Federal Fish and Wildlife Permit Application Form

Return to: U.S. Fish and Wildlife Service
Division of Management Authority (DMA)
Branch of Permits, MS: IA
5275 Leesburg Pike
Falls Church, VA 22041-3803
1-800-358-2104 or 703-358-2104

Type of Activity:
IMPORT OF SPORT-HUNTED TROPHIES
(Appendix I of CITES and/or ESA)

Complete Sections A or B, and C, D, and E of this application. U.S. address may be required in Section C, see instructions for details.
See attached instruction pages for information on how to make your application complete and help avoid unnecessary delays.

A. Complete if applying as an individual

1.a. Last name	1.b. First name	1.c. Middle name or initial	1.d. Suffix
Ragazzine	Justin	Michael	

2. Date of birth (mm/dd/yyyy)	3. Social Security No.	4. Occupation	5. Affiliation/ Doing business as (see instructions)
(b) (6)			

6.a. Tribal membership	6.b. Alternate telephone number	6.c. Fax number	6.d. E-mail address
(b) (6)			(b) (6)

B. Complete if applying on behalf of a business, corporation, public agency, Tribe, or institution

1.a. Name of business, agency, Tribe, or institution	1.b. Doing business as (dba)

2. Tax identification no.	3. Description of business, agency, Tribe, or institution

4.a. Principal officer Last name	4.b. Principal officer First name	4.c. Principal officer Middle name/ initial	4.d. Suffix

5. Principal officer title	6. Primary contact name

7.a. Business telephone number	7.b. Alternate telephone number	7.c. Business fax number	7.d. Business e-mail address

C. All applicants complete address information

1.a. Physical address (Street address; Apartment #, Suite #, or Room #, no P.O. Boxes)
(b) (6)

1.b. City	1.c. State	1.d. Zip code/Postal code	1.e. County/Province	1.f. Country
Youngstown	Ohio	44511	Mahoning	USA

2.a. Mailing Address (include if different than physical address; include name of contact person if applicable)

2.b. City	2.c. State	2.d. Zip code/Postal code	2.e. County/Province	2.f. Country

D. All applicants MUST complete

1. Attach check or money order payable to the U.S. FISH AND WILDLIFE SERVICE **in the amount of $100, nonrefundable processing fee** Federal, Tribal, State, and local government agencies, and those acting on behalf of such agencies, are exempt from the processing fee – ***attach documentation of fee exempt status as outlined in instructions.*** (50 CFR 13.11(d))

2. Do you currently have or have you ever had any Federal Fish and Wildlife permits?
Yes ☑ If yes, list the number of the most current permit you have held or that you are applying to renew/re-issue: 17451009SC/9 No ☐

3. Certification: I hereby certify that I have read and am familiar with the regulations contained in ***Title 50, Part 13 of the Code of Federal Regulations*** and the other ***applicable parts in subchapter B of Chapter I of Title 50***, and I certify that the information submitted in this application for a permit is complete and accurate to the best of my knowledge and belief. I understand that any false statement herein may subject me to the criminal penalties of 18 U.S.C. 1001.

(b) (6) 01/08/2018

Signature (**in blue ink**) of applicant/person responsible for permit (No photocopied or stamped signatures) Date of signature (mm/dd/yyyy)

Please continue to next page

E. IMPORT OF SPORT-HUNTED TROPHIES *(Appendix I of CITES* and/or *ESA)*

Note 1: If you hold an import permit for trophy/trophies that you did not use, please **return the unused original permit.** If you are requesting reissuance of a permit because you have taken a trophy, but are unable to import it prior to the expiration of the permit, please use the renewal form (3-200-52; http://www.fws.gov/international/permits/by-form-number/index.html) and return your original permit with that form.

Note 2: Applications for species listed as endangered under the U.S. Endangered Species Act are published in the Federal Register for a 30-day public comment period. Please allow at least **90 days** for the application to be processed.

Note 3: USFWS has determined that a trophy consists of raw or tanned parts of a specimen taken by a hunter during sport hunt for personal use. It may include the bones, claws, hair, head, hide, hooves, horns, meat, skull, teeth, tusks, or any taxidermied part, including, but not limited to, a rug or taxidermied head, shoulder, or full mount. It does not include articles made from a trophy, such as worked, manufactured, or handicraft items for use as clothing, curios, ornamentation, jewelry, or other utilitarian items. If you wish to import such products, please contact the Division of Management Authority for the proper application form.

Note 4: Certain hunting trophies, including leopard, elephant, and rhinoceros hunting trophies, are subject to restrictions on their use after import into the United States. Please see 50 CFR 23.55 for more information or contact the Division of Management Authority.

Please provide the following information. Complete all questions on the application. Mark questions that are not applicable with "N/A". If needed, use a separate sheet of paper. On all attachments or separate sheets you are submitting; please indicate the application question number you are addressing. If applying for more than one trophy, be sure to answer questions 1-5 for each trophy addressed in this application. If importing trophies from more than one country, you must submit a separate application for each shipment in order to obtain separate import permits.

1. For each trophy to be imported, provide:
   a. Scientific name (genus, species, and, if applicable, subspecies) and common name.
      Panthera leo

   b. Sex (if known).
      Male

2. **IF ANIMAL IS CURRENTLY LIVING IN THE WILD**, please enter the following:
   a. Country and PLACE (area, region, GIS coordinates, ranch AND nearest city) where wildlife is to be taken from the wild:

   b. Date wildlife is to be hunted:

   c. Description of the trophy and parts you intend to import (e.g., skin, skull, shoulder mount, life size mount, claws, horn, tusks).

3. **IF THE ANIMAL IS DEAD**, please enter the following:
   a. Country and PLACE (area, region, GIS coordinates, ranch AND nearest city) where wildlife was removed from the wild (provide a map if possible):
      Zimbabwae, Save Valley Conservancy, Chishakwe Hunting Concession

   b. Date wildlife was hunted:
      November 27 2017

c. Description of the trophy and parts you intend to import (e.g., skin, skull, shoulder mount, life size mount, claws, horn, tusks).
Skin, Skull, & Claws

d. The current location of the trophy (address and country) [the U.S. import permit will identify this country as the country of export/re-export and must match with the export/re-export documents]:
4 Josiah Chinamano Road
Belmont, Bulawayo
Zimbabwe

4. Complete name and address of overseas person or business shipping the trophy to you. If you are applying to import a trophy directly from Namibia, you must provide the name and address of the professional hunter listed on your Namibian hunting permit [this name will also appear on your Namibian export permit and must match the U.S. import permit].

Name:	Cuan
Business Name:	Trophy Consultant International
Address:	4 Josiah Chinamano Road
Address:	
City:	Belmont
State/Province:	Bulawayo, Zimbabwe
Country, Postal Code:	

5. Please be aware that the U.S. Fish and Wildlife Service must make a finding that your activities will enhance or benefit wild populations of the species involved. If you have any information that could support this finding (e.g., population status or trend data; how the funds from license/trophy fees will be spent; what portion of the hunting fee will support conservation), please submit such information on a separate page with your application.

CERTIFICATION STATEMENT (original signature must be provided for either 6 or 7 below)

6. **If you are a broker or taxidermist applying on behalf of a foreign national,** provide documentation to show you have a **Power of Attorney** to act on your client's behalf and sign the following statement.

I acknowledge that the sport-hunted trophy/trophies to be imported has been/will be personally hunted by my client and is being imported only for my client's personal use (i.e., **not for sale, transfer, donation, or exchange that is reasonably likely to result in economic use, gain, or benefit**). I understand that my client may only import two leopard trophies in one calendar year (if applicable). In addition, I have advised my client that raw ivory, once imported into the United States, cannot be re-exported.

Taxidermist/Broker's signature: _____ Date: _____

7. **If you are the hunter applying to import your own trophy**, please read and sign the following statement.

I acknowledge that the sport-hunted trophy/trophies to be imported has been/will be personally hunted by me and is being imported only for my personal use (i.e., **not for sale, transfer, donation, or exchange that is reasonably likely to result in economic use, gain, or benefit**). I understand that I may only import two leopard trophies in one calendar year (if applicable). In addition, I understand that raw ivory, once imported into the United States, cannot be re-exported.

Applicant's signature: (b) (6) Date: 1/8/18

Be aware that there may be additional permitting or approval requirements by your local or state government, as well as required by other Federal agencies or foreign government to conduct your propose activity. While the Service will attempt to assist you, it is your responsibility to obtain such approval.

8. All international shipment(s) must be through a designated port. A list of designated ports (where an inspector is posted) is available from http://www.fws.gov/le/designated-ports.html. If you wish to use a port not listed, please contact the Office of Law Enforcement for a Designated Port Exemption Permit (form 3-200-2).

9. Name and address where you wish permit mailed, if different from page 1 (All permits will be mailed via the U.S. Postal Service, unless you identify an alternative means below):

   Fauna & Flora Custom House Brokers
   15231 135TH Ave
   Jamacia, NY. 11434

10. If you wish the permit to be delivered by means other than USPS regular mail, provide an air bill, pre-paid envelope, or billing information. If you do not have a pre-paid envelope or air bill and wish to pay for a courier service with your credit card, please check the box below. Please DO NOT include credit card number or other information; you will be contacted for this information.

☐ If a permit is issued, please send it via a courier service to the address on page 1 or question 9. I understand that you will contact me for my credit card information once the application has been processed.

11. Who should we contact if we have questions about the application? (Include name, phone number, and email):

John Meehan
(b) (6)
(b) (6)

12. **Disqualification Factor**. A conviction, or entry of a plea of guilty or nolo contendere, for a felony violation of the Lacey Act, the Migratory Bird Treaty Act, or the Bald and Golden Eagle Protection Act disqualifies any such person from receiving or exercising the privileges of a permit, unless such disqualification has been expressly waived by the Service Director in response to a written petition. (50 CFR 13.21(c)) Have you or any of the owners of the business, if applying as a business, been convicted, or entered a plea of guilty or nolo contendere, forfeited collateral, or are currently under charges for any violations of the laws mentioned above?

☐ Yes ☑ No If you answered "Yes" provide: a) the individual's name, b) date of charge, c) charge(s), d) location of incident, e) court, and f) action taken for each violation.

NOTICE OF REPRESENTATION

This is a notice to the U.S. Fish and Wildlife Service that I have appointed John J. Jackson, III of the non-profit firm Conservation Force as my attorneys and legal representatives for all matters concerning my applications for a permit to import a lawfully hunted LION trophy.

This authority is inclusive and extends to all applications and filings, whether administrative or judicial, including but not limited to any request for reconsideration, appeal, and litigation.

I also request that the attorney, through the address for Conservation Force below, be copied with all correspondence, acknowledgements, notices and decisions concerning my application to import my trophy at the following address:

RE: PRT No. MA74840C-0 / Lion Trophy, Zimbabwe / Justin Ragazzine

Dear Chief Cogliano:

As a supplement to our existing application for a Lion Trophy Import permit from Zimbabwe for Justin Ragazzine, please find enclosed the following supporting documents:

Lion Hunting in Zimbabwe's Savé Valley Conservancy (2013)
Carnivore Densities in the Savé Valley Conservancy (2017)
Conservation status of the African Lion in Zimbabwe (2015)

The above documentation highlights the healthy population of lions in the Savé Valley Conservancy and the benefits generated by regulated hunting for the protection of the lion, elephant, rhino and a range of other species. Please take this and the previously submitted material submitted by Conservation Force and Zimbabwe's Parks and Wildlife Management Authority (ZPWMA) into account in making a enhancement finding.

PRT No. MA74840C-0

Please do not hesitate to contact us if you have questions about this permit application.

Sincerely,

John J. Jackson III

African Wildlife Conservation Fund

Savé Valley CONSERVANCY

Carnivore Densities in the Savé Valley Conservancy

Results of the 2017 Spoor Survey & Wild Dog Monitoring Project

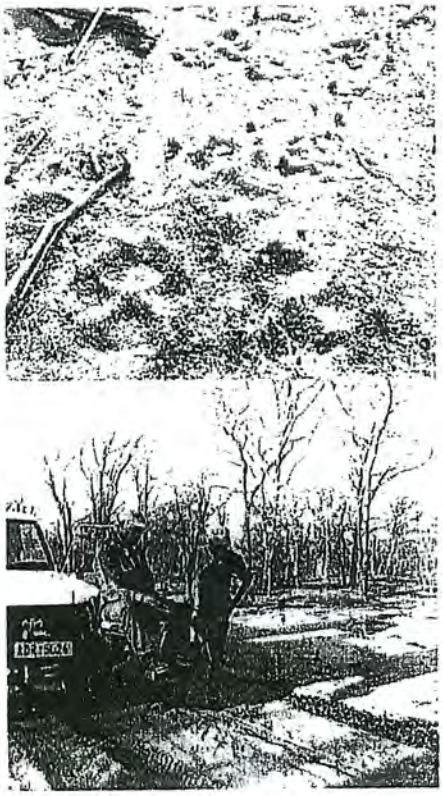
Jessica Watermeyer and Dr Rosemary Groom, African Wildlife Conservation Fund

Introduction

The African Wildlife Conservation Fund carries out an annual large carnivore spoor survey in order to assess population trends of carnivores within the Savé Valley Conservancy (SVC / the conservancy) to aid management decisions. A standardised methodology is used to ensure consistency through time and comparability with other studies. Since 2008, the spoor surveys have been done using the same roads and the same observer.

Spoor surveys have been shown to be an effective and efficient means to assess wildlife densities (Stander 1998; Funston et al. 2001; Davidson & Romañach 2007; Funston et al 2010) with strong correlations existing between spoor density and true density. The technique is considered to produce reliable estimates for lions, spotted hyenas, and leopards, when sample sizes (spoor encounter rates) are sufficient. Other carnivores are included in our counts simply to monitor trends over time.

This report presents the results of the October 2017 carnivore spoor survey for the SVC, together with results from the long term wild dog monitoring project, and looks at trends in the main carnivore species over time.



AWCF head scout, Rueben Bote, and attachment student, Nkosilathi Ngwenya, identifying spoor.

Methodology

The 2017 carnivore spoor survey used the methods pioneered in SVC by Davidson and Romañach (2007), based on those used by Stander (1998) in Namibia. Exactly the same methodology has been used annually since 2008. Road transects were chosen throughout the SVC to represent a fair coverage of all (non-resettled) areas, and these transects were scanned for spoor. The number of kilometres of transects surveyed was chosen to maintain consistency with previous spoor surveys. Thus, for every 6-7km² of

sample area, 1km of transect was surveyed, creating a penetration density (expressed as a ratio of kilometres of transect surveyed to total sample area) of between 1:6 and 1:7.

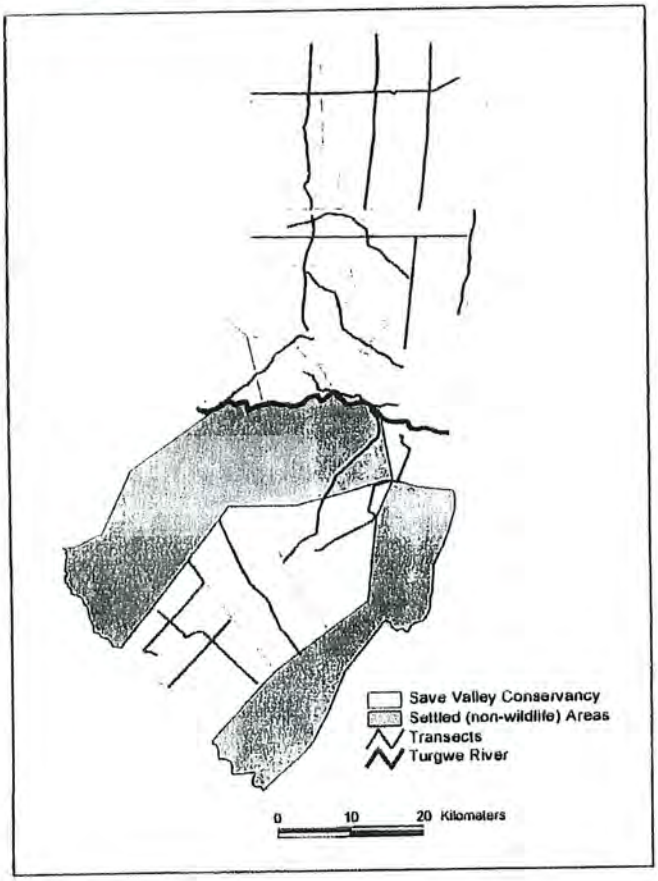
The total area of the Savé Valley Conservancy is 3490km^2. However, the effective wildlife area (excluding the 1051km^2 of resettled land), comes to only 2439km^2; 1639km^2 north of the Turgwe river and 800km^2 south of the Turgwe (see Table 1).

In northern SVC, the total length of all transects combined was 259.7 km, giving a penetration ratio of 6.31. In southern SVC, the combined transect length was 144 km, giving a penetration ratio of 5.56. For the conservancy as a whole, 403.7 km were driven (penetration ratio 6.04).

Transects surveyed were the same as those used in 2007-2017 (Figure 1). Each transect was driven at a speed of between 10 and 20 km/hr with one tracker, AWCF head scout Rueben Bote, sitting on the front of the vehicle scanning for spoor. Transects ranged between 12.7 km and 29.2 km in length, with a mean transect length of 21.2 km.

Each transect survey started as close to sunrise as possible, and wherever feasible was driven from west to east to ensure the best possible tracking conditions. Only tracks less than 24 hours old were counted. Road conditions are generally sandy, such that spoor is relatively easy to see. Where possible, spoor of individual animals were followed to reduce the likelihood of that individual being counted twice on a given transect. Spoor was recorded for all mammalian carnivores bigger than a genet.

Figure 1. Map of the transects driven – October 2017



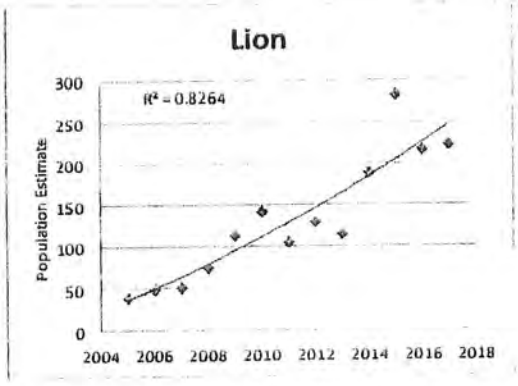
Results

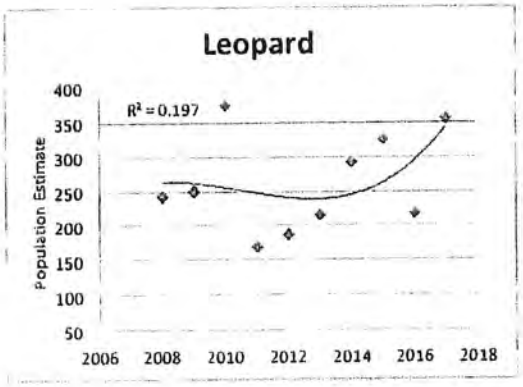
Table 1: Summary of survey parameters (2017)

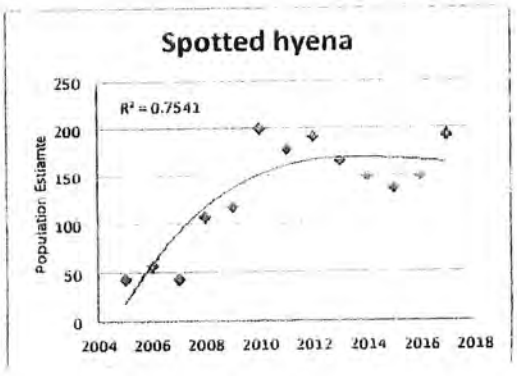
Parameter	Northern SVC	Southern SVC	Total SVC
Area (km²)	1639	800	2439
Total number of km driven	269.7	132	401.7
Penetration ratio	6.08	6.06	6.07

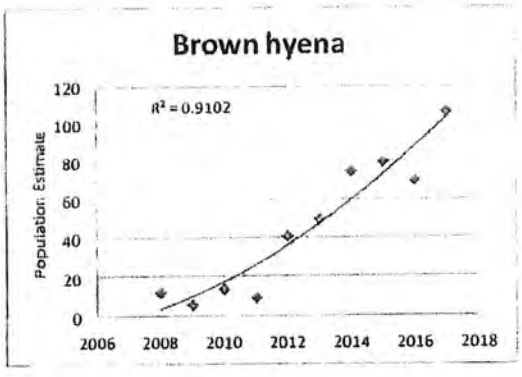
Table 2: Population estimates of the key carnivore species in the **whole of Savé Valley Conservancy** from 2008-2017 (from 2005 – 2017 for lion and spotted hyena).
Data for lion, leopard, spotted and brown hyenas and black backed jackal are from spoor surveys; **data for wild dogs is from the Lowveld Wild Dog Project's direct monitoring efforts** (counts are taken from April of each year and include adult and yearling wild dogs).

Species	2005	2006	2007	2008	2009	2010	2011	2012	2013	2014	2015	2016	2017
Lion	40	50	52	76	114	143	105	130	115	190	284	217	223
Leopard				245	252	378	172	189	218	295	328	221	359
Spotted hyena	44	58	44	107	118	201	178	192	166	150	137	150	193
Brown hyena				12	6	14	10	41	50	75	80	70	107
African Wild dog				45	60	64	61	86	90	81	91	99	94
Black backed jackal				188	190	157	141	151	199	229	241	234	296









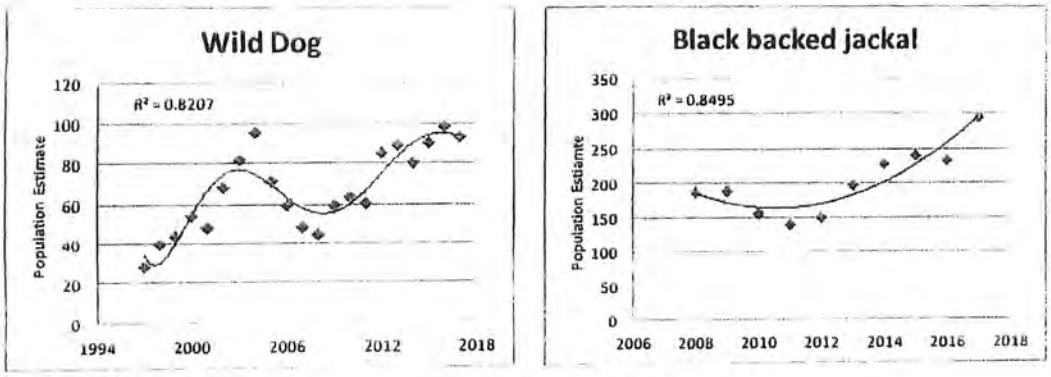


Figure 2: Trends in the populations of key carnivores in SVC for all years for which data is available. Data for lion, leopard and spotted and brown hyenas and black backed jackal are from spoor surveys; data for wild dogs is from the Lowveld Wild Dog Project's direct monitoring efforts (counts are taken from April of each year and include adult and yearling wild dogs). *A breakdown of all survey results for all species between the north and south of the conservancy is given in Appendix 1.*

Discussion

The results for each species are stable/increasing. The trend data suggests that 2016 was a slight undercount for all species (as was also the case in the Gonarezhou National Park survey), and that 2015 was most likely an over count for lion (and maybe for leopard).

Interpretation of results for each species

The **lion population** in the conservancy has increased significantly from c. 40 individuals in 2005 to 190 in 2014. Excluding the anomalous over count in 2015, the population appears to be starting to stabilise. The population **estimate of 223 lions** in 2017 is in keeping with the long-term population growth trend (Figure 2), and the recent marginal increases in estimated individuals could be indicative of a slowing growth rate as the species approaches capacity within the conservancy.

The number of lions in SVC equates to a **density of 9.1 lions / 100km²**, which is in line with densities recorded elsewhere (9.6 lions / 100km² - average over Kruger, Hwange, Selous and Serengeti), although in areas notably larger than SVC. Finally, of the 121 lion tracks we encountered, 31% were adult males, with 55% identified as adult females, 12% as sub-adults and 2% as young cubs. With regards to quota considerations, it is important to not only consider the population trend of the species, but age grouping and sex ratios too.

In 2017 there were an estimated **359 leopard** in the conservancy. If one disregards the 2016 count as an anomalous undercount, and considers the long-term trend data from 2010 – 2017 (inclusive), it is clear that the conservancy's **leopard population** is displaying a good and positive trend (Figure 2).

Leopards are at a **density of 14.7 leopards / 100km²** in the conservancy. This is considerably higher than densities recorded in Phinda and Mkhuze in South Africa (average 9.7 / 100km²; Balme et al. 2009) and in neighbouring Gonarezhou National Park (9.5 / 100km²; Groom & Watermeyer 2017). Finally, the SVC leopard population appears to displays a 2:1 ratio skewed in the favour of females. Of the 85 leopard tracks

we recorded, 32% were adult males, 64% were adult females, with one sub-adult (1%) being recorded and three cubs (3%).

Derivation of population estimates from spoor densities is controversial for leopards (there are several different equations available which give different numbers) so the numbers themselves should be treated with caution. Looking ahead, it may be useful to adopt alternative research methods (e.g. mark recapture camera trap survey) to calibrate the survey results, and obtain a more comprehensive understanding of leopard numbers in the conservancy.

Spotted hyenas appear to have stabilised over the last few years at between 150-200 individuals. There were an estimated **193 spotted hyenas** in 2017. The hyena population could be doing better in light of the recently stabilising lion population, but we will need to monitor the population to determine if a true trend is emerging. Likewise, one must not overlook that the possible causes of the recent slight population decline between 2012-2016 (prey availability, intra-specific competition, hunting pressure, anthropogenic mortality etc.) may still be of consequence.

Spotted hyena's are at a density of **7.9 spotted hyenas / 100km²**. This is lower than other populations; 13.5 / 100km² in Kruger (Mills 1985), 17.0 / 100km² in Hwange (Bowler 1992), and 9.7 / 100km² in Gonarezhou National Park (Groom & Watermeyer 2017). Given the relatively lower density of the species in the conservancy, they may still increase more.

There were an estimated **107 brown hyenas** in the conservancy in 2017. Overall and ignoring the 2016 undercount, the **brown hyena population** is displaying a stable and positive growth trend (Figure 2). The estimated density of brown hyenas was **4.4 brown hyenas / 100km²** in 2017, which is higher than the average (2.5 brown hyenas / 100km²) over the last few years (2012-2015).

The **African wild dog** population appears to be levelling off. **From our comprehensive and direct monitoring of the species, there are 94 adult and yearling wild dogs in the conservancy (3.9 wild dogs / 100km²).** Average wild dog densities are generally lower (average 2.5 wild dogs / 100km² across five populations; Pole 1999). The spoor survey results estimated 313 wild dogs in the conservancy, with a density of 12.8 African wild dogs / 100km². This is clearly a significant overestimate of the wild dog population, and serves to demonstrate that spoor surveys are not a reliable indicator of wild dog numbers.

When counts include pups (as spoor surveys do); the numbers are likely to be higher (particularly in October when densities are highest because it is directly after the denning season). Further, there is the potential to 'hit' or 'miss' a large pack of wild dogs during a spoor survey which can have a large effect on the results. However, looking at the detailed monitoring results, the long term trend for the species is as expected. Wild dogs are a classic 'boom and bust' species showing major population fluctuations over time.

There has been a notable increase in the **black backed jackal** population in the conservancy, from an estimated 241 jackals in 2015 and 234 jackals in 2016, to **296 black backed jackals** in 2017. Overall, the jackal population is displaying a stable positive growth trend (Figure 2). The estimated density of jackals was **12.1 jackals / 100km²** in 2017.

We once again stress, that the spoor encounter rate for **cheetahs** in the conservancy is very low, and thus it is impossible to accurately estimate the number of resident cheetahs, even with large confidence intervals. However, data from the spoor survey suggests there to be a minimum of **four cheetahs** in the whole

conservancy at a **density of 0.2 cheetahs / 100 km²**. This is on the low end of the spectrum when one considers the range of cheetah densities elsewhere (excluding highly managed fenced reserves in South Africa); for example, 0.2 cheetah / 100km² on Namibian farmlands and in the Sahara, and up to 2.5 cheetah / 100km² in the Serengeti National Park (IUCN/SSC 2015).

Although anecdotal evidence suggests the population may be picking up slightly, we can safely say the population is still very low (only two cheetah tracks were seen in the 403.7 km of transects driven). However, spoor surveys are not appropriate techniques for monitoring cheetah because they use the roads a lot less than other large carnivores, and the species would be more accurately surveyed by a mark recapture camera trap survey using cheetah play trees and other key areas. **The Cheetah Conservation Project Zimbabwe, which collected updated photographic information on cheetah throughout Zimbabwe, estimates c. 12 adult cheetahs in SVC (van der Meer, 2016).**

Word of caution

When interpreting the results in the graphs and tables at the end, please do so with caution, especially to quote specific numbers. For lions and hyenas we are confident that these spoor surveys are relatively accurate in the numbers they predict, although anomalous over and undercounts can hinder this. Likewise, we can trust the numbers for wild dogs, as they are from the detailed population monitoring study. For leopards however, several different equations (all considered suitable for estimating leopard numbers from spoor) can give different population estimates from each other. The spoor survey technique has not been calibrated for species like jackals, civets, even brown hyenas, so while the data is useful for looking at trends, using population figures directly from the graphs for these species is unadvisable.

Acknowledgements

Permission to conduct this research was given by the Research Council of Zimbabwe, and the Savé Valley Conservancy, with the support of the Zimbabwe Parks and Wildlife Management Authority. Thank you to Chishakwe Ranch for hosting the project team and for providing logistical support. Thanks also to all of the landowners and managers in the conservancy for allowing us to conduct this spoor survey on their properties. Rueben Bote deserves special mention for his excellent track identification.

Lion Hunting in Zimbabwe's Savé Valley Conservancy

Dr Rosemary Groom, African Wildlife Conservation Fund
(On behalf of the members of the Savé Valley Conservancy)

27th January 2013

1 Background

This document is a case study of the Savé Valley Conservancy in south-east Zimbabwe, where the African lion (*Panthera leo*) population is increasing exponentially, and where lions have been hunted since 2002. This case study clearly illustrates the positive conservation benefit that trophy hunting of lions can have for the species, and briefly describes the importance of hunting to maintaining wildlife in the area.

2 History of the Savé Valley Conservancy

The Savé Valley was a wildlife-rich wilderness until the early 1900s, when the first cattle ranching initiatives started in the area. The establishment of Devuli Ranch and Angus Ranch in 1920 paved the way for seven decades of commercial cattle ranching in the area we know today as the Savé Valley Conservancy. Roads were cut, fences erected and an everlasting "battle" ensued against the wildlife, especially against all predators.

After the Second World War, cattle prices soared to new heights, and the 1950s were years of development and expansion for the cattle industry. The large predators, especially lions, were virtually eradicated (Pole 1999). However, by the late 1980s, declining range productivity, depressions and droughts forced the landowners to consider alternative options. Around that time, empirical evidence of the competitive advantage of wildlife over livestock began to emerge (Child 1988; Bond 1993), especially in arid areas (Jansen et al 1992; Cumming 1993), and wildlife was finally given serious consideration as a viable land use option.

In 1989, a proposal was drawn up (du Toit 1989) to turn what was then the Sabi Valley Intensive Conservation Area into a wildlife conservancy. The plan was to create a single large wildlife area, especially for the re-establishment of endangered species and overexploited species, with cattle remaining the primary income generator. The Savé Valley Conservancy was constitutionally inaugurated in June 1991, and following the severe 1991/1992 drought, wildlife ranching became the primary land-use. At the time this was the largest private wildlife conservancy in the world (3,410 km^2).

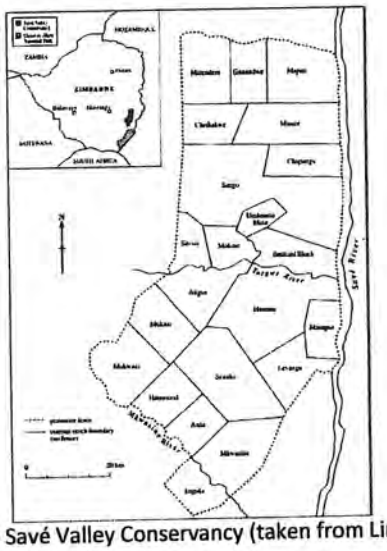

Figure 1 The Savé Valley Conservancy (taken from Lindsey et al 2008)

The conservancy members then restocked the wildlife population (4410 animals; Table 1), removed all internal fencing, erected a common perimeter fence and developed effective security systems. A double, electrified, veterinary-approved fence was completed in 1995, and the following decade saw a massive investment in wildlife re-stocking and security systems.

Table 1: Species and the number of animals per species re-introduced into the Savé Valley Conservancy, Zimbabwe

Animal Species	Number Of Animals Re-introduced				
	Prior to October 1993	November 1993 to December 1999	January 2000 to December 2002	January 2003 to present	**Total**

3 Trophy hunting versus Photo tourism in the Savé Valley Conservancy

Trophy hunting was essential for the successful transition of the conservancy from cattle to wildlife. During the early years, wildlife densities were low, resulting in poor potential for ecotourism, and hunting generated the income needed to erect the fence, re-stock game, and improve security, especially because of the significant numbers of black rhino now found there. Gradually, some of the ranchers shifted more into ecotourism. One property, Senuko Ranch, completed a 16 bed up-market lodge with a view of marketing non-consumptive safaris, doing game drives and bush walks and specializing in rhino walks and African wild dog den visits. Lodge occupancy rose from 0% in 1996 to 62% by the end of 1999.

However, the Zimbabwean land reform program, which was initiated in February 2000, soon made a strong negative impression in the international community, and resulted in travel bans and warning from most of Zimbabwe's source markets. This, together with the political instability meant that the wildlife industry and ecotourism industry collapsed over-night. Sport hunting and trophy hunting became the only economically viable land use options and have remained the only tangible source of income to the landowners of the SVC. In the case of the Senuko Lodge, for example, the land reform program resulted in a 98% cancelation of the confirmed bookings. After four years of

seeking alternative markets, the lodge could achieve no higher than 17% occupancy, and in 2005 moved into a hunting-based operation.

A more direct impact of the land reform program for the Savé Valley Conservancy was the loss of 33% of the area of the conservancy to invading subsistence farmers (Lindsey et al 2008). The loss of land was catastrophic and the related pressure from wire snare poaching was extreme. In the following eight years (2001 to 2009), 10,520 illegal hunting incidences were recorded, 84,396 wire snares were removed and at least 6,454 wild animals killed (Lindsey et al. 2011).

4 Lions in the Savé Valley Conservancy

After the conservancy was formed, and persecution stopped, lions, mainly males, recolonized the area and their numbers started to increase in the late 1990s / early 2000s. Few lionesses were observed until 2003, when small family groups and male-female pairs were seen, and by 2004-5 there were some reports of cubs. During this period 13 lions were also reintroduced into SVC. After an initial lag phase the lion population on SVC has increased dramatically and at present is growing exponentially (Figure 1, Groom 2012).

In 1993, three lions were brought into the conservancy by Humani Ranch; two adult females and one adult male. One of the females was pregnant and four cubs were reared successfully. A further ten lions (four lionesses and six small cubs) were brought in in 2005 and released on Sango Ranch. A few months later three were killed by wire snares, and the rest of the group split up. Tracks suggest that three adult females and one cub survived.

4.1 Lion monitoring

Monitoring of the lion population began in 1999 (Pole 1999) with track index or call-up surveys being conducted sporadically until 2006. From 2007 to present, annual conservancy-wide track index surveys have been conducted using a standardized methodology (Groom 2012). The resulting population estimates were verified in 2011 by a baited lion call-up survey and a collation of managers' estimates, all of which provided similar results.

Prey availability models (Hayward et al. 2007) suggest that the lion population is currently only at 60% of ecological carrying capacity, and thus we can expect to see the upward trend continue unless population control measures are implemented.

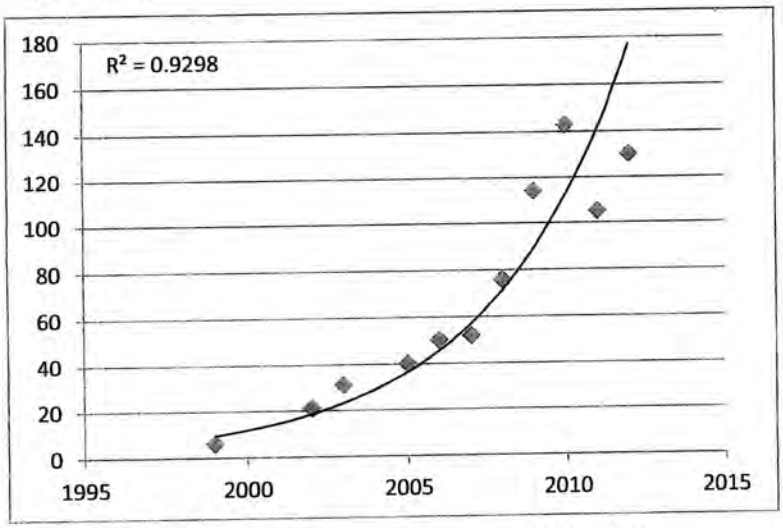

Figure 1 – Lion numbers in Savé Valley Conservancy (1999 – 2012).
Trendline is an exponential growth curve. (Adapted from Groom (2012))

4.2 Lion management plan

A professional lion management plan was commissioned by the conservancy in 2011 (Funston 2011), to provide the SVC members with a science-based plan to help them ethically and sustainably manage their lion population. This plan specifically advocates the use of hunting as a conservation management tool. It demonstrates willingness by the conservancy to guide their lion management based on science and advice from professionals.

4.3 Lion hunting in the Savé Valley Conservancy

Lions have been hunted in Savé Valley Conservancy since 2002, although that was largely for removal of problem animals. Hunting began properly in 2005 with quotas increasing annually to a maximum of seven per year from 2009 onwards (Table 2), but with offtake never exceeding six.

Table 2 Lion quotas and offtakes in Savé Valley Conservancy from 2001 to 2011

Approved quota and success (offtake)	2001	2002	2003	2004	2005	2006	2007	2008	2009	2010	2011
Approved quota	4	5	5	1	3	3	4	6	7	7	7
Quota taken (Success)	0	1	0	1	3	3	3	3	6	5	3
Percentage success	0%	20%	0%	100%	100%	100%	75%	50%	86%	71%	43%

Despite offtakes of lions through trophy hunting, the lion population has continued to increase in the conservancy. This is largely because the lion population is still building up after the initial persecution, and trophy hunting of select, older males does not impact this growth. The revenue generated from hunting lions has enabled landowners to invest in proper land management, anti-poaching and fence maintenance, all of which benefit the lion population (especially as lions seem to be vulnerable to being caught in wire snares; Becker et al 2013; pers. obs.).

Trophy hunting of lions brings considerable revenue to the conservancy, revenue that is vital for the continued functioning of the area for wildlife conservation. A 21 day lion hunt is sold for c. $2,500 per day (prices vary slightly depending on the operator), with an additional trophy fee of $10,000. Net income from lion hunting from 2005 to 2011 (N = 26 lions) would therefore have amounted to c. US $1,365,000 in bed nights and $260,000 in trophy fees.

5 The impact of listing lions as endangered on the US Endangered Species Act

In the current political climate, landowners in the Savé Valley Conservancy have no alternative way to generate sufficient income from wildlife, other than from hunting. Lions are one of the most valuable species to the conservancy. If lions are upgraded to endangered on the Endangered Species Act in the US, the resulting ban on lion trophy imports into the US will effectively result in a collapse of the lion hunting industry in the Savé Valley Conservancy, where on average 90% of hunting clients are American (up to 98% for some properties; SVC members, pers. comm.). The loss of the c. $375,000 annual revenue will be catastrophic for the conservancy, inevitably resulting in less investment in security and other conservation measures.

It should be noted that lions impose a significant cost on conservancy landowners through predation on valuable prey species that could otherwise be sold as trophies or meat. For the Savé Valley Conservancy, this was calculated as a loss of US$ 494,776 in 2009, an 8% loss relative to gross income from the species when hunted at current levels (Funston et al, unpublished data). Without these costs being offset by the income from lion hunting, landowners cannot reasonably be expected to tolerate such high lion numbers, and lion numbers would have to be reduced significantly.

In the Savé Valley Conservancy therefore – and it is by no means the only area in this situation – the listing of lions as endangered on the US Endangered Species Act, and the subsequent collapse of the US lion hunting market, would necessitate a culling or contraceptive program for lions, in order to decrease their numbers to economically and ecologically tolerable levels. The upgrade would therefore, instead of protecting lions in these areas, effectively sign their death warrant.

The Savé Valley Conservancy is extremely expensive to run due to pressure from the illegal bushmeat trade and from rhino poaching. In recent years, robust earnings from trophy hunting have allowed annual investments of US$ 150,000 – 240,000 per year in ranch-based anti-poaching, ensuring that wildlife populations remained stable in all but the areas that were settled (and the heavily impacted immediately adjacent sections). In addition, a central anti-poaching unit operates specifically to provide protection for the conservancy's black rhino, *Diceros bicornis,* population (one of only three remaining populations in Zimbabwe that is defined as having long-term viability in demographic and genetic terms). The operating costs of this unit amount to over $200,000 per year and are shared between the conservancy members and donors. As rhinos are not trophy hunted in Zimbabwe, members' share of these costs need to be generated some other way – and lion hunting is an important contributor. Thus a removal of lions from the hunting quota due to collapsed demand would reduce the ability of the Savé Valley Conservancy to protect the wildlife resource, including endangered species like its valuable populations of African wild dogs, *Lycaon pictus*, and especially black rhinos.

A knock-on impact of this listing will be felt in the communities which neighbour the Savé Valley Conservancy. In 2012, conservancy members provided over US$100,000 worth of support to adjacent villages or farmers in the resettled areas. Assistance included drilling boreholes, maintaining boreholes, dredging of dams, assisting with building projects in clinics and schools, assisting with repairs, maintenance and materials at schools, education initiatives, school field trips, provision of computer equipment in schools, craft programs and regular donations of meat.

Moreover, the conservancy recently entered into a mutually dependent agreement with the Chiefs representing the communities surrounding the Savé Valley Conservancy. The agreement links the communities to the Natural Resource Utilisation that occurs through the business operation of the conservancy and opens up opportunities for the local indigenous populations to share in any wealth creation. This agreement strengthens relations between the conservancy and the surrounding local communities and creates an environment that helps to protect, conserve and sustain the natural assets of the area. The hunting tourism of the conservancy is currently the only form of income by which the surrounding communities can benefit. Revenues from trophy lion hunting constitute a significant portion of inflow and thus an important part of the community benefits. Any reduction would seriously jeopardise the growth of this infant positive relationship and community empowerment initiative.

The Savé Valley Conservancy is thus pioneering private-community partnerships in Zimbabwe, and trade restrictions on lion trophies will indirectly adversely affect these already seriously impoverished communities through a reduction in available income to share with communities. This is very likely to have a knock on impact on the lions themselves with a significantly reduced tolerance and an increase in retaliatory poisoning of lions for livestock predation. Without a demonstration of income from lions, the political pressure from the surrounding communities to remove them from the conservancy altogether will be a challenge to resist.

6 Conclusion

The Savé Valley Conservancy is an excellent example of a focussed and determined effort to make a wildlife based land use viable in an otherwise cattle dominated landscape. From inception, conservancy members and international investors have invested huge amounts of finance and effort into re-stocking the area, building up the wildlife to the incredible numbers and diversity found in the conservancy today, and protecting it from poachers.

The revenue to do this has been almost exclusively generated through hunting, due to the collapse of the ecotourism industry after 2000.

In recent years, lion hunts have provided a significant financial contribution to the ever-more-expensive operation of the conservancy, enabling significant investment in security and community support and engagement. Should lions become listed as endangered on the US Endangered Species Act, the resulting collapse of the lion hunting industry will have serious negative implications. The cost of having lions, both ecologically and financially is high, and with no generation of revenue from the species, numbers will inevitably have to be curtailed.

1.0 INTRODUCTION

The African lion (*Panthera leo*) is an important species that plays a big role in the savannah ecosystem. It is a flagship species with huge social, economic and ecological values. It is a powerful symbol for Africa, and yet living with lions poses hardships for many communities. In some areas, the lion is a major predator on domestic livestock leading to profound conflicts with local communities.

The lion is not only a source of personal and economic damage and danger but is also of economic and personal benefits. The species contributes positively to the livelihoods of local communities through sport hunting. Trophy hunting also contributes to the conservation of lions through financial benefits that are ploughed back into its conservation and that local communities use for rural development programmes. Trophy hunting of the African lion is undertaken through a strict scientific based quota setting process with an objective of ensuring that utilization and any form of harvesting is sustainable.

Zimbabwe is one country that sustainably manages its lion population inside and outside protected areas. The African lion population is increasing in most areas. Research and monitoring of the species is being done collaboratively with external researchers and there is a lot of baseline information and publications. Zimbabwe has a lion management plan and strategy that is being implemented and reviewed on a regular basis. Rigorous monitoring of lion trophy hunting through adaptive management principles is carried out in Zimbabwe and non-detrimental findings are conducted for all exports. In conclusion, harvesting and any other forms of off take are not detrimental to the survival of the African lion in Zimbabwe.

2.0 SPECIES BIOLOGY AND LIFE HISTORY CHARACTERISTICS

2.1 Taxonomy

Class	Mammalia
Order	Carnivora
Family	Felidae
Species	*Panthera leo*
English	African lion
Shona	Shumba
Ndebele	Islwane

African lions are the only social fields, with each pride comprising an average of 4 to 6 adult lionesses, their dependent offspring, and a temporary coalition of pride males. In lion prides there is no dominance hierarchy amongst lionesses, and female lions are "free agents" who only contribute to communal care when they have cubs of their own. Although the pride is a stable social unit, it is a fission–fusion social group, in which individuals are typically found in a range of subgroup sizes and compositions. Although earlier studies suggested otherwise, grouping patterns within lion prides are not associated with foraging efficiency or any other aspect of hunting. However Packer *et al.*, (1990) concluded that group territoriality and group defence of cubs are the main reasons for sociality in lions. Mosser *et al.*, (2009) conclude that female sociality has largely to do with interactions between neighbouring prides supporting the group territorial hypothesis. Larger prides/subgroups usually win encounters with neighbouring prides (Packer *et al.*, 1990; Grinnell *et al.*, 1995). Larger prides are generally found in higher quality habitats, which typically have numerous buffalo herds and several river confluences (Mosser 2008). The threat posed by neighbours leads to larger group sizes than does the threat of infanticide (Mosser *et al.*, 2009). Cooperative defence against infanticide is another benefit of grouping for female lions (Pusey & Packer 1994). Playback experiments revealed that pride with dependent cubs typically retreat from foreign males, but that lionesses approach female intruders (Mc Comb et al., 1993, 1994).

Leaving cubs unprotected puts them at considerable risk, suggesting that the need to respond to territorial threat may often override the value of protecting cubs. Cooperative defence against infanticide is another benefit of grouping for female lions (Pusey & Packer 1994).

Although pride males are not always with the pride they fulfil a key function defending the pride and chasing off would be invading or "infanticidal males". In order to do so, males typically form coalitions of two or three males, with solitary males seldom being able to defend a territory. Territories are defended through roaring, patrolling, scent marking and direct aggressive encounters. Importantly male lions impact their reproductive success, mortality and wounding of females. Neighbouring resident males also influence the female grouping patterns within larger prides, and improve the quality of their own pride"s territory. Thus male lions are important in group-territorial competition and may use lethal aggression to tip the balance of power in favour of their prides (Mosser et al. 2009). Numerical advantage may additionally benefit large male coalitions by reducing levels of inter-pride competition for their females. The effects of intergroup competition between females are direct and immediate, so much so that male coalitions attempt to modify the dynamics of territorial competition. Group-territorial competition therefore provides strong selection for sociality in both male and females lions. Lions are matrilineal (females stay in their natal pride), with one-third of females dispersing to form new prides (Pusey and Packer 1987). Males leave their natal pride by the age of 4 years and remain solo or form a coalition with other males (Pusey and Packer 1987). Large coalitions of young males (4-5 years of age) are able to easily oust single pride males from their territories, and in areas with no males older than six years of age successfully maintaining reproduction in lion prides

Although there is *not yet any empirical evidence* on how the group territorial nature of lions is affected by excessive trophy hunting, the findings from Mosser *et al.*, (2009) suggest that these could be substantive. Without males to co-operate in group territorial defence lionesses might:

- Have to alter their groupings patterns (which may have as yet not described negative consequences)
- Lose more cubs to infanticide, both from foreign males and ***importantly to lionesses from neighbouring prides*** that will kill cubs if the opportunity exists
- Experience higher wounding and mortality rates

3.0 LION DISTRIBUTION AND RANGE

In Zimbabwe, lions are found in three broad land use types, namely gazetted protected areas (parks estate and indigenous forest areas), CAMPFIRE areas and on private land.

3.1 Parks and Wildlife Estate

Parks Estate is under the jurisdiction of the Zimbabwe Parks and Wildlife Management Authority and covers about 13% of the area of the country (390 580 km^2). The Parks Estate comprises six categories of protected areas that are gazetted under the Parks and Wildlife Act, Chapter 20:14. The six categories of protected areas are national parks, recreational parks, sanctuaries, safari areas, botanical reserves and botanic gardens. In these areas, wildlife is the primary and only land use permitted except in botanic gardens.

The African lions occur in most of Zimbabwe Parks and Wildlife Estates with the exception of a few areas located in the high and central parts of the country i.e. Matopos National Park, Sebakwe, Ngezi, Chivero, Kyle and Chegutu Safari Area. There are no free ranging lions found in the country's recreational parks, which are located in areas of high human densities where conventional agricultural practices in the surrounding areas preclude the establishment of viable population sizes.

Recreational Parks are not suitable for lions due to the small size of the areas, existing prey base and are therefore subject to high human-wildlife conflict. Most of the National Parks and Safari Areas located on the borders of the country support lion populations. Connectivity of lion range has been enhanced by the creation of Transfrontier

Conservation Areas such as Greater Limpopo Transfrontier Park (GLTP) and Greater Mapungubwe Transfrontier Conservation Area. Trophy hunting of wildlife is legally permitted in safari areas. There are sixteen safari areas found in the country and lions are found in Matetsi in the north-western area, Chete, Chirisa (in the Sebungwe region), Charara, Hurungwe, Sapi, Doma (in the Zambezi Region), Malipati (South-eastern part of the country) and Tuli safari areas (Figure 1).

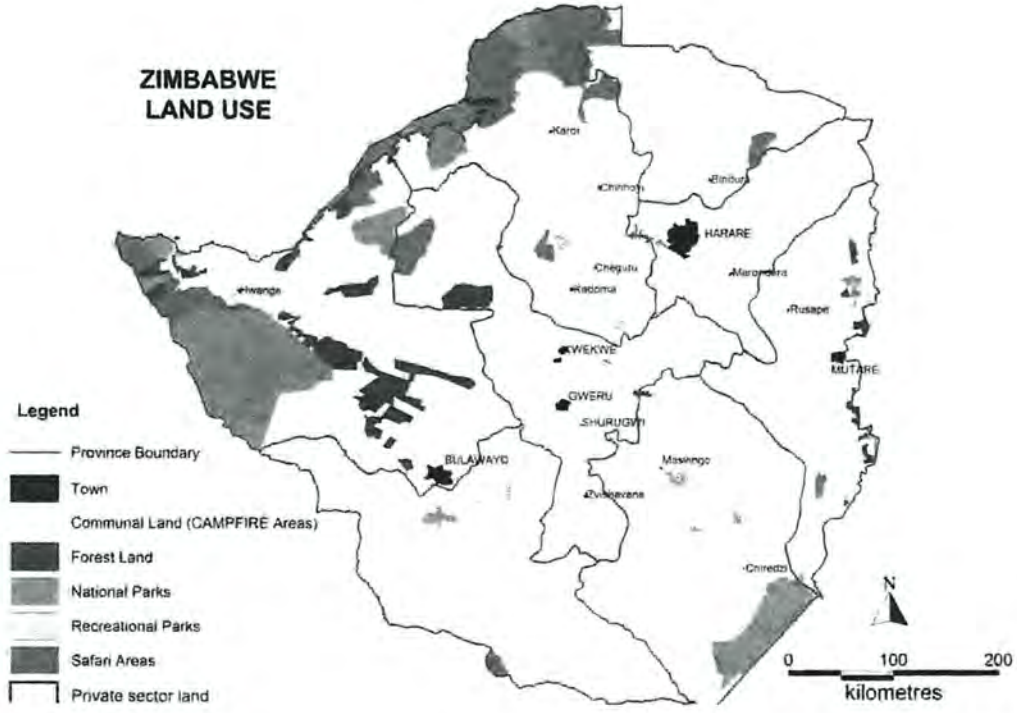

Figure 1: Map of Zimbabwe showing areas where trophy hunting is legally permitted.

3.2 Gazetted Indigenous Forest Areas

According to the Forest Act, Chapter 19:05, twenty-four gazetted indigenous forest areas

are under the jurisdiction of a State parastatal, Forestry Commission and cover about 880 000 ha (2%) of the area of the country. In gazetted indigenous forest areas, lions are found and hunted in Fuller, Kazuma, Pandamasuwe, Ngamo, Sikumi, Gwayi, Sijarira and Gwampa Forests. The above mentioned State gazetted areas are found on Kalahari sands in the north-western part of the country Zimbabwe.

3.3 Private Land

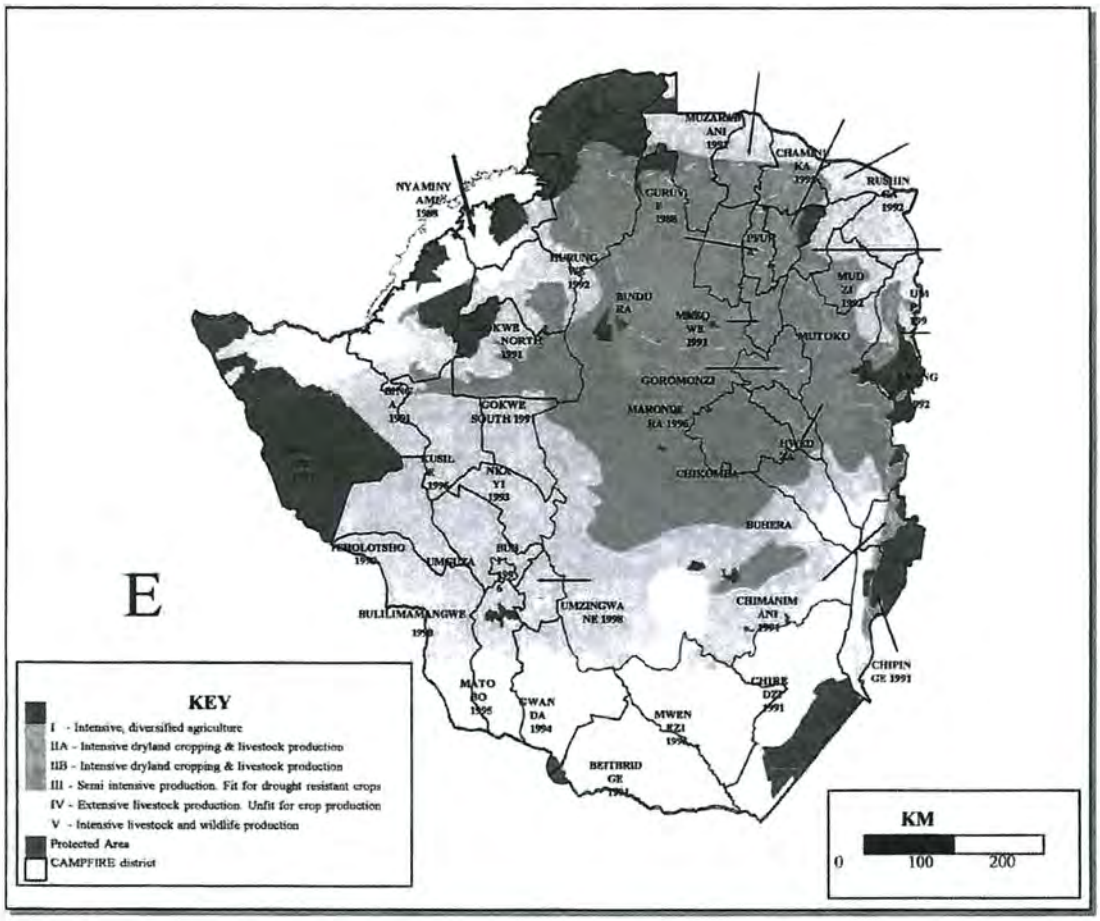
In 1960's there was a shift in wildlife policy from State control to individual proprietorship for white commercial farmers who could now benefit financially from the wildlife on their farms. In 1975, the Parks and Wildlife Act 14/1975 gave commercial farmers the right to exploit wildlife, including lions on their land. The Act legally formalized the policy shift towards sustainable utilization by aiming to confer privileges on owners or occupiers of alienated land as custodians of wildlife. The Act designated these owners or occupiers of alienated land as Appropriate Authorities over wildlife. On commercial private land, lions are found on single ranches and on conservancies. A conservancy is defined as a contractually legitimated entity which involves two or more recognized land and resource authorities. Most of the private farms that have lions are adjacent to major gazetted protected areas.

3.4 Communal Area Management Programme for Indigenous Resources

It was until 1982 that the right to exploit wildlife was extended to communal areas through granting the Appropriate Authority Status over their wildlife resources to Rural District Councils. Such Authority allows Rural District Councils to manage and benefit from wildlife resources occurring in them. The intention was to return rights of access to natural resources through legislative change, devolve responsibility and economic empowerment. The Communal Areas Management Programme for Indigenous Resources (CAMPFIRE) is the process through which Government is devolving the management of wildlife resource to communal farmers. Currently (January 2015), 58 Rural Districts have been granted the Appropriate Authority status to manage wildlife

resources in their areas. Lions are found in communal areas that are adjacent to major protected areas (Figure2). Lion hunting is allowed in CAMPFIRE districts. Outside of protected areas, lions largely exist on areas peripheral to National Parks.

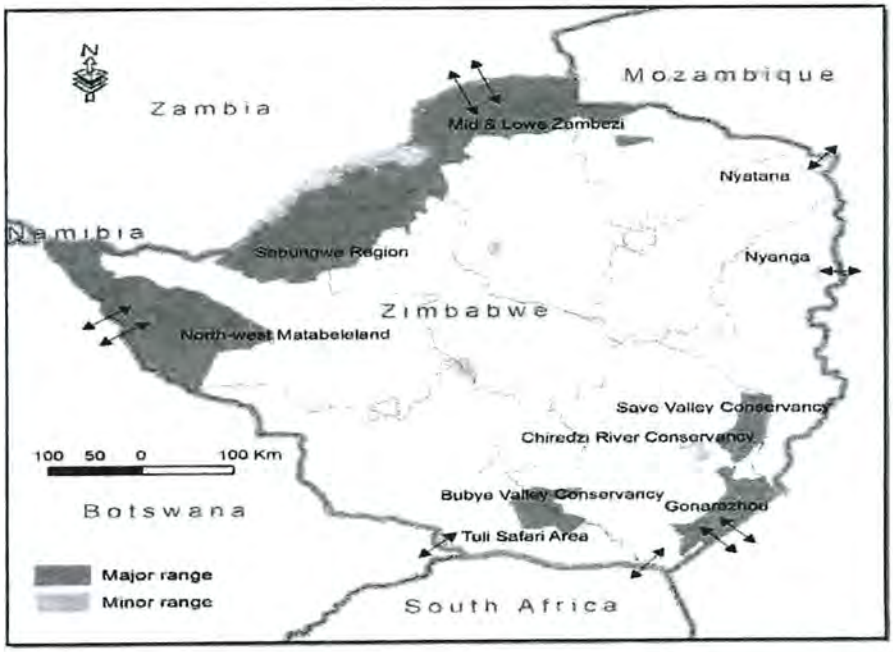
Figure 2: Map of Zimbabwe showing CAMPFIRE districts.



3.5 Summary Distribution of Lions

Figure 3 shows a summary of the distribution of lions in Zimbabwe. The distribution of the African lion in Zimbabwe coincides with the major wildlife areas in the country; which are as follows, the North West Matabeleland Region, Sebungwe Region, the Mid-Lower Zambezi valley and South-Eastern part of the country (Gonarezhou National Park, Save Valley Conservancy, Chiredzi River Conservancy, Malilangwe Conservancy, Beitbridge-Tuli complex). Zimbabwe's main lion range includes the Hwange-Matetsi Ecosystem which is about 25000 km^2, the Mid Zambezi Valley (17127 km^2), Sebungwe (15622 km^2) and the South East Lowveld (11000 km^2) (Table 3). In addition to the main geographic ranges listed above, lions are found on privately owned game farms, conservancies, and isolated state protected areas throughout the country. Occasional African lion sightings have been recorded in other areas from time to time such as Nyanga National Park in Zimbabwe's Eastern Highlands and Nyatana Wilderness in the North Eastern border with Mozambique.

Figure 3: African Lion (*Panthera leo*) Range in Zimbabwe (Zimbabwe Parks and Wildlife Management Authority, 2014)



3.6 Threats to Lion conservation in Zimbabwe

Human-Lion Conflicts

Butler in 2000 noted that countrywide in Zimbabwe's communal lands, 1 to 2% of cattle and 3.4% of goats were taken by predators. In the years 1999 to 2001, 32 reports were made in Nyaminyami District in Mashonaland West, with approximately 50 goats, 13 donkeys and one lion destroyed per year (Chardonnet at al, 2010). In traditional agro-pastoral regions, bordering National parks, livestock predation is a serious problem. In Gokwe communal lands 82 livestock, small and large were killed by lions (Butler 2000).

From 2002 to 2006, in all CAMPFIRE Rural District Councils, 58 Lions were reported as Problem Animals and of these, only 36 reports were attended to resulting in 9 lions being killed. In Mbire Rural District Council, 6 people were killed by lions and 12 lions were killed on Problem Animal Control in 2010 (CAMPFIRE Annual Report).

Human- lion conflict is a significant issue in areas around Hwange National Park where lions come into contact with local communities. Conflict is most intense in the wet season (November- April) when wild prey is sparsely distributed. Over 600 head of domestic stock have been lost directly adjacent to Hwange National Park between 2007 and 2011. Retaliatory killing accounts for close to 40% of recorded lion mortality, suggesting that this may be a significant threat to the population.

Depletion of prey base

Lion presence and abundance in an area is related to the abundance of its prey species which include zebra, buffalo, wildebeest, sable, impala and warthog. Depletion of this resource base in an area mostly through human activities such as poaching, settlement and livestock grazing leads to human-lion conflict as lions replace their natural prey base with livestock. For instance, an incursion by a lion pride in 2007 from Mozambique, into Nyanga National Park, which has a low prey density, resulted in the lions mauling and killing eight horses which

were used by the Parks Authority for conducting horse rides, in addition to killing livestock in settled areas, surrounding the park.

Habitat Loss

In Zimbabwe the threat to lions from habitat loss exists in the Sebungwe and the South East Low Veld where the fragmented nature of the protected areas is compounded by an increasing human and livestock populations surrounding these areas. In these areas, habitat loss, reduction in prey populations and killing of problem lions are the major threats to long term lion survival.

Due to the large size of the protected area system in the Zambezi Valley and North West Matabeleland, threats are limited to lion range which extends into adjacent settled areas. The huge natural prey base in these protected areas, reduced killing of problem animals associated with lions preying on livestock in adjacent settled areas.

Within their range areas, lions dominate the carnivore guild with site-specific competition affecting the distribution and abundance of other large carnivores (cheetahs, Africa wild dogs, hyenas and leopard).

Diseases

Diseases do not appear to be a major issue in Zimbabwe lion population. Recent disease screening reveals an absence of Tuberculosis (TB) and Feline Leukemia (FeLV) in the South Eastern Lowveld. Nine of the sixteen lions sampled for Feline Immunodeficiency Virus (FIV) showed a positive reaction to the test in Hwange National Park. However it is thought that FIV has little clinical effect on lions and this is therefore unlikely to be a threat. FIV is prevalent in many wild populations (Loveridge 2011 pers comm).

4.0 SURVEY METHODOLOGY

The population estimates of African lions in Zimbabwe are determined through carnivore spoor surveys, systematic lion collaring and call-up surveys. With the strategy to maintain the wilderness values of most protected areas, there is low road penetration in the parks estates, however all suitable roads are used as transects, and in areas of suitable substrate, spoor surveys have shown to be an effective and efficient means to assess wildlife

densities (Stander 1998: Fuston et al. 2001; Davidson and Romanach 2007). Patrol reports, field observations by Zimbabwe Parks and Wildlife Management Authority rangers and other sightings by tour operators and tourists also contribute to knowledge of the status of lions in Zimbabwe's protected areas. Between 2006 and 2012 leopard and lion spoor surveys were conducted in the major wildlife areas. The surveyed areas are shown in the map in Figure 4. A total of 28 sites were surveyed between 2006 and 2012. The survey covered the major areas within the lion range in the country. The survey sites covered 48123km^2 **(12% of the country)** and 14 400km of transects.

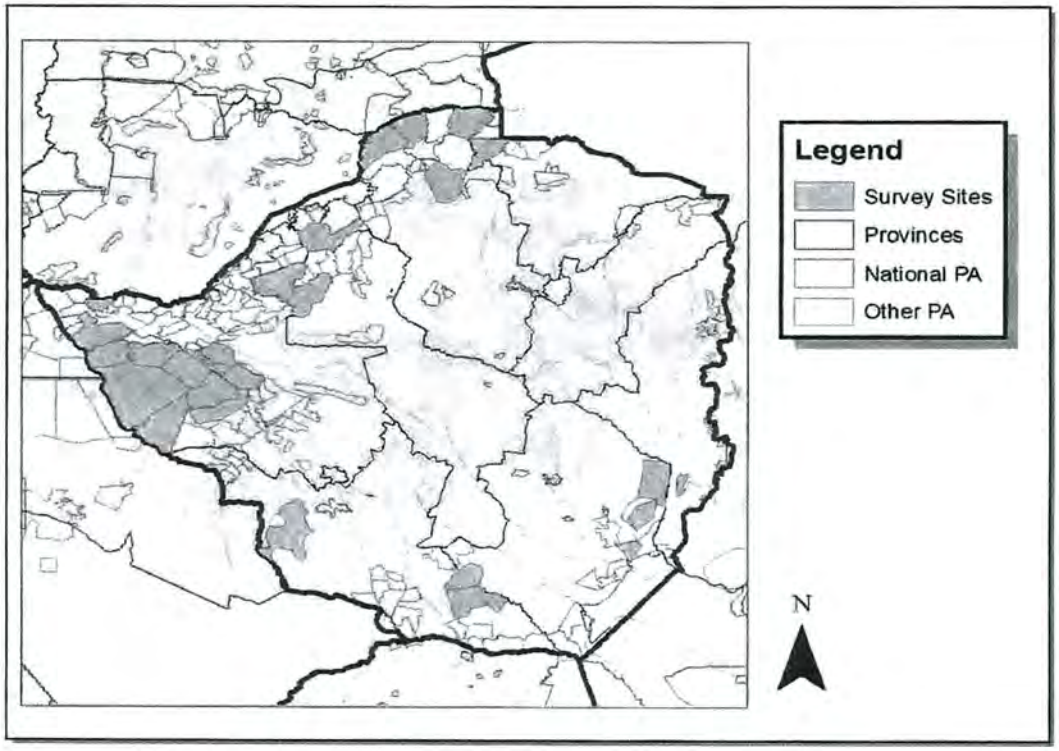


Figure 4: African Lion Survey Sites in Zimbabwe (2012)

Lion population surveys provide useful indices of abundance that can be used to determine spatial distribution, as well as temporal trends in population numbers. Different survey methods are conducted in most of the wildlife estates and areas of minor distribution for purposes of generating information for setting sustainable lion trophy hunting quotas and for population management. In most protected areas, lions compete

for food with other carnivores such as spotted hyenas, leopard and wild dog. Carnivore density information can offer early warnings about conservation needs, and provide information for successful future management as well as offer input for decisions regarding hunting quotas or any management requirement. Moreover, carnivore density trends are a reflection of prey densities and therefore save as useful indicator (Conservation Strategy and Action plan for the Lion (*Panthera leo*) In Zimbabwe, 2006).

5.0 POPULATION ESTIMATES

The lion population estimate at national level ranges from 1700 to 2043 animals (Chardonnet 2002, Bauer and Van Der Merwe 2004) (Table 1). The current lion population estimate for the Hwange Matetsi complex is 750, South Eastern Lowveld 350, between 150-175 in the Save Valley Conservancy, 59 in Gonarezhou National Park, 37 in Malilangwe and 400 animals in Bubye Valley Conservancy. The Mid Zambezi Valley comprising of Matusadonha and Mana Pools National Parks, Charara, Chewore and Sapi Safari Areas has a current population estimate of 600 lions (Zimbabwe Parks and Wildlife Management Authority Reports 2011). The current lion population estimates in the minor range areas are also significant.

Table 1: Lion Population Estimates (Bauer & Van Der Merwe, 2004, Chardonnet, 2002)

		Bauer & Van Der Merwe (2004)			Chardonnet (2002)		
Area	**Sq km's**	**Estimated population**	**Estimated minimum**	**Estimated maximum**	**Estimated population**	**Estimated minimum**	**Estimated maximum**

Totals	72 840	1057	678	1397	1686	1328	2043

6.0 POPULATION DENSITIES

Table 2 shows the current lion population estimates and densities in the Hwange-Matetsi ecosystem. The 12 year average density in the Hwange National Park is 2.8 lions per 100km^2 (2000-2011) with the population fluctuating over this time. This estimate is based on spoor transects and detailed population estimates and on individual recognition of animals in an intensively studied population.

Table 2: Results of lion population surveys of lions in the North West Matabeleland (Hwange Lion Research, 2014)

	Density	Area (km2)	Estimated number of lions	Year of survey
Hwange NP	3.75	14900	559	2013
Matetsi Units 1-5	3.04	1934	59	2008

Matetsi Units 6-7 and Zambezi NP	2.98	1585	47	2013
Ngamo & Sikumi Forest	0.45	1386	6	2008

Chirisa SA	0.00	1713	0	2012
Matusadonha NP	2.17	1427	31	2013
TOTAL Lion Estimate			**750**	

The South Eastern Lowveld has a lion population density of about 6 lions per 100km^2 in the Save Valley Conservancy, 9 lions per 100 km^2 in Malilangwe and 0.8 lions per 100 km^2 in the Gonarezhou National Park (Zimbabwe Parks and Wildlife Management Authority Annual Report, 2013) (Figure 5).

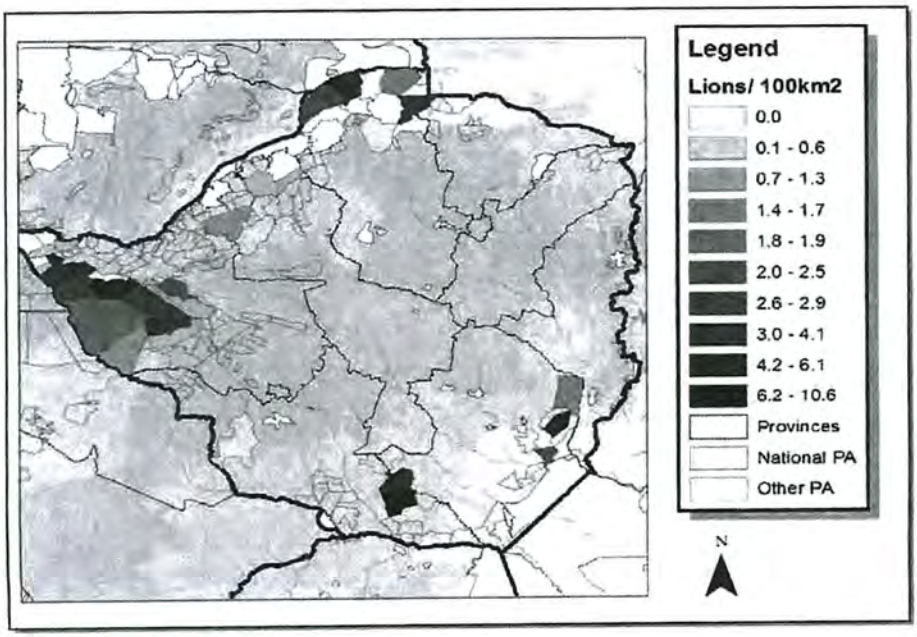

Figure 5: Lion densities in Zimbabwe (Leopard and Lion Spoor Survey Report, 2012).

The Matetsi-Kazuma-Zambezi complex to the North West of Hwange (4935km^2; composed of Deka and Matetsi Safari Areas, Kazuma and Zambezi National Parks and Kazuma and Pandamasuie Forests) is estimated to have a population of 222 lions based on a density of 4.5 lions per 100km^2. This estimate is extrapolated from a spoor survey of 1600km^2 area of the Matetsi-Kazuma-Zambezi complex in 2007. Table 3 shows lion population estimates and densities in selected survey sites in the Zambezi Valley and surrounding areas from the spoor survey done between 2011 and 2012. Table 4 shows the population estimates for Gonarezhou National Park in 2013.

Table 3: Population estimates and lion densities in selected survey sites in the Zambezi Valley (Hwange Lion Research, 2014)

Survey Site	Density/ 100km^2	Area (km^2)	Estimated number	Year of Survey
Omay	0.28	1865	5	2012
Chewore North	1.92	1648	32	2012
Dande	1.83	1155	21	2012
Hurungwe (Nyakasanga & Rifa)	1.89	1709	32	2011
Mana Pools	4.52	1287	58	2011
Hurungwe Mukwichi CAMPFIRE Area	0	1853	0	2011

Table 4: Population estimates from call up survey for Gonarezhou National Park (Lion Call Up Survey, 2013)

Parameter	Northern GNP	Southern GNP	Total
Area (km^2)	1665	2121	3786
Combined transect length (km)	229.8	301.8	531.6

Density of lions per $100km^2$ (Y=0.3049X)	2.9	0.5	1.5
Estimated number of lions	48	11	59

7.0 POPULATION TRENDS

In Zimbabwe, trends in the population estimates of African lions show a growing

population trend. The average lion densities in most protected areas are also showing an increasing trend. For example in Gonarezhou National Park as shown in Table 5, an estimate of 24 lions was established in 2009 and by 2013 the population had grown by 150% to an estimated 60 individuals within a period of 4 years. Other areas within other protected areas with similar management regimes are also reflecting similar trends in population estimates.

Table 5: African Lion population estimates for Gonarezhou National Park (2009 to 2013) (Annual Report, 2013)

Species	2009	2010	2011	2012	2013
Lion	24	34	55	49	59

Bubye Valley Conservancy is a closed protected are system with a large resident lion population. Figure 6 shows the trend in lion population growth for the Conservancy from the time of introduction of lions into the property in 1999 to present. Bubye valley conservancy has the highest lion density of 14 lions per 100km^2.

Population trends of lions in Bubye Valley Conservancy

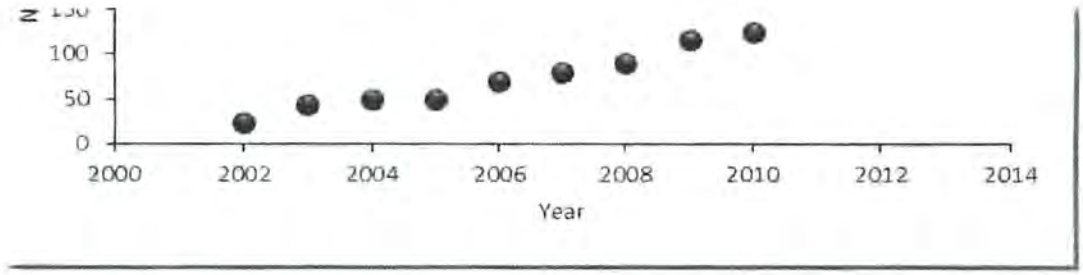

Figure 6: Trends in lion population for Bubye Valley Conservancy (Lion Report, 2014)

8.0 LEGAL UTILIZATION OF LIONS

8.1 Annual Trophy Quotas

Lions are used for consumptive and non-consumptive purposes. The main uses are trophy sport hunting, photographic safaris and educational purposes in captive breeding operations. Table 8 shows national annual lion trophy quotas for different broad land use types. The quotas set for trophy hunting are declining from 114 in 2004 to 89 in 2014 as part of adaptive management of the lions.

Table 8: National Annual Lion Trophy Quotas (ZPWMA Utilisation Unit, 2014)

	2004	2005	2006	2007	2008	2009	2010	2011	2012	2013	2014
Parks	36	30	34	30	29	25	26	29	31	36	38
Communal	58	45	43	34	35	38	34	33	31	24	26
Forestry	9	8	3	3	3	3	3	4	4	4	4

Totals	**114**	**98**	**102**	**93**	**92**	**90**	**82**	**86**	**83**	**85**	**89**

8.2 Quota Setting

African lions are one of the most sought after species by international hunting clients and are key for the viability of the trophy hunting industry. However, during recent years there has been increasing awareness of the negative impacts associated with lion hunting on lion populations in some areas, including in Zimbabwe. However, research has also demonstrated that lion hunting can be sustainable if quotas are established in a

scientific manner, and that lion populations are able to recover quickly from over-harvest if the pressure on them is removed.

8.2.1 The Quota Setting Process

For the African lion, a specific Hunt Return Form was introduced in 2013 hunting season. On this Hunt Return Form, key variables are recorded such as trophy quality, hunting success and hunting effort. Photos of all lion trophies are also included on the Hunt Return Form and are used to determine the age of the lion trophy. A Points System is being used to determine the 2015 Sport Hunting Quotas for African lions in Zimbabwe (Table 9)

Table 9: Proposed points system for lion age restrictions and quota setting in Zimbabwe

	≥6 years	No trophy	5 years	4-4.9 Years	<4 years	Failure to submit hunt return/incomplete hunt returns
For quotas of 3 or more	4	3	3	2	-3	0
For quotas of 2	4	3	3	2	0	0
For quotas of 1	6	3	3	2	0	0
Quota setting process	These points are added up and divided by 3 to yield the quota for next year					

The new Points System will restrict hunting to old males. Hunters are recommended to hunt mature males that are older than 5 years old. Latest scientific evidence suggests that if harvesting of lions is restricted to animals of 5-6 years or older, the impact of trophy hunting on the species population is likely to be minimal (Whitman et al. 2007).. By age 5 or 6, the lion has a chance to sire at least one litter. Restricting offtakes to older lions also increases the net number of lions that can be harvested over time.

In the Points System, operators would be penalized if they hunted animals less than 5 years old by not getting an approval for a lion quota on the same property for the

subsequent hunting season. If however, the operator hunts a lion older than 6 years, they would be rewarded through an increased quota of the same species in the subsequent hunting season.

Lion aging will be conducted through different aging characteristics including: the degree of facial scarring; teeth colour and degree of wear; mane development (particularly regarding the shape around the ear and the mohawk); and through post mortem analysis of the width of the pulp cavity of the second premolar (which becomes narrower with age).

Field-based training on aging techniques has already been conducted for the Zimbabwe Parks and Wildlife Management Authority and Safari Operators. Specialized training manuals including Field Guides have also been developed.

8.2.2 Monitoring of quota utilization and trade data

- Approved quota are issued to local authority/landowner
- Quotas are utilized by contracted Safari Operators
- Monitoring at the local level is carried out by community game guards and wildlife monitors
- The Zimbabwe Parks and Wildlife Authority undertakes monitoring programmes at the national level including monitoring of biological and trade information on the species, environmental and other data. The Authority also ensures compliance with wildlife laws and regulations.
- A Hunt Return Form is completed for each hunt by the safari operator and local authority and is submitted to the Zimbabwe Parks and Wildlife Management Authority,
- The Hunt Return Form allows key variables to be captured for input into national database and provides further datasets for subsequent quota setting exercises

9.0 ILLEGAL TRADE IN LIONS AND THEIR PRODUCTS

Illegal trade in lions and their products is very insignificant. There are no records of people found in possession of illegally acquired lion specimens in Zimbabwe. Anyone found in possession of illegally acquired lion specimens pays a fine of USD5000 or faces a mandatory jail sentence. In On conviction for lion poaching, courts may ask the convict to pay compensation fee of US**$20 000.** Some illegal off takes occur when lions are accidentally killed through snares or chemical poisoning meant for herbivores. Other cases involve retaliatory killing of lions as a result of livestock predation outside protected areas.

10.0 HUMAN AND LION CONFLICT MANAGEMENT

The lion is a flagship species and powerful symbol of Africa, and yet living with lions poses hardships for many communities. In some areas, the lion is a major predator on domestic livestock, leading to profound conflicts with local herders.

Table 10 Human and Lion Conflict (2009 to 2011) (CAMPFIRE Association, 2012)

District	Total incidents	People Injured	People Killed	Livestock killed
Hurungwe	5	2	2	1
Chiredzi	25	0	0	136
Mbire	5	0	5	7
Binga	9	0	0	39
Total	**44**	**2**	7	**183**

11.0 MANAGEMENT INITIATIVES AND CONTROL MEASURES WITH REGARD TO LION CONSERVATION

11.1 Conservation strategy and action plan for the lion (*Panthera leo*) in Zimbabwe

Zimbabwe is one of the few lion range states in Africa, where large areas of land which have been set aside as protected areas, still have viable lion populations. In some parts of Africa, lions have been completely wiped out through uncontrolled hunting, revenge killings, habitat loss and other factors with the only record to indicate their existence in the past now left as anecdotal evidence. The conflict with local communities and the threat to livestock and human lives in many parts of the world including Zimbabwe is well documented. While its attraction in ecotourism as one of the most beautiful and graceful cats, and as a trophy animal in sport hunting, its economic benefits are huge. Its social and cultural values are an integral part of the Zimbabwean lifestyle, therefore efforts to ensure lion conservation need to be strengthened.

The Zimbabwe Conservation Strategy and Action Plan for the Lion will guide the conservation and management of this important top predator. The strategy and action plan is the outcome of a workshop in which stakeholders representing the wildlife industry, technocrats, inter and non-governmental organizations, wildlife producers etc, actively participated.

11. 2 Law enforcement efforts being implemented in Zimbabwe with regard to lion conservation

- Intensive anti-poaching efforts by Parks rangers throughout the country.
- Joint investigative operations based on intelligence between the Zimbabwe Parks and Wildlife Management Authority other law-enforcement agencies like the police and the army.
- Joint Field Anti-poaching by the Zimbabwe Republic Police and Parks Rangers on Private game farms and Conservancies and on Stateland.

- Border Control – Trade compliance officers at ports of exit and entry who monitor and enforce compliance together with Customs Officials, Immigration and the Zimbabwe Republic Police.
- Information led deployment
- Problem animal control by Zimbabwe Parks and Wildlife Management Authority- Management Division (Anti poaching Rangers) in the communal areas and Natural Resource Monitors in Rural District Councils
- Harvesting controls: sustainable quotas, hunting permits and hunt monitoring and Tourism Return Forms (TR2).
- Trade controls: Issuing of CITES Export and Import Permits following recommendations based on non-detriment findings by the Scientific Authority.

12.0 LEGAL FRAMEWORK GOVERNING LION CONSERVATION

Zimbabwe's National Legislation is very comprehensive to ensure long term survival of the African Lion. Zimbabwe has a full range of national legislative and administrative measures needed to effectively implement all aspects of the Convention on Trade In Endangered Species of wild flora and fauna (CITES) and related Resolutions and Decisions of the Conference of Parties. Zimbabwe's legislation is in Category 1 of CITES and therefore meets all the requirements of CITES implementation.

The African Lion is a specially protected species whose conservation is regulated through a policy and legal framework and regulations which include:

- Parks and Wildlife Act; Chapter 20:14 (1996) as amended in 2001
- Environmental Management Act; Chapter 20:27
- Forest Act; Chapter 19:05
- Statutory Instrument 362 of 1990 : Parks and Wildlife (General) Regulations, 1990

- Statutory Instrument 76 of 1998 :Import and Export of Wildlife Products
- Statutory Instrument 40 of 1994 : Parks and Wildlife Act (General) Amendments
- Statutory Instrument 26 of 1998: Parks & Wildlife Act (General) Amendment
- Statutory Instrument 92 of 2009; Compensation Values for Wildlife
- Statutory Instrument 93 of 2009; Compensation Values for Trapping of Animals
- Trapping of Animals Control Act 20.16
- Licensing and Protection of wildlife properties
- Conservation Strategy and Action Plan for Lion (*Panthera leo*) in Zimbabwe (2006). Prepared following a Workshop. 30-31 October 2006. Harare.
- Tourism Hunt Return Forms (TR2)
- Code of Ethics for Hunting in Zimbabwe

Parks and Wild Life Act Chapter 20:14 of 1996 as amended in 2001

It is the Principal legislation which governs and regulates the purchasing, selling and exporting of parts and derivates including live animals. It also protects the gazetted protected areas which form the major range and habitat for the African lion.

The Act prohibits the hunting of any animal and removal of parts of animals from any land without authority. The Act provides for the protection of animals in the following designated areas, National Parks, Parks and Wild life Estates, Parks and Wild life land, Sanctuaries and Safari Areas.

The Act further provides for categorization of animals into protected and specially protected animals. Of particular interest to lion conservation is Part XII of the Act which prohibits the hunting, removal and sale of live animals and animal products from designated national parks.

The Act has the following provisions which address issues related to Control of live animals, trophies and trade;

- Section 59 provides for the general protection of all wildlife which is not covered by the above categories.

This Act empowers the Minister responsible for the Parks and Wild Life to issue regulations governing certain activities such as-:

- Section 60 where the Minister may prohibit or restrict hunting and removal of animals in defined areas.
- Section 66 provides for the licensing of professional hunters who undertake legalized hunting safaris.
- Section 72 provides for the sale of animals born or hatched and held in captivity.
- Section 73 provides for the sale and manufacture of articles from trophies.

Environmental Management Act Chapter 20:27 Of 2006
This Act provides for the sustainable management of natural resources and protection of the environment. The Act also provides for the preparation of National Environmental Plans for the management and protection of the environment in Zimbabwe.

Forest Act Chapter 19:05
This Act provides for the establishment of a commission, to control, manage and protect of State forests as well as private forests thus providing a secure habitat for lions and other wildlife species.

Statutory Instrument 362 Of 1990
This legislation provides in sections 66-75 for the Regulation of Manufacture, Processing and Dealing in trophies.

Statutory Instrument 76 Of 1998
Statutory Instrument number 76 of 1998, Parks and Wild Life (Import and Export) (Wild Life) Regulations specifically deals with Import and Export of wildlife products. This legislation was enacted to ensure compliance with CITES requirements for export and import of wild flora and fauna. These provide for the following-:

- Section 3 deals with the Control of Import and Export of wild life and trophies.

The above section lays down a general prohibition on the import into or export from Zimbabwe of any "wild life" or trophy of "wild life" except in accordance with either a certificate issued in terms of section 5 by the Director or Director of Customs, or an open general permit:

- Section 5 deals with Permits and Certificates and is consistent with CITES legislation.

- Section 15 deals with Offences and Penalties.

Any person who contravenes any of the provisions of subsection 1 shall be guilty of an offence, and liable to a fine or imprisonment. To effectively ensure compliance, the Zimbabwe Parks and Wildlife Management Authority deployed a permanent team of officers based at all ports of exit and entry to assist border control officials in monitoring and inspection of all wildlife exports.

Statutory Instrument 26 Of 1998
The regulations provides for the monitoring of all hunting activities in the country to ensure compliance by all Safari Operators and international clients and to ensure that the TR2 Form. (Tourism Hunting Return Form) is duly completed.

Trapping Of Animals (Control) Act Chapter 20:21
The Act provides for the control, restriction and regulation of the construction, possession and use of certain traps for the purpose of trapping animals; to control the sale and disposal of certain animals, to include lions and to provide for matters incidental to or connected with the foregoing.

Statutory Instrument 92 Of 1992
Parks and Wild Life (Payment for Hunting of Animals and Fish) Notice, 2009
This instrument provides for compensation values of various wildlife forms to include animals and fish. It acts as an additional deterrent measure in matters where poaching cases are being dealt with in accordance with the law. The compensation value for illegal hunting of lion is USD 5 000, 00.

Statutory Instrument 93 Of 2009
Parks and Wild Life (Payment for Trapping of Wild Animals) Notice, 2009
This instrument provides for the payment of compensation to the state or game owners in the event that one is convicted for illegally trapping wild animals on various land categories. The compensation value for illegal hunting of lion is USD 5 000, 00.

Statutory Instrument 40 Of 1994
Parks and Wildlife (Appropriate Authorities for Communal Land) Notice, 1994, resulted in the according of Appropriate Authority status to various Rural District Councils. This legislation devolved authority to Rural District Councils and gave rights to local communities to sustainable utilize wildlife and other natural resources in their areas of jurisdiction.

New Draft Statutory Instrument
A draft Statutory Instrument, Parks and Wildlife (Inspection, Registration and Licensing of Wildlife Properties) Regulations is currently under consideration in the Office of The Attorney General. This legislation will assist the Zimbabwe Parks Management Authority to adequately monitor the activities of private property owners whose premises have wildlife.

Code of Hunting Ethics for Zimbabwe

A Code of Ethics for Hunting in Zimbabwe is in place which regulates all forms of hunting including all lion hunts.

RE: PRT No. MA74840C/ Lion Trophy/ Zimbabwe/ Justin Ragazzine

Dear Chief Cogliano:

This document and the attached materials are supplement to our existing lion trophy import application for Justin Ragazzine, PRT No. 74840C. We have the following information to add.

The lion in question was harvested on November 27, 2017 . The lion was taken from the Savé Valley Conservancy. The GPS Coordinates are 022 696.

The current location of the Trophy: Trophy Consultants International, 4 Josiah Chinamano Road, Belmont, Bulawayo, Zimbabwe

Attached is a copy of the Zimbabwe Hunting permit. Please note the original dates on the hunting permit were: 11/28/2017 – 12/7/2017 and were changed to: 11/26/2017 to 12/7/2017.

Please do not hesitate to contact us if you have questions about this permit application.

Sincerely,

John J. Jackson III

ZIMBABWE PARKS AND WILDLIFE MANAGEMENT AUTHORITY

MEMORANDUM

To: Director General

From: Area Manager HQ

Date: 21 November 2017

RE: AUTHORITY TO PROCESS SPECIAL PERMIT FOR HUNTING OUTSIDE PARKS ESTATE

Your authority is kindly sought to process the permit for Passing Cloud Safaris who have applied for permit to hunt 1 x lion with client Justin Micheal Ragazzine the following property:

- Chishakwe in Save Valley Conservancy Masvingo Province. **Note that the client wants to change the dates from 28 November 2017 - 7 December 2017. The new dates are 26 November 2017 – 7 December 2017.**

The hunt will be under the guidance of professional hunter Johan Bezuidenhout PH license #27.

Kindly find attached application from the operator and copies of 2017 hunting permit and quota.

Recommended/ Not Recommended..... 24/11/17

VALID AS AUTHORITY TO HUNT

ZIMBABWE PARKS AND WILDLIFE MANAGEMENT AUTHORITY
HUNTING PERMIT
PARKS AND WILDLIFE ACT [CHAPTER 20:14]

Permission is hereby granted on the authority of the Minister of Environment and Natural Resources Management in terms of the Parks and Wildlife Act [Chapter 20:14],

to Chishakwe

of Save Valley Conservancey

and co-hunter .....

of .....

Firstly to hunt in Hunt Number or Section Chishakwe-Save Valley Conservancy of the Masvingo Area, such number of animals as is indicated in column "A" below against the name of the animals specified. Such hunting shall be conducted during the period extending between 01/01/2017 and 31-12-17 (inclusive dates)

Animal	A	B	Animal	A	B	Animal	A	B
Baboon	30		Geese	15		Jackal B/B	4	
Buffalo (m)	9		Genet	3		Klipspringer (m)	4	
Bushbuck (m)	3		Giraffe (m)	3		Kudu (m)	8	
Bushpig	8		Grysbok (m)	2		Leopard (m)	2	
Civet	2		Guinea Fowl	20		Lion (m)	1	
Crocodile	2		Hare	4		Mongoose	2	
Duiker (m)	5		Honey Badger	3		Monkey (m)	4	
Eland (m	6		Hyaena (Spotted)	2		Nyala (m)	1	
Elephant (m)	1		Hyrax	30		Pegions/ Doves	100	
Francolin	30		Impala (m)	30		Porcupine	5	

Secondly to remove from the Hunting Area such number of animals as indicated in column "B" above against the name of the animal specified. An animal specified may be removed in whole or in part unless there is a condition on this permit prohibiting such removal.

Thirdly to sell within a period of six months from the second date which appears above, the trophies of such number of animals as may be indicated in column "B" above against the name of the animal and subject to any other regulations which may be in force governing movement, sale or export of wildlife trophies.

The holder of this permit shall not permit any other person to hunt the animals specified in addition to such holder and his co-hunter appointed at the time of issue of this permit.

This permit is issued strictly subject to the terms and conditions which appear on the list.

Enhancement Finding

Applicant: Justin Michael Ragazzine (PRT–74840C)

Introduction

Justin Michael Ragazzine submitted an application on January 30, 2018, for the importation of one male lion *(Panthera leo melanochaita)* taken on November 27, 2017, from the Savé Valley Conservancy (SVC), Chishakwe Ranch, Masvingo Province, Zimbabwe, for the purpose of enhancing the propagation or survival of the species in the wild. After evaluating the available information submitted with the application, information provided by the Government of Zimbabwe, other information available to the U.S. Fish & Wildlife Service (Service), and comments received from interested parties, the Service has determined that the importation of the sport-hunted trophy meets the requirements for making a positive enhancement finding pursuant to 50 CFR 17.40(r) and 50 CFR 17.32(a). The rationale for our finding follows.

U.S. Permit Requirements for Import of Lions (*Panthera leo melanochaita*)

ESA

The African lion, subspecies *Panthera leo melanochaita* (southern and eastern Africa), is a threatened species under the U.S. Endangered Species Act (ESA or Act) and is regulated under a species-specific 4(d) rule, 50 C.F.R. § 17.40(r) that provides specific conservation measures for this subspecies. Under the 4(d) rule for *P. l. melanochaita*, all of the prohibitions at 50 C.F.R. § 17.21 and 50 C.F.R. § 17.31 apply to *P. l. melanochaita* specimens. These prohibitions, in part, make it illegal for any person subject to the jurisdiction of the United States to import or export any lion specimens.

Although import of the lion subspecies *P. l. melanochaita* is a prohibited activity under the Act, exceptions may be made in accordance with the 4(d) rule at 50 C.F.R. § 17.40(r) when

the import activity qualifies for and the Service issues an ESA threatened-species enhancement permit under 50 C.F.R. § 17.32(a). The preamble to the 4(d) rulemaking, 80 Fed. Reg. 79999, 80043-46 (Dec. 23, 2015), explains the factors the Service considers when making an enhancement finding for importation of sport-hunted trophies of *P. l. melanochaita*, as described below.

Our threatened species permitting regulations at 50 CFR 17.32 provide issuance criteria for threatened species permits (50 CFR 17.32(a)(2)), but do not specify what would constitute the enhancement of propagation or survival with regard to authorizing the import of parts or products of *P. l. melanochaita,* including sport-hunted trophies. Therefore, when making a determination of whether an otherwise prohibited activity enhances the propagation or survival of *P. l. melanochaita,* the Service will examine the overall conservation and management of the subspecies in the country where the specimen originated and whether that management of the subspecies addresses the threats to the subspecies (*i.e.,* that it is based on sound scientific principles and that the management program is actively addressing the current and longer term threats to the subspecies). In that review, we will evaluate whether the import contributes to the overall conservation of the species by considering whether the biological, social, and economic aspects of a program from which the specimen was obtained provide a net benefit to the subspecies and its ecosystem.

The Service will evaluate any application received that involves *P. l. melanochaita* in the context of enhancement of propagation or survival permitting in accordance with our threatened species permitting regulations at 50 CFR 17.32 and issuance criteria for threatened species permits (50 CFR 17.32(a)(2)). These include, in addition to the general permitting criteria in 50 CFR 13.21(b):

(i) Whether the purpose for which the permit is required is adequate to justify removing from the wild or otherwise changing the status of the wildlife sought to be covered by the permit;
(ii) The probable direct and indirect effect that issuing the permit would have on the wild populations of the wildlife sought to be covered by the permit;
(iii) Whether the permit, if issued, would in any way, directly or indirectly, conflict with any known program intended to enhance the survival probabilities of the population from which the wildlife sought to be covered by the permit was or would be removed;
(iv) Whether the purpose for which the permit is required would be likely to reduce the threat of extinction facing the species of wildlife sought to be covered by the permit;
(v) The opinions or views of scientists or other persons or organizations having expertise concerning the wildlife or other matters germane to the application; and
(vi) Whether the expertise, facilities, or other resources available to the applicant appear adequate to successfully accomplish the objectives stated in the application.

In addition to these factors, particularly in relation to sport hunting, we find the *IUCN Species Survival Commission (SSC) Guiding Principles on Trophy Hunting as a Tool for Creating Conservation Incentives, Ver. 1.0* (IUCN SSC 2012), to provide useful principles, which, considered in conjunction with our threatened species issuance criteria, will aid the Service when making an enhancement finding for importation of sport-hunted trophies of *P. l. melanochaita.* This document sets out guidance from experts in the field on the use of trophy hunting as a tool for "creating incentives for the conservation of species and their habitats and for the equitable sharing of the benefits of use of natural resources" (IUCN SSC

2012, p. 2) and recognizes that recreational hunting, particularly trophy hunting, can contribute to biodiversity conservation and more specifically, the conservation of the hunted species.

The SSC document lays out five guiding principles that, considered in conjunction with our threatened species issuance criteria, will aid the Service when making an enhancement finding for importation of sport-hunted trophies of *P. l. melanochaita:*

(a) *Biological sustainability:* The hunting program cannot contribute to the long-term decline of the hunted species. It should not alter natural selection and ecological function of the hunted species or any other species that share the habitat. The program should not inadvertently facilitate poaching or illegal trade in wildlife by acting as a cover for such illegal activities. The hunting program should also not manipulate the ecosystem or its component elements in a way that alters the native biodiversity.
(b) *Net Conservation Benefit:* The biologically sustainable hunting program should be based on laws, regulations, and scientifically based quotas, established with local input, that are transparent and periodically reviewed. The program should produce income, employment, and other benefits to create incentives for reducing the pressure on the target species. The program should create benefits for local residents to co-exist with the target species and other species. It is also imperative that the program is part of a legally recognized governance system that supports conservation.
(c) *Socio-Economic-Cultural Benefit:* A well-managed hunting program can serve as a conservation tool when it respects the local cultural values and practices. It should be accepted by most members of the community, involving and benefiting local residents in an equitable manner. The program should also adopt business practices that promote long-term economic sustainability.
(d) *Adaptive Management: Planning, Monitoring, and Reporting:* Hunting can enhance the species when it is based on appropriate resource assessments and monitoring (*e.g.,* population counts, trend data), upon which specific science-based quotas and hunting programs can be established. Resource assessments should be objective, well documented, and use the best science available. Adaptive management of quotas and programs based on the results of resource assessments and monitoring is essential. The program should monitor hunting activities to ensure that quotas and sex/age restrictions of harvested animals are met. The program should also generate reliable documentation of its biological sustainability and conservation benefits.
(e) *Accountable and Effective Governance:* A biologically sustainable trophy-hunting program should be subject to a governance structure that clearly allocates management responsibilities. The program should account for revenues in a transparent manner and distribute net revenues to conservation and community beneficiaries according to properly agreed decisions. All necessary steps to eliminate corruption should be taken and to ensure compliance with all relevant national and international requirements and regulations by relevant bodies such as administrators, regulators and hunters.

The Service's approach to enhancement findings for the importation of sport-hunted trophies of *P. l. melanochaita* is consistent with the purpose and intent of the Endangered Species Act. Before we will authorize the importation of a sport-hunted trophy, we must determine that the trophy hunting program is managed to ensure the long-term survival of the species. In many parts of the world, wildlife exists outside of protected areas and must share the same habitat

and compete with humans living in these areas for space and resources. If communities that share these resources with wildlife do not perceive any benefits from the presence of wildlife, they may be less willing to tolerate the wildlife. However, under certain circumstances, trophy hunting can address this problem by making wildlife more valuable to the local communities and encourage community support for managing and conserving the hunted species, as well as other species.

When evaluating whether the importation of a trophy of *P. l. melanochaita* would be authorized pursuant to 50 CFR 17.32, in accordance with our threatened species issuance criteria, we will examine how a country's management program for lions addresses the three main threats that have led to the decline of the subspecies: Habitat loss, loss of prey base, and human-lion conflict. When examining a management program and whether trophies taken as part of that program meet the issuance criteria, we would study a number of factors. Some of the factors we would consider include whether the program is based on sound scientific information and identifies mechanisms that would arrest the loss of habitat or increase available habitat (*i.e.,* by establishing protected areas and ensuring adequate protection from human encroachment). We would consider whether the management program actively address the loss of the lion's prey base by addressing poaching or unsustainable offtake within the country. A component of a management plan from which trophy imports would meet the issuance criteria would be whether there are government incentives in place that encourage habitat protection by private landowners and communities and incentives to local communities to reduce the incursion of livestock into protected areas or to actively manage livestock to reduce conflicts with lions. We would examine if the hunting component of the management program supports all of these efforts by looking at whether hunting concessions/tracts are managed to ensure the long-term survival of the lion, its prey base, and habitat. As stated previously, hunting can generate significant economic benefits if properly conducted. In looking at whether we would be able to authorize the import of a trophy under the issuance criteria of 50 CFR 17.32, we would examine if the trophy hunting provides financial assistance to the wildlife department to carry out elements of the management program and if there is a compensation scheme or other incentives to benefit local communities that may be impacted by lion predation. We would also consider how a U.S. hunter's participation in the hunting program contributes to the overall management of lions within a country.

Management programs for *P. l. melanochaita* would be expected to address, but are not limited to, evaluating population levels and trends; the biological needs of the species; quotas; management practices; legal protection; local community involvement; and use of hunting fees for conservation. In evaluating these factors, we will work closely with the range countries and interested parties to obtain the information. By allowing entry into the United States of *P. l. melanochaita* trophies from range countries that have science-based management programs, we anticipate that other range countries would be encouraged to adopt and financially support the sustainable management of lions that benefits both the species and local communities. In addition to addressing the biological needs of the subspecies, a scientifically based management program would provide economic incentives for local communities to protect and expand *P. l. melanochaita* habitat.

As stated, under this 4(d) rule any person wishing to conduct an otherwise prohibited activity, including all imports of *P. l. melanochaita* specimens, must first obtain a permit under 50

CFR 17.32. As with all permit applications submitted under 50 CFR 17.32, the individual requesting authorization to import a sport-hunted trophy of *P. l. melanochaita* bears the burden of providing information in their application showing that the activity meets the requirements for issuance criteria under 50 CFR 17.32. In some cases for imports, such as sport-hunted trophies, it is not always possible for the applicant to provide all of the necessary information needed by the Service to make a positive determination under the Act to authorize the activity. For the import of sport-hunted trophies of *P. l. melanochaita,* the Service will typically consult with the range country to the extent practicable and other interested parties to obtain necessary information.

The Service has the discretion to make the required findings on sport-hunted trophy imports of *P. l. melanochaita* on a country-wide basis, although individual import permits will be evaluated and issued or denied for each applicant. While the Service may make enhancement findings for sport-hunted trophy imports of *P. l. melanochaita* on a country-wide basis, the Service encourages the submission of information from individual applicants. We would rely on the information available to the Service and may rely on information from sources other than the applicant when making a permitting decision.

CITES

The African lion is also included in Appendix II of the Convention on International Trade in Endangered Species of Wild Fauna and Flora (CITES). It is unlawful for any person subject to the jurisdiction of the United States to engage in international trade in CITES specimens contrary to the provisions of the Convention, the ESA, or our CITES implementing regulations in 50 CFR part 23. 16 U.S.C. § 1538(c)(1), (g); 50 C.F.R. § 23.13. As required by CITES, export of a specimen of an Appendix II species to another country requires prior issuance of a CITES permit. Under CITES, importation of an Appendix II species does not require issuance of an import permit from the importing country. Consequently, the United States is not required to issue a CITES permit in order for U.S. hunters to import their sport-hunted lions. In compliance with CITES, the United States does require CITES imports to meet all CITES requirements, including that the imported lion trophies be accompanied by the required CITES export permits issued by the exporting countries, *see* 50 C.F.R. §§ 23.20; 23.23; 23.24; 23.26; 23.27, and including requirements for sport-hunted trophies at 50 C.F.R. § 23.74.

Individual Permit Adjudication Considerations

When the African lion listing under the ESA became effective, January 22, 2016, the Service began issuing enhancement findings for *P. l. melanochaita* on a countrywide basis, as had been the practice for a number of other threatened sport-hunted species. On March 1, 2018, however, in response to a D.C. Circuit Court opinion (*Safari Club Int'l v. Zinke*, 878 F.3d 316 (D.C. Cir. 2017)), the Service withdrew its countrywide enhancement findings for a range of species, including lions, across several countries, and began assessing applications to import sport-hunted trophies of these species on an application-by-application basis. These withdrawals were upheld in a D.C. Circuit Court opinion (*Friends of Animals v. Bernhardt*, No. 19-5147 (D.C. Cir. June 16, 2020); *Center for Biological Diversity v. Bernhardt*, No. 19-5152 (D.C. Cir. June 16, 2020)). No countrywide ESA enhancement findings are currently in effect. Therefore, since March 1, 2018, the Service has been making

ESA enhancement findings for the import of sport-hunted trophies of lions on an application-by-application basis, ensuring consistent application of the regulatory criteria across all permit application adjudications and ensuring that each permit decision is based on the best scientific and management information available.

Although the Service makes the required enhancement findings on sport-hunted trophy imports of *P. l. melanochaita* on an individual application basis, information obtained for the range country as a whole is also considered, as it is pertinent to the Service's evaluation. In addition to considering national-level species management, we also consider species management and contributions to species enhancement on a smaller-scale (e.g., at the regional or hunting management unit scale such as at the hunting operator, community conservancy, concessionaire, reserve, or ranch-level scale). In addition, we consider how the hunter's personal involvement in the hunting experience directly or indirectly contributes to enhancement of the species in the wild. In its enhancement evaluation, the Service, therefore, considers efforts made by the hunting management unit and/or individual hunter to directly or indirectly address the threats posed to lions in the wild together with other information available concerning the overall management and population status of the lion in the range country at the time of the hunt.

In making ESA enhancement findings, we review all relevant information available to us, including information submitted with the individual permit applications, information received in response to inquiries we make of the range countries, and all other reliable information we receive from interested parties, such as species experts, hunting organizations, hunting operators, community groups, and non-governmental organizations. We evaluate and consider all relevant information obtained or submitted to the Service on an ongoing basis as it relates to permit applications received for import of sport-hunted trophies of *P. l. melanochaita*.

The Service considers information at these different levels in order to assess:

1) How the range country government manages the hunted species and how hunting serves to enhance the survival of the species in the wild in the context of the management system;
2) How hunting serves to enhance the survival of the species in the wild in the context of the management unit at the hunting operator, concessionaire, community conservancy, reserve, or ranch level; and
3) How the individual hunter has contributed (where the hunt has already taken place) or will contribute (where the hunt has not yet taken place) to enhancement of survival of that species through their hunting activities and contributions to the survival of the species in the wild associated to the hunt and subsequent import.

Government-Level Factors Considered

- Enforcement of wildlife laws and regulations, particularly with regard to the range country's ability to implement wildlife regulations developed for the hunted species
- Implementation of a scientifically-based management plan that addresses the major threats to the species and provides economic incentives for local communities to conserve the species
- Investment of hunting fees into conservation, including whether the range country has standard processes and infrastructure in place to ensure an effective transfer of hunting revenues back into the country's management of the species and community benefits
- Management of human-lion conflict, including whether the range country has a compensation scheme or other incentives to local communities to reduce the incursion of livestock into protected areas or to actively manage livestock to reduce conflicts with lions
- Management of the lion's prey base by addressing poaching or unsustainable offtake of the lion's prey species
- Management of lion hunting areas through a system that ensures the long-term survival of the lion, its prey base, and habitat
- Protection of lion habitat through establishment of protected areas, ensuring adequate protection from human encroachment and providing incentives that encourage habitat protection by private landowners and communities
- Establishment and use of science-based quotas, a sex and age-based harvest system, and a monitoring program for the lion and its prey species

Hunting Management Unit-Level Factors Considered

- Monitoring populations of the hunted species and their prey-base
- Protecting and/or increasing the prey-base for lions in the wild
- Maximizing biodiversity of the lion's prey species
- Protecting and improving the habitat for lions in the wild to ensure maintenance of ecosystem functions and biodiversity (e.g., creating water holes, habitat management, etc.)
- Engaging in anti-poaching activities for lion and their prey base
- Managing human-lion conflict
- Investing in community benefits and employment, where such investments provide incentives for conservation of lions in the wild
- Complying with harvest laws and regulations
- Re-investing hunting fees or other contributions associated to lion hunting to a fund that supports conservation of lions in the wild

Hunter-Level Factors Considered

- Complying with harvest laws and regulations
- Paying hunting/import-related fees or other contributions associated to lion hunting that are re-invested to support conservation of lions in the wild (e.g., funding habitat protection for lions in the wild, protection of the lion's prey base, or mitigation of human-lion conflict)
- Participating in a hunting program with an operator that supports sustainable use of the species

This application-by-application permit review process offers an opportunity to incentivize hunting in concessions, conservancies, reserves, or ranches that support conservation of the species through rigorous anti-poaching programs, local wildlife monitoring activities, and compliance with government rules and regulations. By complying with our enhancement requirements, a hunter's personal import will help conserve lion populations in the wild by supporting the local communities where they hunt and promoting conservation of these species and their habitats by providing protection incentives to communities that live alongside these species.

Basis for Finding

On February 1, 2016, the Service sent a letter to the Parks and Wildlife Management Authority in Zimbabwe (ZPWMA) with a list of questions related to management plans, population status, conservation, management, hunting policies, and regulations of Zimbabwe's lion populations. Additionally in the letter, the Service referenced the IUCN SSC Guiding Principles on Trophy Hunting as a Tool for Creating Conservation Incentives Ver. 1.0 (09 August 2012), as it provides useful principles which, when considered in conjunction with the Service's permit issuance criteria, would aid when making the required enhancement findings for permitting importation of sport-hunted lion trophies.

On February 16, 2016, the Service sent a second request to ZPWMA for specific documents related to the conservation status of lions in Zimbabwe. ZPWMA responded to the Service's request on February 17, 2016, with a copy of *Conservation Status of African Lion in Zimbabwe,* and subsequently, on November 29, 2016, provided a copy of its *Enhancement and Non-detriment Finding for Lion (Panthera leo) in Zimbabwe.* The Service has also been corresponding with ZPWMA regarding African elephant management for several years. In this correspondence, ZPWMA, as well as other sources, have provided the Service with documents and information that are relevant to our evaluation of lions in Zimbabwe.

Since 2016, the Service has met with officials from Zimbabwe multiple times to receive updated information on the status of and management of lions in Zimbabwe with respect to imports of sport-hunted lion trophies. For example, Service representatives met with Zimbabwe officials in January 2018 at the annual Safari Club International convention in Las Vegas, and November 2018 at the African Wildlife Consultative Forum in Uganda. In September 2018, Zimbabwe officials provided to the Service the May 2017 Zimbabwe National CAMPFIRE Stakeholder's Review and the Zimbabwe Parks and Wildlife Management Authority Strategic Plan, 2019-2023. In addition, in September 2018 the Service received a letter dated 6 December 2017 from Hon. E.D. Mnangagwa, President of the Republic of Zimbabwe, addressed to President Donald Trump, addressing the

change of administration in Zimbabwe. In this letter Hon. E.D. Mnangagwa provided assurance to the United States that Zimbabwe is politically stable and that Zimbabwe's previous conservation initiatives would be enhanced, with the previous Minister, Permanent Secretary, and Director General confirmed to remain in place.

This information provided by the Zimbabwe authorities (including verbal updates and presentations at the 16th Annual African Wildlife Consultative Forum (Uganda, November 2018), along with the Service's final rule on the lion listing under the Act and other relevant information from reliable sources, are the basis of this finding.

Governance of Lions in Zimbabwe

The legal framework for Zimbabwe's regulatory mechanism is informed by its Wildlife Policy (1992), which is intended to maintain a protected area network for the conservation of the nation's wild resources and biological diversity. The Wildlife Policy (1992) provides for the Government of Zimbabwe to maintain a network of protected areas known as the Parks and Wild Life Estate, comprised of the country's National Parks, safari areas, botanical gardens, and sanctuary and recreational areas for the conservation of the nation's wild resources and biological diversity (CITES 2016; ZPWMA 2016). The framework is intended to create economic activity to enhance rural development and encourages the conservation of wild animals and their habitats outside the protected areas.

ZPWMA was established by the Parks and Wildlife Act of 1996 (Chapter 20:14) [as amended by Act Number 19 of 2001] which came into operation on June 1, 2002, through Statutory Instrument 144C of 2002. The Act provides for the establishment of a Parks and Wildlife Board; establishment of national parks, botanical reserves, botanical gardens, sanctuaries, safari areas and recreational parks; and the preservation, conservation, propagation or control of wildlife, fish, and plants of Zimbabwe and the protection of Zimbabwe's natural landscape and scenery. This Act includes sections on virtually every aspect of ZPWMA, including requirements for annual financial audits and reporting to the central government. The Act also provides for substantial penalties for the unlawful possession of or trading in protected wildlife species. In addition, the General Laws Amendment Act (No. 5) of 2010 provides for mandatory imprisonment for poaching.

The Parks and Wildlife Act, Chapter 20:14, devolved authority to manage and benefit from wildlife on communal and private lands to the landholders. In 1982, the legal provisions of this Act were extended to Rural District Councils (RDCs), on behalf of rural communities in communal lands whose areas contain viable populations of wildlife. Communal areas in Zimbabwe are administered by RDCs which have become a mechanism for implementation of the government's policy of conservation by utilization of natural resources. The Act enables local communities to manage and benefit from wildlife resources through the Communal Areas Management Programme for Indigenous Resources (CAMPFIRE) established in 1989.

CAMPFIRE was developed to encourage reduction in human-wildlife conflicts through conservation-based community development and to provide an economic incentive to

improve community tolerance of wildlife, including lions. At the time, the CAMPFIRE program was the model for community-based conservation efforts in several other African countries and was identified as an innovative program. Under a community-based conservation program, like CAMPFIRE, rural communities should benefit from revenue generated by sport-hunting.

As Zimbabwe's premiere wildlife agency, the main functions of the ZPWMA are to control, manage, and maintain Zimbabwe's wildlife resources with the primary role of protecting and conserving Zimbabwe's natural heritage for present and future generations on behalf of the country. It also provides the cornerstone of Zimbabwe's tourism industry (ZPWMA 2015). The rationale behind the establishment of the ZPWMA was to allow for a self-funding mechanism, and thereby reduce its dependence on the national treasury. In January 1996, the Government of Zimbabwe approved the establishment of the Parks and Wild Life Conservation Fund that provides for financing wildlife operations directly from revenues generated through wildlife-related activities. The funding for ZPWMA is therefore coming from revenue generated through sport hunting conducted on state and private lands, concession leases, National Park visitor fees, and other wildlife-related fees. While there have been requests by ZPWMA for funding from the central treasury in the past, to our knowledge, no other significant government funding has been provided, and only limited outside funding from non-governmental organizations (NGOs) or other governments appears to be available.

A major component of ZPWMA mandate is law enforcement. Poaching mainly occurs along the boundaries of protected areas where lions are incidentally snared as non-target prey. Between 2013 and 2015, 21 lions were killed illegally, with six animals killed through snaring in the area adjacent to Hwange National Park in 2015; poverty stands as the major driver of illegal hunting (ZPWMA 2016). If anyone is found in possession of poached specimens, they must pay a fine of USD 5,000 or face a mandatory jail sentence. If convicted of lion poaching, courts could require the payment of a compensation fee of USD 20,000 (ZPWMA 2014). Hunting operators are obligated through their concession lease agreements to assist with anti-poaching efforts (ZPWMA 2016). Reportedly, USD 590,000 was spent on anti-poaching efforts by the Bubye Valley Conservancy (BVC) alone during 2015 (K. Leathern, pers. comm., as cited in Du Preez et al. 2016), and USD 546,000 is spent annually on anti-poaching by the Savé Valley Conservancy (SVC) (Lindsey et al. 2012); these expenses are mainly covered by sport-hunting revenue (Du Preez et al. 2016). In 2002, ZPWMA had 2,146 rangers at its establishment (ZPWMA 2016); however, by the end 2015, there were 1,448 rangers in post (67% of 2002 level). Of the 1,448 rangers in post, 1,004 are deployable for anti-poaching operations (ZPWMA 2016).

Safari operators in Zimbabwe are required to be registered and licensed by the Zimbabwe Tourism Authority (https://www.soaz.net/index.php/2, accessed August 16, 2019). Operators must hold a lease or agreement on a suitable concession with an approved quota of animals. They are responsible for the official paperwork and permits connected to the hunt. Hunting operators are required by law to provide the services of a Zimbabwe Licensed Professional Hunter to accompany foreign hunters in Zimbabwe. Licensing is undertaken by the National Parks & Wildlife Authority.

Zimbabwe is a member of the Southern African Development Community (SADC). Under the SADC Treaty, Article 5(g) establishes objectives to, among other aspects, promote the sustainable use of wildlife, harmonize legal instruments governing wildlife use and conservation, promote the conservation of shared wildlife resources through the establishment of trans-frontier conservation areas (TFCA), and facilitate community-based natural resources management practices. To implement the SADC Treaty, member states are required to establish management programs for the conservation and sustainable use of wildlife.

Currently Zimbabwe is pursuing six TFCA initiatives at various stages of development. These are: Great Limpopo Transfrontier Park (GLTP) / Great Limpopo Transfrontier Conservation Area (GLTFCA); Chimanimani TFCA; Greater Mapungubwe TFCA; Kavango-Zambezi (KAZA) TFCA; Lower Zambezi-Mana Pools LZMP (TFCA) and Zimbabwe-Mozambique-Zambia (ZIMOZA) TFCA (Mandisodza-Chikerema 2018, p. 34).

Through TFCAs, wildlife management entities are linking many of the major protected areas by removing boundary fences along national borders that separate many reserves in addition to creating or improving corridors to link good-quality habitat for wildlife (Newmark 2008). The principle of ecological and migratory connectivity lies at the heart of the TFCA initiative linking large protected areas across international boundaries and providing space for wildlife populations.

Another provision of the SADC Treaty is that member states are required to establish management programs for the conservation and sustainable use of wildlife. Zimbabwe has met this criterion for African lions through the development of its 2006 *Conservation Strategy and Action Plan/or the Lion (Panthera leo) in Zimbabwe* (ZPWMA), which is still in use.

As previously mentioned, Zimbabwe is also a Party to CITES, and the African lion species is included in Appendix II of the Convention. As an Appendix-II species, certain criteria must be met before the CITES Management Authority of the country of export may issue an export permit, including a finding from the exporting country's CITES Scientific Authority that the proposed activity will not be detrimental to the survival of the species in the wild (non-detriment finding; NDF) and a finding from the CITES Management Authority that the specimens proposed for export were legally acquired (legal acquisition finding).

The ZPWMA has provided the Service with a copy of its standing CITES non-detriment finding (NDF), dated October 2016, for the export of African lion specimens. The NDF explains that lion populations in Zimbabwe are being managed sustainably for the benefit of the species and that Zimbabwe's management program for lion provides economic incentives for local communities to protect and expand lion habitats. The NDF document provides information to support the following:

- The Zimbabwe hunting industry is based on sound scientific information, provides mechanisms to arrest habitat loss, or where feasible increase habitat, and provides protection from human encroachment.

- Government incentives are in place to encourage habitat protection by private landowners and communities.
- Government Incentives are provided to local communities to reduce human-wildlife conflicts.
- Hunting concessions are managed to ensure the long-term survival of the African lion and its habitat.
- Trophy hunting provides financial assistance to the ZPWMA, the communal CAMPFIRE program, and private landowners to implement wildlife management programs.
- Local communities directly and indirectly benefit from the presence of lion in their areas.
- Participation of U.S. hunters in the Zimbabwe hunting industry contributes to the overall conservation and management of lions in Zimbabwe (ZPWMA 2016).

Lion Status in Zimbabwe

When the Service listed the subspecies of lion in southern and eastern Africa (*P. l. melanochaita*) as threatened under the Act (80 FR 79999), three primary threats to the species throughout its range were identified: loss of habitat, loss of prey base, and human-lion conflict. While human population growth clearly has an impact due to loss of available habitat for lions, increasing human population has a direct impact on prey base. Prey availability affects the reproduction, recruitment, and foraging behavior of lions and, as a result, strongly influences lion movements, abundance, and population viability (Winterbach *et al.* 2012, as cited in USFWS 2015). Lion densities are directly dependent on prey biomass (Hayward *et al.* 2007). Outside of protected areas, the lion's prey base is much reduced (Du Preez et al. 2016); inadequate management and law enforcement have led to poaching of the lion's prey base for bushmeat, which has been critically depleted (USFWS 2015). Population trends across eastern and southern Africa show that most prey species have declined in recent years; and for Zimbabwe, droughts have been a critical factor (ZPWMA 2016).

A reduced prey base results in a relatively greater chance of lions encountering livestock (Du Preez et al. 2016). While actual losses of livestock to predators may be relatively low, the perceived financial cost to farmers can be high, and lions are persecuted intensely in livestock areas as a consequence. Their scavenging behavior makes them particularly vulnerable to the practice of lacing prey carcasses with poison to eliminate predators (CITES 2016). Co-existence of lions and people is promoted through giving value to lions, such as through tourism and hunting in CAMPFIRE areas (ZPWMA 2014). The threat to lions from habitat loss is especially present in Sebungwe and the South East Low Veld where the fragmented nature of the protected areas is compounded by increasing human and livestock populations surrounding these areas (ZPWMA 2016).

According to the Service's CoPl7 *Consideration of Proposals for Amendment of Appendices I and II,* international trade in lion products is emerging as an additional threat; however, the relative extent to which this threat has contributed to lion population declines is difficult to evaluate accurately (CITES 2016). According to ZPWMA (2016), the illegal local and international trade in lions and their products poses an insignificant risk to the

species in Zimbabwe, as there are no records of people found in possession of illegally acquired lion specimens in Zimbabwe. It is not clear what level of legal trade of lion products, if any, occurs within Zimbabwe.

The bulk of Zimbabwe's wildlife occurs within the Parks Estate which includes 11 national parks, 16 safari areas, 16 recreational parks, 6 sanctuaries, 12 botanical reserves and 3 botanical gardens, all spread across the country (Parks and Wildlife Act 2001 Chapter 20:14). Wildlife populations also occur on the state Forest Areas, Communal CAMPFIRE areas, and private conservancies dedicated to wildlife-based land use. There are approximately 319,317 km^2 of land where some form of wildlife-based land use is practiced in Zimbabwe (ZPWMA 2016). Lions occur permanently in 45% of this available range (circa 145,000 km^2) with the majority occurring in national parks (96%) and safari areas (92%). Lions also occur permanently in 47% of the State forest areas and 66% of privately owned conservancies. The CAMPFIRE areas comprise approximately 247,000 km^2 and lions occur in 36% of these areas. Lions are transient in CAMPFIRE, conservancy, and resettled areas adjacent to the major protected areas, and lions move across the border into Zambia, Mozambique, South Africa, and Botswana.

Zimbabwe's main lion range includes the Hwange-Matetsi Ecosystem, Mid Zambezi Valley, Sebungwe, and South East Lowveld. The lion population estimates in Zimbabwe are determined primarily through carnivore spoor surveys, systematic lion collaring, and call-up surveys. According to ZPWMA's *Conservation Status of the African lion (Panthera leo) in Zimbabwe* July 2014 report, starting in 2015, lion spoor surveys were to be done at two-year intervals in all wildlife areas, and lion call-up surveys were to be done every three years in all major lion areas (ZPWMA 2014). Although the Service has not received confirmation that these surveys have been conducted since 2015, in September 2018, the Service received Zimbabwe's Parks and Wildlife Management Authority's Strategic Plan for 2019-2023, which indicates that Zimbabwe is actively working to improve the monitoring and management of their wildlife species. In their updated strategic plan, signed in December 2018, they indicated that one of their strategic objectives is protection of wildlife resources. Their identified timeline is to update and implement key species management plans (lion is identified as one of these) by December 2023.

ZPWMA (ZPWMA 2016) has estimated that the minimum number of lions that occur on approximately 5l,642 km^2 of land where reliable survey data are available is approximately 1,900 (range 1,800 - 2,000). The western portion of the country, consisting primarily of Hwange National Park and the surrounding safari areas, forest areas, communal areas, and private conservancies, supports approximately 737 lions (or 38% of the overall population). The southern portion of the country, dominated by the two major conservancies (SVC and BVC) and Gonarezhou National Park supports approximately 896 lions (48%). These numbers are supported by several studies.

Within Gonarezhou National Park, Groom et al. 2014, used call-up surveys to obtain direct estimates of the lion population and compared actual lion densities with potential density estimates. In this study, while lions were only seen at five percent of calling stations, this equated to a population estimate of 33 lions, which is consistent with spoor survey results conducted in June 2010 (Groom et al. 2014). A 2015 spoor count

survey of Gonarezhou National Park revealed an estimated 125 lions within the park (ZPWMA 2016).

From 2007 to present, annual track index surveys at the SVC have been conducted using a standardized methodology (Groom and Watermeyer 2015, as cited in Du Preez et al. 2016). Prey availability models suggest that the carrying capacity for this lion population is approximately 271 lions (Hayward et al. 2007). In 2015, the estimated population was 284 lions (Du Preez et al. 2016). The Rifa Safari Area was surveyed using camera trapping and spoor counts in 2015, which supported an estimated population of 68 lions. The central and northern portions of the country reportedly support an estimated population of 284 lions (15%). The 12-year (2000-2011) average lion density per 100 km^2 is 2.8 in Hwange National Park, 6.0 for South Eastern Lowveld in the SVC, 9.0 in Malilangwe, and 0.8 in Gonarezhou National Park (ZPWMA Annual Report 2013, as cited in ZPWMA 2014). SVC's website indicates that at SVC, an annual predator spoor count is conducted by the African Wildlife Conservation Fund (AWCF), an independent organization (http://savevalleyconservancy.org/conservation.html#header1-z, accessed August 14, 2019).

According to Riggio et al. 2013 (p. 32), and Bjorklund in Riggio et al 2013 (p. 32), the minimum number of lions that are estimated to constitute a viable population is 500 individuals. Hwange National Park, with an estimated population of 559, is the only area within Zimbabwe that has a viable population as laid out by Riggio et al. 2013. However, the two regions that make up the largest percentage of the country's lion population (Western 38% and Southern 48%) have regional populations of 737 and 896, respectively. The areas within the Central and Northern regions of Zimbabwe, albeit smaller, encompass parks that are part of Transfrontier Conservation Areas, such as the Mana Pools region.

Lion Management in Zimbabwe

In response to discussions surrounding a possible up-listing of lion to Appendix I under CITES at the 13th Meeting of the Conference of the Parties (CoP13), and subsequent workshops involving lion range states, IUCN, ZPWMA, and other key stakeholders held a workshop to develop the *Conservation Strategy and Action Plan for the Lion (Panthera leo) in Zimbabwe* which was published by ZPWMA in 2006. The plan responds to regional and international standards set by Treaties such as CITES and the Convention on Biological Diversity (CBD), among others. The plan states "it will guide the conservation and management of this top predator" which "addresses the needs of th[e] country." The Service is not aware of any additional or updated iterations of the plan since 2006; however, in Zimbabwe's 2016 response, *Enhancement and Non-Detrimental Findings for Panthera leo in Zimbabwe,* ZPWMA provided updates on each of the outputs and respective targets established under the 2006 *Conservation Strategy and Action Plan/or the Lion (Panthera leo) in Zimbabwe* (ZPWMA 2016).

The 2006 plan identifies a vision that "...lions should be conserved and managed sustainably for their aesthetic, cultural, and ecological values, and the socio-economic

development of Zimbabwe." The plan lays out three broad targets to achieve this objective:

- Ensure the persistence of key lion populations and other important populations including those of doubtful viability.
- Human and livestock loss reduced.
- Optimize wildlife conservation-related net benefits to local communities.

All three targets are stepped down to seven specific outputs with their own targets and activities to meet such targets. Although the plan does not identify a time period, some activities do, of which a period of 5 years is the most common. In response to inquiries from the Service, ZPWMA has provided a summary of the progress made to implement the 2006 strategy.

While all three of the broad targets appear to serve a valuable role in lion management in Zimbabwe, three of the specific outputs are most relevant to determining if the implementation of the strategy enhances the propagation or survival of the species, as required by the Act for the issuance of import permits. The first output, "lion populations, their habitats and wild prey effectively conserved and managed in collaboration with local stakeholders" is broken down into a number of targets: establish a baseline survey and monitoring program; maintain and strengthen capacity for lion conservation, management, monitoring and research; identify and implement best management standards and practices for the hunting program; develop and implement co-management frameworks; and expand the geographic distribution range of lions. Baseline surveys have been completed for the Parks Estate using monitoring protocols for key variables (populations, habitats, prey), and selected surveys have been undertaken in areas outside National Parks (ZPWMA 2016).

Carnivore research programs conducted by NGOs and research institutions such as WildCRU are taking place in various parts of the country; in addition, personnel have been trained in data collection and capture, management, and lion aging and analysis. Adaptive age-based criteria for male trophy animals are in place and functioning. The quota for a certain year is determined by a point system based off the hunts from the previous season. Therefore, ZPWMA is actively working toward meeting the target areas for this output.

The second output, "human-lion related conflicts minimized and, where possible, eliminated" has also been broken down into a number of targets: develop and establish databases on lion-human conflicts; identify and implement methods to reduce and mitigate livestock losses and lion attacks on humans; and train and properly staff problem animal control (PAC) units to conduct rapid response and precisely target problem animals. According to information from ZPWMA (2016), approaches to mitigate livestock losses and lion attacks on humans are in the process of being tested and implemented in Hwange, and methods to mitigate lion attacks on livestock are being implemented as appropriate at selected sites (e.g. Tsholotshe). Data on PAC reports for lion-related problems have been collated, and PAC units at ZPWMA field station and/or RDC levels have been partially established. In Matusadona, Hwange, and Gonarezhou regions, specific awareness and education packages on lion conservation and

management have been developed and implemented. The information submitted in the ZPWMA update suggests that they have met one target, and are in the process of implementing the remaining two.

The third output, "the costs and benefits of long-term lion management equitably distributed," is a socio-economic output to establish agreement and implementation of area-specific lion management plans with identified stakeholders in each wildlife region, and implementing a transparent mechanism to equitably distribute lion-related income to identified stakeholders." The specific targets for this output are: complete an inventory of stakeholders directly affected by lion conservation, deliver appropriate training and capacity building to prioritized stakeholders, agree to and implement collaboratively developed area-specific lion management plans with identified stakeholder groups in each wildlife region within 5 years, and implement transparent mechanisms to equitably distribute lion-related/generated income to identified stakeholders (groups and/or communities). Current information from ZPWMA shows that they have identified key stakeholders and assessed the financial impacts of lion conservation and the magnitude of socio-economic impacts on each stakeholder group. Limited training has been undertaken for representative stakeholders in Hwange, Matusadona, and Gonarezhou. ZPWMA has also implemented an adaptive management program across four wildlife regions and is in the progress of developing and implementing area-specific lion management plans with identified stakeholder groups. According to ZPWMA, a Management Plan for Hwange was approved. The Hwange National Park (HNP) Management Plan was updated in 2015 and officially accepted at Zimbabwe's Ministry of Environment level in 2016 (Conservation and Wildlife Fund (CWF) 2018, p. 16). One of the four components of this 10-year plan is implementation of a cooperation plan between the park and park neighbors. The Conservation and Wildlife Fund – Hwange (CWF) is a relatively new model of the private and NGO sectors in and around Hwange National Park (HNP) Zimbabwe, formalizing an alliance of individual members to materially and in-kind assist authorities with conservation work.

The Hwange Lion Research (HLR) which is part of the Wildlife Conservation Research Unit (WILDCRU), Oxford University, UK, with some financial support and collaborative effort from CWF, set up a comparative camera trap survey in May 2018, to establish a baseline of both lion and lion prey identification and densities in contiguous areas with differing management – the exact CWF project area. Although data were only obtained from the 40-day HNP camera grid, combined sources of complimentary data on the lion population in Forest Areas outside the national park suggest that anthropogenic mortality is slowing down, believed to be in part due to CWF's new law enforcement activities (CWF 2018, p. 21).

Zimbabwe's conservation strategy for lions also identifies roles and responsibilities for a number of participants in Zimbabwe's lion conservation efforts. According to the strategy, there is a national lion coordinator that coordinates all national activities on lion conservation, research, and management, including census surveys, setting up monitoring needs, and coordinating data on human-lion conflicts. The strategy identifies roles for the field stations, wardens, ecologists and utilization units, which are responsible for ensuring compliance with hunting regulations and maintaining safari hunting databases. In addition, the strategy identifies roles for CAMPFIRE, safari operators, and

professional hunters to facilitate training and ensure compliance with hunting regulations.

The Conservation Strategy and Action Plan for the Lion in Zimbabwe (ZPWMA 2006) borrows language from the *IUCN Conservation Strategy* (2006). It iterates areas in need of improvement regarding lion conservation in Zimbabwe, including standardized lion census methods and surveys, further mitigating human-lion conflicts, and maximizing benefits for rural communities that live with lions. ZPWMA (2006) notes their intention to review and put in place criteria for age-based identification of male trophy animals, but do not mention if they will be reviewing possible combination strategies. As part of the 2006 lion conservation strategy for eastern and southern Africa, six objectives were established to secure and restore sustainable lion populations, which were housed under the following categories: management, mitigation, socio-economics, policy and land-use, politics, and trade. The strategy was intended to be implemented within 10 years (Macdonald 2016), and Zimbabwe gave an update on progress regarding these objectives in their *Enhancement and Non-Detrimental Findings for Panthera leo in Zimbabwe* (ZPWMA 2016) that also addressed outputs and targets laid out in their 2006 action plan.

Additionally, to mitigate human-lion conflict, the "Long Shields Guardian Programme" was initiated whereby communities are notified of movements of collared lions into their areas via cell phone, and then have the opportunity to take appropriate action, such as moving cattle. In 2013 alone, 1,850 warnings were passed to the "Long Shields." These actions may reduce the incidents of lions marauding livestock; however, retaliatory killing of lions still occur. Further, as is policy under the Parks and Wildlife Act of 2001, any lions that attack humans or livestock will be lethally eliminated (ZPWMA 2016). Between 2007 and 2013 a total of 1,113 conflict incidents were recorded in the Hwange area in which 915 head of stock were lost to lions.

