~~Although the States language may appear "reasonable" by some, it leaves the recalibration question to a body (the YGCC) that is yet to be formed, and for which we do not know the membership, or rules of procedure.~~

The language proposed by the Service ~~believes it is much clearer and scientifically warranted,~~is written to state clearly that if the population estimator is changed we will recalibrate the associated metrics to ensure continuity with the overarching management objective – to maintain stability of the population around the long term population average.

FWS suggested revisions to State suggested Appendix C language.

Adoption of a different population estimator will require recalibration of the associated demographic objectives and standards ~~if the YGCC determines that such recalibration is necessary for maintaining a recovered grizzly bear population as defined in the Conservation Strategy.~~ (e.g. populations objective, confidence intervals, mortality limits) that are based upon the population estimator.

---

Matt. Just talked to Jen about where we are with this meeting tomorrow but realize that you have just seen the attached. The States have signed a memo to the YES committee and provided suggested revisions to Appendix C from the proposal:

Adoption of a different population estimator will require recalibration of the associated demographic objectives and standards if the YGCC determines that such recalibration is necessary for maintaining a recovered grizzly bear population as defined in the Conservation Strategy.

The State's intention is to have this voted on at the YES meeting, tomorrow afternoon at 1 PM. Through the YES procedure it appears this is allowable. We should probably chat about the potential consequences of this event tomorrow if you can get away for a few minutes. Jen and I are free all morning. Thanks. JB

To: "Jodi_Bush@fws.gov" <Jodi_Bush@fws.gov>, FWS Matt Hogan <matt_hogan@fws.gov>

Jodi and Matt, please see the information provided from Brian.

I will forward these documents to YES for review. I believe this is allowable under the YES process since any member can bring something forward for consideration. However it is rather awkward since this is not the result of agreement between FWS and the States. I think we will need some clarity from FWS on where your agency stands with this or whether you would offer a different alternative for consideration as well?

Thanks, Mary

Mary,

Attached are two documents. One is a new proposal for Appendix C that I will present tomorrow at our meeting. The other is a letter expressing support for the proposal from the three State Agency Directors. Please forward these to YES members for their review prior to tomorrow's meeting.

I look forward to a productive meeting and approval of the Conservation Strategy appendices tomorrow. The meeting will be a great opportunity to finish all of the hard work that has gone into revising the Conservation Strategy and renewing all of our commitments to a viable, healthy and recovered Yellowstone grizzly bear population for generations to come.

VR,
Brian

October 27, 2016

Dear Members of the Yellowstone Ecosystem Subcommittee:

The United States Fish and Wildlife Service listed grizzly bears in the lower 48 states as threatened under the Endangered Species Act on July 28, 1975. At the time, scientists believed as few as 136 bears remained in the Greater Yellowstone Area (GYA), so recovering the GYA population of this iconic species was paramount. In 1983, the states of Wyoming, Montana, and Idaho partnered with affected federal agencies and local and tribal governments to establish the Interagency Grizzly Bear Committee which included the Yellowstone Ecosystem Subcommittee (YES). These committees facilitated grizzly bear recovery through science-based management, public education, and policy recommendations.

Over the last four decades, the states have shown an unwavering commitment to grizzly bear recovery. They have invested tens of millions of dollars and immeasurable personnel resources on grizzly bear research and recovery. Through these efforts, the states, and other members of the committees, have succeeded. Today, approximately 700, and likely many more, grizzly bears reside in the GYA. Grizzly bears have consistently met or surpassed recovery metrics for more than a dozen years, and there are no known threats to the bear's long-term persistence in the GYA. It is now time to celebrate this remarkable success by formally returning grizzly bear management to the states whose decades of proactive management made recovery possible.

In revising the Conservation Strategy, the states are renewing their commitment to manage bears based upon best available science, in a way that ensures a vibrant, sustainable population for the benefit of future generations. As stated in the Conservation Strategy, upon delisting the YES will become the Yellowstone Grizzly Bear Coordinating Committee (YGCC) and will be responsible for coordinating management of the recovered population.

The U.S. Fish and Wildlife Service and members of YES have discussed the incorporation of language to address the potential for change in the population estimator to ensure long-term comparability of data and review of related demographic criteria.

As the states' professional wildlife managers, we have evaluated how to resolve differing perspectives regarding appropriate language in Appendix C of the Conservation Strategy related to recalibration in the event that the population estimator changes in the future. The YES has already agreed upon language stating that adoption of new population estimator would only occur after scientific review and public comment. Inherent in the commitment to best available science is ensuring appropriate data comparability over time.

In order to resolve the last remaining issue before YES, we support the addition of the following language to Appendix C of the Conservation Strategy to replace related language inserted prior to YES review:

> Adoption of a different population estimator will require recalibration of the associated demographic objectives and standards if the YGCC determines that such recalibration is necessary for maintaining a recovered grizzly bear population as defined in the Conservation Strategy.

This language ensures that if the YGCC adopts a different population estimator in the future, the states will seek direction from the YGCC on how to implement that estimator in a way that applies best available science and ensures grizzly bears will not risk becoming threatened or endangered in the foreseeable future.

We look forward to the delisting of the GYA grizzly bear population and continuing our cooperative effort to maintain a recovered population as demonstrated by our commitments in the Conservation Strategy.

Appendix C. Calculation of Total Population Size and Mortality Limits

Efforts to improve the population size estimation and management methods and to reevaluate the sustainable mortality limits in the Greater Yellowstone Ecosystem (GYE) have continued with the Interagency Grizzly Bear Study Team (IGBST) leading these efforts. Notably, several special reports have been produced including: "Reassessing Methods to Estimate Population Size and Sustainable Mortality Limits for the Yellowstone Grizzly Bear" (hereafter referred to as the Reassessing Methods Document, IGBST 2005, Appendix L), which was released for public comment and peer review. In response to comments received during this process, a second document, "Reassessing Methods To Estimate Population Size And Sustainable Mortality Limits For The Yellowstone Grizzly Bear: Workshop document supplement on 19–21 June 2006" (hereafter referred to as the Supplement to the Reassessing Methods Document, IGBST 2006, Appendix M) was produced after further peer review. Most recently, a third document "Updating and Evaluating Approaches to Estimate Population Size and Sustainable Mortality Limits for Grizzly Bears in the Greater Yellowstone Ecosystem" (hereafter referred to as the Updated Demographics document, IGBST 2012) was prepared in response to updated information and changes in population trajectory related to grizzly bear demographics. This 2012 document is attached to this 2016 Conservation Strategy as Appendix N.

The goals of these IGBST workshops were to assemble internal and external experts to review and enhance existing methods and, to the extent feasible, use existing data to develop new population estimation methods in order and ensure that population estimation and mortality management methods for the GYE grizzly bear population are based on the best available science. This effort was undertaken as per the commitment in the Conservation Strategy of all management agencies to employ adaptive management using the best available science to manage the GYE grizzly bear population.

The IGBST will use the protocol described in this Appendix to annually estimate population size within the Demographic Monitoring Area (DMA), and then set mortality limits inside the DMA for the following year based on the sliding scale in Table 1. Methods used in this protocol are described in the Reassessing Methods Document (IGBST 2005), summarized in the Supplement

to the Reassessing Methods Document (IGBST 2006), and revised in the Updated Demographics Rates Document (IGBST 2012). Adoption of a different population estimator will require recalibration of the associated demographic objectives and standards if the YGCC determines that such recalibration is necessary for maintaining a recovered grizzly bear population as defined in the Conservation Strategy. Any change in the methods described below would be considered a change to the Conservation Strategy and would be revised through the Yellowstone Grizzly Bear Coordinating Committee process with the requirement that any proposed changes: 1) be based upon the best available science; and 2) go through public review before they are accepted, as per p. 99 of this Conservation Strategy.

~~The population goal is set for the average population size 2002–2014 inside the DMA. The current and approved method to estimate population size in the DMA uses the model-averaged Chao2 estimator. If another population estimator was adopted as per the Conservation Strategy procedures described above, this new population estimator will be applied to the 2002–2014 data to estimate the average population size 2002–2014. The new population estimate results would be inserted in Table 1 to reset the population size numbers with the same sliding scale, with the intent to maintain the population goal of the average population size 2002–2014. If a review of the vital rate data by the IGBST (similar to that in the 2012 report) resulted in new mortality rate for a sustainable population at the 2002–2014 average population size, then the new sustainable mortality rate for the average 2002–2014 population size would replace the 7.6% for independent females and dependent young in Table 1. Any such change would be considered a change to the Conservation Strategy and would be revised through the Yellowstone Grizzly Bear Coordinating Committee process, which requires that any proposed changes: 1) be based upon the best available science; and 2) go through public review before they are accepted, as per p. 99 of this Conservation Strategy.~~

The following procedures detail how population size and mortality thresholds would be calculated:

1. Observations of sightings of females with cubs-of-the-year[1] will be separated into an estimate of unique females with cubs-of-the-year and repeat observations of the same female using the methods of Knight *et al.* (1995).

Formatted: Numbered + Level: 1 + Numbering Style: 1, 2, 3, … + Start at: 1 + Alignment: Left + Aligned at: 0.08" + Indent at: 0.33", Tab stops: Not at 0.5"

[1] Adult female grizzly bears accompanied by cubs that are less than one year old.

2. Only sightings of unique females with cubs-of-the-year from within the DMA will be used for subsequent estimates.
3. The Chao2 estimator (Keating *et al*. 2002) will be applied to sighting frequencies of unique females with cubs-of-the-year to estimate the total number of females with cubs of the year in the population.
4. The number of unique females with cubs-of-the-year obtained from the Chao2 estimator each year will be added to the long-term dataset to conduct the model-averaging process described in the Supplement to the Reassessing Methods Document (IGBST 2006). This process involves fitting a linear and quadratic trend model, followed by averaging model parameters based on the respective Akaike's Information Criterion (AIC_c) weights of the linear and quadratic models. These model-averaged parameters are then used to estimate the number of females with cubs-of-the-year.
5. The estimated number of females with cubs-of-the-year obtained through the model averaging will be used as the best estimate of the total number of independent females with cub-of-the-year in the DMA for that year.
6. The purpose of fitting the trend model is to obtain the best estimate of the current number of females with cubs-of-the-year by using information from past estimates, recognizing that with each iteration, some change is expected. Retrospectively adjusting estimates from previous years will not occur.
7. The estimated number of females with cubs-of-the-year will be divided by the proportion of females ≥4 years old estimated to be accompanied by cubs-of-the-year (transition probability = 0.2965) observed during 2002–2011. The resulting value represents the best estimate of the total number of females in the population ≥4 years old.
8. The number of females ≥4 years old will be divided by the estimated proportion of females ≥4 years old in the population of females ≥2 years old (proportion = 0.844) observed during 2002–2011. The resulting value is the best estimate of the number of independent females (≥2 years old) in the population that year.
9. The sustainable mortality limit for independent females is dependent on the population estimate of independent females (Table 1).
10. Unknown and unreported mortality will be estimated based on the methods of Cherry *et al*. (2002) as described in the Reassessing Methods Document (IGBST 2005).

Formatted: Numbered + Level: 1 + Numbering Style: 1, 2, 3, … + Start at: 1 + Alignment: Left + Aligned at: 0.08" + Indent at: 0.33", Tab stops: Not at 0.5"

Formatted: Numbered + Level: 1 + Numbering Style: 1, 2, 3, … + Start at: 1 + Alignment: Left + Aligned at: 0.08" + Indent at: 0.33", Tab stops: Not at 0.5"

Formatted: Numbered + Level: 1 + Numbering Style: 1, 2, 3, … + Start at: 1 + Alignment: Left + Aligned at: 0.08" + Indent at: 0.33", Tab stops: Not at 0.5"

11. The number of independent males in the population will be based on the estimated ratio of independent males to independent females (ratio = 1:1) observed during 2002–2011 and derived via stochastic modeling described in the Supplement to the Reassessing Methods Document (IGBST 2006). The number of independent females in the population will thus be multiplied by 1.0 and the resulting value represents the best estimate of the number of independent males that year.
12. The sustainable mortality limit for independent males is dependent on the population estimate of independent males (Table 1).
13. The number of cubs-of-the-year in the annual population estimate will be calculated directly from the model-averaged estimate of females with cubs-of-the-year (IGBST 2006). The number of cubs will be estimated by multiplying the model-averaged estimate of females with cubs-of-the-year by the mean litter size (litter size = 2.49; mortality adjusted estimate) observed during 2002–2011.
14. The number of yearlings will be estimated by multiplying the estimated number of cubs from the previous year by the mean survival rate for cubs (cub survival = 0.553) observed during 2002–2011.
15. The sustainable mortality limit for dependent young (cubs and yearlings) is dependent on the population estimate of dependent young (Table 1). Only human-caused deaths (reported known and probable) will be tallied against the threshold for dependent young.
16. Unknown and unreported mortality will not be estimated for dependent young.
17. Sustainable mortality limits will be established annually based on the data collected in that year and the calculations described here. These mortality limits will then apply the following year. Because model-averaged estimates are used, annual variability among estimates is explicitly addressed. Consequently, annual limits based on a 3-year running average, as proposed in the Reassessing Methods Document (IGBST 2005), are not used. Instead, annual sustainable mortality limits for any year will be based on the data and calculations for the previous year (as described in this protocol and the Updated Demographic Rates Document, IGBST 2012, Appendix N).
18. Estimates of uncertainty about the number of independent females, independent males, dependent young, and total population size will be derived following methods detailed in the

Formatted: Indent: Left: 0.07", Numbered + Level: 1 + Numbering Style: 1, 2, 3, … + Start at: 1 + Alignment: Left + Aligned at: 0.08" + Indent at: 0.33", Tab stops: Not at 0.5"

Supplement to the Reassessing Methods Document (IGBST 2006) using updated vital rates as documented in IGBST (2012, Appendix N).

~~19.~~1. The objective of 48[2] females with cubs-of-the-year as estimated with Chao2 will be evaluated based on the model-averaged estimate of females with cubs-of-the-year (IGBST 2012).

~~20.~~19. ~~A biology and monitoring review by the IGBST will occur should the model-averaged Chao2 estimate decline below 48 females with cubs of the year for any 2 consecutive years~~.

~~21. Agencies will implement management to attempt to limit female mortality model averaged Chao2 estimate decline below 48 females with cub of the year in any given year.~~

~~22.~~20. In modeling the rate of change (trend) of females with cubs-of-the-year as described in the Supplement to the Reassessing Methods Document (IGBST 2006), if the AIC_c weight favors the quadratic term and corresponding $\Delta AIC_c \geq 2.0$ compared with the linear model for 3 consecutive years, a full review of the population's demographics will be undertaken to better understand its status. Given evidence of a population nearing carrying capacity and a population fluctuating around a long-term mean, this approach allows timely detection of a sustained increasing or decreasing trend (van Manen *et al.* 2015).

~~23.~~21. If dead bears are reported in years subsequent to actual year of mortality, they will be tallied against year of death and total mortality will be recalculated. If mortality exceeds the threshold for that year, the difference (total mortality minus threshold) will be counted against the current years' threshold.

~~24.~~22. For bears that are estimated to be independent of age, if sex cannot be determined, sex will be assigned randomly using ratio of 59:41 male:female as recommended in Appendix A of Schwartz and Haroldson (2001).

Formatted: Numbered + Level: 1 + Numbering Style: 1, 2, 3, … + Start at: 1 + Alignment: Left + Aligned at: 0.08" + Indent at: 0.33", Tab stops: Not at 0.5"

[2] 48 independent females with cubs of the year in the DMA is approximately equivalent to a population of 600 bears.

Table 1. Annual sustainable mortality limits by sex and age cohorts[3] of grizzly bears in the Greater Yellowstone Ecosystem under the protocol to manage for a population at the average annual population estimate for the period 2002–2014 in the Demographic Monitoring Area (DMA) (using the Chao2 estimator this average number is 674).

Maximum mortality rate for:	Population estimate inside the DMA using the model-averaged Chao2 method.			
	<674	674	675-747	>747
% of independent <u>FEMALES</u>	<7.6%	7.6%	9%	10%
% of independent <u>MALES</u>	15%	15%	20%	22%
% of DEPENDENT <u>YOUNG</u>	<7.6%	7.6%	9%	10%

October 27, 2016

Dear Members of the Yellowstone Ecosystem Subcommittee:

The United States Fish and Wildlife Service listed grizzly bears in the lower 48 states as threatened under the Endangered Species Act on July 28, 1975. At the time, scientists believed as few as 136 bears remained in the Greater Yellowstone Area (GYA), so recovering the GYA population of this iconic species was paramount. In 1983, the states of Wyoming, Montana, and Idaho partnered with affected federal agencies and local and tribal governments to establish the Interagency Grizzly Bear Committee which included the Yellowstone Ecosystem Subcommittee (YES). These committees facilitated grizzly bear recovery through science-based management, public education, and policy recommendations.

Over the last four decades, the states have shown an unwavering commitment to grizzly bear recovery. They have invested tens of millions of dollars and immeasurable personnel resources on grizzly bear research and recovery. Through these efforts, the states, and other members of the committees, have succeeded. Today, approximately 700, and likely many more, grizzly bears reside in the GYA. Grizzly bears have consistently met or surpassed recovery metrics for more than a dozen years, and there are no known threats to the bear's long-term persistence in the GYA. It is now time to celebrate this remarkable success by formally returning grizzly bear management to the states whose decades of proactive management made recovery possible.

In revising the Conservation Strategy, the states are renewing their commitment to manage bears based upon best available science, in a way that ensures a vibrant, sustainable population for the benefit of future generations. As stated in the Conservation Strategy, upon delisting the YES will become the Yellowstone Grizzly Bear Coordinating Committee (YGCC) and will be responsible for coordinating management of the recovered population.

The U.S. Fish and Wildlife Service and members of YES have discussed the incorporation of language to address the potential for change in the population estimator to ensure long-term comparability of data and review of related demographic criteria.

As the states' professional wildlife managers, we have evaluated how to resolve differing perspectives regarding appropriate language in Appendix C of the Conservation Strategy related to recalibration in the event that the population estimator changes in the future. The YES has already agreed upon language stating that adoption of new population estimator would only occur after scientific review and public comment. Inherent in the commitment to best available science is ensuring appropriate data comparability over time.

In order to resolve the last remaining issue before YES, we support the addition of the following language to Appendix C of the Conservation Strategy to replace related language inserted prior to YES review:

> Adoption of a different population estimator will require recalibration of the associated demographic objectives and standards if the YGCC determines that such recalibration is necessary for maintaining a recovered grizzly bear population as defined in the Conservation Strategy.

This language ensures that if the YGCC adopts a different population estimator in the future, the states will seek direction from the YGCC on how to implement that estimator in a way that applies best available science and ensures grizzly bears will not risk becoming threatened or endangered in the foreseeable future.

We look forward to the delisting of the GYA grizzly bear population and continuing our cooperative effort to maintain a recovered population as demonstrated by our commitments in the Conservation Strategy.

Appendix C. Calculation of Total Population Size and Mortality Limits

Efforts to improve the population size estimation and management methods and to reevaluate the sustainable mortality limits in the Greater Yellowstone Ecosystem (GYE) have continued with the Interagency Grizzly Bear Study Team (IGBST) leading these efforts. Notably, several special reports have been produced including: "Reassessing Methods to Estimate Population Size and Sustainable Mortality Limits for the Yellowstone Grizzly Bear" (hereafter referred to as the Reassessing Methods Document, IGBST 2005, Appendix L), which was released for public comment and peer review. In response to comments received during this process, a second document, "Reassessing Methods To Estimate Population Size And Sustainable Mortality Limits For The Yellowstone Grizzly Bear: Workshop document supplement on 19–21 June 2006" (hereafter referred to as the Supplement to the Reassessing Methods Document, IGBST 2006, Appendix M) was produced after further peer review. Most recently, a third document "Updating and Evaluating Approaches to Estimate Population Size and Sustainable Mortality Limits for Grizzly Bears in the Greater Yellowstone Ecosystem" (hereafter referred to as the Updated Demographics document, IGBST 2012) was prepared in response to updated information and changes in population trajectory related to grizzly bear demographics. This 2012 document is attached to this 2016 Conservation Strategy as Appendix N.

The goals of these IGBST workshops were to assemble internal and external experts to review and enhance existing methods and, to the extent feasible, use existing data to develop new population estimation methods in order and ensure that population estimation and mortality management methods for the GYE grizzly bear population are based on the best available science. This effort was undertaken as per the commitment in the Conservation Strategy of all management agencies to employ adaptive management using the best available science to manage the GYE grizzly bear population.

The IGBST will use the protocol described in this Appendix to annually estimate population size within the Demographic Monitoring Area (DMA), and then set mortality limits inside the DMA for the following year based on the sliding scale in Table 1. Methods used in this protocol are described in the Reassessing Methods Document (IGBST 2005), summarized in the Supplement

to the Reassessing Methods Document (IGBST 2006), and revised in the Updated Demographics Rates Document (IGBST 2012). Adoption of a different population estimator will require recalibration of the associated demographic objectives and standards if the YGCC determines that such recalibration is necessary for maintaining a recovered grizzly bear population as defined in the Conservation Strategy. Any change in the methods described below would be considered a change to the Conservation Strategy and would be revised through the Yellowstone Grizzly Bear Coordinating Committee process with the requirement that any proposed changes: 1) be based upon the best available science; and 2) go through public review before they are accepted, as per p. 99 of this Conservation Strategy.

~~The population goal is set for the average population size 2002–2014 inside the DMA. The current and approved method to estimate population size in the DMA uses the model-averaged Chao2 estimator. If another population estimator was adopted as per the Conservation Strategy procedures described above, this new population estimator will be applied to the 2002–2014 data to estimate the average population size 2002–2014. The new population estimate results would be inserted in Table 1 to reset the population size numbers with the same sliding scale, with the intent to maintain the population goal of the average population size 2002–2014. If a review of the vital rate data by the IGBST (similar to that in the 2012 report) resulted in new mortality rate for a sustainable population at the 2002–2014 average population size, then the new sustainable mortality rate for the average 2002–2014 population size would replace the 7.6% for independent females and dependent young in Table 1. Any such change would be considered a change to the Conservation Strategy and would be revised through the Yellowstone Grizzly Bear Coordinating Committee process, which requires that any proposed changes: 1) be based upon the best available science; and 2) go through public review before they are accepted, as per p. 99 of this Conservation Strategy.~~

The following procedures detail how population size and mortality thresholds would be calculated:

1. Observations of sightings of females with cubs-of-the-year[1] will be separated into an estimate of unique females with cubs-of-the-year and repeat observations of the same female using the methods of Knight *et al.* (1995).

Formatted: Numbered + Level: 1 + Numbering Style: 1, 2, 3, … + Start at: 1 + Alignment: Left + Aligned at: 0.08" + Indent at: 0.33", Tab stops: Not at 0.5"

[1] Adult female grizzly bears accompanied by cubs that are less than one year old.

2. Only sightings of unique females with cubs-of-the-year from within the DMA will be used for subsequent estimates.
3. The Chao2 estimator (Keating *et al*. 2002) will be applied to sighting frequencies of unique females with cubs-of-the-year to estimate the total number of females with cubs of the year in the population.
4. The number of unique females with cubs-of-the-year obtained from the Chao2 estimator each year will be added to the long-term dataset to conduct the model-averaging process described in the Supplement to the Reassessing Methods Document (IGBST 2006). This process involves fitting a linear and quadratic trend model, followed by averaging model parameters based on the respective Akaike's Information Criterion (AIC_c) weights of the linear and quadratic models. These model-averaged parameters are then used to estimate the number of females with cubs-of-the-year.
5. The estimated number of females with cubs-of-the-year obtained through the model averaging will be used as the best estimate of the total number of independent females with cub-of-the-year in the DMA for that year.
6. The purpose of fitting the trend model is to obtain the best estimate of the current number of females with cubs-of-the-year by using information from past estimates, recognizing that with each iteration, some change is expected. Retrospectively adjusting estimates from previous years will not occur.
7. The estimated number of females with cubs-of-the-year will be divided by the proportion of females ≥4 years old estimated to be accompanied by cubs-of-the-year (transition probability = 0.2965) observed during 2002–2011. The resulting value represents the best estimate of the total number of females in the population ≥4 years old.
8. The number of females ≥4 years old will be divided by the estimated proportion of females ≥4 years old in the population of females ≥2 years old (proportion = 0.844) observed during 2002–2011. The resulting value is the best estimate of the number of independent females (≥2 years old) in the population that year.
9. The sustainable mortality limit for independent females is dependent on the population estimate of independent females (Table 1).
10. Unknown and unreported mortality will be estimated based on the methods of Cherry *et al*. (2002) as described in the Reassessing Methods Document (IGBST 2005).

Formatted: Numbered + Level: 1 + Numbering Style: 1, 2, 3, … + Start at: 1 + Alignment: Left + Aligned at: 0.08" + Indent at: 0.33", Tab stops: Not at 0.5"

Formatted: Numbered + Level: 1 + Numbering Style: 1, 2, 3, … + Start at: 1 + Alignment: Left + Aligned at: 0.08" + Indent at: 0.33", Tab stops: Not at 0.5"

Formatted: Numbered + Level: 1 + Numbering Style: 1, 2, 3, … + Start at: 1 + Alignment: Left + Aligned at: 0.08" + Indent at: 0.33", Tab stops: Not at 0.5"

11. The number of independent males in the population will be based on the estimated ratio of independent males to independent females (ratio = 1:1) observed during 2002–2011 and derived via stochastic modeling described in the Supplement to the Reassessing Methods Document (IGBST 2006). The number of independent females in the population will thus be multiplied by 1.0 and the resulting value represents the best estimate of the number of independent males that year.
12. The sustainable mortality limit for independent males is dependent on the population estimate of independent males (Table 1).
13. The number of cubs-of-the-year in the annual population estimate will be calculated directly from the model-averaged estimate of females with cubs-of-the-year (IGBST 2006). The number of cubs will be estimated by multiplying the model-averaged estimate of females with cubs-of-the-year by the mean litter size (litter size = 2.49; mortality adjusted estimate) observed during 2002–2011.
14. The number of yearlings will be estimated by multiplying the estimated number of cubs from the previous year by the mean survival rate for cubs (cub survival = 0.553) observed during 2002–2011.
15. The sustainable mortality limit for dependent young (cubs and yearlings) is dependent on the population estimate of dependent young (Table 1). Only human-caused deaths (reported known and probable) will be tallied against the threshold for dependent young.
16. Unknown and unreported mortality will not be estimated for dependent young.
17. Sustainable mortality limits will be established annually based on the data collected in that year and the calculations described here. These mortality limits will then apply the following year. Because model-averaged estimates are used, annual variability among estimates is explicitly addressed. Consequently, annual limits based on a 3-year running average, as proposed in the Reassessing Methods Document (IGBST 2005), are not used. Instead, annual sustainable mortality limits for any year will be based on the data and calculations for the previous year (as described in this protocol and the Updated Demographic Rates Document, IGBST 2012, Appendix N).
18. Estimates of uncertainty about the number of independent females, independent males, dependent young, and total population size will be derived following methods detailed in the

Formatted: Indent: Left: 0.07", Numbered + Level: 1 + Numbering Style: 1, 2, 3, … + Start at: 1 + Alignment: Left + Aligned at: 0.08" + Indent at: 0.33", Tab stops: Not at 0.5"

Supplement to the Reassessing Methods Document (IGBST 2006) using updated vital rates as documented in IGBST (2012, Appendix N).

~~19.~~1. The objective of 48[2] females with cubs-of-the-year as estimated with Chao2 will be evaluated based on the model-averaged estimate of females with cubs-of-the-year (IGBST 2012).

~~20.~~19. ~~A biology and monitoring review by the IGBST will occur should the model-averaged Chao2 estimate decline below 48 females with cubs of the year for any 2 consecutive years~~.

~~21. Agencies will implement management to attempt to limit female mortality model averaged Chao2 estimate decline below 48 females with cub of the year in any given year.~~

~~22.~~20. In modeling the rate of change (trend) of females with cubs-of-the-year as described in the Supplement to the Reassessing Methods Document (IGBST 2006), if the AIC_c weight favors the quadratic term and corresponding $\Delta AIC_c \geq 2.0$ compared with the linear model for 3 consecutive years, a full review of the population's demographics will be undertaken to better understand its status. Given evidence of a population nearing carrying capacity and a population fluctuating around a long-term mean, this approach allows timely detection of a sustained increasing or decreasing trend (van Manen *et al.* 2015).

~~23.~~21. If dead bears are reported in years subsequent to actual year of mortality, they will be tallied against year of death and total mortality will be recalculated. If mortality exceeds the threshold for that year, the difference (total mortality minus threshold) will be counted against the current years' threshold.

~~24.~~22. For bears that are estimated to be independent of age, if sex cannot be determined, sex will be assigned randomly using ratio of 59:41 male:female as recommended in Appendix A of Schwartz and Haroldson (2001).

Formatted: Numbered + Level: 1 + Numbering Style: 1, 2, 3, … + Start at: 1 + Alignment: Left + Aligned at: 0.08" + Indent at: 0.33", Tab stops: Not at 0.5"

[2] 48 independent females with cubs of the year in the DMA is approximately equivalent to a population of 600 bears.

Table 1. Annual sustainable mortality limits by sex and age cohorts[3] of grizzly bears in the Greater Yellowstone Ecosystem under the protocol to manage for a population at the average annual population estimate for the period 2002–2014 in the Demographic Monitoring Area (DMA) (using the Chao2 estimator this average number is 674).

Maximum mortality rate for:	Population estimate inside the DMA using the model-averaged Chao2 method.			
	<674	674	675-747	>747
% of independent <u>FEMALES</u>	<7.6%	7.6%	9%	10%
% of independent <u>MALES</u>	15%	15%	20%	22%
% of DEPENDENT <u>YOUNG</u>	<7.6%	7.6%	9%	10%

> Mary. Thank for you letting us know about this new development regarding the YES conference call today. Attached please find the Service's proposed language regarding recalibration in Appendix C which we are providing as an alternative to the language proposed by the 3 State Directors. We ask that you forward this email and the attached to YES members for their consideration for this afternoon's call.
>
> As you are aware, the management commitments and mechanisms described in the Conservation Strategy are foundational to our delisting determination. We anticipate that we will be challenged if we move forward with delisting, so it is essential that we have a solid record upon which to defend our decision. We believe the language the State's suggest is too ambiguous with regard to what will happen if a new population estimator is adopted – it leaves the response to be determined by the YGCC, in consideration of a recovery standard as defined by the Conservation Strategy, not the Recovery Plan criteria. The Service cannot simply cede our authority to define recovery to another entity in the future and we and our legal counsel do not believe that such an approach would be defensible.
>
> The language proposed by the Service is written to state clearly that if the population estimator is changed we will recalibrate the associated metrics to ensure continuity with the overarching management objective – to maintain stability of the population around the long term population average.

Thank you for sharing this with the Committee. JB

FWS suggested revisions to State suggested Appendix C language.

Adoption of a different population estimator will require recalibration of the associated demographic objectives and standards ~~if the YGCC determines that such recalibration is necessary for maintaining a recovered grizzly bear population as defined in the Conservation Strategy.~~ (e.g. populations objective, confidence intervals, mortality limits) that are based upon the population estimator.

Appendix C. Calculation of Total Population Size and Mortality Limits

Efforts to improve the population size estimation and management methods and to reevaluate the sustainable mortality limits in the Greater Yellowstone Ecosystem (GYE) have continued with the Interagency Grizzly Bear Study Team (IGBST) leading these efforts. Notably, several special reports have been produced including: "Reassessing Methods to Estimate Population Size and Sustainable Mortality Limits for the Yellowstone Grizzly Bear" (hereafter referred to as the Reassessing Methods Document, IGBST 2005, Appendix L), which was released for public comment and peer review. In response to comments received during this process, a second document, "Reassessing Methods To Estimate Population Size And Sustainable Mortality Limits For The Yellowstone Grizzly Bear: Workshop document supplement on 19–21 June 2006" (hereafter referred to as the Supplement to the Reassessing Methods Document, IGBST 2006, Appendix M) was produced after further peer review. Most recently, a third document "Updating and Evaluating Approaches to Estimate Population Size and Sustainable Mortality Limits for Grizzly Bears in the Greater Yellowstone Ecosystem" (hereafter referred to as the Updated Demographics document, IGBST 2012) was prepared in response to updated information and changes in population trajectory related to grizzly bear demographics. This 2012 document is attached to this 2016 Conservation Strategy as Appendix N.

The goals of these IGBST workshops were to assemble internal and external experts to review and enhance existing methods and, to the extent feasible, use existing data to develop new population estimation methods in order and ensure that population estimation and mortality management methods for the GYE grizzly bear population are based on the best available science. This effort was undertaken as per the commitment in the Conservation Strategy of all management agencies to employ adaptive management using the best available science to manage the GYE grizzly bear population.

The IGBST will use the protocol described in this Appendix to annually estimate population size within the Demographic Monitoring Area (DMA), and then set mortality limits inside the DMA for the following year based on the sliding scale in Table 1. Methods used in this protocol are described in the Reassessing Methods Document (IGBST 2005), summarized in the Supplement

to the Reassessing Methods Document (IGBST 2006), and revised in the Updated Demographics Rates Document (IGBST 2012). Adoption of a different population estimator will require recalibration of the associated demographic objectives and standards ~~if the YGCC determines that such recalibration is necessary for maintaining a recovered grizzly bear population as defined in the Conservation Strategy.~~ (e.g. populations objective, confidence intervals, mortality limits) that are based upon the population estimator. Any change in the methods described below would be considered a change to the Conservation Strategy and would be revised through the Yellowstone Grizzly Bear Coordinating Committee process with the requirement that any proposed changes: 1) be based upon the best available science; and 2) go through public review before they are accepted, as per p. 99 of this Conservation Strategy.

Formatted: Strikethrough

~~The population goal is set for the average population size 2002–2014 inside the DMA. The current and approved method to estimate population size in the DMA uses the model averaged Chao2 estimator. If another population estimator was adopted as per the Conservation Strategy procedures described above, this new population estimator will be applied to the 2002–2014 data to estimate the average population size 2002–2014. The new population estimate results would be inserted in Table 1 to reset the population size numbers with the same sliding scale, with the intent to maintain the population goal of the average population size 2002–2014. If a review of the vital rate data by the IGBST (similar to that in the 2012 report) resulted in new mortality rate for a sustainable population at the 2002–2014 average population size, then the new sustainable mortality rate for the average 2002–2014 population size would replace the 7.6% for independent females and dependent young in Table 1. Any such change would be considered a change to the Conservation Strategy and would be revised through the Yellowstone Grizzly Bear Coordinating Committee process, which requires that any proposed changes: 1) be based upon the best available science; and 2) go through public review before they are accepted, as per p. 99 of this Conservation Strategy.~~

The following procedures detail how population size and mortality thresholds would be calculated:

1. Observations of sightings of females with cubs-of-the-year[1] will be separated into an estimate of unique females with cubs-of-the-year and repeat observations of the same female using the methods of Knight *et al.* (1995).

Formatted: Numbered + Level: 1 + Numbering Style: 1, 2, 3, … + Start at: 1 + Alignment: Left + Aligned at: 0.08" + Indent at: 0.33", Tab stops: Not at 0.5"

[1] Adult female grizzly bears accompanied by cubs that are less than one year old.

2. Only sightings of unique females with cubs-of-the-year from within the DMA will be used for subsequent estimates.
3. The Chao2 estimator (Keating *et al*. 2002) will be applied to sighting frequencies of unique females with cubs-of-the-year to estimate the total number of females with cubs of the year in the population.
4. The number of unique females with cubs-of-the-year obtained from the Chao2 estimator each year will be added to the long-term dataset to conduct the model-averaging process described in the Supplement to the Reassessing Methods Document (IGBST 2006). This process involves fitting a linear and quadratic trend model, followed by averaging model parameters based on the respective Akaike's Information Criterion (AIC_c) weights of the linear and quadratic models. These model-averaged parameters are then used to estimate the number of females with cubs-of-the-year.
5. The estimated number of females with cubs-of-the-year obtained through the model averaging will be used as the best estimate of the total number of independent females with cub-of-the-year in the DMA for that year.
6. The purpose of fitting the trend model is to obtain the best estimate of the current number of females with cubs-of-the-year by using information from past estimates, recognizing that with each iteration, some change is expected. Retrospectively adjusting estimates from previous years will not occur.
7. The estimated number of females with cubs-of-the-year will be divided by the proportion of females ≥4 years old estimated to be accompanied by cubs-of-the-year (transition probability = 0.2965) observed during 2002–2011. The resulting value represents the best estimate of the total number of females in the population ≥4 years old.
8. The number of females ≥4 years old will be divided by the estimated proportion of females ≥4 years old in the population of females ≥2 years old (proportion = 0.844) observed during 2002–2011. The resulting value is the best estimate of the number of independent females (≥2 years old) in the population that year.
9. The sustainable mortality limit for independent females is dependent on the population estimate of independent females (Table 1).
10. Unknown and unreported mortality will be estimated based on the methods of Cherry *et al*. (2002) as described in the Reassessing Methods Document (IGBST 2005).

Formatted: Numbered + Level: 1 + Numbering Style: 1, 2, 3, … + Start at: 1 + Alignment: Left + Aligned at: 0.08" + Indent at: 0.33", Tab stops: Not at 0.5"

Formatted: Numbered + Level: 1 + Numbering Style: 1, 2, 3, … + Start at: 1 + Alignment: Left + Aligned at: 0.08" + Indent at: 0.33", Tab stops: Not at 0.5"

Formatted: Numbered + Level: 1 + Numbering Style: 1, 2, 3, … + Start at: 1 + Alignment: Left + Aligned at: 0.08" + Indent at: 0.33", Tab stops: Not at 0.5"

11. The number of independent males in the population will be based on the estimated ratio of independent males to independent females (ratio = 1:1) observed during 2002–2011 and derived via stochastic modeling described in the Supplement to the Reassessing Methods Document (IGBST 2006). The number of independent females in the population will thus be multiplied by 1.0 and the resulting value represents the best estimate of the number of independent males that year.
12. The sustainable mortality limit for independent males is dependent on the population estimate of independent males (Table 1).
13. The number of cubs-of-the-year in the annual population estimate will be calculated directly from the model-averaged estimate of females with cubs-of-the-year (IGBST 2006). The number of cubs will be estimated by multiplying the model-averaged estimate of females with cubs-of-the-year by the mean litter size (litter size = 2.49; mortality adjusted estimate) observed during 2002–2011.
14. The number of yearlings will be estimated by multiplying the estimated number of cubs from the previous year by the mean survival rate for cubs (cub survival = 0.553) observed during 2002–2011.
15. The sustainable mortality limit for dependent young (cubs and yearlings) is dependent on the population estimate of dependent young (Table 1). Only human-caused deaths (reported known and probable) will be tallied against the threshold for dependent young.
16. Unknown and unreported mortality will not be estimated for dependent young.
17. Sustainable mortality limits will be established annually based on the data collected in that year and the calculations described here. These mortality limits will then apply the following year. Because model-averaged estimates are used, annual variability among estimates is explicitly addressed. Consequently, annual limits based on a 3-year running average, as proposed in the Reassessing Methods Document (IGBST 2005), are not used. Instead, annual sustainable mortality limits for any year will be based on the data and calculations for the previous year (as described in this protocol and the Updated Demographic Rates Document, IGBST 2012, Appendix N).
18. Estimates of uncertainty about the number of independent females, independent males, dependent young, and total population size will be derived following methods detailed in the

Formatted: Indent: Left: 0.07", Numbered + Level: 1 + Numbering Style: 1, 2, 3, … + Start at: 1 + Alignment: Left + Aligned at: 0.08" + Indent at: 0.33", Tab stops: Not at 0.5"

Supplement to the Reassessing Methods Document (IGBST 2006) using updated vital rates as documented in IGBST (2012, Appendix N).

~~19.~~1. The objective of 48[2] females with cubs-of-the-year as estimated with Chao2 will be evaluated based on the model-averaged estimate of females with cubs-of-the-year (IGBST 2012).

~~20.~~19. ~~A biology and monitoring review by the IGBST will occur should the model-averaged Chao2 estimate decline below 48 females with cubs of the year for any 2 consecutive years~~.

~~21. Agencies will implement management to attempt to limit female mortality model averaged Chao2 estimate decline below 48 females with cub of the year in any given year.~~

~~22.~~20. In modeling the rate of change (trend) of females with cubs-of-the-year as described in the Supplement to the Reassessing Methods Document (IGBST 2006), if the AIC_c weight favors the quadratic term and corresponding $\Delta AIC_c \geq 2.0$ compared with the linear model for 3 consecutive years, a full review of the population's demographics will be undertaken to better understand its status. Given evidence of a population nearing carrying capacity and a population fluctuating around a long-term mean, this approach allows timely detection of a sustained increasing or decreasing trend (van Manen *et al.* 2015).

~~23.~~21. If dead bears are reported in years subsequent to actual year of mortality, they will be tallied against year of death and total mortality will be recalculated. If mortality exceeds the threshold for that year, the difference (total mortality minus threshold) will be counted against the current years' threshold.

~~24.~~22. For bears that are estimated to be independent of age, if sex cannot be determined, sex will be assigned randomly using ratio of 59:41 male:female as recommended in Appendix A of Schwartz and Haroldson (2001).

Formatted: Numbered + Level: 1 + Numbering Style: 1, 2, 3, … + Start at: 1 + Alignment: Left + Aligned at: 0.08" + Indent at: 0.33", Tab stops: Not at 0.5"

[2] 48 independent females with cubs of the year in the DMA is approximately equivalent to a population of 600 bears.

Table 1. Annual sustainable mortality limits by sex and age cohorts[3] of grizzly bears in the Greater Yellowstone Ecosystem under the protocol to manage for a population at the average annual population estimate for the period 2002–2014 in the Demographic Monitoring Area (DMA) (using the Chao2 estimator this average number is 674).

Maximum mortality rate for:	Population estimate inside the DMA using the model-averaged Chao2 method.			
	<674	674	675-747	>747
% of independent <u>FEMALES</u>	<7.6%	7.6%	9%	10%
% of independent <u>MALES</u>	15%	15%	20%	22%
% of DEPENDENT <u>YOUNG</u>	<7.6%	7.6%	9%	10%

To: Wayne Kasworm

Hi Wayne,

Thanks for the response.

Why is the IGBST not reporting on these violations and why is FWS not making this public either? As you well know, after delisting, managers and the public need to know is there are problems meeting FWS's standards so as to make course corrections. If you don't know there are problems, how will this occur? Will there be some new plan to release these findings by FWS, if IGBST does not do it?

Until the 2015 report, the IGBST annual reports always included a very clear chart of total mortalities and whether limits were exceeded. Why was this stopped? Since FWS is one of the most important "clients" of USGS, if FWS wanted this information in the reports, it certainly would have been included.

From what I hear from the YES discussion yesterday, the states are not planning to show this kind of data so the public can see it. While that is disturbing in its own right, it makes it especially important for FWS and IGBST to be clear.

Also, by my math, using IGBST estimates for the population, 18 independent females was the limit last year, and 25 died. Can you please confirm that this is what you get?

This is not a subtle violation.

I look forward to hearing from you,

Sincerely,

Louisa

On 9/30/2016 1:46 PM, wayne_kasworm@fws.gov wrote:

> Under the 2007 supplement to the recovery plan for Yellowstone, the independent female mortality limit is 9%, the independent male mortality limit is 15%, and the dependent young mortality limit is 9%. The IGBST Yellowstone report for 2015 indicates that independent female mortality was 10.1%, independent males was 13% and dependent young was 5.8%. Therefore independent female mortality exceeded the limit in 2015, but independent males and dependent young did not exceed the limits.

> Dear Wayne, Jennifer and Matt, I am not sure who to direct this question to, so am sending it to all of you. Using the methods for assessing the population that are presently in place, were limits on annual Yellowstone grizzly bear mortality violated in 2015? Can you explain which cohort, and the degree of the violation? I would appreciate a prompt response to this request. Sincerely, Louisa Willcox Grizzly Times

Subject: Tribal Grizzly Bear Treaty
To: "Williams, Jim" <jiwilliams@mt.gov>, nanderson@mt.gov, wayne_kasworm@fws.gov, Dan Carney <dcarney@3rivers.net>

WE worked with the Tribal Council yesterday to develop a legal signing statement to accompany the Tribes' signature on the Tribal Grizzly Bear Treaty. I am attaching a copy of the text of the Treaty, as well as a copy of the Tribes' signed signing statement. Stacy, Tom and I had concerns specifically about the treaty language in Articles 7 and 10, which we felt could impinge on our ability to work cooperatively with MFWP and USFWS on grizzly bear management and recovery.. Our attorneys believe that the signing statement takes care of that, in addition to the Tribal Chairman's assurance received in the discussion with the Piikuni representative that brought the treaty to the Council.

Signing Statement of the Confederated Salish and Kootenai Tribes of the Flathead Reservation

This Signing Statement of the Confederated Salish and Kootenai Tribes (CSKT) is submitted together with the signature of the Tribal Chairman on the document entitled "The Grizzly: A Treaty of Cooperation, Cultural Revitalization and Restoration" (Grizzly Treaty) signed at the CSKT Tribal Council Chambers on October 18, 2016.

The CSKT is in agreement with the aspirations and goals of the Grizzly Treaty particularly regarding the reverence that Tribes have for the Grizzly Bear, and the spiritual, cultural, and ceremonial role that the Grizzly plays in the life and history of each signatory Tribe. The CSKT agrees that Grizzly Bears should be managed through the use of the best available science, traditional ecological knowledge, and culturally relevant information.

With these goals in mind, the CSKT signs this Grizzly Treaty with the intention of continuing our proven management of Grizzly Bears and their habitat in western Montana. The CSKT has a robust Grizzly Bear management program in place, and will continue to manage them utilizing our knowledge and experience, including our understanding of the current habitat conditions and status of Grizzlies in western Montana.

The CSKT offers its signature in solidarity with the other signatories to this Grizzly Treaty, but want to clearly state our intention to honor our existing and future partnerships with appropriate state and federal wildlife and natural resource management agencies. We believe these partnerships offer the best chance for meaningful recovery and management of this profoundly important species, particularly within the Crown of the Continent ecosystem, where intergovernmental cooperation is the key to successfully managing all activities for the benefit of Grizzly Bears.

Finally, the CSKT has not taken a formal position that delisting of the Grizzly Bear should never occur, however the CSKT will remain consistent in our opposition to the sport and trophy hunting of Grizzly Bears.

The CSKT joins with all Tribal Nations who are signatories to this Grizzly Treaty in hoping that this agreement will serve as a catalyst to all individuals, organizations and governments to voice their concern for Grizzly Bears. We hope to see this sacred Bear forever retain its place in our traditions and on our landscapes.

Sincerely,

Vernon S. Finley

Vernon S. Finley, Chairman

THE GRIZZLY: A TREATY OF COOPERATION, CULTURAL REVITALIZATION AND RESTORATION

RELATIONSHIP TO THE GRIZZLY

Since time immemorial, hundreds of generations of the first peoples of the FIRST NATIONS of North America have come and gone since before and after the melting of the glaciers that covered North America. For all those generations the GRIZZLY has been our ancestor, our relative. The GRIZZLY is part of us and WE are part of the GRIZZLY culturally, spiritually and ceremonially. Our ancient relationship is so close and so embodied in us that the GRIZZLY is the spirit of our holistic eco-cultural life-ways.

PURPOSE AND OBJECTIVE OF THE TREATY

To honor, recognize, and revitalize the ancient relationship we have with the GRIZZLY, it is the collective intention of WE, the undersigned NATIONS, to welcome the GRIZZLY to once again live beside us as CREATOR intended and to restore the balance where WE are the stewards and GRIZZLY is the guardian of our lands. WE will do everything within our means so that with GRIZZLY, WE will once again live in the sacred cycle of reciprocity to nurture each other culturally and spiritually. It is our collective intention to recognize the GRIZZLY as an umbrella species, central to the ecological system; and to provide a safe space and environment across our historic homelands we once shared with the GRIZZLY where biologically suitable habitat still exists in the United States and Canada, so together WE can have our grandparent, the GRIZZLY, guide us in nurturing our land, plants and the other two-legged, four-legged and winged beings to once again realize the GRIZZLY MEDICINE WAYS for our future generations and recognize that OUR DRUMBEAT IS THE HEARTBEAT OF THE GRIZZLY. In our collective NATIONS' efforts to protect and preserve the GRIZZLY – and by doing so protect, preserve and perpetuate indigenous cultures – this treaty is analogous to the UN Declaration on the Rights of Indigenous People (UNDRIP).

PARTIES TO THE TREATY

WE, the undersigned, including the PIIKANI NATION and TRIBAL NATIONS from the four sacred directions of TURTLE ISLAND.

ARTICLE 1 – CONSERVATION

Recognizing the GRIZZLY as a practitioner of conservation, WE, collectively, recognize that our ancestors were conservationists before the term existed in the Western lexicon, and that in their honor we agree to perpetuate their principals of caring for Mother Earth that is today called conservation. Fundamental to that is respecting the interrelationships between us and "all our relations" including animals, plants and all living and growing things that are shapes, as are WE, of Mother Earth. WE commit to perpetuate and continue our spiritual ceremonies, sacred societies, sacred languages and sacred bundles in which the GRIZZLY has a unique place, and to perpetuate and practice as a means to embody the thoughts and beliefs of ecological balance.

ARTICLE II – CULTURE

Realizing the GRIZZLY is a foundation of our traditional ways, WE, collectively, agree to perpetuate all aspects of our respective cultures related to the GRIZZLY including customs, practices, healing and curing rituals, naming, beliefs, songs, and ceremonies.

ARTICLE III – ECONOMICS

Recognizing the GRIZZLY as a traditional teacher and guardian of our lands and people, We, collectively, agree to pursue economic development revolving around the GRIZZLY in an environmentally and culturally compatible manner, including eco-tourism models with grizzly watching, photography and culturally oriented educational tourism, traditional crafts, publishing and literacy materials inspired by traditional narratives to which the GRIZZLY is central, and other beneficial by-products arising out of GRIZZLY's gifts to us.

ARTICLE IV – HEALTH

Taking into consideration all the social and health benefits the GRIZZLY has shared with our people for millennia, WE, collectively, agree to follow and develop the traditional GRIZZLY BEAR MEDICINE TEACHINGS that introduced our ancestors to our first healing and curing practices.

ARTICLE V – EDUCATION

Recognizing and continuing to embody all the teachings we have received from the GRIZZLY, WE, collectively, agree to develop programs revolving around GRIZZLY as a means of transferring intergenerational knowledge to the younger and future generations and sharing knowledge amongst our respective NATIONS.

ARTICLE VI – HUNTING

Understanding that the GRIZZLY is an ancestor, a grandparent, and a relative, no hunting of the GRIZZLY – be that categorized as sport or trophy hunting – will be permitted or licensed on any lands our NATIONS hold jurisdiction over. The GRIZZLY will enjoy full protections on all tribal lands.

ARTICLE VII – MANAGEMENT

Recognizing that our collective objective is to see the GRIZZLY returned to areas of biologically suitable habitat on tribal lands within the GRIZZLY's historic range pre-colonial contact, and for linkage zones to be established between the existing, fragmented populations, GRIZZLY management plans for our NATIONS will be formulated from a cultural foundation, while accommodating the "best available science." WE, collectively, recognize that our ancestors practiced the "best available science" in their stewardship of the land, as they lived in balance with our Mother Earth when the biomass was at its height. Our NATIONS will not adopt state, provincial or federal plans, as all are infringements of our sovereignty. WE, collectively, will formulate vocational and educational programs for our people, so that on our lands, they will be the leaders of our culturally compatible GRIZZLY management programs. Upon the signing of this TREATY, any management removal of a GRIZZLY will be undertaken with ceremony, and such parts of the GRIZZLY that have

always been kept in sacred bundles or used for traditional healing practices will be provided to such persons qualified. No GRIZZLY will be removed from the population before all other options have been exhausted.

ARTICLE VIII – RESEARCH

Recognizing that learning is a life-long process, WE, collectively, agree to perpetuate knowledge-gathering and knowledge-sharing according to our customs and inherent authorities revolving around the GRIZZLY that do not violate our traditional ethical standards as a means to expand our knowledge base regarding the environment, wildlife, plant life, water, and the role GRIZZLY played in the history, spiritual, economic, and social life of our NATIONS. WE, collectively, agree to consult with the leading, independent biologists qualified in the study of the GRIZZLY to ensure that our NATIONS continue to lead in the preservation and recovery of the GRIZZLY.

ARTICLE IX –THREATS

THE CROWN OF THE CONTINENT

WE, collectively, recognize that the GRIZZLY in the Crown of the Continent is threatened, as are the grizzly bears attempting to live in arterial habitats connecting with populations elsewhere in the Rocky Mountains. Only a limited portion of the Crown of the Continent is productive enough and safe enough to produce grizzly bears in excess of the numbers that die. These favored areas include Glacier and Waterton National Parks, the North and Middle Forks of the Flathead River, and western portions of the Blackfeet Reservation. Most other areas, including central and southern portions of the Bob Marshall Wilderness, the East Front, and portions of the Flathead Valley, produce lethal human interactions that kill grizzly bears at a greater rate than they can reproduce. In addition, the GRIZZLY in the Crown of the Continent has suffered from devastating environmental changes. On the west side, a 15-year berry famine lasted from 1996 through 2010. Between 1985 and 2012 some 25% of GRIZZLY habitat in the United States burned, including around 40% of core GRIZZLY distribution. Many of these burns have come back as unproductive habitats, including dog hair regeneration of lodgepole pine. Between the 1970s and 2012, most mature whitebark pine in the Crown was killed by white pine blister rust. Human populations in the Flathead and Swan Valleys have concurrently exploded. Not surprisingly, grizzly bear deaths increased between the early 1990s and early 2010s by 2-10 times as much as any plausible increase in population size. WE, collectively, recognize that the GRIZZLY is seeking habitats on the plains and elsewhere not because of increasing numbers, but because of the need to find new food sources.

GREATER YELLOWSTONE

All evidence indicates that the GRIZZLY population in Greater Yellowstone has been stationary since the early part of the twenty-first century, and repopulation of historic range is due to GRIZZLY seeking alternative foods. The catastrophic loss of GRIZZLY’s dietary staples in this region, including whitebark pine, which has been reduced by some 85%, and cutthroat throat, are well documented. One of GRIZZLY’s remaining protein-rich food sources, the army cutworm moth, is vulnerable to climate change and pesticides. If as a result of wasting disease or otherwise the region’s elk population suffers significant

reduction the impact on GRIZZLY would be similarly devastating. A greater reliance on meat for survival increases the potential for conflicts. No alternative food sources exist in this ecosystem that provide caloric equivalency to those that are rapidly disappearing. GRIZZLY in Greater Yellowstone is an island population, genetically isolated, and with no present opportunity to establish critical linkage zones with the Crown of the Continent population. An island population is forever a threatened population.

THE GREAT BEAR RAINFOREST

In common with those in the Crown of the Continent and Greater Yellowstone, the GRIZZLY in the Great Bear Rainforest faces significant threats from climate change, including deforestation and declining salmon runs. GRIZZLIES are abandoning areas where they were once supposed to be abundant, and seeking sustenance on islands where they have never been seen before. As salmon stocks dwindle, the GRIZZLY is searching for alternative food sources, and consequently having fewer cubs, replicating the pernicious cycle in Yellowstone and the Crown. The GRIZZLY population in the Great Bear Rainforest is unknown, but irrespective, in contravention of ordinances passed by the Coastal First Nations, authorities issue batches of trophy hunting tags every year based only on population guesstimates. GRIZZLIES are commonly spotted from planes, chased down in boats, or shot as they walk by camouflaged blinds. They are hunted in the fall when they come down to feed on salmon, and then hunted in the spring when they emerge from hibernation. There are no rules against trophy hunting mothers, and a third of the GRIZZLIES killed in BC are female.

GRIZZLY has been an integral part of human culture since time before memory, and factors into the songs, dances, and crests of every First Nation on the coast. GRIZZLY is more than a neighbor; in many families, GRIZZLIES are considered relatives, because bears move fluidly between the worlds in First Nations oral histories, transforming into people, and even marrying humans. GRIZZLY is a teacher, healer, and protector. Killing a GRIZZLY for no reason represents a grave breach of protocol and traditional law.

As the original stewards of this land, our NATIONS commit to act to aid our sacred relative, the GRIZZLY.

ARTICLE X – CONFLICT REDUCTIONS

Following the precedent set by some of our sister NATIONS, WE, collectively, recognize the need to establish seasonal closures to areas that offer the GRIZZLY sensitive habitat, be that for food gathering, reproduction, or the rearing of young. In the spirit of our ancestors, WE will introduce culturally compatible conflict reduction programs on our NATIONS, that are inclusive and educational, and reconnect our people with GRIZZLY and traditional precepts of tribal society and responsibility.

ARTICLE XI – ADHESIONS

North American Tribes and First Nations, and NATIONS, STATES, AND PROVINCES may become signatories to this treaty providing they agree to the terms of this treaty.

ARTICLE XII – PARTNERSHIPS AND SUPPORTERS

WE, collectively, seek to be true partners with federal authorities in the reintroduction and future management of the GRIZZLY, in a relationship of reciprocity and equality. WE, collectively, invite Non-Governmental Organizations, Corporations and others of the business and commercial community, to form partnerships with the signatories to bring about the manifestation of the intent of this treaty. Organizations and individuals may become signatories to this treaty as partners and supporters providing they perpetuate the spirit and intent of this treaty.

ARTICLE XIII – AMENDMENTS

This treaty may be amended from time-to-time by a simple majority of the signatories.

Our proposed language for App C is as follows:

"Adoption of a different population estimator will require recalibration of the associated demographic objectives and standards (e.g. populations objective, confidence intervals, mortality limits) that are based upon the population estimator.

The language that the 3 states are putting forward is as follows:

"Adoption of a different population estimator will require recalibration of the associated demographic objectives and standards if the YGCC determines that such recalibration is necessary for maintaining a recovered grizzly bear population as defined in the Conservation Strategy."

Subject: URGENT - Yellowstone Grizzly Bear

Jon, Neil and Tom, we need your help to ensure solidarity among the federal representatives to the Yellowstone Ecosystem Subcommittee (YES) to the Interagency Grizzly Bear Committee (IGBC). For several weeks, we have been trying to reach a compromise on key language to the Grizzly Bear Conservation Strategy. It regards the issue of "recalibration" of the demographic standards (population goals, mortality limits and rates, etc.) if the population estimator is changed post-delisting. We believe this is a key commitment that must be clear in the strategy in order to ensure that the states are committed to the basic goal of maintaining the delisted population of bears.

We heard today that the 3 Governors cannot accept our final recommended recalibration language, and apparently, today, 3 state fish and game directors sent a letter to the YES chair urging that the WY language be brought to a vote at the YES meeting tomorrow.

The Service representatives on the YES will offer our language as an alternative to the language proposed by the states. We need the USFS, BLM and NPS members on the YES to stand with the Service on this key issue. The membership of the YES is as follows:

Mary Erickson, Custer-Gallatin NF

Tricia O'Conner, Bridger Teton NF

Melany Gossa, Beaverhead Deerlodge NF

Garth Smelser, Caribou-Targhee NF

Joe Alexander, Shoshone NF

David Vela, Grant Teton National Park

Dan Wenk, Yellowstone National Park

Ken McDonald, MT Fish, Wildlife And Parks

Jeff Gould, Idaho Dept. of Fish and Game

Brian Nesvik, WY Game and Fish Department

Tom Rice, MT Association of Counties

Lee Miller, ID County Commissioners

Loren Grosskopf, WY County Commission

Leander Watson, Shoshone Bannock Tribes

Delissa Minnick, WY BLM

Cornie Hudson, MT BLM

Matt Hogan, FWS

Jodi Bush, FWS

Thanks for your support. I'll be in the office tomorrow and available to talk if you have questions.

Dan.

As current chair of YES, Mary Erickson is putting together the agenda for the upcoming meeting in Cody, November 16-17. We need your help with that. Originally, the intent for this meeting was to provide updates on the delisting process reflecting final stages or conclusion of this effort.

However, we find ourselves in a very different spot, which the conference call this past Friday revealed. Topics that we expected to fill much of the meeting are no longer worthy (e.g. State Plans, commitment for signatures with a level of ceremony, sentimental retrospect on this conservation success story). Consequently, we need to find a way to express the current reality- the current status of the process.

We owe the public good and transparent updates, but we also have big gaps in the agenda that we now need to responsibly use. We need your help with this, especially since public expectations are very high given the time-line for delisting provided the public at previous meetings. Consider as well the unique culture of Cody, WY.

Here is a list of potential topics for your consideration- ones we could use your help with:

- Overview of the delisting process to date.
- Current status of the delisting process.
- Strategic look at next steps in the delisting process- USFWS expectations.
- Posting of the draft Conservation Strategy.
- Summary of response to comments.
- Process used to revise the Conservation Strategy.
- Summary of changes made to the Conservation Strategy and potential effects to grizzly bear management in the GYE.
- Portions of the Conservation Strategy not approved and why.
- Associated status of the proposed delisting Rule.
- The role of YES and IGBC in the delisting process in relationship to FWS authority.
- Relationship of the Conservation Strategy to Forest Plans.

We should have an agenda available Wednesday. So, could we get your response to this tomorrow? We can talk this through and assign and consolidate topics. Thanks! I will be around all day tomorrow and checking in with Mary.

Subject: Upcoming YES meeting - November 16 and 17
To: "Fortin-Noreus, Jennifer (jennifer.fortin-noreus@mso.umt.edu)" <jennifer.fortin-noreus@mso.umt.edu>, "Jackson, Scott -FS" <sjackson03@fs.fed.us>, "Landenburger, Lisa A -FS" <lalandenburger@fs.fed.us>, "Barndt, Scott A -FS" <sbarndt@fs.fed.us>, "Jodi_Bush@fws.gov" <Jodi_Bush@fws.gov>
Cc: "Rupert, Susan -FS" <srupert@fs.fed.us>, "O'Connor, Patricia - FS" <poconnor@fs.fed.us>

As current chair of YES, Mary Erickson is putting together the agenda for the upcoming meeting in Cody, November 16-17. We need your help with that. Originally, the intent for this meeting was to provide updates on the delisting process reflecting final stages or conclusion of this effort.

However, we find ourselves in a very different spot, which the conference call this past Friday revealed. Topics that we expected to fill much of the meeting are no longer worthy (e.g. State Plans, commitment for signatures with a level of ceremony, sentimental retrospect on this conservation success story). Consequently, we need to find a way to express the current reality- the current status of the process.

We owe the public good and transparent updates, but we also have big gaps in the agenda that we now need to responsibly use. We need your help with this, especially since public expectations are very high given the time-line for delisting provided the public at previous meetings. Consider as well the unique culture of Cody, WY.

Here is a list of potential topics for your consideration- ones we could use your help with:

- Overview of the delisting process to date.
- Current status of the delisting process.
- Strategic look at next steps in the delisting process- USFWS

expectations.

- Posting of the draft Conservation Strategy.
- Summary of response to comments.
- Process used to revise the Conservation Strategy.
- Summary of changes made to the Conservation Strategy and potential effects to grizzly bear management in the GYE.
- Portions of the Conservation Strategy not approved and why.
- Associated status of the proposed delisting Rule.
- The role of YES and IGBC in the delisting process in relationship to FWS authority.
- Relationship of the Conservation Strategy to Forest Plans.

We should have an agenda available Wednesday. So, could we get your response to this tomorrow? We can talk this through and assign and consolidate topics. Thanks! I will be around all day tomorrow and checking in with Mary.

Hello All,

Attached are the TPs I used for my interview with Laura Zuckerman with Reuter's today explaining the Service's tribal outreach on the Yellowstone grizzly bear population proposed delisting rule, and in response to tribal allegations that the Service has failed to properly offer consultation. Laura is a solid reporter, and one of our main media resources in Idaho.

Happy to answer questions. Thanks!

The U.S. Fish and Wildlife Service (FWS) has and will continue to offer government-to-government consultation with federally-recognized Native American tribes west of the Mississippi River on the Yellowstone grizzly bear population proposed delisting. Tribes have a tremendous amount of traditional ecological knowledge and scientific information to contribute to this matter, and their input is very important to the Service

The Service conducted 5 consultations with tribes located in the GYE prior to the release of the proposed delisting rule.

Since the release of the proposed rule, the Service has held two consultation meetings - one in Bozeman, MT, one in Rapid City, SD - and invited all tribes west of the Mississippi River to attend. The Service announced the consultation meetings in the *Federal Register* notice for the proposed delisting and contacted tribes directly to ensure that they were invited to these meetings.

Since these meetings, we have reached out to 5 additional tribes who have requested government-to-government consultation and are actively working to schedule these meetings.

In addition to engaging in government-to-government consultation, the Service has been reaching out to and engaging tribes on this proposal through other meetings and forums.

For example, the Service met with the Rocky Mountain Tribal Leaders Council in Billings, Montana and invited tribal representative to engage in consultation concerning the bear.

In October 2015, the Service invited 53 tribes, Tribal Councils, and First Nations in Canada that have contacted the Service regarding the GYE grizzly bear population to participate in a Tribal webinar and conference call. The letters also invited Federal Tribes to engage in government-to-government consultation.

We have also hosted informational webinars and conference calls related to the proposed delisting. We recognize that these webinars and calls do not constitute government-to-government consultation. These were efforts made to provide

ongoing opportunities for providing timely information, answering questions, and explaining next steps.

Since April 2014, Service leadership has reached out to 48 tribes via both letters and personal phone calls or emails to offer an opportunity for government-to-government consultation related to the potential delisting of the Yellowstone grizzly bear.

We recognize that the grizzly bear is culturally and spiritually significant to many Tribes.

Region 6 has been maintaining a webpage to publish all meeting information and the hyperlink to this site was included in the tribal notification e-mails and letters

>
> The States felt 500 was an inaccurate representation of the Miller and Waits 2003 paper. This paper said 400 bears was enough for the short term genetic health. We buffered this genetic floor to 500 to be a little conservative. No other logic was offered as reason to drop the 500 (as far as jennifer and I know). Without reference to genetic health, it makes it appear we have two different population floors, already a point of confusion for the public (including in the recent Grijalva letter).
>
> **Is that recovery criterion, especially the numerical metric of 500 bears, still referenced in some fashion in the CS, or has all reference to it been removed entirely?**
>
> The number 500 number was retained; the rationale for 500 bears was dropped. The rationale for 500 (being genetics driven) is not otherwise captured in the CS.
>
> This creates a perception that 500 is a floor in RC1, and 600 is a floor in RC3. This obviously makes it very confusing. In a general sense, the intention of this part of the CS is to restate (capture) the recovery criterion. Now they are inconsistent (there are a few other minor differences too). States (but not necessarily other YES folks?) have indicated changes to the strategy should be made to the other documents too. i.e., we should change the plan per this vote. Our feeling is the RP is our document and is our call.

Does this answer the question?

Seth,

Attached is a list of changes to the Strategy. The specific language that you mentioned, “grizzly bears will not be persecuted just because they are present there” is in the recovery plan and not the proposed rule or strategy. Let me know if you have any questions.

Subject:	Fwd: public comment about allocation of discretionary mortality
Date:	Wednesday, October 19, 2016 3:26:21 PM

Good afternoon folks.

Jennifer was going through the second round of comments and found what we feel is an important issue that we will need to resolve in our response to comments. Because we will track the issue through our comment response and because we felt it was important to share with you as we go through discussions we have included it paraphrased in the email below.

The public comment is focused on the NPS allocation of mortality (or lack thereof) and its concomitant result to the YES GB population. The detailed comment demonstrates how not allocating the NPS their percentage of discretionary mortality could lead to over-harvest and a source-sink situation.

We have checked with USGS on this issue and on its face it appears to be plausible.

Perhaps we could have a call next week to determine how we might proceed in responding to the comment. JB

Date: Tue, Oct 18, 2016 at 1:18 PM
Subject: public comment about allocation of discretionary mortality
To: Jodi Bush <jodi_bush@fws.gov>

During the second round of public comments, several commenters expressed concern that the National Park Service will not be allocated a percentage of the discretionary mortality based on the percentage of land under their jurisdiction within the GYE DMA. Under the draft Conservation Strategy and the Tri-state MOA, all discretionary mortality is allocated to the states for regulated harvest based on percentage of the DMA outside of NPS lands (i.e., WY = 58%, MT = 34%, ID = 8%). National Park Service lands comprise 21% of the DMA.

We also received a detailed public comment that demonstrates how not allocating the NPS

their percentage of discretionary mortality could lead to over-harvest and a source-sink situation. To paraphrase, the commenter describes that if allocation of discretionary mortality is solely between the three states, as is currently proposed, at a population of 674 allowable mortality rates are 7.6% and 15% for independent females and males, respectively. However, mortality within the park would probably be maintained at approximately 5% (current levels) and be >7.6% and >15% for independent females and males, respectively, on non-park lands if mortality limit are reached or exceeded. The subpopulation of reproductive females in the DMA and therefore the population estimate, would remain relatively stable because hunting will primarily target males. At the same time, males would likely emigrate out of the park, causing a mortality sink on non-park lands. In addition, transboundary males and females would be vulnerable to hunting. Although the population estimate would be stable, the population would actually be declining due to over-harvest of males. In this scenario, a significant population decline is possible without mortality limits being exceeded. This situation would only be exacerbated if the population estimate was >674 and therefore mortality limits were even higher.

I discussed this comment with Mark Haroldson of the Interagency Grizzly Bear Study team and he felt the commenter made a valid argument for the potential for over-harvest.

Wayne Kasworm
Acting Grizzly Bear Recovery Coordinator
U.S. Fish and Wildlife Service
University Hall, Rm #309
University of Montana
Missoula, MT 59812

Dear Mr. Kasworm:

On behalf of our supporters, The Humane Society of the United States (HSUS) requests an extension for the reopened comment period on the proposed rule removing the Greater Yellowstone Ecosystem (GYE) population of grizzly bears (*Ursus arctos horribilis*) from the federal list of endangered and threatened wildlife. 81 Fed. Reg. 61,658 (Sept. 7, 2016); *see also* 81 Fed. Reg. 13,173 (March 11, 2016). Specifically, the Fish and Wildlife Service (FWS) requested comments "on the proposed rule in light of [the peer review and Montana, Wyoming, and Idaho regulatory mechanisms]." *Id.* at 61,661. The FWS has provided only a 30-day comment period, with the comment period ending on October 7, 2016.

In its initial March 11 proposed rule, FWS made a firm commitment that before it would move forward on a final rule, the state regulatory mechanisms that would define post-delisting management of GYE grizzly bears "must be in place by law and regulation in each State." 81 Fed. Reg. at 13210. The current proposed rule reiterates that commitment. *See* 81 Fed. Reg. at 61661 ("We noted that regulatory mechanisms containing these provisions must be in place in each State for delisting ot occur because the adequacy or inadequacy of those regulatory mechanisms help inform us whether a species, once delisted, will remain recover."). Yet as explained below, these state regulatory mechanisms are *not* final: Idaho has just this week opened public comment on a proposed grizzly bear hunting rule docketed for its October 26 meeting, and key mechanisms adopted by Montana and Wyoming are the subject of ongoing litigation alleging the violation of state administrative procedure statutes. Thus, it is improper for FWS to move forward with finalizing the rule as the existence of final, stable, predictable rules is a prerequisite to FWS' ability to determine – and the public's ability to comment on – the adequacy of existing regulatory mechanisms.

However, if FWS continues to move forward as if the state regulatory mechanisms are final, we respectfully request that the comment period be extended an additional 60 days, so that the comment period closes on December 7, 2016. That extension would allow parties to analyze fully the tremendous volume of new documents relevant to this comment period, and prepare substantive and informed comment responses.

Idaho's regulatory mechanisms are not finalized and thus, it would be improper for FWS to move forward with the rule until such documents are finalized.
Section 4(a)(D) of the ESA mandates consideration of "*existing* regulatory mechanisms," and during the course of this rulemaking FWS has accordingly committed to ensuring that post-delisting regulatory mechanisms are "in place by law and regulation in each State" prior to delisting. 81 Fed. Reg. at 13210. That standard has not been met yet, and the comment period should be extended until it has been.

The new proposed rule notes that Idaho has issued a "proclamation" regarding the take of GYE grizzly bears, but fails to note that a state rulemaking process to amend IDAPA 13.01.08 – in the State's words, "proposed rules [to] administer grizzly bear hunting should the Idaho Fish and Game Commission authorize hunting after grizzly bear in the Greater Yellowstone Ecosystem are taken off the federal endangered species list" – was opened on August 29, 2016, and has been filed for notice in the October 5, 2016 Idaho Administrative Bulletin (a copy of the advance notice is attached to this letter). A hearing is to be held on October 12, and the comment period closes on October 26. This state rulemaking – which will not conclude until nearly a month after FWS' deadline for comment on this proposed rule closes – has the potential to alter, amend, supplement, or supersede the content of the "proclamation." FWS cannot in good faith terminate a comment period meant to solicit public input on final state regulatory mechanisms in the middle of an open state rulemaking process on one of those very mechanisms. At a minimum, FWS should extend this comment period until Idaho's state process has concluded so that the public can comment on state regulations as they will actually exist at the time of any proposed delisting.

The Peer Review, State regulatory mechanisms, and supporting documentation total thousands of pages in length and introduce new concepts that demand additional time for comment. There is a tremendous amount of complex information to review for legal and scientific issues related to the proposed rule in light of the peer review analysis and the mechanisms put in place by the states of Idaho, Montana, and Wyoming.

First, the peer review itself totals 48 pages, and the studies and other documents cited therein total hundreds of additional pages of highly technical information. Furthermore, the peer review identifies several areas where "additional review and discussion" of concepts that it introduces or explicates for the first time in this rulemaking process, such as periodic environmental DNA sampling as a means of measuring genetic exchange, finer-grained analysis of human population growth factors, and other important but technically complex issues. Thirty days is simply not enough time for even the most sophisticated members of the public to research, consider, and comment meaningfully on these concepts.

Second, both the State regulatory documents referred to in the proposed rule and other state materials related to state management of grizzly bears in Wyoming, Montana, and Idaho - including memorandums of understanding; state management plans; state environmental impact analyses; and state laws and regulations that interact with or are incorporated by the specific state mechanisms

identified in the proposed rule - total thousands of pages of legal and scientific documentation. As FWS is well aware, the complex interplay among these state mechanisms is central to the health of the GYE grizzly bear population post-delisting. Summary documents like the Idaho proclamation cannot be adequately considered without reference to the many studies, state management plans, and broader legal frameworks referred to and relied on by each implementing State. Accordingly, more than thirty days is necessary for the public to review and substantively comment on those mechanisms that have been implemented.

For the foregoing reasons, the HSUS requests that the FWS extend the reopening of the comment period on the GYE grizzly bear proposed delisting rule by 60 days.

Thank you in advance for considering this request. Please contact me either by electronic mail (ksedlacek@hsus.org) or telephone (202-955-3661) as soon as possible to inform me of your decision on this matter or if you should have any questions about this request.

Sincerely,

Can you please give this a quick fact check. Thanks.

Governor Matt Mead
State of Wyoming

Governor Steve Bullock
State of Montana

Governor Butch Otter
State of Idaho

Dear Governor :

As you know, the U.S. Fish and Wildlife Service has proposed to delist the distinct population segment of the grizzly bear that occurs in the Greater Yellowstone Ecosystem (GYE) shared by the States of Wyoming, Montana, and Idaho. One of the foundational elements of a final delisting determination is an interagency conservation strategy that reflects the commitment of the federal, state, tribal, and local land and resource managers on how this population of grizzly bears will be managed in the foreseeable future, absent the protections of the Endangered Species Act. In the course of negotiating revisions to the draft conservation strategy, it has come to our attention that there may be fundamental differences in perspective about the nature of the management objective for this population in a post delisted environment.

Accordingly, this letter is to seek confirmation, for the record, of the views of the States regarding the management objective for GYE grizzly bear population post-delisting.

There exists a lengthy history of discussion and collaboration with the States on grizzly bear management, including on the post-delisting management objective. When we delisted the GYE grizzly bear population in 2007, the Service's recovery criteria and the associated conservation strategy called for a **stable or increasing** population objective following delisting. This proposal was developed in collaboration with and supported by all three states and reflected the agreement that at minimum the population would be managed for stability if not for continued growth.

When we proposed new recovery criteria and took public comment in 2013, we amended our recovery criterion to reflect the fact that the population had stabilized and that the objective would be to maintain that **stable population** following delisting. This change reflected our collective understanding that the population has reached or was approaching carrying capacity and that managing for an increasing population as called for in 2007 was no longer appropriate. The Wyoming Game and Fish Department responded via letter in support of these proposed revisions while the states of Montana and Idaho did not comment.

As we began work on a proposed delisting in 2015, it became apparent in conversations with States that they desired a bit more management flexibility in a post delisting environment. Accordingly, we revised our recovery criteria to provide additional flexibility to manage **around the long-term mean** (i.e., the mean population size over the period 2002-2014), thus allowing for flexibility in the management objective and the possibility of some decrease in population size. All three states agreed with the revised recovery criteria. The conservation strategy was likewise amended to address this new objective.

When we proposed delisting in February of this year, the conservation strategy was silent on the issue of what would happen if the parties decided to change from the current population estimator (Chao2) to an alternative methodology. However, through the course of responding to peer review and public comment about how such a change would be implemented, there now exists significant inconsistencies in the record about the post delisting management objective that must be addressed.

In order for the Service to make a final determination that the GYE population warrants delisting, i.e., no longer meets the definition of an endangered or threatened species under the ESA, and to then successfully defend that delisting determination, the conservation strategy must clearly commit to managing the population into the foreseeable future with an objective of stability around the 2002-2014 average population level.

However, recent discussions among the working group revising the conservation strategy lead us to question whether the States have the same understanding and a continued commitment to that population management objective. Specifically, we are concerned about the refusal to commit to recalibrating the metrics used for managing the population for stability around the 2002-2014 average if a new population estimator is adopted, along with statements to the effect that maintaining the population above 500 bears is sufficient to achieve recovery and delisting. Both are at odds with a commitment to manage the population for stability around the 2002-2014 average population level for the foreseeable future.

Managing for stability has been the approach for over a decade, up to and including the 2016 proposed rule, and the record simply does not support finalizing a rule with such a **significant deviation** from the agreed upon historical approach to post delisting management. Our ability to make a final determination that delisting is warranted, and to successfully defend that determination if challenged, is dependent upon a clear and firm commitment from the States to this population management objective. It is imperative that there is no confusion around this issue and accordingly, I request a response within 15 days as to whether the States are committed, for the foreseeable future, to managing the GYE population of grizzly bears for stability around the 2002-2014 mean population level.

Wayne Kasworm
Acting Grizzly Bear Recovery Coordinator
U.S. Fish and Wildlife Service
University Hall, Rm #309
University of Montana
Missoula, MT 59812

Dear Mr. Kasworm:

On behalf of our supporters, The Humane Society of the United States (HSUS) requests an extension for the reopened comment period on the proposed rule removing the Greater Yellowstone Ecosystem (GYE) population of grizzly bears (*Ursus arctos horribilis*) from the federal list of endangered and threatened wildlife. 81 Fed. Reg. 61,658 (Sept. 7, 2016); *see also* 81 Fed. Reg. 13,173 (March 11, 2016). Specifically, the Fish and Wildlife Service (FWS) requested comments "on the proposed rule in light of [the peer review and Montana, Wyoming, and Idaho regulatory mechanisms]." *Id.* at 61,661. The FWS has provided only a 30-day comment period, with the comment period ending on October 7, 2016.

In its initial March 11 proposed rule, FWS made a firm commitment that before it would move forward on a final rule, the state regulatory mechanisms that would define post-delisting management of GYE grizzly bears "must be in place by law and regulation in each State." 81 Fed. Reg. at 13210. The current proposed rule reiterates that commitment. *See* 81 Fed. Reg. at 61661 ("We noted that regulatory mechanisms containing these provisions must be in place in each State for delisting ot occur because the adequacy or inadequacy of those regulatory mechanisms help inform us whether a species, once delisted, will remain recover."). Yet as explained below, these state regulatory mechanisms are *not* final: Idaho has just this week opened public comment on a proposed grizzly bear hunting rule docketed for its October 26 meeting, and key mechanisms adopted by Montana and Wyoming are the subject of ongoing litigation alleging the violation of state administrative procedure statutes. Thus, it is improper for FWS to move forward with finalizing the rule as the existence of final, stable, predictable rules is a prerequisite to FWS' ability to determine – and the public's ability to comment on – the adequacy of existing regulatory mechanisms.

However, if FWS continues to move forward as if the state regulatory mechanisms are final, we respectfully request that the comment period be extended an additional 60 days, so that the comment period closes on December 7, 2016. That extension would allow parties to analyze fully the tremendous volume of new documents relevant to this comment period, and prepare substantive and informed comment responses.

Idaho's regulatory mechanisms are not finalized and thus, it would be improper for FWS to move forward with the rule until such documents are finalized.
Section 4(a)(D) of the ESA mandates consideration of "*existing* regulatory mechanisms," and during the course of this rulemaking FWS has accordingly committed to ensuring that post-delisting regulatory mechanisms are "in place by law and regulation in each State" prior to delisting. 81 Fed. Reg. at 13210. That standard has not been met yet, and the comment period should be extended until it has been.

The new proposed rule notes that Idaho has issued a "proclamation" regarding the take of GYE grizzly bears, but fails to note that a state rulemaking process to amend IDAPA 13.01.08 – in the State's words, "proposed rules [to] administer grizzly bear hunting should the Idaho Fish and Game Commission authorize hunting after grizzly bear in the Greater Yellowstone Ecosystem are taken off the federal endangered species list" – was opened on August 29, 2016, and has been filed for notice in the October 5, 2016 Idaho Administrative Bulletin (a copy of the advance notice is attached to this letter). A hearing is to be held on October 12, and the comment period closes on October 26. This state rulemaking – which will not conclude until nearly a month after FWS' deadline for comment on this proposed rule closes – has the potential to alter, amend, supplement, or supersede the content of the "proclamation." FWS cannot in good faith terminate a comment period meant to solicit public input on final state regulatory mechanisms in the middle of an open state rulemaking process on one of those very mechanisms. At a minimum, FWS should extend this comment period until Idaho's state process has concluded so that the public can comment on state regulations as they will actually exist at the time of any proposed delisting.

The Peer Review, State regulatory mechanisms, and supporting documentation total thousands of pages in length and introduce new concepts that demand additional time for comment. There is a tremendous amount of complex information to review for legal and scientific issues related to the proposed rule in light of the peer review analysis and the mechanisms put in place by the states of Idaho, Montana, and Wyoming.

First, the peer review itself totals 48 pages, and the studies and other documents cited therein total hundreds of additional pages of highly technical information. Furthermore, the peer review identifies several areas where "additional review and discussion" of concepts that it introduces or explicates for the first time in this rulemaking process, such as periodic environmental DNA sampling as a means of measuring genetic exchange, finer-grained analysis of human population growth factors, and other important but technically complex issues. Thirty days is simply not enough time for even the most sophisticated members of the public to research, consider, and comment meaningfully on these concepts.

Second, both the State regulatory documents referred to in the proposed rule and other state materials related to state management of grizzly bears in Wyoming, Montana, and Idaho - including memorandums of understanding; state management plans; state environmental impact analyses; and state laws and regulations that interact with or are incorporated by the specific state mechanisms

identified in the proposed rule - total thousands of pages of legal and scientific documentation. As FWS is well aware, the complex interplay among these state mechanisms is central to the health of the GYE grizzly bear population post-delisting. Summary documents like the Idaho proclamation cannot be adequately considered without reference to the many studies, state management plans, and broader legal frameworks referred to and relied on by each implementing State. Accordingly, more than thirty days is necessary for the public to review and substantively comment on those mechanisms that have been implemented.

For the foregoing reasons, the HSUS requests that the FWS extend the reopening of the comment period on the GYE grizzly bear proposed delisting rule by 60 days.

Thank you in advance for considering this request. Please contact me either by electronic mail (ksedlacek@hsus.org) or telephone (202-955-3661) as soon as possible to inform me of your decision on this matter or if you should have any questions about this request.

Hi Michel,

I got both rtf files in document ID number FWS-R6-ES-2016-0042-9775 from the Humane Society Legislative Fund (both the edited letters and the unedited letters). Thanks!

I am now waiting on the second set of Humane Society form letters to process and appear in regulations.gov. You said it was around 26 rtf files? That should hopefully be in a new document ID as they are from a different chapter of the Humane Society.

Thanks Michel!

Hey Jennifer,

I noticed that you were waiting for a response from Gary and up to draft response to issue 8. I read it and thought we could adequately respond with the information in hand, so I took a stab at it. I suppose we could augment once the Gary on up issues are resolved, but thought we could knock this one out. Let me know what you think (its in the google doc). Feel free to edit as you see fit.

Governor Matt Mead
State of Wyoming

Governor Steve Bullock
State of Montana

Governor Butch Otter
State of Idaho

Dear Governor :

As you know, the U.S. Fish and Wildlife Service has proposed to delist the distinct population segment of the grizzly bear that occurs in the Greater Yellowstone Ecosystem (GYE) shared by the States of Wyoming, Montana, and Idaho. One of the foundational elements of a final delisting determination is an interagency conservation strategy that reflects the commitment of the federal, state, tribal, and local land and resource managers on how this population of grizzly bears will be managed in the foreseeable future, absent the protections of the Endangered Species Act. In the course of negotiating revisions to the draft conservation strategy, it has come to our attention that there may be fundamental differences in perspective about the nature of the management objective for this population in a post delisted environment.

Accordingly, this letter is to seek confirmation, for the record, of the views of the States regarding the management objective for GYE grizzly bear population post-delisting.

There exists a lengthy history of discussion and collaboration with the States on grizzly bear management, including on the post-delisting management objective. When we delisted the GYE grizzly bear population in 2007, the Service's recovery criteria and the associated conservation strategy called for a **stable or increasing** population objective following delisting. This proposal was developed in collaboration with and supported by all three states and reflected the agreement that at minimum the population would be managed for stability if not for continued growth.

When we proposed new recovery criteria and took public comment in 2013, we amended our recovery criterion to reflect the fact that the population had stabilized and that the objective would be to maintain that **stable population** following delisting. This change reflected our collective understanding that the population has reached or was approaching carrying capacity and that managing for an increasing population as called for in 2007 was no longer appropriate. The Wyoming Game and Fish Department responded via letter in support of these proposed revisions while the states of Montana and Idaho did not comment.

As we began work on a proposed delisting in 2015, it became apparent in conversations with States that they desired a bit more management flexibility in a post delisting environment. Accordingly, we revised our recovery criteria to provide additional flexibility to manage **around the long-term mean** (i.e., the mean population size over the period 2002-2014), thus allowing for flexibility in the management objective and the possibility of some decrease in population size. All three states agreed with the revised recovery criteria. The conservation strategy was likewise amended to address this new objective.

When we proposed delisting in February of this year, the conservation strategy was silent on the issue of what would happen if the parties decided to change from the current population estimator (Chao2) to an alternative methodology. However, through the course of responding to peer review and public comment about how such a change would be implemented, there now exists significant inconsistencies in the record about the post delisting management objective that must be addressed.

In order for the Service to make a final determination that the GYE population warrants delisting, i.e., no longer meets the definition of an endangered or threatened species under the ESA, and to then successfully defend that delisting determination, the conservation strategy must clearly commit to managing the population into the foreseeable future with an objective of stability around the 2002-2014 average population level.

However, recent discussions among the working group revising the conservation strategy lead us to question whether the States have the same understanding and a continued commitment to that population management objective. Specifically, we are concerned about the refusal to commit to recalibrating the metrics used for managing the population for stability around the 2002-2014 average if a new population estimator is adopted, along with statements to the effect that maintaining the population above 500 bears is sufficient to achieve recovery and delisting. Both are at odds with a commitment to manage the population for stability around the 2002-2014 average population level for the foreseeable future.

Managing for stability has been the approach for over a decade, up to and including the 2016 proposed rule, and the record simply does not support finalizing a rule with such a **significant deviation** from the agreed upon historical approach to post delisting management. Our ability to make a final determination that delisting is warranted, and to successfully defend that determination if challenged, is dependent upon a clear and firm commitment from the States to this population management objective. It is imperative that there is no confusion around this issue and accordingly, I request a response within 15 days as to whether the States are committed, for the foreseeable future, to managing the GYE population of grizzly bears for stability around the 2002-2014 mean population level.

Subject:	Question related to follow-up with the Tribes
Date:	Thursday, October 06, 2016 1:30:56 PM

And as a follow-up to the question about Tribal coordination, SECRETARIAL ORDER # 3206
Subject: American Indian Tribal Rights, Federal-Tribal Trust Responsibilities, and the Endangered Species Act Section B(6) states the following.

(6) Having first provided the affected Indian tribe(s) the opportunity to actively review and
comment on proposed listing actions, provide affected Indian tribe(s) with a written explanation whenever a final decision on any of the following activities conflicts with comments provided by an affected Indian tribe: (i) list a species as endangered or threatened; (ii) designate critical habitat; (iii) reclassify a species from endangered to threatened (or vice versa); (iv) remove a species from the list; or (v) designate experimental populations. If an affected Indian tribe petitions for rulemaking under Section 4(b)(3), the Services will consult with and provide a written explanation to the affected tribe if they fail to adopt the requested regulation.

Sounds kinda like what we do for 4(i) and States. I don't have much background with this though so I'd recommend consulting with Ivy.

Subject: YNP Snowmobile plan

Hi Wade,

I work for the Fish and Wildlife Service Grizzly Bear Recovery Program and am working responses to public comment for the proposed delisting of the Yellowstone grizzly bear. The Service has been asked to consider the potential impacts from activities associated with snow mobiles, particularly artillery for avalanche control. Kerry Gunther thought that a similar comment may have come up in the YNP Snowmobile plan public comment period in regards to wolverines or pikas. I would like to be able to provide some information in our response about the limited scope and timing of avalanche control. Thank you for your time and help.

Hey Randy,

There are 13 active wells on the Forest that I know of (all gas +-condensate wells on the Big Piney RD, 7 producing and 1 shut-in on Deadline Ridge, 4 shut-in at South Cottonwood/Bare Creek, 1 temporarily abandoned in South Piney Creek). There are an additional 3 pads on which the well has been plugged, but the location not yet reclaimed.

The best source for O&G well GIS data is the Wyoming Oil & Gas Conservation Commission. You can check out their esri online map at http://wogccms.state.wy.us/flexviewers/unitmap/. The same data can be downloaded from the Wyoming Geospatial Hub at http://pathfinder.geospatialhub.org/ ("Highlight: Oil and Gas Wells"). Note that different types of O&G wells are in different datasets (e.g. conventional, horizontal, coalbed, disposal, injection), but that all the B-T wells are in the conventional category.

I downloaded some data earlier this year that is located at T:\FS\NFS\BridgerTeton\Program\2800MineralsGeology\GIS\WOGCC Wells dwnld 13JUNE2016.

Hi Kerry,
As part of the grizzly bear delisting effort, the USFWS needs to know if the following statement is true:

"Even with the high potential for occurrence and development in the Bridger-Teton, only 14 active oil and gas wells are currently inside that National Forest and none are within Service defined suitable grizzly habitat."

Can you point me to someone who could address the validity of the above statement? Thanks.

The same data can be downloaded from the Wyoming Geospatial Hub at http://pathfinder.geospatialhub.org/ ("Highlight: Oil and Gas Wells"). Note that different types of O&G wells are in different datasets (e.g. conventional, horizontal, coalbed, disposal, injection), but that all the B-T wells are in the conventional category.

I downloaded some data earlier this year that is located at
T:\FS\NFS\BridgerTeton\Program\2800MineralsGeology\GIS\WOGCC Wells dwnld 13JUNE2016.

Justin,

Please see the email thread below - wondering if you could validate that answer to the group? Mainly, if the number of active oil and gas wells is correct and if there is a shapefile of those we could access and see where they are located in relation to grizzly bear habitat.

PAUL: Let us know if you have any GIS info on this subject that could help answer the questions.

Thanks,

Randy

Hi Kerry,
As part of the grizzly bear delisting effort, the USFWS needs to know if the following statement is true:

"Even with the high potential for occurrence and development in the Bridger-Teton, only 14 active oil and gas wells are currently inside that National Forest and none are within Service defined suitable grizzly habitat."

Can you point me to someone who could address the validity of the above statement? Thanks.

Here you go:

ISSUE 81: We received some comments from peer reviewers and the public in reference to the Forest Service designation of the grizzly bear as a "sensitive species" or "species of conservation concern" upon delisting. This designation by the Forest Service was considered to be an important component of ongoing management of grizzly bears. Some asked for specific statutory and regulatory definitions for "sensitive species" and "species of conservation concern." There was concern about the authority provided by the Forest Service designations and that the new designation of "species of conservation concern" under the 2012 Planning Rule does not provide the same project-level prohibitions as the "sensitive species" designation.

Answer 81: The inherent protections afforded by the Sensitive Species designation and the Species of Conservation Concern and the Individual Species Direction are comparable. All three are designed to meet the intent of U.S. Department of Agriculture Departmental Regulation 9500-4 which directs the Forest Service to "Avoid actions which may cause a species to become threatened or endangered" and Sensitive Species Objectives (FSM 2670.22) which include: "Develop and implement management practices to ensure that species do not become threatened or endangered because of Forest Service actions and "Develop and implement management objectives for populations and/or habitat of sensitive species." Following are the regulatory definitions:

- **Sensitive Species**. Those plant and animal species identified by a regional forester for which population viability is a concern, as evidenced by:
  - Significant current or predicted downward trends in population numbers or density.
  - Significant current or predicted downward trends in habitat capability that would reduce a species' existing distribution. (FSM 2670.05)

- **Species of conservation concern**. For purposes of this subpart, a species of conservation concern is a species, other than federally recognized threatened, endangered, proposed, or candidate species, that is known to occur in the plan area and for which the regional forester has determined that the best available scientific information indicates substantial concern about the species' capability to persist over the long-term in the plan area. (FSM 219.9(c).

---

Jennifer,

That reference to Species of Conservation Concern (FSM 219.9(c)), is actually a CFR not a FSM.

Should be referenced as CFR 36 219.9(c). Here is the link:

http://www.ecfr.gov/cgi-bin/retrieveECFR?gp=&SID=5ef4a31b3b978f8e839f582d3504646c&mc=true&n=pt36.2.219&r=PART&ty=HTML#se36.2.219_19

Hope that helps,

Subject: RE:

Matt,

The Conservation Strategy says that the goal is to maintain a recovered population in accordance with the Recovery Criteria. However, recovery criterion 1 in the Conservation Strategy is inconsistent with the Recovery Plan Supplement because all reference to genetic health have been removed. This adds to confusion as to whether the population goal is a minimum of 500 (criterion 1) or to maintain the population around the 2002-2014 model-averaged Chao2 estimate (criterion 3). Furthermore, in the Executive Summary it now says "maintaining at least 500 bears in the GYE" but there is no mention of the population goal from criterion 3. In addition, without language that requires recalibration if a new population estimator is implemented, it is unclear as to whether the population goal in criterion 3 is a number (i.e., around 674 or between 600-747) or a condition (i.e., stability).

I hope that helps,
Jennifer

I am going to send you an email every time I add something to the highly substantive comments Google Drive folder beyond what was on the CD I sent you, so we can keep a record of it. So far, it is just one document. Deidre Bainbridge sent her exhibits by mail (she uploaded the text of her comment electronically so that is on your CD). I thus added these scanned exhibits to her folder in the Google drive and will update the spreadsheet accordingly.

As of now, we do not have the state comments organized into a different part of the rule. However, I am working on re-reading the state comments and attributing any appropriate pieces of the issue summaries to the state that raised the issue.

Should we change this to a separate part of the rule?

We made a decision on this early on, that it made more sense from a flow and readability perspective, given how many comments and issues we received, to keep them sorted by topic. Let's stay the course on this one. That said, noting which came from a State would be nice to do (if we can do it without way too much time and energy).

Hi everyone,

I am scheduling this call for October 6 from 9:30am-11am MT (11:30am-1pm ET). I know Marj and Jodi likely will not be able to join because of the Project Leaders/Biologists meeting.

Let me know if you foresee any issues with this! I will be in touch later next week if it turns out this conversation will not be necessary.

The Honorable Raúl M. Grijalva
Committee on Natural Resources
House of Representatives
218 Cannon House Office Building
Washington, D.C. 20515

Dear Representative Grijalva:

Thank you for your September 27, 2016 letter, concerning the proposed rule to delist grizzly bears in the Greater Yellowstone Ecosystem (GYE). Specifically, your letter expressed concern about the Conservation Strategy, population targets, connectivity, and hunting. We share your interest in the conservation of the Yellowstone grizzly bear population. Delisting will only occur if I am completely satisfied that we have robust commitments to maintain this conservation success in the long-term.

Recovery of the Yellowstone grizzly bear population is a remarkable conservation success story and further validation of the achievements of the Endangered Species Act. The Yellowstone grizzly bear population has rebounded from as few as 136 bears in 1975 to more than 700 today. Yellowstone grizzly bear's range has doubled since listing; this population now occupies more than 22,500 square miles of the ecosystem. This success would not have been possible without the tireless efforts of countless partners including Federal, State, and Tribal agencies, conservation groups, and private citizens, including ranchers, sportsmen, and outfitters.

As a result, last month we reopened the comment period on our proposed delisting. In total, we have offered two public comment periods totaling 90-days over the last seven months including March 11, 2016 to May 10, 2016, and September 7, 2016 to October 7, 2016. The most pertinent documents guiding management after delisting have now all been provided to the public for comment including the draft Conservation Strategy, Federal land management regulatory documents, and State discretionary mortality regulatory documents. Additional changes to the Conservation Strategy being considered are either minor or responsive to the public comments. Therefore, we do not believe an additional public comment period on the final draft Conservation Strategy is necessary.

Regarding management intentions, our management partners have agreed to maintain the total population size near the average population estimate for the period of stability achieved during 2002-2014 (i.e., 674 bears as measured by the model-averaged Chao2 estimate with a 95% confidence interval of 600 to 747 bears). This will be accomplished by reducing discretionary mortality to modest, sustainable levels

(<7.6%) should the model-averaged Chao2 fall below 674 bears and prohibiting discretionary mortality (except as necessary for human safety) in the unlikely event that the population ever falls below 600 bears. Montana, Idaho, and Wyoming have now all formally adopted these commitments.

Your letter also raised concerns related to the geography of harvest. Specifically, you asked that the John D. Rockefeller, Jr. Memorial Parkway retain its authority to prohibit hunting as a National Park Service Unit. You also indicated hunting should be prohibited on lands adjacent to the National Parks and within the Primary Conservation Area. Nothing in this rule would alter, or in any way affect, the jurisdiction or authority of the State of Wyoming, Tribal governments, the National Park Service, the U.S. Fish and Wildlife Service, or any other entity with respect to the regulation of hunting. The promulgation of a final determination will preserve the jurisdictions or authorities to authorize, prohibit, or regulate hunting that currently exist in these areas (except, of course, that this rule removes the protections of the Act). In short, it is beyond our authority to negotiate further on this point unless these issues present threats to the viability of the population.

Finally, your letter expressed concern about connectivity to other grizzly bear populations. We agree that connectivity to other grizzly bear populations to the north is desirable. Such connectivity has been and remains a focus of the Service and our partners. In the context of our proposed delisting, nearly all of the intervening habitat where dispersal would occur retains the full protections of the ESA, suggesting limited impacts to connectivity of grizzly bear habitat.

In our view, the current suite of discretionary mortality regulations will maintain the Yellowstone grizzly bear's recovered status. That said, the National Park Service and the States have a long history of cooperatively managing harvest for other species in a way that provides for the needs of all parties. We expect this partnership and successful management of harvest will continue.

Thank you for your interest in this iconic species and the conservation success story it represents. I hope this letter addresses your concerns. If you need further information, please do not hesitate to contact me at the above letterhead.

Sincerely,

Director

Hi Jodi,

I hope you are doing well! Jennifer suggested I reach out to you to see if you had an updated statistic for this tidbit that was in the 2007 delisting. "Five of the six GYA National Forests consulted with us in 2001 regarding the effect of snowmobiles on denning grizzly bears."

Thanks Jodi!

We have no documented records of grizzly bears abandoning dens do to snowmobile activity. Since the winter of 2013-2014, I have been responsible for documenting potential conflicts between denning and/or emerging grizzly bears and snowmobile use on the Gallatin National Forest. For the last 3 denning seasons there have been no reports of grizzly bear active during the winter/early spring seasons by agency personnel (IGBST or MTFWP) that indicated potential conflicts between denning and/or emerging grizzly bears and snowmobile use. Reports to the Gallatin National Forest for the winters of 2013-14, 2014-15, and 2015-16 are attached.

Additionally, during the winter of 2009-2010, a grizzly bear was observed digging a den in the Squaw Basin, Bridger-Teton National Forest in a area heavily used by snowmobiles. The attached reports documents over winter snowmobile activity near the den site. The grizzly bear remained in the den throughout the winter and emerged 20 April 2010 with one cub-of-the-year.

Date:	Wednesday, November 09, 2016 10:43:26 AM

I am happy to give an update on our Bear Wise Program and local conflict prevention, proactive efforts as well as discuss on the ground reality and work in the local area and GYE -- but an hour seems a bit long for that. 15-30 minutes would be more appropriate, can happily do 30.

Sorry I missed you call Dan, was in a separate meeting.

Subject: GYE grizzly Conservation Strategy

Mike Thabault just called to report that the Yellowstone Ecosystem Subcommittee postponed a vote on the recalibration language until next Friday, Nov 4. The federal agency reps reportedly said that they needed that additional time to review and discuss with their agency leadership.

I understand that the USFS co-chair of the YES stated on the call that, "The States believe the recovery goal is a number, not related to the population estimator", and the State reps agreed with that characterization. I have not seen them put their view forward so plainly before.

Our position, of course, is that recovery is a condition, not an absolute number, and that the mean, confidence intervals, triggers, and floor used to describe and manage for that condition are absolutely tied to the population estimator being employed.

Hard to believe that after 2 years of arguing about this threshold issue, and after negotiating the language of demographic recovery criterion last January, we still remain in such fundamental disagreement. -- GDF

YES mtg. This is where our YES meeting is being held. We do not know if there are plans to somehow present this or otherwise mark it at YES mtg. Might be something to consider at least planning for the unexpected, especially after what is going on with the pipeline issue……

http://nativenewsonline.net/currents/tribes-make-history-signing-grizzly-treaty-alberta-greater-yellowstone-sept-30-oct-2/

FYI. From the release.

The Department of the Interior needs to institute a moratorium on the delisting of the Yellowstone grizzly bear until proper consultation is addressed with each affected tribal nation respectively, so we can get better solutions for the future of the grizzly bear and for our people," says Shoshone-Bannock

Any words of wisdom? They are likely to be there at the meeting on Monday. JB

The new files have been added to the document id. I was also able to open all the existing files in both FDMS and on regulations.gov. The newly added also were accessible in both systems! the contents are indeed identical.

Anyhow there are part of the document id.

That is all for now

Michel

Hello Tracie,

Thank you for chatting. Below is the email sent to Keisha describing the situation. Please let me know if you are able and interested in resubmitting the third file for our consideration. We would like to consider the comments if possible. As indicated below, we request the resubmitted file no later than 3pm mountain tomorrow.

Thanks,

Seth

Hello Keisha,

I am contacting you regarding your comments on the proposed delisting of the Yellowstone Grizzly Bear population (Docket ID: FWS-R6-ES-2016-0042). This is a follow up to two previous voice messages from myself (10/13) and Michel Bagbonon (10/12). As previously indicated, we received 30 rtf files with member comments. However, the 3rd of the 30 files was corrupt and cannot be opened; the remaining files function normally. Your comments, minus the third corrupt file, have been uploaded here: https://www.regulations.gov/document?D=FWS-R6-ES-2016-0042-9781

We are reaching out again to see if you wish to resubmit the third file. If so, we need this file by 3pm mountain time tomorrow. Please let me know.

Additionally, on the off chance you are on leave, I am going to call your main line to see if we can reach another person in your shop.

Thanks,

Seth

Good morning,

I am attaching here two .rtf files – depending on in which order you received the files (including the edited comments), one of the attached versions should be the 3rd (corrupted) file. These seem to open fine on my computer, but please let me know if they continue to be inoperable on your end, and I will figure out a different format for them.

Thanks so much for letting us know about the problem!

Very best,

Jen Lonergan

Washington, D.C. 20037

Dear Ms. Sedlacek,

Thank you for your September 12, 2016 letter requesting a 60-day extension of the current comment period on the proposal to remove the Greater Yellowstone Ecosystem population of grizzly bears from the federal list of endangered and threatened wildlife. The comment period between March 11, 2016 and May 10, 2016 together with the current comment period between September 7, 2016 and October 7, 2016 provided the public with 90 days to share their thoughts on our proposal. The states have finalized regulatory mechanisms that meet the letter or intent of the five specific regulatory requirements we outlined in our proposed rule and we shared the content of these regulatory mechanisms with the public. Provided those specific regulatory requirements are met, as they are in Idaho, the Service considers it the prerogative of the states to regulate other aspects of grizzly bear hunting. We believe we have given the public ample time to comment on the proposed rule, both initially and following enactment of state regulatory mechanisms and completion of the peer review. Therefore, we are denying your request to extend this comment period. We will reply to the specific concerns you presented in your letter as responses to public comments in our final determination.

We appreciate your continued involvement and interest in this process. If you need further information, please do not hesitate to contact me at the above letterhead.

Sincerely,

Wayne Kasworm

Acting Grizzly Bear Recovery Coordinator

There were 1,124 comments in the latest bulk extract. It deduplicated down to 945 units. Once I removed the overlapping comments that we already coded last week, there are only 673 for us to code. Some of those 673 units are the highly substantive comments I already place in our shared folder. Some of them are also the spreadsheets with form letter submissions.

We have form letters/petitions now, though. I will share the spreadsheet tracking these with you so you can see how many units we have to code from form letter submissions.

I will start doing some comparisons in Adobe.

Hi Jennifer,

I spent some time yesterday looking at every attachment we received thus far. I uploaded all of the highly substantive comments to our shared folder in google drive ("Highly substantive comments_Round 2"). We may still receive some highly substantive comments in hard copy. These may not appear in regulations.gov until late this week or early next week. But, I think we have received the bulk of the highly substantive comments.

We are forging ahead with the comment processing. I already have two output spreadsheets that I can start cleaning up.

Let me know if there are other things I can be doing to be helpful!

That's what I was hoping! There are a lot of citations that were in the example text we pulled from the 2007 delisting. Should I go through and cross-check each of those with the proposed rule lit cited? If any of those citations were not in the proposed rule, then I suppose that is literature I technically added and should put in this folder.

I know you are keeping careful track of this in your own folders but I wanted to make sure things I cite end up there as well. I am going to drop anything I cite in this folder. So far, the only things in it are the four documents on snowmobile use that were attached to Frank's email.

Hi Tyler,

I hope you have been having a great week. Just wanted to follow up again to see if you could share the email you sent to the counties about the reopener with me and Jennifer for the record.

Thanks!
Alex

> > > My name is Alex Kasdin and I am a graduate student fellow working in the R6 RO and assisting with grizzly bear. Hopefully you are all aware that we are planning to reopen the comment period on the proposed rule to delist the grizzly bear in the Greater Yellowstone Ecosystem. This reopener will allow the public to comment on the proposal in light of the peer reviews and recently finalized state regulations. We are still waiting to hear when this notice will publish in the Federal Register (we are hoping it will happen later this week or early next week). As we did with the proposed rule in March, we are hoping that you all can notify the affected counties of the comment reopener on the day the notice publishes in the Federal Register. The earliest this would happen would be on

Friday September 2. However, the notice may not publish until Wednesday September 7.

Please do not call the counties yet. I just wanted to give you a heads up that we will be requiring your assistance with this effort when the time comes. I will let you know ASAP when I know the publication date of the notice. Please let me know if you anticipate any issues with making these calls.

I am attaching the same county contact list we used with the proposed rule, though it is likely a bit out of date. Please let me know if I can be of any assistance in tracking down accurate contacts for any counties.

Thanks so much for your help in this effort!

I will attached revised Appendix C with our email.

_____
_____

Mary. Thank for you letting us know about this new development. Attached please find the Service's proposed language regarding recalibration in Appendix C. Given that we have not reached agreement with the States about the alternate language regarding recalibration in Appendix C and that they have chosen to bring their alternative language to the YES committee, we are providing this to you to share as well.

We believe the language the State suggests has too much ambiguity about the long term objectives of recovery, is inconsistent with the recovery plan and criteria and will be difficult to defend successfully in litigation.

(IT MIGHT BE USEFUL TO EXPLAIN WHY WE THINK ITS AMBIGUOUS AND INCONSISTENT HERE...)

Although the States language may appear "reasonable" by some, it leaves the recalibration question to a body (the YGCC) that is yet to be formed, and for which we do not know the membership, or rules of procedure.

The Service believes it is much clearer and scientifically warranted, to state clearly that if the population estimator is changed we will recalibrate.

FWS suggested revisions to State suggested Appendix C language.

Adoption of a different population estimator will require recalibration of the associated demographic objectives and standards ~~if the YGCC determines that such recalibration is necessary for maintaining a recovered grizzly bear population as defined in the Conservation Strategy.~~ (e.g. populations objective, confidence intervals, mortality limits) that are based upon the population estimator.

Date: Tuesday, September 27, 2016 10:23:08 AM

Hi Grant,

It was so great to meet you in person last week. I hope you had safe travels back to Portland. I just wanted to ping this back to the top of your inbox. If you do have some time this week or early next week to work on a few responses to comments, it would be so appreciated. The google doc linked here contains the summaries of all the issues raised in the first round of public comment and the peer review. Any issue that still needs a response is highlighted in yellow. Give the document a read and let me know if any of the highlighted issues appeal to you. However, I am assigning and writing these responses as we speak so availability of responses is constantly changing. So, please check with me before starting to write a response. If the response you'd like to write is still available, I will send you some additional guidance and resources.

Thank you so much again for your willingness to help!
Alex

Attachments:	Edits from p48 Conservation Strategy 9-26-2016.docx

Apologies. I also told folks I would get back to them on the language that seemed to just "appear" in the CS on page 48.

At the September 8th YES meeting, issues were raised to the Committee regarding how discretionary and total mortality rates are calculated as the public had requested clarification on these two integral issues. Commenters suggested that the Strategy should include Table 3 and the subsequent from the proposed rule to clarify how hunting mortality will be calculated. Without these explanations commenters were concerned that the calculation of hunting mortality was unclear and could potentially equal 200 bears with the current population estimate of 717.

At the YES meeting Jennifer Fortin Noreus was asked to work with the IGBST to draft technical language for the Strategy and the Rule to address these questions/concerns. The suggested verbiage on pages 49-50 of the Sept 22 CS (see below) is the result of that assignment. The new language and tables were modified from those in the proposed rule in response to the public comments and to clarify that these are only examples.

Please note that given the short timeline for this request only Frank van Manen of the IGBST provided input.

That suggested language is attached and is what was in the 9-26-16 version of the CS that we saw on Monday.

Please review this language in that light so we can come to a decision regarding its inclusion or not on Monday, October 3. Thank you. JB

Group. As was discussed on the call on Monday, I indicated I would get the suggested language to you to address the perpetuity question that was raised during the comment period and that we discussed at the September YES meeting. The suggested revision is to add "for the foreseeable future" in 2 places in the CS. One on page 7 the other on page 19. See language below. We will be talking about this at the Oct 3 meeting so wanted to make sure you were aware ahead of time. Thanks JB

On page 7 of the CS. The suggested change in red.

This Conservation Strategy was developed to be the document guiding management and monitoring of the Yellowstone grizzly bear population and its habitat upon recovery and delisting. The Conservation Strategy will remain in effect for the foreseeable future, well beyond recovery and delisting. Ongoing review and evaluation of the effectiveness of this Conservation Strategy is the responsibility of the state, tribal, and federal managers in the GYE. All monitoring protocols will be conducted and funded by those agencies assigned the responsibility. This Conservation Strategy will be evaluated by the management agencies every five years, allowing public comment in the updating process.

The other on page 19, just before the signatory block.

This Strategy will remain in effect for the foreseeable future well beyond the delisting and the five year monitoring period required by the Act to address the long-term need for continued coordination among signatory agencies. This Strategy will be adaptive in nature and will be re-evaluated at least every 5 years beginning on the date of the last signature below.

Jodi L. Bush

Proposed revisions to pages 49-50 of the Conservation Strategy (9-26-16 version)

At the September 8th YES meeting, issues were raised to the group regarding how discretionary and total mortality rates are calculated as the public had requested clarification on these two integral issues. Commenters suggested that the Strategy should include Table 3 and the subsequent from the proposed rule to clarify how hunting mortality will be calculated. Without these explanations commenters were concerned that the calculation of hunting mortality was unclear and could potentially equal 200 bears with the current population estimate of 717.

At the YES meeting Jennifer Fortin Noreus was asked to work with the IGBST to draft technical language for the Strategy and the Rule to address these questions/concerns. The suggested verbiage on pages 49-50 of the Sept 22 CS (see below) is the result of that assignment. The new language and tables were modified from those in the proposed rule in response to the public comments and to clarify that these are only examples.

Please note that given the short timeline for this request only Frank van Manen of the IGBST provided input.

Proposed revisions to include in both the Rule and the Strategy (suggested to be added to page 48)

The number of bears available for discretionary mortality in a given year is based on the population estimate inside the DMA from the previous year, the total annual mortality rate (*see* Table 1), and the non-hunting mortality from the previous year. Total annual mortality numbers are calculated by multiplying the total annual mortality rate by the size for each sex/age cohort. The size of each sex/age cohort varies with population size. Total mortality includes documented known and probable grizzly bear mortalities from all causes including but not limited to: management removals, illegal kills, mistaken identity kills, self-defense kills, vehicle kills, natural mortalities, undetermined-cause mortalities, grizzly bear hunting, and a statistical estimate of the number of unknown/unreported mortalities (Cherry et al. 2002). The number of non-hunting mortalities for independent females and males from the previous year will then be subtracted from the total number of allowable mortalities for the most recent population estimate

resulting in the expected number of independent female and male bears available for hunting allocation. Two examples serve to demonstrate how the expected number of bears available for hunting mortality will be calculated: the number of independent female and male bears available for hunting inside the DMA based on the 2015 population estimate of 717 are shown in Table 3 and the 2002–2014 average population estimate of 674 are shown in Table 4. For each population estimate, examples are given for low non-hunting mortality in the previous year and high non-hunting mortality in the previous year.

Table 3. Example calculations of allowable total annual mortality inside the DMA and expected number of independent female and male bears available for hunting inside the DMA at the 2015 estimated population size of 717. These are example calculations under 2 scenarios: (1) low non-hunting mortality in the previous year, as occurred in 2014; and (2) high non-hunting mortality in the previous year, as occurred in 2015.

	Estimated population size of 717			
	Low mortality in preceding year (as occurred in 2014)		**High mortality in preceding year (as occurred in 2015)**	
	Independent **Females**	Independent **Males**	Independent **Females**	Independent **Males**
Size of sex/age cohort at this population size	250	250	250	250
Total annual mortality rate	9%	20%	9%	20%
Allowable total annual mortality number	22	50	22	50
Non-hunting mortality for the previous year	20	29	25	32
Bears available for hunting inside the DMA	**2**	**21**	**0**	**18**

Table 4. Example calculations of allowable total annual mortality inside the DMA and expected number of independent female and male bears available for hunting inside the DMA at the 2002–2014 average population size of 674. These are example calculations under 2 hypothetical scenarios: (1) low non-hunting mortality in the previous year; and (2) high non-hunting mortality in the previous year.

	Estimated population size of 674			
	Low mortality in preceding year		**High mortality in preceding year**	
	Independent **Females**	Independent **Males**	Independent **Females**	Independent **Males**
Size of sex/age cohort at this population size	236	236	236	236
Total annual mortality rate	7.6%	15%	7.6%	15%
Allowable total annual mortality number	18	35	18	35
Non-hunting mortality for the previous year	10	15	18	34
Bears available for hunting inside the DMA	**8**	**20**	**0**	**1**

Our proposed language for App C is as follows:

"Adoption of a different population estimator will require recalibration of the associated demographic objectives and standards (e.g. populations objective, confidence intervals, mortality limits) that are based upon the population estimator.

The language that the 3 states are putting forward is as follows:

"Adoption of a different population estimator will require recalibration of the associated demographic objectives and standards if the YGCC determines that such recalibration is necessary for maintaining a recovered grizzly bear population as defined in the Conservation Strategy."

>
> Jon, Neil and Tom, we need your help to ensure solidarity among the federal representatives to the Yellowstone Ecosystem Subcommittee (YES) to the Interagency Grizzly Bear Committee (IGBC). For several weeks, we have been trying to reach a compromise on key language to the Grizzly Bear Conservation Strategy. It regards the issue of "recalibration" of the demographic standards (population goals, mortality limits and rates, etc.) if the population estimator is

changed post-delisting. We believe this is a key commitment that must be clear in the strategy in order to ensure that the states are committed to the basic goal of maintaining the delisted population of bears.

We heard today that the 3 Governors cannot accept our final recommended recalibration language, and apparently, today, 3 state fish and game directors sent a letter to the YES chair urging that the WY language be brought to a vote at the YES meeting tomorrow.

The Service representatives on the YES will offer our language as an alternative to the language proposed by the states. We need the USFS, BLM and NPS members on the YES to stand with the Service on this key issue. The membership of the YES is as follows:

Mary Erickson, Custer-Gallatin NF

Tricia O'Conner, Bridger Teton NF

Melany Gossa, Beaverhead Deerlodge NF

Garth Smelser, Caribou-Targhee NF

Joe Alexander, Shoshone NF

David Vela, Grant Teton National Park

Dan Wenk, Yellowstone National Park

Ken McDonald, MT Fish, Wildlife And Parks

Jeff Gould, Idaho Dept. of Fish and Game

Brian Nesvik, WY Game and Fish Department

Tom Rice, MT Association of Counties

Lee Miller, ID County Commissioners

Loren Grosskopf, WY County Commission

Leander Watson, Shoshone Bannock Tribes

Delissa Minnick, WY BLM

Cornie Hudson, MT BLM

Matt Hogan, FWS

Jodi Bush, FWS

Thanks for your support. I'll be in the office tomorrow and available to talk if you have questions.

Dan.

---

It was attached to Jennifer's email. And FS sent it to Gary directly. Therefore, I think we can say it was received by the FWS leadership. All it basically says is they support calibration. I think we knew that, but this says it formally.

US Forest Service Statement of interest in management objectives for the GYE grizzly bear
9/15/2016

In March 2016, the U.S. Fish and Wildlife Service (USFWS) published a Proposed Rule to remove the Greater Yellowstone Ecosystem (GYE) grizzly bear population from the Federal List of Endangered and Threatened Wildlife. As stated in the May 13, 2016, letter from Leslie Weldon (Deputy Chief, National Forest System) to the USFWS, the Forest Service supports the Proposed Rule, inclusive of the statements that the Yellowstone grizzly bear population is stable and that the threats to this population are sufficiently minimized. However, as also indicated in that letter, the Forest Service has concerns regarding language in the Proposed Rule and Conservation Strategy associated with population management objectives. Principally, these concerns involve language consistency between the two documents and clarity in stated objectives.

In recent decades, the Forest Service has contributed significantly to the successful multi-agency program to recover and conserve the GYE grizzly bear. These efforts have resulted in a demonstrative increase in secure habitat and a biological recovery of the population. In light of this commitment, the Forest Service has a vested interest in implementing a Conservation Strategy that provides the best framework for managing the GYE grizzly bear population into the future. To that end, it is in the best interest of all partner agencies, as well as the grizzly bear, that an overall population objective is clearly stated and in a manner consistent between the Final Delisting Rule and the Conservation Strategy. To ensure transparency in a delisting process and to withstand legal challenge, the Forest Service leadership supports providing a post-delisting management objective that promotes maintaining a stable grizzly bear population. Consistent with this objective, the best science available should be utilized to maintain the total population size near the average population estimate for the period of stability achieved during 2002-2014, regardless of which population estimator is used.

The Forest Service affirms the commitment to manage GYE habitat commensurate with this population objective. It also intends to manage habitat in a manner that promotes natural movement and genetic exchange between GYE grizzly bears and nearby populations.

Recovering the Yellowstone grizzly bear population has been a 40-year lesson in cooperation and commitment toward a common goal. In that spirit, the Forest Service is similarly committed to working with partner agencies to see the legacy of this remarkable accomplishment secured by attending to the conservation of the GYE grizzly bear population.

> >
> > As current chair of YES, Mary Erickson is putting together the agenda for the

upcoming meeting in Cody, November 16-17. We need your help with that. Originally, the intent for this meeting was to provide updates on the delisting process reflecting final stages or conclusion of this effort.

However, we find ourselves in a very different spot, which the conference call this past Friday revealed. Topics that we expected to fill much of the meeting are no longer worthy (e.g. State Plans, commitment for signatures with a level of ceremony, sentimental retrospect on this conservation success story). Consequently, we need to find a way to express the current reality- the current status of the process.

We owe the public good and transparent updates, but we also have big gaps in the agenda that we now need to responsibly use. We need your help with this, especially since public expectations are very high given the time-line for delisting provided the public at previous meetings. Consider as well the unique culture of Cody, WY.

Here is a list of potential topics for your consideration- ones we could use your help with:

- Overview of the delisting process to date.
- Current status of the delisting process.
- Strategic look at next steps in the delisting process- USFWS expectations.
- Posting of the draft Conservation Strategy.
- Summary of response to comments.
- Process used to revise the Conservation Strategy.
- Summary of changes made to the Conservation Strategy and potential effects to grizzly bear management in the GYE.
- Portions of the Conservation Strategy not approved and why.
- Associated status of the proposed delisting Rule.
- The role of YES and IGBC in the delisting process in relationship to FWS authority.
- Relationship of the Conservation Strategy to Forest Plans.

We should have an agenda available Wednesday. So, could we get your response to this tomorrow? We can talk this through and assign and consolidate topics. Thanks! I will be around all day tomorrow and checking in with Mary.

Dan Ashe
Director, U.S. Fish and Wildlife Service

On Oct 27, 2016, at 8:17 PM, Frazer, Gary <gary_frazer@fws.gov> wrote:

> Dan -- Got a call from David Willms around 6p. The Governors are all in agreement that they cannot accept our recalibration language. (David said that he had all the WY interests in agreement to accept our language two days ago, but a WG&FD Commissioner managed to blow it all up. So close.) As a result, the 3 state directors sent a letter to the chair of the Yellowstone Ecosystem Subcommittee today urging that the WY language be brought to a vote at the YES meeting tomorrow. Ultimately, if the Service does not proceed with delisting, David said that the states would file suit to compel us to do so.
>
> I next spoke to Matt. He said he heard from the USFS that it might be difficult for them to oppose the state language unless the Service put forward an alternative. I don't see any downside to us putting forward to the Subcommittee our language for Appendix C and recommend that we do so. Do you agree?
>
> In addition, if the USFS and BLM and NPS members on the YES all stand with the Service on this issue, it is unlikely that the state language will get a majority of votes on the Subcommittee. Suggest that you reach out to Tom and Neil to encourage their agency reps to stand with us. I think it's a safe assumption that the NPS members will be with us. The membership of the YES is as follows:
>
> Mary Erickson, Custer-Gallatin NF
> Tricia O'Conner, Bridger Teton NF
> Melany Gossa, Beaverhead Deerlodge NF
> Garth Smelser, Caribou-Targhee NF
> Joe Alexander, Shoshone NF
> David Vela, Grant Teton National Park
> Dan Wenk, Yellowstone National Park
> Ken McDonald, MT Fish, Wildlife And Parks
> Jeff Gould, Idaho Dept. of Fish and Game
> Brian Nesvik, WY Game and Fish Department
> Tom Rice, MT Association of Counties
> Lee Miller, ID County Commissioners
> Loren Grosskopf, WY County Commission

Leander Watson, Shoshone Bannock Tribes
Delissa Minnick, WY BLM
Cornie Hudson, MT BLM
Matt Hogan, FWS
Jodi Bush, FWS

I'm about to head to the gym, but will be back home by 10p if you want to discuss. Or I'll be in first thing tomorrow. -- GDF

------ATTORNEY-CLIENT PRIVILEGE-------

Hi Tyson,

(b)(5) attorney-client [redacted]

It would be great if we could get this as final as possible today.

Thanks!
Alex

Yellowstone National Park

Wildland Fire in Yellowstone

Read about the "Summer of Fire" in the **"Yellowstone Fires of 1988."** (1.2 MB pdf)

Landscapes such as those seen in Yellowstone have long been shaped by fire and not just the cool, creeping ground fires often described as "good" for grass production. The natural history of fire in the park includes large-scale conflagrations sweeping across the park's vast volcanic plateaus, hot, wind-driven fires torching up the trunks to the crowns of the pine and fir trees at several hundred-year intervals.

Such wildfires occurred across much of the ecosystem in the 1700s. But that, of course, was prior to the arrival of European explorers, to the designation of the park, and the pattern established by its early caretakers to battle all blazes in the belief that fire suppression was good stewardship. Throughout much of the 20th century, park managers and visitors alike have continued to view fire as a destructive force, one to be mastered, or at least tempered to a tamer, more controlled entity. By the 1940s, ecologists recognized that fire was a primary agent of change in many ecosystems, including the arid mountainous western United States. In the 1950s and 1960s, national parks and forests began to experiment with controlled burns, and by the 1970s Yellowstone and other parks had instituted a natural fire management plan to allow the process of lightning-caused fire to continue influencing wildland succession.

Many of Yellowstone's plant species are fire-adapted. Some (not all) of the lodgepole pines (*Pinus contorta*), which make up nearly 80% of the park's extensive forests, have cones that are serotinous sealed by resin until the intense heat of fire cracks the bonds and releases the seeds inside. Fires may stimulate regeneration of sagebrush, aspen, and willows, but the interactions between these plants and fire is complicated by other influences such as grazing levels and climate. Though above-ground parts of grasses and forbs are consumed by flames, the below-ground root systems typically remain unharmed, and for a few years after fire these plants commonly increase in productivity.

In the first sixteen years of Yellowstone's natural fire policy (1972-1987), 235 fires were allowed to burn 33,759 acres. Only 15 of those fires were larger than 100 acres, and all of the fires were extinguished naturally. Public response to the fires was good, and the program was considered a success. The summers of 1982-1987 were wetter than average, which may have contributed to the relatively low fire activity in those years.

No one anticipated that 1988 would be radically different. In April and May, Yellowstone received higher-than normal rainfall. But by June, the greater Yellowstone area was experiencing a severe drought. Forest fuels grew progressively drier, and the early summer thunderstorms produced lightning without rain. The fire season began, but still without hint of the record season to come. Eleven of 20 early-season fires went out by themselves, and the rest were being monitored in accordance with the existing fire management plan.

The summer of 1988 turned out to be the driest in the park's recorded history. By

July 15, only 8,500 acres had burned in the entire greater Yellowstone area. Still, due to continued dry conditions, on July 21 by which time fire activity had become noticeable to park visitors and to the national media the decision was made to suppress all fires. But within a week, fires within the park alone encompassed more nearly 99,000 acres, and by the end of the month, dry fuels and high winds combined to make the larger fires nearly uncontrollable. National news reporters poured into Yellowstone National Park, as did firefighters from around the country, bolstered by military recruits. On the worst single day, August 20, 1988, tremendous winds pushed fire across more than 150,000 acres. Throughout August and early September, some park roads and facilities were closed to the public, and residents of nearby towns outside the park feared for their property and their lives. Yellowstone's fire management policy was the topic of heated debate, from the restaurants of park border towns to the halls of Congress.

By September 11, 1988, the first snows of autumn had dampened the fires as the nation's largest fire-fighting effort could not. The imminent danger to life and property was over, and firefighters were gradually sent home, although the last of the smoldering flames were not extinguished until November. Staff in Yellowstone National Park went to work surveying the impacts of the fires on wildlife, plants, historic structures, trails, and more and answering the demands for information, explanation, and a new fire management policy.

A total of 248 fires started in greater Yellowstone in 1988; 50 of those were in Yellowstone National Park. Despite widespread misconceptions that all fires were initially allowed to burn, only 31 of the total were; 28 of these began inside the park. In the end, 7 major fires were responsible for more than 95% of the burned acreage. Five of those fires were ignited outside the park, and 3 of them were human-caused fires that firefighters attempted to control from the beginning. More than 25,000 firefighters, as many as 9000 at one time, attacked Yellowstone fires in 1988, at a total cost of about $120 million. Thankfully, the fires killed no park visitors and no nearby residents. Outside the park, two firefighters were killed, one by a falling tree and one while piloting a plane transporting other personnel.

Ecosystemwide, about 1.2 million acres was scorched; 793,000 (about 36%) of the park's 2,221,800 acres were burned. Sixty-seven structures were destroyed, including 18 cabins used by employees and guests and one backcountry patrol cabin in Yellowstone. Estimated property damage totaled more than $3 million. About 665 miles of hand-cut fireline and 137 miles of bulldozer lines, including 32 miles in the park, needed some rehabilitation, along with the remnants of fire camps and helicopter-landing spots. Surveys found that 345 dead elk (of an estimated 40,000-50,000), 36 deer, 12 moose, 6 black bears, and 9 bison died in greater Yellowstone as a direct result of the fires; 2 radio-collared grizzly bears were missing and were presumed to have been killed, (although one turned up alive and well several years later). Most of the animals that died were trapped as fire quickly swept down two drainages, and were discovered when biologists subsequently observed scavenging grizzlies, coyotes, and birds feeding on the carcasses. A few small fish-kills occurred as a result of either heated water or dropping fire retardant on the streams. Surveys revealed that less than 1% of soils were heated enough to burn below-ground plant seeds and roots.

A massive effort was funded by the U.S. Congress to restore damaged facilities and to study the long-term ecological, social, and economic effects of the Yellowstone fires. Although the tourist season was cut prematurely short by the fires and associated firefighting activity, the feared abandonment of regional visitors failed to materialize in 1989. The effects on many plants and animals are still being studied, although in the short-term, most wildlife populations showed no effect or rebounded

quickly from the fiery summer. In the several years following 1988, ample precipitation combined with the short-term effects of ash and nutrient influx to make for spectacular displays of wildflowers in burned areas. And, where serotinous lodgepole pines were burned, seed densities ranged from 50,000 to 1 million per acre, beginning a new cycle of forest growth under the blackened canopy above.

Across the nation, national parks and forests suspended and updated their fire management plans, assisted by the ecological assessment of a panel of independent scientists and by revised national fire management policies. In 1992, Yellowstone National Park again had a wildland fire management plan, but with stricter guidelines under which naturally occurring fires may be allowed to burn.

Although unprecedented in the 125-year history of the park, the scientists reviewing the effects of the 1988 fires reminded us that fires of such scale burned elsewhere in similar ecosystems during this century, and earlier in the landscape's history.

> *Only a miniscule portion of once vast wilderness landscapes has been preserved, and the boundaries and spatial extent of these preserved bear little relationship to the natural processes necessary for their preservation. The 1988 fires have laid bare the broad extent of our ignorance of those natural processes.*
>
> *N. A. Christensen, et al.*

Through continued public education, scientific research, and professional fire management, Yellowstone hopes to preserve the process of natural fire in the park while minimizing adverse effects on park visitors and neighbors, recognizing the inevitability of this force to continue shaping the landscape as it has for centuries.

INFORMATION/BRIEFING MEMORANDUM

DATE: October 10, 2016

FROM: Jodi Bush, Supervisor, Montana Ecological Services Office, (406) 449-5225.

SUBJECT: Update on Yellowstone Grizzly Bear Delisting and YES Committee

The U.S. Fish and Wildlife Service (Service) is working, at all levels of the agency, to get agreement on outstanding issues in the Yellowstone Ecosystem (YES) grizzly bear delisting process. These include issues in the Conservation Strategy (CS), the Recovery Plan (RP) and the Proposed Rule/Federal Register document. Based on our most recent YES meeting (October 3, 2016), we appear to have agreement on all previous outstanding issues except for recalibration. The YES committee deferred any discussion on this topic (recalibration) at that meeting as management at higher levels in multiple agencies remain engaged in discussions.

BACKGROUND

On March 11, 2016 the Service proposed to delist the YES population of grizzly bear. With the proposed rule the Service also released two other documents for public comment, a draft supplement to the 1993 Grizzly Bear Recovery Plan with revised demographic criteria for the Yellowstone grizzly bear population, and a draft conservation strategy. These detail how both grizzly bears and their habitat will be managed in a post-delisting environment. The Conservation Strategy was developed by our State and Federal partners to be the document that identifies and guides management and monitoring of the Yellowstone grizzly bear population and its habitat upon delisting. Many of the comments we received during the open comment period pointed to inconsistencies between the CS and the Service's proposed rule and RP. In addition, our partners found errors and requested clarifications in the CS prior to its finalization. Since April of 2016, a subset of the YES committee –the YES Steering committee, has met regularly to address both the internal partner agency issues (identified at the April YES meeting), and those issues brought up by the public and peer reviewers during open comment period. This has resulted in resolution of most of the issues identified with the exception of recalibration and revisions of triggers for a Service status review.

KEY POINTS

- The Service had several issues that needed to be resolved prior to finalizing the delisting rule. These included: (1) clarifying the triggers, (2) addressing NPS concerns with the 1998 baseline, (3) language regarding how long the CS would be in place – revising the perpetuity language, (4) addressing food storage as a benefit to connectivity, and the concept of connectivity in general, (5) clarifying recovery criterion #1 –related to genetic health, and (6) recalibration.
- The majority vote by the YES was to remove any reference to genetic health in the discussion of recovery criterion #1. This removal makes recovery criterion #1 in the Strategy inconsistent with the Recovery Plan Supplement and the Rule. In addition, the Supplement

and Rule clarify that 500 is not a population target but a minimum. Genetic management is referred to in another location in the document (Chapter 2) as is a genetic monitoring protocol, and referenced to the science behind RC#1.

- The Service worked with our partners to address, clarify and revise all of these issues with the exception of recalibration. That issue remains with upper management to resolve. In addition issues that were brought up by the public, the peer reviewers, and the agencies themselves have been addressed in the CS and suggested edits to the Rule made.
- At the last YES meeting (October 3, 2016), the committee was able to work through each chapter of the CS and get to final agreement on the edits and revisions for the entire document.
- We are still working on the Appendices and plan to have draft versions for YES committee review by later this week. As most of the edits in these Appendices (except Appendices C), are tied to changes in the main CS document that have already been approved: we do not feel that these will be controversial.
- The outcome of Appendix C is directly related to discussions on recalibration and as such no changes have been agreed to yet.
- We continue to engage our State, Tribal and other Federal partners and other stakeholders, as well as through YES meetings and coordination calls.

POSITION OF PARTICIPATING AGENCIES

- The U.S. Forest Service is committed to the process, the CS and moving forward with delisting the YES grizzly bear. They have amended their Forest Plans as necessary to include relevant guidance and clarified language in their policies regarding the grizzly bear.
- The National Park Service remains concerned about hunting in the John D Rockefeller Parkway as well as immediately adjacent to both National Parks. They did approve the CS locally (Yellowstone NS and Grand Teton NP) and seem willing to go forward with delisting.
- The Bureau of Land Management seems willing to move forward with delisting and did not bring forward any concerns. They also approved the CS for their 3 state jurisdictions.
- The States have stated that they are unsure resolution on the recalibration will occur. They also approved the CS as edited for all 3 state jurisdictions.
- The Warm Springs Tribe went on record as being against the delisting and abstained from approving the CS.
- The Service is pleased with the progress we have made and is optimistic that a resolution on recalibration can be made.

Subject: Yellowstone Grizzly bear delisting proposal
To: dan_ashe@fws.gov

Dear Mr Ashe,

I understand that you are planning to delist the Yellowstone grizzly bear from the endangered species list. The Sierra Club is concerned that the states that would be involved in their management, if this happened, are not interested in their ongoing recovery.

As the population is only around 700 this is of great concern. Please do not delist until and unless there is a strong agreement between USFWS and the states concerned for continued recovery and conservation of Greater Yellowstone grizzly bears. Would this involve on going monitoring by the USFWS?

Biodiversity is critical to a healthy environment and I'd just like to know that grizzly's are thriving somewhere, even if I never get to see one.

Thanks, Kim

Subject: Re: another issue
Date: Friday, October 21, 2016 8:25:31 AM

The Lacey Act of 1900 (16 U.S.C.3371–3378) is a conservation law in the United States that prohibits trade in wildlife, fish, and plants that have been illegally taken, possessed, transported, or sold.Under the Lacey Act, it is unlawful to import, export, sell, acquire, or purchase fish, wildlife or plants that are taken, possessed, transported, or sold: 1) in violation of U.S. or Indian law, or 2) in interstate or foreign commerce involving any fish, wildlife, or plants taken possessed or sold in violation of State or foreign law. The law covers all fish and wildlife and their parts or products, plants protected by the Convention on International Trade in Endangered Species of Wild Fauna and Flora (CITES) and those protected by State law. Commercial guiding and outfitting are considered to be a sale under the provisions of the Act.

On Thu, Oct 20, 2016 at 3:55 PM, Jennifer Fortin-Noreus <jennifer_fortin-noreus@fws.gov> wrote:

> Wayne, another potential issue with a draft response that hopefully you can help finish. Please let me know if you can finish it. Thanks! Jennifer
>
> **Issue 43:** We received a public comment asking that we discuss the trade of grizzly bear parts, including the extent of trafficking in the U.S. and the state of current legislation. The commenter suggested that States pass appropriate laws making such trafficking illegal.
>
> **Response 43 (Team):** All international trade in brown bears is restricted by either CITES I (in parts of central Asia) or CITES II. All U.S. and Canadian populations are included in Appendix II. Even populations not at risk (e.g., the population in Canada) is still regulated by CITES as it is a look-alike to those populations in Appendix I (including other species of ursids). Grizzly bear harvest under Appendix II for the purpose of international trade is also

monitored via the issuance of CITES Export permits. Approved States and Tribes have procedures for placement of CITES export tags on skins (including furs and pelts) that were legally taken. The presence of a tag on a skin provides us with reasonable assurance that the skin was obtained legally and provides a basis for our legal acquisition finding. We review the information we receive annually from each State or Tribe to determine if there is a need to reevaluate our State-or Tribe-based finding or if the species needs closer monitoring. Although harvest of grizzly bears for the purpose of trade in parts for medicinal purposes still occurs to some extent despite it being prohibited, we lack information to indicate this is a meaningful threat to this or any lower 48-State grizzly bear population nor do we believe it is likely to become so within the foreseeable future. **[NOT COMPLETE]**

Thats a good question Loren. The expectation is that we will typically complete a final rule within 12 months of the proposed rule for a delisting. However, we have gone over that timeline before so its not really a drop dead date as such and there isn't anything in the Act itself which requires us to meet that timeline. JB

PROPOSED DRAFT RESPONSE - SEE ANY PROBLEMS WITH THIS?????

As it appears Frank van Manen has responded to your question about the dead bear and DNA analysis in 2014, I will only answer the remaining ones and will ask Frank to respond if I am wrong.

> **1. Also, by my math, using IGBST estimates for the population, 18 independent females was the limit last year, and 25 died. Can you please confirm that this is what you get?**
> Assuming your are referring to 2015 results (using table 18 on Page 37) of the 2015 IGBST report , I see that 25 died, but applying the 9% limit (2007 recovery criteria) to the estimate of independent females in (Table 7, page 17) which was 247 (0.09 x 247) I get a limit of 22 (22..23) females. This is over the 9% limit as I previous responded.
>
> **2. As to the reporting of the recovery plan limits and whether the IGBST reports should compare their results to the recovery plan goals?**
> I am currently in discussion with the IGBST about this issue for the next report, and why it was not included in the 2015 report. I will let you know the results of that discussion.

First though, I would like to emphasize that I take such correspondence seriously. Protecting the public trust entails responding to questions from the public in a timely manner. I appreciate that you are very busy. But I feel the need to underscore the seriousness of this matter to me, so I am copying this to Matt Hogan and Director Dan Ashe. I will consider taking further steps if needed.

Here is my additional question: were the mortality thresholds for independent male grizzly bears violated in 2014? In the 2014 IGBST annual report (p. 30), authors state that the pending results of DNA analysis of one dead bear would determine whether sustainable mortality limits had been violated using the previous protocol. Although I have sent a separate email to Frank Van Manen with this question, it is FWS' job under the ESA to know whether mortality limits have been violated. (IGBST has been reporting using both current and previous protocols.) So, I assume you have an answer to this question.

I look forward to your response to this and the additional questions below.

Sincerely,

Louisa Willcox

Hi Wayne,

Thanks for the response.

Why is the IGBST not reporting on these violations and why is FWS not making this public either? As you well know, after delisting, managers and the public need to know is there are problems meeting FWS's standards so as to make course corrections. If you don't know there are problems, how will this

occur? Will there be some new plan to release these findings by FWS, if IGBST does not do it?

Until the 2015 report, the IGBST annual reports always included a very clear chart of total mortalities and whether limits were exceeded. Why was this stopped? Since FWS is one of the most important "clients" of USGS, if FWS wanted this information in the reports, it certainly would have been included.

From what I hear from the YES discussion yesterday, the states are not planning to show this kind of data so the public can see it. While that is disturbing in its own right, it makes it especially important for FWS and IGBST to be clear.

Also, by my math, using IGBST estimates for the population, 18 independent females was the limit last year, and 25 died. Can you please confirm that this is what you get?

This is not a subtle violation.

I look forward to hearing from you,

Sincerely,

Louisa

Dear Wayne, Jennifer and Matt, I am not sure who to direct this question to, so am sending it to all of you. Using the methods for assessing the population that are presently in place, were limits on annual Yellowstone grizzly bear mortality violated in 2015? Can you explain which cohort, and the degree of the violation? I would appreciate a prompt response to this request. Sincerely, Louisa Willcox Grizzly Times

Hi Wayne,

I got the same inquiry and I will reply and copy you; I need to doublecheck 1 item with Mark before I do so. "Pleasant" side note is that Louisa finds it necessary to copy the USGS director and my regional director on the email! Supposedly because I had not answered a set of questions from her back in August, which is incorrect as I did answer her on Sep 7 (and fortunately have proof of it).

Also I would like to know a bit more why USGS is not indicating whether the recovery goals are being met or not in your reporting? We might want to put this on the study team meeting agenda if you feel it necessary. It seems like a minor issue to me to just report the relationship of the demographic data to the existing recovery criteria. I do it in the CY and Selkirks. We may want to consider ccing each other on these types of responses to Ms Wilcox to assure that our answers align.

Hi Wayne,

Your response under no. 1 is accurate; of course, Louisa's number of 18 independent females as the mortality limit is based on the 7.6% threshold and I wonder if you should mention that as well? In other words, both the 2007 recovery criteria and "updated" mortality thresholds are exceeded (this is why we presented the *mortality rate* only, as we did not want to make any assumptions about which mortality thresholds we are actually operating under).

Regarding No. 2, I suggest we put this on the agenda for the Study Team meeting in Cody.

All the best,

Frank

Wayne, or others,

Any suggested citation for this sentence?

ISSUE 35: One peer reviewer requested citations to justify our statement that “the primary factor affecting grizzly bears at both the individual and population level is excessive human-caused mortality.”

Seems if we add this citation (or a series of citations) to the rule itself (revising the sentence if necessary), this issue goes away.

Thanks,

Seth

Awesome. I have made it to Issue 68 in my copy-paste exercise and I am working on it as we speak. Once I finish the first round of doing this for the comments assigned to me, I will do this for the comments assigned to Seth and Marj (unless you think that won't be helpful at this point). Then I can go back through a third time and draft responses to the remaining bullets for any issues that you want to pass on to me/the RO (I am thinking this might be the case with the Adequate Regulatory Mechanisms issues). Let me know if you think any of this will be counter-productive!

Jennifer,

I can only comment on this from my personal experience here and this would be largely unsupported except by personal communication. Instead I pulled this from the 5 year review and wonder in some of this might be useful. Probably just the first 3 paragraphs and the last paragraph may be useful here, but I left the middle stuff in to see if some of the state specific stuff should be kept.

Public Support for Grizzly Bear Recovery. The 1975 listing identified human attitudes toward grizzly bears as the cause of "a continual loss of animals through indiscriminate illegal killing" (40 FR 31734, July 28, 1975). Public support is paramount to any successful large carnivore conservation program (Servheen 1998; Alberta GBRT 2008). Historically, human attitudes played a primary role in grizzly bear population declines through excessive human-caused mortality. Through government-endorsed eradication programs and perceived threats to human life and economic livelihood, humans settling the West were able to effectively eliminate most known grizzly populations after only 100 years of westward expansion. Today, human attitudes still play a pivotal role in grizzly bear conservation with mortalities related to malicious killing. Overall, we have seen an improvement in public perceptions and attitudes toward grizzly bears in the last several decades. The same government that once financially supported active extermination of the bear now uses its resources to protect the great symbol of American wildness. This change in government policy and practice is a product of changing public attitudes about the grizzly bear. Although attitudes about grizzlies vary geographically and demographically, there has been a widespread increase in positive attitudes toward the grizzly bear and its conservation, even among traditionally conflict-related communities, like the ranching industry (Kellert et al. 1996). A survey of public attitudes in northwest Montana in 2007 found that athough 54% of respondents believed that grizzly bears can be dangerous to humans, more than 70% indicated that grizzly bears belong in the CYE and should be preserved as a symbol of our national heritage (Canepa et al. 2008). Similar surveys in the North Cascades in 2002 indicated that 76% of respondents supported grizzly bear recovery (Davis and Morgan 2005). Grizzly bear/human conflicts often lead to grizzly bear mortalities, either legally in self defense or a management removal or illegally through vandal killing. Effective I&E programs increase public understanding of grizzly bear biology, behavior, and recovery efforts which in turn reduces grizzly bear/human conflicts and grizzly bear mortalities while increasing human safety.

