 56 acres. That proposal has now been withdrawn, and DNR has applied for a USFWS grant to acquire the property. We have

found HN on that property, as well as bunched arrowhead. The Heritage Trust manager for our area has surveyed the property and has a count of the HN populations on that property.

In addition, there is property adjacent to the Preserve and the proposed development property owned by a conservation-minded person, Johnny Stone. Some years ago, he enrolled some of his property in the Heritage Trust Program because of the presence of bunched arrowhead. We found HN on his property, in addition to the bunched arrowhead, and in close proximity to it.

We did not survey the Blackwell HTP for HN, but it is possible there are some HN populations on the existing HTP.

And, SC with location data updates...

For Gateway, the best I could get for a location was directly behind school near stream. I've supplied coordinates that are behind the school and what appears to be near a stream.

>
> 500-1,000 = high
>
> 100-500 = moderate
>
> <100 = low
>
> Rebekah....a few notes: for NC pops...I wasn't sure if a population was made up of multiple EOs, if the population number was an additional EO.. for example, if the population was labeled 100.000, and it was composed of 100.20, 100.21, and 100.22, is there just 3 EOs (20, 21, and 22), or are there 4 EOs (20, 21, 22, and 100)....I went with there only being 3 EOs, but all the data is preserved on the new sheet. Also, for SC...there are 2 populations at the end that I don't have EOs for... no problem, except for being able to spatially delineate these for the model, etc....

> Thanks, Mike. That all sounds good. I like the population size break down and will be interested to see what our experts think. Once you have the spreadsheet for current populations settled, send it my way. I will need to go through the spatial data and get it to Mark for the model. SC was supposed to send me data for their preserves but I haven't received it yet. I've reminded them again. My hope is that the preserve data is more current than what is in the SC EO data and we can add a few more populations to our list of current populations for SC. We'll see...

>
> > Hi Rebekah,

Thanks for the info....very helpful. I'm using the spreadsheets with the data you provided to come up with a clean spreadsheet that shows only those populations for which the last observed/detection was no more than 10 years ago....this will change the narrative for number of populations, which is totally fine. Seems, as we discussed, the estimated number of populations came from data spread out over 20-30 years....we discussed not being too confident about the species actually being present, or especially abundance estimates that were older than 10 years...I will just be explicit about how the historical narrative on populations came from a wide time frame, but for the purposes of the SSA, we only focus on recent detections for the current condition of the species. As an example of what the estimates would be....for North Carolina, we go down from 90-something populations to 63....SC will be in the single digits. This is still a lot of populations, and the model will indicate there is a lot more available habitat that may or may not be occupied, but is suitable....will also point out that there are likely more populations at previous EO locations, but we did not want to include in the SSA analysis.

As for categorizing resilience based on population size....it seems the EO ranks consider threats, surrounding matrix, habitat and population numbers....because >1,000 plants is mentioned in many of the reports, I'd like to capture that....I'm thinking something like:

>1,000 plants = very high

500-1,000 = high

100-500 = moderate

<100 = low

This of course will be vetted through the experts via review of the SSA, and probably another round of elicitations. We will also discuss the subset of populations for which we have growth rate/trajectory data, but because we won't have this for every population, I think we stick with population size as an indicator of the resilience of a population.

Hope that all makes sense! Have a great weekend!

Mike

> In an ideal world, the EO Rank would be updated with the last observance (so those two dates would be consistent). However, there may be a good reason for the discrepancy or it may have just been overlooked (Jame's comment was that they are only human). She asked me to pull out the discrepancies and she'd take a look. I'm working on that. Right now, it looks like maybe a third have that discrepancy.

There are EO Rank Specifications for HENA. This was in the back of the Range-wide Status Report and I missed it. I've pulled it out of the main document so we now all have easy access (see attached). Notice an A-ranked EO has >500 individuals...we talked about 1,000 as the magic number yesterday because of the previous reports but we may want to reconsider.

NCNHP did go through SCNHP's EO data and came up with 22 populations. Jame knows that a 2km buffer was used but she also thinks that habitat may have also been considered. That may account for the 18 vs 22 for SC - some of the larger aggregation of points may have had separations due to unsuitable habitat. Laura Robinson was the one to go through that data. If we want specifics, we will have to wait for her to return from maternity leave (sometime mid-February).

I've been playing phone tag with SCNHP but I did get this info in an email:

> The 100-or-1000 meter buffers are there to represent how exact (or inexact) we think a location might be, whereas the "30 meters" I mentioned yesterday is a minimum separation distance – i.e., in terms of distance, what should separate one occurrence record (of the same species) from the next? This is up to the biologist, but for plant observations we usually use a minimum distance of 30 meters.
>
> The confidence buffer and the separation distance are related in that, say, it wouldn't make sense to talk about a less-than-30-meter separation if you weren't confident that your GPS readings were accurate within 15 meters. But other separation considerations include – how stationary is the organism? at what scale is the biologist assessing population?
>
> I'm not sure how well any of this corresponds with NatureServe practices -- with no data manager on staff, we've been improvising!

I'm thinking we will just have to go with what we have for the SC data. NCNHP came up with 22 populations and I'm sure they have justification beyond just the 2km buffer so I'm comfortable with that.

I'll be in touch with any updated rank dates for the table. Thanks and have a great weekend!

Jeff Beacham and I visited the site on November 28, 2016 at Boulder Creek. The plants were there.

I'm not sure when I last visited Gateway, but my guess is about 6 months ago, and saw the plants.

You can find the location of Gateway Elementary on the website of the Greenville school district.