In and around Hwange National Park, data collected between 1999 and 2004 suggested that hunting surrounding the park was having a negative impact on the lion population. As a result, sport hunting of lions was suspended in the area surrounding the park between 2005 and 2009. Following the lifting of the moratorium, and by implementing stricter monitoring and hunting guidelines through the Hwange Lion Research Project, the overall Hwange lion population has continued to show a positive trend, and as of 2015 the population was estimated at over 550 animals (ZPWMA 2015).

Hunting, Management, and Utilization of Lions

In Zimbabwe, much of the trophy hunting occurs in Safari Areas which are managed mainly for the sustainable use and as buffer zones next to National Parks (Jeke et al 2019, p. 2). Trophy hunting of wildlife is legally permitted in safari areas; as of 2014, there were 16 in Zimbabwe (ZPWMA 2014). According to the Forest Act, Chapter 19:05, there are 24 gazetted indigenous forest areas in Zimbabwe; within these forest areas, lions may be hunted in the following forests: Fuller, Kazuma, Pandamasuwe, Ngamo, Sikumi, Gwayi, Sijarira, and Gwampa (ZPWMA 2014).

As of 2016, the minimum number of lions that occur in approximately 51,642 km^2 of land in Zimbabwe, where reliable survey data are available, is estimated to be 1,917 (range 1,800 - 2,000), the majority of which occur in western and southern Zimbabwe. When taking this population estimate into consideration, trophy hunting harvests a yearly mean of 2.7% of adult male lions. This figure decreased since the establishment of age restrictions on lion hunting (ZPWMA 2016).

In 2013, an adaptive quota management system for lion hunting based on the ages of lions hunted was agreed to in Harare, Zimbabwe, during a meeting hosted by ZPWMA and an independent non- governmental conservation organization (Du Preez et al. 2016). After reviewing aging techniques, attendees at the July 2013 meeting in Harare, Zimbabwe were confident that hunters could be expected to categorize lions as being below or above five years of age. In determining quotas for the following years, operators would be rewarded with increased quotas if they hunted animals of six years or older, would not be penalized if they hunted animals five years of age, but would have quotas cut if they hunted animals younger than five years old, or if they failed to complete hunt returns (ZPWMA and Panthera 2014). In 2013, only 28% of lions hunted were five years old or older. In 2015, that figure rose to 77.3% (ZPWMA 2016).

According to Hunter et al. (2013), an adaptive quota management system utilizing age-based criteria would not only aid in the prevention of over-harvesting lions, but would also prevent excessively conservative quotas. Further, according to Miller et al. (2016), results indicate that age-based hunting is feasible for sustainably managing threatened and economically significant species such as the lion, but must be guided by rigorous training, strict monitoring of compliance and error, and conservative quotas. No single trait can be relied upon exclusively to precisely age lions. Rather, multiple traits must be examined in combination to cross-validate an individual's age and, according to Whitman et al. (2004), restricting hunting to individuals that are at least six years old is desirable from a biological perspective due to the reduced risk of the loss of pride males and infanticide of cubs associated with the harvest of such individuals (Whitman et al. 2004).

During 2013, operators were requested to submit hunt returns and photos as a trial run to get the adaptive quota system up and running. In 2014, operators were requested to do the same but were informed that the age of the lions hunted in 2014 would determine their lion quotas in 2015 (Du Preez et al. 2016). In 2015, there was a marked increase in the age of lions hunted in Zimbabwe as a whole. The majority of lions hunted were on the cusp of 5-6 years of age but were not older than six years. National hunting offtakes for lions in Zimbabwe from 2013 to 2015 were 29, 42, and 47 respectively (Masterson 2016). It appears these do not include illegal forms of hunting offtake. In 2011, Zimbabwe's quota was set at 101 lions; in 2014, it was reduced to 50 male lions following the implementation of age restrictions (Henschel 2015, pers. comm., as cited in USFWS 2015).

As described above, CAMPFIRE is the program through which the Government of Zimbabwe has relegated the management of wildlife resources to communal farmers. As of July 2014, there are at least 58 Rural Districts that have been granted the Appropriate Authority status to manage wildlife resources in their areas; however,

according to *Enhancement and Non-Detrimental Findings for Panthera leo in Zimbabwe* ZPWMA 2016, only 16 are actively engaged in some form of wildlife-based land use (ZPWMA 2016). Lions are found in communal areas that are adjacent to major protected areas, and lion hunting is allowed in CAMPFIRE districts (ZPWMA 2014).

In setting adaptive lion quotas, Zimbabwe uses scientific information including spoor surveys, camera traps, and ranger-based sighting. In CAMPFIRE areas, incidences of human-lion conflict are also taken into consideration where survey information is not readily available, when determining quotas for those areas (ZPWMA 2014). The quota-setting process involves all stakeholders, including the ZPWMA, landowners, safari operators, and CAMPFIRE managers and their representatives. During the annual quota-setting workshop, presentations are made by the proponents who then make proposals for quotas. Where it is felt that not enough information has been presented, a precautionary quota will be issued (ZPWMA 2014).

ZPWMA (2016) mentions seven concessions that are leased on five-year terms, and how these concessionaires pay a 5-year "right to lease" fee, annual rental, fixed quota fee (payable if animals are shot or not) and a supplementary quota fee that allows additional animals to be bought as needed. It is unclear to what extent Zimbabwe still utilizes fixed quotas, as Du Preez et al. claims fixed quotas are no longer being used by Zimbabwe, but a fixed quota fee is mentioned in ZPWMA (2016). It is also unclear how many animals concessionaires are able to "buy as needed," and how such requests may be accommodated without going over the national quota (ZPWMA 2016). However, when evaluating the lower quota with higher utilization reported by ZPWMA (2016), and taking into consideration the land area of the Parks Estate alone, Zimbabwe did not exceed the best management practice of 0.5 lions/1,000 km^2; the 2015 off-take would have accounted for 0.125 lions/1,000 km^2.

According to *The Role of Trophy Hunting of Elephant in Support of the Zimbabwe CAMPFIRE Program -December 2016,* a report the Service received in December 2016, the Reserve Bank of Zimbabwe, in collaboration with relevant stakeholders, established the Tourism Receipts Accounting System (TRAS2) that required all outfitters to submit returns listing the revenue generated for hunting activities. This system has been in place for several years, but it required manual analysis of the data to extract information on hunting revenue. In January 2015, to account fully for earnings in the hunting sector, the Reserve Bank of Zimbabwe in collaboration with relevant stakeholders, introduced TRAS, a web-based system that links Safari operators, ZPWMA Authority, taxidermists, shipping agents, International marketing agents, and the Reserve Bank. Under this system, all authorized hunts are registered, allowing for the capture of hunting data, such as the origin of clients, value of trophies and hunts, and area hunted, to monitor hunting quota utilization and track hunted trophies. According to the December 2016 report, the Exchange Control Division of the Reserve Bank of Zimbabwe and the ZPWMA are now able to:

1. Assess regional price differentials of similar hunts and the reasons thereof;
2. Present TRAS2 system updates and reports to the users, including international marketing agents;
3. Engage with international marketing agents of sport hunting;

4. Obtain relevant insights on governing of the hunting sector; and
5. Come up with an effective mechanism to fully account for export proceeds from the hunting sector.

The TRAS2 information provides a breakdown of the source of hunting income, and the amount of funds generated by trophy fees by land category, among other insights, and has demonstrated the TRAS2 system's ability to obtain relevant insights on governing of the hunting sector.

Evaluation

Justin Michael Ragazzine hunted in the Savé Valley Conservancy (SVC) in southeastern Zimbabwe, reportedly one of the largest private game reserves in Africa (https://savevalleyconservancy.org/). In the early 1900's, the 3,440 km^2 of land that now comprises the SVC was used for cattle ranching, which led to the elimination of most large herbivores and predators, including lions. In the 1990's upon establishment of the SVC, the cattle farms were converted to a wildlife-based land use system and wildlife populations were restored (Pole 1999).

In evaluating whether the importation of Mr. Ragazzine's trophy of *P. l. melanochaita* would be authorized pursuant to 50 CFR 17.40(r) and 50 CFR 17.32(a), in accordance with our threatened species permit issuance criteria, we examined how Zimbabwe's management of lions overall as well as how Savé Valley Conservancy and Mr. Ragazzine himself have contributed to enhancement of wild lions both directly and indirectly by addressing the three main threats that led to the decline of the subspecies: habitat loss, loss of prey base, and human-lion conflict.

Below, we summarize our evaluation with reference to each of the permit issuance criteria at 50 CFR 17.32(a)(2) on the basis of information available to the Service.

17.32(a)(2)(i): Whether the purpose for which the permit is required is adequate to justify removing from the wild or otherwise changing the status of the wildlife sought to be covered by the permit:

Zimbabwe's lion hunting industry generated 9% of all sport-hunting revenue in 2015; 51% was contributed by U.S. hunters during 2010-2015 country-wide, and 90% of the sport-hunting market in the Bubye Valley Conservancy (BVC) and the Savé Valley Conservancy (SVC) from 2005-2015. Even though 9% may not seem like much, lions are a key component of the sport hunting industry, as they are part of the "Big 5" trophies and draw U.S. hunters to Zimbabwe. Without the hunting industry, protected wildlife areas such as BVC and SVC, which have become conservation havens in the threat of human encroachment across much of Zimbabwe, would not be economically viable, and therefore would likely not exist. These wildlife areas not only provide habitat for lions, but also support the lion's prey species. As previously noted, the southern portion Zimbabwe, which is dominated by SVC, BVC, and Gonarezhou National Park, supports approximately 896 lions (48% of the Zimbabwe lion population).

According to Lindsey et al. (2012), hunting operators in the SVC spend USD 546,000 annually on anti-poaching activities and employ 186 permanent game scouts. Hunting revenues are used to support expenses associated with these activities (Du Preez et al. 2016).

The *Strategy and Action Plan* has put into place mechanisms to adequately oversee the harvest of lions in Zimbabwe. With an annual harvest of approximately 85 lions, Zimbabwe is not exceeding the limits identified of 0.5 lions/1,000 sq. km. The objectives of the *Strategy and Action Plan* and the actions and monitoring activities that have been put into place to achieve these objectives should support the adaptive management approach that Zimbabwe has established for managing lions. The Service will continue to monitor the effectiveness of the Strategy and Action Plan, for consideration in future findings.

As described above, we have determined that the government of Zimbabwe and the Savé Valley Conservancy contribute towards positive conservation outcomes by addressing the main threats of habitat loss, human-lion-livestock conflict, and prey depletion, which contributes to improving the status of lions in Zimbabwe. Further, the fees garnered through Mr. Ragazzine's hunt will provide revenue to support these positive conservation outcomes.

Therefore, based on the information available to the Service, the purpose for which the permit is being requested, import of this trophy lion, is adequate to justify removing the sport-hunted trophy lion from the wild or otherwise changing its status.

17.32(a)(2)(ii): The probable direct and indirect effect that issuing the permit would have on the wild populations of the wildlife sought to be covered by the permit:

The total area under wildlife-based land use and conservation in Zimbabwe amounts to 10.7 million hectares and represents 27% of the total surface area of the country. Of this, 7.9 million hectares, or 75% of all conservation land in the country, falls under safari hunting as the primary or only source of revenue. Sport hunting of lions by U.S. hunters such as Mr. Ragazzine supports the programs in Zimbabwe that provide the opportunity for locals to see value in lions, which in turn conserves the species in the long-term.

A scientifically based quota is the number of a given species that can be removed from a specific population without damaging the biological integrity and sustainability of that population (WWF 1997). However, full implementation and enforcement of the age-based strategy could potentially cause the need for quotas to become irrelevant or eliminated (USFWS 2015). Age restrictions will naturally restrict offtake to a limited number of individuals that meet the age criteria (Loveridge *et al.* 2007, Whitman *et al.* 2004).

Based on the information provided to the Service, it is clear that Zimbabwe has made strides in their management of their lion populations. Additionally, Zimbabwe appears to be transparent in its management processes, including its quota setting. In 2013, Zimbabwe proposed an adaptive age-based strategy for setting hunting quotas. This

adaptive quota management system for lion hunting based on the ages of lions hunted has been accepted and embraced by all stakeholders; it has not only led to a reduced national lion hunting quota, but has also resulted in a significant increase in the age of harvested lions to a level that is considered to have a reduced ecological impact (Du Preez et al. 2016).

In 2015, the development of TRAS2 allowed the country to better monitor and govern the hunting sector, including developing an effective mechanism to fully account for export proceeds from the hunting sector. The continued participation of U.S. hunters, including Mr. Ragazzine, in this market is anticipated to continue to maintain the viability of managing areas such as the BVC and SVC in their current form, including their contribution to conservation of lions in the wild. In 2015, lion sport-hunting generated USD 753,000 in revenue, which accounts for about 9% of all sport hunting revenue in Zimbabwe that year (ZPWMA 2016).

After evaluating the information provided by the Zimbabwe government and other sources, it appears that the hunting program in Zimbabwe is addressing the three main threats that were identified by the Service when making the determination that the species was threatened with the possibility of extinction. Moreover, hunting areas such as BVC and SVC are maintaining habitat for lions and ensuring that there is no further loss, provided that the hunting areas can remain economically viable. In order to maintain a viable population of lions, the parks, safari areas, and CAMPFIRE areas must maintain biodiversity and a sustainable prey base. Finally, Zimbabwe is actively working to reduce human-lion conflicts and the number of lions killed in retaliation for killing livestock. Therefore, the management of lions within Zimbabwe and the limited hunting of lions contributes to the on-going survival of the species in Zimbabwe.

The participation of Mr. Ragazzine in the hunting and subsequent import of the trophy lion he harvested in the SVC provides an indirect benefit to wild lion populations by helping to support the reserves where lions are found; Mr. Ragazzine's hunt has generated revenue to help support a hunting area where lions are found and conserved. Therefore, based on the information available to the Service, the probable direct and indirect effect that issuing an import permit for a legally hunted lion would have on the species would be positive.

17.32(a)(2)(iii): Whether the permit, if issued, would in any way, directly or indirectly, conflict with any known program intended to enhance the survival probabilities of the population from which the wildlife sought to be covered by the permit was or would be removed:

As stated above, Zimbabwe is monitoring and controlling the harvest of lions through permitting under their regulations and through the *Strategy and Action Plan*. The issuance of import permits for lions legally hunted under these authorities would not conflict with any programs intended to enhance the survival probability of the species in Zimbabwe. Issuance of a permit authorizing import of Mr. Ragazzine's trophy lion from Zimbabwe would work in favor of, not against, the principal acts governing lion conservation in Zimbabwe. Furthermore, sport

hunting opportunities help local communities realize the value in conserving the African lion.

Therefore, based on the information available to the Service, the issuance of an import permit for a legally hunted lion does not conflict with known conservation programs.

17.32(a)(2)(iv): Whether the purpose for which the permit is required would be likely to reduce the threat of extinction facing the species of wildlife sought to be covered by the permit:

Considering Zimbabwe's limited, controlled off-take of lions in a manner that maintains sustainability, Mr. Ragazzine's legal hunt contributes to reducing the threat of extinction of lions. It appears that the permitting activities under Zimbabwe's laws and CITES, as well as the implementation of the adaptive age-based lion quota, and a continuation of implementation of the outputs in the *Strategy and Action Plan* are working in concert to promote the long-term survival of lions in the wild in Zimbabwe. The use of revenue received from hunters, such as Mr. Ragazzine, to manage the populations on the reserves is an important element of the success of lion management in Zimbabwe. For example, hunting operators in the SVC spend USD 546,000 annually on anti-poaching activities (Lindsey et al. 2012). Therefore, based on the information available to the Service, the issuance of the requested import permit for Mr. Ragazzine's legally hunted lion will likely reduce the threat of extinction facing lions in Zimbabwe.

17.32(a)(2)(v): The opinions or views of scientists or other persons or organizations having expertise concerning the wildlife or other matters germane to the application:

Based on reviewing comments made during the listing process for lions, as well as information obtained through personal conversations and literature, there is general agreement that hunting, done properly and well managed, would not have an adverse effect on lion populations. Numerous researchers have stated that, while they may not support hunting in general, they see that benefits can be received through a scientifically based hunting program for lions.

Based on the information available to the Service, there is general support by scientists and other persons or organizations having expertise concerning lions that the legal and sustainable harvest of lions, and the subsequent import of legally harvested lion trophies, as proposed in this application, would not have an adverse effect on the species and would further efforts to conserve the species in the wild into the future.

17.32(a)(2)(vi): Whether the expertise, facilities, or other resources available to the applicant appear adequate to successfully accomplish the objectives stated in the application:

Mr. Ragazzine submitted a permit application to import a trophy of his personally, legally harvested lion from Zimbabwe for the purpose of enhancing the propagation or survival of the species in the wild. As a sport-hunter, Mr. Ragazzine plays a large role in the hunting industry of Zimbabwe; the hunting and subsequent import of Mr. Ragazzine's trophy lion increases the funds available to the Zimbabwe Government and SVC to implement lion conservation initiatives. Therefore, based on the Service's review of the information available relating to Mr. Ragazzine's permit request, we find that the expertise, facilities, or other resources available to Mr. Ragazzine appear adequate to successfully accomplish the objectives stated in the application.

Conclusion

As described above, the Government of Zimbabwe has been documented to implement the *Strategy and Action Plan* in the manner identified in the documents referenced in making this finding. The on-going adaptive management and limited and sustainable off-take of lions is important to the survival of lions in Zimbabwe, and the funds generated by Mr. Ragazzine's participation contributes to the ongoing benefits the program provides to lions in the wild.

Therefore, based on the Service's consideration and analysis of the information associated with Mr. Ragazzine's permit application and other relevant information available to the Service, as described above, we find that the import of the lion harvested by Mr. Ragazzine on November 27, 2017, from the Savé Valley Conservancy, Zimbabwe, meets the requirements for making a positive enhancement finding pursuant to 50 CFR 17.40(r) and 50 CFR 17.32(a). Therefore, the Service is able to authorize the import of the trophy of one lion taken from the wild in Zimbabwe, to Justin Michael Ragazzine of Youngstown, Ohio.

I. **Service Program and Geographic Area or Station Name**: Branch of Permits, Division of Management Authority, International Affairs

II. **Flexible Funding Program** (e.g. Joint Venture, etc.) if applicable: N/A

III. **Location**: 5275 Leesburg Pike, MS: IA, Falls Church, VA 22041-3803

IV. **Species/Critical Habitat**:

Southern and Eastern African lion (*Panthera leo melanochaita*)

Critical Habitat: N/A

V. **Project Description:** Describe proposed project or action or, if referencing other documents, prepare an executive summary (attach additional pages as needed):

As described in the permit application, 74840C, Justin Michael Ragazzine, has requested a permit to import a trophy of one lion that he lawfully hunted in Zimbabwe. The import is for personal purposes.

VI. **Determination of Effects:**

(A) Description of Effects: Describe the action(s) that may affect the species and critical habitats listed in item IV. Your rationale for the Section 7 determinations made below (B) should be fully described here.

Issuance of the requested import permit by the Branch of Permits will result in the importation of one personally sport-hunted lion that has been lawfully taken in Zimbabwe on the date specified in the permit application.

The trophy will be accompanied by the required CITES export permit issued by the CITES Management Authority of Zimbabwe.

The requestd U.S. Federal Fish and Wildlife import permit does not authorize the killing of an African lion; the authorization to hunt and lawfully take a lion is under the purview of the government of Zimbabwe. Therefore, the proposed action of issuing a Federal Fish and Wildlife import permit for this lawfully hunted lion will not directly or indirectly affect individuals of listed or proposed species or designated/proposed critical habitat of such species.

(B) Determination: Determine the anticipated effects of the proposed project on species and critical habitats listed in item IV. Check all applicable boxes and list the species (or attach a list) associated with each determination**.**

Determination

No Effect: This determination is appropriate when the proposed project will not directly or indirectly affect (neither negatively nor beneficially) individuals of listed/proposed/candidate species or designated/proposed critical habitat of such species. **No concurrence from DSA/ESFO required.** **X**

May Affect but Not Likely to Adversely Affect: This determination is appropriate when the proposed project is likely to cause insignificant, discountable, or wholly beneficial effects to individuals of listed species and/or designated critical habitat. **Concurrence from DSA/ESFO required.** _____

May Affect and Likely to Adversely Affect: This determination is appropriate when the proposed project is likely to adversely impact individuals of listed species and/or designated critical habitat. **Formal consultation with DSA/ESFO required.** _____

May affect but Not Likely to Jeopardize candidate or proposed species/critical habitat: This determination is appropriate when the proposed project may affect, but is not expected to jeopardize the continued existence of a species proposed for listing or a candidate species, or adversely modify an area proposed for designation as critical habitat. **Concurrence from DSA/ESFO optional.** _____

Likely to Jeopardize candidate or proposed species/critical habitat: This determination is appropriate when the proposed project is reasonably expected to jeopardize the continued existence of a species proposed for listing or a candidate species, or adversely modify an area proposed for designation as critical habitat. **Conference with DSA/ESFO required.** _____

JUSTIN MICHAEL RAGAZZINE
(b) (6) [redacted]
YOUNGSTOWN, OH 44511
U.S.A.

Authority: Statutes and Regulations: 50 CFR 17.40(r).

Location where authorized activity may be conducted:
IMPORT THROUGH ANY PORT LISTED IN 50 CFR 14.12

Reporting requirements: Not applicable

Authorizations and Conditions:

A. Authorized to import the sport-hunted trophy of one male African lion (*Panthera leo melanochaita*), taken in Zimbabwe for the purpose of enhancement of the survival of the species.

B. Specimen may not be sold or transferred for any financial remuneration.

C. **Trophy must have been taken during the 2017 hunting season.**

D. Trophy must be accompanied by a valid trophy permit or hunting license issued by the government of Zimbabwe for the 2017 season.

E. Trophy must be accompanied by a valid Convention on International Trade in Endangered Species (CITES) Appendix II export permit/re-export certificate, source code "W", issued by the Management Authority of the exporting/re-exporting country.

F. General conditions set out in Subpart D of 50 CFR 13, and specific conditions contained in Federal regulations cited above, are hereby made a part of this permit. All activities authorized herein must be carried out in accord with and for the purposes described in the application submitted. Continued validity, or renewal of this permit is subject to complete and timely compliance with all applicable conditions, including the filing of all required information and reports.

G. The validity of this permit is also conditioned upon strict observance of all applicable foreign, state, local, tribal, or other federal law. **This permit can be photocopied.**

H. Valid for use by permittee named above.

I. Acceptance of this permit serves as evidence that the permittee understands and agrees to abide by the "General Permit Conditions" (copy attached).

RCVD DEC 08 2017

Complete Sections A or B, and C, D, and E of this application. U.S. address may be required in Section C, see instructions for details.
See attached instruction pages for information on how to make your application complete and help avoid unnecessary delays.

A. Complete if applying as an individual

1.a. Last name	1.b. First name	1.c. Middle name or initial	1.d. Suffix
TAYLOR	CHRISTOPHER	EDWARD	MR

2. Date of birth (mm/dd/yyyy)	3. Social Security No.	4. Occupation	5. Affiliation/ Doing business as (see instructions)
(b) (6)			

6.a. Telephone number	6.b. Alternate telephone number	6.c. Fax number	6.d. E-mail address
(b) (6)			

B. Complete if applying on behalf of a business, corporation, public agency, Tribe, or institution

1.a. Name of business, agency, Tribe, or institution	1.b. Doing business as (dba)
N/A	

2. Tax identification no.	3. Description of business, agency, Tribe, or institution

4.a. Principal officer Last name	4.b. Principal officer First name	4.c. Principal officer Middle name/ initial	4.d. Suffix

5. Principal officer title	6. Primary contact name

7.a. Business telephone number	7.b. Alternate telephone number	7.c. Business fax number	7.d. Business e-mail address

C. All applicants complete address information

1.a. Physical address (Street address; Apartment #, Suite #, or Room #; no P.O. Boxes)
(b) (6)

1.b. City	1.c. State	1.d. Zip code/Postal code:	1.e. County/Province	1.f. Country
Berthold	ND	58718	Ward	USA

2.a. Mailing Address (include if different than physical address; include name of contact person if applicable)
(b) (6)

2.b. City	2.c. State	2.d. Zip code/Postal code:	2.e. County/Province	2.f. Country
Berthold	ND	58718	Ward	USA

D. All applicants MUST complete

1. Attach check or money order payable to the U.S. FISH AND WILDLIFE SERVICE **in the amount of $100, nonrefundable processing fee**. Federal, Tribal, State, and local government agencies, and those acting on behalf of such agencies, are exempt from the processing fee – ***attach documentation of fee exempt status as outlined in instructions.*** (50 CFR 13.11(d))

2. Do you currently have or have you ever had any Federal Fish and Wildlife permits?
Yes ☑ If yes, list the number of the most current permit you have held or that you are applying to renew/re-issue: 15US76241B/9 No ☐

3. Certification: I hereby certify that I have read and am familiar with the regulations contained in ***Title 50, Part 13 of the Code of Federal Regulations*** and the other ***applicable parts in subchapter B of Chapter I of Title 50***, and I certify that the information submitted in this application for a permit is complete and accurate to the [illegible] any false statement herein may subject me to the criminal penalties of 18 U.S.C. 1001.

(b) (6)

[illegible]ble for permit (No photocopied or stamped signatures) — Date of signature (mm/dd/yyyy): 11/27/17

E. IMPORT OF SPORT-HUNTED TROPHIES *(Appendix I of CITES* and/or *ESA)*

Note 1: If you hold an import permit for trophy/trophies that you did not use, please **return the unused original permit**. If you are requesting reissuance of a permit because you have taken a trophy, but are unable to import it prior to the expiration of the permit, please use the renewal form (3-200-52; http://www.fws.gov/international/permits/by-form-number/index.html) and return your original permit with that form.

Note 2: Applications for species listed as endangered under the U.S. Endangered Species Act are published in the Federal Register for a 30-day public comment period. Please allow at least **90 days** for the application to be processed.

Note 3: USFWS has determined that a trophy consists of raw or tanned parts of a specimen taken by a hunter during sport hunt for personal use. It may include the bones, claws, hair, head, hide, hooves, horns, meat, skull, teeth, tusks, or any taxidermied part, including, but not limited to, a rug or taxidermied head, shoulder, or full mount. It does not include articles made from a trophy, such as worked, manufactured, or handicraft items for use as clothing, curios, ornamentation, jewelry, or other utilitarian items. If you wish to import such products, please contact the Division of Management Authority for the proper application form.

Note 4: Certain hunting trophies, including leopard, elephant, and rhinoceros hunting trophies, are subject to restrictions on their use after import into the United States. Please see 50 CFR 23.55 for more information or contact the Division of Management Authority.

Please provide the following information. Complete all questions on the application. Mark questions that are not applicable with "N/A". If needed, use a separate sheet of paper. On all attachments or separate sheets you are submitting; please indicate the application question number you are addressing. If applying for more than one trophy, be sure to answer questions 1-5 for each trophy addressed in this application. If importing trophies from more than one country, you must submit a separate application for each shipment in order to obtain separate import permits.

1. For each trophy to be imported, provide:
   a. Scientific name (genus, species, and, if applicable, subspecies) and common name.

      Panthera. leo. melanochaita (African lion)

   b. Sex (if known).

      Male

2. **IF ANIMAL IS CURRENTLY LIVING IN THE WILD**, please enter the following:
   a. Country and PLACE (area, region, GIS coordinates, ranch AND nearest city) where wildlife is to be taken from the wild:

      Bubye Valley Conservancy, Masvingo Province, Zimbabwe

   b. Date wildlife is to be hunted:

      Between the 21st May 2018 and the 7th June 2018

   c. Description of the trophy and parts you intend to import (e.g., skin, skull, shoulder mount, life size mount, claws, horn, tusks).

      Skin (Life size mount including claws) and the skull

3. **IF THE ANIMAL IS DEAD**, please enter the following:
   a. Country and PLACE (area, region, GIS coordinates, ranch AND nearest city) where wildlife was removed from the wild (provide a map if possible):

   b. Date wildlife was hunted:

c. Description of the trophy and parts you intend to import (e.g., skin, skull, shoulder mount, life size mount, claws, horn, tusks).

d. The current location of the trophy (address and country) [the U.S. import permit will identify this country as the country of export/re-export and must match with the export/re-export documents]:

4. Complete name and address of overseas person or business shipping the trophy to you. If you are applying to import a trophy directly from Namibia, you must provide the name and address of the professional hunter listed on your Namibian hunting permit [this name will also appear on your Namibian export permit and must match the U.S. import permit].

Name:	
Business Name:	TROPHY CONSULTANTS INTERNATIONAL
Address:	4 JOSIAH CHINAMANO ROAD
Address:	BELMONT
City:	BULAWAYO
State/Province:	
Country, Postal Code:	ZIMBABWE

5. Please be aware that the U.S. Fish and Wildlife Service must make a finding that your activities will enhance or benefit wild populations of the species involved. If you have any information that could support this finding (e.g., population status or trend data; how the funds from license/trophy fees will be spent; what portion of the hunting fee will support conservation), please submit such information on a separate page with your application.

Please see information provided by Conservation Force, Bubye and Save Valley Conservancies, Zimbabwe authorities, safari operators, and others

CERTIFICATION STATEMENT (original signature must be provided for either 6 or 7 below)

6. **If you are a broker or taxidermist applying on behalf of a foreign national,** provide documentation to show you have a **Power of Attorney** to act on your client's behalf and sign the following statement.

I acknowledge that the sport-hunted trophy/trophies to be imported has been/will be personally hunted by my client and is being imported only for my client's personal use (i.e., **not for sale, transfer, donation, or exchange that is reasonably likely to result in economic use, gain, or benefit**). I understand that my client may only import two leopard trophies in one calendar year (if applicable). In addition, I have advised my client that raw ivory, once imported into the United States, cannot be re-exported.

Taxidermist/Broker's signature: N/A Date: _____

7. **If you are the hunter applying to import your own trophy,** please read and sign the following statement.

I acknowledge that the sport-hunted trophy/trophies to be imported has been/will be personally hunted by me and is being imported only for my personal use (i.e., **not for sale, transfer, donation, or exchange that is reasonably likely to result in economic use, gain, or benefit**). I understand that I may only import two leopard trophies in one calendar year (if applicable). In addition, I understand that raw ivory, once imported into the United States, cannot be re-exported.

Applicant's signature: (b) (6) Date: 11/27/17

Be aware that there may be additional permitting or approval requirements by your local or state government, as well as required by other Federal agencies or foreign government to conduct your propose activity. While the Service will attempt to assist you, it is your responsibility to obtain such approval.

8. All international shipment(s) must be through a designated port. A list of designated ports (where an inspector is posted) is available from http://www.fws.gov/le/designated-ports.html. If you wish to use a port not listed, please contact the Office of Law Enforcement for a Designated Port Exemption Permit (form 3-200-2).

9. Name and address where you wish permit mailed, if different from page 1 (All permits will be mailed via the U.S. Postal Service, unless you identify an alternative means below):

10. If you wish the permit to be delivered by means other than USPS regular mail, provide an air bill, pre-paid envelope, or billing information. If you do not have a pre-paid envelope or air bill and wish to pay for a courier service with your credit card, please check the box below. Please DO NOT include credit card number or other information; you will be contacted for this information.

☐ If a permit is issued, please send it via a courier service to the address on page 1 or question 9. I understand that you will contact me for my credit card information once the application has been processed.

11. Who should we contact if we have questions about the application? (Include name, phone number, and email):
Attorneys at Conservation Force, 504-837-1233, cf@conservationforce.org

12. **Disqualification Factor**. A conviction, or entry of a plea of guilty or nolo contendere, for a felony violation of the Lacey Act, the Migratory Bird Treaty Act, or the Bald and Golden Eagle Protection Act disqualifies any such person from receiving or exercising the privileges of a permit, unless such disqualification has been expressly waived by the Service Director in response to a written petition. (50 CFR 13.21(c)) Have you or any of the owners of the business, if applying as a business, been convicted, or entered a plea of guilty or nolo contendere, forfeited collateral, or are currently under charges for any violations of the laws mentioned above?

☐ Yes ☑ No If you answered "Yes" provide: a) the individual's name, b) date of charge, c) charge(s), d) location of incident, e) court, and f) action taken for each violation.

Please be aware that we process application on a first come first serve basis and due to the number of applications we receive some delays are unavoidable.

ALERT You may have noticed that our application forms expired 5/31/2017 . The forms are currently undergoing periodic review by the Office of Management and Budget. Once that process is complete, we will post updated application forms. In the interim, please continue to use the application forms available from our website with the expiration date 5/31/2017. We will continue to accept those forms until new ones become available. However, please check back each time you submit a new application to see whether our new forms have been posted. We do not accept applications via fax or e-mail.

Sign up for our e-newsletter to learn how we're working around the globe to protect species and their habitats!

SUMMARY OF STEPS TAKEN BY ZIMBABWE TO IMPROVE THE MANAGEMENT OF LION SPORT-HUNTING

i – Banning of all lioness hunting in Zimbabwe

ii – Hunting moratoria around the Gonarezhou and Hwange National Parks

iii – Removal of fixed hunting quotas

iv – Age restrictions on sport-hunted lions

v – Scientifically-based adaptive quota management system

SUMMARY OF LION SPORT-HUNTING'S CONTRIBUTION TO CONSERVATION

i – Lion sport-hunting contributes 33.9% to 42.4% of total revenue on private land

ii – Lion sport-hunting generates up to US$ 557 km^{-2}

iii – Anti-poaching (in particular that of rhinoceroses) costs ~US$ 216 km^{-2}

INTRODUCTION

THE United States Fish and Wildlife Service (USFWS) have recently evaluated the conservation status of the lion *Panthera leo* with particular regard to sport-hunting (http://www.fws.gov/endangered/what-we-do/lion.html [accessed 2015-01-19]). The results of this evaluation have led to the formal protection of two subspecies under the Endangered Species Act, classifying *P. l. leo* as endangered and *P. l. melanochaita* as threatened. Together these subspecies apparently represent all of the lions in Africa (Barnett et al. 2014).

Sport-hunting is a legal activity in which the international import/export of trophies is both sanctioned and carefully controlled by the Convention on International Trade in Endangered Species of Wild Fauna and Flora (CITES). The USFWS found that the sport-hunting of *P. l. melanochaita* "*if well managed, may provide a benefit to the subspecies*" (http://www.fws.gov/endangered/what-we-do/lion.html [accessed 2015-01-19]). Here we explore this statement further, and present data from three long-term *in situ* lion research projects; the Bubye Valley Conservation Research Initiative, Savé Val-

ley Conservancy Research, and the Hwange Lion Research Project.

The data presented in this report clearly illustrates the positive conservation benefit that well-managed trophy hunting of lions can have for the species, as well as the importance of hunting in maintaining the wildlife in an area; addressing Point 5 on page 3 of the Federal Fish and Wildlife Permit Application Form (Form 3-200-20) [i.e. "*Please be aware that the U.S. Fish and Wildlife Service must make a finding that your activities will enhance or benefit wild populations of the species involved. If you have any information that could support this finding (e.g., population status or trend data; how the funds from license/trophy fees will be spent; what portion of the hunting fee will support conservation), please submit such information on a separate page with your application*"].

Figure 1: The lions pictured here, known as Winston (*standing*) and Geronimo (*lying*), were both collared in March 2012 when they were the dominant males in the Matombosa area and have been continuously monitored ever since as part of the on-going long-term WildCRU Bubye Valley Conservation Research Initiative. In November 2015 Geronimo, who was approximately 9 years old, died after succumbing to injuries sustained from fighting with another male. Winston, also 9 years old, has since lost his dominant status, lost his territory to two 4.5 year old males, become nomadic and avoids contact with other males. As of this report being written, the recent litter of cubs that both Winston and Geronimo sired are still alive.

Most importantly, since July 2013 there has been a continuous self-imposed internal reform of the lion hunting industry in Zimbabwe that is actively participated in and supported by all of the relevant stakeholders, including; the Zimbabwe Parks and Wildlife Management Authority (ZPWMA), non-governmental organisations, professional hunters, safari operators, scientists and researchers.

Here we discuss the results of this process in terms of robust evidence regarding the sustainability and self-regulation of lion hunting in Zimbabwe.

Figure 2: Winston and Geronimo's cubs.

LIONS – *Panthera leo*

The IUCN Red List have recently reclassified lions as Vulnerable (remaining as such since 1996; IUCN 2015), estimating that there are between 20,000 and 30,000 free-ranging lions left (Bauer et al. 2015a) in less than 25% of their historic range (IUCN 2006). However, this generalised classification does not take into account an apparent conservation dichotomy: sample subpopulations of lions in Botswana, Namibia, South Africa and Zimbabwe have in fact increased overall (Bauer et al. 2015a). Lions were historically present throughout Africa, some of Europe, the Middle East and Asia (Bauer and Van Der Merwe 2004), but current conservation strongholds remain only in parts of eastern

and southern Africa (Brassine and Parker 2012; Nowell and Jackson 1996). The current lion population estimate for Zimbabwe's major lion areas is approximately 2,600 individuals [Hwange-Matetsi Complex: 750, South Eastern Lowveld: 350, Gonarezhou National Park: 60, Malilangwe: 37, Savé Valley Conservancy: 284, Bubye Valley Conservancy: 500, Mid-Zambezi Valley Complex: 600], though the actual number would be larger if there were data available for the countries minor lion areas that are yet to be surveyed] (ZPWMA 2015).

The lion is a uniquely social felid, forming coalitions of up to nine males associated with one or more female prides that may consist of more than 20 individuals (Macdonald et al. 2010; Schaller 1972). Lions are infamously infanticidal (Schaller 1972), where males will kill unrelated cubs so as to bring the female into oestrus and present an opportunity to sire their own litter, which is often used as an argument against sport-hunting of the species (e.g. Packer et al. 2010), where it is feared that the removal of dominant males causes cub mortality that eventually results in lowered population recruitment and survival (Packer et al. 2009). Infanticide, however, does not result from sport-hunting when age-appropriate males, past their prime and no longer territorial or with dependent cubs, are harvested (Whitman et al. 2004). Moreover, the fission-fusion nature of lion society (Mosser and Packer 2009; Pusey and Packer 1987) means that infanticide may still occur when the dominant males are simply not present there and then to defend their cubs (B. du Preez, pers. obs.).

In the 1990's, lions were successfully reintroduced into private areas in parts of their former range, where they achieved high reproductive and survival rates (Miller and Funston 2014). However, the resultant population growth inevitably led to the potential problem of overabundance (Funston 2008) and low genetic diversity (Trinkel et al. 2010), with both of these issues requiring active and intensive management (Hunter et al. 2007) and ultimately reducing the conservation value of these lion populations (Miller and Funston 2014). The ability to translocate lions originally facilitated the relief of overpopulation, but as the available areas for relocations were used up, sport-hunting and euthanasia have subsequently become the main methods of lion population control (Miller and Funston 2014).

The lion is the apex predator wherever it occurs (Macdonald et al. 2010), and is an ideal conservation umbrella; being large, charismatic and easily observable (e.g. Williams et al. 2000). Lions are important to commercial wildlife ventures, which risk losing significant market share where they cannot offer them to clients (Lindsey et al. 2007), and are thus prioritised in conservation; exploiting their charisma to attract tourists and raise the funds required in ensuring that wildlife areas remain viable. The lion is also a particularly valuable species in the sport-hunting industry, rivalled only in demand by buffalo *Syncerus caffer* and leopard *Panthera pardus* (Creel and Creel 1997), and are therefore prevalent in private wildlife areas (Packer et al. 2013) where their populations can achieve exponential growth rates given the protection and resources afforded by well-managed operations (Smuts et al. 1978; Loveridge et al. 2007b; Kettles and Slotow 2009; Miller and Funston 2014).

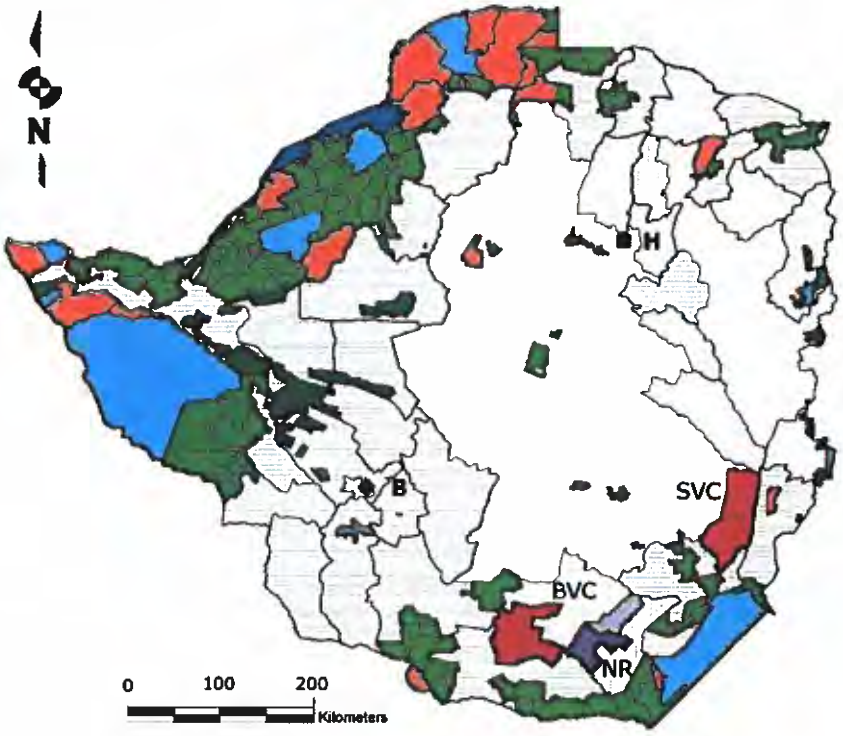

Figure 3: Map of Zimbabwe's main wildlife areas: [*i*] National Parks are represented in light blue; [*ii*] Safari areas are represented in orange; [*iii*] Forestry areas are represented in dark green; [*iv*] Community and Private wildlife areas are represented in light green; [*v*] Communal Land (CAMPFIRE Areas) in which sport-hunting may occur is represented by light green horizontal stripes; [*vi*] Communal Land in which sport-hunting does not occur is represented by grey vertical stripes. [*vii*] The Bubye Valley [BVC] and Savé Valley [SVC] Conservancies are represented in red. [*viii*]The Nuanetsi Ranch [NR] on which sport-hunting takes place is represented in dark purple (light purple represents the Nuanetsi Ranch cattle area); [*ix*] Lake Kariba is represented in dark blue. Harare (the capital city) is represented by a black square and letter '**H**'. Bulawayo is represented by a black diamond and letter '**B**'. Sport-hunting may occur in areas: *ii, iii, iv, v, vii & viii*

The ability of lions to rapidly increase in abundance is an aspect of their ecology that is often overlooked. Lion populations can achieve exponential growth rates (Miller and Funston 2015; Groom and Watermeyer 2015; du Preez et al. in prep.), and the problems associated with high lion densities fast present themselves and require significant investment in their solution (Hunter et al. 2007; Kettles and Slotow 2009; Loveridge et al. 2007; Packer et al. 2013; Smuts 1978). Whilst unregulated sport-hunting of lions (in particular that of dominant males and pride females) may result in population declines (e.g. Packer et al. 2010; Packer et al. 2009), restricting offtake to only males over

a certain age (i.e. have already bred and/or are no longer dominant) has no impact on lion population persistence, irrespective of quota size (Whitman et al. 2004). Such is the situation currently facing both the Bubye Valley and Savé Valley Conservancies, where the lion populations continue to grow despite sport-hunting and increasing quotas. Whilst sport-hunting may not alleviate over-population in these areas, it does somewhat offset the cost of keeping lions. Culling of lions may be the only realistic option for controlling numbers in larger areas, as the use of contraceptives is likely to be inefficient and expensive. Because of fears about public sentiment associated with sport-hunting, it has now become common practice for managers to cull excess lions in more than 45 wildlife areas in South Africa to which lions have been introduced, and which resulted in the wasteful destruction of about 200 lions in 2012 (Miller and Funston 2014).

CONSERVATION AND SPORT-HUNTING

There is more land area in Africa conserved for hunting than there is in all of Africa's formally protected areas combined: approximately 1.4 million km^2, which exceeds the total area covered by national parks by 22% (Lindsey et al. 2007). For wildlife conservation to be successful outside of national parks, these areas must be self-sufficient and able to generate sufficient revenue to cover the considerable costs of protecting the habitat and wildlife therein (Lindsey et al. 2006). Indeed, conservation would benefit from an incentive to utilise land for wildlife rather than the alternatives of livestock grazing, agriculture, and deforestation.

The international trade of lions, including trophies, is controlled by a strict CITES licensing system on the basis that this trade does not endanger the ultimate survival of the population (https://www.cites.org/eng/disc/how.php [accessed 2015-01-19]). The positive aspects of sport-hunting as a conservation tool include a focus on males and a low percentage off-take; neither of which generally jeopardise populations, and also suggest that hunting could play a role in population recovery (Leader-Williams et al. 2005).

The recommendation of setting uniform harvest limits, e.g. 1 lion 2,000 km^{-2} (Lindsey et al. 2012; Packer et al. 2010), may be overly simplistic, affect the economics of wildlife based landscape use, and disincentivise investment in conservation (Lindsey et al. 2007). A more practical approach to sustainably setting realistic lion sport-hunting quotas could involve using a positive/negative feedback method that calculates a fluid quota per area based on the previous season's performance. Such an adaptive quota management system has already been implemented in Zimbabwe.

ZIMBABWE'S ADAPTIVE LION QUOTA MANAGEMENT SYSTEM

An adaptive quota management system for lion hunting based on the ages of lions hunted was agreed on in July 2013 in Harare, Zimbabwe, during a meeting hosted by the Zimbabwe Parks and Wildlife Management Authority (ZPWMA) and an independent non-governmental conservation organisation. The points system is summarised in Table 1.

Table 1: *Points allocated to hunting blocks arising from the harvest of lions of different ages*

	≥ 6 years	No trophy	5 years old	4 years old	< 4 years	Failure to submit return, or incomplete return
For quotas of ≥3	4	3	3	2	-3	0
For quotas of 2	4	3	3	2	0	0
For quotas of 1	6	3	3	2	0	0
Resultant quota	*These points are added up and divided by 3 to yield the quota for next year*					

During 2013, operators were requested to submit hunt returns and photos as a trial run to get the system up and running. In 2014 operators were requested to do the same but were informed that the age of the lions hunted in 2014 would determine their lion quotas in 2015. The 2015 lion hunt results would thus also determine the 2016 quota.

Results of the Adaptive Lion Quota Management System

In 2015 there was a marked increase in the age of lions hunted in Zimbabwe as a whole. Notably, only one lion of <4 years of age was hunted and the large majority of lions were 5 years or older (Figure 4). In 2013, only 28% of the lions hunted were 5 years or older, in 2014 that figure had risen to 49% and in 2015 to 77.3% (Figure 5). The proportion of lions hunted that were less that 5 years of age dropped overall between 2013 and 2015 (Figure 6). For this achievement, credit is due to the hunting community for showing greater selectivity of harvest. A word of caution however, is that the majority of lions hunted were on the cusp of 5 - 6 years of age and were not older than six years. Restricting hunting to individuals that are at least six (and preferably older) is desirable from a biological perspective due to the reduced risk of the loss of pride males and infanticide of cubs associated with the harvest of such individuals (Whitman et al. 2004).

In 2015 the Zimbabwe national lion hunting quota was set at 85 lions. Of this 85, only 39 were hunted in 2015, and based on the resultant score from aging the trophies, and the fact that operators chose not to hunt lions of inadequate age (see Figures 4, 5 & 6), the recommended quota for 2016 was set at 75 [Harare 2015-11-11]. (The Rural District Council areas in which lions occur are currently exempted from the age restrictions, as was agreed upon at the 2013 lion management meeting in Harare, as a means of ensuring that impoverished communities obtain the opportunity to benefit from the presence of lions, recognising the potential negative impacts the species has on the livelihoods of livestock farmers).

Using these figures and estimating the average value of a lion safari at approximately US$ 80,000 then a 50% offtake (35 lions) would generate US$ 2,800,000 annually. If management costs are approximately \$150 km^{-2} (V. Booth, pers. comm.), then the lion safaris alone can support 18,600 km^{-2} of wildlife habitat in Zimbabwe.

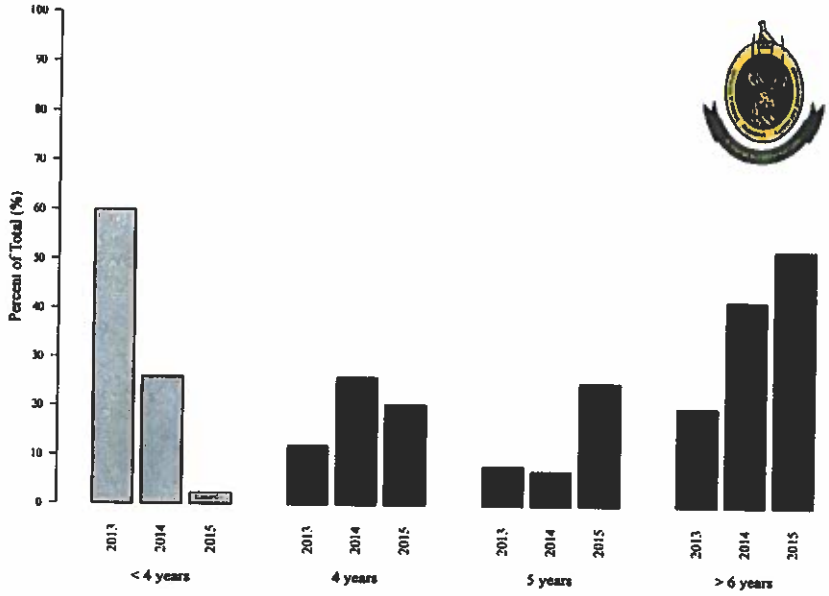

Figure 4: The percentage of lions hunted in each age class in 2013, 2014 and 2015 in Zimbabwe.

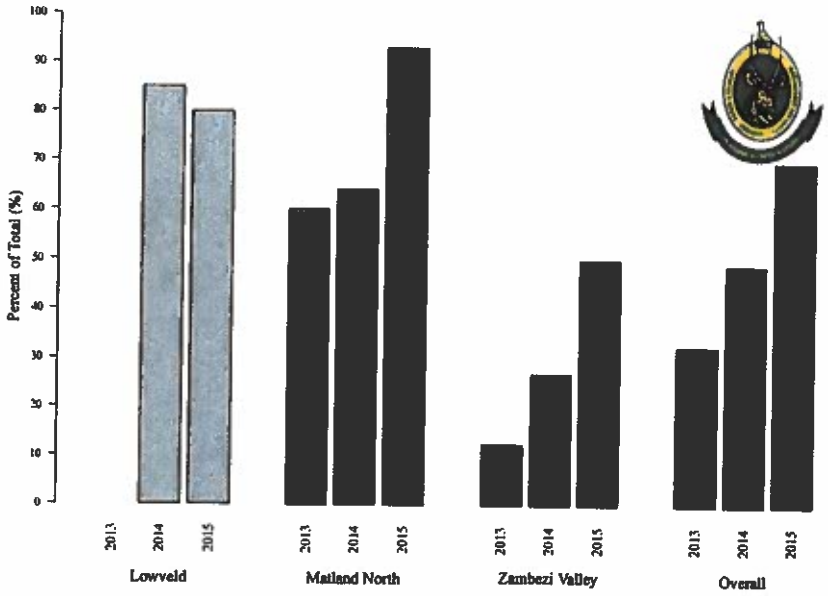

Figure 5: The proportion of lions hunted that were 5 years or older in the three main lion-hunting areas of Zimbabwe.

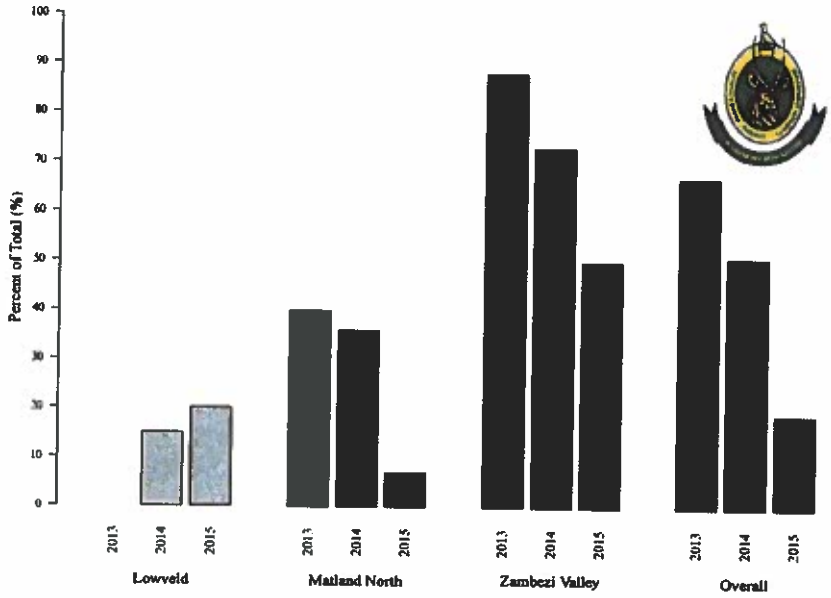

Figure 6: The proportion of lions hunted that were less than 5 years of age in the three main lion-hunting areas of Zimbabwe.

Table 2: *Human and Lion Conflict (2009 - 2011) in Zimbabwe, including human mortality caused by lion (CAMPFIRE Association, 2012)*

District	Total Incidents	Livestock killed	*People Injured*	*People Killed*

Chiredzi	25	136	*0*	*0*
Mbire	5	7	*0*	*5*
Binga	9	39	*0*	*0*
Total	44	183	*2*	*7*

Human-Lion Conflict

The lion is a flagship species and powerful symbol of Africa; yet living with lions poses hardships for many communities (e.g. Table 2). In some areas, the lion is a major predator on domestic livestock, inevitably leading to conflicts with local herders. Both sides suffer in this situation.

Outside of protected areas, the lion's prey base is much reduced, which results in relatively greater chance of encountering livestock. Co-existence of lions with people may be enhanced by giving value to lions through tourism and hunting promoted in communal lands under the Communal Area Management Programme for Indigenous Resources (CAMPFIRE). This hunting contributes to the conservation of lions via the financial revenue generated, which is ploughed back into conservation of the resource and empowers local communities to invest in their own rural development programs.

THE BUBYE VALLEY CONSERVANCY

History of the Bubye Valley Conservancy

Towards the end of the nineteenth century, the Liebig's Extract of Meat Company (LEMCO) founded an extensive cattle ranch in the Zimbabwean lowveld, to the detriment of the indigenous wildlife that was initially eliminated because of competition for grazing with the livestock, as well as a risk of disease transmission from buffalo and wildebeest *Connochaetes taurinus*. As their natural prey base became depleted, the predators were subsequently persecuted when they began to prey on the livestock. Some wildlife persisted in small pockets of remote habitat, however lion, elephant *Loxodonta africana*, buffalo and rhinoceros *Diceros bicornis* [black] & *Ceratotherium simum* [white] were all completely eradicated. A monoculture of cattle dominated the landscape and impacted on the environment for the better part of a century.

Then, in 1992, Zimbabwe suffered one of the worst droughts on record, a relatively short time after the devastating one of 1983 that LEMCO was still trying to recover from. The frequency and severity of the droughts effectively reduced confidence in the economic viability of cattle ranching in the area, and the Bubye Valley Conservancy was subsequently founded in 1994 with the realisation that endemic wildlife, which are better adapted than livestock to cope with the local climate, could be successfully commercialised (Child 1988; Bond 1993).

The conversion from cattle ranching back to a wildlife area was neither straightforward nor cheap, requiring a significant initial investment and annual running costs. In just 20 years of operation the Bubye Valley Conservancy now protects the world's third largest black rhinoceros population, one of Zimbabwe's largest lion populations, a large and increasing elephant population, and abundant game.

Sport-hunting is an essential step in converting areas that were previously dedicated to livestock farming into non-consumptive tourism areas (Child 1993), and was fundamental to the formation of Bubye Valley Conservancy and allowing the wildlife populations to recover. The Samanyanga area of the Bubye Valley Conservancy, probably the most scenic section, was originally set aside for non-consumptive photographic tourism, but made an annual loss for several years, before, largely due to Zimbabwe's land reform program and resultant instability in the country, it was reverted back to sport-hunting as the only practical and economically viable option (K. Leathem, pers. comm.). Sustainable sport-hunting provides the sole economic incentive to continue operating the Bubye Valley Conservancy as a wildlife conservation area.

Bubye Valley Conservancy Community Support

The Bubye Valley Conservancy donates over 45 tonnes of meat from sport-hunting to the local communities each year. This meat donation is worth over US$ 100,000 per year, and the communities are free to decide how they use it. In addition to this, the Conservancy also supports several schools, clinics, and community projects in the three surrounding districts of Mwenezi, Maranda and Jopempe. The local community thus

sees a direct benefit from the wildlife on the Bubye Valley Conservancy, but is also empowered by job opportunities created both with these special projects, as well as on the Conservancy. A summary of the Bubye Valley Conservancy community support effort between 2011 and 2015 is provided in Table 4.

Bubye Valley Conservancy Lion Monitoring and Management

After originally being eradicated by cattle ranchers in the area, 13 lions were reintroduced to the Bubye Valley Conservancy in 1999, and four young males broke into the Conservancy that same year. From the original 17 animals present in 1999, the Bubye Valley Conservancy lion population was estimated at approximately 280 individuals in 2009 when robust population surveys were initiated by a research team from the University of Oxford Wildlife Conservation Research Unit (WildCRU), and this population has continued to grow. Today it is estimated that there are over 500 lions on the Bubye Valley Conservancy (du Preez et al. 2015). The exponentially increasing Bubye Valley Conservancy lion population currently exists at one of the highest densities in Africa (~0.187 lions km^{-2}: du Preez et al. 2015; Figure 7), greater than that of the Serengeti, Tanzania (0.100 lions km^{-2}: Pusey and Packer 1987; Spong 2002), Selous, Tanzania (0.080 - 0.130 lions km^{-2}: Creel and Creel 1996, 1997), Kruger National Park, South Africa (0.096 - 0.112 lions km^{-2}: Mills 1995), and Hwange National Park, Zimbabwe (0.027 lions km^{-2}: Loveridge et al. 2007). This equates to one of the largest contiguous lion populations in Zimbabwe.

Bubye Valley Conservancy Lion Hunting

The Bubye Valley Conservancy offsets the cost of lion predation on its wildlife via sport-hunting of the species, and which began in 2002. In 2014, the lion hunting quota allocated to the Bubye Valley Conservancy by ZPWMA was 10 individuals. Based on the fact that the entire quota was harvested and that maximum points were scored for each individual trophy (more than six years in age), the allocated quota was raised to 13 lions for 2015. Only 12 out of 13 lions were hunted in 2015 due to a late cancellation; nevertheless eight lions over six years old and four lions of five years old were harvested and the resultant points justifying a quota of 15 lions for 2016.

Table 3: *The Bubye Valley Conservancy annual lion hunting quota and offtake from 2002 to 2015.*

	2002	2003	2004	2005	2006	2007	2008	2009	2010	2011	2012	2013	2014	2015
Approved quota	1	2	3	2	2	2	3	3	5	8	12	10	10	13
Quota taken	1	2	3	2	2	2	2	3	5	8	12	10	10	12
Percentage success	100	100	100	100	100	100	67	100	100	100	100	100	100	92

Note that while the lion hunting quota for Zimbabwe has been voluntarily reduced by the national steering committee, the Bubye Valley Conservancy lion hunting quota has been successively raised twice based on both hunt success and age of lions hunted and the resultant points scored under the national adaptive quota management system (Table 3).

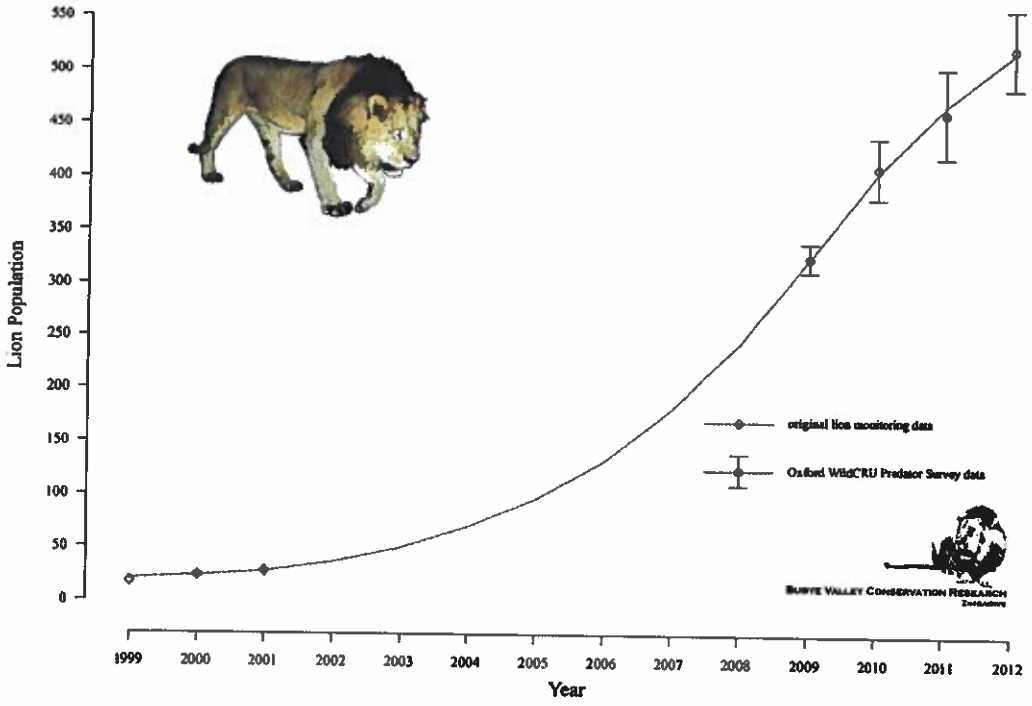

Figure 7: The Bubye Valley Conservancy lion population has grown exponentially since the reintroduction of lions in 1999. Diamonds represent the known lion abundance from monitoring of the original individuals introduced; Points indicate lion abundance calculated from spoor transect analyses; error bars represent the standard error of the mean.

Table 4: *Summary of the Bubye Valley Conservancy support to the surrounding local communities (2011 - 2015)*

Boreholes:	- 1 x Jompembi Village 2 - 1 x Penemene - 1 x Jompembi Village 4 - 1 x Nyimani village (Mwenezi) - 1 x Driehoek School - 1 x Mgaladhivha School - 2 x Mtetengwe to supply water to the clinic site
	- 2 new bush pumps (complete) purchased and installed at Village 2 & Village 3 and troughs built at both sites *Drinking trough for cattle built at Village 2 borehole* *All boreholes equiped with new bushpumps, piping and cylinders* *Boreholes at Village 3, Mtetengwe, Mdzwiti, Vumani and Penemene and Makedo Police post repaired and maintained* *All new piping and pumps etc. are supplied by BVC*
Buildings:	- Mtetengwe Clinic's main building built - 3 x F13 staff houses built *Clinic and House fenced - everything funded and built by BVC* *The clinic is a standard large Government clinic - male & female wards + maternity ward and outpatients* *Storerooms, offices etc. also built* *All houses and buildings are electrified, painted and supplied with running water*
	- Mtetengwe School school office block and staff room built and painted *All classroom windows repaired and the schools second borehole repaired.*
	- Secure engine house was built at the second borehole site - Borehole equipped with BH15S mono pump unit driven by a rebuilt Lister LT 1 engine
	- 5000 litre header tank and stand erected - new 5000 litre header tank purchased and fitted - pipeline laid to connect the borehole to the clinic - another pipeline connected to the same borehole to supply the Mtetengwe school with fresh water
	- New coldroom and refrigeration unit purchased and fitted at the Lutumba butchery *Part of aid program to get the Beit Bridge RDC self funding projects up and running*
	- New coldroom and refrigeration unit was purchased and fitted at the Rutenga butchery *Part of aid program to get the Mwenezi RDC self funding projects up and running*
Meat Donations:	- BVC donates meat on a regularly basis to the Mwenezi Orphange
	- Numerous donations of meat were made to support school sports days & speech nights/prize giving events *Both Beit Bridge & Mwenezi districts*
	- 1600 kgs of meat has been donated each month since July 2011 to a Maranda trust *Administered by Chiefs and local headmen* *Excess meat sold and funds used for community projects* *Classroom roof replaced at Vhongwe school* *4 new classroom blocks constructed at other schools using funds from these monthly allocations*
	- 1000 kgs of meat per month is been donated to Beit Bridge communities since April 2014
	- 1000 kgs of meat per month is been donated to Mwenezi communities since August 2013
Miscellaneous:	- Sports uniforms for the Penemene school team purchased ($2600) *Sports uniforms required for inter-schools sports*
	- Transport the soccer teams representing Mgaladivha, Jompembi and Tongwe *To Lutumba for the inter-school competitions*
	- 2 sets of soccer goal posts & 2 sets of Netball poles were made for Mgaladivha School *New soccer field graded by BVC*
	- 2m security fencing supplied to Penemene School
	- Second hand door and window frames donated to Mapiri school (ex Mazunga School)
	- 1 new 3 1/2 " rod pump cylinder was purchased and fitted to the Vumhani borehole *All repairs to b/holes in the Vumhani area are done by BVC*
	- 26 bags of cement were donated to Mgaladivha School
	- Fencing donated to the Mgaladivha School
	- Supplied 10 x 5/8" mono shafts for the Botalele Clinic (Maranda) borehole
	- Water supply to Mielezi Clinic
	- 400 m pipeline laid to supply the Nyimani Villarge's cattle with water *3.5 m drinking trough build for this same project*
	- 60 bags cement donated to the Welkom for repairs to a dam wall
	- 6 loads of riversand and 20 cement donated to Vumani Preschool
	- Various school renovations in both the Beit Bridge and Maranda areas
Current Projects:	- Construction of a School admin block at Mgaladhivha School
	- Supply of 24 loads of riversand to Mdzwiti School (value $1200)
	- All roofing materials supplied to Mdzwiti School
	- Supply roofing materials, cement, all window and door frames for Vumani Preschool

THE SAVÉ VALLEY CONSERVANCY

History of the Savé Valley Conservancy

The Savé Valley was a wildlife-rich wilderness until the early 1900's, when the first cattle ranching initiatives started in the area. The establishment of Devuli Ranch and Angus Ranch in 1920 paved the way for seven decades of commercial cattle ranching in the area we know today as the Savé Valley Conservancy. Roads were cut, fences erected and an everlasting 'battle' ensued against the wildlife, especially against all predators.

The large predators, especially lions, were virtually eradicated (Pole 1999). However, by the late 1980's, declining range productivity, depressions and droughts forced the landowners to consider alternative options. Around that time, empirical evidence of the competitive advantage of wildlife over livestock began to emerge (Child 1988; Bond 1993), especially in arid areas (Jansen et al 1992; Cumming 1993), and wildlife was finally given serious consideration as a viable land use option.

In 1989, a proposal was drawn up (du Toit 1989) to turn what was then the Sabi Valley Intensive Conservation Area into a wildlife conservancy. The plan was to create a single large wildlife area, especially for the re-establishment of endangered species and overexploited species, with cattle remaining the primary income generator. The Savé Valley Conservancy was constitutionally inaugurated in June 1991, and following the severe 1991/1992 drought, wildlife ranching became the primary land-use. At the time this was the largest private wildlife conservancy in the world (3,410 km^2).

The conservancy members then restocked the wildlife, removed all internal fencing, erected a common perimeter fence and developed effective security systems. A double, electrified, veterinary-approved fence was completed in 1995, and the following decade saw a massive investment in wildlife re-stocking and security systems.

Sport-hunting was essential for the successful transition of the conservancy from cattle to wildlife. During the early years, wildlife densities were low, resulting in poor potential for ecotourism, and hunting generated the income needed to erect the fence, re-stock game, and improve security, especially because of the significant numbers of black rhinoceros now found there. Gradually, some of the ranchers shifted more into ecotourism. One property, Senuko Ranch, completed a 16 bed up-market lodge with a view of marketing non-consumptive safaris, offering game drives and bush walks and specializing in rhino walks and African wild dog *Lycaon pictus* den visits. Lodge occupancy rose from 0% in 1996 to 62% by the end of 1999.

However, the Zimbabwean land reform program, which was initiated in February 2000, soon made a strong negative impression in the international community, and resulted in travel bans and warning from most of Zimbabwe's source markets. This, together with the political instability meant that the wildlife industry and ecotourism industry collapsed over-night: sport-hunting became the only economically viable land use option, and has remained the only tangible source of income to the landowners of the Savé Valley Conservancy. In the case of the Senuko Lodge, for example, the land reform program resulted in a 98% cancellation of

the confirmed bookings. After four years of seeking alternative markets, the lodge could achieve no higher than 17% occupancy, and in 2005 moved back into a hunting-based operation.

A more direct impact of the land reform program for the Savé Valley Conservancy was the loss of 33% of the area of the conservancy to invading subsistence farmers (Lindsey et al 2008). The loss of land was catastrophic and the related pressure from wire snare poaching was extreme. In the following eight years (2001 to 2009), 10,520 illegal hunting incidences were recorded, 84,396 wire snares were removed and at least 6,454 wild animals killed (Lindsey et al. 2011).

Savé Valley Conservancy Community Support and Anti-Poaching

In 2012, conservancy members provided over US$ 100,000 worth of support to adjacent villages or farmers in the resettled areas. Assistance included drilling boreholes, maintaining boreholes, dredging of dams, assisting with building projects in clinics and schools, assisting with repairs, maintenance and materials at schools, education initiatives, school field trips, provision of computer equipment in schools, craft programs and regular donations of meat.

Moreover, the conservancy recently entered into a mutually dependent agreement with the Chiefs representing the communities surrounding the Savé Valley Conservancy. The agreement links the communities to the Natural Resource Utilisation that occurs through the business operation of the conservancy and opens up opportunities for the local indigenous populations to share in any wealth creation. This agreement strengthens relations between the conservancy and the surrounding local communities and creates an environment that helps to protect, conserve and sustain the natural assets of the area. The hunting tourism of the conservancy is currently the only form of income by which the surrounding communities can benefit. Revenues from trophy lion hunting constitute a significant portion of inflow and thus an important part of the community benefits. Any reduction would seriously jeopardise the growth of this infant positive relationship and community empowerment initiative.

The Savé Valley Conservancy is thus pioneering private-community partnerships in Zimbabwe, and trade restrictions on lion trophies will indirectly adversely affect these already seriously impoverished communities through a reduction in available income to share with communities. This is very likely to have a knock on impact on the lions themselves with a significantly reduced tolerance and an increase in retaliatory poisoning of lions for livestock predation. Without a demonstration of income from lions, the political pressure from the surrounding communities to remove them from the conservancy altogether will be a challenge to resist.

Savé Valley Conservancy Lion Monitoring and Management

After the Conservancy was formed, and persecution stopped, lions, mainly males, recolonized the area and their numbers started to increase in the late 1990's / early 2000's. Few lionesses were observed until 2003, when small family groups and male-female pairs were seen, and by 2004 - 2005 there were some reports of cubs. During this period 13

lions were also reintroduced into the Savé Valley Conservancy. After an initial lag phase the lion population on the Savé Valley Conservancy has increased dramatically and at present is growing exponentially (Figure 8; Groom and Watermeyer 2015).

Monitoring of the lion population began in 1999 (Pole 1999) with track index or call-up surveys being conducted sporadically until 2006. From 2007 to present, annual conservancy-wide track index surveys have been conducted using a standardized methodology (Groom and Watermeyer 2015). The resulting population estimates were verified in 2011 by a baited lion call-up survey and a collation of managers' estimates, all of which provided similar results.

Prey availability models (Hayward et al. 2007) suggest that the carrying capacity for the lion population in the Savé Valley Conservancy is approximately 271 lions. The population estimate for 2015 was 284 lions, suggesting lions have reached their ecological carrying capacity, even whilst being responsibly hunted.

A professional lion management plan was commissioned by the conservancy in 2011 (Funston 2011), to provide the Savé Valley Conservancy members with a science-based plan to help them ethically and sustainably manage their lion population. This plan specifically advocates the use of hunting as a conservation management tool. It also demonstrates willingness by the conservancy to guide their lion management based on science and advice from professionals.

Savé Valley Conservancy Lion Hunting

Lions have been hunted in the Savé Valley Conservancy since 2002, although that was largely for removal of problem animals. Hunting began properly in 2005 with quotas increasing annually to a maximum of seven per year from 2009 onwards (Table 5), with the quota being raised to ten for 2016 based on trophy ages.

Despite offtakes of lions through sport-hunting, the lion population has continued to increase in the Conservancy. The revenue generated from hunting lions has enabled landowners to invest in proper land management, anti-poaching, water provision and fence maintenance, all of which benefit the lion population (especially as lions seem to be vulnerable to being caught in wire snares; Becker et al 2013; R. Groom, pers. obs.).

Table 5: *The Savé Valley Conservancy annual lion hunting quota and offtake from 2002 to 2015.*

	2002	2003	2004	2005	2006	2007	2008	2009	2010	2011	2012	2013	2014	2015
Approved quota	5	5	1	3	3	4	6	7	7	7	4	2	3	5
Quota taken	1	0	1	3	3	3	3	6	5	3	4	1	3	5
Percentage success	20	0	100	100	100	75	50	86	71	43	100	50	100	100

Sport-hunting of lions brings considerable revenue to the Conservancy, revenue that is vital for the continued functioning of the area for wildlife conservation. Without the costs of lions being offset by the income from sport-hunting, landowners cannot reasonably be expected to tolerate such high lion densities, and their numbers would have to be reduced significantly.

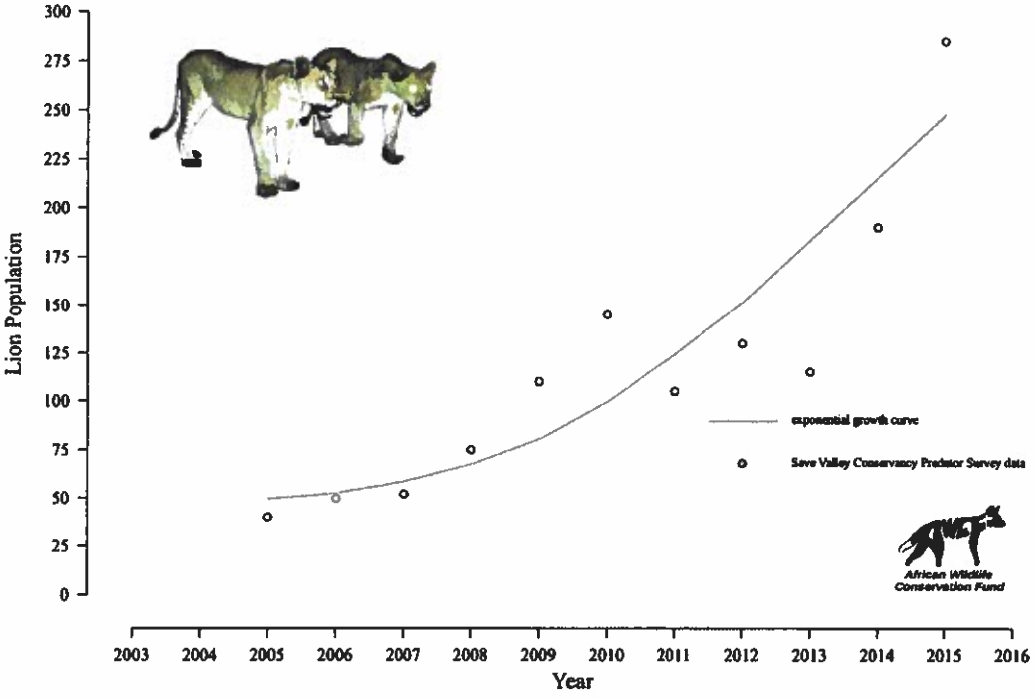

Figure 8: The Savé Valley Conservancy lion population, like that of the Bubye Valley Conservancy, has grown exponentially. Points indicate estimated lion abundance calculated from field surveys; the line represents the exponential growth curve.

THE PROS AND CONS OF CONSERVING LIONS

The saturation of lions in wildlife areas on both state and private land is positive for their future conservation security; but it is also critical to that of incidentally conserved endangered species, such as both species of rhinoceros on private wildlife conservancies in Zimbabwe (Lindsey et al. 2009; Suzuki 2001), which benefit from the same resources and protection that are incentivised and provided by the revenue generated from sport-hunting. The Bubye Valley Conservancy now boasts the world's third largest black rhinoceros population (N. Anderson [Lowveld Rhino Trust], pers. comm.), which is classified as Key 1 by the African Rhino Specialist Group and means that this population is considered key to the overall survival of the species. The Savé Valley Conservancy has the second largest black rhinoceros population in Zimbabwe after Bubye. These are not coincidences. These rhinoceros (and other endangered species, such as wild dog) strongholds are the result of the incidental conservation benefits derived entirely from sport-hunting activities - there are no photographic tourists visiting either the Bubye Valley or Savé Valley Conservancies, and the rhinoceros are not hunted. Having rhinoceros on the land therefore generates no revenue - and in fact there is a significant cost associated with protecting these animals; US$ 590,000 (not including incentive and reward bonuses donated for these purposes) was spent on anti-poaching by the Bubye Valley Conservancy during 2015 (K. Leathem, pers. comm.), and US$ 546,000 is spent annually on anti-poaching by the Savé Valley Conservancy (Lindsey et al. 2012). This expense is covered mainly by the revenue generated by sport-hunting with additional donations from the clients; and most importantly, the habitat for the rhinoceros is preserved by maintaining the land as a conservation area, as opposed to converting it into agricultural or grazing land for example.

However, the high densities of lion populations achieved within commercial wildlife areas have the potential for intense intraguild persecution. Lions are aggressively competitive, and research on the relationship between lions and leopards has shown that high densities of lions can negatively affect leopard population density, demographic structure, cub survival, and spatial ecology down to even the step-wise decisions that leopards make regarding habitat use and behaviour based on both the actual and potential risk of encountering lions (du Preez 2014; du Preez 2015). Leopards are a generalist species that are able to cope with persecution by adapting their behaviour and ecological niche, and even they suffer under a burgeoning lion population; ecological specialists and endangered species, such as cheetah *Acinonyx jubatus* and wild dog, do not fare nearly as well under such intense competitive pressure. In fact, competition with lions has been directly linked to reductions in cheetah (e.g. Durant 1998, 2000; Laurenson 1995) and wild dog (e.g. Creel 2001; Creel and Creel 1996; Vucetich and Creel 1999) densities, both of which face local extinction where lion abundance, and the respective level of persecution, is high. Excessive lion densities may also result in population declines of ungulate prey (e.g. Wegge et al. 2009). It is vital to holistic conservation that wildlife managers can understand and deal with the level of impact that lions exert on other species; particularly those that

are elusive difficult to observe, and which face decline if not carefully monitored. To this end, a conservation research initiative in partnership with WildCRU was established on the Bubye Valley Conservancy in 2009, and research conducted on the Savé Valley Conservancy since 2007.

Based on the number of kills made (du Preez et al. in prep.) and the current value of the meat (K. Leathem, pers. comm.), the Bubye Valley Conservancy lion population consumes hundreds of thousands of dollars worth of prey each year. These lions are mainly tolerated because of their ability to generate the revenue that helps to offset this expense - although it is estimated that economically it is still not worth keeping the lions whose cost outweighs their value (Funston et al. 2013).

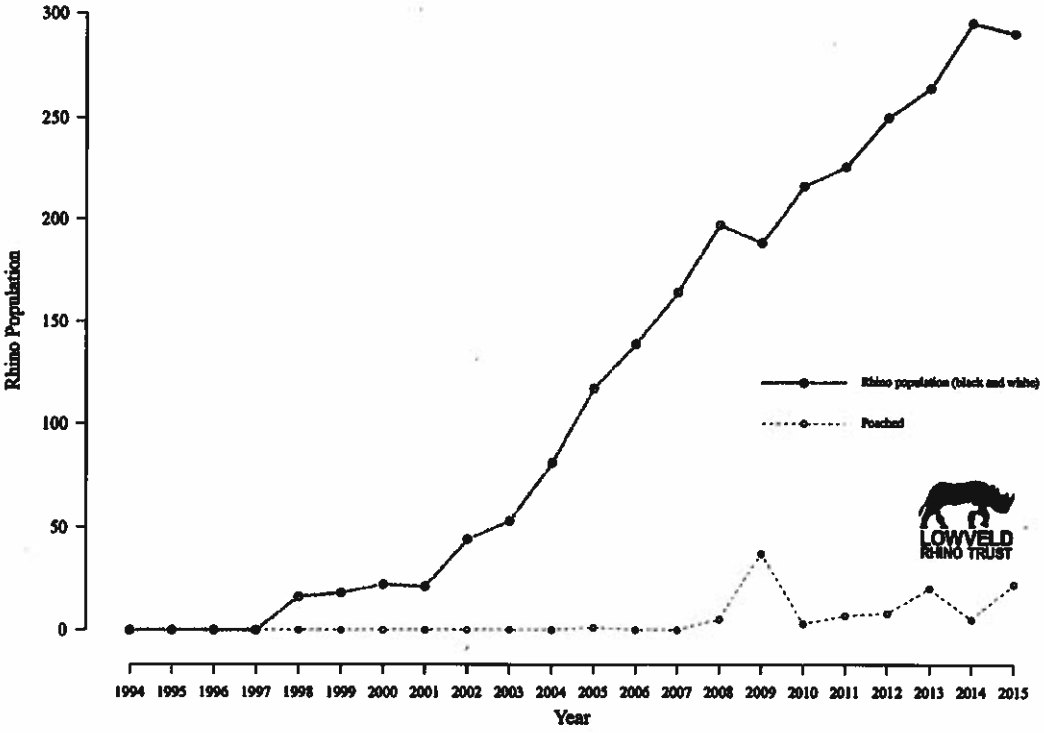

Figure 9: The Bubye Valley Conservancy black rhino population is rated as Key 1 by the African Rhino Specialist Group which means that the population is considered key to the overall survival of the species.

WHERE THE MONEY GOES: THE FINANCES OF LION SPORT-HUNTING AND REINVESTMENT IN THEIR CONSERVATION

Break-down of the finances involved in a typical lion hunt on the Bubye Valley Conservancy:

Lion Trophy fee: US$ 42,000
Lion Hunt Daily rate: US$ 2,950 day^{-1}
(Minimum lion hunt duration: 18 days [*total daily rate of US$ 53,100 lion hunt^{-1}*])

Additional costs include:
ZPWMA scout
Observers
Bait used
Other trophy species taken during the lion hunt, etc.
[*These additional costs average approximately US$ 6,500 lion hunt^{-1}*]

BUBYE VALLEY CONSERVANCY - LION SPORT-HUNTING REVENUE GENERATED (2015):

((18 days × 2,950 day^{-1}) + 42,000 trophy fee + 6,500 additional costs) × 12 lions
= **US$ 1,219,200**

Lion sport-hunting therefore represents approximately 33.9% of the Bubye Valley Conservancy's total annual revenue generation (which includes post-hunt meat and hide sales).

All of the revenue generated from lion sport-hunting on the Bubye Valley Conservancy has gone back into the running costs of the Conservancy, which is all part of conservation, and which includes: anti-poaching and fence monitoring and maintenance (approximately US$ 506,000 year^{-1}), research (approximately US$ 34,700 year^{-1} not including client and sponsor donations), and community support assistance (approximately US$ 210,000 year^{-1}).

[*No profit after costs has been declared, nor dividends taken by shareholders, since the Bubye Valley Conservancy was formed in 1994. All revenue generated to date has been spent on running costs, improvements and restocking.*]

DISCUSSION

Here we have shown that since their reintroduction after historical eradication, both the Bubye Valley and Savé Valley Conservancies' lion populations have increased exponentially - not despite sport-hunting, but because of sport-hunting and the incentive it provides for protection.

The success of the Bubye Valley and Savé Valley Conservancies, in terms of both of their hunted lion and non-hunted rhinoceros populations, may also provide the motivation for other areas in the country to sustainably manage their wildlife resource. A case in point is the Nuanetsi Ranch, a wildlife area that is also a legacy of failed cattle ranching, located almost directly between the Bubye Valley and Savé Valley Conservancies in Zimbabwe (Figure 3). At present there is a single lion on the Nuanetsi Ranch but management is not able to justify introducing more due to the current uncertainty over the future of lion hunting (B. Lees-May [Nuanetsi Ranch Conservator], pers. comm.). The Nuanetsi Ranch is a wildlife area of 1,489 km^2, and could conceivably sustainably hold between 201 and 278 lions (based on the most recently estimated lion densities of the Savé Valley [0.135 lions km^{-2}; Groom and Watermeyer 2015]; and Bubye Valley [0.187 lions km^{-2}; du Preez et al. 2015] Conservancies respectively). However, the Nuanetsi Ranch has invested in building up an abundant wildlife population, which is sport-hunted, and the management will not risk losing a significant amount of valuable game, that could otherwise be sold as trophies or meat, to a species from which it can not recuperate lost revenue, and instead that requires further investment in control measures (B. Lees-May [Nuanetsi Ranch Conservator], pers. comm.).

Between 2005 and 2015 the United States market has represented 70.4% of the total Zimbabwean lion sport-hunting industry (http://trade.cites.org/en/cites_trade/ [accessed 2015-01-19]), though in reality it constituted over 90% for both the Bubye Valley and Savé Valley Conservancies. If this market was effectively lost due an inability of prospective clients to import their trophies, based on the economics involved it would become unviable to continue managing the Bubye Valley Conservancy as a wildlife area in its current form, and lions would either have to be re-exterminated, or at least severely reduced via culling; or else what is the largest privately owned wildlife area in the world would be converted back into a cattle ranching area (K. Leathem, pers. comm.). This is the reality of any business, in that it needs to cover costs and pay staff and cannot run at a loss for luxury of conservation. Child (1993) states "*A refusal to treat wildlife in the same way as other resources and maintenance of centralised protectionist management prejudices its survival. Only by raising its commercial value will wildlife be able to compete for space on the scarce African landscape. Trade bans which detract from wildlife's commercial value prejudice its chances of survival in the long term*".

Although the USFWS understandably categorises lion conservation by country for simplicity, rather than individual properties, the Bubye Valley and Savé Valley Conservancies currently and deservedly hunt more than a third of the total Zimbabwean lion quota between them. Here we have shown that this sport-hunting does not negatively affect the lion population, which remains in positive growth despite off-take. In addition

to this, other areas, such as the Nuanetsi Ranch, could be incentivised to invest in lion conservation if the ability to sustainably utilise the lions as a resource was guaranteed.

The USFWS identified five primary factors that threaten lion survival in the wild, namely: habitat loss; loss of prey; retaliatory killing due to increased human-lion conflicts; inadequate regulatory mechanisms; and weak management of protected areas (http://www.fws.gov/endangered/what-we-do/lion.html [accessed 2015-01-19]). Each and every point on this list, which notably does not include sport-hunting, supports the fact that incentivising tolerance for lions through sustainable use would enhance the species' overall survival.

As responsible conservationists, we are not arguing against tight regulation of sport-hunting, especially with regard to sensitive species such as lions, and we support the need for transparency and accountability within the industry. However, this reform is a process being driven from within, as any indiscretion is an affront on all stakeholders. For example, long-term lion monitoring by WildCRU in Hwange National Park (HNP), Matabeleland North, Zimbabwe, documented a 'vacuum effect' and reduction in male lion density in the Park as a result of sport-hunting in the surrounding areas (Loveridge et al. 2007). A result of this research was the recommendation that ZPWMA implement a hunting moratorium in western Zimbabwe, which was accepted and enforced from 2005 to 2008 (Davidson 2009). Subsequent monitoring of the HNP lion population showed that the perturbation effects caused by sport-hunting were reversed during the moratorium, and sport-hunting was reinstated at a reduced, more sustainable quota (Davidson 2009). This example demonstrates both the relationship between independent researchers and ZP-WMA, and that the research assists ZP-WMA in robust decision making. This study has also shown that the lion population was able to recover quickly, and that a blanket-ban would have been as unnecessary as it would have been detrimental to overall lion conservation in the country.

In addition to the self-imposed hunting moratorium in the Matabeleland North district, Zimbabwe has voluntarily stopped sport-hunting of any lioness. The fixed-quota concept, in which hunting quotas had to be paid for upfront before the hunting season even began, and which was resultantly attributed to poor quality trophies and young animals being hunted, has also been abandoned. The adaptive quota management system for lion hunting based on the ages of lions hunted has been accepted and embraced by all stakeholders. This adaptive quota management system has not only led to a reduced national lion hunting quota, but has also resulted in a significant increase in the age of harvested lions to a level that is considered to have minimal ecological impact, being old individuals that are no longer contributing to the gene pool nor protecting cubs.

The IUCN Red List lion conservation status has remained unchanged for 20 years even in the face of Africa's ever-changing landscape. Despite fears that lion abundance is decreasing overall, in southern Africa it is in fact increasing (Bauer et al. 2015b).

CONCLUSION

Given the evidence presented, the arguments against sport-hunting would appear to be based more in emotion than logic and reality (e.g. Lindsey et al. 2015). Conservation, however, is not about individuals within populations, but the overall populations themselves. Sustainable sport-hunting of lions is just that: *sustainable* - and ironically, without it, the lions themselves become unsustainable. Conservation objectives need to be balanced with both social and economic factors if they are to be achieved.

The USFWS states "Well-managed conservation programs use trophy hunting revenues to sustain lion conservation, research and anti-poaching activitie" (http://www.fws.gov/endangered/what-we-do/lion.html [accessed 2015-01-19]). The Bubye Valley and Savé Valley Conservancies both fully meet each one of these conditions: clearly contributing to lion conservation in Zimbabwe; having long-term conservation research programs; and self-funded anti-poaching units.

The histories regarding the formation of both the Bubye Valley and Savé Valley Conservancies were both presented in this report, despite being remarkably similar; the point being that lion conservation in both areas, and many others, has the same fate either way. The Bubye Valley and Savé Valley Conservancies are both excellent examples of focussed and determined efforts to make wildlife based land use viable in an otherwise cattle dominated landscape. However, the fact remains that the cost of having lions, both ecologically and financially, is high. Simply increasing the abundance of one species at the expense of another cannot be considered a conservation success.

CONSERVATION FORCE

THE IMPORTANCE OF LION HUNTING IN ZIMBABWE

Media outlets are reporting that "Xanda," a six-year-old African lion and the alleged "son" of "Cecil," was recently killed in a lawful tourist hunt in northwestern Zimbabwe. The reports are inconsistent and biased. Most of all, they ignore the critical conservation role that regulated hunting plays in Zimbabwe. The facts below emphasize the importance of licensed, regulated lion hunting as a conservation tool in Zimbabwe and lion range states.

Habitat Security: Regulated hunting in Zimbabwe takes place in government safari areas and forest areas, communal areas in the CAMPFIRE program, and private conservancies. Hunting justifies the protection of nearly five times as much habitat as in National Parks (>130,000 km^2 compared to <28,000 km^2).

Zimbabwe is not alone. Hunting areas are more than five times the size of Tanzania's National Parks, more than 2.8 times the size of Zambia's National Parks, more than 2.5 times the size of South Africa's National and Provincial Parks, and more than 1.5 times the size of Mozambique's National Parks. Hunting mitigates the habitat loss identified as the single greatest threat to large carnivores like lion and leopard. It provides habitat for other game and essential lion prey.

Wildlife Authority Revenue: Regulated hunting contributes significant operating revenues to the wildlife authorities of range states like Zimbabwe. These revenues pay for law enforcement, monitoring, and other conservation activities. Hunting fees in Zimbabwe cover most of the authority's operating expense. Under the current quota, lion fees alone can underwrite the protection of over 18,000 km^2, two-thirds the size of the National Parks. In other African countries, hunting fees make up between 30% and 80% of the wildlife authority's operating budget.

Anti-Poaching: Many hunting operators maintain their own anti-poaching teams to support government enforcement efforts. This spreads the costs of law enforcement between the public and private sectors, and reduces the burden on under-resourced governments. According to a study of 18 hunting operators in Zimbabwe, 26% of company staff were engaged in law enforcement. Similarly, a study of 27 operators in Tanzania found they spent over $6.7 million in anti-poaching from 2013 to 2015 and patrolled more than 7,170 days in that period.

Community Tolerance: Regulated hunting increases the tolerance of rural communities living side-by-side with dangerous game like lion by generating tangible benefits, which improve community livelihoods. The CAMPFIRE program in Zimbabwe devolves control of wildlife on communal lands to rural district councils. These councils contract with safari operators and benefit from the fees paid for lion, elephant, and other hunts. At least 55% of these fees are deposited directly in village bank accounts. Another 41% goes to the district councils for community services.

Communities receive other benefits, such as consolation payments, infrastructure project funding, game meat distributions, and employment. This system creates value for species that otherwise face retaliation because they prey upon livestock (e.g., lion and leopard) or raid crops (e.g., elephant and buffalo). (Given these benefits, traditional leaders (chiefs) and CAMPFIRE representatives have spoken out against import restrictions on hunting trophies and calls to ban hunting by some international NGOs.)

Conclusion: Regulated hunting is essential to Zimbabwe's wildlife management and conservation system. This system is working. A 2016 IUCN *Red List* assessment of African lion concluded that Zimbabwe is one of four range states with an increasing lion population. This is an amazing achievement given Zimbabwe's rapidly growing human population and high human population density (26). Hunting takes place across a wide range of land, and in marginalized areas that are simply not appropriate for photographic tourism. If that land is to remain as habitat, there must an incentive for the rural people who would otherwise use it for farming and livestock. Hunting offtakes are low—only 33 lions hunted in 2016—but the incentives are high. This carefully-designed, sustainable-use based system benefits the lion and people of Zimbabwe.

History of Bubye Valley Conservancy

The Bubye Valley Conservancy- once a legendary cattle ranch, one of the largest in Africa, is situated in southwestern Matabeleland, Zimbabwe. It was originally staked out in the then Southern Rhodesian lowveld in the 1900s by the cattle ranching family of Baron Justus von Liebig, supplier of canned 'bully beef' to World War II armies, and the inventor of the Oxo cube. For decades, the Liebigs Ranch cattle competed with the indigenous wildlife for the nourishing 'sweetveld' grasses upon which they fattened and thrived. Liebigs even hired professional hunters to rid the area of wild herbivores. Liebig's company was succeeded by Lemco and then Unilever, and the ranch continued to raise beef into the late 1980s.

Under the Parks and Wildlife Act of 1975, land owners had been given the control and ownership of the wildlife on their properties. The concept of wildlife ranching was born, helped along with ecological studies that indicated that wildlife would generate higher returns than cattle in these drought-prone areas. Many Lowveld cattle ranchers grouped together with their neighbours to form vast wildlife conservancies, removing their boundary fences, allowing the natural habitat to bounce back and re-stocking the land with indigenous animals. Several famous Conservancies were formed such as the Save Valley, Chiredzi River and the Bubiana Conservancy, which was specifically dedicated to rhino conservation.

In the 1990s, after a series of devastating droughts, the vast Lemco ranch was put up for sale. It was purchased by Charles Davy who motivated a consortium of international investors. The property was re-named after the Bubye river, which runs through it, and converted into a wildlife reserve, sustained by profits to be generated from venison and sport hunting. Davy managed the massive wildlife re-stocking exercise, and over the years the perimeter was secured by thousands of kilometres of electrified fence. A ferociously efficient anti-poaching unit was set up to protect the new Conservancy's animals, including an internationally-monitored population of black and white rhinoceros.

International efforts also participated in restoring this African 'Eden'. The International Rhino Foundation translocated eighty-two black rhinos from unsafe areas to the Bubye Valley Conservancy in order to establish a new breeding population in the reserve. This return of habitat to an endangered species was the largest exercise of its kind anywhere in Africa at the time.

Today, thriving herds live in balance on the open savannah, mopani woodlands and in the dense riverine forests. The diverse habitats found in the Bubye Valley Conservancy now support an astonishing 35 species of wild, free-ranging game animals including the classic Big Five. Protected by the conservancy are countless other smaller species found in a healthy and natural eco-system. The conservancy currently boasts the world's fourth largest black rhino (*Diceros bicornis*) population, Zimbabwe's largest lion population, and a flourishing elephant (*Loxadonta africana*) population.

The **3,740 square kilometer** conservancy (Bigger than Luxembourg) is now sustained by carefully regulated low-density, high-value hunting and donor support from individuals and organisations.

Lion Research Programme

...He is quick, and his power to do harm is enormous, for he can cause death with a stroke of his paw or one grip of his jaws..."
- Guide to Rhodesia, 1914

THE BIG CATS

Lion and leopard are two of Africa's most iconic and charismatic carnivores. As a function of their role at the top of the food chain, they are vital to proper ecosystem functioning and health. However, both of these species are facing global population decline through the effects of burgeoning human population growth, and the resultant persecution and habitat fragmentation.

Approximately half of all habitat available to African lions is currently found in commercial trophy-hunting areas; yet the vast majority of lion studies have been conducted inside core protected areas such as national parks – the need for a comprehensive lion study within trophy-hunting areas has generally been neglected.

Conservation research on these key ecological species was initiated on the Bubye Valley Conservancy in 2009, beginning with simple density estimates calculated by counting animal tracks on dirt roads. Since the project's conception; the scope of the research has grown to include GPS collaring for population monitoring and interaction analyses, camera-trapping to determine population density, demographics and age structure, and activity loggers to help us better understand the behavioural ecology and eco-physiology of these species. The breadth of research has also increased to include habitat and herbivore surveys, which are fundamental to understanding the ecology of any species in a dynamic ecosystem. The research on BVC has so far produced three doctoral projects through the University of Oxford. Byron du Preez completed his study in 2013, which used leopards as a model species to investigate the impact of lions on the behavioural ecology of a competitively subordinate carnivore, and highlighted the conservation implications that could result from uncontrolled lion populations at densities higher than the local system can sustain. In 2015, Paul Trethowan built on this study of lion-leopard conflict on the conservancy, and expanded the research to assess lion behavioural ecology using activity loggers mounted on the collars of study animals. Matt Wijers is currently undertaking the most recent doctoral study, which focuses on testing the application of new technology to the monitoring of large carnivores.

In addition to these projects, the ecology unit at BVC also conducts surveys to assist management of key species on the conservancy. These include an annual lion population survey, herbivore counts and long-term camera trap surveys targeting leopard, lion and hyenas.

Bubye Valley Conservancy
Motivation for the hunting of adult lionesses

Blondie Leathem, General Manager, Bubye Valley Conservancy
Email: mazunga@bvczim.com

The Bubye Valley Conservancy (BVC) is one of largest private wildlife areas in Zimbabwe with a total area of approximately 3400 km². Originally a cattle ranch, the BVC was established in 1994 through the introduction of a variety of large, wild herbivores and with the primary objective of maintaining an ecologically sustainable and economically viable wildlife enterprise based on ethical trophy hunting. In 1999, thirteen lions of Namibian origin were introduced to the conservancy from Pilansberg National Park, South Africa. An additional four animals were recorded to have broken in between 1999 and 2003. With abundant prey and the protection from human-wildlife conflict provided by the electrified perimeter fence, the lion population increased at a rate of 25% per annum reaching an estimated population size of 500 individuals in 2013 (Wijers, 2016). The rapid increase in the lion population has had detrimental effects on prey populations particularly wildebeest, eland and giraffe which have recorded declines exceeding 60% (Wijers & Gush, 2018b).

The lion population explosion observed in the BVC likely emanated from the lack of natural regulatory processes that are known to limit population growth in larger unfenced systems. Miller et al. (2013) suggested that management interventions that are implemented to control population growth in smaller, fenced reserves should aim to mimic the outcomes of natural processes particularly regarding reproductive, survival and dispersal schedules. Given the size of the BVC lion population, it would be logistically and financially unfeasible to alter reproductive schedules using contraceptive methods. Furthermore, contraception has been reported to result in fragmentation of prides into smaller groups and single females which can further impact predator prey dynamics through increased predation (Lehmann et al., 2008; Miller et al., 2013). Options for manipulating survival and dispersal rates include translocation, euthanasia and hunting. Although translocation remains an option for BVC management, previous offers and attempts to move animals have proven this to be an unlikely solution due to highly restrictive government policies as well as the limited number of areas willing to receive lions. Trophy hunting and euthanasia are therefore the only reasonable methods of lion population control for BVC.

Adult female lions represent approximately 44% of the total BVC lion population (Wijers & Gush, 2018a). Although the majority of adult females exist in large, stable prides, several lone individuals have been observed. In addition, GPS collar data and sightings information from single lionesses that have either split from their native prides, or that have never been part of a pride, has shown that these individuals typically remain alone and form smaller groups with their offspring. Removal of lone, non-lactating lionesses has therefore been identified as an important management objective aimed at reducing the overall lion population, recruitment and predation. Hunting of lionesses is a preferable method of removal to euthanasia as the income generated from each hunt will be used to fund the conservancy's lion research and anti-poaching projects which are vital for effective wildlife management and protection. Furthermore, the allocated lioness hunting quota represents only a small fraction (15-20%) of the ideal required management offtake. The hunting of selected lionesses will benefit the conservancy ecologically as well as financially helping to ensure continued sustainable management of BVC's wildlife.

BUBYE VALLEY CONSERVANCY (/)

History of Bubye Valley Conservancy

The Bubye Valley Conservancy- once a legendary cattle ranch, one of the largest in Africa, is situated in southwestern Matabeleland, Zimbabwe. It was originally staked out in the then Southern Rhodesian lowveld in the 1900s by the cattle ranching family of Baron Justus von Liebig, supplier of canned 'bully beef' to World War II armies, and the inventor of the Oxo cube. For decades, the Liebigs Ranch cattle competed with the indigenous wildlife for the nourishing 'sweetveld' grasses upon which they fattened and thrived. Liebigs even hired professional hunters to rid the area of wild herbivores. Liebig's company was succeeded by Lemco and then Unilever, and the ranch continued to raise beef into the late 1980s.

Under the Parks and Wildlife Act of 1975, land owners had been given the control and ownership of the wildlife on their properties. The concept of wildlife ranching was born, helped along with ecological studies that indicated that wildlife would generate higher returns than cattle in these drought-prone areas. Many Lowveld cattle ranchers grouped together with their neighbours to form vast wildlife conservancies, removing their boundary fences, allowing the natural habitat to bounce back and re-stocking the land with indigenous animals. Several famous Conservancies were formed such as the Save Valley, Chiredzi River and the Bubiana Conservancy, which was specifically dedicated to rhino conservation.

In the 1990s, after a series of devastating droughts, the vast Lemco ranch was put up for sale. It was purchased by Charles Davy who motivated a consortium of international investors. The property was re-named after the Bubye river, which runs through it, and converted into a wildlife reserve, sustained by profits to be generated from venison and sport hunting. Davy managed the massive wildlife re-stocking exercise, and over the years the perimeter was secured by thousands of kilometres of electrified fence. A ferociously efficient anti-poaching unit was set up to protect the new Conservancy's animals, including an internationally-monitored population of black and white rhinoceros.

International efforts also participated in restoring this African 'Eden'. The

International Rhino Foundation translocated eighty-two black rhinos from unsafe areas to the Bubye Valley Conservancy in order to establish a new breeding population in the reserve. This return of habitat to an endangered species was the largest exercise of its kind anywhere in Africa at the time.

Today, thriving herds live in balance on the open savannah, mopani woodlands and in the dense riverine forests. The diverse habitats found in the Bubye Valley Conservancy now support an astonishing 35 species of wild, free-ranging game animals including the classic Big Five. Protected by the conservancy are countless other smaller species found in a healthy and natural eco-system. The conservancy currently boasts the world's fourth largest black rhino (*Diceros bicornis*) population, Zimbabwe's largest lion population, and a flourishing elephant (*Loxadonta africana*) population.

The **3,740 square kilometre** conservancy (Bigger than Luxembourg) is now sustained by carefully regulated low-density, high-value hunting and donor support from individuals and organisations.

LION CONSERVATION RESEARCH (/WHAT-WE-DO)

Since lions *Panthera leo* were re-introduced to BVC in 1999 the population has grown rapidly. Today BVC is home to approximately 20% of Zimbabwe's lions. This is not just the largest continuous population of lion in Zimbabwe but also the densest. Due to the importance of this population for the species' conservation, and the unique management challenges associated with a large fenced population of lion, a long-term conservation research project was established in 2009. Seventeen lions were initially introduced to BVC in 1999. Ten years later, in 2009, when carnivore population surveys were initiated, the lion abundance was estimated to be at around 280 individuals. It has continued to grow. Today there are estimated to be in excess of 400 lions on BVC, which is the largest population in the country.

Learn More → (/what-we-do)

RHINO CONSERVATION (/ANTIPOACHING)

Black rhinos *Diceros bicornis* were first introduced to BVC in 2002, and the population growth rate was accelerated by continual translocations from other areas that were unable to protect their rhino populations as poaching escalated during the mid 2000's. In the face of the renewed rhino-poaching onslaught in Zimbabwe, only the big privately owned conservancies are able to maintain positive rhino population growth rates.

Ms. Brisendine,

Please see the attached letter and document to be included with all applications listed, which should be all outstanding lion import permit applications for trophies coming from Zimbabwe that were filed through Conservation Force.

If you have any questions regarding this matter, please do not hesitate to contact me.

Thank you,

Aimee Korver

Ms. Brisendine:

The document attached is to be included as supplement to all original import permit applications filed with the U.S. Fish and Wildlife Service listed above.

Since filing these applications we have received additional documentation of conservation efforts for lions in Zimbabwe that further detail the populations as stable and growing. The CAMPFIRE document strongly argues the importance of trophy imports and the value that they provide to communities in Zimbabwe through income flows from tourism and hunting which serve to support sustainable community livelihoods in a way that promotes conservation of wild species and habitat.

The Campfire document details the drastic effects that COVID-19 has had and is having on Zimbabwe's tourism and hunting market, which is in a state of collapse. It is leaving the country uncertain of how wild-life and anti-poaching programs will be supported on the ground in the coming months. This information can be used to predict what might transpire if trophy hunting and imports were to cease to exist and the tragic outcome it could have on the conservation efforts of wildlife in the area.

We ask that you please consider these documents when making your decision on enhancement in each import permit application.

Please feel free to contact me if you have any questions regarding this mater.

Cordially,

Aimee Korver
Permits Paralegal

1. CAMPFIRE communities Concern on Import Bans

Open Letter to the United States Fish and Wildlife Service

Dear Dr Mary Cogliano

CAMPFIRE Communities Concern on Import Bans

CA/MPFIRE Association, otherwise known as the Community Areas Management Program for Indigenous Resources in Zimbabwe wishes to register its opposition to continuing campigns for the banning of trophy imports. We are fully aware that the general outrage in both print and social media against sport hunting, which many distant voices refer to as unethical, is aimed at influencing policy action by importing countires.. These arguments, none of which are supported by science, are based on a perfected art of global misinformation and do not represent the views of rural communities who live side by side with wildlife. To us as a people with substantial wildlife populations, trophy hunting is indispensable for conservation and rural livelihoods.

Zimbabwe has one of the most resilient and successful conservation programs in Africa. Its conservation efforts have historically enabled local communities to thrive on sustainable livelihoods in biodiversity-rich landscapes. At least 800 000 households or 2.5 million people (out of a national population of 16 million) benefit directly and indirectly from the sustainable use of wildlife and tourism related investments in their areas. However, our ever growing elephant population has increased the levels of conflict between humans and wildlife in recent years, which, together with recurrent droughts that threaten food security, have made traditional livelihoods more difficult, especially for subsistence farming communities that live in the wildlife rich areas of the country.

Communities in CAMPFIRE areas reside in an environment where conflict between humans and wildlife is common, as both compete for the limited available land and water resources. But this comes at a high price: people in Zimbabwe are paying with their lives for tolerating wild animals in their areas. As recently as 23rd March 2020, Barnabas Mwinga, a 50 year old man, was killed by an elephant in his field in front of his wife and young daughter in Gonono Ward, Mbire District. He is one of seven other people that have needlessly lost their lives to wildlife attacks throughout the country since the beginning of 2020, in addition to the 41 killed in 2019. Yet despite this high cost, wildlife is still highly valued by rural communities who continue to tolerate massive crop destruction and livestock losses from wildlife without compensation. For example, elephant poaching in Mbire District where Barnabas Mwinga was recently killed has gone down from a peak of 40 in 2010 to only 3 elephants poached in 2019 (Figure 1). The decline in poaching incidents is a result of collaborative efforts between the Safari Operator and the hunting clients who invest nearly $100,000 annually into an anti-poaching unit.

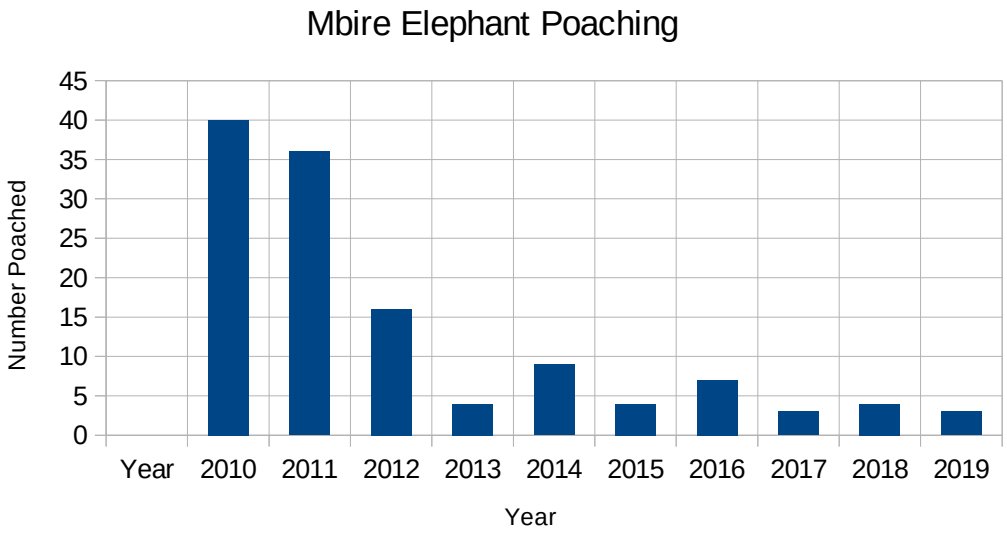

Figure 1: Mbire Elephant Poaching Trends (Source – Mbire Rural District Council)

The aim of the CAMPFIRE programme is to support sustainable community livelihoods in a way that promotes conservation of wild species and habitat. For nearly 30 years, trophy hunting, which relies heavily on the American market, has been cautiously implemented in the absence of other tourism opportunities to achieve this goal. Not only has it resulted in increasing food and livelihood security of rural people, it has also played a role in undermining the drivers of poaching and mitigating human and wildlife conflict. The net impact is seen in securing wildlife habitat and assisting in the regeneration of degraded landscapes.

The financial resources to succeed with this programme in CAMPFIRE areas are heavily dependent on the sustainable hunting of big game, especially elephants. The monies generated from these activities finance the local economies, social services as well as anti-poaching efforts and wildlife management at the District and Ward levels. For example, as can be seen from Table 1 below, the total number of elephants hunted as trophies over nine years is 807 out of a cumulative quota of 1381, from an estimated national population of 83,000 elephants. Hunting quotas are set at no more than 0.5% of the population estimate compared to an elephant population growth of 5% to 6% annually. The levels of off-take (58%) also demonstrate that while hunting is based on controlled numbers for each species annually, it is not uncommon for a client to pay for a full hunt and enjoy the wild experience, but not take a trophy. It is also important to note that communities do not view international hunting clients just as tourists, but as vital conservation partners.

Table 1: Trophy Hunting Quota Summary and Income: 2010-2018

Source: *The Role of Trophy Hunting of Elephant in Support of the Zimbabwe CAMPFIRE Program: Vernon Booth* (in progress).

District and Ward-level institutions in the CAMPFIRE areas rely on income from hunting to provide significant local livelihood benefits (income, jobs, skills) and social services (schools, clinics, irrigation schemes, boreholes) in remote regions where agriculture is marginal and there are very few jobs or other sources of cash income. Table 2 and Table 3 below summarise the impact of pre- and post-elephant trophy import suspension expenditure on the CAMPFIRE programme at the District and Ward level. The District administration costs absorb 89% of the budget with 30% devoted to law enforcement. With the suspension of elephant trophy imports to the USA and Europe in 2016, expenditure on law enforcement dropped from 33% to 9% as a result of District administration having to offset the human and wildlife costs which increased from 1% to 33%. At the Ward level, 46% of the budget is allocated to administration and 54% to community benefits (45% devoted to social services, Table 3).

Table 2: District level expenditure on administration and community benefits: 2010-2018

With growing awareness from several years of CAMPFIRE implementation, communities have been demanding their rightful place in the management of wildlife resources for their own benefit. To accommodate this, CAMPFIRE has undergone a review of its policy framework to enable communities to reap greater and more tangible benefits from living in harmony with nature. A key aspect of this review is to establish Community Conservancies that redefine ways in which communities can benefit more from wildlife and other income generation opportunities, as well as the mitigation of human and wildlife conflict. This initiative is being directed under the Global Environment Facility (GEF) 5 and 6 cycles covering five districts with the aim of developing innovative ways to improve the management of wildlife for the benefit or rural people. If trophy hunting and trade here was stopped, the impact on local livelihood would be severe, and both poaching and changes to alternative land use would increase. Non-consumptive tourism currently plays virtually no positive conservation role in the CAMPFIRE areas (<4% of overall income is generated through tourism). Instead of banning the import of trophies, more international oversight and support is needed from importing states, and of in-country CITES controls, to ensure sound sustainable management e.g. quota-setting, permit allocation, independent population surveys; building robust, equitable and transparent benefit allocation mechanisms at local level, particularly where communities have elected to invest their land and time in Community Conservancies.

STOP PRESS: The pressure for imports bans comes at the worst possible time as the Covid-19 pandemic has severely disrupted income flows from tourism and hunting. The collapse of both markets leaves rural people and safari operators with virtually no income, and it is uncertain how wildlife protection and anti-poaching programs will be supported on the ground in the coming months. What remains clear is that trophy import bans will seriously undermine conservation in Zimbabwe, and indeed open floodgates for rural people to destroy wildlife and wildlife habitat through conversion of land for other subsistence uses, even if unviable.

Enhancement Finding

Applicant: Christopher Edward Taylor (PRT– 66783C)

Introduction

Christopher Edward Taylor submitted an application, received by the Service on December 08, 2017, for the importation of one male lion *(Panthera leo melanochaita)* taken October 08, 2018, from the Bubye Valley Conservancy, Zimbabwe, for the purpose of enhancing the propagation or survival of the species in the wild. After evaluating the available information submitted with the application, information provided by the Government of Zimbabwe, other information available to the U.S. Fish & Wildlife Service (Service), and comments received from interested parties, the Service has determined that the importation of the sport-hunted trophy meets the requirements for making a positive enhancement finding pursuant to 50 CFR 17.40(r) and 50 CFR 17.32(a). The rationale for our finding follows.

U.S. Permit Requirements for Import of Lions (*Panthera leo melanochaita*)

ESA

The African lion, subspecies *Panthera leo melanochaita* (southern and eastern Africa), is a threatened species under the U.S. Endangered Species Act (ESA or Act) and is regulated under a species-specific 4(d) rule, 50 C.F.R. § 17.40(r) that provides specific conservation measures for this subspecies. Under the 4(d) rule for *P. l. melanochaita*, all of the prohibitions at 50 C.F.R. § 17.21 and 50 C.F.R. § 17.31 apply to *P. l. melanochaita* specimens. These prohibitions, in part, make it illegal for any person subject to the jurisdiction of the United States to import or export any lion specimens.

Although import of the lion subspecies *P. l. melanochaita* is a prohibited activity under the Act, exceptions may be made in accordance with the 4(d) rule at 50 C.F.R. § 17.40(r) when the import activity qualifies for and the Service issues an ESA threatened-species

enhancement permit under 50 C.F.R. § 17.32(a). The preamble to the 4(d) rulemaking, 80 Fed. Reg. 79999, 80043-46 (Dec. 23, 2015), explains the factors the Service considers when making an enhancement finding for importation of sport-hunted trophies of *P. l. melanochaita*, as described below.

Our threatened species permitting regulations at 50 CFR 17.32 provide issuance criteria for threatened species permits (50 CFR 17.32(a)(2)), but do not specify what would constitute the enhancement of propagation or survival with regard to authorizing the import of parts or products of *P. l. melanochaita,* including sport-hunted trophies. Therefore, when making a determination of whether an otherwise prohibited activity enhances the propagation or survival of *P. l. melanochaita,* the Service will examine the overall conservation and management of the subspecies in the country where the specimen originated and whether that management of the subspecies addresses the threats to the subspecies (*i.e.,* that it is based on sound scientific principles and that the management program is actively addressing the current and longer term threats to the subspecies). In that review, we will evaluate whether the import contributes to the overall conservation of the species by considering whether the biological, social, and economic aspects of a program from which the specimen was obtained provide a net benefit to the subspecies and its ecosystem.

The Service will evaluate any application received that involves *P. l. melanochaita* in the context of enhancement of propagation or survival permitting in accordance with our threatened species permitting regulations at 50 CFR 17.32 and issuance criteria for threatened species permits (50 CFR 17.32(a)(2)). These include, in addition to the general permitting criteria in 50 CFR 13.21(b):

(i) Whether the purpose for which the permit is required is adequate to justify removing from the wild or otherwise changing the status of the wildlife sought to be covered by the permit;
(ii) The probable direct and indirect effect that issuing the permit would have on the wild populations of the wildlife sought to be covered by the permit;
(iii) Whether the permit, if issued, would in any way, directly or indirectly, conflict with any known program intended to enhance the survival probabilities of the population from which the wildlife sought to be covered by the permit was or would be removed;
(iv) Whether the purpose for which the permit is required would be likely to reduce the threat of extinction facing the species of wildlife sought to be covered by the permit;
(v) The opinions or views of scientists or other persons or organizations having expertise concerning the wildlife or other matters germane to the application; and
(vi) Whether the expertise, facilities, or other resources available to the applicant appear adequate to successfully accomplish the objectives stated in the application.

In addition to these factors, particularly in relation to sport hunting, we find the *IUCN Species Survival Commission (SSC) Guiding Principles on Trophy Hunting as a Tool for Creating Conservation Incentives, Ver. 1.0* (IUCN SSC 2012), to provide useful principles, which, considered in conjunction with our threatened species issuance criteria, will aid the Service when making an enhancement finding for importation of sport-hunted trophies of *P. l. melanochaita.* This document sets out guidance from experts in the field on the use of trophy hunting as a tool for "creating incentives for the conservation of species and their habitats and for the equitable sharing of the benefits of use of natural resources" (IUCN SSC 2012, p. 2) and recognizes that recreational hunting, particularly trophy hunting, can

contribute to biodiversity conservation and more specifically, the conservation of the hunted species.

The SSC document lays out five guiding principles that, considered in conjunction with our threatened species issuance criteria, will aid the Service when making an enhancement finding for importation of sport-hunted trophies of *P. l. melanochaita:*

(a) *Biological sustainability:* The hunting program cannot contribute to the long-term decline of the hunted species. It should not alter natural selection and ecological function of the hunted species or any other species that share the habitat. The program should not inadvertently facilitate poaching or illegal trade in wildlife by acting as a cover for such illegal activities. The hunting program should also not manipulate the ecosystem or its component elements in a way that alters the native biodiversity.
(b) *Net Conservation Benefit:* The biologically sustainable hunting program should be based on laws, regulations, and scientifically based quotas, established with local input, that are transparent and periodically reviewed. The program should produce income, employment, and other benefits to create incentives for reducing the pressure on the target species. The program should create benefits for local residents to co-exist with the target species and other species. It is also imperative that the program is part of a legally recognized governance system that supports conservation.
(c) *Socio-Economic-Cultural Benefit:* A well-managed hunting program can serve as a conservation tool when it respects the local cultural values and practices. It should be accepted by most members of the community, involving and benefiting local residents in an equitable manner. The program should also adopt business practices that promote long-term economic sustainability.
(d) *Adaptive Management: Planning, Monitoring, and Reporting:* Hunting can enhance the species when it is based on appropriate resource assessments and monitoring (*e.g.,* population counts, trend data), upon which specific science-based quotas and hunting programs can be established. Resource assessments should be objective, well documented, and use the best science available. Adaptive management of quotas and programs based on the results of resource assessments and monitoring is essential. The program should monitor hunting activities to ensure that quotas and sex/age restrictions of harvested animals are met. The program should also generate reliable documentation of its biological sustainability and conservation benefits.
(e) *Accountable and Effective Governance:* A biologically sustainable trophy-hunting program should be subject to a governance structure that clearly allocates management responsibilities. The program should account for revenues in a transparent manner and distribute net revenues to conservation and community beneficiaries according to properly agreed decisions. All necessary steps to eliminate corruption should be taken and to ensure compliance with all relevant national and international requirements and regulations by relevant bodies such as administrators, regulators and hunters.

The Service's approach to enhancement findings for the importation of sport-hunted trophies of *P. l. melanochaita* is consistent with the purpose and intent of the Endangered Species Act. Before we will authorize the importation of a sport-hunted trophy, we must determine that the trophy hunting program is managed to ensure the long-term survival of the species. In many parts of the world, wildlife exists outside of protected areas and must share the same habitat and compete with humans living in these areas for space and resources. If communities that

share these resources with wildlife do not perceive any benefits from the presence of wildlife, they may be less willing to tolerate the wildlife. However, under certain circumstances, trophy hunting can address this problem by making wildlife more valuable to the local communities and encourage community support for managing and conserving the hunted species, as well as other species.

When evaluating whether the importation of a trophy of *P. l. melanochaita* would be authorized pursuant to 50 CFR 17.32, in accordance with our threatened species issuance criteria, we will examine how a country's management program for lions addresses the three main threats that have led to the decline of the subspecies: Habitat loss, loss of prey base, and human-lion conflict. When examining a management program and whether trophies taken as part of that program meet the issuance criteria, we would study a number of factors. Some of the factors we would consider include whether the program is based on sound scientific information and identifies mechanisms that would arrest the loss of habitat or increase available habitat (*i.e.,* by establishing protected areas and ensuring adequate protection from human encroachment). We would consider whether the management program actively address the loss of the lion's prey base by addressing poaching or unsustainable offtake within the country. A component of a management plan from which trophy imports would meet the issuance criteria would be whether there are government incentives in place that encourage habitat protection by private landowners and communities and incentives to local communities to reduce the incursion of livestock into protected areas or to actively manage livestock to reduce conflicts with lions. We would examine if the hunting component of the management program supports all of these efforts by looking at whether hunting concessions/tracts are managed to ensure the long-term survival of the lion, its prey base, and habitat. As stated previously, hunting can generate significant economic benefits if properly conducted. In looking at whether we would be able to authorize the import of a trophy under the issuance criteria of 50 CFR 17.32, we would examine if the trophy hunting provides financial assistance to the wildlife department to carry out elements of the management program and if there is a compensation scheme or other incentives to benefit local communities that may be impacted by lion predation. We would also consider how a U.S. hunter's participation in the hunting program contributes to the overall management of lions within a country.

Management programs for *P. l. melanochaita* would be expected to address, but are not limited to, evaluating population levels and trends; the biological needs of the species; quotas; management practices; legal protection; local community involvement; and use of hunting fees for conservation. In evaluating these factors, we will work closely with the range countries and interested parties to obtain the information. By allowing entry into the United States of *P. l. melanochaita* trophies from range countries that have science-based management programs, we anticipate that other range countries would be encouraged to adopt and financially support the sustainable management of lions that benefits both the species and local communities. In addition to addressing the biological needs of the subspecies, a scientifically based management program would provide economic incentives for local communities to protect and expand *P. l. melanochaita* habitat.

As stated, under this 4(d) rule any person wishing to conduct an otherwise prohibited activity, including all imports of *P. l. melanochaita* specimens, must first obtain a permit under 50 CFR 17.32. As with all permit applications submitted under 50 CFR 17.32, the individual

requesting authorization to import a sport-hunted trophy of *P. l. melanochaita* bears the burden of providing information in their application showing that the activity meets the requirements for issuance criteria under 50 CFR 17.32. In some cases for imports, such as sport-hunted trophies, it is not always possible for the applicant to provide all of the necessary information needed by the Service to make a positive determination under the Act to authorize the activity. For the import of sport-hunted trophies of *P. l. melanochaita,* the Service will typically consult with the range country to the extent practicable and other interested parties to obtain necessary information.

The Service has the discretion to make the required findings on sport-hunted trophy imports of *P. l. melanochaita* on a country-wide basis, although individual import permits will be evaluated and issued or denied for each applicant. While the Service may make enhancement findings for sport-hunted trophy imports of *P. l. melanochaita* on a country-wide basis, the Service encourages the submission of information from individual applicants. We would rely on the information available to the Service and may rely on information from sources other than the applicant when making a permitting decision.

CITES

The African lion is also included in Appendix II of the Convention on International Trade in Endangered Species of Wild Fauna and Flora (CITES). It is unlawful for any person subject to the jurisdiction of the United States to engage in international trade in CITES specimens contrary to the provisions of the Convention, the ESA, or our CITES implementing regulations in 50 CFR part 23. 16 U.S.C. § 1538(c)(1), (g); 50 C.F.R. § 23.13. As required by CITES, export of a specimen of an Appendix II species to another country requires prior issuance of a CITES permit. Under CITES, importation of an Appendix II species does not require issuance of an import permit from the importing country. Consequently, the United States is not required to issue a CITES permit in order for U.S. hunters to import their sport-hunted lions. In compliance with CITES, the United States does require CITES imports to meet all CITES requirements, including that the imported lion trophies be accompanied by the required CITES export permits issued by the exporting countries, *see* 50 C.F.R. §§ 23.20; 23.23; 23.24; 23.26; 23.27, and including requirements for sport-hunted trophies at 50 C.F.R. § 23.74.

Individual Permit Adjudication Considerations

When the African lion listing under the ESA became effective, January 22, 2016, the Service began issuing enhancement findings for *P. l. melanochaita* on a countrywide basis, as had been the practice for a number of other threatened sport-hunted species. On March 1, 2018, however, in response to a D.C. Circuit Court opinion (*Safari Club Int'l v. Zinke*, 878 F.3d 316 (D.C. Cir. 2017)), the Service withdrew its countrywide enhancement findings for a range of species, including lions, across several countries, and began assessing applications to import sport-hunted trophies of these species on an application-by-application basis. These withdrawals were upheld in a D.C. Circuit Court opinion (*Friends of Animals v. Bernhardt*, No. 19-5147 (D.C. Cir. June 16, 2020); *Center for Biological Diversity v. Bernhardt*, No. 19-5152 (D.C. Cir. June 16, 2020)). No countrywide ESA enhancement findings are currently in effect. Therefore, since March 1, 2018, the Service has been making ESA enhancement findings for the import of sport-hunted trophies of lions on an

application-by-application basis, ensuring consistent application of the regulatory criteria across all permit application adjudications and ensuring that each permit decision is based on the best scientific and management information available.

Although the Service makes the required enhancement findings on sport-hunted trophy imports of *P. l. melanochaita* on an individual application basis, information obtained for the range country as a whole is also considered, as it is pertinent to the Service's evaluation. In addition to considering national-level species management, we also consider species management and contributions to species enhancement on a smaller-scale (e.g., at the regional or hunting management unit scale such as at the hunting operator, community conservancy, concessionaire, reserve, or ranch-level scale). In addition, we consider how the hunter's personal involvement in the hunting experience directly or indirectly contributes to enhancement of the species in the wild. In its enhancement evaluation, the Service, therefore, considers efforts made by the hunting management unit and/or individual hunter to directly or indirectly address the threats posed to lions in the wild together with other information available concerning the overall management and population status of the lion in the range country at the time of the hunt.

In making ESA enhancement findings, we review all relevant information available to us, including information submitted with the individual permit applications, information received in response to inquiries we make of the range countries, and all other reliable information we receive from interested parties, such as species experts, hunting organizations, hunting operators, community groups, and non-governmental organizations. We evaluate and consider all relevant information obtained or submitted to the Service on an ongoing basis as it relates to permit applications received for import of sport-hunted trophies of *P. l. melanochaita*.

The Service considers information at these different levels in order to assess:

1) How the range country government manages the hunted species and how hunting serves to enhance the survival of the species in the wild in the context of the management system;
2) How hunting serves to enhance the survival of the species in the wild in the context of the management unit at the hunting operator, concessionaire, community conservancy, reserve, or ranch level; and
3) How the individual hunter has contributed (where the hunt has already taken place) or will contribute (where the hunt has not yet taken place) to enhancement of survival of that species through their hunting activities and contributions to the survival of the species in the wild associated to the hunt and subsequent import.

Government-Level Factors Considered

- Enforcement of wildlife laws and regulations, particularly with regard to the range country's ability to implement wildlife regulations developed for the hunted species
- Implementation of a scientifically-based management plan that addresses the major threats to the species and provides economic incentives for local communities to conserve the species
- Investment of hunting fees into conservation, including whether the range country has standard processes and infrastructure in place to ensure an effective transfer of hunting revenues back into the country's management of the species and community benefits
- Management of human-lion conflict, including whether the range country has a compensation scheme or other incentives to local communities to reduce the incursion of livestock into protected areas or to actively manage livestock to reduce conflicts with lions
- Management of the lion's prey base by addressing poaching or unsustainable offtake of the lion's prey species
- Management of lion hunting areas through a system that ensures the long-term survival of the lion, its prey base, and habitat
- Protection of lion habitat through establishment of protected areas, ensuring adequate protection from human encroachment and providing incentives that encourage habitat protection by private landowners and communities
- Establishment and use of science-based quotas, a sex and age-based harvest system, and a monitoring program for the lion and its prey species

Hunting Management Unit-Level Factors Considered

- Monitoring populations of the hunted species and their prey-base
- Protecting and/or increasing the prey-base for lions in the wild
- Maximizing biodiversity of the lion's prey species
- Protecting and improving the habitat for lions in the wild to ensure maintenance of ecosystem functions and biodiversity (e.g., creating water holes, habitat management, etc.)
- Engaging in anti-poaching activities for lion and their prey base
- Managing human-lion conflict
- Investing in community benefits and employment, where such investments provide incentives for conservation of lions in the wild
- Complying with harvest laws and regulations
- Re-investing hunting fees or other contributions associated to lion hunting to a fund that supports conservation of lions in the wild

Hunter-Level Factors Considered

- Complying with harvest laws and regulations
- Paying hunting/import-related fees or other contributions associated to lion hunting that are re-invested to support conservation of lions in the wild (e.g., funding habitat protection for lions in the wild, protection of the lion's prey base, or mitigation of human-lion conflict)
- Participating in a hunting program with an operator that supports sustainable use of the species

This application-by-application permit review process offers an opportunity to incentivize hunting in concessions, conservancies, reserves, or ranches that support conservation of the species through rigorous anti-poaching programs, local wildlife monitoring activities, and compliance with government rules and regulations. By complying with our enhancement requirements, a hunter's personal import will help conserve lion populations in the wild by supporting the local communities where they hunt and promoting conservation of these species and their habitats by providing protection incentives to communities that live alongside these species.

Basis for Finding

On February 1, 2016, the Service sent a letter to the Parks and Wildlife Management Authority in Zimbabwe (ZPWMA) with a list of questions related to management plans, population status, conservation, management, hunting policies, and regulations of Zimbabwe's lion populations. Additionally in the letter, the Service referenced the IUCN SSC Guiding Principles on Trophy Hunting as a Tool for Creating Conservation Incentives Ver. 1.0 (09 August 2012), as it provides useful principles which, when considered in conjunction with the Service's permit issuance criteria, would aid when making the required enhancement findings for permitting importation of sport-hunted lion trophies.

On February 16, 2016, the Service sent a second request to ZPWMA for specific documents related to the conservation status of lions in Zimbabwe. ZPWMA responded to the Service's request on February 17, 2016, with a copy of *Conservation Status of African Lion in Zimbabwe,* and subsequently, on November 29, 2016, provided a copy of its *Enhancement and Non-detriment Finding for Lion (Panthera leo) in Zimbabwe.* The Service has also been corresponding with ZPWMA regarding African elephant management for several years. In this correspondence, ZPWMA, as well as other sources, have provided the Service with documents and information that are relevant to our evaluation of lions in Zimbabwe.

Since 2016, the Service has met with officials from Zimbabwe multiple times to receive updated information on the status of and management of lions in Zimbabwe with respect to imports of sport-hunted lion trophies. For example, Service representatives met with Zimbabwe officials in January 2018 at the annual Safari Club International convention in Las Vegas, and November 2018 at the African Wildlife Consultative Forum in Uganda. In September 2018, Zimbabwe officials provided to the Service the May 2017 Zimbabwe National CAMPFIRE Stakeholder's Review and the Zimbabwe Parks and Wildlife Management Authority Strategic Plan, 2019-2023. In addition, in September 2018 the Service received a letter dated 6 December 2017 from Hon. E.D. Mnangagwa, President of the Republic of Zimbabwe, addressed to President Donald Trump, addressing the

change of administration in Zimbabwe. In this letter Hon. E.D. Mnangagwa provided assurance to the United States that Zimbabwe is politically stable and that Zimbabwe's previous conservation initiatives would be enhanced, with the previous Minister, Permanent Secretary, and Director General confirmed to remain in place.

This information provided by the Zimbabwe authorities (including verbal updates and presentations at the 16th Annual African Wildlife Consultative Forum (Uganda, November 2018), along with the Service's final rule on the lion listing under the Act and other relevant information from reliable sources, are the basis of this finding.

Governance of Lions in Zimbabwe

The legal framework for Zimbabwe's regulatory mechanism is informed by its Wildlife Policy (1992), which is intended to maintain a protected area network for the conservation of the nation's wild resources and biological diversity. The Wildlife Policy (1992) provides for the Government of Zimbabwe to maintain a network of protected areas known as the Parks and Wild Life Estate, comprised of the country's National Parks, safari areas, botanical gardens, and sanctuary and recreational areas for the conservation of the nation's wild resources and biological diversity (CITES 2016; ZPWMA 2016). The framework is intended to create economic activity to enhance rural development and encourages the conservation of wild animals and their habitats outside the protected areas.

ZPWMA was established by the Parks and Wildlife Act of 1996 (Chapter 20:14) [as amended by Act Number 19 of 2001] which came into operation on June 1, 2002, through Statutory Instrument 144C of 2002. The Act provides for the establishment of a Parks and Wildlife Board; establishment of national parks, botanical reserves, botanical gardens, sanctuaries, safari areas and recreational parks; and the preservation, conservation, propagation or control of wildlife, fish, and plants of Zimbabwe and the protection of Zimbabwe's natural landscape and scenery. This Act includes sections on virtually every aspect of ZPWMA, including requirements for annual financial audits and reporting to the central government. The Act also provides for substantial penalties for the unlawful possession of or trading in protected wildlife species. In addition, the General Laws Amendment Act (No. 5) of 2010 provides for mandatory imprisonment for poaching.