Public outreach presents a unique opportunity to effectively integrate human dimensions of wildlife management into comprehensive programs that can modify societal beliefs about, perceptions of, and behaviors toward grizzly bears. Attitudes toward wildlife are shaped by numerous factors including basic wildlife values, biological and ecological understanding of species, perceptions of individual species, and specific interactions or experiences with species (Kellert 1994; Kellert et al. 1996).

The I&E programs teach visitors and residents about grizzly bear biology, ecology, and behavior which enhances appreciation for this large predator by dispelling myths about its

temperament and feeding habits. Effective I&E programs have been an essential factor contributing to grizzly bear conservation since its listing in 1975. Being aware of specific values
common to certain user groups allows I&E materials and workshops to be tailored to their specific concerns and perceptions. By providing general information to visitors and targeting specific user groups living and working in grizzly country, coexistence between grizzly bears and humans can be accomplished. Traditionally, people involved in resource extraction industries (i.e., timber harvest, mining, ranching, and hunting) are the largest opponents to land-use restrictions which place the needs of the grizzly bear above human needs (Kellert 1994; Kellert et al. 1996). Surveys of these user groups have shown that they tolerate large predators when they are not seen as direct threats to their economic stability or personal freedoms
(Kellert et al. 1996).

State wildlife agencies recognize that the key to preventing grizzly bear/human conflicts is providing I&E to the public and connecting the public with the right resources to prevent conflicts (Dood et al. 2006; Wakkinen et al. 2009). This outreach is the most effective long-term solution to grizzly bear/human conflicts and is paramount to ongoing grizzly bear survival and successful coexistence with humans so that the measures of the ESA are no longer necessary. All four affected States wildlife agencies (MFWP, WGFD, IDFG, and WDFW) and associated partners (e.g., Grizzly Bear Outreach Project) have been actively involved in I&E outreach for over a decade. In addition, the grizzly bear management plans developed by MFWP, WGFD, and IDFG contain chapters detailing efforts to continue current programs and expand them when possible. Since 1993, MFWP has implemented countless public outreach efforts to minimize bear/human conflicts including: presentations to schools, colleges, civic and sportsmen's groups; interviews with newspaper, radio, and TV reporters; Statewide newspaper features; press releases; radio reports; MFWP website devoted to bear identification; Public Information Plan designed by Conservation/Education Division in reaching public; video entitled "Bears and Bees," advising beekeepers about avoiding conflicts with bears; information on electric fencing to keep bears out of orchards, garbage, grain storage and bee yards; meetings with homeowner groups on sanitation, bear-proof containers at Whitefish; bear-proof enclosure fences for garbage containment; day-to-day public contacts by MFWP personnel during conflict situations with bears; design and production of several brochures ("Living with Grizzlies," "Who's Who? - Know Your Bear," "Bears," "Be Bear Aware – for children"); "Bear Hunters - Know Your Target!" wallet cards; internal education and training; and bumper stickers reading "A Fed Bear is a Dead Bear" (Dood et al. 2006). The WGFD created a formal human/grizzly bear conflict management program in July 1990 and has coordinated an extensive I&E program since then. Accomplishments include: installation of electric fences around
numerous apiaries; distribution of over 250 bear-resistant garbage cans and 30 dumpsters to hundreds of private property owners; installation of food storage boxes and meat poles in many camp sites on public land; establishment of "Living in Bear Country" workshops; production of nearly 40 public service announcements and 28 news releases promoting techniques to co-exist with bears; incorporation of grizzly bear encounter management as a core subject in basic hunter education courses; implementation of annual bear encounter training for outfitters and guides; and mailing information about how to avoid conflicts and behave in encounters to all limited quota big game licenses holders hunting in occupied grizzly bear habitat. The IDFG also organizes and implements extensive I&E programs and workshops focused on private and public lands within grizzly bear habitat. The goal of the IDFG Grizzly Bear Enforcement and Education Project is to reduce human-caused mortalities

of grizzly bears in the SE and CYE areas in Idaho, assisting with the recovery and ultimately the delisting of grizzly bears as a threatened species. Extensive field patrols are conducted throughout the spring, summer, and fall. Field contacts serve to educate all user groups on grizzly bear identification, natural history, and conflict avoidance strategies. Field patrols act as an enforcement deterrent, help prevent and detect road closure violations, and permit the collection of information that might prove useful in solving illegal grizzly bear killings. Field contacts also build a one-on-one relationship with people using grizzly bear habitat, provide information on human activities
within the recovery zone, and help to gather information on human-grizzly bear encounters. A comprehensive educational program is conducted during the winter months to teach grizzly bear biology, identification, and methods for coexisting with bears. The Grizzly Bear Outreach Project began in Okanogan County, Washington in 2002, expanded to serve all counties within the NCASC by 2007, and expanded into the SE by 2010. The Project's mission to promote an accurate understanding of grizzly bears and their recovery in these ecosystems is achieved through community education and involvement. To date, the Project has held more than 800 meetings; given 198 presentations; begun a Bear Smart Program to prevent bear/human conflicts; distributed over 2,000 posters, 3,000 fact sheets, 2,000 bear identification sheets, and 65,000 informational brochures; been featured in 78 press articles; created and distributed 2 radio public service announcements; and conducted multiple public knowledge and attitude surveys to hone their outreach efforts.

Compensating ranchers for losses caused by grizzly bears is another approach to build support for coexistence between livestock operators and grizzly bears. In cases of grizzly bear livestock depredation that have been verified by USDA Animal and Plant Health Inspection Service-Wildlife Services, IDFG, or MFWP, affected livestock owners are compensated. Since 1997, compensation in Montana and Idaho has been provided primarily by Defenders of Wildlife. The Defenders of Wildlife's Grizzly Bear Compensation Trust has paid $184,681 to livestock operators within the NCDE and CYE for confirmed and probable livestock losses to grizzly bears (Proctor 2009). The MFWP will continue to rely on Defenders of Wildlife to compensate livestock operators for losses due to grizzly bears while MFWP focuses on preventing such conflicts. In Wyoming, compensation has always been paid directly by the State. If grizzlies were delisted in the GYA, both Idaho and Wyoming's grizzly bear management plans provide for State funding of compensation programs (Idaho's Grizzly Bear Delisting Advisory Team 2002; WGFD 2005). Despite these compensation efforts, some ranching interests continue to resent grizzly bears (and predators in general) due to the perception that many of their livestock losses are not compensated because they cannot be quantified or investigated quickly enough to determine a cause of death.

Ultimately, the future of the grizzly bear will be based on the people who live, work, and recreate in grizzly habitat and the willingness and ability of these people to learn to coexist with the grizzly and to accept this animal as a cohabitant of the land. Other management strategies are unlikely to succeed without effective and innovative public I&E programs. The primary goals of public outreach programs are to proactively address grizzly/human conflicts by educating the public about the root causes of these conflicts and providing options to prevent them. By increasing awareness about grizzly bear behavior and biology, we hope to enhance public involvement and appreciation of the grizzly bear.

Thanks, Jennifer!

I called Penny back. She came to our public meeting in Cody.

There is some confusion. Some people are thinking that at the November Yellowstone Ecosystem Subcommittee meeting the presentation of the final Conservation Strategy is also a decision by the U.S. Fish and Wildlife Service on whether or not to delist Yellowstone grizzly bears.

I explained it is not and the goal of the FWS is to have a decision regarding delisting around the end of the calendar year.

Thanks again, and keep up the great work on all the comments! :)

I'm trying to figure out if they're talking about d-sites on public lands inside the PCA or the 500 d-sites in suitable habitat outside the PCA OR if they're talking about private land development.

thanks!

I understand. I am here to help in any way I can so we can meet these deadlines. Please do not be shy about telling me and/or Seth when you think there's an inefficiency or when you think the RO needs to take on more work. I will do what I can to address the concern! I am taking note of all the suggestions about how to more effectively instruct the coders. And I will keep thinking about how to better organize/reduce redundancy in the DiscoverText outputs.

Yeah, that will not be ok this time around. I will try to give clearer instructions!

Perhaps I will use that one as an example of dos and don'ts. We will do our best!

On Tue, Sep 27, 2016 at 10:07 AM, Jennifer Fortin-Noreus <Jennifer_fortin-noreus@fws.gov> wrote:

Definitely need to make sure this time around. This is an example of “trigger text” that was in one cell:

As a hunter and wildlife photographer, retired conservation officer, and regional habitat manager for the South Dakota Department of Game Fish and Parks, I feel that available scientific data indicates that the Greater Yellowstone Ecosystem(GYE) population of grizzly bears (Ursus arctos horribilis) has recovered and no longer meets the definition of an endangered or threatened species underthe Endangered Species Act, as amended (Act). The United States Fish and Wildlife Service (Service) has also proposed to identify the GYE grizzly bear population as a distinctpopulation segment (DPS). Therefore, the Service proposes to revise the List of Endangered and Threatened Wildlife, under the authority of the Act, by removing the GYE population. The Service has determined that the GYE grizzly bearpopulation has increased in size and more than tripled its occupied range since being listed as threatened under the Actin 1975 and that threats to the population are sufficiently minimized. Grizzlies in the Lower 48, of which the Yellowstone population is the second largest (next to the Northern Continental DivideEcosystem in Montana at 1,000 - also likely to be proposed for delisting), have more than doubled their range to 22,500 squaremiles, an area larger than the states of New Hampshire, Massachusetts and Rhode Island combined. Grizzlies again roam from the Tetons south of Yellowstone up through northwestern Montana and a good part of Idaho,to the Canadian border. Existing state management plans will protect Yellowstone grizzly bears and will allow them to connect to other grizzlypopulations if they are delisted now. Wyoming, Montana, and Idaho, the three states where Yellowstone grizzly bears

live,plan to jointly manage Idaho, Montana and Wyoming have a joint plan adjusting hunting if the population falls below 675 and will halt huntingaltogether if the number drops to 600. NGO's should be celebrating the delisting and not challenging because of the support from hunters, state and federalwildlife agencies for the work that they have done to restore this population. I fully support delisting this GYE population of grizzly bears.Great job USFWS!

I'm driving now with spotty cell coverage. Have a G2G this afternoon but could talk after that - late afternoon. Tomorrow is difficult because I have a refuge call at 8 and then have to head to bison release til noon. Then driving again with spotty cell service. I'm fine if call happens without me but someone needs to reach out to Gary to see what our message is both pre and post vote depending on the outcome.

Kate

Probably need Cody for the evening of the 15th and 16th. We will also need rooms for the evening of the 14th, but that may be Bozeman or Livingston. It is at least a 3 hour drive from Bozeman to Cody and we need to get there by about 10.

Jennifer - do you have a preference?

Wayne,

I am going to book my hotel for the YES and IGBST meeting that will be November 15-17 in Cody. I was planning on driving over on the 14th. I think it would be a good idea if you could attend. Kate could make your hotel reservation at the same time. The meeting is at the Buffalo Bill Center. Do you have a hotel preference?

Thanks,
Jennifer

I don't have time to review so suggest we just get them out. I assume there is nothing controversial in them. JB

Ms. Keisha Sedlacek
Senior Regulatory Specialist
Humane Society of the United States
1255 23rd Street, NW, Suite 450
Washington, D.C. 20037

Dear Ms. Sedlacek,

Thank you for your September 12, 2016 letter requesting a 60-day extension of the current comment period on the proposal to remove the Greater Yellowstone Ecosystem population of grizzly bears from the federal list of endangered and threatened wildlife. The comment period between March 11, 2016 and May 10, 2016 together with the current comment period between September 7, 2016 and October 7, 2016 provided the public with 90 days to share their thoughts on our proposal. The states have finalized regulatory mechanisms that meet the letter or intent of the five specific regulatory requirements we outlined in our proposed rule and we shared the content of these regulatory mechanisms with the public. Provided those specific regulatory requirements are met, as they are in Idaho, the Service considers it the prerogative of the states to regulate other aspects of grizzly bear hunting. We believe we have given the public ample time to comment on the proposed rule, both initially and following enactment of state regulatory mechanisms and completion of the peer review. Therefore, we are denying your request to extend this comment period. We will reply to the specific concerns you presented in your letter as responses to public comments in our final determination.

We appreciate your continued involvement and interest in this process. If you need further information, please do not hesitate to contact me at the above letterhead.

Sincerely,

Wayne Kasworm

Acting Grizzly Bear Recovery Coordinator

Has public comments in issues

Comment [AEK1]: Go back through and indicate whether was one commenter or many
Double check that issues not in here are indeed not relevant

Issue 1

- Public comment period too short, not enough opportunity for public comment
    - One the length of the reopener: "I do not believe there has been sufficient opportunity for public comment. I know I haven't had nearly an enough time: 30 days is an insulting inadequacy."
    - From public hearing in April: "Park County residents also include some of the world's leading grizzly bear experts, and those scientists have not been given an adequate amount of time to review and to respond to the delisting rule, so we're also asking for more time."
- Limited locations of public hearings
    - "In addition, all Americans should have the opportunity to give verbal testimony. So far, that has been limited to people physically in the tri-state area."
    - On public hearings: "if you could do the same for Gardiner, that would mean the world to local community. But because it is a national issue, I think that meetings in Denver and Boise are also probably important."

Issue 1.25: Commenting on proposed rule without a final conservation strategy or state regulations (Idaho) → problem. Need to work to finalize and then need another round of peer review and public comment on the "complete proposed delisting rule package, including the final Conservation Strategy, all final revised and enforceable state management plans and regulatory frameworks and the peer review"

- Must release final conservation strategy for public comment and peer review
    - "How can we comment on the act of delisting without knowing how the grizzly bear is going to be managed? The USFWS and state agencies must release the information we need on the revised Conservation Strategy in order for us to comment intelligently on the delisting action itself."
    - "Even though it isn't even legally binding, shouldn't the Interagency Grizzly Bear Committee's Yellowstone Ecosystem Subcommittee final Conservation Strategy have been completed and publicly released prior to the start of the second round of public comments?"
    - "A Conservation Strategy is presently the subject of revision by the Forest Service, the National Park Service, and other states."
    - "The peer reviewers raised substantive concerns regarding the regulatory mechanisms and the ability of the Service to ensure that the population would remain stable and connect to other populations. The reviewers were asked to review state regulatory mechanisms that have been significantly modified and a Conservation Strategy that will be significantly different than the document they reviewed. The peer-review must be repeated with the actual management framework for grizzly bears that will be signed and finalized and their concerns must be addressed in the final rule."
    - "I am extremely disappointed but not surprised that the public has not been allowed to comment on the draft conservation strategy after initially being told at the YES meeting in West Yellowstone that there would be a public comment period on the draft. This is simply more evidence that this process has been corrupted for sake of political expediency."
- Idaho's plan is out of date but, as commenters claim, updating It and getting approval from the legislature would take too long

- "Idaho's management plan dates from the year 2002!! and therefore severely out of date, it fails to contain current science plus public opinion!! Interestingly had Idaho reopened it's plan, it would have been approved by the state legislature and thus would have delayed the delisting process. Political pressure ensured the state of Idaho failed in preparing a new document relying instead on outdated and obsolete documentation to meet a USFWS deadline."

- Idaho's regulations are not final
  - "For instance, today is the deadline for federal comment, but the Idaho Fish and Game commission won't be authorizing their proposed rules for at least 10 more days. What Idaho Fish and Game agrees upon then needs to pass the notorious Idaho legislature. Essentially, you are asking for Idaho to receive a blank check from the Federal government, the governments of Montana and Wyoming, plus the people of America."
  - Add HSUS extension request letter here
- Process is "rushed," "convoluted," "politically driven"

Issue 1.5: How we consider public comments is flawed

- How we "consider" public comments is flawed
  - "Worse yet, Kent Nelson of Wyoming Wildlife Advocates did an analysis calculating FWS was only considering 8 out of every 1,000 submitted comments in the previous round."
  - "Refusal to give weight to any but "scientific" comments seems a ploy aimed at assuring very few voices will be heard, canceling out the democratic process citizens are entitled to. As tax payers, we funded the grizzly recovery, so we should have a say in the delisting. More public discussions are needed before any action takes place."
  - "The department should not rush into any decisions that are not researched and backed by data or public opinions." → i.e. public thinking we should make decisions based on public opinion; this should be a voting process
    - "These iconic animals have not recovered. 90% of the American people support a strong Endangered Species Act. We want OUR wildlife protected. We do not believe in trophy hunting. Only 6% of Americans hunt and of that number many do not believe in trophy hunting. Our voices are being ignored. Please listen to what the mass majority of Americans want."
  - Thinking we throw out large proportions of public comments

Issue 3 (Joy)

Comment [AEK2]: Compare to current issue

- Insufficient consultation thus cannot proceed
  - "Under Executive Order 13175, started by President Clinton and affirmed by President Obama, all federal agencies are required to engage in proper consultation with tribal nations on issues impacting the tribes. This has not happened. Many tribal leaders contradict the Service's assertions that it has contacted "all Native America tribes that are federally recognized west of the Mississippi."[illegible] Proper consultation must be government to government. As a result, a stock letter addressed "Dear Tribal Leader" does not constitute meaningful tribal consultation. Neither are webinars or emails appropriate consultation. Further, such consultation must be predecisional. That means that the requirement of consultation was violated as soon as USFWS published its proposed grizzly delisting rule. Please pause the delisting process and enter into a meaningful consultation process with each of the impacted tribes. (Navajo Nation Calls Feds Out on Grizzly Delisting Claims & Reinforces Link to Dakota Access, NativeNewsOnline.net, September 3, 2016)."

- "The Tribal Nations, which met to sign an historic Cross Border Treaty with the First Nations of Canada this past weekend, were not consulted AT ALL about an animal central to their religion and culture. As citizens THEY TOO deserve a voice. Not only about the animal's plight, but about the mining, drilling, ranching and other developments that will surely follow delisting."
- "It is required under Executive Order 13175 implemented by President Clinton and affirmed by President Obama that federal Agencies MUST engage in a meaningful consultation with the Tribes. To date this has NOT been accomplished. Tribal Nations has requested a consultation numerous times including sending a letter to Director Danial Ashe of the US Fish and Wildlife. As of today this has not occurred an email or letter does not constitute proper consultation. Recently, the Tribal Nation has informed the YES committee these concerns at the meeting on October 3rd, 2016. A cross - border Treaty has been signed by Native Tribes denouncing that grizzly bears be delisted and hunted. Prior to delisting this Executive Order must meet all qualifications. Any discussion of delisting the grizzly bear should not happen until this requirement is fulfilled."
- "A major oversight was also made in the the government's failure to engage in meaningful face-to-face consultation with the Tribes, for whom the grizzly bear plays an iconic role in religion and culture."
- "Please pause the delisting process so that USFWS can meet and properly consult with each tribe impacted by this decision."

- Tribes opposed
  - "Fifty federally recognized tribes and the Assembly of First Nations sent formal objections to delisting and trophy hunting to Interior Secretary Sally Jewell prior to the FWS delisting proposal. Native News Online.Net also reported that the Oglala Sioux Tribe presented an eight-page resolution that details spiritual, scientific, political, and environmental objections to delisting.Tom Poor Bear, Vice President of the Oglala Sioux Tribe, sees delisting as a way to allow the hunting of their sacred relative, the grizzly bear. "These so-called state game and fish agencies exist to serve a clientele that is 95% white, 95% male, and many of who kill for trophies. They are the vocal minority, and under the systems that exist through colonialism and patriarchy they have been able to dominate, lie and cheat their way into control.""
  - "All native tribes indigenous to the GYE oppose delisting and trophy hunting."
  - "Some 35 tribes have passed resolutions opposing the delisting of the Yellowstone grizzlies, an animal considered a sacred symbol of spiritual renewal."
- "The native tribes consider the bears sacred and deserve to have their voice heard. The trophy hunting of these bears by the states will be a cultural overstep and travesty."

Issue 4.4: Need additional collaboration (especially with NPS → perception that we are not addressing their concerns)

- "Many reputable organizations oppose this delisting and I encourage the Fish and Wildlife Service to meet with them and to delay this action until these organizations can support an effective plan for sustainable protection of the bears and their habitat."
- "Finally, the USFWS should pause and work with the National Forests, National Park Service, and the three states to ensure that all of the pieces of the Conservation Strategy are complete, accurate, and consistent with each other. The current process and rule is completely out of sync with the decades of efforts that have gone toward ensuring a coordinated recovery of bears."

- "It would be a disservice to park grizzly bears, the efforts of countless people and future park visitors to rush this decision without fully addressing the concerns of the National Park Service and the public. The U.S. Fish and Wildlife Service should provide the National Park Service with a formal role in the management of bears on habitat adjacent to park borders, and fully address Park Service concerns with the current proposal."
- "Why is the National Park Service not more involved in this decision? They should have a formal role in this decision and the management of bear habitat adjacent to the parks, and there should be an extensive buffer zone surrounding the parks."
- "No one has yet addressed the National Park Service's concern about how bears will be managed outside the Parks."

Issue 4.5: Concerns about bias/conflict of interest in peer review, qualifications of peer reviewers *(starts to overlap with Issue 4.7 (undue political influence))*

- Peer reviewers not qualified because of lack of relevant experience
    - "Black and grizzly bears have different ecological requirements and life histories, so that expertise in one may not translate to the other."
    - "The outside peer review that supports this de-listing proposal consisted of 4 out of 5 researchers who do not specialize in grizzly bears, but rather one researches polar bears and 3 study black bears. Both of which species are vastly different from grizzly bears both behaviorally and ecologically. Perhaps this is due to the fact that de-listing seems to be politically motivated, while the majority of grizzly bear experts, such as Dave Mattson are opposed to de-listing (234 grizzly bear researchers were surveyed, and 60% say that they should remain listed or be upgraded to endangered)." → starts to overlap with section of Issue 10 that discusses Ohio State Survey and grizzly experts
- Peer reviewers have a conflict of interest (because of contractor)
    - "Furthermore, it is unclear whether, and to what extent, Amec Foster Wheeler has inherent conflict of interest"
    - "The implication of using this multinational, profit-driven, resource-exploitive firm for peer review is that US FWS is in collusion with industry to remove ESA protection from the grizzly bear. Do USFWS officials fear that an unbiased and transparent peer review process by a trusted source of biological expertise could threaten energy development that will come on the heels of delisting?"
    - "To act as third parties, multinational oil, gas and mining corporations were contracted by USFWS to oversee the critical process (peer review). Should the unthinkable happen and Grizzlies are delisted, three million acres of habitat will then be open for increased fossil fuel development and mining. Twenty-eight mining claims are stated in what is the Primary Conservation Area. Why such a firm was brought in to oversee peer review is at best wholly unfair and at worst smacks of a foregone conclusion. Documentation obtained under FOIA showed USFWS had selected scientists for the peer review on the delisting rule. Independent means precisely that and yet the validity to this 'independence' is compromised by the choice of who forms the peer review and undermines the validity of the peer review."
    - "If the 3rd party contractor hired to recruit the peer reviewers has a specialty in wildlife, it is not clear from their website. In fact, their specialty seems to be energy development. Since grizzly delisting opens huge swaths of land to energy development, choosing a contractor with this profile further undermines trust and confidence in our public institutions. It certainly has the appearance of a stacked deck."

    - "It appears that all 5 reviewers are "conservationists" in the sense that hunters/trappers are conservationists. Who presents the views and perspectives of the majority of people, those of us who do not engage in recreational killing?"
    - "The team responsible for peer review of the grizzly science…should NOT include ANYONE with ties to hunting coalitions, mining companies, or the oil industry."
- USFWS handpicked peer reviewers
    - "Further, a document obtained under FOIA revealed that USFWS handpicked the scientists for peer review of the delisting rule. This cannot be considered "independent" and undermines the validity of the peer review."

Issue 4.7: Undue political influence/corrupt decision-making process

- *Pull text from current Issue 10 and 39; use response (marked with comment) from Issue 10*
- We are allowing "politics and private interests to trump science." Plan caves to pressure from:
    - hunters, who don't want to compete with another predator
    - Sportsman alliances
    - Gun retailers
    - ranchers who don't want to adopt wildlife-friendly practices
    - wildlife agencies that are chronically underfunded and overwhelmingly regressive in their management practices.
    - states
    - anti-government extremists with a political agenda - and these groups will spare no expense to try and derail bear conservation in America
    - Livestock industry and cattle interests
    - Mining, oil, and gas interests
- Request: "Would the USFWS please disclose the special interests that have been involved in their recommended delisting decision."
- Claims that we've been "bought," that we are biased
    - "Dan Ashe himself is not neutral, having stated "We need to re-establish and reground hunting as part of an ethical tradition...". Other individuals involved in this process have strong ties to pro-hunting groups, such as the Safari Club and Sporting Club."
    - Claims of political meddling with 2015 IGBST report on mortality limits: "The unusual delay in the release of the IGBST report for 2015, as well as the kinds of information conveniently omitted in this last report, reinforce the charge of bias" and "We must not ignore the fact that, in spite of two years straight of record GYE grizzly deaths, the Interagency Grizzly Bear Study Team is no longer reporting violations of mortality thresholds! (IGBST 2015 Annual Report, pgs 29-30)." And "Finally, the Interagency Grizzly Bear Study Team annual report is typically released in spring or early summer of the following year. This year, the report for 2015 was delayed - allegedly due to staffing issues - and only released after intense public pressure. Once the report was finally published on August 26, 2016, experts immediately noted glaring omissions regarding mortality limits, growth rate and data and analyses on bears outside the DMA. Such delays and omissions have the unfortunate appearance of serving a political agenda because information in this report indicates that delisting is not appropriate at this time."
    - "This is based on a study that was done by the Union of Concerned Scientists, where Fish and Wildlife Service employees were interviewed. These were some of the conclusions from the study. 'Political interference and a lack of scientific integrity are influencing outcomes and hampering the agency's work.' A majority of employees of the

Service, '"...believe their office is less effective than it was five years ago.' 'In addition to scientists' over overwhelming indictment of political influence at the agency, many scientists identified a lack of staff capacity and resources to complete their jobs. Further, more than half of the surveyed Fish and Wildlife researchers said the agency only occasionally or seldom collects sufficient scientific and monitoring data to do its work'. The survey also indicated concerns over, '... accommodation of the states,' which potentially diminishes science-based outcomes since states may be more interested in avoiding federal restrictions than doing what's best for species. For instance, a whistleblower retaliation case in Texas (https://www .hcn.org/u-s-fish-and-wildlife-whistleblower-retaliation-case-raises-questions), settled last fall, documented how a Fish and Wildlife scientist was transferred and basically forced into early retirement after he argued politics and scientific misconduct factored into a non-listing for the dunes sagebrush lizard, whose habitat overlaps with the oil-rich Permian Basin. Yet there are some signs of progress. Compared with surveys of Fish and Wildlife's Ecological Services staff during the Bush years, twice as many employees say morale is now good or excellent, and more feel they are now allowed to speak with the media and public about their work." (from MT public hearing)
    - "I submit the USFWS is in a demonstrated state of dysfunction and is presently incapable of making science-based decisions free from the corrupting influence of politics"
    - "Why are GYE bears at risk for delisting and hunting when the larger northern population is not? Might it have to do with the incredible amount of money and power behind the hunting lobbies, extractive industries and trophy homes that are a constant threat to our way of life, economies, wildlife habitat, and wildness? I believe it must, since there's no other reason to delist only this population."
- Claims on the other side: we are not politically influenced
    - "I really disagree that you or the scientists were bought. We actually have a group of scientists that don't work for the Fish and Wildlife Service or state agencies that are doing most of the monitoring and much of the research. They are not purchased by U.S. Fish and Wildlife Service or any state agency. You have one of the most independent, most collaborative and most informing science that you could find anywhere in the world on this bear population. Their science is good."
- Claims that delisting GYE grizzlies is a political stunt to weaken ESA
    - "Many Americans are genuinely concerned this is a calculated political stunt to weaken the Endangered Species Act, which has proven to be highly effective for real recovery."
    - "Congresswoman Cyntyhia Lummis, and Senator John Barrasso both of WY, have advocated with language in bill HR-884 to protect delisting from further judicial review and to deny opponents due process"

Issue 6.5: General confusion about what delisting means, what we are proposing to delist

- "if you did list them, how do you distinguish the GYE grizzlies from those who might be in Idaho, Montana or Wyoming? Shouldn't they all be either "listed" or "delisted" ?"
- "They are a vital link in the ecological chain in the Yellowstone area. Grizzly bears are not increasing in numbers in habitats in Yellowstone & other areas. In fact scientific evidence also shows they are declining in North Cascades National Park."

Issue 7

- "USFWS has failed to update the Recovery Plan for this grizzly bear population so as to reflect the massive amount of best available science that has been produced since the early 1990's. USFWS has also failed to follow through with its own 2011 recommendation to update and revise the Yellowstone Grizzly Bear Recovery Plan."
- "The inadequate science is having two unequal criteria in the same units, for the same thing. That is, the state goal of a minimum of 500 grizzly bears population in the DSP area, per state management plans, while there is a Federal goal of 674 average and 600 minimum grizzly bears in the DMA, which is smaller than the DSP area. Get the 500-value out of the state plans and keep this value out of your plan."

Issue 8

- "The USFWS, and the states in their respective plans, must commit to a stable population. The USFWS and three states are clearly at odds on how the population would be maintained post-delisting. The draft rule states the population will be managed for 'stability', however the state plans and Memorandum of Agreement are set up to maintain a population below 674 bears with the proposed mortality thresholds. The only firm commitment is ensuring a population above 500 bears. This is not a "stable" population, as the current estimated population was 717 grizzly bears in 2015. The proposed regulatory mechanisms are inadequate to ensure a stable population."
- "The proposal says the goal is a population size of 674 bears and that numbers won't be allowed to go below 500. How did the service come up with these numbers? There is no evidence that this is the number of bears that will ensure population sustainability."

Issue 9 (Alex)

- Delisting is "premature" because bears are not yet recovered ("record mortality" last year; aren't enough bears)
    - "While there may appear to be some recovery of grizzly bear populations in recent years, the issues facing grizzly bears will not doubt soon begin to effect the success of their breeding and survival will begin to decline. Removing protections now, in the face of increased stressors with high risks for mortality is extremely short sighted."
    - "Grizzlies exist in less than 1 percent of their historic range. Less than 1% and you're considering that "recovered?" and "Population estimates are that approximately 1,800 grizzly bears reside in the lower 48 United States, representing only 3.6% of the historical population; the argument that this is a recovery is highly flawed."
    - Not enough bears
        - "Can we please wait until there's let say, a stadium's worth of them in each of the states that once was their shared historic range before settlers moved in and with our own modern day territories factored together to guarantee minimal overlap before calling in a reasonable hunting season to maintain a healthier ecosystem's status quo?"
        - "The Suzuki report states that some scientific research suggests that grizzly bear population units should number at least 500-700 individuals to outlast catastrophic natural events. food availability and human behaviour in order to survive for hundreds of years."
        - "The article I read reported more than 750 bears in and around Yellowstone National Park. To me that is nowhere near a stable population. Think of the millions of square miles of this area and 750, 800, 900 bears is a drop in the bucket."

Comment [AEK3]: COMPARE TO ISSUE 9 TO TAKE OUT REDUNDANCY
Shorten more

        - "Twice as many bears are needed to maintain genetic diversity and population persistence in order to survive for thousands of years."
        - "I am skeptical that a population of 700+, constitutes recovery, particularly if 600 bears is the number at which the "discretionary mortality" within the DMA must cease."
        - "Scientific consensus is that Yellowstone's grizzly bear population is still not recovered. Yellowstone's population of 600-700 grizzly bears is completely isolated from all other grizzly bear populations and much smaller than the 2000+ animals widely considered necessary for long-term viability."
    - Many people anecdotally citing lower frequency of grizzly bear sightings in various parts of the GYE
    - Lack of using GYE as a source population for reintroductions implies the population is not secure enough to support delisting
        - "If there are enough grizzlies to propose delisting, why haven't reintroduction plans for other States, such as California, been created? I doubt the population is truly stable enough for losses, and that's why reintroduction is off the table. And if it isn't happening, then State management, which include takings for different reasons, should be off the table as well."
    - "These bears have not made the recovery that the FWS claims. Scientists have shown that this population is still in danger of extinction." And "It is highly disputable whether the species has even met the USFWS's own recovery plan objectives - the population measures are currently being scrutinized and questioned.'
    - "The Endangered Species Act protections were put in place to protect these bears until their populations are stable enough to support adequate genetic diversity and robust restoration of previous geographical ranges. Neither of these criteria have been met and grizzlies still face many threats within the states of Idaho, Montana, and Wyoming."
- Grizzlies are recovered/recovery criteria have been met
    - "Federal and state wildlife managers have documented the GYE Grizzly population at more than 700 animals occupying habitat of more than 22,500 square miles. These bears are now being observed in places where they haven't been seen in over 100 years!"
    - "Population numbers have surpassed population goals and have continued to grow - they're currently more than 25-percent above that target and have been for more than five years."
    - "As a wildlife biologist in the state of Wyoming, I believe the federal government should follow their own rules regarding populations of animals that have been listed under the Endangered Species Act (ESA). When those populations have recovered to the parameters that were designated at the time of listing they need and should be delisted. To not do so, seriously jeopardizes the ESA! The grizzly population in the Greater Yellowstone Ecosystem has recovered to the extent that they are regularly leaving the Yellowstone area, as they naturally disperse due to a population that has exceeded it's carrying capacity. There is nothing wrong with this! It is just a reminder that it is time to delist that population, to allow for management. I firmly believe that the states surrounding the Greater Yellowstone Ecosystem, will responsibly manage all species, to ensure their survival and to prevent any possibility of relisting"
- Doubts about our population estimates/methods (the ones we are using to claim there are enough bears for recovery)

Comment [AEK4]: Couldn't find this. Are we sure it's not anywhere?? Maybe in Chao2 issue (Issue 13?)

- "No one really knows how many grizzlies are in the GYE. David Mattson, an ecologist who spent more than 20 years studying grizzly bears in and around Yellowstone, doubts the FWS numbers. "...what you'll hear from the [U.S.] Fish and Wildlife Service is that the population has tripled and even quadrupled in size, and I think that's a gross exaggeration."
- ""It justifies delisting the Yellowstone bears based primarily on the size of the population, even though its estimates are just that a matter of sample counts and extrapolation (bears don't sit still for a census). Nor is the agency asking how many of the bears are females, or how old they are. It's no real science at all." → no consideration of gender ratio in criteria?
- "There are serious concerns on how you come to your conclusions about population data. It used to be 260 to 600 bears. Then it was with no net increase, 700. In 2007, when counting methods changed, the number nearly doubled, impossible with a slow-growing population, but coincidentally, the year before delisting was back on the table. There may be 700 bears, but base population data needs to be made available to trusted, independent, qualified sources who don't have a stake in the GYE who can be trusted with the geographic data that you don't want made public, the National Research Council comes to mind."

- IUCN
  - "The International Union for the Conservation Nature guidelines, which Alberta uses, recommends that wildlife populations should maintain more than 1000 mature, breeding adults to prevent unacceptable risk of decline."

Issue 9.5

- "It appears that USFWS is using outdated science to categorize Yellowstone Grizzlies Bears as part of a species that spans the continent, while the best science available now finds that the Yellowstone population is part of a "clade 4," which consists of a common ancestor and all its lineal descendants, and represents a single "branch" on the "tree of life.""
- "USFWS makes reference in the Rule to an antiquated research paper (Rausch 1963) as a basis for lumping Yellowstone Grizzlies in with a presumed subspecies that spans the entire western North America. The best available science comprised of a large body of post-1995 research, clearly shows that Yellowstones grizzlies are, instead, part of the first representative of Ursus arctos to migrate across Beringia into North America, perhaps as early as 70,000 years ago, and have an ancient history and current distribution that is restricted to central-western North America. USFWS does not make reference to this unique evolutionary and biogeographic circumstance of Yellowstones Grizzly Bears anywhere in the current delisting package. This is a MAJOR OMISSION. Nor does the USFWS make mention of the unique and much diminished status of this clade 4" grizzly bears."
- "The greater Yellowstone bear is a primitive bear that migrated over the Bering Land Strait, and it is called Cash 4 as opposed to – no, a Cash 3, an earlier bear. Most of the grizzly bears in North America are of a more recent passage of these Eurasian grizzly bears over the Bering Land Strait into North America and stayed further north. And there is a difference in their genetic Aleo contribution. Once Aleos are lost, they are lost permanently, forever."

Issue 10 (Alex)

- Pro
  - Recovery criteria has been met

Comment [AEK5]: Look for more repetition between current issue summary and these bullets

        - "We can't just continue to move the goal post every time we reach 500, 700, 800, 1200"
    - Management should be left to the states (like with black bear, elk, mountain lions, deer).
    - "Hunting is conservation, it is time to delist the Grizzly bear."
    - Delisting needed for continued social acceptance of grizzlies
        - "And it's been apparent to citizens and scientists alike for a few years, that the bear has reached its physical carrying capacity in the GYE. It is also starting to reach its social carrying capacity, and I am concerned that if we don't delist it and declare a victory and move on, it might erode the respect, acceptance and tolerance this great bear has achieved."
        - "Social acceptance is one of the biggest issues when recovery comes of species…and if anyone has lived in this area or around the GYE, you'll know that social acceptance of this bear is waning"
    - Failure to delist will pose a safety threat, create more conflict
        - "Furthermore, if population levels grow beyond recovery goals it will result in more negative interactions with humans, livestock and have impacts on wildlife population that will result in animosity from local human populations resulting in removal of "problem bears" at the expense of tax payers."
        - "Man is supposed to be the top of the food chain. Well, if you're in grizzly country, you're not. You're at their mercy. There's been 40 people killed by the bears since 1970. 40. Six in the last five years, and that's not counting all the people that were mauled."
        - Many people anecdotally citing greater frequency of grizzly bear sightings near their home or in various parts of the GYE → "safety issue…hardship on operating business"
        - More people will encounter bears and get hurt
    - "The FWS must delist the Grizzly Bear and turn the management of the bears over to the State where wildlife management belongs. People who do not live in the State, should not be dictating the management of the State's wildlife, especially Grizzly bears!"
- Con
    - Delisting is "premature" because of process (lacking final regulatory mechanisms)
        - See Issue 1.25 and adequate regulatory mechanisms section
    - Delisting is "premature" because bears are not yet recovered ("record mortality" last year; aren't enough bears)
        - See issue 9
    - We're rushing to delist when we should wait for additional information
        - "We just spent 40 years and millions of dollars to increase the bear population from 125 to 725 (see how slow reproduction is!). With the climate changing so fast (this is the warmest winter on record), and food sources changing for bears, why are we rushing into delisting. Why not wait another 5-10 years for the science to reveal more data?"
        - "The general public has been faced with incredible hurdles in the government's rush to delist the grizzly-from the insistence on "scientific" comments to the delaying of the IGBST report to the fact that Idaho's plan isn't even finished yet, on the very eve of the close of the public comments period. Nothing about that is right. Nothing about that is democracy."

Comment [AEK6]: Issue 9?

        - "I am always pleased when species recover enough to take them off the endangered species list, but for grizzlies, this appears to be at least 10 years premature."
        - "With the population growing very little and mortalities increasing, we believe it is prudent to wait a few more years to determine whether the population is secure, sustainable and resilient enough to withstand future changes."
    - If we keep grizzlies on the list, we will be able to protect an array of other species
        - "as an "umbrella species," protecting grizzlies and their habitat also helps protect an enormous array of other plants and animals -- from megafauna like wolves, elk and bison to bats, beavers and pocket gophers and all the way down to whitebark pine trees, one of grizzlies' most important food sources."
    - Delisting GYE puts other populations at risk
        - because it threatens "genetic security"
        - "We fear that the Service's proposed rule will hamper recovery efforts on the whole. For example, Yellowstone's bears have yet to make the bio connection to Glacier's population, nor have they had the chance to re-populate important, suitable habitats, such as Selway Bitterroot recovery zone. Grizzly bears remain absent from 98% of this historic range."
    - "Grizzly bears are the slowest reproducing mammals in North America. A female bear will, at best, duplicate herself in a 10 year period."
    - Oppose delisting because of the state management that will follow (i.e. hunting)
        - "I am mainly concerned about delisting bears because I'm worried that the state will start hunting grizzly bears immediately"
        - "Delisting will result in an increase in the number of bears killed every year and a reduction in their range."
    - Delisting will lead to GYE grizzly population declines/endangerment/extinction, which will then have impacts on ecosystem function and local economies (tourism dollars)
        - Delisting will lead to endangerment or extinction
            - "Delisting will not only further threaten the species, but send them towards and unnecessary, and tragic downward spiral."
            - "If you delist, we will see a major drop in population, already happening with a 6% decrease two years ago, and 59 known dead last year, probably half of the actual number -- due to hunting and pressure on viable sows."
            - "Delisting grizzly bears will lead to immediate annihilation and extinction!"
            - "Please Please do not let the Yellowstone Grizzly's disappear like they did in California! These iconic creatures need more protection not less."
            - "As a former resident of Florida, I have seen firsthand how bear eradication is dangerous and ineffective to a region's ecology (in their case, black bears). If stripped of federal protection, a state hunt for grizzlies or hunting in general could wipe out entire sectors of these apex predators that the regional ecology needs to thrive. Eradicating wolves from Yellowstone was a flawed, devastating plan that should remind folks of the dangers involving a lack of species protection. To avoid costly and ineffectual bear restoration (like wolf restoration), I urge the federal protections remain in place."

Comment [AEK7]: This is also in Issue 26 summary

Comment [AEK8]: See Factor B and Factor D issues

- "Since we are again in another period of mass extinction, it would seem unwise to intentionally contribute to that phenomenon."
- ON THE OTHER HAND: "Please ignore the misinformed people who seem to think that "de-listing" a species means approving it for extinction, when quite the opposite is true -- "de-listing" means the preservation efforts have been successful. It should be obvious that Yellowstone grizzlies, and other de-listed species can always be re-listed in the future if conditions warrant. At this point, states can do a fine job of managing grizzly populations without further federal intervention."

- Impacts to ecosystem
  - "They are a key part of the ecosystem. We do not know the impact it would have on nature if they were removed from the chain. Are salmon now going to over populate, because there are no bears to keep their numbers in check? If the salmon over populate, what impact will that have on the smaller fish they eat? Will those fish then disappear? Every action has a separate and equal reaction."
  - "Without the grizzly, I know you're aware that you've removed a top predator which is going to cause a tremendous trickle down effect for the entire environment, including streams, erosion, plants, birds, insects...the whole thing."
  - "I don't believe grizzlies have recovered enough to delist them. They are important to the ecosystem, like the plant life they eat is relocated by feces to grow anew…They also help keep predators such as cougars coyotes, and fox at bay. Grizzly bears are terrestrial predators. When they are no longer present in the ecosystem ungulate populations can grow out of control and alter the vegetation structure in an area. Another reason why Grizzly Bears are so important to the ecosystem is that they assist the vegetation by doing a lot of digging and foraging. This helps to mix up the nutrient level in the soil which helps to increase the ammonium and nitrate levels of the soil which helps other plants species. This helps the ecosystem where they live to be more bio diverse and have a more even equilibrium. One important reason is that the scientific community uses this type of bear as an indicator to determine the health of an ecosystem. A strong and flourishing Grizzly Bear population usually means a string and flourishing ecosystem with a thriving flora and fauna landscape. Studies show that the removal of wolves and grizzly bears in Grand Teton National Park caused populations of their herbivorous prey to increase, which decreased the density of plants in the area. The decrease of plant density led to a decrease in the population sizes of migratory birds. Grizzly bears, like all carnivores, are keystone predators, having a major influence on their ecosystems. So yes grizzly bears are one of the most important predator along with the wolf to help balance the ecosystem."
  - "In the Suzuki Foundation report entitled "A Grizzly Challenge, Ensuring a Future for Alberta's Threatened Grizzlies', it is reported that most biologists believe grizzly bears are an essential part of a healthy, fully

functioning ecosystem. They are termed “ecosystem engineers" that help to regulate prey species and disperse the seeds of many plant species. They also help to maintain plant and forest health, both by aerating the soil as they dig for roots, pine nuts and ground squirrels. In regions where salmon spawn, they move thousands of kilograms of carcasses into the forest, where trees and other plants absorb their high levels of nitrogen. This type of species is called a "keystone" species. One estimate indicates that by protecting grizzly bears in the Central Canadian Rockies, approximately 400 terrestrial vertebrate species will also be protected.”

- Impacts to tourism
  - “3.5 million people visited Yellowstone in 2014; according to a 2003 study prepared by Robert Eisenberger and Ross Loomis, 42% of visitors taking surveys reported seeing wildlife as their favorite activity, specifically mentioning the unusual wildlife, including grizzly, moose, and bison.”
  - “Bear tourism generates as estimated $10 million a year for the park and several times that amount for the local economy.” And “The National Parks represent a significant boon to local economies, providing a 10 to 1 return on investment for every dollar spent, collecting admission and camping fees, and providing critical revenues to local restaurants, hotels, and stores of various types. All of these business would be adversely impacted by the loss of tourist dollars should the park profile change, resulting in decline in visitors”
  - “The economic impact of visitors and those hoping to get a glimpse of a bear significantly outweighs any detrimental impact to ranchers.” AND “Furthermore, the economic value of the GYE grizzly bears far surpasses the revenues that hunting grizzly bears would offer to the communities that are within the GYE. If you look at revenue in Grand Teton and Yellowstone National Parks, which is a fraction of the Greater Yellowstone Ecosystem, $911 million was spent by visitors in 2014 alone. Looking at proposed tags for grizzly bears in MT, it would cost residents $50 and non-residents $1000 for a grizzly bear tag. While I understand that fee does not include revenue from hotels, outfitters, etc. that is generated by hunters, this does not change the fact that there are not the numbers of grizzly bears to offer hunting opportunities that would be able to match the countless revenue that is generated by the tourists that are hoping to catch a glimpse of a grizzly bear through lodging, food, photographic and wildlife guided tours, etc. It is estimated that without the viewing that iconic "roadside bears" provide in Yellowstone (which is likely when you consider the home range of grizzly bears is so large that many bears leave the parks at some point throughout the year and would potentially be subjected to hunting, thus even if not harvested would be shy of humans) would result in $10 million lost annually.”
  - “Currently, some of the bears are somewhat habituated to being around people. Despite the habituation, bears can still be difficult to find and observe. If hunting of bears is allowed, it will become

extremely difficult to find and observe bears. If grizzlies remain protected, we and thousands of other visitors to the area will continue to come and spend our tourist dollars in Wyoming and Montana. If the grizzlies become hunted, and difficult to observe, thousands of us will not continue to come to these areas."

- "Grizzly bear experts" and conservation leaders think this is the wrong thing to do (additional detail beyond Ohio State survey)
  - "Heed the knowledge of the numerous independent scientists who have factually proven that delisting is not appropriate and the doubts raised by Yellowstone's own superintendent of parks, Dan Wenk. More proven and valid scientific research is needed before delisting can become even a consideration."
  - "The vast majority of Yellowstone grizzly experts are opposed to delisting. According to recent research, nearly 2 in 3 grizzly bear researchers experienced with the Yellowstone population believed delisting would be the incorrect decision, given the multitude of threats bears still face. Indeed, the pre-eminent Yellowstone grizzly researcher in the world, Dr. David Mattson, has come out forcefully opposed to delisting. Mattson, who has researched Yellowstone grizzlies for the USGS for decades and been the lead author on dozens of scientific papers on Yellowstone bears, recently wrote that we should put the brakes on the rush to delist Yellowstone's grizzly bear population until we have a more reliable picture of what's going on, produced by a more reliable and independent process of inquiry."
  - "A range of scientists have said that delisting is premature, and grizzly bears have not fully recovered in the Greater Yellowstone Ecosystem."
- Precautionary principle
  - "Additionally the precautionary principle is applicable in this case, given how quickly hunting could decimate this population and how difficult it would be for the population to rebound given low fertility rates of the bears. Even if state plans are successful, the bears face other challenges stemming from habitat change and climate change - especially impacts on food sources, fires, and rising risk of human/animal interaction."

Issue 12

- Rule not based on best available science
  - "Grizzly, like any other wildlife, should be managed according to sound scientific principles based on data as opposed to emotions, misinformation, myth and bias."
  - "I am in agreement with FWS director Dan Ashe in an email sent to his assistant Gary Frazer (acquired through FOIA); "this recommendation seem as odds with the best available science standard of the ESA"
  - "I've listened to Dr. David Mattson several times so I know who is thorough, scientific, very experienced in the GYE and straight forward."

Issue 13

- Concerns about counting methods, overestimation
  - "Grizzlies are notorious for being difficult to count."
  - "You say the GYE has about 700 grizzlies. How do you know? Did you count every one of them? Are you sure you didn't count somebody twice?"

- "The exact number of GYE grizzlies is not known by the federal and state wildlife agencies, [estimated at fewer than 700 individuals, possibly as low as 638 or as high as 1,110]."

Comment [AEK9]: In issue 9/10?

Issue 16

- Grizzly bear deaths have trended upward for the past decade, and total population has trended downward, per the Interagency Grizzly Bear Study Teams own reports. Sixty-one known and probable grizzly bear fatalities occurred in 2015. This number did not include an additional 24 bears that were thought to have died at human hands but went unreported
- "Further, grizzly deaths are increasing at a rate of 9-11% a year, 2002-2011"
- Mortality in 2015 was a "record high." This info was excluded from the 2015 annual report, giving "the appearance of political meddling"
- 2016 mortality on track to surpass 2015 records (as of September, already 35 bear deaths; last year that time there were only 25) → unsustainable
- "nothing has been done to address the violation of female mortality limits in 2015. If this issue is unaddressed now, why should the public believe that things will be better when grizzlies are delisted?"
- Misconceptions about the number of bear mortalities and how they are categorized and calculated)
  - "the [WY] policy has a chart showing Bear mortality, both natural and Man---due to ranchers having Wyoming's Fish Wildlife and the U.S. Forest Service " take out " so called problem bears. They state in the policy that a total of 7 bears were killed last year and 14 so far this year due to these circumstances ----THIS IS A MISCONCEPTION AND FLAT OUT LIE ----the number of Grizzly Bears as reported by Federal agencies and even Wyoming's FWS stands around 87."
  - ""Last year the total bears living in the Ecosystem was said to be 717 bears and now counting last years and so far this years totals of bears killed which is 130, the number would now be down to 585 bears."
  - Current levels of mortality ("as many as 65 female bears per year") are "three times higher than the sustainable mortality level for female bears set by government biologists."

Comment [AEK10]: Redundant to undue political pressure issue?

Issue 17

- The IGBST estimates that 96 females had cubs, Using the IGBSTs own estimate of 1.5 cubs per litter, this would be 144 cubs, of which only 50%, or 72, would be projected to survive to adulthood.

Issue 18

Comment [AEK11]: Check overlap with current issue 18 and 19

- Debate among commenters about whether or not bears have reached carrying capacity
  - Haven't reached carrying capacity
    - "Multiple reviewers note that the Service's assertions that the GYE population has met its carrying capacity are scientifically flawed and inconclusive."
    - "Delisting proponents go so far as to suggest that grizzlies in the greater Yellowstone area have outgrown the ecosystem. The proof, they say, is that bears are showing up where they haven't been seen in years. But the real reason for the grizzlies' spread may be simpler. With their food and habitat ever diminishing, they are venturing into unfamiliar places, often closer to humans,

where "negative interactions" get bears killed despite their endangered-species status."
        - "Questionable science as to whether the "ecosystem is full" or if bears are moving out to find new food sources as their primary sources, cutthroat trout and especially Whitebark Pine nuts, diminish."
        - "USFWS has argued that the population growth has stagnated because the population has reached carrying capacity. In reality, whats happened is the bears major food sources are in a state of disaster and more bears are roaming more widely in search of different foods and getting killed by humans in the process."
    - Have reached carrying capacity
        - "Biologist have done extensive studies and decided that the GYE has reached it carrying capacity for the Bears."
        - "Indeed, the U.S. National Park Service found evidence that the carrying capacity has been reached: The number of females producing cubs in the park has remained relatively stable since 1996, suggesting that the park may be at or near ecological carrying capacity for grizzly bears. This may occur not only from competition with each other for space and resources but also from competition with other species for food and water resources, which leads into the second factor for delisting stability of habitat quality and quantity ."
        - "I have talked to Chris Servheen, the Grizzly Bear Recovery Coordinator, and he has told me for almost 10 years now that grizzly bears have reached carrying capacity."
- Effects of reaching carrying capacity
    - "Recent attacks on humans is a clear indication that there is not enough land to sustain yellowstone bear population"
    - More bears will mean males will start to kill young

Issue 19

Comment [AEK12]: Check overlap with current issue 18 and 19

- "Recent data indicate that distribution of GB in the GYE has expanded markedly by as much as 40%. While that suggests a positive trend, other data suggest abundance has been largely stable or slightly decreasing since ~year 2000. The only way distribution can increase without a concomitant increase in abundance, is for density to decline. Evidence of negative changes in density suggests quality of habitat for GB is declining in the GYE, because density is linked to carrying capacity & areas with larger carrying capacities per unit area are higher quality habitats. Such changes are likely due to the loss of whitebark pine & trout as major foods."

Issue 20

- "lack of rationale for FWS' definition of suitable habitat…significant issues raised in the peer review that have not been addressed"
- In numbered list, add "Wyoming Range" and "Bighorn Range" to point 1 → "In it's draft conservation strategy, the USFWS has declared these areas as "socially unacceptable" but over 2/3 of Wyoming residents supported grizzly bear range expansion into the Wyoming Range and Wind River Range (not to mention the Bighorn Range. ("Public Attitudes Toward Grizzly Bear Management" by Wyoming Game and Fish Department - 2001)."

Issue 21

- "We have to understand how much habitat they need to have a viable long-term population, including whether they need corridors to other populations to maintain healthy populations."

Issue 21.5: General concerns about adequacy of habitat

- "Projected impact of shrinking habitat"
- "As a NOAA Scientist , I'm particularly tuned with environmental change and its impact. Satellite data and ecological models provided by our NESDIS branch demonstrate that the habitat does not currently and is not trending toward the ability to support a significant increase in grizzly bear population."

Issue 23

- In this summary, generally need to emphasize the concerns about threats from roads (many commenters brought this up):
    - "Another diminishing resource grizzlies require: wide swaths of secure, wild country without roads. Better yet, wide swaths of wild country that are connected, so the small remnant grizzly populations in the contiguous U.S. and Canada can intermingle."
    - "It should also be pointed out that the Greater Yellowstone Ecosystem is constantly under threat by new roads, trails and other human activity. With limited space and a diminished food source, the grizzlies are not stable enough without the protection afforded under the act."
    - "more roads equal higher bear mortality. Therefore, states need to commit to strict development guidelines to maintain protected habitat of roadless buffer zones between areas where grizzlies would be fair game (private developed and undeveloped areas along with USFS lands) and where it would remain protected (national parks). If this isn't done prior to de-listing, more roads will lead to greater grizzly mortality than you have accounted for in your de-listing proposal."
- "The reason that the bears of Yellowstone are not and cannot be recovered under present circumstances is because they live on an island, an island that the state of Wyoming has stated they intend to make smaller."

Issue 24

- "The USFWS's proposal does not adequately protect habitat outside the Primary Conservation Area, even though perhaps as many as half of the ecosystem's grizzlies spend some time outside the Primary Conservation Area. The USFWS should call for continued protections of habitat for EVERYWHERE grizzlies currently live, even if outside the PCA"
- Concerns that delisting will lead to unfettered development, disrupting the "large swaths of undeveloped land" grizzlies need to survive and threatening the bear
    - "delisting will re-open surrounding areas within the greater Yellowstone ecosystem to new development -- golf courses, mini-mansions, malls, ranches, roads, pipelines, oil and gas drilling and logging. Human/bear interactions will increase, and bears will die. Four Wyoming counties have already passed laws prohibiting bears within their borders." (not sure if this was referring to within the PCA/secure habitat or outside)
    - "The removal of protections for grizzlies also removes many crucial habitat safeguards. Grizzlies are a true wilderness animal and are dependent on large swaths of undeveloped land. When grizzlies were listed under the ESA, many logging, oil/gas, and tourist developments were stopped to protect the bear. Without protections, these

habitat safeguards are removed, and many acres of pristine land in the ecosystem could be opened up to development."
    - "Development is on the rise around the park borders"

Issue 26

Comment [AEK13]: Haven't checked for redundancy yet

- Grizzly is isolated
- "Island populations are by very definition always at risk, not only from genetic concerns…but also demographic, environmental, and catastrophic concerns, any of which can take down an island population and island"
- Habitat corridors are not being protected, expansion is not being encouraged. Grizzlies are therefore limited in their future range; "developing biological corridors between grizzly populations can help ensure genetic diversity and the grizzly's long-term survival."
    - Populations will not be allowed to expand southward in Wyoming (at least under the state's current management plan) i.e. Wyoming Range, southern Winds, Salt River Range."
    - 150 miles of farmland and roads separate Yellowstone grizzlies from their northern neighbors
    - "ID and WY don't care about connectivity": "Peer reviewer #4 correctly observes that Idaho's plan "clearly states that moving grizzlies into new areas (e.g., Bitterroot) is prohibited and intentions to connect GYE bear populations to these unoccupied areas is vague. (Id.). Wyoming's plan likewise seems designed to discourage recolonization or reintroduction in areas not occupied by grizzlies already. (Id., pp 3-4). If states are this hostile to bears outside of the DMA, how can connectivity - which most scientists deem critical - ever occur?"
    - "Yellowstone-border states eager to begin trophy hunts, with outfitters vociferously pledging to kill specific productive females, with the fact that area ranchers and hunters often display fierce animosity toward grizzlies, and with the reality that human-bear interactions very frequently end with a dead bear, it is unscientific, illogical and arrogant to pretend (as this rule does) that the bears will be able to safely exploit new territory."
- Need the following for adequate assurances of connectivity:
    - "ability to connect with other bear populations in the Northern Rockies without human intervention" (including Canada); "My understanding is that the Endangered Species Act stipulates that this happen."; "The USFWS's proposal does not adequately address the problem of genetic isolation by improperly relying on non-binding "assurances" from the state of Montana to "limit mortality" in potential linkage zones. The USFWS needs to do more to ensure that GYE grizzlies are able to exchange genetics with grizzly populations to the north, which is an absolute necessity if grizzlies are to survive in the long term"
    - Connections to Bob Marshall Complex.
    - Connections to the west along the Continental Divide to the Salmon/Selway/Bitterroot Complex; "Reintroduction of grizzlies through translocation in areas like the Selway Bitterroot Wilderness should be implemented first before delisting the GYE grizzlies"
    - "establish a viable grizzly bear population in central Idaho"
    - "secure practical linkage habitat between the Yellowstone bears and other populations to the north and west"
    - "One vital connective corridor is the Centennial Range west of the Park. It is one of the very few mountain ranges in Montana that runs east and west, making it an ideal path for grizzlies and other wildlife to travel to areas further west, and over time, Glacier and

central Idaho. These connections will help ensure a genetic diversified Yellowstone grizzly population."

- Protecting forests with large roadless tracts
- "A final rule must commit to connectivity and coordinated management"
- "It is absolutely critical that the states are on board with detailed, specific plans for connecting the grizzly populations given the fact that mortality outside of the DMA is at 47%! Connectivity will never happen at this rate."
- "Increasingly communities around the GYE and beyond are learning to adapt to the bears and to tolerate their movements. This is very promising progress that should not now be short-circuited."
- "There is an excellent opportunity to extend grizzly bear range and diversity for this bear as well as other far ranging threatened or endangered wildlife species i.e. wolverine, lynx and fisher come to mind. That opportunity lies in the huge area of federally administered public lands. ~ Extending from Yellowstone Park west through the Centennial Valley, thence west along the Continental Divide, Beaverhead-Deerlodge National Forest, Targhee NF, and BLM lands. ~ Thence northwest following along the Continental Divide (plus the Tendoy Mountain Flange to the east), Beaverhead-Deerlodge and Salmon NF northwest to Lemhi Pass. ~ Thence north on both the east and west side of the Continental Divide (Beaverhead-Deerlodge, Salmon and Bitterroot National Forest to the Big Hole, Chief Joseph and Lost Trail Passes. ~ Thence southwest along the Idaho/Montana State line, (including the Allan Mountain Fioadless Area), on the Bitterroot and Salmon NF tothe Frank Church River of No Return Wilderness and the Bitterroot-Selway Wilderness. These two wilderness areas, the largest joining designated wilderness areas in the contiguous forty eight states, will afford the Yellowstone grizzlies, that wander west from Yellowstone and points in-between, the opportunity to connect with northern grizzlies. This would enable the species to establish a more genetically diverse and sustainable grizzly population."

- Connectivity is actually adequate:
  - "The Bears are showing up in other areas, and expanding their ranges. The evidence is clear from the reports of Bears in the Big Hole Valley, and over on the prairie. http://mtstandard.com/news/local/grizzly-bear-spotted-in-upper-big-hole-for-first-time/article_2705b73a-1c8b-5c15-a8ed-95f1095a7606.html lands of eastern Montana. The fact that Grizzlies showed up in the Big Hole now shows they are using the corridors that will keep their genetics healthy. This shows that Grizzlies will be moving up and down those corridors from the Northern recovery areas to the southern. The science shows that our bears have recovered and should come off the list."
  - "Grizzly populations have expanded from the GYE and are colonizing new areas adjacent to YNP. In addition, grizzly populations have been expanding into areas between the GYE and the Northern Rockies population, which will promote the occurrence of genetic connectivity."

Issue 27

- "Farmers do what is best for their own business profit. Farmers do not manage wildlife."
- "Withdrawing most grazing rights on the region's national forests would be a good start in minimizing human-bear conflicts,"
- "Also, cattlemen and sheep men cannot lease grazing rights in these areas... This natural habitat must remain free from outside interests like these, and the Grizzly Bears need this refuge! SO,

Comment [AEK14]: This is in issue 23

keeping Grizzly Bears on the Endangered Species list means their pristine habitats cannot be leased"

- "If the federal government must pay farmers to leave grizzlies alone then so be it. Grizzlies belong in Yellowstone. It would be money well spent."
- "cattle is something we have to get rid of to begin with. WHO says this factor alone dooms us as there about 50 billion on earth or some such figure every year. you are not obligated to see the cattle industry survives just the reverse. cattle consume 100x the water, 100x the sewage, and 10x the food as if that food would be eaten directly all as times to humans ."
- "If we continue this trend to allow domestic sheep production to obstruct genetic connectivity, it will lead to the loss of genetic diversity. These sheepherders maintain multiple large guard-like dogs that displace migrating grizzly bears away from potential natural corridors of migration. And this is most prominent in female bears with cubs. Barking, aggressive guard dogs will deter them from their natural historic migration pathway, and this is inappropriate, and this needs to be analyzed." And "Domestic sheep grazing is a major obstruction to grizzly bear connectivity because of alien sheep herders who will harass or kill grizzly bears near their flocks."
- On issue of Sheep Experiment Station
    - "The U.S. Experimental Sheep Station that straddles this range must go before delisting the grizzly. Years ago, I came across a few sheep herders in the Gravellies that were in the process of disposing a grizzly that had killed some of their sheep the previous night. "Shoot, shovel and shut up" was code of the West back then, and there is nothing to show that this fact has changed. The dead grizzly recently found on the Sheep Experiment lands reflects this." This station blocks connectivity: "They have talked about the Sheep Research Station in the Centennials, which is the only east/west mountain corridor. And this is blocked by the Department of Agricultural Sheep Research Station, which has illegally killed bears there in the past."

Issue 28

- "I would ask that you use the power of your office to protect our environment from destructive hard rock mining projects like the Montanore Mine in the Cabinet Mountains Wilderness. As you know, the Montanore Mine is a massive mine in the heart of critical wilderness habitat for grizzly bears and bull trout, both threatened species protected by the Endangered Species Act. Hard rock mining projects like the Montanore Mine are threatening spectacular wilderness areas, placing short-term profits above wildlife and wild lands."
- "28 mines are able to be developed, oil extraction becomes viable… if Grizzly Bears lose their ESA status"
- Many commenters did not want *any* oil and gas leasing in grizzly habitat (especially the PCA) and "keeping Grizzly Bears on the Endangered Species list means their pristine habitats cannot be leased"

Issue 30

- "Humans continue to encroach on the habitat of our wildlife, humans do not follow posted, common sense guidelines/rules that in place for the safety of said humans, especially in national parks causing the necessity of restricting humans from the national parks."
- "Yellowstone has seen record #s of visitors the past two years, and that trend is likely to increase with much of the visitors being foreign travelers. Bear/human conflicts will increase with the increase of bear population & increase in #s of visitors."

Comment [AEK15]: Already added these to the issue summaries

Issue 31

- "over 3 million acres of pristine land open to timber harvest and road building if Grizzly Bears lose their ESA status"
- Many commenters did not want *any* logging in grizzly habitat (especially the PCA) and "keeping Grizzly Bears on the Endangered Species list means their pristine habitats cannot be leased"

Issue 33

- "Habitat fragmentation has perpetually increased the isolation of this group of bears."

Issue 37 (Joy)

- Pro
  - "Allowing hunters to purchase hunting tags to regulate animal populations is both ethical and financially sound."
  - "I strongly believe opening a hunt can be healthy for the overall population of Grizzlies in this area. While this might seem counter intuitive the idea is actually quite logical to me, if a reasonable amount of bears are taken, through hunting, the food resources available to remaining individuals in the species will increase. Having more available food resources will help young bears grow to maturity and it will also allow more energy to be spent on mating and less on searching for food. In other words, if bears are spending all there time hunting or if they are too weak, they will not breed as much." And "If animal populations aren't controlled with these methods they will continue to grow and then will start dying off due to disease or food shortages"
  - "Hunters could effectively take care of [problem bears] and the state would make money instead of having to pay to have bears relocated or killed" (value of depredation hunts)
  - Hunting will increase bears' fear of humans, reducing future conflict with humans/bear harassment of humans
- Con
  - Population too small to justify hunting:
    - "Removing federal protections from this one small, isolated population and subjecting them to trophy hunting will not advance the conservation of this species."
    - Hunting will lead to inbreeding, inbreeding depression, and "subsequent extinction."
    - Population can't handle mortalities beyond management removals, traffic deaths, etc (what's already happen). Just with these, there is a lot of mortality:
      - "In the past two years over 90 bears have been killed , either by the state of Wyoming Fish & Game , the US Forest Service, the USFWS or traffic fatalities . This alone would drop their population down to around 600 or fewer, and you being a hunter yourself should know that natural mortality cause even reduce their number lower than this."
      - "Last year saw record high deaths, with roughly 85 bears killed in the Yellowstone region alone. That is over 10% of the population lost in a single year even with federal protections in place!"
      - "Human-caused grizzly deaths are at all time highs, and the species is currently protected, so this is only going to increase once the protections are lifted."

Comment [AEK16]: Already added

Comment [AEK17]: Compare to current issue

Comment [AEK18]: Make sure not redundant to what's in Issue 16/move this discussion completely to Issue 16?

        - "The current populations are being managed for stability, not growth. There is no significant increase in grizzly populations. Reinstating any kind of hunt prematurely on this species risks a decline in numbers that most likely will exceed reproduction rates."
- "The population is not recovered in actuality, despite what Chris Servheen might say, and he seems to represent the bias that the public will only value grizzlies if we can kill them. That is an outmoded 19th-century attitude which is certainly not true today, and recent published research has de-bunked that antiquated theory."
- Requests for data to support claims that hunting will improve the health of bears in the GYE
    - "I'd like to see the impact study that says hunting (you call harvesting) the bears will improve the health of the GYE?"
- Bear population will not be able to withstand hunting because of grizzlies' slow reproductive cycle
    - "Upon further research of the bears' current condition, I don't have full confidence that the fish and game has a grasp of how hunting will impact female bears and their ability to sustain a healthy population of grizzly given the animals are slow to reproduce. There are so many other pressures and obstacles faced by the grizzly and I'm confident that the research is plentiful enough to support my concern."
    - "Grizzly bears evolved without predation pressure, and as so, they evolved a low birth rate. As such, they are ill-suited to survive in the face of sport hunting as demonstrated by their catastrophic population crash during the previous two centuries."
- Negative impacts on grizzly behavior and social structure
    - "Additionally, I have not been able to find any scientific information in the proposal about how removal of a dominate male from a territory often results in a skewed age structure of the population, increased infanticide, increased juvenile male disperses, and increased human-wildlife conflict."
    - "Hunting not only stresses the entire population but also single individuals. In a few years time these animals will produce less offspring due to the added stress."
    - "They aren't like elk or deer which run away from hunting threats."
    - "And how do you know hunters will not "harvest" pregnant females or females with cubs? Potentially one "harvested" adult results in 3 more deaths."
    - "hunt for grizzlies or hunting in general could wipe out entire sectors of these apex predators that the regional ecology needs to thrive. Eradicating wolves from Yellowstone was a flawed, devastating plan that should remind folks of the dangers involving a lack of species protection. To avoid costly and ineffectual bear restoration (like wolf restoration), I urge the federal protections remain in place."
    - "and I'm concerned about how hunters will know for sure which bear is being shot - a reckless youngster or the brain trust for generations of cubs"
- Hunting and human-bear conflict
    - "Bigger bears will be most not all hunters' prizes. What of the cubs and sub-adults that will be left behind? Younger populations are more fragile; young bears disperse widely, leading to more negative human-bear interactions."
    - Hunting will increase conflicts between humans and bears

- Hunting applies perverse evolutionary pressure
  - "Mother Nature takes care of population control by limiting population booms if enough food is not available and by having natural predators take out sick, weak and old. Mankind improperly controls animal populations by killing the biggest and healthiest animals for trophy mounts and photo ops. Mankind can only protect animals from certain human hazards such as arson, poison, steel traps, bearpits. and prohibiting the cruelty of spears, bows and bullets. In addition, please ban hunters from posting photos of men and children alongside killed animals."
  - "Furthermore, allowing hunting of this vulnerable population could lead to rapid directional selection resulting in a less fit and viable breeding population"
- Ethical opposition to hunting or trophy hunting
  - "Hunting is a consumptive activity that benefits the individual at the cost of the general public."
  - General opposition to trophy hunting (hunting for sport instead of for food)
  - "In quoting Michael Sutton, former federal wildlife inspector and past president of California Fish & Game Commission; "the problem with trophy hunting is that it inspires unethical and sometimes illegal behavior on the part of hunters, that reflect poorly on all hunters not just trophy hunters". It also conveys a message that it is o.k. to kill threatened or endangered wildlife, a huge and well documented international problem."
- Hunting and increasing fear or humans
  - "In addition, there's a lack of scientific evidence that it is possible for animals such as bears to adjust their habits in the face of hunting in the same manner as more social animals, such as deer and elk. According to Swensen in 1999, the construction of such an experiment to determine something like this is virtually impossible in the wild."
- Relocate "surplus bears" instead of hunting
  - The best way to recover GB is to approach conservation from a larger continental scale. If the GB population in the GYE is in fact saturated, surplus animals from the GYE should be trans-located to new ranges in ID, MT, WA, OR, & CA where there is available habitat. Surplus animals should be used to advance broader conservation goals on continental scales, & repatriate GB to the other 98% of their range in the western U.S. where they have been extirpated.
  - "A good plan needs to be devised with all players at the table, including Wyo G&F, Wyoming stockmen in counties surrounding the park, the Wind River Indian Reservation - Tribal G&F and BIA biologists. If surplus young males or females become an issue, use them to transplant into suitable vacant habitat in Wyoming or in Rocky Mtn. NP or even to large CA parks with long vacant habitat such as Sequoia, Yosemite"
  - "Instead of a hunting season, please consider the tribal offer to allow the relocation of Grizzly Bears to biologically suitable tribal lands within historic range. Every tribe in Montana opposes the delisting and hunting of Yellowstone ecosystem Grizzly Bears. The tribes object to trophy hunting of the bears on cultural and religious grounds, science, and economics. Therefore, if the Yellowstone population actually does need to be managed - and there remains significant debate that it does - these bears should not be killed. Rather, they

Comment [AEK19]: This is also in existing summary of Issue 45 (poaching Issue)

should be transplanted to sovereign tribal lands. Reintroducing grizzlies to tribal land would revitalize many tribal cultures, which hold the grizzly bear as sacred."

Issue 38

- JDR
  - "Wyoming continues to assume authority over National Park Service managed lands within the John D. Rockefeller Jr. Memorial. This is in violation of the Organic Act and in direct conflict with the proposed rule, which states that hunting would be prohibited in National Parks. This approach potentially opens Park Service lands to grizzly bear hunting and is an error in regulatory authority that must be fixed in the final rule."
- To add to point 3
  - "How will "secure" habitat be protected within the Primary Conservation Area when mortality rates are allowed to range up to 10% for female bears and 22% for male bears? This proposal does not contain adequate regulatory mechanisms to ensure secure habitat remains and that hunting will not disrupt National Park Service resources."
- To potentially add to discussions about buffer zones around park boundaries
  - "However, grizzlies have huge ranges that extend well beyond park boundaries. It would be expected that these grizzly would endeavor into areas outside of the parks in search of suitable mates and food sources. Without the protection under the act these bears would be hunted, thus furthering their plight, considering a diminished food supply and a lack of open space."
  - "And they have been habituated to leaving the park's boundaries to feed on gut piles left by hunters particularly in the Teton area and those bears will be shot immediately if they are not protected."
  - "It is a known fact that the Grizzlies of the two national parks do travel out of the parks on a regular basis and there needs to be protection of the grizzly when they step out of the parks boundary."
  - "The U.S. Fish and Wildlife Service should provide the National Park Service with a formal role in the management of bears on habitat adjacent to park borders"
- "Further, NPS has expressed concern that 100% of the hunting would take place where only 80% of the bears live. This could cause problems with connecting the Yellowstone population to the Northern Continental Divide Ecosystem, as evidenced by a 47% mortality rate outside of the DMA in 2015. (IGBST 2015 Annual Report, pg 29-30). NPS is familiar with the importance of these bears to tourism and its concerns should be addressed."

Issue 39

Comment [AEK20]: Compare to current issue

- Scientific basis
  - "The best-available, peer-reviewed science and wildlife management practices all point to continued growth of grizzly populations - mortality rates, including hunting, are factored in and do not support claims that populations will face any sort of precipitous drop."
- How applied
  - Claims that we are not accounting for losses from immigration

- “Population could be reduced to 600 bears (500 bears in Wyoming) before "discretionary" (hunting, management "removals" etc.) mortality would be curtailed.- Population will no longer be allowed to grow - population is now being managed for stability, not growth.”
- The mortality limits we outline will lead to population declines, are “unsustainable”
    - “Simple addition and subtraction indicates that the number of bears would decline yearly, and that is before allowing for the stress on the bears due to the loss of important food sources, the whitebark pine seeds and army cutwork moths. Wyoming Game and Fish has acknowledged the stress on the bears from the loss of whitebark pine seeds in their own publication, Wyoming Wildlife.”
    - “With an estimated ~ 700 grizzly bears in the ecosystem and 600 bears being the proposed delisting criteria, the first year of delisting could and likely will reduce that population below that minimum population. In 2015 USGS reports that 61 grizzly bears were killed, 57 of those inside the DMA”
    - “Also, I fear how states may react -- would they assert a mortality limit percentage has not been reached unless the margin of error inherent in the estimate has been applied to the population estimate, thereby resulting in a more diminished population. Given the length of time necessary to achieve the increase in numbers (Grizzlies have been listed for approximately 40 years), mortality limit percentages geared to allow a one year decline of up to approximately 14% seems irrational. The rate of allowed population decline should not exceed the rate at which the population can grow. When the rate of allowed decline can so exceed the rate of natural population growth the stated goal of maintaining a recovered population is not effectively or even rationally served.”
    - “The IGBST study itself states that a loss of a mere 10 percent of females could crash the population into a precipitous decline, something we cannot afford to take chances with in this genetically isolated population.”
- Concerns about overshooting the mortality limits
    - “Do we really want to risk, "whoops!--hunters "harvested" over-quota," (as has recently happened with Yellowstone wolves in areas immediately adjacent to Yellowstone) with this slow reproducing vital animal that is already facing threats from sources known and unknown?”
- Alternative methods for setting mortality limits in a different way
    - “Reconsider the calculation of mortality limits given how slowly grizzly bears reproduce - Place more weight on the actual mortality rates from recent years - which occurred even as the bears are under Endangered Species Act protection”
    - “Mortality limits need to be set on trends in addition to total counts.”
- “The USFWS must provide the public and peer reviewers a full analysis of how the proposed mortality thresholds will impact population numbers, dispersal, and connectivity.
- Concerns about limiting monitoring to the DMA
    - “The proposal today in front of us results in all bears who are outside of those boundaries temporarily, or permanently, to be managed at the complete discretion of the states, and those bears will not count at all towards the population estimate, and as a result of this, they could be totally eliminated.”
    - “we're also concerned about grizzly bear occupancy and habitat. Particularly we're concerned about the demographic monitoring area and the relatively small portion of the entire ecosystem where grizzly bears and grizzly bear mortalities will be counted toward mortality thresholds.”

Issue 43

- "...illegal harvesting data have not been substantially included and addressed in this debate: I urge you to keep grizzly bears on the endangered species list until this information is included to represent a complete and thorough assessment for delisting...Although Asia appears to be the largest market for bear bile, paw, and other parts the United States made 210 seizures (page 13) of shipments from Asia related to illegal bear trafficking during 2000-2011." (http://www.poachingfacts.com/poaching-statistics/bear-poaching-statistics/)
- Please read INTERPOL's report, "Assessment on Illegal Bear Trade," 1 Dec 2014, and include their findings http://www.interpol.int/contentinterpol/search?SearchText=Assessment+on+illegal+bear+trade&x=0&y=0

Issue 44

Comment [AEK21]: Need to compare to existing issue summary

- Claims that instances of human-bear conflict have increased:
  - "The grizzly bear population in and around Yellowstone is dense enough that grizzly bears now prey on humans. Three deadly, predatory grizzly bear attacks on humans have occurred since 2010 within undeveloped bear habitat. I refer specifically to the bear attacks at Soda Butte Campground (victim Erwin Evert) in 2010; at Hayden Valley (victim John Wallace) in 2011; and on Elephant Back Mountain (victim Lance Crosby) in 2015. When the grizzly bear population grows so dense that the bears turn to humans as prey, it is too dense. I've noticed that grizzly bears increasingly inhabit the developed parts of Yellowstone National Park. I've come to the Park, to Old Faithful, every summer since 1988. In the late 1980s, grizzly bears were uncommonly seen around Old Faithful. Now, grizzly bears are commonly seen there, even in the highest-visitation months of July and August. Also, grizzly bears are now commonly seen at the roadside throughout the Park. Although they are admired by huge crowds of Park visitors, it is unnatural for grizzly bears and people to be so close together. It isn't safe, either. Bears that grow up around crowds of people lose their fear of humans, making future conflict more likely. These bears used to have enough space in the backcountry. Now, they no longer do because there are too many bears."
  - "In Montana, grizzly bears have been observed to be moving down to lower elevations as a result of changing food sources and this is leading to more and more human/bear conflicts, making bears incredibly vulnerable to human caused mortality"
  - "Grizzlies have dispersed farther to the periphery of their ranges in search of meat to replace the loss of pine nuts and trout. This has led to the increased conflicts, primarily with livestock and hunters, and ultimately death for the bears." And "Moreover, the directions of population expansion are largely to the south & east where the only remaining good stands of whitebark pine occur & where Cutworm Moths are found in abundance. These alterations in distribution are alarming because they also place GB at greater risk to humans, because land uses are higher in those areas"
- Delisting will help reduce this human-bear conflict
  - "The result of de-listing the bears would allow for better management of #s of bears. It would also reduce bear/human conflicts which often result in harm to the bear or a human or both."
  - Better to have hunting than management removals (will ultimately lead to less overall grizzly death) → "Make sure the states follow the selective harvest requirements and quotas, if not the populations will increase and you will have more disastrous

encounters with humans and livestock , so ranchers and cattlemen will take more out of the picture then hunting will."

- There are more ways to reduce conflict that don't require delisting...
  - "Suzuki report states that "there is no scientific evidence to support the claims that sport hunting these large omnivores Is a necessary part of keeping people safe. There are far more effective management approaches to allow people and grizzly bears to co-exist without killing so-called "problem" bears. Educating people about how to avoid conflicts with bears. how to hunt safe in bear country and how to carry and use bear spray ere the most effective means of preventing dangerous beer-human encounters. Pepper spray. for instance, stops undesirable behaviour by bears 92% of the time, and has been proven to be more effective than firearms". The report states that hunting bears to help keep them wild and wary of humans and hunting them to keep the population healthy by eliminating older bears are both myths."
  - "Nature always takes care of itself and the bear population will be reduced most likely through disease or starvation."
- Need more non-lethal control
  - "Non-lethal means should be used to deter bears from encroaching on private property."
  - "More needs to be done to prevent conflicts between bears and hunters and ranchers. More methods of coexistence tried rather than lethal control. And, that also is not included in the plan"

Comment [AEK22]: Already added

Issue 45

- Various claims that there will be more illegal killing in a post-delisting environment, jeopardizing the population
  - "Without adequate protection, people who don't like grizzlies will kill more of them since they wouldn't have to pay as big a fine if caught"
  - "Hunters will claim that they had to shoot a bear in self- defense."
  - Local attitudes towards grizzlies will lead to "shoot, shovel, and shutup" in a post-delisting environment
  - "it seems that there would be too many ways for illegal killings to fall through the cracks if the Bears were delisted."
  - "Idaho has not raised poaching fees since 1999. Montana proposes an "illegal take of grizzly" fine of $8000, the same as for plentiful species like elk and deer. Why isn't the proposed fine equivalent to that for bighorn sheep ($30,000)? The impression is certainly one of indifference. How can the public feel confident that poaching will be taken seriously by any of the three states?"
- "Poaching...data have not been substantially included and addressed in this debate: I urge you to keep grizzly bears on the endangered species list until this information is included to represent a complete and thorough assessment for delisting. Historical poaching data: From 1983 through 2002 there were 8 North American brown bear (grizzly bear) deaths attributed to poaching (page 70) in the Cabinet Yaak and Selkirk ecosystems of Idaho, Montana, Washington, and British Columbia. During the same period 14 grizzly bears were killed due to unknown human intervention where no clear proof of motive was available. These statistics are higher than the number of bears killed in self defense or as a result of legal hunting." (http://www.poachingfacts.com/poaching-statistics/bear-poaching-statistics/)

Comment [AEK23]: Reduce redundancy between this issue and Issue 26

Also compare to original issue summary

Issue 47

- "Yellowstones grizzlies have had zero genetic connectivity with outside populations in the last 100 years. This means that every grizzly in the Yellowstone population today came from a gene pool of only 136 animals (the population low point in 1975). A wildlife population will not survive in the long term without genetic connectivity to promote genetic diversity and avoid the damaging effects that inbreeding can have on a wildlife population. Establishing corridors to allow bears to move between populations in Yellowstone and Glacier will require more protection, not less. Genetic connectivity is an absolute necessity if the Yellowstone grizzly is to survive in the long term and this prospect becomes much more difficult in the absence of ESA protections."
- "Inbreeding is a serious threat to the genetic diversity of these animals." And "The population must be large enough so that genetic abnormalities and birth defects won't make a difference in the long run."
- "Lack of connectivity to other grizzly populations is a long-term genetic risk for Yellowstone grizzlies. (Haroldson, M. A., C. C. Schwartz, K. C. Kendall, K. A. Gunther, D. S. Moody, K. Frey, and D. Paetkau. 2010. Genetic analysis of individual origins supports isolation of grizzly bears in the Greater Yellowstone Ecosystem. Ursus 21:113. BioOne)."
    - "The USFWS's proposal does not adequately address the problem of genetic isolation by improperly relying on non-binding "assurances" from the state of Montana to "limit mortality" in potential linkage zones. The USFWS needs to do more to ensure that GYE grizzlies are able to exchange genetics with grizzly populations to the north, which is an absolute necessity if grizzlies are to survive in the long-term."
    - "There is no adequate plan in the delisting regs for connecting grizzly bears with the Northern Rockies. Without a plan for a connective corridor, and a no-hunting policy between these two populations, I believe that the future of the Yellowstone Grizzly is bleak. I believe this because although at this time one study says there is sufficient genetic diversity in our population, this diversity will overtime decline without an influx of new blood. Bears cannot be 'flown' in which I understand is the present plan if the gene pool is limited"
    - "In the least, Yellowstone grizzlies need proper connections with other major bear populations. Wildlife corridors need to be established between core areas and subpopulations need to be able to exchange genetics. As of now, our bears will not be able to maintain a healthy population."
- "At least 1,850 bears would be needed to keep long-term genetic viability, a number that is still far from being reached."
- "The Rule assumes that the genetically effective size of the Yellowstone population is large enough to maintain genetic viability, but the research supporting this contention is based on seriously flawed assumptions."
- "Also, there are a lot of bears in Canada and Alaska -- occasionally supplementing the Yellowstone population with bears from the north if necessary to meet objectives could be part of the plan."
- "Because 40 years is not enough time to establish a varied genetic tribe of bears."

General food → Issue 51??

- Food sources (e.g. huckleberries, elk/bison, whitebark pine, cutthroat trout, army cutworm moths) are declining/disappearing. Leads to grizzlies wandering farther to find food and "Although the bear population has rebounded, two of the main food sources have collapsed

(white bark pine nuts and cutthroat trout) leaving the population vulnerable to rapid decline if other food sources become short."

- "You can't possibly delist an animal whose sources of food are declining and whose access to those food sources outside a protected range is restricted." "Without federal protections, grizzlies would not be able to reach further vital food sources in Wyoming."
- "Grizzlies are very territorial and each bear requires tens of thousands of acres to get enough food."
- We need to see what climate change does to their main food sources.

Issue 50

- "You say grizzlies are finding other food as their historic food sources dwindle. But I don't believe you have taken into account the variables with other options, like caloric intake, quality and availability of that food, or how much vulnerability or human interface is required to get to them. The "adaptable bear" is not a valid argument for delisting."
- "There is also a fallacy that bears are omnivores so they can eat anything. There are too many assumptions based upon this rationale. Climate change or global warming is changing all that. Yes, they can eat many things, but how nutritious is that diet going to be?"

Comment [AEK24]: This is already in the summary

Issue 52

- "And how do you know the bears' food sources are in healthy supply? Have you actually determined the ratio of army cutworm moths to bears?"
- "USFWS fails to adequately address the effect of army cutworm moths on birth and death rates of Yellowstones Grizzly Bears and fails to account for past effects of increases in consumption of moths by bears and future effects of losses of this food on the population.
- Army cutworm moths are among the highest quality of grizzly bear foods in the Yellowstone Ecosystem, (Erienbach et al, 2014). Over summering moths can consist of 50-80% fat (Kevan & Kendall 1997), which female grizzly bears need to achieve substantial body fat in excess of 20% to produce and sustain cubs. (Farley & Robbins 1995).
- "Individual sightings of grizzly bears on moth sites have numbered between 240-350 during the last three years (IGBST 2015:42-43), which strongly suggests that a substantial number of bears use this food resources and perhaps even the majority of those bears living in the eastern portions of the Yellowstone Ecosystem. All of the 31 known army cutworm moths sites are located on US Forest Service lands. (Gunther 2014). Six of these sites are located outside of the Primary Conservation Area. Nowhere in the Proposed Rule does USFWS address the demographic analyses relied upon and referenced by USFWS or have they in any way incorporated the effect of army cutworm moths consumption in their analyses of grizzly bear birth or death rates."
- "There are further questions about another important food source, the army cutworm moths, which migrate to the ecosystems highest mountains during the summer from agricultural lands on the great plains where they are threatened by heavy pesticide use."
- "Allowing mining, ranching, or other kinds of development on these lands may further affect the available food sources for the GYE grizzly," specifically army cutworm moths.
- "Army cutworm moths are found mostly in the alpine talus slopes in the southeast area of Yellowstone Park and outside the Park to the southeast. These alpine areas are predicted to have a 90% loss by 2099."

Comment [AEK25]: Already in the summaries

Comment [AEK26]: Already in the summaries

- "Another food recently used in large quality is Cutworm Moths in the alpine, but they do not compensate for loss of other prey & their center of abundance is located to the southeast where GB are more exposed to human conflicts."

Issue 53

- "Another important food source, the cutthroat trout of Yellowstone lake and its tributaries, has also experienced massive declines due to predation from non-native lake trout."
- "spawning cutthroat trout (losses greater than 90% in many important spawning streams) followed the introduction of Lake trout into Yellowstone Lake."

Issue 54

Comment [AEK27]: Compare to current Issue summary

- A lot of commenters expressed concern about whitebark pine declining. Reasons cited for decline include:
  - Drought
  - Beetles (multiplying with warming climate)
  - Fire
  - Blister rust

  These factors "destroyed most of the trees between 1995 and 2005"
- Declining whitebark pine will make it difficult for grizzlies to find the food they need to survive
  - "The service's recent research on whitebark pine offers no reason to believe that bears will continue to flourish in the Yellowstone Ecosystem in the absence of functioning and healthy whitebark pine stands. Simply stating that "bears are omnivores so they'll find alternatives" does not adequately address the concerns raised by the Federal Disctrict Court Judge Molloy, affirmed by the Ninth Circuit Court of Appeals."
  - "While bears in Yellowstone feed on elk, bison and fish, it is important to understand that their most essential food source is seeds and nuts from the whitebark pine.
  - "The pine nuts are rich in protein and fat which allows bears to fatten up for the long winter. For breeding females, body fat determines their ability to reproduce. Pregnant females going into hibernation with insufficient body fat absorb their fertilized eggs."
  - "Historically, the high-fat food source of the whitebark fuels the reproduction of female grizzlies."
  - "With trees dying from invasive beetles; a large part of the bear's diet is decling that will have them going into hibernation less robust; may affect the sow's ability to bear young or keep them fed enough to grow up."
- Climate change threatens whitebark pine with further decline
  - "Both of these threats (beetles and blister rust) will increase as global-warming trends continue. Historically, the bitter cold winters of Yellowstone would wipe out the fungus and beetle infestations. No longer. Studies by the Natural Resources Ecology Lab at Colorado State University and by scientists at the U.S. Forest Service clearly document warming trends over recent decades in the mountainous regions of the western United States, with strong correlations to increased insect and fungi infestation to native pine tree populations."
  - The retired head of the US Forest Service bark beetle research unit stated that the central habitat of the grizzlies is among the hardest-hit in the beetle epidemic and the infestation does not appear to be waning.
  - "Within this range, more than 80% of their major food source (the white bark pine) has been lost due to climate change."

- "Because GB are long lived & changes in whitebark pine food has been recent, there will be lag effects on PGRs. More time is required to observe these effects & evaluate jeopardy to GB population."
- "The rule acknowledges the rapid decline of whitebark pine but rather than including it as one of four important food source for GYE grizzlies, as stated in the 2007 rule, this current proposal merely claims 'it can be a significant food source', severely deemphasizing the role of whitebark pine has in a grizzly bear diet. The Service's research found grizzly bears' selection of whitebark pine seeds has declined since 2000, coinciding with whitebark pine population declines reaching epidemic proportion, but the agency fails to acknowledge the likely causal connection of stark and rapid declines of whitebark pine populations being a limiting factor for grizzly bears using it as a food source"

Issue 55

Comment [AEK28]: Compare with current summary

- Dependence on ungulates is risky because:
  - Forces females to compete directly with males for food
    - "Additionally, competition from male grizzlies particularly during the early months of spring add pressure on a female with cubs from getting nourishment from dead bison or ungulate species such as elk immediately after the winter season. This puts the mother and the cubs at risk of starvation particularly during a time when other food sources are scarce."
  - More dangerous to acquire
  - Lower quality; "not the best food source for the females to meet their reproductive needs"
  - Exposes females with cubs to males, who may commit infanticide
  - "brings them into more contact with humans, which means more grizzly death"
  - "You haven't considered the types of food that grizzlies teach their cubs to eat, which determines how many cubs will survive their first year; meat-eaters for example are more likely not to live."
- "One of their main food sources is wild grazing animals and many of those species are in decline because of birth defects like underbite, male reproductive malformations, heart defects, underdeveloped thymus and lung damage. These birth defects result in high mortality in the young, which helps feed grizzlies in the short term, but cause serious declines in the overall populations of the affected species."

Issue 57 (Joy)

- Dismiss climate change too readily
  - "The current proposal fails to adequately consider the impacts of climate change on grizzlies, now and into the future. The U.S. Fish and Wildlife Service must explain to the American public how climate change will impact Yellowstone grizzly bears long-term."
  - "We need to guard them and create climate change pathways of land for them to migrate to and forage on as climate shifts."
  - "We don't yet know…how they'll deal with shorter hibernation cycles in the era of climate change."
  - "The uncertainty about the impacts of climate change on bear food sources, surrounding human land use patterns, and the synergistic effects of these multiple potential threats to grizzly bear persistence are unclear and difficult to predict" (39)."Climate change renders the future occupancy of protected areas such as parks into question" (39). "What is unclear, however, is how a warming climate in this area, lower

Comment [AEK29]: Already added

elk numbers in the GYE, the continued impacts of invasive species (e.g. rainbow trout) and disease (whitebark pine) will synergistically impact the very complex trophic web in this region and affect bear numbers in coming decades" (40)."

- "Yellowstone National Park's climate study concludes that not only will there be less and less snow pack, but that the GYE will look more and more like a sagebrush steppe. What will bears be eating then? All these are very unknown factors that are not acknowledged in your plan. In addition, climate change makes it even more imperative that we establish connective corridors, and protected private and public lands for these bears to survive."
- "The impact of climate change on Yellowstone's grizzlies is summarily dismissed in The Rule by the statement, "Most grizzly bear biologists in the United States and Canada do not expect habitat changes predicted under climate change scenarios to directly threaten grizzly bears." The only support for this statement is citation of a non-referred summary publication authored by Dr. Servheen, the principle author of The Rule. Elsewhere in the document, ample evidence is presented (pp. 13216 - 13217) that, in fact, climate change has already detrimentally affected Yellowstone's grizzly population. but this evidence is likewise summarily dismissed with the blithe statement that, 'grizzly bears are adaptable, they'll do just fine,' with little or no supporting evidence."
- "Grizzly habitat is shrinking, their population growth has stalled, and I believe climate change is a huge wild card that is already radically shifting precipitation, snowpack, fire regimes, and habitat distributions of all kinds of flora and fauna, and can therefore be expected to greatly impact top predators like grizzlies as well. The precautionary principle tells us that it's not wise to blithely expect a secure future for Yellowstone's grizzlies, but rather to expect unforeseen consequences, particularly from climate change, and therefore to cautiously retain (or strengthen!) existing protections for grizzlies."

- Agree climate change is not a threat in the foreseeable future
  - "First, if climate change has drastically changed the local climate and ecosystem how is it than that the Bear has been able to recover and increase its population to its current size? If the climate is really changing at a rate to where it is affecting bear populations opening a hunt will help maintain the population within a limit to where it will not exceed the amount of available food sources."

Issue 63

- "The bears' survival is at risk due to things such as reduced food availability (i.e. much less whitebark pine nuts, much less cutthroat trout, etc), a lack of genetic diversity due to isolated populations, and potential contamination of the park's air and water from sources outside the park (ex: mining operations, oil/gas operations, etc.). This newer, "holistic" perspective on the bears (and all other flora and fauna), and their food-chain, ecosystem and climate needs should be a significant consideration in deciding the bears' fate."
  - This quote brings up some threats not currently included in the summary (i.e. genetics, isolation, "and potential contamination of the park's air and water from sources outside the park")
- "The GYE grizzly bear population remains in peril from the combined effects of habitat loss and fragmentation, climate change, decline of primary food sources, and human-caused mortality."
- "Grizzly bears are threatened by shrinking habitat, disappearing food sources like whitebark pine, isolation and increasing conflicts with people and livestock, and these challenges have only been compounded under the mounting strains of climate change."

- "The Yellowstone population continues to be jeopardized by increasing regional human populations, energy development, problematic livestock husbandry practices, habitat degradation caused by climate warming, hostile state management, and unreliable methods for monitoring status and trends."

Issue 65

- Not only must adequate regulatory mechanisms be finalized prior to delisting but they also must be "proven to be effective"
- Claims that regulatory mechanisms and state management plans still aren't final and thus can't be part of our analysis of adequate regulatory mechanisms (see Issue 1.25)
    - "We haven't even seen draft plans from Montana or Idaho yet, and they are key for connectivity." (from April public hearing)
    - ID regs not final

Comment [AEK30]: Move this Issue here?

Issue 66

Comment [AEK31]: Check for redundancy

- Potential additions to discussion of the gray wolf (and this causing distrust of state management)
    - "As a resident of this area, I know well that Wyoming Game and Fish Department is solidly anti-predator; their obvious goal is to reduce wolves and lions to the minimum (typically an arbitrary, subjective number based on flawed methods of estimation)--and it will be the same for bears. Please do not turn the fate of grizzly bears over to the state of Wyoming. Science and management of predators in this state have not progressed past the middle of the 20th century."
    - "One needs only to look at the applicable states management of the Gray Wolf to see they are simply incapable of managing a critical species, when other priorities exist and they defer and cater to the hunting public."
    - "When the wolves were delisted in these 3 states, their populations have declined greater than 50% from 3 years ago. Idaho is on record for killing all wolves until there are only 100 left. The grizzly bears would be decimated & as their reproduction is much lower than most predators, it is likely the bear would have to be relisted."
    - "Idaho allows indiscriminate wolf (and coyote) killing contests, without environmental review." And "Witness the slaughter of Idaho's wolves by hunters and trappers that has reduced wolf numbers across that state to the point that they no longer function as an integral part of that state's ecosystem."
    - "FWS with the full support of Governor Mead of Wyoming managed to reduce the states wolf population by 40% in three months after they were delisted. They were later put back on protection of the Endangered Species Act by a federal judge who ruled FWS was "arbitrary and capricious" in accepting Wyoming's promise of "minimum management targets"." And "Wyoming holds the vast majority of grizzlies. I do not believe that Wyoming can be considered capable of maintaining populations of any large carnivore in a scientific manner, considering its dismal record of "managing" wolf populations. Its wolf management was so bad that it has had to be struck down in federal court twice."
- States cater to hunting interests
    - "The states are not trustable in this regard as their monies come directly from hunters, not the environmental community."
    - "and state management practices that are hostile to large carnivores (state agencies view large carnivores primarily as competitors for deer, elk, etc. that could otherwise be

on the market for sport hunting licenses, which are a major source of agency revenues.)"

- "Hunting allowed by all three states bordering YNP ls favored by state game agencies, is suspect, because these agencies derive significant revenues from hunting. These people can be biased toward saving their jobs."

- States generally can't be trusted to "do the right thing," seem to have bad intentions
  - "Wyoming, Idaho and Montana are notorious for their hostile treatment of predators. How can we trust them to manage our grizzlies? In the states' joint comment, they (a) reject the need for federal oversight after the initial 5-year monitoring period, (b) reject the requirement of connectivity and (c) push for a range of 600-747 bears instead of accepting the population objective of 674 bears. They indicate that they want to "manage downward" meaning the states will aim for the lower number of 600 bears. Will USFWS give in to the states' demands? If so, why are those requirements no longer important to the continued survival of Yellowstone grizzlies?"
  - "I cannot think of any states who are less qualified to manage the bears, than ID, MT and WY, due to their addiction to inhumane wildlife practices, and psychopathic torment of the wild's predators."
  - "The States have neither made nor committed to anything to maintain the current bear population. The American people and the bears deserve some commitment. There should be no trust that the states will do the right thing. They wont."
  - "hostile state wildlife management" → add this phrase?
  - "An additional note on state "management" of Grizzly Bears - Wyoming has certainly proved themselves incapable of managing apex predators with their oft-rejected wolf "plans" (currently defunct and not being rewritten, but rather looking for political shenanigans to reapprove). They are even excluding many suitable areas from their current plans. Look at the history of state "management" of Grizzly Bears. In the early 1970's, the grizzly bear population in the Greater Yellowstone was on the brink of extirpation. By 1975, the year they received federal protection, the population was estimated to be as few as 136 bears. The states' response to the dwindling population was to continue issuing hunting licenses. In 1974, Wyoming's chief game warden at the time, Rex Corsi, was quoted in a newspaper article as estimating there to be around 50 grizzlies in the state. The same year, Wyoming issued 12 grizzly hunting licenses. Allowing 25% of the state's grizzly population to be hunted in a single year is NOT "sound management", given they are one of the slowest reproducing land mammals in the world. The authorities today often point solely to the closure of the dumps in Yellowstone and the resulting mass killings of so-called "problem bears" as the reason for the bears demise. In fact, "trophy hunting" by the states continued to be a significant source of grizzly mortality in the early 1970's and continued right up until the time they were forced to stop in 1975 (aside from Idaho). Astonishingly, wildlife officials from Montana and Wyoming were saying the exact same thing then as they are now: That the grizzly population is healthy and thriving and not in danger of extinction. They fought listing the whole way, decrying it as "federal overreach". Fortunately, they lost that fight. If the states of Wyoming and Montana had their way and been allowed to continue with their reckless and irresponsible grizzly "management", it's highly doubtful there would even be any grizzly bears left in the Greater Yellowstone today."
  - "In September 2014 Wyoming Fish & Game "bear management specialist" Luke Ellsbury illegally shot and killed a grizzly bear 23 feet from state highway 14/16/20 west of Cody. He apparently couldn't tell the difference between a grizzly bear and a black bear.

Wyoming Fish and Game punishment for such an egregious act of incompetence and dereliction of duty-a week without pay at the start of hunting season! Any other business of a proportionate act would have fired him on the spot. By the way, Mr. Ellsbury is a contributing author for much of the documentation used by the state for delisting."

- States don't have enough capacity to manage grizzly bears
  - "And how can you trust a department to manage grizzly bears when they can't even impose significant punishment on illegal poachers? They don't have the Fish and Wildlife of Montana, they don't have the manpower during deer season hunting to answer all the calls from concerned citizens regarding hunting violations."
  - "They don't have the money or knowledge to do adequate research themselves to develop bear management plans."
  - "you won't cut off the hunting soon enough; you and the state wildlife agencies do not have the staff to properly manage the hunting and other human kills of the grizzly on a timely basis."
- ON THE OTHER HAND, states are the entities best equipped to manage grizzlies
  - "Not only do the states surrounding Yellowstone already have viable legislation in place to help conserve the GYE population of grizzly bears,2 they also will be able to respond to any variations of said issues in a more timely and effective manner than federal agencies."
  - Will allow consistency of management in a state/ecosystem: "Having them managed separately and distinctly by a different entity than the rest of the wildlife in the system [the wildlife that is currently managed by the state] creates an imbalance and disconnect in the science of that management which needs to be resolved."
  - "The social & economic losses have been huge with the federal management, it is time to put the Grizzly bear back into the hand of state hands which understands the local conservation needs for its natural resources."
  - "The states have a proven track record in managing many other species for hunting while maintaining healthy populations of the animals based on the available habitat."
  - "It is now time to return Grizzly bear management to the individual state wildlife management agencies as was done with the grey wolf, which seems to be doing just fine under state management."
  - "The delisting of Grizzlies will provide local state government the ability to provide diligent oversight to regulate the population while meeting local stakeholders needs."
  - "The state of Wyoming has demonstrated its strong track record as fully capable of managing wildlife within its borders. The Wyoming Game and Fish Department has the proven skill and expertise to successfully and effectively manage the grizzly bear, but we, meaning the U.S. Citizens, need to trust their ability and commitment."

Issue 66.5

Comment [AEK32]: Compare to current issue 66.5

- Because of history with wolves, public doesn't trust the Service's judgment in determining adequacy of state plans: "Your agency backed down regarding wolves in that state, and the same appears to be true for the grizzly. I do not trust your agency to make sure the states have an adequate bear plans"
- Multiple commenters claimed that the state regulatory mechanisms and management plans are "inadequate" to protect grizzly bears into the future and will not "ensure a stable, thriving, and connected grizzly population."
  - General

- Plans do not adequately address connectivity: "Idaho and Wyoming's plans both appear to strongly disfavor reintroduction or facilitating recolonization. Idaho's plan clearly states that moving grizzlies into new areas (e.g., Bitterroot) is prohibited and intentions to connect GYE bear populations to these unoccupied areas is vague. Montana's plan to facilitate reconnection is extremely unclear with no details other than to manage for discretionary mortality and having attractant storage rules." And "Additionally, Wyoming's management plan does not make any efforts to expand the grizzly's range, or allow the Yellowstone bears to reconnect with other grizzly bear populations. " (see Issue 26 for more detail)
- "How will communication between states be undertaken concerning the different types of mortality and how and when will that data be used to maintain an overall population number?"
- Not enough assurances for habitat protection: "Delisting relies on habitat management plans which are not yet in place. To sustain current population numbers, habitat conditions must also be maintained."

Comment [AEK33]: Include this at all? Or remove from Issue 26?

- Idaho
  - "Idaho's plan is outdated and flawed. There is no mention of the updated recovery criterion or mortality thresholds that would maintain a stable population."
  - "Idaho's process remains underway, with only a proclamation of good faith currently in place."
- Montana
  - "With the exception of one regulation to prohibit the killing of a female grizzly with cubs by her side, Montana relies solely on the completely voluntary Memorandum of Agreement between the three states to demonstrate its alleged good faith commitment to managing grizzly bear mortality in accordance with the proposed rule's requirements."
- Wyoming
  - "The bear population should not be managed the way some states, such as WY, seek to do by maintaining minimum populations."
  - "Wyoming's plan concerns me greatly, as it offers hunting grizzlies for a small fee (and if hunting should be allowed in any manner it should be extremely expensive to do so)…Wyoming also does not outline any steps to provide buffer zones around the national parks, nor does Wyoming outline any steps to take non-lethal intervention when grizzlies and humans are in conflict, even when the conflict is property destruction. We should not be allowing these bears to be killed for damages to property or livestock. The state of Wyoming's management plan would put grizzlies at great risk of extinction."
- Overall, no binding commitments:
  - "The lack of binding regulatory commitments from the states demonstrates that the required adequate regulatory mechanisms are not in place to justify a delisting. The states provide absolutely no binding assurances to the Service or the public that they will manage grizzly bears to preserve their continued conservation upon potential delisting."
  - "The delisting plans do not contain any binding agreements to act. There are no enforceable limits on mortality once delisting has occurred. The Conservation Strategy, itself, does not compel any agency to do anything. In fact, even if

deaths exceed prescribed levels, no agency is required to do anything." And "The state bear plans and the conservation strategy don't make anybody do anything or fund anything. That's not adequate to protect bears after delisting"
        - "Will the states be required to maintain a stable population of bears and if so, how?"
        - "There must be penalties for the states not if but when they exceed reasonable mortality thresholds."
        - "There are no enforceable limits on mortality nor any rules to force agencies to act once grizzly numbers begin to decline."
- Inconsistent state management could create a population sink →
    - "Because grizzly bears roam over large swaths of land or territories and obviously know nothing about human state boundaries, they will be unprotected when they leave the safety of Yellowstone National Park. Furthermore, to turn over control of the bears to multiple states would mean that one state could have a shoot on sight rule while still others may have a more regulated approach. This would mean that if many bears roam into the shoot on sight area that number of bears could be destroyed causing a negative impact upon the species as a whole,"
    - "Since Yellowstone overlaps three states (Wyoming, Idaho and Montana) it is imperative that one federal policy be kept to maintain healthy grizzly bears. Keeping grizzlies on the endangered list will prevent them from being slaughtered by overeager farmers and hunters."
    - "In addition, delisting will reduce the scientific oversight of the population and fragment management of a single population among three state wildlife agencies, not all of whom have the best interest of the bears at heart."
- State regulations cater to the desires of:
    - Livestock operators
    - Hunters
- Issues with regulations in National Forests
    - "Will our national forests provide adequate habitat protections for bears?"

Comment [AEK34]: Check with Forest Service issues...

Issue 68:

- INADEQUATE
    - "From what I have read, hunting will cease if the population is below is estimated below 600, but that will mean the population is already below that critical threshold."
    - "I believe that element prescribed by the USFWS are not sufficient to account for loss of individual bears due to unforeseen events, such as illness and natural disasters."
- ADEQUATE
    - "I also believe that the five listed "elements to maintain the grizzly population" were reasonable. Point number four was a critical point that helped shape my opinion on the issue. This was the point that said, "In a given year, allowance of discretionary mortality only if nondiscretionary mortality (e.g., mortality from illegal kills, mortality from self-defense, calculated unknown/unreported mortalities, natural mortalities, and mortality from other causes such as vehicle collisions) does not meet or exceed total mortality limits for that year." If this element is established and followed correctly the grizzly bear population will be maintained. If there is a bad year for grizzly mortality as a result of any of the points listed in that 4th element the number of available tags will go down. This makes perfect sense to me. There is no reason in my mind as to why, now that the

local population of bears is high and healthy, that they should stay on the endangered species list."
    - [quotes 4th element] "If this element is established and followed correctly the grizzly bear population will be maintained. If there is a bad year for grizzly mortality as a result of any of the points listed in that 4th element the number of available tags will go down."

Issue 69

Comment [AEK35]: Compare to current Issue

- Doubts that relisting could happen in a timely manner (and, if it doesn't, our safety net is meaningless)
    - "The entire scheme of the proposed rule is based on the false premise that if the population should decline precipitously, relisting could be accomplished, and accomplished timely. At a population of 700ish, the margins are too thin and the risk is too great"
    - "Big-game hunters and others argue that if Yellowstone's bear population falls precipitously after delisting, the federal government can come back in and declare the bears endangered again. But "relisting" is a lengthy process, sometimes requiring decades, and it is highly politicized. The Fish and Wildlife Service generally doesn't list a species as endangered unless ordered to do so by a court. In the meantime, grizzly bears would keep dying, and the culture of the surviving bears would be altered further."
- Triggers need to kick in sooner
    - "States have made clear their plans to significantly reduce the population, including through trophy hunts. The current proposal would allow states to exceed maximum bear deaths for years before any review, allowing for potentially irreversible damage, and would allow eradication of bears in some areas."
    - "One of the serious flaws of the plan is that it allows the acceptable mortality rate for bears to be exceeded for three years in a row before a review is undertaken. And even then, re-listing may not be required"
- No one is even required to follow the triggers
    - "In fact, even if deaths exceed prescribed levels, no agency is required to do anything. USFWS indicates that it will step in if the population dips below 500 but that is not compulsory."
    - "There are no enforceable limits on mortality nor any rules to force agencies to act QUICKLY once grizzly numbers begin to decline."
- Additional triggers
    - "Management plans need to include specific triggers based on trends and mortality counts for increased protections."
- "I do have some concerns with the rules provision [trigger that discusses re-evaluating if there are major changes to state regulations, etc) that requires relisting if changes are made to the rules or regulations of the federal, state, or tribes. I believe that this will not provide for the necessary flexibility that any management of any ecosystem requires. I think that the state of Wyoming needs to manage these bears based on what they learn over time, and that by allowing these states to alter their plans when they see it's necessary, this will only improve the chances that the grizzly bear will continue to recover"

Issue 70.5:

- "The proposal says that a review of numbers will be done every 5-10 years. Changes in grizzly populations can take years to be noticed. Dramatic changes can be occurring in the short-term."

HUNTING REGULATIONS:

- Concerns about specific hunting regulations → combine with Factor D stuff/our 5 elements (Issue 68)?
    - "There are less than 700 grizzlies living...and their reproduction rate is VERY slow. It can take up to 8 years for a female to reach breeding maturity. Once she has cubs...usually 2 or 3...she will not breed again for several years, while the cubs are growing. Any idea of not shooting a female with cubs, is bogus!!! Who can tell a female from a male until they can be examined up close...which means the bear is already dead!!! Also, females with cubs, usually hide them when there are open fields or sense of danger. So then what??? THE MOTHER IS KILLED, THE CUBS ORPHANED WHICH WILL KILL THEM ALSO, AS THEY DON'T KNOW HOW TO FEND FOR THEMSELVES!!!"
    - "If the federal government is delisting the grizzly bears due to inadequate funding, mismanagement of funds, or that the federal government is not concerned with the plight of the grizzly anymore, the states should be required to have a no hunt policy issued."
    - "concerns about allowing the population to fall to 600 bears before trophy hunting or other intentional killing of bears is curtailed are significant issues raised in the peer review that have not been addressed"
    - "A moratorium on trophy hunting of the Grizzly of the Greater Yellowstone Region should be part of all three states management plans for at least three to five years should they get delisted. There needs to be a time period for the states to adjust to managing the grizzly population prior to any hunting of the grizzly." And "If they just met or just passed the threshold for protection status, they should still have several more years to rebuild their numbers before opening hunting on them"
    - Premature → "At the very least, the Service shouldn't be laying any potential state hunting fees, and to see how these bears fare first without federal protections before subjecting them to a potential firing line outside of national park boundaries."
    - Hunters will not be able to distinguish between male and female grizzlies; also may not be able to see cubs because female grizzlies hide them "when there are open fields or sense of danger."
        - "I could find nothing on any of the state websites to help recreational killers distinguish between male and female bears… Further, I could find no educational info for recreational killers to identify the young that they are prohibited from killing. What exactly does a 2 year old cub look like?"
    - "These are the same people from the same state who with their proposed Grizzly Bear hunting regulations for the first season have stated that a " certain number of female Grizzlies " will be allowed to be taken"
    - "Compared to other large carnivores, and with fragile numbers and increased threats, grizzly bears will be much more vulnerable to the effects of aggressive state-sponsored sport hunting, and much less able to recover from predictable hunting excesses designed by state agencies to benefit elk and moose populations."
    - "Population could be reduced to 600 bears (500 bears in Wyoming) before "discretionary" (hunting, management "removals" etc.) mortality would be curtailed."

- “Impact of black bear baiting and hunting with hounds has not been sufficiently addressed. Idaho's plan says these practices are allowable outside the PCA, evidence of their stellar commitment to grizzly "conservation."’
- “Obviously, the number of licenses should be limited, and they should be distributed through a lottery draw system.”
- “This, the management policy in Wyoming , would permit them to hunt mothers with cubs , the cubs also, and take the female population down to as low as only 48 females. Three ------ there policy states that due to the " FAST reproductive rate of the Grizzly they would be able to " absorb " being managed through Hunting with no harm to the sustainability of the over all population . (Grizzly Bears do not become ready to breed until they reach the age of around eight, only breed every two to three years and only have around two or three cubs a litter) Four ----- The Grizzly hunting " management areas " totally surround all of Yellowstone and they would be able to hunt the bears right along the park boundaries. Five ------ Wyoming's " management " policy calls for practically an OPEN hunting season on any area outside of the outer zone of the GYE---. (this would virtually shut down any migration corridor)”
- “A trophy hunt could be disastrous, as the management of such would be conducted by three separate states, which appear to not have comprehensive, effective plans to prevent a sudden plunge in grizzly numbers should something go wrong.”
- “The proposed hunting zones cut off all the migration corridors (no way to avoid extermination), and hunters can take out the cubs along with their moms.”
- “Idahos management plan for grizzlies is from 2002 and thus extremely out of date. All bordering states already have plans for trophy hunting of grizzlies, including being able to bait bears and lure them outside Park boundaries. There are no assurances that hunting will take place well away from parks, where bears are tolerant and unwary of humans.”
- “In a related matter, the tri-state MOA is missing the National Park Service, a critical federal partner who manages grizzly bears within prime habitat in the ecosystem. By not including discretionary mortality for the parks or withdrawing the population that lives within the three national park units (YELL, GRTE and JODFI) from calculations to determine hunting quotas, hunting mortality will disproportionately occur along park boundaries. Any hunt by the three states should focus the majority of grizzly bear "harvests" away from park boundaries; the NPS manages approximately 40% of the PCA, and has historically played a pivotal role in the recovery of the grizzly bear in the GYE. To allow hunting along park boundaries runs counter to any and all logic in presenting grizzly bears within prime or core habitat.”
- “It is likely that hunting regulations for the states of Montana, Idaho and Wyoming will include practices that would be rightly considered unsportsmanlike by the American public .”
- “Bear data clearly shows that the breeding grizzly populations travel outside of the protected National Parks and state hunting areas need to be set that do to overlap with this movement. The bear population target numbers need to be set high for at least ten years until the state's management hunting plans have proved to be working, and the other impacts on mortality are better understood.”
- “The proposed rule allows the population to be decreased by over 100 bears before intentional killing from hunting or management actions could be curtailed. It sacrifices bears outside of the Demographic Monitoring Area.”

- Other concerns

- "no one seems to have thought about what to do with the wounded bears that will escape"
- "Idaho has not gotten grizzly identification anywhere near adequate for hunting. Before delisting, either get all three states to prove identification performance is at 99% or better, or, just don't hunt any bears in the DMA."
- Prohibit black bear hunting/mandatory bear ID test

Issue 74 (Seth)

- "Also, the grizzly bear is a conservation-reliant species that requires coordinated management be continued into the foreseeable future."
- "The states of Wyoming, Idaho, and Montana have issued a joint statement that they reject the idea of federal oversight after an initial five-year monitoring period."

Issue 76

- "Grizzly bear habitat must receive protections under post-delisting National Forest and Bureau of Land Management Plans to ensure the continued recovery of bears. Regulatory mechanisms that will protect grizzly bear habitat remain missing or are in drafts that have been unavailable to the public."
- "After de-listing, N.F. and BLM lands must have mechanisms for the protection for grizzly bear habitat of ensure recovery."
- "The U.S. Forest Service and Bureau of Land Management Plan must have plans in place to protect the bear's habitat and the American people have a right to comment on those management plans. These and all federal agencies involved in grizzly bear management and or wildlife issues must be a part of the overall continued recovery plan"

Issue 77

- "The Endangered Species Act (ESA)states that a listed species may be delisted in its entirety only. It does not allow for delisting by population segments. Therefore, the USFWS is undermining the ESA with this delisting proposal and interfering with grizzly bear recovery efforts."

Issue 80

- "Grizzly bears are not recovered over a significant portion of their historic range. Rather, grizzly bears occupy a minuscule proportion of their historic range, in just a few small isolated areas."
- "Rather than taking a piecemeal approach to recovery and delisting, we believe that Fish and Wildlife Service should be recovering grizzly bears and more of their historic range. Right now, grizzly bears only occupy 2% of their historic range in the lower 48 states, and there is plenty of remaining suitable habitat where bears can and should be recovered. For example, the Selway-Bitterroot in central Idaho is listed as one of six necessary recovery areas for grizzly bears, yet when we petitioned for FWS to push forward with its original proposal to reestablish a population there, FWS said it did not currently have the time or funding to do so. Establishing a population in this area could provide crucial connectivity for bears in the Yellowstone region"
- "Today, wild grizzly bears number at best between 1,400 and 1,700 bears in the lower48 states and are not recovered over a significant portion of their historic range-but in just a few small isolated areas."

Issue 84

- "A key regulatory element that ensures that habitat protections are intact for grizzly bears is still missing. The Forest Plan Amendments have not been revised to reflect the 2012 Forest Planning Rule or opened to public comment."
- "After de-listing, N.F. and BLM lands must have mechanisms for the protection for grizzly bear habitat of ensure recovery."
- "These forest plan amendments are inadequate to ensure eventual connectivity to the Greater Yellowstone."
- "Forest plan amendments aren't consistent with the current planning rule."

FIGURE OUT WHERE TO PUT THESE

- Peer reviewers expressed legitimate concerns
  - "The concerns raised by the outside bears experts who were consulted by the Fish and Wildlife Services regarding FWS' present plan were very real and practical."
    - "These outside experts also mentioned that climate change and its effects on bear habitat and food sources was not being factored in nor studied enough."

Concerns about limiting monitoring to the DMA/interpreting this as only protecting inside the DMA

- "Bears ranging north outside the Demographic Recovery Area will not be counted and those are the bears that would enlarge the GYE gene pool"
- "Therefore, we find it very concerning that the proposed rules only considers bears in the current population for habitat, the DMA, and bears outside that area should also have delisting protection."
- "By creating arbitrary boundaries outside of which bears are not protected, which is highlighted by Wyoming's draft plan, stating they will manage areas outside of the DMA as unsuitable for grizzly occupation, delisting essentially ensures that the Yellowstone grizzly will remain forever isolated."

"Without a healthy and unmolested grizzly bear population, the Greater Yellowstone Ecosystem is no longer true wilderness. We must protect wilderness in perpetuity. The interests of a few property owners and hunters must not prevail over the rights of future generations who would enjoy unspoiled wilderness."

The new plans offer no real explanation as to how grizzly numbers will be accurately monitored or how adjustments will be made based on the actual number of deaths.

you are upsetting the balance of nature by contriving a proposal to remove all protections, and . additionally allowing them to be slaughtered by hunters in the three states. You are creating a type of zoo, totally controlled by man, instead of allowing natural forces and habitat expansion and human development to naturally manage grizzly bears.

"And right now, we are at the sixth extinction addressed by science in this world. It is not a time to come up with a delisting proposal with only three years of study that is an opaque study, not presently available to the public, nor is it appropriate to only allow 60 days for comment."

Hi Jennifer,

Apologies for the delay. Attached are the bullet summaries for the four issues I thought you could write up, when you have time. Some of these points may already be in the summaries. Please highlight any text you add in teal.

Thanks!

Alex Kasdin

Issue for Jennifer to add to summaries

Issue 7

- General concerns about criteria
  - "USFWS has failed to update the Recovery Plan for this grizzly bear population so as to reflect the massive amount of best available science that has been produced since the early 1990's. USFWS has also failed to follow through with its own 2011 recommendation to update and revise the Yellowstone Grizzly Bear Recovery Plan."
  - The Service should be revising the outdated Recovery Plan instead of delisting. "Recovery plan revisions are required by the ESA every 15 years."
  - The recovery criteria should be reviewed in light of recommendations by Pyare and Berger (2003) and the use of ecological data in addition to demographic criteria.
  - The rule does not adequately justify changing the demographic recovery criteria from a minimum population size of 500, which was upheld by the courts.
  - The Service needs to stop moving the "goal post for what 'recovery' is for a population." And "We can't just continue to move the goal post every time we reach 500, 700, 800, 1200"
  - These criteria should be considered minimums.
- Concerns about criterion #1
  - "The inadequate science is having two unequal criteria in the same units, for the same thing. That is, the state goal of a minimum of 500 grizzly bears population in the DSP area, per state management plans, while there is a Federal goal of 674 average and 600 minimum grizzly bears in the DMA, which is smaller than the DSP area. Get the 500-value out of the state plans and keep this value out of your plan."
  - Both "and" and "or" are used when referring to 500 bears and/or 48 females with cubs.
  - Alludes to implementation of a new method, does it intend to switch to a new method which it has kept secret during delisting?
  - Is 48 FCOY a count as stated or modeled using Chao2, what are the counting rules, assumptions, etc.
  - If the population falls below 500 there is no mechanism to prevent further decline
  - The count of FCOY could drop below 48 if bears respond to a stabilizing population by lack of reproduction.
  - Should have the same population trigger of 600 as criterion 3 instead of setting two separate population floors.
  - All documents need to reflect that this is not a population target but a minimum to maintain short-term genetic fitness.
- Concerns about criterion #2
  - How is occupied defined? Females move between BMUs and could be counted more than once if a cub is lost
- Concerns about Criterion #3
  - Concern that if a review is conducted it will be politically influenced and slow
  - Remove "there will be no discretionary mortality, except as necessary for human safety" below populations of 600. The state needs flexibility to "make the necessary bear removal decisions"
  - It states that the mortality rates are adjustable, when will these rates be adjusted and how? They are the foundation of the regulatory mechanisms.
  - "So the decrease in the mortality limit is to compensate for an assumption that there will be fewer females with cubs? This needs further explanation since it appears to be

Comment [AEK1]: Already in Issue 7 and issue 15?

inconsistent in keeping with the mortality limits and a criterion of 48 females with cubs. If this is consistent with the findings, then why did the mortality limits for independent males not increase? Also, it is unclear how this is a conservative approach to a stabilized population when the old (higher) numbers were calculated for a stable to increasing population."

- In Criterion #3, what does the Service consider "reasonable and manageable" for each of the following kinds of management to minimize conflicts: I&E; installation of bear-proof garbage containers or electric fences to protect garbage, bee hives, livestock forage, livestock, or crops; live-trapping and removal of nuisance bears; and aversive conditions of intrusive bears. (Stringham)

Comment [AEK2]: ????

Comment [AEK3]: Better in Issue 44?

- The Service failed to include the review by John Waller in the peer review report or provide it to the public, dated April 25, 2013, on the proposed revisions to the Demographic Recovery Criteria for the GYE grizzly bear population and the application protocol for these proposed revisions. "That the review was solicited prior to the Proposed Rule does not mean it is invaluable to the public or should not have been included in the process."' It was "critical of the new demographic criteria, explaining numerous scientific shortcomings." This review needs to be included in the peer review package and made available for the public during an additional public comment period. (CBD)
  - the total number of adult females in the population is derived from an estimate of an estimate using the Chao2 estimator "with numerous assumptions that are not necessarily supported by the data (for example assuming transition probabilities are an age and time invariant Markovian process." To obtain a population estimate you have an estimate divided by an estimate divided by an estimate.
  - The methods used for many of the steps are not contained within the document but referred to multiple external documents that are difficult and time consuming to read.
  - The rationale for 15% mortality for independent males "because that level appeared to sustain an increasing population 1983-2001" is a "departure from the demographic rationale used for other cohorts.
  - The change to suitable habitat/DMA is about half of the size of the area indicated in the CS, the consequences if this adjustment need to be discussed and a description of this changes (possibly a flow chart showing the changes in controlling documents).
  - Criteria 1: 500 is an arbitrary inflation of the minimum number suggested by Miller and Waits (2003). This may not be as conservative as we think based on recent publications (Waples and Yokota 2007; Luikart et al. 2010). The original target area of 500 was the GYA but the DMA is half this size, should the same minimum still apply? There are no details on how this will be measured or obtained. Allowing for a new method to be implemented (in place of Chao2) would make interpretation of estimates and trends difficult.
  - The use of 1.0 as the ratio of independent males: females is not clearly explained and is a dramatic departure from the previous ratio (0.635).
  - Accurate demographic analysis is precluded by low sample size and wide variance, when variance can be calculated. The demographic criteria will only support recovery as long as the assumptions, biases, and errors are conservative.
  - Other concerns in other issues

Issue 15

- Potential new methods

    - The Service needs to employ DNA assessment to accurately monitor the population. The Service does not include what was included in its Reassessing Methods paper (2006) of $3.5-5 million to determine why it was rejected. The current costs are not different than those associated with current methods (monitoring unduplicated females with cubs, distribution of family groups, and maintaining 25 adult females with radio-collars). These costs would be obviated by a DNA census. It is not reasonable to apply this method in the NCDE, which is not proposed for delisting, and not in the GYE.
    - From John Waller: DNA based methods should be considered and can be done at a lower cost than the methods used by Kendall et al. (2009) and dismissed as too costly. Other options use rube trees (Stetz et al. 2010) or combine data types to increase precision (Boulanger et al. 2008, Abadi et al. 2010).
    - Population estimates need to be a census include information on age, sex, and location of each bear to provide data about the status of the population and changes in distribution.
- The MOA and state plans need to clearly state how a new estimator will be calibrated as directed in Appendix C and undergo public review.
- The recalibration language should remain in the Appendix C as was published in the draft CS and be included in the rule and the tristate MOA. (Defenders)
- Adequate regulatory mechanisms are not in place because of the states' failure to commit to recalibrating mortality thresholds in the event of a revised stable population target. (Earthjustice)
- The WY State plan must be clear that if a new population estimator is adopted that it will follow the direction of Appendix C in the draft CS that clearly defines the process by which a new estimator would be adopted. (Defenders)
- The CS (and state mechanisms) does not address the need to recalibrate mortality thresholds should a new counting methodology to estimate the grizzly bear population win the DMA be adopted. Chao2 is a conservative method so adoption of a new method would likely generate a higher population estimate. If a new method was adopted without recalibration, the states would be able to kill hundreds of bears, as long as they maintain the population goal of 674 bears (or 600 bears under the States' view). (CBD, Wild Earth Guardians)

Issue 18

- Unclear if carrying capacity has been reached inside the PCA or DMA
- Debate among commenters about whether or not bears have reached carrying capacity
    - Haven't reached carrying capacity
        - "Multiple reviewers note that the Service's assertions that the GYE population has met its carrying capacity are scientifically flawed and inconclusive."
        - "Delisting proponents go so far as to suggest that grizzlies in the greater Yellowstone area have outgrown the ecosystem. The proof, they say, is that bears are showing up where they haven't been seen in years. But the real reason for the grizzlies' spread may be simpler. With their food and habitat ever diminishing, they are venturing into unfamiliar places, often closer to humans, where "negative interactions" get bears killed despite their endangered-species status."
        - "Questionable science as to whether the "ecosystem is full" or if bears are moving out to find new food sources as their primary sources, cutthroat trout and especially Whitebark Pine nuts, diminish."

        - "USFWS has argued that the population growth has stagnated because the population has reached carrying capacity. In reality, whats happened is the bears major food sources are in a state of disaster and more bears are roaming more widely in search of different foods and getting killed by humans in the process."
        - If the population is increasing by 3-4% per year and harvest has to be adjusted to maintain total mortalities up to 10-22% in order to limit the population then this is not characteristic of biological carrying capacity.
    - Have reached carrying capacity
        - "Biologist have done extensive studies and decided that the GYE has reached it carrying capacity for the Bears."
        - "Indeed, the U.S. National Park Service found evidence that the carrying capacity has been reached: The number of females producing cubs in the park has remained relatively stable since 1996, suggesting that the park may be at or near ecological carrying capacity for grizzly bears. This may occur not only from competition with each other for space and resources but also from competition with other species for food and water resources, which leads into the second factor for delisting stability of habitat quality and quantity ."
        - "I have talked to Chris Servheen, the Grizzly Bear Recovery Coordinator, and he has told me for almost 10 years now that grizzly bears have reached carrying capacity."
- If carrying capacity has been reached it is because carrying capacity has declined in the GYE and therefore, additional habitat must be provided (i.e. range expansion) to allow for population expansion and recovery.
- Effects of reaching carrying capacity
    - "Recent attacks on humans is a clear indication that there is not enough land to sustain yellowstone bear population"
    - More bears will mean males will start to kill young
- Commenters expressed that peer reviewers were concerned about the conclusion by the Service that the population has reached carrying capacity

Issue 19

- Too add to second sentence in current issue summary?
    - "Recent data indicate that distribution of GB in the GYE has expanded markedly by as much as 40%. While that suggests a positive trend, other data suggest abundance has been largely stable or slightly decreasing since ~year 2000. The only way distribution can increase without a concomitant increase in abundance, is for density to decline. Evidence of negative changes in density suggests quality of habitat for GB is declining in the GYE, because density is linked to carrying capacity & areas with larger carrying capacities per unit area are higher quality habitats. Such changes are likely due to the loss of whitebark pine & trout as major foods."
    - Bear density is decreasing as the bear population has not increased and the occupancy has expanded by 40%. Bears are expanding to the south and east where the only remaining good stands of whitebark pine occur & where cutworm moths are found in abundance (Flesch).

pg 26 of the 2011, 9th circuit grizz delisting opinion (attached).

"First of all, we reject out of hand any suggestion that the future possibility of relisting a species can operate as a reasonable justification for delisting. Whatever comfort may be taken in relisting as a safety net, it is no answer to conclude that a species is not threatened simply because it can be relisted if it is threatened."

OPINION

Appeals from the United States District Court
for the District of Montana
Donald W. Molloy, District Judge, Presiding

Argued and Submitted
March 7, 2011—Portland, Oregon

Filed November 22, 2011

Before: Sidney R. Thomas, Susan P. Graber, and
Richard C. Tallman, Circuit Judges.

Opinion by Judge Tallman;
Partial Concurrence and Partial Dissent by Judge Thomas

COUNSEL

Allen M. Brabender (argued), Coby Howell, U.S. Department of Justice, Washington, DC, for defendants-appellants U.S. Fish and Wildlife Service, et al.

Robert N. Lane, William A. Schenk, Special Assistants to the Attorney General, Helena, Montana, for defendant-intervenor-appellant the State of Montana and Montana Department of Fish, Wildlife, and Parks.

Jay A. Jerde, Deputy Attorney General, Cheyenne, Wyoming, for defendant-intervenor-appellant the State of Wyoming.

Thomas France (argued), National Wildlife Federation, Missoula, Montana; David K.W. Wilson, Jr., Reynolds, Motl, and Sherwood, Helena, Montana, for defendant-intervenor-appellant National Wildlife Federation.

Douglas S. Burdin, Anna M. Seidman, Safari Club International, Washington, DC, for defendant-intervenor-appellant Safari Club International.

Douglas L. Honnold (argued), Timothy J. Preso, Jenny K. Harbine, Earthjustice, Bozeman, Montana; Jack R. Tuholske, Tuholske Law Office PC, Missoula, Montana, for plaintiff-appellee Greater Yellowstone Coalition.

Andrew E. Wetzler, Natural Resources Defense Council, Chicago, Illinois, for amicus curiae Natural Resources Defense Council, Inc.

Robert H. Aland, Winnetka, Illinois, pro se amicus curiae.

OPINION

TALLMAN, Circuit Judge:

This case involves one of the American West's most iconic wild animals in one of its most iconic landscapes. The grizzly bear (*Ursus arctos horribilis*)—so named for the gray-tipped hairs that give it a "grizzled" appearance—is both revered and feared as a symbol of wildness, independence, and massive strength. But while grizzlies may inspire some sense of human vulnerability, history has shown that it is the bears who have often been the more vulnerable ones. During the nineteenth and early twentieth centuries, widespread hunting, trapping, poisoning, and habitat destruction associated with American expansion decimated the grizzly population in the West and relegated the bears to increasingly remote and rugged terrain. Since then, their survival has depended both on their own ability to adapt to their surroundings and on human ability to adapt to their presence. These seemingly irreconcilable tensions have come to a head before us in this appeal.

The Yellowstone region of northwestern Wyoming, southern Montana, and northeastern Idaho is home to a grizzly population, two popular national parks—Yellowstone and Grand Teton—and a network of rural communities built on indus-

tries such as natural resource extraction, ranching, agriculture, and tourism. As such, it has served as a kind of living laboratory for the coexistence of people and grizzlies in close proximity. For much of the twentieth century, Yellowstone National Park's open-pit garbage dumps provided a reliable food source for the bears as well as a convenient bear-viewing opportunity for tourists. After the dumps were closed in the early 1970s due to concerns about encouraging the bears' attraction to human foods, however, grizzly mortality rates skyrocketed. By 1975 the grizzly population decline at Yellowstone and elsewhere prompted the U.S. Fish and Wildlife Service (the "Service") to list the grizzly as "threatened" in the lower 48 states under the Endangered Species Act (ESA).

Since then, the Yellowstone grizzly population has rebounded, as scientists, conservationists and land managers have made unprecedented efforts to study the bear and to change those human attitudes and behaviors that unnecessarily threaten it. These efforts, spearheaded by the Service's Grizzly Bear Recovery Coordinator Dr. Christopher Servheen, culminated in the "Final Conservation Strategy for the Grizzly Bear in the Greater Yellowstone Area" (the "Strategy"), an impressive inter-agency, multi-state cooperative blueprint for long-term protection and management of a sustainable grizzly population. Interagency Conservation Strategy Team, *Final Conservation Strategy for the Grizzly Bear in the Greater Yellowstone Area* (Mar. 2007) *available at* http://www.fws.gov/mountain-prairie/species/mammals/grizzly/Final_Conservation_Strategy.pdf. Shortly after the Strategy's finalization, the Service removed the Yellowstone grizzly from the threatened species list.

The Service's delisting decision, the subject of this appeal, raises a host of scientific, political, and philosophical questions regarding the complex relationship between grizzlies and people in the Yellowstone region. We emphasize at the outset that those are not the questions that we grapple with here. We, as judges, do not purport to resolve scientific

uncertainties or ascertain policy preferences. We address only those issues we are expressly called upon to decide pertaining to the legality of the Service's delisting decision: first, whether the Service rationally supported its conclusion that a projected decline in whitebark pine, a key food source for the bears, does not threaten the Yellowstone grizzly population; and second, whether the Service rationally supported its conclusion that adequate regulatory mechanisms are in place to maintain a recovered Yellowstone grizzly population without the ESA's staunch protections.

As to the first issue, we affirm the district court's ruling that the Service failed to articulate a rational connection between the data in the record and its determination that whitebark pine declines were not a threat to the Yellowstone grizzly, given the lack of data indicating grizzly population stability in the face of such declines, and the substantial data indicating a direct correlation between whitebark pine seed availability and grizzly survival and reproduction. As to the second issue, we reverse the district court and hold that the Service's determination regarding the adequacy of existing regulatory mechanisms was reasonable.

I

Grizzly bears once thrived in a variety of habitats across the western coterminous United States, from the West Coast and Southwest to the Great Plains and Texas. By the time of ESA listing in 1975, however, the grizzly population in the lower 48 states was confined to a few fragments amounting to less than 2% of its formerly contiguous historic range, and its numbers had dwindled from about 50,000 in 1800 to less than 1,000 today. The Yellowstone area grizzly population—unique because it is entirely isolated from larger populations in Canada—was estimated to number between 136 and 312 bears at the time of listing.

As required by the ESA, a Grizzly Bear Recovery Plan was developed by the Service and issued in 1982. The Recovery

Plan aimed to foster viable, self-sustaining grizzly populations in areas known to have been occupied by grizzlies within the preceding ten years, including the Greater Yellowstone Area (GYA) as well as the Northern Continental Divide Ecosystem area of northern Montana, the North Cascades area of northern Washington, and the Selkirk and Cabinet-Yaak areas of northern Idaho, northwestern Montana, and northeastern Washington. Because the Plan's ultimate goal was the delisting of the grizzly, demographic recovery criteria were established in each identified area.

When the Service revised the Recovery Plan in 1993, it delineated a "Recovery Zone" for each region, defined as "an area large enough and of sufficient habitat quality to support a recovered bear population within which habitat and population would be monitored." The revised Plan also included updated demographic recovery criteria and mandated the development of a "conservation strategy" for each grizzly population to guide long-term management after delisting. Habitat-based recovery criteria were appended to the Plan following a successful legal challenge to its adequacy under the ESA. *See Fund for Animals v. Babbitt*, 903 F. Supp. 96 (D.D.C. 1995). The Plan's demographic- and habitat-based recovery criteria continued to be refined during the 1990s and 2000s.

The Plan has been widely regarded as a success and a model for grizzly recovery plans elsewhere. Scientists estimate that the GYA's grizzly population increased at an average rate of 4.2% to 7.6% per year between 1983 and 2002 and expanded its range by 48% between the 1970s and 2000. By 2006, the Service had determined that the Plan's demographic- and habitat-based recovery criteria were being met. Total grizzly population in the GYA was estimated at more than 500 bears, and scientists concluded that grizzlies were approaching Yellowstone National Park's carrying capacity.

Pursuant to the Recovery Plan, the Strategy was developed in order to "guid[e] management and monitoring of the Yellowstone grizzly bear population and its habitat upon recovery and delisting." Its stated purpose was to:

> describe and summarize the coordinated efforts to manage the grizzly bear population and its habitat to ensure continued conservation in the GYA[;] . . . specify the population, habitat, and nuisance bear standards to maintain a recovered grizzly bear population for the foreseeable future; document the regulatory mechanisms and legal authorities, policies, management, and monitoring programs that exist to maintain the recovered grizzly bear population; and document the commitment of the participating agencies.

After undergoing notice and comment, as well as scientific peer review, the Strategy was finalized in March 2007. Eight federal and state entities signed a Memorandum of Understanding agreeing to implement it: the Service; the U.S. Forest Service (the "Forest Service"); the National Park Service (the "Park Service"); the U.S. Geological Survey (USGS); the Bureau of Land Management; the Montana Department of Fish, Wildlife, and Parks; the Wyoming Game and Fish Department; and the Idaho Department of Fish and Game. In addition, the Strategy formally incorporated as appendices the grizzly bear management plans of Montana, Wyoming, and Idaho, each of which was developed in conjunction with the Strategy.

The Strategy redesignated the Yellowstone Recovery Zone as the "Primary Conservation Area" (PCA). The PCA is a 9,210-square-mile area within the GYA, divided into 18 "Bear Management Units," encompassing Yellowstone National Park and surrounding public and some private land. The PCA, which is 98% managed by the Park Service and the Forest Service, includes approximately 51% of all suitable

habitat for the grizzly population in the entire GYA and an estimated 84% to 90% of the GYA's population of female grizzlies with cubs. According to the Strategy, "[t]he PCA will be a secure area for grizzly bears, with population and habitat conditions that have allowed the grizzly bear population to achieve recovery and expand outside the PCA." Outside the PCA, the bears "will be allowed to expand into biologically suitable and socially acceptable areas." These are areas "that are not managed solely for bears but in which their needs are considered along with other uses." According to the Service, the suitable grizzly habitat outside the PCA is roughly 84% federally owned, 6% tribally owned, 1.6% state owned, and 9.5% privately owned.

The Strategy's key mechanisms for maintaining a recovered Yellowstone grizzly population are its population and habitat standards, which are based on the recovery criteria originally set forth in the Recovery Plan. Its population standards are (1) a total population of more than 500 bears; (2) at least 16 of 18 Bear Management Units occupied by at least one female with cubs over a six-year period, with no two adjacent Bear Management Units unoccupied; and (3) annual mortality limits of 9% of adult females (not exceeded in two consecutive years), 15% of adult males (not exceeded in three consecutive years), and 9% of cubs under two years old (not exceeded in three consecutive years). *Final Conservation Strategy*, *supra* at 27.

The Strategy's habitat standards apply only inside the PCA. They are designed to maintain habitat conditions as they existed in 1998, because those conditions were found to have adequately supported a growing bear population throughout the 1990s. The percentage of "secure habitat," defined as contiguous area of at least 10 acres that is more than 500 meters from a motorized access route or helicopter flightline, must be maintained at or above 1998 levels. The number and capacity of developed sites (including campgrounds, visitor services facilities, and resource development operations) and grazing

allotments must be maintained at or below 1998 levels. The Strategy also requires monitoring of vegetation, food availability, and human activities compared to a 1998 baseline.

As for lands outside the PCA, the Strategy notes that the state bear management plans of Wyoming, Montana, and Idaho "recommend and encourage land management agencies to maintain or improve habitats that are important to grizzly bears and to monitor habitat conditions." It also indicates that on national forest land outside the PCA the Forest Service will assess projects that potentially affect the grizzly against the Strategy's habitat standards.

In addition to population and habitat standards, the Strategy establishes protocols for the management of "bear/human conflicts," defined as "incidents in which bears injure people, damage property, kill or injure livestock, damage beehives, obtain anthropogenic foods, or damage or obtain garden and orchard fruits and vegetables." Such conflicts, which ranged in number from 24 to 165 per year in the GYA between 1992 and 2001, are harmful to bears as well as humans because bears involved in serious or repeated conflicts may be killed, captured, or relocated. In the case of conflicts inside the PCA, the Strategy emphasizes the removal of the human cause of the conflict rather than the removal or relocation of the bear. In general, a bear may be removed from the population only if it is involved in repeated conflicts or displays "unnatural aggression," defined as aggression toward humans that is not provoked or defensive. Outside the PCA, conflicts are to be handled in accordance with state management plans, and "more consideration will be given to existing human uses." All bear removals in the GYA, both inside and outside the PCA, must be consistent with the Strategy's mortality limits. To minimize conflicts, the Strategy calls for a coordinated information and education campaign that "facilitates changing inappropriate human behaviors and helps people learn to coexist with bears."

Implementation of the Strategy is to be overseen by the Yellowstone Grizzly Coordinating Committee (the "Committee"), consisting of representatives from each of the Strategy's signatories. Scientific research and monitoring data collection will be conducted by the Interagency Grizzly Bear Study Team (the "Study Team"), a USGS-led team of scientists that has studied the Yellowstone grizzly since 1973. Based on periodic reports from the Study Team, the Committee will evaluate the status of the grizzly population. Any deviations from the Strategy's standards will trigger a six-month investigation by the Study Team known as a "Biology and Monitoring Review," which may result in recommendations for changes to the Strategy or, in the case of a serious threat to the grizzly population, a petition for relisting under the ESA.

Based on the attainment of the Recovery Plan's demographic- and habitat-based recovery criteria and the finalization of the Strategy as a long-term conservation plan, the Service proposed the removal of the Yellowstone grizzly from the ESA's threatened species list. After notice and comment, the Service published its "Final Rule Removing the Yellowstone Distinct Population Segment of Grizzly Bears From the Federal List of Endangered and Threatened Wildlife" (the "Rule") in March 2007. 72 Fed. Reg. 14,866-01 (Mar. 29, 2007). The delisting determination applied only to the Yellowstone grizzly population, which was designated as a "distinct population segment" of North American grizzly in the same Rule. *Id.*

On November 13, 2007, the Greater Yellowstone Coalition (GYC), a non-profit conservation organization based in Bozeman, Montana, filed a lawsuit in the United States District Court for the District of Montana challenging the Service's Rule as arbitrary, capricious, and unlawful under the ESA. GYC claimed that (1) there were not adequate regulatory mechanisms in place to protect the grizzly; (2) the Service failed to consider the grizzly's historic range, rather than its current range, when it assessed whether the grizzly was

threatened by habitat loss; (3) the Service failed to adequately consider the impacts of global warming and mountain pine beetle infestation on the vitality of the region's whitebark pine trees; and (4) the Yellowstone grizzly population is too small to be delisted because it lacks sufficient genetic diversity to be self-sustaining. The States of Wyoming and Montana intervened as defendants, as did the National Wildlife Federation, a non-profit wildlife conservation organization, and Safari Club International, a non-profit hunters' rights and wildlife conservation organization.

