Interior Secretary Sally Jewell,
US Department of the Interior,
1849 C Street, NW
Washington, DC 20240

RE: Official resolutions, declarations and letters of twenty-nine (29) federally recognized Indian Tribes in opposition to the US Fish and Wildlife Service's proposed delisting of the Yellowstone grizzly bear (*Ursus arctos horribilis*) from the Endangered Species Act, and the US Fish and Wildlife Service's contravention of the established protocols for tribal consultation in this process.

Dear Madam Secretary,

Enclosed please find both original documents and copies of the aforementioned official resolutions, declarations and letters of twenty-nine (29) federally recognized Indian Tribes in opposition to the US Fish and Wildlife Service's (FWS) proposed delisting of the Yellowstone grizzly bear from the Endangered Species Act (ESA).

Included among these is a resolution by the Eastern Shoshone Tribe, whom you visited in August 2013, a declaration by the Standing Rock Sioux Tribe, to whom President Obama made an official government-to-government visit in June 2014, and a letter from the Crow Tribe, President Obama's adopted people.

In addition, copies of resolutions recently passed by the Northern Cheyenne Tribe and the Great Plain Plains Tribal Chairmen's Association will be forthcoming. In total, this amounts to every tribe in Wyoming, Montana, South Dakota, North Dakota, Nebraska, and some in Idaho and Oklahoma. GOAL (Guardians of Our Ancestors' Legacy) Tribal Coalition, of which I am a co-founder, liaised and coordinated with the respective Tribal Nations and representative bodies in amassing this official documentation.

RECEIVED

As articulated in all of the resolutions, declarations and letters, due to the immense spiritual and religious significance of the grizzly bear in tribal cultures, all of the Tribal Nations cite violations of the American Indian Religious Freedom Act (AIRFA–PL 95-341–1978/PL 103-344 –1994) in FWS's actions to date relative to delisting the grizzly bear.

Similarly, all of the Tribal Nations specify FWS's disregard for established consultation protocols. Standing Rock Sioux Chairman, Dave Archambault II, succinctly articulates this in his tribe's declaration:

"Executive Order 13175 (Nov. 6, 2000) 'Consultation and Coordination with Indian Tribal Governments' signed by President Clinton, and the Memorandum for the Heads of Executive Departments and Agencies (Nov. 5, 2009) issued by President Obama, requiring a 'complete and consistent implementation of Executive Order 13175,' have yet to be followed by the US Fish and Wildlife Service (FWS) during this process.

Executive Order 13647 (June 2013) states, 'Greater engagement and meaningful consultation with tribes is of paramount importance in developing any policies affecting tribal nations.' The proposed delisting of the Yellowstone grizzly bear affects the Lakota, Dakota and Nakota people of the Great Sioux Nation.

This lack of consultation by FWS stands in direct contrast to the policy directives of the Obama Administration. President Obama has attempted to strengthen consultation with tribes when federal policies and actions have the potential to affect tribes and have tribal implications. Clearly, removing the Yellowstone grizzly bear from the ESA and permitting states to proceed with high-dollar trophy hunts on our historic cultural landscape fits the criteria.

President Obama made a highly visible commitment to improving dialogue between tribal nations and the federal government when he visited the Standing Rock Sioux Nation in June 2014."

As you are no doubt aware, the Standing Rock Sioux Tribe is one of the 26 Tribal Nations the federal government identifies as having an ancestral connection to the Greater Yellowstone Ecosystem ("Associated Tribe of Yellowstone" – *Resources & Issues*, NPS, 2010), and is, therefore, one of the 26 Tribal Nations that must be consulted in this latest attempt to delist the Yellowstone grizzly bear.

In your statement of 12/19/2014 pertaining to the National Defense Authorization Act, specifically the Resolution Copper Mining provision, you said that you were "profoundly disappointed" with the disregard for tribal spiritual rights and how the provision "short-circuits the long-standing and fundamental practice of pursuing meaningful government-to-government consultation." This is precisely what is occurring with FWS's failure to pursue

"meaningful government-to-government consultation" in the proposed delisting of the Yellowstone grizzly bear.

Further, FWS appears oblivious to your emphasizing that, "the appropriate time for honoring our government-to-government relationship with tribes is before legislating issues of this magnitude."

In response to questions from the press about the lack of tribal consultation, FWS's "Grizzly Bear Coordinator," Dr. Christopher Servheen, recently claimed "we've done what we are required to do" (*Bozeman Daily Chronicle* 1/9/15), and identified four letters he sent in April 2014 as validation, one each to the Eastern Shoshone, the Shoshone-Bannock Tribes of Idaho, the Northern Arapaho, and an unidentified tribe in Idaho. From personal contact GOAL has had with the chairmen of each of the tribes identified, I can attest to the fact that they never had sight of a letter from Dr. Servheen.

Dr. Servheen then repeated to the Associated Press (*New York Times* et al 1/11/15) what he stated to the *Missoula Independent* about consultation with the tribes (12/17/14): "They were all sent those letters, and we haven't heard anything in response to those letters." This is patently false on two counts; one, not all of the 26 affected tribes were sent letters; and two, the Eastern Shoshone Tribe responded to FWS's intent to proceed with delisting by issuing their resolution in opposition on 10/28/14, the Shoshone-Bannock Tribes of Idaho did similarly 11/4/14, and as a member tribe of the Montana & Wyoming Tribal Leaders Council (TLC) the Northern Arapaho did the same when the TLC issued a resolution opposing delisting on 12/11/14.

Dr. Servheen's comment deriding the tribes' position on sovereignty in regard to this issue (*Bozeman Daily Chronicle* 1/9/15), and the context of his remark to the Associated Press that "we asked for their input and ideas" as if he were the arbiter of the validity of the tribes' knowledge of the grizzly bear which has been amassed since time immemorial, speaks to an individual lacking in both cultural sensitivity and knowledge relative to the consultation process required by acts of Congress (AIRFA, etc.), Secretarial Orders, and Executive Orders that define the government-to-government status that exists between Indian tribes and the federal government.

Tribes have a relationship with Congress and the Secretary of the Interior; tribes are not required to report to a department coordinator or follow his instructions, as, for example, Dr. Servheen bade the Eastern Shoshone in his April 2014 letter that Chairman Darwin St. Clair didn't receive, but Servheen released to the press regardless (*Bozeman Daily Chronicle*

1/9/15): "If you are aware of others who should also receive this request, either within your tribe or with another tribe, please forward this letter," he wrote.

The 26 affected Tribal Nations were not consulted by FWS during the process of its previous delisting attempt, a fact Dr. Servheen conceded when he said he "received no comment from the tribes on that proposal" (*Bozeman Daily Chronicle* 1/9/15). Again, this demonstrates a fundamental misunderstanding of the protocols involved; it is the responsibility of the respective federal agency or department to initiate the consultation process with the Tribal Nations that may be impacted by the consequences of federal actions, not vice-versa.

I would be amazed if either you or President Obama would concur that mailing a letter to only four of the impacted Tribal Nations constitutes "meaningful government-to-government consultation," or that either you or the President would agree with Coordinator Servheen that in terms of consultation FWS has "done what they are required to do." Among other tribal leaders, Oglala Sioux Tribal Vice President, Tom Poor Bear, outlined the framework of "meaningful government-to-government consultation" in his tribe's declaration (copy enclosed).

In addition to the abrogation of consultation protocols and the violation of religious and spiritual rights, all of the Tribal Nations have called for FWS to release the raw data from which the Interagency Grizzly Bear Study Team (IGBST) made its recommendation to proceed with delisting the Yellowstone grizzly bear. The American people have funded the collection of this data through their taxes, and as this is not a matter of national security there is no reason why this data should be withheld from public scrutiny. As Chairman Dave Archambault II highlighted in the Standing Rock Sioux Tribe's declaration:

"The Standing Rock Sioux Tribe (and the other affected Tribal Nations) is entitled to review the raw data the FWS is basing all of its conclusions upon relative to delisting the grizzly bear through the Secretarial Order issued by the Secretary of the Interior and the Secretary of Commerce pursuant to the Endangered Species Act (ESA) of 1973 (16 U.S.C. 1531). Several tribes have already called upon the FWS to release that data not only to the affected Tribal Nations, but also to independent scientists for analysis and review. The cultural importance of this issue is such that questions and contradictions must be resolved without bias if tribal members, and the public at large, are to have confidence in the outcome."

Madam Secretary, I was present on the Wind River Indian Reservation when you visited in August 2013. During your remarks you said, "I want to be helpful, but you are the experts," and you then concluded with "I'm all ears." I sincerely hope that you will listen to the tribes

on this occasion and intervene to ensure that there is a thorough and "meaningful government-to-government consultation" process, and that you will institute a moratorium on the proposed delisting of the Yellowstone grizzly bear until all of the issues raised by the affected Tribal Nations have been fully addressed.

Néá'eše/àho (Thank you).

Respectfully,

R. Bear Stands Last

To Whom it May Concern:

The sovereignty and spiritual rights of the Crow Creek Sioux Tribe and the Lakota, Dakota and Nakota people of the Great Sioux Nation are threatened by the proposed delisting of the Yellowstone grizzly bear from Endangered Species Act (ESA) protections by the US Fish and Wildlife Service (FWS). The Crow Creek Sioux Tribe is one of the twenty-six Tribal Nations the federal government recognizes as having an ancestral connection to Yellowstone ("Associated Tribe of Yellowstone" – *Resources & Issues*, NPS, 2010). In total, ten of those Tribal Nations are from the Oceti Sakowin (Great Sioux Nation), but to date none have been consulted in this process.

Chief Arvol Looking Horse, 19th Generation Keeper of the White Buffalo Calf Pipe of the Great Sioux Nation, detailed the spiritual and ceremonial significance of the grizzly bear in Lakota, Dakota and Nakota culture in his November 2014 statement in opposition to delisting of the Yellowstone grizzly from the ESA.

The cultural, geographic and sacred landscape of the Lakota, Dakota and Nakota people demonstrates the cultural importance of the grizzly bear. Sacred sites like Mato Tipila (Devils Tower) and Mato Paha (Bear Butte) are inseparable from our ceremonial connection to the grizzly. Numerous traditional and current family names, along with the names of creeks, rivers and buttes, were inspired by the grizzly bear. Many of our great historical leaders carried grizzly bear names, Smutty Bear, Medicine Bear, White Bear, and Two Bears among them.

As Chief Looking Horse has demonstrated, the ceremonial significance of the grizzly in our spiritual lifeway is an ancient

connection. Like all of our spiritual and religious ways, ceremonies related to the grizzly are protected by the American Indian Religious Freedom Act (PL 95-341–1978/PL 103-344 –1994). The Act states that laws and policies pertaining to "conservation and preservation of natural species" cannot be "passed without consideration of their effect on traditional American Indian religions." So far, in its attempts to delist the Yellowstone grizzly bear without regard to the religious practices of tribal people, the FWS is doing precisely that.

Abrogation of the AIRFA threatens potentially detrimental consequences not only for our religious and spiritual rights, but the sovereignty of all of the affected Tribal Nations.

Executive Order 13175 (Nov. 6, 2000) "Consultation and Coordination with Indian Tribal Governments" signed by President Clinton, and the Memorandum for the Heads of Executive Departments and Agencies (Nov. 5, 2009) issued by President Obama, requiring a "complete and consistent implementation of Executive Order 13175," have yet to be followed by the US Fish and Wildlife Service (FWS) during this process.

Executive Order 13647 (June 2013) states, "Greater engagement and meaningful consultation with tribes is of paramount importance in developing any policies affecting tribal nations." The proposed delisting of the Yellowstone grizzly bear affects the Lakota, Dakota and Nakota people of the Oceti Sakowin (Great Sioux Nation).

The Secretarial Order issued by the Secretary of the Interior and the Secretary of Commerce pursuant to the Endangered Species Act (ESA) of 1973 (16 U.S.C. 1531), established the protocols to be followed when decisions related to the ESA had the potential to impact tribes. The Order directs the FWS to "solicit traditional knowledge, and comments from, and utilize the expertise of, affected Indian tribes" during the consultation

process, and "cooperate with affected tribes to develop and implement Recovery Plans in a manner that minimizes" social and cultural impacts on tribal people. In the move to delist the grizzly, this has not been followed.

Ignoring these Acts and Orders contradicts the basis of the the government-to-government relationship that exists between not only the Lakota, Dakota and Nakota Tribal Nations and the federal government, but all of the 26 Tribal Nations affected by this issue.

The Crow Creek Sioux Tribe rejects the designation of the grizzly bear as a "trophy game animal" to be killed by big game hunters on the lands our ancestors defended. As one of those defenders, the respected Lakota Bear Medicine Man, Sword, said, "The grizzly bear is *wakan*."

The Acts and Orders cited herein entitle the Crow Creek Sioux Tribe (and the other 25 affected Tribal Nations) to review the raw data the FWS is basing all of its conclusions upon relative to delisting the grizzly bear. Several tribes have already called upon the FWS to release that data not only to the affected Tribal Nations, but also to independent scientists for analysis and review, which must happen.

The Crow Creek Sioux Tribe supports Chief Arvol Looking Horse's position in opposing the removal of the Yellowstone grizzly bear from the Endangered Species Act, and the work of GOAL Tribal Coalition. We join the other affected Tribal Nations that have issued resolutions, declarations and statements in opposition to delisting the grizzly and call for the FWS to begin the process of consultation to ensure that our sovereignty and spiritual rights are upheld.

Roxanne Sazue
CCST Chairwoman

JAN 20 2015

To Whom It May Concern:

The Eastern Shoshone Tribe stands beside the other tribal nations that have offered their support to GOAL (Guardians of Our Ancestors' Legacy) Tribal Coalition in their efforts to defend tribal sovereignty and Native American religious and spiritual rights as defined by the American Indian Religious Freedom Act (PL 95-341--AUG. 11, 1978).

The drive by the US Fish and Wildlife Service (FWS) and the State of Wyoming to remove the Yellowstone grizzly bear from Endangered Species Act (ESA) protections to enable Wyoming to manage the grizzly as a "trophy game animal" and generate tens of thousands of dollars for the state from trophy hunters' license fees amounts to an infringement of the American Indian Religious Freedom Act.

Even prior to the Richardson Amendments (HR 4230) that President Clinton signed into law in 1994 (PL 103-344, 108 Stat. 3125), PL 95-341 made plain that laws related to "conservation and preservation of natural species" could not, as had been the norm prior to the Act, be "passed without consideration of their effect on traditional American Indian religions." However, in its attempts to delist the Yellowstone grizzly bear without regard to the religious practices of tribal people, the FWS is doing precisely that.

The grizzly bear is highly respected by tribal people, and has a prominent role in the traditional spiritual practices of our people – the very lifeblood of our culture. The opposition of tribal members on the Wind River Indian Reservation to the delisting and trophy hunting of the grizzly bear has been apparent since our 55th Annual Eastern Shoshone Indian Days and Powwow, at which GOAL began making our tribal members aware of this issue and its consequences.

The Eastern Shoshone Tribe is among the twenty-six tribal nations recognized by the federal government as having an ancestral connection to Yellowstone ("Associated Tribe of Yellowstone" – *Resources & Issues*, NPS Division of Interpretation, 2010). Therefore, by the federal government's own criteria, the Eastern Shoshone Tribe must be included in any discussions pertaining to the removal of the sacred grizzly bear from ESA protections.

To date there has been no consultation with any of the spiritual leaders of the tribes impacted by the proposed delisting of the grizzly bear, which means that the FWS is also in contravention of the Secretarial Order issued by the Secretary of the Interior and the Secretary of Commerce pursuant to the Endangered Species Act of 1973 (16 U.S.C. 1531), which established the protocols to be followed when actions taken under authority of the ESA affect tribes.

The *American Indian Tribal Rights, Federal-Tribal Trust Responsibilities*, and the Endangered Species Act Order state, among other significant clauses:

"The Departments shall take into consideration the impacts of their actions and policies under the Act on Indian use of listed species for cultural and religious purposes (Sec. 5 #4)."

The Order directs the US Fish and Wildlife Service to "solicit traditional knowledge, and comments from, and utilize the expertise of, affected Indian tribes" during the consultation process, and "cooperate with affected tribes to develop and implement Recovery Plans in a manner that minimizes" social and cultural impacts on tribal people.

Clearly, the FWS and State of Wyoming have made no provision to abide by the Order.

The State of Wyoming has identified the Wind River Mountains as one area from which it intends to extinguish the grizzly bear. The FWS has already provided Wyoming Game and Fish with the mechanism to do so if the grizzly is delisted, but attempts to prosecute this action would be tantamount to an infringement of the sovereignty of the Eastern Shoshone Tribe.

The Eastern Shoshone Tribe opposes trophy hunting of the grizzly bear in the Wind River Mountains and will not permit the State of Wyoming to inflict its policies on Eastern Shoshone tribal lands. The leadership on the Wind River Indian Reservation rejected proposals to permit the trophy hunting of wolves on our land when the wolf was delisted from the ESA, and we hold that same position in relation to the grizzly bear. The grizzly bear is not recovered by the standard required to fulfill the ESA. A genetically isolated population of approximately 600 grizzlies existing on less than 1.5% of its original range does not meet the criteria of recovery.

Sincerely,

Darwin St. Clair Jr., Chairman
Shoshone Business Council

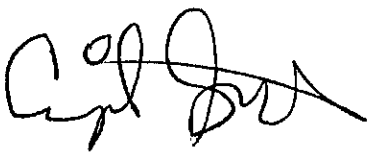
For the attention of:
Dan Ashe, Director – US Fish and Wildlife Service;
Chris Servheen, Grizzly Bear Recovery Coordinator – US Fish and Wildlife Service;
Other Parties Concerned:

The Rosebud Sioux Tribe is one of the twenty-six Tribal Nations recognized by the federal government as having an ancestral connection to Yellowstone ("Associated Tribe of Yellowstone" – *Resources & Issues*, NPS, 2010). Therefore, under the federal government's own criteria, the Rosebud Sioux Tribe should be consulted by the federal departments and agencies presently engaged in attempting to remove of the sacred grizzly bear from Endangered Species Act (ESA) protections.

Executive Order 13175 (Nov. 6, 2000) "Consultation and Coordination with Indian Tribal Governments" signed by President Clinton, and the Memorandum for the Heads of Executive Departments and Agencies (Nov. 5, 2009) issued by President Obama, requiring a "complete and consistent implementation of Executive Order 13175," have yet to be followed by the US Fish and Wildlife Service (FWS) during this process.

This issue extends beyond delisting the grizzly bear, and threatens potentially detrimental consequences for tribal sovereignty and our religious and spiritual rights as defined by the American Indian Religious Freedom Act (PL 95-341–1978/PL 103-344 –1994). Laws and policies related to "conservation and preservation of natural species" cannot, as had been the norm prior to the Act, be "passed without consideration of their effect on traditional American Indian religions." However, in its attempts to delist the Yellowstone grizzly bear without regard to the religious practices of tribal people, the FWS is doing precisely that.

In his statement of November 2014, Chief Arvol Looking Horse, 19th Generation Keeper of the White Buffalo Calf Pipe of the Oceti Sakowin, detailed the spiritual and ceremonial significance of the grizzly bear in Lakota, Dakota and Nakota culture.



The Lakota cultural and geographic landscape demonstrates the cultural importance of the grizzly bear. Many physical features and sacred sites are known by names inspired by the grizzly bear. Our people still carry names that reflect the significance of the grizzly. Throughout our history, numerous great leaders have borne grizzly bear names.

The specter of trophy hunters killing grizzly bears on our sacred lands is painful for the Lakota people. The most famous image of the 1874 Black Hills Expedition that contravened the 1868 Fort Laramie Treaty – and resulted in the theft of the Black Hills – is the photograph of Custer with the grizzly he killed for a "trophy." We cannot allow a repeat 140-years later on lands our ancestors fought so hard to defend when they opposed the construction of the Northern Pacific

Railroad along the Yellowstone in 1872/73, which was itself a violation of the 1868 Fort Laramie Treaty.

The Rosebud Sioux Tribe (along with the other 25 affected Tribal Nations) is also entitled to review the raw data the FWS is basing all of its conclusions upon relative to delisting the grizzly bear. Several tribes have already called upon the FWS to release that data not only to the affected Tribal Nations, but also to independent scientists for analysis and review so that questions of credibility might be answered.

The Rosebud Sioux Tribe joins the other affected Tribal Nations that have issued resolutions, declarations and statements in opposition to the US Fish and Wildlife Service's proposed delisting of the Yellowstone grizzly bear.

For the attention of:
Dan Ashe, Director – US Fish and Wildlife Service;
Other Parties Concerned.

The Yankton Sioux Tribe supports Chief Arvol Looking Horse and GOAL Tribal Coalition in opposing the US Fish and Wildlife Service's intention to remove the Yellowstone grizzly bear from Endangered Species Act protections.

Chief Arvol Looking Horse, the 19th Generation Keeper of the White Buffalo Calf Pipe of the Great Sioux Nation, detailed the spiritual and ceremonial significance of the grizzly bear in Nakota, Lakota, and Dakota culture in his November 2014 statement. As Chief Looking Horse demonstrated, the ceremonial significance of the grizzly in our spiritual life way has existed from time immemorial.

The American Indian Religious Freedom Act (PL 95-341–1978/PL 103-344 –1994) protects the spiritual and religious ways of the Nakota, Lakota and Dakota people related to the grizzly bear. The Act states that laws and policies pertaining to "conservation and preservation of natural species" cannot be "passed without consideration of their effect on traditional American Indian religions." In its attempts to delist the Yellowstone grizzly bear without regard to the religious practices of tribal people, the FWS is contravening the Act.

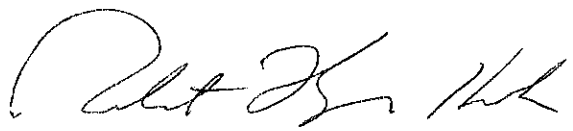
Abrogation of the AIRFA threatens potentially detrimental consequences not only for our religious and spiritual rights, but also the sovereignty of all of the affected Tribal Nations.

Executive Order 13175 (Nov. 6, 2000) "Consultation and Coordination with Indian Tribal Governments" signed by President Clinton, and the Memorandum for the Heads of Executive Departments and Agencies (Nov. 5, 2009) issued by President Obama, requiring a "complete and consistent implementation of Executive Order 13175," have yet to be followed by the US Fish and Wildlife Service (FWS) during this process.

Executive Order 13647 (June 2013) states, "Greater engagement and meaningful consultation with tribes is of paramount importance in developing any policies affecting tribal nations." The proposed delisting of the Yellowstone grizzly bear affects the Nakota, Dakota and Lakota people of the Oceti Sakowin (Great Sioux Nation).

The Secretarial Order issued by the Secretary of the Interior and the Secretary of Commerce pursuant to the Endangered Species Act (ESA) of 1973 (16 U.S.C. 1531), established the protocols to be followed when decisions related to the ESA had the potential to impact tribes. However, during the proposed delisting process, this framework has also not been followed.

During his official June 2014 visit to the Standing Rock Sioux Tribe, President Obama told the people of the Oceti Sakowin (Great Sioux Nation), "My administration is determined to partner with tribes, and it's not something that just happens once in a while. It takes place every day, on just about every issue that touches your lives. And that's what real nation-to-nation partnerships look like."



The delisting of the sacred grizzly bear, the subsequent trophy hunting, and the virtual cull proposed by the state of Wyoming, will touch the lives of the Flandreau Santee Sioux people. The cultural, geographic and sacred landscape of the Nakota, Lakota and Dakota people demonstrates the cultural importance of the grizzly bear.

Ignoring these Acts and Orders contradicts the basis of the government-to-government relationship that exists not only between the Nakota, Dakota and Lakota Tribal Nations and the federal government, but all of the 26 Tribal Nations affected by this issue. It is imperative that tribal sovereignty and the spiritual rights of our people be upheld.

The Yankton Sioux Tribe is one of the twenty-six Tribal Nations the federal government recognizes as having an ancestral connection to Yellowstone ("Associated Tribe of Yellowstone" – *Resources & Issues*, NPS, 2010). As such,
the Acts and Orders cited herein entitle the Yankton Sioux Tribe to review the raw data the FWS is basing all of its conclusions upon relative to delisting the grizzly bear. We join the other tribes of the Great Sioux Nation that have called upon the FWS to release that data not only to the affected Tribal Nations, but also to independent scientists for analysis and review.

Today the grizzly bear survives on less than 2% of its original range, with only 2% of its historic population. There is much work to be done before the grizzly bear can be considered recovered. Many areas of biologically suitably habitat exist where the grizzly once roamed, many of them in our ancestral homelands, and the grizzly should be returned to those areas. Two small island populations of grizzlies in two isolated ecosystems in the lower-48 cannot be considered to constitute a recovered species.

In the spirit of our ancestors, and to ensure that our children and future generations will grow-up in a world where grizzlies are returning to parts our ancestral homeland where they ranged before they were extirpated post-the Lewis and Clark Expedition, the Yankton Sioux Tribe opposes delisting the Yellowstone grizzly bear – preserving the grizzly equates to cultural preservation.

Robert Flying Hawk
Chairman
Yankton Sioux Tribe

JAN 2 0 2015

December 17, 2014

For the attention of:
Secretary of the Interior, Sally Jewell;
Dan Ashe, Director – US Fish and Wildlife Service;
Other Parties Concerned:

The sovereignty and spiritual rights of the Spirit Lake Sioux Tribe are threatened by the proposed delisting of the Yellowstone grizzly bear from Endangered Species Act (ESA) protections by the US Fish and Wildlife Service (FWS).

The Spirit Lake Sioux Tribe is one of the twenty-six Tribal Nations the federal government recognizes as having an ancestral connection to Yellowstone ("Associated Tribe of Yellowstone" - *Resources & Issues*, NPS, 2010). Ten of the identified associated Tribal Nations are from the Oceti Sakowin (Great Sioux Nation), but to date none have been consulted in this process.

Federally recognized tribes have a unique nation-to-nation relationship with the federal government that requires consultation to be held at a government-to-government level; and government-to-government consultation is conducted under existing protocols and within an established framework.

Yellowstone and the Greater Yellowstone Ecosystem is a matrix of sacred and cultural sites of great significance to the twenty-six affected tribes, and those tribes' Tribal Historic Preservation Offices (THPOs) must be engaged in an initial process of consultation consistent with the criteria of the THPOs designated mission (Section 101(d)(2) of the National Historic Preservation Act), in addition to consultation with tribal governments (executive and legislative branches), and recognized spiritual leaders.

Chief Arvol Looking Horse, 19th Generation Keeper of the White Buffalo Calf Pipe of the Great Sioux Nation, detailed the spiritual and ceremonial significance of the grizzly bear in Lakota, Dakota and Nakota culture in his November 2014 statement in opposition to delisting of the Yellowstone grizzly from the ESA.

The cultural, geographic and sacred landscape of the Lakota, Dakota and Nakota people demonstrates the cultural importance of the grizzly bear. Numerous sacred sites, along with the names of creeks, rivers and buttes, were inspired by the grizzly bear. Many of our great historical leaders carried grizzly bear names, and those traditional names are present today among families in our communities.

As Chief Looking Horse has demonstrated, the ceremonial significance of the grizzly is an ancient connection. Lakota ceremonies related to the grizzly, historically known as Bear Medicine Ceremonies, are, like all of our spiritual and religious ways, protected by the American Indian Religious Freedom Act (PL 95-341–1978/PL 103-344 –1994). The Act states that laws and policies pertaining to "conservation and preservation of natural species" cannot be "passed without consideration of their effect on traditional American Indian religions." In its attempts to delist the Yellowstone grizzly bear without regard to the religious practices of tribal people, the FWS is doing so "without consideration of their effect on traditional American Indian religions."

Abrogation of the AIRFA threatens potentially detrimental consequences not only for our religious and spiritual rights, but the sovereignty of all of the affected Tribal Nations.

Executive Order 13175 (Nov. 6, 2000) "Consultation and Coordination with Indian Tribal Governments" signed by President Clinton, and the Memorandum for the Heads of Executive Departments and Agencies (Nov. 5, 2009) issued by President Obama, requiring a "complete and consistent implementation of Executive Order 13175," have yet to be followed by the US Fish and Wildlife Service (FWS) during this process.

Executive Order 13647 (June 2013) states, "Greater engagement and meaningful consultation with tribes is of paramount importance in developing any policies affecting tribal nations." The proposed delisting of the Yellowstone grizzly bear affects the Spirit Lake Sioux Tribe and the Lakota, Dakota and Nakota people of the Oceti Sakowin (Great Sioux Nation).

The Secretarial Order issued by the Secretary of the Interior and the Secretary of Commerce pursuant to the Endangered Species Act (ESA) of 1973 (16 U.S.C. 1531), established the protocols to be followed when decisions related to the ESA had the potential to impact tribes. The Order directs the FWS to "solicit traditional knowledge, and comments from, and utilize the expertise of, affected Indian tribes" during the consultation process, and "cooperate with affected tribes to develop and implement Recovery Plans in a manner that minimizes" social and cultural impacts on tribal people. In the move to delist the grizzly, this has not been followed.

Ignoring these Acts and Orders contradicts the basis of the the government-to-government relationship that exists between not only the Lakota, Dakota and Nakota Tribal Nations and the federal government, but all of the 26 Tribal Nations affected by this issue.

The Spirit Lake Sioux Tribe rejects the designation of the grizzly bear as a "trophy game animal" to be killed by big game hunters on the lands our ancestors defended. Revered spiritual leaders from the past, the likes of Black Elk and Sword, articulated the perception of the Lakota, Dakota and Nakota people when they said, "The grizzly bear is *wakan* (sacred)."

Today the grizzly bear survives on less than 2% of its original range, with only 2% of its historic population. There is much work to be done before the grizzly bear can be considered recovered. Many areas of biologically suitably habitat exist where the grizzly once roamed, many of them in our ancestral homelands, and the grizzly should be returned to those areas.

Tribal Nations have alternative solutions to the outdated wildlife management practice of killing. Trophy hunting sentient beings appeals only to a tiny minority of the population, a minority that is over 95% white, from high economic strata. Just as the buffalo is being returned to reservation homelands with biologically suitable habitat, some Tribal Nations with appropriate land bases have expressed a desire to develop programs to return the grizzly to their sovereign nations.

Under such circumstances, estimated carrying capacity in one ecosystem would not result in killing but relocation to ignite new populations that would realize the long-projected need for linkage zones between grizzly populations. Today, the two small island populations of grizzlies surviving in two isolated ecosystems in the lower-48 cannot be considered a recovered species appropriate for delisting and subsequent trophy hunting.

Grizzly bear management plans post-delisting should be sensitive to the cultures of the affected Tribal Nations. Rather than have the states influence grizzly bear management on tribal lands, the affected Tribal Nations should be provided with the resources to initiate their own management practices and programs that are consistent with their cultural values. By doing so, tribal sovereignty will be upheld and potential employment and economic opportunity provided.

The consultation process that is mandated by the aforementioned Acts and Orders entitles the Spirit Lake Sioux Tribe (and the other nations of the Oceti Sakowin and affected Tribal Nations) to review the raw data the FWS is basing all of its conclusions upon

relative to delisting the grizzly bear. Several tribes have already called upon the FWS to release that data not only to the affected Tribal Nations, but also to independent scientists for analysis and review – the Spirit Lake Sioux Tribe adds its voice to that call.

The Spirit Lake Sioux Tribe supports Chief Arvol Looking Horse's position in opposing the removal of the Yellowstone grizzly bear from the Endangered Species Act, and we support the efforts of GOAL Tribal Coalition to protect the sacred grizzly bear and in doing so defend tribal sovereignty and spiritual rights.

Sincerely,

Myra Pearson
Spirit Lake Tribe Chairperson

The SHOSHONE-BANNOCK TRIBES

FORT HALL INDIAN RESERVATION
PHONE: (208) 478-3700
(208) 237-0797

FORT HALL BUSINESS COUNCIL
PO BOX 306
FORT HALL, IDAHO 83203

To Whom It May Concern:

This letter is in strong support of GOAL Tribal Coalition. JAN 2 0 2015

The Fort Hall Business Council of the Shoshone-Bannock Tribes of Fort Hall, Idaho oppose the federal government' s proposed removal of the Yellowstone grizzly bear from Endangered Species Act protections through the US Fish and Wildlife Service, recognizing that the federal government' s resolve to remove the grizzly bear from Endangered Species Act protection contravenes the American Indian Religious Freedom Act (AIRFA. PUBLIC LAW 95-341--AUG. 11, 1978).

Our Tribe is one of the few of the twenty-six federally recognized tribes which federal government openly acknowledges has an original ancestral connection to the Yellowstone National Park and the Greater Yellowstone Ecosystem regions. The connection between our tribe and this land has existed hundreds and thousands of years and requires the US Fish and Wildlife Service to consult with the Shoshone-Bannock Tribes since the American Indian Religious Freedom Act states that laws pertaining to 'conservation and preservation of natural species and resources" were never intended to impact American Indian religious practices.

The Secretarial Order issued by the Secretary of the Interior and the Secretary of Commerce pursuant to the *Endangered Species Act* (ESA) of 1973 (16 U.S.C. 1531) clearly sets forth the framework to be followed when actions taken under authority of the ESA affect tribes. With the proposed delisting of the grizzly bear, the US Fish and Wildlife Service is in contravention of this order which directs the that agency to 'solicit traditional knowledge, and comments from, and utilize the expertise of, affected Indian tribes' during the

consultation process, and 'cooperate with affected tribes to develop and implement Recovery Plans in a manner that minimizes social and cultural impacts on tribal people.'

The Shoshone-Bannock Tribe has been afforded no such consultation throughout the US Fish and Wildlife Service' s process proposing a new Rule to delist the Yellowstone grizzly bear, despite the supposed protection of religious practices of traditional tribal people by PL-95-341.

In respecting our unique cultural imperatives, and the preservation of our sovereignty, the Shoshone-Bannock Tribe renounces the federal government' s desire to delist the grizzly bear from Endangered Species Act protections. We oppose the legislative resolve to see trophy hunting of grizzlies on reservations and the extirpation of the grizzly bear from swathes of reservation lands.

Additionally, in recognition that that the Shoshone-Bannock Tribe' s Fish and Wildlife Department has a seat on the IGBC' s (Interagency Grizzly Bear Committee) Yellowstone Subcommittee, this letter of support from the Shoshone-Bannock Tribe countermands any previous votes cast by the Shoshone-Bannock Tribe' s Fish and Wildlife Department in favor of delisting the Yellowstone grizzly bear.

Our council hereby officially strongly opposes this position in delisting the Yellowstone grizzly bear.

Respectfully,

Nathan Small, Chairman
Fort Hall Business Council

Don Garnier
Cultural Liaison

Attn: United States Fish and Wildlife Director, Dan Ashe;
All other affected parties.

The sovereignty and spiritual rights of the Oglala Sioux Tribe (Oglala Lakota Nation) and the Lakota, Dakota and Nakota people of the Oceti Sakowin (Great Sioux Nation) are threatened by the proposed delisting of the Yellowstone grizzly bear from Endangered Species Act (ESA) protections by the US Fish and Wildlife Service (FWS).

The Oglala Sioux Tribe is one of the twenty-six Tribal Nations the federal government recognizes as having an ancestral connection to Yellowstone ("Associated Tribe of Yellowstone" – *Resources & Issues*, NPS, 2010), and as such must be consulted in this process.

Federally recognized tribes have a unique nation-to-nation relationship with the federal government that requires consultation to be held at a government-to-government level; and government-to-government consultation is conducted under existing protocols and within an established framework. Unsolicited correspondence from a federal agency coordinator or similar does not constitute consultation between a tribal nation and the federal government.

Yellowstone and the Greater Yellowstone Ecosystem is a matrix of sacred and cultural sites of great significance to the twenty-six affected tribes, and those tribes' Tribal Historic Preservation Offices (THPOs) must be engaged in an initial process of consultation consistent with the criteria of the THPOs designated mission (Section 101(d)(2) of the National Historic Preservation Act), in addition to consultation with tribal governments (executive and legislative branches), and recognized spiritual leaders.

Chief Arvol Looking Horse, 19th Generation Keeper of the White Buffalo Calf Pipe of the Great Sioux Nation, detailed the spiritual and ceremonial significance of the grizzly bear in Lakota, Dakota and Nakota culture in his November 2014 statement in opposition to the planned delisting of the Yellowstone grizzly from the ESA.

The cultural, geographic and sacred landscape of the Lakota, Dakota and Nakota people demonstrates the cultural importance of the grizzly bear. Sacred sites like Mato Tipila (Devils Tower) and Mato Paha (Bear Butte) are inseparable from our ceremonial connection to the grizzly. Numerous traditional and current family names, along with the names of creeks, rivers

and buttes, were inspired by the grizzly bear. Not without reason were Crazy Horse and his mentor, High Back Bone (Hump), described as "the grizzly and his cub."

As Chief Looking Horse has demonstrated, the ceremonial significance of the grizzly is an ancient connection. Lakota ceremonies related to the grizzly, historically known as Bear Medicine Ceremonies, are, like all of our spiritual and religious ways, protected by the American Indian Religious Freedom Act (PL 95-341–1978/PL 103-344 –1994). The Act states that laws and policies pertaining to "conservation and preservation of natural species" cannot be "passed without consideration of their effect on traditional American Indian religions." In its attempts to delist the Yellowstone grizzly bear without regard to the religious practices of tribal people, the FWS is doing so "without consideration of their effect on traditional American Indian religions."

Abrogation of the AIRFA threatens potentially detrimental consequences not only for our religious and spiritual rights, but the sovereignty of all of the affected Tribal Nations.

Executive Order 13175 (Nov. 6, 2000) "Consultation and Coordination with Indian Tribal Governments" signed by President Clinton, and the Memorandum for the Heads of Executive Departments and Agencies (Nov. 5, 2009) issued by President Obama, requiring a "complete and consistent implementation of Executive Order 13175," have yet to be followed by the FWS during this process.

Executive Order 13647 (June 2013) states, "Greater engagement and meaningful consultation with tribes is of paramount importance in developing any policies affecting tribal nations." The proposed delisting of the Yellowstone grizzly bear affects the Lakota, Dakota and Nakota people of the Oceti Sakowin (Great Sioux Nation) on cultural and religious grounds.

The Secretarial Order issued by the Secretary of the Interior and the Secretary of Commerce pursuant to the Endangered Species Act (ESA) of 1973 (16 U.S.C. 1531), established the protocols to be followed when decisions related to the ESA had the potential to impact tribes.

The Order directs the FWS to "solicit traditional knowledge, and comments from, and utilize the expertise of, affected Indian tribes" during the consultation process, and "cooperate with affected tribes to develop and implement Recovery Plans in a manner that minimizes" social and cultural impacts on tribal people. In the context of attempting to delist the Yellowstone grizzly, this equates to the FWS having to consult with respected spiritual leaders such as Chief Arvol Looking Horse.

Chief Arvol Looking Horse describes this present movement to remove ESA protections from the grizzly and allow the states of Wyoming, Montana and Idaho to operate profligate trophy hunts as an extension of the "disease of the mind" that enabled Manifest Destiny; the massacres of our people, and the near extermination of the grizzly, the wolf and the buffalo in the 19th Century. The world will see this in play again if the grizzly is delisted. Each spring and fall, some visitors to Yellowstone National Park will see grizzlies gutted by the sides of the roads leading to Yellowstone, or bloody grizzly carcasses strapped to vehicles.

We reject the designation of the grizzly bear as a "trophy game animal." It is shameful that a sentient being – one our people revere as sacred – is to be killed for "fun" by affluent trophy hunters. Great Lakota holy men like Black Elk, and Lakota Bear Medicine Men like Sword, articulated our feelings when they said, "The grizzly bear is *wakan*." The Oglala Lakota people will not stand idle and watch this sacred being be slaughtered on the lands our ancestors fought to defend.

The thought of trophy hunters killing grizzly bears on our sacred lands is painful for the Lakota people. The image that came to represent the 1874 Black Hills Expedition that contravened the 1868 Fort Laramie Treaty is the photograph of Custer with the grizzly he killed for a "trophy." That violation of the 1868 Fort Laramie Treaty resulted in the annexation of the Black Hills. We cannot allow a repeat 140-years later on other sacred ancestral lands.

Ignoring these Acts and Orders contradicts the basis of the the government-to-government relationship that exists between not only the Lakota, Dakota and Nakota Tribal Nations and the federal government, but all of the 26 Tribal Nations affected by this issue. These Acts and Orders entitle the Oglala Sioux Tribe (and the other 25 affected Tribal Nations) to review the raw data the FWS is basing all of its conclusions upon relative to delisting the grizzly bear. Several nations of the Oceti Sakowin, and other affected Tribal Nations, have already called upon the FWS to release that data not only to the tribes, but also to independent scientists for analysis and review. To date, FWS has refused to do so. If the data is sound, it will not be undermined by scrutiny.

The Oglala Sioux Tribe supports Chief Arvol Looking Horse's position in opposing the removal of the Yellowstone grizzly bear from the Endangered Species Act, and the work of GOAL Tribal Coalition in bringing this important issue to the fore. We join the other affected Tribal Nations that have issued resolutions, declarations and statements in opposition to delisting the grizzly, and call for the federal government to begin the process of thorough consultation in accordance with the existing mandates, to ensure that our sovereignty and spiritual rights are upheld.

December 09, 2014

Attn: Director Dan Ashe,
US Fish and Wildlife Service.

All Parties Concerned.

The Cheyenne River Sioux Tribe is one of the twenty-six Tribal Nations recognized by the federal government as having an ancestral connection to Yellowstone ("Associated Tribe of Yellowstone" – *Resources & Issues*, NPS, 2010). Therefore, under the federal government's own criteria, the Cheyenne River Sioux Tribe should be consulted by the federal departments and agencies presently engaged in attempting to remove of the sacred grizzly bear from Endangered Species Act (ESA) protections.

Executive Order 13175 (Nov. 6, 2000) "Consultation and Coordination with Indian Tribal Governments" signed by President Clinton, and the Memorandum for the Heads of Executive Departments and Agencies (Nov. 5, 2009) issued by President Obama, requiring a "complete and consistent implementation of Executive Order 13175," have yet to be followed by the US Fish and Wildlife Service (FWS) during this process.

Executive Order 13647 (June 2013) states, "Greater engagement and meaningful consultation with tribes is of paramount importance in developing any policies affecting tribal nations." The proposed delisting of the Yellowstone grizzly bear affects the Lakota, Dakota and Nakota people of the Oceti Sakowin (Great Sioux Nation).

This issue extends beyond delisting the grizzly bear, and threatens potentially detrimental consequences for tribal sovereignty and our religious and spiritual rights as defined by the American Indian Religious Freedom Act (PL 95-341–1978/PL 103-344 –1994).

Laws and policies related to "conservation and preservation of natural species" cannot, as had been the norm prior to the Act, be "passed without consideration of their effect on traditional American

The blue represents the thunderclouds above the world where live the thunder birds who control the four winds. The rainbow is for the Cheyenne River Sioux people who are keepers of the Most Sacred Calf Pipe, a gift from the White Buffalo Calf Maiden. The eagle feathers at the edges of the rim of the world represent the spotted eagle who is the protector of all Lakota. The two pipes fused together are for unity. One pipe is for the Lakota, the other for all the other Indian Nations. The yellow hoops represent the Sacred Hoop, which shall not be broken. The Sacred Calf Pipe Bundle in red represents Wakan Tanka – The Great Mystery. All the colors of the Lakota are visible. The red, yellow, black and white represent the four major races. The blue is for heaven and the green for Mother Earth.

Indian religions." However, in its attempts to delist the Yellowstone grizzly bear without regard to the religious practices of tribal people, the FWS is doing precisely that.

In his statement of November 2014, Chief Arvol Looking Horse, 19th Generation Keeper of the White Buffalo Calf Pipe of the Oceti Sakowin, detailed the spiritual and ceremonial significance of the grizzly bear in Lakota, Dakota and Nakota culture.

The Lakota cultural and geographic landscape demonstrates the cultural importance of the grizzly bear. Many physical features and sacred sites are known by names inspired by the grizzly bear. Our people still carry names that reflect the significance of the grizzly. Throughout our history, numerous great leaders have borne grizzly bear names.

Opposing the removal of ESA protections from the Yellowstone grizzly bear, and the proposed trophy hunting of the grizzly, is consistent with CRST Ordinance 57, the Cheyenne River Sioux Tribe's Cultural Resources Protection Act, which affirms: "The spiritual and physical well-being of the Cheyenne River Sioux Tribe and its members is directly related to the preservation of the historical traditions and cultural heritage of the Lakota people."

In this process to date, FWS is yet to abide by the Secretarial Order issued by the Secretary of the Interior and the Secretary of Commerce pursuant to the Endangered Species Act (ESA) of 1973 (16 U.S.C. 1531), which established the protocols to be followed when actions taken under authority of the ESA have tribal implications.

The Order directs the FWS to "solicit traditional knowledge, and comments from, and utilize the expertise of, affected Indian tribes" during the consultation process, and "cooperate with affected tribes to develop and implement Recovery Plans in a manner that minimizes" social and cultural impacts on tribal people.

The thought of trophy hunters killing grizzly bears on our sacred lands is painful for the Lakota people. The image that came to represent the 1874 Black Hills Expedition that contravened the 1868 Fort Laramie Treaty is the photograph of Custer with the grizzly he killed for a "trophy." That violation of the 1868 Fort Laramie Treaty resulted in the annexation of the Black Hills. We cannot allow a repeat 140-years later on lands our ancestors fought so hard to protect when they opposed the construction of the Northern Pacific Railroad along the Yellowstone in 1872 and 1873, which was also a violation of the 1868 Fort Laramie Treaty. Some of the principal leaders in that resistance were from the Lakota bands that comprise the Cheyenne River Sioux Tribe.

Through the aforementioned Acts and Orders, the Cheyenne River Sioux Tribe (along with the other 25 affected Tribal Nations) is entitled to review the raw data the FWS is basing all of its conclusions upon relative to delisting the grizzly bear. Several tribes have already called upon the FWS to release that data not only to the affected Tribal Nations, but also to independent scientists for analysis and review so that questions of credibility might be answered.

The Cheyenne River Sioux Tribe joins the other affected Tribal Nations that have issued resolutions, declarations and statements in opposition to the US Fish and Wildlife Service's proposed delisting of the Yellowstone grizzly bear. We support the positions expressed by Chief Arvol Looking Horse, and the efforts of GOAL Tribal Coalition to protect the grizzly bear and defend our sovereignty and spiritual rights.

If you should have any questions or concerns, please contact me at 605-964-4155.

Sincerely,

Harold C. Frazier,
CRST Chairman

RESOLUTION NO. 14-142

WHEREAS, the Flandreau Santee Sioux Tribe (the "Tribe") is a federally recognized Indian tribe organized pursuant to the Constitution and By-laws approved by the Secretary of Interior and Commissioner of Indian Affairs on April 24, 1936, amended February 7, 1941, and further amended November 16, 1967, and further amended November 14, 1984, and further amended May 17, 1997; and

WHEREAS, Article III of the Tribe's Constitution and By-laws provides that the governing body of the Tribe shall be the Executive Committee; and

WHEREAS, Article VIII, Section (a) provides that the Executive Committee may negotiate with Federal, State, and local governments; and

WHEREAS, the Tribe opposes the Federal Government's proposed removal of the Yellowstone grizzly bear from Endangered Species Act protections through the US Fish and Wildlife Service; and

WHEREAS, the US Fish and Wildlife Service, Department of the Interior, has so far ignored Executive Order 13175 (Nov. 6, 2000) entiltled "Consultation and Coordination with Indian Tribal Governments" signed by President Clinton, and the Memorandum for the Heads of Executive Departments and Agencies (Nov. 5, 2009) issued by President Obama requiring a "complete and consistent implementation of Executive Order 13175"; and

WHEREAS, the federal government's determination to remove the grizzly bear from Endangered Species Act protection contravenes the American Indian Religious Freedom Act, 42 U.S.C. § 1996 (2014); and

WHEREAS, the American Indian Religious Freedom Act states laws pertaining to "conservation and preservation of natural species and resources" were never intended to impact American Indian religious practices but did "and, therefore, were passed without consideration of their effect on traditional American Indian religions"; and

WHEREAS, in its proposed delisting of the grizzly bear the US Fish and Wildlife Service is in contravention of the Secretarial Order issued by the Secretary of the Interior and the Secretary of Commerce pursuant to the Endangered Species

Act (ESA) of 1973, 16 U.S.C. § 1531 (2014), which sets forth the framework to be followed when actions taken under authority of the ESA affect tribes; and

WHEREAS, the *American Indian Tribal Rights, Federal-Tribal Trust Responsibilities, and the Endangered Species Act Order* states: "The Departments shall take into consideration the impacts of their actions and policies under the Act on Indian use of listed species for cultural and religious purposes"; and

WHEREAS, the Order directs the US Fish and Wildlife Service to "solicit traditional knowledge, and comments from, and utilize the expertise of, affected Indian tribes" during the consultation process, and "cooperate with affected tribes to develop and implement Recovery Plans in a manner that minimizes" social and cultural impacts on tribal people; and

WHEREAS, none of these commitments has been honored; and

WHEREAS, the US Fish and Wildlife Service has refused to release the data it has based its conclusions on for independent scientific review, that data being the basis for the federal government's proposal to remove the grizzly bear from Endangered Species Act protections; and

WHEREAS, when considering the intent of the Endangered Species Act, a species cannot be considered sufficiently recovered to warrant removal from Endangered Species Act protection if it presently only survives on approximately 2% of its original range; and

WHEREAS, throughout the US Fish and Wildlife Service's process proposing a new Rule to delist the Yellowstone grizzly bear there has been no discussion related to the impact delisting the grizzly, and the subsequent trophy hunting of the bear, will have on American Indian spirituality, namely the religious practices of traditional tribal people; and

WHEREAS, the grizzly bear holds a unique position in traditional Dakota culture and the cultures and ceremonial lifeways of the traditional spiritual practitioners of tribes also identified by the federal government as possessing centuries old, and in some instances, millennia-long connections to the lands where the grizzly now survives; and

WHEREAS, those cultural imperatives and the preservation of sovereignty require a repudiation of the federal government's desire to delist the grizzly bear from Endangered Species Act protections; and the legislative resolve to deny the states' determination to see trophy hunting of grizzlies on reservations and the extirpation of the grizzly bear from swathes of reservation and ancestral

homelands; and

NOW THEREFORE BE IT RESOLVED, that the Executive Committee hereby officially adopts this position in respect to delisting the Yellowstone grizzly bear, and authorizes President Anthony Reider to sign a letter for support for the cause on the Tribe's behalf.

CERTIFICATION

The foregoing Resolution was duly enacted and adopted on this 11th day of December, 2014 by the Executive Committee of the Flandreau Santee Sioux Tribe during a duly called meeting with a quorum was present of 6 In Favor, 0 Opposed, 0 Abstaining, and 1 Not Voting, as follows:

Dan Ashe, Director – US Fish and Wildlife Service;
Chris Servheen, Grizzly Bear Recovery Coordinator – US Fish and Wildlife Service;
Other Parties Concerned:

The sovereignty and spiritual rights of the Sisseton Wahpeton Oyate and the Lakota, Dakota and Nakota people of the Great Sioux Nation are threatened by the proposed delisting of the Yellowstone grizzly bear from Endangered Species Act (ESA) protections by the US Fish and Wildlife Service (FWS).

The Sisseton Wahpeton Oyate is one of the twenty-six Tribal Nations the federal government recognizes as having an ancestral connection to Yellowstone ("Associated Tribe of Yellowstone" – *Resources & Issues*, NPS, 2010). In total, ten of those Tribal Nations are from the Oceti Sakowin (Great Sioux Nation), but to date none have been consulted in this process.

Chief Arvol Looking Horse, 19th Generation Keeper of the White Buffalo Calf Pipe of the Great Sioux Nation, detailed the spiritual and ceremonial significance of the grizzly bear in Lakota, Dakota and Nakota culture in his November 2014 statement in opposition to delisting of the Yellowstone grizzly from the ESA.

The cultural, geographic and sacred landscape of the Lakota, Dakota and Nakota people demonstrates the cultural importance of the grizzly bear. Numerous sacred sites, along with the names of creeks, rivers and buttes, were inspired by the grizzly bear. Many of our great historical leaders carried grizzly bear names, and those traditional names are present today among families in our communities.

As Chief Looking Horse has demonstrated, the ceremonial significance of the grizzly in our spiritual lifeway is an ancient connection. Our spiritual and religious ways related to the grizzly are protected by the American Indian Religious Freedom Act (PL 95-341–1978/PL 103-344 –1994).

The Act states that laws and policies pertaining to "conservation and preservation of natural species" cannot be "passed without consideration of their effect on traditional American Indian religions." So far, in its attempts to delist the Yellowstone grizzly bear without regard to the religious practices of tribal people, the FWS is doing precisely that.

Abrogation of the AIRFA threatens potentially detrimental consequences not only for our religious and spiritual rights, but the sovereignty of all of the affected Tribal Nations.

Executive Order 13175 (Nov. 6, 2000) "Consultation and Coordination with Indian Tribal Governments" signed by President Clinton, and the Memorandum for the Heads of Executive Departments and Agencies (Nov. 5, 2009) issued by President Obama, requiring a "complete and consistent implementation of Executive Order 13175," have yet to be followed by the US Fish and Wildlife Service (FWS) during this process.

Executive Order 13647 (June 2013) states, "Greater engagement and meaningful consultation with tribes is of paramount importance in developing any policies affecting tribal nations." The proposed delisting of the Yellowstone grizzly bear affects the Lakota, Dakota and Nakota people of the Oceti Sakowin (Great Sioux Nation).

The Secretarial Order issued by the Secretary of the Interior and the Secretary of Commerce pursuant to the Endangered Species Act (ESA) of 1973 (16 U.S.C. 1531), established the protocols to be followed when decisions related to the ESA had the potential to impact tribes. The Order directs the FWS to "solicit traditional knowledge, and comments from, and utilize the expertise of, affected Indian tribes" during the consultation process, and "cooperate with affected tribes to develop and implement Recovery Plans in a manner that minimizes" social and cultural impacts on tribal people. In the move to delist the grizzly, this has not been followed.

Ignoring these Acts and Orders contradicts the basis of the the government-to-government relationship that exists between not only the Lakota, Dakota and Nakota Tribal Nations and the federal government, but all of the 26 Tribal Nations affected by this issue.

The Sisseton Wahpeton Oyate opposes the designation of the grizzly bear as a "trophy game animal" to be killed by big game hunters on the lands our ancestors

defended. Revered spiritual leaders from the past, the likes of Black Elk and Sword, articulated the perception of the Lakota, Dakota and Nakota people when they said, "The grizzly bear is *wakan*."

The consultation process that is mandated by the aforementioned Acts and Orders entitles the Sisseton Wahpeton Oyate (and the other nations of the Oceti Sakowin and affected Tribal Nations) to review the raw data the FWS is basing all of its conclusions upon relative to delisting the grizzly bear. Several tribes have already called upon the FWS to release that data not only to the affected Tribal Nations, but also to independent scientists for analysis and review – the Sisseton Wahpeton Oyate adds its voice to that call.

The Sisseton Wahpeton Oyate supports Chief Arvol Looking Horse's position in opposing the removal of the Yellowstone grizzly bear from the Endangered Species Act, and we support the efforts of GOAL Tribal Coalition to protect the sacred grizzly bear and in doing so defend tribal sovereignty and spiritual rights.

Respectfully,

December 8, 2014

Daniel M. Ashe
Director
United States Fish and Wildlife Service

Dear Mr. Ashe:

In his November 2014 statement opposing the proposed delisting and subsequent trophy hunting of the Yellowstone grizzly bear, Chief Arvol Looking Horse outlined the sacred nature of the grizzly bear in Lakota, Dakota and Nakota culture. As the 19th Generation Keeper of the White Buffalo Calf Pipe of the Oceti Sakowin (Great Sioux Nation), Chief Looking Horse's insights are those of a highly respected spiritual leader.

To date, there has been no discussion in this process related to the impact delisting the grizzly bear, and the subsequent trophy hunting of the grizzly, will have on Native American spirituality, namely the religious practices of traditional tribal people, protected by the American Indian Religious Freedom Act (PL 95-341–1978/PL 103-344 –1994).

Though this proposed action is to take place on defined ancestral lands of the Great Sioux Nation, the Standing Rock Sioux Tribe has yet to be consulted. As one of the 26 Tribal Nations the federal government acknowledges as having an ancestral connection to Yellowstone ("Associated Tribe of Yellowstone" – *Resources & Issues*, NPS, 2010), the US Fish and Wildlife Service (FWS) is required to consult with the Standing Rock Sioux Tribe, as, like many of the other affected tribes, due to the cultural significance of the grizzly bear in Lakota, Dakota and Nakota culture, our people will be detrimentally impacted if the grizzly is delisted and trophy hunted in lands once familiar to our ancestors.

BLDG 1 NORTH STANDING ROCK AVE. P.O.BOX D • FORT YATES, NORTH DAKOTA 58538
PHONE: 701-854-7201 or 701-854-8500 • FAX 701-854-7299

Executive Order 13175 (Nov. 6, 2000) "Consultation and Coordination with Indian Tribal Governments" signed by President Clinton, and the Memorandum for the Heads of Executive Departments and Agencies (Nov. 5, 2009) issued by President Obama, requiring a "complete and consistent implementation of Executive Order 13175," have yet to be followed by the US Fish and Wildlife Service (FWS) during this process.

Executive Order 13647 (June 2013) states, "Greater engagement and meaningful consultation with tribes is of paramount importance in developing any policies affecting tribal nations." The proposed delisting of the Yellowstone grizzly bear affects the Lakota, Dakota and Nakota people of the Great Sioux Nation.

This lack of consultation by FWS stands in direct contrast to the policy directives of the Obama Administration. President Obama has attempted to strengthen consultation with tribes when federal policies and actions have the potential to affect tribes and have tribal implications. Clearly, removing the Yellowstone grizzly bear from the ESA and permitting states to proceed with high-dollar trophy hunts on our historic cultural landscape fits the criteria.

President Obama made a highly visible commitment to improving dialogue between tribal nations and the federal government when he visited the Standing Rock Sioux Nation in June 2014.

The American Indian Religious Freedom Act states that laws related to "conservation and preservation of natural species" cannot, as was the norm prior to the Act, be "passed without consideration of their effect on traditional American Indian religions." So far, in its attempts to delist the Yellowstone grizzly bear without regard to the religious practices of tribal people, the FWS is doing that.

The Standing Rock Sioux Tribe (and the other affected Tribal Nations) is entitled to review the raw data the FWS is basing all of its conclusions upon relative to delisting the grizzly bear through the Secretarial Order issued by the Secretary of the Interior and the Secretary of Commerce pursuant to the Endangered Species Act (ESA) of 1973 (16 U.S.C. 1531). Several tribes have already called upon the FWS to release that data not only to the affected Tribal Nations, but also to independent scientists for analysis and review. The cultural importance of this issue is such that questions and contradictions must be resolved without bias if tribal members, and the public at large, are to have confidence in the outcome.

efore the Lewis and Clark Expedition, there were an estimated 100,000 grizzly bears in the Western US, many in the environs of the Missouri River where the Standing Rock Sioux Tribe is now located. Today the grizzly bear survives on less than 2% of its original range, with possibly 2% of its historic population. The Yellowstone grizzly bear is a genetically isolated, island population that numbers in the hundreds. In a historical context, and by the spirit and intent of the ESA, it cannot yet be considered recovered.

Until the aforementioned issues have been addressed and resolved to the satisfaction of all of the affected Tribal Nations, we believe that it is premature to even consider delisting the iconic Yellowstone grizzly bear from ESA protections. It is imperative that tribal sovereignty and the spiritual rights of our people be upheld. Thank you for your attention to this matter, and please feel free to contact me should further discussion be helpful.

Sincerely,

Dave Archambault II, Chairman
Standing Rock Sioux Tribe

November 26, 2014

To all parties concerned:

The area now known as Greater Yellowstone lays within the boundaries of Crow Country that were defined by Chief Sits in the Middle of the Land at the 1851 Fort Laramie Treaty Council. For centuries, the Crow people have had a deep spiritual connection to the landscape, a relationship that continues to this day. Today, right in the heart of Crow country, exactly where Chief Sits in the Middle of the Land described, the federal government intends to delist the grizzly bear from Endangered Species Act protections and permit the State of Wyoming to open high-dollar trophy hunting seasons on the grizzly.

In common with the land, the Crow People have an ancient relationship with the grizzly bear. In Crow culture, the grizzly bear is referred to as biiké, elder brother, which connotes great respect for the bear. From the stars to the rocks, images of the bear communicate that sacred relationship the Crow people have with the grizzly, knowledge that was preserved by Crow elders and passed on to future generations. For example, Daxpitcheeishuulissúua, the Bear Song Dance, was one of the most sacred ceremonies of our people. The grizzly bear is a significant symbol for ceremonies for certain families in the Crow Tribe. The symbolic parts of a grizzly bear are used during ceremonies for healing. These parts of the grizzly bear has been handed down generation to generation and also used during competitions such as the handgames and other Crow traditional games. The elders say that a bear symbol can be seen in the palms of hands signifying power of the grizzly bear.

Though this proposed action is to take place on traditional Crow land, the Crow Tribe has yet to be consulted. As one of the 26 tribal nations the federal government openly acknowledges has an ancestral connection to Yellowstone, the US Fish and Wildlife Service (FWS) is required to consult with the Crow Tribe, like many of the other affected tribes. Due to the cultural significance of the grizzly bear, the Crow people will be detrimentally impacted if the grizzly is delisted and subsequently trophy hunted.

The Kiowa Tribe of Oklahoma, the historic allies of the Crow people, articulated the issues arising from the proposed delisting of the grizzly bear in its declaration of 10/10/14 and the Crow Tribe supports those positions.

The Crow Tribe is entitled to review the data the FWS is basing its conclusions on under the Secretarial Order issued by the Secretary of the Interior and the Secretary of commerce pursuant to the Endangered Species Act (ESA) of 1973 (16 U.S.C. 1531). The Crow Tribe joins with the other affected tribal nations that have called upon the FWS to release that data not only to the tribes, but also to independent scientists

for analysis and review. Transparency is essential if tribal members and the public at large are to have confidence in the outcome.

The Guardians of Ancestors Legacy (GOAL) Tribal Coalition is doing valuable work in its efforts to preserve and protect the Yellowstone grizzly bear and in the process defend tribal sovereignty and spiritual rights.

Sincerely,

Darrin Old Coyote, Chairman
Crow Tribe

Open Letter Approved By Official Resolution No. 11Dec2014-04 of the MT WY Tribal Leaders Council on December 11, 2014

The sovereignty and spiritual rights of Tribal Nations in Montana and Wyoming are threatened by the proposed delisting of the Yellowstone grizzly bear from Endangered Species Act (ESA) protections by the US Fish and Wildlife Services. Ten of the twenty-six Tribal Nations the federal government recognizes as having an ancestral connection to Yellowstone are located in Montana and Wyoming, but to date they have not been consulted in this process.

The grizzly bear holds a unique position in the traditional cultures, ceremonies and spiritual practices of the affected tribes. If the Yellowstone grizzly bear is delisted, the management plans of the states of Wyoming, Montana and Idaho propose trophy hunting the grizzly on both the ancestral and current homelands of the affected tribes, which not only represents a threat to tribal sovereignty, but also contravenes the American Indian Religious Freedom Act (AIRFA) PL-95-341.

During this process, the FWS, Department of the Interior, has so far ignored Executive Order 13175 (Nov. 6, 2000) "Consultation and Coordination with Indian Tribal Governments" signed by President Clinton, and the Memorandum for the Heads of Executive Departments and Agencies (Nov. 5, 2009) issued by President Obama, requiring a "complete and consistent implementation of Executive Order 13175."

The AIRFA states that laws related to "conservation and preservation of natural species" cannot, as was the norm prior to the Act, be "passed without consideration of their effect on traditional American Indian religions." However, in its attempts to delist the Yellowstone grizzly bear without regard to the religious practices of tribal people, the FWS is doing precisely that.

Prominent spiritual leaders and elders from the affected Tribal Nations have issued statements in opposition to delisting the Yellowstone grizzly bear.

Given the economic challenges faced by the affected Tribal Nations, and the cultural significance of the grizzly bear, the prospect of the states charging anywhere between the quoted figures of $10,000 to $100,000 to trophy hunt this sacred being on ancestral tribal lands is at best disrespectful.

Grizzly bear management plans post-delisting should be sensitive to the cultures of the affected Tribal Nations. Rather than have the states influence grizzly bear management on tribal lands, the affected Tribal Nations should be provided with the resources to initiate their own management practices and programs that are consistent with their cultural values. By doing so, tribal sovereignty will be upheld and potential employment and economic opportunity provided.

Additionally, the states' grizzly bear management plans also threaten to detrimentally impact tourism initiatives that would aid the economies of the affected Tribal Nations. Recent studies demonstrate that in strictly economic terms, grizzlies are a legitimate "economic powerhouse," worth far more alive than dead.

At the October 2014 meeting of the cross-jurisdictional body, the Interagency Grizzly Bear Committee (IGBC), the State of Wyoming reaffirmed its previously stated position that it wishes to cap the Greater Yellowstone grizzly bear population at 500. Not only is that number inconsistent with the purpose of the ESA, if recent population estimates issued by the tri-states and FWS are accurate, it would result in a virtual cull post-delisting that would have a devastating impact on tribal people relative to the spiritual importance of the grizzly bear.

As of fall 2014, the FWS and tri-states claim that there are now approximately 1,000 grizzlies in the Greater Yellowstone Ecosystem, which, based upon their own estimates, is an increase of 259 grizzlies in one year, which followed an estimated increase of approximately 112 in six months during 2013. The grizzly bear has the second slowest reproduction rate of any mammal, and clearly the Greater Yellowstone population cannot have increased by 35% in one year.

The affected Tribal Nations are entitled to review the raw data the FWS is basing all of its conclusions upon (not just its population estimates) relative to delisting the grizzly bear through the Secretarial Order issued by the Secretary of the Interior and the Secretary of Commerce pursuant to the Endangered Species Act (ESA) of 1973 (16 U.S.C. 1531). Several tribes have already called upon the FWS to release that data not only to the affected Tribal Nations, but also to independent scientists for analysis and review. This body echoes those calls.

Every federal agency is required to consult with Tribal Nations before they recommend a course of action that has the potential to affect tribal rights and interests. This must occur in this process, as the affected Tribal Nations cannot permit their sovereignty to be undermined.

The manner is which this process has so far been conducted without the consultation and input of the affected Tribal Nations is representative of the recent history of Yellowstone (post-1872). It must be remembered that Yellowstone was a homeland, a sacred cultural landscape to twenty-six tribes, before it was a National Park. However, a visitor to Yellowstone today would not know that, due to the lack of cultural interpretation. A change in that respect is long overdue. America's first national park should no longer have features named after the proponents and exponents of genocide, as is the case with Hayden Valley and Mount Doane.

Seven months before Lieutenant Gustavus Cheyney Doane, 2nd Cavalry, guided the 1870 Yellowstone Expedition, he had led the massacre of Chief Heavy Runner's Piegan Blackfeet village on the Marias River. On his subsequent application to become Superintendent of Yellowstone National Park, he boasted, "Greatest slaughter of Indians ever made by U.S. Troops." Of the 173 victims killed on January 23, 1870, only 15 were men of fighting age.

Where Doane participated in genocide, Dr. Ferdinand V. Hayden advocated it. "Unless they are localized and made to enter upon agricultural and pastoral pursuits they must ultimately be exterminated," Hayden said of our ancestors who were about to be dispossessed by the establishment of Yellowstone National Park. "If extermination is the result of non-compliance, then compulsion is an act of mercy," he concluded.

These names must be changed with the input of the affected Tribal Nations, just as any move to delist the sacred grizzly bear on this ancestral landscape must involve consultation with the affected Tribal Nations.

Pre-the Lewis and Clark Expedition, there were an estimated 100,000 grizzly bears in the Western US. Today the grizzly bear survives on less than 2% of its original range, with possibly 2% of its historic population. The Yellowstone grizzly bear is a genetically isolated, island population that numbers in the hundreds. In a historical context, and by the spirit and intent of the ESA, it cannot yet be considered recovered.

Until these issues cited herein are addressed and resolved to the satisfaction of all of the affected Tribal Nations, we believe that it is premature to even consider issuing a new Rule to delist the iconic Yellowstone grizzly bear from ESA protections.

Respectfully submitted,

TLC Board Chairman Ivan Posey

OFFICE OF THE LADY CHAIRMAN

October 10, 2014

GOAL Tribal Coalition
PO Box 30,000. #360
Jackson, WY 83002

Respectful GOAL Tribal Coalition Representative,

With Regard to and/or all parties concerned to the GOAL Coalition's efforts towards it's endeavors. The Kiowa Tribe of Oklahoma supports the mission of Guardians of Our Ancestors' Legacy (GOAL) Tribal Coalition to preserve and protect the endangered Yellowstone grizzly bear. In doing so, we will help to ensure that Native American spiritual rights are upheld, and our sovereignty defended.

The area now known as the Greater Yellowstone Ecosystem with Yellowstone National Park at its heart is the ancestral homeland of the Kiowa. It was in this region that our ancestors first established sacred kinship with the grizzly bear.

Our respect and reverence for the grizzly bear is reflected in many Kiowa names; some of the greatest leaders in Kiowa history carried names inspired by the grizzly bear, including Set-tain-te (Satanta) and Set-angya (Satank), and the importance of the bear in our traditional culture can still be heard in our names today.

Narratives pertaining to the grizzly bear are fundamental to many of our sacred sites in what is now Wyoming, and what was once our homeland. We oppose the present attempts by the US Fish and Wildlife Service (FWS) and the states of Wyoming, Montana and Idaho to remove Endangered Species Act (ESA) protections from the Yellowstone grizzly bear.

The Kiowa Tribe of Oklahoma rejects the notion that the sacred grizzly bear should be considered a "trophy game animal" and hunted in our ancestral homeland.

We agree that the FWS's determination to remove the Yellowstone grizzly bear from ESA protection without thorough consultation with the affected tribes identified as possessing an ancestral connection to Yellowstone contravenes the American Indian Religious Freedom Act (PL-95-341). There has been no discussion related to the impact

delisting the grizzly, and the subsequent trophy hunting of the bear, will have on American Indian spirituality, namely the religious practices of traditional tribal people, protected by PL-95-341.

We further agree that by ignoring the affected tribes, the FWS is also in contravention of the Secretarial Order issued by the Secretary of the Interior and the Secretary of Commerce pursuant to the Endangered Species Act (ESA) of 1973 (16 U.S.C. 1531), which sets forth the framework to be followed when actions taken under authority of the ESA affect tribes.

The *American Indian Tribal Rights, Federal-Tribal Trust Responsibilities, and the Endangered Species Act Order* explicitly states: "The Departments shall take into consideration the impacts of their actions and policies under the Act on Indian use of listed species for cultural and religious purposes (Sec. 5 #4). The Order also directs the FWS to "solicit traditional knowledge, and comments from, and utilize the expertise of, affected Indian tribes" during consultation processes. This has yet to happen.

Not consulting with the affected tribes is not only a breach of PL-95-341 and 16 U.S.C. 1531, it constitutes an infringement of our sovereignty.

Clearly the grizzly bear is not recovered under the criteria set forth by the Endangered Species Act. A population of between 500–700 grizzlies surviving on less than 1% of their original range pre-contact could not be considered recovered even if it were not genetically isolated and threatened by the loss of keystone food sources, which the Yellowstone grizzly bear is.

It is essential that the FWS finally makes the data it is basing its conclusions upon available, not only to the affected tribes, but crucially, to the scientific community for independent analysis and review. The affected tribes are entitled to the information under 16 U.S.C. 1531.

By protecting the sacred grizzly bear and in the process defending our religious freedom and sovereignty we honor our ancestors. The tribal heritage of Rain Bear Stands Last, the founder of GOAL, includes Kiowa. One of his ancestors, the great Cheyenne leader, Sleeping Bear, once presented the legendary Kiowa chief, Téh-tóot-sah (Little Bluff), with a famous painted tipi.

This exchange began a tradition amongst our peoples. In supporting GOAL and this effort, we continue that tradition, and in the spirit of our ancestors attempt to ensure that

our children and future generations will grow-up in a world where grizzlies still roam our ancestral homeland so that a large part of our culture and history will remain intact.

Respectfully Submitted,

Amber C. Toppah, Lady Chairman
Kiowa Business Committee
Kiowa Tribe of Oklahoma

THE SHOSHONE-PAIUTE TRIBES
OF THE DUCK VALLEY INDIAN RESERVATION
P.O. Box 219 Owyhee, NV 89832
(208) 759-3100
www.shopaitribes.org

December 18, 2014

For the attention of all parties concerned:

The Shoshone-Paiute Tribes of the Duck Valley Indian Reservation stand in solidarity with our sister tribes, the Eastern Shoshone Tribe of the Wind River Indian Reservation, and the Shoshone-Bannock Tribes of Idaho, in opposing the proposed delisting of the Yellowstone grizzly bear from Endangered Species Act (ESA) protections by the US Fish and Wildlife Service (FWS).

The Shoshone-Paiute Tribes of the Duck Valley Indian Reservation supports the positions articulated by the Eastern Shoshone Tribe and the Shoshone-Bannock Tribes in their resolution and declarations respectively.

The Shoshone-Paiute Tribes have clear interests to this issue. Many of our tribal members are descended from those whom enjoyed a connection to the landscape now referred to as Greater Yellowstone since time immemorial. In more recent times, our ancestors stood with the Bannock people in defending our homelands in 1878.

The grizzly bear has a significant place in Shoshone-Paiute culture. The grizzly bear is a sacred being, intricately tied to the ceremonies and practices of our people. Such is our respect for the grizzly that we refer to the great bear as our brother.

In its attempts to delist the Yellowstone grizzly bear without regard to the ceremonial and religious practices of tribal people, the FWS is doing so "without consideration of their effect on traditional American Indian religions," which is a violation of the American Indian Religious Freedom Act (PL 95-341–1978/PL 103-344 –1994).

Abrogation of the AIRFA threatens potentially detrimental consequences not only for our religious and spiritual rights, but the sovereignty of all of the Tribal Nations impacted by this issue.

Federally recognized tribes have a unique nation-to-nation relationship with the federal government that requires consultation to be held at a government-to-government level; and government-to-government consultation is conducted under existing protocols and within an established framework.

Given the tremendous concern expressed by many of the Associated Tribes of Yellowstone regarding the potential delisting of the grizzly bear, the FWS should immediately commence consultation with the impacted Tribal Nations regarding the implications of a delisting decision. US government agencies, including FWS, have a duty to consult with tribes regarding policies that have tribal implications. This duty has been embodied in a variety of executive orders, secretarial orders, and memoranda. Executive Order 13175, issued by President Clinton in 2000, was written "to establish regular and meaningful consultation and collaboration with tribal officials in the development of Federal policies that have tribal implications." Such policies include "regulations ... and other policy statements or actions that have substantial direct effects on one or more Indian tribes," such as listing and delisting decisions.

A 2009 memorandum issued by President Obama emphasized the importance of President Clinton's Executive Order, noting that "[c]onsultation is a critical ingredient of a sound and productive Federal-tribal relationship" and affirming the Administration's "commit[ment] to regular and meaningful consultation and collaboration with tribal officials in policy decisions that have tribal implications." President Obama's 2013 Executive Order Establishing the White House Council on Native American Affairs further recognizes that "[g]reater engagement and meaningful consultation with tribes is of paramount importance in developing any policies affecting tribal nations."

The US Departments of Interior and Commerce issued an order on June 5, 1997, specifically regarding tribal consultation obligations in the context of the Endangered Species Act. That order provides that FWS "shall coordinate with affected Indian tribes in order to fulfill the Service['s] trust responsibilities and encourage meaningful tribal participation" in listing and delisting decisions.

Ignoring these Acts and Orders contradicts the basis of the government-to-government relationship that exists between the federal government and all of the Tribal Nations impacted by this issue, a situation that must be remedied.

We join our sister tribes in rejecting the designation of the grizzly bear as a "trophy game animal" and the intent of the states to sell licenses and generate multiple

thousands of dollars from trophy hunting the sacred grizzly bear on our ancestral homelands.

Tribal Nations have alternative solutions to the outdated "wildlife management" practices. Trophy hunting sentient beings appeals only to a tiny minority of the population, and is antithetical to the traditional cultures and subsistence practices of tribal people. Just as the buffalo is being returned to reservation homelands with biologically suitable habitat, some Tribal Nations with appropriate land bases have expressed a desire to develop programs to return the grizzly to their sovereign nations.

Grizzly bear management plans post-delisting should be sensitive to the cultures of the affected Tribal Nations. Rather than have the states influence grizzly bear management on tribal lands, the affected Tribal Nations should be provided with the resources to initiate their own management practices and programs that are consistent with their cultural values. By doing so, tribal sovereignty will be upheld and potential employment and economic opportunity provided.

Our people, those of our sister tribes, and the memberships of the other impacted tribes, retain unique insights into this landscape. Our ancestors are the only ones who had practical experience of what it was to live within these ecosystems when they were complete. The knowledge that they retained and passed down is truly the definition of the "best available science" as they lived it – they did not speculate upon the theoretic. Their voices, through us, need to be heard.

Until these issues cited herein are addressed and resolved to the satisfaction of all of the affected Tribal Nations, we believe that it is premature to even consider issuing a new Rule to delist the iconic Yellowstone grizzly bear from ESA protections.

Sincerely,

Lindsey W. Manning

September 12, 2014

To Whom It May Concern:

This letter is in support of the GOAL Tribal Coalition. The Northern Cheyenne Tribe opposes the federal government's proposed removal of the Yellowstone grizzly bear from Endangered Species Act protections through the US Fish and Wildlife Service and we believe the federal government's determination to remove the grizzly bear from Endangered Species Act protection contravenes the American Indian Religious Freedom Act (AIRFA. PUBLIC LAW 95-341--AUG. 11, 1978).

As one of the twenty-six federally recognized tribes the federal government acknowledges has an ancestral connection to the region now known as Yellowstone National Park and the Greater Yellowstone Ecosystem the US Fish and Wildlife Service is thus required to consult with the Northern Cheyenne Tribe, yet the US Fish and Wildlife Service has refused to release the data it has based its conclusions on for independent scientific review, that data being the basis for the federal government's proposal to remove the grizzly bear from Endangered Species Act protections.

The grizzly bear holds a unique position in the traditional cultures and ceremonial life-ways of the traditional spiritual practitioners of tribes identified by the federal

government as possessing centuries old, and in some instances, millennia-long connections to the lands where the grizzly now survives.

Clearly cultural imperatives and the preservation of sovereignty require a repudiation of the federal government's desire to delist the grizzly bear from Endangered Species Act protections; and the legislative resolve to deny the states' determination to see trophy hunting of grizzlies on reservations and the extirpation of the grizzly bear from swathes of reservation and ancestral homelands.

We the Cheyenne Nation stand in support of the grizzly bear, and the right of Native peoples to religious freedom

Yours faithfully,

Llevando Fisher

President of the Northern Cheyenne Nation

To Whom it May Concern:

The sovereignty and spiritual rights of the Crow Creek Sioux Tribe and the Lakota, Dakota and Nakota people of the Great Sioux Nation are threatened by the proposed delisting of the Yellowstone grizzly bear from Endangered Species Act (ESA) protections by the US Fish and Wildlife Service (FWS). The Crow Creek Sioux Tribe is one of the twenty-six Tribal Nations the federal government recognizes as having an ancestral connection to Yellowstone ("Associated Tribe of Yellowstone" – *Resources & Issues*, NPS, 2010). In total, ten of those Tribal Nations are from the Oceti Sakowin (Great Sioux Nation), but to date none have been consulted in this process.

Chief Arvol Looking Horse, 19th Generation Keeper of the White Buffalo Calf Pipe of the Great Sioux Nation, detailed the spiritual and ceremonial significance of the grizzly bear in Lakota, Dakota and Nakota culture in his November 2014 statement in opposition to delisting of the Yellowstone grizzly from the ESA.

The cultural, geographic and sacred landscape of the Lakota, Dakota and Nakota people demonstrates the cultural importance of the grizzly bear. Sacred sites like Mato Tipila (Devils Tower) and Mato Paha (Bear Butte) are inseparable from our ceremonial connection to the grizzly. Numerous traditional and current family names, along with the names of creeks, rivers and buttes, were inspired by the grizzly bear. Many of our great historical leaders carried grizzly bear names, Smutty Bear, Medicine Bear, White Bear, and Two Bears among them.

As Chief Looking Horse has demonstrated, the ceremonial significance of the grizzly in our spiritual lifeway is an ancient

connection. Like all of our spiritual and religious ways, ceremonies related to the grizzly are protected by the American Indian Religious Freedom Act (PL 95-341–1978/PL 103-344 –1994). The Act states that laws and policies pertaining to "conservation and preservation of natural species" cannot be "passed without consideration of their effect on traditional American Indian religions." So far, in its attempts to delist the Yellowstone grizzly bear without regard to the religious practices of tribal people, the FWS is doing precisely that.

Abrogation of the AIRFA threatens potentially detrimental consequences not only for our religious and spiritual rights, but the sovereignty of all of the affected Tribal Nations.

Executive Order 13175 (Nov. 6, 2000) "Consultation and Coordination with Indian Tribal Governments" signed by President Clinton, and the Memorandum for the Heads of Executive Departments and Agencies (Nov. 5, 2009) issued by President Obama, requiring a "complete and consistent implementation of Executive Order 13175," have yet to be followed by the US Fish and Wildlife Service (FWS) during this process.

Executive Order 13647 (June 2013) states, "Greater engagement and meaningful consultation with tribes is of paramount importance in developing any policies affecting tribal nations." The proposed delisting of the Yellowstone grizzly bear affects the Lakota, Dakota and Nakota people of the Oceti Sakowin (Great Sioux Nation).

The Secretarial Order issued by the Secretary of the Interior and the Secretary of Commerce pursuant to the Endangered Species Act (ESA) of 1973 (16 U.S.C. 1531), established the protocols to be followed when decisions related to the ESA had the potential to impact tribes. The Order directs the FWS to "solicit traditional knowledge, and comments from, and utilize the expertise of, affected Indian tribes" during the consultation

process, and "cooperate with affected tribes to develop and implement Recovery Plans in a manner that minimizes" social and cultural impacts on tribal people. In the move to delist the grizzly, this has not been followed.

Ignoring these Acts and Orders contradicts the basis of the the government-to-government relationship that exists between not only the Lakota, Dakota and Nakota Tribal Nations and the federal government, but all of the 26 Tribal Nations affected by this issue.

The Crow Creek Sioux Tribe rejects the designation of the grizzly bear as a "trophy game animal" to be killed by big game hunters on the lands our ancestors defended. As one of those defenders, the respected Lakota Bear Medicine Man, Sword, said, "The grizzly bear is *wakan*."

The Acts and Orders cited herein entitle the Crow Creek Sioux Tribe (and the other 25 affected Tribal Nations) to review the raw data the FWS is basing all of its conclusions upon relative to delisting the grizzly bear. Several tribes have already called upon the FWS to release that data not only to the affected Tribal Nations, but also to independent scientists for analysis and review, which must happen.

The Crow Creek Sioux Tribe supports Chief Arvol Looking Horse's position in opposing the removal of the Yellowstone grizzly bear from the Endangered Species Act, and the work of GOAL Tribal Coalition. We join the other affected Tribal Nations that have issued resolutions, declarations and statements in opposition to delisting the grizzly and call for the FWS to begin the process of consultation to ensure that our sovereignty and spiritual rights are upheld.

Roxanne Sazue
CCST Chairwoman

KJ9

Eastern Shoshone Business Council
P.O. Box 538
Fort Washakie, WY 82514
(307) 332-3532/4932
Fax: (307) 332-3055

JAN 20 2015

To Whom It May Concern:

The Eastern Shoshone Tribe stands beside the other tribal nations that have offered their support to GOAL (Guardians of Our Ancestors' Legacy) Tribal Coalition in their efforts to defend tribal sovereignty and Native American religious and spiritual rights as defined by the American Indian Religious Freedom Act (PL 95-341--AUG. 11, 1978).

The drive by the US Fish and Wildlife Service (FWS) and the State of Wyoming to remove the Yellowstone grizzly bear from Endangered Species Act (ESA) protections to enable Wyoming to manage the grizzly as a "trophy game animal" and generate tens of thousands of dollars for the state from trophy hunters' license fees amounts to an infringement of the American Indian Religious Freedom Act.

Even prior to the Richardson Amendments (HR 4230) that President Clinton signed into law in 1994 (PL 103-344, 108 Stat. 3125), PL 95-341 made plain that laws related to "conservation and preservation of natural species" could not, as had been the norm prior to the Act, be "passed without consideration of their effect on traditional American Indian religions." However, in its attempts to delist the Yellowstone grizzly bear without regard to the religious practices of tribal people, the FWS is doing precisely that.

The grizzly bear is highly respected by tribal people, and has a prominent role in the traditional spiritual practices of our people – the very lifeblood of our culture. The opposition of tribal members on the Wind River Indian Reservation to the delisting and trophy hunting of the grizzly bear has been apparent since our 55th Annual Eastern Shoshone Indian Days and Powwow, at which GOAL began making our tribal members aware of this issue and its consequences.

The Eastern Shoshone Tribe is among the twenty-six tribal nations recognized by the federal government as having an ancestral connection to Yellowstone ("Associated Tribe of Yellowstone" – *Resources & Issues*, NPS Division of Interpretation, 2010). Therefore, by the federal government's own criteria, the Eastern Shoshone Tribe must be included in any discussions pertaining to the removal of the sacred grizzly bear from ESA protections.

To date there has been no consultation with any of the spiritual leaders of the tribes impacted by the proposed delisting of the grizzly bear, which means that the FWS is also in contravention of the Secretarial Order issued by the Secretary of the Interior and the Secretary of Commerce pursuant to the Endangered Species Act of 1973 (16 U.S.C. 1531), which established the protocols to be followed when actions taken under authority of the ESA affect tribes.

The *American Indian Tribal Rights, Federal-Tribal Trust Responsibilities*, and the Endangered Species Act Order state, among other significant clauses:

"The Departments shall take into consideration the impacts of their actions and policies under the Act on Indian use of listed species for cultural and religious purposes (Sec. 5 #4)."

The Order directs the US Fish and Wildlife Service to "solicit traditional knowledge, and comments from, and utilize the expertise of, affected Indian tribes" during the consultation process, and "cooperate with affected tribes to develop and implement Recovery Plans in a manner that minimizes" social and cultural impacts on tribal people.

Clearly, the FWS and State of Wyoming have made no provision to abide by the Order.

The State of Wyoming has identified the Wind River Mountains as one area from which it intends to extinguish the grizzly bear. The FWS has already provided Wyoming Game and Fish with the mechanism to do so if the grizzly is delisted, but attempts to prosecute this action would be tantamount to an infringement of the sovereignty of the Eastern Shoshone Tribe.

The Eastern Shoshone Tribe opposes trophy hunting of the grizzly bear in the Wind River Mountains and will not permit the State of Wyoming to inflict its policies on Eastern Shoshone tribal lands. The leadership on the Wind River Indian Reservation rejected proposals to permit the trophy hunting of wolves on our land when the wolf was delisted from the ESA, and we hold that same position in relation to the grizzly bear. The grizzly bear is not recovered by the standard required to fulfill the ESA. A genetically isolated population of approximately 600 grizzlies existing on less than 1.5% of its original range does not meet the criteria of recovery.

Sincerely,

Darwin St. Clair Jr., Chairman

JAN 2 0 2015

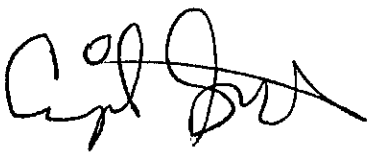
For the attention of:
Dan Ashe, Director – US Fish and Wildlife Service;
Chris Servheen, Grizzly Bear Recovery Coordinator – US Fish and Wildlife Service;
Other Parties Concerned:

The Rosebud Sioux Tribe is one of the twenty-six Tribal Nations recognized by the federal government as having an ancestral connection to Yellowstone ("Associated Tribe of Yellowstone" – *Resources & Issues*, NPS, 2010). Therefore, under the federal government's own criteria, the Rosebud Sioux Tribe should be consulted by the federal departments and agencies presently engaged in attempting to remove of the sacred grizzly bear from Endangered Species Act (ESA) protections.

Executive Order 13175 (Nov. 6, 2000) "Consultation and Coordination with Indian Tribal Governments" signed by President Clinton, and the Memorandum for the Heads of Executive Departments and Agencies (Nov. 5, 2009) issued by President Obama, requiring a "complete and consistent implementation of Executive Order 13175," have yet to be followed by the US Fish and Wildlife Service (FWS) during this process.

This issue extends beyond delisting the grizzly bear, and threatens potentially detrimental consequences for tribal sovereignty and our religious and spiritual rights as defined by the American Indian Religious Freedom Act (PL 95-341–1978/PL 103-344 –1994). Laws and policies related to "conservation and preservation of natural species" cannot, as had been the norm prior to the Act, be "passed without consideration of their effect on traditional American Indian religions." However, in its attempts to delist the Yellowstone grizzly bear without regard to the religious practices of tribal people, the FWS is doing precisely that.

In his statement of November 2014, Chief Arvol Looking Horse, 19th Generation Keeper of the White Buffalo Calf Pipe of the Oceti Sakowin, detailed the spiritual and ceremonial significance of the grizzly bear in Lakota, Dakota and Nakota culture.



The Lakota cultural and geographic landscape demonstrates the cultural importance of the grizzly bear. Many physical features and sacred sites are known by names inspired by the grizzly bear. Our people still carry names that reflect the significance of the grizzly. Throughout our history, numerous great leaders have borne grizzly bear names.

The specter of trophy hunters killing grizzly bears on our sacred lands is painful for the Lakota people. The most famous image of the 1874 Black Hills Expedition that contravened the 1868 Fort Laramie Treaty – and resulted in the theft of the Black Hills – is the photograph of Custer with the grizzly he killed for a "trophy." We cannot allow a repeat 140-years later on lands our ancestors fought so hard to defend when they opposed the construction of the Northern Pacific

Railroad along the Yellowstone in 1872/73, which was itself a violation of the 1868 Fort Laramie Treaty.

The Rosebud Sioux Tribe (along with the other 25 affected Tribal Nations) is also entitled to review the raw data the FWS is basing all of its conclusions upon relative to delisting the grizzly bear. Several tribes have already called upon the FWS to release that data not only to the affected Tribal Nations, but also to independent scientists for analysis and review so that questions of credibility might be answered.

The Rosebud Sioux Tribe joins the other affected Tribal Nations that have issued resolutions, declarations and statements in opposition to the US Fish and Wildlife Service's proposed delisting of the Yellowstone grizzly bear.

President Cyril Scott
Rosebud Sioux Tribe

For the attention of:
Dan Ashe, Director – US Fish and Wildlife Service;
Other Parties Concerned.

The Yankton Sioux Tribe supports Chief Arvol Looking Horse and GOAL Tribal Coalition in opposing the US Fish and Wildlife Service's intention to remove the Yellowstone grizzly bear from Endangered Species Act protections.

Chief Arvol Looking Horse, the 19th Generation Keeper of the White Buffalo Calf Pipe of the Great Sioux Nation, detailed the spiritual and ceremonial significance of the grizzly bear in Nakota, Lakota, and Dakota culture in his November 2014 statement. As Chief Looking Horse demonstrated, the ceremonial significance of the grizzly in our spiritual life way has existed from time immemorial.

The American Indian Religious Freedom Act (PL 95-341–1978/PL 103-344 –1994) protects the spiritual and religious ways of the Nakota, Lakota and Dakota people related to the grizzly bear. The Act states that laws and policies pertaining to "conservation and preservation of natural species" cannot be "passed without consideration of their effect on traditional American Indian religions." In its attempts to delist the Yellowstone grizzly bear without regard to the religious practices of tribal people, the FWS is contravening the Act.

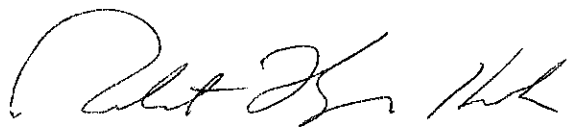
Abrogation of the AIRFA threatens potentially detrimental consequences not only for our religious and spiritual rights, but also the sovereignty of all of the affected Tribal Nations.

Executive Order 13175 (Nov. 6, 2000) "Consultation and Coordination with Indian Tribal Governments" signed by President Clinton, and the Memorandum for the Heads of Executive Departments and Agencies (Nov. 5, 2009) issued by President Obama, requiring a "complete and consistent implementation of Executive Order 13175," have yet to be followed by the US Fish and Wildlife Service (FWS) during this process.

Executive Order 13647 (June 2013) states, "Greater engagement and meaningful consultation with tribes is of paramount importance in developing any policies affecting tribal nations." The proposed delisting of the Yellowstone grizzly bear affects the Nakota, Dakota and Lakota people of the Oceti Sakowin (Great Sioux Nation).

The Secretarial Order issued by the Secretary of the Interior and the Secretary of Commerce pursuant to the Endangered Species Act (ESA) of 1973 (16 U.S.C. 1531), established the protocols to be followed when decisions related to the ESA had the potential to impact tribes. However, during the proposed delisting process, this framework has also not been followed.

During his official June 2014 visit to the Standing Rock Sioux Tribe, President Obama told the people of the Oceti Sakowin (Great Sioux Nation), "My administration is determined to partner with tribes, and it's not something that just happens once in a while. It takes place every day, on just about every issue that touches your lives. And that's what real nation-to-nation partnerships look like."



The delisting of the sacred grizzly bear, the subsequent trophy hunting, and the virtual cull proposed by the state of Wyoming, will touch the lives of the Flandreau Santee Sioux people. The cultural, geographic and sacred landscape of the Nakota, Lakota and Dakota people demonstrates the cultural importance of the grizzly bear.

Ignoring these Acts and Orders contradicts the basis of the government-to-government relationship that exists not only between the Nakota, Dakota and Lakota Tribal Nations and the federal government, but all of the 26 Tribal Nations affected by this issue. It is imperative that tribal sovereignty and the spiritual rights of our people be upheld.

The Yankton Sioux Tribe is one of the twenty-six Tribal Nations the federal government recognizes as having an ancestral connection to Yellowstone ("Associated Tribe of Yellowstone" – *Resources & Issues*, NPS, 2010). As such,
the Acts and Orders cited herein entitle the Yankton Sioux Tribe to review the raw data the FWS is basing all of its conclusions upon relative to delisting the grizzly bear. We join the other tribes of the Great Sioux Nation that have called upon the FWS to release that data not only to the affected Tribal Nations, but also to independent scientists for analysis and review.

Today the grizzly bear survives on less than 2% of its original range, with only 2% of its historic population. There is much work to be done before the grizzly bear can be considered recovered. Many areas of biologically suitably habitat exist where the grizzly once roamed, many of them in our ancestral homelands, and the grizzly should be returned to those areas. Two small island populations of grizzlies in two isolated ecosystems in the lower-48 cannot be considered to constitute a recovered species.

In the spirit of our ancestors, and to ensure that our children and future generations will grow-up in a world where grizzlies are returning to parts our ancestral homeland where they ranged before they were extirpated post-the Lewis and Clark Expedition, the Yankton Sioux Tribe opposes delisting the Yellowstone grizzly bear – preserving the grizzly equates to cultural preservation.

Robert Flying Hawk
Chairman
Yankton Sioux Tribe

JAN 2 0 2015

December 17, 2014

For the attention of:
Secretary of the Interior, Sally Jewell;
Dan Ashe, Director – US Fish and Wildlife Service;
Other Parties Concerned:

The sovereignty and spiritual rights of the Spirit Lake Sioux Tribe are threatened by the proposed delisting of the Yellowstone grizzly bear from Endangered Species Act (ESA) protections by the US Fish and Wildlife Service (FWS).

The Spirit Lake Sioux Tribe is one of the twenty-six Tribal Nations the federal government recognizes as having an ancestral connection to Yellowstone ("Associated Tribe of Yellowstone" - *Resources & Issues*, NPS, 2010). Ten of the identified associated Tribal Nations are from the Oceti Sakowin (Great Sioux Nation), but to date none have been consulted in this process.

Federally recognized tribes have a unique nation-to-nation relationship with the federal government that requires consultation to be held at a government-to-government level; and government-to-government consultation is conducted under existing protocols and within an established framework.

Yellowstone and the Greater Yellowstone Ecosystem is a matrix of sacred and cultural sites of great significance to the twenty-six affected tribes, and those tribes' Tribal Historic Preservation Offices (THPOs) must be engaged in an initial process of consultation consistent with the criteria of the THPOs designated mission (Section 101(d)(2) of the National Historic Preservation Act), in addition to consultation with tribal governments (executive and legislative branches), and recognized spiritual leaders.

Chief Arvol Looking Horse, 19th Generation Keeper of the White Buffalo Calf Pipe of the Great Sioux Nation, detailed the spiritual and ceremonial significance of the grizzly bear in Lakota, Dakota and Nakota culture in his November 2014 statement in opposition to delisting of the Yellowstone grizzly from the ESA.

The cultural, geographic and sacred landscape of the Lakota, Dakota and Nakota people demonstrates the cultural importance of the grizzly bear. Numerous sacred sites, along with the names of creeks, rivers and buttes, were inspired by the grizzly bear. Many of our great historical leaders carried grizzly bear names, and those traditional names are present today among families in our communities.

As Chief Looking Horse has demonstrated, the ceremonial significance of the grizzly is an ancient connection. Lakota ceremonies related to the grizzly, historically known as Bear Medicine Ceremonies, are, like all of our spiritual and religious ways, protected by the American Indian Religious Freedom Act (PL 95-341–1978/PL 103-344 –1994). The Act states that laws and policies pertaining to "conservation and preservation of natural species" cannot be "passed without consideration of their effect on traditional American Indian religions." In its attempts to delist the Yellowstone grizzly bear without regard to the religious practices of tribal people, the FWS is doing so "without consideration of their effect on traditional American Indian religions."

Abrogation of the AIRFA threatens potentially detrimental consequences not only for our religious and spiritual rights, but the sovereignty of all of the affected Tribal Nations.

Executive Order 13175 (Nov. 6, 2000) "Consultation and Coordination with Indian Tribal Governments" signed by President Clinton, and the Memorandum for the Heads of Executive Departments and Agencies (Nov. 5, 2009) issued by President Obama, requiring a "complete and consistent implementation of Executive Order 13175," have yet to be followed by the US Fish and Wildlife Service (FWS) during this process.

Executive Order 13647 (June 2013) states, "Greater engagement and meaningful consultation with tribes is of paramount importance in developing any policies affecting tribal nations." The proposed delisting of the Yellowstone grizzly bear affects the Spirit Lake Sioux Tribe and the Lakota, Dakota and Nakota people of the Oceti Sakowin (Great Sioux Nation).

The Secretarial Order issued by the Secretary of the Interior and the Secretary of Commerce pursuant to the Endangered Species Act (ESA) of 1973 (16 U.S.C. 1531), established the protocols to be followed when decisions related to the ESA had the potential to impact tribes. The Order directs the FWS to "solicit traditional knowledge, and comments from, and utilize the expertise of, affected Indian tribes" during the consultation process, and "cooperate with affected tribes to develop and implement Recovery Plans in a manner that minimizes" social and cultural impacts on tribal people. In the move to delist the grizzly, this has not been followed.

Ignoring these Acts and Orders contradicts the basis of the the government-to-government relationship that exists between not only the Lakota, Dakota and Nakota Tribal Nations and the federal government, but all of the 26 Tribal Nations affected by this issue.

The Spirit Lake Sioux Tribe rejects the designation of the grizzly bear as a "trophy game animal" to be killed by big game hunters on the lands our ancestors defended. Revered spiritual leaders from the past, the likes of Black Elk and Sword, articulated the perception of the Lakota, Dakota and Nakota people when they said, "The grizzly bear is *wakan* (sacred)."

Today the grizzly bear survives on less than 2% of its original range, with only 2% of its historic population. There is much work to be done before the grizzly bear can be considered recovered. Many areas of biologically suitably habitat exist where the grizzly once roamed, many of them in our ancestral homelands, and the grizzly should be returned to those areas.

Tribal Nations have alternative solutions to the outdated wildlife management practice of killing. Trophy hunting sentient beings appeals only to a tiny minority of the population, a minority that is over 95% white, from high economic strata. Just as the buffalo is being returned to reservation homelands with biologically suitable habitat, some Tribal Nations with appropriate land bases have expressed a desire to develop programs to return the grizzly to their sovereign nations.

Under such circumstances, estimated carrying capacity in one ecosystem would not result in killing but relocation to ignite new populations that would realize the long-projected need for linkage zones between grizzly populations. Today, the two small island populations of grizzlies surviving in two isolated ecosystems in the lower-48 cannot be considered a recovered species appropriate for delisting and subsequent trophy hunting.

Grizzly bear management plans post-delisting should be sensitive to the cultures of the affected Tribal Nations. Rather than have the states influence grizzly bear management on tribal lands, the affected Tribal Nations should be provided with the resources to initiate their own management practices and programs that are consistent with their cultural values. By doing so, tribal sovereignty will be upheld and potential employment and economic opportunity provided.

The consultation process that is mandated by the aforementioned Acts and Orders entitles the Spirit Lake Sioux Tribe (and the other nations of the Oceti Sakowin and affected Tribal Nations) to review the raw data the FWS is basing all of its conclusions upon

relative to delisting the grizzly bear. Several tribes have already called upon the FWS to release that data not only to the affected Tribal Nations, but also to independent scientists for analysis and review – the Spirit Lake Sioux Tribe adds its voice to that call.

The Spirit Lake Sioux Tribe supports Chief Arvol Looking Horse's position in opposing the removal of the Yellowstone grizzly bear from the Endangered Species Act, and we support the efforts of GOAL Tribal Coalition to protect the sacred grizzly bear and in doing so defend tribal sovereignty and spiritual rights.

Sincerely,

Myra Pearson
Spirit Lake Tribe Chairperson

The SHOSHONE-BANNOCK TRIBES

FORT HALL INDIAN RESERVATION
PHONE: (208) 478-3700
(208) 237-0797

FORT HALL BUSINESS COUNCIL
PO BOX 306
FORT HALL, IDAHO 83203

To Whom It May Concern:

This letter is in strong support of GOAL Tribal Coalition. JAN 2 0 2015

The Fort Hall Business Council of the Shoshone-Bannock Tribes of Fort Hall, Idaho oppose the federal government' s proposed removal of the Yellowstone grizzly bear from Endangered Species Act protections through the US Fish and Wildlife Service, recognizing that the federal government' s resolve to remove the grizzly bear from Endangered Species Act protection contravenes the American Indian Religious Freedom Act (AIRFA. PUBLIC LAW 95-341--AUG. 11, 1978).

Our Tribe is one of the few of the twenty-six federally recognized tribes which federal government openly acknowledges has an original ancestral connection to the Yellowstone National Park and the Greater Yellowstone Ecosystem regions. The connection between our tribe and this land has existed hundreds and thousands of years and requires the US Fish and Wildlife Service to consult with the Shoshone-Bannock Tribes since the American Indian Religious Freedom Act states that laws pertaining to 'conservation and preservation of natural species and resources" were never intended to impact American Indian religious practices.

The Secretarial Order issued by the Secretary of the Interior and the Secretary of Commerce pursuant to the *Endangered Species Act* (ESA) of 1973 (16 U.S.C. 1531) clearly sets forth the framework to be followed when actions taken under authority of the ESA affect tribes. With the proposed delisting of the grizzly bear, the US Fish and Wildlife Service is in contravention of this order which directs the that agency to 'solicit traditional knowledge, and comments from, and utilize the expertise of, affected Indian tribes' during the

consultation process, and 'cooperate with affected tribes to develop and implement Recovery Plans in a manner that minimizes social and cultural impacts on tribal people.'

The Shoshone-Bannock Tribe has been afforded no such consultation throughout the US Fish and Wildlife Service' s process proposing a new Rule to delist the Yellowstone grizzly bear, despite the supposed protection of religious practices of traditional tribal people by PL-95-341.

In respecting our unique cultural imperatives, and the preservation of our sovereignty, the Shoshone-Bannock Tribe renounces the federal government' s desire to delist the grizzly bear from Endangered Species Act protections. We oppose the legislative resolve to see trophy hunting of grizzlies on reservations and the extirpation of the grizzly bear from swathes of reservation lands.

Additionally, in recognition that that the Shoshone-Bannock Tribe' s Fish and Wildlife Department has a seat on the IGBC' s (Interagency Grizzly Bear Committee) Yellowstone Subcommittee, this letter of support from the Shoshone-Bannock Tribe countermands any previous votes cast by the Shoshone-Bannock Tribe' s Fish and Wildlife Department in favor of delisting the Yellowstone grizzly bear.

Our council hereby officially strongly opposes this position in delisting the Yellowstone grizzly bear.

Respectfully,

Nathan Small, Chairman
Fort Hall Business Council

Don Garnier
Cultural Liaison

Attn: United States Fish and Wildlife Director, Dan Ashe;
All other affected parties.

The sovereignty and spiritual rights of the Oglala Sioux Tribe (Oglala Lakota Nation) and the Lakota, Dakota and Nakota people of the Oceti Sakowin (Great Sioux Nation) are threatened by the proposed delisting of the Yellowstone grizzly bear from Endangered Species Act (ESA) protections by the US Fish and Wildlife Service (FWS).

The Oglala Sioux Tribe is one of the twenty-six Tribal Nations the federal government recognizes as having an ancestral connection to Yellowstone ("Associated Tribe of Yellowstone" – *Resources & Issues*, NPS, 2010), and as such must be consulted in this process.

Federally recognized tribes have a unique nation-to-nation relationship with the federal government that requires consultation to be held at a government-to-government level; and government-to-government consultation is conducted under existing protocols and within an established framework. Unsolicited correspondence from a federal agency coordinator or similar does not constitute consultation between a tribal nation and the federal government.

Yellowstone and the Greater Yellowstone Ecosystem is a matrix of sacred and cultural sites of great significance to the twenty-six affected tribes, and those tribes' Tribal Historic Preservation Offices (THPOs) must be engaged in an initial process of consultation consistent with the criteria of the THPOs designated mission (Section 101(d)(2) of the National Historic Preservation Act), in addition to consultation with tribal governments (executive and legislative branches), and recognized spiritual leaders.

Chief Arvol Looking Horse, 19th Generation Keeper of the White Buffalo Calf Pipe of the Great Sioux Nation, detailed the spiritual and ceremonial significance of the grizzly bear in Lakota, Dakota and Nakota culture in his November 2014 statement in opposition to the planned delisting of the Yellowstone grizzly from the ESA.

The cultural, geographic and sacred landscape of the Lakota, Dakota and Nakota people demonstrates the cultural importance of the grizzly bear. Sacred sites like Mato Tipila (Devils Tower) and Mato Paha (Bear Butte) are inseparable from our ceremonial connection to the grizzly. Numerous traditional and current family names, along with the names of creeks, rivers

and buttes, were inspired by the grizzly bear. Not without reason were Crazy Horse and his mentor, High Back Bone (Hump), described as "the grizzly and his cub."

As Chief Looking Horse has demonstrated, the ceremonial significance of the grizzly is an ancient connection. Lakota ceremonies related to the grizzly, historically known as Bear Medicine Ceremonies, are, like all of our spiritual and religious ways, protected by the American Indian Religious Freedom Act (PL 95-341–1978/PL 103-344 –1994). The Act states that laws and policies pertaining to "conservation and preservation of natural species" cannot be "passed without consideration of their effect on traditional American Indian religions." In its attempts to delist the Yellowstone grizzly bear without regard to the religious practices of tribal people, the FWS is doing so "without consideration of their effect on traditional American Indian religions."

Abrogation of the AIRFA threatens potentially detrimental consequences not only for our religious and spiritual rights, but the sovereignty of all of the affected Tribal Nations.

Executive Order 13175 (Nov. 6, 2000) "Consultation and Coordination with Indian Tribal Governments" signed by President Clinton, and the Memorandum for the Heads of Executive Departments and Agencies (Nov. 5, 2009) issued by President Obama, requiring a "complete and consistent implementation of Executive Order 13175," have yet to be followed by the FWS during this process.

Executive Order 13647 (June 2013) states, "Greater engagement and meaningful consultation with tribes is of paramount importance in developing any policies affecting tribal nations." The proposed delisting of the Yellowstone grizzly bear affects the Lakota, Dakota and Nakota people of the Oceti Sakowin (Great Sioux Nation) on cultural and religious grounds.

The Secretarial Order issued by the Secretary of the Interior and the Secretary of Commerce pursuant to the Endangered Species Act (ESA) of 1973 (16 U.S.C. 1531), established the protocols to be followed when decisions related to the ESA had the potential to impact tribes.

The Order directs the FWS to "solicit traditional knowledge, and comments from, and utilize the expertise of, affected Indian tribes" during the consultation process, and "cooperate with affected tribes to develop and implement Recovery Plans in a manner that minimizes" social and cultural impacts on tribal people. In the context of attempting to delist the Yellowstone grizzly, this equates to the FWS having to consult with respected spiritual leaders such as Chief Arvol Looking Horse.

Chief Arvol Looking Horse describes this present movement to remove ESA protections from the grizzly and allow the states of Wyoming, Montana and Idaho to operate profligate trophy hunts as an extension of the "disease of the mind" that enabled Manifest Destiny; the massacres of our people, and the near extermination of the grizzly, the wolf and the buffalo in the 19th Century. The world will see this in play again if the grizzly is delisted. Each spring and fall, some visitors to Yellowstone National Park will see grizzlies gutted by the sides of the roads leading to Yellowstone, or bloody grizzly carcasses strapped to vehicles.

We reject the designation of the grizzly bear as a "trophy game animal." It is shameful that a sentient being – one our people revere as sacred – is to be killed for "fun" by affluent trophy hunters. Great Lakota holy men like Black Elk, and Lakota Bear Medicine Men like Sword, articulated our feelings when they said, "The grizzly bear is *wakan*." The Oglala Lakota people will not stand idle and watch this sacred being be slaughtered on the lands our ancestors fought to defend.

The thought of trophy hunters killing grizzly bears on our sacred lands is painful for the Lakota people. The image that came to represent the 1874 Black Hills Expedition that contravened the 1868 Fort Laramie Treaty is the photograph of Custer with the grizzly he killed for a "trophy." That violation of the 1868 Fort Laramie Treaty resulted in the annexation of the Black Hills. We cannot allow a repeat 140-years later on other sacred ancestral lands.

Ignoring these Acts and Orders contradicts the basis of the the government-to-government relationship that exists between not only the Lakota, Dakota and Nakota Tribal Nations and the federal government, but all of the 26 Tribal Nations affected by this issue. These Acts and Orders entitle the Oglala Sioux Tribe (and the other 25 affected Tribal Nations) to review the raw data the FWS is basing all of its conclusions upon relative to delisting the grizzly bear. Several nations of the Oceti Sakowin, and other affected Tribal Nations, have already called upon the FWS to release that data not only to the tribes, but also to independent scientists for analysis and review. To date, FWS has refused to do so. If the data is sound, it will not be undermined by scrutiny.

The Oglala Sioux Tribe supports Chief Arvol Looking Horse's position in opposing the removal of the Yellowstone grizzly bear from the Endangered Species Act, and the work of GOAL Tribal Coalition in bringing this important issue to the fore. We join the other affected Tribal Nations that have issued resolutions, declarations and statements in opposition to delisting the grizzly, and call for the federal government to begin the process of thorough consultation in accordance with the existing mandates, to ensure that our sovereignty and spiritual rights are upheld.

December 09, 2014

Attn: Director Dan Ashe,
US Fish and Wildlife Service.

All Parties Concerned.

The Cheyenne River Sioux Tribe is one of the twenty-six Tribal Nations recognized by the federal government as having an ancestral connection to Yellowstone ("Associated Tribe of Yellowstone" – *Resources & Issues*, NPS, 2010). Therefore, under the federal government's own criteria, the Cheyenne River Sioux Tribe should be consulted by the federal departments and agencies presently engaged in attempting to remove of the sacred grizzly bear from Endangered Species Act (ESA) protections.

Executive Order 13175 (Nov. 6, 2000) "Consultation and Coordination with Indian Tribal Governments" signed by President Clinton, and the Memorandum for the Heads of Executive Departments and Agencies (Nov. 5, 2009) issued by President Obama, requiring a "complete and consistent implementation of Executive Order 13175," have yet to be followed by the US Fish and Wildlife Service (FWS) during this process.