Attached is the USFWS file on Boulder Creek, which I think will give you what you need.

Thanks!

Hi Frank,

I wanted to follow-up on two sites you mentioned - Gateway Elementary and Boulder Creek. Can you tell me, when was the last time you saw plants at these locations? And, can you send me coordinates or drop a pin on Google maps for the location of these sites? I'm pretty sure I found Gateway on the map but I can't find Boulder Creek.

Thank you for all your help.

On Thu, Nov 30, 2017 at 11:03 AM, Frank Holleman <fholleman@selcnc.org> wrote:

Rebekah,

I'm the President of Naturaland Trust, the land trust in Greenville that works to protect special places in the SC Piedmont and SC's Blue Ridge Mountains. We are interested in Hexastylis naniflora and seek to protect properties that include it. I'm also a volunteer with the SC Native Plant Society. I'm copying Jeff Beacham, the former state president, because, as set out below, he and I have worked on a couple of projects involving it, and also our current state president, Lisa Lord. I'm also an attorney with the Southern Environmental Law Center, and sometimes the various projects overlap.

Here are some projects we've been involved in:

1. Peters Creek. Naturaland Trust acquired a parcel (about one acre, as I recall) that bisected the trail and the creek in the Peters Creek Heritage Trust Preserve, to protect the Preserve. We have not thoroughly checked that property, but we aren't aware of any HN on it.

2. We are currently working with SC DNR to try to acquire property next to the Blackwell Heritage Trust Preserve in Travelers Rest, SC. That preserve was established to protect the bunched arrowhead. There was a proposal to intensively develop an adjacent 56 acres. That proposal has now been withdrawn, and DNR has applied for a USFWS grant to acquire the property. We have found HN on that property, as well as bunched arrowhead. The Heritage Trust manager for our area has surveyed the property and has a count of the HN populations on that property.

In addition, there is property adjacent to the Preserve and the proposed development property owned by a conservation-minded person, Johnny Stone. Some years ago, he enrolled some of his property in the Heritage Trust Program because of the presence of bunched arrowhead. We found HN on his property, in addition to the bunched arrowhead, and in close proximity to it.

We did not survey the Blackwell HTP for HN, but it is possible there are some HN populations on the existing HTP.

3. Jeff Beacham and I and others have worked to try to deal with the storm water on the site of Gateway Elementary School in Travelers Rest. The campus of that school includes an undeveloped woodland that is braided with seeps and streams, which include the bunched arrowhead. Stormwater has impacted the bunched arrowhead in the woodland. We have found HN on that property, as well.

4. In the course of checking on mitigation activities in the area for SELC, I ran across a subdivision in Greer, Boulder Creek, where the developer was required to put aside land because of the presence of HN on it. Jeff and I have met with the Homeowners Association and visited the site. There are populations of HN on the property, and the properties in question have been put aside. The HOA was unaware of the plants, however, until we contacted them and met with them. The mitigation requirements required the developer to put in place a plan with the HOA for the long term protection of the plant, which had not been done. I am sure the HOA would be happy for you to come and see the plant.

This mitigation was done under a Biological Opinion for HN done by the USFWS. It would be good if you could survey the USFWS records for any other BiOps for HN, and we could check on their status, too. Attached are some of the documents related to this one.

There are also other plants on neighboring properties upstream and downstream of these mitigation properties. I wrote the property owners seeking to purchase those portions, but have never heard back. If you wanted to pursue them, that would be great, too!

5. Finally, if you know of any other opportunities to preserve and protect populations of this plant, let us know. We would be happy and pleased to work with you on the effort. I am particularly interested in the subdivision populations you mentioned. If you could send me information on those sites and if they are in our area, we could visit them and see what's up. There may be opportunities to protect the plants and/or acquire properties for protection.

Subject: [Scpca] Hexastylis naniflora in SC

Hi Everyone,

I am the species lead for Hexastylis naniflora and I work out of the FWS Asheville Field Office. I am seeking information about H. naniflora populations in SC. I have thorough information for Cowpens, Peters Creek Heritage Preserve, and Blalock Res; but, not much in the way of current information for other SC populations. Any information regarding the following would be very helpful:

- Who is working on H. naniflora in SC? And, what have you been up to?
- Does anyone have information on the following sites:

  Cherokee Creek near Cowpens (last Heritage update 2004)

  Spartanburg Water System Preserve (last Heritage update 2001)

  Claggett site in Raintree subdivision (last Heritage update 1991)

  UT to Spivey Creek (last Heritage update 1991)

  Peters Creek Heartleaf Site/Saranac Lake Subdivision (last Heritage update 1991)

- Other than sites I've mentioned, does anyone have information of other large and/or high ranked and/or preserved populations in SC?
- Anything else that can help me get up to speed on H. naniflora in SC?

Thank you and please feel free to email me directly.

Thanks Rebekah! I think this is a solid list for us to move forward with current conditions (agree with taking away the population that is likely extirpated as you noted).....as for using these in the model...anything else you need to push forward with that effort?

Thanks,

Mike

> I've attached 2 spreadsheets to this email (for North and South Carolina). Within these files, I have created a separate sheet labeled "Populations Only", in which I took only the populations that have been detected within the last 10 years.....those populations then got a resilience ranking based on population size based off of the rules:
>
> >1,000 plants = very high
>
> 500-1,000 = high
>
> 100-500 = moderate
>
> <100 = low
>
> Rebekah....a few notes: for NC pops...I wasn't sure if a population was made up of multiple EOs, if the population number was an additional EO...for example, if the population was labeled 100.000, and it was composed of 100.20, 100.21, and 100.22, is there just 3 EOs (20, 21, and 22), or are there 4 EOs (20, 21, 22, and 100)....I went with there only being 3 EOs, but all the data is preserved on the new sheet. Also, for SC...there are 2 populations at the end that I don't have EOs for....no problem, except for being able to spatially delineate these for the model, etc....