On September 21, 2009, the district court granted summary judgment to GYC on its first and third claims, holding that the Service had failed to rationally support its conclusions that adequate regulatory mechanisms were in place to protect the grizzly and that declines in whitebark pine did not threaten the grizzly.[1] Based on these rulings, the district court vacated and remanded the Rule. The Service appeals.

II

We have jurisdiction under 28 U.S.C. § 1291. We review de novo a district court's grant of summary judgment. *Suever v. Connell*, 579 F.3d 1047, 1055 (9th Cir. 2009). Our review of an agency's compliance with the ESA is governed by the Administrative Procedure Act (APA). *Native Ecosystems Council v. Dombeck*, 304 F.3d 886, 901 (9th Cir. 2002). Under the APA, we hold unlawful and set aside only those agency actions found to be "arbitrary, capricious, an abuse of discretion, or otherwise not in accordance with law." 5 U.S.C. § 706(2)(A). Under this deferential standard, our job is not to substitute our judgment for that of the agency, but "is simply to ensure that the agency considered the relevant factors and articulated a rational connection between the facts found and the choices made." *Nw. Ecosystem Alliance v. U.S. Fish &*

[1]The district court granted summary judgment to the Service on the other two claims, which are not at issue in this appeal.

Wildlife Serv., 475 F.3d 1136, 1140 (9th Cir. 2007) (internal quotation marks omitted); *see Motor Vehicle Mfrs. Ass'n of U.S., Inc. v. State Farm Mut. Auto Ins. Co.*, 463 U.S. 29, 43 (1983) ("[A]n agency rule would be arbitrary and capricious if the agency has relied on factors which Congress has not intended it to consider, entirely failed to consider an important aspect of the problem, offered an explanation for its decision that runs counter to the evidence before the agency, or is so implausible that it could not be ascribed to a difference in view or the product of agency expertise.").

III

[1] The ESA, enacted in 1973, directs the Secretary of the Interior to maintain a list of all "threatened" and "endangered" species. 16 U.S.C. § 1533(c)(1). An endangered species is one that is "in danger of extinction throughout all or a significant portion of its range." *Id.* § 1532(6). A threatened species is one that is "likely to become an endangered species within the foreseeable future throughout all or a significant portion of its range." *Id.* § 1532(20). A species must be listed if it is determined to be endangered or threatened because of any one or a combination of the following factors:

> (A) the present or threatened destruction, modification, or curtailment of its habitat or range;
>
> (B) overutilization for commercial, recreational, scientific, or educational purposes;
>
> (C) disease or predation;
>
> (D) the inadequacy of existing regulatory mechanisms; or
>
> (E) other natural or manmade factors affecting its continued existence.

Id. § 1533(a)(1); 50 C.F.R. § 424.11(c). Listed species receive near-absolute legal protection against "taking," which includes harassment, harm, hunting, killing, and significant habitat modification or degradation. 16 U.S.C. §§ 1532(19), 1538(a)(1)(B); 50 C.F.R. § 17.3. A major goal of the ESA's protections is recovery of threatened and endangered species such that they can be removed from the list. 16 U.S.C. § 1533(f)(1); 50 C.F.R. § 424.11(d)(2). Delisting requires a determination that none of the above five factors threatens or endangers the species. 50 C.F.R. § 424.11(d). Both listing and delisting determinations must be made "solely on the basis of the best available scientific and commercial information regarding a species' status, without reference to possible economic or other impacts of such determination." *Id.* § 424.11(b).

The Secretary of the Interior has delegated to the Service the authority to administer the ESA. *Id.* § 402.01(b). In this appeal, GYC challenges the Service's determinations in its delisting Rule that the Yellowstone grizzly bear is not threatened by (1) whitebark pine declines under § 1533(a)(1)(E) ("Factor E"); or (2) inadequate existing regulatory mechanisms under § 1533(a)(1)(D) ("Factor D"). We consider both issues.

A

In the Rule's analysis of Factor E, "other natural or man-made factors affecting [the grizzly's] continued existence," the Service concluded that "any changes in whitebark pine production . . . are not likely to impact the [Yellowstone grizzly] to the point where [it] is likely to become endangered within the foreseeable future throughout all or a significant portion of its range." 72 Fed. Reg. at 14,929. The district court ruled that the Service failed to articulate a rational connection between the science it relied upon and its conclusion.

Based on our review of the Rule and the record before the agency at the time it was published,[2] we agree.

[2] On the basis of the information the Service presents in the Rule, it cannot reasonably be denied that whitebark pine loss presents at least a potential threat to the Yellowstone grizzly population. First, whitebark pine seeds are identified as one of four food sources "important to grizzly bear survival and reproductive success" in the GYA, along with winter-killed ungulates (hoofed mammals), spawning cutthroat trout, and army cutworm moths. 72 Fed. Reg. at 14,867. The pine seeds "serve as an important fall food due to their high fat content and abundance as a pre-hibernation food," and the bears consume them "extensively" and even "predominantly" when they are available. *Id.* at 14,867, 14,868. This food source permits the bears to efficiently add weight and store fat before they hibernate for the winter.

[3] Second, the Service acknowledges "concern[ ] that there will be future changes in whitebark pine abundance" because of stresses on the trees from mountain pine beetles and white pine blister rust, both of which may be exacerbated by climate change. *Id.* at 14,929. According to the Rule, "[d]uring the last 2 to 4 years, there has been an epidemic of mountain pine beetles in whitebark pine in the GYA" and aerial survey data have indicated that approximately 16% of the GYA's whitebark pine has experienced "some level of mortality" as a result. *Id.* at 14,928. In addition, the Rule notes that blister rust "also contributes to whitebark pine declines" and reports a study estimating that "roughly 25 percent of all

[2]Of course, we cannot and do not consider any reports or studies that have been compiled since the Rule was published in March of 2007. Under the APA, we may consider only the record that was before the agency at the time the challenged decision was made. *See* 5 U.S.C. § 706; *Citizens to Preserve Overton Park, Inc. v. Volpe*, 401 U.S. 402, 420 (1971), *overruled on other grounds by Califano v. Sanders*, 430 U.S. 99, 105 (1977).

whitebark pine trees in the GYA are currently infected to some level." *Id.* at 14,928-29.

As to climate change, the Rule refers to "a general consensus among the world's best scientists that climate change is occurring" and points out that "[t]he magnitude of warming in the northern Rocky Mountains has been particularly great." *Id.* at 14,927. According to the Rule, "[t]he most substantial way in which changing climate conditions may affect whitebark pine is through outbreaks of native mountain pine beetles that might not continue to be regulated by extremely cold winters, and an increased prevalence of white pine blister rust." *Id.* at 14,929. Thus, "a changing climate may shift the overall distribution of whitebark pine north and higher in elevation, resulting in local extinction and reduced overall distribution in the GYA." *Id.* While the Service does not anticipate that whitebark pine will disappear entirely from the GYA in the foreseeable future, *id.*, one of the studies upon which it relies concludes that "as long as climate warming continues, whitebark pine as a species and ecosystem is at high risk for loss over much of its geographic distribution," including the Yellowstone area. Jesse A. Logan, *Climate Change Induced Invasions by Native and Exotic Pests*, USFS Rocky Mountain Research Station (2006).

Finally, of critical importance here, the Rule repeatedly acknowledges a "well-documented association" between reduced whitebark pine seed abundance and increased grizzly mortality. 72 Fed. Reg. at 14,899; *see, e.g.*, *id.* at 14,933 (noting that whitebark pine "has been linked to grizzly bear survival and reproduction"); *id.* at 14,868 ("During poor whitebark pine years, grizzly bear/human conflicts are more frequent, resulting in higher numbers of human-caused grizzly bear mortalities due to defense of life or property and management removals of nuisance bears."); *id.* at 14,929 (noting that "studies suggest a decrease in whitebark pine can change both grizzly bear spatial distribution and the number of bear/human conflicts"). In short, when whitebark pine seeds

are scarce, grizzlies range more widely in search of food, and contacts between bears and humans increase substantially. Numerous scientific studies and reports cited in the Rule document this connection.[3] The Rule also reports that pine seed unavailability can result in reduced female reproductive success. *Id.* at 14,932.

[4] Based on the evidence of a relationship between reduced whitebark pine seed availability, increased grizzly mortality, and reduced grizzly reproduction, it is logical to conclude that an overall decline in the region's whitebark pine population would have a negative effect on its grizzly bear population. The Service advances several rationales in the Rule to support its conclusion that food shortages caused by whitebark pine declines are nonetheless "not a threat" to the Yellowstone grizzly. *Id.* at 14,932. Below, we explain why we find all of them lacking.

---

[3]*See* Laura A. Felicetti et al., *Use of Sulfur and Nitrogen Stable Isotopes to Determine the Importance of Whitebark Pine Nuts to Yellowstone Grizzly Bears*, 81 Canadian J. Zoology 763, 763 (2003) ("Grizzly bear survival in the Greater Yellowstone Ecosystem is strongly linked to variation in pine-nut availability."); David J. Mattson et al., *Yellowstone Grizzly Bear Mortality, Human Habituation, and Whitebark Pine Seed Crops*, 56 J. Wildlife Mgmt. 432, 436 (1992) (in years of low whitebark pine seed use by bears, 1.9 times as many human-caused bear deaths occurred); David J. Mattson et al., *Food Habits of Yellowstone Grizzly Bears, 1977-1987*, 69 Canadian J. Zoology 1619, 1627 (1991) ("[D]uring years when pine seed production is low, grizzly bears come into greater contact with humans and more bears are killed."); Charles C. Schwartz et al., *Grizzly Bear*, in Wild Mammals of North America 556, 569 (G.A. Feldhammer et al. eds., 2003) ("[M]ost [bear/human] conflicts occur during years when important natural foods fail."); John L. Weaver et al., *Resilience and Conservation of Large Carnivores in the Rocky Mountains*, 10 Conservation Biology 964, 971 (1996) ("During years of poor production of berries and pine seeds, bears respond by substituting lower quality foods. . . . In the face of a shortfall in nutritious foods, bears move widely in search of food, which may bring them into contact with humans. This substantially increases the risk of direct human-caused mortality.").

First, the Service points out that grizzlies "are notoriously resourceful omnivores that will make behavioral adaptations regarding food acquisition." *Id.* at 14,932. While this uncontroversial assertion is adequately supported by science, it fails to address the heart of the threat that whitebark pine loss poses to the bears: increased proximity to humans when bears *do* adapt to seed shortages by seeking substitute foods. As the Rule itself recognizes just a few paragraphs later, "[t]he potential threat from decreases in whitebark pine cone production is not one of starvation, but one of larger home range size and movements," which "may result in increased conflicts with humans and increased mortality, as well as lower reproductive success the following year as females produce smaller litters." *Id.* That the bears are likely to seek alternate foods in the face of whitebark pine decline is a part of the problem, not an answer to it.

Second, the Service suggests that, even if there is a link between whitebark pine seed unavailability and *individual* mortality, there is no indication that the grizzly *population* will be negatively affected by seed shortages, because it has increased over the past three decades despite the fact that whitebark pine cone production has "varied dramatically" from year to year. *Id.* As explained by the Rule, "[b]ecause of the life history strategy of whitebark pine, which naturally exhibits extreme annual variability in cone production, grizzly bears have always had to cope with a high degree of uncertainty regarding this food resource." *Id.* The problem with this rationale is that the study on which the Service relied to demonstrate long-term grizzly population growth included data only until 2002, *before* the "epidemic of mountain pine beetles" began to kill the region's whitebark pines. *Id.* at 14,871, 14,928. It is not rational for the Service to rely on grizzly population trend data from a time of natural pine seed *variability* in order to predict the effect on the grizzly population of an overall whitebark pine tree *decline*.[4]

[4]Two other studies warrant mention here. First, the Rule cites to "Schwartz *et al.* 2006b" to support its assertion that the Yellowstone griz-

Another rationale presented in the Rule for why whitebark pine loss does not threaten the Yellowstone grizzly population is that a different grizzly population in the Northern Continental Divide Ecosystem in northern Montana "has continued to increase and thrive since the 1980s despite severe declines in whitebark pine communities in the last 50 years." *Id.* at 14,932. However, the force of this comparison is undercut by the fact that, in the very same Rule, the Service designates the Yellowstone grizzly as a "distinct population segment" of North American grizzly, based in part on its unique dependence on whitebark pine rather than, for example, berry-producing shrubs, which are relatively uncommon in the

---

zly population "has continued to increase and expand" as whitebark pine seed production has varied. *Id.* at 14,932. But that study, entitled "Distribution of grizzly bears in the Greater Yellowstone Ecosystem in 2004," is about changing population distribution, not changing population size. *See* Charles C. Schwartz et al., *Distribution of grizzly bears in the Greater Yellowstone Ecosystem in 2004*, 17 Ursus 63 (2006). In fact, it specifically cautions that the bear distribution map it presents "is not a reflection of bear density within this area." *Id.* The Service does not explain how a wider population distribution is indicative of a population increase, especially given that the Rule explicitly states that "home range expansion" as bears range more widely in search of food represents a potential threat from low whitebark seed production. *See* 72 Fed. Reg. at 14,932.

Second, the federal defendants' reply brief points to a modeling study suggesting that poor whitebark pine seed years lead only to a decline in the rate of grizzly population *growth*, and not a decline in overall population. *See* Charles C. Schwartz et al., *Impacts of Spatial and Environmental Heterogeneity on Grizzly Bear Demographics in the Greater Yellowstone Ecosystem*, in Demographics of the Yellowstone Grizzly 57 (Schwartz et al., eds., 2006). Putting aside the fact that poor whitebark pine seed years are not necessarily analogous to overall loss of whitebark pine trees, this study is nowhere mentioned or cited in the Rule's discussion of Factor E. "It is well-established that an agency's action must be upheld, if at all, on the basis articulated by the agency itself," not post-hoc rationalizations. *State Farm*, 463 U.S. at 50. If the Service relied on this study in making its determination, it did not adequately connect the dots in the Rule such that its "path may reasonably be discerned." *Id.* at 43 (internal quotation marks omitted).

GYA compared to other regions. *Id.* at 14,878. Indeed, the record before us includes a 2007 fact sheet authored by Recovery Coordinator Servheen noting that the difference in the range of foods eaten by the bears in these two regions "makes direct comparisons of the impacts of the loss of [whitebark pine] uncertain."

We recognize that the Service is the best judge of how comparable these two regions might ultimately be. However, we think it irrational for the Service to determine on the one hand that the Yellowstone grizzly population is sufficiently distinct to warrant independent delisting consideration, and then on the other base its delisting determination on observations pertaining entirely to a different population. We therefore conclude that this comparison is insufficient to support the Service's determination that whitebark pine declines do not threaten the Yellowstone grizzly.

The Service also claims that even if projected whitebark pine losses occur, there will still be adequate habitat in the Yellowstone region to support a recovered grizzly population. Specifically, the Rule notes that whitebark pine is expected to persist in high-elevation areas such as the eastern half of the PCA and 1,138 square miles of protected habitat in the Wind River Mountains. *Id.* at 14,929. According to the Rule, these "reserve" areas provide suitable grizzly habitat and "increase[ ] the resiliency of the Yellowstone [grizzly population] to future changes in whitebark pine availability." *Id.* at 14,929, 14,930. But heavy reliance on some subset of the habitat within the PCA, or on habitat outside the PCA, to mitigate the impact of widespread whitebark pine decline is simply not rational given that the Service has defined the entire 9,210-square-mile PCA as the area "*necessary* to support the recovered grizzly population." *Id.* at 14,914 (emphasis added). Having determined what is "necessary," the Service cannot reasonably rely on something less to be enough.

The Service's ultimate (and understandable) conclusion is that it simply does not yet know what impact whitebark pine

declines may have on the Yellowstone grizzly. As the Rule acknowledges, "the specific amount of decline in whitebark pine distribution and the rate of this decline are difficult to predict with certainty. The specific response of grizzly bears to declines in whitebark cone production is even more uncertain." *Id.* at 14,929. We recognize that scientific uncertainty generally calls for deference to agency expertise. *See Lands Council v. McNair*, 537 F.3d 981, 993 (9th Cir. 2008) (en banc) ("We are to be most deferential when the agency is making predictions, within its area of special expertise, at the frontiers of science." (internal quotation marks and brackets omitted)).

But we nonetheless have a responsibility to ensure that an agency's decision is not arbitrary. *See id.* It is not enough for the Service to simply invoke "scientific uncertainty" to justify its action. As the Supreme Court has explained, "[r]ecognizing that policymaking in a complex society must account for uncertainty . . . does not imply that it is sufficient for an agency to merely recite the terms 'substantial uncertainty' as a justification for its actions." *State Farm*, 463 U.S. at 52. The Service must rationally explain why the uncertainty regarding the impact of whitebark pine loss on the grizzly counsels in favor of delisting now, rather than, for example, more study. *See id.* Otherwise, we might as well be deferring to a coin flip.

The Service relies heavily on "adaptive management" to justify its decision to delist the grizzly despite the scientific uncertainty.[5] According to the Rule, the Study Team and other

[5]The Service has defined "adaptive management" as "a structured process for learning by doing" and "a method for examining alternative strategies for meeting measurable biological goals and objectives, and then, if necessary, adjusting future conservation management actions according to what is learned." Notice of Availability of a Final Addendum to the Handbook for Habitat Conservation Planning and Incidental Take Permitting Process, 65 Fed. Reg. 35,242-01, 35,252 (June 1, 2000). Commentators

scientists "will continue to monitor the abundance and distribution of major grizzly bear foods such that any decline in the grizzly bear population as a result of these declines is detected in a sufficient time and addressed through adaptive management actions by the Coordinating Committee." 72 Fed. Reg. at 14,933. The Service explains that any biologically significant decline in an important food such as whitebark pine would be reflected in changes in mortality rates of independent females, litter size, and cub survival. If food declines occur and the Study Team "concludes these are related to significant increases in known and probable bear mortalities, and that such increases could threaten the grizzly population, the Study Team would recommend appropriate management responses to the Coordinating Committee, or submission of a relisting petition." *Id.*

[5] First of all, we reject out of hand any suggestion that the future possibility of relisting a species can operate as a reasonable justification for delisting. Whatever comfort may be taken in relisting as a safety net, it is no answer to conclude that a species is not threatened simply because it can be relisted if it is threatened. But there is no explanation of what the other "management responses" referred to might be, or why they would be reasonably likely to mitigate population declines caused by whitebark loss.[6] For adaptive management

---

have noted that, while adaptive management has become the dominant agency response to scientific uncertainty, it can be difficult to evaluate against the substantive requirements of environmental laws such as the ESA. *See* J.B. Ruhl & Robert L. Fischman, *Adaptive Management in the Courts*, 95 Minn. L. Rev. 424, 472 (2010).

[6]Elsewhere in the Rule, the Service discusses "short-term" management responses to "poor whitebark pine production years," including:

> immediate limitation on all discretionary mortalities; enhanced outreach and education to minimize bear/human conflicts and the availability of attractants in bear habitat that might promote such conflicts; notice to residents and users of bear habitat about the

of a potential threat to suffice as a basis for a delisting determination, we believe that more specific management responses, tied to more specific triggering criteria, are required. *See, e.g.*, *Natural Res. Def. Council v. Kempthorne*, 506 F. Supp. 2d 322, 341 (E.D. Cal. 2007) (rejecting an adaptive management plan under the ESA when it did not include "defined action criteria"). Just as it is not enough simply to invoke "scientific uncertainty" to justify an agency action, it is not enough to invoke "adaptive management" as an answer to scientific uncertainty.

The Strategy establishes an intensive management and monitoring framework but, unfortunately, it was not developed to be responsive to whitebark pine declines. In fact, it does not even specifically discuss them. The Strategy grew out of the successful management regime that was developed during the 1980s, 1990s, and early 2000s, and it may be entirely reasonable to conclude that it adequately addresses potential threats that were apparent during that time, such as natural resource extraction, tourism, and annual variation in whitebark pine seed production. However, widespread whitebark pine loss, which did not begin until approximately 2002, was simply not one of those threats. Because the Strategy was

---

> possible increased foraging of bears in peripheral habitats; detailed monitoring of food habit shifts and possible changes in home range size and locations . . . ; limitation of human activities in new or expanded feeding areas . . . ; and requests for a status review and/or immediate emergency relisting.

72 Fed. Reg. at 14,891. The only proposed responses to an overall loss of whitebark pine are replanting and recruitment of whitebark pine and enhancement of habitat outside the PCA where healthy whitebark pine may be available. As to the first, the Service provides no explanation as to why replanted whitebark pine is not subject to the same landscape-wide threats as existing whitebark pine, such as pine mountain beetle infestation. Moreover, there necessarily is a time lag before newly planted trees mature. As to the second, as previously explained, reliance on habitat outside the PCA contradicts the Service's own definition of the PCA as the area necessary to support a recovered grizzly population.

not developed to address whitebark pine declines, its effectiveness as a response is speculative.

The Yellowstone grizzly has been the focus of a laudable, decades-long cooperative research effort—one that we hope continues. It may be that scientists will compile data demonstrating grizzly population stability in the face of whitebark pine declines. Such information, however, simply is not in the record before us. The lack of any data showing a population decline due to whitebark pine loss is not enough. *See Tucson Herpetological Soc'y v. Salazar*, 566 F.3d 870, 879 (9th Cir. 2009) ("If the science on population . . . trends is undeveloped and unclear, the Secretary cannot reasonably infer that the absence of evidence of population decline equates to evidence of persistence."). The Rule presents no data indicating that whitebark pine declines will not threaten the Yellowstone grizzly population, and considerable data—demonstrating a relationship between pine seed shortages, increased bear mortality, and decreased female reproductive success—pointing in the opposite direction. *See State Farm*, 463 U.S. at 57 (rejecting agency rationale when "every indication in the record points the other way" (internal quotation marks omitted)).

[6] Perhaps the Service's delisting process, based on two decades of grizzly population growth, was well underway before the whitebark pine loss problem appeared on the radar and could be studied. But now that this threat has emerged, the Service cannot take a full-speed ahead, damn-the-torpedoes approach to delisting—especially given the ESA's "policy of institutionalized caution." *Ariz. Cattle Growers' Ass'n v. Salazar*, 606 F.3d 1160, 1167 (9th Cir. 2010) (internal quotation marks omitted), *cert. denied*, 131 S. Ct. 1471 (2011). The Rule did not articulate a rational connection between the data before it and its conclusion that whitebark pine declines were not likely to threaten the Yellowstone grizzly bear. Therefore, we affirm the decision of the district court on this ground.

B

The ESA's five-factor listing and delisting framework also requires the Service to determine whether a species is threatened because of "the inadequacy of existing regulatory mechanisms." 16 U.S.C. § 1533(a)(1)(D). The Service concluded that adequate regulatory mechanisms were in place to maintain a recovered Yellowstone grizzly population after delisting. 72 Fed. Reg. at 14,923. The district court held that the Service relied on too many measures that were not legally binding and failed to explain adequately how the legally binding measures would protect the grizzlies. Because we find adequate support in the Rule for the Service's conclusion, we reverse the district court on this ground.

The parties dispute whether the Strategy or associated state plans are themselves appropriately considered "regulatory mechanisms." We have previously held that the Service could consider protective measures in a multi-agency, multi-state conservation agreement in its assessment of delisting Factor A, "the present or threatened destruction, modification, or curtailment of [a species'] habitat or range." 16 U.S.C. § 1533(a)(1)(A); *see Tucson Herpetological Soc'y*, 566 F.3d at 879. Although this holding suggests that measures implemented pursuant to such agreements are not a legal nullity, we have never squarely considered whether a conservation agreement qualifies as a "regulatory mechanism" under Factor D. District courts have held that voluntary, unenforceable measures in conservation plans are not "regulatory mechanisms." *See Or. Natural Res. Council v. Daley*, 6 F. Supp. 2d 1139, 1153-56 (D. Or. 1998).

[7] But we need not decide whether the Strategy itself, as a whole, constitutes a "regulatory mechanism." Even assuming that the Service's consideration of the Strategy's voluntary or unenforceable components was error, its consideration of components of the Strategy that have been made legally binding adequately supports its Factor D determination. *See*

Tucson Herpetological Soc'y, 566 F.3d at 880 (proceeding to assess agency's delisting determination after setting aside those portions of the determination found to be erroneous).

Most importantly, the Service has pointed to the incorporation of certain of the Strategy's standards into the National Park Superintendents' Compendia and National Forest Plans (NFPs). For example, the Rule explains that the Park Service "has incorporated the habitat, population, monitoring, and nuisance bear standards described in the Strategy into their Superintendent's Compendium for each affected National Park." 72 Fed. Reg. at 14,924. Judge Thomas's contention that "there is not a single federal or state law or regulation that provides the means for enforcing the Strategy's morality standards," *see Dissent* at 20360, ignores the import of this fact. A Park Superintendent's Compendium "operat[es] as a summary of the rulemaking implemented under the discretionary authority of the Park Superintendent" in a particular National Park, and consists of regulations which augment the generally applicable Park Service regulations published in Title 36 of the Code of Federal Regulations. *Mausolf v. Babbitt*, 125 F.3d 661, 664 n.4 (8th Cir. 1997); *see* 36 C.F.R. §§ 1.5(a), 1.7(b). Therefore, the incorporation of the Strategy's population standards into the Yellowstone and Grand Teton National Park Superintendent's Compendia gives these standards—which include mortality limits, *see Final Conservation Strategy*, *supra*, at 173-74, 178-81-federal regulatory force, and the Park Service must adhere to them. *See Nat'l Ass'n of Home Builders v. Norton*, 340 F.3d 835, 852 (9th Cir. 2003) (noting that federal agencies must follow their own rules).

The situation is similar on National Forest lands, because the Strategy's habitat standards will be incorporated into legally enforceable National Forest Plans for all national forest land within the PCA upon delisting. 72 Fed. Reg. at 14,923. Management of national forest lands "must be consistent with the governing forest plan." *See Greater Yellowstone Coal. v. Lewis*, 628 F.3d 1143, 1149 (9th Cir. 2010) (citing 16

U.S.C. § 1604(i)). *See, e.g., Greater Yellowstone Coal.*, 628 F.3d at 1149-50 (legal challenge against the Forest Service for failure to comply with an NFP).

That the Forest and Park Services are legally bound to uphold key Strategy standards within the PCA is highly significant because these agencies collectively own and manage 98% of the land there. 72 Fed. Reg. at 14,874. And as the Rule indicates, the PCA has been shown to support the vast majority of the Yellowstone grizzly population. *Id.* Furthermore, even beyond the boundaries of the PCA, binding regulatory mechanisms protect a significant portion of the suitable grizzly habitat. In particular, the Rule explains that

> roughly 30 percent of all suitable habitat outside of the PCA is within a designated Wilderness Area . . . . The Wilderness Act of 1964 does not allow road construction, new livestock allotments, or new oil, gas, and mining developments within designated Wilderness areas; therefore, about 6,799 sq km (2,625 sq mi) will remain secure habitat . . . . This secure suitable habitat is biologically significant to the Yellowstone [grizzly] because it will allow population expansion into these areas that are minimally impacted by humans.

Id. at 14,924.

The Rule also cites to a wide range of other rules, regulations, and laws, both state and federal, which could facilitate the protection of the grizzly bear and the implementation of the Strategy.[7] The breadth of these measures is a tribute to the

[7]Judge Thomas faults the Service for citing to state laws that "allow the killing of bears." *Dissent* at 20363. We simply point out that these laws "allow the killing of bears" only under state regulation—such as with hunting licenses that are subject to annual limits—and thus enable the state to exercise some control over grizzly mortality. Therefore, we think it entirely appropriate that the Service considered them in its discussion of laws that facilitate the implementation of the Strategy.

comprehensive multi-jurisdictional cooperative effort between federal and state agencies, as well as private interest groups. The multi-state commitment to implement the Strategy represents a substantial wildlife conservation planning achievement —and one that, we have no doubt, ultimately improves the lot of the Yellowstone grizzly bear. For purposes of the Factor D determination, however, we need not, and do not, consider those measures, some or all of which may not be binding, because we hold that the clearly binding regulatory mechanisms discussed above suffice.

[8] The National Forest Plans and National Park Compendia make legally binding the Strategy's standards on 98% of the critical PCA and are buffered by the legal protections afforded by the Wilderness Act on a significant portion of grizzly habitat outside the PCA. In light of these measures, we believe the Service could reasonably conclude that adequate regulatory mechanisms exist to protect the Yellowstone grizzly bear. Importantly, we recognize that delisting cannot require the imposition of legal protections commensurate with those provided by the ESA itself. After all, the ESA expressly aims for species recovery to the point where its own measures are "no longer necessary," 16 U.S.C. § 1532(3), thus contemplating that something less can be enough to maintain a recovered species. It is therefore reasonable to conceive of "adequate" regulatory mechanisms as offering a recovered species something less than the stalwart protections of the ESA, but considerably more than no special protection at all. We believe that the Service could rationally conclude that the regulatory framework described in the Rule is sufficient to sustain a recovered Yellowstone grizzly bear population. On this issue, we reverse the district court.

IV

We affirm the district court's grant of summary judgment in favor of Greater Yellowstone Coalition on the issue of whether the Service rationally supported its determination that

potential whitebark pine declines did not threaten the Yellowstone grizzly bear. This is sufficient to affirm the district court's judgment vacating the Rule. However, we reverse the district court's grant of summary judgment in favor of Greater Yellowstone Coalition as to the Service's determination that existing regulatory mechanisms are adequate to protect a recovered Yellowstone grizzly population, and we direct the district court to enter summary judgment in favor of the governmental Appellants on that issue. We remand to the district court for further proceedings consistent with this Opinion.

Costs are awarded to Plaintiff-Appellee.

AFFIRMED in part; REVERSED AND REMANDED in part

THOMAS, Circuit Judge, concurring in part and dissenting in part:

I agree with the majority that the U.S. Fish and Wildlife Service (the "Service") did not, in its delisting rule,[1] articulate a rational connection between the record data and its determination that whitebark pine declines were not likely to threaten the Yellowstone grizzly bear. Unlike the majority, I would hold that the agency also erred in concluding the Yellowstone grizzly is not threatened by "the inadequacy of regulatory mechanisms." 16 U.S.C. § 1533(a)(1)(D) ("Factor D").[2]

[1]Final Rule Removing the Yellowstone Distinct Population Segment of Grizzly Bears From the Federal List of Endangered and Threatened Wildlife. 72 Fed. Reg. 14,866 (Mar. 29, 2007) ("Rule").

[2]The whitebark pine holding suffices to affirm the district court's judgment vacating the Rule. *Greater Yellowstone Coal., Inc. v. Servheen*, 672 F. Supp. 2d 1105 (D. Mont. 2009). Therefore, it is unnecessary to assess the Service's Factor D analysis. However, because the majority has opined on the issue, I will as well.

Therefore, I would affirm the district court's decision in its entirety.

I

The Service did not fulfill its regulatory responsibility in determining that existing regulatory mechanisms were sufficient to protect the Yellowstone grizzly. Not only did the Service rely on voluntary, rather than "regulatory," measures, but it did not explain adequately how existing regulatory mechanisms actually prevent grizzly bear mortality. *Motor Vehicle Mfrs. Ass'n of U.S., Inc. v. State Farm Mut. Auto. Ins. Co.*, 463 U.S. 29, 43 (1983); *Pac. Coast Fed'n of Fishermen's Ass'ns v. U.S. Bureau of Reclamation*, 426 F.3d 1082, 1091 (9th Cir. 2005).

A

In response to dramatic grizzly bear population declines, the Service listed the grizzly as "threatened" under the Endangered Species Act in 1975. Since that time, the Service has repeatedly recognized the need for binding conservation measures that safeguard grizzlies from the threats which led to their decline. Amendment Listing the Grizzly Bear of the 48 Conterminous States as a Threatened Species, 40 Fed. Reg. 31,734, 31,734 (July 23, 1975); 72 Fed. Reg. at 14,922.

In the Greater Yellowstone Area, where grizzly populations were in jeopardy, the need for binding conservation measures and mortality controls has remained paramount. *See* 72 Fed. Reg. at 14,868, 14,871, 14,922. As the Service explained in its brief:

> Because the lack of adequate mortality and habitat standards contributed to the grizzly bears decline and ultimate listing, the Service and its State and federal partners spent over a decade developing the Conservation Strategy, which, among its other protections,

> imposes *strict mortality limits* and many *legally enforceable habitat standards* on its state and federal signatories.

(Emphasis added.)

In its Factor D determination, however, the Service relied on a number of voluntary, rather than "regulatory," measures. Chief among these is the "Final Conservation Strategy for the Grizzly Bear in the Greater Yellowstone Area" ("Strategy"),[3] upon which the Service tells us it "largely based" its analysis.[4] Indeed, the Service lauds the Strategy's "strict mortality limits" as one of its "key tenets." But under the Rule, compliance with the Strategy is purely voluntary. *See* 72 Fed. Reg. at 14,904 ("[T]he Strategy cannot legally compel any of the signatories to implement management policies or obligate funding."). There is not a single federal or state law or regulation that provides a means for enforcing the Strategy's mortality standards.[5] *Id.* at 14,922-26. Rather, if the grizzly population becomes threatened, the agency is to review the situation and call a committee meeting.[6] And that only occurs if the mortal-

[3]Interagency Conservation Strategy Team, *Final Conservation Strategy for the Grizzly Bear in the Greater Yellowstone Area* (Mar. 2007) *available at* http://www fws.gov/mountain-prairie/species/mammals/grizzly/yellowstone.htm.

[4]Because the Service offered the Strategy as a primary basis for its Factor D determination, "we cannot readily say" that this error "clearly had no bearing on the Secretary's ultimate decision" to delist. *Tucson Herpetological Soc'y v. Salazar*, 566 F.3d 870, 880 (9th Cir. 2009).

[5]The Service claims the incorporation of the Strategy's standards into National Forest Plans and National Park Superintendent's Compendia afford the Strategy the force of law. But the National Forest Plans only incorporate the Strategy's habitat standards and contain no mechanism to enforce mortality limits.

[6]More specifically, when a deviation from the Strategy's mortality standards occurs, it triggers a non-binding "Biological and Monitoring Review," to be completed and made public within six months of initiation. 72 Fed. Reg. at 14,925. Then, the "multi-agency Yellowstone Grizzly

ity limits are exceeded for at least two years. 72 Fed. Reg. at 14,925.

The Service's reliance on voluntary action is contrary to law. The phrase "regulatory mechanism" plainly does not encompass voluntary, unenforceable measures such as the Strategy and many of its components. *Or. Natural Res. Council v. Daley*, 6 F. Supp. 2d 1139, 1155 (D. Or. 1998) (interpreting 16 U.S.C. § 1533(a)(1)(D) to mean that "the [agency] must base its decision on current, enforceable measures"). The Service therefore erred by considering the Strategy's voluntary and unenforceable components in its Factor D determination. Good intentions are not rules of law. Unenforceable aspirational goals are not regulatory mechanisms. Promises to monitor, review, and convene committees do not satisfy the statutory requirement. *See Norton v. So. Utah Wilderness Alliance*, 542 U.S. 55, 72 (2004) (noting that monitoring is not a legally binding commitment under the APA). Thus, the Rule must be vacated for non-compliance with 16 U.S.C. § 1533(a)(1)(D). *See State Farm*, 463 U.S. at 43 ("[A]n agency rule would be arbitrary and capricious if the agency has relied on factors which Congress has not intended it to consider . . . .").

B

The Service's analysis of existing laws and regulations is also flawed. Notably, the Rule does not explain how these measures prevent excessive grizzly bear mortality. Given the Service's view that mortality control is "a key part of any successful management effort," 72 Fed. Reg. at 14,871; *see also*

Coordinating Committee" responds to the Review, and "if the desired population and habitat standards specified in the Strategy cannot be met . . . the Coordinating Committee will petition [the Service] for relisting." *Id.* However, as the majority also recognizes, the "suggestion" of a future relisting does not "operate as a reasonable justification for delisting."

Strategy, *supra* note 3, at 31, its failure to account for regulatory mechanisms addressing mortality renders the Rule arbitrary and capricious. *See State Farm*, 463 U.S. at 43 ("[A]n agency rule would be arbitrary and capricious if the agency has . . . entirely failed to consider an important aspect of the problem.").

Citing to the Strategy, the Rule refers to 40 "Federal laws, rules, guidelines, strategies, and reports and 33 State laws, statutes, and regulations" applicable to management of the Yellowstone grizzly population. 72 Fed. Reg. at 14,922-23. The list sounds impressive, but the Rule is silent as to how these measures actually protect the grizzly. In fact, the vast majority of the cited laws and regulations predate the original listing and thus failed to protect the grizzly 35 years ago. The Service does not explain why these old laws now offer sufficient protection, despite the fact that the Service is required to consider the same factors in delisting as when listing. 16 U.S.C. § 1533(a)(1); 50 C.F.R. § 424.11(d).

Moreover, most of the listed laws and regulations do not specifically relate to grizzly protection; rather, they involve generic environmental and resource management. For example, one does not often think of a federal act establishing a highway between national parks as a statute aimed at protecting the grizzly, and yet this law is among those cited by the Strategy.[7] So is the Sikes Act of 1960, which provides for cooperative resource management on military reservations.[8]

---

[7] *See* Appendix J *in* Strategy, *supra* note 3, at 157 (referencing Act to Establish John D. Rockefeller, Jr., Memorial Parkway, Pub. L. No. 92-404, 86 Stat. 619, 619 (1972)).

[8] *Id.* (referencing Sikes Act of 1960, 16 U.S.C. § 670a). The other federal statutes cited in the Strategy are similarly tangential or generic: Yellowstone National Park Act of 1872, ch. 24, § 1, 17 Stat. 32, 32-33 (1872); National Park Service Organic Act of 1916, 16 U.S.C. § 1; Lacey Act of 1900, 16 U.S.C. § 701; Fish & Wildlife Coordination Act of 1934, 16 U.S.C. §§ 551-664; Grand Teton National Park Expansion Act of 1950, 16

The listed state laws and regulations provide no more comfort. These provisions do not require the states to control grizzly mortality in accordance with the Strategy, and they only apply outside of the Primary Conservation Area. Further, the cited state laws do not necessarily protect the grizzly. Indeed, most of the statutes cited are laws that allow the killing of bears. For example, Wyoming statutes define a grizzly bear as a "[t]rophy game animal," Wyo. Stat. Ann. § 23-1-101(a)(xii)(A), and require a hunting license, *id.* at § 23-3-102(b). The Wyoming Grizzly Bear Management Plan allows regulated hunting of grizzlies. It also flatly states that it will not allow grizzlies to reoccupy certain mountain ranges, and that it will enforce that policy through sport hunting and removal.[9] Idaho's Grizzly Bear Management Plan similarly recognizes the grizzly as a "game animal" and further acknowledges that a large portion of potential grizzly habitat is beyond the reach of state law because it is located on the Shoshone-Bannock reservation, which is governed by tribal law.[10] The Tribe has not spoken on how it intends to proceed.[11]

U.S.C. § 406d-1; Multiple-Use Sustained-Yield Act of 1960, Pub. L. No. 86-517, 74 Stat. 215 (codified as amended in scattered sections of 26 U.S.C.); National Environmental Policy Act of 1969, 42 U.S.C. §§ 4321-4370; Endangered Species Act of 1973, 16 U.S.C. §§ 1531-1536; Forest and Rangeland Renewable Resources Planning Act of 1974, Pub. L. 93-378, 88 Stat. 476 (codified as amended in scattered sections of 16 U.S.C.); National Forest Management Act of 1976, Pub. L. No. 94-588, 90 Stat. 2949 (codified as amended in scattered sections of 16 U.S.C.); Federal Land Policy and Management Act of 1976, 43 U.S.C. §§ 1701-1787; Fish & Wildlife Improvement Act of 1978, 16 U.S.C. § 742; and Fish and Wildlife Conservation Act of 1980, 16 U.S.C. §§ 2901-2911.

[9]Wyoming Game and Fish Department, *Wyoming Grizzly Bear Management Plan* 15 (Feb. 2002, as amended, July, 2005).

[10]Idaho's Yellowstone Grizzly Bear Delisting Advisory Team, *State of Idaho Yellowstone Grizzly Bear Management Plan* 18 (Mar. 2002).

[11]The Idaho Management Plan states: "The hunting of grizzly bears by members of the Shoshone-Bannock Tribes is a traditional and cultural issue, which will be determined by the Governing Body of the Shoshone-Bannock Tribal Council after delisting of the grizzly bear is finalized." *Id.*

The Montana plan also allows regulated hunting of grizzlies and states that "[r]egulated harvest will be a part of Montana's long-term conservation plan.[12]

Neither the Rule nor the Strategy adequately explains how these 70-odd federal and state laws and regulations will affect the Yellowstone grizzly. The only reference is contained in Appendix J to the Strategy,[13] where a simple grid lists each federal and state provision and an "X" beside the provisions that purport to address Factor D. There is no explanation or rationale provided. It is difficult to imagine a less illuminating document.

Merely compiling a list of potentially applicable statutes and regulations is not sufficient; the agency must explain why these laws and regulations constitute adequate regulatory mechanisms for grizzly protection. In short, the Service has not met its obligation to "articulate a satisfactory explanation" for its determination that adequate regulatory mechanisms exist to protect the Yellowstone grizzly. *State Farm*, 463 U.S. at 43; *Ctr. for Biological Diversity v. U.S. Dep't of Interior*, 623 F.3d 633, 648 (9th Cir. 2010) (noting that this circuit has "insisted that agencies support and explain their conclusions with evidence and reasoned analysis").

C

In sum, the district court correctly determined that the Rule did not comply with 16 U.S.C. § 1533(a)(1)(D). As a matter of law, unenforceable, voluntary promises do not constitute "regulatory mechanisms." Mere citation to potentially applicable statutes and regulations without analysis does not fulfill the Service's obligation to explain how they act as adequate

[12]Montana Department of Fish, Wildlife & Parks, *Grizzly Bear Management Plan for Southwestern Montana 2002-2012* 56 (Oct. 2002).

[13]Appendix J is entitled "The Relationship Between the Five Factors in Section 4(a)(1) of the ESA and the Existing Laws and Authorities."

regulatory mechanisms for protection of the grizzly. Neither the Rule nor the Strategy provide a legally enforceable method by which the Service can impose its mortality limits. The district court was right to reject the Service's Factor D analysis.

II

I do not question, much less criticize, the enormous effort that the Service, the states, and interest groups have made to study and manage the Yellowstone grizzly. However, our task is not to assess those endeavors from a policy viewpoint; it is to apply the law as Congress has directed. In doing so, I reach the same conclusions as the district court. To the extent my colleagues hold otherwise, I respectfully dissent.

Wayne, or others,

Any suggested citation for this sentence?

ISSUE 35: One peer reviewer requested citations to justify our statement that "the primary factor affecting grizzly bears at both the individual and population level is excessive human-caused mortality."

Seems if we add this citation (or a series of citations) to the rule itself (revising the sentence if necessary), this issue goes away.

Thanks,
Seth

Issue 74: Public commenters presented differing points of view on the implementation period of the Conservation Strategy. Some parties took issue with our characterization in the rule describing the Conservation Strategy as being indefinite or being in place in perpetuity. These commenters suggested an overly long post-delisting monitoring period impinged upon States rights and the concept that the ESA is an emergency room statute and that once a species is recovered its management should be returned to the States. Many commenters noted that the ESA requires a post-delisting monitoring period of at least 5 years. Some suggested the Conservation Strategy should stay in place for this minimum 5-year monitoring period while others suggested it should stay in place for much longer than 5 years. Other commenters noted that the Conservation Strategy had been changed to add a clarification that it would remain in effect for the foreseeable future. In light of the above, commenters requested that we clarify how long the Conservation Strategy would remain in effect, how long monitoring would continue, and what would happen after that point.

Response 74: The Conservation Strategy serves as our post-delisting monitoring plan and represents the agreement from all management partners on post-delisting management. Post-delisting monitoring refers to activities undertaken to verify that a species delisted due to recovery remains secure from risk of extinction after the protections of the ESA no longer apply (Service 2008, p. 1-1). The primary goal of post-delisting monitoring is to monitor the species to ensure the status does not deteriorate, and if a substantial decline in the species (numbers of individuals or populations) or an increase in threats is detected, to take measures to halt the decline so that re-proposing it as a threatened or endangered species is not needed (Service 2008, p. 1-1).

Section 4(g), added to the ESA in the 1988 reauthorization, requires the Service to implement a system in cooperation with the states to monitor for not less than five years the status of all species that have recovered and been removed from the list of threatened and endangered plants and animals (Service 2008, p. 1-1). The legislative history of section 4(g) indicates that Congress intended to give the Services and states latitude to determine the extent and intensity of post-delisting monitoring that is needed and appropriate (Service 2008, p. 1-1).

Delisting criteria and the formal rule-making process for removal from the list are designed to provide reasonable confidence that the species will remain secure for the foreseeable future, and post-delisting monitoring provides an additional "check" on projections that the species will remain secure after removal of ESA protections (Service 2008, p. 4-3). There are no absolute guarantees against future declines, but if the species appears to remain secure, conclusion of post-delisting monitoring is appropriate (Service 2008, p. 4-3).

According to our 2008 Post-Delisting Monitoring Plan Guidance, decisions regarding frequency and duration of effective monitoring should appropriately reflect the species' biology and residual threats (Service 2008, p. 4-4). Factors that should be considered include age of sexual maturity (if reproducing individuals are being monitored) and anticipated power to detect a statistically significant change (Service 2008, p. 4-4). The nature of the residual threats and the rate at which they might manifest their effects on the species should also be considered (Service 2008, p. 4-4). While post-delisting monitoring should be sufficient to meet the spirit and letter of section 4(g), it should be confined to the time period needed to verify that removal of ESA

protection did not cause a deterioration of status that would warrant re-listing (Service 2008, p. 4-5). Termination of PDM enables the reallocation of funding and other resources to species in more critical need of ESA protections and funding (Service 2008, p. 4-5).

We agree that it is unrealistic and is beyond what is required by the ESA to expect any single version of the conservation strategy and intensive Federal oversight to remain in effect in perpetuity. Therefore, we have revised the Conservation Strategy to remain in effect for the foreseeable future as this is the time horizon that we must consider as we evaluate the species status relative to the ESA's definition of a threatened species. Consistent with the Department of the Interior, Office of the Solicitor's Memorandum Opinion on "The Meaning of 'Foreseeable Future' in Section 3(20) of the ESA" (Department of the Interior 2009, entire), foreseeable future determinations by the Service are typically based on the timeframes over which the best available scientific data allow us to reliably assess threats and the species' response to those threats. Similarly, this opinion notes that such determinations are made species by species, or situation by situation, based upon the best data available for a particular species and its habitat.

It remains our belief that the Conservation Strategy will remain in place for the long term and its termination is not a foreseeable event. While we hesitate to offer an exact year which is the cut off for the foreseeable future, we offer here our thoughts to book end the concept. Because it takes a single female grizzly bear 14 years to replace herself in the population and because demographic responses to management or habitat changes may not immediately manifest themselves or be detectable, we believe two to three generation times (28 to 42 years) is an appropriate minimum. This time period is reasonable in that it would allow a complete turnover of the population and would be sufficient time for any adverse changes in the status of the population under post-delisting management to be evident. In the unlikely and unforeseeable event that the Conservation Strategy is terminated (or key partners withdraw) prior to this timeframe, we would consider this a violation of the first Service status review trigger ("any changes in Federal, State, or Tribal laws, rules, regulations, or management plans that depart significantly from the specifics of population or habitat management detailed in this proposed rule and significantly increase the threat to the population") and would initiate a Service status review. However, just as 2 to 3 generation times is viewed as a reasonable minimum foreseeable timeframe, we conversely believe 50 to 75 years starts to push past that which is reasonably and reliably foreseeable (beyond the foreseeable future). To the extent that this timeframe is considered and informs our threats analysis in this rulemaking, longer time horizons are considered for individual threat factors to the extent reliable data is available.

However, there is not an expectation that the Conservation Strategy will remain static during its lifespan. In fact, the Yellowstone Grizzly Bear Coordinating Committee (the body that will coordinate management and promote the exchange of information about the Yellowstone grizzly bear population after delisting) can revise or amend the Conservation Strategy based on the best biological data and best available science (U.S. Fish and Wildlife Service 2016, chapter 6). Any such amendments will be subject to public review and comment and approved by Yellowstone Grizzly Bear Coordinating Committee majority vote (U.S. Fish and Wildlife Service 2016, chapter 6). More meaningful changes would need to be evaluated by the Service to determine whether they constitute a violation of the first Service status review trigger (e.g.,

whether it would depart significantly from previous commitments or represent a significant threat to the population).

The Service has a history of conducting such reviews during the Northern Rocky Mountain gray wolf post delisting monitoring period. Specifically, during this five year post-delisting monitoring period, we conducted six annual evaluations of status (Service 2009, entire; Serivce 2011, entire; Service 2012, entire; Service 2013, entire; Service 2014, entire; Service 2015, entire) and seven "on-the-spot" evaluations considering whether some of the more meaningful changes to state management laws or regulations met that standard (Cooley 2011, *in litt*.; Cooley 2012, *in litt*.; Jimenez and Cooley 2012, *in litt*.; Sartorius 2012, *in litt*.; Jimenez 2013, *in litt*.; Cooley 2013, *in litt*.; Cooley 2014, *in litt.*). In those cases, wolf biology, high population levels and a demonstrated track record of withstanding high levels of human caused mortality provided us with sufficient confidence that the changes did not represent a significant threat and did not trigger a Service status review. In retrospect, these determinations were validated by annual reports which show Northern Rocky Mountain gray wolf populations basically stable since we removed Federal ESA protections in 2011 (Service et al. 2016, Table 6b).

Finally, its important to note that that regardless of the duration of the Federal post-delisting monitoring period, this population of grizzly bears will likely continue to be monitored by the States in perpetuity. States monitor wildlife to manage hunts for all species they manage, especially for harvested species. All three States have a relatively large and well-distributed professional game and fish staffs that have demonstrated skill and experience in successfully monitoring and managing a diversity of resident species, including many large, high-profile, and controversial carnivores (e.g., black bears and mountain lions). These State agencies, in coordination and cooperation with our other Federal partners, are fully qualified to monitor and manage a recovered grizzly bear population. We expect such monitoring will continue long-term for grizzly bears regardless of the Federal monitoring requirements. Although intensity and method may vary over time, this data will be looked to as needed to verify the recovered nature of this population long after Federal ESA involvement ceases.

Hey Jennifer,
Issue 23 says "increased development on lands surrounding national parks should be considered" and "the presence of 500 development sites on the 5 National Forests should be addressed"
I'm trying to figure out if they're talking about d-sites on public lands inside the PCA or the 500 d-sites in suitable habitat outside the PCA OR if they're talking about private land development.

thanks!

Interior Secretary Sally Jewell,
US Department of the Interior,
1849 C Street, NW
Washington, DC 20240

RE: Your response to my letter of 1/16/15 –

Official resolutions, declarations and letters of twenty-nine (29) federally recognized Indian Tribes in opposition to the US Fish and Wildlife Service's proposed delisting of the Yellowstone grizzly bear (*Ursus arctos horribilis*) from the Endangered Species Act, and the US Fish and Wildlife Service's contravention of the established protocols for tribal consultation in this process.

Dear Madam Secretary,

Thank you for directing US Fish and Wildlife Service (FWS) Mountain-Prairie Region Deputy Regional Director Bryan to reply to me on your behalf (received 2/21).

While I appreciate the Deputy Director stating that FWS "agree that Tribal governments should have the opportunity for meaningful engagement with the Service" and that FWS "fully understand our obligation to consult with Federally Recognized Native American Tribes on a government-to-government basis," the subsequent actions of Deputy Regional Director Bryan's office, and of the FWS as a whole, call those sentiments into question.

Before raising those concerns, with all due respect, this is no longer – if it ever was – a regional concern. Thirty-two federally recognized Tribal Nations now comprise GOAL Tribal Coalition, the latest being the Cherokee Nation of Oklahoma, the second largest Tribal Nation in the United States. Governor Bill Anoatubby, one of the longest serving and most respected tribal leaders in the country, recently wrote to FWS Director Dan Ashe about this issue (2/2/15), specifically about the lack of meaningful tribal consultation.

When he responded to GOAL Tribal Coalition on your behalf, Deputy Director Bryan also replied to the Montana Wyoming Tribal Leaders Council (TLC). The TLC only received that letter 2/21, yet FWS was insisting that the TLC furnish venues for three meetings by March 6, or alternatively, be prepared to submit thorough presentations on this issue to FWS by March 31.

There is no definition existing under which the three proposed consultation meetings described by Deputy Director Bryan as "broad areas where tribes have expressed an interest in this issue" equates to the "meaningful consultation and collaboration with tribal officials in the development of Federal policies that have tribal implications" detailed in Executive Order 13175, and twice reaffirmed by President Obama in his 2009 memorandum and 2013 executive order. It would also be similarly dubious to claim that the three "broad area" meetings proposed fulfill the intent of Secretarial Order 3206.

The timescale insisted on for the three meetings is totally unrealistic. The compressed timeframe, with a deadline of March 6, will, in all likelihood, preclude tribes from participating in these meetings. Tribal leaders have a daunting daily workload, and the notion that they will be able to schedule and commit to these meetings in such a short period of time is impracticable.

A requisite of any consultation process is that those being consulted have a reasonable opportunity to participate.

While a positive first step in recognizing that the required consultation process with Tribal Nations must be honored, the three consultation meetings proposed must be viewed as just that – the initiation of the process, not the consultation process in entirety. Additionally, thirty-two Tribal Nations have written to you and Director Ashe in opposition to the proposed delisting of the Yellowstone grizzly bear; the TLC has only ten member tribes.

On the day I received your response via Deputy Director Bryan, GOAL Tribal Coalition was informed that FWS intends to issue the new rule to delist the Yellowstone grizzly bear this June. This would, of course, explain FWS's desire to undertake the minimum the Service thinks it can offer as passable in terms of consultation, and exposes FWS's desire for such an unrealistically short time frame.

In light of this, the intent behind these "three proposed consultation meetings in broad areas where tribes have expressed an interest in this issue" becomes clearer. It appears to be FWS's intent to delist the Yellowstone grizzly bear before the affected Tribal Nations have received a decent and fair opportunity to contribute, and, evidently, if the decision has already been made, FWS and the federal government is simply employing the same patriarchal attitude that has for centuries defined the relationship between our sovereign tribal nations and the United States. This cannot be described as a good faith effort, and runs counter to what President Obama has advocated on tribal consultation.

In all of the resolutions, declarations and letters you have been furnished with from affected tribes, each Tribal Nation has raised the issue of FWS's lack of transparency and the need for the raw data held by the FWS to be subject to open and impartial review by independent scientists. That prescient insight by our tribal leaders has taken on greater urgency in light of the now public testimony given August 18, 2014 in a hearing before the US Merit Systems Protection Board. The case of Gary Mowad revealed rampant scientific fraud and the manipulation and politicization of data by FWS.

The delisting of the Yellowstone grizzly bear has been highly politicized by Wyoming Governor Matt Mead, and Wyoming's Congressional delegation. Not only the citizens of our tribal nations, but every citizen in the US, is entitled to see independent scientific review of the data FWS is basing its claims on relative to delisting the Yellowstone grizzly bear. Taxpayers have funded the collection of this data for decades. This is not an issue of national security, and therefore there is no justification for denying an

open and transparent process so all can be confident that scientific fraud and politicization are not the deciding factors in a delisting decision if this magnitude.

In closing, in my letter of 1/16, I cataloged a series of concerns that demonstrated how unfit to participate in consultation with Tribal Nations FWS's grizzly bear recovery coordinator, Dr. Christopher Servheen is. In response, Deputy Director Bryan failed to address those concerns, and, instead, advised us, and our tribal leaders, to submit cultural information and traditional knowledge to Dr. Servheen by March 31 so he could decide whether it was worthy of inclusion in FWS's review of the Yellowstone grizzly bear. This, simply put, is the height of insensitivity.

Madam Secretary, I look forward to receiving your response to the points raised herein, and working with you to forge a positive path forward on this very important issue.

I have done some research regarding Service process and protocols on consultation. There is no requirement for publishing a consultation notification in the Federal Register as Cheryl suggests in her email. There appears to be a requirement or at least a strong suggestion that we provide a 30 day notification of the desire to consult, but it does not have to be in the F.R. I suggest that we have a more thorough discussion and planning session on how to approach the consultation process. There appears to be changes to the Montana/Wyoming Tribal Leaders group and it may be more inclusive of the North and South Dakota and Nebraska Tribes. I have some personal contacts with the E.D. of the Montana/Wyoming Tribal Leaders group and will try and find out about their new structure. We may want to re-design our consultation proposal and work to schedule consultation at a state level with interested tribes or continue to go through tribal associations. Cheryl's recently deceased spouse and her predecessor at the MT/WY Tribal Leaders group held the bear in high esteem and was personally opposed to de-listing. We may be seeing some of his personal commitment to the bear reflected in her approach.

I will do some more research and get back to all of you.

Hello all at the Department of Interior and Fish Wildlife Service,
Please see the attached letter in response to the letter from the DOI-FWS Mountain Prairie Office (the latter was received by the Tribal Leaders Council office a couple weeks ago dated 2/17/2015 -- RE: FWS/R6/ES/EA ESO-00060852). Both letters as well as the original TLC Resolution to which the letters pertain are attached for your reference.

Although you had requested a response by March 6 (this past Friday), as the subsequent TLC letter reiterates, more time is needed to accomplish the full fledged meaningful consultation process that is required for the Tribes to be able to really engage and be heard on this issue.

My understanding is that ordinarily, Tribal Consultation is announced in the Federal Register 30 days in advance of the first session.

Ivy, I do not think we could do an adequate consultation with the tribes of grizzly bears in 2 hours. I think it would take most of a day. Of course, it's not my decision, but I think we should anticipate quite a diverse set of concerns. Many tribes will be prompted to ask certain questions I am sure.

Hi Cheryl,

We were actually wondering if there would be an opportunity for us to do the consultation in conjunction with one of your upcoming meetings? Many of the concerned Tribes are within the Rocky Mountains and Great Plains. Most of the Montana/Wyoming Tribes have voiced concerns. We can be somewhat flexible on the consultation dates and times. The meetings will be sort of

regional in scope. However, they will overlap outside of the Mountain-Prairie Region and we are open to Tribes outside of the region participating. I think the meetings could go up to two hours but I don't think they would go over three hours. Please let us know if this sounds like an option TLC would be interested in pursuing?
Sincerely, Ivy

Hello Ivy,
I called you to find out if there is a timeframe for getting the consultation referenced in the attached letter completed…I just received the letter requesting dates in the mail today – the letter says to contact you by March 6 with potential dates for the meetings but I will be out all next week so, need to respond by this week and don't know how far down the road the consultations can/should/must occur??

What is the estimated timeframe for the consultation sessions to be accomplished and are these only regional or national consultations??

Subject: RE: Consultation dates re Tribes n Grizzly

Ivy, I do not think we could do an adequate consultation with the tribes of grizzly bears in 2 hours. I think it would take most of a day. Of course, it's not my decision, but I think we should anticipate quite a diverse set of concerns. Many tribes will be prompted to ask certain questions I am sure.

Subject: RE: Consultation dates re Tribes n Grizzly

Hi Cheryl,

We were actually wondering if there would be an opportunity for us to do the consultation in conjunction with one of your upcoming meetings? Many of the concerned Tribes are within the Rocky Mountains and Great Plains. Most of the Montana/Wyoming Tribes have voiced concerns. We can be somewhat flexible on the consultation dates and times. The meetings will be sort of

regional in scope. However, they will overlap outside of the Mountain-Prairie Region and we are open to Tribes outside of the region participating. I think the meetings could go up to two hours but I don't think they would go over three hours. Please let us know if this sounds like an option TLC would be interested in pursuing?
Sincerely, Ivy

Subject: Consultation dates re Tribes n Grizzly

Hello Ivy,
I called you to find out if there is a timeframe for getting the consultation referenced in the attached letter completed…I just received the letter requesting dates in the mail today – the letter says to contact you by March 6 with potential dates for the meetings but I will be out all next week so, need to respond by this week and don't know how far down the road the consultations can/should/must occur??

What is the estimated timeframe for the consultation sessions to be accomplished and are these only regional or national consultations??

the first attempt had failed. Try again.

Ivy,
Hello. I just received your letter in the mail concerning grizzly bears. I am emailing you regarding the location and venue suggested for 3 consultations. I would have to say sometime in May, After June and July, that is our ceremonial season, and maybe august and oct? A location I would dare to say Casper,Wy and Denver, Co would work for us.

If you have any questions email me here for a quick response.

Dan and Lisa,
Does this document look familiar? We can use this as a template to update the habitat chapter. This is what Rebecca was using. I suggest that you use this to review and confirm your proposed changes and your reviews with managers. You will also have to involve NPS in these discussions. Once you are in agreement, we can work to get these changes into the CS habitat chapter and necessary appendices.
Sound like a plan?
Chris

Chapter 3 Habitat Standards and Monitoring

Style Definition: Heading 2: Space Before: 14 pt

Style Definition: Heading 3: Space Before: 18 pt, After: 10 pt

Introduction

Since 1986 and prior to delisting of the Yellowstone population, grizzly bear~~,~~ habitat~~s for grizzly bears~~ in the Greater Yellowstone ~~Area~~ Ecosystem (GYE) has~~ve~~ been managed under standards and guidelines specified in national forest and national park management plans, which included the *Interagency Grizzly Bear Guidelines* (IGBC 1986). These standards and guidelines imposed upon public Federal lands have been instrumental in recovery of the grizzly bear in the ~~GYA~~GYE.

The 1993 *Recovery Plan* required the ~~documentation~~ preservation and monitoring of ~~the~~ habitat necessary to support a recovered population. This task led to the development of ~~the~~ measurable habitat criteria for the ~~GYA~~ GYE that were first released for public comment in 1999. These same habitat criteria were included in the draft Conservation Strategy that was released for public comment in 2000. ~~Content analysis~~ Analysis of ~~the~~ public comments ~~for both documents~~, as well as new information~~,~~ was~~ere~~ used to ~~develop~~ establish the habitat standards for a delisted Yellowstone population in the~~is~~ 2007 Conservation Strategy. This **2015** revision of the Conservation Strategy includes some changes to the 2007 document that help clarify habitat standards as they pertain to the 1998 baseline. Clarifying language to the application rules has also been inserted where necessary to provide better direction for application of these standards on a local project level. No substantive changes in the content of habitat standards have been made under this revision. However, some changes in habitat monitoring protocol have been made and are documented in this chapter.

~~Bear management units (BMUs) and subunits were identified to provide a basis for ensuring that habitats for bears were well distributed across the recovery area. The recovery area was divided into18 BMUs and 40 BMU subunits. Due to their smaller size, subunits rather than BMUs proved to be better suited as a base for ensuring good distribution of bear habitat.~~

H~~The h~~abitat standards ~~identified in this document are factors~~apply to Federal lands inside the Primary Conservation Area (PCA) and identify three factors that must~~will~~ be maintained at or improved upon with respect to conditions that existed in ~~identified~~ 1998~~levels.~~: 1) secure habitat, 2) number and capacity of developed sites, and 3) acreage of active commercial livestock grazing allotments. All three of these factors are linked to human activities that affect mortality and displacement of grizzly bears. These three standards apply only to public lands within the PCA, a safe haven located at the core of the ecosystem that accounts for approximately 47% of the Yellowstone grizzly bear's occupied range. The 1998 baseline for habitat standards was selected because studies showed that the Yellowstone grizzly bear population was increasing annually at a rate of 4 to 7 percent between 1983 and 2001 (Boyce *et al*. 2001, Harris *et al*. 2006). Habitat conditions in 1998 were considered representative of this time period since levels of secure habitat and developed sites had remained relatively constant in the 10 years preceding 1998 and beyond (USFS 2004). Hence, conditions in 1998 were believed to contribute to the population growth observed between 1983 and 2001. Habitat standards, as they apply to the 1998 baseline, impose measurable side boards on allowed levels of human activity inside the PCA and establish a clear benchmark against which future improvements and impacts of habitat can be measured. ~~In addition to the habitat standards, several other habitat factors will be monitored and evaluated to determine the overall condition of habitat for bears in the PCA. The habitat standards in this document are subject to revision based on the best available science and will be reviewed and updated as necessary.~~

Bear management units (BMUs) and subunits were delineated in the PCA to provide a basis for ensuring that grizzly bear habitat is well distributed across the recovery area. The PCA was

divided into 18 BMUs, each of which approximate in size the average *lifetime* range of an adult female grizzly bear in the GYE. BMUs were further subdivided into a total of 40 subunits (**Fig 2, chapter 1?**). Subunits, which are comparable in size to the average *annual* home range of an adult female grizzly bear, provided greater landscape resolution and proved to be better suited as a base for analyzing habitat use patterns and ensuring good distribution of bear habitat throughout the recovery zone (USDA 1985). Consequently, habitat conditions pertaining to the three standards are measured and compared against 1998 levels for each of the 40 bear management subunits within the PCA. To date, habitat-based criteria throughout the PCA have been successfully maintained at or surpassed1998 levels. Adherence to these standards ensures that sufficient habitat for the Yellowstone grizzly bear will continue to be available into the foreseeable future. ~~The h~~Habitat standards in this document are subject to revision based on the best available science and will be reviewed and updated as necessary.

In addition to ~~the~~ habitat standards, several other habitat factors will be monitored and evaluated to determine the overall condition of habitat for grizzly bears in the PCA. These monitoring items include productivity of the four major foods: 1) winter-killed ungulates, 2) cutthroat trout, 3) whitebark pine seeds, and 4) alpine moths. ~~=~~Production and availability of these four major foods have a positive effect on reproduction and survival rates of Yellowstone grizzly bears (Mattson *et al*. 2002, Merrill and Mattson 2003).

A~~The a~~gencies responsible for habitat management in the ~~GYA~~ GYE ~~agree~~ have committed to continue ~~to~~ collecting the necessary information needed to evaluate ~~maintenance~~ adherence of these standards and monitor other habitat parameters ~~within~~ throughout the PCA. The overall goal for habitat management inside the PCA is to maintain or improve habitat conditions as of 1998, as measured ~~within each~~per subunit ~~within the PCA~~, while maintaining options for resource management activities at approximately the same level that~~as~~ existed in 1998. ~~-~~ H~~The h~~abitat standards ~~and monitoring requirements~~ in this Conservation Strategy will, with time, be incorporated into national forest, and national park ~~, and BLM~~ management plans.

Outside the PCA, grizzly bears will be allowed to expand into adjacent areas considered biologically suitable and socially acceptable. Whereas lands within the PCA are managed primarily to maintain grizzly bear habitat, lands outside of the PCA boundary are managed with more consideration for human use (Service 1993). The key to successful management of grizzly bears outside the PCA lies in striking a sustainable balance that accommodates the needs of grizzly bears along with competing demands of human use. As such, an important management objective for areas outside the PCA is to maintain existing resource management and recreational uses and to allow agencies to respond to demonstrated problems with appropriate management actions. Such flexible management promotes acceptance and tolerance for grizzly bears. Today, roughly 66 percent of suitable habitat outside the PCA is occupied by grizzly bears (IGBST calculation).

Suitable habitat outside of the PCA is approximately 84 percent federally owned land administered by the six National Forests in the region (79%), National Park Service (3.6%), Bureau of Land Management (1%), and USFWS (0.5%). Federal land management agencies will work cooperatively with state wildlife agencies to meet identified habitat and population goals for grizzly bears in the GYE. The ~~three~~ state grizzly bear management plans for Idaho, Montana, and Wyoming recommend and encourage land management agencies to maintain or improve habitats ~~that are~~ important to grizzly bears and to monitor habitat conditions outside the PCA. ~~Each~~ All 3 state~~s~~ ~~recognizes~~acknowledge the importance of secure habitat, motorized access management, and road density issues ~~related~~as they pertain to grizzly bears ~~-~~and other wildlife. Consequently, secure habitat and total motorized route density is monitored on federal lands outside the PCA to identify potential threats to habitat and prevent them from negatively impacting the long-term viability of the Yellowstone population. ~~This A~~access management issue~~s~~ ~~has~~ have also been recognized in each state's elk management efforts. Land

management agencies will work cooperatively with state wildlife agencies to meet identified population and habitat goals for grizzly bears in the GYE.A Tand the process of implementing these state and federal grizzly bear management goals will be coordinated by the Yellowstone Grizzly Coordinating Committee (YGCC) representing all the respective agencies in the greater Yellowstone area (*see* Chapter 6 Implementation and Evaluation).

Forest and Ppark plan standards and guidelines for other wildlife species will indirectly provide some additional habitat management direction for bears outside the PCA. By approval of this Conservation Strategy, Forest Service regional foresters in regions 1, 2, and 4 agree to add the grizzly bear to their Ssensitive Sspecies lists immediately upon ESA delisting of the species. Forest Service sensitive species direction requires that any project "*must not result in loss of species viability or create significant trends toward federal listing*" (USDA Forest Service Manual (FSM) 2600 2005). Sensitive species direction also requires the Forest Service to "*assist states in achieving their goals for conservation of endemic species*" (USDA FSM 2600). A biological evaluation will be completed for all Forest Service projects potentially affecting the grizzly bear. These evaluations will be completed and will be used to determine if whether projects willdo or will do not meet the habitat standards in this Conservation Strategy. If the biological evaluation shows demonstrates that the project will does not meet the habitat standards in this Conservation Strategy, the project will be modified as necessary to ensure that it will meetcomplete adherence with these standards.

Conservation Strategy Habitat Standards Insideinside the PCA

The most important issues to control on the landscape are the levels of human activities. Human activities resulting in mortality and displacement were the main reasons the grizzly bear was listed as threatened. Human activity is the primary factor negatively impacting availability and security of grizzly bear habitat in the GYE. This relationship between bears and habitat is extremely complex and difficult to quantify. However, unfettered human activity is known to result in the displacement and mortality of grizzly bears and was a significant contributing factor leading to listing the grizzly bear as a threatened species in 1975. Changes in human activities may have allowed bears to achieve recovered status. The key issues related to human activity are food storage, livestock allotments, motorized access, and site developments, as these were activities that either resulted in mortality or habitat displacement. Restrictions in human activities due to management practices implemented by IGBC in the mid-1980s correlate strongly with the steady increase in the Yellowstone grizzly bear population observed between 1983 and 2001 (Mattson and Knight 1991a). Habitat standards serve as sideboards on levels of human activity allowed on Federal lands inside the PCA, thereby reducing opportunities for grizzly-human conflicts and displacement of grizzly bears from valuable habitat.

Habitat standards identified in this document address 3 key factors related to human activity (motorized access, site development, and commercial livestock grazing) and specifically call for no net loss in secure habitat inside the PCA from what was known to exist in 1998 (Appendix F). Secure habitat is especially important to the survival and reproductive success of grizzly bears, especially adult females. It is the goal of habitat management agencies throughout the ecosystem to maintain or improve habitat conditions as of 1998 as measured per bear management subunit, while maintaining options for resource management activities comparable to levels that existed in 1998. The Yellowstone grizzly bear population achieved all demographic recovery criteria by 1998 with this management regime in place. These levels of secure habitat have been maintained and will continue to be maintained and improved where possible, long into the future. Potential impacts to grizzly bears and their habitat will be evaluated and mitigated using the criteria and standards in this Conservation Strategy in coordination with the state wildlife agencies.

~~It is the goal of the habitat management agencies to maintain or improve habitat conditions as of 1998, as measured within each subunit within the PCA, while maintaining options for resource management activities at approximately the same level as existed in 1998 (Appendix F). The grizzly population achieved all demographic recovery goals by 1998 with this management regime in place. The habitat standards identified here are similar to those identified in the draft Strategy, with some modifications in response to public comments and to increase the effectiveness of application. These standards apply only inside the PCA. Changes to these standards can be made by the YGCC, following appropriate public processes of the affected land management agencies, if monitoring indicates a need or better scientific information becomes available.~~

~~Existing forest and park plan standards and guidelines will provide grizzly bear habitat management direction outside the PCA. Land management agencies will cooperate with the appropriate state wildlife agency in development of additional future, area-specific grizzly bear management goals. All projects on federal public lands outside the PCA will be evaluated through the NEPA (National Environmental Policy Act) process. Potential impacts to grizzly bears and their habitat will be evaluated and mitigated using the criteria and standards in this Conservation Strategy in coordination with the state wildlife agencies. Appendix G presents an analysis of the potential for motorized access management changes both inside and outside the PCA.~~

Application rules -specific to each habitat standard provide additional direction on how these standards are to be implemented at a Federal project level~~under each standard are the specific ways that each habitat standard will be applied to implement this Conservation Strategy~~. The following ~~specific~~ habitat standards and application rules apply to~~on~~ all F~~f~~ederal lands inside the PCA~~, and will be monitored and maintained on subunits in the PCA~~.

Secure Habitat Standard

~~Secure Habitat Standard~~

Inside the PCA, ~~T~~the percentage of secure habitat within each bear management subunit must be maintained at or above levels that existed in 1998 (Appendix F). Authorized Federal projects that result in temporary or permanent changes to secure habitat must follow the Application Rules identified below. Secure habitat is defined as those areas ≥ 10 acres in size and more than 500 meters away from a motorized access route (open or gated) or recurring helicopter line during the non-denning period. Lakes larger than 1 square mile in spatial extent are excluded from secure habitat calculations. Gated routes that prohibit motorized access to the public but which are open to administrative personnel are counted against this standard and thus detract from secure grizzly bear habitat. Decommissioned routes which are closed to the public and administrative staff do not count against this standard. ~~Temporary and permanent changes are allowed under specific conditions identified below. Appendix G provides additional information on definitions and rules for implementation of this standard. Figure 10 provides a summary of the secure area management rules. The rule set in Figure 10 will be used in management and evaluation of projects and habitat management actions as appropriate under this Conservation Strategy.~~

Application Rules for Permanent Changes ~~in~~ to Secure Habitat

~~**Permanent changes to secure habitat.** A project may permanently change secure habitat provided that replacement secure habitat of equivalent habitat quality (as measured by the Cumulative Effects Model or equivalent technology) is provided in the same grizzly subunit. The replacement habitat must either be in place before project initiation or be provided concurrently with project development as an integral part of the project plan.~~

Permanent changes to secure habitat associated with an authorized Federal project involving construction of a new motorized route (i.e., road or trail), relocation of an existing motorized route, or opening of a previously decommissioned route are allowed if and only if the following conditions are met:

- Any loss in secure habitat below 1998 levels must be replaced by restoring secure habitat of equivalent quality and quantity (e.g., through road decommissioning) in the same bear management subunit. Quality of replacement habitat must be assessed based on our best collective scientific understanding of grizzly bear habitat ecology, and the rationale for mitigation fully documented.

- Replacement habitat must be either in place before project implementation or provided concurrent with project development as an integral part of the project plan.

- Replacement habitat must remain in place for a minimum of 10 years before it can subsequently be replaced and mitigated for per application rules. (*This duration is based upon the generation time for a female grizzly bear, or the time it takes to replace herself.*)

- Reductions in secure habitat below 1998 levels due to activities based on statutory rights such as the 1872 General Mining Law or the Alaska National Interest Lands Conservation Act (ANLCA) must be mitigated for within the affected subunit or in the nearest possible subunit. In those rare cases where mitigation occurs in a subunit other than the affected one, subsequent changes to secure habitat in both subunits become permanent changes to the 1998 baseline.

- For those subunits identified as in need of improvement above 1998 levels (*Gallatin #3, Madison #2,* and *Henry's Lake #2*), maintain secure habitat at or above levels of the fully implemented 2006 Gallatin National Forest Travel Management Plan (Appendix F).

- Motorized routes on private land are not counted against this standard. However, for motorized routes (roads or trails) acquired through land exchanges or acquisition, and which are desirable to maintain for public use, mitigation is strongly encouraged but not required.

Application Rules for Temporary ~~c~~Changes to ~~s~~Secure ~~h~~Habitat~~.~~

Temporary reductions in secure habitat associated with authorized Federal projects are allowed ~~can occur to allow projects,~~ if analysis of secure habitat is conducted to ensure compliance with the habitat standard and all ~~of the following~~ conditions specified in the Application Rules for temporary changes are met. A Federal project refers to any activity requiring construction of a new road, reconstruction of an existing road, opening of a permanently restricted road, or recurring helicopter flights at low elevations (< 500 m above ground level). Application rules for temporary changes to secure habitat are as follows:~~:~~

- Only one project affecting secure habitat may be~~is~~ active ~~per grizzly~~within a given bear management subunit at any one time.

- Total acreage of ~~active projects~~secure habitat affected within a given BMU ~~will~~ must not exceed 1~~%~~ percent of the acreage ~~in~~of the largest subunit within that BMU ~~(see Appendix C)~~. The acreage of a project that counts against the 1% limit is the acreage ~~associated with~~within the 500-meter buffer around any motorized ~~access~~ project route that extends into existing secure habitat.

- All temporary project roads that affect secure habitat will be in place collectively for no more than 3 consecutive years.

- Secure habitat ~~is~~ must be restored within one year ~~after completion of the~~upon project completion.

Activities Allowed in Secure Habitat

The following activities are allowed in secure habitat without violating the standard:

- **Activities that do not require re-opening of a decommissioned route; construction or reconstruction of motorized routes; or recurring low level helicopter flight lines.** Non-wheeled, over the snow use (i.e., snow machines) is allowed until research identifies a concern. Conflicts associated with winter-use activities that develop either during denning or after den emergence in the spring, can be addressed with local area restrictions.

- Helicopter use for short term (no more than 2 days in the duration of a project), or at higher elevation (> 500 meters above ground level with no landing). Aircraft used in emergency firefighting are allowed.

- Access to power line or utility corridors for occasional maintenance service that does not require new route construction.

- Project activities (e.g., temporary road construction / maintenance / use of recurring low level helicopter flights) that occur during the grizzly bear denning season between December 1 and February 28.

Comment [LL1]: This is taken from the 2007 CS but seems **extremely** nebulous. This could literally be interpreted to allow OHV use since it doesn't involve new routes or changes to existing routes. Should we instead say that all motorized vehicular traffic is limited to existing system motorized routes?

Figure 10. The rule set for secure habitat management in the Yellowstone Primary Conservation Area.

Criteria	Definition
Software, Database, and Calculation Parameters	ARC INFO using the moving window GIS technique (Mace et al. 1996), 30-meter pixel size, square mile window size and density measured as miles/square mile. Motorized access features from the CEM GIS database
Motorized Access Routes in Database	All routes having motorized use or the potential for motorized use (restricted roads) including motorized trails, highways, and forest roads. Private roads and state and county highways counted.
Season Definitions	Season 1 – 1 March to 15 July. Season 2 – 16 July to 30 November. There are no access standards in the winter season (1 December to 28 February).
Habitat Considerations	Habitat quality not part of the standards but 1) Replacement secure habitat requires equal or greater habitat value 2) Road closures should consider seasonal habitat needs.
Project	An activity requiring construction of new roads, reconstructing or opening a restricted road or recurring helicopter flights at low elevations.
Secure Habitat	More than 500 meters from an open or gated motorized access route or reoccurring helicopter flight line. Must be greater than or equal to 10 acres in size. Replacement secure habitat created to mitigate for loss of existing secure habitat must be of equal or greater habitat value and remain in place for a minimum of 10 years. Large lakes not included in calculations.
Activities Allowed in Secure Habitat	Activities that do not require road construction, reconstruction, opening a restricted road, or reoccurring helicopter flights. Over the snow use allowed until further research identifies a concern.
Inclusions in Secure Habitat	Roads restricted with permanent barriers (not gates), decommissioned or obliterated roads, and/or non-motorized trails.
Temporary Reduction in Secure Habitat	One project per subunit is permitted that may temporarily reduce secure habitat. Total acreage of active projects in the BMU will not exceed 1% of the acreage in the largest subunit within the BMU. The acreage that counts against the 1% is the 500-meter buffer around open motorized access routes extending into secure habitat. Secure habitat is restored within one year after completion of the project.
Permanent Changes to Secure Habitat	A project may permanently change secure habitat provided that replacement secure habitat of equivalent habitat quality (as measured by CEM or equivalent technology) is provided in the same grizzly subunit. The replacement habitat either must be in place before project initiation or be provided as an integral part of the project plan.

Comment [LL2]: I vote we delete this table. It is incomplete and redundant with the body of the text.

~~Subunits with Planned Temporary Secure Habitat Reduction~~	~~Secure habitat for subunits Gallatin #3 and Hilgard #1 will temporarily decline below 1998 values due to the Gallatin Range Consolidation Act. Upon completion of the land exchange and associated timber sales, secure habitat in these subunits will be improved from the 1998 baseline.~~
~~Subunits with Potential for Improvement~~	~~Access values for Henrys Lake #2, Gallatin #3, and Madison # 2 have the potential for improvement. The quantity and timing of the improvement will be determined by the Gallatin National Forest Travel Management Plan.~~
~~Proactive Improvement in Secure Habitat~~	~~A proactive increase in secure habitat may be used at a future date to mitigate for impacts of proposed projects of that administrative unit within that subunit.~~
~~Exceptions for Caribou-Targhee NF~~	~~When fully adopted and implemented the Standards and Guidelines in the 1997 revised Targhee Forest Plan met the intent of maintaining secure habitat levels.~~

Comment [LL3]: Banking is implicit to the habitat standard since any gains in secure habitat above 1998 levels can be "rolled back" to 1998 levels at any time (as long as NEPA approves). I see no need to explicitly refer to banking since it may encourage the notion and be used as a lame justification in a BA for retracting gains in secure habitat. It does not occur in the application rules or body of text in the CS. I opt to remove it altogether. Your thoughts?

Comment [LL4]: It seems that this statement is not actually an exception, but instead contradicts the standard itself. It effectively renders the standard no more effective than the standard requirement of a BA or NEPA analysis. If we remove it to be on par with the GNF Cleanup Amendment, does it constitute a substantive change?

Developed Site Standard

On Federal lands inside the PCA ~~The~~ the number and capacity of developed sites ~~within the PCA will~~must be maintained at or below the 1998 level (Appendix F).~~with the following exceptions: any proposed increase, expansion, or change of use of developed sites from the 1998 baseline in the PCA (Appendix F) will be analyzed, and potential detrimental and positive impacts documented through biological evaluation or assessment by the action agency.~~

~~**A developed site includes but is not limited to sites on public land developed or improved for human use or resource development such**~~ **Developed sites** refer to those sites or facilities on public land with features intended to accommodate public use or recreation. Such sites typically are identified or advertised via visitor maps or information displays as identifiable destination sites promoted by the agency**.** Examples of developed sites include, but are not limited to: ~~as~~ campgrounds, picnic areas, trailheads, boat launches,~~ lodges,~~ rental cabins, summer homes, ~~administrative sites~~lodges, service stations, ~~summer homes,~~ restaurants, visitor centers,~~,~~ and administrative sites. For the purposes of this Conservation Strategy, ~~and permitted resource development sites such as~~ oil and gas exploratory wells, production wells, and plans of operation for mining activities will also be tracked as developed sites.~~,~~ ~~work camps~~**(Dan, do we include work camps???)**~~, etc~~. **Administrative sites** are those sites or facilities constructed for use primarily by government employees to facilitate the administration and management of public lands. Administrative sites are counted toward developed sites and examples include headquarters, ranger stations, patrol cabins, park entrances, federal employee housing and other facilities supporting government operations. In contrast to developed or administrative sites, **Dispersed sites** are those not associated with a developed site such as a front-country campground. These sites are typically characterized as having no permanent agency-constructed features, have minimal to no site modifications, have informal spacing and possibly include primitive road access. Dispersed sites are not counted toward developed sites.

Application Rules for Developed Sites

Mitigation of detrimental impacts due to construction or expansion of developed sites ~~will~~ must occur within the affected subunit and ~~will~~ be of equivalent ~~to the~~ type and comparable in extent of impact. Mitigation measures ~~will~~ must be in place before ~~the~~ initiation of the project or included as an integral part of ~~the~~ completion of the project.

- A New~~New~~ site~~s will~~ requires mitigation via removal of another site of equivalent type within that subunit to offset any increase~~s~~ in capacity for human ~~capacity~~use, habitat loss, and increased access to surrounding habitats.
-

- **E~~Consolidation and/or e~~limination of dispersed camping sites will be considered adequate mitigation for construction of a minor day-use developed site or an increase~~d~~s capacity of use of an existing site ~~in human capacity at developed campgrounds~~ if the ~~new~~ increased ~~site~~ capacity is ~~equivalent~~ comparable to and offset by the decrease in use resulting from elimination of the dispersed sites ~~camping eliminated~~. Such mitigation can be used only if it can be demonstrated that the dispersed sites have had consistent perennial use and can be closed in such a way that future use of the site is definitively curtailed.**
-
- ~~**New sites will require mitigation within that subunit to offset any increases in human capacity, habitat loss, and increased access to surrounding habitats.**~~
  ~~**Administrative site expansions are exempt from human capacity mitigation expansion if such developments are necessary for enhancement of management of public lands and other viable alternatives are not available. Temporary construction work camps for highway construction or other major maintenance projects are exempt from human capacity mitigation if other viable alternatives are not available. Food storage facilities and management must be in place to ensure food storage compliance, i.e., regulations established and enforced, camp monitors, etc. All other factors resulting in potential detrimental impacts to grizzly bears will be mitigated as identified for other developed sites.**~~
- ~~**Land managers may improve the condition of developed sites for bears or reduce the number of sites. The improvements may then be used at a future date to mitigate equivalent impacts of proposed site development increase, expansion, or change of use for that administrative unit within that subunit.**~~

- Expansion of administrative sites are exempt from human capacity mitigation if such developments are necessary for enhancing management of public lands and other viable alternatives are not available. Temporary construction of work camps for highway construction or other major camp maintenance projects are exempt from human capacity mitigation if other viable alternatives are not available. Food storage structures and management must be in place and all other factors resulting in potential detrimental impacts to grizzly bears will be mitigated as identified for other developed sites.

- Land managers may improve the condition of developed sites for bears or reduce the number of sites. The improvements may then be used at a future date to mitigate equivalent impacts of proposed site development increase, expansion, or change of use for that administrative unit within that subunit.

Comment [LL5]: I would delete this. This rule is implicit in the standard and does not need to be explicitly encouraged.

- **Modifications to existing developed sites that reduce resource damage, detrimental environmental impacts, and/or the potential for grizzly bear conflicts are allowed (e.g., installing a vaulted toilet to avoid damage to water resources or installing bear-resistant food storage structures to reduce conflict).**

- To the fullest extent of its regulatory authority, the Forest Service will minimize effects on grizzly bear habitat from activities based in statutory rights~~, such as the~~(e.g., 1872 General Mining Law, Americans with Disability Act, ANILCA, etc.). ~~-~~ In those ~~expected~~ few cases

where the mitigated effects ~~will~~ result in an exceedance of the 1998 baseline that cannot be compensated for within that subunit, compensation~~, in the PCA,~~ to levels at or below the 1998 baseline will be accomplished in ~~adjacent subunits when possible, or~~ the ~~closest~~ nearest subunit ~~if this is not possible~~, or in areas outside the PCA adjacent to the impacted subunit ~~impacted~~if the latter is not possible. Mitigation for Mining Law site impacts will follow standard developed site mitigation to offset any increases in human capacity, habitat loss, and increased access to surrounding habitats. Access impacts relating to Mining Law activities will be mitigated per the applications rules for changes in secure habitat.

- Existing oil and gas and other mineral leases will be honored, and Proposed Applications for Permit to Drill (APDs) and operating plans within those leases will strive to meet the developed site standard. New leases, APDs and operating plans must meet the developed site standard and application rules.

- ~~—~~

- **Developments on private land are not counted against this standard; however, for developed sites acquired through land exchanges or acquisitions, and which are desirable to maintain, mitigation is strongly encouraged but not required. The rationale is to avoid restrictions that encumber acquisition and transformation of private land to public ownership. Once a parcel is transferred to public ownership any further development would be subject to the developed site standard. Acquired sites that pre-date 1998 may be amended to the 1998 baseline.~~**~~.~~**

Livestock Allotment Standard

Inside the PCA, there will be no ~~new~~ net increase in acreage of active commercial livestock grazing allotments ~~will be created and there will be no increases~~or in permitted sheep Animal Months (AMs) on Federal land from ~~the identified~~that which existed in 1998 ~~baseline~~ (Appendix F). Existing sheep allotments will be monitored, evaluated, and phased out as the opportunity arises with willing permittees.

Application Rules for Livestock Allotments

Allotments include both vacant and active commercial cattle/horse/sheep grazing allotments. Vacant allotments are those without an active permit, but may be used periodically by other permittees at the discretion of the land management agency to resolve resource issues or other concerns. ~~Reissuance of permits for vacant cattle allotments may result in an increase in the number of permitted cattle, but the number of allotments would remain the same as the 1998 baseline. Combining or dividing existing allotments would be allowed as long as acreage in allotments does not increase. Any such use of vacant cattle allotments resulting in an increase in permitted cattle numbers will be allowed only after an analysis by the action agency to evaluate impacts on grizzly bears. Where chronic conflicts occur on cattle allotments inside the PCA, and an opportunity exists with a willing permittee, one alternative for resolving the conflict may be to phase out cattle grazing or to move the cattle to a currently vacant allotment where there is less likelihood of conflict.~~ Changes in livestock allotments inside the PCA may occur if the following conditions are met:

- Reissuance of permits for vacant cattle allotments may result in an increase in the number of permitted cattle, but the number of active allotments inside the PCA must not exceed the 1998 baseline.

- Combining or dividing existing allotments is allowed as long as the net acreage and number of active allotments does not exceed 1998 levels.

- Where chronic conflicts occur on cattle allotments inside the PCA, and an opportunity exists with a willing permittee, alternatives for resolving conflicts may include authorization of a non-use permit, livestock can be moved to a vacant allotment where there is less likelihood of conflict, or cattle grazing can be phased out on that allotment.

Habitat Monitoringg

The primary objective of hHabitat monitoring will focusprotocol is to on evaluateion of adherence to the habitat standards identified in this Strategy. Monitoring of otherHowever, a dditional important habitat parameters pertaining to four major food types of the grizzly bear diet ers will also be monitored to provide additional information to assist in evaluatingevaluate fully the status of grizzly bear habitat and its ability to the status of the habitat for supporting a recovered grizzly bear population population and the effectiveness of habitat standards. Changes to habitat monitoring protocol especially pertaining to open motorized route density (OMARD) and evaluation of habitat effectiveness are documented in Appendix F. Habitat standards and other habitat parameters will be monitored as follows.

Monitoring Secure Habitat and Motorized Access Route Density

Background

Motorized access is one of the most influential factors negatively affecting grizzly bear use of habitats. Open rRoad density has been utilized historically as a surrogate measure of human impacts to grizzly bear habitatpresence on the landscape and consequently serves as the basis for identifying non-secure habitat. Restricted roads and motorized trails are important factors to be considered when in evaluating habitat availability and potential for and mortality risk to grizzly bears (McLellan and Shackleton 1988, Mattson and Knight 1991b, Mace *et al*. 1996, Schwartz *et al*. 2010, Proctor *et al*. 2012). Grizzly bear researchers and Land managers throughout the GYE generally agreerecognize that availability of secure habitat, defined as those (areas more than 500 meters (550 yards) from a motorized access route) during the non-denning period, are especially important is crucial to the survival and reproductive success of grizzly bears, especially adult females grizzly bears.

Motorized access parameters were measured and calculated using procedures identified in the 1998 IGBC *Taskforce Report on Grizzly Bear/Motorized Access Management*. For the Yellowstone PCA, the Motorized access parameters including percent secure habitat, OMARD and TMARD are measured and monitored against levels that existed in 1998. percent of secure habitat, open motorized access route density (OMARD) greater than one mile/square mile, and total motorized access route density (TMARD) greater than two miles/square mile per subunit in 1998 is presented in Appendix F. No change in these parameters has occurred since 1998, as managers agreed to maintain these values pending the finalization of the Strategy. No net decrease in secure habitat with respect to 1998 levels has occurred on federal lands inside the PCA in any of the 40 bear management subunits since 1998. Instead, secure habitat inside the PCA has increased by 1.4 percent since 1998. This gain is approximate in size to the area of Yellowstone Lake.

***Subunits with potential for improvement*:** Several subunits, Henrys Lake #2, Gallatin #3, and Madison #2 have been identified as needing improvement in access parameters. The area with potential for improvement in these subunits is within the boundaries of the Gallatin National

~~Forest. However, a large percentage of the OMARD and TMARD values and secure habitat loss in these subunits is due to motorized access features on private land (Appendix G). The Forest is working on several land exchange efforts with private parties in these subunits. These land exchanges would allow management of the roads on these private parcels and increase the secure habitat in these subunits.~~

~~The Gallatin Range Consolidation Act will result in trading timber for land in the Gallatin #3 and Hilgard #1 subunits. The private land involved will become public land under the jurisdiction of the Gallatin National Forest. In order to complete the exchange, access values in these two subunits will temporarily decline below 1998 values. However, upon completion of this sale and land exchange, secure habitat and motorized access route density in these subunits will be improved from the 1998 baseline (Appendix F).~~

~~All the above-mentioned subunits on the Gallatin National Forest have the potential for improvement in the long term. The timing and amount of improvement will be determined through the Gallatin National Forest travel management planning process. This is a new effort since the release of the 2000 draft Conservation Strategy and may take several years to complete. The Travel Plan will amend the Forest Plan and set a new baseline for access values in these subunits. This travel plan revision will reduce the motorized access route density in these subunits and increase secure habitat.~~

Three subunits, Gallatin #3, Henrys Lake #2, and Madison #2 have been targeted as needing improvement in secure habitat and reduction in motorized route density with respect to 1998 levels. The specific areas in need of improvement identified in these three subunits fall within the Gallatin National Forest boundary and the quantity and timing of improvements was to be determined by the Gallatin National Forest Travel Management Plan (TMP). A large factor contributing to elevated OMARD and TMARD values and impoverished secure habitat values in these subunits were due to motorized access roads occurring on private land enclosures. Since 1998, the Gallatin National Forest conducted several land exchanges under the *Gallatin Range Consolidation and Protection Act* with private parties in the Gallatin #3 subunit and in other areas inside and outside the PCA. These land exchanges resulted in the acquisition of formerly private parcels in and adjacent to the Hyalite-Porcupine-Buffalo Horn Wilderness Study Area (Gallatin #3) which are now administered as part of the Gallatin National Forest. Consequently the Forest Service also inherited some private roads and many old timber harvest roads that caused a temporary decrease in secure habitat (mostly outside the PCA, but some inside). With implementation of the 2006 Gallatin TMP, many roads inherited from these exchanges have been permanently decommissioned. Additional access routes not designated for motorized use in the TMP have also been closed, with a high priority given to road decommissions in the three subunits identified as in need of improvement. With full implementation of the Gallatin Travel Plan very near completion, measurable increases in secure habitat and reductions in motorized route density with respect to 1998 baseline levels have been realized in the three targeted subunits. The Gallatin National Forest has proposed that increases in secure habitat due to full TMP implementation constitute new baseline levels for these 3 subunits (Appendix F). If approved, the elevated secure levels for these 3 subunits will serve as new measures against which future changes will be made.

~~Several~~ One other subunit~~s~~ ~~were~~ that was listed as needing improvement in the 2000 draft, Henrys Lake #1, ~~Conservation Strategy (Plateau #1, Plateau #2, and Henrys Lake #1). The draft stated that upon full implementation of the access management changes in the revised Targhee Forest Plan, those subunits will be acceptable for OMARD, TMARD, and secure habitat. Those access management changes have been fully implemented and those subunits are no longer identified as having potential for improvement. This is due to road decommissioning that was completed following the signing of the 1997 revised Targhee Forest Plan and the 1999 FEIS for the Targhee Travel Plan (Open Road and Open Motorized Train~~

~~Analysis (motorized road and trail travel plan)). The 1998 baseline (Appendix F) for these subunits was modified to reflect the full implementation of the 1997 Targhee Forest Plan. Henrys Lake subunit #1~~ still has high levels of motorized access density and a low secure habitat level. However, much of the effect is due to motorized access routes on private lands. ~~(Appendix F).~~ Little opportunity remains for improvement on public lands inside this subunit due to the legal requirements to provide access to Sawtell Peak, state lands, mining claims, county, state, and federal rights-of-way, private lands, and summer homes.

Monitoring Protocol for Secure Habitat and Motorized Route Density

Motorized access parameters including 1) percent s~~S~~ecure habitat, 2) open motorized access route density (OMARD) greater than one mile~~/~~ per square mile, and 3) total motorized access route density (TMARD) greater than two miles~~/~~ per square mile ~~will be monitored utilizing Yellowstone Grizzly Bear Cumulative Effects Model (CEM) Geographic Information System (GIS) databases,~~ are measured per bear management subunit using the Motorized Access Model described in Appendix F. Inside the PCA, these three parameters~~and~~ are calculated per bear management subunit and compared against 1998 levels on an annual basis. These measurements are reported annually ~~annually within each subunit~~ in the IGBST Annual Report, *Yellowstone Grizzly Bear Investigations*~~.~~ and are posted online for public access at the IGBST website.~~Protocols are established for an annual update of motorized access routes and other CEM GIS databases for the PCA. To provide evaluation of motorized access proposals relative to the 1998 baseline, automated GIS programs are available on each administrative unit (Appendix G).~~

Monitoring Developed Sites

Background

Levels of human ~~D~~development~~ed sites~~ on the landscape ~~are known to displace~~have been shown to be an important predictor of grizzly bear survival in the GYE ~~grizzly bears and this has some direct effect on habitat effectiveness~~(Schwartz *et al.* 2010). ~~The primary~~A significant concern related to developed sites is grizzly bear mortality ~~connected to~~associated with food conditioning and ~~bear~~ habituation. Past attempts at modeling grizzly bear mortality in the ~~GYA~~GYE have focused on numbers of people spending the night as a primary factor related to grizzly bear mortality. Increased numbers of people using an area and potentially interacting with grizzly bears increases opportunities for human–grizzly conflict and is ~~the~~ an important issue in evaluating ~~the~~ impacts from developed sites on grizzly bear survival. Contributing factors to the displacement and mortality of grizzly bears ~~Impacts to bears as a result of~~due to new or expanding developed sites ~~could result from~~include increase~~d s in~~ spatial and temporal extent of human ~~capacity at the site~~presence, temporary or permanent loss of grizzly bear habitat~~, increased length of time of use~~, limited access to important food sources ~~increased access to surrounding areas or backcountry trails~~, and unsecured bear attractants.

~~The effects of the current number of~~ Maintaining the number and human-use capacity of developed sites at 1998 levels ~~are~~ is considered ~~the level that~~ a sustainable threshold that can be accommodated on public lands within the PCA because ~~the 1998 level of site development is allowing~~1998 levels allowed ~~a stable to increasing~~an increasing to stable grizzly bear population ~~(Appendix F)~~from 1983 to 2001. C~~All c~~hanges in human developed sites ~~since 1998 have been~~are evaluated against the 1998 baseline (Appendix F) and have been determined acceptable under the standard for developed sites identified in this Strategy.

Monitoring Protocol for Developed Sites

~~Monitoring numbers of developed sites can indirectly assess displacement from habitat, habituation to human activities, and increased grizzly mortality risk.~~ Changes in the number and human-use capacity of developed sites on public lands inside the PCA will be compiled annually per bear management subunit and ~~compared to~~tracked with respect to the 1998 baseline (Appendix F). Changes in d~~D~~eveloped sites as measured against the baseline are currently inventoried in existing GIS databases and ~~are an input item to the CEM~~are reported annually in the IGBST Annual Report *Yellowstone Grizzly Bear Investigations*. ~~Appendix F displays the number of developed sites in the PCA within seven categories and will serve as the 1998 baseline.~~

Monitoring Livestock Grazing

Background

Interaction between livestock and grizzly bears has historically led to the relocation or removal of grizzly bears in the GYE (Knight and Judd 1983; Johnson and Griffel 1982; Anderson *et al* 2002; Gunther *et al* 2004). Grizzly bears tend to kill cattle and sheep regardless of the abundance of natural bear foods. Most grizzly bear - livestock conflicts tend to occur outside the PCA, and as grizzly bears continue to expand farther outside of the recovery zone, the number of conflicts will most likely continue to pose a challenge to grizzly bear managers (Gunther *et al* 2004). This is particularly true on domestic sheep allotments. ~~While there have been recent increases in bear depredations on cattle in the Greater Yellowstone Area, the number of allotments and distribution of cattle inside the PCA in 1998 did not preclude achieving the demographic recovery criteria. In the case of sheep allotments, conflicts are much more prevalent and more difficult to resolve without eventually phasing out sheep grazing in the PCA.~~ Financial incentives with non-governmental organizations (NGOs) have been successful in retiring sheep grazing allotments on public land when willing participants were available (Gunther *et al*. 2004). These types of opportunistic partnerships between federal agencies, NGOs, and willing permittees are recommended as one possible method for resolving chronic conflicts on grazing allotments within prime grizzly bear habitat.

Inside the PCA there were There were 73 cattle and 15 sheep allotments inside the PCA as of 1998. A total of 17,279 sheep AMs were permitted inside the PCA in 1998 (Appendix F).

Two sheep allotments on the Caribou-Targhee National Forest within the PCA have been phased out since the establishment of the 1998 baseline, resulting in a decrease of 7,889 sheep AMs in the PCA.

Monitoring Protocol for Commercial Livestock Grazing

To ensure no net increase from the 1998 baseline, numbers and acreage of commercial livestock grazing allotments and numbers of sheep AMs on Federal land within the PCA will be monitored and reported to the IGBST annually by the permitting agencies. The number of allotments will be reported to provide useful information on the distribution of grazing inside the PCA.

Major Foods

Background

In addition to the 3 objective and measurable habitat criteria listed above, additional food indices will be monitored annually and used to assess any impacts of habitat changes on the Yellowstone grizzly bear population. Four specific food items have been identified as major components of the ~~GYA~~GYE grizzly bear diet (Mattson *et al.* 1991). These are seeds of the whitebark pine, army cutworm moths, ungulates, and spawning cutthroat trout. These food sources may exert a positive influence on grizzly bear fecundity and survival and are some of the highest sources of digestible energy available to grizzly bears in the Yellowstone area (Mealey 1975, Servheen *et al.* 1986, Pritchard and Robbins 1990, Craighead *et al.* 1995). Each of these food sources is limited in distribution and subject to wide annual fluctuations in availability. During years when these food sources are abundant, there are very few grizzly bear/human conflicts in the ~~GYA~~GYE (Gunther *et al.* 1997). In contrast, during years when there are shortages of one or more of these foods, grizzly bear/human conflicts are more frequent and there are generally higher numbers of known and probable human-caused grizzly bear ~~known and probable~~ mortalities (Mattson ~~et al.~~*et al.* 1992*a*, Mattson ~~et al.~~*et al.* 1992*b*, Gunther ~~et al.~~*et al.* 1997).

These foods are very important to grizzly bears in the ~~GYA~~GYE. Introduced organisms, habitat loss, and other human activities have the potential to negatively impact ~~negatively~~ the abundance and distribution of these foods. Because of natural annual changes in abundance and distribution of these four major foods, threshold values of abundance for each food type have not been established. Whitebark pine, ungulates, cutthroat trout, and army cutworm moths are currently monitored either directly or indirectly on an annual basis. With the distribution and range of bears expanding in the GYE, additional food resources will become available.

~~By expanding the distribution and range of bears in the GYA, additional food resources will become available.~~

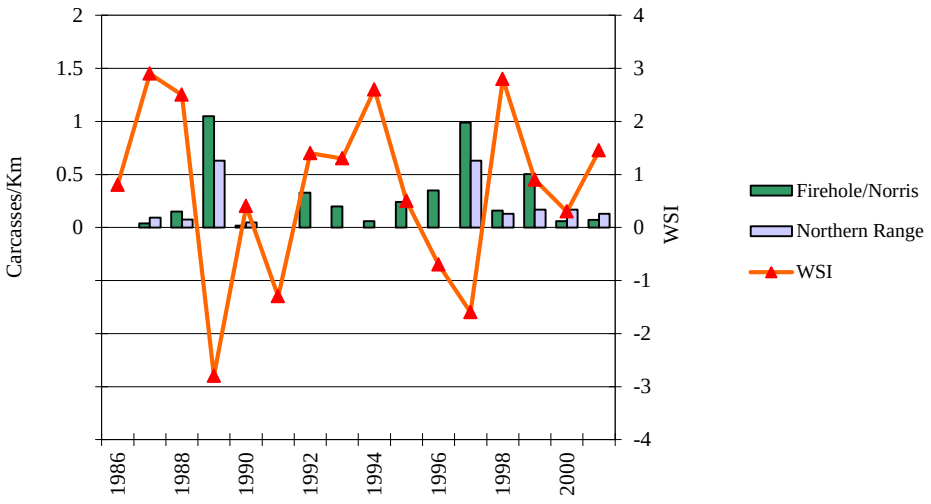
Monitoring Protocol of Major Foods

To monitor these major foods and their importance to grizzly bears, the IGBST will survey and report on each food annually, as per ~~the~~ detailed food monitoring protocols in Appendix E. There are no threshold values for the four food indices, however, f~~F~~ood abundance data will be compared with information on numbers of grizzly bear/human conflicts, grizzly bear management actions, human-caused known and probable grizzly bear mortalities, and changes in the distribution of bears. This analysis will be completed by the IGBST, including interpretations of influences of food availability on population standards and grizzly bear/human conflict rates. Results will be presented in the annual reports prepared by the IGBST. If declines in certain foods occur and, using the best available scientific data and techniques, the IGBST concludes these are related to significant increases in ~~bear~~ known and probable bear mortalities and that such increases could threaten the grizzly population, the IGBST shall recommend a petition for relisting (*see* Chapter 6, Implementation and Evaluation, for details on this process). Significant declines in important foods could also result in reductions in cub production. Since both human-caused mortality and numbers of females with cubs are measurable criteria monitored annually for the population, any significant decline in important foods would also be reflected in changes in these measurable population standards.

Monitoring these important foods also provides managers with some ability to predict annual seasonal bear habitat use, and estimate, prepare for, and avoid grizzly bear/human conflicts due to a shortage of one or more foods.

Existing monitoring programs will be continued under this Conservation Strategy; however, monitoring programs may be changed to incorporate new technological advances in monitoring techniques or new knowledge of bear habitat use in the Greater Yellowstone Area. Existing monitoring programs may be expanded beyond the PCA to areas currently being used by bears or areas predicted for future use by bears.

Winter-killed Ungulates



Background

The ~~GYA~~GYE is unique among areas in North America inhabited by grizzly bears in that ungulates are a major food source, as indicated by bear scats (Mattson 1997), feed site analysis (Mattson 1997), and bear hair isotope analysis (Hildebrand ~~et al.~~*et al.* 1999). On average, approximately 79% of the diet of adult male and 45% of the diet of adult female grizzly bears in the ~~GYA~~GYE is meat (Hildebrand ~~et al.~~*et al.* 1999). In contrast, in Glacier National Park, over 95% of the diets of both adult male and female grizzly bears is vegetation (Hildebrand ~~et al.~~*et al.* 1999). Ungulates rank as the second highest source of net digestible energy available to grizzly bears in the ~~GYA~~GYE (Mealey 1975, Pritchard and Robbins 1990, Craighead ~~et al.~~*et al.* 1995). Ungulates are also important to bears because they provide a high quality food source during early spring before most plant foods become available. Grizzly bears with home ranges in areas with few plant foods depend extensively on ungulate meat (Harting 1985). Grizzly bears feed on ungulates primarily as winter-killed carrion from March through May (Mattson and Knight 1992, Green ~~et al.~~*et al.* 1997). Carcass availability fluctuates with winter severity (Figure 11).

Monitoring Protocol

There are currently 30 spring ungulate carcass survey routes in Yellowstone National Park (YNP) and 11 on the Gallatin National Forest (Haroldson ~~et al.~~*et al.* 1998). Under this Conservation Strategy, monitoring of winter-killed ungulate carcass availability along these survey routes will continue and the results summarized and reported annually. ~~Data from these survey efforts will also be used to update productivity values in the CEM.~~ Current survey methods may be redesigned or modified when appropriate.

Figure 1. Winter Severity Index (WSI) derived for elk on the Northern Range and ungulate carcasses/km along transects in two survey areas, Yellowstone National Park, 1986-2001 (Podruzny and Gunther 2002).

Cutthroat Trout

Background

Due to their high digestibility and protein and lipid content, spawning cutthroat trout are one of the highest sources of digestible energy available to bears in Yellowstone National Park (Mealey 1975, Pritchard and Robbins 1990). Grizzly bears are known to prey on cutthroat trout in at least 36 different streams tributary to Yellowstone Lake (Hoskins 1975, Reinhart and Mattson 1990). In 2002, Haroldson ~~et al.~~*et al.* (in review *a*) estimated that approximately 69 to 85 grizzly bears per year frequented and likely fished spawning streams tributary to Yellowstone Lake. In 1994, non-native lake trout were discovered in Yellowstone Lake. Lake trout could depress the native cutthroat trout populations and associated bear fishing activity (National Park Service 1994).

Monitoring Protocol

The Yellowstone Lake cutthroat trout population is currently monitored using gillnets, fish weirs, spawning stream surveys, and hydroacoustic techniques (Appendix E). YNP will provide an annual summary to the IGBST. Current survey methods may be modified or redesigned as appropriate.

Moth Aggregation Sites

Background

Alpine moth aggregations are an important food source for a significant portion of the Yellowstone grizzly bear population (Mattson ~~et al.~~*et al.* 1991). As many as 55 different grizzly bears have been observed feeding at moth sites on a single morning (Annual Report 2002 in

prep). Some bears may feed almost exclusively on moths for a period of over one month (French ~~et al.~~*et al.* 1994). Moths have the highest caloric content per gram of any other bear food (French ~~et al.~~*et al.* 1994) and are available during the late summer/early fall periods when bears are consuming large quantities of foods in order to acquire sufficient fat levels for winter (Mattson ~~et al.~~*et al.* 1991). A grizzly bear feeding extensively on moths over a 30-day period can consume 47%, close to half, of its annual energy budget of 960,000 calories (White 1996). Moths are also valuable to bears because they are located in relatively remote areas, thereby reducing the potential for grizzly bear/human conflicts during the late-summer tourist months. During years when moths are abundant on high elevation moth sites, there are few grizzly bear/human conflicts at nearby low elevation human developments (Gunther ~~et al.~~*et al.* 1997). During years when moths are absent from the high elevation talus slopes, there are more grizzly bear/human conflicts at nearby low elevation human developments (Gunther ~~et al.~~*et al.* 1997).

Figure 2. The annual number of confirmed moth sites in the Greater Yellowstone Area, the number used by bears, and the total number of telemetry relocations or aerial observations of bears recorded at each site, 1986-2001 (Bjornlie and Haroldson 2002).

Year	Number of confirmed moth sites[a]	Number of moth sites used[b]	Number of locations or observations[c]
1986	5	2	8
1987	6	4	15
1988	7	4	43
1989	11	9	47
1990	13	10	69
1991	16	14	144
1992	19	15	88
1993	19	2	4
1994	20	7	14
1995	23	13	28
1996	24	14	69
1997	24	14	67
1998	26	17	124
1999	27	17	144
2000	27	14	78
2001	27	16	98
Total			1,040

[a] The year of discovery was considered the first year a telemetry location or aerial observation was documented at a site. Sites were considered confirmed every year thereafter regardless of whether additional locations were documented.

[b] A site was considered used if ≥1 location or observation was documented within the site that year.

[c] May include replicate sightings or telemetry relocations.

Monitoring Protocol

Bear use of moth aggregation sites has been noted during radio tracking and observation flights. Bear use of these sites will be used as an indirect measure of moth abundance. Aerial surveys for moth use will be conducted annually on representative moth feeding sites (Figure 12). Results will be summarized and reported in the IGBST Annual Report.

Whitebark Pine Cone Production

Background

Due to their high fat content and potential abundance as a pre-hibernation food, whitebark pine seeds are an important fall food for bears in the ~~GYA~~GYE (Mattson and Jonkel 1990). Yellowstone grizzly bears consume whitebark pine seeds extensively when whitebark cones are available. Bears may feed almost predominantly on whitebark pine seeds when production exceeds 22 cones per tree (Mattson ~~et al.~~*et al.* 1992). During years of low whitebark pine seed availability, grizzly bears often seek alternate foods at lower elevations in association with human activities, leading to increased nuisance bear management actions and human-caused grizzly bear known and probable mortalities during the fall (Mattson ~~et al.~~*et al.* 1992, Knight and Blanchard 1994, Gunther ~~et al.~~*et al.* 1997). During years when whitebark pine nuts are abundant, there are generally very few grizzly bear/human conflicts during the fall season (Mattson ~~et al.~~*et al.* 1992, Gunther ~~et al.~~*et al.* 1997).

Monitoring Protocol

Currently there are 19 whitebark pine cone production transects (Figure 13) within the ~~GYA~~GYE, nine of which have been monitored on an annual basis since 1980 (Knight ~~et al.~~*et al.* 1997). Monitoring of whitebark pine cone production using current or modified methods will continue under this Conservation Strategy. New transects may be added or methods changed as knowledge of bear use of this resource evolves. Results will be summarized and reported in the IGBST Annual Report.

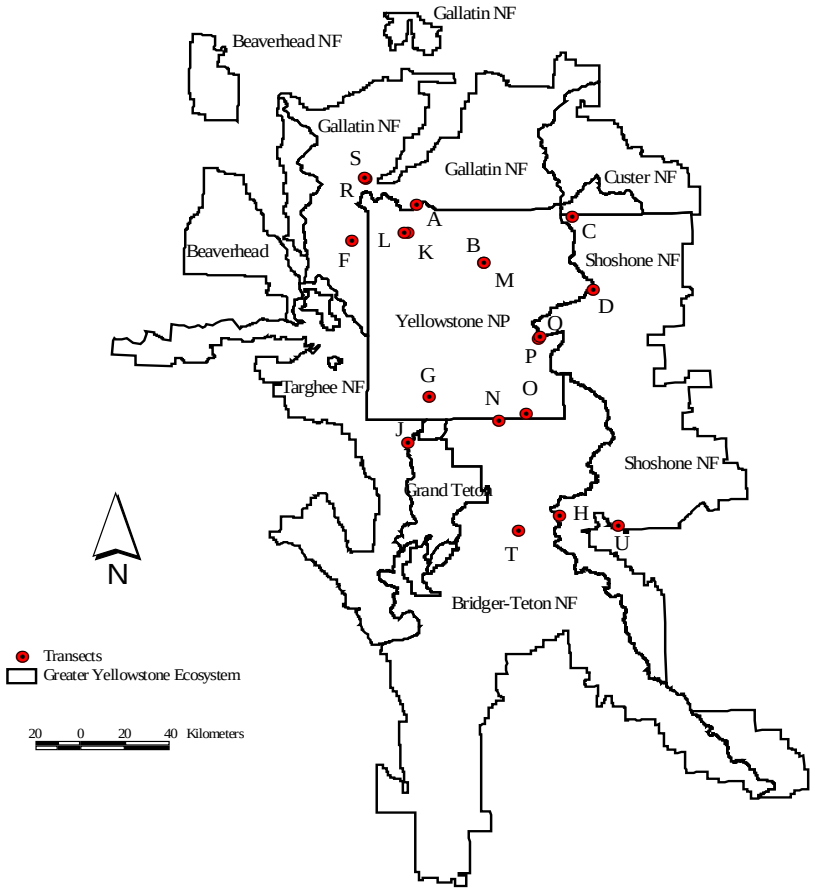


Figure 3. Location of whitebark pine cone transects.

White Pine Blister Rust Infection

Background

Whitebark pine mortality due to white pine blister rust exceeds 90% throughout the northwest U.S. (Kendall and Arno 1990). Although tree mortality has been low to date in the ~~GYA~~GYE, some whitebark pine stands are infected with blister rust. The extent of the blister rust infection and the future effects it will have on whitebark pine in the ~~GYA~~GYE are unknown.

Monitoring Protocol

Along each whitebark pine cone transect, each tree will be examined for presence of blister rust, and the data recorded. Results will be recorded and reported annually by the IGBST.

~~Habitat Effectiveness and Habitat Value~~

~~Background~~

~~The Yellowstone Grizzly Bear CEM was designed to assess the inherent productivity of grizzly bear habitat and to assess the effects of human activities on bear use of that habitat (Dixon 1997, Weaver et al. 1986, Mattson et al. in press). The model uses GIS databases and relative value coefficients of human activities, vegetation, and key grizzly bear foods to calculate Habitat Value (HV) and Habitat Effectiveness (HE) (Weaver et al. 1986, Bevins 1997, Mattson et al. in press). The CEM is the result of more than a decade of interagency effort. Interagency mapping protocols and procedures (Mattson and Despain 1985) have been developed and approved for the PCA. Research is limited as to what level of human activity on backcountry trails actually displaces bears from these habitats. Additional information on human use in the backcountry may help determine the relationship between human activities and bear use.~~

~~Habitat Value in the CEM is a relative measure of the average net digested energy potentially available to bears in a subunit for each of four seasons. Habitat Effectiveness is that part of the energy potentially derived from the area that is available to bears given their response to humans (Mattson et al. in press). It is recognized that motorized access and site developments are the primary human activities influencing grizzly bear use of habitats. However, there are other activities that collectivity may have significant impact on the effectiveness of the habitat for bears. The CEM can be used to estimate the cumulative effects of all human activities on the availability of habitats and associated foods to bears. The 1998 baseline seasonal HE values for each subunit from CEM are displayed in Appendix F.~~

~~The current level of HE for some subunits likely differs from the 1998 baseline. This is not due to changes in the level of human activity, as human activity has not significantly changed since 1998. Rather, several wildfires and prescribed fires have occurred which changed HV. Since HE is calculated as a percentage of the HV, this has resulted in a corresponding change in HE. The change is likely not detrimental to bears and in some instances has improved the seasonal HV.~~

~~Monitoring Protocol~~

~~The agencies will measure changes in seasonal Habitat Effectiveness in each BMU and subunit by regular application of the CEM or the best available system, and compare outputs to the 1998 baseline (Appendix F). CEM databases will be reviewed annually and updated as needed. These databases include location, duration, and intensity of use for motorized access routes, non-motorized access routes, developed sites, and front country and backcountry dispersed~~

~~uses. Emphasis and funding will continue to refine and verify CEM assumptions and to update databases.~~

~~Representative trails or access points, where risk of grizzly bear mortality is highest, will be monitored when funding is available. CEM databases will be updated to reflect any noted changes in intensity or duration of human use.~~

Hunter Numbers

Background

The number of elk hunters in Wyoming, Idaho, and Montana who recreate in the PCA (Figure 14) were estimated and compared to grizzly bear known and probable mortalities, both verified and probable, from 1987 to 1997 to determine if bear mortality is correlated to hunter numbers. The data show there is little relationship between hunter numbers and human-caused grizzly mortality.

The highest source of grizzly bear mortality in the ~~GYA~~GYE has been due to interactions with hunters. While the number of hunters using the PCA has not increased significantly, the number of grizzly bear known and probable mortalities due to interactions with hunters increased in the last decade. Possibilities for why this occurred include bears learning to seek hunter-killed game, and bear distribution shifting to elk hunting units that open early (Haroldson ~~et al.~~*et al.* in review *b*). Nearly all known and probable bear mortalities occur as surprise encounters, at big game carcasses, or at hunter camps.

Figure 4. Estimated numbers of elk hunters within the grizzly bear recovery zone plus a 10-mile perimeter in Idaho, Montana, and Wyoming for the years 1991-2001.

	Year										
State	1991	1992	1993	1994	1995	1996	1997	1998	1999	2000	2001
Idaho[a]	2,292	2,573	2,962	2,682	2,366	3,102	2,869	2,785	2,883	NA[b]	2,914

Wyoming[d]	16,233	17,154	17,105	17,053	17,464	16,283	17,458	15,439	15,727	12,812	13,591
Total	36,789	35,789	36,159	36,212	35,118	35,493			32,908		29,009

[a] Idaho and Wyoming numbers include archery and gun hunters.

[b] NA = hunter number estimates not currently available.

[c] Gun only season.

[d] A percentage of total hunter numbers was used in hunt areas 61 to 63, 67, 68, 73, and 83 because a portion of the hunt area falls outside the designated area.

State and federal wildlife agencies have attempted to reduce the loss of bears to hunters by expanding information and education programs. “Living in Bear Country” workshops are conducted regularly in many ~~GYA~~GYE communities, and licensed outfitters and guides have increased training for their members and clients.

Monitoring Protocol

Data from state wildlife agencies on big game herd units or hunting districts will be used as an index to backcountry use during the hunting season. Hunter use levels combined with numbers of grizzly bear/human conflicts will be used to identify when and where to increase public education efforts and develop appropriate management actions to minimize grizzly bear/human conflicts that result in bear mortality.

Private Land Development

Background

While the existing cumulative effects database accounts for private land development effects within the PCA, influences outside this area are not included. Outside the PCA, several factors influence state and federal grizzly bear management programs. Among the most important is the rapidly accelerating growth of human populations in some areas in grizzly bear habitat in western Montana, southeast Idaho, and northwest Wyoming. This growth results not only in increased visitor use, but also increased residential development on important wildlife habitat adjacent to public lands. This increased human use, primarily residential development, results in the loss of wildlife habitat and permanent increases in grizzly bear/human conflicts, resulting in higher bear mortality rates.

Activities associated with permanent human presence often result in continual management actions that adversely impact bears. Many of these activities occur on or are associated with private lands. Private lands account for a disproportionate number of bear deaths and conflicts (Figures 15 and 16).

Management agencies devote significant efforts toward private landowner outreach programs to minimize grizzly bear/human conflicts and to manage bears and potential conflict situations on such sites. Both the Montana Fish, Wildlife & Parks Department and the Wyoming Game and Fish Department employ bear management specialists devoted specifically to managing grizzly bear/human conflicts on private lands and to working with private landowners to minimize such conflicts.

It is recognized that federal land management and state wildlife agencies do not have direct management authority over private lands and that these agencies do not have the ability to respond to all private land development by management actions on public lands. As private lands are developed and as secure habitat on private lands declines, state and federal agencies will work together to explore options that address impacts from private land development.

Monitoring Protocol

Human-caused mortality related to private land conflicts will be monitored and must be controlled to meet the standards in this Conservation Strategy. This requires ongoing efforts to limit grizzly bear/human conflicts on private lands inside and outside the PCA.

To assist in minimizing grizzly bear/human conflicts on private lands, a need exists to develop a protocol to categorize private lands and report changes. The objective is to provide a system for monitoring the status of grizzly bear habitat on private lands within the PCA, and to direct management efforts, conservation actions by private organizations, and outreach efforts to the public in areas where private lands are being developed. The protocol should provide a qualitative and quantitative system for classifying the potential of private land parcels as productive and secure grizzly bear habitat.

While the sole responsibility for monitoring the status and condition of private lands does not lie with the states, the states will assist private non-profits and other entities to categorize and prioritize potential lands suitable for permanent conservation. The quality and availability of land parcel data varies greatly within and among states and is generally available through the various county governments. Therefore, the methodology to monitor private land status and condition will be specific to data availability by county/state.

Habitat Connectivity

Background

Excessive clearing widths, increased speeds, increased traffic volume, and widened roads, e.g., four lanes, passing lanes, and wide shoulders, are known to cause increased road mortality and/or reduce habitat connectivity (Proctor 2003, Clevenger ~~et al.~~*et al.* 2002).

Vehicle size and numbers continue to increase on the roads in the ~~GYA~~GYE. As existing roads age and deteriorate, plans are developed to reconstruct these roads to support increases in the size and numbers of vehicles. Federal and state highway departments prefer to design roads that allow increased speed, have wider road surfaces, including wider shoulders, and wide vegetation clearing widths for visibility. A combination of any or all of these design standards results in increased driver comfort and higher speeds. This increase in speed results in increased wildlife mortality (Gunther ~~et al.,~~*et al.* 1998).

Certain road improvement designs can cause reduction of bear crossings. This results in elimination of traditional dispersal routes and fragmentation of home ranges in the ~~GYA~~GYE.

Monitoring Protocol

Monitoring and surveys will be conducted before designs are initiated. These surveys or analyses will include known bear crossing areas, bear sighting information, ungulate road mortality data, bear home range analysis, and game trail information. This information will be used to complete a connectivity analysis to identify important crossing areas.

To ensure that habitat connectivity is addressed for new road construction or reconstruction in the ~~GYA~~GYE, federal land management agencies will evaluate habitat connectivity during the NEPA analysis process.

Genetic Study Confirms Growth of Yellowstone Grizzly Bear Population

BOZEMAN, Mont. – Genetic data show the grizzly bear population in the Greater Yellowstone Ecosystem has grown since the 1980s with no loss in genetic diversity, according to a report by the Interagency Grizzly Bear Study Team.

Results indicate that the effective population size of Yellowstone grizzly bears, or the number of individuals that contribute offspring to the next generation, has increased 4-fold over a 25-year period. This provides evidence that Yellowstone grizzly bears are approaching the effective size necessary for long-term genetic viability.

“The increase in effective size of the Yellowstone grizzly bear population over the past several decades, with no significant change in genetic diversity, supports evidence of population growth based on traditional surveys,” said Pauline Kamath, USGS ecologist and lead author of the study. “This is a key genetic indicator of a population’s ability to respond to future environmental change.”

Researchers used several newly available techniques to assess trends in effective population size from a sample of 729 grizzly bears in the Greater Yellowstone Ecosystem, a region slightly smaller than South Carolina. Based on one of several methods, they found estimates of effective population size increased from approximately 100 bears in the 1980s to 450 in the 2000s. These numbers are smaller than estimates of total population size because not all animals in the population breed. Although an isolated population, grizzly bear genetic diversity remained stable and inbreeding was relatively low, 0.2 percent, over the time period.

The application of these new methods to monitor trends in effective population size of wildlife has been limited because it is difficult to measure and requires long-term data on individuals in the population. The isolated and well-studied population of Yellowstone grizzly bears provided a rare opportunity to examine the usefulness of this technique for monitoring a threatened species because of the breadth of genetic and demographic, gender and age, data that have been collected over decades. Grizzly bear populations in the lower 48 states were listed as threatened in 1975 under the Endangered Species Act.

"For long-lived species such as grizzly bears, a concerted effort is required to collect long-term genetic and associated demographic data. Four decades of intensive research on Yellowstone grizzly bears presented a unique opportunity to evaluate and compare genetic estimators for monitoring of wildlife populations." said Frank van Manen, USGS wildlife biologist and Team Leader of the Interagency Grizzly Bear Study Team.

The study demonstrates how genetic monitoring can complement traditional demographic-based monitoring, providing valuable tools for wildlife managers for current and future studies. It also underscores the effectiveness of long-term studies that provide detailed data to support a variety of analyses, providing researchers and managers a better picture of the status of populations of interest.

The article "Multiple estimates of effective population size for monitoring a long-lived vertebrate: an application to Yellowstone grizzly bears[SSC1]" is published in *Molecular Ecology*.

The study is a collaborative effort between the USGS, Wildlife Genetics International, the University of Montana, and the federal, state and tribal partners of the Interagency Grizzly Bear Study Team.

Abstract

Effective population size (N_e) is a key parameter for monitoring the genetic health of threatened populations because it reflects a population's evolutionary potential and risk of extinction due to genetic stochasticity. However, its application to wildlife monitoring has been limited because it is difficult to measure in natural populations. The isolated and well-studied population of grizzly bears (*Ursus arctos*) in the Greater Yellowstone Ecosystem provides a rare opportunity to examine the usefulness of different N_e estimators for monitoring. We genotyped 729 Yellowstone grizzly bears using 20 microsatellites and applied three single-sample estimators to examine contemporary trends in generation interval (GI), effective number of breeders (N_b) and N_e during 1982–2007. We also used multisample methods to estimate variance (N_{eV}) and inbreeding N_e (N_{eI}). Single-sample estimates revealed positive trajectories, with over a four-fold increase in N_e (≈100 to 450) and near doubling of the GI (≈8 to 14) from the 1980s to 2000s. N_{eV} (240–319) and N_{eI} (256) were comparable with the harmonic mean single-sample N_e (213) over the time period. Reanalysing historical data, we found N_{eV} increased from ≈80 in the 1910s–1960s to ≈280 in the contemporary population. The estimated ratio of effective to total census size (N_e/N_c) was stable and high (0.42–0.66) compared to previous brown bear studies. These results support independent demographic evidence for Yellowstone grizzly bear population growth since the 1980s. They further demonstrate how genetic monitoring of N_e can complement demographic-based monitoring of N_c and vital rates, providing a valuable tool for wildlife managers.

Keywords: conservation genetics, effective number of breeders, effective population size, N_e/N_c ratio, population size, wildlife management

Received 29 June 2015; revision received 17 September 2015; accepted 17 September 2015

Introduction

The examination of short- and long-term trends in population size is vital to evaluating the status of wildlife populations of conservation concern. As a population declines in size, the risk of extinction increases as a result of demographic and genetic stochasticity (e.g. loss of alleles, increased frequency of deleterious alleles and inbreeding depression) (Lynch & Gabriel 1990). Effective population size (N_e) is the size of an 'ideal population' (e.g. random mating, random variance in reproductive success, even sex ratio) that would lose genetic diversity at the same rate of the observed population (Fisher 1930; Wright 1931). The N_e of natural populations is usually far lower than for ideal populations (in which N_e equals the census size, N_c), due to high variance in reproductive success among individuals. It is a key parameter for quantifying the rate at which genetic diversity will be lost due to random

© 2015 John Wiley & Sons Ltd

genetic drift, and is influenced by factors such as variance in fecundity and survival, and mating system. Therefore, unlike census size, N_e captures the effects of both demographic and genetic processes and also relates to a population's evolutionary potential (i.e. ability to respond to selection or environmental change), making it an important parameter for population monitoring in both evolutionary ecology and conservation biology (Schwartz *et al.* 1999; Frankham 2005; Charlesworth 2009).

Both direct (ecological) and indirect (genetic) estimations of N_e in natural populations are challenging, particularly for iteroparous species with overlapping generations. Multiple genetic estimation approaches have been developed that are based on theoretically different concepts of N_e (e.g. variance N_e, inbreeding N_e and eigenvalue N_e; Crow & Denniston 1988; Ewens 1982). These approaches not only differ in the time frame they apply to (Waples 2005), but can also be affected differently by population-level processes, such as gene flow, genetic substructure, changes in population size and life history parameters. Therefore, in natural populations that are typically under nonequilibrium conditions, distinguishing between and comparing estimates based on the various N_e concepts is critical (Crandall *et al.* 1999; Wang 2005; Serbezov *et al.* 2012), particularly when applied within a monitoring framework.

The most frequently used approach for estimating contemporary N_e (corresponding to the past few generations or less; Luikart *et al.* 2010) has been the temporal method (Nei & Tajima 1981), also called variance N_e (N_{eV}). This method is based on the assumption that changes in allele frequencies over time due to genetic drift (i.e. the effects of mutation, migration and selection are negligible) are inversely related to N_e. A disadvantage of this approach is that it assumes discrete, nonoverlapping generations when, in contrast, most species are age-structured. Violation of this assumption may result in biased N_e estimates. These biases may be overcome, if the time period between samples is large and, thus, the drift signal is strong (Nei & Tajima 1981; Waples & Yokota 2007). Jorde & Ryman (1995) modified the standard temporal method, correcting for biases resulting from population age structure, but this unbiased estimator has not been widely implemented because it requires information on age-specific survival and fecundity from cohorts sampled in successive years. A recent update to their technique allows for cohort sampling any number of generations apart (Jorde 2012). A similar concept is inbreeding N_e (N_{eI}), which is based on the rate of increase in inbreeding (as measured by the loss of heterozygosity over time) as opposed to the rate of allele frequency change due to genetic drift (i.e. N_{eV}). N_{eI} and N_{eV} are theoretically expected to yield similar values under the assumption of constant population size (Crow & Denniston 1988).

Despite advancements in the temporal (variance) method, and its extensive use for estimating N_e, sampling remains difficult for most studies. This is due to the requirement of either multiple samples separated by an interval of one or more generations, or samples from cohorts accompanied by detailed demographic information. Thus, the development and implementation of single-sample N_e estimators has increased substantially. Single-sample estimators are generally based on patterns that result from processes acting in the parental generation (e.g. heterozygosity, gametic disequilibrium, individual relatedness) and are thus expected to be measures of inbreeding N_{eI} (Laurie-Ahlberg & Weir 1979). These estimators include the linkage disequilibrium (LD) (Laurie-Ahlberg & Weir 1979; Hill 1981; Waples 2006a), estimator by parentage assignments (EPA) (Wang *et al.* 2010) and sibship assignment (SA) (Wang 2009) methods.

The LD approach is based on the principle that gamete disequilibrium among independent loci is generated by genetic drift, the strength of which is determined by N_e per generation and the effective number of breeders (N_b) per year (Hill 1981; Waples *et al.* 2014). The SA and EPA methods use frequencies of related individuals in a random sample (Wang *et al.* 2010); SA estimates the frequencies of full- and half-siblings, whereas EPA infers parentage using a likelihood approach. The LD and SA methods also assume discrete generations, but in age-structured populations, they can be used to estimate the N_b that produced a given cohort. Although the relationship between N_b and N_e is complex, N_b can be a comparable index of genetic health and, when measured in cohorts over time, is particularly useful for population monitoring (Waples 2005).

In the contiguous ('lower') 48 States of the United States of America, grizzly bears (*Ursus arctos*) are a 'conservation-reliant' species (Scott *et al.* 2005). Their abundance and distribution declined dramatically through the 1900s, with bears disappearing from approximately 98% of their historic range (Mattson *et al.* 1995). Due in part to concerns regarding the future of Greater Yellowstone Ecosystem (GYE) bears, grizzly bear populations in the contiguous United States were listed as threatened in 1975 under the U.S. Endangered Species Act (ESA) (US Fish and Wildlife Service 1993). Even before listing under the ESA, intensive research efforts were focused on this population, resulting in the availability of long-term, comprehensive data sets that include detailed capture histories. Since a likely nadir in the early 1980s, multiple indices used to estimate trends suggest that the population has experienced positive growth for the past three decades (Eberhardt *et al.* 1994; Eberhardt 1995; Boyce

© 2015 John Wiley & Sons Ltd

et al. 2001; Harris *et al.* 2006, 2007; Interagency Grizzly Bear Study Team 2012).

However, the GYE grizzly bear population has experienced isolation for over a century (Mattson & Merrill 2002) and genetic data have confirmed that it is genetically distinct (Proctor *et al.* 2012), with no evidence of recent immigration from the nearest populations in the Northern Continental Divide Ecosystem (NCDE), Cabinet-Yaak or southern Selkirk Mountains (Haroldson *et al.* 2010). The GYE population likely was also subjected to the loss of genetic diversity following historical reductions in size due to anthropogenic influences (e.g. human-related mortality, garbage dump closures). Consequently, the genetic diversity of GYE bears is among the lowest reported for continental brown bear populations in North America (Paetkau *et al.* 1998b; Proctor *et al.* 2012). Despite this, using museum specimens from GYE bears, Miller & Waits (2003) detected only a gradual decline in diversity over the past century. Using a temporal-based estimator, they estimated an N_e of ≈80 throughout the 20th century, with N_e approaching 100 during the late 1990s. Recent trends in both genetic diversity and N_e, however, have not been examined in this ecosystem.

Conditions that form an optimal research framework for estimation of N_e in wildlife populations are difficult to obtain. Most notably, few studies meet the assumption of genetic isolation and also have long-term demographic and genetic samples representative of individuals from all age classes (but see Palm *et al.* 2003; Serbezov *et al.* 2012). As an isolated and comprehensively studied population, the GYE grizzly bear population presents a rare opportunity to examine and compare the utility of various N_e estimation techniques as a potential tool for population monitoring. Our objectives were to (i) examine trends in N_b and N_e of GYE grizzly bears over recent decades using both single- and multisample temporal N_e estimation methods; (ii) contrast estimates based on the different methods; and (iii) assess whether trends in N_e estimates, independent of demographic-based estimators of population size (N_c), corroborate or refute observed population trends.

Materials and methods

Study area

The study area encompassed the GYE, which includes Yellowstone National Park, Grand Teton National Park, all or portions of five national forests, other Federal lands, plus State, tribal and private lands in Wyoming, Montana and Idaho (Fig. S1, Supporting information). Geographically, the GYE includes headwaters of the Missouri–Mississippi, Snake–Columbia and Green–Colorado river systems, the Yellowstone Plateau and 14 surrounding mountain ranges (Marston & Anderson 1991). The grizzly bear population in the GYE (centred at latitude 44.64°N, 110.52°W) has been expanding its range over the past several decades and by 2010 occupied approximately 50 000 km^2 (Bjornlie *et al.* 2014). More detailed descriptions of the study area can be found in Blanchard & Knight (1991), Mattson *et al.* (1991) and Schwartz *et al.* (2006).

Sampling, DNA extraction and genotyping

Tissue, blood and hair samples (n = 729) were collected by the Interagency Grizzly Bear Study Team (IGBST) from grizzly bears born between 1962 and 2010 (Fig. S1, Supporting information). These samples were obtained through live captures and mortalities. Detailed capture methods are described in Schwartz *et al.* (2006), and sample preservation protocols can be found in Haroldson *et al.* (2010). Genomic DNA was extracted using DNeasy tissue kits, following manufacturer's instructions (Qiagen Inc.), at the Wildlife Genetics International laboratory (Nelson, British Columbia, Canada). Bears were genotyped at 20 microsatellite loci: REN145P07, REN144A06, CPH9, CXX20, CXX110, G1A, G10B, G10C, G1D, G10H, G10J, G10L, G10M, G10P, G10U, G10X, MU23, MU50, MU51 and MU59 (Ostrander *et al.* 1993; Fredholm & Wintero 1995; Paetkau *et al.* 1995, 1998a; Taberlet *et al.* 1997; Breen *et al.* 2001; Proctor *et al.* 2002). Altered primer sequences for REN145P07, REN144A06, MU23 and MU51 are reported in Table S1 (Supporting information). Genotyping protocols are described in Paetkau *et al.* (1998a).

In a previous study involving samples analysed in the same genetics laboratory, Kendall *et al.* (2009) estimated genotyping error rates (i.e. combination of scoring errors, allelic dropout and false amplifications) for 16 of the 20 loci we used. Error rates were low (0.002 per loci/sample) based on >4000 hair samples from more than 500 individual grizzly bears within the NCDE. Because their study involved noninvasive samples, these genotyping error rates are conservative (i.e. overestimates) when applied to our GYE sample from higher-quality materials (i.e. primarily tissue samples). We further estimated per-locus null allele frequencies using the expected maximum algorithm implemented in FreeNA (Chapuis & Estoup 2007). We accounted for modelled estimates of genotyping error due to null alleles in methods that involved making relatedness inferences (SA, EPA), as described below (see *Single-sample estimation of effective population size and numbers of breeders*).

Marker tests and genetic diversity indices

We performed exact tests to test for departures from Hardy–Weinberg (H-W) proportions and genotypic

© 2015 John Wiley & Sons Ltd

linkage equilibrium. We tested for departures in population samples spaced by 5-year intervals spanning the time period (1985–2010) using a Markov chain algorithm (Guo & Thompson 1992) (dememorization steps = 1000; batches = 100; Markov chain iterations/batch = 1000) as implemented in GENEPOP v4.2 (Raymond & Rousset 1995). We corrected for multiple comparisons by applying the sequential Holm–Bonferroni procedure (Holm 1979) to adjust the critical *P*-value ($\alpha = 0.05$). Bear population genetic diversity was examined across temporally spaced population samples (from 1985 to 2010) by estimating the observed heterozygosity (H_O) and expected heterozygosity (H_E) in ARLEQUIN v3.5 (Excoffier & Lischer 2010). We also measured allelic richness (A) after correcting for unequal sample sizes by rarefaction in HP-RARE (Kalinowski 2005). We performed paired *t*-tests, comparing allelic richness over the time period for each of the 20 loci, to test the null hypothesis of no change in diversity over time. Furthermore, to compare diversity estimates with previously reported results in Miller & Waits (2003), we recalculated diversity indices using the eight microsatellites common to both studies: G1A, G10B, G10C, G1D, G10L, G10M, G10P and G10X.

Single-sample estimation of effective population size and number of breeders

We used three approaches based on single samples to estimate effective population size (N_e) or number of breeders (N_b) over time: (i) estimator by parentage assignments (EPA, Wang *et al.* 2010); (ii) linkage disequilibrium (LD) estimator (LDNe, Waples 2006a; Waples & Do 2008); and (iii) the sibship assignment estimator (SA, Wang 2009). The EPA method offers a direct estimate of N_e and the generation interval (GI) by incorporating individual sex, age and genotype data from a population (sample) with overlapping generations. The remaining two methods provide an estimate of N_b in a single cohort (i.e. a discrete age class).

In applying the EPA method, we organized known-aged bears (born between 1970 and 2007) into annual samples of animals alive during 1982–2007, based on birth and mortality (or oldest known age) data. Data were truncated at 2007 due to a potential sampling bias because data obtained from a cohort or age class increases as individuals are captured and aged into the future. Thus, this sampling approach may affect the probability of offspring presence in the data, and consequently, N_e estimates for the most recent sampling years. Age-specific sample sizes per year for the period are reported in Table S2 (Supporting information). We used AGE-STRUCT (Wang *et al.* 2010) and incorporated age, sex and multilocus genotypes to assign parentage within the random population sample, fitting them to a genetic model (Johnson 1977) from which we estimated N_e and GI. We applied modelled estimates of null allele frequencies and assumed a minimum breeding age of 3 years, 95% reliability of parentage assignments and 0.5 prior probability of including a parent in the sample. We conducted 1000 bootstrap replicates to obtain 95% confidence intervals on estimates.

In contrast to the EPA method, LDN_e and SA methods generally assume discrete, nonoverlapping generations and cannot estimate N_e directly (but see Waples *et al.* 2014). Instead, when applied to a random sample from a single cohort in a population with overlapping generations, these methods can provide an adequate estimate of N_b (the effective number of breeders that produced the cohort) (Robinson & Moyer 2013). Thus, we applied these methods to estimate N_b for individual cohorts. To obtain acceptable sample sizes and account for intermittent breeding, we organized bear samples into 3-year running (pooled) 'cohorts' from 1983 to 2008 based on birth year, which assumes a minimum reproductive age of 3 years to ensure no parent–offspring pairs exist within a cohort.

The LDNe approach uses Weir's (1979) unbiased estimator of Burrow's Δ to estimate LD, with a correction for sample size bias (Waples 2006a). We applied a random mating model and upheld a critical threshold for the lowest allele frequency (P_{crit}) based on the criterion that $P_{crit} > 1/(2n)$ (Waples & Do 2010).

Next, we applied the SA method to the same cohorts using the program COLONY 2 (Jones & Wang 2010), which simultaneously infers parentage and sibship dyad assignments to estimate N_b from frequencies of full- and half-sibling pairs (Wang 2009). We used full likelihood inference and assumed a polygamous breeding system without inbreeding. When estimating relatedness, we accounted for genotyping error due to null alleles using the model estimated error rates. We improved sibship inference through parentage assignments by defining a pool of candidate parents for each bear, including all individuals that were ≥3 years old in the bear's birth year.

Multisample estimation of variance and inbreeding effective population size

We applied the multisample temporal method (Krimbas & Tsakas 1971; Nei & Tajima 1981; Waples 1989) to estimate variance N_e (N_{eV}). This method is based on the Wright–Fisher model (Fisher 1930; Wright 1931) and assumes temporal changes in allele frequencies are caused by genetic drift alone. We calculated the standardized variance in allele frequency with two moment-based *F*-statistic estimators, F_S (Jorde &

© 2015 John Wiley & Sons Ltd

Ryman 2007) and F_C (Nei & Tajima 1981), as implemented in NEESTIMATOR v2 (Do *et al.* 2014). We performed this analysis using two temporally spaced random population samples (including adults and cubs), separated by 25 years (1982 vs. 2007), which is equivalent to 2.5 generations under an assumed 10-year GI. We conservatively repeated the analysis with a GI of 12 years (~2 generations), which is expected to yield lower N_e estimates because more drift (allele frequency change) can occur with more years passing per generation. We set the starting population census size to 200 in 1982, based on demographic estimates (Eberhardt & Knight 1996). We applied sampling plan I, which is a correction for temporal estimates when taking samples with replacement nonlethally before reproduction (see Waples 2005), and a minimum allele frequency of 0.01.

In addition, we implemented the modified temporal approach of Jorde & Ryman (2007) in GONE (Coombs *et al.* 2012) using 26 consecutive birth year cohorts (from 1982 to 2007) and a starting cohort size of 50, while incorporating estimates of age-specific survival and fecundity (data from Waples *et al.* 2013). We further used a likelihood-based temporal approach, calculating a pseudo-maximum-likelihood estimator of effective size in MLNE (Wang 2001; Wang & Whitlock 2003). With this approach, we assumed a closed and isolated population with no migration, substructure or selection, and a prior upper bound for N_e equal to 5000.