Executive Order 13647 (June 2013) states, "Greater engagement and meaningful consultation with tribes is of paramount importance in developing any policies affecting tribal nations." The proposed delisting of the Yellowstone grizzly bear affects the Lakota, Dakota and Nakota people of the Oceti Sakowin (Great Sioux Nation).

This issue extends beyond delisting the grizzly bear, and threatens potentially detrimental consequences for tribal sovereignty and our religious and spiritual rights as defined by the American Indian Religious Freedom Act (PL 95-341–1978/PL 103-344 –1994).

Laws and policies related to "conservation and preservation of natural species" cannot, as had been the norm prior to the Act, be "passed without consideration of their effect on traditional American

The blue represents the thunderclouds above the world where live the thunder birds who control the four winds. The rainbow is for the Cheyenne River Sioux people who are keepers of the Most Sacred Calf Pipe, a gift from the White Buffalo Calf Maiden. The eagle feathers at the edges of the rim of the world represent the spotted eagle who is the protector of all Lakota. The two pipes fused together are for unity. One pipe is for the Lakota, the other for all the other Indian Nations. The yellow hoops represent the Sacred Hoop, which shall not be broken. The Sacred Calf Pipe Bundle in red represents Wakan Tanka – The Great Mystery. All the colors of the Lakota are visible. The red, yellow, black and white represent the four major races. The blue is for heaven and the green for Mother Earth.

Indian religions." However, in its attempts to delist the Yellowstone grizzly bear without regard to the religious practices of tribal people, the FWS is doing precisely that.

In his statement of November 2014, Chief Arvol Looking Horse, 19th Generation Keeper of the White Buffalo Calf Pipe of the Oceti Sakowin, detailed the spiritual and ceremonial significance of the grizzly bear in Lakota, Dakota and Nakota culture.

The Lakota cultural and geographic landscape demonstrates the cultural importance of the grizzly bear. Many physical features and sacred sites are known by names inspired by the grizzly bear. Our people still carry names that reflect the significance of the grizzly. Throughout our history, numerous great leaders have borne grizzly bear names.

Opposing the removal of ESA protections from the Yellowstone grizzly bear, and the proposed trophy hunting of the grizzly, is consistent with CRST Ordinance 57, the Cheyenne River Sioux Tribe's Cultural Resources Protection Act, which affirms: "The spiritual and physical well-being of the Cheyenne River Sioux Tribe and its members is directly related to the preservation of the historical traditions and cultural heritage of the Lakota people."

In this process to date, FWS is yet to abide by the Secretarial Order issued by the Secretary of the Interior and the Secretary of Commerce pursuant to the Endangered Species Act (ESA) of 1973 (16 U.S.C. 1531), which established the protocols to be followed when actions taken under authority of the ESA have tribal implications.

The Order directs the FWS to "solicit traditional knowledge, and comments from, and utilize the expertise of, affected Indian tribes" during the consultation process, and "cooperate with affected tribes to develop and implement Recovery Plans in a manner that minimizes" social and cultural impacts on tribal people.

The thought of trophy hunters killing grizzly bears on our sacred lands is painful for the Lakota people. The image that came to represent the 1874 Black Hills Expedition that contravened the 1868 Fort Laramie Treaty is the photograph of Custer with the grizzly he killed for a "trophy." That violation of the 1868 Fort Laramie Treaty resulted in the annexation of the Black Hills. We cannot allow a repeat 140-years later on lands our ancestors fought so hard to protect when they opposed the construction of the Northern Pacific Railroad along the Yellowstone in 1872 and 1873, which was also a violation of the 1868 Fort Laramie Treaty. Some of the principal leaders in that resistance were from the Lakota bands that comprise the Cheyenne River Sioux Tribe.

Through the aforementioned Acts and Orders, the Cheyenne River Sioux Tribe (along with the other 25 affected Tribal Nations) is entitled to review the raw data the FWS is basing all of its conclusions upon relative to delisting the grizzly bear. Several tribes have already called upon the FWS to release that data not only to the affected Tribal Nations, but also to independent scientists for analysis and review so that questions of credibility might be answered.

The Cheyenne River Sioux Tribe joins the other affected Tribal Nations that have issued resolutions, declarations and statements in opposition to the US Fish and Wildlife Service's proposed delisting of the Yellowstone grizzly bear. We support the positions expressed by Chief Arvol Looking Horse, and the efforts of GOAL Tribal Coalition to protect the grizzly bear and defend our sovereignty and spiritual rights.

If you should have any questions or concerns, please contact me at 605-964-4155.

Sincerely,

Harold C. Frazier,
CRST Chairman

RESOLUTION NO. 14-142

WHEREAS, the Flandreau Santee Sioux Tribe (the "Tribe") is a federally recognized Indian tribe organized pursuant to the Constitution and By-laws approved by the Secretary of Interior and Commissioner of Indian Affairs on April 24, 1936, amended February 7, 1941, and further amended November 16, 1967, and further amended November 14, 1984, and further amended May 17, 1997; and

WHEREAS, Article III of the Tribe's Constitution and By-laws provides that the governing body of the Tribe shall be the Executive Committee; and

WHEREAS, Article VIII, Section (a) provides that the Executive Committee may negotiate with Federal, State, and local governments; and

WHEREAS, the Tribe opposes the Federal Government's proposed removal of the Yellowstone grizzly bear from Endangered Species Act protections through the US Fish and Wildlife Service; and

WHEREAS, the US Fish and Wildlife Service, Department of the Interior, has so far ignored Executive Order 13175 (Nov. 6, 2000) entiltled "Consultation and Coordination with Indian Tribal Governments" signed by President Clinton, and the Memorandum for the Heads of Executive Departments and Agencies (Nov. 5, 2009) issued by President Obama requiring a "complete and consistent implementation of Executive Order 13175"; and

WHEREAS, the federal government's determination to remove the grizzly bear from Endangered Species Act protection contravenes the American Indian Religious Freedom Act, 42 U.S.C. § 1996 (2014); and

WHEREAS, the American Indian Religious Freedom Act states laws pertaining to "conservation and preservation of natural species and resources" were never intended to impact American Indian religious practices but did "and, therefore, were passed without consideration of their effect on traditional American Indian religions"; and

WHEREAS, in its proposed delisting of the grizzly bear the US Fish and Wildlife Service is in contravention of the Secretarial Order issued by the Secretary of the Interior and the Secretary of Commerce pursuant to the Endangered Species

Act (ESA) of 1973, 16 U.S.C. § 1531 (2014), which sets forth the framework to be followed when actions taken under authority of the ESA affect tribes; and

WHEREAS, the *American Indian Tribal Rights, Federal-Tribal Trust Responsibilities, and the Endangered Species Act Order* states: "The Departments shall take into consideration the impacts of their actions and policies under the Act on Indian use of listed species for cultural and religious purposes"; and

WHEREAS, the Order directs the US Fish and Wildlife Service to "solicit traditional knowledge, and comments from, and utilize the expertise of, affected Indian tribes" during the consultation process, and "cooperate with affected tribes to develop and implement Recovery Plans in a manner that minimizes" social and cultural impacts on tribal people; and

WHEREAS, none of these commitments has been honored; and

WHEREAS, the US Fish and Wildlife Service has refused to release the data it has based its conclusions on for independent scientific review, that data being the basis for the federal government's proposal to remove the grizzly bear from Endangered Species Act protections; and

WHEREAS, when considering the intent of the Endangered Species Act, a species cannot be considered sufficiently recovered to warrant removal from Endangered Species Act protection if it presently only survives on approximately 2% of its original range; and

WHEREAS, throughout the US Fish and Wildlife Service's process proposing a new Rule to delist the Yellowstone grizzly bear there has been no discussion related to the impact delisting the grizzly, and the subsequent trophy hunting of the bear, will have on American Indian spirituality, namely the religious practices of traditional tribal people; and

WHEREAS, the grizzly bear holds a unique position in traditional Dakota culture and the cultures and ceremonial lifeways of the traditional spiritual practitioners of tribes also identified by the federal government as possessing centuries old, and in some instances, millennia-long connections to the lands where the grizzly now survives; and

WHEREAS, those cultural imperatives and the preservation of sovereignty require a repudiation of the federal government's desire to delist the grizzly bear from Endangered Species Act protections; and the legislative resolve to deny the states' determination to see trophy hunting of grizzlies on reservations and the extirpation of the grizzly bear from swathes of reservation and ancestral

homelands; and

NOW THEREFORE BE IT RESOLVED, that the Executive Committee hereby officially adopts this position in respect to delisting the Yellowstone grizzly bear, and authorizes President Anthony Reider to sign a letter for support for the cause on the Tribe's behalf.

CERTIFICATION

The foregoing Resolution was duly enacted and adopted on this 11th day of December, 2014 by the Executive Committee of the Flandreau Santee Sioux Tribe during a duly called meeting with a quorum was present of 6 In Favor, 0 Opposed, 0 Abstaining, and 1 Not Voting, as follows:

Vice President, Cynthia J. Weddell:	YES	NO	ABSTAIN	NOT PRESENT
Secretary, Gordon Jones, Jr.:	YES	NO	ABSTAIN	NOT PRESENT
Trustee I, Jean Paul Roy:	YES	NO	ABSTAIN	NOT PRESENT
Trustee II, Roxee Johnson:	YES	NO	ABSTAIN	NOT PRESENT
Trustee III, Michael Weston:	YES	NO	ABSTAIN	NOT PRESENT
Trustee IV, Kenny Weston:	YES	NO	ABSTAIN	NOT PRESENT
President, Anthony Reider *(If Required)*:	YES	NO	ABSTAIN	NOT PRESENT

Dan Ashe, Director – US Fish and Wildlife Service;
Chris Servheen, Grizzly Bear Recovery Coordinator – US Fish and Wildlife Service;
Other Parties Concerned:

The sovereignty and spiritual rights of the Sisseton Wahpeton Oyate and the Lakota, Dakota and Nakota people of the Great Sioux Nation are threatened by the proposed delisting of the Yellowstone grizzly bear from Endangered Species Act (ESA) protections by the US Fish and Wildlife Service (FWS).

The Sisseton Wahpeton Oyate is one of the twenty-six Tribal Nations the federal government recognizes as having an ancestral connection to Yellowstone ("Associated Tribe of Yellowstone" – *Resources & Issues*, NPS, 2010). In total, ten of those Tribal Nations are from the Oceti Sakowin (Great Sioux Nation), but to date none have been consulted in this process.

Chief Arvol Looking Horse, 19th Generation Keeper of the White Buffalo Calf Pipe of the Great Sioux Nation, detailed the spiritual and ceremonial significance of the grizzly bear in Lakota, Dakota and Nakota culture in his November 2014 statement in opposition to delisting of the Yellowstone grizzly from the ESA.

The cultural, geographic and sacred landscape of the Lakota, Dakota and Nakota people demonstrates the cultural importance of the grizzly bear. Numerous sacred sites, along with the names of creeks, rivers and buttes, were inspired by the grizzly bear. Many of our great historical leaders carried grizzly bear names, and those traditional names are present today among families in our communities.

As Chief Looking Horse has demonstrated, the ceremonial significance of the grizzly in our spiritual lifeway is an ancient connection. Our spiritual and religious ways related to the grizzly are protected by the American Indian Religious Freedom Act (PL 95-341–1978/PL 103-344 –1994).

The Act states that laws and policies pertaining to "conservation and preservation of natural species" cannot be "passed without consideration of their effect on traditional American Indian religions." So far, in its attempts to delist the Yellowstone grizzly bear without regard to the religious practices of tribal people, the FWS is doing precisely that.

Abrogation of the AIRFA threatens potentially detrimental consequences not only for our religious and spiritual rights, but the sovereignty of all of the affected Tribal Nations.

Executive Order 13175 (Nov. 6, 2000) "Consultation and Coordination with Indian Tribal Governments" signed by President Clinton, and the Memorandum for the Heads of Executive Departments and Agencies (Nov. 5, 2009) issued by President Obama, requiring a "complete and consistent implementation of Executive Order 13175," have yet to be followed by the US Fish and Wildlife Service (FWS) during this process.

Executive Order 13647 (June 2013) states, "Greater engagement and meaningful consultation with tribes is of paramount importance in developing any policies affecting tribal nations." The proposed delisting of the Yellowstone grizzly bear affects the Lakota, Dakota and Nakota people of the Oceti Sakowin (Great Sioux Nation).

The Secretarial Order issued by the Secretary of the Interior and the Secretary of Commerce pursuant to the Endangered Species Act (ESA) of 1973 (16 U.S.C. 1531), established the protocols to be followed when decisions related to the ESA had the potential to impact tribes. The Order directs the FWS to "solicit traditional knowledge, and comments from, and utilize the expertise of, affected Indian tribes" during the consultation process, and "cooperate with affected tribes to develop and implement Recovery Plans in a manner that minimizes" social and cultural impacts on tribal people. In the move to delist the grizzly, this has not been followed.

Ignoring these Acts and Orders contradicts the basis of the the government-to-government relationship that exists between not only the Lakota, Dakota and Nakota Tribal Nations and the federal government, but all of the 26 Tribal Nations affected by this issue.

The Sisseton Wahpeton Oyate opposes the designation of the grizzly bear as a "trophy game animal" to be killed by big game hunters on the lands our ancestors

defended. Revered spiritual leaders from the past, the likes of Black Elk and Sword, articulated the perception of the Lakota, Dakota and Nakota people when they said, "The grizzly bear is *wakan*."

The consultation process that is mandated by the aforementioned Acts and Orders entitles the Sisseton Wahpeton Oyate (and the other nations of the Oceti Sakowin and affected Tribal Nations) to review the raw data the FWS is basing all of its conclusions upon relative to delisting the grizzly bear. Several tribes have already called upon the FWS to release that data not only to the affected Tribal Nations, but also to independent scientists for analysis and review – the Sisseton Wahpeton Oyate adds its voice to that call.

The Sisseton Wahpeton Oyate supports Chief Arvol Looking Horse's position in opposing the removal of the Yellowstone grizzly bear from the Endangered Species Act, and we support the efforts of GOAL Tribal Coalition to protect the sacred grizzly bear and in doing so defend tribal sovereignty and spiritual rights.

December 8, 2014

Daniel M. Ashe
Director
United States Fish and Wildlife Service

Dear Mr. Ashe:

In his November 2014 statement opposing the proposed delisting and subsequent trophy hunting of the Yellowstone grizzly bear, Chief Arvol Looking Horse outlined the sacred nature of the grizzly bear in Lakota, Dakota and Nakota culture. As the 19th Generation Keeper of the White Buffalo Calf Pipe of the Oceti Sakowin (Great Sioux Nation), Chief Looking Horse's insights are those of a highly respected spiritual leader.

To date, there has been no discussion in this process related to the impact delisting the grizzly bear, and the subsequent trophy hunting of the grizzly, will have on Native American spirituality, namely the religious practices of traditional tribal people, protected by the American Indian Religious Freedom Act (PL 95-341–1978/PL 103-344 –1994).

Though this proposed action is to take place on defined ancestral lands of the Great Sioux Nation, the Standing Rock Sioux Tribe has yet to be consulted. As one of the 26 Tribal Nations the federal government acknowledges as having an ancestral connection to Yellowstone ("Associated Tribe of Yellowstone" – *Resources & Issues*, NPS, 2010), the US Fish and Wildlife Service (FWS) is required to consult with the Standing Rock Sioux Tribe, as, like many of the other affected tribes, due to the cultural significance of the grizzly bear in Lakota, Dakota and Nakota culture, our people will be detrimentally impacted if the grizzly is delisted and trophy hunted in lands once familiar to our ancestors.

BLDG 1 NORTH STANDING ROCK AVE. P.O.BOX D • FORT YATES, NORTH DAKOTA 58538
PHONE: 701-854-7201 or 701-854-8500 • FAX 701-854-7299

Executive Order 13175 (Nov. 6, 2000) "Consultation and Coordination with Indian Tribal Governments" signed by President Clinton, and the Memorandum for the Heads of Executive Departments and Agencies (Nov. 5, 2009) issued by President Obama, requiring a "complete and consistent implementation of Executive Order 13175," have yet to be followed by the US Fish and Wildlife Service (FWS) during this process.

Executive Order 13647 (June 2013) states, "Greater engagement and meaningful consultation with tribes is of paramount importance in developing any policies affecting tribal nations." The proposed delisting of the Yellowstone grizzly bear affects the Lakota, Dakota and Nakota people of the Great Sioux Nation.

This lack of consultation by FWS stands in direct contrast to the policy directives of the Obama Administration. President Obama has attempted to strengthen consultation with tribes when federal policies and actions have the potential to affect tribes and have tribal implications. Clearly, removing the Yellowstone grizzly bear from the ESA and permitting states to proceed with high-dollar trophy hunts on our historic cultural landscape fits the criteria.

President Obama made a highly visible commitment to improving dialogue between tribal nations and the federal government when he visited the Standing Rock Sioux Nation in June 2014.

The American Indian Religious Freedom Act states that laws related to "conservation and preservation of natural species" cannot, as was the norm prior to the Act, be "passed without consideration of their effect on traditional American Indian religions." So far, in its attempts to delist the Yellowstone grizzly bear without regard to the religious practices of tribal people, the FWS is doing that.

The Standing Rock Sioux Tribe (and the other affected Tribal Nations) is entitled to review the raw data the FWS is basing all of its conclusions upon relative to delisting the grizzly bear through the Secretarial Order issued by the Secretary of the Interior and the Secretary of Commerce pursuant to the Endangered Species Act (ESA) of 1973 (16 U.S.C. 1531). Several tribes have already called upon the FWS to release that data not only to the affected Tribal Nations, but also to independent scientists for analysis and review. The cultural importance of this issue is such that questions and contradictions must be resolved without bias if tribal members, and the public at large, are to have confidence in the outcome.

efore the Lewis and Clark Expedition, there were an estimated 100,000 grizzly bears in the Western US, many in the environs of the Missouri River where the Standing Rock Sioux Tribe is now located. Today the grizzly bear survives on less than 2% of its original range, with possibly 2% of its historic population. The Yellowstone grizzly bear is a genetically isolated, island population that numbers in the hundreds. In a historical context, and by the spirit and intent of the ESA, it cannot yet be considered recovered.

Until the aforementioned issues have been addressed and resolved to the satisfaction of all of the affected Tribal Nations, we believe that it is premature to even consider delisting the iconic Yellowstone grizzly bear from ESA protections. It is imperative that tribal sovereignty and the spiritual rights of our people be upheld. Thank you for your attention to this matter, and please feel free to contact me should further discussion be helpful.

Sincerely,

Dave Archambault II, Chairman
Standing Rock Sioux Tribe

November 26, 2014

To all parties concerned:

The area now known as Greater Yellowstone lays within the boundaries of Crow Country that were defined by Chief Sits in the Middle of the Land at the 1851 Fort Laramie Treaty Council. For centuries, the Crow people have had a deep spiritual connection to the landscape, a relationship that continues to this day. Today, right in the heart of Crow country, exactly where Chief Sits in the Middle of the Land described, the federal government intends to delist the grizzly bear from Endangered Species Act protections and permit the State of Wyoming to open high-dollar trophy hunting seasons on the grizzly.

In common with the land, the Crow People have an ancient relationship with the grizzly bear. In Crow culture, the grizzly bear is referred to as biiké, elder brother, which connotes great respect for the bear. From the stars to the rocks, images of the bear communicate that sacred relationship the Crow people have with the grizzly, knowledge that was preserved by Crow elders and passed on to future generations. For example, Daxpitcheeishuulissúua, the Bear Song Dance, was one of the most sacred ceremonies of our people. The grizzly bear is a significant symbol for ceremonies for certain families in the Crow Tribe. The symbolic parts of a grizzly bear are used during ceremonies for healing. These parts of the grizzly bear has been handed down generation to generation and also used during competitions such as the handgames and other Crow traditional games. The elders say that a bear symbol can be seen in the palms of hands signifying power of the grizzly bear.

Though this proposed action is to take place on traditional Crow land, the Crow Tribe has yet to be consulted. As one of the 26 tribal nations the federal government openly acknowledges has an ancestral connection to Yellowstone, the US Fish and Wildlife Service (FWS) is required to consult with the Crow Tribe, like many of the other affected tribes. Due to the cultural significance of the grizzly bear, the Crow people will be detrimentally impacted if the grizzly is delisted and subsequently trophy hunted.

The Kiowa Tribe of Oklahoma, the historic allies of the Crow people, articulated the issues arising from the proposed delisting of the grizzly bear in its declaration of 10/10/14 and the Crow Tribe supports those positions.

The Crow Tribe is entitled to review the data the FWS is basing its conclusions on under the Secretarial Order issued by the Secretary of the Interior and the Secretary of commerce pursuant to the Endangered Species Act (ESA) of 1973 (16 U.S.C. 1531). The Crow Tribe joins with the other affected tribal nations that have called upon the FWS to release that data not only to the tribes, but also to independent scientists

for analysis and review. Transparency is essential if tribal members and the public at large are to have confidence in the outcome.

The Guardians of Ancestors Legacy (GOAL) Tribal Coalition is doing valuable work in its efforts to preserve and protect the Yellowstone grizzly bear and in the process defend tribal sovereignty and spiritual rights.

Sincerely,

Darrin Old Coyote, Chairman
Crow Tribe

Open Letter Approved By Official Resolution No. 11Dec2014-04 of the MT WY Tribal Leaders Council on December 11, 2014

The sovereignty and spiritual rights of Tribal Nations in Montana and Wyoming are threatened by the proposed delisting of the Yellowstone grizzly bear from Endangered Species Act (ESA) protections by the US Fish and Wildlife Services. Ten of the twenty-six Tribal Nations the federal government recognizes as having an ancestral connection to Yellowstone are located in Montana and Wyoming, but to date they have not been consulted in this process.

The grizzly bear holds a unique position in the traditional cultures, ceremonies and spiritual practices of the affected tribes. If the Yellowstone grizzly bear is delisted, the management plans of the states of Wyoming, Montana and Idaho propose trophy hunting the grizzly on both the ancestral and current homelands of the affected tribes, which not only represents a threat to tribal sovereignty, but also contravenes the American Indian Religious Freedom Act (AIRFA) PL-95-341.

During this process, the FWS, Department of the Interior, has so far ignored Executive Order 13175 (Nov. 6, 2000) "Consultation and Coordination with Indian Tribal Governments" signed by President Clinton, and the Memorandum for the Heads of Executive Departments and Agencies (Nov. 5, 2009) issued by President Obama, requiring a "complete and consistent implementation of Executive Order 13175."

The AIRFA states that laws related to "conservation and preservation of natural species" cannot, as was the norm prior to the Act, be "passed without consideration of their effect on traditional American Indian religions." However, in its attempts to delist the Yellowstone grizzly bear without regard to the religious practices of tribal people, the FWS is doing precisely that.

Prominent spiritual leaders and elders from the affected Tribal Nations have issued statements in opposition to delisting the Yellowstone grizzly bear.

Given the economic challenges faced by the affected Tribal Nations, and the cultural significance of the grizzly bear, the prospect of the states charging anywhere between the quoted figures of $10,000 to $100,000 to trophy hunt this sacred being on ancestral tribal lands is at best disrespectful.

Grizzly bear management plans post-delisting should be sensitive to the cultures of the affected Tribal Nations. Rather than have the states influence grizzly bear management on tribal lands, the affected Tribal Nations should be provided with the resources to initiate their own management practices and programs that are consistent with their cultural values. By doing so, tribal sovereignty will be upheld and potential employment and economic opportunity provided.

Additionally, the states' grizzly bear management plans also threaten to detrimentally impact tourism initiatives that would aid the economies of the affected Tribal Nations. Recent studies demonstrate that in strictly economic terms, grizzlies are a legitimate "economic powerhouse," worth far more alive than dead.

At the October 2014 meeting of the cross-jurisdictional body, the Interagency Grizzly Bear Committee (IGBC), the State of Wyoming reaffirmed its previously stated position that it wishes to cap the Greater Yellowstone grizzly bear population at 500. Not only is that number inconsistent with the purpose of the ESA, if recent population estimates issued by the tri-states and FWS are accurate, it would result in a virtual cull post-delisting that would have a devastating impact on tribal people relative to the spiritual importance of the grizzly bear.

As of fall 2014, the FWS and tri-states claim that there are now approximately 1,000 grizzlies in the Greater Yellowstone Ecosystem, which, based upon their own estimates, is an increase of 259 grizzlies in one year, which followed an estimated increase of approximately 112 in six months during 2013. The grizzly bear has the second slowest reproduction rate of any mammal, and clearly the Greater Yellowstone population cannot have increased by 35% in one year.

The affected Tribal Nations are entitled to review the raw data the FWS is basing all of its conclusions upon (not just its population estimates) relative to delisting the grizzly bear through the Secretarial Order issued by the Secretary of the Interior and the Secretary of Commerce pursuant to the Endangered Species Act (ESA) of 1973 (16 U.S.C. 1531). Several tribes have already called upon the FWS to release that data not only to the affected Tribal Nations, but also to independent scientists for analysis and review. This body echoes those calls.

Every federal agency is required to consult with Tribal Nations before they recommend a course of action that has the potential to affect tribal rights and interests. This must occur in this process, as the affected Tribal Nations cannot permit their sovereignty to be undermined.

The manner is which this process has so far been conducted without the consultation and input of the affected Tribal Nations is representative of the recent history of Yellowstone (post-1872). It must be remembered that Yellowstone was a homeland, a sacred cultural landscape to twenty-six tribes, before it was a National Park. However, a visitor to Yellowstone today would not know that, due to the lack of cultural interpretation. A change in that respect is long overdue. America's first national park should no longer have features named after the proponents and exponents of genocide, as is the case with Hayden Valley and Mount Doane.

Seven months before Lieutenant Gustavus Cheyney Doane, 2nd Cavalry, guided the 1870 Yellowstone Expedition, he had led the massacre of Chief Heavy Runner's Piegan Blackfeet village on the Marias River. On his subsequent application to become Superintendent of Yellowstone National Park, he boasted, "Greatest slaughter of Indians ever made by U.S. Troops." Of the 173 victims killed on January 23, 1870, only 15 were men of fighting age.

Where Doane participated in genocide, Dr. Ferdinand V. Hayden advocated it. "Unless they are localized and made to enter upon agricultural and pastoral pursuits they must ultimately be exterminated," Hayden said of our ancestors who were about to be dispossessed by the establishment of Yellowstone National Park. "If extermination is the result of non-compliance, then compulsion is an act of mercy," he concluded.

These names must be changed with the input of the affected Tribal Nations, just as any move to delist the sacred grizzly bear on this ancestral landscape must involve consultation with the affected Tribal Nations.

Pre-the Lewis and Clark Expedition, there were an estimated 100,000 grizzly bears in the Western US. Today the grizzly bear survives on less than 2% of its original range, with possibly 2% of its historic population. The Yellowstone grizzly bear is a genetically isolated, island population that numbers in the hundreds. In a historical context, and by the spirit and intent of the ESA, it cannot yet be considered recovered.

Until these issues cited herein are addressed and resolved to the satisfaction of all of the affected Tribal Nations, we believe that it is premature to even consider issuing a new Rule to delist the iconic Yellowstone grizzly bear from ESA protections.

Respectfully submitted,

TLC Board Chairman Ivan Posey

GOAL Tribal Coalition
PO Box 30,000. #360
Jackson, WY 83002

Respectful GOAL Tribal Coalition Representative,

With Regard to and/or all parties concerned to the GOAL Coalition's efforts towards it's endeavors. The Kiowa Tribe of Oklahoma supports the mission of Guardians of Our Ancestors' Legacy (GOAL) Tribal Coalition to preserve and protect the endangered Yellowstone grizzly bear. In doing so, we will help to ensure that Native American spiritual rights are upheld, and our sovereignty defended.

The area now known as the Greater Yellowstone Ecosystem with Yellowstone National Park at its heart is the ancestral homeland of the Kiowa. It was in this region that our ancestors first established sacred kinship with the grizzly bear.

Our respect and reverence for the grizzly bear is reflected in many Kiowa names; some of the greatest leaders in Kiowa history carried names inspired by the grizzly bear, including Set-tain-te (Satanta) and Set-angya (Satank), and the importance of the bear in our traditional culture can still be heard in our names today.

Narratives pertaining to the grizzly bear are fundamental to many of our sacred sites in what is now Wyoming, and what was once our homeland. We oppose the present attempts by the US Fish and Wildlife Service (FWS) and the states of Wyoming, Montana and Idaho to remove Endangered Species Act (ESA) protections from the Yellowstone grizzly bear.

The Kiowa Tribe of Oklahoma rejects the notion that the sacred grizzly bear should be considered a "trophy game animal" and hunted in our ancestral homeland.

We agree that the FWS's determination to remove the Yellowstone grizzly bear from ESA protection without thorough consultation with the affected tribes identified as possessing an ancestral connection to Yellowstone contravenes the American Indian Religious Freedom Act (PL-95-341). There has been no discussion related to the impact

delisting the grizzly, and the subsequent trophy hunting of the bear, will have on American Indian spirituality, namely the religious practices of traditional tribal people, protected by PL-95-341.

We further agree that by ignoring the affected tribes, the FWS is also in contravention of the Secretarial Order issued by the Secretary of the Interior and the Secretary of Commerce pursuant to the Endangered Species Act (ESA) of 1973 (16 U.S.C. 1531), which sets forth the framework to be followed when actions taken under authority of the ESA affect tribes.

The *American Indian Tribal Rights, Federal-Tribal Trust Responsibilities, and the Endangered Species Act Order* explicitly states: "The Departments shall take into consideration the impacts of their actions and policies under the Act on Indian use of listed species for cultural and religious purposes (Sec. 5 #4). The Order also directs the FWS to "solicit traditional knowledge, and comments from, and utilize the expertise of, affected Indian tribes" during consultation processes. This has yet to happen.

Not consulting with the affected tribes is not only a breach of PL-95-341 and 16 U.S.C. 1531, it constitutes an infringement of our sovereignty.

Clearly the grizzly bear is not recovered under the criteria set forth by the Endangered Species Act. A population of between 500–700 grizzlies surviving on less than 1% of their original range pre-contact could not be considered recovered even if it were not genetically isolated and threatened by the loss of keystone food sources, which the Yellowstone grizzly bear is.

It is essential that the FWS finally makes the data it is basing its conclusions upon available, not only to the affected tribes, but crucially, to the scientific community for independent analysis and review. The affected tribes are entitled to the information under 16 U.S.C. 1531.

By protecting the sacred grizzly bear and in the process defending our religious freedom and sovereignty we honor our ancestors. The tribal heritage of Rain Bear Stands Last, the founder of GOAL, includes Kiowa. One of his ancestors, the great Cheyenne leader, Sleeping Bear, once presented the legendary Kiowa chief, Téh-tóot-sah (Little Bluff), with a famous painted tipi.

This exchange began a tradition amongst our peoples. In supporting GOAL and this effort, we continue that tradition, and in the spirit of our ancestors attempt to ensure that

our children and future generations will grow-up in a world where grizzlies still roam our ancestral homeland so that a large part of our culture and history will remain intact.

Respectfully Submitted,

Amber C. Toppah, Lady Chairman
Kiowa Business Committee
Kiowa Tribe of Oklahoma

THE SHOSHONE-PAIUTE TRIBES
OF THE DUCK VALLEY INDIAN RESERVATION
P.O. Box 219 Owyhee, NV 89832
(208) 759-3100
www.shopaitribes.org

December 18, 2014

For the attention of all parties concerned:

The Shoshone-Paiute Tribes of the Duck Valley Indian Reservation stand in solidarity with our sister tribes, the Eastern Shoshone Tribe of the Wind River Indian Reservation, and the Shoshone-Bannock Tribes of Idaho, in opposing the proposed delisting of the Yellowstone grizzly bear from Endangered Species Act (ESA) protections by the US Fish and Wildlife Service (FWS).

The Shoshone-Paiute Tribes of the Duck Valley Indian Reservation supports the positions articulated by the Eastern Shoshone Tribe and the Shoshone-Bannock Tribes in their resolution and declarations respectively.

The Shoshone-Paiute Tribes have clear interests to this issue. Many of our tribal members are descended from those whom enjoyed a connection to the landscape now referred to as Greater Yellowstone since time immemorial. In more recent times, our ancestors stood with the Bannock people in defending our homelands in 1878.

The grizzly bear has a significant place in Shoshone-Paiute culture. The grizzly bear is a sacred being, intricately tied to the ceremonies and practices of our people. Such is our respect for the grizzly that we refer to the great bear as our brother.

In its attempts to delist the Yellowstone grizzly bear without regard to the ceremonial and religious practices of tribal people, the FWS is doing so "without consideration of their effect on traditional American Indian religions," which is a violation of the American Indian Religious Freedom Act (PL 95-341–1978/PL 103-344 –1994).

Abrogation of the AIRFA threatens potentially detrimental consequences not only for our religious and spiritual rights, but the sovereignty of all of the Tribal Nations impacted by this issue.

Federally recognized tribes have a unique nation-to-nation relationship with the federal government that requires consultation to be held at a government-to-government level; and government-to-government consultation is conducted under existing protocols and within an established framework.

Given the tremendous concern expressed by many of the Associated Tribes of Yellowstone regarding the potential delisting of the grizzly bear, the FWS should immediately commence consultation with the impacted Tribal Nations regarding the implications of a delisting decision. US government agencies, including FWS, have a duty to consult with tribes regarding policies that have tribal implications. This duty has been embodied in a variety of executive orders, secretarial orders, and memoranda. Executive Order 13175, issued by President Clinton in 2000, was written "to establish regular and meaningful consultation and collaboration with tribal officials in the development of Federal policies that have tribal implications." Such policies include "regulations ... and other policy statements or actions that have substantial direct effects on one or more Indian tribes," such as listing and delisting decisions.

A 2009 memorandum issued by President Obama emphasized the importance of President Clinton's Executive Order, noting that "[c]onsultation is a critical ingredient of a sound and productive Federal-tribal relationship" and affirming the Administration's "commit[ment] to regular and meaningful consultation and collaboration with tribal officials in policy decisions that have tribal implications." President Obama's 2013 Executive Order Establishing the White House Council on Native American Affairs further recognizes that "[g]reater engagement and meaningful consultation with tribes is of paramount importance in developing any policies affecting tribal nations."

The US Departments of Interior and Commerce issued an order on June 5, 1997, specifically regarding tribal consultation obligations in the context of the Endangered Species Act. That order provides that FWS "shall coordinate with affected Indian tribes in order to fulfill the Service['s] trust responsibilities and encourage meaningful tribal participation" in listing and delisting decisions.

Ignoring these Acts and Orders contradicts the basis of the government-to-government relationship that exists between the federal government and all of the Tribal Nations impacted by this issue, a situation that must be remedied.

We join our sister tribes in rejecting the designation of the grizzly bear as a "trophy game animal" and the intent of the states to sell licenses and generate multiple

thousands of dollars from trophy hunting the sacred grizzly bear on our ancestral homelands.

Tribal Nations have alternative solutions to the outdated "wildlife management" practices. Trophy hunting sentient beings appeals only to a tiny minority of the population, and is antithetical to the traditional cultures and subsistence practices of tribal people. Just as the buffalo is being returned to reservation homelands with biologically suitable habitat, some Tribal Nations with appropriate land bases have expressed a desire to develop programs to return the grizzly to their sovereign nations.

Grizzly bear management plans post-delisting should be sensitive to the cultures of the affected Tribal Nations. Rather than have the states influence grizzly bear management on tribal lands, the affected Tribal Nations should be provided with the resources to initiate their own management practices and programs that are consistent with their cultural values. By doing so, tribal sovereignty will be upheld and potential employment and economic opportunity provided.

Our people, those of our sister tribes, and the memberships of the other impacted tribes, retain unique insights into this landscape. Our ancestors are the only ones who had practical experience of what it was to live within these ecosystems when they were complete. The knowledge that they retained and passed down is truly the definition of the "best available science" as they lived it – they did not speculate upon the theoretic. Their voices, through us, need to be heard.

Until these issues cited herein are addressed and resolved to the satisfaction of all of the affected Tribal Nations, we believe that it is premature to even consider issuing a new Rule to delist the iconic Yellowstone grizzly bear from ESA protections.

Sincerely,

Lindsey W. Manning

To Whom It May Concern:

This letter is in support of the GOAL Tribal Coalition. The Northern Cheyenne Tribe opposes the federal government's proposed removal of the Yellowstone grizzly bear from Endangered Species Act protections through the US Fish and Wildlife Service and we believe the federal government's determination to remove the grizzly bear from Endangered Species Act protection contravenes the American Indian Religious Freedom Act (AIRFA. PUBLIC LAW 95-341--AUG. 11, 1978).

As one of the twenty-six federally recognized tribes the federal government acknowledges has an ancestral connection to the region now known as Yellowstone National Park and the Greater Yellowstone Ecosystem the US Fish and Wildlife Service is thus required to consult with the Northern Cheyenne Tribe, yet the US Fish and Wildlife Service has refused to release the data it has based its conclusions on for independent scientific review, that data being the basis for the federal government's proposal to remove the grizzly bear from Endangered Species Act protections.

The grizzly bear holds a unique position in the traditional cultures and ceremonial life-ways of the traditional spiritual practitioners of tribes identified by the federal

government as possessing centuries old, and in some instances, millennia-long connections to the lands where the grizzly now survives.

Clearly cultural imperatives and the preservation of sovereignty require a repudiation of the federal government's desire to delist the grizzly bear from Endangered Species Act protections; and the legislative resolve to deny the states' determination to see trophy hunting of grizzlies on reservations and the extirpation of the grizzly bear from swathes of reservation and ancestral homelands.

We the Cheyenne Nation stand in support of the grizzly bear, and the right of Native peoples to religious freedom

Yours faithfully,

Llevando Fisher

President of the Northern Cheyenne Nation

December 17, 2014

For the attention of:
Secretary of the Interior, Sally Jewell;
Dan Ashe, Director – US Fish and Wildlife Service;
Other Parties Concerned:

The sovereignty and spiritual rights of the Spirit Lake Sioux Tribe are threatened by the proposed delisting of the Yellowstone grizzly bear from Endangered Species Act (ESA) protections by the US Fish and Wildlife Service (FWS).

The Spirit Lake Sioux Tribe is one of the twenty-six Tribal Nations the federal government recognizes as having an ancestral connection to Yellowstone ("Associated Tribe of Yellowstone" – *Resources & Issues*, NPS, 2010). Ten of the identified associated Tribal Nations are from the Oceti Sakowin (Great Sioux Nation), but to date none have been consulted in this process.

Federally recognized tribes have a unique nation-to-nation relationship with the federal government that requires consultation to be held at a government-to-government level; and government-to-government consultation is conducted under existing protocols and within an established framework.

Yellowstone and the Greater Yellowstone Ecosystem is a matrix of sacred and cultural sites of great significance to the twenty-six affected tribes, and those tribes' Tribal Historic Preservation Offices (THPOs) must be engaged in an initial process of consultation consistent with the criteria of the THPOs designated mission (Section 101(d)(2) of the National Historic Preservation Act), in addition to consultation with tribal governments (executive and legislative branches), and recognized spiritual leaders.

Chief Arvol Looking Horse, 19th Generation Keeper of the White Buffalo Calf Pipe of the Great Sioux Nation, detailed the spiritual and ceremonial significance of the grizzly bear in Lakota, Dakota and Nakota culture in his November 2014 statement in opposition to delisting of the Yellowstone grizzly from the ESA.

The cultural, geographic and sacred landscape of the Lakota, Dakota and Nakota people demonstrates the cultural importance of the grizzly bear. Numerous sacred sites, along with the names of creeks, rivers and buttes, were inspired by the grizzly bear. Many of our great historical leaders carried grizzly bear names, and those traditional names are present today among families in our communities.

As Chief Looking Horse has demonstrated, the ceremonial significance of the grizzly is an ancient connection. Lakota ceremonies related to the grizzly, historically known as Bear Medicine Ceremonies, are, like all of our spiritual and religious ways, protected by the American Indian Religious Freedom Act (PL 95-341–1978/PL 103-344 –1994). The Act states that laws and policies pertaining to "conservation and preservation of natural species" cannot be "passed without consideration of their effect on traditional American Indian religions." In its attempts to delist the Yellowstone grizzly bear without regard to the religious practices of tribal people, the FWS is doing so "without consideration of their effect on traditional American Indian religions."

Abrogation of the AIRFA threatens potentially detrimental consequences not only for our religious and spiritual rights, but the sovereignty of all of the affected Tribal Nations.

Executive Order 13175 (Nov. 6, 2000) "Consultation and Coordination with Indian Tribal Governments" signed by President Clinton, and the Memorandum for the Heads of Executive Departments and Agencies (Nov. 5, 2009) issued by President Obama, requiring a "complete and consistent implementation of Executive Order 13175," have yet to be followed by the US Fish and Wildlife Service (FWS) during this process.

Executive Order 13647 (June 2013) states, "Greater engagement and meaningful consultation with tribes is of paramount importance in developing any policies affecting tribal nations." The proposed delisting of the Yellowstone grizzly bear affects the Spirit Lake Sioux Tribe and the Lakota, Dakota and Nakota people of the Oceti Sakowin (Great Sioux Nation).

The Secretarial Order issued by the Secretary of the Interior and the Secretary of Commerce pursuant to the Endangered Species Act (ESA) of 1973 (16 U.S.C. 1531), established the protocols to be followed when decisions related to the ESA had the potential to impact tribes. The Order directs the FWS to "solicit traditional knowledge, and comments from, and utilize the expertise of, affected Indian tribes" during the consultation process, and "cooperate with affected tribes to develop and implement Recovery Plans in a manner that minimizes" social and cultural impacts on tribal people. In the move to delist the grizzly, this has not been followed.

Ignoring these Acts and Orders contradicts the basis of the the government-to-government relationship that exists between not only the Lakota, Dakota and Nakota Tribal Nations and the federal government, but all of the 26 Tribal Nations affected by this issue.

The Spirit Lake Sioux Tribe rejects the designation of the grizzly bear as a "trophy game animal" to be killed by big game hunters on the lands our ancestors defended. Revered spiritual leaders from the past, the likes of Black Elk and Sword, articulated the perception of the Lakota, Dakota and Nakota people when they said, "The grizzly bear is *wakan* (sacred)."

Today the grizzly bear survives on less than 2% of its original range, with only 2% of its historic population. There is much work to be done before the grizzly bear can be considered recovered. Many areas of biologically suitably habitat exist where the grizzly once roamed, many of them in our ancestral homelands, and the grizzly should be returned to those areas.

Tribal Nations have alternative solutions to the outdated wildlife management practice of killing. Trophy hunting sentient beings appeals only to a tiny minority of the population, a minority that is over 95% white, from high economic strata. Just as the buffalo is being returned to reservation homelands with biologically suitable habitat, some Tribal Nations with appropriate land bases have expressed a desire to develop programs to return the grizzly to their sovereign nations.

Under such circumstances, estimated carrying capacity in one ecosystem would not result in killing but relocation to ignite new populations that would realize the long-projected need for linkage zones between grizzly populations. Today, the two small island populations of grizzlies surviving in two isolated ecosystems in the lower-48 cannot be considered a recovered species appropriate for delisting and subsequent trophy hunting.

Grizzly bear management plans post-delisting should be sensitive to the cultures of the affected Tribal Nations. Rather than have the states influence grizzly bear management on tribal lands, the affected Tribal Nations should be provided with the resources to initiate their own management practices and programs that are consistent with their cultural values. By doing so, tribal sovereignty will be upheld and potential employment and economic opportunity provided.

The consultation process that is mandated by the aforementioned Acts and Orders entitles the Spirit Lake Sioux Tribe (and the other nations of the Oceti Sakowin and affected Tribal Nations) to review the raw data the FWS is basing all of its conclusions upon

relative to delisting the grizzly bear. Several tribes have already called upon the FWS to release that data not only to the affected Tribal Nations, but also to independent scientists for analysis and review – the Spirit Lake Sioux Tribe adds its voice to that call.

The Spirit Lake Sioux Tribe supports Chief Arvol Looking Horse's position in opposing the removal of the Yellowstone grizzly bear from the Endangered Species Act, and we support the efforts of GOAL Tribal Coalition to protect the sacred grizzly bear and in doing so defend tribal sovereignty and spiritual rights.

Sincerely,

Myra Pearson
Spirit Lake Tribe Chairperson

Open Letter Approved By Official Resolution No. 11Dec2014-04 of the MT WY Tribal Leaders Council on December 11, 2014

The sovereignty and spiritual rights of Tribal Nations in Montana and Wyoming are threatened by the proposed delisting of the Yellowstone grizzly bear from Endangered Species Act (ESA) protections by the US Fish and Wildlife Services. Ten of the twenty-six Tribal Nations the federal government recognizes as having an ancestral connection to Yellowstone are located in Montana and Wyoming, but to date they have not been consulted in this process.

The grizzly bear holds a unique position in the traditional cultures, ceremonies and spiritual practices of the affected tribes. If the Yellowstone grizzly bear is delisted, the management plans of the states of Wyoming, Montana and Idaho propose trophy hunting the grizzly on both the ancestral and current homelands of the affected tribes, which not only represents a threat to tribal sovereignty, but also contravenes the American Indian Religious Freedom Act (AIRFA) PL-95-341.

During this process, the FWS, Department of the Interior, has so far ignored Executive Order 13175 (Nov. 6, 2000) "Consultation and Coordination with Indian Tribal Governments" signed by President Clinton, and the Memorandum for the Heads of Executive Departments and Agencies (Nov. 5, 2009) issued by President Obama, requiring a "complete and consistent implementation of Executive Order 13175."

The AIRFA states that laws related to "conservation and preservation of natural species" cannot, as was the norm prior to the Act, be "passed without consideration of their effect on traditional American Indian religions." However, in its attempts to delist the Yellowstone grizzly bear without regard to the religious practices of tribal people, the FWS is doing precisely that.

Prominent spiritual leaders and elders from the affected Tribal Nations have issued statements in opposition to delisting the Yellowstone grizzly bear.

Given the economic challenges faced by the affected Tribal Nations, and the cultural significance of the grizzly bear, the prospect of the states charging anywhere between the quoted figures of $10,000 to $100,000 to trophy hunt this sacred being on ancestral tribal lands is at best disrespectful.

Grizzly bear management plans post-delisting should be sensitive to the cultures of the affected Tribal Nations. Rather than have the states influence grizzly bear management on tribal lands, the affected Tribal Nations should be provided with the resources to initiate their own management practices and programs that are consistent with their cultural values. By doing so, tribal sovereignty will be upheld and potential employment and economic opportunity provided.

Additionally, the states' grizzly bear management plans also threaten to detrimentally impact tourism initiatives that would aid the economies of the affected Tribal Nations. Recent studies demonstrate that in strictly economic terms, grizzlies are a legitimate "economic powerhouse," worth far more alive than dead.

At the October 2014 meeting of the cross-jurisdictional body, the Interagency Grizzly Bear Committee (IGBC), the State of Wyoming reaffirmed its previously stated position that it wishes to cap the Greater Yellowstone grizzly bear population at 500. Not only is that number inconsistent with the purpose of the ESA, if recent population estimates issued by the tri-states and FWS are accurate, it would result in a virtual cull post-delisting that would have a devastating impact on tribal people relative to the spiritual importance of the grizzly bear.

As of fall 2014, the FWS and tri-states claim that there are now approximately 1,000 grizzlies in the Greater Yellowstone Ecosystem, which, based upon their own estimates, is an increase of 259 grizzlies in one year, which followed an estimated increase of approximately 112 in six months during 2013. The grizzly bear has the second slowest reproduction rate of any mammal, and clearly the Greater Yellowstone population cannot have increased by 35% in one year.

The affected Tribal Nations are entitled to review the raw data the FWS is basing all of its conclusions upon (not just its population estimates) relative to delisting the grizzly bear through the Secretarial Order issued by the Secretary of the Interior and the Secretary of Commerce pursuant to the Endangered Species Act (ESA) of 1973 (16 U.S.C. 1531). Several tribes have already called upon the FWS to release that data not only to the affected Tribal Nations, but also to independent scientists for analysis and review. This body echoes those calls.

Every federal agency is required to consult with Tribal Nations before they recommend a course of action that has the potential to affect tribal rights and interests. This must occur in this process, as the affected Tribal Nations cannot permit their sovereignty to be undermined.

The manner is which this process has so far been conducted without the consultation and input of the affected Tribal Nations is representative of the recent history of Yellowstone (post-1872). It must be remembered that Yellowstone was a homeland, a sacred cultural landscape to twenty-six tribes, before it was a National Park. However, a visitor to Yellowstone today would not know that, due to the lack of cultural interpretation. A change in that respect is long overdue. America's first national park should no longer have features named after the proponents and exponents of genocide, as is the case with Hayden Valley and Mount Doane.

Seven months before Lieutenant Gustavus Cheyney Doane, 2nd Cavalry, guided the 1870 Yellowstone Expedition, he had led the massacre of Chief Heavy Runner's Piegan Blackfeet village on the Marias River. On his subsequent application to become Superintendent of Yellowstone National Park, he boasted, "Greatest slaughter of Indians ever made by U.S. Troops." Of the 173 victims killed on January 23, 1870, only 15 were men of fighting age.

Where Doane participated in genocide, Dr. Ferdinand V. Hayden advocated it. "Unless they are localized and made to enter upon agricultural and pastoral pursuits they must ultimately be exterminated," Hayden said of our ancestors who were about to be dispossessed by the establishment of Yellowstone National Park. "If extermination is the result of non-compliance, then compulsion is an act of mercy," he concluded.

Interior Secretary Sally Jewell,
US Department of the Interior,
1849 C Street, NW
Washington, DC 20240

RE: Official resolutions, declarations and letters of twenty-nine (29) federally recognized Indian Tribes in opposition to the US Fish and Wildlife Service's proposed delisting of the Yellowstone grizzly bear (*Ursus arctos horribilis*) from the Endangered Species Act, and the US Fish and Wildlife Service's contravention of the established protocols for tribal consultation in this process.

Dear Madam Secretary,

Enclosed please find both original documents and copies of the aforementioned official resolutions, declarations and letters of twenty-nine (29) federally recognized Indian Tribes in opposition to the US Fish and Wildlife Service's (FWS) proposed delisting of the Yellowstone grizzly bear from the Endangered Species Act (ESA).

Included among these is a resolution by the Eastern Shoshone Tribe, whom you visited in August 2013, a declaration by the Standing Rock Sioux Tribe, to whom President Obama made an official government-to-government visit in June 2014, and a letter from the Crow Tribe, President Obama's adopted people.

In addition, copies of resolutions recently passed by the Northern Cheyenne Tribe and the Great Plain Plains Tribal Chairmen's Association will be forthcoming. In total, this amounts to every tribe in Wyoming, Montana, South Dakota, North Dakota, Nebraska, and some in Idaho and Oklahoma. GOAL (Guardians of Our Ancestors' Legacy) Tribal Coalition, of which I am a co-founder, liaised and coordinated with the respective Tribal Nations and representative bodies in amassing this official documentation.

RECEIVED

As articulated in all of the resolutions, declarations and letters, due to the immense spiritual and religious significance of the grizzly bear in tribal cultures, all of the Tribal Nations cite violations of the American Indian Religious Freedom Act (AIRFA–PL 95-341–1978/PL 103-344 –1994) in FWS's actions to date relative to delisting the grizzly bear.

Similarly, all of the Tribal Nations specify FWS's disregard for established consultation protocols. Standing Rock Sioux Chairman, Dave Archambault II, succinctly articulates this in his tribe's declaration:

"Executive Order 13175 (Nov. 6, 2000) 'Consultation and Coordination with Indian Tribal Governments' signed by President Clinton, and the Memorandum for the Heads of Executive Departments and Agencies (Nov. 5, 2009) issued by President Obama, requiring a 'complete and consistent implementation of Executive Order 13175,' have yet to be followed by the US Fish and Wildlife Service (FWS) during this process.

Executive Order 13647 (June 2013) states, 'Greater engagement and meaningful consultation with tribes is of paramount importance in developing any policies affecting tribal nations.' The proposed delisting of the Yellowstone grizzly bear affects the Lakota, Dakota and Nakota people of the Great Sioux Nation.

This lack of consultation by FWS stands in direct contrast to the policy directives of the Obama Administration. President Obama has attempted to strengthen consultation with tribes when federal policies and actions have the potential to affect tribes and have tribal implications. Clearly, removing the Yellowstone grizzly bear from the ESA and permitting states to proceed with high-dollar trophy hunts on our historic cultural landscape fits the criteria.

President Obama made a highly visible commitment to improving dialogue between tribal nations and the federal government when he visited the Standing Rock Sioux Nation in June 2014."

As you are no doubt aware, the Standing Rock Sioux Tribe is one of the 26 Tribal Nations the federal government identifies as having an ancestral connection to the Greater Yellowstone Ecosystem ("Associated Tribe of Yellowstone" – *Resources & Issues*, NPS, 2010), and is, therefore, one of the 26 Tribal Nations that must be consulted in this latest attempt to delist the Yellowstone grizzly bear.

In your statement of 12/19/2014 pertaining to the National Defense Authorization Act, specifically the Resolution Copper Mining provision, you said that you were "profoundly disappointed" with the disregard for tribal spiritual rights and how the provision "short-circuits the long-standing and fundamental practice of pursuing meaningful government-to-government consultation." This is precisely what is occurring with FWS's failure to pursue

"meaningful government-to-government consultation" in the proposed delisting of the Yellowstone grizzly bear.

Further, FWS appears oblivious to your emphasizing that, "the appropriate time for honoring our government-to-government relationship with tribes is before legislating issues of this magnitude."

In response to questions from the press about the lack of tribal consultation, FWS's "Grizzly Bear Coordinator," Dr. Christopher Servheen, recently claimed "we've done what we are required to do" (*Bozeman Daily Chronicle* 1/9/15), and identified four letters he sent in April 2014 as validation, one each to the Eastern Shoshone, the Shoshone-Bannock Tribes of Idaho, the Northern Arapaho, and an unidentified tribe in Idaho. From personal contact GOAL has had with the chairmen of each of the tribes identified, I can attest to the fact that they never had sight of a letter from Dr. Servheen.

Dr. Servheen then repeated to the Associated Press (*New York Times* et al 1/11/15) what he stated to the *Missoula Independent* about consultation with the tribes (12/17/14): "They were all sent those letters, and we haven't heard anything in response to those letters." This is patently false on two counts; one, not all of the 26 affected tribes were sent letters; and two, the Eastern Shoshone Tribe responded to FWS's intent to proceed with delisting by issuing their resolution in opposition on 10/28/14, the Shoshone-Bannock Tribes of Idaho did similarly 11/4/14, and as a member tribe of the Montana & Wyoming Tribal Leaders Council (TLC) the Northern Arapaho did the same when the TLC issued a resolution opposing delisting on 12/11/14.

Dr. Servheen's comment deriding the tribes' position on sovereignty in regard to this issue (*Bozeman Daily Chronicle* 1/9/15), and the context of his remark to the Associated Press that "we asked for their input and ideas" as if he were the arbiter of the validity of the tribes' knowledge of the grizzly bear which has been amassed since time immemorial, speaks to an individual lacking in both cultural sensitivity and knowledge relative to the consultation process required by acts of Congress (AIRFA, etc.), Secretarial Orders, and Executive Orders that define the government-to-government status that exists between Indian tribes and the federal government.

Tribes have a relationship with Congress and the Secretary of the Interior; tribes are not required to report to a department coordinator or follow his instructions, as, for example, Dr. Servheen bade the Eastern Shoshone in his April 2014 letter that Chairman Darwin St. Clair didn't receive, but Servheen released to the press regardless (*Bozeman Daily Chronicle*

1/9/15): "If you are aware of others who should also receive this request, either within your tribe or with another tribe, please forward this letter," he wrote.

The 26 affected Tribal Nations were not consulted by FWS during the process of its previous delisting attempt, a fact Dr. Servheen conceded when he said he "received no comment from the tribes on that proposal" (*Bozeman Daily Chronicle* 1/9/15). Again, this demonstrates a fundamental misunderstanding of the protocols involved; it is the responsibility of the respective federal agency or department to initiate the consultation process with the Tribal Nations that may be impacted by the consequences of federal actions, not vice-versa.

I would be amazed if either you or President Obama would concur that mailing a letter to only four of the impacted Tribal Nations constitutes "meaningful government-to-government consultation," or that either you or the President would agree with Coordinator Servheen that in terms of consultation FWS has "done what they are required to do." Among other tribal leaders, Oglala Sioux Tribal Vice President, Tom Poor Bear, outlined the framework of "meaningful government-to-government consultation" in his tribe's declaration (copy enclosed).

In addition to the abrogation of consultation protocols and the violation of religious and spiritual rights, all of the Tribal Nations have called for FWS to release the raw data from which the Interagency Grizzly Bear Study Team (IGBST) made its recommendation to proceed with delisting the Yellowstone grizzly bear. The American people have funded the collection of this data through their taxes, and as this is not a matter of national security there is no reason why this data should be withheld from public scrutiny. As Chairman Dave Archambault II highlighted in the Standing Rock Sioux Tribe's declaration:

"The Standing Rock Sioux Tribe (and the other affected Tribal Nations) is entitled to review the raw data the FWS is basing all of its conclusions upon relative to delisting the grizzly bear through the Secretarial Order issued by the Secretary of the Interior and the Secretary of Commerce pursuant to the Endangered Species Act (ESA) of 1973 (16 U.S.C. 1531). Several tribes have already called upon the FWS to release that data not only to the affected Tribal Nations, but also to independent scientists for analysis and review. The cultural importance of this issue is such that questions and contradictions must be resolved without bias if tribal members, and the public at large, are to have confidence in the outcome."

Madam Secretary, I was present on the Wind River Indian Reservation when you visited in August 2013. During your remarks you said, "I want to be helpful, but you are the experts," and you then concluded with "I'm all ears." I sincerely hope that you will listen to the tribes

on this occasion and intervene to ensure that there is a thorough and "meaningful government-to-government consultation" process, and that you will institute a moratorium on the proposed delisting of the Yellowstone grizzly bear until all of the issues raised by the affected Tribal Nations have been fully addressed.

Néá'eše/àho (Thank you).

Respectfully,

R. Bear Stands Last

To Whom it May Concern:

The sovereignty and spiritual rights of the Crow Creek Sioux Tribe and the Lakota, Dakota and Nakota people of the Great Sioux Nation are threatened by the proposed delisting of the Yellowstone grizzly bear from Endangered Species Act (ESA) protections by the US Fish and Wildlife Service (FWS). The Crow Creek Sioux Tribe is one of the twenty-six Tribal Nations the federal government recognizes as having an ancestral connection to Yellowstone ("Associated Tribe of Yellowstone" – *Resources & Issues*, NPS, 2010). In total, ten of those Tribal Nations are from the Oceti Sakowin (Great Sioux Nation), but to date none have been consulted in this process.

Chief Arvol Looking Horse, 19th Generation Keeper of the White Buffalo Calf Pipe of the Great Sioux Nation, detailed the spiritual and ceremonial significance of the grizzly bear in Lakota, Dakota and Nakota culture in his November 2014 statement in opposition to delisting of the Yellowstone grizzly from the ESA.

The cultural, geographic and sacred landscape of the Lakota, Dakota and Nakota people demonstrates the cultural importance of the grizzly bear. Sacred sites like Mato Tipila (Devils Tower) and Mato Paha (Bear Butte) are inseparable from our ceremonial connection to the grizzly. Numerous traditional and current family names, along with the names of creeks, rivers and buttes, were inspired by the grizzly bear. Many of our great historical leaders carried grizzly bear names, Smutty Bear, Medicine Bear, White Bear, and Two Bears among them.

As Chief Looking Horse has demonstrated, the ceremonial significance of the grizzly in our spiritual lifeway is an ancient

connection. Like all of our spiritual and religious ways, ceremonies related to the grizzly are protected by the American Indian Religious Freedom Act (PL 95-341–1978/PL 103-344 –1994). The Act states that laws and policies pertaining to "conservation and preservation of natural species" cannot be "passed without consideration of their effect on traditional American Indian religions." So far, in its attempts to delist the Yellowstone grizzly bear without regard to the religious practices of tribal people, the FWS is doing precisely that.

Abrogation of the AIRFA threatens potentially detrimental consequences not only for our religious and spiritual rights, but the sovereignty of all of the affected Tribal Nations.

Executive Order 13175 (Nov. 6, 2000) "Consultation and Coordination with Indian Tribal Governments" signed by President Clinton, and the Memorandum for the Heads of Executive Departments and Agencies (Nov. 5, 2009) issued by President Obama, requiring a "complete and consistent implementation of Executive Order 13175," have yet to be followed by the US Fish and Wildlife Service (FWS) during this process.

Executive Order 13647 (June 2013) states, "Greater engagement and meaningful consultation with tribes is of paramount importance in developing any policies affecting tribal nations." The proposed delisting of the Yellowstone grizzly bear affects the Lakota, Dakota and Nakota people of the Oceti Sakowin (Great Sioux Nation).

The Secretarial Order issued by the Secretary of the Interior and the Secretary of Commerce pursuant to the Endangered Species Act (ESA) of 1973 (16 U.S.C. 1531), established the protocols to be followed when decisions related to the ESA had the potential to impact tribes. The Order directs the FWS to "solicit traditional knowledge, and comments from, and utilize the expertise of, affected Indian tribes" during the consultation

process, and "cooperate with affected tribes to develop and implement Recovery Plans in a manner that minimizes" social and cultural impacts on tribal people. In the move to delist the grizzly, this has not been followed.

Ignoring these Acts and Orders contradicts the basis of the the government-to-government relationship that exists between not only the Lakota, Dakota and Nakota Tribal Nations and the federal government, but all of the 26 Tribal Nations affected by this issue.

The Crow Creek Sioux Tribe rejects the designation of the grizzly bear as a "trophy game animal" to be killed by big game hunters on the lands our ancestors defended. As one of those defenders, the respected Lakota Bear Medicine Man, Sword, said, "The grizzly bear is *wakan*."

The Acts and Orders cited herein entitle the Crow Creek Sioux Tribe (and the other 25 affected Tribal Nations) to review the raw data the FWS is basing all of its conclusions upon relative to delisting the grizzly bear. Several tribes have already called upon the FWS to release that data not only to the affected Tribal Nations, but also to independent scientists for analysis and review, which must happen.

The Crow Creek Sioux Tribe supports Chief Arvol Looking Horse's position in opposing the removal of the Yellowstone grizzly bear from the Endangered Species Act, and the work of GOAL Tribal Coalition. We join the other affected Tribal Nations that have issued resolutions, declarations and statements in opposition to delisting the grizzly and call for the FWS to begin the process of consultation to ensure that our sovereignty and spiritual rights are upheld.

JAN 20 2015

To Whom It May Concern:

The Eastern Shoshone Tribe stands beside the other tribal nations that have offered their support to GOAL (Guardians of Our Ancestors' Legacy) Tribal Coalition in their efforts to defend tribal sovereignty and Native American religious and spiritual rights as defined by the American Indian Religious Freedom Act (PL 95-341--AUG. 11, 1978).

The drive by the US Fish and Wildlife Service (FWS) and the State of Wyoming to remove the Yellowstone grizzly bear from Endangered Species Act (ESA) protections to enable Wyoming to manage the grizzly as a "trophy game animal" and generate tens of thousands of dollars for the state from trophy hunters' license fees amounts to an infringement of the American Indian Religious Freedom Act.

Even prior to the Richardson Amendments (HR 4230) that President Clinton signed into law in 1994 (PL 103-344, 108 Stat. 3125), PL 95-341 made plain that laws related to "conservation and preservation of natural species" could not, as had been the norm prior to the Act, be "passed without consideration of their effect on traditional American Indian religions." However, in its attempts to delist the Yellowstone grizzly bear without regard to the religious practices of tribal people, the FWS is doing precisely that.

The grizzly bear is highly respected by tribal people, and has a prominent role in the traditional spiritual practices of our people – the very lifeblood of our culture. The opposition of tribal members on the Wind River Indian Reservation to the delisting and trophy hunting of the grizzly bear has been apparent since our 55th Annual Eastern Shoshone Indian Days and Powwow, at which GOAL began making our tribal members aware of this issue and its consequences.

The Eastern Shoshone Tribe is among the twenty-six tribal nations recognized by the federal government as having an ancestral connection to Yellowstone ("Associated Tribe of Yellowstone" – *Resources & Issues*, NPS Division of Interpretation, 2010). Therefore, by the federal government's own criteria, the Eastern Shoshone Tribe must be included in any discussions pertaining to the removal of the sacred grizzly bear from ESA protections.

To date there has been no consultation with any of the spiritual leaders of the tribes impacted by the proposed delisting of the grizzly bear, which means that the FWS is also in contravention of the Secretarial Order issued by the Secretary of the Interior and the Secretary of Commerce pursuant to the Endangered Species Act of 1973 (16 U.S.C. 1531), which established the protocols to be followed when actions taken under authority of the ESA affect tribes.

The *American Indian Tribal Rights, Federal-Tribal Trust Responsibilities*, and the Endangered Species Act Order state, among other significant clauses:

"The Departments shall take into consideration the impacts of their actions and policies under the Act on Indian use of listed species for cultural and religious purposes (Sec. 5 #4)."

The Order directs the US Fish and Wildlife Service to "solicit traditional knowledge, and comments from, and utilize the expertise of, affected Indian tribes" during the consultation process, and "cooperate with affected tribes to develop and implement Recovery Plans in a manner that minimizes" social and cultural impacts on tribal people.

Clearly, the FWS and State of Wyoming have made no provision to abide by the Order.

The State of Wyoming has identified the Wind River Mountains as one area from which it intends to extinguish the grizzly bear. The FWS has already provided Wyoming Game and Fish with the mechanism to do so if the grizzly is delisted, but attempts to prosecute this action would be tantamount to an infringement of the sovereignty of the Eastern Shoshone Tribe.

The Eastern Shoshone Tribe opposes trophy hunting of the grizzly bear in the Wind River Mountains and will not permit the State of Wyoming to inflict its policies on Eastern Shoshone tribal lands. The leadership on the Wind River Indian Reservation rejected proposals to permit the trophy hunting of wolves on our land when the wolf was delisted from the ESA, and we hold that same position in relation to the grizzly bear. The grizzly bear is not recovered by the standard required to fulfill the ESA. A genetically isolated population of approximately 600 grizzlies existing on less than 1.5% of its original range does not meet the criteria of recovery.

Sincerely,

Darwin St. Clair Jr., Chairman
Shoshone Business Council

JAN 2 0 2015

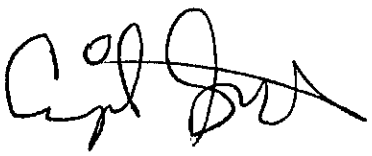
For the attention of:
Dan Ashe, Director – US Fish and Wildlife Service;
Chris Servheen, Grizzly Bear Recovery Coordinator – US Fish and Wildlife Service;
Other Parties Concerned:

The Rosebud Sioux Tribe is one of the twenty-six Tribal Nations recognized by the federal government as having an ancestral connection to Yellowstone ("Associated Tribe of Yellowstone" – *Resources & Issues*, NPS, 2010). Therefore, under the federal government's own criteria, the Rosebud Sioux Tribe should be consulted by the federal departments and agencies presently engaged in attempting to remove of the sacred grizzly bear from Endangered Species Act (ESA) protections.

Executive Order 13175 (Nov. 6, 2000) "Consultation and Coordination with Indian Tribal Governments" signed by President Clinton, and the Memorandum for the Heads of Executive Departments and Agencies (Nov. 5, 2009) issued by President Obama, requiring a "complete and consistent implementation of Executive Order 13175," have yet to be followed by the US Fish and Wildlife Service (FWS) during this process.

This issue extends beyond delisting the grizzly bear, and threatens potentially detrimental consequences for tribal sovereignty and our religious and spiritual rights as defined by the American Indian Religious Freedom Act (PL 95-341–1978/PL 103-344 –1994). Laws and policies related to "conservation and preservation of natural species" cannot, as had been the norm prior to the Act, be "passed without consideration of their effect on traditional American Indian religions." However, in its attempts to delist the Yellowstone grizzly bear without regard to the religious practices of tribal people, the FWS is doing precisely that.

In his statement of November 2014, Chief Arvol Looking Horse, 19th Generation Keeper of the White Buffalo Calf Pipe of the Oceti Sakowin, detailed the spiritual and ceremonial significance of the grizzly bear in Lakota, Dakota and Nakota culture.



The Lakota cultural and geographic landscape demonstrates the cultural importance of the grizzly bear. Many physical features and sacred sites are known by names inspired by the grizzly bear. Our people still carry names that reflect the significance of the grizzly. Throughout our history, numerous great leaders have borne grizzly bear names.

The specter of trophy hunters killing grizzly bears on our sacred lands is painful for the Lakota people. The most famous image of the 1874 Black Hills Expedition that contravened the 1868 Fort Laramie Treaty – and resulted in the theft of the Black Hills – is the photograph of Custer with the grizzly he killed for a "trophy." We cannot allow a repeat 140-years later on lands our ancestors fought so hard to defend when they opposed the construction of the Northern Pacific

Railroad along the Yellowstone in 1872/73, which was itself a violation of the 1868 Fort Laramie Treaty.

The Rosebud Sioux Tribe (along with the other 25 affected Tribal Nations) is also entitled to review the raw data the FWS is basing all of its conclusions upon relative to delisting the grizzly bear. Several tribes have already called upon the FWS to release that data not only to the affected Tribal Nations, but also to independent scientists for analysis and review so that questions of credibility might be answered.

The Rosebud Sioux Tribe joins the other affected Tribal Nations that have issued resolutions, declarations and statements in opposition to the US Fish and Wildlife Service's proposed delisting of the Yellowstone grizzly bear.

MONA WRIGHT

For the attention of:
Dan Ashe, Director – US Fish and Wildlife Service;
Other Parties Concerned.

The Yankton Sioux Tribe supports Chief Arvol Looking Horse and GOAL Tribal Coalition in opposing the US Fish and Wildlife Service's intention to remove the Yellowstone grizzly bear from Endangered Species Act protections.

Chief Arvol Looking Horse, the 19th Generation Keeper of the White Buffalo Calf Pipe of the Great Sioux Nation, detailed the spiritual and ceremonial significance of the grizzly bear in Nakota, Lakota, and Dakota culture in his November 2014 statement. As Chief Looking Horse demonstrated, the ceremonial significance of the grizzly in our spiritual life way has existed from time immemorial.

The American Indian Religious Freedom Act (PL 95-341–1978/PL 103-344 –1994) protects the spiritual and religious ways of the Nakota, Lakota and Dakota people related to the grizzly bear. The Act states that laws and policies pertaining to "conservation and preservation of natural species" cannot be "passed without consideration of their effect on traditional American Indian religions." In its attempts to delist the Yellowstone grizzly bear without regard to the religious practices of tribal people, the FWS is contravening the Act.

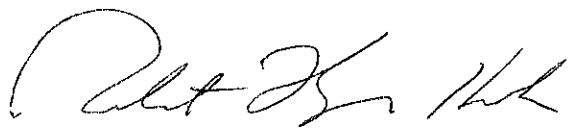
Abrogation of the AIRFA threatens potentially detrimental consequences not only for our religious and spiritual rights, but also the sovereignty of all of the affected Tribal Nations.

Executive Order 13175 (Nov. 6, 2000) "Consultation and Coordination with Indian Tribal Governments" signed by President Clinton, and the Memorandum for the Heads of Executive Departments and Agencies (Nov. 5, 2009) issued by President Obama, requiring a "complete and consistent implementation of Executive Order 13175," have yet to be followed by the US Fish and Wildlife Service (FWS) during this process.

Executive Order 13647 (June 2013) states, "Greater engagement and meaningful consultation with tribes is of paramount importance in developing any policies affecting tribal nations." The proposed delisting of the Yellowstone grizzly bear affects the Nakota, Dakota and Lakota people of the Oceti Sakowin (Great Sioux Nation).

The Secretarial Order issued by the Secretary of the Interior and the Secretary of Commerce pursuant to the Endangered Species Act (ESA) of 1973 (16 U.S.C. 1531), established the protocols to be followed when decisions related to the ESA had the potential to impact tribes. However, during the proposed delisting process, this framework has also not been followed.

During his official June 2014 visit to the Standing Rock Sioux Tribe, President Obama told the people of the Oceti Sakowin (Great Sioux Nation), "My administration is determined to partner with tribes, and it's not something that just happens once in a while. It takes place every day, on just about every issue that touches your lives. And that's what real nation-to-nation partnerships look like."



The delisting of the sacred grizzly bear, the subsequent trophy hunting, and the virtual cull proposed by the state of Wyoming, will touch the lives of the Flandreau Santee Sioux people. The cultural, geographic and sacred landscape of the Nakota, Lakota and Dakota people demonstrates the cultural importance of the grizzly bear.

Ignoring these Acts and Orders contradicts the basis of the government-to-government relationship that exists not only between the Nakota, Dakota and Lakota Tribal Nations and the federal government, but all of the 26 Tribal Nations affected by this issue. It is imperative that tribal sovereignty and the spiritual rights of our people be upheld.

The Yankton Sioux Tribe is one of the twenty-six Tribal Nations the federal government recognizes as having an ancestral connection to Yellowstone ("Associated Tribe of Yellowstone" – *Resources & Issues*, NPS, 2010). As such,
the Acts and Orders cited herein entitle the Yankton Sioux Tribe to review the raw data the FWS is basing all of its conclusions upon relative to delisting the grizzly bear. We join the other tribes of the Great Sioux Nation that have called upon the FWS to release that data not only to the affected Tribal Nations, but also to independent scientists for analysis and review.

Today the grizzly bear survives on less than 2% of its original range, with only 2% of its historic population. There is much work to be done before the grizzly bear can be considered recovered. Many areas of biologically suitably habitat exist where the grizzly once roamed, many of them in our ancestral homelands, and the grizzly should be returned to those areas. Two small island populations of grizzlies in two isolated ecosystems in the lower-48 cannot be considered to constitute a recovered species.

In the spirit of our ancestors, and to ensure that our children and future generations will grow-up in a world where grizzlies are returning to parts our ancestral homeland where they ranged before they were extirpated post-the Lewis and Clark Expedition, the Yankton Sioux Tribe opposes delisting the Yellowstone grizzly bear – preserving the grizzly equates to cultural preservation.

Robert Flying Hawk
Chairman
Yankton Sioux Tribe

OFFICE OF THE TRIBAL CHAIRPERSON

MYRA PEARSON

PO BOX 359 • FORT TOTTEN, ND 58335 • PHONE 701 766-4221 • FAX 701 766-4126

JAN 2 0 2015

December 17, 2014

For the attention of:
Secretary of the Interior, Sally Jewell;
Dan Ashe, Director – US Fish and Wildlife Service;
Other Parties Concerned:

The sovereignty and spiritual rights of the Spirit Lake Sioux Tribe are threatened by the proposed delisting of the Yellowstone grizzly bear from Endangered Species Act (ESA) protections by the US Fish and Wildlife Service (FWS).

The Spirit Lake Sioux Tribe is one of the twenty-six Tribal Nations the federal government recognizes as having an ancestral connection to Yellowstone ("Associated Tribe of Yellowstone" - *Resources & Issues*, NPS, 2010). Ten of the identified associated Tribal Nations are from the Oceti Sakowin (Great Sioux Nation), but to date none have been consulted in this process.

Federally recognized tribes have a unique nation-to-nation relationship with the federal government that requires consultation to be held at a government-to-government level; and government-to-government consultation is conducted under existing protocols and within an established framework.

Yellowstone and the Greater Yellowstone Ecosystem is a matrix of sacred and cultural sites of great significance to the twenty-six affected tribes, and those tribes' Tribal Historic Preservation Offices (THPOs) must be engaged in an initial process of consultation consistent with the criteria of the THPOs designated mission (Section 101(d)(2) of the National Historic Preservation Act), in addition to consultation with tribal governments (executive and legislative branches), and recognized spiritual leaders.

Chief Arvol Looking Horse, 19th Generation Keeper of the White Buffalo Calf Pipe of the Great Sioux Nation, detailed the spiritual and ceremonial significance of the grizzly bear in Lakota, Dakota and Nakota culture in his November 2014 statement in opposition to delisting of the Yellowstone grizzly from the ESA.

The cultural, geographic and sacred landscape of the Lakota, Dakota and Nakota people demonstrates the cultural importance of the grizzly bear. Numerous sacred sites, along with the names of creeks, rivers and buttes, were inspired by the grizzly bear. Many of our great historical leaders carried grizzly bear names, and those traditional names are present today among families in our communities.

As Chief Looking Horse has demonstrated, the ceremonial significance of the grizzly is an ancient connection. Lakota ceremonies related to the grizzly, historically known as Bear Medicine Ceremonies, are, like all of our spiritual and religious ways, protected by the American Indian Religious Freedom Act (PL 95-341–1978/PL 103-344 –1994). The Act states that laws and policies pertaining to "conservation and preservation of natural species" cannot be "passed without consideration of their effect on traditional American Indian religions." In its attempts to delist the Yellowstone grizzly bear without regard to the religious practices of tribal people, the FWS is doing so "without consideration of their effect on traditional American Indian religions."

Abrogation of the AIRFA threatens potentially detrimental consequences not only for our religious and spiritual rights, but the sovereignty of all of the affected Tribal Nations.

Executive Order 13175 (Nov. 6, 2000) "Consultation and Coordination with Indian Tribal Governments" signed by President Clinton, and the Memorandum for the Heads of Executive Departments and Agencies (Nov. 5, 2009) issued by President Obama, requiring a "complete and consistent implementation of Executive Order 13175," have yet to be followed by the US Fish and Wildlife Service (FWS) during this process.

Executive Order 13647 (June 2013) states, "Greater engagement and meaningful consultation with tribes is of paramount importance in developing any policies affecting tribal nations." The proposed delisting of the Yellowstone grizzly bear affects the Spirit Lake Sioux Tribe and the Lakota, Dakota and Nakota people of the Oceti Sakowin (Great Sioux Nation).

The Secretarial Order issued by the Secretary of the Interior and the Secretary of Commerce pursuant to the Endangered Species Act (ESA) of 1973 (16 U.S.C. 1531), established the protocols to be followed when decisions related to the ESA had the potential to impact tribes. The Order directs the FWS to "solicit traditional knowledge, and comments from, and utilize the expertise of, affected Indian tribes" during the consultation process, and "cooperate with affected tribes to develop and implement Recovery Plans in a manner that minimizes" social and cultural impacts on tribal people. In the move to delist the grizzly, this has not been followed.

Ignoring these Acts and Orders contradicts the basis of the the government-to-government relationship that exists between not only the Lakota, Dakota and Nakota Tribal Nations and the federal government, but all of the 26 Tribal Nations affected by this issue.

The Spirit Lake Sioux Tribe rejects the designation of the grizzly bear as a "trophy game animal" to be killed by big game hunters on the lands our ancestors defended. Revered spiritual leaders from the past, the likes of Black Elk and Sword, articulated the perception of the Lakota, Dakota and Nakota people when they said, "The grizzly bear is *wakan* (sacred)."

Today the grizzly bear survives on less than 2% of its original range, with only 2% of its historic population. There is much work to be done before the grizzly bear can be considered recovered. Many areas of biologically suitably habitat exist where the grizzly once roamed, many of them in our ancestral homelands, and the grizzly should be returned to those areas.

Tribal Nations have alternative solutions to the outdated wildlife management practice of killing. Trophy hunting sentient beings appeals only to a tiny minority of the population, a minority that is over 95% white, from high economic strata. Just as the buffalo is being returned to reservation homelands with biologically suitable habitat, some Tribal Nations with appropriate land bases have expressed a desire to develop programs to return the grizzly to their sovereign nations.

Under such circumstances, estimated carrying capacity in one ecosystem would not result in killing but relocation to ignite new populations that would realize the long-projected need for linkage zones between grizzly populations. Today, the two small island populations of grizzlies surviving in two isolated ecosystems in the lower-48 cannot be considered a recovered species appropriate for delisting and subsequent trophy hunting.

Grizzly bear management plans post-delisting should be sensitive to the cultures of the affected Tribal Nations. Rather than have the states influence grizzly bear management on tribal lands, the affected Tribal Nations should be provided with the resources to initiate their own management practices and programs that are consistent with their cultural values. By doing so, tribal sovereignty will be upheld and potential employment and economic opportunity provided.

The consultation process that is mandated by the aforementioned Acts and Orders entitles the Spirit Lake Sioux Tribe (and the other nations of the Oceti Sakowin and affected Tribal Nations) to review the raw data the FWS is basing all of its conclusions upon

relative to delisting the grizzly bear. Several tribes have already called upon the FWS to release that data not only to the affected Tribal Nations, but also to independent scientists for analysis and review – the Spirit Lake Sioux Tribe adds its voice to that call.

The Spirit Lake Sioux Tribe supports Chief Arvol Looking Horse's position in opposing the removal of the Yellowstone grizzly bear from the Endangered Species Act, and we support the efforts of GOAL Tribal Coalition to protect the sacred grizzly bear and in doing so defend tribal sovereignty and spiritual rights.

Sincerely,

Myra Pearson
Spirit Lake Tribe Chairperson

The SHOSHONE-BANNOCK TRIBES

FORT HALL INDIAN RESERVATION
PHONE: (208) 478-3700
(208) 237-0797

FORT HALL BUSINESS COUNCIL
PO BOX 306
FORT HALL, IDAHO 83203

To Whom It May Concern:

This letter is in strong support of GOAL Tribal Coalition. JAN 2 0 2015

The Fort Hall Business Council of the Shoshone-Bannock Tribes of Fort Hall, Idaho oppose the federal government' s proposed removal of the Yellowstone grizzly bear from Endangered Species Act protections through the US Fish and Wildlife Service, recognizing that the federal government' s resolve to remove the grizzly bear from Endangered Species Act protection contravenes the American Indian Religious Freedom Act (AIRFA. PUBLIC LAW 95-341--AUG. 11, 1978).

Our Tribe is one of the few of the twenty-six federally recognized tribes which federal government openly acknowledges has an original ancestral connection to the Yellowstone National Park and the Greater Yellowstone Ecosystem regions. The connection between our tribe and this land has existed hundreds and thousands of years and requires the US Fish and Wildlife Service to consult with the Shoshone-Bannock Tribes since the American Indian Religious Freedom Act states that laws pertaining to 'conservation and preservation of natural species and resources" were never intended to impact American Indian religious practices.

The Secretarial Order issued by the Secretary of the Interior and the Secretary of Commerce pursuant to the *Endangered Species Act* (ESA) of 1973 (16 U.S.C. 1531) clearly sets forth the framework to be followed when actions taken under authority of the ESA affect tribes. With the proposed delisting of the grizzly bear, the US Fish and Wildlife Service is in contravention of this order which directs the that agency to 'solicit traditional knowledge, and comments from, and utilize the expertise of, affected Indian tribes' during the

consultation process, and 'cooperate with affected tribes to develop and implement Recovery Plans in a manner that minimizes social and cultural impacts on tribal people.'

The Shoshone-Bannock Tribe has been afforded no such consultation throughout the US Fish and Wildlife Service' s process proposing a new Rule to delist the Yellowstone grizzly bear, despite the supposed protection of religious practices of traditional tribal people by PL-95-341.

In respecting our unique cultural imperatives, and the preservation of our sovereignty, the Shoshone-Bannock Tribe renounces the federal government' s desire to delist the grizzly bear from Endangered Species Act protections. We oppose the legislative resolve to see trophy hunting of grizzlies on reservations and the extirpation of the grizzly bear from swathes of reservation lands.

Additionally, in recognition that that the Shoshone-Bannock Tribe' s Fish and Wildlife Department has a seat on the IGBC' s (Interagency Grizzly Bear Committee) Yellowstone Subcommittee, this letter of support from the Shoshone-Bannock Tribe countermands any previous votes cast by the Shoshone-Bannock Tribe' s Fish and Wildlife Department in favor of delisting the Yellowstone grizzly bear.

Our council hereby officially strongly opposes this position in delisting the Yellowstone grizzly bear.

Respectfully,

Nathan Small, Chairman
Fort Hall Business Council

Executive Secretary

Don Garnier
Cultural Liaison

Attn: United States Fish and Wildlife Director, Dan Ashe;
All other affected parties.

The sovereignty and spiritual rights of the Oglala Sioux Tribe (Oglala Lakota Nation) and the Lakota, Dakota and Nakota people of the Oceti Sakowin (Great Sioux Nation) are threatened by the proposed delisting of the Yellowstone grizzly bear from Endangered Species Act (ESA) protections by the US Fish and Wildlife Service (FWS).

The Oglala Sioux Tribe is one of the twenty-six Tribal Nations the federal government recognizes as having an ancestral connection to Yellowstone ("Associated Tribe of Yellowstone" – *Resources & Issues*, NPS, 2010), and as such must be consulted in this process.

Federally recognized tribes have a unique nation-to-nation relationship with the federal government that requires consultation to be held at a government-to-government level; and government-to-government consultation is conducted under existing protocols and within an established framework. Unsolicited correspondence from a federal agency coordinator or similar does not constitute consultation between a tribal nation and the federal government.

Yellowstone and the Greater Yellowstone Ecosystem is a matrix of sacred and cultural sites of great significance to the twenty-six affected tribes, and those tribes' Tribal Historic Preservation Offices (THPOs) must be engaged in an initial process of consultation consistent with the criteria of the THPOs designated mission (Section 101(d)(2) of the National Historic Preservation Act), in addition to consultation with tribal governments (executive and legislative branches), and recognized spiritual leaders.

Chief Arvol Looking Horse, 19th Generation Keeper of the White Buffalo Calf Pipe of the Great Sioux Nation, detailed the spiritual and ceremonial significance of the grizzly bear in Lakota, Dakota and Nakota culture in his November 2014 statement in opposition to the planned delisting of the Yellowstone grizzly from the ESA.

The cultural, geographic and sacred landscape of the Lakota, Dakota and Nakota people demonstrates the cultural importance of the grizzly bear. Sacred sites like Mato Tipila (Devils Tower) and Mato Paha (Bear Butte) are inseparable from our ceremonial connection to the grizzly. Numerous traditional and current family names, along with the names of creeks, rivers

and buttes, were inspired by the grizzly bear. Not without reason were Crazy Horse and his mentor, High Back Bone (Hump), described as "the grizzly and his cub."

As Chief Looking Horse has demonstrated, the ceremonial significance of the grizzly is an ancient connection. Lakota ceremonies related to the grizzly, historically known as Bear Medicine Ceremonies, are, like all of our spiritual and religious ways, protected by the American Indian Religious Freedom Act (PL 95-341–1978/PL 103-344 –1994). The Act states that laws and policies pertaining to "conservation and preservation of natural species" cannot be "passed without consideration of their effect on traditional American Indian religions." In its attempts to delist the Yellowstone grizzly bear without regard to the religious practices of tribal people, the FWS is doing so "without consideration of their effect on traditional American Indian religions."

Abrogation of the AIRFA threatens potentially detrimental consequences not only for our religious and spiritual rights, but the sovereignty of all of the affected Tribal Nations.

Executive Order 13175 (Nov. 6, 2000) "Consultation and Coordination with Indian Tribal Governments" signed by President Clinton, and the Memorandum for the Heads of Executive Departments and Agencies (Nov. 5, 2009) issued by President Obama, requiring a "complete and consistent implementation of Executive Order 13175," have yet to be followed by the FWS during this process.

Executive Order 13647 (June 2013) states, "Greater engagement and meaningful consultation with tribes is of paramount importance in developing any policies affecting tribal nations." The proposed delisting of the Yellowstone grizzly bear affects the Lakota, Dakota and Nakota people of the Oceti Sakowin (Great Sioux Nation) on cultural and religious grounds.

The Secretarial Order issued by the Secretary of the Interior and the Secretary of Commerce pursuant to the Endangered Species Act (ESA) of 1973 (16 U.S.C. 1531), established the protocols to be followed when decisions related to the ESA had the potential to impact tribes.

The Order directs the FWS to "solicit traditional knowledge, and comments from, and utilize the expertise of, affected Indian tribes" during the consultation process, and "cooperate with affected tribes to develop and implement Recovery Plans in a manner that minimizes" social and cultural impacts on tribal people. In the context of attempting to delist the Yellowstone grizzly, this equates to the FWS having to consult with respected spiritual leaders such as Chief Arvol Looking Horse.

Chief Arvol Looking Horse describes this present movement to remove ESA protections from the grizzly and allow the states of Wyoming, Montana and Idaho to operate profligate trophy hunts as an extension of the "disease of the mind" that enabled Manifest Destiny; the massacres of our people, and the near extermination of the grizzly, the wolf and the buffalo in the 19th Century. The world will see this in play again if the grizzly is delisted. Each spring and fall, some visitors to Yellowstone National Park will see grizzlies gutted by the sides of the roads leading to Yellowstone, or bloody grizzly carcasses strapped to vehicles.

We reject the designation of the grizzly bear as a "trophy game animal." It is shameful that a sentient being – one our people revere as sacred – is to be killed for "fun" by affluent trophy hunters. Great Lakota holy men like Black Elk, and Lakota Bear Medicine Men like Sword, articulated our feelings when they said, "The grizzly bear is *wakan*." The Oglala Lakota people will not stand idle and watch this sacred being be slaughtered on the lands our ancestors fought to defend.

The thought of trophy hunters killing grizzly bears on our sacred lands is painful for the Lakota people. The image that came to represent the 1874 Black Hills Expedition that contravened the 1868 Fort Laramie Treaty is the photograph of Custer with the grizzly he killed for a "trophy." That violation of the 1868 Fort Laramie Treaty resulted in the annexation of the Black Hills. We cannot allow a repeat 140-years later on other sacred ancestral lands.

Ignoring these Acts and Orders contradicts the basis of the the government-to-government relationship that exists between not only the Lakota, Dakota and Nakota Tribal Nations and the federal government, but all of the 26 Tribal Nations affected by this issue. These Acts and Orders entitle the Oglala Sioux Tribe (and the other 25 affected Tribal Nations) to review the raw data the FWS is basing all of its conclusions upon relative to delisting the grizzly bear. Several nations of the Oceti Sakowin, and other affected Tribal Nations, have already called upon the FWS to release that data not only to the tribes, but also to independent scientists for analysis and review. To date, FWS has refused to do so. If the data is sound, it will not be undermined by scrutiny.

The Oglala Sioux Tribe supports Chief Arvol Looking Horse's position in opposing the removal of the Yellowstone grizzly bear from the Endangered Species Act, and the work of GOAL Tribal Coalition in bringing this important issue to the fore. We join the other affected Tribal Nations that have issued resolutions, declarations and statements in opposition to delisting the grizzly, and call for the federal government to begin the process of thorough consultation in accordance with the existing mandates, to ensure that our sovereignty and spiritual rights are upheld.

Attn: Director Dan Ashe,
US Fish and Wildlife Service.

All Parties Concerned.

The Cheyenne River Sioux Tribe is one of the twenty-six Tribal Nations recognized by the federal government as having an ancestral connection to Yellowstone ("Associated Tribe of Yellowstone" – *Resources & Issues*, NPS, 2010). Therefore, under the federal government's own criteria, the Cheyenne River Sioux Tribe should be consulted by the federal departments and agencies presently engaged in attempting to remove of the sacred grizzly bear from Endangered Species Act (ESA) protections.

Executive Order 13175 (Nov. 6, 2000) "Consultation and Coordination with Indian Tribal Governments" signed by President Clinton, and the Memorandum for the Heads of Executive Departments and Agencies (Nov. 5, 2009) issued by President Obama, requiring a "complete and consistent implementation of Executive Order 13175," have yet to be followed by the US Fish and Wildlife Service (FWS) during this process.

Executive Order 13647 (June 2013) states, "Greater engagement and meaningful consultation with tribes is of paramount importance in developing any policies affecting tribal nations." The proposed delisting of the Yellowstone grizzly bear affects the Lakota, Dakota and Nakota people of the Oceti Sakowin (Great Sioux Nation).

This issue extends beyond delisting the grizzly bear, and threatens potentially detrimental consequences for tribal sovereignty and our religious and spiritual rights as defined by the American Indian Religious Freedom Act (PL 95-341–1978/PL 103-344 –1994).

Laws and policies related to "conservation and preservation of natural species" cannot, as had been the norm prior to the Act, be "passed without consideration of their effect on traditional American

The blue represents the thunderclouds above the world where live the thunder birds who control the four winds. The rainbow is for the Cheyenne River Sioux people who are keepers of the Most Sacred Calf Pipe, a gift from the White Buffalo Calf Maiden. The eagle feathers at the edges of the rim of the world represent the spotted eagle who is the protector of all Lakota. The two pipes fused together are for unity. One pipe is for the Lakota, the other for all the other Indian Nations. The yellow hoops represent the Sacred Hoop, which shall not be broken. The Sacred Calf Pipe Bundle in red represents Wakan Tanka – The Great Mystery. All the colors of the Lakota are visible. The red, yellow, black and white represent the four major races. The blue is for heaven and the green for Mother Earth.

Indian religions." However, in its attempts to delist the Yellowstone grizzly bear without regard to the religious practices of tribal people, the FWS is doing precisely that.

In his statement of November 2014, Chief Arvol Looking Horse, 19th Generation Keeper of the White Buffalo Calf Pipe of the Oceti Sakowin, detailed the spiritual and ceremonial significance of the grizzly bear in Lakota, Dakota and Nakota culture.

The Lakota cultural and geographic landscape demonstrates the cultural importance of the grizzly bear. Many physical features and sacred sites are known by names inspired by the grizzly bear. Our people still carry names that reflect the significance of the grizzly. Throughout our history, numerous great leaders have borne grizzly bear names.

Opposing the removal of ESA protections from the Yellowstone grizzly bear, and the proposed trophy hunting of the grizzly, is consistent with CRST Ordinance 57, the Cheyenne River Sioux Tribe's Cultural Resources Protection Act, which affirms: "The spiritual and physical well-being of the Cheyenne River Sioux Tribe and its members is directly related to the preservation of the historical traditions and cultural heritage of the Lakota people."

In this process to date, FWS is yet to abide by the Secretarial Order issued by the Secretary of the Interior and the Secretary of Commerce pursuant to the Endangered Species Act (ESA) of 1973 (16 U.S.C. 1531), which established the protocols to be followed when actions taken under authority of the ESA have tribal implications.

The Order directs the FWS to "solicit traditional knowledge, and comments from, and utilize the expertise of, affected Indian tribes" during the consultation process, and "cooperate with affected tribes to develop and implement Recovery Plans in a manner that minimizes" social and cultural impacts on tribal people.

The thought of trophy hunters killing grizzly bears on our sacred lands is painful for the Lakota people. The image that came to represent the 1874 Black Hills Expedition that contravened the 1868 Fort Laramie Treaty is the photograph of Custer with the grizzly he killed for a "trophy." That violation of the 1868 Fort Laramie Treaty resulted in the annexation of the Black Hills. We cannot allow a repeat 140-years later on lands our ancestors fought so hard to protect when they opposed the construction of the Northern Pacific Railroad along the Yellowstone in 1872 and 1873, which was also a violation of the 1868 Fort Laramie Treaty. Some of the principal leaders in that resistance were from the Lakota bands that comprise the Cheyenne River Sioux Tribe.

Through the aforementioned Acts and Orders, the Cheyenne River Sioux Tribe (along with the other 25 affected Tribal Nations) is entitled to review the raw data the FWS is basing all of its conclusions upon relative to delisting the grizzly bear. Several tribes have already called upon the FWS to release that data not only to the affected Tribal Nations, but also to independent scientists for analysis and review so that questions of credibility might be answered.

The Cheyenne River Sioux Tribe joins the other affected Tribal Nations that have issued resolutions, declarations and statements in opposition to the US Fish and Wildlife Service's proposed delisting of the Yellowstone grizzly bear. We support the positions expressed by Chief Arvol Looking Horse, and the efforts of GOAL Tribal Coalition to protect the grizzly bear and defend our sovereignty and spiritual rights.

If you should have any questions or concerns, please contact me at 605-964-4155.

Sincerely,

Harold C. Frazier,
CRST Chairman

RESOLUTION NO. 14-142

WHEREAS, the Flandreau Santee Sioux Tribe (the "Tribe") is a federally recognized Indian tribe organized pursuant to the Constitution and By-laws approved by the Secretary of Interior and Commissioner of Indian Affairs on April 24, 1936, amended February 7, 1941, and further amended November 16, 1967, and further amended November 14, 1984, and further amended May 17, 1997; and

WHEREAS, Article III of the Tribe's Constitution and By-laws provides that the governing body of the Tribe shall be the Executive Committee; and

WHEREAS, Article VIII, Section (a) provides that the Executive Committee may negotiate with Federal, State, and local governments; and

WHEREAS, the Tribe opposes the Federal Government's proposed removal of the Yellowstone grizzly bear from Endangered Species Act protections through the US Fish and Wildlife Service; and

WHEREAS, the US Fish and Wildlife Service, Department of the Interior, has so far ignored Executive Order 13175 (Nov. 6, 2000) entiltled "Consultation and Coordination with Indian Tribal Governments" signed by President Clinton, and the Memorandum for the Heads of Executive Departments and Agencies (Nov. 5, 2009) issued by President Obama requiring a "complete and consistent implementation of Executive Order 13175"; and

WHEREAS, the federal government's determination to remove the grizzly bear from Endangered Species Act protection contravenes the American Indian Religious Freedom Act, 42 U.S.C. § 1996 (2014); and

WHEREAS, the American Indian Religious Freedom Act states laws pertaining to "conservation and preservation of natural species and resources" were never intended to impact American Indian religious practices but did "and, therefore, were passed without consideration of their effect on traditional American Indian religions"; and

WHEREAS, in its proposed delisting of the grizzly bear the US Fish and Wildlife Service is in contravention of the Secretarial Order issued by the Secretary of the Interior and the Secretary of Commerce pursuant to the Endangered Species

Act (ESA) of 1973, 16 U.S.C. § 1531 (2014), which sets forth the framework to be followed when actions taken under authority of the ESA affect tribes; and

WHEREAS, the *American Indian Tribal Rights, Federal-Tribal Trust Responsibilities, and the Endangered Species Act Order* states: "The Departments shall take into consideration the impacts of their actions and policies under the Act on Indian use of listed species for cultural and religious purposes"; and

WHEREAS, the Order directs the US Fish and Wildlife Service to "solicit traditional knowledge, and comments from, and utilize the expertise of, affected Indian tribes" during the consultation process, and "cooperate with affected tribes to develop and implement Recovery Plans in a manner that minimizes" social and cultural impacts on tribal people; and

WHEREAS, none of these commitments has been honored; and

WHEREAS, the US Fish and Wildlife Service has refused to release the data it has based its conclusions on for independent scientific review, that data being the basis for the federal government's proposal to remove the grizzly bear from Endangered Species Act protections; and

WHEREAS, when considering the intent of the Endangered Species Act, a species cannot be considered sufficiently recovered to warrant removal from Endangered Species Act protection if it presently only survives on approximately 2% of its original range; and

WHEREAS, throughout the US Fish and Wildlife Service's process proposing a new Rule to delist the Yellowstone grizzly bear there has been no discussion related to the impact delisting the grizzly, and the subsequent trophy hunting of the bear, will have on American Indian spirituality, namely the religious practices of traditional tribal people; and

WHEREAS, the grizzly bear holds a unique position in traditional Dakota culture and the cultures and ceremonial lifeways of the traditional spiritual practitioners of tribes also identified by the federal government as possessing centuries old, and in some instances, millennia-long connections to the lands where the grizzly now survives; and

WHEREAS, those cultural imperatives and the preservation of sovereignty require a repudiation of the federal government's desire to delist the grizzly bear from Endangered Species Act protections; and the legislative resolve to deny the states' determination to see trophy hunting of grizzlies on reservations and the extirpation of the grizzly bear from swathes of reservation and ancestral

homelands; and

NOW THEREFORE BE IT RESOLVED, that the Executive Committee hereby officially adopts this position in respect to delisting the Yellowstone grizzly bear, and authorizes President Anthony Reider to sign a letter for support for the cause on the Tribe's behalf.

CERTIFICATION

The foregoing Resolution was duly enacted and adopted on this 11th day of December, 2014 by the Executive Committee of the Flandreau Santee Sioux Tribe during a duly called meeting with a quorum was present of 6 In Favor, 0 Opposed, 0 Abstaining, and 1 Not Voting, as follows:

Dan Ashe, Director – US Fish and Wildlife Service;
Chris Servheen, Grizzly Bear Recovery Coordinator – US Fish and Wildlife Service;
Other Parties Concerned:

The sovereignty and spiritual rights of the Sisseton Wahpeton Oyate and the Lakota, Dakota and Nakota people of the Great Sioux Nation are threatened by the proposed delisting of the Yellowstone grizzly bear from Endangered Species Act (ESA) protections by the US Fish and Wildlife Service (FWS).

The Sisseton Wahpeton Oyate is one of the twenty-six Tribal Nations the federal government recognizes as having an ancestral connection to Yellowstone ("Associated Tribe of Yellowstone" – *Resources & Issues*, NPS, 2010). In total, ten of those Tribal Nations are from the Oceti Sakowin (Great Sioux Nation), but to date none have been consulted in this process.

Chief Arvol Looking Horse, 19th Generation Keeper of the White Buffalo Calf Pipe of the Great Sioux Nation, detailed the spiritual and ceremonial significance of the grizzly bear in Lakota, Dakota and Nakota culture in his November 2014 statement in opposition to delisting of the Yellowstone grizzly from the ESA.

The cultural, geographic and sacred landscape of the Lakota, Dakota and Nakota people demonstrates the cultural importance of the grizzly bear. Numerous sacred sites, along with the names of creeks, rivers and buttes, were inspired by the grizzly bear. Many of our great historical leaders carried grizzly bear names, and those traditional names are present today among families in our communities.

As Chief Looking Horse has demonstrated, the ceremonial significance of the grizzly in our spiritual lifeway is an ancient connection. Our spiritual and religious ways related to the grizzly are protected by the American Indian Religious Freedom Act (PL 95-341–1978/PL 103-344 –1994).

The Act states that laws and policies pertaining to "conservation and preservation of natural species" cannot be "passed without consideration of their effect on traditional American Indian religions." So far, in its attempts to delist the Yellowstone grizzly bear without regard to the religious practices of tribal people, the FWS is doing precisely that.

Abrogation of the AIRFA threatens potentially detrimental consequences not only for our religious and spiritual rights, but the sovereignty of all of the affected Tribal Nations.

Executive Order 13175 (Nov. 6, 2000) "Consultation and Coordination with Indian Tribal Governments" signed by President Clinton, and the Memorandum for the Heads of Executive Departments and Agencies (Nov. 5, 2009) issued by President Obama, requiring a "complete and consistent implementation of Executive Order 13175," have yet to be followed by the US Fish and Wildlife Service (FWS) during this process.

Executive Order 13647 (June 2013) states, "Greater engagement and meaningful consultation with tribes is of paramount importance in developing any policies affecting tribal nations." The proposed delisting of the Yellowstone grizzly bear affects the Lakota, Dakota and Nakota people of the Oceti Sakowin (Great Sioux Nation).

The Secretarial Order issued by the Secretary of the Interior and the Secretary of Commerce pursuant to the Endangered Species Act (ESA) of 1973 (16 U.S.C. 1531), established the protocols to be followed when decisions related to the ESA had the potential to impact tribes. The Order directs the FWS to "solicit traditional knowledge, and comments from, and utilize the expertise of, affected Indian tribes" during the consultation process, and "cooperate with affected tribes to develop and implement Recovery Plans in a manner that minimizes" social and cultural impacts on tribal people. In the move to delist the grizzly, this has not been followed.

Ignoring these Acts and Orders contradicts the basis of the the government-to-government relationship that exists between not only the Lakota, Dakota and Nakota Tribal Nations and the federal government, but all of the 26 Tribal Nations affected by this issue.

The Sisseton Wahpeton Oyate opposes the designation of the grizzly bear as a "trophy game animal" to be killed by big game hunters on the lands our ancestors

defended. Revered spiritual leaders from the past, the likes of Black Elk and Sword, articulated the perception of the Lakota, Dakota and Nakota people when they said, "The grizzly bear is *wakan*."

The consultation process that is mandated by the aforementioned Acts and Orders entitles the Sisseton Wahpeton Oyate (and the other nations of the Oceti Sakowin and affected Tribal Nations) to review the raw data the FWS is basing all of its conclusions upon relative to delisting the grizzly bear. Several tribes have already called upon the FWS to release that data not only to the affected Tribal Nations, but also to independent scientists for analysis and review – the Sisseton Wahpeton Oyate adds its voice to that call.

The Sisseton Wahpeton Oyate supports Chief Arvol Looking Horse's position in opposing the removal of the Yellowstone grizzly bear from the Endangered Species Act, and we support the efforts of GOAL Tribal Coalition to protect the sacred grizzly bear and in doing so defend tribal sovereignty and spiritual rights.

December 8, 2014

Daniel M. Ashe
Director
United States Fish and Wildlife Service

Dear Mr. Ashe:

In his November 2014 statement opposing the proposed delisting and subsequent trophy hunting of the Yellowstone grizzly bear, Chief Arvol Looking Horse outlined the sacred nature of the grizzly bear in Lakota, Dakota and Nakota culture. As the 19th Generation Keeper of the White Buffalo Calf Pipe of the Oceti Sakowin (Great Sioux Nation), Chief Looking Horse's insights are those of a highly respected spiritual leader.

To date, there has been no discussion in this process related to the impact delisting the grizzly bear, and the subsequent trophy hunting of the grizzly, will have on Native American spirituality, namely the religious practices of traditional tribal people, protected by the American Indian Religious Freedom Act (PL 95-341–1978/PL 103-344 –1994).

Though this proposed action is to take place on defined ancestral lands of the Great Sioux Nation, the Standing Rock Sioux Tribe has yet to be consulted. As one of the 26 Tribal Nations the federal government acknowledges as having an ancestral connection to Yellowstone ("Associated Tribe of Yellowstone" – *Resources & Issues*, NPS, 2010), the US Fish and Wildlife Service (FWS) is required to consult with the Standing Rock Sioux Tribe, as, like many of the other affected tribes, due to the cultural significance of the grizzly bear in Lakota, Dakota and Nakota culture, our people will be detrimentally impacted if the grizzly is delisted and trophy hunted in lands once familiar to our ancestors.

BLDG 1 NORTH STANDING ROCK AVE. P.O.BOX D • FORT YATES, NORTH DAKOTA 58538
PHONE: 701-854-7201 or 701-854-8500 • FAX 701-854-7299

Executive Order 13175 (Nov. 6, 2000) "Consultation and Coordination with Indian Tribal Governments" signed by President Clinton, and the Memorandum for the Heads of Executive Departments and Agencies (Nov. 5, 2009) issued by President Obama, requiring a "complete and consistent implementation of Executive Order 13175," have yet to be followed by the US Fish and Wildlife Service (FWS) during this process.

Executive Order 13647 (June 2013) states, "Greater engagement and meaningful consultation with tribes is of paramount importance in developing any policies affecting tribal nations." The proposed delisting of the Yellowstone grizzly bear affects the Lakota, Dakota and Nakota people of the Great Sioux Nation.

This lack of consultation by FWS stands in direct contrast to the policy directives of the Obama Administration. President Obama has attempted to strengthen consultation with tribes when federal policies and actions have the potential to affect tribes and have tribal implications. Clearly, removing the Yellowstone grizzly bear from the ESA and permitting states to proceed with high-dollar trophy hunts on our historic cultural landscape fits the criteria.

President Obama made a highly visible commitment to improving dialogue between tribal nations and the federal government when he visited the Standing Rock Sioux Nation in June 2014.

The American Indian Religious Freedom Act states that laws related to "conservation and preservation of natural species" cannot, as was the norm prior to the Act, be "passed without consideration of their effect on traditional American Indian religions." So far, in its attempts to delist the Yellowstone grizzly bear without regard to the religious practices of tribal people, the FWS is doing that.

The Standing Rock Sioux Tribe (and the other affected Tribal Nations) is entitled to review the raw data the FWS is basing all of its conclusions upon relative to delisting the grizzly bear through the Secretarial Order issued by the Secretary of the Interior and the Secretary of Commerce pursuant to the Endangered Species Act (ESA) of 1973 (16 U.S.C. 1531). Several tribes have already called upon the FWS to release that data not only to the affected Tribal Nations, but also to independent scientists for analysis and review. The cultural importance of this issue is such that questions and contradictions must be resolved without bias if tribal members, and the public at large, are to have confidence in the outcome.

efore the Lewis and Clark Expedition, there were an estimated 100,000 grizzly bears in the Western US, many in the environs of the Missouri River where the Standing Rock Sioux Tribe is now located. Today the grizzly bear survives on less than 2% of its original range, with possibly 2% of its historic population. The Yellowstone grizzly bear is a genetically isolated, island population that numbers in the hundreds. In a historical context, and by the spirit and intent of the ESA, it cannot yet be considered recovered.

Until the aforementioned issues have been addressed and resolved to the satisfaction of all of the affected Tribal Nations, we believe that it is premature to even consider delisting the iconic Yellowstone grizzly bear from ESA protections. It is imperative that tribal sovereignty and the spiritual rights of our people be upheld. Thank you for your attention to this matter, and please feel free to contact me should further discussion be helpful.

Sincerely,

Dave Archambault II, Chairman
Standing Rock Sioux Tribe

CROW TRIBE EXECUTIVE BRANCH

Office of
Chairman Darrin Old Coyote

November 26, 2014

To all parties concerned:

The area now known as Greater Yellowstone lays within the boundaries of Crow Country that were defined by Chief Sits in the Middle of the Land at the 1851 Fort Laramie Treaty Council. For centuries, the Crow people have had a deep spiritual connection to the landscape, a relationship that continues to this day. Today, right in the heart of Crow country, exactly where Chief Sits in the Middle of the Land described, the federal government intends to delist the grizzly bear from Endangered Species Act protections and permit the State of Wyoming to open high-dollar trophy hunting seasons on the grizzly.

In common with the land, the Crow People have an ancient relationship with the grizzly bear. In Crow culture, the grizzly bear is referred to as biiké, elder brother, which connotes great respect for the bear. From the stars to the rocks, images of the bear communicate that sacred relationship the Crow people have with the grizzly, knowledge that was preserved by Crow elders and passed on to future generations. For example, Daxpitcheeishuulissúua, the Bear Song Dance, was one of the most sacred ceremonies of our people. The grizzly bear is a significant symbol for ceremonies for certain families in the Crow Tribe. The symbolic parts of a grizzly bear are used during ceremonies for healing. These parts of the grizzly bear has been handed down generation to generation and also used during competitions such as the handgames and other Crow traditional games. The elders say that a bear symbol can be seen in the palms of hands signifying power of the grizzly bear.

Though this proposed action is to take place on traditional Crow land, the Crow Tribe has yet to be consulted. As one of the 26 tribal nations the federal government openly acknowledges has an ancestral connection to Yellowstone, the US Fish and Wildlife Service (FWS) is required to consult with the Crow Tribe, like many of the other affected tribes. Due to the cultural significance of the grizzly bear, the Crow people will be detrimentally impacted if the grizzly is delisted and subsequently trophy hunted.

The Kiowa Tribe of Oklahoma, the historic allies of the Crow people, articulated the issues arising from the proposed delisting of the grizzly bear in its declaration of 10/10/14 and the Crow Tribe supports those positions.

The Crow Tribe is entitled to review the data the FWS is basing its conclusions on under the Secretarial Order issued by the Secretary of the Interior and the Secretary of commerce pursuant to the Endangered Species Act (ESA) of 1973 (16 U.S.C. 1531). The Crow Tribe joins with the other affected tribal nations that have called upon the FWS to release that data not only to the tribes, but also to independent scientists

for analysis and review. Transparency is essential if tribal members and the public at large are to have confidence in the outcome.

The Guardians of Ancestors Legacy (GOAL) Tribal Coalition is doing valuable work in its efforts to preserve and protect the Yellowstone grizzly bear and in the process defend tribal sovereignty and spiritual rights.

Sincerely,

Darrin Old Coyote, Chairman
Crow Tribe

These names must be changed with the input of the affected Tribal Nations, just as any move to delist the sacred grizzly bear on this ancestral landscape must involve consultation with the affected Tribal Nations.