Once you have the spreadsheet for current populations settled, send it my way. I will need to go through the spatial data and get it to Mark for the model. SC was supposed to send me data for their preserves but I haven't received it yet. I've reminded them again. My hope is that the preserve data is more current than what is in the SC EO data and we can add a few more populations to our list of current populations for SC. We'll see...

> Hi Rebekah,
>
> Thanks for the info....very helpful. I'm using the spreadsheets with the data you provided to come up with a clean spreadsheet that shows only those populations for which the last observed/detection was no more than 10 years ago....this will change the narrative for number of populations, which is totally fine. Seems, as we discussed, the estimated number of populations came from data spread out over 20-30 years....we discussed not being too confident about the species actually being present, or especially abundance estimates that were older than 10 years...I will just be explicit about how the historical narrative on populations came from a wide time frame, but for the purposes of the SSA, we only focus on recent detections for the current condition of the species. As an example of what the estimates would be....for North Carolina, we go down from 90-something populations to 63....SC will be in the single digits. This is still a lot of populations, and the model will indicate there is a lot more available habitat that may or may not be occupied, but is suitable....will also point out that there are likely more populations at previous EO locations, but we did not want to include in the SSA analysis.
>
> As for categorizing resilience based on population size....it seems the EO ranks consider threats, surrounding matrix, habitat and population numbers....because >1,000 plants is mentioned in many of the reports, I'd like to capture that....I'm thinking something like:
>
> >1,000 plants = very high
>
> 500-1,000 = high
>
> 100-500 = moderate
>
> <100 = low
>
> This of course will be vetted through the experts via review of the SSA, and probably another round of elicitations. We will also discuss the subset of populations for which we have growth rate/trajectory data, but because we won't have this for every population, I think we stick with population size as an indicator of the resilience of a population.

Mike,

I spoke with Jame about EO Ranks.

In an ideal world, the EO Rank would be updated with the last observance (so those two dates would be consistent). However, there may be a good reason for the discrepancy or it may have just been overlooked (Jame's comment was that they are only human). She asked me to pull out the discrepancies and she'd take a look. I'm working on that. Right now, it looks like maybe a third have that discrepancy.

There are EO Rank Specifications for HENA. This was in the back of the Range-wide Status Report and I missed it. I've pulled it out of the main document so we now all have easy access (see attached). Notice an A-ranked EO has >500 individuals...we talked about 1,000 as the magic number yesterday because of the previous reports but we may want to reconsider.

NCNHP did go through SCNHP's EO data and came up with 22 populations. Jame knows that a 2km buffer was used but she also thinks that habitat may have also been considered. That may account for the 18 vs 22 for SC - some of the larger aggregation of points may have had separations due to unsuitable habitat. Laura Robinson was the one to go through that data. If we want specifics, we will have to wait for her to return from maternity leave (sometime mid-February).

I've been playing phone tag with SCNHP but I did get this info in an email:

> The 100-or-1000 meter buffers are there to represent how exact (or inexact) we think a location might be, whereas the "30 meters" I mentioned yesterday is a minimum separation distance – i.e., in terms of distance, what should separate one occurrence record (of the same species) from the next? This is up to the biologist, but for plant observations we usually use a minimum distance of 30 meters.
>
> The confidence buffer and the separation distance are related in that, say, it wouldn't make sense to talk about a less-than-30-meter separation if you weren't confident that your GPS readings were accurate within 15 meters. But other separation considerations include – how stationary is the organism? at what scale is the biologist assessing population?
>
> I'm not sure how well any of this corresponds with NatureServe practices -- with no data manager on staff, we've been improvising!

I'm thinking we will just have to go with what we have for the SC data. NCNHP came up with 22 populations and I'm sure they have justification beyond just the 2km buffer so I'm comfortable with that.

I'll be in touch with any updated rank dates for the table. Thanks and have a great

weekend!

I don't need anything else at this point. It's on me to go through the spatial data and get it to Mark. I'm on it!

We'll keep you posted.

Mike,

Check this out. I've added/updated info for NC in blue on the spreadsheet. I identified a few more "current" EOs. I've added them at the bottom so that you can incorporate them as you see fit (wasn't sure if they were intentionally not included).

I did not have any changes for the SC sheet. I heard back from the preserve manager from SC. All she could find was one, 2006 report for one of the preserves so that doesn't really help. I'm am working on getting more specific location data for the Gateway Elementary and Boulder Creek.

Let me know if you think the NC list looks good. Thanks.

> Hi Rebekah,
>
> Thanks for the info....very helpful. I'm using the spreadsheets with the data you provided to come up with a clean spreadsheet that shows only those populations for which the last observed/detection was no more than 10 years ago....this will change the narrative for number of populations, which is totally fine. Seems, as we discussed, the estimated number of populations came from data spread out over 20-30 years....we discussed not being too confident about the species actually being present, or especially abundance estimates that were older than 10 years...I will just be explicit about how the historical narrative on populations came from a wide time frame, but for the purposes of the SSA, we only focus on recent detections for the current condition of the species. As an example of what the estimates would be....for North Carolina, we go down from 90-something populations to 63....SC will be in the single digits. This is still a lot of populations, and the model will indicate there is a lot more available habitat that may or may not be occupied, but is suitable....will also point out that there are likely more populations at previous EO locations, but we did not want to include in the SSA analysis.
>
> As for categorizing resilience based on population size....it seems the EO ranks consider threats, surrounding matrix, habitat and population numbers....because >1,000 plants is mentioned in many of the reports, I'd like to capture that....I'm thinking something like:

>1,000 plants = very high

500-1,000 = high

100-500 = moderate

<100 = low

This of course will be vetted through the experts via review of the SSA, and probably another round of elicitations. We will also discuss the subset of populations for which we have growth rate/trajectory data, but because we won't have this for every population, I think we stick with population size as an indicator of the resilience of a population.