To contrast our results to historical estimates, we obtained genotype data representing three past time periods (1910s, 1960s and 1990s) from which N_{eV} was previously estimated using both maximum-likelihood and moment-based estimators (see Miller & Waits 2003). With these data, we re-evaluated N_{eV} for the 1910–1960, 1960–1990 and 1910–1990 time frames using the same variance estimators (F_S, F_C and MLNe) applied to the current data, as described previously. For these historical data, we assumed a GI of 10 years and a starting census population size of 350 in 1910, as in Miller & Waits (2003).

Finally, we applied another multisample approach to estimate inbreeding N_e (N_{eI}) based on loss of expected heterozygosity. This approach applied the following equation: $H_t = H_o\,(1-1/2N_e)^t$, where t is the number of generations, H_o is the expected heterozygosity at time zero, and H_t is the expected heterozygosity at generation t (Nei *et al.* 1975). In contrast to N_{eV}, this approach generally yields a longer-term estimate of N_e corresponding more closely to the parental generation. N_{eI} is less sensitive to population declines than N_{eV} because of the delay in mating between close relatives (Kimura & Crow 1963; Allendorf *et al.* 2013). Again, we assumed approximately 2.5 generations and used H_E estimates from 1985 vs. 2010.

Evaluating sensitivity of estimators to sample size and parentage assignment threshold

We evaluated bias due to small sample sizes at earlier time periods for all single-sample N_b and N_e estimation approaches by randomly subsampling to equal sample sizes on select data points over the monitoring period (every 5 years from 1985 to 2005). We randomly selected 10 data subsets of equal sample size (EPA: $n = 100$, SA/LD: $n = 50$) and conducted independent replicate runs to estimate the mean and 95% confidence intervals of the N_e point estimates. We further investigated the sensitivity of EPA-based N_e estimates to the reliability threshold for parentage assignments specified in the underlying genetic model. We assumed a low probability of parentage assignment threshold of 0.80, and compared this with our previous estimates for which we assumed a threshold of 0.95.

Comparisons with demographic-based estimates

We used N_e estimates and demographic-based estimates of total population size (i.e. census size estimates, or N_c) to calculate the N_e to N_c ratio and determine whether population trends differ between the demographic- and genetic-based techniques. We used two demographic-based population estimators for these comparisons: (i) Chao2 estimator based on counts of females with cubs-of-the-year (Keating *et al.* 2002; Cherry *et al.* 2007), and (ii) a mark-resight (M-R) estimator based on systematic observation flights of marked and unmarked females with cubs-of-the-year (Higgs *et al.* 2013). These two techniques provided estimates of the number of females with cubs-of-the-year, which we used to derive estimates of total population size (Interagency Grizzly Bear Study Team 2012). Therefore, estimates of N_c included all bears (dependent young, subadults, and adults) in the population. Chao2 estimates covered the time period from 1984 to 2007, whereas M-R estimates were from 2001 to 2007. We chose the latter period for the M-R technique because it coincided with a period over which this estimator showed little change (Higgs *et al.* 2013) and thus provided a useful period to assess the N_e/N_c ratio. The N_e/N_c ratio was calculated for each year using the EPA-derived N_e point estimates in the numerator and 3-year running means of the demographic estimates (Chao2, M-R) in the denominator. We used harmonic means over the entire time period to calculate the final N_e/N_c ratios.

Results

Null allele frequency, H-W equilibrium and genetic diversity indices

We observed low null allele frequencies across all our microsatellite markers (average frequency = 0.006, SD = 0.008; Table S3, Supporting information). In each population sample assessed, we detected no evidence of departures from H-W expectations and no LD among loci pairs across all six temporally spaced population samples. However, in four of six samples tested, the following loci pairs were in significant LD: G1D/G10P, CPH9/G10U. Significant loci associations may represent a signal of population substructure or, alternatively, represent a random statistical artefact with only ~3% of tests below the significance threshold value of 5%.

Paired comparison tests showed no statistical support ($P_{1985–2010}$ = 0.23) for a decline in mean allelic richness (number of alleles/ locus) from 1985 to 2010 (A_{1985} = 4.65, A_{2010} = 4.52; Table 1). Expected heterozygosity of the GYE grizzly bear population remained stable over the past several decades and paired comparisons similarly suggested no change over time ($P_{1985–2010}$ = 0.56). When limiting the analyses of genetic diversity (allelic richness) to the same eight microsatellite loci examined by Miller & Waits (2003), and correcting for differences in sample sizes across studies, the 1990s estimates were similar across studies (Table S4, Supporting information). When using the eight markers in common, we again observed stability in diversity indices from 1985 to 2010.

Table 1 Genetic diversity of the Greater Yellowstone Ecosystem grizzly bear population over time. We evaluated population genetic diversity at 5-year intervals (1985–2010) based on mean allelic richness (A), observed heterozygosity (H_O) and expected heterozygosity (H_E) across 20 microsatellite loci. Standard errors (SE) of estimates are reported

Year	No. gene copies	$A^{\dagger}$ (SE)	H_O (SE)	H_E (SE)
1985	132	4.65 (0.31)	0.611 (0.042)	0.615 (0.038)
1990	228	4.60 (0.30)	0.618 (0.040)	0.609 (0.037)
1995	422	4.59 (0.30)	0.621 (0.038)	0.616 (0.036)
2000	654	4.55 (0.30)	0.617 (0.036)	0.614 (0.036)
2005	740	4.56 (0.29)	0.610 (0.037)	0.612 (0.036)
2010	576	4.52 (0.29)	0.610 (0.038)	0.612 (0.037)

[†]Estimates of A are corrected for sample size through rarefaction in HP-RARE (Kalinowski 2005) using the smallest number of gene copies (132, or 68 diploid individuals).

Single-sample estimates of generation interval, N_b, and N_e

Annual sample sizes, used to calculate EPA-based estimates of N_e, ranged from 52 to 379 bears (Tables S2 and S5), whereas sample sizes by cohort used in LDNe and SA analyses ranged from 22 to 108 (Tables S5 and S6). EPA-derived estimates of N_e indicated an increasing trend, with over a fourfold increase in N_e from 102 (95% CI: 64–207) in 1982 to 469 (95% CI: 284–772) in 2007 (Fig. 1A; Table S5, Supporting information). These results were accompanied by an increase in the GI from a harmonic mean of 8 years in the 1980s to 14 years in the 2000s (Fig. 1B; Table S5, Supporting information). Results from SA analyses indicated a similar increase in N_b from 44 in 1984 to 145 in 2007 (Fig. 1C; Table S6, Supporting information), whereas LD-based N_b increased from a low of 46 in the mid-1980s to 92 in 2007 (Fig. 1C; Table S7, Supporting information).

Temporal-based estimates of N_e

Temporal estimates of N_e ranged from 240 to 319 for the time period 1982–2007 when assuming a GI of 10 years (Fig. 2). Estimates were slightly lower (range = 202–268) when assuming a longer GI of 12 years. These estimates generally agreed with N_e estimates from the EPA single-sample method over this time period (mean = 274, harmonic mean = 213; Table S5, Supporting information). Using the unbiased approach of Jorde & Ryman (2007) (based on successive birth years and life history information), N_e was 259 (95% CI = 180–353) for the time period, 1982–2007. The maximum-likelihood-based method for estimating N_e (in MLNe) did not perform well. Estimates were large and reached the upper prior limit of 5000 (Fig. 2), indicating that this approach had low precision or reliability when estimating N_e with our data set. Finally, the loss of heterozygosity from 0.615 to 0.612 in 1985 to 2010, respectively (Table 1), suggested a 0.2% rate of inbreeding over the time period, with an estimated harmonic mean N_{eI} of 256.

Historical estimates of N_{eV} were similar to those previously reported (Miller & Waits 2003) (Fig. 2). The 1910–1960 estimates ranged from 69 to 89, whereas estimates were lower and more variable (range = 35–95) for the 1960–1990 time period. For the entire time frame, 1910–1990, N_e was slightly higher and in some cases exceeded 100 (range = 82–133).

Evaluating sensitivity in N_e and N_b estimation approaches

We evaluated potential sensitivity in EPA-based N_e estimates due to the reliability of the parentage assignment

© 2015 John Wiley & Sons Ltd

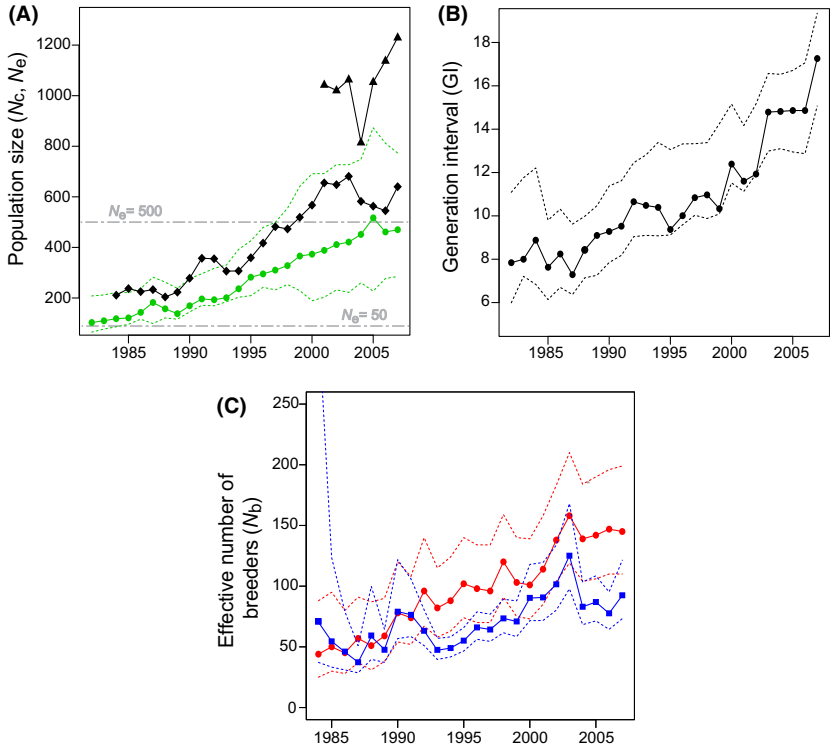

Fig. 1 Population size indices of grizzly bears in the Greater Yellowstone Ecosystem, 1982–2007. (A) Estimates of census population size (N_c), including bears of all ages, based on Chao2 (black diamonds; 1984–2007) and Mark-Resight (black triangles; 2001–2007) methods are shown with respect to estimator by parentage assignments (EPA) estimates (green circles; 1982–2007) of effective population size (N_e). Gray dash-dotted lines indicate the N_e thresholds for short-term (N_e = 50) and long-term (N_e = 500) conservation as defined by Franklin (1980); (B) generation interval (GI), 1982-2007; (C) cohort-based estimates of the effective number of breeders (N_b) using the Linkage Disequilibrium (LD, blue squares) and Sibship Analysis (SA, red circles) methods, 1984–2007. Point estimates for cohort-based approaches represent the middle year of the 3-year period (e.g. 1984 estimate represents the 1983–1985 cohort); For all N_e and N_b indices, annual point estimates and 95% confidence intervals are indicted by solid and dotted lines, respectively.

threshold specified. Estimates of N_e were slightly lower and more precise when relaxing this threshold from 0.95 to 0.80 (Fig. S3A, Supporting information). However, confidence intervals overlapped and a similarly increasing population trend was observed, regardless of the specified probability of parentage assignment. Estimates of GI from 1985 to 1995 were similar for the 0.80 and 0.95 thresholds. For 2000 and 2005, when applying a strict (0.95) parentage assignment threshold, we observed an increase in GI; whereas, when we relaxed this threshold (0.80), GI remained relatively constant (Fig. S3B, Supporting information).

We examined sensitivity to sample size in single-sample estimates and found that even when applying a consistent sample size (n = 100), EPA-derived N_e increased over time, albeit at a lower rate (Fig. S4A, Supporting information). Estimates were increasingly depressed as sample size relative to N_e decreased over time. Estimates of GI were similar for 1985, 1990 and 1995, but low in more recent years (2000 and 2005; Fig. S4B, Supporting information). The EPA method is particularly sensitive to sampling proportion (i.e. the percentage of the population sampled) because the probability of capturing parent–offspring pairs decreases at lower sampling proportions, thereby affecting the accuracy of GI and N_e estimates (Wang *et al.* 2010). The LD-derived N_b estimate did not appear to be sensitive to sample size when the appropriate critical threshold for lowest allele frequency was applied (Fig. S5A, Supporting information). In contrast, SA-based N_b estimates were lower with smaller sample size relative to N_e (Fig. S5B, Supporting information). Again, similar to the EPA method, these results confirmed that an increase in N_b over time remains apparent even when sample size is held constant.

N_e/N_c ratio

Harmonic mean estimates of the N_e/N_c ratio based on EPA-derived N_e over the period from 1984 to 2007 were 0.66 and 0.42 when using the Chao2 and M-R-derived estimates of population size, respectively. The N_e/N_c

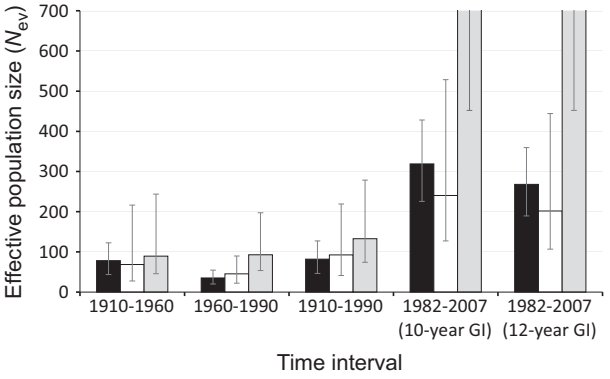

Fig. 2 Variance effective population size (N_{eV}) estimates of grizzly bears in the Greater Yellowstone Ecosystem for four time intervals (1910–1960, 1960–1990, 1910–1990, 1982–2007) using three estimators: Jorde–Ryman F_S (black), Nei–Tajima F_C (white) and MLNe (gray). Vertical bars represent 95% confidence intervals. Genotype data for 1910–1960, 1960–1990 and 1910–1990 were taken from Miller & Waits (2003) and used to recalculate N_e with the methods used on the contemporary data (1982–2007). Estimates were computed assuming both a 10- and 12-year GI for the 1982–2007 time period. Upper limits of 95% confidence intervals for some MLNe estimates exceeded the upper limit (i.e. >5000) and are not shown.

ratio generally remained stable throughout the study time period (Fig. S2, Supporting information).

Discussion

Grizzly bears in the lower 48 states are listed as threatened under the United States Endangered Species Act and receive considerable conservation interest. Monitoring of genetic diversity and effective population size helps to inform management decisions regarding their recovery and protective status. Our results from the EPA (estimator by parentage assignments) N_e estimator suggested over a fourfold increase in the GYE population from 1982 to 2007. The single-sample N_b estimators (LD, SA) also increased over this time period, with SA increasing more rapidly than LD estimates. This observation is consistent with increasing N_e because LD estimates can be affected by the previous one to few generations due to residual disequilibria that have not yet broken down through recombination (Hill & Robertson 1968; Sved 1971; Waples 2005), whereas SA estimates are not. In addition, the harmonic mean EPA N_e estimate over the entirety of the study period (N_e = 213; Table S4, Supporting information) corresponded to N_{eV} temporal estimators (range = 240–319; Fig. 2). Furthermore, N_{eI} as estimated from the loss of heterozygosity over the time period fell within the same range (N_{eI} = 256) and suggested a low rate of inbreeding (0.2%) since 1985. The comparisons among multiple independent estimation procedures substantiate the reliability of these methods and strengthen confidence in our findings.

We also contrasted current N_{eV} and N_{eI} relative to estimates using genotype data obtained from museum specimens of Yellowstone bears. Based on these historical data, Miller & Waits (2003) reported an N_e of ≈85 during the 1910–1960s and ≈75–89 during the 1960–1990s. Assuming the GYE population was as diverse as the NCDE in the early part of the 20th century, their heterozygosity-based estimate was very low (N_e = 22) relative to the current N_{eI} estimate of 256. Here, we reanalysed their genotype data using the same temporal estimators implemented in this study (including the unbiased Jorde–Ryman approach; Jorde & Ryman 2007) and confirmed that N_{eV} increased approximately three- to fourfold, from ≈80 in the 1910–1960s to ≈280 in the contemporary population (Fig. 2).

Yellowstone grizzly bears have been isolated from other populations for over a century, and the prospect for restoring natural connectivity with northern populations (e.g. the NCDE, 100 km north) has improved as both populations have increased in numbers and expanded their range (Haroldson *et al.* 2010; Proctor *et al.* 2012). Reflecting this isolation, genetic diversity displayed an initial decline in both allelic richness (A) and expected heterozygosity (H_E) in the early half of the 20th century (Miller & Waits 2003). Our data for 1985–2010 indicate genetic diversity remained stable over the span of this study (Table 1). When limiting our contemporary data to the same eight microsatellites used in Miller & Waits (2003), patterns of diversity over time were similarly stable (Table S4, Supporting information). Relative to most North American (Paetkau *et al.* 1998b; Proctor *et al.* 2012) and European (Waits *et al.* 2000; De Barba *et al.* 2010; Skrbinsek *et al.* 2012a) brown bear populations, genetic diversity in Yellowstone bears is moderately low, with several isolated populations exhibiting diversity estimates that are approximately half those of Yellowstone bears (summarized in Skrbinsek *et al.* 2012b). Given that this is an isolated population, there will inevitably be loss of genetic variation without immigrants or transplants. However, increasing GI and N_e will slow the loss in genetic variation over the long term (100–200 years) (e.g. Perez-Figueroa *et al.* 2012).

Technical considerations

The accuracy of N_e and N_b estimates is affected by the amount of marker information (number and variability of genetic loci) and sample sizes used in calculations. Bias will decrease as the number of genetic loci available increases. The SA and EPA methods are particu-

© 2015 John Wiley & Sons Ltd

larly sensitive to this because they rely heavily on the accuracy of assigning genetic relationships among individuals. Wang *et al.* (2010) showed that a minimum of eight microsatellites are needed to accurately estimate N_e with the EPA approach, even with low sampling effort (16% of each age class). Another study revealed the SA method, when applied to polygamous species, essentially becomes unbiased with 20 loci, but this is also contingent on having a sufficient sample size relative to N_e (Wang 2009). Simulations indicated that SA-based estimates are biased low (Wang 2009) and EPA-based estimates display a bimodal distribution as the sampling proportion decreases (Wang *et al.* 2010).

Here, using empirical data, we confirmed that N_e estimates derived from both relatedness-based methods might be sensitive to small sample sizes (Figs S4 and S5B). For example, with an approximate 50% reduction in sample size, estimates were 18% and 28% lower for the EPA and SA methods, respectively. Also, sensitivity appears to increase as sample sizes decrease (Fig. S6, Supporting information). The potential nature and magnitude of sample size sensitivity should be considered when assessing overall trends in N_e. For example, if sample size in any given year/cohort is small, the true N_e may be higher than what is reported. Alternatively, the observation that relatedness-based estimates showed greater sensitivity to sampling in more recent years may be more directly related to a decrease in the sampling proportion, imposed by holding sample size constant and given that the true N_e has increased over time.

In contrast, LD-based estimates appeared to be less sensitive to decreased sample size ($n = 50$) when correcting for the lowest allele frequency applied (Fig. S5, Supporting information). For the LD method, a minimum cohort sample size threshold of $n = 30$ animals/cohort is recommended, based on evidence from simulations suggesting that estimates are reasonably unbiased when $n > 30$ and $n/N_e > 0.1$, given that N_e is not very large ($N_e < 300$–500) (Waples 2006a; Waples & Do 2010). The 1984 (i.e. 1983–1985) through 1986 (i.e. 1985–1987) cohorts had sample sizes <30, which is reflected in the low precision of N_e estimates for these years (Fig. 1C). Sampling proportions were likely lower in the 1980s and, thus, if such bias exists, it may only apply to estimates from earlier years. Despite these possible biases, when we accounted for differences in sample size across yearly or cohort samples, we consistently observed an increasing trend in N_b and N_e for the GYE grizzly bear population (Figs S4 and S5).

All N_e estimators can be influenced by the sampling scheme (Waples & Yokota 2007), with most methods assuming random sampling from a single discrete generation or cohort in the population. If sampling is nonrandom, N_e might be underestimated because the frequency of related individuals is likely to be higher than the population as a whole. In this study, yearly sampling was conducted broadly throughout the whole ecosystem (Fig. S1, Supporting information) and the probability of nonrandom sampling was low. The assumption of discrete, nonoverlapping generations is a major drawback, as it is often violated in long-lived species such as grizzly bears. In fact, there are very few species that would satisfy this requirement, and many studies have applied these approaches to age-structured populations (e.g. Jansson *et al.* 2012; Skrbinsek *et al.* 2012a; Wright *et al.* 2012; Baalsrud *et al.* 2014).

In heterogeneous samples with individuals from multiple age classes, allele frequency differences among age classes may cause biases in N_e estimates that cannot be overcome by increasing sample size. In large mammals in particular, estimates may be biased high (Waples & Yokota 2007; Luikart *et al.* 2010; Waples 2010). The temporal method of Jorde & Ryman (2007) addresses this problem by measuring allele frequency changes over consecutive homogeneous cohorts. It has been demonstrated as being nearly unbiased and therefore the best option if demographic data are available (Waples & Yokota 2007). Of the single-sample approaches, only the EPA (Wang *et al.* 2010) method is regarded as unbiased and applicable to age-structured populations. Nonetheless, here we show coincident estimates and trajectories for N_e and N_b in GYE grizzly bears using a range of both temporal and single-sample approaches that vary in the assumption of nonoverlapping generations.

Simulations have shown that the standard temporal method is biased when violating the assumption of discrete generations, but can reasonably approximate N_e in populations with overlapping generations when the time interval between samples (t) is large ($t \gg$ GI) and the population size is small (Nei & Tajima 1981; Waples & Yokota 2007; Waples 2010). The separation of samples many generations apart maximizes the drift signal to overcome noise due to sampling variance and internal age-sex structures (Jorde & Ryman 1995; Waples & Yokota 2007). Even though the maximum-likelihood approach (MLNe) for estimating N_{eV} has been shown to be more precise than other temporal methods using F-statistics, due to the presence of rare alleles (Wang 2001), this method did not appear to perform well with our data set. Point estimates of N_e using MLNe were imprecise and unrealistically high, approaching the *a priori* assumed upper threshold of 5000 (Fig. 2). This result may be due to a low signal to noise ratio, potentially resulting from small t and large population size. As population size increases, the drift signal becomes weak and, thus, larger t may be required to detect an

© 2015 John Wiley & Sons Ltd

adequate signal for N_e estimation. Also, in our data, sample size in 1982 was small ($n = 52$), and sampling variance possibly contributed to the noise. We repeated the analysis using a larger sample, but more closely separated in time (i.e. 1987: $n = 74$, two generations apart), and results were similar (data not shown). We conclude that the maximum number of generations between samples applied (2.5 generations) was probably not sufficient and that the available samples and study time frame limited our ability to estimate N_e with the MLNe approach. We also note that in contrast to the other moment-based temporal estimators of Jorde & Ryman (2007) and Nei & Tajima (1981), the MLNe method incorrectly assumes sampling without replacement, which may introduce another source of error.

When violating the assumption of nonoverlapping generations, estimates from the LD and SA approaches yield estimates of N_b (number of breeders that produced the cohort) rather than N_e, as described previously. Here, in order to estimate N_b using these approaches, we pooled cohorts over three successive years, to increase sample sizes, while also accounting for intermittent breeding and excluding the possibility of parent–offspring pairs within the 3-year interval. Both Waples *et al.* (2014) and Robinson & Moyer (2013) showed that LD estimates are downwardly biased when using random samples from adults of all age classes. The effects of pooling cohorts vary across species, depending on the ratio of N_b to N_e, with a slight upward bias in grizzly bears when three cohorts are pooled and when $N_b/N_e \approx 1$ (see Figure S7 in Waples *et al.* 2014). However, negative bias due to skip breeding might counterbalance this positive bias due to pooling cohorts. The power of the SA approach, in particular, should not be compromised by the inclusion of multiple cohorts as long as individuals can be partitioned into offspring and candidate parents (Wang 2009), which we were able to do with considerably detailed information on individuals' sex and age due to long-term monitoring of this population.

The relationship between N_b and N_e is complicated and, in previous studies (e.g. Skrbinsek *et al.* 2012a), has been generalized from semelparous species that show N_b multiplied by the GI is approximately equivalent to N_e (i.e. $N_e \approx \text{GI} \times N_b$) (Waples 2006b). In reality, N_e may fall somewhere between N_b and GI $\times$ N_b because the number of breeders each year consists of adults from multiple age classes that represent several generations (Wang 2009; Luikart *et al.* 2010). A recent study by Waples *et al.* (2013) demonstrated that the ratio of N_b/N_e is a function of a few key life history traits and varies much more than previously expected in species with overlapping generations. Using previously published life history parameters, their study also estimated the N_b/N_e ratio in grizzly bears to be close to 1. However, this estimate would be reduced if lifetime variance in reproductive success among individuals in a cohort (V_k) is greater than the mean number of offspring produced by a parent over its lifetime ($\overline{K}$).

It is not clear how the N_b/N_e ratio may be affected by changes in demographic parameters (e.g. sex-specific survival, sex ratio, GI) through time, and our data suggest it is probable that these parameters have not remained constant in Yellowstone bears. For example, GI increased over our study period from approximately 8 years in the 1980s to 10 years in the 1990s and 14 years in the 2000s (Fig. 1B). This finding is supported by demographic evidence of an increase in GI based on population projections (1983–2001: GI = 10.6–10.8, 2002–2011: GI = 12.9–13.6; IGBST, unpublished data). In addition, a shift in the female to male sex ratio from 3:2 to 1:1 has been detected, as male survivorship has increased (Interagency Grizzly Bear Study Team 2012). Intermittent breeding may also decrease N_b and increase N_e, which together would reduce the N_b/N_e ratio, although this reduction has been theoretically shown to be small (7–16%) for species with type I survival, such as grizzly bears (Waples & Antao 2014).

Given the recent work of Waples *et al.* (2013), N_{eI} could be potentially much closer to N_b in grizzly bears and other species. Also, in theory, heterozygosity-based estimates of N_e are expected to be lower than variance-based estimates in a growing population (Crow & Denniston 1988; Allendorf *et al.* 2013). In this study, neither of these expectations was met, although N_{eI} did fall on the lower end of the range of N_{eV} values.

When comparing N_e and N_b estimates from single- and multiple-sample temporal approaches, it is important to note that the time frame to which the estimates apply may differ (Waples 2005). The LD- and SA-based N_b estimates are expected to apply to the 3-year time period during which a cohort was sampled, representing the number of breeders producing that cohort (e.g. Beebee 2009; Skrbinsek *et al.* 2012a). In nonequilibrium populations undergoing fluctuations in effective size, however, the LD approach is affected by previous generations that are theoretically expected to introduce transient biases in N_e due to residual linkage disequilibria (Waples 2005). In contrast, N_e estimated using the EPA approach is expected to represent the generation (i.e. approximately 10 years) prior to when the population sample was collected (Wang *et al.* 2010). Temporal estimates do not provide information on N_e relevant to the most recent generation sampled, but instead reflect the harmonic mean of N_e over the entire time interval analysed (Waples 2005).

Ratio of effective to census population size

The N_e/N_c ratio in our study ranged between 0.42 and 0.66, which is considerably higher than other published estimates for this population that are based on historical genetic data (N_e/N_c = 0.27; Miller & Waits 2003) and demographic simulations accounting for a broad range in the variance of reproductive success (N_e/N_c = 0.24–0.32; Harris & Allendorf 1989). Our estimated ratio was also much higher than brown bear populations in Alaska (N_e/N_c = 0.04–0.19; Paetkau *et al.* 1998b) and southern Sweden (N_e/N_c = 0.06–0.14; Tallmon *et al.* 2004), but comparable to a population in the Pasvik Valley of Northern Europe ($N_e/N_c \sim 0.6$; Schregel *et al.* 2012). Results from a meta-analysis indicated that the N_e/N_c ratio is often higher in small populations (Palstra & Ruzzante 2008), which may have contributed to the ratios we observed.

A high N_e/N_c ratio may also be caused by inflated N_e estimates or conservative estimates of N_c (i.e. demographic estimates that are biased low). Our sensitivity analyses indicated a tendency to underestimate N_e at low sampling proportions, so we do not regard inflated N_e estimates as a likely explanation. However, an underestimation bias has been documented for the Chao2 estimator (Cherry *et al.* 2007; Schwartz *et al.* 2008), which produced the largest N_e/N_c ratios. Indeed, the N_e/N_c ratios were lower when using the M-R estimates, which appear to be unbiased (Higgs *et al.* 2013). If in fact the N_e/N_c ratio corresponds more closely with previous estimates, these findings suggest the M-R estimates are much closer to the true population size than the Chao2 estimates. This interpretation is consistent with the study of Higgs *et al.* (2013), who concluded based on simulations that M-R estimates were centred on the true value, although variability was large.

Inferring N_c from N_e may only be appropriate if the N_e/N_c ratio remains stable over time, but is generally not advisable if variance in reproductive success is high (reviewed in Luikart *et al.* 2010). We observed relatively stable values for the N_e/N_c ratio for the duration of the study period (Fig. S2, Supporting information) and reproductive parameters tend to have low variance among Yellowstone grizzly bears (e.g. low standard error for fecundity; Schwartz *et al.* (2006), IGBST 2012:33). This implies that if we could accurately measure this ratio, estimation of N_e could provide an additional tool for evaluating N_c.

Conclusions

Our results suggest that the Yellowstone grizzly bear population has increased substantially over the past three decades, supporting demographic evidence that conservation measures implemented under the ESA have thus far aided the recovery of this population. Specifically, our findings suggest that genetic diversity has shown no decline in recent decades, and contemporary N_e substantially exceeds the inbreeding avoidance goal ($N_e > 50$) and may eventually approach the long-term viable population criterion ($N_e > 500$) defined by Franklin (1980) (Fig. 1A). Thus, our study suggests that current effective population sizes are sufficiently large ($N_e \gg 50$) to avoid substantial accumulation of inbreeding depression, reducing concerns regarding genetic factors affecting the viability of Yellowstone grizzly bears. Nonetheless, the historically small N_e, relatively low diversity and isolation over many generations suggest the grizzly population could benefit from increased fitness following the restoration of gene flow (e.g. Tallmon *et al.* 2004; Hogg *et al.* 2006), particularly given the unpredictability of future climate and habitat changes.

Our study shows that genetic monitoring of N_e can be a valuable tool for animal conservation and management. Effective population size summarizes the effects of many demographic factors (e.g. N_c, sex ratio, variance in fecundity and survival) on the strength of inbreeding and genetic drift processes and can provide important information regarding a population's long-term evolutionary potential and susceptibility to short-term inbreeding depression. Although N_c is positively related to N_e, two populations with the same N_c may differ in N_e and thus follow different evolutionary (and viability) trajectories. Therefore, monitoring of N_c alone may not be sufficient for making informed decisions regarding long-term population health. This study demonstrates how multiple independent estimators of the genetically effective population size can be used to complement traditional ecological estimators of abundance to improve our understanding of eco-evolutionary processes and population monitoring for conservation and management.

Acknowledgements

We thank Chris Servheen and the U.S. Fish and Wildlife Service for providing funding for this study, Lisette Waits and Craig Miller for historical genotype data, and Per Jorde for discussions regarding analyses. We are especially grateful to Robin Waples for valuable discussions regarding technical considerations of effective population size estimators. Cecily Costello, Robert Wayne and three anonymous reviewers provided helpful comments on previous drafts of the article. We further thank the member agencies of the Interagency Grizzly Bear Study Team for their continued support and commitment to providing GYE grizzly bear samples for genotyping: U.S. Geological Survey; U.S. Fish and Wildlife Service; National Park Service; U.S. Forest Service; Wyoming Game and Fish Department; Montana Fish Wildlife and Parks, Idaho Fish and Game;

Table S4. Genetic diversity indices for the Greater Yellowstone Ecosystem grizzly bear population compiled and recomputed (to correct for differences in sample size) across studies. Population genetic diversity indices, evaluated at time points between 1910 and 2010, included allelic richness (*A*), observed heterozygosity (H_O), and expected heterozygosity (H_E) across 8 microsatellite loci. Standard deviation (sd) of heterozygosity estimates are reported. Results are compared with data from a previous study on the same GYE grizzly bear population by Miller and Waits (2003). Results reported here use the same 8 loci for all datasets, however, alleles were not standardized across studies and, therefore, analyses were conducted independently.

Year	No. gene copies[1]	A^2	H_O (sd)	H_E (sd)	Data source
1910s	44	4.39	0.569 (0.169)	0.580 (0.157)	Miller & Waits, 2003
1960s	99	4.01	0.565 (0.196)	0.580 (0.196)	Miller & Waits, 2003
1985	132	3.94	0.566 (0.261)	0.561 (0.244)	This study
1990	228	3.91	0.575 (0.251)	0.557 (0.239)	This study
1990s	225	3.88	0.558 (0.224)	0.559 (0.232)	Miller & Waits, 2003
1995	422	3.95	0.586 (0.244)	0.566 (0.239)	This study
2000	654	3.97	0.568 (0.239)	0.566 (0.239)	This study
2005	740	3.93	0.568 (0.239)	0.568 (0.239)	This study
2010	576	3.89	0.559 (0.246)	0.564 (0.245)	This study

[1]*Average number of gene copies across 8 loci reported for Miller & Waits (2003) data: G1A, G10B, G10C, G1D, G10L, G10M, G10P, G10X.*

[2]*Estimates of A corrected for sample size through rarefaction in HP-RARE (Kalinowski), using smallest number of gene copies at a single locus (n = 35).*

Table S5. EPA-based estimates of grizzly bear effective population size (N_e) and generation interval (GI), Greater Yellowstone Ecosystem, 1982–2007.

Year	*n*	N_e	GI
1982	52	102 (64–207)	7.8 (6.0–11.1)
1983	63	109 (76–211)	8.0 (7.2–11.8)
1984	67	117 (85–221)	9.4 (7.1–12.2)
1985	66	120 (95–220)	7.7 (6.1–9.9)
1986	76	142 (115–236)	8.5 (6.8–10.9)
1987	74	181 (98–281)	7.8 (6.7–10.3)
1988	88	156 (120–262)	8.3 (7.0–10.0)
1989	95	137 (115–237)	8.7 (7.2–10.4)
1990	114	168 (144–275)	9.0 (7.6–11.3)
1991	128	195 (170–295)	9.1 (7.9–11.2)
1992	143	192 (168–316)	10.7 (8.8–12.0)
1993	166	200 (184–329)	10.4 (9.2–12.7)
1994	183	235 (202–391)	10.6 (9.1–13.7)
1995	211	281 (208–425)	9.4 (9.0–12.7)
1996	239	294 (241–478)	10.4 (9.7–13.4)
1997	269	309 (231–498)	10.5 (9.9–13.1)
1998	286	327 (252–554)	11.0 (10.0–13.5)
1999	314	365 (228–640)	10.1 (9.4–13.9)
2000	327	372 (188–690)	10.8 (10.4–14.9)
2001	328	387 (202–691)	10.6 (10.5–14.0)
2002	342	410 (231–726)	13.4 (11.6–15.2)
2003	348	420 (221–726)	14.7 (12.6–16.4)
2004	364	450 (259–747)	15.3 (13.7–16.8)
2005	370	516 (226–872)	14.8 (13.3–16.6)
2006	379	460 (276–811)	15.0 (13.2–17.3)
2007	379	469 (284–772)	17.1 (14.7–19.1)
Mean		274	10.8
Harmonic mean		213	10.2

Table S6. SA-based estimates of effective number of breeders (N_b) of grizzly bears in the Greater Yellowstone Ecosystem, 1984–2007. Effective number of breeders is reported per 3-year cohort. Year for which the estimate represents (as in Fig. 1C), and sample size (*n*) are reported.

Cohort	Year	*n*	N_b
83–85	1984	22	44 (25–88)
84–86	1985	25	50 (30–95)
85–87	1986	29	45 (28–80)
86–88	1987	38	57 (37–91)
87–89	1988	34	51 (31–87)

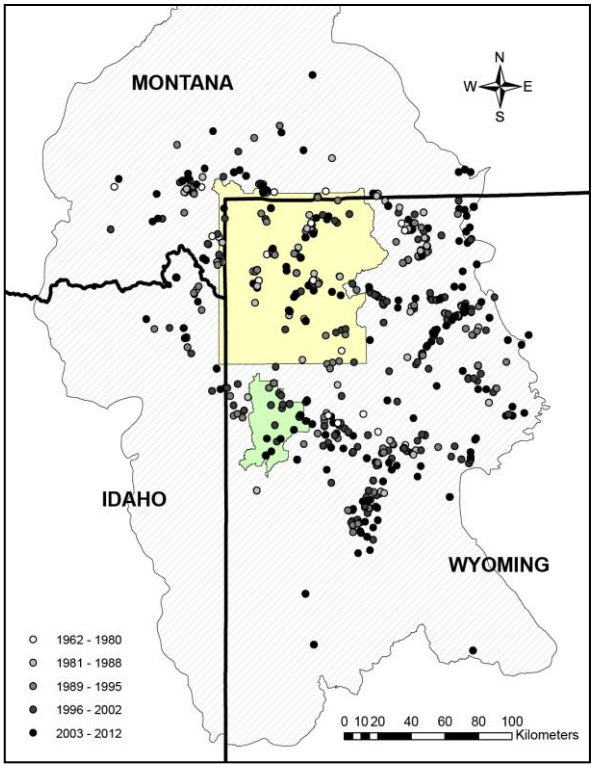

Figure S1. Map of grizzly bear genetic sampling locations. Samples color-coded by birth year in a gradient from white to black (1962 to 2012). Yellowstone National Park is shaded in yellow and Grand Teton National Park in green. The Greater Yellowstone Ecosystem is represented by diagonal line shading.

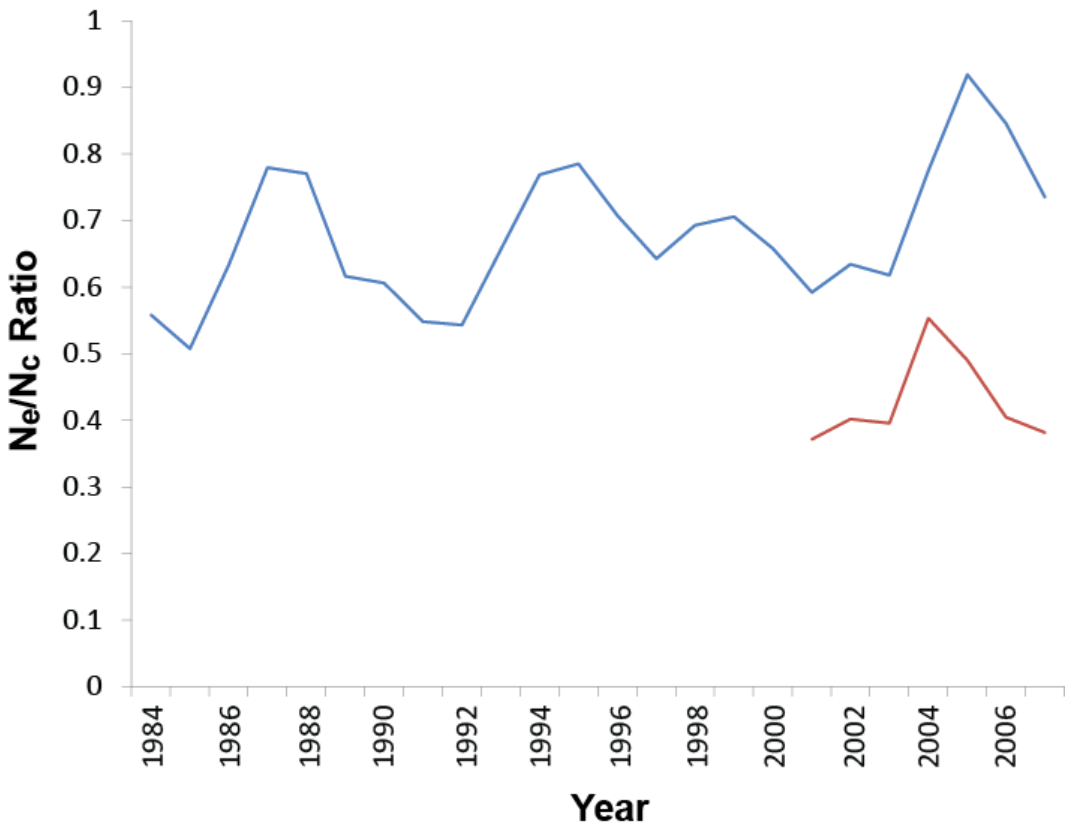

Figure S2. N_e/N_c ratio over time of grizzly bears in the Greater Yellowstone Ecosystem. The ratios of effective-to-census population size (N_e/N_c) for the Greater Yellowstone Ecosystem grizzly bear population, 1984–2007, estimated for each year using the N_e point estimate from the EPA (estimator by parentage assignment) single-sample method in the numerator. Ratios were calculated with two different demographic estimators of N_c (Chao2 = blue; Mark-Resight = red).

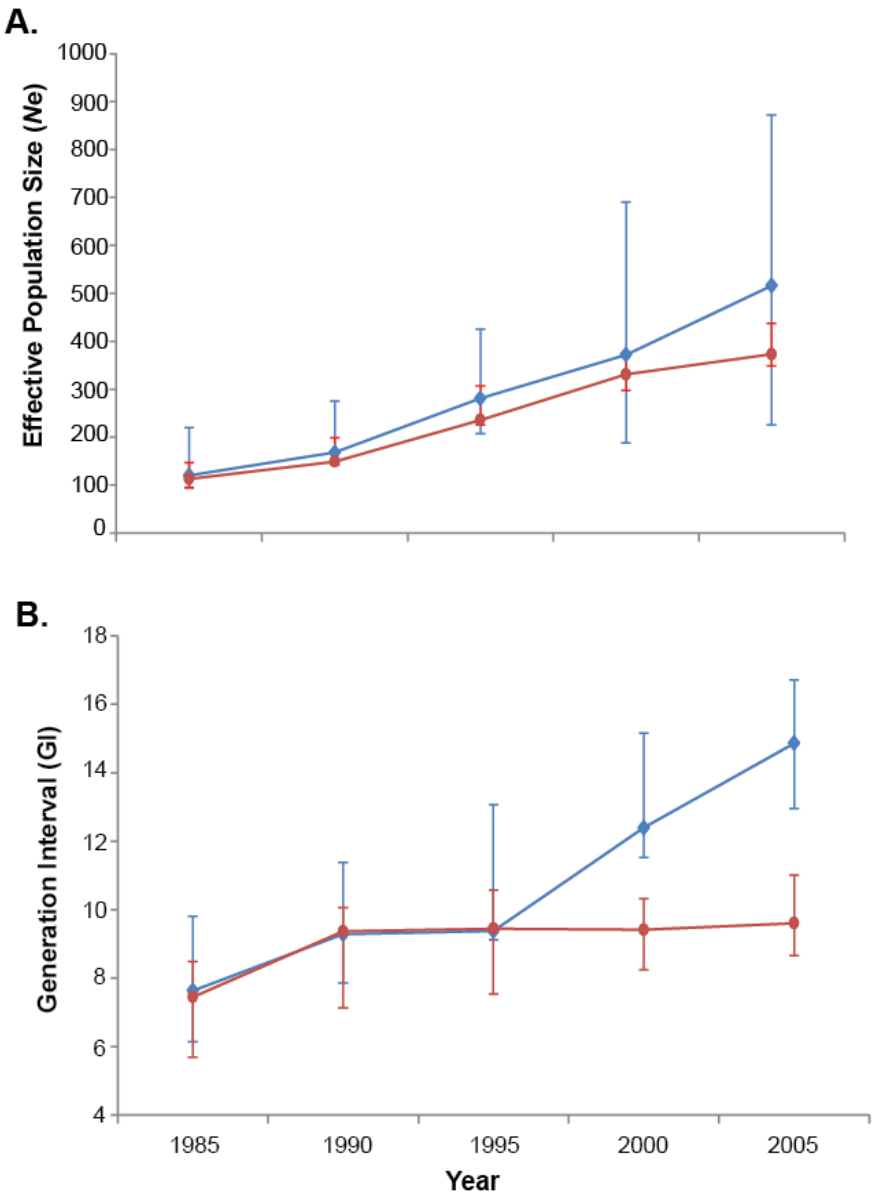

Figure S3. Evaluating sensitivity of the EPA (estimator by parentage assignments) approach to assumed parentage threshold values. Effective population size (A) and generation interval (B) estimated over five population samples using a parentage assignment probability threshold of 0.95 (blue) and 0.80 (red) for grizzly bears in the Greater Yellowstone Ecosystem, 1985–2005**.** Error bars indicate parametric 95% confidence intervals based on 1,000 simulations.

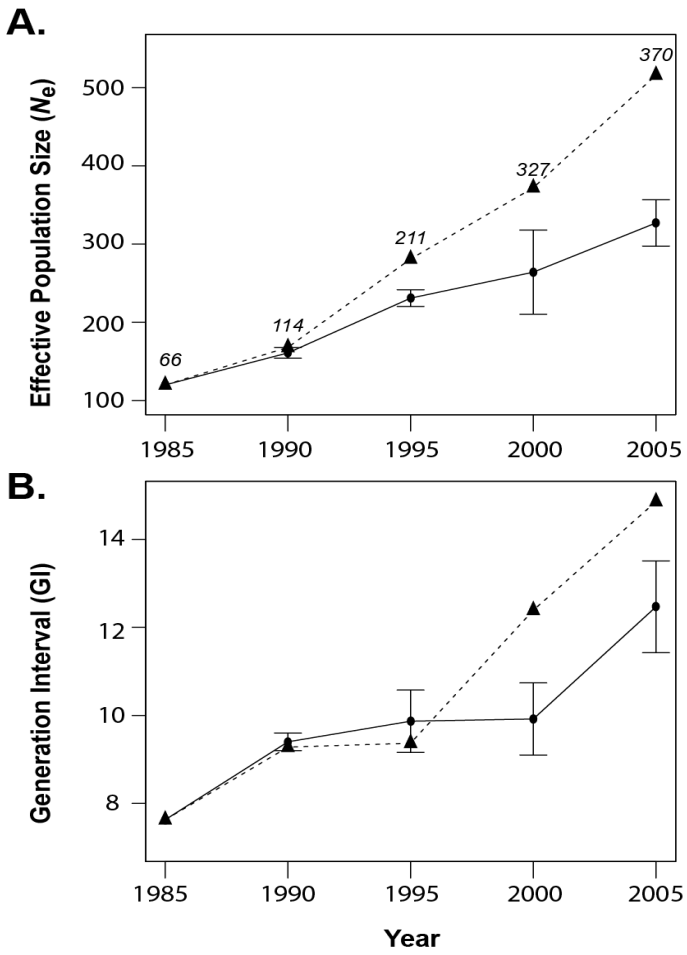

Figure S4. Evaluating sensitivity of the EPA (estimator by parentage assignments) approach to sample size. Effective population size (A) and generation interval (B) estimated over five cohort samples using all data (dashed line; sample size shown in italics) and a random subset of the data (solid line; *n* = 100) for grizzly bears in the Greater Yellowstone Ecosystem, 1985–2005. Error bars showing 95% confidence intervals are derived from 10 independent runs using randomly selected data subsets. Runs applied marker error rates and assumed 95% reliability of parentage assignments, 0.5 prior probability of including a parent in the sample, and 1,000 bootstrap replicates.

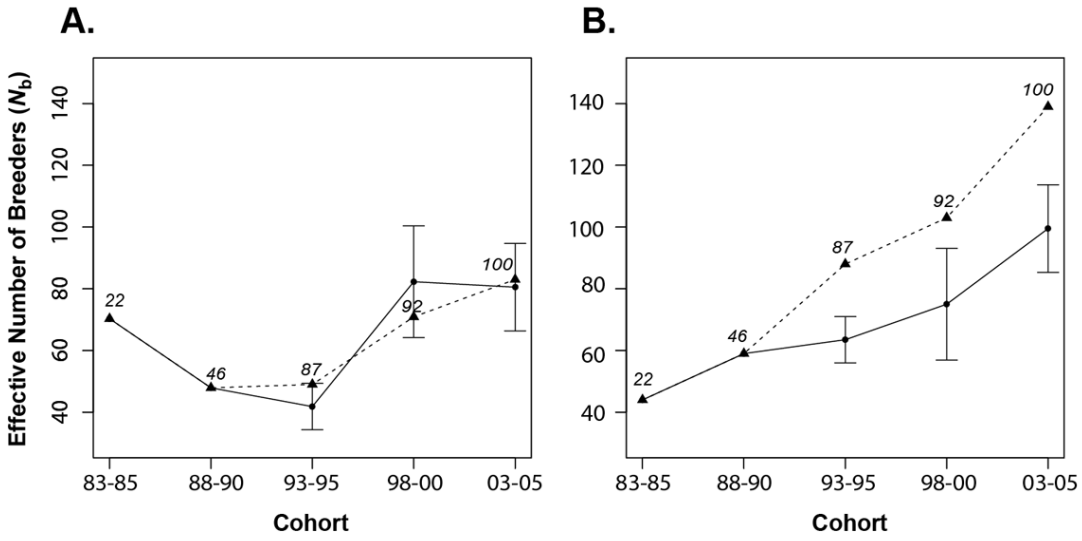

Figure S5. Evaluating sensitivity of N_b estimation approaches to sample size. Sensitivity to sample size evaluated for the Linkage Disequilibrium (A) and Sibship Assignment (B) single-sample approaches for grizzly bears in the Greater Yellowstone Ecosystem, 1985–2005. Effective number of breeders (N_b) estimated over five cohort samples using all data (dashed line; sample size shown in italics) and a random subset of the data (solid line; n = 50). In LD analyses, lowest allele frequency used was 0.02 for subset analysis to account for lower sample size. Error bars showing 95% confidence intervals are derived from 10 independent runs using randomly selected data subsets.

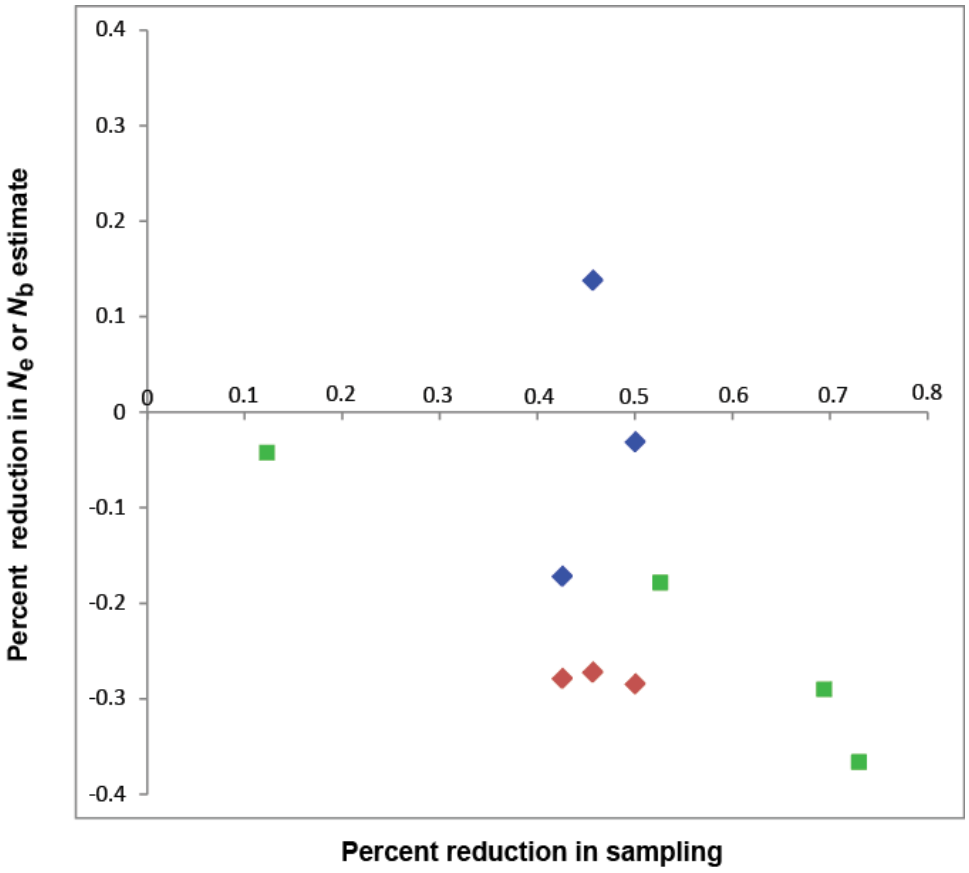

Figure S6. Percent differences in estimates with reductions in sampling. Percent differences in N_e (EPA: green squares) and N_b (LD: blue diamonds, SA: red diamonds) estimates as a function of the percent reduction in sample size for grizzly bears in the Greater Yellowstone Ecosystem, 1985–2005. Data shown summarize the results of sample size sensitivity analyses reported in Figures S4a and S5.

November 6, 2015.

Dear Secretary Jewell and Director Ashe:

As envoys representing the stance taken by over forty federally recognized tribal nations that stand in opposition to the federal government's stated intent to imminently remove Endangered Species Act (ESA) protections from the Yellowstone grizzly bear to enable state management of grizzlies, which will include the trophy hunting of these beings that are integral to our cultures, we again wish to draw your attention to matters of great concern that have yet to be addressed by the Department of the Interior.

The US Fish and Wildlife Service's (FWS) public admission that it has, to date, only attended five preparatory consultation meetings with tribes, when over forty tribal nations have issued official declarations and resolutions opposing the delisting of the Yellowstone grizzly bear, is unacceptable and entirely contradicts both the established framework for the consultation process between tribal nations and federal agencies that is to be conducted on a government-to-government basis, and also the position espoused and formulated on consultation with tribal nations by the President of the United States.

FWS's latest maneuver, a publicized invitation for tribes to participate in a "webinar," does not amount to the "meaningful consultation" called for by President Obama in his 2013 Executive Order establishing the White House Council on Native American Affairs. FWS's "webinar" invitation asks for tribes to "voice concerns" and states, "Given the historical, cultural, and spiritual connection many tribes have to the grizzly bear, we are especially interested in talking to you and hearing input on any potential actions the Service may take" concerning the Yellowstone grizzly bear. While it is encouraging to note that FWS now recognizes the cultural significance of the grizzly bear to tribal nations, which clearly falls under the American Indian Tribal Rights, Federal-Tribal Trust Responsibilities, and the Endangered Species Act (US Dept. of Interior and Commerce Order, June 5, 1997), it is disturbing that the information being

requested has already been submitted to the FWS in the form of official declarations and resolutions. Were those documents to be read, the answers solicited would be found.

A "webinar" is not consultation. Consultation, as detailed in recent resolutions by the Standing Rock Sioux Tribe and Oglala Sioux Tribe, is to be conducted on a government-to-government basis with tribes individually. The consensus among tribal representatives we have discussed this development with consider it to be no more than a PR stunt, designed for the press as part of FWS's and the states' delisting publicity mechanism, and for that reason we are urging affected tribes to boycott this "webinar" and insist that FWS honor the long-established obligation of a federal agency to engage in a thorough, good faith, consultation process. Attached is Oglala Sioux Tribe Resolution 15-192, passed 10/5/15, which details that process. In the last six weeks alone, the Ute Mountain Ute Tribe, the Southern Ute Tribe, the Hopi Tribe, the Standing Rock Sioux Tribe, the Oglala Sioux Tribe, the San Carlos Apache Tribe and the Zuni Pueblo have all submitted written requests to FWS asking for the initiation of formal consultation on this issue.

In a statement issued to the Interagency Grizzly Bear Committee–Yellowstone Ecosystem Subcommittee (IGBC-YES) on 11/3/15, Oglala Sioux President, John Yellow Bird Steele, stated: "The federal government recognizes the Oglala Sioux Tribe as one of the twenty-six Associated Tribes of Yellowstone, but it did not include the Oglala Sioux Tribe, or indeed any tribal nation, in the Conservation Strategy relative to its plans to delist the grizzly bear. Ignoring the tribal nations impacted by this proposal, an action that will take place upon our ancestral lands, speaks to the complete lack of respect accorded tribal nations in this process. The OST, along with every other Associated Tribe of Yellowstone, and tribal nations farther afield impacted by this policy, must be signatories of the Conservation Strategy and included in all subsequent discussions in the decision making process. Continuing to ignore tribal nations on this issue is a violation of tribal sovereignty, an attack on our religious and spiritual freedoms, and a clear violation of the federal trust responsibility."

It is at best contradictory for FWS to refer to tribes as "valued tribal partners" in the handful of stock letters it has issued to tribal leaders on this issue, and then completely overlook tribes, not only relative to consultation, but the Conservation Strategy. The Shoshone-Bannock Tribes of Idaho and the Eastern Shoshone Tribe are two of the three tribes with seats on the IGBC-YES Subcommittee, but even they were omitted. All of the nations recognized by the federal government as "Associated Tribes of Yellowstone," along with those tribes that have demonstrated that they are affected by this action, must be included in this process and be signatories to the Conservation Strategy. The Wind River Mountain region is both undeniably part of the traditionally territory of the Eastern Shoshone and Shoshone-Bannock Tribes, and also vital grizzly bear recovery habitat under the criteria of the Conservation Strategy.

It is a clear infringement of tribal sovereignty to exclude these tribes. The existent grizzly bear management plan for the Wind River Indian Reservation was largely crafted by the State of Wyoming. Tribal nations must be included, and their inclusion facilitated by the federal government, in the formulation of grizzly bear management plans, in order that those plans reflect the cultural imperatives of those tribes, and provide for possible economic opportunities through eco-tourism. Tribes should be supported in developing their own grizzly bear management programs that employ qualified tribal members. To that end, the federal

government should be investing in programs to enable tribes to pursue this avenue of self-determination under the federal trust responsibility, not undermining tribes by encouraging the adoption of state influenced plans that are contrary to tribal values. In short, FWS should validate its claim that tribes are "valued partners" by accepting tribes as partners in the co-management of grizzly bears, and making tangible strides to that end.

To date, this process has lacked transparency. On 5/6/2015 Director Ashe indicated during a US Senate Committee on Environment & Public Works hearing that the decision to proceed with delisting the Yellowstone grizzly bear from the ESA had already been made before any meaningful tribal consultation process had even been initiated. During the hearing Ashe stated to Senator John Barrasso (R-WY), Chairman of the Senate Committee on Indian Affairs, "We agree that grizzly bears are recovered. We are working with the states of Wyoming and Idaho and Montana literally as we speak to try to put together the frame for a potential delisting proposal." Director Ashe's statement about actively putting together "the frame for a potential delisting proposal" on 5/6/15 contradicted the attestation of FWS Mountain-Prairie Regional Director, Noreen Walsh, made in the FWS stock letter of 6/15/15 to Standing Rock Sioux Chairman, Dave Archambault II, that FWS was "in the early stages of considering the listing status of the Yellowstone grizzly bear population." FWS Assistant Director Gary Frazer's statement of 8/18/15 that FWS was "cautiously optimistic" about issuing the new rule to delist the Yellowstone grizzly bear this fall (2015) further contradicts FWS's claim on the delisting timetable. As OST President Steele highlighted in his statement to the IGBC, "The consultation process must take place and be concluded before any proposed delisting rule can be issued." By its recent public pronouncements, FWS has admitted that the consultation process has barely begun, but that it still plans to issue the delisting rule before the end of the year.

The totality of the circumstances require the proposal first submitted to the Obama Administration by the Navajo Nation and the Northwestern Band of the Shoshone Nation to be adopted. Those nations called for a moratorium to be instituted by the Department of the Interior on the delisting of the Yellowstone grizzly bear so that a full, thorough, and meaningful tribal consultation process can take place, during which the points raised by each respective tribal nation in their official resolutions and declarations can be fully addressed and incorporated into future federal grizzly bear management plans and policy positions. A moratorium would also allow tribes to engage independent scientists to review the raw data the FWS is basing its decisions on, but as yet has refused to release to tribal nations or independent scientists. As President Steele said, "Transparency is essential for not only tribal members, but also the American people as a whole, to have any confidence in this process." Multiple nations have since petitioned the Department of the Interior and FWS to follow this course.

It is completely unacceptable that the raw data compiled at the expense of taxpayers is not being made available to the affected tribes, and to independent scientists for review. When FOIA requests have been filed, the FWS and its agents have provided only redacted documents or documents with "Do not cite" notices attached (WWA FOIA-USGS/IGBST, 5/26/15). Interagency Grizzly Bear Study Team (IGBST) leader, Frank Van Manen, publicly stated that the data would not be released because, as a researcher and scientist, his livelihood depended on being able to submit articles to journals from this data. This issue is greater than the personal agenda of one government biologist. Indeed, the most recent article authored by Mr. Van Manen

and Ms. Pauline Kamath in Molecular Ecology has been dismantled and discredited by independent scientists, among them former IGBST members, who state that it is, "founded on numerous often unmet assumptions." Tribal nations and the American people deserve biological conclusions established by the "best available science," not propaganda designed to support the delisting agenda. A recent study by Harmony Kristin Szarek revealed that two out of three leading grizzly bear biologists she canvassed opposed delisting.

The population projections released at the IGBC-YES Subcommittee this week validate the concerns expressed by tribal nations that oppose delisting the Yellowstone grizzly bear. The Northern Cheyenne Tribe and the Shoshone-Bannock Tribes of Idaho were the first to question the population trend. Former IGBST scientists advising GOAL Tribal Coalition and the tribes deduced that the Yellowstone grizzly population was not expanding, as consistently being stated by FWS and the states, but was, in fact, declining, and had plateaued since 2002. There are not more grizzly bears; there is less food, which is resulting in bears being observed in areas white people have not seen them in since they virtually extirpated the grizzly. In the Bozeman Daily Chronicle (8/2/15), Suzanna Soileau of the IGBST publicly stated, "Right now we can't tell which direction the [grizzly] population is going." Now we know; the IGBC grizzly population estimate of 714 demonstrates the decline. When the known mortality for 2015 is factored in, the population estimate will be 660. This figure stands in stark contrast to the estimates fed to the press by FWS Coordinator Chris Servheen and past and present IGBC chairs, all of who inflated the figure to twice that, presumably to support the delisting agenda. In September, one grizzly bear was killed every other day in Greater Yellowstone. Applying FWS's approved estimator to account for unknown mortality, it is likely that 10% of the Greater Yellowstone grizzly population has been killed this year. In light of this, and the accepted analysis of the catastrophic loss of the staples of the grizzly bear's diet, it is inconceivable to move forward with a delisting rule.

Neither tribal people, nor the American people en masse, will stand silent if they start to see footage and images of the most iconic being in the West being slaughtered for fun in arguably the most iconic landscape in America. The majority of the American people, irrespective of ethnicity, are not going to support the facilitation of hundreds of Dr. Walter Palmer's, the slayer of Cecil the lion, at the expense of their interests and values, and those of myriad tribal nations. Trophy hunters comprise a tiny minority among the American people. The majority find trophy hunting sentient beings to be abhorrent, archaic, and unacceptable as a "wildlife management tool." Tribal nations have viable alternatives to this practice.

In closing, we quote from Chairman Herman G. Honanie in the Hopi Tribe's declaration opposing delisting: "It is not necessary to debate whether or not the grizzly bear is recovered, being as the government's own population estimates show that there may be fewer than 1,400 grizzlies remaining in the contiguous United States, where, pre-Anglo European contact, it is believed that the grizzly population was in excess of 100,000. Some former government biologists warn that if federal protections are lifted, the grizzly could be doomed to the path of extinction within a decade. It is not the role of the federal government to restrict grizzly bears to two small, genetically isolated pockets; under the letter and intent of the ESA it is the government's responsibility to facility a full recovery. It is estimated that some 110,000 square miles of biologically suitable grizzly habitat exists in this region alone."

Respectfully,

Lee Juan Tyler,
Vice Chairman – Fort Hall Business Council, Shoshone-Bannock Tribes of Idaho.

James Walks Along,
Director – Northern Cheyenne Tribe THPO.

Ben Nuvamsa
Former Chairman – Hopi Tribe.
Hopi Bear Clan, and President of the Kiva Institute.

David Bearshield,
Chairman – GOAL Tribal Coalition, and Member of United Indian Nations of Oklahoma, Kansas and Texas.

Mike,
Here are the state comments on the CS. I have only reviewed quickly. Let's follow the same process we used on the MOU and talk next week after you have reviewed. Thanks.

Executive Summary
2016 Conservation Strategy for the Grizzly Bear in the Greater Yellowstone Ecosystem

Chapter 1 Introduction and Background

The future management of the Yellowstone grizzly bear population is envisioned as one in which the grizzly bear (*Ursus arctos*) and its habitat are conserved as integral parts of the Greater Yellowstone Ecosystem.

Within the Greater Yellowstone Ecosystem(GYE), the grizzly bear population and its habitat will be managed utilizing a management approach that identifies a Primary Conservation Area (PCA) and adjacent areas where occupancy by grizzly bears is anticipated and acceptable. The PCA is the existing Yellowstone grizzly bear recovery zone as identified in the 1993 *Grizzly Bear Recovery Plan (Recovery Plan)* (USFWS 1993). The PCA boundary will replace the recovery zone boundary to reflect the paradigm shift from managing for recovery to one of conservation.

In the Conservation Strategy, management direction is described for both the PCA and adjacent areas within the GYE (i.e., the Demographic Monitoring Area (DMA)). State grizzly bear management plans, forest plans, and other appropriate planning documents will provide specific management direction for the adjacent areas outside the PCA.

This Conservation Strategy was developed to be the document guiding management and monitoring of the Yellowstone grizzly bear population and its habitat upon recovery and delisting. This approach will remain in place beyond recovery and delisting. Ongoing review and evaluation of the effectiveness of this Conservation Strategy is the responsibility of the state, tribal, and federal managers in the GYE. This Conservation Strategy will be evaluated ~~updated~~ by the management agencies every five years or as necessary, allowing public comment in the updating process.

Comment [G5]: Comment: 2007 language sets expectations that may not be met so replace updated with evaluated

Upon implementation of the Conservation Strategy, the Yellowstone Grizzly Bear Coordinating Committee (YGCC) will replace the Yellowstone Ecosystem Subcommittee.

The purpose of this Conservation Strategy (Strategy) and the state plans is to:

- Describe and summarize the coordinated efforts to manage the grizzly bear population and its habitat to ensure continued conservation in the GYE.
- Specify the population, habitat, and nuisance bear standards[1] to maintain a recovered grizzly bear population for the foreseeable future.
- Document the regulatory mechanisms and legal authorities, policies, management, and monitoring programs that exist to maintain the recovered grizzly bear population.
- Document the commitment of the participating agencies.

Implementation of the management strategies requires continued cooperation between federal and state agencies.

The GYE is a dynamic environment; monitoring systems in the Strategy allow for dynamic management as environmental issues change. The agencies are committed to be responsive to the needs of the grizzly bear by dynamic management actions based on the results of detailed annual population and habitat monitoring.

The vision of the Strategy can be summarized as follows:

- The PCA will be a secure area for grizzly bears, with population and habitat conditions maintained to ensure a recovered population is maintained for the foreseeable future and to allow bears to continue to expand outside the PCA.
- Outside of the PCA, grizzly bears will be allowed to expand into biologically suitable and socially acceptable areas.

[1] Standards are management actions that are required in this Conservation Strategy. A deviation from a standard would occur only with a revision or amendment to the Conservation Strategy.

Outside of the PCA, the objective is to maintain existing resource management and recreational uses and to allow agencies to respond to demonstrated problems with appropriate management actions.

Outside of the PCA, the key to successful management of grizzly bears lies in bears utilizing lands that are not managed solely for bears but in which their needs are considered along with other uses.

Manage the GYA grizzly bear~~a~~ population within the area called the Demographic Monitoring Area (DMA), which is the area formerly called Suitable Habitat, to at least the 2002-2014 Chao2 average point estimate for total population, with 95% confidence intervals (i.e. 600-747). ~~The population objective in the DMA is the average population size in the DMA 2002–2014 and associated confidence intervals when this population was essentially stable. Use the model-averaged Chao2 population estimator applied inside the DMA to estimate the population on an annual basis and to set the mortality limits within the DMA so as to maintain this average population size using a sliding scale of mortality for independent females and males, and dependent young (*see* Appendix C).~~

Expand public information and education efforts.

Provide quick responsive management to ~~deal with~~address grizzly bear conflicts.

Manage grizzly bears as a game animal; including allowing regulated hunting when and where appropriate.

Comment [G6]: 2016 language to strike- population objectives above recovery are the purview of the states, replace with language from MOA

Relationship to Other Plans

By integrating state plans into the Strategy, it was ensured that the plans and the Strategy are consistent where necessary and complementary. The state plans are formally incorporated in the Conservation Strategy as Appendices I, J, and K.

Relationships with national forest and national park plans are also mentioned throughout the Strategy. Land and resource management plans for national forests and national parks in the GYE have incorporated the habitat standards and other relevant provisions of the Conservation

Strategy. For those standards and provisions not yet incorporated into management plans, the agencies will implement the habitat standards and monitoring requirements in this conservation strategy through their established planning processes, subject to NEPA or other legal requirements

Chapter 2 Population Standards and Monitoring

To maintain a healthy (recovered) grizzly bear population in the GYE, it is necessary to have adequate numbers of bears that are widely distributed with a balance between reproduction and mortality. This section details the population criteria in the *Recovery Plan* that were necessary to achieve recovery, and the population standards necessary to maintain it (USFWS 2016). The Strategy will continue to assess demographic recovery criteria within the Demograhpic Monitoring Area (DMA) created by the *Recovery Plan*. Because grizzly bears are a difficult species to monitor and manage, multiple standards with additional monitoring items are identified to provide sufficient information upon which to base management decisions. It is the goal of the agencies implementing this Conservation Strategy to manage the Yellowstone grizzly bear population in the entire GYE ~~at or above a total of 500 grizzly bears. DMA at the average population size between 2002–2014 when the population inside the DMA was essentially stable. Using the model-averaged Chao2 population estimation method this average population size was 674 (average lower 95% CI = 600; average upper 95% CI = 747)~~.

Comment [G7]: 2016 language to strike and replace with 2007 language; population goals above recovery are the purview of the states-support recovery cirteria which is to maintain a minimum population size of 500 animals in the Greater Yellowstone Area. The estimate of total population size cannot drop below 500 in two consecutive years. This estimate will be calculated by the Study Team using data obtained within the Demographic Monitoring Area.

Population standards and monitoring items include:

- Monitoring unduplicated females with cubs-of-the-year inside the GYE DMA.
- Calculating a total population estimate for the GYE DMA using the model-averaged Chao2 estimate of females with cubs-of-the-year (*see* Appendix C).
- Maintaining at least 500 bears in the GYE to assure the genetic health of the population.
  - ~~Five hundred bears is not a population goal but a minimum number necessary to address genetic health.~~

Comment [G8]: 2016 language to strike

- Monitoring the distribution of females with young of all ages and having a target of at least 16 of 18 BMUs (Bear Management Units) within the PCA occupied at least one year in every six, and no two adjacent BMUs can be unoccupied over any six-year period.
- Monitoring all sources of mortality for independent females and males (≥ 2 years old) and dependent young (<2 years old) within the GYE DMA and limiting mortality to annual mortality percentages on a sliding scale depending on the annual population size estimate using model-averaged Chao2.
- Monitoring population trend using female survivorship and reproductive rate data from radio-collared bears.
- Ensure meeting defined genetic management objectives ~~by facilitating occasional male movement between the Northern Continental Divide Ecosystem (NCDE) and GYE~~.

Comment [G9]: 2016 language to strike; if there are no defined genetic management objectives presently then strike the entire bullet

Chapter 3 Habitat Standards and Monitoring

The habitat standards identified in this document will be maintained at identified levels inside the PCA. In addition to the habitat standards, several other habitat factors will be monitored and evaluated to determine the overall condition of habitat for bears. It is the goal of the habitat management agencies to maintain or improve habitat conditions existing as of 1998, as measured within each subunit within the PCA, while maintaining options for management of resource activities at approximately the same level as existed in 1998. The habitat standards in this document are subject to revision based on the best available science and will be reviewed and updated as necessary.

Habitat standards include:

- Maintenance of secure habitat at 1998 levels in each BMU subunit through management of motorized access route building and density, with short-term deviations allowed under specific conditions. Secure habitat is defined as more than 500 meters from an open or

gated motorized access route or recurring helicopter flight line and must be greater than or equal to 10 acres in size.

The number and acreage of commercial livestock allotments and number of permitted domestic sheep animal months will not exceed 1998 levels inside the PCA. Existing sheep allotments will be phased out as the opportunity arises with willing permittees.

Management of developed sites at 1998 levels within each BMU subunit, with some exceptions for administrative and maintenance needs.

Habitat criteria that will be monitored and reported include:

Monitoring open and total motorized access route density in each BMU subunit inside the PCA.

Monitoring of four high-calorie food items throughout the Yellowstone area: winter ungulate carcasses, cutthroat trout (*Oncorhynchus clarki*) spawning numbers, bear use of army cutworm moth (*Euxoa auxiliaris*) sites, and whitebark pine (*Pinus albicaulis*) cone production. The incidence of white pine blister rust (*Cronartium ribicola*) and whitebark pine mortality in sampled areas will also be monitored.

Monitoring the number of elk hunters inside the PCA.

Land managers will ensure that habitat connectivity is addressed throughout the Yellowstone area as part of any new road construction or reconstruction and that food storage orders are in place.

Chapter 4 Management and Monitoring of Grizzly Bear-Human Conflicts

The management of grizzly bear-human conflicts inside the PCA is based upon the existing laws and authorities of the state wildlife agencies and federal land management agencies. Outside the PCA, state management plans will direct the management of nuisance bears. Management of nuisance bears usually falls into one or more of the following categories:

Removing or securing the attractant.

Deterring the bear from the site through the use of aversive conditioning techniques.

Capturing and relocating the nuisance bear.

Removing the bear from the wild, including lethal control.

The focus and intent of nuisance grizzly bear management will be predicated on strategies and actions to prevent grizzly bear-human conflicts. It is recognized that active management aimed at individual nuisance bears will be required. Management actions outside the PCA will be implemented according to state and tribal management plans. These actions will be compatible with grizzly bear population management objectives for each state for the areas outside the PCA.

In circumstances that result in a nuisance bear situation outside the PCA, more consideration will be given to existing human uses. Site-specific conflict areas within and outside the PCA will be documented and prioritized to focus proactive management actions to minimize grizzly bear-human conflicts and address existing and potential human activities that may cause future conflicts. Past conflict management has demonstrated that grizzly bears can coexist with most human activities.

Management of ~~all~~ nuisance bear situations will emphasize resolving the human cause of the conflict. Relocation and removal of grizzly bears may occur if other management actions are not successful. ~~Before any removal, except in cases of human safety, management authorities will consult with each other prior to judging the adequacy of the reason for removal.~~

Comment [G10]: 2007 language to strike-no longer appropriate once delisted

Captured grizzly bears identified for removal may be given to public research institutions or public zoological parks for appropriate non-release educational or scientific purposes as per regulations of states and national parks. Grizzly bears not suitable for release, research, or educational purposes will be removed as described in appropriate state management plans or in compliance with national park management plans.

All grizzly bear relocations and removals will be documented and reported annually in the Interagency Grizzly Bear Study Team (IGBST) Annual Report.

Chapter 5 Information and Education

The purposes of the information and education aspects of this cooperative effort are to support the development, implementation, and dissemination of a coordinated information and education program. This program should be understandable and useful for the people who visit, live, work, and recreate in bear habitat to minimize grizzly bear-human conflicts and to provide for the safety of people while building support for viable bear populations.

Information made available to the public will be open and responsive to public concerns. Open discussions with the public will increase credibility of the grizzly bear management program. These efforts will be reviewed periodically and program adjustments will be made as necessary. In addition, efforts will be expanded as the bear population expands and additional efforts will be needed in areas that could become occupied in the near future.

The current information and education (I & E) working group within the Greater Yellowstone Ecosystem will continue. Members of this I & E team include public affairs personnel from Forest Service Regions 1, 2, and 4; Grand Teton and Yellowstone National Parks; the BLM; representatives from each state wildlife agency; and the I & E specialist from the Interagency Grizzly Bear Committee (IGBC). This team will continue to work with all affected interests to ensure consistency of information, efficient funding strategies, identifying and targeting audiences, developing partnerships, and identifying new tools for implementation.

Chapter 6 Implementation and Evaluation

A new committee, the Yellowstone Grizzly Bear Coordinating Committee (YGCC), will replace the Yellowstone Ecosystem Subcommittee. YGCC meetings will be open to the public.

Some primary activities of the YGCC are:

- Coordinate implementation of this Conservation Strategy.
- Ensure that population and habitat data are collected annually by the IGBST, as specified in this Conservation Strategy, and evaluated to assess current status of the grizzly bear population.
- Share information and implement management actions in a coordinated fashion.
- Identify management, research, and financial needs to successfully implement the coordinated Conservation Strategy.
- Implement a Biology and Monitoring Review ~~as necessary and submit a petition for relisting~~ as appropriate to ensure agency responsiveness to changing circumstances of the grizzly bear or its habitat in the GYE.
- Appoint a chairperson and members of the Information and Education Team, and coordinate information and education efforts.

Comment [G11]: 2007 language to strike-not an appropriate function for individual agency representatives on the Committee

This committee does not supersede the authority of the management agencies beyond the specific actions agreed to as signatories of this Conservation Strategy.

YGCC membership consists of representatives of the following:

Federal	National parks: Yellowstone and Grand Teton
	National forests: Beaverhead-Deerlodge, Bridger-Teton, Caribou-Targhee, Custer-Gallatin, and Shoshone
	One Bureau of Land Management representative
	The Biological Resources Division of the U.S. Geological Survey
State wildlife agencies	Idaho, Montana, and Wyoming
Local government	One representative from each state
Tribal	One representative from each Native American tribe with sovereign

The IGBST and the I & E will perform necessary tasks and report to the YGCC.

As detailed in the monitoring portion of this Strategy, the IGBST will take the lead in preparing an annual monitoring report with staff support from the YGCC. Agencies responsible for monitoring major demographic and habitat parameters are listed in Appendix G Monitoring results and analysis will be presented to the YGCC by the IGBST.

If there are deviations from ~~any of~~ the population and/or habitat standards stipulated in this Conservation Strategy, a Biology and Monitoring Review will be initiated.

Comment [G12]: 2007 language to strike-contradicts making new changes based on the best available science

Biology and Monitoring Review

Under this Conservation Strategy, a Biology and Monitoring Review is a process carried out by the IGBST. A Biology and Monitoring Review examines management of habitat, populations, or efforts of participating agencies to complete their required monitoring. Biology and Monitoring Reviews would normally be undertaken after the annual summary of monitoring information presented to the YGCC and in response to deviations from required population or habitat standards. Any YGCC member agency can request that a Biology and Monitoring Review be considered. Such consideration would be a topic for discussion by the YGCC and the review would be initiated based on the decision of the YGCC. The Biology and Monitoring Review process will be completed within six months and the resulting written report presented to the YGCC and made available to the public. The IGBST is not responsible for completing impact analyses for projects proposed by any agency; such analyses are the responsibility of the agency making the proposal.

The purposes of a Biology and Monitoring Review are:

To identify the reasons why particular demographic or habitat objectives have not been achieved and to modify management as necessary, or

To consider potential impacts of a proposed action of concern to one or more members of the YGCC, or

To consider departures by one or more agencies from the monitoring effort required under this Conservation Strategy and to develop plans to ensure that monitoring efforts be maintained as per the standards in this document, or

To consider and establish a scientific basis for possible changes in management due to changed conditions in the ecosystem.

~~Biology and Monitoring Reviews will be submitted as written reports by the IGBST to the YGCC and made available to the public.~~

~~The YGCC will respond to the Biology and Monitoring Review with actions to address the deviations from the population or habitat standards. If the situation, after completion of the Biology and Monitoring Review, is such that some or all of the desired population and habitat standards specified in this Conservation Strategy are not being met, and cannot be met in the opinion of the YGCC, then the YGCC will petition the Fish and Wildlife Service (Service) for relisting. In the case of a vote on this issue, a simple majority is necessary.~~

Comment [G13]: 2007 language to strike-too much detail for this portion of the document

Comment [G14]: 2007 language to strike- not an appropriate function for individual agency representatives on the Committee or a committee that is not a separate legal entity; it makes no sense for the Service to subject itself to deadlines to respond to a petition from a committee in which USFSW is a technical support member

~~*Petition for Relisting*~~

~~The YGCC can petition for relisting and a resulting status review from the U.S. Fish and Wildlife Service. A status review is a process that requires the Service to review the status of the GYE grizzly bear population and is triggered by a petition to list a species. This petition from the YGCC will be accompanied by the available specific biological data on the population and its habitat sufficient to judge its status as a recovered population as per the requirements of this Conservation Strategy. A status review will evaluate all factors affecting the population and result in a finding that summarizes the current status of the population. For purposes of a status review, the status of the entire GYE grizzly bear population will be considered.~~

Comment [G15]: 2007 language to strike-this is unnecessary in the summary and the detail is in Chap 6.

~~Additionally, the Service can initiate a status review to determine if the grizzly bear in the GYE should be added to the list of candidate species for listing independent of the YGCC based on concerns about the population and/or its habitat. Under Section 4 of the Endangered Species Act, a petition from an individual or organization can also initiate a status review, as long as the petition is deemed to be warranted. To be warranted, such a petition must present credible scientific information to support the petition.~~

~~If, as the result of the status review for candidate status or the petition for relisting, the population is found to be warranted for listing, as per the criteria of the Endangered Species Act in Section 4(a)(1), then the species could be immediately considered for relisting and could be relisted under emergency regulations, per Section 4(b)(7) if the threat were severe and immediate.~~

~~The Service will initiate a status review with possible emergency relisting if necessary if there are changes to Federal, State, or Tribal laws, rules, regulations, or management plans that depart significantly from the specifics in the Conservation Strategy, thereby compromising implementation of the Strategy.~~

Comment [G16]: 2016 language to strike-asking the signators to agree to more than the legal standard for emergency relisting, not necessary when Service already has this authority.

Chapter 7 Existing Authorities

The existence of adequate regulatory mechanisms that serve to maintain the GYE grizzly bear population as recovered is one of the five factors required to change the status of the population to delisted and to assure a healthy grizzly bear population.

This chapter lists applicable federal, state (Idaho, Montana, and Wyoming) and tribal acts, statutes, regulations, rules, plans, and guidelines[2].

Comment [G17]: 2016 footnote language to strike-the reference is inappropriate for states and federal agencies

[2] ~~Guidelines are management actions that are highly recommended in this Conservation Strategy. A deviation from a guideline would not require a revision or amendment to the Conservation Strategy. A deviation from a guideline requires written rationale as to why the guideline is not being followed.~~

Memorandum of Understanding Detailing Agency Agreement to Implement this Conservation Strategy

The agencies signing this Conservation Strategy agree to use their authorities to maintain and enhance the recovered status of the grizzly bear in the Greater Yellowstone Ecosystem (GYE) by implementing the regulatory mechanisms, interagency cooperation, population and habitat management and monitoring, and other provisions of the Conservation Strategy as per the details and responsibilities described in this document. All signatories recognize that each has statutory responsibilities that cannot be delegated and that this agreement does not and is not considered to abrogate any of their statutory responsibilities. This agreement is subject to and is intended to be consistent with all appropriate federal and state laws. Funding of this MOU is subject to approval and appropriations by approved state and federal entities. All agencies will take appropriate steps to seek funding to implement this document. The adequacy of the regulatory mechanisms demonstrated by this Conservation Strategy are dependent upon funding being available to fully implement the management and monitoring actions detailed in this document. This Conservation Strategy does not go into effect until all agencies have signed this document and the final rule delisting the GYE grizzly bear DPS has been published in the Federal Register.

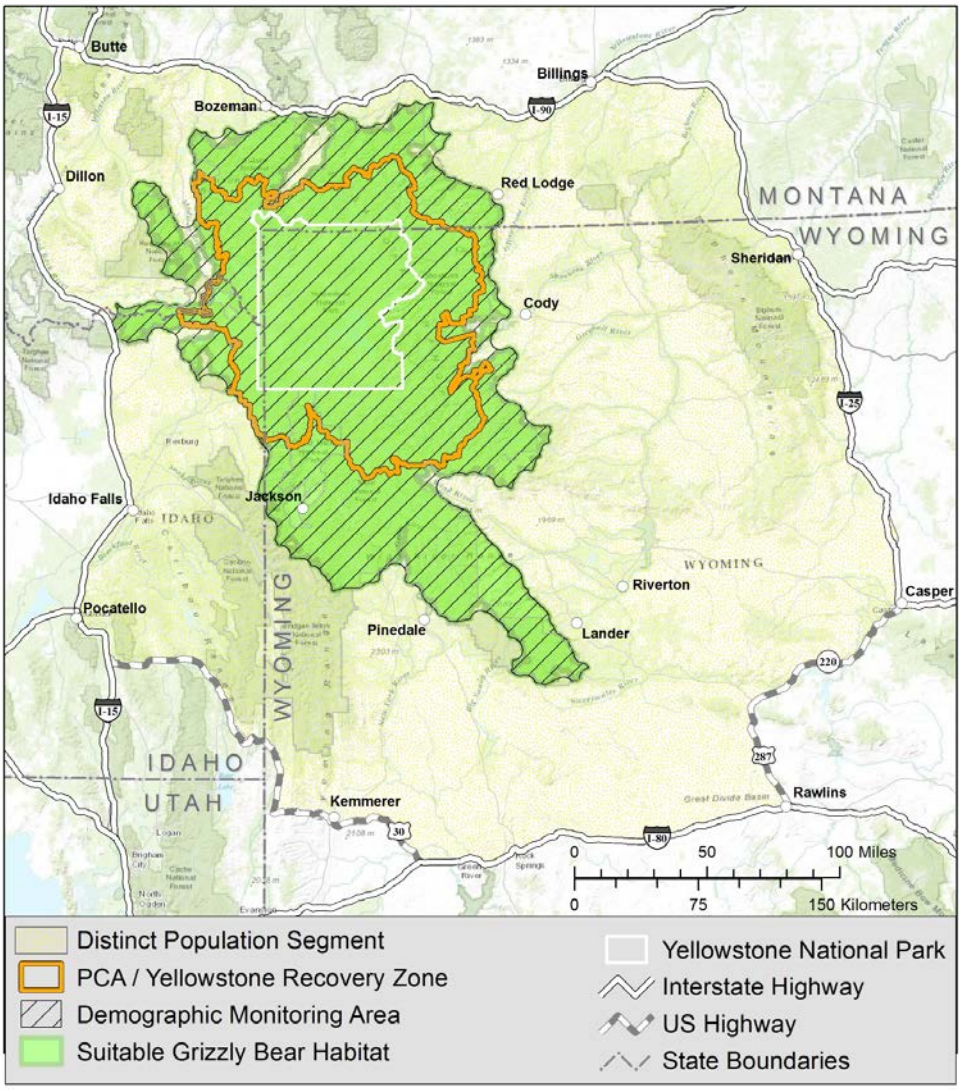
Chapter 1 Introduction and Background

Introduction

The future management of the Yellowstone grizzly bear population is envisioned as one in which the grizzly bear and its habitat are conserved as integral parts of the Greater Yellowstone Ecosystem (GYE).

Within the GYE , the grizzly bear population and its habitat will be managed utilizing a management approach that identifies a Primary Conservation Area (PCA) and adjacent areas where occupancy by grizzly bears is anticipated and acceptable. The PCA is the existing Yellowstone grizzly bear recovery zone as identified in the 1993 *Grizzly Bear Recovery Plan* (Recovery Plan) (USFWS 1993). The size of the recovery zone is not being expanded in this approach. The PCA boundary will replace the recovery zone boundary to reflect the paradigm shift from managing for recovery to one of conservation (Figure 1).

In this Conservation Strategy (Strategy), management direction is described for both the PCA and adjacent areas within the GYE. State grizzly bear management plans, forest plans, and other appropriate planning documents provide additional management direction for the adjacent areas outside the PCA.



This Strategy was developed to be the document guiding management and monitoring of the GYE grizzly bear population and its habitat upon recovery and delisting. This Strategy will remain in effect beyond recovery~~,~~ and delisting, ~~and the five year monitoring period required by the Act as grizzly bears will always be a "conservation reliant" species (Scott *et al.* 2005) because of their low resiliency to excessive human-caused mortality. Therefore, the need to coordinate management of the population across multiple land ownerships and jurisdictions will always remain.~~

Comment [G18]: 2016 language to strike-This language is not necessary

~~Ongoing review and evaluation of the effectiveness of this Strategy is the responsibility of the state and federal managers in the~~ GYE. This Strategy will be ~~updated~~ evaluated by the management agencies every five years, or as necessary, allowing public comment in the updating process.

Comment [G19]: Comment-same reference as page 2, set expectations that may not be reasonable so replace update with evaluate

Figure 1. Map of the Greater Yellowstone Ecosystem (GYE). Boundaries are shown for: (1) the GYE grizzly bear Distinct Population Segment Area (the legal boundary where grizzly bears would be delisted); (2) the Primary Conservation Area (PCA); (3) Suitable Habitat; and (4) the Demographic Monitoring Area (DMA).

Upon implementation of this Strategy, the Yellowstone Grizzly Bear Coordinating Committee (YGCC) replaces the Yellowstone Ecosystem Subcommittee. (*See* Chapter 6 for more information about the activities of the YGCC.)

The Conservation Strategy

The purpose of this Strategy, which includes the state plans, is to:

- Describe and summarize the coordinated efforts to manage the grizzly bear population and its habitat to ensure continued conservation in the GYE.
- Specify the population, habitat, and nuisance bear standards to maintain a recovered grizzly bear population.
- Document the regulatory mechanisms and legal authorities, policies, and management and monitoring programs that exist to maintain the recovered grizzly bear population.
- Document the commitment of the participating agencies.

Implementation of the management strategies requires continued cooperation between federal and state agencies.

The GYE is a dynamic environment; monitoring systems in the Strategy allow for dynamic management as environmental issues change. The agencies are committed to be responsive to the needs of the grizzly bear by dynamic management actions based on the results of detailed annual population and habitat monitoring.

Development of the Conservation Strategy and State Plans

Development of the Strategy began in 1993, when biologists representing the National Park Service, U. S. Forest Service, U. S. Fish and Wildlife Service, Interagency Grizzly Bear Study Team, Idaho Department of Fish and Game, Montana Fish, Wildlife & Parks, and the Wyoming Department of Game and Fish were appointed to the Interagency Conservation Strategy Team. In March 2000, a draft Conservation Strategy was released to the public for review and comment. Later the same year, a Governors' Roundtable was organized to provide

recommendations from the perspectives of the three states that would be involved with management of grizzly bears after delisting. The Governors' Roundtable recognized the need to have state management plans that would give direction for grizzly bear management outside the PCA. The state management plans apply to management of grizzly bears outside the PCA, and describe the general areas that grizzly bears are likely to occupy in the foreseeable future.

In 2002, the 2007 Conservation Strategy was developed and the state plans were completed. Although this 2016 version of the Conservation Strategy updates sections of the Strategy, the vision remains the same.

The vision of the Strategy can be summarized as follows:

- The PCA will be a secure area for grizzly bears, with population and habitat conditions maintained that have allowed the grizzly bear population to achieve recovery and expand outside the PCA.
- Outside of the PCA, grizzly bears will be allowed to expand into biologically suitable and socially acceptable areas.
- Manage the GYA grizzly bear population within the DMA, to at least the 2002-2014 Chao2 average point estimate for total population, with 95% confidence intervals (i.e. 600-747).
- ~~Manage a population within the area called the Demographic Monitoring Area (DMA), which is the area formerly called Suitable Habitat (Figure 1). The population objective in the DMA is the average population size 2002-2014 when the population in this area was essentially stable. Use the model-averaged Chao2 population estimator applied inside the DMA to measure the population on an annual basis and to set the mortality limits within the DMA so as to maintain this average population size using a sliding scale of mortality for independent females and males, and dependent young.~~
- Outside of the PCA, the objective is to maintain existing resource management and recreational uses and to allow agencies to respond to demonstrated problems with appropriate management actions.

Comment [G20]: 2016 language to strike-replaced with language from MOA

Outside of the PCA, the key to successful management of grizzly bears lies in bears utilizing lands that are not managed solely for bears but in which their needs are considered along with other uses.

Expand public information and education efforts.

Provide responsive management to deal with nuisance grizzly bears.

Manage grizzly bears as a game animal, including allowing regulated hunting when and where appropriate.

Relationship to Other Plans

The state of Idaho, Montana, and Wyoming and the Tribes of the Wind River ~~Indian~~ Reservation all developed grizzly bear management plans. The three states also entered into a memorandum of agreement memoralizing how the states will coordinate with each other regarding bear management and allocation of mortality[3]. The individual state plans {and three-state memorandum of agreement} are complementary to this Strategy. ~~The state plans are integrated into the Strategy to ensure that the plans and the Strategy are consistent where necessary and complementary.~~ The state and tribal management plans are ~~formally incorporated in the Conservation Strategy as~~ Appendices I, J, K, ~~and~~ O, and P.

Comment [G21]: 2016 new language-The additions re Tribes are inconsistent (is WRT a signatory needed to finalize the revision?)

Comment [G22]: 2016 proposed language-*Add MOA language upon finalization of the Tri-State MOA or use with footnote to reference draft status*

Comment [G23]: 2007 language to change in light of evolution of state plans and MOA; revisions and amendments to state plans should not be encumbered by the Stategy process or vice versa

National Forest and National Park plans are also complimentary to this Strategy. Land and resource management plans for National Forests and National Parks in the GYE have incorporated the habitat standards and other relevant provisions of the Conservation Strategy. Those standards and provisions not yet incorporated into management plans will be integrated into future land management plan amendments or revisions.

[3] The states have provided a draft MOA that will be finalized by commission approvals in 2016

Background

The Grizzly Bear Population

The grizzly bear population in the lower 48 states was listed as threatened in 1975 pursuant to the Endangered Species Act of 1973.

The Recovery Plan established several demographic (population) recovery targets that must be achieved for a recovered grizzly bear population. All recovery targets are currently being met. When grizzly bears were listed in 1975, "indiscriminate illegal killing" and management removals were identified as threats to the population. In response, the Service and signatories to this Strategy implemented demographic recovery criteria to maintain a minimum population size, a well-distributed population, and establish mortality limits based on scientific data and direct monitoring of the population. Since implementing these criteria, the GYE grizzly bear population has tripled in size and range (Eberhardt *et al.* 1994; Knight and Blanchard 1995; Boyce *et al.* 2001*a*; Schwartz *et al.* 2006; Pyare *et al.* 2004; Schwartz *et al.* 2006a; IGBST 2012; Bjornlie *et al.* 2014).

Counts of females with cubs-of-the-year have increased. In 2013, the estimate of unique females with cubs-of-the-year within the entire GYE was 58 (Haroldson *et al.* 2014). This is the highest count ever recorded. The Recovery Plan target for the number of females with cubs-of-the-year has been exceeded since 1988. Calculations of population trajectory derived from radio-monitored female bears show an increasing population trend at a rate of 4 to 7 percent per year between 1983 and 2002 (Eberhardt *et al.* 1994; Knight and Blanchard 1995; Schwartz *et al.* 2006) and 0.3 to 2.2 percent between 2002 and 2011 (IGBST 2012). Grizzly bear range and distribution has more than tripled since 1975 (Basile 1982; Blanchard *et al.* 1992; Schwartz *et al.* 2002; Pyare *et al.* 2004; Schwartz *et al.* 2006a; Bjornlie *et al.* 2014). Independent female survival rates, the single most important cohort to population trajectory, are high (IGBST 2012).

In total, this population has increased from estimates ranging between 230 and 312 bears when listed in 1975 (Cowan *et al.* 1974; Craighead *et al.* 1974; McCullough 1981) to at least 714 animals as of 2014 (van Manen 2015, *in litt.*).

The Primary Conservation Area and the Demographic Monitoring Area

The Strategy identifies and provides a framework for managing habitat within a Primary Conservation Area (PCA) and managing demographic parameters within a Demographic Monitoring Area (DMA) (Figure 1). The PCA boundaries (containing 23,853 sq km (9,210 sq mi)) correspond to those of the Yellowstone Recovery Zone (U.S. Fish and Wildlife Service 1993) and will replace the Recovery Zone boundary (Figure 1). The PCA contains adequate seasonal habitat components needed to support the recovered GYE grizzly bear population for the foreseeable future and to allow bears to continue to expand outside the PCA. The National Park Service and the U. S. Forest Service manage the majority of lands within the PCA; a small percentage of land is privately owned or managed by the states or the Bureau of Land Management (BLM) (Table 1).

Table 12. Area of lands within the Primary Conservation Area by management type.

Management Type	Area (square miles)	Percent of the PCA
National Park Service	3,632	39.4
U. S. Forest Service	5,383	58.5
Private and Other Ownerships	195	2.1
TOTAL	9,210	100

To facilitate habitat management and ensure habitat was well distributed, the PCA was divided into 18 bear management units (BMUs) and 40 subunits (Figure 2). BMUs are used to measure the distribution of females with offspring while subunits allow better resolution of habitat

measurement. Habitat protections inside the PCA that allowed the recovery of the grizzly bear population will be maintained.

Figure 3. The Primary Conservation Area showing bear management unit and subunit boundaries.

Characterization of Grizzly Bear Habitat

Background on the Area Necessary for a Recovered Population

Grizzly bears are one of the subspecies of brown bears, which range throughout diverse areas and habitats in Europe, Asia, and North America. Brown bears have the most widespread distribution of any bear species and live in the widest range of habitats of any bear species including deserts, boreal forests, arctic tundra, coniferous forests, deciduous forests, alpine areas, and coastal rainforests. At minimum, grizzly bears need food, seasonal foraging habitat, denning habitat, and security in an area of sufficient size for survival. Bears overlap in home ranges and change densities based on a variety of social and environmental factors. However, the precise mixture of these diverse elements and the precise size of the area necessary to support a population of grizzly bears are impossible to specify. To a great degree, the difficulty lies in the fact that grizzly bears are long-lived opportunistic omnivores whose needs for foods and space vary depending on a multitude of environmental and behavioral factors and on variation in the experience and knowledge of each individual bear. The key to establishing habitat criteria that will maintain a healthy population is to look to the habitat factors in the past that produced a grizzly bear population in the Yellowstone area that is increasing in numbers and expanding in range. Habitat factors that produced a healthy population in the past were used to establish the habitat criteria for the future that must be maintained if a healthy population continues to be preserved.

The available habitat for bears is largely determined by human activities. Human activities are the primary factor impacting habitat security. Human activities and the social structure and relationships among resident bears are the two major influences on the accessibility of available foods for bears. The issue of how many grizzly bears can live in any specific area is a function of overall habitat productivity, annual production, availability of important foods, and the levels and types of human activities. There is no known way to calculate the number of grizzly bears that can live in an area in relation to ongoing changes in habitat values or to fully understand the

social system of the grizzly bear and how it is influenced by changes in bear density and related social interactions at various densities. As food availability fluctuates, there are corresponding changes in bear density in important use areas and changes in social tolerance within the bear population. This in turn will affect age-specific survivorship. Additional numbers of bears in many areas will result in the expansion of bear range, increasing grizzly bear-human conflicts, and erosion of public support for bears. All these factors interact.

A viable and therefore recovered population is one that has high long-term prospects for survival within acceptable levels of risk. Population size is an important factor in understanding population survival (Boyce 1992, Caughley 1994). However, there is no quantitative way to estimate precisely the number of animals required for a viable population of any species (Boyce 1992, 1993). From the mid 1980s, the Yellowstone grizzly bear population has grown at approximately 3 to 4% or more per year (Eberhardt *et al*. 1994, Boyce 1995, Boyce *et al*. 2001*b*). Boyce (1995) has calculated that the Yellowstone population currently has a probability of extinction of 0.0004 (4/10,000)—a very low probability. Nevertheless, as Boyce *et al.* (2001*b*) points out, "*population size alone is not a sufficient criterion for evaluating population viability*," and "*even though a population may have increased or decreased over the past 10 to 20 years, this offers no indication that the population will continue on the same trajectory in the future*." The best way to ensure a healthy population of grizzly bears is to monitor both population and habitat parameters closely and respond when necessary with adaptive management (Walters and Holling 1990) addressing the problems of the population in a dynamic way. That is what this Conservation Strategy is designed to accomplish.

The PCA has provided the vast majority of habitat for the currently increasing population in the Greater Yellowstone Ecosystem. This area will continue to be managed and monitored carefully to maintain habitat security, and to limit access-related disturbances and developed sites on public lands at or below 1998 levels. The GYE grizzly bear population was increasing at a rate of 3 to 4% per year as of 1998 (Boyce *et al*. 2001*b*). Due to this ongoing bear population increase, 1998 was chosen as the baseline year for measurement of levels of human activities.

The 1998 habitat baseline values for secure, developed sites on public lands, and livestock grazing are shown in Appendix E.

Food

The broad historic distribution of grizzly bears suggests adaptability in food habits of different populations. Although the digestive system of bears is essentially that of a carnivore, bears are successful omnivores, and in some areas may be almost entirely herbivorous. Bears feed on animal matter or vegetable matter that is highly digestible and high in starch, sugars, protein, and stored fat.

Grizzly bears must avail themselves of foods rich in protein or carbohydrates in excess of maintenance requirements in order to survive denning and post-denning periods. Other plant materials are eaten as they emerge, when crude protein levels are highest.

Grizzly bears are opportunistic feeders and will prey or scavenge on almost any available food including ground squirrels, ungulates, carrion, and garbage. In areas where animal matter is less available, roots, bulbs, tubers, fungi, and tree cambium may be important in meeting nutrient requirements. High quality foods such as berries, nuts, and fish are important in some areas.

The search for food has a prime influence on grizzly bear movements. Upon emergence from the den, they seek lower elevations, drainage bottoms, avalanche chutes, and ungulate winter ranges where their food requirements can be met. Throughout late spring and early summer, they follow plant maturity back to higher elevations. In late summer and fall, there is a transition to fruit and nut sources, as well as other plant materials. This is a generalized pattern, however, and it should be kept in mind that bears are individuals trying to survive and will go where they can best meet their food requirements.

Specific to the GYE, four seasonal foods have been identified for monitoring. These are: winter-killed ungulates (primarily elk (*Cervus elaphus*) and bison (*Bison bison*), but also deer (*Odocileus* species) and moose (*Alces alces*)), spawning cutthroat trout, whitebark pine seeds, and army cutworm moths. The High-Calorie Foods section in Chapter 3 provides more detail about the components of grizzly bear diet.

Cover

The relative importance of cover to grizzly bears was documented by Blanchard (1978) in a four-year study in the GYE. The importance of an interspersion of open parks as feeding sites associated with cover is also recorded in Blanchard's study.

Changes in the distribution and quantity and quality of cover are not necessarily detrimental to grizzly bears. The IGBST studied the effects of the large 1988 wildfires on grizzly bears. "*On the average, grizzly bears used burned habitats in proportion to their availability within individual annual ranges during 1989 to1992. Seasonal indices of movement and annual range sizes of cohorts are not statistically different from the 1975 to 1987 averages*" (Blanchard and Knight 1996).

Denning

Grizzly bears excavate dens. Dens are usually dug on steep slopes in forest cover where wind and topography cause an accumulation of deep snow and where the snow is unlikely to melt during warm periods. Elevations of dens vary geographically; generally, they are found at higher elevations well away from development or human activity. Abundant denning habitat is available and is not considered a limiting factor for grizzly bears (Podruzny and Gunther 2002).

Secure Habitat

History has demonstrated that grizzly bear populations survived where frequencies of contact with humans were very low. Populations of grizzly bears persisted in those areas where large expanses of relatively secure habitat were retained and where human-caused mortality was low. In the Yellowstone area, this is primarily associated with national parks, wilderness areas, and large blocks of public lands (IGBC 1998). Habitat security requires minimizing mortality risk and displacement from human activities in a sufficient amount of habitat to allow the population to benefit from this secure habitat and respond with increasing numbers and distribution. Habitat security allows a population to increase in numbers and distribution as lowered mortality results in more reproduction and cub recruitment into the adult population. This results in an increasing population. As the population increases, it begins to expand in range and distribution. Both of these responses to habitat security are currently ongoing in the Yellowstone population as the population is increasing at 3 to 4% per year (Boyce *et al*. 2001*b*), and increasing in distribution (Schwartz *et al*. 2002). Maintaining habitat security is a major goal of this conservation strategy.

By managing motorized access, the following grizzly bear management objectives can be met (IGBC 1998):

Minimize human interaction and potential grizzly bear mortality
Minimize displacement from important habitats
Minimize habituation to humans
Provide relatively secure habitat where energetic requirements can be met

Historically, management of motorized use has been primarily accomplished through restriction of certain types of motorized use on established access routes, i.e., management of open motorized route densities. Recent research has shown that secure habitat (areas that are free of motorized traffic, also referred to as core areas) is an important component of grizzly bear habitat (IGBC 1998).

The management of human use levels through access route management is one of the most powerful tools available to balance the needs of grizzly bears with the needs and activities of humans. It has been documented in several research projects, completed and ongoing, that unregulated human access and development within grizzly bear habitat can contribute to increased bear mortality and affect bear use of existing habitat (IGBC 1998).

Management Improvements and Mortality Reduction Efforts

Since listing of the grizzly bear under the Endangered Species Act (ESA), government agencies (federal, tribal, state, county, and city), organizations, and individuals have worked to improve management coordination and habitat conditions, minimize grizzly bear-human conflicts and bear mortality, and increase public awareness and appreciation for the grizzly bear in the GYE.

Summary of Management Improvements Related to Habitat

- The Interagency Grizzly Bear Committee (IGBC) was created to coordinate management efforts across multiple federal lands and different states. The Yellowstone Ecosystem Subcommittee was also created to coordinate efforts specific to the GYE grizzly bear. These committees cooperated in developing the *Interagency Grizzly Bear Guidelines* (IGBC 1986) and the *Interagency Grizzly Bear Committee Taskforce Report on Grizzly Bear/Motorized Access Management* (IGBC 1998). These guidelines were instrumental in changing land management practices on federal lands to provide security and to maintain or improve habitat conditions for the grizzly bear.
- The IGBST was created to provide scientific information for the management and recovery of the grizzly bear in the GYE. Scientific protocols have been developed to monitor the grizzly bear population and important habitat parameters.
- Federal and state agencies developed nuisance bear guidelines to manage bears that become habituated to human foods and refuse. The overall objective of these guidelines is to provide a quick response to grizzly bear-human confrontations.

Miles of open motorized access routes have been reduced through restrictions (such as gates and signs on motorized routes) and decommissioning (the route is no longer available for motorized use), thereby reducing open motorized access route densities and increasing secure habitat for the grizzly bear.

Highway design changes have been implemented, including changed guardrail heights to allow cub crossings; minimized cut-slope barrier walls to facilitate movement; revegetation planting to provide cover, minimize exotic plants, and discourage planting of palatable foods; and narrower rights of way and road widths.

Federal land management agencies have closed areas to cross-country motorized travel to provide more security for grizzly bears.

Federal land management agencies have closed some areas to all human entry during certain seasons to increase human safety and provide security for grizzly bears.

Many areas in the GYE have been closed to oil and gas leasing, or have restrictions (such as no surface occupancy) on oil and gas leasing to protect grizzly bear habitat.

Mortality Reduction Efforts Related to Habitat

Significant reductions in the human-caused bear mortality rate have been the primary reason the bear population is now meeting the demographic sub-goals established in the *Recovery Plan*. In addition to the above management improvements, the following actions have been found to be effective in limiting grizzly bear mortality and grizzly bear-human conflicts. These actions have been ongoing and will continue inside the PCA.

Federal land management agencies have implemented and monitored compliance with food storage orders that require people using grizzly bear habitat to store food and refuse properly on public lands so bears will not become habituated to unnatural foods. This also reduces grizzly bear-human encounters.

Bear-resistant garbage containers have been installed in campgrounds, picnic areas, and other public use areas on federal lands. Garbage collection schedules have been improved to collect garbage before it becomes an attractant to grizzly bears.

Some counties and communities have improved their landfills and garbage collection systems to reduce or prevent conflicts with grizzly bears.

Numerous education and information materials and programs have been developed by federal and state agencies and various organizations, to teach those living, working, and recreating in grizzly bear country how to be safe, to reduce grizzly bear-human encounters, and minimize grizzly bear mortality. Non-agency participation is encouraged.

The state wildlife agencies have developed active management/conflict resolution programs to help minimize conflicts between people and bears.

To provide increased protection for grizzly bears, Montana does not allow baiting or hound hunting for bears. Wyoming prohibits hound hunting within the state, and baiting is not allowed within the PCA. Baiting and use of hounds are not allowed within the PCA in Idaho.

The number of domestic sheep allotments and the number of domestic sheep grazing within the PCA has been reduced; the remaining domestic sheep allotments are to be phased out as opportunities arise. Sheep grazing permittees and herders must follow strict requirements in their grazing permits to protect grizzly bears and reduce grizzly bear/grazing conflicts.

Individuals and organizations with special use permits on federal lands must follow strict requirements in their special use permits to protect grizzly bears and reduce grizzly bear-human conflicts.

Adjustments have been made on cattle grazing allotments within the PCA, and cattle permittees must follow strict requirements in their grazing permits to protect grizzly bears and reduce grizzly bear/grazing conflicts.

The IGBST coordinates an annual analysis of the causes of conflicts and known and probable mortalities, and proposed management solutions. Reports were reviewed by the

Yellowstone Ecosystem Subcommittee and appropriate actions initiated. The Yellowstone Grizzly Bear Coordinating Committee will continue this review process.

Federal and non-federal landowners have cooperated in limiting grizzly bear mortality and grizzly bear-human conflicts.

Livestock and road-killed carcasses are managed to minimize grizzly bear-human conflict. Hunters are encouraged to quickly care for and remove hunter-killed carcasses to minimize grizzly bear-human conflicts.

State and federal law enforcement agents have cooperated to ensure consistent enforcement of laws protecting grizzly bears. A task force of state and federal prosecutors and enforcement personnel from each state and federal jurisdiction will work together to make recommendations to all jurisdictions, counties, and states, on uniform enforcement, prosecution, and sentencing relating to illegal grizzly bear kills.

Comment [G24]: Comment-2007 language-may need to recalibrate this expectation

When reclaiming or obliterating motorized access routes or restricting motorized or non-motorized access, priority has been and will be given to areas with historical grizzly bear-human conflicts or areas of probable grizzly bear-human conflicts

Appropriate actions to reduce mortality will be implemented as described in the state plans outside the PCA where grizzly bears occur or can reasonably be expected to occur when and where possible to improve public safety and minimize grizzly bear mortality.

Recovery of the grizzly bear in the GYE is the result of partnerships between federal and state agencies, the governors of three states, county and city governments, educational institutions, numerous organizations, private landowners, and the public who live, work, and recreate in the GYE. Maintenance of a recovered grizzly bear population depends on these partnerships.

Chapter 2 Population Standards and Monitoring

Introduction

To maintain a healthy (recovered) grizzly bear population in the GYE, it is necessary to have adequate numbers of bears that are widely distributed with a balance between reproduction and mortality. This section details the demographic criteria in the *1993 Recovery Plan* that were necessary to achieve recovery, and the criteria necessary to maintain it in the *2016 Recovery Plan Supplement: Revised Demographic Criteria for the Greater Yellowstone Ecosystem*. The *1993 Recovery Plan* criteria focused on the PCA and a 10-mile perimeter, whereas criteria in the Strategy, the *2016 Recovery Plan Supplement: Revised Demographic Criteria for the Yellowstone Ecosystem*, and the appended state plans encompass the Demographic Monitoring Area (DMA) of the GYE. Because grizzly bears are a difficult species to monitor and manage, multiple criteria are identified to provide sufficient information upon which to base management decisions.

The IGBST has generated extensive information useful to determine the status of the GYE grizzly bear population. Few populations have benefited from the amount of effort in data collection, as has the Yellowstone population. Agencies responsible for management will continue their commitment to data collection so population status can be determined and all designated standards maintained.

Under this Conservation Strategy and the *2016 Recovery Plan Supplement: Revised Demographic Criteria for the Greater Yellowstone Ecosystem*, all mortalities and all reports of unduplicated females with cubs (*see* Appendix C) will be monitored within the DMA (Figure 1). This will result in the management and monitoring of the grizzly bear population in the entire GYE DMA , as opposed to the system in the *1993 Recovery Plan*, which managed and monitored only the population inside the recovery zone and within 10 miles outside the recovery zone. This wider monitoring of mortalities and accounting for mortality limits is more stringent

than the system under the *1993 Recovery Plan*. Conservation Strategy demographic standards ~~and the standards in the state plans~~ are tied to the DMA, shown in Figure 1. The criteria and objectives in the existing *1993 Recovery Plan* have modified, as described below.

Comment [G25]: 2016 new language to strike-state plans should be left out of this sentance

Population Monitoring

~~Primary~~ demographic monitoring protocols for the GYE population will focus on the area within the DMA and monitoring and documenting population size, distribution of females with young, and all forms of mortality ~~so as to be within the mortality limits described~~. Additional monitoring or research may be conducted as determined by the IGBST.

Comment [G26]: 2016 language to strike-not necessary and over presciptive

Demographic Recovery Criteria from the 2016 Recovery Plan Supplement: Revised Demographic Criteria for the Greater Yellowstone Ecosystem

The *1993 Recovery Plan* defined a recovered grizzly bear population as one that could sustain a defined level of mortality and is well distributed throughout the recovery zone. The *1993 Recovery Plan* outlined a monitoring scheme that employed three demographic sub-goals to measure and monitor recovery of the Yellowstone grizzly bear population. The second criterion pertaining to the distribution of females with offspring remains unchanged. However, the first and third criteria pertaining to the minimum allowable number of females with cubs of the year and sustainable mortality limits were revised and updated to reflect current methods based on the best available science. The current demographic recovery criteria in the 2016 *Recovery Plan Supplement: Revised Demographic Criteria for the Greater Yellowstone Ecosystem* are:

Comment [G27]: Comment: The document to be incorporated by reference has problems

Demographic Recovery Criterion 1 ~~– Within the Demographic Monitoring Area (DMA), maintain a minimum population size of at least 500 animals to assure genetic health, as quantified by methods established in published, peer-reviewed scientific literature and calculated by the IGBST using the most updated protocol, as posted on their website. This number was chosen to ensure the short-term fitness of the population was not threatened by losses in genetic~~

~~diversity in such an isolated population. Five hundred is not a management target or population goal. Instead, it is a minimum population threshold. The goal is to maintain the population well above this threshold to ensure that genetic issues are not a detriment to the genetic fitness of the GYE grizzly bear population. At this threshold population of 500, more than a third of the suitable habitat in the DMA would be unoccupied (van Manen 2015, *in litt.*) and therefore the grizzly bear population could not be considered demographically recovered.~~ Maintain a minimum population size of 500 animals in the Greater Yellowstone Area. The estimate of total population size cannot drop below 500 in two consecutive years. This estimate will be calculated by IGBST using data obtained within the Demographic Monitoring Area (Figure 1).~~The IGBST has been calculating population size on an annual basis using the model-averaged Chao2 estimate since 2002. As the grizzly bear population has increased, model-averaged Chao2 estimates have become increasingly conservative (i.e., prone to underestimation). As a conservative approach to population estimation, the model-averaged Chao2 method will continue to be the method used to assess Criterion 1 (*see* Appendix C for the application protocol for annual population estimation using the model-averaged Chao2 method). The IGBST will continue to investigate new methods for population estimation as appropriate. If new methods become available, these will be considered for application in the GYE as long as they represent the best available science. However, until possible new methods are developed, the model-averaged Chao2 method will continue to be used.~~

Comment [G28]: 2016 language to strike- We understood there was agreement that Criterion 1 would not be changed. Criterion 1 has been discussed numerous times and now we see lots of new stuff.

Replace with previously agreed upon language regarding 500 and cannot drop below in 2 consecutive years.

Comment [G29]: 2016 language to strike-out of place- move to page 42.

Formatted: Highlight

Demographic Recovery Criterion 2—Sixteen of 18 bear management units within the PCA (Figure 2, Chapter 1) must be occupied by females with young, with no two adjacent bear management units unoccupied, during a 6-year sum of observations. This criterion is important as it ensures that reproductive females occupy the majority of the PCA and are not concentrated in one portion of the ecosystem.

~~*Demographic Recovery Criterion 3*—Within the DMA, establish annual mortality limits for independent females (at least 2 years old), independent males (at least 2 years old), and dependent young (less than 2 years old) that stabilizes the population at approximately the~~

~~average model-averaged Chao2 estimate 2002–2014 of 674 (average lower 95% CI = 600; average upper 95% CI = 747).~~ Ensure the following total mortality rates are not exceeded within the DMA for three consecutive years for independent males, independent females and dependent young, as set forth in table 2, and based on the 2002-2014 Chao2 average point estimate for the total population with 95% confidence intervals (600-747).

~~Each year the IGBST will calculate the model-averaged Chao2 population estimate for the DMA. This population estimate will be used to set the mortality limits for the following year. These mortality rates will be on a sliding scale with the population objective being to maintain the population within the DMA at the 2002–2014 average (using the Chao2 estimate this is 674 (average lower 95% CI = 600; average upper 95% CI = 747)). The mortality rate that resulted in population stability 2002–2011 was 7.6% for independent females, 7.6% for dependent young, and 15% for independent males (IGBST 2012). The higher rate for independent males is biologically sound since population growth is less sensitive to independent male mortality than to independent female mortality. In order to maintain the population goal at the 2002–2014 average size and associated confidence intervals inside the DMA, a sliding scale of mortality rates will be applied to the model-averaged Chao2 population estimate from the year before as per Table 2.~~ Mortalities are tracked and reported annually using data obtained within the DMA shown in Figure 1.

Comment [G30]: 2016 language to strike-new language aligns with MOA; the criteira is that the identified, adjustable, population size-correlated mortality rates are not exceeded. The language USFWS has proposed is not a criterion. Criterion should be in terms of mortality rate of X for {Demongraphic class" should not be exceeded in Z consecutive years.

~~***Table 2. Mortality***~~ ***Total mortality rates used to establish annual mortality limits for independent females, independent males, and dependent youmg inside the DMA.*** ~~***using the model-averaged Chao2 population estimate method. These mortality limits are on a sliding scale to achieve the population goal inside the DMA of the average population size 2002–2014 of 674 (average lower 95% CI = 600; average upper 95% CI = 747) using the Chao2 method inside the DMA. For populations less than 600, there will be no discretionary mortality unless necessary for public safety or management of bear–human conflicts.***~~

Comment [G32]: replaced

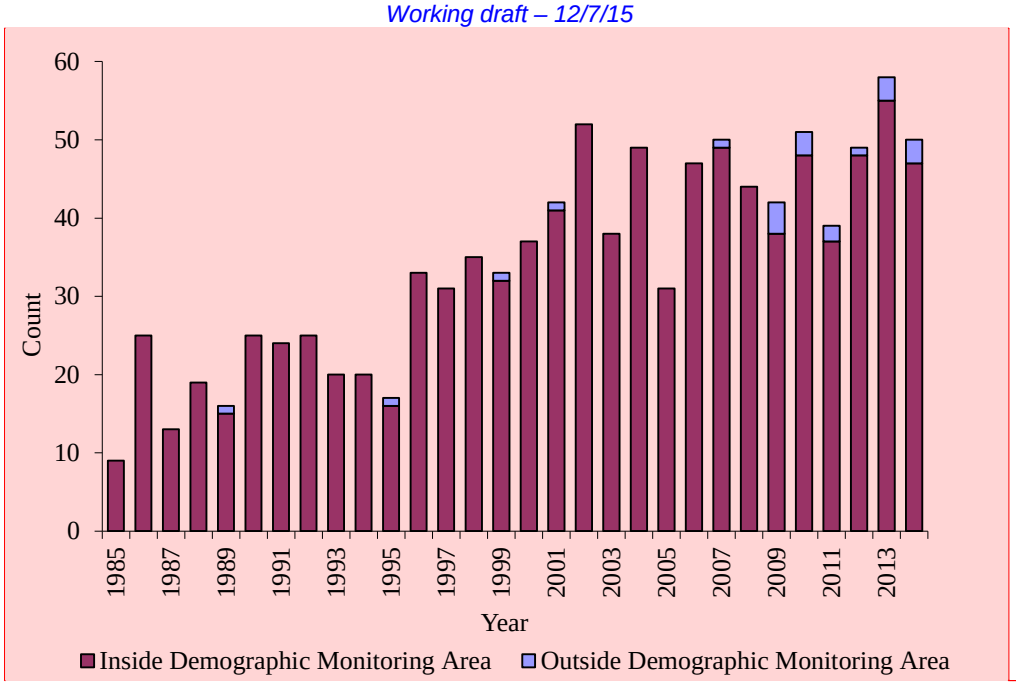
Conservation Strategy Population Standards

This Conservation Strategy and the state management plans set an objective of maintaining a recovered grizzly bear population in the Yellowstone area sufficient to meet management objectives inside and outside the PCA in biologically suitable and socially acceptable habitats. The demographic standards in this Conservation Strategy are designed to meet these goals.

The GYE grizzly bear population exceeds 500 total bears as of 2006 (Appendix M). The intent of the Conservation Strategy is to allow grizzly bears ~~to expand their range and numbers and re~~occupy all biologically suitable and socially acceptable habitats. It is the goal of the agencies of the YGCC implementing this Conservation Strategy to manage the Yellowstone grizzly bear

Comment [G33]: 2007 language to strike-no longer appropriate.

population in the entire GYE at or above a total of 500 grizzly bears ~~stabilize the Yellowstone grizzly bear population inside the DMA at the 2002-2014 average Chao2 population estimate of 674 individuals (average lower 95% CI = 600; average upper 95% CI = 747).~~ This Conservation Strategy requires continued monitoring of the standards in the 2016 Recovery Plan Supplement to the *1993 Recovery Plan* and some additional standards. These specific population standards, will be applied to the population within the DMA.



Comment [G34]: 2016 language to strike and replace with 2007 language. Population management is the purview of the states.

Unduplicated Females with Cubs-of-the-Year

Background

Females with COY occupy all of the existing bear management units within the PCA as well as areas outside the PCA (Figure 3).

Figure 3. The number of unduplicated females with cubs-of-the-year inside and outside the Demographic Monitoring Area, as per the Recovery Plan, 1985–2014.

Comment [G35]: 2007 plan had the recovery plan objective reference line-it needs to be added in this table

Monitoring Protocol

Monitoring unduplicated females with COY will provide information to demonstrate adequate reproduction and to estimate *total* population size. *Total* population size will be estimated using the model-averaged Chao2 method, as described in Appendices B, C, L, and M using the sightings and resightings of unduplicated females with cubs from all areas where grizzly bears occur in Figure 2. The IGBST has been calculating population size on an annual basis using the model-averaged Chao2 estimate since 2002. As the grizzly bear population has increased, model-averaged Chao2 estimates have become increasingly conservative (i.e., prone to underestimation). As a conservative approach to population estimation, the model-averaged Chao2 method will continue to be the method used to assess Criterion 1 (*see* Appendix C for the application protocol for annual population estimation using the model-averaged Chao2 method). The IGBST will continue to investigate new methods for population estimation as appropriate. If new methods become available, these will be considered for application in the GYE as long as

Comment [G36]: Make sure this is accurate

they represent the best available science. However, until possible new methods are developed, the model-averaged Chao2 method will continue to be used. This is a departure from the way the population estimate was done per the *1993 Recovery Plan*. In the *1993 Recovery Plan*, a *minimum* population estimate was made based on the most recent three years of sightings of unduplicated females with cubs, using only unduplicated sights from the recovery zone and 10 miles outside the recovery zone. The revised and improved methodology used in this document allows an estimate of the *total* population using the model-averaged Chao2 method rather than the *minimum* population size. This allows the calculation of mortality limits based on the total population size for each age and sex class (i.e., independent females, independent males, and dependent young) within the DMA (Figure 2). This method allows mortality management and population monitoring of the grizzly bear population in the DMA, as opposed to the method used in the *Recovery Plan*, which focused mortality management and population monitoring on only a portion of the Yellowstone grizzly bear population inside the PCA (the former Recovery Zone) and within 10 miles of the outer boundary of the PCA. The number and distribution of females with cubs-of-the-year can also be used to demonstrate that a sufficient number of adult females are alive within the population to reproduce and offset existing levels of human-caused mortality.

Comment [G37]: 2016 new language moved from Criteria one paragraph-still not sure this is the appropriate place.

The numbers of unduplicated sightings and resightings of females with cubs of the year inside the DMA will be reported by the IGBST. Using these data, the IGBST will produce the model-averaged Chao2 estimate of the total number of independent females in the population inside the DMA, which will then be used to estimate the total population size in the DMA. This total population estimate will be used to apply the mortality limits as per Table 2 within the DMA for independent females (> 2 years old) and independent males (> 2 years old) from all causes as well as mortality limits for dependent young (≤ 2 years old) from human-caused mortality. For a more detailed description of this methodology, see Appendix C.

Sightings and resightings of females with COY inside the DMA will be obtained from numerous sources, including radio tracking flights, confirmed sightings, and observation flights. Observation flights are primarily designed to survey the DMA and the number of flights

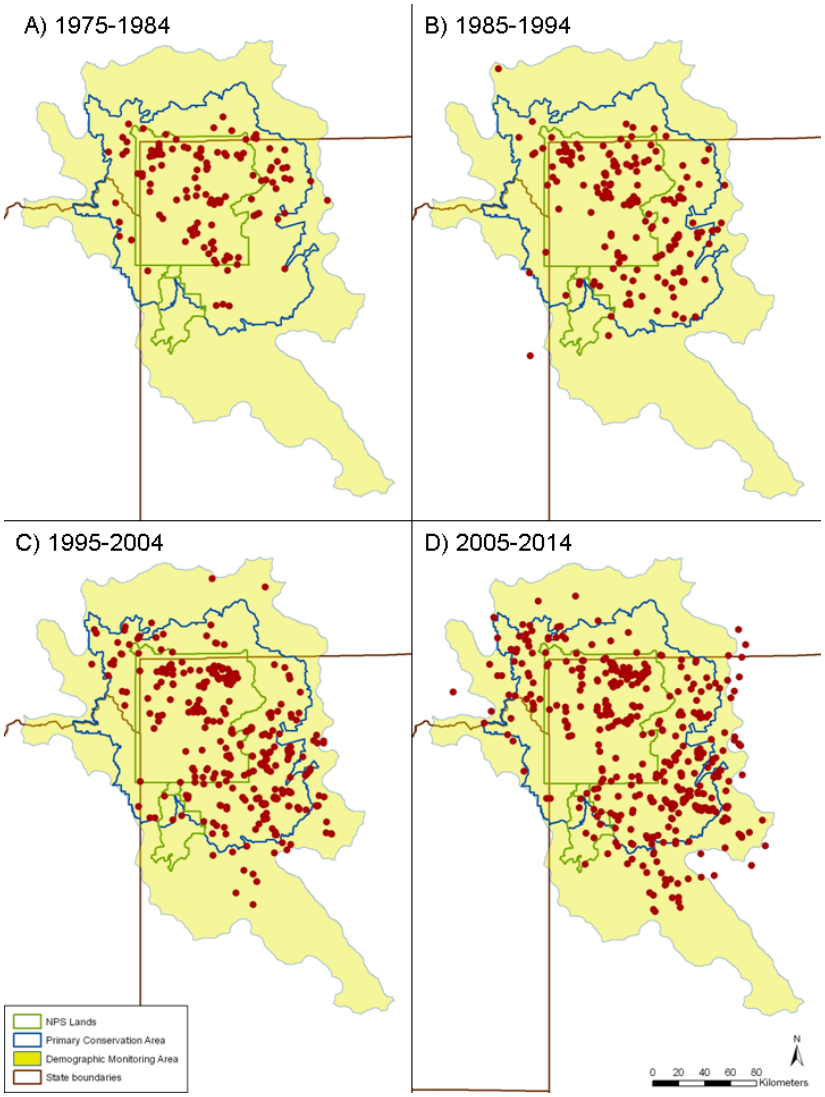
conducted is standardized to ensure equal effort in obtaining data. The IGBST will verify the reliability of all sightings. The IGBST will plot all sightings and summarize data for unduplicated females and numbers of cubs seen for the entire population. Methodology developed by Knight *et al*. (1995) will be used to separate duplicated from unduplicated sightings (*see* Appendix C for more information).

Distribution of Females with Young

Background

The distribution of females with young of all ages, based on the most recent six years of observations in the ecosystem, is presented in Figure 4. The recovery criterion of having 16 of 18 BMUs occupied with no two adjacent units vacant continues to be met (Table 3). This criterion is important as it ensures that reproducing females occupy the majority of the PCA and that successful reproductive females are not concentrated in one portion of the ecosystem.

Monitoring Protocol



This effort will provide information to assess distribution of the reproductive cohort in all occupied habitats, although the specific distribution standard for reproducing females will apply only to the PCA. A recovered population should be well distributed throughout grizzly bear range. Successful reproduction is one indicator of habitat sufficiency, thus distribution of family groups of grizzly bears is one indicator of suitable habitat in areas where such sightings occur. Since sub-adult females usually establish home ranges adjacent to that of their mothers, the distribution of family groups is also an indication of future occupancy of these areas by grizzly bears. Radio tracking flights, observation flights, agency personnel sightings, and verified reports from other individuals will be the primary methods employed to collect female distribution data. The IGBST will verify all reports and keep a record of locations. Data will be maintained by the IGBST.

The number of BMUs occupied by females with young will be reported for the most recent six years. Females with young outside the PCA will also be reported, but only those females with young within the PCA will be used to document achievement of this distribution standard.

Table 4. Bear Management Units occupied by females with young based on verified reports, 2009–2014.

Mortality

Background

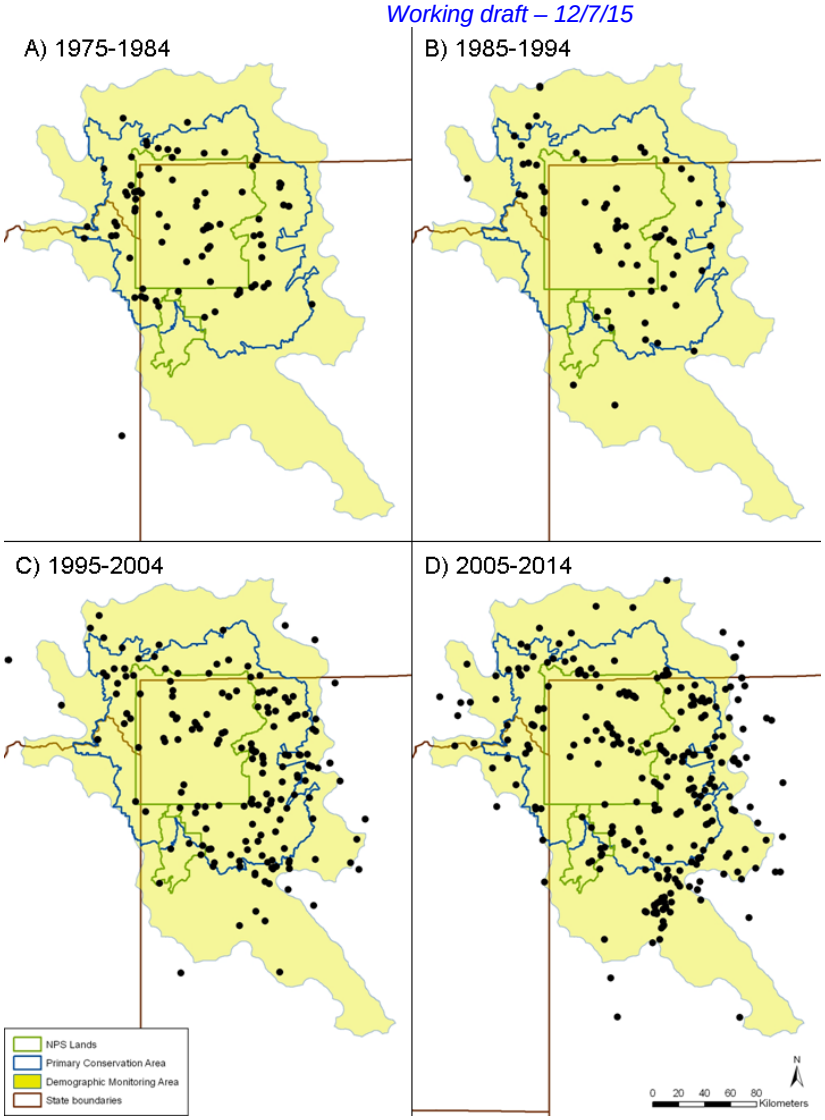
Agencies have invested significant effort aimed at limiting human-caused deaths for grizzly bears. To date, these efforts have been very successful at limiting mortality and allowing the population to increase since it was listed in 1975.

The distribution of known and probably human-caused mortalities 1975–2014 is shown in Figure 5. As the population continues to expand, the percentage of known and probable mortalities occurring outside the PCA and outside the DMA is increasing ~~and~~ however this is expected.

Comment [G38]: Comment-More explanation why it's expected from protocol section below to this paragraph

Monitoring Protocol

The management of human-caused mortality of grizzly bears is key to successful maintenance of the grizzly bear population in the ~~Greater Yellowstone Ecosystem~~GYE. Mortality limits are a necessary tool for managers in regulating human impacts to any wildlife population, including grizzly bears. Managing mortality is necessary to avoid the unregulated killing that occurred as the Yellowstone area was settled and to build support for long-term survival of the population. Higher numbers of mortalities can be expected in areas outside the DMA as the grizzly bear population expands, particularly in areas on the edge of the range when bears move on to private lands or in areas with higher levels of human development. Mortality management recognizes the need for some bears to be removed to address recurring conflicts to meet management needs for nuisance bears, human safety issues, etc.



The state wildlife agenices (Montana, Wyoming, and Idaho) have signed a Memorandum of Agreement setting forth how they will coordinate bear management actions and limit discretionary mortality to ensure it will not jeopardize the recovery and survival of the GYE grizzly bear population (Appendix P). This document also summarizes each state's regulatory mechanisms for regulating discretionary mortality, including harvest. The states may use

Comment [G39]: New 2016 language that should be included-This language may benefit from further editing and expanded reference to the MOA (Proposed as Appendix P).
The concept is that the Strategy explains what the States will do; comparable to the habitat sections, which explain what the federal land management agencies have agreed to do. This approach can be used in combination with the deletion of USFWS' incorrect version of the discretionary mortality table.

~~R~~regulated harvest ~~may be utilized~~ as a management tool when and where appropriate. ~~all known and probable mortalities due to regulated harvest will be limited by the overall mortality limits within the DMA. Mortality limits will be monitored and managed within the mortality limits described in Table 2 and Table 4 to ensure mortality will not jeopardize the health and survival of the GYE grizzly bear population.~~

Comment [G40]: 2016 language to strike-

Figure 6. Distribution of known and probable mortalities, from all causes, in the Greater Yellowstone Ecosystem, by decade from 1975–2014 (IGBST Data).

~~*Table 4. Framework to manage inside the DMA for the population goal of the average population 2002–2014 using the model-averaged Chao2 method.*~~

Comment [t41]: 2016 language to strike-Since there are two Table 4s, the tables will not need to be renumbered when this is deleted.

Management Framework	Background and Application Protocol				
1. Area within which mortality limits apply.	49,928 sq km (19,279 sq mi) Demographic Monitoring Area (DMA) (Figure 2).				
2. Management objective.	To maintain the population at the average estimate for 2002–2014, a period of population stability (674 using the model-averaged Chao2 methodology (Keating *et al.* 2002; Cherry *et al.* 2007; Harris *et al.* 2007) (average lower 95% CI = 600; average upper 95% CI = 747)).				
3. Population estimator.	The model-averaged Chao2 population estimator will be used as the population measurement tool unless another scientifically sound method becomes available. The model-averaged Chao2 population estimate for 2002–2014 was 674 (average lower 95% CI = 600; average upper 95% CI = 747).				
4. Mortality limit setting protocol.	Each fall the IGBST will annually produce a model-averaged Chao2 population estimate for the DMA. That population estimate will be used to establish the mortality limit percentages for each age/sex class for the following year as per #7, #8, and #9 (below).				
5. Allocation process for managed mortalities	The States will coordinate to manage within the mortality limits per age/sex class outside National Parks and the Wind River Reservation (WRR). The WRR will receive a portion of the available mortality limit based on the % of the WRR geographic area within the DMA. Mortalities outside the DMA are the responsibility of each State and do not count against mortality limits.				
6. Management review by the IGBST every 5–10 years to assure that management actions are achieving the objective of a stable population at the estimated number at time of delisting.	This management review will assess if the management system is achieving the desired objective to maintain a stable population at the 2002–2014 average estimated population size based on the model-averaged Chao2. The management review is a science-based process that will be led by the IGBST (which includes all State and Federal agencies and the WRR Tribes) using all recent available scientific data to assess population numbers and trend against the management objective. Vital rates such as age/sex-specific survival and reproductive rates will also be reevaluated using the most recent data to adjust mortality levels as necessary.				
7. Mortality limit % for independent FEMALES based on the results of the model-averaged Chao2 method.	Pop. size	<674	674	675–747	>747
	Mort. %	<7.6%	7.6%	9%	10%
8. Mortality limit % for independent MALES based on the results of the model-averaged Chao2 method.	Pop. size	<674	674	675–747	>747
	Mort. %	15%	15%	20%	22%
9. Mortality limit for % of dependent young based on the results of the model-averaged Chao2 method.	Pop. size	<674	674	675–747	>747
	Mort. %	<7.6%	7.6%	9%	10%

Comment [t42]: USFWS new language. Stable population at the estimated number at time of delisting. THIS IS NOT THE OBJECTIVE; THIS HAS BEEN DISCUSED REPEATEDLY.

10. Example of background level of annual mortalities from management and other causes – Using average yearly total mortality of independent bears (≥2 years) from all causes including unknown/unreported estimates, this example uses the average 2011 to 2014.	38 expected independent bear deaths/year due to management, illegals, and other deaths (17 F, 21 M). (This includes dead bears from inside the DMA only.) Note that this is only an example of the expected background level of annual mortalities. This number may vary from 38/year and will have to be factored into the numbers presented in items #11 and #12 below. The average number of background mortalities inside the DMA for the previous four years will be used to estimate the expected number of animals available for discretionary mortality allocation.				
11. Total annual mortality limit from all causes for independent FEMALES (≥2 years).	< 600 (as an example of <7.6% mortality)	600–673 <7.6% mortality	674 at 7.6% mortality	675–747 at 9% mortality	>747 at 10% mortality
	<16	16 to 17	18	21 to 23	>26
12. Total annual mortality limit from all causes for independent MALES (≥2 years).	<600 at <15% mortality	600–673 15% mortality	674 at 15% mortality	675–747 at 20% mortality	>747 at 22% mortality
	<31	31 to 34	35	47 to 52	>57

Known and probable human-caused mortalities are defined as follows:

Known. Carcass recovered or evidence to indicate known status due to radio telemetry. Known deaths require a carcass, management removal, or a cut radio collar. Found collars having the appearance of being cut should receive additional forensic review for definitive proof.

Probable. Strong evidence to indicate mortality, reported by highly reliable sources, no carcass recovered. Probable deaths include those cases where there is supportive evidence that a bear was wounded. Circumstances of each reported instance should be considered. Probable includes those cases where evidence of blood, hair, or other tissues clearly indicates wounding serious enough to result in death. The literature is unclear on the likelihood of survival for orphaned cubs, therefore, any cub(s) orphaned during its first year of life because of a known mortality of its mother is considered a probable mortality.

Because probable mortalities will be counted against the mortality quota, and because there is a female quota, each probable mortality must be assigned a sex. Sex will be assigned in the following manner:

Probable deaths of adult bears where cubs-of-the-year are reported present will be classified as sex = female.

Lone bears classified as probable deaths will be assigned sex based upon statistics available from known deaths in the ecosystem. The percentage of known male and female deaths in the GYE between 1975 and 1998 is 59% and 41% respectively. These estimates exclude natural mortalities, management removals, and females with young. Therefore, sex will be assigned to probable adult mortalities in the GYE at a ratio of 59:41, male: female.

Cubs-of-the-year that are orphaned and counted as mortalities will be assigned sex based a 50:50 sex ratio at birth (Eberhardt *et al*. 1994). For each cub, a random number will be drawn between 1 and 100. If the number is 1 through 50, the sex will be assigned as male; if the number is 51 to 100, the sex will be assigned as female.

~~Mortality Management~~

State agencies will ~~assure that~~manage mortalities ~~remain~~ within the limits described in Table 2 and Appendix P, by implementing specific regulatory mechanisms in state law and regulation.~~Table 4 by enacting specific regulatory mechanisms in state law and regulation to demonstrate adequate regulatory mechanisms over human-caused mortality, including mortality from sport hunting. These regulations are as follows:~~

Comment [t43]: 2016 language to strike- USFWS "enacting" mischaracterizes the status of state regulatory mechanisms as not in place. Suggested language above re state MOA addresses this issue.

~~- PLACEHOLDER -~~

Formatted: Highlight

~~Other regulations, such as timing and location of hunting seasons should seasons be implemented, would be devised by the States to minimize the possibility that mortality limits of independent females are exceeded within the DMA.~~

Comment [t44]: 2016 language to strike- season adjustments are based on biological factors and management considerations.

It is recognized that established mortality limits might be exceeded in any given year. Any mortality threshold will not affect the immediate management of bears for human safety concerns or for management of nuisance grizzly bears. ~~This document~~ Appendix P describes agency responsibilities ~~and actions to reduce mortality~~ should this occur. ~~State plans provide for the take of nuisance bears regardless of the current mortality quota upon consultation among all involved agencies.~~

Comment [t45]: 2007 language to strike-or clarify what "involved" means.

Monitoring Protocol

Mortality will be monitored by the IGBST reports from all sources. The IGBST will estimate the annual unknown and unreported mortality as per Appendix C and these mortalities will be added to the known and probably mortalities to produce a total annual mortality estimate by age and sex class. Each State wildlife agency, Tribe, and National Park will provide mortality information to the IGBST, who will update and report ~~ongoing~~ mortalities within the DMA to all agencies so that the states may adjust management actions under their purview ~~mortality management can be adjusted in a rapid fashion should that be necessary~~ if a mortality limit is approached or exceeded. The IGBST will annually

Comment [t46]: 2016 language to modify- clarify it is the states who determine adjustments.

summarize all mortality information as to location, type, date, sex, and age for the ~~Greater Yellowstone Ecosystem~~GYE and produce this information in their annual reports.

Mortality standards and grizzly bear vital rates will be reviewed and reported by the IGBST every 5 years. ~~This information may be used to revise mortality management as necessary as long as any such revisions meet the population objectives in the recovery criteria and use the best available science. All management of and information on mortality management will be open to full public review.~~

Formatted: Highlight

Comment [t47]: 2016 language to strike- ESA "best available science" standard does not apply in perpetuity to delisted population management decisions.

Comment [t48]: 2007 language to strike- states and federal agencies have public records laws.

Population Trend

Background

The population of grizzly bears was increasing at approximately 4% to 7% annually between 1983 and 2001 (Eberhardt *et al*. 1994, Boyce 1995, Boyce *et al*. 2001*b*, Harris *et al*. 2006). While there is some debate related to the actual level of increase since the bear was listed in 1975, all information, number of unduplicated females (Figure 3), distribution of reproducing females (Figure 4), distribution of bears, informal sightings by agency personnel, and areas where nuisance bears are being managed indicate this population has increased in both numbers of bears (Figure 5) and the geographic area they occupy (Schwartz *et al*. 2002).

Schwartz *et al.* (2006*b*) used data from 1983 through 2001, while the 2012 IGBST report examined a more recent time period, 2002 through 2011 (IGBST 2012). The 2012 report (IGBST 2012) reported that population growth had slowed since the previous time period, but was still stable to slightly increasing, and had not declined. Because the fates of some radio-collared bears are unknown, Schwartz *et al.* (2006*b*) and the IGBST (2012) calculated two separate estimates of population growth rate: one based on the assumption that every bear with an unknown fate had died (a conservative estimate); and the other simply removing bears with an unknown fate from the sample. The true population growth rate is assumed to be somewhere in

between these two estimates because we know from 30 years of tracking grizzly bears with radio-collars that every lost collar does not indicate a dead bear. While Schwartz *et al.* (2006*b*) found the GYE grizzly bear population increased at a rate between 4.2 and 7.6 percent per year between 1983 and 2002, the IGBST (2012) found this growth had slowed and leveled off and was between 0.3 percent and 2.2 percent per year during 2002–2011.

