This brings us back to the measurement of that parameter. If they want to use the CI as a measure, then the need to use the annual CI as the measure, not the annual point estimate. Thus, for 2015, the point estimate was 717 but the 95% CI was 639-794.

And they also specifically want the rule to remove 674 as the population objective and replace it with "at least a range between 600 and 747".

This letter is simply amazing. They attempt to rewrite biology and history and eliminate any type of regulation or commitment by the states that limits mortality in any way, except to stay above 500. Their comments on p. 11 that we not even mention that MT will manage for genetic connectivity to the NCDE and to remove every shred of reference to the relationship of the 500 number to genetic minimum number are biologically incredible and astonishing.

I've located the letter from the states referenced in the article and attached it here. It was part of the public comments that I just hadn't gotten to yet.
