Jennifer,

Here is how the 150 was derived. It is important to remember, it is a very rough estimate for interpretive purposes to answer a common visitor question. It was never published in a scientific peer reviewed journal and so cannot be considered best available science. The Conservation Strategy manages bears throughout the DMA, not just YNP.

The 126 - 312 was for the area occupied in 1975, which included YNP and portions of the 5 National Forests Surrounding the park, so you can't compare the 150 just for YNP to the 126 - 312 for the occupied range of the GYE in 1975.

Thanks! I may have you look over our response to the comment when we get that far. The comment was:

o The estimated population inside the park, "approximately 150 with home ranges wholly or partially in the park" (www.nps.gov/yell/learn/nature/grizzlybear.htm<<http://www.nps.gov/yell/learn/nature/grizzlybear.htm>>) means that current bear numbers in the park are less than or barely exceed numbers estimated in 1975 (126-312 "restricted largely to the confines of Yellowstone National Park and some surrounding areas").

That is a very rough estimate based on the number of females with cubs observed in the park. It was never intended for scientific or management purposes, visitors always ask, so we give them a rough estimate. Since our counts of females with cubs have been relatively stable, it is still applicable, but I wouldn't necessarily call it accurate. I'll see if I can dig up the calculations it was based on.

Kerry,

On the YNP grizzly bear webpage it says that there are "approximately 150 with home ranges wholly or partially in park." Do you know if this is still accurate? We received a public comment related to this estimate.

Thank you,

Jennifer