Schwartz *et al.* (2006*b*) analyzed survivorship of cubs, yearlings, and independent bears based on whether they lived inside Yellowstone National Park, outside the Park but inside the Recovery Zone or Primary Conservation Area (PCA), or outside the PCA entirely. The PCA boundaries (containing 23,853 sq km (9,210 sq mi) correspond to those of the Yellowstone Recovery Zone (U.S. Fish and Wildlife Service 1993) and will replace the Recovery Zone boundary (Figure 2). They concluded that grizzly bears were approaching carrying capacity inside Yellowstone National Park. Consistent with this conclusion, t~~T~~he IGBST (2012) documented lower cub and yearling survival than in the previous time period~~, results consistent with the conclusion by Schwartz *et al.* (2006*b*)~~. Importantly, annual survival of independent females (the most influential age-sex cohort on population trend) remained the same while independent male survival increased (IGBST 2012). Collectively, these two studies indicate that the growth rate of the grizzly bear population inside the DMA had slowed as bear densities have approached carrying capacity, particularly in the core area of occupied range. Recent work by van Manen ~~at~~ *et al.* (2015) confirms that population growth has slowed and the population is showing density dependent population regulation as the population occupies almost all suitable habitat in the DMA.

Monitoring Protocol

This Strategy recognizes that any one factor cannot provide the needed information to assess population size and trend. Ultimately, population assessments will require multiple sources of information.

Population trend, using the Lotka equation as calculated from adult female survivorship and reproductive rate data for the appropriate period (Eberhardt *et al*. 1994, Eberhardt and Knight 1996), will be used as supportive information to evaluate population trend. This method will be applied to the population inside the DMA.

The agencies will strive to maintain a minimum of 25 adult female grizzly bears fitted with mortality-sensing radio collars and monitored at all times. To adequately sample survival, these 25 adult females will be spatially distributed throughout the ecosystem. The target distribution of these 25 radio-collared adult females will be determined by the IGBST; the expected distribution of collared females by agency will be assigned. Each female will be monitored using aerial telemetry flights during the non-denning period. These data will be collected in conjunction with other regularly scheduled relocation flights. When a radio collar indicates that a bear may have died, a field crew will evaluate the actual status of the female and determine cause of death. The IGBST will coordinate field crew collection of mortality data on each bear.

Data to calculate reproduction and survival are collected annually in all areas occupied by grizzly bears throughout the DMA. These data sets will be maintained by the IGBST and used periodically to evaluate population trend.

Table 7. Within the Greater Yellowstone Ecosystem Demographic Monitoring Area: (1) Annual minimum and total count of unduplicated females with cubs-of-the-year (COY) and the 6-year average; (2) documented known and probable mortalities, estimated total mortalities (including unknown-unreported), and estimated annual percent mortality for independent males and females; and (3) for dependent young, estimated annual population, documented known and probably human-caused mortalities and estimated annual percent human-caused mortality within the DMA, 2004-2014.

Genetic Management

Comment [t49]: 2016 language to strike- The statement in the 2007 statregy may be preferable, but it references reintroduction into the Selway Bitterroot, which Idaho cannot support.

~~*Background*~~

~~The GYE supports the southernmost population of grizzly bears remaining in North America. Areas of human occupation, development, and transportation networks separate the Yellowstone grizzly bear from its nearest neighboring population in the Northern Continental Divide Ecosystem (NCDE) of northwestern Montana. Currently, physical distance and relatively high mortality risk due to anthropogenic influences inhibits gene flow between these two grizzly bear populations. As with any isolated population, genetic issues can potentially be of concern for the Yellowstone grizzly bear population because of long-term inbreeding effects due to the loss of genetic diversity. The question of concern is whether genetic factors pose a risk of compromising the long-term viability of the Yellowstone grizzly bear population.~~

~~DNA analyses conducted on museum specimens by Miller and Waits (2003) indicated a slight decline in genetic variability in the Yellowstone population since the early 20th century; however, this loss of variability was less severe than previously hypothesized. Indeed, a~~ A ~~more~~ recent study by Kamath *et al*. (2015) using recent advances in genetic analysis techniques with molecular markers (Luikart *et al*. 2010) indicate that despite isolation, genetic diversity in the contemporary population has stabilized. Kamath *et al*. (2015) found that the current rate of inbreeding in the Yellowstone grizzly bear population is very low (0.2%). Likewise, the effective population size (N_e), which reflects the number of reproducing individuals in a population, has increased from 102 to 469 during the 25-year period of 1982–2007. This positive trend is important because N_e serves as a surrogate measure for a population's evolutionary potential and risk of inbreeding (Franklin and Frankham 1998). The most current N_e estimate of 469 based on Kamath *et al.* (2015) approaches the minimum threshold criterion of 500 required for a threatened population to retain long-term evolutionary potential and maintain adequate genetic variation necessary for adaptation to environmental change. It also exceeds the requisite minimum threshold (N_e > 50 individuals) needed to avoid risk of inbreeding (Franklin

1980). The recent findings of Kamath *et al.* (2015) that 1) genetic diversity is not declining, 2) rate of inbreeding since 1985 is very low, and 3) effective population size has increased nearly 4-fold since 1982, collectively indicate that, at current population levels and under the current environmental conditions, genetic factors do not pose a substantial risk to the viability of the Yellowstone grizzly bear population.

~~Given that the Yellowstone grizzly bear is an isolated population, it is inevitable that sometime in the future there will be loss of genetic variation in the population if no natural movement between neighboring population(s) and no artificial transplants occur. Although in the short term the urgency of this scenario is reduced (Kamath *et al.* 2015), the genetic diversity of Yellowstone grizzly bears remains low relative to other interior grizzly bear populations. However, Kamath *et al.* (2015) recommend that efforts continue to eventually realize natural connectivity and therefore gene flow between Yellowstone and other ecosystems: *"Thus, our study suggests that current effective population sizes are sufficiently large ($N_e \gg 50$) to avoid substantial accumulation of inbreeding depression, reducing concerns regarding genetic factors affecting the viability of Yellowstone grizzly bears. Nonetheless, the historically small Ne, relatively low diversity and isolation over many generations suggest the grizzly population could benefit from increased fitness following the restoration of gene flow (e.g. Tallmon et al. 2004; Hogg et al. 2006), particularly given the unpredictability of future climate and habitat changes."* Therefore, it is important that facilitation of natural movements between the NCDE and the GYE continue, and that monitoring for flow of new genetic material via natural immigration and assessment of genetic diversity aslo continue. In recent decades, as the NCDE and Yellowstone populations have both increased in numbers and expanded in range, the prospect for re-establishing natural connectivity has been improved (Haroldson *et al.* 2010, Proctor *et al.* 2012).~~

~~It is important to continue to facilitate natural movement between the NCDE and the GYE by: (1) management of attractants on public lands in the intervening areas through food storage orders; (2) that there be continued outreach and education about the fact that grizzly bears may~~

~~occasionally be present in these intervening areas; and (3) by minimizing discretionary mortality in these intervening areas. This effort to facilitate natural connectivity between the NCDE and the GYE will not impact necessary management of nuisance bears should they occur in these intervening areas. Although current genetic monitoring methods yield a very high probability (0.96) for detecting a first generation hybrid if one is to occur, no evidence of recent immigration from neighboring populations has been observed (Haroldson *et al*. 2010). Miller and Waits (2003) suggest that one to two effective migrants per generation from the genetically diverse NCDE population would be an appropriate level of gene flow to maintain or increase current levels of genetic diversity in the Yellowstone population.~~

Comment [G50]: 2016 language to strike-states cannot agree to this

Genetic Monitoring Protocol

Genetic samples will be collected from all grizzly bear captures and mortalities in the GYE for analysis via cooperative efforts between the IGBST and recognized genetic experts. Genetic analyses of these samples will be conducted and evaluated for potential evidence of grizzly bears from other populations immigrating into the Yellowstone population and producing offspring. Monitoring of radio-collared grizzly bears will be used to document potential movements between other ecosystems and the GYE.

Miller and Waits (2003) suggest that one to two effective migrants per generation from the genetically diverse NCDE population would be an appropriate level of gene flow to maintain or increase current levels of genetic diversity in the Yellowstone population. If genetic monitoring indicates a significant decline in genetic health, infusion of new genetics will occur through transplants or natural introgression.

Chapter 3 Habitat Standards and Monitoring

Background

Between 1986 and the initial 2007 delisting of the Yellowstone grizzly bear population, grizzly bear habitat in the Greater Yellowstone Ecosystem (GYE) ~~were~~ was managed under standards and guidelines specified in national forest and national park management plans, which included Guidelines established by the Interagency Grizzly Bear Guidelines (IGBC 1986). Acknowledging that humans are the primary agent of grizzly bear mortalities, a principal objective of the IGBC was to improve survival rates by implementing management strategies that minimized anthropogenic influences and grizzly bear-human conflicts. IGBC measures implemented inside the Grizzly Bear Recovery Zone (GBRZ) improved management of garbage and food attractants, reduced sheep grazing, and restricted motorized access and human development. These standards and guidelines ~~that~~ were imposed upon public lands were instrumental in recovery of the grizzly bear in the GYE.

Comment [t51]: Comment-There are some weird edits to this section; it would benefit from proofreading and better wordsmithing.

Comment [t52]: Comments-"imposed upon public lands"?.

The subsequent1993 *Recovery Plan* required the preservation and monitoring of habitat necessary to support a recovered population. This led to the to the development of more explicit and measureable habitat criteria to be applied inside the GBRZ, as per the *Recovery Plan Supplment: Habitat-based Recovery Criteria for the Greater Yellowstone Ecosystem* (USFWS 2007*c*). ~~.~~To satisfy this requirement, measureable habitat criteria were established that called for no net loss of secure habitat with respect to 1998 conditions. These criteria~~s~~ were embraced and incorporated into the draft Conservation Strategy and released for public comment in 2000. Analysis of public comments and new information was used to establish the final habitat standards for a recovered Yellowstone population as identified in the 2007 Conservation Strategy (USFWS 2007*a*) and appended in a supplement to the Recovery Plan (USFWS 2007*b*). Upon delisting of the Yellowstone population, the GBRZ will be referred to as the Primary Conservation Area (PCA) to reflect the shift from managing for recovery to one of conservation. This 2016 revision of the Conservation Strategy includes some changes

Comment [t53]: Comment-"Embraced"? for a draft?

to the 2007 document that help clarify habitat standards as they pertain to the 1998 baseline. Clarifying language to the application rules has been inserted where necessary to provide better direction for application of these standards on a local project level. No substantive changes in the content of habitat standards have been made under this revision. However, some modifications in habitat monitoring protocols have been made and are documented in this chapter.

Introduction

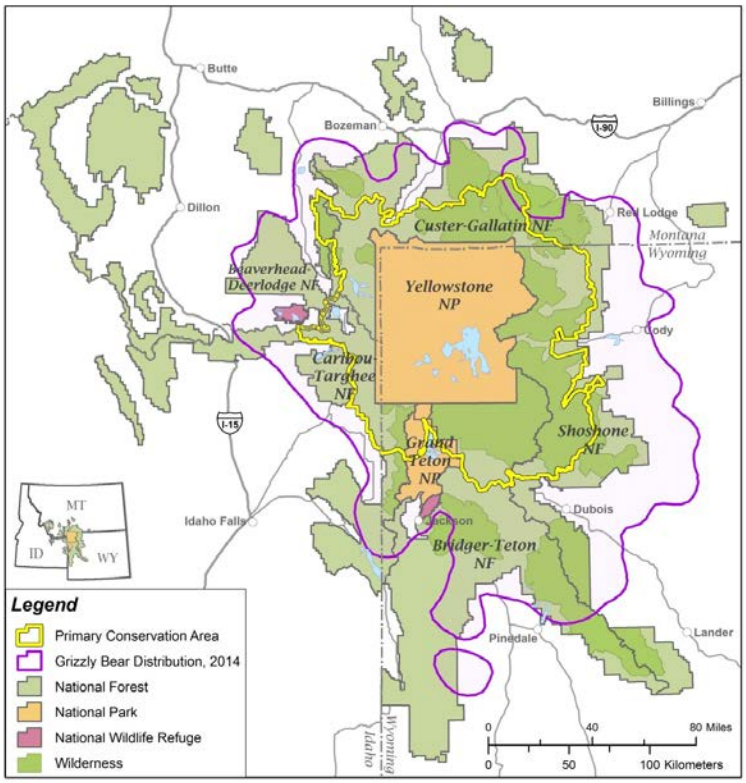
Habitat standards apply to Federal lands inside the PCA and identify three factors that must be maintained at, or improved upon with respect to conditions existing in 1998: 1) secure habitat, 2) number and capacity of developed sites, and 3) number and acreage of active commercial livestock grazing allotments. All three of these factors are linked to human activities that affect grizzly bear mortality and displacement. These three standards apply only to public lands within the PCA, the area where past recovery efforts and present habitat conservation measures are primariy focused. The PCA serves as a relatively safe haven located at the core of the ecosystem and accounts ~~fro~~ for approximately 47% of the Yellowstone grizzly bear's occupied range as estimated from methods of Bjornlie *et al*. 2014 (Figure 6). The 1998 baseline for habitat standards was selected because studies showed (and recently affirmed) that the Yellowstone grizzly bear population was increasing annually at a robust rate of 4 to 7 percent between 1983 and 2001 (Boyce *et al.* 2001*b*, Harris *et al*. 2006, 2007, IGBST 2012). Habitat conditions in 1998 were considered representative of this time period since levels of secure habitat and developed sites inside the PCA had remained relatively constant in the 10 years preceding 1998 and beyond (USDA 2004). Hence, conditions in 1998 are believed to have supported and contributed to the population growth observed during 1983-2001. Habitat standards, as they apply to the 1998 baseline, impose measureable side boards on allowed levels of human activity inside the PCA and establish a clear benchmark against which future improvements and impacts of habitat can be measured.

Comment [t54]: Comment-Accurate?

Comment [t55]: Comment-Figure 6 is the mortalities figure?

To facilitate management of habitat throughout the PCA, the area inside the PCA is divided into 18 distinct bear management units (BMUs) and 40 subunits (Figure 2, Chapter 1). BMU boundaries were delineated to approximate the average *lifetime* range of an adult female grizzly bear in the GYE. Each BMU was further subdivided into one ore more subunits comparable in size to the average *annual* home range of an adult female grizzly bear. Monitoring habitat at a subunit scale provides greater spatial resolution and proved to be better suited for analyzing habitat use patterns and ensuring good distribution of bear habitat throughout the PCA (USDA 1985). Hence, conditions pertaining to secure habitat and developed site standards are measured and compared against 1998 levels for each of the 40 bear management subunits within the PCA. To date, habitat-based criteria throughout the PCA have been successfully maintained at, or improved upon, 1998 levels for all 40 subunits. Adherence to these standards ensures that sufficient habitat for the Yellowstone grizzly bear will continue to be available into the foreseeable future. Habitat standards in this document are subject to revision based on the best available science and will be reviewd and updated as necessary.

In addition to mandatory habitat standards, several other habitat parameters will be monitored and evaluated to determine the overall condition of habitat for grizzly bears in the PCA. These additional monitoring items include habitat connectivity, hunter numbers, and productivity of the following four high-calorie foods: 1) winter-killed ungulates, 2) cutthroat trout, 3) army cutworm moths, and 4) whitebark pine seeds. Information on monitoring protocols for these items is found in subsequent sections of this chapter.



Agencies responsible for management of grizzly bear habitat in the GYE are committed to continue collecting the necessary information to evaluate adherence to habitat standards and monitoring protocols throughout the PCA. The overall objective for habitat management inside the PCA is to reduce human-caused grizzly bear mortalities by maintaining or improving habitat with respect to 1998 conditions while maintaining options for resource management activities at approximately the same level as existed in 1998. The habitat

standards and monitoring requirements in this Conservation Strategy will be incorporated into National Forest, National Park, and BLM plans.

Comment [t56]: Comment-Have been?

Figure 8. Federal lands comprising the Greater Yellowstone Ecosystem (GYE), the Primary Conservation Area (PCA), and estimated current (2014) Grizzly Bear Occupied Range.

Comment [t57]: Comment-This map looks like it includes considerable area outside of the boundaries of the prior GYA DPS. Was this larger area used for the % of occupied habitat? this doesn't match figure 1; what's up with math regarding occupied habitat, such as the reference of unoccupied habitat in demographic critierion 1, etc.

Outside the PCA, grizzly bears are allowed to expand into adjacent areas considered biologically suitable and socially acceptable, as per direction in the State management plans

(Appendices I, J, and K). The key to successful management of grizzly bears outside the PCA is a sustainable balance that accommodates the needs of grizzly bears along with the competing demands of human use. As such, an important management objective for areas outside the PCA is to maintain existing resource management and recreational uses and allow agencies to respond to demonstrated problems with appropriate management actions. ~~Approximately 83 percent of suitable habitat outside the PCA occurs on federally owned land and about 66 percent of that suitable habitat is occupied by grizzly bears (Figure 6).~~ A flexible management strategy is crucial for promoting acceptance and tolerance for grizzly bears as they continue to expand into suitable habitat outside the PCA. Standards and guidelines for other wildlife species identified in National Forest and Park management plans indirectly provide additional habitat management direction for bears outside the PCA.

Comment [t58]: Where did this figure regarding occupation come from?
The document previously stated: "Collectively, these two studies indicate that the growth rate of the grizzly bear population inside the DMA had slowed as bear densities have approached carrying capacity, particularly in the core area of occupied range. Recent work by van Manen *et al.* (2015) confirms that population growth has slowed and the population is showing density dependent population regulation as the population occupies almost all suitable habitat in the DMA." See prior note about Figures 1 and 8.

State grizzly bear management plans for Idaho, Montana, and Wyoming recommend and encourage land management agencies to maintain or improve habitats important to grizzly bears and to monitor habitat conditions outside the PCA. These three states acknowledge the importance of secure habitat, motorized access management, and road density issues related to the survival of grizzly bears and other wildlife. Consequently, levels of secure habitat and motorized route density are monitored on federal lands outside the PCA to identify and prevent potential habitat threats from negatively impacting the long-term viability of the Yellowstone grizzly bear population. Land management agencies work cooperatively with state wildlife agencies to meet identified population and habitat goals for grizzly bears in the GYE. The process of implementing state and federal grizzly bear management is coordinated by the Yellowstone Grizzly Bear Coordinating Committee (YGCC) representing all respective land management agencies in the GYE (*see* Chapter 6 Implementation and Evaluation).

Immediately upon ESA delisting of the species, Forest Service regional foresters in Regions 1, 2, and 4 agree to add the grizzly bear to their Sensitive Species lists for the five National Forests in the GYE. Forest Service sensitive species direction requires that any project "*must*

not result in loss of species viability or create significant trends toward federal listing" (USDA 2005). Sensitive species direction also requires the Forest Service to "*assist states in achieving their goals for conservation of endemic species*" (USDA 2005). A biological evaluation will be completed for all Forest Service projects potentially affecting the grizzly bear. These evaluations will be completed for all Forest Service projects potentially affecting the grizzly bear. These evaluations will determine whether projects do or do not meet the habitat standards in this Conservation Strategy. If the biological evaluation demonstrates that a project does not meet the habitat standards as well as other relevant habitat and population criteria, the project will be modified as necessary to ensure complete adherence with all required measures.

Habitat Standards Inside the PCA

Human activity is the primary factor negatively impacting availability and security of grizzly bear habitat in the GYE. The relationship between bears and habitat is extremely complex and difficult to quantify. However, unfettered human activity is known to result in displacement and mortality of grizzly bears and was a significant contributing factor leading to listing the grizzly bear in the conterminous U.S. as a Threatened species in 1975. Restrictions in human activities due to management practices implemented by the IGBC in the mid-1980s correlate strongly with the steady increase in the Yellowstone grizzly bear population that was observed between 1983 and 2001. Habitat standards formalized in this document impose measurable sideboards on levels of human activity allowed on Federal lands inside the PCA, thereby reducing opportunities for grizzly bear-human conflicts, habitat disturbance, and displacement of grizzly bears from valuable habitat.

Habitat standards identified in this document address three key factors related to human activity (motorized access, site development, and commercial livestock grazing) and specifically call for no net loss in secure habitat inside the PCA from what existed in 1998

(Appendix E). Adequate secure habitat is essential to the survival and reproductive success of grizzly bears, particularly adult females.

It is the goal of habitat management agencies to maintain or improve habitat conditions throughout the PCA at or above 1998 levels, as measured per bear managementsubunit, These levels of secure habitat have been maintained and will continue to be maintained, and improved on where possible, long into the future.

Potential impacts to grizzly bears and their habitat will be evaluated and mitigated using the criteria and standards in this Conservation Strategy in coordination with state wildlife agencies.

Omissions to the 1998 habitat measurements comprising the baseline (Appendix E) may be corrected for when based on new and well documented information substantiating the existence and status of anthropomorphic features (i.e., motorized routes, developed sites, or livestock allotments) that were not propery accounted for in the 1998 baseline. When verified, legitimate corrections to the baseline will be tracked and reported and will constitute new baseline habitat levels against which future change will be measured.

Application rules specific to each habitat standard provide additional direction on how these standards are to be implemented at a Federal project level. The following habitat standards and application rules apply to all Federal lands inside the PCA.

Secure Habitat Standard

The Secure Habitat Standard requires that inside the PCA, the percentage of secure habitat within each bear management subunit must be maintained at or above levels that existed in 1998 (Appendix E). The sole exception to the 1998 secure habitat baseline applies to the three subunits identified in the 2007 Conservation strategy as in need of improvement above 1998 levels (Gallatin #3, Henrys Lake #2, and Madison #2). These three subunits must be

maintained at or above levels attained from the full implementation of the 2006 Gallatin National Forest Travel Management Plan (Appendix E). Authorized Federal projects that result in temporary or permanent changes to secure habitat must follow the Application Rules identified below.

Secure habitat is defined as any contiguous area ≥ 10 acres in size and more than 500 m from an open or gated motorized access route (road or trail) or recurring low level helicopter line during the non-denning period (March 1 – November 30). Gated routes that are closed year-round to public motorized use but remain accessible to administrative personnel are still considered motorized access routes, and hence, detract from secure grizzly bear habitat. Decomissioned routes that are permanently and effectively closed to the public and administrative staff do not count against this standard. Lakes larger than 1.6 sq km (1 sq mi) in spatial extent are excluded from secure habitat calculations.

Application Rules for Permanent Changes in Secure Habitat

Permanent changes to secure habitat are allowed inside the PCA when associated with an authorized Federal project involving construction of new motorized routes (i.e., roads or trails), reconstruction of existing motorized routes, or opening of a previously decommissioned route if, and only if, the following conditions are met:

- Any loss in secure habitat below baseline levels is replaced by restoring secure habitat of equivalent quality and quantity (e.g., through decommissioning) in the same bear management subunit. Habitat quality must be assessed based on the best collective scientific understanding of grizzly bear habitat ecology and the rationale for all mitigation measures must be fully documented.
- Replacement habitat must be in place before project implementation or concurrent with project development as an integral part of the project plan. Replacement habitat must remain in place for a minimum of 10 years before it can be subsequently replaced and

mitigated for per application rules (this duration is based upone the generation time for a female grizzly bear, or the time it takes to replace herself in the population).

- For those subunits identified as in need of improvement above 1998 levels (*Gallatin #3, Madison #2,* and *Henry's Lake #2*), secure habitat will be maintained at or above levels associated with full implementation of the 2006 Gallatin National Forest Travel Management Plan (see Appendix E).
- For activities based on statutory rights, such as access to private lands under the *Alaska National Interest Lands Conservation* (ANILCA) or the *1872 General Mining Law*, where permanent reductions in secure habitat cannot be replaced within the affected subunit, then secure habitat will be compensated at a commensurate level at or above the baseline in the nearest possible subunit. In these rare situations, subsequent changes to secure habitat in the two affected subunits constitute permante changes to the baseline.
- Honor existing oil and gas or other mineral leases. Proposed *Applications for Permit to Drill* (APDs) and operating plans within those leases would strive to meet the application rules for changes to secure habitat. New leases, APDs, and operating plans must meet the secure habitat and developed site standards.
- Motorized routes on private land that post-date 1998 are not counted against this standard. However, for motorized roads or trails acquired through land exchanges or acquisition that are desirable to maintain for public use, mitigation is strongly recommended.

Application Rules for Temporary Changes in Secure Habitat

Temporary reductions in secure habitat below baseline levels inside the PCA are allowed when associated with authorized Federal projects. Project activities should be concentrated in space and time to minimize disturbance**.** The following conditions must be met for temporary projects:

Only one project affecting secure habitat may be active within a given bear management subunit at any one time.

Total acreage of secure habitat affected within a given BMU does not exceed 1 percent of the acreage in the largest subunit within that BMU. The acreage of a project that counts against the 1 percent limit (i.e., the amount of secure habitat affected) is measured as the acreage within the 500-meter buffer around any temporary motorized access route or low-level helicopter flight line that intrudes into existing secure habitat.

Use of project roads will be limited to administrative purposes associated with project activities. Project implementation shall not reduce secure habitat below baseline levels for more than 4 consecutive years. The collective set of project roads that affect secure habitat below baseline levels shall be closed to all motorized travel after 3 years. Project roads shall be decommissioned such that secure habitat is restored within 1 year after road closure.

Activities Allowed in Secure Habitat

The following activities are allowed in secure habitat inside the PCA without violating the standard:

- ***Activities that do not require route construction or reconstruction, re-opening of a permanently closed road, or recurring low-level helicopter flight lines.***
- ***Helicopter use for short term (no more than 2 days in the duration of a project), or at higher elevations (> 500 m above ground level with no landing). Aircraft used in emergency firefighting are allowed.***
- Non-wheeled, over-the-snow use (i.e., snow machines) is allowed unless new research identifies a concern. Conflicts associated with winter-use activities that develop either during denning or after den emergence in the spring can be addressed with local area restrictions.

- Access to power lines and/or utility corridors for occasional and necessary maintenance service that does not require new route construction and is used only for administrative purposes related to power line/utility maintenance.
- Project activities (e.g., temporary road construction and maintenance, or use of recurring low-level helicopter flights) that occur during the grizzly bear denning season between December 1 and February 28.

Developed Site Standard

The Developed Site Standard requires that on Federal lands inside the PCA, the number and capacity for human use of developed sites must be maintained at or below the 1998 levels (Appendix E). Projects that propose a change in the number or capacity of developed sites must follow the Application Rules specified below.

Developed sites *refer to those sites or facilities on public land with features intended to accommodate administrative and public recreational use. Such sites typically are identified or advertised via visitor maps or information displays as discernable destination sites promoted by the agency. Developed sites are often associated with human activities that may disrupt grizzly bear use of habitat, or have attractants that potentially lead to increased human-bear conflicts. Examples of developed sites include, but are not limited to: campgrounds, picnic areas, trailheads, boat launches, rental cabins, summer homes, lodges, service stations, restaurants, visitor centers, and administrative sites.* ***Administrative sites*** *are those sites or facilities constructed for use primarily by government employees to facilitate the administrations and management of public lands. Administrative sites are counted towards developed sites. Examples include: administrative headquarters, ranger stations, patrol cabins, park entrances, federal employee housing, and other facilities supporting government operations.* ***Dispersed sites****, in contrast to developed or administrative sites, are those not associated with a developed site, such as a front-country campground. These sites are typically characterized as having no*

permanent agency-constructed features, have minimal to no site modifications, and may include primitive road access. Dispersed sites are not counted toward developed sites.

Application Rules for Developed Sites

On Federal lands inside the PCA, changes to developed sites or construction of new developed sites are allowed if the following conditions are met:

Construction of new sites will be mitigated for within that subunit to offset any increase in the number of developed sites and/or capacity for human use, habitat loss, and increased access to surrounding habitats.

Mitigation of detrimental impacts will occur within the affected subunit and adequately compensate for the type and extent of impacts. Mitigation measures will be in place before implementation of the project or included as an integral part of completion of the project.

Consolidation and/or elimination of dispersed campsites is considered adequate mitigation for increases in human capacity at developed campgrounds if the new campsite capacity is less than or equivalent to that of the dispersed camping eliminated and if future overnight use of the dispersed site(s) is definitively curtailed.

Conversion of uncontrolled dispersed campsites to a minor day-use site is allowed if there is a net benefit to both human and bear safety and if the dispersed site(s) can be modified in such a way that future over-night use of the site is definitively curtailed. Such modification of site-use would not contribute to an increase in baseline developed sites.

Expansion of existing administrative sites is exempt from mitigation if such developments are deemed necessary for enhancement of public land management and other viable alternatives are not available. Temporary construction of work camps for highway construction or other major maintenance projects are exempt from human capacity mitigation if other viable alternatives are not available. Food storage structures and management must be in place and all other factors resulting in potential detrimental impacts to grizzly bears will be mitigated as identified for other developed sites.

Modifications to existing developed sites that reduce resource damage, detrimental environmental impacts, and/or the potential for grizzly bear conflicts are allowed (e.g., installing a vaulted toilet to avoid damage to water resources or installing bear-resistant storage structures to reduce conflict).

For activities based in statutory rights (e.g., *1872 General Mining Law, Americans with Disability Act,* ANILCA, etc.), if the number of developed sites exceeds the 1998 baseline, the Forest Service will, to the fullest extent of its regulatory authority, reduce developed sites to commensurate levels and mitigate to offset any increases in human capacity, habitat loss, and increased access to surrounding habitat within the affected subunit if possible. In those rare cases where mitigation cannot be accomplished within that subunit, commensurate compensation will be accomplished in the nearest subunit and changes in the two affected subunits become permanent changes to the baseline.

Honor existing oil and gas and other mineral leases. For proposed *Applications for Permit to Drill* (APDs) and operating plans within those leases, the Forest Service should, to the fullest extent of their regulatory authority, strive to meet the developed site standard and satisfy application rules for changes in secure habitat. New leases, APDs, and operating plans must meet the developed site standard and satisfy application rules for changes in secure habitat. Developments on private land are not counted against this standard. However, for developed sites acquired through land exchanges or acquisitions that are desirable to maintain, mitigation is strongly encouraged but not required. The rationale behind this is to encourage acquisition and transformation of private land to public ownership since this negates the potential for future development and results in better management for grizzly bears.

Livestock Allotment Standard

The Livestock Allotment Standard requires that on Federal lands inside the PCA, there will be no increase in the number or acreage of active commercial livestock grazing allotments nor an increase in permitted sheep Animal Months (AMs) relative to that which existed

in1998 (see Appendix E). Existing sheep allotments will be monitored, evaluated, and phased out as the opportunity arises with willing permittees.

Application Rules

Grazing allotments tracked for purposes of grizzly bear conservation include both vacant and active commercial livestock units for sheep, cattle, and/or horses on Federal lands inside the PCA. **Active** allotments are livestock units with active grazing permits. **Vacant** allotments are those without an active permit, but which may be restocked or grazed periodically by other permittees at the discretion of the land management agency to resolve resource issues or other concerns. Changes in livestock allotments inside the PCA that satisfy the allotment standard may occur if the following conditions are met:

- A vacant allotment may be reissued an active permit resulting in an increase in the number of permitted cattle, but the number and net acreage of active allotments inside the PCA must not exceed the 1998 baseline. Appropriate analysis by the action agency must be conducted to evaluate impacts on grizzly bears.
- Combining or dividing existing allotments is allowed as long as the net acreage and number of active allotments does not exceed 1998 levels.
- Where chronic grizzly bear conflicts occur on livestock allotments inside the PCA, and an opportunity exists with a willing permittee, alternatives for resolving conflicts may include authorization of a non-use permit, moving livestock to a vacant allotment where there is less likelihood of conflict, or cattle grazing can be phased out on that allotment.

Habitat Monitoring

The primary objective of habitat monitoring is to track and assess the status of grizzly bear habitat throughout the ecosystem with an emphasis placed on habitat inside the PCA. Monitoring requirements presented in this section focus on evaluation of adherence to habitat

standards identified such that secure habitat, developed sites, and commercial livestock grazing allotments are maintained at, or improved upon, 1998 levels. However, additional habitat parameters pertaining to four high-calorie foods of the grizzly bear diet are also monitored to assist in evaluating the status of grizzly bear habitat and its ability to support a a recovered grizzly bear population.

Monitoring Secure Habitat and Motorized Access Route Density

Background

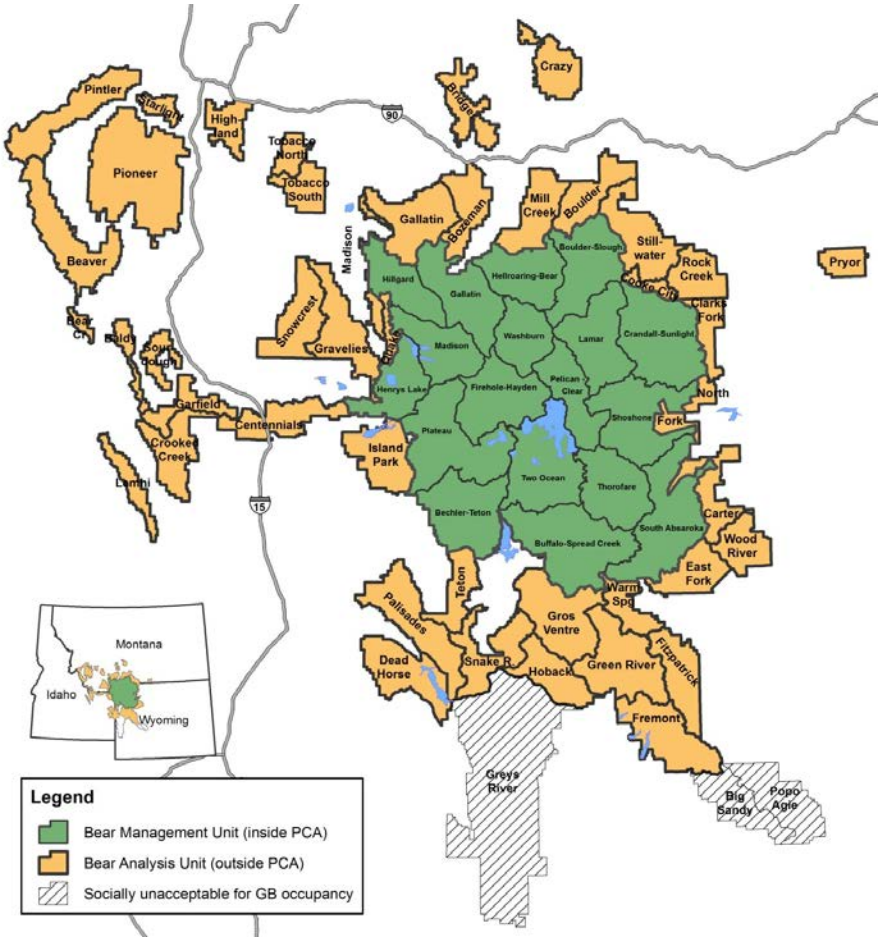
Humans are the primary agent influencing grizzly bear mortality and population trajectories in the GYE and elsewhere (McLellan and Shackleton 1988, Mattson and Knight 1991, Mace *et al*. 1996, Schwartz *et al*. 2010, Proctor *et al*. 2012). Motorized access has historically been used as a surrogate measure of human presence on the landscape, and consequently serves as the basis for differentiating secure and non-secure habitat throughout the ecosystem. Land managers throughout the GYE recognize that availability of secure habitat is crucial to the survival and long-term reproductive success of grizzly bears. Managing the landscape to reduce grizzly bear mortality risk requires that motorized roads and trails be considered when evaluating and maintaining secure habitat throughout the ecosystem.

Motorized access parameters, including: 1) percent secure habitat, 2) open motorized access route density (OMARD), and 3) total motorized access route density (TMARD) , are measured and monitored against levels that existed in 1998. To date, no net decrease in secure habitat relative to 1998 levels has occurred on federal lands in any of the 40 bear management subunits within the PCA. Instead, reductions in motorized access implemented post-1998 have led to an increase of 1.4 percent in secure habitat inside the PCA; a gain approximate in size to the area of Yellowstone Lake.

Subunits with potential for improvement

Several subunits, Gallatin #3, Henrys Lake #2, and Madison #2, were targeted in the 2007 Conservation Strategy as needing improvement in secure habitat with respect to 1998 levels. The specific areas with potential for improvement identified in these three subunits fall within the Gallatin National Forest boundary and consequently, the quantity and timing of improvements was to be determined by the Gallatin National Forest Travel Management Plan (TMP). With implementation of the 2006 Gallatin TMP, many roads inherited from these exchanges have been permanently decommissioned. Non-system routes that are not maintained by the Forest Service have subsequently been closed, with a high priority given to road decommissions in the three subunits identified as in need of improvement. With full implementation of the Gallatin Travel Plan near completion, measureable increases in secure habitat with respect to 1998 baseline levels (Appendix E) and reductions in motorized route density have been realized in the three targeted subunits. The Gallatin National forest determine, via a Travel Plan Amendment, that all gains in secure habitat resulting from full implementation of the TMP will effectively constitute new baseline levels for these three subunits. If and when approved, elevated secure levels for these three subunits will serve as a new measure against which future change will be made.

Monitoring Protocol



Secure habitat and motorized route density are monitored and tracked throughout the ecosystem to verify compliance with secure habitat standards inside the PCA and to assist in balancing grizzly bear security and survival with human land use concerns outside the PCA. Motorized access parameters that are monitored and reported include levels of 1)secure habitat, 2) open motorized access route density (OMARD) greater than 1.6 km/sq km (1 mi/sq mi)), and 3) total motorized access route density (TMARD) greater than 3.2 km/sq km (2 mi/sq mi). Inside the PCA, these three parameters are measured and reported annually for each bear management subunit. Outside the PCA, secure habitat is measured and reported biennially (even numbered years) for each bear analysis unit (BAU, see Figure 7). Changes in configuration and status of

motorized routes are submitted each year to the Grizzly Bear Habitat Database Coordinator by representatives from each National Forest and National Park in the ecosystem. Status and configuration of motorized access routes are inventoried and tracked by the Database Coordinator. This insures that reported measurements are based on the most current available information. Percent secure habitat, OMARD, and TMARD are calculated using the Motorized Access Model as described in Appendix E.

Secure habitat, as definied earlier, refers to those areas ≥ 10 acres in size and more than 500 m from an open or gated motorized route. Lakes greater than 1.6 sq km (1 sq mi) are excluded from secure habitat calculations. **OMARD** is a measure of the density of motorized routes that are open to the public for one or more days during the non-denning portion of the year when grizzly bears are active (March 1-November 30). **TMARD** measure the density of all motorized routes open to the public and/or administrative personnel for one or more days during the non-denning season. Roads that are closed year-round to the public but open to administrative personnel detract from secure habitat and count toward TMARD, but do not contribute to OMARD. Motorized routes that have been permanently decommissioned such that there is no motorized use by either the public or administrative staff, do not contribute to OMARD or TMARD, and do not detract from secure habitat. For a more detailed discussion of OMARD and TMARD, as well as changes in monitoring protocol, please refer to Appendix E. Measurements are reported annually (inside the PCA) and biennially (outside the PCA) in the IGBST Annual Report, *Yellowstone Grizzly Bear Investigations* and are posted online for public access at the IGBST website (http://nrmsc.usgs.gov/products/IGBST).

Figure 7. Bear management units and subunits inside the Primary Conservation Area (PCA) and bear analysis units outside the PCA.

Comment [t59]: Comment-This includes units outside the previously designated DPS??? The more area delisted with management flexilbity the better, but just want to understand what's going on…

Monitoring Developed Sites

Background

Levels of human development on the landscape have been shown to be an important predictor of grizzly bear mortality in the GYE (Schwartz et al. 2010). Developed sites increase the spatial and temporal extent of human presence on the landscape and contribute to the displacement and mortality of grizzly bears. A significant concern related to developed sites is the increased potential for grizzly bear-human conflicts attributable to food conditioning and habituation. Past attempts at modeling grizzly bear mortality in the GYE have focused on levels of overnight human use as a primary factor related to grizzly bear mortality. Increased numbers of people using an area and potentially interacting with grizzly bears is an important issue in evaluating impacts of developed sites on grizzly bear survival.

Monitoring Protocol

Changes in developed sites on public lands inside the PCA are measured, tracked, and evaluated against 1998 levels (Appendix E). Information pertaining to changes in the number of developed sites inside the PCA is submitted annually to the Grizzly Bear Habitat Database Coordinator by representatives from each National Forest and National Park Ecosystem. Current and baseline numbers of developed sites are inventoried in a GIS database and reported annually in the IGBST Annual Report Yellowstone Grizzly Bear
Investigations.

Monitoring Livestock Grazing

Background

Conflicts between livestock and grizzly bears have historically led to the relocation or removal of grizzly bears in the GYE. Grizzly bears tend to prey on cattle and sheep regardless of the abundance of natural foods because livestock in occupied grizzly bear territory represent one of many foraging opportunities (Gunther *et al*. 2004). Most grizzly bear-livestock conflicts tend to

occur outside the PCA since all commercial allotments on National Park lands and many allotments on National Forest lands inside the PCA have been permanently closed. Consequently, monitoring grizzly bear-livestock conflicts on public lands is not limited to inside the PCA, but is conducted annually throughout the entire ecosystem. Currently, approximately 59 percent of the Yellowstone grizzly bear's occupied range falls outside the PCA. As commercial livestock grazing persists in areas where grizzly bears live, the number of conflicts will most likely continue to pose a challenge to grizzly bear managers. This is particularly true on domestic sheep allotments. Financial incentives offered through non-governmental organizations (NGOs) have proven to be a successful mechanism for retiring sheep grazing allotments on public land when willing participants were available (Gunther *et al*. 2004). These types of opportunistic partnerships between federal agencies, NGOs, and willing permittees may be considered an alternative for resolving chronic conflicts on grazing allotments within prime grizzly bear habitat.

Monitoring Protocol

On federal lands inside the PCA, the number and acreage of commercial livestock grazing allotments and the number of sheep animal months (AMs) is monitored and reported annually relative to 1998 levels. Inside and outside the PCA, grizzly bear conflicts associated with grazing of commercial livestock on federal lands is monitored and reported annually. Commercial livestock grazing and conflict information is submitted for publication in the IGBST annual report, *Yellowstone Grizzly Bear Investigations*.

Monitoring High-Caloric Foods

Background

Grizzly bears are opportunistic omnivores who have evolved highly versatile foraging strategies allowing them to shift diets among numerous food sources, depending on what is available

spatially and temporally (Schwartz *et al*. 2003, 2013). Long-term management and conservation of grizzly bears in the GYE call for monitoring of four high-calorie foods. These four food types listed by dry weight kilocalories per gram (kcal/g) include: 1) army cutworm moths (7.91 kcal/g), 2) winter-killed ungulates (6.80 kcal/g), 3) cutthroat trout (6.10 kcal/g), and 4) whitebark pine seeds (3.99 kcal/g). These four foods have varying distributions in the ecosystem and are subject to annual fluctuations and therefore do not necessarily serve as a major dietary component of every grizzly bear in the GYE. Natural annual fluctuations in abundance and distribution of these four calorie-rich foods make it very challenging to establish reliable thresholds. However, these four high-calorie foods are known to exert a positive influence on grizzly bear fecundity and survival and constitute some of the highest sources of digestible energy available to grizzly bears in the GYE (Mealey 1975, Servheen *et al*. 1986, Pritchard and Robbins 1990, Mattson *et al*. 1992, Haroldson *et al*. 2006, Schwartz *et al.* 2006).

Gunther *et al.* (2014*a*) exhaustively documented the diet of the GYE grizzly bears to include over 266 distinct plant and animal species ranging from grasses, fungi, berries and seeds, to fish and carrion. The trophic flexibility of grizzly bears, as documented by the variety of foods they consume, allow them to opportunistically forage across diverse habitats spanning the entire GYE. Their highly varied diet serves as an adaptive mechanism that enhances their ability to persist when faced with rapid and long-term changes in availability and abundance of any one food source. Compositional analysis of scats collected over a 37-year period (1943 to 2009) showed that grizzly bears within the GYE most frequently feed on foods that are consistently available and widely distributed, such as grasses, sedges, and ants (Gunther *et al.* 2014*a*). However, when opportunity arises, grizzly bears will shift their diet to maximize body mass gain by selecting calorie-rich foods such as ungulates, fish, whitebark pine seeds, clover, moths, and small mammals.

Human-induced environmental change, such as introduced organisms, habitat loss, climate change, and other anthropogenic factors, have the potential to affect availability and distribution of these calorie-rich foods in the future. However, despite a substantial decline of whitebark

pine and natural stochasticity of other food resources within the GYE, grizzly bears have shown notable resilience by adjusting habitat use (Costello *et al.* 2014) and shifting diets to maintain body mass and condition (Schwartz *et al.* 2014). Because of their high caloric value and use by grizzly bears, whitebark pine, ungulates, cutthroat trout, and arm cutworm moths are currently monitored either directly or indirectly on an annual basis.

Monitoring Protocol

To monitor these four high-caloric foods and their importance to grizzly bears, the IGBST will survey and report on each of these food groups annually d per detailed food monitoring protocols identified in Appendix D, as budgetary constraints allow. IGBST scientists will analyze the relationship between abundance and availability of these four food types with the number of grizzly bear-human conflicts, grizzly bear management actions, known and probable grizzly bear mortalities, and changes in the distribution and trend of the GYE grizzly bear population. Results of these analysis will be presented, when available, in the annual reports prepared by the IGBST and relevant peer-reviewed publications. If detectable declines in certain foods occur and the IGBST concludes these declines are related to biologically significant changes in demographic parameters , the IGBST shall report these findings for consideration by the GYCC (see Chapter 6, Implementation and Evaluation, for details on this process).

Monitoring protocols of high-caloric foods identified in this Conservation Strategy will continue as long as budgets allow. Monitoring and surveying methods may be modified when necessary to incorporate new technological advances in monitoring techniques or new knowledge of bear foraging and habitat use within the GYE. Existing monitoring programs may be expanded, as budget allows, to include occupied habitat beyond the PCA and areas predicted for future use by bears. Monitoring results of whitebark pine, winter-killed ungulates, cutthroat trout, and army cutworm moths, when available, are to be reported in the annual IGBST publication *Yellowstone Grizzly Bear Investigations*.

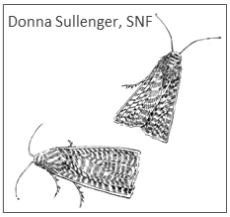
Winter-killed Ungulates

Background—The GYE harbors one of the most carnivorous grizzly bear populations inhabiting the North American interior (Jacoby et al. 1999, Mowat and Heard 2006). Isotopic nitrogen ($\delta^{15}N$) levels measured in 221 grizzly bear hair samples collected between 2000 and 2010 indicate that on average, terrestrial meat accounted for 44.4% of the assimilated diet of Yellowstone grizzly bears (Schwartz et al. 2014). In contrast, in Glacier National Park and adjacent national forest lands, meat accounts for a smaller proportion of the grizzly bear diet; using stable isotope analysis for a small sample of grizzly bears, Jacoby et al. (1999) found that meat accounted for only 33%, 0%, and 6% of adult male, adult female and subadult diets, respectively. Protein and fat from ungulate carcasses ranks as the second-highest food source of gross caloric value available to grizzly bears in the GYE (Gunther et al. 2014a, b). Winter-killed ungulates, primarily elk and bison, provide an important source of protein to bears, especially during early spring before most plant foods become available. As an alternative to carcasses as a spring food, grizzly bears also consume earthworms, ants, and pocket gophers. Grizzly bears continue to opportunistically forage for animal matter and scavenge carrion throughout the active season and will seek out gut piles and other remains left by ungulate hunters in the fall (Haroldson et al. 2004).

Monitoring Protocol—Relative abundance of ungulate carrion is often monitored by correlating the number of carcasses available to grizzly bears and other scavengers during the spring with measures of snow-water equivalency (depth, density, and moisture content) in snowpack (Podruzny *et al.* 2012). Availability of carrion for grizzly bears is potentially affected by increased competition from recently reintroduced wolves and changes in elk and bison management practices. For these and other reasons historic carcass transsects will continue to be surveyed as long as budgetary allocations permit. There are currently 30 spring ungulate carcass survey routes in Yellowstone National Park (YNP) and 12 transect routes on Yellowstone's Northern Range in the Gallatin National Forest. Current survey

methods and ungulate carcass survey routes may be redesigned or modified when appropriate. When available, monitoring results of winter-killed ungulate carcass availability will be summarized and reported annually in the IGBST publication *Yellowstone Grizzly Bear Investigations*.

Cutthroat Trout



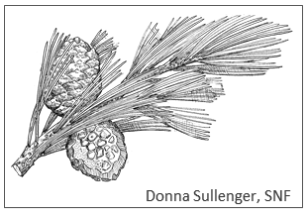
Donna Sullenger, SNF

Background—Due to their high digestibility and protein and lipid content, spawning cutthroat trout are one of the highest sources of digestible energy available to bears in with home ranges in close proximity of Yellowstone Lake and its tributaries (Mealey 1975, Pritchard and Robbins 1990, Gunther et al. 2014a). Grizzly bears were once known to prey on cutthroat trout in at least 36 different streams tributary to Yellowstone Lake (Hoskins 1975, Reinhart and Mattson 1990). Haroldson et al. (2005) estimated that approximately 68 grizzly bears per year frequented and likely fished ten Yellowstone Lake spawning streams tributaries monitored during 1997-2000. Introduction of non-native lake trout (Salvelinus namaycush) and effects of drought and whirling disease (Myxobolus cerebralis) has led to a decline in native cutthroat trout populations and an associated decline in number of bears visiting spawning streams (Teisberg et al. 2014).

Monitoring Protocol—The Yellowstone Lake cutthroat trout population is monitored most years in the spring, depending on weather and spring snow melt, using stream surveys, large mesh gillnets, weirs with fish traps, and occasionally electronic fish counters. An electronic sonar fish counter was installed and calibrated in 2013 along Clear Creek on the east side of Yellowstone Lake to facilitate annual counting of spawning cutthroat trout ascending Clear Creek. Visual stream surveys are also conducted most years to identify trends in the number of cutthroat trout spawning Yellowstone Lake tributaries. Visual surveys to measure the presence of cutthroat trout and rainbow hybrids are also typically conducted at the Trout Lake inlet creek. Yellowstone NP biologists provide an annual summary of cutthroat trout

monitoring results to the IGBST for publication in the *Yellowstone Grizzly Bear Investigations*. Current survey methods may be modified or redesigned as appropriate.

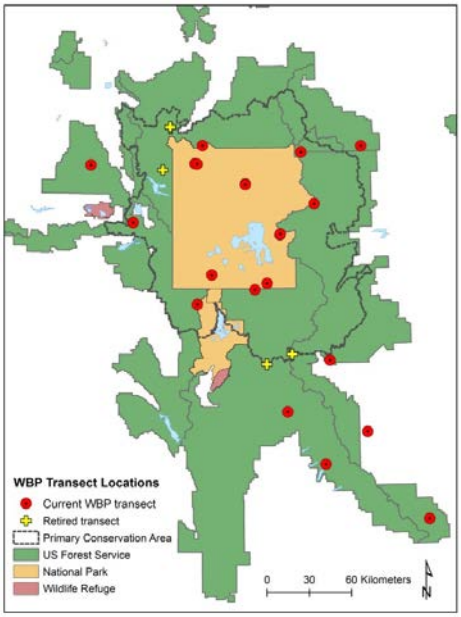
Moth Aggregation Sites



Background—Alpine moth aggregations are a calorie-dense and nutrient-rich food source found at remote, high-elevation alpine sites dominated by talus and scree slopes in the eastern half of the ecosystem. Knowledge regarding the intricate relationship between army cutworm moths and grizzly bears has improved substantially since the late 1980s when grizzly bear use of moth aggregation sites was first discovered and such sites were included in observation flights (Bjornlie and Haroldson 2014). When available, moths are a valuable source of nutrition for grizzly bears because they have the highest reported gross caloric content per gram of any food available to grizzly bears in the GYE (7.91 kcal/g; Gunther et al. 2014a). Some bears may feed almost exclusively on moths for a period of over one month (French et al. 1994). A grizzly bear feeding extensively on moths over a 30-day period can consume 47%, or close to half, of its annual energy budget of 960,000 calories (White 1996). Grizzly bears whose home ranges include moth aggregation sites often visit these talus slopes during mid-to-late summer and early fall to accumulate fat reserves in preparation for the winter denning season. Although grizzly bear use of moth sites does not vary widely over time (1993 is one notable exception; low bear use due to late, extensive snow cover), annual monitoring provides important data regarding this high-calorie resource.

Monitoring Protocol—As of 2013, 37 confirmed and 16 possible moth sites have been identified in the GYE. However, size, location and moth abundance of sites fluctuate from year to year due to natural variation in environmental factors, such as snow cover (Bjornlie and Haroldson 2014). Aerial observations of bears feeding at moth sites are made from fixed-wing aircraft as part of on-going radio tracking and observation flights conducted by the IGBST. Although this monitoring protocol does not provide direct information regarding the abundance of moths,

grizzly bear use of aggregation sites can provide an indirect measure of the relative abundance of this resource in a given year. Aerial surveys of all confirmed moth sites will be conducted annually and results will be summarized and presented in the annual IGBST report Yellowstone Grizzly Bear Investigations.



Whitebark Pine Cone Production

Donna Sullenger, SNF

Background—Due to their high fat content and potential abundance, whitebark pine seeds are an important fall food for bears in the GYE(Mattson and Jonkel 1990). Yellowstone grizzly bears consume whitebark pine seeds extensively when whitebark cones are available. Bears may feed almost exclusively on whitebark pine seeds when production exceeds 22 cones per tree (Mattson et al. 1992). Because whitebark pine is a masting species, availability varies substantially from year to year. During fall seasons of low whitebark pine seed availability, grizzly bears often seek alternate foods at lower elevations, leading to more frequent bear conflicts and human-caused grizzly bear mortalities (Mattson et al. 1992, Knight and Blanchard 1994, Gunther et al. 1997, Haroldson et al. 2006). Conversely, when whitebark pine nuts are abundant, there are generally very few grizzly bear-human conflicts during the fall season (Mattson et al. 1992, Gunther et al. 1997). Studies have shown that during poor whitebark pine years grizzly bears selected less for whitebark pine stands (Costello et al. 2014) and consumed more animal matter, boosting their fat levels to match those measured in years of high cone production (Schwartz et al. 2014). Although whitebark pine has experienced widespread declines in the GYE (see subsequent section), extensive studies by the IGBST showed no profound negative effects on grizzly bears at the individual or population level (IGBST 2013). Costello et al. (2014) reported that approximately one-third of Yellowstone grizzly bears in their study included little or no whitebark pine stands within their fall range.

Monitoring Protocol—Currently there are 21 whitebark pine cone production transects (Figure 8) within the GYE. Annual transect surveys are typically conducted between July 15 and August 15 to count cones after maturation but before cones and seeds have been collected by red squirrels (*Tamiasciurus hudsonicus*) and Clark's nutcrackers (*Nucifraga columbiana*). The presence or absence of blister rust and beetle infestations as well as activity levels of grizzly bear, black bear, red squirrel, and Clark's nutcracker are also recorded during transect surveys. Monitoring of whitebark pine cone production using current or modified methods will continue under this Conservation Strategy and results will be summarized and reported in the IGBST publication *Yellowstone Grizzly Bear Investigations*.

Figure 8. Location of whitebark pine cone production transect sites in the GYE, 2014.

Monitoring Mountain Pine Beetle Infestation and White Pine Blister Rust Infection

Background—Since the early 2000s, whitebark pine has declined significantly throughout much of the species' historic range in the Northern Rockies due to the spread of mountain pine beetle (*Dendroctonus ponderosae*) and white pine blister rust (*Cronartium ribicola*). The greatest levels of whitebark mortality resulted from mountain pine beetle, a native insect that typically attacks large, mature trees with inner bark thick enough to support larvae (Larson 2011). Beetle infestations tend to occur episodically every 20-40 years resulting in high, widespread mortality across coniferous forests. The most recent outbreak began in the early 2000s and impacted millions of hectares in the Rocky Mountains (Raffa *et al.* 2008). The infestation was exacerbated by warmer winters at higher elevations allowing for increased brood development and survival of adult beetles, and greater opportunity for reproduction (Bentz *et al.* 1991, Perkins and Roberts 2003, Larson 2011, Dooley 2012).

White pine blister rust, an exotic invasive pathogen introduced to North America in 1910, affects whitebark pines of all age classes, although seedlings and saplings are especially susceptible to infection. This exotic fungal pathogen infects the cambium of whitebark pine and other five-needle pines, causing reproductive failure and tree mortality (McKinney *et al.* 2009, Bockino and Tinker 2012). However, some individual whitebark pines carry genetic traits that make them more resistant to the disease. Restoration programs launched by the Forest Service use a technique described by Mahalovich *et al.* (2006) to breed and plant rust-resistant whitebark pines as part of an on-going effort to restore and maintain the species in the GYE.

In 2000, under the auspices of the Greater Yellowstone Coordinating Committee (GYCC), the Whitebark Pine Subcommittee (WBPSC) was created and tasked with forging a comprehensive long-term strategy for monitoring whitebark pine throughout the ecosystem. Recognizing the persistent and pervasive threat that blister rust and pine beetle posed to the health of whitebark pine, the subcommittee reached out to other agency and non-governmental partners to avoid duplication of efforts. The result of these alliances is the Greater Yellowstone Whitebark Pine Monitoring Working Group (GYWPMWG), which consists of partners from the National Park Service (NPS), U.S. Forest Service (USFS), U.S. Geological Survey (USGS), and Montana State University (MSU). Led by the NPS Greater Yellowstone Inventory and Monitoring Network (GRYN), a strategic and peer-reviewed monitoring protocol was established for detecting, tracking, assessing, and reporting the health, status, and trends of whitebark pine throughout the GYE (GYWPMWG 2011). This ground-based monitoring program was initiated in 2004 and will continue to assess the current status and long-term trends of whitebark pine into the foreseeable future.

Monitoring Protocol—Spearheaded by the GRYN, an interagency collaborative monitoring effort involving NPS, USFS, and USGS partners will measure the status and trends of whitebark pine throughout the GYE. Monitoring efforts will focus on collecting critical baseline information for assessing 1) infection rates and severity of white pine blister rust; 2) survival of whitebark pine, taking into account synergistic interactions of blister rust, mountain pine beetle,

wildland fire, and other agents of change; and 3) recruitment of whitebark pine trees into cone-bearing age classes. Monitoring protocols will follow methods and procedures established in the *Interagency Whitebark Pine Monitoring Protocol for the Greater Yellowstone Ecosystem* (GYWPMWG 2011). Results of current whitebark pine status and trends will be made available at the GRYN Inventory and Monitoring website and referenced in the annual IGBST monitoring report *Yellowstone Grizzly Bear Investigations*.

Hunter Numbers

Background

The number of elk hunters in Wyoming, Idaho, and Montana who recreate in the PCA (Table 6) were estimated and compared with known and probable grizzly bear mortalities from 2005 to 2014 to determine if bear mortality is correlated with hunter numbers. Although total hunter numbers have declined over this time period, the data showed little evidence of a relationship between hunter numbers and hunting-related human-caused grizzly bear mortality (van Manen 2015, *in litt.*).

The greatest source of grizzly bear (≥2 years old) mortality during 2004–2014 in the GYE has been due to interactions with hunters. Nearly all known and probable bear mortalities occur as surprise encounters, at big game carcasses, or at hunter camps. The number of mistaken identity kills (i.e., mistaken for black bear) are small. Although the number of hunters using the PCA have decreased, the number of grizzly bear known and probable mortalities due to interactions with hunters increased in the last decade, primarily outside the PCA (Figure 5, Chapter 2). Potential explanations for why this occurred include bears learning to seek hunter-killed game, an increase in population size and concurrent expansion of occupied range, and greater use of ungulate resources (Haroldson *et al*. 2004, Schwartz *et al*. 2010, IGBST 2013).

Table 9. Estimated numbers of elk hunters within the GYE grizzly bear recovery zone plus a 10-mile perimeter in Idaho, Montana, and Wyoming, 2005–2014.

	Year									
State	2005	2006	2007	2008	2009	2010	2011	2012	2013	2014
Idaho[a]	3,619	3,016	2,592	1,763	1,819	1,904	1,860	1,803	1,937	2,771
Montana[c]	12,365	12,211	12,635	12,470	12,382	12,334	12,269	10,936	NA[b]	11,925
Wyoming[a,d]	9,888	9,346	8,716	8,792	8,440	6,712	6,413	7,566	7,818	8,109
Total	25,872	24,573	23,943	23,025	22,641	20,950	20,542	20,305	NA	22,805

[a] Idaho and Wyoming numbers include archery and gun hunters.

[b] NA = hunter number estimates not currently available.

[c] Gun-only season.

[d] A percentage of total hunter numbers was used in hunt areas 61 to 63, 67, 68, 73, and 83 because a portion of the hunt area falls outside the designated area.

State and federal wildlife agencies have attempted to reduce the loss of bears to hunters by expanding information and education programs. "Living in Bear Country" workshops are conducted regularly in many GYE communities, and licensed outfitters and guides have increased training for their members and clients.

Monitoring Protocol

Data from state wildlife agencies on big game herd units or hunting districts will be used as an index to backcountry use during the hunting season. Hunter use levels combined with numbers of grizzly bear-human conflicts will be used to identify when and where to increase

public education efforts and develop appropriate management actions to minimize grizzly bear-human conflicts that result in bear mortality.

Monitoring Habitat Connectivity

Background

Habitat connectivity is the degree to which the landscape promotes natural movement of wildlife as they seek important resources for survival and successful procreation. Potential effects of highway improvements, such as increased motorized access, higher traffic volume, and higher speed limits, are known to increase grizzly bear mortality, reduce habitat connectivity, and potentially inhibit gene flow among nearby populations (Mace 2004, Summerfield *et al.* 2004, Proctor *et al.* 2012). Certain road designs and road improvements potentially discourage bear crossings, may lead to increased mortality from vehicle collisions, and may cause habitat fragmentation. The potential impact of highways on demographic and genetic connectivity of grizzly bears in the GYE is a key consideration in the transportation planning process.

Monitoring Protocol

To prevent habitat fragmentation and loss of connectivity, existing road survey information will be compiled and evaluated by the appropriate land management agency as an integral part of the planning stage of any proposed road improvement and/or construction project in suitable grizzly bear habitat within the GYE (both inside and outside the PCA). During the NEPA analysis stage of such projects, analyses of road survey information will be conducted to evaluate potential impacts of the project on grizzly bear habitat connectivity. More specifically, federal agencies will identify important crossing areas by collecting and/or assessing existing information about known grizzly bear sightings, ungulate road mortalities, locations of game trails, and bear home ranges and habitat use within and near the road corridor. By identifying crossing areas used by grizzly bears, federal officials can recommend mitigation measures to reduce potential impacts

from road construction both during and after a project. For example, during construction, work camps should be placed in areas with lower risk of displacing grizzly bears and use of bear-proof food and garbage storage containers should be implemented. Highway planners are encouraged to place warning signs at points of high mortality risk and implement wildlife crossing infrastructure such as culverts or underpasses to enhance safe passage. Road construction in areas of relatively high value for potential grizzly bear habitat linkage should be designed to mitigate potential negative impacts on habitat connectivity, including the consideration of installing crossing structures.

Chapter 4 Management and Monitoring of Grizzly Bear-Human Conflicts

Introduction

Humans and grizzly bears occasionally come into conflict in areas where they encounter one another. The objective of nuisance management is to minimize grizzly bear-human conflicts. In the Greater Yellowstone Ecosystem, nuisance bear management is essential to successful grizzly bear conservation and is often necessary to prevent property damage, livestock losses, and human injury or death. Grizzly bears cannot be totally protected. Like other species, grizzly bears develop individual traits, and some of those traits are not compatible with coexistence with humans. Management emphasis will shift from protecting every individual grizzly bear in the population to assessing an individual's importance to the entire population before instituting management actions. Females will continue to receive a higher level of protection than males. Management of nuisance bears requires rapid responses by state and federal agencies to address conflict situations. This agency response will address the sources of the conflict through public education, removal of attractants, or preventive sanitation of human use areas. Agencies will also capture, relocate, or destroy repeat offender grizzly bears when necessary and when other options have been exhausted.

Analysis of grizzly bear-human incidents indicates that most property damage incidents are the result of bears attempting to gain access to garbage, human foods, livestock or pet foods, or other human-related foods in areas of human presence. Occasionally bears will prey on domestic swine, fowl, or goats, or will damage apiaries. They have rarely injured horses.

Although aggression toward people and human injury or death are rare, bears will occasionally harm people. Incidents of injury are usually the result of a surprise encounter, protection of cubs, defense of a food cache, harassment, or when bears have become accustomed to obtaining food from humans.

The management of grizzly bear-human conflicts is based upon the existing laws and authorities of the state and federal land management agencies as detailed in Chapter 7. Management of nuisance bears usually falls into one or more of the following categories:

- Removing or securing the attractant
- Deterring the bear from the site through the use of aversive conditioning techniques
- Capturing and relocating the nuisance bear
- Removing the bear from the wild, including lethal control

Definitions:

- **Unnatural aggression** by a grizzly bear is defined as behavior that includes active predation on humans, approaching humans or human use areas, such as camps, in an aggressive way, or aggressive behavior when the bear is unprovoked by self-defense, defense of cubs, defense of foods, or in a surprise encounter.

Formatted: No bullets or numbering

- **Grizzly bear-human conflicts** are incidents in which bears injure people, damage property, kill or injure livestock, damage beehives, obtain anthropogenic foods, or damage or obtain garden and orchard fruits and vegetables.

Formatted: No bullets or numbering

- **Natural aggression** by a grizzly bear is defined as defense of young, food, during a surprise encounter, or self-defense.

Formatted: No bullets or numbering

- A bear is classified as **food conditioned** when it has received a significant food reward of human foods such as garbage, camp food, pet food, or processed livestock food, and persistently seeks these foods.

Formatted: No bullets or numbering

- A bear is classified as **habituated** when it does not display avoidance behavior around humans or in human use areas such as camps or town sites or within 100 meters of open roads.

- **Relocation** is the capture and movement by management authorities of a bear involved in a conflict with humans or human-related foods, to a remote area away from the conflict site, usually after fitting the bear with a radio collar.

- **Repeat offense** is the involvement of a bear that has been previously relocated in a nuisance situation or, if not relocated, continues to repeat a behavior that constitutes a grizzly bear-human conflict.

- **Removal** is the capture and placement of a bear in an authorized public zoological or research facility or destruction of that bear. Removal can also involve killing the bear through active measures in the wild when it is not otherwise possible to capture the bear.

- **Management authorities** are the designated representatives of the agencies in the GYE including: Yellowstone National Park; Grand Teton National Park (GTNP); Wyoming Game and Fish Department; Montana Fish, Wildlife & Parks; Idaho Department of Fish and Game; Interagency Grizzly Bear Study Team; each of the GYE national forests—Custer-Gallatin, Shoshone, Bridger-Teton, Caribou-Targhee, and Beaverhead-Deerlodge; the BLM; and USDA Wildlife Services. These authorities will make the decision to classify a bear as nuisance inside the GYE in compliance with the nuisance bear criteria (discussed below). Outside Yellowstone and Grand Teton National Parks within the PCA, subsequent management actions will be coordinated and completed by state wildlife agencies~~, after coordination with other appropriate agencies~~. Nuisance grizzly bear conflict management is under the authority of the states, who will have primary responsibility for the management action. When nuisance bears are in YNP or GTNP, decisions will be made by park representatives, and coordinated with state and Forest Service representatives when

Formatted: No bullets or numbering

Formatted: No bullets or numbering

Formatted: No bullets or numbering

Formatted: No bullets or numbering

Formatted: No bullets or numbering

Comment [t60]: 2007 languageto strike-Delete or clarify that transplants require coordination but management actions are the decision of the state.

necessary, e.g., for bear relocations. Management of nuisance bears outside the PCA will be conducted as described in the state grizzly bear management plans or appropriate park management plans.

Management of nuisance grizzly bears in the Greater Yellowstone Ecosystem will vary depending on whether they are inside or outside the PCA. This system will provide increased security for grizzly bears inside the PCA, as bears will be given greater consideration in most conflicts inside the PCA. Minimization of grizzly bear-human conflicts and management of individual nuisance bears is the primary direction for management within the PCA.

In circumstances that result in a nuisance bear situation outside the PCA, more consideration will be given to existing human uses. Site-specific conflict areas within and outside the PCA will be documented and prioritized to focus proactive management actions to minimize grizzly bear-human conflicts and address existing and potential human activities that may cause future conflicts. Past conflict management has demonstrated that grizzly bears can coexist with most human activities.

Outside the PCA, state management plans will govern how nuisance grizzly bears are handled. Site-specific conflict areas within and outside the PCA will be documented routinely and prioritized to focus proactive management actions to minimize grizzly bear-human conflicts and address existing and potential human activities that may cause future conflicts. The following nuisance grizzly bear standards apply only to the PCA. All nuisance grizzly bear conflicts that occur outside the PCA will be managed according to guidelines in each of the state management plans (Appendices I, J, and K).

Nuisance Bear Standards

The focus and intent of nuisance grizzly bear management inside and outside the PCA are predicated on strategies and actions to prevent grizzly bear-human conflicts. It is recognized that active management aimed at individual nuisance bears will be required in both areas. Management actions outside the PCA will be implemented according to state management plans in coordination with landowners and land management agencies. These actions will be compatible with grizzly bear population management objectives for each state for the areas outside the PCA.

General Criteria

Location, cause of incident, severity of incident, history of bear, health/age/sex of bear, and demographic characteristics of animals involved will all be considered in any relocation or removal. Removal of nuisance bears will be carefully considered and consistent with mortality limits for the GYE as described in the Conservation Strategy. Recognizing that conservation of female bears is essential to maintenance of a grizzly bear population, removal of nuisance females will be minimized.

Within the Primary Conservation Area

Within the PCA, management of nuisance bears will be addressed according to the following standards:

Bears displaying food conditioning and/or habituation may be either relocated or removed based on specific details of the incident. State wildlife agencies~~, following consultation with other appropriate management authorities,~~ and national parks will make this judgment after considering the cause, location, and severity of the incident or incidents.

Bears may be relocated as many times as judged prudent by management authorities. ~~No bear may be removed for any offense, other than unnatural aggression, without at least one relocation~~

Comment [t61]: 2007 language to strike-Delete or clarify that transplants require coordination but management actions are the decision of the state..

~~unless representatives of affected agencies document the reason in writing~~. All relocations outside the PCA will be governed by state management plans.

Bears may be preemptively moved when they are in areas where they are likely to come into conflicts with site-specific human activities, but only as a last resort. Such preemptive moves will not count against the bear as nuisance moves.

Bears preying on lawfully present livestock (cows, domestic sheep, horses, goats, llamas, etc.) on public lands will be managed according to the following criteria:

- No grizzly bear involved in livestock depredations inside the PCA shall be removed unless it has been relocated at least one time and continues to cause livestock depredations.

~~Before any removal, except in cases of human safety, management authorities will consult by telephone or in person to judge the adequacy of the reason for removal.~~

Bears displaying natural aggression are not to be removed, even if the aggression results in human injury or death, unless it is the judgment of management authorities that the particular circumstances warrant removal.

Bears displaying unnatural aggression will be removed from the population.

Decisions will be based on criteria for relocation and removal inside the PCA for management of nuisance bears in the Conservation Strategy and best biological judgment of authorities.

- Authorized National Park Service authorities will implement removals and relocations within YNP and GTNP.
- Authorized state or tribal authorities outside YNP and GTNP will implement other removals and relocations.
- State and tribal wildlife agencies in coordination with the appropriate federal agencies will predetermine adequate and available sites for relocations. Relocation sites should be agreed upon before the need for relocation occurs. In order to deal with problem bears more efficiently, managers should have full access to relocation sites without having to conduct individual consultation for each relocation.
- Livestock damage prevention and compensation are addressed in individual state management plans.

Comment [t62]: 2007 language to strike- there may not be an appropriate location to move the bear and mortality threshold will assure mortality is managed appropriately

Comment [t63]: 2007 language to strike- mortality threshold will assure mortality is managed appropriately

Comment [t64]: 2007 language. Delete

Management of ~~all~~ nuisance bear situations will emphasize removal of the human cause of the conflict, when possible, or management and education actions to limit such conflicts. Relocation and removal of grizzly bears may occur if the above actions are not successful.

Comment [t65]: 2007 language to consider.

Specific Criteria for Removals

Captured grizzly bears identified for removal may be given to public research institutions or public zoological parks for appropriate non-release educational or scientific purposes as per regulations of states and national parks. Grizzly bears not suitable for release, research, or educational purposes will be removed as described in appropriate state management plans or in compliance with national park rules and regulations.

Outside of national parks, individual nuisance bears deemed appropriate for removal may be taken by a legal hunter in compliance with rules and regulations promulgated by the appropriate state wildlife agency commission, as long as such taking is in compliance with existing state and federal laws, and as long as mortality limits specified for the GYE as described in this Conservation Strategy are not exceeded. This could include licensed hunters or property owners or their agents who have obtained appropriate permits from the state. Licensed hunters will be allowed to possess bear parts for bears that are legally harvested under a state permit.

Monitoring Protocol

All nuisance bear control actions, and grizzly bear-human and grizzly bear-livestock conflicts will be summarized annually in the Annual Report of the IGBST. Most conflicts are due to availability of human foods, human developments, or livestock depredations in occupied grizzly bear habitat. This report will detail the cause and location of each conflict and management action and display an annual spatial distribution of conflicts that can be used by managers to

identify where problems occur and to compare trends in locations, sources, land ownership, and types of conflicts.

Chapter 5 Information and Education

Introduction

The future of the Yellowstone grizzly bear lies in our ability to learn to coexist with the grizzly bear and to accept this animal as a cohabitant of the land. Historically, excessive human-caused mortality and loss of habitat are the major factors in grizzly bear population decline. Addressing the source of grizzly bear-human conflicts is critical to an effective public outreach plan. Public attitudes in large part determine the success of efforts to manage a recovered grizzly bear population in the Greater Yellowstone Ecosystem. For the good of the bear and to develop positive public attitudes, a coordinated information and education campaign is essential.

The purposes of the information and education aspects of this cooperative effort are to support the development, implementation, and dissemination of a coordinated information and education program. This program should be understandable and useful for the people who visit, live, work, and recreate in bear habitat to minimize grizzly bear-human conflicts and to provide for the safety of people while building support for viable bear populations.

Other management strategies outlined in this plan are unlikely to succeed without useful, state-of-the-art public information and education programs. A partnership information and education approach involving state and federal agencies, tribes, local communities, and private interests can result in minimizing grizzly bear-human conflicts while building support for bears and bear management.

Successful long-term community involvement in future grizzly bear management efforts requires continued use of current effective methods and tools that have contributed to the success story of the recovered population we have today. In addition, to meet the needs of an ever-growing human population and expanding bear population, it will be necessary to

develop new processes and outreach tools to further enhance public involvement and appreciation of the grizzly bear and monitor social behavior and attitudes. Through close monitoring, we will be able to gauge our success in reaching our diverse public and in minimizing grizzly bear-human conflicts, adjusting programs as needed.

Successful public education and involvement should result in the understanding that it is acceptable and expected human behavior to practice good stewardship, and this will in turn allow us to live with the grizzly bear as part of our valued wildlife resources.

The Information and Education Team

The information and education effort will continue to be coordinated between all agencies and private interests to ensure timely, accurate, and consistent messages to the public. The current information and education (I & E) working group within the Greater Yellowstone Ecosystem will continue. Members of this I & E Team include public affairs personnel from Forest Service Regions 1, 2, and 4; Grand Teton and Yellowstone National Parks; the BLM; representatives from each state wildlife agency; and the information and education specialist from the IGBC. This team will continue to work with all affected interests to ensure consistency of information, efficient funding strategies, identifying and targeting audiences, developing partnerships, and identifying new tools for implementation.

A coordinated information and education campaign will be most effective if it facilitates changing inappropriate human behaviors and helps people learn to coexist with bears. The benefits of grizzly bear management for a multitude of resources and species, including elk habitat management, black bear management, and water quality, recreation, and aesthetic values of access management, will be included in the information and education efforts. Long-term community engagement in grizzly bear issues is necessary to increase the awareness of bear behavior and biology and how these can be compatible with human needs and activities. Identification of sources of grizzly bear-human conflicts and the use of public

education as a tool are essential. The responsibilities of the I & E Team include the following:

Develop a coordinated information and education campaign to cultivate an appreciation of the value of the grizzly bear resource in this area. The grizzly bear will be presented as a valuable wildlife resource, while still acknowledging the risks associated with them in publications and educational outreach.

Continue and expand living-with-bears workshops or outreach with a similar message for citizens and teachers within the Greater Yellowstone Ecosystem. Similar seminars for other specific target groups such as hunters and other backcountry recreationists will be used as appropriate.

Local citizens involvement groups and processes will be used to facilitate information exchange and identify other community interests regarding the grizzly bear.

Updates and information will be provided to all affected interests through various media including news releases and mailings, television, etc.

State and federal volunteer programs will be encouraged to identify and provide an opportunity for public participation in grizzly bear information outreach and management. This could include trailhead demonstrations on bear resistant containers, distribution of brochures, school education programs, etc.

Proactive and preventative safety messages will be expanded.

Citizens will be encouraged to participate in land management decisions at the project level on state and federal lands affecting grizzly bear habitat and management.

Citizens will also be encouraged to be involved in private land issues associated with grizzly bear management. This may include sanitation ordinances, conservation easements, developing private land management plans, and supporting informational outreach campaigns to private landowners.

Knowledge about bears and acceptance of grizzly bears by people and groups that live, work, and recreate in grizzly bear country are key to the long-term conservation of a healthy grizzly bear population. Continuing specific outreach messages and techniques tailored to the needs of

these groups is essential. Some of these groups include landowners, mining industry, timber industry, firewood gatherers, ranchers, outfitters, anglers, hunters, front country visitors, backcountry visitors, summer home owners, local business owners, developers, county planners, and school children.

Finally, information made available to the public will be open and responsive to public concerns. Open discussions with the public will increase credibility of the grizzly bear management program.

These efforts will be reviewed periodically and program adjustments will be made as necessary. In addition, efforts will be expanded as the bear population expands and additional efforts will be needed in areas that could become occupied in the near future.

Many brochures, videos, signs, articles, etc. are currently available and in use. Examples of these specific information and education tools are discussed in the state management plans.

Chapter 6 Implementation and Evaluation

Implementation

A new committee will replace the Yellowstone Ecosystem Subcommittee. The new committee, the Yellowstone Grizzly Bear Coordinating Committee (YGCC), is the body that will coordinate management and promote the exchange of information about the Yellowstone grizzly bear population. The YGCC will inform the IGBC about the Yellowstone grizzly bear population for the benefit of grizzly bear conservation and management.

The Yellowstone Grizzly Bear Coordinating Committee

Within 30 days of a final rule delisting the Greater Yellowstone Ecosystem grizzly bear population, the signatories of this Conservation Strategy will name their agency representatives to the YGCC. The person who was chairperson of the Yellowstone Ecosystem Subcommittee when the final rule changing status is published will call the first meeting of the GYCC. At this first meeting, the YGCC will elect a chairperson. Chairpersons will be elected at intervals determined by the members of the YGCC. The YGCC will meet at least two times each year; public notification of these meetings will be made by the chairperson or her/his representatives. The YGCC will strive for consensus, but when consensus cannot be achieved, decisions of the YGCC will be determined by majority vote. The details on locations and times of meetings and other business issues associated with the functioning of the YGCC will be determined at the first meeting.

YGCC members' expenses will be paid by their respective agencies.

YGCC authorities include:

Revise or amend the Conservation Strategy based on the best biological data and the best available science. Any such amendments will be subject to public review and comment. Amendments will be made by the YGCC with a majority vote.

Comment [t66]: Comment-2007 language. May want to discuss how other legal requirements apply. E.g.,, a majority of votes can't require a change to a USFS plan that Forest hasn't processed

Establish meeting rules and procedures, and chairperson election rules for the committee.

Seek funding to further the conservation of the Yellowstone grizzly bear by implementing this Conservation Strategy. Each agency is responsible for seeking the necessary funding to carry out the tasks assigned in this Conservation Strategy.

Some primary activities of the YGCC are:

Coordinate implementation of this Conservation Strategy.

Ensure that population and habitat data are collected annually by the IGBST, as specified in this Conservation Strategy, and evaluated to assess current status of the grizzly bear population.

Share information and implement management actions in a coordinated fashion.

Identify management, research, and financial needs to successfully implement the coordinated Conservation Strategy.

Implement a Biology and Monitoring Review ~~as necessary and submit a petition for relisting~~ as appropriate to ensure agency responsiveness to changing circumstances of the grizzly or its habitat in the Greater Yellowstone Ecosystem.

Comment [t67]: . 2007 language to strike- not an appropriate function for individual agency representatives on the Committee or a committee that is not a separate legal entity

Appoint a chairperson and members of the Information and Education Team, and coordinate information and education efforts.

This committee does not supersede the authority of the management agencies beyond the specific actions agreed to as signatories of this Conservation Strategy.

YGCC membership will consist of representatives of the following, each having one vote:

Federal	National parks: Yellowstone and Grand Teton
	National forests: Beaverhead-Deerlodge, Bridger-Teton, Caribou-

	Targhee, Custer-Gallatin, and Shoshone
	One Bureau of Land Management representative
	The Biological Resources Division of the U.S. Geological Survey
State wildlife agencies	Idaho, Montana, and Wyoming
Local government	One representative from each state
Tribal	One representative from each Native American tribe with sovereign powers over reservation lands within the ecosystem

The Interagency Grizzly Bear Study Team (IGBST) and the Information and Education Team (I & E) will perform necessary tasks and report to the YGCC.

The Interagency Grizzly Bear Study Team

In order to understand the dynamics of grizzly bears throughout the GYE, a need for centralized responsibility to collect, manage, analyze, and distribute science-based information was identified. To meet this need, in 1973 agencies formed the Interagency Grizzly Bear Study Team, a cooperative effort between the U.S. Geological Survey, National Park Service, U.S. Forest Service, U.S. Fish and Wildlife Service, and the state wildlife agencies of Idaho, Montana, and Wyoming.

Since 1974, the IGBST has published more than 200 scientific papers on the grizzly bear. A complete list of these papers can be found at: http://nrmsc.usgs.gov/science/igbst/detailedpubs .

Quantitative data on grizzly bear abundance, distribution, survival, mortality, nuisance activity, and bear foods are critical to formulating management strategies and decisions. The IGBST coordinates data collection and analysis on an ecosystem scale, prevents overlap of efforts, and pools limited economic and human resources.

The IGBST will continue to function under this Conservation Strategy after delisting.

The responsibilities of the IGBST are to:

Conduct both short- and long-term research projects addressing information needs for bear management
Monitor the bear population, including status and trend, numbers, reproduction, and mortality
Monitor grizzly bear habitats, foods, and the impacts of humans
Provide technical support to agencies and other groups responsible for the immediate and long-term management of grizzly bears in the GYE
Take the lead in preparing a Biology and Monitoring Review with staff support from the YGCC in response to deviations from required population or habitat standards
Coordinate annual updates of the motorized access database
Coordinate annual evaluation of motorized access route density and secure habitat
Document annually any changes in developed sites, livestock allotments, or permitted sheep numbers and maintain associated databases
Ensure all units have the tools and the training to evaluate motorized access route density and secure habitat for projects
Evaluate the need for changes in ways to evaluate motorized access route density, secure habitat, and habitat effectiveness, and make recommendations to the YGCC on such changes, as necessary
Set and maintain standards, definitions, values, formats and processes for collecting and updating data and assessment models, and maintaining data consistency between units.
Produce annual reports on population and habitat monitoring items

The USGS employee who is the lead biologist for USGS on the Greater Yellowstone Ecosystem grizzly bear population chairs the IGBST and will call meetings at least twice each year. The majority of funding for the IGBST comes from USGS but additional funding and in-kind efforts are made by all agencies (*see* Appendix F). The IGBST will report its findings to the YGCC.

The Information and Education Team

Successful maintenance of a recovered grizzly bear population in the GYE requires joint understanding of issues, sharing of knowledge (including new science and results of monitoring), and open communication among agencies, tribes, elected officials, non-governmental groups and organizations, and the public. The goals of the Information and Education (I & E) Team are:

Increase public support for and compliance with agency management actions to maintain a secure GYE grizzly bear population

Utilize all possible modern technology and media resources to help decrease grizzly bear-human conflicts while still maintaining maximum access to natural resources for both humans and grizzly bears

Increase an understanding of grizzly bears and their habitat

Foster information sharing to ensure maximum resource, policy, and scientific informational exchange among agencies, tribes, elected officials, interest groups, local residents, and the public.

Provide for meaningful public involvement through use of open houses, direct mailings, and media campaigns to inform the public about agency decisions relating to grizzly bear habitat and population management activities and other management actions that may affect local residents, landowners, tribes, and users

Members of the Information and Education Team will include I & E specialists from the National Park Service, U.S. Forest Service, and the state wildlife agencies of Idaho, Montana, and Wyoming. The I & E Team will report to the YGCC.

Evaluation

The evaluation of the effectiveness of grizzly bear conservation measures detailed in this Conservation Strategy will be an ongoing process shared by all the members of the Yellowstone Grizzly Bear Coordinating Committee.

As detailed in the monitoring portion of this strategy, the IGBST will take the lead in preparing an annual monitoring report with staff support from the YGCC. Agencies responsible for monitoring major population and habitat parameters are listed in Appendix G. Monitoring results and analyses will be presented to the YGCC by the IGBST. A Biology and Monitoring Review would be triggered if any of the following conditions were met:

- Exceeding independent female mortality limits in 3 consecutive years
- Exceeding independent male mortality limits in 3 consecutive years
- Exceeding dependent young mortality limits in 3 consecutive years
- Failure to meet the distribution criterion

Biology and Monitoring Review

Under this Conservation Strategy, a Biology and Monitoring Review is a process carried out by the IGBST. A Biology and Monitoring Review examines management of habitat, populations, or efforts of participating agencies to complete their required monitoring. Biology and Monitoring Reviews will be undertaken after the annual summary of monitoring information presented to the YGCC and in response to deviations from required population or habitat standards. Any YGCC member agency also can request that a Biology and Monitoring Review be considered. Such consideration would be a topic for discussion by the YGCC and the review would be initiated based on the decision of the YGCC. The Biology and Monitoring Review process will be completed within six months and the resulting written report presented to the YGCC and made available to the public. The IGBST is not responsible for completing impact analyses for projects proposed by any agency; such analyses are the responsibility of the agency making the proposal.

The purposes of a Biology and Monitoring Review are:

To identify the reasons why particular demographic or habitat objectives have not been achieved and to recommend modifications to the YGCC for changes as necessary, or
To consider potential impacts of a proposed action of concern to one or more members of the YGCC, or
To consider departures by one or more agencies from the monitoring effort required under this Conservation Strategy and to recommend plans to the YGCC to ensure that monitoring efforts be maintained as per the standards in this document, or
To consider and establish a scientific basis for possible changes in management due to changed conditions in the ecosystem and make those recommendations to the YGCC~~, or~~
~~Make recommendations as to whether a petition for relisting should be submitted.~~

Comment [t68]: 2007 language to strike. Delete per comments above re petition.

Biology and Monitoring Reviews will be based on the best available science. Biology and Monitoring Reviews will be submitted as written reports by the IGBST to the YGCC and made available to the public. The YGCC will respond to the Biology and Monitoring Review in a written form either through the minutes of the YGCC meeting or in specific Biology and Monitoring Review response documents, as necessary. The purpose of the YGCC response is to address the issues(s) raised in the Biology and Monitoring Review with an explanation or management changes as necessary. In the case of a deviation from monitoring efforts required under this Conservation Strategy, the response will identify the means to be implemented by the YGCC to ensure continued population and/or habitat monitoring efforts as required in this document.

A Biology and Monitoring Review is generally triggered by negative deviations from the desired conditions established in this Conservation Strategy for population, mortality ~~reduction~~management, and habitat parameters; however, the IGBST can recommend a Biology and Monitoring Review to the YGCC if they deem it necessary.

~~A Biology and Monitoring Review will make recommendations as to whether a petition for relisting should be made. This recommendation shall be based upon the magnitude of the threat that the deviation from the desired condition poses to the maintenance of a recovered population.~~

~~The YGCC has to formally agree with a recommendation from the IGBST to petition for relisting.~~

Comment [t69]: 2007 language to strike. Delete per prior comments re petition. Additionally, inappropriate for IGBST to make recommendations or policy decision

~~If the situation, after completion of the Biology and Monitoring Review, is such that some or all of the desired population and habitat conditions specified in this Conservation Strategy are not being met, and cannot be met in the opinion of the YGCC, then the YGCC will submit to the Fish and Wildlife Service a petition for relisting. In the case of a vote on this issue, a simple majority is necessary.~~

Fish and Wildlife Service Status Review

The Service may initiate a formal status review: ~~and may emergency relist the GYE grizzly population until the formal status review is complete under two conditions~~: (1) if there are any changes in Federal, State, or Tribal laws, rules, regulations, or management plans that depart significantly from the specifics of population or habitat management detailed in this section and significantly increase the threat to the population.; ~~and/or (2) if independent female mortality limits are exceeded in 3 consecutive years; or~~ (~~3~~2) ~~A~~ a total population estimate of less than 500 inside the DMA~~.~~; and/or (3) if the Service determines a petition to relist from an individual or organization, including the YGCC, is warranted.

Comment [t70]: 2016 language to strike- These can't be predecided to meet the emergency listing critiera and process of Section 4(a) /4(b) of the ESA. This is covered in paragraph on next page from 2007 language.

Comment [G71]: 2016 language to strike-this triggers a biology and monitoring review, not a status review.

Comment [t72]: 2016 language to modify- these are within the reasonable range of the status review "scenarios" in a delisting rule. The change in regulation or law scenario should include a tie to a significant increase in threat.

~~Under Section 4 of the Endangered Species Act, a petition from an individual or organization to relist this population will initiate a status review, if the Service determines that the petition is warranted.~~ To be warranted, such a petition must present credible scientific information to support the petition. ~~The YGCC can petition the Fish and Wildlife Service to relist the GYE~~

~~grizzly bears.~~ The Service is to perform a status review upon receipt of such a petition that contains sufficient information to demonstrate that the request to relist is warranted. ~~A relisting petition from the YGCC should be accompanied by the available specific biological data on the population and its habitat sufficient to judge its status as a recovered population as per the requirements of this Conservation Strategy.~~ A status review will evaluate the factors affecting the population and result in a finding that summarizes the status of the population and recommends listing or not. For purposes of a status review, the status of the entire Greater Yellowstone Ecosystem grizzly bear population would be considered~~.~~

Comment [G73]: 2007 language to strike. Delete per prior comments re petition.

The Service can also unilaterally initiate a status review to determine if the GYE grizzly bears should be a candidate species and be added to the species to be listed. ~~This could be accomplished independently of the YGCC based on Service concerns about the population and/or its habitat.~~ Based on a review of a petition or a status review initiated by the Service, if the Service finds serious and imminent threats to the population as per the criteria of the Endangered Species Act in Section 4(a)(1), the species could be immediately considered for relisting or could be relisted under emergency regulations, per Section 4(b)(7).

Chapter 7 Existing Authorities

Introduction

The existence of adequate regulatory mechanisms that serve to maintain the Yellowstone grizzly bear population as recovered is one of the five factors required to change the status of the population to delisted and to ensure a healthy grizzly bear population.

The management of populations of grizzly bears and the habitats these bears require for survival is dependent upon the laws and regulations of the federal and state agencies in the Greater Yellowstone Ecosystem (GYE). These laws and regulations provide the legal basis for controlling mortality, providing secure habitats, managing grizzly bear-human conflicts, controlling hunters, limiting access where necessary, controlling livestock grazing, maintaining education and outreach programs to control conflicts, monitoring populations and habitats, and requesting management and petitions for relisting when necessary. Many of these laws provide authorities for a number of these actions and controls.

The following laws and regulations, or portions thereof, exist and are relevant to agency programs regarding management of the grizzly bear and its habitat in the GYE. These provisions, whether national or state, have application in terms of agency compliance, agency authority, or discretion to act.

The relationship between the existing authorities and the five factors in Section 4(a)(1) used to consider listing and delisting of a species is presented in Appendix H. These five factors are all relevant to maintain a recovered population.

Federal Lands

Acts of Congress[4]

The Act of Congress March 1, 1872. Set Yellowstone apart as a public park for the benefit and enjoyment of the people" and "for the preservation, from injury or spoliation, of all timber, mineral deposits, natural curiosities or wonders...and their retention in their natural condition". 16 U.S.C. §§21-22.

National Park Service Organic Act, 1916. The National Park Service...shall promote and regulate the use...by such means... to conserve the scenery and the natural and historic objects and the wild life therein and to provide for the enjoyment of the same in such a manner...as will leave them unimpaired for future generations. 16 U.S.C. §31 repealed June 25, 1948.

Lacey Act, Criminal Code Provisions, 18 U.S.C. 42-44. This Act makes it illegal to import, export, transport, sell, receive, acquire, or purchase any fish or wildlife or plant taken or possessed in violation of any law, treaty or regulation of the United States or in violation of any Indian tribal law; to import, export, transport, sell, receive, acquire, or purchase in interstate or foreign commerce any fish or wildlife taken, possessed, transported, or sold in violation of any law or regulation of any state or in violation of any foreign law. 18 U.S.C. §§42-43.

Fish and Wildlife Coordination Act, 16 U.S.C. §§661-666c. This Act relates to wildlife as associated with water resource development. This act also authorizes that lands and waters may be acquired by Federal construction agencies for wildlife conservation to mitigate water projects in order to preserve and assure for the public benefit the wildlife potential of the particular water project area.

The Act of Congress September 14, 1950. (Expansion of Grand Teton National Park to include Jackson Hole National Monument) "The national park so established shall, so far as

[4] Federal legislation can be viewed at the Library of Congress web site: http://thomas.loc.gov

consistent with the provisions of this Act, be administered in accordance with the general statutes governing national parks..." 16 U.S.C. § 406d-1

Sikes Act, 16 U.S.C. §670g. The Secretaries of Agriculture and Interior and the State agencies will cooperate under this act to plan, develop, maintain, and coordinate programs for the conservation and rehabilitation of wildlife, fish and game. These programs shall include, but not be limited to, specific habitat improvements projects and related activities and provide adequate protection for species considered threatened or endangered pursuant to Section 4 of the ESA.

Multiple-Use Sustained-Yield Act, 16 U.S.C. §§528-531. It is the policy of the Congress that the National Forests are established and shall be administered for outdoor recreation, range, timber, watershed and wildlife and fish purposes. As used in this Act, "Multiple Use" means the management of all the various resources of the National Forests so that they are utilized in the combination that will best meet the needs of the American people; making the most judicious use of the land for some or all of these resources or related services over areas large enough to provide sufficient latitude for periodic adjustments in use to conform to changing needs and conditions; that some land will be used for less than all of the resources; and harmonious and coordinated management of the various resources, each with the other, without impairment of the productivity of the land, with consideration being given to the relative values of the various resources, and not necessarily the combination of uses that will give the greatest dollar return or the greatest unit output.

National Environmental Policy Act, 42 U.S.C. §§ 4321-4331. The purposes of this Act are: To declare a national policy which will encourage productive and enjoyable harmony between man and his environment: to promote efforts which will prevent or eliminate damage to the environment and biosphere and stimulate the health and welfare of man; to enrich the understanding of the ecological systems and natural resources important to the Nation; and to establish a Council on Environmental Quality. The Congress authorizes and directs that, to the fullest extent possible: (1) the policies, regulations, and public laws of the

United States shall be interpreted and administered in accordance with the policies set forth in this Act, and (2) all agencies of the Federal Government shall—
(A) Utilize a systematic, interdisciplinary approach that will insure the integrated use of the natural and social sciences and the environmental design arts in planning and decision making which may have an impact on man's environment; (B) Identify and develop methods and procedures, in consultation with the Council on Environmental Quality established by Title II of this Act, which will insure that presently unquantified environmental amenities and values may be given appropriate consideration in decision making along with economic and technical considerations; (C) Include in every recommendation or report on proposals for legislation and other major Federal actions significantly affecting the quality of the human environment, a detailed statement by the responsible official on—

(i) The environmental impact of the proposed action

(ii) Any adverse environmental effects which cannot be avoided should the proposal be implemented

(iii) Alternatives to the proposed action.

(iv) The relationship between local short term uses of man's environment and the maintenance and enhancement of long term productivity, and

(v) Any irreversible and irretrievable commitments of resources which would be involved in the proposed action should it be implemented.

Prior to making any detailed statement, the responsible Federal official shall consult with and obtain the comments of any Federal agency that has jurisdiction by law or special expertise with respect to any environmental impact involved.

The Act of Congress August 25, 1972, PL. 94-404 86 §620. Authorization to establish John D. Rockefeller, Jr. Memorial Parkway "... to provide both a symbolic and desirable physical connection between... Yellowstone, and the Grand Teton National Park..." "The Secretary shall administer the parkway as a unit of the national park system in accordance with the

authority contained in the Act of August 25, 1916..." Established by the Secretary of the Interior, September 30, 1977.

Endangered Species Act, 16 U.S.C. § 1533. ESA - Section 4 of the Act gives the criteria for determining a species' status as threatened or endangered. In order to delist a species, it must be shown that the opposite is true. It must be shown that: a) the species' habitat or range is not threatened with destruction, modification or curtailment, b) the species is not being over utilized for commercial, recreational, scientific or educational purposes, c) disease and predation are not significant problems, d) there are adequate regulatory mechanisms in place, and e) there are no significant other natural or manmade factors affecting the continued existence of the species. The Secretary of Interior and States shall effectively monitor recovered species for not less than five years after the species is delisted and no longer protected under the ESA.

Forest and Rangeland Renewable Resources Planning Act, 1974. In recognition of the vital importance of America's renewable resources of the forest, range, and other associated lands to the Nation's social and economic well being, and of the necessity for a long term perspective in planning and undertaking related national renewable resource programs administered by the Forest Service, the Secretary of Agriculture shall prepare a Renewable Resources Assessment. A strategic plan for all Forest Service activities shall be prepared every five years based on the assessment of renewable natural resources and on all land ownerships every 10 years. It provides direction that land management plans specify guidelines for land management plans, which provide for diversity of plant and animal communities. 16 U.S.C. §1600.

National Forest Management Act (NFMA) of 1976. NFMA provides the legal basis and direction for development of national forest plans. NFMA specifies that the National Forest System be managed to provide for diversity of plant and animal communities to meet multiple use objectives. Subsequent regulations for planning land and resource management

(36 CFR 219), adopted in 1979 augmented the diversity policy by requiring management of habitats to maintain viable populations of vertebrates. 15 U.S.C. §1600.

Federal Land Policy and Management Act. Public lands will be managed in a manner that will protect the quality of scientific, scenic, historical, ecological, environmental, air and atmospheric, water resource, and archeological values...that will provide food and habitat for fish and wildlife and domestic animals, and that will provide for outdoor recreation and human occupancy and use. 43 U.S.C. §§ 1701-1777.

Fish and Wildlife Improvement Act, 16 U.S.C. § 742(a).

Fish and Wildlife Conservation Act, 16 U.S.C. §§ 2901-2911. Each State should be encouraged to develop, revise and implement, in consultation with appropriate other agencies, a plan for the conservation of fish and wildlife, particularly those species, which are indigenous to the State. The purpose of this act is to provide financial and technical assistance to the States for the development, revision and implementation of conservation plans and programs for nongame fish and wildlife and to conserve and promote conservation of nongame fish and wildlife and their habitats.

The National Parks Omnibus Management Act of 1998 (PL 105-391,112 Stat. 3497). Title I, Section 101 recognizes the ever increasing societal pressures being placed upon America's unique natural and cultural resources contained in the National Park System, the Secretary shall continually improve the ability of the National Park Service to provide state-of-the-art management, protection, and interpretation of and research on the resources of the National Park System. Title II, Section 201, National Park System Resource Inventory and Management identifies the need to enhance management and protection of national park resources by providing clear authority and direction for the conduct of scientific study in the National Park system and to use the information gathered for management purposes. 16 U.S.C. §5901.

Federal Regulations

36 CFR 1.5 (a)(1). Gives National Park Superintendents the authority to establish for all or a portion of a park area a reasonable schedule of visiting hours, impose public use limits, or close all or a portion of a park area to all public use or to a specific use or activity in order to protect natural resources or provide for human safety.

36 CFR 1.7(B). National Park Service Superintendents shall publish in writing all designations, closures, permit requirements and other restrictions imposed under discretionary authority.

36 CFR 1.7(B) 1.2 (d). Gives National Park Superintendents the ability to regulate activities conducted by National Parks, or their agents, relative to the management and handling of grizzly bears (*Ursus arctos horribilis*). Specifics are described in Park Annual Bear Management Plans.

36 CFR 2.10 (d). Gives the National Park Superintendents authority to designate all or a portion of a park area where food, lawfully taken fish or wildlife, garbage and equipment used to cook or store food must be kept to avoid bear-human conflicts. This restriction does not apply to food that is being transported, consumed, or prepared for consumption.

36 CFR 219. Specifies that the National Forest System be managed to provide for diversity of plant and animal communities to meet multiple use objectives. Subsequent regulations for planning land and resource management and requiring management of habitats to maintain viable populations of vertebrates.

36 CFR 219.19. Requires that Fish and wildlife habitat shall be managed to maintain viable populations of existing native and desired non-native vertebrate species in the planning area.

A viable population shall be regarded as one, which has the estimated numbers, and distribution of reproductive individuals to insure its continued existence is well distributed in the planning area.

36 CFR 219.26. Specifies that Forest planning shall provide for diversity of plant and animal communities to meet multiple use objectives.

36 CFR 219.27 (a) (6). States that (a) All management prescriptions shall – (6) Provide for adequate fish and wildlife habitat to maintain viable populations of existing native vertebrate species.

36 CFR 261.50 (a) and (b). Gives Forest Supervisors the authority to issue orders which close or restrict the use of described areas, or of any forest development road or trail within the area over which he has jurisdiction. This authority is used to close areas to minimize human/bear conflicts and to issue food storage, carcass storage and camping requirements.

36 CFR 261.53 (a) and (e). States that when provided for in an order authorized under 36 CFR 261.50 (a) and (b) it is prohibited to go into or be upon any area which is closed for the protection of: (a) threatened, endangered, rare, unique, or vanishing species of plants, animals, birds or fish; or (b) for public health or safety.

36 CFR 261.58 (e) and (s) and (cc). States that when provided for in an order authorized under 36 CFR 261.50 (a) and (b) the following are prohibited. (a) Camping; (s) Possessing, storing, or transporting any bird, fish, or other animal or parts thereof as specified in the order; (cc) Possessing or storing any food or refuse, as specified in the order.

States

State laws, rules, and regulations that provide authority to control grizzly bear mortality, control hunters, manage grizzlybear/human conflicts, and other management activities to maintain the Yellowstone grizzly bear population are attached to the three state draft MOA (Appendix P).

~~Wyoming State Statutes~~[5]

~~23-1-101(a)(xii). "Trophy game animal" means black bear, grizzly bear, or mountain lion.~~

~~23-1-103. Ownership of wildlife. For the purpose of this act, all wildlife in Wyoming is property of the State. There shall be no private ownership of live animals classified as big or trophy game animals.~~

~~23-1-302(a)(ii). Powers and duties of the commission. To establish zones and areas in which trophy game animals may be taken as game animals with a license or in the same manner as predatory animals without a license, giving proper regard to livestock and game industries in those particular areas.~~

~~23-1-901. Owner of damaged property to report damage; claims for damages; time for filing; determination; appeal; arbitration. This is a lengthy statute that addresses procedures for filing damage claims.~~

~~23-2-101(e). Fees. This statute requires the commission to maintain a $500,000 balance to be used to compensate landowners for damage done by game animals.~~

~~23-3-102(b). License requirements. Requires a license to take a grizzly bear, except as otherwise provided.~~

[5] ~~Wyoming statues are available from the Wyoming State Law Library at http://courts.state.wy.us/state_law_library.htm.~~

Formatted: Font: Bold

Formatted: Heading 2

Formatted: Font: Not Bold

Comment [G74]: New 2016 language to include- refers to the draft MOA that needs to be approved by commissions.

Formatted: Font: Not Bold

~~23-3-102(d). Provides for a minimum of $5,000 and a maximum of $10,000 fine for killing a grizzly bear.~~

~~23-3-103(b). Taking predatory animals and trophy animals. Allows trophy game animals to be taken in areas designated by the Commission by the same means as a predatory animal.~~

~~23-3-106. Interstate game tag required. Regulates the transportation of bears within and across Wyoming State lines.~~

~~23-3-107. Wanton destruction. Prohibits a person from wantonly destroying any grizzly bear.~~

~~23-3-109. Use of dogs. Prohibits the use of dogs to hunt, run, or harass big or trophy game animals except as especially permitted by statute.~~

~~23-3-112. Firearms. Prohibits the use of certain types of firearms to take game animals.~~

~~23-3-115. Taking black bears doing damage. Allows landowner to kill black bears doing damage and requires them to notify the department. Grizzly bears may not be taken.~~

~~23-3-301. Importation and sale prohibited. Prohibits the importation and sale of bears.~~
~~Wyoming Game and Fish Commission Regulations~~

~~Chapter XLIII. Prohibits the taking of any wildlife unless the season is specifically opened by the commission.~~

~~Chapter II. Requires the taking of any grizzly bear to be reported to the department and the U.S. Fish Wildlife Service immediately. Section 7.~~

Chapter III. Prohibits the placement of baits in the current grizzly bear recovery zone. Section 6(a)(v).

Idaho State Statutes[6]

36-103 (a). Wildlife property of State – Preservation – Wildlife Policy. All wildlife, including all wild animals, wild birds, and fish, within the State of Idaho, is hereby declared the property of the State of Idaho. It shall be preserved, protected, perpetuated, and managed. It shall only be captured or taken at such times or places, under such conditions, or by such means, or in such manner, as will preserve, protect, and perpetuate such wildlife, and provide for the citizens of this State and, as by law permitted to others, continuous supplies of such wildlife for hunting, fishing and trapping.

36-103 (b). Commission to Administer Policy. Authority, power and duty of the Fish and Game Commission to administer and carry out the provisions of the Idaho Fish and Game Code. The Commission is not authorized to change the states' wildlife policy but only to administer it.

36-201. Fish and Game Commission authorized to classify wildlife. With the exception of predatory animals, the Idaho fish and game commission is hereby authorized to define by classification or reclassification all wildlife in the State of Idaho.

Idaho Fish and Game Commission Regulations

IDAPA 13 G 1.9. Species of Special Concern, Threatened or Endangered Species. Lists the grizzly bear as a Threatened Species. By definition a species likely to be classified as Endangered within the foreseeable future throughout all or a significant portion of its Idaho range.

[6] Idaho statutes are available from http://www3.state.id.us/idstat/TOC/idstTOC.html.

IDAPA 13 G 2.2. No person shall take or possess those species of wildlife classified as Protected non game, Species of Special Concern, or Threatened or Endangered at any time or in any manner, except as provided in Sections 36-106 (e) 5 and 36-1107, Idaho code or by commission regulation.

Comment [t75]: Update to reflect "big game" classification

Montana State Statutes[7]

Section 87-1-301. MCA, Powers of the Commission. Statutes, State of Montana, Department of Fish, Wildlife and Parks.

Requires the Fish, Wildlife and Parks Commission to set policies for the protection, preservation, and propagation of the wildlife, fish, game, furbearers, waterfowl, nongame species, and endangered species of the State and for the fulfillment of all other responsibilities of the department as provided by law.

Section 87-5-301. MCA Policy toward grizzly bear. Statutes, State of Montana, Department of Fish, Wildlife and Parks.

It is hereby declared the policy of the State of Montana to protect, conserve, and manage grizzly bears as a rare species of Montana wildlife.

Section 87-5-302. MCA Commission regulation on grizzly bear. Statutes, State of Montana, Department of Fish, Wildlife and Parks.

The commission shall have authority to provide open and closed seasons; means of taking; shooting hours; tagging requirements for carcasses, skulls, and hides; possession limits; and requirements for transportation, exportation, and importation of grizzly bears.

[7] Montana statues are available from http://www.lawlibrary.state.mt.us, the State Law Library of Montana.

~~Section 87-2-101. MCA Definitions. Statutes, State of Montana, Department of Fish, Wildlife and Parks.~~

~~By definition under this section bears are classified a game animal in Montana.~~

~~Administrative Rules of Montana~~

~~MCA 12.9.103. Grizzly Bear Policy (1) Whereas, the Montana Fish and Game Commission has management authority for the grizzly bear, a resident wildlife species, and is dedicated to the preservation of grizzly bear populations within the State of Montana; and~~

~~Whereas the secure habitat for the grizzly bear has been greatly reduced as a result of human development and population growth from 1850 through 1950 in the bear's traditional range in all western States; and~~

~~Whereas, a significant portion of the remaining grizzly bear habitat and population is located in Montana and these Montana populations occur in wildlands such as wilderness, primitive areas, de facto wilderness areas, national forests, national parks, Indian reservations, and seasonally, on adjacent private lands.~~

~~Now, therefore, in order to promote the preservation of the grizzly bear in its native habitat, the commission establishes the following policy guidelines for the Montana Department of Fish, Wildlife and Parks action when dealing with grizzly bear.~~

~~(a) Habitat. The department shall work to perpetuate and manage grizzly bear in suitable habitats of this State for the welfare of the bear and the enjoyment of the people of Montana and the nation. In performing this work the department should consider the following:~~

~~(i) the commission has the responsibility for the welfare of the grizzly bear and advocates the protection of the bear's habitat;~~

~~(ii) management of Montana's wildlands, including the grizzly bear habitat, is predominately, but not exclusively, a responsibility of various Federal agencies and private landowners;~~

~~(iii) land use decisions made by these agencies and individuals affect grizzly bear habitat, thus cooperative programs with these agencies and individuals are essential to the management of this species;~~

~~(iv) preservation of wildlands is critical to the protection of this species and the commission advocates wildland preservation in occupied grizzly bear habitat; and~~

~~(v) while some logging may not be detrimental to grizzly bear habitat, each logging sale in areas inhabited by grizzly bear should be carefully reviewed and evaluated.~~

~~(b) Research. It is recognized by the commission that research on the habitat requirements and population characteristics of the grizzly bear is essential for the welfare of the species. Departmental research programs and proposals directed at defining those habitat requirements are encouraged and supported.~~

~~(c) Hunting and recreational use. The commission recognizes its responsibility to consider and provide for recreational opportunities as part of a grizzly bear management program. These opportunities shall include legal hunting, recreational experiences, aesthetics of natural ecosystems, and other uses consistent with the overall welfare of the species.~~

~~(i) the department should consider the variability of values between individuals, groups, organizations, and agencies when management programs for various grizzly bear populations are developed.~~

~~(ii) sport hunting is considered the most desirable method of balancing grizzly bear numbers with their available habitat, minimizing depredations against private property within adjacent to grizzly bear habitat, and minimizing grizzly bear attacks on humans.~~

~~(d) Depredations. Contacts between grizzly bear and humans, or property of humans, require delicate handling and consideration. When these contacts reach the stage for definite action, the following actions should be carried out:~~

~~(i) grizzly bear, in the process of threatening or endangering human life, shall be captured or dispatched immediately.~~

~~(ii) where no immediate threat to human life exists, individual bear encounters with humans shall be evaluated on a case-by-case basis and when the attack is abnormal or apparently unprovoked, the individual bear involved shall be captured or dispatched.~~

~~(iii) when the attack is normal (e.g., a female defending her cubs, any bear defending its food, or any bear defending itself) but the situation leads itself to no reasonable possibility of leaving the bear in place, then the bear should be removed.~~

~~(iv) grizzly bear committing depredations that do not directly endanger human life but that are causing property losses shall be evaluated on an individual case basis.~~

~~(v) where removal is determined to be the best resolution to the problem, depredating or nuisance bear shall be trapped, and if determined to be suitable for transplanting, shall be marked and released in suitable habitat previously approved with appropriate land management agencies.~~

~~(vi) reasonable efforts shall be made to inform the public of the transplant program, fully explaining the reasons for the capturing and locations of the release area.~~

~~(vii) upon request by an authorized scientific investigative agency or public zoological institution, a captured bear may be given to that agency or institution, for appropriate non-release research purposes. A reasonable charge may be required to cover costs of handling.~~

~~(e) Depredating grizzly bear that are not suitable for release or research because of old age, acquired behavior, disease, or crippling, shall be killed and sent to the department's research facilities for investigation. The public shall be fully informed when these actions are taken and the reasons for these actions shall be fully explained~~

~~(f) Coordination. The department shall consult with appropriate Federal agencies and comply with applicable Federal rules and regulations in implementation of this policy. (History: Sec.87-1-301MCA, IMP, 87-1-201, 87-1-301 MCA; Eff. 12/31/72; AMD, 1977 MAR p.257, Eff. 8/26/77.)~~

~~Montana Department of Natural Resources and Conservation~~

~~Title 75, Chapter 1, MCA – Montana Environmental Policy Act. Establishes policy of the State of Montana to use all practicable means and measures to create and maintain conditions under which man and nature can coexist in productive harmony.~~

~~Title 76, Chapter 14, MCA – Montana Rangeland Resource Act. Establishes a program of rangeland management whereby the importance of Montana's rangeland with respect to wildlife habitat and the natural beauty of the State is recognized.~~

~~Title 77, Chapter 1, MCA – Administration of State Lands. Directs the State board of land commissioners to manage State lands to support education and for the attainment of other worthy objectives helpful to the well-being of the people of Montana. It further directs the board to manage State lands under the multiple-use management concept to insure: 1) they are utilized in that combination best meeting the needs of the people and the beneficiaries of the trust; and 2) harmonious and coordinated management of the various resources.~~

~~Title 87, Chapter 5, MCA – Nongame and Endangered Species Conservation Act. Establishes Montana policy to manage certain nongame wildlife for human enjoyment and to insure their perpetuation as members of ecosystems. It further declares the policy of the State of Montana to protect, conserve, and manage the grizzly bear as a rare species of Montana wildlife.~~

~~Montana Constitution. Article IX – Environment and Natural Resources. Section 1 – Protection and Improvement. The State and each person shall maintain and improve a clean and healthful environment in Montana for present and future generations.~~

Federal Plans and Guidelines

In addition to federal and state laws, the following plans and guidelines provide both direction and guidance for grizzly bear population and/or habitat management.

National Park Service

Comment [t76]: Comment-Compendia (consistent with Ninth Circuit ruling reference?

NPS-77, Natural Resource Management Guidelines, May 16, 1991. Guides National Park managers to perpetuate and prevent from harm (through human actions) wildlife populations as part of the natural ecosystems of parks.

Final Environmental Impact Statement, Grizzly Bear Management Program, Yellowstone National Park, July 1983:

Identifies sanitation procedures designed to ensure that human foods and attractants are kept secured from bears. Garbage and other unnatural food attractants will be eliminated before control actions are required. The solid waste handling program will encompass use of trash containers of bear-resistant design, careful and frequent garbage pickup to prevent overflow and overnight accumulations.
The Superintendent authorizes and approves the YNP Grizzly Bear Management Program that outlines the park's Bear Management Area Program. The Bear Management Area Program restricts recreational activity in areas with seasonal concentrations of grizzly bears. The goals of these restrictions include: (1) minimize bear-people interactions that may lead to habituation of bears to people (habituation can result in bears being removed from the population for human safety), (2) prevent human-caused displacement of bears from prime food sources, and (3) decrease the risk of bear-caused human injury in areas with high levels of bear activity.
Outlines Park bear monitoring program.
Outlines Park bear research goals and objectives.
Leaves open the possibility for supplemental feeding of grizzly bears, if deemed necessary.
Identifies as an objective that public awareness of exposing bears to unnatural food sources may lead to human injury, or to the bears' destruction, or both. Requires an active information program be directed at both visitors and employees to inform them of policies and goals of bear management, and the reasons for these. Provides guidelines for the distribution of bear safety warning information through entrance stations, signs, visitor contacts, and literature.

Yellowstone National Park Annual Bear Management Plan: Outlines grizzly bear ecology and management information distributed to park employees and the general public by the Bear Management Office.

Grand Teton National Park Human/Bear Management Plan, 1989:

Identifies sanitation procedures designed to ensure that human foods and attractants are kept secured from bears. Garbage and other unnatural food attractants will be eliminated before control actions are required. The solid waste handling program will encompass use of trash containers of bear-resistant design, and careful and frequent garbage pickup to prevent overflow and overnight accumulations. Containers not of bear-resistant design must be located inside the building served. Large animal carcasses that are near trails, facilities, or roads will be managed in a way to reduce human/bear encounters.

Grizzly bear management follows the *Interagency Grizzly Bear Guidelines* (IGBC 1986).

Management of Situation 1 areas includes area closures and/or activity curtailments to protect the bears.

Follows the procedures outlined in the *Interagency Grizzly Bear Guidelines* (IGBC 1986).

Actions subsequent to capture are coordinated with the U.S. Fish and Wildlife Service Grizzly Bear Recovery Coordinator.

All incidents involving human-bear interactions are documented on Bear Sighting/Identification reports. All Park employees and visitors are encouraged to complete these forms for all bear sightings.

Outlines Park bear research goals and objectives.

Outlines a program for the dissemination of information of human/bear relationships, the causes of human-bear conflicts, and how visitors, inholders, Park, and concession employees can help alleviate problems through their personal actions and compliance with Park regulations.

U.S. Forest Service

- If a change of status for the Yellowstone grizzly bear population under the ESA takes place, Forest Service Regions 1, 2, and 4 will classify the grizzly bear as a sensitive species[8] in the GYE. Grizzly bears and their habitats will then be managed as sensitive on National Forest System lands in accordance with Forest Service Manual 2670 (specifically 2670.22, 2670.32, and 2676.1-2676.17e). In addition, national forests will continue to follow direction established in existing land management plans until amended or revised. Bridge-Teton National Forest Land and Resource Management Plan with Amendments and Corrections (2015)
- Custer National Forest and Grasslands Land and Resource Management Plan (1987)
- Gallatin Forest Plan 1987 as Amended through November 2014
- 1997 Revised Forest Plan - Targhee National Forest
- Shoshone National Forest Land Management Plan (2015)
- Beaverhead-Deerlodge National Forest Land and Resource Management Plan (2009)

State Plans and Guidelines

[8] 2672.1 - Sensitive Species Management. Sensitive species of native plant and animal species must receive special management emphasis to ensure their viability and to preclude trends toward endangerment that would result in the need for Federal listing.

There must be no impacts to sensitive species without an analysis of the significance of adverse effects on the populations, its habitat, and on the viability of the species as a whole. It is essential to establish population viability objectives when making decisions that would significantly reduce sensitive species numbers.

2672.11 - Identification of Sensitive Species. Regional Foresters shall identify sensitive species occurring within the Region. They shall examine the following sources as possible candidates for listing as sensitive species:

1. Fish and Wildlife Service or National Marine Fisheries Service candidates for Federal listing (categories 1 and 2) under Federal Register Notice of Review.

2. State lists of endangered, threatened, rare, endemic, unique, or vanishing species, especially those listed as threatened under State law.

3. Other sources as appropriate in order to focus conservation management strategies and to avert the need for Federal or State listing as a result of National Forest management activities.

It is the policy of MDNRC to conduct programs and activities in a manner that limits the potential for conflicts between grizzly bears and people and that provides habitat to help achieve and sustain recovery within the GYE. Land uses which can adversely affect grizzly bears or their habitat will be designed and coordinated in a manner that is compatible with grizzly bear behavior and habitat needs, but not to the extent of excluding other uses.

The Forestry Division of the MDNRC has additional policy guidance for management of grizzly bear habitat within the Yellowstone. In 1988, grizzly bear management standards and guidelines were implemented to integrate management of grizzly bear habitat with timber management on State lands within the GYE. Performance standards and guidelines cover long range planning, project planning and design, management of bear-human conflicts, and special management areas. These will be implemented until the Forestry Division develops and adopts other guidance through a programmatic planning effort that will incorporate grizzly bear management objectives.

Additional policy guidance will be developed in the near future. The USFWS and MDNRC have mutually agreed to develop and implement guidelines for integrating grizzly bear habitat protection and MDNRC land management activities. MDNRC will continue to consult with MFWP on specific projects that may adversely affect any species of wildlife in Montana, in an attempt to minimize or avoid adverse impacts to populations or their habitats.

Executive Summary
2016 Conservation Strategy for the Grizzly Bear in the Greater Yellowstone Ecosystem

Chapter 1 Introduction and Background

The future management of the Yellowstone grizzly bear population is envisioned as one in which the grizzly bear (*Ursus arctos*) and its habitat are conserved as integral parts of the Greater Yellowstone Ecosystem.

Within the Greater Yellowstone Ecosystem(GYE), the grizzly bear population and its habitat will be managed utilizing a management approach that identifies a Primary Conservation Area (PCA) and adjacent areas where occupancy by grizzly bears is anticipated and acceptable. The PCA is the existing Yellowstone grizzly bear recovery zone as identified in the 1993 *Grizzly Bear Recovery Plan (Recovery Plan)* (USFWS 1993). The PCA boundary will replace the recovery zone boundary to reflect the paradigm shift from managing for recovery to one of conservation.

In the Conservation Strategy, management direction is described for both the PCA and adjacent areas within the GYE (i.e., the Demographic Monitoring Area (DMA)). State grizzly bear management plans, forest plans, and other appropriate planning documents will provide specific management direction for the adjacent areas outside the PCA.

This Conservation Strategy was developed to be the document guiding management and monitoring of the Yellowstone grizzly bear population and its habitat upon recovery and delisting. This approach will remain in place beyond recovery and delisting. Ongoing review and evaluation of the effectiveness of this Conservation Strategy is the responsibility of the state, tribal, and federal managers in the GYE. This Conservation Strategy will be evaluated ~~updated~~ by the management agencies every five years or as necessary, allowing public comment in the updating process.

Comment [G5]: Comment: 2007 language sets expectations that may not be met so replace updated with evaluated

Upon implementation of the Conservation Strategy, the Yellowstone Grizzly Bear Coordinating Committee (YGCC) will replace the Yellowstone Ecosystem Subcommittee.

The purpose of this Conservation Strategy (Strategy) and the state plans is to:

- Describe and summarize the coordinated efforts to manage the grizzly bear population and its habitat to ensure continued conservation in the GYE.
- Specify the population, habitat, and nuisance bear standards[1] to maintain a recovered grizzly bear population for the foreseeable future.
- Document the regulatory mechanisms and legal authorities, policies, management, and monitoring programs that exist to maintain the recovered grizzly bear population.
- Document the commitment of the participating agencies.

Implementation of the management strategies requires continued cooperation between federal and state agencies.

The GYE is a dynamic environment; monitoring systems in the Strategy allow for dynamic management as environmental issues change. The agencies are committed to be responsive to the needs of the grizzly bear by dynamic management actions based on the results of detailed annual population and habitat monitoring.

The vision of the Strategy can be summarized as follows:

- The PCA will be a secure area for grizzly bears, with population and habitat conditions maintained to ensure a recovered population is maintained for the foreseeable future and to allow bears to continue to expand outside the PCA.
- Outside of the PCA, grizzly bears will be allowed to expand into biologically suitable and socially acceptable areas.

[1] Standards are management actions that are required in this Conservation Strategy. A deviation from a standard would occur only with a revision or amendment to the Conservation Strategy.

Outside of the PCA, the objective is to maintain existing resource management and recreational uses and to allow agencies to respond to demonstrated problems with appropriate management actions.

Outside of the PCA, the key to successful management of grizzly bears lies in bears utilizing lands that are not managed solely for bears but in which their needs are considered along with other uses.

Manage the GYA grizzly bear~~a~~ population within the area called the Demographic Monitoring Area (DMA), which is the area formerly called Suitable Habitat, to at least the 2002-2014 Chao2 average point estimate for total population, with 95% confidence intervals (i.e. 600-747). ~~The population objective in the DMA is the average population size in the DMA 2002–2014 and associated confidence intervals when this population was essentially stable. Use the model-averaged Chao2 population estimator applied inside the DMA to estimate the population on an annual basis and to set the mortality limits within the DMA so as to maintain this average population size using a sliding scale of mortality for independent females and males, and dependent young (*see* Appendix C).~~

Expand public information and education efforts.

Provide quick responsive management to ~~deal with~~address grizzly bear conflicts.

Manage grizzly bears as a game animal; including allowing regulated hunting when and where appropriate.

Comment [G6]: 2016 language to strike- population objectives above recovery are the purview of the states, replace with language from MOA

Relationship to Other Plans

By integrating state plans into the Strategy, it was ensured that the plans and the Strategy are consistent where necessary and complementary. The state plans are formally incorporated in the Conservation Strategy as Appendices I, J, and K.

Relationships with national forest and national park plans are also mentioned throughout the Strategy. Land and resource management plans for national forests and national parks in the GYE have incorporated the habitat standards and other relevant provisions of the Conservation

Strategy. For those standards and provisions not yet incorporated into management plans, the agencies will implement the habitat standards and monitoring requirements in this conservation strategy through their established planning processes, subject to NEPA or other legal requirements

Chapter 2 Population Standards and Monitoring

To maintain a healthy (recovered) grizzly bear population in the GYE, it is necessary to have adequate numbers of bears that are widely distributed with a balance between reproduction and mortality. This section details the population criteria in the *Recovery Plan* that were necessary to achieve recovery, and the population standards necessary to maintain it (USFWS 2016). The Strategy will continue to assess demographic recovery criteria within the Demograhpic Monitoring Area (DMA) created by the *Recovery Plan*. Because grizzly bears are a difficult species to monitor and manage, multiple standards with additional monitoring items are identified to provide sufficient information upon which to base management decisions. It is the goal of the agencies implementing this Conservation Strategy to manage the Yellowstone grizzly bear population in the entire GYE ~~at or above a total of 500 grizzly bears. DMA at the average population size between 2002–2014 when the population inside the DMA was essentially stable. Using the model-averaged Chao2 population estimation method this average population size was 674 (average lower 95% CI = 600; average upper 95% CI = 747)~~.

Comment [G7]: 2016 language to strike and replace with 2007 language; population goals above recovery are the purview of the states-support recovery cirteria which is to maintain a minimum population size of 500 animals in the Greater Yellowstone Area. The estimate of total population size cannot drop below 500 in two consecutive years. This estimate will be calculated by the Study Team using data obtained within the Demographic Monitoring Area.

Population standards and monitoring items include:

- Monitoring unduplicated females with cubs-of-the-year inside the GYE DMA.
- Calculating a total population estimate for the GYE DMA using the model-averaged Chao2 estimate of females with cubs-of-the-year (*see* Appendix C).
- Maintaining at least 500 bears in the GYE to assure the genetic health of the population.
  - ~~Five hundred bears is not a population goal but a minimum number necessary to address genetic health.~~

Comment [G8]: 2016 language to strike

- Monitoring the distribution of females with young of all ages and having a target of at least 16 of 18 BMUs (Bear Management Units) within the PCA occupied at least one year in every six, and no two adjacent BMUs can be unoccupied over any six-year period.
- Monitoring all sources of mortality for independent females and males (≥ 2 years old) and dependent young (<2 years old) within the GYE DMA and limiting mortality to annual mortality percentages on a sliding scale depending on the annual population size estimate using model-averaged Chao2.
- Monitoring population trend using female survivorship and reproductive rate data from radio-collared bears.
- Ensure meeting defined genetic management objectives ~~by facilitating occasional male movement between the Northern Continental Divide Ecosystem (NCDE) and GYE~~.

Comment [G9]: 2016 language to strike; if there are no defined genetic management objectives presently then strike the entire bullet

Chapter 3 Habitat Standards and Monitoring

The habitat standards identified in this document will be maintained at identified levels inside the PCA. In addition to the habitat standards, several other habitat factors will be monitored and evaluated to determine the overall condition of habitat for bears. It is the goal of the habitat management agencies to maintain or improve habitat conditions existing as of 1998, as measured within each subunit within the PCA, while maintaining options for management of resource activities at approximately the same level as existed in 1998. The habitat standards in this document are subject to revision based on the best available science and will be reviewed and updated as necessary.

Habitat standards include:

- Maintenance of secure habitat at 1998 levels in each BMU subunit through management of motorized access route building and density, with short-term deviations allowed under specific conditions. Secure habitat is defined as more than 500 meters from an open or

gated motorized access route or recurring helicopter flight line and must be greater than or equal to 10 acres in size.

The number and acreage of commercial livestock allotments and number of permitted domestic sheep animal months will not exceed 1998 levels inside the PCA. Existing sheep allotments will be phased out as the opportunity arises with willing permittees.

Management of developed sites at 1998 levels within each BMU subunit, with some exceptions for administrative and maintenance needs.

Habitat criteria that will be monitored and reported include:

Monitoring open and total motorized access route density in each BMU subunit inside the PCA.

Monitoring of four high-calorie food items throughout the Yellowstone area: winter ungulate carcasses, cutthroat trout (*Oncorhynchus clarki*) spawning numbers, bear use of army cutworm moth (*Euxoa auxiliaris*) sites, and whitebark pine (*Pinus albicaulis*) cone production. The incidence of white pine blister rust (*Cronartium ribicola*) and whitebark pine mortality in sampled areas will also be monitored.

Monitoring the number of elk hunters inside the PCA.

Land managers will ensure that habitat connectivity is addressed throughout the Yellowstone area as part of any new road construction or reconstruction and that food storage orders are in place.

Chapter 4 Management and Monitoring of Grizzly Bear-Human Conflicts

The management of grizzly bear-human conflicts inside the PCA is based upon the existing laws and authorities of the state wildlife agencies and federal land management agencies. Outside the PCA, state management plans will direct the management of nuisance bears. Management of nuisance bears usually falls into one or more of the following categories:

Removing or securing the attractant.

Deterring the bear from the site through the use of aversive conditioning techniques.

Capturing and relocating the nuisance bear.

Removing the bear from the wild, including lethal control.

The focus and intent of nuisance grizzly bear management will be predicated on strategies and actions to prevent grizzly bear-human conflicts. It is recognized that active management aimed at individual nuisance bears will be required. Management actions outside the PCA will be implemented according to state and tribal management plans. These actions will be compatible with grizzly bear population management objectives for each state for the areas outside the PCA.

In circumstances that result in a nuisance bear situation outside the PCA, more consideration will be given to existing human uses. Site-specific conflict areas within and outside the PCA will be documented and prioritized to focus proactive management actions to minimize grizzly bear-human conflicts and address existing and potential human activities that may cause future conflicts. Past conflict management has demonstrated that grizzly bears can coexist with most human activities.

Management of ~~all~~ nuisance bear situations will emphasize resolving the human cause of the conflict. Relocation and removal of grizzly bears may occur if other management actions are not successful. ~~Before any removal, except in cases of human safety, management authorities will consult with each other prior to judging the adequacy of the reason for removal.~~

Comment [G10]: 2007 language to strike-no longer appropriate once delisted

Captured grizzly bears identified for removal may be given to public research institutions or public zoological parks for appropriate non-release educational or scientific purposes as per regulations of states and national parks. Grizzly bears not suitable for release, research, or educational purposes will be removed as described in appropriate state management plans or in compliance with national park management plans.

All grizzly bear relocations and removals will be documented and reported annually in the Interagency Grizzly Bear Study Team (IGBST) Annual Report.

Chapter 5 Information and Education

The purposes of the information and education aspects of this cooperative effort are to support the development, implementation, and dissemination of a coordinated information and education program. This program should be understandable and useful for the people who visit, live, work, and recreate in bear habitat to minimize grizzly bear-human conflicts and to provide for the safety of people while building support for viable bear populations.

Information made available to the public will be open and responsive to public concerns. Open discussions with the public will increase credibility of the grizzly bear management program. These efforts will be reviewed periodically and program adjustments will be made as necessary. In addition, efforts will be expanded as the bear population expands and additional efforts will be needed in areas that could become occupied in the near future.

The current information and education (I & E) working group within the Greater Yellowstone Ecosystem will continue. Members of this I & E team include public affairs personnel from Forest Service Regions 1, 2, and 4; Grand Teton and Yellowstone National Parks; the BLM; representatives from each state wildlife agency; and the I & E specialist from the Interagency Grizzly Bear Committee (IGBC). This team will continue to work with all affected interests to ensure consistency of information, efficient funding strategies, identifying and targeting audiences, developing partnerships, and identifying new tools for implementation.

Chapter 6 Implementation and Evaluation

A new committee, the Yellowstone Grizzly Bear Coordinating Committee (YGCC), will replace the Yellowstone Ecosystem Subcommittee. YGCC meetings will be open to the public.

Some primary activities of the YGCC are:

- Coordinate implementation of this Conservation Strategy.
- Ensure that population and habitat data are collected annually by the IGBST, as specified in this Conservation Strategy, and evaluated to assess current status of the grizzly bear population.
- Share information and implement management actions in a coordinated fashion.
- Identify management, research, and financial needs to successfully implement the coordinated Conservation Strategy.
- Implement a Biology and Monitoring Review ~~as necessary and submit a petition for relisting~~ as appropriate to ensure agency responsiveness to changing circumstances of the grizzly bear or its habitat in the GYE.
- Appoint a chairperson and members of the Information and Education Team, and coordinate information and education efforts.

Comment [G11]: 2007 language to strike-not an appropriate function for individual agency representatives on the Committee

This committee does not supersede the authority of the management agencies beyond the specific actions agreed to as signatories of this Conservation Strategy.

YGCC membership consists of representatives of the following:

Federal	National parks: Yellowstone and Grand Teton
	National forests: Beaverhead-Deerlodge, Bridger-Teton, Caribou-Targhee, Custer-Gallatin, and Shoshone
	One Bureau of Land Management representative
	The Biological Resources Division of the U.S. Geological Survey
State wildlife agencies	Idaho, Montana, and Wyoming
Local government	One representative from each state
Tribal	One representative from each Native American tribe with sovereign

The IGBST and the I & E will perform necessary tasks and report to the YGCC.

As detailed in the monitoring portion of this Strategy, the IGBST will take the lead in preparing an annual monitoring report with staff support from the YGCC. Agencies responsible for monitoring major demographic and habitat parameters are listed in Appendix G Monitoring results and analysis will be presented to the YGCC by the IGBST.

If there are deviations from ~~any of~~ the population and/or habitat standards stipulated in this Conservation Strategy, a Biology and Monitoring Review will be initiated.

Comment [G12]: 2007 language to strike-contradicts making new changes based on the best available science

Biology and Monitoring Review

Under this Conservation Strategy, a Biology and Monitoring Review is a process carried out by the IGBST. A Biology and Monitoring Review examines management of habitat, populations, or efforts of participating agencies to complete their required monitoring. Biology and Monitoring Reviews would normally be undertaken after the annual summary of monitoring information presented to the YGCC and in response to deviations from required population or habitat standards. Any YGCC member agency can request that a Biology and Monitoring Review be considered. Such consideration would be a topic for discussion by the YGCC and the review would be initiated based on the decision of the YGCC. The Biology and Monitoring Review process will be completed within six months and the resulting written report presented to the YGCC and made available to the public. The IGBST is not responsible for completing impact analyses for projects proposed by any agency; such analyses are the responsibility of the agency making the proposal.

The purposes of a Biology and Monitoring Review are:

To identify the reasons why particular demographic or habitat objectives have not been achieved and to modify management as necessary, or

To consider potential impacts of a proposed action of concern to one or more members of the YGCC, or

To consider departures by one or more agencies from the monitoring effort required under this Conservation Strategy and to develop plans to ensure that monitoring efforts be maintained as per the standards in this document, or

To consider and establish a scientific basis for possible changes in management due to changed conditions in the ecosystem.

~~Biology and Monitoring Reviews will be submitted as written reports by the IGBST to the YGCC and made available to the public.~~

~~The YGCC will respond to the Biology and Monitoring Review with actions to address the deviations from the population or habitat standards. If the situation, after completion of the Biology and Monitoring Review, is such that some or all of the desired population and habitat standards specified in this Conservation Strategy are not being met, and cannot be met in the opinion of the YGCC, then the YGCC will petition the Fish and Wildlife Service (Service) for relisting. In the case of a vote on this issue, a simple majority is necessary.~~

Comment [G13]: 2007 language to strike-too much detail for this portion of the document

Comment [G14]: 2007 language to strike- not an appropriate function for individual agency representatives on the Committee or a committee that is not a separate legal entity; it makes no sense for the Service to subject itself to deadlines to respond to a petition from a committee in which USFSW is a technical support member

~~*Petition for Relisting*~~

~~The YGCC can petition for relisting and a resulting status review from the U.S. Fish and Wildlife Service. A status review is a process that requires the Service to review the status of the GYE grizzly bear population and is triggered by a petition to list a species. This petition from the YGCC will be accompanied by the available specific biological data on the population and its habitat sufficient to judge its status as a recovered population as per the requirements of this Conservation Strategy. A status review will evaluate all factors affecting the population and result in a finding that summarizes the current status of the population. For purposes of a status review, the status of the entire GYE grizzly bear population will be considered.~~

Comment [G15]: 2007 language to strike-this is unnecessary in the summary and the detail is in Chap 6.

~~Additionally, the Service can initiate a status review to determine if the grizzly bear in the GYE should be added to the list of candidate species for listing independent of the YGCC based on concerns about the population and/or its habitat. Under Section 4 of the Endangered Species Act, a petition from an individual or organization can also initiate a status review, as long as the petition is deemed to be warranted. To be warranted, such a petition must present credible scientific information to support the petition.~~

~~If, as the result of the status review for candidate status or the petition for relisting, the population is found to be warranted for listing, as per the criteria of the Endangered Species Act in Section 4(a)(1), then the species could be immediately considered for relisting and could be relisted under emergency regulations, per Section 4(b)(7) if the threat were severe and immediate.~~

~~The Service will initiate a status review with possible emergency relisting if necessary if there are changes to Federal, State, or Tribal laws, rules, regulations, or management plans that depart significantly from the specifics in the Conservation Strategy, thereby compromising implementation of the Strategy.~~

Comment [G16]: 2016 language to strike-asking the signators to agree to more than the legal standard for emergency relisting, not necessary when Service already has this authority.

Chapter 7 Existing Authorities

The existence of adequate regulatory mechanisms that serve to maintain the GYE grizzly bear population as recovered is one of the five factors required to change the status of the population to delisted and to assure a healthy grizzly bear population.

This chapter lists applicable federal, state (Idaho, Montana, and Wyoming) and tribal acts, statutes, regulations, rules, plans, and guidelines[2].

Comment [G17]: 2016 footnote language to strike-the reference is inappropriate for states and federal agencies

[2] ~~Guidelines are management actions that are highly recommended in this Conservation Strategy. A deviation from a guideline would not require a revision or amendment to the Conservation Strategy. A deviation from a guideline requires written rationale as to why the guideline is not being followed.~~

Memorandum of Understanding Detailing Agency Agreement to Implement this Conservation Strategy

The agencies signing this Conservation Strategy agree to use their authorities to maintain and enhance the recovered status of the grizzly bear in the Greater Yellowstone Ecosystem (GYE) by implementing the regulatory mechanisms, interagency cooperation, population and habitat management and monitoring, and other provisions of the Conservation Strategy as per the details and responsibilities described in this document. All signatories recognize that each has statutory responsibilities that cannot be delegated and that this agreement does not and is not considered to abrogate any of their statutory responsibilities. This agreement is subject to and is intended to be consistent with all appropriate federal and state laws. Funding of this MOU is subject to approval and appropriations by approved state and federal entities. All agencies will take appropriate steps to seek funding to implement this document. The adequacy of the regulatory mechanisms demonstrated by this Conservation Strategy are dependent upon funding being available to fully implement the management and monitoring actions detailed in this document. This Conservation Strategy does not go into effect until all agencies have signed this document and the final rule delisting the GYE grizzly bear DPS has been published in the Federal Register.

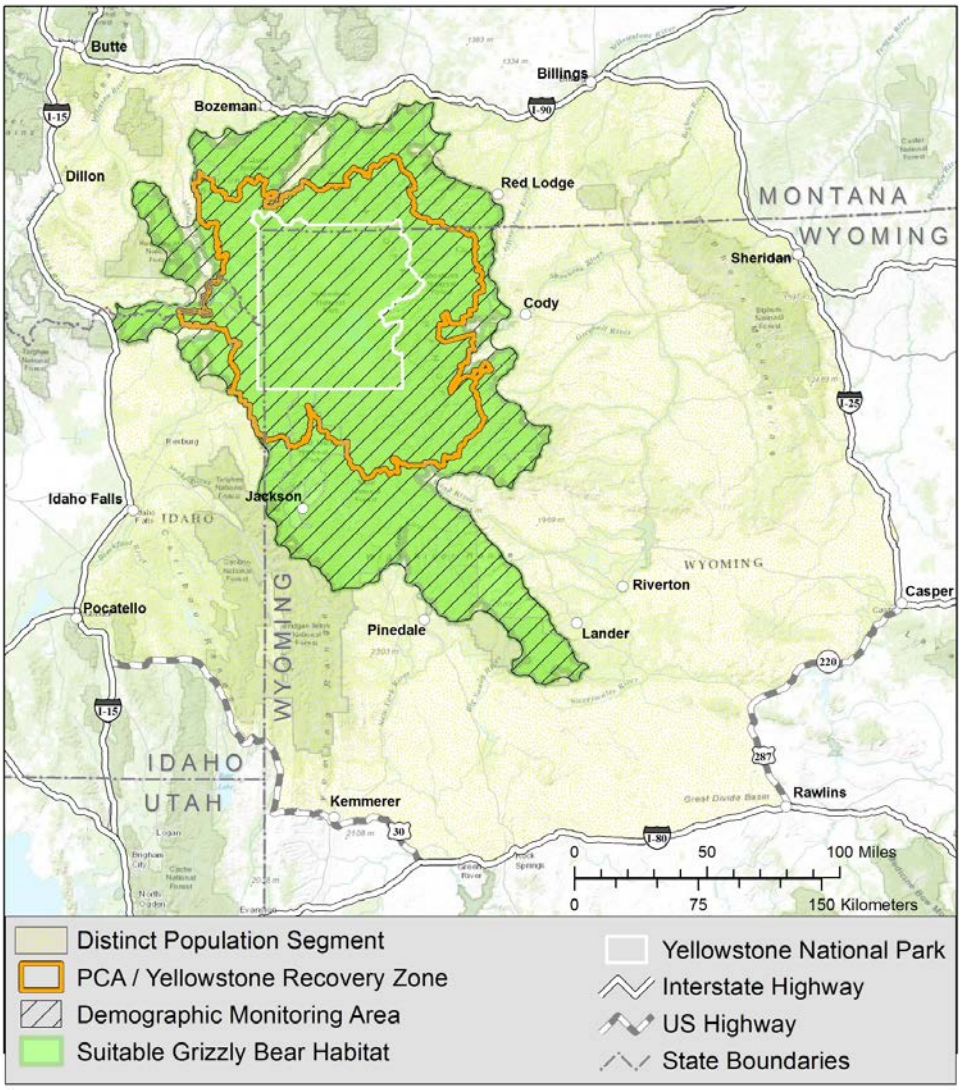
Chapter 1 Introduction and Background

Introduction

The future management of the Yellowstone grizzly bear population is envisioned as one in which the grizzly bear and its habitat are conserved as integral parts of the Greater Yellowstone Ecosystem (GYE).

Within the GYE , the grizzly bear population and its habitat will be managed utilizing a management approach that identifies a Primary Conservation Area (PCA) and adjacent areas where occupancy by grizzly bears is anticipated and acceptable. The PCA is the existing Yellowstone grizzly bear recovery zone as identified in the 1993 *Grizzly Bear Recovery Plan* (Recovery Plan) (USFWS 1993). The size of the recovery zone is not being expanded in this approach. The PCA boundary will replace the recovery zone boundary to reflect the paradigm shift from managing for recovery to one of conservation (Figure 1).

In this Conservation Strategy (Strategy), management direction is described for both the PCA and adjacent areas within the GYE. State grizzly bear management plans, forest plans, and other appropriate planning documents provide additional management direction for the adjacent areas outside the PCA.



This Strategy was developed to be the document guiding management and monitoring of the GYE grizzly bear population and its habitat upon recovery and delisting. This Strategy will remain in effect beyond recovery~~,~~ and delisting, ~~and the five year monitoring period required by the Act as grizzly bears will always be a "conservation reliant" species (Scott *et al.* 2005) because of their low resiliency to excessive human-caused mortality. Therefore, the need to coordinate management of the population across multiple land ownerships and jurisdictions will always remain.~~

Comment [G18]: 2016 language to strike-This language is not necessary

~~Ongoing review and evaluation of the effectiveness of this Strategy is the responsibility of the state and federal managers in the~~ GYE. This Strategy will be ~~updated~~ evaluated by the management agencies every five years, or as necessary, allowing public comment in the updating process.

Comment [G19]: Comment-same reference as page 2, set expectations that may not be reasonable so replace update with evaluate

Figure 1. Map of the Greater Yellowstone Ecosystem (GYE). Boundaries are shown for: (1) the GYE grizzly bear Distinct Population Segment Area (the legal boundary where grizzly bears would be delisted); (2) the Primary Conservation Area (PCA); (3) Suitable Habitat; and (4) the Demographic Monitoring Area (DMA).

Upon implementation of this Strategy, the Yellowstone Grizzly Bear Coordinating Committee (YGCC) replaces the Yellowstone Ecosystem Subcommittee. (*See* Chapter 6 for more information about the activities of the YGCC.)

The Conservation Strategy

The purpose of this Strategy, which includes the state plans, is to:

- Describe and summarize the coordinated efforts to manage the grizzly bear population and its habitat to ensure continued conservation in the GYE.
- Specify the population, habitat, and nuisance bear standards to maintain a recovered grizzly bear population.
- Document the regulatory mechanisms and legal authorities, policies, and management and monitoring programs that exist to maintain the recovered grizzly bear population.
- Document the commitment of the participating agencies.