Hope that all makes sense! Have a great weekend!

Mike

> The confidence buffer and the separation distance are related in that, say, it wouldn't make sense to talk about a less-than-30-meter separation if you weren't confident that your GPS readings were accurate within 15 meters. But other separation considerations include – how stationary is the organism? at what scale is the biologist assessing population?
>
> I'm not sure how well any of this corresponds with NatureServe practices -- with no data manager on staff, we've been improvising!

I'm thinking we will just have to go with what we have for the SC data. NCNHP came up with 22 populations and I'm sure they have justification beyond just the 2km buffer so I'm comfortable with that.

I'll be in touch with any updated rank dates for the table. Thanks and have a great weekend!

Attached are the SHPs and spreadsheets for our current populations in NC and SC.

NC Notes:

- There are four records not in the spatial data that will need to be added. These are EOs 319, 320, 321, and Rock Barn (all highlighted in red on the Population Only tab- lat/long is included in the "notes" column)

SC Notes

- There are two records not in the spatial data that will need to be added. These do not have EO numbers - Gateway Elementary and Boulder Creek (all highlighted in red on the Population Only tab- lat/long is included in the "notes" column)

3	**31.000*^**	C?	NCDOT TIP: R-2824	1,062	>1000	2010	2001		Cata	N	No formal protection throughout all sites that comprise this occurrence. Small portions of sites NW, SW1 and SW2 are found as a roadside population in right-of-way. DOT monitors. 1,202 plants in 2011. Per 2015 draft report, there are now 1,062 plants.
4	**32.000***	D	NCDOT TIP R-2824	457	100-500	2013	2011		Cata	N	The northern subpopulation of the occurrence (76 plants) is situated within the existing DOT ROW of I-40. This portion of the occurrence is a roadside population that is not under formal protection from a binding agreement. Other plants in population are outside of the ROW. DOT monitors. Per draft 2015 report, there are 72 plants in the ROW. 457 plants counted in 2015 DOT survey.
5	**44.000*^**	AB	Little Gunpowder Creek Rare Plant Site 1	617	500-1000	2015	2011		Cald	Y	The DOT purchased a combined 2.68 acers as a perpetual CE for the species. The two easements are the Wallace and Church Conservation Easements. Has management plan been developed? 2011 survey included only an estimate of plants in CE (1,054)? Do we know the number of plants in the CE now? Last monitoring report indicates that 321 will be widened. Does CE prevent impacts to plants from widening? YES (TB 9/21/2017). Tim will send updated monitoring report with 2015 counts. 390 under protection? Presences noted in 2015. 617 plants counted at sites 38, 39, 43, and 44 in 2012.
6	**77.000***	CD	Little Gunpowder Creek Rare Plant Site 2	699	500-1000	2013	2007		Cald	Y	DOT monitors. Three subpops - B is entirely in ROW, A and C are partially in ROW. Per the Amended Biological Opinion, NCDOT agreed to protect 90 plants within Subpopulation C by acquiring additional right-of-way. No other plants were agreed to be protected. However, additional right-of-way was acquired on the west side of Deal Mill Road for a stream mitigation project. In so doing, additional plants were thereby protected. (After conducting monitoring in 2013, it was determined that 37 plants from Subpopulation B and 52 plants from Subpopulation A are also under protection. In addition, 201 plants in Subpopulation C now exist within the expanded right-of-way, and therefore are also under protection.) Plants in ROW as of 2013 total 617. Per 2015 Draft monitoring report, there are now 699 plants. ROW acquired for formal protection.
7	**87.000**	D	Catawba River: Lower Creek: Miller Creek	0	<100	2011	2011		Cald	N	55 plants dug by HARP on 04 November 2011 and relocated to EO 294 (Bud Geitner Park), few plants left, likely extirpated by Quarry expansion

Copy of HENA EO Rank Date vs Last Obs Date.xlsx
Importance: High

Hi Rebekah,

I have reviewed all the records you selected that had discrepancies in the EO rank date and the Last Obs.

59 of them needed review and updating which has been done.
For extirpated or failed to find records, the latest **survey** date was used for the rank date, there were 5 of those.
For some records, the last observed date is based on a survey that provided incomplete data or just presence data. In those cases, the Rank date represents the date when the most complete count occurred. 24 records were in this category.

Thank you for asking about this, and helping us improve our database. Let me know if you have more questions.

Subject: [External] EO Rank vs Last Obs Date

CAUTION: External email. Do not click links or open attachments unless verified. Send all suspicious email as an

attachment to report.spam@nc.gov.