Pre-the Lewis and Clark Expedition, there were an estimated 100,000 grizzly bears in the Western US. Today the grizzly bear survives on less than 2% of its original range, with possibly 2% of its historic population. The Yellowstone grizzly bear is a genetically isolated, island population that numbers in the hundreds. In a historical context, and by the spirit and intent of the ESA, it cannot yet be considered recovered.

Until these issues cited herein are addressed and resolved to the satisfaction of all of the affected Tribal Nations, we believe that it is premature to even consider issuing a new Rule to delist the iconic Yellowstone grizzly bear from ESA protections.

Respectfully submitted,

TLC Board Chairman Ivan Posey

GOAL Tribal Coalition
PO Box 30,000. #360
Jackson, WY 83002

Respectful GOAL Tribal Coalition Representative,

With Regard to and/or all parties concerned to the GOAL Coalition's efforts towards it's endeavors. The Kiowa Tribe of Oklahoma supports the mission of Guardians of Our Ancestors' Legacy (GOAL) Tribal Coalition to preserve and protect the endangered Yellowstone grizzly bear. In doing so, we will help to ensure that Native American spiritual rights are upheld, and our sovereignty defended.

The area now known as the Greater Yellowstone Ecosystem with Yellowstone National Park at its heart is the ancestral homeland of the Kiowa. It was in this region that our ancestors first established sacred kinship with the grizzly bear.

Our respect and reverence for the grizzly bear is reflected in many Kiowa names; some of the greatest leaders in Kiowa history carried names inspired by the grizzly bear, including Set-tain-te (Satanta) and Set-angya (Satank), and the importance of the bear in our traditional culture can still be heard in our names today.

Narratives pertaining to the grizzly bear are fundamental to many of our sacred sites in what is now Wyoming, and what was once our homeland. We oppose the present attempts by the US Fish and Wildlife Service (FWS) and the states of Wyoming, Montana and Idaho to remove Endangered Species Act (ESA) protections from the Yellowstone grizzly bear.

The Kiowa Tribe of Oklahoma rejects the notion that the sacred grizzly bear should be considered a "trophy game animal" and hunted in our ancestral homeland.

We agree that the FWS's determination to remove the Yellowstone grizzly bear from ESA protection without thorough consultation with the affected tribes identified as possessing an ancestral connection to Yellowstone contravenes the American Indian Religious Freedom Act (PL-95-341). There has been no discussion related to the impact

delisting the grizzly, and the subsequent trophy hunting of the bear, will have on American Indian spirituality, namely the religious practices of traditional tribal people, protected by PL-95-341.

We further agree that by ignoring the affected tribes, the FWS is also in contravention of the Secretarial Order issued by the Secretary of the Interior and the Secretary of Commerce pursuant to the Endangered Species Act (ESA) of 1973 (16 U.S.C. 1531), which sets forth the framework to be followed when actions taken under authority of the ESA affect tribes.

The *American Indian Tribal Rights, Federal-Tribal Trust Responsibilities, and the Endangered Species Act Order* explicitly states: "The Departments shall take into consideration the impacts of their actions and policies under the Act on Indian use of listed species for cultural and religious purposes (Sec. 5 #4). The Order also directs the FWS to "solicit traditional knowledge, and comments from, and utilize the expertise of, affected Indian tribes" during consultation processes. This has yet to happen.

Not consulting with the affected tribes is not only a breach of PL-95-341 and 16 U.S.C. 1531, it constitutes an infringement of our sovereignty.

Clearly the grizzly bear is not recovered under the criteria set forth by the Endangered Species Act. A population of between 500–700 grizzlies surviving on less than 1% of their original range pre-contact could not be considered recovered even if it were not genetically isolated and threatened by the loss of keystone food sources, which the Yellowstone grizzly bear is.

It is essential that the FWS finally makes the data it is basing its conclusions upon available, not only to the affected tribes, but crucially, to the scientific community for independent analysis and review. The affected tribes are entitled to the information under 16 U.S.C. 1531.

By protecting the sacred grizzly bear and in the process defending our religious freedom and sovereignty we honor our ancestors. The tribal heritage of Rain Bear Stands Last, the founder of GOAL, includes Kiowa. One of his ancestors, the great Cheyenne leader, Sleeping Bear, once presented the legendary Kiowa chief, Téh-tóot-sah (Little Bluff), with a famous painted tipi.

This exchange began a tradition amongst our peoples. In supporting GOAL and this effort, we continue that tradition, and in the spirit of our ancestors attempt to ensure that

our children and future generations will grow-up in a world where grizzlies still roam our ancestral homeland so that a large part of our culture and history will remain intact.

Respectfully Submitted,

Amber C. Toppah, Lady Chairman
Kiowa Business Committee
Kiowa Tribe of Oklahoma

THE SHOSHONE-PAIUTE TRIBES
OF THE DUCK VALLEY INDIAN RESERVATION
P.O. Box 219 Owyhee, NV 89832
(208) 759-3100
www.shopaitribes.org

December 18, 2014

For the attention of all parties concerned:

The Shoshone-Paiute Tribes of the Duck Valley Indian Reservation stand in solidarity with our sister tribes, the Eastern Shoshone Tribe of the Wind River Indian Reservation, and the Shoshone-Bannock Tribes of Idaho, in opposing the proposed delisting of the Yellowstone grizzly bear from Endangered Species Act (ESA) protections by the US Fish and Wildlife Service (FWS).

The Shoshone-Paiute Tribes of the Duck Valley Indian Reservation supports the positions articulated by the Eastern Shoshone Tribe and the Shoshone-Bannock Tribes in their resolution and declarations respectively.

The Shoshone-Paiute Tribes have clear interests to this issue. Many of our tribal members are descended from those whom enjoyed a connection to the landscape now referred to as Greater Yellowstone since time immemorial. In more recent times, our ancestors stood with the Bannock people in defending our homelands in 1878.

The grizzly bear has a significant place in Shoshone-Paiute culture. The grizzly bear is a sacred being, intricately tied to the ceremonies and practices of our people. Such is our respect for the grizzly that we refer to the great bear as our brother.

In its attempts to delist the Yellowstone grizzly bear without regard to the ceremonial and religious practices of tribal people, the FWS is doing so "without consideration of their effect on traditional American Indian religions," which is a violation of the American Indian Religious Freedom Act (PL 95-341–1978/PL 103-344 –1994).

Abrogation of the AIRFA threatens potentially detrimental consequences not only for our religious and spiritual rights, but the sovereignty of all of the Tribal Nations impacted by this issue.

Federally recognized tribes have a unique nation-to-nation relationship with the federal government that requires consultation to be held at a government-to-government level; and government-to-government consultation is conducted under existing protocols and within an established framework.

Given the tremendous concern expressed by many of the Associated Tribes of Yellowstone regarding the potential delisting of the grizzly bear, the FWS should immediately commence consultation with the impacted Tribal Nations regarding the implications of a delisting decision. US government agencies, including FWS, have a duty to consult with tribes regarding policies that have tribal implications. This duty has been embodied in a variety of executive orders, secretarial orders, and memoranda. Executive Order 13175, issued by President Clinton in 2000, was written "to establish regular and meaningful consultation and collaboration with tribal officials in the development of Federal policies that have tribal implications." Such policies include "regulations ... and other policy statements or actions that have substantial direct effects on one or more Indian tribes," such as listing and delisting decisions.

A 2009 memorandum issued by President Obama emphasized the importance of President Clinton's Executive Order, noting that "[c]onsultation is a critical ingredient of a sound and productive Federal-tribal relationship" and affirming the Administration's "commit[ment] to regular and meaningful consultation and collaboration with tribal officials in policy decisions that have tribal implications." President Obama's 2013 Executive Order Establishing the White House Council on Native American Affairs further recognizes that "[g]reater engagement and meaningful consultation with tribes is of paramount importance in developing any policies affecting tribal nations."

The US Departments of Interior and Commerce issued an order on June 5, 1997, specifically regarding tribal consultation obligations in the context of the Endangered Species Act. That order provides that FWS "shall coordinate with affected Indian tribes in order to fulfill the Service['s] trust responsibilities and encourage meaningful tribal participation" in listing and delisting decisions.

Ignoring these Acts and Orders contradicts the basis of the government-to-government relationship that exists between the federal government and all of the Tribal Nations impacted by this issue, a situation that must be remedied.

We join our sister tribes in rejecting the designation of the grizzly bear as a "trophy game animal" and the intent of the states to sell licenses and generate multiple

thousands of dollars from trophy hunting the sacred grizzly bear on our ancestral homelands.

Tribal Nations have alternative solutions to the outdated "wildlife management" practices. Trophy hunting sentient beings appeals only to a tiny minority of the population, and is antithetical to the traditional cultures and subsistence practices of tribal people. Just as the buffalo is being returned to reservation homelands with biologically suitable habitat, some Tribal Nations with appropriate land bases have expressed a desire to develop programs to return the grizzly to their sovereign nations.

Grizzly bear management plans post-delisting should be sensitive to the cultures of the affected Tribal Nations. Rather than have the states influence grizzly bear management on tribal lands, the affected Tribal Nations should be provided with the resources to initiate their own management practices and programs that are consistent with their cultural values. By doing so, tribal sovereignty will be upheld and potential employment and economic opportunity provided.

Our people, those of our sister tribes, and the memberships of the other impacted tribes, retain unique insights into this landscape. Our ancestors are the only ones who had practical experience of what it was to live within these ecosystems when they were complete. The knowledge that they retained and passed down is truly the definition of the "best available science" as they lived it – they did not speculate upon the theoretic. Their voices, through us, need to be heard.

Until these issues cited herein are addressed and resolved to the satisfaction of all of the affected Tribal Nations, we believe that it is premature to even consider issuing a new Rule to delist the iconic Yellowstone grizzly bear from ESA protections.

Sincerely,

Lindsey W. Manning

September 12, 2014

To Whom It May Concern:

This letter is in support of the GOAL Tribal Coalition. The Northern Cheyenne Tribe opposes the federal government's proposed removal of the Yellowstone grizzly bear from Endangered Species Act protections through the US Fish and Wildlife Service and we believe the federal government's determination to remove the grizzly bear from Endangered Species Act protection contravenes the American Indian Religious Freedom Act (AIRFA. PUBLIC LAW 95-341--AUG. 11, 1978).

As one of the twenty-six federally recognized tribes the federal government acknowledges has an ancestral connection to the region now known as Yellowstone National Park and the Greater Yellowstone Ecosystem the US Fish and Wildlife Service is thus required to consult with the Northern Cheyenne Tribe, yet the US Fish and Wildlife Service has refused to release the data it has based its conclusions on for independent scientific review, that data being the basis for the federal government's proposal to remove the grizzly bear from Endangered Species Act protections.

The grizzly bear holds a unique position in the traditional cultures and ceremonial life-ways of the traditional spiritual practitioners of tribes identified by the federal

government as possessing centuries old, and in some instances, millennia-long connections to the lands where the grizzly now survives.

Clearly cultural imperatives and the preservation of sovereignty require a repudiation of the federal government's desire to delist the grizzly bear from Endangered Species Act protections; and the legislative resolve to deny the states' determination to see trophy hunting of grizzlies on reservations and the extirpation of the grizzly bear from swathes of reservation and ancestral homelands.

We the Cheyenne Nation stand in support of the grizzly bear, and the right of Native peoples to religious freedom

Yours faithfully,

Llevando Fisher

President of the Northern Cheyenne Nation

Dan, Scott, Jeff, and Virgil, and everyone else,
Attached is what I presented at the meeting. Please let me know if you have any questions. I hope we can reach agreement on the management of this recovered grizzly population. We have worked together cooperatively for 34 years to get to this point and we are all on the 1 yard line...

On the 19th, we will begin meeting at 8:00 a.m. and plan to be done by noon, unless we can wrap up all the issues prior to that. Lunch, again, will be on your own.

I look forward to seeing you all next week and making progress toward our shared goal of reaching agreement on a mutually acceptable path forward for delisting the Yellowstone grizzly population.

Thanks,

Chris

Hi Chris, below is some text to work from or edit. I have to loop Marla and John in on all my emails so that is why they are CC'ed.

> The Tribal Leaders Council (TLC) has requested more to time to consult on the consideration to delist the grizzly bear. The TLC has elevated their concerns to Secretary Sally Jewell. There is widespread Tribal opposition to a delisting. R6 has offered 3 in-person consultation meetings but the Tribes are requesting more time. R6 is proposing to host three consultation meetings in broad areas were Tribes have expressed interest in this issue. We would like to offer three meetings in late winter or early spring. Ideally, the three meetings would occur within the Great Plains, Northern Rocky Mountains, and Idaho geographical areas.

Hello all at the Department of Interior and Fish Wildlife Service,
Please see the attached letter in response to the letter from the DOI-FWS Mountain Prairie Office (the latter was received by the Tribal Leaders Council office a couple weeks ago dated 2/17/2015 -- RE: FWS/R6/ES/EA ESO-00060852). Both letters as well as the original TLC Resolution to which the letters pertain are attached for your reference.

Although you had requested a response by March 6 (this past Friday), as the subsequent TLC letter reiterates, more time is needed to accomplish the full fledged meaningful consultation process that is required for the Tribes to be able to really engage and be heard on this issue.

My understanding is that ordinarily, Tribal Consultation is announced in the Federal Register 30 days in advance of the first session.

---

Robert,
We did send letters last April to the 4 tribes that we were told to consult with. I attach one of them so you can see what they looked like. We have received no comment from any of these tribes and no request for consolation from any of them. Several of the tribes you list received these letters and these tribes stated in new releases that they were "not consulted". We sent our letters via registered mail so we know they received these letters (example attached).

We did not receive any comments from any tribes to our draft and final delisting in 2007. There was an extensive public comment period and public hearings, and no tribes commented. The Yellowstone grizzly was delisted for 2 years until 2009 and no comments were received from any tribes during this time.

Both tribes on the Wind River reservation and the Shoshone-Bannock Tribes are members of the Yellowstone ecosystem management subcommittee. A Shoshone-
Bannock tribal representative attended the last subcommittee meeting in October, 2014. He made no statements about delisting even though this issue was a major topic of discussion at the meeting.

I copied your response ideas below and comment on the issues I have concerns about:

1. If an official move to delist the Grizzly Bear is implemented then all Tribes that have concerns would be able to have official government to government consultation as required under the law. This is what our letter said in April, 2014.

2. If any tribes within the Gb range are interested in discussing this issue now they are free to do so at any time with the Service.

3. Send a letter to all interested Tribes reassuring them that if delisting is proposed that Tribes will be offered the opportunity for consultation. Since we already sent such a letter to the tribes with treaty rights, this is redundant for these tribes. This letter can be sent to the other tribes.

4. Inform BIA of the facts and that consultation will occur.

5. Have Ivy Allen reach out to her tribal contacts and assure them that they will have an opportunity to consult. Again we have already done that for the tribes with treaty rights. I don't think we should in effect be apologizing as if we have not done what we are supposed to do.

Chris

Thanks Chris.

Great stuff. I will package this for Marla so she can present to leadership. I will use your comments (I agree we don't need to apologize for doing what we normally do either) so they have some weight.

Hogan just wanted options so I wanted to give him a few courses of Action.

Much appreciated.

Subject: Re: FW: Yellowstone Grizzly Bear Protection Letter

Robert,
We did send letters last April to the 4 tribes that we were told to consult with. I attach one of them so you can see what they looked like. We have received no comment from any of these tribes and no request for consolation from any of them. Several of the tribes you list received these letters and these tribes stated in new releases that they were "not consulted". We sent our letters via registered mail so we know they received these letters (example attached).

We did not receive any comments from any tribes to our draft and final delisting in 2007. There was an extensive public comment period and public hearings, and no tribes commented. The Yellowstone grizzly was delisted for 2 years until 2009 and no comments were received from any tribes during this time.

Both tribes on the Wind River reservation and the Shoshone-Bannock Tribes are members of the Yellowstone ecosystem management subcommittee. A Shoshone-
Bannock tribal representative attended the last subcommittee meeting in October, 2014. He made no statements about delisting even though this issue was a major topic of discussion at the meeting.

I copied your response ideas below and comment on the issues I have concerns about:

1. If an official move to delist the Grizzly Bear is implemented then all Tribes that have concerns would be able to have official government to government consultation as required under the law. This is what our letter said in April, 2014.

2. If any tribes within the Gb range are interested in discussing this issue now they are free to do so at any time with the Service.

3. Send a letter to all interested Tribes reassuring them that if delisting is proposed that Tribes will be offered the opportunity for consultation. Since we already sent such a letter to the tribes with treaty rights, this is redundant for these tribes. This letter can be sent to the other

tribes.

4. Inform BIA of the facts and that consultation will occur.

5. Have Ivy Allen reach out to her tribal contacts and assure them that they will have an opportunity to consult. Again we have already done that for the tribes with treaty rights. I don't think we should in effect be apologizing as if we have not done what we are supposed to do.

Chris

On Thu, Jan 8, 2015 at 1:45 PM, Robert Segin <robert_segin@fws.gov> wrote:

Hi Chris,

I am backing up Ivy in the Tribal Relations while she is out. If you look at the email string below there are some concerns from BIA that Tribes are not being offered the opportunity to consult on a potential Grizzly delisting. Here is what I know and propose. See if it makes sense. Matt Hogan has asked for some strategies to deal with this as well.

What I know:

I am aware that we did send official consultation letters on a potential delisting to tribes that had treaty interests in the spring of 2014.

I understand that none of these tribes has responded or yet. But, then again nothing has been proposed and no decision has been made to propose delisting. Is that still the case?

I understand that there were no tribal concerns during the 2007-2009 delisting.

The below email references an article (not the Louisa Willcox stuff) which I am guessing is http://missoulanews.bigskypress.com/IndyBlog/archives/2014/12/17/tribal-coalition-speaks-out-against-yellowstone-grizzly-delisting

What I would propose Marla take to leadership.

1. If an official move to delist the Grizzly Bear is implemented then all Tribes that have concerns would be able to have official government to government consultation as required under the law.

2. If any tribes within the Gb range are interested in discussing this issue now they are free to do so at any time with the Service.

3. Send a letter to all interested Tribes reassuring them that if delisting is proposed that Tribes will be offered the opportunity for consultation.

4. Inform BIA of the facts and that consultation will occur.

5. Have Ivy Allen reach out to her tribal contacts and assure them that they will have an opportunity to consult.

Does this make sense? And what else would you say?

INFORMATION/BRIEFING MEMORANDUM

DATE: October 10, 2016

FROM: Jodi Bush, Supervisor, Montana Ecological Services Office, (406) 449-5225.

SUBJECT: Update on Yellowstone Grizzly Bear Delisting and YES Committee

The U.S. Fish and Wildlife Service (Service) is working, at all levels of the agency, to get agreement on outstanding issues in the Yellowstone Ecosystem (YES) grizzly bear delisting process. These include issues in the Conservation Strategy (CS), the Recovery Plan (RP) and the Proposed Rule/Federal Register document. Based on our most recent YES meeting (October 3, 2016), we appear to have agreement on all previous outstanding issues except for recalibration. The YES committee deferred any discussion on this topic (recalibration) at that meeting as management at higher levels in multiple agencies remain engaged in discussions.

BACKGROUND

On March 11, 2016 the Service proposed to delist the YES population of grizzly bear. With the proposed rule the Service also released two other documents for public comment, a draft supplement to the 1993 Grizzly Bear Recovery Plan for the Yellowstone grizzly bear population, and a draft conservation strategy. These detail how both grizzly bears and their habitat will be managed in a post-delisting environment. The Conservation Strategy was developed by our State and Federal partners to be the document that identifies and guides management and monitoring of the Yellowstone grizzly bear population and its habitat upon recovery and delisting. Many of the comments we received during the open comment period pointed to inconsistencies between that document and the Service's proposed rule and RP. In addition, our partners found errors and requested clarifications in that document prior to its finalization. Since April of 2016, a subset of the YES committee –the YES Steering committee, has met regularly to address both the internal partner agency issues (identified at the April YES meeting), and those issues brought up by the public and peer reviewers during open comment period. This has resulted in resolution of most of the issues identified with the exception of recalibration.

Comment [JB1]: Others?

KEY POINTS

- The Service had several issues that needed to be resolved prior to finalizing the delisting rule. These included: (1) clarifying the triggers, (2) addressing NPS concerns with the 1998 baseline, (3) language regarding how long the CS would be in place – revising the perpetuity language, (4) addressing food storage as a benefit to connectivity, and the concept of connectivity in general, (5) clarifying recovery criteria #1 –related to genetic health, and (6) recalibration.
- The Service worked with our partners to address, clarify and revise all of these issues with the exception of recalibration. That issue remains with upper management to resolve. In addition issues that were brought up by the public, the peer reviewers, and the agencies themselves have been addressed in the CS and suggested edits to the Rule made.

Comment [JB2]: ?

- At the last YES meeting (October 3, 2016), the committee was able to work through each chapter of the CS and get to final agreement on the edits and revisions for the entire document.
- We are still working on the Appendices and plan to have draft versions for YES committee review by later this week. As most of the edits in these Appendices (except Appendices C), are tied to changes in the main CS document, we do not feel that these will be controversial.
- The outcome of Appendix C is directly related to discussions on recalibration and as such no changes have been agreed to yet.
- We continue to engage our State, Tribal and other Federal partners and other stakeholders, as well as through YES meetings and coordination calls.

POSITION OF PARTICIPATING AGENCIES

- The U.S. Forest Service is committed to the process, the CS and moving forward with delisting the YES grizzly bear. They have amended their Forest Plans as necessary to include relevant guidance and clarified language in their policies regarding the grizzly bear.
- The National Park Service remains concerned about hunting in the John D Rockefeller Parkway as well as immediately adjacent to both National Parks. They did approve the CS locally (Yellowstone NS and Grand Teton NP) and seem willing to go forward with delisting.
- The Bureau of Land Management seems willing to move forward with delisting and did not bring forward any concerns. They also approved the CS for their 3 state jurisdictions.
- The States have stated that they are unsure resolution on the recalibration will occur. They also approved the CS as edited for all 3 state jurisdictions.
- The Warm Springs Tribe went on record as being against the delisting and abstained from approving the CS.
- The Service is pleased with the progress we have made and is optimistic that a resolution on recalibration can be made.

Comment [JB3]: Is this right?

---

Made most of your suggested edits but wondering how to address your one about RC # 1. Please take a stab at it and send back. Because we let this go at the YES meeting, I think the only way we may be able to deal with it is in the response to comments or final Rule.

I'm headed to Missoula (for a Fisher meeting) by 930ish so if you could respond quickly that would be great. JB

INFORMATION/BRIEFING MEMORANDUM

DATE: October 10, 2016

FROM: Jodi Bush, Supervisor, Montana Ecological Services Office, (406) 449-5225.

SUBJECT: Update on Yellowstone Grizzly Bear Delisting and YES Committee

The U.S. Fish and Wildlife Service (Service) is working, at all levels of the agency, to get agreement on outstanding issues in the Yellowstone Ecosystem (YES) grizzly bear delisting process. These include issues in the Conservation Strategy (CS), the Recovery Plan (RP) and the Proposed Rule/Federal Register document. Based on our most recent YES meeting (October 3, 2016), we appear to have agreement on all previous outstanding issues except for recalibration. The YES committee deferred any discussion on this topic (recalibration) at that meeting as management at higher levels in multiple agencies remain engaged in discussions.

BACKGROUND

On March 11, 2016 the Service proposed to delist the YES population of grizzly bear. With the proposed rule the Service also released two other documents for public comment, a draft supplement to the 1993 Grizzly Bear Recovery Plan with revised demographic criteria for the Yellowstone grizzly bear population, and a draft conservation strategy. These detail how both grizzly bears and their habitat will be managed in a post-delisting environment. The Conservation Strategy was developed by our State and Federal partners to be the document that identifies and guides management and monitoring of the Yellowstone grizzly bear population and its habitat upon delisting. Many of the comments we received during the open comment period pointed to inconsistencies between the CS and the Service's proposed rule and RP. In addition, our partners found errors and requested clarifications in the CS prior to its finalization. Since April of 2016, a subset of the YES committee –the YES Steering committee, has met regularly to address both the internal partner agency issues (identified at the April YES meeting), and those issues brought up by the public and peer reviewers during open comment period. This has resulted in resolution of most of the issues identified with the exception of recalibration and revisions of triggers for a Service status review.

KEY POINTS

- The Service had several issues that needed to be resolved prior to finalizing the delisting rule. These included: (1) clarifying the triggers, (2) addressing NPS concerns with the 1998 baseline, (3) language regarding how long the CS would be in place – revising the perpetuity language, (4) addressing food storage as a benefit to connectivity, and the concept of connectivity in general, (5) clarifying recovery criterion~~e~~ #1 –related to genetic health, and (6) recalibration.
- The Service worked with our partners to address, clarify and revise all of these issues with the exception of recalibration. That issue remains with upper management to resolve. In

Comment [JF1]: I think we should be clear that with removal of all references to genetic health, criterion 1 in the Strategy is no longer consistent with the rule and the recovery plan supplement.

addition issues that were brought up by the public, the peer reviewers, and the agencies themselves have been addressed in the CS and suggested edits to the Rule made.

- At the last YES meeting (October 3, 2016), the committee was able to work through each chapter of the CS and get to final agreement on the edits and revisions for the entire document.
- We are still working on the Appendices and plan to have draft versions for YES committee review by later this week. As most of the edits in these Appendices (except Appendices C), are tied to changes in the main CS document that have already been approved: we do not feel that these will be controversial.
- The outcome of Appendix C is directly related to discussions on recalibration and as such no changes have been agreed to yet.
- We continue to engage our State, Tribal and other Federal partners and other stakeholders, as well as through YES meetings and coordination calls.

POSITION OF PARTICIPATING AGENCIES

- The U.S. Forest Service is committed to the process, the CS and moving forward with delisting the YES grizzly bear. They have amended their Forest Plans as necessary to include relevant guidance and clarified language in their policies regarding the grizzly bear.
- The National Park Service remains concerned about hunting in the John D Rockefeller Parkway as well as immediately adjacent to both National Parks. They did approve the CS locally (Yellowstone NS and Grand Teton NP) and seem willing to go forward with delisting.
- The Bureau of Land Management seems willing to move forward with delisting and did not bring forward any concerns. They also approved the CS for their 3 state jurisdictions.
- The States have stated that they are unsure resolution on the recalibration will occur. They also approved the CS as edited for all 3 state jurisdictions.
- The Warm Springs Tribe went on record as being against the delisting and abstained from approving the CS.
- The Service is pleased with the progress we have made and is optimistic that a resolution on recalibration can be made.

Grizzly bear delisting public comment issue summaries

Delisting process and compliance with applicable laws, regulations, and policies

ISSUE 1: Several commenters expressed concern that the opportunity for public involvement was inadequate. Specifically, the commenters requested a longer public comment period, more public hearings, and accommodations for the visually impaired and those without internet access to ensure their ability to provide comments on the rule.

ISSUE 2: We received a public comment regarding the impacts of litigation on the delisting process. Specifically, the commenter expressed concern regarding delays caused by litigation, in addition to the resultant loss of time and money that could be more effectively used elsewhere. The commenter quoted a report from the Department of Interior's Inspector General, which said that "lawsuits should not be driving regulatory decisions." This commenter suggested that Congress update the ESA to address the "legal vulnerabilities" by clarifying a prevailing delisting process that can better recognize success "once a species reaches its recovery goals."

ISSUE 3: A number of commenters noted that Native American interests and concerns were not adequately addressed in the rule. Commenters expressed concern that we did not adequately consider the cultural, spiritual, and ecological significance of the grizzly bear to Native American tribes. Commenters also claimed that we did not appropriately analyze the significance of tribal territory and treaty rights in the GYE. Another commenter stated that we did not fulfill our obligation under Executive Order 13175 to consult with the tribes on the proposed rule.

ISSUE 4: Multiple commenters requested we release the National Environmental Policy Act documentation associated with the proposed rule to delist the GYE population of grizzly bears.

Geographic scope of recovery and delisting

ISSUE 5: Multiple commenters suggested we adjust the boundaries of the DMA. One commenter proposed we remove the Upper Green allotments, and other similar habitat, from the DMA. Another commenter took issue with the fact that the DMA described in the draft Conservation Strategy and proposed rule encompassed the Big Sandy and Popo Agie Management units, "areas outside the 2014 grizzly bear distribution boundary." One commenter advised that we expand the DMA boundaries to "include all designated wilderness lands adjacent to the proposed DMA."

ISSUE 6: Several commenters took issue with the scope of our threats, or "five factor," analysis. They claimed that we failed to fulfill the requirements in Section 4(a)(1) of the Act since we only analyzed the importance of threats inside the DMA and that the threats analysis should not be "limited to suitable habitat." The commenters requested we provide a more thorough threats analysis that considers threats, and their impact on grizzly bears, in the entire GYE DPS because invisible boundaries cannot be used to classify the health of a population.

GYE Grizzly Bears Recovery Criteria and management objectives

ISSUE 7: We received several public comments that expressed confusion and concern about the demographic recovery criteria. Commenters questioned whether the criteria are tied to the model-averaged Chao2 estimate or if the Service retains the discretion to change the method. Others felt that demographic recovery criteria #1 and #2 are not necessary post-delisting, that they will restrict adaptive management, and that only the mortality limits in criterion #3 are necessary to maintain a stable population size. Some suggested additional recovery criteria be added, including: a criterion to monitor the changes in food resources; and a criterion linked to a declining population trend.

Some commenters were concerned about how criterion #1 is measured and the adequacy of triggers associated with this criterion. Several commenters and a peer reviewer asked if the minimum population size of 500 was tied to the Chao2 estimate method. They noted that the method should be clear or a new method would need to be calibrated. Another commenter asked about the biological justification of establishing 500 as the goal for the total population size. Other commenters emphasized that the objective of 500 grizzly bears was based on genetic health (Miller and Waits 2003) with a buffer. However, the second part of the first criterion, which requires 48 females with cubs-of-the-year, equates to a population of 600 and not 500 bears. Thus, commenters suggested that any reference to 500 should be discussed in its historical context of genetic viability or removed to reduce confusion. Several commenters felt that the trigger of 500 grizzly bears is too low. In addition, commenters wondered why three consecutive years of non-compliance led to the criterion not being met in the supplement to the recovery plan, while the Conservation Strategy declared this criterion would not be met if there were two consecutive years of non-compliance.

Some commenters expressed concern with the measurement of demographic recovery criterion #2 and the adequacy of the triggers associated with this criterion. Commenters expressed some confusion on how the three consecutive 6-year sums are calculated; they worried that that this would require 18 years before this criterion is assessed. If female occupancy is not being met, a 6-year sum of observations is a long time to wait to assess the criterion. Some believe that the criterion should apply to the whole DMA, not just the PCA, stratified on flight areas.

Some commenters expressed concern with the measurement of demographic recovery criterion #3 and the adequacy of the triggers associated with this criterion. Many felt that stopping discretionary mortality at a population of 600 bears is too lenient; commenters suggested that the threshold for halting discretionary mortality should be higher than the 95% confidence interval and/or should be the population objective itself (i.e. 674). Commenters expressed that, to be more precautionary, the average around which the population will be maintained should be increased. Suggestions for modification of this criterion included: making exceedance of mortality limits independent of a population minimum; and eliminating the three year wait between the the population dropping below 612 and determining that the criterion is not met. Some suggested that this criterion should be made easier to interpret, such as using an annual index of observed females with cubs to total observed mortality. Lastly, one commenter suggested that the mortality limit for dependent young is unnecessary because it is not currently being measured.

ISSUE 8: We received comments from peer reviewers and the public that expressed confusion about the population management objectives and their scientific basis. Commenters thought that the proposed rule and Conservation Strategy were unclear about whether the population goal is 500, 600, or 674; commenters further opined that, if the population goal is 500 bears, then the states would decrease the current population of grizzly bears by more than 100 bears. Moreover, a peer reviewer emphasized that there is no biological basis for a population goal of 500 bears. Commenters point out that the Service references a management objective of 674 bears within the DMA whereas the states have agreed to a "management objective for the DMA of at least a range between 600 and 747 (based on the 95% confidence interval of the estimated average population size between 2002 and 2014) and upon mortality rates to keep the population within this range." Some commenters believed that the goal should be to have a population that is stable or increasing to allow the population to continue to expand into currently unoccupied lands within the DMA. Some commenters and peer reviewers suggested that it is unrealistic to manage the population to a single number when the confidence intervals are large and do not account for all sources of variation. Finally, one peer reviewer recommended that the population goals be periodically re-evaluated to allow for consideration of natural and anthropogenic changes in the ecosystem.

General comments on whether to delist

ISSUE 9: We received comments both supporting and objecting to our conclusion that the grizzly bear is biologically recovered. Some commenters agreed that the grizzly bear is biologically recovered because the GYE population has consistently fulfilled the conditions of the recovery criteria in recent years, the threats in the five factor analysis required under Section 4 of the ESA have been sufficiently ameliorated, bears have the ability to adapt to changes in habitat, and grizzly bears occupy their entire range within the GYE, so much so that young or transient bears have trouble finding space to "establish their own home ranges."

Commenters also presented a number of reasons they disagreed with our assessment that the grizzly bear is biologically recovered. Some of these commenters reference that grizzly bears currently only inhabit less than 2% of their historic range and that populations are less than 3% of their historic abundance. Commenters also claimed that grizzly bears do not even occupy all suitable habitat within the DMA. Other commenters doubted the accuracy of the current population estimates for the GYE population; they also expressed concern that the population "has not increased since the early 2000s." One commenter suggested that the metapopulation in the lower 48 states would have to have 2500-5000 bears to be considered recovered. Commenters also noted that there are only 1200-1800 grizzly bears in the entire lower 48 states, which commenters claimed to be "five times too few individuals to assure long-term persistence of the species." One commenter noted that, even if population numbers had reached adequate levels, merely the demographic recovery of bears based on numbers is not sufficient for recovery. Another commenter suggested that the GYE population still meets the criteria to be listed as "vulnerable" by the IUCN Red List; this commenter also suggested that, "if the GYE population of grizzly bears fell below 533, it would be categorized as endangered by the IUCN." Other commenters claimed that true recovery would not be possible in the GYE without connectivity to healthy, "permanent populations of bears in the Gravelly-Snowcrest-Centennial Mountains, in the Selway-Bitterroot Wilderness, and along the connecting crest of the Bitterroot Range." The Governor of Wyoming believed that we were arguing the GYE population of grizzly bears has achieved recovery because the bears have reached carrying capacity; these commenters noted that carrying capacity is not a proper metric for assessing recovery.

ISSUE 9.5: We received a comment that believes our description of the taxonomy of grizzly bears in the GYE is no longer the best available science. They presented that the GYE grizzly bears are "part of a clade (Clade 4) with an ancient and unique history, a restricted distribution, and warranting consideration as evolutionary unique and threatened genetic linkage." They continued that because this unique taxonomic classification applies to the whole lower 48 grizzly bear metapopulation, recovery must address grizzly bears in the entire lower 48 states.

ISSUE 10: We received comments that both agreed with and disagreed with our assessment that it is appropriate to remove the grizzly bear from the endangered species list. Those who supported our assessment suggested that states will allocate more money towards grizzly bear conservation and management in a post-delisting environment, submitted that the GYE population of grizzly bears has "exceeded social carrying capacity," and claimed that grizzly bear recovery in the GYE is one of the biggest conservation success stories of the ESA.

However, some commenters did not support our assessment that delisting was appropriate. One commenter expressed that the recovery of the GYE population of grizzly bears "is a success story…but still one in the making." Other commenters suggested that delisting was premature and urged the Service to withdraw the proposal to delist. One commenter claimed that, since the grizzly bear has not fully recovered after 40 years of protections under the ESA, the Service should "increase, rather than remove, federal protections." Commenters expressed

concern that the grizzly bear population would start to decline if it was delisted and that delisting contradicted "the precautionary approach to wildlife management mandated under the ESA." Some of these commenters were concerned that grizzly bears would be classified as predators and thus would be shot, poisoned, or killed on sight. Some commenters expressed concern that delisting could negatively impact the economies and cultural experiences of towns within and surrounding the GYE; these commenters claim that visitation to the public lands in the GYE, which is partly motivated by a desire to encounter grizzly bears, "is a multi-million dollar industry that may decline once grizzly bears are allowed to be hunted on park boundaries." Commenters expressed that grizzly bears are a key aspect of a gratifying experience in the GYE; these commenters wanted future generations to be able to see and enjoy grizzly bears. Commenters also cited research from Ohio State University claiming that, in a survey of grizzly bear experts, 60% of grizzly bear biologists "believe delisting would be an incorrect decision, or at the very least a violation of the precautionary principle." Finally, one commenter expressed concern that there was undue political influence in the proposal to delist.

ISSUE 11: One commenter claimed we inappropriately conclude that threats become irrelevant when they "can be managed." This commenter suggested that threats we and others successfully manage (such as genetic health) should still be regarded as a threat during our evaluation.

Measurement of and interpretation of population parameters

ISSUE 12: Some commenters expressed skepticism towards our data and analysis. They opined that the raw data used in our analysis was not made available for independent review. They expressed concern that the "monopoly" the IGBST has on grizzly bear population data prompts groupthink and a general lack of transparency. Another commenter claimed that the peer review process does not sufficiently detect error or bias and that it is no more likely to detect error or bias than by random chance. The same commenter took issue with the proposed rule's reliance on models because there is never one correct model, claiming that model building is "the most bias-prone form of analysis." Another commenter cautioned against committing Type II errors in analysis.

ISSUE 13: We received comments from peer reviewers and the public that expressed concern about the use of the Chao2 estimate method to estimate the grizzly bear population size, questioned whether the Chao2 method is best the available science, and expressed confusion about the application of this method. Some commenters were concerned with the reliability of the Chao2 estimator and suggested that we need to address the disagreement in the scientific community about the accuracy of the Chao2 population estimate as discussed by Doak and Cutler (2014a, 2014b). In addition, one commenter stated that the current population could be as low as 552 bears (Thuermer 2016) with the lower end of the 2015 estimate of 642 and mortalities of up to 90 bears, including unknown/unrecorded mortalities.

We also received several comments from peer reviewers and the public questioning the application of the model-averaged Chao2 estimate. One peer reviewer questioned whether the Chao2 estimator is an estimate of the total number of females with cubs or an estimate of the overall grizzly bear abundance. Additionally, a peer reviewer asked for additional details of how model averaging is used with the Chao2 estimator, given the potential issues with model-averaging (Cade 1995), or if instead we are reporting the average of annual Chao2 estimates of the population, in which case we should not use the term "model-averaged Chao2 estimate."

Several comments were concerned with the measurement and interpretation of unique females with cubs. Comments expressed concerns about the biases associated with the reliance on counts of unique females with cubs. The first source of bias commenters cited stems from increased sightability; over time, it has become easier to find and count individual bears since bears have increased their use of moth sites, which are easy to monitor. These commenters claimed that the increasing trend of the number of females with cubs in IGBST monitoring data could stem from the fact that it has become easier to count bears and not from the fact that there are actually more bears in the GYE. The second source of bias commenters cited relates to increased unreliability of unique sightings of females with cubs. Based on the guidelines for how we count females with cubs, females with differing numbers of cubs are considered unique (e.g. a female spotted with two cubs near where a female with three cubs was also spotted is counted as an additional unique female). However, increased cub mortality increases the difficulty in distinguishing between unique females with cubs because of changing litter sizes; between multiple survey flights, females could lose a cub and thus be counted twice (once as a unique female when she has three cubs and again as a unique female when she is spotted with only two cubs). This can again cause overestimation of the number of females with cubs. The third source of bias comes from increased search effort (i.e., number of hours flown); increasing efforts in surveys could lead to artificially higher counts of females with cubs. To manage for biases in the Chao2 estimator, one commenter suggested that the Service specify that population monitoring will continue indefinitely at the same intensity, the same distribution, and under the same design to account for potential biases in the Chao2 method. Another commenter suggested that we review Ordiz et al. (2007) as an alternative to the Knight rule in distinguishing unique females with cubs. Under the rules for counting unique females with cubs, we do not consider two females spotted within 30 km of each other as unique (these two females would count as one bear). As grizzly bear populations become denser, females will live closer together and this counting rule may cause an underestimation of the actual number of bears on the ground. Eventually, the population of bears will be so dense that there is a maximum number of bears surveyors can possibly count given these rules (i.e. one bear in every 30 km radius); we refer to this maximum number of bears countable under the Chao2 rules as the "density threshold." One commenter worried that once the population exceeds this threshold, managers will not be able to detect a decline in the population, as long as the number of females with cubs remained above the threshold, since the total counts of numbers of females with cubs are artificially stagnant.

Several comments indicated that the application of the Chao2 estimator should be more transparent. One peer reviewer asked if the Chao2 estimator was published in its entirety in a single published article while another asked if the method had been subject to peer review. It was suggested that more details be provided regarding: the demographic inputs and how they are determined; the model assumptions; how the initial population size was estimated; how the sex-age class distributions were estimated; and how natural mortalities were estimated and included. Some commented that the population estimate is influenced and potentially biased by the multipliers used for dependent young, pre-reproductive independent females, and independent males. Some commenters suggested that the population estimate has increased only because the estimated survival rate and the multiplier for independent males increased in the model in 2012 when survival rates actually decreased. In addition, one commenter suggested that the method is insensitive to rapidly changing conditions. Another commenter expressed that the large change in the Chao2 population estimate based on the use of updated survival rates makes evident the high uncertainty in the monitoring of this population and questioned which rates should be used.

Some commenters were concerned with our interpretation of and reliance on the conservativeness of the Chao2 estimate. One comment suggested that the Chao2 is only conservative if the population is indeed increasing; this commenter noted that if the vital rates and mortality rates are incorrectly estimated, then the population could decline undetected. Another commenter worried that managers could misinterpret reaching the density threshold of the Chao2 estimate (an artifact of the counting methodology that creates a cap on the total number of females with cubs surveyors can count) as reaching the carrying capacity of the population. The grizzly bear population can still be growing even once it reaches the density threshold of the Chao2 estimate.

ISSUE 14: We received comments from peer reviewers and the public that expressed concern about how we measure and interpret the population trend. One commenter asked for statistical or theoretical justification for the use of linear and quadratic models in population trend estimation. Another commenter presented the conclusion from a 2012 IGBST workshop that we should not use observations of females with cubs to estimate population trend because this measure was an unreliable method at the high population densities occurring in 2012. One commentator suggested that the smoothing approach employed in the Chao2 method is highly sensitive to the time period being modelled and that only data since 2000, when major changes occurred in the GYE, should be used.

Some commenters were concerned with a potential lag effect (i.e. that the model-averaged approach is insensitive to rapidly changing conditions and that a negative population trend would not be detected in a timely manner). Lag effects between habitat decline and population decline have been reported by Doak (1995) and McLellan (2015). In addition, one commenter was concerned that a negative population trend would not be detected with the current statistical rigor until it is too late.

Some commenters were concerned that the smoothing approach that the IGBST uses in estimating the population trend should not include data from before 2000 because significant

changes occurred in the GYE grizzly bear population in 2000. Additionally, commenters pointed out that the population trend declines significantly to a 0.8% annual increase if modelers only use data from 2007 to the present . Several commenters suggested additional methods to apply in detecting the population trend. One commenter suggested that we compare the annual uncertainty in the population estimates to long-term averages to further inform the population trend. A peer reviewer recommended that we use an independent measure, including independent sampling, to verify model trends. Other commenters stated that the IGBST should use capture-recapture data to estimate population trend rather than the trapping effort data used by van Manen et al. (2016) and Bjornlie et al. (2014).

Several commenters offered alternative interpretations of the population trend. Some commenters believe that the IGBST over-estimated the population growth rate because the method used does not account for senescence in both birth and death rates of females (Doak and Cutler 2014a, 2014b). Other commenters pointed out that the number of older bears in the GYE population is increasing while the number of cubs and younger bears is decreasing; they expressed that this trend in age structure does not bode well for maintaining a healthy population. Some commenters discussed the 6% population decline between 2014 and 2015; these commenters believed that lower cub survival rates and mortalities from conflicts with hunters and livestock caused this decline. Some commenters believe that the population of grizzly bears has not increased since the early 2000s.

Measurement of and interpretation of population parameters

ISSUE 15: Several commenters and a peer reviewer raised concerns over utilizing a new population estimation method in the future in lieu of the current methodology (Chao2). One commenter noted that the use of the Mark-Resight method may provide a less biased estimation of population size than the estimate from Chao2. Several commenters noted that the Service should abandon the "model-based average" method and instead use a model "based on a running average of annual growth rate over" the six preceding years. Some public commenters requested that any new population estimation methodology be open to public comment prior to implementation. Both commenters and peer-reviewers raised questions about how a new population estimation method would be implemented in the future and how new estimates would be reconciled with previous estimates that used the Chao2 methodology. A peer-reviewer noted that if managers were to use a new population estimation method, they would need to calibrate the method "to ensure long-term comparability of data." Commenters noted that mortality limits would also need to be calibrated with this new population estimation method and the status review triggers for review would need to be redefined in response to any new population estimation methodology. However, other public commenters noted that if a new population estimation methodology is implemented, it "should not be used to re-define what the recovered bear numbers are for future management decisions."

ISSUE 16: We received several public comments and a peer review expressing concerns regarding the measurement of grizzly bear mortality. Commenters asserted that using known fate monitoring to measure grizzly bear mortality (with large data sets covering long time periods) reduces the ability to detect short-term trends and produces death rates that do not match reality. Commenters further asserted that the estimation methods we use to estimate unknown/unreported mortality, which are presented in Cherry et al. (2002), underestimate mortality and are susceptible to bias. These commenters claimed this bias originates from (1) the fact that the cause of a grizzly bear death changes the probability of the death being reported and (2) variable effort in bear capture and radio-collaring. In addition, a peer reviewer suggested that, to be conservative in our estimate of independent female mortality, we should use a sex assignment ratio of 50:50, instead of 59% male and 41% female, when determining the sex of probable or unrecorded mortalities; they suggested we could also assign any probable mortality as female.

Commenters also expressed concern regarding recent increases in human-caused mortality. Commenters provided several statistics including: (1) human-caused mortalities increased in 2015, with 59 known mortalities and at least 30 mortalities of unknown cause; (2) hunter-caused mortalities increased over the past 11 years from 3.7 bears to 10.2 bears lost annually; (3) total human-caused mortality has increased since 1994; (4) the limit for female mortality was exceeded in 2015; and (5) mortality limits for males and/or females were exceeded in five out of the last seven years. Contrary to our claims in the proposed rule, commenters asserted that human-caused mortalities continue to rise despite implementation of information and education programs in 2008. Commenters asserted that if the grizzly bear population has stabilized since 2002 while mortality rates have simultaneously increased, then the bear population is actually declining.

Several commenters expressed that, though reported mortality from all causes was 61 bears in 2015, only approximately 50 percent of total mortality is reported, which means actual mortality was higher than these 61 bears in 2015. One commenter contended that mortality could approach 200 bears annually after delisting, if bears are also killed in trophy hunts.

ISSUE 17: Both commenters and peer reviewers raised concerns over our detection and interpretation of trends in vital rates. A peer reviewer noted that monitored individuals may be more susceptible to capture and may not serve as an accurate representative sample in regards to the measurement of vital rates (i.e. sampling bias may be affecting vital rate estimation). Commenters also noted that negative trends in vital rates may not be detected until it is too late. They highlighted the fact that there has been a decrease in cub and yearling survival since the early 2000's, and that there is uncertainty associated with the ecological factors that may be contributing to this decline in vital rates.

ISSUE 18:

Both commenters and peer reviewers presented comments surrounding our discussion and analysis of the carrying capacity for grizzly bears in the GYE. Both commenters and peer

reviewers raised concerns that Figure 1 of the proposed rule is an oversimplification of a population at carrying capacity. They proposed including an explanation of the variables, in addition to those presented in Figure 1, that influence carrying capacity (e.g. food availability and emigration in search of food, mates, or territory). One commenter noted that a graph illustrating how the Chao2 estimate of the GYE grizzly bear population is leveling off might provide a clearer demonstration of carrying capacity. Additionally, commenters doubted our conclusion that the GYE population is approaching carrying capacity; one commenter noted that grizzly bears only occupy 25% of the GYE (i.e. carrying capacity has not been met), and that we acknowledge the inherent difficulty in calculating carrying capacity.

Commenters and peer reviewers suggested alternative hypotheses to our claim that GYE population is approaching carrying capacity. Commenters suggested that a decrease in food availability may be the driver behind a slowing growth rate in the GYE grizzly bear population. Another commenter noted that carrying capacity itself may have declined as a result of decreasing food availability (specifically of the four major grizzly bear food sources). One peer reviewer concurred with this suggestion, noting that the stabilizing trend for grizzly bears in the GYE could be a result of a shrinking biological carrying capacity. This peer reviewer cited Van Manen et al. (2016, page 309), who noted that a decrease in carrying capacity was a possible alternative explanation for the demographic changes apparent in the GYE population; this peer reviewer suggested that we should note this possible explanation in the rule. Another peer reviewer proposed that grizzly bears in the GYE may have reached a human *social* carrying capacity, not a biological one.

ISSUE 19:

Some commenters questioned our interpretation of bear density in the GYE. Commenters claimed that the core population density has decreased because the population has stabilized since the early 2000s while simultaneously the distribution has increased (i.e., the same number of bears are spread across an ever-increasing area). Additionally, one commenter stated that "the density index directly based on the number of bears trapped and radio-marked in a given area during a given year" has not been reviewed to confirm its reliability.

Commenters also took issue with our conclusion from our analysis density-independent and density-dependent effects on grizzly bear population dynamics in the GYE. Several commenters noted that, though we analyzed four factors to determine the relative influence of density-dependent and density-independent effects, only one factor (home range size) differed between the analyses of density-dependence and density-independence. Commenters suggest that both density-dependent and density-independent causes lead to decreased cub and yearling survival, increased age of first reproduction, and decreased reproduction; these factors thus cannot be used to distinguish between the influence of density-independent and density-dependent effects on the grizzly bear population, especially when these effects potentially stem from limited resources. Others commented that the density-dependence analysis failed to account for temporal changes in the abundance of key foods and habitat. Commenters questioned the causal link we suggest between density dependence and declining vital rates;

these commenters expressed confusion as to why we only explained one of the four factors from our analyses, cub survival.

Finally, one peer reviewer suggested that we review our use of the words "cause," suggesting causality, as opposed to "association" in our density-dependence analysis.

Habitat management

ISSUE 20: We received comments from both the public and peer reviewers regarding our definition of suitable habitat. One reviewer asserted that the definition was qualitative and too weak. One public commenter asserted that the definition of suitable habitat did not include lands with sheep allotments and other livestock operations that can increase human-bear conflicts. They suggested that lands with sheep allotments should be included in suitable habitat and that these operations be considered as a potential threat under the five factor analysis. More specific concerns from public commenters included the following: (1) the definition of suitable habitat excluded important potential habitat such as the Wind River Range, the Palisades Wilderness Study Area, and other public lands adjacent to the DMA; (2) the definition of suitable habitat excluded "some habitat outside the DMA that is already occupied;" and (3) the definition was not based on the "best available science" because it excludes currently unoccupied areas based on the potential "social intolerance" for bears in these areas; this commenter asserted that a science-based conclusion cannot compromise on "what is biologically necessary for long-term persistence" in order to cater to potential public intolerance. One commenter suggested we use "spatially dynamic boundaries" in our definition of suitable habitat to allow for geographical shifts in habitat types and changing food locations.

ISSUE 21: A peer reviewer expressed concerns that our discussion of habitat management in the proposed rule focused almost primarily on preventing human-caused mortality, rather than on systematically identifying the biological features characteristic of important grizzly bear habitat. This peer reviewer requested that we provide information on the biological features of habitats that different ages and sexes of grizzly bears use during each season. The peer reviewer referenced a paper by Proctor et al. (2015) to share common quantitative methods researchers use to identify habitat types that grizzly bears preferentially select. The peer reviewer also suggested that these resource selection models could be used to bolster the definition of suitable habitat.

ISSUE 22:

One peer reviewer requested additional rationale for our use of 10 acres as the minimum size in the definition of secure habitat. Another peer reviewer expressed confusion as to our requirements for lake size in defining secure habitat (we state that any lake that is less than one square mile in size is considered secure); this peer reviewer claimed that grizzly bears do not use most open water so any lake, regardless of size, should be classified as insecure. The peer reviewer instead suggested we define a buffer along lake shorelines that "represents the actual area used by grizzly bears" to include in our secure habitat definition.

One commenter noted that we used a definition of secure habitat from the U.S. Forest Service's 2006 Environmental Impact Statement, which does not contain a justification for the definition. Commenters provided alternative means of defining secure habitat. Commenters noted that Mattson (1993) recommended that "microscale" security areas are approximately 28.3 km^2 in size and have a 2-4 km buffer from roads or human facilities. Another commenter recommended increasing minimum core security areas to approximately 10 km^2 to allow for dietary flexibility and to fully encompass the average daily movements of an adult female grizzly bear (Gibeau et al. 2001). Furthermore, they suggested that secure habitat be at least 500 m from areas of high human use, defined as areas with more than 100 human visits per month; currently the 500 m buffer only applies to motorized access routes .

One peer reviewer supported our definition of secure habitat and our policy of having no net loss of secure habitat due to human activities. However, this peer reviewer emphasized that any future changes to secure habitat, and subsequent mitigation efforts, need to ensure that secure habitat is distributed across the landscape in a way that does not cause habitat fragmentation and that facilitates movements of bears both within and between bear management units.

ISSUE 23:

We received several comments from both the public and peer reviewers regarding use and development in secure habitat within the PCA including: (1) projects that temporarily change the amount of secure habitat should not be allowed; (2) recurring low-level helicopter flights and temporary road construction should not be allowed during denning season; (3) hunting should not be allowed in secure habitat (some commenters and a peer reviewer interpreted our description of secure habitat inside the PCA as an area in which hunting would not be allowed); (4) road densities should continue to be limited after delisting to avoid potential increases in bear mortality and in logging activity; (5) the distinction between permanent and temporary roads should be clarified since only the density of permanent roads is limited in the proposed rule, even though temporary logging roads may have higher traffic; (6) increased development on lands surrounding national parks should be considered; (7) the presence of 500 development sites on the five national forests should be addressed; and (8) the exceptions that allow changes to the 1998 baseline for secure habitat and developed sites for administrative and maintenance needs should either be limited or further clarified.

Commenters also noted that mortality risk is not static within secure habitat. Social and dietary changes since 1998 have resulted in increased exposure to human hazards despite no net increase in livestock allotments and human infrastructure. Another commenter suggested that control, reduction, and outreach will be essential to long-term conservation of grizzly bears in the GYE.

ISSUE 23.5:

We received several comments from both the public and peer reviewers concerned with the habitat monitoring. A peer reviewer recommended that managers develop plans to control

Comment [1]: Would this fit better wi h hunting issues?

Comment [2]: These need more information. I'm checking w/ Jennifer. Are they talking about development on private lands or developed sites on public lands? Are they referring to the 500 d sites inside the PCA or outside the PCA in suitable habitat?

Comment [3]: I think this could be deleted or moved.. it's not a habitat issue.

important habitat components (e.g., distribution and abundance of ungulates). One commenter expressed concern that we do not explain what indices will be used to monitor changes in habitat and why these indices are adequate indicators of habitat degradation. This commenter emphasized that further explanation of these indices would be needed to provide adequate assurances that we will employ sufficient monitoring, beyond tracking population size, to detect possible "lag effects." This commenter also requested that the Service provide specific management responses and triggers based on these indices of potential habitat degradation.

ISSUE 24: We received several public comments regarding stressors outside of the PCA. One commenter questioned the scientific basis for allowing different management techniques within and outside the PCA; this commenter asked whether there is evidence of two distinct grizzly populations (one inside the PCA and one outside the PCA) warranting distinct management approaches. Another commenter claimed that it was "disingenuous" for us to state that "suitable habitat outside the PCA provides additional ecological resiliency and habitat redundancy to allow the population to respond to environmental changes" when the same habitat protections do not occur outside of the PCA as inside the PCA. One commenter noted that habitat outside of the PCA has "become a sink for human-caused mortalities." Another commenter expressed concern that the current protections of 60 percent of suitable habitat outside of the PCA would not be sufficient since 40 percent is not protected. One commenter claimed that the Service is "writing off" 25 percent of independent females, since these females live outside the PCA in areas that will have inadequate habitat protections. This commenter noted that, if these inadequate protections fail to ensure the survival of these female bears, mortality limits exceeding the proposed rule's acceptable levels will result (under no circumstance is 25 percent mortality of independent females acceptable in the proposed rule). One commenter expressed concern about potential increased road development outside of the PCA and associated increased grizzly bear displacement, higher mortality, and lower fecundity. Lastly, a commenter suggested that standards should be applied to all federal lands within the DMA for road density, secure habitat, and no surface occupancy (not just inside the PCA).

ISSUE 25: Several commenters raised concerns with our use of the 1998 baseline for habitat. One commenter stated that the 1998 baseline was based on the population growth rate from 1988-1989, which they felt was overestimated, and therefore 1998 does not actually represent a period of population growth. This would thus make the 1998 habitat baseline insufficient to achieve a flourishing grizzly bear population in the GYE. One commenter questioned the validity of the 1998 baseline because it was calculated using a nonparametric Chao2 estimator versus the current model-averaged Chao2 estimator. One commenter felt that the 1998 habitat baseline did not appropriately distinguish between the frequency of contact with humans and the lethality of these encounters with humans (i.e. high use does not necessarily imply high risk to grizzly bears and low use does not necessarily imply low risk to grizzly bears). One commenter expressed concern over whether the 1998 baseline provision would provide sufficient habitat protection in the long term once ESA protection is removed, specifically Section 9 "take"

prohibitions, Section 7 consultation, the 1986 Interagency Grizzly Bear Guidelines, and the ESA citizen suit provision.

There were several comments regarding whether or not the 1998 habitat baseline could be maintained or was even achievable. Some commenters suggested that there have been changes on the landscape, such as the availability of whitebark pine, since 1998 even if the amount of secure habitat has not changed. Another commenter questioned the implementation of the 1998 baseline given the construction of roads and developments since 1998. Commenters suggested that we use an alternative approach to the 1998 habitat baseline. They suggested that the "moving window analysis" from Mace and Waller (1997) should be implemented and is the best available science. This approach recommends open motorized route densities, total motorized route densities, and core amounts of habitat for each BMU.

The 2007 Conservation Strategy identified three BMU subunits as needing improvement from their 1998 secure habitat baseline; these units would thus be maintained at or above the quality levels achieved from the full implementation of the 2006 Gallatin National Forest Travel Management Plan. One commenter recognized that these three subunits received improvements in secure habitat but noted that we do not explain the extent of these improvements; thus, this commenter questioned whether these improvements were sufficient to meet our 1998 baseline requirements.

ISSUE 26: Many comments from the public and peer reviewers expressed concern with the adequacy of our discussion of connectivity of grizzly bear habitat and populations. Several comments emphasized the importance of facilitating connectivity and one peer reviewer suggested that facilitation of movement should be a management objective. Other peer reviewers suggested that, without adequate connectivity, the GYE population will be at higher risk of local extinction and that connectivity of grizzly bear populations will ensure long-term viability of the species.

Commenters expressed concerns that we either did not have or did not share effective plans for facilitating connectivity between the six grizzly bear recovery zones in the lower 48 states. One commenter took issue with the preamble of the proposed rule because it did not contain a sufficiently clear commitment to manage for connectivity post-delisting. Another commenter urged us to consider and address both demographic connectivity and genetic exchange between the six recovery zones.

We received several public comments with suggestions on how to facilitate connectivity, including: (1) create demographic connectivity areas similar to the Northern Continental Divide Ecosystem (NCDE) to allow for connection between the GYE and NCDE and between the GYE and the Bitterroot Ecosystem; (2) implement the same habitat standards in connectivity areas as those that apply inside the PCA; (3) reduce the DPS boundaries to match those of the DMA to more effectively facilitate connectivity; and (4) promote travel corridors to facilitate the emigration/immigration of male bears even where there is not suitable habitat.

Many commenters expressed concerns with the state plans and how they intend to facilitate or discourage movement of grizzly bears. Commenters and peer reviewers both

expressed concerns that, while we characterize the GYE grizzly bear population as a potential source population to recolonize the Bitterroot Ecosystem, 1) we do not consider connectivity to the east, west, or south a relevant issue in the proposed rule, 2) there are no plans to facilitate connectivity, and 3) Idaho's grizzly bear management plan prohibits the movement of grizzly bears into new areas. Another commenter expressed that Montana's plan is noncommittal on the subject of connectivity. Some comments from the public and peer review suggested that Idaho's and Wyoming's state plans do not discuss connectivity at all and will prevent the successful reoccupation of historic range. In addition, they felt that all of the state plans will actively discourage establishment of bears outside the DMA. A peer reviewer requested that we include a discussion in the rule that shares additional details of state plans to facilitate connectivity (especially Montana's plans). One commenter suggested that state plans must manage for connectivity rather than managing towards a minimum population level.

One peer reviewer acknowledged that we discuss distance as a potential barrier to effective connectivity of grizzly bear recovery zones but that the distance barrier would not be insurmountable; however, this peer reviewer suggested that we need to consider other potential barriers to movement, such as topography or man-made structures, in the rule.

Peer reviewers and commenters expressed that the proposed rule should include stronger commitments and clearer partnerships that will ensure grizzly bear habitat connectivity is considered in any new road construction or highway improvement projects. One peer reviewer also questioned whether there is any scientific evidence of grizzly bear use of crossing structures; such references would strengthen our promotion of these structures as a management tool.

One commenter expressed concerns that if the final rule and associated post-delisting management strategies do not provide for connectivity to other grizzly bear populations, it could undermine the conservation strategy for the NCDE. Another commenter claimed that, under Section 7 of the ESA, we must consider lack of connectivity as a threat to other grizzly bear recovery zones. However, the Governor of Montana emphasized that connectivity between the GYE and the NCDE should not be a requirement of delisting since Montana has "committed through its management plan to allow bears to occur where they are tolerated and because they expect the populations to "intermingle" in the future.

Peer reviewers commented on ways we can measure and monitor connectivity. One peer review suggested that monitoring and collecting genetic samples outside the DMA (e.g. through mandatory registration of bears hunted in the GYE) could help detect immigration and emigration. Another peer review suggested exploring environmental DNA (eDNA) analysis techniques to detect movements between grizzly bear populations. A peer reviewer also suggested using the "step-selection function" method in Thurfjell et al. (2014) to "model habitat attributes that facilitate movement and connectivity".

One peer reviewer asked us to explain the relevance of food storage orders to the issue of connectivity. Another peer reviewer requested that we include a map of the grizzly bear recovery zones to help illuminate the issue of connectivity.

ISSUE 27: Public commenters and peer reviewers expressed concerns with the adequacy of our discussion of livestock allotments in the proposed rule and claimed that they potentially remain a threat. Commenters expressed that livestock allotments contribute to habitat fragmentation, create a barrier to grizzly bear movements, and cause population sinks. As a result, one commenter suggested that any habitat with livestock allotments could not be considered suitable habitat. A peer reviewer noted that, while we say federal agencies must conduct "appropriate analysis" to evaluate the impacts of livestock allotments on grizzly bears, we do not suggest a course of action should the agencies discover impacts.

Peer reviewers and public commenters expressed concern with how conflicts with bears and livestock are handled. Commenters noted that livestock conflicts still accounted for 14% of the human-caused mortalities from 2002-2014. These commenters also expressed that there is no requirement to securely store or remove attractants, including livestock carcasses and feed, on private lands in the PCA. A peer reviewer also cautioned that changing environmental conditions could alter the conflict dynamics between grizzly bears and livestock allotments. Commenters suggested a requirement that livestock permits include a conflict prevention measure. Some suggest that these prevention measures include the use non-lethal techniques to avoid grizzly bear conflict on federal public lands (i.e., removal of attractants, construction of barriers, guard animals) before grizzly bear removal can occur. Another commenter suggested that effective counter measures should be implemented to reduce livestock losses, such as protection dogs and electric fences. One commenter noted that federal agencies must complete the Section 7 process before issuing a livestock allotment permit. Another commenter noted that those landowners who have livestock allotment permits on federal land should accept grizzly bear depredation of livestock and not expect retaliatory action towards grizzlies. One commenter commended Wyoming Game and Fish Department's compensation program as a key part of building support for grizzly bear recovery. Commenters and peer reviewers also expressed concern with our discussion of phasing out livestock allotments. A peer reviewer noted that phasing out livestock allotments, especially those where conflicts are common, should be a "management priority." Some commenters noted that we should include stronger language on the subject of phase-out (e.g., mandatory phase-out) or that we work with third parties to buy out allotments. However, one commenter expressed concerns that "voluntary relinquishments" of livestock allotments are primarily "driven by [livestock owners'] inability to withstand the pressure of predation by bears and/or wolves or regulatory constraints imposed by the federal land agencies." Another commenter warned that even if NGOs compensate ranchers for relinquishing allotments, it will "not negate the severe impacts of relinquishments on these ranchers and [the livestock] industry."

One peer reviewer expressed concern that, though the proposed rule contains a limit on the total acreage of cattle allotments, we do not specify the total number of cattle we will allow. A few commenters also expressed that the U.S. Sheep Experiment Station, the only sheep grazing operation on federal land within the PCA, must be closed prior to delisting because it is an important area connecting the GYE to the Salmon-Selway Ecosystem.

ISSUE 28: Both commenters and peer reviewers provided comments regarding oil, gas, and mineral projects and their effects on grizzly bears in the GYE. One peer reviewer noted a concern that 4% of suitable habitat inside the PCA and 19% of suitable habitat outside the PCA (but inside the DMA) allows for surface occupancy. The impacts of such occupancy can extend beyond the footprint itself and commenters suggested that this would necessitate extensive monitoring and mitigation. An additional peer reviewer noted that the effects of honoring existing oil, gas, and other mineral leases are unclear. In addition, the actions that land managers will take to mitigate for potential impacts from existing leases are unclear with the current language, that land managers are "striving" to meet the application rules for changes to secure habitat. They suggest "additional clarification on the number of leases, the location and area of leases, and possible range of effects of these leases".

Some commenters felt that delisting would "lift" restrictions on oil, gas, and mineral leases in the GYE. Commenters stated that no new oil, gas, or mining projects should be authorized within the PCA after delisting. Other commenters questioned whether we would require new oil, gas, or mineral projects that occur within the PCA to mitigate for impacts on secure habitat by replacing the loss with intact secure habitat of similar habitat quality.

Commenters stated that there are "two mining operations in the process of development in and near the PCA (the Crevice Mine and the Emigrant Mine)" and that these threats need to be acknowledged in the rule. One commenter questioned the ability to limit any new mining developments because of the 1872 General Mining Law.

ISSUE 29: We received comments from both the public and peer reviewers expressing concerns regarding our discussion of snowmobiling. Specifically, comments from the public and a peer reviewer asserted that a lack of evidence of impacts does not equate to a conclusion of no impact from snowmobiles. Additionally, they recommended that monitoring alone is insufficient and that active management programs should be initiated to mitigate the potential impacts of snowmobiling, to possibly include minimizing overlap between snowmobiles and denning habitat and/or limiting snowmobiles after den emergence dates. Lastly, public comments suggested that we did not adequately consider impacts from activities associated with snowmobiling, such as the use of artillery to control avalanches.

ISSUE 30: We received several comments from both the public and peer reviewers expressing concern regarding potential impacts of human recreation other than snowmobiling. Public comments cited potential detriments of increased human recreation and visitation in bear habitat including: 1) long-term exposure of bears to humans causing habituation and higher mortality risks; 2) potential impacts to bears feeding on army cutworm moths; and 3) potential exclusion of bears from habitat since grizzly bears are twice as likely to use an area when human activity is restricted or when people are inactive (i.e., nighttime) (Coleman et al. 2013). Comments from the public and peer reviewers also proposed potential management responses to these impacts including: 1) placing a limit on visitation to Grand Teton and Yellowstone National Parks; 2) increasing infrastructure to support increasing park visitation; 3) assessing human visitation as

"take" under Section 9 of the Endangered Species Act because it harasses wildlife and causes displacement from food sources; and 4) to the maximum extent possible within the law, imposing food storage orders on all habitat within the DPS boundaries, especially within the DMA.

ISSUE 31: Comments from the public and peer reviewers expressed concern about the potential future impacts of logging on grizzly bears in the GYE. A peer reviewer noted that 11% of suitable habitat outside the PCA, but inside the DMA, allows timber harvesting. A commenter expressed that timber harvest would increase after delisting since there would no longer be limits on road densities in grizzly bear habitat.

Public comments provided varied perspectives on the impacts of logging on grizzly bears. One comment noted that grizzly bears avoid recently logged forests (McClellan and Hovey 2001; Apps et al. 2004). In addition, comments expressed that timber harvest can degrade habitat quality under "short-rotation management regimes" (Mattson and Knight 1991) and that, although food availability can increase in early successional forests, this does not occur in Yellowstone. Another comment noted that logging could degrade red squirrel habitat and that red squirrels are essential to making whitebark pine nuts available for grizzly bear consumption. One comment noted that our analysis of logging only explores impacts from 2000 to 2002; this commenter noted that we need to analyze impacts of logging after 2002, unless no logging occurred between 2002 and 2016. Another commenter noted that, besides the research on grizzly bear mortalities from roads, there is not currently enough science to determine the impacts of logging on bears.

One comment noted that mitigation for projects that impact secure habitat should not be able to include land that has already been disturbed (e.g., previously logged land).

ISSUE 32: Commenters and peer reviewers expressed concerns with how we approached the impacts to grizzly bears of activities on private land. One commenter cited research by Doak & Cutler (2014) to suggest that increasing development of formerly rural areas has negative impacts on grizzly bear population trends. Another commenter expressed concern that the 1998 baseline does not consider the impacts of edge effects with residential and recreational developments on private lands.

One commenter urged us to examine the impacts of private lands more closely and to include more discussion of how to minimize grizzly bear deaths and conflicts on private lands. Peer reviewers noted that education and mitigation will be key strategies in reducing the likelihood of "attractant sinks" (i.e., increased human-caused grizzly bear mortalities as a result of unsecured attractants) developing on the 9% of suitable habitat outside the PCA that is private land. One commenter expressed that the federal government should use public lands to mitigate for impacts to grizzly bears that are occurring on private lands.

Finally, one commenter expressed concern that the potential privatization of federal land could pose a threat to habitat maintenance; this commenter noted that it would be easier to transfer federal land to private control if it does not contain listed species.

ISSUE 33: Several comments from the public and a peer reviewer raised concerns over habitat fragmentation. One commenter noted that there is already a high degree of fragmentation of suitable habitat within the PCA and, to a greater degree, within the DMA (Forest Service 2006, Schwartz et al. 2010). Another commenter noted that there was no provision in the rule designed to limit habitat fragmentation within the DPS boundary outside of the DMA. Other comments highlighted the fact that private land uses, energy development, timber harvest, off-road vehicle use, etc. are potential sources of further habitat fragmentation outside the PCA and were not adequately analyzed in the rule. One peer reviewer stated that, although we discuss the impacts of livestock and timber harvest on human-caused mortality, we do not adequately address how these competing land uses impact grizzly bears (e.g. the quality and conservation of available habitat).

ISSUE 34: A few public comments assumed that most or all of the GYE is designated as critical habitat for the grizzly bear.

ISSUE 36: One peer reviewer expressed concern that we discussed some of the habitat-based recovery criteria more than others in the proposed rule. This peer reviewer requested that we treat all of the habitat-based recovery criteria equally in our discussion (i.e. provide more detail on habitat-based recovery criteria 1 and 2).

Human-caused mortality

ISSUE 35: One peer reviewer requested citations to justify our statement that "the primary factor affecting grizzly bears at both the individual and population level is excessive human-caused mortality."

ISSUE 37: Public comments expressed opinions both for and against the hunting of grizzly bears in the GYE. Those comments that favored grizzly bear hunting expressed that opportunities to hunt grizzly bears would provide enhanced funding for state grizzly bear monitoring and conservation.

Comments against hunting covered a range of arguments. First, comments expressed concern that there is a lack of scientific basis to allow hunting and not enough data to support discounting hunting as a substantial threat.

Second, comments suggested that hunting would decrease the population of grizzly bears in the GYE. These comments expressed that hunting will only add to the current levels of human-caused mortality, since there is nothing in the rule suggesting that other forms of human-caused mortality will go down after delisting; these comments claim that this additional mortality from hunting could lead to drastic population declines. These comments also expressed that hunting could increase reproductive suppression among females and increase the immigration of males (after hunters remove independent males). Females may avoid these new males, leading

to the use of less suitable habitat and smaller litter sizes. These comments also suggested that the immigrant males could commit infanticide, further depressing population numbers.

Third, comments suggested that hunting could have negative impacts on grizzly bear behavior, including: disrupting activity patterns during hyperphagia, which can be energetically costly; orphaning of young grizzlies; and other behavioral effects. These comments urged researchers to continue to explore the impacts of hunting on grizzly bear social structure. They also noted that there is no evidence that hunting will increase grizzly bears' fear of humans.

Fourth, comments expressed concern that hunting is an ineffective, and potentially damaging, wildlife management strategy because it can cause trophic cascades, can decrease genetic resilience by removing the biggest and strongest males from the population, and can disrupt the sex and age structure of the population. These comments also noted that hunting is not an appropriate tool for managing bear conflicts because hunters will not selectively target nuisance bears. Moreover, comments expressed that the State Fish and Game Commissions already adequately deal with nuisance bears in the absence of a hunting season. One comment expressed the inaccuracy of the theory that hunters can act as a substitute for predators to maintain an ecosystem's prey base at desired levels.

Fifth, comments presented ethical reasons for opposition to a hunting season for grizzly bear. These comments disagreed with trophy hunting on principle and noted that hunting is contrary to the reverence that Native American tribes have for grizzly bears. These comments also cited an April 2016 Humane Society poll to show that the American people oppose trophy hunting of grizzly bears.

Sixth, comments referenced economic arguments associated with trophy hunting. These commenters questioned whether the economic benefits of trophy hunting truly outweigh the costs and noted that hunting would negatively impact "sustainable ecotourism, as visitors typically perceive they cannot safely visit to observe or hike trails shared by armed hunting enthusiasts." These commenters highlighted the economic benefits that tourists bring to local communities when they visit the GYE to see grizzly bears.

Seventh, comments expressed concern that "controlling" or "limiting" the GYE grizzly bear population, especially through hunting, could have negative effects on other grizzly bear populations, such as the Bitterroot Ecosystem population and the NCDE population. One commenter suggested that, instead of hunting "surplus bears," these bears should be used to augment populations in other recovery zones.

Finally, commenters opposed to grizzly bear hunting in the GYE expressed concern that iconic and beloved grizzly bears that seasonally travel outside of NPS boundaries could be killed by hunters, which could spark public outrage that would erode public support for wildlife recovery.

ISSUE 38:

We received many comments from both the public and peer reviewers regarding hunting boundaries. Several comments recommended that no hunting be allowed within the PCA, the DMA (e.g., secure habitat), John D. Rockefeller, Jr. Memorial Parkway, Grand Teton National

Park (including on State or private inholdings), at food aggregate sites, or in other densely populated grizzly areas. Comments and peer reviewers sought clarification regarding whether or not hunting would be allowed within the PCA, since it is defined as a "secure area." Noting that the boundaries of the PCA and "secure habitat" are hard to identify, comments suggested that hunting be limited to zones that are easier to define geographically. Additionally, comments requested that the Service assess the impacts of grizzly bear hunting on park inholdings. Comments also suggested that managers create a buffer around Yellowstone and Grand Teton National Parks in which no hunting would be allowed. Peer reviewers and public commenters suggested that hunting be prohibited in connectivity areas, particularly in suboptimal habitat if these areas provide connectivity between more suitable habitats. In contrast, we also received some public comments recommending that hunting be focused in areas prone to human-grizzly bear conflict, such as the Upper Green, so hunters could remove individual problem bears. Lastly, one public commenter emphasized that hunters represent a minority of the American public and, since public lands belong to everyone, the public should have a say in how grizzly bears that originate from public lands are managed.

ISSUE 39:

We received several comments from peer review and the public that expressed concerns with the scientific basis of the proposed mortality limits. One commenter said that FOIA documents revealed inappropriate political influence in the setting of mortality limits. Some questioned the biological basis for independent female mortality limits greater than 7.6% and the probable population declines that would result. They suggested that the models used to derive these mortality thresholds need to be available for independent peer review. Other comments were concerned with the potential to overshoot the population objective with the current framework of mortality limits and that the population may continue to decline even after the mortality rate is reduced to less than or equal to 7.6%. Some comments suggested that the uncertainty around the estimated mortality limit must be large given the large confidence intervals around vital rates; they noted that this uncertainty should be stated clearly and should be reflected in the mortality limits. Another commenter suggested that the mortality limits should be more conservative to account for the bias associated with the population size and trend. One commenter questioned whether 7.6% is actually sustainable since the age at first reproduction will increase as the population approaches carrying capacity and the mortality rates will not be adjusted accordingly. Lastly, comments suggested that the use of the average estimate for vital rates, mortality rates, and population size means there is a 50% chance that the mortality limits are unsustainable (that they will be too high). They continue on to suggest that the mortality limits should be set at the lower end of the confidence interval for the estimated mortality rates, as opposed to the average; they note that other larger and more connected populations have total human-caused mortality limits much lower than our proposed limits (e.g., some populations have mortality limits of only 4%, of which only 30% can be female).

Several comments from the public and peer reviewers requested clarification on how the mortality limits would be applied. One peer reviewer requested an example; this peer reviewer

asked how many bears would have been available for hunting between 2002 to 2014 and how many years in this period would have resulted in no hunting. Some comments asked for clarification as to what the mortality rate would be at population levels less than 674 bears because the tables in our proposed rule state that the mortality limits would be less than 7.6% but does not specify how much less. Additionally, they asked what the mortality rate would be at population levels less than 600 to ensure population growth; these commenters suggested that merely halting all discretionary mortality would not be a sufficient response. One peer reviewer asked that we clarify whether the mortality limits are annual or not.

Several comments pertained to discrepancies between the proposed rule and the draft Conservation Strategy. First, the footnote in Table 1 of the rule, which states that at a population less than 674 bears the mortality limit would be less than 7.6%, is not present in the draft Conservation Strategy; comments noted that, in order to maintain a stable population, mortality limits should be less than 7.6% when the population estimate is less than 674 bears, not less than or equal to 7.6%. Second, the proposed rule defines total mortality and states that the mortality limits apply to total mortality; comments state that this clarification should also be in the Conservation Strategy. Third, comments suggested that Table 3, the explanation of background mortality, and the example calculations for the number of individual grizzly bears that could be available for hunting harvest (in the proposed rule) should also be in the Conservation Strategy.

We received several comments from the public and peer reviewers suggesting how mortality limits should be adjusted in the future, including: discretionary mortality should be shifted in response to potential shifts in sex-age classes that may be caused by hunting and environmental conditions; hunting limits should consider, and potentially be tempered to account for annual changes in environmental conditions (i.e., drought, fire, or berry crop failures);

Some commenters took issue with the fact that managers will not consider mortality outside the DMA in mortality limits after delisting. They asserted that bears that die outside the DMA likely emigrated from the DMA and consequently should count as losses for the DMA. Otherwise, threats to the population will not be accurately assessed.

Lastly, commenters suggested alternative methods to set or measure mortality limits. One commenter suggested that the hunting targets should be spatially explicit, concentrating mortality in the southern and eastern portions of the GYE while encouraging expansion to the west and north. Several commenters felt that the National Park Service (NPS) should be allocated a percentage of the discretionary mortality based on the percentage of land under their management within the GYE DMA; this would allow for foreseeable mortality under NPS management. One commenter claimed that the strategy proposed by the Service is a "proportional harvesting strategy;" this commenter suggested that, to avoid overharvest when there is uncertainty in population size, only a fraction of the estimated population available for discretionary mortality should be harvested, a strategy known as "proportional threshold harvesting." Another comment suggested that annual total mortality should be a percentage of the Chao2 population estimate with a range based on the lower and upper confidence intervals. Finally, some suggested that if the population goal is stabilization around 674 bears then

discretionary mortality should stop when the population estimate is less than 674 rather than when the population drops below 600 bears. Furthermore, if mortality is allowed at population levels below 674 bears, then total human-caused mortality should be at the threshold proposed in the 2007 Recovery Plan: Supplement to the Demographic Recovery Criteria.

ISSUE 40: Several public commenters raised questions about the calculations used for both background and total mortality rates. One comment noted that the rule needs to address the uncertainty in the number of deaths from natural causes or unreported human-caused mortality. Another commenter stated that the IGBST reports do not include confidence intervals on mortality rates, which are broad depending on the priors used in the model and how the IGBST deals with unexplained and unresolved cases (Cherry et al. 2002); this comment also suggested that the IGBST does not include natural deaths their mortality estimations. One commenter opined that the method the IGBST uses to calculate total deaths underestimates the number of total deaths with an unknown and inconsistent degree of bias. One comment stated that we should account for uncertainty in the calculation of background mortality. In addition, one commenter suggested that background mortality must take into account unknown and unreported mortalities. Another commenter pointed out that emigration out of the DMA does not count towards total allowable mortality in the DMA or towards background mortality when calculating allowable discretionary mortality limits (i.e., if a bear leaves the GYE, it should functionally be treated as a mortality when setting and monitoring discretionary mortality limits).

Some comments raised concerns with the implementation of limitations on discretionary mortality. One commenter noted the difficulty in closing the hunting season when total mortality limits are reached since up to half of individual grizzly bear mortalities are unknown because they occur in non-telemetered bears (McLellan et al. 1999). One commenter posited that cumulative annual mortality should be indexed on a month-to-month or seasonal basis, in-lieu of annually, to be able to alert managers in a more timely manner if annual mortality limits are on track to be exceeded. Furthermore, a trigger could be added to stop discretionary mortality for the current year in light of this information.

Lastly, the Governor of Wyoming requested the removal of the language following Table 3 which explains mortality allocation beginning with "[t]here are mortalities that occur…" through the sentence, "[t]hese examples serve to explain the process…". Another commenter, on the other hand, suggested that the definitions and calculations (i.e., total mortality, background mortality, discretionary mortality, and Table 3) included in the proposed rule should be included in the Strategy for clarity. One comment stated that we need to define the period over which the moving average of background mortality will be calculated.

ISSUE 41:

Public commenters felt that the States' should prohibit black bear hunting within the DMA, or at the very least within the PCA, in order to reduce human-caused mortality from mistaken identification. One comment also noted that Idaho and Wyoming should have a mandatory bear identification test in order to reduce accidental mistaken identity mortalities.

ISSUE 42:

There were several public comments pertaining to the use of traps intended for game other than grizzly bears and the potential negative effects to grizzly bears. Several commenters felt that trapping, as a means of harvest, should be prohibited for any animal within the PCA and/or the DMA to prevent the incidental take of grizzly bears. Several comments pointed out that the state plans do not have a reporting requirement or protocol if/when a grizzly bear is caught in a trap set for other game/nuisance species.

ISSUE 43:

We received a public comment asking that we discuss the trade of grizzly bear parts, including the extent of trafficking in the U.S. and the state of current legislation. The commenter suggested that States pass appropriate laws making such trafficking illegal.

ISSUE 44:

We received many comments from both the public and peer reviewers regarding the management of human-bear conflict. One peer reviewer commented that the current stable population trend of grizzly bears in the GYE may not confirm that the efforts to reduce human caused mortalities are effective.

Commenters and peer reviewers shared a number of ways to reduce human-bear conflict. Commenters noted a need to change attitudes and behaviors of people living in grizzly bear country in order to reduce conflict. Other commenters noted that defense of life and property kills, especially by ungulate hunters, are still a major cause of human-caused mortality. Commenters suggested that ungulate hunting be limited or eliminated to reduce this type of conflict. They further noted that hunters are only required to carry bear spray in Grand Teton National Park and John D. Rockefeller Jr. Memorial Parkway. Comments from the public and a peer reviewer also suggested that managers coordinate and fund programs to reduce bear attractants on public and private lands, including: the removal of dead livestock, the use of electric fencing, the use of bear-resistant garbage and feed bins, and implementation of waste management improvements throughout the GYE.

Commenters and peer reviewers also expressed concerns regarding lethal control of problem bears. In particular, one commenter argued that lethal control does not increase public tolerance nor does it encourage avoidance of future conflict. Another commenter was worried that lethal responses would increase following delisting. One peer reviewer requested we clarify how conflict bears will be treated inside versus outside the PCA.

Commenters and peer reviewers also discussed alternatives to lethal control of problem bears. One commenter recommended that a Grizzly Bear Management Relocation Plan with pre-arranged relocation sites be prepared prior to delisting. One peer reviewer recommended that managers track relocated animals to assess the efficacy of relocating problem bears. One commenter suggested that the Service provide funding to the states to encourage development and use of non-lethal management tools.

One commenter pointed out that the IGBST 2009 Yellowstone Mortality and Conflicts Reduction Report recommended creating a publicly available database of all bear encounters and mortalities; they claimed that this database still does not exist. A peer reviewer noted that researchers could use NDVI data (satellite imagery) to understand bear distribution and how these distributions relate to human-bear conflict. One peer reviewer noted, "given that human occupancy and recreation will likely continue to increase in the GYE...there should be additional review and consideration regarding how factors used to regulate human-caused mortality (e.g., public education, management removal policy or procedures, etc.) might be modified in response to changes in human activity in the GYE." This peer reviewer also suggested we provide a review of "the social aspects of managing large predators."

ISSUE 45: There were a number of comments from the public and peer reviewers related to poaching. Several commenters expressed their opinion that poaching might in fact increase after the grizzly bear is delisted and a legal hunt is established (Treves et al. 2015). One commenter noted that legal trophy hunting of grizzly bears could create an atmosphere where poaching of grizzly bears, though illegal, would be acceptable. Both commenters and peer reviewers stated that we need to provide more support for our assertion that the designation of the grizzly bear as a game animal post delisting may reduce the threat of poaching. Several commenters were concerned that there would not be enough resources to investigate and prosecute poachers without assistance from our special agents. Another commenter opined that poaching is rarely investigated or prosecuted and that the details of mortalities that are "under investigation" are not available to the public. One peer reviewer noted that the level of poaching is an unknown and would need to be monitored.

ISSUE 46:

Public commenters expressed concern about our ability to accurately track natural death and predation. They claimed that most deaths of cubs and yearlings are due to predation and are undocumented. One commenter disagreed with the estimates of natural death we quoted in our proposed rule; this commenter suggested that, based on calculations from vital rates, three bears died from natural causes each year over the period between 1986 and 2015, as opposed to the one bear we quoted in our proposed rule. This commenter also notes that when you look at the data since 2010, a median of six bears die from natural causes each year. This commenter urged us to consider this data in our final rule.

Genetic health

ISSUE 47:

Both peer reviewers and public commenters raised concerns about our analysis of genetic viability. Several comments raised concerns over the scientific basis for our lower limit of 500 bears and our analysis of effective population size. They further stated that our reference to Franklin (1980) is outdated and that more recent critical assessment of the 50/500 rule (Frankham et al. 2014) and the use of effective population size (Ewens 1990) is available. Some

comments stated that an effective population size of 100 and a total population of 400 (Miller and Waits 2003) is the minimum for short-term, but not long-term, genetic fitness and should not be a population goal. Other comments suggested that a population size of 500-5000 is the minimum for long-term genetic viability. One comment stated that, in our analysis of effective population size, we selectively chose to report the upper end of the effective population estimate of 469 bears when we should have chosen the more conservative estimates discussed by Kamath et al. (2015). In addition, one commenter pointed out that Kamath et al. (2015) stated that the effective population size (N_e) is approaching, but hasn't reached, the long-term viable population criterion of more than 500 bears, as defined by Franklin (1980). They also said that restoration of gene flow would increase fitness. One commenter pointed out that if the "effective population size is approximately 25-27 percent of total population size (Allendorf et al. 1991, p. 650; Miller and Waits 2003; Groom et al. 2006, 405)" then the finding by Kamath et al. (2015) of an effective population size of 469 would mean that the population size is actually 1876 grizzly bears. They continue that, "In reality, the current population estimate of 717 corresponds to an effective population size of 179." Several comments stated that the current metapopulation of 1200-1800 animals is "5-11 times too few individuals to assure long-term persistence (Frankham et al. 2013)".

There were a suite of public comments regarding the maintenance of genetic diversity and its effect on long-term population viability. Commenters pointed out that genomic changes are slow and take decades to detect, declines in the GYE grizzly bear population will deplete extant levels of genetic diversity, and that reintroductions into other ecosystems are the best option to expand the gene pool. Another commenter suggested that we model the rate of allele loss due to genetic drift at various population sizes. One commenter noted that the most commonly measured indices of genetic health and microevolution are heterozygosity, allelic diversity, and effective population size. They continued that the long-term fitness implications of changes in allelic diversity are not well understood. One commenter felt that we conflated the need for genetic diversity in the GYE population with the need for the maintenance of genetic diversity of all the current and future subpopulations of grizzly bears. They continued that the Service should clearly state that "current genetic diversity sufficiently supports the delisting decision and that future management of genetic diversity after delisting is a separate matter to be managed as described in the Conservation Strategy." One commenter felt that the long-term evolutionary health of the grizzly bear population should be projected and considered.

Several public commenters raised concerns over connectivity issues. One commenter felt that all five of the extant grizzly populations in the lower 48 are genetically isolated from each other. One comment stated that we dismissed the need for immigration in the GYE in our proposed rule with a promise from the State of Montana to "manage discretionary mortality in [connectivity] area[s] in order to retain the opportunity for natural movements of bears between ecosystems." One commenter asked us to provide more justification behind our assertion that one to two immigrants or transplants per generation is an adequate level of gene flow into the GYE (Miller and Waits 2003). Lastly, one commenter felt that management should place more

effort on facilitating natural dispersal instead of relying on potential future translocations between core grizzly bear populations.

Food resources

ISSUE 48:

Public commenters challenged the validity of our analysis of the effects of food availability on grizzly bear health. Commenters pointed out potential flaws in the research we used in our analysis of grizzly bear body condition. One commenter cited a study by Schwartz et al (2013), which found a recent decline in body fat among female grizzly bears. They noted that the study we referenced in the proposed rule in our discussion of grizzly bear body condition "included bears that were not captured specifically for monitoring change in body fat levels" and only "included female grizzly fat level data from spring and summer;" the commenter noted that even if females have adequate levels of body fat in the spring and summer, they could still be fat deficient in the fall. Other commenters worried about the defensibility of the IGBST's models analyzing the effects of food availability on grizzly bear populations; these commenters noted that much of the IGBST's data for these models comes from observational studies, which makes it difficult to isolate the effects of individual variables or rule out other confounding drivers of birth and death rates. One commenter specifically expressed concern that the IGBST fails to account for spatial and temporal correlations in its food models and how these relate to birth and death rates. One commenter expressed concern that the Food Synthesis Report does the minimum to satisfy the requirement of the Ninth Circuit ruling; the commenter argued that researchers should have done a robust assessment of the four key food sources, at the very least, to detect diet changes.

ISSUE 49:

Both public commenters and peer reviewers suggested additional monitoring and analysis of the availability of food sources and the potential impacts to grizzly bear health. Peer reviewers recommended completing a regular review of the whole grizzly bear diet in the GYE. In addition, they recommend that we analyze the movements and home-ranges of females with cubs; if the home ranges are decreasing, it could bolster claims that the population is approaching biological carrying capacity. Both public commenters and peer reviewers expressed the need to continue monitoring the relationship between the availability of the four main food sources, grizzly bear use of the four main food sources, vital rates for the GYE population, and body condition of grizzly bears. One public commenter suggested we discuss the different hazard levels associated with acquiring different types of high quality food and whether these hazards are primarily relevant to dependent young, independent bears, or both. Another commenter claimed that, in their models, the IGBST and the Service "fail to account for potential interactions between spatial distributions of and temporal trends in key food resources." Finally, one commenter claimed that the three IGBST papers (Bjornlie et al. 2014, Costello et al. 2014, and van Manen et al. 2015) did not account for long-term weather trends or changes in the

abundance of key foods (i.e., army cutworm moths, cutthroat trout, and ungulates) other than whitebark pine in their analysis of vital rates.

ISSUE 50:

Several public commenters asserted that we inaccurately downplayed the importance of the four main food sources. One commenter contended that, since the IGBST continues to monitor only these four food sources, they must be of critical importance to grizzly bears. Commenters noted that the nutritional value (i.e., fat, protein, and gross energy), seasonal abundance, and risk and energetic cost of obtaining of any alternative food sources must be comparable to the four main food sources. Of these qualities, commenters stated that fat is especially important and is uniquely abundant in army cutworm moths, whitebark pine seeds, and late-season ungulates (Mattson et al. 2004, Erlenbach et al. 2014). Furthermore, they stated that, historically, grizzly bears have relied on the four main food sources and only fed on other foods opportunistically. Commenters asserted that the list of more than 200 grizzly bear foods cited in Gunther et al. (2014) is inflated because to a bear "a grass is a grass." They also asserted that, although researchers documented that grizzly bears used false truffles during poor whitebark pine years, the use of false truffles was only documented in the core of the ecosystem and there was also no indication of the nutritional value of this food source. Lastly, commenters noted that bear densities vary widely depending on habitat productivity (Mowat et al. 2013), which they suggested ran counter to our claims that grizzly bears are extremely flexible in their diet and thus resilient to changes in food abundance.

ISSUE 51:

We received several comments from both the public and peer reviewers regarding the potential impacts of declines in food resources. One peer reviewer expressed concern that a decline in major food sources could result in a corresponding decline in a habitat's carrying capacity for grizzly bears. Commenters noted that as whitebark pine and cutthroat trout decline, bears may increase home range size and dispersal distance in an effort to find food, which could lead to increased bear mortalities. Commenters also suggested that reduced food resources are impacting both the birth (i.e., reduced health of reproductive females) and death rates (i.e., "ecological traps") in the GYE population of grizzly bears. Commenters attributed the decline in the population growth rate from the 4-7 percent annual increases to 0.3-2.2 percent annual increases to declines in food sources.

Peer reviewers and commenters also provided input on potential management of declining food sources. A peer reviewer disagreed with our statement that "land managers have little influence on how calories are spread across the landscape" and suggested a few examples of management actions that affect food distribution, including: "increasing ungulate densities through improving habitat and controlling hunting harvest; improving fish stocks and habitat; controlling invasive species to protect native food resources desired by grizzly bears;" and increasing bison populations by limiting lethal control of bison as a means of managing brucellosis.

ISSUE 52:

Several commenters and one peer reviewer had concerns about army cutworm moths, an important food resource for grizzly bears. Several commenters raised questions about the alpine habitat on which the moths depend. One commenter said that all documented moth feeding sites are in the alpine fell fields. One commenter stated that it is unknown how moths will respond if up to 90% of subalpine and alpine environment is lost, as is predicted in some climate change models. Similarly, one commenter noted that the moths depend on flowers in the tundra which are disappearing with warmer temperatures. Another commenter raised concerns about the potential impacts of pesticide use and new farming technologies on cutworm moths. One public commenter expressed that the forest service needs to address the issue of human activity at moth aggregation sites and the potential disturbance to grizzly bears feeding at those sites.

One commenter explained that grizzly bears have become increasingly reliant on cutworm moths (a high fat content food source) since they had almost no consumption of the moths in the 1980s but had high sustained use in the 1990s. This commenter maintained that we did not account for the effect of this dietary shift on birth (fatter females leads to greater fecundity) and death rates (remote locations means less potential for conflict with people). One commenter stated that the remoteness of most moth sites has led to a reduction in human-caused mortality. In contrast, another commenter noted that there is a high correlation between moth habitat and grazing allotment location, thus potentially increasing the risk of human-caused mortality.

Lastly, one peer reviewer noted that "bear use of army cutworm moth sites may not be a good measure of cutworm moth relative abundance because grizzly bears may return to areas where they've found abundant food sources in the past even though those resources are not present."

ISSUE 53:

A suite of commenters had concerns about the status of cutthroat trout and the related impacts to grizzly bears. Several comments stated that there has been a decrease in the cutthroat population due to declines in winter snowfall, increased drought, and subsequent reductions of in-stream flows that could result in the blockage of stream outlets. Additionally, they said that this trend is likely to continue. One comment pointed out that cutthroat trout have stopped spawning in all tributaries to Yellowstone Lake. One commenter stated that, although warmer temperatures in trout streams may result in faster growing trout, warmer temperatures could also result in a potential increase in incidents of whirling disease.

Several commenters noted how declining cutthroat populations (i.e., food availability) have affected diet selection by grizzly bears. Citing Haroldson et al. (2005), one commenter challenged our assertion that only a small portion of GYE bears use cutthroat trout, claiming that as many as 15% of GYE grizzly bears eat cutthroat trout, and that the data producing this percentage is outdated. One commenter noted that the loss of cutthroat trout has left a seasonal

gap in the diet of grizzly bears; grizzly bears have filled this gap by consuming elk calves and lower-quality vegetation (Fortin et al. 2013, Middleton et al. 2013, Ebinger et al. 2016). One commenter questioned the disparity between males and females in their use of cutthroat trout that Mattson and Reinhardt (1995) discuss in contrast to the disparity that Haroldson et al. (2005) and Felicetti et al. (2004) discuss. Additionally, commenters stated that the decline in cutthroat trout has impacted females the most, resulting in more female consumption of terrestrial meat (especially elk calves), which has likely led to decreases in cub and yearling survival. Lastly, comments suggested that the decline in cutthroat trout has almost certainly decreased carrying capacity in the core of Yellowstone National Park.

ISSUE 54:

We received public comments both in support of and critical of our analysis that declining abundance of whitebark pine seeds does not constitute a threat to the GYE grizzly DPS. One commenter, who concurred with our analysis, expressed that whitebark pines will eventually regenerate, ameliorating the losses that have occurred. Another supportive commenter emphasized that if the whitebark pine decline, which began in 2001, was negatively impacting grizzly bears, then the population would not have continued to increase over the same period. Some commenters suggested that the cone production on remaining whitebark pine trees has doubled in recent years, potentially as a result of warmer temperatures, but cautioned that this extra production may only be temporary.

However, other public commenters suggested that the decline in whitebark pine is a more serious stressor on the GYE grizzly bear population than we acknowledged in our proposed rule. Some of these commenters expressed concerns over the methods of our analysis, including: concern that our analysis of whitebark pine availability did not account for the loss of whitebark pine that occurred in a 1988 fire and the subsequent lack of regeneration; a request that we provide additional detail on the protocol we use to monitor the location and availability of whitebark pine, suggesting that our protocol may be inadequate or outdated; concern that the three IGBST papers analyzing whitebark pine (Bjornlie et al. 2014, Costello et al. 2014, and van Manen et al. 2015) failed to account for long-term trends in weather and for major changes in abundance of other key food sources (army cutworm moths, cutthroat trout, elk, and bison); and concern that the method that the IGBST uses to measure whitebark pine abundance (remote sensing) underestimates the extent of whitebark pine loss and the historic use of whitebark pine by grizzly bears.

Other commenters were concerned with the conclusions of our analysis. Some commenters expressed concern that, in claiming loss of whitebark pine is not a serious threat at this time, we overlooked how whitebark pine die-offs and grizzly bear vital rates declined simultaneously. Additionally, one commenter noted that even if the population currently has a positive growth rate, it does not mean the population is healthy nor that the threat of declining whitebark pine is insubstantial. Another commenter took issue with our analysis of female body fat levels and their correlation to whitebark pine levels, noting, “Nearly 20% of females handled

during 2008-2013 had season-specific body fat levels low enough to put them at risk for reproductive failure, whereas prior to 2004, no females assessed were so clearly deficient in body fat;" this commenter cautioned against Type II error, that even though there was not a statistical correlation between the decline in whitebark pine and body fat does not mean the relationship does not exist. This commenter continued to discuss how the use of pooled data and small sample size can contribute to type II errors. Other commenters cautioned that we have not yet observed the impacts of the recent declines in whitebark pine; the most severe losses in whitebark pine have occurred too recently to detect long-term population impacts, especially considering grizzly bear's slow reproductive rate. In addition, Costello et al. (2015) only detected a decline in the use of whitebark pine at the end of her study, which is not enough time to detect population-level impacts. Other commenters took issue with our conclusion that the GYE population of grizzly bears will adapt to losses of whitebark pine simply because the NCDE population of grizzly bears has continued to grow in the absence of whitebark pine. Commenters also expressed concerns over potential future decline in whitebark pine due to disease, insects, fire, reproductive failure, climate change, and competition from lower elevation species; these commenters expressed concern that whitebark pine cannot adapt rapidly enough to changing environmental conditions given its long generation length. Additionally, they say that climate change models predict the terminal loss of whitebark pine from the Yellowstone ecoregion. Other commenters expressed concerns about potential future impacts of the higher human-caused mortality that occurs during years of low whitebark pine production.

Finally, commenters and peer reviewers suggested additional analyses we may consider conducting. One peer reviewer emphasized the potential utility of an analysis comparing the vital rates of grizzly bears that feed on whitebark pine to the vital rates of those that do not. A public commenter suggested the creation of a cone availability index for use in our analysis to more accurately assess availability. Another public commenter suggested we analyze the fungi that grow symbiotically with whitebark pine, since the health and survival of the pine and the fungi are closely related.

ISSUE 55:

We received many comments from both the public and peer reviewers regarding the decline in the availability of ungulates as a food source. Commenters asserted that the decline in ungulates as a food source is more of a threat than we acknowledged. They noted that all elk herds in the GYE (excepting the Upper Madison herd) have declined due to increased calf depredation, drought, chronic wasting disease, and human hunters. Commenters also suggested that any food monitoring effort must include data on the numbers of elk and bison in various ecosystem herds. One commenter also asserted that the effects on elk from hunters are "super-additive" because hunters preferentially target top breeding individuals (Vucetich et al. 2005, Wright et al. 2006, Mallonee 2011).

Commenters suggested that bison have likely become a more prominent part of grizzly bear diets in recent years. However, they asserted that we neglected to include a discussion of bison population trends. They claimed that we thus did not account for the impacts to grizzly

bears of planned herd reductions in the Interagency Bison Management Plan, Yellowstone National Park's bison management plan, and Montana's new bison management plan. They also asserted that we incorrectly assumed grizzly bears do not depend on bison from the Northern Range herd (which is experiencing population increase) because of Fortin et al.'s (2013) findings that grizzlies do not frequently feed on bison in the the Central herd (which is experiencing population decline).

Commenters also suggested that drought impacts forage conditions for ungulates—affecting pregnancy rates and calf survival "with unknown effects on herd numbers," and thus has potential indirect impacts on grizzly bears. Commenters noted that winter severity and length have decreased with climate change, which has decreased the availability of winter-killed carrion in the spring. In addition, they claim that we failed to present the data from the IGBST Annual Reports that shows the decline in the availability in spring carrion.

Lastly, commenters expressed concerns regarding the potential side-effects of grizzly bear reliance on ungulates as a food source. They noted that as bears consume more livestock and hunter-killed carcasses instead of traditional food sources, more conflicts occur with ranchers and hunters. They also noted that male and female bears now eat more comparable amounts of meat, due to decreased availability of whitebark pine and cutthroat trout. Commenters claimed that increased female bear reliance on ungulate consumption has led to a decline in cub and yearling survival rates due to more deadly confrontations between females with cubs and other predators, including adult male grizzly bears. A peer reviewer suggested researchers analyze cub survival from 2002-2014 to assess predator-prey relationships, which may have a time-lag in detectability. Commenters also recommended that agencies manage for higher wild ungulate populations to decrease livestock depredation. One peer reviewer stated that "carcass remains from hunter kills can be an important seasonal food source;" in order to monitor this food source, this peer reviewer suggested that managers track how many ungulates are killed by hunters, monitor which species of ungulates hunters successfully target, and and estimate the average quantity of carcass remains because these measures "would be a better metric than counting the number of hunters."

ISSUE 56:

One commenter cited Bjornlie et al. (2014) to suggest that huckleberries are currently less abundant as a result of warming temperatures and a persistent drought pattern in the GYE. Another commenter referenced McLellan (2015) to warn that the impacts of huckleberry decline on grizzly bear populations could be delayed; the grizzly bear population in Canada and northern Montana did not start to decline until eleven years after the huckleberry abundance started to drop.

Climate change

ISSUE 57:

We received many comments from both the public and peer reviewers regarding impacts to grizzly bears as a result of climate change. Overall, they asserted that our discussion of

climate change was inadequate, mentioning the following concerns: (1) we reviewed the current literature regarding climate change, but did not link effects to grizzly bears or their habitat; (2) we should consider future impacts from climate change, despite the fact that the exact extent of impacts is unknown; (3) the "downscaled" projection we used to analyze climate change may have underestimated impacts; (4) climate change may reduce snowpack and shorten the winter season, which may impact the timing and success of denning, potentially affecting reproductive success and increasing conflict; (5) less snowpack could result in fewer avalanche chutes; (6) we should have assessed impacts from the changing hydrological regime; (7) drought has affected death rates; and (8) increased frequency and extent of fire as a result of climate change could alter plant and animal composition (Westerling et al. 2011) and affect the frequency of human-grizzly bear interactions and conflicts. One commenter cited Servheen and Cross (2010) who stated that "climate change may play a significant role in driving grizzly bear/human interactions and conflicts," noting that we inaccurately summarize their publication in the rule when we say that "most grizzly bear biologists in the United States and Canada do not expect habitat changes predicted under climate change scenarios to directly threaten grizzly bears." In addition, this commenter asked why surveyed biologists believed that climate change is not a threat to grizzly bears and that climate change "may even make habitat more suitable and food sources more abundant."

Commenters suggested that several issues related to climate change require monitoring. Commenters and peer reviewers recommended both monitoring and modeling potential impacts of climate change on habitat suitability and the abundance and distribution of grizzly bear foods. One commenter noted that grizzly bear foraging is both temperature and moisture dependent. A peer reviewer also suggested that we should monitor possible effects of climate change on grizzly bear vital rates. Lastly, commenters and peer reviewers noted that the frequency of diseases and parasites will likely change in the context of climate change; therefore, we should be monitoring for emerging diseases.

Other potential threat factors

ISSUE 58:

Some commenters raised questions about wolves and their effects on grizzly bears in the GYE. One commenter stated that wolves have decreased the availability of spring carrion since their reintroduction, disproportionately affecting females, and decreasing elk populations. One commenter noted that wolves have been known to kill grizzly bear cubs, though this phenomena is very difficult to detect and quantify. One comment maintained that female grizzly bears rarely usurp wolf kills (this behavior is mostly reserved for male grizzly bears) (Gunther & Smith 2004).

ISSUE 59:

One peer reviewer cited the geological instability of the GYE as a potential remaining threat factor affecting the grizzly bears. He urged us to strongly consider the geological risk of the area before making a decision on delisting.

ISSUE 60:

We received some comments from both the public and peer reviewers requesting increased efforts towards public Information and Education (I&E) campaigns regarding grizzly bears. Specifically, commenters recommended I&E on bear safety, bear identification for hunters, the importance of bear spray, and effective coexistence with bears. One commenter claims that I&E, specifically bear identification training, has failed to reduce human-caused mortality from hunters. A peer reviewer noted that modern media, such as phone applications, could be useful tools for I&E.

ISSUE 61:

We received a public comment stating that social acceptance of grizzly bears will not improve if we allow more discretion in bear management; instead, the commenter suggested that increased acceptance will come from rigid enforcement of laws and expanded tourism.

ISSUE 62:

One commenter expressed concern that we did not adequately acknowledge the grizzly bear mortalities associated with the annual elk hunt in Grand Teton National Park as a continuing threat. This commenter cited a recent court decision that allowed "an increase in the number of grizzly bears that could be 'incidentally' killed in association with the annual elk hunt in Grand Teton National Park."

Cumulative impacts of threats

ISSUE 63:

Both commenters and peer reviewers expressed concern that the synergistic effects of climate change, changing food availability, and the impacts from invasive species and disease are unknown and may not be detected for decades. The commenters and peer reviewers recommended a more complete analysis of this suite of impacts and consideration of their potential interactions.

Adequate regulatory mechanisms and post-delisting monitoring

ISSUE 64:

Both peer reviewers and public commenters expressed concern that the language in the Factor D section of the proposed rule was too non-committal. They requested we remove words such as "may," "anticipate," or "expect" if we hope to suggest a firm commitment to ensuring effective management post-delisting.

ISSUE 65:

A number of public comments questioned what we can legitimately consider an "adequate regulatory mechanism" and what we can thus factor into our analysis. A number of commenters claimed that our analysis was flawed because it relied on management regimes that

are outdated or not yet final. These commenters emphasized that the analysis surrounding Factor D (inadequacy of existing regulatory mechanisms) must be based on existing regulatory mechanisms; thus, we must have finalized State plans, State regulations, Conservation Strategy, and MOA to consider in our final rule. One commenter suggested that, though the 2006 Forest Service Plan "no longer represents the best available science," any needed updates would only take effect after delisting occurs. This commenter argued that we thus could not consider the Forest Service management plans in our analysis of the adequacy of existing regulatory mechanisms since the final version is not yet available nor is it currently in effect. Another commenter noted that Yellowstone National Park currently includes the outdated 2007 Conservation Strategy in its Superintendent's Compendium; this commenter requested additional clarity on whether the 2016 Superintendent's Compendium would incorporate the provisions in the revised 2016 Conservation Strategy. One commenter opined that the Conservation Strategy cannot be considered a regulatory mechanism because it is not enforceable.

Based on legal precedent (e.g., Norton v. Southern Utah Wilderness Alliance), other commenters noted that land use plans, State management plans, Memorandums of Agreement, and conservation strategies cannot be considered adequate regulatory mechanisms since they are not "legally binding documents."

Comment [4]: cite?

ISSUE 66:

Multiple commenters weighed in on the adequacy of the State management plans and the States' ability to appropriately manage grizzly bears. Some of the commenters critical of State plans and management practices focused on the difficulties surrounding coordination of management between all the political entities in the GYE. One commenter stated that the three States "have shown little if any ability to be in agreement when it comes to managing wolves or other species" and that "there needs to be uniformity, consistency, and communication among these three States to prevent elimination of the bear from certain landscapes." Another commenter expressed specific concerns about the complications associated with coordinating management of grizzly bears between three State entities, tribes, and federal land managers; these potential complications include "allocation among States and tribes, feasibility of enforcement, prevention of exceedance of limits (including gender limits), and subsequent implementation of mitigation (reducing discretionary mortality) in a following year." Another commenter asked us to describe the measures in place that "ensure that grizzlies within the DMA but outside the PCA will be managed in a consistent method between the three States" and guarantee that total mortality limits are not exceeded, recovery criteria are not violated, and genetic connectivity is facilitated. Another commenter requested the inclusion of additional detail in the Conservation Strategy describing the processes States will use to coordinate with each other. Other commenters worried that State management would be more susceptible to political influences on decision-making; one commenter suggested that the processes that require legislative approval of management plans and allow amendments from state legislatures would subject the management plans to inappropriate "political pressure." Similarly, another commenter opined that allowing the States to manage grizzly bears would "relegate the bear's

importance to only a few special interest stakeholders" while another suggested that "State wildlife management agencies in the Northern Rockies represent the views of a politically influential minority whose interests focus on extractive uses of the natural world." One commenter asked who would "be the watchdog" for State wildlife management agencies. Other commenters claimed state management would be harmful or ineffective, based on evidence from past State management of large carnivores and the content of the State management plans. One commenter expressed concern that Montana and Idaho have no plans to update their old grizzly bear management plans, which the commenter considered to be inadequate. Another commenter expressed concern that the Wyoming Game and Fish Department has not thoroughly explained and recognized the stressors on the grizzly bear population outside of national parks. One commenter suggested that at least two of the States involved in grizzly bear management have "clearly demonstrated non-precautionary management of large carnivores, as exemplified by unsustainable harvest levels of the [Northern Rocky Mountain] gray wolf (Creel and Rotella 2010; Ausband et al. 2015)." Another commenter opined that States will inappropriately make management decisions based on what is "socially acceptable," "politically popular," or profitable. A peer reviewer noted that instead of "establish[ing] population targets and associated specific harvest criteria," the States only identified a minimum population size for the total GYE grizzly bear population; the peer reviewer was concerned this oversight could lead to "overharvest" and that "a lag in management response could drive the population below the desired minimum." Commenters suggested that decision-makers develop a means to share tourism dollars with state wildlife managers to relieve the financial burden of post-delisting grizzly bear management.