Implementation of the management strategies requires continued cooperation between federal and state agencies.

The GYE is a dynamic environment; monitoring systems in the Strategy allow for dynamic management as environmental issues change. The agencies are committed to be responsive to the needs of the grizzly bear by dynamic management actions based on the results of detailed annual population and habitat monitoring.

Development of the Conservation Strategy and State Plans

Development of the Strategy began in 1993, when biologists representing the National Park Service, U. S. Forest Service, U. S. Fish and Wildlife Service, Interagency Grizzly Bear Study Team, Idaho Department of Fish and Game, Montana Fish, Wildlife & Parks, and the Wyoming Department of Game and Fish were appointed to the Interagency Conservation Strategy Team. In March 2000, a draft Conservation Strategy was released to the public for review and comment. Later the same year, a Governors' Roundtable was organized to provide

recommendations from the perspectives of the three states that would be involved with management of grizzly bears after delisting. The Governors' Roundtable recognized the need to have state management plans that would give direction for grizzly bear management outside the PCA. The state management plans apply to management of grizzly bears outside the PCA, and describe the general areas that grizzly bears are likely to occupy in the foreseeable future.

In 2002, the 2007 Conservation Strategy was developed and the state plans were completed. Although this 2016 version of the Conservation Strategy updates sections of the Strategy, the vision remains the same.

The vision of the Strategy can be summarized as follows:

- The PCA will be a secure area for grizzly bears, with population and habitat conditions maintained that have allowed the grizzly bear population to achieve recovery and expand outside the PCA.
- Outside of the PCA, grizzly bears will be allowed to expand into biologically suitable and socially acceptable areas.
- Manage the GYA grizzly bear population within the DMA, to at least the 2002-2014 Chao2 average point estimate for total population, with 95% confidence intervals (i.e. 600-747).
- ~~Manage a population within the area called the Demographic Monitoring Area (DMA), which is the area formerly called Suitable Habitat (Figure 1). The population objective in the DMA is the average population size 2002-2014 when the population in this area was essentially stable. Use the model-averaged Chao2 population estimator applied inside the DMA to measure the population on an annual basis and to set the mortality limits within the DMA so as to maintain this average population size using a sliding scale of mortality for independent females and males, and dependent young.~~
- Outside of the PCA, the objective is to maintain existing resource management and recreational uses and to allow agencies to respond to demonstrated problems with appropriate management actions.

Comment [G20]: 2016 language to strike-replaced with language from MOA

Outside of the PCA, the key to successful management of grizzly bears lies in bears utilizing lands that are not managed solely for bears but in which their needs are considered along with other uses.

Expand public information and education efforts.

Provide responsive management to deal with nuisance grizzly bears.

Manage grizzly bears as a game animal, including allowing regulated hunting when and where appropriate.

Relationship to Other Plans

The state of Idaho, Montana, and Wyoming and the Tribes of the Wind River ~~Indian~~ Reservation all developed grizzly bear management plans. The three states also entered into a memorandum of agreement memoralizing how the states will coordinate with each other regarding bear management and allocation of mortality[3]. The individual state plans {and three-state memorandum of agreement} are complementary to this Strategy. ~~The state plans are integrated into the Strategy to ensure that the plans and the Strategy are consistent where necessary and complementary.~~ The state and tribal management plans are ~~formally incorporated in the Conservation Strategy as~~ Appendices I, J, K, ~~and~~ O, and P.

Comment [G21]: 2016 new language-The additions re Tribes are inconsistent (is WRT a signatory needed to finalize the revision?)

Comment [G22]: 2016 proposed language-*Add MOA language upon finalization of the Tri-State MOA or use with footnote to reference draft status*

Comment [G23]: 2007 language to change in light of evolution of state plans and MOA; revisions and amendments to state plans should not be encumbered by the Stategy process or vice versa

National Forest and National Park plans are also complimentary to this Strategy. Land and resource management plans for National Forests and National Parks in the GYE have incorporated the habitat standards and other relevant provisions of the Conservation Strategy. Those standards and provisions not yet incorporated into management plans will be integrated into future land management plan amendments or revisions.

[3] The states have provided a draft MOA that will be finalized by commission approvals in 2016

Background

The Grizzly Bear Population

The grizzly bear population in the lower 48 states was listed as threatened in 1975 pursuant to the Endangered Species Act of 1973.

The Recovery Plan established several demographic (population) recovery targets that must be achieved for a recovered grizzly bear population. All recovery targets are currently being met. When grizzly bears were listed in 1975, "indiscriminate illegal killing" and management removals were identified as threats to the population. In response, the Service and signatories to this Strategy implemented demographic recovery criteria to maintain a minimum population size, a well-distributed population, and establish mortality limits based on scientific data and direct monitoring of the population. Since implementing these criteria, the GYE grizzly bear population has tripled in size and range (Eberhardt *et al.* 1994; Knight and Blanchard 1995; Boyce *et al.* 2001*a*; Schwartz *et al.* 2006; Pyare *et al.* 2004; Schwartz *et al.* 2006a; IGBST 2012; Bjornlie *et al.* 2014).

Counts of females with cubs-of-the-year have increased. In 2013, the estimate of unique females with cubs-of-the-year within the entire GYE was 58 (Haroldson *et al.* 2014). This is the highest count ever recorded. The Recovery Plan target for the number of females with cubs-of-the-year has been exceeded since 1988. Calculations of population trajectory derived from radio-monitored female bears show an increasing population trend at a rate of 4 to 7 percent per year between 1983 and 2002 (Eberhardt *et al.* 1994; Knight and Blanchard 1995; Schwartz *et al.* 2006) and 0.3 to 2.2 percent between 2002 and 2011 (IGBST 2012). Grizzly bear range and distribution has more than tripled since 1975 (Basile 1982; Blanchard *et al.* 1992; Schwartz *et al.* 2002; Pyare *et al.* 2004; Schwartz *et al.* 2006a; Bjornlie *et al.* 2014). Independent female survival rates, the single most important cohort to population trajectory, are high (IGBST 2012).

In total, this population has increased from estimates ranging between 230 and 312 bears when listed in 1975 (Cowan *et al.* 1974; Craighead *et al.* 1974; McCullough 1981) to at least 714 animals as of 2014 (van Manen 2015, *in litt.*).

The Primary Conservation Area and the Demographic Monitoring Area

The Strategy identifies and provides a framework for managing habitat within a Primary Conservation Area (PCA) and managing demographic parameters within a Demographic Monitoring Area (DMA) (Figure 1). The PCA boundaries (containing 23,853 sq km (9,210 sq mi)) correspond to those of the Yellowstone Recovery Zone (U.S. Fish and Wildlife Service 1993) and will replace the Recovery Zone boundary (Figure 1). The PCA contains adequate seasonal habitat components needed to support the recovered GYE grizzly bear population for the foreseeable future and to allow bears to continue to expand outside the PCA. The National Park Service and the U. S. Forest Service manage the majority of lands within the PCA; a small percentage of land is privately owned or managed by the states or the Bureau of Land Management (BLM) (Table 1).

Table 12. Area of lands within the Primary Conservation Area by management type.

Management Type	Area (square miles)	Percent of the PCA
National Park Service	3,632	39.4
U. S. Forest Service	5,383	58.5
Private and Other Ownerships	195	2.1
TOTAL	9,210	100

To facilitate habitat management and ensure habitat was well distributed, the PCA was divided into 18 bear management units (BMUs) and 40 subunits (Figure 2). BMUs are used to measure the distribution of females with offspring while subunits allow better resolution of habitat

measurement. Habitat protections inside the PCA that allowed the recovery of the grizzly bear population will be maintained.

Figure 3. The Primary Conservation Area showing bear management unit and subunit boundaries.

Characterization of Grizzly Bear Habitat

Background on the Area Necessary for a Recovered Population

Grizzly bears are one of the subspecies of brown bears, which range throughout diverse areas and habitats in Europe, Asia, and North America. Brown bears have the most widespread distribution of any bear species and live in the widest range of habitats of any bear species including deserts, boreal forests, arctic tundra, coniferous forests, deciduous forests, alpine areas, and coastal rainforests. At minimum, grizzly bears need food, seasonal foraging habitat, denning habitat, and security in an area of sufficient size for survival. Bears overlap in home ranges and change densities based on a variety of social and environmental factors. However, the precise mixture of these diverse elements and the precise size of the area necessary to support a population of grizzly bears are impossible to specify. To a great degree, the difficulty lies in the fact that grizzly bears are long-lived opportunistic omnivores whose needs for foods and space vary depending on a multitude of environmental and behavioral factors and on variation in the experience and knowledge of each individual bear. The key to establishing habitat criteria that will maintain a healthy population is to look to the habitat factors in the past that produced a grizzly bear population in the Yellowstone area that is increasing in numbers and expanding in range. Habitat factors that produced a healthy population in the past were used to establish the habitat criteria for the future that must be maintained if a healthy population continues to be preserved.

The available habitat for bears is largely determined by human activities. Human activities are the primary factor impacting habitat security. Human activities and the social structure and relationships among resident bears are the two major influences on the accessibility of available foods for bears. The issue of how many grizzly bears can live in any specific area is a function of overall habitat productivity, annual production, availability of important foods, and the levels and types of human activities. There is no known way to calculate the number of grizzly bears that can live in an area in relation to ongoing changes in habitat values or to fully understand the

social system of the grizzly bear and how it is influenced by changes in bear density and related social interactions at various densities. As food availability fluctuates, there are corresponding changes in bear density in important use areas and changes in social tolerance within the bear population. This in turn will affect age-specific survivorship. Additional numbers of bears in many areas will result in the expansion of bear range, increasing grizzly bear-human conflicts, and erosion of public support for bears. All these factors interact.

A viable and therefore recovered population is one that has high long-term prospects for survival within acceptable levels of risk. Population size is an important factor in understanding population survival (Boyce 1992, Caughley 1994). However, there is no quantitative way to estimate precisely the number of animals required for a viable population of any species (Boyce 1992, 1993). From the mid 1980s, the Yellowstone grizzly bear population has grown at approximately 3 to 4% or more per year (Eberhardt *et al*. 1994, Boyce 1995, Boyce *et al*. 2001*b*). Boyce (1995) has calculated that the Yellowstone population currently has a probability of extinction of 0.0004 (4/10,000)—a very low probability. Nevertheless, as Boyce *et al.* (2001*b*) points out, "*population size alone is not a sufficient criterion for evaluating population viability*," and "*even though a population may have increased or decreased over the past 10 to 20 years, this offers no indication that the population will continue on the same trajectory in the future*." The best way to ensure a healthy population of grizzly bears is to monitor both population and habitat parameters closely and respond when necessary with adaptive management (Walters and Holling 1990) addressing the problems of the population in a dynamic way. That is what this Conservation Strategy is designed to accomplish.

The PCA has provided the vast majority of habitat for the currently increasing population in the Greater Yellowstone Ecosystem. This area will continue to be managed and monitored carefully to maintain habitat security, and to limit access-related disturbances and developed sites on public lands at or below 1998 levels. The GYE grizzly bear population was increasing at a rate of 3 to 4% per year as of 1998 (Boyce *et al*. 2001*b*). Due to this ongoing bear population increase, 1998 was chosen as the baseline year for measurement of levels of human activities.

The 1998 habitat baseline values for secure, developed sites on public lands, and livestock grazing are shown in Appendix E.

Food

The broad historic distribution of grizzly bears suggests adaptability in food habits of different populations. Although the digestive system of bears is essentially that of a carnivore, bears are successful omnivores, and in some areas may be almost entirely herbivorous. Bears feed on animal matter or vegetable matter that is highly digestible and high in starch, sugars, protein, and stored fat.

Grizzly bears must avail themselves of foods rich in protein or carbohydrates in excess of maintenance requirements in order to survive denning and post-denning periods. Other plant materials are eaten as they emerge, when crude protein levels are highest.

Grizzly bears are opportunistic feeders and will prey or scavenge on almost any available food including ground squirrels, ungulates, carrion, and garbage. In areas where animal matter is less available, roots, bulbs, tubers, fungi, and tree cambium may be important in meeting nutrient requirements. High quality foods such as berries, nuts, and fish are important in some areas.

The search for food has a prime influence on grizzly bear movements. Upon emergence from the den, they seek lower elevations, drainage bottoms, avalanche chutes, and ungulate winter ranges where their food requirements can be met. Throughout late spring and early summer, they follow plant maturity back to higher elevations. In late summer and fall, there is a transition to fruit and nut sources, as well as other plant materials. This is a generalized pattern, however, and it should be kept in mind that bears are individuals trying to survive and will go where they can best meet their food requirements.

Specific to the GYE, four seasonal foods have been identified for monitoring. These are: winter-killed ungulates (primarily elk (*Cervus elaphus*) and bison (*Bison bison*), but also deer (*Odocileus* species) and moose (*Alces alces*)), spawning cutthroat trout, whitebark pine seeds, and army cutworm moths. The High-Calorie Foods section in Chapter 3 provides more detail about the components of grizzly bear diet.

Cover

The relative importance of cover to grizzly bears was documented by Blanchard (1978) in a four-year study in the GYE. The importance of an interspersion of open parks as feeding sites associated with cover is also recorded in Blanchard's study.

Changes in the distribution and quantity and quality of cover are not necessarily detrimental to grizzly bears. The IGBST studied the effects of the large 1988 wildfires on grizzly bears. "*On the average, grizzly bears used burned habitats in proportion to their availability within individual annual ranges during 1989 to1992. Seasonal indices of movement and annual range sizes of cohorts are not statistically different from the 1975 to 1987 averages*" (Blanchard and Knight 1996).

Denning

Grizzly bears excavate dens. Dens are usually dug on steep slopes in forest cover where wind and topography cause an accumulation of deep snow and where the snow is unlikely to melt during warm periods. Elevations of dens vary geographically; generally, they are found at higher elevations well away from development or human activity. Abundant denning habitat is available and is not considered a limiting factor for grizzly bears (Podruzny and Gunther 2002).

Secure Habitat

History has demonstrated that grizzly bear populations survived where frequencies of contact with humans were very low. Populations of grizzly bears persisted in those areas where large expanses of relatively secure habitat were retained and where human-caused mortality was low. In the Yellowstone area, this is primarily associated with national parks, wilderness areas, and large blocks of public lands (IGBC 1998). Habitat security requires minimizing mortality risk and displacement from human activities in a sufficient amount of habitat to allow the population to benefit from this secure habitat and respond with increasing numbers and distribution. Habitat security allows a population to increase in numbers and distribution as lowered mortality results in more reproduction and cub recruitment into the adult population. This results in an increasing population. As the population increases, it begins to expand in range and distribution. Both of these responses to habitat security are currently ongoing in the Yellowstone population as the population is increasing at 3 to 4% per year (Boyce *et al*. 2001*b*), and increasing in distribution (Schwartz *et al*. 2002). Maintaining habitat security is a major goal of this conservation strategy.

By managing motorized access, the following grizzly bear management objectives can be met (IGBC 1998):

Minimize human interaction and potential grizzly bear mortality
Minimize displacement from important habitats
Minimize habituation to humans
Provide relatively secure habitat where energetic requirements can be met

Historically, management of motorized use has been primarily accomplished through restriction of certain types of motorized use on established access routes, i.e., management of open motorized route densities. Recent research has shown that secure habitat (areas that are free of motorized traffic, also referred to as core areas) is an important component of grizzly bear habitat (IGBC 1998).

The management of human use levels through access route management is one of the most powerful tools available to balance the needs of grizzly bears with the needs and activities of humans. It has been documented in several research projects, completed and ongoing, that unregulated human access and development within grizzly bear habitat can contribute to increased bear mortality and affect bear use of existing habitat (IGBC 1998).

Management Improvements and Mortality Reduction Efforts

Since listing of the grizzly bear under the Endangered Species Act (ESA), government agencies (federal, tribal, state, county, and city), organizations, and individuals have worked to improve management coordination and habitat conditions, minimize grizzly bear-human conflicts and bear mortality, and increase public awareness and appreciation for the grizzly bear in the GYE.

Summary of Management Improvements Related to Habitat

- The Interagency Grizzly Bear Committee (IGBC) was created to coordinate management efforts across multiple federal lands and different states. The Yellowstone Ecosystem Subcommittee was also created to coordinate efforts specific to the GYE grizzly bear. These committees cooperated in developing the *Interagency Grizzly Bear Guidelines* (IGBC 1986) and the *Interagency Grizzly Bear Committee Taskforce Report on Grizzly Bear/Motorized Access Management* (IGBC 1998). These guidelines were instrumental in changing land management practices on federal lands to provide security and to maintain or improve habitat conditions for the grizzly bear.
- The IGBST was created to provide scientific information for the management and recovery of the grizzly bear in the GYE. Scientific protocols have been developed to monitor the grizzly bear population and important habitat parameters.
- Federal and state agencies developed nuisance bear guidelines to manage bears that become habituated to human foods and refuse. The overall objective of these guidelines is to provide a quick response to grizzly bear-human confrontations.

Miles of open motorized access routes have been reduced through restrictions (such as gates and signs on motorized routes) and decommissioning (the route is no longer available for motorized use), thereby reducing open motorized access route densities and increasing secure habitat for the grizzly bear.

Highway design changes have been implemented, including changed guardrail heights to allow cub crossings; minimized cut-slope barrier walls to facilitate movement; revegetation planting to provide cover, minimize exotic plants, and discourage planting of palatable foods; and narrower rights of way and road widths.

Federal land management agencies have closed areas to cross-country motorized travel to provide more security for grizzly bears.

Federal land management agencies have closed some areas to all human entry during certain seasons to increase human safety and provide security for grizzly bears.

Many areas in the GYE have been closed to oil and gas leasing, or have restrictions (such as no surface occupancy) on oil and gas leasing to protect grizzly bear habitat.

Mortality Reduction Efforts Related to Habitat

Significant reductions in the human-caused bear mortality rate have been the primary reason the bear population is now meeting the demographic sub-goals established in the *Recovery Plan*. In addition to the above management improvements, the following actions have been found to be effective in limiting grizzly bear mortality and grizzly bear-human conflicts. These actions have been ongoing and will continue inside the PCA.

Federal land management agencies have implemented and monitored compliance with food storage orders that require people using grizzly bear habitat to store food and refuse properly on public lands so bears will not become habituated to unnatural foods. This also reduces grizzly bear-human encounters.

Bear-resistant garbage containers have been installed in campgrounds, picnic areas, and other public use areas on federal lands. Garbage collection schedules have been improved to collect garbage before it becomes an attractant to grizzly bears.

Some counties and communities have improved their landfills and garbage collection systems to reduce or prevent conflicts with grizzly bears.

Numerous education and information materials and programs have been developed by federal and state agencies and various organizations, to teach those living, working, and recreating in grizzly bear country how to be safe, to reduce grizzly bear-human encounters, and minimize grizzly bear mortality. Non-agency participation is encouraged.

The state wildlife agencies have developed active management/conflict resolution programs to help minimize conflicts between people and bears.

To provide increased protection for grizzly bears, Montana does not allow baiting or hound hunting for bears. Wyoming prohibits hound hunting within the state, and baiting is not allowed within the PCA. Baiting and use of hounds are not allowed within the PCA in Idaho.

The number of domestic sheep allotments and the number of domestic sheep grazing within the PCA has been reduced; the remaining domestic sheep allotments are to be phased out as opportunities arise. Sheep grazing permittees and herders must follow strict requirements in their grazing permits to protect grizzly bears and reduce grizzly bear/grazing conflicts.

Individuals and organizations with special use permits on federal lands must follow strict requirements in their special use permits to protect grizzly bears and reduce grizzly bear-human conflicts.

Adjustments have been made on cattle grazing allotments within the PCA, and cattle permittees must follow strict requirements in their grazing permits to protect grizzly bears and reduce grizzly bear/grazing conflicts.

The IGBST coordinates an annual analysis of the causes of conflicts and known and probable mortalities, and proposed management solutions. Reports were reviewed by the

Yellowstone Ecosystem Subcommittee and appropriate actions initiated. The Yellowstone Grizzly Bear Coordinating Committee will continue this review process.

Federal and non-federal landowners have cooperated in limiting grizzly bear mortality and grizzly bear-human conflicts.

Livestock and road-killed carcasses are managed to minimize grizzly bear-human conflict. Hunters are encouraged to quickly care for and remove hunter-killed carcasses to minimize grizzly bear-human conflicts.

State and federal law enforcement agents have cooperated to ensure consistent enforcement of laws protecting grizzly bears. A task force of state and federal prosecutors and enforcement personnel from each state and federal jurisdiction will work together to make recommendations to all jurisdictions, counties, and states, on uniform enforcement, prosecution, and sentencing relating to illegal grizzly bear kills.

Comment [G24]: Comment-2007 language-may need to recalibrate this expectation

When reclaiming or obliterating motorized access routes or restricting motorized or non-motorized access, priority has been and will be given to areas with historical grizzly bear-human conflicts or areas of probable grizzly bear-human conflicts

Appropriate actions to reduce mortality will be implemented as described in the state plans outside the PCA where grizzly bears occur or can reasonably be expected to occur when and where possible to improve public safety and minimize grizzly bear mortality.

Recovery of the grizzly bear in the GYE is the result of partnerships between federal and state agencies, the governors of three states, county and city governments, educational institutions, numerous organizations, private landowners, and the public who live, work, and recreate in the GYE. Maintenance of a recovered grizzly bear population depends on these partnerships.

Chapter 2 Population Standards and Monitoring

Introduction

To maintain a healthy (recovered) grizzly bear population in the GYE, it is necessary to have adequate numbers of bears that are widely distributed with a balance between reproduction and mortality. This section details the demographic criteria in the *1993 Recovery Plan* that were necessary to achieve recovery, and the criteria necessary to maintain it in the *2016 Recovery Plan Supplement: Revised Demographic Criteria for the Greater Yellowstone Ecosystem*. The *1993 Recovery Plan* criteria focused on the PCA and a 10-mile perimeter, whereas criteria in the Strategy, the *2016 Recovery Plan Supplement: Revised Demographic Criteria for the Yellowstone Ecosystem*, and the appended state plans encompass the Demographic Monitoring Area (DMA) of the GYE. Because grizzly bears are a difficult species to monitor and manage, multiple criteria are identified to provide sufficient information upon which to base management decisions.

The IGBST has generated extensive information useful to determine the status of the GYE grizzly bear population. Few populations have benefited from the amount of effort in data collection, as has the Yellowstone population. Agencies responsible for management will continue their commitment to data collection so population status can be determined and all designated standards maintained.

Under this Conservation Strategy and the *2016 Recovery Plan Supplement: Revised Demographic Criteria for the Greater Yellowstone Ecosystem*, all mortalities and all reports of unduplicated females with cubs (*see* Appendix C) will be monitored within the DMA (Figure 1). This will result in the management and monitoring of the grizzly bear population in the entire GYE DMA , as opposed to the system in the *1993 Recovery Plan*, which managed and monitored only the population inside the recovery zone and within 10 miles outside the recovery zone. This wider monitoring of mortalities and accounting for mortality limits is more stringent

than the system under the *1993 Recovery Plan*. Conservation Strategy demographic standards ~~and the standards in the state plans~~ are tied to the DMA, shown in Figure 1. The criteria and objectives in the existing *1993 Recovery Plan* have modified, as described below.

Comment [G25]: 2016 new language to strike-state plans should be left out of this sentance

Population Monitoring

~~Primary~~ demographic monitoring protocols for the GYE population will focus on the area within the DMA and monitoring and documenting population size, distribution of females with young, and all forms of mortality ~~so as to be within the mortality limits described~~. Additional monitoring or research may be conducted as determined by the IGBST.

Comment [G26]: 2016 language to strike-not necessary and over presciptive

Demographic Recovery Criteria from the 2016 Recovery Plan Supplement: Revised Demographic Criteria for the Greater Yellowstone Ecosystem

The *1993 Recovery Plan* defined a recovered grizzly bear population as one that could sustain a defined level of mortality and is well distributed throughout the recovery zone. The *1993 Recovery Plan* outlined a monitoring scheme that employed three demographic sub-goals to measure and monitor recovery of the Yellowstone grizzly bear population. The second criterion pertaining to the distribution of females with offspring remains unchanged. However, the first and third criteria pertaining to the minimum allowable number of females with cubs of the year and sustainable mortality limits were revised and updated to reflect current methods based on the best available science. The current demographic recovery criteria in the 2016 *Recovery Plan Supplement: Revised Demographic Criteria for the Greater Yellowstone Ecosystem* are:

Comment [G27]: Comment: The document to be incorporated by reference has problems

Demographic Recovery Criterion 1 ~~– Within the Demographic Monitoring Area (DMA), maintain a minimum population size of at least 500 animals to assure genetic health, as quantified by methods established in published, peer-reviewed scientific literature and calculated by the IGBST using the most updated protocol, as posted on their website. This number was chosen to ensure the short-term fitness of the population was not threatened by losses in genetic~~

~~diversity in such an isolated population. Five hundred is not a management target or population goal. Instead, it is a minimum population threshold. The goal is to maintain the population well above this threshold to ensure that genetic issues are not a detriment to the genetic fitness of the GYE grizzly bear population. At this threshold population of 500, more than a third of the suitable habitat in the DMA would be unoccupied (van Manen 2015, *in litt.*) and therefore the grizzly bear population could not be considered demographically recovered.~~ Maintain a minimum population size of 500 animals in the Greater Yellowstone Area. The estimate of total population size cannot drop below 500 in two consecutive years. This estimate will be calculated by IGBST using data obtained within the Demographic Monitoring Area (Figure 1).~~The IGBST has been calculating population size on an annual basis using the model-averaged Chao2 estimate since 2002. As the grizzly bear population has increased, model-averaged Chao2 estimates have become increasingly conservative (i.e., prone to underestimation). As a conservative approach to population estimation, the model-averaged Chao2 method will continue to be the method used to assess Criterion 1 (*see* Appendix C for the application protocol for annual population estimation using the model-averaged Chao2 method). The IGBST will continue to investigate new methods for population estimation as appropriate. If new methods become available, these will be considered for application in the GYE as long as they represent the best available science. However, until possible new methods are developed, the model-averaged Chao2 method will continue to be used.~~

Comment [G28]: 2016 language to strike- We understood there was agreement that Criterion 1 would not be changed. Criterion 1 has been discussed numerous times and now we see lots of new stuff.

Replace with previously agreed upon language regarding 500 and cannot drop below in 2 consecutive years.

Formatted: Font: 12 pt, Do not check spelling or grammar, Kern at 14 pt, Highlight

Comment [G29]: 2016 language to strike-out of place- move to page 42.

Formatted: Highlight

Demographic Recovery Criterion 2—Sixteen of 18 bear management units within the PCA (Figure 2, Chapter 1) must be occupied by females with young, with no two adjacent bear management units unoccupied, during a 6-year sum of observations. This criterion is important as it ensures that reproductive females occupy the majority of the PCA and are not concentrated in one portion of the ecosystem.

~~*Demographic Recovery Criterion 3*—Within the DMA, establish annual mortality limits for independent females (at least 2 years old), independent males (at least 2 years old), and dependent young (less than 2 years old) that stabilizes the population at approximately the~~

~~average model-averaged Chao2 estimate 2002–2014 of 674 (average lower 95% CI = 600; average upper 95% CI = 747).~~ Ensure the following total mortality rates are not exceeded within the DMA for three consecutive years for independent males, independent females and dependent young, as set forth in table 2, and based on the 2002-2014 Chao2 average point estimate for the total population with 95% confidence intervals (600-747).

~~Each year the IGBST will calculate the model-averaged Chao2 population estimate for the DMA. This population estimate will be used to set the mortality limits for the following year. These mortality rates will be on a sliding scale with the population objective being to maintain the population within the DMA at the 2002–2014 average (using the Chao2 estimate this is 674 (average lower 95% CI = 600; average upper 95% CI = 747)). The mortality rate that resulted in population stability 2002–2011 was 7.6% for independent females, 7.6% for dependent young, and 15% for independent males (IGBST 2012). The higher rate for independent males is biologically sound since population growth is less sensitive to independent male mortality than to independent female mortality. In order to maintain the population goal at the 2002–2014 average size and associated confidence intervals inside the DMA, a sliding scale of mortality rates will be applied to the model-averaged Chao2 population estimate from the year before as per Table 2.~~ Mortalities are tracked and reported annually using data obtained within the DMA shown in Figure 1.

Comment [G30]: 2016 language to strike-new language aligns with MOA; the criteira is that the identified, adjustable, population size-correlated mortality rates are not exceeded. The language USFWS has proposed is not a criterion. Criterion should be in terms of mortality rate of X for {Demongraphic class" should not be exceeded in Z consecutive years.

~~***Table 2. Mortality***~~ ***Total mortality rates used to establish annual mortality limits for independent females, independent males, and dependent youmg inside the DMA.*** ~~***using the model-averaged Chao2 population estimate method. These mortality limits are on a sliding scale to achieve the population goal inside the DMA of the average population size 2002–2014 of 674 (average lower 95% CI = 600; average upper 95% CI = 747) using the Chao2 method inside the DMA. For populations less than 600, there will be no discretionary mortality unless necessary for public safety or management of bear–human conflicts.***~~

Comment [G31]: 2016 language to strike-shorten table description and replace with table from states MOA

	Total Grizzly Bear Population Estimate

	<674	675-747	>747

Comment [G32]: replaced

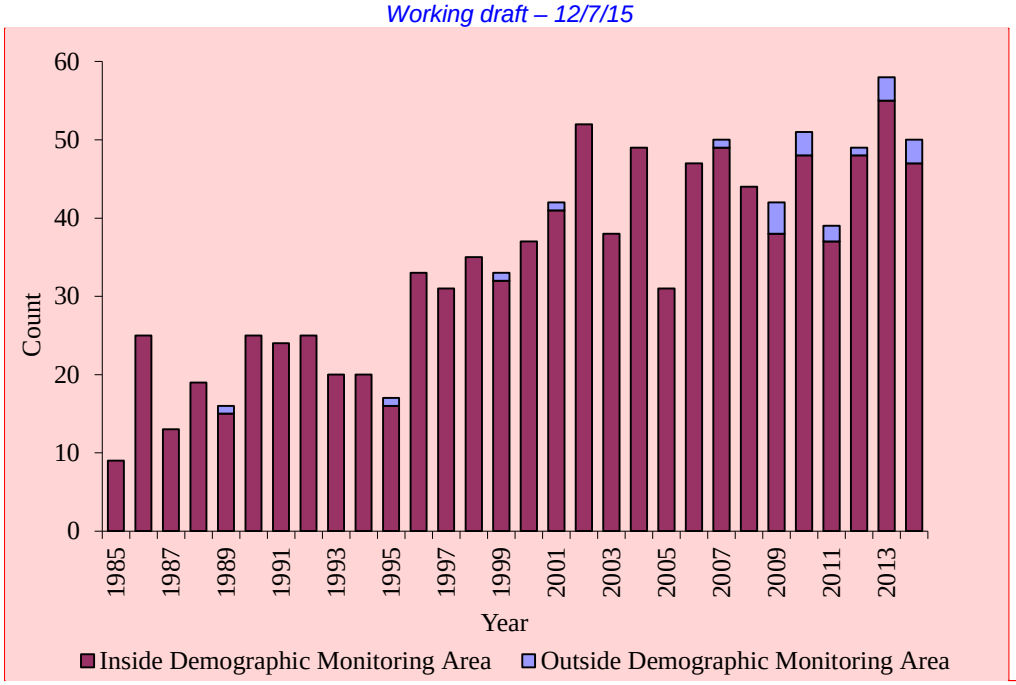
Conservation Strategy Population Standards

This Conservation Strategy and the state management plans set an objective of maintaining a recovered grizzly bear population in the Yellowstone area sufficient to meet management objectives inside and outside the PCA in biologically suitable and socially acceptable habitats. The demographic standards in this Conservation Strategy are designed to meet these goals.

The GYE grizzly bear population exceeds 500 total bears as of 2006 (Appendix M). The intent of the Conservation Strategy is to allow grizzly bears ~~to expand their range and numbers and re~~occupy all biologically suitable and socially acceptable habitats. It is the goal of the agencies of the YGCC implementing this Conservation Strategy to manage the Yellowstone grizzly bear

Comment [G33]: 2007 language to strike-no longer appropriate.

population in the entire GYE at or above a total of 500 grizzly bears ~~stabilize the Yellowstone grizzly bear population inside the DMA at the 2002-2014 average Chao2 population estimate of 674 individuals (average lower 95% CI = 600; average upper 95% CI = 747).~~ This Conservation Strategy requires continued monitoring of the standards in the 2016 Recovery Plan Supplement to the *1993 Recovery Plan* and some additional standards. These specific population standards, will be applied to the population within the DMA.



Comment [G34]: 2016 language to strike and replace with 2007 language. Population management is the purview of the states.

Unduplicated Females with Cubs-of-the-Year

Background

Females with COY occupy all of the existing bear management units within the PCA as well as areas outside the PCA (Figure 3).

Figure 3. The number of unduplicated females with cubs-of-the-year inside and outside the Demographic Monitoring Area, as per the Recovery Plan, 1985–2014.

Comment [G35]: 2007 plan had the recovery plan objective reference line-it needs to be added in this table

Monitoring Protocol

Monitoring unduplicated females with COY will provide information to demonstrate adequate reproduction and to estimate *total* population size. *Total* population size will be estimated using the model-averaged Chao2 method, as described in Appendices B, C, L, and M using the sightings and resightings of unduplicated females with cubs from all areas where grizzly bears occur in Figure 2. The IGBST has been calculating population size on an annual basis using the model-averaged Chao2 estimate since 2002. As the grizzly bear population has increased, model-averaged Chao2 estimates have become increasingly conservative (i.e., prone to underestimation). As a conservative approach to population estimation, the model-averaged Chao2 method will continue to be the method used to assess Criterion 1 (*see* Appendix C for the application protocol for annual population estimation using the model-averaged Chao2 method). The IGBST will continue to investigate new methods for population estimation as appropriate. If new methods become available, these will be considered for application in the GYE as long as

Comment [G36]: Make sure this is accurate

they represent the best available science. However, until possible new methods are developed, the model-averaged Chao2 method will continue to be used. This is a departure from the way the population estimate was done per the *1993 Recovery Plan*. In the *1993 Recovery Plan*, a *minimum* population estimate was made based on the most recent three years of sightings of unduplicated females with cubs, using only unduplicated sights from the recovery zone and 10 miles outside the recovery zone. The revised and improved methodology used in this document allows an estimate of the *total* population using the model-averaged Chao2 method rather than the *minimum* population size. This allows the calculation of mortality limits based on the total population size for each age and sex class (i.e., independent females, independent males, and dependent young) within the DMA (Figure 2). This method allows mortality management and population monitoring of the grizzly bear population in the DMA, as opposed to the method used in the *Recovery Plan*, which focused mortality management and population monitoring on only a portion of the Yellowstone grizzly bear population inside the PCA (the former Recovery Zone) and within 10 miles of the outer boundary of the PCA. The number and distribution of females with cubs-of-the-year can also be used to demonstrate that a sufficient number of adult females are alive within the population to reproduce and offset existing levels of human-caused mortality.

Comment [G37]: 2016 new language moved from Criteria one paragraph-still not sure this is the appropriate place.

The numbers of unduplicated sightings and resightings of females with cubs of the year inside the DMA will be reported by the IGBST. Using these data, the IGBST will produce the model-averaged Chao2 estimate of the total number of independent females in the population inside the DMA, which will then be used to estimate the total population size in the DMA. This total population estimate will be used to apply the mortality limits as per Table 2 within the DMA for independent females (> 2 years old) and independent males (> 2 years old) from all causes as well as mortality limits for dependent young (≤ 2 years old) from human-caused mortality. For a more detailed description of this methodology, see Appendix C.

Sightings and resightings of females with COY inside the DMA will be obtained from numerous sources, including radio tracking flights, confirmed sightings, and observation flights. Observation flights are primarily designed to survey the DMA and the number of flights

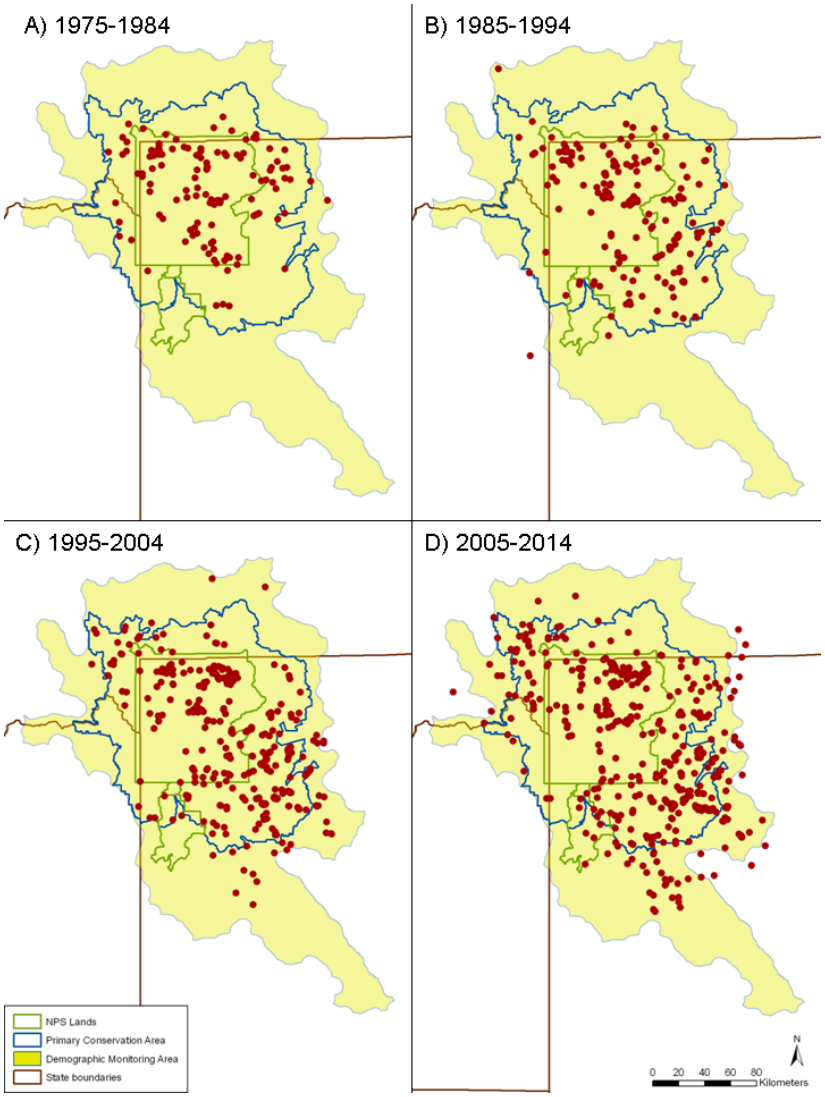
conducted is standardized to ensure equal effort in obtaining data. The IGBST will verify the reliability of all sightings. The IGBST will plot all sightings and summarize data for unduplicated females and numbers of cubs seen for the entire population. Methodology developed by Knight *et al*. (1995) will be used to separate duplicated from unduplicated sightings (*see* Appendix C for more information).

Distribution of Females with Young

Background

The distribution of females with young of all ages, based on the most recent six years of observations in the ecosystem, is presented in Figure 4. The recovery criterion of having 16 of 18 BMUs occupied with no two adjacent units vacant continues to be met (Table 3). This criterion is important as it ensures that reproducing females occupy the majority of the PCA and that successful reproductive females are not concentrated in one portion of the ecosystem.

Monitoring Protocol



This effort will provide information to assess distribution of the reproductive cohort in all occupied habitats, although the specific distribution standard for reproducing females will apply only to the PCA. A recovered population should be well distributed throughout grizzly bear range. Successful reproduction is one indicator of habitat sufficiency, thus distribution of family groups of grizzly bears is one indicator of suitable habitat in areas where such sightings occur. Since sub-adult females usually establish home ranges adjacent to that of their mothers, the distribution of family groups is also an indication of future occupancy of these areas by grizzly bears. Radio tracking flights, observation flights, agency personnel sightings, and verified reports from other individuals will be the primary methods employed to collect female distribution data. The IGBST will verify all reports and keep a record of locations. Data will be maintained by the IGBST.

The number of BMUs occupied by females with young will be reported for the most recent six years. Females with young outside the PCA will also be reported, but only those females with young within the PCA will be used to document achievement of this distribution standard.

Table 4. Bear Management Units occupied by females with young based on verified reports, 2009–2014.

Mortality

Background

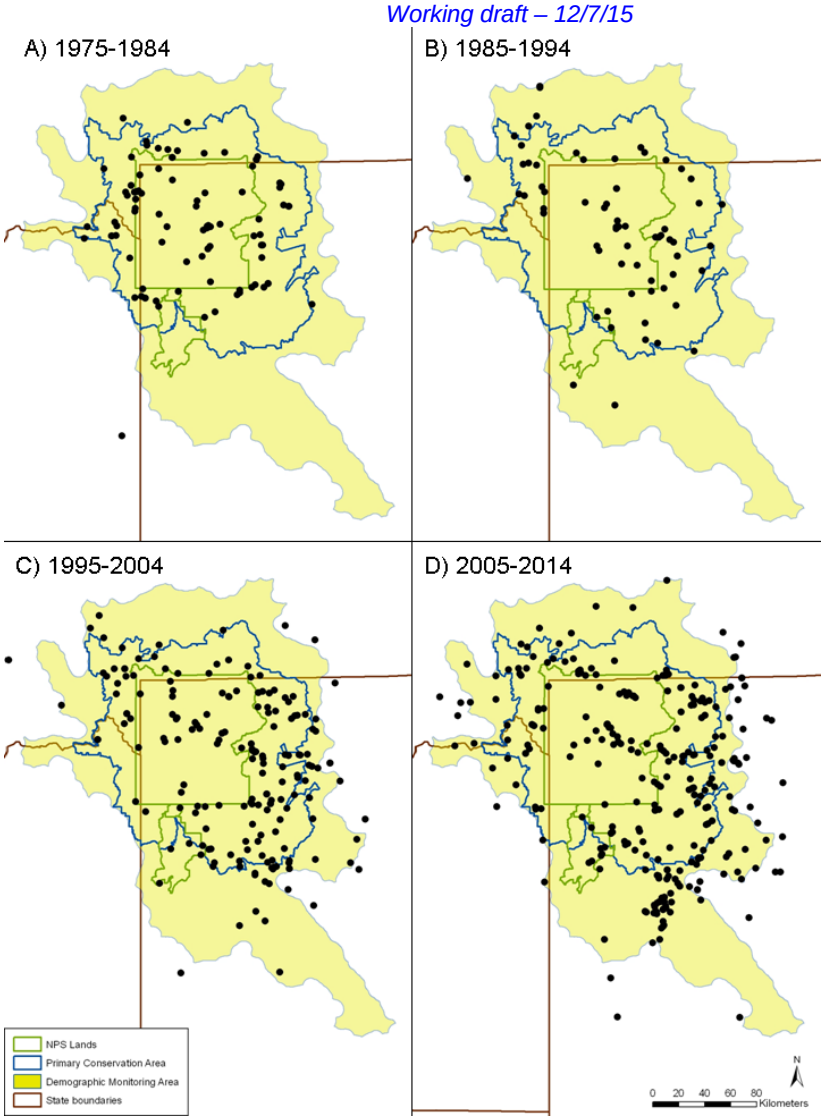
Agencies have invested significant effort aimed at limiting human-caused deaths for grizzly bears. To date, these efforts have been very successful at limiting mortality and allowing the population to increase since it was listed in 1975.

The distribution of known and probably human-caused mortalities 1975–2014 is shown in Figure 5. As the population continues to expand, the percentage of known and probable mortalities occurring outside the PCA and outside the DMA is increasing ~~and~~ however this is expected.

Comment [G38]: Comment-More explanation why it's expected from protocol section below to this paragraph

Monitoring Protocol

The management of human-caused mortality of grizzly bears is key to successful maintenance of the grizzly bear population in the ~~Greater Yellowstone Ecosystem~~GYE. Mortality limits are a necessary tool for managers in regulating human impacts to any wildlife population, including grizzly bears. Managing mortality is necessary to avoid the unregulated killing that occurred as the Yellowstone area was settled and to build support for long-term survival of the population. Higher numbers of mortalities can be expected in areas outside the DMA as the grizzly bear population expands, particularly in areas on the edge of the range when bears move on to private lands or in areas with higher levels of human development. Mortality management recognizes the need for some bears to be removed to address recurring conflicts to meet management needs for nuisance bears, human safety issues, etc.



The state wildlife agenices (Montana, Wyoming, and Idaho) have signed a Memorandum of Agreement setting forth how they will coordinate bear management actions and limit discretionary mortality to ensure it will not jeopardize the recovery and survival of the GYE grizzly bear population (Appendix P). This document also summarizes each state's regulatory mechanisms for regulating discretionary mortality, including harvest. The states may use

Comment [G39]: New 2016 language that should be included-This language may benefit from further editing and expanded reference to the MOA (Proposed as Appendix P).
The concept is that the Strategy explains what the States will do; comparable to the habitat sections, which explain what the federal land management agencies have agreed to do. This approach can be used in combination with the deletion of USFWS' incorrect version of the discretionary mortality table.

~~R~~regulated harvest ~~may be utilized~~ as a management tool when and where appropriate. ~~all known and probable mortalities due to regulated harvest will be limited by the overall mortality limits within the DMA. Mortality limits will be monitored and managed within the mortality limits described in Table 2 and Table 4 to ensure mortality will not jeopardize the health and survival of the GYE grizzly bear population.~~

Comment [G40]: 2016 language to strike-

Figure 6. Distribution of known and probable mortalities, from all causes, in the Greater Yellowstone Ecosystem, by decade from 1975–2014 (IGBST Data).

~~*Table 4. Framework to manage inside the DMA for the population goal of the average population 2002–2014 using the model-averaged Chao2 method.*~~

Comment [t41]: 2016 language to strike-Since there are two Table 4s, the tables will not need to be renumbered when this is deleted.

Management Framework	Background and Application Protocol				
1. Area within which mortality limits apply.	49,928 sq km (19,279 sq mi) Demographic Monitoring Area (DMA) (Figure 2).				
2. Management objective.	To maintain the population at the average estimate for 2002–2014, a period of population stability (674 using the model-averaged Chao2 methodology (Keating *et al.* 2002; Cherry *et al.* 2007; Harris *et al.* 2007) (average lower 95% CI = 600; average upper 95% CI = 747)).				
3. Population estimator.	The model-averaged Chao2 population estimator will be used as the population measurement tool unless another scientifically sound method becomes available. The model-averaged Chao2 population estimate for 2002–2014 was 674 (average lower 95% CI = 600; average upper 95% CI = 747).				
4. Mortality limit setting protocol.	Each fall the IGBST will annually produce a model-averaged Chao2 population estimate for the DMA. That population estimate will be used to establish the mortality limit percentages for each age/sex class for the following year as per #7, #8, and #9 (below).				
5. Allocation process for managed mortalities	The States will coordinate to manage within the mortality limits per age/sex class outside National Parks and the Wind River Reservation (WRR). The WRR will receive a portion of the available mortality limit based on the % of the WRR geographic area within the DMA. Mortalities outside the DMA are the responsibility of each State and do not count against mortality limits.				
6. Management review by the IGBST every 5–10 years to assure that management actions are achieving the objective of a stable population at the estimated number at time of delisting.	This management review will assess if the management system is achieving the desired objective to maintain a stable population at the 2002–2014 average estimated population size based on the model-averaged Chao2. The management review is a science-based process that will be led by the IGBST (which includes all State and Federal agencies and the WRR Tribes) using all recent available scientific data to assess population numbers and trend against the management objective. Vital rates such as age/sex-specific survival and reproductive rates will also be reevaluated using the most recent data to adjust mortality levels as necessary.				
7. Mortality limit % for independent FEMALES based on the results of the model-averaged Chao2 method.	Pop. size	<674	674	675–747	>747
	Mort. %	<7.6%	7.6%	9%	10%
8. Mortality limit % for independent MALES based on the results of the model-averaged Chao2 method.	Pop. size	<674	674	675–747	>747
	Mort. %	15%	15%	20%	22%
9. Mortality limit for % of dependent young based on the results of the model-averaged Chao2 method.	Pop. size	<674	674	675–747	>747
	Mort. %	<7.6%	7.6%	9%	10%

Comment [t42]: USFWS new language. Stable population at the estimated number at time of delisting. THIS IS NOT THE OBJECTIVE; THIS HAS BEEN DISCUSED REPEATEDLY.

10. Example of background level of annual mortalities from management and other causes – Using average yearly total mortality of independent bears (≥2 years) from all causes including unknown/unreported estimates, this example uses the average 2011 to 2014.	38 expected independent bear deaths/year due to management, illegals, and other deaths (17 F, 21 M). (This includes dead bears from inside the DMA only.) Note that this is only an example of the expected background level of annual mortalities. This number may vary from 38/year and will have to be factored into the numbers presented in items #11 and #12 below. The average number of background mortalities inside the DMA for the previous four years will be used to estimate the expected number of animals available for discretionary mortality allocation.				
11. Total annual mortality limit from all causes for independent FEMALES (≥2 years).	< 600 (as an example of <7.6% mortality)	600–673 <7.6% mortality	674 at 7.6% mortality	675–747 at 9% mortality	>747 at 10% mortality
	<16	16 to 17	18	21 to 23	>26
12. Total annual mortality limit from all causes for independent MALES (≥2 years).	<600 at <15% mortality	600–673 15% mortality	674 at 15% mortality	675–747 at 20% mortality	>747 at 22% mortality
	<31	31 to 34	35	47 to 52	>57

Known and probable human-caused mortalities are defined as follows:

Known. Carcass recovered or evidence to indicate known status due to radio telemetry. Known deaths require a carcass, management removal, or a cut radio collar. Found collars having the appearance of being cut should receive additional forensic review for definitive proof.

Probable. Strong evidence to indicate mortality, reported by highly reliable sources, no carcass recovered. Probable deaths include those cases where there is supportive evidence that a bear was wounded. Circumstances of each reported instance should be considered. Probable includes those cases where evidence of blood, hair, or other tissues clearly indicates wounding serious enough to result in death. The literature is unclear on the likelihood of survival for orphaned cubs, therefore, any cub(s) orphaned during its first year of life because of a known mortality of its mother is considered a probable mortality.

Because probable mortalities will be counted against the mortality quota, and because there is a female quota, each probable mortality must be assigned a sex. Sex will be assigned in the following manner:

Probable deaths of adult bears where cubs-of-the-year are reported present will be classified as sex = female.

Lone bears classified as probable deaths will be assigned sex based upon statistics available from known deaths in the ecosystem. The percentage of known male and female deaths in the GYE between 1975 and 1998 is 59% and 41% respectively. These estimates exclude natural mortalities, management removals, and females with young. Therefore, sex will be assigned to probable adult mortalities in the GYE at a ratio of 59:41, male: female.

Cubs-of-the-year that are orphaned and counted as mortalities will be assigned sex based a 50:50 sex ratio at birth (Eberhardt *et al*. 1994). For each cub, a random number will be drawn between 1 and 100. If the number is 1 through 50, the sex will be assigned as male; if the number is 51 to 100, the sex will be assigned as female.

~~Mortality Management~~

State agencies will ~~assure that~~manage mortalities ~~remain~~ within the limits described in Table 2 and Appendix P, by implementing specific regulatory mechanisms in state law and regulation.~~Table 4 by enacting specific regulatory mechanisms in state law and regulation to demonstrate adequate regulatory mechanisms over human-caused mortality, including mortality from sport hunting. These regulations are as follows:~~

Comment [t43]: 2016 language to strike- USFWS "enacting" mischaracterizes the status of state regulatory mechanisms as not in place. Suggested language above re state MOA addresses this issue.

~~- PLACEHOLDER -~~

Formatted: Highlight

~~Other regulations, such as timing and location of hunting seasons should seasons be implemented, would be devised by the States to minimize the possibility that mortality limits of independent females are exceeded within the DMA.~~

Comment [t44]: 2016 language to strike- season adjustments are based on biological factors and management considerations.

It is recognized that established mortality limits might be exceeded in any given year. Any mortality threshold will not affect the immediate management of bears for human safety concerns or for management of nuisance grizzly bears. ~~This document~~ Appendix P describes agency responsibilities ~~and actions to reduce mortality~~ should this occur. ~~State plans provide for the take of nuisance bears regardless of the current mortality quota upon consultation among all involved agencies.~~

Comment [t45]: 2007 language to strike-or clarify what "involved" means.

Monitoring Protocol

Mortality will be monitored by the IGBST reports from all sources. The IGBST will estimate the annual unknown and unreported mortality as per Appendix C and these mortalities will be added to the known and probably mortalities to produce a total annual mortality estimate by age and sex class. Each State wildlife agency, Tribe, and National Park will provide mortality information to the IGBST, who will update and report ~~ongoing~~ mortalities within the DMA to all agencies so that the states may adjust management actions under their purview ~~mortality management can be adjusted in a rapid fashion should that be necessary~~ if a mortality limit is approached or exceeded. The IGBST will annually

Comment [t46]: 2016 language to modify- clarify it is the states who determine adjustments.

summarize all mortality information as to location, type, date, sex, and age for the ~~Greater Yellowstone Ecosystem~~GYE and produce this information in their annual reports.

Mortality standards and grizzly bear vital rates will be reviewed and reported by the IGBST every 5 years. ~~This information may be used to revise mortality management as necessary as long as any such revisions meet the population objectives in the recovery criteria and use the best available science. All management of and information on mortality management will be open to full public review.~~

Formatted: Highlight

Comment [t47]: 2016 language to strike- ESA "best available science" standard does not apply in perpetuity to delisted population management decisions.

Comment [t48]: 2007 language to strike- states and federal agencies have public records laws.

Population Trend

Background

The population of grizzly bears was increasing at approximately 4% to 7% annually between 1983 and 2001 (Eberhardt *et al*. 1994, Boyce 1995, Boyce *et al*. 2001*b*, Harris *et al*. 2006). While there is some debate related to the actual level of increase since the bear was listed in 1975, all information, number of unduplicated females (Figure 3), distribution of reproducing females (Figure 4), distribution of bears, informal sightings by agency personnel, and areas where nuisance bears are being managed indicate this population has increased in both numbers of bears (Figure 5) and the geographic area they occupy (Schwartz *et al*. 2002).

Schwartz *et al.* (2006*b*) used data from 1983 through 2001, while the 2012 IGBST report examined a more recent time period, 2002 through 2011 (IGBST 2012). The 2012 report (IGBST 2012) reported that population growth had slowed since the previous time period, but was still stable to slightly increasing, and had not declined. Because the fates of some radio-collared bears are unknown, Schwartz *et al.* (2006*b*) and the IGBST (2012) calculated two separate estimates of population growth rate: one based on the assumption that every bear with an unknown fate had died (a conservative estimate); and the other simply removing bears with an unknown fate from the sample. The true population growth rate is assumed to be somewhere in

between these two estimates because we know from 30 years of tracking grizzly bears with radio-collars that every lost collar does not indicate a dead bear. While Schwartz *et al.* (2006*b*) found the GYE grizzly bear population increased at a rate between 4.2 and 7.6 percent per year between 1983 and 2002, the IGBST (2012) found this growth had slowed and leveled off and was between 0.3 percent and 2.2 percent per year during 2002–2011.

Schwartz *et al.* (2006*b*) analyzed survivorship of cubs, yearlings, and independent bears based on whether they lived inside Yellowstone National Park, outside the Park but inside the Recovery Zone or Primary Conservation Area (PCA), or outside the PCA entirely. The PCA boundaries (containing 23,853 sq km (9,210 sq mi) correspond to those of the Yellowstone Recovery Zone (U.S. Fish and Wildlife Service 1993) and will replace the Recovery Zone boundary (Figure 2). They concluded that grizzly bears were approaching carrying capacity inside Yellowstone National Park. Consistent with this conclusion, t~~T~~he IGBST (2012) documented lower cub and yearling survival than in the previous time period~~, results consistent with the conclusion by Schwartz *et al.* (2006*b*)~~. Importantly, annual survival of independent females (the most influential age-sex cohort on population trend) remained the same while independent male survival increased (IGBST 2012). Collectively, these two studies indicate that the growth rate of the grizzly bear population inside the DMA had slowed as bear densities have approached carrying capacity, particularly in the core area of occupied range. Recent work by van Manen ~~at~~ *et al.* (2015) confirms that population growth has slowed and the population is showing density dependent population regulation as the population occupies almost all suitable habitat in the DMA.

Formatted: Font: Italic

Monitoring Protocol

This Strategy recognizes that any one factor cannot provide the needed information to assess population size and trend. Ultimately, population assessments will require multiple sources of information.

Population trend, using the Lotka equation as calculated from adult female survivorship and reproductive rate data for the appropriate period (Eberhardt *et al*. 1994, Eberhardt and Knight 1996), will be used as supportive information to evaluate population trend. This method will be applied to the population inside the DMA.

The agencies will strive to maintain a minimum of 25 adult female grizzly bears fitted with mortality-sensing radio collars and monitored at all times. To adequately sample survival, these 25 adult females will be spatially distributed throughout the ecosystem. The target distribution of these 25 radio-collared adult females will be determined by the IGBST; the expected distribution of collared females by agency will be assigned. Each female will be monitored using aerial telemetry flights during the non-denning period. These data will be collected in conjunction with other regularly scheduled relocation flights. When a radio collar indicates that a bear may have died, a field crew will evaluate the actual status of the female and determine cause of death. The IGBST will coordinate field crew collection of mortality data on each bear.

Data to calculate reproduction and survival are collected annually in all areas occupied by grizzly bears throughout the DMA. These data sets will be maintained by the IGBST and used periodically to evaluate population trend.

Table 7. Within the Greater Yellowstone Ecosystem Demographic Monitoring Area: (1) Annual minimum and total count of unduplicated females with cubs-of-the-year (COY) and the 6-year average; (2) documented known and probable mortalities, estimated total mortalities (including unknown-unreported), and estimated annual percent mortality for independent males and females; and (3) for dependent young, estimated annual population, documented known and probably human-caused mortalities and estimated annual percent human-caused mortality within the DMA, 2004-2014.

Genetic Management

Comment [t49]: 2016 language to strike- The statement in the 2007 statregy may be preferable, but it references reintroduction into the Selway Bitterroot, which Idaho cannot support.

~~*Background*~~

~~The GYE supports the southernmost population of grizzly bears remaining in North America. Areas of human occupation, development, and transportation networks separate the Yellowstone grizzly bear from its nearest neighboring population in the Northern Continental Divide Ecosystem (NCDE) of northwestern Montana. Currently, physical distance and relatively high mortality risk due to anthropogenic influences inhibits gene flow between these two grizzly bear populations. As with any isolated population, genetic issues can potentially be of concern for the Yellowstone grizzly bear population because of long-term inbreeding effects due to the loss of genetic diversity. The question of concern is whether genetic factors pose a risk of compromising the long-term viability of the Yellowstone grizzly bear population.~~

~~DNA analyses conducted on museum specimens by Miller and Waits (2003) indicated a slight decline in genetic variability in the Yellowstone population since the early 20th century; however, this loss of variability was less severe than previously hypothesized. Indeed, a~~ A ~~more~~ recent study by Kamath *et al*. (2015) using recent advances in genetic analysis techniques with molecular markers (Luikart *et al*. 2010) indicate that despite isolation, genetic diversity in the contemporary population has stabilized. Kamath *et al*. (2015) found that the current rate of inbreeding in the Yellowstone grizzly bear population is very low (0.2%). Likewise, the effective population size (N_e), which reflects the number of reproducing individuals in a population, has increased from 102 to 469 during the 25-year period of 1982–2007. This positive trend is important because N_e serves as a surrogate measure for a population's evolutionary potential and risk of inbreeding (Franklin and Frankham 1998). The most current N_e estimate of 469 based on Kamath *et al.* (2015) approaches the minimum threshold criterion of 500 required for a threatened population to retain long-term evolutionary potential and maintain adequate genetic variation necessary for adaptation to environmental change. It also exceeds the requisite minimum threshold (N_e > 50 individuals) needed to avoid risk of inbreeding (Franklin

1980). The recent findings of Kamath *et al.* (2015) that 1) genetic diversity is not declining, 2) rate of inbreeding since 1985 is very low, and 3) effective population size has increased nearly 4-fold since 1982, collectively indicate that, at current population levels and under the current environmental conditions, genetic factors do not pose a substantial risk to the viability of the Yellowstone grizzly bear population.

~~Given that the Yellowstone grizzly bear is an isolated population, it is inevitable that sometime in the future there will be loss of genetic variation in the population if no natural movement between neighboring population(s) and no artificial transplants occur. Although in the short term the urgency of this scenario is reduced (Kamath *et al.* 2015), the genetic diversity of Yellowstone grizzly bears remains low relative to other interior grizzly bear populations. However, Kamath *et al.* (2015) recommend that efforts continue to eventually realize natural connectivity and therefore gene flow between Yellowstone and other ecosystems: *"Thus, our study suggests that current effective population sizes are sufficiently large ($N_e \gg 50$) to avoid substantial accumulation of inbreeding depression, reducing concerns regarding genetic factors affecting the viability of Yellowstone grizzly bears. Nonetheless, the historically small Ne, relatively low diversity and isolation over many generations suggest the grizzly population could benefit from increased fitness following the restoration of gene flow (e.g. Tallmon et al. 2004; Hogg et al. 2006), particularly given the unpredictability of future climate and habitat changes."* Therefore, it is important that facilitation of natural movements between the NCDE and the GYE continue, and that monitoring for flow of new genetic material via natural immigration and assessment of genetic diversity aslo continue. In recent decades, as the NCDE and Yellowstone populations have both increased in numbers and expanded in range, the prospect for re-establishing natural connectivity has been improved (Haroldson *et al.* 2010, Proctor *et al.* 2012).~~

~~It is important to continue to facilitate natural movement between the NCDE and the GYE by: (1) management of attractants on public lands in the intervening areas through food storage orders; (2) that there be continued outreach and education about the fact that grizzly bears may~~

~~occasionally be present in these intervening areas; and (3) by minimizing discretionary mortality in these intervening areas. This effort to facilitate natural connectivity between the NCDE and the GYE will not impact necessary management of nuisance bears should they occur in these intervening areas. Although current genetic monitoring methods yield a very high probability (0.96) for detecting a first generation hybrid if one is to occur, no evidence of recent immigration from neighboring populations has been observed (Haroldson *et al*. 2010). Miller and Waits (2003) suggest that one to two effective migrants per generation from the genetically diverse NCDE population would be an appropriate level of gene flow to maintain or increase current levels of genetic diversity in the Yellowstone population.~~

Comment [G50]: 2016 language to strike-states cannot agree to this

Genetic Monitoring Protocol

Genetic samples will be collected from all grizzly bear captures and mortalities in the GYE for analysis via cooperative efforts between the IGBST and recognized genetic experts. Genetic analyses of these samples will be conducted and evaluated for potential evidence of grizzly bears from other populations immigrating into the Yellowstone population and producing offspring. Monitoring of radio-collared grizzly bears will be used to document potential movements between other ecosystems and the GYE.

Miller and Waits (2003) suggest that one to two effective migrants per generation from the genetically diverse NCDE population would be an appropriate level of gene flow to maintain or increase current levels of genetic diversity in the Yellowstone population. If genetic monitoring indicates a significant decline in genetic health, infusion of new genetics will occur through transplants or natural introgression.

Chapter 3 Habitat Standards and Monitoring

Background

Between 1986 and the initial 2007 delisting of the Yellowstone grizzly bear population, grizzly bear habitat in the Greater Yellowstone Ecosystem (GYE) ~~were~~ was managed under standards and guidelines specified in national forest and national park management plans, which included Guidelines established by the Interagency Grizzly Bear Guidelines (IGBC 1986). Acknowledging that humans are the primary agent of grizzly bear mortalities, a principal objective of the IGBC was to improve survival rates by implementing management strategies that minimized anthropogenic influences and grizzly bear-human conflicts. IGBC measures implemented inside the Grizzly Bear Recovery Zone (GBRZ) improved management of garbage and food attractants, reduced sheep grazing, and restricted motorized access and human development. These standards and guidelines ~~that~~ were imposed upon public lands were instrumental in recovery of the grizzly bear in the GYE.

Comment [t51]: Comment-There are some weird edits to this section; it would benefit from proofreading and better wordsmithing.

Comment [t52]: Comments-"imposed upon public lands"?.

The subsequent1993 *Recovery Plan* required the preservation and monitoring of habitat necessary to support a recovered population. This led to the to the development of more explicit and measureable habitat criteria to be applied inside the GBRZ, as per the *Recovery Plan Supplment: Habitat-based Recovery Criteria for the Greater Yellowstone Ecosystem* (USFWS 2007*c*). ~~.~~To satisfy this requirement, measureable habitat criteria were established that called for no net loss of secure habitat with respect to 1998 conditions. These criteria~~s~~ were embraced and incorporated into the draft Conservation Strategy and released for public comment in 2000. Analysis of public comments and new information was used to establish the final habitat standards for a recovered Yellowstone population as identified in the 2007 Conservation Strategy (USFWS 2007*a*) and appended in a supplement to the Recovery Plan (USFWS 2007*b*). Upon delisting of the Yellowstone population, the GBRZ will be referred to as the Primary Conservation Area (PCA) to reflect the shift from managing for recovery to one of conservation. This 2016 revision of the Conservation Strategy includes some changes

Comment [t53]: Comment-"Embraced"? for a draft?

to the 2007 document that help clarify habitat standards as they pertain to the 1998 baseline. Clarifying language to the application rules has been inserted where necessary to provide better direction for application of these standards on a local project level. No substantive changes in the content of habitat standards have been made under this revision. However, some modifications in habitat monitoring protocols have been made and are documented in this chapter.

Introduction

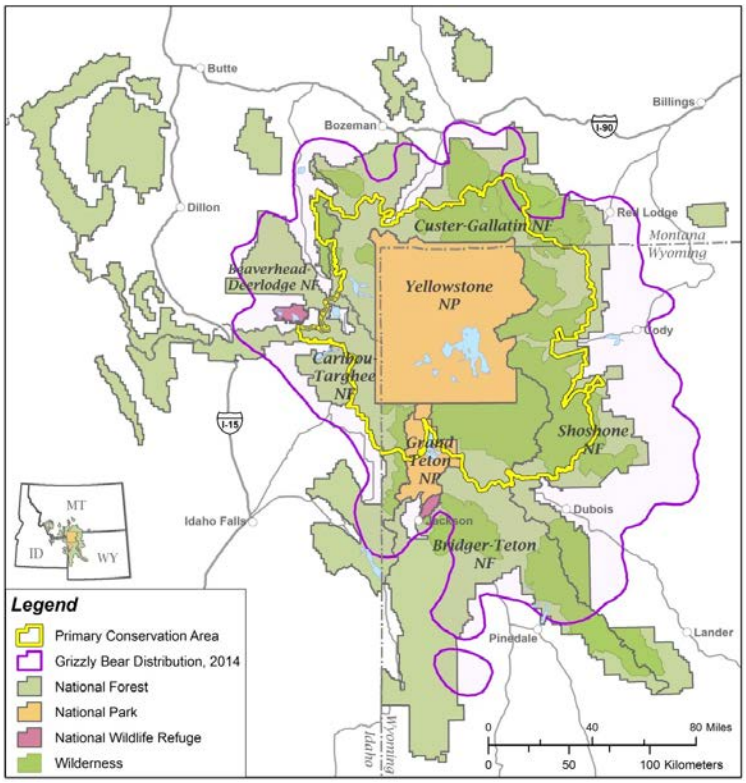
Habitat standards apply to Federal lands inside the PCA and identify three factors that must be maintained at, or improved upon with respect to conditions existing in 1998: 1) secure habitat, 2) number and capacity of developed sites, and 3) number and acreage of active commercial livestock grazing allotments. All three of these factors are linked to human activities that affect grizzly bear mortality and displacement. These three standards apply only to public lands within the PCA, the area where past recovery efforts and present habitat conservation measures are primariy focused. The PCA serves as a relatively safe haven located at the core of the ecosystem and accounts ~~fro~~ for approximately 47% of the Yellowstone grizzly bear's occupied range as estimated from methods of Bjornlie *et al*. 2014 (Figure 6). The 1998 baseline for habitat standards was selected because studies showed (and recently affirmed) that the Yellowstone grizzly bear population was increasing annually at a robust rate of 4 to 7 percent between 1983 and 2001 (Boyce *et al.* 2001*b*, Harris *et al*. 2006, 2007, IGBST 2012). Habitat conditions in 1998 were considered representative of this time period since levels of secure habitat and developed sites inside the PCA had remained relatively constant in the 10 years preceding 1998 and beyond (USDA 2004). Hence, conditions in 1998 are believed to have supported and contributed to the population growth observed during 1983-2001. Habitat standards, as they apply to the 1998 baseline, impose measureable side boards on allowed levels of human activity inside the PCA and establish a clear benchmark against which future improvements and impacts of habitat can be measured.

Comment [t54]: Comment-Accurate?

Comment [t55]: Comment-Figure 6 is the mortalities figure?

To facilitate management of habitat throughout the PCA, the area inside the PCA is divided into 18 distinct bear management units (BMUs) and 40 subunits (Figure 2, Chapter 1). BMU boundaries were delineated to approximate the average *lifetime* range of an adult female grizzly bear in the GYE. Each BMU was further subdivided into one ore more subunits comparable in size to the average *annual* home range of an adult female grizzly bear. Monitoring habitat at a subunit scale provides greater spatial resolution and proved to be better suited for analyzing habitat use patterns and ensuring good distribution of bear habitat throughout the PCA (USDA 1985). Hence, conditions pertaining to secure habitat and developed site standards are measured and compared against 1998 levels for each of the 40 bear management subunits within the PCA. To date, habitat-based criteria throughout the PCA have been successfully maintained at, or improved upon, 1998 levels for all 40 subunits. Adherence to these standards ensures that sufficient habitat for the Yellowstone grizzly bear will continue to be available into the foreseeable future. Habitat standards in this document are subject to revision based on the best available science and will be reviewd and updated as necessary.

In addition to mandatory habitat standards, several other habitat parameters will be monitored and evaluated to determine the overall condition of habitat for grizzly bears in the PCA. These additional monitoring items include habitat connectivity, hunter numbers, and productivity of the following four high-calorie foods: 1) winter-killed ungulates, 2) cutthroat trout, 3) army cutworm moths, and 4) whitebark pine seeds. Information on monitoring protocols for these items is found in subsequent sections of this chapter.



Agencies responsible for management of grizzly bear habitat in the GYE are committed to continue collecting the necessary information to evaluate adherence to habitat standards and monitoring protocols throughout the PCA. The overall objective for habitat management inside the PCA is to reduce human-caused grizzly bear mortalities by maintaining or improving habitat with respect to 1998 conditions while maintaining options for resource management activities at approximately the same level as existed in 1998. The habitat

standards and monitoring requirements in this Conservation Strategy will be incorporated into National Forest, National Park, and BLM plans.

Comment [t56]: Comment-Have been?

Figure 8. Federal lands comprising the Greater Yellowstone Ecosystem (GYE), the Primary Conservation Area (PCA), and estimated current (2014) Grizzly Bear Occupied Range.

Comment [t57]: Comment-This map looks like it includes considerable area outside of the boundaries of the prior GYA DPS. Was this larger area used for the % of occupied habitat? this doesn't match figure 1; what's up with math regarding occupied habitat, such as the reference of unoccupied habitat in demographic critierion 1, etc.

Outside the PCA, grizzly bears are allowed to expand into adjacent areas considered biologically suitable and socially acceptable, as per direction in the State management plans

(Appendices I, J, and K). The key to successful management of grizzly bears outside the PCA is a sustainable balance that accommodates the needs of grizzly bears along with the competing demands of human use. As such, an important management objective for areas outside the PCA is to maintain existing resource management and recreational uses and allow agencies to respond to demonstrated problems with appropriate management actions. ~~Approximately 83 percent of suitable habitat outside the PCA occurs on federally owned land and about 66 percent of that suitable habitat is occupied by grizzly bears (Figure 6).~~ A flexible management strategy is crucial for promoting acceptance and tolerance for grizzly bears as they continue to expand into suitable habitat outside the PCA. Standards and guidelines for other wildlife species identified in National Forest and Park management plans indirectly provide additional habitat management direction for bears outside the PCA.

Comment [t58]: Where did this figure regarding occupation come from?
The document previously stated: "Collectively, these two studies indicate that the growth rate of the grizzly bear population inside the DMA had slowed as bear densities have approached carrying capacity, particularly in the core area of occupied range. Recent work by van Manen *et al.* (2015) confirms that population growth has slowed and the population is showing density dependent population regulation as the population occupies almost all suitable habitat in the DMA." See prior note about Figures 1 and 8.

State grizzly bear management plans for Idaho, Montana, and Wyoming recommend and encourage land management agencies to maintain or improve habitats important to grizzly bears and to monitor habitat conditions outside the PCA. These three states acknowledge the importance of secure habitat, motorized access management, and road density issues related to the survival of grizzly bears and other wildlife. Consequently, levels of secure habitat and motorized route density are monitored on federal lands outside the PCA to identify and prevent potential habitat threats from negatively impacting the long-term viability of the Yellowstone grizzly bear population. Land management agencies work cooperatively with state wildlife agencies to meet identified population and habitat goals for grizzly bears in the GYE. The process of implementing state and federal grizzly bear management is coordinated by the Yellowstone Grizzly Bear Coordinating Committee (YGCC) representing all respective land management agencies in the GYE (*see* Chapter 6 Implementation and Evaluation).

Immediately upon ESA delisting of the species, Forest Service regional foresters in Regions 1, 2, and 4 agree to add the grizzly bear to their Sensitive Species lists for the five National Forests in the GYE. Forest Service sensitive species direction requires that any project "*must*

not result in loss of species viability or create significant trends toward federal listing" (USDA 2005). Sensitive species direction also requires the Forest Service to "*assist states in achieving their goals for conservation of endemic species*" (USDA 2005). A biological evaluation will be completed for all Forest Service projects potentially affecting the grizzly bear. These evaluations will be completed for all Forest Service projects potentially affecting the grizzly bear. These evaluations will determine whether projects do or do not meet the habitat standards in this Conservation Strategy. If the biological evaluation demonstrates that a project does not meet the habitat standards as well as other relevant habitat and population criteria, the project will be modified as necessary to ensure complete adherence with all required measures.

Habitat Standards Inside the PCA

Human activity is the primary factor negatively impacting availability and security of grizzly bear habitat in the GYE. The relationship between bears and habitat is extremely complex and difficult to quantify. However, unfettered human activity is known to result in displacement and mortality of grizzly bears and was a significant contributing factor leading to listing the grizzly bear in the conterminous U.S. as a Threatened species in 1975. Restrictions in human activities due to management practices implemented by the IGBC in the mid-1980s correlate strongly with the steady increase in the Yellowstone grizzly bear population that was observed between 1983 and 2001. Habitat standards formalized in this document impose measurable sideboards on levels of human activity allowed on Federal lands inside the PCA, thereby reducing opportunities for grizzly bear-human conflicts, habitat disturbance, and displacement of grizzly bears from valuable habitat.

Habitat standards identified in this document address three key factors related to human activity (motorized access, site development, and commercial livestock grazing) and specifically call for no net loss in secure habitat inside the PCA from what existed in 1998

(Appendix E). Adequate secure habitat is essential to the survival and reproductive success of grizzly bears, particularly adult females.

It is the goal of habitat management agencies to maintain or improve habitat conditions throughout the PCA at or above 1998 levels, as measured per bear managementsubunit, These levels of secure habitat have been maintained and will continue to be maintained, and improved on where possible, long into the future.

Potential impacts to grizzly bears and their habitat will be evaluated and mitigated using the criteria and standards in this Conservation Strategy in coordination with state wildlife agencies.

Omissions to the 1998 habitat measurements comprising the baseline (Appendix E) may be corrected for when based on new and well documented information substantiating the existence and status of anthropomorphic features (i.e., motorized routes, developed sites, or livestock allotments) that were not propery accounted for in the 1998 baseline. When verified, legitimate corrections to the baseline will be tracked and reported and will constitute new baseline habitat levels against which future change will be measured.

Application rules specific to each habitat standard provide additional direction on how these standards are to be implemented at a Federal project level. The following habitat standards and application rules apply to all Federal lands inside the PCA.

Secure Habitat Standard

The Secure Habitat Standard requires that inside the PCA, the percentage of secure habitat within each bear management subunit must be maintained at or above levels that existed in 1998 (Appendix E). The sole exception to the 1998 secure habitat baseline applies to the three subunits identified in the 2007 Conservation strategy as in need of improvement above 1998 levels (Gallatin #3, Henrys Lake #2, and Madison #2). These three subunits must be

maintained at or above levels attained from the full implementation of the 2006 Gallatin National Forest Travel Management Plan (Appendix E). Authorized Federal projects that result in temporary or permanent changes to secure habitat must follow the Application Rules identified below.

Secure habitat is defined as any contiguous area ≥ 10 acres in size and more than 500 m from an open or gated motorized access route (road or trail) or recurring low level helicopter line during the non-denning period (March 1 – November 30). Gated routes that are closed year-round to public motorized use but remain accessible to administrative personnel are still considered motorized access routes, and hence, detract from secure grizzly bear habitat. Decomissioned routes that are permanently and effectively closed to the public and administrative staff do not count against this standard. Lakes larger than 1.6 sq km (1 sq mi) in spatial extent are excluded from secure habitat calculations.

Application Rules for Permanent Changes in Secure Habitat

Permanent changes to secure habitat are allowed inside the PCA when associated with an authorized Federal project involving construction of new motorized routes (i.e., roads or trails), reconstruction of existing motorized routes, or opening of a previously decommissioned route if, and only if, the following conditions are met:

- Any loss in secure habitat below baseline levels is replaced by restoring secure habitat of equivalent quality and quantity (e.g., through decommissioning) in the same bear management subunit. Habitat quality must be assessed based on the best collective scientific understanding of grizzly bear habitat ecology and the rationale for all mitigation measures must be fully documented.
- Replacement habitat must be in place before project implementation or concurrent with project development as an integral part of the project plan. Replacement habitat must remain in place for a minimum of 10 years before it can be subsequently replaced and

mitigated for per application rules (this duration is based upone the generation time for a female grizzly bear, or the time it takes to replace herself in the population).

- For those subunits identified as in need of improvement above 1998 levels (*Gallatin #3, Madison #2,* and *Henry's Lake #2*), secure habitat will be maintained at or above levels associated with full implementation of the 2006 Gallatin National Forest Travel Management Plan (see Appendix E).
- For activities based on statutory rights, such as access to private lands under the *Alaska National Interest Lands Conservation* (ANILCA) or the *1872 General Mining Law*, where permanent reductions in secure habitat cannot be replaced within the affected subunit, then secure habitat will be compensated at a commensurate level at or above the baseline in the nearest possible subunit. In these rare situations, subsequent changes to secure habitat in the two affected subunits constitute permante changes to the baseline.
- Honor existing oil and gas or other mineral leases. Proposed *Applications for Permit to Drill* (APDs) and operating plans within those leases would strive to meet the application rules for changes to secure habitat. New leases, APDs, and operating plans must meet the secure habitat and developed site standards.
- Motorized routes on private land that post-date 1998 are not counted against this standard. However, for motorized roads or trails acquired through land exchanges or acquisition that are desirable to maintain for public use, mitigation is strongly recommended.

Application Rules for Temporary Changes in Secure Habitat

Temporary reductions in secure habitat below baseline levels inside the PCA are allowed when associated with authorized Federal projects. Project activities should be concentrated in space and time to minimize disturbance**.** The following conditions must be met for temporary projects:

Only one project affecting secure habitat may be active within a given bear management subunit at any one time.

Total acreage of secure habitat affected within a given BMU does not exceed 1 percent of the acreage in the largest subunit within that BMU. The acreage of a project that counts against the 1 percent limit (i.e., the amount of secure habitat affected) is measured as the acreage within the 500-meter buffer around any temporary motorized access route or low-level helicopter flight line that intrudes into existing secure habitat.

Use of project roads will be limited to administrative purposes associated with project activities. Project implementation shall not reduce secure habitat below baseline levels for more than 4 consecutive years. The collective set of project roads that affect secure habitat below baseline levels shall be closed to all motorized travel after 3 years. Project roads shall be decommissioned such that secure habitat is restored within 1 year after road closure.

Activities Allowed in Secure Habitat

The following activities are allowed in secure habitat inside the PCA without violating the standard:

- ***Activities that do not require route construction or reconstruction, re-opening of a permanently closed road, or recurring low-level helicopter flight lines.***
- ***Helicopter use for short term (no more than 2 days in the duration of a project), or at higher elevations (> 500 m above ground level with no landing). Aircraft used in emergency firefighting are allowed.***
- Non-wheeled, over-the-snow use (i.e., snow machines) is allowed unless new research identifies a concern. Conflicts associated with winter-use activities that develop either during denning or after den emergence in the spring can be addressed with local area restrictions.

- Access to power lines and/or utility corridors for occasional and necessary maintenance service that does not require new route construction and is used only for administrative purposes related to power line/utility maintenance.
- Project activities (e.g., temporary road construction and maintenance, or use of recurring low-level helicopter flights) that occur during the grizzly bear denning season between December 1 and February 28.

Developed Site Standard

The Developed Site Standard requires that on Federal lands inside the PCA, the number and capacity for human use of developed sites must be maintained at or below the 1998 levels (Appendix E). Projects that propose a change in the number or capacity of developed sites must follow the Application Rules specified below.

Developed sites *refer to those sites or facilities on public land with features intended to accommodate administrative and public recreational use. Such sites typically are identified or advertised via visitor maps or information displays as discernable destination sites promoted by the agency. Developed sites are often associated with human activities that may disrupt grizzly bear use of habitat, or have attractants that potentially lead to increased human-bear conflicts. Examples of developed sites include, but are not limited to: campgrounds, picnic areas, trailheads, boat launches, rental cabins, summer homes, lodges, service stations, restaurants, visitor centers, and administrative sites.* ***Administrative sites*** *are those sites or facilities constructed for use primarily by government employees to facilitate the administrations and management of public lands. Administrative sites are counted towards developed sites. Examples include: administrative headquarters, ranger stations, patrol cabins, park entrances, federal employee housing, and other facilities supporting government operations.* ***Dispersed sites****, in contrast to developed or administrative sites, are those not associated with a developed site, such as a front-country campground. These sites are typically characterized as having no*

permanent agency-constructed features, have minimal to no site modifications, and may include primitive road access. Dispersed sites are not counted toward developed sites.

Application Rules for Developed Sites

On Federal lands inside the PCA, changes to developed sites or construction of new developed sites are allowed if the following conditions are met:

Construction of new sites will be mitigated for within that subunit to offset any increase in the number of developed sites and/or capacity for human use, habitat loss, and increased access to surrounding habitats.

Mitigation of detrimental impacts will occur within the affected subunit and adequately compensate for the type and extent of impacts. Mitigation measures will be in place before implementation of the project or included as an integral part of completion of the project.

Consolidation and/or elimination of dispersed campsites is considered adequate mitigation for increases in human capacity at developed campgrounds if the new campsite capacity is less than or equivalent to that of the dispersed camping eliminated and if future overnight use of the dispersed site(s) is definitively curtailed.

Conversion of uncontrolled dispersed campsites to a minor day-use site is allowed if there is a net benefit to both human and bear safety and if the dispersed site(s) can be modified in such a way that future over-night use of the site is definitively curtailed. Such modification of site-use would not contribute to an increase in baseline developed sites.

Expansion of existing administrative sites is exempt from mitigation if such developments are deemed necessary for enhancement of public land management and other viable alternatives are not available. Temporary construction of work camps for highway construction or other major maintenance projects are exempt from human capacity mitigation if other viable alternatives are not available. Food storage structures and management must be in place and all other factors resulting in potential detrimental impacts to grizzly bears will be mitigated as identified for other developed sites.

Modifications to existing developed sites that reduce resource damage, detrimental environmental impacts, and/or the potential for grizzly bear conflicts are allowed (e.g., installing a vaulted toilet to avoid damage to water resources or installing bear-resistant storage structures to reduce conflict).

For activities based in statutory rights (e.g., *1872 General Mining Law, Americans with Disability Act,* ANILCA, etc.), if the number of developed sites exceeds the 1998 baseline, the Forest Service will, to the fullest extent of its regulatory authority, reduce developed sites to commensurate levels and mitigate to offset any increases in human capacity, habitat loss, and increased access to surrounding habitat within the affected subunit if possible. In those rare cases where mitigation cannot be accomplished within that subunit, commensurate compensation will be accomplished in the nearest subunit and changes in the two affected subunits become permanent changes to the baseline.

Honor existing oil and gas and other mineral leases. For proposed *Applications for Permit to Drill* (APDs) and operating plans within those leases, the Forest Service should, to the fullest extent of their regulatory authority, strive to meet the developed site standard and satisfy application rules for changes in secure habitat. New leases, APDs, and operating plans must meet the developed site standard and satisfy application rules for changes in secure habitat. Developments on private land are not counted against this standard. However, for developed sites acquired through land exchanges or acquisitions that are desirable to maintain, mitigation is strongly encouraged but not required. The rationale behind this is to encourage acquisition and transformation of private land to public ownership since this negates the potential for future development and results in better management for grizzly bears.

Livestock Allotment Standard

The Livestock Allotment Standard requires that on Federal lands inside the PCA, there will be no increase in the number or acreage of active commercial livestock grazing allotments nor an increase in permitted sheep Animal Months (AMs) relative to that which existed

in1998 (see Appendix E). Existing sheep allotments will be monitored, evaluated, and phased out as the opportunity arises with willing permittees.

Application Rules

Grazing allotments tracked for purposes of grizzly bear conservation include both vacant and active commercial livestock units for sheep, cattle, and/or horses on Federal lands inside the PCA. **Active** allotments are livestock units with active grazing permits. **Vacant** allotments are those without an active permit, but which may be restocked or grazed periodically by other permittees at the discretion of the land management agency to resolve resource issues or other concerns. Changes in livestock allotments inside the PCA that satisfy the allotment standard may occur if the following conditions are met:

- A vacant allotment may be reissued an active permit resulting in an increase in the number of permitted cattle, but the number and net acreage of active allotments inside the PCA must not exceed the 1998 baseline. Appropriate analysis by the action agency must be conducted to evaluate impacts on grizzly bears.
- Combining or dividing existing allotments is allowed as long as the net acreage and number of active allotments does not exceed 1998 levels.
- Where chronic grizzly bear conflicts occur on livestock allotments inside the PCA, and an opportunity exists with a willing permittee, alternatives for resolving conflicts may include authorization of a non-use permit, moving livestock to a vacant allotment where there is less likelihood of conflict, or cattle grazing can be phased out on that allotment.

Habitat Monitoring

The primary objective of habitat monitoring is to track and assess the status of grizzly bear habitat throughout the ecosystem with an emphasis placed on habitat inside the PCA. Monitoring requirements presented in this section focus on evaluation of adherence to habitat

standards identified such that secure habitat, developed sites, and commercial livestock grazing allotments are maintained at, or improved upon, 1998 levels. However, additional habitat parameters pertaining to four high-calorie foods of the grizzly bear diet are also monitored to assist in evaluating the status of grizzly bear habitat and its ability to support a a recovered grizzly bear population.

Monitoring Secure Habitat and Motorized Access Route Density

Background

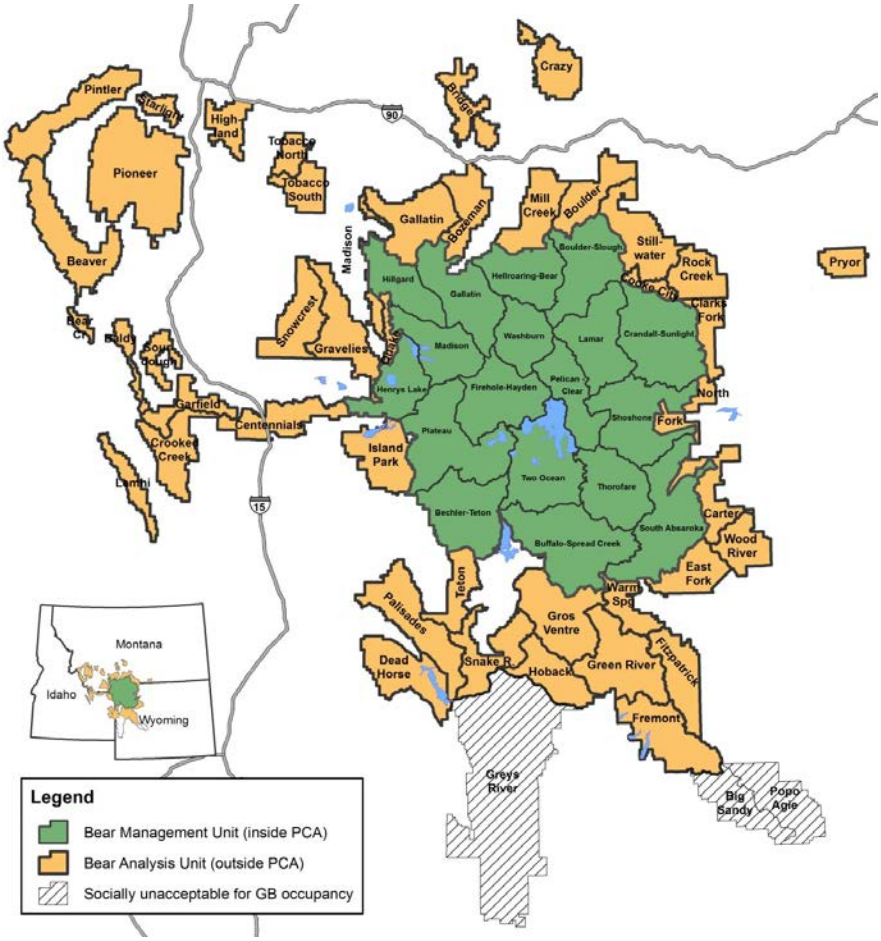
Humans are the primary agent influencing grizzly bear mortality and population trajectories in the GYE and elsewhere (McLellan and Shackleton 1988, Mattson and Knight 1991, Mace *et al*. 1996, Schwartz *et al*. 2010, Proctor *et al*. 2012). Motorized access has historically been used as a surrogate measure of human presence on the landscape, and consequently serves as the basis for differentiating secure and non-secure habitat throughout the ecosystem. Land managers throughout the GYE recognize that availability of secure habitat is crucial to the survival and long-term reproductive success of grizzly bears. Managing the landscape to reduce grizzly bear mortality risk requires that motorized roads and trails be considered when evaluating and maintaining secure habitat throughout the ecosystem.

Motorized access parameters, including: 1) percent secure habitat, 2) open motorized access route density (OMARD), and 3) total motorized access route density (TMARD) , are measured and monitored against levels that existed in 1998. To date, no net decrease in secure habitat relative to 1998 levels has occurred on federal lands in any of the 40 bear management subunits within the PCA. Instead, reductions in motorized access implemented post-1998 have led to an increase of 1.4 percent in secure habitat inside the PCA; a gain approximate in size to the area of Yellowstone Lake.

Subunits with potential for improvement

Several subunits, Gallatin #3, Henrys Lake #2, and Madison #2, were targeted in the 2007 Conservation Strategy as needing improvement in secure habitat with respect to 1998 levels. The specific areas with potential for improvement identified in these three subunits fall within the Gallatin National Forest boundary and consequently, the quantity and timing of improvements was to be determined by the Gallatin National Forest Travel Management Plan (TMP). With implementation of the 2006 Gallatin TMP, many roads inherited from these exchanges have been permanently decommissioned. Non-system routes that are not maintained by the Forest Service have subsequently been closed, with a high priority given to road decommissions in the three subunits identified as in need of improvement. With full implementation of the Gallatin Travel Plan near completion, measureable increases in secure habitat with respect to 1998 baseline levels (Appendix E) and reductions in motorized route density have been realized in the three targeted subunits. The Gallatin National forest determine, via a Travel Plan Amendment, that all gains in secure habitat resulting from full implementation of the TMP will effectively constitute new baseline levels for these three subunits. If and when approved, elevated secure levels for these three subunits will serve as a new measure against which future change will be made.

Monitoring Protocol



Secure habitat and motorized route density are monitored and tracked throughout the ecosystem to verify compliance with secure habitat standards inside the PCA and to assist in balancing grizzly bear security and survival with human land use concerns outside the PCA. Motorized access parameters that are monitored and reported include levels of 1)secure habitat, 2) open motorized access route density (OMARD) greater than 1.6 km/sq km (1 mi/sq mi)), and 3) total motorized access route density (TMARD) greater than 3.2 km/sq km (2 mi/sq mi). Inside the PCA, these three parameters are measured and reported annually for each bear management subunit. Outside the PCA, secure habitat is measured and reported biennially (even numbered years) for each bear analysis unit (BAU, see Figure 7). Changes in configuration and status of

motorized routes are submitted each year to the Grizzly Bear Habitat Database Coordinator by representatives from each National Forest and National Park in the ecosystem. Status and configuration of motorized access routes are inventoried and tracked by the Database Coordinator. This insures that reported measurements are based on the most current available information. Percent secure habitat, OMARD, and TMARD are calculated using the Motorized Access Model as described in Appendix E.

Secure habitat, as definied earlier, refers to those areas ≥ 10 acres in size and more than 500 m from an open or gated motorized route. Lakes greater than 1.6 sq km (1 sq mi) are excluded from secure habitat calculations. **OMARD** is a measure of the density of motorized routes that are open to the public for one or more days during the non-denning portion of the year when grizzly bears are active (March 1-November 30). **TMARD** measure the density of all motorized routes open to the public and/or administrative personnel for one or more days during the non-denning season. Roads that are closed year-round to the public but open to administrative personnel detract from secure habitat and count toward TMARD, but do not contribute to OMARD. Motorized routes that have been permanently decommissioned such that there is no motorized use by either the public or administrative staff, do not contribute to OMARD or TMARD, and do not detract from secure habitat. For a more detailed discussion of OMARD and TMARD, as well as changes in monitoring protocol, please refer to Appendix E. Measurements are reported annually (inside the PCA) and biennially (outside the PCA) in the IGBST Annual Report, *Yellowstone Grizzly Bear Investigations* and are posted online for public access at the IGBST website (http://nrmsc.usgs.gov/products/IGBST).

Figure 7. Bear management units and subunits inside the Primary Conservation Area (PCA) and bear analysis units outside the PCA.

Comment [t59]: Comment-This includes units outside the previously designated DPS??? The more area delisted with management flexilbity the better, but just want to understand what's going on…

Monitoring Developed Sites

Background

Levels of human development on the landscape have been shown to be an important predictor of grizzly bear mortality in the GYE (Schwartz et al. 2010). Developed sites increase the spatial and temporal extent of human presence on the landscape and contribute to the displacement and mortality of grizzly bears. A significant concern related to developed sites is the increased potential for grizzly bear-human conflicts attributable to food conditioning and habituation. Past attempts at modeling grizzly bear mortality in the GYE have focused on levels of overnight human use as a primary factor related to grizzly bear mortality. Increased numbers of people using an area and potentially interacting with grizzly bears is an important issue in evaluating impacts of developed sites on grizzly bear survival.

Monitoring Protocol

Changes in developed sites on public lands inside the PCA are measured, tracked, and evaluated against 1998 levels (Appendix E). Information pertaining to changes in the number of developed sites inside the PCA is submitted annually to the Grizzly Bear Habitat Database Coordinator by representatives from each National Forest and National Park Ecosystem. Current and baseline numbers of developed sites are inventoried in a GIS database and reported annually in the IGBST Annual Report Yellowstone Grizzly Bear
Investigations.

Monitoring Livestock Grazing

Background

Conflicts between livestock and grizzly bears have historically led to the relocation or removal of grizzly bears in the GYE. Grizzly bears tend to prey on cattle and sheep regardless of the abundance of natural foods because livestock in occupied grizzly bear territory represent one of many foraging opportunities (Gunther *et al*. 2004). Most grizzly bear-livestock conflicts tend to

occur outside the PCA since all commercial allotments on National Park lands and many allotments on National Forest lands inside the PCA have been permanently closed. Consequently, monitoring grizzly bear-livestock conflicts on public lands is not limited to inside the PCA, but is conducted annually throughout the entire ecosystem. Currently, approximately 59 percent of the Yellowstone grizzly bear's occupied range falls outside the PCA. As commercial livestock grazing persists in areas where grizzly bears live, the number of conflicts will most likely continue to pose a challenge to grizzly bear managers. This is particularly true on domestic sheep allotments. Financial incentives offered through non-governmental organizations (NGOs) have proven to be a successful mechanism for retiring sheep grazing allotments on public land when willing participants were available (Gunther *et al*. 2004). These types of opportunistic partnerships between federal agencies, NGOs, and willing permittees may be considered an alternative for resolving chronic conflicts on grazing allotments within prime grizzly bear habitat.

Monitoring Protocol

On federal lands inside the PCA, the number and acreage of commercial livestock grazing allotments and the number of sheep animal months (AMs) is monitored and reported annually relative to 1998 levels. Inside and outside the PCA, grizzly bear conflicts associated with grazing of commercial livestock on federal lands is monitored and reported annually. Commercial livestock grazing and conflict information is submitted for publication in the IGBST annual report, *Yellowstone Grizzly Bear Investigations*.

Monitoring High-Caloric Foods

Background

Grizzly bears are opportunistic omnivores who have evolved highly versatile foraging strategies allowing them to shift diets among numerous food sources, depending on what is available

spatially and temporally (Schwartz *et al*. 2003, 2013). Long-term management and conservation of grizzly bears in the GYE call for monitoring of four high-calorie foods. These four food types listed by dry weight kilocalories per gram (kcal/g) include: 1) army cutworm moths (7.91 kcal/g), 2) winter-killed ungulates (6.80 kcal/g), 3) cutthroat trout (6.10 kcal/g), and 4) whitebark pine seeds (3.99 kcal/g). These four foods have varying distributions in the ecosystem and are subject to annual fluctuations and therefore do not necessarily serve as a major dietary component of every grizzly bear in the GYE. Natural annual fluctuations in abundance and distribution of these four calorie-rich foods make it very challenging to establish reliable thresholds. However, these four high-calorie foods are known to exert a positive influence on grizzly bear fecundity and survival and constitute some of the highest sources of digestible energy available to grizzly bears in the GYE (Mealey 1975, Servheen *et al*. 1986, Pritchard and Robbins 1990, Mattson *et al*. 1992, Haroldson *et al*. 2006, Schwartz *et al.* 2006).

Gunther *et al.* (2014*a*) exhaustively documented the diet of the GYE grizzly bears to include over 266 distinct plant and animal species ranging from grasses, fungi, berries and seeds, to fish and carrion. The trophic flexibility of grizzly bears, as documented by the variety of foods they consume, allow them to opportunistically forage across diverse habitats spanning the entire GYE. Their highly varied diet serves as an adaptive mechanism that enhances their ability to persist when faced with rapid and long-term changes in availability and abundance of any one food source. Compositional analysis of scats collected over a 37-year period (1943 to 2009) showed that grizzly bears within the GYE most frequently feed on foods that are consistently available and widely distributed, such as grasses, sedges, and ants (Gunther *et al.* 2014*a*). However, when opportunity arises, grizzly bears will shift their diet to maximize body mass gain by selecting calorie-rich foods such as ungulates, fish, whitebark pine seeds, clover, moths, and small mammals.

Human-induced environmental change, such as introduced organisms, habitat loss, climate change, and other anthropogenic factors, have the potential to affect availability and distribution of these calorie-rich foods in the future. However, despite a substantial decline of whitebark

pine and natural stochasticity of other food resources within the GYE, grizzly bears have shown notable resilience by adjusting habitat use (Costello *et al.* 2014) and shifting diets to maintain body mass and condition (Schwartz *et al.* 2014). Because of their high caloric value and use by grizzly bears, whitebark pine, ungulates, cutthroat trout, and arm cutworm moths are currently monitored either directly or indirectly on an annual basis.

Monitoring Protocol

To monitor these four high-caloric foods and their importance to grizzly bears, the IGBST will survey and report on each of these food groups annually d per detailed food monitoring protocols identified in Appendix D, as budgetary constraints allow. IGBST scientists will analyze the relationship between abundance and availability of these four food types with the number of grizzly bear-human conflicts, grizzly bear management actions, known and probable grizzly bear mortalities, and changes in the distribution and trend of the GYE grizzly bear population. Results of these analysis will be presented, when available, in the annual reports prepared by the IGBST and relevant peer-reviewed publications. If detectable declines in certain foods occur and the IGBST concludes these declines are related to biologically significant changes in demographic parameters , the IGBST shall report these findings for consideration by the GYCC (see Chapter 6, Implementation and Evaluation, for details on this process).

Monitoring protocols of high-caloric foods identified in this Conservation Strategy will continue as long as budgets allow. Monitoring and surveying methods may be modified when necessary to incorporate new technological advances in monitoring techniques or new knowledge of bear foraging and habitat use within the GYE. Existing monitoring programs may be expanded, as budget allows, to include occupied habitat beyond the PCA and areas predicted for future use by bears. Monitoring results of whitebark pine, winter-killed ungulates, cutthroat trout, and army cutworm moths, when available, are to be reported in the annual IGBST publication *Yellowstone Grizzly Bear Investigations*.

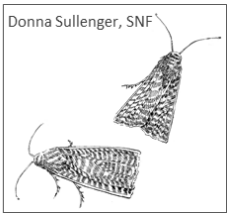
Winter-killed Ungulates

Background—The GYE harbors one of the most carnivorous grizzly bear populations inhabiting the North American interior (Jacoby et al. 1999, Mowat and Heard 2006). Isotopic nitrogen ($\delta^{15}N$) levels measured in 221 grizzly bear hair samples collected between 2000 and 2010 indicate that on average, terrestrial meat accounted for 44.4% of the assimilated diet of Yellowstone grizzly bears (Schwartz et al. 2014). In contrast, in Glacier National Park and adjacent national forest lands, meat accounts for a smaller proportion of the grizzly bear diet; using stable isotope analysis for a small sample of grizzly bears, Jacoby et al. (1999) found that meat accounted for only 33%, 0%, and 6% of adult male, adult female and subadult diets, respectively. Protein and fat from ungulate carcasses ranks as the second-highest food source of gross caloric value available to grizzly bears in the GYE (Gunther et al. 2014a, b). Winter-killed ungulates, primarily elk and bison, provide an important source of protein to bears, especially during early spring before most plant foods become available. As an alternative to carcasses as a spring food, grizzly bears also consume earthworms, ants, and pocket gophers. Grizzly bears continue to opportunistically forage for animal matter and scavenge carrion throughout the active season and will seek out gut piles and other remains left by ungulate hunters in the fall (Haroldson et al. 2004).

Monitoring Protocol—Relative abundance of ungulate carrion is often monitored by correlating the number of carcasses available to grizzly bears and other scavengers during the spring with measures of snow-water equivalency (depth, density, and moisture content) in snowpack (Podruzny *et al.* 2012). Availability of carrion for grizzly bears is potentially affected by increased competition from recently reintroduced wolves and changes in elk and bison management practices. For these and other reasons historic carcass transsects will continue to be surveyed as long as budgetary allocations permit. There are currently 30 spring ungulate carcass survey routes in Yellowstone National Park (YNP) and 12 transect routes on Yellowstone's Northern Range in the Gallatin National Forest. Current survey

methods and ungulate carcass survey routes may be redesigned or modified when appropriate. When available, monitoring results of winter-killed ungulate carcass availability will be summarized and reported annually in the IGBST publication *Yellowstone Grizzly Bear Investigations*.

Cutthroat Trout



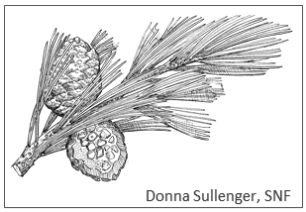
Donna Sullenger, SNF

Background—Due to their high digestibility and protein and lipid content, spawning cutthroat trout are one of the highest sources of digestible energy available to bears in with home ranges in close proximity of Yellowstone Lake and its tributaries (Mealey 1975, Pritchard and Robbins 1990, Gunther et al. 2014a). Grizzly bears were once known to prey on cutthroat trout in at least 36 different streams tributary to Yellowstone Lake (Hoskins 1975, Reinhart and Mattson 1990). Haroldson et al. (2005) estimated that approximately 68 grizzly bears per year frequented and likely fished ten Yellowstone Lake spawning streams tributaries monitored during 1997-2000. Introduction of non-native lake trout (Salvelinus namaycush) and effects of drought and whirling disease (Myxobolus cerebralis) has led to a decline in native cutthroat trout populations and an associated decline in number of bears visiting spawning streams (Teisberg et al. 2014).

Monitoring Protocol—The Yellowstone Lake cutthroat trout population is monitored most years in the spring, depending on weather and spring snow melt, using stream surveys, large mesh gillnets, weirs with fish traps, and occasionally electronic fish counters. An electronic sonar fish counter was installed and calibrated in 2013 along Clear Creek on the east side of Yellowstone Lake to facilitate annual counting of spawning cutthroat trout ascending Clear Creek. Visual stream surveys are also conducted most years to identify trends in the number of cutthroat trout spawning Yellowstone Lake tributaries. Visual surveys to measure the presence of cutthroat trout and rainbow hybrids are also typically conducted at the Trout Lake inlet creek. Yellowstone NP biologists provide an annual summary of cutthroat trout

monitoring results to the IGBST for publication in the *Yellowstone Grizzly Bear Investigations*. Current survey methods may be modified or redesigned as appropriate.

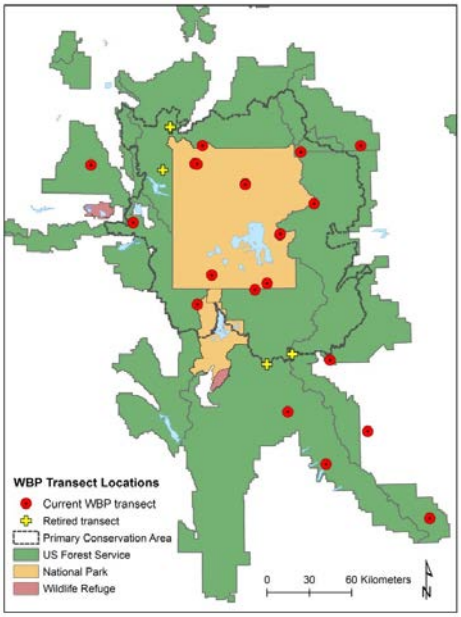
Moth Aggregation Sites



Background—Alpine moth aggregations are a calorie-dense and nutrient-rich food source found at remote, high-elevation alpine sites dominated by talus and scree slopes in the eastern half of the ecosystem. Knowledge regarding the intricate relationship between army cutworm moths and grizzly bears has improved substantially since the late 1980s when grizzly bear use of moth aggregation sites was first discovered and such sites were included in observation flights (Bjornlie and Haroldson 2014). When available, moths are a valuable source of nutrition for grizzly bears because they have the highest reported gross caloric content per gram of any food available to grizzly bears in the GYE (7.91 kcal/g; Gunther et al. 2014a). Some bears may feed almost exclusively on moths for a period of over one month (French et al. 1994). A grizzly bear feeding extensively on moths over a 30-day period can consume 47%, or close to half, of its annual energy budget of 960,000 calories (White 1996). Grizzly bears whose home ranges include moth aggregation sites often visit these talus slopes during mid-to-late summer and early fall to accumulate fat reserves in preparation for the winter denning season. Although grizzly bear use of moth sites does not vary widely over time (1993 is one notable exception; low bear use due to late, extensive snow cover), annual monitoring provides important data regarding this high-calorie resource.

Monitoring Protocol—As of 2013, 37 confirmed and 16 possible moth sites have been identified in the GYE. However, size, location and moth abundance of sites fluctuate from year to year due to natural variation in environmental factors, such as snow cover (Bjornlie and Haroldson 2014). Aerial observations of bears feeding at moth sites are made from fixed-wing aircraft as part of on-going radio tracking and observation flights conducted by the IGBST. Although this monitoring protocol does not provide direct information regarding the abundance of moths,

grizzly bear use of aggregation sites can provide an indirect measure of the relative abundance of this resource in a given year. Aerial surveys of all confirmed moth sites will be conducted annually and results will be summarized and presented in the annual IGBST report Yellowstone Grizzly Bear Investigations.



Whitebark Pine Cone Production

Donna Sullenger, SNF

Background—Due to their high fat content and potential abundance, whitebark pine seeds are an important fall food for bears in the GYE(Mattson and Jonkel 1990). Yellowstone grizzly bears consume whitebark pine seeds extensively when whitebark cones are available. Bears may feed almost exclusively on whitebark pine seeds when production exceeds 22 cones per tree (Mattson et al. 1992). Because whitebark pine is a masting species, availability varies substantially from year to year. During fall seasons of low whitebark pine seed availability, grizzly bears often seek alternate foods at lower elevations, leading to more frequent bear conflicts and human-caused grizzly bear mortalities (Mattson et al. 1992, Knight and Blanchard 1994, Gunther et al. 1997, Haroldson et al. 2006). Conversely, when whitebark pine nuts are abundant, there are generally very few grizzly bear-human conflicts during the fall season (Mattson et al. 1992, Gunther et al. 1997). Studies have shown that during poor whitebark pine years grizzly bears selected less for whitebark pine stands (Costello et al. 2014) and consumed more animal matter, boosting their fat levels to match those measured in years of high cone production (Schwartz et al. 2014). Although whitebark pine has experienced widespread declines in the GYE (see subsequent section), extensive studies by the IGBST showed no profound negative effects on grizzly bears at the individual or population level (IGBST 2013). Costello et al. (2014) reported that approximately one-third of Yellowstone grizzly bears in their study included little or no whitebark pine stands within their fall range.

Monitoring Protocol—Currently there are 21 whitebark pine cone production transects (Figure 8) within the GYE. Annual transect surveys are typically conducted between July 15 and August 15 to count cones after maturation but before cones and seeds have been collected by red squirrels (*Tamiasciurus hudsonicus*) and Clark's nutcrackers (*Nucifraga columbiana*). The presence or absence of blister rust and beetle infestations as well as activity levels of grizzly bear, black bear, red squirrel, and Clark's nutcracker are also recorded during transect surveys. Monitoring of whitebark pine cone production using current or modified methods will continue under this Conservation Strategy and results will be summarized and reported in the IGBST publication *Yellowstone Grizzly Bear Investigations*.

Figure 8. Location of whitebark pine cone production transect sites in the GYE, 2014.

Monitoring Mountain Pine Beetle Infestation and White Pine Blister Rust Infection

Background—Since the early 2000s, whitebark pine has declined significantly throughout much of the species' historic range in the Northern Rockies due to the spread of mountain pine beetle (*Dendroctonus ponderosae*) and white pine blister rust (*Cronartium ribicola*). The greatest levels of whitebark mortality resulted from mountain pine beetle, a native insect that typically attacks large, mature trees with inner bark thick enough to support larvae (Larson 2011). Beetle infestations tend to occur episodically every 20-40 years resulting in high, widespread mortality across coniferous forests. The most recent outbreak began in the early 2000s and impacted millions of hectares in the Rocky Mountains (Raffa *et al.* 2008). The infestation was exacerbated by warmer winters at higher elevations allowing for increased brood development and survival of adult beetles, and greater opportunity for reproduction (Bentz *et al.* 1991, Perkins and Roberts 2003, Larson 2011, Dooley 2012).

White pine blister rust, an exotic invasive pathogen introduced to North America in 1910, affects whitebark pines of all age classes, although seedlings and saplings are especially susceptible to infection. This exotic fungal pathogen infects the cambium of whitebark pine and other five-needle pines, causing reproductive failure and tree mortality (McKinney *et al.* 2009, Bockino and Tinker 2012). However, some individual whitebark pines carry genetic traits that make them more resistant to the disease. Restoration programs launched by the Forest Service use a technique described by Mahalovich *et al.* (2006) to breed and plant rust-resistant whitebark pines as part of an on-going effort to restore and maintain the species in the GYE.

In 2000, under the auspices of the Greater Yellowstone Coordinating Committee (GYCC), the Whitebark Pine Subcommittee (WBPSC) was created and tasked with forging a comprehensive long-term strategy for monitoring whitebark pine throughout the ecosystem. Recognizing the persistent and pervasive threat that blister rust and pine beetle posed to the health of whitebark pine, the subcommittee reached out to other agency and non-governmental partners to avoid duplication of efforts. The result of these alliances is the Greater Yellowstone Whitebark Pine Monitoring Working Group (GYWPMWG), which consists of partners from the National Park Service (NPS), U.S. Forest Service (USFS), U.S. Geological Survey (USGS), and Montana State University (MSU). Led by the NPS Greater Yellowstone Inventory and Monitoring Network (GRYN), a strategic and peer-reviewed monitoring protocol was established for detecting, tracking, assessing, and reporting the health, status, and trends of whitebark pine throughout the GYE (GYWPMWG 2011). This ground-based monitoring program was initiated in 2004 and will continue to assess the current status and long-term trends of whitebark pine into the foreseeable future.

Monitoring Protocol—Spearheaded by the GRYN, an interagency collaborative monitoring effort involving NPS, USFS, and USGS partners will measure the status and trends of whitebark pine throughout the GYE. Monitoring efforts will focus on collecting critical baseline information for assessing 1) infection rates and severity of white pine blister rust; 2) survival of whitebark pine, taking into account synergistic interactions of blister rust, mountain pine beetle,

wildland fire, and other agents of change; and 3) recruitment of whitebark pine trees into cone-bearing age classes. Monitoring protocols will follow methods and procedures established in the *Interagency Whitebark Pine Monitoring Protocol for the Greater Yellowstone Ecosystem* (GYWPMWG 2011). Results of current whitebark pine status and trends will be made available at the GRYN Inventory and Monitoring website and referenced in the annual IGBST monitoring report *Yellowstone Grizzly Bear Investigations*.

Hunter Numbers

Background

The number of elk hunters in Wyoming, Idaho, and Montana who recreate in the PCA (Table 6) were estimated and compared with known and probable grizzly bear mortalities from 2005 to 2014 to determine if bear mortality is correlated with hunter numbers. Although total hunter numbers have declined over this time period, the data showed little evidence of a relationship between hunter numbers and hunting-related human-caused grizzly bear mortality (van Manen 2015, *in litt.*).

The greatest source of grizzly bear (≥2 years old) mortality during 2004–2014 in the GYE has been due to interactions with hunters. Nearly all known and probable bear mortalities occur as surprise encounters, at big game carcasses, or at hunter camps. The number of mistaken identity kills (i.e., mistaken for black bear) are small. Although the number of hunters using the PCA have decreased, the number of grizzly bear known and probable mortalities due to interactions with hunters increased in the last decade, primarily outside the PCA (Figure 5, Chapter 2). Potential explanations for why this occurred include bears learning to seek hunter-killed game, an increase in population size and concurrent expansion of occupied range, and greater use of ungulate resources (Haroldson *et al*. 2004, Schwartz *et al*. 2010, IGBST 2013).

Table 9. Estimated numbers of elk hunters within the GYE grizzly bear recovery zone plus a 10-mile perimeter in Idaho, Montana, and Wyoming, 2005–2014.

	Year									
State	2005	2006	2007	2008	2009	2010	2011	2012	2013	2014
Idaho[a]	3,619	3,016	2,592	1,763	1,819	1,904	1,860	1,803	1,937	2,771
Montana[c]	12,365	12,211	12,635	12,470	12,382	12,334	12,269	10,936	NA[b]	11,925
Wyoming[a,d]	9,888	9,346	8,716	8,792	8,440	6,712	6,413	7,566	7,818	8,109
Total	25,872	24,573	23,943	23,025	22,641	20,950	20,542	20,305	NA	22,805

[a] Idaho and Wyoming numbers include archery and gun hunters.

[b] NA = hunter number estimates not currently available.

[c] Gun-only season.

[d] A percentage of total hunter numbers was used in hunt areas 61 to 63, 67, 68, 73, and 83 because a portion of the hunt area falls outside the designated area.

State and federal wildlife agencies have attempted to reduce the loss of bears to hunters by expanding information and education programs. "Living in Bear Country" workshops are conducted regularly in many GYE communities, and licensed outfitters and guides have increased training for their members and clients.

Monitoring Protocol

Data from state wildlife agencies on big game herd units or hunting districts will be used as an index to backcountry use during the hunting season. Hunter use levels combined with numbers of grizzly bear-human conflicts will be used to identify when and where to increase

public education efforts and develop appropriate management actions to minimize grizzly bear-human conflicts that result in bear mortality.

Monitoring Habitat Connectivity

Background

Habitat connectivity is the degree to which the landscape promotes natural movement of wildlife as they seek important resources for survival and successful procreation. Potential effects of highway improvements, such as increased motorized access, higher traffic volume, and higher speed limits, are known to increase grizzly bear mortality, reduce habitat connectivity, and potentially inhibit gene flow among nearby populations (Mace 2004, Summerfield *et al.* 2004, Proctor *et al.* 2012). Certain road designs and road improvements potentially discourage bear crossings, may lead to increased mortality from vehicle collisions, and may cause habitat fragmentation. The potential impact of highways on demographic and genetic connectivity of grizzly bears in the GYE is a key consideration in the transportation planning process.

Monitoring Protocol

To prevent habitat fragmentation and loss of connectivity, existing road survey information will be compiled and evaluated by the appropriate land management agency as an integral part of the planning stage of any proposed road improvement and/or construction project in suitable grizzly bear habitat within the GYE (both inside and outside the PCA). During the NEPA analysis stage of such projects, analyses of road survey information will be conducted to evaluate potential impacts of the project on grizzly bear habitat connectivity. More specifically, federal agencies will identify important crossing areas by collecting and/or assessing existing information about known grizzly bear sightings, ungulate road mortalities, locations of game trails, and bear home ranges and habitat use within and near the road corridor. By identifying crossing areas used by grizzly bears, federal officials can recommend mitigation measures to reduce potential impacts

from road construction both during and after a project. For example, during construction, work camps should be placed in areas with lower risk of displacing grizzly bears and use of bear-proof food and garbage storage containers should be implemented. Highway planners are encouraged to place warning signs at points of high mortality risk and implement wildlife crossing infrastructure such as culverts or underpasses to enhance safe passage. Road construction in areas of relatively high value for potential grizzly bear habitat linkage should be designed to mitigate potential negative impacts on habitat connectivity, including the consideration of installing crossing structures.

Chapter 4 Management and Monitoring of Grizzly Bear-Human Conflicts

Introduction

Humans and grizzly bears occasionally come into conflict in areas where they encounter one another. The objective of nuisance management is to minimize grizzly bear-human conflicts. In the Greater Yellowstone Ecosystem, nuisance bear management is essential to successful grizzly bear conservation and is often necessary to prevent property damage, livestock losses, and human injury or death. Grizzly bears cannot be totally protected. Like other species, grizzly bears develop individual traits, and some of those traits are not compatible with coexistence with humans. Management emphasis will shift from protecting every individual grizzly bear in the population to assessing an individual's importance to the entire population before instituting management actions. Females will continue to receive a higher level of protection than males. Management of nuisance bears requires rapid responses by state and federal agencies to address conflict situations. This agency response will address the sources of the conflict through public education, removal of attractants, or preventive sanitation of human use areas. Agencies will also capture, relocate, or destroy repeat offender grizzly bears when necessary and when other options have been exhausted.

Analysis of grizzly bear-human incidents indicates that most property damage incidents are the result of bears attempting to gain access to garbage, human foods, livestock or pet foods, or other human-related foods in areas of human presence. Occasionally bears will prey on domestic swine, fowl, or goats, or will damage apiaries. They have rarely injured horses.

Although aggression toward people and human injury or death are rare, bears will occasionally harm people. Incidents of injury are usually the result of a surprise encounter, protection of cubs, defense of a food cache, harassment, or when bears have become accustomed to obtaining food from humans.

The management of grizzly bear-human conflicts is based upon the existing laws and authorities of the state and federal land management agencies as detailed in Chapter 7. Management of nuisance bears usually falls into one or more of the following categories:

- Removing or securing the attractant
- Deterring the bear from the site through the use of aversive conditioning techniques
- Capturing and relocating the nuisance bear
- Removing the bear from the wild, including lethal control

Definitions:

- **Unnatural aggression** by a grizzly bear is defined as behavior that includes active predation on humans, approaching humans or human use areas, such as camps, in an aggressive way, or aggressive behavior when the bear is unprovoked by self-defense, defense of cubs, defense of foods, or in a surprise encounter.

Formatted: No bullets or numbering

- **Grizzly bear-human conflicts** are incidents in which bears injure people, damage property, kill or injure livestock, damage beehives, obtain anthropogenic foods, or damage or obtain garden and orchard fruits and vegetables.

Formatted: No bullets or numbering

- **Natural aggression** by a grizzly bear is defined as defense of young, food, during a surprise encounter, or self-defense.

Formatted: No bullets or numbering

- A bear is classified as **food conditioned** when it has received a significant food reward of human foods such as garbage, camp food, pet food, or processed livestock food, and persistently seeks these foods.

Formatted: No bullets or numbering

- A bear is classified as **habituated** when it does not display avoidance behavior around humans or in human use areas such as camps or town sites or within 100 meters of open roads.

- **Relocation** is the capture and movement by management authorities of a bear involved in a conflict with humans or human-related foods, to a remote area away from the conflict site, usually after fitting the bear with a radio collar.

- **Repeat offense** is the involvement of a bear that has been previously relocated in a nuisance situation or, if not relocated, continues to repeat a behavior that constitutes a grizzly bear-human conflict.

- **Removal** is the capture and placement of a bear in an authorized public zoological or research facility or destruction of that bear. Removal can also involve killing the bear through active measures in the wild when it is not otherwise possible to capture the bear.

- **Management authorities** are the designated representatives of the agencies in the GYE including: Yellowstone National Park; Grand Teton National Park (GTNP); Wyoming Game and Fish Department; Montana Fish, Wildlife & Parks; Idaho Department of Fish and Game; Interagency Grizzly Bear Study Team; each of the GYE national forests—Custer-Gallatin, Shoshone, Bridger-Teton, Caribou-Targhee, and Beaverhead-Deerlodge; the BLM; and USDA Wildlife Services. These authorities will make the decision to classify a bear as nuisance inside the GYE in compliance with the nuisance bear criteria (discussed below). Outside Yellowstone and Grand Teton National Parks within the PCA, subsequent management actions will be coordinated and completed by state wildlife agencies~~, after coordination with other appropriate agencies~~. Nuisance grizzly bear conflict management is under the authority of the states, who will have primary responsibility for the management action. When nuisance bears are in YNP or GTNP, decisions will be made by park representatives, and coordinated with state and Forest Service representatives when

Formatted: No bullets or numbering

Formatted: No bullets or numbering

Formatted: No bullets or numbering

Formatted: No bullets or numbering

Comment [t60]: 2007 languageto strike-Delete or clarify that transplants require coordination but management actions are the decision of the state.

necessary, e.g., for bear relocations. Management of nuisance bears outside the PCA will be conducted as described in the state grizzly bear management plans or appropriate park management plans.

Management of nuisance grizzly bears in the Greater Yellowstone Ecosystem will vary depending on whether they are inside or outside the PCA. This system will provide increased security for grizzly bears inside the PCA, as bears will be given greater consideration in most conflicts inside the PCA. Minimization of grizzly bear-human conflicts and management of individual nuisance bears is the primary direction for management within the PCA.

In circumstances that result in a nuisance bear situation outside the PCA, more consideration will be given to existing human uses. Site-specific conflict areas within and outside the PCA will be documented and prioritized to focus proactive management actions to minimize grizzly bear-human conflicts and address existing and potential human activities that may cause future conflicts. Past conflict management has demonstrated that grizzly bears can coexist with most human activities.

Outside the PCA, state management plans will govern how nuisance grizzly bears are handled. Site-specific conflict areas within and outside the PCA will be documented routinely and prioritized to focus proactive management actions to minimize grizzly bear-human conflicts and address existing and potential human activities that may cause future conflicts. The following nuisance grizzly bear standards apply only to the PCA. All nuisance grizzly bear conflicts that occur outside the PCA will be managed according to guidelines in each of the state management plans (Appendices I, J, and K).

Nuisance Bear Standards

The focus and intent of nuisance grizzly bear management inside and outside the PCA are predicated on strategies and actions to prevent grizzly bear-human conflicts. It is recognized that active management aimed at individual nuisance bears will be required in both areas. Management actions outside the PCA will be implemented according to state management plans in coordination with landowners and land management agencies. These actions will be compatible with grizzly bear population management objectives for each state for the areas outside the PCA.

General Criteria

Location, cause of incident, severity of incident, history of bear, health/age/sex of bear, and demographic characteristics of animals involved will all be considered in any relocation or removal. Removal of nuisance bears will be carefully considered and consistent with mortality limits for the GYE as described in the Conservation Strategy. Recognizing that conservation of female bears is essential to maintenance of a grizzly bear population, removal of nuisance females will be minimized.

Within the Primary Conservation Area

Within the PCA, management of nuisance bears will be addressed according to the following standards:

Bears displaying food conditioning and/or habituation may be either relocated or removed based on specific details of the incident. State wildlife agencies~~, following consultation with other appropriate management authorities,~~ and national parks will make this judgment after considering the cause, location, and severity of the incident or incidents.

Bears may be relocated as many times as judged prudent by management authorities. ~~No bear may be removed for any offense, other than unnatural aggression, without at least one relocation~~

Comment [t61]: 2007 language to strike-Delete or clarify that transplants require coordination but management actions are the decision of the state..

~~unless representatives of affected agencies document the reason in writing~~. All relocations outside the PCA will be governed by state management plans.

Bears may be preemptively moved when they are in areas where they are likely to come into conflicts with site-specific human activities, but only as a last resort. Such preemptive moves will not count against the bear as nuisance moves.

Bears preying on lawfully present livestock (cows, domestic sheep, horses, goats, llamas, etc.) on public lands will be managed according to the following criteria:

- No grizzly bear involved in livestock depredations inside the PCA shall be removed unless it has been relocated at least one time and continues to cause livestock depredations.

~~Before any removal, except in cases of human safety, management authorities will consult by telephone or in person to judge the adequacy of the reason for removal.~~

Bears displaying natural aggression are not to be removed, even if the aggression results in human injury or death, unless it is the judgment of management authorities that the particular circumstances warrant removal.

Bears displaying unnatural aggression will be removed from the population.

Decisions will be based on criteria for relocation and removal inside the PCA for management of nuisance bears in the Conservation Strategy and best biological judgment of authorities.

- Authorized National Park Service authorities will implement removals and relocations within YNP and GTNP.
- Authorized state or tribal authorities outside YNP and GTNP will implement other removals and relocations.
- State and tribal wildlife agencies in coordination with the appropriate federal agencies will predetermine adequate and available sites for relocations. Relocation sites should be agreed upon before the need for relocation occurs. In order to deal with problem bears more efficiently, managers should have full access to relocation sites without having to conduct individual consultation for each relocation.
- Livestock damage prevention and compensation are addressed in individual state management plans.

Comment [t62]: 2007 language to strike- there may not be an appropriate location to move the bear and mortality threshold will assure mortality is managed appropriately

Comment [t63]: 2007 language to strike- mortality threshold will assure mortality is managed appropriately

Comment [t64]: 2007 language. Delete

Management of ~~all~~ nuisance bear situations will emphasize removal of the human cause of the conflict, when possible, or management and education actions to limit such conflicts. Relocation and removal of grizzly bears may occur if the above actions are not successful.

Comment [t65]: 2007 language to consider.

Specific Criteria for Removals

Captured grizzly bears identified for removal may be given to public research institutions or public zoological parks for appropriate non-release educational or scientific purposes as per regulations of states and national parks. Grizzly bears not suitable for release, research, or educational purposes will be removed as described in appropriate state management plans or in compliance with national park rules and regulations.

Outside of national parks, individual nuisance bears deemed appropriate for removal may be taken by a legal hunter in compliance with rules and regulations promulgated by the appropriate state wildlife agency commission, as long as such taking is in compliance with existing state and federal laws, and as long as mortality limits specified for the GYE as described in this Conservation Strategy are not exceeded. This could include licensed hunters or property owners or their agents who have obtained appropriate permits from the state. Licensed hunters will be allowed to possess bear parts for bears that are legally harvested under a state permit.

Monitoring Protocol

All nuisance bear control actions, and grizzly bear-human and grizzly bear-livestock conflicts will be summarized annually in the Annual Report of the IGBST. Most conflicts are due to availability of human foods, human developments, or livestock depredations in occupied grizzly bear habitat. This report will detail the cause and location of each conflict and management action and display an annual spatial distribution of conflicts that can be used by managers to

identify where problems occur and to compare trends in locations, sources, land ownership, and types of conflicts.

Chapter 5 Information and Education

Introduction

The future of the Yellowstone grizzly bear lies in our ability to learn to coexist with the grizzly bear and to accept this animal as a cohabitant of the land. Historically, excessive human-caused mortality and loss of habitat are the major factors in grizzly bear population decline. Addressing the source of grizzly bear-human conflicts is critical to an effective public outreach plan. Public attitudes in large part determine the success of efforts to manage a recovered grizzly bear population in the Greater Yellowstone Ecosystem. For the good of the bear and to develop positive public attitudes, a coordinated information and education campaign is essential.

The purposes of the information and education aspects of this cooperative effort are to support the development, implementation, and dissemination of a coordinated information and education program. This program should be understandable and useful for the people who visit, live, work, and recreate in bear habitat to minimize grizzly bear-human conflicts and to provide for the safety of people while building support for viable bear populations.

Other management strategies outlined in this plan are unlikely to succeed without useful, state-of-the-art public information and education programs. A partnership information and education approach involving state and federal agencies, tribes, local communities, and private interests can result in minimizing grizzly bear-human conflicts while building support for bears and bear management.

Successful long-term community involvement in future grizzly bear management efforts requires continued use of current effective methods and tools that have contributed to the success story of the recovered population we have today. In addition, to meet the needs of an ever-growing human population and expanding bear population, it will be necessary to

develop new processes and outreach tools to further enhance public involvement and appreciation of the grizzly bear and monitor social behavior and attitudes. Through close monitoring, we will be able to gauge our success in reaching our diverse public and in minimizing grizzly bear-human conflicts, adjusting programs as needed.

Successful public education and involvement should result in the understanding that it is acceptable and expected human behavior to practice good stewardship, and this will in turn allow us to live with the grizzly bear as part of our valued wildlife resources.

The Information and Education Team

The information and education effort will continue to be coordinated between all agencies and private interests to ensure timely, accurate, and consistent messages to the public. The current information and education (I & E) working group within the Greater Yellowstone Ecosystem will continue. Members of this I & E Team include public affairs personnel from Forest Service Regions 1, 2, and 4; Grand Teton and Yellowstone National Parks; the BLM; representatives from each state wildlife agency; and the information and education specialist from the IGBC. This team will continue to work with all affected interests to ensure consistency of information, efficient funding strategies, identifying and targeting audiences, developing partnerships, and identifying new tools for implementation.

A coordinated information and education campaign will be most effective if it facilitates changing inappropriate human behaviors and helps people learn to coexist with bears. The benefits of grizzly bear management for a multitude of resources and species, including elk habitat management, black bear management, and water quality, recreation, and aesthetic values of access management, will be included in the information and education efforts. Long-term community engagement in grizzly bear issues is necessary to increase the awareness of bear behavior and biology and how these can be compatible with human needs and activities. Identification of sources of grizzly bear-human conflicts and the use of public

education as a tool are essential. The responsibilities of the I & E Team include the following:

Develop a coordinated information and education campaign to cultivate an appreciation of the value of the grizzly bear resource in this area. The grizzly bear will be presented as a valuable wildlife resource, while still acknowledging the risks associated with them in publications and educational outreach.

Continue and expand living-with-bears workshops or outreach with a similar message for citizens and teachers within the Greater Yellowstone Ecosystem. Similar seminars for other specific target groups such as hunters and other backcountry recreationists will be used as appropriate.

Local citizens involvement groups and processes will be used to facilitate information exchange and identify other community interests regarding the grizzly bear.

Updates and information will be provided to all affected interests through various media including news releases and mailings, television, etc.

State and federal volunteer programs will be encouraged to identify and provide an opportunity for public participation in grizzly bear information outreach and management. This could include trailhead demonstrations on bear resistant containers, distribution of brochures, school education programs, etc.

Proactive and preventative safety messages will be expanded.

Citizens will be encouraged to participate in land management decisions at the project level on state and federal lands affecting grizzly bear habitat and management.

Citizens will also be encouraged to be involved in private land issues associated with grizzly bear management. This may include sanitation ordinances, conservation easements, developing private land management plans, and supporting informational outreach campaigns to private landowners.

Knowledge about bears and acceptance of grizzly bears by people and groups that live, work, and recreate in grizzly bear country are key to the long-term conservation of a healthy grizzly bear population. Continuing specific outreach messages and techniques tailored to the needs of

these groups is essential. Some of these groups include landowners, mining industry, timber industry, firewood gatherers, ranchers, outfitters, anglers, hunters, front country visitors, backcountry visitors, summer home owners, local business owners, developers, county planners, and school children.

Finally, information made available to the public will be open and responsive to public concerns. Open discussions with the public will increase credibility of the grizzly bear management program.

These efforts will be reviewed periodically and program adjustments will be made as necessary. In addition, efforts will be expanded as the bear population expands and additional efforts will be needed in areas that could become occupied in the near future.

Many brochures, videos, signs, articles, etc. are currently available and in use. Examples of these specific information and education tools are discussed in the state management plans.

Chapter 6 Implementation and Evaluation

Implementation

A new committee will replace the Yellowstone Ecosystem Subcommittee. The new committee, the Yellowstone Grizzly Bear Coordinating Committee (YGCC), is the body that will coordinate management and promote the exchange of information about the Yellowstone grizzly bear population. The YGCC will inform the IGBC about the Yellowstone grizzly bear population for the benefit of grizzly bear conservation and management.

The Yellowstone Grizzly Bear Coordinating Committee

Within 30 days of a final rule delisting the Greater Yellowstone Ecosystem grizzly bear population, the signatories of this Conservation Strategy will name their agency representatives to the YGCC. The person who was chairperson of the Yellowstone Ecosystem Subcommittee when the final rule changing status is published will call the first meeting of the GYCC. At this first meeting, the YGCC will elect a chairperson. Chairpersons will be elected at intervals determined by the members of the YGCC. The YGCC will meet at least two times each year; public notification of these meetings will be made by the chairperson or her/his representatives. The YGCC will strive for consensus, but when consensus cannot be achieved, decisions of the YGCC will be determined by majority vote. The details on locations and times of meetings and other business issues associated with the functioning of the YGCC will be determined at the first meeting.

YGCC members' expenses will be paid by their respective agencies.

YGCC authorities include:

Revise or amend the Conservation Strategy based on the best biological data and the best available science. Any such amendments will be subject to public review and comment. Amendments will be made by the YGCC with a majority vote.

Comment [t66]: Comment-2007 language. May want to discuss how other legal requirements apply. E.g.,, a majority of votes can't require a change to a USFS plan that Forest hasn't processed

Establish meeting rules and procedures, and chairperson election rules for the committee.

Seek funding to further the conservation of the Yellowstone grizzly bear by implementing this Conservation Strategy. Each agency is responsible for seeking the necessary funding to carry out the tasks assigned in this Conservation Strategy.

Some primary activities of the YGCC are:

Coordinate implementation of this Conservation Strategy.

Ensure that population and habitat data are collected annually by the IGBST, as specified in this Conservation Strategy, and evaluated to assess current status of the grizzly bear population.

Share information and implement management actions in a coordinated fashion.

Identify management, research, and financial needs to successfully implement the coordinated Conservation Strategy.

Implement a Biology and Monitoring Review ~~as necessary and submit a petition for relisting~~ as appropriate to ensure agency responsiveness to changing circumstances of the grizzly or its habitat in the Greater Yellowstone Ecosystem.

Comment [t67]: . 2007 language to strike- not an appropriate function for individual agency representatives on the Committee or a committee that is not a separate legal entity

Appoint a chairperson and members of the Information and Education Team, and coordinate information and education efforts.

This committee does not supersede the authority of the management agencies beyond the specific actions agreed to as signatories of this Conservation Strategy.

YGCC membership will consist of representatives of the following, each having one vote:

Federal	National parks: Yellowstone and Grand Teton
	National forests: Beaverhead-Deerlodge, Bridger-Teton, Caribou-

	Targhee, Custer-Gallatin, and Shoshone
	One Bureau of Land Management representative
	The Biological Resources Division of the U.S. Geological Survey
State wildlife agencies	Idaho, Montana, and Wyoming
Local government	One representative from each state
Tribal	One representative from each Native American tribe with sovereign powers over reservation lands within the ecosystem

The Interagency Grizzly Bear Study Team (IGBST) and the Information and Education Team (I & E) will perform necessary tasks and report to the YGCC.

The Interagency Grizzly Bear Study Team

In order to understand the dynamics of grizzly bears throughout the GYE, a need for centralized responsibility to collect, manage, analyze, and distribute science-based information was identified. To meet this need, in 1973 agencies formed the Interagency Grizzly Bear Study Team, a cooperative effort between the U.S. Geological Survey, National Park Service, U.S. Forest Service, U.S. Fish and Wildlife Service, and the state wildlife agencies of Idaho, Montana, and Wyoming.

Since 1974, the IGBST has published more than 200 scientific papers on the grizzly bear. A complete list of these papers can be found at: http://nrmsc.usgs.gov/science/igbst/detailedpubs .

Quantitative data on grizzly bear abundance, distribution, survival, mortality, nuisance activity, and bear foods are critical to formulating management strategies and decisions. The IGBST coordinates data collection and analysis on an ecosystem scale, prevents overlap of efforts, and pools limited economic and human resources.

The IGBST will continue to function under this Conservation Strategy after delisting.

The responsibilities of the IGBST are to:

Conduct both short- and long-term research projects addressing information needs for bear management
Monitor the bear population, including status and trend, numbers, reproduction, and mortality
Monitor grizzly bear habitats, foods, and the impacts of humans
Provide technical support to agencies and other groups responsible for the immediate and long-term management of grizzly bears in the GYE
Take the lead in preparing a Biology and Monitoring Review with staff support from the YGCC in response to deviations from required population or habitat standards
Coordinate annual updates of the motorized access database
Coordinate annual evaluation of motorized access route density and secure habitat
Document annually any changes in developed sites, livestock allotments, or permitted sheep numbers and maintain associated databases
Ensure all units have the tools and the training to evaluate motorized access route density and secure habitat for projects
Evaluate the need for changes in ways to evaluate motorized access route density, secure habitat, and habitat effectiveness, and make recommendations to the YGCC on such changes, as necessary
Set and maintain standards, definitions, values, formats and processes for collecting and updating data and assessment models, and maintaining data consistency between units.
Produce annual reports on population and habitat monitoring items

The USGS employee who is the lead biologist for USGS on the Greater Yellowstone Ecosystem grizzly bear population chairs the IGBST and will call meetings at least twice each year. The majority of funding for the IGBST comes from USGS but additional funding and in-kind efforts are made by all agencies (*see* Appendix F). The IGBST will report its findings to the YGCC.

The Information and Education Team

Successful maintenance of a recovered grizzly bear population in the GYE requires joint understanding of issues, sharing of knowledge (including new science and results of monitoring), and open communication among agencies, tribes, elected officials, non-governmental groups and organizations, and the public. The goals of the Information and Education (I & E) Team are:

Increase public support for and compliance with agency management actions to maintain a secure GYE grizzly bear population

Utilize all possible modern technology and media resources to help decrease grizzly bear-human conflicts while still maintaining maximum access to natural resources for both humans and grizzly bears

Increase an understanding of grizzly bears and their habitat

Foster information sharing to ensure maximum resource, policy, and scientific informational exchange among agencies, tribes, elected officials, interest groups, local residents, and the public.

Provide for meaningful public involvement through use of open houses, direct mailings, and media campaigns to inform the public about agency decisions relating to grizzly bear habitat and population management activities and other management actions that may affect local residents, landowners, tribes, and users

Members of the Information and Education Team will include I & E specialists from the National Park Service, U.S. Forest Service, and the state wildlife agencies of Idaho, Montana, and Wyoming. The I & E Team will report to the YGCC.

Evaluation

The evaluation of the effectiveness of grizzly bear conservation measures detailed in this Conservation Strategy will be an ongoing process shared by all the members of the Yellowstone Grizzly Bear Coordinating Committee.

As detailed in the monitoring portion of this strategy, the IGBST will take the lead in preparing an annual monitoring report with staff support from the YGCC. Agencies responsible for monitoring major population and habitat parameters are listed in Appendix G. Monitoring results and analyses will be presented to the YGCC by the IGBST. A Biology and Monitoring Review would be triggered if any of the following conditions were met:

- Exceeding independent female mortality limits in 3 consecutive years
- Exceeding independent male mortality limits in 3 consecutive years
- Exceeding dependent young mortality limits in 3 consecutive years
- Failure to meet the distribution criterion

Biology and Monitoring Review

Under this Conservation Strategy, a Biology and Monitoring Review is a process carried out by the IGBST. A Biology and Monitoring Review examines management of habitat, populations, or efforts of participating agencies to complete their required monitoring. Biology and Monitoring Reviews will be undertaken after the annual summary of monitoring information presented to the YGCC and in response to deviations from required population or habitat standards. Any YGCC member agency also can request that a Biology and Monitoring Review be considered. Such consideration would be a topic for discussion by the YGCC and the review would be initiated based on the decision of the YGCC. The Biology and Monitoring Review process will be completed within six months and the resulting written report presented to the YGCC and made available to the public. The IGBST is not responsible for completing impact analyses for projects proposed by any agency; such analyses are the responsibility of the agency making the proposal.

The purposes of a Biology and Monitoring Review are:

To identify the reasons why particular demographic or habitat objectives have not been achieved and to recommend modifications to the YGCC for changes as necessary, or
To consider potential impacts of a proposed action of concern to one or more members of the YGCC, or
To consider departures by one or more agencies from the monitoring effort required under this Conservation Strategy and to recommend plans to the YGCC to ensure that monitoring efforts be maintained as per the standards in this document, or
To consider and establish a scientific basis for possible changes in management due to changed conditions in the ecosystem and make those recommendations to the YGCC~~, or~~
~~Make recommendations as to whether a petition for relisting should be submitted.~~

Comment [t68]: 2007 language to strike. Delete per comments above re petition.

Biology and Monitoring Reviews will be based on the best available science. Biology and Monitoring Reviews will be submitted as written reports by the IGBST to the YGCC and made available to the public. The YGCC will respond to the Biology and Monitoring Review in a written form either through the minutes of the YGCC meeting or in specific Biology and Monitoring Review response documents, as necessary. The purpose of the YGCC response is to address the issues(s) raised in the Biology and Monitoring Review with an explanation or management changes as necessary. In the case of a deviation from monitoring efforts required under this Conservation Strategy, the response will identify the means to be implemented by the YGCC to ensure continued population and/or habitat monitoring efforts as required in this document.

A Biology and Monitoring Review is generally triggered by negative deviations from the desired conditions established in this Conservation Strategy for population, mortality ~~reduction~~management, and habitat parameters; however, the IGBST can recommend a Biology and Monitoring Review to the YGCC if they deem it necessary.

~~A Biology and Monitoring Review will make recommendations as to whether a petition for relisting should be made. This recommendation shall be based upon the magnitude of the threat that the deviation from the desired condition poses to the maintenance of a recovered population.~~

~~The YGCC has to formally agree with a recommendation from the IGBST to petition for relisting.~~

Comment [t69]: 2007 language to strike. Delete per prior comments re petition. Additionally, inappropriate for IGBST to make recommendations or policy decision

~~If the situation, after completion of the Biology and Monitoring Review, is such that some or all of the desired population and habitat conditions specified in this Conservation Strategy are not being met, and cannot be met in the opinion of the YGCC, then the YGCC will submit to the Fish and Wildlife Service a petition for relisting. In the case of a vote on this issue, a simple majority is necessary.~~

Fish and Wildlife Service Status Review

The Service may initiate a formal status review: ~~and may emergency relist the GYE grizzly population until the formal status review is complete under two conditions~~: (1) if there are any changes in Federal, State, or Tribal laws, rules, regulations, or management plans that depart significantly from the specifics of population or habitat management detailed in this section and significantly increase the threat to the population.; ~~and/or (2) if independent female mortality limits are exceeded in 3 consecutive years; or~~ (~~3~~2) ~~A~~ a total population estimate of less than 500 inside the DMA~~.~~; and/or (3) if the Service determines a petition to relist from an individual or organization, including the YGCC, is warranted.

Comment [t70]: 2016 language to strike- These can't be predecided to meet the emergency listing critiera and process of Section 4(a) /4(b) of the ESA. This is covered in paragraph on next page from 2007 language.

Comment [G71]: 2016 language to strike-this triggers a biology and monitoring review, not a status review.

Comment [t72]: 2016 language to modify- these are within the reasonable range of the status review "scenarios" in a delisting rule. The change in regulation or law scenario should include a tie to a significant increase in threat.

~~Under Section 4 of the Endangered Species Act, a petition from an individual or organization to relist this population will initiate a status review, if the Service determines that the petition is warranted.~~ To be warranted, such a petition must present credible scientific information to support the petition. ~~The YGCC can petition the Fish and Wildlife Service to relist the GYE~~

~~grizzly bears.~~ The Service is to perform a status review upon receipt of such a petition that contains sufficient information to demonstrate that the request to relist is warranted. ~~A relisting petition from the YGCC should be accompanied by the available specific biological data on the population and its habitat sufficient to judge its status as a recovered population as per the requirements of this Conservation Strategy.~~ A status review will evaluate the factors affecting the population and result in a finding that summarizes the status of the population and recommends listing or not. For purposes of a status review, the status of the entire Greater Yellowstone Ecosystem grizzly bear population would be considered~~.~~

Comment [G73]: 2007 language to strike. Delete per prior comments re petition.

