Sorry, I missed this issue....I did not see your comments on the PDF I was reviewing, I hope I did not miss other important issues. On Fig. 3, I see your point; the number of unduplicated FCOY outside the DMA are really not relevant to this document. It might indeed reduce confusion if the figure shows unduplicated FCOY and the Chao2 estimate, so that readers can see the portion of unobserved bears that Chao2 adds to the count of unduplicated FCOY. The next dilemma would be whether to show the annual Chao2 estimates or the model-averaged....or both?

I've added a few comments to those of Dan. Let me know if you need any clarification....

Sounds good to me, once Frank weighs in we can send this back to subgroup. Good call on Word document

Hi Dan and Frank,

I made a few additional comments. Thanks Dan for taking the time to make the initial edits. We will ensure that both the recovery plan and the rule are also clear when referring to females with cubs-of-the-year.

Once we have all agreed on the necessary edits I can make these edits in track changes in a word file to make further editing easier for the subgroup.

Hi Jennifer and Frank,

See attached to address comments pertaining to use of cubs, cubs-of-the-year and for consistency between and within documents. I think I captured any confusion regarding coy/cubs language. There is a portion that addresses the 48 females with cubs-of-the-year metric as being the model-averaged number, which is important to make sure that is clear to the general public. It would be good to make it clear that if we do develop a new estimation technique that does not use females with coy that it should no longer serve as a recovery criterion.

My edits are highlighted or in the comments bubbles. Let me know your thoughts or if I missed something and we can finalize and send back to the subgroup.