The Parks and Wildlife Act, Chapter 20:14, devolved authority to manage and benefit from wildlife on communal and private lands to the landholders. In 1982, the legal provisions of this Act were extended to Rural District Councils (RDCs), on behalf of rural communities in communal lands whose areas contain viable populations of wildlife. Communal areas in Zimbabwe are administered by RDCs which have become a mechanism for implementation of the government's policy of conservation by utilization of natural resources. The Act enables local communities to manage and benefit from wildlife resources through the Communal Areas Management Programme for Indigenous Resources (CAMPFIRE) established in 1989.

CAMPFIRE was developed to encourage reduction in human-wildlife conflicts through conservation-based community development and to provide an economic incentive to

improve community tolerance of wildlife, including lions. At the time, the CAMPFIRE program was the model for community-based conservation efforts in several other African countries and was identified as an innovative program. Under a community-based conservation program, like CAMPFIRE, rural communities should benefit from revenue generated by sport-hunting.

As Zimbabwe's premiere wildlife agency, the main functions of the ZPWMA are to control, manage, and maintain Zimbabwe's wildlife resources with the primary role of protecting and conserving Zimbabwe's natural heritage for present and future generations on behalf of the country. It also provides the cornerstone of Zimbabwe's tourism industry (ZPWMA 2015). The rationale behind the establishment of the ZPWMA was to allow for a self-funding mechanism, and thereby reduce its dependence on the national treasury. In January 1996, the Government of Zimbabwe approved the establishment of the Parks and Wild Life Conservation Fund that provides for financing wildlife operations directly from revenues generated through wildlife-related activities. The funding for ZPWMA is therefore coming from revenue generated through sport hunting conducted on state and private lands, concession leases, National Park visitor fees, and other wildlife-related fees. While there have been requests by ZPWMA for funding from the central treasury in the past, to our knowledge, no other significant government funding has been provided, and only limited outside funding from non-governmental organizations (NGOs) or other governments appears to be available.

A major component of ZPWMA mandate is law enforcement. Poaching mainly occurs along the boundaries of protected areas where lions are incidentally snared as non-target prey. Between 2013 and 2015, 21 lions were killed illegally, with six animals killed through snaring in the area adjacent to Hwange National Park in 2015; poverty stands as the major driver of illegal hunting (ZPWMA 2016). If anyone is found in possession of poached specimens, they must pay a fine of USD 5,000 or face a mandatory jail sentence. If convicted of lion poaching, courts could require the payment of a compensation fee of USD 20,000 (ZPWMA 2014). Hunting operators are obligated through their concession lease agreements to assist with anti-poaching efforts (ZPWMA 2016). Reportedly, USD 590,000 was spent on anti-poaching efforts by the Bubye Valley Conservancy (BVC) alone during 2015 (K. Leathern, pers. comm., as cited in Du Preez et al. 2016), and USD 546,000 is spent annually on anti-poaching by the Save Valley Conservancy (SVC) (Lindsey et al. 2012); these expenses are mainly covered by sport-hunting revenue (Du Preez et al. 2016). In 2002, ZPWMA had 2,146 rangers at its establishment (ZPWMA 2016); however, by the end 2015, there were 1,448 rangers in post (67% of 2002 level). Of the 1,448 rangers in post, 1,004 are deployable for anti-poaching operations (ZPWMA 2016).

Safari operators in Zimbabwe are required to be registered and licensed by the Zimbabwe Tourism Authority (https://www.soaz.net/index.php/2, accessed August 16, 2019). Operators must hold a lease or agreement on a suitable concession with an approved quota of animals. They are responsible for the official paperwork and permits connected to the hunt. Hunting operators are required by law to provide the services of a Zimbabwe Licensed Professional Hunter to accompany foreign hunters in Zimbabwe. Licensing is undertaken by the National Parks & Wildlife Authority.

Zimbabwe is a member of the Southern African Development Community (SADC). Under the SADC Treaty, Article 5(g) establishes objectives to, among other aspects, promote the sustainable use of wildlife, harmonize legal instruments governing wildlife use and conservation, promote the conservation of shared wildlife resources through the establishment of trans-frontier conservation areas (TFCA), and facilitate community-based natural resources management practices. To implement the SADC Treaty, member states are required to establish management programs for the conservation and sustainable use of wildlife.

Currently Zimbabwe is pursuing six TFCA initiatives at various stages of development. These are: Great Limpopo Transfrontier Park (GLTP) / Great Limpopo Transfrontier Conservation Area (GLTFCA); Chimanimani TFCA; Greater Mapungubwe TFCA; Kavango-Zambezi (KAZA) TFCA; Lower Zambezi-Mana Pools LZMP (TFCA) and Zimbabwe-Mozambique-Zambia (ZIMOZA) TFCA (Mandisodza-Chikerema 2018, p. 34).

Through TFCAs, wildlife management entities are linking many of the major protected areas by removing boundary fences along national borders that separate many reserves in addition to creating or improving corridors to link good-quality habitat for wildlife (Newmark 2008). The principle of ecological and migratory connectivity lies at the heart of the TFCA initiative linking large protected areas across international boundaries and providing space for wildlife populations.

Another provision of the SADC Treaty is that member states are required to establish management programs for the conservation and sustainable use of wildlife. Zimbabwe has met this criterion for African lions through the development of its 2006 *Conservation Strategy and Action Plan/or the Lion (Panthera leo) in Zimbabwe* (ZPWMA), which is still in use.

As previously mentioned, Zimbabwe is also a Party to CITES, and the African lion species is included in Appendix II of the Convention. As an Appendix-II species, certain criteria must be met before the CITES Management Authority of the country of export may issue an export permit, including a finding from the exporting country's CITES Scientific Authority that the proposed activity will not be detrimental to the survival of the species in the wild (non-detriment finding; NDF) and a finding from the CITES Management Authority that the specimens proposed for export were legally acquired (legal acquisition finding).

The ZPWMA has provided the Service with a copy of its standing CITES non-detriment finding (NDF), dated October 2016, for the export of African lion specimens. The NDF explains that lion populations in Zimbabwe are being managed sustainably for the benefit of the species and that Zimbabwe's management program for lion provides economic incentives for local communities to protect and expand lion habitats. The NDF document provides information to support the following:

- The Zimbabwe hunting industry is based on sound scientific information, provides mechanisms to arrest habitat loss, or where feasible increase habitat, and provides protection from human encroachment.

- Government incentives are in place to encourage habitat protection by private landowners and communities.
- Government Incentives are provided to local communities to reduce human-wildlife conflicts.
- Hunting concessions are managed to ensure the long-term survival of the African lion and its habitat.
- Trophy hunting provides financial assistance to the ZPWMA, the communal CAMPFIRE program, and private landowners to implement wildlife management programs.
- Local communities directly and indirectly benefit from the presence of lion in their areas.
- Participation of U.S. hunters in the Zimbabwe hunting industry contributes to the overall conservation and management of lions in Zimbabwe (ZPWMA 2016).

Lion Status in Zimbabwe

When the Service listed the subspecies of lion in southern and eastern Africa (*P. l. melanochaita*) as threatened under the Act (80 FR 79999), three primary threats to the species throughout its range were identified: loss of habitat, loss of prey base, and human-lion conflict. While human population growth clearly has an impact due to loss of available habitat for lions, increasing human population has a direct impact on prey base. Prey availability affects the reproduction, recruitment, and foraging behavior of lions and, as a result, strongly influences lion movements, abundance, and population viability (Winterbach *et al.* 2012, as cited in USFWS 2015). Lion densities are directly dependent on prey biomass (Hayward *et al.* 2007). Outside of protected areas, the lion's prey base is much reduced (Du Preez et al. 2016); inadequate management and law enforcement have led to poaching of the lion's prey base for bushmeat, which has been critically depleted (USFWS 2015). Population trends across eastern and southern Africa show that most prey species have declined in recent years; and for Zimbabwe, droughts have been a critical factor (ZPWMA 2016).

A reduced prey base results in a relatively greater chance of lions encountering livestock (Du Preez et al. 2016). While actual losses of livestock to predators may be relatively low, the perceived financial cost to farmers can be high, and lions are persecuted intensely in livestock areas as a consequence. Their scavenging behavior makes them particularly vulnerable to the practice of lacing prey carcasses with poison to eliminate predators (CITES 2016). Co-existence of lions and people is promoted through giving value to lions, such as through tourism and hunting in CAMPFIRE areas (ZPWMA 2014). The threat to lions from habitat loss is especially present in Sebungwe and the South East Low Veld where the fragmented nature of the protected areas is compounded by increasing human and livestock populations surrounding these areas (ZPWMA 2016).

According to the Service's CoPl7 *Consideration of Proposals for Amendment of Appendices I and II,* international trade in lion products is emerging as an additional threat; however, the relative extent to which this threat has contributed to lion population declines is difficult to evaluate accurately (CITES 2016). According to ZPWMA (2016), the illegal local and international trade in lions and their products poses an insignificant risk to the

species in Zimbabwe, as there are no records of people found in possession of illegally acquired lion specimens in Zimbabwe. It is not clear what level of legal trade of lion products, if any, occurs within Zimbabwe.

The bulk of Zimbabwe's wildlife occurs within the Parks Estate which includes 11 national parks, 16 safari areas, 16 recreational parks, 6 sanctuaries, 12 botanical reserves and 3 botanical gardens, all spread across the country (Parks and Wildlife Act 2001 Chapter 20:14). Wildlife populations also occur on the state Forest Areas, Communal CAMPFIRE areas, and private conservancies dedicated to wildlife-based land use. There are approximately 319,317 km^2 of land where some form of wildlife-based land use is practiced in Zimbabwe (ZPWMA 2016). Lions occur permanently in 45% of this available range (circa 145,000 km^2) with the majority occurring in national parks (96%) and safari areas (92%). Lions also occur permanently in 47% of the State forest areas and 66% of privately owned conservancies. The CAMPFIRE areas comprise approximately 247,000 km^2 and lions occur in 36% of these areas. Lions are transient in CAMPFIRE, conservancy, and resettled areas adjacent to the major protected areas, and lions move across the border into Zambia, Mozambique, South Africa, and Botswana.

Zimbabwe's main lion range includes the Hwange-Matetsi Ecosystem, Mid Zambezi Valley, Sebungwe, and South East Lowveld. The lion population estimates in Zimbabwe are determined primarily through carnivore spoor surveys, systematic lion collaring, and call-up surveys. According to ZPWMA's *Conservation Status of the African lion (Panthera leo) in Zimbabwe* July 2014 report, starting in 2015, lion spoor surveys were to be done at two-year intervals in all wildlife areas, and lion call-up surveys were to be done every three years in all major lion areas (ZPWMA 2014). Although the Service has not received confirmation that these surveys have been conducted since 2015, in September 2018, the Service received Zimbabwe's Parks and Wildlife Management Authority's Strategic Plan for 2019-2023, which indicates that Zimbabwe is actively working to improve the monitoring and management of their wildlife species. In their updated strategic plan, signed in December 2018, they indicated that one of their strategic objectives is protection of wildlife resources. Their identified timeline is to update and implement key species management plans (lion is identified as one of these) by December 2023.

ZPWMA (ZPWMA 2016) has estimated that the minimum number of lions that occur on approximately 5l,642 km^2 of land where reliable survey data are available is approximately 1,900 (range 1,800 - 2,000). The western portion of the country, consisting primarily of Hwange National Park and the surrounding safari areas, forest areas, communal areas, and private conservancies, supports approximately 737 lions (or 38% of the overall population). The southern portion of the country, dominated by the two major conservancies (SVC and BVC) and Gonarezhou National Park supports approximately 896 lions (48%). These numbers are supported by several studies.

Within Gonarezhou National Park, Groom et al. 2014, used call-up surveys to obtain direct estimates of the lion population and compared actual lion densities with potential density estimates. In this study, while lions were only seen at five percent of calling stations, this equated to a population estimate of 33 lions, which is consistent with spoor survey results conducted in June 2010 (Groom et al. 2014). A 2015 spoor count

survey of Gonarezhou National Park revealed an estimated 125 lions within the park (ZPWMA 2016).

From 2007 to present, annual track index surveys at the SVC have been conducted using a standardized methodology (Groom and Watermeyer 2015, as cited in Du Preez et al. 2016). Prey availability models suggest that the carrying capacity for this lion population is approximately 271 lions (Hayward et al. 2007). In 2015, the estimated population was 284 lions (Du Preez et al. 2016). The Rifa Safari Area was surveyed using camera trapping and spoor counts in 2015, which supported an estimated population of 68 lions. The central and northern portions of the country reportedly support an estimated population of 284 lions (15%). The 12-year (2000-2011) average lion density per 100 km^2 is 2.8 in Hwange National Park, 6.0 for South Eastern Lowveld in the SVC, 9.0 in Malilangwe, and 0.8 in Gonarezhou National Park (ZPWMA Annual Report 2013, as cited in ZPWMA 2014). SVC's website indicates that at SVC, an annual predator spoor count is conducted by the African Wildlife Conservation Fund (AWCF), an independent organization (http://savevalleyconservancy.org/conservation.html#header1-z, accessed August 14, 2019).

According to Riggio et al. 2013 (p. 32), and Bjorklund in Riggio et al 2013 (p. 32), the minimum number of lions that are estimated to constitute a viable population is 500 individuals. Hwange National Park, with an estimated population of 559, is the only area within Zimbabwe that has a viable population as laid out by Riggio et al. 2013. However, the two regions that make up the largest percentage of the country's lion population (Western 38% and Southern 48%) have regional populations of 737 and 896, respectively. The areas within the Central and Northern regions of Zimbabwe, albeit smaller, encompass parks that are part of Transfrontier Conservation Areas, such as the Mana Pools region.

Lion Management in Zimbabwe

In response to discussions surrounding a possible up-listing of lion to Appendix I under CITES at the 13th Meeting of the Conference of the Parties (CoP13), and subsequent workshops involving lion range states, IUCN, ZPWMA, and other key stakeholders held a workshop to develop the *Conservation Strategy and Action Plan for the Lion (Panthera leo) in Zimbabwe* which was published by ZPWMA in 2006. The plan responds to regional and international standards set by Treaties such as CITES and the Convention on Biological Diversity (CBD), among others. The plan states "it will guide the conservation and management of this top predator" which "addresses the needs of th[e] country." The Service is not aware of any additional or updated iterations of the plan since 2006; however, in Zimbabwe's 2016 response, *Enhancement and Non-Detrimental Findings for Panthera leo in Zimbabwe,* ZPWMA provided updates on each of the outputs and respective targets established under the 2006 *Conservation Strategy and Action Plan/or the Lion (Panthera leo) in Zimbabwe* (ZPWMA 2016).

The 2006 plan identifies a vision that "...lions should be conserved and managed sustainably for their aesthetic, cultural, and ecological values, and the socio-economic

development of Zimbabwe." The plan lays out three broad targets to achieve this objective:

- Ensure the persistence of key lion populations and other important populations including those of doubtful viability.
- Human and livestock loss reduced.
- Optimize wildlife conservation-related net benefits to local communities.

All three targets are stepped down to seven specific outputs with their own targets and activities to meet such targets. Although the plan does not identify a time period, some activities do, of which a period of 5 years is the most common. In response to inquiries from the Service, ZPWMA has provided a summary of the progress made to implement the 2006 strategy.

While all three of the broad targets appear to serve a valuable role in lion management in Zimbabwe, three of the specific outputs are most relevant to determining if the implementation of the strategy enhances the propagation or survival of the species, as required by the Act for the issuance of import permits. The first output, "lion populations, their habitats and wild prey effectively conserved and managed in collaboration with local stakeholders" is broken down into a number of targets: establish a baseline survey and monitoring program; maintain and strengthen capacity for lion conservation, management, monitoring and research; identify and implement best management standards and practices for the hunting program; develop and implement co-management frameworks; and expand the geographic distribution range of lions. Baseline surveys have been completed for the Parks Estate using monitoring protocols for key variables (populations, habitats, prey), and selected surveys have been undertaken in areas outside National Parks (ZPWMA 2016).

Carnivore research programs conducted by NGOs and research institutions such as WildCRU are taking place in various parts of the country; in addition, personnel have been trained in data collection and capture, management, and lion aging and analysis. Adaptive age-based criteria for male trophy animals are in place and functioning. The quota for a certain year is determined by a point system based off the hunts from the previous season. Therefore, ZPWMA is actively working toward meeting the target areas for this output.

The second output, "human-lion related conflicts minimized and, where possible, eliminated" has also been broken down into a number of targets: develop and establish databases on lion-human conflicts; identify and implement methods to reduce and mitigate livestock losses and lion attacks on humans; and train and properly staff problem animal control (PAC) units to conduct rapid response and precisely target problem animals. According to information from ZPWMA (2016), approaches to mitigate livestock losses and lion attacks on humans are in the process of being tested and implemented in Hwange, and methods to mitigate lion attacks on livestock are being implemented as appropriate at selected sites (e.g. Tsholotshe). Data on PAC reports for lion-related problems have been collated, and PAC units at ZPWMA field station and/or RDC levels have been partially established. In Matusadona, Hwange, and Gonarezhou regions, specific awareness and education packages on lion conservation and

management have been developed and implemented. The information submitted in the ZPWMA update suggests that they have met one target, and are in the process of implementing the remaining two.

The third output, "the costs and benefits of long-term lion management equitably distributed," is a socio-economic output to establish agreement and implementation of area-specific lion management plans with identified stakeholders in each wildlife region, and implementing a transparent mechanism to equitably distribute lion-related income to identified stakeholders." The specific targets for this output are: complete an inventory of stakeholders directly affected by lion conservation, deliver appropriate training and capacity building to prioritized stakeholders, agree to and implement collaboratively developed area-specific lion management plans with identified stakeholder groups in each wildlife region within 5 years, and implement transparent mechanisms to equitably distribute lion-related/generated income to identified stakeholders (groups and/or communities). Current information from ZPWMA shows that they have identified key stakeholders and assessed the financial impacts of lion conservation and the magnitude of socio-economic impacts on each stakeholder group. Limited training has been undertaken for representative stakeholders in Hwange, Matusadona, and Gonarezhou. ZPWMA has also implemented an adaptive management program across four wildlife regions and is in the progress of developing and implementing area-specific lion management plans with identified stakeholder groups. According to ZPWMA, a Management Plan for Hwange was approved. The Hwange National Park (HNP) Management Plan was updated in 2015 and officially accepted at Zimbabwe's Ministry of Environment level in 2016 (Conservation and Wildlife Fund (CWF) 2018, p. 16). One of the four components of this 10-year plan is implementation of a cooperation plan between the park and park neighbors. The Conservation and Wildlife Fund – Hwange (CWF) is a relatively new model of the private and NGO sectors in and around Hwange National Park (HNP) Zimbabwe, formalizing an alliance of individual members to materially and in-kind assist authorities with conservation work.

The Hwange Lion Research (HLR) which is part of the Wildlife Conservation Research Unit (WILDCRU), Oxford University, UK, with some financial support and collaborative effort from CWF, set up a comparative camera trap survey in May 2018, to establish a baseline of both lion and lion prey identification and densities in contiguous areas with differing management – the exact CWF project area. Although data were only obtained from the 40-day HNP camera grid, combined sources of complimentary data on the lion population in Forest Areas outside the national park suggest that anthropogenic mortality is slowing down, believed to be in part due to CWF's new law enforcement activities (CWF 2018, p. 21).

Zimbabwe's conservation strategy for lions also identifies roles and responsibilities for a number of participants in Zimbabwe's lion conservation efforts. According to the strategy, there is a national lion coordinator that coordinates all national activities on lion conservation, research, and management, including census surveys, setting up monitoring needs, and coordinating data on human-lion conflicts. The strategy identifies roles for the field stations, wardens, ecologists and utilization units, which are responsible for ensuring compliance with hunting regulations and maintaining safari hunting databases. In addition, the strategy identifies roles for CAMPFIRE, safari operators, and

professional hunters to facilitate training and ensure compliance with hunting regulations.

The Conservation Strategy and Action Plan for the Lion in Zimbabwe (ZPWMA 2006) borrows language from the *IUCN Conservation Strategy* (2006). It iterates areas in need of improvement regarding lion conservation in Zimbabwe, including standardized lion census methods and surveys, further mitigating human-lion conflicts, and maximizing benefits for rural communities that live with lions. ZPWMA (2006) notes their intention to review and put in place criteria for age-based identification of male trophy animals, but do not mention if they will be reviewing possible combination strategies. As part of the 2006 lion conservation strategy for eastern and southern Africa, six objectives were established to secure and restore sustainable lion populations, which were housed under the following categories: management, mitigation, socio-economics, policy and land-use, politics, and trade. The strategy was intended to be implemented within 10 years (Macdonald 2016), and Zimbabwe gave an update on progress regarding these objectives in their *Enhancement and Non-Detrimental Findings for Panthera leo in Zimbabwe* (ZPWMA 2016) that also addressed outputs and targets laid out in their 2006 action plan.

Additionally, to mitigate human-lion conflict, the "Long Shields Guardian Programme" was initiated whereby communities are notified of movements of collared lions into their areas via cell phone, and then have the opportunity to take appropriate action, such as moving cattle. In 2013 alone, 1,850 warnings were passed to the "Long Shields." These actions may reduce the incidents of lions marauding livestock; however, retaliatory killing of lions still occur. Further, as is policy under the Parks and Wildlife Act of 2001, any lions that attack humans or livestock will be lethally eliminated (ZPWMA 2016). Between 2007 and 2013 a total of 1,113 conflict incidents were recorded in the Hwange area in which 915 head of stock were lost to lions.

In and around Hwange National Park, data collected between 1999 and 2004 suggested that hunting surrounding the park was having a negative impact on the lion population. As a result, sport hunting of lions was suspended in the area surrounding the park between 2005 and 2009. Following the lifting of the moratorium, and by implementing stricter monitoring and hunting guidelines through the Hwange Lion Research Project, the overall Hwange lion population has continued to show a positive trend, and as of 2015 the population was estimated at over 550 animals (ZPWMA 2015).

Hunting, Management, and Utilization of Lions

In Zimbabwe, much of the trophy hunting occurs in Safari Areas which are managed mainly for the sustainable use and as buffer zones next to National Parks (Jeke et al 2019, p. 2). Trophy hunting of wildlife is legally permitted in safari areas; as of 2014, there were 16 in Zimbabwe (ZPWMA 2014). According to the Forest Act, Chapter 19:05, there are 24 gazetted indigenous forest areas in Zimbabwe; within these forest areas, lions may be hunted in the following forests: Fuller, Kazuma, Pandamasuwe, Ngamo, Sikumi, Gwayi, Sijarira, and Gwampa (ZPWMA 2014).

As of 2016, the minimum number of lions that occur in approximately 51,642 km^2 of land in Zimbabwe, where reliable survey data are available, is estimated to be 1,917 (range 1,800 - 2,000), the majority of which occur in western and southern Zimbabwe. When taking this population estimate into consideration, trophy hunting harvests a yearly mean of 2.7% of adult male lions. This figure decreased since the establishment of age restrictions on lion hunting (ZPWMA 2016).

In 2013, an adaptive quota management system for lion hunting based on the ages of lions hunted was agreed to in Harare, Zimbabwe, during a meeting hosted by ZPWMA and an independent non- governmental conservation organization (Du Preez et al. 2016). After reviewing aging techniques, attendees at the July 2013 meeting in Harare, Zimbabwe were confident that hunters could be expected to categorize lions as being below or above five years of age. In determining quotas for the following years, operators would be rewarded with increased quotas if they hunted animals of six years or older, would not be penalized if they hunted animals five years of age, but would have quotas cut if they hunted animals younger than five years old, or if they failed to complete hunt returns (ZPWMA and Panthera 2014). In 2013, only 28% of lions hunted were five years old or older. In 2015, that figure rose to 77.3% (ZPWMA 2016).

According to Hunter et al. (2013), an adaptive quota management system utilizing age-based criteria would not only aid in the prevention of over-harvesting lions, but would also prevent excessively conservative quotas. Further, according to Miller et al. (2016), results indicate that age-based hunting is feasible for sustainably managing threatened and economically significant species such as the lion, but must be guided by rigorous training, strict monitoring of compliance and error, and conservative quotas. No single trait can be relied upon exclusively to precisely age lions. Rather, multiple traits must be examined in combination to cross-validate an individual's age and, according to Whitman et al. (2004), restricting hunting to individuals that are at least six years old is desirable from a biological perspective due to the reduced risk of the loss of pride males and infanticide of cubs associated with the harvest of such individuals (Whitman et al. 2004).

During 2013, operators were requested to submit hunt returns and photos as a trial run to get the adaptive quota system up and running. In 2014, operators were requested to do the same but were informed that the age of the lions hunted in 2014 would determine their lion quotas in 2015 (Du Preez et al. 2016). In 2015, there was a marked increase in the age of lions hunted in Zimbabwe as a whole. The majority of lions hunted were on the cusp of 5-6 years of age but were not older than six years. National hunting offtakes for lions in Zimbabwe from 2013 to 2015 were 29, 42, and 47 respectively (Masterson 2016). It appears these do not include illegal forms of hunting offtake. In 2011, Zimbabwe's quota was set at 101 lions; in 2014, it was reduced to 50 male lions following the implementation of age restrictions (Henschel 2015, pers. comm., as cited in USFWS 2015).

As described above, CAMPFIRE is the program through which the Government of Zimbabwe has relegated the management of wildlife resources to communal farmers. As of July 2014, there are at least 58 Rural Districts that have been granted the Appropriate Authority status to manage wildlife resources in their areas; however,

according to *Enhancement and Non-Detrimental Findings for Panthera leo in Zimbabwe* ZPWMA 2016, only 16 are actively engaged in some form of wildlife-based land use (ZPWMA 2016). Lions are found in communal areas that are adjacent to major protected areas, and lion hunting is allowed in CAMPFIRE districts (ZPWMA 2014).

In setting adaptive lion quotas, Zimbabwe uses scientific information including spoor surveys, camera traps, and ranger-based sighting. In CAMPFIRE areas, incidences of human-lion conflict are also taken into consideration where survey information is not readily available, when determining quotas for those areas (ZPWMA 2014). The quota-setting process involves all stakeholders, including the ZPWMA, landowners, safari operators, and CAMPFIRE managers and their representatives. During the annual quota-setting workshop, presentations are made by the proponents who then make proposals for quotas. Where it is felt that not enough information has been presented, a precautionary quota will be issued (ZPWMA 2014).

ZPWMA (2016) mentions seven concessions that are leased on five-year terms, and how these concessionaires pay a 5-year "right to lease" fee, annual rental, fixed quota fee (payable if animals are shot or not) and a supplementary quota fee that allows additional animals to be bought as needed. It is unclear to what extent Zimbabwe still utilizes fixed quotas, as Du Preez et al. claims fixed quotas are no longer being used by Zimbabwe, but a fixed quota fee is mentioned in ZPWMA (2016). It is also unclear how many animals concessionaires are able to "buy as needed," and how such requests may be accommodated without going over the national quota (ZPWMA 2016). However, when evaluating the lower quota with higher utilization reported by ZPWMA (2016), and taking into consideration the land area of the Parks Estate alone, Zimbabwe did not exceed the best management practice of 0.5 lions/1,000 km^2; the 2015 off-take would have accounted for 0.125 lions/1,000 km^2.

According to *The Role of Trophy Hunting of Elephant in Support of the Zimbabwe CAMPFIRE Program -December 2016,* a report the Service received in December 2016, the Reserve Bank of Zimbabwe, in collaboration with relevant stakeholders, established the Tourism Receipts Accounting System (TRAS2) that required all outfitters to submit returns listing the revenue generated for hunting activities. This system has been in place for several years, but it required manual analysis of the data to extract information on hunting revenue. In January 2015, to account fully for earnings in the hunting sector, the Reserve Bank of Zimbabwe in collaboration with relevant stakeholders, introduced TRAS, a web-based system that links Safari operators, ZPWMA Authority, taxidermists, shipping agents, International marketing agents, and the Reserve Bank. Under this system, all authorized hunts are registered, allowing for the capture of hunting data, such as the origin of clients, value of trophies and hunts, and area hunted, to monitor hunting quota utilization and track hunted trophies. According to the December 2016 report, the Exchange Control Division of the Reserve Bank of Zimbabwe and the ZPWMA are now able to:

1. Assess regional price differentials of similar hunts and the reasons thereof;
2. Present TRAS2 system updates and reports to the users, including international marketing agents;
3. Engage with international marketing agents of sport hunting;

4. Obtain relevant insights on governing of the hunting sector; and
5. Come up with an effective mechanism to fully account for export proceeds from the hunting sector.

The TRAS2 information provides a breakdown of the source of hunting income, and the amount of funds generated by trophy fees by land category, among other insights, and has demonstrated the TRAS2 system's ability to obtain relevant insights on governing of the hunting sector.

Evaluation

Christopher Edward Taylor hunted in the Bubye Valley Conservancy (BVC) in Zimbabwe. Based on information submitted with the permit application, the Bubye Valley Conservancy (BVC) is reportedly one of largest private wildlife areas in Zimbabwe with a total area of approximately 3,400 km^2. The land that now occupies BVC was historically a cattle ranch, and in 1994 the BVC was established and land use converted through the introduction of a variety of large, wild herbivores and with the primary objective of maintaining an ecologically sustainable and economically viable wildlife enterprise based on ethical trophy hunting.

In evaluating whether the importation of Mr. Taylor's trophy of *P. l. melanochaita* would be authorized pursuant to 50 CFR 17.40(r) and 50 CFR 17.32(a), in accordance with our threatened species permit issuance criteria, we examined how Zimbabwe's management of lions overall as well as how Bubye Valley Conservancy and Mr. Taylor himself have contributed to enhancement of wild lions both directly and indirectly by addressing the three main threats that led to the decline of the subspecies: habitat loss, loss of prey base, and human-lion conflict.

Below, we summarize our evaluation with reference to each of the permit issuance criteria at 50 CFR 17.32(a)(2) on the basis of information available to the Service.

17.32(a)(2)(i): Whether the purpose for which the permit is required is adequate to justify removing from the wild or otherwise changing the status of the wildlife sought to be covered by the permit:

Zimbabwe's lion hunting industry generated 9% of all sport-hunting revenue in 2015; 51% was contributed by U.S. hunters during 2010-2015 country-wide, and 90% of the sport-hunting market in the Bubye Valley Conservancy (BVC) and the Save Valley Conservancy (SVC) from 2005-2015. Even though 9% may not seem like much, lions are a key component of the sport hunting industry, as they are part of the "Big 5" trophies and draw U.S. hunters to Zimbabwe. Without the hunting industry, protected wildlife areas such as BVC and SVC, which have become conservation havens in the threat of human encroachment across much of Zimbabwe, would not be economically viable, and therefore would likely not exist. These wildlife areas not only provide habitat for lions, but also support the lion's prey species.

Sport hunting was essential for the successful transition of the BVC from cattle to wildlife (Du Preez et al. 2016), in that it provided monetary benefits for the

conservation of lions and local communities. The BVC donates over 45 tons of meat from sport hunting to the local communities each year. This meat donation is worth over US $100,000 per year. The BVC also supports several schools, clinics, and community projects in the three surrounding districts of Mwenezi, Maranda, and Jopempe. The local community sees a direct benefit from the wildlife in BVC, but it is also empowered by job opportunities created both within these communities, as well as in the BVC (Du Preez et al. 2016).

The *Strategy and Action Plan* has put into place mechanisms to adequately oversee the harvest of lions in Zimbabwe. With an annual harvest of approximately 85 lions, Zimbabwe is not exceeding the limits identified of 0.5 lions/1,000 sq. km. The objectives of the *Strategy and Action Plan* and the actions and monitoring activities that have been put into place to achieve these objectives should support the adaptive management approach that Zimbabwe has established for managing lions. The Service will continue to monitor the effectiveness of the Strategy and Action Plan, for consideration in future findings.

As described above, we have determined that the government of Zimbabwe and the Bubye Valley Conservancy contribute towards positive conservation outcomes by addressing the main threats of habitat loss, human-lion-livestock conflict, and prey depletion, which contributes to improving the status of lions in Zimbabwe. Further, the fees garnered through Mr. Taylor's hunt will provide revenue to support these positive conservation outcomes.

Therefore, based on the information available to the Service, the purpose for which the permit is being requested, import of this trophy lion, is adequate to justify removing the sport-hunted trophy lion from the wild or otherwise changing its status.

17.32(a)(2)(ii): The probable direct and indirect effect that issuing the permit would have on the wild populations of the wildlife sought to be covered by the permit:

The total area under wildlife-based land use and conservation in Zimbabwe amounts to 10.7 million hectares and represents 27% of the total surface area of the country. Of this, 7.9 million hectares, or 75% of all conservation land in the country, falls under safari hunting as the primary or only source of revenue. Sport hunting of lions by U.S. hunters such as Mr. Taylor supports the programs in Zimbabwe that provide the opportunity for locals to see value in lions, which in turn conserves the species in the long-term.

A scientifically based quota is the number of a given species that can be removed from a specific population without damaging the biological integrity and sustainability of that population (WWF 1997). However, full implementation and enforcement of the age-based strategy could potentially cause the need for quotas to become irrelevant or eliminated (USFWS 2015). Age restrictions will naturally restrict offtake to a limited number of individuals that meet the age criteria (Loveridge *et al.* 2007, Whitman *et al.* 2004).

Based on the information provided to the Service, it is clear that Zimbabwe has made strides in their management of their lion populations. Additionally, Zimbabwe appears to be transparent in its management processes, including its quota setting. In 2013, Zimbabwe proposed an adaptive age-based strategy for setting hunting quotas. This adaptive quota management system for lion hunting based on the ages of lions hunted has been accepted and embraced by all stakeholders; it has not only led to a reduced national lion hunting quota, but has also resulted in a significant increase in the age of harvested lions to a level that is considered to have a reduced ecological impact (Du Preez et al. 2016).

In 2015, the development of TRAS2 allowed the country to better monitor and govern the hunting sector, including developing an effective mechanism to fully account for export proceeds from the hunting sector. The continued participation of U.S. hunters, including Mr. Taylor, in this market is anticipated to continue to maintain the viability of managing areas such as the BVC and SVC in their current form, including their contribution to conservation of lions in the wild. In 2015, lion sport-hunting generated USD 753,000 in revenue, which accounts for about 9% of all sport hunting revenue in Zimbabwe that year (ZPWMA 2016).

After evaluating the information provided by the Zimbabwe government and other sources, it appears that the hunting program in Zimbabwe is addressing the three main threats that were identified by the Service when making the determination that the species was threatened with the possibility of extinction. Moreover, hunting areas such as BVC and SVC are maintaining habitat for lions and ensuring that there is no further loss, provided that the hunting areas can remain economically viable. In order to maintain a viable population of lions, the parks, safari areas, and CAMPFIRE areas must maintain biodiversity and a sustainable prey base. Finally, Zimbabwe is actively working to reduce human-lion conflicts and the number of lions killed in retaliation for killing livestock. Therefore, the management of lions within Zimbabwe and the limited hunting of lions contributes to the on-going survival of the species in Zimbabwe.

The participation of Mr. Taylor in the hunting and subsequent import of the trophy lion he harvested in the BVC provides an indirect benefit to wild lion populations by helping to support the reserves where lions are found; Mr. Taylor's hunt has generated revenue to help support a hunting area where lions are found and conserved. Therefore, based on the information available to the Service, the probable direct and indirect effect that issuing an import permit for a legally hunted lion would have on the species would be positive.

17.32(a)(2)(iii): Whether the permit, if issued, would in any way, directly or indirectly, conflict with any known program intended to enhance the survival probabilities of the population from which the wildlife sought to be covered by the permit was or would be removed:

As stated above, Zimbabwe is monitoring and controlling the harvest of lions through permitting under their regulations and through the Strategy and Action Plan. The issuance of import permits for lions legally hunted under these

authorities would not conflict with any programs intended to enhance the survival probability of the species in Zimbabwe. Issuance of a permit authorizing import of Mr. Taylor's trophy lion from Zimbabwe would work in favor of, not against, the principal acts governing lion conservation in Zimbabwe. Furthermore, sport hunting opportunities help local communities realize the value in conserving the African lion.

Therefore, based on the information available to the Service, the issuance of an import permit for a legally hunted lion does not conflict with known conservation programs.

17.32(a)(2)(iv): Whether the purpose for which the permit is required would be likely to reduce the threat of extinction facing the species of wildlife sought to be covered by the permit:

Considering Zimbabwe's limited, controlled off-take of lions in a manner that maintains sustainability, Mr. Taylor's legal hunt contributes to reducing the threat of extinction of lions. It appears that the permitting activities under Zimbabwe's laws and CITES, as well as the implementation of the adaptive age-based lion quota, and a continuation of implementation of the outputs in the *Strategy and Action Plan* are working in concert to promote the long-term survival of lions in the wild in Zimbabwe. The use of revenue received from hunters, such as Mr. Taylor, to manage the populations on the reserves is an important element of the success of lion management in Zimbabwe. For example, reportedly, USD 590,000 was spent on anti-poaching efforts by BVC alone during 2015 (K. Leathern, pers. comm., as cited in Du Preez et al. 2016). Therefore, based on the information available to the Service, the issuance of the requested import permit for Mr. Taylor's legally hunted lion will likely reduce the threat of extinction facing lions in Zimbabwe.

17.32(a)(2)(v): The opinions or views of scientists or other persons or organizations having expertise concerning the wildlife or other matters germane to the application:

Based on reviewing comments made during the listing process for lions, as well as information obtained through personal conversations and literature, there is general agreement that hunting, done properly and well managed, would not have an adverse effect on lion populations. Numerous researchers have stated that, while they may not support hunting in general, they see that benefits can be received through a scientifically based hunting program for lions.

Based on the information available to the Service, there is general support by scientists and other persons or organizations having expertise concerning lions that the legal and sustainable harvest of lions, and the subsequent import of legally harvested lion trophies, as proposed in this application, would not have an adverse effect on the species and would further efforts to conserve the species in the wild into the future.

17.32(a)(2)(vi): Whether the expertise, facilities, or other resources available to the applicant appear adequate to successfully accomplish the objectives stated in the application:

Mr.Taylor submitted a permit application to import a trophy of his personally, legally harvested lion from Zimbabwe for the purpose of enhancing the propagation or survival of the species in the wild. As a sport-hunter, Mr. Taylor plays a large role in the hunting industry of Zimbabwe; the hunting and subsequent import of Mr. Taylor's trophy lion increases the funds available to the Zimbabwe Government and BVC to implement lion conservation initiatives. Therefore, based on the Service's review of the information available relating to Mr. Taylor's permit request, we find that the expertise, facilities, or other resources available to Mr. Taylor appear adequate to successfully accomplish the objectives stated in the application.

Conclusion

As described above, the Government of Zimbabwe has been documented to implement the *Strategy and Action Plan* in the manner identified in the documents referenced in making this finding. The on-going adaptive management and limited and sustainable off-take of lions is important to the survival of lions in Zimbabwe, and the funds generated by Mr. Taylor's participation contributes to the ongoing benefits the program provides to lions in the wild.

Therefore, based on the Service's consideration and analysis of the information associated with Mr. Taylor's permit application and other relevant information available to the Service, as described above, we find that the import of the lion harvested by Mr. Taylor on October 08, 2018, from the Bubye Valley Conservancy, Zimbabwe, meets the requirements for making a positive enhancement finding pursuant to 50 CFR 17.40(r) and 50 CFR 17.32(a). Therefore, the Service is able to authorize the import of the trophy of one lion taken from the wild in Zimbabwe, to Christopher Edward Taylor of Berthold, North Dakota.

I. **Service Program and Geographic Area or Station Name**: Branch of Permits, Division of Management Authority, International Affairs

II. **Flexible Funding Program** (e.g. Joint Venture, etc.) if applicable: N/A

III. **Location**: 5275 Leesburg Pike, MS: IA, Falls Church, VA 22041-3803

IV. **Species/Critical Habitat**:

Southern and Eastern African lion (*Panthera leo melanochaita*)

Critical Habitat: N/A

V. **Project Description:** Describe proposed project or action or, if referencing other documents, prepare an executive summary (attach additional pages as needed):

As described in the permit application, 66783C, Christopher Edward Taylor, has requested a permit to import a trophy of one lion that he lawfully hunted in Zimbabwe. The import is for personal purposes.

VI. **Determination of Effects:**

(A) Description of Effects: Describe the action(s) that may affect the species and critical habitats listed in item IV. Your rationale for the Section 7 determinations made below (B) should be fully described here.

Issuance of the requested import permit by the Branch of Permits will result in the importation of one personally sport-hunted lion that has been lawfully taken in Zimbabwe on the date specified in the permit application.

The trophy will be accompanied by the required CITES export permit issued by the CITES Management Authority of Zimbabwe.

The requestd U.S. Federal Fish and Wildlife import permit does not authorize the killing of an African lion; the authorization to hunt and lawfully take a lion is under the purview of the government of Zimbabwe. Therefore, the proposed action of issuing a Federal Fish and Wildlife import permit for this lawfully hunted lion will not directly or indirectly affect individuals of listed or proposed species or designated/proposed critical habitat of such species.

(B) Determination: Determine the anticipated effects of the proposed project on species and critical habitats listed in item IV. Check all applicable boxes and list the species (or attach a list) associated with each determination**.**

Determination

No Effect: This determination is appropriate when the proposed project will not directly or indirectly affect (neither negatively nor beneficially) individuals of listed/proposed/candidate species or designated/proposed critical habitat of such species. **No concurrence from DSA/ESFO required.** **X**

May Affect but Not Likely to Adversely Affect: This determination is appropriate when the proposed project is likely to cause insignificant, discountable, or wholly beneficial effects to individuals of listed species and/or designated critical habitat. **Concurrence from DSA/ESFO required.** _____

May Affect and Likely to Adversely Affect: This determination is appropriate when the proposed project is likely to adversely impact individuals of listed species and/or designated critical habitat. **Formal consultation with DSA/ESFO required.** _____

May affect but Not Likely to Jeopardize candidate or proposed species/critical habitat: This determination is appropriate when the proposed project may affect, but is not expected to jeopardize the continued existence of a species proposed for listing or a candidate species, or adversely modify an area proposed for designation as critical habitat. **Concurrence from DSA/ESFO optional.** _____

Likely to Jeopardize candidate or proposed species/critical habitat: This determination is appropriate when the proposed project is reasonably expected to jeopardize the continued existence of a species proposed for listing or a candidate species, or adversely modify an area proposed for designation as critical habitat. **Conference with DSA/ESFO required.** _____

CHRISTOPHER EDWARD TAYLOR
(b) (6) [redacted]
BERTHOLD, ND 58718
U.S.A.

Authority: Statutes and Regulations: 50 CFR 17.40(r).

Location where authorized activity may be conducted:
IMPORT THROUGH ANY PORT LISTED IN 50 CFR 14.12

Reporting requirements: Not applicable

Authorizations and Conditions:

A. Authorized to import the sport-hunted trophy of one male African lion (*Panthera leo melanochaita*), taken in Zimbabwe for the purpose of enhancement of the survival of the species.

B. Specimen may not be sold or transferred for any financial remuneration.

C. **Trophy must have been taken during the 2018 hunting season.**

D. Trophy must be accompanied by a valid trophy permit or hunting license issued by the government of Zimbabwe for the 2018 season.

E. Trophy must be accompanied by a valid Convention on International Trade in Endangered Species of Wild Fauna and Flora (CITES) Appendix II export permit/re-export certificate, source code "W", issued by the Management Authority of Zimbabwe.

F. General conditions set out in Subpart D of 50 CFR 13, and specific conditions contained in Federal regulations cited above, are hereby made a part of this permit. All activities authorized herein must be carried out in accord with and for the purposes described in the application submitted. Continued validity, or renewal of this permit is subject to complete and timely compliance with all applicable conditions, including the filing of all required information and reports.

G. The validity of this permit is also conditioned upon strict observance of all applicable foreign, state, local, tribal, or other federal law. **This permit can be photocopied.**

H. Valid for use by permittee named above.

I. Acceptance of this permit serves as evidence that the permittee understands and agrees to abide by the "General Permit Conditions" (copy attached).

Complete Sections A or B, and C, D, and E of this application. U.S. address may be required in Section C, see instructions for details.
See attached instruction pages for information on how to make your application complete and help avoid unnecessary delays.

A. Complete if applying as an individual

1.a. Last name	1.b. First name	1.c. Middle name or initial	1.d. Suffix
Cater	Paul	David	

2. Date of birth (mm/dd/yyyy)	3. Social Security No.	4. Occupation	5. Affiliation/ Doing business as (see instructions)
(b) (6)			

6.a. Telephone number	6.b. Alternate telephone number	6.c. Fax number	6.d. E-mail address
(b) (6)			

B. Complete if applying on behalf of a business, corporation, public agency, Tribe, or institution

1.a. Name of business, agency, Tribe, or institution	1.b. Doing business as (dba)
N/A	

2. Tax identification no.	3. Description of business, agency, Tribe, or institution

4.a. Principal officer Last name	4.b. Principal officer First name	4.c. Principal officer Middle name/ initial	4.d. Suffix

5. Principal officer title	6. Primary contact name

7.a. Business telephone number	7.b. Alternate telephone number	7.c. Business fax number	7.d. Business e-mail address

C. All applicants complete address information

1.a. Physical address (Street address; Apartment #, Suite #, or Room #; no P.O. Boxes)
(b) (6)

1.b. City	1.c. State	1.d. Zip code/Postal code:	1.e. County/Province	1.f. Country
Katy	Texas	77493	Waller	USA

2.a. Mailing Address (include if different than physical address; include name of contact person if applicable)
N/A

2.b. City	2.c. State	2.d. Zip code/Postal code:	2.e. County/Province	2.f. Country
N/A	N/A	N/A	N/A	N/A

D. All applicants MUST complete

1. Attach check or money order payable to the U.S. FISH AND WILDLIFE SERVICE **in the amount of $100, nonrefundable processing fee**. Federal, Tribal, State, and local government agencies, and those acting on behalf of such agencies, are exempt from the processing fee – ***attach documentation of fee exempt status as outlined in instructions.*** (50 CFR 13.11(d))

2. Do you currently have or have you ever had any Federal Fish and Wildlife permits?
Yes ☐ If yes, list the number of the most current permit you have held or that you are applying to renew/re-issue: 15US691588/9 No ☐

3. Certification: I hereby certify that I have read and am familiar with the regulations contained in ***Title 50, Part 13 of the Code of Federal Regulations*** and the other ***applicable parts in subchapter B of Chapter I of Title 50***, and I certify that the information submitted in this application for a permit is complete and accurate to the best (b) (6) I understand that any false statement herein may subject me to the criminal penalties of 18 U.S.C. 1001.

Signature (in blue ink) of applicant/person responsible for permit (No photocopied or stamped signatures) — Date of signature (mm/dd/yyyy): 02/06/2018

E. IMPORT OF SPORT-HUNTED TROPHIES *(Appendix I of CITES* and/or *ESA)*

Note 1: If you hold an import permit for trophy/trophies that you did not use, please **return the unused original permit.** If you are requesting reissuance of a permit because you have taken a trophy, but are unable to import it prior to the expiration of the permit, please use the renewal form (3-200-52; http://www.fws.gov/international/permits/by-form-number/index.html) and return your original permit with that form.

Note 2: Applications for species listed as endangered under the U.S. Endangered Species Act are published in the Federal Register for a 30-day public comment period. Please allow at least **90 days** for the application to be processed.

Note 3: USFWS has determined that a trophy consists of raw or tanned parts of a specimen taken by a hunter during sport hunt for personal use. It may include the bones, claws, hair, head, hide, hooves, horns, meat, skull, teeth, tusks, or any taxidermied part, including, but not limited to, a rug or taxidermied head, shoulder, or full mount. It does not include articles made from a trophy, such as worked, manufactured, or handicraft items for use as clothing, curios, ornamentation, jewelry, or other utilitarian items. If you wish to import such products, please contact the Division of Management Authority for the proper application form.

Note 4: Certain hunting trophies, including leopard, elephant, and rhinoceros hunting trophies, are subject to restrictions on their use after import into the United States. Please see 50 CFR 23.55 for more information or contact the Division of Management Authority.

Please provide the following information. Complete all questions on the application. Mark questions that are not applicable with "N/A". If needed, use a separate sheet of paper. On all attachments or separate sheets you are submitting; please indicate the application question number you are addressing. If applying for more than one trophy, be sure to answer questions 1-5 for each trophy addressed in this application. If importing trophies from more than one country, you must submit a separate application for each shipment in order to obtain separate import permits.

1. For each trophy to be imported, provide:
   a. Scientific name (genus, species, and, if applicable, subspecies) and common name.

      P. l. melanochaita (African lion)

   b. Sex (if known).

      Male

2. **IF ANIMAL IS CURRENTLY LIVING IN THE WILD**, please enter the following:
   a. Country and PLACE (area, region, GIS coordinates, ranch AND nearest city) where wildlife is to be taken from the wild:

      Zimbabwe Save Conservancy

   b. Date wildlife is to be hunted: 6/19/2018 – 7/12/2018

   c. Description of the trophy and parts you intend to import (e.g., skin, skull, shoulder mount, life size mount, claws, horn, tusks). Skin, Skull, Claws

3. **IF THE ANIMAL IS DEAD**, please enter the following:
   a. Country and PLACE (area, region, GIS coordinates, ranch AND nearest city) where wildlife was removed from the wild (provide a map if possible):

      N/A

   b. Date wildlife was hunted:

      N/A

c. Description of the trophy and parts you intend to import (e.g., skin, skull, shoulder mount, life size mount, claws, horn, tusks).

N/A

d. The current location of the trophy (address and country) [the U.S. import permit will identify this country as the country of export/re-export and must match with the export/re-export documents]:

N/A

4. Complete name and address of overseas person or business shipping the trophy to you. If you are applying to import a trophy directly from Namibia, you must provide the name and address of the professional hunter listed on your Namibian hunting permit [this name will also appear on your Namibian export permit and must match the U.S. import permit].

Name: Leon Du Plessis
Business Name: Save Safaris
Address: Box CH 381
Address: Chisipite
City:
State/Province: Harare
Country, Postal Code: Zimbabwe N/A

5. Please be aware that the U.S. Fish and Wildlife Service must make a finding that your activities will enhance or benefit wild populations of the species involved. If you have any information that could support this finding (e.g., population status or trend data; how the funds from license/trophy fees will be spent; what portion of the hunting fee will support conservation), please submit such information on a separate page with your application.

CERTIFICATION STATEMENT (original signature must be provided for either 6 or 7 below)

6. **If you are a broker or taxidermist applying on behalf of a foreign national,** provide documentation to show you have a **Power of Attorney** to act on your client's behalf and sign the following statement.

I acknowledge that the sport-hunted trophy/trophies to be imported has been/will be personally hunted by my client and is being imported only for my client's personal use (i.e., **not for sale, transfer, donation, or exchange that is reasonably likely to result in economic use, gain, or benefit**). I understand that my client may only import two leopard trophies in one calendar year (if applicable). In addition, I have advised my client that raw ivory, once imported into the United States, cannot be re-exported.

Taxidermist/Broker's signature: N/A Date: N/A

7. **If you are the hunter applying to import your own trophy**, please read and sign the following statement.

I acknowledge that the sport-hunted trophy/trophies to be imported has been/will be personally hunted by me and is being imported only for my personal use (i.e., **not for sale, transfer, donation, or exchange that is reasonably likely to result in economic use, gain, or benefit**). I understand that I may only import two leopard trophies in one calendar year (if applicable). In addition, I understand that raw ivory, once imported into the United States, cannot be re-exported.

Applicant's signature: (b) (6) Date: 02/04/2018

Be aware that there may be additional permitting or approval requirements by your local or state government, as well as required by other Federal agencies or foreign government to conduct your propose activity. While the Service will attempt to assist you, it is your responsibility to obtain such approval.

8. All international shipment(s) must be through a designated port. A list of designated ports (where an inspector is posted) is available from http://www.fws.gov/le/designated-ports.html. If you wish to use a port not listed, please contact the Office of Law Enforcement for a Designated Port Exemption Permit (form 3-200-2).

9. Name and address where you wish permit mailed, **if** different from page 1 (All permits will be mailed via the U.S. Postal Service, unless you identify an alternative means below):

N/A

10. If you wish the permit to be delivered by means other than USPS regular mail, provide an air bill, pre-paid envelope, or billing information. If you do not have a pre-paid envelope or air bill and wish to pay for a courier service with your credit card, please check the box below. Please DO NOT include credit card number or other information; you will be contacted for this information.

☐ If a permit is issued, please send it via a courier service to the address on page 1 or question 9. I understand that you will contact me for my credit card information once the application has been processed.

11. Who should we contact if we have questions about the application? (Include name, phone number, and email):
Attorneys at Conservation Force, 504-837-1233, cf@conservationforce.org

12. **Disqualification Factor.** A conviction, or entry of a plea of guilty or nolo contendere, for a felony violation of the Lacey Act, the Migratory Bird Treaty Act, or the Bald and Golden Eagle Protection Act disqualifies any such person from receiving or exercising the privileges of a permit, unless such disqualification has been expressly waived by the Service Director in response to a written petition. (50 CFR 13.21(c)) Have you or any of the owners of the business, if applying as a business, been convicted, or entered a plea of guilty or nolo contendere, forfeited collateral, or are currently under charges for any violations of the laws mentioned above?

☐ Yes ☑ No If you answered "Yes" provide: a) the individual's name, b) date of charge, c) charge(s), d) location of incident, e) court, and f) action taken for each violation.

Hi Paul

Please see bellow and attached some information that may help with your lion application. If you are able to send this in with a renewed request for them to issue your import permit. To fish and wildlife. I will send a separate email with the questions as bellow. These questions were from fish and wildlife

I hope it helps

All the very best

Leon

Please see as follows

Question A. Is answered by the attached population survey for carnivores in the SVC.

Also attached are Recent documents from SVC and national parks regarding the upcoming translocation of elephant and various other species.

Bear in mind that all of these species are a joint conservancy asset even tho the parks report use one ranch

Question B & C Is answered Bellow

With regards to the revenue generated from this and other hunts conducted within out concession in the Save Valley Conservancy (SVC), these funds are used for the day to day running of the ranch. We employ 30 staff from the surrounding communities to work on anti poaching, wildlife security, general ranch work, making adequate provisions for water , Camp staff etc.

Funds are also generated for use in specific community projects such as dam repairs donations to the local school and clinic to mention a few.

As a member of the SVC we not only do we look after our own concession, we pay levies which go towards the preservation of the whole of the SVC.

We have a large budget in SVC which goes to protect endangered species such as the rhino, wild dog, pangolins etc. This is funded by members, and donations from Tusk, AWF, Save Australia to mention a few.

In 2018 the SVC translocated 100 elephant to Rifa Safari area of Zimbabwe. This coming year we are in negotiations with out National parks department to translocate a further 400 elephant, 40 buffalo, 2 pride of lion to help with overstocking in the SVC and restocking of Zimbabwe National Parks some of which are depleted. The SVC is very well known in conservation circles and can be researched extensively on the internet Save Safaris has Both a web sight and face book page.

ZIMBABWE PARKS AND WILDLIFE MANAGEMENT AUTHORITY

Feasibility Study for the proposed wildlife destocking from Sango in Save Valley Conservancy to suitable Parks Estate

By

D. Madhlamoto

B. Chirombe

August 2019

Introduction

This report has been compiled in response to a proposed destocking of wildlife from Sango in Save Valley Conservancy to suitable and secure National Parks. A proposal has been put forward by Sango to destock and translocate some of the animals to Parks Estate. This proposal was made so as to relieve pressure on vegetation and ensure animal populations are within the ecological carrying capacity of the area. The reason brought forward by the proponent that has initiated the destocking includes;

- The elephant population in Sango has exceeded the ecological carrying capacity leading to vegetation destruction with secondary impacts on other species.
- There are severe droughts being experienced in the conservancy leading to decline in grazing productivity and negatively affecting wildlife populations.
- The amount of rainfall being received on average is below 300mm hence reducing the potential of the area to support excess numbers.
- Carnivores such as lions and wild dogs have increased to the detriment of prey base.

A feasibility assessment was done at Sango to determine the feasibility of the proposed destocking and to assess the veld conditions. Sango is made up of 4 properties and occupies an area of 60 000 hectares (600km²) and is the largest property in the Save Valley Conservancy. The conservancy is made up of over 10 different properties adjoining each other and wildlife moves freely between properties.

Objectives of the assessment

- To assess the veld and range condition of the proposed source area (mainly vegetation condition and grass production).
- To assess the wildlife populations in the proposed source area.
- To review available information and scientific research conducted in Sango which is part of ecological monitoring being carried out.

Large herbivore populations

Animal population in Sango are primarily monitored though aerial surveys and other methods of estimating animal populations such as distance sampling, spoor surveys and camera traps are being conducted as part of population monitoring. Sango conducted an aerial survey in September 2018 and most properties did not participate due to the cost associated with the survey. The aerial survey results conducted in Sango showed an increase in numbers of species such as elephant, giraffe, buffalo, eland, waterbuck, impala, zebra and kudu. The survey showed a decline in wildebeest population. The elephant carrying capacity for Sango should be less than 200 elephants with a density of about 0.2 to 0.3 per km². Currently the density is about 1.15 elephants per km². During the field assessment, noticeable impacts of elephants on their habitats and that of other species were noted in the property. Not only Sango is experience the challenges of overabundance of elephants but also other management units within the conservancy. During a traverse of Sango the following animals were sighted; +1000 impala, giraffe 87, eland 158, kudu 39, zebra 73, wildebeest 54 and warthog 21.

Table 1: Estimates of animal numbers from Aerial Survey conducted in Sango, SVC

Species	**2018 Population estimates**
Buffalo	1042
Zebra	597
Bushpig	116
White rhino	16
Wildebeest	566
Waterbuck	350
Eland	477
Elephant	665
Impala	6360
Warthog	171
Bushbuck	178
Giraffe	518
Kudu	207
Nyala	52

Large carnivore populations

Spoor surveys are conducted annually in Sango to estimate the population of large carnivores together with call-up surveys and camera traps. The survey results shows an increase in lion and wild dog numbers. Lion tracks were noted along the Msaize river bed and, leopard and wild dogs spoors were sighted on some roads.

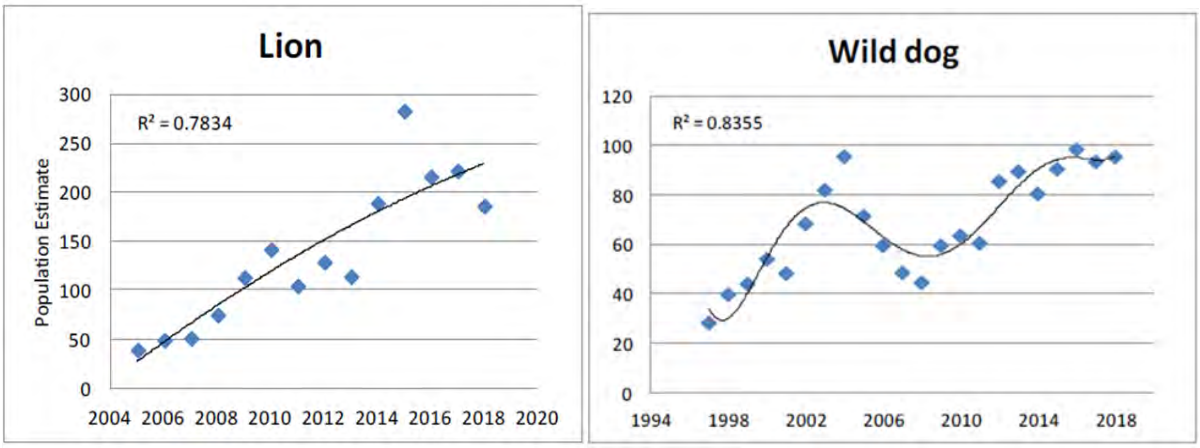

Figure 1: Trends in lions and wild dog numbers

Vegetation condition assessment

Sango has 42 permanent vegetation plots which had been monitored for over 10 years. The assessment team visited some of the plots to assess the damage to vegetation and the range condition. The plots are located in different vegetation communities. The most affected and targeted woodlands by elephants includes the Acacia, Mopane and Riverine. Tree mortalities were frequently noted at *Colophospermum mopane*, baobab *Adsonia digitata,* knob thorn *Acacia nigrescens,* false maruala *Lannea schweinfurthii* and *Acacia tortilis*. The Mopane woodland is being converted to scrub land due to the impacts of elephants. The damage by elephants involve the complete uprooting of a tree leading to creation of bare areas prone to erosion. This has led to a decline in many browsing and grazing units with secondary impacts on species that depend on these woodland and the disappearance of certain tree species. The grass production in most of the areas is very low and cannot support the existing animal populations. Most of high forage value

grass species such as *Panicum maximum* and *Digitaria spp* had been degraded leaving low value species and most areas being invaded by forbs.

Images showing some of the damages to vegetation and decline in graze in Sango

Sango has an estimated 2,520 grazing units, throughout the 7 management vegetation units. The amount of grazing units taken up by the current stocking density far exceeds this carrying capacity. The table and figure below shows that the ecological carrying capacity of Sango has been exceeded and the area is currently overstocked hence the need for destocking.

Table 2: Grazing units in Sango

Species	Offtake number	Grazing units (GU)	Total GU to be removed
Elephant	400	9.8	3,920
Giraffe	70	3.2	224
Zebra	50	1.32	66
Wildebeest	50	1.0	50
Impala	2000	0.3	600
Eland	50	2.0	100
Buffalo	50	2.2	110
		TOTAL	**5,070**

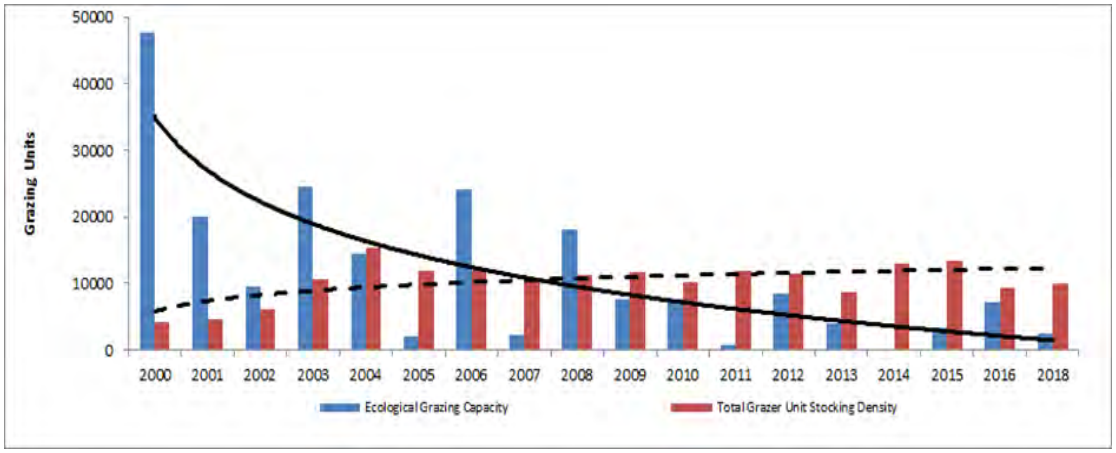

Figure 2: Decline of ecological grazing capacity in Sango

Impacts of drought

The overall rainfall received on an annual basis in the conservancy is less than 400mm. The rainfall received this year in Sango was very low below 200mm. Wildebeest were mostly affected by the recurring droughts leading to a crush in their numbers from a population of about 2000 to 500 individuals. The frequent droughts resulted in declines in the amount of graze available to animals and population crush in some plains game species. There are concern of diseases outbreaks induced by droughts but no recent outbreaks had been recorded in the property. Due to the poor grass production the proponent is looking forward to provision of supplementary feed mainly for white rhinos. However this is not the first time to supplement feed due to poor grazing production in Sango it was done in 2016. There is no permanent water body is Sango hence depend on artificial water supply to sustain animals.

Proposed receiving park areas

The table below shows proposed areas to be restocked with animals from Sango, however some areas can be identified and added to the list basing on the suitability of the areas.

Table 3: Identified proposed sites for restocking

Name	Description
Chizarira National Park	The park covers an area of 1910km ². It lies between (17º 42'S, 27º55'E). The predominant vegetation type is Miombo woodland.

Zambezi National Park	The park covers an area of 560km² and lies between (17º53'S, 25 41'E). Vegetation is divided into five types mixed, Acacia, Zambezi teak (*Baikiaea plurijuga*), *Terminalia* and grasslands.
Mushandike Sanctuary	Covers an area of about 129km² and lies between 20º 12'S, 30º 40' E. The area is dominated by Miombo woodland. A paddock was recently fenced dedicated towards semi-intensive wildlife management.
Sengwa Wildlife Research Area	The park lies between 28°03′ and 28°20′E and 18°01′ and 18°13′S and covering an area of 373 km². The area is dedicated for wildlife research and Miombo woodland is the dominant vegetation.
Matusadonha National Park	The park is located in Northwest Zimbabwe and occupies an area of 1470km². The vegetation found are open *Terminalia-Combretum* woodlands in the valley floor and Miombo woodland in the escarpment and lakeshore grasslands.
Nyanga National Park	The park covers an area of about 47 000 hectares. It is located in the Eastern Highlands of Zimbabwe. Montane forest –grassland and with other areas dominated by Miombo woodland.
Victoria Falls National Park	The predominant vegetation is mopane forest, with small areas of teak and Miombo woodland and a narrow band of riverine forest along the Zambezi.
Matobo National Park	The park covers an area of 424km².The park has mixed type of vegetation that ranges from Mopane, *Acacia* species, *Brachystegia* in other areas, *Azanza* species, *Zizphus* species, *Strychnos* species and *Terminalia* species.

Ecological Suitability of the sites

Suitable habitat is available in all the identified sites for the proposed wildlife translocations and habitat suitability assessments are being carried out. The protected areas already host similar animal species hence the species will certainly adapt to these ecosystems. Most of the areas are

dry savanna woodlands able to support a diverse species of fauna. The proposed areas are dominated by Miombo, Mopane, Acacia and Riverine woodlands which is almost similar to the vegetation types in Sango. Forage availability is enough and these woodlands can support diverse wildlife species and are able to provide feed and cover for these species. Ecological monitoring of mammals both herbivores and carnivores is ongoing with assistance of MoUs signed with various NGOs. Water availability is guaranteed as there are perennial river, water pans, springs, pools that holds water for long periods of time in most of these areas.

Law Enforcement and Safety

Over the past years the Authority has been focusing towards intensifying law enforcement and protection of wildlife hence ensuring the security of wildlife. Current technologies that include the use of drones, SMART and MIKE have been adopted to step-up law enforcement efforts to increase protection of wildlife. Some of the parks have new running vehicles for deployments and permanent bases were reopened to increase the presence and coverage in all parts of the park. Recruitments had been done in almost all park areas to increase the number of people on the ground. Private-Public-Partnership agreement with various organization had been signed resulting in infrastructure development, training of staff and availability of equipment to carryout law enforcement duties effectively. Commitments on conservation education to increase awareness to local communities on protection and wildlife conservation through the use of media, social forums and dialogue all this effected to promote wildlife protection.

Background to decline in some species and how this has been addressed

Most populations were reduced as a result of poaching activities. Rapid response units have been built in most parks in collaboration with donors to step up law enforcements efforts and reduce poaching. Rangers have been trained in Cyber tracking and SMART. Decisions are being based on adaptive management resulting in declines in poaching incidence in most park areas. Community engagement project have been facilitated to ensure that communities experiencing losses from wildlife realize the value of conserving wildlife and benefit from conservation. Trainings had been initiated in local communities on how to mitigate human-wildlife conflicts to increase support for wildlife conservation.

Current situation of animals to be destocked

The animal numbers in Sango had exceeded the ecological carrying capacity of the environment and the animals are overstocked. This has led to vegetation damage and decline in the grazing potential of the area to support grazers. The uprooting of trees is massive and certain tree species will disappear in the near future and some species may fail to regenerate from the impacts.

Table 4: Animals to be destocked from Sango

Species name	Number to be destocked
Elephants	400
Giraffes	70
Eland	50
Zebra	50
Wildebeest	50
Buffalo	50
Impala	2000
Wild dogs	1 pack
Lions	2 prides

Recommendations

- The proposed wildlife destocking exercise from Sango to appropriate Parks Estate is recommended.
- Elephants to be translocated to identified Parks area so as to reduce numbers in the Sango SVC and relieve pressure on vegetation and enhance recovery.
- Due to the decline in grazing potential of the area plains game can be destocked in the area to prevent population crash due to poor and unavailability of forage.
- The animal population in Save Valley Conservancy are a shared populations. Hence a holistic approach toward mitigating the ecological damage requires that the whole conservancy be involved to mitigate against possible conflicts among other property owners in Sango.

THE DIRECTOR GENERAL
ZIMPARKS
HARARE

Dear Fulton

REF: PROPOSED TRANSLOCATION OF 600 ELEPHANT FROM SVC TO SAPI, CHIZARIRA AND MAVURADHONA

As per Mrs Mandisodza's recommendation after Zimparks ecological survey (attached) in the north of SVC, the SVC hereby writes to confirm that the Committee has ratified the following for translocation to Zimparks approved destinations:

600 elephants
2 000 impala
50 buffalo
40 giraffe
1 pack wild dog
2 prides lion

Mrs Price will begin the process of applying for translocation permits. Once our aerial survey is complete SVC will review Sango's list regarding the additional off take of zebra, eland and wildebeest.

Attached is the brochure for the proposed elephant translocation. The donor has confirmed they are happy to fund the entire translocation.

Yours faithfully

STEVEN J E F VOS

Cell: +263 714 532475

CC: CHIEF ECOLOGIST TERRESTRIAL, MRS R MANDISODZA

FOR IMMEDIATE RELEASE

Save Valley Conservancy, Translocation of Wildlife.

Following a statement by Zimbabwe Parks and Wildlife Management Authority (Zimparks) the Save Valley Conservancy issues the following statement.

The conservation success story of the Save Valley Conservancy (SVC) in the south east of Zimbabwe is truly a beacon of light for the long term. The SVC has been called "The Gold Standard of Conservation" by American NGO's for good reason. Sustainable livelihood of the Big Five as well as numerous plains game and other predator species living in the pristine, unspoiled protected area, that is the Save Valley Conservancy. The Save Valley Conservancy, once a series of cattle ranches, has over the last three decades proved that the business model of conservation based on sustainable use can work, so much so that the conservancy today has an overabundance of species and is able to be seen a source population for the re-populating or augmentation of several species in Zimparks estates.

To this end the Zimbabwe Parks and Wildlife Management Authority has recently issued permits for the translocation of up to 600 elephant to various destinations within Zimbabwe. A selection of plains game and other species has also been earmarked for translocation to release pressure on grazing and browsing in the Save Valley. The Conservancy would like to commend the Zimbabwe Department of National Parks in their progressive outlook with regards to the sustainable management of their wildlife resources.

The translocation is proposed to take place in 2020/21 following the engagement of relevant stakeholders, ecologists and supporters to ensure that the destination landscapes are ecologically capable of sustaining the new wildlife and that the adequate protective and management measures are in place.
The SVC is working closely in the initial planning stages of the project with the donors, ecologists, capture specialists and stakeholders to ensure the sustainability and success of the proposed translocation.

The Save Valley Conservancy has engaged with The Ivan Carter Wildlife Conservation Alliance to assist with several aspects of this translocation and we are very grateful to the Cabela Family Foundation for underwriting 100% of this this translocation as a commitment to the conservation of key species and ecosystems in Africa. The Conservancy is proud to be associated with ZimParks in this proposed project which is of vital importance to conservation in Zimbabwe.

The SVC is looking forward to a successful partnership with Zimparks in ensuring the safe completion of the translocation. There are some areas in Zimbabwe that over the years have suffered wildlife losses due to illegal poaching and human wildlife conflict. With renewed commitment from Zimparks and its associated partners, stronger anti-poaching measures are now in place in these areas alongside safe boundary management and the SVC is assured that the animals will be able to flourish in their new homes.

To this end the SVC is proud to be able to prove that sustainable use of wildlife does indeed create excess animals, which can in turn be used to repopulated National Parks and related wildlife areas.

To date the Save Valley remains a prime destination. Good rains in the Lowveld region have ensured Save Valley has flowing rivers and adequate forage and feed for the abundant wildlife. The translocation proposal is there as a management tool to ensure that the Save Valley remains one of the last large-scale pristine wildlife areas on the planet. And it will assist other areas in Zimbabwe that are capable of sustaining wildlife long term where their populations have been diminished.

Any press enquiries should be directed to the SVC COO Steven Vos at coo@savevalleyconservancy.org

Carnivore Densities in the Savé Valley Conservancy

Results of the 2018 Spoor Survey & Wild Dog Monitoring Project

Jessica Watermeyer and Dr Rosemary Groom, African Wildlife Conservation Fund
(Spoor survey carried out by Amy Wolton, Rueben Boté, and Douglas Tomwe)

Introduction

The African Wildlife Conservation Fund carries out an annual large carnivore spoor survey in order to assess population trends of carnivores within the Savé Valley Conservancy (SVC / the conservancy) to aid management decisions. A standardised methodology is used to ensure consistency through time and comparability with other studies. Since 2008, the spoor surveys have been done using the same roads and the same observer.

Spoor surveys have been shown to be an effective and efficient means to assess wildlife densities (Stander 1998; Funston et al. 2001; Davidson & Romañach 2007; Funston et al 2010) with strong correlations existing between spoor density and true density. The technique is considered to produce reliable estimates for lions, spotted hyenas, and leopards, when sample sizes (spoor encounter rates) are sufficient. Other carnivores are included in our counts simply to monitor trends over time.

This report presents the results of the October 2018 carnivore spoor survey for the SVC, together with results from the long term wild dog monitoring project, and looks at trends in the main carnivore species over time.

Methodology

The 2018 carnivore spoor survey used the methods pioneered in SVC by Davidson and Romañach (2007), based on those used by Stander (1998) in Namibia. Exactly the same methodology has been used annually since 2008. Road transects were chosen throughout the SVC to represent a fair coverage of all (non-resettled) areas, and these transects were scanned for spoor. The number of kilometres of transects surveyed was chosen to maintain consistency with previous spoor surveys. Thus, for every 6-7km^2 of

sample area, 1km of transect was surveyed, creating a penetration density (expressed as a ratio of kilometres of transect surveyed to total sample area) of between 1:6 and 1:7.

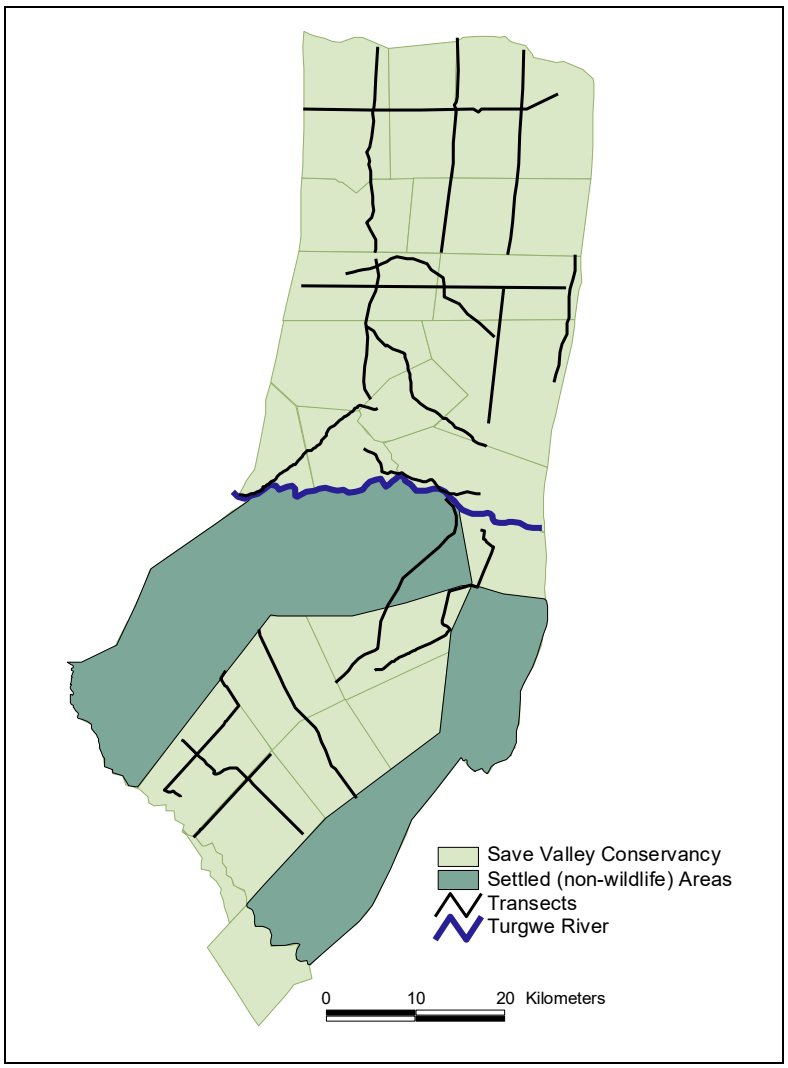
The total area of the Savé Valley Conservancy is 3,490km^2. However, the effective wildlife area (excluding the 1051km^2 of resettled land), comes to only 2,439km^2; 1,639km^2 north of the Turgwe river and 800km^2 south of the Turgwe (see Table 1).

In northern SVC, the total length of all transects combined was 259.5 km, giving a penetration ratio of 6.32. In southern SVC, the combined transect length was 130.9 km, giving a penetration ratio of 6.12. For the conservancy as a whole, 390.4 km were driven (penetration ratio 6.25).

Transects surveyed were the same as those used in 2007-2017 (Figure 1). Each transect was driven at a speed of between 10 and 20 km/hr with one tracker, AWCF head scout Rueben Boté, sitting on the front of the vehicle scanning for spoor. Transects ranged between 12.6 km and 29.1 km in length, with a mean transect length of 21.7 km.

Each transect survey started as close to sunrise as possible, and wherever feasible was driven from west to east to ensure the best possible tracking conditions. Only tracks less than 24 hours old were counted. Road conditions are generally sandy, such that spoor is relatively easy to see. Where possible, spoor of individual animals were followed to reduce the likelihood of that individual being counted twice on a given transect. Spoor was recorded for all mammalian carnivores bigger than a genet.

Figure 1. Map of the transects driven – October 2018



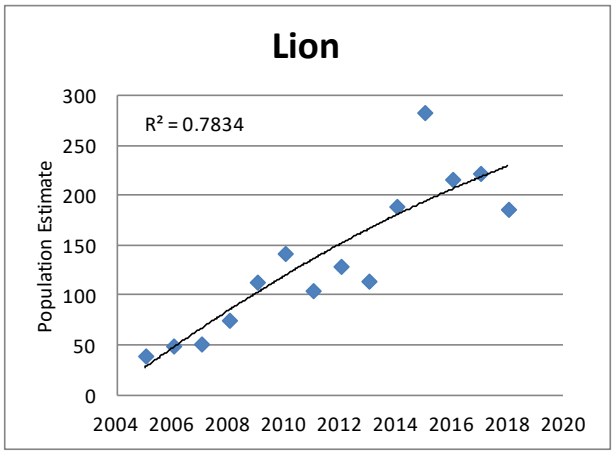
Results

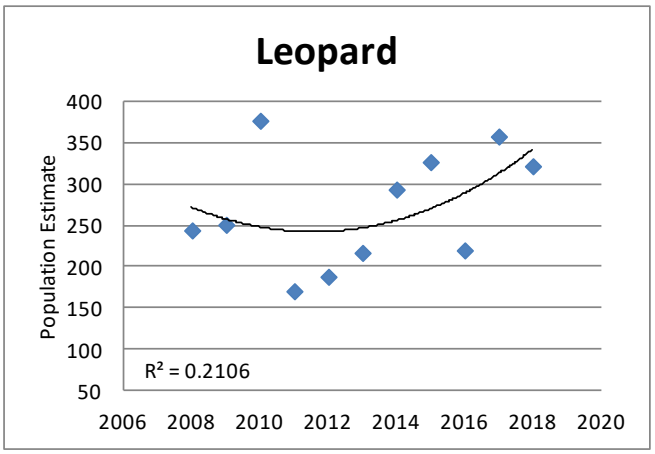
Table 1: Summary of survey parameters (2018)

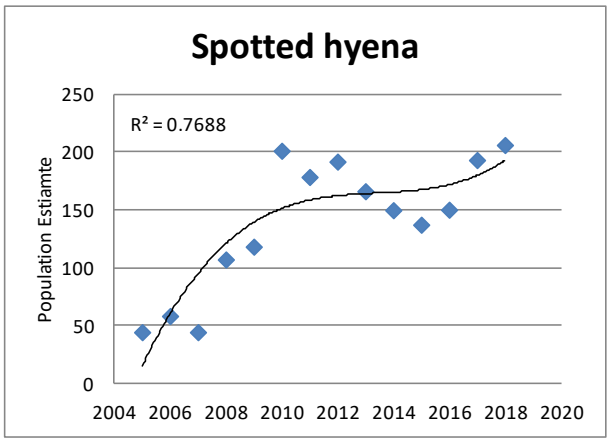
Parameter	Northern SVC	Southern SVC	Total SVC
Area (km^2)	1639	800	2439
Total number of km driven	259.5	130.9	390.4
Penetration ratio	6.32	6.12	6.25

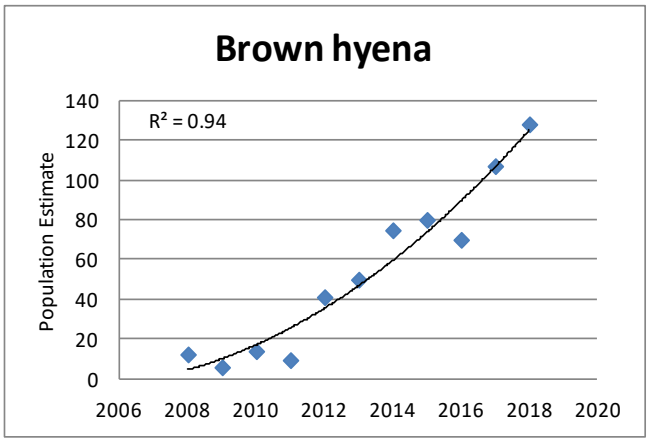
Table 2: Population estimates of the key carnivore species in the **whole of Savé Valley Conservancy** from 2008-2018 (from 2005-2018 for lion and spotted hyena).
Data for lion, leopard, spotted and brown hyenas and black backed jackal are from spoor surveys; **data for wild dogs is from the Lowveld Wild Dog Project's direct monitoring efforts** (counts are taken from April of each year and include adult and yearling wild dogs only)**.**

Species	2005	2006	2007	2008	2009	2010	2011	2012	2013	2014	2015	2016	2017	2018
Lion	40	50	52	76	114	143	105	130	115	190	284	217	223	187
Leopard				245	252	378	172	189	218	295	328	221	359	323
Spotted hyena	44	58	44	107	118	201	178	192	166	150	137	150	193	206
Brown hyena				12	6	14	10	41	50	75	80	70	107	128
African Wild dog				45	60	64	61	86	90	81	91	99	94	96
Black backed jackal				188	190	157	141	151	199	229	241	234	296	153









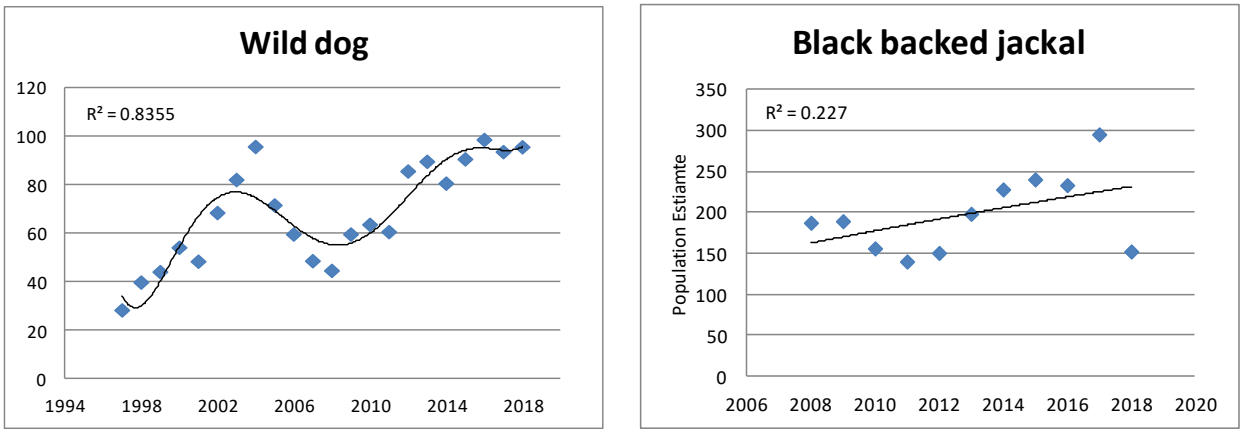


Figure 2: Trends in the populations of key carnivores in SVC for all years for which data is available. Data for lion, leopard and spotted and brown hyenas and black backed jackal are from spoor surveys; data for wild dogs is from the Lowveld Wild Dog Project's direct monitoring efforts (counts are taken from April of each year and include adult and yearling wild dogs). *A breakdown of all survey results for all species between the north and south of the conservancy is given in Appendix 1*.

Discussion

The results show a slight drop in lion and leopard numbers, and a significant decline in black backed jackals (currently unclear as to whether this represents a genuine decline or simply a low count). The spotted and brown hyenas, and wild dog population, remain stable and/or increasing.

Interpretation of results for each species

The **lion population** in the conservancy has increased significantly from c. 40 individuals in 2005 to 190 in 2014. Excluding the anomalous over count in 2015, the population appears to have been relatively stable since 2014, with a few natural fluctuations. Despite the slight decrease in estimated individuals since last year, the population **estimate of 187 lions** in 2018 is within range of the long-term population trend (Figure 2).

The number of lions in SVC equates to a **density of 7.7 lions / 100km²**, which is in line with densities recorded elsewhere (9.6 lions / 100km² - average over Kruger, Hwange, Selous and Serengeti), although in areas notably larger than SVC. Finally, of the 98 lion tracks we encountered, 22% were adult males, with 65% identified as adult females, 6% as young cubs, and 7% of tracts were unidentified. With regards to quota considerations, it is important to not only consider the population trend of the species, but age grouping and sex ratios too.

In 2018 there were an estimated **323 leopard** in the conservancy. If one disregards the 2016 count as an anomalous undercount, and considers the long-term trend data from 2011 – 2017 (inclusive), it is clear that the conservancy's **leopard population** is displaying a positive trend (Figure 2).

Leopards are at a **density of 13.3 leopards / 100km²** in the conservancy. This is considerably higher than densities recorded in other places, for example in Phinda and Mkhuze in South Africa (average 9.7 / 100km²; Balme et al. 2009) and in neighbouring Gonarezhou National Park (8.1 / 100km^2; Groom & Watermeyer 2018). Finally, the SVC leopard population appears to display a 2:1 ratio skewed in the favour

of females. Of the 74 leopard tracks we recorded, 62% were adult females and 30% were adult males. No cub tracts were recorded (0%) and 8% of the tracts were unidentified.

Derivation of population estimates from spoor densities is controversial for leopards (there are several different equations available which give different numbers) so the numbers themselves should be treated with caution. Looking ahead, it may be useful to adopt alternative research methods (e.g. mark recapture camera trap survey) to calibrate the survey results, and obtain a more comprehensive understanding of leopard numbers in the conservancy.

Spotted hyenas appear to have stabilised over the last few years at between 150-200 individuals. Indeed, there were an estimated **206 spotted hyenas** in 2018. The hyena population could be doing better in light of the recently stabilising lion numbers, but we will need to monitor the population to determine if a true trend is emerging.

Spotted hyenas are at a density of **8.4 spotted hyenas / 100km²**. This is lower than other populations; 13.5 / 100km² in Kruger (Mills 1985), 17.0 / 100km² in Hwange (Bowler 1992), and 10.4 / 100km^2 in Gonarezhou National Park (Groom & Watermeyer 2018). Given the relatively lower density of the species in the conservancy, they may still increase more (especially if the lion numbers continue to drop).

There were an estimated **128 brown hyenas** in the conservancy in 2018. Overall and ignoring the 2016 undercount, the **brown hyena population** is displaying a stable and positive growth trend (Figure 2). The estimated density of brown hyenas was **5.2 brown hyenas / 100km^2** in 2018 which is higher than the average (3.4 brown hyenas / 100km^2) over the last few years (2014-2017).

As reported consistently for the past few years, the **African wild dog** population appears to be levelling off. **From our comprehensive and direct monitoring of the species, there are 96 adult and yearling wild dogs in the conservancy (3.9 wild dogs / 100km^2)**. Average wild dog densities are generally lower (average 2.5 wild dogs / 100km² across five populations; Pole 1999). The spoor survey results estimated 278 wild dogs in the conservancy, with a density of 11.4 African wild dogs / 100km^2. This is clearly a significant overestimate of the wild dog population, and serves to demonstrate that spoor surveys are not a reliable indicator of wild dog numbers.

When counts include pups (as spoor surveys do); the numbers are likely to be higher (particularly in October when densities are highest because it is directly after the denning season). Further, there is the potential to 'hit' or 'miss' a large pack of wild dogs during a spoor survey which can have a large effect on the results. However, looking at the detailed monitoring results, the long term trend for the species is as expected. Wild dogs are a classic 'boom and bust' species showing major population fluctuations over time. Nonetheless, their population has been relatively stable since 2011.

There has been a significant decrease in the **black backed jackal** population estimate for the conservancy. At an estimated **153 black backed jackals** in 2018, this is the lowest count of the species since 2013. Whether this is a true decline or not is unclear. At this stage, however, we are cautiously treating the 2018 count as an anomaly, but this species will need to be watched very closely. The estimated density of jackals was **6.3 jackals / 100km^2** in 2018.

We once again stress, that the spoor encounter rate for **cheetah** in the conservancy is very low, and thus it is impossible to accurately estimate the number of resident cheetah, even with large confidence intervals. Indeed, **we did not pick up a signal track for cheetah in the 2018 spoor survey**. Although we know that there are resident cheetah in the conservancy, we can safely say the population is still very low (zero cheetah tracks were seen in the 390.4 km of transects driven in 2018). However, spoor surveys are not appropriate techniques for monitoring cheetah because they use the roads a lot less than other large carnivores, and the species would be more accurately surveyed by a mark recapture camera trap survey using cheetah play trees and other key areas. **The Cheetah Conservation Project Zimbabwe, which collected updated photographic information on cheetah throughout Zimbabwe, estimated c. 12 adult cheetahs in SVC in 2015 (van der Meer, 2016).** We have no reason to think this number has changed much.

Word of caution

When interpreting the results in the graphs and tables at the end, please do so with caution, especially to quote specific numbers. For lions and hyenas we are confident that these spoor surveys are relatively accurate in the numbers they predict, although occasional anomalous over and undercounts need to be treated carefully. Likewise, we can trust the numbers for wild dogs, as they are from AWCF's detailed population monitoring study. For leopards however, several different equations (all considered suitable for estimating leopard numbers from spoor) can give different population estimates from each other. The spoor survey technique has not been calibrated for species like jackals, civets, even brown hyenas, so while the data is useful for looking at trends, using population figures directly from the graphs for these species is unadvisable.

Acknowledgements

Permission to conduct this research was given by the Research Council of Zimbabwe, and the Savé Valley Conservancy, with the support of the Zimbabwe Parks and Wildlife Management Authority. Thank you to Chishakwe Ranch for hosting the project team and for providing logistical support. Thanks also to all of the landowners and managers in the conservancy for allowing us to conduct this spoor survey on their properties. Rueben Bote deserves special mention for his excellent track identification.

600 ELEPHANTS

The largest elephant translocation in history.

IVAN CARTER
WILDLIFE CONSERVATION ALLIANCE

Savé Valley
CONSERVANCY

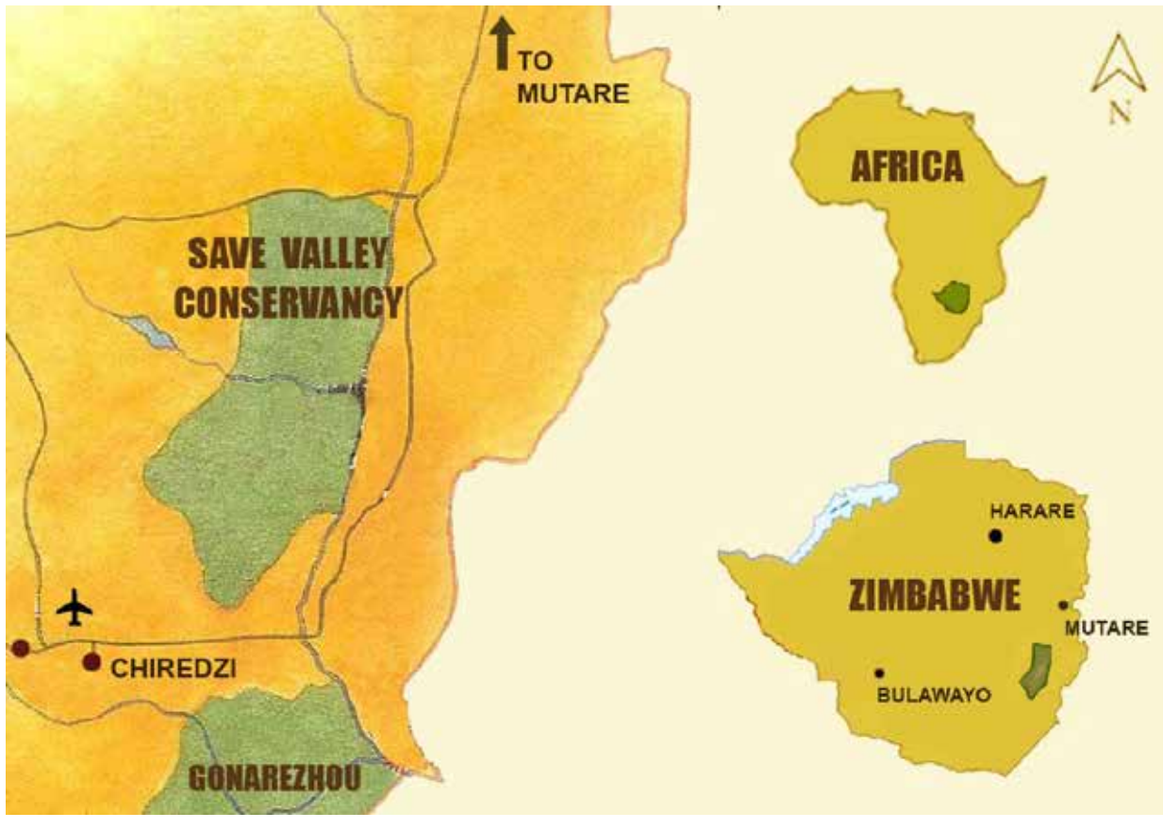
HISTORY OF SAVE VALLEY CONSERVANCY

The Savé Valley conservancy covers an area of some 3400 km2.

The area was once populated by a substantial elephant population, but the majority were eliminated in the 1950's during a campaign against Foot-and-Mouth disease in order to make land available for cattle farming.

In the early 1990's the land was once again repurposed for the use of wildlife. Together, the members of the newly formed Conservancy collaborated to create what has become the SVC today. A massive external fence was built around the whole area, water points established, a road infrastructure developed, safari camp facilities built and anti-poaching activities were taken up to secure the area.

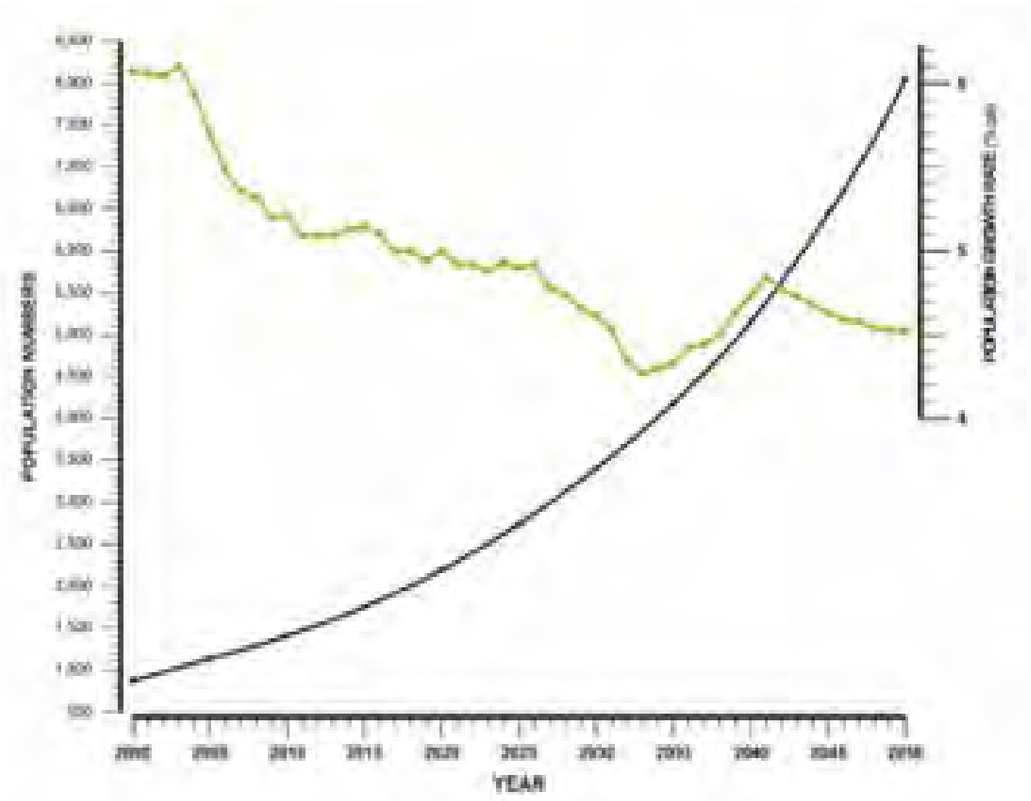
Animal species, additional to those already existing in the area, were introduced. Wildlife populations increased rapidly and withn a few years, SVC was home to globally significant populations of endangered African wild dogs and black rhinos and substantial populations of other threatened species such as elephants; cheetah; white rhino; southern ground hornbills and lappet faced vultures.



SVC ELEPHANT POPULATION

The elephant population in Gonarezhou National Park was relatively high in 1991 (over 5,000 animals) and a severe drought precipitated a population crash. Over a thousand elephants died in the park and 526 were translocated to the Savé Conservancy. The relocated elephants established themselves in the Conservancy and began to increase in numbers after 1992 to the point where their present density is once more a matter for concern due to the significant conservation success story behind the Conservancy.

The SVC has a well organised, professional full-time anti-poaching unit. The risk became too high for poachers to pursue ivory and elephant poaching has been virtually eradicated. This has allowed elephant populations to thrive on the Conservancy.



The Challenge

This incredible success story creates challenges of its own. Elephants have a significant impact on their habitat as a keystone species and if their populations are left unchecked, they threaten the very ecosystem they depend on for their survival. Conservation best practise dictates that the elephant numbers must be reduced drastically.

THE INITIATIVE

In order to mitigate the impacts of excessive elephant populations, there is an urgent need to translocate elephants. This will facilitate saving the flora from further damage, reduce the impact of human / wildlife conflict, and reduce PAC (problem animal control) incidents as well as, repopulate safe locations where in the past elephants have existed.

The alternative of culling elephants is the last resort option, which must be avoided at all costs.

The Goal

Translocate up to 600 elephants to aleviate the pressure on the Save Valley ecosystem. While repopulating depleted areas within Zimbabwe that have adequate protection to ensure their succesful re-introduction.

The Relevance

Never before has the hunting community been able to showcase such concrete conservation returns for large animals where hunter's dollars have led to the protection of the entire ecosystem.

THE DESTINATIONS

The destinations proposed for the SVC elephants are all areas where anti-poaching has been re-established, the private sector has re-engaged and there are community engagement projects under way. Each of these areas have private and NGO funding to continue the project and habitat suitability assessments are being carried out:

① CHIZARIRA NATIONAL PARK
200 elephants

- An area measuring 2000 km2 on the Zambezi Escarpment.
- As part of the Zimparks privatisation plan, Chizarira now falls under private management by way of an MoU with Bejani Trust.

② SAPI SAFARI AREA
200 elephants

- Sapi forms part of three separate State protected areas and is declared a UNESCO World Heritage Site.
- The area measures in at 1200 km2. Anti-poaching efforts are managed privately by Great Plains Conservation.

③ MAVURADHONA WILDERNESS AREA
200 elephants

- Designated as a protected wilderness area in 1982 and afforded National Monument Status in 2017.
- The area spans 615 km2 and has been fenced to elephant proof standards.
- Anti-poaching is managed by a local NGO as part of an upscaled anti-poaching effort up to the border of Mozambique.

THE CAPTURE ITSELF

Moving 600 elephants is no small task and a skilled team of professionals will be required in order to make this dream a reality.

Elephant family herds are carefully selected for suitability. Once chosen, the entire herd is quickly darted by helicopter and put to sleep by a professional game capture team. Each individual elephant is attended to, ensuring the safety of both the elephants and the people, taking genetic data, collaring and taking measurements.

The elephants are then gently hoisted by crane onto flatbed trucks where they are driven to a collection point and transferred to a holding truck. The drugs reversed and they are woken up, fed, cooled, and are moved overnight by road to their destination where they are released into their new environment with as minimal stress to the animals as possible.

The Follow Up

- The matriarch of each group will be collared - researchers will monitor and interpret the data over a three year period.
- At the end of three years, the project will be deemed a success and the collars will be removed.
- The scientific team that will monitor this will be overseen by the same two individuals that oversee 24 lions in Mozambique.

CABELA FAMILY FOUNDATION

Key Points of Agreement

- This will be the most elephants ever translocated anywhere to date.
- There will be a clear contract about branding and how the Cabela Family Foundation logo and name will appear on all media generated.
- The government permits giving legal permission will be in hand.
- There is a signed letter from the SVC Chairman, COO and all Conservancy stakeholders upon whose land the elephant will be captured.
- The family will partake from the 13-19th July, with no other observers present that are unrelated to the physical translocation.
- Any partnership or involvement of any third party NGO's will first be discussed and unanimously agreed upon by the Cabela Family Foundation.
- No funds will be expected to change hands until all permits, permissions and key points of agreement are met.

Commitments

- We will have exclusive filming and media rights for the entire process.
- The initiative will be professionally filmed for both social media and online platform distribution.
- Writers and media from both the hunting and non-huntings sectors will be engaged to help spread the word and get international traction around the story.
- Time will be set aside for participants to get their hands on elephants and be actively involved in the tasks required for the translocation.

“There may be a day I cannot make a difference but there will never be a day that I do not try.” - Ivan Carter

[EXTERNAL] Supplement to all outstanding Zimbabwe Lion Permits - CAMPFIRE document

Aimee Korver <permits@conservationforce.org>

Ms. Brisendine,

Please see the attached letter and document to be included with all applications listed, which should be all outstanding lion import permit applications for trophies coming from Zimbabwe that were filed through Conservation Force.

If you have any questions regarding this matter, please do not hesitate to contact me.

Thank you,

Aimee Korver

Ms. Brisendine:

The document attached is to be included as supplement to all original import permit applications filed with the U.S. Fish and Wildlife Service listed above.

Since filing these applications we have received additional documentation of conservation efforts for lions in Zimbabwe that further detail the populations as stable and growing. The CAMPFIRE document strongly argues the importance of trophy imports and the value that they provide to communities in Zimbabwe through income flows from tourism and hunting which serve to support sustainable community livelihoods in a way that promotes conservation of wild species and habitat.

The Campfire document details the drastic effects that COVID-19 has had and is having on Zimbabwe's tourism and hunting market, which is in a state of collapse. It is leaving the country uncertain of how wild-life and anti-poaching programs will be supported on the ground in the coming months. This information can be used to predict what might transpire if trophy hunting and imports were to cease to exist and the tragic outcome it could have on the conservation efforts of wildlife in the area.

We ask that you please consider these documents when making your decision on enhancement in each import permit application.

Please feel free to contact me if you have any questions regarding this mater.

Cordially,

Aimee Korver
Permits Paralegal

1. CAMPFIRE communities Concern on Import Bans

Open Letter to the United States Fish and Wildlife Service

Dear Dr Mary Cogliano

CAMPFIRE Communities Concern on Import Bans

CA/MPFIRE Association, otherwise known as the Community Areas Management Program for Indigenous Resources in Zimbabwe wishes to register its opposition to continuing campigns for the banning of trophy imports. We are fully aware that the general outrage in both print and social media against sport hunting, which many distant voices refer to as unethical, is aimed at influencing policy action by importing countires.. These arguments, none of which are supported by science, are based on a perfected art of global misinformation and do not represent the views of rural communities who live side by side with wildlife. To us as a people with substantial wildlife populations, trophy hunting is indispensable for conservation and rural livelihoods.

Zimbabwe has one of the most resilient and successful conservation programs in Africa. Its conservation efforts have historically enabled local communities to thrive on sustainable livelihoods in biodiversity-rich landscapes. At least 800 000 households or 2.5 million people (out of a national population of 16 million) benefit directly and indirectly from the sustainable use of wildlife and tourism related investments in their areas. However, our ever growing elephant population has increased the levels of conflict between humans and wildlife in recent years, which, together with recurrent droughts that threaten food security, have made traditional livelihoods more difficult, especially for subsistence farming communities that live in the wildlife rich areas of the country.

Communities in CAMPFIRE areas reside in an environment where conflict between humans and wildlife is common, as both compete for the limited available land and water resources. But this comes at a high price: people in Zimbabwe are paying with their lives for tolerating wild animals in their areas. As recently as 23rd March 2020, Barnabas Mwinga, a 50 year old man, was killed by an elephant in his field in front of his wife and young daughter in Gonono Ward, Mbire District. He is one of seven other people that have needlessly lost their lives to wildlife attacks throughout the country since the beginning of 2020, in addition to the 41 killed in 2019. Yet despite this high cost, wildlife is still highly valued by rural communities who continue to tolerate massive crop destruction and livestock losses from wildlife without compensation. For example, elephant poaching in Mbire District where Barnabas Mwinga was recently killed has gone down from a peak of 40 in 2010 to only 3 elephants poached in 2019 (Figure 1). The decline in poaching incidents is a result of collaborative efforts between the Safari Operator and the hunting clients who invest nearly $100,000 annually into an anti-poaching unit.

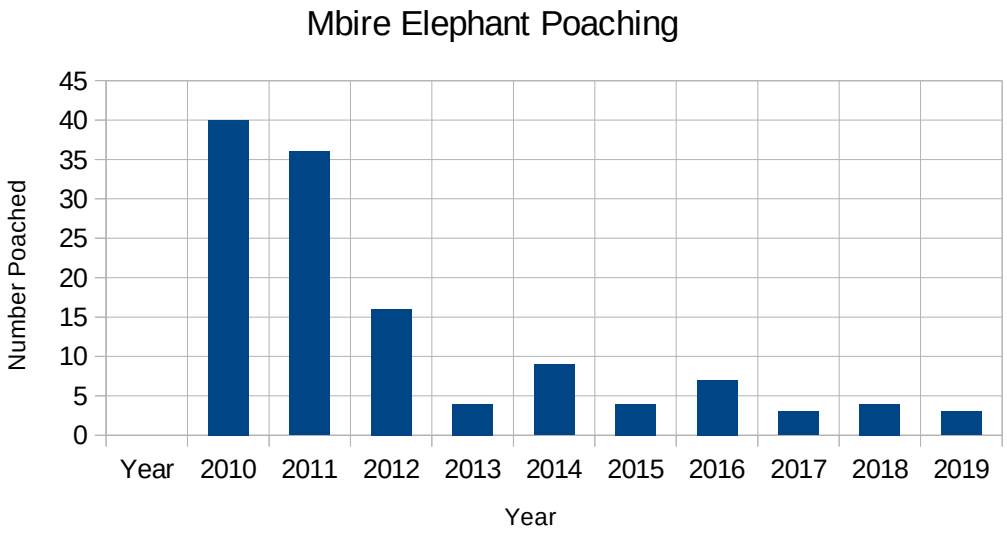

Figure 1: Mbire Elephant Poaching Trends (Source – Mbire Rural District Council)

The aim of the CAMPFIRE programme is to support sustainable community livelihoods in a way that promotes conservation of wild species and habitat. For nearly 30 years, trophy hunting, which relies heavily on the American market, has been cautiously implemented in the absence of other tourism opportunities to achieve this goal. Not only has it resulted in increasing food and livelihood security of rural people, it has also played a role in undermining the drivers of poaching and mitigating human and wildlife conflict. The net impact is seen in securing wildlife habitat and assisting in the regeneration of degraded landscapes.

The financial resources to succeed with this programme in CAMPFIRE areas are heavily dependent on the sustainable hunting of big game, especially elephants. The monies generated from these activities finance the local economies, social services as well as anti-poaching efforts and wildlife management at the District and Ward levels. For example, as can be seen from Table 1 below, the total number of elephants hunted as trophies over nine years is 807 out of a cumulative quota of 1381, from an estimated national population of 83,000 elephants. Hunting quotas are set at no more than 0.5% of the population estimate compared to an elephant population growth of 5% to 6% annually. The levels of off-take (58%) also demonstrate that while hunting is based on controlled numbers for each species annually, it is not uncommon for a client to pay for a full hunt and enjoy the wild experience, but not take a trophy. It is also important to note that communities do not view international hunting clients just as tourists, but as vital conservation partners.

Table 1: Trophy Hunting Quota Summary and Income: 2010-2018

All Districts:	**Elephant**	**Lion**	**Leopard**	**Buffalo**	**Hippo**	**Crocodile**	**Total**

Source: *The Role of Trophy Hunting of Elephant in Support of the Zimbabwe CAMPFIRE Program: Vernon Booth* (in progress).

District and Ward-level institutions in the CAMPFIRE areas rely on income from hunting to provide significant local livelihood benefits (income, jobs, skills) and social services (schools, clinics, irrigation schemes, boreholes) in remote regions where agriculture is marginal and there are very few jobs or other sources of cash income. Table 2 and Table 3 below summarise the impact of pre- and post-elephant trophy import suspension expenditure on the CAMPFIRE programme at the District and Ward level. The District administration costs absorb 89% of the budget with 30% devoted to law enforcement. With the suspension of elephant trophy imports to the USA and Europe in 2016, expenditure on law enforcement dropped from 33% to 9% as a result of District administration having to offset the human and wildlife costs which increased from 1% to 33%. At the Ward level, 46% of the budget is allocated to administration and 54% to community benefits (45% devoted to social services, Table 3).

Table 2: District level expenditure on administration and community benefits: 2010-2018

	Administration			**Community Benefits**			
All District Expenditure	**Administration**	**Law Enforcement**	**Management**	**Assistance to Wildlife Victims**	**Social Services**	**Total**	**Average/ year**

With growing awareness from several years of CAMPFIRE implementation, communities have been demanding their rightful place in the management of wildlife resources for their own benefit. To accommodate this, CAMPFIRE has undergone a review of its policy framework to enable communities to reap greater and more tangible benefits from living in harmony with nature. A key aspect of this review is to establish Community Conservancies that redefine ways in which communities can benefit more from wildlife and other income generation opportunities, as well as the mitigation of human and wildlife conflict. This initiative is being directed under the Global Environment Facility (GEF) 5 and 6 cycles covering five districts with the aim of developing innovative ways to improve the management of wildlife for the benefit or rural people. If trophy hunting and trade here was stopped, the impact on local livelihood would be severe, and both poaching and changes to alternative land use would increase. Non-consumptive tourism currently plays virtually no positive conservation role in the CAMPFIRE areas (<4% of overall income is generated through tourism). Instead of banning the import of trophies, more international oversight and support is needed from importing states, and of in-country CITES controls, to ensure sound sustainable management e.g. quota-setting, permit allocation, independent population surveys; building robust, equitable and transparent benefit allocation mechanisms at local level, particularly where communities have elected to invest their land and time in Community Conservancies.

STOP PRESS: The pressure for imports bans comes at the worst possible time as the Covid-19 pandemic has severely disrupted income flows from tourism and hunting. The collapse of both markets leaves rural people and safari operators with virtually no income, and it is uncertain how wildlife protection and anti-poaching programs will be supported on the ground in the coming months. What remains clear is that trophy import bans will seriously undermine conservation in Zimbabwe, and indeed open floodgates for rural people to destroy wildlife and wildlife habitat through conversion of land for other subsistence uses, even if unviable.

Subject: FWS Permit Application #78387C
Date: Monday, August 17, 2020 9:10:43 AM

Hello,

This email is in regard to the FWS permit application #78387C for Paul Cater to import a lion trophy from Zimbabwe. On the application, it was indicated that the hunt was to take place between June 19, 2018 and July 12, 2018. Please provide the specific date that the lion was taken. Also, please specify which ranch within the Save Valley Conservancy the lion was taken from.

Please reply directly to this email with the requested information.

Thank you and let me know if you have any questions.

In accordance with 50 CFR 13.ll(e), if the requested information is not received by this office ***within 45 calendar days of the date of this email****, your application will be abandoned and administratively closed. Once a file is closed, you will need to submit a new application, and all required fees, for the Service to consider your proposed activity.*

Thank you,

Jenna King

Ms. King,

Attached you will find the TRAS2 hunting permits for Mr. Cater's hunt. The date the lion was taken was June 28th, 2018.

The Ranch that the hunt took place in was Mapari Ranch in Save Valley Conservancy Masvingo Province.

Please let us know that you have received this information and if you have any other questions.

Thank you,
AiméeKorver

ZIMBABWE PARKS AND WILDLIFE MANAGEMENT AUTHORITY

MEMORANDUM

To: Director General

From: Area Manager HQ

Date: 26 June 2018

RE: AUTHORITY TO PROCESS SPECIAL PERMIT FOR HUNTING OUTSIDE PARKS ESTATE

Your authority is kindly sought to process the permit for Save Safaris who have applied for permit to hunt 1 x lion with client Paul Cater in the following properties:

- Matendere Ranch in Save Valley Conservancy Masvingo Province
- Mapari Ranch in Save Valley Conservancy Masvingo Province

The hunt will be **from 26 June 2018 to 04 July 2018** under the guidance of professional hunter **L. du Plessis** PH license **#102**.

Kindly find attached application from the operator and copies of 2018 hunting permit and quota.

Enhancement Finding

Applicant: Paul David Cater (PRT–78387C)

Introduction

Paul David Cater submitted an application on February 26, 2018, for the importation of one male lion *(Panthera leo melanochaita)* taken in June 28, 2018, from the Savé Valley Conservancy (SVC), Mapari Ranch, Masvingo Province, Zimbabwe, for the purpose of enhancing the propagation or survival of the species in the wild. After evaluating the available information submitted with the application, information provided by the Government of Zimbabwe, other information available to the U.S. Fish & Wildlife Service (Service), and comments received from interested parties, the Service has determined that the importation of the sport-hunted trophy meets the requirements for making a positive enhancement finding pursuant to 50 CFR 17.40(r) and 50 CFR 17.32(a). The rationale for our finding follows.

U.S. Permit Requirements for Import of Lions (*Panthera leo melanochaita*)

ESA

The African lion, subspecies *Panthera leo melanochaita* (southern and eastern Africa), is a threatened species under the U.S. Endangered Species Act (ESA or Act) and is regulated under a species-specific 4(d) rule, 50 C.F.R. § 17.40(r) that provides specific conservation measures for this subspecies. Under the 4(d) rule for *P. l. melanochaita*, all of the prohibitions at 50 C.F.R. § 17.21 and 50 C.F.R. § 17.31 apply to *P. l. melanochaita* specimens. These prohibitions, in part, make it illegal for any person subject to the jurisdiction of the United States to import or export any lion specimens.

Although import of the lion subspecies *P. l. melanochaita* is a prohibited activity under the Act, exceptions may be made in accordance with the 4(d) rule at 50 C.F.R. § 17.40(r) when

the import activity qualifies for and the Service issues an ESA threatened-species enhancement permit under 50 C.F.R. § 17.32(a). The preamble to the 4(d) rulemaking, 80 Fed. Reg. 79999, 80043-46 (Dec. 23, 2015), explains the factors the Service considers when making an enhancement finding for importation of sport-hunted trophies of *P. l. melanochaita*, as described below.

Our threatened species permitting regulations at 50 CFR 17.32 provide issuance criteria for threatened species permits (50 CFR 17.32(a)(2)), but do not specify what would constitute the enhancement of propagation or survival with regard to authorizing the import of parts or products of *P. l. melanochaita,* including sport-hunted trophies. Therefore, when making a determination of whether an otherwise prohibited activity enhances the propagation or survival of *P. l. melanochaita,* the Service will examine the overall conservation and management of the subspecies in the country where the specimen originated and whether that management of the subspecies addresses the threats to the subspecies (*i.e.,* that it is based on sound scientific principles and that the management program is actively addressing the current and longer term threats to the subspecies). In that review, we will evaluate whether the import contributes to the overall conservation of the species by considering whether the biological, social, and economic aspects of a program from which the specimen was obtained provide a net benefit to the subspecies and its ecosystem.

The Service will evaluate any application received that involves *P. l. melanochaita* in the context of enhancement of propagation or survival permitting in accordance with our threatened species permitting regulations at 50 CFR 17.32 and issuance criteria for threatened species permits (50 CFR 17.32(a)(2)). These include, in addition to the general permitting criteria in 50 CFR 13.21(b):

(i) Whether the purpose for which the permit is required is adequate to justify removing from the wild or otherwise changing the status of the wildlife sought to be covered by the permit;
(ii) The probable direct and indirect effect that issuing the permit would have on the wild populations of the wildlife sought to be covered by the permit;
(iii) Whether the permit, if issued, would in any way, directly or indirectly, conflict with any known program intended to enhance the survival probabilities of the population from which the wildlife sought to be covered by the permit was or would be removed;
(iv) Whether the purpose for which the permit is required would be likely to reduce the threat of extinction facing the species of wildlife sought to be covered by the permit;
(v) The opinions or views of scientists or other persons or organizations having expertise concerning the wildlife or other matters germane to the application; and
(vi) Whether the expertise, facilities, or other resources available to the applicant appear adequate to successfully accomplish the objectives stated in the application.

In addition to these factors, particularly in relation to sport hunting, we find the *IUCN Species Survival Commission (SSC) Guiding Principles on Trophy Hunting as a Tool for Creating Conservation Incentives, Ver. 1.0* (IUCN SSC 2012), to provide useful principles, which, considered in conjunction with our threatened species issuance criteria, will aid the Service when making an enhancement finding for importation of sport-hunted trophies of *P. l. melanochaita.* This document sets out guidance from experts in the field on the use of trophy hunting as a tool for "creating incentives for the conservation of species and their habitats and for the equitable sharing of the benefits of use of natural resources" (IUCN SSC

2012, p. 2) and recognizes that recreational hunting, particularly trophy hunting, can contribute to biodiversity conservation and more specifically, the conservation of the hunted species.

The SSC document lays out five guiding principles that, considered in conjunction with our threatened species issuance criteria, will aid the Service when making an enhancement finding for importation of sport-hunted trophies of *P. l. melanochaita:*

(a) *Biological sustainability:* The hunting program cannot contribute to the long-term decline of the hunted species. It should not alter natural selection and ecological function of the hunted species or any other species that share the habitat. The program should not inadvertently facilitate poaching or illegal trade in wildlife by acting as a cover for such illegal activities. The hunting program should also not manipulate the ecosystem or its component elements in a way that alters the native biodiversity.
(b) *Net Conservation Benefit:* The biologically sustainable hunting program should be based on laws, regulations, and scientifically based quotas, established with local input, that are transparent and periodically reviewed. The program should produce income, employment, and other benefits to create incentives for reducing the pressure on the target species. The program should create benefits for local residents to co-exist with the target species and other species. It is also imperative that the program is part of a legally recognized governance system that supports conservation.
(c) *Socio-Economic-Cultural Benefit:* A well-managed hunting program can serve as a conservation tool when it respects the local cultural values and practices. It should be accepted by most members of the community, involving and benefiting local residents in an equitable manner. The program should also adopt business practices that promote long-term economic sustainability.
(d) *Adaptive Management: Planning, Monitoring, and Reporting:* Hunting can enhance the species when it is based on appropriate resource assessments and monitoring (*e.g.,* population counts, trend data), upon which specific science-based quotas and hunting programs can be established. Resource assessments should be objective, well documented, and use the best science available. Adaptive management of quotas and programs based on the results of resource assessments and monitoring is essential. The program should monitor hunting activities to ensure that quotas and sex/age restrictions of harvested animals are met. The program should also generate reliable documentation of its biological sustainability and conservation benefits.
(e) *Accountable and Effective Governance:* A biologically sustainable trophy-hunting program should be subject to a governance structure that clearly allocates management responsibilities. The program should account for revenues in a transparent manner and distribute net revenues to conservation and community beneficiaries according to properly agreed decisions. All necessary steps to eliminate corruption should be taken and to ensure compliance with all relevant national and international requirements and regulations by relevant bodies such as administrators, regulators and hunters.

The Service's approach to enhancement findings for the importation of sport-hunted trophies of *P. l. melanochaita* is consistent with the purpose and intent of the Endangered Species Act. Before we will authorize the importation of a sport-hunted trophy, we must determine that the trophy hunting program is managed to ensure the long-term survival of the species. In many parts of the world, wildlife exists outside of protected areas and must share the same habitat

and compete with humans living in these areas for space and resources. If communities that share these resources with wildlife do not perceive any benefits from the presence of wildlife, they may be less willing to tolerate the wildlife. However, under certain circumstances, trophy hunting can address this problem by making wildlife more valuable to the local communities and encourage community support for managing and conserving the hunted species, as well as other species.

When evaluating whether the importation of a trophy of *P. l. melanochaita* would be authorized pursuant to 50 CFR 17.32, in accordance with our threatened species issuance criteria, we will examine how a country's management program for lions addresses the three main threats that have led to the decline of the subspecies: Habitat loss, loss of prey base, and human-lion conflict. When examining a management program and whether trophies taken as part of that program meet the issuance criteria, we would study a number of factors. Some of the factors we would consider include whether the program is based on sound scientific information and identifies mechanisms that would arrest the loss of habitat or increase available habitat (*i.e.,* by establishing protected areas and ensuring adequate protection from human encroachment). We would consider whether the management program actively address the loss of the lion's prey base by addressing poaching or unsustainable offtake within the country. A component of a management plan from which trophy imports would meet the issuance criteria would be whether there are government incentives in place that encourage habitat protection by private landowners and communities and incentives to local communities to reduce the incursion of livestock into protected areas or to actively manage livestock to reduce conflicts with lions. We would examine if the hunting component of the management program supports all of these efforts by looking at whether hunting concessions/tracts are managed to ensure the long-term survival of the lion, its prey base, and habitat. As stated previously, hunting can generate significant economic benefits if properly conducted. In looking at whether we would be able to authorize the import of a trophy under the issuance criteria of 50 CFR 17.32, we would examine if the trophy hunting provides financial assistance to the wildlife department to carry out elements of the management program and if there is a compensation scheme or other incentives to benefit local communities that may be impacted by lion predation. We would also consider how a U.S. hunter's participation in the hunting program contributes to the overall management of lions within a country.

Management programs for *P. l. melanochaita* would be expected to address, but are not limited to, evaluating population levels and trends; the biological needs of the species; quotas; management practices; legal protection; local community involvement; and use of hunting fees for conservation. In evaluating these factors, we will work closely with the range countries and interested parties to obtain the information. By allowing entry into the United States of *P. l. melanochaita* trophies from range countries that have science-based management programs, we anticipate that other range countries would be encouraged to adopt and financially support the sustainable management of lions that benefits both the species and local communities. In addition to addressing the biological needs of the subspecies, a scientifically based management program would provide economic incentives for local communities to protect and expand *P. l. melanochaita* habitat.

As stated, under this 4(d) rule any person wishing to conduct an otherwise prohibited activity, including all imports of *P. l. melanochaita* specimens, must first obtain a permit under 50

CFR 17.32. As with all permit applications submitted under 50 CFR 17.32, the individual requesting authorization to import a sport-hunted trophy of *P. l. melanochaita* bears the burden of providing information in their application showing that the activity meets the requirements for issuance criteria under 50 CFR 17.32. In some cases for imports, such as sport-hunted trophies, it is not always possible for the applicant to provide all of the necessary information needed by the Service to make a positive determination under the Act to authorize the activity. For the import of sport-hunted trophies of *P. l. melanochaita,* the Service will typically consult with the range country to the extent practicable and other interested parties to obtain necessary information.

The Service has the discretion to make the required findings on sport-hunted trophy imports of *P. l. melanochaita* on a country-wide basis, although individual import permits will be evaluated and issued or denied for each applicant. While the Service may make enhancement findings for sport-hunted trophy imports of *P. l. melanochaita* on a country-wide basis, the Service encourages the submission of information from individual applicants. We would rely on the information available to the Service and may rely on information from sources other than the applicant when making a permitting decision.

CITES

The African lion is also included in Appendix II of the Convention on International Trade in Endangered Species of Wild Fauna and Flora (CITES). It is unlawful for any person subject to the jurisdiction of the United States to engage in international trade in CITES specimens contrary to the provisions of the Convention, the ESA, or our CITES implementing regulations in 50 CFR part 23. 16 U.S.C. § 1538(c)(1), (g); 50 C.F.R. § 23.13. As required by CITES, export of a specimen of an Appendix II species to another country requires prior issuance of a CITES permit. Under CITES, importation of an Appendix II species does not require issuance of an import permit from the importing country. Consequently, the United States is not required to issue a CITES permit in order for U.S. hunters to import their sport-hunted lions. In compliance with CITES, the United States does require CITES imports to meet all CITES requirements, including that the imported lion trophies be accompanied by the required CITES export permits issued by the exporting countries, *see* 50 C.F.R. §§ 23.20; 23.23; 23.24; 23.26; 23.27, and including requirements for sport-hunted trophies at 50 C.F.R. § 23.74.

Individual Permit Adjudication Considerations

When the African lion listing under the ESA became effective, January 22, 2016, the Service began issuing enhancement findings for *P. l. melanochaita* on a countrywide basis, as had been the practice for a number of other threatened sport-hunted species. On March 1, 2018, however, in response to a D.C. Circuit Court opinion (*Safari Club Int'l v. Zinke*, 878 F.3d 316 (D.C. Cir. 2017)), the Service withdrew its countrywide enhancement findings for a range of species, including lions, across several countries, and began assessing applications to import sport-hunted trophies of these species on an application-by-application basis. These withdrawals were upheld in a D.C. Circuit Court opinion (*Friends of Animals v. Bernhardt*, No. 19-5147 (D.C. Cir. June 16, 2020); *Center for Biological Diversity v. Bernhardt*, No. 19-5152 (D.C. Cir. June 16, 2020)). No countrywide ESA enhancement findings are currently in effect. Therefore, since March 1, 2018, the Service has been making

ESA enhancement findings for the import of sport-hunted trophies of lions on an application-by-application basis, ensuring consistent application of the regulatory criteria across all permit application adjudications and ensuring that each permit decision is based on the best scientific and management information available.

Although the Service makes the required enhancement findings on sport-hunted trophy imports of *P. l. melanochaita* on an individual application basis, information obtained for the range country as a whole is also considered, as it is pertinent to the Service's evaluation. In addition to considering national-level species management, we also consider species management and contributions to species enhancement on a smaller-scale (e.g., at the regional or hunting management unit scale such as at the hunting operator, community conservancy, concessionaire, reserve, or ranch-level scale). In addition, we consider how the hunter's personal involvement in the hunting experience directly or indirectly contributes to enhancement of the species in the wild. In its enhancement evaluation, the Service, therefore, considers efforts made by the hunting management unit and/or individual hunter to directly or indirectly address the threats posed to lions in the wild together with other information available concerning the overall management and population status of the lion in the range country at the time of the hunt.

In making ESA enhancement findings, we review all relevant information available to us, including information submitted with the individual permit applications, information received in response to inquiries we make of the range countries, and all other reliable information we receive from interested parties, such as species experts, hunting organizations, hunting operators, community groups, and non-governmental organizations. We evaluate and consider all relevant information obtained or submitted to the Service on an ongoing basis as it relates to permit applications received for import of sport-hunted trophies of *P. l. melanochaita*.

The Service considers information at these different levels in order to assess:

1) How the range country government manages the hunted species and how hunting serves to enhance the survival of the species in the wild in the context of the management system;
2) How hunting serves to enhance the survival of the species in the wild in the context of the management unit at the hunting operator, concessionaire, community conservancy, reserve, or ranch level; and
3) How the individual hunter has contributed (where the hunt has already taken place) or will contribute (where the hunt has not yet taken place) to enhancement of survival of that species through their hunting activities and contributions to the survival of the species in the wild associated to the hunt and subsequent import.

Government-Level Factors Considered

- Enforcement of wildlife laws and regulations, particularly with regard to the range country's ability to implement wildlife regulations developed for the hunted species
- Implementation of a scientifically-based management plan that addresses the major threats to the species and provides economic incentives for local communities to conserve the species
- Investment of hunting fees into conservation, including whether the range country has standard processes and infrastructure in place to ensure an effective transfer of hunting revenues back into the country's management of the species and community benefits
- Management of human-lion conflict, including whether the range country has a compensation scheme or other incentives to local communities to reduce the incursion of livestock into protected areas or to actively manage livestock to reduce conflicts with lions
- Management of the lion's prey base by addressing poaching or unsustainable offtake of the lion's prey species
- Management of lion hunting areas through a system that ensures the long-term survival of the lion, its prey base, and habitat
- Protection of lion habitat through establishment of protected areas, ensuring adequate protection from human encroachment and providing incentives that encourage habitat protection by private landowners and communities
- Establishment and use of science-based quotas, a sex and age-based harvest system, and a monitoring program for the lion and its prey species

Hunting Management Unit-Level Factors Considered

- Monitoring populations of the hunted species and their prey-base
- Protecting and/or increasing the prey-base for lions in the wild
- Maximizing biodiversity of the lion's prey species
- Protecting and improving the habitat for lions in the wild to ensure maintenance of ecosystem functions and biodiversity (e.g., creating water holes, habitat management, etc.)
- Engaging in anti-poaching activities for lion and their prey base
- Managing human-lion conflict
- Investing in community benefits and employment, where such investments provide incentives for conservation of lions in the wild
- Complying with harvest laws and regulations
- Re-investing hunting fees or other contributions associated to lion hunting to a fund that supports conservation of lions in the wild

Hunter-Level Factors Considered

- Complying with harvest laws and regulations
- Paying hunting/import-related fees or other contributions associated to lion hunting that are re-invested to support conservation of lions in the wild (e.g., funding habitat protection for lions in the wild, protection of the lion's prey base, or mitigation of human-lion conflict)
- Participating in a hunting program with an operator that supports sustainable use of the species

This application-by-application permit review process offers an opportunity to incentivize hunting in concessions, conservancies, reserves, or ranches that support conservation of the species through rigorous anti-poaching programs, local wildlife monitoring activities, and compliance with government rules and regulations. By complying with our enhancement requirements, a hunter's personal import will help conserve lion populations in the wild by supporting the local communities where they hunt and promoting conservation of these species and their habitats by providing protection incentives to communities that live alongside these species.

Basis for Finding

On February 1, 2016, the Service sent a letter to the Parks and Wildlife Management Authority in Zimbabwe (ZPWMA) with a list of questions related to management plans, population status, conservation, management, hunting policies, and regulations of Zimbabwe's lion populations. Additionally in the letter, the Service referenced the IUCN SSC Guiding Principles on Trophy Hunting as a Tool for Creating Conservation Incentives Ver. 1.0 (09 August 2012), as it provides useful principles which, when considered in conjunction with the Service's permit issuance criteria, would aid when making the required enhancement findings for permitting importation of sport-hunted lion trophies.

On February 16, 2016, the Service sent a second request to ZPWMA for specific documents related to the conservation status of lions in Zimbabwe. ZPWMA responded to the Service's request on February 17, 2016, with a copy of *Conservation Status of African Lion in Zimbabwe,* and subsequently, on November 29, 2016, provided a copy of its *Enhancement and Non-detriment Finding for Lion (Panthera leo) in Zimbabwe.* The Service has also been corresponding with ZPWMA regarding African elephant management for several years. In this correspondence, ZPWMA, as well as other sources, have provided the Service with documents and information that are relevant to our evaluation of lions in Zimbabwe.

Since 2016, the Service has met with officials from Zimbabwe multiple times to receive updated information on the status of and management of lions in Zimbabwe with respect to imports of sport-hunted lion trophies. For example, Service representatives met with Zimbabwe officials in January 2018 at the annual Safari Club International convention in Las Vegas, and November 2018 at the African Wildlife Consultative Forum in Uganda. In September 2018, Zimbabwe officials provided to the Service the May 2017 Zimbabwe National CAMPFIRE Stakeholder's Review and the Zimbabwe Parks and Wildlife Management Authority Strategic Plan, 2019-2023. In addition, in September 2018 the Service received a letter dated 6 December 2017 from Hon. E.D. Mnangagwa, President of the Republic of Zimbabwe, addressed to President Donald Trump, addressing the

change of administration in Zimbabwe. In this letter Hon. E.D. Mnangagwa provided assurance to the United States that Zimbabwe is politically stable and that Zimbabwe's previous conservation initiatives would be enhanced, with the previous Minister, Permanent Secretary, and Director General confirmed to remain in place.

This information provided by the Zimbabwe authorities (including verbal updates and presentations at the 16th Annual African Wildlife Consultative Forum (Uganda, November 2018), along with the Service's final rule on the lion listing under the Act and other relevant information from reliable sources, are the basis of this finding.

Governance of Lions in Zimbabwe

The legal framework for Zimbabwe's regulatory mechanism is informed by its Wildlife Policy (1992), which is intended to maintain a protected area network for the conservation of the nation's wild resources and biological diversity. The Wildlife Policy (1992) provides for the Government of Zimbabwe to maintain a network of protected areas known as the Parks and Wild Life Estate, comprised of the country's National Parks, safari areas, botanical gardens, and sanctuary and recreational areas for the conservation of the nation's wild resources and biological diversity (CITES 2016; ZPWMA 2016). The framework is intended to create economic activity to enhance rural development and encourages the conservation of wild animals and their habitats outside the protected areas.

ZPWMA was established by the Parks and Wildlife Act of 1996 (Chapter 20:14) [as amended by Act Number 19 of 2001] which came into operation on June 1, 2002, through Statutory Instrument 144C of 2002. The Act provides for the establishment of a Parks and Wildlife Board; establishment of national parks, botanical reserves, botanical gardens, sanctuaries, safari areas and recreational parks; and the preservation, conservation, propagation or control of wildlife, fish, and plants of Zimbabwe and the protection of Zimbabwe's natural landscape and scenery. This Act includes sections on virtually every aspect of ZPWMA, including requirements for annual financial audits and reporting to the central government. The Act also provides for substantial penalties for the unlawful possession of or trading in protected wildlife species. In addition, the General Laws Amendment Act (No. 5) of 2010 provides for mandatory imprisonment for poaching.