Jame,

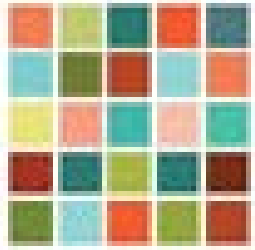
Attached is spreadsheet that show HENA EO records with a discrepancy between EO rank date and last observed date. There are two scenarios represented in the table:

- EO rank date older than last observe date
- Last observe date older than EO rank date

Our questions are:

- In the case of EO rank date older than last observe date - Can we assume an EO rank date consistent with last observed date even if it is listed as older? Example EO14 - The last observed date was 2009 and the EO rank date is 2001. Can we assume 2009 for an updated EO rank date?
- In the case of last observe date older than EO rank date - We can assume the EO rank date is accurate and maybe desk updated?

Thank you and have a great weekend!



Rebekah Reid

Jame,

Thank you for looking at this for us. This is a wonderful update!

We've been working on a species distribution model so I've been going through the data with a fine tooth comb. I noticed two duplicate/overlaps in the spatial data - EOs 50 and 233, and EOs 106 and 286. We've reconciled these for the purpose of our model but I thought you would like to know for future updates.

Thanks again!

Thank you for asking about this, and helping us improve our database. Let me know if you have more questions.

Jame,

Attached is spreadsheet that show HENA EO records with a discrepancy between EO rank date and last observed date. There are two scenarios represented in the table:

- EO rank date older than last observe date
- Last observe date older than EO rank date

Our questions are:

- In the case of EO rank date older than last observe date - Can we assume an EO rank date consistent with last observed date even if it is listed as older? Example EO14 - The last observed date was 2009 and the EO rank date is 2001. Can we assume 2009 for an updated EO rank date?
- In the case of last observe date older than EO rank date - We can assume the EO rank date is accurate and maybe desk updated?

Thank you and have a great weekend!

Mike,

Attached is a spreadsheet of updated EO ranks. Let me know how you'd like to use this data and I can incorporate it into the spreadsheet.

Thanks.

Hi Rebekah,

I have reviewed all the records you selected that had discrepancies in the EO rank date and the Last Obs.

59 of them needed review and updating which has been done.

For extirpated or failed to find records, the latest **survey** date was used for the rank date, there were 5 of those.

For some records, the last observed date is based on a survey that provided incomplete data or

just presence data. In those cases, the Rank date represents the date when the most complete count occurred. 24 records were in this category.

Thank you for asking about this, and helping us improve our database. Let me know if you have more questions.

Awesome, thanks! I'm not exactly sure how the EO ranks will end up playing into the SSA, except that they help determine our population size bins for purposes of resilience, and inform our foreseeable future for projections (e.g. 20-30 years).....I might also compare our resilience ranks based on pop size to the EO ranks, and if there is a discrepancy, dive deeper in to see if there is something underlying that discrepancy.....finally, the EO ranks might help in any endeavor to model habitat for the species....I'm thinking along the lines of habitat quality....for example, what are the habitat metrics that result in excellent viability ranks for the species, or something along those lines.

That was just a quick brain dump....hope it makes some amount of sense.

Thanks,

Mike

Hi Rebekah,

I have reviewed all the records you selected that had discrepancies in the EO rank date and the Last Obs.

59 of them needed review and updating which has been done.

For extirpated or failed to find records, the latest **survey** date was used for the rank date, there were 5 of those.

For some records, the last observed date is based on a survey that provided incomplete data or just presence data. In those cases, the Rank date represents the date when the most complete count occurred. 24 records were in this category.

Thank you for asking about this, and helping us improve our database. Let me know if you have more questions.

Jame,

Attached is spreadsheet that show HENA EO records with a discrepancy between EO rank date and last observed date. There are two scenarios represented in the table:

- EO rank date older than last observe date
- Last observe date older than EO rank date

Our questions are:

- In the case of EO rank date older than last observe date - Can we assume an EO rank date consistent with last observed date even if it is listed as older? Example EO14 - The last observed date was 2009 and the EO rank date is 2001. Can we assume 2009 for an updated EO rank date?
- In the case of last observe date older than EO rank date - We can assume the EO rank date is accurate and maybe desk updated?

Thank you and have a great weekend!

Hi Rebekah,

EOs 50 and 233 are part of the same Parent record and represent different survey and data entry efforts. NHP will also reconcile these.

EOs 106 and 286 have deliberate overlap as noted in the directions field –" [**Note:** Transplant plots (EO 286) source feature currently overlaps area of native plants (EO 106). M. Buchanan (pers. comm. with S. Mason, 10 March 2009) advised to leave mapping this way because the native population may be patchy and the polygon provided by Padgett (2007) may not account for this and encompass the entire extent of the occurrence.]"

Attached are the polygons for EOs 319, 320, and 321 in zipped geodatabase EO_SHAPE_2018_02_09_091617.gdb. Let me know if you would prefer .shp instead of .gdb.

Hope you have a great weekend!

Jame

Subject: Map for current conditions for HENA
Date: Wednesday, February 14, 2018 1:06:20 PM
Importance: High

Hey guys,

I was thinking about figures and tables for the current conditions section....typically, I like to produce a figure with the locations of all of the populations across the range...color coded by resilience category....however, due to not showing locations of these populations, we're gonna have to be clever.

Mark, perhaps a figure similar to the one you produced showing # of EOs in each county....thinking the figure would show tallies within each county for very high, high, moderate, and low....just a visual representation of the data embedded in the current conditions table.

Thoughts?

Thanks,

Mike

I think this would be an efficient way to visually represent that data. We could also get creative with the table sorting to make it easier to read...

They are color coded by number of EOs. I think what Mike is thinking is breaking that down another level and indicating how many of the EOs in each county are very high, high, moderate, and low to show resiliency.

Mike - am I catching that correctly?

