

Framework to move forward on delisting by managing inside the DMA to stabilize the population at the 2007 ~~Chao2 population estimate of 683, estimated population level.~~

Management Framework	Background and Application Protocol
1. Area within which mortality limits apply.	19,279 square miles Demographic Monitoring Area (DMA) ¹ (Figures 1 and 2).
2. Management objective.	To stabilize the population at approximately <u>at</u> the 2007 Chao2 population population estimate of (currently 683 using the Chao 2 methodology), and to annually measure population size using the Chao2 method to assess the success of this management objective. ²
3. Population goal estimator.	A population close to the 2007 Chao2 population estimator estimate of 683 bears using the Chao2 estimator will be used as the population measurement tool. <u>The 2007 population estimate was 683 (CI 609 to 757) and the 2015 population estimate is 757</u>
4. Allocation process for managed mortalities and response if limits are exceeded.	Management within the mortality limits within the DMA. Coordination among the states to manage within the mortality limits within the DMA. The Wind River reservation will receive a portion of the available mortality limit based on the % of the WRR geographic area within the DMA.
5. Management review by the Study Team every 5 years to assure that management actions are achieving the objective of a stable population at the estimated number at time of delisting.	The management review will assess if the management system is achieving the desired objective to maintain a stable population at the 2007 Chao2 estimated level estimated population size. The management review is a science-based process that will be led by the Study Team (which includes all state and federal agencies and the WRR Tribes) using all recent available scientific data to assess population numbers and trend against the management objective. Vital rates such as age/sex-specific survival and reproductive rates will also be reevaluated using the most recent data to adjust sustainable mortality levels as necessary.

¹ See maps on p. 4.

² ~~The 2014 Chao2 population estimate is 757.~~

6. Mortality limit % for independent FEMALES.	<683	683 ³	684-757	>757	
	<7.6%	7.6% ⁴	9%	10%	
7. Mortality limit % for independent MALES.	<683	683	684-757	>757	
	<15%	15%	20%	22%	
8. Mortality limit for % of dependent young.	<683	683	684-757	>757	
	<7.6%	7.6%	9%	10%	
9. Expected background level of annual mortalities from management and other causes – Using average yearly total mortality of independent bears (≥2 years) from all causes including unknown/unreported estimates, 2011 to 2014.	38 expected independent bear deaths/year due to management, illegals, and other deaths (17 F, 21 M) (This includes dead bears from inside the DMA only.)				
10. Total mortality limit independent FEMALES (≥2 years).	609 (as an example) at <7.6% mortality	609-683 <7.6% mortality	683 at 7.6% mortality	684-757 at 9% mortality	>757 at 10% ⁵ mortality
	<16	16 to 18	18	21 to 24	≥26
11. Total mortality limit independent MALES (≥2 years).	609 at <15% mortality	<683 <15% mortality	683 at 15% mortality	684-757 at 20% mortality	>757 at 22% mortality
	<32	<36	36	48 to 53	≥58

³ Population ranges based on annual application of the Chao2 counting method. The mortality limits for independent females and males change as the annual Chao2 population estimate changes.

⁴ A 7.6% independent female mortality rate will result in population stability using the updated vital rates (IGBST 2012).

⁵ A 10% mortality level of females will result in rapid return to lower population numbers with resulting rapid reductions in available discretionary mortality. Such a high female mortality rate will result in inconsistent year to year discretionary mortality levels and challenges in season setting and management. A lower level such as 8% or 9% would result in a less rapid decline in population down to the 2007 level of 683.

12. Examples of the number of independent female and male bears “available” for hunting and additional management removals inside the DMA. This is the number available in excess of the expected annual mortality from other causes.	Examples: For 683 bears: (manage for population stability) F limit = 18 – 17 background mortalities = 1 F available (1 state, 0 WRR) M limit = 36 – 21 background mortalities = 15 M available (15 state, 0 WRR) For 757 bears: (manage for population decline) F limit = 24 – 17 F background mortalities = 7 F available (7 state, 0 WRR) M limit = 53 – 21 M background mortalities = 32 M available (31 state, 1 WRR) (+ any mortalities outside the DMA)			
13. State allocation (all 3 states) (based on % of area within the DMA) <u>Allocation among states will be determined through a future methodology.</u>	609 (as an example)	683 ⁶	684-757	>757
	F: 0 M: 10⁷	F: 1 M: 15⁵	F: 4 to 7 M: 25 to 31	F: ≥9 M: ≥36
14. Wind River Reservation allocation (based on % of reservation within the DMA).	609 (as an example)	683	684-757	>757
	F: 0 M: 0	F: 0 M: 0	F: 0 M: 1	F: 0 M: 1

Important connectivity issue that needs to be addressed:

It is important to maximize the opportunity for occasional male movement between the NCDE and Yellowstone to address concerns about negative long-term isolation impacts to Yellowstone. To achieve this objective, it will be desirable to minimize discretionary mortality in the genetic connector area in Montana between the NCDE and Yellowstone though the Madison Range, Tobacco Roots, Highland Mountains, Boulder Mountains and Nevada Mountains. This can be accomplished by not permitting sport hunting in these connector areas. Management of any human-bear conflict in these connector areas will still proceed as necessary and appropriate; only sport hunting would be curtailed in these connector areas. Since there are few if any grizzly bears currently in these areas, there is little loss of hunter opportunity by implementing this conservation objective. A commitment to connectivity

⁶ Between 609 and 683 there would be a fraction of an adult female available.

⁷ For practical application, with 0 or 1 female available and the difficulty of the average hunter to distinguish between males and females in the field, the states may consider what hunting management for males is actually available.

management in state regulations or in Commission policy statement would make this clear and legally defensible.

Regulatory mechanisms are required that demonstrate management responses to departures from the established and desired conditions in place under the Conservation Strategy. The table below shows some examples of departures from desired demographic conditions and legally defensible and adequate regulatory responses to these departures.

Condition	Response
1. Exceeding independent female mortality limit at any time during the year.	Cease grizzly hunting in the DMA upon exceeding the limit.
2. Exceeding independent female mortality limit for 3 consecutive years	No grizzly hunting in the DMA the following year. FWS status review.
3. Exceeding independent male mortality limit for 3 consecutive years.	No grizzly hunting the following year. IGBST biology and monitoring review.
4. Exceeding dependent young mortality limit for 3 consecutive years.	No grizzly hunting the following year. IGBST biology and monitoring review.
5. Failure to meet distribution of reproductive females criterion.	IGBST biology and monitoring review.
6. Failure to meet/adhere to habitat standards in forest plans.	IGBST biology and monitoring review.
7. Failure to receive adequate funding to implement monitoring and management requirements in the Conservation Strategy.	IGBST biology and monitoring review. Could lead to a FWS status review.
8. Total population less than 500 bears necessary for genetic health as measured with Chao2 method.	No grizzly hunting inside the DMA the following year. FWS status review and possible relisting.
9. Changes in Federal, State, or Tribal laws, rules, regulations, or management plans that depart significantly from the specifics in the Conservation Strategy.	FWS status review and possible relisting.