The Parks and Wildlife Act, Chapter 20:14, devolved authority to manage and benefit from wildlife on communal and private lands to the landholders. In 1982, the legal provisions of this Act were extended to Rural District Councils (RDCs), on behalf of rural communities in communal lands whose areas contain viable populations of wildlife. Communal areas in Zimbabwe are administered by RDCs which have become a mechanism for implementation of the government's policy of conservation by utilization of natural resources. The Act enables local communities to manage and benefit from wildlife resources through the Communal Areas Management Programme for Indigenous Resources (CAMPFIRE) established in 1989.

CAMPFIRE was developed to encourage reduction in human-wildlife conflicts through conservation-based community development and to provide an economic incentive to

improve community tolerance of wildlife, including lions. At the time, the CAMPFIRE program was the model for community-based conservation efforts in several other African countries and was identified as an innovative program. Under a community-based conservation program, like CAMPFIRE, rural communities should benefit from revenue generated by sport-hunting.

As Zimbabwe's premiere wildlife agency, the main functions of the ZPWMA are to control, manage, and maintain Zimbabwe's wildlife resources with the primary role of protecting and conserving Zimbabwe's natural heritage for present and future generations on behalf of the country. It also provides the cornerstone of Zimbabwe's tourism industry (ZPWMA 2015). The rationale behind the establishment of the ZPWMA was to allow for a self-funding mechanism, and thereby reduce its dependence on the national treasury. In January 1996, the Government of Zimbabwe approved the establishment of the Parks and Wild Life Conservation Fund that provides for financing wildlife operations directly from revenues generated through wildlife-related activities. The funding for ZPWMA is therefore coming from revenue generated through sport hunting conducted on state and private lands, concession leases, National Park visitor fees, and other wildlife-related fees. While there have been requests by ZPWMA for funding from the central treasury in the past, to our knowledge, no other significant government funding has been provided, and only limited outside funding from non-governmental organizations (NGOs) or other governments appears to be available.

A major component of ZPWMA mandate is law enforcement. Poaching mainly occurs along the boundaries of protected areas where lions are incidentally snared as non-target prey. Between 2013 and 2015, 21 lions were killed illegally, with six animals killed through snaring in the area adjacent to Hwange National Park in 2015; poverty stands as the major driver of illegal hunting (ZPWMA 2016). If anyone is found in possession of poached specimens, they must pay a fine of USD 5,000 or face a mandatory jail sentence. If convicted of lion poaching, courts could require the payment of a compensation fee of USD 20,000 (ZPWMA 2014). Hunting operators are obligated through their concession lease agreements to assist with anti-poaching efforts (ZPWMA 2016). Reportedly, USD 590,000 was spent on anti-poaching efforts by the Bubye Valley Conservancy (BVC) alone during 2015 (K. Leathern, pers. comm., as cited in Du Preez et al. 2016), and USD 546,000 is spent annually on anti-poaching by the Savé Valley Conservancy (SVC) (Lindsey et al. 2012); these expenses are mainly covered by sport-hunting revenue (Du Preez et al. 2016). In 2002, ZPWMA had 2,146 rangers at its establishment (ZPWMA 2016); however, by the end 2015, there were 1,448 rangers in post (67% of 2002 level). Of the 1,448 rangers in post, 1,004 are deployable for anti-poaching operations (ZPWMA 2016).

Safari operators in Zimbabwe are required to be registered and licensed by the Zimbabwe Tourism Authority (https://www.soaz.net/index.php/2, accessed August 16, 2019). Operators must hold a lease or agreement on a suitable concession with an approved quota of animals. They are responsible for the official paperwork and permits connected to the hunt. Hunting operators are required by law to provide the services of a Zimbabwe Licensed Professional Hunter to accompany foreign hunters in Zimbabwe. Licensing is undertaken by the National Parks & Wildlife Authority.

Zimbabwe is a member of the Southern African Development Community (SADC). Under the SADC Treaty, Article 5(g) establishes objectives to, among other aspects, promote the sustainable use of wildlife, harmonize legal instruments governing wildlife use and conservation, promote the conservation of shared wildlife resources through the establishment of trans-frontier conservation areas (TFCA), and facilitate community-based natural resources management practices. To implement the SADC Treaty, member states are required to establish management programs for the conservation and sustainable use of wildlife.

Currently Zimbabwe is pursuing six TFCA initiatives at various stages of development. These are: Great Limpopo Transfrontier Park (GLTP) / Great Limpopo Transfrontier Conservation Area (GLTFCA); Chimanimani TFCA; Greater Mapungubwe TFCA; Kavango-Zambezi (KAZA) TFCA; Lower Zambezi-Mana Pools LZMP (TFCA) and Zimbabwe-Mozambique-Zambia (ZIMOZA) TFCA (Mandisodza-Chikerema 2018, p. 34).

Through TFCAs, wildlife management entities are linking many of the major protected areas by removing boundary fences along national borders that separate many reserves in addition to creating or improving corridors to link good-quality habitat for wildlife (Newmark 2008). The principle of ecological and migratory connectivity lies at the heart of the TFCA initiative linking large protected areas across international boundaries and providing space for wildlife populations.

Another provision of the SADC Treaty is that member states are required to establish management programs for the conservation and sustainable use of wildlife. Zimbabwe has met this criterion for African lions through the development of its 2006 *Conservation Strategy and Action Plan/or the Lion (Panthera leo) in Zimbabwe* (ZPWMA), which is still in use.

As previously mentioned, Zimbabwe is also a Party to CITES, and the African lion species is included in Appendix II of the Convention. As an Appendix-II species, certain criteria must be met before the CITES Management Authority of the country of export may issue an export permit, including a finding from the exporting country's CITES Scientific Authority that the proposed activity will not be detrimental to the survival of the species in the wild (non-detriment finding; NDF) and a finding from the CITES Management Authority that the specimens proposed for export were legally acquired (legal acquisition finding).

The ZPWMA has provided the Service with a copy of its standing CITES non-detriment finding (NDF), dated October 2016, for the export of African lion specimens. The NDF explains that lion populations in Zimbabwe are being managed sustainably for the benefit of the species and that Zimbabwe's management program for lion provides economic incentives for local communities to protect and expand lion habitats. The NDF document provides information to support the following:

- The Zimbabwe hunting industry is based on sound scientific information, provides mechanisms to arrest habitat loss, or where feasible increase habitat, and provides protection from human encroachment.

- Government incentives are in place to encourage habitat protection by private landowners and communities.
- Government Incentives are provided to local communities to reduce human-wildlife conflicts.
- Hunting concessions are managed to ensure the long-term survival of the African lion and its habitat.
- Trophy hunting provides financial assistance to the ZPWMA, the communal CAMPFIRE program, and private landowners to implement wildlife management programs.
- Local communities directly and indirectly benefit from the presence of lion in their areas.
- Participation of U.S. hunters in the Zimbabwe hunting industry contributes to the overall conservation and management of lions in Zimbabwe (ZPWMA 2016).

Lion Status in Zimbabwe

When the Service listed the subspecies of lion in southern and eastern Africa (*P. l. melanochaita*) as threatened under the Act (80 FR 79999), three primary threats to the species throughout its range were identified: loss of habitat, loss of prey base, and human-lion conflict. While human population growth clearly has an impact due to loss of available habitat for lions, increasing human population has a direct impact on prey base. Prey availability affects the reproduction, recruitment, and foraging behavior of lions and, as a result, strongly influences lion movements, abundance, and population viability (Winterbach *et al.* 2012, as cited in USFWS 2015). Lion densities are directly dependent on prey biomass (Hayward *et al.* 2007). Outside of protected areas, the lion's prey base is much reduced (Du Preez et al. 2016); inadequate management and law enforcement have led to poaching of the lion's prey base for bushmeat, which has been critically depleted (USFWS 2015). Population trends across eastern and southern Africa show that most prey species have declined in recent years; and for Zimbabwe, droughts have been a critical factor (ZPWMA 2016).

A reduced prey base results in a relatively greater chance of lions encountering livestock (Du Preez et al. 2016). While actual losses of livestock to predators may be relatively low, the perceived financial cost to farmers can be high, and lions are persecuted intensely in livestock areas as a consequence. Their scavenging behavior makes them particularly vulnerable to the practice of lacing prey carcasses with poison to eliminate predators (CITES 2016). Co-existence of lions and people is promoted through giving value to lions, such as through tourism and hunting in CAMPFIRE areas (ZPWMA 2014). The threat to lions from habitat loss is especially present in Sebungwe and the South East Low Veld where the fragmented nature of the protected areas is compounded by increasing human and livestock populations surrounding these areas (ZPWMA 2016).

According to the Service's CoPl7 *Consideration of Proposals for Amendment of Appendices I and II,* international trade in lion products is emerging as an additional threat; however, the relative extent to which this threat has contributed to lion population declines is difficult to evaluate accurately (CITES 2016). According to ZPWMA (2016), the illegal local and international trade in lions and their products poses an insignificant risk to the

species in Zimbabwe, as there are no records of people found in possession of illegally acquired lion specimens in Zimbabwe. It is not clear what level of legal trade of lion products, if any, occurs within Zimbabwe.

The bulk of Zimbabwe's wildlife occurs within the Parks Estate which includes 11 national parks, 16 safari areas, 16 recreational parks, 6 sanctuaries, 12 botanical reserves and 3 botanical gardens, all spread across the country (Parks and Wildlife Act 2001 Chapter 20:14). Wildlife populations also occur on the state Forest Areas, Communal CAMPFIRE areas, and private conservancies dedicated to wildlife-based land use. There are approximately 319,317 km^2 of land where some form of wildlife-based land use is practiced in Zimbabwe (ZPWMA 2016). Lions occur permanently in 45% of this available range (circa 145,000 km^2) with the majority occurring in national parks (96%) and safari areas (92%). Lions also occur permanently in 47% of the State forest areas and 66% of privately owned conservancies. The CAMPFIRE areas comprise approximately 247,000 km^2 and lions occur in 36% of these areas. Lions are transient in CAMPFIRE, conservancy, and resettled areas adjacent to the major protected areas, and lions move across the border into Zambia, Mozambique, South Africa, and Botswana.

Zimbabwe's main lion range includes the Hwange-Matetsi Ecosystem, Mid Zambezi Valley, Sebungwe, and South East Lowveld. The lion population estimates in Zimbabwe are determined primarily through carnivore spoor surveys, systematic lion collaring, and call-up surveys. According to ZPWMA's *Conservation Status of the African lion (Panthera leo) in Zimbabwe* July 2014 report, starting in 2015, lion spoor surveys were to be done at two-year intervals in all wildlife areas, and lion call-up surveys were to be done every three years in all major lion areas (ZPWMA 2014). Although the Service has not received confirmation that these surveys have been conducted since 2015, in September 2018, the Service received Zimbabwe's Parks and Wildlife Management Authority's Strategic Plan for 2019-2023, which indicates that Zimbabwe is actively working to improve the monitoring and management of their wildlife species. In their updated strategic plan, signed in December 2018, they indicated that one of their strategic objectives is protection of wildlife resources. Their identified timeline is to update and implement key species management plans (lion is identified as one of these) by December 2023.

ZPWMA (ZPWMA 2016) has estimated that the minimum number of lions that occur on approximately 5l,642 km^2 of land where reliable survey data are available is approximately 1,900 (range 1,800 - 2,000). The western portion of the country, consisting primarily of Hwange National Park and the surrounding safari areas, forest areas, communal areas, and private conservancies, supports approximately 737 lions (or 38% of the overall population). The southern portion of the country, dominated by the two major conservancies (SVC and BVC) and Gonarezhou National Park supports approximately 896 lions (48%). These numbers are supported by several studies.

Within Gonarezhou National Park, Groom et al. 2014, used call-up surveys to obtain direct estimates of the lion population and compared actual lion densities with potential density estimates. In this study, while lions were only seen at five percent of calling stations, this equated to a population estimate of 33 lions, which is consistent with spoor survey results conducted in June 2010 (Groom et al. 2014). A 2015 spoor count

survey of Gonarezhou National Park revealed an estimated 125 lions within the park (ZPWMA 2016).

From 2007 to present, annual track index surveys at the SVC have been conducted using a standardized methodology (Groom and Watermeyer 2015, as cited in Du Preez et al. 2016). Prey availability models suggest that the carrying capacity for this lion population is approximately 271 lions (Hayward et al. 2007). In 2015, the estimated population was 284 lions (Du Preez et al. 2016). The Rifa Safari Area was surveyed using camera trapping and spoor counts in 2015, which supported an estimated population of 68 lions. The central and northern portions of the country reportedly support an estimated population of 284 lions (15%). The 12-year (2000-2011) average lion density per 100 km^2 is 2.8 in Hwange National Park, 6.0 for South Eastern Lowveld in the SVC, 9.0 in Malilangwe, and 0.8 in Gonarezhou National Park (ZPWMA Annual Report 2013, as cited in ZPWMA 2014). SVC's website indicates that at SVC, an annual predator spoor count is conducted by the African Wildlife Conservation Fund (AWCF), an independent organization (http://savevalleyconservancy.org/conservation.html#header1-z, accessed August 14, 2019).

According to Riggio et al. 2013 (p. 32), and Bjorklund in Riggio et al 2013 (p. 32), the minimum number of lions that are estimated to constitute a viable population is 500 individuals. Hwange National Park, with an estimated population of 559, is the only area within Zimbabwe that has a viable population as laid out by Riggio et al. 2013. However, the two regions that make up the largest percentage of the country's lion population (Western 38% and Southern 48%) have regional populations of 737 and 896, respectively. The areas within the Central and Northern regions of Zimbabwe, albeit smaller, encompass parks that are part of Transfrontier Conservation Areas, such as the Mana Pools region.

Lion Management in Zimbabwe

In response to discussions surrounding a possible up-listing of lion to Appendix I under CITES at the 13th Meeting of the Conference of the Parties (CoP13), and subsequent workshops involving lion range states, IUCN, ZPWMA, and other key stakeholders held a workshop to develop the *Conservation Strategy and Action Plan for the Lion (Panthera leo) in Zimbabwe* which was published by ZPWMA in 2006. The plan responds to regional and international standards set by Treaties such as CITES and the Convention on Biological Diversity (CBD), among others. The plan states "it will guide the conservation and management of this top predator" which "addresses the needs of th[e] country." The Service is not aware of any additional or updated iterations of the plan since 2006; however, in Zimbabwe's 2016 response, *Enhancement and Non-Detrimental Findings for Panthera leo in Zimbabwe,* ZPWMA provided updates on each of the outputs and respective targets established under the 2006 *Conservation Strategy and Action Plan/or the Lion (Panthera leo) in Zimbabwe* (ZPWMA 2016).

The 2006 plan identifies a vision that "...lions should be conserved and managed sustainably for their aesthetic, cultural, and ecological values, and the socio-economic

development of Zimbabwe." The plan lays out three broad targets to achieve this objective:

- Ensure the persistence of key lion populations and other important populations including those of doubtful viability.
- Human and livestock loss reduced.
- Optimize wildlife conservation-related net benefits to local communities.

All three targets are stepped down to seven specific outputs with their own targets and activities to meet such targets. Although the plan does not identify a time period, some activities do, of which a period of 5 years is the most common. In response to inquiries from the Service, ZPWMA has provided a summary of the progress made to implement the 2006 strategy.

While all three of the broad targets appear to serve a valuable role in lion management in Zimbabwe, three of the specific outputs are most relevant to determining if the implementation of the strategy enhances the propagation or survival of the species, as required by the Act for the issuance of import permits. The first output, "lion populations, their habitats and wild prey effectively conserved and managed in collaboration with local stakeholders" is broken down into a number of targets: establish a baseline survey and monitoring program; maintain and strengthen capacity for lion conservation, management, monitoring and research; identify and implement best management standards and practices for the hunting program; develop and implement co-management frameworks; and expand the geographic distribution range of lions. Baseline surveys have been completed for the Parks Estate using monitoring protocols for key variables (populations, habitats, prey), and selected surveys have been undertaken in areas outside National Parks (ZPWMA 2016).

Carnivore research programs conducted by NGOs and research institutions such as WildCRU are taking place in various parts of the country; in addition, personnel have been trained in data collection and capture, management, and lion aging and analysis. Adaptive age-based criteria for male trophy animals are in place and functioning. The quota for a certain year is determined by a point system based off the hunts from the previous season. Therefore, ZPWMA is actively working toward meeting the target areas for this output.

The second output, "human-lion related conflicts minimized and, where possible, eliminated" has also been broken down into a number of targets: develop and establish databases on lion-human conflicts; identify and implement methods to reduce and mitigate livestock losses and lion attacks on humans; and train and properly staff problem animal control (PAC) units to conduct rapid response and precisely target problem animals. According to information from ZPWMA (2016), approaches to mitigate livestock losses and lion attacks on humans are in the process of being tested and implemented in Hwange, and methods to mitigate lion attacks on livestock are being implemented as appropriate at selected sites (e.g. Tsholotshe). Data on PAC reports for lion-related problems have been collated, and PAC units at ZPWMA field station and/or RDC levels have been partially established. In Matusadona, Hwange, and Gonarezhou regions, specific awareness and education packages on lion conservation and

management have been developed and implemented. The information submitted in the ZPWMA update suggests that they have met one target, and are in the process of implementing the remaining two.

The third output, "the costs and benefits of long-term lion management equitably distributed," is a socio-economic output to establish agreement and implementation of area-specific lion management plans with identified stakeholders in each wildlife region, and implementing a transparent mechanism to equitably distribute lion-related income to identified stakeholders." The specific targets for this output are: complete an inventory of stakeholders directly affected by lion conservation, deliver appropriate training and capacity building to prioritized stakeholders, agree to and implement collaboratively developed area-specific lion management plans with identified stakeholder groups in each wildlife region within 5 years, and implement transparent mechanisms to equitably distribute lion-related/generated income to identified stakeholders (groups and/or communities). Current information from ZPWMA shows that they have identified key stakeholders and assessed the financial impacts of lion conservation and the magnitude of socio-economic impacts on each stakeholder group. Limited training has been undertaken for representative stakeholders in Hwange, Matusadona, and Gonarezhou. ZPWMA has also implemented an adaptive management program across four wildlife regions and is in the progress of developing and implementing area-specific lion management plans with identified stakeholder groups. According to ZPWMA, a Management Plan for Hwange was approved. The Hwange National Park (HNP) Management Plan was updated in 2015 and officially accepted at Zimbabwe's Ministry of Environment level in 2016 (Conservation and Wildlife Fund (CWF) 2018, p. 16). One of the four components of this 10-year plan is implementation of a cooperation plan between the park and park neighbors. The Conservation and Wildlife Fund – Hwange (CWF) is a relatively new model of the private and NGO sectors in and around Hwange National Park (HNP) Zimbabwe, formalizing an alliance of individual members to materially and in-kind assist authorities with conservation work.

The Hwange Lion Research (HLR) which is part of the Wildlife Conservation Research Unit (WILDCRU), Oxford University, UK, with some financial support and collaborative effort from CWF, set up a comparative camera trap survey in May 2018, to establish a baseline of both lion and lion prey identification and densities in contiguous areas with differing management – the exact CWF project area. Although data were only obtained from the 40-day HNP camera grid, combined sources of complimentary data on the lion population in Forest Areas outside the national park suggest that anthropogenic mortality is slowing down, believed to be in part due to CWF's new law enforcement activities (CWF 2018, p. 21).

Zimbabwe's conservation strategy for lions also identifies roles and responsibilities for a number of participants in Zimbabwe's lion conservation efforts. According to the strategy, there is a national lion coordinator that coordinates all national activities on lion conservation, research, and management, including census surveys, setting up monitoring needs, and coordinating data on human-lion conflicts. The strategy identifies roles for the field stations, wardens, ecologists and utilization units, which are responsible for ensuring compliance with hunting regulations and maintaining safari hunting databases. In addition, the strategy identifies roles for CAMPFIRE, safari operators, and

professional hunters to facilitate training and ensure compliance with hunting regulations.

The Conservation Strategy and Action Plan for the Lion in Zimbabwe (ZPWMA 2006) borrows language from the *IUCN Conservation Strategy* (2006). It iterates areas in need of improvement regarding lion conservation in Zimbabwe, including standardized lion census methods and surveys, further mitigating human-lion conflicts, and maximizing benefits for rural communities that live with lions. ZPWMA (2006) notes their intention to review and put in place criteria for age-based identification of male trophy animals, but do not mention if they will be reviewing possible combination strategies. As part of the 2006 lion conservation strategy for eastern and southern Africa, six objectives were established to secure and restore sustainable lion populations, which were housed under the following categories: management, mitigation, socio-economics, policy and land-use, politics, and trade. The strategy was intended to be implemented within 10 years (Macdonald 2016), and Zimbabwe gave an update on progress regarding these objectives in their *Enhancement and Non-Detrimental Findings for Panthera leo in Zimbabwe* (ZPWMA 2016) that also addressed outputs and targets laid out in their 2006 action plan.

Additionally, to mitigate human-lion conflict, the "Long Shields Guardian Programme" was initiated whereby communities are notified of movements of collared lions into their areas via cell phone, and then have the opportunity to take appropriate action, such as moving cattle. In 2013 alone, 1,850 warnings were passed to the "Long Shields." These actions may reduce the incidents of lions marauding livestock; however, retaliatory killing of lions still occur. Further, as is policy under the Parks and Wildlife Act of 2001, any lions that attack humans or livestock will be lethally eliminated (ZPWMA 2016). Between 2007 and 2013 a total of 1,113 conflict incidents were recorded in the Hwange area in which 915 head of stock were lost to lions.

In and around Hwange National Park, data collected between 1999 and 2004 suggested that hunting surrounding the park was having a negative impact on the lion population. As a result, sport hunting of lions was suspended in the area surrounding the park between 2005 and 2009. Following the lifting of the moratorium, and by implementing stricter monitoring and hunting guidelines through the Hwange Lion Research Project, the overall Hwange lion population has continued to show a positive trend, and as of 2015 the population was estimated at over 550 animals (ZPWMA 2015).

<u>Hunting, Management, and Utilization of Lions</u>

In Zimbabwe, much of the trophy hunting occurs in Safari Areas which are managed mainly for the sustainable use and as buffer zones next to National Parks (Jeke et al 2019, p. 2). Trophy hunting of wildlife is legally permitted in safari areas; as of 2014, there were 16 in Zimbabwe (ZPWMA 2014). According to the Forest Act, Chapter 19:05, there are 24 gazetted indigenous forest areas in Zimbabwe; within these forest areas, lions may be hunted in the following forests: Fuller, Kazuma, Pandamasuwe, Ngamo, Sikumi, Gwayi, Sijarira, and Gwampa (ZPWMA 2014).

As of 2016, the minimum number of lions that occur in approximately 51,642 km^2 of land in Zimbabwe, where reliable survey data are available, is estimated to be 1,917 (range 1,800 - 2,000), the majority of which occur in western and southern Zimbabwe. When taking this population estimate into consideration, trophy hunting harvests a yearly mean of 2.7% of adult male lions. This figure decreased since the establishment of age restrictions on lion hunting (ZPWMA 2016).

In 2013, an adaptive quota management system for lion hunting based on the ages of lions hunted was agreed to in Harare, Zimbabwe, during a meeting hosted by ZPWMA and an independent non- governmental conservation organization (Du Preez et al. 2016). After reviewing aging techniques, attendees at the July 2013 meeting in Harare, Zimbabwe were confident that hunters could be expected to categorize lions as being below or above five years of age. In determining quotas for the following years, operators would be rewarded with increased quotas if they hunted animals of six years or older, would not be penalized if they hunted animals five years of age, but would have quotas cut if they hunted animals younger than five years old, or if they failed to complete hunt returns (ZPWMA and Panthera 2014). In 2013, only 28% of lions hunted were five years old or older. In 2015, that figure rose to 77.3% (ZPWMA 2016).

According to Hunter et al. (2013), an adaptive quota management system utilizing age-based criteria would not only aid in the prevention of over-harvesting lions, but would also prevent excessively conservative quotas. Further, according to Miller et al. (2016), results indicate that age-based hunting is feasible for sustainably managing threatened and economically significant species such as the lion, but must be guided by rigorous training, strict monitoring of compliance and error, and conservative quotas. No single trait can be relied upon exclusively to precisely age lions. Rather, multiple traits must be examined in combination to cross-validate an individual's age and, according to Whitman et al. (2004), restricting hunting to individuals that are at least six years old is desirable from a biological perspective due to the reduced risk of the loss of pride males and infanticide of cubs associated with the harvest of such individuals (Whitman et al. 2004).

During 2013, operators were requested to submit hunt returns and photos as a trial run to get the adaptive quota system up and running. In 2014, operators were requested to do the same but were informed that the age of the lions hunted in 2014 would determine their lion quotas in 2015 (Du Preez et al. 2016). In 2015, there was a marked increase in the age of lions hunted in Zimbabwe as a whole. The majority of lions hunted were on the cusp of 5-6 years of age but were not older than six years. National hunting offtakes for lions in Zimbabwe from 2013 to 2015 were 29, 42, and 47 respectively (Masterson 2016). It appears these do not include illegal forms of hunting offtake. In 2011, Zimbabwe's quota was set at 101 lions; in 2014, it was reduced to 50 male lions following the implementation of age restrictions (Henschel 2015, pers. comm., as cited in USFWS 2015).

As described above, CAMPFIRE is the program through which the Government of Zimbabwe has relegated the management of wildlife resources to communal farmers. As of July 2014, there are at least 58 Rural Districts that have been granted the Appropriate Authority status to manage wildlife resources in their areas; however,

according to *Enhancement and Non-Detrimental Findings for Panthera leo in Zimbabwe* ZPWMA 2016, only 16 are actively engaged in some form of wildlife-based land use (ZPWMA 2016). Lions are found in communal areas that are adjacent to major protected areas, and lion hunting is allowed in CAMPFIRE districts (ZPWMA 2014).

In setting adaptive lion quotas, Zimbabwe uses scientific information including spoor surveys, camera traps, and ranger-based sighting. In CAMPFIRE areas, incidences of human-lion conflict are also taken into consideration where survey information is not readily available, when determining quotas for those areas (ZPWMA 2014). The quota-setting process involves all stakeholders, including the ZPWMA, landowners, safari operators, and CAMPFIRE managers and their representatives. During the annual quota-setting workshop, presentations are made by the proponents who then make proposals for quotas. Where it is felt that not enough information has been presented, a precautionary quota will be issued (ZPWMA 2014).

ZPWMA (2016) mentions seven concessions that are leased on five-year terms, and how these concessionaires pay a 5-year "right to lease" fee, annual rental, fixed quota fee (payable if animals are shot or not) and a supplementary quota fee that allows additional animals to be bought as needed. It is unclear to what extent Zimbabwe still utilizes fixed quotas, as Du Preez et al. claims fixed quotas are no longer being used by Zimbabwe, but a fixed quota fee is mentioned in ZPWMA (2016). It is also unclear how many animals concessionaires are able to "buy as needed," and how such requests may be accommodated without going over the national quota (ZPWMA 2016). However, when evaluating the lower quota with higher utilization reported by ZPWMA (2016), and taking into consideration the land area of the Parks Estate alone, Zimbabwe did not exceed the best management practice of 0.5 lions/1,000 km^2; the 2015 off-take would have accounted for 0.125 lions/1,000 km^2.

According to *The Role of Trophy Hunting of Elephant in Support of the Zimbabwe CAMPFIRE Program -December 2016,* a report the Service received in December 2016, the Reserve Bank of Zimbabwe, in collaboration with relevant stakeholders, established the Tourism Receipts Accounting System (TRAS2) that required all outfitters to submit returns listing the revenue generated for hunting activities. This system has been in place for several years, but it required manual analysis of the data to extract information on hunting revenue. In January 2015, to account fully for earnings in the hunting sector, the Reserve Bank of Zimbabwe in collaboration with relevant stakeholders, introduced TRAS, a web-based system that links Safari operators, ZPWMA Authority, taxidermists, shipping agents, International marketing agents, and the Reserve Bank. Under this system, all authorized hunts are registered, allowing for the capture of hunting data, such as the origin of clients, value of trophies and hunts, and area hunted, to monitor hunting quota utilization and track hunted trophies. According to the December 2016 report, the Exchange Control Division of the Reserve Bank of Zimbabwe and the ZPWMA are now able to:

1. Assess regional price differentials of similar hunts and the reasons thereof;
2. Present TRAS2 system updates and reports to the users, including international marketing agents;
3. Engage with international marketing agents of sport hunting;

4. Obtain relevant insights on governing of the hunting sector; and
5. Come up with an effective mechanism to fully account for export proceeds from the hunting sector.

The TRAS2 information provides a breakdown of the source of hunting income, and the amount of funds generated by trophy fees by land category, among other insights, and has demonstrated the TRAS2 system's ability to obtain relevant insights on governing of the hunting sector.

Evaluation

Paul David Cater hunted in the Savé Valley Conservancy (SVC) in southeastern Zimbabwe, reportedly one of the largest private game reserves in Africa (https://savevalleyconservancy.org/). In the early 1900's, the 3,440 km^2 of land that now comprises the SVC was used for cattle ranching, which led to the elimination of most large herbivores and predators, including lions. In the 1990's upon establishment of the SVC, the cattle farms were converted to a wildlife-based land use system and wildlife populations were restored (Pole 1999).

In evaluating whether the importation of Mr. Cater's trophy of *P. l. melanochaita* would be authorized pursuant to 50 CFR 17.40(r) and 50 CFR 17.32(a), in accordance with our threatened species permit issuance criteria, we examined how Zimbabwe's management of lions overall as well as how Savé Valley Conservancy and Mr. Cater himself have contributed to enhancement of wild lions both directly and indirectly by addressing the three main threats that led to the decline of the subspecies: habitat loss, loss of prey base, and human-lion conflict.

Below, we summarize our evaluation with reference to each of the permit issuance criteria at 50 CFR 17.32(a)(2) on the basis of information available to the Service.

17.32(a)(2)(i): Whether the purpose for which the permit is required is adequate to justify removing from the wild or otherwise changing the status of the wildlife sought to be covered by the permit:

Zimbabwe's lion hunting industry generated 9% of all sport-hunting revenue in 2015; 51% was contributed by U.S. hunters during 2010-2015 country-wide, and 90% of the sport-hunting market in the Bubye Valley Conservancy (BVC) and the Savé Valley Conservancy (SVC) from 2005-2015. Even though 9% may not seem like much, lions are a key component of the sport hunting industry, as they are part of the "Big 5" trophies and draw U.S. hunters to Zimbabwe. Without the hunting industry, protected wildlife areas such as BVC and SVC, which have become conservation havens in the threat of human encroachment across much of Zimbabwe, would not be economically viable, and therefore would likely not exist. These wildlife areas not only provide habitat for lions, but also support the lion's prey species. As previously noted, the southern portion Zimbabwe, which is dominated by SVC, BVC, and Gonarezhou National Park, supports approximately 896 lions (48% of the Zimbabwe lion population).

According to Lindsey et al. (2012), hunting operators in the SVC spend USD 546,000 annually on anti-poaching activities and employ 186 permanent game scouts. Hunting revenues are used to support expenses associated with these activities (Du Preez et al. 2016).

The *Strategy and Action Plan* has put into place mechanisms to adequately oversee the harvest of lions in Zimbabwe. With an annual harvest of approximately 85 lions, Zimbabwe is not exceeding the limits identified of 0.5 lions/1,000 sq. km. The objectives of the *Strategy and Action Plan* and the actions and monitoring activities that have been put into place to achieve these objectives should support the adaptive management approach that Zimbabwe has established for managing lions. The Service will continue to monitor the effectiveness of the Strategy and Action Plan, for consideration in future findings.

As described above, we have determined that the government of Zimbabwe and the Savé Valley Conservancy contribute towards positive conservation outcomes by addressing the main threats of habitat loss, human-lion-livestock conflict, and prey depletion, which contributes to improving the status of lions in Zimbabwe. Further, the fees garnered through Mr. Cater's hunt will provide revenue to support these positive conservation outcomes.

Therefore, based on the information available to the Service, the purpose for which the permit is being requested, import of this trophy lion, is adequate to justify removing the sport-hunted trophy lion from the wild or otherwise changing its status.

17.32(a)(2)(ii): The probable direct and indirect effect that issuing the permit would have on the wild populations of the wildlife sought to be covered by the permit:

The total area under wildlife-based land use and conservation in Zimbabwe amounts to 10.7 million hectares and represents 27% of the total surface area of the country. Of this, 7.9 million hectares, or 75% of all conservation land in the country, falls under safari hunting as the primary or only source of revenue. Sport hunting of lions by U.S. hunters such as Mr. Cater supports the programs in Zimbabwe that provide the opportunity for locals to see value in lions, which in turn conserves the species in the long-term.

A scientifically based quota is the number of a given species that can be removed from a specific population without damaging the biological integrity and sustainability of that population (WWF 1997). However, full implementation and enforcement of the age-based strategy could potentially cause the need for quotas to become irrelevant or eliminated (USFWS 2015). Age restrictions will naturally restrict offtake to a limited number of individuals that meet the age criteria (Loveridge *et al.* 2007, Whitman *et al.* 2004).

Based on the information provided to the Service, it is clear that Zimbabwe has made strides in their management of their lion populations. Additionally, Zimbabwe appears to be transparent in its management processes, including its quota setting. In 2013, Zimbabwe proposed an adaptive age-based strategy for setting hunting quotas. This

adaptive quota management system for lion hunting based on the ages of lions hunted has been accepted and embraced by all stakeholders; it has not only led to a reduced national lion hunting quota, but has also resulted in a significant increase in the age of harvested lions to a level that is considered to have a reduced ecological impact (Du Preez et al. 2016).

In 2015, the development of TRAS2 allowed the country to better monitor and govern the hunting sector, including developing an effective mechanism to fully account for export proceeds from the hunting sector. The continued participation of U.S. hunters, including Mr. Cater, in this market is anticipated to continue to maintain the viability of managing areas such as the BVC and SVC in their current form, including their contribution to conservation of lions in the wild. In 2015, lion sport-hunting generated USD 753,000 in revenue, which accounts for about 9% of all sport hunting revenue in Zimbabwe that year (ZPWMA 2016).

After evaluating the information provided by the Zimbabwe government and other sources, it appears that the hunting program in Zimbabwe is addressing the three main threats that were identified by the Service when making the determination that the species was threatened with the possibility of extinction. Moreover, hunting areas such as BVC and SVC are maintaining habitat for lions and ensuring that there is no further loss, provided that the hunting areas can remain economically viable. In order to maintain a viable population of lions, the parks, safari areas, and CAMPFIRE areas must maintain biodiversity and a sustainable prey base. Finally, Zimbabwe is actively working to reduce human-lion conflicts and the number of lions killed in retaliation for killing livestock. Therefore, the management of lions within Zimbabwe and the limited hunting of lions contributes to the on-going survival of the species in Zimbabwe.

The participation of Mr. Cater in the hunting and subsequent import of the trophy lion he harvested in the SVC provides an indirect benefit to wild lion populations by helping to support the reserves where lions are found; Mr. Cater's hunt has generated revenue to help support a hunting area where lions are found and conserved. Therefore, based on the information available to the Service, the probable direct and indirect effect that issuing an import permit for a legally hunted lion would have on the species would be positive.

17.32(a)(2)(iii): Whether the permit, if issued, would in any way, directly or indirectly, conflict with any known program intended to enhance the survival probabilities of the population from which the wildlife sought to be covered by the permit was or would be removed:

As stated above, Zimbabwe is monitoring and controlling the harvest of lions through permitting under their regulations and through the *Strategy and Action Plan*. The issuance of import permits for lions legally hunted under these authorities would not conflict with any programs intended to enhance the survival probability of the species in Zimbabwe. Issuance of a permit authorizing import of Mr. Cater's trophy lion from Zimbabwe would work in favor of, not against, the principal acts governing lion conservation in Zimbabwe. Furthermore, sport

hunting opportunities help local communities realize the value in conserving the African lion.

Therefore, based on the information available to the Service, the issuance of an import permit for a legally hunted lion does not conflict with known conservation programs.

17.32(a)(2)(iv): Whether the purpose for which the permit is required would be likely to reduce the threat of extinction facing the species of wildlife sought to be covered by the permit:

Considering Zimbabwe's limited, controlled off-take of lions in a manner that maintains sustainability, Mr. Cater's legal hunt contributes to reducing the threat of extinction of lions. It appears that the permitting activities under Zimbabwe's laws and CITES, as well as the implementation of the adaptive age-based lion quota, and a continuation of implementation of the outputs in the *Strategy and Action Plan* are working in concert to promote the long-term survival of lions in the wild in Zimbabwe. The use of revenue received from hunters, such as Mr. Cater, to manage the populations on the reserves is an important element of the success of lion management in Zimbabwe. For example, hunting operators in the SVC spend USD 546,000 annually on anti-poaching activities (Lindsey et al. 2012). Therefore, based on the information available to the Service, the issuance of the requested import permit for Mr. Cater's legally hunted lion will likely reduce the threat of extinction facing lions in Zimbabwe.

17.32(a)(2)(v): The opinions or views of scientists or other persons or organizations having expertise concerning the wildlife or other matters germane to the application:

Based on reviewing comments made during the listing process for lions, as well as information obtained through personal conversations and literature, there is general agreement that hunting, done properly and well managed, would not have an adverse effect on lion populations. Numerous researchers have stated that, while they may not support hunting in general, they see that benefits can be received through a scientifically based hunting program for lions.

Based on the information available to the Service, there is general support by scientists and other persons or organizations having expertise concerning lions that the legal and sustainable harvest of lions, and the subsequent import of legally harvested lion trophies, as proposed in this application, would not have an adverse effect on the species and would further efforts to conserve the species in the wild into the future.

17.32(a)(2)(vi): Whether the expertise, facilities, or other resources available to the applicant appear adequate to successfully accomplish the objectives stated in the application:

Mr. Cater submitted a permit application to import a trophy of his personally, legally harvested lion from Zimbabwe for the purpose of enhancing the propagation or survival of the species in the wild. As a sport-hunter, Mr. Cater plays a large role in the hunting industry of Zimbabwe; the hunting and subsequent import of Mr. Cater's trophy lion increases the funds available to the Zimbabwe Government and SVC to implement lion conservation initiatives. Therefore, based on the Service's review of the information available relating to Mr. Cater's permit request, we find that the expertise, facilities, or other resources available to Mr. Cater appear adequate to successfully accomplish the objectives stated in the application.

Conclusion

As described above, the Government of Zimbabwe has been documented to implement the *Strategy and Action Plan* in the manner identified in the documents referenced in making this finding. The on-going adaptive management and limited and sustainable off-take of lions is important to the survival of lions in Zimbabwe, and the funds generated by Mr. Cater's participation contributes to the ongoing benefits the program provides to lions in the wild.

Therefore, based on the Service's consideration and analysis of the information associated with Mr. Cater's permit application and other relevant information available to the Service, as described above, we find that the import of the lion harvested by Mr. Cater on June 28, 2018, from the Savé Valley Conservancy, Zimbabwe, meets the requirements for making a positive enhancement finding pursuant to 50 CFR 17.40(r) and 50 CFR 17.32(a). Therefore, the Service is able to authorize the import of the trophy of one lion taken from the wild in Zimbabwe, to Paul David Cater of Katy, Texas.

JENNA KING Digitally signed by JENNA KING Date: 2020.08.18 12:53:09 -04'00'

I. **Service Program and Geographic Area or Station Name**: Branch of Permits, Division of Management Authority, International Affairs

II. **Flexible Funding Program** (e.g. Joint Venture, etc.) if applicable: N/A

III. **Location**: 5275 Leesburg Pike, MS: IA, Falls Church, VA 22041-3803

IV. **Species/Critical Habitat**:

Southern and Eastern African lion (*Panthera leo melanochaita*)

Critical Habitat: N/A

V. **Project Description:** Describe proposed project or action or, if referencing other documents, prepare an executive summary (attach additional pages as needed):

As described in the permit application, 78387C, Paul David Cater, has requested a permit to import a trophy of one lion that he lawfully hunted in Zimbabwe. The import is for personal purposes.

VI. **Determination of Effects:**

(A) Description of Effects: Describe the action(s) that may affect the species and critical habitats listed in item IV. Your rationale for the Section 7 determinations made below (B) should be fully described here.

Issuance of the requested import permit by the Branch of Permits will result in the importation of one personally sport-hunted lion that has been lawfully taken in Zimbabwe on the date specified in the permit application.

The trophy will be accompanied by the required CITES export permit issued by the CITES Management Authority of Zimbabwe.

The requested U.S. Federal Fish and Wildlife import permit does not authorize the killing of an African lion; the authorization to hunt and lawfully take a lion is under the purview of the government of Zimbabwe. Therefore, the proposed action of issuing a Federal Fish and Wildlife import permit for this lawfully hunted lion will not directly or indirectly affect individuals of listed or proposed species or designated/proposed critical habitat of such species.

(B) Determination: Determine the anticipated effects of the proposed project on species and critical habitats listed in item IV. Check all applicable boxes and list the species (or attach a list) associated with each determination**.**

Determination

No Effect: This determination is appropriate when the proposed project will not directly or indirectly affect (neither negatively nor beneficially) individuals of listed/proposed/candidate species or designated/proposed critical habitat of such species. **No concurrence from DSA/ESFO required.** **X**

May Affect but Not Likely to Adversely Affect: This determination is appropriate when the proposed project is likely to cause insignificant, discountable, or wholly beneficial effects to individuals of listed species and/or designated critical habitat. **Concurrence from DSA/ESFO required.** _____

May Affect and Likely to Adversely Affect: This determination is appropriate when the proposed project is likely to adversely impact individuals of listed species and/or designated critical habitat. **Formal consultation with DSA/ESFO required.** _____

May affect but Not Likely to Jeopardize candidate or proposed species/critical habitat: This determination is appropriate when the proposed project may affect, but is not expected to jeopardize the continued existence of a species proposed for listing or a candidate species, or adversely modify an area proposed for designation as critical habitat. **Concurrence from DSA/ESFO optional.** _____

Likely to Jeopardize candidate or proposed species/critical habitat: This determination is appropriate when the proposed project is reasonably expected to jeopardize the continued existence of a species proposed for listing or a candidate species, or adversely modify an area proposed for designation as critical habitat. **Conference with DSA/ESFO required.** _____

PAUL DAVID CATER
(b) (6)
KATY, TX 77493
U.S.A.

Authority: Statutes and Regulations: 50 CFR 17.40(r).

Location where authorized activity may be conducted:
IMPORT THROUGH ANY PORT LISTED IN 50 CFR 14.12

Reporting requirements: Not applicable

Authorizations and Conditions:

A. Authorized to import the sport-hunted trophy of one male African lion (*Panthera leo melanochaita*), taken in Zimbabwe for the purpose of enhancement of the survival of the species.

B. Specimen may not be sold or transferred for any financial remuneration.

C. **Trophy must have been taken during the 2018 hunting season.**

D. Trophy must be accompanied by a valid trophy permit or hunting license issued by the government of Zimbabwe for the 2018 season.

E. Trophy must be accompanied by a valid Convention on International Trade in Endangered Species of Wild Fauna and Flora (CITES) Appendix II export permit/re-export certificate, source code "W", issued by the Management Authority of Zimbabwe.

F. General conditions set out in Subpart D of 50 CFR 13, and specific conditions contained in Federal regulations cited above, are hereby made a part of this permit. All activities authorized herein must be carried out in accord with and for the purposes described in the application submitted. Continued validity, or renewal of this permit is subject to complete and timely compliance with all applicable conditions, including the filing of all required information and reports.

G. The validity of this permit is also conditioned upon strict observance of all applicable foreign, state, local, tribal, or other federal law. **This permit can be photocopied.**

H. Valid for use by permittee named above.

I. Acceptance of this permit serves as evidence that the permittee understands and agrees to abide by the "General Permit Conditions" (copy attached).

Type of Activity

IMPORT OF SPORT-HUNTED TROPHIES under Appendix I of the Convention on International Trade in Endangered Species (CITES) and/or U.S. Endangered Species Act (ESA)

Complete Sections A or B, and C, D, and E of this application. U S address may be required in Section C, see instructions for details.
Instructions on how to make your application complete and help avoid unnecessary delays are attached.

Section A: Complete if applying as an individual

1 a Last Name		1 b First Name	1 c Middle Name/Initial	1 d Suffix
Morris		Brandon	Trey	
2 Date of Birth (mm/dd/yyyy)	3 Telephone Number	3 a Alternate Telephone Number	4 E-mail address	
(b) (6)				

Section B: Complete if applying on behalf of a business, corporation, public agency, Tribe, or institution

1 a Name of business/agency/Tribe/institution		1 b Doing business as (DBA)	
2 Tax identification no.		3 Description of business/agency/Tribe/institution	
4 a Principal officer Last name	4 b Principal officer First Name	4 c Principal officer Middle name/initial	4 d Suffix
5 Principal officer title	6 Primary contact name		
7 a Business telephone number	7 b Alternate telephone number	7 c Business fax number	7 d Business e-mail address

Section C: All applicants complete address information

1 a Physical address (Street address, Apartment #, Suite #, or Room #; no P O Boxes)
(b) (6)

1 b City	1 c State	1 d Zip code/Postal code	1 e County/Province	1 f Country
Shreveport	Louisiana	71101	Caddo	USA

2 a Mailing address (include if different than physical address; include name of contact person if applicable)
Same as above Darbi Rice (b) (6)

2 b City	2 c State	2 d Zip code/Postal code	2 e

Section D: All applicants MUST complete

1 Attach the **nonrefundable application processing fee** in the form of a check or money order payable to the U S FISH AND WILDLIFE SERVICE in the amount of **$100**. Federal, Tribal, State, and local government agencies, and those acting on behalf of such agencies, are exempt from the processing fee--attach documentation of fee exempt status as outlined in instructions [50 CFR 13 11(d)]

2 Certification I hereby certify that I have read and am familiar with the regulations contained in ***Title 50 Part 13 of the Code of Federal Regulations*** and the other ***applicable parts in subchapter B of Chapter I of Title 50***, and I certify that the information submitted in this application for a permit is complete and accu[illegible]ief I understand that any false statement herein may subject me to the criminal penalties of 18 U S C 1001

E. IMPORT OF SPORT-HUNTED TROPHIES *(Appendix I of CITES and/or ESA)*

Note 1: This form should be used to request authorization to import trophies of species listed on Appendix I of CITES and/or as threatened or endangered under the ESA (examples include elephants, lions, cheetahs, wood bison, and markhor).

PLEASE USE FORM 3-200-19 FOR SOUTHERN AFRICAN LEOPARD TROPHIES AND SOUTHERN WHITE RHINOCEROS TROPHIES TAKEN IN NAMIBIA.

Note 2: If you hold an import permit for trophy/trophies that you did not use, please **return the unused original permit**. If you are requesting reissuance of a permit because you have taken a trophy, but were unable to import it prior to the expiration of the permit, please use the renewal form (3-200-52) and return your original permit with that form.

Note 3: Applications for species listed as endangered under the U.S. Endangered Species Act are published in the Federal Register for a 30-day public comment period. Please allow at least **90 days** for the application to be processed.

Note 4: *Sport-hunted trophy* is defined at 50 CFR 23.74 as follows: *Sport-hunted trophy* means a whole dead animal or a readily recognizable part or derivative of an animal specifically identified on the accompanying CITES document that meets the following criteria:

- Is raw, processed, or manufactured;
- Was legally obtained by the hunter through hunting for his or her personal use;
- Is being imported, exported, or re-exported by or on behalf of the hunter as part of the transfer from its country of origin ultimately to the hunter's country of usual residence; and
- Includes worked, manufactured, or handicraft items made from the sport-hunted animal only when:
  - i. Such items are contained in the same shipment as raw or tanned parts of the sport-hunted animal and are for the personal use of the hunter;
  - ii. The quantity of such items is no more than could reasonably be expected given the number of animals taken by the hunter as shown on the license or other documentation of the authorized hunt accompanying the shipment; and
  - iii. The accompanying CITES documents (export document and, if appropriate, import permit) contain a complete itemization and description of all items included in the shipment.

Note 5: Certain hunting trophies, including elephants, are subject to restrictions on their use after import into the United States. Please see 50 CFR 23.55 for more information or contact the Division of Management Authority.

Please provide the following information. Complete all questions on the application. Mark questions that are not applicable with "N/A". If needed, use a separate sheet of paper. On all attachments or separate sheets you are submitting; please indicate the application question number you are addressing. If applying for more than one trophy, be sure to answer questions 1-6 for each trophy addressed in this application. If importing trophies from more than one country, you must submit a separate application for each shipment in order to obtain separate import permits.

1. Name and address where you wish the permit to be mailed, if different from page 1. If you would like expedited shipping, please enclose a self-addressed, pre-paid, computer-generated, courier service airway bill. If unspecified, all documents will be mailed via the U.S. Postal Service.

Fedex envelope enclosed

2. Who should we contact if we have questions about the application (name, phone number, and e-mail)?

Darbi Rice (b) (6) [redacted]

3. Have you or your client (if a broker applying on behalf of your client), been assessed a civil penalty or convicted of any criminal provision of any statute or regulation relating to the activity for which the application is filed; been convicted, or entered a plea of guilty or nolo contendere, for a felony violation of the Lacey Act, the Migratory Bird Treaty Act, or the Bald and Golden Eagle Protection Act; forfeited collateral; OR are currently under charges for any violation of the laws mentioned above?

☒ No ☐ Yes

If you answered "Yes" to Question 3, provide: a) the individual's name; b) date of charge; c) charge(s); d) location of incident; e) court, and f) action taken for each violation. Please be aware that a "Yes" response does not automatically disqualify you from getting a permit.

4. For each trophy to be imported, provide:

   a. Scientific name (genus, species, and, if applicable, subspecies) and common name.

   Panthera leo, Lion

   b. Sex (if known). Male

5. **IF ANIMAL IS CURRENTLY LIVING IN THE WILD**, please enter the following information:

   a. Country and place (area, region, GIS coordinates, ranch, conservancy, management area, or hunting block, AND nearest city) where wildlife is to be taken from the wild:

   b. Date wildlife is to be hunted:

   c. Name of hunting outfitter, safari company, or professional hunter you will be hunting with:

6. IF THE TROPHY HAS ALREADY BEEN TAKEN, please enter the following:

   a. Country and place (area, region, GIS coordinates, ranch, conservancy, management area, or hunting block, AND nearest city) where trophy was removed from the wild:

   Area - South Eastern Lowveld, Zimbabwe; Region - Masvingo Province. GIS coordinates - 962143; Ranch - Senuko Ranch; Conservancy - Sa Valley; Hunting block - Senuko 2; Nearest city - Chiredzi town

   b. Date wildlife was hunted:

   1-6-18

c. Name of hunting outfitter, safari company, or professional hunter you hunted with:

Clive Hallamore
Hallamore Hunt

d. The current location of the trophy (address and country) [the U.S. import permit will identify this country as the country of export/re-export and must match with the export/re-export document]:

Trophy Consultants International

7. Please provide a copy of any applicable foreign government permits or licenses that were required to remove this animal from the wild (if you have not hunted yet and do not currently hold any such permits or licenses, please indicate so). see attached permit

8. Complete name and address of overseas person or business shipping the trophy to you. If you are applying to import a trophy directly from Namibia, you must provide the name and address of the professional hunter listed on your Namibian hunting permit [this name will appear on the face of the export permit].

Name: Trophy Consultants International
Business Name:
Address: 4 Josiah Chinamano Rd
City: Belmont
State/Province: Bulawayo
Country, Postal Code: Zimbabwe

9. For species listed under the Endangered Species Act, please be aware that the U.S. Fish and Wildlife Service must make a finding that your activities will enhance or benefit wild populations of the species involved. While we will communicate with the range country for the species you will hunt or hunted when making the required findings, if you have any information that could support this finding, it would be helpful to our review if you could provide it. Please submit such information on a separate page with your application.

a. Do you have any information regarding the population status or trend data on the species hunted?

Please see attached SVC carnivore survey

b. In order to hunt, you likely paid for licenses or trophy fees. What were those fees and do you have any information on how those funds were used by either the landowner, community, or government?

1500/day x 21 days + 16,000 trophy fee. All fees are back into the hunting area in the form of running costs such as staff wages, water, power, fuel, anti-poaching, rd Mainten etc.

c. Do you have information on other funding activities that are being carried out, or were carried out, by the safari outfitter, professional hunter, concession holder, or land owner that provide a conservation benefit to the species being hunted/species hunted

Other hunts are also done in t area which fund the above which benefits all specie including lion. The Senuko Ranch also partners with th local community which helps with poaching pressure etc

CERTIFICATION STATEMENT (original signature must be provided for either 10 or 11 below)

10. If you are a broker or taxidermist applying on behalf of a U.S. hunter or foreign national, provide documentation to show you have a Power of Attorney to act on your client's behalf and sign the following statement.

    I acknowledge that the sport-hunted trophy/trophies to be imported has been/will be personally hunted by my client and is being imported only for my client's personal use (i.e., not for sale, transfer, donation, or exchange that is reasonably likely to result in economic use, gain, or benefit). If applying for the import of a leopard trophy, I understand that my client may only import two leopard trophies in one calendar year.

    Taxidermist/Broker's signature: _____ Date: _____

11. If you are the hunter applying to import your own trophy, please read and sign the following statement.

    I acknowledge that the sport-hunted trophy/trophies to be imported has been/will be personally hunted by me and is being imported only for my personal use (i.e., not for sale, transfer, donation, or exchange that is reasonably likely to result in economic use, gain, or benefit). If applying to import a leopard trophy, I understand that I may only import two leopard trophies in one calendar year.

    Applicant's signature: _____ (b) (6) _____ Date: 7-18-18

    Be aware that there may be additional permitting or approval requirements by your local or state governments, as well as required by other Federal agencies or foreign government to conduct your propose activity. While the Service will attempt to assist where possible, it is your responsibility to obtain such approval.

12. All international shipment(s) must be through a designated port. A list of designated ports (where an inspector is posted) is available from **the list of designated ports**. If you wish to use a port not listed, please contact the Office of Law Enforcement for a Designated Port Exemption Permit (form 3-200-2).

VALID AS AUTHORITY TO HUNT

ZIMBABWE PARKS AND WILDLIFE MANAGEMENT AUTHORITY
HUNTING PERMIT
PARKS AND WILDLIFE ACT [*CHAPTER 20:14*]

Permission is hereby granted on the authority of the Minister of Environment and Natural Resources Management in terms of the Parks and Wildlife Act [*Chapter 20:14*].

to .....

of .....

and co-hunter .....

of .....

Firstly to hunt in Hunt Number or Section Senuko 2 of the Masvingo Area, such number of animals as is indicated in column "A" below against the name of the animals specified. Such hunting shall be conducted during the period extending between 01-01-18 and 31-12-18 (inclusive dates)

Animal	A	B	Animal	A	B	Animal	A	B
Antbear	2		Duiker (m)	3		Hare	1	
Baboon	10		Eland (m)	3		Honey badger	2	
Buffalo (f)	2		Elephant (m)	1		Hornbill	1	
Buffalo (m)	10		Elephant (T/L	1		S. Hyaena	2	
Bushbuck (m)	1		Francolin	2		Impala (m)	20	
Bushpig	3		Geese	1		Klipspringer (m)	2	
Caracal	1		Genet	4		Kudu (m)	5	
Civet	3		Giraffe (m)	3		Lion (m)	1	
Cobra	1		Grysbok (Sharpe's) (m)	2		Leopard (m)	1	
Dassie	2		Guinea fowl	2		Mongoose	2	

Secondly to remove from the Hunting Area such number of animals as indicated in column "B" above against the name of the animal specified. An animal specified may be removed in whole or in part unless there is a condition on this permit prohibiting such removal.

Thirdly to sell, within a period of six months from the second date which appears above, the trophies of such number of animals as may be indicated in column "B" above against the name of the animal and subject to any other regulations which may be in force governing movement, sale or export of wildlife trophies.

The holder of this permit shall not permit any other person to hunt the animals specified in addition to such holder and his co-hunter appointed at the time of issue of this permit.

This permit is issued strictly subject to the terms and conditions which appear on the reverse.

Jessica Watermeyer and Dr Rosemary Groom, African Wildlife Conservation Fund

Introduction

The African Wildlife Conservation Fund carries out an annual large carnivore spoor survey in order to assess population trends of carnivores within the Savé Valley Conservancy (SVC / the conservancy) to aid management decisions. A standardised methodology is used to ensure consistency through time and comparability with other studies. Since 2008, the spoor surveys have been done using the same roads and the same observer.

Spoor surveys have been shown to be an effective and efficient means to assess wildlife densities (Stander 1998; Funston et al. 2001; Davidson & Romañach 2007; Funston et al 2010) with strong correlations existing between spoor density and true density. The technique is considered to produce reliable estimates for lions, spotted hyenas, and leopards, when sample sizes (spoor encounter rates) are sufficient. Other carnivores are included in our counts simply to monitor trends over time.

This report presents the results of the October 2017 carnivore spoor survey for the SVC, together with results from the long term wild dog monitoring project, and looks at trends in the main carnivore species over time.

AWCF head scout, Rueben Bote, and attachment student, Nkosilathi Ngwenya, identifying spoor.

Methodology

The 2017 carnivore spoor survey used the methods pioneered in SVC by Davidson and Romañach (2007), based on those used by Stander (1998) in Namibia. Exactly the same methodology has been used annually since 2008. Road transects were chosen throughout the SVC to represent a fair coverage of all (non-resettled) areas, and these transects were scanned for spoor. The number of kilometres of transects surveyed was chosen to maintain consistency with previous spoor surveys. Thus, for every 6-7km^2 of

sample area, 1km of transect was surveyed, creating a penetration density (expressed as a ratio of kilometres of transect surveyed to total sample area) of between 1:6 and 1:7.

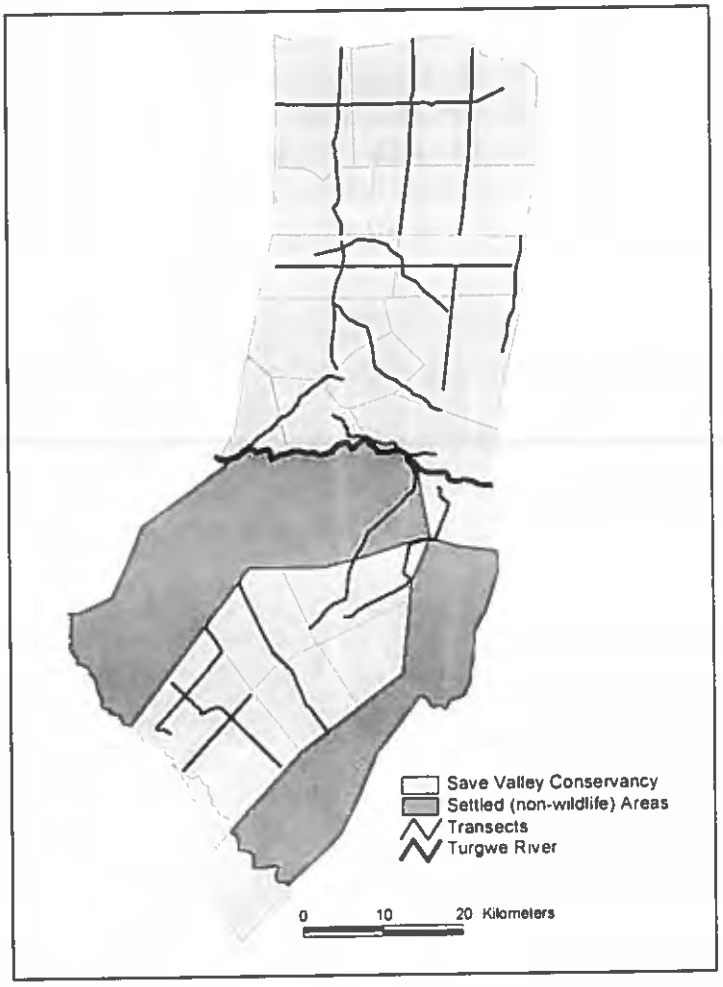
The total area of the Savé Valley Conservancy is 3490km^2. However, the effective wildlife area (excluding the 1051km^2 of resettled land), comes to only 2439km^2; 1639km^2 north of the Turgwe river and 800km^2 south of the Turgwe (see Table 1).

In northern SVC, the total length of all transects combined was 259.7 km, giving a penetration ratio of 6.31. In southern SVC, the combined transect length was 144 km, giving a penetration ratio of 5.56. For the conservancy as a whole, 403.7 km were driven (penetration ratio 6.04).

Transects surveyed were the same as those used in 2007-2017 (Figure 1). Each transect was driven at a speed of between 10 and 20 km/hr with one tracker, AWCF head scout Rueben Bote, sitting on the front of the vehicle scanning for spoor. Transects ranged between 12.7 km and 29.2 km in length, with a mean transect length of 21.2 km.

Each transect survey started as close to sunrise as possible, and wherever feasible was driven from west to east to ensure the best possible tracking conditions. Only tracks less than 24 hours old were counted. Road conditions are generally sandy, such that spoor is relatively easy to see. Where possible, spoor of individual animals were followed to reduce the likelihood of that individual being counted twice on a given transect. Spoor was recorded for all mammalian carnivores bigger than a genet.

Figure 1. Map of the transects driven – October 2017



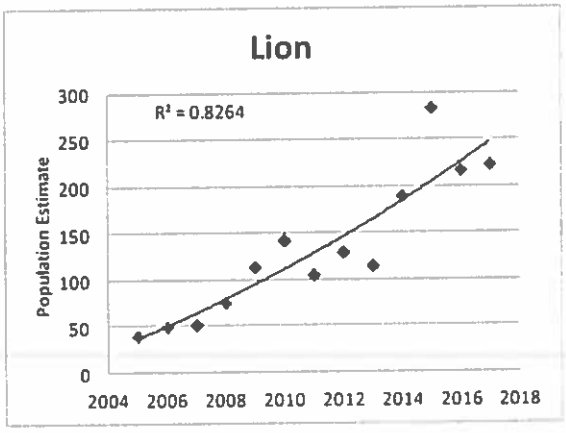
Results

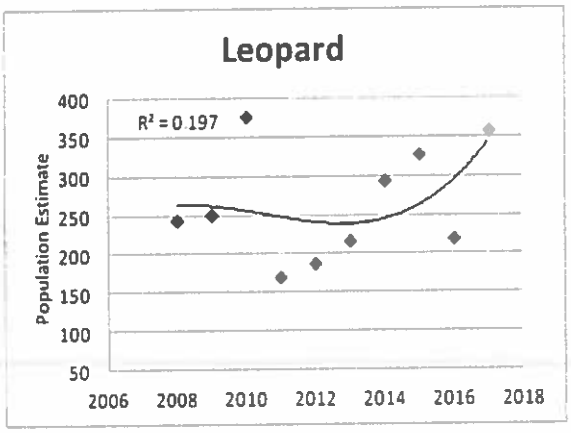
Table 1: Summary of survey parameters (2017)

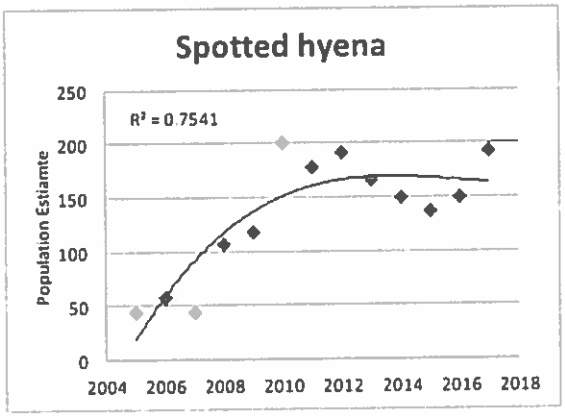
Parameter	Northern SVC	Southern SVC	Total SVC
Area (km²)	1639	800	2439
Total number of km driven	269.7	132	401.7
Penetration ratio	6.08	6.06	6.07

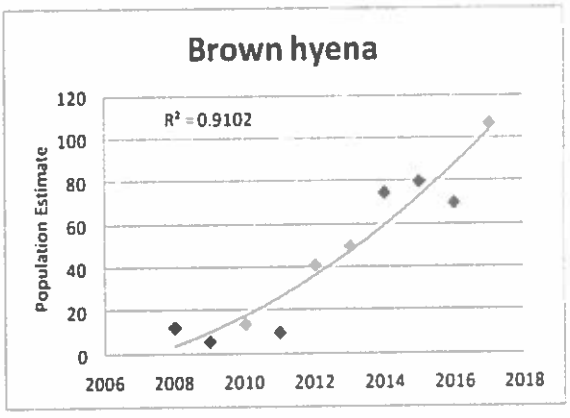
Table 2: Population estimates of the key carnivore species in the **whole of Savé Valley Conservancy** from 2008-2017 (from 2005 – 2017 for lion and spotted hyena).
Data for lion, leopard, spotted and brown hyenas and black backed jackal are from spoor surveys; **data for wild dogs is from the Lowveld Wild Dog Project's direct monitoring efforts** (counts are taken from April of each year and include adult and yearling wild dogs).

Species	2005	2006	2007	2008	2009	2010	2011	2012	2013	2014	2015	2016	2017
Lion	40	50	52	76	114	143	105	130	115	190	284	217	223
Leopard				245	252	378	172	189	218	295	328	221	359
Spotted hyena	44	58	44	107	118	201	178	192	166	150	137	150	193
Brown hyena				12	6	14	10	41	50	75	80	70	107
African Wild dog				45	60	64	61	86	90	81	91	99	94
Black backed jackal				188	190	157	141	151	199	229	241	234	296









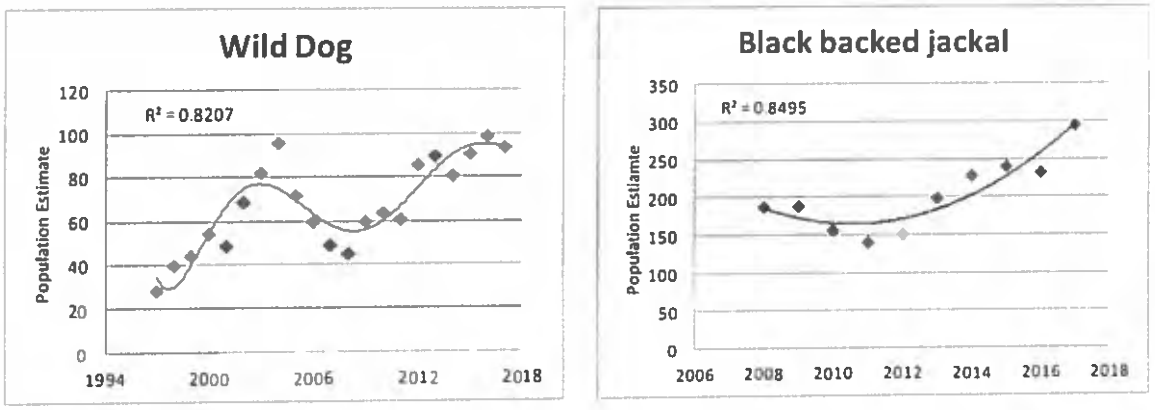


Figure 2: Trends in the populations of key carnivores in SVC for all years for which data is available. Data for lion, leopard and spotted and brown hyenas and black backed jackal are from spoor surveys; data for wild dogs is from the Lowveld Wild Dog Project's direct monitoring efforts (counts are taken from April of each year and include adult and yearling wild dogs). *A breakdown of all survey results for all species between the north and south of the conservancy is given in Appendix 1.*

Discussion

The results for each species are stable/increasing. The trend data suggests that 2016 was a slight undercount for all species (as was also the case in the Gonarezhou National Park survey), and that 2015 was most likely an over count for lion (and maybe for leopard).

Interpretation of results for each species

The **lion population** in the conservancy has increased significantly from c. 40 individuals in 2005 to 190 in 2014. Excluding the anomalous over count in 2015, the population appears to be starting to stabilise. The population **estimate of 223 lions** in 2017 is in keeping with the long-term population growth trend (Figure 2), and the recent marginal increases in estimated individuals could be indicative of a slowing growth rate as the species approaches capacity within the conservancy.

The number of lions in SVC equates to a **density of 9.1 lions / 100km²**, which is in line with densities recorded elsewhere (9.6 lions / 100km² - average over Kruger, Hwange, Selous and Serengeti), although in areas notably larger than SVC. Finally, of the 121 lion tracks we encountered, 31% were adult males, with 55% identified as adult females, 12% as sub-adults and 2% as young cubs. With regards to quota considerations, it is important to not only consider the population trend of the species, but age grouping and sex ratios too.

In 2017 there were an estimated **359 leopard** in the conservancy. If one disregards the 2016 count as an anomalous undercount, and considers the long-term trend data from 2010 – 2017 (inclusive), it is clear that the conservancy's **leopard population** is displaying a good and positive trend (Figure 2).

Leopards are at a **density of 14.7 leopards / 100km²** in the conservancy. This is considerably higher than densities recorded in Phinda and Mkhuze in South Africa (average 9.7 / 100km²; Balme et al. 2009) and in neighbouring Gonarezhou National Park (9.5 / 100km²; Groom & Watermeyer 2017). Finally, the SVC leopard population appears to displays a 2:1 ratio skewed in the favour of females. Of the 85 leopard tracks

we recorded, 32% were adult males, 64% were adult females, with one sub-adult (1%) being recorded and three cubs (3%).

Derivation of population estimates from spoor densities is controversial for leopards (there are several different equations available which give different numbers) so the numbers themselves should be treated with caution. Looking ahead, it may be useful to adopt alternative research methods (e.g. mark recapture camera trap survey) to calibrate the survey results, and obtain a more comprehensive understanding of leopard numbers in the conservancy.

Spotted hyenas appear to have stabilised over the last few years at between 150-200 individuals. There were an estimated **193 spotted hyenas** in 2017. The hyena population could be doing better in light of the recently stabilising lion population, but we will need to monitor the population to determine if a true trend is emerging. Likewise, one must not overlook that the possible causes of the recent slight population decline between 2012-2016 (prey availability, intra-specific competition, hunting pressure, anthropogenic mortality etc.) may still be of consequence.

Spotted hyena's are at a density of **7.9 spotted hyenas / 100km²**. This is lower than other populations; 13.5 / 100km² in Kruger (Mills 1985), 17.0 / 100km² in Hwange (Bowler 1992), and 9.7 / 100km² in Gonarezhou National Park (Groom & Watermeyer 2017). Given the relatively lower density of the species in the conservancy, they may still increase more.

There were an estimated **107 brown hyenas** in the conservancy in 2017. Overall and ignoring the 2016 undercount, the **brown hyena population** is displaying a stable and positive growth trend (Figure 2). The estimated density of brown hyenas was **4.4 brown hyenas / 100km²** in 2017, which is higher than the average (2.5 brown hyenas / 100km²) over the last few years (2012-2015).

The **African wild dog** population appears to be levelling off. **From our comprehensive and direct monitoring of the species, there are 94 adult and yearling wild dogs in the conservancy (3.9 wild dogs / 100km²)**. Average wild dog densities are generally lower (average 2.5 wild dogs / 100km² across five populations; Pole 1999). The spoor survey results estimated 313 wild dogs in the conservancy, with a density of 12.8 African wild dogs / 100km². This is clearly a significant overestimate of the wild dog population, and serves to demonstrate that spoor surveys are not a reliable indicator of wild dog numbers.

When counts include pups (as spoor surveys do); the numbers are likely to be higher (particularly in October when densities are highest because it is directly after the denning season). Further, there is the potential to 'hit' or 'miss' a large pack of wild dogs during a spoor survey which can have a large effect on the results. However, looking at the detailed monitoring results, the long term trend for the species is as expected. Wild dogs are a classic 'boom and bust' species showing major population fluctuations over time.

There has been a notable increase in the **black backed jackal** population in the conservancy, from an estimated 241 jackals in 2015 and 234 jackals in 2016, to **296 black backed jackals** in 2017. Overall, the jackal population is displaying a stable positive growth trend (Figure 2). The estimated density of jackals was **12.1 jackals / 100km²** in 2017.

We once again stress, that the spoor encounter rate for **cheetahs** in the conservancy is very low, and thus it is impossible to accurately estimate the number of resident cheetahs, even with large confidence intervals. However, data from the spoor survey suggests there to be a minimum of **four cheetahs** in the whole

conservancy at a **density of 0.2 cheetahs / 100 km²**. This is on the low end of the spectrum when one considers the range of cheetah densities elsewhere (excluding highly managed fenced reserves in South Africa); for example, 0.2 cheetah / 100km² on Namibian farmlands and in the Sahara, and up to 2.5 cheetah / 100km² in the Serengeti National Park (IUCN/SSC 2015).

Although anecdotal evidence suggests the population may be picking up slightly, we can safely say the population is still very low (only two cheetah tracks were seen in the 403.7 km of transects driven). However, spoor surveys are not appropriate techniques for monitoring cheetah because they use the roads a lot less than other large carnivores, and the species would be more accurately surveyed by a mark recapture camera trap survey using cheetah play trees and other key areas. **The Cheetah Conservation Project Zimbabwe, which collected updated photographic information on cheetah throughout Zimbabwe, estimates c. 12 adult cheetahs in SVC (van der Meer, 2016).**

Word of caution

When interpreting the results in the graphs and tables at the end, please do so with caution, especially to quote specific numbers. For lions and hyenas we are confident that these spoor surveys are relatively accurate in the numbers they predict, although anomalous over and undercounts can hinder this. Likewise, we can trust the numbers for wild dogs, as they are from the detailed population monitoring study. For leopards however, several different equations (all considered suitable for estimating leopard numbers from spoor) can give different population estimates from each other. The spoor survey technique has not been calibrated for species like jackals, civets, even brown hyenas, so while the data is useful for looking at trends, using population figures directly from the graphs for these species is unadvisable.

Acknowledgements

Permission to conduct this research was given by the Research Council of Zimbabwe, and the Savé Valley Conservancy, with the support of the Zimbabwe Parks and Wildlife Management Authority. Thank you to Chishakwe Ranch for hosting the project team and for providing logistical support. Thanks also to all of the landowners and managers in the conservancy for allowing us to conduct this spoor survey on their properties. Rueben Bote deserves special mention for his excellent track identification.

Darbi,

Prior to March 12, 2018, it did not take this long for our office to process applications for the import of sport-hunted trophy and now with the requirement of providing enhancement findings on an application-by-application basis the process has been delayed further. At this time no additional information is needed to complete Mr. Morris's application.

Sincerely,

Anna Barry

NOTICE OF REPRESENTATION

This is a notice to the U.S. Fish and Wildlife Service that I have appointed John J. Jackson, III of the non-profit firm Conservation Force as my attorney and legal representative for all matters concerning my application for a permit to import a lawfully hunted Lion trophy.

This authority is inclusive and extends to all applications and filings, whether administrative or judicial, including but not limited to any request for reconsideration, appeal, and litigation.

In the case of a permit an ESA endangered listed species this is also a request for Ten Days Notice before the permit is issued so I and my attorney can know of approval as soon as those that may have opposed the issuance of the permit.

Thomas Whaley	11229C
Thomas Whaley	50280C
Thomas Zulim	30345C

Ms. Brisendine:

The document attached is to be included as supplement to all original import permit applications filed with the U.S. Fish and Wildlife Service listed above.

Since filing these applications we have received additional documentation of conservation efforts for lions in Zimbabwe that further detail the populations as stable and growing. The CAMPFIRE document strongly argues the importance of trophy imports and the value that they provide to communities in Zimbabwe through income flows from tourism and hunting which serve to support sustainable community livelihoods in a way that promotes conservation of wild species and habitat.

The Campfire document details the drastic effects that COVID-19 has had and is having on Zimbabwe's tourism and hunting market, which is in a state of collapse. It is leaving the country uncertain of how wild-life and anti-poaching programs will be supported on the ground in the coming months. This information can be used to predict what might transpire if trophy hunting and imports were to cease to exist and the tragic outcome it could have on the conservation efforts of wildlife in the area.

We ask that you please consider these documents when making your decision on enhancement in each import permit application.

Please feel free to contact me if you have any questions regarding this mater.

Cordially,

Aimee Korver
Permits Paralegal

Attachments
1. CAMPFIRE communities Concern on Import Bans

Open Letter to the United States Fish and Wildlife Service

Dear Dr Mary Cogliano

CAMPFIRE Communities Concern on Import Bans

CA/MPFIRE Association, otherwise known as the Community Areas Management Program for Indigenous Resources in Zimbabwe wishes to register its opposition to continuing campigns for the banning of trophy imports. We are fully aware that the general outrage in both print and social media against sport hunting, which many distant voices refer to as unethical, is aimed at influencing policy action by importing countires.. These arguments, none of which are supported by science, are based on a perfected art of global misinformation and do not represent the views of rural communities who live side by side with wildlife. To us as a people with substantial wildlife populations, trophy hunting is indispensable for conservation and rural livelihoods.

Zimbabwe has one of the most resilient and successful conservation programs in Africa. Its conservation efforts have historically enabled local communities to thrive on sustainable livelihoods in biodiversity-rich landscapes. At least 800 000 households or 2.5 million people (out of a national population of 16 million) benefit directly and indirectly from the sustainable use of wildlife and tourism related investments in their areas. However, our ever growing elephant population has increased the levels of conflict between humans and wildlife in recent years, which, together with recurrent droughts that threaten food security, have made traditional livelihoods more difficult, especially for subsistence farming communities that live in the wildlife rich areas of the country.

Communities in CAMPFIRE areas reside in an environment where conflict between humans and wildlife is common, as both compete for the limited available land and water resources. But this comes at a high price: people in Zimbabwe are paying with their lives for tolerating wild animals in their areas. As recently as 23rd March 2020, Barnabas Mwinga, a 50 year old man, was killed by an elephant in his field in front of his wife and young daughter in Gonono Ward, Mbire District. He is one of seven other people that have needlessly lost their lives to wildlife attacks throughout the country since the beginning of 2020, in addition to the 41 killed in 2019. Yet despite this high cost, wildlife is still highly valued by rural communities who continue to tolerate massive crop destruction and livestock losses from wildlife without compensation. For example, elephant poaching in Mbire District where Barnabas Mwinga was recently killed has gone down from a peak of 40 in 2010 to only 3 elephants poached in 2019 (Figure 1). The decline in poaching incidents is a result of collaborative efforts between the Safari Operator and the hunting clients who invest nearly $100,000 annually into an anti-poaching unit.

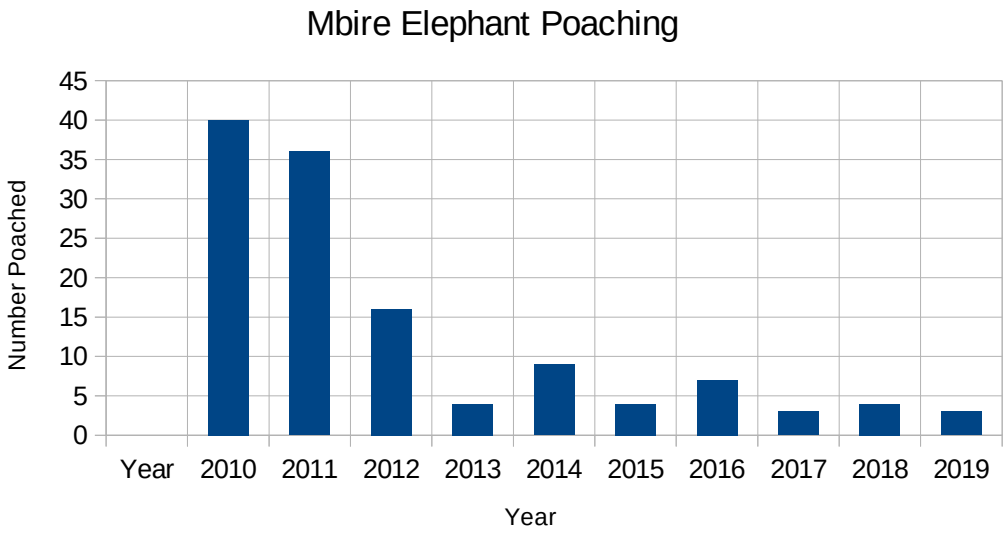

Figure 1: Mbire Elephant Poaching Trends (Source – Mbire Rural District Council)

The aim of the CAMPFIRE programme is to support sustainable community livelihoods in a way that promotes conservation of wild species and habitat. For nearly 30 years, trophy hunting, which relies heavily on the American market, has been cautiously implemented in the absence of other tourism opportunities to achieve this goal. Not only has it resulted in increasing food and livelihood security of rural people, it has also played a role in undermining the drivers of poaching and mitigating human and wildlife conflict. The net impact is seen in securing wildlife habitat and assisting in the regeneration of degraded landscapes.

The financial resources to succeed with this programme in CAMPFIRE areas are heavily dependent on the sustainable hunting of big game, especially elephants. The monies generated from these activities finance the local economies, social services as well as anti-poaching efforts and wildlife management at the District and Ward levels. For example, as can be seen from Table 1 below, the total number of elephants hunted as trophies over nine years is 807 out of a cumulative quota of 1381, from an estimated national population of 83,000 elephants. Hunting quotas are set at no more than 0.5% of the population estimate compared to an elephant population growth of 5% to 6% annually. The levels of off-take (58%) also demonstrate that while hunting is based on controlled numbers for each species annually, it is not uncommon for a client to pay for a full hunt and enjoy the wild experience, but not take a trophy. It is also important to note that communities do not view international hunting clients just as tourists, but as vital conservation partners.

Table 1: Trophy Hunting Quota Summary and Income: 2010-2018

All Districts:	**Elephant**	**Lion**	**Leopard**	**Buffalo**	**Hippo**	**Crocodile**	**Total**

Source: *The Role of Trophy Hunting of Elephant in Support of the Zimbabwe CAMPFIRE Program: Vernon Booth* (in progress).

District and Ward-level institutions in the CAMPFIRE areas rely on income from hunting to provide significant local livelihood benefits (income, jobs, skills) and social services (schools, clinics, irrigation schemes, boreholes) in remote regions where agriculture is marginal and there are very few jobs or other sources of cash income. Table 2 and Table 3 below summarise the impact of pre- and post-elephant trophy import suspension expenditure on the CAMPFIRE programme at the District and Ward level. The District administration costs absorb 89% of the budget with 30% devoted to law enforcement. With the suspension of elephant trophy imports to the USA and Europe in 2016, expenditure on law enforcement dropped from 33% to 9% as a result of District administration having to offset the human and wildlife costs which increased from 1% to 33%. At the Ward level, 46% of the budget is allocated to administration and 54% to community benefits (45% devoted to social services, Table 3).

Table 2: District level expenditure on administration and community benefits: 2010-2018

	Administration			**Community Benefits**

With growing awareness from several years of CAMPFIRE implementation, communities have been demanding their rightful place in the management of wildlife resources for their own benefit. To accommodate this, CAMPFIRE has undergone a review of its policy framework to enable communities to reap greater and more tangible benefits from living in harmony with nature. A key aspect of this review is to establish Community Conservancies that redefine ways in which communities can benefit more from wildlife and other income generation opportunities, as well as the mitigation of human and wildlife conflict. This initiative is being directed under the Global Environment Facility (GEF) 5 and 6 cycles covering five districts with the aim of developing innovative ways to improve the management of wildlife for the benefit or rural people. If trophy hunting and trade here was stopped, the impact on local livelihood would be severe, and both poaching and changes to alternative land use would increase. Non-consumptive tourism currently plays virtually no positive conservation role in the CAMPFIRE areas (<4% of overall income is generated through tourism). Instead of banning the import of trophies, more international oversight and support is needed from importing states, and of in-country CITES controls, to ensure sound sustainable management e.g. quota-setting, permit allocation, independent population surveys; building robust, equitable and transparent benefit allocation mechanisms at local level, particularly where communities have elected to invest their land and time in Community Conservancies.

STOP PRESS: The pressure for imports bans comes at the worst possible time as the Covid-19 pandemic has severely disrupted income flows from tourism and hunting. The collapse of both markets leaves rural people and safari operators with virtually no income, and it is uncertain how wildlife protection and anti-poaching programs will be supported on the ground in the coming months. What remains clear is that trophy import bans will seriously undermine conservation in Zimbabwe, and indeed open floodgates for rural people to destroy wildlife and wildlife habitat through conversion of land for other subsistence uses, even if unviable.

Enhancement Finding

Applicant: Brandon Trey Morris (PRT–01264D)

Introduction

Brandon Trey Morris submitted an application on July 31, 2018, for the importation of one male lion *(Panthera leo melanochaita)* taken on January 06, 2018, from the Savé Valley Conservancy (SVC), Senuko Ranch, Masvingo Province, Zimbabwe, for the purpose of enhancing the propagation or survival of the species in the wild. After evaluating the available information submitted with the application, information provided by the Government of Zimbabwe, other information available to the U.S. Fish & Wildlife Service (Service), and comments received from interested parties, the Service has determined that the importation of the sport-hunted trophy meets the requirements for making a positive enhancement finding pursuant to 50 CFR 17.40(r) and 50 CFR 17.32(a). The rationale for our finding follows.

U.S. Permit Requirements for Import of Lions (*Panthera leo melanochaita*)

ESA

The African lion, subspecies *Panthera leo melanochaita* (southern and eastern Africa), is a threatened species under the U.S. Endangered Species Act (ESA or Act) and is regulated under a species-specific 4(d) rule, 50 C.F.R. § 17.40(r) that provides specific conservation measures for this subspecies. Under the 4(d) rule for *P. l. melanochaita*, all of the prohibitions at 50 C.F.R. § 17.21 and 50 C.F.R. § 17.31 apply to *P. l. melanochaita* specimens. These prohibitions, in part, make it illegal for any person subject to the jurisdiction of the United States to import or export any lion specimens.

Although import of the lion subspecies *P. l. melanochaita* is a prohibited activity under the Act, exceptions may be made in accordance with the 4(d) rule at 50 C.F.R. § 17.40(r) when

the import activity qualifies for and the Service issues an ESA threatened-species enhancement permit under 50 C.F.R. § 17.32(a). The preamble to the 4(d) rulemaking, 80 Fed. Reg. 79999, 80043-46 (Dec. 23, 2015), explains the factors the Service considers when making an enhancement finding for importation of sport-hunted trophies of *P. l. melanochaita*, as described below.

Our threatened species permitting regulations at 50 CFR 17.32 provide issuance criteria for threatened species permits (50 CFR 17.32(a)(2)), but do not specify what would constitute the enhancement of propagation or survival with regard to authorizing the import of parts or products of *P. l. melanochaita,* including sport-hunted trophies. Therefore, when making a determination of whether an otherwise prohibited activity enhances the propagation or survival of *P. l. melanochaita,* the Service will examine the overall conservation and management of the subspecies in the country where the specimen originated and whether that management of the subspecies addresses the threats to the subspecies (*i.e.,* that it is based on sound scientific principles and that the management program is actively addressing the current and longer term threats to the subspecies). In that review, we will evaluate whether the import contributes to the overall conservation of the species by considering whether the biological, social, and economic aspects of a program from which the specimen was obtained provide a net benefit to the subspecies and its ecosystem.

The Service will evaluate any application received that involves *P. l. melanochaita* in the context of enhancement of propagation or survival permitting in accordance with our threatened species permitting regulations at 50 CFR 17.32 and issuance criteria for threatened species permits (50 CFR 17.32(a)(2)). These include, in addition to the general permitting criteria in 50 CFR 13.21(b):

(i) Whether the purpose for which the permit is required is adequate to justify removing from the wild or otherwise changing the status of the wildlife sought to be covered by the permit;
(ii) The probable direct and indirect effect that issuing the permit would have on the wild populations of the wildlife sought to be covered by the permit;
(iii) Whether the permit, if issued, would in any way, directly or indirectly, conflict with any known program intended to enhance the survival probabilities of the population from which the wildlife sought to be covered by the permit was or would be removed;
(iv) Whether the purpose for which the permit is required would be likely to reduce the threat of extinction facing the species of wildlife sought to be covered by the permit;
(v) The opinions or views of scientists or other persons or organizations having expertise concerning the wildlife or other matters germane to the application; and
(vi) Whether the expertise, facilities, or other resources available to the applicant appear adequate to successfully accomplish the objectives stated in the application.

In addition to these factors, particularly in relation to sport hunting, we find the *IUCN Species Survival Commission (SSC) Guiding Principles on Trophy Hunting as a Tool for Creating Conservation Incentives, Ver. 1.0* (IUCN SSC 2012), to provide useful principles, which, considered in conjunction with our threatened species issuance criteria, will aid the Service when making an enhancement finding for importation of sport-hunted trophies of *P. l. melanochaita.* This document sets out guidance from experts in the field on the use of trophy hunting as a tool for "creating incentives for the conservation of species and their habitats and for the equitable sharing of the benefits of use of natural resources" (IUCN SSC

2012, p. 2) and recognizes that recreational hunting, particularly trophy hunting, can contribute to biodiversity conservation and more specifically, the conservation of the hunted species.

The SSC document lays out five guiding principles that, considered in conjunction with our threatened species issuance criteria, will aid the Service when making an enhancement finding for importation of sport-hunted trophies of *P. l. melanochaita:*

(a) *Biological sustainability:* The hunting program cannot contribute to the long-term decline of the hunted species. It should not alter natural selection and ecological function of the hunted species or any other species that share the habitat. The program should not inadvertently facilitate poaching or illegal trade in wildlife by acting as a cover for such illegal activities. The hunting program should also not manipulate the ecosystem or its component elements in a way that alters the native biodiversity.
(b) *Net Conservation Benefit:* The biologically sustainable hunting program should be based on laws, regulations, and scientifically based quotas, established with local input, that are transparent and periodically reviewed. The program should produce income, employment, and other benefits to create incentives for reducing the pressure on the target species. The program should create benefits for local residents to co-exist with the target species and other species. It is also imperative that the program is part of a legally recognized governance system that supports conservation.
(c) *Socio-Economic-Cultural Benefit:* A well-managed hunting program can serve as a conservation tool when it respects the local cultural values and practices. It should be accepted by most members of the community, involving and benefiting local residents in an equitable manner. The program should also adopt business practices that promote long-term economic sustainability.
(d) *Adaptive Management: Planning, Monitoring, and Reporting:* Hunting can enhance the species when it is based on appropriate resource assessments and monitoring (*e.g.,* population counts, trend data), upon which specific science-based quotas and hunting programs can be established. Resource assessments should be objective, well documented, and use the best science available. Adaptive management of quotas and programs based on the results of resource assessments and monitoring is essential. The program should monitor hunting activities to ensure that quotas and sex/age restrictions of harvested animals are met. The program should also generate reliable documentation of its biological sustainability and conservation benefits.
(e) *Accountable and Effective Governance:* A biologically sustainable trophy-hunting program should be subject to a governance structure that clearly allocates management responsibilities. The program should account for revenues in a transparent manner and distribute net revenues to conservation and community beneficiaries according to properly agreed decisions. All necessary steps to eliminate corruption should be taken and to ensure compliance with all relevant national and international requirements and regulations by relevant bodies such as administrators, regulators and hunters.

The Service's approach to enhancement findings for the importation of sport-hunted trophies of *P. l. melanochaita* is consistent with the purpose and intent of the Endangered Species Act. Before we will authorize the importation of a sport-hunted trophy, we must determine that the trophy hunting program is managed to ensure the long-term survival of the species. In many parts of the world, wildlife exists outside of protected areas and must share the same habitat

and compete with humans living in these areas for space and resources. If communities that share these resources with wildlife do not perceive any benefits from the presence of wildlife, they may be less willing to tolerate the wildlife. However, under certain circumstances, trophy hunting can address this problem by making wildlife more valuable to the local communities and encourage community support for managing and conserving the hunted species, as well as other species.

When evaluating whether the importation of a trophy of *P. l. melanochaita* would be authorized pursuant to 50 CFR 17.32, in accordance with our threatened species issuance criteria, we will examine how a country's management program for lions addresses the three main threats that have led to the decline of the subspecies: Habitat loss, loss of prey base, and human-lion conflict. When examining a management program and whether trophies taken as part of that program meet the issuance criteria, we would study a number of factors. Some of the factors we would consider include whether the program is based on sound scientific information and identifies mechanisms that would arrest the loss of habitat or increase available habitat (*i.e.,* by establishing protected areas and ensuring adequate protection from human encroachment). We would consider whether the management program actively address the loss of the lion's prey base by addressing poaching or unsustainable offtake within the country. A component of a management plan from which trophy imports would meet the issuance criteria would be whether there are government incentives in place that encourage habitat protection by private landowners and communities and incentives to local communities to reduce the incursion of livestock into protected areas or to actively manage livestock to reduce conflicts with lions. We would examine if the hunting component of the management program supports all of these efforts by looking at whether hunting concessions/tracts are managed to ensure the long-term survival of the lion, its prey base, and habitat. As stated previously, hunting can generate significant economic benefits if properly conducted. In looking at whether we would be able to authorize the import of a trophy under the issuance criteria of 50 CFR 17.32, we would examine if the trophy hunting provides financial assistance to the wildlife department to carry out elements of the management program and if there is a compensation scheme or other incentives to benefit local communities that may be impacted by lion predation. We would also consider how a U.S. hunter's participation in the hunting program contributes to the overall management of lions within a country.

Management programs for *P. l. melanochaita* would be expected to address, but are not limited to, evaluating population levels and trends; the biological needs of the species; quotas; management practices; legal protection; local community involvement; and use of hunting fees for conservation. In evaluating these factors, we will work closely with the range countries and interested parties to obtain the information. By allowing entry into the United States of *P. l. melanochaita* trophies from range countries that have science-based management programs, we anticipate that other range countries would be encouraged to adopt and financially support the sustainable management of lions that benefits both the species and local communities. In addition to addressing the biological needs of the subspecies, a scientifically based management program would provide economic incentives for local communities to protect and expand *P. l. melanochaita* habitat.

As stated, under this 4(d) rule any person wishing to conduct an otherwise prohibited activity, including all imports of *P. l. melanochaita* specimens, must first obtain a permit under 50

CFR 17.32. As with all permit applications submitted under 50 CFR 17.32, the individual requesting authorization to import a sport-hunted trophy of *P. l. melanochaita* bears the burden of providing information in their application showing that the activity meets the requirements for issuance criteria under 50 CFR 17.32. In some cases for imports, such as sport-hunted trophies, it is not always possible for the applicant to provide all of the necessary information needed by the Service to make a positive determination under the Act to authorize the activity. For the import of sport-hunted trophies of *P. l. melanochaita,* the Service will typically consult with the range country to the extent practicable and other interested parties to obtain necessary information.

The Service has the discretion to make the required findings on sport-hunted trophy imports of *P. l. melanochaita* on a country-wide basis, although individual import permits will be evaluated and issued or denied for each applicant. While the Service may make enhancement findings for sport-hunted trophy imports of *P. l. melanochaita* on a country-wide basis, the Service encourages the submission of information from individual applicants. We would rely on the information available to the Service and may rely on information from sources other than the applicant when making a permitting decision.

CITES

The African lion is also included in Appendix II of the Convention on International Trade in Endangered Species of Wild Fauna and Flora (CITES). It is unlawful for any person subject to the jurisdiction of the United States to engage in international trade in CITES specimens contrary to the provisions of the Convention, the ESA, or our CITES implementing regulations in 50 CFR part 23. 16 U.S.C. § 1538(c)(1), (g); 50 C.F.R. § 23.13. As required by CITES, export of a specimen of an Appendix II species to another country requires prior issuance of a CITES permit. Under CITES, importation of an Appendix II species does not require issuance of an import permit from the importing country. Consequently, the United States is not required to issue a CITES permit in order for U.S. hunters to import their sport-hunted lions. In compliance with CITES, the United States does require CITES imports to meet all CITES requirements, including that the imported lion trophies be accompanied by the required CITES export permits issued by the exporting countries, *see* 50 C.F.R. §§ 23.20; 23.23; 23.24; 23.26; 23.27, and including requirements for sport-hunted trophies at 50 C.F.R. § 23.74.

Individual Permit Adjudication Considerations

When the African lion listing under the ESA became effective, January 22, 2016, the Service began issuing enhancement findings for *P. l. melanochaita* on a countrywide basis, as had been the practice for a number of other threatened sport-hunted species. On March 1, 2018, however, in response to a D.C. Circuit Court opinion (*Safari Club Int'l v. Zinke*, 878 F.3d 316 (D.C. Cir. 2017)), the Service withdrew its countrywide enhancement findings for a range of species, including lions, across several countries, and began assessing applications to import sport-hunted trophies of these species on an application-by-application basis. These withdrawals were upheld in a D.C. Circuit Court opinion (*Friends of Animals v. Bernhardt*, No. 19-5147 (D.C. Cir. June 16, 2020); *Center for Biological Diversity v. Bernhardt*, No. 19-5152 (D.C. Cir. June 16, 2020)). No countrywide ESA enhancement findings are currently in effect. Therefore, since March 1, 2018, the Service has been making

ESA enhancement findings for the import of sport-hunted trophies of lions on an application-by-application basis, ensuring consistent application of the regulatory criteria across all permit application adjudications and ensuring that each permit decision is based on the best scientific and management information available.

Although the Service makes the required enhancement findings on sport-hunted trophy imports of *P. l. melanochaita* on an individual application basis, information obtained for the range country as a whole is also considered, as it is pertinent to the Service's evaluation. In addition to considering national-level species management, we also consider species management and contributions to species enhancement on a smaller-scale (e.g., at the regional or hunting management unit scale such as at the hunting operator, community conservancy, concessionaire, reserve, or ranch-level scale). In addition, we consider how the hunter's personal involvement in the hunting experience directly or indirectly contributes to enhancement of the species in the wild. In its enhancement evaluation, the Service, therefore, considers efforts made by the hunting management unit and/or individual hunter to directly or indirectly address the threats posed to lions in the wild together with other information available concerning the overall management and population status of the lion in the range country at the time of the hunt.

In making ESA enhancement findings, we review all relevant information available to us, including information submitted with the individual permit applications, information received in response to inquiries we make of the range countries, and all other reliable information we receive from interested parties, such as species experts, hunting organizations, hunting operators, community groups, and non-governmental organizations. We evaluate and consider all relevant information obtained or submitted to the Service on an ongoing basis as it relates to permit applications received for import of sport-hunted trophies of *P. l. melanochaita*.

The Service considers information at these different levels in order to assess:

1) How the range country government manages the hunted species and how hunting serves to enhance the survival of the species in the wild in the context of the management system;
2) How hunting serves to enhance the survival of the species in the wild in the context of the management unit at the hunting operator, concessionaire, community conservancy, reserve, or ranch level; and
3) How the individual hunter has contributed (where the hunt has already taken place) or will contribute (where the hunt has not yet taken place) to enhancement of survival of that species through their hunting activities and contributions to the survival of the species in the wild associated to the hunt and subsequent import.

Government-Level Factors Considered

- Enforcement of wildlife laws and regulations, particularly with regard to the range country's ability to implement wildlife regulations developed for the hunted species
- Implementation of a scientifically-based management plan that addresses the major threats to the species and provides economic incentives for local communities to conserve the species
- Investment of hunting fees into conservation, including whether the range country has standard processes and infrastructure in place to ensure an effective transfer of hunting revenues back into the country's management of the species and community benefits
- Management of human-lion conflict, including whether the range country has a compensation scheme or other incentives to local communities to reduce the incursion of livestock into protected areas or to actively manage livestock to reduce conflicts with lions
- Management of the lion's prey base by addressing poaching or unsustainable offtake of the lion's prey species
- Management of lion hunting areas through a system that ensures the long-term survival of the lion, its prey base, and habitat
- Protection of lion habitat through establishment of protected areas, ensuring adequate protection from human encroachment and providing incentives that encourage habitat protection by private landowners and communities
- Establishment and use of science-based quotas, a sex and age-based harvest system, and a monitoring program for the lion and its prey species

Hunting Management Unit-Level Factors Considered

- Monitoring populations of the hunted species and their prey-base
- Protecting and/or increasing the prey-base for lions in the wild
- Maximizing biodiversity of the lion's prey species
- Protecting and improving the habitat for lions in the wild to ensure maintenance of ecosystem functions and biodiversity (e.g., creating water holes, habitat management, etc.)
- Engaging in anti-poaching activities for lion and their prey base
- Managing human-lion conflict
- Investing in community benefits and employment, where such investments provide incentives for conservation of lions in the wild
- Complying with harvest laws and regulations
- Re-investing hunting fees or other contributions associated to lion hunting to a fund that supports conservation of lions in the wild

Hunter-Level Factors Considered

- Complying with harvest laws and regulations
- Paying hunting/import-related fees or other contributions associated to lion hunting that are re-invested to support conservation of lions in the wild (e.g., funding habitat protection for lions in the wild, protection of the lion's prey base, or mitigation of human-lion conflict)
- Participating in a hunting program with an operator that supports sustainable use of the species

This application-by-application permit review process offers an opportunity to incentivize hunting in concessions, conservancies, reserves, or ranches that support conservation of the species through rigorous anti-poaching programs, local wildlife monitoring activities, and compliance with government rules and regulations. By complying with our enhancement requirements, a hunter's personal import will help conserve lion populations in the wild by supporting the local communities where they hunt and promoting conservation of these species and their habitats by providing protection incentives to communities that live alongside these species.

Basis for Finding

On February 1, 2016, the Service sent a letter to the Parks and Wildlife Management Authority in Zimbabwe (ZPWMA) with a list of questions related to management plans, population status, conservation, management, hunting policies, and regulations of Zimbabwe's lion populations. Additionally in the letter, the Service referenced the IUCN SSC Guiding Principles on Trophy Hunting as a Tool for Creating Conservation Incentives Ver. 1.0 (09 August 2012), as it provides useful principles which, when considered in conjunction with the Service's permit issuance criteria, would aid when making the required enhancement findings for permitting importation of sport-hunted lion trophies.

On February 16, 2016, the Service sent a second request to ZPWMA for specific documents related to the conservation status of lions in Zimbabwe. ZPWMA responded to the Service's request on February 17, 2016, with a copy of *Conservation Status of African Lion in Zimbabwe,* and subsequently, on November 29, 2016, provided a copy of its *Enhancement and Non-detriment Finding for Lion (Panthera leo) in Zimbabwe.* The Service has also been corresponding with ZPWMA regarding African elephant management for several years. In this correspondence, ZPWMA, as well as other sources, have provided the Service with documents and information that are relevant to our evaluation of lions in Zimbabwe.

Since 2016, the Service has met with officials from Zimbabwe multiple times to receive updated information on the status of and management of lions in Zimbabwe with respect to imports of sport-hunted lion trophies. For example, Service representatives met with Zimbabwe officials in January 2018 at the annual Safari Club International convention in Las Vegas, and November 2018 at the African Wildlife Consultative Forum in Uganda. In September 2018, Zimbabwe officials provided to the Service the May 2017 Zimbabwe National CAMPFIRE Stakeholder's Review and the Zimbabwe Parks and Wildlife Management Authority Strategic Plan, 2019-2023. In addition, in September 2018 the Service received a letter dated 6 December 2017 from Hon. E.D. Mnangagwa, President of the Republic of Zimbabwe, addressed to President Donald Trump, addressing the

change of administration in Zimbabwe. In this letter Hon. E.D. Mnangagwa provided assurance to the United States that Zimbabwe is politically stable and that Zimbabwe's previous conservation initiatives would be enhanced, with the previous Minister, Permanent Secretary, and Director General confirmed to remain in place.

This information provided by the Zimbabwe authorities (including verbal updates and presentations at the 16th Annual African Wildlife Consultative Forum (Uganda, November 2018), along with the Service's final rule on the lion listing under the Act and other relevant information from reliable sources, are the basis of this finding.

Governance of Lions in Zimbabwe

The legal framework for Zimbabwe's regulatory mechanism is informed by its Wildlife Policy (1992), which is intended to maintain a protected area network for the conservation of the nation's wild resources and biological diversity. The Wildlife Policy (1992) provides for the Government of Zimbabwe to maintain a network of protected areas known as the Parks and Wild Life Estate, comprised of the country's National Parks, safari areas, botanical gardens, and sanctuary and recreational areas for the conservation of the nation's wild resources and biological diversity (CITES 2016; ZPWMA 2016). The framework is intended to create economic activity to enhance rural development and encourages the conservation of wild animals and their habitats outside the protected areas.

ZPWMA was established by the Parks and Wildlife Act of 1996 (Chapter 20:14) [as amended by Act Number 19 of 2001] which came into operation on June 1, 2002, through Statutory Instrument 144C of 2002. The Act provides for the establishment of a Parks and Wildlife Board; establishment of national parks, botanical reserves, botanical gardens, sanctuaries, safari areas and recreational parks; and the preservation, conservation, propagation or control of wildlife, fish, and plants of Zimbabwe and the protection of Zimbabwe's natural landscape and scenery. This Act includes sections on virtually every aspect of ZPWMA, including requirements for annual financial audits and reporting to the central government. The Act also provides for substantial penalties for the unlawful possession of or trading in protected wildlife species. In addition, the General Laws Amendment Act (No. 5) of 2010 provides for mandatory imprisonment for poaching.

The Parks and Wildlife Act, Chapter 20:14, devolved authority to manage and benefit from wildlife on communal and private lands to the landholders. In 1982, the legal provisions of this Act were extended to Rural District Councils (RDCs), on behalf of rural communities in communal lands whose areas contain viable populations of wildlife. Communal areas in Zimbabwe are administered by RDCs which have become a mechanism for implementation of the government's policy of conservation by utilization of natural resources. The Act enables local communities to manage and benefit from wildlife resources through the Communal Areas Management Programme for Indigenous Resources (CAMPFIRE) established in 1989.

CAMPFIRE was developed to encourage reduction in human-wildlife conflicts through conservation-based community development and to provide an economic incentive to

improve community tolerance of wildlife, including lions. At the time, the CAMPFIRE program was the model for community-based conservation efforts in several other African countries and was identified as an innovative program. Under a community-based conservation program, like CAMPFIRE, rural communities should benefit from revenue generated by sport-hunting.

As Zimbabwe's premiere wildlife agency, the main functions of the ZPWMA are to control, manage, and maintain Zimbabwe's wildlife resources with the primary role of protecting and conserving Zimbabwe's natural heritage for present and future generations on behalf of the country. It also provides the cornerstone of Zimbabwe's tourism industry (ZPWMA 2015). The rationale behind the establishment of the ZPWMA was to allow for a self-funding mechanism, and thereby reduce its dependence on the national treasury. In January 1996, the Government of Zimbabwe approved the establishment of the Parks and Wild Life Conservation Fund that provides for financing wildlife operations directly from revenues generated through wildlife-related activities. The funding for ZPWMA is therefore coming from revenue generated through sport hunting conducted on state and private lands, concession leases, National Park visitor fees, and other wildlife-related fees. While there have been requests by ZPWMA for funding from the central treasury in the past, to our knowledge, no other significant government funding has been provided, and only limited outside funding from non-governmental organizations (NGOs) or other governments appears to be available.

A major component of ZPWMA mandate is law enforcement. Poaching mainly occurs along the boundaries of protected areas where lions are incidentally snared as non-target prey. Between 2013 and 2015, 21 lions were killed illegally, with six animals killed through snaring in the area adjacent to Hwange National Park in 2015; poverty stands as the major driver of illegal hunting (ZPWMA 2016). If anyone is found in possession of poached specimens, they must pay a fine of USD 5,000 or face a mandatory jail sentence. If convicted of lion poaching, courts could require the payment of a compensation fee of USD 20,000 (ZPWMA 2014). Hunting operators are obligated through their concession lease agreements to assist with anti-poaching efforts (ZPWMA 2016). Reportedly, USD 590,000 was spent on anti-poaching efforts by the Bubye Valley Conservancy (BVC) alone during 2015 (K. Leathern, pers. comm., as cited in Du Preez et al. 2016), and USD 546,000 is spent annually on anti-poaching by the Savé Valley Conservancy (SVC) (Lindsey et al. 2012); these expenses are mainly covered by sport-hunting revenue (Du Preez et al. 2016). In 2002, ZPWMA had 2,146 rangers at its establishment (ZPWMA 2016); however, by the end 2015, there were 1,448 rangers in post (67% of 2002 level). Of the 1,448 rangers in post, 1,004 are deployable for anti-poaching operations (ZPWMA 2016).

Safari operators in Zimbabwe are required to be registered and licensed by the Zimbabwe Tourism Authority (https://www.soaz.net/index.php/2, accessed August 16, 2019). Operators must hold a lease or agreement on a suitable concession with an approved quota of animals. They are responsible for the official paperwork and permits connected to the hunt. Hunting operators are required by law to provide the services of a Zimbabwe Licensed Professional Hunter to accompany foreign hunters in Zimbabwe. Licensing is undertaken by the National Parks & Wildlife Authority.

Zimbabwe is a member of the Southern African Development Community (SADC). Under the SADC Treaty, Article 5(g) establishes objectives to, among other aspects, promote the sustainable use of wildlife, harmonize legal instruments governing wildlife use and conservation, promote the conservation of shared wildlife resources through the establishment of trans-frontier conservation areas (TFCA), and facilitate community-based natural resources management practices. To implement the SADC Treaty, member states are required to establish management programs for the conservation and sustainable use of wildlife.

Currently Zimbabwe is pursuing six TFCA initiatives at various stages of development. These are: Great Limpopo Transfrontier Park (GLTP) / Great Limpopo Transfrontier Conservation Area (GLTFCA); Chimanimani TFCA; Greater Mapungubwe TFCA; Kavango-Zambezi (KAZA) TFCA; Lower Zambezi-Mana Pools LZMP (TFCA) and Zimbabwe-Mozambique-Zambia (ZIMOZA) TFCA (Mandisodza-Chikerema 2018, p. 34).

Through TFCAs, wildlife management entities are linking many of the major protected areas by removing boundary fences along national borders that separate many reserves in addition to creating or improving corridors to link good-quality habitat for wildlife (Newmark 2008). The principle of ecological and migratory connectivity lies at the heart of the TFCA initiative linking large protected areas across international boundaries and providing space for wildlife populations.

Another provision of the SADC Treaty is that member states are required to establish management programs for the conservation and sustainable use of wildlife. Zimbabwe has met this criterion for African lions through the development of its 2006 *Conservation Strategy and Action Plan/or the Lion (Panthera leo) in Zimbabwe* (ZPWMA), which is still in use.

As previously mentioned, Zimbabwe is also a Party to CITES, and the African lion species is included in Appendix II of the Convention. As an Appendix-II species, certain criteria must be met before the CITES Management Authority of the country of export may issue an export permit, including a finding from the exporting country's CITES Scientific Authority that the proposed activity will not be detrimental to the survival of the species in the wild (non-detriment finding; NDF) and a finding from the CITES Management Authority that the specimens proposed for export were legally acquired (legal acquisition finding).

The ZPWMA has provided the Service with a copy of its standing CITES non-detriment finding (NDF), dated October 2016, for the export of African lion specimens. The NDF explains that lion populations in Zimbabwe are being managed sustainably for the benefit of the species and that Zimbabwe's management program for lion provides economic incentives for local communities to protect and expand lion habitats. The NDF document provides information to support the following:

- The Zimbabwe hunting industry is based on sound scientific information, provides mechanisms to arrest habitat loss, or where feasible increase habitat, and provides protection from human encroachment.

- Government incentives are in place to encourage habitat protection by private landowners and communities.
- Government Incentives are provided to local communities to reduce human-wildlife conflicts.
- Hunting concessions are managed to ensure the long-term survival of the African lion and its habitat.
- Trophy hunting provides financial assistance to the ZPWMA, the communal CAMPFIRE program, and private landowners to implement wildlife management programs.
- Local communities directly and indirectly benefit from the presence of lion in their areas.
- Participation of U.S. hunters in the Zimbabwe hunting industry contributes to the overall conservation and management of lions in Zimbabwe (ZPWMA 2016).

Lion Status in Zimbabwe

When the Service listed the subspecies of lion in southern and eastern Africa (*P. l. melanochaita*) as threatened under the Act (80 FR 79999), three primary threats to the species throughout its range were identified: loss of habitat, loss of prey base, and human-lion conflict. While human population growth clearly has an impact due to loss of available habitat for lions, increasing human population has a direct impact on prey base. Prey availability affects the reproduction, recruitment, and foraging behavior of lions and, as a result, strongly influences lion movements, abundance, and population viability (Winterbach *et al.* 2012, as cited in USFWS 2015). Lion densities are directly dependent on prey biomass (Hayward *et al.* 2007). Outside of protected areas, the lion's prey base is much reduced (Du Preez et al. 2016); inadequate management and law enforcement have led to poaching of the lion's prey base for bushmeat, which has been critically depleted (USFWS 2015). Population trends across eastern and southern Africa show that most prey species have declined in recent years; and for Zimbabwe, droughts have been a critical factor (ZPWMA 2016).

A reduced prey base results in a relatively greater chance of lions encountering livestock (Du Preez et al. 2016). While actual losses of livestock to predators may be relatively low, the perceived financial cost to farmers can be high, and lions are persecuted intensely in livestock areas as a consequence. Their scavenging behavior makes them particularly vulnerable to the practice of lacing prey carcasses with poison to eliminate predators (CITES 2016). Co-existence of lions and people is promoted through giving value to lions, such as through tourism and hunting in CAMPFIRE areas (ZPWMA 2014). The threat to lions from habitat loss is especially present in Sebungwe and the South East Low Veld where the fragmented nature of the protected areas is compounded by increasing human and livestock populations surrounding these areas (ZPWMA 2016).

According to the Service's CoPl7 *Consideration of Proposals for Amendment of Appendices I and II,* international trade in lion products is emerging as an additional threat; however, the relative extent to which this threat has contributed to lion population declines is difficult to evaluate accurately (CITES 2016). According to ZPWMA (2016), the illegal local and international trade in lions and their products poses an insignificant risk to the

species in Zimbabwe, as there are no records of people found in possession of illegally acquired lion specimens in Zimbabwe. It is not clear what level of legal trade of lion products, if any, occurs within Zimbabwe.

The bulk of Zimbabwe's wildlife occurs within the Parks Estate which includes 11 national parks, 16 safari areas, 16 recreational parks, 6 sanctuaries, 12 botanical reserves and 3 botanical gardens, all spread across the country (Parks and Wildlife Act 2001 Chapter 20:14). Wildlife populations also occur on the state Forest Areas, Communal CAMPFIRE areas, and private conservancies dedicated to wildlife-based land use. There are approximately 319,317 km^2 of land where some form of wildlife-based land use is practiced in Zimbabwe (ZPWMA 2016). Lions occur permanently in 45% of this available range (circa 145,000 km^2) with the majority occurring in national parks (96%) and safari areas (92%). Lions also occur permanently in 47% of the State forest areas and 66% of privately owned conservancies. The CAMPFIRE areas comprise approximately 247,000 km^2 and lions occur in 36% of these areas. Lions are transient in CAMPFIRE, conservancy, and resettled areas adjacent to the major protected areas, and lions move across the border into Zambia, Mozambique, South Africa, and Botswana.

Zimbabwe's main lion range includes the Hwange-Matetsi Ecosystem, Mid Zambezi Valley, Sebungwe, and South East Lowveld. The lion population estimates in Zimbabwe are determined primarily through carnivore spoor surveys, systematic lion collaring, and call-up surveys. According to ZPWMA's *Conservation Status of the African lion (Panthera leo) in Zimbabwe* July 2014 report, starting in 2015, lion spoor surveys were to be done at two-year intervals in all wildlife areas, and lion call-up surveys were to be done every three years in all major lion areas (ZPWMA 2014). Although the Service has not received confirmation that these surveys have been conducted since 2015, in September 2018, the Service received Zimbabwe's Parks and Wildlife Management Authority's Strategic Plan for 2019-2023, which indicates that Zimbabwe is actively working to improve the monitoring and management of their wildlife species. In their updated strategic plan, signed in December 2018, they indicated that one of their strategic objectives is protection of wildlife resources. Their identified timeline is to update and implement key species management plans (lion is identified as one of these) by December 2023.

ZPWMA (ZPWMA 2016) has estimated that the minimum number of lions that occur on approximately 5l,642 km^2 of land where reliable survey data are available is approximately 1,900 (range 1,800 - 2,000). The western portion of the country, consisting primarily of Hwange National Park and the surrounding safari areas, forest areas, communal areas, and private conservancies, supports approximately 737 lions (or 38% of the overall population). The southern portion of the country, dominated by the two major conservancies (SVC and BVC) and Gonarezhou National Park supports approximately 896 lions (48%). These numbers are supported by several studies.

Within Gonarezhou National Park, Groom et al. 2014, used call-up surveys to obtain direct estimates of the lion population and compared actual lion densities with potential density estimates. In this study, while lions were only seen at five percent of calling stations, this equated to a population estimate of 33 lions, which is consistent with spoor survey results conducted in June 2010 (Groom et al. 2014). A 2015 spoor count

survey of Gonarezhou National Park revealed an estimated 125 lions within the park (ZPWMA 2016).

From 2007 to present, annual track index surveys at the SVC have been conducted using a standardized methodology (Groom and Watermeyer 2015, as cited in Du Preez et al. 2016). Prey availability models suggest that the carrying capacity for this lion population is approximately 271 lions (Hayward et al. 2007). In 2015, the estimated population was 284 lions (Du Preez et al. 2016). The Rifa Safari Area was surveyed using camera trapping and spoor counts in 2015, which supported an estimated population of 68 lions. The central and northern portions of the country reportedly support an estimated population of 284 lions (15%). The 12-year (2000-2011) average lion density per 100 km^2 is 2.8 in Hwange National Park, 6.0 for South Eastern Lowveld in the SVC, 9.0 in Malilangwe, and 0.8 in Gonarezhou National Park (ZPWMA Annual Report 2013, as cited in ZPWMA 2014). SVC's website indicates that at SVC, an annual predator spoor count is conducted by the African Wildlife Conservation Fund (AWCF), an independent organization (http://savevalleyconservancy.org/conservation.html#header1-z, accessed August 14, 2019).

According to Riggio et al. 2013 (p. 32), and Bjorklund in Riggio et al 2013 (p. 32), the minimum number of lions that are estimated to constitute a viable population is 500 individuals. Hwange National Park, with an estimated population of 559, is the only area within Zimbabwe that has a viable population as laid out by Riggio et al. 2013. However, the two regions that make up the largest percentage of the country's lion population (Western 38% and Southern 48%) have regional populations of 737 and 896, respectively. The areas within the Central and Northern regions of Zimbabwe, albeit smaller, encompass parks that are part of Transfrontier Conservation Areas, such as the Mana Pools region.

Lion Management in Zimbabwe

In response to discussions surrounding a possible up-listing of lion to Appendix I under CITES at the 13th Meeting of the Conference of the Parties (CoP13), and subsequent workshops involving lion range states, IUCN, ZPWMA, and other key stakeholders held a workshop to develop the *Conservation Strategy and Action Plan for the Lion (Panthera leo) in Zimbabwe* which was published by ZPWMA in 2006. The plan responds to regional and international standards set by Treaties such as CITES and the Convention on Biological Diversity (CBD), among others. The plan states "it will guide the conservation and management of this top predator" which "addresses the needs of th[e] country." The Service is not aware of any additional or updated iterations of the plan since 2006; however, in Zimbabwe's 2016 response, *Enhancement and Non-Detrimental Findings for Panthera leo in Zimbabwe,* ZPWMA provided updates on each of the outputs and respective targets established under the 2006 *Conservation Strategy and Action Plan/or the Lion (Panthera leo) in Zimbabwe* (ZPWMA 2016).

The 2006 plan identifies a vision that "...lions should be conserved and managed sustainably for their aesthetic, cultural, and ecological values, and the socio-economic

development of Zimbabwe." The plan lays out three broad targets to achieve this objective:

- Ensure the persistence of key lion populations and other important populations including those of doubtful viability.
- Human and livestock loss reduced.
- Optimize wildlife conservation-related net benefits to local communities.

All three targets are stepped down to seven specific outputs with their own targets and activities to meet such targets. Although the plan does not identify a time period, some activities do, of which a period of 5 years is the most common. In response to inquiries from the Service, ZPWMA has provided a summary of the progress made to implement the 2006 strategy.

While all three of the broad targets appear to serve a valuable role in lion management in Zimbabwe, three of the specific outputs are most relevant to determining if the implementation of the strategy enhances the propagation or survival of the species, as required by the Act for the issuance of import permits. The first output, "lion populations, their habitats and wild prey effectively conserved and managed in collaboration with local stakeholders" is broken down into a number of targets: establish a baseline survey and monitoring program; maintain and strengthen capacity for lion conservation, management, monitoring and research; identify and implement best management standards and practices for the hunting program; develop and implement co-management frameworks; and expand the geographic distribution range of lions. Baseline surveys have been completed for the Parks Estate using monitoring protocols for key variables (populations, habitats, prey), and selected surveys have been undertaken in areas outside National Parks (ZPWMA 2016).

Carnivore research programs conducted by NGOs and research institutions such as WildCRU are taking place in various parts of the country; in addition, personnel have been trained in data collection and capture, management, and lion aging and analysis. Adaptive age-based criteria for male trophy animals are in place and functioning. The quota for a certain year is determined by a point system based off the hunts from the previous season. Therefore, ZPWMA is actively working toward meeting the target areas for this output.

The second output, "human-lion related conflicts minimized and, where possible, eliminated" has also been broken down into a number of targets: develop and establish databases on lion-human conflicts; identify and implement methods to reduce and mitigate livestock losses and lion attacks on humans; and train and properly staff problem animal control (PAC) units to conduct rapid response and precisely target problem animals. According to information from ZPWMA (2016), approaches to mitigate livestock losses and lion attacks on humans are in the process of being tested and implemented in Hwange, and methods to mitigate lion attacks on livestock are being implemented as appropriate at selected sites (e.g. Tsholotshe). Data on PAC reports for lion-related problems have been collated, and PAC units at ZPWMA field station and/or RDC levels have been partially established. In Matusadona, Hwange, and Gonarezhou regions, specific awareness and education packages on lion conservation and

management have been developed and implemented. The information submitted in the ZPWMA update suggests that they have met one target, and are in the process of implementing the remaining two.

The third output, "the costs and benefits of long-term lion management equitably distributed," is a socio-economic output to establish agreement and implementation of area-specific lion management plans with identified stakeholders in each wildlife region, and implementing a transparent mechanism to equitably distribute lion-related income to identified stakeholders." The specific targets for this output are: complete an inventory of stakeholders directly affected by lion conservation, deliver appropriate training and capacity building to prioritized stakeholders, agree to and implement collaboratively developed area-specific lion management plans with identified stakeholder groups in each wildlife region within 5 years, and implement transparent mechanisms to equitably distribute lion-related/generated income to identified stakeholders (groups and/or communities). Current information from ZPWMA shows that they have identified key stakeholders and assessed the financial impacts of lion conservation and the magnitude of socio-economic impacts on each stakeholder group. Limited training has been undertaken for representative stakeholders in Hwange, Matusadona, and Gonarezhou. ZPWMA has also implemented an adaptive management program across four wildlife regions and is in the progress of developing and implementing area-specific lion management plans with identified stakeholder groups. According to ZPWMA, a Management Plan for Hwange was approved. The Hwange National Park (HNP) Management Plan was updated in 2015 and officially accepted at Zimbabwe's Ministry of Environment level in 2016 (Conservation and Wildlife Fund (CWF) 2018, p. 16). One of the four components of this 10-year plan is implementation of a cooperation plan between the park and park neighbors. The Conservation and Wildlife Fund – Hwange (CWF) is a relatively new model of the private and NGO sectors in and around Hwange National Park (HNP) Zimbabwe, formalizing an alliance of individual members to materially and in-kind assist authorities with conservation work.

The Hwange Lion Research (HLR) which is part of the Wildlife Conservation Research Unit (WILDCRU), Oxford University, UK, with some financial support and collaborative effort from CWF, set up a comparative camera trap survey in May 2018, to establish a baseline of both lion and lion prey identification and densities in contiguous areas with differing management – the exact CWF project area. Although data were only obtained from the 40-day HNP camera grid, combined sources of complimentary data on the lion population in Forest Areas outside the national park suggest that anthropogenic mortality is slowing down, believed to be in part due to CWF's new law enforcement activities (CWF 2018, p. 21).

Zimbabwe's conservation strategy for lions also identifies roles and responsibilities for a number of participants in Zimbabwe's lion conservation efforts. According to the strategy, there is a national lion coordinator that coordinates all national activities on lion conservation, research, and management, including census surveys, setting up monitoring needs, and coordinating data on human-lion conflicts. The strategy identifies roles for the field stations, wardens, ecologists and utilization units, which are responsible for ensuring compliance with hunting regulations and maintaining safari hunting databases. In addition, the strategy identifies roles for CAMPFIRE, safari operators, and

professional hunters to facilitate training and ensure compliance with hunting regulations.

The Conservation Strategy and Action Plan for the Lion in Zimbabwe (ZPWMA 2006) borrows language from the *IUCN Conservation Strategy* (2006). It iterates areas in need of improvement regarding lion conservation in Zimbabwe, including standardized lion census methods and surveys, further mitigating human-lion conflicts, and maximizing benefits for rural communities that live with lions. ZPWMA (2006) notes their intention to review and put in place criteria for age-based identification of male trophy animals, but do not mention if they will be reviewing possible combination strategies. As part of the 2006 lion conservation strategy for eastern and southern Africa, six objectives were established to secure and restore sustainable lion populations, which were housed under the following categories: management, mitigation, socio-economics, policy and land-use, politics, and trade. The strategy was intended to be implemented within 10 years (Macdonald 2016), and Zimbabwe gave an update on progress regarding these objectives in their *Enhancement and Non-Detrimental Findings for Panthera leo in Zimbabwe* (ZPWMA 2016) that also addressed outputs and targets laid out in their 2006 action plan.

Additionally, to mitigate human-lion conflict, the "Long Shields Guardian Programme" was initiated whereby communities are notified of movements of collared lions into their areas via cell phone, and then have the opportunity to take appropriate action, such as moving cattle. In 2013 alone, 1,850 warnings were passed to the "Long Shields." These actions may reduce the incidents of lions marauding livestock; however, retaliatory killing of lions still occur. Further, as is policy under the Parks and Wildlife Act of 2001, any lions that attack humans or livestock will be lethally eliminated (ZPWMA 2016). Between 2007 and 2013 a total of 1,113 conflict incidents were recorded in the Hwange area in which 915 head of stock were lost to lions.

In and around Hwange National Park, data collected between 1999 and 2004 suggested that hunting surrounding the park was having a negative impact on the lion population. As a result, sport hunting of lions was suspended in the area surrounding the park between 2005 and 2009. Following the lifting of the moratorium, and by implementing stricter monitoring and hunting guidelines through the Hwange Lion Research Project, the overall Hwange lion population has continued to show a positive trend, and as of 2015 the population was estimated at over 550 animals (ZPWMA 2015).

<u>Hunting, Management, and Utilization of Lions</u>

In Zimbabwe, much of the trophy hunting occurs in Safari Areas which are managed mainly for the sustainable use and as buffer zones next to National Parks (Jeke et al 2019, p. 2). Trophy hunting of wildlife is legally permitted in safari areas; as of 2014, there were 16 in Zimbabwe (ZPWMA 2014). According to the Forest Act, Chapter 19:05, there are 24 gazetted indigenous forest areas in Zimbabwe; within these forest areas, lions may be hunted in the following forests: Fuller, Kazuma, Pandamasuwe, Ngamo, Sikumi, Gwayi, Sijarira, and Gwampa (ZPWMA 2014).

As of 2016, the minimum number of lions that occur in approximately 51,642 km^2 of land in Zimbabwe, where reliable survey data are available, is estimated to be 1,917 (range 1,800 - 2,000), the majority of which occur in western and southern Zimbabwe. When taking this population estimate into consideration, trophy hunting harvests a yearly mean of 2.7% of adult male lions. This figure decreased since the establishment of age restrictions on lion hunting (ZPWMA 2016).

In 2013, an adaptive quota management system for lion hunting based on the ages of lions hunted was agreed to in Harare, Zimbabwe, during a meeting hosted by ZPWMA and an independent non- governmental conservation organization (Du Preez et al. 2016). After reviewing aging techniques, attendees at the July 2013 meeting in Harare, Zimbabwe were confident that hunters could be expected to categorize lions as being below or above five years of age. In determining quotas for the following years, operators would be rewarded with increased quotas if they hunted animals of six years or older, would not be penalized if they hunted animals five years of age, but would have quotas cut if they hunted animals younger than five years old, or if they failed to complete hunt returns (ZPWMA and Panthera 2014). In 2013, only 28% of lions hunted were five years old or older. In 2015, that figure rose to 77.3% (ZPWMA 2016).

According to Hunter et al. (2013), an adaptive quota management system utilizing age-based criteria would not only aid in the prevention of over-harvesting lions, but would also prevent excessively conservative quotas. Further, according to Miller et al. (2016), results indicate that age-based hunting is feasible for sustainably managing threatened and economically significant species such as the lion, but must be guided by rigorous training, strict monitoring of compliance and error, and conservative quotas. No single trait can be relied upon exclusively to precisely age lions. Rather, multiple traits must be examined in combination to cross-validate an individual's age and, according to Whitman et al. (2004), restricting hunting to individuals that are at least six years old is desirable from a biological perspective due to the reduced risk of the loss of pride males and infanticide of cubs associated with the harvest of such individuals (Whitman et al. 2004).

During 2013, operators were requested to submit hunt returns and photos as a trial run to get the adaptive quota system up and running. In 2014, operators were requested to do the same but were informed that the age of the lions hunted in 2014 would determine their lion quotas in 2015 (Du Preez et al. 2016). In 2015, there was a marked increase in the age of lions hunted in Zimbabwe as a whole. The majority of lions hunted were on the cusp of 5-6 years of age but were not older than six years. National hunting offtakes for lions in Zimbabwe from 2013 to 2015 were 29, 42, and 47 respectively (Masterson 2016). It appears these do not include illegal forms of hunting offtake. In 2011, Zimbabwe's quota was set at 101 lions; in 2014, it was reduced to 50 male lions following the implementation of age restrictions (Henschel 2015, pers. comm., as cited in USFWS 2015).

As described above, CAMPFIRE is the program through which the Government of Zimbabwe has relegated the management of wildlife resources to communal farmers. As of July 2014, there are at least 58 Rural Districts that have been granted the Appropriate Authority status to manage wildlife resources in their areas; however,

according to *Enhancement and Non-Detrimental Findings for Panthera leo in Zimbabwe* ZPWMA 2016, only 16 are actively engaged in some form of wildlife-based land use (ZPWMA 2016). Lions are found in communal areas that are adjacent to major protected areas, and lion hunting is allowed in CAMPFIRE districts (ZPWMA 2014).

In setting adaptive lion quotas, Zimbabwe uses scientific information including spoor surveys, camera traps, and ranger-based sighting. In CAMPFIRE areas, incidences of human-lion conflict are also taken into consideration where survey information is not readily available, when determining quotas for those areas (ZPWMA 2014). The quota-setting process involves all stakeholders, including the ZPWMA, landowners, safari operators, and CAMPFIRE managers and their representatives. During the annual quota-setting workshop, presentations are made by the proponents who then make proposals for quotas. Where it is felt that not enough information has been presented, a precautionary quota will be issued (ZPWMA 2014).

ZPWMA (2016) mentions seven concessions that are leased on five-year terms, and how these concessionaires pay a 5-year "right to lease" fee, annual rental, fixed quota fee (payable if animals are shot or not) and a supplementary quota fee that allows additional animals to be bought as needed. It is unclear to what extent Zimbabwe still utilizes fixed quotas, as Du Preez et al. claims fixed quotas are no longer being used by Zimbabwe, but a fixed quota fee is mentioned in ZPWMA (2016). It is also unclear how many animals concessionaires are able to "buy as needed," and how such requests may be accommodated without going over the national quota (ZPWMA 2016). However, when evaluating the lower quota with higher utilization reported by ZPWMA (2016), and taking into consideration the land area of the Parks Estate alone, Zimbabwe did not exceed the best management practice of 0.5 lions/1,000 km^2; the 2015 off-take would have accounted for 0.125 lions/1,000 km^2.

According to *The Role of Trophy Hunting of Elephant in Support of the Zimbabwe CAMPFIRE Program -December 2016,* a report the Service received in December 2016, the Reserve Bank of Zimbabwe, in collaboration with relevant stakeholders, established the Tourism Receipts Accounting System (TRAS2) that required all outfitters to submit returns listing the revenue generated for hunting activities. This system has been in place for several years, but it required manual analysis of the data to extract information on hunting revenue. In January 2015, to account fully for earnings in the hunting sector, the Reserve Bank of Zimbabwe in collaboration with relevant stakeholders, introduced TRAS, a web-based system that links Safari operators, ZPWMA Authority, taxidermists, shipping agents, International marketing agents, and the Reserve Bank. Under this system, all authorized hunts are registered, allowing for the capture of hunting data, such as the origin of clients, value of trophies and hunts, and area hunted, to monitor hunting quota utilization and track hunted trophies. According to the December 2016 report, the Exchange Control Division of the Reserve Bank of Zimbabwe and the ZPWMA are now able to:

1. Assess regional price differentials of similar hunts and the reasons thereof;
2. Present TRAS2 system updates and reports to the users, including international marketing agents;
3. Engage with international marketing agents of sport hunting;

4. Obtain relevant insights on governing of the hunting sector; and
5. Come up with an effective mechanism to fully account for export proceeds from the hunting sector.

The TRAS2 information provides a breakdown of the source of hunting income, and the amount of funds generated by trophy fees by land category, among other insights, and has demonstrated the TRAS2 system's ability to obtain relevant insights on governing of the hunting sector.

Evaluation

Brandon Trey Morris hunted in the Savé Valley Conservancy (SVC) in southeastern Zimbabwe, reportedly one of the largest private game reserves in Africa (https://savevalleyconservancy.org/). In the early 1900's, the 3,440 km^2 of land that now comprises the SVC was used for cattle ranching, which led to the elimination of most large herbivores and predators, including lions. In the 1990's upon establishment of the SVC, the cattle farms were converted to a wildlife-based land use system and wildlife populations were restored (Pole 1999).

In evaluating whether the importation of Mr. Morris' trophy of *P. l. melanochaita* would be authorized pursuant to 50 CFR 17.40(r) and 50 CFR 17.32(a), in accordance with our threatened species permit issuance criteria, we examined how Zimbabwe's management of lions overall as well as how Savé Valley Conservancy and Mr. Morris himself have contributed to enhancement of wild lions both directly and indirectly by addressing the three main threats that led to the decline of the subspecies: habitat loss, loss of prey base, and human-lion conflict.

Below, we summarize our evaluation with reference to each of the permit issuance criteria at 50 CFR 17.32(a)(2) on the basis of information available to the Service.