The Service can also unilaterally initiate a status review to determine if the GYE grizzly bears should be a candidate species and be added to the species to be listed. ~~This could be accomplished independently of the YGCC based on Service concerns about the population and/or its habitat.~~ Based on a review of a petition or a status review initiated by the Service, if the Service finds serious and imminent threats to the population as per the criteria of the Endangered Species Act in Section 4(a)(1), the species could be immediately considered for relisting or could be relisted under emergency regulations, per Section 4(b)(7).

Chapter 7 Existing Authorities

Introduction

The existence of adequate regulatory mechanisms that serve to maintain the Yellowstone grizzly bear population as recovered is one of the five factors required to change the status of the population to delisted and to ensure a healthy grizzly bear population.

The management of populations of grizzly bears and the habitats these bears require for survival is dependent upon the laws and regulations of the federal and state agencies in the Greater Yellowstone Ecosystem (GYE). These laws and regulations provide the legal basis for controlling mortality, providing secure habitats, managing grizzly bear-human conflicts, controlling hunters, limiting access where necessary, controlling livestock grazing, maintaining education and outreach programs to control conflicts, monitoring populations and habitats, and requesting management and petitions for relisting when necessary. Many of these laws provide authorities for a number of these actions and controls.

The following laws and regulations, or portions thereof, exist and are relevant to agency programs regarding management of the grizzly bear and its habitat in the GYE. These provisions, whether national or state, have application in terms of agency compliance, agency authority, or discretion to act.

The relationship between the existing authorities and the five factors in Section 4(a)(1) used to consider listing and delisting of a species is presented in Appendix H. These five factors are all relevant to maintain a recovered population.

Federal Lands

Acts of Congress[4]

The Act of Congress March 1, 1872. Set Yellowstone apart as a public park for the benefit and enjoyment of the people" and "for the preservation, from injury or spoliation, of all timber, mineral deposits, natural curiosities or wonders...and their retention in their natural condition". 16 U.S.C. §§21-22.

National Park Service Organic Act, 1916. The National Park Service...shall promote and regulate the use...by such means... to conserve the scenery and the natural and historic objects and the wild life therein and to provide for the enjoyment of the same in such a manner...as will leave them unimpaired for future generations. 16 U.S.C. §31 repealed June 25, 1948.

Lacey Act, Criminal Code Provisions, 18 U.S.C. 42-44. This Act makes it illegal to import, export, transport, sell, receive, acquire, or purchase any fish or wildlife or plant taken or possessed in violation of any law, treaty or regulation of the United States or in violation of any Indian tribal law; to import, export, transport, sell, receive, acquire, or purchase in interstate or foreign commerce any fish or wildlife taken, possessed, transported, or sold in violation of any law or regulation of any state or in violation of any foreign law. 18 U.S.C. §§42-43.

Fish and Wildlife Coordination Act, 16 U.S.C. §§661-666c. This Act relates to wildlife as associated with water resource development. This act also authorizes that lands and waters may be acquired by Federal construction agencies for wildlife conservation to mitigate water projects in order to preserve and assure for the public benefit the wildlife potential of the particular water project area.

The Act of Congress September 14, 1950. (Expansion of Grand Teton National Park to include Jackson Hole National Monument) "The national park so established shall, so far as

[4] Federal legislation can be viewed at the Library of Congress web site: http://thomas.loc.gov

consistent with the provisions of this Act, be administered in accordance with the general statutes governing national parks..." 16 U.S.C. § 406d-1

Sikes Act, 16 U.S.C. §670g. The Secretaries of Agriculture and Interior and the State agencies will cooperate under this act to plan, develop, maintain, and coordinate programs for the conservation and rehabilitation of wildlife, fish and game. These programs shall include, but not be limited to, specific habitat improvements projects and related activities and provide adequate protection for species considered threatened or endangered pursuant to Section 4 of the ESA.

Multiple-Use Sustained-Yield Act, 16 U.S.C. §§528-531. It is the policy of the Congress that the National Forests are established and shall be administered for outdoor recreation, range, timber, watershed and wildlife and fish purposes. As used in this Act, "Multiple Use" means the management of all the various resources of the National Forests so that they are utilized in the combination that will best meet the needs of the American people; making the most judicious use of the land for some or all of these resources or related services over areas large enough to provide sufficient latitude for periodic adjustments in use to conform to changing needs and conditions; that some land will be used for less than all of the resources; and harmonious and coordinated management of the various resources, each with the other, without impairment of the productivity of the land, with consideration being given to the relative values of the various resources, and not necessarily the combination of uses that will give the greatest dollar return or the greatest unit output.

National Environmental Policy Act, 42 U.S.C. §§ 4321-4331. The purposes of this Act are: To declare a national policy which will encourage productive and enjoyable harmony between man and his environment: to promote efforts which will prevent or eliminate damage to the environment and biosphere and stimulate the health and welfare of man; to enrich the understanding of the ecological systems and natural resources important to the Nation; and to establish a Council on Environmental Quality. The Congress authorizes and directs that, to the fullest extent possible: (1) the policies, regulations, and public laws of the

United States shall be interpreted and administered in accordance with the policies set forth in this Act, and (2) all agencies of the Federal Government shall—
(A) Utilize a systematic, interdisciplinary approach that will insure the integrated use of the natural and social sciences and the environmental design arts in planning and decision making which may have an impact on man's environment; (B) Identify and develop methods and procedures, in consultation with the Council on Environmental Quality established by Title II of this Act, which will insure that presently unquantified environmental amenities and values may be given appropriate consideration in decision making along with economic and technical considerations; (C) Include in every recommendation or report on proposals for legislation and other major Federal actions significantly affecting the quality of the human environment, a detailed statement by the responsible official on—

(i) The environmental impact of the proposed action

(ii) Any adverse environmental effects which cannot be avoided should the proposal be implemented

(iii) Alternatives to the proposed action.

(iv) The relationship between local short term uses of man's environment and the maintenance and enhancement of long term productivity, and

(v) Any irreversible and irretrievable commitments of resources which would be involved in the proposed action should it be implemented.

Prior to making any detailed statement, the responsible Federal official shall consult with and obtain the comments of any Federal agency that has jurisdiction by law or special expertise with respect to any environmental impact involved.

The Act of Congress August 25, 1972, PL. 94-404 86 §620. Authorization to establish John D. Rockefeller, Jr. Memorial Parkway "... to provide both a symbolic and desirable physical connection between... Yellowstone, and the Grand Teton National Park..." "The Secretary shall administer the parkway as a unit of the national park system in accordance with the

authority contained in the Act of August 25, 1916..." Established by the Secretary of the Interior, September 30, 1977.

Endangered Species Act, 16 U.S.C. § 1533. ESA - Section 4 of the Act gives the criteria for determining a species' status as threatened or endangered. In order to delist a species, it must be shown that the opposite is true. It must be shown that: a) the species' habitat or range is not threatened with destruction, modification or curtailment, b) the species is not being over utilized for commercial, recreational, scientific or educational purposes, c) disease and predation are not significant problems, d) there are adequate regulatory mechanisms in place, and e) there are no significant other natural or manmade factors affecting the continued existence of the species. The Secretary of Interior and States shall effectively monitor recovered species for not less than five years after the species is delisted and no longer protected under the ESA.

Forest and Rangeland Renewable Resources Planning Act, 1974. In recognition of the vital importance of America's renewable resources of the forest, range, and other associated lands to the Nation's social and economic well being, and of the necessity for a long term perspective in planning and undertaking related national renewable resource programs administered by the Forest Service, the Secretary of Agriculture shall prepare a Renewable Resources Assessment. A strategic plan for all Forest Service activities shall be prepared every five years based on the assessment of renewable natural resources and on all land ownerships every 10 years. It provides direction that land management plans specify guidelines for land management plans, which provide for diversity of plant and animal communities. 16 U.S.C. §1600.

National Forest Management Act (NFMA) of 1976. NFMA provides the legal basis and direction for development of national forest plans. NFMA specifies that the National Forest System be managed to provide for diversity of plant and animal communities to meet multiple use objectives. Subsequent regulations for planning land and resource management

(36 CFR 219), adopted in 1979 augmented the diversity policy by requiring management of habitats to maintain viable populations of vertebrates. 15 U.S.C. §1600.

Federal Land Policy and Management Act. Public lands will be managed in a manner that will protect the quality of scientific, scenic, historical, ecological, environmental, air and atmospheric, water resource, and archeological values...that will provide food and habitat for fish and wildlife and domestic animals, and that will provide for outdoor recreation and human occupancy and use. 43 U.S.C. §§ 1701-1777.

Fish and Wildlife Improvement Act, 16 U.S.C. § 742(a).

Fish and Wildlife Conservation Act, 16 U.S.C. §§ 2901-2911. Each State should be encouraged to develop, revise and implement, in consultation with appropriate other agencies, a plan for the conservation of fish and wildlife, particularly those species, which are indigenous to the State. The purpose of this act is to provide financial and technical assistance to the States for the development, revision and implementation of conservation plans and programs for nongame fish and wildlife and to conserve and promote conservation of nongame fish and wildlife and their habitats.

The National Parks Omnibus Management Act of 1998 (PL 105-391,112 Stat. 3497). Title I, Section 101 recognizes the ever increasing societal pressures being placed upon America's unique natural and cultural resources contained in the National Park System, the Secretary shall continually improve the ability of the National Park Service to provide state-of-the-art management, protection, and interpretation of and research on the resources of the National Park System. Title II, Section 201, National Park System Resource Inventory and Management identifies the need to enhance management and protection of national park resources by providing clear authority and direction for the conduct of scientific study in the National Park system and to use the information gathered for management purposes. 16 U.S.C. §5901.

Federal Regulations

36 CFR 1.5 (a)(1). Gives National Park Superintendents the authority to establish for all or a portion of a park area a reasonable schedule of visiting hours, impose public use limits, or close all or a portion of a park area to all public use or to a specific use or activity in order to protect natural resources or provide for human safety.

36 CFR 1.7(B). National Park Service Superintendents shall publish in writing all designations, closures, permit requirements and other restrictions imposed under discretionary authority.

36 CFR 1.7(B) 1.2 (d). Gives National Park Superintendents the ability to regulate activities conducted by National Parks, or their agents, relative to the management and handling of grizzly bears (*Ursus arctos horribilis*). Specifics are described in Park Annual Bear Management Plans.

36 CFR 2.10 (d). Gives the National Park Superintendents authority to designate all or a portion of a park area where food, lawfully taken fish or wildlife, garbage and equipment used to cook or store food must be kept to avoid bear-human conflicts. This restriction does not apply to food that is being transported, consumed, or prepared for consumption.

36 CFR 219. Specifies that the National Forest System be managed to provide for diversity of plant and animal communities to meet multiple use objectives. Subsequent regulations for planning land and resource management and requiring management of habitats to maintain viable populations of vertebrates.

36 CFR 219.19. Requires that Fish and wildlife habitat shall be managed to maintain viable populations of existing native and desired non-native vertebrate species in the planning area.

A viable population shall be regarded as one, which has the estimated numbers, and distribution of reproductive individuals to insure its continued existence is well distributed in the planning area.

36 CFR 219.26. Specifies that Forest planning shall provide for diversity of plant and animal communities to meet multiple use objectives.

36 CFR 219.27 (a) (6). States that (a) All management prescriptions shall – (6) Provide for adequate fish and wildlife habitat to maintain viable populations of existing native vertebrate species.

36 CFR 261.50 (a) and (b). Gives Forest Supervisors the authority to issue orders which close or restrict the use of described areas, or of any forest development road or trail within the area over which he has jurisdiction. This authority is used to close areas to minimize human/bear conflicts and to issue food storage, carcass storage and camping requirements.

36 CFR 261.53 (a) and (e). States that when provided for in an order authorized under 36 CFR 261.50 (a) and (b) it is prohibited to go into or be upon any area which is closed for the protection of: (a) threatened, endangered, rare, unique, or vanishing species of plants, animals, birds or fish; or (b) for public health or safety.

36 CFR 261.58 (e) and (s) and (cc). States that when provided for in an order authorized under 36 CFR 261.50 (a) and (b) the following are prohibited. (a) Camping; (s) Possessing, storing, or transporting any bird, fish, or other animal or parts thereof as specified in the order; (cc) Possessing or storing any food or refuse, as specified in the order.

States

State laws, rules, and regulations that provide authority to control grizzly bear mortality, control hunters, manage grizzlybear/human conflicts, and other management activities to maintain the Yellowstone grizzly bear population are attached to the three state draft MOA (Appendix P).

~~Wyoming State Statutes~~[5]

~~23-1-101(a)(xii). "Trophy game animal" means black bear, grizzly bear, or mountain lion.~~

~~23-1-103. Ownership of wildlife. For the purpose of this act, all wildlife in Wyoming is property of the State. There shall be no private ownership of live animals classified as big or trophy game animals.~~

~~23-1-302(a)(ii). Powers and duties of the commission. To establish zones and areas in which trophy game animals may be taken as game animals with a license or in the same manner as predatory animals without a license, giving proper regard to livestock and game industries in those particular areas.~~

~~23-1-901. Owner of damaged property to report damage; claims for damages; time for filing; determination; appeal; arbitration. This is a lengthy statute that addresses procedures for filing damage claims.~~

~~23-2-101(e). Fees. This statute requires the commission to maintain a $500,000 balance to be used to compensate landowners for damage done by game animals.~~

~~23-3-102(b). License requirements. Requires a license to take a grizzly bear, except as otherwise provided.~~

[5] ~~Wyoming statues are available from the Wyoming State Law Library at http://courts.state.wy.us/state_law_library.htm.~~

Formatted: Font: Bold

Formatted: Heading 2

Formatted: Font: Not Bold

Comment [G74]: New 2016 language to include- refers to the draft MOA that needs to be approved by commissions.

Formatted: Font: Not Bold

~~23-3-102(d). Provides for a minimum of $5,000 and a maximum of $10,000 fine for killing a grizzly bear.~~

~~23-3-103(b). Taking predatory animals and trophy animals. Allows trophy game animals to be taken in areas designated by the Commission by the same means as a predatory animal.~~

~~23-3-106. Interstate game tag required. Regulates the transportation of bears within and across Wyoming State lines.~~

~~23-3-107. Wanton destruction. Prohibits a person from wantonly destroying any grizzly bear.~~

~~23-3-109. Use of dogs. Prohibits the use of dogs to hunt, run, or harass big or trophy game animals except as especially permitted by statute.~~

~~23-3-112. Firearms. Prohibits the use of certain types of firearms to take game animals.~~

~~23-3-115. Taking black bears doing damage. Allows landowner to kill black bears doing damage and requires them to notify the department. Grizzly bears may not be taken.~~

~~23-3-301. Importation and sale prohibited. Prohibits the importation and sale of bears.~~
~~Wyoming Game and Fish Commission Regulations~~

~~Chapter XLIII. Prohibits the taking of any wildlife unless the season is specifically opened by the commission.~~

~~Chapter II. Requires the taking of any grizzly bear to be reported to the department and the U.S. Fish Wildlife Service immediately. Section 7.~~

Chapter III. Prohibits the placement of baits in the current grizzly bear recovery zone. Section 6(a)(v).

Idaho State Statutes[6]

36-103 (a). Wildlife property of State – Preservation – Wildlife Policy. All wildlife, including all wild animals, wild birds, and fish, within the State of Idaho, is hereby declared the property of the State of Idaho. It shall be preserved, protected, perpetuated, and managed. It shall only be captured or taken at such times or places, under such conditions, or by such means, or in such manner, as will preserve, protect, and perpetuate such wildlife, and provide for the citizens of this State and, as by law permitted to others, continuous supplies of such wildlife for hunting, fishing and trapping.

36-103 (b). Commission to Administer Policy. Authority, power and duty of the Fish and Game Commission to administer and carry out the provisions of the Idaho Fish and Game Code. The Commission is not authorized to change the states' wildlife policy but only to administer it.

36-201. Fish and Game Commission authorized to classify wildlife. With the exception of predatory animals, the Idaho fish and game commission is hereby authorized to define by classification or reclassification all wildlife in the State of Idaho.

Idaho Fish and Game Commission Regulations

IDAPA 13 G 1.9. Species of Special Concern, Threatened or Endangered Species. Lists the grizzly bear as a Threatened Species. By definition a species likely to be classified as Endangered within the foreseeable future throughout all or a significant portion of its Idaho range.

[6] Idaho statutes are available from http://www3.state.id.us/idstat/TOC/idstTOC.html.

IDAPA 13 G 2.2. No person shall take or possess those species of wildlife classified as Protected non game, Species of Special Concern, or Threatened or Endangered at any time or in any manner, except as provided in Sections 36-106 (e) 5 and 36-1107, Idaho code or by commission regulation.

Comment [t75]: Update to reflect "big game" classification

Montana State Statutes[7]

Section 87-1-301. MCA, Powers of the Commission. Statutes, State of Montana, Department of Fish, Wildlife and Parks.

Requires the Fish, Wildlife and Parks Commission to set policies for the protection, preservation, and propagation of the wildlife, fish, game, furbearers, waterfowl, nongame species, and endangered species of the State and for the fulfillment of all other responsibilities of the department as provided by law.

Section 87-5-301. MCA Policy toward grizzly bear. Statutes, State of Montana, Department of Fish, Wildlife and Parks.

It is hereby declared the policy of the State of Montana to protect, conserve, and manage grizzly bears as a rare species of Montana wildlife.

Section 87-5-302. MCA Commission regulation on grizzly bear. Statutes, State of Montana, Department of Fish, Wildlife and Parks.

The commission shall have authority to provide open and closed seasons; means of taking; shooting hours; tagging requirements for carcasses, skulls, and hides; possession limits; and requirements for transportation, exportation, and importation of grizzly bears.

[7] Montana statues are available from http://www.lawlibrary.state.mt.us, the State Law Library of Montana.

~~Section 87-2-101. MCA Definitions. Statutes, State of Montana, Department of Fish, Wildlife and Parks.~~

~~By definition under this section bears are classified a game animal in Montana.~~

~~Administrative Rules of Montana~~

~~MCA 12.9.103. Grizzly Bear Policy (1) Whereas, the Montana Fish and Game Commission has management authority for the grizzly bear, a resident wildlife species, and is dedicated to the preservation of grizzly bear populations within the State of Montana; and~~

~~Whereas the secure habitat for the grizzly bear has been greatly reduced as a result of human development and population growth from 1850 through 1950 in the bear's traditional range in all western States; and~~

~~Whereas, a significant portion of the remaining grizzly bear habitat and population is located in Montana and these Montana populations occur in wildlands such as wilderness, primitive areas, de facto wilderness areas, national forests, national parks, Indian reservations, and seasonally, on adjacent private lands.~~

~~Now, therefore, in order to promote the preservation of the grizzly bear in its native habitat, the commission establishes the following policy guidelines for the Montana Department of Fish, Wildlife and Parks action when dealing with grizzly bear.~~

~~(a) Habitat. The department shall work to perpetuate and manage grizzly bear in suitable habitats of this State for the welfare of the bear and the enjoyment of the people of Montana and the nation. In performing this work the department should consider the following:~~

~~(i) the commission has the responsibility for the welfare of the grizzly bear and advocates the protection of the bear's habitat;~~

~~(ii) management of Montana's wildlands, including the grizzly bear habitat, is predominately, but not exclusively, a responsibility of various Federal agencies and private landowners;~~

~~(iii) land use decisions made by these agencies and individuals affect grizzly bear habitat, thus cooperative programs with these agencies and individuals are essential to the management of this species;~~

~~(iv) preservation of wildlands is critical to the protection of this species and the commission advocates wildland preservation in occupied grizzly bear habitat; and~~

~~(v) while some logging may not be detrimental to grizzly bear habitat, each logging sale in areas inhabited by grizzly bear should be carefully reviewed and evaluated.~~

~~(b) Research. It is recognized by the commission that research on the habitat requirements and population characteristics of the grizzly bear is essential for the welfare of the species. Departmental research programs and proposals directed at defining those habitat requirements are encouraged and supported.~~

~~(c) Hunting and recreational use. The commission recognizes its responsibility to consider and provide for recreational opportunities as part of a grizzly bear management program. These opportunities shall include legal hunting, recreational experiences, aesthetics of natural ecosystems, and other uses consistent with the overall welfare of the species.~~

~~(i) the department should consider the variability of values between individuals, groups, organizations, and agencies when management programs for various grizzly bear populations are developed.~~

~~(ii) sport hunting is considered the most desirable method of balancing grizzly bear numbers with their available habitat, minimizing depredations against private property within adjacent to grizzly bear habitat, and minimizing grizzly bear attacks on humans.~~

~~(d) Depredations. Contacts between grizzly bear and humans, or property of humans, require delicate handling and consideration. When these contacts reach the stage for definite action, the following actions should be carried out:~~

~~(i) grizzly bear, in the process of threatening or endangering human life, shall be captured or dispatched immediately.~~

~~(ii) where no immediate threat to human life exists, individual bear encounters with humans shall be evaluated on a case-by-case basis and when the attack is abnormal or apparently unprovoked, the individual bear involved shall be captured or dispatched.~~

~~(iii) when the attack is normal (e.g., a female defending her cubs, any bear defending its food, or any bear defending itself) but the situation leads itself to no reasonable possibility of leaving the bear in place, then the bear should be removed.~~

~~(iv) grizzly bear committing depredations that do not directly endanger human life but that are causing property losses shall be evaluated on an individual case basis.~~

~~(v) where removal is determined to be the best resolution to the problem, depredating or nuisance bear shall be trapped, and if determined to be suitable for transplanting, shall be marked and released in suitable habitat previously approved with appropriate land management agencies.~~

~~(vi) reasonable efforts shall be made to inform the public of the transplant program, fully explaining the reasons for the capturing and locations of the release area.~~

~~(vii) upon request by an authorized scientific investigative agency or public zoological institution, a captured bear may be given to that agency or institution, for appropriate non-release research purposes. A reasonable charge may be required to cover costs of handling.~~

~~(e) Depredating grizzly bear that are not suitable for release or research because of old age, acquired behavior, disease, or crippling, shall be killed and sent to the department's research facilities for investigation. The public shall be fully informed when these actions are taken and the reasons for these actions shall be fully explained~~

~~(f) Coordination. The department shall consult with appropriate Federal agencies and comply with applicable Federal rules and regulations in implementation of this policy. (History: Sec.87-1-301MCA, IMP, 87-1-201, 87-1-301 MCA; Eff. 12/31/72; AMD, 1977 MAR p.257, Eff. 8/26/77.)~~

~~Montana Department of Natural Resources and Conservation~~

~~Title 75, Chapter 1, MCA – Montana Environmental Policy Act. Establishes policy of the State of Montana to use all practicable means and measures to create and maintain conditions under which man and nature can coexist in productive harmony.~~

~~Title 76, Chapter 14, MCA – Montana Rangeland Resource Act. Establishes a program of rangeland management whereby the importance of Montana's rangeland with respect to wildlife habitat and the natural beauty of the State is recognized.~~

~~Title 77, Chapter 1, MCA – Administration of State Lands. Directs the State board of land commissioners to manage State lands to support education and for the attainment of other worthy objectives helpful to the well-being of the people of Montana. It further directs the board to manage State lands under the multiple-use management concept to insure: 1) they are utilized in that combination best meeting the needs of the people and the beneficiaries of the trust; and 2) harmonious and coordinated management of the various resources.~~

~~Title 87, Chapter 5, MCA – Nongame and Endangered Species Conservation Act. Establishes Montana policy to manage certain nongame wildlife for human enjoyment and to insure their perpetuation as members of ecosystems. It further declares the policy of the State of Montana to protect, conserve, and manage the grizzly bear as a rare species of Montana wildlife.~~

~~Montana Constitution. Article IX – Environment and Natural Resources. Section 1 – Protection and Improvement. The State and each person shall maintain and improve a clean and healthful environment in Montana for present and future generations.~~

Federal Plans and Guidelines

In addition to federal and state laws, the following plans and guidelines provide both direction and guidance for grizzly bear population and/or habitat management.

National Park Service

Comment [t76]: Comment-Compendia (consistent with Ninth Circuit ruling reference?

NPS-77, Natural Resource Management Guidelines, May 16, 1991. Guides National Park managers to perpetuate and prevent from harm (through human actions) wildlife populations as part of the natural ecosystems of parks.

Final Environmental Impact Statement, Grizzly Bear Management Program, Yellowstone National Park, July 1983:

Identifies sanitation procedures designed to ensure that human foods and attractants are kept secured from bears. Garbage and other unnatural food attractants will be eliminated before control actions are required. The solid waste handling program will encompass use of trash containers of bear-resistant design, careful and frequent garbage pickup to prevent overflow and overnight accumulations.
The Superintendent authorizes and approves the YNP Grizzly Bear Management Program that outlines the park's Bear Management Area Program. The Bear Management Area Program restricts recreational activity in areas with seasonal concentrations of grizzly bears. The goals of these restrictions include: (1) minimize bear-people interactions that may lead to habituation of bears to people (habituation can result in bears being removed from the population for human safety), (2) prevent human-caused displacement of bears from prime food sources, and (3) decrease the risk of bear-caused human injury in areas with high levels of bear activity.
Outlines Park bear monitoring program.
Outlines Park bear research goals and objectives.
Leaves open the possibility for supplemental feeding of grizzly bears, if deemed necessary.
Identifies as an objective that public awareness of exposing bears to unnatural food sources may lead to human injury, or to the bears' destruction, or both. Requires an active information program be directed at both visitors and employees to inform them of policies and goals of bear management, and the reasons for these. Provides guidelines for the distribution of bear safety warning information through entrance stations, signs, visitor contacts, and literature.

Yellowstone National Park Annual Bear Management Plan: Outlines grizzly bear ecology and management information distributed to park employees and the general public by the Bear Management Office.

Grand Teton National Park Human/Bear Management Plan, 1989:

Identifies sanitation procedures designed to ensure that human foods and attractants are kept secured from bears. Garbage and other unnatural food attractants will be eliminated before control actions are required. The solid waste handling program will encompass use of trash containers of bear-resistant design, and careful and frequent garbage pickup to prevent overflow and overnight accumulations. Containers not of bear-resistant design must be located inside the building served. Large animal carcasses that are near trails, facilities, or roads will be managed in a way to reduce human/bear encounters.

Grizzly bear management follows the *Interagency Grizzly Bear Guidelines* (IGBC 1986).

Management of Situation 1 areas includes area closures and/or activity curtailments to protect the bears.

Follows the procedures outlined in the *Interagency Grizzly Bear Guidelines* (IGBC 1986).

Actions subsequent to capture are coordinated with the U.S. Fish and Wildlife Service Grizzly Bear Recovery Coordinator.

All incidents involving human-bear interactions are documented on Bear Sighting/Identification reports. All Park employees and visitors are encouraged to complete these forms for all bear sightings.

Outlines Park bear research goals and objectives.

Outlines a program for the dissemination of information of human/bear relationships, the causes of human-bear conflicts, and how visitors, inholders, Park, and concession employees can help alleviate problems through their personal actions and compliance with Park regulations.

U.S. Forest Service

- If a change of status for the Yellowstone grizzly bear population under the ESA takes place, Forest Service Regions 1, 2, and 4 will classify the grizzly bear as a sensitive species[8] in the GYE. Grizzly bears and their habitats will then be managed as sensitive on National Forest System lands in accordance with Forest Service Manual 2670 (specifically 2670.22, 2670.32, and 2676.1-2676.17e). In addition, national forests will continue to follow direction established in existing land management plans until amended or revised. Bridge-Teton National Forest Land and Resource Management Plan with Amendments and Corrections (2015)
- Custer National Forest and Grasslands Land and Resource Management Plan (1987)
- Gallatin Forest Plan 1987 as Amended through November 2014
- 1997 Revised Forest Plan - Targhee National Forest
- Shoshone National Forest Land Management Plan (2015)
- Beaverhead-Deerlodge National Forest Land and Resource Management Plan (2009)

State Plans and Guidelines

[8] 2672.1 - Sensitive Species Management. Sensitive species of native plant and animal species must receive special management emphasis to ensure their viability and to preclude trends toward endangerment that would result in the need for Federal listing.

There must be no impacts to sensitive species without an analysis of the significance of adverse effects on the populations, its habitat, and on the viability of the species as a whole. It is essential to establish population viability objectives when making decisions that would significantly reduce sensitive species numbers.

2672.11 - Identification of Sensitive Species. Regional Foresters shall identify sensitive species occurring within the Region. They shall examine the following sources as possible candidates for listing as sensitive species:

1. Fish and Wildlife Service or National Marine Fisheries Service candidates for Federal listing (categories 1 and 2) under Federal Register Notice of Review.

2. State lists of endangered, threatened, rare, endemic, unique, or vanishing species, especially those listed as threatened under State law.

3. Other sources as appropriate in order to focus conservation management strategies and to avert the need for Federal or State listing as a result of National Forest management activities.

It is the policy of MDNRC to conduct programs and activities in a manner that limits the potential for conflicts between grizzly bears and people and that provides habitat to help achieve and sustain recovery within the GYE. Land uses which can adversely affect grizzly bears or their habitat will be designed and coordinated in a manner that is compatible with grizzly bear behavior and habitat needs, but not to the extent of excluding other uses.

The Forestry Division of the MDNRC has additional policy guidance for management of grizzly bear habitat within the Yellowstone. In 1988, grizzly bear management standards and guidelines were implemented to integrate management of grizzly bear habitat with timber management on State lands within the GYE. Performance standards and guidelines cover long range planning, project planning and design, management of bear-human conflicts, and special management areas. These will be implemented until the Forestry Division develops and adopts other guidance through a programmatic planning effort that will incorporate grizzly bear management objectives.

Additional policy guidance will be developed in the near future. The USFWS and MDNRC have mutually agreed to develop and implement guidelines for integrating grizzly bear habitat protection and MDNRC land management activities. MDNRC will continue to consult with MFWP on specific projects that may adversely affect any species of wildlife in Montana, in an attempt to minimize or avoid adverse impacts to populations or their habitats.

---

All,

I thought it would be helpful to see the comments that were submitted by IBA. They established a review panel of respected scientists. There are several misinterpretations of our data and I would certainly argue with several of their assertions. But, by and large, I do value this as a purely scientific and independent review and it would behoove us to take note of these comments.

I would appreciate any feedback.

Frank

To the U.S. Fish and Wildlife Service:

The International Association for Bear Research and Management (IBA) is a professional organization of bear biologists, managers, and conservationists around the world. We have >600 members from 67 countries; 368 of these are from North America. The IBA mission is to promote the conservation and restoration of the world's bears through science-based research, management, and education. To this end we hold regular conferences, publish a thrice-yearly newsletter and the peer-reviewed journal, ***Ursus***, and provide >$80,000 in grants annually for bear research, conservation, and collaboration each year. We maintain a close working relationship with the IUCN Bear Specialist Group. (For more information about IBA go to www.bearbiology.com.)

On occasion, on issues of particular national or international bear conservation significance, we also offer scientific review and comments. Our goal is to help ensure that science and data interpretations underpinning policy decisions and conservation strategies regarding bears are sound and clearly articulated. The Yellowstone grizzly bear population is one of the best studied in the world. The iconic setting in a unique ecosystem and in America's first national park make this population of worldwide conservation significance. In March, 2016, IBA's governing Council voted unanimously to review and submit public comment on the US Fish and Wildlife Service's proposal to remove the grizzly bear population of the Greater Yellowstone Ecosystem (GYE) from the US Endangered Species List, thereby returning management responsibilities to the three states that encompass the GYE. For this purpose, we chose, by vote of Council, a review team of 4 highly qualified scientists from among our members. These scientists were selected for their demonstrated competence, integrity, and expertise in related work. We took great care to choose reviewers who were independent of ties to the Interagency

Grizzly Bear Study Team (IGBST), the Interagency Grizzly Bear Committee (IGBC), and the wildlife management agencies of Montana, Idaho, and Wyoming.

As officers of IBA, and on behalf of IBA's Council, we submit here the attached review authored by this team. In it, they review key scientific methods and findings presented in the USFWS Proposed Rule (Docket Number FWS–R6–ES–2016–0042) and the supporting papers cited therein. This review was approved by IBA Council for submission on our behalf to the US Fish and Wildlife Service.

Key findings in the review are as follows. Evidence is clear that the specifically defined habitat and demographic criteria for population recovery have been met. However, 9 key issues are identified and discussed that have implications for the success of the conservation strategy, should delisting proceed. These issues are relevant whether management of the GYE grizzly bear population remains with the federal government (listed) or is transferred to state agencies (delisted). The specific issues can be summarized under 3 general concerns: a) the magnitude of uncertainty surrounding multiple key factors has not been adequately recognized in the rule or incorporated into the conservation strategy; b) managing the population to a specific target size is difficult at best and entails risk, especially for a population of a size that still qualifies as "Vulnerable" under IUCN Red List criteria; c) plans for managing to a target population size seem counter to the goal of continued population expansion and connectivity.

In addition to the content of the attached review, we offer several additional comments:

1) We commend the USFWS and all associated parties for their steadfast focus, leadership, and enormous effort in working to return the GYE grizzly bear population from critically low to healthy numbers over the past decades. This recovery is a stunning example of what can be achieved in conservation even in the face of fiercely divided public opinions.

2) The growth and expansion of the GYE grizzly bear population was only possible through conservative management. A conservative management approach is still warranted, given the rapid pace of ecological change in the GYE. It is particularly important to guard against Type II errors in data interpretation, when one falsely concludes there is no effect because statistical analyses fail to detect one. As an example, we suggest that it is too soon to conclude that declines in key grizzly bear foods in the GYE have not affected vital rates of grizzly bears, despite the failure to statistically detect such effect in the analyses presented to date. Schwartz et al. (2014) suggested that body fat content of female grizzly bears might be declining coincident with loss of whitebark pine (WBP) from the environment, but the trend was not statistically significant. A second analysis that included additional data (albeit a small amount) again failed to demonstrate such an effect (IGBST 2013). Moreover, no differences were detected in a comparison of seasonal body fat trends in females pre- and post- WBP decline.

These analyses, however, were subject to acknowledged limitations in sample size and distribution, leaving them at risk for Type II errors. Seasonal body mass and composition are highly variable among individuals and are strongly affected by reproductive status (i.e., if a female is accompanied by dependent offspring or not). Yet in the analyses presented, all females were pooled, due to insufficient sample sizes for partitioning data by reproductive status (or age, etc). Pooled data for adult females has characteristically high variance and

samples are subject to bias due to uneven sampling relative to reproductive status; both conditions can make it difficult to discern statistical trends. The fact remains that nearly 20% of females handled during 2008–2013 had season-specific body fat levels low enough to definitively put them at risk for reproductive failure, whereas prior to 2004, no females assessed were so clearly deficient in body fat. Because reproductive parameters often are connected to threshold levels, the reproductive implications for populations showing this great a difference may be considerable.

We encourage efforts to improve the tracking of body mass and body composition relative to environmental conditions and reproductive success in this bear population. We also suggest that future analyses take into account reproductive status, as body mass, composition and their seasonal trends differ markedly between females with cubs of the year and other females, and pooling these data can obscure significant relationships.

3) Aspects of outlined conservation strategies are not consistent regarding continued expansion of the GYE grizzly bear population either to the west, to enable repopulation of the Bitterroot ecosystem, or to the north to re-establish connectivity with the NCDE population.

The attached review notes that GYE grizzly bear population is relatively small and isolated, and by virtue of its size, still carries a "Vulnerable" designation under the IUCN Red List criteria. As such, future strategies that include habitat and population management that encourage connectivity between the GYE and both the NCDE and Bitterroot ecosystems are certainly prudent. According to the 2016 Conservation Strategy (CS), the State of Montana will manage grizzly bears between the GYE and NCDE ecosystems. We have concerns that the Montana State policies (as summarized in the CS) to allow for "discretionary mortality" (i.e., grizzly bear hunting) and to *not expand* "habitat based restrictions and programs" outside the proposed Primary Conservation Area (PCA), may further challenge the ability of grizzly bears to successfully connect between these ecosystems. Attaining connectivity will be particularly difficult when these state policies are combined with the intention to manage the GYE grizzly populations to the targeted 674 individuals. Currently the intervening habitats between these ecosystems are essentially absent of grizzly bears. We therefore encourage more attention be placed on habitat and population management on the lands connecting the GYE, NCDE, and Bitterroot ecosystems to encourage inter-area connectivity.

We realize that legitimate social concerns influence management programs, as was mentioned in the CS relative to Montana's policy. Human safety, of course, has to remain a top priority. We therefore encourage an iterative approach that monitors the expansion of bears between these ecosystems (or the lack thereof), and improves habitat and population management as required to eventually attain inter-area connectivity. IBA members who work extensively with connectivity issues in other jurisdictions suggest that management strategies that minimize human-caused mortality in linkage areas, be it through legal hunting, non-hunt mortalities on backcountry roads, or frontcountry mortalities related to bear attractants, be considered in linkage habitats. It might be beneficial or even necessary to identify areas of especially high quality habitats with important food resources or with linkage movement potential and apply habitat restrictions to those areas, rather than applying blanket restrictions across all habitats.

In conclusion, IBA neither specifically endorses nor opposes delisting of the GYE grizzly bear population. Our role is to provide a review of the science, its interpretation, and the monitoring and proposed management practices that are the foundation of the USFWS delisting proposal. Our concern is the security and sustainability of the Yellowstone ecosystem grizzly bear population. With appropriate measures in place, this goal is theoretically attainable under either federal or state management. Whether or not to delist the Yellowstone grizzly is a decision that must be heavily informed by science. But, it is a policy issue that rests also on other issues of public opinion and core values. Those may include the desirability of sport hunting of grizzly bears, the openness and equitability of the delisting process, desired future condition of the landscape, desired future range of grizzlies, level of comfort with future uncertainty (e.g. climate change, political change, etc), public trust in the political will and ability of multiple state agencies to manage for a shared objective, and issues of Native American tribal sovereignty and inclusion in policy-making. Though informed by science, these issues are not determined by science.

On behalf of the IBA Council and the review team, we emphasize that our comments in this letter and the attached review represent our best professional judgment regarding scientific and management measures that deserve specific attention and effort to ensure the persistence of the GYE grizzly bear population. They also represent our very best intentions in supporting the ongoing work of the capable and dedicated scientists, managers, and policy makers who have worked so hard to secure the future of these bears.

Respectfully yours,

Karen Noyce

Karyn Rode, U.S. Geological Survey, Alaska Science Center, krode@usgs.gov
Polar Bear Specialist Group

We were asked by the International Association for Bear Research and Management (IBA) to provide a science-based review of the US Fish and Wildlife Service's proposed rule (Federal Register 81 [48], March 11, 2016) (henceforth 'rule') to delist grizzly bears (*Ursus arctos horribilis*) in the Greater Yellowstone Ecosystem (GYE) as a distinct population segment (DPS) under the U.S. Endangered Species Act, and the Draft 2016 Conservation Strategy (CS) that outlines what would follow after such delisting. The objective of this review is to critically evaluate the science, the interpretation, and the proposed monitoring and management practices as they relate to the security and sustainability of the grizzly bear population in the Yellowstone ecosystem. We recognize that a sustainable grizzly bear population can occur under federal (listed) or state (delisted) management, and our intention is not to endorse or oppose delisting, but rather to ensure decisions are based on sound science. As a group of scientists with considerable experience in bear ecology, nutrition, demography, and management, we respectfully submit these comments as a critical evaluation of the scientific findings upon which the rule and CS are

based. None of us have any direct relationship with the politics, science, or activities related to the delisting, and so we hope that our comments are taken as objective, with the caveat that we may not understand all of the intricacies of the data. We would like to mention, in that regard, that the data are extensive, and so took considerable effort to understand, while much of the writing in the rule and CS is quite verbose, repetitive, and not organized in such a way as to lend to easy interpretation. We thus relied to a large degree on published papers and our own experiences in the field.

For delisting, the USFWS has established habitat-based recovery criteria and 3 demographic recovery criteria. These have been updated and revised multiple times, based on new understanding of this population and ecosystem. The habitat-based recovery criteria have the goal of maintaining or improving habitat conditions at levels that existed in 1998 when conditions allowed the population to expand. These criteria are based on measures of motorized access levels, areas of secure habitat, number of developed sites, and livestock allotments. All of these measures have been met. However, future management will need to involve careful monitoring of continued changes in food resources. This is particularly important in light of the vast uncertainty that surrounds the effects of climate change relative to the distribution and abundance of bear foods as well as the response by bears to the changing landscape. Therefore, while the quantity of developed sites and the amount of secure habitat may remain at levels similar to 1998 it is unlikely that the habitat remains in the same condition as it was in 1998. An example of this change may be best exemplified with whitebark pine (*Pinus albicuaulis*), which not only continues to die due to white pine blister rust fungus (*Cronartium ribicola*) and the mountain pine beetle (*Dendroctonus ponderosae*) epidemics, but is also being successionally replaced by other tree species, particularly subalpine fir (*Abies lasiocarpa*)(Keane and Arno 1993).

The 3 demographic recovery criteria relate to population size, distribution, and stability. Specifically these are: 1) maintain a population size of at least 500 bears and at least 48 females with cubs in the demographic monitoring area (DMA), calculated by the most updated protocol; 2) ensure a broad geographic distribution of reproducing female bears by confirming occupancy of females with young in at least 16 of the 18 bear management units (with no 2 adjacent units unoccupied over a 6-year period); and 3) maintain the population around the 2002-2014 average of 674 bears (95% CI 600 – 757) through control of mortality within specified limits.

We agree that, for more than a decade, all of these habitat and demographic criteria have been met. We commend the enormous effort over the past 40 years that the various US agencies and US citizens have put into recovering grizzly bears in the GYE; yours has been one of the most successful programs for bears world-wide. Having a population increase from perhaps 230-300 bears in the early 1970s to over 700 (2–3% per year) is a substantial achievement and, in comparison to 40 years ago, must seem to local researchers and managers like there are a lot of grizzly bears. In truth, however, ≈700 bears in an isolated region is not a large population. The IUCN rates populations threatened with extinction as vulnerable, endangered, or critically endangered, using explicit criteria related to population size, growth, and degree of isolation. Recently, the IUCN Bear Specialist Group categorized the level of risk for all isolated brown bear populations worldwide (44 populations in North America, Europe, and Asia) using the IUCN Redlist Criteria. The GYE was categorized as Vulnerable (using criteria D1: 250–1000 mature individuals), meaning that it is threatened of becoming endangered; if the population drops to

under 250 mature individuals (533 total population for GYE grizzly bears given present estimated composition), this population would be categorized as endangered by IUCN. Although we trust that the states of Montana, Wyoming, and Idaho, and the Federal agencies that will remain responsible for managing bears and their habitat will continue to do an excellent job of management, we want to stress that the grizzly bears in the GYE still form a small, isolated population, and must continue to be managed with great care.

The Fish and Wildlife Service (Federal Register 70 [221], Sept. 17, 2005) argued convincingly that the grizzly bears in the GYE were a DPS in part because of their discreteness (isolation and genetic differences), but also because they are ecologically and genetically "significant" or have a significant evolutionary legacy. Under the DPS policy, if delisted from the ESA, they should be as if they were their own species or, in this case, the last Yellowstone grizzly bears on earth.

Below we outline issues that pertain to managing such a small and isolated population. We underscore a number of continued risks moving forward that generally fall under the broad issue of uncertainty. We believe that a number of looming uncertainties exist in terms of changing food supplies, methods of population size and trend monitoring, and employing the associated mortality limits. We list these under subheadings of specific issues, and provide some recommendations.

Issue: Uncertain implications of measured declines of important grizzly bear foods

Cutthroat trout (*Onchohynchus clarki*), whitebark pine seeds, elk (*Cervus elaphus*), and army cutworm moths (*Euxoa auxiliaris*) have been identified as high quality forage for grizzly bears in the GYE. Cutthroat trout, whitebark pine, and elk are in decline due to various factors including competition with or predation by other species, disease and insect outbreaks, and/or climate change.

Although high-quality grizzly bear foods have declined, data on bear body condition and diet suggest bears have a flexible diet and have used alternative food sources to meet energetic requirements. Schwartz et al. (2014) and IGBST (2013) found no difference in the body condition of male or female bears during poor vs. good pine seed production years. The IGBC (2013:35) concluded that the decline in whitebark pine seeds "has had no profound negative effects on grizzly bears at the individual or population level." Bears that previously consumed cutthroat trout appear to now eat elk calves (Felicetti et al. 2003, Fortin et al. 2012, Ebinger et al. 2016). During years with poor whitebark pine seed production, bears appear to consume more meat (Felicetti et al. 2003, Schwartz et al. 2014) and false truffles (*Rhizopogon* spp.)(Fortin et al. 2012). van Manen et al. (2016) suggested that the population trend has recently stabilized due to density-dependent processes, including probable intraspecific killing.

Grizzly bears in Yellowstone National Park continue to adjust to changing food resources (Fortin et al. 2012) and available data have limitations in assessing effects. For example, some elk herds that use the GYE have declined as grizzly bear, wolf and human predation increased (IGBST 2013, Fortin et al. 2012). Elk appear to be the primary food replacing declining cutthroat trout (Fortin et al. 2012) and whitebark pine (Schwartz et al. 2014). Schwartz et al. (2014) documented no declines in female body mass but a decline in percent body fat that reached levels known to cause reproductive failure (i.e., <20%; Robbins et al. 2012). With additional years of data, IGBST (2013) found no decline in percent body fat, but

acknowledged important limitations with sample size and seasonal variability of data collection. Also, they did not consider the reproductive state of females in their analysis. Moreover, we observed that their data (IGBST 2013: Fig. 4) show female bears with exceedingly low levels of body fat in fall only since 2008, when loss of whitebark pine has been most severe.

Separating density-independent from density-dependent effects on population growth is acknowledged in the rule as being challenging. van Manen et al. (2016) concluded that the decline in population growth in recent years was associated more with increasing grizzly bear density than whitebark pine decline. This finding, though, cannot discount the potential role of whitebark pine seed production in demographics of grizzly bears in this ecosystem. The direct relationship between whitebark pine production and survival rates of independent bears is well documented (Blanchard and Knight 1995, Mattson 1998, Schwartz et al. 2006). This relationship is driven mainly by increased human-bear conflicts during years of poor whitebark pine production (Schwartz et al. 2006). This effect continues to date (IGBST 2013). It is also possible that social interactions change in complex ways with changing food conditions, with male bears sequestering some key food resources, and putting younger bears (especially dependent offspring) at increased risk (Garshelis and Pelton 1981, Ditmer et al. 2016); this may not be detectable from an analysis of body condition or the type of modelling conducted by van Manen et al. (2016). The challenges of quantifying mechanisms that influenced changes in population growth rate are significant. Based on the cumulative body of literature on nutrition and demography of bears in North America (e.g., Elowe and Dodge 1989, Costello et al. 2003, Obbard and Howe 2008, McLellan 2015), we believe that declining food resources must have played some role in recent reductions in population growth and is an important factor warranting consideration in management and monitoring in the future.

We recommend that the minimum size of core security areas be increased to allow for dietary flexibility required to respond to continually changing food resources. The minimum size of core security areas is typically set as approximately 10-km^2 (1,000 ha), because that size takes into account the size of average daily movement for an adult female grizzly bear (Gibeau et al. 2001). It should be at least 500 m from high human use defined as >100 human visits/month, not just an “open or gated motorized access route”.

Issue: Uncertain implications of climate change

The impact of climate change on grizzly bears is highly uncertain because bears are opportunistic omnivores with a diverse diet (Roberts et al. 2014). Whitebark pine is a high elevation species currently being negatively affected by climate change. In years of low availability of whitebark pine seeds, bears seek alternate foods usually at lower elevations where they are more likely to encounter humans. Grizzly bear deaths depend on type and frequency of contact between bears and humans (Mattson et al. 1996) and habitats that attract bears to high-risk areas can result in local population sinks (Delibes et al. 2001, Naves et al. 2003, Schwartz et al. 2010). For grizzly bears inhabiting the GYE, survival was lowest in the fall corresponding with the highest incidence of human-bear conflicts (Schwartz et al. 2006). The ability of grizzly bears to adapt to climate change via use of alternative foods can be misleading if those habitats also hold a higher risk of human-caused mortality.

In light of recently observed declines in some food resources and uncertain effects of climate change, we recommend continued monitoring of the relationship between the availability and use of key food resources and the vital rates and body condition of grizzly bears (such monitoring does not appear to be part of the CS). We also recommend a more thorough examination of the uncertainty surrounding the effects of climate change on the loss, redistribution, and potential change in grizzly bear foods (including army cutworm moths) and associated effects on bears attempting to access high quality food sources.

Issue: Limitations of methods for estimating population size and trend

The IGBST developed an index of bear density, based on counts of unique females with cubs of the year (FCOY), to monitor the recovery of the Yellowstone grizzly bear population. The premise was that FCOY were spread out enough that FCOY individuals could be distinguished using a combination of litter size, distance between sightings (and intervening barriers to movements), and days between sightings. The process for doing so was formalized by Knight et al. (1995), and has come to be known as the Knight rule set. (Different rule sets have been proposed for counts of FCOY brown bears in Europe; Ordiz et al. 2007).

Application of the Knight rule set provides an estimate of the minimum number of FCOY per year and estimates of frequencies of sightings of each known FCOY. This is converted to an estimate of total FCOY (i.e., including those not observed) using the Chao2 estimator (Chao 1989, Cherry et al. 2007).

Schwartz et al. (2008) investigated the important assumption that changes in density do not affect the ability to distinguish FCOY. They found that at higher densities, with more overlap among FCOY, it became increasingly difficult to distinguish individuals based on the Knight rule set. Hence, the Chao2 estimator becomes increasingly negatively-biased with increasing density. As such, Chao2 estimates could level off while the population continues to increase, giving a false sense of the population reaching carrying capacity (K). Likewise, once the population has exceeded the density threshold of FCOY that precludes further differentiation of distinct individuals, a decline also would not be detectable until dropping below this threshold.

If the Choa2 estimates are increasingly biased low, then mortality limits would also be biased low, allowing for the population to increase. Hence, the bias in the Chao2 is considered to be “conservative”. It is conservative, though, only when the population is indeed increasing. If vital rates or mortalities are mis-estimated, the population could also decline, undetected. Thus, once a density threshold of population density has been exceeded, it is difficult to accurately assess population size and trend using the Chao2 estimator.

An additional important potential limitation of the Chao2 estimator is that it might become even more unreliable with increased mortality of cubs, as has apparently occurred (van Manen et al. 2016). This higher mortality could lead to more confusion in distinguishing FCOY (because litter sizes are changing and because more FCOY have similar litter sizes) and more errors in tabulating sighting frequencies used in the Chao2 estimator.

A series of workshops conducted by the IGBST including a contracted biometrician tried to rectify this problem (IGBST 2012) and concluded that it is not possible to rely on FCOY observations as a trend indicator at the current high densities. Thus, continued reliance of FCOY estimates for trend monitoring and estimation of total population size and composition (through matrix modelling of vital rates) is problematic and has important implications on the ability to accurately set sustainable mortality limits.

Problems with the Chao2 estimator spurred the IGBST to seek an alternative method for monitoring this population (IGBST 2012). The most promising seems to be a mark-resight method that uses observations made during search flights for FCOYs, and checking (after sighting them) for whether they are marked (collared) using a telemetry receiver. An advantage of this method is that unlike the present Chao2, it is unbiased with respect to bear density. Also, data are available back to 1997 (with 2 search flights per year), so provide an indication of trend since then. Unfortunately, these data are rather sparse, so the precision is low (Higgs et al. 2013). That issue could be addressed, though, with larger samples of collared bears and/or more search flights. Whereas the IGBST clearly sees the value in pursuing and enhancing this alternative method (Haroldson and van Manen 2014), the sole reliance on Chao2 for monitoring this population has an associated risk of bias and inaccuracy that is not acknowledged in the Rule or Conservation Strategy (CS).

In sum, the Chao2 estimator is likely no longer the "best available science" for continued monitoring of this population. We agree that this method has served well to demonstrate the strong recovery of this population, but it is likely not the best method for continued monitoring to (a) discern whether the population is truly at K, and (b) to derive limits of allowable mortality. We recommend an eventual conversion to mark–resight methodology, with a management system adaptable enough to accommodate the inevitable changes in population estimates that this will entail.

Issue: Biological and management challenges of maintaining a population at a specified size

A stated goal of the rule is to try to maintain a total population of 674 grizzly bears in the demographic monitoring area (based on the Chao2 estimate of FCOY, extrapolated to the full population using data on vital rates). We believe this is unrealistic for a population in an ecosystem in which food resources vary year to year and for which estimates of population size and trend are inexact (and still being modified — see below). The confidence intervals of Chao2-based population estimates are large. For example, the 2014 Chao2 estimate had a 95%CI that ranged from 588–721 (Haroldson and van Manen 2014), making it quite uncertain whether the true population was above or below the target of 674. Additionally, there are many sources of variation not included in the CIs (IGBST 2012: Table 2.1), so the actual CIs are even larger.

Second, the population may already be above 674. Telemetry data indicated that survival rates have changed, and when these new rates are applied (to convert Chao2 estimates of FCOYs to estimate the total population size), the "updated" estimates are much larger. The updated estimates for the most recent years show a much higher number of males and slightly lower number of females than estimates calculated with the older survival rates (Haroldson and van Manen 2014). This not only begs the question: which is right, but also demonstrates the considerable uncertainty in the monitoring system.

One of the most ironic outcomes is that the "updated" estimates put the population into the highest category of allowable mortality (10% for females, for a population exceeding 747), whereas the non-updated estimates for the same year put the population in the lowest allowable mortality category (<7.6% for females) — that is, although the estimated number of females was *lower* in the updated estimates, the allowable mortality for females was higher because the population had more males, which does not make biological sense.

Setting a goal of maintaining a population at a certain numerical size is not only impractical, but seems counter to other stated conservation strategies of allowing the population to fill all suitable habitat, and even expand to connect to the NCDE and possibly the Bitterroots, the latter of which is a significant and important component of protecting grizzly bears as a species. There seems to be evidence that the population is still expanding geographically, and may still be increasing numerically: vital rates suggest that the current growth rate is 0–2% (based on 2 different assumptions [IGBST 2012]; the true CI is much wider; see Harris et al. 2007, IGBST 2012: Table 2.1). If the population is indeed still increasing, this further challenges the ability to maintain it at its present level: in other words, *is the goal to prevent a further increase even if it is increasing now, or is the goal to maintain the current numbers because the population is believed to be relatively stable?* The rule and CS do not make this distinction clear. We do not believe that either strategy is in the best interest of conserving this population (further discussion below).

Issue: Sustainable mortality rates may be over-estimated

The rule suggests that a total mortality rate (natural mortalities, plus known and unknown human-caused mortalities [HCM]) of 7.6% for independent female bears would maintain a long-term average population of 674 bears (the average population during 2002–2014). This rate was estimated by: 1) field methods and survival rate estimation following Schwartz et al. (2006), 2) reproductive rate estimates based on transition probabilities (ground-based capture in the GYE has led to biased capture with respect to female reproductive states plus short-term monitoring of individuals) described by Schwartz and White (2008), and 3) adjustments in reproductive rates to account for mortality of cubs before they were first observed, following Mace et al. (2012). These complex results were used in a matrix projection model and independent female survival was varied until population growth was stable.

We have two concerns over the use of the 7.6% total female mortality limits (and even higher limits for higher populations). First is the lack of confidence limits on the estimate. Given the large CIs on the survival estimates of each sex-age group and non-age-specific reproductive rate (IGBST 2012), the estimated mortality limit must have wide uncertainty.

Second are potential problems with how these vital rates were combined into the projection model. We used the data from the IGBST report (2012: Table 4.1) in a projection matrix and obtained the same 7.6% sustainable female mortality rate, provided all females aged 4–30 years maintained an average reproductive rate (0.336). Although the estimation of stable states may have been based on transitions of immature animals and old bears in reproductive senescence, we believe using this static reproductive rate for females of all of these ages (i.e. 4 to 30) may not only add considerable uncertainty, but may

have caused the sustainable mortality to be over-estimated. Schwartz et al. (2006, p. 19) found that during 1983–2001, when the population was below carrying capacity and increasing rapidly, the mean age of first reproduction was 5.8 years (95%CI: 5.6–6.3) and age was an important predictor of reproductive output (Schwartz and White 2008). Prime reproductive age is 10–15 years old, followed by declining reproduction through 25 years of age when reproduction usually stops in these southern grizzly bear populations (Schwartz et al. 2003, Schwartz and White 2008, McLellan 2015).

If average reproduction spans ages 6–26 years (Schwartz et al. 2006), then independent females could only sustain a 5.4% mortality rate. However, the average age of first litter may have increased as the population supposedly approached carrying capacity so this rate may be even lower. For example, if the mean age of first litter increased to 7 years, then the sustainable rate would be only 4.7%. If cub and yearling survival have declined to the extent presented by van Manen et al. (2016, Fig. 3)(i.e., 0.4 and 0.3 instead of the 0.553 and 0.539 used in the IGBST [2012] report), then female survival would have to be 100% through senescence to maintain a stable population.

We recommend a re-consideration of these mortality limits in light of the above concerns combined with known declines (and further projected declines) in survival of dependent young, and probable instability of the age structure caused by institution of a hunt (thus likely violating a key assumption of the matrix modelling upon which the allowable mortality rates are calculated).

Issue: Uncertainty in the estimates of annual mortality

There is considerable uncertainty in the number of bears that die of natural causes and that are killed by people but not reported. In 2013 and 2014, for example, estimated unreported losses formed a significant contribution to the number of deaths in the total mortality. With data from 1983 to 2011, Schwartz et al. (2006) did not document any independent radio-collared females dying of natural causes although 3 died of undetermined causes. Natural deaths are uncommon, but other studies towards the southern edge of the grizzly bear distribution have found natural mortalities of females (Garshelis et al. 2005, Mace et al. 2012, McLellan 2015) and Schwartz et al. (2006) did document 5 cases of males dying of natural causes. Bears do sometimes kill one another, they die in avalanches, rock slides, collapsed dens, and some starve. Recently, some natural deaths of females in the GYE have been documented (van Manen 2016). Without telemetry, most of these deaths go unrecorded and must be estimated using rates of collared bears, which adds another layer of uncertainty.

The total number of human-caused deaths (reported and unreported) was estimated using a Bayesian approach. This method resulted in broad credible intervals that depend on different priors that in turn, depend on how the unexplained and unresolved cases are dealt with (Cherry et al. 2002). For example, depending on which of the 3 priors are chosen for years 1997-1999 (typical years), the 95% posterior probability intervals could vary from 16 to 78 bears killed by people when “possible” cases are included. When possible cases are excluded, the number could vary from 12 to 64. In IGBST annual reports, a point estimate is used and the credible intervals are not shown. Natural deaths are not included in this estimation method (Cherry et al. 2002).

Unknown mortalities are an inherent part of any management system, but we saw little recognition in the rule or CS of the effects of 3 intersecting uncertainties that should be considered in establishing quotas on discretionary killing: (1) the unknown number of bears that died of other causes, (2) the true sustainable mortality rate, given the uncertainty in the vital rates, and (3) the true population size.

Issue: High mortality rates above targeted population size are risky

Allowable female mortality rates of 9% for total populations 675–747 and 10% for populations >747 would not be sustainable, especially with increasing density dependent forces (van Manen et al. 2016). We interpret these high allowable rates as a purposeful attempt to reduce the population to achieve the target of 674 bears if it is found to exceed that number. However, this is never explicitly stated, and the language in the rule and CS seem not to be consistent as to whether the aim is to reduce the population if it exceeds 674.

Given the uncertainties in the estimation of sustainable mortality, uncertainties in estimation of population size and trend, and lack of understanding of the density dependent factors at play as well as effects of changing food conditions (discussed below), we believe it is risky to manage for a purposeful reduction in this population.

Issue: Managing with uncertainty calls for conservatism

An important question that grizzly bear managers must answer is how confident they want to be that the number of bears being killed by people is sustainable. Using "best estimates" for population size, vital rates used in the matrix model, unknown HCM, and natural deaths, as appears to be the case in this proposed rule, would mean that there would be a 50% chance that the mortality limits would be unsustainable. Given the breadth of all confidence limits, there is a reasonable chance that the mortality limits might be far from sustainable and may cause the population to decline. To manage grizzly bear populations more conservatively (preferring to err on the side of an increase rather than a decline), other management agencies do not set mortality limits at "best estimates", but rather nearer the lower confidence limit. For example, British Columbia (BC) has > 20 times as many grizzly bears over an area 16 times as extensive as the GYE, and many BC bears are in rich ecosystems with many fruit species, ungulates, and salmon. BC's bears are also fully connected with bears in Alaska, the Yukon, Alberta, and Northwest Territories. In hunted populations, BC has a total HCM annual limit (recorded including hunting, human-bear conflicts, road or train kills, and estimated unrecorded kills) of 4-6% and only 30% of these can be females. In threatened BC populations, any human-caused mortality is opposed to the population recovery objective so there is no legal hunting. In areas where there is higher uncertainty around population estimates, BC managers typically choose total HCM limits lower than maximums. The limit used in BC, although the population is much larger and more secure, is far more conservative than the 7.6% and 15% for female and male bears suggested in the proposed rule for managing GYE.

We recommend that a more conservative approach to harvesting, analogous to that used in BC, be used in the GYE.

Issue: Population target seems counter to the goal of population expansion and reconnection

Large population size and connection with neighboring populations should be a prime strategy for long-term population persistence of grizzly bears, particularly during a time of unpredictable ecological conditions stemming from climatic change. However, the overall thrust of the rule appears to purposefully limit both population growth and dispersion. The rationale for this decision is not clear, and seems counter to the overall objective of ensuring the persistence of Yellowstone grizzly bears post-delisting. Even without the documented density-dependent decline in cub and yearling survival and reproductive output (van Manen et al. 2016), revised population estimates (Haroldson and van Manen 2014) will result in high and unsustainable mortality rates, which will reduce population size and likely preclude expansion. We believe that continuing to encourage population grown, expansion, and ultimately reoccupying the Bitterroot Ecosystem (BE) and connecting with the Northern Continental Divide Ecosystem (NCDE) should be the long-term goal.

The rule (p 13192) suggests that future connectivity is desirable and will be actively managed for, but tying increasing mortality limits to increasing population size does just the opposite. We suggest a re-examination of the apparent discord between the high, unsustainable mortality limits when the population exceeds the target of 674, versus encouraging the population to expand westward (towards the BE) and northward (towards the NCDE). Having spatially-explicit targets for this population would be better, we believe, than exact numerical targets. For example, mortality limits could be higher in the southern and eastern portions of the GYE than to the west and north. Moreover, habitat to the north and west of the DMA should be managed in such a way as to encourage population expansion. We acknowledge that such expansion would occur within the constraints of human-bear conflicts (i.e., social carrying capacity), but in the face of a changing biological carrying capacity, it would seem prudent to view the social carrying capacity as also adaptable in the long term.

---

Jennifer,

Do you have time to put together a rough response to this. I agree with Sarah that the congressman is asking for things we already expect to do such as having completed Forest Plan amendments and State management plans, but could we provide step through outline of our approach with these items prior to a delisting decision.

Sarah and Justin - Jennifer and I are leaving Friday to attend a conference in Anchorage. Also I am busy much of tomorrow with a telemetry flight but will get back in the office late in the day. I will be around part of the day Friday to try and review a draft if Jennifer can give us a start.

Subject: Fwd: FW: 063311 - Concerns about certain decisions regarding the GYE Bears vs other grizzlies in the listing/delisting process
To: Wayne Kasworm <Wayne_kasworm@fws.gov>, Justin Shoemaker <justin_shoemaker@fws.gov>

Hi Wayne,

Could you work on drafting a response to this letter from Rep. Grijalva? Justin, could you be the RO lead to help Wayne with this? Seems like what he is requesting is fairly consistent

with what we plan to do, as I understand it? So we should be able to confirm as much in our response, but let me know if we need to discuss further.

We'll probably need something drafted by early next week I think, in order to get it through surname and to the RD's office by the due date of **June 16th.** Also attached is an example Congressional letter put together by our RO "correspondence team" to help with formatting.

Thanks,

Sarah Backsen (Fierce)

The Honorable Daniel M. Ashe
Director, U.S. Fish and Wildlife
Department of the Interior
1849 C St., NW
Washington, D.C. 20240

Dear Director Ashe,

I would like to congratulate you on the significant progress the U.S. Fish and Wildlife Service (Service) and its partners have made toward protecting and recovering grizzly bears in the Greater Yellowstone Ecosystem (GYE). The tremendous growth of this population of bears is a testament to the effectiveness of the Endangered Species Act (ESA), and the many people who have worked tirelessly to restore the grizzly to this landscape deserve our highest praise.

However, I am concerned that the recent proposal to isolate GYE bears from the rest of the grizzlies in North America and remove it from the list of ESA threatened species does not do enough to ensure that these bears will continue to thrive. Specifically, the proposed rule makes the bold assumption that the states of Wyoming, Montana, and Idaho will put in place grizzly bear management plans containing adequate and enforceable regulatory mechanisms as required by the ESA. While these three states are currently developing their management plans, the contents of the final products are largely unknowable at this point. Further, the U.S. Forest Service has not started the process of amending forest plans in the GYE to incorporate necessary post-delisting conservation measures.

Ensuring that federal land managers and state wildlife officials have in place plans that will conserve grizzly bear habitat, allow for connectivity of GYE bears with other populations, and limit mortality to sustainable levels is critical to conservation success after ESA protections are removed. This is especially important given the scientific uncertainty surrounding the availability of forage for GYE grizzlies, and how climate change could cause them to range farther in search of food, increasing the likelihood of interactions with humans. For these reasons, I respectfully ask that you commit to not issuing a final rule on GYE grizzlies until after the state and Forest

Service have finalized their plans, the Service has allowed for additional public comment on the utility of these plans as part of a post-delisting conservation strategy, and Service scientists have deemed the plans adequate and enforceable as required by law. Rushing to finalize the rule without addressing these concerns will likely result in the Service losing yet another lawsuit – an outcome that no one wants.

Thank you for your attention to this matter. If you have any questions, please have your staff contact Matt Strickler on the Natural Resources Committee Democratic Staff at (202) 225-6065. I look forward to your response.

Sincerely,

Raúl M. Grijalva
Ranking Member
Committee on Natural Resources

United States Department of the Interior

FISH AND WILDLIFE SERVICE
Mountain-Prairie Region

CONGRESSIONAL LETTER

All Congressional letters must be routed through External Affairs.

If the incoming is addressed to someone other than the person signing the response, you should explain this in the opening paragraph.

The Honorable Scott Tipton
House of Representatives
218 Cannon House Office Building
Washington, D.C. 20515

D~~D~~ear Representative Tipton:

Thank you for your letter of March 14, 2016, concerning a programmatic biological opinion (PBO) for the White River basin under the Upper Colorado River Endangered Fish Recovery Program (Recovery Program). Director Ashe requested that I respond to your inquiry. Specifically, your letter encouraged the U.S. Fish and Wildlife Service (Service) to initiate and complete a PBO for the White River in the most expeditious manner possible.

The Recovery Program is working to recover endangered fish in the Upper Colorado River Basin while water and hydropower resources are managed within state and federal laws and tribal rights to meet the needs of people in growing western communities. PBOs are proven tools to provide localized, drainage-specific application of the Recovery Program's goal to recover the endangered fish while water use and development continue. PBOs expedite compliance with the Endangered Species Act for water users, federal agencies, and the Service. The Service has strongly committed to developing a PBO for the White River. The process begins with the development of a White River Management Plan (WRMP), which will:

1. Recognize historical water development and some amount of future water depletion that the Recovery Program can cover from an Endangered Species Act perspective.
2. Identify specific Recovery Program actions (e.g. finalization of endangered fish flow recommendations for the White River) that will offset the effects of those depletions.

The WRMP requires hydrologic modeling to determine how the flow needs of the endangered fish and some level of future water development compare to the current range of flows in the White River. Hydrologic modeling will be conducted by the Colorado Water Conservation Board

(CWCB), but has been deferred while CWCB developed Colorado's Water Plan. With the completion of the Water Plan, the Service believesCWCB has indicated that the the development of a White River Management Plan,WRMP and the and PBO should be completed by are scheduled for the summer of 20187.

The WRMP dManagement Plan Development will be is a stakeholder driven; process and we look forward to open engagement throughout that process. With completion of the WRMP in 2017, the Service believes the PBO will be completed in 2018, as that plan is developed.

Thank you for this opportunity to communicate our proposed process, schedule, and commitment to develop a PBO for the White River. I hope this letter fully addresses your concerns. If you need further information, please contact me at (303) 236-7920 or Michael Thabault, the Assistant Regional Director for Ecological Services in the Mountain-Prairie Region, at (303) 236-4210.

Sincerely,

Regional Director

Mary,

Attached are several documents I recommend you push to the entire YES committee in advance of our meeting next Tuesday. As you are aware, the themes addressed by the Steering Committee will be presented and covered in detail, however the attached documents may give members who are interested some material in advance to review and re-familiarize.

I am available to talk on Monday.

If possible, I think it would be handy to have access to a projector and screen so that we can project some of the recommended changes.

I did not include a copy of the recommended process because you and the steering committee have had a chance to weigh in on the final written version. We can disseminate Monday evening or at the meeting. I will bring some paper copies. For the same reason, I did not include several of the other sub-group recommendations.

Attachments include:
1) Original list of themes and their sub-group assignment
2) Final Steering committee theme list
3) Meeting minutes from past three Steering Committee meetings-these provide some detail on theme discussions

Mary,

Attached are several documents I recommend you push to the entire YES committee in advance of our meeting next Tuesday. As you are aware, the themes addressed by the Steering Committee will be presented and covered in detail, however the attached documents may give members who are interested some material in advance to review and re-familiarize.

If possible, I think it would be handy to have access to a projector and screen so that we can project some of the recommended changes.

I did not include a copy of the recommended process because you and the steering committee have had a chance to weigh in on the final written version. We can disseminate Monday evening or at the meeting. I will bring some paper copies. For the same reason, I did not include several of the other sub-group recommendations.

Attachments include:
1) Original list of themes and their sub-group assignment
2) Final Steering committee theme list
3) Meeting minutes from past three Steering Committee meetings-these provide some detail on theme discussions

Wayne,

You probably don't know all the effort that has gone into getting the Blackfeet Tribal Business Council to adopt a position on delisting. They have been getting a LOT of pressure from members of GOAL including the Blackfeet Confederacy members in Canada. On Friday they passed the attached position paper in which they state the Blackfeet Tribe does not oppose delisting. A bit short of supporting delisting and some sovereignty finger pointing, but what the hey, better than most other tribes.

Chris,
I copied you on this just because I know at some level you must be still interested and I hope relieved that its someone else's worry.

Dan

STATEMENT OF THE
BLACKFEET NATION
REGARDING THE PROPOSED DELISTING
OF THE GRIZZLY BEAR FROM THE ENDANGERED SPECIES ACT

We, the Amskapi Piikani People of the Blackfeet Nation have lived with the Grizzly Bear from the beginning of time. We recognize the cultural reverence of the Grizzly bear to our People and to all members of the *Siksikaisitapi (*Blackfoot Confederacy*)* Prior to the enactment of the Endangered Species Act by the United States government and the subsequent listing of the Grizzly Bear as a protected and endangered species pursuant to that Act, we exercised our inherent sovereign authority to regulate all wildlife within our territorial borders.

To the extent that the Endangered Species Act usurped our authority to regulate all game species within our territory, it is an infringement on our inherent sovereignty and right of self-government.

Delisting the grizzly bear or any other plant, animal or bird restores to the Blackfeet Nation our sovereign power to resume regulation of all game within our territory.

We do not support hunting the grizzly bear whether by our own People or by non-Natives for sport or for a fee. However, we reserve the right to regulate the grizzly bear within our territory.

Today, the area of the United States known as the Northern Continental Divide Ecosystem, which includes the current Blackfeet Reservation , Glacier National Park and the Badger-Two Medicine unit of the Lewis and Clark National forest has the highest population of grizzly bears in the continental United States.

This increased population has resulted in conflicts between the Grizzly bear and the Ampskai Piikani People and has endangered our People and our communities within our territory.

For the reasons set forth herein, we, the Blackfeet Tribal Business Council, as guardians of the Blackfeet Nation and all our People, do not oppose the delisting of the grizzly bear from the Endangered Species Act. Such delisting restores to the Blackfeet Nation our inherent sovereign right to regulate all game species within our territory.

Subj: Specific Questions Regarding ESA + Grizzly Bears

Dear Director Ashe,

I appreciate the response of July 6 from your regional office director to my letter regarding concerns over the U.S. Fish and Wildlife Service (Service) proposal to remove Endangered Species Act (ESA) protections for grizzly bears in the Greater Yellowstone Ecosystem (GYE). I also appreciate your decision to reopen the public comment period on the proposed delisting rule for consideration of the peer review and documents pertaining to the states of Idaho, Montana, and Wyoming's plans to allow sport hunting for grizzly bears immediately upon delisting. However, significant uncertainty remains about whether or not GYE grizzly bears will be managed responsibly in a post-delisting environment because the Service has not made public proposed revisions to the draft GYE Grizzly Bear Conservation Strategy (Conservation Strategy).

As you know, the Conservation Strategy is the critical document that will guide management of GYE grizzlies should the delisting proposal become final. Therefore, it is imperative that it includes clear and enforceable commitments by federal and state agencies to ensure that the progress made to this point on grizzly bear recovery is not lost. It is my understanding from talking to numerous stakeholders that the Conservation Strategy has undergone significant revision since the final draft was released earlier this year, warranting additional review of the document by the public before it becomes final. I also understand that the views of the National Park Service, which manages approximately 40 percent of the Primary Conservation Area for grizzly bears and has played a pivotal role in the recovery of grizzly bears in the GYE, have not been adequately considered.

I recently received a letter from NPS in response to a series of questions I asked Yellowstone National Park Superintendent Dan Wenk about GYE grizzly bears. I have enclosed a copy of that letter for your consideration. Among other things, NPS raised significant concerns with the Service's specification of a minimum population size of 500 grizzly bears, the lack of strong standards to ensure connectivity of GYE grizzly bears with other populations, and the

uncertainty of how a sharp increase in human-caused mortality through hunting would impact the population. These concerns are echoed in the peer review of the proposed rule, with reviewers writing that the issue of management to facilitate connectivity with other grizzly populations "is not adequately addressed," that "overharvest and a potential subsequent lag in management response could drive bear numbers below the desired minimum populations size," and that "there is no scientific basis for the lower limit of 500 bears," a level that represents a 17 percent reduction from the Service's most conservative estimate for the current population.[1] Finally, NPS expresses legitimate concerns about the impacts of allowing hunting within the John D. Rockefeller, Jr. Memorial Parkway and other areas adjacent to Yellowstone and Grand Teton National Parks on the visitor experience, the regional economy, and the core population of bears living within the parks.

For these reasons, I request the following:

1. Before finalizing a delisting rule for GYE grizzly bears, release and allow public comment on a revised final draft Conservation Strategy, including final state management plans.

2. Require that the Conservation Strategy and state management plans contain clear and enforceable measures to ensure the GYE grizzly population remains stable or increases and allow for connectivity to other populations, and that the conservation strategy adequately addresses the potential impacts of climate change and secures grizzly bear habitat on federal lands.

3. Ensure that the National Park Service retains its authority to manage the John D. Rockefeller, Jr. Memorial Parkway as a National Park Service Unit, including by prohibiting the hunting of grizzly bears, and prohibit the hunting of grizzly bears on lands adjacent to the Parks and within the Primary Conservation Area.

Without these conditions being met, it seems unlikely that grizzly bear recovery will be a lasting success, and therefore I will not be able to support delisting. Thank you for your attention to this matter. If you have any questions, please have your staff contact Matt Strickler on the Natural Resources Committee Democratic Staff at (202) 225-6065. I look forward to your response.

Sincerely,

Raúl M. Grijalva
Ranking Member
Committee on Natural Resources

P.O. Box 25287
Denver, Colorado 80225-0287

IN REPLY REFER TO:

September 14, 2016

The Honorable Raúl M. Grijalva
United States House of Representatives
Committee on Natural Resources
Washington, D.C. 20515

Dear Congressman Grijalva:

Thank you for your recent letter requesting answers to questions regarding the proposed delisting of grizzly bears in the Greater Yellowstone Ecosystem (GYE) and potential effects inside and outside Yellowstone National Park. I am responding on behalf of the Intermountain Region of the National Park Service, which encompasses the parks in the affected area. Our responses to these questions follow:

Does the National Park Service (NPS) believe that hunting within the Primary Conservation Area (PCA) is consistent with the habitat security goals of the Conservation Strategy?

The PCA encompasses Yellowstone National Park, part of Grand Teton National Park and the John D. Rockefeller, Jr. Memorial Parkway, national forests and other ownerships. It is intended to provide secure habitat for grizzly bears where access-related disturbances are limited. If, after delisting, the states of Idaho, Montana, and Wyoming decide to hunt grizzly bears within the portion of the PCA outside national parks, the NPS has requested they focus the majority of these harvests away from park boundaries and in areas where human-bear conflicts are prevalent. Without such commitments, hunting could be concentrated within the PCA and near park unit boundaries, which could have significant impacts to bear viewing, regional economics, dispersal, and genetic connectivity.

Does the NPS support the potential removal of more than 200 – or one out of every four – bears from the Demographic Monitoring Area (DMA)?

The NPS does not support the removal of 200 grizzly bears from the DMA. Demographic recovery criterion 1 of the Draft Grizzly Bear Recovery Plan Supplement: Revised Demographic Criteria (USFWS 2016) and the proposed delisting rule specify a minimum population size of 500 grizzly bears within the DMA for genetic health. This is not a population goal or target. Rather, demographic recovery criterion 3 identifies a population objective based on the 2002-2014 Chao 2-modeled average of 674 bears (95% confidence interval = 600-757 bears). Furthermore, in Table 1 the proposed delisting rule indicates "if population size is estimated as fewer than or equal to 600 in any year, no discretionary mortality will occur unless

necessary for human safety." The NPS has conveyed to the U.S. Fish and Wildlife Service that these different population thresholds are confusing and could be interpreted differently by various stakeholders.

Does it concern the NPS that bears in national parks would effectively be providing the source population of bears for the states' discretionary mortality allocation?

Human-caused mortality within the PCA likely will increase after the delisting of grizzly bears if and when the states decide to implement hunting on national forest lands, private lands, and elsewhere outside NPS-managed lands. Without commitments to conservative restrictions on hunting and focusing hunting away from park boundaries, the role of the PCA in providing secure habitat and reducing human-caused mortalities to grizzly bears likely will be substantially diminished. Such commitments would help lessen the adverse effects of habitat loss from private developments in the PCA, dampen the effects of high and unpredictable human-caused mortality on multiple use and private lands (i.e., provide a refuge effect), offset the effects of unreported, harvest-related, wounding loss on the grizzly bear population, and limit potential source-sink dynamics from inside to outside the parks.

How would mortality rates of 9-10 percent for independent females and 20-22 percent for independent males impact the ability to maintain a recovered population?

Survival rates of adult grizzly bears are high without human-caused deaths, while reproductive rates are quite low. Any harvest of bears above conservative harvest levels could intentionally or inadvertently contribute to reduced population growth due to increased adult mortality and disruption of social organization, which could result in fewer young animals added to the population in the future.

The states maintain the proposed harvest levels combined with rigorous monitoring and timely adaptive management adjustments should result in sustainable harvests and the maintenance of a viable population of grizzly bears. Current estimates of grizzly bear vital rates suggest an adult female mortality rate of 7.6 percent or less would result in a stable to increasing population, whereas mortality rates of 9 to 10 percent would cause a population decline. Mortality rates of 20 to 22 percent for adult males may potentially disrupt the social structure of the population, possibly lowering cub production. We have recommended monitoring and research to evaluate the extent of unintended harvest of females with cubs, wounding loss, whether hunting is being sustained by dispersal of bears from national parks (i.e., source-sink dynamics), and any effects of modest to liberal harvests on the demographics and numbers of bears living within the PCA.

How would these mortality rates impact the ability of bears to expand outside of the PCA and achieve connectivity with other grizzly bear populations within the Northern Continental Divide Ecosystem?

The extent to which hunting in the PCA would inhibit connectivity to the Northern Continental Divide Ecosystem would depend on the extent and location of future hunter harvest. If grizzly bears are harvested at rates near the upper end of the proposed mortality limits, and that harvest is concentrated within the linkage zones connecting to the Northern Continental Divide

Ecosystem, then connectivity could be inhibited. The state of Montana has indicated that they will manage discretionary mortality in these areas to retain the opportunity for natural movements of bears between ecosystems, but no details have been provided as to how this would be assured. Some stakeholders would like to see a more detailed plan for connectivity within these linkage zones in the delisting rule, conservation strategy, state management plans, and/or the three-state memorandum of agreement.

How important is wildlife viewing – and grizzly bear viewing in particular – to Yellowstone visitors and surrounding communities?

Grizzly bears are one of the premier wildlife attractions for visitors to the Yellowstone/Grand Teton area, which contributes to the public's enjoyment and sense of pride in our conservation heritage. Tourism has a large and increasing influence on the regional economy, with more and more entrepreneurs, residents, and visitors seeing the environment and wildlife as valuable resources for recreation and viewing. There were more than 4.1 million visits to Yellowstone National Park during 2015, which contributed an estimated $493 million to nearby communities, supported about 7,730 jobs, and had a collective benefit of about $638 million to the area's economy. Over 90% of visitors indicated the park was the primary reason for visiting the area.

Visitation to Yellowstone and Grand Teton National Parks for wildlife viewing and other recreational activities is expected to continue to increase in the future. Ninety-nine percent of visitors to Yellowstone National Park expect to see a bear, and 67% did during a recent trip. This illustrates the strong desire and expectation of park visitors to see bears while they are in national parks.

How would bear hunting immediately outside Yellowstone impact opportunities for bear viewing within the park?

Many grizzly bears in Grand Teton and Yellowstone National Parks have necessarily habituated to the presence of millions of non-threatening visitors each year, for the many decades since bears were last hunted. This may make them more susceptible to future hunting when they leave the parks. Bear viewing could be impacted by the harvest of bears that frequent roadsides, bear avoidance of people following encounters with hunters, or other factors. Thus, the NPS has recommended to the U.S. Fish and Wildlife Service and the surrounding states that any future harvests be conducted in a way that (1) respects the mission of the NPS, (2) protects regional economic benefits and the enjoyment of bear watching, (3) reduces the risks associated with wounded bears entering the parks, and (4) limits the likelihood that well-known or transboundary bears will be harvested.

The NPS respects that hunting regulations are firmly in the purview of the states. However, the NPS is concerned that a delisting decision without commitments to conservative harvest restrictions in the portion of the PCA outside the national parks could result in a serious setback for grizzly bear management. The harvest of bears in such as manner as may impact bear-viewing opportunities in the parks will create great pressure to revisit this delisting decision and likely make future delistings of other iconic species more difficult. Thus, the NPS would like to lessen the risk of a bears being harvested near park boundaries. Elements of such a strategy

could include (1) no hunting of bears in the John D. Rockefeller, Jr. Memorial Parkway, (2) focusing the majority of harvests away from park boundaries and in areas where human-bear conflicts are more prevalent, and (3) imposing strict limits on female harvest in areas near park boundaries.

How vulnerable are so-called "celebrity bears" within Yellowstone and Grand Teton National Parks to hunting outside the park?

A grizzly bears' vulnerability to hunting when leaving the refuge of a national park likely would depend, in part, on the proportion of time it spent outside the national park and the distance it traveled from the park's boundary. Concentrating hunting in areas that have frequent human-bear conflicts could reduce the chances of bears that frequent the parks being harvested because most concentrations of conflicts occur in areas away from park unit boundaries. Conflicts sometimes occur in park gateway communities, which could expose those bears to some risk of harvest. However, if these bears are causing conflicts in gateway communities, they would likely be removed in management actions by state agencies regardless.

Is grizzly bear hunting along the Parkway consistent with the mission of NPS? Would hunting along the Parkway be supported by visitors to these parks?

The enabling legislation for the John D. Rockefeller, Jr. Memorial Parkway allows hunting at the discretion of the Wyoming Game and Fish Commission. However, due to the popularity and documented regional economic benefits of non-consumptive use of grizzly bears for viewing and photography, the NPS has requested that the delisting rule, conservation strategy, state management plans, and other related documents identify the John D. Rockefeller, Jr. Memorial Parkway as one of the three national park units in the Greater Yellowstone Ecosystem where grizzly bear hunting will not be permitted. Many visitors and stakeholders that prioritize photography, recreation, and wildlife watching strongly support this request.

Thank you for the opportunity to provide comments.

Sincerely,

Sue E. Masica

The Honorable Raúl M. Grijalva
Committee on Natural Resources
House of Representatives
218 Cannon House Office Building
Washington, D.C. 20515

Dear Representative Grijalva:

Thank you for your letter of June 7, 2016, concerning the proposed rule to delist grizzly bears in the Greater Yellowstone Ecosystem (GYE). Director Ashe requested that I respond to your inquiry. Specifically, your letter encouraged the U.S. Fish and Wildlife Service (Service) not to publish a final rule to delist the GYE grizzly bear until federal land managers and state wildlife officials have plans in place that exhibit adequate regulatory mechanisms to conserve grizzly bear habitat, allow for connectivity between the GYE and other populations, and limit mortality to sustainable levels.

As stated in the proposed rule to delist the GYE population of grizzly bears, all the state and federal agencies party to the draft 2016 Conservation Strategy for the Grizzly Bear in the GYE will need to sign a memorandum of understanding agreeing to implement the revised 2016 Conservation Strategy prior to a final delisting rule. Furthermore, revised state plans will be finalized prior to a final determination on the proposed rule. We intend to fully evaluate all aspects of the plans, including whether they effectively provide for the conservation of grizzly bears and their habitat, prior to a final determination on the proposed delisting rule. Sustainable mortality limits are addressed in the proposed rule and are part of the requirements for the states to adopt in their management plans and regulations prior to the Service issuing a final rule. Grizzly bears outside of the GYE area delineated in the proposed rule, including areas that provide potential connectivity to other populations, would remain listed should we finalize the delisting of the GYE population. In addition, affected National Forests and National Parks have incorporated, or will incorporate before a final rule is issued, the habitat standards and criteria into their Forest Plans and National Park management plans and/or Superintendent's Compendia via appropriate amendment processes so that they are legally applied to these public lands within the GYE.

Thank you for this opportunity to communicate our proposed process and commitment to the delisting of the GYE grizzly bear. I hope this letter fully addresses your concerns. If you need further information, please contact me at (303) 236-7920 or Michael Thabault, the Assistant Regional Director for Ecological Services in the Mountain-Prairie Region, at (303) 236-4210.

Sincerely,

Regional Director

The Honorable Daniel M. Ashe
Director, U.S. Fish and Wildlife
Department of the Interior
1849 C St., NW
Washington, D.C. 20240

Dear Director Ashe,

I would like to congratulate you on the significant progress the U.S. Fish and Wildlife Service (Service) and its partners have made toward protecting and recovering grizzly bears in the Greater Yellowstone Ecosystem (GYE). The tremendous growth of this population of bears is a testament to the effectiveness of the Endangered Species Act (ESA), and the many people who have worked tirelessly to restore the grizzly to this landscape deserve our highest praise.

However, I am concerned that the recent proposal to isolate GYE bears from the rest of the grizzlies in North America and remove it from the list of ESA threatened species does not do enough to ensure that these bears will continue to thrive. Specifically, the proposed rule makes the bold assumption that the states of Wyoming, Montana, and Idaho will put in place grizzly bear management plans containing adequate and enforceable regulatory mechanisms as required by the ESA. While these three states are currently developing their management plans, the contents of the final products are largely unknowable at this point. Further, the U.S. Forest Service has not started the process of amending forest plans in the GYE to incorporate necessary post-delisting conservation measures.

Ensuring that federal land managers and state wildlife officials have in place plans that will conserve grizzly bear habitat, allow for connectivity of GYE bears with other populations, and limit mortality to sustainable levels is critical to conservation success after ESA protections are removed. This is especially important given the scientific uncertainty surrounding the availability of forage for GYE grizzlies, and how climate change could cause them to range farther in search of food, increasing the likelihood of interactions with humans. For these reasons, I respectfully ask that you commit to not issuing a final rule on GYE grizzlies until after the state and Forest

Service have finalized their plans, the Service has allowed for additional public comment on the utility of these plans as part of a post-delisting conservation strategy, and Service scientists have deemed the plans adequate and enforceable as required by law. Rushing to finalize the rule without addressing these concerns will likely result in the Service losing yet another lawsuit – an outcome that no one wants.

Thank you for your attention to this matter. If you have any questions, please have your staff contact Matt Strickler on the Natural Resources Committee Democratic Staff at (202) 225-6065. I look forward to your response.

Sincerely,

Raúl M. Grijalva

The Honorable Raúl M. Grijalva
Committee on Natural Resources
House of Representatives
218 Cannon House Office Building
Washington, D.C. 20515

Dear Representative Grijalva:

Thank you for your letter of September 27, 2016, concerning the proposed rule to delist grizzly bears in the Greater Yellowstone Ecosystem (GYE). Specifically, your letter expressed concern about the Conservation Strategy, population targets, connectivity, and hunting. We share your concern for the conservation of the Yellowstone grizzly bear population and delisting will only occur if I am completely satisfied that we have robust commitments that this success can be maintained in the long-term.

Recovery of the Yellowstone grizzly bear population is a remarkable conservation success story and further validation of the success of the Endangered Species Act. The Yellowstone grizzly bear population has rebounded from as few as 136 bears in 1975 to more than 700 today and more than doubled their range since listing. This population now occupies more than 22,500 square miles of the ecosystem. This success would not have been possible without the tireless efforts countless partners including Federal, State, and Tribal agencies, conservation groups, and private citizens, including ranchers, sportsmen, and outfitters.

Recognizing that the population has basically stabilized at or near long-term carrying capacity (with modest growth in recent years), our management partners have agreed to maintain the total population size near the average population estimate for the period of stability achieved during 2002-2014 (i.e., 674 bears as measured by the model-averaged Chao2 with a 95% confidence interval of 600 to 757 bears). This will be accomplished by reducing discretionary mortality to modest, sustainable levels (<7.6%) should the model-averaged Chao2 fall below 674 bears and prohibiting discretionary mortality (except as necessary for human safety) in the unlikely event that the population ever falls below 600 bears. Montana, Idaho, and Wyoming have now all formally adopted these regulatory commitments.

As a result, last month we reopened the comment period on our proposed delisting. In total, we have offered two public comment periods totaling 90-days over the last seven months including March 11, 2016 to May 10, 2016, and September 7, 2016 to October 7, 2016. The most pertinent documents guiding management after delisting have now all been provided to the public for comment including the draft

Conservation Strategy, Federal land management regulatory documents and State discretionary mortality regulatory documents. Additional changes to the Conservation Strategy being considered are either minor or responsive to the public comments. Therefore, we do not believe an additional public comment period on the final draft Conservation Strategy is necessary.

Your letter also raised concerns related to the geography of harvest. Specifically, you asked that the John D. Rockefeller, Jr. Memorial Parkway retain its authority to prohibit hunting as a National Park Service Unit. You also indicated hunting should be prohibited on lands adjacent to the National Parks and within the Primary Conservation Area. Nothing in this rule would alter, or in any way affect, the jurisdiction or authority of the State of Wyoming, Tribal governments, the National Park Service, the U.S. Fish and Wildlife Service, or any other entity with respect to the regulation of hunting. Whatever jurisdiction or authority to authorize, prohibit, or regulate hunting existed in such areas prior to this final rule is unchanged by the promulgation of this rule (except, of course, that this rule removes the protections of the Act).

In short, it is beyond our authority to negotiate further on this point unless it rises to the level of being a threat to viability of the population. In our view, the current suit of discretionary mortality regulations will maintain the Yellowstone grizzly bear's recovered status. That said, the National Park Service and the States have a long history of cooperatively managing harvest for other species in a way that provides for the needs of all parties. We expect this partnership and successful management of harvest will continue.

Finally, your letter expressed concern about connectivity to other grizzly bear populations. We agree that connectivity to other grizzly bear populations to the north is desirable. Such connectivity has been and remains a focus of the Service and our partners. Our proposed delisting would have limited impact on connectivity as nearly all of the intervening habitat where dispersal would occur would remain fully protected by the ESA.

Thank you for your interest in this iconic species and the conservation success story it represents. I hope this letter addresses your concerns. If you need further information, please do not hesitate to contact me at the above letterhead.

Sincerely,

Director

1/20/2015

INFORMATION MEMORANDUM FOR THE R6 RD/DRD

FROM: External Affairs / R1 & R6 Tribal Programs

SUBJECT: Yellowstone Grizzly Bear Delisting and Tribal Opposition

I. SUMMARY

In April 2014, the Grizzly Bear Recovery Program sent out letters offering G2G consultation to the four Native American Tribes having treaty interests in the proposed Yellowstone grizzly bear delisting area. In November 2014, 26 tribes contended the federal government failed to consult the all Tribal nations, which have an ancestral connection to Yellowstone. Their dissatisfaction was broadly spread in the media *(links are located at the end of the report).*

II. DISCUSSION

None of the four Tribes that received the original letter had responded to the G2G offer. When the Service delisted the bears in 2007, for two years until 2009, no Tribal opposition was documented or expressed.

According to the Guardians of Our Ancestors' Legacy Tribal Coalition (GOAL), Tribes throughout the region have increasingly spoken out against delisting the species. GOAL has stepped to the forefront as the organized group of Tribes leading the opposition effort. Tribal members are very sensitive to the species and cite deep spiritual and cultural connections to the bears as well as disgust at the idea of state-managed trophy hunts.

III. OPTIONS FORWARD

These options were drafted with input from Region 1. Although numerous Tribes are in opposition to the effort, most of the opposition is coming from the Northern Cheyenne Tribe with some from the Shoshone-Bannock Tribes of Idaho.

1. Plan to meet in person for consultation with specific Tribes within their regional context, including Wind River, Flathead, Blackfeet and perhaps ShoBans, together in a central location (such as the Great Sioux Nation in South Dakota).

2. Work with the states of Wyoming and Montana to have them address the issue of hunting on reservations (killing most of the bears and also eliminating bears from the areas around the reservations). This directly impacts Wind River, Flathead and Blackfeet Tribes.

3. Begin direct contact at the informative (subject matter expert) level to hold conversations with the large organizations that wrote declarations expressing joint oppositions to include: Guardians of Our Ancestors' Legacy Tribal Coalition, Fort Hall Business Council, Montana Wyoming Tribal Leaders Council and all Tribes comprising Great Sioux Nation.

4. Given the response, the regions believe a webinar may be inadequate at this time. The program should make telephone contact with the Tribes directly followed up with email confirmation of what was said and/or agreed to.

5. R6 and R1 strongly recommend an additional in-person presentation and conversation. This could be a topic or agenda item at the upcoming Tribal roundtable and could help make up for the lack of earlier consultation.

6. A letter outlining the facts along with a couple of conversation options (informal discussions, G2G, presentations) and perhaps an apology could be drafted (with RD signature) and sent out to the 26 Tribal entities that are upset with the process.

7. Lastly, there is always the option of doing a webinar that talks about the species and presents factual information while opening up a question and answer session at the end.

PREPARED BY: R6 and R1 **DATE:** 1/20/15

Meeting Outcomes with DRD on 1/27/2015

Matt Hogan, Marla Trollan, Steve Torbit

We will move forward with recommend options 1/2/3/6

The attachment is what Marla Trollan and Steve Torbit took into Matt Hogan's office yesterday. The email that is attached is the one that spurred this meeting. I'm not sure if Mike T was told about the meeting but he did receive a copy of the attached email. Below are her directions to me. She said that these are the DRD's directions to her.

- We are to get a letter out to all 26 tribes listed in the press articles and the organizations involved, to include: GOAL, Great Plains Tribal Chairman's Association, & the Montana and Wyoming Tribal Leaders Council. We need to share this with R1 for contacting their Tribes that are involved.
- The letter needs to stress the point that nothing has been proposed and we are in the discussion stage. All Tribes will have an opportunity for formal consultation before a proposal is moved forwarded.
- ES is to conduct 3 in person consultation meetings.
- Refer to the consultation meetings broadly in our first letter, *not with direct dates or locations,* outside of the Great Plains, Northern Rocky Mountains and Idaho (that one needs coordinated with R1). It will also be discussed at the Regional Tribal Roundtable on March 19th in Denver at RMA.
- We are to follow-up with a second letter to all the Tribes and NGOs around until mid-to-late February. That date was determined by a meeting with FWS/Director Ashe and the states that a delisting would effect. I believe that meeting is happening in early February. That meeting does not involve Tribes.
- ES (you and maybe Mike T?) & possibly Steve Torbit (if needed) would attend/host the consultations *(maybe Seth W. would be able to help in this area).*
- I asked Marla who would schedule the locations, times and coordinate the consultation meetings. She said that would be you and Steve Torbit (*since he told Matt H. he is reaching out to the NGOs*).
- All cost for the meeting spaces would be the responsibility of ES.

Please let me know what questions we are going to need answered before moving forward and at what other levels in ES we may need to involve. Thank you and I apologize for calling you on this without you getting a heads up.

Attachments: Comments on the state response.docx

Jenn,

Here is that summary I told you about.

c

Comments on the state response dated May 8, 2015:

1. The state's population goal set at 683 (95% CI 607-757) must be measured with the Chao2 method. This cannot be the goal using the mark-resight method, which shows 1229 bears in 2007. Mixing monitoring results for management is not possible.
2. We have already let the states reduce the population post-delisting by letting them go to the 2007 number using Chao2 – from 757 to 683.
3. A 7.6% independent female mortality level below 683 will never allow the population to increase above that number, so it continually declines. That is why below 683 the mort limit must be <7.6%.
4. MOUs signed by state directors are not in any way regulatory of anything. They can be changed at will since such an MOU only involves the regulated.
5. Tribes do not have to negotiate with states.
6. There is no mention of how populations would be monitored or of the IGBST. No mention of use of ISBST data or how regulation will take place. The courts will want more specifics as follows: 9th circuit (grizzly): "more specific management responses, tied to more specific triggering criteria, are required." "the promise of adaptive management is not a sufficient answer to scientific uncertainty". The statement about MOUs and adaptive management is meaningless without specific criteria enforceable by management responses and these enforceable management responses cannot end at 5 years.
7. Connectivity is an accepted conservation effort for all species. What we are asking for is management efforts to facilitate connectivity, not demonstrated connectivity. The USFS is doing a lot to facilitate connectivity in these areas like implementing food storage regulations on public lands. The state refuses to do anything for connectivity thereby nullifying the USFS efforts. This is a huge deal for the NGOs and will be a litigation point if not included. What we are asking the state to do will cost them nothing since there are few if any bears in these areas most of the time to hunt anyway. This is MAJOR issue. The objection to doing this is driven by extreme ideology.
8. Triggers must be regulatory and objective and measurable. Molloy (grizzly): "[A biology and Monitoring Review] does not serve as a regulatory mechanism because…the Service and other agencies are not required to take any concrete response to protect grizzlies if monitoring shows population or habitat declines." 9th circuit (grizzly): "…more specific management responses, tied to more specific triggering criteria, are required." "the promise of adaptive management is not a sufficient answer to scientific uncertainty."
9. We took the states recommended mortality limits on a sliding scale to keep the population at the 2007 level and accepted them completely. We added triggers and connectivity to make this biologically and legally defensible. They did not even recognize what we did to appease them and instead asked for more.

10. 5-year limit on standards. This is the most egregious departure from the approach we have used to build post-delisting management plans (Conservation Strategies). There has never been anything discussed in the 14+ years of meetings among all agencies that any standards would disappear after 5 years post-delisting. Everyone has always agreed that the CS demographic and habitat management standards are to be in place in perpetuity post-delisting. These standards can be amended as necessary as long as such amendments are based on the best available science and the amendments are subject to public comment, but they are never to just disappear.
11. Note that if we somehow decide to allow the demographic standards to disappear after 5 years for the states, they also disappear for the tribes as well and we have lots of bears on 2 reservations in the NCDE. This will compound uncertainty and make such a decision even more indefensible.
12. The Service does not have the power to decide that the demographic standards in the CS will go away after 5 years because this is an interagency document signed by all state and federal and Tribal agencies and binding them to implement it. The demographic standards are not a state-FWS pact independent of the other agencies (even though some seem to think they are). Any idea to change the standards and make them disappear after 5 years would require reopening the entire Yellowstone and NCDE CS documents (the NCDE draft went out for comment in 2013). This would take years to rewrite these if it was to succeed, which I strongly doubt. A "5 year disappear" clause for demographic criteria would destabilize the foundation of the documents and be a significant departure requiring reopening the process and the public comment process. This would significantly weaken the CS and the proposed rule.
13. This idea that demographic standards disappear after 5 years and that concerns about policy changes from the states or legislatures disappear after 5 years is from one radical state administrator who has not been involved in any of this process. He has essentially hijacked the entire process at the 11th hour making delisting impossible and we are letting him do it.
14. When we completed the 2007 CS and rule we did not have RO and WO involvement in these documents. Instead we were backed up on what we did in my office and we got it done. Now we have been on hold for almost 10 months because the states appealed to the RO and WO and, instead of saying what we are doing is the way we need to get the delisting accomplished, the states were given uncertainty about what we (at the field level) were doing. This uncertainty from the RO and WO has allowed the states to depart from science and hijack the process and get us to the very edge of biological and legal defensibility where we are now.
15. It is useful to review where we are:
    a. As an interagency team (just as we did in 2007), we developed by mid-2014 a scientifically sound approach to delisting using the new data on whitebark pine and incorporated state concerns about the need to increase management flexibility by reducing the area where

we counted mortality by half (almost 48,000 sq km) and stabilized the population management approach. This approach was ready for a proposed rule to come out in the fall of 2014.

b. Certain state administrators went to the RO and WO and wanted to reduce the population post-delisting. They were given the impression that it might be possible, so movement forward on a proposed rule was stalled and has been stalled for almost 10 months.
c. At a meeting in February 2015, the state administrators were presented with multiple scientific indicators by USGS that the population has been essentially stable since the early 2000s and that a less biased population estimator showed the population was now about 1200 bears and was at that same level in 2007 and before. The state response was to deny these scientific facts. They thought the population was increasing and they preferred to use the Chao2 estimate of 757 bears in 2014.
d. The Service overruled NPS concerns about mortalities and allocated the percentage of the mortalities for NPS area populations to the states for state management.
e. In April 2015, the states proposed a management system to reduce the population to the 2007 Chao2-based number of 683 with a sliding scale of mortality levels to maintain this 2007 level of population. On April 17, 2015, the Service accepted everything the states proposed and added management triggers showing responses should there be departure from the state proposal. These additions by the Service were necessary to make the state proposal biologically and legally defensible.
f. The state response dated May 8, 2015 to the Service document making the state approach defendable in a delisting proposal was to remove every item the Service added to make the state approach defensible.
g. Not one of the many state biologists I have talked to in these 3 states supports this approach. This is an administrator-produced approach
h. If we want to produce a biologically and legally defensible delisting proposal and actually delist the Yellowstone grizzly bear, we cannot go any farther than we went with our acceptance of the state proposal on April 17, 2015. If we remove any of the items we added like triggers and connectivity management in intervening habitats, or (most damaging) make the demographic criteria disappear after 5 years, we will not be able to biologically and legally defend it and we will be not be able to delist.
i. Proposing something we cannot biologically and legally defend risks the future of the recovered grizzly populations we have worked for 34 years to recover, gravely hurts the credibility of the Service, erodes local public support for grizzly bears, and will damage the ESA.
j. I believe we will have broad local public support for the proposal we put forth on April 17, 2015. The local publics will see this as meeting

their needs for management flexibility while maintaining a health population in the demographic monitoring area. Local people are particularly interested in actually achieving delisting and this proposal has a real chance to succeed. Proposing an approach that has little chance of delisting success to meet the desires of a few state administrators will erode local public support for the grizzly bear and the ESA.

k. The Service is the lead on the conservation of listed species. For 34 years we have led the recovery effort and the result is the recovered populations we have today in the Yellowstone and the NCDE. We have to defend any delisting proposal biologically and legally. The states do not. We should be taking the lead is what is necessary to delist the grizzly and not be in a reactive mode to certain state administrators.

l. To put this last 10 months of drifting along on a delisting approach in perspective, if we would have had a similar approach over the last 34 years of the recovery effort whereby necessary recovery actions and tasks could be appealed to the RO and WO by the states or other agencies with resulting suspension or manipulation of these necessary recovery actions, we would never have achieved recovery. What got us to recovery was sufficient depth of political support for the tough decisions that had to be made. We (the Service) made tough decisions and held to these with support within the Service leadership and we achieved recovery.

m. To move forward we need to send our April 17 outline back to the states and tell them this is what will be necessary to delist with a biologically and legally defendable proposal. We should note that this approach:
    i. Accepts the sliding scale of mortality the states proposed to manage the population.
    ii. Increases management flexibility in many ways to allow the states to manage bear-human conflicts.
    iii. Accepts the state desire to manage the population down to the Chao2 population estimate of 683 bears when the Yellowstone bears were delisted in 2007.
    iv. Allows for increased discretionary take.
    v. Has a good likelihood of succeeding in delisting the Yellowstone population.

Subject:	Information regarding GYE Grizzly Bears

Tyson—

Here are few items, fyi. I have cc'd FWS staff that have asked IDFG for documents related to the Commission action.

1. On August 8, 2016, the Idaho Fish and Game Commission accepted Montana's edits to the MOA and adopted a proclamation related to the limit of take of GYE grizzly bear. The links are below.

   https://idfg.idaho.gov/sites/default/files/grizzly-bear-proclamation-8-8-2016.pdf

   https://idfg.idaho.gov/sites/default/files/grizzly-bear-tri-state-moa-8-8-2016.pdf

2. IDFG provides the following feedback to draft language circulating regarding Idaho's regulatory authorities. Notes are in italics and are intended for agency reference only and are not intended for inclusion in publication. Additions are in underline; deletions are in ~~strikeout~~.

   Idaho. ~~IDF&G.~~ *(Idaho Department of Fish and Game and the Idaho Fish and Game Commission are separate entities; the Commission is authorized to adopt proclamations, rules, and orders that are enforced by IDFG)* Idaho's Fish and Game Commission issued a proclamation relating to the limit of the take of grizzly bears in the GYE on August 8, 2016. Idaho Code Section 36-105 ~~gives the~~ authorizes the Idaho Fish and Game Commission ~~the authority~~ to use proclamations, which "have full force and effect as law," as a means of "setting any season or limit on numbers, size, sex or species of wildlife classified by the commission as game animals." ~~(Idaho Code Section 36-105).~~ *(deleted redundancy to code reference at start of sentence)* Since grizzly bears are classified as game animals in ~~IDAPA~~ Idaho Administrative Code *(use consistent references to either IDAPA or Idaho Administrative Code)* 13.01.06.100.01e, the Idaho Fish and Game Commission may use a proclamation to establish binding ~~rules~~ limits ~~ing~~ on the take ~~hunting~~ of grizzly bears (Idaho Administrative Code 13.01.06.100.01e).

3. Administrative Process related to the Take of Wildlife

IDFG provides the following brief summary of existing mechanisms for regulating the take of wildlife in Idaho. For wildlife classified as game animals, Idaho law (Idaho Code Section 36-104(b)(2)) authorizes the Idaho Fish and Game Commission to open seasons for public take of wildlife, where it finds a season will not endanger the species of game, and the Commission may impose limits on the numbers, sex, size and species, along with identifying allowable methods of take. The Commission may choose to limit a season to a certain number of hunters through a controlled hunt (Idaho Code Section 36-104(b)(5)). Both the Commission and IDFG Director have authority to close seasons when established limits are reached or in emergency situations (Idaho Code Sections 36-104(b)(3) and 36-106(6)).

Under Idaho Code Section 36-105(3), the Commission has authority to set seasons or limits for the take of wildlife by proclamation. Under Idaho Code 36-105(2), Commission proclamations, as well as Commission rules and orders, have the full force and effect as law. A proclamation identifies the time and place allowed for take of wildlife, along with any limits on numbers, sex, size and species the Commission may find appropriate. The

Commission typically reviews and sets seasons on an annual or biennial basis with public input, but may review them more frequently as conditions warrants.

The Commission also conducts rulemaking under the Idaho Administrative Procedure Act to establish administrative rules for classification of wildlife, allowances and restrictions for methods of take of wildlife, licensing requirements for take of wildlife, and other administrative aspects of wildlife take. To be responsive to biological factors, the proclamation process for setting seasons and limits involves fewer procedural requirements than rulemaking under the Idaho Administrative Procedure Act. For example, the big game season proclamation and administrative rule summary for 2015-2016 is available at: https://idfg.idaho.gov/sites/default/files/seasons-rules-big-game_2015-2016.pdf.

The Commission and IDFG agreed to evaluate take of grizzly bear on an annual basis under a Memorandum of Agreement with their counterparts in Montana and Wyoming. The Commission is not proposing to open a season for grizzly bear at this time, and the Commission would only make such a decision after delisting.

The Commission adopted a proclamation on August 8, 2016 related to the limit of take of GYE grizzly bear to provide clarity as to its existing authorities and season closure process for GYE grizzly bear management, consistent with its Memorandum of Agreement with Montana and Wyoming.

Subject:	Fwd: Information regarding GYE Grizzly Bears

Hi Maricela,

Last week, Jodi reached out to each state to share the language we used to describe their rulemaking process. Idaho just responded with some changes (a little late). They seem relatively minor but, if it's possible, could you adjust the paragraph that describes Idaho's process to reflect the changes below? I am not sure where the FR is in the approval process in HQ so let me know if you think it is too late for changes.

Thanks!!

Idaho's edits: Idaho's Fish and Game Commission issued a proclamation relating to the limit of the take of grizzly bears in the GYE on August 8, 2016. Idaho Code Section 36-105 ~~gives the~~ authorizes the Idaho Fish and Game Commission ~~the authority~~ to use proclamations, which "have full force and effect as law," as a means of "setting any season or limit on numbers, size, sex or species of wildlife classified by the commission as game animals." ~~(Idaho Code Section 36-105).~~ *(deleted redundancy to code reference at start of sentence)* Since grizzly bears are classified as game animals in ~~IDAPA~~ Idaho Administrative Code *(use consistent references to either IDAPA or Idaho Administrative Code)* 13.01.06.100.01e, the Idaho Fish and Game Commission may use a proclamation to establish binding ~~rules~~limits ~~ing~~ on the take ~~hunting~~ of grizzly bears (Idaho Administrative Code 13.01.06.100.01e).

3. Administrative Process related to the Take of Wildlife

IDFG provides the following brief summary of existing mechanisms for regulating the take of wildlife in Idaho. For wildlife classified as game animals, Idaho law (Idaho Code Section 36-104(b)(2)) authorizes the Idaho Fish and Game Commission to open seasons for public take of wildlife, where it finds a season will not endanger the species of game, and the Commission may impose limits on the numbers, sex, size and species, along with identifying allowable methods of take. The Commission may choose to limit a season to a certain number of hunters through a controlled hunt (Idaho Code Section 36-104(b)(5)). Both the Commission and IDFG Director have authority to close seasons when established limits are reached or in emergency situations (Idaho Code Sections 36-104(b)(3) and 36-106(6)).

Under Idaho Code Section 36-105(3), the Commission has authority to set seasons or limits for the take of wildlife by proclamation. Under Idaho Code 36-105(2), Commission proclamations, as well as Commission rules and orders, have the full force and effect as law. A proclamation identifies the time and place allowed for take of wildlife, along with any limits on numbers, sex, size and species the Commission may find appropriate. The Commission typically reviews and sets seasons on an annual or biennial basis with public input, but may review them more frequently as conditions warrants.

The Commission also conducts rulemaking under the Idaho Administrative Procedure Act to establish administrative rules for classification of wildlife, allowances and restrictions for methods of take of wildlife, licensing requirements for take of wildlife, and other administrative aspects of wildlife take. To be responsive to biological factors, the proclamation process for setting seasons and limits involves fewer procedural requirements than rulemaking under the Idaho Administrative Procedure Act. For example, the big game season proclamation and administrative rule summary for 2015-2016 is available at: https://idfg.idaho.gov/sites/default/files/seasons-rules-big-game_2015-2016.pdf.

The Commission and IDFG agreed to evaluate take of grizzly bear on an annual basis under a Memorandum of Agreement with their counterparts in Montana and Wyoming. The Commission is not proposing to open a season for grizzly bear at this time, and the Commission would only make such a decision after delisting.

The Commission adopted a proclamation on August 8, 2016 related to the limit of take of GYE grizzly bear to provide clarity as to its existing authorities and season closure process for GYE grizzly bear management, consistent with its Memorandum of Agreement with Montana and Wyoming.

Alex,
I have the document open now so can easily incorporate these edits. Will let you know if I have questions.

I've cc:ed Tyson on this email so that he can determine if these changes need to be made to the version that is undergoing SOL surname now.

Tyson—

Here are few items, fyi. I have cc'd FWS staff that have asked IDFG for documents related to the Commission action.

1. On August 8, 2016, the Idaho Fish and Game Commission accepted Montana's edits to the MOA and adopted a proclamation related to the limit of take of GYE grizzly bear. The links are below.

https://idfg.idaho.gov/sites/default/files/grizzly-bear-proclamation-8-8-2016.pdf

https://idfg.idaho.gov/sites/default/files/grizzly-bear-tri-state-moa-8-8-2016.pdf

2. IDFG provides the following feedback to draft language circulating regarding Idaho's regulatory authorities. Notes are in italics and are intended for agency reference only and are not intended for inclusion in publication. Additions are in underline; deletions are in ~~strikeout~~.

> Idaho. ~~IDF&G.~~ *(Idaho Department of Fish and Game and the Idaho Fish and Game Commission are separate entities; the Commission is authorized to adopt proclamations, rules, and orders that are enforced by IDFG)* Idaho's Fish and Game Commission issued a proclamation relating to the limit of the take of grizzly bears in the GYE on August 8, 2016. Idaho Code Section 36-105 ~~gives the~~ authorizes the Idaho Fish and Game Commission ~~the authority~~ to use proclamations, which "have full force and effect as law," as a means of "setting any season or limit on numbers, size, sex or species of wildlife classified by the commission as game animals." ~~(Idaho Code Section 36-105).~~ *(deleted redundancy to code reference at start of sentence)* Since grizzly bears are classified as game animals in ~~IDAPA~~ Idaho Administrative Code *(use consistent references to either IDAPA or Idaho Administrative Code)* 13.01.06.100.01e, the Idaho Fish and Game Commission may use a proclamation to establish binding ~~rules~~ limits ~~ing~~ on the take ~~hunting~~ of grizzly bears (Idaho Administrative Code 13.01.06.100.01e).

3. Administrative Process related to the Take of Wildlife

IDFG provides the following brief summary of existing mechanisms for regulating the take of wildlife in Idaho. For wildlife classified as game animals, Idaho law (Idaho Code Section 36-104(b)(2)) authorizes the Idaho Fish and Game Commission to open seasons for public take of wildlife, where it finds a season will not endanger the species of game, and the Commission may impose limits on the numbers, sex, size and species, along with identifying allowable methods of take. The Commission may choose to limit a season to a certain number of

hunters through a controlled hunt (Idaho Code Section 36-104(b)(5)). Both the Commission and IDFG Director have authority to close seasons when established limits are reached or in emergency situations (Idaho Code Sections 36-104(b)(3) and 36-106(6)).

Under Idaho Code Section 36-105(3), the Commission has authority to set seasons or limits for the take of wildlife by proclamation. Under Idaho Code 36-105(2), Commission proclamations, as well as Commission rules and orders, have the full force and effect as law. A proclamation identifies the time and place allowed for take of wildlife, along with any limits on numbers, sex, size and species the Commission may find appropriate. The Commission typically reviews and sets seasons on an annual or biennial basis with public input, but may review them more frequently as conditions warrants.

The Commission also conducts rulemaking under the Idaho Administrative Procedure Act to establish administrative rules for classification of wildlife, allowances and restrictions for methods of take of wildlife, licensing requirements for take of wildlife, and other administrative aspects of wildlife take. To be responsive to biological factors, the proclamation process for setting seasons and limits involves fewer procedural requirements than rulemaking under the Idaho Administrative Procedure Act. For example, the big game season proclamation and administrative rule summary for 2015-2016 is available at: https://idfg.idaho.gov/sites/default/files/seasons-rules-big-game_2015-2016.pdf.

The Commission and IDFG agreed to evaluate take of grizzly bear on an annual basis under a Memorandum of Agreement with their counterparts in Montana and Wyoming. The Commission is not proposing to open a season for grizzly bear at this time, and the Commission would only make such a decision after delisting.

The Commission adopted a proclamation on August 8, 2016 related to the limit of take of GYE grizzly bear to provide clarity as to its existing authorities and season closure process for GYE grizzly bear management, consistent with its Memorandum of Agreement with Montana and Wyoming.

Tyson—

Here are few items, fyi. I have cc'd FWS staff that have asked IDFG for documents related to the Commission action.

1. On August 8, 2016, the Idaho Fish and Game Commission accepted Montana's edits to the MOA and adopted a proclamation related to the limit of take of GYE grizzly bear. The links are below.

https://idfg.idaho.gov/sites/default/files/grizzly-bear-proclamation-8-8-2016.pdf

https://idfg.idaho.gov/sites/default/files/grizzly-bear-tri-state-moa-8-8-2016.pdf

2. IDFG provides the following feedback to draft language circulating regarding Idaho's regulatory authorities. Notes are in italics and are intended for agency reference only and are not intended for inclusion in publication. Additions are in underline; deletions are in ~~strikeout~~.

> Idaho. ~~IDF&G.~~ *(Idaho Department of Fish and Game and the Idaho Fish and Game Commission are separate entities; the Commission is authorized to adopt proclamations, rules, and orders that are enforced by IDFG)* Idaho's Fish and Game Commission issued a proclamation relating to the limit of the take of grizzly bears in the GYE on August 8, 2016. Idaho Code Section 36-105 ~~gives the~~ authorizes the Idaho Fish and Game Commission ~~the authority~~ to use proclamations, which "have full force and effect as law," as a means of "setting any season or limit on numbers, size, sex or species of wildlife classified by the commission as game animals." ~~(Idaho Code Section 36-105).~~ *(deleted redundancy to code reference at start of sentence)* Since grizzly bears are classified as game animals in ~~IDAPA~~ Idaho Administrative Code *(use consistent references to either IDAPA or Idaho Administrative Code)* 13.01.06.100.01e, the Idaho Fish and Game Commission may use a proclamation to establish binding ~~rules~~ limits ~~ing~~ on the take ~~hunting~~ of grizzly bears (Idaho Administrative Code 13.01.06.100.01e).

3. Administrative Process related to the Take of Wildlife

IDFG provides the following brief summary of existing mechanisms for regulating the take of wildlife in Idaho. For wildlife classified as game animals, Idaho law (Idaho Code Section 36-104(b)(2)) authorizes the Idaho Fish and Game Commission to open seasons for public take of wildlife, where it finds a season will not endanger the species of game, and the Commission may impose limits on the numbers, sex, size and species, along with identifying allowable methods of take. The Commission may choose to limit a season to a certain number of hunters through a controlled hunt (Idaho Code Section 36-104(b)(5)). Both the Commission and IDFG Director have authority to close seasons when established limits are reached or in emergency situations (Idaho Code Sections 36-104(b)(3) and 36-106(6)).

Under Idaho Code Section 36-105(3), the Commission has authority to set seasons or limits for the take of wildlife by proclamation. Under Idaho Code 36-105(2), Commission proclamations, as well as Commission rules and orders, have the full force and effect as law. A proclamation identifies the time and place allowed for take of wildlife, along with any limits on numbers, sex, size and species the Commission may find appropriate. The Commission typically reviews and sets seasons on an annual or biennial basis with public

input, but may review them more frequently as conditions warrants.

The Commission also conducts rulemaking under the Idaho Administrative Procedure Act to establish administrative rules for classification of wildlife, allowances and restrictions for methods of take of wildlife, licensing requirements for take of wildlife, and other administrative aspects of wildlife take. To be responsive to biological factors, the proclamation process for setting seasons and limits involves fewer procedural requirements than rulemaking under the Idaho Administrative Procedure Act. For example, the big game season proclamation and administrative rule summary for 2015-2016 is available at: https://idfg.idaho.gov/sites/default/files/seasons-rules-big-game_2015-2016.pdf.

The Commission and IDFG agreed to evaluate take of grizzly bear on an annual basis under a Memorandum of Agreement with their counterparts in Montana and Wyoming. The Commission is not proposing to open a season for grizzly bear at this time, and the Commission would only make such a decision after delisting.

The Commission adopted a proclamation on August 8, 2016 related to the limit of take of GYE grizzly bear to provide clarity as to its existing authorities and season closure process for GYE grizzly bear management, consistent with its Memorandum of Agreement with Montana and Wyoming.

OPINION

TALLMAN, Circuit Judge:

This case involves one of the American West's most iconic wild animals in one of its most iconic landscapes. The grizzly bear (*Ursus arctos horribilis*)—so named for the gray-tipped hairs that give it a "grizzled" appearance—is both revered and feared as a symbol of wildness, independence, and massive strength. But while grizzlies may inspire some sense of human vulnerability, history has shown that it is the bears who have often been the more vulnerable ones. During the nineteenth and early twentieth centuries, widespread hunting, trapping, poisoning, and habitat destruction associated with American expansion decimated the grizzly population in the West and relegated the bears to increasingly remote and rugged terrain. Since then, their survival has depended both on their own ability to adapt to their surroundings and on human ability to adapt to their presence. These seemingly irreconcilable tensions have come to a head before us in this appeal.

The Yellowstone region of northwestern Wyoming, southern Montana, and northeastern Idaho is home to a grizzly population, two popular national parks—Yellowstone and Grand Teton—and a network of rural communities built on indus-

tries such as natural resource extraction, ranching, agriculture, and tourism. As such, it has served as a kind of living laboratory for the coexistence of people and grizzlies in close proximity. For much of the twentieth century, Yellowstone National Park's open-pit garbage dumps provided a reliable food source for the bears as well as a convenient bear-viewing opportunity for tourists. After the dumps were closed in the early 1970s due to concerns about encouraging the bears' attraction to human foods, however, grizzly mortality rates skyrocketed. By 1975 the grizzly population decline at Yellowstone and elsewhere prompted the U.S. Fish and Wildlife Service (the "Service") to list the grizzly as "threatened" in the lower 48 states under the Endangered Species Act (ESA).

Since then, the Yellowstone grizzly population has rebounded, as scientists, conservationists and land managers have made unprecedented efforts to study the bear and to change those human attitudes and behaviors that unnecessarily threaten it. These efforts, spearheaded by the Service's Grizzly Bear Recovery Coordinator Dr. Christopher Servheen, culminated in the "Final Conservation Strategy for the Grizzly Bear in the Greater Yellowstone Area" (the "Strategy"), an impressive inter-agency, multi-state cooperative blueprint for long-term protection and management of a sustainable grizzly population. Interagency Conservation Strategy Team, *Final Conservation Strategy for the Grizzly Bear in the Greater Yellowstone Area* (Mar. 2007) *available at* http://www.fws.gov/mountain-prairie/species/mammals/grizzly/Final_Conservation_Strategy.pdf. Shortly after the Strategy's finalization, the Service removed the Yellowstone grizzly from the threatened species list.

The Service's delisting decision, the subject of this appeal, raises a host of scientific, political, and philosophical questions regarding the complex relationship between grizzlies and people in the Yellowstone region. We emphasize at the outset that those are not the questions that we grapple with here. We, as judges, do not purport to resolve scientific

uncertainties or ascertain policy preferences. We address only those issues we are expressly called upon to decide pertaining to the legality of the Service's delisting decision: first, whether the Service rationally supported its conclusion that a projected decline in whitebark pine, a key food source for the bears, does not threaten the Yellowstone grizzly population; and second, whether the Service rationally supported its conclusion that adequate regulatory mechanisms are in place to maintain a recovered Yellowstone grizzly population without the ESA's staunch protections.

As to the first issue, we affirm the district court's ruling that the Service failed to articulate a rational connection between the data in the record and its determination that whitebark pine declines were not a threat to the Yellowstone grizzly, given the lack of data indicating grizzly population stability in the face of such declines, and the substantial data indicating a direct correlation between whitebark pine seed availability and grizzly survival and reproduction. As to the second issue, we reverse the district court and hold that the Service's determination regarding the adequacy of existing regulatory mechanisms was reasonable.

I

Grizzly bears once thrived in a variety of habitats across the western coterminous United States, from the West Coast and Southwest to the Great Plains and Texas. By the time of ESA listing in 1975, however, the grizzly population in the lower 48 states was confined to a few fragments amounting to less than 2% of its formerly contiguous historic range, and its numbers had dwindled from about 50,000 in 1800 to less than 1,000 today. The Yellowstone area grizzly population—unique because it is entirely isolated from larger populations in Canada—was estimated to number between 136 and 312 bears at the time of listing.

As required by the ESA, a Grizzly Bear Recovery Plan was developed by the Service and issued in 1982. The Recovery

Plan aimed to foster viable, self-sustaining grizzly populations in areas known to have been occupied by grizzlies within the preceding ten years, including the Greater Yellowstone Area (GYA) as well as the Northern Continental Divide Ecosystem area of northern Montana, the North Cascades area of northern Washington, and the Selkirk and Cabinet-Yaak areas of northern Idaho, northwestern Montana, and northeastern Washington. Because the Plan's ultimate goal was the delisting of the grizzly, demographic recovery criteria were established in each identified area.

When the Service revised the Recovery Plan in 1993, it delineated a "Recovery Zone" for each region, defined as "an area large enough and of sufficient habitat quality to support a recovered bear population within which habitat and population would be monitored." The revised Plan also included updated demographic recovery criteria and mandated the development of a "conservation strategy" for each grizzly population to guide long-term management after delisting. Habitat-based recovery criteria were appended to the Plan following a successful legal challenge to its adequacy under the ESA. *See Fund for Animals v. Babbitt*, 903 F. Supp. 96 (D.D.C. 1995). The Plan's demographic- and habitat-based recovery criteria continued to be refined during the 1990s and 2000s.

The Plan has been widely regarded as a success and a model for grizzly recovery plans elsewhere. Scientists estimate that the GYA's grizzly population increased at an average rate of 4.2% to 7.6% per year between 1983 and 2002 and expanded its range by 48% between the 1970s and 2000. By 2006, the Service had determined that the Plan's demographic- and habitat-based recovery criteria were being met. Total grizzly population in the GYA was estimated at more than 500 bears, and scientists concluded that grizzlies were approaching Yellowstone National Park's carrying capacity.

Pursuant to the Recovery Plan, the Strategy was developed in order to "guid[e] management and monitoring of the Yellowstone grizzly bear population and its habitat upon recovery and delisting." Its stated purpose was to:

> describe and summarize the coordinated efforts to manage the grizzly bear population and its habitat to ensure continued conservation in the GYA[;] . . . specify the population, habitat, and nuisance bear standards to maintain a recovered grizzly bear population for the foreseeable future; document the regulatory mechanisms and legal authorities, policies, management, and monitoring programs that exist to maintain the recovered grizzly bear population; and document the commitment of the participating agencies.

After undergoing notice and comment, as well as scientific peer review, the Strategy was finalized in March 2007. Eight federal and state entities signed a Memorandum of Understanding agreeing to implement it: the Service; the U.S. Forest Service (the "Forest Service"); the National Park Service (the "Park Service"); the U.S. Geological Survey (USGS); the Bureau of Land Management; the Montana Department of Fish, Wildlife, and Parks; the Wyoming Game and Fish Department; and the Idaho Department of Fish and Game. In addition, the Strategy formally incorporated as appendices the grizzly bear management plans of Montana, Wyoming, and Idaho, each of which was developed in conjunction with the Strategy.

The Strategy redesignated the Yellowstone Recovery Zone as the "Primary Conservation Area" (PCA). The PCA is a 9,210-square-mile area within the GYA, divided into 18 "Bear Management Units," encompassing Yellowstone National Park and surrounding public and some private land. The PCA, which is 98% managed by the Park Service and the Forest Service, includes approximately 51% of all suitable

habitat for the grizzly population in the entire GYA and an estimated 84% to 90% of the GYA's population of female grizzlies with cubs. According to the Strategy, "[t]he PCA will be a secure area for grizzly bears, with population and habitat conditions that have allowed the grizzly bear population to achieve recovery and expand outside the PCA." Outside the PCA, the bears "will be allowed to expand into biologically suitable and socially acceptable areas." These are areas "that are not managed solely for bears but in which their needs are considered along with other uses." According to the Service, the suitable grizzly habitat outside the PCA is roughly 84% federally owned, 6% tribally owned, 1.6% state owned, and 9.5% privately owned.

The Strategy's key mechanisms for maintaining a recovered Yellowstone grizzly population are its population and habitat standards, which are based on the recovery criteria originally set forth in the Recovery Plan. Its population standards are (1) a total population of more than 500 bears; (2) at least 16 of 18 Bear Management Units occupied by at least one female with cubs over a six-year period, with no two adjacent Bear Management Units unoccupied; and (3) annual mortality limits of 9% of adult females (not exceeded in two consecutive years), 15% of adult males (not exceeded in three consecutive years), and 9% of cubs under two years old (not exceeded in three consecutive years). *Final Conservation Strategy*, *supra* at 27.

The Strategy's habitat standards apply only inside the PCA. They are designed to maintain habitat conditions as they existed in 1998, because those conditions were found to have adequately supported a growing bear population throughout the 1990s. The percentage of "secure habitat," defined as contiguous area of at least 10 acres that is more than 500 meters from a motorized access route or helicopter flightline, must be maintained at or above 1998 levels. The number and capacity of developed sites (including campgrounds, visitor services facilities, and resource development operations) and grazing

allotments must be maintained at or below 1998 levels. The Strategy also requires monitoring of vegetation, food availability, and human activities compared to a 1998 baseline.

As for lands outside the PCA, the Strategy notes that the state bear management plans of Wyoming, Montana, and Idaho "recommend and encourage land management agencies to maintain or improve habitats that are important to grizzly bears and to monitor habitat conditions." It also indicates that on national forest land outside the PCA the Forest Service will assess projects that potentially affect the grizzly against the Strategy's habitat standards.

In addition to population and habitat standards, the Strategy establishes protocols for the management of "bear/human conflicts," defined as "incidents in which bears injure people, damage property, kill or injure livestock, damage beehives, obtain anthropogenic foods, or damage or obtain garden and orchard fruits and vegetables." Such conflicts, which ranged in number from 24 to 165 per year in the GYA between 1992 and 2001, are harmful to bears as well as humans because bears involved in serious or repeated conflicts may be killed, captured, or relocated. In the case of conflicts inside the PCA, the Strategy emphasizes the removal of the human cause of the conflict rather than the removal or relocation of the bear. In general, a bear may be removed from the population only if it is involved in repeated conflicts or displays "unnatural aggression," defined as aggression toward humans that is not provoked or defensive. Outside the PCA, conflicts are to be handled in accordance with state management plans, and "more consideration will be given to existing human uses." All bear removals in the GYA, both inside and outside the PCA, must be consistent with the Strategy's mortality limits. To minimize conflicts, the Strategy calls for a coordinated information and education campaign that "facilitates changing inappropriate human behaviors and helps people learn to coexist with bears."

Implementation of the Strategy is to be overseen by the Yellowstone Grizzly Coordinating Committee (the "Committee"), consisting of representatives from each of the Strategy's signatories. Scientific research and monitoring data collection will be conducted by the Interagency Grizzly Bear Study Team (the "Study Team"), a USGS-led team of scientists that has studied the Yellowstone grizzly since 1973. Based on periodic reports from the Study Team, the Committee will evaluate the status of the grizzly population. Any deviations from the Strategy's standards will trigger a six-month investigation by the Study Team known as a "Biology and Monitoring Review," which may result in recommendations for changes to the Strategy or, in the case of a serious threat to the grizzly population, a petition for relisting under the ESA.

Based on the attainment of the Recovery Plan's demographic- and habitat-based recovery criteria and the finalization of the Strategy as a long-term conservation plan, the Service proposed the removal of the Yellowstone grizzly from the ESA's threatened species list. After notice and comment, the Service published its "Final Rule Removing the Yellowstone Distinct Population Segment of Grizzly Bears From the Federal List of Endangered and Threatened Wildlife" (the "Rule") in March 2007. 72 Fed. Reg. 14,866-01 (Mar. 29, 2007). The delisting determination applied only to the Yellowstone grizzly population, which was designated as a "distinct population segment" of North American grizzly in the same Rule. *Id.*

On November 13, 2007, the Greater Yellowstone Coalition (GYC), a non-profit conservation organization based in Bozeman, Montana, filed a lawsuit in the United States District Court for the District of Montana challenging the Service's Rule as arbitrary, capricious, and unlawful under the ESA. GYC claimed that (1) there were not adequate regulatory mechanisms in place to protect the grizzly; (2) the Service failed to consider the grizzly's historic range, rather than its current range, when it assessed whether the grizzly was

threatened by habitat loss; (3) the Service failed to adequately consider the impacts of global warming and mountain pine beetle infestation on the vitality of the region's whitebark pine trees; and (4) the Yellowstone grizzly population is too small to be delisted because it lacks sufficient genetic diversity to be self-sustaining. The States of Wyoming and Montana intervened as defendants, as did the National Wildlife Federation, a non-profit wildlife conservation organization, and Safari Club International, a non-profit hunters' rights and wildlife conservation organization.

On September 21, 2009, the district court granted summary judgment to GYC on its first and third claims, holding that the Service had failed to rationally support its conclusions that adequate regulatory mechanisms were in place to protect the grizzly and that declines in whitebark pine did not threaten the grizzly.[1] Based on these rulings, the district court vacated and remanded the Rule. The Service appeals.

II

We have jurisdiction under 28 U.S.C. § 1291. We review de novo a district court's grant of summary judgment. *Suever v. Connell*, 579 F.3d 1047, 1055 (9th Cir. 2009). Our review of an agency's compliance with the ESA is governed by the Administrative Procedure Act (APA). *Native Ecosystems Council v. Dombeck*, 304 F.3d 886, 901 (9th Cir. 2002). Under the APA, we hold unlawful and set aside only those agency actions found to be "arbitrary, capricious, an abuse of discretion, or otherwise not in accordance with law." 5 U.S.C. § 706(2)(A). Under this deferential standard, our job is not to substitute our judgment for that of the agency, but "is simply to ensure that the agency considered the relevant factors and articulated a rational connection between the facts found and the choices made." *Nw. Ecosystem Alliance v. U.S. Fish &*

[1]The district court granted summary judgment to the Service on the other two claims, which are not at issue in this appeal.

Wildlife Serv., 475 F.3d 1136, 1140 (9th Cir. 2007) (internal quotation marks omitted); *see Motor Vehicle Mfrs. Ass'n of U.S., Inc. v. State Farm Mut. Auto Ins. Co.*, 463 U.S. 29, 43 (1983) ("[A]n agency rule would be arbitrary and capricious if the agency has relied on factors which Congress has not intended it to consider, entirely failed to consider an important aspect of the problem, offered an explanation for its decision that runs counter to the evidence before the agency, or is so implausible that it could not be ascribed to a difference in view or the product of agency expertise.").

III

[1] The ESA, enacted in 1973, directs the Secretary of the Interior to maintain a list of all "threatened" and "endangered" species. 16 U.S.C. § 1533(c)(1). An endangered species is one that is "in danger of extinction throughout all or a significant portion of its range." *Id.* § 1532(6). A threatened species is one that is "likely to become an endangered species within the foreseeable future throughout all or a significant portion of its range." *Id.* § 1532(20). A species must be listed if it is determined to be endangered or threatened because of any one or a combination of the following factors:

> (A) the present or threatened destruction, modification, or curtailment of its habitat or range;
>
> (B) overutilization for commercial, recreational, scientific, or educational purposes;
>
> (C) disease or predation;
>
> (D) the inadequacy of existing regulatory mechanisms; or
>
> (E) other natural or manmade factors affecting its continued existence.

Id. § 1533(a)(1); 50 C.F.R. § 424.11(c). Listed species receive near-absolute legal protection against "taking," which includes harassment, harm, hunting, killing, and significant habitat modification or degradation. 16 U.S.C. §§ 1532(19), 1538(a)(1)(B); 50 C.F.R. § 17.3. A major goal of the ESA's protections is recovery of threatened and endangered species such that they can be removed from the list. 16 U.S.C. § 1533(f)(1); 50 C.F.R. § 424.11(d)(2). Delisting requires a determination that none of the above five factors threatens or endangers the species. 50 C.F.R. § 424.11(d). Both listing and delisting determinations must be made "solely on the basis of the best available scientific and commercial information regarding a species' status, without reference to possible economic or other impacts of such determination." *Id.* § 424.11(b).

The Secretary of the Interior has delegated to the Service the authority to administer the ESA. *Id.* § 402.01(b). In this appeal, GYC challenges the Service's determinations in its delisting Rule that the Yellowstone grizzly bear is not threatened by (1) whitebark pine declines under § 1533(a)(1)(E) ("Factor E"); or (2) inadequate existing regulatory mechanisms under § 1533(a)(1)(D) ("Factor D"). We consider both issues.

A

In the Rule's analysis of Factor E, "other natural or man-made factors affecting [the grizzly's] continued existence," the Service concluded that "any changes in whitebark pine production . . . are not likely to impact the [Yellowstone grizzly] to the point where [it] is likely to become endangered within the foreseeable future throughout all or a significant portion of its range." 72 Fed. Reg. at 14,929. The district court ruled that the Service failed to articulate a rational connection between the science it relied upon and its conclusion.

Based on our review of the Rule and the record before the agency at the time it was published,[2] we agree.

[2] On the basis of the information the Service presents in the Rule, it cannot reasonably be denied that whitebark pine loss presents at least a potential threat to the Yellowstone grizzly population. First, whitebark pine seeds are identified as one of four food sources "important to grizzly bear survival and reproductive success" in the GYA, along with winter-killed ungulates (hoofed mammals), spawning cutthroat trout, and army cutworm moths. 72 Fed. Reg. at 14,867. The pine seeds "serve as an important fall food due to their high fat content and abundance as a pre-hibernation food," and the bears consume them "extensively" and even "predominantly" when they are available. *Id.* at 14,867, 14,868. This food source permits the bears to efficiently add weight and store fat before they hibernate for the winter.

[3] Second, the Service acknowledges "concern[ ] that there will be future changes in whitebark pine abundance" because of stresses on the trees from mountain pine beetles and white pine blister rust, both of which may be exacerbated by climate change. *Id.* at 14,929. According to the Rule, "[d]uring the last 2 to 4 years, there has been an epidemic of mountain pine beetles in whitebark pine in the GYA" and aerial survey data have indicated that approximately 16% of the GYA's whitebark pine has experienced "some level of mortality" as a result. *Id.* at 14,928. In addition, the Rule notes that blister rust "also contributes to whitebark pine declines" and reports a study estimating that "roughly 25 percent of all

[2]Of course, we cannot and do not consider any reports or studies that have been compiled since the Rule was published in March of 2007. Under the APA, we may consider only the record that was before the agency at the time the challenged decision was made. *See* 5 U.S.C. § 706; *Citizens to Preserve Overton Park, Inc. v. Volpe*, 401 U.S. 402, 420 (1971), *overruled on other grounds by Califano v. Sanders*, 430 U.S. 99, 105 (1977).

whitebark pine trees in the GYA are currently infected to some level." *Id.* at 14,928-29.

As to climate change, the Rule refers to "a general consensus among the world's best scientists that climate change is occurring" and points out that "[t]he magnitude of warming in the northern Rocky Mountains has been particularly great." *Id.* at 14,927. According to the Rule, "[t]he most substantial way in which changing climate conditions may affect whitebark pine is through outbreaks of native mountain pine beetles that might not continue to be regulated by extremely cold winters, and an increased prevalence of white pine blister rust." *Id.* at 14,929. Thus, "a changing climate may shift the overall distribution of whitebark pine north and higher in elevation, resulting in local extinction and reduced overall distribution in the GYA." *Id.* While the Service does not anticipate that whitebark pine will disappear entirely from the GYA in the foreseeable future, *id.*, one of the studies upon which it relies concludes that "as long as climate warming continues, whitebark pine as a species and ecosystem is at high risk for loss over much of its geographic distribution," including the Yellowstone area. Jesse A. Logan, *Climate Change Induced Invasions by Native and Exotic Pests*, USFS Rocky Mountain Research Station (2006).

Finally, of critical importance here, the Rule repeatedly acknowledges a "well-documented association" between reduced whitebark pine seed abundance and increased grizzly mortality. 72 Fed. Reg. at 14,899; *see, e.g.*, *id.* at 14,933 (noting that whitebark pine "has been linked to grizzly bear survival and reproduction"); *id.* at 14,868 ("During poor whitebark pine years, grizzly bear/human conflicts are more frequent, resulting in higher numbers of human-caused grizzly bear mortalities due to defense of life or property and management removals of nuisance bears."); *id.* at 14,929 (noting that "studies suggest a decrease in whitebark pine can change both grizzly bear spatial distribution and the number of bear/human conflicts"). In short, when whitebark pine seeds

are scarce, grizzlies range more widely in search of food, and contacts between bears and humans increase substantially. Numerous scientific studies and reports cited in the Rule document this connection.[3] The Rule also reports that pine seed unavailability can result in reduced female reproductive success. *Id.* at 14,932.

[4] Based on the evidence of a relationship between reduced whitebark pine seed availability, increased grizzly mortality, and reduced grizzly reproduction, it is logical to conclude that an overall decline in the region's whitebark pine population would have a negative effect on its grizzly bear population. The Service advances several rationales in the Rule to support its conclusion that food shortages caused by whitebark pine declines are nonetheless "not a threat" to the Yellowstone grizzly. *Id.* at 14,932. Below, we explain why we find all of them lacking.

---

[3]*See* Laura A. Felicetti et al., *Use of Sulfur and Nitrogen Stable Isotopes to Determine the Importance of Whitebark Pine Nuts to Yellowstone Grizzly Bears*, 81 Canadian J. Zoology 763, 763 (2003) ("Grizzly bear survival in the Greater Yellowstone Ecosystem is strongly linked to variation in pine-nut availability."); David J. Mattson et al., *Yellowstone Grizzly Bear Mortality, Human Habituation, and Whitebark Pine Seed Crops*, 56 J. Wildlife Mgmt. 432, 436 (1992) (in years of low whitebark pine seed use by bears, 1.9 times as many human-caused bear deaths occurred); David J. Mattson et al., *Food Habits of Yellowstone Grizzly Bears, 1977-1987*, 69 Canadian J. Zoology 1619, 1627 (1991) ("[D]uring years when pine seed production is low, grizzly bears come into greater contact with humans and more bears are killed."); Charles C. Schwartz et al., *Grizzly Bear*, in Wild Mammals of North America 556, 569 (G.A. Feldhammer et al. eds., 2003) ("[M]ost [bear/human] conflicts occur during years when important natural foods fail."); John L. Weaver et al., *Resilience and Conservation of Large Carnivores in the Rocky Mountains*, 10 Conservation Biology 964, 971 (1996) ("During years of poor production of berries and pine seeds, bears respond by substituting lower quality foods. . . . In the face of a shortfall in nutritious foods, bears move widely in search of food, which may bring them into contact with humans. This substantially increases the risk of direct human-caused mortality.").

First, the Service points out that grizzlies "are notoriously resourceful omnivores that will make behavioral adaptations regarding food acquisition." *Id.* at 14,932. While this uncontroversial assertion is adequately supported by science, it fails to address the heart of the threat that whitebark pine loss poses to the bears: increased proximity to humans when bears *do* adapt to seed shortages by seeking substitute foods. As the Rule itself recognizes just a few paragraphs later, "[t]he potential threat from decreases in whitebark pine cone production is not one of starvation, but one of larger home range size and movements," which "may result in increased conflicts with humans and increased mortality, as well as lower reproductive success the following year as females produce smaller litters." *Id.* That the bears are likely to seek alternate foods in the face of whitebark pine decline is a part of the problem, not an answer to it.

Second, the Service suggests that, even if there is a link between whitebark pine seed unavailability and *individual* mortality, there is no indication that the grizzly *population* will be negatively affected by seed shortages, because it has increased over the past three decades despite the fact that whitebark pine cone production has "varied dramatically" from year to year. *Id.* As explained by the Rule, "[b]ecause of the life history strategy of whitebark pine, which naturally exhibits extreme annual variability in cone production, grizzly bears have always had to cope with a high degree of uncertainty regarding this food resource." *Id.* The problem with this rationale is that the study on which the Service relied to demonstrate long-term grizzly population growth included data only until 2002, *before* the "epidemic of mountain pine beetles" began to kill the region's whitebark pines. *Id.* at 14,871, 14,928. It is not rational for the Service to rely on grizzly population trend data from a time of natural pine seed *variability* in order to predict the effect on the grizzly population of an overall whitebark pine tree *decline*.[4]

[4]Two other studies warrant mention here. First, the Rule cites to "Schwartz *et al.* 2006b" to support its assertion that the Yellowstone griz-

Another rationale presented in the Rule for why whitebark pine loss does not threaten the Yellowstone grizzly population is that a different grizzly population in the Northern Continental Divide Ecosystem in northern Montana "has continued to increase and thrive since the 1980s despite severe declines in whitebark pine communities in the last 50 years." *Id.* at 14,932. However, the force of this comparison is undercut by the fact that, in the very same Rule, the Service designates the Yellowstone grizzly as a "distinct population segment" of North American grizzly, based in part on its unique dependence on whitebark pine rather than, for example, berry-producing shrubs, which are relatively uncommon in the

---

zly population "has continued to increase and expand" as whitebark pine seed production has varied. *Id.* at 14,932. But that study, entitled "Distribution of grizzly bears in the Greater Yellowstone Ecosystem in 2004," is about changing population distribution, not changing population size. *See* Charles C. Schwartz et al., *Distribution of grizzly bears in the Greater Yellowstone Ecosystem in 2004*, 17 Ursus 63 (2006). In fact, it specifically cautions that the bear distribution map it presents "is not a reflection of bear density within this area." *Id.* The Service does not explain how a wider population distribution is indicative of a population increase, especially given that the Rule explicitly states that "home range expansion" as bears range more widely in search of food represents a potential threat from low whitebark seed production. *See* 72 Fed. Reg. at 14,932.