Those commenters supportive of state management expressed confidence in the states' abilities to maintain a recovered population of grizzly bears. The Governor of Montana shared, "Montana has the expertise to conserve and manage grizzly bears, and we are committed to continuing our sound management practices into the future. The Yellowstone area's wildlife is one of the region's great resources, and perhaps the most charismatic of all the species is the grizzly bear." The Governor of Wyoming stated, "Since 1975, Wyoming has spent more than $40 million on grizzly bear management. Wyoming remains committed to robust grizzly bear population and ensuring they never warrant protection under the ESA again." One commenter suggested that the proposed rule also included "every possible safety net, including triggers for relisting." In a joint comment from the Idaho Department of Fish and Game, Montana Fish, Wildlife, and Parks, and Wyoming Game and Fish Department, the three states emphasized that they have agreed to collectively manage the GYE population at the ecosystem scale to maintain recovery through the Tri-State MOA.

ISSUE 67:

Both public commenters and peer reviewers raised concerns about the adequacy of funding moving forward. One commenter noted that implementation of the Conservation Strategy is dependent on funding. Another commenter stated that funds generated from the sale of hunting licenses (for grizzly bears) will not provide adequate funding to the States to manage

grizzly bears. They felt that we should continue to assist our state partners in funding field biologists and other programs to minimize bear conflicts. One commenter asked whether or not we have made any financial commitments to assist with management or monitoring. Lastly, a peer reviewer pointed out that the draft rule is based on the assumption that sufficient federal and state funds will be available into the foreseeable future "to monitor and detect population changes with enough resolution to trigger management fallback mechanisms (e.g., no discretionary mortality if population is less than 600 bears)".

ISSUE 68:

A number of public commenters believed that the five requirements for state hunting regulations that we laid out in the proposed rule were inadequate. One commenter noted that it would be difficult for the average hunter to distinguish between a male and female grizzly in the field, implying that the regulatory requirements are insufficient to protect female grizzlies. Other commenters opined that the measures give the states too much latitude in manner of take (e.g., baiting, hounding, trapping, stalking), bag limits, seasons, and sex ratios and age limits for grizzly bear hunting; commenters were concerned that this flexibility would lead to hunting regulations that are too liberal. Commenters were concerned that the gaps in our regulatory requirements would not provide for adequate ecosystem-wide coordination and consistency in regulations.

A number of commenters proposed additional content for the state regulatory requirements. One commenter suggested prohibiting the shooting of any grizzly bear traveling with other bears to further ensure females with dependent young are not killed. Another commenter suggested we require states to coordinate season dates through the Yellowstone Grizzly Coordinating Committee and time seasons to minimize risks to females. One commenter suggested that timing the hunt to minimize female mortality was not a legally binding requirement; this commenter also noted that creating such restrictions would be logistically challenging since denning times are highly variable with weather and food conditions and because males usually emerge from dens only two or three weeks earlier than females. Another commenter suggested that normal licensing and hunting procedures should apply to any grizzly bear hunt (i.e., hunts should be open to the public and non-resident hunters); this commenter thought that the hunts should not be special limited or controlled hunts. One commenter stated that regulations should impose heavy fines or the threat of license revocation for hunters that fail to carry bear spray. Another commenter desired more stringent restrictions on the types of grizzly bear take that will be permitted; this commenter asked there to be a ban on baiting, trapping, and the use of hounds for grizzly bear hunting in the GYE in all three states before delisting. This commenter noted that Montana's proposed regulations prohibit baiting grizzlies, hunting grizzlies with dogs, and the use of scents to attract grizzlies; in addition, Montana's proposed regulations set conservative fall and spring seasons to reduce female mortalities. This commenter questioned why the Service did not require comparable provisions in Wyoming and Idaho's regulations. The Governor of Wyoming argued that a restriction on bear trapping should

not be a foundation for grizzly delisting; this commenter requested we remove the language in the rule that discusses bear trapping as part of legal take.

One commenter asked that we explain what will be considered "human safety purposes" when deciding whether to allow additional grizzly bear mortality, suggesting that the distinction between human conflict and human safety is unclear. Another commenter asked that we clearly explain the difference between the terms "hunting" and "discretionary mortality" and use each term consistently.

ISSUE 69:

A few comments from peer reviewers and the public suggested that our status review triggers are too low or unclear; these commenters also proposed additional triggers. Commenters pointed out that it is unclear what "significantly" means in our trigger "if…[t]here are any changes in Federal, State, or Tribal laws, rules, regulations, or management plans that depart significantly from the specifics of population or habitat management detailed in this proposed rule and significantly increase the threat to the population." Commenters provided two suggestions for revising the current status review triggers. First, in the proposed rule, we stated that we would initiate a status review if the population estimate fell below 500 bears in any year; commenters suggested increasing the population size in this trigger so we would initiate a Service status review if the Chao2 population estimate fell below 600 bears in any given year. Second, in the proposed rule, we state that we would initiate a status review "if independent female mortality limits as per tables 1, 2, and 3...are exceeded for three consecutive years and the population is fewer than 600;" commenters expressed concern that this trigger could allow states to exceed mortality limits in 7 out of every 10 years (as long as the years in which mortality limits are exceeded never occur three times in a row), which would allow the population to decline until it drops below 600 bears. As such, these commenters suggested changing this trigger so that the Service would initiate a status review if the mortality limits for independent females are exceeded for two consecutive years and the population is below 600 bears. Commenters and peer reviewers also expressed concern that there will be a lag in a decision-making response to population declines that drop below 600, which may be especially true in high mortality years. Additional suggested triggers included: lack of funding; triggers related to habitat standards and monitoring protocols, including food monitoring; lack of connectivity between the GYE and NCDE at least once during every 6-year period; and if the States list grizzly bears as a predator in the future. Some expressed concern about the meaningfulness of our triggers and whether the Service would be willing to relist the grizzly bear, should it become necessary. Commenters also noted that the Service triggers need to be standardized in the rule, the Conservation Strategy, and other management plans.

ISSUE 70:

A few comments from peer reviewers and the public suggested that the triggers for an IGBST Biology and Monitoring Review are too low or are unclear; these commenters and peer reviewers proposed additional triggers. It was suggested that lack of funding should be a trigger

for a Biology and Monitoring review. The Biology and Monitoring Review triggers need to be standardized in the rule, the Conservation Strategy, and other management plans.

ISSUE 70.5:

One peer reviewer suggested that because the generation length for grizzly bears is close to 10 years the proposed timeline of 5-10 years for a demographic monitoring review by the IGBST should be 5 years to be consistent with precautionary management.

ISSUE 71:

Several peer reviewers raised concerns about limiting monitoring to the DMA. One peer reviewer noted that less monitoring outside the DMA may produce "less data about individual bears that may behave differently than those within the DMA." One reviewer commented that mortality rates may be misinterpreted when bears whose home ranges overlap the DMA boundary are killed outside the DMA (i.e., mortality rates could be underestimated). Lastly, reviewers point out that catastrophic events within the DMA (e.g. fire like in 1988), "could displace grizzly bears forcing some to shift home-ranges to outside the DMA boundaries," which would require sampling outside of the DMA.

ISSUE 72:

Public commenters presented differing perspectives on whether the content of the proposed rule represented an overreach of Service authority or too little federal government involvement. Commenters took issue with the fact that the rule compromised the States' management authority by requiring the states to pass particular hunting regulations before a final rule; they explained that the Service does not have the authority to demand management provisions from the States. One commenter expressed concern that the "tone" and some content of the proposed rule "indicate[s] a level of continued Service engagement that exceeds their authority under the ESA."

Other commenters did not think the proposed rule allowed for enough federal involvement. One commenter wondered what the role of the federal government would be in a post-delisting environment while another stated, "Management should continue to be the responsibility of the USFWS." Another commenter questioned whether the Service can require states to classify grizzly bears as "non-game," which would prevent trophy hunting.

ISSUE 73:

A number of public commenters expressed concern about our use of the term "conservation reliant" species in reference to grizzly bears. These commenters requested additional clarity about what the term "conservation reliant" species means, what "authority accompanies such a designation," why this designation should apply to grizzly bears, and how management differs for "conservation reliant" species in comparison to those that are not given this descriptor. The State wildlife management agencies note that Scott et al. 2005 "recommends against perpetual requirements and for 'necessary management actions as long as necessary.'"

The State wildlife management agencies proposed their own clarifying definition of a "conservation reliant" species as "simply those requiring management post-delisting;" they claimed we related "conservation reliance" to a "low resiliency to excessive human-caused mortality," even though "the Tri-State MOA and the States' commitment in many forms to mortality limits and the regulatory mechanisms to maintain a recovered population all work to prevent 'excessive' human caused mortality." The State wildlife management agencies continued to suggest that they successfully manage "a wide array of 'conservation reliant species' in the absence of ESA listing" and that "mere 'conservation reliance' does not mandate ESA protection or extension of federal requirements post-delisting."

ISSUE 74:

Public commenters presented differing points of view on the implementation period of the Conservation Strategy. Many commenters suggested that the Conservation Strategy should be in effect beyond the statutorily required five year minimum, including "in perpetuity." One commenter expressed, "Even if states are cautious during the first five years of federal oversight that follows delisting, over time, management will reverse gains made over the last 40 years of endangered species protection."

However, the states of Idaho, Montana, and Wyoming stated that the proposed rule went "too far" in declaring the Conservation Strategy would be in place "in perpetuity" or indefinitely. The Governor of Wyoming expressed concern that such a lengthy post-delisting monitoring period was "unprecedented in the context of the ESA." The Governor of Montana emphasized that "The Endangered Species Act (ESA) requires the U.S. Fish and Wildlife Service to recover and delist imperiled species, after which management reverts back to states and tribes." The Idaho Office of Species Conservation called this language "an overreach" and claimed it contradicted the Ninth Circuit Court's opinion on the 2007 delisting (16 U.S.C. § 1523(3)). The Governor of Wyoming requested that, instead of saying the the Conservation Strategy will be in effect "in perpetuity" or "indefinitely," we state that it will "remain in effect beyond the 5-year monitoring period." Other commenters asked for full removal of the terms "in perpetuity" or "indefinitely" in reference to the duration of the Conservation Strategy because they thought the Conservation Strategy should expire after the five year period required by the ESA; this would allow the states to completely take over management after five years. Another commenter thought we "inappropriately" required an unlimited Conservation Strategy because we declared the grizzly bear to be "conservation reliant."

Other commenters discussed the difference between post-delisting monitoring and post-delisting management. One commenter emphasized the need for "robust monitoring and research post-delisting." Another commenter recognized the value in continuous monitoring but thought "post-delisting should not require management" since this is a costly endeavor for which there is currently no "biological or scientific need."

ISSUE 75:

A few commenters requested additional clarity in the Conservation Strategy. One commenter asked us to explicitly note that the Conservation Strategy's preamble is subject to change given the availability of new research. This commenter also asked us to always refer to the Conservation Strategy as the "2016 Conservation Strategy," to clearly distinguish it from any past and future versions. Another commenter asked that we "clarify that the Conservation Strategy is a cooperative agreement and that the Service's role is not to oversee management but [rather to] evaluate the five factors under the ESA should it be necessary."

ISSUE 76:

One commenter expressed concern that we do not discuss the Bureau of Land Management's (BLM) sensitive species program in the proposed rule. This commenter wanted us to describe "how grizzly bears will be classified for planning and management purposes on BLM lands post-delisting."

DPS/SPR comments

ISSUE 77:

A number of commenters took issue with what they claim to be an illegal simultaneous designation and delisting of the GYE DPS. Commenters asserted that designating the GYE as a DPS violated the law because we are purportedly not allowed to designate a DPS for the purposes of delisting it. Commenters alleged that no provision in the ESA allows this and legislative history weighs heavily against such an action. In addition, the commenters contended that our proposed action (designating a DPS for the purposes of delisting) has repeatedly been rejected by Federal Courts. Commenters referenced the December 2014 D.C. District Court Opinion on a challenge of our 2012 final rule delisting gray wolves in the Great Lakes region in which the judge stated, "the creation or initial designation of a DPS operates as a one-way ratchet to provide ESA protections to the covered vertebrates." One commenter cited several additional statements from the Court Opinion supporting their claim that the ESA does not permit delisting a threatened species by individual sub-population if the species is not listed as individual sub-populations in the first place (e.g., we can only delist entities as they are listed). Commenters took issue with our position that the designation of the DPS in the proposed delisting rule is consistent with Service's past practice. They pointed out that some of our supporting examples of past practice relate to listings that predate the DPS Policy and most of our "relevant" examples of past practice resulted in lawsuits that reinstated protections for the species. Commenters contended that none of our prior actions justify our current approach because the federal courts have already determined that our approach is not a reasonable interpretation of the law (citing the 2014 WGL DPS Opinion). Commenters believed our reliance on the 2008 Solicitors' opinion supporting the approach of designating a DPS and delisting said DPS at the same time is not legally binding in a court of law and that the Solicitors' reasoning is refutable under the plain language of the ESA.

Comment [5]: cite

ISSUE 78:

Even if we were allowed to designate the GYE as a DPS at the time of delisting, commenters claimed our analysis did not adequately justify such a designation. First, in the opinion of some commenters, the Service's DPS policy requires that we consider three factors when determining whether a DPS designation is valid -- discreteness, significance, and status; these commenters contended that we only considered discreteness and significance and left out the status analysis. The commenters argued that our DPS policy only allows designation of a DPS if the DPS in isolation qualifies for listing as either endangered or threatened; this is the "status" portion of the DPS designation analysis and these commenters contend that we "skipped" this portion of the analysis. We instead, they argued, "rolled" the status analysis into the proposed rule's five factor analysis. These commenters suggested that if we had followed the "requirement" that the status analysis be done in the context of the DPS designation, we could not have designated the DPS because we would have concluded that the population does not qualify as threatened or endangered. One stated that our conclusion that the GYE DPS does not qualify as an endangered or threatened species meant that the GYE DPS does not qualify as a "species" under the Act.

Second, commenters suggested that we did not make a satisfactory argument for the "discreteness" of the DPS (another of the DPS policy's requirements for designation). These commenters pointed out potential inconsistencies in our discreteness analysis. First we determined that the GYE population is "markedly separated" from other populations of grizzly bears because connectivity to other populations has yet to occur, thereby justifying our conclusion that the population is sufficiently "discrete" to warrant a DPS designation. However, in the proposed rule, we also acknowledged that future connectivity is desirable and will be actively facilitated; we then concluded that such "future connectivity" would not undermine our discreteness analysis because absolute separation of the populations is not required. Commenters contended that it is well accepted in the scientific community that the GYE grizzly population will need to be well connected with other populations across the western landscape in order to foster the species' true recovery. Commenters thus found it illogical to use the GYE population's current lack of connectivity to other grizzly bear populations to justify DPS designation and subsequent delisting. Additionally, one commenter found our "reliance on genetic data to justify" our conclusion that the GYE population is adequately discrete "unconvincing" and inconsistent. The proposed rule notes that GYE grizzly bears are separated from other populations because they show 60% heterozygosity, while NCDE bears show 67% heterozygosity. Commenters found our position with respect to genetics inconsistent because we make the opposite argument when asserting, in our DPS analysis of significance, that the GYE grizzly bear population's genetics likely do not differ 'markedly' from other grizzly bear populations.

Third, commenters largely agreed with our analysis of the third aspect of DPS designation--significance. However, they found our conclusion that the population's "loss would represent a significant gap in the range of the taxon" to be hypocritical. This conclusion supports

the designation of the DPS, which in turn results in the delisting of the GYE DPS; commenters thus felt that this conclusion, with its implications for delisting, thus hypocritically would make the loss of bears more likely. Commenters also argued that our DPS significance determination undermines our duty to recover the "species as a whole;" they argue that we cannot simultaneously assert that the GYE population of grizzly bears is essential to the species as a whole and that it should be delisted. Commenters contended that the Service's duty under the ESA is to get listed species to a point where the law's protections are no longer required, not to undermine recovery efforts for the remainder of the listed entity by using conflicting interpretations of scientific data.

Several commenters wanted greater certainty about our intentions for grizzly bear recovery in the remainder of the listed entity (lower 48 states outside of the GYE DPS). Some stated that prior to taking action on any individual population, the Service must designate multiple DPSs encompassing the entire range of the subspecies, set recovery goals for each DPS, and evaluate the status of each DPS for listing. Others recommended that we explain our intentions for the remainder of the grizzly bear listed entities in a Notice of Proposed Rulemaking, which should set forth a timeline for initiating and completing such reevaluation and allow solicitation of public comment on possible ways the remainder of the listed entity could be reclassified.

One commenter disagreed with the scope of our DPS, suggesting that all grizzly bears in the state of Montana should be removed from the list of threatened and endangered species. Another commenter suggested that, because the grizzly bear is currently listed as a DPS (grizzly bears are only listed in the lower 48), we cannot designate the GYE population as a DPS because this would be creating a DPS of a DPS.

ISSUE 79:

Commenters expressed discontent with the Service's 2014 policy on interpreting the phrase ''significant portion of its range'' (SPR) in the ESA's definitions of ''endangered species'' and ''threatened species;" this policy was the basis for our analysis of SPR in the proposed rule. One commenter cited several statements from the 2001 9th Circuit Court Opinion in Defenders of Wildlife v. Norton and the 2009 9th Circuit Court Opinion in Tucson Herpetological Society v. Salazar to support their contention that the Service's 2014 SPR Policy is fatally flawed. Some commenters did not believe the Service's 2014 SPR Policy is reflective of Congressional intent. They cited a 1978 Congressional record stating that "the term 'range' is used in the general sense, and refers to the historic range of the species;" commenters thus believed that the Service erroneously interpreted "range" to mean only the range in which the species currently exists; they took issue with the exclusion of historic range from any SPR analysis. Commenters also referred to the Western Great Lakes Wolf DPS 2014 court opinion which states that the Service's interpretation of range renders "meaningless the word 'curtailment' in 16 U.S.C. §1533(a)(1)(A), since it is impossible to determine the 'present…curtailment of [a species'] habitat or range' without knowing what the species' historic range was prior to being curtailed." Commenters also believed that the Service's requirement

Comment [6]: https://www.fws.gov/endangered/improving_ESA/SPR.html

Comment [7]: From Maricela: I did not include all of them here because my expecta ion is that we would refer to the 2014 FR notice for the SPR policy (79 FR 37578) to address past court decisions. If we want to address each specific quote hen we'll need to take a look at the Wild Ear h Guardian comment.

that individuals living in the significant portion of the species' range must be essential to ensuring that the species is not endangered or threatened across its entire range is too stringent.

Comment [8]: what does this mean? Can we word it more simply?

ISSUE 80:

Several commenters expressed concern about our "significant portion of its range" analysis. Specifically, commenters instructed the Service to consider historic range in our SPR analysis and to conduct an evaluation of whether the habitat lost from the historic range is a significant portion of that range. A commenter expressed concern that the proposed rule relegates grizzlies to small portions of the lower 48 states and ignores the species' lost historic range in the remainder of the lower 48 states. Commenters specified that our analysis of lost historic range should consider the entire population of grizzly bears across the lower 48 states. Further, assuming that our proposed DPS delisting process is legal, commenters instructed us to also consider lost historic range of the GYE DPS, including an analysis of what constitutes the GYE DPS' historic range, how that compares with the GYE DPS' current range, and whether or not the loss of historic range is significant. They further directed the Service to consider threats in areas where the population is either extirpated or home to only a few individuals; they claimed that it is insufficient to focus analysis entirely on an area where a population persists to support a finding that threats elsewhere are not significant. Commenters noted that many activities that have potentially adverse effects on bears are only found outside of Yellowstone National Park, outside of the PCA, or outside the DMA. They expressed concern that the Service acknowledges some of these threats but discounts their importance. Commenters stated that the standard we seemed to apply (localized threats must threaten extinction of the GYE DPS as a whole) was inappropriate and illegal. They further stated that the Service's SPR analysis ignores the fact that loss of bears in the peripheral areas would result in significant range contraction and that, according to our own policy, such lost range may never be reclaimed or considered in future listing decisions.

Forest Service issues

ISSUE 81: We received some comments from peer reviewers and the public in reference to the Forest Service designation of the grizzly bear as a "sensitive species" or "species of conservation concern" upon delisting. This designation by the Forest Service was considered to be an important component of ongoing management of grizzly bears. Some asked for specific statutory and regulatory definitions for "sensitive species" and "species of conservation concern." There was concern about the authority provided by the Forest Service designations and that the new designation of "species of conservation concern" under the 2012 Planning Rule does not provide the same project-level prohibitions as the "sensitive species" designation.

ISSUE 82: Some commenters were concerned with the Service's portrayal of the Forest Service designations of wilderness, wilderness study areas, and roadless areas and the protections each of these areas provide. Some felt that these designations are not restrictive enough to assume that

there will be no impact on grizzly bears living in those areas. In roadless areas, energy development or road construction can occur in conjunction with oil and gas leases that pre-date the effective date of the roadless rule. In addition, roadless areas allow for off-road vehicle use, motorized ATV trails, and human recreation, which may impact habitat. Moreover, it cannot be assumed that there will be no changes to the roadless rule as it is currently under judicial review. In Wilderness and wilderness study areas, mining claims that pre-date the Wilderness Act may be pursued. Livestock grazing is also permitted on these lands.

ISSUE 83: Some commenters expressed concern with the 2006 Gallatin Travel Management Plan implementation and whether it was approved. "The Service states that the Gallatin National Forest determined that gains in secure habitat resulting from full implementation of the 2006 Gravel Management Plan will constitute a new baseline, but it is unclear why the Service is not enforcing the Gallatin National Forest to decommission motorized routes and develop sites to comply with the 1998 baselines as all other forests have done."

ISSUE 84: Some public commenters expressed concern about the Forest Service plans and how they will be implemented. One commenter expressed that the Forest Service's 2005 guidelines for habitat outside the PCA are not legally enforceable. While some comments expressed that that the Forest Service plans are not regulatory because of the 2012 Planning Rule, others expressed that the 2012 Planning rule requires the Forest Service to consider connectivity, including roads (permanent or temporary, open or closed) and site development in light of how they may increase human-bear conflicts and grizzly bear mortality. Another commenter suggested that, once delisting is finalized, the 2006 Amendment cannot simply be reinstated; the Forest Service needs to do a new planning and public review process to amend their plans because the new Conservation Strategy changes the habitat protection provided by existing forest plans. The forest plans that currently implement the habitat-based recovery criteria may no longer be implemented once delisting occurs and the current tools and incentives are removed.

Make sure we include an issue that says something like: "Issue 1—Numerous comments suggesting corrections to facts and data in the proposed rule such as correcting typographical errors, including omitted cooperators, and modifying the presentation of statistical results." (taken from 2007 rule)

Grizzly bear delisting public comment issue response drafts

Delisting process and compliance with applicable laws, regulations, and policies

Response 1: We appreciate the time and thought put into comments on the proposed rule to delist the GYE grizzly bear. We provided several opportunities for public involvement. Notifications of comment periods, meetings, and hearings were provided in the proposed rule, which was published in the Federal Register, posted on our website, and publicized in news articles. To the maximum extent possible, these postings were compliant with the requirements of Section 508 of the Rehabilitation Act of 1973, as amended (29 U.S.C. § 794 (d)). We also provided access information for persons using a telecommunications device.

Initially, we allotted 60 days for submittal of written comments and additional information. We offered a variety of options for submitting comments; the public could submit their comments electronically, using a specified website, or in hard copy, via U.S. mail or hand delivery. Those without internet access could mail hard copy comments. During the first comment period we received more than 290,000 comments. Subsequently, we reopened the comment period for an additional 30 days during September and October 2016. During the second comment period we received an additional XXXXX comments.

We also scheduled two public meetings and two public hearings in Cody, WY and Bozeman, MT, where verbal or written comments could be submitted. These two cities were selected because of their proximity to the Greater Yellowstone Ecosystem. We again provided access information for persons using a telecommunications device. We noted that persons with disabilities wanting to participate in a public meeting or hearing, including the need for American Sign Language or English as a second language interpreter, could be accommodated.

Collectively, we believe the public had ample opportunity for input. Additional public comment periods nor additional methods to comment were not necessary to adequately comment on the proposed rule. **(COMPLETE)**

Response 2: This rulemaking has not been litigated, has not been driven or delayed by litigation. General comments on our administration of the ESA, not specific to this rulemaking, and the impact of litigation, are beyond the purview of this rulemaking. **(COMPLETE? I think this is enough detail. Sent an email to Marj asking - her draft text saved in word document of Rebecca's)**

Response 3: We take our relationships with Tribes very seriously. In accordance with the President's memorandum of April 29, 1994, Government-to-Government Relations with Native American Tribal Governments (59 FR 22951), E.O. 13175, and the DOI manual at 512 DM 2,

we readily acknowledge our responsibility for meaningful communication with Federal Tribes. In accordance with Secretarial Order 3206 (American Indian Tribal Rights, Federal-Tribal Trust Responsibilities, and the Endangered Species Act), we also acknowledge and continuously work to fulfill our responsibilities to Tribes to develop programs for healthy ecosystems, to recognize that Tribal lands are not subject to the same controls as Federal public lands, to remain sensitive to Tribal culture, and to make information available to Tribes.

In the proposed rule, we noted over 65 instances of discussion related to Tribes or Tribal issues prior to the issuance of the proposal. We regularly work with directly affected Tribes as active participants in recovery and management of the GYE grizzly bear. The Northern Arapahoe and Eastern Shoshone Tribes are participants in the Yellowstone Ecosystem Subcommittee of the IGBC as they manage nearly 3 percent of suitable habitat (1,360 sq km/525 sq mi), although no Tribally managed land occurs within the PCA. We also recognized our partnership with Tribal agencies and others in the 2016 Conservation Strategy. The Yellowstone Grizzly Bear Coordinating Committee will be the interagency group coordinating implementation of the 2016 Conservation Strategy and will include representatives from the Shoshone Bannock, Northern Arapahoe, and Eastern Shoshone Tribes. Hunting on the Wind River Reservation will be at the discretion of these sovereign Tribes.

Following publication of the proposed rule, the Grizzly Bear Recovery Program sent invitation letters to the four Tribes having known direct interests in the proposed GYE grizzly bear delisting area: Northern Arapaho, Eastern Shoshone, Northwestern Band of the Shoshone Nation, and Shoshone-Bannock Tribes. After other interested Tribes came forward, we sent letters in February of 2015 offering government-to-government consultation with 26 Tribes. In June of 2015, we sent a second round of letters to 48 Tribes, offering another opportunity for consultation, followed by personal phone calls or emails to the same 48 Tribes, personally inviting their participation in government-to-government consultation. In August of 2015, the Service met with the Rocky Mountain Tribal Leaders Council in Billings, MT, and invited Tribal representatives to engage in consultation. In October of 2015, the Service sent letters to all 53 Tribes that have contacted the Service regarding the GYE grizzly bear population inviting their participation in government-to-government consultation. We also offered informational webinars to Tribes and other interested parties. We have been very clear that our phone calls, webinars, and letters do not themselves constitute consultation, but were merely to provide timely information, answer questions, and explain possible next steps.

Once the proposed delisting rule was published, the Service held two consultation meetings - one in Bozeman, Mont., and one in Rapid City, SD - and invited all tribes west of the Mississippi River to attend. The Service announced the consultation meetings in the Federal Register notice for the proposed delisting and contacted tribes directly to ensure that they were invited to these meetings. We also conducted private government-to-government consultations

with Tribes that requested it. In total, the Service has conducted seven Tribal consultations in response to the above communications.

We considered issues of cultural, spiritual, and ecological importance that Tribes raised and we are sensitive to those concerns. However, the ESA requires the Service to make decisions based on the biological status of the species as informed solely by the best scientific and commercial data available, not based on spiritual and cultural concerns. That said, once this action becomes effective, Tribes will have the right to manage grizzly bears on their Tribal lands in accordance with their spiritual, cultural, and historic traditions. **(SHARED WITH TRIBAL FOLKS FOR THEIR INPUT, BY SETH)**

Response 4: This delisting rule is promulgated under section 4(a) of the Act and consequently is exempt from NEPA procedures. Our decision that NEPA does not apply under section 4(a) is based on the reasoning in *Pacific Legal Foundation* v. *Andrus*, 657 F.2d 829 (6th Circuit 1981). In this case, the court determined that a NEPA document cannot serve the purposes of the Act because the Secretary must make listing and delisting decisions based only on the five factors described in section 4(a). We cannot consider environmental impacts beyond those addressed by the five factors and must use only the best scientific and commercial data available in evaluating those factors. After this ruling, we officially determined that NEPA documents are not required for regulations adopted pursuant to section 4(a) of the Act and published that determination in the Federal Register (48 FR 49244, October 25, 1983). Therefore, this delisting decision is based solely on the five factor analysis described in section 4(a) and there is no NEPA documentation to release. **(COMPLETE)**

Geographic scope of recovery and delisting

Response 5: The DMA boundaries are based on the best available science from the Interagency Grizzly Bear Study Team (2012, pp. 41-44). While the Recovery Plan identified the Recovery Zone as the "area within which the population and habitat criteria…will be measured" (U.S. Fish and Wildlife Service 1993, p. 17), the Study Team recommended that maintenance of a grizzly bear population that extends outside of those boundaries into adjacent suitable habitat would help "ensure the long-term viability of this population" (IGBST 2012, p. 41). The IGBST then examined the Service's suitable habitat boundary, population monitoring data, and mortality data to identify boundaries that would be "…sufficiently large to support a viable population in the long term, such that mortalities beyond it could be excluded from consideration" (IGBST 2012, p. 42). Because the Service's suitable habitat line is based largely on mountainous ecoregions, the IGBST recommended including valley floors surrounded by suitable habitat in the DMA so that the disproportionate mortality that may occur in those areas is not excluded from the overall picture of population health and monitoring. The IGBST used the average annual activity radii of independent female grizzly bears to buffer and smooth the boundaries of suitable habitat so that the DMA would encompass areas outside of suitable habitat that were likely to be used by

grizzly bears on a regular basis. This is the process by which areas like the Upper Green River were included within the DMA boundaries. Conversely, because this quantitative technique smoothed the boundaries of suitable habitat and did not attempt to define suitable habitat itself, it is also the reason some areas in the southern Wind River Range were not included in the DMA even though they are found within Wilderness Areas. These were areas that did not meet the definition of suitable habitat because they possessed high mortality risk because of large, contiguous blocks of sheep allotments. The Service proposed to adopt the IGBST's recommended DMA boundaries in the Revised Demographic Criteria (U.S. Fish and Wildlife Service 2016, entire) . The Big Sandy and Popo Agie areas are included in the DMA because we consider most of the Wind River Range to be suitable habitat for grizzly bears in the GYE due to the large percentage of Wilderness. **(COMPLETE)**

Response 6: Our threats analysis focused on those portions of grizzly bear range that currently contribute meaningfully to the GYE grizzly bear population or have the potential to in the foreseeable future (i.e., suitable habitat, as defined and discussed in the Suitable Habitat section above). In total, Grizzly bears are currently found across 22,515 sq mi (58,314 sq km) of land within the GYE DPS boundaries. Seventy-two percent of this population occurs within areas we consider suitable habitat and seventy-seven percent are found within the DMA boundaries. The DMA and suitable habitat provide more than enough suitable habitat to provide for a large, robust, healthy and viable population and will continue to do so for the foreseeable future. Put another way, the DMA contains sufficient numbers and distribution of reproductive individuals to maintain the population's recovered status. Additional occupancy beyond this area is beyond what is needed to maintain recovery. Therefore, we believe focusing on this area is a reasonable and defensible approach. The approach taken here was also taken in our 2007 GYA grizzly bear delisting determination, and was upheld by the in the United States District Court, District of Montana. Specifically, the court agreed that we "provide[d] a reasoned explanation for the conclusion that unsuitable habitat is not a significant portion of the bears' range." (GYC vs. Servheen et al., CV 07-134-M-DWM, September 21, 2009, p. 43).

To the extent that this comment requests consideration of threats outside of the suitable habitat, we offer such an analysis here (considering Factors A, B, C, D, and E). Although grizzly bears once occurred throughout the area within the Yellowstone DPS boundaries (Stebler 1972, pp. 297-299), records indicate that even in the early 19th century, grizzly bears were less common in these eastern prairie habitats than in mountainous areas to the west and south (Rollins 1935, p. 191; Wade 1947, p. 444). Today, these habitats are no longer biologically suitable for grizzly bears as they lack adequate natural food resources (i.e., bison) and land use changes have altered the suitability of the habitat for grizzly bear persistence (considering Factors A, B, C, D, and E). These marginal, peripheral areas are either unoccupied or occupancy is largely the result of the strong, dispersing core source population within the PCA, DMA, and suitable habitat. While grizzly bears that do establish or move into these unsuitable habitats will face a reduced probability of persistence (considering Factors A, B, C, D, and E), such impacts

are anticipated to be restricted to a small percentage of the population and, thus, of minimal importance to the sustainability of the overall population. Such peripheral impacts will not compromise the viability of the population and do not either singularly or in combination with other factors mean the population is in danger of extinction nor is it likely to become so within the foreseeable future in all or a significant portion of its range. **(REVISED TEXT SHARED WITH THE TEAM VIA EMAIL, BY SETH)**

GYE Grizzly Bears Recovery Criteria and management objectives

Response 8: The Service and our partners have all agreed to maintain the total population size near the average population estimate for the period of stability achieved during 2002-2014. This population target was selected because: it was a time period where the recovery goals were met; it represents a population level which is sufficiently robust to provide for the viability of the species; and it represents a period where the ecosystem was likely at or near long-term carrying capacity. As measured by the the model-averaged Chao2, this equated to 674 grizzly bears. However, we agree that it is not practical or even possible to manage for an exact population target as populations naturally and inevitably fluctuate through time. Add to that, our belief that partners should reasonably be given some management flexibility recognizing the complexities of the system and the complexities of managing grizzly bears (provided that said flexibility maintains recovery and viability, which we believe stability around the 2002-2014 period does achieve).

Therefore, the Service and our partners agreed to allow flexibility around this population target by creating a population management range of between 600 and 747 grizzly bears, as measured by the the model-averaged Chao2. In our professional opinion, management within this range, as measured by the the model-averaged Chao2, will maintain recovery and a large, robust, healthy and viable population. We also believe that the ecosystem can and will continue to support such populations. Put another way, habitat quality and management (discussed further under Factors A and D) provide us with sufficient assurance that habitat is unlikely to be the limiting factor in determining whether these targets are met now or within the foreseeable future.

With this as the backdrop, we set human caused mortality limits that the best scientific and commercial information available indicated would allow slow, and measured declines at the higher end of this range, and capped total mortality limits to allow no worse than population stability at the lower ends of this range. Although we did not feel a need to micromanage this issue beyond the regulatory requirement for at least stability at the lower end of this range, practically, we anticipate managers will further limit mortality the closer they get to the population floor of 600 grizzly bears, as measured by the the model-averaged Chao2.

We recognize and regret confusion caused by recovery criterion 1's inclusion of a population goal of 500 grizzly bears. This goal was developed as the minimum necessary to

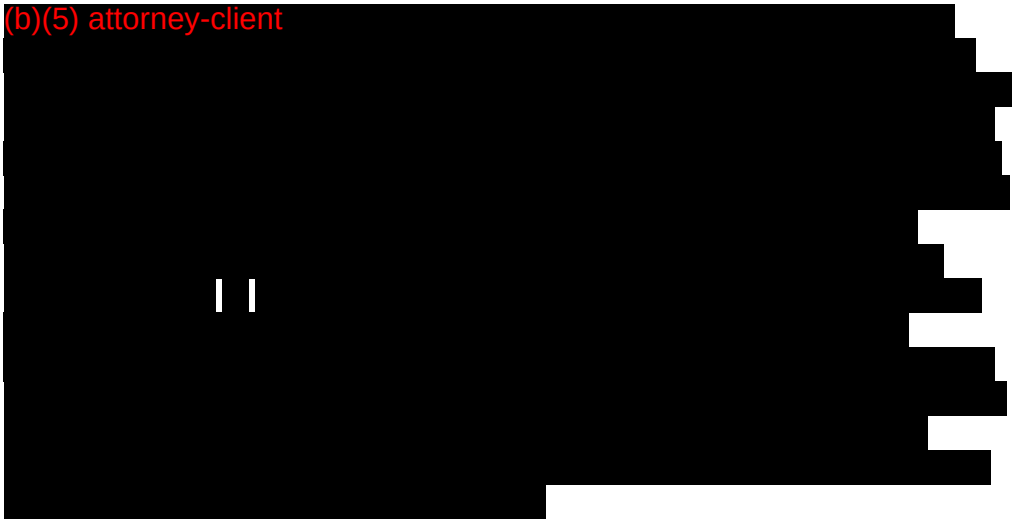
support the population's short-term genetic fitness. However, management will exceed this genetic health minimum. Recovery criterion 3 further clarifies our management floor of 600 grizzly bears, as measured by the the model-averaged Chao2. Specifically, recovery criterion 3 indicates the population's demographic recovery goals will not be met if the population falls below 600, as measured by the the model-averaged Chao2. Therefore, no discretionary mortality will be allowed, except as necessary for human safety, in the very unlikely scenario that the population falls below 600 grizzly bears, as measured by the the model-averaged Chao2.

It is also worth noting…

Comment [1]: This is the one piece that might change based on final high level discussions… specifically, mention trigger around 600 intended to clarify our targets, etc.

We recognize that some parties support continued population growth in perpetuity. We believe this is impractical, that the system has biological limits, that the average population estimate for the period of stability achieved during 2002-2014 likely approximates or approaches those limits, that expansion into unsuitable habitat is largely unsustainable, and that continued population growth is beyond what is required by the ESA as it is unnecessary for viability or sustainability. Therefore, we did not require human caused mortality limits that achieve continued population growth. **[Seth took a stab at drafting; I didn't see anything in this comment that required us waiting for the results on the ongoing discussions, IMHO]**

General comments on whether to delist



Response 9: The Service believes, based on the best available science and commercial data, that the GYE population of grizzly bears is recovered and no longer meets the definition of threatened or endangered under the Endangered Species Act. While grizzly bears do currently only occupy a fraction of historic habitat in the lower 48 states, the Service does not believe that restoration of grizzly bears to all historic habitats (particularly those no longer capable of supporting grizzly bear populations) within the DPS boundaries or within the lower 48 States is necessary or possible. The purpose of the Act is to conserve endangered species and the ecosystems on which they depend. We have recovered the GYE grizzly bear population in areas where portions of the ecosystem on which they depend still exist or could be restored. We have restored grizzly bears to most of their suitable habitat within the DPS and anticipate the State management plans will lead to re-occupancy of the remaining suitable habitat in the near future.

(b)(5) attorney-client

[redacted]

Comment [2]: (b)(5) attorney-client [redacted]

(b)(5) attorney-client

We also disagree with the claim that we have focused only on demographic recovery. While demographic factors such as mortality control and population monitoring are critical to recovery, we have also established habitat-based recovery criteria to address habitat security (i.e., motorized access), developed sites on public lands, and livestock allotments while implementing extensive habitat monitoring programs for grizzly bear foods, human recreational use, and elk hunter numbers. Additionally, the IGBST monitors genetic diversity and trends in grizzly bear conflicts throughout the ecosystem annually. This comprehensive approach to recovery has led to reduced mortality, increasing population numbers, and significant increases in range and has allowed grizzly bears to reoccupy habitat they have been absent from for decades while ensuring demographic and habitat security into the foreseeable future.

Regarding the assertion that the GYE grizzly bear population meets the definition of "vulnerable" under the IUCN Red List criteria, we have reviewed these criteria and, while it is true this population meets one of the criteria for vulnerable (population size less than 1,000 mature individuals), we still conclude that the extensive protections in place if the population is delisted will adequately ensure a recovered population is maintained and prevent extinction. Our recovery and post-delisting management goals were designed to provide for the long term conservation of the GYE grizzly bear population by ensuring sufficient control of human-caused mortality and maintenance of suitable habitat. We have expended considerable effort to develop, repeatedly reevaluate, and, when necessary, modify, these recovery goals. In the end, the Service is legally bound by the definitions and processes described in the Act, not by the IUCN, and must act accordingly.

Finally, regarding carrying capacity, this has never been one of our recovery criteria because it is impossible to quantify with any degree of certainty. While there are multiple lines of evidence suggesting the population is at or near carrying capacity (decreased cub and yearling survival, increased generation interval, decreased home range size) we have not used this

information to assess recovery. Instead, this information has helped us understand some of the more recent demographic changes the IGBST has documented such as a lower population growth rate between 2002 and 2011 than that documented between 1982 and 2001.

Response 9.5: We have determined that the GYE population of grizzly bears is discrete and significant, meeting the definition of a DPS under the ESA. Therefore, the GYE grizzly bear is a listable entity under the act, and may be delisted (per this rule). In the event that a taxonomic change occurs based on genetic differentiation between brown bears in North America (Waits et al. 1998), the GYE grizzly bear population still would meet the Service's definition of a DPS and would have reached recovery. There is genetic evidence suggesting four different evolutionary significant units (ESU) in North America (Waits et al. 1998), Clade IV representing brown bears in Southern Canada and the coterminous lower 48. The current listing under the ESA reflects the suggested ESU *defacto*, as the grizzly bear in the lower 48 are listed under the ESA while "grizzly bears" in mainland Alaska (Clades II and III) are not listed under the ESA. The potential unique genetic heritage that may be present in grizzly bears in the coterminous lower 48, is protected by the ESA in the other five extant populations, and wouldn't change our determination that the GYE population of grizzly bears has reached recovery and no longer warrant protection under the act.

Response 10: The principal goal of the Act is to return listed species to a point at which protection under the Act is no longer required (50 CFR 424.11(d)(2)). A species may be delisted on the basis of recovery only if the best scientific and commercial data available indicate that it is no longer endangered or threatened within all or a significant portion of its range (50 CFR 424.11(d)). As described later in this rule, we believe the GYE DPS meets neither of these definitions for listing, thereby justifying delisting due to recovery. The basis for our determination, as required by the Act, is the best scientific and commercial information available, which indicates that the GYE grizzly bear population is recovered and does not meet the definition of threatened or endangered. This decision is not based on political and stakeholder pressure, nor has our support for hunting biased our decision. Furthermore, very little of the Service's budget and none of the Endangered Species program's budget comes from hunting revenue. While we respect the moral and ethical reasons some members of the public may have for disapproving of this decision, delisting is the appropriate decision based on the statutory requirements of the Act.

To be clear, the Act does not contain a mandate or requirement that we institute a "precautionary approach to wildlife management." Instead, the Act mandates that we make decisions about conservation status based on its definitions of threatened and endangered. That being said, this rule, the Conservation Strategy, and the protective measures in Montana, Wyoming, and Idaho implement a precautionary management approach by establishing science-based population criteria identical to the demographic recovery criteria used by the Service while the GYE grizzly bear DPS is listed under the Act. While these criteria could lead to small decreases in relative population size from current levels (717) to the long-term average

population size (674), these will only be allowed if population size and distribution criteria are simultaneously being met. Providing this flexibility to the states is biologically sound and reasonable. The adaptive management system in the Strategy incorporates the results from intensive monitoring of population vital rates, habitat standards, and major foods into management decisions and ensures the GYE grizzly bear DPS will remain recovered under the management frameworks now in place in Wyoming, Idaho, and Montana. In short, the regulatory frameworks now in place give us great confidence that this success story for American conservation and the Act will be maintained and that future generations will be able to see and enjoy grizzly bears in the GYE.

Strict regulations and regulatory mechanisms within state statute and/or codified regulation are in place to protect grizzly bears within the DPS boundaries. The states of Wyoming, Montana, and Idaho have classified grizzly bears throughout the entire GYE DPS boundaries as a game animal and have never suggested they will be classified as predators (W.S. 23-1-101 (a)(xii)(A). Game animal status is much more protective than predator status which would allow private citizens to kill grizzly bears using any method, at any time of the year, regardless of sex or age, and not have to report it. In contrast, game animals may only be taken via specific methods (not trapped or poisoned) during a designated hunting season by a hunter with a hunting license; females with young may not be killed; dependent young may not be killed; and any mortalities must be reported within 24 hours (WGFD 2016, pp. 46-47). Any grizzly bear found outside of the DPS boundaries would be protected under the Act as threatened. If the states reversed course and decided to classify grizzly bears as predators, resulting in grizzly bear mortality that exceeds the appropriate limits outlined in this rule and in the Conservation Strategy, we would consider this a significant departure from current state laws and regulations and would conduct a status review.

We are not allowed to consider economic impacts in listing decisions. That being said, we do not anticipate any negative economic impacts to the tourism industry related to grizzly bear viewing once delisting occurs and there are no data to indicate this source of eco-tourism is linked to listed status. The increasing distribution of grizzly bears allowed for a very successful tourist and guide industry to develop in the past decade, especially associated with areas near Grand Teton National Park. It should be noted that opportunities to view grizzly bears are due to recovery efforts, the Conservation Strategy, and relevant jurisdictional management plans all working toward the goal of maintaining a recovered grizzly bear population. The vast majority of this viewing occurs inside National Parks (see Richardson et al. 2014), where bears will not be hunted. While there is some evidence suggesting hunting on the periphery of Yellowstone N.P. reduced viewing opportunities for wolves inside the Park (Borg et al. 2016), we question the applicability of this research to the GYE grizzly bear population because of its preliminary nature. Although this work is interesting, the authors "…caution[ed] that our results from YNP were based on a limited sample size" (Borg et al. 2016, p. 13) of only 3 years, one of which was censored from the results because the 2 wolves that died that year did not live along road corridors and therefore were not frequently observed by Park visitors. When these 2 wolves

were included, Borg et al. (2016, p. 11) found the likelihood of sighting wolves was not different between years following hunting and those without hunting. This study identified harvest that reduces population size to be the biggest risk to subsequent viewing opportunities inside adjacent Parks (Borg et al. 2016, p. 11) and the states have demonstrated that hunting will not appreciably reduce the population size inside the DMA through a coordinated approach to managing mortalities within the DMA at levels that result in long-term, relative population size stability. The states have made regulatory assurances (through legislative and commission regulations) that grizzly bear management, including hunting, will be heavily regulated and in accordance with the multiple recovery criteria to ensure a recovered grizzly bear population. Hunt area boundaries will be developed in order to direct harvest where appropriate if hunting occurs (WGFD 2016, p. 16). Therefore, we do not anticipate harvest will reduce viewing opportunities because we are confident there will continue to be abundant bears inside the DMA.

Regarding the Ohio State Survey referenced by commenters, we believe its utility is limited because of its anonymity. While we would be interested in speaking with the respondents directly to understand their concerns more fully and address them, that is not an option. We do not know the expertise or qualifications of the respondents but we are confident many of them also commented on the Proposed Rule and we hope to address their concerns here.

Response 11: In our five factor analysis of threats to the GYE population of grizzly bears, we do not claim that managed stressors are irrelevant but rather that these threats have been ameliorated to the level that they no longer could result in the extinction of the species in the foreseeable future. Please see the "Determination" section at the end of the threats analysis for more information.

Comment [3]: make sure this is consistent with agreed upon language

Comment [4]: could we cite the final CS here?

Comment [5]: assuming this is what he "proposed determina ion" section will be called in the final rule

Measurement of and interpretation of population parameters

Response 12: (IGBST FLAG - need their review and input) We have a responsibility to rely upon the best scientific and commercial data available. In this case, we relied upon numerous peer reviewed and published documents that we made available upon request. This information was publicly available when we published our proposed rule and during our public comment period. For example, mortality information, including date of death, sex, age, certainty of death, if the bear was marked or not, and location are published annually in the Study Team's annual reports, available at: https://www.usgs.gov/centers/norock/science/igbst-annual-reports?qt-science_center_objects=1#qt-science_center_objects It is important to note that we did not rely upon any of this raw data to make our decisions, but rather on the peer-reviewed published interpretations of that raw data. We did not have any additional data than what was available to the public.

Data used to calculate population size are available in the tables provided by Keating et al. (2002, p. 171), included in the Supplement to the Reassessing Methods Document (Interagency Grizzly Bear Study Team 2007, p. 7). Estimates of sustainable mortality limits recommended in the Reassessing Methods Document are based on survival and associated

population growth rates analyzed by Harris et al. (2006, p. 50). All results of Harris et al. (2006, p. 48) where estimates of population growth were made can be duplicated from data available in the other chapters of the Monograph. Data used to calculate transition probabilities are included in the Supplement to the Reassessing Methods Document (Interagency Grizzly Bear Study Team 2007, pp. 19-21). The Interagency Grizzly Bear Study Team also released the raw data files and digital records from 1975-1998 in response to a Freedom of Information Act request. The Interagency Grizzly Bear Study Team replied to a later request for such data but has not received a formal Freedom of Information Act request for these. Requests received for exact locations of grizzly bears obtained via radio-telemetry and GPS radio-collars (i.e., ''raw data'') could not be honored because this information was not in our possession. Additionally, without the permission of the Secretary of the Interior, the Omnibus Parks and Public Lands Act of 1998 (16 U.S.C. 5937) prohibits the release of specific locations of threatened species that spend any part of their lives within National Parks.

The peer-reviewed scientific journal articles used in the final rule represent the best available science. The science available on the Yellowstone grizzly bears and their habitat is the best information available on any bear population in the world. Regarding the comment that the peer review process in general is flawed, we would love to hear a better alternative. Peer review is an integral part of the scientific process. It is designed to detect biases and flawed assumptions by allowing an objective, often anonymous, reviewer to examine the methods, results, and conclusions of colleagues to identify weaknesses and suggest improvements before publication.

Regarding our reliance on modeling, we agree that modeling can be prone to Type II errors. Simply put, this means models are only as good as the variables you include and if a variable is missed, you may not get an accurate picture of what is going on. To combat these potential concerns with modeling, the IGBST uses a quantitative process to select variables… To suggest that models shouldn't be used or relied upon is directly counter to the Act's requirement that we base our decisions on the best available science

Response 13: The Chao2 estimate method is the best available science that is currently available and can apply under the current monitoring schemes. Additional details were added to the Rule (*see* Demographic Recovery Criterion 1) to clarify the application of the Chao2 method. Although there are other methods that would likely result in greater precision and lower bias (e.g., DNA sampling), the annual implementation of these methods would be prohibitive both in costs and logistics. The IGBST estimated that the costs for a *single* DNA-based population estimate for the entire GYE would be approximately $11 million. The IGBST will continue to investigate cost-effective techniques that may result in relatively unbiased estimates with greater precision. Revisions to the Rule (*see* Demographic Recovery Criteria 1) address the critique of Doak and Cutler (2014). Based on the rebuttal by van Manen et al. (2014) there was no justification to account for "bias associated with the method or disagreements in the scientific community about the population estimate of ~700"; particularly given the demonstrated underestimation bias of the rule set (Schwartz et al. 2008) and the Chao2 estimator (Cherry et al. 2007). Both sources of known negative bias contribute to conservative population estimates.

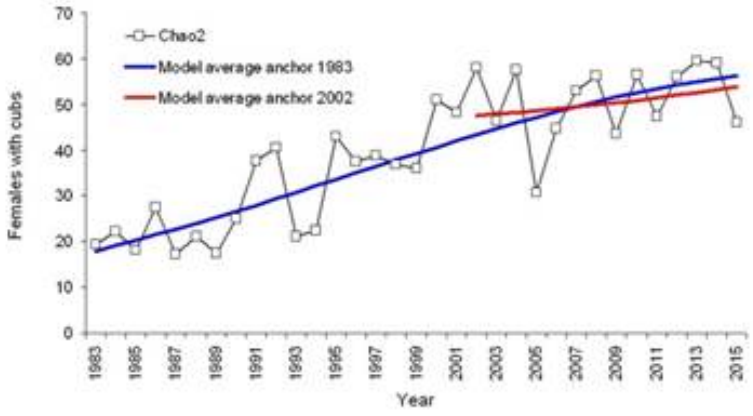
This comment disregards the notion of the central tendency of data and abuses the scientific concept of uncertainty. We answer this using a relevant quote from Schwartz et al. (2006), who addressed the issue of uncertainty in demographic estimates as they relate to management: *"Thus, we see no escape from uncertainty. To claim that no decision about what has occurred should be adopted until uncertainty is removed or to claim that the only acceptable decision adopts some lower confidence limit as truth is to reject the role of science. If the possibility of population decline is treated as the fact of population decline (even where overwhelming evidence suggests otherwise), there is no need to spend money on research or monitoring because the management approach would be identical regardless of what data were produced. Because it is impossible to absolutely reject the hypothesis of decline, one would always manage as though a decline had occurred. To us this would seem poor policy."* -- Schwartz et al. 2006.

We have provided clarifications in the Rule (*see* Population and Demographic Recovery Criteria) and the 2016 Conservation Strategy (*see* Chapter 2) to address comments concerning the application of the definition of the Chao2 estimator. The model-averaged Chao2 provides an estimate of the number of females with cubs-of-the-year, rather than an estimate of the overall grizzly bear abundance, which is then used to derive a total population estimate. In response to a comment about potential issues with model-averaging, our interpretation of Cade (2015) and others (e.g., Fieberg and Johnson 2015) is that model-averaging of the regression coefficients is not recommended but that model-averaging of predictions (i.e., in this instance, annual estimates of the number of females with cubs-of-the-year based on a linear and quadratic model) is appropriate. Thus, the term "model-averaged Chao2 estimate" is appropriate and should be continued.

The critique of increased search effort and sightability were addressed in substantial detail in the response by van Manen et al. (2014) to the critique article by Doak and Cutler (2014). Specifically, in figure 1 of the Supplemental file from van Manen et al. 92014), they demonstrated that the number of flight hours increased as flight observation areas were added to accommodate range expansion from 1986–2010. The correlation coefficient suggested this was a near 1-to-1 relationship: $r = 0.916$, $P < 0.001$. One key aspect of the Chao2 estimator is that it reduces bias due to variation in sightability among different females with cubs-of-the-year. Additionally, model averaging smooths annual variations in counts that are due to both sampling and process variation, with the process variation coming from the proportion of females that have cubs at the side in any particular year. If anything, changes in litter size would increase underestimation bias and thus be conservative. Moreover, while cub mortality has increased, the geographic distribution of observed litter size has not. The suggestion that we continue the current method of population monitoring indefinitely, including intensity, distribution, and design, is addressed in the Rule (*see* Population and Demographic Recovery Criteria) and in the 2016 Conservation Strategy (*see* Chapter 2). In response to the suggestion that we review Ordiz et al. (2007) as an alternative to the Knight rule, there are multiple techniques and different rule sets can be developed to estimate unique females with cubs-of-the-year. The Ordiz et al. (2007) paper does not describe a rules set but examines relationships among distances and number of

days of individual females with cubs-of-the-year; data on litter size were not incorporated. Schwartz et al. (2008) investigated similar distance and time relationships for GYE female grizzly bears with cubs-of-the-year but no adjustments to the Knight et al. (1995) were made to reduce the probability of Type I errors (i.e., mistakenly identifying sightings of the same family as different families). The IGBST may consider alternatives to the existing rule set in the future; if those alternatives are deemed to improve the best available science, new procedures will be adopted per the process outlined in the Rule and the 2016 Conservation Strategy. Although it is true that changes in the estimates of females with cubs-of-the-year may be more difficult to detect once above a density threshold, this is again a conservative approach. The analogy is a thermometer that does not register temperatures above 102 degrees; as long as the value of interest is below 102, it still registers when it drops to that point.

We have provided clarifications in the Rule (*see* Population and Demographic Recovery Criteria) and the 2016 Conservation Strategy (*see* Chapter 2) to address comments concerning the transparency of the definition of the Chao2 estimator. Although the details of the Chao2 estimator are not published in their entirety in a single article, we have expanded the description of the Chao2 estimator to include all relevant literature, which has been subject to peer review. All of the details are provided in the literature regarding the application of the Chao2 estimator and the inputs and would be too technical and cumbersome to include in the Rule and Conservation Strategy, which were revised to provide all relevant references for the Chao2 estimate technique. The derivation of total population size introduces additional uncertainty into the total population estimate, but we have no data that suggest that bias would increase. Indeed, the vital rates (i.e., survival and fecundity) derived from the IGBST's large sample of radio-marked bears monitored annually, which form the basis for the multipliers, have been published in multiple peer-reviewed papers using well-established techniques (e.g., Schwartz et al. 2006, van Manen et al. 2016). The most recent analyses by van Manen et al. (2016) showed that male survival rates increased from 1983–2001 to 2002–2012. The survival estimates are not inflated and, in fact, may be underestimates because IGBST assigns the month of death as the last month an individual bear was known to be active when a bear was lost from monitoring and the date of death was unknown. If some of these individuals were lost the following month, the overall estimate of survival would be higher (Haroldson et al. 2006). Regarding insensitivity to rapidly changing conditions, IGBST is currently investigating the power of the current population estimation protocol to detect a declining trend (*see* ISSUE 14). One commenter referred to the findings of the demographic review conducted by IGBST in 2011, which was triggered by the monitoring system indicating a change in population trend had occurred. That demographic review was based on 2002-2011 data and indicated that population growth had slowed starting in the early 2000s and, importantly, also indicated that several vital rates had changed (e.g., lower survival of cubs and yearlings, greater survival of independent-aged males). Because IGBST uses vital rates to extrapolate population estimates of females with cubs-of-the-year to a total population estimate, the relative proportions of different population segments changed. Due to the increase in survival of independent-aged males, the sex ratio of independent males and



females is now 1:1, which means the independent male segment in the population is now proportionally greater than what was documented in 1983-2001. Thus, while population growth indeed slowed down, a given estimate of the number females with cubs-of-the-year based on 2002-2011 vital rates translates into a larger total population compared to 1983-2001 data because of the greater proportion of independent males in the population. These observations are not an indicator of the "high uncertainty in the monitoring of this population". In fact, IGBST concluded that the monitoring system was effective: 1) IGBST developed set up a population monitoring system and established triggers that indicate when a change has occurred; 2) a change in population growth was detected; 3) IGBST studied the demographic factors (i.e., vital rates) associated with that change (i.e., lower cub and yearling survival, greater independent male survival; slight reduction in fecundity); 4) IGBST tested hypotheses regarding these changes in vital rates (effects of change in food resources vs. density dependence); and 5) the findings were published in peer-reviewed journals and other outlets so that managers can adjust management accordingly.

The Chao2 and associated rule set for identifying unique females with cubs-of-the-year is conservative and relatively more with a greater number of unique females with cubs-of-the-year (i.e., population level determines the level of bias, not population growth). Although the Chao2 estimate does become increasingly negatively-biased with increasing density, the IGBST uses additional data for demographic inference (i.e., to determine the population trend and if the population is reaching carrying capacity). The IGBST used multiple data sources to assess demographic changes, including: 1) another estimator based on mark-resight technique (Higgs et al. 2013); 2) a population reconstruction technique; and 3) population projections based on known-fate monitoring (Schwartz et al. 2006). Combined with recent analyses (van Manen et al. 2016), these data suggest that density-dependent factors may be operating and are an indicator of the population at or near carrying capacity.

Response 14: In response to a request for a justification of our use of linear and quadratic models in population trend estimation, a detailed explanation and justification was provided in the peer-reviewed publication Harris et al. (2007). Another comment seems to reference the following statement in the IGBST (2012) report: "We believe that obtaining an unbiased estimate of the true number of animals from unduplicated counts is difficult because it becomes increasingly challenging to distinguish unique animals from duplicates as density increases." This statement in the 2012 report remains true; however, it would be incorrect to conclude that "it is not possible to rely on FCOY observations as a trend indicator at the current high densities". Although changes in the estimate of females with cubs-of-the-year may be more difficult to detect as density increases, the current protocol represents a conservative monitoring approach. We have previously used the analogy of a thermometer that does not register temperatures above 102 degrees; as long as the value of interest is below 102, it still registers when it drops to that point. Additionally, IGBST is currently investigating the power of the current population estimation protocol to detect a declining trend. Primary findings will be submitted to a peer-reviewed journal during fall 2016.

For large vertebrate populations, lag effects can occur, if there is indeed habitat decline and animals are affected by that decline. With 2016 being approximately 10 years after the peak years of whitebark pine decline and about 20 years since the decline of cutthroat trout, there is currently little evidence of a lag effect either at the population level (population remains stable) or at the individual level (lack of evidence of changes in survival, litter size, fecundity, etc. during the last 10-15 years). It should be noted that observed changes in vital rates (i.e., lower cub and yearling survival, slight suppression of reproduction) occurred during the late 1990s and early 2000s. Even without a lag effect, these changes in vital rates occurred prior to, or close to, the onset of whitebark pine decline; thus, there is little support for a lag effect due to changes in food resources. IGBST is currently investigating the power of the current population estimation protocol to detect a declining trend. Primary findings will be submitted to a peer-reviewed journal during fall 2016.

IGBST investigated the influence of "anchoring" the time series in 1983 versus 2002. The difference in model-averaged Chao2 estimates was negligible. For example, the 2014 estimate of females with cubs-of-the-year using the time series of 1983-2014 was 60, whereas the 2002-2014 time series resulted in an estimate of 57 for 2014. Similarly, the 2015 estimate of females with cubs-of-the-year based on the 1983-2015 time series was 56, whereas the 2002-2015 times series produced and estimate of 54 (see figure below). It should be noted that the graph below also shows no statistical trend based on the 2002-2015 data, supporting the interpretation of population being stable during this time period.

Although not specifically presented in the Proposed Rule, the IGBST uses 4 independent methods to estimate population size and/or trend: 1) Chao2 method (IGBST annual reports), 2) mark-resight estimator (IGBST annual reports); 3) population projections from known-fate

analysis (Schwartz et al. 2006; IGBST 2012), and 4) population reconstruction (IGBST, unpublished data) . These 4 methods support the interpretation that the Yellowstone grizzly bear population experienced robust population growth from the mid to late 1980s through the late 1990s, followed by a slowing of population growth since the early 2000s. Neither van Manen et al. (2016) nor Bjornlie et al. (2014) estimated population size. van Manen et al. (2016) used radio-monitored bears in their analysis of known-fate data to estimate vital rates and Bjornlie et al. (2014) was based on home-range data of grizzly bears. Although the IGBST continues to investigate the mark-resight method (i.e., capture-recapture data), implementation is contingent on the ability of the technique to detect changes in population trend over time. A preliminary assessment of the ability of the mark-resight method concluded that *"current sample sizes are insufficient to provide early detection of changes in population trend"* (Peck 2016).

In a rebuttal to the critique by Doak and Cutler (2014a, 2014b), van Manen et al. (2014) showed that Doak and Cutler's choice of extreme mortality risk beyond age 20 and their incompatible estimate of baseline fecundity led to erroneous conclusions. Commenters make a valid point that the number of older bears in the GYE population is increasing while the number of cubs and younger bears is decreasing, and supports the notion that GYE grizzly bears may be nearing carrying capacity in portions of the ecosystem. As van Manen et al. (2016) point out, observations or more, older bears and suppression of recruitment support the notion of density-dependence in the GYE grizzly bear population. One consequence of density dependence indeed is that trends stabilize or possibly even decline. In response to comments that there was a 6% population decline between 2014 and 2015, for a long-lived vertebrate, such as grizzly bears, inference of trend based on model-averaged Chao2 estimates from one year to the next is inappropriate. Trends should be investigated over longer time periods; based on unpublished IGBST analyses of 2000-2015 data, analyses do not indicate a population decline. Trend analyses and population projections based on known-fate data indicate the population has indeed remained stable to slightly increasing since the early 2000s. So far, no analyses have indicated evidence of a population decline.

ISSUE 15 (waiting…/Jennifer)

ISSUE 16 (Jennifer/IGBST)

- The IGBST does not use known-fate monitoring to measure grizzly bear mortality. They do use known-fate monitoring to understand what levels of mortality the grizzly bear population can endure without long-term decline to establish sustainable mortality limits.
- From 2007 delisting: Recovery plans are intended to provide guidance and are subject to revision as new data are reported. They are not regulatory documents. Recovery of species requires adaptive management that may, or may not, fully follow the guidance provided in a recovery plan. That said, we no longer consider 1993 Demographic Recovery Criterion 3 to represent the best scientific and commercial data available nor the best technique to assess recovery of the Yellowstone grizzly bear population. Therefore, the 1993 mortality management system for the Yellowstone grizzly bear

Formatted: Not Highlight

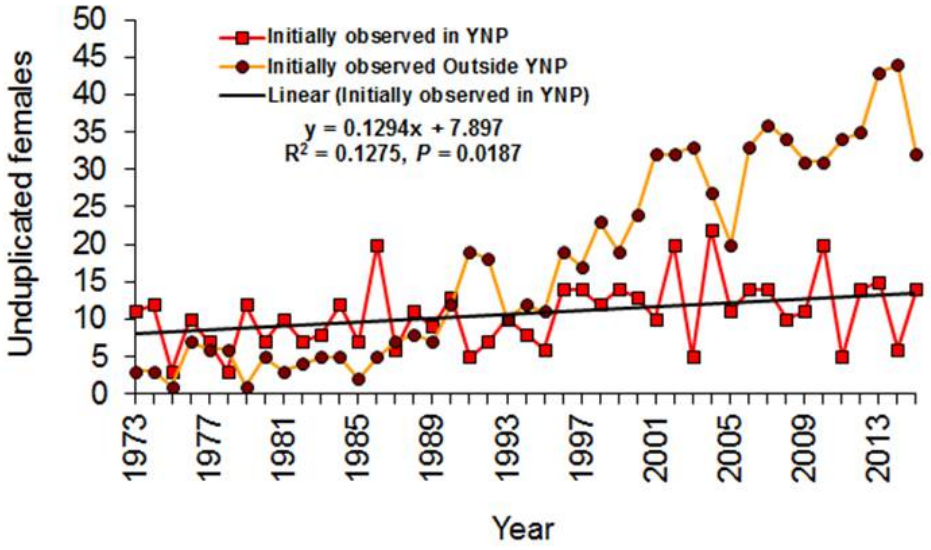
population has been reevaluated and revised using a recent and more accurate model (Harris et al. 2006, pp. 51–55). This approach was consistent with a 1995 court order to reevaluate this issue (Fund for Animals v. Babbitt) and Recovery Plan Task Y11, which suggested we work to ‘‘determine population conditions at which the species is viable and self sustaining,’’ and to ‘‘reevaluate and refine population criteria as new information becomes available’’ (U.S. Fish and Wildlife Service 1993, p. 44). Under the revised methods for calculating sustainable mortality, female mortality was not exceeded in either 2004 or 2005. These changes have been appended to the Recovery Plan and the Strategy.

ISSUE 17 (Jennifer/IGBST)

- From 2007 delisting: Harris et al. (2006, p. 48) provided estimates of population growth in the GYA using estimates of reproduction and survival obtained from radio collared bears. His results indicate that, on average, the bear population was increasing at a rate between 4 and 7 percent per year from 1983 to 2002. His estimates were not based on counts of females with cubs. Schwartz et al. (2006a, p. 19) observed 104 cub litters over 329 bear years, for an estimate of 3.16 years/litter. These data do not indicate any significant reduction in interbirth intervals from the Craighead data set. Estimates of sustainable mortality provided in the Reassessing Methods document link estimates of female survival with those of reproduction. If female reproduction were to decline, or if survival of dependent young were to change, ongoing monitoring would detect these changes and result in revised estimates of sustainable mortality. It is recommended that these estimates be revised every 8-10 years to reflect any changes in demographic parameters (Interagency Grizzly Bear Study Team 2005, p. 45). The ongoing monitoring of female reproduction and cub survival using radio collars from a sample of bears provides consistent, detailed data that will capture any changes in these vital rates.

ISSUE 18 (IGBST)

To partially address comments from the public and peer reviewers surrounding our discussion and analysis of the carrying capacity for grizzly bears in the GYE we made clarifications in the language of the rule (*see* Population Ecology—Background; Population and Demographic Recovery Criteria; and Changes in Food Resources) and the 2016 Conservation Strategy (*see* Population Trend). Although figure 1 of the proposed rule is a simplification of a population at carrying capacity, it is necessary to explain the general principles behind the concept of K. In addition, the narrative of the carrying capacity addresses the complexity of this issue, including an explanation of the variables that some commenters proposed we include (i.e., density-dependent and density-independent effects) and the difficulty in measuring carrying capacity. In response to the suggestion that a graph illustrating how the Chao2 estimate of the GYE population is leveling off may be a clearer demonstration of carrying capacity, we believe that actual data would not be conducive to conveying the concept of K. One commenter noted that grizzly bears only occupy 25% of the GYE; however, suitable habitat is roughly 24 percent



of the total area within the GYE DPS boundaries, of which grizzly bears occupy 90 percent (*see* ISSUE 9).

Studies by the IGBST provide strong support for a density-dependent effect for the leveling off of the population. Discussion of the Food Synthesis Report (*see* Factor E of the Rule) addresses comment that suggested that a decrease in food availability may be the driver behind the slowing growth rate of the GYE grizzly bear population. Although van Manen *et al.* (2016, p. 309) recognized that a decreased carrying capacity was an alternative explanation for demographic changes in the GYE population, they also indicate the scientific evidence is not strong: *"If bears were responding to a decline in carrying capacity, however, we would have expected home-range size and movements to have increased (McLoughlin et al. 2000), bears to have relied on lower energy food resources (McLellan 2011), and body condition to have declined as a consequence (Rode et al. 2001, Robbins et al. 2004, Zedrosser et al. 2006). To date, there is little support for these conditions in the Yellowstone Ecosystem: female home ranges have decreased in size and are less variable in areas with greater bear densities (Bjornlie et al. 2014b), daily movement rates and daily activity radii have not changed for either sex during fall (Costello et al. 2014), bears continue to use high-quality foods (Fortin et al. 2013), and body mass has not declined (Schwartz et al. 2014). As we discussed previously, percent body fat among adult females has not declined since the early 2000s (IGBST 2013, Schwartz et al. 2014) and, regardless, this effect would be consistent with either interference or exploitation competition and would not explain the changes in vital rates that occurred much earlier than the declines in foods. Current evidence indicates bears showed a functional response to declines in whitebark pine (Costello et al. 2014) and cutthroat trout (Fortin et al. 2013) and compensated for the loss of these particular foods through diet shifts Schwartz et al. 2014)."* The IGBST data does not support the alternative hypothesis that human social carrying capacity has been reached and is contributing to the slowing of population growth. On average, total mortality rates over the last 10 to 15 years have not exceeded established mortality thresholds and there is no evidence of an increase in poaching, which has remained low for several decades.

ISSUE 19 (IGBST)

The hypothesis that population density in the core area has decreased and that the same number of bears is spread across an increasing area is not supported by the data: (1) The number of females with cubs-of-the-year in Yellowstone National Park showed a gradual but study increase from 1973 through 2015, while the number of females with cubs-of-the-year observed outside of Yellowstone National Park increased at a much higher rate starting in the late 1980s (IGBST, unpublished data) (*see* figure below); (2) home-range and movement data do not support the interpretation that bears are leaving the core of the ecosystem, additionally, from a live history aspect range fidelity for adult female grizzly bears is high and female offspring also tend to establish their ranges adjacent to or near their maternal ranges; (3) recent range expansion has occurred beyond the DMA, and thus beyond the area where IGBST conducts population monitoring—with a relatively constant population size and high bear densities in portions of the DMA, continued range expansion can occurs through bear dispersal; and (4) the IGBST uses 4

independent methods to estimate population size and/or trend (Chao2 method (IGBST annual reports), mark-resight estimator (Higgs et al. 2013; IGBST annual reports), population projections from known-fate analysis (Schwartz et al. 2006; IGBST 2012), and population reconstruction (IGBST, unpublished data). All 4 methods support the interpretation that the Yellowstone grizzly bear population experienced robust population growth from the mid to late 1980s through the late 1990s, followed by a slowing of population growth and relatively constant population size since the early 2000s. The density index was peer-reviewed, contrary to the comment submitted that it was not. It was published and presented in detail in Supplemental Materials in Bjornlie et al. (2014) and was again presented and reviewed in van Manen et al. (2016). The basis for the density index is a spatially explicit population reconstruction—thus it incorporates capture and home range information from much more then bears trapped in any one year.

In response to comments about our conclusions from our analysis of density-independent and density-dependent effects on grizzly bear population dynamics in the GYE we added clarifying language in the rule (*see* Population Ecology—Background *and* Changes in Food Resources) and Conservation Strategy (*see* Population Trend).

We reviewed our use of "cause," as opposed to "association," in our density-dependent analysis as was suggested by a peer reviewer.

Habitat management

ISSUE 20 (Seth)

Our analysis of suitable habitat was a quantitative, broad-scale habitat assessment. As such, its purpose was to provide an understanding of the broad trends in habitat distribution, not to address the nuances of changing food sources or dynamic mortality risk as "spatially dynamic boundaries" would. While we appreciate this commenter's suggestion, we believe the spatially explicit survival modeling done by the IGBST is adequate to address these concerns (see Schwartz et al. 2010). We have not assigned numerical quality scores to habitats based on grizzly bear body condition or productivity because of the uncertainties surrounding such calculations. We thought it was appropriate to use a more generalized, coarse-scale interpretation of what habitat would meet grizzly bear needs. Other models predicting where suitable grizzly bear habitat occurs within the GYE produced results similar to ours (Noss et al. 2002, p. 903; Merrill and Mattson 2003, pp. 182, 184).

Our definition of suitable habitat is based on biological criteria and the results of previously published research about grizzly bear mortality risk and biological needs. We used the Middle Rockies Ecoregion as a surrogate for habitat quality/capacity. This approach is supported by many previous studies which have found that mountainous regions generally possess the habitat components necessary for grizzly bear persistence, including hiding cover, topographic variation necessary to ensure a wide variety of seasonal foods, steep slopes used for denning, and remoteness from humans (Craighead 1980, pp. 8–13; Knight 1980, pp. 1–3; Judd et al. 1986, pp. 114–115; Peek et al. 1987, 160–161; Aune and Kasworm 1989, pp. 29–58; Merrill et al. 1999, pp. 233–235; Pease and Mattson 1999, p. 969; Linnell et al. 2000, pp. 403–405; Mattson and Merrill 2002, p. 1128).

Our determination that large, contiguous blocks of sheep allotments were not suitable for grizzly bears was based on mortality rates, which is a biological issue. Scattered, small, and/or isolated sheep allotments were included in suitable habitat and considered in our threats analysis under Factor A below. The sheep allotments outside suitable habitat are not necessary to ensure that this population avoids becoming threatened within all or a significant portion of its range in the foreseeable future. Because of the habitat protections inside the PCA and the large percentage of suitable habitat outside the PCA (60 percent) that is currently a Designated Wilderness Area (6,799 sq km/4,225 sq mi), Wilderness Study Area (708 sq km/440 sq mi), or Inventoried Roadless Area (6,179 sq km/3,839 sq mi), the long-term persistence of the Yellowstone grizzly bear population is assured without their occupancy of these areas that currently contain large, contiguous blocks of sheep allotments. Even with the exclusion of these large, contiguous blocks of sheep allotments, most of the Wind River Range met the definition of suitable habitat. The Palisades may be outside of suitable habitat but the Idaho grizzly bear management plan specifically identifies this area as "likely to be inhabited by grizzly bears" (Idaho Yellowstone Delisting Advisory Team 2002, pp. 8-9). States have no plans or intentions of excluding non-conflict grizzly bears from Wilderness Areas, WSAs, or IRAs on public lands and have made it clear their management efforts outside of suitable habitat and the DMA will focus on conflict response in areas with higher human densities such as subdivisions (Idaho

Yellowstone Grizzly Bear Delisting Advisory Team 2002, pp. 8-9; MFWP 2013, p. 44; WGFD 2016, pp. 12, 20).

The presence of grizzly bears in places with high levels of human activity and human occupancy results in biological impacts to grizzly bears in terms of increased mortality risk and displacement. The level of this impact is directly related to the location and numbers of humans, their activities, and their attitudes and beliefs about grizzly bears. The consideration of human activities is fundamental to the management of grizzly bears and their habitat. While it is true that the current distribution of grizzly bears extends outside of the DMA into unsuitable habitat, the records of grizzly bears in these areas are generally due to recorded grizzly bear/human conflicts or to transient animals, not reproductive females with offspring. For instance, between 1985 and 2014, only 2.1 percent of all sightings of unduplicated females with cubs-of-the-year were outside of the DMA (Haroldson in litt. 2016). These areas are defined as unsuitable due to the high risk of mortality resulting from these grizzly bear/human conflicts. These unsuitable habitat areas do not permit grizzly bear reproduction or survival because bears that repeatedly come into conflict with humans or livestock are usually either relocated or removed from these areas.

ISSUE 21 (Nathan) Rebecca reviewed. IGBST FLAG - need IGBST to review summary of Schwartz et al. 2010 and comparison to Proctor.

Our habitat management standards rely heavily on reducing anthropogenic influences and minimizing grizzly bear-human conflicts because excessive human-caused mortality and subsequent population decline was the primary factor that lead to the original listing as threatened in 1975. For a detailed explanation of this rationale please refer to the "Habitat-Based Recovery Criteria" section of this Final Rule and Chapter 3 of the Draft 2016 Conservation Strategy. Schwartz et al. (2010, p. 658) used 21 years of data and nearly 12,000 known grizzly bear locations to create a habitat-based risk model that accounted for the habitat features affecting grizzly bear survival throughout the GYE. This risk model examined how motorized use, productivity and seasonality of high calorie foods, site developments, livestock allotments, number of homes on private lands, elk hunting units, and season influenced grizzly bear survival on the landscape (Schwartz et al. 2010, pp. 656-658). The resulting models identified source and sink habitats throughout the GYE and further supported our management approach of limiting motorized use and developed sites to improve grizzly bear survival (Schwartz et al. 2010, p. 659). Schwartz et al. (2010) did not use Resource Selection Functions to develop their model because resource selection functions are not always proportional to the true probability of use are, therefore, are not always the best way to describe habitat relationships (Keating and Cherry 2004, p. 788). We have reviewed Proctor et al. (2015) and, while we acknowledge it is a useful tool for predicting areas of grizzly bear use, we find the results of Schwartz et al. (2010) more helpful for making management decisions because they linked habitat features to actual grizzly bear survival on the landscape.

ISSUE 22 (Seth) Rebecca reviewed.

Comment [6]: (b)(5) deliberative process

[redacted]

There are different definitions of secure habitat in different ecosystems because the IGBC recommended that each ecosystem develop its own motorized access standards based on research in that ecosystem and that's what they did.

Our definition of secure habitat includes areas as small as 10 acres in size and was not limited to very large areas because this would eliminate protection for all secure habitat areas of smaller size. While we recognize there are many different ways and recommendations for the minimum size of secure habitat as pointed out by commenters, the IGBST and Yellowstone Ecosystem Subcommittee decided that all secure habitats are important for grizzly bears in the GYE, regardless of size and particularly in peripheral areas. We remain confident in our definition of secure habitat because Schwartz et al. (2010, p. 661) were able to demonstrate a direct link between this definition and grizzly bear survival in the GYE. If we heeded the recommendations of commenters and enlarged the minimum size of secure habitat to 28.3 sq km or 10 sq km, the end result would be that thousands of acres of secure habitat would no longer be considered secure and would therefore not be subject to the no net loss standard. By using a smaller minimum acreage requirement, we are not excluding any of the larger blocks of secure habitat. The negative impacts of humans on grizzly bear survival and habitat use are well documented (Harding and Nagy 1980, p. 278; McLellan and Shackleton 1988, pp. 458–459; Aune and Kasworm 1989, pp. 83–103; McLellan 1989, pp. 1862–1864; McLellan and Shackleton 1989, pp. 377–378; Mattson 1990, pp. 41–44; Mattson and Knight 1991, pp. 9–11; Mattson et al. 1992, pp. 436–438; Mace et al. 1996, p. 1403; McLellan et al. 1999, pp. 914–916; White et al. 1999, p. 150; Woodroffe 2000, pp. 166–168; Boyce et al. 2001, p. 34; Johnson et al. 2004, p. 976; Schwartz et al. 2010, p. 661). In light of this, the importance of secure habitat, simply defined as a function of distance from roads, is indisputable.

Lakes are not automatically considered secure habitat. Instead, secure habitat is based on the presence or absence of motorized access. Lakes larger than 1 sq mi are removed from the analysis and are not considered either secure or non-secure habitat. Security of lakes smaller than 1 sq mi, is evaluated by the presence/absence of motorized roads and trails within the general vicinity. If a small lake is farther than 500 meters from a motorized access route, it is deemed secure habitat; otherwise, portions of lakes within 500 meters of motorized access routes are considered non-secure habitat.

We agree with the comment that any changes to secure habitat should ensure it is distributed across the landscape in a way that does not cause habitat fragmentation. The Conservation Strategy directs that on the rare occasions when there are projects inside the PCA that require the construction of new roads (i.e., permanent changes to secure habitat), any replacement secure habitat must be of equivalent quality and quantity (U.S. Fish and Wildlife Service 2016, p. 62). One of the many factors that would be assessed in determining if that replacement habitat was of equivalent quality would be grizzly bear habitat connectivity. Additionally any project on public lands within suitable habitat outside the PCA that requires road construction would evaluate the impacts of this motorized use on grizzly bear habitat connectivity (U.S. Fish and Wildlife Service 2016, p. 86).

Finally, we do not think it is necessary to modify our definition of secure habitat to exclude areas within 500 m of high human use. Federal agencies lack sufficient resources and data needed to measure the intensity of human-use for every road and trail throughout the

ecosystem. Instead, for grizzly bear purposes, motorized access is a surrogate measure of human presence on the landscape and one that can be reliably tracked via GIS. Those areas farther than 500 meters from the nearest motorized access are considered secure habitat. Research indicates that non-motorized trails do not significantly affect grizzly bear survival, and that survival was better explained by the presence of motorized routes (Schwartz et al. 2010, p. 659).

ISSUE 23 (Seth)

- projects that temporarily change the amount of secure habitat should not be allowed;
    - If the use of an existing developed site is to be increased, expanded, or changed in nature, the impacts will be mitigated by reducing the capacity or eliminating another developed site in that bear management subunit. Any such changes will be analyzed with a biological evaluation or biological assessment. The existing level of site development within the PCA has allowed the grizzly population to increase 4-7 percent per year. The management system in the Conservation Strategy limits increases in amenity site developments inside the PCA to assure adequate secure habitat and no increase in mortality risk for the grizzly population.
    - Temporary changes in secure habitat may reduce secure habitat for a period no longer than 3 years and can be no larger than 1 percent of the largest subunit size within that Bear Management Unit. All secure habitat would be restored upon completion of a temporary project. There will be no net loss of secure habitat in any subunit. The reason the 1 percent level was deemed acceptable was that there were limited ongoing timber harvest activities that temporarily affected secure habitat throughout the 1990s while the population was increasing at a rate between 4 and 7 percent per year. There are no biological data that demonstrate that the temporary 1 percent level of secure habitat disturbance in any subunit has had any detrimental impact on the grizzly bear population.
    - The requirement to maintain secure habitat for 10 years is considered a minimum, and cannot be eliminated after the 10 years unless mitigated by an equal quantity and quality of secure habitat that then must be retained for at least 10 years. There will be no net loss of secure habitat in any subunit. Temporary changes in secure habitat may reduce secure habitat for a period no longer than 3 years and can be no larger than 1 percent of the largest subunit size within that Bear Management Unit. All secure habitat would be restored upon completion of a temporary project. There are no biological data that demonstrate that the temporary 1 percent level of secure habitat disturbance in any subunit has had any detrimental impact on the grizzly bear population.
- **recurring low-level helicopter flights and temporary road construction should not be allowed during denning season;**
- **hunting should not be allowed in secure habitat;**

- **road densities should continue to be limited after delisting to avoid potential increases in bear mortality and in logging activity;**
    - The intent of the 1998 habitat baseline is to prevent or mitigate those cumulative effects on bear habitat within the PCA, where 84 to 90 percent of the females with cubs occur. By maintaining the amount of secure habitat and restricting increases in the total mileage of roads, the number of developed sites, and livestock allotments, the PCA will be able to support a stable to increasing bear population. The USDA Forest Service will continue to apply and improve the Cumulative Effects Model and run this model at least every 5 years to assess the cumulative effects of development on bears. The Study Team will continue to pursue improved methods to assess cumulative impacts.
- **the distinction between permanent and temporary roads should be clarified since only the density of permanent roads is limited in the proposed rule, even though temporary logging roads may have higher traffic;**
    - Limiting motorized recreation is a fundamental component of the Strategy, hence the requirement for no net decrease in secure habitat inside the PCA. This measure directly limits the total area impacted by motorized recreation, so that grizzly bears have adequate secure habitat regardless of the number of people using motorized trails. Limitation of non-motorized recreation throughout the GYA is not currently necessary, as evidenced by the increasing grizzly bear population since the 1980's (Harris et al. 2006, p. 48). The adaptive management approach in the Strategy will allow managers to respond to detrimental levels of non-motorized recreation on a case-by-case basis and also provide managers with the data necessary to determine if ecosystem-wide limitations may be necessary in the future.
    - The intent of road closures is to improve habitat security and reduce mortality risk and displacement. The newly secure habitat may not provide any additional food or cover after road closure, but it will reduce the chance of human/grizzly conflicts, which is a primary source of mortality.
- **increased development on lands surrounding national parks should be considered;**
- **the presence of 500 development sites on the five national forests should be addressed**
    - Regarding developed sites, the habitat standard in the Strategy states that there will be no net increase in the capacity or number of developed sites from the 1998 baseline (U.S. Fish and Wildlife Service 2007, p. 42). Any proposed expansion of an existing developed site or any new developed sites will be analyzed, with the potential detrimental and positive impacts on grizzly bears documented, through a biological evaluation or assessment. This evaluation/assessment would determine the mitigation necessary for any proposed increases in number or capacity of developed sites. The final EIS states that any project that changes the number or

capacity of developed sites must follow specific application rules requiring that any new sites be mitigated by removing an existing site within that subunit to offset any increases in human capacity, habitat loss, or human access to surrounding habitats (USDA Forest Service 2006a, p. 36). The application rules allow for an expansion of developed campgrounds if an equivalent capacity of dispersed campsites is eliminated.

- **the exceptions that allow changes to the 1998 baseline for secure habitat and developed sites for administrative and maintenance needs should either be limited or further clarified.**
    - Administrative site expansions are exempt from human capacity mitigation expansion only if they are necessary for enhancement of management of public lands and other viable alternatives are not available.
- **mortality risk is not static within secure habitat**
- **control, reduction, and outreach will be essential to long-term conservation of grizzly bears in the GYE**

ISSUE 23.5 (Seth)

- **managers develop plans to control important habitat components (e.g., distribution and abundance of ungulates)**
    - The multiple indices used to monitor both bear foods and bear vital rates provide a dynamic and intensive data source to allow the agencies to respond to results that might indicate problems. The monitoring system in place in the GYE under the Conservation Strategy (U.S. Fish and Wildlife Service 2007, pp. 25-60) is one of the most detailed monitoring systems developed for any wildlife species.
- **concern that we do not explain what indices will be used to monitor changes in habitat and why these indices are adequate indicators of habitat degradation (adequate to detect lag effects)**
    - Since we will be monitoring a suite of vital rates including survival or radio-collared bears, mortality of all conflict bears, and fecundity, we feel confident that we will be able to detect the consequences of significantly reduced habitat productivity.
- **requested that the Service provide specific management responses and triggers based on these indices of potential habitat degradation**
    - Due to the natural annual variation in abundance and distribution in the 4 major food sources, there is no known way to calculate minimum threshold values for grizzly bear foods. We consider the establishment of habitat thresholds for food sources to be unrealistic. The 1998 baseline will address these issues adequately through access management and limitations on site development. Managers will use an adaptive management approach that addresses poor food years with responsive management actions such as limiting grizzly bear mortality, increasing Information and Education (I & E) efforts, and long-term habitat restoration (i.e.,

revegetation, prescribed burning, etc.) as appropriate. The multiple indices used to monitor both bear foods and bear vital rates provide a dynamic and intensive data source to allow the agencies to respond to potential problems. We believe the adaptive management system described in the Conservation Strategy (U.S. Fish and Wildlife Service 2007, pp. 25-60) is one of the most detailed monitoring systems developed for any wildlife species and ensures the maintenance of a recovered grizzly bear population in the GYE.

Comment [7]: update citation to Conservation Strategy (include page numbers)

- To address the possibility that we could be monitoring the ''wrong surrogates,'' the responsible agencies also will be monitoring a suite of other factors including habitat parameters, population criteria, mortalities, and conflicts. Our partners will improve the technique for the monitoring of habitat as better methods become available and as the relationships between habitat quality and vital rates are better documented.
- The Strategy commits the agencies to intensive monitoring of all grizzly bear vital rates and the relationship of these vital rates to changes in major foods and levels and types of human activities in their habitat. This monitoring does not solely rely on vital rate monitoring to indirectly infer changes in habitat. Annual habitat monitoring will produce results on any changes in habitat values and key food production and possible disease in key foods. Thus, the system in place will not rely on indirect measures of habitat values but will produce direct measures of habitat values annually. Since our partners will be monitoring a suite of vital rates including survival of radio-collared bears, mortality of all conflict bears, and fecundity, we feel confident that we will be able to detect the consequences of significantly reduced habitat productivity.

ISSUE 24 (Seth/Jennifer)

- scientific basis for allowing different management techniques within and outside the PCA; this commenter asked whether there is evidence of two distinct grizzly populations (one inside the PCA and one outside the PCA) warranting distinct management approaches
- "disingenuous" for us to state that "suitable habitat outside the PCA provides additional ecological resiliency and habitat redundancy to allow the population to respond to environmental changes" when the same habitat protections do not occur outside of the PCA as inside the PCA
- habitat outside of the PCA has "become a sink for human-caused mortalities."
- the current protections of 60 percent of suitable habitat outside of the PCA would not be sufficient since 40 percent is not protected
- the Service is "writing off" 25 percent of independent females, since these females live outside the PCA in areas that will have inadequate habitat protections
- concern about potential increased road development outside of the PCA and associated increased grizzly bear displacement, higher mortality, and lower fecundity

- standards should be applied to all federal lands within the DMA for road density, secure habitat, and no surface occupancy (not just inside the PCA)

(the paragraphs below cover a number of the bullets above but not completely)

The Service has applied a reserve design approach by designating the PCA. The PCA, which is a subset of the suitable habitat, contains between 84 to 90 percent of the females with cubs (the population's most important age and sex group) (Schwartz et al. 2006b, p. 64). The population has been growing at 4 to 7 percent per year since the 1990s (Harris et al. 2006, p. 48), with most of the growth occurring inside the PCA (Schwartz et al. 2006b, p. 64). The best available information demonstrates that the PCA contains the habitat necessary for a healthy and viable grizzly bear population in the long-term. Strict habitat protection within the PCA is guaranteed to assure the future of the population. Sixty percent of suitable habitat outside the PCA is Designated Wilderness, Wilderness Study Area, or Inventoried Roadless Area. This amount of protected habitat combined with the GYA National Forests' commitment to manage habitat for a viable grizzly bear population, forest-wide food storage orders, and designation of the grizzly bear as a species-of-concern on GYA National Forests, gives the Service reasonable assurance that grizzly bears outside of the PCA will continue to be protected adequately. In addition, allowable hunting mortalities will be determined and limited by the total sustainable mortality limit.

Outside the PCA, nearly 60 percent of all suitable habitat is either Designated Wilderness Area, Wilderness Study Area, or Inventoried Roadless Area. These designations will prevent many extractive projects from occurring (see Factor D below). All projects on Federal lands are required to comply with the National Environmental Policy Act of 1969 (NEPA) (42 U.S.C. 4321 et seq.) process, which includes a section on the cumulative effects of the proposed project. Any NEPA process for a project on National Forest lands also will include an analysis of the impacts of the proposed project on USDA Forest Service species of concern, which will include the grizzly bear upon delisting (USDA Forest Service 2006b, p. 26)

ISSUE 25 (Alex, Jennifer help with last paragraph)

The year 1998 was chosen because secure habitat and site developments had been roughly the same during the previous ten years (USDA Forest Service 2004, p. 27) and the population was increasing during these years (Eberhardt and Knight 1996, p. 419; Harris et al. 2006, p. 48). The selection of any other year between 1988 and 1998 would have resulted in approximately the same baseline values for roads and developed sites. We did not select baseline habitat values from years before 1988 because habitat improvements that occurred after the implementation of the Interagency Grizzly Bear Committee Guidelines (USDA Forest Service 1986, pp. 6–21) would not have been reflected.

Habitat conditions relating to the habitat standards described in the Strategy (U.S. Fish and Wildlife Service 2007, pp. 38–56) have either remained stable or improved since 1998 for road densities, levels of secure habitat, site developments, and livestock allotments. The 1998 baseline was not developed to address specific projects such as oil and gas development or timber harvest. The 1998 baseline does not contain threshold values for any of the major foods

due to the natural variability in their abundance and distribution that occurs annually. The 1998 baseline attempted to establish realistic habitat standards that ensure adequate habitat security and minimum livestock conflicts within the PCA. We consider the establishment of habitat thresholds for human population growth, food sources, and specific projects to be unrealistic and that the 1998 baseline will address these issues adequately through access management and limitations on site development.

The habitat identified by the Draft Conservation Strategy that was in need of improvement was on the Targhee and Gallatin National Forests. The high road density values and subsequently low levels of secure habitat in these subunits is primarily due to motorized access on private land (see U.S. Fish and Wildlife Service 2007, pp. 145-153). Managers have made improvements in these areas and the improvements are sufficient to meet the 1998 baseline.

The Gallatin National Forest is working on several land exchange efforts with private parties in these subunits. These land exchanges allow management of the roads on these private parcels and increase the secure habitat in these subunits. The Gallatin Range Consolidation and Protection Act of 1993 (Pub. L 103-91) and the Gallatin Range Consolidation Act of 1998 (Pub. L 105-267) will result in trading timber for land in Gallatin No. 3 and Hilgard No. 1 subunits. The private land involved will become public land under the jurisdiction of the Gallatin National Forest. Upon completion of this sale and land exchange, secure habitat and motorized access route density in these subunits will improve from the 1998 baseline (see U.S. Fish and Wildlife Service 2007, pp. 133-144). The timing and amount of improvement will be determined through the Gallatin National Forest travel management planning process. The Travel Plan for the Gallatin National Forest was revised and the Final Environmental Impact Statement and Record of Decision approved (Gallatin National Forest 2006, pp. 82-85) on December 6, 2006. The Travel Plan amended the Gallatin Forest Plan and set a 1998 baseline for access values in these subunits.

The Conservation Strategy identified several subunits within the boundaries of the Targhee National Forest inside the PCA that need improvement in terms of motorized access (Plateau No. 1, Plateau No. 2, and Henry's Lake No. 1). The Conservation Strategy states that upon full implementation of the access management changes in the revised 1997 Targhee Forest Plan, those subunits will have acceptable levels of road densities and secure habitat due to the decommissioning of roughly 433 miles of roads within the PCA (U.S. Fish and Wildlife Service 2007, pp. 43-44). As of 2005, the Targhee National Forest completed this decommissioning work (USDA Forest Service 2006a, pp. 200-202). The 1998 baseline for these subunits was modified to reflect these anticipated road closures upon full implementation of the 1997 Targhee Forest Plan (U.S. Fish and Wildlife Service 2007, pp. 133-144). Henry's Lake subunit No. 1 and No. 2 still have high levels of motorized access density and a low secure habitat level dues to motorized access routes on private lands as well as county roads, State and Federal highways, and roads to species use sites (e.g., Federal Aviation Administration radar site on Sawtell Peak) that cannot be closed.

Comment [8]: check the paragraphs below with Jennifer and update the names of documents

Comment [16]: update?

Overall, the improvements made to degraded habitat on these two National Forests have increased the amount of secure habitat available to grizzly bears to the levels recommended in the Final Conservation Strategy. These levels of secure habitat will continue to support a stable to increasing population of grizzly bears.

- **Basis for claim that 1998 period of population growth (population estimates between 1988-1989) overestimated so 1998 not actually a period of population growth**
- **Basis for claim that 1998 period of population growth not using Chao2 model-averaged population estimation method**
- **1998 sufficient in long-term without ESA protections?**
- **Frequency of human encounters vs. lethality of human encounters →**
- **Alternative "moving window analysis" from Mace and Waller (1997) →**

Comment [17]: is this a typo? Did they mean 1998-1999?

ISSUE 26 (Seth/Jennifer)

- Facilitating connectivity should be a management objective
- without adequate connectivity, the GYE population will be at higher risk of local extinction and that connectivity of grizzly bear populations will ensure long-term viability of the species
    - While some have suggested recolonization of historically suitable habitat to achieve ''ecological effectiveness'' (Trombulak 2006), the Act neither requires us to consider ecological effectiveness, nor do we have any objective way of measuring this type of success currently. We do not believe the restoration of the grizzly bear as a top predator and scavenger throughout all historically occupied habitat is feasible or required. Instead, we have restored grizzly bears to most of their suitable habitat within the DPS and anticipate the State management plans will lead to re-occupancy of the remaining suitable habitat in the near future. Other issues such as linkage are only relevant to this rulemaking to the extent that they impact the Yellowstone DPS. For example, connectivity or a lack thereof, has the potential to impact this population's genetic fitness. As such, this issue is discussed and addressed in our five factor analysis (see Factor E below) and in the Strategy.
    - The Service has considered population viability in considerable depth (Boyce et al. 2001, p. 2). Boyce et al. (2001, p. 1) concluded that the available data ''provide optimistic projections of the likelihood of persistence for grizzly bears in the GYE; a 99.2% probability that the GYE grizzly bear population will persist for 100 years.'' Boyce et al. (2001, pp. 30–31) discuss the implications of several types of stochastic (random) events on the likelihood of persistence for the Yellowstone grizzly bear population. Catastrophes were believed merely to represent extreme environmental events that had a low probability of occurrence and were unpredictable. They believe that there are insufficient data on grizzly bear genetics to understand or model genetic stochasticity, such as inbreeding depression or genetic drift. Boyce et al. (2001, p. 30) believe that demographic

Comment [18]: This issue had a lot of potential resources, and a lot of facets. I have bulleted the elements of the issue summary in black and put the potentially helpful response text in blue (to help you distinguish the response text from the issue summary bullets)

stochasticity, such as chance events associated with births and deaths, only affects viability when populations are very small (e.g., 30 to 50 bears). Similarly, Harris et al. (2006, p. 50) found that demographic stochasticity had little effect on the growth rate estimates unless population size fell below 100 females. Environmental stochasticity is generally thought to be more important than demographic stochasticity when calculating extinction risk (Lande 1988, p. 1457). In light of this, Boyce et al. (2001, pp. 31–32, 34) recommend that the best possible analysis of population viability for the Yellowstone grizzly bear population would be based on relationships between grizzly bear vital rates (survival and reproduction) and habitat factors (a habitat-based PVA). However, the range of possible outcomes of such a modeling exercise, based on compound uncertainties, provides little management value and minimal confidence about future viability. Instead, the Strategy will ensure monitoring of multiple indices and use an adaptive management system that allows rapid feedback about the success of management actions designed to address the maintenance of a viable population. Because it is generally accepted that isolated populations are at greater risk of extinction over the long-term, we will continue efforts to reestablish natural connectivity between the GYA and other grizzly bear ecosystems. Although natural connectivity is the best possible scenario, isolation does not constitute a long-term threat to the Yellowstone grizzly bear population because of intensive monitoring and adaptive management strategies that will remain in effect post-delisting.

- Due to the habitat protections, population standards, mortality control, outreach efforts, and the adaptive management approach described in the Strategy, we do not believe isolation is a threat to the Yellowstone grizzly bear population and, therefore, does not preclude delisting.

- We either did not have or did not share effective plans for facilitating connectivity between the six grizzly bear recovery zones
  - A process to identify, maintain, and improve wildlife movement areas between the large blocks of public land in the Northern Rocky Mountains is ongoing (Servheen et al. 2003, p. 3). This interagency effort involves 13 State and Federal agencies working on linkage facilitation across private lands, public lands, and highways (Interagency Grizzly Bear Committee 2001, pp. 1–2). To date, this effort has included: (1) Development of a written protocol and guidance document on how to implement linkage zone management on public lands (Public Land Linkage Taskforce 2004, pp. 3–5); (2) production of several private land linkage management documents, including ''Making Connections from the Perspective of Local People'' (Parker and Parker 2002, p. 2), and the Swan Conservation Agreement (U.S. Fish and Wildlife Service 1997), which is a collaborative linkage zone management document; (3) analyses of linkage zone

Comment [19]: update this list of work

management in relation to highways, including identification of multiple linkage areas in southeast Idaho from Idaho Falls to Lost Trail Pass (Geodata Services Inc. 2005, p. 2) and the effects of highways on wildlife (Waller and Servheen 2005, p. 998); and (4) a workshop in the spring of 2006 on implementing management actions for wildlife linkage, the proceedings of which are available online at: www.cfc.umt.edu/linkage. The objective of this work is to maintain and enhance movement opportunities for all wildlife species across the northern Rockies. This linkage work is not directly associated with the Yellowstone grizzly population and will continue to address ways to improve cooperation and affect management on public lands, private lands, and highways in linkage areas across the northern Rockies regardless of the listed status of the Yellowstone grizzly bear DPS.

- Preamble of the proposed rule did not contain a sufficiently clear commitment to manage for connectivity post-delisting
- Consider both demographic connectivity and genetic exchange
- Suggestions on how to facilitate connectivity:
    - create demographic connectivity areas between GYE and NCDE and GYE and Bitterroot
    - implement the same habitat standards in connectivity areas as those that apply inside the PCA
    - reduce the DPS boundaries to match those of the DMA to more effectively facilitate connectivity
    - promote travel corridors to facilitate the emigration/immigration of male bears even where there is not suitable habitat
- Concerns with states:
    - Bitterroot: not adequate regulatory mechanisms or management considerations to allow for recolonization
        - We prefer natural reconnection as well and are actively involved in efforts to maintain and expand the opportunities for grizzly bears to move into and out of the Yellowstone ecosystem via the linkage zone program. However, we cannot control bear movement and as discussed in the final rule (see Behavior section above), they have limited dispersal mechanisms. By working to maintain current movement opportunities while implementing conservation actions to recover populations in other grizzly bear ecosystems, we anticipate that bears will naturally reestablish themselves between recovery ecosystems and achieve connectivity. We agree that the establishment of a grizzly bear population in the Bitterroot Recovery Zone would contribute to recovery of the grizzly bear in the Lower 48 States (Boyce 2000, p. 6–243). However, the lack of natural connectivity will not threaten the Yellowstone DPS because of the genetic

management plan described in the Strategy (U.S. Fish and Wildlife Service 2007, p. 37).
        - Delisting of the Yellowstone grizzly bear population should have no effect on the potential for natural recovery of grizzly bears through the Bitterroot Ecosystem. Both the GYA and NCDE populations are increasing in size and expanding their geographical ranges, increasing the likelihood of eventual dispersal to the Bitterroot Ecosystem.
    - Montana's plan non-committal on subject of connectivity
    - WY/ID plans don't discuss connectivity at all
        - The Idaho Plan does not limit or restrict bears in the Palisades. The Idaho Plan acknowledges this area as one of many outside the PCA where grizzly bear occupancy is anticipated in the next 5 to 10 years (Idaho's Yellowstone Grizzly Bear Delisting Advisory Team 2002, pp. 8–9). The Wyoming Plan calls for management emphasis to limit conflicts in the southern Wind River and the Wyoming Ranges by discouraging grizzly bear dispersal and occupancy of these areas. The Wyoming Grizzly Bear Management Plan (WGFD 2005, pp. 12–16) does not exclude grizzlies from the southern Wind Rivers; rather, it recognizes a higher potential for grizzly bear/human conflicts if they move into areas such as the southern Wind River or Wyoming Mountain ranges. The presence of grizzly bears in places where there are high levels of human activity and occupancy results in biological impacts to grizzly bears in terms of increased mortality risk and displacement. Consideration of these potential biological impacts was a critical element in the determination of suitable habitat. As the grizzly population increases in area and density, an emphasis will be placed on education, conflict prevention, relocation, or removal of bears to limit conflicts.
    - all of the state plans will actively discourage establishment of bears outside the DMA
    - In the final rule, share more details of state plans to facilitate connectivity
    - state plans must manage for connectivity rather than managing towards a minimum population level
- we need to consider other potential barriers to movement, such as topography or man-made structures, in the rule
- stronger commitments and clearer partnerships that will ensure grizzly bear habitat connectivity is considered in any new road construction or highway improvement projects
- any scientific evidence of grizzly bear use of crossing structures? Include references
- Connection to NCDE

    - Inadequate consideration of connectivity in this rule could undermine conservation strategy for NCDE
        - The delisting of the Yellowstone DPS will not have detrimental impacts on grizzly bear recovery actions in other recovery zones, as the grizzly bears in these areas remain threatened under the Act. As such, coordinated recovery efforts will continue in these areas
    - under Section 7 of the ESA, we must consider lack of connectivity as a threat to other grizzly bear recovery zones
        - Delisting a recovered species is a non-discretionary duty and not subject to the provisions of Section 7(a)(2) of the Act.
    - another commenter emphasized that connectivity between the GYE and the NCDE should not be a requirement of delisting since Montana has committed to allow bears to occur where they are tolerated and because they expect the populations to intermingle in the future
- Measuring and monitoring connectivity
    - monitoring and collecting genetic samples outside the DMA to detect immigration and emigration
        - The current cost of a onetime, point population estimate using DNA is roughly $3.5 million to $5 million (Interagency Grizzly Bear Study Team 2005, p. 12). The Yellowstone Ecosystem Subcommittee decided in 2001 that such funds would be spent more effectively on other management actions. The Service and the Study Team recognize the need to improve methods to estimate population size and calculate sustainable mortality limits and will continue to consider ways in which this might be accomplished. As the costs associated with DNA amplification and analysis decrease with time, the Study Team may revisit this possibility. The Study Team will continue to take DNA samples opportunistically from all bears trapped for research or management and all known mortalities so that future analyses of other genetic or demographic parameters are possible. For now, as long as mortality continues to remain within the sustainable mortality limits as evidenced by a Chao2 estimate of at least 48 females with cubs of the year, there are no data to indicate that this method is inadequate to manage for a stable to increasing Yellowstone grizzly bear population.
    - exploring environmental DNA (eDNA) analysis techniques to detect movements between grizzly bear populations
    - using the “step-selection function” method in Thurfjell et al. (2014) to “model habitat attributes that facilitate movement and connectivity”
- explain the relevance of food storage orders to the issue of connectivity

- include a map of the grizzly bear recovery zones to help illuminate the issue of connectivity

ISSUE 27 (Alex)

We have thoroughly analyzed the issue of habitat and range and conclude that livestock allotments are not a threat to the population now or in the foreseeable future. Commenters suggested that livestock allotments should not be considered suitable habitat. In our rule, livestock allotments are not considered suitable habitat: "because urban sites and sheep allotments possess high mortality risks for grizzly bears, we did not include these areas as suitable habitat...Due to the negative edge effects of this distribution of sheep allotments on the periphery of grizzly bear range, our analysis did not classify linear strips and isolated patches of habitat as suitable habitat" (13185 in proposed rule). The sheep allotments *outside* suitable habitat are not necessary to ensure that this population avoids becoming threatened within all or a significant portion of its range in the foreseeable future. Because of the habitat protections inside the PCA and the large percentage of suitable habitat outside the PCA (60 percent) that is currently a Designated Wilderness Area (6,799 sq km/4,225 sq mi), Wilderness Study Area (708 sq km/440 sq mi), or Inventoried Roadless Area (6,179 sq km/ 3,839 sq mi), the long-term persistence of the Yellowstone grizzly bear population is assured without the sheep allotments.

Comment [20]: update to reflect final rule

Comment [21]: update this info

- **Course of action should agencies discover impacts →**
- **No requirement to remove attractants**
- **Changing environmental conditions alter conflict dynamics**
- **Permits require conflict prevention measures**/implement conflict prevention techniques (dogs, fences)
    - From 2007 habitat-based recovery criteria: "Through the coordinated monitoring of grizzly bear/human conflicts, the IGBST identifies areas of concentrated conflicts annually (Gunther et al. 2006, pp. 58-59). Managers can then focus efforts to prevent grizzly bear/human conflicts in these areas in subsequent years. All three State management plans contain direction on reducing grizzly bear/livestock conflicts and cooperating with private landowners to reach this goal (Idaho's Yellowstone Grizzly Bear Delisting Advisory Team 2002, pp. 15-16; MTFWP 2002, pp. 46-48; WGFD 2005, pp. 29-30)."

Comment [22]: update citations

The Federal and State management agencies emphasize preventative measures and non-lethal techniques whenever possible (Idaho's Yellowstone Grizzly Bear Delisting Advisory Team 2002, pp. 15–16; MTFWP 2002, pp. 46–49; U.S. Fish and Wildlife Service 2007, pp. 59–60; WGFD 2005, pp. 28, 31). Inside the PCA, numerous sheep allotments have been retired or relocated to other, less-conflict-prone areas to accommodate grizzly bears (USDA Forest Service 2006a, p. 170). As of 2006, there is only one remaining active sheep allotment inside the PCA (USDA Forest Service 2006a, p. 168). In areas inside the PCA, managers will give grizzly bears involved in any livestock conflict a second chance and will relocate them at least once before using removal (U.S. Fish and Wildlife Service 2007, p. 59). Management removal will only be used as a last resort inside the PCA. The respective State wildlife agency's grizzly bear

Comment [23]: update these cita ions

management plan will guide management of grizzly bear conflicts with livestock grazing on public lands outside of the PCA. Thus, removals as a result of these conflicts will remain within the sustainable mortality limits established in the Conservation Strategy. As such, this source of mortality will not threaten the Yellowstone grizzly bear population.

The Service must make its decisions based on scientific data. In light of this requirement, the Service focuses on whether or not grizzly bear mortalities resulting from conflicts with livestock affect overall population trajectory. The Service has established nuisance bear guidelines that are strategic in nature and provide managers with a framework to assess conflicts on a case-by-case basis. Grizzly bears depredating on lawfully present livestock on public lands may or may not be removed from the population, depending on several factors such as location of the conflict, severity of the incident, age and sex of the bear, and conflict history of the bear (U.S. Fish and Wildlife Service 2007, p. 59). While not required by the Act, State, Tribal, and Federal managers will continue to use a combination of management options in order to reduce grizzly-human conflicts, including nonlethal forms (Bangs et al. 2006). However, these methods are only effective in some circumstances, and no single tool is a cure for every problem. Lethal control will still be required in many circumstances. Lethal control used in combination with nonlethal methods can improve the overall effectiveness of both management options (Bangs et al. 2006, p. 8; Brietenmoser et al. 2005, p. 70). To further ensure that human-caused grizzly bear mortality does not negatively impact the population, the IGBST has established biologically sustainable mortality limits (Interagency Grizzly Bear Study Team 2005, pp. 31-41) that Federal and State agencies in the GYE have agreed to adhere to by signing the Conservation Strategy and that States have incorporated into their regulations.

Comment [24]: update citation

Comment [25]: update citation

- **Section 7 before livestock allotment permit? →**
- **Landowners should accept depredation and not expect retaliatory action** → covered enough by above text?

Some commenters thought we needed stronger language on necessary phaseouts of livestock allotments. The Service has established a management system in the Conservation Strategy (U.S. Fish and WIldlife Service 2007, p. 45) that balances livestock grazing on public lands with the needs of grizzly bears. The vast majority of public lands in grizzly bear habitat in the GYE are managed with no livestock grazing. While livestock grazing allotments are a legitimate use of some public lands, we recognize that such grazing, especially sheep grazing, can lead to some grizzly bear mortality. In light of this, and past management experience, the Service endorses an approach that includes minimizing livestock allotments with recurring conflicts. The U.S. Forest Service has stated that "Inside the PCA, no new active commercial livestock grazing allotments would be created and there would be no increases in permitted sheep AMs from the identified 1998 baseline. Existing sheep allotments would be monitored, evaluated, and phased out as opportunities arise with willing permittees...Inside the PCA, cattle allotments or portions of cattle allotments with recurring conflicts that cannot be resolved through modification of grazing practices may be retired as opportunities arise with willing permittees. Outside the PCA in areas identified in state management plans as biologically

Comment [26]: update this citation

suitable and socially acceptable for grizzly bear occupancy, livestock allotments or portions of allotments with recurring conflicts that cannot be resolved through modification of grazing practices may be retired as opportunities arise with willing permittees" (USDA Forest Service 2006a, pp. 36-37). This approach to livestock grazing is a logical and responsive way to manage grizzly/livestock conflicts. There are three livestock allotments within Grand Teton National Park, all of which are cattle allotments with no recurring conflicts with grizzly bears in the last decade. These allotments do not represent a significant source of mortality for grizzly bears. As of 2014, there is only one active sheep allotment within the PCA, on the Caribou-Targhee National Forest. Because it has been demonstrated that grizzly bears and cattle are more likely to coexist without conflict than grizzly bears and sheep, the phasing out of cattle allotments inside the PCA will only occur when there are recurring, irresolvable conflicts on these allotments or if willing permittees volunteer to waive their permits back to the government. Because there will continue to be no net increase in cattle or sheep allotments allowed on public lands inside the PCA, we do not expect that livestock allotments inside the PCA will constitute a threat to the GYE grizzly bear DPS now, or in the future.