Sorry for the confusion.....I've attached a Word document. Take a look at the Table on page 3. These are the populations we are using for Current Resilience, and it is the table I am hoping to capture with a map.....I can certainly be convinced that a map is not needed....perhaps the table by itself is sufficient. What do you guys think?

Mike

CURRENT CONDITIONS

Below we assess current resilience, representation, and redundancy as they relate to population and habitat factors known to be important for species viability. Based off of recent reports (NCNHP 2016a; NCNHP 2016b), the species consists of 113 populations distributed across 12 counties in North Carolina and South Carolina. Recent genetic research suggests that dwarf-flowered heartleaf, as originally described, is found in the southern portion of its presumed range based on current EO locations, and the northern portion could be a currently undescribed species. The genetic analysis to support this is complete, but a review of the morphology is ongoing and a new species has not yet been described (Estep pers. Comm. 2018). For the purpose of this SSA, we assume all EO detections are H. Naniflora, and represent the best currently available scientific data.

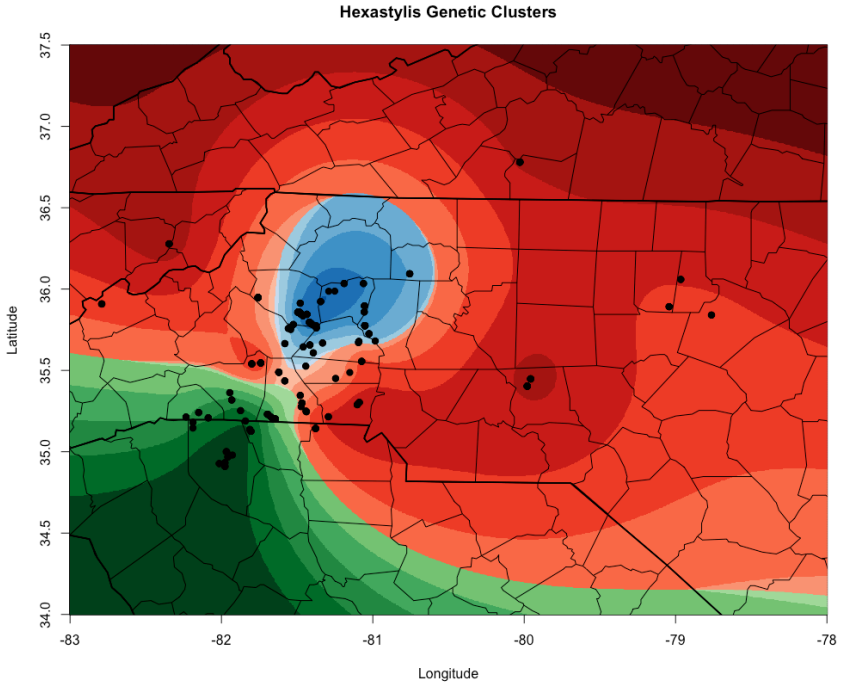

Figure 1-Recent genetic analyses detailing clustering of the genus Hexastylis. Green areas represent "true" H. naniflora; Blue represents a possible new species; Red represents other species in the genus (H. minor, H. heterophylla, etc.).

Current Population Resilience

Categorizing Resilience

For the purposes of this SSA, we use population size as the main driver of population resilience. The unit of measurement for population size in this species is a "clump" (rosette). As discussed previously, populations were delineated by NCNHP and SCNHP, and these delineations were based off of NatureServe criteria such as EO separation distance and intervening landscape matrix. EO data included a wide range of years since the species was last observed at a given location (1964-2017), so although recent reports suggest the species consists of 113 populations, some of that data is fairly outdated. For the purposes of this SSA, we only used EO that were last observed within the last 10 years (2007-2017). Based on that criteria, there are currently 68 populations distributed across the range of dwarf-flowered heartleaf, although this may be an underestimate as discussed in more detail in the habitat modelling section later.

To determine overall resilience for populations, we used EO viability ranks and expert opinion to bin population size classes into corresponding resilience categories. EO viability ranks for the species include excellent, good, fair, poor, extant, historical, and failed to find. The primary factor in determining these ranks is EO size (as quantified by number of clumps). Condition of habitat (vegetation community and structure) and landscape context (extent of suitable habitat and physical factors) are also incorporated secondarily. Appendix 2 shows the NCNHP EO rank specifications for dwarf-flowered heartleaf. The EO rank specifications suggest good-excellent viability for populations consisting of at least 500 individuals, given there is sufficient high quality habitat; fair viability for populations consisting of 100-500 individuals, depending on habitat conditions; poor viability for populations consisting of less than 100 individuals. Recent reports (NCNHP 2016a; NCNHP 2016b) focus monitoring studies on populations with greater

than 1,000 individuals, populations that are assumed to be extremely viable. Because we do not have habitat level information for every population we assessed, we synthesized all of the above population size information and created four resilience categories as follows:

- Very high—populations with >1,000 individuals; very high probability of persistence for 20-30 years at or above the current population size.
- High—populations with 500-1,000 individuals; moderate-high probability of persistence for 20-30 years at or above the current population size.
- Moderate—populations with 100-500 individuals; low probability of persistence for 20-30 years at or above the current population size.
- Low—populations with <100 individuals; low probability of persistence, and moderate-high probability of extirpation for 20-30 years at or above the current population size.

Occupancy and Abundance

There are 67 populations of dwarf-flowered heartleaf that have been observed within the last 10 years (Table ##), and resilience of these populations is as follows: 27 (very high); 5 (high); 20 (moderate); 15 (low).