Second, the federal defendants' reply brief points to a modeling study suggesting that poor whitebark pine seed years lead only to a decline in the rate of grizzly population *growth*, and not a decline in overall population. *See* Charles C. Schwartz et al., *Impacts of Spatial and Environmental Heterogeneity on Grizzly Bear Demographics in the Greater Yellowstone Ecosystem*, in Demographics of the Yellowstone Grizzly 57 (Schwartz et al., eds., 2006). Putting aside the fact that poor whitebark pine seed years are not necessarily analogous to overall loss of whitebark pine trees, this study is nowhere mentioned or cited in the Rule's discussion of Factor E. "It is well-established that an agency's action must be upheld, if at all, on the basis articulated by the agency itself," not post-hoc rationalizations. *State Farm*, 463 U.S. at 50. If the Service relied on this study in making its determination, it did not adequately connect the dots in the Rule such that its "path may reasonably be discerned." *Id.* at 43 (internal quotation marks omitted).

GYA compared to other regions. *Id.* at 14,878. Indeed, the record before us includes a 2007 fact sheet authored by Recovery Coordinator Servheen noting that the difference in the range of foods eaten by the bears in these two regions "makes direct comparisons of the impacts of the loss of [whitebark pine] uncertain."

We recognize that the Service is the best judge of how comparable these two regions might ultimately be. However, we think it irrational for the Service to determine on the one hand that the Yellowstone grizzly population is sufficiently distinct to warrant independent delisting consideration, and then on the other base its delisting determination on observations pertaining entirely to a different population. We therefore conclude that this comparison is insufficient to support the Service's determination that whitebark pine declines do not threaten the Yellowstone grizzly.

The Service also claims that even if projected whitebark pine losses occur, there will still be adequate habitat in the Yellowstone region to support a recovered grizzly population. Specifically, the Rule notes that whitebark pine is expected to persist in high-elevation areas such as the eastern half of the PCA and 1,138 square miles of protected habitat in the Wind River Mountains. *Id.* at 14,929. According to the Rule, these "reserve" areas provide suitable grizzly habitat and "increase[ ] the resiliency of the Yellowstone [grizzly population] to future changes in whitebark pine availability." *Id.* at 14,929, 14,930. But heavy reliance on some subset of the habitat within the PCA, or on habitat outside the PCA, to mitigate the impact of widespread whitebark pine decline is simply not rational given that the Service has defined the entire 9,210-square-mile PCA as the area "*necessary* to support the recovered grizzly population." *Id.* at 14,914 (emphasis added). Having determined what is "necessary," the Service cannot reasonably rely on something less to be enough.

The Service's ultimate (and understandable) conclusion is that it simply does not yet know what impact whitebark pine

declines may have on the Yellowstone grizzly. As the Rule acknowledges, "the specific amount of decline in whitebark pine distribution and the rate of this decline are difficult to predict with certainty. The specific response of grizzly bears to declines in whitebark cone production is even more uncertain." *Id.* at 14,929. We recognize that scientific uncertainty generally calls for deference to agency expertise. *See Lands Council v. McNair*, 537 F.3d 981, 993 (9th Cir. 2008) (en banc) ("We are to be most deferential when the agency is making predictions, within its area of special expertise, at the frontiers of science." (internal quotation marks and brackets omitted)).

But we nonetheless have a responsibility to ensure that an agency's decision is not arbitrary. *See id.* It is not enough for the Service to simply invoke "scientific uncertainty" to justify its action. As the Supreme Court has explained, "[r]ecognizing that policymaking in a complex society must account for uncertainty . . . does not imply that it is sufficient for an agency to merely recite the terms 'substantial uncertainty' as a justification for its actions." *State Farm*, 463 U.S. at 52. The Service must rationally explain why the uncertainty regarding the impact of whitebark pine loss on the grizzly counsels in favor of delisting now, rather than, for example, more study. *See id.* Otherwise, we might as well be deferring to a coin flip.

The Service relies heavily on "adaptive management" to justify its decision to delist the grizzly despite the scientific uncertainty.[5] According to the Rule, the Study Team and other

[5]The Service has defined "adaptive management" as "a structured process for learning by doing" and "a method for examining alternative strategies for meeting measurable biological goals and objectives, and then, if necessary, adjusting future conservation management actions according to what is learned." Notice of Availability of a Final Addendum to the Handbook for Habitat Conservation Planning and Incidental Take Permitting Process, 65 Fed. Reg. 35,242-01, 35,252 (June 1, 2000). Commentators

scientists "will continue to monitor the abundance and distribution of major grizzly bear foods such that any decline in the grizzly bear population as a result of these declines is detected in a sufficient time and addressed through adaptive management actions by the Coordinating Committee." 72 Fed. Reg. at 14,933. The Service explains that any biologically significant decline in an important food such as whitebark pine would be reflected in changes in mortality rates of independent females, litter size, and cub survival. If food declines occur and the Study Team "concludes these are related to significant increases in known and probable bear mortalities, and that such increases could threaten the grizzly population, the Study Team would recommend appropriate management responses to the Coordinating Committee, or submission of a relisting petition." *Id.*

[5] First of all, we reject out of hand any suggestion that the future possibility of relisting a species can operate as a reasonable justification for delisting. Whatever comfort may be taken in relisting as a safety net, it is no answer to conclude that a species is not threatened simply because it can be relisted if it is threatened. But there is no explanation of what the other "management responses" referred to might be, or why they would be reasonably likely to mitigate population declines caused by whitebark loss.[6] For adaptive management

---

have noted that, while adaptive management has become the dominant agency response to scientific uncertainty, it can be difficult to evaluate against the substantive requirements of environmental laws such as the ESA. *See* J.B. Ruhl & Robert L. Fischman, *Adaptive Management in the Courts*, 95 Minn. L. Rev. 424, 472 (2010).

[6]Elsewhere in the Rule, the Service discusses "short-term" management responses to "poor whitebark pine production years," including:

> immediate limitation on all discretionary mortalities; enhanced outreach and education to minimize bear/human conflicts and the availability of attractants in bear habitat that might promote such conflicts; notice to residents and users of bear habitat about the

of a potential threat to suffice as a basis for a delisting determination, we believe that more specific management responses, tied to more specific triggering criteria, are required. *See, e.g.*, *Natural Res. Def. Council v. Kempthorne*, 506 F. Supp. 2d 322, 341 (E.D. Cal. 2007) (rejecting an adaptive management plan under the ESA when it did not include "defined action criteria"). Just as it is not enough simply to invoke "scientific uncertainty" to justify an agency action, it is not enough to invoke "adaptive management" as an answer to scientific uncertainty.

The Strategy establishes an intensive management and monitoring framework but, unfortunately, it was not developed to be responsive to whitebark pine declines. In fact, it does not even specifically discuss them. The Strategy grew out of the successful management regime that was developed during the 1980s, 1990s, and early 2000s, and it may be entirely reasonable to conclude that it adequately addresses potential threats that were apparent during that time, such as natural resource extraction, tourism, and annual variation in whitebark pine seed production. However, widespread whitebark pine loss, which did not begin until approximately 2002, was simply not one of those threats. Because the Strategy was

---

> possible increased foraging of bears in peripheral habitats; detailed monitoring of food habit shifts and possible changes in home range size and locations . . . ; limitation of human activities in new or expanded feeding areas . . . ; and requests for a status review and/or immediate emergency relisting.

72 Fed. Reg. at 14,891. The only proposed responses to an overall loss of whitebark pine are replanting and recruitment of whitebark pine and enhancement of habitat outside the PCA where healthy whitebark pine may be available. As to the first, the Service provides no explanation as to why replanted whitebark pine is not subject to the same landscape-wide threats as existing whitebark pine, such as pine mountain beetle infestation. Moreover, there necessarily is a time lag before newly planted trees mature. As to the second, as previously explained, reliance on habitat outside the PCA contradicts the Service's own definition of the PCA as the area necessary to support a recovered grizzly population.

not developed to address whitebark pine declines, its effectiveness as a response is speculative.

The Yellowstone grizzly has been the focus of a laudable, decades-long cooperative research effort—one that we hope continues. It may be that scientists will compile data demonstrating grizzly population stability in the face of whitebark pine declines. Such information, however, simply is not in the record before us. The lack of any data showing a population decline due to whitebark pine loss is not enough. *See Tucson Herpetological Soc'y v. Salazar*, 566 F.3d 870, 879 (9th Cir. 2009) ("If the science on population . . . trends is undeveloped and unclear, the Secretary cannot reasonably infer that the absence of evidence of population decline equates to evidence of persistence."). The Rule presents no data indicating that whitebark pine declines will not threaten the Yellowstone grizzly population, and considerable data—demonstrating a relationship between pine seed shortages, increased bear mortality, and decreased female reproductive success—pointing in the opposite direction. *See State Farm*, 463 U.S. at 57 (rejecting agency rationale when "every indication in the record points the other way" (internal quotation marks omitted)).

[6] Perhaps the Service's delisting process, based on two decades of grizzly population growth, was well underway before the whitebark pine loss problem appeared on the radar and could be studied. But now that this threat has emerged, the Service cannot take a full-speed ahead, damn-the-torpedoes approach to delisting—especially given the ESA's "policy of institutionalized caution." *Ariz. Cattle Growers' Ass'n v. Salazar*, 606 F.3d 1160, 1167 (9th Cir. 2010) (internal quotation marks omitted), *cert. denied*, 131 S. Ct. 1471 (2011). The Rule did not articulate a rational connection between the data before it and its conclusion that whitebark pine declines were not likely to threaten the Yellowstone grizzly bear. Therefore, we affirm the decision of the district court on this ground.

B

The ESA's five-factor listing and delisting framework also requires the Service to determine whether a species is threatened because of "the inadequacy of existing regulatory mechanisms." 16 U.S.C. § 1533(a)(1)(D). The Service concluded that adequate regulatory mechanisms were in place to maintain a recovered Yellowstone grizzly population after delisting. 72 Fed. Reg. at 14,923. The district court held that the Service relied on too many measures that were not legally binding and failed to explain adequately how the legally binding measures would protect the grizzlies. Because we find adequate support in the Rule for the Service's conclusion, we reverse the district court on this ground.

The parties dispute whether the Strategy or associated state plans are themselves appropriately considered "regulatory mechanisms." We have previously held that the Service could consider protective measures in a multi-agency, multi-state conservation agreement in its assessment of delisting Factor A, "the present or threatened destruction, modification, or curtailment of [a species'] habitat or range." 16 U.S.C. § 1533(a)(1)(A); *see Tucson Herpetological Soc'y*, 566 F.3d at 879. Although this holding suggests that measures implemented pursuant to such agreements are not a legal nullity, we have never squarely considered whether a conservation agreement qualifies as a "regulatory mechanism" under Factor D. District courts have held that voluntary, unenforceable measures in conservation plans are not "regulatory mechanisms." *See Or. Natural Res. Council v. Daley*, 6 F. Supp. 2d 1139, 1153-56 (D. Or. 1998).

[7] But we need not decide whether the Strategy itself, as a whole, constitutes a "regulatory mechanism." Even assuming that the Service's consideration of the Strategy's voluntary or unenforceable components was error, its consideration of components of the Strategy that have been made legally binding adequately supports its Factor D determination. *See*

Tucson Herpetological Soc'y, 566 F.3d at 880 (proceeding to assess agency's delisting determination after setting aside those portions of the determination found to be erroneous).

Most importantly, the Service has pointed to the incorporation of certain of the Strategy's standards into the National Park Superintendents' Compendia and National Forest Plans (NFPs). For example, the Rule explains that the Park Service "has incorporated the habitat, population, monitoring, and nuisance bear standards described in the Strategy into their Superintendent's Compendium for each affected National Park." 72 Fed. Reg. at 14,924. Judge Thomas's contention that "there is not a single federal or state law or regulation that provides the means for enforcing the Strategy's morality standards," *see Dissent* at 20360, ignores the import of this fact. A Park Superintendent's Compendium "operat[es] as a summary of the rulemaking implemented under the discretionary authority of the Park Superintendent" in a particular National Park, and consists of regulations which augment the generally applicable Park Service regulations published in Title 36 of the Code of Federal Regulations. *Mausolf v. Babbitt*, 125 F.3d 661, 664 n.4 (8th Cir. 1997); *see* 36 C.F.R. §§ 1.5(a), 1.7(b). Therefore, the incorporation of the Strategy's population standards into the Yellowstone and Grand Teton National Park Superintendent's Compendia gives these standards—which include mortality limits, *see Final Conservation Strategy*, *supra*, at 173-74, 178-81-federal regulatory force, and the Park Service must adhere to them. *See Nat'l Ass'n of Home Builders v. Norton*, 340 F.3d 835, 852 (9th Cir. 2003) (noting that federal agencies must follow their own rules).

The situation is similar on National Forest lands, because the Strategy's habitat standards will be incorporated into legally enforceable National Forest Plans for all national forest land within the PCA upon delisting. 72 Fed. Reg. at 14,923. Management of national forest lands "must be consistent with the governing forest plan." *See Greater Yellowstone Coal. v. Lewis*, 628 F.3d 1143, 1149 (9th Cir. 2010) (citing 16

U.S.C. § 1604(i)). *See, e.g., Greater Yellowstone Coal.*, 628 F.3d at 1149-50 (legal challenge against the Forest Service for failure to comply with an NFP).

That the Forest and Park Services are legally bound to uphold key Strategy standards within the PCA is highly significant because these agencies collectively own and manage 98% of the land there. 72 Fed. Reg. at 14,874. And as the Rule indicates, the PCA has been shown to support the vast majority of the Yellowstone grizzly population. *Id.* Furthermore, even beyond the boundaries of the PCA, binding regulatory mechanisms protect a significant portion of the suitable grizzly habitat. In particular, the Rule explains that

> roughly 30 percent of all suitable habitat outside of the PCA is within a designated Wilderness Area . . . . The Wilderness Act of 1964 does not allow road construction, new livestock allotments, or new oil, gas, and mining developments within designated Wilderness areas; therefore, about 6,799 sq km (2,625 sq mi) will remain secure habitat . . . . This secure suitable habitat is biologically significant to the Yellowstone [grizzly] because it will allow population expansion into these areas that are minimally impacted by humans.

Id. at 14,924.

The Rule also cites to a wide range of other rules, regulations, and laws, both state and federal, which could facilitate the protection of the grizzly bear and the implementation of the Strategy.[7] The breadth of these measures is a tribute to the

[7]Judge Thomas faults the Service for citing to state laws that "allow the killing of bears." *Dissent* at 20363. We simply point out that these laws "allow the killing of bears" only under state regulation—such as with hunting licenses that are subject to annual limits—and thus enable the state to exercise some control over grizzly mortality. Therefore, we think it entirely appropriate that the Service considered them in its discussion of laws that facilitate the implementation of the Strategy.

comprehensive multi-jurisdictional cooperative effort between federal and state agencies, as well as private interest groups. The multi-state commitment to implement the Strategy represents a substantial wildlife conservation planning achievement —and one that, we have no doubt, ultimately improves the lot of the Yellowstone grizzly bear. For purposes of the Factor D determination, however, we need not, and do not, consider those measures, some or all of which may not be binding, because we hold that the clearly binding regulatory mechanisms discussed above suffice.

[8] The National Forest Plans and National Park Compendia make legally binding the Strategy's standards on 98% of the critical PCA and are buffered by the legal protections afforded by the Wilderness Act on a significant portion of grizzly habitat outside the PCA. In light of these measures, we believe the Service could reasonably conclude that adequate regulatory mechanisms exist to protect the Yellowstone grizzly bear. Importantly, we recognize that delisting cannot require the imposition of legal protections commensurate with those provided by the ESA itself. After all, the ESA expressly aims for species recovery to the point where its own measures are "no longer necessary," 16 U.S.C. § 1532(3), thus contemplating that something less can be enough to maintain a recovered species. It is therefore reasonable to conceive of "adequate" regulatory mechanisms as offering a recovered species something less than the stalwart protections of the ESA, but considerably more than no special protection at all. We believe that the Service could rationally conclude that the regulatory framework described in the Rule is sufficient to sustain a recovered Yellowstone grizzly bear population. On this issue, we reverse the district court.

IV

We affirm the district court's grant of summary judgment in favor of Greater Yellowstone Coalition on the issue of whether the Service rationally supported its determination that

potential whitebark pine declines did not threaten the Yellowstone grizzly bear. This is sufficient to affirm the district court's judgment vacating the Rule. However, we reverse the district court's grant of summary judgment in favor of Greater Yellowstone Coalition as to the Service's determination that existing regulatory mechanisms are adequate to protect a recovered Yellowstone grizzly population, and we direct the district court to enter summary judgment in favor of the governmental Appellants on that issue. We remand to the district court for further proceedings consistent with this Opinion.

Costs are awarded to Plaintiff-Appellee.

AFFIRMED in part; REVERSED AND REMANDED in part

THOMAS, Circuit Judge, concurring in part and dissenting in part:

I agree with the majority that the U.S. Fish and Wildlife Service (the "Service") did not, in its delisting rule,[1] articulate a rational connection between the record data and its determination that whitebark pine declines were not likely to threaten the Yellowstone grizzly bear. Unlike the majority, I would hold that the agency also erred in concluding the Yellowstone grizzly is not threatened by "the inadequacy of regulatory mechanisms." 16 U.S.C. § 1533(a)(1)(D) ("Factor D").[2]

[1]Final Rule Removing the Yellowstone Distinct Population Segment of Grizzly Bears From the Federal List of Endangered and Threatened Wildlife. 72 Fed. Reg. 14,866 (Mar. 29, 2007) ("Rule").

[2]The whitebark pine holding suffices to affirm the district court's judgment vacating the Rule. *Greater Yellowstone Coal., Inc. v. Servheen*, 672 F. Supp. 2d 1105 (D. Mont. 2009). Therefore, it is unnecessary to assess the Service's Factor D analysis. However, because the majority has opined on the issue, I will as well.

Therefore, I would affirm the district court's decision in its entirety.

I

The Service did not fulfill its regulatory responsibility in determining that existing regulatory mechanisms were sufficient to protect the Yellowstone grizzly. Not only did the Service rely on voluntary, rather than "regulatory," measures, but it did not explain adequately how existing regulatory mechanisms actually prevent grizzly bear mortality. *Motor Vehicle Mfrs. Ass'n of U.S., Inc. v. State Farm Mut. Auto. Ins. Co.*, 463 U.S. 29, 43 (1983); *Pac. Coast Fed'n of Fishermen's Ass'ns v. U.S. Bureau of Reclamation*, 426 F.3d 1082, 1091 (9th Cir. 2005).

A

In response to dramatic grizzly bear population declines, the Service listed the grizzly as "threatened" under the Endangered Species Act in 1975. Since that time, the Service has repeatedly recognized the need for binding conservation measures that safeguard grizzlies from the threats which led to their decline. Amendment Listing the Grizzly Bear of the 48 Conterminous States as a Threatened Species, 40 Fed. Reg. 31,734, 31,734 (July 23, 1975); 72 Fed. Reg. at 14,922.

In the Greater Yellowstone Area, where grizzly populations were in jeopardy, the need for binding conservation measures and mortality controls has remained paramount. *See* 72 Fed. Reg. at 14,868, 14,871, 14,922. As the Service explained in its brief:

> Because the lack of adequate mortality and habitat standards contributed to the grizzly bears decline and ultimate listing, the Service and its State and federal partners spent over a decade developing the Conservation Strategy, which, among its other protections,

> imposes *strict mortality limits* and many *legally enforceable habitat standards* on its state and federal signatories.

(Emphasis added.)

In its Factor D determination, however, the Service relied on a number of voluntary, rather than "regulatory," measures. Chief among these is the "Final Conservation Strategy for the Grizzly Bear in the Greater Yellowstone Area" ("Strategy"),[3] upon which the Service tells us it "largely based" its analysis.[4] Indeed, the Service lauds the Strategy's "strict mortality limits" as one of its "key tenets." But under the Rule, compliance with the Strategy is purely voluntary. *See* 72 Fed. Reg. at 14,904 ("[T]he Strategy cannot legally compel any of the signatories to implement management policies or obligate funding."). There is not a single federal or state law or regulation that provides a means for enforcing the Strategy's mortality standards.[5] *Id.* at 14,922-26. Rather, if the grizzly population becomes threatened, the agency is to review the situation and call a committee meeting.[6] And that only occurs if the mortal-

[3]Interagency Conservation Strategy Team, *Final Conservation Strategy for the Grizzly Bear in the Greater Yellowstone Area* (Mar. 2007) *available at* http://www.fws.gov/mountain-prairie/species/mammals/grizzly/yellowstone.htm.

[4]Because the Service offered the Strategy as a primary basis for its Factor D determination, "we cannot readily say" that this error "clearly had no bearing on the Secretary's ultimate decision" to delist. *Tucson Herpetological Soc'y v. Salazar*, 566 F.3d 870, 880 (9th Cir. 2009).

[5]The Service claims the incorporation of the Strategy's standards into National Forest Plans and National Park Superintendent's Compendia afford the Strategy the force of law. But the National Forest Plans only incorporate the Strategy's habitat standards and contain no mechanism to enforce mortality limits.

[6]More specifically, when a deviation from the Strategy's mortality standards occurs, it triggers a non-binding "Biological and Monitoring Review," to be completed and made public within six months of initiation. 72 Fed. Reg. at 14,925. Then, the "multi-agency Yellowstone Grizzly

ity limits are exceeded for at least two years. 72 Fed. Reg. at 14,925.

The Service's reliance on voluntary action is contrary to law. The phrase "regulatory mechanism" plainly does not encompass voluntary, unenforceable measures such as the Strategy and many of its components. *Or. Natural Res. Council v. Daley*, 6 F. Supp. 2d 1139, 1155 (D. Or. 1998) (interpreting 16 U.S.C. § 1533(a)(1)(D) to mean that "the [agency] must base its decision on current, enforceable measures"). The Service therefore erred by considering the Strategy's voluntary and unenforceable components in its Factor D determination. Good intentions are not rules of law. Unenforceable aspirational goals are not regulatory mechanisms. Promises to monitor, review, and convene committees do not satisfy the statutory requirement. *See Norton v. So. Utah Wilderness Alliance*, 542 U.S. 55, 72 (2004) (noting that monitoring is not a legally binding commitment under the APA). Thus, the Rule must be vacated for non-compliance with 16 U.S.C. § 1533(a)(1)(D). *See State Farm*, 463 U.S. at 43 ("[A]n agency rule would be arbitrary and capricious if the agency has relied on factors which Congress has not intended it to consider . . . .").

B

The Service's analysis of existing laws and regulations is also flawed. Notably, the Rule does not explain how these measures prevent excessive grizzly bear mortality. Given the Service's view that mortality control is "a key part of any successful management effort," 72 Fed. Reg. at 14,871; *see also*

Coordinating Committee" responds to the Review, and "if the desired population and habitat standards specified in the Strategy cannot be met . . . the Coordinating Committee will petition [the Service] for relisting." *Id.* However, as the majority also recognizes, the "suggestion" of a future relisting does not "operate as a reasonable justification for delisting."

Strategy, *supra* note 3, at 31, its failure to account for regulatory mechanisms addressing mortality renders the Rule arbitrary and capricious. *See State Farm*, 463 U.S. at 43 ("[A]n agency rule would be arbitrary and capricious if the agency has . . . entirely failed to consider an important aspect of the problem.").

Citing to the Strategy, the Rule refers to 40 "Federal laws, rules, guidelines, strategies, and reports and 33 State laws, statutes, and regulations" applicable to management of the Yellowstone grizzly population. 72 Fed. Reg. at 14,922-23. The list sounds impressive, but the Rule is silent as to how these measures actually protect the grizzly. In fact, the vast majority of the cited laws and regulations predate the original listing and thus failed to protect the grizzly 35 years ago. The Service does not explain why these old laws now offer sufficient protection, despite the fact that the Service is required to consider the same factors in delisting as when listing. 16 U.S.C. § 1533(a)(1); 50 C.F.R. § 424.11(d).

Moreover, most of the listed laws and regulations do not specifically relate to grizzly protection; rather, they involve generic environmental and resource management. For example, one does not often think of a federal act establishing a highway between national parks as a statute aimed at protecting the grizzly, and yet this law is among those cited by the Strategy.[7] So is the Sikes Act of 1960, which provides for cooperative resource management on military reservations.[8]

---

[7] *See* Appendix J *in* Strategy, *supra* note 3, at 157 (referencing Act to Establish John D. Rockefeller, Jr., Memorial Parkway, Pub. L. No. 92-404, 86 Stat. 619, 619 (1972)).

[8] *Id.* (referencing Sikes Act of 1960, 16 U.S.C. § 670a). The other federal statutes cited in the Strategy are similarly tangential or generic: Yellowstone National Park Act of 1872, ch. 24, § 1, 17 Stat. 32, 32-33 (1872); National Park Service Organic Act of 1916, 16 U.S.C. § 1; Lacey Act of 1900, 16 U.S.C. § 701; Fish & Wildlife Coordination Act of 1934, 16 U.S.C. §§ 551-664; Grand Teton National Park Expansion Act of 1950, 16

The listed state laws and regulations provide no more comfort. These provisions do not require the states to control grizzly mortality in accordance with the Strategy, and they only apply outside of the Primary Conservation Area. Further, the cited state laws do not necessarily protect the grizzly. Indeed, most of the statutes cited are laws that allow the killing of bears. For example, Wyoming statutes define a grizzly bear as a "[t]rophy game animal," Wyo. Stat. Ann. § 23-1-101(a)(xii)(A), and require a hunting license, *id.* at § 23-3-102(b). The Wyoming Grizzly Bear Management Plan allows regulated hunting of grizzlies. It also flatly states that it will not allow grizzlies to reoccupy certain mountain ranges, and that it will enforce that policy through sport hunting and removal.[9] Idaho's Grizzly Bear Management Plan similarly recognizes the grizzly as a "game animal" and further acknowledges that a large portion of potential grizzly habitat is beyond the reach of state law because it is located on the Shoshone-Bannock reservation, which is governed by tribal law.[10] The Tribe has not spoken on how it intends to proceed.[11]

U.S.C. § 406d-1; Multiple-Use Sustained-Yield Act of 1960, Pub. L. No. 86-517, 74 Stat. 215 (codified as amended in scattered sections of 26 U.S.C.); National Environmental Policy Act of 1969, 42 U.S.C. §§ 4321-4370; Endangered Species Act of 1973, 16 U.S.C. §§ 1531-1536; Forest and Rangeland Renewable Resources Planning Act of 1974, Pub. L. 93-378, 88 Stat. 476 (codified as amended in scattered sections of 16 U.S.C.); National Forest Management Act of 1976, Pub. L. No. 94-588, 90 Stat. 2949 (codified as amended in scattered sections of 16 U.S.C.); Federal Land Policy and Management Act of 1976, 43 U.S.C. §§ 1701-1787; Fish & Wildlife Improvement Act of 1978, 16 U.S.C. § 742; and Fish and Wildlife Conservation Act of 1980, 16 U.S.C. §§ 2901-2911.

[9]Wyoming Game and Fish Department, *Wyoming Grizzly Bear Management Plan* 15 (Feb. 2002, as amended, July, 2005).

[10]Idaho's Yellowstone Grizzly Bear Delisting Advisory Team, *State of Idaho Yellowstone Grizzly Bear Management Plan* 18 (Mar. 2002).

[11]The Idaho Management Plan states: "The hunting of grizzly bears by members of the Shoshone-Bannock Tribes is a traditional and cultural issue, which will be determined by the Governing Body of the Shoshone-Bannock Tribal Council after delisting of the grizzly bear is finalized." *Id.*

The Montana plan also allows regulated hunting of grizzlies and states that "[r]egulated harvest will be a part of Montana's long-term conservation plan.[12]

Neither the Rule nor the Strategy adequately explains how these 70-odd federal and state laws and regulations will affect the Yellowstone grizzly. The only reference is contained in Appendix J to the Strategy,[13] where a simple grid lists each federal and state provision and an "X" beside the provisions that purport to address Factor D. There is no explanation or rationale provided. It is difficult to imagine a less illuminating document.

Merely compiling a list of potentially applicable statutes and regulations is not sufficient; the agency must explain why these laws and regulations constitute adequate regulatory mechanisms for grizzly protection. In short, the Service has not met its obligation to "articulate a satisfactory explanation" for its determination that adequate regulatory mechanisms exist to protect the Yellowstone grizzly. *State Farm*, 463 U.S. at 43; *Ctr. for Biological Diversity v. U.S. Dep't of Interior*, 623 F.3d 633, 648 (9th Cir. 2010) (noting that this circuit has "insisted that agencies support and explain their conclusions with evidence and reasoned analysis").

C

In sum, the district court correctly determined that the Rule did not comply with 16 U.S.C. § 1533(a)(1)(D). As a matter of law, unenforceable, voluntary promises do not constitute "regulatory mechanisms." Mere citation to potentially applicable statutes and regulations without analysis does not fulfill the Service's obligation to explain how they act as adequate

[12]Montana Department of Fish, Wildlife & Parks, *Grizzly Bear Management Plan for Southwestern Montana 2002-2012* 56 (Oct. 2002).

[13]Appendix J is entitled "The Relationship Between the Five Factors in Section 4(a)(1) of the ESA and the Existing Laws and Authorities."

regulatory mechanisms for protection of the grizzly. Neither the Rule nor the Strategy provide a legally enforceable method by which the Service can impose its mortality limits. The district court was right to reject the Service's Factor D analysis.

II

I do not question, much less criticize, the enormous effort that the Service, the states, and interest groups have made to study and manage the Yellowstone grizzly. However, our task is not to assess those endeavors from a policy viewpoint; it is to apply the law as Congress has directed. In doing so, I reach the same conclusions as the district court. To the extent my colleagues hold otherwise, I respectfully dissent.

---

Here is the updated document with a few edits I made this morning on page four. I left the track changes on so we can discuss. We also have to address the comments made by the steering committee and they are as follows:

The Steering Committee's decision is provided below by theme.

Theme #1-NPS Managers included in the discussions and decision making process.....allocation of harvest—*Elevated to Steering Committee for discussion*

Theme #2-Update Chapter on Conflict—*Proceed with your recommendation*

Theme #3-Connectivity/Linkage/Genetic Management— *Elevated to Steering Committee for discussion*

Theme #4-USFS concerns related to the safety and moving bears—*Proceed with your recommendation*

Theme #5-Food storage, consistency of orders and linkage to NCDE- *Prepare to discuss with Steering Committee to provide additional clarification regarding this recommendation.*

Theme #6-Coordination and consultation re: moving bears.....- *Proceed with your recommendation*

Theme #7-USDA sheep station—*Concur with your recommendation to leave as is in C.S.*

Theme #8-Limit on bear relocations to other ecosystems—*Proceed with your recommendation*

Again, the call in number for tomorrow June 28th from 9-11 is [redacted] and the passcode is [redacted]#

Thanks, Joe

Subject: Tomorrow's Call

Here is the updated document with a few edits I made this morning on page four. I left the track changes on so we can discuss. We also have to address the comments made by the steering committee and they are as follows:
The Steering Committee's decision is provided below by theme.
Theme #1-NPS Managers included in the discussions and decision making process…..allocation of harvest—*Elevated to Steering Committee for discussion*
Theme #2-Update Chapter on Conflict—*Proceed with your recommendation*
Theme #3-Connectivity/Linkage/Genetic Management— *Elevated to Steering Committee for discussion*
Theme #4-USFS concerns related to the safety and moving bears—*Proceed with your recommendation*
Theme #5-Food storage, consistency of orders and linkage to NCDE- *Prepare to discuss with Steering Committee to provide additional clarification regarding this recommendation.*
Theme #6-Coordination and consultation re: moving bears…..- *Proceed with your recommendation*
Theme #7-USDA sheep station—*Concur with your recommendation to leave as is in C.S.*
Theme #8-Limit on bear relocations to other ecosystems—*Proceed with your recommendation*

Again, the call in number for tomorrow June 28th from 9-11 is (b) (5) commercial privilege and the passcode is (b) (5) commercial privilege#

Thanks, Joe

The Department of the Interior needs to institute a moratorium on the delisting of the Yellowstone grizzly bear until proper consultation is addressed with each affected tribal nation respectively, so we can get better solutions for the future of the grizzly bear and for our people," says Shoshone-Bannock

Any words of wisdom? They are likely to be there at the meeting on Monday. JB

Guardians of our Ancestral Legacy (GOAL) Tribal Coalition
Mr. R. Bear Stands Last
Box 30,000 #360
Jackson, Wyoming 83002

Dear Mr. Bear Stands Last:

Thank you for your January 16, 2015, letter to Secretary Jewell concerning the grizzly bear (*Ursus arctos horribilis*) and the Fish and Wildlife Service's (Service) relationship with sovereign Tribes with ancestral connections to the Greater Yellowstone Ecosystem. We appreciate your concerns and fully understand our obligation to consult with Federally Recognized Native American Tribes on a government-to-government basis.

In accordance with Secretarial Order 3206 (Order), we consult with Native American Tribes when actions taken under authority of the Endangered Species Act (ESA) may affect their lands, tribal trust resources, or the exercise of Native American tribal rights as defined in the Order. We agree that Tribal governments should have the opportunity for meaningful engagement with the Service on the status of all wildlife species of concern to them.

Importantly, no decision has been made on the status of Yellowstone grizzly bears. Before any decisions are reached on the status of the Yellowstone grizzly bears, we will be sure Tribes are offered the opportunity to participate in consultations with the Service concerning this issue.

Thank you for your interest in the grizzly bear in the Yellowstone ecosystem. If you would like to discuss Tribal relationships further, please contact Ivy Allen, Tribal Liaison by email at ivy_allen@fws.gov or by phone at 303-236-4575. If you have questions about the grizzly bear or its status, please contact and Chris Servheen, Grizzly Bear Recovery Coordinator at 406-243-4903.

Sincerely,

Deputy Regional Director

United States Department of the Interior

FISH AND WILDLIFE SERVICE
Mountain-Prairie Region

FEB 17 2015

Montana Wyoming Tribal Leader's Council
711 Central Avenue, Suite 220
Billings, Montana 59102

Dear Tribal Partner:

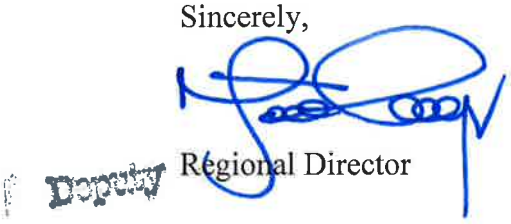
Based on your organization's concerns, please accept this letter as our advance notice of intent to review the endangered species status of the grizzly bear (*Ursus arctos horribilis*) in the Greater Yellowstone Area. While the Interagency Grizzly Bear Committee's Yellowstone Ecosystem Subcommittee has recommended delisting this population, at this, time no delisting actions or proposals have been moved forward. If desired, we would gladly engage in a discussion on the grizzly bear's status.

We recognize each Tribe's inherent powers to make and enforce laws and to manage and control their natural resources. It is our goal to support this authority. We also wish to improve our relationship with your organization. We want to hear your concerns and keep an open line of communication during this process. As an organization, you will also the opportunity for formal comments during the federal register process if any proposal is moved forward.

We are proposing to host three consultation meetings in broad areas were Tribes have expressed interest in this issue. We would like to offer three meetings in late winter or early spring. Ideally, the three meetings would occur within the Great Plains, Northern Rocky Mountains, and Idaho geographical areas. In addition, during the March 19, 2015, Mountain-Prairie Region Tribal Leadership Roundtable we will spend some time discussing this topic.

We are requesting location and venue suggestions for the three consultation meetings. If your organization is interested in coordinating a consultation meeting in conjunction with an organizational meeting, please reach out to the contacts listed below. We are asking for this information no later than **March 6**, as we plan to announce all three consultation meetings with details about locations and times by **March 18.**

At your request, the Service is available to talk with your organization to share information we have about this species and the status review process. We will also discuss how Tribal information, comments, and expertise can be incorporated into the process.



At your request, the Service is available to talk with your organization to share information we have about this species and the status review process. We will also discuss how Tribal information, comments, and expertise can be incorporated into the process.

To ensure Tribal information regarding Yellowstone grizzly bears may be incorporated into our review, we request that the Tribes participate in the consultation meetings or submit any comments and information by **March 31, 2015**. «Chairperson» «First_Name» «Last_Name»
«Tribe»
«Address»
«City», «State» «ZIP»

Dear «Chairperson» «Last_Name»:

Based on your Tribe's status as a sovereign nation and in keeping with our trust responsibility, please accept this letter as our advance notice of intent to review the endangered species status of the grizzly bear (*Ursus arctos horribilis*) in the Greater Yellowstone Area. While the Interagency Grizzly Bear Committee's Yellowstone Ecosystem Subcommittee has recommended delisting this population, at this time, no delisting actions or proposals have been moved forward. We will gladly engage in government-to-government consultation prior to any actions on the grizzly bear's status.

In accordance with Secretarial Order 3206 (Order), we consult with Indian tribes when actions taken under authority of the Endangered Species Act (ESA) may affect Indian lands, tribal trust resources, or the exercise of American Indian tribal rights as defined in the Order. We recognize your inherent powers to make and enforce laws and to manage and control your natural resources. It is our goal to support this authority and maintain good working relationships with all Native American Tribes.

We propose to host four meetings in areas where Tribes have expressed interest in this issue. Specifically, we would like to offer three consultation meetings in late winter or early spring. Ideally, the three consultation meetings would occur within the Great Plains, the Northern Rocky Mountains, and the Idaho geographical areas. We are requesting location and venue suggestions for the three consultation meetings. We would be happy to coordinate a date and location that can meet these consultation needs. An informational meeting on this will be held on March 19, 2015, at the Denver Mountain-Prairie Region Tribal Leadership Roundtable.

At your request, the Service is available to meet with you and learn how your Tribe may be affected by a possible change in status and share information we have about this species and the status review process. We will also discuss how Tribal information, comments, and expertise can be incorporated into the process.

To ensure that your tribal information regarding Yellowstone grizzly bears may be incorporated into our review, we request that you submit any information by **March 31, 2015**. Please send your response electronically to chris_servheen@fws.gov or by mail to:

Grizzly Bear Recovery Coordinator
U.S. Fish and Wildlife Service

Dear Chairperson:

We would like to take this opportunity to let you know that the U.S. Fish and Wildlife Service (Service) is in the early stages of considering the listing status of the Yellowstone grizzly bear population under the Endangered Species Act (ESA).

While we recently reached out to tribes in close proximity to the Greater Yellowstone Ecosystem (GYE), we did not initially appreciate the breadth of historical, cultural, and spiritual connection that some tribes outside that geographic area have with the grizzly bear and the GYE.

As a result, the Service is redoubling its efforts to engage interested tribes in government-to-government consultation regarding potential actions we may take concerning the status of Yellowstone grizzly bears under the ESA.

As you know, the grizzly bear came under the protection of the ESA in the lower 48 states in 1975 when it was listed as a threatened species. Recovery efforts began in 1981, and since that time, the Yellowstone grizzly bear population has nearly tripled in number and currently occupies approximately twice the geographic area that it did at the time of listing. The scientific data, population surveys, and on-the-ground monitoring show us that Yellowstone grizzly bears are now a healthy, self-sustaining population that has almost completely occupied the suitable habitat available for them in the GYE.

The objective of the ESA is to recover listed species to the point that they no longer need ESA protection. We do not have a formal proposal to delist the species at this time. However, if the science demonstrates that the present threatened status of the Yellowstone grizzly bear population warrants delisting, this action would only impact this species in the Yellowstone area. All other grizzly bear populations would remain listed under the ESA.

If delisting is proposed, our overall goal at the Service would be to work to ensure that the Yellowstone grizzly bear population is sustainably managed so that it never again becomes necessary to be managed under the ESA.

As our valued tribal partner, we would appreciate knowing the level of interest your tribe has in government-to-government consultation on this matter. If you are interested in formal consultation, we would like to know where and when you would like that to occur, whether you would be willing to meet individually or jointly with other interested tribes, and if you have any formal tribal resolutions related to the Yellowstone grizzly bear population.

To request consultation on this matter, please send a letter to:

Matt Hogan, Deputy Regional Director
U.S. Fish and Wildlife Service, Mountain-Prairie Region
134 Union Boulevard
Lakewood, Colorado 80228

Matt Hogan, Deputy Regional Director will also be calling you in the next few weeks to discuss the consultation process and to ask about your interest in formally consulting with us about the status of the Yellowstone grizzly bear population. If you are interested, he will work with you to arrange a time and location for these consultations.

Sincerely,

Regional Director

First Name	Last Name	Chairperson	Tribe	Phone Number	Notes
Manuel	Heart	Chairman	Ute Mountain Ute	970-565-3751	Not GOAL Tribe. Did receive letter offering consultation in June
Clement	Frost	Chairman	Southern Ute Indian Tribe	970-563-0100	Not GOAL Tribe. Did receive letter offering consultation in June
Lester	Randall	Chairman	Kickapoo Tribe	785-486-2131 *223	Not GOAL Tribe. Did receive letter offering consultation in June
Liana	Onnen	Chairperson	Prairie Band of Potawatomi of Kansas	785-966-4000	Not GOAL Tribe. Did receive letter offering consultation in June

INFORMATION MEMORANDUM FOR THE REGIONAL DIRECTOR

FROM: Tribal Liaison, External Affairs, Region 6,

CC: Assistant Regional Director for External Affairs & Ecological Services

SUBJECT: Service Interactions with Tribes about Their Concerns Regarding a Delisting of the Yellowstone Grizzly Bear

I. BACKGROUND

In April of 2014, the Grizzly Bear Recovery Program sent out letters offering Government-to-Government (G2G) consultation to the 4 Native American Tribes having treaty interests in the proposed Yellowstone grizzly bear delisting area. In November of 2014, a group of 26 tribes contended the federal government failed to consult the all Tribal nations which have an ancestral connection to Yellowstone. Their dissatisfaction was broadly spread in the media and through the Guardians of Our Ancestors Legacy (GOAL).

II. ACTIONS TAKEN *(See attached PDF file: Actions Taken)*

The Service took action at that time to offer consultation in multiple formats.

- February 17, 2015 the Service sent letters offering consultation to the 26 Tribes listed as opposed under GOAL and to other Tribal groups.
- March 19, 2015 Tribal leaders and wildlife managers attending the R6 Regional Roundtable discussed the grizzly bear concerns.
- Steve Torbit spoke to Tribal wildlife managers about grizzly bears during the April 6-9, 2015 Great Plains Regional Native American Fish and Wildlife Society Meeting.
- June 15, 2015 the Region sent out a second round of letters to Tribes offering another opportunity to consult.
- July 6-15, 2015 Deputy Regional Director, Matt Hogan placed phone calls, emails or otherwise made contact with all Tribes on the GOAL opposition list and some additional Tribes to personally talk to Tribes about concerns and consultation.

III. RESPONSES RECEIVED *(See attached PDF file: Responses Received)*

Tribes throughout the regions have increasingly spoken out against delisting the species. Tribal members are very sensitive to the species and cite deep spiritual and cultural connections to the bears as well as disgust at the idea of state-managed trophy hunts.

- Spirit Lake Tribe; December 17, 2014
- Guardians of Our Ancestors Legacy (GOAL); January 16, 2015

- Tribal Resolutions/letters from 15 Tribes opposing a delisting arrive my mail at Regional Director's Office; January 20, 2015
- Tribal Leaders Council; February 27, 2015
- Guardians of Our Ancestors Legacy (GOAL); March 2, 2015

IV. CONSULTATIONS REQUESTED *(See attached PDF file: G2G Requested)*

I directly received 3 requests for formal consultations and the programs received additional requests.

- Cheryl Belcourt; Montana Wyoming Tribal Leaders Council, February 23, and March 9 2015
- Yufna Soldier Wolf; Tribal Historic Preservation Officer; Northern Arapaho Tribe; March 02, 2015
- Rich Janssen; Department Head, Natural Resources Department; Confederated Salish and Kootenai Tribes; February 26, 2015

V. CONSULTATIONS CONDUCTED *(See attached PDF file: G2G Conducted)*

Christopher Servheen, Grizzly Bear Recovery Coordinator for Region 6, conducted 6 government-to-government consultations.

- Confederated Salish and Kootenai Tribes; June 10, 2015
- Blackfeet Nation; Wildlife Committee; June 18, 2015
- Northern Cheyenne Tribal Council; July 20, 2015
- Northern Arapahoe Tribal Council; July 21, 2015
- Eastern Shoshone Tribal Council; July 21, 2015
- Shoshone Bannock Tribal Council; July 30, 2015

VI. CONCERNED PARTIES

Below is a listing of the Tribes with official resolutions, declarations and opposition to delisting of the grizzly bear. This information is from the GOAL website or by resolution/letters received or communicated to the regional office.

TRIBAL ORGANIZATIONS

Montana Wyoming Tribal Leader's Council
Great Plains Tribal Chairman's Association

TRIBES

Santee Sioux Nation
Blackfeet
Confederated Salish & Kootenai Tribes
Northern Arapaho
Three Affiliated Tribes of North Dakota
Omaha Tribe
Ponca Tribe of Nebraska
Winnebago Tribe

Fort Peck
Fort Belknap
Little Shell *(Not a federal recognized tribe so we don't send a letter offering consultation).*
Chippewa and Cree
Cheyenne River Sioux Tribe
Crow Creek Sioux Tribe
Flandreau Santee Sioux Tribe
Lower Brule Sioux Tribe
Oglala Sioux Tribe
Rosebud Sioux Tribe
Sisseton Wahpeton Oyate
Standing Rock Sioux Tribe
Yankton Sioux Tribe
Crow
Northern Cheyenne
Kiowa
Spirit Lake Tribe
Turtle Mountain Band of Chippewa
Shoshone Bannock Tribes
Eastern Shoshone Tribe

INFORMATION MEMORANDUM FOR THE REGIONAL DIRECTOR

FROM: Tribal Liaison, External Affairs, Region 6,

CC: Assistant Regional Director for External Affairs & Ecological Services

SUBJECT: Service Interactions with Tribes about Their Concerns Regarding a Delisting of the Yellowstone Grizzly Bear

I. BACKGROUND

In April of 2014, the Grizzly Bear Recovery Program sent out letters offering Government-to-Government (G2G) consultation to the 4 Native American Tribes having treaty interests in the proposed Yellowstone grizzly bear delisting area. In November of 2014, a group of 26 tribes contended the federal government failed to consult the all Tribal nations which have an ancestral connection to Yellowstone. Their dissatisfaction was broadly spread in the media and through the Guardians of Our Ancestors Legacy (GOAL).

II. ACTIONS TAKEN *(See attached PDF file: Actions Taken)*

The Service took action at that time to offer consultation in multiple formats.

- February 17, 2015 the Service sent letters offering consultation to the 26 Tribes listed as opposed under GOAL and to other Tribal groups.
- March 19, 2015 Tribal leaders and wildlife managers attending the R6 Regional Roundtable discussed the grizzly bear concerns.
- Steve Torbit spoke to Tribal wildlife managers about grizzly bears during the April 6-9, 2015 Great Plains Regional Native American Fish and Wildlife Society Meeting.
- June 15, 2015 the Region sent out a second round of letters to Tribes offering another opportunity to consult.
- July 6-15, 2015 Deputy Regional Director, Matt Hogan placed phone calls, emails or otherwise made contact with all Tribes on the GOAL opposition list and some additional Tribes to personally talk to Tribes about concerns and consultation.

III. RESPONSES RECEIVED *(See attached PDF file: Responses Received)*

Tribes throughout the regions have increasingly spoken out against delisting the species. Tribal members are very sensitive to the species and cite deep spiritual and cultural connections to the bears as well as disgust at the idea of state-managed trophy hunts.

- Spirit Lake Tribe; December 17, 2014
- Guardians of Our Ancestors Legacy (GOAL); January 16, 2015

- Tribal Resolutions/letters from 15 Tribes opposing a delisting arrive my mail at Regional Director's Office; January 20, 2015
- Tribal Leaders Council; February 27, 2015
- Guardians of Our Ancestors Legacy (GOAL); March 2, 2015

IV. CONSULTATIONS REQUESTED *(See attached PDF file: G2G Requested)*

I directly received 3 requests for formal consultations and the programs received additional requests.

- Cheryl Belcourt; Montana Wyoming Tribal Leaders Council, February 23, and March 9 2015
- Yufna Soldier Wolf; Tribal Historic Preservation Officer; Northern Arapaho Tribe; March 02, 2015
- Rich Janssen; Department Head, Natural Resources Department; Confederated Salish and Kootenai Tribes; February 26, 2015

V. CONSULTATIONS CONDUCTED *(See attached PDF file: G2G Conducted)*

Christopher Servheen, Grizzly Bear Recovery Coordinator for Region 6, conducted 6 government-to-government consultations.

- Confederated Salish and Kootenai Tribes; June 10, 2015
- Blackfeet Nation; Wildlife Committee; June 18, 2015
- Northern Cheyenne Tribal Council; July 20, 2015
- Northern Arapahoe Tribal Council; July 21, 2015
- Eastern Shoshone Tribal Council; July 21, 2015
- Shoshone Bannock Tribal Council; July 30, 2015

VI. CONCERNED PARTIES

Below is a listing of the Tribes with official resolutions, declarations and opposition to delisting of the grizzly bear. This information is from the GOAL website or by resolution/letters received or communicated to the regional office.

TRIBAL ORGANIZATIONS

Montana Wyoming Tribal Leader's Council
Great Plains Tribal Chairman's Association

TRIBES

Santee Sioux Nation
Blackfeet
Confederated Salish & Kootenai Tribes
Northern Arapaho
Three Affiliated Tribes of North Dakota
Omaha Tribe
Ponca Tribe of Nebraska
Winnebago Tribe

Fort Peck
Fort Belknap
Little Shell *(Not a federal recognized tribe so we don't send a letter offering consultation).*
Chippewa and Cree
Cheyenne River Sioux Tribe
Crow Creek Sioux Tribe
Flandreau Santee Sioux Tribe
Lower Brule Sioux Tribe
Oglala Sioux Tribe
Rosebud Sioux Tribe
Sisseton Wahpeton Oyate
Standing Rock Sioux Tribe
Yankton Sioux Tribe
Crow
Northern Cheyenne
Kiowa
Spirit Lake Tribe
Turtle Mountain Band of Chippewa
Shoshone Bannock Tribes
Eastern Shoshone Tribe

Mike,
Attached is my summary of my consultation yesterday with the Confederated Salish and Kootenai Tribe about Yellowstone grizzly delisting. Since this is such a high profile issue, I am copying extra folks. The consultations with this tribe went well. An interesting issue was raised when they asked if Tribal members would be able to hunt grizzly bears in Montana if they choose to do do. They currently participate in a bison hunt each year when bison leave YNP and move into Montana.

The Tribal wildlife biologist described the GOAL group and the fact that the GOAL group was claiming that "all tribes in MT and WY were opposed to delisting". The CS&KT Council did not know who GOAL was nor do they support such a statement. They treated this as a monitor issue and did not seem to concerned about it one way or the other.

All in all, the discussions went well. Full disclosure: I did my Ph.D. dissertation work on grizzly bears on the Flathead Reservation and this work was financially supported by the CS&KT Council and the BIA.

Summary of Consultations with Confederated Salish and Kootenai Tribes (CS&KT) concerning Yellowstone grizzly bear delisting

Chris Servheen

I met with the CS&KT Tribal Council on the afternoon of June 9 at their request after working with Dale Becker to make these arrangements. I was introduced by their tribal wildlife manager Dale Becker and Tribal natural resources chief Tom McDonald as the Service representative consulting with them under nation-to-nation consultation. I summarized the status of Yellowstone bears, the recovery effort, and the objective of the ESA to get listed species to the point at which protection under that Act is no longer required. I also summarized the interagency effort and the conservation strategy and its purpose.

Questions from the Council (in bold):

1. **How were tribal cultural and religious beliefs considered in this process?** I told them this was one of the purposes of this consultation – to obtain such input. Dale Becker noted that the CS&KT Cultural Committee was invited to today's consultation but they we not present. Dale said he would discuss this with them in the future if they requested more information.
2. **How does this process relate to the NCDE where the Flathead reservation is located?** We would be moving toward a similar process in the NCDE sometime in the future if certain details can be worked out.
3. **Would hunting be allowed?** Yes, as long as total mortalities were within the mortality limits needed to stabilize the population. They did not object to hunting but wanted to know how it would be carried out.
4. **How would tribal members be allowed to hunt grizzlies in the Yellowstone ecosystem if they wanted to as part of their cultural heritage like they now hunt bison when they leave YNP?** This remains to be worked out. (Note: CS&KT members along with several other tribal members hunt bison in Montana every March/April when some bison have left YNP. They do so as part of their cultural heritage.)
5. **Would there be increased management flexibility after delisting to manage conflicts with bears?** Yes. There would be strict annual mortality limits to maintain a stable population and if there were any "left" after all other sources of mortality, these could be used for increased management flexibility or for hunting.
6. **Please explain the video being circulated that shows a Cheyenne elder being treated disrespectfully at an agency meeting when he tried to make a comment.** I explained the details of the situation (below) and this explanation was appreciated by the Council with a positive reaction:
   The Yellowstone Ecosystem Subcommittee meeting was held in Cody, WY April 30 – May 1. One of the presentations at the meeting was "Grizzly Bear

Management on Tribal Lands: Collaborations between WGFD, USFWS, and IGBST" presented by Dan Thompson of WYGF and Pat Hnilicka of the FWS Tribal Assistance office in Lander, WY. This presentation was about the long-term cooperation between Tribal, state, and FWS biologists on a wide range of issues including grizzly bears. The agenda for the meeting is attached. This presentation had nothing to do with the position of the tribes on delisting.

After this presentation, a Tribal member, Mr. James Walks Along, Director Tribal Historic Preservation Office, Northern Cheyenne Tribe walked up to the front of the room and took the microphone from the meeting chair, Brian Nesvik of WYGF and started to make a statement. Brian asked Mr. Walks Along to make his statement at the end of the meeting when public comment was taken. As is customary, no public comment is taken during formal presentations. Instead there is a formal public comment period at the end of each day of the meeting. Mr. Walks Along refused to give up the microphone and to end this disruption the power to the microphone was turned off. Mr. Walks Along then was assured he would be able to comment during the public comment period and he sat down.

At the end of the day, public comment was taken and Mr. Walks Along read a resolution against delisting and requested that FWS consult with the tribes on the status of the Yellowstone grizzly bear. His time to make these comments was not limited and he completed his statement. Immediately after he gave his statement during the public comment period, he approached me and introduced himself and we shook hands. He gave me a folder containing several tribal resolutions against delisting. Mr. Walks Along volunteered to me that "he should have not done that (the disruption) during the meeting" and expressed regret about his disruption. I asked him the best way for us (FWS) to obtain the views of his tribe on this issue. He said to call or email him and he would arrange a meeting with the Tribal Council so we could consult with them. I told him we were eager to hear the concerns of the tribes and would be in touch with him. I told him I would be happy to come and listen to their concerns. He expressed that this was good and he looked forward to it. He was friendly and we had a cordial conversation as he wrote down his contact information so I could reach him. I phoned him later and have a consultation scheduled with the Northern Cheyenne Tribe in Lame Deer in July.

At the end of the discussion I told the CS&KT Council that I would be happy to come back and further consult with them on this issue if they desired. They thanked me and were very cordial and appreciative.

Attachments: June 18 consultation with Blackfeet tribe.docx
June 9 consultation with CS&KT tribes.docx

Mike,
I have consolation meetings with the Northern Cheyenne on July 16 in Lame Deer, MT, both the Arapahoes and Shoshones on the Wind River reservation on July 21 (Pat Hnilika can go with me to those) and have a consultation meeting with the Shoshone Bannock Tribes on July 29 from 10 AM to noon in Fort Hall, ID. David Kampworth will go with me to that one.

The positions of these tribes differ as follows:
Northern Cheyenne - oppose
Shoshones - oppose
Arapahos - support (even though Norman Willow said differently in the YES meeting). Pat Hnilika continues to hear from the Arapahos in council that they support delisting.
Shoshone Bannock - oppose

Attached is my summary of my consultation on June 9 with the Confederated Salish and Kootenai Tribe (CS&KT) about Yellowstone grizzly delisting. The consultations with this tribe went well. An interesting issue was raised when they asked if Tribal members would be able to hunt grizzly bears in Montana if they choose to do do. They currently participate in a bison hunt each year when bison leave YNP and move into Montana.
The CS&KT Tribal wildlife biologist described the GOAL group and the fact that the GOAL group was claiming that "all tribes in MT and WY were opposed to delisting". The CS&KT Council did not know who GOAL was nor do they support such a statement. They treated this as a minor issue and did not seem to concerned about it one way or the other. The CS&KT support delisting.

I met with the Blackfeet Nation wildlife committee of the Tribal Council on June 18 and a summary of that meeting is also attached.

I have arranged 4 consultation meetings with Tribes in July. I am perfectly happy if someone else from the Service would like to attend these meetings in my place because of the personal attacks that have been made against me. There are several upcoming meetings with Tribes who have made resolutions against delisting in cooperation with the GOAL group. These upcoming meetings with these Tribes are likely to be more contentious that the completed meetings with the CS&KT and the Blackfeet Nation, both of whom are in the NCDE and have not made any resolutions against delisting.

Summary of Consultations with Blackfeet Nation wildlife committee of the Tribal Council concerning Yellowstone grizzly bear delisting

Chris Servheen

I met with the Blackfeet Nation wildlife committee of the Tribal Council on June 18 at their request after working with the tribal wildlife biologist, Dan Carney, to make these arrangements. Dan Carney introduced me. I summarized the status of Yellowstone bears, the recovery effort, and the objective of the ESA to get listed species to the point at which protection under that Act is no longer required. I also summarized the interagency effort and the conservation strategy and its purpose.

Questions from the Council (in bold):

1. **How does this process relate to the NCDE where the Flathead reservation is located?** We would be moving toward a similar process in the NCDE sometime in the future if certain details can be worked out.
2. **Would hunting be allowed?** Yes, as long as total mortalities were within the mortality limits needed to stabilize the population. They did not object to hunting but wanted to know how it would be carried out. This hunting would be managed by the Tribe on Tribal lands.
3. **Would there be increased management flexibility after delisting to manage conflicts with bears?** Yes. There would be strict annual mortality limits to maintain a stable population and if there were any "left" after all other sources of mortality, these could be used for increased management flexibility or for hunting.
4. **How many grizzly bears were on the Blackfeet Reservation?** Dan Carney answered that in the spring there were between 2-300 grizzly bears on the reservation and that many of these bears returned to Glacier Park and Forest Service lands in the summer and fall.

Dan Carney explained to the Blackfeet Council wildlife committee members about the GOAL group and the claims by this GOAL group that the Blackfeet Nation opposes Yellowstone grizzly delisting and that "all tribes in MT and WY were opposed to delisting". The Blackfeet Council members did not know who GOAL was. The tribal attorney said he would call the GOAL group and ask them on what basis they were making such a statement and he would then get back to Council members on the answer. The Blackfeet Nation wildlife committee of the Tribal Council was supportive of the concept of delisting. Once their attorney got an answer from GOAL, they would consider this issue with the entire Council.

At the end of the discussion I told the members of the wildlife committee of the Tribal Council that I would be happy to come back and further consult with them on this issue if they desired. They thanked me and were very cordial and appreciative.

July 20, 2015

Summary of Consultations with Northern Cheyenne Tribal Council concerning Yellowstone grizzly bear delisting

Chris Servheen

I met with the Northern Cheyenne Tribal Council on the morning of July 20 after contacting James Walks Along and asking him to set up a consultation between the Tribal authorities and FWS. James is the tribal cultural liaison and we met at the Yellowstone Ecosystem subcommittee meeting in Cody in May. Terry Thibeault from LE and George Jordon the MT ES liaison for tribal activities joined me but did not speak to the Council other than to introduce themselves.

I asked James to set up a formal government-to-government consultation with the Council to get their input on the idea of delisting Yellowstone grizzly bears, but it soon became clear that this is not what the Council was expecting. James introduced the issue of delisting Yellowstone bears. He started that the Tribe has passed a formal resolution against delisting and that there were Tribal elders opposed to the idea. He spoke of his treatment at the Yellowstone Ecosystem subcommittee meeting (I have summarized this previously). James introduced a Tribal Elder (whose name I did not catch) who spoke of the importance of grizzly bears to the Tribe and how bears were sacred animals. I was then asked to come up to the Council table and speak to the Council. I summarized the ESA recovery process and the specifics of grizzly bears and how the population was 3x what it was and we were considering changing the status of the species and wanted to know the perspective of the tribe about this. I stressed that no decision had been made to propose delisting as yet. I explained that the objective of the ESA is to get listed species to the point at which protection under that Act is no longer required and that delisting was not a threat to the grizzly in any way. I also explained the formal process to get to delisting should it be decided to proceed to propose this.

This discussion with the Northern Cheyenne Council was different than the meetings with the CS & K Tribes and the Blackfeet in that the Northern Cheyenne Council did not ask any questions about bears, or the status of bears, or what delisting would mean to the bears or to them. The main issues are summarized below:

Concerns raised by the Council (in bold):

1. **They were very concerned about process and proper government-to-government (G to G) consultation. They wanted to know if I was there for G to G consultation and if so, this required a different format than a Council meeting. They said G to G consultation would require setting up a new meeting since they did not have "all the information" on this issue yet.**

2. **They asked if I was the "decision-maker" on this issue.** I told them that I could make recommendations to those who were the decision makers based on what they told me about their concerns. **They asked if Sally Jewell was the decision maker.** I told them ultimately yes, but the FWS director was the decision maker for the Service.
3. **They were concerned about the treatment of James Walks Along at the Yellowstone ecosystem subcommittee and asked me to apologize to him and to them about this treatment. They asked me if I was running this meeting and was responsible for his treatment.** I was not running this meeting and told them so. I told them what happened was an unfortunate misunderstanding about the meeting protocol. I apologized to James and to the Council for the resulting treatment of James at the meeting and for this unfortunate misunderstanding . **James and Council thanked me for this apology.**
4. **They said that a new meeting should be arranged with the Council president so they could prepare for G to G consultation and asked me to write the Council president a letter ask for this.** I told them I would do this and James and I spoke about it after the meeting. James said he would talk to the council about this and get back to me about how it should be arranged.
5. **They were very pointed in telling me that tribal consultation was not like public comment and that G to G consultation was "very different" than public involvement. This point about them being treated in a special manner was a key issue for them.**

In summary, the meeting was very different from previous tribal meetings with tribes that have grizzlies on their reservations. The tribes I have spoken with who had grizzlies on their reservations asked about bear management issues and how delisting related to management. The Northern Cheyenne do not have grizzlies on their reservation. Their concerns were about process, respect for Tribal people at meetings (relating to James Walks Along and the Yellowstone ecosystem subcommittee), respect for Tribal opinions and input through the G to G consolation process, and having someone to consult with who was a decision maker so that there was perceived equality between the Council and the US government during this G to G consultation. This issue of equality was an important issue to them. The said that historically, tribes had been disrespected by the US government and this had to change. They asked no questions about bears or about the impact of delisting on bears. They expressed no concerns about hunting or state management plans or anything about bears. They did not even mention hunting. The Council did not say anything about GOAL. James Walks Along did say that there were many other tribes opposed to delisting but he did not mention GOAL either.

We need to contact the Tribal Council president and request a formal government-to-government consolation. It would be valuable if high-level Service people attended the next meeting.

July 21 consultation with Arapahoe tribe.docx
July 21 consultation with Eastern Shoshone tribe.docx

Mike,
Here are my reports on 3 Tribal consultations this past week. As you can see, there will have to be another consultation with the Northern Cheyenne.

Pat Hnilicka is on leave until next week and he may have some additional observations when he returns. Pat was very helpful in setting up and introducing the 2 meetings on the Wind River Reservation Terry and George joined me in Lame Deer and it was excellent to have several Service representatives present.

Summary of Consultations with Northern Cheyenne Tribal Council concerning Yellowstone grizzly bear delisting

Chris Servheen

I met with the Northern Cheyenne Tribal Council on the morning of July 20 after contacting James Walks Along and asking him to set up a consultation between the Tribal authorities and FWS. James is the tribal cultural liaison and we met at the Yellowstone Ecosystem subcommittee meeting in Cody in May. Terry Thibeault from LE and George Jordon the MT ES liaison for tribal activities joined me but did not speak to the Council other than to introduce themselves.

I asked James to set up a formal government-to-government consultation with the Council to get their input on the idea of delisting Yellowstone grizzly bears, but it soon became clear that this is not what the Council was expecting. James introduced the issue of delisting Yellowstone bears. He started that the Tribe has passed a formal resolution against delisting and that there were Tribal elders opposed to the idea. He spoke of his treatment at the Yellowstone Ecosystem subcommittee meeting (I have summarized this previously). James introduced a Tribal Elder (whose name I did not catch) who spoke of the importance of grizzly bears to the Tribe and how bears were sacred animals. I was then asked to come up to the Council table and speak to the Council. I summarized the ESA recovery process and the specifics of grizzly bears and how the population was 3x what it was and we were considering changing the status of the species and wanted to know the perspective of the tribe about this. I stressed that no decision had been made to propose delisting as yet. I explained that the objective of the ESA is to get listed species to the point at which protection under that Act is no longer required and that delisting was not a threat to the grizzly in any way. I also explained the formal process to get to delisting should it be decided to proceed to propose this.

This discussion with the Northern Cheyenne Council was different than the meetings with the CS & K Tribes and the Blackfeet in that the Northern Cheyenne Council did not ask any questions about bears, or the status of bears, or what delisting would mean to the bears or to them. The main issues are summarized below:

Concerns raised by the Council (in bold):

1. **They were very concerned about process and proper government-to-government (G to G) consultation. They wanted to know if I was there for G to G consultation and if so, this required a different format than a Council meeting. They said G to G consultation would require setting up a new meeting since they did not have "all the information" on this issue yet.**

2. **They asked if I was the "decision-maker" on this issue.** I told them that I could make recommendations to those who were the decision makers based on what they told me about their concerns. **They asked if Sally Jewell was the decision maker.** I told them ultimately yes, but the FWS director was the decision maker for the Service.
3. **They were concerned about the treatment of James Walks Along at the Yellowstone ecosystem subcommittee and asked me to apologize to him and to them about this treatment. They asked me if I was running this meeting and was responsible for his treatment.** I was not running this meeting and told them so. I told them what happened was an unfortunate misunderstanding about the meeting protocol. I apologized to James and to the Council for the resulting treatment of James at the meeting and for this unfortunate misunderstanding . **James and Council thanked me for this apology.**
4. **They said that a new meeting should be arranged with the Council president so they could prepare for G to G consultation and asked me to write the Council president a letter ask for this.** I told them I would do this and James and I spoke about it after the meeting. James said he would talk to the council about this and get back to me about how it should be arranged.
5. **They were very pointed in telling me that tribal consultation was not like public comment and that G to G consultation was "very different" than public involvement. This point about them being treated in a special manner was a key issue for them.**

In summary, the meeting was very different from previous tribal meetings with tribes that have grizzlies on their reservations. The tribes I have spoken with who had grizzlies on their reservations asked about bear management issues and how delisting related to management. The Northern Cheyenne do not have grizzlies on their reservation. Their concerns were about process, respect for Tribal people at meetings (relating to James Walks Along and the Yellowstone ecosystem subcommittee), respect for Tribal opinions and input through the G to G consolation process, and having someone to consult with who was a decision maker so that there was perceived equality between the Council and the US government during this G to G consultation. This issue of equality was an important issue to them. The said that historically, tribes had been disrespected by the US government and this had to change. They asked no questions about bears or about the impact of delisting on bears. They expressed no concerns about hunting or state management plans or anything about bears. They did not even mention hunting. The Council did not say anything about GOAL. James Walks Along did say that there were many other tribes opposed to delisting but he did not mention GOAL either.

We need to contact the Tribal Council president and request a formal government-to-government consolation. It would be valuable if high-level Service people attended the next meeting.

Summary of Consultations with Arapahoe Tribal Council concerning Yellowstone grizzly bear delisting

Chris Servheen

I met with the Arapahoe Tribal Council on the morning of July 21. Pat Hnilicka of the FWS Tribal Liaison Office in Lander arranged the meeting as government-to-government consultation. Pat accompanied me to the meeting and was very helpful in the entire process. Ben Snyder, the acting director of the Wind River Reservation Tribal Fish and Game Department, also accompanied us.

Pat introduced me to the Council and said that I was there to speak to the issue of delisting Yellowstone bears. He also outlined the need for government-to-government consultation. I briefly summarized the ESA recovery process and the status of Yellowstone grizzly bears, and how the population was 3x what it was when we started. I said we were considering changing the status of the species and wanted to know the perspective of the tribe about this. I stressed that no decision had been made to propose delisting as yet. I explained that the objective of the ESA is to get listed species to the point at which protection under that Act is no longer required and that delisting was not a threat to the grizzly in any way. I also explained the process to get to delisting should it be decided to proceed to propose this.

The discussion was very useful and candid. They asked questions about grizzly bears on the reservation shared their views about delisting. The main issues that arose are summarized below:

Concerns raised by the Council (in bold):

1. **They agreed to and accepted that this was a government-to-government consultation.**
2. **They were very interested in the current status of grizzly bears on the reservation. Pat and Ben explained what the status was with increasing numbers of bears in the Owl Creek and Wind River Ranges.**
3. **They said people had approached them from GOAL (apparently in November of 2014), but they did not join with the GOAL coalition or agree with what these people said.**
4. **The Council said they were not opposed to delisting, but there was somewhat of a split in the Council since one member (Norman Willow) stated that his personal opinion was that he was opposed to delisting. Norman had attended the YES meeting in May in Cody and made a statement against delisting during that meeting. Normal Willow did not give any reasons that he was opposed to delisting. The other members deferred to Norman's personal opinion but this did not change the position of the Council.**

In summary, the consultation was very productive. They did not take a position against delisting and were generally positive about grizzly bears expanding onto the reservation. I thanked them for their time. The consultation lasted about 30 minutes.

Summary of Consultations with Eastern Shoshone Tribal Council concerning Yellowstone grizzly bear delisting

Chris Servheen

I met with the Eastern Shoshone Tribal Council on the afternoon of July 21. Pat Hnilicka of the FWS Tribal Liaison Office in Lander arranged the meeting as government-to-government consultation. Pat accompanied me to the meeting and was very helpful in the entire process. Ben Snyder, the acting director of the Tribal Fish and Game Department, also accompanied us.

Pat introduced me to the Council and said that I was there to speak to the issue of delisting Yellowstone bears. He also outlined the need for government-to-government consultation. I briefly summarized the ESA recovery process and the status of Yellowstone grizzly bears, and how the population was 3x what it was when we started. I said we were considering changing the status of the species and wanted to know the perspective of the tribe about this. I stressed that no decision had been made to propose delisting as yet. I explained that the objective of the ESA is to get listed species to the point at which protection under that Act is no longer required and that delisting was not a threat to the grizzly in any way. I also explained the process to get to delisting should it be decided to proceed to propose this.

The discussion was very useful and candid. They asked questions about grizzly bears on the reservation shared their views about delisting. The main issues that arose are summarized below:

Concerns raised by the Council (in bold):

1. **The agreed to and accepted that this was a government-to-government consultation.**
2. **They were very interested about the current status of grizzly bears on the reservation. Pat and Ben explained what the status was with increasing numbers of bears in the Owl Creek and Wind River Ranges.**
3. **They spoke of what they had been told by Louisa Wilcox and another woman from GOAL (apparently in November of 2014). They said this group told them the state would be hunting grizzlies on the reservation if the bear was delisted. They said they knew this was not true. The were apparently shown a video of a bear hunt in Alaska by the GOAL people to inflame tension about trophy hunting. The Council members called GOAL a "radical" group and stated that they did not agree with some of the things this group says. They stated that this group misrepresented them and they misquoted the Tribal Chairman. They said they had declined to provide further comments to GOAL against delisting and against the Service when requested.**

4. **The Council said they were opposed to trophy hunting of bears and noted the difference between subsistence hunting for consumption and trophy hunting for sport and a trophy. This was a deeply held belief and they expressed this belief with conviction and eloquence.**
5. **That said that their concern with delisting was basically related to trophy hunting. They expressed concern with the "need" to hunt bears after delisting. They understood and accepted the need to sometimes remove (kill) bears that were in conflict with people or livestock. They did not see the need to hunt bears if they were not in conflict, particularly by those who would not eat the bear.**
6. **They said that the term delisting was being confused with trophy hunting and perhaps the term needed better understanding. They said that their opposition to delisting was really opposition to trophy hunting of bears and if delisting did not involve hunting of bears they would not be opposed to it.**

In summary, the consultation was very productive and valuable. The Council spoke with conviction and eloquence about their concerns about grizzly bear hunting and trophy hunting. They liked having grizzly bears on the reservation and being a part of the research and monitoring system for Yellowstone ecosystem grizzly bears. I thanked them for their time. The consultation lasted about 90 minutes.

They liked having grizzly bears on the reservation and being a part of the research and monitoring system for Yellowstone ecosystem grizzly bears. I thanked them for their time. The consultation lasted about 90 minutes.

July 20, 2015

Summary of Consultations with Northern Cheyenne Tribal Council concerning Yellowstone grizzly bear delisting

Chris Servheen

I met with the Northern Cheyenne Tribal Council on the morning of July 20 after contacting James Walks Along and asking him to set up a consultation between the Tribal authorities and FWS. James is the tribal cultural liaison and we met at the Yellowstone Ecosystem subcommittee meeting in Cody in May. Terry Thibeault from LE and George Jordon the MT ES liaison for tribal activities joined me but did not speak to the Council other than to introduce themselves.

I asked James to set up a formal government-to-government consultation with the Council to get their input on the idea of delisting Yellowstone grizzly bears, but it soon became clear that this is not what the Council was expecting. James introduced the issue of delisting Yellowstone bears. He started that the Tribe has passed a formal resolution against delisting and that there were Tribal elders opposed to the idea. He spoke of his treatment at the Yellowstone Ecosystem subcommittee meeting (I have summarized this previously). James introduced a Tribal Elder (whose name I did not catch) who spoke of the importance of grizzly bears to the Tribe and how bears were sacred animals. I was then asked to come up to the Council table and speak to the Council. I summarized the ESA recovery process and the specifics of grizzly bears and how the population was 3x what it was and we were considering changing the status of the species and wanted to know the perspective of the tribe about this. I stressed that no decision had been made to propose delisting as yet. I explained that the objective of the ESA is to get listed species to the point at which protection under that Act is no longer required and that delisting was not a threat to the grizzly in any way. I also explained the formal process to get to delisting should it be decided to proceed to propose this.

This discussion with the Northern Cheyenne Council was different than the meetings with the CS & K Tribes and the Blackfeet in that the Northern Cheyenne Council did not ask any questions about bears, or the status of bears, or what delisting would mean to the bears or to them. The main issues are summarized below:

Concerns raised by the Council (in bold):

1. **They were very concerned about process and proper government-to-government (G to G) consultation. They wanted to know if I was there for G to G consultation and if so, this required a different format than a Council meeting. They said G to G consultation would require setting up a new meeting since they did not have "all the information" on this issue yet.**

2. **They asked if I was the "decision-maker" on this issue.** I told them that I could make recommendations to those who were the decision makers based on what they told me about their concerns. **They asked if Sally Jewell was the decision maker.** I told them ultimately yes, but the FWS director was the decision maker for the Service.
3. **They were concerned about the treatment of James Walks Along at the Yellowstone ecosystem subcommittee and asked me to apologize to him and to them about this treatment. They asked me if I was running this meeting and was responsible for his treatment.** I was not running this meeting and told them so. I told them what happened was an unfortunate misunderstanding about the meeting protocol. I apologized to James and to the Council for the resulting treatment of James at the meeting and for this unfortunate misunderstanding . **James and Council thanked me for this apology.**
4. **They said that a new meeting should be arranged with the Council president so they could prepare for G to G consultation and asked me to write the Council president a letter ask for this.** I told them I would do this and James and I spoke about it after the meeting. James said he would talk to the council about this and get back to me about how it should be arranged.
5. **They were very pointed in telling me that tribal consultation was not like public comment and that G to G consultation was "very different" than public involvement. This point about them being treated in a special manner was a key issue for them.**

In summary, the meeting was very different from previous tribal meetings with tribes that have grizzlies on their reservations. The tribes I have spoken with who had grizzlies on their reservations asked about bear management issues and how delisting related to management. The Northern Cheyenne do not have grizzlies on their reservation. Their concerns were about process, respect for Tribal people at meetings (relating to James Walks Along and the Yellowstone ecosystem subcommittee), respect for Tribal opinions and input through the G to G consolation process, and having someone to consult with who was a decision maker so that there was perceived equality between the Council and the US government during this G to G consultation. This issue of equality was an important issue to them. The said that historically, tribes had been disrespected by the US government and this had to change. They asked no questions about bears or about the impact of delisting on bears. They expressed no concerns about hunting or state management plans or anything about bears. They did not even mention hunting. The Council did not say anything about GOAL. James Walks Along did say that there were many other tribes opposed to delisting but he did not mention GOAL either.

We need to contact the Tribal Council president and request a formal government-to-government consolation. It would be valuable if high-level Service people attended the next meeting.

Mike,
Here is my summary of the consultation I had with the Eastern Shoshone Tribe last week. They refer to the Shoshone in Ft. Hall as their western brethren so we may see similar ideas there. I will plan to be in front of the tribal administration building by 9:30 on Wednesday morning. I will be driving a blue Chevy Trailblazer with GSA plates.
See you then,
Chris

Hi Leander,

It was good to visit with you in Cody a few weeks ago. As we discussed, I would be happy to come to consult with your Tribal leadership on the status of Yellowstone grizzly bears if there is interest in such a discussion. What is the best way to start the process of such a consultation? Are there some dates that would work for the Tribal leaders? Please let me know how we can start these consultations and who I should speak to about this.

Thank you.

Sincerely,

Chris

Summary of Consultations with Eastern Shoshone Tribal Council concerning Yellowstone grizzly bear delisting

Chris Servheen

I met with the Eastern Shoshone Tribal Council on the afternoon of July 21. Pat Hnilicka of the FWS Tribal Liaison Office in Lander arranged the meeting as government-to-government consultation. Pat accompanied me to the meeting and was very helpful in the entire process. Ben Snyder, the acting director of the Tribal Fish and Game Department, also accompanied us.

Pat introduced me to the Council and said that I was there to speak to the issue of delisting Yellowstone bears. He also outlined the need for government-to-government consultation. I briefly summarized the ESA recovery process and the status of Yellowstone grizzly bears, and how the population was 3x what it was when we started. I said we were considering changing the status of the species and wanted to know the perspective of the tribe about this. I stressed that no decision had been made to propose delisting as yet. I explained that the objective of the ESA is to get listed species to the point at which protection under that Act is no longer required and that delisting was not a threat to the grizzly in any way. I also explained the process to get to delisting should it be decided to proceed to propose this.

The discussion was very useful and candid. They asked questions about grizzly bears on the reservation shared their views about delisting. The main issues that arose are summarized below:

Concerns raised by the Council (in bold):

1. **The agreed to and accepted that this was a government-to-government consultation.**
2. **They were very interested about the current status of grizzly bears on the reservation. Pat and Ben explained what the status was with increasing numbers of bears in the Owl Creek and Wind River Ranges.**
3. **They spoke of what they had been told by Louisa Wilcox and another woman from GOAL (apparently in November of 2014). They said this group told them the state would be hunting grizzlies on the reservation if the bear was delisted. They said they knew this was not true. The were apparently shown a video of a bear hunt in Alaska by the GOAL people to inflame tension about trophy hunting. The Council members called GOAL a "radical" group and stated that they did not agree with some of the things this group says. They stated that this group misrepresented them and they misquoted the Tribal Chairman. They said they had declined to provide further comments to GOAL against delisting and against the Service when requested.**

4. **The Council said they were opposed to trophy hunting of bears and noted the difference between subsistence hunting for consumption and trophy hunting for sport and a trophy. This was a deeply held belief and they expressed this belief with conviction and eloquence.**
5. **That said that their concern with delisting was basically related to trophy hunting. They expressed concern with the "need" to hunt bears after delisting. They understood and accepted the need to sometimes remove (kill) bears that were in conflict with people or livestock. They did not see the need to hunt bears if they were not in conflict, particularly by those who would not eat the bear.**
6. **They said that the term delisting was being confused with trophy hunting and perhaps the term needed better understanding. They said that their opposition to delisting was really opposition to trophy hunting of bears and if delisting did not involve hunting of bears they would not be opposed to it.**

In summary, the consultation was very productive and valuable. The Council spoke with conviction and eloquence about their concerns about grizzly bear hunting and trophy hunting. They liked having grizzly bears on the reservation and being a part of the research and monitoring system for Yellowstone ecosystem grizzly bears. I thanked them for their time. The consultation lasted about 90 minutes.

Thanks, Mike for attending and for these excellent notes. It was great to meet you. I will draft my summary today using your notes and my memory, and send it to you for edits and review before moving it up the ladder.

Thanks for those nice words about the consultation. It has been a while since anyone said such nice things like that. Much appreciated!

> Chris
> Summarized listing history, current range and status with explanation of Yellowstone population.
> Explained parameters associated with delisting including the determination that adequate measures are in place post delisting. Also explained status of determination to list or not list and how long the process takes.
>
> Chair: Blaine Edmo
> Got a call from someone in FWS in Colorado asking as early questions as today. Tribe remains opposed to delisting and feels that the decision is being influenced by IDFGs desire to promote trophy hunting. Also concerned about exurban population growth in the region and negative impacts on wildlife.
> Doesn't think tribe will support any effort to delist grizzly bears. Prefers instead that we establish large protective buffers for wildlife.
>
> Devon Boyer:
> Never heard that there are too many grizzly bears. Has always heard the opposite. Bears are considered a brother to the. Tribes and has spiritual significance. Questioned if ESA considers spiritual values and what gain there would be if hunting was allowed. Does not see any sensible reason for removing protections. Referred to tribe's letter recently sent opposing delisting. Also favors establishment of a development buffer around the Yellowstone population.

Mitzi Sabori:
Has FWS met with other tribes like the Blackfeet. Not meeting with tribes outside the Yellowstone population range.
Chris talked about the Wy and Mt tribes he has met with. Chairman clarified that those tribes were not originally from there. The Sho-Ban were.

Claudio Branco:
Agrees with council members and discussed Sho-Bans history in the Yellowstone area. Also stressed the cultural significance of all bears and concern that hunting would threaten the status of Grizzlies. Sho-Ban's heritage tied to the. Snake River from Yellowstone to the Columbia. Stressed tribe's belief that bears are like humans and should not be killed.

Donna Bollinger:
Echoed other's views and doesn't understand why we would delist. Chris explained the purpose of the act being to get to delisting and the need for adequate assurances of continued viability and that any hunting would be strictly controlled to prevent decline toward imperiled status.

Chair:
Again stated that the problem is human development in bear habitat.

Claudio:
Asked why the decision to delist is being handled in a piecemeal fashion and treating Glacier bears from Yellowstone bears.
Chris explained how the current populations are not connected but the Service's work to create connectivity.

Devon:
Described the interactions of humans and bears in Alaska and how they generally get along ok. Asked about status of reintroduction in other areas. Chris explained the proposal to establish bears in the Bitterroot-Selway which has not been funded. Devon asked how the number of bears to be hunted would be determined and if translocation could be an alternative to hunting.

Chair:
Getting impression that FWS is determined to delist and promote hunting. Talked about elk hunting on the refuge and how tribes were denied opportunity to participate.

Leander:
Concerned that after delisting, the state will assert its control and do whatever it wants and over harvest bears. Chris explained that the Service would require and acceptable state management plan and if the plan was not followed the Service could emergency re-list.

Devon:
Doesn't understand why the other proposals to re-establish bears were not funded. Chris offered that the Bitterroot proposal was made in the Clinton Admin but decision to not fund was made by Bush Admin.

Audience:
Asked how bears are monitored and counted. Chris explained.

Claudio:
Asked about current timeline for Service to delist. Suggested that tribe be kept informed throughout the process. Sho-Ban still has treaty rights and wants to exercise those rights relative to this process and to be fully aware of everything that's occurring.

Devon:
Summarized. Tribe opposes delisting. Favors managing bears in alternative ways such as funding the Bitterroot project.

Chairman:
Agrees with Devon. Thanked us for coming.

Summary of Consultations with Shoshone Bannock Tribal Council concerning Yellowstone grizzly bear delisting

Chris Servheen

I met with the Shoshone Bannock Tribal Council on the morning of July 29. Mike Carrier, the Idaho State Supervisor, joined me for the consultation and took detailed notes.

I introduced Mike and myself to the Council and said that we were there to speak about delisting Yellowstone bears and that we were interested in listening to the views of the Council about this delisting issue. I also confirmed that we wished this to be a government-to-government consultation and asked if this was agreeable to the Council. They said that this was agreeable and that this would be a government-to-government consultation. I briefly summarized the ESA recovery process and the status of Yellowstone grizzly bears, and how the population was 3x what it was when we started. I said we were considering changing the status of the species and wanted to know the perspective of the Council about this. I stressed that no decision had been made to propose delisting as yet. I explained that the objective of the ESA is to get listed species to the point at which protection under that Act is no longer required and that delisting was not a threat to the grizzly in any way. I also explained the process to delist should it be decided to propose this.

The discussion was very useful and candid. They their views about delisting. The main issues that arose are summarized below:

Concerns raised by the Council (in bold):

1. **The agreed to and accepted that this was a government-to-government consultation.**
2. **The Council chair said that he had previously received a phone call from a FWS person in Denver** (I assume this was Matt Hogan) **who asked him about delisting. He said he understood that the Shoshone Bannock Tribe was not in the Denver FWS region and wondered why he received this call.**
3. **The Council chair said the tribe is opposed to delisting and has written a letter detailing that opposition. He said he feels that FWS is being influenced by IDFG and IDFG's desire to implement trophy hunting of grizzly bears. He said the tribe is also concerned about continued development on private lands and the negative impacts on grizzly bears. He said an alternative to delisting would be to establish buffer areas for sensitive wildlife around areas like Yellowstone.**
4. **The Council said they were not aware that there were "too many" grizzly bears that required population reductions by hunting.**

5. **The council noted that grizzly bears had spiritual significance to the Tribe and sport hunting was incompatible with the Tribe's spiritual view of bears.**
6. **The Council wanted to know if we had met with other Tribal councils and what their views were.** I noted the meetings with the other 5 tribal councils before this meeting, and that some councils were opposed to delisting or neutral as the case with the Arapahoe, CS & KT, and the Blackfeet.
7. **The council noted their long-time connection to the Yellowstone ecosystem and to grizzly bears and that they used this country long before white people arrived.**
8. **The council members and some audience members noted the similarity of bears to humans. They stated that they believe that "trophy hunters" should not be able to pay to kill bears.**
9. **The Council asked why we were considering delisting by area instead of all the areas where bears were.** I explained that separate populations could be delisted separately and they FWS was working to facilitate connections between all populations.
10. **They asked about reintroducing bears into other areas as an alternative to hunting these bears. They asked about the Bitterroot reintroduction and why this was not done.** I explained the existing ROD to reintroduce grizzly bears to the Bitterroot and that this was not implemented because it was not funded.
11. **They asked about how the number of bears to be hunted would be determined.** I explained that careful mortality management to maintain a stable and healthy population would be in place if the bear was to be delisted.
12. **The expressed distrust of the state of Idaho and that upon delisting the state would do whatever they wanted and would remove bears from areas based on politics. They compared wolf management under the state (which they referred to negatively) to what would happen if bears were delisted.**
13. **The asked about the current timeline for a decision. They noted that they have treaty rights in the Yellowstone ecosystem and that they wanted to exercise their treaty rights in relation to this delisting issue.** I said any decision was months away and perhaps much longer and that the ultimate decision was the Director's decision.
14. **The Council members summarized by saying they were opposed to delisting and trophy hunting of bears. They preferred alternatives to deal with bears instead of hunting such as using these bears to reintroduce them into other areas.**

The consultation was very productive and valuable. The Council spoke with one voice about their spiritual connection to bears and their opposition to trophy hunting of bears. Mike and I thanked them for their time. The consultation lasted about 90 minutes.

Summary of Consultations with Northern Arapahoe Tribal Council concerning Yellowstone grizzly bear delisting

Chris Servheen

I met with the Northern Arapahoe Tribal Council on the morning of July 21. Pat Hnilicka of the FWS Tribal Liaison Office in Lander arranged the meeting as government-to-government consultation. Pat accompanied me to the meeting and was very helpful in the entire process. Ben Snyder, the acting director of the Wind River Reservation Tribal Fish and Game Department, also accompanied us.

Pat introduced me to the Council and said that I was there to speak to the issue of delisting Yellowstone bears. He also outlined the need for government-to-government consultation. I briefly summarized the ESA recovery process and the status of Yellowstone grizzly bears, and how the population was 3x what it was when we started. I said we were considering changing the status of the species and wanted to know the perspective of the tribe about this. I stressed that no decision had been made to propose delisting as yet. I explained that the objective of the ESA is to get listed species to the point at which protection under that Act is no longer required and that delisting was not a threat to the grizzly in any way. I also explained the process to get to delisting should it be decided to proceed to propose this.

The discussion was very useful and candid. They asked questions about grizzly bears on the reservation shared their views about delisting. The main issues that arose are summarized below:

Concerns raised by the Council (in bold):

1. **They agreed to and accepted that this was a government-to-government consultation.**
2. **They were very interested in the current status of grizzly bears on the reservation. Pat and Ben explained what the status was with increasing numbers of bears in the Owl Creek and Wind River Ranges.**
3. **They said people had approached them from GOAL (apparently in November of 2014), but they did not join with the GOAL coalition or agree with what these people said.**
4. **They stated that there was not agreement among council-members on whether grizzlies should be delisted. One member stated he was opposed to delisting on cultural matters, but was not specific as to what that entailed. He simply didn't want bears killed, though he did mention that he knew that bears would need to be removed when in conflict with people. The other two council-members thought that grizzly bear management should be allowed on the Reservation (implied as supporting delisting), but that the Council did not have an official**

stance on supporting or opposing delisting. This would come at a later date.

5. **The Council was unaware that GOAL was using their Tribe's logo and listing them as supporting GOAL's efforts.**

In summary, the consultation was very productive. They did not take a position for or against delisting and were generally positive about grizzly bears expanding onto the reservation. I thanked them for their time. The consultation lasted about 30 minutes.

July 21, 2015

Summary of Consultations with Eastern Shoshone Tribal Council concerning Yellowstone grizzly bear delisting

Chris Servheen

I met with the Eastern Shoshone Business Council on the afternoon of July 21. Pat Hnilicka of the FWS's Fish and Wildlife Conservation Office in Lander arranged the meeting as government-to-government consultation. Pat accompanied me to the meeting and was very helpful in the entire process. Ben Snyder, the acting director of the Tribal Fish and Game Department, also accompanied us. Council-members present were Darwin St. Clair (Chair), Clint Wagon (Vice Chair), Jodie McAdams and Nick Harris.

Pat introduced me to the Council and said that I was there to speak to the issue of delisting Yellowstone bears. He also outlined the need for government-to-government consultation. I briefly summarized the ESA recovery process and the status of Yellowstone grizzly bears, and how the population was 3x what it was when we started. I said we were considering changing the status of the species and wanted to know the perspective of the tribe about this. I stressed that no decision had been made to propose delisting as yet. I explained that the objective of the ESA is to get listed species to the point at which protection under that Act is no longer required and that delisting was not a threat to the grizzly in any way. I also explained the process to get to delisting should it be decided to proceed to propose this.

The discussion was very useful and candid. They asked questions about grizzly bears on the reservation and shared their views about delisting. The main issues that arose are summarized below:

Concerns raised by the Council (in bold):

1. **They agreed to and accepted that this was a government-to-government consultation.**
2. **They were very interested about the current status of grizzly bears on the Wind River Reservation. Pat and Ben explained what the status was with increasing numbers of bears in the Owl Creek and Wind River Ranges.**
3. **They spoke of what they had been told by Louisa Wilcox and another woman from GOAL (apparently in November of 2014). They said this group told them the state would be hunting grizzlies on the reservation if the bear was delisted. They said they knew this was not true. The were apparently shown a video of a bear hunt in Alaska by the GOAL people to inflame tension about trophy hunting. The Council members called GOAL a "radical" group and stated that they did not agree with some of the things this group says. They stated that this group**

misrepresented them and they misquoted the Tribal Chairman. They said they had declined to provide further comments to GOAL against delisting and against the Service when requested.

4. **The Council said they were opposed to trophy hunting of bears and noted the difference between subsistence hunting for consumption and trophy hunting for sport and a trophy. This was a deeply held belief and they expressed this belief with conviction and eloquence.**
5. **They said that their concern with delisting was basically related to trophy hunting. They expressed concern with the "need" to hunt bears after delisting. They understood and accepted the need to sometimes remove (kill) bears that were in conflict with people or livestock. They did not see the need to hunt bears if they were not in conflict, particularly by those who would not eat the bear.**
6. **They said that the term delisting was being confused with trophy hunting and perhaps the term needed to be better understood. They said that their opposition to delisting was really opposition to trophy hunting and if delisting did not involve hunting of bears they would not be opposed to it.**
7. **The Council was concerned that their opposition to delisting might result in a loss of FWS's efforts at monitoring grizzly bears on the Reservation (i.e. radio-collaring, aerial surveys, etc.). They were assured that this would not be the case and monitoring efforts would continue regardless of their stance.**

In summary, the consultation was very productive and valuable. The Council spoke with conviction and eloquence about their concerns about grizzly bear hunting and trophy hunting. They liked having grizzly bears on the reservation and being a part of the research and monitoring system for Yellowstone ecosystem grizzly bears. I thanked them for their time. The consultation lasted about 90 minutes.

July 30, 2015

Summary of Consultations with Shoshone Bannock Tribal Council concerning Yellowstone grizzly bear delisting

Chris Servheen

I met with the Shoshone Bannock Tribal Council on the morning of July 29. Mike Carrier, the Idaho State Supervisor, joined me for the consultation and took detailed notes.

I introduced Mike and myself to the Council and said that we were there to speak about delisting Yellowstone bears and that we were interested in listening to the views of the Council about this delisting issue. I also confirmed that we wished this to be a government-to-government consultation and asked if this was agreeable to the Council. They said that this was agreeable and that this would be a government-to-government consultation. I briefly summarized the ESA recovery process and the status of Yellowstone grizzly bears, and how the population was 3x what it was when we started. I said we were considering changing the status of the species and wanted to know the perspective of the Council about this. I stressed that no decision had been made to propose delisting as yet. I explained that the objective of the ESA is to get listed species to the point at which protection under that Act is no longer required and that delisting was not a threat to the grizzly in any way. I also explained the process to delist should it be decided to propose this.

The discussion was very useful and candid. They expressed their views about delisting. The main issues that arose are summarized below:

Concerns raised by the Council (in bold):

1. **The Council agreed to and accepted that this was a government-to-government consultation.**
2. **The Council chair said that he had previously received a phone call from a FWS person in Denver** (I assume this was Matt Hogan) **who asked him about delisting. He said he understood that the Shoshone Bannock Tribe was not in the Denver FWS region and wondered why he received this call.**
3. **The Council chair said the tribe is opposed to delisting and has written a letter detailing that opposition. He said he feels that FWS is being influenced by IDFG and IDFG's desire to implement trophy hunting of grizzly bears. He said the tribe is also concerned about continued development on private lands and the negative impacts on grizzly bears. He said an alternative to delisting would be to establish buffer areas for sensitive wildlife around areas like Yellowstone.**
4. **The Council said they were not aware that there were "too many" grizzly bears that required population reductions by hunting.**

5. **The Council noted that grizzly bears had spiritual significance to the Tribe and sport hunting was incompatible with the Tribe's spiritual view of bears.**
6. **The Council wanted to know if we had met with other Tribal councils and what their views were.** I noted the meetings with the other 5 tribal councils before this meeting, and that some councils were opposed to delisting or neutral as the case with the Arapahoe, CS & KT, and the Blackfeet.
7. **The Council noted their long-time connection to the Yellowstone ecosystem and to grizzly bears and that they used this country long before white people arrived.**
8. **The Council members and some audience members noted the similarity of bears to humans. They stated that they believe that "trophy hunters" should not be able to pay to kill bears.**
9. **The Council asked why we were considering delisting by area instead of all the areas where bears were.** I explained that separate populations could be delisted separately and the FWS was working to facilitate connections between all populations.
10. **They asked about reintroducing bears into other areas as an alternative to hunting these bears. They asked about the Bitterroot reintroduction and why this was not done.** I explained the existing ROD to reintroduce grizzly bears to the Bitterroot and that this was not implemented because it was not funded.
11. **They asked about how the number of bears to be hunted would be determined.** I explained that careful mortality management to maintain a stable and healthy population would be in place if the bear was to be delisted.
12. **They expressed distrust of the state of Idaho and that upon delisting the state would do whatever it wanted and would remove bears from areas based on politics. They compared wolf management under the state (which they referred to negatively) to what would happen if bears were delisted.**
13. **They asked about the current timeline for a decision. They noted that they have treaty rights in the Yellowstone ecosystem and that they wanted to exercise their treaty rights in relation to this delisting issue.** I said any decision was months away and perhaps much longer and that the ultimate decision was the Director's decision.
14. **The Council members summarized by saying they were opposed to delisting and trophy hunting of bears. They preferred alternatives to deal with bears instead of hunting such as using these bears to reintroduce them into other areas.**
15. **The Council requested that the FWS communicate regularly with the Tribe on any new developments regarding this issue.**

The consultation was very productive and valuable. The Council spoke with one voice about their spiritual connection to bears and their opposition to trophy

hunting of bears. Mike and I thanked them for their time. The consultation lasted about 90 minutes.

July 20, 2015

Summary of Consultations with Northern Cheyenne Tribal Council concerning Yellowstone grizzly bear delisting

Chris Servheen

I met with the Northern Cheyenne Tribal Council on the morning of July 20 after contacting James Walks Along and asking him to set up a consultation between the Tribal authorities and FWS. James is the tribal cultural liaison and we met at the Yellowstone Ecosystem subcommittee meeting in Cody in May. Terry Thibeault from LE and George Jordon the MT ES liaison for tribal activities joined me but did not speak to the Council other than to introduce themselves.

I asked James to set up a formal government-to-government consultation with the Council to get their input on the idea of delisting Yellowstone grizzly bears, but it soon became clear that this is not what the Council was expecting. James introduced the issue of delisting Yellowstone bears. He started that the Tribe has passed a formal resolution against delisting and that there were Tribal elders opposed to the idea. He spoke of his treatment at the Yellowstone Ecosystem subcommittee meeting (I have summarized this previously). James introduced a Tribal Elder (whose name I did not catch) who spoke of the importance of grizzly bears to the Tribe and how bears were sacred animals. I was then asked to come up to the Council table and speak to the Council. I summarized the ESA recovery process and the specifics of grizzly bears and how the population was 3x what it was and we were considering changing the status of the species and wanted to know the perspective of the tribe about this. I stressed that no decision had been made to propose delisting as yet. I explained that the objective of the ESA is to get listed species to the point at which protection under that Act is no longer required and that delisting was not a threat to the grizzly in any way. I also explained the formal process to get to delisting should it be decided to proceed to propose this.

This discussion with the Northern Cheyenne Council was different than the meetings with the CS & K Tribes and the Blackfeet in that the Northern Cheyenne Council did not ask any questions about bears, or the status of bears, or what delisting would mean to the bears or to them. The main issues are summarized below:

Concerns raised by the Council (in bold):

1. **They were very concerned about process and proper government-to-government (G to G) consultation. They wanted to know if I was there for G to G consultation and if so, this required a different format than a Council meeting. They said G to G consultation would require setting up a new meeting since they did not have "all the information" on this issue yet.**

2. **They asked if I was the "decision-maker" on this issue.** I told them that I could make recommendations to those who were the decision makers based on what they told me about their concerns. **They asked if Sally Jewell was the decision maker.** I told them ultimately yes, but the FWS director was the decision maker for the Service.
3. **They were concerned about the treatment of James Walks Along at the Yellowstone ecosystem subcommittee and asked me to apologize to him and to them about this treatment. They asked me if I was running this meeting and was responsible for his treatment.** I was not running this meeting and told them so. I told them what happened was an unfortunate misunderstanding about the meeting protocol. I apologized to James and to the Council for the resulting treatment of James at the meeting and for this unfortunate misunderstanding . **James and Council thanked me for this apology.**
4. **They said that a new meeting should be arranged with the Council president so they could prepare for G to G consultation and asked me to write the Council president a letter ask for this.** I told them I would do this and James and I spoke about it after the meeting. James said he would talk to the council about this and get back to me about how it should be arranged.
5. **They were very pointed in telling me that tribal consultation was not like public comment and that G to G consultation was "very different" than public involvement. This point about them being treated in a special manner was a key issue for them.**

In summary, the meeting was very different from previous tribal meetings with tribes that have grizzlies on their reservations. The tribes I have spoken with who had grizzlies on their reservations asked about bear management issues and how delisting related to management. The Northern Cheyenne do not have grizzlies on their reservation. Their concerns were about process, respect for Tribal people at meetings (relating to James Walks Along and the Yellowstone ecosystem subcommittee), respect for Tribal opinions and input through the G to G consolation process, and having someone to consult with who was a decision maker so that there was perceived equality between the Council and the US government during this G to G consultation. This issue of equality was an important issue to them. The said that historically, tribes had been disrespected by the US government and this had to change. They asked no questions about bears or about the impact of delisting on bears. They expressed no concerns about hunting or state management plans or anything about bears. They did not even mention hunting. The Council did not say anything about GOAL. James Walks Along did say that there were many other tribes opposed to delisting but he did not mention GOAL either.

We need to contact the Tribal Council president and request a formal government-to-government consolation. It would be valuable if high-level Service people attended the next meeting.

June 10, 2015

Summary of Consultations with Confederated Salish and Kootenai Tribes (CS&KT) concerning Yellowstone grizzly bear delisting

Chris Servheen

I met with the CS&KT Tribal Council on the afternoon of June 9 at their request after working with Dale Becker to make these arrangements. I was introduced by their tribal wildlife manager Dale Becker and Tribal natural resources chief Tom McDonald as the Service representative consulting with them under nation-to-nation consultation. I summarized the status of Yellowstone bears, the recovery effort, and the objective of the ESA to get listed species to the point at which protection under that Act is no longer required. I also summarized the interagency effort and the conservation strategy and its purpose.

Questions from the Council (in bold):

1. **How were tribal cultural and religious beliefs considered in this process?** I told them this was one of the purposes of this consultation – to obtain such input. Dale Becker noted that the CS&KT Cultural Committee was invited to today's consultation but they we not present. Dale said he would discuss this with them in the future if they requested more information.
2. **How does this process relate to the NCDE where the Flathead reservation is located?** We would be moving toward a similar process in the NCDE sometime in the future if certain details can be worked out.
3. **Would hunting be allowed?** Yes, as long as total mortalities were within the mortality limits needed to stabilize the population. They did not object to hunting but wanted to know how it would be carried out.
4. **How would tribal members be allowed to hunt grizzlies in the Yellowstone ecosystem if they wanted to as part of their cultural heritage like they now hunt bison when they leave YNP?** This remains to be worked out. (Note: CS&KT members along with several other tribal members hunt bison in Montana every March/April when some bison have left YNP. They do so as part of their cultural heritage.)
5. **Would there be increased management flexibility after delisting to manage conflicts with bears?** Yes. There would be strict annual mortality limits to maintain a stable population and if there were any "left" after all other sources of mortality, these could be used for increased management flexibility or for hunting.
6. **Please explain the video being circulated that shows a Cheyenne elder being treated disrespectfully at an agency meeting when he tried to make a comment.** I explained the details of the situation (below) and this explanation was appreciated by the Council with a positive reaction:
   The Yellowstone Ecosystem Subcommittee meeting was held in Cody, WY April 30 – May 1. One of the presentations at the meeting was "Grizzly Bear

Management on Tribal Lands: Collaborations between WGFD, USFWS, and IGBST" presented by Dan Thompson of WYGF and Pat Hnilicka of the FWS Tribal Assistance office in Lander, WY. This presentation was about the long-term cooperation between Tribal, state, and FWS biologists on a wide range of issues including grizzly bears. The agenda for the meeting is attached. This presentation had nothing to do with the position of the tribes on delisting.

After this presentation, a Tribal member, Mr. James Walks Along, Director Tribal Historic Preservation Office, Northern Cheyenne Tribe walked up to the front of the room and took the microphone from the meeting chair, Brian Nesvik of WYGF and started to make a statement. Brian asked Mr. Walks Along to make his statement at the end of the meeting when public comment was taken. As is customary, no public comment is taken during formal presentations. Instead there is a formal public comment period at the end of each day of the meeting. Mr. Walks Along refused to give up the microphone and to end this disruption the power to the microphone was turned off. Mr. Walks Along then was assured he would be able to comment during the public comment period and he sat down.

At the end of the day, public comment was taken and Mr. Walks Along read a resolution against delisting and requested that FWS consult with the tribes on the status of the Yellowstone grizzly bear. His time to make these comments was not limited and he completed his statement. Immediately after he gave his statement during the public comment period, he approached me and introduced himself and we shook hands. He gave me a folder containing several tribal resolutions against delisting. Mr. Walks Along volunteered to me that "he should have not done that (the disruption) during the meeting" and expressed regret about his disruption. I asked him the best way for us (FWS) to obtain the views of his tribe on this issue. He said to call or email him and he would arrange a meeting with the Tribal Council so we could consult with them. I told him we were eager to hear the concerns of the tribes and would be in touch with him. I told him I would be happy to come and listen to their concerns. He expressed that this was good and he looked forward to it. He was friendly and we had a cordial conversation as he wrote down his contact information so I could reach him. I phoned him later and have a consultation scheduled with the Northern Cheyenne Tribe in Lame Deer in July.

At the end of the discussion I told the CS&KT Council that I would be happy to come back and further consult with them on this issue if they desired. They thanked me and were very cordial and appreciative.

June 18, 2015

Summary of Consultations with Blackfeet Nation wildlife committee of the Tribal Council concerning Yellowstone grizzly bear delisting

Chris Servheen

I met with the Blackfeet Nation wildlife committee of the Tribal Council on June 18 at their request after working with the tribal wildlife biologist, Dan Carney, to make these arrangements. Dan Carney introduced me. I summarized the status of Yellowstone bears, the recovery effort, and the objective of the ESA to get listed species to the point at which protection under that Act is no longer required. I also summarized the interagency effort and the conservation strategy and its purpose.

Questions from the Council (in bold):

1. **How does this process relate to the NCDE where the Flathead reservation is located?** We would be moving toward a similar process in the NCDE sometime in the future if certain details can be worked out.
2. **Would hunting be allowed?** Yes, as long as total mortalities were within the mortality limits needed to stabilize the population. They did not object to hunting but wanted to know how it would be carried out. This hunting would be managed by the Tribe on Tribal lands.
3. **Would there be increased management flexibility after delisting to manage conflicts with bears?** Yes. There would be strict annual mortality limits to maintain a stable population and if there were any "left" after all other sources of mortality, these could be used for increased management flexibility or for hunting.
4. **How many grizzly bears were on the Blackfeet Reservation?** Dan Carney answered that in the spring there were between 2-300 grizzly bears on the reservation and that many of these bears returned to Glacier Park and Forest Service lands in the summer and fall.

Dan Carney explained to the Blackfeet Council wildlife committee members about the GOAL group and the claims by this GOAL group that the Blackfeet Nation opposes Yellowstone grizzly delisting and that "all tribes in MT and WY were opposed to delisting". The Blackfeet Council members did not know who GOAL was. The tribal attorney said he would call the GOAL group and ask them on what basis they were making such a statement and he would then get back to Council members on the answer. The Blackfeet Nation wildlife committee of the Tribal Council was supportive of the concept of delisting. Once their attorney got an answer from GOAL, they would consider this issue with the entire Council.

At the end of the discussion I told the members of the wildlife committee of the Tribal Council that I would be happy to come back and further consult with them on this issue if they desired. They thanked me and were very cordial and appreciative.

June 10, 2015

Summary of Consultations with Confederated Salish and Kootenai Tribes (CS&KT) concerning Yellowstone grizzly bear delisting

Chris Servheen

I met with the CS&KT Tribal Council on the afternoon of June 9 at their request after working with Dale Becker to make these arrangements. I was introduced by their tribal wildlife manager Dale Becker and Tribal natural resources chief Tom McDonald as the Service representative consulting with them under nation-to-nation consultation. I summarized the status of Yellowstone bears, the recovery effort, and the objective of the ESA to get listed species to the point at which protection under that Act is no longer required. I also summarized the interagency effort and the conservation strategy and its purpose.

Questions from the Council (in bold):

1. **How were tribal cultural and religious beliefs considered in this process?** I told them this was one of the purposes of this consultation – to obtain such input. Dale Becker noted that the CS&KT Cultural Committee was invited to today's consultation but they we not present. Dale said he would discuss this with them in the future if they requested more information.

At the end of the discussion I told the CS&KT Council that I would be happy to come back and further consult with them on this issue if they desired. They thanked me and were very cordial and appreciative.

June 18, 2015

Summary of Consultations with Blackfeet Nation wildlife committee of the Tribal Council concerning Yellowstone grizzly bear delisting

Chris Servheen

I met with the Blackfeet Nation wildlife committee of the Tribal Council on June 18 at their request after working with the tribal wildlife biologist, Dan Carney, to make these arrangements. Dan Carney introduced me. I summarized the status of Yellowstone bears, the recovery effort, and the objective of the ESA to get listed species to the point at which protection under that Act is no longer required. I also summarized the interagency effort and the conservation strategy and its purpose.

Questions from the Council (in bold):

1. **How does this process relate to the NCDE where the Flathead reservation is located?** We would be moving toward a similar process in the NCDE sometime in the future if certain details can be worked out.
2. **Would hunting be allowed?** Yes, as long as total mortalities were within the mortality limits needed to stabilize the population. They did not object to hunting but wanted to know how it would be carried out. This hunting would be managed by the Tribe on Tribal lands.
3. **Would there be increased management flexibility after delisting to manage conflicts with bears?** Yes. There would be strict annual mortality limits to maintain a stable population and if there were any "left" after all other sources of mortality, these could be used for increased management flexibility or for hunting.
4. **How many grizzly bears were on the Blackfeet Reservation?** Dan Carney answered that in the spring there were between 2-300 grizzly bears on the reservation and that many of these bears returned to Glacier Park and Forest Service lands in the summer and fall.

Dan Carney explained to the Blackfeet Council wildlife committee members about the GOAL group and the claims by this GOAL group that the Blackfeet Nation opposes Yellowstone grizzly delisting and that "all tribes in MT and WY were opposed to delisting". The Blackfeet Council members did not know who GOAL was. The tribal attorney said he would call the GOAL group and ask them on what basis they were making such a statement and he would then get back to Council members on the answer. The Blackfeet Nation wildlife committee of the Tribal Council was supportive of the concept of delisting. Once their attorney got an answer from GOAL, they would consider this issue with the entire Council.

At the end of the discussion I told the members of the wildlife committee of the Tribal Council that I would be happy to come back and further consult with them on this issue if they desired. They thanked me and were very cordial and appreciative.

July 20, 2015

Summary of Consultations with Northern Cheyenne Tribal Council concerning Yellowstone grizzly bear delisting

Chris Servheen

I met with the Northern Cheyenne Tribal Council on the morning of July 20 after contacting James Walks Along and asking him to set up a consultation between the Tribal authorities and FWS. James is the tribal cultural liaison and we met at the Yellowstone Ecosystem subcommittee meeting in Cody in May. Terry Thibeault from LE and George Jordon the MT ES liaison for tribal activities joined me but did not speak to the Council other than to introduce themselves.

I asked James to set up a formal government-to-government consultation with the Council to get their input on the idea of delisting Yellowstone grizzly bears, but it soon became clear that this is not what the Council was expecting. James introduced the issue of delisting Yellowstone bears. He started that the Tribe has passed a formal resolution against delisting and that there were Tribal elders opposed to the idea. He spoke of his treatment at the Yellowstone Ecosystem subcommittee meeting (I have summarized this previously). James introduced a Tribal Elder (whose name I did not catch) who spoke of the importance of grizzly bears to the Tribe and how bears were sacred animals. I was then asked to come up to the Council table and speak to the Council. I summarized the ESA recovery process and the specifics of grizzly bears and how the population was 3x what it was and we were considering changing the status of the species and wanted to know the perspective of the tribe about this. I stressed that no decision had been made to propose delisting as yet. I explained that the objective of the ESA is to get listed species to the point at which protection under that Act is no longer required and that delisting was not a threat to the grizzly in any way. I also explained the formal process to get to delisting should it be decided to proceed to propose this.

This discussion with the Northern Cheyenne Council was different than the meetings with the CS & K Tribes and the Blackfeet in that the Northern Cheyenne Council did not ask any questions about bears, or the status of bears, or what delisting would mean to the bears or to them. The main issues are summarized below:

Concerns raised by the Council (in bold):

1. **They were very concerned about process and proper government-to-government (G to G) consultation. They wanted to know if I was there for G to G consultation and if so, this required a different format than a Council meeting. They said G to G consultation would require setting up a new meeting since they did not have "all the information" on this issue yet.**

2. **They asked if I was the "decision-maker" on this issue.** I told them that I could make recommendations to those who were the decision makers based on what they told me about their concerns. **They asked if Sally Jewell was the decision maker.** I told them ultimately yes, but the FWS director was the decision maker for the Service.
3. **They were concerned about the treatment of James Walks Along at the Yellowstone ecosystem subcommittee and asked me to apologize to him and to them about this treatment. They asked me if I was running this meeting and was responsible for his treatment.** I was not running this meeting and told them so. I told them what happened was an unfortunate misunderstanding about the meeting protocol. I apologized to James and to the Council for the resulting treatment of James at the meeting and for this unfortunate misunderstanding . **James and Council thanked me for this apology.**
4. **They said that a new meeting should be arranged with the Council president so they could prepare for G to G consultation and asked me to write the Council president a letter ask for this.** I told them I would do this and James and I spoke about it after the meeting. James said he would talk to the council about this and get back to me about how it should be arranged.
5. **They were very pointed in telling me that tribal consultation was not like public comment and that G to G consultation was "very different" than public involvement. This point about them being treated in a special manner was a key issue for them.**

In summary, the meeting was very different from previous tribal meetings with tribes that have grizzlies on their reservations. The tribes I have spoken with who had grizzlies on their reservations asked about bear management issues and how delisting related to management. The Northern Cheyenne do not have grizzlies on their reservation. Their concerns were about process, respect for Tribal people at meetings (relating to James Walks Along and the Yellowstone ecosystem subcommittee), respect for Tribal opinions and input through the G to G consolation process, and having someone to consult with who was a decision maker so that there was perceived equality between the Council and the US government during this G to G consultation. This issue of equality was an important issue to them. The said that historically, tribes had been disrespected by the US government and this had to change. They asked no questions about bears or about the impact of delisting on bears. They expressed no concerns about hunting or state management plans or anything about bears. They did not even mention hunting. The Council did not say anything about GOAL. James Walks Along did say that there were many other tribes opposed to delisting but he did not mention GOAL either.

We need to contact the Tribal Council president and request a formal government-to-government consolation. It would be valuable if high-level Service people attended the next meeting.

Summary of Consultations with Northern Arapahoe Tribal Council concerning Yellowstone grizzly bear delisting

Chris Servheen

I met with the Northern Arapahoe Tribal Council on the morning of July 21. Pat Hnilicka of the FWS Tribal Liaison Office in Lander arranged the meeting as government-to-government consultation. Pat accompanied me to the meeting and was very helpful in the entire process. Ben Snyder, the acting director of the Wind River Reservation Tribal Fish and Game Department, also accompanied us.

Pat introduced me to the Council and said that I was there to speak to the issue of delisting Yellowstone bears. He also outlined the need for government-to-government consultation. I briefly summarized the ESA recovery process and the status of Yellowstone grizzly bears, and how the population was 3x what it was when we started. I said we were considering changing the status of the species and wanted to know the perspective of the tribe about this. I stressed that no decision had been made to propose delisting as yet. I explained that the objective of the ESA is to get listed species to the point at which protection under that Act is no longer required and that delisting was not a threat to the grizzly in any way. I also explained the process to get to delisting should it be decided to proceed to propose this.

The discussion was very useful and candid. They asked questions about grizzly bears on the reservation shared their views about delisting. The main issues that arose are summarized below:

Concerns raised by the Council (in bold):

1. **They agreed to and accepted that this was a government-to-government consultation.**
2. **They were very interested in the current status of grizzly bears on the reservation. Pat and Ben explained what the status was with increasing numbers of bears in the Owl Creek and Wind River Ranges.**
3. **They said people had approached them from GOAL (apparently in November of 2014), but they did not join with the GOAL coalition or agree with what these people said.**
4. **They stated that there was not agreement among council-members on whether grizzlies should be delisted. One member stated he was opposed to delisting on cultural matters, but was not specific as to what that entailed. He simply didn't want bears killed, though he did mention that he knew that bears would need to be removed when in conflict with people. The other two council-members thought that grizzly bear management should be allowed on the Reservation (implied as supporting delisting), but that the Council did not have an official**

stance on supporting or opposing delisting. This would come at a later date.

5. **The Council was unaware that GOAL was using their Tribe's logo and listing them as supporting GOAL's efforts.**

In summary, the consultation was very productive. They did not take a position for or against delisting and were generally positive about grizzly bears expanding onto the reservation. I thanked them for their time. The consultation lasted about 30 minutes.

July 21, 2015

Summary of Consultations with Eastern Shoshone Tribal Council concerning Yellowstone grizzly bear delisting

Chris Servheen

I met with the Eastern Shoshone Business Council on the afternoon of July 21. Pat Hnilicka of the FWS's Fish and Wildlife Conservation Office in Lander arranged the meeting as government-to-government consultation. Pat accompanied me to the meeting and was very helpful in the entire process. Ben Snyder, the acting director of the Tribal Fish and Game Department, also accompanied us. Council-members present were Darwin St. Clair (Chair), Clint Wagon (Vice Chair), Jodie McAdams and Nick Harris.

Pat introduced me to the Council and said that I was there to speak to the issue of delisting Yellowstone bears. He also outlined the need for government-to-government consultation. I briefly summarized the ESA recovery process and the status of Yellowstone grizzly bears, and how the population was 3x what it was when we started. I said we were considering changing the status of the species and wanted to know the perspective of the tribe about this. I stressed that no decision had been made to propose delisting as yet. I explained that the objective of the ESA is to get listed species to the point at which protection under that Act is no longer required and that delisting was not a threat to the grizzly in any way. I also explained the process to get to delisting should it be decided to proceed to propose this.

The discussion was very useful and candid. They asked questions about grizzly bears on the reservation and shared their views about delisting. The main issues that arose are summarized below:

Concerns raised by the Council (in bold):

1. **They agreed to and accepted that this was a government-to-government consultation.**
2. **They were very interested about the current status of grizzly bears on the Wind River Reservation. Pat and Ben explained what the status was with increasing numbers of bears in the Owl Creek and Wind River Ranges.**
3. **They spoke of what they had been told by Louisa Wilcox and another woman from GOAL (apparently in November of 2014). They said this group told them the state would be hunting grizzlies on the reservation if the bear was delisted. They said they knew this was not true. The were apparently shown a video of a bear hunt in Alaska by the GOAL people to inflame tension about trophy hunting. The Council members called GOAL a "radical" group and stated that they did not agree with some of the things this group says. They stated that this group**

misrepresented them and they misquoted the Tribal Chairman. They said they had declined to provide further comments to GOAL against delisting and against the Service when requested.

4. **The Council said they were opposed to trophy hunting of bears and noted the difference between subsistence hunting for consumption and trophy hunting for sport and a trophy. This was a deeply held belief and they expressed this belief with conviction and eloquence.**
5. **They said that their concern with delisting was basically related to trophy hunting. They expressed concern with the "need" to hunt bears after delisting. They understood and accepted the need to sometimes remove (kill) bears that were in conflict with people or livestock. They did not see the need to hunt bears if they were not in conflict, particularly by those who would not eat the bear.**
6. **They said that the term delisting was being confused with trophy hunting and perhaps the term needed to be better understood. They said that their opposition to delisting was really opposition to trophy hunting and if delisting did not involve hunting of bears they would not be opposed to it.**
7. **The Council was concerned that their opposition to delisting might result in a loss of FWS's efforts at monitoring grizzly bears on the Reservation (i.e. radio-collaring, aerial surveys, etc.). They were assured that this would not be the case and monitoring efforts would continue regardless of their stance.**

In summary, the consultation was very productive and valuable. The Council spoke with conviction and eloquence about their concerns about grizzly bear hunting and trophy hunting. They liked having grizzly bears on the reservation and being a part of the research and monitoring system for Yellowstone ecosystem grizzly bears. I thanked them for their time. The consultation lasted about 90 minutes.

July 30, 2015

Summary of Consultations with Shoshone Bannock Tribal Council concerning Yellowstone grizzly bear delisting

Chris Servheen

I met with the Shoshone Bannock Tribal Council on the morning of July 29. Mike Carrier, the Idaho State Supervisor, joined me for the consultation and took detailed notes.

I introduced Mike and myself to the Council and said that we were there to speak about delisting Yellowstone bears and that we were interested in listening to the views of the Council about this delisting issue. I also confirmed that we wished this to be a government-to-government consultation and asked if this was agreeable to the Council. They said that this was agreeable and that this would be a government-to-government consultation. I briefly summarized the ESA recovery process and the status of Yellowstone grizzly bears, and how the population was 3x what it was when we started. I said we were considering changing the status of the species and wanted to know the perspective of the Council about this. I stressed that no decision had been made to propose delisting as yet. I explained that the objective of the ESA is to get listed species to the point at which protection under that Act is no longer required and that delisting was not a threat to the grizzly in any way. I also explained the process to delist should it be decided to propose this.

The discussion was very useful and candid. They expressed their views about delisting. The main issues that arose are summarized below:

Concerns raised by the Council (in bold):

1. **The Council agreed to and accepted that this was a government-to-government consultation.**
2. **The Council chair said that he had previously received a phone call from a FWS person in Denver** (I assume this was Matt Hogan) **who asked him about delisting. He said he understood that the Shoshone Bannock Tribe was not in the Denver FWS region and wondered why he received this call.**
3. **The Council chair said the tribe is opposed to delisting and has written a letter detailing that opposition. He said he feels that FWS is being influenced by IDFG and IDFG's desire to implement trophy hunting of grizzly bears. He said the tribe is also concerned about continued development on private lands and the negative impacts on grizzly bears. He said an alternative to delisting would be to establish buffer areas for sensitive wildlife around areas like Yellowstone.**
4. **The Council said they were not aware that there were "too many" grizzly bears that required population reductions by hunting.**

5. **The Council noted that grizzly bears had spiritual significance to the Tribe and sport hunting was incompatible with the Tribe's spiritual view of bears.**
6. **The Council wanted to know if we had met with other Tribal councils and what their views were.** I noted the meetings with the other 5 tribal councils before this meeting, and that some councils were opposed to delisting or neutral as the case with the Arapahoe, CS & KT, and the Blackfeet.
7. **The Council noted their long-time connection to the Yellowstone ecosystem and to grizzly bears and that they used this country long before white people arrived.**
8. **The Council members and some audience members noted the similarity of bears to humans. They stated that they believe that "trophy hunters" should not be able to pay to kill bears.**
9. **The Council asked why we were considering delisting by area instead of all the areas where bears were.** I explained that separate populations could be delisted separately and the FWS was working to facilitate connections between all populations.
10. **They asked about reintroducing bears into other areas as an alternative to hunting these bears. They asked about the Bitterroot reintroduction and why this was not done.** I explained the existing ROD to reintroduce grizzly bears to the Bitterroot and that this was not implemented because it was not funded.
11. **They asked about how the number of bears to be hunted would be determined.** I explained that careful mortality management to maintain a stable and healthy population would be in place if the bear was to be delisted.
12. **They expressed distrust of the state of Idaho and that upon delisting the state would do whatever it wanted and would remove bears from areas based on politics. They compared wolf management under the state (which they referred to negatively) to what would happen if bears were delisted.**
13. **They asked about the current timeline for a decision. They noted that they have treaty rights in the Yellowstone ecosystem and that they wanted to exercise their treaty rights in relation to this delisting issue.** I said any decision was months away and perhaps much longer and that the ultimate decision was the Director's decision.
14. **The Council members summarized by saying they were opposed to delisting and trophy hunting of bears. They preferred alternatives to deal with bears instead of hunting such as using these bears to reintroduce them into other areas.**
15. **The Council requested that the FWS communicate regularly with the Tribe on any new developments regarding this issue.**

The consultation was very productive and valuable. The Council spoke with one voice about their spiritual connection to bears and their opposition to trophy

hunting of bears. Mike and I thanked them for their time. The consultation lasted about 90 minutes.

In summary, the consultation was very productive and valuable. The Council spoke with conviction and eloquence about their concerns about grizzly bear hunting and trophy hunting. They liked having grizzly bears on the reservation and being a part of the research and monitoring system for Yellowstone ecosystem grizzly bears. I thanked them for their time. The consultation lasted about 90 minutes.

July 20, 2015

Summary of Consultations with Northern Cheyenne Tribal Council concerning Yellowstone grizzly bear delisting

Chris Servheen

I met with the Northern Cheyenne Tribal Council on the morning of July 20 after contacting James Walks Along and asking him to set up a consultation between the Tribal authorities and FWS. James is the tribal cultural liaison and we met at the Yellowstone Ecosystem subcommittee meeting in Cody in May. Terry Thibeault from LE and George Jordon the MT ES liaison for tribal activities joined me but did not speak to the Council other than to introduce themselves.

I asked James to set up a formal government-to-government consultation with the Council to get their input on the idea of delisting Yellowstone grizzly bears, but it soon became clear that this is not what the Council was expecting. James introduced the issue of delisting Yellowstone bears. He started that the Tribe has passed a formal resolution against delisting and that there were Tribal elders opposed to the idea. He spoke of his treatment at the Yellowstone Ecosystem subcommittee meeting (I have summarized this previously). James introduced a Tribal Elder (whose name I did not catch) who spoke of the importance of grizzly bears to the Tribe and how bears were sacred animals. I was then asked to come up to the Council table and speak to the Council. I summarized the ESA recovery process and the specifics of grizzly bears and how the population was 3x what it was and we were considering changing the status of the species and wanted to know the perspective of the tribe about this. I stressed that no decision had been made to propose delisting as yet. I explained that the objective of the ESA is to get listed species to the point at which protection under that Act is no longer required and that delisting was not a threat to the grizzly in any way. I also explained the formal process to get to delisting should it be decided to proceed to propose this.

This discussion with the Northern Cheyenne Council was different than the meetings with the CS & K Tribes and the Blackfeet in that the Northern Cheyenne Council did not ask any questions about bears, or the status of bears, or what delisting would mean to the bears or to them. The main issues are summarized below:

Concerns raised by the Council (in bold):

1. **They were very concerned about process and proper government-to-government (G to G) consultation. They wanted to know if I was there for G to G consultation and if so, this required a different format than a Council meeting. They said G to G consultation would require setting up a new meeting since they did not have "all the information" on this issue yet.**

2. **They asked if I was the "decision-maker" on this issue.** I told them that I could make recommendations to those who were the decision makers based on what they told me about their concerns. **They asked if Sally Jewell was the decision maker.** I told them ultimately yes, but the FWS director was the decision maker for the Service.
3. **They were concerned about the treatment of James Walks Along at the Yellowstone ecosystem subcommittee and asked me to apologize to him and to them about this treatment. They asked me if I was running this meeting and was responsible for his treatment.** I was not running this meeting and told them so. I told them what happened was an unfortunate misunderstanding about the meeting protocol. I apologized to James and to the Council for the resulting treatment of James at the meeting and for this unfortunate misunderstanding . **James and Council thanked me for this apology.**
4. **They said that a new meeting should be arranged with the Council president so they could prepare for G to G consultation and asked me to write the Council president a letter ask for this.** I told them I would do this and James and I spoke about it after the meeting. James said he would talk to the council about this and get back to me about how it should be arranged.
5. **They were very pointed in telling me that tribal consultation was not like public comment and that G to G consultation was "very different" than public involvement. This point about them being treated in a special manner was a key issue for them.**

In summary, the meeting was very different from previous tribal meetings with tribes that have grizzlies on their reservations. The tribes I have spoken with who had grizzlies on their reservations asked about bear management issues and how delisting related to management. The Northern Cheyenne do not have grizzlies on their reservation. Their concerns were about process, respect for Tribal people at meetings (relating to James Walks Along and the Yellowstone ecosystem subcommittee), respect for Tribal opinions and input through the G to G consolation process, and having someone to consult with who was a decision maker so that there was perceived equality between the Council and the US government during this G to G consultation. This issue of equality was an important issue to them. The said that historically, tribes had been disrespected by the US government and this had to change. They asked no questions about bears or about the impact of delisting on bears. They expressed no concerns about hunting or state management plans or anything about bears. They did not even mention hunting. The Council did not say anything about GOAL. James Walks Along did say that there were many other tribes opposed to delisting but he did not mention GOAL either.

We need to contact the Tribal Council president and request a formal government-to-government consolation. It would be valuable if high-level Service people attended the next meeting.

July 30, 2015

Summary of Consultations with Shoshone Bannock Tribal Council concerning Yellowstone grizzly bear delisting

Chris Servheen

I introduced Mike and myself to the Council and said that we were there to speak about delisting Yellowstone bears and that we were interested in listening to the views of the Council about this delisting issue. I also confirmed that we wished this to be a government-to-government consultation and asked if this was agreeable to the Council. They said that this was agreeable and that this would be a government-to-government consultation. I briefly summarized the ESA recovery process and the status of Yellowstone grizzly bears, and how the population was 3x what it was when we started. I said we were considering changing the status of the species and wanted to know the perspective of the Council about this. I stressed that no decision had been made to propose delisting as yet. I explained that the objective of the ESA is to get listed species to the point at which protection under that Act is no longer required and that delisting was not a threat to the grizzly in any way. I also explained the process to delist should it be decided to propose this.

The discussion was very useful and candid. They expressed their views about delisting. The main issues that arose are summarized below:

Concerns raised by the Council (in bold):

1. **The Council agreed to and accepted that this was a government-to-government consultation.**
2. **The Council chair said that he had previously received a phone call from a FWS person in Denver** (I assume this was Matt Hogan) **who asked him about delisting. He said he understood that the Shoshone Bannock Tribe was not in the Denver FWS region and wondered why he received this call.**
3. **The Council chair said the tribe is opposed to delisting and has written a letter detailing that opposition. He said he feels that FWS is being influenced by IDFG and IDFG's desire to implement trophy hunting of grizzly bears. He said the tribe is also concerned about continued development on private lands and the negative impacts on grizzly bears. He said an alternative to delisting would be to establish buffer areas for sensitive wildlife around areas like Yellowstone.**
4. **The Council said they were not aware that there were "too many" grizzly bears that required population reductions by hunting.**

5. **The Council noted that grizzly bears had spiritual significance to the Tribe and sport hunting was incompatible with the Tribe's spiritual view of bears.**
6. **The Council wanted to know if we had met with other Tribal councils and what their views were.** I noted the meetings with the other 5 tribal councils before this meeting, and that some councils were opposed to delisting or neutral as the case with the Arapahoe, CS & KT, and the Blackfeet.
7. **The Council noted their long-time connection to the Yellowstone ecosystem and to grizzly bears and that they used this country long before white people arrived.**
8. **The Council members and some audience members noted the similarity of bears to humans. They stated that they believe that "trophy hunters" should not be able to pay to kill bears.**
9. **The Council asked why we were considering delisting by area instead of all the areas where bears were.** I explained that separate populations could be delisted separately and the FWS was working to facilitate connections between all populations.
10. **They asked about reintroducing bears into other areas as an alternative to hunting these bears. They asked about the Bitterroot reintroduction and why this was not done.** I explained the existing ROD to reintroduce grizzly bears to the Bitterroot and that this was not implemented because it was not funded.
11. **They asked about how the number of bears to be hunted would be determined.** I explained that careful mortality management to maintain a stable and healthy population would be in place if the bear was to be delisted.
12. **They expressed distrust of the state of Idaho and that upon delisting the state would do whatever it wanted and would remove bears from areas based on politics. They compared wolf management under the state (which they referred to negatively) to what would happen if bears were delisted.**
13. **They asked about the current timeline for a decision. They noted that they have treaty rights in the Yellowstone ecosystem and that they wanted to exercise their treaty rights in relation to this delisting issue.** I said any decision was months away and perhaps much longer and that the ultimate decision was the Director's decision.
14. **The Council members summarized by saying they were opposed to delisting and trophy hunting of bears. They preferred alternatives to deal with bears instead of hunting such as using these bears to reintroduce them into other areas.**
15. **The Council requested that the FWS communicate regularly with the Tribe on any new developments regarding this issue.**

The consultation was very productive and valuable. The Council spoke with one voice about their spiritual connection to bears and their opposition to trophy

hunting of bears. Mike and I thanked them for their time. The consultation lasted about 90 minutes.

Summary of Consultations with Confederated Salish and Kootenai Tribes (CS&KT) concerning Yellowstone grizzly bear delisting

Chris Servheen

I met with the CS&KT Tribal Council on the afternoon of June 9 at their request after working with Dale Becker to make these arrangements. I was introduced by their tribal wildlife manager Dale Becker and Tribal natural resources chief Tom McDonald as the Service representative consulting with them under nation-to-nation consultation. I summarized the status of Yellowstone bears, the recovery effort, and the objective of the ESA to get listed species to the point at which protection under that Act is no longer required. I also summarized the interagency effort and the conservation strategy and its purpose.

Questions from the Council (in bold):

1. **How were tribal cultural and religious beliefs considered in this process?** I told them this was one of the purposes of this consultation – to obtain such input. Dale Becker noted that the CS&KT Cultural Committee was invited to today's consultation but they we not present. Dale said he would discuss this with them in the future if they requested more information.
2. **How does this process relate to the NCDE where the Flathead reservation is located?** We would be moving toward a similar process in the NCDE sometime in the future if certain details can be worked out.
3. **Would hunting be allowed?** Yes, as long as total mortalities were within the mortality limits needed to stabilize the population. They did not object to hunting but wanted to know how it would be carried out.
4. **How would tribal members be allowed to hunt grizzlies in the Yellowstone ecosystem if they wanted to as part of their cultural heritage like they now hunt bison when they leave YNP?** This remains to be worked out. (Note: CS&KT members along with several other tribal members hunt bison in Montana every March/April when some bison have left YNP. They do so as part of their cultural heritage.)
5. **Would there be increased management flexibility after delisting to manage conflicts with bears?** Yes. There would be strict annual mortality limits to maintain a stable population and if there were any "left" after all other sources of mortality, these could be used for increased management flexibility or for hunting.
6. **Please explain the video being circulated that shows a Cheyenne elder being treated disrespectfully at an agency meeting when he tried to make a comment.** I explained the details of the situation (below) and this explanation was appreciated by the Council with a positive reaction:
   The Yellowstone Ecosystem Subcommittee meeting was held in Cody, WY April 30 – May 1. One of the presentations at the meeting was "Grizzly Bear

Management on Tribal Lands: Collaborations between WGFD, USFWS, and IGBST" presented by Dan Thompson of WYGF and Pat Hnilicka of the FWS Tribal Assistance office in Lander, WY. This presentation was about the long-term cooperation between Tribal, state, and FWS biologists on a wide range of issues including grizzly bears. The agenda for the meeting is attached. This presentation had nothing to do with the position of the tribes on delisting.

After this presentation, a Tribal member, Mr. James Walks Along, Director Tribal Historic Preservation Office, Northern Cheyenne Tribe walked up to the front of the room and took the microphone from the meeting chair, Brian Nesvik of WYGF and started to make a statement. Brian asked Mr. Walks Along to make his statement at the end of the meeting when public comment was taken. As is customary, no public comment is taken during formal presentations. Instead there is a formal public comment period at the end of each day of the meeting. Mr. Walks Along refused to give up the microphone and to end this disruption the power to the microphone was turned off. Mr. Walks Along then was assured he would be able to comment during the public comment period and he sat down.

At the end of the day, public comment was taken and Mr. Walks Along read a resolution against delisting and requested that FWS consult with the tribes on the status of the Yellowstone grizzly bear. His time to make these comments was not limited and he completed his statement. Immediately after he gave his statement during the public comment period, he approached me and introduced himself and we shook hands. He gave me a folder containing several tribal resolutions against delisting. Mr. Walks Along volunteered to me that "he should have not done that (the disruption) during the meeting" and expressed regret about his disruption. I asked him the best way for us (FWS) to obtain the views of his tribe on this issue. He said to call or email him and he would arrange a meeting with the Tribal Council so we could consult with them. I told him we were eager to hear the concerns of the tribes and would be in touch with him. I told him I would be happy to come and listen to their concerns. He expressed that this was good and he looked forward to it. He was friendly and we had a cordial conversation as he wrote down his contact information so I could reach him. I phoned him later and have a consultation scheduled with the Northern Cheyenne Tribe in Lame Deer in July.

At the end of the discussion I told the CS&KT Council that I would be happy to come back and further consult with them on this issue if they desired. They thanked me and were very cordial and appreciative.

June 18, 2015

Summary of Consultations with Blackfeet Nation wildlife committee of the Tribal Council concerning Yellowstone grizzly bear delisting

Chris Servheen

I met with the Blackfeet Nation wildlife committee of the Tribal Council on June 18 at their request after working with the tribal wildlife biologist, Dan Carney, to make these arrangements. Dan Carney introduced me. I summarized the status of Yellowstone bears, the recovery effort, and the objective of the ESA to get listed species to the point at which protection under that Act is no longer required. I also summarized the interagency effort and the conservation strategy and its purpose.

Questions from the Council (in bold):

1. **How does this process relate to the NCDE where the Flathead reservation is located?** We would be moving toward a similar process in the NCDE sometime in the future if certain details can be worked out.
2. **Would hunting be allowed?** Yes, as long as total mortalities were within the mortality limits needed to stabilize the population. They did not object to hunting but wanted to know how it would be carried out. This hunting would be managed by the Tribe on Tribal lands.
3. **Would there be increased management flexibility after delisting to manage conflicts with bears?** Yes. There would be strict annual mortality limits to maintain a stable population and if there were any "left" after all other sources of mortality, these could be used for increased management flexibility or for hunting.
4. **How many grizzly bears were on the Blackfeet Reservation?** Dan Carney answered that in the spring there were between 2-300 grizzly bears on the reservation and that many of these bears returned to Glacier Park and Forest Service lands in the summer and fall.

Dan Carney explained to the Blackfeet Council wildlife committee members about the GOAL group and the claims by this GOAL group that the Blackfeet Nation opposes Yellowstone grizzly delisting and that "all tribes in MT and WY were opposed to delisting". The Blackfeet Council members did not know who GOAL was. The tribal attorney said he would call the GOAL group and ask them on what basis they were making such a statement and he would then get back to Council members on the answer. The Blackfeet Nation wildlife committee of the Tribal Council was supportive of the concept of delisting. Once their attorney got an answer from GOAL, they would consider this issue with the entire Council.

At the end of the discussion I told the members of the wildlife committee of the Tribal Council that I would be happy to come back and further consult with them on this issue if they desired. They thanked me and were very cordial and appreciative.

July 30, 2015

Summary of Consultations with Shoshone Bannock Tribal Council concerning Yellowstone grizzly bear delisting

Chris Servheen

I met with the Shoshone Bannock Tribal Council on the morning of July 29. Mike Carrier, the Idaho State Supervisor, joined me for the consultation and took detailed notes.

I introduced Mike and myself to the Council and said that we were there to speak about delisting Yellowstone bears and that we were interested in listening to the views of the Council about this delisting issue. I also confirmed that we wished this to be a government-to-government consultation and asked if this was agreeable to the Council. They said that this was agreeable and that this would be a government-to-government consultation. I briefly summarized the ESA recovery process and the status of Yellowstone grizzly bears, and how the population was 3x what it was when we started. I said we were considering changing the status of the species and wanted to know the perspective of the Council about this. I stressed that no decision had been made to propose delisting as yet. I explained that the objective of the ESA is to get listed species to the point at which protection under that Act is no longer required and that delisting was not a threat to the grizzly in any way. I also explained the process to delist should it be decided to propose this.

The discussion was very useful and candid. They expressed their views about delisting. The main issues that arose are summarized below:

Concerns raised by the Council (in bold):

1. **The Council agreed to and accepted that this was a government-to-government consultation.**
2. **The Council chair said that he had previously received a phone call from a FWS person in Denver** (I assume this was Matt Hogan) **who asked him about delisting. He said he understood that the Shoshone Bannock Tribe was not in the Denver FWS region and wondered why he received this call.**
3. **The Council chair said the tribe is opposed to delisting and has written a letter detailing that opposition. He said he feels that FWS is being influenced by IDFG and IDFG's desire to implement trophy hunting of grizzly bears. He said the tribe is also concerned about continued development on private lands and the negative impacts on grizzly bears. He said an alternative to delisting would be to establish buffer areas for sensitive wildlife around areas like Yellowstone.**
4. **The Council said they were not aware that there were "too many" grizzly bears that required population reductions by hunting.**

5. **The Council noted that grizzly bears had spiritual significance to the Tribe and sport hunting was incompatible with the Tribe's spiritual view of bears.**
6. **The Council wanted to know if we had met with other Tribal councils and what their views were.** I noted the meetings with the other 5 tribal councils before this meeting, and that some councils were opposed to delisting or neutral as the case with the Arapahoe, CS & KT, and the Blackfeet.
7. **The Council noted their long-time connection to the Yellowstone ecosystem and to grizzly bears and that they used this country long before white people arrived.**
8. **The Council members and some audience members noted the similarity of bears to humans. They stated that they believe that "trophy hunters" should not be able to pay to kill bears.**
9. **The Council asked why we were considering delisting by area instead of all the areas where bears were.** I explained that separate populations could be delisted separately and the FWS was working to facilitate connections between all populations.
10. **They asked about reintroducing bears into other areas as an alternative to hunting these bears. They asked about the Bitterroot reintroduction and why this was not done.** I explained the existing ROD to reintroduce grizzly bears to the Bitterroot and that this was not implemented because it was not funded.
11. **They asked about how the number of bears to be hunted would be determined.** I explained that careful mortality management to maintain a stable and healthy population would be in place if the bear was to be delisted.
12. **They expressed distrust of the state of Idaho and that upon delisting the state would do whatever it wanted and would remove bears from areas based on politics. They compared wolf management under the state (which they referred to negatively) to what would happen if bears were delisted.**
13. **They asked about the current timeline for a decision. They noted that they have treaty rights in the Yellowstone ecosystem and that they wanted to exercise their treaty rights in relation to this delisting issue.** I said any decision was months away and perhaps much longer and that the ultimate decision was the Director's decision.
14. **The Council members summarized by saying they were opposed to delisting and trophy hunting of bears. They preferred alternatives to deal with bears instead of hunting such as using these bears to reintroduce them into other areas.**
15. **The Council requested that the FWS communicate regularly with the Tribe on any new developments regarding this issue.**

The consultation was very productive and valuable. The Council spoke with one voice about their spiritual connection to bears and their opposition to trophy

hunting of bears. Mike and I thanked them for their time. The consultation lasted about 90 minutes.

Grizzy Bear Actions Tribes 1-28-15.docx

Marla,

I have spoken with Chris on your directions from yesterday. I have added your directions into the end of the attached Word file. Chris is contacting Mike T for further guidance, since the work would be done by ES and the actions are directed at ES. After talking with Chris and reviewing the attached email, which spurred the meeting with Matt, we believe there is a need to get a copy of the letter that went to the DOI solicitors office. It is pertinent to us and our actions as we reach out to the Tribes to offer consultation to the appropriate folks involved and in addressing their concerns. I know you prefer to send any emails that go to DOI or HQ. We do need a copy of the letter referenced in the attached email.

See the attached email quote:

Dear Assistant Secretary Washburn,

I have attached a letter from the Sisseton Wahpeton Oyate concerning the proposed delisting of the Yellowstone grizzly bear from the Endangered Species Act protections by the US Fish and Wildlife Service. Your attention to this matter is greatly appreciated.

Thank you,

Maya Peters-Kwon, Executive Assistant
Sisseton-Wahpeton Oyate
Office of the Tribal Chairman