17.32(a)(2)(i): Whether the purpose for which the permit is required is adequate to justify removing from the wild or otherwise changing the status of the wildlife sought to be covered by the permit:

Zimbabwe's lion hunting industry generated 9% of all sport-hunting revenue in 2015; 51% was contributed by U.S. hunters during 2010-2015 country-wide, and 90% of the sport-hunting market in the Bubye Valley Conservancy (BVC) and the Savé Valley Conservancy (SVC) from 2005-2015. Even though 9% may not seem like much, lions are a key component of the sport hunting industry, as they are part of the "Big 5" trophies and draw U.S. hunters to Zimbabwe. Without the hunting industry, protected wildlife areas such as BVC and SVC, which have become conservation havens in the threat of human encroachment across much of Zimbabwe, would not be economically viable, and therefore would likely not exist. These wildlife areas not only provide habitat for lions, but also support the lion's prey species. As previously noted, the southern portion Zimbabwe, which is dominated by SVC, BVC, and Gonarezhou National Park, supports approximately 896 lions (48% of the Zimbabwe lion population).

According to Lindsey et al. (2012), hunting operators in the SVC spend USD 546,000 annually on anti-poaching activities and employ 186 permanent game scouts. Hunting revenues are used to support expenses associated with these activities (Du Preez et al. 2016).

The *Strategy and Action Plan* has put into place mechanisms to adequately oversee the harvest of lions in Zimbabwe. With an annual harvest of approximately 85 lions, Zimbabwe is not exceeding the limits identified of 0.5 lions/1,000 sq. km. The objectives of the *Strategy and Action Plan* and the actions and monitoring activities that have been put into place to achieve these objectives should support the adaptive management approach that Zimbabwe has established for managing lions. The Service will continue to monitor the effectiveness of the Strategy and Action Plan, for consideration in future findings.

As described above, we have determined that the government of Zimbabwe and the Savé Valley Conservancy contribute towards positive conservation outcomes by addressing the main threats of habitat loss, human-lion-livestock conflict, and prey depletion, which contributes to improving the status of lions in Zimbabwe. Further, the fees garnered through Mr. Morris' hunt will provide revenue to support these positive conservation outcomes.

Therefore, based on the information available to the Service, the purpose for which the permit is being requested, import of this trophy lion, is adequate to justify removing the sport-hunted trophy lion from the wild or otherwise changing its status.

17.32(a)(2)(ii): The probable direct and indirect effect that issuing the permit would have on the wild populations of the wildlife sought to be covered by the permit:

The total area under wildlife-based land use and conservation in Zimbabwe amounts to 10.7 million hectares and represents 27% of the total surface area of the country. Of this, 7.9 million hectares, or 75% of all conservation land in the country, falls under safari hunting as the primary or only source of revenue. Sport hunting of lions by U.S. hunters such as Mr. Morris supports the programs in Zimbabwe that provide the opportunity for locals to see value in lions, which in turn conserves the species in the long-term.

A scientifically based quota is the number of a given species that can be removed from a specific population without damaging the biological integrity and sustainability of that population (WWF 1997). However, full implementation and enforcement of the age-based strategy could potentially cause the need for quotas to become irrelevant or eliminated (USFWS 2015). Age restrictions will naturally restrict offtake to a limited number of individuals that meet the age criteria (Loveridge *et al.* 2007, Whitman *et al.* 2004).

Based on the information provided to the Service, it is clear that Zimbabwe has made strides in their management of their lion populations. Additionally, Zimbabwe appears to be transparent in its management processes, including its quota setting. In 2013, Zimbabwe proposed an adaptive age-based strategy for setting hunting quotas. This

adaptive quota management system for lion hunting based on the ages of lions hunted has been accepted and embraced by all stakeholders; it has not only led to a reduced national lion hunting quota, but has also resulted in a significant increase in the age of harvested lions to a level that is considered to have a reduced ecological impact (Du Preez et al. 2016).

In 2015, the development of TRAS2 allowed the country to better monitor and govern the hunting sector, including developing an effective mechanism to fully account for export proceeds from the hunting sector. The continued participation of U.S. hunters, including Mr. Morris, in this market is anticipated to continue to maintain the viability of managing areas such as the BVC and SVC in their current form, including their contribution to conservation of lions in the wild. In 2015, lion sport-hunting generated USD 753,000 in revenue, which accounts for about 9% of all sport hunting revenue in Zimbabwe that year (ZPWMA 2016).

After evaluating the information provided by the Zimbabwe government and other sources, it appears that the hunting program in Zimbabwe is addressing the three main threats that were identified by the Service when making the determination that the species was threatened with the possibility of extinction. Moreover, hunting areas such as BVC and SVC are maintaining habitat for lions and ensuring that there is no further loss, provided that the hunting areas can remain economically viable. In order to maintain a viable population of lions, the parks, safari areas, and CAMPFIRE areas must maintain biodiversity and a sustainable prey base. Finally, Zimbabwe is actively working to reduce human-lion conflicts and the number of lions killed in retaliation for killing livestock. Therefore, the management of lions within Zimbabwe and the limited hunting of lions contributes to the on-going survival of the species in Zimbabwe.

The participation of Mr. Morris in the hunting and subsequent import of the trophy lion he harvested in the SVC provides an indirect benefit to wild lion populations by helping to support the reserves where lions are found; Mr. Morris' hunt has generated revenue to help support a hunting area where lions are found and conserved. Therefore, based on the information available to the Service, the probable direct and indirect effect that issuing an import permit for a legally hunted lion would have on the species would be positive.

17.32(a)(2)(iii): Whether the permit, if issued, would in any way, directly or indirectly, conflict with any known program intended to enhance the survival probabilities of the population from which the wildlife sought to be covered by the permit was or would be removed:

As stated above, Zimbabwe is monitoring and controlling the harvest of lions through permitting under their regulations and through the *Strategy and Action Plan*. The issuance of import permits for lions legally hunted under these authorities would not conflict with any programs intended to enhance the survival probability of the species in Zimbabwe. Issuance of a permit authorizing import of Mr. Morris' trophy lion from Zimbabwe would work in favor of, not against, the principal acts governing lion conservation in Zimbabwe. Furthermore, sport

hunting opportunities help local communities realize the value in conserving the African lion.

Therefore, based on the information available to the Service, the issuance of an import permit for a legally hunted lion does not conflict with known conservation programs.

17.32(a)(2)(iv): Whether the purpose for which the permit is required would be likely to reduce the threat of extinction facing the species of wildlife sought to be covered by the permit:

Considering Zimbabwe's limited, controlled off-take of lions in a manner that maintains sustainability, Mr. Morris' legal hunt contributes to reducing the threat of extinction of lions. It appears that the permitting activities under Zimbabwe's laws and CITES, as well as the implementation of the adaptive age-based lion quota, and a continuation of implementation of the outputs in the *Strategy and Action Plan* are working in concert to promote the long-term survival of lions in the wild in Zimbabwe. The use of revenue received from hunters, such as Mr. Morris, to manage the populations on the reserves is an important element of the success of lion management in Zimbabwe. For example, hunting operators in the SVC spend USD 546,000 annually on anti-poaching activities (Lindsey et al. 2012). Therefore, based on the information available to the Service, the issuance of the requested import permit for Mr. Morris' legally hunted lion will likely reduce the threat of extinction facing lions in Zimbabwe.

17.32(a)(2)(v): The opinions or views of scientists or other persons or organizations having expertise concerning the wildlife or other matters germane to the application:

Based on reviewing comments made during the listing process for lions, as well as information obtained through personal conversations and literature, there is general agreement that hunting, done properly and well managed, would not have an adverse effect on lion populations. Numerous researchers have stated that, while they may not support hunting in general, they see that benefits can be received through a scientifically based hunting program for lions.

Based on the information available to the Service, there is general support by scientists and other persons or organizations having expertise concerning lions that the legal and sustainable harvest of lions, and the subsequent import of legally harvested lion trophies, as proposed in this application, would not have an adverse effect on the species and would further efforts to conserve the species in the wild into the future.

17.32(a)(2)(vi): Whether the expertise, facilities, or other resources available to the applicant appear adequate to successfully accomplish the objectives stated in the application:

Mr. Morris submitted a permit application to import a trophy of his personally, legally harvested lion from Zimbabwe for the purpose of enhancing the propagation or survival of the species in the wild. As a sport-hunter, Mr. Morris plays a large role in the hunting industry of Zimbabwe; the hunting and subsequent import of Mr. Morris' trophy lion increases the funds available to the Zimbabwe Government and SVC to implement lion conservation initiatives. Therefore, based on the Service's review of the information available relating to Mr. Morris' permit request, we find that the expertise, facilities, or other resources available to Mr. Morris appear adequate to successfully accomplish the objectives stated in the application.

Conclusion

As described above, the Government of Zimbabwe has been documented to implement the *Strategy and Action Plan* in the manner identified in the documents referenced in making this finding. The on-going adaptive management and limited and sustainable off-take of lions is important to the survival of lions in Zimbabwe, and the funds generated by Mr. Morris' participation contributes to the ongoing benefits the program provides to lions in the wild.

Therefore, based on the Service's consideration and analysis of the information associated with Mr. Morris' permit application and other relevant information available to the Service, as described above, we find that the import of the lion harvested by Mr. Morris on January 06, 2018, from the Savé Valley Conservancy, Zimbabwe, meets the requirements for making a positive enhancement finding pursuant to 50 CFR 17.40(r) and 50 CFR 17.32(a). Therefore, the Service is able to authorize the import of the trophy of one lion taken from the wild in Zimbabwe, to Brandon Trey Morris of Shreveport, Louisiana.

I. **Service Program and Geographic Area or Station Name**: Branch of Permits, Division of Management Authority, International Affairs

II. **Flexible Funding Program** (e.g. Joint Venture, etc.) if applicable: N/A

III. **Location**: 5275 Leesburg Pike, MS: IA, Falls Church, VA 22041-3803

IV. **Species/Critical Habitat**:

Southern and Eastern African lion (*Panthera leo melanochaita*)

Critical Habitat: N/A

V. **Project Description:** Describe proposed project or action or, if referencing other documents, prepare an executive summary (attach additional pages as needed):

As described in the permit application, 01264D, Brandon Trey Morris, has requested a permit to import a trophy of one lion that he lawfully hunted in Zimbabwe. The import is for personal purposes.

VI. **Determination of Effects:**

(A) Description of Effects: Describe the action(s) that may affect the species and critical habitats listed in item IV. Your rationale for the Section 7 determinations made below (B) should be fully described here.

Issuance of the requested import permit by the Branch of Permits will result in the importation of one personally sport-hunted lion that has been lawfully taken in Zimbabwe on the date specified in the permit application.

The trophy will be accompanied by the required CITES export permit issued by the CITES Management Authority of Zimbabwe.

The requestd U.S. Federal Fish and Wildlife import permit does not authorize the killing of an African lion; the authorization to hunt and lawfully take a lion is under the purview of the government of Zimbabwe. Therefore, the proposed action of issuing a Federal Fish and Wildlife import permit for this lawfully hunted lion will not directly or indirectly affect individuals of listed or proposed species or designated/proposed critical habitat of such species.

(B) Determination: Determine the anticipated effects of the proposed project on species and critical habitats listed in item IV. Check all applicable boxes and list the species (or attach a list) associated with each determination**.**

Determination

No Effect: This determination is appropriate when the proposed project will not directly or indirectly affect (neither negatively nor beneficially) individuals of listed/proposed/candidate species or designated/proposed critical habitat of such species. **No concurrence from DSA/ESFO required.** **X**

May Affect but Not Likely to Adversely Affect: This determination is appropriate when the proposed project is likely to cause insignificant, discountable, or wholly beneficial effects to individuals of listed species and/or designated critical habitat. **Concurrence from DSA/ESFO required.** _____

May Affect and Likely to Adversely Affect: This determination is appropriate when the proposed project is likely to adversely impact individuals of listed species and/or designated critical habitat. **Formal consultation with DSA/ESFO required.** _____

May affect but Not Likely to Jeopardize candidate or proposed species/critical habitat: This determination is appropriate when the proposed project may affect, but is not expected to jeopardize the continued existence of a species proposed for listing or a candidate species, or adversely modify an area proposed for designation as critical habitat. **Concurrence from DSA/ESFO optional.** _____

Likely to Jeopardize candidate or proposed species/critical habitat: This determination is appropriate when the proposed project is reasonably expected to jeopardize the continued existence of a species proposed for listing or a candidate species, or adversely modify an area proposed for designation as critical habitat. **Conference with DSA/ESFO required.** _____

IMPORT THROUGH ANY PORT LISTED IN 50 CFR 14.12

Reporting requirements: Not applicable

Authorizations and Conditions:

A. Authorized to import the sport-hunted trophy of one male African lion (*Panthera leo melanochaita*), taken in Zimbabwe for the purpose of enhancement of the survival of the species.

B. Specimen may not be sold or transferred for any financial remuneration.

C. **Trophy must have been taken during the 2018 hunting season.**

D. Trophy must be accompanied by a valid trophy permit or hunting license issued by the government of Zimbabwe for the 2018 season.

E. Trophy must be accompanied by a valid Convention on International Trade in Endangered Species of Wild Fauna and Flora (CITES) Appendix II export permit/re-export certificate, source code "W", issued by the Management Authority of Zimbabwe.

F. General conditions set out in Subpart D of 50 CFR 13, and specific conditions contained in Federal regulations cited above, are hereby made a part of this permit. All activities authorized herein must be carried out in accord with and for the purposes described in the application submitted. Continued validity, or renewal of this permit is subject to complete and timely compliance with all applicable conditions, including the filing of all required information and reports.

G. The validity of this permit is also conditioned upon strict observance of all applicable foreign, state, local, tribal, or other federal law. **This permit can be photocopied.**

H. Valid for use by permittee named above.

I. Acceptance of this permit serves as evidence that the permittee understands and agrees to abide by the "General Permit Conditions" (copy attached).

Type of Activity

IMPORT OF SPORT-HUNTED TROPHIES under Appendix I of the Convention on International Trade in Endangered Species (CITES) and/or U.S. Endangered Species Act (ESA)

Complete Sections A or B, and C, D, and E of this application. U.S. address may be required in Section C, see instructions for details.
Instructions on how to make your application complete and help avoid unnecessary delays are attached.

Section A: Complete if applying as an individual

1.a. Last Name	1.b. First Name	1.c. Middle Name/Initial	1.d. Suffix
Wade	Mark	A	

(b) (6)

Section B: Complete if applying on behalf of a business, corporation, public agency, Tribe, or institution

1.a. Name of business, agency, Tribe, or institution		1.b. Doing business as (DBA)	
2. Tax identification no.		3. Description of business, agency, Tribe, or institution	
4.a. Principal officer Last name	4.b. Principal officer First Name	4.c. Principal officer Middle name/initial	4.d. Suffix
5. Principal officer title	6. Primary contact name		
7.a. Business telephone number	7.b. Alternate telephone number	7.c. Business fax number	7.d. Business e-mail address

Section C: All applicants complete address information

1.a. Physical address (Street address, Apartment #, Suite #, or Room #; no P.O. Boxes)

(b) (6)

1.b. City	1.c. State	1.d. Zip code/Postal code	1.e. County/Province	1.f. Country
Fairbanks	Alaska	99709	Fairbanks N Star Borou	USA

2.a. Mailing address (include if different than physical address, include name of contact person if applicable)

2.b. City	2.c. State	2.d. Zip code/Postal code	2.e. County/Province	2.f. Country

Section D: All applicants MUST complete

1. Attach the **nonrefundable application processing fee** in the form of a check or money order payable to the U.S. FISH AND WILDLIFE SERVICE in the **amount of $100**. Federal, Tribal, State, and local government agencies, and those acting on behalf of such agencies, are exempt from the processing fee--attach documentation of fee exempt status as outlined in instructions [50 CFR 13.11(d)].
2. Certification: I hereby certify that I have read and am familiar with the regulations contained in ***Title 50 Part 13 of the Code of Federal Regulations*** and the other ***applicable parts in subchapter B of Chapter I of Title 50***, and I certify that the information submitted in this application for a permit is complete and accurate to the best of my knowledge and belief. I understand that any false statement herein may subject me to the criminal penalties of 18 U.S.C. 1001.

E. IMPORT OF SPORT-HUNTED TROPHIES *(Appendix I of CITES and/or ESA)*

Note 1: This form should be used to request authorization to import trophies of species listed on Appendix I of CITES and/or as threatened or endangered under the ESA (examples include elephants, lions, cheetahs, wood bison, and markhor).

PLEASE USE FORM 3-200-19 FOR SOUTHERN AFRICAN LEOPARD TROPHIES AND SOUTHERN WHITE RHINOCEROS TROPHIES TAKEN IN NAMIBIA.

Note 2: If you hold an import permit for trophy/trophies that you did not use, please **return the unused original permit.** If you are requesting reissuance of a permit because you have taken a trophy, but were unable to import it prior to the expiration of the permit, please use the renewal form (3-200-52) and return your original permit with that form.

Note 3: Applications for species listed as endangered under the U.S. Endangered Species Act are published in the Federal Register for a 30-day public comment period. Please allow at least **90 days** for the application to be processed.

Note 4: *Sport-hunted trophy* is defined at 50 CFR 23.74 as follows: *Sport-hunted trophy* means a whole dead animal or a readily recognizable part or derivative of an animal specifically identified on the accompanying CITES document that meets the following criteria:

- Is raw, processed, or manufactured;
- Was legally obtained by the hunter through hunting for his or her personal use;
- Is being imported, exported, or re-exported by or on behalf of the hunter as part of the transfer from its country of origin ultimately to the hunter's country of usual residence; and
- Includes worked, manufactured, or handicraft items made from the sport-hunted animal only when:
  - i. Such items are contained in the same shipment as raw or tanned parts of the sport-hunted animal and are for the personal use of the hunter;
  - ii. The quantity of such items is no more than could reasonably be expected given the number of animals taken by the hunter as shown on the license or other documentation of the authorized hunt accompanying the shipment; and
  - iii. The accompanying CITES documents (export document and, if appropriate, import permit) contain a complete itemization and description of all items included in the shipment.

Note 5: Certain hunting trophies, including elephants, are subject to restrictions on their use after import into the United States. Please see 50 CFR 23.55 for more information or contact the Division of Management Authority.

Please provide the following information. Complete all questions on the application. Mark questions that are not applicable with "N/A". If needed, use a separate sheet of paper. On all attachments or separate sheets you are submitting; please indicate the application question number you are addressing. If applying for more than one trophy, be sure to answer questions 1-6 for each trophy addressed in this application. If importing trophies from more than one country, you must submit a separate application for each shipment in order to obtain separate import permits.

1. Name and address where you wish the permit to be mailed, if different from page 1. If you would like expedited shipping, please enclose a self-addressed, pre-paid, computer-generated, courier service airway bill. If unspecified, all documents will be mailed via the U.S. Postal Service.

Mark Wade
(b) (6)
Fairbanks, Alaska 99709

2. Who should we contact if we have questions about the application (name, phone number, and e-mail)?

Mark Wade
(b) (6)
Fairbanks, Alaska (b) (6)

3. Have you or your client (if a broker applying on behalf of your client), been assessed a civil penalty or convicted of any criminal provision of any statute or regulation relating to the activity for which the application is filed; been convicted, or entered a plea of guilty or nolo contendere, for a felony violation of the Lacey Act, the Migratory Bird Treaty Act, or the Bald and Golden Eagle Protection Act; forfeited collateral; OR are currently under charges for any violation of the laws mentioned above?

☒ No ☐ Yes

If you answered "Yes" to Question 3, provide: a) the individual's name; b) date of charge; c) charge(s); d) location of incident; e) court, and f) action taken for each violation. Please be aware that a "Yes" response does not automatically disqualify you from getting a permit.

4. For each trophy to be imported, provide:

a. Scientific name (genus, species, and, if applicable, subspecies) and common name.

Panthera Leo / African Lion

b. Sex (if known). Male

5. **IF ANIMAL IS CURRENTLY LIVING IN THE WILD**, please enter the following information:

a. Country and place (area, region, GIS coordinates, ranch, conservancy, management area, or hunting block, AND nearest city) where wildlife is to be taken from the wild:

N/A

b. Date wildlife is to be hunted:

N/A

c. Name of hunting outfitter, safari company, or professional hunter you will be hunting with:

N/A

6. IF THE TROPHY HAS ALREADY BEEN TAKEN, please enter the following:

a. Country and place (area, region, GIS coordinates, ranch, conservancy, management area, or hunting block, AND nearest city) where trophy was removed from the wild:

Zimbabwe / Masvingo Province
Area / Save Valley Conservancy , Msaise Ranch
Nearest City / Masvingo GIS VC 810719
GIS VC 810719

b. Date wildlife was hunted:

23 June 2018

c. Name of hunting outfitter, safari company, or professional hunter you hunted with:

DesFountain & Jones Safaris Pvt/Ltd
PH Dale DesFountain PH licence number 90

d. The current location of the trophy (address and country) [the U.S. import permit will identify this country as the country of export/re-export and must match with the export/re-export document]:

Harare / Zimbabwe

7. Please provide a copy of any applicable foreign government permits or licenses that were required to remove this animal from the wild (if you have not hunted yet and do not currently hold any such permits or licenses, please indicate so).

8. Complete name and address of overseas person or business shipping the trophy to you. If you are applying to import a trophy directly from Namibia, you must provide the name and address of the professional hunter listed on your Namibian hunting permit [this name will appear on the face of the export permit].

Name:	Lyn Duncan
Business Name:	LD Forwarding Co. Ltd
Address:	P.O.Box GD 467 , Greendale
City:	Harare
State/Province:	Zimbabwe
Country, Postal Code:	

9. For species listed under the Endangered Species Act, please be aware that the U.S. Fish and Wildlife Service must make a finding that your activities will enhance or benefit wild populations of the species involved. While we will communicate with the range country for the species you will hunt or hunted when making the required findings, if you have any information that could support this finding, it would be helpful to our review if you could provide it. Please submit such information on a separate page with your application.

a. Do you have any information regarding the population status or trend data on the species hunted?

Populations are in Excess of carrying capacities, Wildebeest , Zebra and Eland numbers are depleting because of the booming lion populations. Please see attached page

b. In order to hunt, you likely paid for licenses or trophy fees. What were those fees and do you have any information on how those funds were used by either the landowner, community, or government?

Please see attached page. I have no information how specifically the funds were used.

c. Do you have information on other funding activities that are being carried out, or were carried out, by the safari outfitter, professional hunter, concession holder, or land owner that provide a conservation benefit to the species being hunted/species hunted

A team of 38 permanent Game Scouts are employed to curb poaching. Several community projects are being funded by the safari operator, with focus on school support and education teaching wildlife management and conservation. There are also agricultural projects going on to help add a source of employment income to families. See attached.

CERTIFICATION STATEMENT (original signature must be provided for either 10 or 11 below)

10. If you are a broker or taxidermist applying on behalf of a U.S. hunter or foreign national, provide documentation to show you have a Power of Attorney to act on your client's behalf and sign the following statement.

I acknowledge that the sport-hunted trophy/trophies to be imported has been/will be personally hunted by my client and is being imported only for my client's personal use (i.e., not for sale, transfer, donation, or exchange that is reasonably likely to result in economic use, gain, or benefit). If applying for the import of a leopard trophy, I understand that my client may only import two leopard trophies in one calendar year.

Taxidermist/Broker's signature: _____ Date: _____

11. If you are the hunter applying to import your own trophy, please read and sign the following statement.

I acknowledge that the sport-hunted trophy/trophies to be imported has been/will be personally hunted by me and is being imported only for my personal use (i.e., not for sale, transfer, donation, or exchange that is reasonably likely to result in economic use, gain, or benefit). If applying to import a leopard trophy, I understand that I may only import two leopard tro[redacted]year.

Applicant's signature: _____ Date: 8/3/2018

Be aware that there may be additional permitting or approval requirements by your local or state governments, as well as required by other Federal agencies or foreign government to conduct your propose activity. While the Service will attempt to assist where possible, it is your responsibility to obtain such approval.

12. All international shipment(s) must be through a designated port. A list of designated ports (where an inspector is posted) is available from **the list of designated ports**. If you wish to use a port not listed, please contact the Office of Law Enforcement for a Designated Port Exemption Permit (form 3-200-2).

Re: Question 9 on Federal Fish and Wildlife Permit Application Form

I hunted African lion with Desfountain Safaris from June 20 to June 24 in the Save Valley Conservancy in the Msaise Ranch of the Masvingo Province. During that time, we saw several lions including many mature male lions. Indeed, in my opinion, that area had too many lions as we saw tracks everywhere it seemed. I harvested a 9-10 year old male lion on June 23, 2018. We saw several mature male lions during this hunt.

Every night we heard lions roaring near our camp coming from several different directions, and they had a female lion living in the area coming into the skinning area at night looking for food. In the time we were there, we did not see this female lion come into camp, but we saw photos. But we did see lions while driving around, and tracks were seen around several waterholes frequently. As the outfitter used motion detector cameras to monitor the animals, we frequently saw pictures of groups of females and several males in both groups and alone. According to Mr. DesFountain, their wildebeest, eland, and zebra populations are in decline because he feels an over-population of lions. Based on my observations, I would agree. There clearly was a lion presence in this area.

My fee for this hunt was $45,000. A portion of this fee went to the Save Valley Conservancy Fund, as well as taxes for the Zimbabwe government. You would have to contact Mr. Desfountain about the specifics of how much the Conservancy Fund receives for this type hunt.

In terms of other activities for conservation, this outfitter pays considerable monies to operate an anti-poaching program to prevent illegal taking of game. We often encountered men walking the roads who were making routine checks for poachers or illegal activities. We delivered food to the outer camps where the rangers stayed, as well as brought working radios to them to insure communications. Snares were found periodically as we walked through the brush, and of course these snares were destroyed. The area is flown frequently with an airplane and drones to take game counts and monitor animal movements. They employ 38 full time anti-poaching scouts walking the perimeter and areas.

All in all, I was very impressed in how this operation worked with the local population as well as spending considerable resources to protect their wild game and prevent poaching. Fundings for school education on wildlife conservancy and support for local farms to provide employment to the people in that area appeared ongoing.

Another regular activity we observed was to insure water pumps from the Save River were operating as we often stopped to turn off and turn on water pumps into the water holes to guarantee water was available to the local game. These activities, although time consuming, supported both the predators and other species of a viable and valuable water resource. This outfitter had several dozen water pumps, solar pumps, and miles of pipeline to support and repair to maintain this operation.

My impression is that with the activities we witnessed, this particular area of Zimbabwe is doing quite well in protecting and supporting the wildlife there, and recognizes that resources and time are required to sustain and conserve the great wild species of animals we saw. As they continue to monitor the

animal populations subject to lion predation, a possible increase in permits may be required in the future.

Please feel free to contact me for any further information or help you might need to gather facts concerning the lion populations in this region of Zimbabwe.

Many thanks.

[EXTERNAL] CITES application

1 message

Mark Wade (b) (6) Mon, May 13, 2019 at 4:30 PM
To: anna_barry@fws.gov

Ms. Barry,

I left a voicemail message on your phone. I put in an application for a CITES permit almost a year ago, and have yet to hear back in any way. No confirmation of receipt or status report. I called your office today, and was told my permit number was 02727D.

Could you provide me with some feedback on my application if possible. I was under the impression that I was able to qualify for a CITES permit, and as of yet, it has been almost a year since submitting my application and I have had no word on the status.

Thank you for your time

Dear Mr. Wade,

The following is in response to your phone call yesterday and your e-mail message below.

As background, on March 1, 2018, in response to a recent D.C. Circuit Court opinion, the U.S. Fish and Wildlife Service (Service) informed the public that it is revising its procedure for assessing applications to import certain sport-hunted species like the African lion. We have withdrawn our countrywide enhancement findings for a range of species across several countries, including elephants and lions. In their place, we intend to make findings for trophy imports on an application-by application basis.

The Service is continuing to monitor the status and management of these species in their range countries. We review each application received for the import of sport-hunted African lion and evaluate the information provided in the application as well as other information available to us regarding the status and management of the species to ensure that the hunting program is promoting the conservation of the species. Each application must also meet all other applicable permitting requirements before it may be authorized. Therefore, your application is pending at this time.

Sincerely,

Anna Barry

Barry, Anna <anna_barry@fws.gov> Tue, May 14, 2019 at 2:29 PM
To: Mark Wade (b) (6)
Cc: "Brisendine, Amy" <amy_brisendine@fws.gov>

Dear Mr. Wade,

Whenever an application is received in our office and place in our system an acknowledgement letter is generated, which is then e-mailed to the applicant. This letter provides the date the application was received in our office, the PRT #, and the check/money order information. I will request that one of my co-workers forward it to you before the end of the day.

In regards to receiving an update, I will request the person assigned to your application to contact you when the application is submitted for review and signature to their supervisor.

Sincerely,

Anna Barry

> Dear Mr. Wade,

The following is in response to your phone call yesterday and your e-mail message below.

As background, on March 1, 2018, in response to a recent D.C. Circuit Court opinion, the U.S. Fish and Wildlife Service (Service) informed the public that it is revising its procedure for assessing applications to import certain sport-hunted species like the African lion. We have withdrawn our countrywide enhancement findings for a range of species across several countries, including elephants and lions. In their place, we intend to make findings for trophy imports on an application-by application basis.

The Service is continuing to monitor the status and management of these species in their range countries. We review each application received for the import of sport-hunted African lion and evaluate the information provided in the application as well as other information available to us regarding the status and management of the species to ensure that the hunting program is promoting the conservation of the species. Each application must also meet all other applicable permitting requirements before it may be authorized. Therefore, your application is pending at this time.

Sincerely,

Anna Barry

FAIRBANKS, AK 99709
U.S.A.

Dear Applicant,

Thank you for submitting an application (Form 3-200) to the U.S. Fish and Wildlife Service. The application you submitted was received by the Division of Management Authority on 08/14/2018; check number 240324 accompanied the application for AFRICAN LION. (If you are exempt from the processing fee, the above will be blank.) Your application has been assigned the following PRT number (identification number): **US02727D/9 and we are beginning the review process.

When can I expect to receive my permit? It is the U.S. Fish and Wildlife Service's goal to provide the quickest processing time possible. While processing time may be less, you should anticipate a minimum of 30 days to process your request, with many requests averaging between 60 and 90 days to process.

Why does it take so long? Many statutory and procedural requirements must be considered when reviewing an application requesting a permit, including in some case requirement to publish the receipt of applications in the Federal Register and/or the review by other Service offices. Once a staff member has an opportunity to completely review your application, you may be contacted if further information is required. If complete answers were provided for all relevant questions on the application form, it may not be necessary to contact you before making a final decision on your application.

Can I contact you? While we are aware that you may want to inquire about the status of your application, we request that you allow our office at least three weeks after the receipt of this letter to make any inquiries. This letter confirms we have your application and will begin processing it as quickly as possible. Our office processes over 6,000 applications and responds to over 200,000 telephone calls and e- mails annually. We need time to review your application to ensure it is processed as quickly as possible.

What if I need to give you more information? If you have specific information that needs to be provided so that we can successfully complete the processing of your application, please feel free to mail (address above) or fax (703-358-2281) the additional information to our office. Please include your PRT number, name, and daytime telephone number on all correspondence. If it is necessary to call our office (800-358-2104), please speak to the staff member on duty for the day. Any information you provide will be passed on to the staff member assigned to your file. If the assigned staff member needs further information, they will contact you.

Again, thank you for your application and your patience.

Enhancement Finding

Applicant: Mark A. Wade (PRT–02727D)

Introduction

Mark A. Wade submitted an application on August 14, 2018, for the importation of one male lion *(Panthera leo melanochaita)* taken on June 23, 2018, from the Savé Valley Conservancy (SVC), Msaise Ranch, Masvingo Province, Zimbabwe, for the purpose of enhancing the propagation or survival of the species in the wild. After evaluating the available information submitted with the application, information provided by the Government of Zimbabwe, other information available to the U.S. Fish & Wildlife Service (Service), and comments received from interested parties, the Service has determined that the importation of the sport-hunted trophy meets the requirements for making a positive enhancement finding pursuant to 50 CFR 17.40(r) and 50 CFR 17.32(a). The rationale for our finding follows.

U.S. Permit Requirements for Import of Lions (*Panthera leo melanochaita*)

ESA

The African lion, subspecies *Panthera leo melanochaita* (southern and eastern Africa), is a threatened species under the U.S. Endangered Species Act (ESA or Act) and is regulated under a species-specific 4(d) rule, 50 C.F.R. § 17.40(r) that provides specific conservation measures for this subspecies. Under the 4(d) rule for *P. l. melanochaita*, all of the prohibitions at 50 C.F.R. § 17.21 and 50 C.F.R. § 17.31 apply to *P. l. melanochaita* specimens. These prohibitions, in part, make it illegal for any person subject to the jurisdiction of the United States to import or export any lion specimens.

Although import of the lion subspecies *P. l. melanochaita* is a prohibited activity under the Act, exceptions may be made in accordance with the 4(d) rule at 50 C.F.R. § 17.40(r) when

the import activity qualifies for and the Service issues an ESA threatened-species enhancement permit under 50 C.F.R. § 17.32(a). The preamble to the 4(d) rulemaking, 80 Fed. Reg. 79999, 80043-46 (Dec. 23, 2015), explains the factors the Service considers when making an enhancement finding for importation of sport-hunted trophies of *P. l. melanochaita*, as described below.

Our threatened species permitting regulations at 50 CFR 17.32 provide issuance criteria for threatened species permits (50 CFR 17.32(a)(2)), but do not specify what would constitute the enhancement of propagation or survival with regard to authorizing the import of parts or products of *P. l. melanochaita,* including sport-hunted trophies. Therefore, when making a determination of whether an otherwise prohibited activity enhances the propagation or survival of *P. l. melanochaita,* the Service will examine the overall conservation and management of the subspecies in the country where the specimen originated and whether that management of the subspecies addresses the threats to the subspecies (*i.e.,* that it is based on sound scientific principles and that the management program is actively addressing the current and longer term threats to the subspecies). In that review, we will evaluate whether the import contributes to the overall conservation of the species by considering whether the biological, social, and economic aspects of a program from which the specimen was obtained provide a net benefit to the subspecies and its ecosystem.

The Service will evaluate any application received that involves *P. l. melanochaita* in the context of enhancement of propagation or survival permitting in accordance with our threatened species permitting regulations at 50 CFR 17.32 and issuance criteria for threatened species permits (50 CFR 17.32(a)(2)). These include, in addition to the general permitting criteria in 50 CFR 13.21(b):

(i) Whether the purpose for which the permit is required is adequate to justify removing from the wild or otherwise changing the status of the wildlife sought to be covered by the permit;
(ii) The probable direct and indirect effect that issuing the permit would have on the wild populations of the wildlife sought to be covered by the permit;
(iii) Whether the permit, if issued, would in any way, directly or indirectly, conflict with any known program intended to enhance the survival probabilities of the population from which the wildlife sought to be covered by the permit was or would be removed;
(iv) Whether the purpose for which the permit is required would be likely to reduce the threat of extinction facing the species of wildlife sought to be covered by the permit;
(v) The opinions or views of scientists or other persons or organizations having expertise concerning the wildlife or other matters germane to the application; and
(vi) Whether the expertise, facilities, or other resources available to the applicant appear adequate to successfully accomplish the objectives stated in the application.

In addition to these factors, particularly in relation to sport hunting, we find the *IUCN Species Survival Commission (SSC) Guiding Principles on Trophy Hunting as a Tool for Creating Conservation Incentives, Ver. 1.0* (IUCN SSC 2012), to provide useful principles, which, considered in conjunction with our threatened species issuance criteria, will aid the Service when making an enhancement finding for importation of sport-hunted trophies of *P. l. melanochaita.* This document sets out guidance from experts in the field on the use of trophy hunting as a tool for "creating incentives for the conservation of species and their habitats and for the equitable sharing of the benefits of use of natural resources" (IUCN SSC

2012, p. 2) and recognizes that recreational hunting, particularly trophy hunting, can contribute to biodiversity conservation and more specifically, the conservation of the hunted species.

The SSC document lays out five guiding principles that, considered in conjunction with our threatened species issuance criteria, will aid the Service when making an enhancement finding for importation of sport-hunted trophies of *P. l. melanochaita:*

(a) *Biological sustainability:* The hunting program cannot contribute to the long-term decline of the hunted species. It should not alter natural selection and ecological function of the hunted species or any other species that share the habitat. The program should not inadvertently facilitate poaching or illegal trade in wildlife by acting as a cover for such illegal activities. The hunting program should also not manipulate the ecosystem or its component elements in a way that alters the native biodiversity.
(b) *Net Conservation Benefit:* The biologically sustainable hunting program should be based on laws, regulations, and scientifically based quotas, established with local input, that are transparent and periodically reviewed. The program should produce income, employment, and other benefits to create incentives for reducing the pressure on the target species. The program should create benefits for local residents to co-exist with the target species and other species. It is also imperative that the program is part of a legally recognized governance system that supports conservation.
(c) *Socio-Economic-Cultural Benefit:* A well-managed hunting program can serve as a conservation tool when it respects the local cultural values and practices. It should be accepted by most members of the community, involving and benefiting local residents in an equitable manner. The program should also adopt business practices that promote long-term economic sustainability.
(d) *Adaptive Management: Planning, Monitoring, and Reporting:* Hunting can enhance the species when it is based on appropriate resource assessments and monitoring (*e.g.,* population counts, trend data), upon which specific science-based quotas and hunting programs can be established. Resource assessments should be objective, well documented, and use the best science available. Adaptive management of quotas and programs based on the results of resource assessments and monitoring is essential. The program should monitor hunting activities to ensure that quotas and sex/age restrictions of harvested animals are met. The program should also generate reliable documentation of its biological sustainability and conservation benefits.
(e) *Accountable and Effective Governance:* A biologically sustainable trophy-hunting program should be subject to a governance structure that clearly allocates management responsibilities. The program should account for revenues in a transparent manner and distribute net revenues to conservation and community beneficiaries according to properly agreed decisions. All necessary steps to eliminate corruption should be taken and to ensure compliance with all relevant national and international requirements and regulations by relevant bodies such as administrators, regulators and hunters.

The Service's approach to enhancement findings for the importation of sport-hunted trophies of *P. l. melanochaita* is consistent with the purpose and intent of the Endangered Species Act. Before we will authorize the importation of a sport-hunted trophy, we must determine that the trophy hunting program is managed to ensure the long-term survival of the species. In many parts of the world, wildlife exists outside of protected areas and must share the same habitat

and compete with humans living in these areas for space and resources. If communities that share these resources with wildlife do not perceive any benefits from the presence of wildlife, they may be less willing to tolerate the wildlife. However, under certain circumstances, trophy hunting can address this problem by making wildlife more valuable to the local communities and encourage community support for managing and conserving the hunted species, as well as other species.

When evaluating whether the importation of a trophy of *P. l. melanochaita* would be authorized pursuant to 50 CFR 17.32, in accordance with our threatened species issuance criteria, we will examine how a country's management program for lions addresses the three main threats that have led to the decline of the subspecies: Habitat loss, loss of prey base, and human-lion conflict. When examining a management program and whether trophies taken as part of that program meet the issuance criteria, we would study a number of factors. Some of the factors we would consider include whether the program is based on sound scientific information and identifies mechanisms that would arrest the loss of habitat or increase available habitat (*i.e.,* by establishing protected areas and ensuring adequate protection from human encroachment). We would consider whether the management program actively address the loss of the lion's prey base by addressing poaching or unsustainable offtake within the country. A component of a management plan from which trophy imports would meet the issuance criteria would be whether there are government incentives in place that encourage habitat protection by private landowners and communities and incentives to local communities to reduce the incursion of livestock into protected areas or to actively manage livestock to reduce conflicts with lions. We would examine if the hunting component of the management program supports all of these efforts by looking at whether hunting concessions/tracts are managed to ensure the long-term survival of the lion, its prey base, and habitat. As stated previously, hunting can generate significant economic benefits if properly conducted. In looking at whether we would be able to authorize the import of a trophy under the issuance criteria of 50 CFR 17.32, we would examine if the trophy hunting provides financial assistance to the wildlife department to carry out elements of the management program and if there is a compensation scheme or other incentives to benefit local communities that may be impacted by lion predation. We would also consider how a U.S. hunter's participation in the hunting program contributes to the overall management of lions within a country.

Management programs for *P. l. melanochaita* would be expected to address, but are not limited to, evaluating population levels and trends; the biological needs of the species; quotas; management practices; legal protection; local community involvement; and use of hunting fees for conservation. In evaluating these factors, we will work closely with the range countries and interested parties to obtain the information. By allowing entry into the United States of *P. l. melanochaita* trophies from range countries that have science-based management programs, we anticipate that other range countries would be encouraged to adopt and financially support the sustainable management of lions that benefits both the species and local communities. In addition to addressing the biological needs of the subspecies, a scientifically based management program would provide economic incentives for local communities to protect and expand *P. l. melanochaita* habitat.

As stated, under this 4(d) rule any person wishing to conduct an otherwise prohibited activity, including all imports of *P. l. melanochaita* specimens, must first obtain a permit under 50

CFR 17.32. As with all permit applications submitted under 50 CFR 17.32, the individual requesting authorization to import a sport-hunted trophy of *P. l. melanochaita* bears the burden of providing information in their application showing that the activity meets the requirements for issuance criteria under 50 CFR 17.32. In some cases for imports, such as sport-hunted trophies, it is not always possible for the applicant to provide all of the necessary information needed by the Service to make a positive determination under the Act to authorize the activity. For the import of sport-hunted trophies of *P. l. melanochaita,* the Service will typically consult with the range country to the extent practicable and other interested parties to obtain necessary information.

The Service has the discretion to make the required findings on sport-hunted trophy imports of *P. l. melanochaita* on a country-wide basis, although individual import permits will be evaluated and issued or denied for each applicant. While the Service may make enhancement findings for sport-hunted trophy imports of *P. l. melanochaita* on a country-wide basis, the Service encourages the submission of information from individual applicants. We would rely on the information available to the Service and may rely on information from sources other than the applicant when making a permitting decision.

CITES

The African lion is also included in Appendix II of the Convention on International Trade in Endangered Species of Wild Fauna and Flora (CITES). It is unlawful for any person subject to the jurisdiction of the United States to engage in international trade in CITES specimens contrary to the provisions of the Convention, the ESA, or our CITES implementing regulations in 50 CFR part 23. 16 U.S.C. § 1538(c)(1), (g); 50 C.F.R. § 23.13. As required by CITES, export of a specimen of an Appendix II species to another country requires prior issuance of a CITES permit. Under CITES, importation of an Appendix II species does not require issuance of an import permit from the importing country. Consequently, the United States is not required to issue a CITES permit in order for U.S. hunters to import their sport-hunted lions. In compliance with CITES, the United States does require CITES imports to meet all CITES requirements, including that the imported lion trophies be accompanied by the required CITES export permits issued by the exporting countries, *see* 50 C.F.R. §§ 23.20; 23.23; 23.24; 23.26; 23.27, and including requirements for sport-hunted trophies at 50 C.F.R. § 23.74.

Individual Permit Adjudication Considerations

When the African lion listing under the ESA became effective, January 22, 2016, the Service began issuing enhancement findings for *P. l. melanochaita* on a countrywide basis, as had been the practice for a number of other threatened sport-hunted species. On March 1, 2018, however, in response to a D.C. Circuit Court opinion (*Safari Club Int'l v. Zinke*, 878 F.3d 316 (D.C. Cir. 2017)), the Service withdrew its countrywide enhancement findings for a range of species, including lions, across several countries, and began assessing applications to import sport-hunted trophies of these species on an application-by-application basis. These withdrawals were upheld in a D.C. Circuit Court opinion (*Friends of Animals v. Bernhardt*, No. 19-5147 (D.C. Cir. June 16, 2020); *Center for Biological Diversity v. Bernhardt*, No. 19-5152 (D.C. Cir. June 16, 2020)). No countrywide ESA enhancement findings are currently in effect. Therefore, since March 1, 2018, the Service has been making

ESA enhancement findings for the import of sport-hunted trophies of lions on an application-by-application basis, ensuring consistent application of the regulatory criteria across all permit application adjudications and ensuring that each permit decision is based on the best scientific and management information available.

Although the Service makes the required enhancement findings on sport-hunted trophy imports of *P. l. melanochaita* on an individual application basis, information obtained for the range country as a whole is also considered, as it is pertinent to the Service's evaluation. In addition to considering national-level species management, we also consider species management and contributions to species enhancement on a smaller-scale (e.g., at the regional or hunting management unit scale such as at the hunting operator, community conservancy, concessionaire, reserve, or ranch-level scale). In addition, we consider how the hunter's personal involvement in the hunting experience directly or indirectly contributes to enhancement of the species in the wild. In its enhancement evaluation, the Service, therefore, considers efforts made by the hunting management unit and/or individual hunter to directly or indirectly address the threats posed to lions in the wild together with other information available concerning the overall management and population status of the lion in the range country at the time of the hunt.

In making ESA enhancement findings, we review all relevant information available to us, including information submitted with the individual permit applications, information received in response to inquiries we make of the range countries, and all other reliable information we receive from interested parties, such as species experts, hunting organizations, hunting operators, community groups, and non-governmental organizations. We evaluate and consider all relevant information obtained or submitted to the Service on an ongoing basis as it relates to permit applications received for import of sport-hunted trophies of *P. l. melanochaita*.

The Service considers information at these different levels in order to assess:

1) How the range country government manages the hunted species and how hunting serves to enhance the survival of the species in the wild in the context of the management system;
2) How hunting serves to enhance the survival of the species in the wild in the context of the management unit at the hunting operator, concessionaire, community conservancy, reserve, or ranch level; and
3) How the individual hunter has contributed (where the hunt has already taken place) or will contribute (where the hunt has not yet taken place) to enhancement of survival of that species through their hunting activities and contributions to the survival of the species in the wild associated to the hunt and subsequent import.

Government-Level Factors Considered

- Enforcement of wildlife laws and regulations, particularly with regard to the range country's ability to implement wildlife regulations developed for the hunted species
- Implementation of a scientifically-based management plan that addresses the major threats to the species and provides economic incentives for local communities to conserve the species
- Investment of hunting fees into conservation, including whether the range country has standard processes and infrastructure in place to ensure an effective transfer of hunting revenues back into the country's management of the species and community benefits
- Management of human-lion conflict, including whether the range country has a compensation scheme or other incentives to local communities to reduce the incursion of livestock into protected areas or to actively manage livestock to reduce conflicts with lions
- Management of the lion's prey base by addressing poaching or unsustainable offtake of the lion's prey species
- Management of lion hunting areas through a system that ensures the long-term survival of the lion, its prey base, and habitat
- Protection of lion habitat through establishment of protected areas, ensuring adequate protection from human encroachment and providing incentives that encourage habitat protection by private landowners and communities
- Establishment and use of science-based quotas, a sex and age-based harvest system, and a monitoring program for the lion and its prey species

Hunting Management Unit-Level Factors Considered

- Monitoring populations of the hunted species and their prey-base
- Protecting and/or increasing the prey-base for lions in the wild
- Maximizing biodiversity of the lion's prey species
- Protecting and improving the habitat for lions in the wild to ensure maintenance of ecosystem functions and biodiversity (e.g., creating water holes, habitat management, etc.)
- Engaging in anti-poaching activities for lion and their prey base
- Managing human-lion conflict
- Investing in community benefits and employment, where such investments provide incentives for conservation of lions in the wild
- Complying with harvest laws and regulations
- Re-investing hunting fees or other contributions associated to lion hunting to a fund that supports conservation of lions in the wild

Hunter-Level Factors Considered

- Complying with harvest laws and regulations
- Paying hunting/import-related fees or other contributions associated to lion hunting that are re-invested to support conservation of lions in the wild (e.g., funding habitat protection for lions in the wild, protection of the lion's prey base, or mitigation of human-lion conflict)
- Participating in a hunting program with an operator that supports sustainable use of the species

This application-by-application permit review process offers an opportunity to incentivize hunting in concessions, conservancies, reserves, or ranches that support conservation of the species through rigorous anti-poaching programs, local wildlife monitoring activities, and compliance with government rules and regulations. By complying with our enhancement requirements, a hunter's personal import will help conserve lion populations in the wild by supporting the local communities where they hunt and promoting conservation of these species and their habitats by providing protection incentives to communities that live alongside these species.

Basis for Finding

On February 1, 2016, the Service sent a letter to the Parks and Wildlife Management Authority in Zimbabwe (ZPWMA) with a list of questions related to management plans, population status, conservation, management, hunting policies, and regulations of Zimbabwe's lion populations. Additionally in the letter, the Service referenced the IUCN SSC Guiding Principles on Trophy Hunting as a Tool for Creating Conservation Incentives Ver. 1.0 (09 August 2012), as it provides useful principles which, when considered in conjunction with the Service's permit issuance criteria, would aid when making the required enhancement findings for permitting importation of sport-hunted lion trophies.

On February 16, 2016, the Service sent a second request to ZPWMA for specific documents related to the conservation status of lions in Zimbabwe. ZPWMA responded to the Service's request on February 17, 2016, with a copy of *Conservation Status of African Lion in Zimbabwe,* and subsequently, on November 29, 2016, provided a copy of its *Enhancement and Non-detriment Finding for Lion (Panthera leo) in Zimbabwe.* The Service has also been corresponding with ZPWMA regarding African elephant management for several years. In this correspondence, ZPWMA, as well as other sources, have provided the Service with documents and information that are relevant to our evaluation of lions in Zimbabwe.

Since 2016, the Service has met with officials from Zimbabwe multiple times to receive updated information on the status of and management of lions in Zimbabwe with respect to imports of sport-hunted lion trophies. For example, Service representatives met with Zimbabwe officials in January 2018 at the annual Safari Club International convention in Las Vegas, and November 2018 at the African Wildlife Consultative Forum in Uganda. In September 2018, Zimbabwe officials provided to the Service the May 2017 Zimbabwe National CAMPFIRE Stakeholder's Review and the Zimbabwe Parks and Wildlife Management Authority Strategic Plan, 2019-2023. In addition, in September 2018 the Service received a letter dated 6 December 2017 from Hon. E.D. Mnangagwa, President of the Republic of Zimbabwe, addressed to President Donald Trump, addressing the

change of administration in Zimbabwe. In this letter Hon. E.D. Mnangagwa provided assurance to the United States that Zimbabwe is politically stable and that Zimbabwe's previous conservation initiatives would be enhanced, with the previous Minister, Permanent Secretary, and Director General confirmed to remain in place.

This information provided by the Zimbabwe authorities (including verbal updates and presentations at the 16th Annual African Wildlife Consultative Forum (Uganda, November 2018), along with the Service's final rule on the lion listing under the Act and other relevant information from reliable sources, are the basis of this finding.

Governance of Lions in Zimbabwe

The legal framework for Zimbabwe's regulatory mechanism is informed by its Wildlife Policy (1992), which is intended to maintain a protected area network for the conservation of the nation's wild resources and biological diversity. The Wildlife Policy (1992) provides for the Government of Zimbabwe to maintain a network of protected areas known as the Parks and Wild Life Estate, comprised of the country's National Parks, safari areas, botanical gardens, and sanctuary and recreational areas for the conservation of the nation's wild resources and biological diversity (CITES 2016; ZPWMA 2016). The framework is intended to create economic activity to enhance rural development and encourages the conservation of wild animals and their habitats outside the protected areas.

ZPWMA was established by the Parks and Wildlife Act of 1996 (Chapter 20:14) [as amended by Act Number 19 of 2001] which came into operation on June 1, 2002, through Statutory Instrument 144C of 2002. The Act provides for the establishment of a Parks and Wildlife Board; establishment of national parks, botanical reserves, botanical gardens, sanctuaries, safari areas and recreational parks; and the preservation, conservation, propagation or control of wildlife, fish, and plants of Zimbabwe and the protection of Zimbabwe's natural landscape and scenery. This Act includes sections on virtually every aspect of ZPWMA, including requirements for annual financial audits and reporting to the central government. The Act also provides for substantial penalties for the unlawful possession of or trading in protected wildlife species. In addition, the General Laws Amendment Act (No. 5) of 2010 provides for mandatory imprisonment for poaching.

The Parks and Wildlife Act, Chapter 20:14, devolved authority to manage and benefit from wildlife on communal and private lands to the landholders. In 1982, the legal provisions of this Act were extended to Rural District Councils (RDCs), on behalf of rural communities in communal lands whose areas contain viable populations of wildlife. Communal areas in Zimbabwe are administered by RDCs which have become a mechanism for implementation of the government's policy of conservation by utilization of natural resources. The Act enables local communities to manage and benefit from wildlife resources through the Communal Areas Management Programme for Indigenous Resources (CAMPFIRE) established in 1989.

CAMPFIRE was developed to encourage reduction in human-wildlife conflicts through conservation-based community development and to provide an economic incentive to

improve community tolerance of wildlife, including lions. At the time, the CAMPFIRE program was the model for community-based conservation efforts in several other African countries and was identified as an innovative program. Under a community-based conservation program, like CAMPFIRE, rural communities should benefit from revenue generated by sport-hunting.

As Zimbabwe's premiere wildlife agency, the main functions of the ZPWMA are to control, manage, and maintain Zimbabwe's wildlife resources with the primary role of protecting and conserving Zimbabwe's natural heritage for present and future generations on behalf of the country. It also provides the cornerstone of Zimbabwe's tourism industry (ZPWMA 2015). The rationale behind the establishment of the ZPWMA was to allow for a self-funding mechanism, and thereby reduce its dependence on the national treasury. In January 1996, the Government of Zimbabwe approved the establishment of the Parks and Wild Life Conservation Fund that provides for financing wildlife operations directly from revenues generated through wildlife-related activities. The funding for ZPWMA is therefore coming from revenue generated through sport hunting conducted on state and private lands, concession leases, National Park visitor fees, and other wildlife-related fees. While there have been requests by ZPWMA for funding from the central treasury in the past, to our knowledge, no other significant government funding has been provided, and only limited outside funding from non-governmental organizations (NGOs) or other governments appears to be available.

A major component of ZPWMA mandate is law enforcement. Poaching mainly occurs along the boundaries of protected areas where lions are incidentally snared as non-target prey. Between 2013 and 2015, 21 lions were killed illegally, with six animals killed through snaring in the area adjacent to Hwange National Park in 2015; poverty stands as the major driver of illegal hunting (ZPWMA 2016). If anyone is found in possession of poached specimens, they must pay a fine of USD 5,000 or face a mandatory jail sentence. If convicted of lion poaching, courts could require the payment of a compensation fee of USD 20,000 (ZPWMA 2014). Hunting operators are obligated through their concession lease agreements to assist with anti-poaching efforts (ZPWMA 2016). Reportedly, USD 590,000 was spent on anti-poaching efforts by the Bubye Valley Conservancy (BVC) alone during 2015 (K. Leathern, pers. comm., as cited in Du Preez et al. 2016), and USD 546,000 is spent annually on anti-poaching by the Savé Valley Conservancy (SVC) (Lindsey et al. 2012); these expenses are mainly covered by sport-hunting revenue (Du Preez et al. 2016). In 2002, ZPWMA had 2,146 rangers at its establishment (ZPWMA 2016); however, by the end 2015, there were 1,448 rangers in post (67% of 2002 level). Of the 1,448 rangers in post, 1,004 are deployable for anti-poaching operations (ZPWMA 2016).

Safari operators in Zimbabwe are required to be registered and licensed by the Zimbabwe Tourism Authority (https://www.soaz.net/index.php/2, accessed August 16, 2019). Operators must hold a lease or agreement on a suitable concession with an approved quota of animals. They are responsible for the official paperwork and permits connected to the hunt. Hunting operators are required by law to provide the services of a Zimbabwe Licensed Professional Hunter to accompany foreign hunters in Zimbabwe. Licensing is undertaken by the National Parks & Wildlife Authority.

Zimbabwe is a member of the Southern African Development Community (SADC). Under the SADC Treaty, Article 5(g) establishes objectives to, among other aspects, promote the sustainable use of wildlife, harmonize legal instruments governing wildlife use and conservation, promote the conservation of shared wildlife resources through the establishment of trans-frontier conservation areas (TFCA), and facilitate community-based natural resources management practices. To implement the SADC Treaty, member states are required to establish management programs for the conservation and sustainable use of wildlife.

Currently Zimbabwe is pursuing six TFCA initiatives at various stages of development. These are: Great Limpopo Transfrontier Park (GLTP) / Great Limpopo Transfrontier Conservation Area (GLTFCA); Chimanimani TFCA; Greater Mapungubwe TFCA; Kavango-Zambezi (KAZA) TFCA; Lower Zambezi-Mana Pools LZMP (TFCA) and Zimbabwe-Mozambique-Zambia (ZIMOZA) TFCA (Mandisodza-Chikerema 2018, p. 34).

Through TFCAs, wildlife management entities are linking many of the major protected areas by removing boundary fences along national borders that separate many reserves in addition to creating or improving corridors to link good-quality habitat for wildlife (Newmark 2008). The principle of ecological and migratory connectivity lies at the heart of the TFCA initiative linking large protected areas across international boundaries and providing space for wildlife populations.

Another provision of the SADC Treaty is that member states are required to establish management programs for the conservation and sustainable use of wildlife. Zimbabwe has met this criterion for African lions through the development of its 2006 *Conservation Strategy and Action Plan/or the Lion (Panthera leo) in Zimbabwe* (ZPWMA), which is still in use.

As previously mentioned, Zimbabwe is also a Party to CITES, and the African lion species is included in Appendix II of the Convention. As an Appendix-II species, certain criteria must be met before the CITES Management Authority of the country of export may issue an export permit, including a finding from the exporting country's CITES Scientific Authority that the proposed activity will not be detrimental to the survival of the species in the wild (non-detriment finding; NDF) and a finding from the CITES Management Authority that the specimens proposed for export were legally acquired (legal acquisition finding).

The ZPWMA has provided the Service with a copy of its standing CITES non-detriment finding (NDF), dated October 2016, for the export of African lion specimens. The NDF explains that lion populations in Zimbabwe are being managed sustainably for the benefit of the species and that Zimbabwe's management program for lion provides economic incentives for local communities to protect and expand lion habitats. The NDF document provides information to support the following:

- The Zimbabwe hunting industry is based on sound scientific information, provides mechanisms to arrest habitat loss, or where feasible increase habitat, and provides protection from human encroachment.

- Government incentives are in place to encourage habitat protection by private landowners and communities.
- Government Incentives are provided to local communities to reduce human-wildlife conflicts.
- Hunting concessions are managed to ensure the long-term survival of the African lion and its habitat.
- Trophy hunting provides financial assistance to the ZPWMA, the communal CAMPFIRE program, and private landowners to implement wildlife management programs.
- Local communities directly and indirectly benefit from the presence of lion in their areas.
- Participation of U.S. hunters in the Zimbabwe hunting industry contributes to the overall conservation and management of lions in Zimbabwe (ZPWMA 2016).

Lion Status in Zimbabwe

When the Service listed the subspecies of lion in southern and eastern Africa (*P. l. melanochaita*) as threatened under the Act (80 FR 79999), three primary threats to the species throughout its range were identified: loss of habitat, loss of prey base, and human-lion conflict. While human population growth clearly has an impact due to loss of available habitat for lions, increasing human population has a direct impact on prey base. Prey availability affects the reproduction, recruitment, and foraging behavior of lions and, as a result, strongly influences lion movements, abundance, and population viability (Winterbach *et al.* 2012, as cited in USFWS 2015). Lion densities are directly dependent on prey biomass (Hayward *et al.* 2007). Outside of protected areas, the lion's prey base is much reduced (Du Preez et al. 2016); inadequate management and law enforcement have led to poaching of the lion's prey base for bushmeat, which has been critically depleted (USFWS 2015). Population trends across eastern and southern Africa show that most prey species have declined in recent years; and for Zimbabwe, droughts have been a critical factor (ZPWMA 2016).

A reduced prey base results in a relatively greater chance of lions encountering livestock (Du Preez et al. 2016). While actual losses of livestock to predators may be relatively low, the perceived financial cost to farmers can be high, and lions are persecuted intensely in livestock areas as a consequence. Their scavenging behavior makes them particularly vulnerable to the practice of lacing prey carcasses with poison to eliminate predators (CITES 2016). Co-existence of lions and people is promoted through giving value to lions, such as through tourism and hunting in CAMPFIRE areas (ZPWMA 2014). The threat to lions from habitat loss is especially present in Sebungwe and the South East Low Veld where the fragmented nature of the protected areas is compounded by increasing human and livestock populations surrounding these areas (ZPWMA 2016).

According to the Service's CoPl7 *Consideration of Proposals for Amendment of Appendices I and II,* international trade in lion products is emerging as an additional threat; however, the relative extent to which this threat has contributed to lion population declines is difficult to evaluate accurately (CITES 2016). According to ZPWMA (2016), the illegal local and international trade in lions and their products poses an insignificant risk to the

species in Zimbabwe, as there are no records of people found in possession of illegally acquired lion specimens in Zimbabwe. It is not clear what level of legal trade of lion products, if any, occurs within Zimbabwe.

The bulk of Zimbabwe's wildlife occurs within the Parks Estate which includes 11 national parks, 16 safari areas, 16 recreational parks, 6 sanctuaries, 12 botanical reserves and 3 botanical gardens, all spread across the country (Parks and Wildlife Act 2001 Chapter 20:14). Wildlife populations also occur on the state Forest Areas, Communal CAMPFIRE areas, and private conservancies dedicated to wildlife-based land use. There are approximately 319,317 km^2 of land where some form of wildlife-based land use is practiced in Zimbabwe (ZPWMA 2016). Lions occur permanently in 45% of this available range (circa 145,000 km^2) with the majority occurring in national parks (96%) and safari areas (92%). Lions also occur permanently in 47% of the State forest areas and 66% of privately owned conservancies. The CAMPFIRE areas comprise approximately 247,000 km^2 and lions occur in 36% of these areas. Lions are transient in CAMPFIRE, conservancy, and resettled areas adjacent to the major protected areas, and lions move across the border into Zambia, Mozambique, South Africa, and Botswana.

Zimbabwe's main lion range includes the Hwange-Matetsi Ecosystem, Mid Zambezi Valley, Sebungwe, and South East Lowveld. The lion population estimates in Zimbabwe are determined primarily through carnivore spoor surveys, systematic lion collaring, and call-up surveys. According to ZPWMA's *Conservation Status of the African lion (Panthera leo) in Zimbabwe* July 2014 report, starting in 2015, lion spoor surveys were to be done at two-year intervals in all wildlife areas, and lion call-up surveys were to be done every three years in all major lion areas (ZPWMA 2014). Although the Service has not received confirmation that these surveys have been conducted since 2015, in September 2018, the Service received Zimbabwe's Parks and Wildlife Management Authority's Strategic Plan for 2019-2023, which indicates that Zimbabwe is actively working to improve the monitoring and management of their wildlife species. In their updated strategic plan, signed in December 2018, they indicated that one of their strategic objectives is protection of wildlife resources. Their identified timeline is to update and implement key species management plans (lion is identified as one of these) by December 2023.

ZPWMA (ZPWMA 2016) has estimated that the minimum number of lions that occur on approximately 5l,642 km^2 of land where reliable survey data are available is approximately 1,900 (range 1,800 - 2,000). The western portion of the country, consisting primarily of Hwange National Park and the surrounding safari areas, forest areas, communal areas, and private conservancies, supports approximately 737 lions (or 38% of the overall population). The southern portion of the country, dominated by the two major conservancies (SVC and BVC) and Gonarezhou National Park supports approximately 896 lions (48%). These numbers are supported by several studies.

Within Gonarezhou National Park, Groom et al. 2014, used call-up surveys to obtain direct estimates of the lion population and compared actual lion densities with potential density estimates. In this study, while lions were only seen at five percent of calling stations, this equated to a population estimate of 33 lions, which is consistent with spoor survey results conducted in June 2010 (Groom et al. 2014). A 2015 spoor count

survey of Gonarezhou National Park revealed an estimated 125 lions within the park (ZPWMA 2016).

From 2007 to present, annual track index surveys at the SVC have been conducted using a standardized methodology (Groom and Watermeyer 2015, as cited in Du Preez et al. 2016). Prey availability models suggest that the carrying capacity for this lion population is approximately 271 lions (Hayward et al. 2007). In 2015, the estimated population was 284 lions (Du Preez et al. 2016). The Rifa Safari Area was surveyed using camera trapping and spoor counts in 2015, which supported an estimated population of 68 lions. The central and northern portions of the country reportedly support an estimated population of 284 lions (15%). The 12-year (2000-2011) average lion density per 100 km^2 is 2.8 in Hwange National Park, 6.0 for South Eastern Lowveld in the SVC, 9.0 in Malilangwe, and 0.8 in Gonarezhou National Park (ZPWMA Annual Report 2013, as cited in ZPWMA 2014). SVC's website indicates that at SVC, an annual predator spoor count is conducted by the African Wildlife Conservation Fund (AWCF), an independent organization (http://savevalleyconservancy.org/conservation.html#header1-z, accessed August 14, 2019).

According to Riggio et al. 2013 (p. 32), and Bjorklund in Riggio et al 2013 (p. 32), the minimum number of lions that are estimated to constitute a viable population is 500 individuals. Hwange National Park, with an estimated population of 559, is the only area within Zimbabwe that has a viable population as laid out by Riggio et al. 2013. However, the two regions that make up the largest percentage of the country's lion population (Western 38% and Southern 48%) have regional populations of 737 and 896, respectively. The areas within the Central and Northern regions of Zimbabwe, albeit smaller, encompass parks that are part of Transfrontier Conservation Areas, such as the Mana Pools region.

Lion Management in Zimbabwe

In response to discussions surrounding a possible up-listing of lion to Appendix I under CITES at the 13th Meeting of the Conference of the Parties (CoP13), and subsequent workshops involving lion range states, IUCN, ZPWMA, and other key stakeholders held a workshop to develop the *Conservation Strategy and Action Plan for the Lion (Panthera leo) in Zimbabwe* which was published by ZPWMA in 2006. The plan responds to regional and international standards set by Treaties such as CITES and the Convention on Biological Diversity (CBD), among others. The plan states "it will guide the conservation and management of this top predator" which "addresses the needs of th[e] country." The Service is not aware of any additional or updated iterations of the plan since 2006; however, in Zimbabwe's 2016 response, *Enhancement and Non-Detrimental Findings for Panthera leo in Zimbabwe,* ZPWMA provided updates on each of the outputs and respective targets established under the 2006 *Conservation Strategy and Action Plan/or the Lion (Panthera leo) in Zimbabwe* (ZPWMA 2016).

The 2006 plan identifies a vision that "...lions should be conserved and managed sustainably for their aesthetic, cultural, and ecological values, and the socio-economic

development of Zimbabwe." The plan lays out three broad targets to achieve this objective:

- Ensure the persistence of key lion populations and other important populations including those of doubtful viability.
- Human and livestock loss reduced.
- Optimize wildlife conservation-related net benefits to local communities.

All three targets are stepped down to seven specific outputs with their own targets and activities to meet such targets. Although the plan does not identify a time period, some activities do, of which a period of 5 years is the most common. In response to inquiries from the Service, ZPWMA has provided a summary of the progress made to implement the 2006 strategy.

While all three of the broad targets appear to serve a valuable role in lion management in Zimbabwe, three of the specific outputs are most relevant to determining if the implementation of the strategy enhances the propagation or survival of the species, as required by the Act for the issuance of import permits. The first output, "lion populations, their habitats and wild prey effectively conserved and managed in collaboration with local stakeholders" is broken down into a number of targets: establish a baseline survey and monitoring program; maintain and strengthen capacity for lion conservation, management, monitoring and research; identify and implement best management standards and practices for the hunting program; develop and implement co-management frameworks; and expand the geographic distribution range of lions. Baseline surveys have been completed for the Parks Estate using monitoring protocols for key variables (populations, habitats, prey), and selected surveys have been undertaken in areas outside National Parks (ZPWMA 2016).

Carnivore research programs conducted by NGOs and research institutions such as WildCRU are taking place in various parts of the country; in addition, personnel have been trained in data collection and capture, management, and lion aging and analysis. Adaptive age-based criteria for male trophy animals are in place and functioning. The quota for a certain year is determined by a point system based off the hunts from the previous season. Therefore, ZPWMA is actively working toward meeting the target areas for this output.

The second output, "human-lion related conflicts minimized and, where possible, eliminated" has also been broken down into a number of targets: develop and establish databases on lion-human conflicts; identify and implement methods to reduce and mitigate livestock losses and lion attacks on humans; and train and properly staff problem animal control (PAC) units to conduct rapid response and precisely target problem animals. According to information from ZPWMA (2016), approaches to mitigate livestock losses and lion attacks on humans are in the process of being tested and implemented in Hwange, and methods to mitigate lion attacks on livestock are being implemented as appropriate at selected sites (e.g. Tsholotshe). Data on PAC reports for lion-related problems have been collated, and PAC units at ZPWMA field station and/or RDC levels have been partially established. In Matusadona, Hwange, and Gonarezhou regions, specific awareness and education packages on lion conservation and

management have been developed and implemented. The information submitted in the ZPWMA update suggests that they have met one target, and are in the process of implementing the remaining two.

The third output, "the costs and benefits of long-term lion management equitably distributed," is a socio-economic output to establish agreement and implementation of area-specific lion management plans with identified stakeholders in each wildlife region, and implementing a transparent mechanism to equitably distribute lion-related income to identified stakeholders." The specific targets for this output are: complete an inventory of stakeholders directly affected by lion conservation, deliver appropriate training and capacity building to prioritized stakeholders, agree to and implement collaboratively developed area-specific lion management plans with identified stakeholder groups in each wildlife region within 5 years, and implement transparent mechanisms to equitably distribute lion-related/generated income to identified stakeholders (groups and/or communities). Current information from ZPWMA shows that they have identified key stakeholders and assessed the financial impacts of lion conservation and the magnitude of socio-economic impacts on each stakeholder group. Limited training has been undertaken for representative stakeholders in Hwange, Matusadona, and Gonarezhou. ZPWMA has also implemented an adaptive management program across four wildlife regions and is in the progress of developing and implementing area-specific lion management plans with identified stakeholder groups. According to ZPWMA, a Management Plan for Hwange was approved. The Hwange National Park (HNP) Management Plan was updated in 2015 and officially accepted at Zimbabwe's Ministry of Environment level in 2016 (Conservation and Wildlife Fund (CWF) 2018, p. 16). One of the four components of this 10-year plan is implementation of a cooperation plan between the park and park neighbors. The Conservation and Wildlife Fund – Hwange (CWF) is a relatively new model of the private and NGO sectors in and around Hwange National Park (HNP) Zimbabwe, formalizing an alliance of individual members to materially and in-kind assist authorities with conservation work.

The Hwange Lion Research (HLR) which is part of the Wildlife Conservation Research Unit (WILDCRU), Oxford University, UK, with some financial support and collaborative effort from CWF, set up a comparative camera trap survey in May 2018, to establish a baseline of both lion and lion prey identification and densities in contiguous areas with differing management – the exact CWF project area. Although data were only obtained from the 40-day HNP camera grid, combined sources of complimentary data on the lion population in Forest Areas outside the national park suggest that anthropogenic mortality is slowing down, believed to be in part due to CWF's new law enforcement activities (CWF 2018, p. 21).

Zimbabwe's conservation strategy for lions also identifies roles and responsibilities for a number of participants in Zimbabwe's lion conservation efforts. According to the strategy, there is a national lion coordinator that coordinates all national activities on lion conservation, research, and management, including census surveys, setting up monitoring needs, and coordinating data on human-lion conflicts. The strategy identifies roles for the field stations, wardens, ecologists and utilization units, which are responsible for ensuring compliance with hunting regulations and maintaining safari hunting databases. In addition, the strategy identifies roles for CAMPFIRE, safari operators, and

professional hunters to facilitate training and ensure compliance with hunting regulations.

The Conservation Strategy and Action Plan for the Lion in Zimbabwe (ZPWMA 2006) borrows language from the *IUCN Conservation Strategy* (2006). It iterates areas in need of improvement regarding lion conservation in Zimbabwe, including standardized lion census methods and surveys, further mitigating human-lion conflicts, and maximizing benefits for rural communities that live with lions. ZPWMA (2006) notes their intention to review and put in place criteria for age-based identification of male trophy animals, but do not mention if they will be reviewing possible combination strategies. As part of the 2006 lion conservation strategy for eastern and southern Africa, six objectives were established to secure and restore sustainable lion populations, which were housed under the following categories: management, mitigation, socio-economics, policy and land-use, politics, and trade. The strategy was intended to be implemented within 10 years (Macdonald 2016), and Zimbabwe gave an update on progress regarding these objectives in their *Enhancement and Non-Detrimental Findings for Panthera leo in Zimbabwe* (ZPWMA 2016) that also addressed outputs and targets laid out in their 2006 action plan.

Additionally, to mitigate human-lion conflict, the "Long Shields Guardian Programme" was initiated whereby communities are notified of movements of collared lions into their areas via cell phone, and then have the opportunity to take appropriate action, such as moving cattle. In 2013 alone, 1,850 warnings were passed to the "Long Shields." These actions may reduce the incidents of lions marauding livestock; however, retaliatory killing of lions still occur. Further, as is policy under the Parks and Wildlife Act of 2001, any lions that attack humans or livestock will be lethally eliminated (ZPWMA 2016). Between 2007 and 2013 a total of 1,113 conflict incidents were recorded in the Hwange area in which 915 head of stock were lost to lions.

In and around Hwange National Park, data collected between 1999 and 2004 suggested that hunting surrounding the park was having a negative impact on the lion population. As a result, sport hunting of lions was suspended in the area surrounding the park between 2005 and 2009. Following the lifting of the moratorium, and by implementing stricter monitoring and hunting guidelines through the Hwange Lion Research Project, the overall Hwange lion population has continued to show a positive trend, and as of 2015 the population was estimated at over 550 animals (ZPWMA 2015).

<u>Hunting, Management, and Utilization of Lions</u>

In Zimbabwe, much of the trophy hunting occurs in Safari Areas which are managed mainly for the sustainable use and as buffer zones next to National Parks (Jeke et al 2019, p. 2). Trophy hunting of wildlife is legally permitted in safari areas; as of 2014, there were 16 in Zimbabwe (ZPWMA 2014). According to the Forest Act, Chapter 19:05, there are 24 gazetted indigenous forest areas in Zimbabwe; within these forest areas, lions may be hunted in the following forests: Fuller, Kazuma, Pandamasuwe, Ngamo, Sikumi, Gwayi, Sijarira, and Gwampa (ZPWMA 2014).

As of 2016, the minimum number of lions that occur in approximately 51,642 km^2 of land in Zimbabwe, where reliable survey data are available, is estimated to be 1,917 (range 1,800 - 2,000), the majority of which occur in western and southern Zimbabwe. When taking this population estimate into consideration, trophy hunting harvests a yearly mean of 2.7% of adult male lions. This figure decreased since the establishment of age restrictions on lion hunting (ZPWMA 2016).

In 2013, an adaptive quota management system for lion hunting based on the ages of lions hunted was agreed to in Harare, Zimbabwe, during a meeting hosted by ZPWMA and an independent non- governmental conservation organization (Du Preez et al. 2016). After reviewing aging techniques, attendees at the July 2013 meeting in Harare, Zimbabwe were confident that hunters could be expected to categorize lions as being below or above five years of age. In determining quotas for the following years, operators would be rewarded with increased quotas if they hunted animals of six years or older, would not be penalized if they hunted animals five years of age, but would have quotas cut if they hunted animals younger than five years old, or if they failed to complete hunt returns (ZPWMA and Panthera 2014). In 2013, only 28% of lions hunted were five years old or older. In 2015, that figure rose to 77.3% (ZPWMA 2016).

According to Hunter et al. (2013), an adaptive quota management system utilizing age-based criteria would not only aid in the prevention of over-harvesting lions, but would also prevent excessively conservative quotas. Further, according to Miller et al. (2016), results indicate that age-based hunting is feasible for sustainably managing threatened and economically significant species such as the lion, but must be guided by rigorous training, strict monitoring of compliance and error, and conservative quotas. No single trait can be relied upon exclusively to precisely age lions. Rather, multiple traits must be examined in combination to cross-validate an individual's age and, according to Whitman et al. (2004), restricting hunting to individuals that are at least six years old is desirable from a biological perspective due to the reduced risk of the loss of pride males and infanticide of cubs associated with the harvest of such individuals (Whitman et al. 2004).

During 2013, operators were requested to submit hunt returns and photos as a trial run to get the adaptive quota system up and running. In 2014, operators were requested to do the same but were informed that the age of the lions hunted in 2014 would determine their lion quotas in 2015 (Du Preez et al. 2016). In 2015, there was a marked increase in the age of lions hunted in Zimbabwe as a whole. The majority of lions hunted were on the cusp of 5-6 years of age but were not older than six years. National hunting offtakes for lions in Zimbabwe from 2013 to 2015 were 29, 42, and 47 respectively (Masterson 2016). It appears these do not include illegal forms of hunting offtake. In 2011, Zimbabwe's quota was set at 101 lions; in 2014, it was reduced to 50 male lions following the implementation of age restrictions (Henschel 2015, pers. comm., as cited in USFWS 2015).

As described above, CAMPFIRE is the program through which the Government of Zimbabwe has relegated the management of wildlife resources to communal farmers. As of July 2014, there are at least 58 Rural Districts that have been granted the Appropriate Authority status to manage wildlife resources in their areas; however,

according to *Enhancement and Non-Detrimental Findings for Panthera leo in Zimbabwe* ZPWMA 2016, only 16 are actively engaged in some form of wildlife-based land use (ZPWMA 2016). Lions are found in communal areas that are adjacent to major protected areas, and lion hunting is allowed in CAMPFIRE districts (ZPWMA 2014).

In setting adaptive lion quotas, Zimbabwe uses scientific information including spoor surveys, camera traps, and ranger-based sighting. In CAMPFIRE areas, incidences of human-lion conflict are also taken into consideration where survey information is not readily available, when determining quotas for those areas (ZPWMA 2014). The quota-setting process involves all stakeholders, including the ZPWMA, landowners, safari operators, and CAMPFIRE managers and their representatives. During the annual quota-setting workshop, presentations are made by the proponents who then make proposals for quotas. Where it is felt that not enough information has been presented, a precautionary quota will be issued (ZPWMA 2014).

ZPWMA (2016) mentions seven concessions that are leased on five-year terms, and how these concessionaires pay a 5-year "right to lease" fee, annual rental, fixed quota fee (payable if animals are shot or not) and a supplementary quota fee that allows additional animals to be bought as needed. It is unclear to what extent Zimbabwe still utilizes fixed quotas, as Du Preez et al. claims fixed quotas are no longer being used by Zimbabwe, but a fixed quota fee is mentioned in ZPWMA (2016). It is also unclear how many animals concessionaires are able to "buy as needed," and how such requests may be accommodated without going over the national quota (ZPWMA 2016). However, when evaluating the lower quota with higher utilization reported by ZPWMA (2016), and taking into consideration the land area of the Parks Estate alone, Zimbabwe did not exceed the best management practice of 0.5 lions/1,000 km^2; the 2015 off-take would have accounted for 0.125 lions/1,000 km^2.

According to *The Role of Trophy Hunting of Elephant in Support of the Zimbabwe CAMPFIRE Program -December 2016,* a report the Service received in December 2016, the Reserve Bank of Zimbabwe, in collaboration with relevant stakeholders, established the Tourism Receipts Accounting System (TRAS2) that required all outfitters to submit returns listing the revenue generated for hunting activities. This system has been in place for several years, but it required manual analysis of the data to extract information on hunting revenue. In January 2015, to account fully for earnings in the hunting sector, the Reserve Bank of Zimbabwe in collaboration with relevant stakeholders, introduced TRAS, a web-based system that links Safari operators, ZPWMA Authority, taxidermists, shipping agents, International marketing agents, and the Reserve Bank. Under this system, all authorized hunts are registered, allowing for the capture of hunting data, such as the origin of clients, value of trophies and hunts, and area hunted, to monitor hunting quota utilization and track hunted trophies. According to the December 2016 report, the Exchange Control Division of the Reserve Bank of Zimbabwe and the ZPWMA are now able to:

1. Assess regional price differentials of similar hunts and the reasons thereof;
2. Present TRAS2 system updates and reports to the users, including international marketing agents;
3. Engage with international marketing agents of sport hunting;

4. Obtain relevant insights on governing of the hunting sector; and
5. Come up with an effective mechanism to fully account for export proceeds from the hunting sector.

The TRAS2 information provides a breakdown of the source of hunting income, and the amount of funds generated by trophy fees by land category, among other insights, and has demonstrated the TRAS2 system's ability to obtain relevant insights on governing of the hunting sector.

Evaluation

Mark A. Wade hunted in the Savé Valley Conservancy (SVC) in southeastern Zimbabwe, reportedly one of the largest private game reserves in Africa (https://savevalleyconservancy.org/). In the early 1900's, the 3,440 km^2 of land that now comprises the SVC was used for cattle ranching, which led to the elimination of most large herbivores and predators, including lions. In the 1990's upon establishment of the SVC, the cattle farms were converted to a wildlife-based land use system and wildlife populations were restored (Pole 1999).

In evaluating whether the importation of Mr. Wade's trophy of *P. l. melanochaita* would be authorized pursuant to 50 CFR 17.40(r) and 50 CFR 17.32(a), in accordance with our threatened species permit issuance criteria, we examined how Zimbabwe's management of lions overall as well as how Savé Valley Conservancy and Mr. Wade himself have contributed to enhancement of wild lions both directly and indirectly by addressing the three main threats that led to the decline of the subspecies: habitat loss, loss of prey base, and human-lion conflict.

Below, we summarize our evaluation with reference to each of the permit issuance criteria at 50 CFR 17.32(a)(2) on the basis of information available to the Service.

17.32(a)(2)(i): Whether the purpose for which the permit is required is adequate to justify removing from the wild or otherwise changing the status of the wildlife sought to be covered by the permit:

Zimbabwe's lion hunting industry generated 9% of all sport-hunting revenue in 2015; 51% was contributed by U.S. hunters during 2010-2015 country-wide, and 90% of the sport-hunting market in the Bubye Valley Conservancy (BVC) and the Savé Valley Conservancy (SVC) from 2005-2015. Even though 9% may not seem like much, lions are a key component of the sport hunting industry, as they are part of the "Big 5" trophies and draw U.S. hunters to Zimbabwe. Without the hunting industry, protected wildlife areas such as BVC and SVC, which have become conservation havens in the threat of human encroachment across much of Zimbabwe, would not be economically viable, and therefore would likely not exist. These wildlife areas not only provide habitat for lions, but also support the lion's prey species. As previously noted, the southern portion Zimbabwe, which is dominated by SVC, BVC, and Gonarezhou National Park, supports approximately 896 lions (48% of the Zimbabwe lion population).

According to Lindsey et al. (2012), hunting operators in the SVC spend USD 546,000 annually on anti-poaching activities and employ 186 permanent game scouts. Hunting revenues are used to support expenses associated with these activities (Du Preez et al. 2016).

The *Strategy and Action Plan* has put into place mechanisms to adequately oversee the harvest of lions in Zimbabwe. With an annual harvest of approximately 85 lions, Zimbabwe is not exceeding the limits identified of 0.5 lions/1,000 sq. km. The objectives of the *Strategy and Action Plan* and the actions and monitoring activities that have been put into place to achieve these objectives should support the adaptive management approach that Zimbabwe has established for managing lions. The Service will continue to monitor the effectiveness of the Strategy and Action Plan, for consideration in future findings.

As described above, we have determined that the government of Zimbabwe and the Savé Valley Conservancy contribute towards positive conservation outcomes by addressing the main threats of habitat loss, human-lion-livestock conflict, and prey depletion, which contributes to improving the status of lions in Zimbabwe. Further, the fees garnered through Mr. Wade's hunt will provide revenue to support these positive conservation outcomes.

Therefore, based on the information available to the Service, the purpose for which the permit is being requested, import of this trophy lion, is adequate to justify removing the sport-hunted trophy lion from the wild or otherwise changing its status.

17.32(a)(2)(ii): The probable direct and indirect effect that issuing the permit would have on the wild populations of the wildlife sought to be covered by the permit:

The total area under wildlife-based land use and conservation in Zimbabwe amounts to 10.7 million hectares and represents 27% of the total surface area of the country. Of this, 7.9 million hectares, or 75% of all conservation land in the country, falls under safari hunting as the primary or only source of revenue. Sport hunting of lions by U.S. hunters such as Mr. Wade supports the programs in Zimbabwe that provide the opportunity for locals to see value in lions, which in turn conserves the species in the long-term.

A scientifically based quota is the number of a given species that can be removed from a specific population without damaging the biological integrity and sustainability of that population (WWF 1997). However, full implementation and enforcement of the age-based strategy could potentially cause the need for quotas to become irrelevant or eliminated (USFWS 2015). Age restrictions will naturally restrict offtake to a limited number of individuals that meet the age criteria (Loveridge *et al.* 2007, Whitman *et al.* 2004).

Based on the information provided to the Service, it is clear that Zimbabwe has made strides in their management of their lion populations. Additionally, Zimbabwe appears to be transparent in its management processes, including its quota setting. In 2013, Zimbabwe proposed an adaptive age-based strategy for setting hunting quotas. This

adaptive quota management system for lion hunting based on the ages of lions hunted has been accepted and embraced by all stakeholders; it has not only led to a reduced national lion hunting quota, but has also resulted in a significant increase in the age of harvested lions to a level that is considered to have a reduced ecological impact (Du Preez et al. 2016).

In 2015, the development of TRAS2 allowed the country to better monitor and govern the hunting sector, including developing an effective mechanism to fully account for export proceeds from the hunting sector. The continued participation of U.S. hunters, including Mr. Wade, in this market is anticipated to continue to maintain the viability of managing areas such as the BVC and SVC in their current form, including their contribution to conservation of lions in the wild. In 2015, lion sport-hunting generated USD 753,000 in revenue, which accounts for about 9% of all sport hunting revenue in Zimbabwe that year (ZPWMA 2016).

After evaluating the information provided by the Zimbabwe government and other sources, it appears that the hunting program in Zimbabwe is addressing the three main threats that were identified by the Service when making the determination that the species was threatened with the possibility of extinction. Moreover, hunting areas such as BVC and SVC are maintaining habitat for lions and ensuring that there is no further loss, provided that the hunting areas can remain economically viable. In order to maintain a viable population of lions, the parks, safari areas, and CAMPFIRE areas must maintain biodiversity and a sustainable prey base. Finally, Zimbabwe is actively working to reduce human-lion conflicts and the number of lions killed in retaliation for killing livestock. Therefore, the management of lions within Zimbabwe and the limited hunting of lions contributes to the on-going survival of the species in Zimbabwe.

The participation of Mr. Wade in the hunting and subsequent import of the trophy lion he harvested in the SVC provides an indirect benefit to wild lion populations by helping to support the reserves where lions are found; Mr. Wade's hunt has generated revenue to help support a hunting area where lions are found and conserved. Therefore, based on the information available to the Service, the probable direct and indirect effect that issuing an import permit for a legally hunted lion would have on the species would be positive.

17.32(a)(2)(iii): Whether the permit, if issued, would in any way, directly or indirectly, conflict with any known program intended to enhance the survival probabilities of the population from which the wildlife sought to be covered by the permit was or would be removed:

As stated above, Zimbabwe is monitoring and controlling the harvest of lions through permitting under their regulations and through the *Strategy and Action Plan*. The issuance of import permits for lions legally hunted under these authorities would not conflict with any programs intended to enhance the survival probability of the species in Zimbabwe. Issuance of a permit authorizing import of Mr. Wade's trophy lion from Zimbabwe would work in favor of, not against, the principal acts governing lion conservation in Zimbabwe. Furthermore, sport

hunting opportunities help local communities realize the value in conserving the African lion.

Therefore, based on the information available to the Service, the issuance of an import permit for a legally hunted lion does not conflict with known conservation programs.

17.32(a)(2)(iv): Whether the purpose for which the permit is required would be likely to reduce the threat of extinction facing the species of wildlife sought to be covered by the permit:

Considering Zimbabwe's limited, controlled off-take of lions in a manner that maintains sustainability, Mr. Wade's legal hunt contributes to reducing the threat of extinction of lions. It appears that the permitting activities under Zimbabwe's laws and CITES, as well as the implementation of the adaptive age-based lion quota, and a continuation of implementation of the outputs in the *Strategy and Action Plan* are working in concert to promote the long-term survival of lions in the wild in Zimbabwe. The use of revenue received from hunters, such as Mr. Wade, to manage the populations on the reserves is an important element of the success of lion management in Zimbabwe. For example, hunting operators in the SVC spend USD 546,000 annually on anti-poaching activities (Lindsey et al. 2012). Therefore, based on the information available to the Service, the issuance of the requested import permit for Mr. Wade's legally hunted lion will likely reduce the threat of extinction facing lions in Zimbabwe.

17.32(a)(2)(v): The opinions or views of scientists or other persons or organizations having expertise concerning the wildlife or other matters germane to the application:

Based on reviewing comments made during the listing process for lions, as well as information obtained through personal conversations and literature, there is general agreement that hunting, done properly and well managed, would not have an adverse effect on lion populations. Numerous researchers have stated that, while they may not support hunting in general, they see that benefits can be received through a scientifically based hunting program for lions.

Based on the information available to the Service, there is general support by scientists and other persons or organizations having expertise concerning lions that the legal and sustainable harvest of lions, and the subsequent import of legally harvested lion trophies, as proposed in this application, would not have an adverse effect on the species and would further efforts to conserve the species in the wild into the future.

17.32(a)(2)(vi): Whether the expertise, facilities, or other resources available to the applicant appear adequate to successfully accomplish the objectives stated in the application:

Mr. Wade submitted a permit application to import a trophy of his personally, legally harvested lion from Zimbabwe for the purpose of enhancing the propagation or survival of the species in the wild. As a sport-hunter, Mr. Wade plays a large role in the hunting industry of Zimbabwe; the hunting and subsequent import of Mr. Wade's trophy lion increases the funds available to the Zimbabwe Government and SVC to implement lion conservation initiatives. Therefore, based on the Service's review of the information available relating to Mr. Wade's permit request, we find that the expertise, facilities, or other resources available to Mr. Wade appear adequate to successfully accomplish the objectives stated in the application.

Conclusion

As described above, the Government of Zimbabwe has been documented to implement the *Strategy and Action Plan* in the manner identified in the documents referenced in making this finding. The on-going adaptive management and limited and sustainable off-take of lions is important to the survival of lions in Zimbabwe, and the funds generated by Mr. Wade's participation contributes to the ongoing benefits the program provides to lions in the wild.

Therefore, based on the Service's consideration and analysis of the information associated with Mr. Wade's permit application and other relevant information available to the Service, as described above, we find that the import of the lion harvested by Mr. Wade on June 23, 2018, from the Savé Valley Conservancy, Zimbabwe, meets the requirements for making a positive enhancement finding pursuant to 50 CFR 17.40(r) and 50 CFR 17.32(a). Therefore, the Service is able to authorize the import of the trophy of one lion taken from the wild in Zimbabwe, to Mark A. Wade of Fairbanks, Alaska.

I. **Service Program and Geographic Area or Station Name**: Branch of Permits, Division of Management Authority, International Affairs

II. **Flexible Funding Program** (e.g. Joint Venture, etc.) if applicable: N/A

III. **Location**: 5275 Leesburg Pike, MS: IA, Falls Church, VA 22041-3803

IV. **Species/Critical Habitat**:

Southern and Eastern African lion (*Panthera leo melanochaita*)

Critical Habitat: N/A

V. **Project Description:** Describe proposed project or action or, if referencing other documents, prepare an executive summary (attach additional pages as needed):

As described in the permit application, 02727D, Mark A. Wade, has requested a permit to import a trophy of one lion that he lawfully hunted in Zimbabwe. The import is for personal purposes.

VI. **Determination of Effects:**

(A) Description of Effects: Describe the action(s) that may affect the species and critical habitats listed in item IV. Your rationale for the Section 7 determinations made below (B) should be fully described here.

Issuance of the requested import permit by the Branch of Permits will result in the importation of one personally sport-hunted lion that has been lawfully taken in Zimbabwe on the date specified in the permit application.

The trophy will be accompanied by the required CITES export permit issued by the CITES Management Authority of Zimbabwe.

The requestd U.S. Federal Fish and Wildlife import permit does not authorize the killing of an African lion; the authorization to hunt and lawfully take a lion is under the purview of the government of Zimbabwe. Therefore, the proposed action of issuing a Federal Fish and Wildlife import permit for this lawfully hunted lion will not directly or indirectly affect individuals of listed or proposed species or designated/proposed critical habitat of such species.

(B) Determination: Determine the anticipated effects of the proposed project on species and critical habitats listed in item IV. Check all applicable boxes and list the species (or attach a list) associated with each determination**.**

Determination

No Effect: This determination is appropriate when the proposed project will not directly or indirectly affect (neither negatively nor beneficially) individuals of listed/proposed/candidate species or designated/proposed critical habitat of such species. **No concurrence from DSA/ESFO required.** **X**

May Affect but Not Likely to Adversely Affect: This determination is appropriate when the proposed project is likely to cause insignificant, discountable, or wholly beneficial effects to individuals of listed species and/or designated critical habitat. **Concurrence from DSA/ESFO required.** _____

May Affect and Likely to Adversely Affect: This determination is appropriate when the proposed project is likely to adversely impact individuals of listed species and/or designated critical habitat. **Formal consultation with DSA/ESFO required.** _____

May affect but Not Likely to Jeopardize candidate or proposed species/critical habitat: This determination is appropriate when the proposed project may affect, but is not expected to jeopardize the continued existence of a species proposed for listing or a candidate species, or adversely modify an area proposed for designation as critical habitat. **Concurrence from DSA/ESFO optional.** _____

Likely to Jeopardize candidate or proposed species/critical habitat: This determination is appropriate when the proposed project is reasonably expected to jeopardize the continued existence of a species proposed for listing or a candidate species, or adversely modify an area proposed for designation as critical habitat. **Conference with DSA/ESFO required.** _____

U.S.A.

Authority: Statutes and Regulations: 50 CFR 17.40(r).

Location where authorized activity may be conducted:
IMPORT THROUGH ANY PORT LISTED IN 50 CFR 14.12

Reporting requirements: Not applicable

Authorizations and Conditions:

A. Authorized to import the sport-hunted trophy of one male African lion (*Panthera leo melanochaita*), taken in Zimbabwe for the purpose of enhancement of the survival of the species.

B. Specimen may not be sold or transferred for any financial remuneration.

C. **Trophy must have been taken during the 2018 hunting season.**

D. Trophy must be accompanied by a valid trophy permit or hunting license issued by the government of Zimbabwe for the 2018 season.

E. Trophy must be accompanied by a valid Convention on International Trade in Endangered Species of Wild Fauna and Flora (CITES) Appendix II export permit/re-export certificate, source code "W", issued by the Management Authority of Zimbabwe.

F. General conditions set out in Subpart D of 50 CFR 13, and specific conditions contained in Federal regulations cited above, are hereby made a part of this permit. All activities authorized herein must be carried out in accord with and for the purposes described in the application submitted. Continued validity, or renewal of this permit is subject to complete and timely compliance with all applicable conditions, including the filing of all required information and reports.

G. The validity of this permit is also conditioned upon strict observance of all applicable foreign, state, local, tribal, or other federal law. **This permit can be photocopied.**

H. Valid for use by permittee named above.

I. Acceptance of this permit serves as evidence that the permittee understands and agrees to abide by the "General Permit Conditions" (copy attached).

RE: Import Application of Zimbabwe Lion Trophy for Todd Fry

Dear Chief Cogliano:

Enclosed please find the permit application to import a lion trophy from Zimbabwe for Todd Fry. Please refer to the hundreds of pages of enhancement information Conservation Force previously submitted to the U.S. Fish and Wildlife Service, as well as information submitted by Zimbabwe authorities, outfitters, and others, in making an enhancement finding for lion trophy imports.

Please do not hesitate to contact us if you have questions about this permit application.

Sincerely,

John J. Jackson III

Type of Activity:

IMPORT OF SPORT-HUNTED TROPHIES
(Appendix I of CITES and/or ESA)

Complete Sections A or B, and C, D, and E of this application. U.S. address may be required in Section C, see instructions for details.
See attached instruction pages for information on how to make your application complete and help avoid unnecessary delays.

A. Complete if applying as an individual

1.a. Last name	1.b. First name	1.c Middle name or initial	1.d. Suffix
Fry	Todd	D.	

2. Date of birth (mm/dd/yyyy)	3. Telephone number	3.a. Alternate telephone number	4. E-mail address
(b) (6) [redacted]			

B. Complete if applying on behalf of a business, corporation, public agency, Tribe, or institution

1.a. Name of business, agency, Tribe, or institution	1.b. Doing business as (dba)

2. Tax identification no.	3. Description of business, agency, Tribe, or institution

4.a. Principal officer Last name	4.b. Principal officer First name	4.c. Principal officer Middle name/ initial	4.d. Suffix

5. Principal officer title	6. Primary contact name

7.a. Business telephone number	7.b. Alternate telephone number	7.c. Business fax number	7.d. Business e-mail address

C. All applicants complete address information

1.a. Physical address (Street address; Apartment #, Suite #, or Room #; no P.O. Boxes) (If Broker or Taxidermist is applying on behalf of a foreign national, provide Broker or Taxidermist's name and address in this block; U.S. hunters must provide their U.S. address)

(b) (6) [redacted]

1.b. City	1.c. State	1.d. Zip code/Postal code	1.e. County/Province	1.f. Country
Boerne	Texas	78006	Kendall	USA

2.a. Mailing Address (include if different than physical address; include name of contact person if applicable)

2.b. City	2.c. State	2.d. Zip code/Postal code	2.e. County/Province	2.f. Country

D. All applicants MUST complete

1. Attach check or money order payable to the U.S. FISH AND WILDLIFE SERVICE **in the amount of $100, nonrefundable processing fee**. Federal, Tribal, State, and local government agencies, and those acting on behalf of such agencies, are exempt from the processing fee – ***attach documentation of fee exempt status as outlined in instructions.*** (50 CFR 13.11(d))

2. Certification: I hereby certify that I have read and am familiar with the regulations contained in ***Title 50, Part 13 of the Code of Federal Regulations*** and the other ***applicable parts in subchapter B of Chapter I of Title 50***, and I certify that the information submitted in this application for a permit is complete and accurate to the best of my knowledge and belief. I understand that any false statement herein may subject me to the criminal penalties of 18 U.S.

(b) (6) [redacted] 7-25-18

Signature of applicant/Principal Officer for permit (No photocopied or stamped signatures) — Date of signature (mm/dd/yyyy)

Please continue to next page

E. IMPORT OF SPORT-HUNTED TROPHIES *(Appendix I of CITES and/or ESA)*

Note 1: This form should be used to request authorization to import trophies of species listed on Appendix I of CITES and/or as threatened or endangered under the ESA (examples include elephants, lions, cheetahs, wood bison, and markhor).

PLEASE USE FORM 3-200-19 FOR SOUTHERN AFRICAN LEOPARD TROPHIES AND SOUTHERN WHITE RHINOCEROS TROPHIES TAKEN IN NAMIBIA.

Note 2: If you hold an import permit for trophy/trophies that you did not use, please **return the unused original permit**. If you are requesting reissuance of a permit because you have taken a trophy, but were unable to import it prior to the expiration of the permit, please use the renewal form (3-200-52) and return your original permit with that form.

Note 3: Applications for species listed as endangered under the U.S. Endangered Species Act are published in the Federal Register for a 30-day public comment period. Please allow at least **90 days** for the application to be processed.

Note 4: *Sport-hunted trophy* is defined at 50 CFR 23.74 as follows: *Sport-hunted trophy* means a whole dead animal or a readily recognizable part or derivative of an animal specifically identified on the accompanying CITES document that meets the following criteria:
(1) Is raw, processed, or manufactured;
(2) Was legally obtained by the hunter through hunting for his or her personal use;
(3) Is being imported, exported, or re-exported by or on behalf of the hunter as part of the transfer from its country of origin ultimately to the hunter's country of usual residence; and
(4) Includes worked, manufactured, or handicraft items made from the sport-hunted animal only when:
(i) Such items are contained in the same shipment as raw or tanned parts of the sport-hunted animal and are for the personal use of the hunter;
(ii) The quantity of such items is no more than could reasonably be expected given the number of animals taken by the hunter as shown on the license or other documentation of the authorized hunt accompanying the shipment; and
(iii) The accompanying CITES documents (export document and, if appropriate, import permit) contain a complete itemization and description of all items included in the shipment.

Note 5: Certain hunting trophies, including elephants, are subject to restrictions on their use after import into the United States. Please see 50 CFR 23.55 for more information or contact the Division of Management Authority.

Please provide the following information. Complete all questions on the application. Mark questions that are not applicable with "N/A". If needed, use a separate sheet of paper. On all attachments or separate sheets you are submitting; please indicate the application question number you are addressing. If applying for more than one trophy, be sure to answer questions 1-6 for each trophy addressed in this application. If importing trophies from more than one country, you must submit a separate application for each shipment in order to obtain separate import permits.

---

1. Name and address where you wish the permit to be mailed, **if different from page 1**. If you would like expedited shipping, please enclose a self-addressed, pre-paid, computer-generated, courier service airway bill. If unspecified, all documents will be mailed via regular mail through the U.S. Postal Service.

2. Who should we contact if we have questions about the application (name, phone number, and e-mail)?

   Todd Fry - (b) (6) [redacted]

3. Have you or your client (if a broker applying on behalf of your client), been assessed a civil penalty or convicted of any criminal provision of any statute or regulation relating to the activity for which the

application is filed; been convicted, or entered a plea of guilty or nolo contendere, for a felony violation of the Lacey Act, the Migratory Bird Treaty Act, or the Bald and Golden Eagle Protection Act; forfeited collateral; OR are currently under charges for any violation of the laws mentioned above?

No X ____ Yes ____

If you answered "Yes" to Question 3, provide: a) the individual's name; b) date of charge; c) charge(s); d) location of incident; e) court, and f) action taken for each violation. Please be aware that a "Yes" response does not automatically disqualify you from getting a permit.

4. For each trophy to be imported, provide:

   a. Scientific name (genus, species, and, if applicable, subspecies) and common name.

Lion

   b. Sex (if known). Male

5. **IF ANIMAL IS CURRENTLY LIVING IN THE WILD**, please enter the following information:

   a. Country and place (area, region, GIS coordinates, ranch, conservancy, management area, or hunting block, AND nearest city) where wildlife is to be taken from the wild:

Zimbabwe - Bubye Valley

   b. Date wildlife is to be hunted: 10/22/18 to 11/8/18

   b. Name of hunting outfitter, safari company, or professional hunter you will be hunting with:

Mazunga Safaris - Pete Fick. 8 Norfolk Rd. Hillside, Bulawayo, Zimbabwe

6. **IF THE TROPHY HAS ALREADY BEEN TAKEN**, please enter the following:

   a. Country and place (area, region, GIS coordinates, ranch, conservancy, management area, or hunting block, AND nearest city) where trophy was removed from the wild:

   b. Date wildlife was hunted:

   b. Name of hunting outfitter, safari company, or professional hunter you hunted with:

   c. The current location of the trophy (address and country) [the U.S. import permit will identify this country as the country of export/re-export and must match with the export/re-export document]:

7. Please provide a copy of any applicable foreign government permits or licenses that were required to remove this animal from the wild (if you have not hunted yet and do not currently hold any such permits or licenses, please indicate so).

8. Complete name and address of overseas person or business shipping the trophy to you. If you are applying to import a trophy directly from Namibia, you **must** provide the name and address of the professional hunter listed on your Namibian hunting permit [this name will appear on the face of the export permit].

Name: PETE FICK
Business Name: MAZUNGA SAFARIS
Address: 8 NORFOLK RD
City:
State/Province: BULAWAYO, ZIMBABWE
Country, Postal Code:

9. For species listed under the Endangered Species Act, please be aware that the U.S. Fish and Wildlife Service must make a finding that your activities will enhance or benefit wild populations of the species involved. While we will communicate with the range country for the species you will hunt or hunted when making the required findings, if you have any information that could support this finding, it would be helpful to our review if you could provide it. Please submit such information on a separate page with your application.

   a. Do you have any information regarding the population status or trend data on the species hunted?

   b. In order to hunt, you likely paid for licenses or trophy fees. What were those fees and do you have any information on how those funds were used by either the landowner, community, or government?

   c. Do you have information on other funding activities that are being carried out, or were carried out, by the safari outfitter, professional hunter, concession holder, or land owner that provide a conservation benefit to the species being hunted/species hunted?

CERTIFICATION STATEMENT (original signature must be provided for either 10 or 11 below)

10. **If you are a broker or taxidermist applying on behalf of a U.S. hunter or foreign national,** provide documentation to show you have a **Power of Attorney** to act on your client's behalf and sign the following statement.

    I acknowledge that the sport-hunted trophy/trophies to be imported has been/will be personally hunted by my client and is being imported only for my client's personal use (i.e., **not for sale, transfer, donation, or exchange that is reasonably likely to result in economic use, gain, or benefit**). I understand that my client may only import two leopard trophies and two elephant trophies within the same calendar year (if applicable). In addition, I have advised my client that raw ivory, once imported into the United States, cannot be re-exported.

    Taxidermist/Broker's signature: _____ Date: _____

11. **If you are the hunter applying to import your own trophy**, please read and sign the following statement.

    I acknowledge that the sport-hunted trophy/trophies to be imported has been/will be personally hunted by me and is being imported only for my personal use (i.e., **not for sale, transfer, donation, or exchange that is reasonably likely to result in economic use, gain, or benefit**). I understand that I may only import two leopard trophies and two elephant trophies within the same calendar year. In addition, I understand that raw ivory, once imported into the United States, cannot be re-exported.

    Applicant's signature: (b) (6) Date: 7-25-18

    Be aware that there may be additional permitting or approval requirements by your local or state governments, as well as required by other Federal agencies or foreign government to conduct your propose activity. While the Service will attempt to assist where possible, it is your responsibility to obtain such approval.

All international shipment(s) must be imported through a designated port. A list of designated ports (where an inspector is posted) is available from http://www.fws.gov/le/designated-ports.html. If you wish to use a port not listed, please contact the Office of Law Enforcement for a Designated Port Exemption Permit (form 3-200-2).

NOTICE OF REPRESENTATION

This is a notice to the U.S. Fish and Wildlife Service that I have appointed John J. Jackson, III and Regina Lennox of the non-profit firm Conservation Force as my attorneys and legal representatives for all matters concerning my applications for a permit to import a lawfully hunted LION trophy.

This authority is inclusive and extends to all applications and filings, whether administrative or judicial, including but not limited to any request for reconsideration, appeal, and litigation.

I also request that these attorneys, through the address for Conservation Force below, be copied with all correspondence, acknowledgements, notices and decisions concerning my application to import my trophy at the following address:

RE: SUPPLEMENT TO APPLICATION

PRT #: 08061D

APPLICANT NAME: TODD FRY

Dear Ms. Brisendine:

Pursuant to our phone conversation we are supplementing the above captioned application for a lion to also include a lioness that was also taken on the same safari, in the same location and with the same operator as follows:

COUNTRY:	Zimbabwe
SPECIE:	Panthera Leo Melanochaita – LIONESS
DATE OF HUNT:	10/22/2018 to 11/08/2018
HUNTING WITH:	Mazunga Safaris
CONSERVANCY:	Bubye Valley Conservancy

Attached please find Hunting Permit No. 001902 for the Lioness, issued by Zimbabwe Parks and Wildlife Management Authority, dated 09/08/2018.

If you have any question about this supplement, please do not hesitate to contact us.

Regards,

/s/ Emma C. Sampson

Bubye Valley Conservancy
Motivation for the hunting of adult lionesses

Blondie Leathem, General Manager, Bubye Valley Conservancy
Email: mazunga@bvczim.com

The Bubye Valley Conservancy (BVC) is one of largest private wildlife areas in Zimbabwe with a total area of approximately 3400 km^2. Originally a cattle ranch, the BVC was established in 1994 through the introduction of a variety of large, wild herbivores and with the primary objective of maintaining an ecologically sustainable and economically viable wildlife enterprise based on ethical trophy hunting. In 1999, thirteen lions of Namibian origin were introduced to the conservancy from Pilansberg National Park, South Africa. An additional four animals were recorded to have broken in between 1999 and 2003. With abundant prey and the protection from human-wildlife conflict provided by the electrified perimeter fence, the lion population increased at a rate of 25% per annum reaching an estimated population size of 500 individuals in 2013 (Wijers, 2016). The rapid increase in the lion population has had detrimental effects on prey populations particularly wildebeest, eland and giraffe which have recorded declines exceeding 60% (Wijers & Gush, 2018b).

The lion population explosion observed in the BVC likely emanated from the lack of natural regulatory processes that are known to limit population growth in larger unfenced systems. Miller et al. (2013) suggested that management interventions that are implemented to control population growth in smaller, fenced reserves should aim to mimic the outcomes of natural processes particularly regarding reproductive, survival and dispersal schedules. Given the size of the BVC lion population, it would be logistically and financially unfeasible to alter reproductive schedules using contraceptive methods. Furthermore, contraception has been reported to result in fragmentation of prides into smaller groups and single females which can further impact predator prey dynamics through increased predation (Lehmann et al., 2008; Miller et al., 2013). Options for manipulating survival and dispersal rates include translocation, euthanasia and hunting. Although translocation remains an option for BVC management, previous offers and attempts to move animals have proven this to be an unlikely solution due to highly restrictive government policies as well as the limited number of areas willing to receive lions. Trophy hunting and euthanasia are therefore the only reasonable methods of lion population control for BVC.

Adult female lions represent approximately 44% of the total BVC lion population (Wijers & Gush, 2018a). Although the majority of adult females exist in large, stable prides, several lone individuals have been observed. In addition, GPS collar data and sightings information from single lionesses that have either split from their native prides, or that have never been part of a pride, has shown that these individuals typically remain alone and form smaller groups with their offspring. Removal of lone, non-lactating lionesses has therefore been identified as an important management objective aimed at reducing the overall lion population, recruitment and predation. Hunting of lionesses is a preferable method of removal to euthanasia as the income generated from each hunt will be used to fund the conservancy's lion research and anti-poaching projects which are vital for effective wildlife management and protection. Furthermore, the allocated lioness hunting quota represents only a small fraction (15-20%) of the ideal required management offtake. The hunting of selected lionesses will benefit the conservancy ecologically as well as financially helping to ensure continued sustainable management of BVC's wildlife.

Ms. Brisendine:

The document attached is to be included as supplement to all original import permit applications filed with the U.S. Fish and Wildlife Service listed above.

Since filing these applications we have received additional documentation of conservation efforts for lions in Zimbabwe that further detail the populations as stable and growing. The CAMPFIRE document strongly argues the importance of trophy imports and the value that they provide to communities in Zimbabwe through income flows from tourism and hunting which serve to support sustainable community livelihoods in a way that promotes conservation of wild species and habitat.

The Campfire document details the drastic effects that COVID-19 has had and is having on Zimbabwe's tourism and hunting market, which is in a state of collapse. It is leaving the country uncertain of how wild-life and anti-poaching programs will be supported on the ground in the coming months. This information can be used to predict what might transpire if trophy hunting and imports were to cease to exist and the tragic outcome it could have on the conservation efforts of wildlife in the area.

We ask that you please consider these documents when making your decision on enhancement in each import permit application.

Please feel free to contact me if you have any questions regarding this mater.

Cordially,

Aimee Korver
Permits Paralegal

1. CAMPFIRE communities Concern on Import Bans

Open Letter to the United States Fish and Wildlife Service

Dear Dr Mary Cogliano

CAMPFIRE Communities Concern on Import Bans

CA/MPFIRE Association, otherwise known as the Community Areas Management Program for Indigenous Resources in Zimbabwe wishes to register its opposition to continuing campigns for the banning of trophy imports. We are fully aware that the general outrage in both print and social media against sport hunting, which many distant voices refer to as unethical, is aimed at influencing policy action by importing countires.. These arguments, none of which are supported by science, are based on a perfected art of global misinformation and do not represent the views of rural communities who live side by side with wildlife. To us as a people with substantial wildlife populations, trophy hunting is indispensable for conservation and rural livelihoods.

Zimbabwe has one of the most resilient and successful conservation programs in Africa. Its conservation efforts have historically enabled local communities to thrive on sustainable livelihoods in biodiversity-rich landscapes. At least 800 000 households or 2.5 million people (out of a national population of 16 million) benefit directly and indirectly from the sustainable use of wildlife and tourism related investments in their areas. However, our ever growing elephant population has increased the levels of conflict between humans and wildlife in recent years, which, together with recurrent droughts that threaten food security, have made traditional livelihoods more difficult, especially for subsistence farming communities that live in the wildlife rich areas of the country.

Communities in CAMPFIRE areas reside in an environment where conflict between humans and wildlife is common, as both compete for the limited available land and water resources. But this comes at a high price: people in Zimbabwe are paying with their lives for tolerating wild animals in their areas. As recently as 23rd March 2020, Barnabas Mwinga, a 50 year old man, was killed by an elephant in his field in front of his wife and young daughter in Gonono Ward, Mbire District. He is one of seven other people that have needlessly lost their lives to wildlife attacks throughout the country since the beginning of 2020, in addition to the 41 killed in 2019. Yet despite this high cost, wildlife is still highly valued by rural communities who continue to tolerate massive crop destruction and livestock losses from wildlife without compensation. For example, elephant poaching in Mbire District where Barnabas Mwinga was recently killed has gone down from a peak of 40 in 2010 to only 3 elephants poached in 2019 (Figure 1). The decline in poaching incidents is a result of collaborative efforts between the Safari Operator and the hunting clients who invest nearly $100,000 annually into an anti-poaching unit.

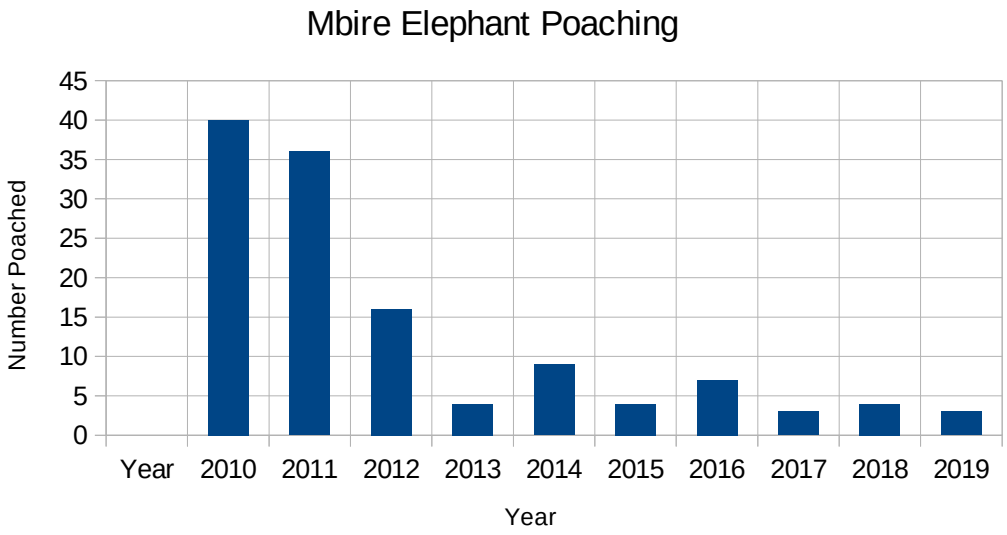

Figure 1: Mbire Elephant Poaching Trends (Source – Mbire Rural District Council)

The aim of the CAMPFIRE programme is to support sustainable community livelihoods in a way that promotes conservation of wild species and habitat. For nearly 30 years, trophy hunting, which relies heavily on the American market, has been cautiously implemented in the absence of other tourism opportunities to achieve this goal. Not only has it resulted in increasing food and livelihood security of rural people, it has also played a role in undermining the drivers of poaching and mitigating human and wildlife conflict. The net impact is seen in securing wildlife habitat and assisting in the regeneration of degraded landscapes.

The financial resources to succeed with this programme in CAMPFIRE areas are heavily dependent on the sustainable hunting of big game, especially elephants. The monies generated from these activities finance the local economies, social services as well as anti-poaching efforts and wildlife management at the District and Ward levels. For example, as can be seen from Table 1 below, the total number of elephants hunted as trophies over nine years is 807 out of a cumulative quota of 1381, from an estimated national population of 83,000 elephants. Hunting quotas are set at no more than 0.5% of the population estimate compared to an elephant population growth of 5% to 6% annually. The levels of off-take (58%) also demonstrate that while hunting is based on controlled numbers for each species annually, it is not uncommon for a client to pay for a full hunt and enjoy the wild experience, but not take a trophy. It is also important to note that communities do not view international hunting clients just as tourists, but as vital conservation partners.

Table 1: Trophy Hunting Quota Summary and Income: 2010-2018

All Districts:	**Elephant**	**Lion**	**Leopard**	**Buffalo**	**Hippo**	**Crocodile**	**Total**

Source: *The Role of Trophy Hunting of Elephant in Support of the Zimbabwe CAMPFIRE Program: Vernon Booth* (in progress).

District and Ward-level institutions in the CAMPFIRE areas rely on income from hunting to provide significant local livelihood benefits (income, jobs, skills) and social services (schools, clinics, irrigation schemes, boreholes) in remote regions where agriculture is marginal and there are very few jobs or other sources of cash income. Table 2 and Table 3 below summarise the impact of pre- and post-elephant trophy import suspension expenditure on the CAMPFIRE programme at the District and Ward level. The District administration costs absorb 89% of the budget with 30% devoted to law enforcement. With the suspension of elephant trophy imports to the USA and Europe in 2016, expenditure on law enforcement dropped from 33% to 9% as a result of District administration having to offset the human and wildlife costs which increased from 1% to 33%. At the Ward level, 46% of the budget is allocated to administration and 54% to community benefits (45% devoted to social services, Table 3).

Table 2: District level expenditure on administration and community benefits: 2010-2018

With growing awareness from several years of CAMPFIRE implementation, communities have been demanding their rightful place in the management of wildlife resources for their own benefit. To accommodate this, CAMPFIRE has undergone a review of its policy framework to enable communities to reap greater and more tangible benefits from living in harmony with nature. A key aspect of this review is to establish Community Conservancies that redefine ways in which communities can benefit more from wildlife and other income generation opportunities, as well as the mitigation of human and wildlife conflict. This initiative is being directed under the Global Environment Facility (GEF) 5 and 6 cycles covering five districts with the aim of developing innovative ways to improve the management of wildlife for the benefit or rural people. If trophy hunting and trade here was stopped, the impact on local livelihood would be severe, and both poaching and changes to alternative land use would increase. Non-consumptive tourism currently plays virtually no positive conservation role in the CAMPFIRE areas (<4% of overall income is generated through tourism). Instead of banning the import of trophies, more international oversight and support is needed from importing states, and of in-country CITES controls, to ensure sound sustainable management e.g. quota-setting, permit allocation, independent population surveys; building robust, equitable and transparent benefit allocation mechanisms at local level, particularly where communities have elected to invest their land and time in Community Conservancies.

STOP PRESS: The pressure for imports bans comes at the worst possible time as the Covid-19 pandemic has severely disrupted income flows from tourism and hunting. The collapse of both markets leaves rural people and safari operators with virtually no income, and it is uncertain how wildlife protection and anti-poaching programs will be supported on the ground in the coming months. What remains clear is that trophy import bans will seriously undermine conservation in Zimbabwe, and indeed open floodgates for rural people to destroy wildlife and wildlife habitat through conversion of land for other subsistence uses, even if unviable.

Subject: CITES Permit Application # 08061D
Date: Thursday, August 13, 2020 6:04:59 PM

Hi Mr. Fry,

This email is in regard to your CITES permit application #08061D to import a lion trophy from Zimbabwe. On the application, it was indicated that the hunt was to take place between 10/22/2018 and 11/8/2018. Please provide the specific date that the lion was taken.

Please reply directly to this email with the requested information.

Thank you and let me know if you have any questions.

In accordance with 50 CFR 13.ll(e), if the requested information is not received by this office ***within 45 calendar days of the date of this email****, your application will be abandoned and administratively closed. Once a file is closed, you will need to submit a new application, and all required fees, for the Service to consider your proposed activity.*

Thank you,

Jenna King

Hello Jenna,

The lion was taken November 3, 2018

Please let me know if you are need of any further information.

Thank you and have a nice evening,

Todd D. Fry

Enhancement Finding

Applicant: Todd D. Fry (PRT– 08061D)

Introduction

Todd D. Fry submitted an application, received by the Service on September 13, 2018, for the importation of one male lion *(Panthera leo melanochaita)* taken November 03, 2018, from the Bubye Valley Conservancy, Zimbabwe, for the purpose of enhancing the propagation or survival of the species in the wild. After evaluating the available information submitted with the application, information provided by the Government of Zimbabwe, other information available to the U.S. Fish & Wildlife Service (Service), and comments received from interested parties, the Service has determined that the importation of the sport-hunted trophy meets the requirements for making a positive enhancement finding pursuant to 50 CFR 17.40(r) and 50 CFR 17.32(a). The rationale for our finding follows.

U.S. Permit Requirements for Import of Lions (*Panthera leo melanochaita*)

ESA

The African lion, subspecies *Panthera leo melanochaita* (southern and eastern Africa), is a threatened species under the U.S. Endangered Species Act (ESA or Act) and is regulated under a species-specific 4(d) rule, 50 C.F.R. § 17.40(r) that provides specific conservation measures for this subspecies. Under the 4(d) rule for *P. l. melanochaita*, all of the prohibitions at 50 C.F.R. § 17.21 and 50 C.F.R. § 17.31 apply to *P. l. melanochaita* specimens. These prohibitions, in part, make it illegal for any person subject to the jurisdiction of the United States to import or export any lion specimens.

Although import of the lion subspecies *P. l. melanochaita* is a prohibited activity under the Act, exceptions may be made in accordance with the 4(d) rule at 50 C.F.R. § 17.40(r) when

the import activity qualifies for and the Service issues an ESA threatened-species enhancement permit under 50 C.F.R. § 17.32(a). The preamble to the 4(d) rulemaking, 80 Fed. Reg. 79999, 80043-46 (Dec. 23, 2015), explains the factors the Service considers when making an enhancement finding for importation of sport-hunted trophies of *P. l. melanochaita*, as described below.

Our threatened species permitting regulations at 50 CFR 17.32 provide issuance criteria for threatened species permits (50 CFR 17.32(a)(2)), but do not specify what would constitute the enhancement of propagation or survival with regard to authorizing the import of parts or products of *P. l. melanochaita,* including sport-hunted trophies. Therefore, when making a determination of whether an otherwise prohibited activity enhances the propagation or survival of *P. l. melanochaita,* the Service will examine the overall conservation and management of the subspecies in the country where the specimen originated and whether that management of the subspecies addresses the threats to the subspecies (*i.e.,* that it is based on sound scientific principles and that the management program is actively addressing the current and longer term threats to the subspecies). In that review, we will evaluate whether the import contributes to the overall conservation of the species by considering whether the biological, social, and economic aspects of a program from which the specimen was obtained provide a net benefit to the subspecies and its ecosystem.

The Service will evaluate any application received that involves *P. l. melanochaita* in the context of enhancement of propagation or survival permitting in accordance with our threatened species permitting regulations at 50 CFR 17.32 and issuance criteria for threatened species permits (50 CFR 17.32(a)(2)). These include, in addition to the general permitting criteria in 50 CFR 13.21(b):

(i) Whether the purpose for which the permit is required is adequate to justify removing from the wild or otherwise changing the status of the wildlife sought to be covered by the permit;
(ii) The probable direct and indirect effect that issuing the permit would have on the wild populations of the wildlife sought to be covered by the permit;
(iii) Whether the permit, if issued, would in any way, directly or indirectly, conflict with any known program intended to enhance the survival probabilities of the population from which the wildlife sought to be covered by the permit was or would be removed;
(iv) Whether the purpose for which the permit is required would be likely to reduce the threat of extinction facing the species of wildlife sought to be covered by the permit;
(v) The opinions or views of scientists or other persons or organizations having expertise concerning the wildlife or other matters germane to the application; and
(vi) Whether the expertise, facilities, or other resources available to the applicant appear adequate to successfully accomplish the objectives stated in the application.

In addition to these factors, particularly in relation to sport hunting, we find the *IUCN Species Survival Commission (SSC) Guiding Principles on Trophy Hunting as a Tool for Creating Conservation Incentives, Ver. 1.0* (IUCN SSC 2012), to provide useful principles, which, considered in conjunction with our threatened species issuance criteria, will aid the Service when making an enhancement finding for importation of sport-hunted trophies of *P. l. melanochaita.* This document sets out guidance from experts in the field on the use of trophy hunting as a tool for "creating incentives for the conservation of species and their habitats and for the equitable sharing of the benefits of use of natural resources" (IUCN SSC

2012, p. 2) and recognizes that recreational hunting, particularly trophy hunting, can contribute to biodiversity conservation and more specifically, the conservation of the hunted species.

The SSC document lays out five guiding principles that, considered in conjunction with our threatened species issuance criteria, will aid the Service when making an enhancement finding for importation of sport-hunted trophies of *P. l. melanochaita:*

(a) *Biological sustainability:* The hunting program cannot contribute to the long-term decline of the hunted species. It should not alter natural selection and ecological function of the hunted species or any other species that share the habitat. The program should not inadvertently facilitate poaching or illegal trade in wildlife by acting as a cover for such illegal activities. The hunting program should also not manipulate the ecosystem or its component elements in a way that alters the native biodiversity.
(b) *Net Conservation Benefit:* The biologically sustainable hunting program should be based on laws, regulations, and scientifically based quotas, established with local input, that are transparent and periodically reviewed. The program should produce income, employment, and other benefits to create incentives for reducing the pressure on the target species. The program should create benefits for local residents to co-exist with the target species and other species. It is also imperative that the program is part of a legally recognized governance system that supports conservation.
(c) *Socio-Economic-Cultural Benefit:* A well-managed hunting program can serve as a conservation tool when it respects the local cultural values and practices. It should be accepted by most members of the community, involving and benefiting local residents in an equitable manner. The program should also adopt business practices that promote long-term economic sustainability.
(d) *Adaptive Management: Planning, Monitoring, and Reporting:* Hunting can enhance the species when it is based on appropriate resource assessments and monitoring (*e.g.,* population counts, trend data), upon which specific science-based quotas and hunting programs can be established. Resource assessments should be objective, well documented, and use the best science available. Adaptive management of quotas and programs based on the results of resource assessments and monitoring is essential. The program should monitor hunting activities to ensure that quotas and sex/age restrictions of harvested animals are met. The program should also generate reliable documentation of its biological sustainability and conservation benefits.
(e) *Accountable and Effective Governance:* A biologically sustainable trophy-hunting program should be subject to a governance structure that clearly allocates management responsibilities. The program should account for revenues in a transparent manner and distribute net revenues to conservation and community beneficiaries according to properly agreed decisions. All necessary steps to eliminate corruption should be taken and to ensure compliance with all relevant national and international requirements and regulations by relevant bodies such as administrators, regulators and hunters.

The Service's approach to enhancement findings for the importation of sport-hunted trophies of *P. l. melanochaita* is consistent with the purpose and intent of the Endangered Species Act. Before we will authorize the importation of a sport-hunted trophy, we must determine that the trophy hunting program is managed to ensure the long-term survival of the species. In many parts of the world, wildlife exists outside of protected areas and must share the same habitat

and compete with humans living in these areas for space and resources. If communities that share these resources with wildlife do not perceive any benefits from the presence of wildlife, they may be less willing to tolerate the wildlife. However, under certain circumstances, trophy hunting can address this problem by making wildlife more valuable to the local communities and encourage community support for managing and conserving the hunted species, as well as other species.

When evaluating whether the importation of a trophy of *P. l. melanochaita* would be authorized pursuant to 50 CFR 17.32, in accordance with our threatened species issuance criteria, we will examine how a country's management program for lions addresses the three main threats that have led to the decline of the subspecies: Habitat loss, loss of prey base, and human-lion conflict. When examining a management program and whether trophies taken as part of that program meet the issuance criteria, we would study a number of factors. Some of the factors we would consider include whether the program is based on sound scientific information and identifies mechanisms that would arrest the loss of habitat or increase available habitat (*i.e.,* by establishing protected areas and ensuring adequate protection from human encroachment). We would consider whether the management program actively address the loss of the lion's prey base by addressing poaching or unsustainable offtake within the country. A component of a management plan from which trophy imports would meet the issuance criteria would be whether there are government incentives in place that encourage habitat protection by private landowners and communities and incentives to local communities to reduce the incursion of livestock into protected areas or to actively manage livestock to reduce conflicts with lions. We would examine if the hunting component of the management program supports all of these efforts by looking at whether hunting concessions/tracts are managed to ensure the long-term survival of the lion, its prey base, and habitat. As stated previously, hunting can generate significant economic benefits if properly conducted. In looking at whether we would be able to authorize the import of a trophy under the issuance criteria of 50 CFR 17.32, we would examine if the trophy hunting provides financial assistance to the wildlife department to carry out elements of the management program and if there is a compensation scheme or other incentives to benefit local communities that may be impacted by lion predation. We would also consider how a U.S. hunter's participation in the hunting program contributes to the overall management of lions within a country.

Management programs for *P. l. melanochaita* would be expected to address, but are not limited to, evaluating population levels and trends; the biological needs of the species; quotas; management practices; legal protection; local community involvement; and use of hunting fees for conservation. In evaluating these factors, we will work closely with the range countries and interested parties to obtain the information. By allowing entry into the United States of *P. l. melanochaita* trophies from range countries that have science-based management programs, we anticipate that other range countries would be encouraged to adopt and financially support the sustainable management of lions that benefits both the species and local communities. In addition to addressing the biological needs of the subspecies, a scientifically based management program would provide economic incentives for local communities to protect and expand *P. l. melanochaita* habitat.

As stated, under this 4(d) rule any person wishing to conduct an otherwise prohibited activity, including all imports of *P. l. melanochaita* specimens, must first obtain a permit under 50

CFR 17.32. As with all permit applications submitted under 50 CFR 17.32, the individual requesting authorization to import a sport-hunted trophy of *P. l. melanochaita* bears the burden of providing information in their application showing that the activity meets the requirements for issuance criteria under 50 CFR 17.32. In some cases for imports, such as sport-hunted trophies, it is not always possible for the applicant to provide all of the necessary information needed by the Service to make a positive determination under the Act to authorize the activity. For the import of sport-hunted trophies of *P. l. melanochaita,* the Service will typically consult with the range country to the extent practicable and other interested parties to obtain necessary information.

The Service has the discretion to make the required findings on sport-hunted trophy imports of *P. l. melanochaita* on a country-wide basis, although individual import permits will be evaluated and issued or denied for each applicant. While the Service may make enhancement findings for sport-hunted trophy imports of *P. l. melanochaita* on a country-wide basis, the Service encourages the submission of information from individual applicants. We would rely on the information available to the Service and may rely on information from sources other than the applicant when making a permitting decision.

CITES

The African lion is also included in Appendix II of the Convention on International Trade in Endangered Species of Wild Fauna and Flora (CITES). It is unlawful for any person subject to the jurisdiction of the United States to engage in international trade in CITES specimens contrary to the provisions of the Convention, the ESA, or our CITES implementing regulations in 50 CFR part 23. 16 U.S.C. § 1538(c)(1), (g); 50 C.F.R. § 23.13. As required by CITES, export of a specimen of an Appendix II species to another country requires prior issuance of a CITES permit. Under CITES, importation of an Appendix II species does not require issuance of an import permit from the importing country. Consequently, the United States is not required to issue a CITES permit in order for U.S. hunters to import their sport-hunted lions. In compliance with CITES, the United States does require CITES imports to meet all CITES requirements, including that the imported lion trophies be accompanied by the required CITES export permits issued by the exporting countries, *see* 50 C.F.R. §§ 23.20; 23.23; 23.24; 23.26; 23.27, and including requirements for sport-hunted trophies at 50 C.F.R. § 23.74.

Individual Permit Adjudication Considerations

When the African lion listing under the ESA became effective, January 22, 2016, the Service began issuing enhancement findings for *P. l. melanochaita* on a countrywide basis, as had been the practice for a number of other threatened sport-hunted species. On March 1, 2018, however, in response to a D.C. Circuit Court opinion (*Safari Club Int'l v. Zinke*, 878 F.3d 316 (D.C. Cir. 2017)), the Service withdrew its countrywide enhancement findings for a range of species, including lions, across several countries, and began assessing applications to import sport-hunted trophies of these species on an application-by-application basis. These withdrawals were upheld in a D.C. Circuit Court opinion (*Friends of Animals v. Bernhardt*, No. 19-5147 (D.C. Cir. June 16, 2020); *Center for Biological Diversity v. Bernhardt*, No. 19-5152 (D.C. Cir. June 16, 2020)). No countrywide ESA enhancement findings are currently in effect. Therefore, since March 1, 2018, the Service has been making

ESA enhancement findings for the import of sport-hunted trophies of lions on an application-by-application basis, ensuring consistent application of the regulatory criteria across all permit application adjudications and ensuring that each permit decision is based on the best scientific and management information available.

Although the Service makes the required enhancement findings on sport-hunted trophy imports of *P. l. melanochaita* on an individual application basis, information obtained for the range country as a whole is also considered, as it is pertinent to the Service's evaluation. In addition to considering national-level species management, we also consider species management and contributions to species enhancement on a smaller-scale (e.g., at the regional or hunting management unit scale such as at the hunting operator, community conservancy, concessionaire, reserve, or ranch-level scale). In addition, we consider how the hunter's personal involvement in the hunting experience directly or indirectly contributes to enhancement of the species in the wild. In its enhancement evaluation, the Service, therefore, considers efforts made by the hunting management unit and/or individual hunter to directly or indirectly address the threats posed to lions in the wild together with other information available concerning the overall management and population status of the lion in the range country at the time of the hunt.

In making ESA enhancement findings, we review all relevant information available to us, including information submitted with the individual permit applications, information received in response to inquiries we make of the range countries, and all other reliable information we receive from interested parties, such as species experts, hunting organizations, hunting operators, community groups, and non-governmental organizations. We evaluate and consider all relevant information obtained or submitted to the Service on an ongoing basis as it relates to permit applications received for import of sport-hunted trophies of *P. l. melanochaita*.

The Service considers information at these different levels in order to assess:

1) How the range country government manages the hunted species and how hunting serves to enhance the survival of the species in the wild in the context of the management system;
2) How hunting serves to enhance the survival of the species in the wild in the context of the management unit at the hunting operator, concessionaire, community conservancy, reserve, or ranch level; and
3) How the individual hunter has contributed (where the hunt has already taken place) or will contribute (where the hunt has not yet taken place) to enhancement of survival of that species through their hunting activities and contributions to the survival of the species in the wild associated to the hunt and subsequent import.