The Final Environmental Impact Statement (EIS) for the Forest Plan Amendment for Grizzly Bear Habitat Conservation for the Greater Yellowstone Area National Forests includes an analysis of the potential economic impacts of implementing the Conservation Strategy, including the strategy surrounding livestock allotments (USDA Forest Service 2006a, pp. 242-254). This Final EIS concludes that the negative economic impacts of implementing the Conservation Strategy would be minimal to livestock operators and do not outweigh the positive effects to grizzly bears (USDA Forest Service 2006a, pp. 251-252).

ISSUE 28 (Alex)

We have thoroughly analyzed the issue of habitat and range and conclude that extractive industries (e.g., oil, gas, mining) are not a threat to the population now or in the foreseeable future. Inside the PCA, the potential for increased oil and gas development in the future is guided by the Strategy and its limitations on road density and development (U.S. Fish and Wildlife Service 2007, p. 41). We do not anticipate a dramatic increase in resource extraction outside of the PCA either due to the quantity of National Forest land designated as Wilderness Area (6,799 sq km (2,625 sq mi)), Wilderness Study Area (708 sq km (273 sq mi)), or Inventoried Roadless Area (6,179 sq km (2,386 sq mi)). Approximately 79 percent of all suitable habitat on National Forest lands outside the PCA falls into one of these categories. There are also moderate to low potentials for both oil and gas occurrence and development throughout most of the six GYE National Forests, with the exception of the Bridger-Teton National Forest (USDA Forest Service 2006a, pp. 210– 213). Even with the high potential for occurrence and development in the Bridger-Teton, only 14 active oil and gas wells are currently inside that National Forest and none are within Service defined suitable grizzly habitat. In fact, there are no

Comment [27]: Cite FOREST PLAN AMENDMENT FOR GRIZZLY BEAR HABITAT CONSERVATION FOR THE GREATER YELLOWSTONE AREA NATIONAL FORESTS FINAL ENVIRONMENTAL IMPACT STATEMENT

Comment [28]: is this still true?

Comment [29]: Can we remove passive voice here? Who has demonstrated his?

Comment [30]: number still accurate?

active oil and gas wells in Service-defined suitable grizzly habitat. There has never been any high-density oil and gas development in suitable grizzly habitat in the GYE.

Under the conditions of the draft 2016 Conservation Strategy, any new oil, gas or mineral project will be approved only if it conforms to secure habitat and developed site standards (U.S. Fish and Wildlife Service 1993, p. 5–6; U.S. Fish and Wildlife Service 2016, Chapter 3). For instance, any oil, gas or mineral project that reduces the amount of secure habitat permanently will have to provide replacement secure habitat of similar habitat quality (based on our scientific understanding of grizzly bear habitat), and any change in developed sites will require mitigation equivalent to the type and extent of the impact, and such mitigation must be in place before project initiation or be provided concurrently with project development as an integral part of the project plan (U.S. Fish and Wildlife Service 2016, chapter 3). For projects that temporarily change the amount of secure habitat, only one project is allowed in any subunit at any time (U.S. Fish and Wildlife Service 2016, chapter 3). Mitigation of any project will occur within the same subunit and will be proportional to the type and extent of the project (U.S. Fish and Wildlife Service 2016, chapter 3). In conclusion, because any new mineral or energy development will continue to be approved only if it conforms to the secure habitat and developed site standards set forth in the 2016 Conservation Strategy, we do not expect that such development inside the PCA will constitute a threat to the GYE grizzly bear DPS now, or in the future.

- **Impacts of oil and gas can extend beyond footprint of operations; need mitigation and monitoring →**
- **effects of honoring existing oil, gas, and other mineral leases are unclear**
- **actions that will be taken to mitigate for potential impacts are unclear**
- **additional clarification on the number of leases, the location and area of leases, and possible range of effects of these leases**
- **no new oil, gas, or mining projects should be authorized within the PCA after delisting**
- **Discuss Crevice Mine and the Emigrant Mine**
- **questioned the ability to limit any new mining developments because of the 1872 General Mining Law**

ISSUE 29 (Alex)

We have thoroughly analyzed the issue of habitat and range and conclude that snowmobile use is not a threat to the population now or in the foreseeable future. The Forest Plan Amendment includes guidance that inside the PCA, localized area restrictions are to be used to mitigate conflicts, where conflicts occur during denning or after bear emergence in the spring. Much of the grizzly bear denning habitat identified in the Forest Plan Amendment Final EIS as being open to snowmobiling is not actually used by snowmachines (USDA Forest Service 2006a, p. 92). Bears tend to den in remote areas with characteristics that are not conducive to snowmachining (i.e., steep, forested habitats). Eighty-eight percent of the known dens in the Yellowstone ecosystem are located in areas where snowmachine use does not occur (USDA Forest Service 2006a, p. 92). Suitable denning habitat is well distributed on the forests. Five of

Comment [31]: can we replace his word wi h snowmobiles?

the six GYA National Forests consulted with us in 2001 regarding the effect of snowmachines on denning grizzly bears. While the potential for disturbance exists, USDA Forest Service and Study Team monitoring over the last three years has not documented any disturbance (Gallatin National Forest 2006, p. D–68). Our best information suggests that current levels of snowmachine use are not appreciably reducing the survival or recovery of grizzly bears. As we state in the rule, the available data about the potential for disturbance while denning and den abandonment from nearby snowmobile use are extrapolated from studies examining the impacts of other human activities and are identified as ''anecdotal'' in nature (Swenson et al. 1997, p. 37) with sample sizes so small they cannot be legitimately applied to assess population-level impacts (in their entirety: Harding and Nagy 1980; Reynolds et al. 1986; Hegg et al. 2010). Because there are no data or information suggesting snowmobile use in the GYE is negatively affecting grizzly bear population, or even individual bears, we determine that snowmobiling does not constitute a threat to the GYE grizzly bear DPS now, or in the future. Yet, because the potential for disturbance and impacts to reproductive success exists, monitoring will continue to support adaptive management decisions about snowmobile use in areas where disturbance is documented or likely to occur.

- **we did not adequately consider impacts from activities associated with snowmobiling, such as the use of artillery to control avalanches.**

ISSUE 30 (Alex)

We have thoroughly analyzed the issue of habitat and range and conclude that human recreation is not a threat to the population now or in the foreseeable future. Human use of the GYE, as measured by the annual number of people visiting Yellowstone National Park, has increased since the grizzly was listed as threatened in 1975 (Gunther 2000, p. 48). During the 1970s, the average annual number of people visiting the Park was 2,243,737. In the 1990s, this number was 3,023,916 (Gunther 2000, p. 48). However, during that period, the grizzly population also has increased, and the bears within Yellowstone National Park appear to have reached the carrying capacity of the Park habitat (Schwartz et al. 2006c, p. 29).

The Service considers the establishment of habitat thresholds for human population growth and recreation to be unrealistic and feels that the 1998 baseline will address these issues adequately through access management and limitations on site development. Using the adaptive management approach described in the Strategy, management agencies will respond with adequate restrictions and enforcement if recreation on public lands due to increased human populations in the GYA becomes detrimental to the Yellowstone grizzly bear population.

- **Potential management responses: increasing infrastructure to support increasing park visitation**
- **Potential management responses: assessing human visitation as "take" under Section 9 of the Endangered Species Act because it harasses wildlife and causes displacement from food sources**

As human populations and recreational activity have increased in the GYE National Forests, additional regulations have been implemented to limit bear/human conflicts such as the

Comment [32]: update

Comment [33]: update

Comment [34]: do we want to say this?

Comment [35]: more clearly explain we are referring to caps on visitation?

food storage orders in all suitable habitat on National Forest lands and comprehensive State and Federal information and education programs that explain how to coexist with bears. These efforts will continue so that the potential negative impacts of increasing human populations and recreationists on the GYE grizzly bear population are adequately mitigated. Extensive collaborative efforts involving State wildlife agencies, NGOs, waste management companies, and private landowners to improve garbage storage and to avoid future grizzly bear/human conflicts on private lands will continue (Servheen et al. 2004, pp. 6–7). Over two-thirds of the suggested budgets created by the States and Federal agencies responsible for managing the grizzly bear post-delisting are for managing grizzly bear/human conflicts and Information and Education efforts (U.S. Fish and Wildlife Service 2007, p. 154). This level of commitment by responsible agencies demonstrates their understanding that I & E efforts and conflict management and prevention are crucial elements of maintaining a healthy Yellowstone grizzly bear population.

Comment [36]: is this a thing?

ISSUE 31 (Alex)

- **A commenter expressed that timber harvest would increase after delisting since there would no longer be limits on road densities in grizzly bear habitat.**
- **Debate in comments about impacts to grizzlies from logging**
- **mitigation for projects that impact secure habitat should not be able to include land that has already been disturbed (e.g., previously logged land)**

Timber is the primary resource extracted in grizzly bear habitat. Habitat quality (as a function of road density and timber harvest) has improved as a result of declining timber harvest, decreasing road construction, and increasing road decommissioning since the mid-1990s (USDA Forest Service 2006a, pp. 156, 200). Timber harvest volumes and road construction have declined since the mid-1990s. Under the 1998 level of secure habitat, the Yellowstone grizzly bear population has been increasing at between 4 to 7 percent per year (Harris et al. 2006, p. 48). From 1986 to 2002 there has been a net reduction of more than 1,600 km (1,000 mi) of road on the six GYA National Forests (inside and outside the PCA). Inside the PCA on National Forests, there was an average reduction (elimination) of 59.9 km (37.2 mi) of road per year from 1986 to 2002 (USDA Forest Service 2006a, p. 200). Similarly, outside the PCA, there was an average reduction of 40.7 km (25.3 mi) of road per year for this time period (USDA Forest Service 2006a, p. 200).

Comment [37]: update

Comment [38]: update

ISSUE 32 (Alex)

Private lands comprise 2.1 percent of the PCA. The consideration of private land activities on grizzly/human conflicts is fundamental to the proper management of grizzly bears and to human safety. Because a disproportionate number of grizzly bear/human conflicts occur at site developments on private lands (see Servheen et al. 2004, p. 15) and the Service has no direct authority over private lands, the Service recommends that private landowners become involved in efforts to reduce these conflicts. These conflicts often lead to grizzly bear mortality so the Service makes such recommendations based on its responsibility and jurisdiction to

promote grizzly bear conservation and welfare. However, the vast majority of suitable grizzly bear habitat is secure in public land (i.e. National Parks or National Forests). Thus, despite the conflicts that arise on private lands, we do not anticipate these issues will constitute a threat to the GYE grizzly bear DPS now, or in the future.

One commenter suggested that the potential privatization of federal public land could pose a threat to grizzly bears in the GYE. While changes to the protected status of grizzly bear habitat on these public lands is theoretically possible, such an outcome is highly improbable, especially at the scale that would be necessary to affect the viability of the GYE grizzly bear population.

Comment [39]: is this he response we want?

Limits on developing private lands to reduce conflicts with resident wildlife are the responsibility of the counties and the States. County representatives are members of the Coordinating Committee and will insure that efforts to limit conflicts on private lands will continue. Their cooperation with the State wildlife agencies to promote outreach, education and management of land development activities in grizzly habitat to reduce bear/human conflicts will continue upon delisting. These efforts to limit conflicts on private lands will continue under the Coordinating Committee's management.

- **increasing development of formerly rural areas has negative impacts on grizzly bear population trends**
- **1998 baseline doesn't consider edge effects with private land**
- **examine the impacts of private lands more closely and to include more discussion of how to minimize grizzly bear deaths and conflicts on private lands**
- **education and mitigation will be key strategies in reducing the likelihood of "attractant sinks" developing on suitable habitat that is private land**
- **federal government should use public lands to mitigate for impacts to grizzly bears that are occurring on private lands**

ISSUE 33 (Alex)

All the biological evidence demonstrates that the PCA, within the suitable habitat line, contains the habitat necessary for a healthy and viable grizzly bear population in the long-term. Furthermore, the Service believes that the habitat outside the suitable habitat line has minimal biological value to grizzly bears and is not necessary to maintain a biologically recovered population in a significant portion of its range in the forseeable future. Because habitat inside the PCA will be protected by the habitat standards in the Conservation Strategy, areas outside of suitable habitat will not affect the trajectory and health of the Yellowstone population now or in the future.

Moreover, if managers plan to increase, expand, or change in nature the use of an existing developed site, they will need to mitigate the impacts by reducing the capacity or eliminating another developed site in that same bear management subunit. Any such changes will be analyzed with a biological evaluation or biological assessment. The existing level of site developments within the PCA has allowed the grizzly population to increase at 4-7 percent per

Comment [40]: still true?

year. The management system in the Conservation Strategy will ensure adequate secure habitat and no increases in mortality risk for the grizzly population.

- **Already high degree of fragmentation**
- **no provision in the rule designed to limit habitat fragmentation within the DPS boundary outside of the DMA/private land uses, energy development, timber harvest, off-road vehicle use, etc. are potential sources of further habitat fragmentation outside the PCA and were not adequately analyzed in the rule**
- **although we discuss the impacts of livestock and timber harvest on human-caused mortality, we do not adequately address how these competing land uses impact grizzly bears (e.g. the quality and conservation of available habitat).**

ISSUE 34 (Marj)

Critical habitat was never designated for the grizzly bear because their listing pre-dated the requirement. I know we have a canned response for this.

Comment [41]: Find response!

ISSUE 36 (Jennifer)

Human-caused mortality

ISSUE 35 (Jennifer/Rebecca)

ISSUE 37 (Alex)

- **Hunting will provide enhanced funding for conservation**

Commenters expressed concern that there was not enough data to discount grizzly bear hunting as a substantial threat to the GYE population. Because the sustainable mortality limits for independent males and females include mortalities from all sources (Interagency Grizzly Bear Study Team 2005, pp. 6– 7), including hunting, and are applied ecosystem-wide within the Conservation Strategy Management Area (Figure 1), hunting should never threaten the GYE grizzly bear population. Hunting is a discretionary mortality source and will occur only if the mortality limits from all causes have not been exceeded (U.S. Fish and Wildlife Service 2007, p. 31). Hunting permits will not be issued by the States if mortality limits are exceeded. Commenters also expressed concern about the potential for infanticide from immigrant males, if hunting is allowed. Sexually selected infanticide is the practice by which a territory vacated by an adult male is filled by a newly arrived subadult male, which then kills any cubs in the territory (Swenson et al. 1997b, p. 450). That behavior can reduce the population growth rate through cub mortality (Swenson et al. 1997b, p. 450). It has been documented in two European brown bear populations (Swenson et al. 2001, pp 75–77), and instances of infanticide by North American grizzly bears of both sexes also have been documented (McLellan 1994, pp.15–16). However, Miller et al. (2003, p. 144) and McLellan (2005, pp. 153–154) could not find evidence of population level effects of sexually selected infanticide in North American grizzly populations. If

Comment [42]: do we need to respond to his?

Comment [43]: revise these citations

sport hunting preferentially removes adult male bears, and if sexually selected infanticide is common, sport hunting might result in some reduction in cub survival in localized areas. However, this would likely have little impact on overall population growth rate because hunting mortality on males would be limited in numbers and extent. We thus do not anticipate that the male to female ratio would change markedly under the adopted mortality limits or that sexually-selected infanticide would become an issue affecting population trajectory of the GYE grizzly bear population. Continued monitoring of the population through radio-telemetry and observations of unmarked reproductive females will alert the Interagency Grizzly Bear Study Team to any substantial changes in cub survival or production and appropriate management responses.

- **there is a lack of scientific basis to allow hunting and not enough data to support discounting hunting as a substantial threat**
- **comments suggested that hunting could increase reproductive suppression among females**

Commenters also worried that hunting would have negative impacts on grizzly bear behavior. Because hunting in the GYE will be limited, it is unlikely to have an impact on the population dynamics or behavior of the GYE population.

- **hunting could have negative impacts on grizzly bear behavior, including: disrupting activity patterns during hyperphagia, which can be energetically costly; orphaning of young grizzlies. Continue to explore impacts on grizzly bear social structure** *(or is the above paragraph sufficient response…)*
- **no evidence that hunting will increase grizzly bears' fear of humans**

Commenters also explained that hunting is an ineffective, and potentially damaging, wildlife management strategy. The States have control over when and where a grizzly bear permit holder may hunt, so the targeting of bears in specific areas, or even specific individual bears, is possible. Sport hunting could be used in that way as a compensatory mortality source, by killing bears that would otherwise have to be removed by management action. However, hunting will be allowed only as long as the overall mortality limits are not exceeded. We also believe that it would be useful to compare grizzly bear/human conflicts before and after the implementation of a hunting season to demonstrate its effects on the frequency of grizzly bear/human conflicts. The Study Team and State agencies collect data on grizzly bear/human conflicts, and will continue to do so after delisting. These data are reported and displayed spatially in the Study Team's Annual Report. If the effects of any change in the frequency, location, or nature of grizzly bear/human conflicts are detectable, the data will indicate these changes.

- **hunting is an ineffective, and potentially damaging, wildlife management strategy (see examples in issue summary)** *(or is above paragraph sufficient)*

While we respect the values and opinions of all commenters, we are required by law to make decisions based on the best available science. As such, the various values that people hold about sport hunting are outside the scope of our decisionmaking authority. The Study Team has established sustainable mortality limits for the Yellowstone grizzly bear population that ensure

that hunting will not threaten the overall status of the population (Interagency Grizzly Bear Study Team 2005, pp. 5–9)

- **economic arguments associated with trophy hunting**

The DPS policy was carefully followed in designating the GYE DPS. The delisting of the GYE DPS, and the changes in grizzly bear management associated with this action, will not have detrimental impacts on grizzly bear recovery actions in other recovery zones, as the grizzly bears in these areas remain threatened under the Act. As such, coordinated recovery efforts will continue in these areas.

- **"controlling" or "limiting" the GYE grizzly bear population, especially through hunting, could have negative effects on other grizzly bear populations (use surplus bears to augment other populations) (or is above paragraph sufficient)**

ISSUE 38 (Nathan/Rebecca)

Hunting is regulated by the States', and is not under the legal purview of this rule. All hunting remains prohibited within the borders of Yellowstone National Park which comprises 39.4% of the PCA, hunting will be prohibited within Grand Teton National Park. Hunting will be allowed on private lands and other public lands within the PCA. Within the John D.Rockefeller Jr. Memorial Parkway, the Secretary of the Interior is required to permit hunting in accordance with applicable Federal and State law, with exceptions for public safety, administration, or public use and enjoyment.

"Secure habitat" is defined in the rule as areas that are more than "500 m (1,650 ft) from a motorized access route and greater than or equal to 4 hectares (ha) (10 acres (ac) in size (U.S. Fish and Wildlife Service 2016, Chapter 3)). Thus "secure habitat" is an area where the risk of human- grizzly bear conflicts is reduces, however hunting may occur on "secure habitat" where authorized by applicable federal and state laws.

The total annual mortality limits inside the DMA by definition include any grizzly bear legally harvested on park inholdings. Any grizzly bears occupying private land inholdings within park service boundaries are inside the DMA and are a part of both the annual population estimate and annual mortality limits. As such, those grizzly bears occupying private inholdings within park service boundaries were explicitly considered during the analysis' conducted in the preparation of this rule.

In effect, the PCA represents a management level "buffer" around the park boundaries. However, hunting is regulated by the States' and is not under the legal purview of this rule.

Though hunting is regulated by the States', in order to increase the likelihood of occasional genetic interchange between the GYE grizzly bear population and the NCDE grizzly bear population , the State of Montana has indicated they will manage discretionary mortality in this area (corridors between the the GYE and the NCDE) in order to retain the opportunity for natural movements of bears between the GYE and NCDE ecosystems.

The management of nuisance bears within the GYE grizzly bear DPS boundaries would be based upon existing laws and authorities of State wildlife agencies and Federal land management agencies, and directed by protocols established in the draft 2016 Conservation

Strategy and State management plans. Inside the National Parks, Yellowstone or Grand Teton National Park grizzly bear biologists will continue to respond to grizzly bear human conflicts. In all areas outside of the National Parks, State and Tribal wildlife agencies will continue responding to grizzly bear-human conflicts. The States' could focus legal harvest in certain areas to reduce grizzly bear-human conflicts through the creation of Hunt Management Units or other management designations, as long as the tag numbers stayed within the tri-state annual total mortality limits.

In a post de-listing scenario, the States' have management authority over wildlife. In most cases the public has opportunities for input when the State is adjusting hunting and management regulations.

ISSUE 39 (IGBST/Jennifer)

ISSUE 40 (IGBST)

The IGBST does not report credible intervals for the estimate of unknown/unreported mortalities. When estimates of unknown/unreported mortalities were first implemented by the IGBST, it was discussed if and how the credible intervals would be used. The conclusion of those discussions was that this would substantially complicate implementation (i.e., a range of mortality thresholds is not practical for managers) and to instead rely on the central tendency of the data. For decision making, relying on the central tendency of the data is justified. Uncertainty is often interpreted to reflect a possibility of worst-case scenarios (i.e., the low end of the credible interval that underestimates unknown/unreported mortality in this instance) but it should be noted that the tendency is towards the median and that about 50% of estimates will be conservative (i.e., above the median and thus overestimating unknown/unreported mortality). All reported mortalities for independent-aged bears, including those from natural cause, are used in the estimate of unknown/unreported mortality. The method of estimating unknown/unreported mortalities indeed has a slight underestimation bias. However, all other estimations associated with calculation of mortality rates are conservative, and in several cases very conservative, such as the Knight et al. (1995) Rule set (*see* Schwartz et al. 2008). Thus, the slight low bias associated with estimation of unknown/unreported mortalities is relatively inconsequential. Contrary to the public comment, background mortality includes unknown/unreported mortalities as based on methodology developed by Cherry et al. (2002), with specific application of the method provided by the IGBST (2005, 2006). The assertion that emigration out of the DMA should count towards total allowable or background mortality is incorrect. Emigration out of the DMA, if it occurred, would result in a lower population estimate, which would result in a higher mortality rate if the number of mortalities were the same.

The IGBST uses a similar method as McLellan et al. (1999) to estimate unknown/unreported mortalities but our estimates of unknown/unreported mortalities are actually higher (as discussed in the preceding paragraph): for every reported mortality, our

estimates are closer to 2 unreported mortalities. The estimate of unknown/unreported mortalities allows a full accounting of total mortality and thus ensures that hunting mortality does not contribute to exceeding allowable mortality thresholds. In response to the suggestion of a monthly or seasonal mortality index, the IGBST already summarize mortalities on a continuous basis, i.e., as records come in and would allow for managers to be alerted in a timely manner if mortalities were exceeded. This information is posted on the IGBST website (under mortality tables) and is available to both the public and managers. In addition, the IGBST is able to calculate unknown/unreported mortality every time a mortality is added to the mortality database so that the hunting season can be closed if allowable total mortality is exceeded.

In response to comments about Table 3 in the proposed rule and the definitions (i.e., total mortality, background mortality, and discretionary mortality) we modified the language and tables in the rule to make these example calculations and definitions clearer. It is important to note that Table 3 in the proposed rule was only an example. The period over which background mortality was 4 years in the example presented in the proposed rule. However, as stated in the Tri-State MOA, the states will annually to calculate allowable discretionary mortality using the previous year's population estimate and the previous year's total mortality. To reduce confusion, the Strategy and the rule no longer refer to background mortality but rather total, discretionary, non-discretionary, and hunting mortality.

ISSUE 41 (Nathan)

Hunting is regulated by the States', and is not under the legal purview of this rule. All hunting remains prohibited within the borders of Yellowstone National Park which comprises 39.4% of the PCA. All grizzly bears harvested legally or by mistaken identity, will count towards the annual mortality limits. If a grizzly bear is taken via mistaken identity and the current years' mortality limit has already been reached, the mortality will count towards the annual limit for the next year. Idaho and Wyoming provide a voluntary bear identification test online, and all three States include grizzly bear encounter management as a core subject in their basic hunter education courses.

ISSUE 42 (Joy)

Based on the available information, we do not find any persuasive information to indicate that trapping for species other than grizzly bears will affect the viability of the GYE grizzly bear population. The Act requires that we make our determination based on the status of the GYE grizzly bear—is it recovered and will State management retain that recovered status if the Act's protections are removed. The Act does not allow us to consider the manner in which individuals will be killed after delisting unless it would affect the overall determination of viability.

The 2016 Conservation Strategy identifies, defines, and requires adequate post-delisting monitoring to maintain a healthy GYE grizzly bear population, with clear State and Federal management responses if deviations occur. Total mortality limits, which would include accidental mortality from trapping, and State regulations to manage GYE grizzly bears within

agreed-upon mortality limits, will ensure that mortality will continue to be managed at levels that do not result in long-term population decline.

ISSUE 43 (asked the states...otherwise Seth)

Comment [44]: this issue did not have an helpful text in he 2007 materials

ISSUE 44 (Joy)

We agree that nonlethal control of grizzly bears is the preferred option for managing human-bear conflict. However, no single management tool can resolve all issues associated with human-bear conflict. Therefore, State, Tribal, and Federal managers will continue to use a combination of management options, including nonlethal forms of management. The current methods we use to reduce human-caused grizzly bear mortality by preventing conflicts and addressing conflicts in a systematic, fair, and prompt manner have accommodated an increasing GYE grizzly bear population and range since 2002. Efforts to address grizzly bear conflicts will continue to comprise the majority of money spent post-delisting.

As previously noted, the 2016 Conservation Strategy identifies, defines, and requires adequate post-delisting monitoring to maintain a healthy GYE grizzly bear population, with clear State and Federal management responses if deviations occur. Agreed-upon total mortality limits will ensure that mortality will continue to be managed at levels that do not result in long-term population decline. Notably, more than two-thirds of all suggested funding to implement the Conservation Strategy is designated to managing conflicts and conducting outreach to minimize conflicts, especially by decreasing attractants on private lands. Nonlethal means of addressing conflict such as relocation of nuisance bears are included in the Conservation Strategy.

The Conservation Strategy prioritizes outreach and education programs to minimize human-bear conflicts. These programs work to change human values, perceptions, and beliefs about grizzly bears and Federal regulation of public lands. For example, hunter education courses and other educational materials strongly encourage hunters to carry pepper spray, and information and education programs educate the public about potential grizzly bear attractants and how to properly store them. A stable to increasing GYE grizzly bear population despite large increases in people living and recreating in the GYE over the last three decades is evidence of the success of programs implemented under the Conservation Strategy.

In addition to public outreach and education, the States have implemented programs to help reduce conflicts with people directly affected by grizzly bears including: livestock carcass removal, electric fencing subsidies for apiaries and orchards, and cost-sharing for bear-resistant garbage bins. Removal of nuisance bears is still sometimes necessary. Removal is lethal to the individual bear, but promotes long-term conservation of the GYE grizzly bear population by minimizing illegal killing of bears, providing an opportunity to educate the public about how to avoid conflicts, and encouraging tolerance of grizzly bears by responding promptly and effectively when bears pose a threat to public safety. In our proposed rule, we describe the YGCC's development of a comprehensive encounter, conflict, and mortality database. The IGBST also maintains a USGS database of known and probable GYE grizzly bear mortalities.

ISSUE 45 (Joy)

After delisting, GYE grizzly bears will continue to be protected by State, Tribal, and Federal laws and regulations, and enforcing agencies will continue to cooperate in the investigation of poaching incidents. There is no data that suggests that the jurisdiction under which poaching is prosecuted affects the willingness of poachers to commit the crime. We are aware of at least 22 intentional, illegal killing of grizzly bears in the GYE between 2002 and 2014, which constituted seven percent of known grizzly bear mortalities during the same period. We do not expect poaching to significantly increase post-delisting because State and Tribal designation of the grizzly bear as a game animal means that poaching will remain illegal and subject to prosecution. Fortunately, poaching is not significant enough to impact the stability of the GYE grizzly bear population.

ISSUE 46 (IGBST/Jennifer)

Genetic health

ISSUE 47 (Seth, Jennifer addressing in rule)

- Concerns over effective population size and 500 number for genetic fitness
  - **Concerns over lower limit of 500 bears and effective population size analysis (our reference to Franklin (1980) is outdated and more recent critical assessment of the 50/500 rule (Frankham et al. 2014) and the use of effective population size (Ewens 1990) is available)**
  - **an effective population size of 100 and a total population of 400 (Miller and Waits 2003) is the minimum for short-term, but not long-term, genetic fitness and should not be a population goal**
  - population size of 500-5000 is the minimum for long-term genetic viability
    - Although the effective population size (i.e., the number of breeding individuals in an idealized population that would show the same amount of dispersion of allele frequencies under random genetic drift or the same amount of inbreeding as the population under consideration) of the Yellowstone grizzly bear population is lower than recommended for evolutionary success in the absence of management in published literature on evolutionary theory (e.g., Franklin 1980, p.136), the genetic program for the Yellowstone grizzly bear population will effectively address future genetic concerns (Hedrick 1995, p. 1004; Miller and Waits 2003, p. 4338).
  - **we selectively chose to report the upper end of the effective population estimate of 469 bears when we should have chosen the more conservative estimates discussed by Kamath et al. (2015)**
  - **Kamath et al. (2015) stated that the effective population size (N_e) is approaching, but hasn't reached, the long-term viable population criterion of more than 500 bears**

Comment [45]: This issue had a lot of potential resources, and a lot of facets. I have bulleted the elements of the issue summary in black and put the potentially helpful response text in blue (to help you distinguish the response text from the issue summary bullets)

- **In reality, the current population estimate of 717 corresponds to an effective population size of 179**
- **Several comments stated that the current metapopulation of 1200-1800 animals is "5-11 times too few individuals to assure long-term persistence**

- maintenance of genetic diversity and its effect on long-term population viability
  - restoration of gene flow would increase fitness
    - Indicators of fitness in the Yellowstone population demonstrate that the current levels of genetic heterozygosity are adequate, as evidenced by measures such as litter size, little evidence of disease, high survivorship, an equal sex ratio, normal body size and physical characteristics, and an increasing population. These indicators of fitness will be monitored annually, in perpetuity. The very low rate of loss of heterozygosity over the 20th century, in combination with the introduction of 1 or 2 effective migrants per generation (naturally or through augmentation), will ensure long-term genetic viability, and the recovered status, of the Yellowstone grizzly bear DPS (Miller and Waits 2003, p. 4338).
  - **genomic changes are slow and take decades to detect**
  - **declines in the GYE grizzly bear population will deplete extant levels of genetic diversity**
  - **model the rate of allele loss due to genetic drift at various population sizes; long-term fitness implications of changes in allelic diversity are not well understood**
    - Although allelic diversity has declined in the GYA population over the 20th century, the decline was not as precipitous as previously anticipated (Miller and Waits 2003, p. 4338). As measured by Miller and Waits (2003, p. 4337), allelic richness decreased from approximately 5.89 alleles per locus at the beginning of the 20th century (1910s) to 5.50 at the end of the century (1990s). Considering all of the information available that examines heterozygosity and allelic diversity of grizzly bears in the GYA, Miller and Waits (2003, p. 4338) conclude that ''the viability of the Yellowstone grizzly bear population is unlikely to be compromised by genetic factors in the near future * * *'' and that ''* * * one to two effective migrants per generation from the NCDE to the YE (Yellowstone ecosystem) is an appropriate level of gene flow.'' We considered these conclusions pertinent to the genetic management of the DPS and incorporated them into the Strategy (U.S. Fish and Wildlife Service 2007, p. 37).
  - **the long-term evolutionary health of the grizzly bear population should be projected and considered**

    - **conflated the need for genetic diversity in the GYE population with the need for the maintenance of genetic diversity of all the current and future subpopulations of grizzly bears → just reference Conservation Strategy for management implications**
- Connectivity issues
    - all five of the extant grizzly populations in the lower 48 are genetically isolated from each other
        - Because it is generally accepted that isolated populations are at greater risk of extinction over the long-term, we will continue efforts to reestablish natural connectivity between the GYA and other grizzly bear ecosystems. Although natural connectivity is the best possible scenario, isolation does not constitute a long-term threat to the Yellowstone grizzly bear population because of intensive monitoring and adaptive management strategies that will remain in effect post-delisting.
        - The placement of bears into the Yellowstone by augmentation would be a precautionary approach to assure that genetic issues are not a factor in the survival of the Yellowstone population. As stated by Miller and Waits (2003, p. 4338)—''The viability of the Yellowstone grizzly population is unlikely to be compromised by genetic factors in the near future.'' Although we view the NCDE as the most likely source population, many other appropriate grizzly bear populations in Canada could serve as source populations, should the NCDE population not be adequate for some unforeseen reason. We have previously cooperated with international partners to translocate bears from the North Fork of the Flathead River in Canada to the Cabinet-Yaak ecosystem (Kasworm et al. 1998, p. 148).
        - Regarding isolation of the Yellowstone grizzly bear population, those potential threats are related to genetic concerns and changes in the population's habitat. Based on the best available science (Miller and Waits 2003, p. 4338), the Service concludes that the genetic diversity of the Yellowstone grizzly bear population will be adequately maintained by the immigration or relocation of one to two effective migrants from the NCDE every 10 years. This movement of grizzly bears between ecosystems may occur naturally or through management intervention. Regardless of the method, the Service is confident that genetic impoverishment will not threaten the Yellowstone grizzly bear population. The source population for augmentation, if augmentation becomes necessary, will be the NCDE population. The NCDE bears are those most closely related to the Yellowstone grizzly bear DPS, having been separated for roughly 100 years (Miller and Waits 2003, p. 4334). Offspring of individuals from these two populations are unlikely to experience outbreeding depression.

- **we dismissed the need for immigration in the GYE in our proposed rule with a promise from the State of Montana to "manage discretionary mortality in [connectivity] area[s] in order to retain the opportunity for natural movements of bears between ecosystems."**
- provide more justification behind our assertion that one to two immigrants or transplants per generation is an adequate level of gene flow into the GYE
    - This issue is discussed in the Supplemental Information Appended to the Recovery Plan, its supporting literature, and the literature cited in this final rule. Both the Strategy and this final rule recognize that declines in genetic diversity due to inbreeding effects are expected in isolated populations (Ralls et al. 1986, p. 35; U.S. Fish and Wildlife Service 2007, p. 37). We agree that inbreeding depression has the potential to negatively affect the Yellowstone grizzly bear DPS if genetic diversity declines below current levels. For this reason, we have reviewed relevant literature about this topic (Ralls and Ballou 1983, pp. 147–179; Allendorf and Leary 1986, pp. 72–76; Ralls et al. 1986, pp. 35–37; Lande 1988, pp. 1455–1456, 1460; Roelke et al. 1993, pp. 344–348; Hunter 1996, pp. 88–90; Wang et al. 1999, pp. 168–176) and, upon the recommendation of Miller and Waits (2003, p. 4338), our partners will translocate grizzly bears from other populations into the GYA to maintain current levels of genetic diversity if natural movement of grizzly bears into the GYA from other areas is not documented by 2020.
    - Our recommendation to augment the population with one migrant per generation is based on Miller and Waits (2003, p. 4338), who conclude that one to two effective migrants per generation is appropriate to maintain current levels of genetic diversity. ''The viability of the Yellowstone grizzly population is unlikely to be compromised by genetic factors in the near future as we hypothesized based on modern samples. Rather, the genetic consequences of inbreeding and isolation are likely to transpire over longer time periods (decades or centuries)'' (Miller and Waits 2003, p. 4338). Regarding our definition of an ''effective migrant'' as one which remains in the area, survives, and successfully reproduces, we recognize that a more complete definition involves measures of relatedness between the source and recipient population, as well as other genetic measures (Wang 2004, p. 335). If translocation is required in the future, our partners will consult with geneticists and use the best available science to determine how many bears must be translocated from the source population to equal one effective migrant to the Yellowstone grizzly bear DPS. Regarding the effects of other selective forces on the one-migrant-pergeneration rule, Wang (2004, p. 341) concluded that, ''In general, the

onemigrant-per-generation rule is robust to the systematic forces of selection and mutation.’’

- management should place more effort on facilitating natural dispersal instead of relying on potential future translocations
  - As Miller and Waits (2003, p. 4338) recommend, we will continue efforts to reestablish natural connectivity, but our partners will transplant one to two effective migrants per generation if no movement or genetic exchange is documented by 2020 (U.S. Fish and Wildlife Service 2007, p. 37).
  - The feasibility of translocating grizzly bears for genetic augmentation is not untested. Translocation has been successfully employed in the Cabinet-Yaak Ecosystem (Kasworm et al., in press, p. 6). Kasworm et al. (in press, pp. 6, 8) were only able to document successful reproduction by one of the three bears that remained in the area after being translocated; confirmation of successful reproduction events for the other two bears was not possible because they lacked reference genetic material. Any bear that is translocated from the NCDE into the GYA will be radio-collared and monitored to determine whether it remains in the area and survives. As in the Cabinet-Yaak Ecosystem, genetic analysis will be used in subsequent years to confirm whether a transplanted bear has successfully reproduced in the GYA. The exact number of translocated migrants into the GYA will be determined through these monitoring activities. Any bear translocated from the NCDE to the GYA would be counted as an NCDE mortality. Please see our response to Issue 12 in this section below for more discussion about the adequacy of the NCDE to serve as a source population. Augmentation in the GYA may not be necessary if natural immigration occurs before 2020.
  - We prefer natural reconnection as well and are actively involved in efforts to maintain and expand the opportunities for grizzly bears to move into and out of the Yellowstone ecosystem via the linkage zone program. However, we cannot control bear movement and as discussed in the final rule (see Behavior section above), they have limited dispersal mechanisms. By working to maintain current movement opportunities while implementing conservation actions to recover populations in other grizzly bear ecosystems, we anticipate that bears will naturally reestablish themselves between recovery ecosystems and achieve connectivity. We agree that the establishment of a grizzly bear population in the Bitterroot Recovery Zone would contribute to recovery of the grizzly bear in the Lower 48 States (Boyce 2000, p. 6–243). However, the lack of natural connectivity will not threaten the Yellowstone DPS because of the genetic

management plan described in the Strategy (U.S. Fish and Wildlife Service 2007, p. 37).

- The Act does not require a ''hands off'' approach as a prerequisite for delisting. In fact, the presence of adequate regulatory mechanisms to ensure that appropriate management and monitoring activities continue is required before delisting can occur. For the Yellowstone grizzly bear DPS to remain unthreatened in all or a significant portion of its range in the foreseeable future, active management is necessary to limit mortality, provide adequate habitat, respond to grizzly bear/human conflicts, and maintain genetic diversity either through natural connectivity or through translocation. In this way, the Yellowstone grizzly bear DPS is a ''conservation-reliant species'' (Scott et al. 2005, p. 383). Augmentation is proposed as a precautionary measure based on the recommendations of Miller and Waits (2003, p. 4338) to maintain current levels of genetic diversity, should grizzly bear movement into the GYA not occur over the next 20 years.
- The effects of genetic isolation can be mitigated by either natural immigration or augmentation. There is an ongoing process to identify and implement management on linkage areas for wildlife in order to maintain and improve the potential for wildlife movement between all the large blocks of public land in the Northern Rocky Mountains (Servheen et al. 2003, p. 3). This interagency effort involves 13 State and Federal agencies working on linkage facilitation across private lands, public lands, and highways (Interagency Grizzly Bear Committee 2001, pp. 1–2). To date, this effort has included: (1) Development of a written protocol and guidance document on how to implement linkage zone management on public lands (Public Land Linkage Taskforce 2004, pp. 3–5); (2) production of several private land linkage management documents, including ''Making Connections from the Perspective of Local People'' (Parker and Parker 2002, p. 2), and the Swan Conservation Agreement (U.S. Fish and Wildlife Service 1997), which is a collaborative linkage zone management document; (3) analyses of linkage zone management in relation to highways, including identification of multiple linkage areas in southeast Idaho from Idaho Falls to Lost Trail Pass (Geodata Services Inc. 2005, p. 2) and the effects of highways on wildlife (Waller and Servheen 2005, p. 998); and (4) a workshop in the spring of 2006 on implementing management actions for wildlife linkage, the proceedings of which are available online at: www.cfc.umt.edu/linkage. The objective of this work is to maintain and enhance movement opportunities for all wildlife species across the northern Rockies. This linkage work is not directly associated

Comment [46]: update this list of work

with the Yellowstone grizzly population and will continue to address ways to improve cooperation and affect management on public lands, private lands, and highways in linkage areas across the northern Rockies regardless of the listed status of the Yellowstone grizzly bear DPS.

- Efforts to promote connectivity between existing populations will continue after delisting as these programs are independent of the delisting of the GYA population.

- **reintroductions into other ecosystems are the best option to expand the gene pool**

Food resources

ISSUE 48 (Alex)

- **Flaws in our analysis of grizzly bear body condition**
- **defensibility of the IGBST's models analyzing the effects of food availability on grizzly bear populations**
- **Concerns with adequacy of Food Synthesis Report**

ISSUE 49 (Alex)

The amounts of major foods for grizzly bears will likely fluctuate due to possible changes in average temperature, precipitation, forest fires, introduced species, and resident insects. Changes in environmental conditions and resulting changes in foods for grizzly bears have been recognized by management agencies throughout the recovery process. That such changes will occur is neither exceptional nor unexpected. The key issue is determining how management agencies will quantify and respond to such changes. Presently, a system has been implemented to monitor changes in the production and distribution of foods in relation to grizzly bear vital rates (U.S. Fish and Wildlife Service 2007, pp. 25–60). The Study Team will report the monitoring results on food production, extent and impact of insect and disease on food production, bear mortality, reproductive success, and age-specific survival annually to the Coordinating Committee. The relationships between these factors will detect any impacts of changes in foods on bear viability in the ecosystem and will be the basis for an adaptive management response by the Coordinating Committee.

The monitoring program does annually monitor litter size and cub survival. These data are compared to indicators of habitat quality such as annual production and availability of major foods.

The extent to which natural foods will change across the landscape and the resulting impacts on bears is impossible to calculate with any degree of certainty. With the exception of whitebark pine, there are not any documented relationships among grizzly bear demographic rates and the consumption of the other major grizzly bear foods (cutthroat trout, army cutworm moths, and ungulates). The response of bears in years of low whitebark pine sees production suggests that the loss or near extirpation of whitebark pine trees could reduce survivorship for

some grizzly bears, especially those involved in grizzly/bear human conflicts (Mattson et al. 1992, p. 439; Haroldson et al. 2006, p. 39). It is important to note that the annual abundance and distribution of whitebark pine seeds vary naturally and are not predictable. During years with little or no whitebark pine seed production, grizzly bears switch to alternative foods. The compound uncertainties associated with projections of possible future habitat changes, predicted responses of grizzly bears to multiple possible future conditions, and assumed changes to vital rates in response to any such possible future habitat changes create a wide realm of possible responses. Rather than such a compound uncertainty approach, the management system outlined in the Conservation Strategy (U.S. Fish and Wildlife Service 2007, pp. 25-60) depends on monitoring of multiple indices including production and availability of all major foods; and monitoring of grizzly bear vital rates including survival, age at first reproduction, reproductive rate, mortality cause and location, dispersal, and human-bear conflicts. These data will allow managers to use and adaptive management approach that addresses poor food years with responsive management actions such as limiting grizzly bear mortality, increasing I & E efforts, and long-term habitat restoration (i.e., revegetation, prescribed burning, etc.), as appropriate. The continued monitoring of these multiple indices will allow rapid feedback on the success of management actions to address the objective of maintaining a recovered population.

There is no biological way to define ‘‘baseline’’ levels for various foods because the natural foods for grizzly bears naturally fluctuate, annually and spatially, across the ecosystem. Instead of establishing artificial baseline values for major grizzly bear foods, the protocol in place for the monitoring of major foods will provide annual indices of the variation of these foods, and will compare changes in these foods to grizzly bear vital rates such as mortality causes and locations, cub production and survival, adult female survival, and numbers and distribution of bear/human conflicts. The results will guide adaptive management responses to changes in foods such as enhanced Information and Education (I & E) efforts, limiting grizzly bear mortality, planting whitebark pine, controlling exotic species, and/or prescribed burning.

- **Regular review of whole grizzly bear diet in GYE**
  - *Covered by paragraphs above?*
- **Analyze movements and home ranges of females with cubs**
  - *Covered by paragraphs above?*
- **continue monitoring the relationship between the availability of the four main food sources, grizzly bear use of the four main food sources, vital rates for the GYE population, and body condition of grizzly bears**
  - *Covered by paragraphs above?*
  - *Or add this:* The Strategy commits the agencies to intensive monitoring of all grizzly bear vital rates and the relationship of these vital rates to changes in major foods and levels and types of human activities in their habitat. This monitoring does not solely rely on vital rate monitoring to indirectly infer changes in habitat. Annual habitat monitoring will produce results on any changes in habitat values and key food production and possible disease in key foods. Thus, the system in

place will not rely on indirect measures of habitat values but will produce direct measures of habitat values annually. Since our partners will be monitoring a suite of vital rates including survival of radio-collared bears, mortality of all conflict bears, and fecundity, we feel confident that we will be able to detect the consequences of significantly reduced habitat productivity.

- **discuss the different hazard levels associated with acquiring different types of high quality food and whether these hazards are primarily relevant to dependent young, independent bears, or both**
- **fail to account for potential interactions between spatial distributions of and temporal trends in key food resources.**
    - *Covered by paragraphs above?*
- **the three IGBST papers (Bjornlie et al. 2014, Costello et al. 2014, and van Manen et al. 2015) did not account for long-term weather trends or changes in the abundance of key foods (i.e., army cutworm moths, cutthroat trout, and ungulates) other than whitebark pine in their analysis of vital rates.**

ISSUE 50 (Alex)

Aside from the well-documented association between whitebark pine cone crop size and subsequent management actions on grizzly bears (Mattson et al. 1992, p. 432), we have not been able to detect any cause-effect relationships between abundances of the three other major foods and grizzly bear vital rates. Those foods have either fluctuated (e.g., ungulates, army cutworm moths) or declined (e.g., cutthroat trout) during the period in which the GYE grizzly population grew at a rate of between 4 percent and 7 percent

Comment [47]: update?

While we agree that the extent to which grizzly bears might be able to compensate for the loss of one of the four major foods is unknown, the rule reflects the best scientific and commercial data available. Future food source availability and the possible grizzly bear reaction to those possible future changes are discussed under Factor E below and in the Summary to Public Comments' sections J, K, L, and M above. We also agree that human-caused mortality is probably the major factor limiting grizzly populations, although mortality can be mediated by food availability (Mattson et al. 1992, p. 432). The Study Team will continue to monitor major food abundance and grizzly bear conflicts and mortalities. The combination of results and Study Team analyses from these multiple monitoring indices on foods, bear vital rates, and bear/human conflicts will allow managers to respond to changes as necessary. Managers will respond to poor food years with reductions in allowable mortalities and with increased I & E efforts that forewarn the public about the increased potential for grizzly bear/human conflicts.

Comment [48]: update

- **nutritional value (i.e., fat, protein, and gross energy), seasonal abundance, and risk and energetic cost of obtaining of any alternative food sources must be comparable to the four main food sources**
- **the list of more than 200 grizzly bear foods cited in Gunther et al. (2014) is inflated because to a bear "a grass is a grass."**

- **use of false truffles was only documented in the core of the ecosystem and there was also no indication of the nutritional value of this food source**
- **bear densities vary widely depending on habitat productivity (Mowat et al. 2013), which they suggested ran counter to our claims that grizzly bears are extremely flexible in their diet and thus resilient to changes in food abundance**

Not sure if we need to address the above bullets more specifically or if they are adequately covered by the above paragraph

ISSUE 51 (Alex)

Comment [49]: this issue didn't really have any helpful text in the 2007 materials

ISSUE 52 (Alex)

The final rule contains a discussion of the potential effects of global climate change and pesticides on army cutworm moths. There is no evidence to suggest that spraying of army cutworm moths has any population-level effects on grizzly bears (Robison et al. 2006b, pp. 1706-1710). The Study Team is sponsoring research on the geospatial prediction of army cutworm moth sites that will help managers identify sites that are potentially exposed to human recreational use. It is highly unlikely that any of the high-elevation sites used by the moths, all of which are on public lands, will be exposed to development.

Comment [50]: did this already happen? is it still happening?

(does this paragraph adequately cover the three bullets below?)

- Alpine habitat of moths and climate change
- Impacts of pesticide use and new farming technologies
- Human disturbance at moth aggregation sites

There is no accurate method available to monitor moth numbers across thousands of square kilometers of alpine habitat. The method currently used quantifies bear use of moths sites as an index of moth presence and distribution. Although it is known that moth abundance fluctuates in the spring on agricultural lands on the plans (Burton et al. 1980, pp. 4-5) and that moth flights vary in magnitude along their migration routes (Hendricks 1998, p. 165), we are not able to predict where army cutworm moths will occur on the landscape each year except by observing where bears use this food source. The Interagency Grizzly Bear Study Team is currently sponsoring the development of spatial models to predict where potential army cutworm moth habitat is (Robison et al., 2006a, p. 88). The Interagency Grizzly Bear Study Team has not documented an association between grizzly bear use of moth aggregation sites and variation in vital rates and the direct monitoring of army cutworm moth abundance and status is not necessary at this time.

(does this paragraph adequately cover the two bullets below?)

- Effect of increased reliance on moths on grizzly bear health
- "bear use of army cutworm moth sites may not be a good measure of cutworm moth relative abundance because grizzly bears may return to areas where they've found abundant food sources in the past even though those resources are not present."

- **Moth sites correlating with higher or lower human-caused mortality?**

ISSUE 53 (Alex)

Only a small proportion of the Yellowstone grizzly bear DPS eat cutthroat trout and the nutritional contribution of cutthroat trout to the overall diet of those few bears is minimal (Felicetti et al. 2004, p. 496). Overall, we do not foresee a decline in the GYE cutthroat trout as a threat to the GYE grizzly bear population in all or a significant portion of its range in the foreseeable future (see Factor E below).

- **No longer spawning in Yellowstone Lake**
- **Whirling disease**
- **Outdated data about the percentage of grizzly bears that use cutthroat trout**
- **seasonal gap in diet filled by eating elk calves or lower-quality vegetation**
- **male/female disparity in use of cutthroat trout**
- **Decline in trout disproportionately affecting females → decreases in cub and yearling survival**

ISSUE 54 (Jennifer)

ISSUE 55 (Joy)

The availability of ungulate prey such as elk and bison is not a threat to the persistence of GYE grizzly bears, and future changes in prey abundance are not expected to change this conclusion. There have been documented declines in some ungulate populations and we expect fluctuations in ungulate populations to continue in the future. As generalist consumers, GYE grizzly bears have demonstrated flexibility in meeting their dietary needs and are accustomed to successfully finding alternative natural foods.

The population decline in the northern elk herd has been attributed to a variety of factors including severe winters, drought, hunter harvest, and increased predation on elk calves by grizzly bears, black bears, and wolves. However, it is noteworthy that during this same time period the grizzly bear population has continued to increase. This suggests that there is no detectable cause and effect relationship between elk population declines and grizzly bear population trends.

The GYE grizzly bear consumes bison primarily as winter-killed carrion, but also kills calves opportunistically and preys on weakened adults. The Yellowstone bison population size has remained within the IBMP's recommended range of 2,500-4,500 bison since the year 2000, with the exception of 2005 and 2007 years when numbers exceeded 4,500. Therefore, we do not anticipate that bison as a potential food source will be a limiting factor for GYE grizzly bears in the future.

Areas with a high risk of grizzly bear mortality due to repeated conflict with humans or livestock are not considered suitable habitat and are not included in our quantification of habitat available to meet the needs of a recovered grizzly bear population. Within the PCA, there is a mandatory restriction on creating new livestock allotments and a voluntary phasing out of

livestock allotments with recurring conflicts. One of our demographic recovery criteria is to maintain a population size of at least 500 bears including at least 48 females with cubs in the demographic monitoring area. If numbers drop below these established thresholds for three consecutive years, the criterion will not be met. However, this recovery criterion has been met since 2003.

The Conservation Strategy will continue monitoring multiple indices including production and availability of all major foods and grizzly bear vital rates—survival, age at first reproduction, reproductive rate, mortality cause and location, dispersal, and human-bear conflicts. These data will allow managers to use an adaptive management approach that addresses poor food years with responsive management actions such as limiting grizzly bear mortality, increasing I & E efforts, and long-term habitat restoration as appropriate. The continued monitoring of these multiple indices will maintain the recovered population.

ISSUE 56 (Nathan)

- **Huckleberries less abundant**
- **Impacts of huckleberry decline will be delayed**

(maybe covered by paragraph below?)

The extent to which natural foods will change across the landscape and the resulting impacts on bears is impossible to calculate with any degree of certainty. With the exception of whitebark pine, there are not any documented relationships among grizzly bear demographic rates and the consumption of the other major grizzly bear foods (cutthroat trout, army cutworm moths, and ungulates). The compound uncertainties associated with projections of possible future habitat changes, predicted responses of grizzly bears to multiple possible future conditions, and assumed changes to vital rates in response to any such possible future habitat changes create a wide realm of possible responses. Rather than such a compound uncertainty approach, the management system outlined in the Conservation Strategy (U.S. Fish and Wildlife Service 2007, pp. 25-60) depends on monitoring of multiple indices including production and availability of all major foods; and monitoring of grizzly bear vital rates including survival, age at first reproduction, reproductive rate, mortality cause and location, dispersal, and human-bear conflicts. These data will allow managers to use and adaptive management approach that addresses poor food years with responsive management actions such as limiting grizzly bear mortality, increasing I & E efforts, and long-term habitat restoration (i.e., revegetation, prescribed burning, etc.), as appropriate. The continued monitoring of these multiple indices will allow rapid feedback on the success of management actions to address the objective of maintaining a recovered population.

The rule reflects the best scientific and commercial data available. Future food source availability and the possible grizzly bear reaction to those possible future changes are discussed under Factor E below and in the Summary to Public Comments' sections J, K, L, and M above.

Comment [51]: update

Climate change

ISSUE 57 (Seth)

- **we reviewed the current literature regarding climate change, but did not link effects to grizzly bears or their habitat**
- **we should consider future impacts from climate change, despite the fact that the exact extent of impacts is unknown**
- **the "downscaled" projection we used to analyze climate change may have underestimated impacts**
- **climate change may reduce snowpack and shorten the winter season, which may impact the timing and success of denning, potentially affecting reproductive success and increasing conflict**
- **less snowpack could result in fewer avalanche chutes**
- **we should have assessed impacts from the changing hydrological regime**
- **drought has affected death rates**
- **increased frequency and extent of fire as a result of climate change could alter plant and animal composition (Westerling et al. 2011) and affect the frequency of human-grizzly bear interactions and conflicts**
- **We inaccurately summarize Servheen and Cross (2010) in the rule**
- **asked why surveyed biologists believed that climate change is not a threat to grizzly bears and that climate change "may even make habitat more suitable and food sources more abundant."**
- **Monitoring**
    - **recommended both monitoring and modeling potential impacts of climate change on habitat suitability and the abundance and distribution of grizzly bear foods**
    - **monitor possible effects of climate change on grizzly bear vital rates**
    - Monitor for emerging diseases
        - Approximately 10 percent of the Yellowstone grizzly population is currently tracked using radio collars. The Study Team examines all bears captured for research or management purposes, and performs post mortem examinations on the carcasses of dead bears. If a disease outbreak were to occur, it would be identified promptly. Due to the lack of evidence that diseases and parasites play any significant role in grizzly bear population dynamics in the GYE (see Factor C below), we do not view developing a management plan to respond to a potential outbreak as necessary.

Comment [52]: update

From 2012 WY wolf rule: This issue is discussed in our Factor E analysis below. We continue to conclude that wolves are unlikely to be threatened by climate change. Wolves are one of the most adaptable and resilient land mammals on earth, once ranged across most of North America from central Mexico to the Arctic Ocean and from coast to coast, and can prey on every type of ungulate in their worldwide northern hemisphere range. Thus, wolves are among the least likely species to be threatened by this factor.

Other potential threat factors

ISSUE 58 (Joy)

There have been documented declines in some ungulate populations; however, overall, prey numbers remain healthy. Intraspecific conflict between wolves and grizzly bears over competition for carrion does occasionally occur. Grizzly bears sometimes displace wolves from carcasses, and wolves sometimes displace grizzly bears. We are aware of 339 wolf-grizzly bear interactions in the GYE, which resulted in eight known grizzly bear mortalities. However, these interactions usually do not result in any injury to either bears or wolves and do not threaten the grizzly bear population. Recent models and field investigations suggest that since they were reintroduced to the GYA in 1995, wolves have had little effect on ungulate availability to GYE grizzly bears.

ISSUE 59 (Nathan)

The GYE has experienced several exceedingly large volcanic eruptions in the past 2.1 million years. Super eruptions occurred 2.1 million, 1.3 million, and 640,000 years ago (Lowenstern *et al.* 2005, pp. 1–2). Such a similar event would devastate the GYE ecosystem. While one could argue ''we are due'' for such an event, scientists with the Yellowstone Volcano Observatory maintain that they ''see no evidence that another such cataclysmic eruption will occur at Yellowstone in the foreseeable future * * * [and that] recurrence intervals of these events are neither regular nor predictable'' (Lowenstern *et al.* 2005, p. 6). We agree and do conclude that such an event is not likely within the foreseeable future.

More likely to occur is a nonexplosive lava flow eruption or a hydrothermal explosion. There have been 30 nonexplosive lava flows in YNP over the last 640,000 years, most recently 70,000 years ago (Lowenstern *et al.* 2005, p. 2). During such an eruption, flows ooze slowly over the surface, moving a few hundred feet per day for several months to several years (Lowenstern *et al.* 2005, p. 2). Any renewed volcanic activity at YNP would most likely take this form (Lowenstern *et al.* 2005, p. 3). In general, such events would have localized impacts and be far less devastating than a large eruption (although such an event could also cause fires; fire as a threat is discussed above). Hydrothermal explosions, triggered by sudden changes in pressure of the hydrothermal system, also occasionally affect the region. More than a dozen large hydrothermal explosion craters formed between about 14,000 and 3,000 years ago (Lowenstern *et al.* 2005, p. 4). The largest hydrothermal explosion crater documented in the world is along the north edge of Yellowstone Lake in an embayment known as Mary Bay; this 2.6-km (1.5- mile) diameter crater formed about 13,800 years ago (Lowenstern *et al.* 2005, p. 4). We do not consider either a nonexplosive lava flow eruption or a hydrothermal-explosion likely within the foreseeable future, but even if one of these did occur, the impact to grizzly bears would likely be localized, temporary, and would not threaten the viability of the GYE grizzly bear population.

Earthquakes also occur in the region. The most notable earthquake in YNP's recent history was a magnitude 7.5 in 1959 (Lowenstern *et al.* 2005, p. 3). Similarly, a magnitude 6.5

Comment [53]: Up to yall- we could add this language to the rule itself or just leave it here to respond to this comment- he language was pulled from he 9/10/12 Wolf Rule its all on page 55598. I did EDIT it some- i switched GYA to GYE, I swapped out wolves for grizzly bears. And in the last paragraph I had to remove a reference/brief discussion as the model was constructed for wolves specifically.

Comment [54]: note- i deleted the last paragrpah entirely- discussing the Carrol et al paper 2003

earthquake hit within YNP in 1975 (Lowenstern *et al.* 2005, p. 3). The 1959 earthquake killed 28 people, most of them in a massive landslide triggered by the quake (Lowenstern *et al.* 2005, p. 3). Such massive landslides and other earthquake-related impacts could also affect wildlife. But as with other potential catastrophic events, the impact of a large earthquake to grizzly bears would likely be localized, temporary, and would not threaten the viability of the GYE grizzly bear population.

ISSUE 60 (Alex)

The Strategy prioritizes outreach and education to minimize grizzly bear/human conflicts (U.S. Fish and Wildlife Service 2007, pp. 57–62). The State plans also contain direction on ways to minimize grizzly bear/hunter conflicts (Idaho's Yellowstone Grizzly Bear Delisting Advisory Team 2002, p. 15; MTFWP 2002, pp. 24, 62; WGFD 2005, pp. 31–35). Although the States do not currently require hunters to carry pepper spray, it is strongly encouraged in hunter education courses and other educational materials. Elk hunters in Grand Teton National Park are required to carry bear spray, and this may prove to be a research opportunity to quantify how much, if any, this requirement reduces grizzly bear conflicts with elk hunters.

Between 1980 and 2002, 19 percent (50/257) of human-caused grizzly bear mortalities were related to hunting (Servheen et al. 2004, p. 21), so an increase in backcountry user awareness would be beneficial. The affected states of Wyoming, Montana, and Idaho have cooperated with the Service to address conflicts between grizzly bears and hunters through extensive I&E programs. The Wyoming Game and Fish Department (WGFD) coordinates with its information specialists to help people avoid grizzly bear/human conflicts. The WGFD has held over 150 workshops and programs throughout 18 communities in Wyoming, attended by over 6,000 people (Servheen et al. 2004, p. 3). Grizzly bear encounter management is a core subject in basic hunter education courses taught by the WGFD and outfitters and guides teach a bear encounter class designed specifically for other in their field annually (Servheen et al. 2004, p. 3). Additionally, all limited quota big game license holders hunting in occupied grizzly bear habitat are mailed bear encounter and conflict management informational materials. In Montana, black bear hunters are required to pass a bear identification test before obtaining their license. The Montana Department of Fish, Wildlife, and Parks (MTFWP) tries in numerous ways to communicate with hunters, including airing public service announcements on local media stations, talking with hunters at hunter check stations, posting informational signs at trailheads, distributing numerous brochures about avoiding grizzly bear/human conflicts, and backcountry patrols of hunting camps (Servheen et al. 2004, p. 5-6, 8). Because Idaho has experienced less grizzly bear activity and subsequent conflicts than Montana or Wyoming, educational outreach in Idaho has focused on educating community members of the Island Park area. The IDFG has conducted at least 20 "Living in Bear Country" workshops in the upper Snake River region (Servheen et al. 2004, p. 10). These I&E efforts will continue to be the primary way in which agencies to attempt to reduce conflicts between grizzly bears and hunters.

Comment [55]: update these stats

Comment [56]: update

Comment [57]: update

Comment [58]: update MT info, if necessary

Comment [59]: update

We recognize the importance of outreach and I&E efforts to the long-term conservation of the GYE grizzly bear population. The details related to implementing effective outreach

efforts and preventing and responding to grizzly bear/human conflicts are in the final Conservation Strategy (U.S. Fish and Wildlife Service 2007, pp. 59-62) and the State management plans (CITE CURRENT MANAGEMENT PLANS). Over two-thirds ($2,393,200 of $3,496,337) of the anticipated costs of managing the GYE grizzly bear population are for managing grizzly bear/human conflicts and I&E efforts (CITE CONSERVATION STRATEGY). This level of commitment by responsible agencies demonstrates their understanding that I&E efforts and conflict management and prevention are crucial elements of maintaining a healthy Yellowstone grizzly bear population.

Comment [60]: update

- **claims that I&E, specifically bear identification training, has failed to reduce human-caused mortality from hunters**
- **Use modern media as I&E tool**

ISSUE 61 (Alex)

- From 2007 delisting (but doesn't cover this whole issue): We agree that there is no scientific literature documenting that delisting would or could build public support and tolerance for grizzly bears. This result is inferred by professional wildlife biologists familiar with local community attitudes in the Yellowstone ecosystem. We have eliminated this rationale from the final rule.

ISSUE 62 (Alex)

Comment [61]: this issue did not have any helpful text in he 2007 materials

Cumulative impacts of threats

ISSUE 63 (Alex)

Our assessment of threats considered potential risk factors individually and cumulatively. Our threats assessment is organized sequentially, consistent with how section 4(a) of the Act is organized. We then discuss the overall finding, which considers the cumulative impacts of all potential threat factors. We considered and weighed the cumulative effects of all known and reasonably foreseeable threat factors facing the population when reaching the conclusion that the grizzly bear population in the GYE no longer meets and is unlikely to ever again meet the definition of a threatened species. When considering the population's recovered status, it is important to remember that the minimum recovery criteria require

[wolf rule then made a lengthy argument about how the population is indeed recovered. Not sure if we need or want this but here is the example: When considering the population's recovered status, it is important to remember that the minimum recovery criteria require Idaho, Montana, and Wyoming to each maintain at least 10 breeding pairs and at least 100 wolves in mid-winter. After delisting, Wyoming has committed to maintain at least 10 breeding pairs and at least 100 wolves outside of YNP and the Wind River Indian Reservation at the end of the year, and will maintain a buffer above these minimum levels so that the minimum targets are not compromised. Thus, Wyoming intends to manage for the entire recovery goal outside of YNP.

These statewide totals will be further buffered by wolves in YNP which experience extremely low rates of human-caused mortality allowing the population essentially to be naturally regulated at carrying capacity. From 2000 to the end of 2011 (the most recent official wolf population estimates available), the wolf population in YNP ranged from 96 to 174 wolves, and between 6 to 16 breeding pairs. The YNP wolf population appears to be settling around the lower end of this range (Service et al. 2000–2010, Table b; Smith 2012). Specifically, YNP biologists expect that the park will settle between 50 to 100 wolves and 5 to 10 packs with 4 to 6 of these packs meeting the breeding pair definition annually (Smith 2012). Given the above, the minimum recovery criteria for Wyoming will always be greatly exceeded. Additionally, the GYA wolf population will be further buffered by wolves in Idaho and Montana's portion of the GYA. Since 2002, Montana's GYA wolf population ranged from 55 to 130 wolves since recovery was achieved in 2002, and Idaho's ranged from 0 to 40 wolves in its portion of the GYA (Service et al. 2003–2012, Tables 1b, 2)."]

Comment [62]: edit to be about grizzly bears

All three States have maintained, and are expected to continue to maintain, a sizable population in their portion of the GYE. We expect the population will be managed around the 2002-2014 population average of 674 grizzly bears across portions of Montana, Idaho, and Wyoming. Overall, the GYE grizzly bear population's expected abundance and geographic distribution (occurring in both protected and unprotected portions of the GYE and occurring across multiple management jurisdictions) provides the GYE grizzly bear population with substantial representation, resiliency, and redundancy. Additional representation, redundancy, and resiliency is also provided across the other grizzly bear recovery areas. These factors provide us with confidence the population can withstand the types of impacts mentioned in the above comments. Wolves are very resilient and can withstand and recover from most of the specific events noted in the above comments. Such events are likely to cause localized impacts, which would not affect all or even a majority of the population in Wyoming, the GYA, or the NRM DPS. For example, when disease hit the YNP wolf population in 2005 and 2008 there were substantial, temporary impacts, but they were experienced only on a local scale and the YNP population quickly rebounded. No similar large-scale events have been documented in other portions of Wyoming. It should be noted that wolves' natural reproductive capacity and dispersal ability, State commitments to monitoring and adaptive management, and the regional population's representation, resiliency, and redundancy would not provide total protection from catastrophic events. For example, as noted in the rule, a cataclysmic eruption underneath YNP would devastate the GYA ecosystem. However, events such as these are extremely unlikely within the foreseeable future.

Comment [63]: provide similar example for grizzly bears

Regarding management, the States do not intend to manage the population at minimum agreed-upon targets. Instead, the State intends to manage for a buffer, recognizing that some unforeseen events could affect the population. Furthermore, Wyoming, Montana, and Idaho intend to carefully monitor the population and will adjust all controllable mortality factors, such as mortality resulting from harvest and depredation control, in response to measured mortality from all causes in order to ensure established mortality limits are not exceeded (CITE MOA

Comment [64]: from the wolf rule. Is this something we want to say here?

AND STATE REGS). The management measures in the State regulations and the Tri-State MOA provide that impacts related to human-caused mortality are appropriately managed and will not singularly, or in combination with other factors, compromise the population's recovered status.

Adequate regulatory mechanisms and post-delisting monitoring

ISSUE 64 (Grant)

The proposed rule's discussion of Factor D (the inadequacy of existing regulatory mechanisms) describes laws and regulations of Federal, State, and Tribal governments that govern management of grizzly bear habitat and populations. State grizzly bear management plans direct that grizzly bears would be managed as a game animal throughout the DPS in the event of delisting. Detailed regulations for grizzly bear hunting seasons (e.g., quotas, hunting seasons, licenses and fees, closures) may be approved and promulgated at the discretion of State wildlife commissions, but as stated in the proposed rule, such game regulations would need to be in place and consistent with specific mortality and population targets identified in the management framework in order for delisting to occur.

Because such modifications to State game regulations had not been approved at the time the proposed rule was published, we were able to describe them only in conditional terms. Thus, we believe the terms "anticipate", and "expect" were used appropriately in this section of the proposed rule. However, this does not imply a lack of commitment to ensuring effective management. Because the management framework provides specific standards for evaluating State game regulations, and the decision to delist the GYE grizzly bear DPS is contingent on meeting these standards, we could reasonably anticipate that in the event of delisting State regulations would restrict take of grizzly bears consistent with the mortality limits identified in the management framework.

[**not sure what has happened with state regs since proposed rule… will that affect this discussion? Language of specific comment letters might indicate a more detailed response. - GC***]

ISSUE 65 (????)

Potentially helpful text from 2007 rule:

- The Strategy and the Habitat-Based Recovery Criteria supplement to the Recovery Plan have been finalized (72 FR 11376; 72 FR 11376–11377). There have been no significant changes from the drafts of Habitat-Based Recovery Criteria, the Strategy, and the Forest Plan Amendment for Grizzly Bear Habitat Conservation for the GYA National Forests. All the supporting documents have been available for full public review, in accordance

with the Administrative Procedure Act (62 FR 47677, September 10, 1997; 64 FR 38464, July 16, 1999; 64 FR 38465, July 16, 1999; 70 FR 70632, November 22, 2005). The proposed rule also noted that these draft documents were available online at—http://mountainprairie fws.gov/species/mammals/ grizzly/yellowstone.htm. As envisioned by the Administrative Procedure Act, changes to the Reassessing Methods Document were made in response to public comments. These changes did not affect our final determination from that described in the draft rule. We responded to comments in the final documents. The Strategy and the Forest Plan Amendment are existing regulatory mechanisms that are currently in existence and take effect upon implementation of this final rule. Therefore, we considered these mechanisms when determining if the regulatory mechanisms were sufficient to protect the Yellowstone DPS' recovered status.

- By signing the Strategy, responsible agencies demonstrate that they are committed to implementing the features within their discretion and authority. The Strategy provides adequate assurance that the participating agencies will implement the agreement, which is sufficient to meet the reasonableness required for regulatory mechanisms. Furthermore, the USDA Forest Service finalized the Forest Plan Amendment for Grizzly Bear Habitat Conservation for the GYA National Forests and has incorporated this Amendment into the affected National Forests' Land Management Plans (USDA Forest Service 2006a, 2006b, p. 4). This amendment was completed pursuant to the 1982 planning regulations and supported by full Environmental Impact Statement analysis under the National Environmental Policy Act and would not be invalidated by a revision of the Forest Plan pursuant to the 2005 planning regulations. Yellowstone and Grand Teton National Parks appended the habitat standards to their Park Superintendent's Compendiums, thereby assuring that these National Parks would manage habitat in accordance with the habitat standards (Grand Teton National Park 2006, p. 1; Yellowstone National Park 2006, p. 44). These issues, and the use and impact of the various forest planning regulations (1982 and 2005), are discussed under Factor D below.

ISSUE 66 (Tyson)

Potential Content:

- (from 2012 WY wolf) While Wyoming can support more wolves than the agreement requires, the Act does not require managing the species at carrying capacity. Instead, it requires achieving and maintaining recovery and providing reasonable assurance of long term viability so that the population does not again become threatened or endangered. We have determined that Wyoming's approach to wolf management after delisting will achieve these goals and, when considered in the region's larger management scheme, will maintain recovery in Wyoming, the GYA, and across the NRM DPS. Furthermore, the addendum notes Wyoming's authority to revise, reduce, or close hunting seasons if necessary (WGFC 2012, pp. 6–7). Such flexibility allows the State to adaptively respond to population problems should its assumptions on susceptibility to human-caused mortality prove overly optimistic. Overall, we conclude that this approach of managing,

monitoring, and regulating and limiting human-caused mortality, including adjustments throughout the year as necessary, so that minimum management targets will be achieved, the population's recovered status will not be compromised, and the population will not again become endangered within the foreseeable future throughout all or a significant portion of its range.

- State agencies have the authority and the necessary State laws to limit human-caused mortality (U.S. Fish and Wildlife Service 2007, pp. 72– 76) and have committed to do so by signing the Strategy (U.S. Fish and Wildlife Service 2007, p. 13).
- It is true that States cannot compel Federal agencies to manage their lands in accordance with their State plans. However, as participants in the Strategy, both State and Federal agencies have agreed to carry out all provisions of the Strategy, including the appended State plans.
- All monitoring, reporting results, and management actions are centralized under the Coordinating Committee and the Study Team, as described in the Strategy (U.S. Fish and Wildlife Service 2007, pp. 25–67), which all the State and Federal agencies have signed and agreed to implement. The agencies responsible for managing the Yellowstone grizzly bear population upon delisting helped develop the Strategy and have been effectively cooperating and communicating with each other about grizzly bear management decisions for the last 25 years.
- In response to those questioning ability intentions of states/ability to manage → The States are committed to manage grizzlies in accordance with the Strategy and its appended State grizzly bear management plans. By signing the Strategy, all management agencies have agreed to adhere to the sustainable mortality limits.

ISSUE 67 (Joy)

We believe that combined State and Federal commitments will provide for adequate management of the GYE grizzly bear after delisting. Federal funding is dependent on year-to-year allocations whether or not the species is listed. Therefore, we cannot predict with certainty how future governmental appropriations will be directed, and we cannot commit Federal funds beyond those appropriated (21 U.S.C. 1341(a)(1)(A)). Federal funding and management will continue on Federal lands such as the National Parks and Forests, although it may not be to the extent that it was when the GYE grizzly bear was listed. We will also continue to assist the States in securing adequate funding for grizzly bear management,

The Conservation Strategy provides adequate assurance that State and Federal management agencies will implement the agreement, which is sufficient to meet the reasonableness required for regulatory mechanisms. By signing the Conservation Strategy, participating agencies have committed to implementing the protective features that are within their discretion and authority, and to secure adequate funding for implementation. In the unlikely event that grizzly bear management is inadequately funded to carry out the commitments in the Conservation Strategy, the lack of management would trigger a status review for possible relisting under the Act.

ISSUE 68 (Alex/Seth)

Even if hunters mistakenly kill a female grizzly, this grizzly will still count towards the total allowable mortality for females. All three states will require prompt reporting and registration of any grizzly bear mortality; this will ensure that managers appropriately account for the sex of any taken bear. According to the States' regulations, any grizzly bear hunting season will immediately halt if the number of females killed (through any means, discretionary or non-discretionary, by mistake or on purpose) exceeds the allowable mortality limits outlined in the MOA. If a hunter kills a female by mistake and causes an exceedance of the total allowable mortality limits for female bears, managers will subtract this mortality from the total allowable number of kills in the subsequent year, ensuring the number of female grizzly bear mortalities stays in check.

Comment [65]: can we say this? This is explici ly in MT and WY's regs but not Idaho's.

We believe, based on the best scientific and commercial data available, that the regulatory requirements we outlined in our proposed rule, and that the States incorporated into regulation, will maintain a recovered population of grizzly bears in the GYE. We do not believe the hunting regulations in Montana, Wyoming, and Idaho are too liberal but rather believe that their provisions requiring adherence to strict mortality limits, with the additional safeguard of subtracting any excess mortality in subsequent years, will ensure the GYE grizzly bear population remains at healthy levels.

The Conservation Strategy and the Tri-State MOA demonstrate Wyoming, Montana, and Idaho's commitment to coordination in grizzly bear management. We believe the provisions outlined in the Conservation Strategy and the Tri-State MOA are adequate to ensure that the three states coordinate regularly to reconcile mortality statistics, plan appropriate conservation actions, adapt management, and generally assure the continued recovery of grizzly bears in the GYE.

- **Distinguishing between male and female grizzlies**
- **too much latitude in manner of take (e.g., baiting, hounding, trapping, stalking), bag limits, seasons, and sex ratios and age limits for grizzly bear hunting → hunting regulations that are too liberal**
- **gaps in our regulatory requirements would not provide for adequate ecosystem-wide coordination and consistency in regulations**

(above three bullets covered by above paragraph?)

- Additional regulations:
  - **prohibiting the shooting of any grizzly bear traveling with other bears to further ensure females with dependent young are not killed**
  - **coordinate season dates through the Yellowstone Grizzly Coordinating Committee and time seasons to minimize risks to females**
  - **normal licensing and hunting procedures should apply to any grizzly bear hunt (i.e., hunts should be open to the public and non-resident hunters); hunts should not be special limited or controlled hunts**

- **heavy fines or the threat of license revocation for hunters that fail to carry bear spray**
  - RESPONSE: Although the States do not currently require hunters to carry pepper spray, it is strongly encouraged in hunter education courses and other educational materials. For more information on hunter education and public information efforts, see Issue [insert I&E issue #].
- ban on **baiting**, trapping, and the **use of hounds** for grizzly bear hunting in the GYE
  - RESPONSE: We recognize and respect that many find some or all forms of human-caused grizzly bear mortality as morally or ethically objectionable. However, the Act requires that we make our determination based on the status of the subject species (is it recovered and will State management retain that recovered status if the Act's protections are removed) and does not allow us to consider the manner in which individuals will be killed after delisting unless it would affect this overarching viability determination. The manner of take is subject to State control once grizzly bears are delisted. Based on the available information, we do not find any persuasive information to indicate that the manner of killing will affect the viability of the GYE grizzly bear population. Protection of the GYE grizzly bear population and maintenance of the ecosystems on which bears depend has been, and will continue to be, protected to the extent necessary.

- **explain what will be considered "human safety purposes" when deciding whether to allow additional grizzly bear mortality**
- clearly explain the difference between the terms "hunting" and "discretionary mortality" and use each term consistently
  - RESPONSE: The proposed rule defines "discretionary mortality" as "mortalities that are the result of hunting or management removals;" thus, hunting is a form of discretionary mortality. We made changes to the discussion of human-caused mortality in Factor B to clarify this issue.

ISSUE 69 (waiting...then Alex)

Comment [66]: might be more appropriate to draft this after end of this comment period

To respond to request for additional triggers on habitat or food monitoring:

Due to the natural annual variation in abundance and distribution in the 4 major food sources, there is no known way to calculate minimum threshold values for grizzly bear foods. We consider the establishment of habitat thresholds for food sources to be unrealistic. The 1998 baseline will address these issues adequately through access management and limitations on site development. Managers will use an adaptive management approach that addresses poor food years with responsive management actions such as limiting grizzly bear mortality, increasing Information and Education (I & E) efforts, and long-term habitat restoration (i.e., revegetation,

prescribed burning, etc.) as appropriate. The multiple indices used to monitor both bear foods and bear vital rates provide a dynamic and intensive data source to allow the agencies to respond to potential problems. We believe the adaptive management system described in the Conservation Strategy (U.S. Fish and Wildlife Service 2007, pp. 25-60) is one of the most detailed monitoring systems developed for any wildlife species and ensures the maintenance of a recovered grizzly bear population in the GYE.

ISSUE 70 (waiting...then Alex)

ISSUE 70.5 (Alex)

ISSUE 71 (Alex)

ISSUE 72 (Grant)

We believe that the Service's involvement in grizzly bear management, as described in the proposed rule, is appropriate in scope and is consistent with statutory requirements. Under section 4 of the Endangered Species Act, in order to remove a species from the List of Endangered and Threatened Wildlife we must determine whether it is endangered or threatened because of any of the following factors: (A) the present or threatened destruction, modification, or curtailment of its habitat or range; (B) overutilization for commercial, recreational, scientific, or educational purposes; (C) disease or predation; (D) the inadequacy of existing regulatory mechanisms; or (E) other natural or manmade factors affecting its continued existence. For grizzly bears, our analysis of Factors B and D identifies human-caused mortality and the regulations governing it as crucial determinants of whether grizzly bear populations in the GYE will meet the definition of an endangered or threatened species. Therefore, regulatory mechanisms that adequately address these threats are a necessary component of the path to delisting; the proposed rule thus describes standards for evaluating State game regulations and confirming that they are consistent with grizzly bear mortality targets, under the management framework of the interagency 2016 Conservation Strategy. The authority for promulgating hunting regulations for game animals remains with State wildlife commissions; nonetheless, it remains the Service's statutory responsibility to analyze threats to the species under the five listing factors and evaluate whether such regulations are consistent with a delisting determination under the ESA. The State, Federal, and Tribal partner agencies implementing the 2016 Conservation Strategy continue to work together to implement a regulatory framework that allows grizzly bears in the GYE to be recovered and delisted under the ESA, with continuing habitat and population management under the authorities of the individual agencies.

After the delisting of grizzly bears in the GYE, the regulatory protections of the ESA will be withdrawn but the Service will continue to evaluate the species' status through post-delisting monitoring as described in the interagency 2016 Conservation Strategy. Because grizzly bears are vulnerable to excessive human-caused mortality, we anticipate that after delisting there will be a continuing need for grizzly bear conservation measures under the Conservation Strategy to

Comment [67]: update citation to Conservation Strategy (include page numbers)

Comment [68]: might be more appropriate to draft this after end of this comment period

Comment [69]: might be more appropriate to draft this after end of this comment period

Comment [70]: might be more appropriate to draft this after end of this comment period

be implemented actively under the jurisdiction and authority of the various Federal, State, and Tribal agencies. With continuing interagency cooperation in implementing the Conservation Strategy, we fully expect that it will be feasible to maintain healthy grizzly bear populations in the GYE without the protections of the ESA. As is the case for any non-listed species, the Service could potentially review the grizzly bear for re-listing in response to petitions, or at our discretion if we believe it may meet the definition of a threatened or endangered species (e.g., if population and mortality targets in the Conservation Strategy should consistently fail to be met). [****check this language for legal consonance with listing process and standards****]

We anticipate that the Federal government will continue to be involved in grizzly bear management after delisting. As discussed in the proposed rule, the National Park Service, Forest Service, and Bureau of Land Management are responsible for land management over much of the GYE, and will continue to be actively involved in interagency groups implementing the Conservation Strategy. The Service plans to remain informed about grizzly bear status and population trends, and to remain engaged with partners as the Conservation Strategy is implemented. [****please revise if more specific details about future Service role are needed****] However, with delisting, the ESA will no longer provide a statutory mandate for the Service to hold primary responsibility for grizzly bear management; primary authority for population management will rest with State wildlife commissions and fish and game agencies under State laws and regulations. As noted previously, land management actions affecting grizzly bears will continue to be implemented by various State and Federal agencies under their respective legal authorities, as well as by Tribal and private landowners. As participants in the Strategy, both State and Federal agencies have agreed to carry out all provisions of the Strategy, including the appended State plans.

As discussed in the proposed rule, we believe that limited and well-regulated hunting of grizzlies can be compatible with meeting mortality targets under the Conservation Strategy, and thus maintaining a healthy population that does not require ESA protections. Therefore, we do not believe that State classification of grizzly bears as a nongame species is a necessary prerequisite for delisting.

ISSUE 73 (Grant)

The proposed rule uses the term “conservation-reliant species” in reference to Scott et al. (2005), who originally defined these as “species that can maintain a self-sustaining population in the wild only if ongoing management actions of proven effectiveness are implemented” (p. 386). While this term is not a statutory or regulatory designation under the ESA, we believe the concept has practical implications for the process of delisting a species under the ESA. Species “that are threatened by clear and remediable threats that are highly unlikely to occur” (p. 386) might be readily delisted without ongoing management agreements once certain discrete recovery actions are complete. Conservation-reliant species, on the other hand, because they are likely to require ongoing maintenance, are likely to require some assurance that ongoing

management will be implemented. This distinction would be reflected in the analysis of Factor D (the inadequacy of existing regulatory mechanisms) within a delisting rule.

Because grizzly bears have naturally low reproductive rates, they are vulnerable to depletion by non-sustainable harvest levels, and prior to their listing this factor was a major contributor to their decline[***cite best reference?***]. For grizzly bears in the GYE, as stated in the proposed rule, we expect that "(t)he need to carefully manage human-caused bear mortality and to coordinate management of the population across multiple land ownerships and jurisdictions will always remain." We believe that appropriate game regulations, if adequately implemented and enforced, will be able to maintain viable grizzly bear populations in the GYE. Thus we consider it appropriate to characterize them as "conservation-reliant". The 2016 Conservation Strategy was developed with the commitments of multiple signatory agencies due to this ongoing need for coordinating interagency management and ensuring that mortality limits are not exceeded. We fully expect that this Conservation Strategy will be able to successfully maintain a viable grizzly bear population in the GYE, but at the same time we anticipate that the need for active interagency coordination and commitments to implementing this Conservation Strategy and monitoring its success will remain into the future. If threats continue to be managed such that mortality targets are successfully met, we do not anticipate a need for renewed listing under the ESA.

- Excerpts from proposed rule:
  - "The 2016 Conservation Strategy will remain in effect in perpetuity, beyond delisting and the 5-year monitoring period required by the Act as grizzly bears, like many other species, will always be ''conservation-reliant'' (Scott et al. 2005, p. 384) because of their low resiliency to excessive human-caused mortality. The need to carefully manage human-caused bear mortality and to coordinate management of the population across multiple land ownerships and jurisdictions will always remain." (13209)
  - "Conservation-reliant species can maintain recovered, self-sustaining wild populations with ongoing management actions (Scott et al. 2005, p. 383). These management actions are detailed in the draft 2016 Conservation Strategy and will be informed and updated as necessary by all the habitat and population parameters that will be annually monitored by the IGBST." (13223)
- Excerpts from Scott et al. 2005 (paper referenced in proposed rule):
  - "Conservation-reliant species" can maintain self-sustaining wild populations with ongoing management actions (383)
  - Criteria for assessing whether a species is conservation-reliant (384)
    - Threats to the species' continued existence are known and treatable
    - The threats are pervasive and recurrent, eg nest parasites, nonnative predators

        - The threats render the species at risk of extinction, absent ongoing conservation management
        - Management actions sufficient to counter threats have been identified and can be implemented, eg prescribed fires, restrictions on grazing or public access, predator or parasite control
        - Federal, state, or local governments – often in cooperation with private or tribal interests – are capable of carrying out the necessary management actions as long as necessary. ("In perpetuity" is a lightning rod)
    - "We suspect that the only "walkaway" species are likely to be those few that are threatened by clear and remediable threats that are highly unlikely to recur. Most listed species will require continuous management action in order to maintain their recovered status. They are "conservation-reliant" species, in other words, species that can maintain a self-sustaining population in the wild only if ongoing management actions of proven effectiveness are implemented. A "self-sustaining" population should be able to remain stable or increase over time without human assistance to reproduction or dispersal in the wild. Although occasional translocations to maintain genetic diversity would not violate this notion of a self-sustaining population, frequent translocations to overcome anthropogenic dispersal barriers or to compensate for losses due to predation, disease, or other mortality factors would. Examples of management actions that would meet our criteria for defining "conservation-reliant" include control of invasive species, the recurring use of prescribed fire to maintain suitable habitat, restrictions on grazing or public access, predator control, regularly scheduled water releases from dams, or limited translocations to maintain genetic diversity. We would not consider species to be conservation-reliant if they are dependent upon releases of captive-reared individuals (eg California condor or hatchery-reared salmon; Myers et al. 2004) or manipulation of large portions of a species' population rather than manipulation of its habitat (eg barging of salmon smolts across dams to overcome migration barriers; Ward et al. 1997; Levin and Tolimieri 2001; Figure 7). Considering a species to be recovered on the basis of populations sustained only through captive propagation, removal from the wild, or artificial migration is inconsistent with the objective of the ESA to conserve ecosystems [ie ESA sec 2(b)]." (386)
    - "The conservation-reliant species concept serves at least two purposes. First, it explicitly acknowledges that the simplistic model of recovery – a species is listed, steps are taken to resolve the threats, the species is delisted and lives happily ever after – is unrealistic. Most rare species are dependent upon ongoing conservation management. Second, and more important, the conservation-reliant species concept can assist in recovery by allowing a species whose population has stabilized at or above its recovery goals to be delisted, even though the threats to

its existence can only be successfully mitigated rather than eliminated by ongoing conservation management...For these threatened, conservation-reliant species, statutory restrictions could be replaced with more flexible regulations as long as the needed management is being supplied." (387)

ISSUE 74 (waiting…)

ISSUE 75 (Alex)

ISSUE 76 (BLM helping)

Upon delisting of the GYE grizzly bear, they will be added classified as a sensitive species by the Bureau of Land Management for at least 5 years. This information has been added to both the rule (*see* Factor A) and the Conservation Strategy (*see* Chapters 3 and 6).

DPS/SPR comments

ISSUE 77 (Maricela)

ISSUE 78 (Maricela)

ISSUE 79 (Maricela)

ISSUE 80 (Maricela)

Limited gene flow, as suggested here, would not compromise the required level of discreteness for DPS status, as the DPS policy does not require complete separation of one DPS from other populations, but instead requires ''marked separation.''

Forest Service issues

ISSUE 81 (Jennifer/Forest Service)

ISSUE 82 (Jennifer/Forest Service)

In response to concerns about our portrayal of the Forest Service designations of wilderness areas, wilderness study areas, and roadless areas in the proposed rule, revisions were made to the Rule (*see* Factors A and D) that provide clarification to our description of the Forest Service designations of wilderness, wilderness study areas, and roadless areas and the protections each of these designations provide. Although it is true that development can occur in conjunction with oil and gas leases that pre-date the roadless rule, these claims must be valid to be pursued and the plans of operation are subject to reasonable regulations to protect roadless characteristics with mitigation to offset potential impacts from development. Although

motorized roads and trails may occur in roadless areas, they are subject to forest travel management plans. The roadless rule is no longer under judicial review and was upheld by the 10th Circuit Court of Appeals (*Wyoming v. United States Department of Agriculture,* 661 F.3d. 1209 (10th Cir. 2011)). If valid mining claims are pursued, the plans of operation are subject to reasonable regulations to protect wilderness values with mitigation to offset potential impacts from development. Although pre-existing livestock permits are allowed under these designations, new livestock allotments are not permitted in these areas.

ISSUE 83 (Jennifer/Forest Service)

ISSUE 84 (Jennifer/Forest Service)

Calibration response

IGBST will evaluate any new method to estimate population size within the DMA. If accepted, the new method will be used in conjunction with the model-averaged Chao2 method until it is calibrated to the model-averaged Chao2 method. The population objectives, confidence intervals, and mortality limits will also be reset to be consistent with the goal of maintaining a stable population around the 2002-2014 population average, as measured by the new method. The recovery objective for the GYE population of grizzly bears is to maintain the population at the average size between 2002 and 2014. A new method may produce a different population average between 2002 and 2014. This new average would be the new population objective. Determining the correlation or correction between the model-averaged Chao2 method and any new estimation method (and appropriately resetting the population objective, confidence intervals, and mortality limits) is critical to maintaining the population at the 2002-2014 average. *From Forest Service position statement: Consistent with this objective, the best science available should be utilized to maintain the total population size near the average population estimate for the period of stability achieved during 2002-2014, regardless of which population estimator is used.*

Mary,
At Dan's direction, and per your request, attached is a copy of the USFS Position Statement pertaining to GYE grizzly bear population objectives. This is the document that was sent to and approved by Dave Schmid. It is ready to be delivered to USFWS.

US Forest Service Statement of interest in management objectives for the GYE grizzly bear
9/15/2016

In March 2016, the U.S. Fish and Wildlife Service (USFWS) published a Proposed Rule to remove the Greater Yellowstone Ecosystem (GYE) grizzly bear population from the Federal List of Endangered and Threatened Wildlife. As stated in the May 13, 2016, letter from Leslie Weldon (Deputy Chief, National Forest System) to the USFWS, the Forest Service supports the Proposed Rule, inclusive of the statements that the Yellowstone grizzly bear population is stable and that the threats to this population are sufficiently minimized. However, as also indicated in that letter, the Forest Service has concerns regarding language in the Proposed Rule and Conservation Strategy associated with population management objectives. Principally, these concerns involve language consistency between the two documents and clarity in stated objectives.

In recent decades, the Forest Service has contributed significantly to the successful multi-agency program to recover and conserve the GYE grizzly bear. These efforts have resulted in a demonstrative increase in secure habitat and a biological recovery of the population. In light of this commitment, the Forest Service has a vested interest in implementing a Conservation Strategy that provides the best framework for managing the GYE grizzly bear population into the future. To that end, it is in the best interest of all partner agencies, as well as the grizzly bear, that an overall population objective is clearly stated and in a manner consistent between the Final Delisting Rule and the Conservation Strategy. To ensure transparency in a delisting process and to withstand legal challenge, the Forest Service leadership supports providing a post-delisting management objective that promotes maintaining a stable grizzly bear population. Consistent with this objective, the best science available should be utilized to maintain the total population size near the average population estimate for the period of stability achieved during 2002-2014, regardless of which population estimator is used.

The Forest Service affirms the commitment to manage GYE habitat commensurate with this population objective. It also intends to manage habitat in a manner that promotes natural movement and genetic exchange between GYE grizzly bears and nearby populations.

Recovering the Yellowstone grizzly bear population has been a 40-year lesson in cooperation and commitment toward a common goal. In that spirit, the Forest Service is similarly committed to working with partner agencies to see the legacy of this remarkable accomplishment secured by attending to the conservation of the GYE grizzly bear population.

Subject: YES Conference Call and November Meeting Reminder

Custer Gallatin National Forest

Fellow Committee members: a reminder that we set aside ***Friday October 28th from 1 to 3 p.m.*** for a full Committee conference call.
The intent is to review and seek agreement on final Conservation Strategy language for key points in Appendix C that have been under discussion between the Department of Interior and the States. We expect to get you any revised language before the call.

Call in information is as follows:

Conference Line: 888-844-9904, Passcode 7621437#

In Bozeman, we will gather at the Fish, Wildlife and Parks Office for the call.

The November YES Meeting will be November 16th and 17th in Cody. It will be preceded by the GYCC meeting on the 15th and 16th. The YES meeting will start at 1 p.m. on the 16th and end at noon on the 17th.

We will be at the Buffalo Bill Center of the West. There are several motels in Cody. We have held a block of rooms at the Holiday Inn, under the "Greater Yellowstone Coordinating Committee" with a $104/night government rate. Their phone number is 307-587-5555.

Thanks to all for your attention to this.

Subject: Re: snow mobiling

We have no documented records of grizzly bears abandoning dens do to snowmobile activity. Since the winter of 2013-2014, I have been responsible for documenting potential conflicts between denning and/or emerging grizzly bears and snowmobile use on the Gallatin National Forest. For the last 3 denning seasons there have been no reports of grizzly bear active during the winter/early spring seasons by agency personnel (IGBST or MTFWP) that indicated potential conflicts between denning and/or emerging grizzly bears and snowmobile use. Reports to the Gallatin National Forest for the winters of 2013-14, 2014-15, and 2015-16 are attached.

Additionally, during the winter of 2009-2010, a grizzly bear was observed digging a den in the Squaw Basin, Bridger-Teton National Forest in a area heavily used by snowmobiles. The attached reports documents over winter snowmobile activity near the den site. The grizzly bear remained in the den throughout the winter and emerged 20 April 2010 with one cub-of-the-year.

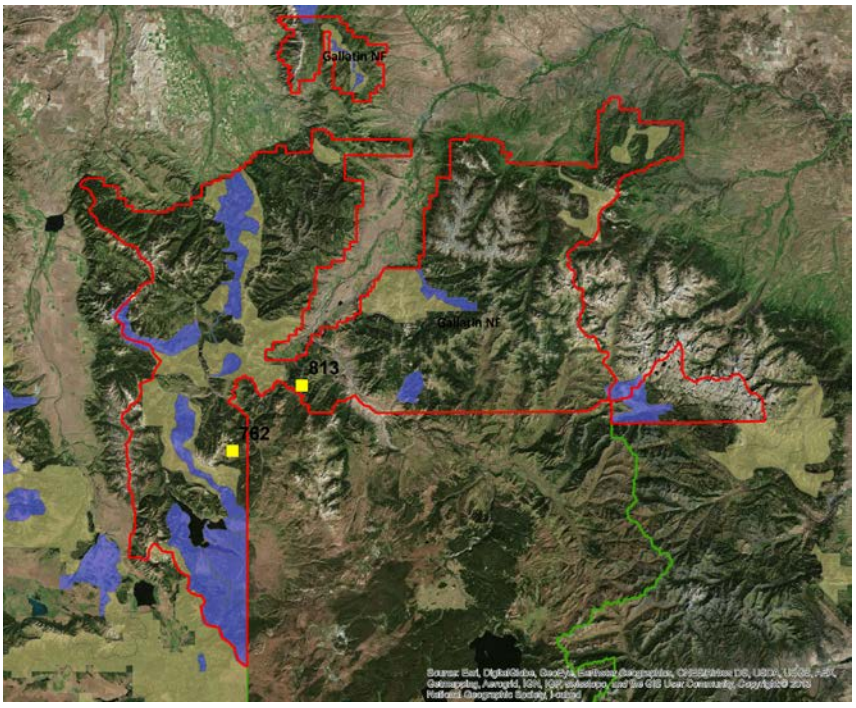
Report to GNF for Grizzly Bear Den Sites 2015-16.

5) New Grizzly Bear Den Site Locations Relative to Snowmobile Use.



Two den sites from radio-marked grizzly bears were located on the Gallatin National Forest during the winter of 2015–16. Both den sites were in areas closed to snowmobiling.

6) Grizzly Bear Detections in Winter/Early Spring.

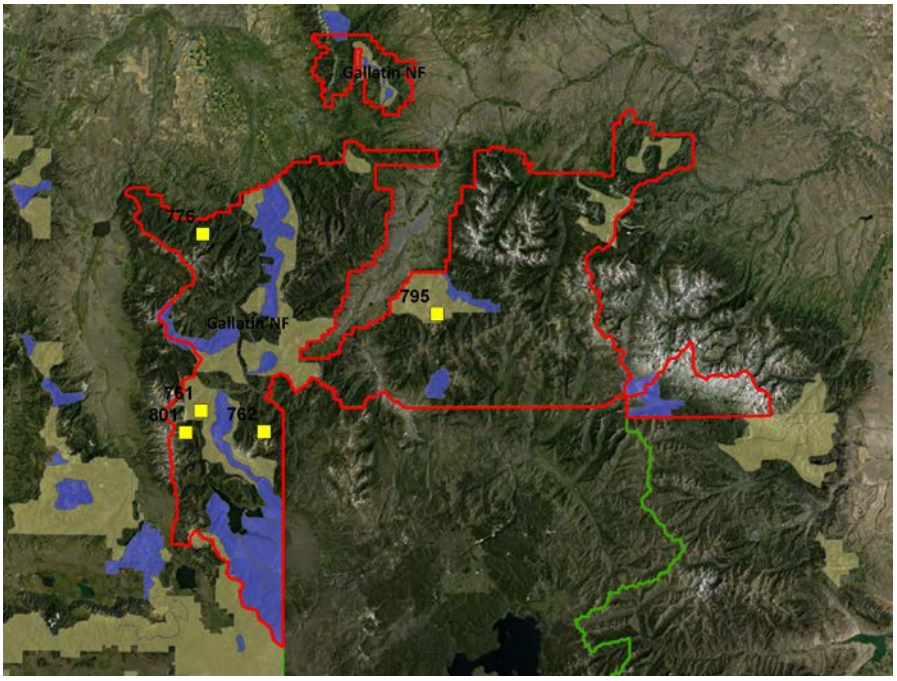
There were no grizzly bear sightings, nor detections of grizzly bear activity in the winter or early spring seasons throughout this reporting period by any GNF personnel. Further, there were no reports of bears active during the winter/early spring seasons by other agency personnel (IGBST or MTFWP) that indicated potential conflicts between denning and/or emerging grizzly bears and snowmobile use on NFS lands within the Gallatin Forest boundary.

7) Grizzly Bear Population Trends and Potential Impacts from Snowmobile Use

Mark Haroldson, Supervisory Wildlife Biologist for the IGBST was contacted (personal communication, Bozeman, MT, 25 August 2016) and he indicated that IGBST has no data to indicate that snowmobile use on the Gallatin National Forest is having any impact on grizzly bear demographics in the GYA.

Report to GNF for Grizzly Bear Den Sites 2014-15.

5) New Grizzly Bear Den Site Locations Relative to Snowmobile Use.



Five den site locations from radio-marked grizzly bears were located on the Gallatin National Forest during the winter of 2014–15. Two den sites were in areas open to snowmobiling. However there was no immediate concern for snowmobile use causing issues with either den site as both were located in relatively inaccessible areas, and additionally, 1 was also in heavy timber (M. Haroldson personal communication, Bozeman, MT, 23 June 2014).

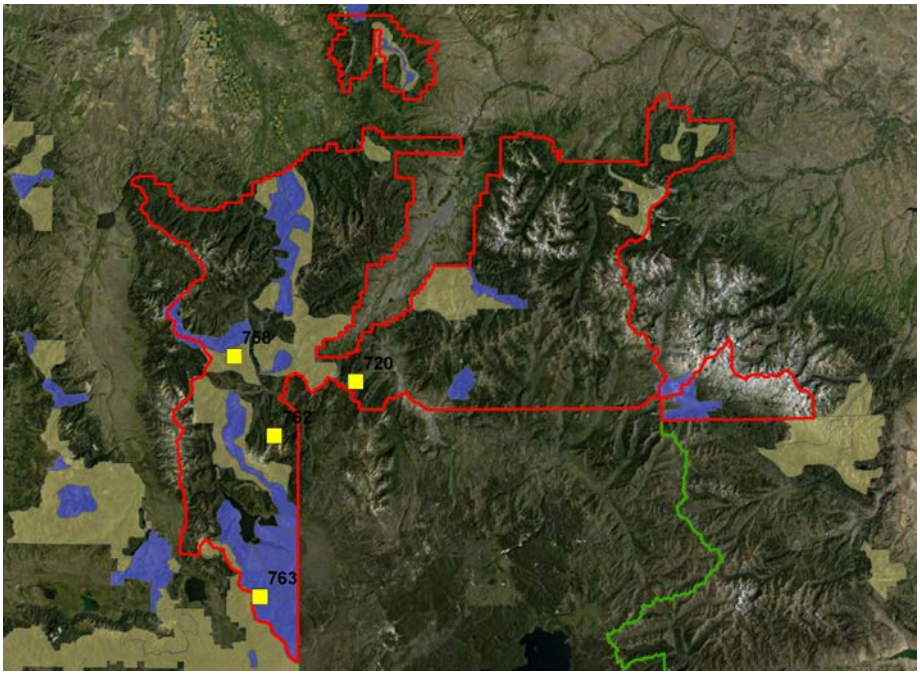
6) Grizzly Bear Detections in Winter/Early Spring.

There were no grizzly bear sightings, nor detections of grizzly bear activity in the winter or early spring seasons throughout this reporting period by any GNF personnel. Further, there were no reports of bears active during the winter/early spring seasons by other agency personnel (IGBST or MTFWP) that indicated potential conflicts between denning and/or emerging grizzly bears and snowmobile use on NFS lands within the Gallatin Forest boundary.

7) Grizzly Bear Population Trends and Potential Impacts from Snowmobile Use

Mark Haroldson, Supervisory Wildlife Biologist for the IGBST was contacted (personal communication, Bozeman, MT, 23 June 2015) and he indicated that IGBST has no data to indicate that snowmobile use on the Gallatin National Forest is having any impact on grizzly bear demographics in the GYA.

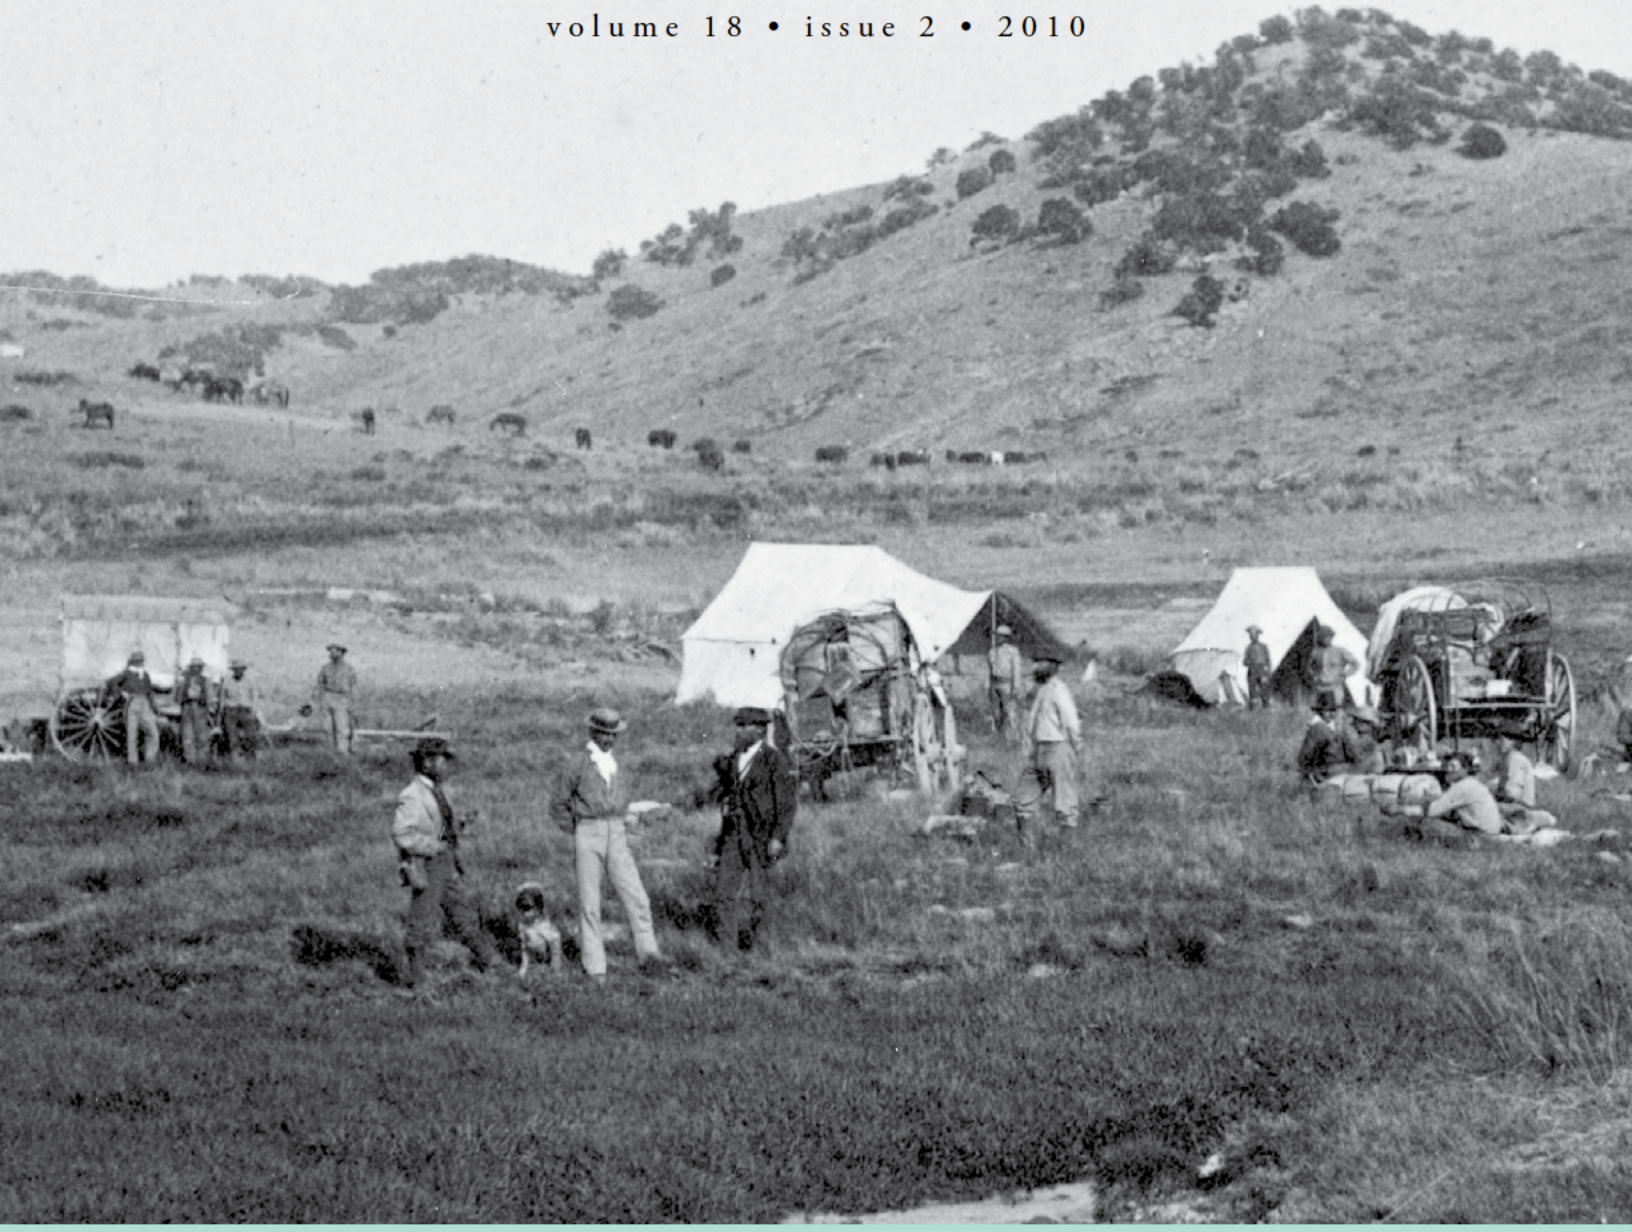
Report to GNF for Grizzly Bear Den Sites 2013-14.



H. New Grizzly Bear Den Site Locations Relative to Snowmobile Use.

Four new den site locations were discovered during the winter of 2013–14 on the Gallatin National Forest. Two were in areas open to snowmobiling. However there was no immediate concern for snowmobile use causing issues with either den site because both were in heavy timber (>40% canopy closure) and in relatively inaccessible locations (M. Haroldson personal communication, Bozeman, MT, 28 July 2014).

I. Grizzly Bear Detections in Winter/Early Spring.



There were no grizzly bear sightings, nor detections of grizzly bear activity in the winter or early spring seasons throughout this reporting period by any GNF personnel. Further, there were no reports of bears active during the winter/early spring seasons by other agency personnel (IGBST or MTFWP) that indicated potential conflicts between denning and/or emerging grizzly bears and snowmobile use on NFS lands within the Gallatin Forest boundary.

J. Grizzly Bear Population Trends and Potential Impacts from Snowmobile Use
Mark Haroldson, Supervisory Wildlife Biologist for the IGBST was contacted (personal communication, Bozeman, MT, 28 July 2014) and he indicated that IGBST has no data to indicate that snowmobile use on the Gallatin National Forest is having any impact on grizzly bear demographics in the GYA.

Greater Yellowstone Science: Past, Present, and Future

Science Agenda for the Greater Yellowstone Area

Grizzly Bears and Snowmobile Use

LYNN WELLS

A grizzly sow and her cub emerge from their den and wander away amidst snowmobile tracks.

The *Aww* of Science

This photo from Sarah Hegg's article of a grizzly sow and her cub is compelling for its *aww* factor, a reminder of why we live and work here. It is also an image of the resilience of nature that Paul Schullery talked about at a November 2009 science agenda workshop focused on climate change, land use change, and invasive species. Hegg's study provides an example of the tolerance that a bear can have for human activities. It also illustrates how scientific information can be used to manage a situation for the benefit of both wildlife and humans.

With all the uncertainty that climate change brings, getting scientific information that can inform decision making into the hands of managers is as relevant as ever. Managers and scientists agree that in the face of these global issues, cross-boundary partnerships and increased communication are critical to efforts to discuss management options in future scenarios. The November workshop was one of many current efforts to bring people together to develop viable, long-term, integrated approaches to ecosystem management. Tom Olliff et al. present some of the results from that workshop here as a Greater Yellowstone Area Science Agenda.