Although we lack an adequate past time series of abundance data for all populations to estimate growth rates or population trends, NCNHP conducted surveys of thirteen of the largest populations across the range of the species from 2012-2016. Table ## shows the results of these surveys. Two populations show an increasing trend, nine show a stable trend, and two show a decreasing trend.

Table ##-Summary of population trends over 5 years of monitoring data for 13 of the largest populations of dwarf-flowered heartleaf across its range (from: NCNHP 2016).

Commented [MME1]: DOT data.....add here.

Trend	Site	2016 estimated number of plants (Rosettes)	2016 area occupied (Acres)
Increasing	Cliffside Steam Station (EO 276)	39,535	52
	Broad River: Floyds Creek, Long Branch (EO 177)	12,687	5.67
Stable	Island Creek Bluff/Love Lady Site (EO 029)	50,481	61.76
	Rhyne Preserve (EO 302)	19,873	22.43
	Mills Creek Forest and Seep (EO 023)	1,733	1.39
	New Hope Springhead Swamp (EO 125)	12,235	5.03
	Broad River: Henson's Creek, Brice, & Sandy Mush Outcrop (EO 099)	106,940	83.39
	Broad River: Cleghorn Creek, US 221 (EO 176)	6,750	7.24
	Cowpens National Battlefield (SC EO 016, 017, 018)	2,823	6.05
	Peters Creek Preserve (SC EO 011)	3,306	8.98
	Blalock Reservoir (SC EO 007, 031)	3,505	7.59
Decreasing	Second Broad River (Forest City Industrial Complex) (EO 154)	2,576	4.74
	South Fork Catawba River: Jacob Fork, Camp Creek (EO 158)	123	0.09

Habitat Factors: Slope, Aspect, Elevation, Soil, and Forest Type

This will be where we describe our population model….what covariates are used….what covariates best explain areas where HENA is highly resilient. I can envision a table that lists all of the populations, and columns describing habitat elements within each population. Also, we can describe how much potential habitat is out there based on the model (occupied and unoccupied)…this will set us up for scenarios in the future condition.

Resilience Summary

A narrative that summarizes how many populations are on the landscape and their associated resilience score.

Current Species Representation

Representation describes the ability of a species to adapt to changing environmental conditions. We lack genetic and ecological diversity data to characterize representation for dwarf-flowered heartleaf. In the absence of species-specific genetic and ecological diversity information, we typically evaluate representation based on the extent and variability of habitat characteristics across the geographical range. However, the dwarf-flowered heartleaf has a very limited range, and after consulting with experts, we decided delineating representative units was not appropriate for this species.

Current Species Redundancy

Redundancy describes the ability of a species to withstand catastrophic events. Measured by the number of populations, their resiliency, and their distribution (and connectivity), redundancy gauges the probability that the species has a margin of safety to withstand or can bounce back from catastrophic events (such as a rare destructive natural event or episode involving many populations). Redundancy for dwarf-flowered heartleaf is the total number and resilience of population segments and their distribution across the species range. As stated previously, there are 68 populations of dwarf-flowered heartleaf that have been observed within the last 10 years, and resilience of these populations is as follows: 27 (very high); 5 (high); 20 (moderate); 13 (low); 2 (unknown); 1 (possibly extirpated). The populations are spread across the range, although a majority occur in North Carolina. Although, there appears to be adequate redundancy within the range of dwarf-flowered heartleaf, the species range is very small, making it potentially vulnerable to catastrophic events. Thus we classify redundancy as inherently low for the species.

Agreed....never mind on the map....although, once we get to the recommendation meeting, we might decide to produce a map printout that captures that...seems the decision makers like to see maps....but we'll cross that bridge once we get to it.

Thanks!

Mike

Hey guys,

I was thinking about figures and tables for the current conditions section....typically, I like to produce a figure with the locations of all of the populations across the range...color coded by resilience category....however, due to not showing locations of these populations, we're gonna have to be clever.

Mark, perhaps a figure similar to the one you produced showing # of EOs in each county....thinking the figure would show tallies within each county for very high, high, moderate, and low....just a visual representation of the data embedded in the current conditions table.

Thoughts?

Thanks,

Mike

Replicated maxent model for Hexastylis_naniflora.pdf
Importance: High

Hi All,

Here is a Maxent output map and the latest model output. Last night I ran a 10 replicate model. This runs 10 separate models then smashes them all together to get an average output. I didn't have it create the response curves or jackknife tests, we can use the single run output for that.

What table summaries are needed?

Thanks!

