I think we're good, so if we're all on the same page should I send this to Gould?

Frank and I were discussing removing unduplicated females with cubs outside the DMA from the existing figure and adding either annual Chao2 or model-averaged Chao2 or both. Your thoughts?

Great and I have a figure already for the Chao2 FCOY that I can include.

Attached is a word file with the edits. I put a comment in that we are working on a new Figure 3 that includes the Chao2 estimate for FCOY.

Hey Jennifer if you can incorporate all comments into Word, we can do a quick review and then send back to Gould et al. How does this sound?

Sounds good to me, once Frank weighs in we can send this back to subgroup. Good call on Word document

Hi Dan and Frank,

I made a few additional comments. Thanks Dan for taking the time to make the initial edits. We will ensure that both the recovery plan and the rule are also clear when referring to females with cubs-of-the-year.

Once we have all agreed on the necessary edits I can make these edits in track changes in a word file to make further editing easier for the subgroup.

Hi Jennifer and Frank,

See attached to address comments pertaining to use of cubs, cubs-of-the-year and for

consistency between and within documents. I think I captured any confusion regarding coy/cubs language. There is a portion that addresses the 48 females with cubs-of-the-year metric as being the model-averaged number, which is important to make sure that is clear to the general public. It would be good to make it clear that if we do develop a new estimation technique that does not use females with coy that it should no longer serve as a recovery criterion.

My edits are highlighted or in the comments bubbles. Let me know your thoughts or if I missed something and we can finalize and send back to the subgroup.