As Schullery reminds us in his talk, crises in the Yellowstone area have come and gone. Climate change opens a new chapter and offers new opportunities for mucking around, adaptive management, and plain old observation. How we make these choices will frame how historians speak of us.

Please join us at the 10th Biennial Scientific Conference on the Greater Yellowstone Ecosystem, *Questioning Greater Yellowstone's Future: Climate, Land Use, and Invasive Species*, October 11–13 at Mammoth Hot Springs, for lively discussions on these topics. For more information go to: www.greateryellowstonescience.org/gyesciconf2010.

We hope you enjoy the issue.

Grizzly Bears and Snowmobile Use

A Summary of Monitoring a Grizzly Den on Togwotee Pass

Sarah J. Hegg, Kerry Murphy, and Dan Bjornlie

During winter 2009–2010, a grizzly bear was observed digging a den in the Squaw Basin area of Togwotee Pass, providing a unique opportunity to monitor a grizzly bear den and the bear's reaction to snowmobile use. Togwotee Pass is located on the Bridger-Teton National Forest, in the southern part of the Absaroka mountain range in northwestern Wyoming. This majestic mountain range forms a part of the southern and eastern border of Yellowstone National Park. Squaw Basin is an open meadow area, approximately 500 meters (1,640 ft) from State Highway 26/287 and 1,300 meters (4,265 ft) from the popular Continental Divide snowmobile trail. The Togwotee Pass area is well known by snowmobile recreationists and there are almost 402 kilometers (250 mi) of groomed snowmobile trails in the area. With the exception of designated Wilderness areas and a handful of ungulate winter ranges that require humans to stay on designated trails, much of the terrain on Togwotee Pass is open to off-trail snowmobile use. Squaw Basin is one of those popular places for snowmobilers to freely explore large open meadows and hillsides.

Much of the snowmobile activity in the Greater Yellowstone Ecosystem occurs on the same federal lands that are also home to the Yellowstone grizzly bear population. In order to properly manage federal lands, wildlife biologists have tried to analyze the possible effects of snowmobiling on the bears of the Greater Yellowstone Ecosystem. Studies have found that bears are potentially sensitive to disturbance by roads, human habitation, and industrial activity (Linnell et al. 2000). Also, grizzly bears may prefer den sites in remote areas with little human use or activity within 1–2 kilometers (0.62–1.24 mi) (Goldstein et al. 2010; Craighead and Craighead 1972). While these studies may seem to point to a possible sensitivity by bears to other general disturbances, very little is known specifically about a bear's reaction to snowmobiles. Due to the scarcity of information, the US Fish and Wildlife Service recommends monitoring known grizzly bear dens in snowmobile recreation areas.

Methods

In December 2009, the Interagency Grizzly Bear Study Team notified the Bridger-Teton National Forest of the Squaw Basin den. It was occupied when it was first reported by hunters in November and it was observed from a distance by Wyoming Game and Fish Department biologists

Camera set-up used to monitor snowmobile and grizzly bear activity at a den site on Togwotee Pass, Bridger-Teton National Forest, January–April 2010. Camera #1 on the left and Camera #2 on the right. The camera site is located approximately 175 meters north of the den.

SARAH HEGG

Photo of the hillside supporting the grizzly bear den and snowmobile activity near Togwotee Pass, Bridger-Teton National Forest, taken from the camera site on January 19, 2010. The collapsed breathing hole that was observed on January 12, 2010 is circled.

throughout the next several months. In January 2010, two RECONYX® cameras were deployed on a rocky outcrop approximately 175 meters (574 ft) north of the den to remotely monitor bear and snowmobile activity in the area. The cameras were positioned to obtain a panoramic view of the den, encompassing an area of approximately 5 hectares.

The RECONYX® cameras were programmed to take pictures every 5 minutes during daylight hours. Due to their distance from the den, the cameras were not triggered by movement on the hillside that supported the den. During January through April the camera site was visited every 1–2 weeks, during which visual observations were made and memory cards were collected.

Observations and track counts were gathered using a variety of procedures. Most of the general observations were taken from the camera site, using both binoculars and plain sight. The snowmobile track counts were made using the RECONYX® photos. The photos were viewed individually and a new track was counted when it became visible. The tracks were counted in two categories. One category was for tracks that drove directly over the den area, defined as within a 25-square-meter (83 ft^2) area of the den entrance. The other category counted any tracks that could be seen around the hillside that supported the den, including those directly over the den.

Some discrepancies were found between the number of snowmobile tracks captured by the two cameras. Due to glare from the sun and snow, and camera lenses being occasionally covered by drifting snow, each camera captured close but slightly different track numbers. For consistency, only the track numbers counted by Camera #1 were used in the graphs and statistics reported in the following sections.

Results

The den was first reported to Wyoming Game and Fish Department biologists in early November 2009. The den was then monitored from Highway 26/287 by the Wyoming

Photo of the hillside supporting the grizzly bear den near Togwotee Pass, taken from Highway 26/287 on April 21, 2010, a few days after bear emergence, showing the entrance hole and both bear and snowmobile tracks. The den entrance is circled and bear tracks are marked with an arrow.

Game and Fish Department several times thereafter through December 2009. The Wyoming Game and Fish Department found that the den entrance was covered by snow on December 3, 2009. A few kite-skiing tracks were observed near the den in early November and again in early December. No snowmobiles were observed near the den until the end of December, although there was some snowmobile use reported in the general Squaw Basin area during those months.

On January 12, 2010, the RECONYX® cameras were installed and monitoring with photos began. On that same day, a hole was first observed over the den entrance. This was presumed to have been caused by snow collapsing into the den hole when a snowmobile user drove directly over the den. It was the first sign of den presence since it was initially covered with snow in early December. The den entrance was subsequently covered by snow after an ensuing winter storm and there was no other sign of den occupation until bear emergence in April.

We visited the camera site on Monday, April 19, to recover photos and make visual observations of the den site. The RECONYX® photos revealed that the den entrance was first exposed by the bear at 4:36 PM on Sunday, April 18. At 2:00 PM on Tuesday, April 20, we observed a sow with one cub of the year 10 meters (32 ft) from the den entrance, prompting the Buffalo District Ranger to initiate an emergency closure of the area surrounding the den to help ensure public safety and bear security. On Wednesday, April 21 at 1:00 PM, the sow and cub were observed leaving the den area, moving west across a large (approximately 50 hectares) treeless area toward conifer cover 1 kilometer from the den.

At 9:00 AM on Thursday, April 22, we located the family's tracks leaving the den and followed them to the treed area. We also followed the tracks back to the den area where three bed sites were found on an east-facing hillside approximately 130 meters (426 ft) west of the den. We collected hair from those bed sites and sent them to the Interagency Grizzly Bear Study Team for DNA analysis. This may

provide individual bear identification and lineage of the bear when included in the full Greater Yellowstone Ecosystem grizzly bear DNA database.

We monitored the den site intermittently from the highway for six days following emergence. There was no sign of the bears' return to the den area, despite ample fresh snow that would clearly indicate use of the site by the family. The closure was then lifted and the cameras removed.

Snowmobile use occurred in the general vicinity of Squaw Basin meadow (approximately a 370 hectares), the den hillside itself (approximately 2.5 hectares), as well as at the den entrance (figs. 1 and 2). All recreation use observed was by snowmobiles, with the exception of one snow-kite skier. Snowmobile use increased at the end of December and continued throughout the rest of the winter. There was an increase in use on weekends—65% of tracks occurred on weekend days versus weekdays. April 12 was the last time a snowmobile was observed on the den hillside—six days before bear emergence. The average number of new tracks per week was 11.5, ranging from a minimum of 0 to a maximum of 23. The total number of tracks directly over the den area for the entire winter was 48.

Discussion

The denning period is a vulnerable time for bears. On average, lactating females lose 30%–40% of their body weight during the winter (Schwartz et al. 2003). Studies on black bears have shown that body weight can decrease an additional 3%–20% if dens are abandoned (Tietje and Ruff 1980). Of the potential reactions to disturbance, the abandonment of a den by a sow with a neonatal cub carries the highest energy cost (Linnell et al. 2000), since it exposes the cub to many risks and greatly decreases its chance for survival. Therefore, females with cubs should be expected to withstand the greatest levels of disturbance without abandonment (Cherry 2001), and it may be expected that maternal females may tolerate snowmobile activity, even directly on top of the den.

Our observations suggest tolerance by some bears to disturbance from both highway and snowmobile traffic. The sow and her cub experienced high levels of disturbance by snowmobiles during the winter—an average of 11.5 snowmobile tracks on the den hillside per week. Although significant snowmobile use likely did not occur until mid-late

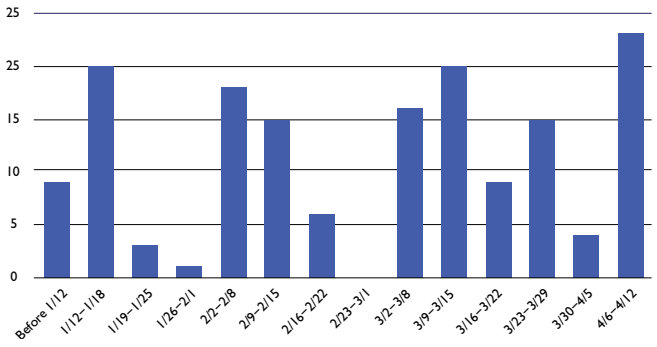

Figure 1. The weekly number of total snowmobile tracks observed within a 2.5 hectare area around the grizzly bear den at Togwotee Pass, including tracks directly over the den entrance. The number of snowmobile machines associated with the weekly counts was not estimated.

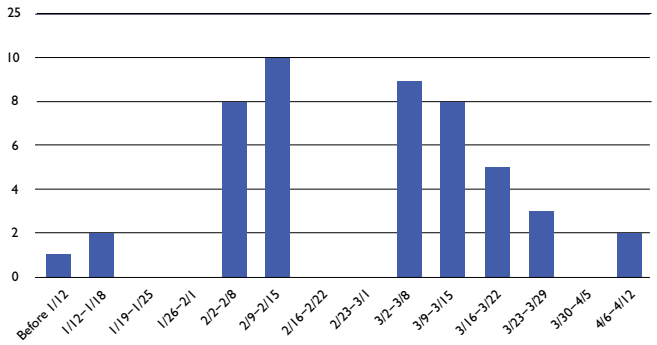

Figure 2. The weekly number of snowmobile tracks observed within 25 square meters of the den entrance, Togwotee Pass.

December, when the sow had already selected the site and built the den, the highway was in use at the time the den was selected and dug by the sow. Bears may be more likely to abandon dens if disturbed shortly after entry rather than in mid-winter (Craighead and Craighead 1972; Linnell et al. 2000).

While the sow did not abandon the den, lesser responses to disturbances, such as increased heart rate, waking and movement in the den, among others, are possible and also have the potential to increase energy costs (Linnell et al. 2000). The presence or absence of these responses could not be determined by this monitoring.

One factor contributing to the successful over-wintering may be that the snow covering the den may have significantly diminished the sound and vibrations from snowmobiles and the highway. Studies with polar bears in Alaska have found dry arctic snow to be a good sound insulator (Blix and Lentfer 1992).

After emergence, the amount of time spent by grizzly bears in the vicinity of the dens is variable (Judd et al. 1983). However, it is not uncommon, particularly for sows with cubs of the year, to spend several weeks in the vicinity of the den after emergence (Craighead and Craighead 1972). Haroldson et al. (2002) found that females with cubs often stay within 3 kilometers (1.8 mi) of the den until late May. This den was apparently abandoned within about 24 hours of emergence. At the time of the bears' emergence there was no known snowmobile use in the nearby area for the 24 hours they remained close to the den. Therefore, we were not able to assess any potential reactions to snowmobile use close by the den. Disturbances by traffic along the highway may have contributed to an apparent early departure from the den area. While this sow and cub may have abandoned the den site proper, it is possible they remained within a 3 kilometers (1.8 mi) radius.

A considerable amount of glare on the camera lens resulted from the sun and snow. During most cloudless days, this glare was strong enough to completely block photos of activity on the hillside for significant lengths of time. Drifting snow also periodically covered the camera and/or lens. This happened with both cameras, although it was more frequent with Camera #2, which was located in the corner of a large rock outcrop which may have contributed to the drifting snow. These difficulties likely explained the discrepancies in track numbers observed between the two cameras.

Management implications

This example suggests tolerance by a bear to large amounts of snowmobile use and disturbance during her denning period. However, as noted by other researchers (Craighead and Craighead 1972; Mace and Waller 1997; Haroldson et al. 2002), perhaps the greatest potential for negative consequences of direct disturbance for females with newborn cubs is directly after emergence. This case does not amend that hypothesis; the sow selected the site long before snowmobile use occurred, and having a cub of the year present

SARAH HEGG

KERRY MURPHY

Author Sarah Hegg following the tracks of the sow and cub on April 22, 2010, after they left the den vicinity.

would have greatly increased the potential costs of moving the den site. Monitoring dens in high disturbance situations and taking cautionary measures after emergence is important to protect bears and better understand their reactions to human activity. However, because grizzly bears rarely reuse a den site, particularly one dug into a hillside (Judd et al. 1986), providing extended area protections in a situation such as this is likely unnecessary. As the grizzly bear population in the Greater Yellowstone Ecosystem increases, conflicts with recreationists may also increase. Observations such as this can be referenced to evaluate anthropogenic effects on grizzly bears and future research and management actions.

Acknowledgements

Thanks to Kerry Murphy for his patient mentorship. Thanks to the Bridger-Teton National Forest Buffalo Ranger District staff, specifically Wade Undem and Rick Taylor, for their assistance in monitoring the den. Thanks also to Gordon Ash, Tom Hill, Jim Ramirez, Ray Spencer, and Mike Boyce for their quick response in implementing the closure and assisting den monitoring post-emergence. Dan Bjornlie and Dan Thompson (WGFD) helped provide the remote cameras and set up the monitoring site. Thank you to Mark Haroldson of the Interagency Grizzly Bear Study Team for his valuable advice and counsel. Thanks to Lynn Wells for the useful and entertaining photos.

COURTESY SARAH HEGG

Sarah Hegg has worked in wilderness recreation and wildlife biology for the Forest Service for the last seven years in New Mexico and Wyoming, along with various other wildlife research projects in the southern GYA. She is currently a biological technician working for Grand Teton National Park on a whitebark pine regeneration study. Sarah attended the College of St. Benedict in St. Joseph, Minnesota, from which she received a BA in Natural Science and Ecology. **Kerry Murphy** has worked with a variety of state, tribal, and federal agencies as a technician and wildlife biologist, and with numerous large and medium-sized carnivores in both a research and management context, including cougars, black bears, bobcats, Canada lynx, wolverines, and gray wolves. Kerry served as an endangered species and mid-sized carnivore biologist with the National Park Service in Yellowstone National Park from 1998 to 2009. Kerry is currently a wildlife biologist for the Bridger-Teton National Forest in Jackson, Wyoming. In addition to the ecology of carnivores, Kerry has a broad interest in wildlife population and habitat management. **Dan Bjornlie** is a bear biologist for the Wyoming Game and Fish Department.

The Honorable Daniel M. Ashe
Director, U.S. Fish and Wildlife
Department of the Interior
1849 C St., NW
Washington, D.C. 20240

Dear Secretary Jewell and Director Ashe,

Our collective organizations write to you today with our concerns and opposition to the current process to delist grizzly bears in the Greater Yellowstone Ecosystem. Grizzly bear recovery in the Greater Yellowstone Ecosystem is testament to years of hard work on the part of federal and state agencies, many NGOs and committed individuals. Unfortunately, the delisting process, rather than building on this success, has exacerbated the tensions among federal and state agencies and the NGOs most invested in grizzly bear conservation. More important, it has not produced a conservation strategy that we can support. Given the short amount of time that exists before the election and the next administration coming into office, we ask that you put a hold on the delisting process so that the next administration can take the time needed to resolve the many outstanding problems with the delisting rule and the conservation strategy.

Since the delisting rule was published in the Federal Register on March 11, the process has been driven by a political timeline with concurrent and rushed comment periods that have left the proposed rule incomplete and missing key components that are critical to the continued recovery of grizzly bears. The USFWS, in its effort to pacify growing pressure from the three states, has failed to address key components of the management of grizzly bears going forward, including the habitat management requirements of five National Forests and the concerns raised by two of our premier national parks. This process has driven agencies and constituents further apart, when it should be an opportunity to thoughtfully address the future of the bear and continue the remarkable success story that Yellowstone bears represent. The timing and the political clock are not serving the public or federal agency needs.

There are also key commitments that have been made from the Service in terms of what recovery and transition to state management should include. The following points must be included in a final rule.

1.) The population will remain stable. The proposed mortality thresholds require a detailed analysis of how the sliding scale of mortality will impact population numbers, dispersal, and connectivity.
2.) Commitments to manage for connectivity, allowing for dispersal between the Northern Continental Divide Ecosystem, the Greater Yellowstone Ecosystem, and the recovery of a grizzly bear population in the Selway-Bitterroot Ecosystem. These commitments must be explicit in the management framework and regulations.

3.) The conservation strategy must continue to remain in place in perpetuity with coordinated interagency management continuing, specifically between the National Park Service and the states.
4.) The National Park Service has raised significant concerns regarding delisting that remain unanswered.
5.) To date the Forest Plan Amendment process has not been released and there is so assurance that core habitat will be protected in order conserve grizzly bears. This must be released to the public and align with the current Forest Planning regulations.
6.) The Conservation Strategy has seen significant modification and edits behind closed doors. The public should have an opportunity to comment on this document before it is finalized and the peer reviewers should consider this guiding framework in their review of delisting.

Our organizations ask that these issues be addressed and that the Service lead with a more open and transparent process that can create support for this critically important decision and process. Otherwise, what should be a successful celebration over grizzly bear recovery appears certain to turn into yet another divisive wildlife management crisis that will end up delayed for years in the courts. The result will be a further erosion of public support for grizzly bears in Greater Yellowstone and beyond.

To summarize, we believe that DOI and FWS should formally end the current delisting by acknowledging that not enough time remains before a new administration comes into office to fully resolve the many issues still outstanding. We further think that FWS should begin a conversation with the governors of Montana, Idaho, and Wyoming about how a stakeholder process might be created that would address the larger goals of the states and FWS in delisting the Yellowstone grizzly bear. Convening such a process early in 2017 would be the first step in a more deliberate and transparent undertaking to build support for delisting and state management of grizzly bears.

Thank you for your attention to these requests.

Very truly yours,

Here is a tentative agenda for the YES meeting next week in Cody. Mary hopes to release a draft for wider review later today. However, we wanted to solicit your opinion before we took the next step. Jodi and Jennifer, we realize there are constraints on what you can present, so feel free to match the material you provide to your political reality.

What feedback would you offer? Thanks for your review. If you are presenting- thanks also for your help at the conference.

Scott Jackson- if you are still at NCDE meeting with Jennifer, could you check with her to see if she received this message?

Mary,

Here is the final Steering Committee approved version of the Conservation Strategy for dissemination to YES. All edits in this version have been approved by the committee. There remain a few issues that will be addressed at the meeting next Monday including recalibration language and wording to address the term of the CS.

When you send to YES, please remind them to come to the meeting next week prepared to ask questions and provide input on anything they have problems with. Below are some recommendations discussed by the Steering Committee yesterday regarding the conduct of next week's YES meeting.

---We need to have finality on individual issues at the end of the meeting. Call for a vote on those issues where there isn't unanimous support
---Ask committee members to advise the rest of the committee if there are particular issues or components of the CS that will not allow them to recommend signature and provide recommendations for what could be done to alleviate the concern

Jodi will bring all appendices for reference.

We should probably talk sometime this week about details of the conduct of the meeting. Let me know when you have some time.

Brian

Executive Summary
2016 Conservation Strategy for the Grizzly Bear in the Greater Yellowstone Ecosystem

Chapter 1 Introduction and Background

The future management of the Yellowstone grizzly bear population is envisioned as one in which the grizzly bear (*Ursus arctos*) and its habitat are conserved as integral parts of the Greater Yellowstone Ecosystem (GYE).

~~Grizzly bears are one of the premier wildlife attractions for visitors to the GYE, which contribute to the public's enjoyment and sense of pride in our conservation heritage. Tourism has a large and increasing influence on the regional economy, infusing hundreds of millions of dollars into local communities, and more and more entrepreneurs, residents, and visitors see the environment and wildlife as valuable resources for recreation and viewing. Visitation to Yellowstone and Grand Teton National Parks for wildlife viewing and other recreational activities is expected to increase in the future.~~

~~Grizzly bears also play a critical role with influence over other industries in the GYE. Like tourism, agriculture is a key industry with deep cultural and economic roots in the GYE and important to our conservation heritage. Other industries like outfitting, wildlife touring, and professional photography are important to many who have and continue to contribute to the grizzly bear conservation success story.~~

~~For these reasons, i~~It is the intent of this strategy that management of grizzly bear populations and their habitats in the GYE is conducted in a way that respects the ~~myriad~~varied missions and interests of all who visit, live in, and use this ecosystem.

Within the ~~Greater Yellowstone Ecosystem (~~GYE~~)~~, the grizzly bear population and its habitat will be managed utilizing a management approach that identifies a Primary Conservation Area

(PCA) and adjacent areas where occupancy by grizzly bears is anticipated and acceptable. The PCA is the existing Yellowstone grizzly bear recovery zone as identified in the 1993 *Grizzly Bear Recovery Plan (Recovery Plan)* (USFWS 1993). The PCA boundary will replace the recovery zone boundary to reflect the paradigm shift from managing for recovery to one of conservation.

In the Conservation Strategy, management direction is described for both the PCA and adjacent areas within the GYE (i.e., the Demographic Monitoring Area (DMA)[1]). State grizzly bear management plans, forest plans, and other appropriate planning documents will provide specific management direction for the adjacent areas outside the PCA.

This Conservation Strategy was developed to be the document guiding management and monitoring of the Yellowstone grizzly bear population and its habitat upon recovery and delisting. The Conservation Strategy will remain in effect for the foreseeable future, well~~This approach will remain in place~~ beyond recovery and delisting. Ongoing review and evaluation of the effectiveness of this Conservation Strategy is the responsibility of the state, tribal, and federal managers in the GYE. All monitoring protocols will be conducted and funded by those agencies assigned ~~to the area of~~the responsibility. This Conservation Strategy will be evaluated by the management agencies every five years~~ or as necessary~~, allowing public comment in the updating process.

Upon implementation of the Conservation Strategy, the Yellowstone Grizzly Bear Coordinating Committee (YGCC) will replace the Yellowstone Ecosystem Subcommittee.

The Conservation Strategy and the State Management Plans

The purpose of this Conservation Strategy (Strategy) and the state plans is to:

- Describe and summarize the coordinated efforts to manage the grizzly bear population

[1] An interactive map of the GYE boundaries is available at: http://usgs.maps.arcgis.com/home/webmap/viewer.html?webmap=78152b8e0bde457ca95918fdd48c5352

and its habitat to ensure continued conservation in the GYE.

- Specify the population, habitat, and ~~nuisance~~ conflict bear standards[2] to maintain a recovered grizzly bear population for the foreseeable future.
- Document the regulatory mechanisms and legal authorities, policies, management, and monitoring programs that exist to maintain the recovered grizzly bear population.
- Document the commitment of the participating agencies.

Implementation of the management strategies requires continued cooperation between federal and state agencies.

The GYE is a dynamic environment; monitoring systems in the Strategy allow for dynamic management as environmental issues change. The agencies are committed to be responsive to the needs of the grizzly bear by dynamic management actions based on the results of detailed annual population and habitat monitoring.

The vision of the Strategy can be summarized as follows:

- The PCA will be a secure area for grizzly bears, with population and habitat conditions maintained to ensure a recovered population is maintained for the foreseeable future and to allow bears to continue to expand outside the PCA.
- Outside of the PCA, grizzly bears will be allowed to expand into biologically suitable and socially acceptable areas.
- Outside of the PCA, the objective is to maintain existing resource management and recreational uses and to allow agencies to respond to demonstrated problems with appropriate management actions.
- Outside of the PCA, the key to successful management of grizzly bears lies in bears utilizing lands that are not managed solely for bears but in which their needs are considered along with other uses.

[2] Standards are management actions that are required in this Conservation Strategy. A deviation from a standard would occur only with a revision or amendment to the Conservation Strategy.

- Manage the GYE grizzly bear population within the area called the Demographic Monitoring Area (DMA), to ensure a recovered population in accordance with the established Recovery Criteria.
- Expand public information and education efforts.
- Provide quick responsive management to address grizzly bear conflicts.
- Manage grizzly bears as a game animal; including allowing regulated hunting when and where appropriate.

Relationship to Other Plans

By integrating state plans into the Strategy, it was ensured that the plans and the Strategy are consistent where necessary and complementary. The state plans are formally incorporated in the Conservation Strategy as Appendices I, J, and K.

Relationships with national forest and national park plans are also mentioned throughout the Strategy. Land and resource management plans for national forests and national parks in the GYE have incorporated the habitat standards and other relevant provisions of the Conservation Strategy. For those standards and provisions not yet incorporated into management plans, the agencies will implement the habitat standards and monitoring requirements in this conservation strategy through their established planning processes, subject to NEPA or other legal requirements.

Chapter 2 Population Standards and Monitoring

To maintain a healthy (recovered) grizzly bear population in the GYE, it is necessary to have adequate numbers of bears that are widely distributed with a balance between reproduction and mortality. This section details the population criteria in the *Recovery Plan* that were necessary to achieve recovery, and the population standards necessary to maintain it (USFWS 2016). The Strategy will continue to assess demographic recovery criteria within the Demographic Monitoring Area (DMA) created by the *Recovery Plan*. Because grizzly bears are a difficult

species to monitor and manage, multiple standards with additional monitoring items are identified to provide sufficient information upon which to base management decisions. It is the goal of the agencies implementing this Conservation Strategy to manage the Yellowstone grizzly bear population within the area called the Demographic Monitoring Area (DMA), to ensure a recovered population in accordance with the established Recovery Criteria.

Population standards and monitoring items include:

- Monitoring ~~unduplicated~~ unique females with cubs-of-the-year inside the GYE DMA.
- Calculating a total population estimate for the GYE DMA using the model-averaged Chao2 estimate of females with cubs-of-the-year (*see* Appendix C).
- Maintaining at least 500 bears in the GYE to assure the genetic health of the population (Miller and Waits 2003).
- Monitoring the distribution of females with young of all ages and having a target of at least 16 of 18 BMUs (Bear Management Units) within the PCA occupied at least one year in every six, and no two adjacent BMUs can be unoccupied over any six-year period.
- Monitoring all sources of mortality for independent females and males (≥ 2 years old) and dependent young (<2 years old) within the GYE DMA and limiting mortality to annual mortality percentages on a sliding scale depending on the annual population size estimate using model-averaged Chao2.
- Monitoring population trend using female survivorship and reproductive rate data from radio-collared bears.
- Ensure meeting defined genetic management objectives.

Chapter 3 Habitat Standards and Monitoring

The habitat standards identified in this document will be maintained at identified levels inside the PCA. In addition to the habitat standards, several other habitat factors will be monitored and evaluated to determine the overall condition of habitat for bears. It is the goal of the habitat

management agencies to maintain or improve habitat conditions existing as of 1998, as measured within each subunit within the PCA, while maintaining options for management of resource activities at approximately the same level as existed in 1998. The habitat standards in this document are subject to revision based on the best available science and will be reviewed and updated as necessary.

Habitat standards include:

- Maintenance of secure habitat at 1998 levels in each BMU subunit through management of motorized access route building and density, with short-term deviations allowed under specific conditions. Secure habitat is defined as more than 500 meters from an open or gated motorized access route or recurring helicopter flight line and must be greater than or equal to 10 acres in size.
- The number and acreage of commercial livestock allotments and number of permitted domestic sheep animal months will not exceed 1998 levels inside the PCA. Existing sheep allotments will be phased out as the opportunity arises with willing permittees.
- Management of developed sites at 1998 levels within each BMU subunit, with some exceptions for administrative and maintenance needs.

Habitat criteria that will be monitored and reported include:

- Monitoring open and total motorized access route density in each BMU subunit inside the PCA.
- Monitoring of four high-calorie food items throughout the Yellowstone area: ~~winter ungulate carcasses~~ungulates, cutthroat trout (*Oncorhynchus clarki*) spawning numbers, bear use of army cutworm moth (*Euxoa auxiliaris*) sites, and whitebark pine (*Pinus albicaulis*) cone production. The incidence of white pine blister rust (*Cronartium ribicola*) and whitebark pine mortality in sampled areas will also be monitored.
- ~~Monitoring the number of elk hunters inside the PCA.~~
- Land managers will ensure that habitat connectivity is addressed throughout the ~~Yellowstone area~~GYE as part of any new road construction or reconstruction and that

food storage orders are in place.

Chapter 4 Management and Monitoring of Grizzly Bear-Human Conflicts

The management of grizzly bear-human conflicts inside the PCA is based upon the existing laws and authorities of the state wildlife agencies and federal land management agencies. Outside the PCA, state management plans will direct the management of ~~nuisance~~ conflict bears. Management of ~~nuisance~~ conflict bears usually falls into one or more of the following categories:

- Removing or securing the attractant and providing education to modify human behavior/practices that contributed to the conflict.~~,~~
- Deterring the bear from the site through the use of aversive conditioning or hazing techniques.~~,~~
- ~~Capturing and relocating the n~~Relocation of the ~~uisance~~ conflict bear, and/or~~.~~
- ~~Removing the bear from the wild~~Removal of the conflict bear, including lethal control.

The focus and intent of ~~nuisance~~ conflict grizzly bear management will be predicated on strategies and actions to prevent grizzly bear-human conflicts. It is recognized that active management aimed at individual ~~nuisance~~ conflict bears will be required. Management actions outside the PCA will be implemented according to state and tribal management plans. These actions will be compatible with grizzly bear population management objectives for each state for the areas outside the PCA.

In circumstances that result in a ~~nuisance~~ conflict bear situation outside the PCA, more consideration will be given to existing human uses. Site-specific conflict areas within and outside the PCA will be documented and prioritized to focus proactive management actions to minimize grizzly bear- human conflicts and address existing and potential human activities that may cause future conflicts. Past conflict management has demonstrated that grizzly bears can coexist with most human activities.

Management of all ~~nuisance~~ conflict bear situations will emphasize resolving the human cause of

the conflict. Relocation and removal of grizzly bears may occur if other management actions are not successful. ~~Before any removal, except in cases of human safety, management authorities will consult with each other prior to judging the adequacy of the reason for removal.~~

Captured grizzly bears identified for removal may be given to public research institutions or public zoological parks for appropriate non-release educational or scientific purposes as per regulations of states and national parks. Grizzly bears not suitable for release, research, or educational purposes will be removed as described in appropriate state management plans or in compliance with national park management plans.

All grizzly bear relocations and removals will be documented and reported annually in the Interagency Grizzly Bear Study Team (IGBST) Annual Report.

Chapter 5 Information and Education

The purposes of the information and education aspects of this cooperative effort are to support the development, implementation, and dissemination of a coordinated information and education program. This program should be understandable and useful for the people who visit, live, work, and recreate in bear habitat to minimize grizzly bear-human conflicts and to provide for the safety of people while building support for viable bear populations.

Information made available to the public will be open and responsive to public concerns. Open discussions with the public will increase credibility of the grizzly bear management program.

These efforts will be reviewed periodically and program adjustments will be made as necessary. In addition, efforts will be expanded as the bear population expands and additional efforts will be needed in areas that could become occupied in the near future.

The current information and education (I & E) working group within the ~~Greater Yellowstone Ecosystem~~GYE will continue. Members of this I & E team include public affairs personnel from

Forest Service Regions 1, 2, and 4; Grand Teton and Yellowstone National Parks; the BLM; representatives from each state wildlife agency; and the I & E specialist from the Interagency Grizzly Bear Committee (IGBC). This team will continue to work with all affected interests to ensure consistency of information, efficient funding strategies, identifying and targeting audiences, developing partnerships, and identifying new tools for implementation.

Chapter 6 Implementation and Evaluation

A new committee, the Yellowstone Grizzly Bear Coordinating Committee (YGCC), will replace the Yellowstone Ecosystem Subcommittee. YGCC meetings will be open to the public.

Some primary activities of the YGCC are:

- Coordinate implementation of this Conservation Strategy.
- Ensure that population and habitat data are collected annually by the IGBST, as specified in this Conservation Strategy, and evaluated to assess current status of the grizzly bear population.
- Share information and implement management actions in a coordinated fashion.
- Identify management, research, and financial needs to successfully implement the coordinated Conservation Strategy.
- Implement a Biology and Monitoring Review as necessary and ~~submit a petition~~recommend consideration ~~for relisting~~ recommend whether the Service should conduct a status review as appropriate to ensure agency responsiveness to changing circumstances of the grizzly bear or its habitat in the GYE.
- Appoint a chairperson and members of the Information and Education Team, and coordinate information and education efforts.

This committee does not supersede the authority of the management agencies beyond the specific actions agreed to as signatories of this Conservation Strategy.

YGCC membership consists of representatives of the following:

Federal	National parks: Yellowstone and Grand Teton/John D. Rockefeller Jr. Memorial Parkway National forests: Beaverhead-Deerlodge, Bridger-Teton, Caribou-Targhee, Custer -Gallatin, and Shoshone One Bureau of Land Management representative The Biological Resources Division of the U.S. Geological Survey
State wildlife agencies	Idaho, Montana, and Wyoming
Local government	One representative from each state
Tribal	One representative from each Native American tribe with sovereign powers over reservation lands within the GYE

Formatted: Indent: Left: 0", Hanging: 2"

The IGBST and the I & E will perform necessary tasks and report to the YGCC.

As detailed in the monitoring portion of this Strategy, the IGBST will take the lead in preparing an annual monitoring report with staff support from the YGCC. Agencies responsible for monitoring major demographic and habitat parameters are listed in Appendix G Monitoring results and analysis will be presented to the YGCC by the IGBST.

If there are deviations from any of the population and/or habitat standards stipulated in this Conservation Strategy, a Biology and Monitoring Review will be initiated.

Biology and Monitoring Review

Under this Conservation Strategy, a Biology and Monitoring Review is a process carried out by the IGBST. A Biology and Monitoring Review examines management of habitat, populations, or efforts of participating agencies to complete their required monitoring. Biology and Monitoring Reviews would normally be undertaken after the annual summary of monitoring information presented to the YGCC and in response to deviations from required population or habitat standards. Any YGCC member agency can request that a Biology and Monitoring Review be considered. Such consideration would be a topic for discussion by the YGCC and the

review would be initiated based on the decision of the YGCC. The Biology and Monitoring Review process will be completed within six months of the request by the YGCC and the resulting written report presented to the YGCC and made available to the public. The IGBST is not responsible for completing impact analyses for projects proposed by any agency; such analyses are the responsibility of the agency making the proposal.

The purposes of a Biology and Monitoring Review are:

- To identify the reasons why particular demographic or habitat objectives have not been achieved and to modify management as necessary, or
- To consider potential impacts of a proposed action of concern to one or more members of the YGCC, or
- To consider departures by one or more agencies from the monitoring effort required under this Conservation Strategy and to develop plans to ensure that monitoring efforts be maintained as per the standards in this document, or
- To consider and establish a scientific basis for possible changes in management due to changed conditions in the ecosystem.

Biology and Monitoring Reviews will be submitted as written reports by the IGBST to the YGCC and made available to the public.

The YGCC will respond to the Biology and Monitoring Review with actions to address the deviations from the population or habitat standards. If the situation, after completion of the Biology and Monitoring Review, is such that some or all of the desired population and habitat standards specified in this Conservation Strategy are not being met, and cannot be met in the opinion of the YGCC, then the YGCC ~~will petition the~~may recommend that the Fish and Wildlife Service (Service) ~~consider for relisting~~conduct a status review. In the case of a vote on this issue, a simple majority is necessary.

~~Petition for Relisting~~Fish and Wildlife Service Status Review

~~The YGCC~~Under Section 3 of the Endangered Species Act, any individual or organization can petition for relisting and a resulting status review from the U.S. Fish and Wildlife Service. A status review is a process that requires the Service to review the status of the GYE grizzly bear population and is triggered by a petition to list a species. ~~This~~ Any petition ~~from the YGCC will~~ should be accompanied by the available specific biological data on the population and its habitat sufficient to judge its status as a recovered population as per the requirements of this Conservation Strategy. A status review will evaluate all factors affecting the population and result in a finding that summarizes the current status of the population. For purposes of a status review, the status of the entire GYE grizzly bear population will be considered.

~~Additionally, t~~The Service can initiate a status review to determine if the grizzly bear in the GYE should be added to the list of candidate species for listing independent of ~~the YGCC~~a petition based on concerns about the population and/or its habitat. ~~Under Section 4 of the Endangered Species Act, a petition from an individual or organization can also initiate a status review, as long as the petition is deemed to be warranted. To be warranted, such a petition must present credible scientific information to support the petition.~~

If, as the result of the status review for candidate status or the petition for relisting, the population is found to be warranted for listing, as per the criteria of the Endangered Species Act in Section 4(a)(1), then the species could be immediately considered for relisting and could relisted under emergency regulations, per Section 4(b)(7) if the threat were severe and immediate.

The Service will initiate a status review with possible emergency relisting if necessary if there are changes to Federal, State, or Tribal laws, rules, regulations, or management plans that depart significantly from the specifics in the Conservation Strategy, thereby compromising implementation of the Strategy.

Chapter 7 Existing Authorities

The existence of adequate regulatory mechanisms that serve to maintain the GYE grizzly bear population as recovered is one of the five factors required to change the status of the population to delisted and to assure a healthy grizzly bear population.

This chapter lists applicable federal, state (Idaho, Montana, and Wyoming) and tribal acts, statutes, regulations, rules, plans, and guidelines[3].

[3] Guidelines are management actions that are highly recommended in this Conservation Strategy. A deviation from a guideline would not require a revision or amendment to the Conservation Strategy. A deviation from a guideline requires written rationale as to why the guideline is not being followed.

Memorandum of Understanding Detailing Agency Agreement to Implement this Conservation Strategy

The agencies signing this Conservation Strategy agree to use their authorities to maintain ~~and enhance~~ the recovered status of the grizzly bear in the Greater Yellowstone Ecosystem (GYE) by implementing the regulatory mechanisms, interagency cooperation, population and habitat management and monitoring, and other provisions of the Conservation Strategy as per the details and responsibilities described in this document. All signatories recognize that each has statutory responsibilities that cannot be delegated and that this agreement does not and is not considered to abrogate any of their statutory responsibilities. This agreement is subject to and is intended to be consistent with all appropriate federal and state laws. Funding of this MOU is subject to approval and appropriations by approved state and federal entities. All agencies will take appropriate steps to seek funding to implement this document. The adequacy of the regulatory mechanisms demonstrated by this Conservation Strategy are dependent upon funding being available to fully implement the management and monitoring actions detailed in this document. This Conservation Strategy does not go into effect until all agencies have signed this document and the final rule delisting the GYE grizzly bear DPS has been published in the Federal Register. This Strategy will remain in effect well beyond the delisting and the five year monitoring period required by the Act to address the long-term need for continued coordination among signatory agencies. This Strategy will be adaptive in nature and will be ~~revised and re-signed~~ re-evaluated at least every 5 years beginning on the date of the last signature below.

Chapter 1 Introduction and Background

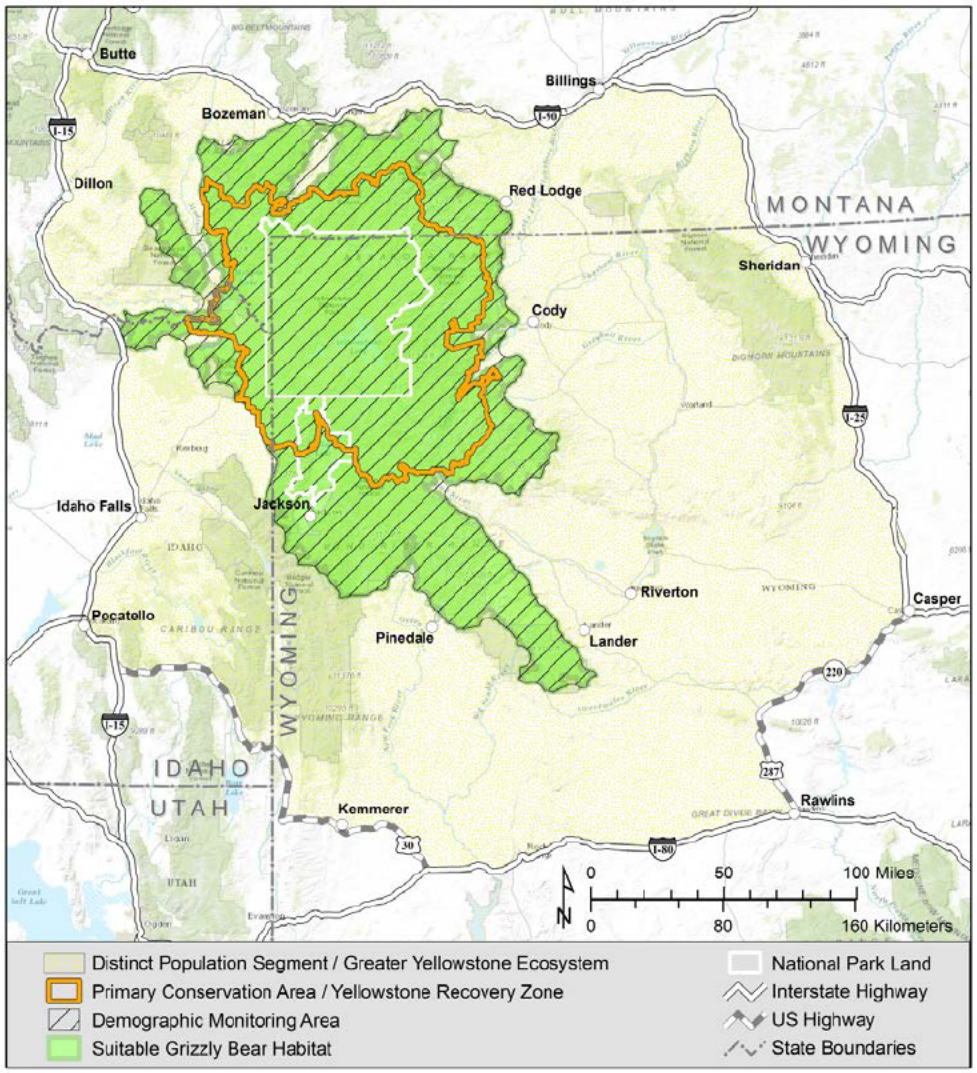
Introduction

The future management of the Yellowstone grizzly bear population is envisioned as one in which the grizzly bear and its habitat are conserved as integral parts of the Greater Yellowstone Ecosystem (GYE).

Grizzly bears are one of the premier wildlife attractions for visitors to the GYE, which contribute to the public's enjoyment and sense of pride in our conservation heritage. Tourism has a large and increasing influence on the regional economy, infusing hundreds of millions of dollars into local communities, and more and more entrepreneurs, residents, and visitors see the environment and wildlife as valuable resources for recreation and viewing. Visitation to the Greater Yellowstone Area ~~and Grand Teton National Parks~~ for wildlife viewing and other recreational activities is expected to increase in the future.

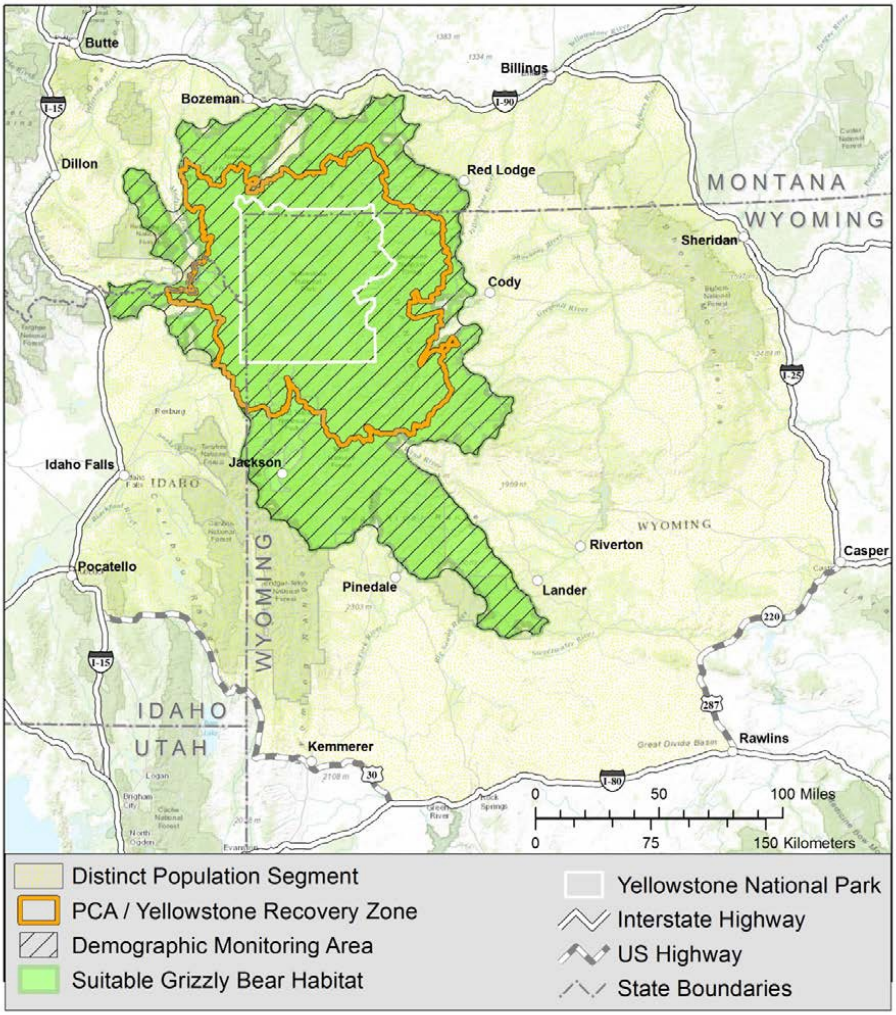
Grizzly bears also have an effect on~~play a critical role with influence over~~ other industries in the GYE. Like tourism, agriculture is a key industry with deep cultural and economic roots in the GYE and important to our society and to conservation heritage. Other industries like outfitting, wildlife touring, and professional photography are important to many who have and continue to contribute to the grizzly bear conservation success story.

For these reasons, it is the intent of this strategy that management of grizzly bear populations and their habitats in the GYE is conducted in a way that respects the ~~myriad~~ varied missions and interests of all who visit, live in, and use this ecosystem.



Within the GYE, the grizzly bear population and its habitat will be managed utilizing a management approach that identifies a Primary Conservation Area (PCA) and adjacent areas where occupancy by grizzly bears is anticipated and acceptable. The PCA is the existing

Yellowstone grizzly bear recovery zone as identified in the 1993 *Grizzly Bear Recovery Plan* (Recovery Plan) (USFWS 1993). The size of the recovery zone is not being expanded in this approach. The PCA boundary will replace the recovery zone boundary to reflect the paradigm shift from managing for recovery to one of conservation (Figure 1).



In this Conservation Strategy (Strategy), management direction is described for both the PCA and adjacent areas within the GYE (i.e., the Demographic Monitoring Area (DMA). State grizzly bear management plans, forest plans, and other appropriate planning documents provide additional management direction for the adjacent areas outside the PCA. All monitoring protocols will be conducted and funded by those agencies assigned ~~to~~ the ~~area of~~ responsibility.

This Strategy was developed to be the document guiding management and monitoring of the GYE grizzly bear population and its habitat upon recovery and delisting. This Strategy will remain in effect beyond recovery and delisting, and the five year monitoring period required by the Act. ~~Therefore, t~~The need to coordinate management of the population across multiple land ownerships and jurisdictions will always remain.

Figure 1. Map of the Greater Yellowstone Ecosystem (GYE). Boundaries are shown for: (1) the GYE grizzly bear Distinct Population Segment Area (the legal boundary where grizzly bears would be delisted); (2) the Primary Conservation Area (PCA); (3) Suitable Habitat; ~~and~~ (4) the Demographic Monitoring Area (DMA); and (5) National Park lands, which include Yellowstone National Park, Grand Teton National Park, and the John D. Rockefeller, Jr. Memorial Parkway . An interactive version of a map of the GYE boundaries is available at: http://usgs.maps.arcgis.com/home/webmap/viewer.html?webmap=78152b8e0bde457ca95918fdd48c5352.

Ongoing review and evaluation of the effectiveness of this Strategy is the responsibility of the state and federal managers in the GYE. This Strategy will be evaluated by the management agencies at least every five years ~~, or as necessary,~~ allowing public comment in the updating process.

Upon implementation of this Strategy, the Yellowstone Grizzly Bear Coordinating Committee (YGCC) replaces the Yellowstone Ecosystem Subcommittee. (*See* Chapter 6 for more information about the activities of the YGCC.)

The Conservation Strategy

The purpose of this Strategy, which includes the state plans, is to:

- Describe and summarize the coordinated efforts to manage the grizzly bear population and its habitat to ensure continued conservation in the GYE.
- Specify the population, habitat, and ~~nuisance~~ conflict bear standards to maintain a recovered grizzly bear population.
- Document the regulatory mechanisms and legal authorities, policies, and management and monitoring programs that exist to maintain the recovered grizzly bear population.
- Document the commitment of the participating agencies.

Implementation of the management strategies requires continued cooperation between federal and state agencies.

The GYE is a dynamic environment; monitoring systems in the Strategy allow for dynamic management as environmental issues change. The agencies are committed to be responsive to the needs of the grizzly bear by dynamic management actions based on the results of detailed annual population and habitat monitoring.

Development of the Conservation Strategy and State Plans

Development of the Strategy began in 1993, when biologists representing the National Park Service, U. S. Forest Service, U. S. Fish and Wildlife Service, Interagency Grizzly Bear Study Team, Idaho Department of Fish and Game, Montana Fish, Wildlife & Parks, and the Wyoming Department of Game and Fish were appointed to the Interagency Conservation Strategy Team. In March 2000, a draft Conservation Strategy was released to the public for review and comment. Later the same year, a Governors' Roundtable was organized to provide recommendations from the perspectives of the three states that would be involved with management of grizzly bears after delisting. The Governors' Roundtable recognized the need to have state management plans that would give direction for grizzly bear management outside the PCA. The state management plans apply to management of grizzly bears outside the PCA, and describe the general areas that grizzly bears are likely to occupy in the foreseeable future.

In 2000 a Draft Conservation Strategy was released for public comment with the final Conservation Strategy released in 2007. ~~Concurrently, the state plans were completed in~~ ~~In 2002, the 2007 Conservation Strategy was developed and the state plans were completed~~. ~~Although t~~This 2016 version ~~of the Conservation Strategy~~ updates sections of the Strategy~~, the vision remains the same~~.

The vision of the Strategy can be summarized as follows:

- ~~The PCA will be a s~~Secure habitat ~~area for grizzly bears, with~~and population ~~and habitat conditions~~ standards, as defined in Chapters 2 and 3, will be ~~maintained that have allowed the grizzly bear population to achieve recovery and expand outside the~~in the PCA to limit access-related disturbances and reduce human-caused mortality.
- Outside of the PCA, grizzly bears will be allowed to expand into biologically suitable and socially acceptable areas.
- Manage the GYA grizzly bear population within the DMA to ensure a recovered population in accordance with the established Recovery Criteria.
- Outside of the PCA, the objective is to maintain existing resource management and recreational uses and to allow agencies to respond to demonstrated problems with appropriate management actions.

- Outside of the PCA, the key to successful management of grizzly bears lies in bears utilizing lands that are not managed solely for bears but in which their needs are considered along with other uses.
- Expand public information and education efforts.
- Provide responsive management to deal with ~~nuisance~~ conflict grizzly bears.
- Manage grizzly bears as a game animal, including allowing regulated hunting when and where appropriate.

Relationship to Other Plans

The state of Idaho, Montana, and Wyoming and the Tribes of the Wind River Reservation all developed grizzly bear management plans. The three states also entered into a memorandum of agreement memorializing how the states will coordinate with each other regarding bear management and allocation of mortality[4]. The individual state plans and ~~three~~tri-state memorandum of agreement are complementary to this Strategy. The state and tribal management plans are formally incorporated in the Conservation Strategy as Appendices I, J, K, O, and P.

National Forest and National Park plans are also complimentary to this Strategy. Land and resource management plans for National Forests and National Parks in the GYE have incorporated the habitat standards and other relevant provisions of the Conservation Strategy. Those standards and provisions not yet incorporated into management plans will be integrated into future land management plan amendments or revisions.

Background

The Grizzly Bear Population

[4] ~~The states have provided a draft MOA that will be finalized by commission approvals in 2016.~~

The grizzly bear population in the lower 48 states was listed as threatened in 1975 pursuant to the Endangered Species Act of 1973.

The Recovery Plan established several demographic (population) recovery targets that must be achieved for a recovered grizzly bear population. All recovery targets are currently being met. When grizzly bears were listed in 1975, "indiscriminate illegal killing" and management removals were identified as threats to the population. In response, the Service and signatories to this Strategy implemented demographic recovery criteria to maintain a minimum population size, a well-distributed population, and establish mortality limits based on scientific data and direct monitoring of the population. Since implementing these criteria, the GYE grizzly bear population has tripled in size and range (Eberhardt *et al.* 1994; Knight and Blanchard 1995; Boyce *et al.* 2001*a*; Schwartz *et al.* 2006; Pyare *et al.* 2004; Schwartz *et al.* 2006a; IGBST 2012; Bjornlie *et al.* 2014).

Counts of females with cubs-of-the-year have increased. In 2013, the estimate of unique females with cubs-of-the-year within the entire GYE was 58 (Haroldson *et al.* 2014). This is the highest count ever recorded. The Recovery Plan target for the number of females with cubs-of-the-year has been exceeded since 1988. Calculations of population trajectory ~~derived from radio-monitored female bears~~ vital rate data showed an increasing population trend at a rate of 4.2 to 7.6 percent per year between 1983 and 2012 (~~Eberhardt *et al.* 1994; Knight and Blanchard 1995; Schwartz *et al.* 2006~~Harris *et al.* 2006) and that population growth had slowed to 0.3 to 2.2 percent between 2002 and 2011 (IGBST 2012). The population trajectory that includes the most recent data is based on the Chao2 estimator and indicates no statistical trend ~~(i.e., relatively flat population trajectory)~~ within the DMA for the period 2002 to 2014 (IGBST, unpublished data). ~~Grizzly bear range and distribution has more than tripled since 1975 (Basile 1982; Blanchard *et al.* 1992; Schwartz *et al.* 2002; Pyare *et al.* 2004; Schwartz *et al.* 2006a; Bjornlie *et al.* 2014).~~ Independent female survival rates, the single most important cohort to population trajectory, are high (IGBST 2012). In total, this population has increased from estimates ranging between 230 and 312 bears when listed in 1975 (Cowan *et al.* 1974; Craighead *et al.* 1974; McCullough 1981) to at least 714 animals as of 2014 (van Manen 2015, *in litt.*). Grizzly bear range and distribution

has more than tripled since 1975 (Basile 1982; Blanchard *et al.* 1992; Schwartz *et al.* 2002; Pyare *et al.* 2004; Schwartz *et al.* 2006a; Bjornlie *et al.* 2014).

The Primary Conservation Area and the Demographic Monitoring Area

The Strategy identifies and provides a framework for managing habitat within a Primary Conservation Area (PCA) and managing demographic parameters within a Demographic Monitoring Area (DMA) (Figure 1). The PCA boundaryies (containing 23,853 sq km (9,210 sq mi)) corresponds to thatose of the Yellowstone Recovery Zone (U.S. Fish and Wildlife Service 1993) and will replace the Recovery Zone boundary (Figure 1). The PCA contains adequate seasonal habitat components needed to support the recovered GYE grizzly bear population for the foreseeable future and to allow bears to continue to expand outside the PCA. The National Park Service and the U. S. Forest Service manage the majority of lands within the PCA; a small percentage of land is privately owned or managed by the states or the Bureau of Land Management (BLM) (Table 1).

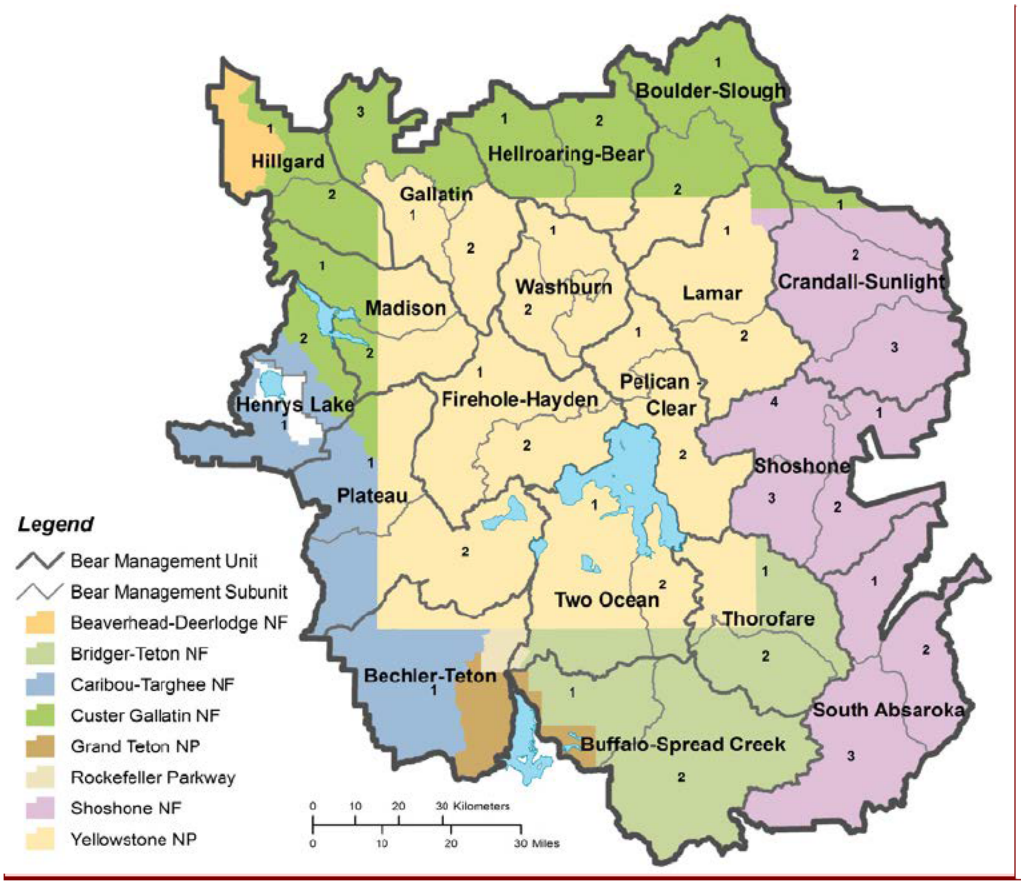

Table 1. Area of lands within the Primary Conservation Area by management type.

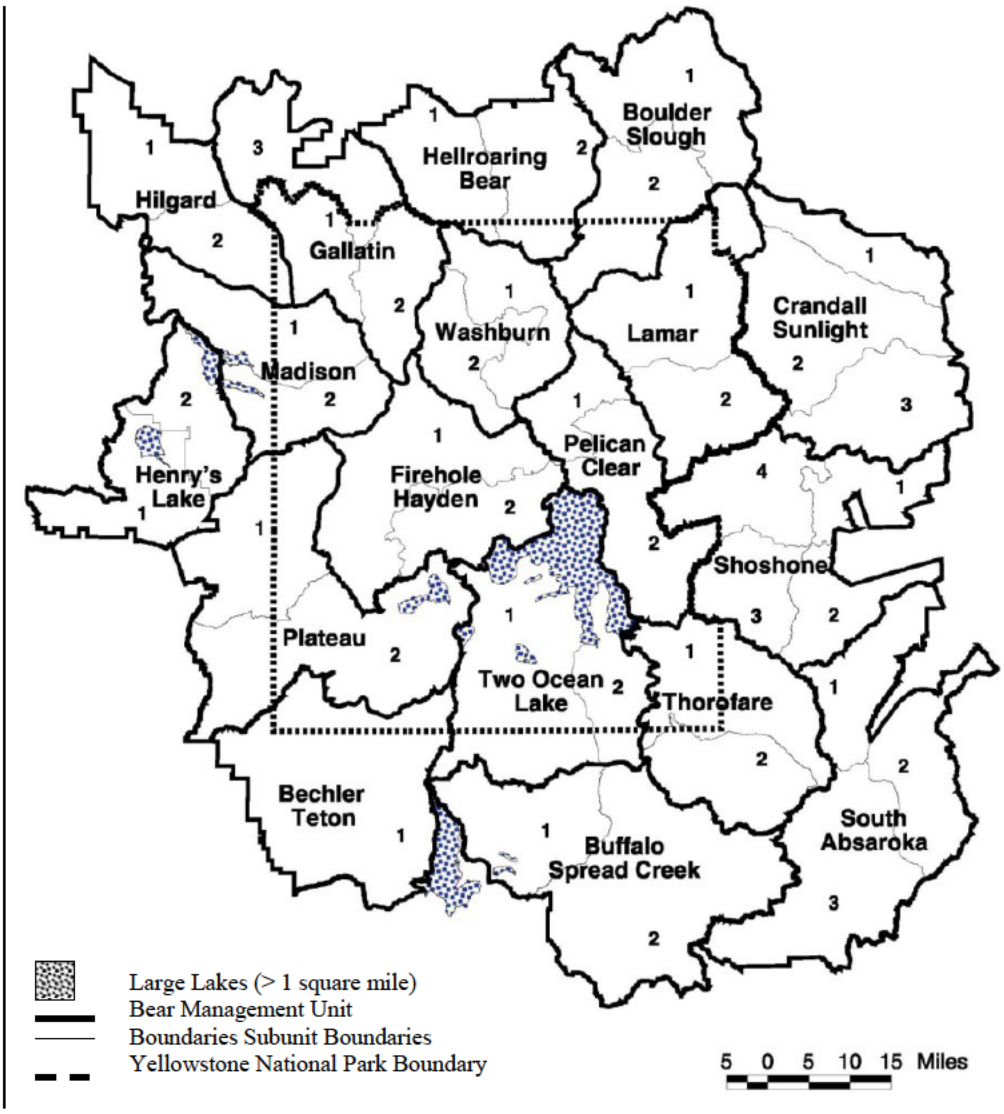
Management Type	Area (square miles)	Percent of the PCA
National Park Service	3,632	39.4
U. S. Forest Service	5,383	58.5
Private and Other Ownerships	195	2.1
TOTAL	9,210	100



To facilitate habitat management and ensure habitat was well distributed, the PCA was divided into 18 bear management units (BMUs) and 40 subunits (Figure 2). BMUs are used to measure the distribution of females with ~~offspring~~ young while subunits allow better resolution of habitat measurement. ~~H~~Secure habitat ~~protections~~ standards, as described in Chapter 3, will be maintained inside the PCA ~~that allowed the recovery of the grizzly bear population will be~~

~~maintained~~.

The DMA boundary (containing 49,928 sq km (19,279 sq mi) is based on the suitable habitat area plus the potential sink areas (i.e., linear areas along valley floors that did not meet the definition of suitable habitat). The suitable habitat contained within the DMA is sufficiently large to support a viable population in the long term. The DMA is the area within which the population is annually surveyed and estimated and within which the total mortality limits apply.

Characterization of Grizzly Bear Habitat

Background on the Area Necessary for a Recovered Population

Grizzly bears are one of the subspecies of brown bears, which range throughout diverse areas and habitats in Europe, Asia, and North America. Brown bears have the most widespread distribution of any bear species and live in the widest range of habitats of any bear species including deserts, boreal forests, arctic tundra, coniferous forests, deciduous forests, alpine areas, and coastal rainforests. At minimum, grizzly bears need food, seasonal foraging habitat, denning habitat, and security in an area of sufficient size for survival. Bears overlap in home ranges and change densities based on a variety of social and environmental factors. However, the precise mixture of these diverse elements and the precise size of the area necessary to support a population of grizzly bears are impossible to specify. To a great degree, the difficulty lies in the fact that grizzly bears are long-lived opportunistic omnivores whose needs for foods and space vary depending on a multitude of environmental and behavioral factors and on variation in the experience and knowledge of each individual bear. The key to establishing habitat criteria that will maintain a healthy population is to look to the habitat factors in the past that produced a grizzly bear population in the ~~Yellowstone area~~GYE that is increasing in numbers and expanding in range. Habitat factors that produced a healthy population in the past were used to establish the habitat criteria for the future that must be maintained if a healthy population continues to be preserved.

The available habitat for bears is largely determined by human activities. Human activities are the primary factor impacting habitat security. Human activities and the social structure and

relationships among resident bears are the two major influences on the accessibility of available foods for bears. The issue of how many grizzly bears can live in any specific area is a function of overall habitat productivity, annual production~~,~~ and availability of important foods, and the levels and types of human activities. There is no known way to calculate the number of grizzly bears that can live in an area in relation to ongoing changes in habitat values or to fully understand the social system of the grizzly bear and how it is influenced by changes in bear density and related social interactions at various densities. As food availability fluctuates, there are corresponding changes in bear density in important use areas and changes in social tolerance within the bear population. This in turn will affect age-specific survivorship. Additional numbers of bears in many areas will result in the expansion of bear range, increasing grizzly bear-human conflicts, and erosion of public support for bears. All these factors interact.

A viable and therefore recovered population is one that has high long-term prospects for survival within acceptable levels of risk. Population size is an important factor in understanding population survival (Boyce 1992, Caughley 1994). However, there is no quantitative way to estimate precisely the number of animals required for a viable population of any species (Boyce 1992, 1993). From ~~the mid-1980s~~1983 to 2001, the Yellowstone grizzly bear population ~~has grown~~grew at approximately ~~3 to 4~~4.2 to 7.6% or more per year (~~Eberhardt *et al.* 1994, Boyce 1995, Knight and Blanchard 1995, Boyce *et al.* 2001*b*, Schwartz *et al.* 2006*b*~~Harris *et al.* 2006). ~~Although p~~Population growth ~~has~~ slowed~~, it is still stable to slightly increasing at~~ to 0.3 to 2.2% from 2002 to 2011 (IGBST 2012). The population trajectory that includes the most recent data is based on the Chao2 estimator and indicates no statistical trend ~~(i.e., relatively flat population trajectory)~~ within the DMA for the period 2002 to 2014 (IGBST, unpublished data). Boyce (1995) has calculated that the Yellowstone population currently has a probability of extinction of 0.0004 (4/10,000)—a very low probability. Nevertheless, as Boyce *et al.* (2001*b*) points out, "*population size alone is not a sufficient criterion for evaluating population viability,*" and "*even though a population may have increased or decreased over the past 10 to 20 years, this offers no indication that the population will continue on the same trajectory in the future*." The best way to ensure a healthy population of grizzly bears is to monitor both population and habitat parameters closely and respond when necessary with adaptive management (Walters and Holling

1990) addressing the problems of the population in a dynamic way. That is what this Conservation Strategy is designed to accomplish.

The PCA has provided the vast majority of habitat for the currently increasing population in the ~~Greater Yellowstone Ecosystem~~GYE. This area will continue to be managed and monitored carefully to maintain secure habitat above 1998 levels~~security, and to limit access related disturbances~~ and developed sites on public lands at or below 1998 levels. The GYE grizzly bear population was increasing at a rate of 3 to 4% per year as of 1998 (Boyce *et al*. 2001*b*). Due to this ongoing bear population increase, 1998 was chosen as the baseline year for measurement of levels of human activities. The 1998 habitat baseline values for secure habitat, developed sites on public lands, and livestock grazing are shown in Appendix E.

Food

The broad historic distribution of grizzly bears suggests adaptability in food habits of different populations. Although the digestive system of bears is essentially that of a carnivore, bears are successful omnivores, and in some areas may be almost entirely herbivorous. Bears feed on animal ~~matter~~ or vegetable matter that is typically highly digestible and high in starch, sugars, protein, and/or ~~stored~~ fat.

Grizzly bears must avail themselves of foods rich in protein or carbohydrates in excess of maintenance requirements in order to survive denning and post-denning periods. Other plant materials are eaten as they emerge, when crude protein levels are highest.

Grizzly bears are opportunistic feeders and will prey or scavenge on almost any available food including ground squirrels, ungulates, carrion, and garbage. In areas where animal matter is less available, roots, bulbs, tubers, fungi, and tree cambium may be important in meeting nutrient requirements. High quality foods such as berries, nuts, insects, and fish are important in some areas.

The search for food has a prime influence on grizzly bear movements. Upon emergence from the den, they seek lower elevations, drainage bottoms, avalanche chutes, and ungulate winter ranges where their food requirements can be met. Throughout late spring and early summer, they follow plant maturity back to higher elevations. In late summer and fall, there is a transition to fruit and nut sources, as well as other plant materials. This is a generalized pattern, however, and it should be kept in mind that bears are individuals trying to survive and will go where they can best meet their food requirements.

Specific to the GYE, four seasonal foods have been identified for monitoring. These are: winter-killed ungulates (primarily elk (*Cervus elaphus*) and bison (*Bison bison*), but also deer (*Odocoileus* species) and moose (*Alces alces*)), spawning cutthroat trout, whitebark pine seeds, and army cutworm moths. The High-Calorie Foods section in Chapter 3 provides more detail about the components of grizzly bear diet.

Cover

The relative importance of cover to grizzly bears was documented by Blanchard (1978) in a four-year study in the GYE. The importance of an interspersion of open parks as feeding sites associated with cover is also recorded in Blanchard's study.

Changes in the distribution and quantity and quality of cover are not necessarily detrimental to grizzly bears. The IGBST studied the effects of the large 1988 wildfires on grizzly bears. "*On the average, grizzly bears used burned habitats in proportion to their availability within individual annual ranges during 1989 to 1992. Seasonal indices of movement and annual range sizes of cohorts are not statistically different from the 1975 to 1987 averages*" (Blanchard and Knight 1996).

Denning

Grizzly bears excavate dens. Dens are usually dug on steep slopes in forest cover where wind

and topography cause an accumulation of deep snow and where the snow is unlikely to melt during warm periods. Elevations of dens vary geographically; generally, they are found at higher elevations well away from development or human activity. Abundant denning habitat is available and is not considered a limiting factor for grizzly bears (Podruzny and Gunther 2002).

Secure Habitat

History has demonstrated that grizzly bear populations survived where frequencies of contact with humans were very low. Populations of grizzly bears persisted in those areas where large expanses of relatively secure habitat were retained and where human-caused mortality was low. In the ~~Yellowstone area~~GYE, this is primarily associated with national park lands, wilderness areas, and large blocks of public lands (IGBC 1998). Habitat security requires minimizing mortality risk and displacement from human activities in a sufficient amount of habitat to allow the population to benefit from this secure habitat and respond with increasing numbers and distribution. Habitat security allows a population to increase in numbers and distribution as lowered mortality results in more reproduction and cub recruitment into the adult population. This results in an increasing population. As the population increases, it begins to expand in range and distribution. Both of these responses to habitat security ~~are currently ongoing~~occurred in the Yellowstone population as the population ~~is increasing~~experienced a growth rate of ~~at~~ 4.2~~3~~ to ~~4~~7.6% per year during 1983–2001 (~~Eberhardt *et al.* 1994, Knight and Blanchard 1995, Boyce *et al.* 2001*b*, Schwartz *et al.* 2006*b*~~Harris *et al.* 2006), and an increase~~ing~~ in distribution (Schwartz *et al*. 2002). Updated demographic analysis indicated that the growth rate ~~has~~ slowed to 0.3 to 2.2% per year during 2002–2011(IGBST 2012) and continued to increase in distribution (Bjornlie 2014). The population trajectory that includes the most recent data is based on the Chao2 estimator and indicates no statistical trend ~~(i.e., relatively flat population trajectory)~~ within the DMA for the period 2002 to 2014 (IGBST, unpublished data). ~~but is still stable to slightly increasing (IGBST 2012), and has continued to increase in distribution (Bjornlie 2014).~~ Continued range expansion, including in areas beyond the DMA, is not inconsistent with this observation. A relatively constant population size in the DMA, combined with high bear densities in portions thereof, likely stimulate continued range expansion through bear dispersal.

Maintaining habitat security is a major goal of this conservation strategy.

By managing motorized access, the following grizzly bear management objectives can be met (IGBC 1998):

- Minimize human interaction and potential grizzly bear mortality.
- Minimize displacement from important habitats.
- Minimize habituation to humans.
- Provide relatively secure habitat where energetic requirements can be met.

Historically, management of motorized use has been primarily accomplished through restriction of certain types of motorized use on established access routes, i.e., management of open motorized route densities. Recent research has shown that secure habitat (areas that are free of motorized traffic, also referred to as core areas) is an important component of grizzly bear habitat (IGBC 1998).

The management of human use levels through access route management is one of the most powerful tools available to balance the needs of grizzly bears with the needs and activities of humans. It has been documented in several research projects, completed and ongoing, that unregulated human access and development within grizzly bear habitat can contribute to increased bear mortality and affect bear use of existing habitat (IGBC 1998).

Management Improvements and Mortality Reduction Efforts

Since listing of the grizzly bear under the Endangered Species Act (ESA), government agencies (federal, tribal, state, county, and city), organizations, and individuals have worked to improve management coordination and habitat conditions, minimize grizzly bear-human conflicts and bear mortality, and increase public awareness and appreciation for the grizzly bear in the GYE.

Summary of Management Improvements Related to Habitat

- The Interagency Grizzly Bear Committee (IGBC) was created to coordinate management efforts across multiple federal lands and different states. The Yellowstone Ecosystem Subcommittee was also created to coordinate efforts specific to the GYE grizzly bear. These committees cooperated in developing the *Interagency Grizzly Bear Guidelines* (IGBC 1986) and the *Interagency Grizzly Bear Committee Taskforce Report on Grizzly Bear/Motorized Access Management* (IGBC 1998). These guidelines were instrumental in changing land management practices on federal lands to provide security and to maintain or improve habitat conditions for the grizzly bear.
- The IGBST was created to provide scientific information for the management and recovery of the grizzly bear in the GYE. Scientific protocols have been developed to monitor the grizzly bear population and important habitat parameters.
- Federal and state agencies developed ~~nuisance~~ conflict bear guidelines to manage bears that become habituated to human foods and refuse. The overall objective of these guidelines is to provide a quick response to grizzly bear-human confrontations.
- Miles of open motorized access routes have been reduced through restrictions (such as gates and signs on motorized routes) and decommissioning (the route is no longer available for motorized use), thereby reducing open motorized access route densities and increasing secure habitat for the grizzly bear.
- Highway design changes have been implemented, including changed guardrail heights to allow cub crossings; minimized cut-slope barrier walls to facilitate movement; revegetation ~~planting~~ to provide cover, minimize exotic plants, and discourage planting of palatable foods; and narrower rights of way and road widths.
- Federal land management agencies have closed areas to cross-country motorized travel to provide more security for grizzly bears.
- Federal land management agencies have closed some areas to all human entry during certain seasons to increase human safety and provide security for grizzly bears.
- Many areas in the GYE have been closed to oil and gas leasing, or have restrictions (such as no surface occupancy) on oil and gas leasing to protect grizzly bear habitat.

Mortality Reduction Efforts Related to Habitat

Significant reductions in the human-caused bear mortality rate have been the primary reason the bear population is now meeting the demographic sub-goals established in the *Recovery Plan*. In addition to the above management improvements, the following actions have been found to be effective in limiting grizzly bear mortality and grizzly bear-human conflicts. These actions have been ongoing and will continue inside the PCA.

- Federal land management agencies have implemented and monitored compliance with food storage orders that require people using grizzly bear habitat to store food and refuse properly on public lands so bears will not become habituated to unnatural foods. This also reduces grizzly bear-human encounters.
- Bear-resistant garbage containers have been installed in campgrounds, picnic areas, and other public use areas on federal lands. Garbage collection schedules have been improved to collect garbage before it becomes an attractant to grizzly bears.
- Some counties and communities have improved their landfills and garbage collection systems to reduce or prevent conflicts with grizzly bears.
- Numerous education and information materials and programs have been developed by federal and state agencies and various organizations, to teach those living, working, and recreating in grizzly bear country how to be safe, to reduce grizzly bear-human encounters, and minimize grizzly bear mortality. Non-agency participation is encouraged.
- The state wildlife agencies have developed active management/conflict resolution programs to help minimize conflicts between people and bears.
- To provide increased protection for grizzly bears, Montana does not allow baiting or hound hunting for bears. Wyoming prohibits hound hunting within the state, and baiting is not allowed within the PCA. Baiting and use of hounds are not allowed within the PCA in Idaho.
- The number of domestic sheep allotments and the number of domestic sheep grazing within the PCA has been reduced; the remaining domestic sheep allotments are to be

phased out as opportunities arise. Sheep grazing permittees and herders must follow strict requirements in their grazing permits to protect grizzly bears and reduce grizzly bear/grazing conflicts.

- Individuals and organizations with special use permits on federal lands must follow strict requirements in their special use permits to protect grizzly bears and reduce grizzly bear-human conflicts.
- Adjustments have been made on cattle grazing allotments within the PCA, and cattle permittees must follow strict requirements in their grazing permits to protect grizzly bears and reduce grizzly bear-grazing conflicts.
- The IGBST coordinates an annual analysis of the causes of conflicts and known and probable mortalities, and proposed management solutions. Reports were reviewed by the Yellowstone Ecosystem Subcommittee and appropriate actions initiated. The Yellowstone Grizzly Bear Coordinating Committee will continue this review process.
- Federal and non-federal landowners have cooperated in limiting grizzly bear mortality and grizzly bear-human conflicts.
- Livestock and road-killed carcasses are managed to minimize grizzly bear-human conflict. Hunters are encouraged to quickly care for and remove hunter-killed carcasses to minimize grizzly bear-human conflicts.
- State and federal law enforcement agents have cooperated to ensure consistent enforcement of laws protecting grizzly bears. A task force of state and federal prosecutors and enforcement personnel from each state and federal jurisdiction will work together to make recommendations to all jurisdictions, counties, and states, on uniform enforcement, prosecution, and sentencing relating to illegal grizzly bear kills.
- When reclaiming or obliterating motorized access routes or restricting motorized or non-motorized access, priority has been and will be given to areas with historical grizzly bear-human conflicts or areas of probable grizzly bear-human conflicts.
- Appropriate actions to reduce mortality will be implemented as described in the state plans outside the PCA where grizzly bears occur or can reasonably be expected to occur when and where possible to improve public safety and minimize grizzly bear mortality.

Recovery of the grizzly bear in the GYE is the result of partnerships between federal and state agencies, the governors of three states, county and city governments, educational institutions, numerous organizations, private landowners, and the public who live, work, and recreate in the GYE. Maintenance of a recovered grizzly bear population depends on these partnerships.

Chapter 2 Population Standards and Monitoring

Introduction

To maintain a healthy (recovered) grizzly bear population in the GYE, it is necessary to have adequate numbers of bears that are widely distributed with a balance between reproduction and mortality. This section details the demographic criteria in the *1993 Recovery Plan* that were necessary to achieve recovery, and the criteria necessary to maintain it in the *2016 Recovery Plan Supplement: Revised Demographic Criteria for the Greater Yellowstone Ecosystem*. The *1993 Recovery Plan* criteria focused on the PCA and a 10-mile perimeter, whereas criteria in the Strategy, the *2016 Recovery Plan Supplement: Revised Demographic Criteria for the Yellowstone Ecosystem*, and the appended state plans encompass the ~~Demographic Monitoring Area (~~DMA~~)~~ of the GYE. Because grizzly bears are a difficult species to monitor and manage, multiple criteria are identified to provide sufficient information upon which to base management decisions.

The IGBST has generated extensive information useful to determine the status of the GYE grizzly bear population. Few populations have benefited from the amount of effort in data collection, as has the Yellowstone population. Agencies responsible for management will continue their commitment to data collection so population status can be determined and all designated standards maintained.

Under this Conservation Strategy and the *2016 Recovery Plan Supplement: Revised Demographic Criteria for the Greater Yellowstone Ecosystem*, all mortalities and all reports of ~~unduplicated~~ unique females with cubs-of-the-year (*see* Appendix C) will be monitored within the DMA (Figure 1). This will result in the management and monitoring of the grizzly bear population in the ~~entire GYE~~ DMA, as opposed to the system based ~~in~~ on the *2007 Recovery Plan Supplement: Revised Demographic Recovery Criteria*, as amended to the *1993 Recovery Plan*, in which mortalities and sightings of females with cubs-of-the-year were counted within the previously ~~defined~~described Conservation Management Area ~~(CMA).~~, ~~which is defined as~~

~~the Yellowstone Grizzly Bear Recovery Zone and immediately surrounding 10 mile area~~. This reduction in the area monitored for population estimates and estimating mortality rates ~~brings in~~focuses the monitoring efforts ~~within~~to the DMA, which corresponds to the area monitored by the IGBST. ~~which managed and monitored only the population inside the recovery zone and within 10 miles outside the recovery zone. This wider monitoring of mortalities and accounting for mortality limits is more stringent than the system under the *1993 Recovery Plan*.~~ Conservation Strategy demographic standards are tied to the DMA, shown in Figure 1. The criteria and objectives in the existing *1993 Recovery Plan* have modified, as described below.

Population Monitoring

Demographic monitoring protocols for the GYE population will focus on the area within the DMA and monitoring and documenting population size, distribution of females with young, and all forms of mortality. Additional monitoring or research may be conducted as determined by the IGBST.

Demographic Recovery Criteria from the 2016 Recovery Plan Supplement: Revised Demographic Criteria for the Greater Yellowstone Ecosystem

The *1993 Recovery Plan* defined a recovered grizzly bear population as one that could sustain a defined level of mortality and is well distributed throughout the recovery zone. The *1993 Recovery Plan* outlined a monitoring scheme that employed three demographic sub-goals to measure and monitor recovery of the Yellowstone grizzly bear population. The second criterion pertaining to the distribution of females with ~~offspring~~ young remains unchanged. However, the first and third criteria pertaining to the minimum allowable number of females with cubs ~~-~~of ~~-~~the ~~-~~year and sustainable mortality limits were revised and updated to reflect current methods based on the best available science. The current demographic recovery criteria in the 2016 *Recovery Plan Supplement: Revised Demographic Criteria for the Greater Yellowstone Ecosystem* are:

Demographic Recovery Criterion 1: Maintain a minimum population size of 500 animals and at least 48 females with cubs-of-the-year within the DMA (Figure 1), as indicated by methods established in published, peer-reviewed scientific literature and calculated by the IGBST using the most updated Protocol, as posted on their website. A minimum population size of at least 500 animals within the DMA will assure genetic health (Miller and Waits 2003). The estimate of total population size cannot drop below 500 in ~~two~~ three consecutive years or 48 females with cubs-of-the-year in ~~two~~ three consecutive years. ~~This estimate will be calculated using data obtained within the DMA shown in Figure 1.~~ The 48 females with cubs-of-the-year metric is a model-averaged number of documented ~~unduplicated~~unique females with cubs-of-the-year (*see* Monitoring Protocol section).

Demographic Recovery Criterion 2—Sixteen of 18 bear management units within the PCA (Figure 2) must be occupied by females with young, with no two adjacent bear management units unoccupied, during a 6-year sum of observations. This criterion is important as it ensures that reproductive females occupy the majority of the PCA and are not concentrated in one portion of the ecosystem.

Demographic Recovery Criterion 3— Maintain the population within the DMA around the 2002–2014 model-averaged Chao 2 estimate ($\overline{X}$ = 674; 95% CI = 600-~~757~~747; 90% CI = 612-735) by maintaining annual mortality limits for independent females, independent males, and dependent young as shown in Table 2. These adjustable mortality rates were calculated as those necessary to manage the population to the model average of 674 bears which occurred during the time period that this ~~population's growth stabilized~~slowed to stable to ~~slightly increasing~~population had a relatively flat population trajectory. If mortality limits are exceeded for any sex/age class for three consecutive years and any annual population estimate falls below 612 (the lower bound of the 90% confidence interval), the IGBST will produce a Biology and Monitoring Review to inform the appropriate management response. If any annual population estimate falls below 600 (the lower bound of the 95% confidence interval), this criterion will not be met and there will be no discretionary mortality, except as necessary for human safety.

Comment [PE>9/84]: Update once final agreement is reached Discussions are ongoing

Table 2. Total mortality rates used to establish annual total mortality limits for independent females, independent males, and dependent young[5] inside the DMA. For populations less than 600, there will be no discretionary mortality unless necessary for ~~public~~ human safety ~~or management of bear-human conflicts~~.

*using the model-averaged Chao2 estimate

Process for Determining Annual Mortality Limits

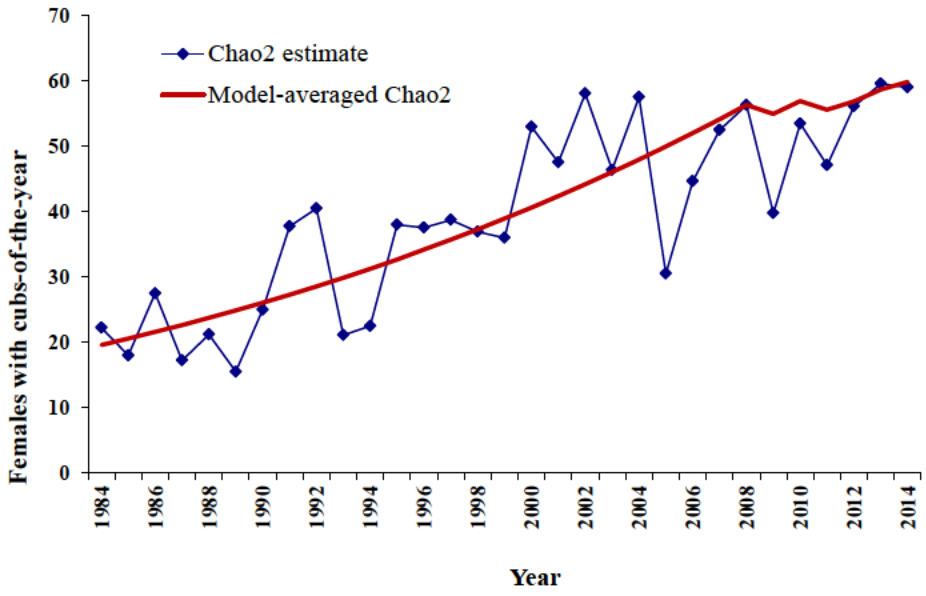
Each year the IGBST will calculate the model-averaged Chao2 population estimate for the DMA. This population estimate will be used to set the mortality limits for the following year within the DMA as per Tables 2, above, and 5, below. These mortality rates will be on a sliding scale to ensure a recovered population in accordance with the established recovery criteria. The mortality rate that resulted in population stability 2002–2011 was 7.6% for independent females, 7.6% for dependent young, and 15% for independent males (IGBST 2012). The higher rate for independent males is biologically sound since population growth is less sensitive to independent male mortality than to independent female mortality. In order to ensure that the grizzly bear population remains recovered in accordance with the Recovery Criteria, inside the DMA, a sliding scale of mortality rates will be applied to the model-averaged Chao2 population estimate from the year before as per Table 2. Mortalities are tracked and reported annually using data obtained within the DMA shown in Figure 1.

[5] Sustainable mortality estimates are based on the sustainable mortality percentage of the respective population segment relative to the population estimates.

Conservation Strategy Population Standards

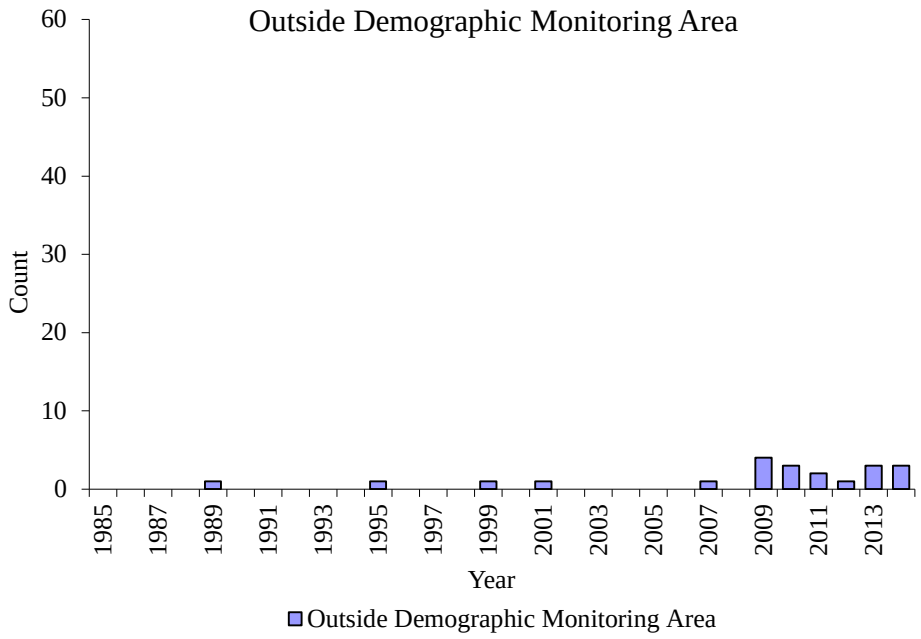
This Conservation Strategy and the state management plans set an objective of maintaining a recovered grizzly bear population in the Yellowstone area sufficient to meet management objectives inside and outside the PCA in biologically suitable and socially acceptable habitats. The demographic standards in this Conservation Strategy are designed to meet these goals.

The GYE grizzly bear population has exceededs 500 total bears as ofsince 2006 (Appendix M). The intent of the Conservation Strategy is to allow grizzly bears to occupy all biologically suitable and socially acceptable habitats. It is the goal of the agencies of the YGCC implementing this Conservation Strategy to ensure a recovered population in accordance with the established Recovery Criteria. This Conservation Strategy requires continued monitoring of the standards in the 2016 Recovery Plan Supplement to the *1993 Recovery Plan* and some additional standards. These specific population standards, will be applied to the population within the DMA.



Unduplicated Unique Females with Cubs-of-the-Year

Background



Females with COY cubs-of-the-year occupy all of the existing bear management units within the PCA as well as areas outside the PCA. Not all portions of the DMA currently have observations of females with cubs-of-the-year, however, several have been observed outside the and DMA in recent years (Figure 3).

Figure 3. The number ofChao2 estimate and model-averaged Chao2 of unduplicated unique females with cubs-of-the-year inside and outside the Demographic Monitoring Area, as per the Recovery Plan, 19845–2014. Estimates of grizzly bear population size in the Greater

Yellowstone Ecosystem are based on the Chao2 estimator. Model-averaged Chao2 estimates were implemented starting in 2007. Estimates for 1984–2007 were model-averaged once, and were annually updated after 2007. Model-averaging is not retroactively applied to update entire time series each year. Starting in 2012, only observations from within the Demographic Monitoring Area (DMA) contribute to population estimates.

Comment [JF5]: Final version of Figure 3

Monitoring Protocol

Monitoring ~~unduplicated~~ unique females with ~~COY~~ cubs-of-the-year will provide information to demonstrate adequate reproduction and to ~~estimate~~ derive annual estimates of *total* population size. ~~*Total*~~ Annual estimate of total population size will be ~~estimated using the~~derived ~~annually~~ from the model-averaged Chao2 ~~method~~estimate of females with cubs-of-the-year within the DMA (Figure 1), as described in Appendices B, C, L, and M, using the sightings and resightings of ~~unduplicated~~ unique females with cubs-of-the-year ~~from within the DMA shown in Figure 1~~. The IGBST has been calculating population size on an annual basis using the model- averaged Chao2 estimate since ~~2002~~2007. As the grizzly bear population has increased, model-averaged Chao2 estimates have become increasingly conservative (i.e., prone to underestimation). As a conservative approach to population estimation, the model-averaged Chao2 method will continue to be the method used to assess population status and the demographic criteria (*see* Appendix C

for the application protocol for annual population estimation using the model-averaged Chao2 method). The IGBST will continue to investigate new methods for population estimation as appropriate. If new methods become available, these will be considered for application in the GYE as long as they represent the best available science. However, until ~~possible~~ new methods are developed, the model-averaged Chao2 method will continue to be used. This is a departure from the way the population estimate was done per the *2007 Recovery Plan Supplement: Revised Demographic Criteria*. ~~*1993 Recovery Plan.*~~ In the ~~*1993 Recovery Plan*~~*2007 Supplement*, a ~~minimum~~ total population estimate using the model-averaged Chao2 method was made based on ~~the most recent three years of~~ sightings of ~~unduplicated~~ unique females with cubs-of-the-year, ~~using only unduplicated sights from the recovery zone and 10 miles outside the recovery zone~~within the Conservation Management Area (the recovery zone plus 10 miles outside the recovery zone). The revised and improved methodology used in this document allows an estimate of the *total* population using the model-averaged Chao2 method ~~rather than the *minimum* population size~~and corresponds directly to the area monitored by the IGBST (i.e., the DMA). This allows the calculation of mortality limits based on the total population size for each age and sex class (i.e., independent females, independent males, and dependent young) within the DMA (Figure 1). This method allows mortality management and population monitoring of the grizzly bear population in the DMA, as opposed to the method used in the original *1993 Recovery Plan*, which focused mortality management and population monitoring on only a portion of the Yellowstone grizzly bear population inside the Conservation Management Area~~PCA (the former Recovery Zone) and within 10 miles of the outer boundary of the PCA~~. ~~The number and distribution of females with cubs of the year can also be used to demonstrate that a sufficient number of adult females are alive within the population to reproduce and offset existing levels of human-caused mortality.~~

Comment [IGBST6]: We deleted this; distribution of females with young is addressed in a separate criterion

The numbers of ~~unduplicated~~ sightings and resightings of unique females with cubs-of-the-year inside the DMA will be reported by the IGBST. Using these data, the IGBST will produce the model- averaged Chao2 estimate of the total number of independent females in the population inside the DMA, which will then be used to estimate the total population size in the DMA. This total population estimate will be used to apply the mortality limits as per Table 2 within the

DMA for independent females (~~>~~ 2 years old) and independent males (~~>~~ 2 years old) from all causes as well as mortality limits for dependent young ~~(~~(< 2 years old) from human-caused mortality. For a more detailed description of this methodology, see Appendix C.

Sightings and resightings of females with ~~COY~~ cubs-of-the-year inside the DMA will be obtained from numerous sources, including systematic observation flights conducted annually throughout the entire DMA, and opportunistic confirmed sightings from ~~other~~ aerial sources and ground observers. ~~radio tracking flights, confirmed sightings, and observation flights.~~

Observation flights are primarily designed to survey the DMA and the number of flights conducted is standardized to ensure equal effort in obtaining data. The IGBST will verify the reliability of all sightings. The IGBST will plot all sightings and summarize data for ~~unduplicated~~ unique females and numbers of cubs-of-the-year seen for the entire population. Methodology developed by Knight *et al.* (1995) will be used to separate duplicated from unduplicated sightings (*see* Appendix C for more information).

Distribution of Females with Young

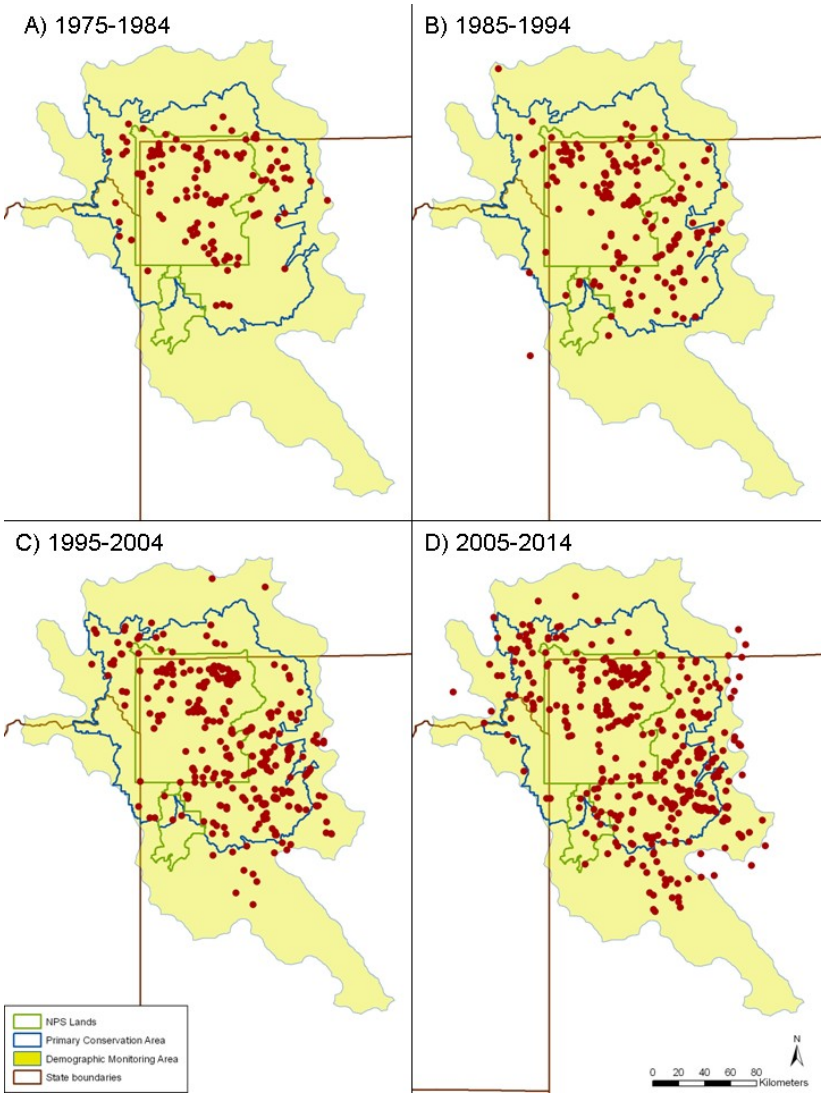
Background

Formatted: Tab stops: 2.03", Left

The distribution of females with young of all ages, based on the most recent six years of observations in the ecosystem, is presented in Figure 4. The recovery criterion of having 16 of 18 BMUs occupied with no two adjacent units vacant continues to be met (Table ~~13~~). This criterion is important as it ensures that reproducing females occupy the majority of the PCA and that successful reproductive females are not concentrated in one portion of the ecosystem.

Monitoring Protocol

This effort will provide information to assess distribution of the reproductive cohort in all occupied habitats, although the specific distribution standard for reproducing females will apply



only to the PCA. A recovered population should be well distributed throughout grizzly bear range. Successful reproduction is one indicator of habitat sufficiency, thus distribution of family groups of grizzly bears is one indicator of suitable habitat in areas where such sightings occur. Since sub-adult females usually establish home ranges adjacent to that of their mothers, the distribution of family groups is also an indication of future occupancy of these areas by grizzly bears. Radio tracking flights, observation flights, agency personnel sightings, and verified reports from other individuals will be the primary methods employed to collect female distribution data. The IGBST will verify all reports and keep a record of locations. Data will be maintained by the IGBST.

The number of BMUs occupied by females with young will be reported for the most recent six years. Females with young outside the PCA will also be reported, but only those females with young within the PCA will be used to document achievement of this distribution standard.

Table 43. Bear management units occupied by females with young based on verified reports, 2009–2014.

Mortality

Background

Agencies have invested significant effort aimed at limiting human-caused deaths for grizzly bears. ~~To date, t~~These efforts ~~have been very successful at limiting~~reduced human-caused mortality and allowed~~ing~~ the population to increase since it was listed in 1975.

The distribution of known and probably human-caused mortalities 1975–2014 is shown in Figure 5. As the population continues to expand, the percentage of known and probable mortalities occurring outside the PCA and outside the DMA is increasing ~~however this is expected~~, which was expected due to increased conflicts with humans and livestock in these areas.

Monitoring Protocol

The management of human-caused mortality of grizzly bears is ~~key~~ vital to the successful maintenance of the grizzly bear population in the GYE. Mortality limits are a necessary tool for managers in regulating human impacts to any wildlife population, including grizzly bears. Managing mortality is necessary to avoid the unregulated killing that occurred as the ~~Yellowstone area~~GYE was settled and to build support for long-term survival of the population. Higher numbers of mortalities can be expected in areas outside the DMA as the grizzly bear population expands, particularly in areas on the edge of the range when bears move on to private lands or in areas with higher levels of human development. Mortality management recognizes the need for some bears to be removed to address recurring conflicts to meet management needs for ~~nuisance~~ conflict bears, human safety issues, etc.

The state wildlife agencies (Montana, Wyoming, and Idaho) have signed a Memorandum of Agreement setting forth how they will coordinate bear management actions and limit discretionary mortality to ensure it will not jeopardize the recovery and survival of the GYE grizzly bear population (Appendix P). This document also summarizes each state's regulatory

mechanisms for regulating discretionary mortality, including harvest (*see* Chapter 7). The states may use regulated harvest as a management tool when and where appropriate. All known and probable mortalities will be limited by the overall mortality limits within the DMA as described in Table 2~~,~~ and Table 5~~4~~.

As per ~~T~~the States' Memorandum of Agreement, they will ~~establishes the~~ conduct ~~of~~ an annual meeting to evaluate the status of the population and develop allowable discretionary mortality by state. The Parties will confer with the National Park Service (NPS), the U.S. Forest Service (USFS, and the Bureau of Land Management (BLM) annually and will invite representatives of both GYE National Parks, the NPS regional office, the GYE USFS Forest Supervisors, and a representative from the BLM to attend the annual meeting.

Figure 5. Distribution of known and probable mortalities, from all causes, in the Greater Yellowstone Ecosystem, by decade from 1975–2014 (IGBST Data).

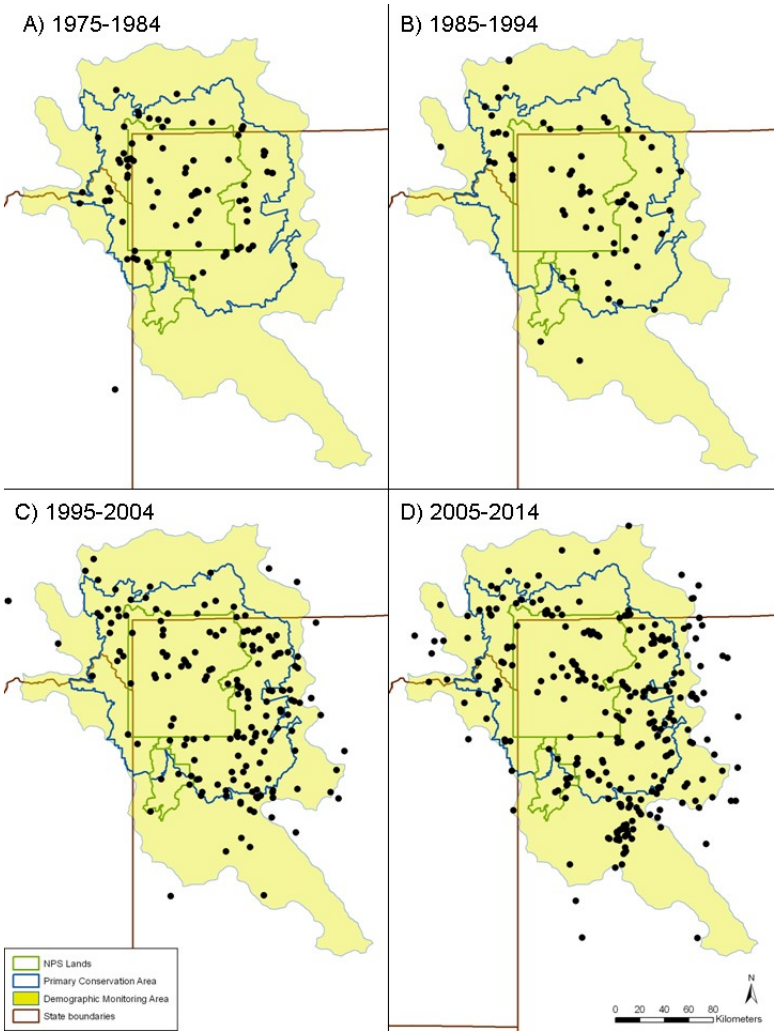

Table 54. Framework to manage mortality inside the DMA.

Management Framework	Background and Application Protocol			
1. Area within which mortality limits apply	49,928 sq km (19,279 sq mi) Demographic Monitoring Area (DMA) (Figure 1).			
2. Conservation Strategy Goal/Recovery Criteria	To ensure the continuation of a recovered grizzly bear population in accordance with the established Recovery Criteria: Criteria 1 (p. X) Criteria 2 (p. X) Criteria 3 (p. X)			
3. Population estimator	The model-averaged Chao2 population estimator will be used as the population measurement tool. An alternative method will be considered if an alternative scientifically sound method becomes available. The model-averaged Chao2 population estimate for 2002–2014 was 674 (average lower 95% CI = 600; average upper 95% CI = 747).			
4. Mortality limit setting protocol	Each fall the IGBST will annually produce a model-averaged Chao2 population estimate for the DMA. That population estimate will be used to establish the mortality limit percentages for each age/sex class for the following year as per #7, #8, and #9 (below).			
5. Allocation process for managed mortalities	Per Appendix P, the States will meet annually in the month of January to review population monitoring data supplied by IGBST and collectively establish discretionary mortality within mortality limits per age/sex class available for regulated harvest for each jurisdiction (MT, ID, WY) in the DMA, so DMA thresholds are not exceeded. If requested, the ~~WRR~~ Wind River Reservation will receive a portion of the available mortality limit based on the % of the WRR geographic area within the DMA. Mortalities outside the DMA are the responsibility of each State and do not count against mortality limits.			
6. State Regulatory Mechanisms specific to discretionary sport take	For specific state regulatory mechanisms, please reference the ~~three~~ Tri-~~s~~State ~~MOU~~ MOA found in Appendix P.			
7. Management review by the IGBST	A management review will be conducted by the IGBST every 5-10 years at the direction of the YGCC. This management review will assess if the management system is achieving the desired goal of ensuring a recovered grizzly bear population in accordance with Recovery Criteria (reference page they appear from CS). The management review is a science-based process that will be led by the IGBST (which includes all State and Federal agencies and the WRR Tribes) using all recent available scientific data to assess population numbers and trend against recovery criteria. Age/sex-specific survival and reproductive rates will also be reevaluated using the most recent data to adjust mortality levels as necessary.			
8. Mortality limit % for independent FEMALES	Pop. size	≤674	675–747	>747
	Mort. %	~~<~~≤7.6%	9%	10%
9. Mortality limit % for independent MALES	Pop. size	≤674	675–747	>747
	Mort. %	15%	20%	22%
10. Mortality limit for % of dependent	Pop. size	≤674	675–747	>747

Comment [FWS7]: Add reference once final

Comment [JF8]: fix

young	Mort. %	<<7.6%	9%	10%

Known and probable human-caused mortalities are defined as follows:

Known. Carcass recovered or evidence to indicate known status due to radio telemetry. Known deaths require a carcass, management removal, or a cut radio collar. Found collars having the appearance of being cut should receive additional forensic review for definitive proof.

Probable. Strong evidence to indicate mortality, reported by highly reliable sources, no carcass recovered. Probable deaths include those cases where there is supportive evidence that a bear was wounded. Circumstances of each reported instance should be considered. Probable includes those cases where evidence of blood, hair, or other tissues clearly indicates wounding serious enough to result in death. The literature is unclear on the likelihood of survival for orphaned cubs, therefore, any cub(s) orphaned during its first year of life because of a known mortality of its mother is considered a probable mortality.

Because probable mortalities will be counted against the mortality quota, and because there is a female quota, each probable mortality must be assigned a sex. Sex will be assigned in the following manner:

- Probable deaths of adult bears where cubs-of-the-year are reported present will be classified as ~~sex =~~ female.
- Lone bears classified as probable deaths will be assigned sex based upon statistics available from known deaths in the ecosystem. The percentage of known male and female deaths in the GYE between 1975 and 1998 is 59% and 41% respectively. These estimates exclude natural mortalities, management removals, and females with young. Therefore, sex will be assigned to probable adult mortalities in the GYE at a ratio of 59:41, male: female.
- Cubs-of-the-year that are orphaned and counted as mortalities will be assigned sex based a 50:50 sex ratio at birth (Eberhardt *et al*. 1994). For each cub, a random number will be drawn between 1 and 100. If the number is 1 through 50, the sex will be assigned as male; if the number is 51 to 100, the sex will be assigned as female.

State agencies will manage mortalities within the limits described in Table 2, Table 5~~4~~, and Appendix P, by implementing specific regulatory mechanisms in state law and regulation.

It is recognized that established mortality limits might be exceeded in any given year. Any mortality threshold will not affect the immediate management of bears for human safety concerns or for management of ~~nuisance~~ conflict grizzly bears. Appendix P describes agency responsibilities and actions to reduce mortality should this occur. State plans provide for the take of ~~nuisance~~ conflict bears regardless of the current mortality quota upon consultation among all involved agencies.

Mortality will be monitored by the IGBST reports from all sources. The IGBST will estimate the annual unknown and unreported mortality as per Appendix C and these mortalities will be added to the known and probably mortalities to produce a total annual mortality estimate by age and sex class. Each State wildlife agency, Tribe, and National Park will provide mortality information to the IGBST, who will update and report ongoing mortalities within the DMA to all agencies so that the states may adjust management actions under their purview if a mortality limit is approached or exceeded. The IGBST will annually summarize all mortality information as to location, type, date, sex, and age for the GYE and produce this information in their annual reports.

Mortality standards and grizzly bear vital rates will be reviewed and reported by the IGBST every 5 years. This information may be used to revise mortality management as necessary as long as any such revisions ensure a recovered population in accordance with the established Recovery Criteria and use the best available science. All management of, and information on, mortality management will be open to full public review.

Population Trend

Background

The population of grizzly bears was increasing at approximately 4.2% to 7.6% annually between 1983 and 2001 (~~Eberhardt *et al.* 1994, Boyce 1995, Boyce *et al.* 2001*b*,~~ Harris *et al.* 2006). While there is some debate related to the actual level of increase since the bear was listed in 1975, all information, including numbers of ~~unduplicated~~ unique females with cubs-of-the-year (Figure 3), distribution of reproducing females (Figure 4), and the distribution of verified grizzly bears occurrences ~~, informal sightings by agency personnel, and areas where nuisance bears are being managed indicate~~support that this population has increased in both numbers of bears (Figure 5) and the geographic area they occupy ~~(Schwartz *et al.* 2002)~~.

~~Schwartz~~ Harris *et al.* (2006~~*b*~~) used data from 1983 through 2001, while the 2012 IGBST report examined a more recent time period, 2002 through 2011 (IGBST 2012). The 2012 report (IGBST 2012) reported that population growth had slowed since the previous time period, but was still stable to slightly increasing, and had not declined. Because the fates of some radio-collared bears are unknown, ~~Schwartz~~ Harris *et al.* (2006~~*b*~~) and the IGBST (2012) calculated two separate estimates of population growth rate: one based on the assumption that every bear with an unknown fate had died (a conservative estimate); and the other simply removing bears with an unknown fate from the sample. The true population growth rate is assumed to be somewhere in between these two estimates because we know from 30 years of tracking grizzly bears with radio-collars that every lost collar does not indicate a dead bear. While ~~Schwartz~~ Harris *et al.* (2006~~*b*~~) found the GYE grizzly bear population increased at a rate between 4.2 and 7.6 percent per year between 1983 and 2002, the IGBST (2012) found this growth ~~had~~ slowed and ~~leveled off~~was~~is~~ stable to slightly increasing ~~and was~~at between 0.3 ~~percent~~ and 2.2 percent per year during 2002–2011. The population trajectory that includes the most recent data is based on the Chao2 estimator and indicates no statistical trend (i.e., relatively flat population trajectory) within the DMA for the period 2002 to 2014 (IGBST, unpublished data).

