hi Mark,

Here's the language I was asking you about yesterday.

"In poor whitebark pine years, this increase in grizzly bear/human conflicts translates into approximately 3–6 more female mortalities across the ecosystem (Interagency Grizzly Bear Study Team 2013, p. 25)"

This is my approximation based on the Food Synthesis report, Figure 5 on p. 25. It is
(difference between 2012 levels of mortality inside RZ) + (difference between 2012
levels of mortality outside RZ) = $(7 - 3.5) + (7 - 5) = 5.5$

Take your time, I won't be able to work on this again until Tuesday at least.

have a good weekend!

rebecca