Mark

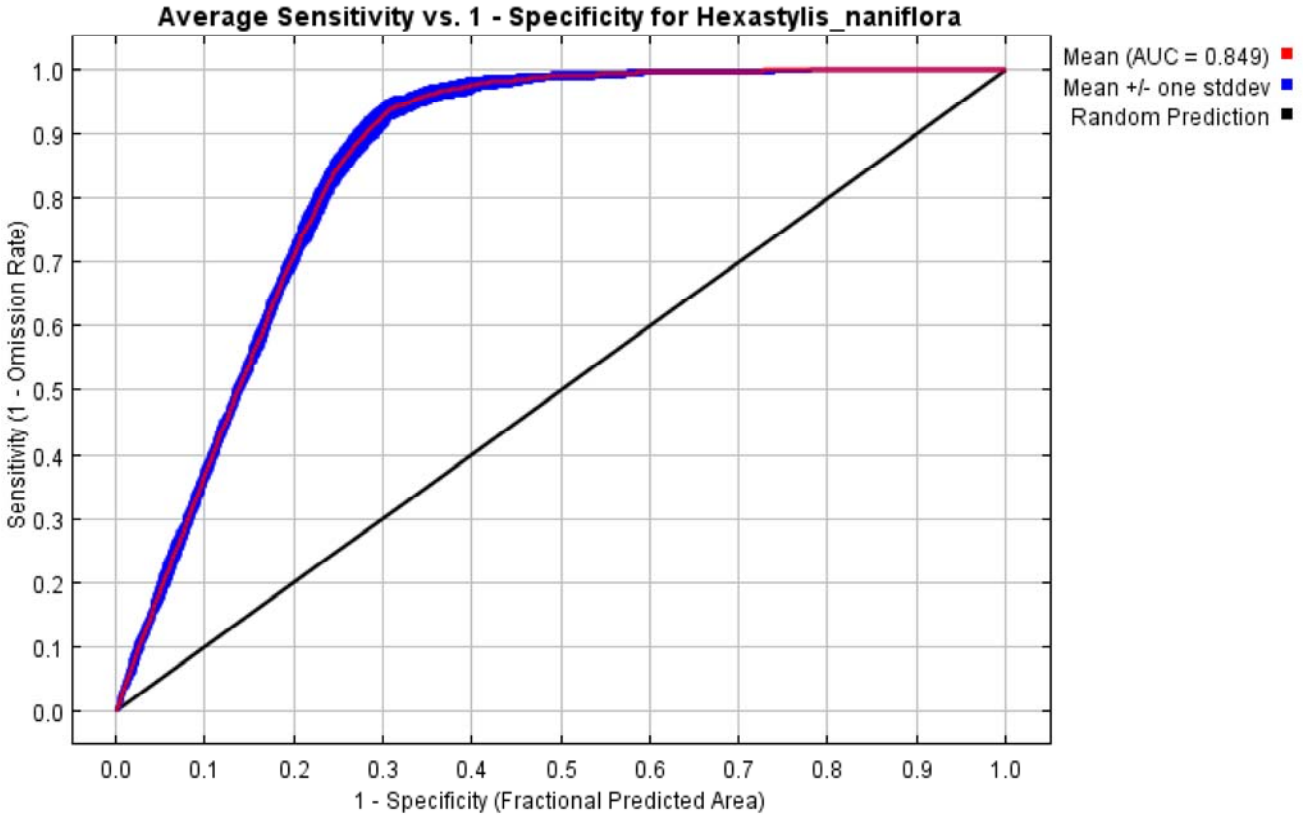
Replicated maxent model for Hexastylis_naniflora



This page summarizes the results of 10-fold cross-validation for Hexastylis_naniflora, created Wed Feb 14 17:50:27 EST 2018 using Maxent version 3.4.1. The individual models are here: [0] [1] [2] [3] [4] [5] [6] [7] [8] [9]

Analysis of omission/commission

The following picture shows the test omission rate and predicted area as a function of the cumulative threshold, averaged over the replicate runs. The omission rate should be close to the predicted omission, because of the definition of the cumulative threshold.

The next picture is the receiver operating characteristic (ROC) curve for the same data, again averaged over the replicate runs. Note that the specificity is defined using predicted area, rather than true commission (see the paper by Phillips, Anderson and Schapire cited on the help page for discussion of what this means). The average test AUC for the replicate runs is 0.849, and the standard deviation is 0.006.

Analysis of variable contributions

The following table gives estimates of relative contributions of the environmental variables to the Maxent model. To determine the first estimate, in each iteration of the training algorithm, the increase in regularized gain is added to the contribution of the corresponding variable, or subtracted from it if the change to the absolute value of lambda is negative. For the second estimate, for each environmental variable in turn, the values of that variable on training presence and background data are randomly permuted. The model is reevaluated on the permuted data, and the resulting drop in training AUC is shown in the table, normalized to percentages. As with the variable jackknife, variable contributions should be interpreted with caution when the predictor variables are correlated. Values shown are averages over replicate runs.

Variable	Percent contribution	Permutation importance
ssurgo_mukey	23.3	40.7
temp_min	20.7	23.9
precip_annual	14.6	16.6
landcover	13	4.8
landcovermajority	9.5	1.5
landcoverreidgrp	7.3	0.6
geomorp05110	6.4	1.3
elevation	5.2	10.7

Looks great, thanks Mark!

As for tables....some of these are embedded in the output (#1 below), but my initial thoughts:

1--Table showing the variables included and their contribution to the model

2--Table showing acreage of habitat...thinking acres of orange; acres of red; and total acres

3--I haven't thought this one through very well, so please correct me if you think this is irrelevant.....but a summary, or summary table, of how the actual populations fell out within the predicted habitat....just trying to see if the majority of the current populations fall within the higher ranked habitat....also, did the populations we categorized as very high and/or high end up in the high ranked habitat? Also, did low resilience populations tend to fall in the lower ranked habitat?

4--I'm not very familiar with Maxent, and I admit to being weak in stats, but is there some summary stats we can show for a goodness of fit, or strength of the model? Is the program calculating AIC scores for all potential models? Any type of basic summary stats that show the model is a good one, in a nice clean simple fashion, would be awesome.

Thanks,

Mike

Subject: Re: Map for current conditions for HENA
Date: Thursday, February 15, 2018 10:51:37 AM
Attachments: Resilience Table 2.0.xlsx
Importance: High

Found some nifty excel functions so this was a snap. Attached is the updated resilience table sorted by resilience category, then county, then site name. Also included is a county summary table with the total in each resilience category and total current populations per county. As a side note, each county in our range has at least one current population in the table.