Formatted: Line spacing: 1.5 lines

Schwartz *et al.* (2006*b*) ~~analyzed~~ estimated survivorship of cubs-of-the-year, yearlings, and independent bears as well as reproductive performance to estimate population growth. They examined geographic patterns of population growth based on whether ~~they~~ bears lived inside Yellowstone National Park, outside the Park but inside the ~~Recovery Zone or~~ Primary

Conservation Area (PCA), or outside the PCA entirely. The PCA boundaries (containing 23,853 sq km (9,210 sq mi) correspond to those of the Yellowstone Recovery Zone (U.S. Fish and Wildlife Service 1993) and will replace the Recovery Zone boundary (Figure 1). They concluded that grizzly bears were approaching carrying capacity inside Yellowstone National Park. Consistent with this ~~conclusion~~interpretation, the IGBST (2012) documented lower cub and yearling survival than in the previous time period. Importantly, annual survival of independent females (the most influential age-sex cohort on population trend) remained the same while independent male survival increased (IGBST 2012). Collectively, these two studies indicate that the growth rate of the grizzly bear population ~~inside the DMA~~ had slowed as bear densities ~~have approached~~may be~~ar~~ nearing carrying capacity in portions of the GYE, particularly in the core area of occupied range. Recent work by van Manen *et al.* (~~2015~~2016) ~~confirms that~~provided further ~~the population growth has slowed and the population is is showing~~ evidence of density-dependent population regulation where bear densities are high. ~~as the population occupies almost all suitable habitat in the DMA.~~

Monitoring Protocol

This Strategy recognizes that any one factor cannot provide the needed information to assess population size and trend. Ultimately, population assessments will require multiple sources of information.

~~Population trend, using the Lotka equation as calculated from adult female survivorship and reproductive rate data for the appropriate period (Eberhardt *et al.* 1994, Eberhardt and Knight 1996).~~Additional methods will be used as supportive information to evaluate population trend: (1) mark-resight estimator (Higgs *et al.* 2013); (2) population projections from known-fate analysis (Schwartz *et al.* 2006, entire; IGBST 2012); and (3) population reconstruction (IGBST, unpublished data). ~~This~~These methods will be applied to the population inside the DMA but can be extended to the entire GYE.

Formatted: Tab stops: 1.69", Left

~~The agencies will strive~~ IGBST's goal will be to maintain a minimum of 25 adult female grizzly

bears fitted with ~~mortality sensing~~ radio collars and ~~monitored at all times~~a similar representative sample of males. To adequately sample survival, these 25 adult females will be spatially distributed throughout the ecosystem. The target distribution of these 25 radio-collared adult females will be determined by the IGBST; the expected distribution of collared females by agency will be assigned. Each female will be monitored using aerial telemetry flights every 10–14 days during the active season and approximately once every month during the denning season. ~~during the non-denning period. These data will be collected in conjunction with other regularly scheduled relocation flights.~~ When a radio collar indicates via a mortality signal that a bear may have died, a field crew will evaluate the bear's ~~actual~~ status ~~of the female~~ and, if a mortality is observed, determine cause of death. The IGBST will coordinate ~~field crew~~ collection of mortality data on each bear.

Data to ~~calculate~~ estimate reproductive parameters, such as litter size, and survival of cubs-of-the-year and yearlings~~on and survival~~ are collected ~~annually~~ in conjunction with telemetry flights in all areas occupied by grizzly bears throughout the DMA. These data sets will be maintained by the IGBST and used periodically for population projections and ~~to~~ evaluation~~e~~ of population trend.

Genetic Management

The GYE supports the southernmost population of grizzly bears remaining in North America. The question of concern is whether genetic factors, now or in the future, would compromise the long-term viability of the Yellowstone grizzly bear population.

DNA analyses conducted on museum specimens by Miller and Waits (2003) indicated a slight decline in genetic variability in the Yellowstone population since the early 20th century; however, this loss of variability was less severe than previously hypothesized. Indeed, a recent study by Kamath *et al*. (2015) using recent advances in genetic analysis techniques with molecular markers (Luikart *et al*. 2010) indicated that despite isolation, genetic diversity in the contemporary population has stabilized. Kamath *et al*. (2015) found that the current rate of

inbreeding in the Yellowstone grizzly bear population is very low (0.2%). Likewise, the effective population size (N_e), which reflects the number of reproducing individuals in a population, has increased from 102 to 469 during the 25-year period of 1982–2007.

This positive trend is important because N_e serves as a surrogate measure for a population's evolutionary potential and risk of inbreeding (Franklin and Frankham 1998). The most current N_e estimate of 469 (Kamath *et al.* 2015) approaches the minimum threshold criterion of 500 required for a threatened population to retain long-term evolutionary potential and maintain adequate genetic variation necessary for adaptation to environmental change as defined by Franklin (1980). It also exceeds the requisite minimum threshold ($N_e > 50$ individuals) needed to avoid risk of inbreeding (Franklin 1980), reducing concerns regarding genetic factors affecting the viability of Yellowstone grizzly bears (Kamath *et al*. 2015). In summary, Kamath *et al.* (2015) concluded that (1) genetic diversity has shown no decline over recent decades;~~,~~ (2) rate of inbreeding since 1985 is very low;~~,~~ and (3) effective population size has increased nearly 4-fold since 1982. These results collectively indicate that, at current population levels and under the current environmental conditions, genetic factors do not pose a substantial risk to the viability of the Yellowstone grizzly bear population. Kamath *et al*. (2015; page 5517) conclude that nonetheless, the historically small N_e, relatively low diversity, and isolation over many generations suggest the grizzly population could benefit from increased fitness following the restoration of gene flow, particularly given the unpredictability of future climate and habitat changes.

The State of Montana, in their Grizzly Bear Management Plan for Southwestern Montana (Appendix I) indicates Montana's belief that, as documented from sightings, captures, and mortalities in the past decade, grizzly bears from the ~~GYA~~ GYE and the NCDE are expanding their distribution and there is considerable potential for these populations to connect. Moreover, Montana states in this plan a long-term goal to allow the grizzly bear populations in southwest and western Montana to reconnect through the maintenance of non-conflict grizzly bears in areas between the ecosystems.

Management of non-conflict grizzly bears in areas between the NCDE management area and the DMA of the ~~GYA~~ GYE (Figure 7 of the 2013 Grizzly Bear Management Plan for Southwestern Montana) will be compatible with maintaining some grizzly occupancy. Maintaining presence of non-conflict grizzly bears in areas between the NCDE management area and the demographic monitoring area of the ~~GYA~~GYE, such as the Tobacco Root and Highland Mountains, would likely facilitate periodic grizzly movements between the NCDE and ~~GYA~~GYE. The Montana Grizzly Bear Management Plan indicates that the state of Montana will retain a priority around conflict management and removal of problem grizzly bears in this area, similar to the rest of Montana.

Human safety will always be prioritized over facilitation of grizzly movement for genetic connection between the ecosystems. However, the state of Montana has indicated that while discretionary mortality may occur here as needed, they will manage discretionary mortality in this area in order to retain the opportunity for natural movements of bears between ecosystems. Additionally, it is FWP's opinion that expanding the current level of habitat restriction and programs to bear-occupied areas outside the PCA would not generate social acceptance for the bear nor is expansion of habitat restrictions necessary for population recovery. Incorporating the grizzly as another component of FWP's ongoing programs for all wildlife is a more productive approach. The level of social acceptance of grizzlies in historical habitat changes based on how the issues are approached, the density of the bear population, and how much faith people have in wildlife managers.

Montana Fish Wildlife and Parks (MFWP) anticipates that successful implementation of this plan, along with adequate local involvement, can allow this to occur, and MFWP commits to continue to address land-use patterns that promote or hinder bear movement.

Genetic Monitoring Protocol

Genetic samples will be collected from all grizzly bear captures and mortalities in the GYE for

analysis via cooperative efforts between the IGBST and recognized genetic experts. Genetic analyses of these samples will be conducted and evaluated for potential evidence of grizzly bears from other populations immigrating into the Yellowstone population and producing offspring. Monitoring of radio-collared grizzly bears will be used to document potential movements between other ecosystems and the GYE.

Chapter 3 Habitat Standards and Monitoring

Background

Habitat standards and monitoring protocol in this Conservation Strategy identify provisions that Federal and State land managers throughout the ~~Greater Yellowstone Ecosystem (~~GYE~~)~~ are committed to for habitat preservation of a recovered Yellowstone grizzly bear population. Between 1986 and the initial 2007 delisting of the Yellowstone grizzly bear population, grizzly bear habitat in the GYE was managed under standards and guidelines established by the Interagency Grizzly Bear Committee (IGBC 1986) and specified in national forest and national park management plans. Acknowledging that humans are the primary agent of grizzly bear mortalities, a principal objective of the IGBC was to improve survival rates by implementing management strategies that minimized anthropogenic influences and grizzly bear-human conflicts. IGBC measures implemented inside the Grizzly Bear Recovery Zone (GBRZ) led to improved management of garbage and food attractants, reduced sheep grazing, and restrictions on motorized access and human development. These standards and guidelines that were imposed upon public lands were instrumental in the recovery of the grizzly bear in the GYE throughout the mid-1980s and into the 1990s.

The subsequent 1993 *Grizzly Bear Recovery Plan* (USFWS 1993) required the preservation and monitoring of habitat necessary to support a recovered population. This led to the development of more explicit and measureable habitat criteria to be applied inside the GBRZ, as per the *Recovery Plan Supplement: Habitat-based Recovery Criteria for the Greater Yellowstone Ecosystem* (USFWS 2007*c*). To satisfy this requirement, measureable habitat criteria were established that called for no net loss of secure habitat with respect to 1998 conditions. These criteria were embraced and incorporated into the draft Conservation Strategy and released for public comment in 2000. Analysis of public comments and new information was used to establish the final habitat standards for a recovered ~~Yellowstone~~ GYE population as identified in the 2007 Conservation Strategy (USFWS 2007*a*) and appended in a supplement to the Recovery Plan (USFWS 2007*b*). This 2016 revision of the Conservation Strategy includes some changes

to the 2007 document that help clarify habitat standards as they pertain to the 1998 baseline.

Clarifying language to the application rules has been inserted where necessary to provide better direction for application of these standards on a local project level. No substantive changes in the content of habitat standards have been made under this revision. However, some modifications in habitat monitoring protocols have been made and are documented in this chapter. Upon delisting of the Yellowstone population, the GBRZ will be referred to as the Primary Conservation Area (PCA) to reflect the shift from managing for recovery to one of conservation.

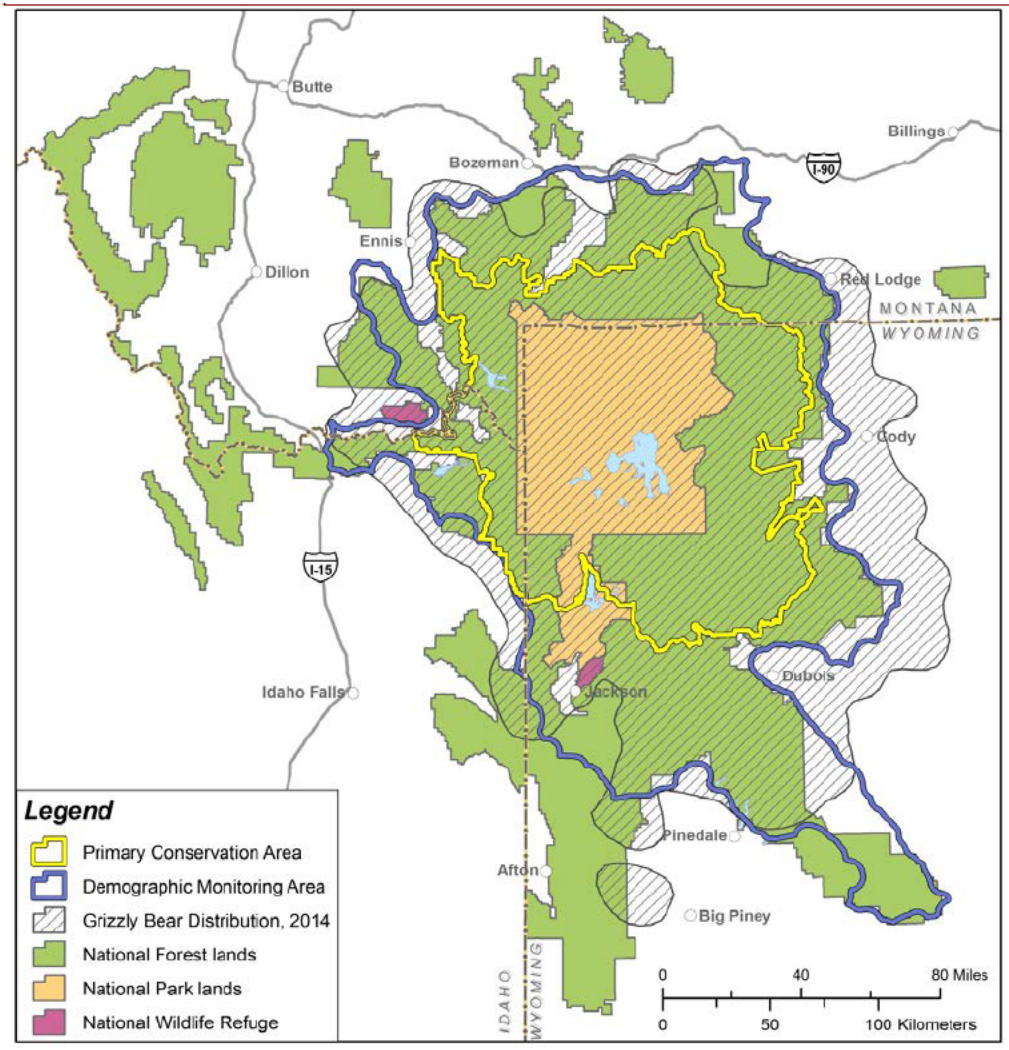
Since 1998, visitor use in National Park lands and surrounding federal public lands has increased significantly. During this time there was a significant increase in grizzly bear numbers and occupied range such that there are more bears in more places. Adherence to the habitat standards and its associated sideboards to human activities has contributed to the successful recovery of the GYE grizzly bear population. However, the habitat standards associated with the 1998 baseline and the administrative mandates to manage for increased visitation have not kept pace with the recent changes in a manner that allows land managers to responsibly accommodate the current, and likely future, increase in visitor use. For example, the steady increase in visitor numbers may necessitate more administrative infrastructure to strategically manage the impacts of more people on the landscape while ensuring the continued protection of grizzly bears and their habitat. Therefore, it is necessary to reconsider the role and responsibility for stewardship and resource management of public lands inside the PCA and throughout the GYE. Specifically, how could future modifications to the 1998 baseline standards be designed so that increased visitation can be addressed without threatening the habitat and population gains that have been secured? As such, it is proposed that a multi-agency effort be conducted to determine the best long-term solutions for alleviating administrative pressures associated with increased visitation. Any future management changes proposed in this effort will be evaluated in a cooperative and meaningful manner with full consideration to long-term consequences. ~~Proposed modifications will minimize deviations to the 1998 baseline.~~ A multi-agency planning group will be established in calendar year 2017 to complete this re-evaluation effort ~~on or before the end of calendar year 2018~~. Production of a draft document enumerating proposed revisions to the 1998

Comment [PE>9/89]: Consider whether we should attach the timeline as an Appendix

habitat standards will be released for public comment and approved by the YGCC. ~~The final revision document must be agreeable to each of the affected federal land management agencies represented on the YES, including the National Park Service, U.S. Forest Service, Bureau of Land Management, as well as the U.S. Fish and Wildlife Service.~~

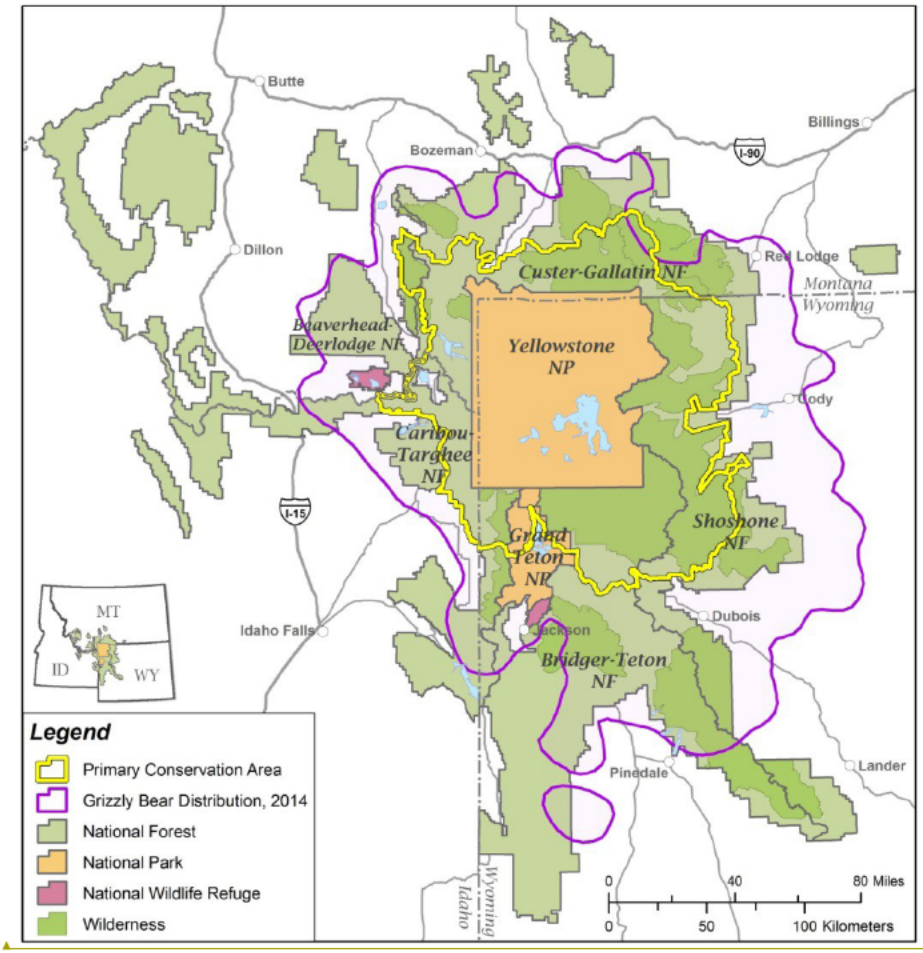
Introduction

The overall objective for habitat management inside the PCA is to reduce access-related disturbances and human-cause mortalities by maintaining or improving habitat with respect to 1998 conditions while maintaining options for resource management activities at approximately the same level as existed in 1998. Habitat standards apply to Federal lands inside the PCA and identify three factors that must be maintained at, or improved upon with respect to conditions existing in 1998: (1) secure habitat, (2) number and capacity of developed sites, and (3) number and acreage of active commercial livestock grazing allotments. All three of these factors are linked to human activities that affect grizzly bear mortality and displacement. These three standards apply to public lands within the PCA, the area where past recovery efforts and present habitat conservation measures are primarily focused. The PCA ~~serves as a relatively safe haven located at the core of the ecosystem and~~ accounts for approximately 41% of the ~~Yellowstone~~ GYE grizzly bear's occupied range as estimated from methods of Bjornlie *et al*. 2014 (Figure 6). The 1998 baseline for habitat standards was selected because studies showed (and recently affirmed) that the ~~Yellowstone~~ GYE grizzly bear population was increasing annually at a robust rate of 4.2 to 7.6 percent between 1983 and 2001 (~~Boyce *et al*. 2001*b*,~~ Harris *et al*. 2006, 2007, IGBST 2012). Habitat conditions in 1998 were considered representative of this time period since levels of secure habitat and developed sites inside the PCA had remained relatively constant in the 10 years preceding 1998 and beyond (USDA 2004). Hence, conditions in 1998 are believed to have supported and contributed to the population growth observed during 1983–2001. Habitat standards, as they apply to the 1998 baseline, impose measureable side boards on allowed levels of human activity inside the PCA and establish a clear benchmark against which future improvements and impacts of habitat can be measured.



To facilitate management of habitat throughout the PCA, the area inside the PCA is divided into 18 distinct bear management units (BMUs) and 40 subunits (Figure 2). BMU boundaries were delineated to approximate the average *lifetime* range of an adult female grizzly bear in the GYE. Each BMU was further subdivided into one or more subunits comparable in size to the average *annual* home range of an adult female grizzly bear. Monitoring habitat at a subunit scale provides greater spatial resolution and proved to be better suited for analyzing habitat use patterns and ensuring good distribution of bear habitat throughout the PCA (USDA 1985). Hence, conditions pertaining to secure habitat and developed site standards are measured and compared against 1998 levels for each of the 40 bear management subunits within the PCA. To date, habitat-based criteria throughout the PCA have been successfully maintained at, or improved upon, 1998 levels for all 40 subunits. Adherence to these standards ensures that sufficient habitat for the Yellowstone grizzly bear will continue to be available into the foreseeable future. Habitat standards in this document are subject to revision based on the best available science and will be reviewed and updated as necessary.

In addition to mandatory habitat standards, several other habitat parameters will be monitored and evaluated to determine the overall condition of habitat for grizzly bears in the PCA. These additional monitoring items include ~~habitat connectivity~~~~transportation planning and food storage orders with respect to habitat connectivity,~~ ~~hunter numbers,~~ ~~and~~ productivity or grizzly bear use of the following ~~four high calorie~~ foods: (1) ~~winter killed~~ ungulates, (2) cutthroat trout, (3) army cutworm moths, and (4) whitebark pine seeds. Information on monitoring protocols for these items is found in subsequent sections of this chapter.



Agencies responsible for management of grizzly bear habitat in the GYE are committed to continue collecting the necessary information to evaluate adherence to habitat standards and monitoring protocols throughout the PCA. ~~The overall objective for habitat management inside the PCA is to reduce human-caused grizzly bear mortalities by maintaining or improveing habitat with respect to 1998 conditions while maintaining options for resource management activities at approximately the same level as existed in 1998.~~ The habitat standards and monitoring requirements in this Conservation Strategy ~~will be~~have been incorporated into

National Forest plans, National Park compendiums, and BLM plans.

Figure 6. Federal lands comprising the Greater Yellowstone Ecosystem (GYE), the Primary Conservation Area (PCA), the Demographic Monitoring Area (MDA), and current (2000–2014) grizzly bear occupied range as estimated based on techniques described in Bjornlie et al. (2014). ~~estimated Grizzly Bear Occupied Range as of 2014~~.

Comment [JF10]: New version of figure 6

Formatted: Font: 10 pt

Outside the PCA, grizzly bears ~~are allowed to expand~~have expanded into adjacent areas considered biologically suitable and socially acceptable, as per direction in the State and Tribal management plans (Appendices I, J, ~~and~~ K, and O). The key to successful management of grizzly bears outside the PCA is a sustainable balance that accommodates the needs of grizzly bears along with the competing demands of human use. As such, an important management objective for areas outside the PCA is to maintain existing resource management and recreational uses and allow agencies to respond to demonstrated problems with appropriate management actions. Approximately 83 percent of suitable habitat outside the PCA occurs on federally owned land and about 82.6 percent of that suitable habitat is occupied by grizzly bears (Figure 6). Most lands outside the PCA are under Forest Service management and the majority of these lands will remain as relatively secure habitat due to land designation. The Forest Service manages 76 percent (17,292 sq km (6,676 sq mi)) of suitable habitat outside of the PCA, of which nearly 71 percent (12,396 sq km (4,786 sq mi)) is relatively secure because ~~of designation~~ they are Congressionally designated ~~as~~ Wilderness ~~Areas~~, Wilderness Study Areas, or Inventoried Roadless Areas. ~~The amount of secure habitat is less than the total contained within Inventoried Roadless areas because some motorized use occurs in Inventoried Roadless Areas due to roads that existed before the area was designated as roadless.~~ These designations provide regulatory mechanisms outside of this Conservation Strategy that ~~protect~~ minimize impacts to secure grizzly bear habitat ~~from increased motorized use, oil and gas development, livestock allotments, and timber harvest~~. A flexible management strategy is crucial for promoting acceptance and tolerance for grizzly bears as they continue to expand into suitable habitat outside the PCA. Standards and guidelines for other wildlife species identified in National Forest and Park management plans indirectly provide additional habitat management direction for bears outside the PCA.

State grizzly bear management plans for Idaho, Montana, and Wyoming recommend and encourage land management agencies to maintain or improve habitats important to grizzly bears and to monitor habitat conditions outside the PCA. These three states acknowledge the importance of secure habitat (*see* secure habitat definition below), motorized access management, and road density issues related to the survival of grizzly bears and other wildlife.

Consequently, levels of secure habitat ~~and motorized route density~~ are monitored on federal lands outside the PCA ~~to identify and prevent potential habitat threats from negatively impacting the long-term viability of the Yellowstone grizzly bear population~~. Land management agencies work cooperatively with state wildlife agencies to meet identified population and habitat goals for grizzly bears in the GYE. The process of implementing state and federal grizzly bear management is coordinated by the ~~Yellowstone Grizzly Bear Coordinating Committee (~~YGCC~~)~~ representing all respective land management agencies in the GYE (*see* Chapter 6 Implementation and Evaluation).

~~Immediately upon ESA delisting of the species, regional foresters in Regions 1, 2, and 4 of the U.S. Forest Service agree to add the grizzly bear to their Sensitive Species lists for the five National Forests in the GYE. Forest Service sensitive species direction requires that any project "*must not result in loss of species viability or create significant trends toward federal listing*" (USDA 2005). Sensitive species direction also requires the Forest Service to "*assist states in achieving their goals for conservation of endemic species*" (USDA 2005). A biological evaluation will be completed for all Forest Service projects potentially affecting the GYE grizzly bear. These evaluations will be completed for all Forest Service projects potentially affecting the grizzly bear. These evaluations will determine whether projects do or do not meet the habitat standards in this Conservation Strategy. If the biological evaluation demonstrates that a project does not meet the habitat standards as well as other relevant habitat and population criteria, the project will be modified as necessary to ensure complete adherence with all required measures.~~

Habitat Standards i~~I~~nside the Primary Conservation Area

Human activity is the primary factor negatively impacting availability and security of grizzly bear habitat in the GYE. The relationship between bears and habitat is extremely complex and difficult to quantify. However, unfettered human activity is known to result in displacement and mortality of grizzly bears and was a significant contributing factor leading to listing the grizzly bear in the conterminous U.S. as a Threatened species in 1975. Restrictions in human activities due to management practices implemented by the IGBC in the mid-1980s correlate strongly with

the steady increase in the Yellowstone grizzly bear population ~~that was~~ observed between 1983 and 2001. Habitat standards formalized in this document impose measurable sideboards on levels of ~~human activity~~road development, construction of developed sites and livestock grazing allowed on Federal lands inside the PCA, thereby reducing opportunities for grizzly bear-human conflicts, habitat disturbance, and displacement of grizzly bears from valuable habitat.

Habitat standards identified in this document address three key factors related to human activity (motorized access, site development, and commercial livestock grazing) and specifically call for no net loss in secure habitat inside the PCA from what existed in 1998 (Appendix E). Adequate secure habitat is essential to the survival and reproductive success of grizzly bears~~, particularly adult females~~.

It is the goal of habitat management agencies to maintain or improve habitat conditions throughout the PCA at or above 1998 levels, as measured per bear management subunit. These levels of secure habitat have been maintained and will continue to be maintained, and improved on where possible, ~~long into the future~~for the foreseeable future.

Potential impacts to grizzly bears and their habitat resulting from federal activities occurring inside the PCA will be evaluated and mitigated using the criteria and standards in this Conservation Strategy in coordination with state wildlife agencies.

Errors of ~~O~~omission~~s~~ to the 1998 habitat measurements comprising the baseline (Appendix E) may be corrected for when based on new and well documented information substantiating the existence and status of anthropomorphic features (i.e., motorized routes, developed sites, or livestock allotments) that were not properly accounted for in the 1998 baseline. When verified, legitimate corrections to the baseline will be tracked and reported and will constitute new baseline habitat levels against which future change will be measured.

Application rules specific to each habitat standard provide additional direction on how these standards are to be implemented at a Federal project level. The following habitat standards and

Comment [PE>9/811]: Comment from PJ White: This statement needs to be clarified/revised because there are two notable exceptions: 1) the portion of mortalities due to bears shot in defense by primarily elk hunters and, perhaps in the future, 2) grizzly bear hunting There are no specific habitat standards (e g , commitments to conservative harvests) that attempt to reduce the effects of these activities on the overall intent of the Recovery Zone/PCA, which was to reduce human-caused disturbances and mortalities of grizzly bears

application rules apply to all Federal lands inside the PCA.

Secure Habitat Standard

The Secure Habitat Standard requires that inside the PCA, the percentage of secure habitat within each bear management subunit must be maintained at or above levels that existed in 1998 (Appendix E). The sole exception to the 1998 secure habitat baseline applies to the three subunits identified in the 2007 Conservation strategy as in need of improvement above 1998 levels (Gallatin #3, Henrys Lake #2, and Madison #2). These three subunits must be maintained at or above levels attained from ~~the~~ full implementation of the 2006 Gallatin National Forest Travel Management Plan (Appendix E). Authorized Federal projects that result in temporary or permanent changes to secure habitat are allowed per~~must follow~~ the Application Rules identified below.

Secure habitat is defined as any contiguous area ≥ 10 acres in size and more than 500 m from an open or gated motorized access route (road or trail) or recurring low level helicopter line during the non-denning period (March 1 – November 30). Gated routes that are closed year-round to public motorized use but remain accessible to administrative personnel are still considered motorized access routes, and hence, detract from secure grizzly bear habitat. ~~There are activities allowed in secure habitat (*see below*) that do not violate standards or count as motorized access routes.~~ Decommissioned routes that are permanently and effectively closed to the public and administrative staff do not count against this standard. Lakes larger than 1.6 sq km (1 sq mi) in spatial extent are excluded from secure habitat calculations.

For the purposes of this chapter, secure habitat is correlated with key habitat components, such as foods, cover, space, arrangement of habitat types, and the ability of grizzly bears to move between them. For the purposes of describing habitat management and conservation in this chapter, secure habitat has no direct link to discretionary mortality. Any potential population and conflict management activities are distinctly separate components of this strategy and addressed in other chapters.

Application Rules for Permanent Changes in Secure Habitat

Permanent changes to secure habitat are allowed inside the PCA when associated with an authorized Federal project involving construction of new motorized routes (i.e., roads or trails), reconstruction of existing motorized routes, or opening of a previously decommissioned route if, and only if, the following conditions are met:

- Any loss in secure habitat below baseline levels is replaced by restoring secure habitat of equivalent quality and quantity (e.g., through decommissioning) in the same bear management subunit. Habitat quality must be assessed based on the best collective scientific understanding of grizzly bear habitat ecology and the rationale for all mitigation measures must be fully documented.
- Replacement habitat must be in place before project implementation or concurrent with project development as an integral part of the project plan. Replacement habitat must remain in place for a minimum of 10 years before it can be subsequently replaced and mitigated for per application rules (this duration is based ~~up~~on the approximate generation time ~~for~~ of a female grizzly bear, or the time it takes to replace herself in the population).
- For those subunits identified as in need of improvement above 1998 levels (*Gallatin #3, Madison #2,* and *Henry's Lake #2*), secure habitat will be maintained at or above levels associated with full implementation of the 2006 Gallatin National Forest Travel Management Plan (*see* Appendix E).
- For activities based on statutory rights, such as access to private lands under the *Alaska National Interest Lands Conservation* (ANILCA) or the *1872 General Mining Law*, where permanent reductions in secure habitat cannot be replaced within the affected subunit, then secure habitat will be compensated at a commensurate level at or above the baseline in the nearest possible subunit. In these rare situations, subsequent changes to secure habitat in the two affected subunits constitute permanent changes to the baseline.
- Honor existing oil and gas or other mineral leases. Proposed *Applications for Permit to Drill* (APDs) and operating plans within those leases would strive to meet the application

rules for changes to secure habitat. New leases, APDs, and operating plans must meet the secure habitat and developed site standards.

- Motorized routes on private land that post-date 1998 are not counted against this standard. However, for motorized roads or trails acquired through land exchanges or acquisition that are desirable to maintain for public use, mitigation is strongly recommended.

Application Rules for Temporary Changes in Secure Habitat

Temporary reductions in secure habitat below baseline levels inside the PCA are allowed when associated with authorized Federal projects. Project activities should be concentrated in space and time to minimize disturbance**.** The following conditions must be met for temporary projects:

- Only one project affecting secure habitat may be active within a given bear management subunit at any one time.
- Total acreage of secure habitat affected within a given BMU does not exceed 1 percent of the acreage in the largest subunit within that BMU. The acreage of a project that counts against the 1 percent limit (i.e., the amount of secure habitat affected) is measured as the acreage within the 500-meter buffer around any temporary motorized access route or low-level helicopter flight line that intrudes into existing secure habitat.
- Use of project roads will be limited to administrative purposes associated with project activities. Project implementation shall not reduce secure habitat below baseline levels for more than 4 consecutive years. The collective set of project roads that affect secure habitat below baseline levels shall be closed to all motorized travel after 3 years. Project roads shall be decommissioned such that secure habitat is restored within 1 year after road closure.

Activities Allowed in Secure Habitat

The following activities are allowed in secure habitat inside the PCA without violating the standard:

- Activities that do not require route construction or reconstruction, re-opening of a permanently closed road, or recurring low-level helicopter flight lines.
- Helicopter use for short term (no more than 2 days in the duration of a project), or at higher elevations (> 500 m above ground level with no landing). Aircraft used in emergency firefighting are allowed.
- Non-wheeled, over-the-snow use (i.e., snow machines) is allowed unless new research identifies a ~~concern~~threat. Conflicts associated with winter-use activities that develop either during denning or after den emergence in the spring can be addressed with local area restrictions.
- Access to power lines and/or utility corridors for occasional and necessary maintenance service that does not require new route construction and is used only for administrative purposes related to power line/utility maintenance.
- Project activities (e.g., temporary road construction and maintenance, or use of recurring low-level helicopter flights) that occur during the grizzly bear denning season between December 1 and February 28.

Developed Site Standard

The Developed Site Standard requires that on Federal lands inside the PCA, the number and capacity for human use of developed sites must be maintained at or below the 1998 levels (Appendix E). Projects that propose a change in the number or capacity of developed sites must follow the Application Rules specified below.

Developed sites refer to those sites or facilities on public land with features intended to accommodate administrative needs and public recreational use. Such sites typically are identified or advertised via visitor maps, information displays, or administrative personnel as discernable destination sites promoted by the agency. Developed sites are often associated with human activities that may disrupt grizzly bear use of habitat, or have attractants that potentially lead to increased human-bear conflicts. Examples of developed sites include, but are not limited to: campgrounds, picnic areas, trailheads, boat launches, rental cabins, summer homes, lodges,

service stations, restaurants, visitor centers, and administrative sites. **Administrative sites** are those sites or facilities constructed for use primarily by government employees to facilitate the administrations and management of public lands. Administrative sites are counted towards developed sites. Examples include: administrative headquarters, ranger stations, patrol cabins, park entrances, federal employee housing, and other facilities supporting government operations. **Dispersed sites**, in contrast to developed or administrative sites, are those not associated with a developed site, such as a front-country campground. These sites are typically characterized as having ~~no permanent agency-constructed features, have~~ minimal to no site modifications, and may include primitive road access. Dispersed sites are not counted toward developed sites.

Application Rules for Developed and Dispersed Sites

On Federal lands inside the PCA, changes to developed sites or construction of new developed sites are allowed if the following conditions are met:

- Construction of new sites will be mitigated for within that subunit to offset any increase in the number of developed sites and/or capacity for human use, habitat loss, and increased access to surrounding habitats.
- Mitigation of detrimental impacts will occur within the affected subunit and adequately compensate for the type and extent of impacts. Mitigation measures will be in place before implementation of the project or included as an integral part of completion of the project.
- Consolidation and/or elimination of dispersed campsites is considered adequate mitigation for increases in human capacity at developed campgrounds if the new campsite capacity is less than or equivalent to that of the dispersed camping eliminated and if future overnight use of the dispersed site(s) is definitively curtailed.
- Conversion of uncontrolled dispersed campsites to a minor day-use site is allowed if there is a net benefit to both human and bear safety and if the dispersed site(s) can be modified in such a way that future over-night use of the site is definitively curtailed. Such modification of site-use would not contribute to an increase in baseline developed sites.
- Expansion (in capacity and acreage) of existing administrative sites is exempt from

mitigation if such developments are deemed necessary for enhancement of public land management and other viable alternatives are not available. Temporary construction of work camps for highway construction or other major maintenance projects and for emergency response (such as fire) are exempt from human capacity mitigation if other viable alternatives are not available. Food storage structures and management must be in place and all other factors resulting in potential detrimental impacts to grizzly bears will be mitigated as identified for other developed sites.

- Modifications to existing developed sites that reduce resource damage, detrimental environmental impacts, and/or the potential for grizzly bear conflicts are allowed (e.g., installing a vaulted toilet to avoid damage to water resources or installing bear-resistant storage structures to reduce conflict).
- Modifications to dispersed campsites that reduce resource damage, detrimental environmental impacts, and/or the potential for grizzly bear conflicts are allowed (e.g., installing bear-resistant storage structures and limiting parking expansion). Such modifications do not require mitigations as long as they are not permanent or ~~irretreviable~~irretrievable.
- For activities based in statutory rights (e.g., *1872 General Mining Law*, *Americans with Disability Act*, ANILCA, etc.), if the number of developed sites exceeds the 1998 baseline, the Forest Service will, to the fullest extent of its regulatory authority, reduce developed sites to commensurate levels and mitigate to offset any increases in human capacity, habitat loss, and increased access to surrounding habitat within the affected subunit if possible. In those rare cases where mitigation cannot be accomplished within that subunit, commensurate compensation will be accomplished in the nearest subunit and changes in the two affected subunits become permanent changes to the baseline.
- Honor existing oil and gas and other mineral leases. For proposed *Applications for Permit to Drill* (APDs) and operating plans within those leases, the Forest Service should, to the fullest extent of their regulatory authority, strive to meet the developed site standard and satisfy application rules for changes in secure habitat. New leases, APDs, and operating plans must meet the developed site standard and satisfy application rules for changes in secure habitat.

- Developments on private land are not counted against this standard. However, for developed sites acquired through land exchanges or acquisitions that are desirable to maintain, mitigation is strongly encouraged but not required. The rationale behind this is to encourage acquisition and transformation of private land to public ownership since this negates the potential for future development and results in better management for grizzly bears.

Livestock Allotment Standard

The Livestock Allotment Standard requires that on Federal lands inside the PCA, there will be no increase in the number or acreage of active commercial livestock grazing allotments nor an increase in permitted sheep Animal Months (AMs) relative to that which existed in1998 (see Appendix E). Existing sheep allotments will be monitored, evaluated, and phased out as the opportunity arises with willing permittees.

Application Rules

Grazing allotments tracked for purposes of grizzly bear conservation include both vacant and active commercial livestock units for sheep, cattle, and/or horses on Federal lands inside the PCA. **Active** allotments are livestock units with active grazing permits. **Vacant** allotments are those without an active permit, but which may be restocked or grazed periodically by other permittees at the discretion of the land management agency to resolve resource issues or other concerns. Changes in livestock allotments inside the PCA that satisfy the allotment standard may occur if the following conditions are met:

- A vacant allotment may be reissued an active permit resulting in an increase in the number of permitted cattle as long as~~, but~~ the number and net acreage of active allotments inside the PCA ~~must not~~ does exceed the 1998 baseline. Appropriate analysis by the action agency must be conducted to evaluate impacts on grizzly bears.
- Combining or dividing existing allotments is allowed as long as the net acreage and number of active allotments inside the PCA does not exceed 1998 levels.

- Where chronic grizzly bear conflicts occur on livestock allotments inside the PCA, and an opportunity exists with a willing permittee, alternatives for resolving conflicts may include authorization of a non-use permit, moving livestock to a vacant allotment where there is less likelihood of conflict, or cattle grazing can be phased out on that allotment.

Habitat Monitoring

The primary objective of habitat monitoring is to track and assess the status of grizzly bear habitat throughout the ecosystem with an emphasis placed on habitat inside the PCA. Monitoring requirements presented in this section focus on evaluation of adherence to habitat standards ~~identified~~ such that secure habitat, developed sites, and commercial livestock grazing allotments are maintained at, or improved upon, 1998 levels. However, additional habitat parameters pertaining to four high-calorie foods of the grizzly bear diet are also monitored to assist in evaluating the status of grizzly bear habitat and its ability to support a recovered grizzly bear population.

Monitoring Secure Habitat and Motorized Access Route Density

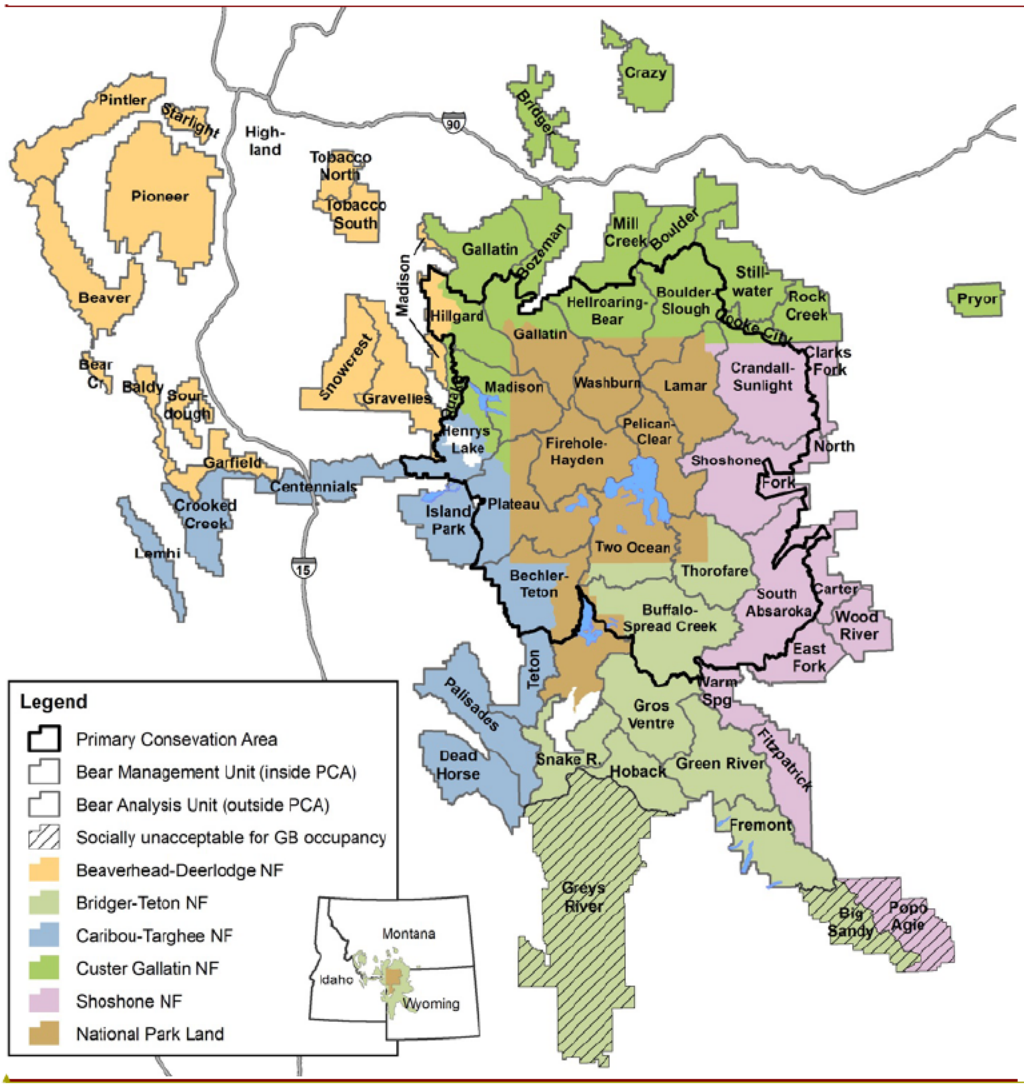
Background

Humans are the primary agent influencing grizzly bear mortality and population trajectories in the GYE and elsewhere (McLellan and Shackleton 1988, Mattson and Knight 1991, Mace *et al*. 1996, Schwartz *et al*. 2010, Proctor *et al*. 2012). Motorized access has historically been used as a surrogate measure of human presence on the landscape, and consequently serves as the basis for differentiating secure and non-secure habitat throughout the ecosystem. Land managers throughout the GYE recognize that availability of secure habitat is crucial to the survival and long-term reproductive success of grizzly bears. Managing the landscape to reduce grizzly bear mortality risk requires that motorized roads and trails be considered when evaluating and maintaining secure habitat throughout the ecosystem.

Motorized access parameters, including: (1) percent secure habitat, (2) open motorized access route density (OMARD), and (3) total motorized access route density (TMARD)~~.~~, are measured and monitored against levels that existed in 1998. To date, no net decrease in secure habitat relative to 1998 levels has occurred on federal lands in any of the 40 bear management subunits within the PCA. Instead, reductions in motorized access implemented post-1998 have led to an increase of 1.4 percent in secure habitat inside the PCA; a gain approximate in size to the area of Yellowstone Lake.

Subunits with potential for improvement

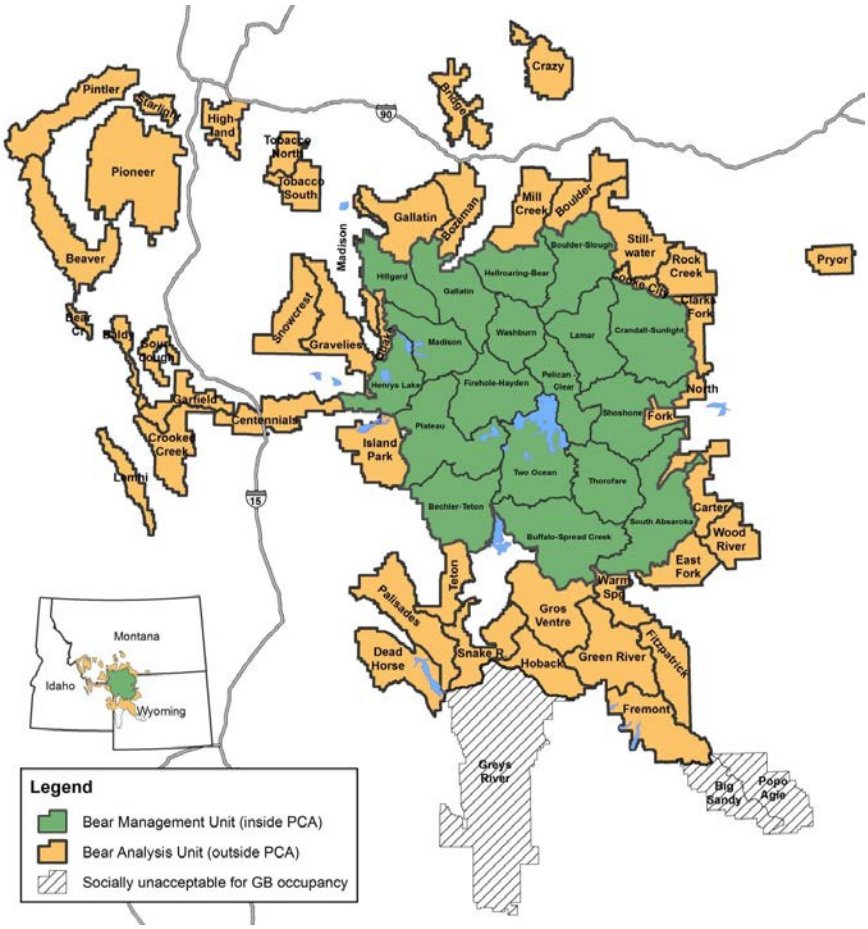
Several subunits, Gallatin #3, Henrys Lake #2, and Madison #2, were targeted in the 2007 Conservation Strategy as needing improvement in secure habitat with respect to 1998 levels. The specific areas with potential for improvement identified in these three subunits fall within the Custer Gallatin National Forest boundary and consequently, the quantity and timing of improvements was to be determined by the Gallatin National Forest Travel Management Plan (TMP). With implementation of the 2006 Gallatin TMP, many ~~roads inherited from these exchanges~~motorized routes have been permanently decommissioned~~. Non-system routes that are not maintained by the Forest Service have subsequently been closed,~~ with a high priority given to road ~~decommissions~~ closures in the three subunits identified as in need of improvement. With full implementation of the Gallatin Travel Plan near completion, measureable increases in secure habitat with respect to 1998 baseline levels ~~(Appendix E)~~ and corresponding reductions in motorized route density have been realized in the three targeted subunits (Appendix E). The Custer Gallatin National ~~f~~Forest ~~determine~~, via a ~~Travel~~ Forest Plan Amendment, has incorporated these new levels of secure habitat as new thresholds against which future change will be measured ~~that all gains in secure habitat resulting from full implementation of the TMP will effectively constitute new baseline levels~~ for these three subunits. ~~If and when approved, elevated secure levels for these three subunits will serve as a new measure against which future change will be made.~~



Monitoring Protocol

Secure habitat and motorized route density are monitored inside the PCA ~~and tracked throughout the ecosystem~~ to verify compliance with secure habitat standards ~~inside the PCA and to assist in balancing grizzly bear security and survival with human land use concerns outside the PCA~~. Motorized access parameters that are monitored and reported include levels of 1) secure habitat, 2) open motorized access route density (OMARD) greater than 1.6 km/sq km (1 mi/sq mi)), and 3) total motorized access route density (TMARD) greater than 3.2 km/sq km (2 mi/sq mi). Inside the PCA, these three parameters are measured and reported annually for each bear management subunit. ~~Outside the PCA, secure habitat is measured and reported biennially (even numbered years) for each bear analysis unit (BAU, see Figure 7). Changes in configuration and status of motorized routes are submitted each year to the Grizzly Bear Habitat Database Coordinator by representatives from each National Forest and National Park in the ecosystem.~~ Status and configuration of motorized access routes are inventoried and tracked by the Database Coordinator. ~~This insures that reported measurements are based on the most current available information.~~ Percent secure habitat, OMARD, and TMARD are calculated using the Motorized Access Model as described in Appendix E. Outside the PCA, secure habitat is measured and reported biennially (even numbered years) for each bear analysis unit (BAU, see Figure 7) ~~by the Grizzly Bear Habitat Database Coordinator~~.

~~**Secure habitat**, as defined earlier, refers to those areas ≥ 10 acres in size and more than 500 m from an open or gated motorized route. Lakes greater than 1.6 sq km (1 sq mi) are excluded from secure habitat calculations. **OMARD** is a measure of the density of motorized routes that are open to the public for one or more days during the non-denning portion of the year when grizzly bears are active (March 1-November 30). **TMARD** measure the density of all motorized routes open to the public and/or administrative personnel for one or more days during the non-denning season. Roads that are closed year-round to the public but open to administrative personnel detract from secure habitat and count toward TMARD, but do not contribute to OMARD. Motorized routes that have been permanently decommissioned such that there is no motorized use by either the public or administrative staff, do not contribute to OMARD or TMARD, and do not detract from secure habitat. For a more detailed discussion of OMARD and~~



~~TMARD, as well as changes in monitoring protocol, please refer to Appendix E.~~ Measurements are reported annually (inside the PCA) and biennially (outside the PCA) in the IGBST Annual Report~~, *Yellowstone Grizzly Bear Investigations*~~ and are posted online for public access at the IGBST website (https://www.usgs.gov/centers/norock/science/igbst-annual-reports?qt-science_center_objects=1#qt-science_center_objects ~~http://nrmsc.usgs.gov/products/IGBST~~).

Monitoring Developed Sites

Background

Levels of human development on the landscape have been shown to be an important predictor of grizzly bear mortality in the GYE (Schwartz et al. 2010). Developed sites increase the spatial and temporal extent of human presence on the landscape and contribute to the displacement and mortality of grizzly bears. A significant concern related to developed sites is the increased potential for grizzly bear-human conflicts attributable to food conditioning and habituation. Past attempts at modeling grizzly bear mortality in the GYE have focused on levels of overnight human use as a primary factor related to grizzly bear mortality. Increased numbers of people using an area and potentially interacting with grizzly bears is an important issue in evaluating impacts of developed sites on grizzly bear survival.

Monitoring Protocol

Changes in developed sites on public lands inside the PCA are measured, tracked, and evaluated against 1998 levels (Appendix E). Information pertaining to changes in the number of developed sites inside the PCA is submitted annually to the Grizzly Bear Habitat Database Coordinator by representatives from each National Forest and National Park Ecosystem. Current and baseline numbers of developed sites are inventoried in a GIS database and reported annually in the IGBST Annual Report ~~*Yellowstone Grizzly Bear Investigations*~~.

Monitoring Livestock Grazing

Background

Conflicts between livestock and grizzly bears have historically led to the relocation or removal of grizzly bears in the GYE. Grizzly bears tend to prey on cattle and sheep regardless of the abundance of natural foods because livestock in occupied grizzly bear territory represent one of

many foraging opportunities (Gunther *et al*. 2004). Most grizzly bear-livestock conflicts tend to occur outside the PCA since all commercial allotments on National Park lands and many allotments on National Forest lands inside the PCA have been permanently closed. Consequently, monitoring grizzly bear-livestock conflicts on public lands is not limited to inside the PCA, but is conducted annually throughout the entire ecosystem. Currently, approximately 59 percent of the Yellowstone grizzly bear's occupied range falls outside the PCA. As commercial livestock grazing persists in areas where grizzly bears live, the number of conflicts will most likely continue to pose a challenge to grizzly bear managers. This is particularly true on domestic sheep allotments. Financial incentives offered through non-governmental organizations (NGOs) have proven to be a successful mechanism for retiring sheep grazing allotments on public land when willing participants were available (Gunther *et al*. 2004). These types of opportunistic partnerships between federal agencies, NGOs, and willing permittees may be considered an alternative for resolving chronic conflicts on grazing allotments within prime grizzly bear habitat.

Monitoring Protocol

On federal lands inside the PCA, the number and acreage of commercial livestock grazing allotments and the number of sheep animal months (AMs) is monitored and reported annually relative to 1998 levels. ~~Inside and outside the PCA, g~~Grizzly bear conflicts associated with grazing of commercial livestock on federal lands is monitored and reported annually both inside and outside the PCA.

Commercial livestock grazing and conflict information is submitted for publication in the IGBST A~~a~~nnual R~~r~~eport~~, *Yellowstone Grizzly Bear Investigations*~~.

Monitoring ~~High Caloric~~Grizzly Bear Foods

Background

Grizzly bears are opportunistic omnivores who have evolved highly versatile foraging strategies

allowing them to shift diets among numerous food sources, depending on what is available spatially and temporally (Schwartz *et al*. 2003, 2013). The IGBST will continue to monitor four ~~high calorie~~ foods, ~~Long-term management and conservation of grizzly bears in the GYE call for monitoring of four high-calorie foods. These four food types~~ listed by dry weight kilocalories per gram (kcal/g) include: (1) army cutworm moths (7.91 kcal/g), (2) ~~winter-killed~~ ungulates (6.80 kcal/g), (3) cutthroat trout (6.10 kcal/g), and (4) whitebark pine seeds (3.99 kcal/g). These four foods have varying distributions in the ecosystem and are subject to annual fluctuations and therefore do not necessarily serve as a major dietary component of every grizzly bear in the GYE. Natural annual fluctuations in abundance and distribution of these four ~~calorie-rich~~ foods make it very challenging to establish reliable thresholds. However, these four ~~high-calorie~~ foods are known to exert a positive influence on grizzly bear fecundity and survival and constitute some of the highest sources of digestible energy available to grizzly bears in the GYE (Mealey 1975, Servheen *et al*. 1986, Pritchard and Robbins 1990, Mattson *et al*. 1992, Haroldson *et al*. 2006, Schwartz *et al.* 2006).

Gunther *et al.* (2014*a*) exhaustively documented the diet of the GYE grizzly bears to include over 266 distinct plant and animal species ranging from grasses, fungi, berries and seeds, to fish and carrion. The trophic flexibility of grizzly bears, as documented by the variety of foods they consume, allow them to opportunistically forage across diverse habitats spanning the entire GYE. Their highly varied diet serves as an adaptive mechanism that enhances their ability to persist when faced with rapid and long-term changes in availability and abundance of any one food source. Compositional analysis of scats collected over a 37-year period (1943 to 2009) showed that grizzly bears within the GYE most frequently feed on foods that are consistently available and widely distributed, such as grasses, sedges, and ants (Gunther *et al.* 2014*a*). However, when opportunity arises, grizzly bears will shift their diet to maximize body mass gain by selecting calorie-rich foods such as ungulates, fish, whitebark pine seeds, clover, moths, and small mammals.

Human-induced environmental change, such as introduced organisms, habitat loss, climate change, and other anthropogenic factors, has the potential to affect availability and distribution

of these calorie-rich foods in the future. However, despite a substantial decline of whitebark pine and natural stochasticity of other food resources within the GYE, grizzly bears have shown notable resilience by adjusting habitat use (Costello *et al.* 2014) and shifting diets to maintain body mass and condition (Schwartz *et al.* 2014, Ebinger et al. 2016). In a comprehensive synthesis study conducted by the IGBST, findings did not indicate a strong dependence of GYE grizzly bears on whitebark pine seeds; ~~but rather,~~instead, grizzly bears used whitebark pine seeds where and when available, ~~the inclusion of this food~~ as one ~~a~~ component of a diverse and dynamic diet (IGBST 2013). Monitoring foods comprising such a diverse diet is challenging, which is why efforts have focused on four foods with relatively high energetic value and for which abundance (or use by bears) is relatively easey to measure: ~~Because of their high caloric value and use by grizzly bears,~~ whitebark pine, ungulates, cutthroat trout, and army cutworm moths ~~are currently monitored either directly or indirectly on an annual basis~~.

Monitoring Protocol

To monitor these four ~~high caloric~~ foods and their importance to grizzly bears, the IGBST will survey and report on ~~each of~~ these foods and their availability (or use by bears) ~~groups~~ annually ~~d~~ per detailed ~~food~~ monitoring protocols identified in Appendix D~~, as budgetary constraints allow~~. IGBST scientists will analyze the relationship between abundance and availability of these four food types with the number of grizzly bear-human conflicts, grizzly bear management actions, known and probable grizzly bear mortalities, and changes in the distribution and trend of the GYE grizzly bear population. Results of these analyses will be presented, when available, in the annual reports prepared by the IGBST and relevant peer-reviewed publications. If detectable declines in certain foods occur and the IGBST concludes these declines are related to biologically significant changes in demographic parameters, the IGBST shall report these findings for consideration by the ~~GYCC~~ YGCC (*see* Chapter 6, Implementation and Evaluation, for details on this process). Annually monitoring results of whitebark pine, ungulates, cutthroat trout, and army cutworm moths, when available, are to be reported in the IGBST Annual Report.

~~Monitoring protocols of high caloric foods identified in this Conservation Strategy will continue~~

~~as long as budgets allow.~~ Monitoring and surveying methods may be modified when necessary to incorporate new technological advances in monitoring techniques or new knowledge of bear foraging and habitat use within the GYE. For example, variation in body condition among bears is strongly associated with available food and provides insight into seasonal nutrition of individual bears, as well as different sex and age classes. Body condition may be derived through bioelectrical impedance analysis (BIA), which allows for direct estimation of fat content of captured grizzly bears (Farley and Robbins 1994). The IGBST collects this information on captured bears when feasible, but sample sizes are small and inference for some analyses (e.g., fall season analyses) is limited. An alternative method to BIA to measure body condition is the estimation of storage energy using measurements of mass and body length (e.g., Sciullo *et al*. 2016; Molnar *et al*. 2009). Results of any investigations of alternative approaches will be reported by the IGBST in annual reports and peer-reviewed publications. ~~Existing monitoring programs may be expanded, as budget allows, to include occupied habitat beyond the PCA and areas predicted for future use by bears. Monitoring results of whitebark pine, winter-killed ungulates, cutthroat trout, and army cutworm moths, when available, are to be reported in the annual IGBST publication *Yellowstone Grizzly Bear Investigations*.~~

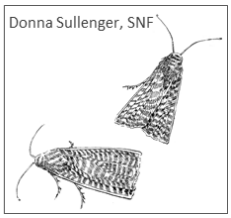
~~*Winter-killed*~~ *Ungulates*

Background—The GYE harbors one of the most carnivorous grizzly bear populations inhabiting the North American interior (Jacoby et al. 1999, Mowat and Heard 2006). Isotopic nitrogen ($\delta^{15}N$) levels measured in 221 grizzly bear hair samples collected between 2000 and 2010 indicate that on average, terrestrial meat accounted for 44.4% of the assimilated diet of Yellowstone grizzly bears (Schwartz et al. 2014). In contrast, in Glacier National Park and adjacent national forest lands, meat accounts for a smaller proportion of the grizzly bear diet; using stable isotope analysis for a small sample of grizzly bears, Jacoby et al. (1999) found that meat accounted for only 33%, 0%, and 6% of adult male, adult female and subadult diets, respectively. ~~Protein and fat from ungulate carcasses ranks as the second highest food source of gross caloric value available to grizzly bears in the GYE (Gunther et al.~~

~~2014a, b).~~ Winter-killed ungulates, primarily elk and bison, historically provided an important source of protein to bears, especially during early spring before most plant foods become available. Transects were historically surveyed each spring to estimate availability of winter-killed ungulates. However, the survey designng does not allow estimation of the amount of biomass available (Cherry 2006). Additionally, ungulate herd distribution has shifted as a result of the reintroduction of wolves, and it is unclear how much of the biomass was consumed by wolves before bears emerge from their dens. As an alternative to carcasses as a spring food, grizzly bears also consume earthworms, ants, and pocket gophers. Grizzly bears continue to opportunistically forage for animal matter and scavenge carrion throughout the active season and will seek out gut piles and other remains left by ungulate hunters in the fall (Haroldson et al. 2004).

Monitoring Protocol—~~Relative abundance of ungulate carrion is often monitored by correlating the number of carcasses available to grizzly bears and other scavengers during the spring with measures of snow water equivalency (depth, density, and moisture content) in snowpack (Podruzny *et al.* 2012). Availability of carrion for grizzly bears is potentially affected by increased competition from recently reintroduced wolves and changes in elk and bison management practices. For these and other reasons historic carcass transects will continue to be surveyed as long as budgetary allocations permit. There are currently 30 spring ungulate carcass survey routes in Yellowstone National Park (YNP) and 12 transect routes on Yellowstone's Northern Range in the Gallatin National Forest. Current survey methods and ungulate carcass survey routes may be redesigned or modified when appropriate.~~ Annual estimates of ungulate herds, both bison and elk, ~~have been made since XXXX by~~are conducted by the National Park Service and the States of Idaho, Montana, and Wyoming and will continue into the foreseeable future. These estimates occur by ungulate herd unit and provide a measure of availability and distribution across the landscape occupied by grizzly bears. When available~~, monitoring results of winter-killed ungulate carcass availability~~ ungulate herd estimates will be summarized and reported annually in the IGBST Annual Report~~publication *Yellowstone Grizzly Bear Investigations*~~.

Cutthroat Trout

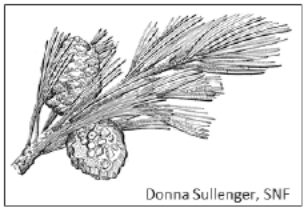


Donna Sullenger, SNF

Background—Due to their high digestibility and protein and lipid content, spawning cutthroat trout are one of the highest sources of digestible energy available to bears ~~in~~ with home ranges in close proximity of Yellowstone Lake and its tributaries (Mealey 1975, Pritchard and Robbins 1990, Gunther et al. 2014a). Grizzly bears were once known to prey on cutthroat trout in at least 36 different streams tributary to Yellowstone Lake (Hoskins 1975, Reinhart and Mattson 1990). Haroldson et al. (2005) estimated that approximately 68 grizzly bears per year frequented and likely fished ten Yellowstone Lake spawning streams tributaries monitored during 1997-2000. Introduction of non-native lake trout (*Salvelinus namaycush*) and effects of drought and whirling disease (*Myxobolus cerebralis*) has led to a decline in native cutthroat trout populations and an associated decline in number of bears visiting spawning streams (Teisberg et al. 2014).

Monitoring Protocol—The Yellowstone Lake cutthroat trout population is monitored most years in the spring, depending on weather and spring snow melt, using stream surveys, ~~large mesh gillnets,~~ weirs with fish traps, and occasionally electronic fish counters. An electronic sonar fish counter was installed and calibrated in 2013 along Clear Creek on the east side of Yellowstone Lake to facilitate annual counting of spawning cutthroat trout ascending Clear Creek. Visual stream surveys are also conducted most years to identify trends in the number of cutthroat trout spawning in Yellowstone Lake tributaries. ~~Visual surveys to measure the presence of cutthroat trout and rainbow hybrids are also typically conducted at the Trout Lake inlet creek.~~ Yellowstone NP biologists provide an annual summary of cutthroat trout monitoring results ~~to the IGBST~~ for publication in the IGBST Annual Report ~~*Yellowstone Grizzly Bear Investigations*~~. Current survey methods may be modified or redesigned as appropriate.

Moth Aggregation Sites



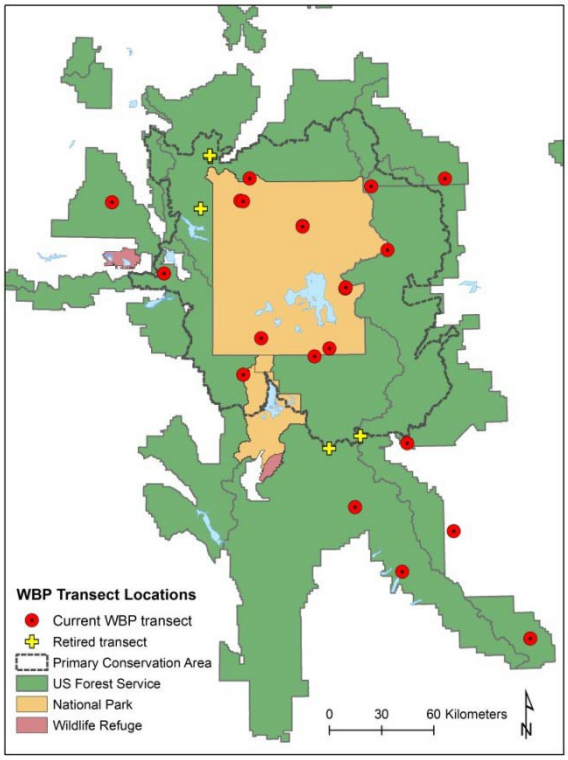
Background—Alpine moth aggregations are a calorie-dense and nutrient- rich food source found

at remote, high-elevation alpine sites dominated by talus and scree slopes in the eastern half of the ecosystem. Knowledge regarding the intricate relationship between army cutworm moths and grizzly bears has improved substantially since the late 1980s -when grizzly bear use of moth aggregation sites was first discovered and such sites were included in observation flights (Bjornlie and Haroldson 2014). When available, moths are a valuable source of nutrition for grizzly bears because they have the highest reported gross caloric content per gram of any food available to grizzly bears in the GYE (7.91 kcal/g; Gunther et al. 2014a). Some bears may feed almost exclusively on moths for a period of over one month (French et al. 1994). A grizzly bear feeding extensively on moths over a 30-day period can consume 47%, or close to half, of its annual energy budget of 960,000 calories (White 1996). Grizzly bears whose home ranges include moth aggregation sites often visit these talus slopes during mid-to-late summer and early fall to accumulate fat reserves in preparation for the winter denning season. Although grizzly bear use of moth sites does not vary widely over time (1993 is one notable exception; low bear use due to late, extensive snow cover), annual monitoring provides important data regarding this high-calorie resource.

Monitoring Protocol—As of 2013, 37 confirmed and 16 possible moth sites have been identified in the GYE. However, size, location and moth abundance of sites fluctuate from year to year due to natural variation in environmental factors, such as snow cover (Bjornlie and Haroldson 2014). Aerial observations of bears feeding at moth sites are made from fixed-wing aircraft as part of on-going radio tracking and observation flights conducted by the IGBST. Although this monitoring protocol does not provide direct information regarding the abundance of moths, grizzly bear use of aggregation sites can provide an indirect measure of the relative abundance of this resource in a given year. Aerial surveys of all confirmed moth sites will be conducted annually and results will be summarized and presented in the ~~annual~~ IGBST Annual ~~r~~Report ~~Yellowstone Grizzly Bear Investigations~~.

Whitebark Pine Cone Production

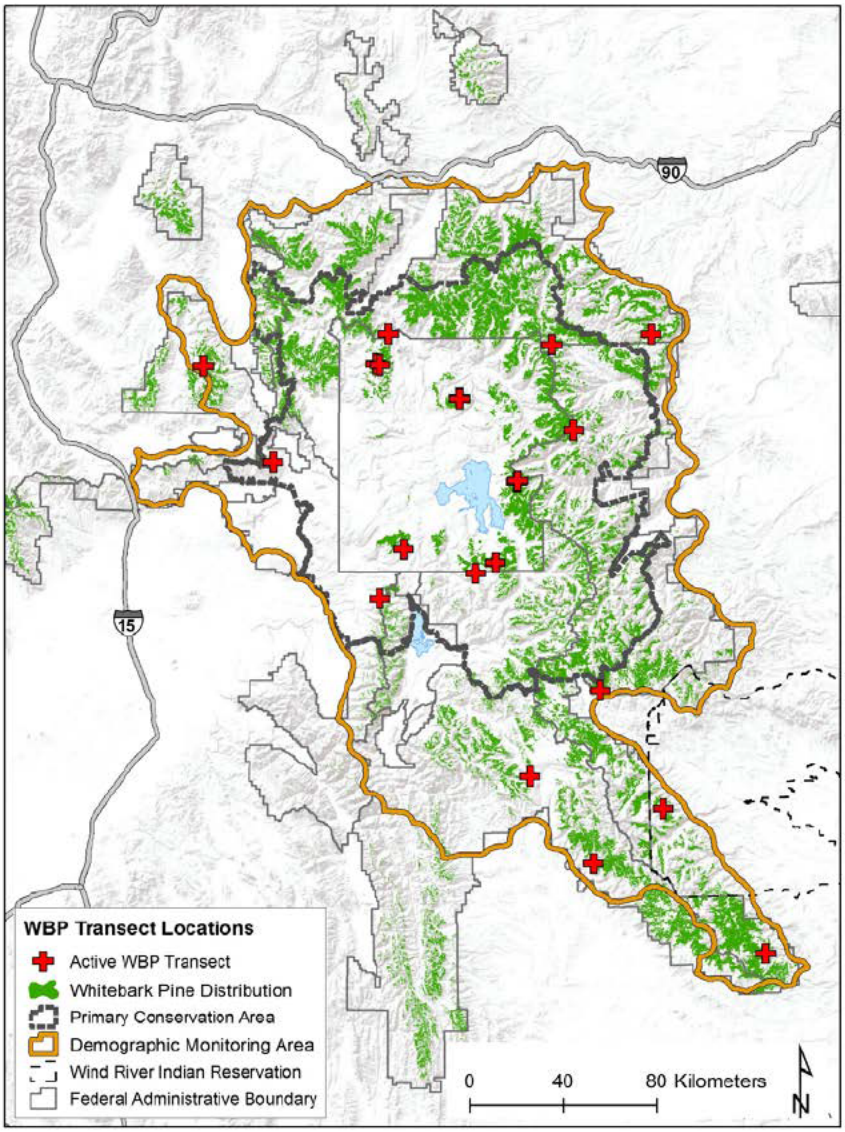
Donna Sullenger, SNF



Background—Due to their high fat content and potential abundance, whitebark pine seeds are an important fall food for bears in the GYE (Mattson and Jonkel 1990). Yellowstone grizzly bears consume whitebark pine seeds extensively when whitebark cones are available. Bears may feed almost exclusively on whitebark pine seeds when production exceeds 22 cones per tree (Mattson et al. 1992). Because whitebark pine is a masting species, availability varies substantially from year to year. ~~During fall seasons of low whitebark pine seed availability, grizzly bears often seek alternate foods at lower elevations, leading to more frequent bear conflicts and human-caused grizzly bear mortalities (Mattson et al. 1992, Knight and Blanchard 1994, Gunther et al. 1997, Haroldson et al. 2006). Conversely, when whitebark pine nuts are abundant, there are generally very few grizzly bear-human conflicts during the fall season (Mattson et al. 1992, Gunther et al. 1997).~~ Studies have shown that during poor whitebark pine years grizzly bears selected less for whitebark pine stands (Costello et al. 2014) and consumed more animal matter, boosting their fat levels to match those measured in years of high cone production (Schwartz et al. 2014). Although whitebark pine has experienced widespread declines in the GYE (see subsequent section), extensive studies by the IGBST showed no profound negative effects on grizzly bears at the individual or population level (IGBST 2013). In addition, Costello et al. (2014) reported that approximately one-third of Yellowstone grizzly bears in their study included little or no whitebark pine stands within their fall range.

Monitoring Protocol—Currently there are 21 whitebark pine cone production transects ~~(Figure 8)~~ within the GYE (Figure 8). Transects will maintain a representative sample of whitebark pine cone production and distribution ~~(Figure 8)~~. Annual transect surveys are typically conducted between July 15 and August 15 to count cones after maturation but before cones and seeds have been collected by red squirrels (*Tamiasciurus hudsonicus*) and Clark's nutcrackers (*Nucifraga columbiana*). The presence or absence of blister rust and beetle infestations as well as activity levels of grizzly bear, black bear, red squirrel, and Clark's nutcracker are also recorded during transect surveys. Monitoring of whitebark pine cone production using current or modified methods will continue under this Conservation Strategy and results will be summarized and

Formatted: Body Text, Tab stops: Not at 0.25"



reported in the IGBST Annual Report ~~publication *Yellowstone Grizzly Bear Investigations*~~.

Figure 8. Distribution of whitebark pine and ~~L~~location of whitebark pine cone production transect sites in the GYE, 2014.

Comment [JF13]: Final version of Figure 8

~~Monitoring~~ Mountain Pine Beetle Infestation and White Pine Blister Rust Infection

Background—Since the early 2000s, whitebark pine has declined significantly throughout much of the species' historic range in the Northern Rockies due to the spread of mountain pine beetle (*Dendroctonus ponderosae*) and white pine blister rust (*Cronartium ribicola*). The greatest levels of whitebark mortality resulted from mountain pine beetle, a native insect that typically attacks large, mature trees with inner bark thick enough to support larvae (Larson 2011). Beetle infestations tend to occur episodically every 20-40 years resulting in high, widespread mortality across coniferous forests. The most recent outbreak began in the early 2000s and impacted millions of hectares in the Rocky Mountains (Raffa *et al.* 2008). The infestation was exacerbated by warmer winters at higher elevations allowing for increased brood development and survival of adult beetles, and greater opportunity for reproduction (Bentz *et al.* 1991, Perkins and Roberts 2003, Larson 2011, Dooley 2012).

White pine blister rust, an exotic invasive pathogen introduced to North America in 1910, affects whitebark pines of all age classes, although seedlings and saplings are especially susceptible to infection. This exotic fungal pathogen infects the cambium of whitebark pine and other five-needle pines, causing reproductive failure and tree mortality (McKinney *et al.* 2009, Bockino and Tinker 2012). However, some individual whitebark pines carry genetic traits that make them more resistant to the disease. Restoration programs launched by the Forest Service use a technique described by Mahalovich *et al.* (2006) to breed and plant rust-resistant whitebark pines as part of an on-going effort to restore and maintain the species in the GYE.

In 2000, under the auspices of the Greater Yellowstone Coordinating Committee (GYCC), the Whitebark Pine Subcommittee (WBPSC) was created and tasked with forging a comprehensive long-term strategy for monitoring whitebark pine throughout the ecosystem. Recognizing the persistent and pervasive threat that blister rust and pine beetle posed to the health of whitebark pine, the subcommittee reached out to other agency and non-governmental partners to avoid duplication of efforts. The result of these alliances is the Greater Yellowstone Whitebark Pine

Monitoring Working Group (GYWPMWG), which consists of partners from the ~~National Park Service (~~NPS~~)~~, ~~U.S. Forest Service (~~USFS~~)~~, U.S. Geological Survey (USGS), and Montana State University (MSU). Led by the NPS Greater Yellowstone Inventory and Monitoring Network (GRYN), a strategic and peer-reviewed monitoring protocol was established for detecting, tracking, assessing, and reporting the health, status, and trends of whitebark pine throughout the GYE (GYWPMWG 2011). This ground-based monitoring program was initiated in 2004 and will continue to assess the current status and long-term trends of whitebark pine into the foreseeable future.

Monitoring Protocol—Spearheaded by the GRYN, an interagency collaborative monitoring effort involving NPS, USFS, and USGS partners will measure the status and trends of whitebark pine throughout the GYE. Monitoring efforts will focus on collecting critical baseline information for assessing: (1) infection rates and severity of white pine blister rust; (2) survival of whitebark pine, taking into account synergistic interactions of blister rust, mountain pine beetle, wildland fire, and other agents of change; and (3) recruitment of whitebark pine trees into cone- bearing age classes. Monitoring protocols will follow methods and procedures established in the *Interagency Whitebark Pine Monitoring Protocol for the Greater Yellowstone Ecosystem* (GYWPMWG 2011). Results of current whitebark pine status and trends will be made available at the GRYN Inventory and Monitoring website and referenced in the ~~annual~~ IGBST Annual Report ~~monitoring report *Yellowstone Grizzly Bear Investigations*~~.

~~Hunter Numbers~~

~~Background~~

~~The number of elk hunters in Wyoming, Idaho, and Montana who recreate in the PCA (Table 5) were estimated and compared with known and probable grizzly bear mortalities from 2005 to 2014 to determine if bear mortality is correlated with hunter numbers. Although total hunter numbers have declined over this time period, the data showed little evidence of a relationship between hunter numbers and hunting-related human-caused grizzly bear mortality (van Manen~~

2015, *in litt.*).

The greatest source of grizzly bear (≥2 years old) mortality during 2004–2014 in the GYE has been due to interactions with hunters. Nearly all known and probable bear mortalities occur as surprise encounters, at big game carcasses, or at hunter camps. The number of mistaken identity kills (i.e., mistaken for black bear) are small. Although the number of hunters using the PCA have decreased, the number of grizzly bear known and probable mortalities due to interactions with hunters increased in the last decade, primarily outside the PCA (Figure 5, Chapter 2). Potential explanations for why this occurred include bears learning to seek hunter-killed game, an increase in population size and concurrent expansion of occupied range, and greater use of ungulate resources (Haroldson *et al.* 2004, Schwartz *et al.* 2010, IGBST 2013).

Table 5. Estimated numbers of elk hunters within the GYE grizzly bear recovery zone plus a 10-mile perimeter in Idaho, Montana, and Wyoming, 2005–2014.

	Year								
State	20052006	2007	2008	2009	2010	2011	2012	2013	2014
Idaho[a]	2,6182,016	2,602	1,762	1,818	1,234	1,260	1,092	1,237	2,771
Montana[c]	12,36512,211	12,635	12,470	12,382	12,334	12,269	10,936	NA[b]	11,925
Wyoming[a,d]	9,8889,346	8,716	8,792	8,440	6,712	6,413	7,566	7,818	8,109
Total	25,87224,573	23,943	23,025	22,641	20,950	20,542	20,305	NA	22,805

[a] Idaho and Wyoming numbers include archery and gun hunters.

[b] NA = hunter number estimates not currently available.

[c] Gun only season.

[d] A percentage of total hunter numbers was used in hunt areas 61 to 63, 67, 68, 73, and 83 because a portion of the hunt area falls outside the designated area.

~~State and federal wildlife agencies have attempted to reduce the loss of bears to hunters by expanding information and education programs. "Living in Bear Country" workshops are conducted regularly in many GYE communities, and licensed outfitters and guides have increased training for their members and clients.~~

~~*Monitoring Protocol*~~

~~Data from state wildlife agencies on big game herd units or hunting districts will be used as an index to backcountry use during the hunting season. Hunter use levels combined with numbers of grizzly bear-human conflicts will be used to identify when and where to increase public education efforts and develop appropriate management actions to minimize grizzly bear-human conflicts that result in bear mortality.~~

~~Monitoring~~ Managing for Habitat Connectivity

Background

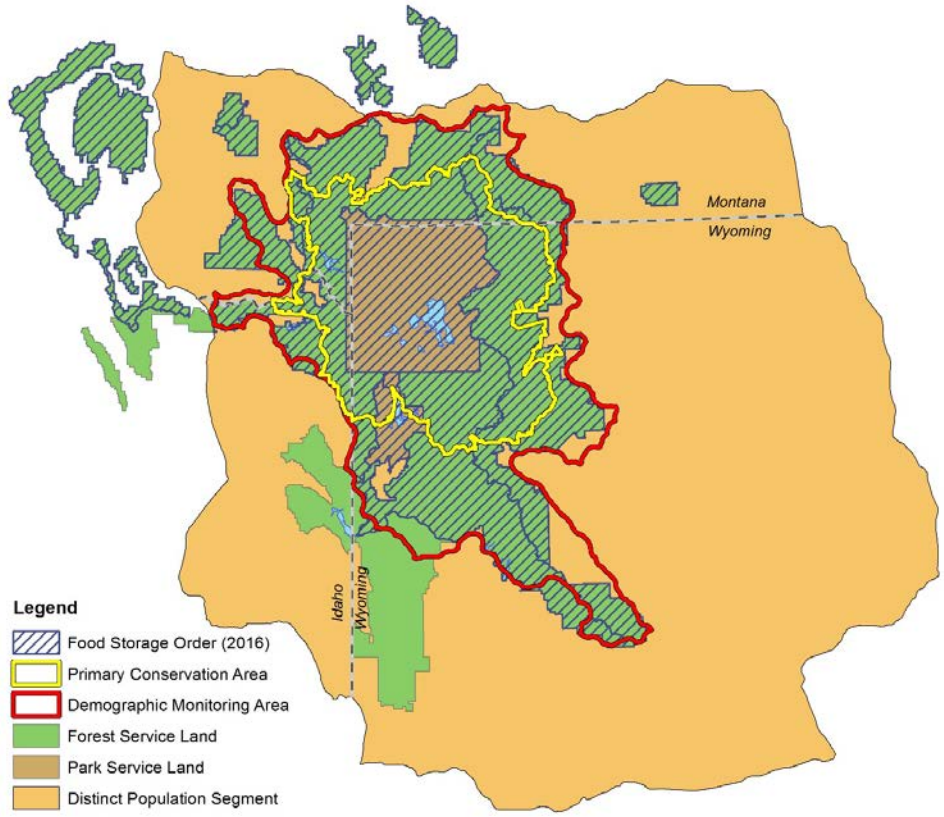
Formatted: Normal

Habitat connectivity is the degree to which the landscape promotes natural movement of wildlife as they seek important resources for survival and successful procreation. To improve prospects for grizzly bear movement between the GYE and the Northern Continental Divide Ecosystem (NCDE) to the north, it is important to minimize anthropogenic barriers that inhibit natural movement of wildlife.

Transportation Planning

Potential effects of highway improvements, such as increased motorized access, higher traffic volume, and higher speed limits, are known to increase grizzly bear mortality, reduce habitat connectivity, and potentially inhibit gene flow among nearby populations (Mace 2004, Summerfield *et al.* 2004, Proctor *et al.* 2012; *see* Chapter 2: Genetic Management). Certain road

designs and ~~road~~ improvements cause habitat fragmentation by imposing barriers that potentially discourage bear crossings~~,~~ and may lead to increased mortality from vehicle collisions~~, and may cause habitat fragmentation~~. The potential impact of highways on demographic and genetic connectivity of grizzly bears in the GYE is a key consideration in the transportation planning process.



~~*Monitoring Protocol*~~

To prevent habitat fragmentation and loss of connectivity within the GYE, existing road survey information will be compiled and evaluated by the appropriate land management agency as an integral part of the planning stage of any proposed road improvement and/or construction project in suitable grizzly bear habitat within the GYE (both inside and outside the PCA). During the NEPA analysis stage of such projects, analyses of road survey information will be conducted to evaluate potential impacts of the project on grizzly bear habitat connectivity. More specifically, federal agencies will identify important crossing areas by collecting and/or assessing existing information about known grizzly bear sightings, ungulate road mortalities, locations of game trails, and bear home ranges and habitat use within and near the road corridor. By identifying crossing areas used by grizzly bears, federal officials can recommend mitigation measures to reduce potential impacts from road construction both during and after a project. For example, during construction, work camps should be placed in areas with lower risk of displacing grizzly bears and use of IGBC-approved bear-resistant~~proof~~ food and garbage storage containers should be implemented. Highway planners are encouraged to place warning signs at points of high mortality risk and implement wildlife crossing mitigation (e.g., radar-speed signs, ~~infrastructure such as~~ culverts or underpasses) to enhance safe passage. Similarly, ~~R~~road construction in areas of relatively high value for potential grizzly bear habitat linkage should be designed to mitigate potential negative impacts on habitat connectivity~~, including the consideration of installing crossing structures~~.

Food Storage Orders

Food storage orders prescribed by land managers on federal lands throughout the GYE help facilitate connectivity by minimizing conflicts between grizzly bears and humans. Food storage orders, which require that all unattended food, refuge, and attractants be effectively stored, have been imposed on 98% of all Forest and Park Service land inside the DMA. The area of application for food storage restrictions inside the GYE include virtually all Forest Service lands in the northern portion of the DPS boundary where movement from the GYE would most likely take place (Figure 9).

Figure 9. Area of application for food storage orders prescribed by the five National Forests within the Greater Yellowstone Ecosystem.

Chapter 4 Management and Monitoring of Grizzly Bear-Human Conflicts

Introduction

~~Humans and g~~Grizzly bears occasionally come into conflict with humans and livestock ~~in areas~~ where they encounter one another. ~~The~~ One objective of ~~the signatory agencies to~~ the Conservation Strategy ~~nuisance management~~ is to minimize grizzly bear ~~human~~ conflicts with humans and livestock. In the ~~Greater Yellowstone Ecosystem~~GYE, ~~nuisance~~ conflict bear management is essential to successful grizzly bear conservation and is often necessary to prevent property damage, livestock losses, and human injury or death.

~~Grizzly bears cannot be totally protected. Like other species, grizzly bears develop individual traits, and some of those traits are not compatible with coexistence with humans. Management emphasis will shift from protecting every individual grizzly bear in the population to assessing an individual's importance to the entire population before instituting management actions. Females will continue to receive a higher level of protection than males.~~

Management of ~~nuisance~~ conflict bears requires rapid responses by state and federal agencies to address conflict situations. ~~This a~~Agency responses will address the sources of the conflict through public education, removal of attractants, ~~or~~ aversive conditioning, hazing, or preventive sanitation of human use areas. Agencies will also capture, relocate, or ~~destroy repeat offender~~remove conflict grizzly bears when necessary ~~and when other options have been exhausted~~.

~~Analysis of grizzly bear-human incidents indicates that most property damage incidents are the result of bears attempting to gain access to garbage, human foods, livestock or pet foods, or other human-related foods in areas of human presence.~~ Conflict bears often result from bears seeking and finding human-related foods and garbage, pets, pet foods, bird feeders, and livestock. Occasionally, bears damage buildings, vehicles, tents, and campers to access food and garbage. ~~will prey on domestic swine, fowl, or goats, or will damage apiaries. They have rarely injured horses.~~

Although aggression toward~~s~~ people and human injury or death is~~are~~ rare, bears will occasionally harm people. Incidents of injury are usually the result of a surprise encounter, protection of cubs, defense of a food cache, ~~harassment,~~ and/or when bears have become accustomed to obtaining food from humans.

~~The m~~Management of grizzly bear-human conflicts is based upon the existing laws and authorities of ~~the~~ state, tribal, and federal ~~land management~~ agencies as detailed in Chapter 7. ~~Management of nuisance bears usually falls into one or more of the following categories~~ Strategies to respond to conflict bears usually fall~~s~~ into one or more of the following categories:

- Removing or securing the attractant and providing education to modify human behavior/practices that contributed to the conflict,
- Deterring the bear from the site through the use of aversive conditioning or hazing techniques,
- ~~Capturing and relocating the nuisance bear~~Relocation of the conflict bear, and/or
- ~~Removing the bear from the wild~~Removal of the conflict bear, ~~including lethal control~~as defined below.

Definitions:

- ~~**Unnatural aggression** by a grizzly bear is defined as behavior that includes active predation on humans, approaching humans or human use areas, such as camps, in an aggressive way, or aggressive behavior when the bear is unprovoked by self-defense, defense of cubs, defense of foods, or in a surprise encounter.~~
- **Grizzly bear-human conflicts** are incidents in ~~which~~ where bears kill or injure ~~people~~humans or livestock, damage property, ~~kill or injure livestock~~obtain anthropogenic foods, ~~damage beehives, obtain anthropogenic foods,~~ or damage or obtain garden and orchard fruits, ~~and~~ vegetables, or beehives.
- ~~**Natural aggression** by a grizzly bear is defined as defense of young, food, during a surprise encounter, or self-defense.~~

- A bear is classified as **food conditioned** when it has received a significant food reward of human foods such as garbage, camp food, pet food, or processed livestock food, and ~~persistently~~ seeks these foods.
- A bear is classified as **habituated** when it does not display avoidance behavior around humans or in human use areas such as camps or town sites ~~or within 100 meters of open roads~~.
- **Relocation** is the capture and movement by management authorities of a bear involved in a grizzly bear-human ~~conflict with humans or human-related foods, to a remote area away from the conflict site, usually after fitting the bear with a radio collar~~to a pre-approved release site.
- ~~**Repeat offense** is the involvement of a bear that has been previously relocated in a nuisance conflict situation or, if not relocated, is a bear that continues to repeat a behavior that constitutes a grizzly bear-human conflict.~~
- **Removal** is the capture and lethal removal or placement of a bear in an authorized public zoological or research facility ~~or destruction of that bear. Removal can also involve killing the bear through active measures in the wild when it is not otherwise possible to capture the bear.~~
- **Management authorities** are the designated representatives of the agencies in the GYE including: Yellowstone National Park ~~(YNP)~~; Grand Teton National Park ~~(GTNP)~~; Wyoming Game and Fish Department; Montana Fish, Wildlife & Parks; Idaho Department of Fish and Game; ~~Interagency Grizzly Bear Study Team; each of the GYE national forests~~ Custer ~~-~~Gallatin, Shoshone, Bridger-Teton, Caribou-Targhee, and Beaverhead-Deerlodge National Forests; the BLM; and USDA Wildlife Services. These authorities will employ one or more of the four ~~agencies~~strategies listed above to manage conflict ~~make the decision to classify a bear as nuisance inside the GYE in compliance with the nuisance bear criteria (discussed below)~~. Outside National Park lands (Yellowstone and Grand Teton National Parks and the John D. Rockefeller Parkway) ~~(JDRP) (National Park lands), within the PCA, subsequent~~ management actions will be coordinated and completed by state wildlife agencies that have responsibility for

Comment [PE>9/814]: From Idaho: "repeat offense" is no longer used elsewhere in the document with proposed edits

management actions. ~~, after coordination with other appropriate agencies. Nuisance grizzly bear conflict management is under the authority of the states, who will have primary responsibility for the management action.~~ When ~~nuisance~~ conflict bears are in ~~YNP, or GTNP, or JDRP~~National Park lands, decisions will be made by park representatives~~,~~ and coordinated with state and Forest Service representatives when necessary~~,~~ (e.g., ~~for~~ bear relocations). Management of ~~nuisance~~ conflict bears outside the PCA and outside National Park lands will be conducted as described in ~~the~~ state and tribal grizzly bear management plans ~~or appropriate park management plans~~.

Management of ~~nuisance~~ conflict grizzly bears in the ~~Greater Yellowstone Ecosystem~~GYE will vary depending on whether they are inside or outside the PCA, or inside National Park lands. This system will provide increased security for grizzly bears inside the PCA and inside National Park lands, as bears will be given greater consideration in most conflicts inside the PCA and inside National Park lands. ~~Minimization of grizzly bear-human conflicts and management of individual nuisance bears is the primary direction for management within the PCA.~~

In circumstances that result in a ~~nuisance~~ conflict bear situation outside the PCA and ~~the~~ National Park lands, more consideration will be given to existing human uses. Outside ~~YNP, GTNP, JDPR,~~ National Park lands and the PCA~~R~~, tribal plans on tribal lands or state management plans will govern how conflict grizzly bears are handled. Site-specific conflict areas within and outside the PCA and National Park lands will be documented routinely and prioritized to focus proactive management actions to minimize grizzly bear-~~-~~human conflicts and address existing and potential human activities that may cause future conflicts. ~~Past conflict management has demonstrated that grizzly bears can coexist with most human activities.~~

All grizzly bear conflicts that occur ~~O~~outside the PCA and National Park lands will be managed in according to guidelines in each of the tribal and state management plans (Appendices I, J, K, and O). ~~, state management plans will govern how nuisance grizzly bears are handled. Site-specific conflict areas within and outside the PCA will be documented routinely and prioritized to focus proactive management actions to minimize grizzly bear-human conflicts and address~~

~~existing and potential human activities that may cause future conflicts. The following nuisance conflict grizzly bear standards apply only to the PCA and National Park lands. All nuisance grizzly bear conflicts that occur outside the PCA will be managed according to guidelines in each of the state management plans (Appendices I, J, and K).~~

~~Nuisance~~ Conflict Bear Standards

~~The focus and intent of nuisance grizzly bear management~~Conflict grizzly bear management is focused on appropriate responses and strategies to address and prevent grizzly bear-human conflicts inside and outside the PCA. ~~are predicated on strategies and actions to prevent grizzly bear human conflicts.~~ It is recognized that active management aimed at individual ~~nuisance~~ conflict bears will be required in both areas.

Management actions ~~outside the PCA~~ will be implemented according to state, federal, and tribal management plans in coordination with landowners and land management agencies. These actions will be compatible with grizzly bear population management objectives for each state ~~for the areas outside the PCA~~and agency.

General Criteria

Location, cause of incident, severity of incident, history of bear, health/age/sex of bear, and demographic characteristics of animals involved will all be considered in any relocation o~~f~~r removal. Removal of ~~nuisance~~ conflict bears will be carefully considered and ~~consistent with~~counted against the mortality limits for the GYE as described in the Conservation Strategy. Recognizing that conservation of female bears is essential to maintenance of a grizzly bear population, removal of ~~nuisance~~ conflict females will be minimized.

Within the Primary Conservation Area

Within the PCA, but outside of ~~YNP, GTNP, and JDRP~~National Park lands, management of

~~nuisance~~ conflict bears will be addressed according to the following standards:

- Bears displaying food conditioning and/or habituation may be ~~either~~ relocated or removed based on specific details of the incident. State wildlife agencies~~, following consultation with other appropriate management authorities, and national parks~~ will make this judgment after considering the cause, location, and severity of the incident or incidents.
- Bears may be relocated when and as many times as judged prudent by ~~management authorities~~the state wildlife agency. ~~No bear may be removed for any offense, other than unnatural aggression, without at least one relocation unless representatives of affected agencies document the reason in writing.~~ All relocations outside the PCA and National Park lands will be governed by state management plans.

Within the PCA, management of conflict bears will be addressed according to the following standards:

- ~~Bears may be preemptively moved when they are in areas where they are likely to come into conflicts with site-specific human activities, but only as a last resort. Such preemptive moves will not count against the bear as nuisance moves.~~
- ~~Bears preying on lawfully present livestock (cows, domestic sheep, horses, goats, llamas, etc.) on public lands will be managed according to the following criteria: No grizzly bear involved in livestock depredations inside the PCA shall be removed unless it has been relocated at least one time and continues to cause livestock depredations.~~
- ~~Before any removal, except in cases of human safety, management authorities will consult by telephone or in person to judge the adequacy of the reason for removal.~~
- ~~Bears displaying natural aggression are not to be removed, even if the aggression results in human injury or death, unless it is the judgment of management authorities that the particular circumstances warrant removal.~~
- ~~Bears displaying unnatural aggression will be removed from the population.~~
- ~~Decisions will be based on criteria for relocation and removal inside the PCA for~~

~~management of nuisance bears in the Conservation Strategy and best biological judgment of authorities.~~

- ~~Authorized National Park Service~~NPS authorities will implement trapping, removals, and relocations within ~~YNP, and GTNP, and JDRP~~National Park lands and shall coordinate with the respective state wildlife agency when trapping and/or relocating conflict bears.
-
- ~~Authorized~~ Outside National Park lands, state wildlife agencies shall coordinate with and notify the appropriate land management agency when trapping and/or relocating conflict bears. ~~or tribal authorities outside YNP and GTNP will implement other removals and relocations~~.
- Tribal wildlife agencies will implement removals or relocations within tribal reservation lands.
- ~~State and tribal wildlife agencies in coordination~~ The respective wildlife management agency will coordinate with the appropriate federal land management agency~~ies will~~ to predetermine adequate and available sites for relocations ~~outside YNP, GTNP, and the JDRP~~National Park lands. Relocation sites should be agreed upon before the need for relocation occurs. ~~In order to deal with problem bears more efficiently, managers should have full access to relocation sites without having to conduct individual consultation for each relocation.~~
    - ~~Livestock damage prevention and compensation are addressed in individual state management plans.~~
- ~~Management of nuisance bear situations will emphasize removal of the human cause of the conflict, when possible, or management and education actions to limit such conflicts. Relocation and removal of grizzly bears may occur if the above actions are not successful.~~

Specific Criteria for Removals

Captured grizzly bears identified for removal may be given to public research institutions or public zoological parks for appropriate non-release educational or scientific purposes as per regulations of states and national parks. Grizzly bears not suitable for release, research, or educational purposes will be removed as described in appropriate state management plans or in compliance with national park rules and regulations.

Outside of Nnational Pparks, individual nuisanceconflict bears deemed appropriate for removal may be taken by a legal hunter in compliance with rules and regulations promulgated by the appropriate state wildlife agency commission, as long as such taking is in compliance with existing state and federal laws.. The removal will be counted against the and as long as mortality limits specified for the GYE as described in this Conservation Strategy are not exceeded. This could include licensed hunters or property owners or their agents who have obtained appropriate permits from the state. Licensed hunters will be allowed to possess bear parts for bears that are legally harvested under a state permit.

Monitoring Protocol

All nuisance conflict bear control management actions, and grizzly bear-human and grizzly bear-livestock conflicts will be summarized annually in the Annual Report of the IGBST. Most conflicts are due to availability of human foods, human developments, or livestock depredations in occupied grizzly bear habitat. This report will detail the cause and location of each conflict and management action and display an annual spatial distribution of conflicts that can be used by managers to identify where problems occur and to compare trends in locations, sources, land ownership, and types of conflicts.

Hunter Numbers

Hunter numbers will no longer be collected because the data showed little evidence of a relationship between hunter numbers and hunting-related human-caused grizzly bear mortality

(van Manen 2015, *in litt.*). The cause and location of each human-caused grizzly bear mortality will continue to be reported.

Chapter 5 Information and Education

Introduction

The future of the ~~Yellowstone~~ GYE grizzly bear lies in our ability to learn to coexist with the grizzly bear and to accept this animal as a cohabitant of the land. Historically, excessive human-caused mortality and loss of habitat are the major factors in grizzly bear population decline. Addressing the source of grizzly bear-human conflicts is critical to an effective public outreach plan. Public attitudes in large part determine the success of efforts to manage a recovered grizzly bear population in the ~~Greater Yellowstone Ecosystem~~GYE. For the good of the bear and to develop positive public attitudes, a coordinated information and education campaign is essential.

The purposes of the information and education aspects of this cooperative effort are to support the development, implementation, and dissemination of a coordinated information and education program. This program should be understandable and useful for the people who visit, live, work, and recreate in bear habitat to minimize grizzly bear-human conflicts and to provide for the safety of people while building support for viable bear populations.

Other management strategies outlined in this plan are unlikely to succeed without useful, state-of-the-art public information and education programs. A partnership information and education approach involving state and federal agencies, tribes, local communities, and private interests can result in minimizing grizzly bear-human conflicts while building support for bears and bear management.

Successful long-term community involvement in future grizzly bear management efforts requires continued use of current effective methods and tools that have contributed to the success story of the recovered population we have today. In addition, to meet the needs of an ever-growing human population and expanding bear population, it will be necessary to develop new processes and outreach tools to further enhance public involvement and appreciation of the grizzly bear and monitor social behavior and attitudes. Through close monitoring, we will be able to gauge our

success in reaching our diverse public and in minimizing grizzly bear-human conflicts, adjusting programs as needed.

Successful public education and involvement should result in the understanding that it is acceptable and expected human behavior to practice good stewardship, and this will in turn allow us to live with the grizzly bear as part of our valued wildlife resources.

The Information and Education Team

The information and education effort will continue to be coordinated between all agencies and private interests to ensure timely, accurate, and consistent messages to the public. The current information and education (I & E) working group within the ~~Greater Yellowstone Ecosystem~~GYE will continue. Members of this I & E Team include public affairs personnel from Forest Service Regions 1, 2, and 4; Grand Teton and Yellowstone National Parks; the BLM; representatives from each state wildlife agency; and the information and education specialist from the IGBC. This team will continue to work with all affected interests to ensure consistency of information, efficient funding strategies, identifying and targeting audiences, developing partnerships, and identifying new tools for implementation.

A coordinated information and education campaign will be most effective if it facilitates changing inappropriate human behaviors and helps people learn to coexist with bears. The benefits of grizzly bear management for a multitude of resources and species, including elk habitat management, black bear management, and water quality, recreation, and aesthetic values of access management, will be included in the information and education efforts. Long-term community engagement in grizzly bear issues is necessary to increase the awareness of bear behavior and biology and how these can be compatible with human needs and activities. Identification of sources of grizzly bear-human conflicts and the use of public education as a tool are essential. The responsibilities of the I & E Team include the following:

- Develop a coordinated information and education campaign to cultivate an appreciation of the value of the grizzly bear resource in this area. The grizzly bear will be presented as

a valuable wildlife resource, while still acknowledging the risks associated with them in publications and educational outreach.

- Continue and expand living-with-bears workshops or outreach with a similar message for citizens and teachers within the ~~Greater Yellowstone Ecosystem~~GYE. Similar seminars for other specific target groups such as hunters and other backcountry recreationists will be used as appropriate.
- Local citizen involvement groups and processes will be used to facilitate information exchange and identify other community interests regarding the grizzly bear.
- Updates and information will be provided to all affected interests through various media including news releases and mailings, television, etc.
- State and federal volunteer programs will be encouraged to identify and provide an opportunity for public participation in grizzly bear information outreach and management. This could include trailhead demonstrations on bear~~–~~resistant containers, distribution of brochures, school education programs, etc.
- Proactive and preventative safety messages will be expanded.
- Citizens will be encouraged to participate in land management decisions at the project level on state and federal lands affecting grizzly bear habitat and management.
- Citizens will also be encouraged to be involved in private land issues associated with grizzly bear management. This may include sanitation ordinances, conservation easements, developing private land management plans, and supporting informational outreach campaigns to private landowners.
- Knowledge about bears and acceptance of grizzly bears by people and groups that live, work, and recreate in grizzly bear country are key to the long-term conservation of a healthy grizzly bear population. Continuing specific outreach messages and techniques tailored to the needs of these groups is essential. Some of these groups include landowners, mining industry, timber industry, firewood gatherers, ranchers, outfitters, anglers, hunters, front country visitors, backcountry visitors, summer home owners, local business owners, developers, county planners, and school children.

Finally, information made available to the public will be open and responsive to public concerns. Open discussions with the public will increase credibility of the grizzly bear management program.

These efforts will be reviewed periodically and program adjustments will be made as necessary. In addition, efforts will be expanded as the bear population expands and additional efforts will be needed in areas that could become occupied in the near future.

Many brochures, videos, signs, articles, etc. are currently available and in use. Examples of these specific information and education tools are discussed in the state management plans.

Chapter 6 Implementation and Evaluation

Implementation

A new committee will replace the Yellowstone Ecosystem Subcommittee (YES). The new committee, the Yellowstone Grizzly Bear Coordinating Committee (YGCC), is the body that will coordinate management and promote the exchange of information about the Yellowstone grizzly bear population. The YGCC will inform the IGBC about the Yellowstone grizzly bear population for the benefit of grizzly bear conservation and management.

The Yellowstone Grizzly Bear Coordinating Committee

Within 30 days of a final rule delisting the ~~Greater Yellowstone Ecosystem~~GYE grizzly bear population, the signatories of this Conservation Strategy will name their agency representatives to the YGCC. The representatives from ~~T~~the three local governments and each Native American tribe with sovereign powers over reservation lands within the DMA will remain the same as on the YES committee. The person who was chairperson of YES ~~the Yellowstone Ecosystem Subcommittee~~ when the final rule changing status is published will call the first meeting of the GYCC. At this first meeting, the YGCC will elect a chairperson. At their first meeting the committee will develop and adopt, by a super-majority (2/3) vote of the members present, a set of by-laws that will set forth rules and procedures used by the committee to make decisions and conduct business. At a minimum, by-laws will include: ~~F~~future elections of chairmen or other officers and committee chairs as deemed appropriate, intervals of chairmen service, frequency of meetings, requirements for voting (in person versus attendance by proxy or by phone/video), definition of a quorum, the processes to make changes to the Conservation Strategy, threshold for changes that require re-signing of the Conservation Strategy, required vote to make changes (majority vs. super-majority, and process to change by-laws. ~~Chairpersons will be elected at intervals determined by the members of the YGCC. The YGCC will meet at least two times each year; public notification of these meetings will be made by the chairperson or her/his representatives. The YGCC will strive for consensus, but when consensus cannot be achieved,~~

~~decisions of the YGCC will be determined by majority vote. The details on locations and times of meetings and other business issues associated with the functioning of the YGCC will be determined at the first meeting.~~

YGCC members' expenses will be paid by their respective agencies. YGCC authorities include:

- Revise or amend the Conservation Strategy based on the best biological data and the best available science. Any such amendments will be subject to public review and comment. ~~Amendments will be made by the YGCC with a majority vote.~~
- ~~Establish meeting rules and procedures, and chairperson election rules for the committee.~~
- Seek funding to further the conservation of the Yellowstone grizzly bear by implementing this Conservation Strategy. Each agency is responsible for seeking the necessary funding to carry out the tasks ~~assigned~~ agreed to in this Conservation Strategy.

Some primary activities of the YGCC are:

- Coordinate implementation of this Conservation Strategy.
- Ensure that population and habitat data are collected annually by the IGBST, as specified in this Conservation Strategy, and evaluated to assess current status of the grizzly bear population.
- Share information and ~~implement~~ coordinate management actions ~~in a coordinated fashion~~.
- Identify management, research, and financial needs to successfully implement the coordinated Conservation Strategy.
- Implement a Biology and Monitoring Review as necessary and recommend whether the Service should conduct a status review ~~and submit a petition for relisting~~ as appropriate to ensure agency responsiveness to changing circumstances of the grizzly or its habitat in the ~~Greater Yellowstone Ecosystem~~GYE.
- ~~Appoint a chairperson and members of the Information and Education Team, and coordinate information and education efforts.~~

Comment [JF15]: Does the present I&E continue under the YGCC? If yes, then delete this same sentence in the executive summary If no, keep this sentence here? Still unclear on whether this should be deleted or not

This committee does not supersede the authority of the management agencies beyond the specific actions agreed to as signatories of this Conservation Strategy.

YGCC membership will consist of representatives of the following, each having one vote:

Federal	National parks: Yellowstone and Grand Teton/John D. Rockefeller, Jr. Memorial Parkway National forests: Beaverhead-Deerlodge, Bridger-Teton, Caribou-Targhee, Custer -Gallatin, and Shoshone One Bureau of Land Management representative The Biological Resources Division of the U.S. Geological Survey
State wildlife management agencies	Idaho, Montana, and Wyoming
Local government	One representative from each state
Tribal	One representative from each Native American tribe with sovereign powers over reservation lands within the ~~ecosystem~~DMA

The ~~Interagency Grizzly Bear Study Team (~~IGBST~~)~~ and the ~~Information and Education Team (~~I & E~~)~~ will perform necessary tasks and report to the YGCC.

The Interagency Grizzly Bear Study Team

In order to understand the dynamics of grizzly bears throughout the GYE, a need for centralized responsibility to collect, manage, analyze, and distribute science-based information was identified. To meet this need, in 1973 agencies formed the ~~Interagency Grizzly Bear Study Team~~IGBST, a cooperative effort between the ~~U.S. Geological Survey~~USGS, ~~National Park Service~~NPS, ~~U.S. Forest Service~~USFS, U.S. Fish and Wildlife Service, and the state wildlife agencies of Idaho, Montana, and Wyoming.

Since 1974, the IGBST has published more than 200 scientific papers on the grizzly bear. A complete list of these papers can be found at: https://www.usgs.gov/science/interagency-grizzly-bear-study-team?qt-science_center_objects=4#qt-science_center_objects~~http://nrmsc.usgs.gov/science/igbst/detailedpubs.~~ Quantitative data on grizzly bear abundance, distribution, survival, mortality, nuisance activity, and bear foods are critical to formulating management strategies and decisions. The IGBST coordinates data collection and analysis on an ecosystem scale, prevents overlap of efforts, and pools limited economic and human resources.

The IGBST will continue to function under this Conservation Strategy after delisting.

The responsibilities of the IGBST are to:

- Conduct both short- and long-term research projects addressing information needs for bear management.
- Monitor the bear population, including status and trend, numbers, reproduction, and mortality.
- Monitor grizzly bear habitats, foods, and the impacts of humans.
- Provide technical support to agencies and other groups responsible for the immediate and long-term management of grizzly bears in the GYE.
- Take the lead in preparing a Biology and Monitoring Review with staff support from the YGCC in response to deviations from required population or habitat standards.
- Complete Biology and Monitoring Reviews and present findings to YGCC within 6 months.
- Coordinate annual updates of the motorized access database.
- Coordinate annual evaluation of motorized access route density and secure habitat.
- Document annually any changes in developed sites, livestock allotments, or permitted sheep numbers and maintain associated databases.
- Ensure all units have the tools and the training to evaluate motorized access route density and secure habitat for projects.

- Evaluate the need for changes in ways to evaluate motorized access route density, secure habitat, and habitat effectiveness, and make recommendations to the YGCC on such changes, as necessary.
- Set and maintain standards, definitions, values, formats and processes for collecting and updating data and assessment models, and maintaining data consistency between units.
- Produce annual reports on population and habitat monitoring items.

The USGS employee who is the lead biologist for USGS on the ~~Greater Yellowstone Ecosystem~~GYE grizzly bear population chairs the IGBST and will call meetings at least twice each year. The majority of funding for the IGBST comes from USGS but additional funding and in-kind efforts are made by all agencies (*see* Appendix F). The IGBST will report its findings to the YGCC.

The Information and Education Team

Successful maintenance of a recovered grizzly bear population in the GYE requires joint understanding of issues, sharing of knowledge (including new science and results of monitoring), and open communication among agencies, tribes, elected officials, non-governmental groups and organizations, and the public. The goals of the ~~Information and Education (~~I & E~~)~~ Team are:

- Increase public support for and compliance with agency management actions to maintain a secure GYE grizzly bear population.
- Utilize all possible modern technology and media resources to help decrease grizzly bear-human conflicts while still maintaining maximum access to natural resources for both humans and grizzly bears.
- Increase an understanding of grizzly bears and their habitat.
- Foster information sharing to ensure maximum resource, policy, and scientific informational exchange among agencies, tribes, elected officials, interest groups, local residents, and the public.
- Provide for meaningful public involvement through use of open houses, direct mailings,

and media campaigns to inform the public about agency decisions relating to grizzly bear habitat and population management activities and other management actions that may affect local residents, landowners, tribes, and users

Members of the ~~Information and Education~~ I & E Team will include I & E specialists from the National Park Service, U.S. Forest Service, and the state wildlife agencies of Idaho, Montana, and Wyoming. The I & E Team will report to the YGCC.

Evaluation

The evaluation of the effectiveness of grizzly bear conservation measures detailed in this Conservation Strategy will be an ongoing process shared by all the members of the ~~Yellowstone Grizzly Bear Coordinating Committee~~YGCC.

As detailed in the monitoring portion of this strategy, the IGBST will take the lead in preparing an annual monitoring report with staff support from the YGCC. Agencies responsible for monitoring major population and habitat parameters are listed in Appendix G. Monitoring results and analyses will be presented to the YGCC by the IGBST. A Biology and Monitoring Review would be triggered if any of the following conditions were met:

Comment [PE>9/816]: Update these once finalized

- Exceeding independent female mortality limits in 3 consecutive years, or
- Exceeding independent male mortality limits in 3 consecutive years, or
- Exceeding dependent young mortality limits in 3 consecutive years, or
- Failure to meet the distribution criterion.