Government-Level Factors Considered

- Enforcement of wildlife laws and regulations, particularly with regard to the range country's ability to implement wildlife regulations developed for the hunted species
- Implementation of a scientifically-based management plan that addresses the major threats to the species and provides economic incentives for local communities to conserve the species
- Investment of hunting fees into conservation, including whether the range country has standard processes and infrastructure in place to ensure an effective transfer of hunting revenues back into the country's management of the species and community benefits
- Management of human-lion conflict, including whether the range country has a compensation scheme or other incentives to local communities to reduce the incursion of livestock into protected areas or to actively manage livestock to reduce conflicts with lions
- Management of the lion's prey base by addressing poaching or unsustainable offtake of the lion's prey species
- Management of lion hunting areas through a system that ensures the long-term survival of the lion, its prey base, and habitat
- Protection of lion habitat through establishment of protected areas, ensuring adequate protection from human encroachment and providing incentives that encourage habitat protection by private landowners and communities
- Establishment and use of science-based quotas, a sex and age-based harvest system, and a monitoring program for the lion and its prey species

Hunting Management Unit-Level Factors Considered

- Monitoring populations of the hunted species and their prey-base
- Protecting and/or increasing the prey-base for lions in the wild
- Maximizing biodiversity of the lion's prey species
- Protecting and improving the habitat for lions in the wild to ensure maintenance of ecosystem functions and biodiversity (e.g., creating water holes, habitat management, etc.)
- Engaging in anti-poaching activities for lion and their prey base
- Managing human-lion conflict
- Investing in community benefits and employment, where such investments provide incentives for conservation of lions in the wild
- Complying with harvest laws and regulations
- Re-investing hunting fees or other contributions associated to lion hunting to a fund that supports conservation of lions in the wild

Hunter-Level Factors Considered

- Complying with harvest laws and regulations
- Paying hunting/import-related fees or other contributions associated to lion hunting that are re-invested to support conservation of lions in the wild (e.g., funding habitat protection for lions in the wild, protection of the lion's prey base, or mitigation of human-lion conflict)
- Participating in a hunting program with an operator that supports sustainable use of the species

This application-by-application permit review process offers an opportunity to incentivize hunting in concessions, conservancies, reserves, or ranches that support conservation of the species through rigorous anti-poaching programs, local wildlife monitoring activities, and compliance with government rules and regulations. By complying with our enhancement requirements, a hunter's personal import will help conserve lion populations in the wild by supporting the local communities where they hunt and promoting conservation of these species and their habitats by providing protection incentives to communities that live alongside these species.

Basis for Finding

On February 1, 2016, the Service sent a letter to the Parks and Wildlife Management Authority in Zimbabwe (ZPWMA) with a list of questions related to management plans, population status, conservation, management, hunting policies, and regulations of Zimbabwe's lion populations. Additionally in the letter, the Service referenced the IUCN SSC Guiding Principles on Trophy Hunting as a Tool for Creating Conservation Incentives Ver. 1.0 (09 August 2012), as it provides useful principles which, when considered in conjunction with the Service's permit issuance criteria, would aid when making the required enhancement findings for permitting importation of sport-hunted lion trophies.

On February 16, 2016, the Service sent a second request to ZPWMA for specific documents related to the conservation status of lions in Zimbabwe. ZPWMA responded to the Service's request on February 17, 2016, with a copy of *Conservation Status of African Lion in Zimbabwe,* and subsequently, on November 29, 2016, provided a copy of its *Enhancement and Non-detriment Finding for Lion (Panthera leo) in Zimbabwe.* The Service has also been corresponding with ZPWMA regarding African elephant management for several years. In this correspondence, ZPWMA, as well as other sources, have provided the Service with documents and information that are relevant to our evaluation of lions in Zimbabwe.

Since 2016, the Service has met with officials from Zimbabwe multiple times to receive updated information on the status of and management of lions in Zimbabwe with respect to imports of sport-hunted lion trophies. For example, Service representatives met with Zimbabwe officials in January 2018 at the annual Safari Club International convention in Las Vegas, and November 2018 at the African Wildlife Consultative Forum in Uganda. In September 2018, Zimbabwe officials provided to the Service the May 2017 Zimbabwe National CAMPFIRE Stakeholder's Review and the Zimbabwe Parks and Wildlife Management Authority Strategic Plan, 2019-2023. In addition, in September 2018 the Service received a letter dated 6 December 2017 from Hon. E.D. Mnangagwa, President of the Republic of Zimbabwe, addressed to President Donald Trump, addressing the

change of administration in Zimbabwe. In this letter Hon. E.D. Mnangagwa provided assurance to the United States that Zimbabwe is politically stable and that Zimbabwe's previous conservation initiatives would be enhanced, with the previous Minister, Permanent Secretary, and Director General confirmed to remain in place.

This information provided by the Zimbabwe authorities (including verbal updates and presentations at the 16th Annual African Wildlife Consultative Forum (Uganda, November 2018), along with the Service's final rule on the lion listing under the Act and other relevant information from reliable sources, are the basis of this finding.

Governance of Lions in Zimbabwe

The legal framework for Zimbabwe's regulatory mechanism is informed by its Wildlife Policy (1992), which is intended to maintain a protected area network for the conservation of the nation's wild resources and biological diversity. The Wildlife Policy (1992) provides for the Government of Zimbabwe to maintain a network of protected areas known as the Parks and Wild Life Estate, comprised of the country's National Parks, safari areas, botanical gardens, and sanctuary and recreational areas for the conservation of the nation's wild resources and biological diversity (CITES 2016; ZPWMA 2016). The framework is intended to create economic activity to enhance rural development and encourages the conservation of wild animals and their habitats outside the protected areas.

ZPWMA was established by the Parks and Wildlife Act of 1996 (Chapter 20:14) [as amended by Act Number 19 of 2001] which came into operation on June 1, 2002, through Statutory Instrument 144C of 2002. The Act provides for the establishment of a Parks and Wildlife Board; establishment of national parks, botanical reserves, botanical gardens, sanctuaries, safari areas and recreational parks; and the preservation, conservation, propagation or control of wildlife, fish, and plants of Zimbabwe and the protection of Zimbabwe's natural landscape and scenery. This Act includes sections on virtually every aspect of ZPWMA, including requirements for annual financial audits and reporting to the central government. The Act also provides for substantial penalties for the unlawful possession of or trading in protected wildlife species. In addition, the General Laws Amendment Act (No. 5) of 2010 provides for mandatory imprisonment for poaching.

The Parks and Wildlife Act, Chapter 20:14, devolved authority to manage and benefit from wildlife on communal and private lands to the landholders. In 1982, the legal provisions of this Act were extended to Rural District Councils (RDCs), on behalf of rural communities in communal lands whose areas contain viable populations of wildlife. Communal areas in Zimbabwe are administered by RDCs which have become a mechanism for implementation of the government's policy of conservation by utilization of natural resources. The Act enables local communities to manage and benefit from wildlife resources through the Communal Areas Management Programme for Indigenous Resources (CAMPFIRE) established in 1989.

CAMPFIRE was developed to encourage reduction in human-wildlife conflicts through conservation-based community development and to provide an economic incentive to

improve community tolerance of wildlife, including lions. At the time, the CAMPFIRE program was the model for community-based conservation efforts in several other African countries and was identified as an innovative program. Under a community-based conservation program, like CAMPFIRE, rural communities should benefit from revenue generated by sport-hunting.

As Zimbabwe's premiere wildlife agency, the main functions of the ZPWMA are to control, manage, and maintain Zimbabwe's wildlife resources with the primary role of protecting and conserving Zimbabwe's natural heritage for present and future generations on behalf of the country. It also provides the cornerstone of Zimbabwe's tourism industry (ZPWMA 2015). The rationale behind the establishment of the ZPWMA was to allow for a self-funding mechanism, and thereby reduce its dependence on the national treasury. In January 1996, the Government of Zimbabwe approved the establishment of the Parks and Wild Life Conservation Fund that provides for financing wildlife operations directly from revenues generated through wildlife-related activities. The funding for ZPWMA is therefore coming from revenue generated through sport hunting conducted on state and private lands, concession leases, National Park visitor fees, and other wildlife-related fees. While there have been requests by ZPWMA for funding from the central treasury in the past, to our knowledge, no other significant government funding has been provided, and only limited outside funding from non-governmental organizations (NGOs) or other governments appears to be available.

A major component of ZPWMA mandate is law enforcement. Poaching mainly occurs along the boundaries of protected areas where lions are incidentally snared as non-target prey. Between 2013 and 2015, 21 lions were killed illegally, with six animals killed through snaring in the area adjacent to Hwange National Park in 2015; poverty stands as the major driver of illegal hunting (ZPWMA 2016). If anyone is found in possession of poached specimens, they must pay a fine of USD 5,000 or face a mandatory jail sentence. If convicted of lion poaching, courts could require the payment of a compensation fee of USD 20,000 (ZPWMA 2014). Hunting operators are obligated through their concession lease agreements to assist with anti-poaching efforts (ZPWMA 2016). Reportedly, USD 590,000 was spent on anti-poaching efforts by the Bubye Valley Conservancy (BVC) alone during 2015 (K. Leathern, pers. comm., as cited in Du Preez et al. 2016), and USD 546,000 is spent annually on anti-poaching by the Save Valley Conservancy (SVC) (Lindsey et al. 2012); these expenses are mainly covered by sport-hunting revenue (Du Preez et al. 2016). In 2002, ZPWMA had 2,146 rangers at its establishment (ZPWMA 2016); however, by the end 2015, there were 1,448 rangers in post (67% of 2002 level). Of the 1,448 rangers in post, 1,004 are deployable for anti-poaching operations (ZPWMA 2016).

Safari operators in Zimbabwe are required to be registered and licensed by the Zimbabwe Tourism Authority (https://www.soaz.net/index.php/2, accessed August 16, 2019). Operators must hold a lease or agreement on a suitable concession with an approved quota of animals. They are responsible for the official paperwork and permits connected to the hunt. Hunting operators are required by law to provide the services of a Zimbabwe Licensed Professional Hunter to accompany foreign hunters in Zimbabwe. Licensing is undertaken by the National Parks & Wildlife Authority.

Zimbabwe is a member of the Southern African Development Community (SADC). Under the SADC Treaty, Article 5(g) establishes objectives to, among other aspects, promote the sustainable use of wildlife, harmonize legal instruments governing wildlife use and conservation, promote the conservation of shared wildlife resources through the establishment of trans-frontier conservation areas (TFCA), and facilitate community-based natural resources management practices. To implement the SADC Treaty, member states are required to establish management programs for the conservation and sustainable use of wildlife.

Currently Zimbabwe is pursuing six TFCA initiatives at various stages of development. These are: Great Limpopo Transfrontier Park (GLTP) / Great Limpopo Transfrontier Conservation Area (GLTFCA); Chimanimani TFCA; Greater Mapungubwe TFCA; Kavango-Zambezi (KAZA) TFCA; Lower Zambezi-Mana Pools LZMP (TFCA) and Zimbabwe-Mozambique-Zambia (ZIMOZA) TFCA (Mandisodza-Chikerema 2018, p. 34).

Through TFCAs, wildlife management entities are linking many of the major protected areas by removing boundary fences along national borders that separate many reserves in addition to creating or improving corridors to link good-quality habitat for wildlife (Newmark 2008). The principle of ecological and migratory connectivity lies at the heart of the TFCA initiative linking large protected areas across international boundaries and providing space for wildlife populations.

Another provision of the SADC Treaty is that member states are required to establish management programs for the conservation and sustainable use of wildlife. Zimbabwe has met this criterion for African lions through the development of its 2006 *Conservation Strategy and Action Plan/or the Lion (Panthera leo) in Zimbabwe* (ZPWMA), which is still in use.

As previously mentioned, Zimbabwe is also a Party to CITES, and the African lion species is included in Appendix II of the Convention. As an Appendix-II species, certain criteria must be met before the CITES Management Authority of the country of export may issue an export permit, including a finding from the exporting country's CITES Scientific Authority that the proposed activity will not be detrimental to the survival of the species in the wild (non-detriment finding; NDF) and a finding from the CITES Management Authority that the specimens proposed for export were legally acquired (legal acquisition finding).

The ZPWMA has provided the Service with a copy of its standing CITES non-detriment finding (NDF), dated October 2016, for the export of African lion specimens. The NDF explains that lion populations in Zimbabwe are being managed sustainably for the benefit of the species and that Zimbabwe's management program for lion provides economic incentives for local communities to protect and expand lion habitats. The NDF document provides information to support the following:

- The Zimbabwe hunting industry is based on sound scientific information, provides mechanisms to arrest habitat loss, or where feasible increase habitat, and provides protection from human encroachment.

- Government incentives are in place to encourage habitat protection by private landowners and communities.
- Government Incentives are provided to local communities to reduce human-wildlife conflicts.
- Hunting concessions are managed to ensure the long-term survival of the African lion and its habitat.
- Trophy hunting provides financial assistance to the ZPWMA, the communal CAMPFIRE program, and private landowners to implement wildlife management programs.
- Local communities directly and indirectly benefit from the presence of lion in their areas.
- Participation of U.S. hunters in the Zimbabwe hunting industry contributes to the overall conservation and management of lions in Zimbabwe (ZPWMA 2016).

Lion Status in Zimbabwe

When the Service listed the subspecies of lion in southern and eastern Africa (*P. l. melanochaita*) as threatened under the Act (80 FR 79999), three primary threats to the species throughout its range were identified: loss of habitat, loss of prey base, and human-lion conflict. While human population growth clearly has an impact due to loss of available habitat for lions, increasing human population has a direct impact on prey base. Prey availability affects the reproduction, recruitment, and foraging behavior of lions and, as a result, strongly influences lion movements, abundance, and population viability (Winterbach *et al.* 2012, as cited in USFWS 2015). Lion densities are directly dependent on prey biomass (Hayward *et al.* 2007). Outside of protected areas, the lion's prey base is much reduced (Du Preez et al. 2016); inadequate management and law enforcement have led to poaching of the lion's prey base for bushmeat, which has been critically depleted (USFWS 2015). Population trends across eastern and southern Africa show that most prey species have declined in recent years; and for Zimbabwe, droughts have been a critical factor (ZPWMA 2016).

A reduced prey base results in a relatively greater chance of lions encountering livestock (Du Preez et al. 2016). While actual losses of livestock to predators may be relatively low, the perceived financial cost to farmers can be high, and lions are persecuted intensely in livestock areas as a consequence. Their scavenging behavior makes them particularly vulnerable to the practice of lacing prey carcasses with poison to eliminate predators (CITES 2016). Co-existence of lions and people is promoted through giving value to lions, such as through tourism and hunting in CAMPFIRE areas (ZPWMA 2014). The threat to lions from habitat loss is especially present in Sebungwe and the South East Low Veld where the fragmented nature of the protected areas is compounded by increasing human and livestock populations surrounding these areas (ZPWMA 2016).

According to the Service's CoPl7 *Consideration of Proposals for Amendment of Appendices I and II,* international trade in lion products is emerging as an additional threat; however, the relative extent to which this threat has contributed to lion population declines is difficult to evaluate accurately (CITES 2016). According to ZPWMA (2016), the illegal local and international trade in lions and their products poses an insignificant risk to the

species in Zimbabwe, as there are no records of people found in possession of illegally acquired lion specimens in Zimbabwe. It is not clear what level of legal trade of lion products, if any, occurs within Zimbabwe.

The bulk of Zimbabwe's wildlife occurs within the Parks Estate which includes 11 national parks, 16 safari areas, 16 recreational parks, 6 sanctuaries, 12 botanical reserves and 3 botanical gardens, all spread across the country (Parks and Wildlife Act 2001 Chapter 20:14). Wildlife populations also occur on the state Forest Areas, Communal CAMPFIRE areas, and private conservancies dedicated to wildlife-based land use. There are approximately 319,317 km^2 of land where some form of wildlife-based land use is practiced in Zimbabwe (ZPWMA 2016). Lions occur permanently in 45% of this available range (circa 145,000 km^2) with the majority occurring in national parks (96%) and safari areas (92%). Lions also occur permanently in 47% of the State forest areas and 66% of privately owned conservancies. The CAMPFIRE areas comprise approximately 247,000 km^2 and lions occur in 36% of these areas. Lions are transient in CAMPFIRE, conservancy, and resettled areas adjacent to the major protected areas, and lions move across the border into Zambia, Mozambique, South Africa, and Botswana.

Zimbabwe's main lion range includes the Hwange-Matetsi Ecosystem, Mid Zambezi Valley, Sebungwe, and South East Lowveld. The lion population estimates in Zimbabwe are determined primarily through carnivore spoor surveys, systematic lion collaring, and call-up surveys. According to ZPWMA's *Conservation Status of the African lion (Panthera leo) in Zimbabwe* July 2014 report, starting in 2015, lion spoor surveys were to be done at two-year intervals in all wildlife areas, and lion call-up surveys were to be done every three years in all major lion areas (ZPWMA 2014). Although the Service has not received confirmation that these surveys have been conducted since 2015, in September 2018, the Service received Zimbabwe's Parks and Wildlife Management Authority's Strategic Plan for 2019-2023, which indicates that Zimbabwe is actively working to improve the monitoring and management of their wildlife species. In their updated strategic plan, signed in December 2018, they indicated that one of their strategic objectives is protection of wildlife resources. Their identified timeline is to update and implement key species management plans (lion is identified as one of these) by December 2023.

ZPWMA (ZPWMA 2016) has estimated that the minimum number of lions that occur on approximately 5l,642 km^2 of land where reliable survey data are available is approximately 1,900 (range 1,800 - 2,000). The western portion of the country, consisting primarily of Hwange National Park and the surrounding safari areas, forest areas, communal areas, and private conservancies, supports approximately 737 lions (or 38% of the overall population). The southern portion of the country, dominated by the two major conservancies (SVC and BVC) and Gonarezhou National Park supports approximately 896 lions (48%). These numbers are supported by several studies.

Within Gonarezhou National Park, Groom et al. 2014, used call-up surveys to obtain direct estimates of the lion population and compared actual lion densities with potential density estimates. In this study, while lions were only seen at five percent of calling stations, this equated to a population estimate of 33 lions, which is consistent with spoor survey results conducted in June 2010 (Groom et al. 2014). A 2015 spoor count

survey of Gonarezhou National Park revealed an estimated 125 lions within the park (ZPWMA 2016).

From 2007 to present, annual track index surveys at the SVC have been conducted using a standardized methodology (Groom and Watermeyer 2015, as cited in Du Preez et al. 2016). Prey availability models suggest that the carrying capacity for this lion population is approximately 271 lions (Hayward et al. 2007). In 2015, the estimated population was 284 lions (Du Preez et al. 2016). The Rifa Safari Area was surveyed using camera trapping and spoor counts in 2015, which supported an estimated population of 68 lions. The central and northern portions of the country reportedly support an estimated population of 284 lions (15%). The 12-year (2000-2011) average lion density per 100 km^2 is 2.8 in Hwange National Park, 6.0 for South Eastern Lowveld in the SVC, 9.0 in Malilangwe, and 0.8 in Gonarezhou National Park (ZPWMA Annual Report 2013, as cited in ZPWMA 2014). SVC's website indicates that at SVC, an annual predator spoor count is conducted by the African Wildlife Conservation Fund (AWCF), an independent organization (http://savevalleyconservancy.org/conservation.html#header1-z, accessed August 14, 2019).

According to Riggio et al. 2013 (p. 32), and Bjorklund in Riggio et al 2013 (p. 32), the minimum number of lions that are estimated to constitute a viable population is 500 individuals. Hwange National Park, with an estimated population of 559, is the only area within Zimbabwe that has a viable population as laid out by Riggio et al. 2013. However, the two regions that make up the largest percentage of the country's lion population (Western 38% and Southern 48%) have regional populations of 737 and 896, respectively. The areas within the Central and Northern regions of Zimbabwe, albeit smaller, encompass parks that are part of Transfrontier Conservation Areas, such as the Mana Pools region.

Lion Management in Zimbabwe

In response to discussions surrounding a possible up-listing of lion to Appendix I under CITES at the 13th Meeting of the Conference of the Parties (CoP13), and subsequent workshops involving lion range states, IUCN, ZPWMA, and other key stakeholders held a workshop to develop the *Conservation Strategy and Action Plan for the Lion (Panthera leo) in Zimbabwe* which was published by ZPWMA in 2006. The plan responds to regional and international standards set by Treaties such as CITES and the Convention on Biological Diversity (CBD), among others. The plan states "it will guide the conservation and management of this top predator" which "addresses the needs of th[e] country." The Service is not aware of any additional or updated iterations of the plan since 2006; however, in Zimbabwe's 2016 response, *Enhancement and Non-Detrimental Findings for Panthera leo in Zimbabwe,* ZPWMA provided updates on each of the outputs and respective targets established under the 2006 *Conservation Strategy and Action Plan/or the Lion (Panthera leo) in Zimbabwe* (ZPWMA 2016).

The 2006 plan identifies a vision that "...lions should be conserved and managed sustainably for their aesthetic, cultural, and ecological values, and the socio-economic

development of Zimbabwe." The plan lays out three broad targets to achieve this objective:

- Ensure the persistence of key lion populations and other important populations including those of doubtful viability.
- Human and livestock loss reduced.
- Optimize wildlife conservation-related net benefits to local communities.

All three targets are stepped down to seven specific outputs with their own targets and activities to meet such targets. Although the plan does not identify a time period, some activities do, of which a period of 5 years is the most common. In response to inquiries from the Service, ZPWMA has provided a summary of the progress made to implement the 2006 strategy.

While all three of the broad targets appear to serve a valuable role in lion management in Zimbabwe, three of the specific outputs are most relevant to determining if the implementation of the strategy enhances the propagation or survival of the species, as required by the Act for the issuance of import permits. The first output, "lion populations, their habitats and wild prey effectively conserved and managed in collaboration with local stakeholders" is broken down into a number of targets: establish a baseline survey and monitoring program; maintain and strengthen capacity for lion conservation, management, monitoring and research; identify and implement best management standards and practices for the hunting program; develop and implement co-management frameworks; and expand the geographic distribution range of lions. Baseline surveys have been completed for the Parks Estate using monitoring protocols for key variables (populations, habitats, prey), and selected surveys have been undertaken in areas outside National Parks (ZPWMA 2016).

Carnivore research programs conducted by NGOs and research institutions such as WildCRU are taking place in various parts of the country; in addition, personnel have been trained in data collection and capture, management, and lion aging and analysis. Adaptive age-based criteria for male trophy animals are in place and functioning. The quota for a certain year is determined by a point system based off the hunts from the previous season. Therefore, ZPWMA is actively working toward meeting the target areas for this output.

The second output, "human-lion related conflicts minimized and, where possible, eliminated" has also been broken down into a number of targets: develop and establish databases on lion-human conflicts; identify and implement methods to reduce and mitigate livestock losses and lion attacks on humans; and train and properly staff problem animal control (PAC) units to conduct rapid response and precisely target problem animals. According to information from ZPWMA (2016), approaches to mitigate livestock losses and lion attacks on humans are in the process of being tested and implemented in Hwange, and methods to mitigate lion attacks on livestock are being implemented as appropriate at selected sites (e.g. Tsholotshe). Data on PAC reports for lion-related problems have been collated, and PAC units at ZPWMA field station and/or RDC levels have been partially established. In Matusadona, Hwange, and Gonarezhou regions, specific awareness and education packages on lion conservation and

management have been developed and implemented. The information submitted in the ZPWMA update suggests that they have met one target, and are in the process of implementing the remaining two.

The third output, "the costs and benefits of long-term lion management equitably distributed," is a socio-economic output to establish agreement and implementation of area-specific lion management plans with identified stakeholders in each wildlife region, and implementing a transparent mechanism to equitably distribute lion-related income to identified stakeholders." The specific targets for this output are: complete an inventory of stakeholders directly affected by lion conservation, deliver appropriate training and capacity building to prioritized stakeholders, agree to and implement collaboratively developed area-specific lion management plans with identified stakeholder groups in each wildlife region within 5 years, and implement transparent mechanisms to equitably distribute lion-related/generated income to identified stakeholders (groups and/or communities). Current information from ZPWMA shows that they have identified key stakeholders and assessed the financial impacts of lion conservation and the magnitude of socio-economic impacts on each stakeholder group. Limited training has been undertaken for representative stakeholders in Hwange, Matusadona, and Gonarezhou. ZPWMA has also implemented an adaptive management program across four wildlife regions and is in the progress of developing and implementing area-specific lion management plans with identified stakeholder groups. According to ZPWMA, a Management Plan for Hwange was approved. The Hwange National Park (HNP) Management Plan was updated in 2015 and officially accepted at Zimbabwe's Ministry of Environment level in 2016 (Conservation and Wildlife Fund (CWF) 2018, p. 16). One of the four components of this 10-year plan is implementation of a cooperation plan between the park and park neighbors. The Conservation and Wildlife Fund – Hwange (CWF) is a relatively new model of the private and NGO sectors in and around Hwange National Park (HNP) Zimbabwe, formalizing an alliance of individual members to materially and in-kind assist authorities with conservation work.

The Hwange Lion Research (HLR) which is part of the Wildlife Conservation Research Unit (WILDCRU), Oxford University, UK, with some financial support and collaborative effort from CWF, set up a comparative camera trap survey in May 2018, to establish a baseline of both lion and lion prey identification and densities in contiguous areas with differing management – the exact CWF project area. Although data were only obtained from the 40-day HNP camera grid, combined sources of complimentary data on the lion population in Forest Areas outside the national park suggest that anthropogenic mortality is slowing down, believed to be in part due to CWF's new law enforcement activities (CWF 2018, p. 21).

Zimbabwe's conservation strategy for lions also identifies roles and responsibilities for a number of participants in Zimbabwe's lion conservation efforts. According to the strategy, there is a national lion coordinator that coordinates all national activities on lion conservation, research, and management, including census surveys, setting up monitoring needs, and coordinating data on human-lion conflicts. The strategy identifies roles for the field stations, wardens, ecologists and utilization units, which are responsible for ensuring compliance with hunting regulations and maintaining safari hunting databases. In addition, the strategy identifies roles for CAMPFIRE, safari operators, and

professional hunters to facilitate training and ensure compliance with hunting regulations.

The Conservation Strategy and Action Plan for the Lion in Zimbabwe (ZPWMA 2006) borrows language from the *IUCN Conservation Strategy* (2006). It iterates areas in need of improvement regarding lion conservation in Zimbabwe, including standardized lion census methods and surveys, further mitigating human-lion conflicts, and maximizing benefits for rural communities that live with lions. ZPWMA (2006) notes their intention to review and put in place criteria for age-based identification of male trophy animals, but do not mention if they will be reviewing possible combination strategies. As part of the 2006 lion conservation strategy for eastern and southern Africa, six objectives were established to secure and restore sustainable lion populations, which were housed under the following categories: management, mitigation, socio-economics, policy and land-use, politics, and trade. The strategy was intended to be implemented within 10 years (Macdonald 2016), and Zimbabwe gave an update on progress regarding these objectives in their *Enhancement and Non-Detrimental Findings for Panthera leo in Zimbabwe* (ZPWMA 2016) that also addressed outputs and targets laid out in their 2006 action plan.

Additionally, to mitigate human-lion conflict, the "Long Shields Guardian Programme" was initiated whereby communities are notified of movements of collared lions into their areas via cell phone, and then have the opportunity to take appropriate action, such as moving cattle. In 2013 alone, 1,850 warnings were passed to the "Long Shields." These actions may reduce the incidents of lions marauding livestock; however, retaliatory killing of lions still occur. Further, as is policy under the Parks and Wildlife Act of 2001, any lions that attack humans or livestock will be lethally eliminated (ZPWMA 2016). Between 2007 and 2013 a total of 1,113 conflict incidents were recorded in the Hwange area in which 915 head of stock were lost to lions.

In and around Hwange National Park, data collected between 1999 and 2004 suggested that hunting surrounding the park was having a negative impact on the lion population. As a result, sport hunting of lions was suspended in the area surrounding the park between 2005 and 2009. Following the lifting of the moratorium, and by implementing stricter monitoring and hunting guidelines through the Hwange Lion Research Project, the overall Hwange lion population has continued to show a positive trend, and as of 2015 the population was estimated at over 550 animals (ZPWMA 2015).

<u>Hunting, Management, and Utilization of Lions</u>

In Zimbabwe, much of the trophy hunting occurs in Safari Areas which are managed mainly for the sustainable use and as buffer zones next to National Parks (Jeke et al 2019, p. 2). Trophy hunting of wildlife is legally permitted in safari areas; as of 2014, there were 16 in Zimbabwe (ZPWMA 2014). According to the Forest Act, Chapter 19:05, there are 24 gazetted indigenous forest areas in Zimbabwe; within these forest areas, lions may be hunted in the following forests: Fuller, Kazuma, Pandamasuwe, Ngamo, Sikumi, Gwayi, Sijarira, and Gwampa (ZPWMA 2014).

As of 2016, the minimum number of lions that occur in approximately 51,642 km^2 of land in Zimbabwe, where reliable survey data are available, is estimated to be 1,917 (range 1,800 - 2,000), the majority of which occur in western and southern Zimbabwe. When taking this population estimate into consideration, trophy hunting harvests a yearly mean of 2.7% of adult male lions. This figure decreased since the establishment of age restrictions on lion hunting (ZPWMA 2016).

In 2013, an adaptive quota management system for lion hunting based on the ages of lions hunted was agreed to in Harare, Zimbabwe, during a meeting hosted by ZPWMA and an independent non- governmental conservation organization (Du Preez et al. 2016). After reviewing aging techniques, attendees at the July 2013 meeting in Harare, Zimbabwe were confident that hunters could be expected to categorize lions as being below or above five years of age. In determining quotas for the following years, operators would be rewarded with increased quotas if they hunted animals of six years or older, would not be penalized if they hunted animals five years of age, but would have quotas cut if they hunted animals younger than five years old, or if they failed to complete hunt returns (ZPWMA and Panthera 2014). In 2013, only 28% of lions hunted were five years old or older. In 2015, that figure rose to 77.3% (ZPWMA 2016).

According to Hunter et al. (2013), an adaptive quota management system utilizing age-based criteria would not only aid in the prevention of over-harvesting lions, but would also prevent excessively conservative quotas. Further, according to Miller et al. (2016), results indicate that age-based hunting is feasible for sustainably managing threatened and economically significant species such as the lion, but must be guided by rigorous training, strict monitoring of compliance and error, and conservative quotas. No single trait can be relied upon exclusively to precisely age lions. Rather, multiple traits must be examined in combination to cross-validate an individual's age and, according to Whitman et al. (2004), restricting hunting to individuals that are at least six years old is desirable from a biological perspective due to the reduced risk of the loss of pride males and infanticide of cubs associated with the harvest of such individuals (Whitman et al. 2004).

During 2013, operators were requested to submit hunt returns and photos as a trial run to get the adaptive quota system up and running. In 2014, operators were requested to do the same but were informed that the age of the lions hunted in 2014 would determine their lion quotas in 2015 (Du Preez et al. 2016). In 2015, there was a marked increase in the age of lions hunted in Zimbabwe as a whole. The majority of lions hunted were on the cusp of 5-6 years of age but were not older than six years. National hunting offtakes for lions in Zimbabwe from 2013 to 2015 were 29, 42, and 47 respectively (Masterson 2016). It appears these do not include illegal forms of hunting offtake. In 2011, Zimbabwe's quota was set at 101 lions; in 2014, it was reduced to 50 male lions following the implementation of age restrictions (Henschel 2015, pers. comm., as cited in USFWS 2015).

As described above, CAMPFIRE is the program through which the Government of Zimbabwe has relegated the management of wildlife resources to communal farmers. As of July 2014, there are at least 58 Rural Districts that have been granted the Appropriate Authority status to manage wildlife resources in their areas; however,

according to *Enhancement and Non-Detrimental Findings for Panthera leo in Zimbabwe* ZPWMA 2016, only 16 are actively engaged in some form of wildlife-based land use (ZPWMA 2016). Lions are found in communal areas that are adjacent to major protected areas, and lion hunting is allowed in CAMPFIRE districts (ZPWMA 2014).

In setting adaptive lion quotas, Zimbabwe uses scientific information including spoor surveys, camera traps, and ranger-based sighting. In CAMPFIRE areas, incidences of human-lion conflict are also taken into consideration where survey information is not readily available, when determining quotas for those areas (ZPWMA 2014). The quota-setting process involves all stakeholders, including the ZPWMA, landowners, safari operators, and CAMPFIRE managers and their representatives. During the annual quota-setting workshop, presentations are made by the proponents who then make proposals for quotas. Where it is felt that not enough information has been presented, a precautionary quota will be issued (ZPWMA 2014).

ZPWMA (2016) mentions seven concessions that are leased on five-year terms, and how these concessionaires pay a 5-year "right to lease" fee, annual rental, fixed quota fee (payable if animals are shot or not) and a supplementary quota fee that allows additional animals to be bought as needed. It is unclear to what extent Zimbabwe still utilizes fixed quotas, as Du Preez et al. claims fixed quotas are no longer being used by Zimbabwe, but a fixed quota fee is mentioned in ZPWMA (2016). It is also unclear how many animals concessionaires are able to "buy as needed," and how such requests may be accommodated without going over the national quota (ZPWMA 2016). However, when evaluating the lower quota with higher utilization reported by ZPWMA (2016), and taking into consideration the land area of the Parks Estate alone, Zimbabwe did not exceed the best management practice of 0.5 lions/1,000 km^2; the 2015 off-take would have accounted for 0.125 lions/1,000 km^2.

According to *The Role of Trophy Hunting of Elephant in Support of the Zimbabwe CAMPFIRE Program -December 2016,* a report the Service received in December 2016, the Reserve Bank of Zimbabwe, in collaboration with relevant stakeholders, established the Tourism Receipts Accounting System (TRAS2) that required all outfitters to submit returns listing the revenue generated for hunting activities. This system has been in place for several years, but it required manual analysis of the data to extract information on hunting revenue. In January 2015, to account fully for earnings in the hunting sector, the Reserve Bank of Zimbabwe in collaboration with relevant stakeholders, introduced TRAS, a web-based system that links Safari operators, ZPWMA Authority, taxidermists, shipping agents, International marketing agents, and the Reserve Bank. Under this system, all authorized hunts are registered, allowing for the capture of hunting data, such as the origin of clients, value of trophies and hunts, and area hunted, to monitor hunting quota utilization and track hunted trophies. According to the December 2016 report, the Exchange Control Division of the Reserve Bank of Zimbabwe and the ZPWMA are now able to:

1. Assess regional price differentials of similar hunts and the reasons thereof;
2. Present TRAS2 system updates and reports to the users, including international marketing agents;
3. Engage with international marketing agents of sport hunting;

4. Obtain relevant insights on governing of the hunting sector; and
5. Come up with an effective mechanism to fully account for export proceeds from the hunting sector.

The TRAS2 information provides a breakdown of the source of hunting income, and the amount of funds generated by trophy fees by land category, among other insights, and has demonstrated the TRAS2 system's ability to obtain relevant insights on governing of the hunting sector.

Evaluation

Todd D. Fry hunted in the Bubye Valley Conservancy (BVC) in Zimbabwe. Based on information submitted with the permit application, the Bubye Valley Conservancy (BVC) is reportedly one of largest private wildlife areas in Zimbabwe with a total area of approximately 3,400 km^2. The land that now occupies BVC was historically a cattle ranch, and in 1994 the BVC was established and land use converted through the introduction of a variety of large, wild herbivores and with the primary objective of maintaining an ecologically sustainable and economically viable wildlife enterprise based on ethical trophy hunting.

In evaluating whether the importation of Mr. Fry's trophy of *P. l. melanochaita* would be authorized pursuant to 50 CFR 17.40(r) and 50 CFR 17.32(a), in accordance with our threatened species permit issuance criteria, we examined how Zimbabwe's management of lions overall as well as how Bubye Valley Conservancy and Mr. Fry himself have contributed to enhancement of wild lions both directly and indirectly by addressing the three main threats that led to the decline of the subspecies: habitat loss, loss of prey base, and human-lion conflict.

Below, we summarize our evaluation with reference to each of the permit issuance criteria at 50 CFR 17.32(a)(2) on the basis of information available to the Service.

17.32(a)(2)(i): Whether the purpose for which the permit is required is adequate to justify removing from the wild or otherwise changing the status of the wildlife sought to be covered by the permit:

Zimbabwe's lion hunting industry generated 9% of all sport-hunting revenue in 2015; 51% was contributed by U.S. hunters during 2010-2015 country-wide, and 90% of the sport-hunting market in the Bubye Valley Conservancy (BVC) and the Save Valley Conservancy (SVC) from 2005-2015. Even though 9% may not seem like much, lions are a key component of the sport hunting industry, as they are part of the "Big 5" trophies and draw U.S. hunters to Zimbabwe. Without the hunting industry, protected wildlife areas such as BVC and SVC, which have become conservation havens in the threat of human encroachment across much of Zimbabwe, would not be economically viable, and therefore would likely not exist. These wildlife areas not only provide habitat for lions, but also support the lion's prey species.

Sport hunting was essential for the successful transition of the BVC from cattle to wildlife (Du Preez et al. 2016), in that it provided monetary benefits for the

conservation of lions and local communities. The BVC donates over 45 tons of meat from sport hunting to the local communities each year. This meat donation is worth over US $100,000 per year. The BVC also supports several schools, clinics, and community projects in the three surrounding districts of Mwenezi, Maranda, and Jopempe. The local community sees a direct benefit from the wildlife in BVC, but it is also empowered by job opportunities created both within these communities, as well as in the BVC (Du Preez et al. 2016).

The *Strategy and Action Plan* has put into place mechanisms to adequately oversee the harvest of lions in Zimbabwe. With an annual harvest of approximately 85 lions, Zimbabwe is not exceeding the limits identified of 0.5 lions/1,000 sq. km. The objectives of the *Strategy and Action Plan* and the actions and monitoring activities that have been put into place to achieve these objectives should support the adaptive management approach that Zimbabwe has established for managing lions. The Service will continue to monitor the effectiveness of the Strategy and Action Plan, for consideration in future findings.

As described above, we have determined that the government of Zimbabwe and the Bubye Valley Conservancy contribute towards positive conservation outcomes by addressing the main threats of habitat loss, human-lion-livestock conflict, and prey depletion, which contributes to improving the status of lions in Zimbabwe. Further, the fees garnered through Mr. Fry's hunt will provide revenue to support these positive conservation outcomes.

Therefore, based on the information available to the Service, the purpose for which the permit is being requested, import of this trophy lion, is adequate to justify removing the sport-hunted trophy lion from the wild or otherwise changing its status.

17.32(a)(2)(ii): The probable direct and indirect effect that issuing the permit would have on the wild populations of the wildlife sought to be covered by the permit:

The total area under wildlife-based land use and conservation in Zimbabwe amounts to 10.7 million hectares and represents 27% of the total surface area of the country. Of this, 7.9 million hectares, or 75% of all conservation land in the country, falls under safari hunting as the primary or only source of revenue. Sport hunting of lions by U.S. hunters such as Mr. Fry supports the programs in Zimbabwe that provide the opportunity for locals to see value in lions, which in turn conserves the species in the long-term.

A scientifically based quota is the number of a given species that can be removed from a specific population without damaging the biological integrity and sustainability of that population (WWF 1997). However, full implementation and enforcement of the age-based strategy could potentially cause the need for quotas to become irrelevant or eliminated (USFWS 2015). Age restrictions will naturally restrict offtake to a limited number of individuals that meet the age criteria (Loveridge *et al.* 2007, Whitman *et al.* 2004).

Based on the information provided to the Service, it is clear that Zimbabwe has made strides in their management of their lion populations. Additionally, Zimbabwe appears to be transparent in its management processes, including its quota setting. In 2013, Zimbabwe proposed an adaptive age-based strategy for setting hunting quotas. This adaptive quota management system for lion hunting based on the ages of lions hunted has been accepted and embraced by all stakeholders; it has not only led to a reduced national lion hunting quota, but has also resulted in a significant increase in the age of harvested lions to a level that is considered to have a reduced ecological impact (Du Preez et al. 2016).

In 2015, the development of TRAS2 allowed the country to better monitor and govern the hunting sector, including developing an effective mechanism to fully account for export proceeds from the hunting sector. The continued participation of U.S. hunters, including Mr. Fry, in this market is anticipated to continue to maintain the viability of managing areas such as the BVC and SVC in their current form, including their contribution to conservation of lions in the wild. In 2015, lion sport-hunting generated USD 753,000 in revenue, which accounts for about 9% of all sport hunting revenue in Zimbabwe that year (ZPWMA 2016).

After evaluating the information provided by the Zimbabwe government and other sources, it appears that the hunting program in Zimbabwe is addressing the three main threats that were identified by the Service when making the determination that the species was threatened with the possibility of extinction. Moreover, hunting areas such as BVC and SVC are maintaining habitat for lions and ensuring that there is no further loss, provided that the hunting areas can remain economically viable. In order to maintain a viable population of lions, the parks, safari areas, and CAMPFIRE areas must maintain biodiversity and a sustainable prey base. Finally, Zimbabwe is actively working to reduce human-lion conflicts and the number of lions killed in retaliation for killing livestock. Therefore, the management of lions within Zimbabwe and the limited hunting of lions contributes to the on-going survival of the species in Zimbabwe.

The participation of Mr. Fry in the hunting and subsequent import of the trophy lion he harvested in the BVC provides an indirect benefit to wild lion populations by helping to support the reserves where lions are found; Mr. Fry's hunt has generated revenue to help support a hunting area where lions are found and conserved. Therefore, based on the information available to the Service, the probable direct and indirect effect that issuing an import permit for a legally hunted lion would have on the species would be positive.

17.32(a)(2)(iii): Whether the permit, if issued, would in any way, directly or indirectly, conflict with any known program intended to enhance the survival probabilities of the population from which the wildlife sought to be covered by the permit was or would be removed:

As stated above, Zimbabwe is monitoring and controlling the harvest of lions through permitting under their regulations and through the Strategy and Action Plan. The issuance of import permits for lions legally hunted under these

authorities would not conflict with any programs intended to enhance the survival probability of the species in Zimbabwe. Issuance of a permit authorizing import of Mr. Fry's trophy lion from Zimbabwe would work in favor of, not against, the principal acts governing lion conservation in Zimbabwe. Furthermore, sport hunting opportunities help local communities realize the value in conserving the African lion.

Therefore, based on the information available to the Service, the issuance of an import permit for a legally hunted lion does not conflict with known conservation programs.

17.32(a)(2)(iv): Whether the purpose for which the permit is required would be likely to reduce the threat of extinction facing the species of wildlife sought to be covered by the permit:

Considering Zimbabwe's limited, controlled off-take of lions in a manner that maintains sustainability, Mr. Fry's legal hunt contributes to reducing the threat of extinction of lions. It appears that the permitting activities under Zimbabwe's laws and CITES, as well as the implementation of the adaptive age-based lion quota, and a continuation of implementation of the outputs in the *Strategy and Action Plan* are working in concert to promote the long-term survival of lions in the wild in Zimbabwe. The use of revenue received from hunters, such as Mr. Fry, to manage the populations on the reserves is an important element of the success of lion management in Zimbabwe. For example, reportedly, USD 590,000 was spent on anti-poaching efforts by BVC alone during 2015 (K. Leathern, pers. comm., as cited in Du Preez et al. 2016). Therefore, based on the information available to the Service, the issuance of the requested import permit for Mr. Fry's legally hunted lion will likely reduce the threat of extinction facing lions in Zimbabwe.

17.32(a)(2)(v): The opinions or views of scientists or other persons or organizations having expertise concerning the wildlife or other matters germane to the application:

Based on reviewing comments made during the listing process for lions, as well as information obtained through personal conversations and literature, there is general agreement that hunting, done properly and well managed, would not have an adverse effect on lion populations. Numerous researchers have stated that, while they may not support hunting in general, they see that benefits can be received through a scientifically based hunting program for lions.

Based on the information available to the Service, there is general support by scientists and other persons or organizations having expertise concerning lions that the legal and sustainable harvest of lions, and the subsequent import of legally harvested lion trophies, as proposed in this application, would not have an adverse effect on the species and would further efforts to conserve the species in the wild into the future.

17.32(a)(2)(vi): Whether the expertise, facilities, or other resources available to the applicant appear adequate to successfully accomplish the objectives stated in the application:

Mr. Fry submitted a permit application to import a trophy of his personally, legally harvested lion from Zimbabwe for the purpose of enhancing the propagation or survival of the species in the wild. As a sport-hunter, Mr. Fry plays a large role in the hunting industry of Zimbabwe; the hunting and subsequent import of Mr. Fry's trophy lion increases the funds available to the Zimbabwe Government and BVC to implement lion conservation initiatives. Therefore, based on the Service's review of the information available relating to Mr. Fry's permit request, we find that the expertise, facilities, or other resources available to Mr. Fry appear adequate to successfully accomplish the objectives stated in the application.

Conclusion

As described above, the Government of Zimbabwe has been documented to implement the *Strategy and Action Plan* in the manner identified in the documents referenced in making this finding. The on-going adaptive management and limited and sustainable off-take of lions is important to the survival of lions in Zimbabwe, and the funds generated by Mr. Fry's participation contributes to the ongoing benefits the program provides to lions in the wild.

Therefore, based on the Service's consideration and analysis of the information associated with Mr. Fry's permit application and other relevant information available to the Service, as described above, we find that the import of the lion harvested by Mr. Fry on November 03, 2018, from the Bubye Valley Conservancy, Zimbabwe, meets the requirements for making a positive enhancement finding pursuant to 50 CFR 17.40(r) and 50 CFR 17.32(a). Therefore, the Service is able to authorize the import of the trophy of one lion taken from the wild in Zimbabwe, to Todd D. Fry of Boerne, Texas.

I. **Service Program and Geographic Area or Station Name**: Branch of Permits, Division of Management Authority, International Affairs

II. **Flexible Funding Program** (e.g. Joint Venture, etc.) if applicable: N/A

III. **Location**: 5275 Leesburg Pike, MS: IA, Falls Church, VA 22041-3803

IV. **Species/Critical Habitat**:

Southern and Eastern African lion (*Panthera leo melanochaita*)

Critical Habitat: N/A

V. **Project Description:** Describe proposed project or action or, if referencing other documents, prepare an executive summary (attach additional pages as needed):

As described in the permit application, 08061D, Todd D. Fry, has requested a permit to import a trophy of one lion that he lawfully hunted in Zimbabwe. The import is for personal purposes.

VI. **Determination of Effects:**

(A) Description of Effects: Describe the action(s) that may affect the species and critical habitats listed in item IV. Your rationale for the Section 7 determinations made below (B) should be fully described here.

Issuance of the requested import permit by the Branch of Permits will result in the importation of one personally sport-hunted lion that has been lawfully taken in Zimbabwe on the date specified in the permit application.

The trophy will be accompanied by the required CITES export permit issued by the CITES Management Authority of Zimbabwe.

The requestd U.S. Federal Fish and Wildlife import permit does not authorize the killing of an African lion; the authorization to hunt and lawfully take a lion is under the purview of the government of Zimbabwe. Therefore, the proposed action of issuing a Federal Fish and Wildlife import permit for this lawfully hunted lion will not directly or indirectly affect individuals of listed or proposed species or designated/proposed critical habitat of such species.

(B) Determination: Determine the anticipated effects of the proposed project on species and critical habitats listed in item IV. Check all applicable boxes and list the species (or attach a list) associated with each determination**.**

Determination

No Effect: This determination is appropriate when the proposed project will not directly or indirectly affect (neither negatively nor beneficially) individuals of listed/proposed/candidate species or designated/proposed critical habitat of such species. **No concurrence from DSA/ESFO required.** **X**

May Affect but Not Likely to Adversely Affect: This determination is appropriate when the proposed project is likely to cause insignificant, discountable, or wholly beneficial effects to individuals of listed species and/or designated critical habitat. **Concurrence from DSA/ESFO required.** _____

May Affect and Likely to Adversely Affect: This determination is appropriate when the proposed project is likely to adversely impact individuals of listed species and/or designated critical habitat. **Formal consultation with DSA/ESFO required.** _____

May affect but Not Likely to Jeopardize candidate or proposed species/critical habitat: This determination is appropriate when the proposed project may affect, but is not expected to jeopardize the continued existence of a species proposed for listing or a candidate species, or adversely modify an area proposed for designation as critical habitat. **Concurrence from DSA/ESFO optional.** _____

Likely to Jeopardize candidate or proposed species/critical habitat: This determination is appropriate when the proposed project is reasonably expected to jeopardize the continued existence of a species proposed for listing or a candidate species, or adversely modify an area proposed for designation as critical habitat. **Conference with DSA/ESFO required.** _____

TODD D. FRY
(b) (6)
BOERNE, TX 78006
U.S.A.

Authority: Statutes and Regulations: 50 CFR 17.40(r).

Location where authorized activity may be conducted:
IMPORT THROUGH ANY PORT LISTED IN 50 CFR 14.12

Reporting requirements: Not applicable

Authorizations and Conditions:

A. Authorized to import the sport-hunted trophy of one male African lion (*Panthera leo melanochaita*), taken in Zimbabwe for the purpose of enhancement of the survival of the species.

B. Specimen may not be sold or transferred for any financial remuneration.

C. **Trophy must have been taken during the 2018 hunting season.**

D. Trophy must be accompanied by a valid trophy permit or hunting license issued by the government of Zimbabwe for the 2018 season.

E. Trophy must be accompanied by a valid Convention on International Trade in Endangered Species of Wild Fauna and Flora (CITES) Appendix II export permit/re-export certificate, source code "W", issued by the Management Authority of Zimbabwe.

F. General conditions set out in Subpart D of 50 CFR 13, and specific conditions contained in Federal regulations cited above, are hereby made a part of this permit. All activities authorized herein must be carried out in accord with and for the purposes described in the application submitted. Continued validity, or renewal of this permit is subject to complete and timely compliance with all applicable conditions, including the filing of all required information and reports.

G. The validity of this permit is also conditioned upon strict observance of all applicable foreign, state, local, tribal, or other federal law. **This permit can be photocopied.**

H. Valid for use by permittee named above.

I. Acceptance of this permit serves as evidence that the permittee understands and agrees to abide by the "General Permit Conditions" (copy attached).

U.S. Fish and Wildlife Service
Division of Management Authority
Branch of Permits, MS: IA
5275 Leesburg Pike
Falls Church, VA 22041-3803
1-800-358-2104 or 703-358-2104

Type of Activity

IMPORT OF SPORT-HUNTED TROPHIES under Appendix I of the Convention on International Trade in Endangered Species (CITES) and/or U.S. Endangered Species Act (ESA)

Complete Sections A or B, and C, D, and E of this application. U.S. address may be required in Section C, see instructions for details.
Instructions on how to make your application complete and help avoid unnecessary delays are attached.

Section A: Complete if applying as an individual

1.a. Last Name	1.b. First Name	1.c. Middle Name/Initial	1.d. Suffix
Somers	Scott	Ross	

2. Date of Birth (mm/dd/yyyy)	3. Telephone Number	3.a. Alternate Telephone Number	4. E-mail address
(b) (6)			

Section B: Complete if applying on behalf of a business, corporation, public agency, Tribe, or institution

1.a. Name of business, agency, Tribe, or institution		1.b. Doing business as (DBA)	
2. Tax identification no.		3. Description of business, agency, Tribe, or institution	
4.a. Principal officer Last name	4.b. Principal officer First Name	4.c. Principal officer Middle name/initial	4.d. Suffix
5. Principal officer title	6. Primary contact name		
7.a. Business telephone number	7.b. Alternate telephone number	7.c. Business fax number	7.d. Business e-mail address

Section C: All applicants complete address information

1.a. Physical address (Street address; Apartment #, Suite #, or Room #; no P.O. Boxes)
(b) (6)

1.b. City	1.c. State	1.d. Zip code/Postal code	1.e. County/Province	1.f. Country
Davison	Michigan	48423	Genesee	U.S.A.

2.a. Mailing address (include if different than physical address; include name of contact person if applicable)

2.b. City	2.c. State	2.d. Zip code/Postal code	2.e. County/Province	2.f.Country

Section D: All applicants MUST complete

1. Attach the **nonrefundable application processing fee** in the form of a check or money order payable to the U.S. FISH AND WILDLIFE SERVICE **in the amount of $100**. Federal, Tribal, State, and local government agencies, and those acting on behalf of such agencies, are exempt from the processing fee–attach documentation of fee exempt status as outlined in instructions [50 CFR 13.11(d)].

2. Certification: I hereby certify that I have read and am familiar with the regulations contained in ***Title 50 Part 13 of the Code of Federal Regulations*** and the other ***applicable parts in subchapter B of Chapter I of Title 50***, and I certify that the information submitted in this application for a permit is complete and accurate to the best of my knowledge and belief. I understand that any false statement herein may subject me to the criminal penalties of 18 U.S.C. 1001.

Signature of applicant/Principal Officer for permit (No photocopied or stamped signatures) Date of signature (mm/dd/yyyy)

E. IMPORT OF SPORT-HUNTED TROPHIES *(Appendix I of CITES and/or ESA)*

Note 1: This form should be used to request authorization to import trophies of species listed on Appendix I of CITES and/or as threatened or endangered under the ESA (examples include elephants, lions, cheetahs, wood bison, and markhor).

PLEASE USE FORM 3-200-19 FOR SOUTHERN AFRICAN LEOPARD TROPHIES AND SOUTHERN WHITE RHINOCEROS TROPHIES TAKEN IN NAMIBIA.

Note 2: If you hold an import permit for a trophy that you did not use, please **return the unused original permit**. If you are requesting reissuance of a permit because you have taken a trophy, but were unable to import it prior to the expiration of the permit, please use the renewal form (3-200-52) and return your original permit with that form.

Note 3: Applications for species listed as endangered under the U.S. Endangered Species Act are published in the Federal Register for a 30-day public comment period. Please allow at least **90 days** for the application to be processed.

Note 4: *Sport-hunted trophy* is defined at 50 CFR 23.74 as follows: *Sport-hunted trophy* means a whole dead animal or a readily recognizable part or derivative of an animal specifically identified on the accompanying CITES document that meets the following criteria:

- Is raw, processed, or manufactured;
- Was legally obtained by the hunter through hunting for his or her personal use;
- Is being imported, exported, or re-exported by or on behalf of the hunter as part of the transfer from its country of origin ultimately to the hunter's country of usual residence; and
- Includes worked, manufactured, or handicraft items made from the sport-hunted animal only when:
  - i. Such items are contained in the same shipment as raw or tanned parts of the sport-hunted animal and are for the personal use of the hunter;
  - ii. The quantity of such items is no more than could reasonably be expected given the number of animals taken by the hunter as shown on the license or other documentation of the authorized hunt accompanying the shipment; and
  - iii. The accompanying CITES documents (export document and, if appropriate, import permit) contain a complete itemization and description of all items included in the shipment.

Note 5: Certain hunting trophies, including elephants, are subject to restrictions on their use after import into the United States. Please see 50 CFR 23.55 for more information or contact the Division of Management Authority.

Please provide the following information. Complete all questions on the application. Mark questions that are not applicable with "N/A". If needed, use a separate sheet of paper. On all attachments or separate sheets you are submitting; please indicate the application question number you are addressing. If applying for more than one trophy, be sure to answer questions 4-6 for each trophy addressed in this application. If importing trophies from more than one country, you must submit a separate application for each shipment in order to obtain separate import permits.

1. Name and address where you wish the permit to be mailed, if different from page 1. If you would like expedited shipping, please enclose a self-addressed, pre-paid, computer-generated, courier service airway bill. If unspecified, all documents will be mailed via the U.S. Postal Service.

2. Who should we contact if we have questions about the application (name, phone number, and e-mail)?

Scott Somers (b) (6) [redacted]

3. Disqualification factor. A conviction, or entry of a plea of guilty or nolo contendere, for a felony violation of the Lacey Act, the Migratory Bird Treaty Act, or the Bald and Golden Eagle Protection Act disqualifies any such person from receiving or exercising the privileges of a permit, unless such disqualification has been expressly waived by the Service Director in response to a written petition. (50 CFR 13.21(c)) Have you or any of the owners of the business, if applying as a business, been convicted, or entered a plea of guilty or nolo contendere, forfeited collateral, or are currently under charges for any violations of the laws mentioned above?

☒ No ☐ Yes

If you answered "Yes" to Question 3, provide: a) the individual's name; b) date of charge; c) charge(s); d) location of incident; e) court; and f) action taken for each violation. Please be aware that a "Yes" response does not automatically disqualify you from getting a permit.

4. For each trophy to be imported, provide:

   a. Scientific name (genus, species, and, if applicable, subspecies) and common name.

Panthera Leo (African Lion)

   b. Sex (if known). Male

5. **IF ANIMAL IS CURRENTLY LIVING IN THE WILD**, please enter the following information:

   a. Country and place (area, region, GIS coordinates, ranch, conservancy, management area, or hunting block, AND nearest city) where wildlife is to be taken from the wild:

   b. Date wildlife is to be hunted:

   c. Name of hunting outfitter, safari company, or professional hunter you will be hunting with:

6. **IF THE TROPHY HAS ALREADY BEEN TAKEN**, please enter the following information:

   a. Country and place (area, region, GIS coordinates, ranch, conservancy, management area, or hunting block, AND nearest city) where wildlife was removed from the wild:

Zimbabwa / Save Conservence / Chishakwe Ranch / Masvingo Province

   b. Date wildlife was hunted:

6/9/2018

c. Name of hunting outfitter, safari company, or professional hunter you hunted with:

John Greeff, PH No. 127 (14 Clark Road Suburbs, Bulawayo, Zimbabwe)
Passing Cloud Safaris T/A Pro Safis Africa 20 Haddon Avenue, Khumalo, Bulawayo, Zimbabwe

d. The current location of the trophy (address and country) [the U.S. import permit will identify this country as the country of export/re-export and must match with the foreign export/re-export document]:

Out Bound Cargo Trophy Exporters
5 Grantham Road Belmont, Bulawayo, Zimbabwe

7. Please provide a copy of any applicable foreign government permits or licenses that were required to remove this animal from the wild (if you have not hunted yet and do not currently hold any such permits or licenses, please indicate so).
Special License Attached

8. Complete name and address of overseas person or business shipping the trophy to you. If you are applying to import a trophy directly from **Namibia**, you must provide the name and address of the professional hunter listed on your Namibian hunting permit [this name will appear on the face of the export permit].

Name:	
Business Name:	Out Bound Cargo Trophy Exporters
Address:	5 Grantham Road
City:	Belmont
State/Province:	Bulawayo
Country, Postal Code:	Zimbabwe

9. For species listed under the U.S. Endangered Species Act, please be aware that the U.S. Fish and Wildlife Service (Service) must make a finding that your activities will enhance or benefit wild populations of the species involved. While we will communicate with the range country for the species you will hunt or hunted when making the required findings, if you have any information that could support this finding, it would be helpful for our review if you could provide it. Please submit such information on a separate page with your application.

a. Do you have any information regarding the population status or trend data on the species hunted?

Yes. Attached Lion Management Plan

b. In order to hunt, you likely paid for licenses or trophy fees. What were those fees and do you have any information on how those funds were used by either the landowner, local community, or government?

Trophys Fees listed on Hunting Return Form TRA52
Also see "Pro Safaris Africa & Documentation

c. Do you have information on other funding activities that are being carried out, or were carried out, by the safari outfitter, professional hunter, concession holder, or landowner that provide a conservation benefit to the species being hunted/species hunted?

See Lion Management Plan

CERTIFICATION STATEMENT (original signature must be provided for either 10 or 11 below)

10. If you are a broker or taxidermist applying on behalf of a U.S. hunter or foreign national, provide documentation to show you have a Power of Attorney to act on your client's behalf and sign the following statement:

I acknowledge that the sport-hunted trophy/trophies to be imported has been/will be personally hunted by my client and is being imported only for my client's personal use (i.e., not for sale, transfer, donation, or exchange that is reasonably likely to result in economic use, gain, or benefit). If applying for the import of an elephant trophy, I understand that my client may import no more than two elephant trophies in one calendar year.

Taxidermist/Broker's signature: _____ Date: _____

11. If you are the hunter applying to import your own trophy, please read and sign the following statement:

I acknowledge that the sport-hunted trophy/trophies to be imported has been/will be personally hunted by me and is being imported only for my personal use (i.e., not for sale, transfer, donation, or exchange that is reasonably likely to result in economic use, gain, or benefit). If applying to import an elephant trophy, I understand that I may import no more than two elephant trophies in one calendar year.

Applicant's signature: (b) (6) Date: 10/03/2018

Be aware that there may be additional permitting or approval requirements by your local or state governments, as well as required by other Federal agencies or foreign governments to conduct your propose activity. While the Service will attempt to assist where possible, it is your responsibility to obtain such approval.

12. All international shipments must be through a designated port. A list of designated ports (where an inspector is posted) is available from **the list of designated ports**. If you wish to use a port not listed, please contact the Office of Law Enforcement for a Designated Port Exemption Permit (form 3-200-2).

RE - SUPPORTING DOCUMENTATION FOR LION IMPORTATION– MR SCOTT ROSS SOMERS

This letter serves to confirm that the Mr Somers hunted with Pro-Safaris Africa on Chishakwe Ranch within the Save Valley conservancy in south east Zimbabwe.

Chishakwe ranch is 100% dependant on hunting income. Earnings from the hunts conducted for the 2018 season to date is $168,964.50 (One hundred and sixty eight thousand, nine hundred and sixty four dollars and fifty cents).
Of this amount the Lion portion is 23% of the value, which is $38,861.84 (Thirty eight thousand, eight hundred and sixty one dollars and eighty four cents only).

The money is spent on the management of the area. This includes staff wages, anti-poaching, water pumping, road maintenance, pipeline maintenance, security and general area maintenance.

Chishakwe employs 32 staff members with 210 Dependants in total.

There are six water points that are pumped from a dam within the ranch with approximately 45km of pipelines that need to be maintained.

Chishakwe receives one Lion tag and this hunt contributes 23% of total income. Losing the Lion tag has devastating implications for the sustainability of the area.

Lion in Zimbabwe have to be of 5 years or older of age. This is well documented.

For any further details, please don't hesitate to contact us.

Sincerely Yours

Louis Muller
Managing Director
Pro Safaris Africa

Executive summary

Although lion populations in African savannas are generally declining, there are several examples in southern Africa where lions have been reintroduced to private land, and where due to the protection afforded, are increasing in numbers. Although increases are typically a desired management outcome, inevitably most reserves reach a point when management decides that there are now sufficient lions to meet the reserves objectives, necessitating population control measures. Population control of lions does, however, often create management dilemmas as it is not always clear what approach will work best given the specific set of circumstances and budgetary constraints. In order of seeming preference the measures typically employed to control lion populations include a) translocation of subadults to new reserves, b) contraception of breeding lionesses, c) culling (including trophy hunting), and d) social manipulation.

All of these management options require a degree of population monitoring, which is often more costly than the management intervention itself. Although excess subadult, and even adult, lions could be removed from the Savé Valley Conservancy, it is not clear that there are any immediate destinations that would be suitable for these animals to be reintroduced into. Thus translocation, although useful, is not likely to remove sufficient lions to be

considered as a key approach for the conservancy. Contraception can be successfully applied in small reserves where resources, habitat and lion behaviour allow intensive monitoring and the manipulation of breeding rates. However, currently in the conservancy the degree of lion monitoring precludes contraception being considered as the main approach to population regulation.

As the numbers of lions in many southern African reserves have reached saturation, now days many reserves are faced with the need to cull lions. Typically this is achieved through the shooting of excess independent subadults, male coalitions, and occasionally lionesses from prides. The latter option is problematic in that it induces fear in the lions and thus affects game viewing opportunities. Few reserves are large enough for more natural population regulation mechanisms to be applied, but these can be simulated on most. Logically population control methods that simulate natural processes are likely to produce the most desirable outcome, with the minimum intervention, and thus minimum social disruption. Social disruption *per se* is a fourth population management approach the can be applied but is generally avoided because of how it may affect the tourism value of lions in many reserves.

Thus although all feasible approaches to lion population control should be investigated, currently culling, ideally as a trophy hunting exercise, is the most suitable option for the Savé Valley Conservancy. However, the lion population in the conservancy is large enough that a culling approach whereby lions of the appropriate sex and age are trophy hunted may be sufficient to induce population stability without having to resort to a more generalised culling approach. To date the aim for trophy hunting lions in the conservancy has been economic, with population management recently having become an additional objective. The challenge for conservancy management is to reliably set an off take or quota that meets the economic expectations and effectively limits lion population growth.

The basis of this plan draws on research findings that indicate that lion populations are more resilient to trophy hunting when only adult male lions are hunted. However, it is possible that stabilizing lion population growth when they have not reached carrying capacity may not be achieved through sustainable use models based on only hunting mature males. Thus it is likely that female lions will have to comprise a proportion of the quota to effectively limit population growth. Using this premise lion hunting in the conservancy could be manipulated in the following ways to maximise hunting returns while effectively limiting population growth:

1. Hunting male lions at an age threshold that will stabilize population growth

Although infanticide by adult male lions can increases the risk of population extinction, trophy hunting can be sustained simply by hunting males above a minimum age threshold. This strategy can maximize both the quantity and the quality of the long-term kill. Thus any

male older than five years of age can be safely hunted without negative effects on the population. This is proposed as the key lion population management tool to be employed in the conservancy.

2. Hunting males out of male coalitions that are large or defend key territories

Male lions reach peak reproductive success (as measured by the number of offspring surviving to 2 years of age) at 8 years of age. But males $\geq$ 7-8 years of age are the most suitable age class for high quality trophies. However, in certain circumstances very large coalitions acquire territories at 4-5years of age. These coalitions can usefully be reduced in size by hunting males out of them, which may delay the age at which they breed.

3. Hunting lionesses in areas where there has been a history of conflict

By monitoring problem animal reports it should be possible to identify areas of the conservancy that are particularly prone to these issues. While it is not advocated that problem causing lions are hunted as trophies, it could be useful to proactively hunt either subadult lionesses or lionesses from small less important prides in these areas. This intervention could reduce the future risk of livestock killing, but alleviates to possibility of unnecessarily classifying any lioness as a problem animal in order to get an allocation to hunt. In terms of problem animal control, sometimes repeat offending lions or lionesses are best shot to resolve conflict problems. For the reasons given, however, it is not suggested that these problem animals are trophy hunted. They should preferably be destroyed by conservancy members in collaboration with conservancy management.

4. Hunting older females from key prides

Although it has been reported in the literature that hunting lionesses can lead to population declines, there are natural scenarios that induce adult female mortality that could be simulated to control lion population growth in the conservancy. Lionesses in large dominant prides sometime kill lionesses from neighbouring prides in territorial fights. But in a population below carrying capacity one might expect fewer territorial fights. Thus one might simulate the 'predatory effect' of neighbours. Thus females to be hunted should be selected from less important prides keeping the nucleus of the dominant prides intact, especially if that meets emerging photo tourism objectives. Dominant prides typically occupy territories including multiple river intersections and have large resident herds of buffalo.

For the seasons 2012-2014 it is proposed that all male lions of five years or older are placed on quota, and that some lionesses are additionally placed on quota. This should equate to a male quota of at least eight males, and 3-5 females, per year. The outcome of this should be monitored by annual spoor surveys, a second conservancy-wide lion census in 2015, and a radio-tracking based monitoring program for the next three years. The objective of the radio-tracking study will be to try and determine the effects of this hunting strategy on key

demographic patterns. The off take strategy for lions in the Savé Valley Conservancy should be supported by the following activities:

1. Lion populations should be monitored via spoor counts, manager's estimates and for the next three years via radio-tracking and direct counts compiled during an annual workshop to help set the following year's quota.
2. Long-term records of quotas, number of licenses issued, and off take should be maintained and reported by the conservator on annual basis.
3. Measurements of lion skull size as well as body size should be recorded according to the guidelines specified in Appendix 2 of this plan for all lion shot, and where possible the individual should be identified by reserve management to assure all involved that an appropriate lion was shot.
4. Trophy age should be assessed by a combination of tooth development and wear, nose pigmentation, mane development, etc (see Appendix 2).
5. Hunters should record locations as accurately as possible of all lion shot using a GPS with records going to a central database to monitor intensity of use of certain areas.
6. The professional hunters should adhere to high ethical standards in terms of what is fair chase and in trophy selection.
7. Safaris should not be marketed to clients as "sure things," to relieve professional guides somewhat from pressure at having to deliver a lion, regardless of quality.

Problems with the implementation of any lion management plan, however, include the fact that lions are difficult to census and available techniques are prone to statistical problems. These issues of population monitoring can be resolved in four ways with increasing levels of certainty and cost, from surveys of landowners and managers to get estimates of population size and structure, to long-term direct monitoring. It is proposed that manager surveys (manager estimates) and track frequency estimates are conducted annually, and that the call-in survey conducted in June/July 2011 be repeated in 2015. However, it is also important to secure funding for long term direct monitoring. Additionally careful monitoring of hunted lions should be mandatory (see Appendix 1). Based on the respective recent surveys there currently seem to be about 170 lions in the conservancy, as detailed in the table below.

Survey method used	**SVC lion population estimate**
Spoor estimate from 2010	148
Call-up estimate	168 (95% confidence limits: 128-207)
Managers estimate	162

An additional concern is the management of livestock predating lions. Although more comprehensive details are presented in the plan, the two key issues to address with all stakeholders to reduce conflict are that:

a. All grazing livestock should be accompanied by a herder and at least two dogs and donkeys that are wary of lions (and other predators).
b. All livestock should be kraaled at night in lion proof bomas (at least 6 foot high and non-see-through) with at least two herders (owners) and two dogs in attendance.

If these fairly simple measures are in place relatively few conflict situations will arise. The appropriate materials for boma construction vary from site to site, but in the conservancy there should be no shortage of mopane trees for stout pole boma constructions, augmented by old fencing materials (see page 7, 10 and 21 of the toolkit). One of the key weak points in bomas is the gates. Corrugated iron, or flattened oil/diesel drums, can be fashioned into useful and effective gates. Dogs are key to the success of most mitigation measures (see page 16 and 17 of the toolkit), but must be vaccinated to avoid disease transmission. Conservancy members should lobby the authorities in the area for comprehensive vaccination of all dogs.

It is also important to reach out to the communities to assist in educating about predators and how to live with them, and for creating awareness and better attitudes generally (see pages 26 to 31 of the toolkit). Existing outreach programs by various conservancy constituencies should be supported by conservancy members and by a conservancy conservation fund.

All livestock predation events should be well reported and any interventions should follow a protocol best established in a work shop process with all stakeholders involved. While habitual livestock killing lions might best be destroyed, this should only be done when other mitigation measures have been attempted, and should not be used as a trophy hunting opportunity. Thus all destruction of problem lions should be undertaken by conservancy members and staff.

1. Introduction

Lions are a powerful cultural symbol of Africa, and an important indicator of an area's wildness. Lions are also a key species for photo-tourism, safari trophy hunting, and research. As a key member of the Big Five they form an integral component of the classical African hunting safari. However, lions are increasingly threatened, with much of their former range now lost. Where lions still survive, they can be a major predator of domestic livestock, presenting challenges and hardship to those who live amongst them. Thus whilst lions are a major source of economic benefit being one of Africa's most important tourism attractions, they can also be an economic and dangerous liability.

In 2002 the Zimbabwe lion population was estimated to be between 1,000-1,700 animals (Chardonnet 2002, Bauer and Van der Merwe 2004,) with an estimated range of c. 90,000 km^2. However, to date information on population status, current distribution and trends still remain lacking for most major wildlife areas in Zimbabwe, although there are estimates of numbers for some areas. Lion specific surveys and research have largely been limited to national parks and wildlife estates, notably Hwange National Park, the Matetsi Safari Area in northwest Matabeleland, and Mana and Matusadona National Parks in the Zambezi Valley (Monks 2005). In the south-east lowveld lions have been monitored in different areas using a combination of track frequency counts, call-in surveys, and direct monitoring. Track surveys have been conducted in Savé Valley Conservancy from 2007-2010 (Groom 2008-2010). Call-in surveys have been conducted in Gonarezhou National Park (Groom & Funston 2010, Groom & Funston in prep) and sporadically in Savé Valley Conservancy from 1996 to 2007 (Pole 1999; Pole 2003), and lions have been directly monitored in Malilangwe.

Previously in this region lions were largely extirpated by cattle ranchers and until quite recently were only resident in and around Gonarezhou National Park. They did, however, re-colonise the Savé Valley Conservancy in about 2000, and have been increasing ever since. The recent rate of recovery has fuelled concerns about the impact on various ecological and economic processes, necessitating a comprehensive management plan with appropriate options.

1.1 Savé Valley Conservancy

During the 1980s and 1990s game ranching developed as a major land use in the south-east Lowveld of Zimbabwe. In several areas, ranchers cooperated to form large collaboratively-managed wildlife areas, or conservancies. The most notable example of this was the 3,450 km^2 Savé Valley Conservancy, created in 1991 from 18 former cattle ranches (Figure 1). The natural land cover is deciduous woodland savanna dominated by *Colophospermum mopane,* Acacia-Combretum woodland and *Acacia tortillis* woodland (Pole 2004). Following a bad drought in 1991/1992, most of the conservancy's cattle were removed and the focus shifted

to development of multi-use wildlife production systems based on high quality tourism (Pole 1999). All internal fences were removed and a double 350 km perimeter game fence was constructed around the perimeter of the conservancy. Today, the conservancy comprises 23 individual properties, constituting 18 management units.

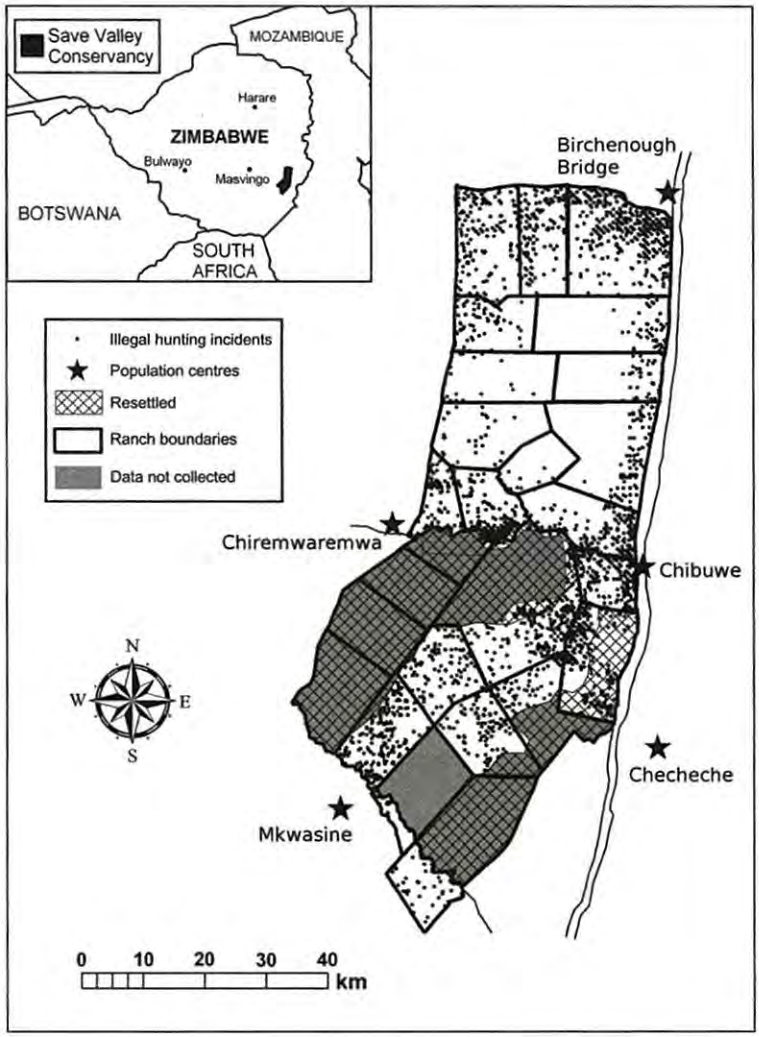

Figure 1. Map of the Savé Valley Conservancy highlighting settled land and the distribution of illegal hunting incidences from 2005 to 2009 (from Lindsey *et al.* 2010)

Prior to the development of the area for cattle ranching in the 1920's, the Savé Valley was one of Zimbabwe's major wildlife refuges (Pole 1999). To facilitate the development of the cattle ranching industry, however, almost all predators and most large herbivores were virtually eradicated. This included wild dogs, lions, cheetahs and spotted hyenas, with leopards managing to exist at reasonable densities (du Toit 1994, Pole 1999). When the conservancy was formed, 3,950 animals of 14 species were reintroduced and a security system was established, including ranch-based anti-poaching teams to control illegal

hunting. Wildlife abundance and diversity increased rapidly during the 1990s, as did financial returns from photographic tourism and safari trophy hunting (Lindsey *et al.* 2008). Since the formation of the wildlife conservancy, however, predator numbers have increased, largely through natural recolonization (although 13 lions were reintroduced between 1995 and 2005). Nonetheless, and despite no eradication attempts since 1991, lion and spotted hyaena densities in the conservancy remained low for several years (see Pole 1999), and only began increasing significantly in 2007/2008.

The conservancy's positive development trends were, however, reversed in 2000-2001 with the onset of national land reform in Zimbabwe. Nine properties in the south of the conservancy (comprising 33% of the total land area) were settled by subsistence farmers, and approximately 80 km of 2m twin perimeter game fences was removed. Properties in the north of the conservancy were not settled. The settlement process coincided with the onset of large scale illegal bushmeat hunting (Lindsey *et al.* 2010).

1.2 Lion Population Recovery in the Savé Valley Conservancy

The initial recolonization of lions in the Savé Valley Conservancy remains sketchy. However, records from Sango Ranch (Dusty Joubert, *unpublished data*) reflect the pattern the process is likely to have taken in much of the conservancy:

"Lion tracks were first recorded on Sango in April 2000. The first records all seemed to be of males, with three males observed during 2001. By the end of 2002 the tracks of five male lions were known, but as yet no females had been identified. However tracks of female lions were recorded in the Bedford Block in 2003. In 2003 a male and female lion were recorded on Mokore Ranch. This lioness was reported with cubs on Mokore in 2004. On 18 August 2005, ten lions (4 lionesses, 6 small cubs) were captured at Malilangwe Conservancy and released on Sango Ranch. These lions remained for approximately two weeks in the Chanurwe hill area, and were driven away by a male and female lion that was now moving regularly along the B-line. The newly released lions moved to Chisangaurwe hill where they would hide in the day and hunt in the Savé River area during the night. On 18 November 2005 two of the 10 lions were found dead in snares with a third lion that had broke the snare. This had a devastating effect on the pride with the remaining lions splitting up. It is not clear how many lions survived but it seems from sightings and track records that three adult females and one cub remained. Over the next few years the lions on Sango increased to about 10 individuals by 2007.

In April 2007 a lion monitoring census was conducted throughout in the conservancy. Two methods were used to determine the number of lions in the area. The first being the call-up method with a tape played of a dying buffalo calf, while the second was a track count

survey. On 7 May 2007 tracks of two male, three female and two-three cubs were seen at B3-trough (C10) and were named the Makonde pride. By September 2007 it was estimated that the lion population on Sango stood at about 24 lions."

Track index surveys conducted from 2007 to present indicate that lions in the conservancy are currently undergoing exponential population increase (Figure 2, Groom 2008-2010). It is thus clear that the numbers of lions are increasing rapidly, and may yet double in numbers before reaching equilibrium. Financial assessments suggest that this would not be a viable situation (Funston, Groom & Lindsey *in prep*) and thus some population control mechanisms are desired by the landowners. This could be effectively achieved through trophy hunting, although some consideration may need to be given to the large female segment of the population.

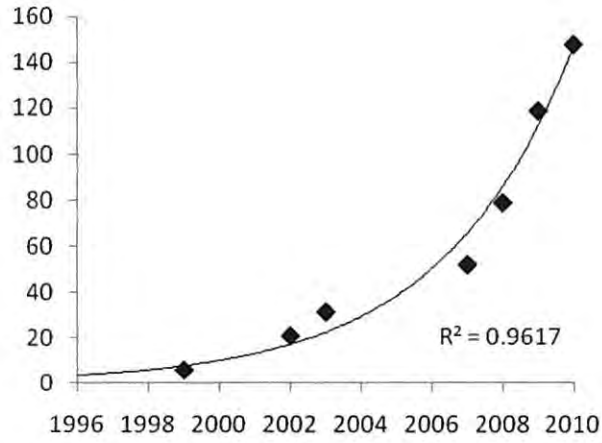

Figure 2. Rate of increase of lions in the Savé Valley Conservancy from 1996 to 2010 as determined by call-in and track index surveys. Average growth rate is $35\%^{-year}$

1.3 Background to Conservation and Modern-Day Trophy Hunting of Lions

Large carnivore species, including lions, are becoming increasingly threatened in Africa, especially when not protected in large conservation areas (Woodroffe & Ginsberg 1998). Fortunately, the popular appeal of charismatic carnivores such as lions has often led to the conservation of habitat that sustains a host of other species. In southern Africa, game reserves and game ranchers recognize the importance of maintaining lion populations and in some game reserves lion populations have been re-established to attract tourists and hunters (Anderson 1981, Mills 1991, Van Dyk 1997, Hunter 1999, Hoare & Williamson 2001, Funston 2008).

Photo-tourism and safari trophy hunting are two industries that have developed to create revenues whilst maintaining wildlife and wild lands. Although these industries differ considerably in their use of wildlife, it is clear that both can help to maintain parks, reserves,

wildlife, and the communities around them (Wilkie & Carpenter 1999, Lindsey *et al.* 2006). Although photo-tourism is generally perceived as less invasive, and therefore seems more in line with conservation efforts, hunters spend substantially more money towards their safaris and generate high revenues that can be used to support wildlife conservation (Wilkie & Carpenter 1999, Lindsey *et al.* 2006). Due to political instability safari trophy hunting, and meat sales from shot animals, currently generates most income in the Savé Valley Conservancy, although some landowners have expressed interest in attempting to shift their economic activities towards photo-tourism.

In Africa, safari trophy hunting generally occurs in areas not suitable for other livelihoods, such as farming or photographic tourism, and generates considerable revenue for land that would otherwise be considered of marginal value (Kiss 1990). The wealthy foreign elite have continued to demonstrate "willingness-to-pay" for the opportunity to hunt. If harnessed responsibly, this motivation may prove to be both an economically and biologically sustainable solution for making wildlife pay for itself (Child & Child 1990, Eltringham 1994). However, this "use-it-or-lose-it" philosophy (Baskin 1994, Kock 1995) is not without its critics (for a review see: Lavigne, Callaghan & Smith 1996). Central to the arguments against hunting is the notion that profit-oriented short-term gains go largely to an elite few at the expense of the masses and increase the risk for over-exploitation. Therefore, given that some target species are especially vulnerable to over-exploitation, in large part due to their life histories (e.g. lions), relative demand by trophy hunters, and economic potential, it is critical that they be managed conservatively and responsibly in order to assure their future existence.

As one of the principal attractions for safari hunters, lions are economically important to the hunting industry. However, a high risk of infanticide associated with the removal of resident males, combined with high demand, unsustainable quotas, and an industry plagued by mismanagement, make lions particularly vulnerable to over-exploitation (Whitman 2002, Yamazaki 1996, Loveridge *et al.* 2007, Packer *et al.* 2009, 2011). For these reasons, lions have a high "extinction potential". This easily sets up a situation of "killing the goose that lays the golden egg" when profit-oriented short-term gains become the driving force behind lion management, rather than sustainable quotas and long-term conservation. Likewise, because harvesting a socially complex species, such as lions, may result in unforeseen cumulative effects, traditional models used for the harvesting of ungulates may be misleading to even the well-intentioned manager, if not at odds with sustainable use (Whitman & Packer 1997, Greene *et al.* 1998).

Currently, only a few scientific studies have examined the extent to which sport hunting affects lion populations (Zambia: Yamazaki, 1996; Tanzania: Creel & Creel 1997, Whitman & Packer 1997, Whitman *et al.* 2004; Zimbabwe: Loveridge *et al.* 2007), and the long-term management implications from an economic or biological perspective have yet to be fully

understood (Whitman 2002). In order to effectively hunt lions within an area, without causing negative impacts on the population, it is imperative to study populations to determine the status of the individuals within the local prides (Whitman & Packer 1997).

Lions tend to be relatively resilient in recovering from population declines, and even catastrophic events, when conditions are good. For example, in the Serengeti National Park, after experiencing a particularly virulent form of canine distemper in 1994-95 that killed approximately 30% of the population, the lion population was fully recovered within a few years (Packer *et al.* 1999). Similar recoveries were recorded in the Kruger National Park after intensive culling programs (Smuts 1976, 1978). However, despite a lion population's ability to recover quickly, local population reductions and extirpations are not uncommon and may result from a combination of a number of factors: illicit game meat hunting, civil unrest, human encroachment, problem animal control, habitat loss, and unsustainable trophy quotas, to name a few. By targeting specific individuals based on their social status, safari hunting could however become a useful management tool to facilitate and maintain population growth and management.

Furthermore lions are also known to affect populations of prey (Mills & Shenk 1992) and smaller carnivore competitors, such as the African wild dog (Mills & Gorman 1997) and cheetah (Kelly & Durant 2000), adding to the uncertain future of several endangered species. Additionally nomads, dispersing subadults and resident lions often become problem animals creating conflicts with farmers and local people.

Large carnivores frequently symbolise Africa's wilderness to the general public who support their relocation or reintroduction. The lion holds a deep emotional appeal to the general public and is the single most sought-after species for tourists visiting reserves. Revenue from increased eco-tourism to South Africa is viewed as a potentially lucrative alternative to either hunting or subsistence and intensive farming practices, which are usually at odds with wildlife. As a result, government and private landowners in South Africa are attempting wildlife reintroduction projects on a scale that is not occurring anywhere else in Africa (Hunter 1999, Funston 2008).

2. Motivation for Trophy Hunting Lions in the Savé Valley Conservancy

To date the main aim of hunting lions in the Savé Valley Conservancy has been to raise revenue. From 2005 to 2009 seventeen lions were hunted (mean = 3.4 lions year^{-1}), yielding gross income of US$912,900 (US$182,580 year^{-1}). Currently the conservancy has a lion population of similar density (160 lions = 6.9 lions/100 km^2) to similarly vegetated areas in northern Kruger National Park with medium prey density (Ferreira & Funston 2010). However, projections based on prey biomass suggest further increase can be expected. Being surrounded by communal settlement areas the conservancy is a net source for lions in

the area, and is no longer a sink for dispersing lions from other areas. Therefore, the population needs to be managed as a distinct population, largely isolated from other populations, but still with the possibility of genetic material coming in from other areas. As a source area, with dispersal of animals to surrounding areas, trophy hunting may be an appropriate management tool to reduce conflict with adjoining land users by targeting specific males before dispersal and possibly small prides in high conflict areas (Venter & Hopkins 1988). In fenced reserves in South Africa intensive removals of dispersing lions are routinely done to reduce the risk of lions breaking out into communal areas (Van Dyk 1997) and to control population growth (Kettles & Slotow 2009).

3. The Potential of Safari Hunting to Impact Lion Populations

Literary sources indicate that excessive safari hunting of lions has the potential to negatively affect lion populations (Yamazaki 1996, Whitman 2002, Loveridge *et al.* 2007, Groom & Funston in prep), especially when lion quotas are large in relation to population size and animals taken from the population are in the early part of their reproductive prime. It is, however, very important that this impact is measured appropriately, and that the results of various data analyses are carefully interpreted. For example, professional hunters throughout Africa generally suggest that "suitable" trophy males appear to be declining in many areas over the last few decades, which may in many cases be true (Yamazaki 1996, Loveridge *et al.* 2007), and may serve as an index of a negative trend within the population. However, it would also seem that immature males are often easier to find because they readily scavenge from baits and are often less wary than older males, thus making them more vulnerable to hunters (Whitman 2002). This could thus in part account for the higher proportion of substandard trophies exported from Africa each year.

The sex and age of the lions hunted is thus important when assessing sustainability. The importance of adult survival for population growth has been reported for numerous moderate- to long-lived (k-selected) animal species (Wu & Botkin 1980, Crouse *et al.* 1987, Caswell 1989, Crooks *et al.* 1997). Since adult survival acts upon individuals with the highest reproductive value repeatedly, changes in this demographic rate are likely to strongly affect population growth. Van Vuuren, Herrmann and Funston (2005) using a deterministic spreadsheet model, found that adult female survival is the most important factor influencing population growth, and that human-livestock-conflict accounted for significant numbers of adult lionesses being shot each year in areas adjacent to the Kgalagadi Transfrontier Park. Loveridge *et al.* (2007) showed that persistence of boundary prides in Hwange National Park is negatively affected both by excessive adult mortality through hunting, as well as adult female mortality through sport hunting and human-livestock-conflict. It would thus seem that the frequency of adult lioness mortality a particular lion population is exposed too might be decisive in forecasting its long-term viability. Until recently lionesses were not hunted in the conservancy and as such this strongly increase the

viability of this population, and its resilience to limited sport hunting of adult males. However, a limited off take of adult lionesses (<3%) should be sustainable (Van Vuuren *et al.* 2005).

Although adult females are crucial members of the population, consideration should also be given to the effect that mortality of pride males might have on the survival of age-classes that are vulnerable to intra-specific competition or conflict, namely dependent cubs that are susceptible to infanticide. The most important shortcoming of most models thus far is that they are unable to monitor or detect socio-ecological changes in the population (Van Vuuren *et al.* 2005), which may be of particular importance if lion persecution were to cause changes in social behaviour (Yamazaki 1996, Whitman & Packer 1997). This has largely been overcome in a model published by Whitman *et al.* (2004), which shows that although infanticide increases the risk of population extinction, trophy hunting could be sustained simply by hunting males above a minimum age threshold, and this strategy maximizes both the quantity and quality in the long-term. Whitman *et al.* (2004) conclude that any males ≥ 6 years of age can be safely hunted without negative effects on the population. This figure, however, is being widely debated as being too young, and may represent the market forces in the country (Tanzania) where the research was conducted.

The mechanism by which the loss of mature males is thought to influence the population is that it may result in an increased rate of young cubs succumbing due to the pride being irregularly guarded by the fathers (Loveridge *et al.* 2007) or infanticide when new adult males become the pride owners (Schaller 1972, Packer *et al.* 1988), ultimately having a detrimental effect on the growth of the population (Starfield *et al.* 1981, Whitman & Packer 1997). Thus the role of the territorial males in defending their territories against other challenging males, and the protection they afford their offspring, should not be dismissed. While it is possible as suggested by Whitman *et al.* (2004) that younger males can impregnate lioness, the experience and maturity of adult males may be very important for successful rearing of cubs.

In areas depopulated of mature males the remaining mature males cover very large areas incorporating several prides (Yamazaki 1996, Loveridge *et al.* 2007). This obviously reduces their ability to effectively defend their prides ranges, and results in average pride size, as measured by the number of lionesses, declining to ≤ 3, as well as cub survival declining to low levels (Loveridge *et al.* 2007). Packer *et al.* (1988) showed that prides of 3-10 adult lionesses have a higher individual fitness than smaller or larger prides, and thus prides reduced to <3 adult females have lower probability of persisting.

Adult males in the Selous Game Reserve, Tanzania, were shown to be able to sustain sport hunting that removed between 2.7 and 4.3 percent of the population annually (Creel & Creel 1997), while the removal of 10 to 16 percent is suggested to be unsustainable in the

long-term (Starfield *et al.* 1981, Venter & Hopkins 1988) in a closed population. In Zimbabwe a quota of 8% of the male population (Martin & Thomas 1991) has been shown to be difficult to sustain (Loveridge *et al.* 2007), although it is debatable whether the starting populations were accurately estimated. Thus it appears that adult males are more resilient to trophy hunting than are adult females, and that off takes of about 5-10 % per year of the adult males in the population are probably sustainable provided that the individual lions are selected carefully (Starfield *et al.* 1981, Venter & Hopkins 1988, Whitman *et al.* 2004).

The challenge that management is thus confronted with is to reliably estimate population size and structure and set a sustainable off take. This is, however, more complex in a reserve such as the SVC, which also supports a sizeable ecotourism sector incorporating safari lodges and photo-tourism vehicle safaris, for which reliable and satisfactory sightings of species such as lions are paramount.

4. Lion Survey Techniques to Determine Quotas

Conventional census techniques are inappropriate for estimating numbers of nocturnal, low-density carnivore species such as lions. The difficulties include that due to their cryptic shy nature, and because many lion areas are wooded further reducing visibility (Norton-Griffiths 1978), which makes aerial censusing inappropriate for lions. Furthermore in areas where lions are intensively hunted they are more likely to be shy, affecting most censusing techniques (Whitman 2002, Funston & Janse van Rensburg 2003). The best method to obtain a reliable population count and demographic assessment of a lion population is via a direct count, whereby each individual in the population is identified and counted. Packer *et al.* (1999) clearly demonstrates the benefits of using individual identification in terms of tracking population fluctuations in the Serengeti over 30 years. However, direct counts are generally not only prohibitively expensive and time consuming, but are also potentially impractical for anything but small areas.

Once direct counts have been discounted for surveying the size of a specific lion population can be effectively determined through total counts using a baited call-up station methodology, as developed by Smuts *et al.* (1977). Mills, Juritz & Zucchini (2001) developed a calling station method (limited time without bait) for censusing spotted hyaena (*Crocuta crocuta*), which has been adapted for censusing lions (Ogutu & Dublin 1998, Ferreira & Funston 2010). Call-ups surveys are generally conducted by broadcasting hyena vocalizations at a kill and/or wildebeest or buffalo distress calls across loudspeakers, and are useful at estimating lion numbers (Mills, 1985; Creel & Creel, 1997; Ogutu & Dublin, 1998, Ferreira & Funston 2010). Calling stations rely on a single, independent experiment to estimate the probability of the response to sounds, which might be different for different regions (Loveridge *et al.* 2001). Thus, call-ups have not yet been clearly shown to be effective for censusing lion populations in all situations, and may be biased by lion response

probabilities being variable as well as by poor experimental design or incorrect analysis. Response to call-ups seems to be particularly low in low-density (Funston 2001) and trophy hunted lion populations (Whitman 2002, Funston & Janse van Rensburg 2003). Furthermore, the effective luring range for predators varies considerably with regards to the vegetation density, topography as well as the season. Smuts *et al.* (1977) suggested that the dry season is definitely the best time of the year to carry out surveys.

There have been recent advances in using track frequency as an index to estimate lion density (Stander 1998, Funston & Ferreira 2010). The Savé Valley Conservancy is a good site for this monitoring technique as it largely has suitable road substrate, available tracking skills, and the possibility of accurate direct counts. As will be presented below it is likely that the combined knowledge of safari guides and landowners could be effectively collated to determine annual estimates of the lion population size and structure within the conservancy.

Given the difficulties generally encountered when trying to estimate lion abundance in a particular area, it is not surprising to find that lion quotas for hunting concessions in Africa are in most cases based on little more than educated guesses (Severre 1995). Thus, as most hunting areas do not have a reliable count of lions, recommending a number based upon a certain percentage for sustainable harvest is inherently problematic in most areas. Lion hunting is thus generally adaptively managed in the sense that off take is generally a reflection of what hunters were able to find in the previous year. In contrast, with good monitoring it should be possible to set lion hunting quotas in the conservancy more carefully based on good estimates of population size and structure. Adaptive management is an accepted technique in resource management (Holling 1978, Walters 1986), and should be the guiding principle in the conservancy to set annual quotas.

However, in practice sound guidelines and adaptive approaches are often flawed in a few important ways specific to the lion hunting industry. This is because standards in trophy quality are often not maintained, quotas are often set beyond sustainable limits, and lions are often then lured out of national parks into adjacent hunting areas. The problems encountered in the lion hunting industry are primarily because much profit is to be made by shooting lions, and government issued policies and quotas are not always conducive to long-term management, nor are government employees beyond corruption whether it be at the lowest or highest level (Overton, 1998). Thus, unless the professional hunter adheres to a higher standard in selecting trophies and companies follow suit by insisting upon (if not suggesting) sustainable quotas, the profit-based quota system as it stands now is not sustainable in the long-term for most countries.

It is, however, clear that the Savé Valley Conservancy collectively desires to conduct safari hunting in a responsible and conservative manner and will police unethical behaviour. This is

important both in terms of sustainability, and to ensure minimum disruption of the photo-tourism potential within the reserve.

5. Population Dynamics and Regulating Lion Population Growth

Although lion populations in African savannas are generally declining, there are several examples in southern Africa where lions have been reintroduced to private land and due to the protection afforded are increasing in numbers (Funston 2008). Although increases are typically a desired management outcome inevitably most reserves reach a point when management decides that there are now sufficient lions to meet the reserves objectives and thus population control measures need to be instituted (Kettles and Slotow 2009; Slotow & Hunter 2009). Population control of lions does, however, often create a management dilemma as it is not always clear what approach will work best given the specific set of circumstances and budgetary constraints. In order of seeming preference, the measures typically employed to control lion populations include translocation of subadults to new reserves, contraception of breeding lionesses, culling (including trophy hunting) and social manipulation (Kettles & Slotow 2009).

All of these management options require a degree of population monitoring, which is often more costly than the management intervention. Although excess subadult, and even adult, lions could be removed from the Savé Valley Conservancy, it is not clear that there are any immediate destinations that would be suitable for these animals. Thus although a useful approach, translocation is not likely to remove sufficient lions to be considered as the key approach for the conservancy. Contraception can be successfully applied in small reserves where resources, habitat and lion behaviour allow intensive monitoring and manipulation of breeding rates. However, currently in the conservancy the degree of lion monitoring precludes contraception being considered as the main approach to population regulation. Lions are just too shy in the conservancy and not well enough understood to effectively apply contraception. However, this could change with time if more resources are invested in monitoring, and particularly if trophy hunting pressures where eased in areas of the conservancy wanting to focus on photo tourism.

As the numbers of lions in many southern African reserves have reached saturation, generally most reserves are currently faced with the need to cull lions (Kettles & Slotow 2009). Typically this is achieved through the shooting of excess independent subadults, adult male coalitions, and occasionally lionesses from prides. The latter option is problematic mainly in that it induces fear in the lions and thus affects game viewing opportunities. Few reserves are large enough to allow natural population regulation mechanisms to be applied or simulated. However, population control methods that largely simulate natural processes are likely to produce the most desirable outcome, with the

minimum intervention, and thus minimum social disruption. The Savé Valley Conservancy is, however, large enough to allow simulated approaches.

Social disruption *per se* is a fourth population management approach the can be applied but is generally avoided because of how it may affect the tourism value of lions in many reserves. Thus although all feasible approaches to lion population control should be investigated, currently culling as a trophy hunting exercise is the most suitable option for the conservancy. Thus the lion population in the conservancy is large enough that a culling approach whereby lions of the appropriate sex and age are trophy hunted may be sufficient to induce population stability without having to resort to a more generalised culling approach.

To date the aim for trophy hunting lions in the conservancy to date has been economic, with population management recently having become an additional objective. The challenge for conservancy management is to reliably set an off take or quota that meets the economic expectations and effectively limits lion population growth. The basis of this plan draws on research findings that indicate that lion populations are more resilient to trophy hunting when only adult male lions are hunted. However, it is possible that stabilizing lion population growth when they have not reached carrying capacity may not be achieved through sustainable use models based on only hunting mature males. Thus it is likely that female lions will have to comprise a proportion of the quota to effectively limit population growth.

The various estimates suggest that currently there are about 170 lions in the conservancy (Appendix 1). An older male biased trophy hunting system, with limited hunting of adult lionesses in certain contexts should stabilize population growth. To be successfully implemented, however, trophy age needs to be carefully monitored, and accurate hunting records kept. The aging criteria and required hunt records are outlined in Appendix 2. As it is the stated goal of conservancy members to hunt lions for profit, and as the threshold lion population that will not induce financial cost is relatively low (Appendix 3), various trophy hunting options to regulate lion population growth are proposed here. The strategies that are suggested are outlined below and discussed in detail in the following four sections:

5.1 Hunting male lions at an age threshold that will stabilize population growth

Whitman *et al.* (2004) showed that although infanticide increases the risk of population extinction, trophy hunting could be sustained simply by hunting males above a minimum age threshold, and this strategy maximizes both the quantity and the quality of the long-term kill. Whitman *et al.* (2004) conclude that any males $\geq$ 6 years of age can be safely hunted without negative effects on the population. Thus logically if one wanted to reduce a lion population one might hunt males below this age threshold, whereas stability should be

achieved hunting at the age-threshold (see Figure 3). This is proposed as the key lion management tool to be employed in the conservancy.

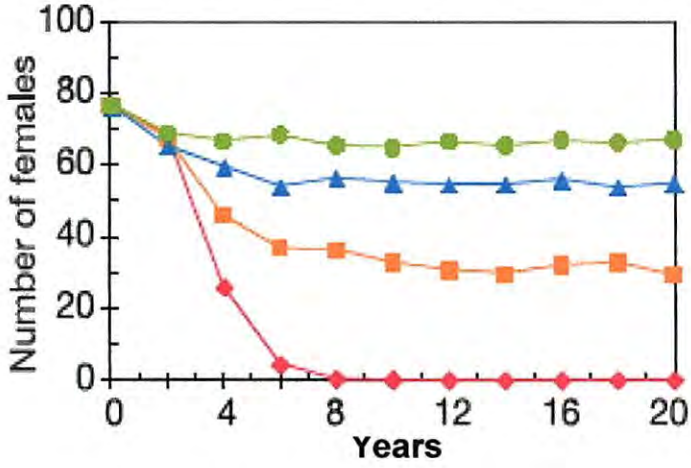

Figure 3. The effects of trophy hunting on the number of adult females after 20 years, as a function of quota size and male age. Average outcome after 100 runs is shown from shooting males of the following ages: ≥3 yr old (red), ≥4 yr (orange), ≥5 yr (blue), ≥6 yr (green)(from Whitman *et al.* 2004).

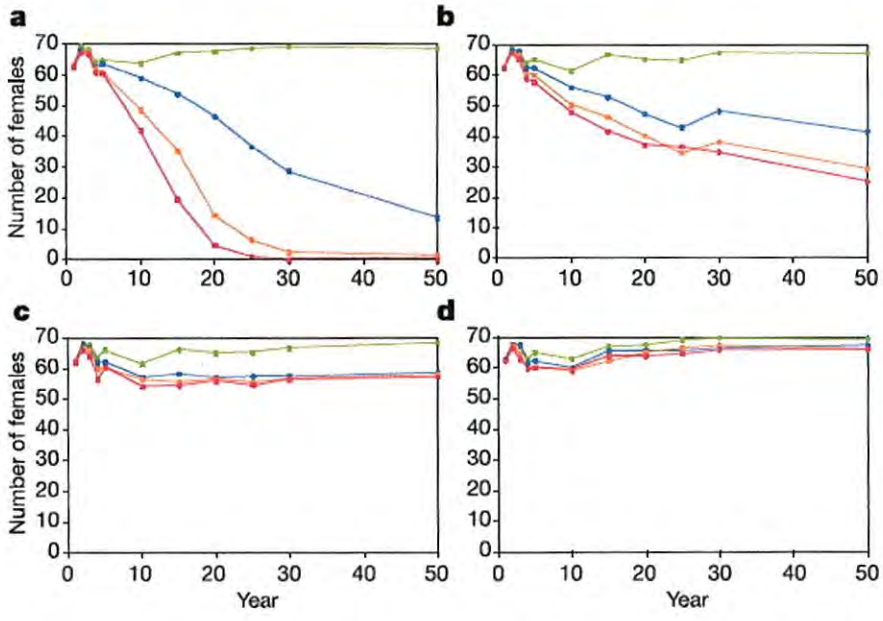

Figure 4. The effect of quota size and male age on female population size through time as a function the age at which males are hunted. Red indicates average outcome over 100 runs from annual quota of 10 males, orange from quota of 6 males, blue from quota of 4, and green from quota of 2. a–d, Female population size when hunters shoot males that are ≥3 yr old (red), ≥4 yr (orange), ≥5 yr (blue), ≥6 yr (green)(from Whitman et al. 2004).

For the seasons 2012-2014 it is proposed that all male lions of five years or older are placed on quota. The outcome of this should be monitored by annual spoor surveys, a second conservancy-wide lion census in 2015, and a radio-tracking based monitoring program for the next three years. The objective of the radio-tracking study will be to try and determine the effects of this hunting strategy on key demographic patterns. An example of how harvesting a fixed number of males in different age categories is depicted in Figure 4.

5.2 Hunting males out of male coalitions that are large or are defending key territories

Male lions reach peak reproductive success (as measured by the number of offspring surviving to 2 years of age) at 8 years of age (Packer *et al.* 1988). But males $\geq$ 7-8 years of age are the most suitable age class for sustained trophy hunting. However, in certain circumstances very large coalitions acquire territories at 4-5years of age (Bygott *et al.* 1979). These coalitions can usefully be reduced in size by hunting males out of them, which may delay the age at which they breed.

Mosser and Packer (2009) found that territorial competition directly affected critical components of female fitness, and that larger prides gained and maintained access to the highest-quality habitat. Neighbours had a significant negative effect on female reproductive success and survival, and larger prides were significantly more likely to maintain control of disputed areas and to improve the quality of their territories. Thus in order to reduce the high reproductive potential of large prides occupying key territories males from these prides should be especially targeted for hunting. These dominant prides typically occupy territories including multiple river intersections and large resident herds of buffalo (Mosser & Packer 2009).

5.3 Hunting lionesses in areas where there has been a history of conflict

By monitoring problem animal reports it should be possible to identify areas of the conservancy that are particularly prone to these issues. While it is not advocated that problem causing lions are hunted as trophies it could be useful to proactively hunt either subadult lionesses or lionesses from small less important prides in these areas. This intervention could reduce the future risk of livestock killing, but alleviates to possibility of unnecessarily classifying any lioness as a problem animal in order to get an allocation to hunt. In terms of problem animal control, sometimes repeat offending lions or lionesses are best shot to resolve conflict problems (Stander 1998). For the reasons given, however, it is not suggested that these problem animals are trophy hunted. They should preferably be destroyed by conservancy members in collaboration with conservancy management. See section on problem animal control for more details.

5.4 Hunting older females from key prides to stabilize population growth

Although it has been reported generally that hunting lionesses can lead to population declines (Whitman *et al.* 2004, Van Vuuren *et al.* 2004), there are natural scenarios that induce adult female mortality that could be simulated to control lion population growth in the conservancy. Lionesses in large dominant prides sometime kill lionesses from neighbouring prides in territorial fights (Mosser & Packer 2009). But in a population below carrying capacity one might expect fewer territorial fights. Thus one might simulate the 'predatory effect' of neighbours and if females are to be hunted select females from less important prides keeping the nucleus of the dominant prides intact, especially if that meets emerging photo-tourism objectives.

6. Offtake Strategies and Final Recommendations

It is recommended that the off take strategy for lions in the Savé Valley Conservancy should be supported by the following activities:

1. Lion populations should be monitored via track frequency, manager's estimates and for the next three years via radio-tracking and direct counts compiled during an annual workshop to help set the following year's quota.
2. Long-term records of quotas, number of licenses issued, and off take should be maintained and reported on an annual report.
3. Measurements of lion skull size as well as body size should be recorded according to the guidelines specified in Appendix 2 of this plan for all lion shot, and where possible the individual should be identified by reserve management to assure all involved that an appropriate lion was shot.
4. Trophy age should be assessed by a combination of tooth development and wear, nose pigmentation, mane development, etc (see Appendix 2).
5. Hunters should record locations as accurately as possible of all lion shot using a GPS with records going to a central database to monitor intensity of use of certain areas.
6. The professional hunters should adhere to high ethical standards in terms of what is fair chase and in trophy selection.
7. Safaris should not be marketed to clients as "sure things," to relieve professional guides somewhat from pressure at having to deliver a lion, regardless of quality.

7. Response to stock raiding lions (and other predators)

In the Savé Valley Conservancy area there are four main constituencies involved in issues to do with problems of livestock depredation by lions (and large predators). These include:

1. Land owners/managers of private ranches in the conservancy
2. Settled communities within the conservancy
3. Neighbouring communities outside the conservancy, and
4. Zimbabwe National Parks and Wildlife Authority

When incidences of live-stock depredation occur these constituencies have different roles to play in addressing the problem. Ideally these roles, and the procedures to be followed, should be decided as part of a consultative workshop process, which is recommended as a next step. The recommendations presented here are synthesised from other published sources (Funston 2001). The keys to minimising conflict include primarily mitigating or preventing livestock depredation from occurring in the first place, and good communication and effective resolution of problems when they do arise.

7.1 Mitigating (preventing) livestock depredation

Much has been written in the literature about conflict between man, predators and livestock and this remains a highly contentious issue. Clearly findings to date indicate that the best way to minimise the development of conflict situations is through the appropriate livestock husbandry or management practices. Essentially the parties should attempt to minimise the contact between predators and livestock, and have measures in place to warn of the presence of predators in the vicinity of livestock. Once the predators have been detected they can often be chased off without incidence. Accompanying this management plan is a Human-Lion Conflict Toolkit document with all the practical steps that should be implemented to minimise conflict (see page 3 of the toolkit). This toolkit should be made available to all landowners, and representatives of all villages of both settled and neighbouring communities.

Where possible it would be in the long-term interests of landowners within the conservancy to engage, particularly with settled communities, to help them implement the recommendations of the Human-Lion Conflict Toolkit. In summary conflict can largely be mitigated by the following fairly simple husbandry techniques:

a. All grazing livestock should be accompanied by a herder and at least two dogs and donkeys that are wary of lions (and other predators)
b. All livestock should be kraaled at night in lion proof bomas (at least 6 foot high and non-see-through) with at least two herders (owners) and two dogs in attendance.

If these fairly simple measures are in place relatively few conflict situations will arise. The appropriate materials for boma construction vary from site to site, but in the conservancy there should be no shortage of mopane trees for stout pole boma constructions, augmented by old fencing materials (see page 7, 10 and 21 of the toolkit). One of the key weak points in bomas is the gates. Corrugated iron, or flattened oil/diesel drums, can be fashioned into useful and effective gates. Dogs are key to the success of most mitigation measures (see page 16 and 17 of the toolkit), but must be vaccinated to avoid disease transmission. Conservancy members should lobby the authorities in the area for comprehensive vaccination of all dogs.

It is also important to reach out to the communities to assist in educating about predators and how to live with them, and for creating awareness and better attitudes generally (see pages 26 to 31 of the toolkit). Existing outreach programs by various conservancy constituencies should be supported by conservancy members and by a conservancy conservation fund.

7.2 Response to livestock depredation events

7.2.1 Settled and Neighbouring communities

a. Promptly report livestock depredation events to the landowner with title deed for that area, the conservator, and ideally the Zimbabwe National Parks and Wildlife Authority. Report accurately the characteristics of the offending large predators or incident so that all have a better idea of what to expect when planning how to respond. This should include descriptions of a) location b) time of day c) was the livestock animal in a kraal at the time d) what are the specifications of that kraal e) has this happened before recently in this area.
b. Settled communities should invest in the necessary communication technology to effectively and timeously report any incidents.

7.2.2 Landowners with title deeds and conservator

a. Respond promptly to reports of offending large predators and livestock predation incidences.
b. Visit the site where the incident occurred and assess the severity of the situation. Just having someone come and investigate can largely reduce tensions.
c. Consult with livestock owners about their livestock management and if possible offer assistance or advice on how to improve their animal husbandry to minimise conflict. The Human-Lion Conflict Toolkit (see Appendix 2) should be consulted to facilitate solving the problem and advising the most appropriate mitigation measures.
d. In the event of repeat problems in that area, and failing of implementing mitigation measures the best option may be to remove or destroy the offending predators. The actions need to be very focused with the specific offending animals targeted. From 2011

to 2015 there will be a lion conservation and management project running in the conservancy and in Gonarezhou National Park. The park has relatively few lions at present.

e. These suggestions are preliminary and need further deliberation through a workshop before being implemented.
f. Different response guidelines for 'occasional' and 'habitual stock raiders' should be followed.

7.2.3 Stock raider classification

a. Occasional stock raiders (first or one incidence reported)

- Attempt the recommended mitigation measures to determine whether this resolves the problem

b. Habitual stock raiders/problem animals (two or more incidences reported)

- Decide whether to translocate or destroy. For example if a lion eats 10 cows over the course of three weeks because those cows are left wandering around the conservancy at night without any protection, that lion is simply an opportunist, not a problem. If however, a lion takes only 3 cows (3 different incidences) out of a well constructed boma, where there are people and dogs sleeping nearby, it is possibly a genuine problem animal. Once there is evidence that livestock was being properly looked after at the time the incident occurred, mitigation measures may be taken.

7.2.4 Record keeping of incidents and co-operation

a. Community, conservancy and park management staff need to improve their record keeping systems to yield more information about offending animals, e.g. sex, age, status, etc., and communicate this in an annual report to all constituencies.
b. Hold an annual farmers meeting to discuss problems and report back on recent incidents.

8 Acknowledgements

Firstly and very importantly I would like to thank the landowners and managers of the Savé Valley Conservancy for the enriching opportunity to work towards and adaptive management plan for lions the conservancy. There are few areas in Africa where lions are increasing in numbers even when being hunted, with this work thus giving me a unique opportunity.

For all her enthusiasm, tireless efforts and brilliant organisational skills I must specifically thank Dr Rosemary Groom, African Wildlife Conservation Fund, for introducing me to the management challenges facing lions in the conservancy and for the opportunity to address the landowners and managers on this, and survey the lion population in July 2011. For all her efforts in this project, and generally, Rosemary deserves special mention.

This work could not have been accomplished without funding and I thank the Tshwane University of Technology Department of Nature Conservation for contributing towards the cost of my trips to the conservancy and giving me the time to pursue this challenge. For funding the 2011 lion survey I am especially grateful to John Jackson III, Conservation Force, who covered the direct costs of the survey and the purchasing of ten VHF radio-collars. I hope Conservation Force continues to support this program as it develop and matures as it is incumbent on the trophy hunting industry to invest in programs that aim to, and show, that lions can be sustainably hunted and managed responsibly by trophy hunting.

I have had numerous useful discussions with stakeholders in the conservancy with the inputs of in particular the conservator Ox Hacking, as well as Clive Stockil, Dusty Joubert, Roger Whittall, Graham Connear, Norman Monks, Alistair Pole, Duke Cloete, Weldon Schenk, Peter Lindsey and Rosemary Groom all of whom contributed enormously to this work. For their efforts in conducting the 2011 lion survey I am indebted to Rosemary Groom, Dusty Joubert, Chris Hooton, Lisa Lerm, and Ruben. For this I would also like to thank all the conservancy members for access to their properties and information, Chishakwe Ranch for hosting the field team and Hammond, Humani, as Senuko for additional accommodation. I am grateful to the Panthera Foundation for being able to insert the lion and leopard trophy monitoring guidelines. Through the support of biologists, NGO's and funding agencies I hope that the Savé Valley Conservancy can become a model for lion management.

Appendix 1: Savé Valley Conservancy Lion Population Survey 2011

Introduction

To augment lion monitoring efforts conducted thus far in the conservancy a baited call-up lion survey was conducted from June 20 to July 10, 2011. This short report is thus largely intended for immediate decision making of lion quotas for 2012-2014. The lion survey was largely designed to determine whether the population increases estimated from spoor counts (Groom 2008-2010; Figure 1), and reported by landowners, were supported by an alternative survey technique. Such a survey would also provide information on the population's age and sex structure which spoor counts cannot do. The average growth rate of the SVC lion population from 1999 to 2010, as estimated largely by spoor counts, was calculated at 35% per year. Such high growth rates have been recorded in re-introduced lion populations elsewhere (Funston 2008), but we wanted to verify if such a high population and growth rate was indeed characteristic of the SVC lion population.

Methods

The survey method used was baited call-up stations as described by Smuts, Whyte & Dearlove (1977), with a modification to the method in the use of camera traps to photograph shy or elusive lions. We used a density of 13 call-up stations per 1,000 km^2, to ensure that we sampled an area of 1886 km^2 assuming a response radius of 5 km (Smuts et al. 1977). A total of 25 stations were surveyed (Figure 5). We attempted to space all stations about 10 km apart from each other, but various logistic constraints precluded an ideal distribution of calling sites in some areas. Notably we would like to survey one or two additional sites on Sango. We were also not granted permission to survey the Msaize and Mapari ranches, and thus positioned calling stations close to their boundaries. For Savuli we had comprehensive camera trap records that further surveying was not necessary in that area. As the stations where placed on the conservancy in a series of concentric 5km radii we assumed this design would achieve as close as possible to a total count, realizing though that the response probability of the lions was not known.

Unlike the non-baited call-up station technique of Ferreira & Funston (2010), the baited call-up design of Smuts et al. (1977) was not calibrated to determine response radius and response probability. However, surveys using this technique in Kruger National Park have consistently revealed close to comprehensive total counts. As we conducted the call-ups for five to six hours, instead of the recommended all night (Smuts et al. 1977), we analyzed our data both with a total count tally, as well as with the relationship defined by Ferreira & Funston (2010) for calling stations to get an idea of how both compared with annual spoor counts (Groom 2008-2010), and with land-owner estimates. A few weeks before the survey

the land owners/managers were asked to collate as much information as possible on the status of lions on their farms. This information was collected in the form of maps where the size, composition, and approximate area of activity of each known lion group were noted. Camera traps placed for hunting purposes greatly facilitated this process.

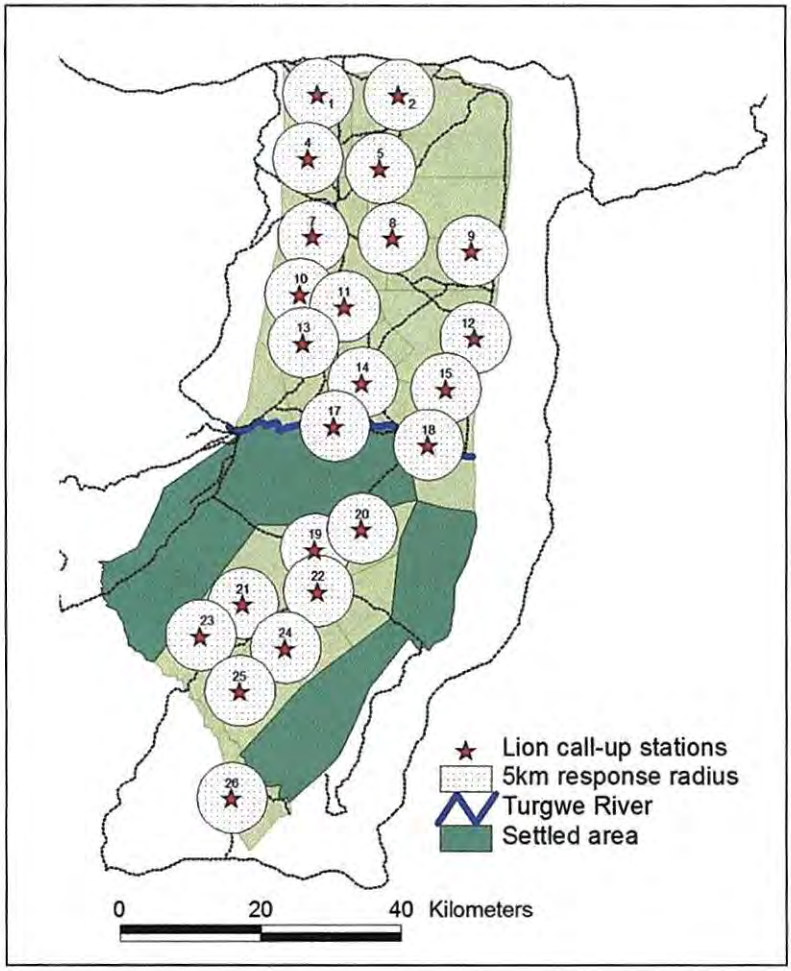

Figure 1. Map of the Savé Valley Conservancy indicating settled area and the planned position of calling stations for the 2011 lion survey

For the survey we used bait in the form of either whole or halved wildebeest and zebra carcasses, and in some cases legs of elephant from culled animals. The gut contents of carcasses were kept and dragged along roads for about 1-3 km in the vicinity of capture stations. Once the drags were completed the carcasses were tied to the base of a stout tree, and branches packed behind the bait to ensure that the lions would feed on the right side of the carcass for identification photographs to be taken, and to permit darting. Camera traps were placed at about 45˚relative to the vehicle bait axis on either side 6-10 m from the carcass. At most stations two cameras were used. Just after sunset the sounds of a buffalo calf in distress, and hyaenas and lions feeding, were broadcast in thirty to sixty minute

intervals with sporadic quiet periods interspersed in between. We used an iPod connected to a 12 volt, 60 watt amplifier, connected to two 4-ohm horn speakers, each with a 40 watt driver unit. The speakers were connected in series and placed c. 2.5m above the ground either on the roof of the vehicle, a steel tripod, or suitable tree, facing 180° direction from each other. The vocalisations were broadcast at full volume, with speakers rotated 180° every 30 minutes to get an all-round sound distribution.

At least two observers sat in the back of the vehicle. When any animal was heard approaching, a torch and/or a red-filtered spotlight were used to identify the animal or group of animals. Parameters recorded included species, number of individuals, group composition (age and sex) and time of arrival at the station. Once all lions in the group had arrived, and were accounted for we darted an adult lioness from each pride encountered, and a sample of males above three years of age, for the fitting of Sirtrack VHF radio-collars.

Results and Discussion

A total of 25 stations were sampled over 14 nights. A total of 44 lions were recorded at the stations (Table 1). During the survey ten lions were immobilized of which eight were large enough to be fitted with radio-collars. These included four male and four female lions (Table 2). An additional five radio-collars are still available to be deployed.

Table 1. The sex and age composition and numbers of lions recorded at calling station during the SVC 2011 lion survey

Station	Time	Number	Group composition
5	20:38	2	2 adult females
7	18:20	4	2 adult males (c. 4-5 years) and 2 adult females (c. 7-8 years)
10	20:05	5	1 adult female, 2 large cubs (c 18 months old), 2 young cubs
11	18:00	2	2 subadult males
13	22:00	1	1 adult female (possibly lactating)
14	23:20	2	1 adult male, 1 adult female
18	18:42	2	2 subadult males (3-4 years)
19	17:55	3	3 large male cubs (c. 18 months)
19	21:50	2	2 subadult males(3-4 years)
19	23:00	4	4 subadult females (2-3 years)
20	18:20	4	2 subadult males, 2 subadult females
21	23:42	1	1 subadult male
22	23:20	5	2 subadult males, 3 females
23	20:30	2	2 adult females
23	22:40	2	2 subadult males
26	18:05	3	2 adult females, 1 adult male
	Total	**44**	

Table 2. Details of lions collared during the SVC 2011 lion survey

Station	Ranch	Collared animal	Collar Frequency
7	Sango/Chishakwe Boundary (Vuma hills)	Adult female (c. 7-8 years)	149.3990
		Adult male (c. 4-5 years)	149.0700
11	Sango - Central	Subadult male (c. 3-4 years)	149.2210
19	Humani - near Mbizi dip	Subadult male (c. 3-4 years)	149.0600
20	Humani - Zambara area	Subadult female (c. 3-4 years)	149.3200
23	Hammond - Near Mopane Pan	Adult female (c. 4-5 years)	149.4200
		Subadult male (c. 3-4 years)	149.2390
26	Impala - central	Adult female (c. 3-4 years)	149.4400

The current lion population estimate for SVC (Table 3) is synthesised from several approaches including an estimate based on the 2010 spoor estimate compounded by the average growth rate from 2007 to 2010 (Groom 2008-2010) to give a 2011 estimate, an estimate of the lion population based on extrapolation of the call up survey, the application of the calling station equation (Ferreira & Funston 2010), and the sum of the managers estimates. A synthesised view from all of these is that there are probably about 160-170 lions in the non-settled areas of the SVC at present. The available data does not allow any better estimate but it is encouraging that the spoor, calling station and managers estimates are all very much in line with each other.

Table 3. Estimates of the lion abundance in the SVC as determined by the 2011 lion survey

Survey method used	SVC lion population estimate
Spoor estimate from 2010	148
Call-up estimate	168 (95% confidence limits: 128-207)
Managers estimate	162

The sex and age composition of the 44 lions recorded during the survey are presented in Table 4. During the survey adults comprised 41% (n = 18) of the lions observed, subadults 43 % (n = 19), and cubs 16% (n = 7). These are similar ratios of adults to other studies, but the subadult segment of the population comprised a higher percentage than is typically found. Thus fewer cubs were recorded than is typical. Either lionesses were not willing to bring their young cubs to calling stations or at present the SVC lion population is dominated by young adults and a high proportion of subadults. The latter explanation seems most likely as the lion population only really started increasing dramatically in 2007. Thus it would be expected that as this 'young' lion population matures a subsequent pulse of reproduction is

expected. This is largely supported by the manager's estimates which recorded a slightly higher cub percentage, but nevertheless lower than typical lion populations.

Table 4. The sex and age ratios of lions in the Savé Valley Conservancy from to 2011 lion survey and managers estimates

Sex / Age classes		Total count		Managers estimate	
Adults	Adult females (>4 years)	14		62	
	Mature adult males (>6 years)	0	***41%***	2	***50%***
	Young adult males (4-6 years)	4		17	
Subadults	Subadult females (2-4 years)	6		3	
	Subadult males (2-4 years)	13	***43%***	19	***28%***
	Subadults unknown	0		8	
Cubs	Cubs	7	***16%***	36	***22%***
	Total	**44**		**162**	

Both estimates (total count and managers estimates) sex and age proportions indicate that the SVC lion population has a relatively high number (and proportion) of adult females, very few mature (>6 year) and young adult (4-6 years) males, and a high proportion of subadult (3-4 years) males, with relatively few cubs. Adult lionesses also outnumber adult males by a ratio of 1:3.3 to 1:3.5. This is a relatively high ratio typical of hunted populations where adult males are removed by hunting.

Recommendations

It is clear that a high number (and proportion) of the SVC lion population are sub-adult males suggesting that many of them will mature into the adult age class in the next few years. However, the relatively distorted adult sex ratio indicates that trophy hunting is removing almost all the mature (>6 years) males in the population. During the survey the oldest male lion we observed was only 4-5 years of age and none were suitable trophies. From the managers estimates we only got reports of two mature adult males, with 17 young adult (4-6 years) males being reported. This is further evidence of the fact that trophy hunting in SVC is effectively removing the mature adult male age class from the population.

The lack of mature males does not seem to be problematic in terms of reproduction, as there are relatively high numbers of cubs, and particularly subadults, in the population. The lack of mature males may, however, be problematic for SVC in terms of hunter satisfaction as clients are unlikely to be consistently satisfied with only hunting young males that do not have heavy manes.

As the landowners generally seem to feel that there are either enough, or in many cases too many lions, the method to halt population growth will of necessity have to include the shooting of either adult or subadult lionesses. This is unfortunately unavoidable when the objective is to halt population growth and a population is not at carrying capacity. This is generally accepted practice when the stated objectives of a wildlife production system dictate that a large carnivore population is too abundant (Packer et al. 2009). Managed hunting of lions will also need to consider illegal killing of problem animals especially by poisoning, but also by shooting.

Thus when setting annual quotas SVC managers need to balance economic returns from good quality trophies, remove the appropriate number of lionesses, and factor in illegal killing, to result in population stability and halt population growth. It may thus be wise to market three types of lion hunts in SVC, which could include a limited number of high quality older male trophies, a larger segment of young relatively poorer quality trophies, and a similar number of lioness trophies. The lionesses should ideally be as young as is acceptable for a trophy, and of an animal not associating in recognised prides. Young lionesses breed at higher rates than older lionesses, with mature pride-living lionesses perhaps being better utilised for photo-tourism opportunities. An additional advantage of shooting young lions is that this age class are the ones most likely to kill livestock.

Ultimately the decision on what and how to hunt lions in SVC lies with the landowners, and needs to be integrated into the overall conservation and management objectives of the conservancy.

Appendix 2: Assessment of trophy hunted lion and leopard trophies

Guidelines for data collection

Sport hunting can provide considerable benefits to conservation if managed sustainably. However, this requires careful regulation and a high degree of compliance with "best practice" standards. This is particularly important for large carnivore species such as lion and leopard that are sensitive to human disturbance and have recently suffered widespread declines. There is a need to standardize data collected from lion and leopard trophies across their range to allow independent assessment of trophy age, trophy quality, and hunt effort. Such data can enable wildlife agencies to track population trends of hunted species over time and react to changes accordingly. The sex and age of harvested individuals will also influence the biological impacts of hunting, and must therefore be monitored closely. In addition, blood and skin samples can easily be taken from trophies to provide valuable information on disease and genetics in wild lion and leopard populations. These data would add immeasurably to conservation efforts.

Effective monitoring requires collaboration between professional hunters (PHs), operators, conservation authorities, and researchers. In this document we provide guidelines on the information and measurements that should routinely be taken from every trophy animal and each hunt. Some of the information is collected in the field by the professional hunter immediately after the hunt, while other data are collected at a later date by examining the cleaned skull. It requires no technical ability or special equipment other than a GPS, digital camera, and measuring tape; all of which are commonly used by sport hunters.

Section A: Information to be provided by professional hunters/operators

1. Hunt return forms

Measures of hunting effort can be used as an index to gauge population trends. This information is best collected on a printed hunt return form filled in by the PH after *every* lion and leopard hunt (i.e. for successful and unsuccessful hunts). Questions should not exceed one page (an example of a hunt return form is provided in Appendix I). The submission of hunt return forms must be mandatory; these data are only useful if collected in a rigorous and consistent manner. Operators must be penalised for failure to submit forms. The onus is on the operator to ensure that all information is sent to the relevant authority by the end of the hunting season. Self addressed envelopes can be provided if postage is necessary.

2. Measurements (included on the hunt return form)

Accurate measurements of body and skull size can assist authorities to age lion and leopard trophies. The Division of Scientific Authority from the U.S. Fish and Wildlife Service require measurements of body size to permit importation of leopard trophies into the United States. In addition, PHs and operators routinely measure skull width and height to provide a Safari Club International rating (width + height in inches) to clients. However, the SCI rating on its own is of limited use; the individual metrics in millimeters are needed to estimate age.

The following body measurements should be taken for every lion and leopard trophy before the animal is skinned:

a) Body length (cm, tip of nose to tip of tail; Measurement A–C)
b) Shoulder height (cm, tip of scapula to end of forepaw; Measurement E)
c) Neck circumference - *only for leopard* (cm, immediately behind the ear; Measurement D)

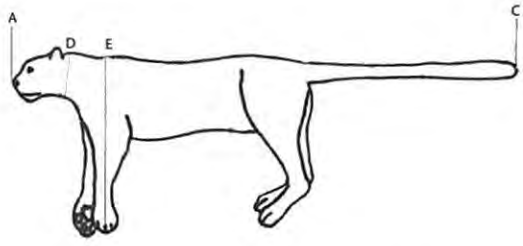

Figure 1: Body measurements to be taken for each trophy before skinning.

Skull measurements should preferably be done by wildlife officials with the skull in hand. However, if this is not possible, operators must provide accurate measurements from the cleaned skull. The following data should be collected:

a) Skull length (mm, greatest length of skull, measured as a straight line between pegs)
b) Skull width (mm, greatest width measured across zygomatic arches)
c) Distance between the post-orbital processes

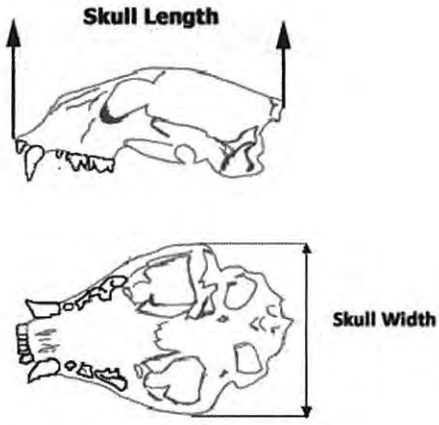

Figure 2: Skull measurements to be taken for each lion and leopard trophy.

3. Photographs

Photographs of the trophy can be used to age hunted lion and leopard effectively. While the traditional photographs taken by clients are useful, more detailed photographs showing body size, facial characteristics, nose pigmentation, tooth wear, and skull dimensions are required for reliable aging. They must be taken from the correct angle and at the highest possible resolution (minimum of 1MB per photo). Nose, teeth, and skull photographs are best taken with the macro-function setting (which is a feature on most cameras) to prevent blurring. The time and date must be correctly set for digital images. Images must also be labeled/tagged with the individual ID number (as appears on the hunt return form), the name of the operator, the name of the client, and the name of the hunting block or property where the hunt was undertaken. Digital images can either be sent by email or placed on a CD and posted with the hunt return form.

Six photographs are required for each lion and leopard trophy before it is skinned (Plates 1a-f and 2a-f) and a further six photographs from the cleaned skull (Plate 3a-f). The skull photographs and measurements should preferably be done by wildlife officials with the skull in hand. However, if this is not possible, operators must submit all twelve photographs.

Plate 1. Lion (before the trophy is skinned):

Plate 1a: Side view showing the entire body with the hunter directly behind for scale. Useful for assessing body size and condition, and basic mane development.

Plate 1b: Side view of the head and shoulder showing mane development above and behind the ears, and between the shoulder blades.

Plate 1c: Frontal view of the head and chest. Useful for assessing mane development on the chest and between the ears.

Plate 1d: Frontal view of the face showing facial scarring and the nose from directly in front.

Plate 1e: Close up of the nose clearly showing the extent of pigmentation.

Plate 1f: Frontal view of the teeth showing coloration and wear on the canines and incisors.

Plate 2. Leopard (before the trophy is skinned).

Plate 2a: Side view showing the entire body with the hunter directly behind for scale. Useful for assessing body size and condition.

Plate 2b: Side view of the head (lifted) and shoulders. Useful for assessing neck circumference and dewlap development.

Plate 2c: Frontal view of the face showing the position and condition of the ears, and facial scarring.

Plate 2d: Close up of the nose clearly showing the extent of pigmentation.

Plate 2e: Frontal view of the teeth showing coloration and wear on the canines and incisors.

Plate 2f: Posterior view of the hindquarters clearly showing the presence or absence of a scrotum.

Plate 3. Clean skull (same for lion and leopard)

Plate 3a: Lower jaw showing all the teeth and chipping of the enamel ridge on the back of the canines.

Plate 3b: Upper jaw showing all the teeth and chipping of the enamel ridge on the back of the canines.

Plate 3c: Side view of the lower jaw (either side) showing the canine and wear on the cusps of molars and premolars

Plate 3d: Wide shot of all the teeth showing wear, broken teeth, and teeth coloration

Plate 3e: Top view of the skull displaying the distance between the postorbital processes. A measure of scale must be included.

Plate 3f: Side view of the skull showing the relative height of the saggital crest. A measure of scale must be included.

4. Removal of single rooted premolar (P^2) for x-ray assessment

Post mortem x-rays of teeth can assist with aging trophies - the pulp cavity fills in as lion and leopard get older. The best tooth to remove is the first upper premolar (P^2 below); it does not matter from which side of the skull. P^2 is small and will not affect the overall appearance of the trophy. The tooth can be removed from the skull using a pair of pliers although care must be taken not to crack it. The tooth can be placed in an envelope and sent with the hunt return form and photographs. It is essential the envelope is correctly labeled with the individual ID number (as appears on the hunt return form), the name of the operator, the name of the client, the date the trophy was taken, and the name of the hunting block or property where the hunt was undertaken.