Biology and Monitoring Review

Under this Conservation Strategy, a Biology and Monitoring Review is a process carried out by the IGBST. A Biology and Monitoring Review examines management of habitat, populations, or efforts of participating agencies to complete their required monitoring. Biology and Monitoring Reviews will be undertaken after the annual summary of monitoring information

presented to the YGCC and in response to deviations from required population or habitat standards. Any YGCC member agency also can request that a Biology and Monitoring Review be considered. Such consideration would be a topic for discussion by the YGCC and the review would be initiated based on the decision of the YGCC. The Biology and Monitoring Review process will be completed within six months and the resulting written report presented to the YGCC and made available to the public. The IGBST is not responsible for completing impact analyses for projects proposed by any agency; such analyses are the responsibility of the agency making the proposal.

The purposes of a Biology and Monitoring Review are:

- To identify the reasons why particular demographic or habitat objectives have not been achieved and to recommend modifications to the YGCC for changes as necessary, or
- To consider potential impacts of a proposed action of concern to one or more members of the YGCC, or
- To consider departures by one or more agencies from the monitoring effort required under this Conservation Strategy and to recommend plans to the YGCC to ensure that monitoring efforts be maintained as per the standards in this document, or
- To consider and establish a scientific basis for possible changes in management due to changed conditions in the ecosystem and make those recommendations to the YGCC.~~, or~~
- ~~Make recommendations as to whether a petition for relisting should be submitted~~ be ~~considered.~~

Biology and Monitoring Reviews will be based on the best available science. Biology and Monitoring Reviews will be submitted as written reports by the IGBST to the YGCC and made available to the public. The YGCC will respond to the Biology and Monitoring Review in a written form either through the minutes of the YGCC meeting or in specific Biology and Monitoring Review response documents, as necessary. The purpose of the YGCC response is to address the issues(s) raised in the Biology and Monitoring Review with an explanation or management changes as necessary. In the case of a deviation from monitoring efforts required under this Conservation Strategy, the response will identify the means to be implemented by the

YGCC to ensure continued population and/or habitat monitoring efforts as required in this document.

A Biology and Monitoring Review is generally triggered by negative deviations from the desired conditions established in this Conservation Strategy for population, mortality management, and habitat parameters; however, the IGBST can recommend a Biology and Monitoring Review to the YGCC if they deem it necessary.

~~A Biology and Monitoring Review will make recommendations as to whether the delisting should be reevaluated a petition for relisting should be made. This recommendation shall be based upon the magnitude of the threat that the deviation from the desired condition poses to the maintenance of a recovered population.~~

~~The YGCC has to formally agree with a recommendation from the IGBST to petition for relisting.~~

If the situation, after completion of the Biology and Monitoring Review, is such that some or all of the desired population and habitat conditions specified in this Conservation Strategy are not being met, and cannot be met in the opinion of the YGCC, then the YGCC ~~will~~ may submit to the Fish and Wildlife Service ~~a petition~~recommendation to ~~consider for relisting~~ conduct a status review. In the case of a vote on this issue, a simple majority is necessary.

Fish and Wildlife Service Status Review

The Service may initiate a formal status review and may emergency relist the GYE grizzly population under Section 4(b)(7) of the Act until the formal status review is complete under two conditions: (1) if there are any changes in Federal, State, or Tribal laws, rules, regulations, or management plans that depart significantly from the specifics of population or habitat management detailed in this section and significantly increase the threat to the population.; (2) a total population estimate of less than 500 inside the DMA in any year using the model-averaged

Chao2 method, or counts of females with cubs fall below 48 for 3 consecutive years; ~~and/or (3) if the population falls below 600 for 3 consecutive years using the model-averaged Chao2 method;~~ (43) if fewer than 16 of 18 bear management units are occupied by females with young for 3 consecutive 6-year sums of observations; and/or (54) if the Service determines a petition to relist from an individual or organization ~~, including the YGCC,~~ is warranted.

To be warranted, such a petition must present credible scientific information to support the petition. The YGCC can ~~petition~~ recommend that the Fish and Wildlife Service reevaluate the delisting of~~to relist~~ the GYE grizzly bears. The Service is to perform a status review upon receipt of such a petition that contains sufficient information to demonstrate that the request to relist is warranted. A relisting petition ~~from the YGCC~~ should be accompanied by the available specific biological data on the population and its habitat sufficient to judge its status as a recovered population as per the requirements of this Conservation Strategy. A status review will evaluate the factors affecting the population and result in a finding that summarizes the status of the population and recommends listing or not.

For purposes of a status review, the status of the entire ~~Greater Yellowstone Ecosystem~~GYE grizzly bear population would be considered.

The Service can also unilaterally initiate a status review to determine if the GYE grizzly bears should be a candidate species and be added to the species to be listed. This could be accomplished independently of the YGCC based on Service concerns about the population and/or its habitat. Based on a review of a petition or a status review initiated by the Service, if the Service finds serious and imminent threats to the population as per the criteria of the Endangered Species Act in Section 4(a)(1), the species could be immediately considered for relisting or could be relisted under emergency regulations, per Section 4(b)(7).

Chapter 7 Existing Authorities

Introduction

The existence of adequate regulatory mechanisms that serve to maintain the Yellowstone grizzly bear population as recovered is one of the five factors required to change the status of the population to delisted and to ensure a healthy grizzly bear population.

The management of populations of grizzly bears and the habitats these bears require for survival is dependent upon the laws and regulations of the federal and state agencies in the ~~Greater Yellowstone Ecosystem (~~GYE~~)~~. These laws and regulations provide the legal basis for controlling mortality, providing secure habitats, managing grizzly bear-human conflicts, controlling hunters, limiting access where necessary, controlling livestock grazing, maintaining education and outreach programs to control conflicts, monitoring populations and habitats, and requesting management and petitions for relisting when necessary. Many of these laws provide authorities for a number of these actions and controls.

The following laws and regulations, or portions thereof, exist and are relevant to agency programs regarding management of the grizzly bear and its habitat in the GYE. These provisions, whether national or state, have application in terms of agency compliance, agency authority, or discretion to act.

The relationship between the existing authorities and the five factors in Section 4(a)(1) used to consider listing and delisting of a species is presented in Appendix H. These five factors are all relevant to maintain a recovered population.

Federal Lands

Acts of Congress[6]

The Act of Congress March 1, 1872. Set Yellowstone apart as a public park for the benefit and enjoyment of the people" and "for the preservation, from injury or spoliation, of all timber, mineral deposits, natural curiosities or wonders...and their retention in their natural condition". 16 U.S.C. §§21-22.

National Park Service Organic Act, 1916. The National Park Service...shall promote and regulate the use...by such means... to conserve the scenery and the natural and historic objects and the wild life therein and to provide for the enjoyment of the same in such a manner...as will leave them unimpaired for future generations. 16 U.S.C. §31 repealed June 25, 1948.

Lacey Act, Criminal Code Provisions, 18 U.S.C. 42-44. This Act makes it illegal to import, export, transport, sell, receive, acquire, or purchase any fish or wildlife or plant taken or possessed in violation of any law, treaty or regulation of the United States or in violation of any Indian tribal law; to import, export, transport, sell, receive, acquire, or purchase in interstate or foreign commerce any fish or wildlife taken, possessed, transported, or sold in violation of any law or regulation of any state or in violation of any foreign law. 18 U.S.C. §§42-43.

Fish and Wildlife Coordination Act, 16 U.S.C. §§661-666c. This Act relates to wildlife as associated with water resource development. This act also authorizes that lands and waters may be acquired by Federal construction agencies for wildlife conservation to mitigate water projects in order to preserve and assure for the public benefit the wildlife potential of the particular water project area.

The Act of Congress September 14, 1950. (Expansion of Grand Teton National Park to include Jackson Hole National Monument) "The national park so established shall, so far as consistent

[6] Federal legislation can be viewed at the Library of Congress web site: http://thomas.loc.gov

with the provisions of this Act, be administered in accordance with the general statutes governing national parks..." 16 U.S.C. § 406d-1

Sikes Act, 16 U.S.C. §670g. The Secretaries of Agriculture and Interior and the State agencies will cooperate under this act to plan, develop, maintain, and coordinate programs for the conservation and rehabilitation of wildlife, fish and game. These programs shall include, but not be limited to, specific habitat improvements projects and related activities and provide adequate protection for species considered threatened or endangered pursuant to Section 4 of the ESA. Multiple-Use Sustained-Yield Act, 16 U.S.C. §§528-531. It is the policy of the Congress that the National Forests are established and shall be administered for outdoor recreation, range, timber, watershed and wildlife and fish purposes. As used in this Act, "Multiple Use" means the management of all the various resources of the National Forests so that they are utilized in the combination that will best meet the needs of the American people; making the most judicious use of the land for some or all of these resources or related services over areas large enough to provide sufficient latitude for periodic adjustments in use to conform to changing needs and conditions; that some land will be used for less than all of the resources; and harmonious and coordinated management of the various resources, each with the other, without impairment of the productivity of the land, with consideration being given to the relative values of the various resources, and not necessarily the combination of uses that will give the greatest dollar return or the greatest unit output.

National Environmental Policy Act, 42 U.S.C. §§ 4321-4331. The purposes of this Act are: To declare a national policy which will encourage productive and enjoyable harmony between man and his environment: to promote efforts which will prevent or eliminate damage to the environment and biosphere and stimulate the health and welfare of man; to enrich the understanding of the ecological systems and natural resources important to the Nation; and to establish a Council on Environmental Quality. The Congress authorizes and directs that, to the fullest extent possible: (1) the policies, regulations, and public laws of the United States shall be interpreted and administered in accordance with the policies set forth in this Act, and (2) all agencies of the Federal Government shall—

(A) Utilize a systematic, interdisciplinary approach that will insure the integrated use of the natural and social sciences and the environmental design arts in planning and decision making which may have an impact on man's environment; (B) Identify and develop methods and procedures, in consultation with the Council on Environmental Quality established by Title II of this Act, which will insure that presently unquantified environmental amenities and values may be given appropriate consideration in decision making along with economic and technical considerations; (C) Include in every recommendation or report on proposals for legislation and other major Federal actions significantly affecting the quality of the human environment, a detailed statement by the responsible official on—

(i) The environmental impact of the proposed action

(ii) Any adverse environmental effects which cannot be avoided should the proposal be implemented

(iii) Alternatives to the proposed action.

(iv) The relationship between local short term uses of man's environment and the maintenance and enhancement of long term productivity, and

(v) Any irreversible and irretrievable commitments of resources which would be involved in the proposed action should it be implemented.

Prior to making any detailed statement, the responsible Federal official shall consult with and obtain the comments of any Federal agency that has jurisdiction by law or special expertise with respect to any environmental impact involved.

The Act of Congress August 25, 1972, PL. 94-404 86 §620. Authorization to establish John D. Rockefeller, Jr. Memorial Parkway "... to provide both a symbolic and desirable physical connection between... Yellowstone, and the Grand Teton National Park..." "The Secretary shall administer the parkway as a unit of the national park system in accordance with the authority contained in the Act of August 25, 1916..." Established by the Secretary of the Interior, September 30, 1977.

Endangered Species Act, 16 U.S.C. § 1533. ESA - Section 4 of the Act gives the criteria for

determining a species' status as threatened or endangered. In order to delist a species, it must be shown that the opposite is true. It must be shown that: a) the species' habitat or range is not threatened with destruction, modification or curtailment, b) the species is not being over utilized for commercial, recreational, scientific or educational purposes, c) disease and predation are not significant problems, d) there are adequate regulatory mechanisms in place, and e) there are no significant other natural or manmade factors affecting the continued existence of the species. The Secretary of Interior and States shall effectively monitor recovered species for not less than five years after the species is delisted and no longer protected under the ESA.

Forest and Rangeland Renewable Resources Planning Act, 1974. In recognition of the vital importance of America's renewable resources of the forest, range, and other associated lands to the Nation's social and economic well-being, and of the necessity for a long term perspective in planning and undertaking related national renewable resource programs administered by the Forest Service, the Secretary of Agriculture shall prepare a Renewable Resources Assessment. A strategic plan for all Forest Service activities shall be prepared every five years based on the assessment of renewable natural resources and on all land ownerships every 10 years. It provides direction that land management plans specify guidelines for land management plans, which provide for diversity of plant and animal communities. 16 U.S.C. §1600.

National Forest Management Act (NFMA) of 1976. NFMA provides the legal basis and direction for development of national forest plans. NFMA specifies that the National Forest System be managed to provide for diversity of plant and animal communities to meet multiple use objectives. Subsequent regulations for planning land and resource management (36 CFR 219), adopted in 1979 augmented the diversity policy by requiring management of habitats to maintain viable populations of vertebrates. 15 U.S.C. §1600.

Federal Land Policy and Management Act. Public lands will be managed in a manner that will protect the quality of scientific, scenic, historical, ecological, environmental, air and atmospheric, water resource, and archeological values...that will provide food and habitat for fish and wildlife and domestic animals, and that will provide for outdoor recreation and human

occupancy and use. 43 U.S.C. §§ 1701-1777.

Fish and Wildlife Improvement Act, 16 U.S.C. § 742(a). Congress recognizesd that wildlife are a living and renewable natural resource that contribute to our national economy and food supply, as well as to the health, recreation and well-binebeing of our citizens. However, this resource is also vulnerable to neglect and exploitation if not properly managed. This Act authorizes the Secretaries of the Interior and Commerce to establish, conduct, and assist with national training programs for State fish and wildlife law enforcement personnel. It also authorized funding for research and development of new or improved methods to support fish and wildlife law enforcement. It also authorizes the disposal of abandoned or forfeited items to facilitate efforts including education.

Fish and Wildlife Conservation Act, 16 U.S.C. §§ 2901-2911. Each State should be encouraged to develop, revise and implement, in consultation with appropriate other agencies, a plan for the conservation of fish and wildlife, particularly those species, which are indigenous to the State. The purpose of this act is to provide financial and technical assistance to the States for the development, revision and implementation of conservation plans and programs for nongame fish and wildlife and to conserve and promote conservation of nongame fish and wildlife and their habitats.

The National Parks Omnibus Management Act of 1998 (PL 105-391,112 Stat. 3497). Title I, Section 101 recognizes the ever increasing societal pressures being placed upon America's unique natural and cultural resources contained in the National Park System, the Secretary shall continually improve the ability of the National Park Service to provide state-of-the-art management, protection, and interpretation of and research on the resources of the National Park System. Title II, Section 201, National Park System Resource Inventory and Management identifies the need to enhance management and protection of national park resources by providing clear authority and direction for the conduct of scientific study in the National Park system and to use the information gathered for management purposes. 16 U.S.C. §5901.

Federal Regulations

36 CFR 1.5 (a)(1). Gives National Park Superintendents the authority to establish for all or a portion of a park area a reasonable schedule of visiting hours, impose public use limits, or close all or a portion of a park area to all public use or to a specific use or activity in order to protect natural resources or provide for human safety.

36 CFR 1.7(B). National Park Service Superintendents shall publish in writing all designations, closures, permit requirements and other restrictions imposed under discretionary authority.

36 CFR 1.7(B) 1.2 (d). Gives National Park Superintendents the ability to regulate activities conducted by National Parks, or their agents, relative to the management and handling of grizzly bears (*Ursus arctos horribilis*). Specifics are described in Park Annual Bear Management Plans.

36 CFR 2.10 (d). Gives the National Park Superintendents authority to designate all or a portion of a park area where food, lawfully taken fish or wildlife, garbage and equipment used to cook or store food must be kept to avoid bear-human conflicts. This restriction does not apply to food that is being transported, consumed, or prepared for consumption.

36 CFR 219. Specifies that the National Forest System be managed to provide for diversity of plant and animal communities to meet multiple use objectives. Subsequent regulations for planning land and resource management and requiring management of habitats to maintain viable populations of vertebrates.

36 CFR 219.19. Requires that Fish and wildlife habitat shall be managed to maintain viable populations of existing native and desired non-native vertebrate species in the planning area. A viable population shall be regarded as one, which has the estimated numbers, and distribution of reproductive individuals to insure its continued existence is well distributed in the planning area.

36 CFR 219.26. Specifies that Forest planning shall provide for diversity of plant and animal

communities to meet multiple use objectives.

36 CFR 219.27 (a) (6). States that (a) All management prescriptions shall – (6) Provide for adequate fish and wildlife habitat to maintain viable populations of existing native vertebrate species.

36 CFR 261.50 (a) and (b). Gives Forest Supervisors the authority to issue orders which close or restrict the use of described areas, or of any forest development road or trail within the area over which he has jurisdiction. This authority is used to close areas to minimize human/bear conflicts and to issue food storage, carcass storage and camping requirements.

36 CFR 261.53 (a) and (e). States that when provided for in an order authorized under 36 CFR 261.50 (a) and (b) it is prohibited to go into or be upon any area which is closed for the protection of: (a) threatened, endangered, rare, unique, or vanishing species of plants, animals, birds or fish; or (b) for public health or safety.

36 CFR 261.58 (e) and (s) and (cc). States that when provided for in an order authorized under 36 CFR 261.50 (a) and (b) the following are prohibited. (a) Camping; (s) Possessing, storing, or transporting any bird, fish, or other animal or parts thereof as specified in the order; (cc) Possessing or storing any food or refuse, as specified in the order.

States

~~State laws, rules, and regulations that provide authority to control grizzly bear mortality, control hunters, manage grizzly bear-human conflicts, and other management activities to maintain the Yellowstone grizzly bear population are attached to the three-state draft MOA (Appendix P).~~ The State regulatory mechanisms include *Grizzly Bear Montana Hunting Regulations*, *Chapter 67 of the Wyoming Game and Fish Commission Regulations*, *Idaho's Fish and Game Proclamation*, and the *Memorandum of Agreement Regarding the Management and Allocation of Discretionary Mortality of Grizzly Bears in the Greater Yellowstone Ecosystem* (Tri-State MOA,

Appendix P). These state laws, rules, and regulations described above and collectively referenced in the Tri-State MOA provide authority to control grizzly bear mortality, control hunters, manage grizzly bear-human conflicts, and other management activities to maintain the GYE grizzly bear population. These regulatory mechanisms include:

- Suspend all discretionary mortality inside the DMA, except if required for human safety, if the model-averaged Chao2 population estimate falls below 600 (Tri-State MOA: Section IV(2)(c)(i), Section IV(2)(a)(i); Chapter 67 of WY Game and Commission Regulations: Section 4(c); Idaho Fish and Game Commission Proclamation: Section 2).
- Suspend grizzly bear hunting inside the DMA if total mortality limits for any sex/age class (per Tables 2 and 4) are met at any time during the year (Tri-State MOA: Section IV(2)(c), Section IV(4)(a), Section IV(6); Chapter 67 of WY Game and Commission Regulations: Section 4(d); Idaho Fish and Game Commission Proclamation: Section 5).
- Prohibit hunting of females accompanied by young and young accompanied by females (Tri-State MOA: Section IV(4)(b); MT State Hunting Regulations p. 4 and 7; Chapter 67 of WY Game and Commission Regulations: Section 4(e); Idaho Fish and Game Commission Proclamation: Section 4).
- In a given year, discretionary mortality will only be allowed if non-discretionary mortality does not meet or exceed allowable total mortality limits for that year (Tri-State MOA: Section IV(2)(c), Section IV(4)(a), Section IV(6); Chapter 67 of WY Game and Commission Regulations: Section 4(d), Section 4(k); Idaho Fish and Game Commission Proclamation: Section 5).
- Any mortality that exceeds allowable total mortality limits in any year will be subtracted from that age/sex class allowable total mortality limits for the following year (Tri-State MOA: Section IV(2)(c); Chapter 67 of WY Game and Commission Regulations: Section 4(g), Section 4(k), and Section 4(l); Idaho Fish and Game Commission Proclamation: Section 6).

Federal Plans and Guidelines

In addition to federal and state laws, the following plans and guidelines provide both direction and guidance for grizzly bear population and/or habitat management.

National Park Service

NPS-77, Natural Resource Management Guidelines, May 16, 1991. Guides National Park managers to perpetuate and prevent from harm (through human actions) wildlife populations as part of the natural ecosystems of parks.

Final Environmental Impact Statement, Grizzly Bear Management Program, Yellowstone National Park, July 1983:
Identifies sanitation procedures designed to ensure that human foods and attractants are kept secured from bears. Garbage and other unnatural food attractants will be eliminated before control actions are required. The solid waste handling program will encompass use of trash containers of bear-resistant design, careful and frequent garbage pickup to prevent overflow and overnight accumulations.

The Superintendent authorizes and approves the YNP Grizzly Bear Management Program that outlines the park's Bear Management Area Program. The Bear Management Area Program restricts recreational activity in areas with seasonal concentrations of grizzly bears. The goals of these restrictions include: (1) minimize bear-people interactions that may lead to habituation of bears to people (habituation can result in bears being removed from the population for human safety);; (2) prevent human-caused displacement of bears from prime food sources;; and (3) decrease the risk of bear-caused human injury in areas with high levels of bear activity. Outlines Park bear monitoring program. Outlines Park bear research goals and objectives. Leaves open the possibility for supplemental feeding of grizzly bears, if deemed necessary. Identifies as an objective that public awareness of exposing bears to unnatural food sources may lead to human injury, or to the bears' destruction, or both. Requires an active information program be directed at both visitors and employees to inform them of policies and goals of bear management, and the reasons for these. Provides guidelines for the distribution of bear safety

warning information through entrance stations, signs, visitor contacts, and literature.

Yellowstone National Park Annual Bear Management Plan: Outlines grizzly bear ecology and management information distributed to park employees and the general public by the Bear Management Office.

Grand Teton National Park Human/Bear Management Plan, 1989:

- Identifies sanitation procedures designed to ensure that human foods and attractants are kept secured from bears. Garbage and other unnatural food attractants will be eliminated before control actions are required. The solid waste handling program will encompass use of trash containers of bear-resistant design, and careful and frequent garbage pickup to prevent overflow and overnight accumulations. Containers not of bear-resistant design must be located inside the building served. Large animal carcasses that are near trails, facilities, or roads will be managed in a way to reduce human/bear encounters.

Formatted: Bulleted + Level: 1 + Aligned at: 0.31" + Indent at: 0 56"

- Grizzly bear management follows the *Interagency Grizzly Bear Guidelines* (IGBC 1986). Management of Situation 1 areas includes area closures and/or activity curtailments to protect the bears.
- Follows the procedures outlined in the *Interagency Grizzly Bear Guidelines* (IGBC 1986). Actions subsequent to capture are coordinated with the U.S. Fish and Wildlife Service Grizzly Bear Recovery Coordinator.
- All incidents involving human-bear interactions are documented on Bear Sighting/Identification reports. All Park employees and visitors are encouraged to complete these forms for all bear sightings.
- Outlines Park bear research goals and objectives.
- Outlines a program for the dissemination of information of human/bear relationships, the causes of human-bear conflicts, and how visitors, inholders, Park, and concession employees can help alleviate problems through their personal actions and compliance with Park regulations.

Formatted: Bulleted + Level: 1 + Aligned at: 0.31" + Indent at: 0 56"

~~If a change of status for the Yellowstone grizzly bear population under the ESA takes place, Forest Service Regions 1, 2, and 4 will classify the grizzly bear as a sensitive species[7] in the GYE. Grizzly bears and their habitats will then be managed as sensitive on National Forest System lands in accordance with Forest Service Manual 2670 (specifically 2670.22, 2670.32, and 2676.1-2676.17e). In addition, national forests will continue to follow direction established in existing land management plans until amended or revised. Bridge-Teton National Forest Land and Resource Management Plan with Amendments and Corrections (2015)~~

- ~~Custer National Forest and Grasslands Land and Resource Management Plan (1987)~~
- ~~Gallatin Forest Plan 1987 as Amended through November 2014~~
- ~~1997 Revised Forest Plan – Targhee National Forest~~
- ~~Shoshone National Forest Land Management Plan (2015)~~
- ~~Beaverhead-Deerlodge National Forest Land and Resource Management Plan (2009)~~

Once the GYE grizzly bear is delisted under the ESA, the Forest Service will evaluate GYE grizzly bear management as a Regional Forest Sensitive Species and a determination of whether

Formatted: Body Text, No bullets or numbering

Formatted: Font: 12 pt

~~[7] 2672.1 Sensitive Species Management. Sensitive species of native plant and animal species must receive special management emphasis to ensure their viability and to preclude trends toward endangerment that would result in the need for Federal listing.~~

~~There must be no impacts to sensitive species without an analysis of the significance of adverse effects on the populations, its habitat, and on the viability of the species as a whole. It is essential to establish population viability objectives when making decisions that would significantly reduce sensitive species numbers.~~

~~Identification of Sensitive Species. Regional Foresters shall identify sensitive species occurring within the Region. They shall examine the following sources as possible candidates for listing as sensitive species:~~

~~1. Fish and Wildlife Service or National Marine Fisheries Service candidates for Federal listing (categories 1 and 2) under Federal Register Notice of Review.~~

~~2. State lists of endangered, threatened, rare, endemic, unique, or vanishing species, especially those listed as threatened under State law.~~

~~3. Other sources as appropriate in order to focus conservation management strategies and to avert the need for Federal or State listing as a result of National Forest management activities.~~

this status is warranted will be made at that time. The Forest Service will consider the GYE grizzly bear as a potential species of conservation concern during any plan revision within the range of the GYE grizzly bear as required by FSH 1909.12 Ch. 10, 12.52(d)(2)(b). This paragraph requires consideration of species that were removed within the past 5 years from the Federal list of threatened or endangered species.

In addition, national forests will continue to follow direction established the following existing land management plans until amended or revised:

- Bridger-Teton National Forest Land and Resource Management Plan with Amendments and Corrections (2015)
- Custer National Forest and Grasslands Land and Resource Management Plan (1987)
- Gallatin Forest Plan 1987 as Amended through November 2014
- 1997 Revised Forest Plan – Targhee National Forest
- Shoshone National Forest Land Management Plan (2015)
- Beaverhead-Deerlodge National Forest Land and Resource Management Plan (2009)

State Plans and Guidelines

Montana Department of Natural Resources and Conservation (MDNRC)

It is the policy of MDNRC to conduct programs and activities in a manner that limits the potential for conflicts between grizzly bears and people and that provides habitat to help achieve and sustain recovery within the GYE. Land uses which can adversely affect grizzly bears or their habitat will be designed and coordinated in a manner that is compatible with grizzly bear behavior and habitat needs, but not to the extent of excluding other uses.

The Forestry Division of the MDNRC has additional policy guidance for management of grizzly bear habitat within the Yellowstone. In 1988, grizzly bear management standards and guidelines were implemented to integrate management of grizzly bear habitat with timber management on

State lands within the GYE. Performance standards and guidelines cover long range planning, project planning and design, management of bear-human conflicts, and special management areas. These will be implemented until the Forestry Division develops and adopts other guidance through a programmatic planning effort that will incorporate grizzly bear management objectives.

Additional policy guidance will be developed in the near future. The USFWS and MDNRC have mutually agreed to develop and implement guidelines for integrating grizzly bear habitat protection and MDNRC land management activities. MDNRC will continue to consult with MFWP on specific projects that may adversely affect any species of wildlife in Montana, in an attempt to minimize or avoid adverse impacts to populations or their habitats.

Subj: Specific Questions Regarding ESA + Grizzly Bears

Dear Director Ashe,

I appreciate the response of July 6 from your regional office director to my letter regarding concerns over the U.S. Fish and Wildlife Service (Service) proposal to remove Endangered Species Act (ESA) protections for grizzly bears in the Greater Yellowstone Ecosystem (GYE). I also appreciate your decision to reopen the public comment period on the proposed delisting rule for consideration of the peer review and documents pertaining to the states of Idaho, Montana, and Wyoming's plans to allow sport hunting for grizzly bears immediately upon delisting. However, significant uncertainty remains about whether or not GYE grizzly bears will be managed responsibly in a post-delisting environment because the Service has not made public proposed revisions to the draft GYE Grizzly Bear Conservation Strategy (Conservation Strategy).

As you know, the Conservation Strategy is the critical document that will guide management of GYE grizzlies should the delisting proposal become final. Therefore, it is imperative that it includes clear and enforceable commitments by federal and state agencies to ensure that the progress made to this point on grizzly bear recovery is not lost. It is my understanding from talking to numerous stakeholders that the Conservation Strategy has undergone significant revision since the final draft was released earlier this year, warranting additional review of the document by the public before it becomes final. I also understand that the views of the National Park Service, which manages approximately 40 percent of the Primary Conservation Area for grizzly bears and has played a pivotal role in the recovery of grizzly bears in the GYE, have not been adequately considered.

I recently received a letter from NPS in response to a series of questions I asked Yellowstone National Park Superintendent Dan Wenk about GYE grizzly bears. I have enclosed a copy of that letter for your consideration. Among other things, NPS raised significant concerns with the Service's specification of a minimum population size of 500 grizzly bears, the lack of strong standards to ensure connectivity of GYE grizzly bears with other populations, and the

uncertainty of how a sharp increase in human-caused mortality through hunting would impact the population. These concerns are echoed in the peer review of the proposed rule, with reviewers writing that the issue of management to facilitate connectivity with other grizzly populations "is not adequately addressed," that "overharvest and a potential subsequent lag in management response could drive bear numbers below the desired minimum populations size," and that "there is no scientific basis for the lower limit of 500 bears," a level that represents a 17 percent reduction from the Service's most conservative estimate for the current population.[1] Finally, NPS expresses legitimate concerns about the impacts of allowing hunting within the John D. Rockefeller, Jr. Memorial Parkway and other areas adjacent to Yellowstone and Grand Teton National Parks on the visitor experience, the regional economy, and the core population of bears living within the parks.

For these reasons, I request the following:

1. Before finalizing a delisting rule for GYE grizzly bears, release and allow public comment on a revised final draft Conservation Strategy, including final state management plans.

2. Require that the Conservation Strategy and state management plans contain clear and enforceable measures to ensure the GYE grizzly population remains stable or increases and allow for connectivity to other populations, and that the conservation strategy adequately addresses the potential impacts of climate change and secures grizzly bear habitat on federal lands.

3. Ensure that the National Park Service retains its authority to manage the John D. Rockefeller, Jr. Memorial Parkway as a National Park Service Unit, including by prohibiting the hunting of grizzly bears, and prohibit the hunting of grizzly bears on lands adjacent to the Parks and within the Primary Conservation Area.

Without these conditions being met, it seems unlikely that grizzly bear recovery will be a lasting success, and therefore I will not be able to support delisting. Thank you for your attention to this matter. If you have any questions, please have your staff contact Matt Strickler on the Natural Resources Committee Democratic Staff at (202) 225-6065. I look forward to your response.

Sincerely,

Raúl M. Grijalva
Ranking Member
Committee on Natural Resources

Denver, Colorado 80225-0287

IN REPLY REFER TO:

September 14, 2016

The Honorable Raúl M. Grijalva
United States House of Representatives
Committee on Natural Resources
Washington, D.C. 20515

Dear Congressman Grijalva:

Thank you for your recent letter requesting answers to questions regarding the proposed delisting of grizzly bears in the Greater Yellowstone Ecosystem (GYE) and potential effects inside and outside Yellowstone National Park. I am responding on behalf of the Intermountain Region of the National Park Service, which encompasses the parks in the affected area. Our responses to these questions follow:

Does the National Park Service (NPS) believe that hunting within the Primary Conservation Area (PCA) is consistent with the habitat security goals of the Conservation Strategy?

The PCA encompasses Yellowstone National Park, part of Grand Teton National Park and the John D. Rockefeller, Jr. Memorial Parkway, national forests and other ownerships. It is intended to provide secure habitat for grizzly bears where access-related disturbances are limited. If, after delisting, the states of Idaho, Montana, and Wyoming decide to hunt grizzly bears within the portion of the PCA outside national parks, the NPS has requested they focus the majority of these harvests away from park boundaries and in areas where human-bear conflicts are prevalent. Without such commitments, hunting could be concentrated within the PCA and near park unit boundaries, which could have significant impacts to bear viewing, regional economics, dispersal, and genetic connectivity.

Does the NPS support the potential removal of more than 200 – or one out of every four – bears from the Demographic Monitoring Area (DMA)?

The NPS does not support the removal of 200 grizzly bears from the DMA. Demographic recovery criterion 1 of the Draft Grizzly Bear Recovery Plan Supplement: Revised Demographic Criteria (USFWS 2016) and the proposed delisting rule specify a minimum population size of 500 grizzly bears within the DMA for genetic health. This is not a population goal or target. Rather, demographic recovery criterion 3 identifies a population objective based on the 2002-2014 Chao 2-modeled average of 674 bears (95% confidence interval = 600-757 bears). Furthermore, in Table 1 the proposed delisting rule indicates "if population size is estimated as fewer than or equal to 600 in any year, no discretionary mortality will occur unless

necessary for human safety." The NPS has conveyed to the U.S. Fish and Wildlife Service that these different population thresholds are confusing and could be interpreted differently by various stakeholders.

Does it concern the NPS that bears in national parks would effectively be providing the source population of bears for the states' discretionary mortality allocation?

Human-caused mortality within the PCA likely will increase after the delisting of grizzly bears if and when the states decide to implement hunting on national forest lands, private lands, and elsewhere outside NPS-managed lands. Without commitments to conservative restrictions on hunting and focusing hunting away from park boundaries, the role of the PCA in providing secure habitat and reducing human-caused mortalities to grizzly bears likely will be substantially diminished. Such commitments would help lessen the adverse effects of habitat loss from private developments in the PCA, dampen the effects of high and unpredictable human-caused mortality on multiple use and private lands (i.e., provide a refuge effect), offset the effects of unreported, harvest-related, wounding loss on the grizzly bear population, and limit potential source-sink dynamics from inside to outside the parks.

How would mortality rates of 9-10 percent for independent females and 20-22 percent for independent males impact the ability to maintain a recovered population?

Survival rates of adult grizzly bears are high without human-caused deaths, while reproductive rates are quite low. Any harvest of bears above conservative harvest levels could intentionally or inadvertently contribute to reduced population growth due to increased adult mortality and disruption of social organization, which could result in fewer young animals added to the population in the future.

The states maintain the proposed harvest levels combined with rigorous monitoring and timely adaptive management adjustments should result in sustainable harvests and the maintenance of a viable population of grizzly bears. Current estimates of grizzly bear vital rates suggest an adult female mortality rate of 7.6 percent or less would result in a stable to increasing population, whereas mortality rates of 9 to 10 percent would cause a population decline. Mortality rates of 20 to 22 percent for adult males may potentially disrupt the social structure of the population, possibly lowering cub production. We have recommended monitoring and research to evaluate the extent of unintended harvest of females with cubs, wounding loss, whether hunting is being sustained by dispersal of bears from national parks (i.e., source-sink dynamics), and any effects of modest to liberal harvests on the demographics and numbers of bears living within the PCA.

How would these mortality rates impact the ability of bears to expand outside of the PCA and achieve connectivity with other grizzly bear populations within the Northern Continental Divide Ecosystem?

The extent to which hunting in the PCA would inhibit connectivity to the Northern Continental Divide Ecosystem would depend on the extent and location of future hunter harvest. If grizzly bears are harvested at rates near the upper end of the proposed mortality limits, and that harvest is concentrated within the linkage zones connecting to the Northern Continental Divide

Ecosystem, then connectivity could be inhibited. The state of Montana has indicated that they will manage discretionary mortality in these areas to retain the opportunity for natural movements of bears between ecosystems, but no details have been provided as to how this would be assured. Some stakeholders would like to see a more detailed plan for connectivity within these linkage zones in the delisting rule, conservation strategy, state management plans, and/or the three-state memorandum of agreement.

How important is wildlife viewing – and grizzly bear viewing in particular – to Yellowstone visitors and surrounding communities?

Grizzly bears are one of the premier wildlife attractions for visitors to the Yellowstone/Grand Teton area, which contributes to the public's enjoyment and sense of pride in our conservation heritage. Tourism has a large and increasing influence on the regional economy, with more and more entrepreneurs, residents, and visitors seeing the environment and wildlife as valuable resources for recreation and viewing. There were more than 4.1 million visits to Yellowstone National Park during 2015, which contributed an estimated $493 million to nearby communities, supported about 7,730 jobs, and had a collective benefit of about $638 million to the area's economy. Over 90% of visitors indicated the park was the primary reason for visiting the area.

Visitation to Yellowstone and Grand Teton National Parks for wildlife viewing and other recreational activities is expected to continue to increase in the future. Ninety-nine percent of visitors to Yellowstone National Park expect to see a bear, and 67% did during a recent trip. This illustrates the strong desire and expectation of park visitors to see bears while they are in national parks.

How would bear hunting immediately outside Yellowstone impact opportunities for bear viewing within the park?

Many grizzly bears in Grand Teton and Yellowstone National Parks have necessarily habituated to the presence of millions of non-threatening visitors each year, for the many decades since bears were last hunted. This may make them more susceptible to future hunting when they leave the parks. Bear viewing could be impacted by the harvest of bears that frequent roadsides, bear avoidance of people following encounters with hunters, or other factors. Thus, the NPS has recommended to the U.S. Fish and Wildlife Service and the surrounding states that any future harvests be conducted in a way that (1) respects the mission of the NPS, (2) protects regional economic benefits and the enjoyment of bear watching, (3) reduces the risks associated with wounded bears entering the parks, and (4) limits the likelihood that well-known or transboundary bears will be harvested.

The NPS respects that hunting regulations are firmly in the purview of the states. However, the NPS is concerned that a delisting decision without commitments to conservative harvest restrictions in the portion of the PCA outside the national parks could result in a serious setback for grizzly bear management. The harvest of bears in such as manner as may impact bear-viewing opportunities in the parks will create great pressure to revisit this delisting decision and likely make future delistings of other iconic species more difficult. Thus, the NPS would like to lessen the risk of a bears being harvested near park boundaries. Elements of such a strategy

could include (1) no hunting of bears in the John D. Rockefeller, Jr. Memorial Parkway, (2) focusing the majority of harvests away from park boundaries and in areas where human-bear conflicts are more prevalent, and (3) imposing strict limits on female harvest in areas near park boundaries.

How vulnerable are so-called "celebrity bears" within Yellowstone and Grand Teton National Parks to hunting outside the park?

A grizzly bears' vulnerability to hunting when leaving the refuge of a national park likely would depend, in part, on the proportion of time it spent outside the national park and the distance it traveled from the park's boundary. Concentrating hunting in areas that have frequent human-bear conflicts could reduce the chances of bears that frequent the parks being harvested because most concentrations of conflicts occur in areas away from park unit boundaries. Conflicts sometimes occur in park gateway communities, which could expose those bears to some risk of harvest. However, if these bears are causing conflicts in gateway communities, they would likely be removed in management actions by state agencies regardless.

Is grizzly bear hunting along the Parkway consistent with the mission of NPS? Would hunting along the Parkway be supported by visitors to these parks?

The enabling legislation for the John D. Rockefeller, Jr. Memorial Parkway allows hunting at the discretion of the Wyoming Game and Fish Commission. However, due to the popularity and documented regional economic benefits of non-consumptive use of grizzly bears for viewing and photography, the NPS has requested that the delisting rule, conservation strategy, state management plans, and other related documents identify the John D. Rockefeller, Jr. Memorial Parkway as one of the three national park units in the Greater Yellowstone Ecosystem where grizzly bear hunting will not be permitted. Many visitors and stakeholders that prioritize photography, recreation, and wildlife watching strongly support this request.

Thank you for the opportunity to provide comments.

Sincerely,

Sue E. Masica

The Honorable Raúl M. Grijalva
Committee on Natural Resources
House of Representatives
218 Cannon House Office Building
Washington, D.C. 20515

Dear Representative Grijalva:

Thank you for your letter of June 7, 2016, concerning the proposed rule to delist grizzly bears in the Greater Yellowstone Ecosystem (GYE). Director Ashe requested that I respond to your inquiry. Specifically, your letter encouraged the U.S. Fish and Wildlife Service (Service) not to publish a final rule to delist the GYE grizzly bear until federal land managers and state wildlife officials have plans in place that exhibit adequate regulatory mechanisms to conserve grizzly bear habitat, allow for connectivity between the GYE and other populations, and limit mortality to sustainable levels.

As stated in the proposed rule to delist the GYE population of grizzly bears, all the state and federal agencies party to the draft 2016 Conservation Strategy for the Grizzly Bear in the GYE will need to sign a memorandum of understanding agreeing to implement the revised 2016 Conservation Strategy prior to a final delisting rule. Furthermore, revised state plans will be finalized prior to a final determination on the proposed rule. We intend to fully evaluate all aspects of the plans, including whether they effectively provide for the conservation of grizzly bears and their habitat, prior to a final determination on the proposed delisting rule. Sustainable mortality limits are addressed in the proposed rule and are part of the requirements for the states to adopt in their management plans and regulations prior to the Service issuing a final rule. Grizzly bears outside of the GYE area delineated in the proposed rule, including areas that provide potential connectivity to other populations, would remain listed should we finalize the delisting of the GYE population. In addition, affected National Forests and National Parks have incorporated, or will incorporate before a final rule is issued, the habitat standards and criteria into their Forest Plans and National Park management plans and/or Superintendent's Compendia via appropriate amendment processes so that they are legally applied to these public lands within the GYE.

Thank you for this opportunity to communicate our proposed process and commitment to the delisting of the GYE grizzly bear. I hope this letter fully addresses your concerns. If you need further information, please contact me at (303) 236-7920 or Michael Thabault, the Assistant Regional Director for Ecological Services in the Mountain-Prairie Region, at (303) 236-4210.

Sincerely,

Regional Director

DCN: 063311.

This letter is in response to a letter from Representative Raul Grijalva on the GYE grizzly bear delisting proposal. Jennifer Fortin-Noreus and Wayne Kasworm helped develop this response. Due date is 6/21/16 for RD signature. The letter states what was stated in the proposed rule as it would be premature to alter any subsequent commitment

The Honorable Daniel M. Ashe
Director, U.S. Fish and Wildlife
Department of the Interior
1849 C St., NW
Washington, D.C. 20240

Dear Director Ashe,

I would like to congratulate you on the significant progress the U.S. Fish and Wildlife Service (Service) and its partners have made toward protecting and recovering grizzly bears in the Greater Yellowstone Ecosystem (GYE). The tremendous growth of this population of bears is a testament to the effectiveness of the Endangered Species Act (ESA), and the many people who have worked tirelessly to restore the grizzly to this landscape deserve our highest praise.

However, I am concerned that the recent proposal to isolate GYE bears from the rest of the grizzlies in North America and remove it from the list of ESA threatened species does not do enough to ensure that these bears will continue to thrive. Specifically, the proposed rule makes the bold assumption that the states of Wyoming, Montana, and Idaho will put in place grizzly bear management plans containing adequate and enforceable regulatory mechanisms as required by the ESA. While these three states are currently developing their management plans, the contents of the final products are largely unknowable at this point. Further, the U.S. Forest Service has not started the process of amending forest plans in the GYE to incorporate necessary post-delisting conservation measures.

Ensuring that federal land managers and state wildlife officials have in place plans that will conserve grizzly bear habitat, allow for connectivity of GYE bears with other populations, and limit mortality to sustainable levels is critical to conservation success after ESA protections are removed. This is especially important given the scientific uncertainty surrounding the availability of forage for GYE grizzlies, and how climate change could cause them to range farther in search of food, increasing the likelihood of interactions with humans. For these reasons, I respectfully ask that you commit to not issuing a final rule on GYE grizzlies until after the state and Forest

Service have finalized their plans, the Service has allowed for additional public comment on the utility of these plans as part of a post-delisting conservation strategy, and Service scientists have deemed the plans adequate and enforceable as required by law. Rushing to finalize the rule without addressing these concerns will likely result in the Service losing yet another lawsuit – an outcome that no one wants.

Thank you for your attention to this matter. If you have any questions, please have your staff contact Matt Strickler on the Natural Resources Committee Democratic Staff at (202) 225-6065. I look forward to your response.

Sincerely,

Raúl M. Grijalva

The Honorable Raúl M. Grijalva
Committee on Natural Resources
House of Representatives
218 Cannon House Office Building
Washington, D.C. 20515

Dear Representative Grijalva:

Thank you for your letter of September 27, 2016, concerning the proposed rule to delist grizzly bears in the Greater Yellowstone Ecosystem (GYE). Specifically, your letter expressed concern about the Conservation Strategy, population targets, connectivity, and hunting. We share your concern for the conservation of the Yellowstone grizzly bear population and delisting will only occur if I am completely satisfied that we have robust commitments that this success can be maintained in the long-term.

Recovery of the Yellowstone grizzly bear population is a remarkable conservation success story and further validation of the success of the Endangered Species Act. The Yellowstone grizzly bear population has rebounded from as few as 136 bears in 1975 to more than 700 today and more than doubled their range since listing. This population now occupies more than 22,500 square miles of the ecosystem. This success would not have been possible without the tireless efforts countless partners including Federal, State, and Tribal agencies, conservation groups, and private citizens, including ranchers, sportsmen, and outfitters.

Recognizing that the population has basically stabilized at or near long-term carrying capacity (with modest growth in recent years), our management partners have agreed to maintain the total population size near the average population estimate for the period of stability achieved during 2002-2014 (i.e., 674 bears as measured by the model-averaged Chao2 with a 95% confidence interval of 600 to 757 bears). This will be accomplished by reducing discretionary mortality to modest, sustainable levels (<7.6%) should the model-averaged Chao2 fall below 674 bears and prohibiting discretionary mortality (except as necessary for human safety) in the unlikely event that the population ever falls below 600 bears. Montana, Idaho, and Wyoming have now all formally adopted these regulatory commitments.

As a result, last month we reopened the comment period on our proposed delisting. In total, we have offered two public comment periods totaling 90-days over the last seven months including March 11, 2016 to May 10, 2016, and September 7, 2016 to October 7, 2016. The most pertinent documents guiding management after delisting have now all been provided to the public for comment including the draft

Conservation Strategy, Federal land management regulatory documents and State discretionary mortality regulatory documents. Additional changes to the Conservation Strategy being considered are either minor or responsive to the public comments. Therefore, we do not believe an additional public comment period on the final draft Conservation Strategy is necessary.

Your letter also raised concerns related to the geography of harvest. Specifically, you asked that the John D. Rockefeller, Jr. Memorial Parkway retain its authority to prohibit hunting as a National Park Service Unit. You also indicated hunting should be prohibited on lands adjacent to the National Parks and within the Primary Conservation Area. Nothing in this rule would alter, or in any way affect, the jurisdiction or authority of the State of Wyoming, Tribal governments, the National Park Service, the U.S. Fish and Wildlife Service, or any other entity with respect to the regulation of hunting. Whatever jurisdiction or authority to authorize, prohibit, or regulate hunting existed in such areas prior to this final rule is unchanged by the promulgation of this rule (except, of course, that this rule removes the protections of the Act).

In short, it is beyond our authority to negotiate further on this point unless it rises to the level of being a threat to viability of the population. In our view, the current suit of discretionary mortality regulations will maintain the Yellowstone grizzly bear's recovered status. That said, the National Park Service and the States have a long history of cooperatively managing harvest for other species in a way that provides for the needs of all parties. We expect this partnership and successful management of harvest will continue.

Finally, your letter expressed concern about connectivity to other grizzly bear populations. We agree that connectivity to other grizzly bear populations to the north is desirable. Such connectivity has been and remains a focus of the Service and our partners. Our proposed delisting would have limited impact on connectivity as nearly all of the intervening habitat where dispersal would occur would remain fully protected by the ESA.

Thank you for your interest in this iconic species and the conservation success story it represents. I hope this letter addresses your concerns. If you need further information, please do not hesitate to contact me at the above letterhead.

Sincerely,

Director

YES members – I am forwarding the States motion that was discussed on last week's call. This motion did not pass. At the end of the call, since we were pressed for time, the States agreed to send this out so everyone could see in writing what was being proposed.

I sent separately the Draft Meeting Agenda – with this topic listed as a placeholder. We will need to have a new motion, second and discussion on this if it is going to be brought forward.

Thanks, Mary

Appendix C. Calculation of Total Population Size and Mortality Limits

Efforts to improve the population size estimation and management methods and to reevaluate the sustainable mortality limits in the Greater Yellowstone Ecosystem (GYE) have continued with the Interagency Grizzly Bear Study Team (IGBST) leading these efforts. Notably, several special reports have been produced including: "Reassessing Methods to Estimate Population Size and Sustainable Mortality Limits for the Yellowstone Grizzly Bear" (hereafter referred to as the Reassessing Methods Document, IGBST 2005, Appendix L), which was released for public comment and peer review. In response to comments received during this process, a second document, "Reassessing Methods To Estimate Population Size And Sustainable Mortality Limits For The Yellowstone Grizzly Bear: Workshop document supplement on 19–21 June 2006" (hereafter referred to as the Supplement to the Reassessing Methods Document, IGBST 2006, Appendix M) was produced after further peer review. Most recently, a third document "Updating and Evaluating Approaches to Estimate Population Size and Sustainable Mortality Limits for Grizzly Bears in the Greater Yellowstone Ecosystem" (hereafter referred to as the Updated Demographics document, IGBST 2012) was prepared in response to updated information and changes in population trajectory related to grizzly bear demographics. This 2012 document is attached to this 2016 Conservation Strategy as Appendix N.

The goals of these IGBST workshops were to assemble internal and external experts to review and enhance existing methods and, to the extent feasible, use existing data to develop new population estimation methods in order and ensure that population estimation and mortality management methods for the GYE grizzly bear population are based on the best available science. This effort was undertaken as per the commitment in the Conservation Strategy of all management agencies to employ adaptive management using the best available science to manage the GYE grizzly bear population.

The IGBST will use the protocol described in this Appendix to annually estimate population size within the Demographic Monitoring Area (DMA), and then set mortality limits inside the DMA for the following year based on the sliding scale in Table 1. Methods used in this protocol are described in the Reassessing Methods Document (IGBST 2005), summarized in the Supplement

to the Reassessing Methods Document (IGBST 2006), and revised in the Updated Demographics Rates Document (IGBST 2012).

Any change in the methods described below would be considered a change to the Conservation Strategy and would be revised through the Yellowstone Grizzly Bear Coordinating Committee process with the requirement that any proposed changes: 1) be based upon the best available science; and 2) go through public review before they are accepted, as per p. 99 of this Conservation Strategy.

The following procedures detail how population size and mortality thresholds would be calculated:

1. Observations of sightings of females with cubs-of-the-year[1] will be separated into an estimate of unique females with cubs-of-the-year and repeat observations of the same female using the methods of Knight *et al*. (1995).
2. Only sightings of unique females with cubs-of-the-year from within the DMA will be used for subsequent estimates.
3. The Chao2 estimator (Keating *et al*. 2002) will be applied to sighting frequencies of unique females with cubs-of-the-year to estimate the total number of females with cubs of the year in the population.
4. The number of unique females with cubs-of-the-year obtained from the Chao2 estimator each year will be added to the long-term dataset to conduct the model-averaging process described in the Supplement to the Reassessing Methods Document (IGBST 2006). This process involves fitting a linear and quadratic trend model, followed by averaging model parameters based on the respective Akaike's Information Criterion (AIC_c) weights of the linear and quadratic models. These model-averaged parameters are then used to estimate the number of females with cubs-of-the-year.
5. The estimated number of females with cubs-of-the-year obtained through the model averaging will be used as the best estimate of the total number of independent females with cub-of-the-year in the DMA for that year.

[1] Adult female grizzly bears accompanied by cubs that are less than one year old.

Comment [idmtwy1]: In drafts circulated before the 11/4/2016 call, this location contained alternate language proposed by USFWS and the States.

Mr. Nesvik's motion was to adopt Appendix C without including either USFWS' proposed language or the states' compromise proposed language.

Comment [idmtwy2]: In drafts circulated before the 11/4/2016 call, this location contained a paragraph in strikeout. This stricken language was not part of the 2007 strategy; it was proposed by USFWS but not agreed to by the parties.

Mr. Nesvik's motion was to adopt Appendix C, without including USFWS' proposed language.

6. The purpose of fitting the trend model is to obtain the best estimate of the current number of females with cubs-of-the-year by using information from past estimates, recognizing that with each iteration, some change is expected. Retrospectively adjusting estimates from previous years will not occur.
7. The estimated number of females with cubs-of-the-year will be divided by the proportion of females ≥4 years old estimated to be accompanied by cubs-of-the-year (transition probability = 0.2965) observed during 2002–2011. The resulting value represents the best estimate of the total number of females in the population ≥4 years old.
8. The number of females ≥4 years old will be divided by the estimated proportion of females ≥4 years old in the population of females ≥2 years old (proportion = 0.844) observed during 2002–2011. The resulting value is the best estimate of the number of independent females (≥2 years old) in the population that year.
9. The sustainable mortality limit for independent females is dependent on the population estimate of independent females (Table 1).
10. Unknown and unreported mortality will be estimated based on the methods of Cherry *et al*. (2002) as described in the Reassessing Methods Document (IGBST 2005).
11. The number of independent males in the population will be based on the estimated ratio of independent males to independent females (ratio = 1:1) observed during 2002–2011 and derived via stochastic modeling described in the Supplement to the Reassessing Methods Document (IGBST 2006). The number of independent females in the population will thus be multiplied by 1.0 and the resulting value represents the best estimate of the number of independent males that year.
12. The sustainable mortality limit for independent males is dependent on the population estimate of independent males (Table 1).
13. The number of cubs-of-the-year in the annual population estimate will be calculated directly from the model-averaged estimate of females with cubs-of-the-year (IGBST 2006). The number of cubs will be estimated by multiplying the model-averaged estimate of females with cubs-of-the-year by the mean litter size (litter size = 2.49; mortality adjusted estimate) observed during 2002–2011.

14. The number of yearlings will be estimated by multiplying the estimated number of cubs from the previous year by the mean survival rate for cubs (cub survival = 0.553) observed during 2002–2011.
15. The sustainable mortality limit for dependent young (cubs and yearlings) is dependent on the population estimate of dependent young (Table 1). Only human-caused deaths (reported known and probable) will be tallied against the threshold for dependent young.
16. Unknown and unreported mortality will not be estimated for dependent young.
17. Sustainable mortality limits will be established annually based on the data collected in that year and the calculations described here. These mortality limits will then apply the following year. Because model-averaged estimates are used, annual variability among estimates is explicitly addressed. Consequently, annual limits based on a 3-year running average, as proposed in the Reassessing Methods Document (IGBST 2005), are not used. Instead, annual sustainable mortality limits for any year will be based on the data and calculations for the previous year (as described in this protocol and the Updated Demographic Rates Document, IGBST 2012, Appendix N).
18. Estimates of uncertainty about the number of independent females, independent males, dependent young, and total population size will be derived following methods detailed in the Supplement to the Reassessing Methods Document (IGBST 2006) using updated vital rates as documented in IGBST (2012, Appendix N).
19. The objective of 48[2] females with cubs-of-the-year as estimated with Chao2 will be evaluated based on the model-averaged estimate of females with cubs-of-the-year (IGBST 2012).
~~20. A biology and monitoring review by the IGBST will occur should the model-averaged Chao2 estimate decline below 48 females with cubs of the year for any 2 consecutive years.~~
~~21. Agencies will implement management to attempt to limit female mortality model-averaged Chao2 estimate decline below 48 females with cub of the year in any given year.~~
~~22.~~20. In modeling the rate of change (trend) of females with cubs-of-the-year as described in the Supplement to the Reassessing Methods Document (IGBST 2006), if the AIC_c weight favors the quadratic term and corresponding $\Delta AIC_c \geq 2.0$ compared with the linear model for 3 consecutive years, a full review of the population's demographics will be undertaken

[2] 48 independent females with cubs of the year in the DMA is approximately equivalent to a population of 600 bears.

Comment [idmtwy3]: Mr. Nesvik's motion was to adopt Appendix C, with deletion of these two steps, consistent with the recommendation of IGBST.

Because of a numbering glitch in the circulated drafts, there was confusion as to Paragraph numbers. This draft provides clarity as to the proposed re-numbering.

to better understand its status. Given evidence of a population nearing carrying capacity and a population fluctuating around a long-term mean, this approach allows timely detection of a sustained increasing or decreasing trend (van Manen *et al.* 2015).

~~23.~~21. If dead bears are reported in years subsequent to actual year of mortality, they will be tallied against year of death and total mortality will be recalculated. If mortality exceeds the threshold for that year, the difference (total mortality minus threshold) will be counted against the current years' threshold.

~~24.~~22. For bears that are estimated to be independent of age, if sex cannot be determined, sex will be assigned randomly using ratio of 59:41 male:female as recommended in Appendix A of Schwartz and Haroldson (2001).

Table 1. Annual sustainable mortality limits by sex and age cohorts[3] of grizzly bears in the Greater Yellowstone Ecosystem under the protocol to manage for a population at the average annual population estimate for the period 2002–2014 in the Demographic Monitoring Area (DMA) (using the Chao2 estimator this average number is 674).

Maximum mortality rate for:	Population estimate inside the DMA using the model-averaged Chao2 method.			
	<674	674	675-747	>747
% of independent FEMALES	<7.6%	7.6%	9%	10%
% of independent MALES	15%	15%	20%	22%
% of DEPENDENT YOUNG	<7.6%	7.6%	9%	10%

Comment [idmtwy4]: Mr. Nesvik's motion was to adopt Appendix C such that this Table reference is consistent with that previously agreed upon for Table 2 in Chapter 2 of the Conservation strategy.

[3] Sustainable mortality estimates are based on the sustainable mortality percentage of the respective population segment relative to the population estimates.

> WE worked with the Tribal Council yesterday to develop a legal signing statement to accompany the Tribes' signature on the Tribal Grizzly Bear Treaty. I am attaching a copy of the text of the Treaty, as well as a copy of the Tribes' signed signing statement. Stacy, Tom and I had concerns specifically about the treaty language in Articles 7 and 10, which we felt could impinge on our ability to work cooperatively with MFWP and USFWS on grizzly bear management and recovery.. Our attorneys believe that the signing statement takes care of that, in addition to the Tribal Chairman's assurance received in the discussion with the

Piikuni representative that brought the treaty to the Council.

Signing Statement of the Confederated Salish and Kootenai Tribes of the Flathead Reservation

This Signing Statement of the Confederated Salish and Kootenai Tribes (CSKT) is submitted together with the signature of the Tribal Chairman on the document entitled "The Grizzly: A Treaty of Cooperation, Cultural Revitalization and Restoration" (Grizzly Treaty) signed at the CSKT Tribal Council Chambers on October 18, 2016.

The CSKT is in agreement with the aspirations and goals of the Grizzly Treaty particularly regarding the reverence that Tribes have for the Grizzly Bear, and the spiritual, cultural, and ceremonial role that the Grizzly plays in the life and history of each signatory Tribe. The CSKT agrees that Grizzly Bears should be managed through the use of the best available science, traditional ecological knowledge, and culturally relevant information.

With these goals in mind, the CSKT signs this Grizzly Treaty with the intention of continuing our proven management of Grizzly Bears and their habitat in western Montana. The CSKT has a robust Grizzly Bear management program in place, and will continue to manage them utilizing our knowledge and experience, including our understanding of the current habitat conditions and status of Grizzlies in western Montana.

The CSKT offers its signature in solidarity with the other signatories to this Grizzly Treaty, but want to clearly state our intention to honor our existing and future partnerships with appropriate state and federal wildlife and natural resource management agencies. We believe these partnerships offer the best chance for meaningful recovery and management of this profoundly important species, particularly within the Crown of the Continent ecosystem, where intergovernmental cooperation is the key to successfully managing all activities for the benefit of Grizzly Bears.

Finally, the CSKT has not taken a formal position that delisting of the Grizzly Bear should never occur, however the CSKT will remain consistent in our opposition to the sport and trophy hunting of Grizzly Bears.

The CSKT joins with all Tribal Nations who are signatories to this Grizzly Treaty in hoping that this agreement will serve as a catalyst to all individuals, organizations and governments to voice their concern for Grizzly Bears. We hope to see this sacred Bear forever retain its place in our traditions and on our landscapes.

Sincerely,

Vernon S. Finley

Excellent. This is very helpful.

On a completely different subject, I assume Mike T told you about the letter Dan and I got from Bob Broscheid conveying WAFWA's desire to work with us to consider new ESA tools to incentivize conservation on federal lands,i.e., the advance 10j rule concept. Mike said that you had been discussing that with Ken McDonald, and Bob was fine with you and Ken continuing to flesh that out. If you need any help from my folks, let Don know. I understand that Mike Young has some ideas on how to effectuate this. If that's the case, we'll want to engage him before the end of the year, because I think he's planning on retirement around that time.

Thanks for all you're doing. Good to see you last week. -- GDF

Good morning,

I am attaching here two .rtf files – depending on in which order you received the files (including the edited comments), one of the attached versions should be the 3rd (corrupted) file. These seem to open fine on my computer, but please let me know if they continue to be inoperable on your end, and I will figure out a different format for them.

Thanks so much for letting us know about the problem!

Very best,

Jen Lonergan

Hello Tracie,

Thank you for chatting. Below is the email sent to Keisha describing the situation. Please let me know if you are able and interested in resubmitting the third file for our consideration. We would like to consider the comments if possible. As indicated below, we request the resubmitted file no later than 3pm mountain tomorrow.

Thanks,

Seth

Hello Keisha,

I am contacting you regarding your comments on the proposed delisting of the Yellowstone Grizzly Bear population (Docket ID: FWS-R6-ES-2016-0042). This is a follow up to two previous voice messages from myself (10/13) and Michel Bagbonon (10/12). As previously indicated, we received 30 rtf files with member comments. However, the 3rd of the 30 files was corrupt and cannot be opened; the remaining files function normally. Your comments, minus the third corrupt file, have been uploaded here: https://www.regulations.gov/document?D=FWS-R6-ES-2016-0042-9781

We are reaching out again to see if you wish to resubmit the third file. If so, we need this file by 3pm mountain time tomorrow. Please let me know.

Additionally, on the off chance you are on leave, I am going to call your main line to see if we can reach another person in your shop.

Thanks,

Seth

U.S. Fish and Wildlife Service

Subject: Please do not remove federal protections from Yellowstone grizzly bears

To: U.S. Fish and Wildlife Service,

I am writing to ask that you do not delist Yellowstone grizzly bears.

Grizzly bears in the Greater Yellowstone Ecosystem (GYE) have benefited greatly from Endangered Species Act (ESA) protections but are not yet recovered. Removing federal protections from this one small, isolated population and subjecting them to trophy hunting will not advance the conservation of this species.

The federal government spent years trying to add bears to the population, only to now turn around and let states give trophy hunters the green light to start killing them.

Yellowstone grizzly bears currently face a world of mounting threats, including a warming climate, reckless big game hunters, loss of important food sources and isolation from other bear populations. This iconic species will be put at an even greater risk if grizzly bears are delisted and managed by the states, where there are inadequate regulatory mechanisms to protect them. Prominent grizzly bear scientists agree that the delisting is premature. The grizzly bear population in the lower 48 states is less than two percent of their pre-settlement population and occupy an insignificant proportion of their pre-settlement range.

Grizzly bears are far from recovered and need to maintain their ESA protections. Please do not remove federal protections from grizzly bears in the GYE area.

Sincerely,
Ms. Cindy Messman

Removing federal protections from this one small, isolated population and subjecting them to trophy hunting will not advance the conservation of this species.

The federal government spent years trying to add bears to the population, only to now turn around and let states give trophy hunters the green light to start killing them.

Yellowstone grizzly bears currently face a world of mounting threats, including a warming climate, reckless big game hunters, loss of important food sources and isolation from other bear populations. This iconic species will be put at an even greater risk if grizzly bears are delisted and managed by the states, where there are inadequate regulatory mechanisms to protect them. Prominent grizzly bear scientists agree that the delisting is premature. The grizzly bear population in the lower 48 states is less than two percent of their pre-settlement population and occupy an insignificant proportion of their pre-settlement range.

Grizzly bears are far from recovered and need to maintain their ESA protections. Please do not remove federal protections from grizzly bears in the GYE area.

Sincerely,
Mrs. Rose Kasper

U.S. Fish and Wildlife Service

Subject: Please do not remove federal protections from Yellowstone grizzly bears

To: U.S. Fish and Wildlife Service,

I am writing to ask that you do not delist Yellowstone grizzly bears.

Grizzly bears in the Greater Yellowstone Ecosystem (GYE) have benefited greatly from Endangered Species Act (ESA) protections but are not yet recovered. Removing federal protections from this one small, isolated population and subjecting them to trophy hunting will not advance the conservation of this species.

The federal government spent years trying to add bears to the population, only to now turn around and let states give trophy hunters the green light to start killing them.

Yellowstone grizzly bears currently face a world of mounting threats, including a warming climate, reckless big game hunters, loss of important food sources and isolation from other bear populations. This iconic species will be put at an even greater risk if grizzly bears are delisted and managed by the states, where there are inadequate regulatory mechanisms to protect them. Prominent grizzly bear scientists agree that the delisting is premature. The grizzly bear population in the lower 48 states is less than two percent of their pre-settlement population and occupy an insignificant proportion of their pre-settlement range.

Grizzly bears are far from recovered and need to maintain their ESA protections. Please do not remove federal protections from grizzly bears in the GYE area.

Sincerely,
Mr. Jerry Mylin

The grizzly bear population in the lower 48 states is less than two percent of their pre-settlement population and occupy an insignificant proportion of their pre-settlement range.

Grizzly bears are far from recovered and need to maintain their ESA protections. Please do not remove federal protections from grizzly bears in the GYE area.

Sincerely,
Mrs. De Ann Glass

U.S. Fish and Wildlife Service

Subject: Please do not remove federal protections from Yellowstone grizzly bears

To: U.S. Fish and Wildlife Service,

I am writing to ask that you do not delist Yellowstone grizzly bears.

Grizzly bears in the Greater Yellowstone Ecosystem (GYE) have benefited greatly from Endangered Species Act (ESA) protections but are not yet recovered. Removing federal protections from this one small, isolated population and subjecting them to trophy hunting will not advance the conservation of this species.

The federal government spent years trying to add bears to the population, only to now turn around and let states give trophy hunters the green light to start killing them.

Yellowstone grizzly bears currently face a world of mounting threats, including a warming climate, reckless big game hunters, loss of important food sources and isolation from other bear populations. This iconic species will be put at an even greater risk if grizzly bears are delisted and managed by the states, where there are inadequate regulatory mechanisms to protect them. Prominent grizzly bear scientists agree that the delisting is premature. The grizzly bear population in the lower 48 states is less than two percent of their pre-settlement population and occupy an insignificant proportion of their pre-settlement range.

Grizzly bears are far from recovered and need to maintain their ESA protections. Please do not remove federal protections from grizzly bears in the GYE area.

Sincerely,
Mrs. Ginger Wehrman

Removing federal protections from this one small, isolated population and subjecting them to trophy hunting will not advance the conservation of this species.

The federal government spent years trying to add bears to the population, only to now turn around and let states give trophy hunters the green light to start killing them.

Yellowstone grizzly bears currently face a world of mounting threats, including a warming climate, reckless big game hunters, loss of important food sources and isolation from other bear populations. This iconic species will be put at an even greater risk if grizzly bears are delisted and managed by the states, where there are inadequate regulatory mechanisms to protect them. Prominent grizzly bear scientists agree that the delisting is premature. The grizzly bear population in the lower 48 states is less than two percent of their pre-settlement population and occupy an insignificant proportion of their pre-settlement range.

Grizzly bears are far from recovered and need to maintain their ESA protections. Please do not remove federal protections from grizzly bears in the GYE area.

Sincerely,
Mrs. L Bruzik

Subject: Please do not remove federal protections from Yellowstone grizzly bears

To: U.S. Fish and Wildlife Service,

I am writing to ask that you do not delist Yellowstone grizzly bears.

Grizzly bears in the Greater Yellowstone Ecosystem (GYE) have benefited greatly from Endangered Species Act (ESA) protections but are not yet recovered. Removing federal protections from this one small, isolated population and subjecting them to trophy hunting will not advance the conservation of this species.

The federal government spent years trying to add bears to the population, only to now turn around and let states give trophy hunters the green light to start killing them.

Yellowstone grizzly bears currently face a world of mounting threats, including a warming climate, reckless big game hunters, loss of important food sources and isolation from other bear populations. This iconic species will be put at an even greater risk if grizzly bears are delisted and managed by the states, where there are inadequate regulatory mechanisms to protect them. Prominent grizzly bear scientists agree that the delisting is premature. The grizzly bear population in the lower 48 states is less than two percent of their pre-settlement population and occupy an insignificant proportion of their pre-settlement range.

Grizzly bears are far from recovered and need to maintain their ESA protections. Please do not remove federal protections from grizzly bears in the GYE area.

Sincerely,
Mrs. Amy Foster

Miss Kendall Reid

U.S. Fish and Wildlife Service

Subject: Please do not remove federal protections from Yellowstone grizzly bears

To: U.S. Fish and Wildlife Service,

I am writing to ask that you do not delist Yellowstone grizzly bears.

Grizzly bears in the Greater Yellowstone Ecosystem (GYE) have benefited greatly from Endangered Species Act (ESA) protections but are not yet recovered. Removing federal protections from this one small, isolated population and subjecting them to trophy hunting will not advance the conservation of this species.

The federal government spent years trying to add bears to the population, only to now turn around and let states give trophy hunters the green light to start killing them.

Yellowstone grizzly bears currently face a world of mounting threats, including a warming climate, reckless big game hunters, loss of important food sources and isolation from other bear populations. This iconic species will be put at an even greater risk if grizzly bears are delisted and managed by the states, where there are inadequate regulatory mechanisms to protect them. Prominent grizzly bear scientists agree that the delisting is premature. The grizzly bear population in the lower 48 states is less than two percent of their pre-settlement population and occupy an insignificant proportion of their pre-settlement range.

Grizzly bears are far from recovered and need to maintain their ESA protections. Please do not remove federal protections from grizzly bears in the GYE area.

Sincerely,
Mr. Craig Decker

This iconic species will be put at an even greater risk if grizzly bears are delisted and managed by the states, where there are inadequate regulatory mechanisms to protect them. Prominent grizzly bear scientists agree that the delisting is premature. The grizzly bear population in the lower 48 states is less than two percent of their pre-settlement population and occupy an insignificant proportion of their pre-settlement range.

Grizzly bears are far from recovered and need to maintain their ESA protections. Please do not remove federal protections from grizzly bears in the GYE area.

Sincerely,
Ms. Alejandra Ruiz

U.S. Fish and Wildlife Service

Subject: Please do not remove federal protections from Yellowstone grizzly bears

To: U.S. Fish and Wildlife Service,

I am writing to ask that you do not delist Yellowstone grizzly bears.

Grizzly bears in the Greater Yellowstone Ecosystem (GYE) have benefited greatly from Endangered Species Act (ESA) protections but are not yet recovered. Removing federal protections from this one small, isolated population and subjecting them to trophy hunting will not advance the conservation of this species.

The federal government spent years trying to add bears to the population, only to now turn around and let states give trophy hunters the green light to start killing them.

Yellowstone grizzly bears currently face a world of mounting threats, including a warming climate, reckless big game hunters, loss of important food sources and isolation from other bear populations. This iconic species will be put at an even greater risk if grizzly bears are delisted and managed by the states, where there are inadequate regulatory mechanisms to protect them. Prominent grizzly bear scientists agree that the delisting is premature. The grizzly bear population in the lower 48 states is less than two percent of their pre-settlement population and occupy an insignificant proportion of their pre-settlement range.

Grizzly bears are far from recovered and need to maintain their ESA protections. Please do not remove federal protections from grizzly bears in the GYE area.

The federal government spent years trying to add bears to the population, only to now turn around and let states give trophy hunters the green light to start killing them.

Yellowstone grizzly bears currently face a world of mounting threats, including a warming climate, reckless big game hunters, loss of important food sources and isolation from other bear populations. This iconic species will be put at an even greater risk if grizzly bears are delisted and managed by the states, where there are inadequate regulatory mechanisms to protect them. Prominent grizzly bear scientists agree that the delisting is premature. The grizzly bear population in the lower 48 states is less than two percent of their pre-settlement population and occupy an insignificant proportion of their pre-settlement range.

Grizzly bears are far from recovered and need to maintain their ESA protections. Please do not remove federal protections from grizzly bears in the GYE area.

Sincerely,
Ms. Melissa Carrier

U.S. Fish and Wildlife Service

Subject: Please do not remove federal protections from Yellowstone grizzly bears

To: U.S. Fish and Wildlife Service,

I am writing to ask that you do not delist Yellowstone grizzly bears.

Grizzly bears in the Greater Yellowstone Ecosystem (GYE) have benefited greatly from Endangered Species Act (ESA) protections but are not yet recovered. Removing federal protections from this one small, isolated population and subjecting them to trophy hunting will not advance the conservation of this species.

The federal government spent years trying to add bears to the population, only to now turn around and let states give trophy hunters the green light to start killing them.

Yellowstone grizzly bears currently face a world of mounting threats, including a warming climate, reckless big game hunters, loss of important food sources and isolation from other bear populations. Subject: Please do not remove federal protections from Yellowstone grizzly bears

To: U.S. Fish and Wildlife Service,

I am writing to ask that you do not delist Yellowstone grizzly bears.

Grizzly bears in the Greater Yellowstone Ecosystem (GYE) have benefited greatly from Endangered Species Act (ESA) protections but are not yet recovered. Removing federal protections from this one small, isolated population and subjecting them to trophy hunting will not advance the conservation of this species.

The federal government spent years trying to add bears to the population, only to now turn around and let states give trophy hunters the green light to start killing them.

Yellowstone grizzly bears currently face a world of mounting threats, including a warming climate, reckless big game hunters, loss of important food sources and isolation from other bear populations. This iconic species will be put at an even greater risk if grizzly bears are delisted and managed by the states, where there are inadequate regulatory mechanisms to protect them. Prominent grizzly bear scientists agree that the delisting is premature. The grizzly bear population in the lower 48 states is less than two percent of their pre-settlement population and occupy an insignificant proportion of their pre-settlement range.

Grizzly bears are far from recovered and need to maintain their ESA protections. Please do not remove federal protections from grizzly bears in the GYE area.

Sincerely,
Ms. Luciana Kress jereissati

Mrs. Nancy Orons

Prominent grizzly bear scientists agree that the delisting is premature. The grizzly bear population in the lower 48 states is less than two percent of their pre-settlement population and occupy an insignificant proportion of their pre-settlement range.

Grizzly bears are far from recovered and need to maintain their ESA protections. Please do not remove federal protections from grizzly bears in the GYE area.

Sincerely,
Ms. Jessica Wagstaff

Sep 28, 2016

U.S. Fish and Wildlife Service

Subject: Please do not remove federal protections from Yellowstone grizzly bears

To: U.S. Fish and Wildlife Service,

I am writing to ask that you do not delist Yellowstone grizzly bears.

Grizzly bears in the Greater Yellowstone Ecosystem (GYE) have benefited greatly from Endangered Species Act (ESA) protections but are not yet recovered. Removing federal protections from this one small, isolated population and subjecting them to trophy hunting will not advance the conservation of this species.

The federal government spent years trying to add bears to the population, only to now turn around and let states give trophy hunters the green light to start killing them.

Yellowstone grizzly bears currently face a world of mounting threats, including a warming climate, reckless big game hunters, loss of important food sources and isolation from other bear populations. This iconic species will be put at an even greater risk if grizzly bears are delisted and managed by the states, where there are inadequate regulatory mechanisms to protect them. Prominent grizzly bear scientists agree that the delisting is premature. The grizzly bear population in the lower 48 states is less than two percent of their pre-settlement population and occupy an insignificant proportion of their pre-settlement range.

Grizzly bears are far from recovered and need to maintain their ESA protections. Please do not remove federal protections from grizzly bears in the GYE area.

Sincerely,

The federal government spent years trying to add bears to the population, only to now turn around and let states give trophy hunters the green light to start killing them.

Yellowstone grizzly bears currently face a world of mounting threats, including a warming climate, reckless big game hunters, loss of important food sources and isolation from other bear populations. This iconic species will be put at an even greater risk if grizzly bears are delisted and managed by the states, where there are inadequate regulatory mechanisms to protect them. Prominent grizzly bear scientists agree that the delisting is premature. The grizzly bear population in the lower 48 states is less than two percent of their pre-settlement population and occupy an insignificant proportion of their pre-settlement range.

Grizzly bears are far from recovered and need to maintain their ESA protections. Please do not remove federal protections from grizzly bears in the GYE area.

Sincerely,
Mrs. Savannah Moore

U.S. Fish and Wildlife Service

Subject: Please do not remove federal protections from Yellowstone grizzly bears

To: U.S. Fish and Wildlife Service,

I am writing to ask that you do not delist Yellowstone grizzly bears.

Grizzly bears in the Greater Yellowstone Ecosystem (GYE) have benefited greatly from Endangered Species Act (ESA) protections but are not yet recovered. Removing federal protections from this one small, isolated population and subjecting them to trophy hunting will not advance the conservation of this species.

The federal government spent years trying to add bears to the population, only to now turn around and let states give trophy hunters the green light to start killing them.

Yellowstone grizzly bears currently face a world of mounting threats, including a warming climate, reckless big game hunters, loss of important food sources and isolation from other bear populations. To: U.S. Fish and Wildlife Service,

I am writing to ask that you do not delist Yellowstone grizzly bears.

Grizzly bears in the Greater Yellowstone Ecosystem (GYE) have benefited greatly from Endangered Species Act (ESA) protections but are not yet recovered. Removing federal protections from this one small, isolated population and subjecting them to trophy hunting will not advance the conservation of this species.

The federal government spent years trying to add bears to the population, only to now turn around and let states give trophy hunters the green light to start killing them.

Yellowstone grizzly bears currently face a world of mounting threats, including a warming climate, reckless big game hunters, loss of important food sources and isolation from other bear populations. This iconic species will be put at an even greater risk if grizzly bears are delisted and managed by the states, where there are inadequate regulatory mechanisms to protect them. Prominent grizzly bear scientists agree that the delisting is premature. The grizzly bear population in the lower 48 states is less than two percent of their pre-settlement population and occupy an insignificant proportion of their pre-settlement range.

Grizzly bears are far from recovered and need to maintain their ESA protections. Please do not remove federal protections from grizzly bears in the GYE area.

Sincerely,
Mrs. Pat Harris

U.S. Fish and Wildlife Service

Subject: Please do not remove federal protections from Yellowstone grizzly bears

To: U.S. Fish and Wildlife Service,

I am writing to ask that you do not delist Yellowstone grizzly bears.

Grizzly bears in the Greater Yellowstone Ecosystem (GYE) have benefited greatly from Endangered Species Act (ESA) protections but are not yet recovered. Removing federal protections from this one small, isolated population and subjecting them to trophy hunting will not advance the conservation of this species.

The federal government spent years trying to add bears to the population, only to now turn around and let states give trophy hunters the green light to start killing them.

Yellowstone grizzly bears currently face a world of mounting threats, including a warming climate, reckless big game hunters, loss of important food sources and isolation from other bear populations. This iconic species will be put at an even greater risk if grizzly bears are delisted and managed by the states, where there are inadequate regulatory mechanisms to protect them. Prominent grizzly bear scientists agree that the delisting is premature. The grizzly bear population in the lower 48 states is less than two percent of their pre-settlement population and occupy an insignificant proportion of their pre-settlement range.

Grizzly bears are far from recovered and need to maintain their ESA protections. Please do not remove federal protections from grizzly bears in the GYE area.

Sincerely,
Ms. Christin Reni

This iconic species will be put at an even greater risk if grizzly bears are delisted and managed by the states, where there are inadequate regulatory mechanisms to protect them. Prominent grizzly bear scientists agree that the delisting is premature. The grizzly bear population in the lower 48 states is less than two percent of their pre-settlement population and occupy an insignificant proportion of their pre-settlement range.

Grizzly bears are far from recovered and need to maintain their ESA protections. Please do not remove federal protections from grizzly bears in the GYE area.

Sincerely,
Mr. Sammy Almaita

U.S. Fish and Wildlife Service

Subject: Please do not remove federal protections from Yellowstone grizzly bears

To: U.S. Fish and Wildlife Service,

I am writing to ask that you do not delist Yellowstone grizzly bears.

Grizzly bears in the Greater Yellowstone Ecosystem (GYE) have benefited greatly from Endangered Species Act (ESA) protections but are not yet recovered. Removing federal protections from this one small, isolated population and subjecting them to trophy hunting will not advance the conservation of this species.

The federal government spent years trying to add bears to the population, only to now turn around and let states give trophy hunters the green light to start killing them.

Yellowstone grizzly bears currently face a world of mounting threats, including a warming climate, reckless big game hunters, loss of important food sources and isolation from other bear populations. This iconic species will be put at an even greater risk if grizzly bears are delisted and managed by the states, where there are inadequate regulatory mechanisms to protect them. Prominent grizzly bear scientists agree that the delisting is premature. The grizzly bear population in the lower 48 states is less than two percent of their pre-settlement population and occupy an insignificant proportion of their pre-settlement range.

Grizzly bears are far from recovered and need to maintain their ESA protections. Please do not remove federal protections from grizzly bears in the GYE area.

Sincerely,

To: U.S. Fish and Wildlife Service,

I am writing to ask that you do not delist Yellowstone grizzly bears.

Grizzly bears in the Greater Yellowstone Ecosystem (GYE) have benefited greatly from Endangered Species Act (ESA) protections but are not yet recovered. Removing federal protections from this one small, isolated population and subjecting them to trophy hunting will not advance the conservation of this species.

The federal government spent years trying to add bears to the population, only to now turn around and let states give trophy hunters the green light to start killing them.

Yellowstone grizzly bears currently face a world of mounting threats, including a warming climate, reckless big game hunters, loss of important food sources and isolation from other bear populations. This iconic species will be put at an even greater risk if grizzly bears are delisted and managed by the states, where there are inadequate regulatory mechanisms to protect them. Prominent grizzly bear scientists agree that the delisting is premature. The grizzly bear population in the lower 48 states is less than two percent of their pre-settlement population and occupy an insignificant proportion of their pre-settlement range.

Grizzly bears are far from recovered and need to maintain their ESA protections. Please do not remove federal protections from grizzly bears in the GYE area.

Sincerely,
Mrs. Gia McGahey

U.S. Fish and Wildlife Service

Subject: Please do not remove federal protections from Yellowstone grizzly bears

To: U.S. Fish and Wildlife Service,

I am writing to ask that you do not delist Yellowstone grizzly bears.

Grizzly bears in the Greater Yellowstone Ecosystem (GYE) have benefited greatly from Endangered Species Act (ESA) protections but are not yet recovered. Removing federal protections from this one small, isolated population and subjecting them to trophy hunting will not advance the conservation of this species.

The federal government spent years trying to add bears to the population, only to now turn around and let states give trophy hunters the green light to start killing them.

Yellowstone grizzly bears currently face a world of mounting threats, including a warming climate, reckless big game hunters, loss of important food sources and isolation from other bear populations. This iconic species will be put at an even greater risk if grizzly bears are delisted and managed by the states, where there are inadequate regulatory mechanisms to protect them. Prominent grizzly bear scientists agree that the delisting is premature. The grizzly bear population in the lower 48 states is less than two percent of their pre-settlement population and occupy an insignificant proportion of their pre-settlement range.

Grizzly bears are far from recovered and need to maintain their ESA protections. Please do not remove federal protections from grizzly bears in the GYE area.

Sincerely,
Ms. Tina Couillard

Prominent grizzly bear scientists agree that the delisting is premature. The grizzly bear population in the lower 48 states is less than two percent of their pre-settlement population and occupy an insignificant proportion of their pre-settlement range.

Grizzly bears are far from recovered and need to maintain their ESA protections. Please do not remove federal protections from grizzly bears in the GYE area.

Sincerely,
Ms. Larie Dixon

Sep 28, 2016

U.S. Fish and Wildlife Service

Subject: Please do not remove federal protections from Yellowstone grizzly bears

To: U.S. Fish and Wildlife Service,

I am writing to ask that you do not delist Yellowstone grizzly bears.

Grizzly bears in the Greater Yellowstone Ecosystem (GYE) have benefited greatly from Endangered Species Act (ESA) protections but are not yet recovered. Removing federal protections from this one small, isolated population and subjecting them to trophy hunting will not advance the conservation of this species.

The federal government spent years trying to add bears to the population, only to now turn around and let states give trophy hunters the green light to start killing them.

Yellowstone grizzly bears currently face a world of mounting threats, including a warming climate, reckless big game hunters, loss of important food sources and isolation from other bear populations. This iconic species will be put at an even greater risk if grizzly bears are delisted and managed by the states, where there are inadequate regulatory mechanisms to protect them. Prominent grizzly bear scientists agree that the delisting is premature. The grizzly bear population in the lower 48 states is less than two percent of their pre-settlement population and occupy an insignificant proportion of their pre-settlement range.

Grizzly bears are far from recovered and need to maintain their ESA protections. Please do not remove federal protections from grizzly bears in the GYE area.

Sincerely,
Ms. Kathleen Barr

The federal government spent years trying to add bears to the population, only to now turn around and let states give trophy hunters the green light to start killing them.

Yellowstone grizzly bears currently face a world of mounting threats, including a warming climate, reckless big game hunters, loss of important food sources and isolation from other bear populations. This iconic species will be put at an even greater risk if grizzly bears are delisted and managed by the states, where there are inadequate regulatory mechanisms to protect them. Prominent grizzly bear scientists agree that the delisting is premature. The grizzly bear population in the lower 48 states is less than two percent of their pre-settlement population and occupy an insignificant proportion of their pre-settlement range.

Grizzly bears are far from recovered and need to maintain their ESA protections. Please do not remove federal protections from grizzly bears in the GYE area.

Sincerely,
Ms. Kathleen Burke

U.S. Fish and Wildlife Service

Subject: Please do not remove federal protections from Yellowstone grizzly bears

To: U.S. Fish and Wildlife Service,

I am writing to ask that you do not delist Yellowstone grizzly bears.

Grizzly bears in the Greater Yellowstone Ecosystem (GYE) have benefited greatly from Endangered Species Act (ESA) protections but are not yet recovered. Removing federal protections from this one small, isolated population and subjecting them to trophy hunting will not advance the conservation of this species.

The federal government spent years trying to add bears to the population, only to now turn around and let states give trophy hunters the green light to start killing them.

Yellowstone grizzly bears currently face a world of mounting threats, including a warming climate, reckless big game hunters, loss of important food sources and isolation from other bear populations. Grizzly bears in the Greater Yellowstone Ecosystem (GYE) have benefited greatly from Endangered Species Act (ESA) protections but are not yet recovered. Removing federal protections from this one small, isolated population and subjecting them to trophy hunting will not advance the conservation of this species.

The federal government spent years trying to add bears to the population, only to now turn around and let states give trophy hunters the green light to start killing them.

Yellowstone grizzly bears currently face a world of mounting threats, including a warming climate, reckless big game hunters, loss of important food sources and isolation from other bear populations. This iconic species will be put at an even greater risk if grizzly bears are delisted and managed by the states, where there are inadequate regulatory mechanisms to protect them. Prominent grizzly bear scientists agree that the delisting is premature. The grizzly bear population in the lower 48 states is less than two percent of their pre-settlement population and occupy an insignificant proportion of their pre-settlement range.

Grizzly bears are far from recovered and need to maintain their ESA protections. Please do not remove federal protections from grizzly bears in the GYE area.

Sincerely,
Ms. Hannah Kim

Subject: Please do not remove federal protections from Yellowstone grizzly bears

To: U.S. Fish and Wildlife Service,

I am writing to ask that you do not delist Yellowstone grizzly bears.

Grizzly bears in the Greater Yellowstone Ecosystem (GYE) have benefited greatly from Endangered Species Act (ESA) protections but are not yet recovered. Removing federal protections from this one small, isolated population and subjecting them to trophy hunting will not advance the conservation of this species.

The federal government spent years trying to add bears to the population, only to now turn around and let states give trophy hunters the green light to start killing them.

Yellowstone grizzly bears currently face a world of mounting threats, including a warming climate, reckless big game hunters, loss of important food sources and isolation from other bear populations. This iconic species will be put at an even greater risk if grizzly bears are delisted and managed by the states, where there are inadequate regulatory mechanisms to protect them. Prominent grizzly bear scientists agree that the delisting is premature. The grizzly bear population in the lower 48 states is less than two percent of their pre-settlement population and occupy an insignificant proportion of their pre-settlement range.

Grizzly bears are far from recovered and need to maintain their ESA protections. Please do not remove federal protections from grizzly bears in the GYE area.

Sincerely,
Mrs. Crystal DeStefano

To: U.S. Fish and Wildlife Service,

I am writing to ask that you do not delist Yellowstone grizzly bears.

Grizzly bears in the Greater Yellowstone Ecosystem (GYE) have benefited greatly from Endangered Species Act (ESA) protections but are not yet recovered. Removing federal protections from this one small, isolated population and subjecting them to trophy hunting will not advance the conservation of this species.

The federal government spent years trying to add bears to the population, only to now turn around and let states give trophy hunters the green light to start killing them.

Yellowstone grizzly bears currently face a world of mounting threats, including a warming climate, reckless big game hunters, loss of important food sources and isolation from other bear populations. This iconic species will be put at an even greater risk if grizzly bears are delisted and managed by the states, where there are inadequate regulatory mechanisms to protect them. Prominent grizzly bear scientists agree that the delisting is premature. The grizzly bear population in the lower 48 states is less than two percent of their pre-settlement population and occupy an insignificant proportion of their pre-settlement range.

Grizzly bears are far from recovered and need to maintain their ESA protections. Please do not remove federal protections from grizzly bears in the GYE area.

Sincerely,
Ms. Monique Dumont

Dear IGBSTers,

We need to start planning for our fall IGBST meeting. The YES meeting will be on 16 and 17 November in Cody (Buffalo Bill Center of the West) so I propose our **IGBST meeting** for **Tuesday November 15** (starting late morning to allow time for travel).

We may have an additional few hours on the morning of November 16, depending on what time the YES meeting starts that day. I will contact Andy Pils and Jim Wilder to see if we can use the USFS conference room for our meeting.

Please send me any agenda items; I have already collected a few.

Best,

Frank

Here's what I would suggest:

The combined efforts of local, state, tribal, and federal partners has brought the population of grizzly bears in the Greater Yellowstone Ecosystem back from the brink. It is now biologically healthy and secure, and for that reason the Service proposed last March to remove

it from the protection of the Endangered Species Act. But to finalize that delisting, the Service must also determine that adequate regulatory mechanisms exist to ensure that the population will be managed in the future to maintain this healthy and secure condition. By their recent vote on the Conservation Strategy, which reflects the agreement among state and federal managers on how to manage the population going forward, the states have refused to make the clear and unequivocal commitment to maintain the population in its current healthy and secure condition. The Service remains committed to working with the states, as well as local, tribal and federal partners, to reach an agreement to maintain the tremendous conservation success we have collectively achieved for the Yellowstone grizzly bear.

My understanding was that, while we don't want to say anything final regarding the fate of the delisting proposal, we do want to make it clear that this is on the states, and any failure on their part to clearly commit to current recovery levels puts the delisting track at risk. The reworked version doesn't seem to do that.

> > >
> > > > The science supports that the Greater Yellowstone Ecosystem grizzly bear population is biologically recovered, and the U.S. Fish and Wildlife Service believes this iconic species warrants removal from federal protection. Still, in order to delist a species, the Endangered Species Act mandates implementation of adequate regulatory mechanisms to ensure recovery will be sustained after delisting and removal of ESA protection. Our recovery goals maintain the total grizzly bear population size to achieve long-term stability in the Yellowstone ecosystem. The Service remains committed to working with the states, as well as

local, tribal and federal partners to reach an agreement that will recognize the tremendous conservation gains we have collectively achieved for the Yellowstone grizzly bear.

The opinion expressed by many tribal leaders at the Oct. 2 signing ceremony, which included a great many western tribes, is that while there has been consultation with the tribes, it hasn't been meaningful. They argued that phone calls, letters, webinars, etc., don't amount to meaningful consultation, and they don't feel their views are reflected in the actual delisting plan. I wanted to give you a chance to respond to that general sentiment.

The U.S. Fish and Wildlife Service has been very clear that our phone calls, webinars, and letters do not constitute consultation, but were merely to provide timely information, answer questions, and explain possible next steps. In terms of consult ation, the Service sat down and held consultation meetings with Tribes within the Greater Yellowstone Ecosystem before proposing delisting for the Yellowstone grizzly bear population. Once the proposed delisting rule was published, the Service held two consultation meetings - one in Bozeman, Mont., and one in Rapid City, SD - and invited all tribes west of the Mississippi River to attend. The Service announced the consultation meetings in the *Federal Register* notice for the proposed delisting and contacted tribes directly to ensure that they were invited to these meetings. Th es e last two consultation meetingso ccu r red after the draft delisting document was published and a final de cision regarding delisting has not yet been made.

Please note, that two tribes - the Shoshone Bannock Tribes, and the Wind River Trib e - sit on the Yellowstone Ecosystem Subcommittee, which is finalizing the Conservation Strategy for the Yellowstone grizzly bear population.

https://www.fws.gov/mountain-prairie/ea/tribal-grizzly.php,

> 2. Many tribal leaders said it is offensive that the grizzly would be subject to trophy hunting, and some said a good alternative would be to reintroduce grizzlies to tribal lands where they have been extirpated. Has Fish and Wildlife considered this alternative? Would it cause unacceptable problems?

If the Yellowstone grizzly bear population, or any species, is delisted, then management returns to the sovereign governments, in this case, Tribes and states. Any post-delisting management activities would be under the purview of those two entities. If delisted, the Service would no longer have any management authority for this species, nor would we have the authority to direct Tribes or states regarding the management of the species on their lands.

> 3. How does Fish and Wildlife weigh tribal cultural/spiritual values in relation to conservation and management values?

We recognize that tribes have a strong spiritual, cultural, and historic connection to

the grizzly bear; however, the Endangered Species Act requires any final federal agency decision to be made “solely on the basis of the best scientific and commercial data available.” Even if delisted, Tribes have the right to manage grizzly bears on their Tribal lands in accordance with their spiritual, cultural, and historic traditions.

A few thoughts...

1. The opinion expressed by many tribal leaders at the Oct. 2 signing ceremony, which included a great many western tribes, is that while there has been consultation with the tribes, it hasn't been meaningful. They argued that phone calls, letters, webinars, etc., don't amount to meaningful consultation, and they don't feel their views are reflected in the actual delisting plan. I wanted to give you a chance to respond to that general sentiment.

> **I assume you have answers to this one... we recognize our tribal government to government responsibilities and take these responsibilities very seriously. we have coordinated early, and often, starting with 40 years of cooperation for tribes in the immediate ecosystem, and expanded the scope at every step of this process. we have done some face to face and will do more as desired. At bottom, ESA decisions must by statute be based on the best scientific and commercial information available. We fully respect the input of tribes as we consider their input in this decision.**

2. Many tribal leaders said it is offensive that the grizzly would be subject to trophy hunting, and some said a good alternative would be to reintroduce grizzlies to tribal lands where they have been extirpated. Has Fish and Wildlife considered this alternative? Would it cause unacceptable problems?

> **Regarding whether hunting should occur at all - Nothing in this rule would alter, or in any way affect, the jurisdiction or authority of the State of Wyoming, Tribal governments, the National Park Service, the U.S. Fish and Wildlife Service, or any other entity with respect to the regulation of hunting. Whatever jurisdiction or authority to authorize, prohibit, or regulate hunting existed in such areas prior to this final rule is unchanged by the promulgation of this rule (except, of course, that this rule removes the protections of the Act).**
>
> **Regarding the alternative proposed - Reintroductions are complicated efforts that are costly, require years of**

planning, a large financial investment at both the planning (e.g., NEPA or 10(j) rulemaking) and implementation (grizzly bear management is one of the most expensive species we manage under the ESA), cannot be done in isolation, requires involvement, cooperation, coordination, and consideration of multiple partners and as well as legal authorities or limitations. Suitable habitat could be limiting factor in some cases. In short, its a very complicated effort.

3. How does Fish and Wildlife weigh tribal cultural/spiritual values in relation to conservation and management values?

ESA requires that our decisions be based solely on the best scientific and commerical information available (is the population T or E based on threats). Secretarial order and other requirements dictate that we consult with tribes. One of our goals is to balance and satisfy both of these requirements.

To: "Baker, Serena" <serena_baker@fws.gov>

Hi Serena,

Here are the questions I had:

1. The opinion expressed by many tribal leaders at the Oct. 2 signing ceremony, which included a great many western tribes, is that while there has been consultation with the tribes, it hasn't been meaningful. They argued that phone calls, letters, webinars, etc., don't amount to meaningful consultation, and they don't feel their views are reflected in the actual delisting plan. I wanted to give you a chance to respond to that general sentiment.

2. Many tribal leaders said it is offensive that the grizzly would be subject to trophy hunting, and some said a good alternative would be to reintroduce grizzlies to tribal lands where they have been extirpated. Has Fish and Wildlife considered this alternative? Would it cause unacceptable problems?

3. How does Fish and Wildlife weigh tribal cultural/spiritual values in relation to conservation and management values?

Thanks,
Bryan

Subject: Fwd: Please disseminate to YES committee in preparation for tomorrow"s meeting
Date: Friday, October 28, 2016 10:15:43 AM
Attachments: Appendix C Proposal-10-28-16_FWS eds.docx

Mary. Thank for you letting us know about this new development regarding the YES conference call today. Attached please find the Service's proposed language regarding recalibration in Appendix C which we are providing as an alternative to the language proposed by the 3 State Directors. We ask that you forward this email and the attached to YES members for their consideration for this afternoon's call.

As you are aware, the management commitments and mechanisms described in the Conservation Strategy are foundational to our delisting determination. We anticipate that we will be challenged if we move forward with delisting, so it is essential that we have a solid record upon which to defend our decision. We believe the language the State's suggest is too ambiguous with regard to what will happen if a new population estimator is adopted – it leaves the response to be determined by the YGCC, in consideration of a recovery standard as defined by the Conservation Strategy, not the Recovery Plan criteria. The Service cannot simply cede our authority to define recovery to another entity in the future and we and our legal counsel do not believe that such an approach would be defensible.

The language proposed by the Service is written to state clearly that if the population estimator is changed we will recalibrate the associated metrics to ensure continuity with the overarching management objective – to maintain stability of the population around the long term population average.

Thank you for sharing this with the Committee. JB

FWS suggested revisions to State suggested Appendix C language.

Adoption of a different population estimator will require recalibration of the associated demographic objectives and standards ~~if the YGCC determines that such recalibration is necessary for maintaining a recovered grizzly bear population as defined in the Conservation Strategy.~~ (e.g. populations objective, confidence intervals, mortality limits) that are based upon the population estimator.

Appendix C. Calculation of Total Population Size and Mortality Limits

Efforts to improve the population size estimation and management methods and to reevaluate the sustainable mortality limits in the Greater Yellowstone Ecosystem (GYE) have continued with the Interagency Grizzly Bear Study Team (IGBST) leading these efforts. Notably, several special reports have been produced including: "Reassessing Methods to Estimate Population Size and Sustainable Mortality Limits for the Yellowstone Grizzly Bear" (hereafter referred to as the Reassessing Methods Document, IGBST 2005, Appendix L), which was released for public comment and peer review. In response to comments received during this process, a second document, "Reassessing Methods To Estimate Population Size And Sustainable Mortality Limits For The Yellowstone Grizzly Bear: Workshop document supplement on 19–21 June 2006" (hereafter referred to as the Supplement to the Reassessing Methods Document, IGBST 2006, Appendix M) was produced after further peer review. Most recently, a third document "Updating and Evaluating Approaches to Estimate Population Size and Sustainable Mortality Limits for Grizzly Bears in the Greater Yellowstone Ecosystem" (hereafter referred to as the Updated Demographics document, IGBST 2012) was prepared in response to updated information and changes in population trajectory related to grizzly bear demographics. This 2012 document is attached to this 2016 Conservation Strategy as Appendix N.

The goals of these IGBST workshops were to assemble internal and external experts to review and enhance existing methods and, to the extent feasible, use existing data to develop new population estimation methods in order and ensure that population estimation and mortality management methods for the GYE grizzly bear population are based on the best available science. This effort was undertaken as per the commitment in the Conservation Strategy of all management agencies to employ adaptive management using the best available science to manage the GYE grizzly bear population.

The IGBST will use the protocol described in this Appendix to annually estimate population size within the Demographic Monitoring Area (DMA), and then set mortality limits inside the DMA for the following year based on the sliding scale in Table 1. Methods used in this protocol are described in the Reassessing Methods Document (IGBST 2005), summarized in the Supplement

to the Reassessing Methods Document (IGBST 2006), and revised in the Updated Demographics Rates Document (IGBST 2012). Adoption of a different population estimator will require recalibration of the associated demographic objectives and standards ~~if the YGCC determines that such recalibration is necessary for maintaining a recovered grizzly bear population as defined in the Conservation Strategy.~~ (e.g. populations objective, confidence intervals, mortality limits) that are based upon the population estimator. Any change in the methods described below would be considered a change to the Conservation Strategy and would be revised through the Yellowstone Grizzly Bear Coordinating Committee process with the requirement that any proposed changes: 1) be based upon the best available science; and 2) go through public review before they are accepted, as per p. 99 of this Conservation Strategy.

Formatted: Strikethrough

~~The population goal is set for the average population size 2002–2014 inside the DMA. The current and approved method to estimate population size in the DMA uses the model averaged Chao2 estimator. If another population estimator was adopted as per the Conservation Strategy procedures described above, this new population estimator will be applied to the 2002–2014 data to estimate the average population size 2002–2014. The new population estimate results would be inserted in Table 1 to reset the population size numbers with the same sliding scale, with the intent to maintain the population goal of the average population size 2002–2014. If a review of the vital rate data by the IGBST (similar to that in the 2012 report) resulted in new mortality rate for a sustainable population at the 2002–2014 average population size, then the new sustainable mortality rate for the average 2002–2014 population size would replace the 7.6% for independent females and dependent young in Table 1. Any such change would be considered a change to the Conservation Strategy and would be revised through the Yellowstone Grizzly Bear Coordinating Committee process, which requires that any proposed changes: 1) be based upon the best available science; and 2) go through public review before they are accepted, as per p. 99 of this Conservation Strategy.~~

The following procedures detail how population size and mortality thresholds would be calculated:

1. Observations of sightings of females with cubs-of-the-year[1] will be separated into an estimate of unique females with cubs-of-the-year and repeat observations of the same female using the methods of Knight *et al.* (1995).

Formatted: Numbered + Level: 1 + Numbering Style: 1, 2, 3, … + Start at: 1 + Alignment: Left + Aligned at: 0.08" + Indent at: 0.33", Tab stops: Not at 0.5"

[1] Adult female grizzly bears accompanied by cubs that are less than one year old.

2. Only sightings of unique females with cubs-of-the-year from within the DMA will be used for subsequent estimates.
3. The Chao2 estimator (Keating *et al*. 2002) will be applied to sighting frequencies of unique females with cubs-of-the-year to estimate the total number of females with cubs of the year in the population.
4. The number of unique females with cubs-of-the-year obtained from the Chao2 estimator each year will be added to the long-term dataset to conduct the model-averaging process described in the Supplement to the Reassessing Methods Document (IGBST 2006). This process involves fitting a linear and quadratic trend model, followed by averaging model parameters based on the respective Akaike's Information Criterion (AIC_c) weights of the linear and quadratic models. These model-averaged parameters are then used to estimate the number of females with cubs-of-the-year.
5. The estimated number of females with cubs-of-the-year obtained through the model averaging will be used as the best estimate of the total number of independent females with cub-of-the-year in the DMA for that year.
6. The purpose of fitting the trend model is to obtain the best estimate of the current number of females with cubs-of-the-year by using information from past estimates, recognizing that with each iteration, some change is expected. Retrospectively adjusting estimates from previous years will not occur.
7. The estimated number of females with cubs-of-the-year will be divided by the proportion of females ≥4 years old estimated to be accompanied by cubs-of-the-year (transition probability = 0.2965) observed during 2002–2011. The resulting value represents the best estimate of the total number of females in the population ≥4 years old.
8. The number of females ≥4 years old will be divided by the estimated proportion of females ≥4 years old in the population of females ≥2 years old (proportion = 0.844) observed during 2002–2011. The resulting value is the best estimate of the number of independent females (≥2 years old) in the population that year.
9. The sustainable mortality limit for independent females is dependent on the population estimate of independent females (Table 1).
10. Unknown and unreported mortality will be estimated based on the methods of Cherry *et al*. (2002) as described in the Reassessing Methods Document (IGBST 2005).

Formatted: Numbered + Level: 1 + Numbering Style: 1, 2, 3, … + Start at: 1 + Alignment: Left + Aligned at: 0.08" + Indent at: 0.33", Tab stops: Not at 0.5"

Formatted: Numbered + Level: 1 + Numbering Style: 1, 2, 3, … + Start at: 1 + Alignment: Left + Aligned at: 0.08" + Indent at: 0.33", Tab stops: Not at 0.5"

Formatted: Numbered + Level: 1 + Numbering Style: 1, 2, 3, … + Start at: 1 + Alignment: Left + Aligned at: 0.08" + Indent at: 0.33", Tab stops: Not at 0.5"

11. The number of independent males in the population will be based on the estimated ratio of independent males to independent females (ratio = 1:1) observed during 2002–2011 and derived via stochastic modeling described in the Supplement to the Reassessing Methods Document (IGBST 2006). The number of independent females in the population will thus be multiplied by 1.0 and the resulting value represents the best estimate of the number of independent males that year.
12. The sustainable mortality limit for independent males is dependent on the population estimate of independent males (Table 1).
13. The number of cubs-of-the-year in the annual population estimate will be calculated directly from the model-averaged estimate of females with cubs-of-the-year (IGBST 2006). The number of cubs will be estimated by multiplying the model-averaged estimate of females with cubs-of-the-year by the mean litter size (litter size = 2.49; mortality adjusted estimate) observed during 2002–2011.
14. The number of yearlings will be estimated by multiplying the estimated number of cubs from the previous year by the mean survival rate for cubs (cub survival = 0.553) observed during 2002–2011.
15. The sustainable mortality limit for dependent young (cubs and yearlings) is dependent on the population estimate of dependent young (Table 1). Only human-caused deaths (reported known and probable) will be tallied against the threshold for dependent young.
16. Unknown and unreported mortality will not be estimated for dependent young.
17. Sustainable mortality limits will be established annually based on the data collected in that year and the calculations described here. These mortality limits will then apply the following year. Because model-averaged estimates are used, annual variability among estimates is explicitly addressed. Consequently, annual limits based on a 3-year running average, as proposed in the Reassessing Methods Document (IGBST 2005), are not used. Instead, annual sustainable mortality limits for any year will be based on the data and calculations for the previous year (as described in this protocol and the Updated Demographic Rates Document, IGBST 2012, Appendix N).
18. Estimates of uncertainty about the number of independent females, independent males, dependent young, and total population size will be derived following methods detailed in the

Formatted: Indent: Left: 0.07", Numbered + Level: 1 + Numbering Style: 1, 2, 3, … + Start at: 1 + Alignment: Left + Aligned at: 0.08" + Indent at: 0.33", Tab stops: Not at 0.5"

Supplement to the Reassessing Methods Document (IGBST 2006) using updated vital rates as documented in IGBST (2012, Appendix N).

~~19.~~1. The objective of 48[2] females with cubs-of-the-year as estimated with Chao2 will be evaluated based on the model-averaged estimate of females with cubs-of-the-year (IGBST 2012).

~~20.~~19. ~~A biology and monitoring review by the IGBST will occur should the model-averaged Chao2 estimate decline below 48 females with cubs of the year for any 2 consecutive years~~.

~~21. Agencies will implement management to attempt to limit female mortality model averaged Chao2 estimate decline below 48 females with cub of the year in any given year.~~

~~22.~~20. In modeling the rate of change (trend) of females with cubs-of-the-year as described in the Supplement to the Reassessing Methods Document (IGBST 2006), if the AIC_c weight favors the quadratic term and corresponding $\Delta AIC_c \geq 2.0$ compared with the linear model for 3 consecutive years, a full review of the population's demographics will be undertaken to better understand its status. Given evidence of a population nearing carrying capacity and a population fluctuating around a long-term mean, this approach allows timely detection of a sustained increasing or decreasing trend (van Manen *et al.* 2015).

~~23.~~21. If dead bears are reported in years subsequent to actual year of mortality, they will be tallied against year of death and total mortality will be recalculated. If mortality exceeds the threshold for that year, the difference (total mortality minus threshold) will be counted against the current years' threshold.

~~24.~~22. For bears that are estimated to be independent of age, if sex cannot be determined, sex will be assigned randomly using ratio of 59:41 male:female as recommended in Appendix A of Schwartz and Haroldson (2001).

Formatted: Numbered + Level: 1 + Numbering Style: 1, 2, 3, … + Start at: 1 + Alignment: Left + Aligned at: 0.08" + Indent at: 0.33", Tab stops: Not at 0.5"

[2] 48 independent females with cubs of the year in the DMA is approximately equivalent to a population of 600 bears.

Table 1. Annual sustainable mortality limits by sex and age cohorts[3] of grizzly bears in the Greater Yellowstone Ecosystem under the protocol to manage for a population at the average annual population estimate for the period 2002–2014 in the Demographic Monitoring Area (DMA) (using the Chao2 estimator this average number is 674).

Maximum mortality rate for:	Population estimate inside the DMA using the model-averaged Chao2 method.			
	<674	674	675-747	>747
% of independent <u>FEMALES</u>	<7.6%	7.6%	9%	10%
% of independent <u>MALES</u>	15%	15%	20%	22%
% of DEPENDENT <u>YOUNG</u>	<7.6%	7.6%	9%	10%

Matt and Jen. Can you take a quick look and see if you have any adds/REVISIONS? Matt I stole some of this from Gary's email. JB

I will attached revised Appendix C with our email.

Mary. Thank for you letting us know about this new development. Attached please find the Service's proposed language regarding recalibration in Appendix C. Given that we have not reached agreement with the States about the alternate language regarding recalibration in Appendix C and that they have chosen to bring their alternative language to the YES committee, we are providing this to you to share as well.

We believe the language the State suggests has too much ambiguity about the long term objectives of recovery, is inconsistent with the recovery plan and criteria and will be difficult to defend successfully in litigation.

(IT MIGHT BE USEFUL TO EXPLAIN WHY WE THINK ITS AMBIGUOUS AND INCONSISTENT HERE...)

Although the States language may appear "reasonable" by some, it leaves the recalibration question to a body (the YGCC) that is yet to be formed, and for which we do not know the membership, or rules of procedure.

The Service believes it is much clearer and scientifically warranted, to state clearly that if the population estimator is changed we will recalibrate.

FWS suggested revisions to State suggested Appendix C language.

Adoption of a different population estimator will require recalibration of the associated demographic objectives and standards ~~if the YGCC determines that such recalibration is necessary for maintaining a recovered grizzly bear population as defined in the Conservation Strategy.~~ (e.g. populations objective, confidence intervals, mortality limits) that are based upon the population estimator.

> I will forward these documents to YES for review. I believe this is allowable under the YES process since any member can bring something forward for consideration. However it is rather awkward since this is not the result of agreement between FWS and the States. I think we will need some clarity from FWS on where your agency stands with this or whether you would offer a different alternative for consideration as well?

Mary. Thank for you letting us know about this new development. Attached please find the Service's proposed language regarding recalibration in Appendix C~~. Given that we have not reached agreement with the States about the alternate language regarding recalibration in Appendix C and that they have chosen to bring their alternative language to the YES committee, we are providing this to you to share as well~~, which we are putting forward as an alternative to the language proposed by the 3 State Directors. We ask that both be considered by the Subcommittee on this afternoon's call.

The management commitments and mechanisms described in the Strategy are the foundation to our delisting determination. We anticipate that we will be challenged if we move forward with delisting, so it is essential that we have a solid record upon which to defend our decision. We believe the language the States suggest~~s has too much ambiguity about the long term objectives of recovery, is inconsistent with the recovery plan and criteria and will be difficult to defend successfully in litigation~~is too ambiguous with regard to what will happen if a new population estimator is adopted – it leaves the response to be determined by the YGCC, in consideration of a recovery standard as defined by the Conservation Strategy, not the Recovery Plan criteria. The Service and our legal counsel do not believe that such an approach would be defensible.

~~**(IT MIGHT BE USEFUL TO EXPLAIN WHY WE THINK ITS AMBIGUOUS AND INCONSISTENT HERE…)**~~