Section B: Additional information that should be collected from trophy animals

Trophy hunted lions and leopards provide a valuable opportunity to collect samples for ongoing conservation research projects. These samples may be particularly important from

areas where research is not currently taking place. They can be collected voluntarily by interested PHs and provided to researchers for analysis. The onus is on the researcher to provide collection materials, details of how the samples must be collected, and to collect the samples at the end of the season. Accurate labeling of each sample is essential with a GPS location (in decimal degrees), the name of the collector, the species, and the date as a minimum.

1. Skin, hair, and scat samples for genetic analysis:

Genetic samples collected from lion and leopard trophies can be used to assess sub-speciation, estimate population size and dispersal distance, examine connectivity between populations, and investigate inbreeding dynamics. This information is critical for establishing range-wide conservation strategies for large carnivores.

DNA can be collected from the trophy by cutting a very small (3-4 mm) disc of skin (that includes both tissue and hair) from anywhere on the carcass. This can be stored in a small cryotube containing either 95% ethanol or salt. If a sterile container is not available, several hairs can be plucked from the trophy (ensuring that the hair root is attached) and placed in a paper envelope.

Genetic material can also be sourced from lion and leopard scat collected by hunters (scat is often found near baits). The best way to handle the samples is to air dry them thoroughly and then to store them individually in sealed plastic bags.

2. Blood samples for disease analysis:

Certain feline diseases such FIV and canine distemper can be tested from blood samples taken by placing a Whatman blotting (filter) paper on the bullet wound until it has soaked through. The paper is then air-dried for 5-10 minutes and stored in an envelope in a cool place. No special techniques or materials are needed other than the Whatman paper, which will be provided by the researcher.

3. Trail camera photographs:

Many hunters now place trail cameras at baits to assess trophy quality prior to setting a blind. Photographs taken by trail cameras can be used by researchers to identify individuals in an area, estimate the relative abundance and vulnerability of different age cohorts in a population, and assess hunter selectivity. PHs must ensure that the date and time information is set correctly on cameras. They should also record the number of cameras that are deployed each day, the number of days that each camera is deployed, and the location (GPS position in decimal degrees) where cameras are deployed.

HUNT PERMIT NUMBER		CLIENT NAME	
PROFESSIONAL HUNTER		HUNTING OUTFITTER	
HUNTING BLOCK		CONCESSION HOLDER	
HUNT START DATE		HUNT FINISH DATE	

1. Was the hunt successful? YES | NO
If no, why not? _____

2. Number of lion / leopard seen during hunt (please provide photographs if possible):

Free ranging: _____ On baits: _____

3. Number of baits used (specify number and species e.g. 5 impala, 1 zebra): _____

4. Number of bait sites: _____ 5. Number of sites fed on by lion / leopard: _____

6. Sex and age of lion / leopard on baits (male, female, subadult, cubs) and how determined (tracks, camera-trapped, seen):

IF TROPHY WAS TAKEN:

7. Date trophy taken: _____ 8. Time shot: _____

9. Location GPS (in decimal degrees): _____

10. Condition of animal (e.g. thin, fat, parasites, scars, wounds, sick, radio-collared, snare wounds, etc.): _____

MEASUREMENTS:

11. Skull length (mm): _____ 12. Skull width (mm): _____

13. Body length (cm): _____ 14. Shoulder height (cm): _____

15. Neck circumference (mm): _____

PHOTOGRAPHS (before skinning):

- Side view of entire body ☐
- Side view of head and shoulders ☐
- Front view of head and chest (*for lion*) ☐
- Front view of face ☐
- Close up of nose ☐
- Hindquarters showing scrotum (*for leopard*) ☐

PHOTOGRAPHS (clean skull)

Running title: Viable large carnivore population and profitable trophy hunting (submitted to Journal of Applied Ecology)

Word count: 6934

Summary

1. Large African carnivores are financially valuable for ecotourism and trophy hunting operations on private, communal and multiple-use state land utilised for wildlife production. However, above certain densities, such species may impose economic costs through impacts on populations of ungulates that are also valuable for trophy hunting. High densities of large carnivores may adversely affect conservation efforts involving smaller carnivore species such as vulnerable cheetahs (*Acinonyx jubatus*) and endangered African wild dogs (*Lycaon pictus*).
2. We investigated the economic and conservation trade-offs associated with managing various species of large carnivores on large, often privately or co-managed communal land (>1000km^2), using a collaboratively managed private wildlife area in south-eastern Zimbabwe, Savé Valley Conservancy (3440km^2) as a case study.
3. Lions (*Panthera leo*) impose substantial economic costs through predation on ungulates, specifically, but for leopards (*Panthera pardus*), trophy hunting benefits significantly outweigh their predation costs. Poaching further disturbed ecological processes.
4. We argue that introducing lions to wildlife production systems necessitates that income from lions is increased by either raising the price of lion hunts, or that income derived from photo-tourism is needed to offset the economic impact of lions.
5. Other members of the large carnivore guild do not influence financial and ecological dynamics nearly as strongly as do lions, and species such as endangered cheetahs and wild dogs may benefit from managed lower densities of lions in hunting concessions and private ranches.
6. Although lions fulfil many important ecological processes, that we have not quantified, there is a need to balance ecological and economic imperatives on private and co-managed communal land to ensure that wildlife-based land uses continue to compare favourably in financial terms with alternative and less conservation-friendly land uses, such as livestock production.

Key words, lions, leopards, predation, trophy hunting, financial implications, management, balancing costs

Introduction

Wild large herbivores provide goods and income to rural communities, have major impacts on land use and habitats of conservation importance and, in some cases, face local or global extinction. As a result, substantial effort is applied to their management across the globe (Gordon, Hester & Festa-Bianchet 2004). In areas where herbivores are commercially utilized, large carnivores can create both economic costs and benefits (Peel & Montagu 1999; Power 2002; Caro *et al.* 2009). In Africa, lions (*Panthera leo*) and leopards (*Panthera pardus*) are unambiguously valuable for ecotourism operations, are high value trophy hunting species, and attract high-paying international tourists (Grobbelaar & Masulani 2003; Booth 2004; Loveridge *et al.* 2007). However, all carnivores impose a cost by consuming herbivores. Thus while sport hunting has provides important economic incentives for conserving wild herbivores, the benefits of wildlife-ranching with large carnivores are less clear (Lindsey *et al.* 2005b).

At natural densities African large carnivores regulate herbivore populations (Fryxell, Greever & Sinclair 1988; Mills & Shenk 1992; Grange *et al.* 2004; Grange & Duncan 2006). Lions especially are the key drivers of this process, being one of the strongest ecological drivers in African savannas (Funston & Mills 2006; Grange & Duncan 2006). Thus, there is a limit to the number of herbivores that can be sustainably removed when lion populations approach equilibrium (Peel & Montagu 1999). These effects are also strongly cyclical, influenced by rainfall variability (Mills, Biggs & Whyte 1995; Funston & Mills 2006; Owen-Smith & Mills 2008a). Predator numbers must be accounted for when calculating harvests of herbivores. Many wildlife populations are additionally impacted by poaching (Lindsey *et al.* 2011).

While most large African carnivores tend to kill smaller, less valuable prey species (Pole *et al.* 2004; Radloff & du Toit 2004; Hayward *et al.* 2006a; Hayward *et al.* 2006b), lions select mainly medium- to large-sized ungulates (Funston *et al.* 1998; Radloff & du Toit 2004; Hayward & Kerley 2005, 2008) that are valuable. If lions and other carnivores reduce the sustainable yield of herbivores, they come into direct competition with hunting operators and local communities that benefit from these resources. This is a world-wide phenomenon where large carnivores occur (Langholz *et al.* 2000). In most countries in Africa, the surface area that is designated either communal or national hunting concessions/game reserves is substantially larger than areas covered by national parks where no hunting is generally allowed (Wilkie & Carpenter 1999; Archabald & Naughton-Treves 2001).

Many of these areas offer the possibility of conserving lions, leopard and spotted hyena (*Crocuta crocuta*), but these species often result in conflict leading to persecution (Ogada *et al.* 2003; Woodroffe & Frank 2005; Kissui 2008; Maclennan *et al.* 2009) or are overhunted (Loveridge *et al.* 2007; Packer *et al.* 2009). However these areas offer ideal habitat for rarer large carnivore species such as cheetahs (*Acinonyx jubatus*) (Durant 2000; Gros 2002; Marker *et al.* 2003) and wild dogs (*Lycaon pictus*) (Woodroffe & Ginsberg 1999; Creel & Creel 2002; Lindsey, du Toit & Mills 2004; Woodroffe *et al.* 2007). Dominant large carnivores, however, can also impact cheetah and wild dog

populations negatively through direct and indirect mechanisms (Caro 1994; Laurenson 1994; Laurenson, Wielebnowski & Caro 1995; Creel & Creel 1996; Durant 2000; Creel, Mills & McNutt 2004). As a model for other areas we examined the Savé Valley Conservancy (SVC), a 3,440 km^2 privately owned ranch in Zimbabwe, where hunting provides the main source of income (Lindsey *et al.* 2011). We used spreadsheet models to evaluate the financial implications of large carnivores in private wildlife areas, and discuss the need for management of lion populations for both economic and ecological sustainability.

Methods and methods

2.1. Study area

Savé Valley Conservancy (3,440km^2), located in a semi-arid area of southeast Zimbabwe, was formed in 1991 by amalgamating 20 cattle ranches, into which 14 species of wildlife reintroduced, and land use shifted to high quality ecotourism and trophy hunting (Lindsey *et al.* 2008). These land use objectives were pursued successfully until a third of the conservancy was annexed in 2001 during Zimbabwe's land 'reform' program (Lindsey *et al.* 2008). Photo-tourism is now almost non-existent and there are high levels of poaching (Lindsey *et al.* 2011).

Large carnivores were all but extirpated by the cattle ranchers (du Toit 1994; Pole 1999). However, in SVC all have increased through natural recolonization, or augmentation, with lion and spotted hyenas populations showing the longest lag effect. Wild dogs, however, increased rapidly following recolonization of the area in 1992 (Pole 1999), due to their high fecundity, the absence of lions, and abundant prey. They peaked at 3.9 wild dogs/100 km^2 in 2004, the highest density on record (Pole 2006; Lindsey *et al.* 2008). Cheetah populations also increased rapidly, but for unexplained reasons declined 2005. Leopard densities seem to have remained relatively high throughout (C.J. Joubert, *pers. comm.*).

2.2. Population estimates

Annual total-count aerial surveys of larger herbivores from 2004 to 2010 (Joubert & Joubert 2010), with adjustment for undercounting (Bothma *et al.* 1990), estimated populations of ten key large carnivore prey species. For large carnivores wild dogs were estimated annually from 1996 through individual monitoring. Lion and spotted hyena populations were estimated sporadically from 1996 to 2007 using call-up surveys (Pole 1999; Pole 2003). From 2007 estimates for large carnivores other than wild dogs were by annual track density index surveys (Funston *et al.* 2010). The generalised model of Funston *et al.* (2010) was used for all species other than leopards where Stander's (1998) model was more appropriate. Cheetah and leopard populations were assumed to be relatively stable from 2005 to 2008. Population estimates for years without surveys were estimated from graph trend lines. Population carrying capacities of large carnivores were determined based on herbivore abundance models (Hayward, O'Brien & Kerley 2007).

2.4. Model development

To assess the impact of all forms of mortality on economics and ungulate trends we built a spreadsheet model with various key inputs.

2.4.1. Prey preferences of large carnivores

To determine the relative proportion of various ungulate species in the diet of large carnivores, where possible we used data from SVC. Scat analyses (Mbizah 2009) provided the basis for determining the prey preferences, but low numbers of lion and cheetah scats necessitated using data from nearby Kruger National Park (Kruger) (Radloff & du Toit 2004). Importantly, eland (*Taurotragus oryx*) and sable antelope (*Hippotragus niger*) did not occur in the area sampled by Radloff & du Toit (2004), and were thus factored into our prey preferences relative to abundance, and accounted for all 'other' species killed by lions, being relatively preferred by lions (Hayward & Kerley 2005).

2.4.2. Predation rates

To estimate annual predation rates we used daily minimum food requirements (Table 1) to calculate the number of adult female equivalents, based on body mass (Skinner & Smithers 1990), of each herbivore that would need to have been killed to meet their needs, in proportion to the prey preference ratios. The available biomass per kill was an estimate of the relative proportion of meat available from small- (<100 kg = 75%), medium- (100-300 kg = 66%) and large-sized (>300 kg = 60%) ungulates. Adults were assumed to make up 50% of each large carnivore population, and sub-adults and cubs were assumed to consume 50% of the adult female requirement (Table 1). However, due to differences in the diets of male and female lions (Funston *et al.* 1998; Radloff & du Toit 2004), we calculated predation rates for each sex.

Table 1. Minimum daily food requirements of the various large carnivore species

	Adults (kg)	Sub-adults and cubs (kg)	Literature source
Female lions	**5**	**2.50**	**(Schaller 1972)**
Male lions	**7.5**		**(Schaller 1972)**
Leopards	**2.5**	**1.25**	**(Bailey 1993)**
Cheetahs	**2.8**	**1.20**	**(Frame 1999)**
Wild dogs	**2.8**	**1.40**	**(Pole 1999)**
Spotted hyenas	**4.0**	**2.00**	**(Henschel & Tilson 1988)**

The total numbers of ten important herbivores killed per large carnivore species per year was estimated by combining the relative proportions of herbivores in the diet, the biomass requirements of each large carnivore, and the numbers each prey species that an individual would kill, multiplied by the annual population estimate of each large carnivore species. We halved this for spotted hyenas as in nearby Kruger spotted hyenas hunted only 50% of their diet, scavenging the rest (Henschel & Skinner 1990).

2.4.3. Determining ungulate population trends

We estimated mortality by summing all quantifiable causes of ungulate mortality. These included trophy hunting, live-capture, poaching and predation estimates. The number of animals found poached from 2005-2009 was adjusted following Lindsey *et al.* (2011). To validate this section of the model we calculated growth rates for time $_t$ to time $_{t+1year}$ that would have been required to reach the population estimates of the following year.

2.4.3. Economic calculations

The financial gains from trophy hunting were calculated as the trophy fee value and the meat value of each animal hunted. However, for buffalo (*Syncerus caffer*) and sable, which were used to sell hunting packages commanding a daily rate in addition to trophy fees, hunt-package fees were also included in the model (calculated as minimum hunt duration x daily rate). The financial losses attributable to predation, poaching and live sales were calculated by summing the value lost in terms of meat, foregone trophy fees, and for buffalo and sable for foregone hunt-package fees. Removals of zebra (*Equus burchelli*) was assumed to result in the additional loss of the value of skins (US$200/individual) (Lindsey *et al.* 2011). All trophy values, daily rates and minimum hunt durations were taken from the main hunting outfitter in the area (Zambezi Hunters 2010).

The value of meat was estimated from the mean adult female body mass of each species (Skinner & Smithers 1990), the mean percentage of body mass comprised of flesh (Bothma, van Rooyen & du Toit 2010), and the mean price that meat was sold for (USD 1.50kg^{-1}). As animals lost to either predation or poaching would not necessarily have been trophy animals, only the average percentage of the overall population of each species hunted from 2005-2009, were considered to be trophies, for which the relevant fee or combined hunt package fee was used to determine that proportion of the losses incurred to large carnivores. To estimate the net economic cost or benefit of various large carnivore species we calculated the annual value of herbivores killed by each carnivore species from the model. We then compared this with the total financial value accrued from hunting those species.

Results

3.1. Population estimates

Buffalo were the only herbivore species that increased in numbers from 2004-2010 (Fig. 2). Populations of giraffe (*Giraffa camelopardalis*), sable antelope, and wildebeest (*Connochaetes taurinus*) remained relatively stable, while eland, kudu (*Tragelaphus strepsiceros*), waterbuck (*Kobus ellipsiprymnus*), zebra, impala (*Aepyceros melampus*) and warthog (*Phacochoerus aethiopicus*) declined. Most large carnivores increased over a ten year period (Fig. 3), with the numbers of lions,

spotted hyenas and cheetahs in SVC being significantly lower than would be expected based on available prey (X^2 = 203, df = 4, P < 0.01) (Table 2).

Table 2. Actual population estimates and predicted population sizes for SVC based on average adjusted herbivore numbers from 2005 to 2009, based on the model of Hayward *et al.* (2007)

	Estimated population in 2009	**Potential carrying capacity**
Lions	148	271
Leopards	249	136
Cheetahs	5	55
Wild dogs	60	63
Spotted hyenas	123	427

3.2. Large carnivore utilization

From 2005 to 2009 seventeen lions were hunted (mean = 3.4 lions year^{-1}), yielding gross income of US$912,900 (US$182,580 year^{-1}). During the same time 144 leopards were hunted (mean = 28.8 leopards year^{-1}), generating a gross income of US$2,135,232 (US$427,046 year^{-1}). A few cheetahs (n = 5) and spotted hyenas (n = 6) were also hunted, with wild dogs being legally protected.

3.3. Model results

The estimated relative proportion of herbivore prey in the diet of large carnivores was used to estimate the number of prey species killed by each individual large carnivore per year (Table 3). Data showed that lions predated mostly on large herbivores, with male lions preying more heavily on buffalo (Table 3). Herbivore growth rates, determined from aerial surveys, showed that the average required population growth rates generated by the model were similar to those recorded elsewhere (Table 4).

3.3.4. Economic calculations

The model showed that lions, poaching and spotted hyena predation had the greatest proportional financial impact, whereas the costs of leopards, wild dogs and cheetahs were proportionally very much less (Fig. 4). It also showed that at all lion abundances the net cost to predation by lions exceeds the gross income from hunting them, irrespective of the formula used (Fig. 5). It should be noted though that gross income from trophy hunting the selected herbivores, lions and leopards, exceeded the financial losses to poaching and predation by an average of 74%, (Table 5).

Even relatively low earnings per landowner from photo-tourism that could be attributed to the presence of lions (e.g. US$5,000 per year^{-1}), combined with a 5% male lion harvest, resulted in a positive gross financial benefit for up to 70 individuals. These benefits increase as the tourism income ascribed to the presence of lions increases, with 135 lions resulting in no gross costs if each landowner was earning

Table 3. Percentage of herbivores in the diet of the large carnivores used in the development of the model, with the estimated number of each key ungulate species caught per individual predator per year

Prey size / species	Percentage of each prey species (number of prey species caught year^{-1})					
	Male lions	Female lions	Leopards	Cheetahs	Wild dogs	Spotted hyenas
Large (>350 kg)						
Buffalo	45.0 (4.50)	1.2 (1.20)	4.8 (0.00)	0.1 (0.02)	-	2.6 (0.05)
Eland	4.0 (1.00)	4.5 (0.22)	0.0 (0.05)	-	-	1.3 (0.03)
Giraffe	19.3 (1.10)	4.3 (0.12)	-	-	-	-
Medium (100 – 350 kg)						
Kudu	1.4 (0.40)	9.3 (1.23)	7.5 (0.50)	3.7 (0.23)	12.5 (1.16)	19.2 (1.01)
Sable	1.1 (0.20)	2.0 (0.23)	0.1 (0.35)	-	0.1 (0.11)	6.4 (0.20)
Waterbuck	1.4 (0.30)	3.1 (0.36)	1.5 (0.26)	1.2 (0.07)	4.2 (0.34)	2.6 (0.12)
Wildebeest	2.1 (0.50)	10.9 (1.17)	6.0 (0.32)	2.7 (0.14)	1.4 (0.11)	6.4 (0.28)
Zebra	6.4 (0.90)	8.4 (0.58)	-	-	-	-
Small (<100 kg)						
Impala	13.6 (12.10)	40.2 (17.94)	60.3 (14.99)	67.7 (14.50)	73.6 (16.46)	46.2 (8.25)
Warthog	5.7 (3.70)	11.3 (3.65)	7.5 (0.24)	4.2 (0.65)	2.8 (0.63)	-
Other	0.0	1.2	17.2	20.6	5.5	15.3

Table 4. Mean growth rates of the key herbivore populations in the Savé Valley Conservancy from 2005 to 2009, and the growth rates needed to match the next year's aerial estimates after all mortality had been accounted for. These growth rates were compared with mean growth rates of herbivores in Kruger National Park and a variety of South African game ranches and reserves (from Bothma *et al.* 2010)

	In SVC from 2005-2010	Required to achieve the years estimate	Kruger National Park (high predator densities)	Game ranches (low predator densities)
Buffalo	8.9	14.7	16*	12-18
Eland	-6.2	0.2		11-38
Giraffe	-0.2	6.9	5.2	12
Kudu	-17.1	23.4	14.8	13-28
Sable	-2.1	11.0		12-28
Waterbuck	-14.0	9.6	13.4	15-35
Wildebeest	-2.2	5.2	17.4	28-38
Zebra	-11.1	0.8	12.4	21-29
Impala	-8.7	26.8	11.6	23-48
Warthog	-18.4	10.2	12.3	

Table 5. The relative gross financial benefits (in US dollars) of trophy hunting ten key herbivores species, leopards and lions, relative to the costs incurred by poaching and predation

	2005	2006	2007	2008	2009

Hunting income:					
Selected herbivores	1,689,670	2,104,260	2,11,8750	2,470,990	2,423,870
Lions	161,100	161,100	161,100	107,400	322,200
Leopards	400,356	504,152	504,152	370,700	355,872
Total	**2,251,126**	**2,769,512**	**2,784,002**	**2,949,090**	**3,101,942**
Income lost to poaching (%)	132,065 (5.9)	90,506 (3.3)	139,969 (5.0)	171,091 (5.8)	179,279 (5.8)
Income lost to predators (%)	437,670 (19.4)	496,561 (17.9)	457,874 (16.4)	693,357 (23.5)	906,450 (29.2)

US$10,000 year^{-1} from lion related photo tourism (Fig. 5). For leopards, however, there was a gross financial benefit at all abundance levels (Fig. 5).

4. Discussion

4.1 Ungulate populations

Large carnivores influence herbivore populations in profound ways that are often associated with climatic variability. Thus managers need to monitor trends and interpret them in the context of rainfall patterns, predation pressure, and human mortality. In our case study combined pressures of hunting, live sales, poaching, and predation may be negatively influencing the populations of some herbivore species, such as eland, kudu, waterbuck, zebra, impala and warthog. Buffalo, the highest value species, however, showed positive population growth and sable antelope, another high value species, seemed to be stable. There are several explanations for, and implications of, these trends. Firstly, climatically SVC has experienced wetter than average rainfall conditions in the last decade that would be expected by to induce predation driven declines for kudu, waterbuck, zebra, wildebeest and warthog (Mills *et al.* 1995; Funston & Mills 2006; Owen-Smith & Mills 2008b). Zebra are important prey species of lions (Mills & Shenk 1992; Hayward & Kerley 2005) and can be vulnerable to over predation as they have foals throughout the year that are preferred by lions, and show relatively slow development when compared with other ungulates (Grange *et al.* 2004; Grange & Duncan 2006). This cautions against the over utilization of zebra with lions potentially shifting to more valuable herbivore species should the zebra population decline. Eland are highly preferred prey of lions (Hayward & Kerley 2005), and due to their very mobile nature may also be more susceptible to poaching, both of which may be driving population declines. Impala are important prey of all large carnivores (Hayward & Kerley 2008; Owen-Smith & Mills 2008a), which when combined with high hunting, management offtake and poaching may be driving population declines.

4.2. Large carnivore populations

Large carnivore populations were stable or increasing. In terms of their impact on the herbivore-economic dynamic, management mainly needs to decide the best course of action with respect to the dominant influence of lions. Currently lions are at about half of expected ecological equilibrium, at which point lions would have an economic impact that could not be offset by hunting. Moreover

with current herbivore offtakes through hunting, poaching and live sales, such predation levels would be expected to result in herbivore collapse.

In Africa, interactions within the large carnivore guild result in cheetahs (Laurenson 1994; Durant 2000) and wild dogs (Mills & Gorman 1997; Creel & Creel 2002) declining in response to high lion and spotted hyena abundance. Conversely mesopredator release can benefit these species, as well as leopards, when lions and spotted hyenas abundances are low (Crooks & Soulé 1999; Pole 1999; Packer *et al.* 2009). Generally dominant larger carnivores have negative effects on rarer smaller species (Kitchen, Gese & Schauster 1999; Bonesi & Macdonald 2004). These effects have implications for attempts to conserve smaller carnivores both generally and through reintroductions (Lindsey *et al.* 2005a). In SVC, where the wild dog population comprises a significant component (c. 17%) of a small and declining national population, local declines are a concern. Therefore, for lion populations to be temporarily controlled to achieve conservation objectives for endangered species could be considered reasonable practice (Linnell & Strand 2000).

4.3 Economic implications

Several key deductions can be made from the economic model. Firstly, the gross income from trophy hunting of herbivores and carnivores, plus live sales of herbivores, collectively outweighed the losses incurred by predation by a substantial margin. This is likely to be true of any area. However, the net income was not known, and the initial capital investments and running costs of the ranch and hunting safaris, as well as losses to predation and poaching, may well exceed income from hunting. Several landowners reported that with a hunting-only model they were making a net loss, and that if hunting only was applied to remedy this, this would not be sustainable. Seemingly in SVC the only way to make lions more financially viable would be to incorporate photo-tourism, or not have high value species such as sable antelope on the conservancy with lions, or buffalo vulnerable to lions.

We do though make one important caveat in our conclusions. In our case study we were dealing with a recovering lion population substantially below carrying capacity. Lions need to hunt in large groups to successfully hunt buffalo (Scheel & Packer 1991; Funston, Mills & Biggs 2001). We did not have kill data available and it is possible that we overestimated the predation rates on buffalo. Furthermore, lion predation on buffalo varies dramatically with rainfall regimes (Mills *et al.* 1995; Owen-Smith & Mills 2008b) and under current rainfall lions would not be expected to predate heavily on buffalo. However, buffalo remain an important prey species for lions and in terms of the general applicability of the model we believe that without data to the contrary one has to assume that on average buffalo would comprise roughly the proportions in the diet of lions that we used.

Lion predation accounted for the bulk of the loss (47%) to large carnivores, which when the income generated from trophy hunting lions was subtracted, resulted in a net loss of US$115,705 year^{-1} specifically for lions. Leopards, on the other hand resulted in a net benefit of US$ 395,151 year^{-1}. Thus while it is clear that lions impose a substantial cost to a wildlife production system (about 8% loss relative to gross income), the impact of this needs to be evaluated against the objectives of the reserve. The model presented in Fig. 5 indicates a harvesting percentage of five percent of the population. This quota may, however, be too high, and result in social instability in a lion population, with harvest rates of about three percent (Creel & Creel 1997), and the hunting of older males

generally being recommended (Whitman *et al.* 2004; Loveridge *et al.* 2007). Adding a small number of lionesses to the hunting quota did not increase the relative profitability of lions substantially, but may be needed if regulating the population of lions was defined as a management need (Packer *et al.* 2009). In order to protect large carnivore populations from declining, national authorities worldwide generally only allow only the hunting of male large carnivores as trophies (Whitman *et al.* 2004; Packer *et al.* 2009). However, livestock and wildlife producers and local communities may need, under certain circumstances, to shoot adult female large carnivores to either halt or reduce population levels (Packer *et al.* 2009).

Lion trophy fees in Zimbabwe (US$5,983) are substantially lower than the average trophy fees in other African countries (US$14,584) (Booth 2009). However, even if lion hunt prices were increased from the current SVC price of US$53,700 (Zambezi Hunters 2010), or the Zimbabwe average of US$51,918 to the African average of US$70,115 (Booth 2009), at a harvest rate of 3% lions would not be any more profitable. Before applying this model, elsewhere, it should be parameterised by local values of all variables, which might influence findings. Lion hunting is an important income generator in Africa hunting concessions (Booth 2009), especially in arid areas without mega-herbivores and buffalo, and where leopards occur at low densities (Stander 1998; Martin 2008). If lions were listed on CITES Appendix 1 this would impose severe restriction on hunting lions and essentially terminate this avenue of income generation. Such a listing would have major implications for management decisions in private wildlife and communal areas, where other interventions (including poisoning) may be employed to reduce lion densities to protect populations of herbivores (both wild and domestic).

Overutilization of leopards was possibly occurring in SVC. Leopards, like lions, are susceptible to overharvesting of adult males as they are an infanticidal species (Packer *et al.* 2009; Packer *et al.* 2011). In SVC the high current abundance of leopards may be as a result mesopredator release owing to low sympatric lion abundances. However, a higher lion population, combined with sustained high hunting pressure, is likely to result in a decline in leopard abundance. Thus in areas where leopard hunting predominates as an economic activity, it may be advisable to regulate lions at a level where they do not impact additionally on the leopards.

4.4 Management implications

Due to the relatively high costs associated with lion predation, landowners in wildlife production systems or rural communities co-existing with lions should consider generating income from lions in other ways. High quality ecotourism operations in areas of exceptional scenery and wildlife resources have clear economic potential, and should be encouraged wherever possible (Barnes 2001). Lions are one of the cornerstones of the photo-tourism industry worth substantially more alive than dead in most areas (Thresher 1981). However, photo-tourism is susceptible to political instability (Reid 1999), and is often not viable in areas lacking high densities of wildlife, scenic splendour, client safety or adequate infrastructure (Krüger 2005). Zimbabwe has been politically unstable for an extended time period, and there is currently little photo-tourism demand or suitable tourism infrastructure in SVC.

Consequently, to allow wildlife-based land uses to compete with alternative options (e.g. livestock ranching or agriculture) it is important that landholders and communities are able to utilize wildlife to generate sufficient income to offset the costs of wildlife. This may include well managed sustainable trophy hunting, which in many areas is the only viable means of generating income from wildlife (Child 1996). Ultimately the responsibility to decide how many lions should occupy a private area lies with landholders. This model is applicable anywhere in the world where large carnivores live on private or rural land, but because of their size and preferred prey is particularly relevant to areas with African lions.

In private or communally owned wildlife areas, management of larger carnivores may be necessary to maximize other returns (Packer *et al.* 2009). This may in turn create favourable opportunities that ensure the persistence of competitively inferior and endangered large carnivores, and may even be justifiable on these grounds alone in some small state protected areas.

Acknowledgements

We would like to thank SVC members for access to their properties and information, Chishakwe Ranch for hosting the field team and Zambezi Hunters for providing information. Dusty Joubert is thanked for leopard data and insights. Funding for the fieldwork was provided by National Geographic Conservation Trust, Columbus Zoo, Chicago Zoological Society and the Rufford Foundation. PJF would like thank the Department of Nature Conservation and Faculty Research Committee, Tshwane University of Technology, for the opportunity to conduct the fieldtrips to develop this paper.

Carnivore Densities in the Savé Valley Conservancy

Results of the 2017 Spoor Survey & Wild Dog Monitoring Project

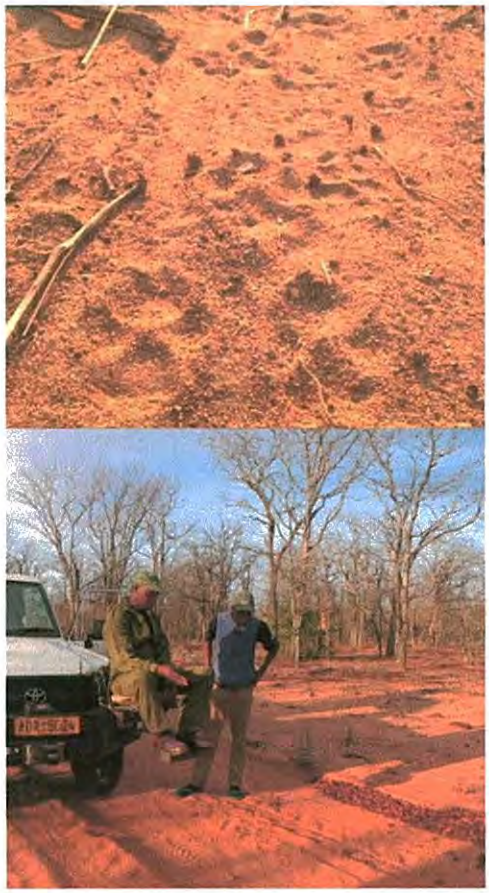
Jessica Watermeyer and Dr Rosemary Groom, African Wildlife Conservation Fund

Introduction

The African Wildlife Conservation Fund carries out an annual large carnivore spoor survey in order to assess population trends of carnivores within the Savé Valley Conservancy (SVC / the conservancy) to aid management decisions. A standardised methodology is used to ensure consistency through time and comparability with other studies. Since 2008, the spoor surveys have been done using the same roads and the same observer.

Spoor surveys have been shown to be an effective and efficient means to assess wildlife densities (Stander 1998; Funston et al. 2001; Davidson & Romañach 2007; Funston et al 2010) with strong correlations existing between spoor density and true density. The technique is considered to produce reliable estimates for lions, spotted hyenas, and leopards, when sample sizes (spoor encounter rates) are sufficient. Other carnivores are included in our counts simply to monitor trends over time.

This report presents the results of the October 2017 carnivore spoor survey for the SVC, together with results from the long term wild dog monitoring project, and looks at trends in the main carnivore species over time.



AWCF head scout, Rueben Bote, and attachment student, Nkosilathi Ngwenya, identifying spoor.

Methodology

The 2017 carnivore spoor survey used the methods pioneered in SVC by Davidson and Romañach (2007), based on those used by Stander (1998) in Namibia. Exactly the same methodology has been used annually since 2008. Road transects were chosen throughout the SVC to represent a fair coverage of all (non-resettled) areas, and these transects were scanned for spoor. The number of kilometres of transects surveyed was chosen to maintain consistency with previous spoor surveys. Thus, for every 6-7km^2 of

sample area, 1km of transect was surveyed, creating a penetration density (expressed as a ratio of kilometres of transect surveyed to total sample area) of between 1:6 and 1:7.

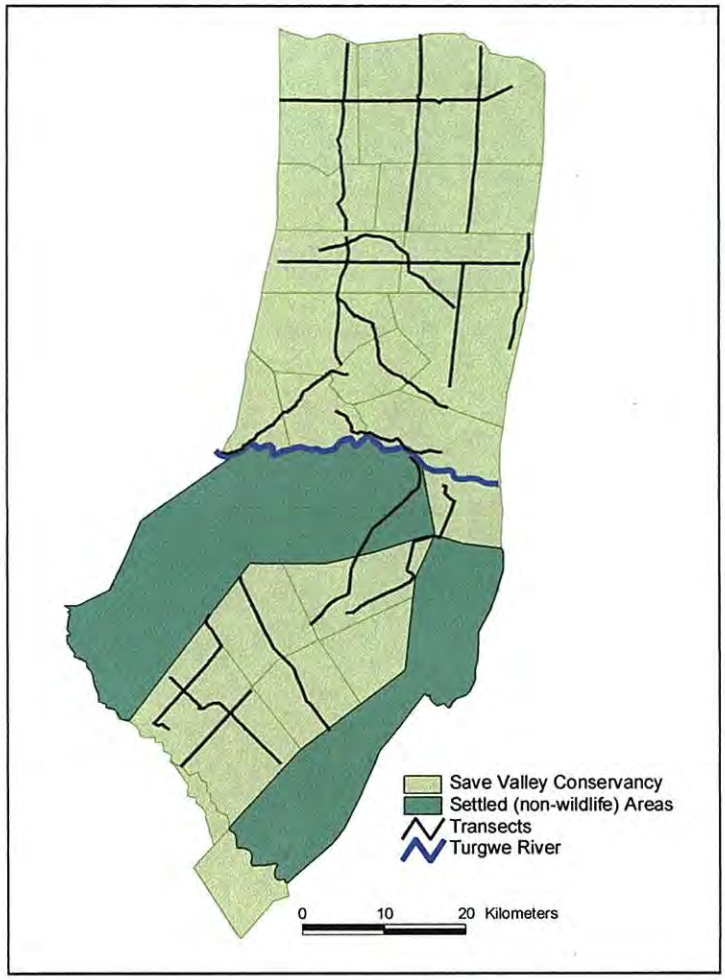
The total area of the Savé Valley Conservancy is 3490km^2. However, the effective wildlife area (excluding the 1051km^2 of resettled land), comes to only 2439km^2; 1639km^2 north of the Turgwe river and 800km^2 south of the Turgwe (see Table 1).

In northern SVC, the total length of all transects combined was 259.7 km, giving a penetration ratio of 6.31. In southern SVC, the combined transect length was 144 km, giving a penetration ratio of 5.56. For the conservancy as a whole, 403.7 km were driven (penetration ratio 6.04).

Transects surveyed were the same as those used in 2007-2017 (Figure 1). Each transect was driven at a speed of between 10 and 20 km/hr with one tracker, AWCF head scout Rueben Bote, sitting on the front of the vehicle scanning for spoor. Transects ranged between 12.7 km and 29.2 km in length, with a mean transect length of 21.2 km.

Each transect survey started as close to sunrise as possible, and wherever feasible was driven from west to east to ensure the best possible tracking conditions. Only tracks less than 24 hours old were counted. Road conditions are generally sandy, such that spoor is relatively easy to see. Where possible, spoor of individual animals were followed to reduce the likelihood of that individual being counted twice on a given transect. Spoor was recorded for all mammalian carnivores bigger than a genet.

Figure 1. Map of the transects driven – October 2017



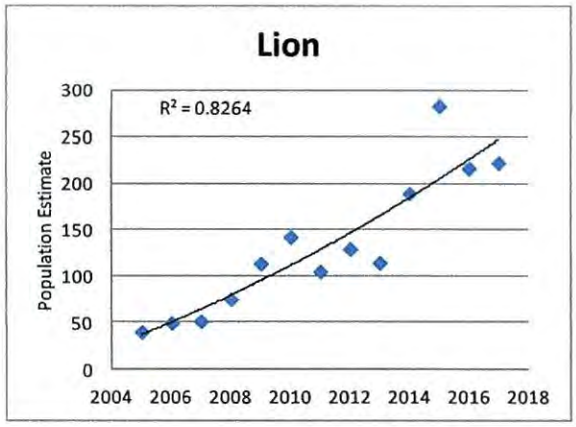
Results

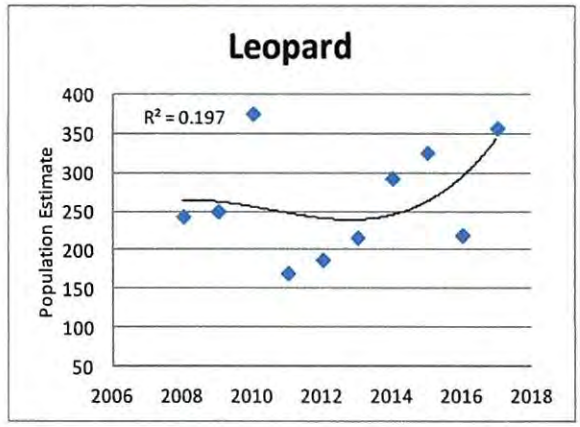
Table 1: Summary of survey parameters (2017)

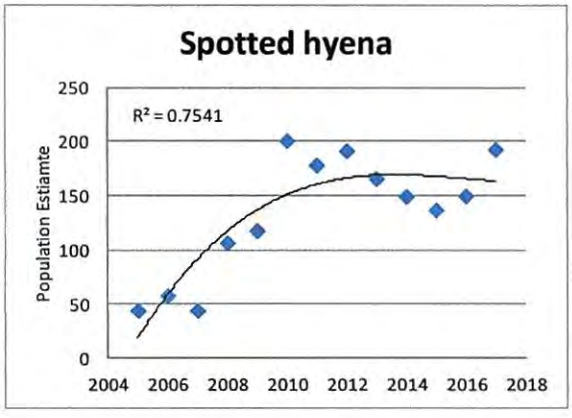
Parameter	Northern SVC	Southern SVC	Total SVC
Area (km^2)	1639	800	2439
Total number of km driven	269.7	132	401.7
Penetration ratio	6.08	6.06	6.07

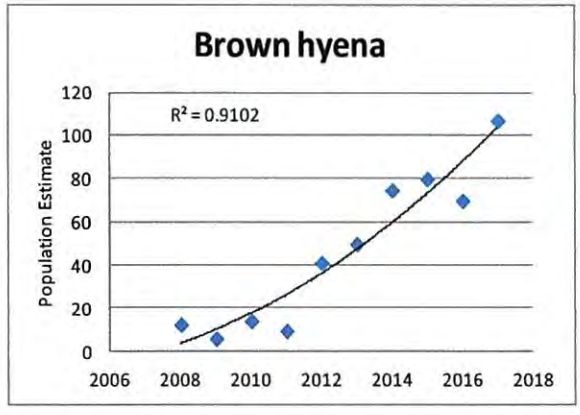
Table 2: Population estimates of the key carnivore species in the **whole of Savé Valley Conservancy** from 2008-2017 (from 2005 – 2017 for lion and spotted hyena).
Data for lion, leopard, spotted and brown hyenas and black backed jackal are from spoor surveys; **data for wild dogs is from the Lowveld Wild Dog Project's direct monitoring efforts** (counts are taken from April of each year and include adult and yearling wild dogs).

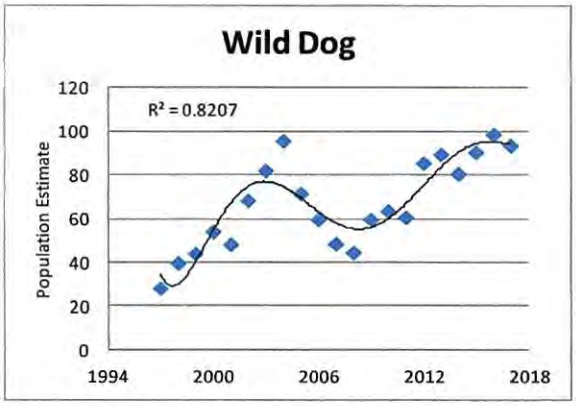
Species	2005	2006	2007	2008	2009	2010	2011	2012	2013	2014	2015	2016	2017
Lion	40	50	52	76	114	143	105	130	115	190	284	217	223
Leopard				245	252	378	172	189	218	295	328	221	359
Spotted hyena	44	58	44	107	118	201	178	192	166	150	137	150	193
Brown hyena				12	6	14	10	41	50	75	80	70	107
African Wild dog				45	60	64	61	86	90	81	91	99	94
Black backed jackal				188	190	157	141	151	199	229	241	234	296











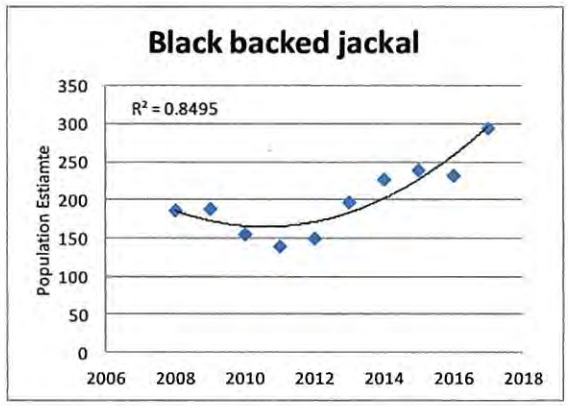


Figure 2: Trends in the populations of key carnivores in SVC for all years for which data is available. Data for lion, leopard and spotted and brown hyenas and black backed jackal are from spoor surveys; data for wild dogs is from the Lowveld Wild Dog Project's direct monitoring efforts (counts are taken from April of each year and include adult and yearling wild dogs). *A breakdown of all survey results for all species between the north and south of the conservancy is given in Appendix 1.*

Discussion

The results for each species are stable/increasing. The trend data suggests that 2016 was a slight undercount for all species (as was also the case in the Gonarezhou National Park survey), and that 2015 was most likely an over count for lion (and maybe for leopard).

Interpretation of results for each species

The **lion population** in the conservancy has increased significantly from c. 40 individuals in 2005 to 190 in 2014. Excluding the anomalous over count in 2015, the population appears to be starting to stabilise. The population **estimate of 223 lions** in 2017 is in keeping with the long-term population growth trend (Figure 2), and the recent marginal increases in estimated individuals could be indicative of a slowing growth rate as the species approaches capacity within the conservancy.

The number of lions in SVC equates to a **density of 9.1 lions / 100km²**, which is in line with densities recorded elsewhere (9.6 lions / 100km² - average over Kruger, Hwange, Selous and Serengeti), although in areas notably larger than SVC. Finally, of the 121 lion tracks we encountered, 31% were adult males, with 55% identified as adult females, 12% as sub-adults and 2% as young cubs. With regards to quota considerations, it is important to not only consider the population trend of the species, but age grouping and sex ratios too.

In 2017 there were an estimated **359 leopard** in the conservancy. If one disregards the 2016 count as an anomalous undercount, and considers the long-term trend data from 2010 – 2017 (inclusive), it is clear that the conservancy's **leopard population** is displaying a good and positive trend (Figure 2).

Leopards are at a **density of 14.7 leopards / 100km²** in the conservancy. This is considerably higher than densities recorded in Phinda and Mkhuze in South Africa (average 9.7 / 100km²; Balme et al. 2009) and in neighbouring Gonarezhou National Park (9.5 / 100km²; Groom & Watermeyer 2017). Finally, the SVC leopard population appears to displays a 2:1 ratio skewed in the favour of females. Of the 85 leopard tracks

we recorded, 32% were adult males, 64% were adult females, with one sub-adult (1%) being recorded and three cubs (3%).

Derivation of population estimates from spoor densities is controversial for leopards (there are several different equations available which give different numbers) so the numbers themselves should be treated with caution. Looking ahead, it may be useful to adopt alternative research methods (e.g. mark recapture camera trap survey) to calibrate the survey results, and obtain a more comprehensive understanding of leopard numbers in the conservancy.

Spotted hyenas appear to have stabilised over the last few years at between 150-200 individuals. There were an estimated **193 spotted hyenas** in 2017. The hyena population could be doing better in light of the recently stabilising lion population, but we will need to monitor the population to determine if a true trend is emerging. Likewise, one must not overlook that the possible causes of the recent slight population decline between 2012-2016 (prey availability, intra-specific competition, hunting pressure, anthropogenic mortality etc.) may still be of consequence.

Spotted hyena's are at a density of **7.9 spotted hyenas / 100km²**. This is lower than other populations; 13.5 / 100km² in Kruger (Mills 1985), 17.0 / 100km² in Hwange (Bowler 1992), and 9.7 / 100km² in Gonarezhou National Park (Groom & Watermeyer 2017). Given the relatively lower density of the species in the conservancy, they may still increase more.

There were an estimated **107 brown hyenas** in the conservancy in 2017. Overall and ignoring the 2016 undercount, the **brown hyena population** is displaying a stable and positive growth trend (Figure 2). The estimated density of brown hyenas was **4.4 brown hyenas / 100km²** in 2017, which is higher than the average (2.5 brown hyenas / 100km²) over the last few years (2012-2015).

The **African wild dog** population appears to be levelling off. **From our comprehensive and direct monitoring of the species, there are 94 adult and yearling wild dogs in the conservancy (3.9 wild dogs / 100km²).** Average wild dog densities are generally lower (average 2.5 wild dogs / 100km² across five populations; Pole 1999). The spoor survey results estimated 313 wild dogs in the conservancy, with a density of 12.8 African wild dogs / 100km². This is clearly a significant overestimate of the wild dog population, and serves to demonstrate that spoor surveys are not a reliable indicator of wild dog numbers.

When counts include pups (as spoor surveys do); the numbers are likely to be higher (particularly in October when densities are highest because it is directly after the denning season). Further, there is the potential to 'hit' or 'miss' a large pack of wild dogs during a spoor survey which can have a large effect on the results. However, looking at the detailed monitoring results, the long term trend for the species is as expected. Wild dogs are a classic 'boom and bust' species showing major population fluctuations over time.

There has been a notable increase in the **black backed jackal** population in the conservancy, from an estimated 241 jackals in 2015 and 234 jackals in 2016, to **296 black backed jackals** in 2017. Overall, the jackal population is displaying a stable positive growth trend (Figure 2). The estimated density of jackals was **12.1 jackals / 100km²** in 2017.

We once again stress, that the spoor encounter rate for **cheetahs** in the conservancy is very low, and thus it is impossible to accurately estimate the number of resident cheetahs, even with large confidence intervals. However, data from the spoor survey suggests there to be a minimum of **four cheetahs** in the whole

conservancy at a **density of 0.2 cheetahs / 100 km²**. This is on the low end of the spectrum when one considers the range of cheetah densities elsewhere (excluding highly managed fenced reserves in South Africa); for example, 0.2 cheetah / 100km² on Namibian farmlands and in the Sahara, and up to 2.5 cheetah / 100km² in the Serengeti National Park (IUCN/SSC 2015).

Although anecdotal evidence suggests the population may be picking up slightly, we can safely say the population is still very low (only two cheetah tracks were seen in the 403.7 km of transects driven). However, spoor surveys are not appropriate techniques for monitoring cheetah because they use the roads a lot less than other large carnivores, and the species would be more accurately surveyed by a mark recapture camera trap survey using cheetah play trees and other key areas. **The Cheetah Conservation Project Zimbabwe, which collected updated photographic information on cheetah throughout Zimbabwe, estimates c. 12 adult cheetahs in SVC (van der Meer, 2016).**

Word of caution

When interpreting the results in the graphs and tables at the end, please do so with caution, especially to quote specific numbers. For lions and hyenas we are confident that these spoor surveys are relatively accurate in the numbers they predict, although anomalous over and undercounts can hinder this. Likewise, we can trust the numbers for wild dogs, as they are from the detailed population monitoring study. For leopards however, several different equations (all considered suitable for estimating leopard numbers from spoor) can give different population estimates from each other. The spoor survey technique has not been calibrated for species like jackals, civets, even brown hyenas, so while the data is useful for looking at trends, using population figures directly from the graphs for these species is unadvisable.

Acknowledgements

Permission to conduct this research was given by the Research Council of Zimbabwe, and the Savé Valley Conservancy, with the support of the Zimbabwe Parks and Wildlife Management Authority. Thank you to Chishakwe Ranch for hosting the project team and for providing logistical support. Thanks also to all of the landowners and managers in the conservancy for allowing us to conduct this spoor survey on their properties. Rueben Bote deserves special mention for his excellent track identification.

Enhancement Finding

Applicant: Scott Ross Somers (PRT–12867D)

Introduction

Scott Ross Somers submitted an application on October 16, 2018, for the importation of one male lion *(Panthera leo melanochaita)* taken on June 09, 2018, from the Savé Valley Conservancy (SVC), Chishakwe Ranch, Masvingo Province, Zimbabwe, for the purpose of enhancing the propagation or survival of the species in the wild. After evaluating the available information submitted with the application, information provided by the Government of Zimbabwe, other information available to the U.S. Fish & Wildlife Service (Service), and comments received from interested parties, the Service has determined that the importation of the sport-hunted trophy meets the requirements for making a positive enhancement finding pursuant to 50 CFR 17.40(r) and 50 CFR 17.32(a). The rationale for our finding follows.

U.S. Permit Requirements for Import of Lions (*Panthera leo melanochaita*)

ESA

The African lion, subspecies *Panthera leo melanochaita* (southern and eastern Africa), is a threatened species under the U.S. Endangered Species Act (ESA or Act) and is regulated under a species-specific 4(d) rule, 50 C.F.R. § 17.40(r) that provides specific conservation measures for this subspecies. Under the 4(d) rule for *P. l. melanochaita*, all of the prohibitions at 50 C.F.R. § 17.21 and 50 C.F.R. § 17.31 apply to *P. l. melanochaita* specimens. These prohibitions, in part, make it illegal for any person subject to the jurisdiction of the United States to import or export any lion specimens.

Although import of the lion subspecies *P. l. melanochaita* is a prohibited activity under the Act, exceptions may be made in accordance with the 4(d) rule at 50 C.F.R. § 17.40(r) when

the import activity qualifies for and the Service issues an ESA threatened-species enhancement permit under 50 C.F.R. § 17.32(a). The preamble to the 4(d) rulemaking, 80 Fed. Reg. 79999, 80043-46 (Dec. 23, 2015), explains the factors the Service considers when making an enhancement finding for importation of sport-hunted trophies of *P. l. melanochaita*, as described below.

Our threatened species permitting regulations at 50 CFR 17.32 provide issuance criteria for threatened species permits (50 CFR 17.32(a)(2)), but do not specify what would constitute the enhancement of propagation or survival with regard to authorizing the import of parts or products of *P. l. melanochaita,* including sport-hunted trophies. Therefore, when making a determination of whether an otherwise prohibited activity enhances the propagation or survival of *P. l. melanochaita,* the Service will examine the overall conservation and management of the subspecies in the country where the specimen originated and whether that management of the subspecies addresses the threats to the subspecies (*i.e.,* that it is based on sound scientific principles and that the management program is actively addressing the current and longer term threats to the subspecies). In that review, we will evaluate whether the import contributes to the overall conservation of the species by considering whether the biological, social, and economic aspects of a program from which the specimen was obtained provide a net benefit to the subspecies and its ecosystem.

The Service will evaluate any application received that involves *P. l. melanochaita* in the context of enhancement of propagation or survival permitting in accordance with our threatened species permitting regulations at 50 CFR 17.32 and issuance criteria for threatened species permits (50 CFR 17.32(a)(2)). These include, in addition to the general permitting criteria in 50 CFR 13.21(b):

(i) Whether the purpose for which the permit is required is adequate to justify removing from the wild or otherwise changing the status of the wildlife sought to be covered by the permit;
(ii) The probable direct and indirect effect that issuing the permit would have on the wild populations of the wildlife sought to be covered by the permit;
(iii) Whether the permit, if issued, would in any way, directly or indirectly, conflict with any known program intended to enhance the survival probabilities of the population from which the wildlife sought to be covered by the permit was or would be removed;
(iv) Whether the purpose for which the permit is required would be likely to reduce the threat of extinction facing the species of wildlife sought to be covered by the permit;
(v) The opinions or views of scientists or other persons or organizations having expertise concerning the wildlife or other matters germane to the application; and
(vi) Whether the expertise, facilities, or other resources available to the applicant appear adequate to successfully accomplish the objectives stated in the application.

In addition to these factors, particularly in relation to sport hunting, we find the *IUCN Species Survival Commission (SSC) Guiding Principles on Trophy Hunting as a Tool for Creating Conservation Incentives, Ver. 1.0* (IUCN SSC 2012), to provide useful principles, which, considered in conjunction with our threatened species issuance criteria, will aid the Service when making an enhancement finding for importation of sport-hunted trophies of *P. l. melanochaita.* This document sets out guidance from experts in the field on the use of trophy hunting as a tool for "creating incentives for the conservation of species and their habitats and for the equitable sharing of the benefits of use of natural resources" (IUCN SSC

2012, p. 2) and recognizes that recreational hunting, particularly trophy hunting, can contribute to biodiversity conservation and more specifically, the conservation of the hunted species.

The SSC document lays out five guiding principles that, considered in conjunction with our threatened species issuance criteria, will aid the Service when making an enhancement finding for importation of sport-hunted trophies of *P. l. melanochaita:*

(a) *Biological sustainability:* The hunting program cannot contribute to the long-term decline of the hunted species. It should not alter natural selection and ecological function of the hunted species or any other species that share the habitat. The program should not inadvertently facilitate poaching or illegal trade in wildlife by acting as a cover for such illegal activities. The hunting program should also not manipulate the ecosystem or its component elements in a way that alters the native biodiversity.
(b) *Net Conservation Benefit:* The biologically sustainable hunting program should be based on laws, regulations, and scientifically based quotas, established with local input, that are transparent and periodically reviewed. The program should produce income, employment, and other benefits to create incentives for reducing the pressure on the target species. The program should create benefits for local residents to co-exist with the target species and other species. It is also imperative that the program is part of a legally recognized governance system that supports conservation.
(c) *Socio-Economic-Cultural Benefit:* A well-managed hunting program can serve as a conservation tool when it respects the local cultural values and practices. It should be accepted by most members of the community, involving and benefiting local residents in an equitable manner. The program should also adopt business practices that promote long-term economic sustainability.
(d) *Adaptive Management: Planning, Monitoring, and Reporting:* Hunting can enhance the species when it is based on appropriate resource assessments and monitoring (*e.g.,* population counts, trend data), upon which specific science-based quotas and hunting programs can be established. Resource assessments should be objective, well documented, and use the best science available. Adaptive management of quotas and programs based on the results of resource assessments and monitoring is essential. The program should monitor hunting activities to ensure that quotas and sex/age restrictions of harvested animals are met. The program should also generate reliable documentation of its biological sustainability and conservation benefits.
(e) *Accountable and Effective Governance:* A biologically sustainable trophy-hunting program should be subject to a governance structure that clearly allocates management responsibilities. The program should account for revenues in a transparent manner and distribute net revenues to conservation and community beneficiaries according to properly agreed decisions. All necessary steps to eliminate corruption should be taken and to ensure compliance with all relevant national and international requirements and regulations by relevant bodies such as administrators, regulators and hunters.

The Service's approach to enhancement findings for the importation of sport-hunted trophies of *P. l. melanochaita* is consistent with the purpose and intent of the Endangered Species Act. Before we will authorize the importation of a sport-hunted trophy, we must determine that the trophy hunting program is managed to ensure the long-term survival of the species. In many parts of the world, wildlife exists outside of protected areas and must share the same habitat

and compete with humans living in these areas for space and resources. If communities that share these resources with wildlife do not perceive any benefits from the presence of wildlife, they may be less willing to tolerate the wildlife. However, under certain circumstances, trophy hunting can address this problem by making wildlife more valuable to the local communities and encourage community support for managing and conserving the hunted species, as well as other species.

When evaluating whether the importation of a trophy of *P. l. melanochaita* would be authorized pursuant to 50 CFR 17.32, in accordance with our threatened species issuance criteria, we will examine how a country's management program for lions addresses the three main threats that have led to the decline of the subspecies: Habitat loss, loss of prey base, and human-lion conflict. When examining a management program and whether trophies taken as part of that program meet the issuance criteria, we would study a number of factors. Some of the factors we would consider include whether the program is based on sound scientific information and identifies mechanisms that would arrest the loss of habitat or increase available habitat (*i.e.,* by establishing protected areas and ensuring adequate protection from human encroachment). We would consider whether the management program actively address the loss of the lion's prey base by addressing poaching or unsustainable offtake within the country. A component of a management plan from which trophy imports would meet the issuance criteria would be whether there are government incentives in place that encourage habitat protection by private landowners and communities and incentives to local communities to reduce the incursion of livestock into protected areas or to actively manage livestock to reduce conflicts with lions. We would examine if the hunting component of the management program supports all of these efforts by looking at whether hunting concessions/tracts are managed to ensure the long-term survival of the lion, its prey base, and habitat. As stated previously, hunting can generate significant economic benefits if properly conducted. In looking at whether we would be able to authorize the import of a trophy under the issuance criteria of 50 CFR 17.32, we would examine if the trophy hunting provides financial assistance to the wildlife department to carry out elements of the management program and if there is a compensation scheme or other incentives to benefit local communities that may be impacted by lion predation. We would also consider how a U.S. hunter's participation in the hunting program contributes to the overall management of lions within a country.

Management programs for *P. l. melanochaita* would be expected to address, but are not limited to, evaluating population levels and trends; the biological needs of the species; quotas; management practices; legal protection; local community involvement; and use of hunting fees for conservation. In evaluating these factors, we will work closely with the range countries and interested parties to obtain the information. By allowing entry into the United States of *P. l. melanochaita* trophies from range countries that have science-based management programs, we anticipate that other range countries would be encouraged to adopt and financially support the sustainable management of lions that benefits both the species and local communities. In addition to addressing the biological needs of the subspecies, a scientifically based management program would provide economic incentives for local communities to protect and expand *P. l. melanochaita* habitat.

As stated, under this 4(d) rule any person wishing to conduct an otherwise prohibited activity, including all imports of *P. l. melanochaita* specimens, must first obtain a permit under 50

CFR 17.32. As with all permit applications submitted under 50 CFR 17.32, the individual requesting authorization to import a sport-hunted trophy of *P. l. melanochaita* bears the burden of providing information in their application showing that the activity meets the requirements for issuance criteria under 50 CFR 17.32. In some cases for imports, such as sport-hunted trophies, it is not always possible for the applicant to provide all of the necessary information needed by the Service to make a positive determination under the Act to authorize the activity. For the import of sport-hunted trophies of *P. l. melanochaita,* the Service will typically consult with the range country to the extent practicable and other interested parties to obtain necessary information.

The Service has the discretion to make the required findings on sport-hunted trophy imports of *P. l. melanochaita* on a country-wide basis, although individual import permits will be evaluated and issued or denied for each applicant. While the Service may make enhancement findings for sport-hunted trophy imports of *P. l. melanochaita* on a country-wide basis, the Service encourages the submission of information from individual applicants. We would rely on the information available to the Service and may rely on information from sources other than the applicant when making a permitting decision.

CITES

The African lion is also included in Appendix II of the Convention on International Trade in Endangered Species of Wild Fauna and Flora (CITES). It is unlawful for any person subject to the jurisdiction of the United States to engage in international trade in CITES specimens contrary to the provisions of the Convention, the ESA, or our CITES implementing regulations in 50 CFR part 23. 16 U.S.C. § 1538(c)(1), (g); 50 C.F.R. § 23.13. As required by CITES, export of a specimen of an Appendix II species to another country requires prior issuance of a CITES permit. Under CITES, importation of an Appendix II species does not require issuance of an import permit from the importing country. Consequently, the United States is not required to issue a CITES permit in order for U.S. hunters to import their sport-hunted lions. In compliance with CITES, the United States does require CITES imports to meet all CITES requirements, including that the imported lion trophies be accompanied by the required CITES export permits issued by the exporting countries, *see* 50 C.F.R. §§ 23.20; 23.23; 23.24; 23.26; 23.27, and including requirements for sport-hunted trophies at 50 C.F.R. § 23.74.

Individual Permit Adjudication Considerations

When the African lion listing under the ESA became effective, January 22, 2016, the Service began issuing enhancement findings for *P. l. melanochaita* on a countrywide basis, as had been the practice for a number of other threatened sport-hunted species. On March 1, 2018, however, in response to a D.C. Circuit Court opinion (*Safari Club Int'l v. Zinke*, 878 F.3d 316 (D.C. Cir. 2017)), the Service withdrew its countrywide enhancement findings for a range of species, including lions, across several countries, and began assessing applications to import sport-hunted trophies of these species on an application-by-application basis. These withdrawals were upheld in a D.C. Circuit Court opinion (*Friends of Animals v. Bernhardt*, No. 19-5147 (D.C. Cir. June 16, 2020); *Center for Biological Diversity v. Bernhardt*, No. 19-5152 (D.C. Cir. June 16, 2020)). No countrywide ESA enhancement findings are currently in effect. Therefore, since March 1, 2018, the Service has been making

ESA enhancement findings for the import of sport-hunted trophies of lions on an application-by-application basis, ensuring consistent application of the regulatory criteria across all permit application adjudications and ensuring that each permit decision is based on the best scientific and management information available.

Although the Service makes the required enhancement findings on sport-hunted trophy imports of *P. l. melanochaita* on an individual application basis, information obtained for the range country as a whole is also considered, as it is pertinent to the Service's evaluation. In addition to considering national-level species management, we also consider species management and contributions to species enhancement on a smaller-scale (e.g., at the regional or hunting management unit scale such as at the hunting operator, community conservancy, concessionaire, reserve, or ranch-level scale). In addition, we consider how the hunter's personal involvement in the hunting experience directly or indirectly contributes to enhancement of the species in the wild. In its enhancement evaluation, the Service, therefore, considers efforts made by the hunting management unit and/or individual hunter to directly or indirectly address the threats posed to lions in the wild together with other information available concerning the overall management and population status of the lion in the range country at the time of the hunt.

In making ESA enhancement findings, we review all relevant information available to us, including information submitted with the individual permit applications, information received in response to inquiries we make of the range countries, and all other reliable information we receive from interested parties, such as species experts, hunting organizations, hunting operators, community groups, and non-governmental organizations. We evaluate and consider all relevant information obtained or submitted to the Service on an ongoing basis as it relates to permit applications received for import of sport-hunted trophies of *P. l. melanochaita*.

The Service considers information at these different levels in order to assess:

1) How the range country government manages the hunted species and how hunting serves to enhance the survival of the species in the wild in the context of the management system;
2) How hunting serves to enhance the survival of the species in the wild in the context of the management unit at the hunting operator, concessionaire, community conservancy, reserve, or ranch level; and
3) How the individual hunter has contributed (where the hunt has already taken place) or will contribute (where the hunt has not yet taken place) to enhancement of survival of that species through their hunting activities and contributions to the survival of the species in the wild associated to the hunt and subsequent import.

Government-Level Factors Considered

- Enforcement of wildlife laws and regulations, particularly with regard to the range country's ability to implement wildlife regulations developed for the hunted species
- Implementation of a scientifically-based management plan that addresses the major threats to the species and provides economic incentives for local communities to conserve the species
- Investment of hunting fees into conservation, including whether the range country has standard processes and infrastructure in place to ensure an effective transfer of hunting revenues back into the country's management of the species and community benefits
- Management of human-lion conflict, including whether the range country has a compensation scheme or other incentives to local communities to reduce the incursion of livestock into protected areas or to actively manage livestock to reduce conflicts with lions
- Management of the lion's prey base by addressing poaching or unsustainable offtake of the lion's prey species
- Management of lion hunting areas through a system that ensures the long-term survival of the lion, its prey base, and habitat
- Protection of lion habitat through establishment of protected areas, ensuring adequate protection from human encroachment and providing incentives that encourage habitat protection by private landowners and communities
- Establishment and use of science-based quotas, a sex and age-based harvest system, and a monitoring program for the lion and its prey species

Hunting Management Unit-Level Factors Considered

- Monitoring populations of the hunted species and their prey-base
- Protecting and/or increasing the prey-base for lions in the wild
- Maximizing biodiversity of the lion's prey species
- Protecting and improving the habitat for lions in the wild to ensure maintenance of ecosystem functions and biodiversity (e.g., creating water holes, habitat management, etc.)
- Engaging in anti-poaching activities for lion and their prey base
- Managing human-lion conflict
- Investing in community benefits and employment, where such investments provide incentives for conservation of lions in the wild
- Complying with harvest laws and regulations
- Re-investing hunting fees or other contributions associated to lion hunting to a fund that supports conservation of lions in the wild

Hunter-Level Factors Considered

- Complying with harvest laws and regulations
- Paying hunting/import-related fees or other contributions associated to lion hunting that are re-invested to support conservation of lions in the wild (e.g., funding habitat protection for lions in the wild, protection of the lion's prey base, or mitigation of human-lion conflict)
- Participating in a hunting program with an operator that supports sustainable use of the species

This application-by-application permit review process offers an opportunity to incentivize hunting in concessions, conservancies, reserves, or ranches that support conservation of the species through rigorous anti-poaching programs, local wildlife monitoring activities, and compliance with government rules and regulations. By complying with our enhancement requirements, a hunter's personal import will help conserve lion populations in the wild by supporting the local communities where they hunt and promoting conservation of these species and their habitats by providing protection incentives to communities that live alongside these species.

Basis for Finding

On February 1, 2016, the Service sent a letter to the Parks and Wildlife Management Authority in Zimbabwe (ZPWMA) with a list of questions related to management plans, population status, conservation, management, hunting policies, and regulations of Zimbabwe's lion populations. Additionally in the letter, the Service referenced the IUCN SSC Guiding Principles on Trophy Hunting as a Tool for Creating Conservation Incentives Ver. 1.0 (09 August 2012), as it provides useful principles which, when considered in conjunction with the Service's permit issuance criteria, would aid when making the required enhancement findings for permitting importation of sport-hunted lion trophies.

On February 16, 2016, the Service sent a second request to ZPWMA for specific documents related to the conservation status of lions in Zimbabwe. ZPWMA responded to the Service's request on February 17, 2016, with a copy of *Conservation Status of African Lion in Zimbabwe,* and subsequently, on November 29, 2016, provided a copy of its *Enhancement and Non-detriment Finding for Lion (Panthera leo) in Zimbabwe.* The Service has also been corresponding with ZPWMA regarding African elephant management for several years. In this correspondence, ZPWMA, as well as other sources, have provided the Service with documents and information that are relevant to our evaluation of lions in Zimbabwe.

Since 2016, the Service has met with officials from Zimbabwe multiple times to receive updated information on the status of and management of lions in Zimbabwe with respect to imports of sport-hunted lion trophies. For example, Service representatives met with Zimbabwe officials in January 2018 at the annual Safari Club International convention in Las Vegas, and November 2018 at the African Wildlife Consultative Forum in Uganda. In September 2018, Zimbabwe officials provided to the Service the May 2017 Zimbabwe National CAMPFIRE Stakeholder's Review and the Zimbabwe Parks and Wildlife Management Authority Strategic Plan, 2019-2023. In addition, in September 2018 the Service received a letter dated 6 December 2017 from Hon. E.D. Mnangagwa, President of the Republic of Zimbabwe, addressed to President Donald Trump, addressing the

change of administration in Zimbabwe. In this letter Hon. E.D. Mnangagwa provided assurance to the United States that Zimbabwe is politically stable and that Zimbabwe's previous conservation initiatives would be enhanced, with the previous Minister, Permanent Secretary, and Director General confirmed to remain in place.

This information provided by the Zimbabwe authorities (including verbal updates and presentations at the 16th Annual African Wildlife Consultative Forum (Uganda, November 2018), along with the Service's final rule on the lion listing under the Act and other relevant information from reliable sources, are the basis of this finding.

Governance of Lions in Zimbabwe

The legal framework for Zimbabwe's regulatory mechanism is informed by its Wildlife Policy (1992), which is intended to maintain a protected area network for the conservation of the nation's wild resources and biological diversity. The Wildlife Policy (1992) provides for the Government of Zimbabwe to maintain a network of protected areas known as the Parks and Wild Life Estate, comprised of the country's National Parks, safari areas, botanical gardens, and sanctuary and recreational areas for the conservation of the nation's wild resources and biological diversity (CITES 2016; ZPWMA 2016). The framework is intended to create economic activity to enhance rural development and encourages the conservation of wild animals and their habitats outside the protected areas.

ZPWMA was established by the Parks and Wildlife Act of 1996 (Chapter 20:14) [as amended by Act Number 19 of 2001] which came into operation on June 1, 2002, through Statutory Instrument 144C of 2002. The Act provides for the establishment of a Parks and Wildlife Board; establishment of national parks, botanical reserves, botanical gardens, sanctuaries, safari areas and recreational parks; and the preservation, conservation, propagation or control of wildlife, fish, and plants of Zimbabwe and the protection of Zimbabwe's natural landscape and scenery. This Act includes sections on virtually every aspect of ZPWMA, including requirements for annual financial audits and reporting to the central government. The Act also provides for substantial penalties for the unlawful possession of or trading in protected wildlife species. In addition, the General Laws Amendment Act (No. 5) of 2010 provides for mandatory imprisonment for poaching.

The Parks and Wildlife Act, Chapter 20:14, devolved authority to manage and benefit from wildlife on communal and private lands to the landholders. In 1982, the legal provisions of this Act were extended to Rural District Councils (RDCs), on behalf of rural communities in communal lands whose areas contain viable populations of wildlife. Communal areas in Zimbabwe are administered by RDCs which have become a mechanism for implementation of the government's policy of conservation by utilization of natural resources. The Act enables local communities to manage and benefit from wildlife resources through the Communal Areas Management Programme for Indigenous Resources (CAMPFIRE) established in 1989.

CAMPFIRE was developed to encourage reduction in human-wildlife conflicts through conservation-based community development and to provide an economic incentive to

improve community tolerance of wildlife, including lions. At the time, the CAMPFIRE program was the model for community-based conservation efforts in several other African countries and was identified as an innovative program. Under a community-based conservation program, like CAMPFIRE, rural communities should benefit from revenue generated by sport-hunting.

As Zimbabwe's premiere wildlife agency, the main functions of the ZPWMA are to control, manage, and maintain Zimbabwe's wildlife resources with the primary role of protecting and conserving Zimbabwe's natural heritage for present and future generations on behalf of the country. It also provides the cornerstone of Zimbabwe's tourism industry (ZPWMA 2015). The rationale behind the establishment of the ZPWMA was to allow for a self-funding mechanism, and thereby reduce its dependence on the national treasury. In January 1996, the Government of Zimbabwe approved the establishment of the Parks and Wild Life Conservation Fund that provides for financing wildlife operations directly from revenues generated through wildlife-related activities. The funding for ZPWMA is therefore coming from revenue generated through sport hunting conducted on state and private lands, concession leases, National Park visitor fees, and other wildlife-related fees. While there have been requests by ZPWMA for funding from the central treasury in the past, to our knowledge, no other significant government funding has been provided, and only limited outside funding from non-governmental organizations (NGOs) or other governments appears to be available.

A major component of ZPWMA mandate is law enforcement. Poaching mainly occurs along the boundaries of protected areas where lions are incidentally snared as non-target prey. Between 2013 and 2015, 21 lions were killed illegally, with six animals killed through snaring in the area adjacent to Hwange National Park in 2015; poverty stands as the major driver of illegal hunting (ZPWMA 2016). If anyone is found in possession of poached specimens, they must pay a fine of USD 5,000 or face a mandatory jail sentence. If convicted of lion poaching, courts could require the payment of a compensation fee of USD 20,000 (ZPWMA 2014). Hunting operators are obligated through their concession lease agreements to assist with anti-poaching efforts (ZPWMA 2016). Reportedly, USD 590,000 was spent on anti-poaching efforts by the Bubye Valley Conservancy (BVC) alone during 2015 (K. Leathern, pers. comm., as cited in Du Preez et al. 2016), and USD 546,000 is spent annually on anti-poaching by the Savé Valley Conservancy (SVC) (Lindsey et al. 2012); these expenses are mainly covered by sport-hunting revenue (Du Preez et al. 2016). In 2002, ZPWMA had 2,146 rangers at its establishment (ZPWMA 2016); however, by the end 2015, there were 1,448 rangers in post (67% of 2002 level). Of the 1,448 rangers in post, 1,004 are deployable for anti-poaching operations (ZPWMA 2016).

Safari operators in Zimbabwe are required to be registered and licensed by the Zimbabwe Tourism Authority (https://www.soaz.net/index.php/2, accessed August 16, 2019). Operators must hold a lease or agreement on a suitable concession with an approved quota of animals. They are responsible for the official paperwork and permits connected to the hunt. Hunting operators are required by law to provide the services of a Zimbabwe Licensed Professional Hunter to accompany foreign hunters in Zimbabwe. Licensing is undertaken by the National Parks & Wildlife Authority.

Zimbabwe is a member of the Southern African Development Community (SADC). Under the SADC Treaty, Article 5(g) establishes objectives to, among other aspects, promote the sustainable use of wildlife, harmonize legal instruments governing wildlife use and conservation, promote the conservation of shared wildlife resources through the establishment of trans-frontier conservation areas (TFCA), and facilitate community-based natural resources management practices. To implement the SADC Treaty, member states are required to establish management programs for the conservation and sustainable use of wildlife.

Currently Zimbabwe is pursuing six TFCA initiatives at various stages of development. These are: Great Limpopo Transfrontier Park (GLTP) / Great Limpopo Transfrontier Conservation Area (GLTFCA); Chimanimani TFCA; Greater Mapungubwe TFCA; Kavango-Zambezi (KAZA) TFCA; Lower Zambezi-Mana Pools LZMP (TFCA) and Zimbabwe-Mozambique-Zambia (ZIMOZA) TFCA (Mandisodza-Chikerema 2018, p. 34).

Through TFCAs, wildlife management entities are linking many of the major protected areas by removing boundary fences along national borders that separate many reserves in addition to creating or improving corridors to link good-quality habitat for wildlife (Newmark 2008). The principle of ecological and migratory connectivity lies at the heart of the TFCA initiative linking large protected areas across international boundaries and providing space for wildlife populations.

Another provision of the SADC Treaty is that member states are required to establish management programs for the conservation and sustainable use of wildlife. Zimbabwe has met this criterion for African lions through the development of its 2006 *Conservation Strategy and Action Plan/or the Lion (Panthera leo) in Zimbabwe* (ZPWMA), which is still in use.

As previously mentioned, Zimbabwe is also a Party to CITES, and the African lion species is included in Appendix II of the Convention. As an Appendix-II species, certain criteria must be met before the CITES Management Authority of the country of export may issue an export permit, including a finding from the exporting country's CITES Scientific Authority that the proposed activity will not be detrimental to the survival of the species in the wild (non-detriment finding; NDF) and a finding from the CITES Management Authority that the specimens proposed for export were legally acquired (legal acquisition finding).

The ZPWMA has provided the Service with a copy of its standing CITES non-detriment finding (NDF), dated October 2016, for the export of African lion specimens. The NDF explains that lion populations in Zimbabwe are being managed sustainably for the benefit of the species and that Zimbabwe's management program for lion provides economic incentives for local communities to protect and expand lion habitats. The NDF document provides information to support the following:

- The Zimbabwe hunting industry is based on sound scientific information, provides mechanisms to arrest habitat loss, or where feasible increase habitat, and provides protection from human encroachment.

- Government incentives are in place to encourage habitat protection by private landowners and communities.
- Government Incentives are provided to local communities to reduce human-wildlife conflicts.
- Hunting concessions are managed to ensure the long-term survival of the African lion and its habitat.
- Trophy hunting provides financial assistance to the ZPWMA, the communal CAMPFIRE program, and private landowners to implement wildlife management programs.
- Local communities directly and indirectly benefit from the presence of lion in their areas.
- Participation of U.S. hunters in the Zimbabwe hunting industry contributes to the overall conservation and management of lions in Zimbabwe (ZPWMA 2016).

Lion Status in Zimbabwe

When the Service listed the subspecies of lion in southern and eastern Africa (*P. l. melanochaita*) as threatened under the Act (80 FR 79999), three primary threats to the species throughout its range were identified: loss of habitat, loss of prey base, and human-lion conflict. While human population growth clearly has an impact due to loss of available habitat for lions, increasing human population has a direct impact on prey base. Prey availability affects the reproduction, recruitment, and foraging behavior of lions and, as a result, strongly influences lion movements, abundance, and population viability (Winterbach *et al.* 2012, as cited in USFWS 2015). Lion densities are directly dependent on prey biomass (Hayward *et al.* 2007). Outside of protected areas, the lion's prey base is much reduced (Du Preez et al. 2016); inadequate management and law enforcement have led to poaching of the lion's prey base for bushmeat, which has been critically depleted (USFWS 2015). Population trends across eastern and southern Africa show that most prey species have declined in recent years; and for Zimbabwe, droughts have been a critical factor (ZPWMA 2016).

A reduced prey base results in a relatively greater chance of lions encountering livestock (Du Preez et al. 2016). While actual losses of livestock to predators may be relatively low, the perceived financial cost to farmers can be high, and lions are persecuted intensely in livestock areas as a consequence. Their scavenging behavior makes them particularly vulnerable to the practice of lacing prey carcasses with poison to eliminate predators (CITES 2016). Co-existence of lions and people is promoted through giving value to lions, such as through tourism and hunting in CAMPFIRE areas (ZPWMA 2014). The threat to lions from habitat loss is especially present in Sebungwe and the South East Low Veld where the fragmented nature of the protected areas is compounded by increasing human and livestock populations surrounding these areas (ZPWMA 2016).

According to the Service's CoPl7 *Consideration of Proposals for Amendment of Appendices I and II,* international trade in lion products is emerging as an additional threat; however, the relative extent to which this threat has contributed to lion population declines is difficult to evaluate accurately (CITES 2016). According to ZPWMA (2016), the illegal local and international trade in lions and their products poses an insignificant risk to the

species in Zimbabwe, as there are no records of people found in possession of illegally acquired lion specimens in Zimbabwe. It is not clear what level of legal trade of lion products, if any, occurs within Zimbabwe.

The bulk of Zimbabwe's wildlife occurs within the Parks Estate which includes 11 national parks, 16 safari areas, 16 recreational parks, 6 sanctuaries, 12 botanical reserves and 3 botanical gardens, all spread across the country (Parks and Wildlife Act 2001 Chapter 20:14). Wildlife populations also occur on the state Forest Areas, Communal CAMPFIRE areas, and private conservancies dedicated to wildlife-based land use. There are approximately 319,317 km^2 of land where some form of wildlife-based land use is practiced in Zimbabwe (ZPWMA 2016). Lions occur permanently in 45% of this available range (circa 145,000 km^2) with the majority occurring in national parks (96%) and safari areas (92%). Lions also occur permanently in 47% of the State forest areas and 66% of privately owned conservancies. The CAMPFIRE areas comprise approximately 247,000 km^2 and lions occur in 36% of these areas. Lions are transient in CAMPFIRE, conservancy, and resettled areas adjacent to the major protected areas, and lions move across the border into Zambia, Mozambique, South Africa, and Botswana.

Zimbabwe's main lion range includes the Hwange-Matetsi Ecosystem, Mid Zambezi Valley, Sebungwe, and South East Lowveld. The lion population estimates in Zimbabwe are determined primarily through carnivore spoor surveys, systematic lion collaring, and call-up surveys. According to ZPWMA's *Conservation Status of the African lion (Panthera leo) in Zimbabwe* July 2014 report, starting in 2015, lion spoor surveys were to be done at two-year intervals in all wildlife areas, and lion call-up surveys were to be done every three years in all major lion areas (ZPWMA 2014). Although the Service has not received confirmation that these surveys have been conducted since 2015, in September 2018, the Service received Zimbabwe's Parks and Wildlife Management Authority's Strategic Plan for 2019-2023, which indicates that Zimbabwe is actively working to improve the monitoring and management of their wildlife species. In their updated strategic plan, signed in December 2018, they indicated that one of their strategic objectives is protection of wildlife resources. Their identified timeline is to update and implement key species management plans (lion is identified as one of these) by December 2023.

ZPWMA (ZPWMA 2016) has estimated that the minimum number of lions that occur on approximately 5l,642 km^2 of land where reliable survey data are available is approximately 1,900 (range 1,800 - 2,000). The western portion of the country, consisting primarily of Hwange National Park and the surrounding safari areas, forest areas, communal areas, and private conservancies, supports approximately 737 lions (or 38% of the overall population). The southern portion of the country, dominated by the two major conservancies (SVC and BVC) and Gonarezhou National Park supports approximately 896 lions (48%). These numbers are supported by several studies.

Within Gonarezhou National Park, Groom et al. 2014, used call-up surveys to obtain direct estimates of the lion population and compared actual lion densities with potential density estimates. In this study, while lions were only seen at five percent of calling stations, this equated to a population estimate of 33 lions, which is consistent with spoor survey results conducted in June 2010 (Groom et al. 2014). A 2015 spoor count

survey of Gonarezhou National Park revealed an estimated 125 lions within the park (ZPWMA 2016).

From 2007 to present, annual track index surveys at the SVC have been conducted using a standardized methodology (Groom and Watermeyer 2015, as cited in Du Preez et al. 2016). Prey availability models suggest that the carrying capacity for this lion population is approximately 271 lions (Hayward et al. 2007). In 2015, the estimated population was 284 lions (Du Preez et al. 2016). The Rifa Safari Area was surveyed using camera trapping and spoor counts in 2015, which supported an estimated population of 68 lions. The central and northern portions of the country reportedly support an estimated population of 284 lions (15%). The 12-year (2000-2011) average lion density per 100 km^2 is 2.8 in Hwange National Park, 6.0 for South Eastern Lowveld in the SVC, 9.0 in Malilangwe, and 0.8 in Gonarezhou National Park (ZPWMA Annual Report 2013, as cited in ZPWMA 2014). SVC's website indicates that at SVC, an annual predator spoor count is conducted by the African Wildlife Conservation Fund (AWCF), an independent organization (http://savevalleyconservancy.org/conservation.html#header1-z, accessed August 14, 2019).

According to Riggio et al. 2013 (p. 32), and Bjorklund in Riggio et al 2013 (p. 32), the minimum number of lions that are estimated to constitute a viable population is 500 individuals. Hwange National Park, with an estimated population of 559, is the only area within Zimbabwe that has a viable population as laid out by Riggio et al. 2013. However, the two regions that make up the largest percentage of the country's lion population (Western 38% and Southern 48%) have regional populations of 737 and 896, respectively. The areas within the Central and Northern regions of Zimbabwe, albeit smaller, encompass parks that are part of Transfrontier Conservation Areas, such as the Mana Pools region.

Lion Management in Zimbabwe

In response to discussions surrounding a possible up-listing of lion to Appendix I under CITES at the 13th Meeting of the Conference of the Parties (CoP13), and subsequent workshops involving lion range states, IUCN, ZPWMA, and other key stakeholders held a workshop to develop the *Conservation Strategy and Action Plan for the Lion (Panthera leo) in Zimbabwe* which was published by ZPWMA in 2006. The plan responds to regional and international standards set by Treaties such as CITES and the Convention on Biological Diversity (CBD), among others. The plan states "it will guide the conservation and management of this top predator" which "addresses the needs of th[e] country." The Service is not aware of any additional or updated iterations of the plan since 2006; however, in Zimbabwe's 2016 response, *Enhancement and Non-Detrimental Findings for Panthera leo in Zimbabwe,* ZPWMA provided updates on each of the outputs and respective targets established under the 2006 *Conservation Strategy and Action Plan/or the Lion (Panthera leo) in Zimbabwe* (ZPWMA 2016).

The 2006 plan identifies a vision that "...lions should be conserved and managed sustainably for their aesthetic, cultural, and ecological values, and the socio-economic

development of Zimbabwe." The plan lays out three broad targets to achieve this objective:

- Ensure the persistence of key lion populations and other important populations including those of doubtful viability.
- Human and livestock loss reduced.
- Optimize wildlife conservation-related net benefits to local communities.

All three targets are stepped down to seven specific outputs with their own targets and activities to meet such targets. Although the plan does not identify a time period, some activities do, of which a period of 5 years is the most common. In response to inquiries from the Service, ZPWMA has provided a summary of the progress made to implement the 2006 strategy.

While all three of the broad targets appear to serve a valuable role in lion management in Zimbabwe, three of the specific outputs are most relevant to determining if the implementation of the strategy enhances the propagation or survival of the species, as required by the Act for the issuance of import permits. The first output, "lion populations, their habitats and wild prey effectively conserved and managed in collaboration with local stakeholders" is broken down into a number of targets: establish a baseline survey and monitoring program; maintain and strengthen capacity for lion conservation, management, monitoring and research; identify and implement best management standards and practices for the hunting program; develop and implement co-management frameworks; and expand the geographic distribution range of lions. Baseline surveys have been completed for the Parks Estate using monitoring protocols for key variables (populations, habitats, prey), and selected surveys have been undertaken in areas outside National Parks (ZPWMA 2016).

Carnivore research programs conducted by NGOs and research institutions such as WildCRU are taking place in various parts of the country; in addition, personnel have been trained in data collection and capture, management, and lion aging and analysis. Adaptive age-based criteria for male trophy animals are in place and functioning. The quota for a certain year is determined by a point system based off the hunts from the previous season. Therefore, ZPWMA is actively working toward meeting the target areas for this output.

The second output, "human-lion related conflicts minimized and, where possible, eliminated" has also been broken down into a number of targets: develop and establish databases on lion-human conflicts; identify and implement methods to reduce and mitigate livestock losses and lion attacks on humans; and train and properly staff problem animal control (PAC) units to conduct rapid response and precisely target problem animals. According to information from ZPWMA (2016), approaches to mitigate livestock losses and lion attacks on humans are in the process of being tested and implemented in Hwange, and methods to mitigate lion attacks on livestock are being implemented as appropriate at selected sites (e.g. Tsholotshe). Data on PAC reports for lion-related problems have been collated, and PAC units at ZPWMA field station and/or RDC levels have been partially established. In Matusadona, Hwange, and Gonarezhou regions, specific awareness and education packages on lion conservation and

management have been developed and implemented. The information submitted in the ZPWMA update suggests that they have met one target, and are in the process of implementing the remaining two.

The third output, "the costs and benefits of long-term lion management equitably distributed," is a socio-economic output to establish agreement and implementation of area-specific lion management plans with identified stakeholders in each wildlife region, and implementing a transparent mechanism to equitably distribute lion-related income to identified stakeholders." The specific targets for this output are: complete an inventory of stakeholders directly affected by lion conservation, deliver appropriate training and capacity building to prioritized stakeholders, agree to and implement collaboratively developed area-specific lion management plans with identified stakeholder groups in each wildlife region within 5 years, and implement transparent mechanisms to equitably distribute lion-related/generated income to identified stakeholders (groups and/or communities). Current information from ZPWMA shows that they have identified key stakeholders and assessed the financial impacts of lion conservation and the magnitude of socio-economic impacts on each stakeholder group. Limited training has been undertaken for representative stakeholders in Hwange, Matusadona, and Gonarezhou. ZPWMA has also implemented an adaptive management program across four wildlife regions and is in the progress of developing and implementing area-specific lion management plans with identified stakeholder groups. According to ZPWMA, a Management Plan for Hwange was approved. The Hwange National Park (HNP) Management Plan was updated in 2015 and officially accepted at Zimbabwe's Ministry of Environment level in 2016 (Conservation and Wildlife Fund (CWF) 2018, p. 16). One of the four components of this 10-year plan is implementation of a cooperation plan between the park and park neighbors. The Conservation and Wildlife Fund – Hwange (CWF) is a relatively new model of the private and NGO sectors in and around Hwange National Park (HNP) Zimbabwe, formalizing an alliance of individual members to materially and in-kind assist authorities with conservation work.

The Hwange Lion Research (HLR) which is part of the Wildlife Conservation Research Unit (WILDCRU), Oxford University, UK, with some financial support and collaborative effort from CWF, set up a comparative camera trap survey in May 2018, to establish a baseline of both lion and lion prey identification and densities in contiguous areas with differing management – the exact CWF project area. Although data were only obtained from the 40-day HNP camera grid, combined sources of complimentary data on the lion population in Forest Areas outside the national park suggest that anthropogenic mortality is slowing down, believed to be in part due to CWF's new law enforcement activities (CWF 2018, p. 21).

Zimbabwe's conservation strategy for lions also identifies roles and responsibilities for a number of participants in Zimbabwe's lion conservation efforts. According to the strategy, there is a national lion coordinator that coordinates all national activities on lion conservation, research, and management, including census surveys, setting up monitoring needs, and coordinating data on human-lion conflicts. The strategy identifies roles for the field stations, wardens, ecologists and utilization units, which are responsible for ensuring compliance with hunting regulations and maintaining safari hunting databases. In addition, the strategy identifies roles for CAMPFIRE, safari operators, and

professional hunters to facilitate training and ensure compliance with hunting regulations.

The Conservation Strategy and Action Plan for the Lion in Zimbabwe (ZPWMA 2006) borrows language from the *IUCN Conservation Strategy* (2006). It iterates areas in need of improvement regarding lion conservation in Zimbabwe, including standardized lion census methods and surveys, further mitigating human-lion conflicts, and maximizing benefits for rural communities that live with lions. ZPWMA (2006) notes their intention to review and put in place criteria for age-based identification of male trophy animals, but do not mention if they will be reviewing possible combination strategies. As part of the 2006 lion conservation strategy for eastern and southern Africa, six objectives were established to secure and restore sustainable lion populations, which were housed under the following categories: management, mitigation, socio-economics, policy and land-use, politics, and trade. The strategy was intended to be implemented within 10 years (Macdonald 2016), and Zimbabwe gave an update on progress regarding these objectives in their *Enhancement and Non-Detrimental Findings for Panthera leo in Zimbabwe* (ZPWMA 2016) that also addressed outputs and targets laid out in their 2006 action plan.

Additionally, to mitigate human-lion conflict, the "Long Shields Guardian Programme" was initiated whereby communities are notified of movements of collared lions into their areas via cell phone, and then have the opportunity to take appropriate action, such as moving cattle. In 2013 alone, 1,850 warnings were passed to the "Long Shields." These actions may reduce the incidents of lions marauding livestock; however, retaliatory killing of lions still occur. Further, as is policy under the Parks and Wildlife Act of 2001, any lions that attack humans or livestock will be lethally eliminated (ZPWMA 2016). Between 2007 and 2013 a total of 1,113 conflict incidents were recorded in the Hwange area in which 915 head of stock were lost to lions.

In and around Hwange National Park, data collected between 1999 and 2004 suggested that hunting surrounding the park was having a negative impact on the lion population. As a result, sport hunting of lions was suspended in the area surrounding the park between 2005 and 2009. Following the lifting of the moratorium, and by implementing stricter monitoring and hunting guidelines through the Hwange Lion Research Project, the overall Hwange lion population has continued to show a positive trend, and as of 2015 the population was estimated at over 550 animals (ZPWMA 2015).

Hunting, Management, and Utilization of Lions

In Zimbabwe, much of the trophy hunting occurs in Safari Areas which are managed mainly for the sustainable use and as buffer zones next to National Parks (Jeke et al 2019, p. 2). Trophy hunting of wildlife is legally permitted in safari areas; as of 2014, there were 16 in Zimbabwe (ZPWMA 2014). According to the Forest Act, Chapter 19:05, there are 24 gazetted indigenous forest areas in Zimbabwe; within these forest areas, lions may be hunted in the following forests: Fuller, Kazuma, Pandamasuwe, Ngamo, Sikumi, Gwayi, Sijarira, and Gwampa (ZPWMA 2014).

As of 2016, the minimum number of lions that occur in approximately 51,642 km^2 of land in Zimbabwe, where reliable survey data are available, is estimated to be 1,917 (range 1,800 - 2,000), the majority of which occur in western and southern Zimbabwe. When taking this population estimate into consideration, trophy hunting harvests a yearly mean of 2.7% of adult male lions. This figure decreased since the establishment of age restrictions on lion hunting (ZPWMA 2016).

In 2013, an adaptive quota management system for lion hunting based on the ages of lions hunted was agreed to in Harare, Zimbabwe, during a meeting hosted by ZPWMA and an independent non- governmental conservation organization (Du Preez et al. 2016). After reviewing aging techniques, attendees at the July 2013 meeting in Harare, Zimbabwe were confident that hunters could be expected to categorize lions as being below or above five years of age. In determining quotas for the following years, operators would be rewarded with increased quotas if they hunted animals of six years or older, would not be penalized if they hunted animals five years of age, but would have quotas cut if they hunted animals younger than five years old, or if they failed to complete hunt returns (ZPWMA and Panthera 2014). In 2013, only 28% of lions hunted were five years old or older. In 2015, that figure rose to 77.3% (ZPWMA 2016).

According to Hunter et al. (2013), an adaptive quota management system utilizing age-based criteria would not only aid in the prevention of over-harvesting lions, but would also prevent excessively conservative quotas. Further, according to Miller et al. (2016), results indicate that age-based hunting is feasible for sustainably managing threatened and economically significant species such as the lion, but must be guided by rigorous training, strict monitoring of compliance and error, and conservative quotas. No single trait can be relied upon exclusively to precisely age lions. Rather, multiple traits must be examined in combination to cross-validate an individual's age and, according to Whitman et al. (2004), restricting hunting to individuals that are at least six years old is desirable from a biological perspective due to the reduced risk of the loss of pride males and infanticide of cubs associated with the harvest of such individuals (Whitman et al. 2004).

During 2013, operators were requested to submit hunt returns and photos as a trial run to get the adaptive quota system up and running. In 2014, operators were requested to do the same but were informed that the age of the lions hunted in 2014 would determine their lion quotas in 2015 (Du Preez et al. 2016). In 2015, there was a marked increase in the age of lions hunted in Zimbabwe as a whole. The majority of lions hunted were on the cusp of 5-6 years of age but were not older than six years. National hunting offtakes for lions in Zimbabwe from 2013 to 2015 were 29, 42, and 47 respectively (Masterson 2016). It appears these do not include illegal forms of hunting offtake. In 2011, Zimbabwe's quota was set at 101 lions; in 2014, it was reduced to 50 male lions following the implementation of age restrictions (Henschel 2015, pers. comm., as cited in USFWS 2015).

As described above, CAMPFIRE is the program through which the Government of Zimbabwe has relegated the management of wildlife resources to communal farmers. As of July 2014, there are at least 58 Rural Districts that have been granted the Appropriate Authority status to manage wildlife resources in their areas; however,

according to *Enhancement and Non-Detrimental Findings for Panthera leo in Zimbabwe* ZPWMA 2016, only 16 are actively engaged in some form of wildlife-based land use (ZPWMA 2016). Lions are found in communal areas that are adjacent to major protected areas, and lion hunting is allowed in CAMPFIRE districts (ZPWMA 2014).

In setting adaptive lion quotas, Zimbabwe uses scientific information including spoor surveys, camera traps, and ranger-based sighting. In CAMPFIRE areas, incidences of human-lion conflict are also taken into consideration where survey information is not readily available, when determining quotas for those areas (ZPWMA 2014). The quota-setting process involves all stakeholders, including the ZPWMA, landowners, safari operators, and CAMPFIRE managers and their representatives. During the annual quota-setting workshop, presentations are made by the proponents who then make proposals for quotas. Where it is felt that not enough information has been presented, a precautionary quota will be issued (ZPWMA 2014).

ZPWMA (2016) mentions seven concessions that are leased on five-year terms, and how these concessionaires pay a 5-year "right to lease" fee, annual rental, fixed quota fee (payable if animals are shot or not) and a supplementary quota fee that allows additional animals to be bought as needed. It is unclear to what extent Zimbabwe still utilizes fixed quotas, as Du Preez et al. claims fixed quotas are no longer being used by Zimbabwe, but a fixed quota fee is mentioned in ZPWMA (2016). It is also unclear how many animals concessionaires are able to "buy as needed," and how such requests may be accommodated without going over the national quota (ZPWMA 2016). However, when evaluating the lower quota with higher utilization reported by ZPWMA (2016), and taking into consideration the land area of the Parks Estate alone, Zimbabwe did not exceed the best management practice of 0.5 lions/1,000 km^2; the 2015 off-take would have accounted for 0.125 lions/1,000 km^2.

According to *The Role of Trophy Hunting of Elephant in Support of the Zimbabwe CAMPFIRE Program -December 2016,* a report the Service received in December 2016, the Reserve Bank of Zimbabwe, in collaboration with relevant stakeholders, established the Tourism Receipts Accounting System (TRAS2) that required all outfitters to submit returns listing the revenue generated for hunting activities. This system has been in place for several years, but it required manual analysis of the data to extract information on hunting revenue. In January 2015, to account fully for earnings in the hunting sector, the Reserve Bank of Zimbabwe in collaboration with relevant stakeholders, introduced TRAS, a web-based system that links Safari operators, ZPWMA Authority, taxidermists, shipping agents, International marketing agents, and the Reserve Bank. Under this system, all authorized hunts are registered, allowing for the capture of hunting data, such as the origin of clients, value of trophies and hunts, and area hunted, to monitor hunting quota utilization and track hunted trophies. According to the December 2016 report, the Exchange Control Division of the Reserve Bank of Zimbabwe and the ZPWMA are now able to:

1. Assess regional price differentials of similar hunts and the reasons thereof;
2. Present TRAS2 system updates and reports to the users, including international marketing agents;
3. Engage with international marketing agents of sport hunting;

4. Obtain relevant insights on governing of the hunting sector; and
5. Come up with an effective mechanism to fully account for export proceeds from the hunting sector.

The TRAS2 information provides a breakdown of the source of hunting income, and the amount of funds generated by trophy fees by land category, among other insights, and has demonstrated the TRAS2 system's ability to obtain relevant insights on governing of the hunting sector.

Evaluation

Scott Ross Somers hunted in the Savé Valley Conservancy (SVC) in southeastern Zimbabwe, reportedly one of the largest private game reserves in Africa (https://savevalleyconservancy.org/). In the early 1900's, the 3,440 km^2 of land that now comprises the SVC was used for cattle ranching, which led to the elimination of most large herbivores and predators, including lions. In the 1990's upon establishment of the SVC, the cattle farms were converted to a wildlife-based land use system and wildlife populations were restored (Pole 1999).

In evaluating whether the importation of Mr. Somers' trophy of *P. l. melanochaita* would be authorized pursuant to 50 CFR 17.40(r) and 50 CFR 17.32(a), in accordance with our threatened species permit issuance criteria, we examined how Zimbabwe's management of lions overall as well as how Savé Valley Conservancy and Mr. Somers himself have contributed to enhancement of wild lions both directly and indirectly by addressing the three main threats that led to the decline of the subspecies: habitat loss, loss of prey base, and human-lion conflict.

Below, we summarize our evaluation with reference to each of the permit issuance criteria at 50 CFR 17.32(a)(2) on the basis of information available to the Service.

17.32(a)(2)(i): Whether the purpose for which the permit is required is adequate to justify removing from the wild or otherwise changing the status of the wildlife sought to be covered by the permit:

Zimbabwe's lion hunting industry generated 9% of all sport-hunting revenue in 2015; 51% was contributed by U.S. hunters during 2010-2015 country-wide, and 90% of the sport-hunting market in the Bubye Valley Conservancy (BVC) and the Savé Valley Conservancy (SVC) from 2005-2015. Even though 9% may not seem like much, lions are a key component of the sport hunting industry, as they are part of the "Big 5" trophies and draw U.S. hunters to Zimbabwe. Without the hunting industry, protected wildlife areas such as BVC and SVC, which have become conservation havens in the threat of human encroachment across much of Zimbabwe, would not be economically viable, and therefore would likely not exist. These wildlife areas not only provide habitat for lions, but also support the lion's prey species. As previously noted, the southern portion Zimbabwe, which is dominated by SVC, BVC, and Gonarezhou National Park, supports approximately 896 lions (48% of the Zimbabwe lion population).

According to Lindsey et al. (2012), hunting operators in the SVC spend USD 546,000 annually on anti-poaching activities and employ 186 permanent game scouts. Hunting revenues are used to support expenses associated with these activities (Du Preez et al. 2016).

The *Strategy and Action Plan* has put into place mechanisms to adequately oversee the harvest of lions in Zimbabwe. With an annual harvest of approximately 85 lions, Zimbabwe is not exceeding the limits identified of 0.5 lions/1,000 sq. km. The objectives of the *Strategy and Action Plan* and the actions and monitoring activities that have been put into place to achieve these objectives should support the adaptive management approach that Zimbabwe has established for managing lions. The Service will continue to monitor the effectiveness of the Strategy and Action Plan, for consideration in future findings.

As described above, we have determined that the government of Zimbabwe and the Savé Valley Conservancy contribute towards positive conservation outcomes by addressing the main threats of habitat loss, human-lion-livestock conflict, and prey depletion, which contributes to improving the status of lions in Zimbabwe. Further, the fees garnered through Mr. Somers' hunt will provide revenue to support these positive conservation outcomes.

Therefore, based on the information available to the Service, the purpose for which the permit is being requested, import of this trophy lion, is adequate to justify removing the sport-hunted trophy lion from the wild or otherwise changing its status.

17.32(a)(2)(ii): The probable direct and indirect effect that issuing the permit would have on the wild populations of the wildlife sought to be covered by the permit:

The total area under wildlife-based land use and conservation in Zimbabwe amounts to 10.7 million hectares and represents 27% of the total surface area of the country. Of this, 7.9 million hectares, or 75% of all conservation land in the country, falls under safari hunting as the primary or only source of revenue. Sport hunting of lions by U.S. hunters such as Mr. Somers supports the programs in Zimbabwe that provide the opportunity for locals to see value in lions, which in turn conserves the species in the long-term.

A scientifically based quota is the number of a given species that can be removed from a specific population without damaging the biological integrity and sustainability of that population (WWF 1997). However, full implementation and enforcement of the age-based strategy could potentially cause the need for quotas to become irrelevant or eliminated (USFWS 2015). Age restrictions will naturally restrict offtake to a limited number of individuals that meet the age criteria (Loveridge *et al.* 2007, Whitman *et al.* 2004).

Based on the information provided to the Service, it is clear that Zimbabwe has made strides in their management of their lion populations. Additionally, Zimbabwe appears to be transparent in its management processes, including its quota setting. In 2013, Zimbabwe proposed an adaptive age-based strategy for setting hunting quotas. This

adaptive quota management system for lion hunting based on the ages of lions hunted has been accepted and embraced by all stakeholders; it has not only led to a reduced national lion hunting quota, but has also resulted in a significant increase in the age of harvested lions to a level that is considered to have a reduced ecological impact (Du Preez et al. 2016).

In 2015, the development of TRAS2 allowed the country to better monitor and govern the hunting sector, including developing an effective mechanism to fully account for export proceeds from the hunting sector. The continued participation of U.S. hunters, including Mr. Somers, in this market is anticipated to continue to maintain the viability of managing areas such as the BVC and SVC in their current form, including their contribution to conservation of lions in the wild. In 2015, lion sport-hunting generated USD 753,000 in revenue, which accounts for about 9% of all sport hunting revenue in Zimbabwe that year (ZPWMA 2016).

After evaluating the information provided by the Zimbabwe government and other sources, it appears that the hunting program in Zimbabwe is addressing the three main threats that were identified by the Service when making the determination that the species was threatened with the possibility of extinction. Moreover, hunting areas such as BVC and SVC are maintaining habitat for lions and ensuring that there is no further loss, provided that the hunting areas can remain economically viable. In order to maintain a viable population of lions, the parks, safari areas, and CAMPFIRE areas must maintain biodiversity and a sustainable prey base. Finally, Zimbabwe is actively working to reduce human-lion conflicts and the number of lions killed in retaliation for killing livestock. Therefore, the management of lions within Zimbabwe and the limited hunting of lions contributes to the on-going survival of the species in Zimbabwe.

The participation of Mr. Somers in the hunting and subsequent import of the trophy lion he harvested in the SVC provides an indirect benefit to wild lion populations by helping to support the reserves where lions are found; Mr. Somers' hunt has generated revenue to help support a hunting area where lions are found and conserved. Therefore, based on the information available to the Service, the probable direct and indirect effect that issuing an import permit for a legally hunted lion would have on the species would be positive.

17.32(a)(2)(iii): Whether the permit, if issued, would in any way, directly or indirectly, conflict with any known program intended to enhance the survival probabilities of the population from which the wildlife sought to be covered by the permit was or would be removed:

As stated above, Zimbabwe is monitoring and controlling the harvest of lions through permitting under their regulations and through the *Strategy and Action Plan*. The issuance of import permits for lions legally hunted under these authorities would not conflict with any programs intended to enhance the survival probability of the species in Zimbabwe. Issuance of a permit authorizing import of Mr. Somers' trophy lion from Zimbabwe would work in favor of, not against, the principal acts governing lion conservation in Zimbabwe. Furthermore, sport

hunting opportunities help local communities realize the value in conserving the African lion.

Therefore, based on the information available to the Service, the issuance of an import permit for a legally hunted lion does not conflict with known conservation programs.

17.32(a)(2)(iv): Whether the purpose for which the permit is required would be likely to reduce the threat of extinction facing the species of wildlife sought to be covered by the permit:

Considering Zimbabwe's limited, controlled off-take of lions in a manner that maintains sustainability, Mr. Somers' legal hunt contributes to reducing the threat of extinction of lions. It appears that the permitting activities under Zimbabwe's laws and CITES, as well as the implementation of the adaptive age-based lion quota, and a continuation of implementation of the outputs in the *Strategy and Action Plan* are working in concert to promote the long-term survival of lions in the wild in Zimbabwe. The use of revenue received from hunters, such as Mr. Somers, to manage the populations on the reserves is an important element of the success of lion management in Zimbabwe. For example, hunting operators in the SVC spend USD 546,000 annually on anti-poaching activities (Lindsey et al. 2012). Therefore, based on the information available to the Service, the issuance of the requested import permit for Mr. Somers' legally hunted lion will likely reduce the threat of extinction facing lions in Zimbabwe.

17.32(a)(2)(v): The opinions or views of scientists or other persons or organizations having expertise concerning the wildlife or other matters germane to the application:

Based on reviewing comments made during the listing process for lions, as well as information obtained through personal conversations and literature, there is general agreement that hunting, done properly and well managed, would not have an adverse effect on lion populations. Numerous researchers have stated that, while they may not support hunting in general, they see that benefits can be received through a scientifically based hunting program for lions.

Based on the information available to the Service, there is general support by scientists and other persons or organizations having expertise concerning lions that the legal and sustainable harvest of lions, and the subsequent import of legally harvested lion trophies, as proposed in this application, would not have an adverse effect on the species and would further efforts to conserve the species in the wild into the future.

17.32(a)(2)(vi): Whether the expertise, facilities, or other resources available to the applicant appear adequate to successfully accomplish the objectives stated in the application:

Mr. Somers submitted a permit application to import a trophy of his personally, legally harvested lion from Zimbabwe for the purpose of enhancing the propagation or survival of the species in the wild. As a sport-hunter, Mr. Somers plays a large role in the hunting industry of Zimbabwe; the hunting and subsequent import of Mr. Somers' trophy lion increases the funds available to the Zimbabwe Government and SVC to implement lion conservation initiatives. Therefore, based on the Service's review of the information available relating to Mr. Somers' permit request, we find that the expertise, facilities, or other resources available to Mr. Somers appear adequate to successfully accomplish the objectives stated in the application.

Conclusion

As described above, the Government of Zimbabwe has been documented to implement the *Strategy and Action Plan* in the manner identified in the documents referenced in making this finding. The on-going adaptive management and limited and sustainable off-take of lions is important to the survival of lions in Zimbabwe, and the funds generated by Mr. Somers' participation contributes to the ongoing benefits the program provides to lions in the wild.

Therefore, based on the Service's consideration and analysis of the information associated with Mr. Somers' permit application and other relevant information available to the Service, as described above, we find that the import of the lion harvested by Mr. Somers on June 09, 2018, from the Savé Valley Conservancy, Zimbabwe, meets the requirements for making a positive enhancement finding pursuant to 50 CFR 17.40(r) and 50 CFR 17.32(a). Therefore, the Service is able to authorize the import of the trophy of one lion taken from the wild in Zimbabwe, to Scott Ross Somers of Davidson, Michigan.

Critical Habitat: N/A

V. **Project Description:** Describe proposed project or action or, if referencing other documents, prepare an executive summary (attach additional pages as needed):

As described in the permit application, 12867D, Scott Ross Somers, has requested a permit to import a trophy of one lion that he lawfully hunted in Zimbabwe. The import is for personal purposes.

VI. **Determination of Effects:**

(A) Description of Effects: Describe the action(s) that may affect the species and critical habitats listed in item IV. Your rationale for the Section 7 determinations made below (B) should be fully described here.

Issuance of the requested import permit by the Branch of Permits will result in the importation of one personally sport-hunted lion that has been lawfully taken in Zimbabwe on the date specified in the permit application.

The trophy will be accompanied by the required CITES export permit issued by the CITES Management Authority of Zimbabwe.

The requestd U.S. Federal Fish and Wildlife import permit does not authorize the killing of an African lion; the authorization to hunt and lawfully take a lion is under the purview of the government of Zimbabwe. Therefore, the proposed action of issuing a Federal Fish and Wildlife import permit for this lawfully hunted lion will not directly or indirectly affect individuals of listed or proposed species or designated/proposed critical habitat of such species.

(B) Determination: Determine the anticipated effects of the proposed project on species and critical habitats listed in item IV. Check all applicable boxes and list the species (or attach a list) associated with each determination**.**

Determination

No Effect: This determination is appropriate when the proposed project will not directly or indirectly affect (neither negatively nor beneficially) individuals of listed/proposed/candidate species or designated/proposed critical habitat of such species. **No concurrence from DSA/ESFO required.** **X**

May Affect but Not Likely to Adversely Affect: This determination is appropriate when the proposed project is likely to cause insignificant, discountable, or wholly beneficial effects to individuals of listed species and/or designated critical habitat. **Concurrence from DSA/ESFO required.** _____

May Affect and Likely to Adversely Affect: This determination is appropriate when the proposed project is likely to adversely impact individuals of listed species and/or designated critical habitat. **Formal consultation with DSA/ESFO required.** _____

May affect but Not Likely to Jeopardize candidate or proposed species/critical habitat: This determination is appropriate when the proposed project may affect, but is not expected to jeopardize the continued existence of a species proposed for listing or a candidate species, or adversely modify an area proposed for designation as critical habitat. **Concurrence from DSA/ESFO optional.** _____

Likely to Jeopardize candidate or proposed species/critical habitat: This determination is appropriate when the proposed project is reasonably expected to jeopardize the continued existence of a species proposed for listing or a candidate species, or adversely modify an area proposed for designation as critical habitat. **Conference with DSA/ESFO required.** _____

Permittee:
SCOTT ROSS SOMERS
(b) (6)
DAVIDSON, MI 48423
U.S.A.

Authority: Statutes and Regulations: 50 CFR 17.40(r).

Location where authorized activity may be conducted:
IMPORT THROUGH ANY PORT LISTED IN 50 CFR 14.12

Reporting requirements: Not applicable

Authorizations and Conditions:

A. Authorized to import the sport-hunted trophy of one male African lion (*Panthera leo melanochaita*), taken in Zimbabwe for the purpose of enhancement of the survival of the species.

B. Specimen may not be sold or transferred for any financial remuneration.

C. **Trophy must have been taken during the 2018 hunting season.**

D. Trophy must be accompanied by a valid trophy permit or hunting license issued by the government of Zimbabwe for the 2018 season.

E. Trophy must be accompanied by a valid Convention on International Trade in Endangered Species of Wild Fauna and Flora (CITES) Appendix II export permit/re-export certificate, source code "W", issued by the Management Authority of Zimbabwe.

F. General conditions set out in Subpart D of 50 CFR 13, and specific conditions contained in Federal regulations cited above, are hereby made a part of this permit. All activities authorized herein must be carried out in accord with and for the purposes described in the application submitted. Continued validity, or renewal of this permit is subject to complete and timely compliance with all applicable conditions, including the filing of all required information and reports.

G. The validity of this permit is also conditioned upon strict observance of all applicable foreign, state, local, tribal, or other federal law. **This permit can be photocopied.**

H. Valid for use by permittee named above.

I. Acceptance of this permit serves as evidence that the permittee understands and agrees to abide by the "General Permit Conditions" (copy attached).

Type of Activity

IMPORT OF SPORT-HUNTED TROPHIES under Appendix I of the Convention on International Trade in Endangered Species (CITES) and/or U.S. Endangered Species Act (ESA)

Complete Sections A or B, and C, D, and E of this application. U.S. address may be required in Section C, see instructions for details.
Instructions on how to make your application complete and help avoid unnecessary delays are attached.

Section A: Complete if applying as an individual

1.a. Last Name	1.b. First Name	1.c. Middle Name/Initial	1.d. Suffix
mahaffey	william	howard	

2. Date of Birth (mm/dd/yyyy)	3. Telephone Number	3.a. Alternate Telephone Number	4. E-mail address
(b) (6)			

Section B: Complete if applying on behalf of a business, corporation, public agency, Tribe, or institution

1.a. Name of business, agency, Tribe, or institution		1.b. Doing business as (DBA)	
2. Tax identification no.		3. Description of business, agency, Tribe, or institution	
4.a. Principal officer Last name	4.b. Principal officer First Name	4.c. Principal officer Middle name/initial	4.d. Suffix
5. Principal officer title	6. Primary contact name		
7.a. Business telephone number	7.b. Alternate telephone number	7.c. Business fax number	7.d. Business e-mail address

Section C: All applicants complete address information

1.a. Physical address (Street address; Apartment #, Suite #, or Room #; no P.O. Boxes)
(b) (6)

1.b. City	1.c. State	1.d. Zip code/Postal code	1.e. County/Province	1.f. Country
Winter Park	Florida	32792	orange	US

2.a. Mailing address (include if different than physical address; include name of contact person if applicable)

2.b. City	2.c. State	2.d. Zip code/Postal code	2.e. County/Province	2.f.Country

Section D: All applicants MUST complete

1. Attach the **nonrefundable application processing fee** in the form of a check or money order payable to the U.S. FISH AND WILDLIFE SERVICE **in the amount of $100**. Federal, Tribal, State, and local government agencies, and those acting on behalf of such agencies, are exempt from the processing fee--attach documentation of fee exempt status as outlined in instructions [50 CFR 13.11(d)].

2. Certification: I hereby certify that I have read and am familiar with the regulations contained in ***Title 50 Part 13 of the Code of Federal Regulations*** and the other ***applicable parts in subchapter B of Chapter I of Title 50***, and I certify that the information submitted in this application for a permit is complete and accurate to the best of my knowledge and belief. I understand that any false statement herein may subject me to the criminal penalties of 18 U.S.C. 1001.

Signature of applicant/Principal Officer for permit (No photocopied or stamped signatures) Date of signature (mm/dd/yyyy)

(b) (6) 10/31/2018

Please continue to next page

E. IMPORT OF SPORT-HUNTED TROPHIES *(Appendix I of CITES and/or ESA)*

Note 1: This form should be used to request authorization to import trophies of species listed on Appendix I of CITES and/or as threatened or endangered under the ESA (examples include elephants, lions, cheetahs, wood bison, and markhor).

PLEASE USE FORM 3-200-19 FOR SOUTHERN AFRICAN LEOPARD TROPHIES AND SOUTHERN WHITE RHINOCEROS TROPHIES TAKEN IN NAMIBIA.

Note 2: If you hold an import permit for a trophy that you did not use, please **return the unused original permit**. If you are requesting reissuance of a permit because you have taken a trophy, but were unable to import it prior to the expiration of the permit, please use the renewal form (3-200-52) and return your original permit with that form.

Note 3: Applications for species listed as endangered under the U.S. Endangered Species Act are published in the Federal Register for a 30-day public comment period. Please allow at least **90 days** for the application to be processed.

Note 4: *Sport-hunted trophy* is defined at 50 CFR 23.74 as follows: *Sport-hunted trophy* means a whole dead animal or a readily recognizable part or derivative of an animal specifically identified on the accompanying CITES document that meets the following criteria:

- Is raw, processed, or manufactured;
- Was legally obtained by the hunter through hunting for his or her personal use;
- Is being imported, exported, or re-exported by or on behalf of the hunter as part of the transfer from its country of origin ultimately to the hunter's country of usual residence; and
- Includes worked, manufactured, or handicraft items made from the sport-hunted animal only when:
  - i. Such items are contained in the same shipment as raw or tanned parts of the sport-hunted animal and are for the personal use of the hunter;
  - ii. The quantity of such items is no more than could reasonably be expected given the number of animals taken by the hunter as shown on the license or other documentation of the authorized hunt accompanying the shipment; and
  - iii. The accompanying CITES documents (export document and, if appropriate, import permit) contain a complete itemization and description of all items included in the shipment.

Note 5: Certain hunting trophies, including elephants, are subject to restrictions on their use after import into the United States. Please see 50 CFR 23.55 for more information or contact the Division of Management Authority.

Please provide the following information. Complete all questions on the application. Mark questions that are not applicable with "N/A". If needed, use a separate sheet of paper. On all attachments or separate sheets you are submitting; please indicate the application question number you are addressing. If applying for more than one trophy, be sure to answer questions 4-6 for each trophy addressed in this application. If importing trophies from more than one country, you must submit a separate application for each shipment in order to obtain separate import permits.

1. Name and address where you wish the permit to be mailed, if different from page 1. If you would like expedited shipping, please enclose a self-addressed, pre-paid, computer-generated, courier service airway bill. If unspecified, all documents will be mailed via the U.S. Postal Service.

2. Who should we contact if we have questions about the application (name, phone number, and e-mail)?

William Mahaffey (b) (6)

3. Disqualification factor. A conviction, or entry of a plea of guilty or nolo contendere, for a felony violation of the Lacey Act, the Migratory Bird Treaty Act, or the Bald and Golden Eagle Protection Act disqualifies any such person from receiving or exercising the privileges of a permit, unless such disqualification has been expressly waived by the Service Director in response to a written petition. (50 CFR 13.21(c)) Have you or any of the owners of the business, if applying as a business, been convicted, or entered a plea of guilty or nolo contendere, forfeited collateral, or are currently under charges for any violations of the laws mentioned above?

☒ No ☐ Yes

If you answered "Yes" to Question 3, provide: a) the individual's name; b) date of charge; c) charge(s); d) location of incident; e) court; and f) action taken for each violation. Please be aware that a "Yes" response does not automatically disqualify you from getting a permit.

4. For each trophy to be imported, provide:

a. Scientific name (genus, species, and, if applicable, subspecies) and common name.

Panthera Leo, African Lion

b. Sex (if known). Male

5. **IF ANIMAL IS CURRENTLY LIVING IN THE WILD**, please enter the following information:

a. Country and place (area, region, GIS coordinates, ranch, conservancy, management area, or hunting block, AND nearest city) where wildlife is to be taken from the wild:

b. Date wildlife is to be hunted:

c. Name of hunting outfitter, safari company, or professional hunter you will be hunting with:

6. **IF THE TROPHY HAS ALREADY BEEN TAKEN**, please enter the following information:

a. Country and place (area, region, GIS coordinates, ranch, conservancy, management area, or hunting block, AND nearest city) where wildlife was removed from the wild:

Shot in Zimbabwe, Masvingo Provence on Bubye Valley Conservancy. gps 011362. nearest town is Beitbridge.

b. Date wildlife was hunted:

July 11, 2018

c. Name of hunting outfitter, safari company, or professional hunter you hunted with:

Pete Fick Safaris. Professional Hunter Paul Zorn

d. The current location of the trophy (address and country) [the U.S. import permit will identify this country as the country of export/re-export and must match with the foreign export/re-export document]:

Mazunga Safaris 8 Norfolk Road Hillside, Bulawayo, Zimbabwe

7. Please provide a copy of any applicable foreign government permits or licenses that were required to remove this animal from the wild (if you have not hunted yet and do not currently hold any such permits or licenses, please indicate so).

8. Complete name and address of overseas person or business shipping the trophy to you. If you are applying to import a trophy directly from **Namibia**, you must provide the name and address of the professional hunter listed on your Namibian hunting permit [this name will appear on the face of the export permit].

Name:	
Business Name:	Mazunga Safaris
Address:	8 Norfolk Road Hillside
City:	Bulawayo, Zimbabwe
State/Province:	
Country, Postal Code:	

9. For species listed under the U.S. Endangered Species Act, please be aware that the U.S. Fish and Wildlife Service (Service) must make a finding that your activities will enhance or benefit wild populations of the species involved. While we will communicate with the range country for the species you will hunt or hunted when making the required findings, if you have any information that could support this finding, it would be helpful for our review if you could provide it. Please submit such information on a separate page with your application.

a. Do you have any information regarding the population status or trend data on the species hunted?

The Lion population on Bubye Valley Conservancy is astounding. They have ongoing scientific lion research taking place at all times.

b. In order to hunt, you likely paid for licenses or trophy fees. What were those fees and do you have any information on how those funds were used by either the landowner, local community, or government?

$100,000 some of the funds are used for anti poaching and scientific research.

c. Do you have information on other funding activities that are being carried out, or were carried out, by the safari outfitter, professional hunter, concession holder, or landowner that provide a conservation benefit to the species being hunted/species hunted?

no

OMB Control No. 1018-0093
Expires 08/31/2020

CERTIFICATION STATEMENT (original signature must be provided for either 10 or 11 below)

10. If you are a broker or taxidermist applying on behalf of a U.S. hunter or foreign national, provide documentation to show you have a Power of Attorney to act on your client's behalf and sign the following statement:

    I acknowledge that the sport-hunted trophy/trophies to be imported has been/will be personally hunted by my client and is being imported only for my client's personal use (i.e., not for sale, transfer, donation, or exchange that is reasonably likely to result in economic use, gain, or benefit). If applying for the import of an elephant trophy, I understand that my client may import no more than two elephant trophies in one calendar year.

    Taxidermist/Broker's signature: _____ Date: _____

11. If you are the hunter applying to import your own trophy, please read and sign the following statement:

    I acknowledge that the sport-hunted trophy/trophies to be imported has been/will be personally hunted by me and is being imported only for my personal use (i.e., not for sale, transfer, donation, or exchange that is reasonably likely to result in economic use, gain, or benefit). If applying to import an elephant trophy, I understand that I may import no more than two elephant trophies in one calendar year.

    Applicant's signature: (b) (6) _____ Date: 10/31/2018

    Be aware that there may be additional permitting or approval requirements by your local or state governments, as well as required by other Federal agencies or foreign governments to conduct your propose activity. While the Service will attempt to assist where possible, it is your responsibility to obtain such approval.

12. All international shipments must be through a designated port. A list of designated ports (where an inspector is posted) is available from **the list of designated ports**. If you wish to use a port not listed, please contact the Office of Law Enforcement for a Designated Port Exemption Permit (form 3-200-2).

Enhancement Finding

Applicant: William Howard Mahaffey (PRT– 15066D)

Introduction

William Howard Mahaffey submitted an application, received by the Service on November 06, 2018, for the importation of one male lion *(Panthera leo melanochaita)* taken July 11, 2018, from the Bubye Valley Conservancy, Zimbabwe, for the purpose of enhancing the propagation or survival of the species in the wild. After evaluating the available information submitted with the application, information provided by the Government of Zimbabwe, other information available to the U.S. Fish & Wildlife Service (Service), and comments received from interested parties, the Service has determined that the importation of the sport-hunted trophy meets the requirements for making a positive enhancement finding pursuant to 50 CFR 17.40(r) and 50 CFR 17.32(a). The rationale for our finding follows.

U.S. Permit Requirements for Import of Lions (*Panthera leo melanochaita*)

ESA

The African lion, subspecies *Panthera leo melanochaita* (southern and eastern Africa), is a threatened species under the U.S. Endangered Species Act (ESA or Act) and is regulated under a species-specific 4(d) rule, 50 C.F.R. § 17.40(r) that provides specific conservation measures for this subspecies. Under the 4(d) rule for *P. l. melanochaita*, all of the prohibitions at 50 C.F.R. § 17.21 and 50 C.F.R. § 17.31 apply to *P. l. melanochaita* specimens. These prohibitions, in part, make it illegal for any person subject to the jurisdiction of the United States to import or export any lion specimens.

Although import of the lion subspecies *P. l. melanochaita* is a prohibited activity under the Act, exceptions may be made in accordance with the 4(d) rule at 50 C.F.R. § 17.40(r) when the import activity qualifies for and the Service issues an ESA threatened-species

enhancement permit under 50 C.F.R. § 17.32(a). The preamble to the 4(d) rulemaking, 80 Fed. Reg. 79999, 80043-46 (Dec. 23, 2015), explains the factors the Service considers when making an enhancement finding for importation of sport-hunted trophies of *P. l. melanochaita*, as described below.

Our threatened species permitting regulations at 50 CFR 17.32 provide issuance criteria for threatened species permits (50 CFR 17.32(a)(2)), but do not specify what would constitute the enhancement of propagation or survival with regard to authorizing the import of parts or products of *P. l. melanochaita,* including sport-hunted trophies. Therefore, when making a determination of whether an otherwise prohibited activity enhances the propagation or survival of *P. l. melanochaita,* the Service will examine the overall conservation and management of the subspecies in the country where the specimen originated and whether that management of the subspecies addresses the threats to the subspecies (*i.e.,* that it is based on sound scientific principles and that the management program is actively addressing the current and longer term threats to the subspecies). In that review, we will evaluate whether the import contributes to the overall conservation of the species by considering whether the biological, social, and economic aspects of a program from which the specimen was obtained provide a net benefit to the subspecies and its ecosystem.

The Service will evaluate any application received that involves *P. l. melanochaita* in the context of enhancement of propagation or survival permitting in accordance with our threatened species permitting regulations at 50 CFR 17.32 and issuance criteria for threatened species permits (50 CFR 17.32(a)(2)). These include, in addition to the general permitting criteria in 50 CFR 13.21(b):

(i) Whether the purpose for which the permit is required is adequate to justify removing from the wild or otherwise changing the status of the wildlife sought to be covered by the permit;
(ii) The probable direct and indirect effect that issuing the permit would have on the wild populations of the wildlife sought to be covered by the permit;
(iii) Whether the permit, if issued, would in any way, directly or indirectly, conflict with any known program intended to enhance the survival probabilities of the population from which the wildlife sought to be covered by the permit was or would be removed;
(iv) Whether the purpose for which the permit is required would be likely to reduce the threat of extinction facing the species of wildlife sought to be covered by the permit;
(v) The opinions or views of scientists or other persons or organizations having expertise concerning the wildlife or other matters germane to the application; and
(vi) Whether the expertise, facilities, or other resources available to the applicant appear adequate to successfully accomplish the objectives stated in the application.

In addition to these factors, particularly in relation to sport hunting, we find the *IUCN Species Survival Commission (SSC) Guiding Principles on Trophy Hunting as a Tool for Creating Conservation Incentives, Ver. 1.0* (IUCN SSC 2012), to provide useful principles, which, considered in conjunction with our threatened species issuance criteria, will aid the Service when making an enhancement finding for importation of sport-hunted trophies of *P. l. melanochaita.* This document sets out guidance from experts in the field on the use of trophy hunting as a tool for "creating incentives for the conservation of species and their habitats and for the equitable sharing of the benefits of use of natural resources" (IUCN SSC 2012, p. 2) and recognizes that recreational hunting, particularly trophy hunting, can

contribute to biodiversity conservation and more specifically, the conservation of the hunted species.

The SSC document lays out five guiding principles that, considered in conjunction with our threatened species issuance criteria, will aid the Service when making an enhancement finding for importation of sport-hunted trophies of *P. l. melanochaita:*

(a) *Biological sustainability:* The hunting program cannot contribute to the long-term decline of the hunted species. It should not alter natural selection and ecological function of the hunted species or any other species that share the habitat. The program should not inadvertently facilitate poaching or illegal trade in wildlife by acting as a cover for such illegal activities. The hunting program should also not manipulate the ecosystem or its component elements in a way that alters the native biodiversity.
(b) *Net Conservation Benefit:* The biologically sustainable hunting program should be based on laws, regulations, and scientifically based quotas, established with local input, that are transparent and periodically reviewed. The program should produce income, employment, and other benefits to create incentives for reducing the pressure on the target species. The program should create benefits for local residents to co-exist with the target species and other species. It is also imperative that the program is part of a legally recognized governance system that supports conservation.
(c) *Socio-Economic-Cultural Benefit:* A well-managed hunting program can serve as a conservation tool when it respects the local cultural values and practices. It should be accepted by most members of the community, involving and benefiting local residents in an equitable manner. The program should also adopt business practices that promote long-term economic sustainability.
(d) *Adaptive Management: Planning, Monitoring, and Reporting:* Hunting can enhance the species when it is based on appropriate resource assessments and monitoring (*e.g.,* population counts, trend data), upon which specific science-based quotas and hunting programs can be established. Resource assessments should be objective, well documented, and use the best science available. Adaptive management of quotas and programs based on the results of resource assessments and monitoring is essential. The program should monitor hunting activities to ensure that quotas and sex/age restrictions of harvested animals are met. The program should also generate reliable documentation of its biological sustainability and conservation benefits.
(e) *Accountable and Effective Governance:* A biologically sustainable trophy-hunting program should be subject to a governance structure that clearly allocates management responsibilities. The program should account for revenues in a transparent manner and distribute net revenues to conservation and community beneficiaries according to properly agreed decisions. All necessary steps to eliminate corruption should be taken and to ensure compliance with all relevant national and international requirements and regulations by relevant bodies such as administrators, regulators and hunters.

The Service's approach to enhancement findings for the importation of sport-hunted trophies of *P. l. melanochaita* is consistent with the purpose and intent of the Endangered Species Act. Before we will authorize the importation of a sport-hunted trophy, we must determine that the trophy hunting program is managed to ensure the long-term survival of the species. In many parts of the world, wildlife exists outside of protected areas and must share the same habitat and compete with humans living in these areas for space and resources. If communities that

share these resources with wildlife do not perceive any benefits from the presence of wildlife, they may be less willing to tolerate the wildlife. However, under certain circumstances, trophy hunting can address this problem by making wildlife more valuable to the local communities and encourage community support for managing and conserving the hunted species, as well as other species.

When evaluating whether the importation of a trophy of *P. l. melanochaita* would be authorized pursuant to 50 CFR 17.32, in accordance with our threatened species issuance criteria, we will examine how a country's management program for lions addresses the three main threats that have led to the decline of the subspecies: Habitat loss, loss of prey base, and human-lion conflict. When examining a management program and whether trophies taken as part of that program meet the issuance criteria, we would study a number of factors. Some of the factors we would consider include whether the program is based on sound scientific information and identifies mechanisms that would arrest the loss of habitat or increase available habitat (*i.e.,* by establishing protected areas and ensuring adequate protection from human encroachment). We would consider whether the management program actively address the loss of the lion's prey base by addressing poaching or unsustainable offtake within the country. A component of a management plan from which trophy imports would meet the issuance criteria would be whether there are government incentives in place that encourage habitat protection by private landowners and communities and incentives to local communities to reduce the incursion of livestock into protected areas or to actively manage livestock to reduce conflicts with lions. We would examine if the hunting component of the management program supports all of these efforts by looking at whether hunting concessions/tracts are managed to ensure the long-term survival of the lion, its prey base, and habitat. As stated previously, hunting can generate significant economic benefits if properly conducted. In looking at whether we would be able to authorize the import of a trophy under the issuance criteria of 50 CFR 17.32, we would examine if the trophy hunting provides financial assistance to the wildlife department to carry out elements of the management program and if there is a compensation scheme or other incentives to benefit local communities that may be impacted by lion predation. We would also consider how a U.S. hunter's participation in the hunting program contributes to the overall management of lions within a country.

Management programs for *P. l. melanochaita* would be expected to address, but are not limited to, evaluating population levels and trends; the biological needs of the species; quotas; management practices; legal protection; local community involvement; and use of hunting fees for conservation. In evaluating these factors, we will work closely with the range countries and interested parties to obtain the information. By allowing entry into the United States of *P. l. melanochaita* trophies from range countries that have science-based management programs, we anticipate that other range countries would be encouraged to adopt and financially support the sustainable management of lions that benefits both the species and local communities. In addition to addressing the biological needs of the subspecies, a scientifically based management program would provide economic incentives for local communities to protect and expand *P. l. melanochaita* habitat.

As stated, under this 4(d) rule any person wishing to conduct an otherwise prohibited activity, including all imports of *P. l. melanochaita* specimens, must first obtain a permit under 50 CFR 17.32. As with all permit applications submitted under 50 CFR 17.32, the individual

requesting authorization to import a sport-hunted trophy of *P. l. melanochaita* bears the burden of providing information in their application showing that the activity meets the requirements for issuance criteria under 50 CFR 17.32. In some cases for imports, such as sport-hunted trophies, it is not always possible for the applicant to provide all of the necessary information needed by the Service to make a positive determination under the Act to authorize the activity. For the import of sport-hunted trophies of *P. l. melanochaita,* the Service will typically consult with the range country to the extent practicable and other interested parties to obtain necessary information.

The Service has the discretion to make the required findings on sport-hunted trophy imports of *P. l. melanochaita* on a country-wide basis, although individual import permits will be evaluated and issued or denied for each applicant. While the Service may make enhancement findings for sport-hunted trophy imports of *P. l. melanochaita* on a country-wide basis, the Service encourages the submission of information from individual applicants. We would rely on the information available to the Service and may rely on information from sources other than the applicant when making a permitting decision.

CITES

The African lion is also included in Appendix II of the Convention on International Trade in Endangered Species of Wild Fauna and Flora (CITES). It is unlawful for any person subject to the jurisdiction of the United States to engage in international trade in CITES specimens contrary to the provisions of the Convention, the ESA, or our CITES implementing regulations in 50 CFR part 23. 16 U.S.C. § 1538(c)(1), (g); 50 C.F.R. § 23.13. As required by CITES, export of a specimen of an Appendix II species to another country requires prior issuance of a CITES permit. Under CITES, importation of an Appendix II species does not require issuance of an import permit from the importing country. Consequently, the United States is not required to issue a CITES permit in order for U.S. hunters to import their sport-hunted lions. In compliance with CITES, the United States does require CITES imports to meet all CITES requirements, including that the imported lion trophies be accompanied by the required CITES export permits issued by the exporting countries, *see* 50 C.F.R. §§ 23.20; 23.23; 23.24; 23.26; 23.27, and including requirements for sport-hunted trophies at 50 C.F.R. § 23.74.

Individual Permit Adjudication Considerations

When the African lion listing under the ESA became effective, January 22, 2016, the Service began issuing enhancement findings for *P. l. melanochaita* on a countrywide basis, as had been the practice for a number of other threatened sport-hunted species. On March 1, 2018, however, in response to a D.C. Circuit Court opinion (*Safari Club Int'l v. Zinke*, 878 F.3d 316 (D.C. Cir. 2017)), the Service withdrew its countrywide enhancement findings for a range of species, including lions, across several countries, and began assessing applications to import sport-hunted trophies of these species on an application-by-application basis. These withdrawals were upheld in a D.C. Circuit Court opinion (*Friends of Animals v. Bernhardt*, No. 19-5147 (D.C. Cir. June 16, 2020); *Center for Biological Diversity v. Bernhardt*, No. 19-5152 (D.C. Cir. June 16, 2020)). No countrywide ESA enhancement findings are currently in effect. Therefore, since March 1, 2018, the Service has been making ESA enhancement findings for the import of sport-hunted trophies of lions on an

application-by-application basis, ensuring consistent application of the regulatory criteria across all permit application adjudications and ensuring that each permit decision is based on the best scientific and management information available.

Although the Service makes the required enhancement findings on sport-hunted trophy imports of *P. l. melanochaita* on an individual application basis, information obtained for the range country as a whole is also considered, as it is pertinent to the Service's evaluation. In addition to considering national-level species management, we also consider species management and contributions to species enhancement on a smaller-scale (e.g., at the regional or hunting management unit scale such as at the hunting operator, community conservancy, concessionaire, reserve, or ranch-level scale). In addition, we consider how the hunter's personal involvement in the hunting experience directly or indirectly contributes to enhancement of the species in the wild. In its enhancement evaluation, the Service, therefore, considers efforts made by the hunting management unit and/or individual hunter to directly or indirectly address the threats posed to lions in the wild together with other information available concerning the overall management and population status of the lion in the range country at the time of the hunt.

In making ESA enhancement findings, we review all relevant information available to us, including information submitted with the individual permit applications, information received in response to inquiries we make of the range countries, and all other reliable information we receive from interested parties, such as species experts, hunting organizations, hunting operators, community groups, and non-governmental organizations. We evaluate and consider all relevant information obtained or submitted to the Service on an ongoing basis as it relates to permit applications received for import of sport-hunted trophies of *P. l. melanochaita*.

The Service considers information at these different levels in order to assess:

1) How the range country government manages the hunted species and how hunting serves to enhance the survival of the species in the wild in the context of the management system;
2) How hunting serves to enhance the survival of the species in the wild in the context of the management unit at the hunting operator, concessionaire, community conservancy, reserve, or ranch level; and
3) How the individual hunter has contributed (where the hunt has already taken place) or will contribute (where the hunt has not yet taken place) to enhancement of survival of that species through their hunting activities and contributions to the survival of the species in the wild associated to the hunt and subsequent import.

Government-Level Factors Considered

- Enforcement of wildlife laws and regulations, particularly with regard to the range country's ability to implement wildlife regulations developed for the hunted species
- Implementation of a scientifically-based management plan that addresses the major threats to the species and provides economic incentives for local communities to conserve the species
- Investment of hunting fees into conservation, including whether the range country has standard processes and infrastructure in place to ensure an effective transfer of hunting revenues back into the country's management of the species and community benefits
- Management of human-lion conflict, including whether the range country has a compensation scheme or other incentives to local communities to reduce the incursion of livestock into protected areas or to actively manage livestock to reduce conflicts with lions
- Management of the lion's prey base by addressing poaching or unsustainable offtake of the lion's prey species
- Management of lion hunting areas through a system that ensures the long-term survival of the lion, its prey base, and habitat
- Protection of lion habitat through establishment of protected areas, ensuring adequate protection from human encroachment and providing incentives that encourage habitat protection by private landowners and communities
- Establishment and use of science-based quotas, a sex and age-based harvest system, and a monitoring program for the lion and its prey species

Hunting Management Unit-Level Factors Considered

- Monitoring populations of the hunted species and their prey-base
- Protecting and/or increasing the prey-base for lions in the wild
- Maximizing biodiversity of the lion's prey species
- Protecting and improving the habitat for lions in the wild to ensure maintenance of ecosystem functions and biodiversity (e.g., creating water holes, habitat management, etc.)
- Engaging in anti-poaching activities for lion and their prey base
- Managing human-lion conflict
- Investing in community benefits and employment, where such investments provide incentives for conservation of lions in the wild
- Complying with harvest laws and regulations
- Re-investing hunting fees or other contributions associated to lion hunting to a fund that supports conservation of lions in the wild

Hunter-Level Factors Considered

- Complying with harvest laws and regulations
- Paying hunting/import-related fees or other contributions associated to lion hunting that are re-invested to support conservation of lions in the wild (e.g., funding habitat protection for lions in the wild, protection of the lion's prey base, or mitigation of human-lion conflict)
- Participating in a hunting program with an operator that supports sustainable use of the species

This application-by-application permit review process offers an opportunity to incentivize hunting in concessions, conservancies, reserves, or ranches that support conservation of the species through rigorous anti-poaching programs, local wildlife monitoring activities, and compliance with government rules and regulations. By complying with our enhancement requirements, a hunter's personal import will help conserve lion populations in the wild by supporting the local communities where they hunt and promoting conservation of these species and their habitats by providing protection incentives to communities that live alongside these species.

Basis for Finding

On February 1, 2016, the Service sent a letter to the Parks and Wildlife Management Authority in Zimbabwe (ZPWMA) with a list of questions related to management plans, population status, conservation, management, hunting policies, and regulations of Zimbabwe's lion populations. Additionally in the letter, the Service referenced the IUCN SSC Guiding Principles on Trophy Hunting as a Tool for Creating Conservation Incentives Ver. 1.0 (09 August 2012), as it provides useful principles which, when considered in conjunction with the Service's permit issuance criteria, would aid when making the required enhancement findings for permitting importation of sport-hunted lion trophies.

On February 16, 2016, the Service sent a second request to ZPWMA for specific documents related to the conservation status of lions in Zimbabwe. ZPWMA responded to the Service's request on February 17, 2016, with a copy of *Conservation Status of African Lion in Zimbabwe,* and subsequently, on November 29, 2016, provided a copy of its *Enhancement and Non-detriment Finding for Lion (Panthera leo) in Zimbabwe.* The Service has also been corresponding with ZPWMA regarding African elephant management for several years. In this correspondence, ZPWMA, as well as other sources, have provided the Service with documents and information that are relevant to our evaluation of lions in Zimbabwe.

Since 2016, the Service has met with officials from Zimbabwe multiple times to receive updated information on the status of and management of lions in Zimbabwe with respect to imports of sport-hunted lion trophies. For example, Service representatives met with Zimbabwe officials in January 2018 at the annual Safari Club International convention in Las Vegas, and November 2018 at the African Wildlife Consultative Forum in Uganda. In September 2018, Zimbabwe officials provided to the Service the May 2017 Zimbabwe National CAMPFIRE Stakeholder's Review and the Zimbabwe Parks and Wildlife Management Authority Strategic Plan, 2019-2023. In addition, in September 2018 the Service received a letter dated 6 December 2017 from Hon. E.D. Mnangagwa, President of the Republic of Zimbabwe, addressed to President Donald Trump, addressing the

change of administration in Zimbabwe. In this letter Hon. E.D. Mnangagwa provided assurance to the United States that Zimbabwe is politically stable and that Zimbabwe's previous conservation initiatives would be enhanced, with the previous Minister, Permanent Secretary, and Director General confirmed to remain in place.

This information provided by the Zimbabwe authorities (including verbal updates and presentations at the 16th Annual African Wildlife Consultative Forum (Uganda, November 2018), along with the Service's final rule on the lion listing under the Act and other relevant information from reliable sources, are the basis of this finding.

Governance of Lions in Zimbabwe

The legal framework for Zimbabwe's regulatory mechanism is informed by its Wildlife Policy (1992), which is intended to maintain a protected area network for the conservation of the nation's wild resources and biological diversity. The Wildlife Policy (1992) provides for the Government of Zimbabwe to maintain a network of protected areas known as the Parks and Wild Life Estate, comprised of the country's National Parks, safari areas, botanical gardens, and sanctuary and recreational areas for the conservation of the nation's wild resources and biological diversity (CITES 2016; ZPWMA 2016). The framework is intended to create economic activity to enhance rural development and encourages the conservation of wild animals and their habitats outside the protected areas.

ZPWMA was established by the Parks and Wildlife Act of 1996 (Chapter 20:14) [as amended by Act Number 19 of 2001] which came into operation on June 1, 2002, through Statutory Instrument 144C of 2002. The Act provides for the establishment of a Parks and Wildlife Board; establishment of national parks, botanical reserves, botanical gardens, sanctuaries, safari areas and recreational parks; and the preservation, conservation, propagation or control of wildlife, fish, and plants of Zimbabwe and the protection of Zimbabwe's natural landscape and scenery. This Act includes sections on virtually every aspect of ZPWMA, including requirements for annual financial audits and reporting to the central government. The Act also provides for substantial penalties for the unlawful possession of or trading in protected wildlife species. In addition, the General Laws Amendment Act (No. 5) of 2010 provides for mandatory imprisonment for poaching.

The Parks and Wildlife Act, Chapter 20:14, devolved authority to manage and benefit from wildlife on communal and private lands to the landholders. In 1982, the legal provisions of this Act were extended to Rural District Councils (RDCs), on behalf of rural communities in communal lands whose areas contain viable populations of wildlife. Communal areas in Zimbabwe are administered by RDCs which have become a mechanism for implementation of the government's policy of conservation by utilization of natural resources. The Act enables local communities to manage and benefit from wildlife resources through the Communal Areas Management Programme for Indigenous Resources (CAMPFIRE) established in 1989.

CAMPFIRE was developed to encourage reduction in human-wildlife conflicts through conservation-based community development and to provide an economic incentive to

improve community tolerance of wildlife, including lions. At the time, the CAMPFIRE program was the model for community-based conservation efforts in several other African countries and was identified as an innovative program. Under a community-based conservation program, like CAMPFIRE, rural communities should benefit from revenue generated by sport-hunting.

As Zimbabwe's premiere wildlife agency, the main functions of the ZPWMA are to control, manage, and maintain Zimbabwe's wildlife resources with the primary role of protecting and conserving Zimbabwe's natural heritage for present and future generations on behalf of the country. It also provides the cornerstone of Zimbabwe's tourism industry (ZPWMA 2015). The rationale behind the establishment of the ZPWMA was to allow for a self-funding mechanism, and thereby reduce its dependence on the national treasury. In January 1996, the Government of Zimbabwe approved the establishment of the Parks and Wild Life Conservation Fund that provides for financing wildlife operations directly from revenues generated through wildlife-related activities. The funding for ZPWMA is therefore coming from revenue generated through sport hunting conducted on state and private lands, concession leases, National Park visitor fees, and other wildlife-related fees. While there have been requests by ZPWMA for funding from the central treasury in the past, to our knowledge, no other significant government funding has been provided, and only limited outside funding from non-governmental organizations (NGOs) or other governments appears to be available.

A major component of ZPWMA mandate is law enforcement. Poaching mainly occurs along the boundaries of protected areas where lions are incidentally snared as non-target prey. Between 2013 and 2015, 21 lions were killed illegally, with six animals killed through snaring in the area adjacent to Hwange National Park in 2015; poverty stands as the major driver of illegal hunting (ZPWMA 2016). If anyone is found in possession of poached specimens, they must pay a fine of USD 5,000 or face a mandatory jail sentence. If convicted of lion poaching, courts could require the payment of a compensation fee of USD 20,000 (ZPWMA 2014). Hunting operators are obligated through their concession lease agreements to assist with anti-poaching efforts (ZPWMA 2016). Reportedly, USD 590,000 was spent on anti-poaching efforts by the Bubye Valley Conservancy (BVC) alone during 2015 (K. Leathern, pers. comm., as cited in Du Preez et al. 2016), and USD 546,000 is spent annually on anti-poaching by the Save Valley Conservancy (SVC) (Lindsey et al. 2012); these expenses are mainly covered by sport-hunting revenue (Du Preez et al. 2016). In 2002, ZPWMA had 2,146 rangers at its establishment (ZPWMA 2016); however, by the end 2015, there were 1,448 rangers in post (67% of 2002 level). Of the 1,448 rangers in post, 1,004 are deployable for anti-poaching operations (ZPWMA 2016).

Safari operators in Zimbabwe are required to be registered and licensed by the Zimbabwe Tourism Authority (https://www.soaz.net/index.php/2, accessed August 16, 2019). Operators must hold a lease or agreement on a suitable concession with an approved quota of animals. They are responsible for the official paperwork and permits connected to the hunt. Hunting operators are required by law to provide the services of a Zimbabwe Licensed Professional Hunter to accompany foreign hunters in Zimbabwe. Licensing is undertaken by the National Parks & Wildlife Authority.

Zimbabwe is a member of the Southern African Development Community (SADC). Under the SADC Treaty, Article 5(g) establishes objectives to, among other aspects, promote the sustainable use of wildlife, harmonize legal instruments governing wildlife use and conservation, promote the conservation of shared wildlife resources through the establishment of trans-frontier conservation areas (TFCA), and facilitate community-based natural resources management practices. To implement the SADC Treaty, member states are required to establish management programs for the conservation and sustainable use of wildlife.

Currently Zimbabwe is pursuing six TFCA initiatives at various stages of development. These are: Great Limpopo Transfrontier Park (GLTP) / Great Limpopo Transfrontier Conservation Area (GLTFCA); Chimanimani TFCA; Greater Mapungubwe TFCA; Kavango-Zambezi (KAZA) TFCA; Lower Zambezi-Mana Pools LZMP (TFCA) and Zimbabwe-Mozambique-Zambia (ZIMOZA) TFCA (Mandisodza-Chikerema 2018, p. 34).

Through TFCAs, wildlife management entities are linking many of the major protected areas by removing boundary fences along national borders that separate many reserves in addition to creating or improving corridors to link good-quality habitat for wildlife (Newmark 2008). The principle of ecological and migratory connectivity lies at the heart of the TFCA initiative linking large protected areas across international boundaries and providing space for wildlife populations.

Another provision of the SADC Treaty is that member states are required to establish management programs for the conservation and sustainable use of wildlife. Zimbabwe has met this criterion for African lions through the development of its 2006 *Conservation Strategy and Action Plan/or the Lion (Panthera leo) in Zimbabwe* (ZPWMA), which is still in use.

As previously mentioned, Zimbabwe is also a Party to CITES, and the African lion species is included in Appendix II of the Convention. As an Appendix-II species, certain criteria must be met before the CITES Management Authority of the country of export may issue an export permit, including a finding from the exporting country's CITES Scientific Authority that the proposed activity will not be detrimental to the survival of the species in the wild (non-detriment finding; NDF) and a finding from the CITES Management Authority that the specimens proposed for export were legally acquired (legal acquisition finding).

The ZPWMA has provided the Service with a copy of its standing CITES non-detriment finding (NDF), dated October 2016, for the export of African lion specimens. The NDF explains that lion populations in Zimbabwe are being managed sustainably for the benefit of the species and that Zimbabwe's management program for lion provides economic incentives for local communities to protect and expand lion habitats. The NDF document provides information to support the following:

- The Zimbabwe hunting industry is based on sound scientific information, provides mechanisms to arrest habitat loss, or where feasible increase habitat, and provides protection from human encroachment.

- Government incentives are in place to encourage habitat protection by private landowners and communities.
- Government Incentives are provided to local communities to reduce human-wildlife conflicts.
- Hunting concessions are managed to ensure the long-term survival of the African lion and its habitat.
- Trophy hunting provides financial assistance to the ZPWMA, the communal CAMPFIRE program, and private landowners to implement wildlife management programs.
- Local communities directly and indirectly benefit from the presence of lion in their areas.
- Participation of U.S. hunters in the Zimbabwe hunting industry contributes to the overall conservation and management of lions in Zimbabwe (ZPWMA 2016).

Lion Status in Zimbabwe

When the Service listed the subspecies of lion in southern and eastern Africa (*P. l. melanochaita*) as threatened under the Act (80 FR 79999), three primary threats to the species throughout its range were identified: loss of habitat, loss of prey base, and human-lion conflict. While human population growth clearly has an impact due to loss of available habitat for lions, increasing human population has a direct impact on prey base. Prey availability affects the reproduction, recruitment, and foraging behavior of lions and, as a result, strongly influences lion movements, abundance, and population viability (Winterbach *et al.* 2012, as cited in USFWS 2015). Lion densities are directly dependent on prey biomass (Hayward *et al.* 2007). Outside of protected areas, the lion's prey base is much reduced (Du Preez et al. 2016); inadequate management and law enforcement have led to poaching of the lion's prey base for bushmeat, which has been critically depleted (USFWS 2015). Population trends across eastern and southern Africa show that most prey species have declined in recent years; and for Zimbabwe, droughts have been a critical factor (ZPWMA 2016).

A reduced prey base results in a relatively greater chance of lions encountering livestock (Du Preez et al. 2016). While actual losses of livestock to predators may be relatively low, the perceived financial cost to farmers can be high, and lions are persecuted intensely in livestock areas as a consequence. Their scavenging behavior makes them particularly vulnerable to the practice of lacing prey carcasses with poison to eliminate predators (CITES 2016). Co-existence of lions and people is promoted through giving value to lions, such as through tourism and hunting in CAMPFIRE areas (ZPWMA 2014). The threat to lions from habitat loss is especially present in Sebungwe and the South East Low Veld where the fragmented nature of the protected areas is compounded by increasing human and livestock populations surrounding these areas (ZPWMA 2016).

According to the Service's CoPl7 *Consideration of Proposals for Amendment of Appendices I and II,* international trade in lion products is emerging as an additional threat; however, the relative extent to which this threat has contributed to lion population declines is difficult to evaluate accurately (CITES 2016). According to ZPWMA (2016), the illegal local and international trade in lions and their products poses an insignificant risk to the

species in Zimbabwe, as there are no records of people found in possession of illegally acquired lion specimens in Zimbabwe. It is not clear what level of legal trade of lion products, if any, occurs within Zimbabwe.

The bulk of Zimbabwe's wildlife occurs within the Parks Estate which includes 11 national parks, 16 safari areas, 16 recreational parks, 6 sanctuaries, 12 botanical reserves and 3 botanical gardens, all spread across the country (Parks and Wildlife Act 2001 Chapter 20:14). Wildlife populations also occur on the state Forest Areas, Communal CAMPFIRE areas, and private conservancies dedicated to wildlife-based land use. There are approximately 319,317 km^2 of land where some form of wildlife-based land use is practiced in Zimbabwe (ZPWMA 2016). Lions occur permanently in 45% of this available range (circa 145,000 km^2) with the majority occurring in national parks (96%) and safari areas (92%). Lions also occur permanently in 47% of the State forest areas and 66% of privately owned conservancies. The CAMPFIRE areas comprise approximately 247,000 km^2 and lions occur in 36% of these areas. Lions are transient in CAMPFIRE, conservancy, and resettled areas adjacent to the major protected areas, and lions move across the border into Zambia, Mozambique, South Africa, and Botswana.

Zimbabwe's main lion range includes the Hwange-Matetsi Ecosystem, Mid Zambezi Valley, Sebungwe, and South East Lowveld. The lion population estimates in Zimbabwe are determined primarily through carnivore spoor surveys, systematic lion collaring, and call-up surveys. According to ZPWMA's *Conservation Status of the African lion (Panthera leo) in Zimbabwe* July 2014 report, starting in 2015, lion spoor surveys were to be done at two-year intervals in all wildlife areas, and lion call-up surveys were to be done every three years in all major lion areas (ZPWMA 2014). Although the Service has not received confirmation that these surveys have been conducted since 2015, in September 2018, the Service received Zimbabwe's Parks and Wildlife Management Authority's Strategic Plan for 2019-2023, which indicates that Zimbabwe is actively working to improve the monitoring and management of their wildlife species. In their updated strategic plan, signed in December 2018, they indicated that one of their strategic objectives is protection of wildlife resources. Their identified timeline is to update and implement key species management plans (lion is identified as one of these) by December 2023.

ZPWMA (ZPWMA 2016) has estimated that the minimum number of lions that occur on approximately 5l,642 km^2 of land where reliable survey data are available is approximately 1,900 (range 1,800 - 2,000). The western portion of the country, consisting primarily of Hwange National Park and the surrounding safari areas, forest areas, communal areas, and private conservancies, supports approximately 737 lions (or 38% of the overall population). The southern portion of the country, dominated by the two major conservancies (SVC and BVC) and Gonarezhou National Park supports approximately 896 lions (48%). These numbers are supported by several studies.

Within Gonarezhou National Park, Groom et al. 2014, used call-up surveys to obtain direct estimates of the lion population and compared actual lion densities with potential density estimates. In this study, while lions were only seen at five percent of calling stations, this equated to a population estimate of 33 lions, which is consistent with spoor survey results conducted in June 2010 (Groom et al. 2014). A 2015 spoor count

survey of Gonarezhou National Park revealed an estimated 125 lions within the park (ZPWMA 2016).

From 2007 to present, annual track index surveys at the SVC have been conducted using a standardized methodology (Groom and Watermeyer 2015, as cited in Du Preez et al. 2016). Prey availability models suggest that the carrying capacity for this lion population is approximately 271 lions (Hayward et al. 2007). In 2015, the estimated population was 284 lions (Du Preez et al. 2016). The Rifa Safari Area was surveyed using camera trapping and spoor counts in 2015, which supported an estimated population of 68 lions. The central and northern portions of the country reportedly support an estimated population of 284 lions (15%). The 12-year (2000-2011) average lion density per 100 km^2 is 2.8 in Hwange National Park, 6.0 for South Eastern Lowveld in the SVC, 9.0 in Malilangwe, and 0.8 in Gonarezhou National Park (ZPWMA Annual Report 2013, as cited in ZPWMA 2014). SVC's website indicates that at SVC, an annual predator spoor count is conducted by the African Wildlife Conservation Fund (AWCF), an independent organization (http://savevalleyconservancy.org/conservation.html#header1-z, accessed August 14, 2019).

According to Riggio et al. 2013 (p. 32), and Bjorklund in Riggio et al 2013 (p. 32), the minimum number of lions that are estimated to constitute a viable population is 500 individuals. Hwange National Park, with an estimated population of 559, is the only area within Zimbabwe that has a viable population as laid out by Riggio et al. 2013. However, the two regions that make up the largest percentage of the country's lion population (Western 38% and Southern 48%) have regional populations of 737 and 896, respectively. The areas within the Central and Northern regions of Zimbabwe, albeit smaller, encompass parks that are part of Transfrontier Conservation Areas, such as the Mana Pools region.

Lion Management in Zimbabwe

In response to discussions surrounding a possible up-listing of lion to Appendix I under CITES at the 13th Meeting of the Conference of the Parties (CoP13), and subsequent workshops involving lion range states, IUCN, ZPWMA, and other key stakeholders held a workshop to develop the *Conservation Strategy and Action Plan for the Lion (Panthera leo) in Zimbabwe* which was published by ZPWMA in 2006. The plan responds to regional and international standards set by Treaties such as CITES and the Convention on Biological Diversity (CBD), among others. The plan states "it will guide the conservation and management of this top predator" which "addresses the needs of th[e] country." The Service is not aware of any additional or updated iterations of the plan since 2006; however, in Zimbabwe's 2016 response, *Enhancement and Non-Detrimental Findings for Panthera leo in Zimbabwe,* ZPWMA provided updates on each of the outputs and respective targets established under the 2006 *Conservation Strategy and Action Plan/or the Lion (Panthera leo) in Zimbabwe* (ZPWMA 2016).

The 2006 plan identifies a vision that "...lions should be conserved and managed sustainably for their aesthetic, cultural, and ecological values, and the socio-economic

development of Zimbabwe." The plan lays out three broad targets to achieve this objective:

- Ensure the persistence of key lion populations and other important populations including those of doubtful viability.
- Human and livestock loss reduced.
- Optimize wildlife conservation-related net benefits to local communities.

All three targets are stepped down to seven specific outputs with their own targets and activities to meet such targets. Although the plan does not identify a time period, some activities do, of which a period of 5 years is the most common. In response to inquiries from the Service, ZPWMA has provided a summary of the progress made to implement the 2006 strategy.

While all three of the broad targets appear to serve a valuable role in lion management in Zimbabwe, three of the specific outputs are most relevant to determining if the implementation of the strategy enhances the propagation or survival of the species, as required by the Act for the issuance of import permits. The first output, "lion populations, their habitats and wild prey effectively conserved and managed in collaboration with local stakeholders" is broken down into a number of targets: establish a baseline survey and monitoring program; maintain and strengthen capacity for lion conservation, management, monitoring and research; identify and implement best management standards and practices for the hunting program; develop and implement co-management frameworks; and expand the geographic distribution range of lions. Baseline surveys have been completed for the Parks Estate using monitoring protocols for key variables (populations, habitats, prey), and selected surveys have been undertaken in areas outside National Parks (ZPWMA 2016).

Carnivore research programs conducted by NGOs and research institutions such as WildCRU are taking place in various parts of the country; in addition, personnel have been trained in data collection and capture, management, and lion aging and analysis. Adaptive age-based criteria for male trophy animals are in place and functioning. The quota for a certain year is determined by a point system based off the hunts from the previous season. Therefore, ZPWMA is actively working toward meeting the target areas for this output.

The second output, "human-lion related conflicts minimized and, where possible, eliminated" has also been broken down into a number of targets: develop and establish databases on lion-human conflicts; identify and implement methods to reduce and mitigate livestock losses and lion attacks on humans; and train and properly staff problem animal control (PAC) units to conduct rapid response and precisely target problem animals. According to information from ZPWMA (2016), approaches to mitigate livestock losses and lion attacks on humans are in the process of being tested and implemented in Hwange, and methods to mitigate lion attacks on livestock are being implemented as appropriate at selected sites (e.g. Tsholotshe). Data on PAC reports for lion-related problems have been collated, and PAC units at ZPWMA field station and/or RDC levels have been partially established. In Matusadona, Hwange, and Gonarezhou regions, specific awareness and education packages on lion conservation and

management have been developed and implemented. The information submitted in the ZPWMA update suggests that they have met one target, and are in the process of implementing the remaining two.

The third output, "the costs and benefits of long-term lion management equitably distributed," is a socio-economic output to establish agreement and implementation of area-specific lion management plans with identified stakeholders in each wildlife region, and implementing a transparent mechanism to equitably distribute lion-related income to identified stakeholders." The specific targets for this output are: complete an inventory of stakeholders directly affected by lion conservation, deliver appropriate training and capacity building to prioritized stakeholders, agree to and implement collaboratively developed area-specific lion management plans with identified stakeholder groups in each wildlife region within 5 years, and implement transparent mechanisms to equitably distribute lion-related/generated income to identified stakeholders (groups and/or communities). Current information from ZPWMA shows that they have identified key stakeholders and assessed the financial impacts of lion conservation and the magnitude of socio-economic impacts on each stakeholder group. Limited training has been undertaken for representative stakeholders in Hwange, Matusadona, and Gonarezhou. ZPWMA has also implemented an adaptive management program across four wildlife regions and is in the progress of developing and implementing area-specific lion management plans with identified stakeholder groups. According to ZPWMA, a Management Plan for Hwange was approved. The Hwange National Park (HNP) Management Plan was updated in 2015 and officially accepted at Zimbabwe's Ministry of Environment level in 2016 (Conservation and Wildlife Fund (CWF) 2018, p. 16). One of the four components of this 10-year plan is implementation of a cooperation plan between the park and park neighbors. The Conservation and Wildlife Fund – Hwange (CWF) is a relatively new model of the private and NGO sectors in and around Hwange National Park (HNP) Zimbabwe, formalizing an alliance of individual members to materially and in-kind assist authorities with conservation work.

The Hwange Lion Research (HLR) which is part of the Wildlife Conservation Research Unit (WILDCRU), Oxford University, UK, with some financial support and collaborative effort from CWF, set up a comparative camera trap survey in May 2018, to establish a baseline of both lion and lion prey identification and densities in contiguous areas with differing management – the exact CWF project area. Although data were only obtained from the 40-day HNP camera grid, combined sources of complimentary data on the lion population in Forest Areas outside the national park suggest that anthropogenic mortality is slowing down, believed to be in part due to CWF's new law enforcement activities (CWF 2018, p. 21).

Zimbabwe's conservation strategy for lions also identifies roles and responsibilities for a number of participants in Zimbabwe's lion conservation efforts. According to the strategy, there is a national lion coordinator that coordinates all national activities on lion conservation, research, and management, including census surveys, setting up monitoring needs, and coordinating data on human-lion conflicts. The strategy identifies roles for the field stations, wardens, ecologists and utilization units, which are responsible for ensuring compliance with hunting regulations and maintaining safari hunting databases. In addition, the strategy identifies roles for CAMPFIRE, safari operators, and

professional hunters to facilitate training and ensure compliance with hunting regulations.

The Conservation Strategy and Action Plan for the Lion in Zimbabwe (ZPWMA 2006) borrows language from the *IUCN Conservation Strategy* (2006). It iterates areas in need of improvement regarding lion conservation in Zimbabwe, including standardized lion census methods and surveys, further mitigating human-lion conflicts, and maximizing benefits for rural communities that live with lions. ZPWMA (2006) notes their intention to review and put in place criteria for age-based identification of male trophy animals, but do not mention if they will be reviewing possible combination strategies. As part of the 2006 lion conservation strategy for eastern and southern Africa, six objectives were established to secure and restore sustainable lion populations, which were housed under the following categories: management, mitigation, socio-economics, policy and land-use, politics, and trade. The strategy was intended to be implemented within 10 years (Macdonald 2016), and Zimbabwe gave an update on progress regarding these objectives in their *Enhancement and Non-Detrimental Findings for Panthera leo in Zimbabwe* (ZPWMA 2016) that also addressed outputs and targets laid out in their 2006 action plan.

Additionally, to mitigate human-lion conflict, the "Long Shields Guardian Programme" was initiated whereby communities are notified of movements of collared lions into their areas via cell phone, and then have the opportunity to take appropriate action, such as moving cattle. In 2013 alone, 1,850 warnings were passed to the "Long Shields." These actions may reduce the incidents of lions marauding livestock; however, retaliatory killing of lions still occur. Further, as is policy under the Parks and Wildlife Act of 2001, any lions that attack humans or livestock will be lethally eliminated (ZPWMA 2016). Between 2007 and 2013 a total of 1,113 conflict incidents were recorded in the Hwange area in which 915 head of stock were lost to lions.

In and around Hwange National Park, data collected between 1999 and 2004 suggested that hunting surrounding the park was having a negative impact on the lion population. As a result, sport hunting of lions was suspended in the area surrounding the park between 2005 and 2009. Following the lifting of the moratorium, and by implementing stricter monitoring and hunting guidelines through the Hwange Lion Research Project, the overall Hwange lion population has continued to show a positive trend, and as of 2015 the population was estimated at over 550 animals (ZPWMA 2015).

Hunting, Management, and Utilization of Lions

In Zimbabwe, much of the trophy hunting occurs in Safari Areas which are managed mainly for the sustainable use and as buffer zones next to National Parks (Jeke et al 2019, p. 2). Trophy hunting of wildlife is legally permitted in safari areas; as of 2014, there were 16 in Zimbabwe (ZPWMA 2014). According to the Forest Act, Chapter 19:05, there are 24 gazetted indigenous forest areas in Zimbabwe; within these forest areas, lions may be hunted in the following forests: Fuller, Kazuma, Pandamasuwe, Ngamo, Sikumi, Gwayi, Sijarira, and Gwampa (ZPWMA 2014).

As of 2016, the minimum number of lions that occur in approximately 51,642 km^2 of land in Zimbabwe, where reliable survey data are available, is estimated to be 1,917 (range 1,800 - 2,000), the majority of which occur in western and southern Zimbabwe. When taking this population estimate into consideration, trophy hunting harvests a yearly mean of 2.7% of adult male lions. This figure decreased since the establishment of age restrictions on lion hunting (ZPWMA 2016).

In 2013, an adaptive quota management system for lion hunting based on the ages of lions hunted was agreed to in Harare, Zimbabwe, during a meeting hosted by ZPWMA and an independent non- governmental conservation organization (Du Preez et al. 2016). After reviewing aging techniques, attendees at the July 2013 meeting in Harare, Zimbabwe were confident that hunters could be expected to categorize lions as being below or above five years of age. In determining quotas for the following years, operators would be rewarded with increased quotas if they hunted animals of six years or older, would not be penalized if they hunted animals five years of age, but would have quotas cut if they hunted animals younger than five years old, or if they failed to complete hunt returns (ZPWMA and Panthera 2014). In 2013, only 28% of lions hunted were five years old or older. In 2015, that figure rose to 77.3% (ZPWMA 2016).

According to Hunter et al. (2013), an adaptive quota management system utilizing age-based criteria would not only aid in the prevention of over-harvesting lions, but would also prevent excessively conservative quotas. Further, according to Miller et al. (2016), results indicate that age-based hunting is feasible for sustainably managing threatened and economically significant species such as the lion, but must be guided by rigorous training, strict monitoring of compliance and error, and conservative quotas. No single trait can be relied upon exclusively to precisely age lions. Rather, multiple traits must be examined in combination to cross-validate an individual's age and, according to Whitman et al. (2004), restricting hunting to individuals that are at least six years old is desirable from a biological perspective due to the reduced risk of the loss of pride males and infanticide of cubs associated with the harvest of such individuals (Whitman et al. 2004).

During 2013, operators were requested to submit hunt returns and photos as a trial run to get the adaptive quota system up and running. In 2014, operators were requested to do the same but were informed that the age of the lions hunted in 2014 would determine their lion quotas in 2015 (Du Preez et al. 2016). In 2015, there was a marked increase in the age of lions hunted in Zimbabwe as a whole. The majority of lions hunted were on the cusp of 5-6 years of age but were not older than six years. National hunting offtakes for lions in Zimbabwe from 2013 to 2015 were 29, 42, and 47 respectively (Masterson 2016). It appears these do not include illegal forms of hunting offtake. In 2011, Zimbabwe's quota was set at 101 lions; in 2014, it was reduced to 50 male lions following the implementation of age restrictions (Henschel 2015, pers. comm., as cited in USFWS 2015).

As described above, CAMPFIRE is the program through which the Government of Zimbabwe has relegated the management of wildlife resources to communal farmers. As of July 2014, there are at least 58 Rural Districts that have been granted the Appropriate Authority status to manage wildlife resources in their areas; however,

according to *Enhancement and Non-Detrimental Findings for Panthera leo in Zimbabwe* ZPWMA 2016, only 16 are actively engaged in some form of wildlife-based land use (ZPWMA 2016). Lions are found in communal areas that are adjacent to major protected areas, and lion hunting is allowed in CAMPFIRE districts (ZPWMA 2014).

In setting adaptive lion quotas, Zimbabwe uses scientific information including spoor surveys, camera traps, and ranger-based sighting. In CAMPFIRE areas, incidences of human-lion conflict are also taken into consideration where survey information is not readily available, when determining quotas for those areas (ZPWMA 2014). The quota-setting process involves all stakeholders, including the ZPWMA, landowners, safari operators, and CAMPFIRE managers and their representatives. During the annual quota-setting workshop, presentations are made by the proponents who then make proposals for quotas. Where it is felt that not enough information has been presented, a precautionary quota will be issued (ZPWMA 2014).

ZPWMA (2016) mentions seven concessions that are leased on five-year terms, and how these concessionaires pay a 5-year "right to lease" fee, annual rental, fixed quota fee (payable if animals are shot or not) and a supplementary quota fee that allows additional animals to be bought as needed. It is unclear to what extent Zimbabwe still utilizes fixed quotas, as Du Preez et al. claims fixed quotas are no longer being used by Zimbabwe, but a fixed quota fee is mentioned in ZPWMA (2016). It is also unclear how many animals concessionaires are able to "buy as needed," and how such requests may be accommodated without going over the national quota (ZPWMA 2016). However, when evaluating the lower quota with higher utilization reported by ZPWMA (2016), and taking into consideration the land area of the Parks Estate alone, Zimbabwe did not exceed the best management practice of 0.5 lions/1,000 km^2; the 2015 off-take would have accounted for 0.125 lions/1,000 km^2.

According to *The Role of Trophy Hunting of Elephant in Support of the Zimbabwe CAMPFIRE Program -December 2016,* a report the Service received in December 2016, the Reserve Bank of Zimbabwe, in collaboration with relevant stakeholders, established the Tourism Receipts Accounting System (TRAS2) that required all outfitters to submit returns listing the revenue generated for hunting activities. This system has been in place for several years, but it required manual analysis of the data to extract information on hunting revenue. In January 2015, to account fully for earnings in the hunting sector, the Reserve Bank of Zimbabwe in collaboration with relevant stakeholders, introduced TRAS, a web-based system that links Safari operators, ZPWMA Authority, taxidermists, shipping agents, International marketing agents, and the Reserve Bank. Under this system, all authorized hunts are registered, allowing for the capture of hunting data, such as the origin of clients, value of trophies and hunts, and area hunted, to monitor hunting quota utilization and track hunted trophies. According to the December 2016 report, the Exchange Control Division of the Reserve Bank of Zimbabwe and the ZPWMA are now able to:

1. Assess regional price differentials of similar hunts and the reasons thereof;
2. Present TRAS2 system updates and reports to the users, including international marketing agents;
3. Engage with international marketing agents of sport hunting;

4. Obtain relevant insights on governing of the hunting sector; and
5. Come up with an effective mechanism to fully account for export proceeds from the hunting sector.

The TRAS2 information provides a breakdown of the source of hunting income, and the amount of funds generated by trophy fees by land category, among other insights, and has demonstrated the TRAS2 system's ability to obtain relevant insights on governing of the hunting sector.

Evaluation

William Howard Mahaffey hunted in the Bubye Valley Conservancy (BVC) in Zimbabwe. Based on information submitted with the permit application, the Bubye Valley Conservancy (BVC) is reportedly one of largest private wildlife areas in Zimbabwe with a total area of approximately 3,400 km^2. The land that now occupies BVC was historically a cattle ranch, and in 1994 the BVC was established and land use converted through the introduction of a variety of large, wild herbivores and with the primary objective of maintaining an ecologically sustainable and economically viable wildlife enterprise based on ethical trophy hunting.

In evaluating whether the importation of Mr. Mahaffey's trophy of *P. l. melanochaita* would be authorized pursuant to 50 CFR 17.40(r) and 50 CFR 17.32(a), in accordance with our threatened species permit issuance criteria, we examined how Zimbabwe's management of lions overall as well as how Bubye Valley Conservancy and Mr. Mahaffey himself have contributed to enhancement of wild lions both directly and indirectly by addressing the three main threats that led to the decline of the subspecies: habitat loss, loss of prey base, and human-lion conflict.

Below, we summarize our evaluation with reference to each of the permit issuance criteria at 50 CFR 17.32(a)(2) on the basis of information available to the Service.

17.32(a)(2)(i): Whether the purpose for which the permit is required is adequate to justify removing from the wild or otherwise changing the status of the wildlife sought to be covered by the permit:

Zimbabwe's lion hunting industry generated 9% of all sport-hunting revenue in 2015; 51% was contributed by U.S. hunters during 2010-2015 country-wide, and 90% of the sport-hunting market in the Bubye Valley Conservancy (BVC) and the Save Valley Conservancy (SVC) from 2005-2015. Even though 9% may not seem like much, lions are a key component of the sport hunting industry, as they are part of the "Big 5" trophies and draw U.S. hunters to Zimbabwe. Without the hunting industry, protected wildlife areas such as BVC and SVC, which have become conservation havens in the threat of human encroachment across much of Zimbabwe, would not be economically viable, and therefore would likely not exist. These wildlife areas not only provide habitat for lions, but also support the lion's prey species.

Sport hunting was essential for the successful transition of the BVC from cattle to wildlife (Du Preez et al. 2016), in that it provided monetary benefits for the

conservation of lions and local communities. The BVC donates over 45 tons of meat from sport hunting to the local communities each year. This meat donation is worth over US $100,000 per year. The BVC also supports several schools, clinics, and community projects in the three surrounding districts of Mwenezi, Maranda, and Jopempe. The local community sees a direct benefit from the wildlife in BVC, but it is also empowered by job opportunities created both within these communities, as well as in the BVC (Du Preez et al. 2016).

The *Strategy and Action Plan* has put into place mechanisms to adequately oversee the harvest of lions in Zimbabwe. With an annual harvest of approximately 85 lions, Zimbabwe is not exceeding the limits identified of 0.5 lions/1,000 sq. km. The objectives of the *Strategy and Action Plan* and the actions and monitoring activities that have been put into place to achieve these objectives should support the adaptive management approach that Zimbabwe has established for managing lions. The Service will continue to monitor the effectiveness of the Strategy and Action Plan, for consideration in future findings.

As described above, we have determined that the government of Zimbabwe and the Bubye Valley Conservancy contribute towards positive conservation outcomes by addressing the main threats of habitat loss, human-lion-livestock conflict, and prey depletion, which contributes to improving the status of lions in Zimbabwe. Further, the fees garnered through Mr. Mahaffey's hunt will provide revenue to support these positive conservation outcomes.

Therefore, based on the information available to the Service, the purpose for which the permit is being requested, import of this trophy lion, is adequate to justify removing the sport-hunted trophy lion from the wild or otherwise changing its status.

17.32(a)(2)(ii): The probable direct and indirect effect that issuing the permit would have on the wild populations of the wildlife sought to be covered by the permit:

The total area under wildlife-based land use and conservation in Zimbabwe amounts to 10.7 million hectares and represents 27% of the total surface area of the country. Of this, 7.9 million hectares, or 75% of all conservation land in the country, falls under safari hunting as the primary or only source of revenue. Sport hunting of lions by U.S. hunters such as Mr. Mahaffey supports the programs in Zimbabwe that provide the opportunity for locals to see value in lions, which in turn conserves the species in the long-term.

A scientifically based quota is the number of a given species that can be removed from a specific population without damaging the biological integrity and sustainability of that population (WWF 1997). However, full implementation and enforcement of the age-based strategy could potentially cause the need for quotas to become irrelevant or eliminated (USFWS 2015). Age restrictions will naturally restrict offtake to a limited number of individuals that meet the age criteria (Loveridge *et al.* 2007, Whitman *et al.* 2004).

Based on the information provided to the Service, it is clear that Zimbabwe has made strides in their management of their lion populations. Additionally, Zimbabwe appears to be transparent in its management processes, including its quota setting. In 2013, Zimbabwe proposed an adaptive age-based strategy for setting hunting quotas. This adaptive quota management system for lion hunting based on the ages of lions hunted has been accepted and embraced by all stakeholders; it has not only led to a reduced national lion hunting quota, but has also resulted in a significant increase in the age of harvested lions to a level that is considered to have a reduced ecological impact (Du Preez et al. 2016).

In 2015, the development of TRAS2 allowed the country to better monitor and govern the hunting sector, including developing an effective mechanism to fully account for export proceeds from the hunting sector. The continued participation of U.S. hunters, including Mr. Mahaffey, in this market is anticipated to continue to maintain the viability of managing areas such as the BVC and SVC in their current form, including their contribution to conservation of lions in the wild. In 2015, lion sport-hunting generated USD 753,000 in revenue, which accounts for about 9% of all sport hunting revenue in Zimbabwe that year (ZPWMA 2016).

After evaluating the information provided by the Zimbabwe government and other sources, it appears that the hunting program in Zimbabwe is addressing the three main threats that were identified by the Service when making the determination that the species was threatened with the possibility of extinction. Moreover, hunting areas such as BVC and SVC are maintaining habitat for lions and ensuring that there is no further loss, provided that the hunting areas can remain economically viable. In order to maintain a viable population of lions, the parks, safari areas, and CAMPFIRE areas must maintain biodiversity and a sustainable prey base. Finally, Zimbabwe is actively working to reduce human-lion conflicts and the number of lions killed in retaliation for killing livestock. Therefore, the management of lions within Zimbabwe and the limited hunting of lions contributes to the on-going survival of the species in Zimbabwe.

The participation of Mr. Mahaffey in the hunting and subsequent import of the trophy lion he harvested in the BVC provides an indirect benefit to wild lion populations by helping to support the reserves where lions are found; Mr. Mahaffey's hunt has generated revenue to help support a hunting area where lions are found and conserved. Therefore, based on the information available to the Service, the probable direct and indirect effect that issuing an import permit for a legally hunted lion would have on the species would be positive.

17.32(a)(2)(iii): Whether the permit, if issued, would in any way, directly or indirectly, conflict with any known program intended to enhance the survival probabilities of the population from which the wildlife sought to be covered by the permit was or would be removed:

As stated above, Zimbabwe is monitoring and controlling the harvest of lions through permitting under their regulations and through the Strategy and Action Plan. The issuance of import permits for lions legally hunted under these

authorities would not conflict with any programs intended to enhance the survival probability of the species in Zimbabwe. Issuance of a permit authorizing import of Mr. Mahaffey's trophy lion from Zimbabwe would work in favor of, not against, the principal acts governing lion conservation in Zimbabwe. Furthermore, sport hunting opportunities help local communities realize the value in conserving the African lion.

Therefore, based on the information available to the Service, the issuance of an import permit for a legally hunted lion does not conflict with known conservation programs.

17.32(a)(2)(iv): Whether the purpose for which the permit is required would be likely to reduce the threat of extinction facing the species of wildlife sought to be covered by the permit:

Considering Zimbabwe's limited, controlled off-take of lions in a manner that maintains sustainability, Mr. Mahaffey's legal hunt contributes to reducing the threat of extinction of lions. It appears that the permitting activities under Zimbabwe's laws and CITES, as well as the implementation of the adaptive age-based lion quota, and a continuation of implementation of the outputs in the *Strategy and Action Plan* are working in concert to promote the long-term survival of lions in the wild in Zimbabwe. The use of revenue received from hunters, such as Mr. Mahaffey, to manage the populations on the reserves is an important element of the success of lion management in Zimbabwe. For example, reportedly, USD 590,000 was spent on anti-poaching efforts by BVC alone during 2015 (K. Leathern, pers. comm., as cited in Du Preez et al. 2016). Therefore, based on the information available to the Service, the issuance of the requested import permit for Mr. Mahaffey's legally hunted lion will likely reduce the threat of extinction facing lions in Zimbabwe.

17.32(a)(2)(v): The opinions or views of scientists or other persons or organizations having expertise concerning the wildlife or other matters germane to the application:

Based on reviewing comments made during the listing process for lions, as well as information obtained through personal conversations and literature, there is general agreement that hunting, done properly and well managed, would not have an adverse effect on lion populations. Numerous researchers have stated that, while they may not support hunting in general, they see that benefits can be received through a scientifically based hunting program for lions.

Based on the information available to the Service, there is general support by scientists and other persons or organizations having expertise concerning lions that the legal and sustainable harvest of lions, and the subsequent import of legally harvested lion trophies, as proposed in this application, would not have an adverse effect on the species and would further efforts to conserve the species in the wild into the future.

17.32(a)(2)(vi): Whether the expertise, facilities, or other resources available to the applicant appear adequate to successfully accomplish the objectives stated in the application:

Mr. Mahaffey submitted a permit application to import a trophy of his personally, legally harvested lion from Zimbabwe for the purpose of enhancing the propagation or survival of the species in the wild. As a sport-hunter, Mr. Mahaffey plays a large role in the hunting industry of Zimbabwe; the hunting and subsequent import of Mr. Mahaffey's trophy lion increases the funds available to the Zimbabwe Government and BVC to implement lion conservation initiatives. Therefore, based on the Service's review of the information available relating to Mr. Mahaffey's permit request, we find that the expertise, facilities, or other resources available to Mr. Mahaffey appear adequate to successfully accomplish the objectives stated in the application.

Conclusion

As described above, the Government of Zimbabwe has been documented to implement the *Strategy and Action Plan* in the manner identified in the documents referenced in making this finding. The on-going adaptive management and limited and sustainable off-take of lions is important to the survival of lions in Zimbabwe, and the funds generated by Mr. Mahaffey's participation contributes to the ongoing benefits the program provides to lions in the wild.

Therefore, based on the Service's consideration and analysis of the information associated with Mr. Mahaffey's permit application and other relevant information available to the Service, as described above, we find that the import of the lion harvested by Mr. Mahaffey on July 11, 2018, from the Bubye Valley Conservancy, Zimbabwe, meets the requirements for making a positive enhancement finding pursuant to 50 CFR 17.40(r) and 50 CFR 17.32(a). Therefore, the Service is able to authorize the import of the trophy of one lion taken from the wild in Zimbabwe, to William Howard Mahaffey of Winter Park, Florida.

Intra-Service Section 7 Biological Evaluation Form

Originating Person: Jenna King Date: August 11, 2020

Telephone Number: (b) (6)

JENNA KING Digitally signed by JENNA KING Date: 2020.08.13 11:44:45 -04'00'

I. **Service Program and Geographic Area or Station Name**: Branch of Permits, Division of Management Authority, International Affairs

II. **Flexible Funding Program** (e.g. Joint Venture, etc.) if applicable: N/A

III. **Location**: 5275 Leesburg Pike, MS: IA, Falls Church, VA 22041-3803

IV. **Species/Critical Habitat**:

Southern and Eastern African lion (*Panthera leo melanochaita*)

Critical Habitat: N/A

V. **Project Description:** Describe proposed project or action or, if referencing other documents, prepare an executive summary (attach additional pages as needed):

As described in the permit application, 15066D, William Howard Mahaffey, has requested a permit to import a trophy of one lion that he lawfully hunted in Zimbabwe. The import is for personal purposes.

VI. **Determination of Effects:**

(A) Description of Effects: Describe the action(s) that may affect the species and critical habitats listed in item IV. Your rationale for the Section 7 determinations made below (B) should be fully described here.

Issuance of the requested import permit by the Branch of Permits will result in the importation of one personally sport-hunted lion that has been lawfully taken in Zimbabwe on the date specified in the permit application.

The trophy will be accompanied by the required CITES export permit issued by the CITES Management Authority of Zimbabwe.

The requestd U.S. Federal Fish and Wildlife import permit does not authorize the killing of an African lion; the authorization to hunt and lawfully take a lion is under the purview of the government of Zimbabwe. Therefore, the proposed action of issuing a Federal Fish and Wildlife import permit for this lawfully hunted lion will not directly or indirectly affect individuals of listed or proposed species or designated/proposed critical habitat of such species.

(B) Determination: Determine the anticipated effects of the proposed project on species and critical habitats listed in item IV. Check all applicable boxes and list the species (or attach a list) associated with each determination**.**

Determination

No Effect: This determination is appropriate when the proposed project will not directly or indirectly affect (neither negatively nor beneficially) individuals of listed/proposed/candidate species or designated/proposed critical habitat of such species. **No concurrence from DSA/ESFO required.** **X**

May Affect but Not Likely to Adversely Affect: This determination is appropriate when the proposed project is likely to cause insignificant, discountable, or wholly beneficial effects to individuals of listed species and/or designated critical habitat. **Concurrence from DSA/ESFO required.** _____

May Affect and Likely to Adversely Affect: This determination is appropriate when the proposed project is likely to adversely impact individuals of listed species and/or designated critical habitat. **Formal consultation with DSA/ESFO required.** _____

May affect but Not Likely to Jeopardize candidate or proposed species/critical habitat: This determination is appropriate when the proposed project may affect, but is not expected to jeopardize the continued existence of a species proposed for listing or a candidate species, or adversely modify an area proposed for designation as critical habitat. **Concurrence from DSA/ESFO optional.** _____

Likely to Jeopardize candidate or proposed species/critical habitat: This determination is appropriate when the proposed project is reasonably expected to jeopardize the continued existence of a species proposed for listing or a candidate species, or adversely modify an area proposed for designation as critical habitat. **Conference with DSA/ESFO required.** _____

WILLIAM HOWARD MAHAFFEY
(b) (6)
WINTER PARK, FL 32792
U.S.A.

Authority: Statutes and Regulations: 50 CFR 17.40(r).

Location where authorized activity may be conducted:
IMPORT THROUGH ANY PORT LISTED IN 50 CFR 14.12

Reporting requirements: Not applicable

Authorizations and Conditions:

A. Authorized to import the sport-hunted trophy of one male African lion (*Panthera leo melanochaita*), taken in Zimbabwe for the purpose of enhancement of the survival of the species.

B. Specimen may not be sold or transferred for any financial remuneration.

C. **Trophy must have been taken during the 2018 hunting season.**

D. Trophy must be accompanied by a valid trophy permit or hunting license issued by the government of Zimbabwe for the 2018 season.

E. Trophy must be accompanied by a valid Convention on International Trade in Endangered Species of Wild Fauna and Flora (CITES) Appendix II export permit/re-export certificate, source code "W", issued by the Management Authority of Zimbabwe.

F. General conditions set out in Subpart D of 50 CFR 13, and specific conditions contained in Federal regulations cited above, are hereby made a part of this permit. All activities authorized herein must be carried out in accord with and for the purposes described in the application submitted. Continued validity, or renewal of this permit is subject to complete and timely compliance with all applicable conditions, including the filing of all required information and reports.

G. The validity of this permit is also conditioned upon strict observance of all applicable foreign, state, local, tribal, or other federal law. **This permit can be photocopied.**

H. Valid for use by permittee named above.

I. Acceptance of this permit serves as evidence that the permittee understands and agrees to abide by the "General Permit Conditions" (copy attached).

Type of Activity

IMPORT OF SPORT-HUNTED TROPHIES under Appendix I of the Convention on International Trade in Endangered Species (CITES) and/or U.S. Endangered Species Act (ESA)

Complete Sections A or B, and C, D, and E of this application. U.S. address may be required in Section C, see instructions for details.
Instructions on how to make your application complete and help avoid unnecessary delays are attached.

Section A: Complete if applying as an individual

1.a. Last Name	1.b. First Name	1.c. Middle Name/Initial	1.d. Suffix
mahaffey	william	howard	

2. Date of Birth (mm/dd/yyyy)	3. Telephone Number	3.a. Alternate Telephone Number	4. E-mail address
	(b) (6)		

Section B: Complete if applying on behalf of a business, corporation, public agency, Tribe, or institution

1.a. Name of business, agency, Tribe, or institution		1.b. Doing business as (DBA)	
2. Tax identification no.		3. Description of business, agency, Tribe, or institution	
4.a. Principal officer Last name	4.b. Principal officer First Name	4.c. Principal officer Middle name/initial	4.d. Suffix
5. Principal officer title	6. Primary contact name		
7.a. Business telephone number	7.b. Alternate telephone number	7.c. Business fax number	7.d. Business e-mail address

Section C: All applicants complete address information

1.a. Physical address (Street address; Apartment #, Suite #, or Room #; no P.O. Boxes)
(b) (6)

1.b. City	1.c. State	1.d. Zip code/Postal code	1.e. County/Province	1.f. Country
Winter Park	Florida	32792	orange	US

2.a. Mailing address (include if different than physical address; include name of contact person if applicable)

2.b. City	2.c. State	2.d. Zip code/Postal code	2.e. County/Province	2.f.Country

Section D: All applicants MUST complete

1. Attach the **nonrefundable application processing fee** in the form of a check or money order payable to the U.S. FISH AND WILDLIFE SERVICE **in the amount of $100**. Federal, Tribal, State, and local government agencies, and those acting on behalf of such agencies, are exempt from the processing fee--attach documentation of fee exempt status as outlined in instructions [50 CFR 13.11(d)].

2. Certification: I hereby certify that I have read and am familiar with the regulations contained in ***Title 50 Part 13 of the Code of Federal Regulations*** and the other ***applicable parts in subchapter B of Chapter I of Title 50***, and I certify that the information submitted in this application for a permit is complete and accurate to the best of my knowledge and belief. I understand that any false statement herein may subject me to the criminal penalties of 18 U.S.C. 1001.

Signature of applicant/Principal Officer for permit (No photocopied or stamped signatures) Date of signature (mm/dd/yyyy)

(b) (6) 10/31/2018

Please continue to next page

E. IMPORT OF SPORT-HUNTED TROPHIES *(Appendix I of CITES and/or ESA)*

Note 1: This form should be used to request authorization to import trophies of species listed on Appendix I of CITES and/or as threatened or endangered under the ESA (examples include elephants, lions, cheetahs, wood bison, and markhor).

PLEASE USE FORM 3-200-19 FOR SOUTHERN AFRICAN LEOPARD TROPHIES AND SOUTHERN WHITE RHINOCEROS TROPHIES TAKEN IN NAMIBIA.

Note 2: If you hold an import permit for a trophy that you did not use, please **return the unused original permit**. If you are requesting reissuance of a permit because you have taken a trophy, but were unable to import it prior to the expiration of the permit, please use the renewal form (3-200-52) and return your original permit with that form.

Note 3: Applications for species listed as endangered under the U.S. Endangered Species Act are published in the Federal Register for a 30-day public comment period. Please allow at least **90 days** for the application to be processed.

Note 4: *Sport-hunted trophy* is defined at 50 CFR 23.74 as follows: *Sport-hunted trophy* means a whole dead animal or a readily recognizable part or derivative of an animal specifically identified on the accompanying CITES document that meets the following criteria:

- Is raw, processed, or manufactured;
- Was legally obtained by the hunter through hunting for his or her personal use;
- Is being imported, exported, or re-exported by or on behalf of the hunter as part of the transfer from its country of origin ultimately to the hunter's country of usual residence; and
- Includes worked, manufactured, or handicraft items made from the sport-hunted animal only when:
  - i. Such items are contained in the same shipment as raw or tanned parts of the sport-hunted animal and are for the personal use of the hunter;
  - ii. The quantity of such items is no more than could reasonably be expected given the number of animals taken by the hunter as shown on the license or other documentation of the authorized hunt accompanying the shipment; and
  - iii. The accompanying CITES documents (export document and, if appropriate, import permit) contain a complete itemization and description of all items included in the shipment.

Note 5: Certain hunting trophies, including elephants, are subject to restrictions on their use after import into the United States. Please see 50 CFR 23.55 for more information or contact the Division of Management Authority.

Please provide the following information. Complete all questions on the application. Mark questions that are not applicable with "N/A". If needed, use a separate sheet of paper. On all attachments or separate sheets you are submitting; please indicate the application question number you are addressing. If applying for more than one trophy, be sure to answer questions 4-6 for each trophy addressed in this application. If importing trophies from more than one country, you must submit a separate application for each shipment in order to obtain separate import permits.

1. Name and address where you wish the permit to be mailed, if different from page 1. If you would like expedited shipping, please enclose a self-addressed, pre-paid, computer-generated, courier service airway bill. If unspecified, all documents will be mailed via the U.S. Postal Service.

2. Who should we contact if we have questions about the application (name, phone number, and e-mail)?

William Mahaffey (b) (6) [redacted]

3. Disqualification factor. A conviction, or entry of a plea of guilty or nolo contendere, for a felony violation of the Lacey Act, the Migratory Bird Treaty Act, or the Bald and Golden Eagle Protection Act disqualifies any such person from receiving or exercising the privileges of a permit, unless such disqualification has been expressly waived by the Service Director in response to a written petition. (50 CFR 13.21(c)) Have you or any of the owners of the business, if applying as a business, been convicted, or entered a plea of guilty or nolo contendere, forfeited collateral, or are currently under charges for any violations of the laws mentioned above?

☒ No ☐ Yes

If you answered "Yes" to Question 3, provide: a) the individual's name; b) date of charge; c) charge(s); d) location of incident; e) court; and f) action taken for each violation. Please be aware that a "Yes" response does not automatically disqualify you from getting a permit.

4. For each trophy to be imported, provide:

a. Scientific name (genus, species, and, if applicable, subspecies) and common name.

Panthera Leo, African Lion

b. Sex (if known). Male

5. **IF ANIMAL IS CURRENTLY LIVING IN THE WILD**, please enter the following information:

a. Country and place (area, region, GIS coordinates, ranch, conservancy, management area, or hunting block, AND nearest city) where wildlife is to be taken from the wild:

b. Date wildlife is to be hunted:

c. Name of hunting outfitter, safari company, or professional hunter you will be hunting with:

6. **IF THE TROPHY HAS ALREADY BEEN TAKEN**, please enter the following information:

a. Country and place (area, region, GIS coordinates, ranch, conservancy, management area, or hunting block, AND nearest city) where wildlife was removed from the wild:

Shot in Zimbabwe, Save Valley Conservancy. nearest town is Beitbridge. Savuli Hunting area.

b. Date wildlife was hunted:

Agust 20, 2016

c. Name of hunting outfitter, safari company, or professional hunter you hunted with:

Professional Hunter Paul Zorn

d. The current location of the trophy (address and country) [the U.S. import permit will identify this country as the country of export/re-export and must match with the foreign export/re-export document]:

Collets Wildlife Artistry
15 Josiah Chinamano Road, Belmont
Bulawayo, Zimbabwe

7. Please provide a copy of any applicable foreign government permits or licenses that were required to remove this animal from the wild (if you have not hunted yet and do not currently hold any such permits or licenses, please indicate so).

8. Complete name and address of overseas person or business shipping the trophy to you. If you are applying to import a trophy directly from **Namibia**, you must provide the name and address of the professional hunter listed on your Namibian hunting permit [this name will appear on the face of the export permit].

Name:	
Business Name:	Collets Wildlife Artistry
Address:	15 Josiah ChinamanoRoad, Belmont
City:	Bulawayo, Zimbabwe
State/Province:	
Country, Postal Code:	

9. For species listed under the U.S. Endangered Species Act, please be aware that the U.S. Fish and Wildlife Service (Service) must make a finding that your activities will enhance or benefit wild populations of the species involved. While we will communicate with the range country for the species you will hunt or hunted when making the required findings, if you have any information that could support this finding, it would be helpful for our review if you could provide it. Please submit such information on a separate page with your application.

a. Do you have any information regarding the population status or trend data on the species hunted?

The Lion population on Save Valley Conservancy is astounding. They have ongoing scientific lion research taking place at all times.

b. In order to hunt, you likely paid for licenses or trophy fees. What were those fees and do you have any information on how those funds were used by either the landowner, local community, or government?

$50,000 some of the funds are used for anti poaching and scientific research.

c. Do you have information on other funding activities that are being carried out, or were carried out, by the safari outfitter, professional hunter, concession holder, or landowner that provide a conservation benefit to the species being hunted/species hunted?

no

CERTIFICATION STATEMENT (original signature must be provided for either 10 or 11 below)

10. If you are a broker or taxidermist applying on behalf of a U.S. hunter or foreign national, provide documentation to show you have a Power of Attorney to act on your client's behalf and sign the following statement:

I acknowledge that the sport-hunted trophy/trophies to be imported has been/will be personally hunted by my client and is being imported only for my client's personal use (i.e., not for sale, transfer, donation, or exchange that is reasonably likely to result in economic use, gain, or benefit). If applying for the import of an elephant trophy, I understand that my client may import no more than two elephant trophies in one calendar year.

Taxidermist/Broker's signature: _____ Date: _____

11. If you are the hunter applying to import your own trophy, please read and sign the following statement:

I acknowledge that the sport-hunted trophy/trophies to be imported has been/will be personally hunted by me and is being imported only for my personal use (i.e., not for sale, transfer, donation, or exchange that is reasonably likely to result in economic use, gain, or benefit). If applying to import an elephant trophy, I understand that I may import no more than two elephant trophies in one calendar year.

Applicant's signature: (b) (6) _____ Date: 10/31/18

Be aware that there may be additional permitting or approval requirements by your local or state governments, as well as required by other Federal agencies or foreign governments to conduct your propose activity. While the Service will attempt to assist where possible, it is your responsibility to obtain such approval.

12. All international shipments must be through a designated port. A list of designated ports (where an inspector is posted) is available from **the list of designated ports**. If you wish to use a port not listed, please contact the Office of Law Enforcement for a Designated Port Exemption Permit (form 3-200-2).

Enhancement Finding

Applicant: William Howard Mahaffey (PRT–15067D)

Introduction

William Howard Mahaffey submitted an application on November 06, 2018, for the importation of one male lion *(Panthera leo melanochaita)* taken on August 20, 2016, from the Savé Valley Conservancy (SVC), Savuli Ranch, Masvingo Province, Zimbabwe, for the purpose of enhancing the propagation or survival of the species in the wild. After evaluating the available information submitted with the application, information provided by the Government of Zimbabwe, other information available to the U.S. Fish & Wildlife Service (Service), and comments received from interested parties, the Service has determined that the importation of the sport-hunted trophy meets the requirements for making a positive enhancement finding pursuant to 50 CFR 17.40(r) and 50 CFR 17.32(a). The rationale for our finding follows.

U.S. Permit Requirements for Import of Lions (*Panthera leo melanochaita*)

ESA

The African lion, subspecies *Panthera leo melanochaita* (southern and eastern Africa), is a threatened species under the U.S. Endangered Species Act (ESA or Act) and is regulated under a species-specific 4(d) rule, 50 C.F.R. § 17.40(r) that provides specific conservation measures for this subspecies. Under the 4(d) rule for *P. l. melanochaita*, all of the prohibitions at 50 C.F.R. § 17.21 and 50 C.F.R. § 17.31 apply to *P. l. melanochaita* specimens. These prohibitions, in part, make it illegal for any person subject to the jurisdiction of the United States to import or export any lion specimens.

Although import of the lion subspecies *P. l. melanochaita* is a prohibited activity under the Act, exceptions may be made in accordance with the 4(d) rule at 50 C.F.R. § 17.40(r) when

the import activity qualifies for and the Service issues an ESA threatened-species enhancement permit under 50 C.F.R. § 17.32(a). The preamble to the 4(d) rulemaking, 80 Fed. Reg. 79999, 80043-46 (Dec. 23, 2015), explains the factors the Service considers when making an enhancement finding for importation of sport-hunted trophies of *P. l. melanochaita*, as described below.

Our threatened species permitting regulations at 50 CFR 17.32 provide issuance criteria for threatened species permits (50 CFR 17.32(a)(2)), but do not specify what would constitute the enhancement of propagation or survival with regard to authorizing the import of parts or products of *P. l. melanochaita,* including sport-hunted trophies. Therefore, when making a determination of whether an otherwise prohibited activity enhances the propagation or survival of *P. l. melanochaita,* the Service will examine the overall conservation and management of the subspecies in the country where the specimen originated and whether that management of the subspecies addresses the threats to the subspecies (*i.e.,* that it is based on sound scientific principles and that the management program is actively addressing the current and longer term threats to the subspecies). In that review, we will evaluate whether the import contributes to the overall conservation of the species by considering whether the biological, social, and economic aspects of a program from which the specimen was obtained provide a net benefit to the subspecies and its ecosystem.

The Service will evaluate any application received that involves *P. l. melanochaita* in the context of enhancement of propagation or survival permitting in accordance with our threatened species permitting regulations at 50 CFR 17.32 and issuance criteria for threatened species permits (50 CFR 17.32(a)(2)). These include, in addition to the general permitting criteria in 50 CFR 13.21(b):

(i) Whether the purpose for which the permit is required is adequate to justify removing from the wild or otherwise changing the status of the wildlife sought to be covered by the permit;
(ii) The probable direct and indirect effect that issuing the permit would have on the wild populations of the wildlife sought to be covered by the permit;
(iii) Whether the permit, if issued, would in any way, directly or indirectly, conflict with any known program intended to enhance the survival probabilities of the population from which the wildlife sought to be covered by the permit was or would be removed;
(iv) Whether the purpose for which the permit is required would be likely to reduce the threat of extinction facing the species of wildlife sought to be covered by the permit;
(v) The opinions or views of scientists or other persons or organizations having expertise concerning the wildlife or other matters germane to the application; and
(vi) Whether the expertise, facilities, or other resources available to the applicant appear adequate to successfully accomplish the objectives stated in the application.

In addition to these factors, particularly in relation to sport hunting, we find the *IUCN Species Survival Commission (SSC) Guiding Principles on Trophy Hunting as a Tool for Creating Conservation Incentives, Ver. 1.0* (IUCN SSC 2012), to provide useful principles, which, considered in conjunction with our threatened species issuance criteria, will aid the Service when making an enhancement finding for importation of sport-hunted trophies of *P. l. melanochaita.* This document sets out guidance from experts in the field on the use of trophy hunting as a tool for "creating incentives for the conservation of species and their habitats and for the equitable sharing of the benefits of use of natural resources" (IUCN SSC

2012, p. 2) and recognizes that recreational hunting, particularly trophy hunting, can contribute to biodiversity conservation and more specifically, the conservation of the hunted species.

The SSC document lays out five guiding principles that, considered in conjunction with our threatened species issuance criteria, will aid the Service when making an enhancement finding for importation of sport-hunted trophies of *P. l. melanochaita:*

(a) *Biological sustainability:* The hunting program cannot contribute to the long-term decline of the hunted species. It should not alter natural selection and ecological function of the hunted species or any other species that share the habitat. The program should not inadvertently facilitate poaching or illegal trade in wildlife by acting as a cover for such illegal activities. The hunting program should also not manipulate the ecosystem or its component elements in a way that alters the native biodiversity.
(b) *Net Conservation Benefit:* The biologically sustainable hunting program should be based on laws, regulations, and scientifically based quotas, established with local input, that are transparent and periodically reviewed. The program should produce income, employment, and other benefits to create incentives for reducing the pressure on the target species. The program should create benefits for local residents to co-exist with the target species and other species. It is also imperative that the program is part of a legally recognized governance system that supports conservation.
(c) *Socio-Economic-Cultural Benefit:* A well-managed hunting program can serve as a conservation tool when it respects the local cultural values and practices. It should be accepted by most members of the community, involving and benefiting local residents in an equitable manner. The program should also adopt business practices that promote long-term economic sustainability.
(d) *Adaptive Management: Planning, Monitoring, and Reporting:* Hunting can enhance the species when it is based on appropriate resource assessments and monitoring (*e.g.,* population counts, trend data), upon which specific science-based quotas and hunting programs can be established. Resource assessments should be objective, well documented, and use the best science available. Adaptive management of quotas and programs based on the results of resource assessments and monitoring is essential. The program should monitor hunting activities to ensure that quotas and sex/age restrictions of harvested animals are met. The program should also generate reliable documentation of its biological sustainability and conservation benefits.
(e) *Accountable and Effective Governance:* A biologically sustainable trophy-hunting program should be subject to a governance structure that clearly allocates management responsibilities. The program should account for revenues in a transparent manner and distribute net revenues to conservation and community beneficiaries according to properly agreed decisions. All necessary steps to eliminate corruption should be taken and to ensure compliance with all relevant national and international requirements and regulations by relevant bodies such as administrators, regulators and hunters.

The Service's approach to enhancement findings for the importation of sport-hunted trophies of *P. l. melanochaita* is consistent with the purpose and intent of the Endangered Species Act. Before we will authorize the importation of a sport-hunted trophy, we must determine that the trophy hunting program is managed to ensure the long-term survival of the species. In many parts of the world, wildlife exists outside of protected areas and must share the same habitat

and compete with humans living in these areas for space and resources. If communities that share these resources with wildlife do not perceive any benefits from the presence of wildlife, they may be less willing to tolerate the wildlife. However, under certain circumstances, trophy hunting can address this problem by making wildlife more valuable to the local communities and encourage community support for managing and conserving the hunted species, as well as other species.

When evaluating whether the importation of a trophy of *P. l. melanochaita* would be authorized pursuant to 50 CFR 17.32, in accordance with our threatened species issuance criteria, we will examine how a country's management program for lions addresses the three main threats that have led to the decline of the subspecies: Habitat loss, loss of prey base, and human-lion conflict. When examining a management program and whether trophies taken as part of that program meet the issuance criteria, we would study a number of factors. Some of the factors we would consider include whether the program is based on sound scientific information and identifies mechanisms that would arrest the loss of habitat or increase available habitat (*i.e.,* by establishing protected areas and ensuring adequate protection from human encroachment). We would consider whether the management program actively address the loss of the lion's prey base by addressing poaching or unsustainable offtake within the country. A component of a management plan from which trophy imports would meet the issuance criteria would be whether there are government incentives in place that encourage habitat protection by private landowners and communities and incentives to local communities to reduce the incursion of livestock into protected areas or to actively manage livestock to reduce conflicts with lions. We would examine if the hunting component of the management program supports all of these efforts by looking at whether hunting concessions/tracts are managed to ensure the long-term survival of the lion, its prey base, and habitat. As stated previously, hunting can generate significant economic benefits if properly conducted. In looking at whether we would be able to authorize the import of a trophy under the issuance criteria of 50 CFR 17.32, we would examine if the trophy hunting provides financial assistance to the wildlife department to carry out elements of the management program and if there is a compensation scheme or other incentives to benefit local communities that may be impacted by lion predation. We would also consider how a U.S. hunter's participation in the hunting program contributes to the overall management of lions within a country.

Management programs for *P. l. melanochaita* would be expected to address, but are not limited to, evaluating population levels and trends; the biological needs of the species; quotas; management practices; legal protection; local community involvement; and use of hunting fees for conservation. In evaluating these factors, we will work closely with the range countries and interested parties to obtain the information. By allowing entry into the United States of *P. l. melanochaita* trophies from range countries that have science-based management programs, we anticipate that other range countries would be encouraged to adopt and financially support the sustainable management of lions that benefits both the species and local communities. In addition to addressing the biological needs of the subspecies, a scientifically based management program would provide economic incentives for local communities to protect and expand *P. l. melanochaita* habitat.

As stated, under this 4(d) rule any person wishing to conduct an otherwise prohibited activity, including all imports of *P. l. melanochaita* specimens, must first obtain a permit under 50

CFR 17.32. As with all permit applications submitted under 50 CFR 17.32, the individual requesting authorization to import a sport-hunted trophy of *P. l. melanochaita* bears the burden of providing information in their application showing that the activity meets the requirements for issuance criteria under 50 CFR 17.32. In some cases for imports, such as sport-hunted trophies, it is not always possible for the applicant to provide all of the necessary information needed by the Service to make a positive determination under the Act to authorize the activity. For the import of sport-hunted trophies of *P. l. melanochaita,* the Service will typically consult with the range country to the extent practicable and other interested parties to obtain necessary information.

The Service has the discretion to make the required findings on sport-hunted trophy imports of *P. l. melanochaita* on a country-wide basis, although individual import permits will be evaluated and issued or denied for each applicant. While the Service may make enhancement findings for sport-hunted trophy imports of *P. l. melanochaita* on a country-wide basis, the Service encourages the submission of information from individual applicants. We would rely on the information available to the Service and may rely on information from sources other than the applicant when making a permitting decision.

CITES

The African lion is also included in Appendix II of the Convention on International Trade in Endangered Species of Wild Fauna and Flora (CITES). It is unlawful for any person subject to the jurisdiction of the United States to engage in international trade in CITES specimens contrary to the provisions of the Convention, the ESA, or our CITES implementing regulations in 50 CFR part 23. 16 U.S.C. § 1538(c)(1), (g); 50 C.F.R. § 23.13. As required by CITES, export of a specimen of an Appendix II species to another country requires prior issuance of a CITES permit. Under CITES, importation of an Appendix II species does not require issuance of an import permit from the importing country. Consequently, the United States is not required to issue a CITES permit in order for U.S. hunters to import their sport-hunted lions. In compliance with CITES, the United States does require CITES imports to meet all CITES requirements, including that the imported lion trophies be accompanied by the required CITES export permits issued by the exporting countries, *see* 50 C.F.R. §§ 23.20; 23.23; 23.24; 23.26; 23.27, and including requirements for sport-hunted trophies at 50 C.F.R. § 23.74.

Individual Permit Adjudication Considerations

When the African lion listing under the ESA became effective, January 22, 2016, the Service began issuing enhancement findings for *P. l. melanochaita* on a countrywide basis, as had been the practice for a number of other threatened sport-hunted species. On March 1, 2018, however, in response to a D.C. Circuit Court opinion (*Safari Club Int'l v. Zinke*, 878 F.3d 316 (D.C. Cir. 2017)), the Service withdrew its countrywide enhancement findings for a range of species, including lions, across several countries, and began assessing applications to import sport-hunted trophies of these species on an application-by-application basis. These withdrawals were upheld in a D.C. Circuit Court opinion (*Friends of Animals v. Bernhardt*, No. 19-5147 (D.C. Cir. June 16, 2020); *Center for Biological Diversity v. Bernhardt*, No. 19-5152 (D.C. Cir. June 16, 2020)). No countrywide ESA enhancement findings are currently in effect. Therefore, since March 1, 2018, the Service has been making

ESA enhancement findings for the import of sport-hunted trophies of lions on an application-by-application basis, ensuring consistent application of the regulatory criteria across all permit application adjudications and ensuring that each permit decision is based on the best scientific and management information available.

Although the Service makes the required enhancement findings on sport-hunted trophy imports of *P. l. melanochaita* on an individual application basis, information obtained for the range country as a whole is also considered, as it is pertinent to the Service's evaluation. In addition to considering national-level species management, we also consider species management and contributions to species enhancement on a smaller-scale (e.g., at the regional or hunting management unit scale such as at the hunting operator, community conservancy, concessionaire, reserve, or ranch-level scale). In addition, we consider how the hunter's personal involvement in the hunting experience directly or indirectly contributes to enhancement of the species in the wild. In its enhancement evaluation, the Service, therefore, considers efforts made by the hunting management unit and/or individual hunter to directly or indirectly address the threats posed to lions in the wild together with other information available concerning the overall management and population status of the lion in the range country at the time of the hunt.

In making ESA enhancement findings, we review all relevant information available to us, including information submitted with the individual permit applications, information received in response to inquiries we make of the range countries, and all other reliable information we receive from interested parties, such as species experts, hunting organizations, hunting operators, community groups, and non-governmental organizations. We evaluate and consider all relevant information obtained or submitted to the Service on an ongoing basis as it relates to permit applications received for import of sport-hunted trophies of *P. l. melanochaita*.

The Service considers information at these different levels in order to assess:

1) How the range country government manages the hunted species and how hunting serves to enhance the survival of the species in the wild in the context of the management system;
2) How hunting serves to enhance the survival of the species in the wild in the context of the management unit at the hunting operator, concessionaire, community conservancy, reserve, or ranch level; and
3) How the individual hunter has contributed (where the hunt has already taken place) or will contribute (where the hunt has not yet taken place) to enhancement of survival of that species through their hunting activities and contributions to the survival of the species in the wild associated to the hunt and subsequent import.

Government-Level Factors Considered

- Enforcement of wildlife laws and regulations, particularly with regard to the range country's ability to implement wildlife regulations developed for the hunted species
- Implementation of a scientifically-based management plan that addresses the major threats to the species and provides economic incentives for local communities to conserve the species
- Investment of hunting fees into conservation, including whether the range country has standard processes and infrastructure in place to ensure an effective transfer of hunting revenues back into the country's management of the species and community benefits
- Management of human-lion conflict, including whether the range country has a compensation scheme or other incentives to local communities to reduce the incursion of livestock into protected areas or to actively manage livestock to reduce conflicts with lions
- Management of the lion's prey base by addressing poaching or unsustainable offtake of the lion's prey species
- Management of lion hunting areas through a system that ensures the long-term survival of the lion, its prey base, and habitat
- Protection of lion habitat through establishment of protected areas, ensuring adequate protection from human encroachment and providing incentives that encourage habitat protection by private landowners and communities
- Establishment and use of science-based quotas, a sex and age-based harvest system, and a monitoring program for the lion and its prey species

Hunting Management Unit-Level Factors Considered

- Monitoring populations of the hunted species and their prey-base
- Protecting and/or increasing the prey-base for lions in the wild
- Maximizing biodiversity of the lion's prey species
- Protecting and improving the habitat for lions in the wild to ensure maintenance of ecosystem functions and biodiversity (e.g., creating water holes, habitat management, etc.)
- Engaging in anti-poaching activities for lion and their prey base
- Managing human-lion conflict
- Investing in community benefits and employment, where such investments provide incentives for conservation of lions in the wild
- Complying with harvest laws and regulations
- Re-investing hunting fees or other contributions associated to lion hunting to a fund that supports conservation of lions in the wild

Hunter-Level Factors Considered

- Complying with harvest laws and regulations
- Paying hunting/import-related fees or other contributions associated to lion hunting that are re-invested to support conservation of lions in the wild (e.g., funding habitat protection for lions in the wild, protection of the lion's prey base, or mitigation of human-lion conflict)
- Participating in a hunting program with an operator that supports sustainable use of the species

This application-by-application permit review process offers an opportunity to incentivize hunting in concessions, conservancies, reserves, or ranches that support conservation of the species through rigorous anti-poaching programs, local wildlife monitoring activities, and compliance with government rules and regulations. By complying with our enhancement requirements, a hunter's personal import will help conserve lion populations in the wild by supporting the local communities where they hunt and promoting conservation of these species and their habitats by providing protection incentives to communities that live alongside these species.

Basis for Finding

On February 1, 2016, the Service sent a letter to the Parks and Wildlife Management Authority in Zimbabwe (ZPWMA) with a list of questions related to management plans, population status, conservation, management, hunting policies, and regulations of Zimbabwe's lion populations. Additionally in the letter, the Service referenced the IUCN SSC Guiding Principles on Trophy Hunting as a Tool for Creating Conservation Incentives Ver. 1.0 (09 August 2012), as it provides useful principles which, when considered in conjunction with the Service's permit issuance criteria, would aid when making the required enhancement findings for permitting importation of sport-hunted lion trophies.

On February 16, 2016, the Service sent a second request to ZPWMA for specific documents related to the conservation status of lions in Zimbabwe. ZPWMA responded to the Service's request on February 17, 2016, with a copy of *Conservation Status of African Lion in Zimbabwe,* and subsequently, on November 29, 2016, provided a copy of its *Enhancement and Non-detriment Finding for Lion (Panthera leo) in Zimbabwe.* The Service has also been corresponding with ZPWMA regarding African elephant management for several years. In this correspondence, ZPWMA, as well as other sources, have provided the Service with documents and information that are relevant to our evaluation of lions in Zimbabwe.

Since 2016, the Service has met with officials from Zimbabwe multiple times to receive updated information on the status of and management of lions in Zimbabwe with respect to imports of sport-hunted lion trophies. For example, Service representatives met with Zimbabwe officials in January 2018 at the annual Safari Club International convention in Las Vegas, and November 2018 at the African Wildlife Consultative Forum in Uganda. In September 2018, Zimbabwe officials provided to the Service the May 2017 Zimbabwe National CAMPFIRE Stakeholder's Review and the Zimbabwe Parks and Wildlife Management Authority Strategic Plan, 2019-2023. In addition, in September 2018 the Service received a letter dated 6 December 2017 from Hon. E.D. Mnangagwa, President of the Republic of Zimbabwe, addressed to President Donald Trump, addressing the

change of administration in Zimbabwe. In this letter Hon. E.D. Mnangagwa provided assurance to the United States that Zimbabwe is politically stable and that Zimbabwe's previous conservation initiatives would be enhanced, with the previous Minister, Permanent Secretary, and Director General confirmed to remain in place.

This information provided by the Zimbabwe authorities (including verbal updates and presentations at the 16th Annual African Wildlife Consultative Forum (Uganda, November 2018), along with the Service's final rule on the lion listing under the Act and other relevant information from reliable sources, are the basis of this finding.

Governance of Lions in Zimbabwe

The legal framework for Zimbabwe's regulatory mechanism is informed by its Wildlife Policy (1992), which is intended to maintain a protected area network for the conservation of the nation's wild resources and biological diversity. The Wildlife Policy (1992) provides for the Government of Zimbabwe to maintain a network of protected areas known as the Parks and Wild Life Estate, comprised of the country's National Parks, safari areas, botanical gardens, and sanctuary and recreational areas for the conservation of the nation's wild resources and biological diversity (CITES 2016; ZPWMA 2016). The framework is intended to create economic activity to enhance rural development and encourages the conservation of wild animals and their habitats outside the protected areas.

ZPWMA was established by the Parks and Wildlife Act of 1996 (Chapter 20:14) [as amended by Act Number 19 of 2001] which came into operation on June 1, 2002, through Statutory Instrument 144C of 2002. The Act provides for the establishment of a Parks and Wildlife Board; establishment of national parks, botanical reserves, botanical gardens, sanctuaries, safari areas and recreational parks; and the preservation, conservation, propagation or control of wildlife, fish, and plants of Zimbabwe and the protection of Zimbabwe's natural landscape and scenery. This Act includes sections on virtually every aspect of ZPWMA, including requirements for annual financial audits and reporting to the central government. The Act also provides for substantial penalties for the unlawful possession of or trading in protected wildlife species. In addition, the General Laws Amendment Act (No. 5) of 2010 provides for mandatory imprisonment for poaching.

The Parks and Wildlife Act, Chapter 20:14, devolved authority to manage and benefit from wildlife on communal and private lands to the landholders. In 1982, the legal provisions of this Act were extended to Rural District Councils (RDCs), on behalf of rural communities in communal lands whose areas contain viable populations of wildlife. Communal areas in Zimbabwe are administered by RDCs which have become a mechanism for implementation of the government's policy of conservation by utilization of natural resources. The Act enables local communities to manage and benefit from wildlife resources through the Communal Areas Management Programme for Indigenous Resources (CAMPFIRE) established in 1989.

CAMPFIRE was developed to encourage reduction in human-wildlife conflicts through conservation-based community development and to provide an economic incentive to

improve community tolerance of wildlife, including lions. At the time, the CAMPFIRE program was the model for community-based conservation efforts in several other African countries and was identified as an innovative program. Under a community-based conservation program, like CAMPFIRE, rural communities should benefit from revenue generated by sport-hunting.

As Zimbabwe's premiere wildlife agency, the main functions of the ZPWMA are to control, manage, and maintain Zimbabwe's wildlife resources with the primary role of protecting and conserving Zimbabwe's natural heritage for present and future generations on behalf of the country. It also provides the cornerstone of Zimbabwe's tourism industry (ZPWMA 2015). The rationale behind the establishment of the ZPWMA was to allow for a self-funding mechanism, and thereby reduce its dependence on the national treasury. In January 1996, the Government of Zimbabwe approved the establishment of the Parks and Wild Life Conservation Fund that provides for financing wildlife operations directly from revenues generated through wildlife-related activities. The funding for ZPWMA is therefore coming from revenue generated through sport hunting conducted on state and private lands, concession leases, National Park visitor fees, and other wildlife-related fees. While there have been requests by ZPWMA for funding from the central treasury in the past, to our knowledge, no other significant government funding has been provided, and only limited outside funding from non-governmental organizations (NGOs) or other governments appears to be available.

A major component of ZPWMA mandate is law enforcement. Poaching mainly occurs along the boundaries of protected areas where lions are incidentally snared as non-target prey. Between 2013 and 2015, 21 lions were killed illegally, with six animals killed through snaring in the area adjacent to Hwange National Park in 2015; poverty stands as the major driver of illegal hunting (ZPWMA 2016). If anyone is found in possession of poached specimens, they must pay a fine of USD 5,000 or face a mandatory jail sentence. If convicted of lion poaching, courts could require the payment of a compensation fee of USD 20,000 (ZPWMA 2014). Hunting operators are obligated through their concession lease agreements to assist with anti-poaching efforts (ZPWMA 2016). Reportedly, USD 590,000 was spent on anti-poaching efforts by the Bubye Valley Conservancy (BVC) alone during 2015 (K. Leathern, pers. comm., as cited in Du Preez et al. 2016), and USD 546,000 is spent annually on anti-poaching by the Savé Valley Conservancy (SVC) (Lindsey et al. 2012); these expenses are mainly covered by sport-hunting revenue (Du Preez et al. 2016). In 2002, ZPWMA had 2,146 rangers at its establishment (ZPWMA 2016); however, by the end 2015, there were 1,448 rangers in post (67% of 2002 level). Of the 1,448 rangers in post, 1,004 are deployable for anti-poaching operations (ZPWMA 2016).

Safari operators in Zimbabwe are required to be registered and licensed by the Zimbabwe Tourism Authority (https://www.soaz.net/index.php/2, accessed August 16, 2019). Operators must hold a lease or agreement on a suitable concession with an approved quota of animals. They are responsible for the official paperwork and permits connected to the hunt. Hunting operators are required by law to provide the services of a Zimbabwe Licensed Professional Hunter to accompany foreign hunters in Zimbabwe. Licensing is undertaken by the National Parks & Wildlife Authority.

Zimbabwe is a member of the Southern African Development Community (SADC). Under the SADC Treaty, Article 5(g) establishes objectives to, among other aspects, promote the sustainable use of wildlife, harmonize legal instruments governing wildlife use and conservation, promote the conservation of shared wildlife resources through the establishment of trans-frontier conservation areas (TFCA), and facilitate community-based natural resources management practices. To implement the SADC Treaty, member states are required to establish management programs for the conservation and sustainable use of wildlife.

Currently Zimbabwe is pursuing six TFCA initiatives at various stages of development. These are: Great Limpopo Transfrontier Park (GLTP) / Great Limpopo Transfrontier Conservation Area (GLTFCA); Chimanimani TFCA; Greater Mapungubwe TFCA; Kavango-Zambezi (KAZA) TFCA; Lower Zambezi-Mana Pools LZMP (TFCA) and Zimbabwe-Mozambique-Zambia (ZIMOZA) TFCA (Mandisodza-Chikerema 2018, p. 34).

Through TFCAs, wildlife management entities are linking many of the major protected areas by removing boundary fences along national borders that separate many reserves in addition to creating or improving corridors to link good-quality habitat for wildlife (Newmark 2008). The principle of ecological and migratory connectivity lies at the heart of the TFCA initiative linking large protected areas across international boundaries and providing space for wildlife populations.

Another provision of the SADC Treaty is that member states are required to establish management programs for the conservation and sustainable use of wildlife. Zimbabwe has met this criterion for African lions through the development of its 2006 *Conservation Strategy and Action Plan/or the Lion (Panthera leo) in Zimbabwe* (ZPWMA), which is still in use.

As previously mentioned, Zimbabwe is also a Party to CITES, and the African lion species is included in Appendix II of the Convention. As an Appendix-II species, certain criteria must be met before the CITES Management Authority of the country of export may issue an export permit, including a finding from the exporting country's CITES Scientific Authority that the proposed activity will not be detrimental to the survival of the species in the wild (non-detriment finding; NDF) and a finding from the CITES Management Authority that the specimens proposed for export were legally acquired (legal acquisition finding).

The ZPWMA has provided the Service with a copy of its standing CITES non-detriment finding (NDF), dated October 2016, for the export of African lion specimens. The NDF explains that lion populations in Zimbabwe are being managed sustainably for the benefit of the species and that Zimbabwe's management program for lion provides economic incentives for local communities to protect and expand lion habitats. The NDF document provides information to support the following:

- The Zimbabwe hunting industry is based on sound scientific information, provides mechanisms to arrest habitat loss, or where feasible increase habitat, and provides protection from human encroachment.

- Government incentives are in place to encourage habitat protection by private landowners and communities.
- Government Incentives are provided to local communities to reduce human-wildlife conflicts.
- Hunting concessions are managed to ensure the long-term survival of the African lion and its habitat.
- Trophy hunting provides financial assistance to the ZPWMA, the communal CAMPFIRE program, and private landowners to implement wildlife management programs.
- Local communities directly and indirectly benefit from the presence of lion in their areas.
- Participation of U.S. hunters in the Zimbabwe hunting industry contributes to the overall conservation and management of lions in Zimbabwe (ZPWMA 2016).

Lion Status in Zimbabwe

When the Service listed the subspecies of lion in southern and eastern Africa (*P. l. melanochaita*) as threatened under the Act (80 FR 79999), three primary threats to the species throughout its range were identified: loss of habitat, loss of prey base, and human-lion conflict. While human population growth clearly has an impact due to loss of available habitat for lions, increasing human population has a direct impact on prey base. Prey availability affects the reproduction, recruitment, and foraging behavior of lions and, as a result, strongly influences lion movements, abundance, and population viability (Winterbach *et al.* 2012, as cited in USFWS 2015). Lion densities are directly dependent on prey biomass (Hayward *et al.* 2007). Outside of protected areas, the lion's prey base is much reduced (Du Preez et al. 2016); inadequate management and law enforcement have led to poaching of the lion's prey base for bushmeat, which has been critically depleted (USFWS 2015). Population trends across eastern and southern Africa show that most prey species have declined in recent years; and for Zimbabwe, droughts have been a critical factor (ZPWMA 2016).

A reduced prey base results in a relatively greater chance of lions encountering livestock (Du Preez et al. 2016). While actual losses of livestock to predators may be relatively low, the perceived financial cost to farmers can be high, and lions are persecuted intensely in livestock areas as a consequence. Their scavenging behavior makes them particularly vulnerable to the practice of lacing prey carcasses with poison to eliminate predators (CITES 2016). Co-existence of lions and people is promoted through giving value to lions, such as through tourism and hunting in CAMPFIRE areas (ZPWMA 2014). The threat to lions from habitat loss is especially present in Sebungwe and the South East Low Veld where the fragmented nature of the protected areas is compounded by increasing human and livestock populations surrounding these areas (ZPWMA 2016).

According to the Service's CoPl7 *Consideration of Proposals for Amendment of Appendices I and II,* international trade in lion products is emerging as an additional threat; however, the relative extent to which this threat has contributed to lion population declines is difficult to evaluate accurately (CITES 2016). According to ZPWMA (2016), the illegal local and international trade in lions and their products poses an insignificant risk to the

species in Zimbabwe, as there are no records of people found in possession of illegally acquired lion specimens in Zimbabwe. It is not clear what level of legal trade of lion products, if any, occurs within Zimbabwe.

The bulk of Zimbabwe's wildlife occurs within the Parks Estate which includes 11 national parks, 16 safari areas, 16 recreational parks, 6 sanctuaries, 12 botanical reserves and 3 botanical gardens, all spread across the country (Parks and Wildlife Act 2001 Chapter 20:14). Wildlife populations also occur on the state Forest Areas, Communal CAMPFIRE areas, and private conservancies dedicated to wildlife-based land use. There are approximately 319,317 km^2 of land where some form of wildlife-based land use is practiced in Zimbabwe (ZPWMA 2016). Lions occur permanently in 45% of this available range (circa 145,000 km^2) with the majority occurring in national parks (96%) and safari areas (92%). Lions also occur permanently in 47% of the State forest areas and 66% of privately owned conservancies. The CAMPFIRE areas comprise approximately 247,000 km^2 and lions occur in 36% of these areas. Lions are transient in CAMPFIRE, conservancy, and resettled areas adjacent to the major protected areas, and lions move across the border into Zambia, Mozambique, South Africa, and Botswana.

Zimbabwe's main lion range includes the Hwange-Matetsi Ecosystem, Mid Zambezi Valley, Sebungwe, and South East Lowveld. The lion population estimates in Zimbabwe are determined primarily through carnivore spoor surveys, systematic lion collaring, and call-up surveys. According to ZPWMA's *Conservation Status of the African lion (Panthera leo) in Zimbabwe* July 2014 report, starting in 2015, lion spoor surveys were to be done at two-year intervals in all wildlife areas, and lion call-up surveys were to be done every three years in all major lion areas (ZPWMA 2014). Although the Service has not received confirmation that these surveys have been conducted since 2015, in September 2018, the Service received Zimbabwe's Parks and Wildlife Management Authority's Strategic Plan for 2019-2023, which indicates that Zimbabwe is actively working to improve the monitoring and management of their wildlife species. In their updated strategic plan, signed in December 2018, they indicated that one of their strategic objectives is protection of wildlife resources. Their identified timeline is to update and implement key species management plans (lion is identified as one of these) by December 2023.

ZPWMA (ZPWMA 2016) has estimated that the minimum number of lions that occur on approximately 5l,642 km^2 of land where reliable survey data are available is approximately 1,900 (range 1,800 - 2,000). The western portion of the country, consisting primarily of Hwange National Park and the surrounding safari areas, forest areas, communal areas, and private conservancies, supports approximately 737 lions (or 38% of the overall population). The southern portion of the country, dominated by the two major conservancies (SVC and BVC) and Gonarezhou National Park supports approximately 896 lions (48%). These numbers are supported by several studies.

Within Gonarezhou National Park, Groom et al. 2014, used call-up surveys to obtain direct estimates of the lion population and compared actual lion densities with potential density estimates. In this study, while lions were only seen at five percent of calling stations, this equated to a population estimate of 33 lions, which is consistent with spoor survey results conducted in June 2010 (Groom et al. 2014). A 2015 spoor count

survey of Gonarezhou National Park revealed an estimated 125 lions within the park (ZPWMA 2016).

From 2007 to present, annual track index surveys at the SVC have been conducted using a standardized methodology (Groom and Watermeyer 2015, as cited in Du Preez et al. 2016). Prey availability models suggest that the carrying capacity for this lion population is approximately 271 lions (Hayward et al. 2007). In 2015, the estimated population was 284 lions (Du Preez et al. 2016). The Rifa Safari Area was surveyed using camera trapping and spoor counts in 2015, which supported an estimated population of 68 lions. The central and northern portions of the country reportedly support an estimated population of 284 lions (15%). The 12-year (2000-2011) average lion density per 100 km^2 is 2.8 in Hwange National Park, 6.0 for South Eastern Lowveld in the SVC, 9.0 in Malilangwe, and 0.8 in Gonarezhou National Park (ZPWMA Annual Report 2013, as cited in ZPWMA 2014). SVC's website indicates that at SVC, an annual predator spoor count is conducted by the African Wildlife Conservation Fund (AWCF), an independent organization (http://savevalleyconservancy.org/conservation.html#header1-z, accessed August 14, 2019).

According to Riggio et al. 2013 (p. 32), and Bjorklund in Riggio et al 2013 (p. 32), the minimum number of lions that are estimated to constitute a viable population is 500 individuals. Hwange National Park, with an estimated population of 559, is the only area within Zimbabwe that has a viable population as laid out by Riggio et al. 2013. However, the two regions that make up the largest percentage of the country's lion population (Western 38% and Southern 48%) have regional populations of 737 and 896, respectively. The areas within the Central and Northern regions of Zimbabwe, albeit smaller, encompass parks that are part of Transfrontier Conservation Areas, such as the Mana Pools region.

Lion Management in Zimbabwe

In response to discussions surrounding a possible up-listing of lion to Appendix I under CITES at the 13th Meeting of the Conference of the Parties (CoP13), and subsequent workshops involving lion range states, IUCN, ZPWMA, and other key stakeholders held a workshop to develop the *Conservation Strategy and Action Plan for the Lion (Panthera leo) in Zimbabwe* which was published by ZPWMA in 2006. The plan responds to regional and international standards set by Treaties such as CITES and the Convention on Biological Diversity (CBD), among others. The plan states "it will guide the conservation and management of this top predator" which "addresses the needs of th[e] country." The Service is not aware of any additional or updated iterations of the plan since 2006; however, in Zimbabwe's 2016 response, *Enhancement and Non-Detrimental Findings for Panthera leo in Zimbabwe,* ZPWMA provided updates on each of the outputs and respective targets established under the 2006 *Conservation Strategy and Action Plan/or the Lion (Panthera leo) in Zimbabwe* (ZPWMA 2016).

The 2006 plan identifies a vision that "...lions should be conserved and managed sustainably for their aesthetic, cultural, and ecological values, and the socio-economic

development of Zimbabwe." The plan lays out three broad targets to achieve this objective:

- Ensure the persistence of key lion populations and other important populations including those of doubtful viability.
- Human and livestock loss reduced.
- Optimize wildlife conservation-related net benefits to local communities.

All three targets are stepped down to seven specific outputs with their own targets and activities to meet such targets. Although the plan does not identify a time period, some activities do, of which a period of 5 years is the most common. In response to inquiries from the Service, ZPWMA has provided a summary of the progress made to implement the 2006 strategy.

While all three of the broad targets appear to serve a valuable role in lion management in Zimbabwe, three of the specific outputs are most relevant to determining if the implementation of the strategy enhances the propagation or survival of the species, as required by the Act for the issuance of import permits. The first output, "lion populations, their habitats and wild prey effectively conserved and managed in collaboration with local stakeholders" is broken down into a number of targets: establish a baseline survey and monitoring program; maintain and strengthen capacity for lion conservation, management, monitoring and research; identify and implement best management standards and practices for the hunting program; develop and implement co-management frameworks; and expand the geographic distribution range of lions. Baseline surveys have been completed for the Parks Estate using monitoring protocols for key variables (populations, habitats, prey), and selected surveys have been undertaken in areas outside National Parks (ZPWMA 2016).

Carnivore research programs conducted by NGOs and research institutions such as WildCRU are taking place in various parts of the country; in addition, personnel have been trained in data collection and capture, management, and lion aging and analysis. Adaptive age-based criteria for male trophy animals are in place and functioning. The quota for a certain year is determined by a point system based off the hunts from the previous season. Therefore, ZPWMA is actively working toward meeting the target areas for this output.

The second output, "human-lion related conflicts minimized and, where possible, eliminated" has also been broken down into a number of targets: develop and establish databases on lion-human conflicts; identify and implement methods to reduce and mitigate livestock losses and lion attacks on humans; and train and properly staff problem animal control (PAC) units to conduct rapid response and precisely target problem animals. According to information from ZPWMA (2016), approaches to mitigate livestock losses and lion attacks on humans are in the process of being tested and implemented in Hwange, and methods to mitigate lion attacks on livestock are being implemented as appropriate at selected sites (e.g. Tsholotshe). Data on PAC reports for lion-related problems have been collated, and PAC units at ZPWMA field station and/or RDC levels have been partially established. In Matusadona, Hwange, and Gonarezhou regions, specific awareness and education packages on lion conservation and

management have been developed and implemented. The information submitted in the ZPWMA update suggests that they have met one target, and are in the process of implementing the remaining two.

The third output, "the costs and benefits of long-term lion management equitably distributed," is a socio-economic output to establish agreement and implementation of area-specific lion management plans with identified stakeholders in each wildlife region, and implementing a transparent mechanism to equitably distribute lion-related income to identified stakeholders." The specific targets for this output are: complete an inventory of stakeholders directly affected by lion conservation, deliver appropriate training and capacity building to prioritized stakeholders, agree to and implement collaboratively developed area-specific lion management plans with identified stakeholder groups in each wildlife region within 5 years, and implement transparent mechanisms to equitably distribute lion-related/generated income to identified stakeholders (groups and/or communities). Current information from ZPWMA shows that they have identified key stakeholders and assessed the financial impacts of lion conservation and the magnitude of socio-economic impacts on each stakeholder group. Limited training has been undertaken for representative stakeholders in Hwange, Matusadona, and Gonarezhou. ZPWMA has also implemented an adaptive management program across four wildlife regions and is in the progress of developing and implementing area-specific lion management plans with identified stakeholder groups. According to ZPWMA, a Management Plan for Hwange was approved. The Hwange National Park (HNP) Management Plan was updated in 2015 and officially accepted at Zimbabwe's Ministry of Environment level in 2016 (Conservation and Wildlife Fund (CWF) 2018, p. 16). One of the four components of this 10-year plan is implementation of a cooperation plan between the park and park neighbors. The Conservation and Wildlife Fund – Hwange (CWF) is a relatively new model of the private and NGO sectors in and around Hwange National Park (HNP) Zimbabwe, formalizing an alliance of individual members to materially and in-kind assist authorities with conservation work.

The Hwange Lion Research (HLR) which is part of the Wildlife Conservation Research Unit (WILDCRU), Oxford University, UK, with some financial support and collaborative effort from CWF, set up a comparative camera trap survey in May 2018, to establish a baseline of both lion and lion prey identification and densities in contiguous areas with differing management – the exact CWF project area. Although data were only obtained from the 40-day HNP camera grid, combined sources of complimentary data on the lion population in Forest Areas outside the national park suggest that anthropogenic mortality is slowing down, believed to be in part due to CWF's new law enforcement activities (CWF 2018, p. 21).

Zimbabwe's conservation strategy for lions also identifies roles and responsibilities for a number of participants in Zimbabwe's lion conservation efforts. According to the strategy, there is a national lion coordinator that coordinates all national activities on lion conservation, research, and management, including census surveys, setting up monitoring needs, and coordinating data on human-lion conflicts. The strategy identifies roles for the field stations, wardens, ecologists and utilization units, which are responsible for ensuring compliance with hunting regulations and maintaining safari hunting databases. In addition, the strategy identifies roles for CAMPFIRE, safari operators, and

professional hunters to facilitate training and ensure compliance with hunting regulations.

The Conservation Strategy and Action Plan for the Lion in Zimbabwe (ZPWMA 2006) borrows language from the *IUCN Conservation Strategy* (2006). It iterates areas in need of improvement regarding lion conservation in Zimbabwe, including standardized lion census methods and surveys, further mitigating human-lion conflicts, and maximizing benefits for rural communities that live with lions. ZPWMA (2006) notes their intention to review and put in place criteria for age-based identification of male trophy animals, but do not mention if they will be reviewing possible combination strategies. As part of the 2006 lion conservation strategy for eastern and southern Africa, six objectives were established to secure and restore sustainable lion populations, which were housed under the following categories: management, mitigation, socio-economics, policy and land-use, politics, and trade. The strategy was intended to be implemented within 10 years (Macdonald 2016), and Zimbabwe gave an update on progress regarding these objectives in their *Enhancement and Non-Detrimental Findings for Panthera leo in Zimbabwe* (ZPWMA 2016) that also addressed outputs and targets laid out in their 2006 action plan.

Additionally, to mitigate human-lion conflict, the "Long Shields Guardian Programme" was initiated whereby communities are notified of movements of collared lions into their areas via cell phone, and then have the opportunity to take appropriate action, such as moving cattle. In 2013 alone, 1,850 warnings were passed to the "Long Shields." These actions may reduce the incidents of lions marauding livestock; however, retaliatory killing of lions still occur. Further, as is policy under the Parks and Wildlife Act of 2001, any lions that attack humans or livestock will be lethally eliminated (ZPWMA 2016). Between 2007 and 2013 a total of 1,113 conflict incidents were recorded in the Hwange area in which 915 head of stock were lost to lions.

In and around Hwange National Park, data collected between 1999 and 2004 suggested that hunting surrounding the park was having a negative impact on the lion population. As a result, sport hunting of lions was suspended in the area surrounding the park between 2005 and 2009. Following the lifting of the moratorium, and by implementing stricter monitoring and hunting guidelines through the Hwange Lion Research Project, the overall Hwange lion population has continued to show a positive trend, and as of 2015 the population was estimated at over 550 animals (ZPWMA 2015).

Hunting, Management, and Utilization of Lions

In Zimbabwe, much of the trophy hunting occurs in Safari Areas which are managed mainly for the sustainable use and as buffer zones next to National Parks (Jeke et al 2019, p. 2). Trophy hunting of wildlife is legally permitted in safari areas; as of 2014, there were 16 in Zimbabwe (ZPWMA 2014). According to the Forest Act, Chapter 19:05, there are 24 gazetted indigenous forest areas in Zimbabwe; within these forest areas, lions may be hunted in the following forests: Fuller, Kazuma, Pandamasuwe, Ngamo, Sikumi, Gwayi, Sijarira, and Gwampa (ZPWMA 2014).

As of 2016, the minimum number of lions that occur in approximately 51,642 km^2 of land in Zimbabwe, where reliable survey data are available, is estimated to be 1,917 (range 1,800 - 2,000), the majority of which occur in western and southern Zimbabwe. When taking this population estimate into consideration, trophy hunting harvests a yearly mean of 2.7% of adult male lions. This figure decreased since the establishment of age restrictions on lion hunting (ZPWMA 2016).

In 2013, an adaptive quota management system for lion hunting based on the ages of lions hunted was agreed to in Harare, Zimbabwe, during a meeting hosted by ZPWMA and an independent non- governmental conservation organization (Du Preez et al. 2016). After reviewing aging techniques, attendees at the July 2013 meeting in Harare, Zimbabwe were confident that hunters could be expected to categorize lions as being below or above five years of age. In determining quotas for the following years, operators would be rewarded with increased quotas if they hunted animals of six years or older, would not be penalized if they hunted animals five years of age, but would have quotas cut if they hunted animals younger than five years old, or if they failed to complete hunt returns (ZPWMA and Panthera 2014). In 2013, only 28% of lions hunted were five years old or older. In 2015, that figure rose to 77.3% (ZPWMA 2016).

According to Hunter et al. (2013), an adaptive quota management system utilizing age-based criteria would not only aid in the prevention of over-harvesting lions, but would also prevent excessively conservative quotas. Further, according to Miller et al. (2016), results indicate that age-based hunting is feasible for sustainably managing threatened and economically significant species such as the lion, but must be guided by rigorous training, strict monitoring of compliance and error, and conservative quotas. No single trait can be relied upon exclusively to precisely age lions. Rather, multiple traits must be examined in combination to cross-validate an individual's age and, according to Whitman et al. (2004), restricting hunting to individuals that are at least six years old is desirable from a biological perspective due to the reduced risk of the loss of pride males and infanticide of cubs associated with the harvest of such individuals (Whitman et al. 2004).

During 2013, operators were requested to submit hunt returns and photos as a trial run to get the adaptive quota system up and running. In 2014, operators were requested to do the same but were informed that the age of the lions hunted in 2014 would determine their lion quotas in 2015 (Du Preez et al. 2016). In 2015, there was a marked increase in the age of lions hunted in Zimbabwe as a whole. The majority of lions hunted were on the cusp of 5-6 years of age but were not older than six years. National hunting offtakes for lions in Zimbabwe from 2013 to 2015 were 29, 42, and 47 respectively (Masterson 2016). It appears these do not include illegal forms of hunting offtake. In 2011, Zimbabwe's quota was set at 101 lions; in 2014, it was reduced to 50 male lions following the implementation of age restrictions (Henschel 2015, pers. comm., as cited in USFWS 2015).

As described above, CAMPFIRE is the program through which the Government of Zimbabwe has relegated the management of wildlife resources to communal farmers. As of July 2014, there are at least 58 Rural Districts that have been granted the Appropriate Authority status to manage wildlife resources in their areas; however,

according to *Enhancement and Non-Detrimental Findings for Panthera leo in Zimbabwe* ZPWMA 2016, only 16 are actively engaged in some form of wildlife-based land use (ZPWMA 2016). Lions are found in communal areas that are adjacent to major protected areas, and lion hunting is allowed in CAMPFIRE districts (ZPWMA 2014).

In setting adaptive lion quotas, Zimbabwe uses scientific information including spoor surveys, camera traps, and ranger-based sighting. In CAMPFIRE areas, incidences of human-lion conflict are also taken into consideration where survey information is not readily available, when determining quotas for those areas (ZPWMA 2014). The quota-setting process involves all stakeholders, including the ZPWMA, landowners, safari operators, and CAMPFIRE managers and their representatives. During the annual quota-setting workshop, presentations are made by the proponents who then make proposals for quotas. Where it is felt that not enough information has been presented, a precautionary quota will be issued (ZPWMA 2014).

ZPWMA (2016) mentions seven concessions that are leased on five-year terms, and how these concessionaires pay a 5-year "right to lease" fee, annual rental, fixed quota fee (payable if animals are shot or not) and a supplementary quota fee that allows additional animals to be bought as needed. It is unclear to what extent Zimbabwe still utilizes fixed quotas, as Du Preez et al. claims fixed quotas are no longer being used by Zimbabwe, but a fixed quota fee is mentioned in ZPWMA (2016). It is also unclear how many animals concessionaires are able to "buy as needed," and how such requests may be accommodated without going over the national quota (ZPWMA 2016). However, when evaluating the lower quota with higher utilization reported by ZPWMA (2016), and taking into consideration the land area of the Parks Estate alone, Zimbabwe did not exceed the best management practice of 0.5 lions/1,000 km^2; the 2015 off-take would have accounted for 0.125 lions/1,000 km^2.

According to *The Role of Trophy Hunting of Elephant in Support of the Zimbabwe CAMPFIRE Program -December 2016,* a report the Service received in December 2016, the Reserve Bank of Zimbabwe, in collaboration with relevant stakeholders, established the Tourism Receipts Accounting System (TRAS2) that required all outfitters to submit returns listing the revenue generated for hunting activities. This system has been in place for several years, but it required manual analysis of the data to extract information on hunting revenue. In January 2015, to account fully for earnings in the hunting sector, the Reserve Bank of Zimbabwe in collaboration with relevant stakeholders, introduced TRAS, a web-based system that links Safari operators, ZPWMA Authority, taxidermists, shipping agents, International marketing agents, and the Reserve Bank. Under this system, all authorized hunts are registered, allowing for the capture of hunting data, such as the origin of clients, value of trophies and hunts, and area hunted, to monitor hunting quota utilization and track hunted trophies. According to the December 2016 report, the Exchange Control Division of the Reserve Bank of Zimbabwe and the ZPWMA are now able to:

1. Assess regional price differentials of similar hunts and the reasons thereof;
2. Present TRAS2 system updates and reports to the users, including international marketing agents;
3. Engage with international marketing agents of sport hunting;

4. Obtain relevant insights on governing of the hunting sector; and
5. Come up with an effective mechanism to fully account for export proceeds from the hunting sector.

The TRAS2 information provides a breakdown of the source of hunting income, and the amount of funds generated by trophy fees by land category, among other insights, and has demonstrated the TRAS2 system's ability to obtain relevant insights on governing of the hunting sector.

Evaluation

William Howard Mahaffey hunted in the Savé Valley Conservancy (SVC) in southeastern Zimbabwe, reportedly one of the largest private game reserves in Africa (https://savevalleyconservancy.org/). In the early 1900's, the 3,440 km^2 of land that now comprises the SVC was used for cattle ranching, which led to the elimination of most large herbivores and predators, including lions. In the 1990's upon establishment of the SVC, the cattle farms were converted to a wildlife-based land use system and wildlife populations were restored (Pole 1999).

In evaluating whether the importation of Mr. Mahaffey's trophy of *P. l. melanochaita* would be authorized pursuant to 50 CFR 17.40(r) and 50 CFR 17.32(a), in accordance with our threatened species permit issuance criteria, we examined how Zimbabwe's management of lions overall as well as how Savé Valley Conservancy and Mr. Mahaffey himself have contributed to enhancement of wild lions both directly and indirectly by addressing the three main threats that led to the decline of the subspecies: habitat loss, loss of prey base, and human-lion conflict.

Below, we summarize our evaluation with reference to each of the permit issuance criteria at 50 CFR 17.32(a)(2) on the basis of information available to the Service.

17.32(a)(2)(i): Whether the purpose for which the permit is required is adequate to justify removing from the wild or otherwise changing the status of the wildlife sought to be covered by the permit:

Zimbabwe's lion hunting industry generated 9% of all sport-hunting revenue in 2015; 51% was contributed by U.S. hunters during 2010-2015 country-wide, and 90% of the sport-hunting market in the Bubye Valley Conservancy (BVC) and the Savé Valley Conservancy (SVC) from 2005-2015. Even though 9% may not seem like much, lions are a key component of the sport hunting industry, as they are part of the "Big 5" trophies and draw U.S. hunters to Zimbabwe. Without the hunting industry, protected wildlife areas such as BVC and SVC, which have become conservation havens in the threat of human encroachment across much of Zimbabwe, would not be economically viable, and therefore would likely not exist. These wildlife areas not only provide habitat for lions, but also support the lion's prey species. As previously noted, the southern portion Zimbabwe, which is dominated by SVC, BVC, and Gonarezhou National Park, supports approximately 896 lions (48% of the Zimbabwe lion population).

According to Lindsey et al. (2012), hunting operators in the SVC spend USD 546,000 annually on anti-poaching activities and employ 186 permanent game scouts. Hunting revenues are used to support expenses associated with these activities (Du Preez et al. 2016).

The *Strategy and Action Plan* has put into place mechanisms to adequately oversee the harvest of lions in Zimbabwe. With an annual harvest of approximately 85 lions, Zimbabwe is not exceeding the limits identified of 0.5 lions/1,000 sq. km. The objectives of the *Strategy and Action Plan* and the actions and monitoring activities that have been put into place to achieve these objectives should support the adaptive management approach that Zimbabwe has established for managing lions. The Service will continue to monitor the effectiveness of the Strategy and Action Plan, for consideration in future findings.

As described above, we have determined that the government of Zimbabwe and the Savé Valley Conservancy contribute towards positive conservation outcomes by addressing the main threats of habitat loss, human-lion-livestock conflict, and prey depletion, which contributes to improving the status of lions in Zimbabwe. Further, the fees garnered through Mr. Mahaffey's hunt will provide revenue to support these positive conservation outcomes.

Therefore, based on the information available to the Service, the purpose for which the permit is being requested, import of this trophy lion, is adequate to justify removing the sport-hunted trophy lion from the wild or otherwise changing its status.

17.32(a)(2)(ii): The probable direct and indirect effect that issuing the permit would have on the wild populations of the wildlife sought to be covered by the permit:

The total area under wildlife-based land use and conservation in Zimbabwe amounts to 10.7 million hectares and represents 27% of the total surface area of the country. Of this, 7.9 million hectares, or 75% of all conservation land in the country, falls under safari hunting as the primary or only source of revenue. Sport hunting of lions by U.S. hunters such as Mr. Mahaffey supports the programs in Zimbabwe that provide the opportunity for locals to see value in lions, which in turn conserves the species in the long-term.

A scientifically based quota is the number of a given species that can be removed from a specific population without damaging the biological integrity and sustainability of that population (WWF 1997). However, full implementation and enforcement of the age-based strategy could potentially cause the need for quotas to become irrelevant or eliminated (USFWS 2015). Age restrictions will naturally restrict offtake to a limited number of individuals that meet the age criteria (Loveridge *et al.* 2007, Whitman *et al.* 2004).

Based on the information provided to the Service, it is clear that Zimbabwe has made strides in their management of their lion populations. Additionally, Zimbabwe appears to be transparent in its management processes, including its quota setting. In 2013, Zimbabwe proposed an adaptive age-based strategy for setting hunting quotas. This

adaptive quota management system for lion hunting based on the ages of lions hunted has been accepted and embraced by all stakeholders; it has not only led to a reduced national lion hunting quota, but has also resulted in a significant increase in the age of harvested lions to a level that is considered to have a reduced ecological impact (Du Preez et al. 2016).

In 2015, the development of TRAS2 allowed the country to better monitor and govern the hunting sector, including developing an effective mechanism to fully account for export proceeds from the hunting sector. The continued participation of U.S. hunters, including Mr. Mahaffey, in this market is anticipated to continue to maintain the viability of managing areas such as the BVC and SVC in their current form, including their contribution to conservation of lions in the wild. In 2015, lion sport-hunting generated USD 753,000 in revenue, which accounts for about 9% of all sport hunting revenue in Zimbabwe that year (ZPWMA 2016).

After evaluating the information provided by the Zimbabwe government and other sources, it appears that the hunting program in Zimbabwe is addressing the three main threats that were identified by the Service when making the determination that the species was threatened with the possibility of extinction. Moreover, hunting areas such as BVC and SVC are maintaining habitat for lions and ensuring that there is no further loss, provided that the hunting areas can remain economically viable. In order to maintain a viable population of lions, the parks, safari areas, and CAMPFIRE areas must maintain biodiversity and a sustainable prey base. Finally, Zimbabwe is actively working to reduce human-lion conflicts and the number of lions killed in retaliation for killing livestock. Therefore, the management of lions within Zimbabwe and the limited hunting of lions contributes to the on-going survival of the species in Zimbabwe.

The participation of Mr. Mahaffey in the hunting and subsequent import of the trophy lion he harvested in the SVC provides an indirect benefit to wild lion populations by helping to support the reserves where lions are found; Mr. Mahaffey's hunt has generated revenue to help support a hunting area where lions are found and conserved. Therefore, based on the information available to the Service, the probable direct and indirect effect that issuing an import permit for a legally hunted lion would have on the species would be positive.

17.32(a)(2)(iii): Whether the permit, if issued, would in any way, directly or indirectly, conflict with any known program intended to enhance the survival probabilities of the population from which the wildlife sought to be covered by the permit was or would be removed:

As stated above, Zimbabwe is monitoring and controlling the harvest of lions through permitting under their regulations and through the *Strategy and Action Plan*. The issuance of import permits for lions legally hunted under these authorities would not conflict with any programs intended to enhance the survival probability of the species in Zimbabwe. Issuance of a permit authorizing import of Mr. Mahaffey's trophy lion from Zimbabwe would work in favor of, not against, the principal acts governing lion conservation in Zimbabwe. Furthermore, sport

hunting opportunities help local communities realize the value in conserving the African lion.

Therefore, based on the information available to the Service, the issuance of an import permit for a legally hunted lion does not conflict with known conservation programs.

17.32(a)(2)(iv): Whether the purpose for which the permit is required would be likely to reduce the threat of extinction facing the species of wildlife sought to be covered by the permit:

Considering Zimbabwe's limited, controlled off-take of lions in a manner that maintains sustainability, Mr. Mahaffey's legal hunt contributes to reducing the threat of extinction of lions. It appears that the permitting activities under Zimbabwe's laws and CITES, as well as the implementation of the adaptive age-based lion quota, and a continuation of implementation of the outputs in the *Strategy and Action Plan* are working in concert to promote the long-term survival of lions in the wild in Zimbabwe. The use of revenue received from hunters, such as Mr. Mahaffey, to manage the populations on the reserves is an important element of the success of lion management in Zimbabwe. For example, hunting operators in the SVC spend USD 546,000 annually on anti-poaching activities (Lindsey et al. 2012). Therefore, based on the information available to the Service, the issuance of the requested import permit for Mr. Mahaffey's legally hunted lion will likely reduce the threat of extinction facing lions in Zimbabwe.

17.32(a)(2)(v): The opinions or views of scientists or other persons or organizations having expertise concerning the wildlife or other matters germane to the application:

Based on reviewing comments made during the listing process for lions, as well as information obtained through personal conversations and literature, there is general agreement that hunting, done properly and well managed, would not have an adverse effect on lion populations. Numerous researchers have stated that, while they may not support hunting in general, they see that benefits can be received through a scientifically based hunting program for lions.

Based on the information available to the Service, there is general support by scientists and other persons or organizations having expertise concerning lions that the legal and sustainable harvest of lions, and the subsequent import of legally harvested lion trophies, as proposed in this application, would not have an adverse effect on the species and would further efforts to conserve the species in the wild into the future.

17.32(a)(2)(vi): Whether the expertise, facilities, or other resources available to the applicant appear adequate to successfully accomplish the objectives stated in the application:

Mr. Mahaffey submitted a permit application to import a trophy of his personally, legally harvested lion from Zimbabwe for the purpose of enhancing the propagation or survival of the species in the wild. As a sport-hunter, Mr. Mahaffey plays a large role in the hunting industry of Zimbabwe; the hunting and subsequent import of Mr. Mahaffey's trophy lion increases the funds available to the Zimbabwe Government and SVC to implement lion conservation initiatives. Therefore, based on the Service's review of the information available relating to Mr. Mahaffey's permit request, we find that the expertise, facilities, or other resources available to Mr. Mahaffey appear adequate to successfully accomplish the objectives stated in the application.

Conclusion

As described above, the Government of Zimbabwe has been documented to implement the *Strategy and Action Plan* in the manner identified in the documents referenced in making this finding. The on-going adaptive management and limited and sustainable off-take of lions is important to the survival of lions in Zimbabwe, and the funds generated by Mr. Mahaffey's participation contributes to the ongoing benefits the program provides to lions in the wild.

Therefore, based on the Service's consideration and analysis of the information associated with Mr. Mahaffey's permit application and other relevant information available to the Service, as described above, we find that the import of the lion harvested by Mr. Mahaffey on August 20, 2016, from the Savé Valley Conservancy, Zimbabwe, meets the requirements for making a positive enhancement finding pursuant to 50 CFR 17.40(r) and 50 CFR 17.32(a). Therefore, the Service is able to authorize the import of the trophy of one lion taken from the wild in Zimbabwe, to William Howard Mahaffey of Winter Park, Florida.

I. **Service Program and Geographic Area or Station Name**: Branch of Permits, Division of Management Authority, International Affairs

II. **Flexible Funding Program** (e.g. Joint Venture, etc.) if applicable: N/A

III. **Location**: 5275 Leesburg Pike, MS: IA, Falls Church, VA 22041-3803

IV. **Species/Critical Habitat**:

Southern and Eastern African lion (*Panthera leo melanochaita*)

Critical Habitat: N/A

V. **Project Description:** Describe proposed project or action or, if referencing other documents, prepare an executive summary (attach additional pages as needed):

As described in the permit application, 15067D, William Howard Mahaffey, has requested a permit to import a trophy of one lion that he lawfully hunted in Zimbabwe. The import is for personal purposes.

VI. **Determination of Effects:**

(A) Description of Effects: Describe the action(s) that may affect the species and critical habitats listed in item IV. Your rationale for the Section 7 determinations made below (B) should be fully described here.

Issuance of the requested import permit by the Branch of Permits will result in the importation of one personally sport-hunted lion that has been lawfully taken in Zimbabwe on the date specified in the permit application.

The trophy will be accompanied by the required CITES export permit issued by the CITES Management Authority of Zimbabwe.

The requestd U.S. Federal Fish and Wildlife import permit does not authorize the killing of an African lion; the authorization to hunt and lawfully take a lion is under the purview of the government of Zimbabwe. Therefore, the proposed action of issuing a Federal Fish and Wildlife import permit for this lawfully hunted lion will not directly or indirectly affect individuals of listed or proposed species or designated/proposed critical habitat of such species.

(B) Determination: Determine the anticipated effects of the proposed project on species and critical habitats listed in item IV. Check all applicable boxes and list the species (or attach a list) associated with each determination**.**

Determination

No Effect: This determination is appropriate when the proposed project will not directly or indirectly affect (neither negatively nor beneficially) individuals of listed/proposed/candidate species or designated/proposed critical habitat of such species. **No concurrence from DSA/ESFO required.** **X**

May Affect but Not Likely to Adversely Affect: This determination is appropriate when the proposed project is likely to cause insignificant, discountable, or wholly beneficial effects to individuals of listed species and/or designated critical habitat. **Concurrence from DSA/ESFO required.** _____

May Affect and Likely to Adversely Affect: This determination is appropriate when the proposed project is likely to adversely impact individuals of listed species and/or designated critical habitat. **Formal consultation with DSA/ESFO required.** _____

May affect but Not Likely to Jeopardize candidate or proposed species/critical habitat: This determination is appropriate when the proposed project may affect, but is not expected to jeopardize the continued existence of a species proposed for listing or a candidate species, or adversely modify an area proposed for designation as critical habitat. **Concurrence from DSA/ESFO optional.** _____

Likely to Jeopardize candidate or proposed species/critical habitat: This determination is appropriate when the proposed project is reasonably expected to jeopardize the continued existence of a species proposed for listing or a candidate species, or adversely modify an area proposed for designation as critical habitat. **Conference with DSA/ESFO required.** _____

Authority: Statutes and Regulations: 50 CFR 17.40(r).

Location where authorized activity may be conducted:
IMPORT THROUGH ANY PORT LISTED IN 50 CFR 14.12

Reporting requirements: Not applicable

Authorizations and Conditions:

A. Authorized to import the sport-hunted trophy of one male African lion (*Panthera leo melanochaita*), taken in Zimbabwe for the purpose of enhancement of the survival of the species.

B. Specimen may not be sold or transferred for any financial remuneration.

C. **Trophy must have been taken during the 2016 hunting season.**

D. Trophy must be accompanied by a valid trophy permit or hunting license issued by the government of Zimbabwe for the 2016 season.

E. Trophy must be accompanied by a valid Convention on International Trade in Endangered Species of Wild Fauna and Flora (CITES) Appendix II export permit/re-export certificate, source code "W", issued by the Management Authority of Zimbabwe.

F. General conditions set out in Subpart D of 50 CFR 13, and specific conditions contained in Federal regulations cited above, are hereby made a part of this permit. All activities authorized herein must be carried out in accord with and for the purposes described in the application submitted. Continued validity, or renewal of this permit is subject to complete and timely compliance with all applicable conditions, including the filing of all required information and reports.

G. The validity of this permit is also conditioned upon strict observance of all applicable foreign, state, local, tribal, or other federal law. **This permit can be photocopied.**

H. Valid for use by permittee named above.

I. Acceptance of this permit serves as evidence that the permittee understands and agrees to abide by the "General Permit Conditions" (copy attached).

RE: Import Application of Zimbabwe Lion Trophy for Frank Cavallo

Dear Chief Cogliano:

Enclosed please find the permit application to import an elephant trophy from Zimbabwe for Frank Cavallo . Also attached to the permit application is enhancement information provided by the Zambizi Hunters Safari Company. Please refer to the hundreds of pages of enhancement information Conservation Force previously submitted to the U.S. Fish and Wildlife Service, as well as information submitted by Zimbabwe authorities, outfitters, and others, in making an enhancement finding for lion trophy imports.

Please do not hesitate to contact us if you have questions about this permit application.

Sincerely,

John J. Jackson III

NOTICE OF REPRESENTATION

This is a notice to the U.S. Fish and Wildlife Service that I have appointed John J. Jackson, III of the non-profit firm Conservation Force as my attorney and legal representative for all matters concerning my applications for a permit to import a lawfully hunted LION trophy.

This authority is inclusive and extends to all applications and filings, whether administrative or judicial, including but not limited to any request for reconsideration, appeal, and litigation.

I also request that the attorney, through the address for Conservation Force below, be copied with all correspondence, acknowledgements, notices and decisions concerning my application to import my trophy at the following address:

IMPORT OF SPORT-HUNTED TROPHIES
(Appendix I of CITES and/or ESA)

Complete Sections A or B, and C, D, and E of this application. U.S. address may be required in Section C, see instructions for details.
See attached instruction pages for information on how to make your application complete and help avoid unnecessary delays.

A. Complete if applying as an individual

1.a. Last name	1.b. First name	1.c. Middle name or initial	1.d. Suffix
Cavallo	Francescomaria	Tiberio	

2. Date of birth (mm/dd/yyyy)	3. Telephone number	3.a. Alternate telephone number	4. E-mail address
(b)(6)	(b)(6)	(b)(6)	(b)(6)

B. Complete if applying on behalf of a business, corporation, public agency, Tribe, or institution

1.a. Name of business, agency, Tribe, or institution	1.b. Doing business as (dba)		
2. Tax identification no.	3. Description of business, agency, Tribe, or institution		
4.a. Principal officer Last name	4.b. Principal officer First name	4.c. Principal officer Middle name/ initial	4.d. Suffix
5. Principal officer title	6. Primary contact name		
7.a. Business telephone number	7.b. Alternate telephone number	7.c. Business fax number	7.d. Business e-mail address

C. All applicants complete address information

1.a. Physical address (Street address; Apartment #, Suite #, or Room #; no P.O. Boxes) (if Broker or Taxidermist is applying on behalf of a foreign national, list's name and address in this block; U.S. hunters must provide their U.S. address)

(b) (6)

1.b. City	1.c. State	1.d. Zip code/Postal code	1.e. County/Province	1.f. Country
El Campo	Tx	77437	Wharton	U.S.A.

2.a. Mailing Address (include if different than physical address; include name of contact person if applicable)

2.b. City	2.c. State	2.d. Zip code/Postal code	2.e. County/Province	2.f. Country

D. All applicants MUST complete

1. Attach check or money order payable to the U.S. FISH AND WILDLIFE SERVICE **in the amount of $100, nonrefundable processing fee** Federal, Tribal, State, and local government agencies, and those acting on behalf of such agencies, are exempt from the processing fee – ***attach documentation of fee exempt status as outlined in instructions.*** (50 CFR 13.11(d))

2. Certification: I hereby certify that I have read and am familiar with the regulations contained in ***Title 50, Part 13 of the Code of Federal Regulations*** and the other ***applicable parts in subchapter B of Chapter I of Title 50***, and I certify that the information submitted in this application for a permit is complete and a understand that any false statement herein may subject me to the criminal penalties of 18 U.S.C. 10

(b) (6)

Signature of applicant/Principal Officer for permit (No photocopied or stamped signatures) — Date of signature (mm/dd/yyyy)

Please continue to next page

E. IMPORT OF SPORT-HUNTED TROPHIES *(Appendix I of CITES and/or ESA)*

Note 1: This form should be used to request authorization to import trophies of species listed on Appendix I of CITES and/or as threatened or endangered under the ESA (examples include elephants, lions, cheetahs, wood bison, and markhor).

PLEASE USE FORM 3-200-19 FOR SOUTHERN AFRICAN LEOPARD TROPHIES AND SOUTHERN WHITE RHINOCEROS TROPHIES TAKEN IN NAMIBIA.

Note 2: If you hold an import permit for trophy/trophies that you did not use, please **return the unused original permit**. If you are requesting reissuance of a permit because you have taken a trophy, but were unable to import it prior to the expiration of the permit, please use the renewal form (3-200-52) and return your original permit with that form.

Note 3: Applications for species listed as endangered under the U.S. Endangered Species Act are published in the Federal Register for a 30-day public comment period. Please allow at least **90 days** for the application to be processed.

Note 4: *Sport-hunted trophy* is defined at 50 CFR 23.74 as follows: *Sport-hunted trophy* means a whole dead animal or a readily recognizable part or derivative of an animal specifically identified on the accompanying CITES document that meets the following criteria:
(1) Is raw, processed, or manufactured;
(2) Was legally obtained by the hunter through hunting for his or her personal use;
(3) Is being imported, exported, or re-exported by or on behalf of the hunter as part of the transfer from its country of origin ultimately to the hunter's country of usual residence; and
(4) Includes worked, manufactured, or handicraft items made from the sport-hunted animal only when:
(i) Such items are contained in the same shipment as raw or tanned parts of the sport-hunted animal and are for the personal use of the hunter;
(ii) The quantity of such items is no more than could reasonably be expected given the number of animals taken by the hunter as shown on the license or other documentation of the authorized hunt accompanying the shipment; and
(iii)The accompanying CITES documents (export document and, if appropriate, import permit) contain a complete itemization and description of all items included in the shipment.

Note 5: Certain hunting trophies, including elephants, are subject to restrictions on their use after import into the United States. Please see 50 CFR 23.55 for more information or contact the Division of Management Authority.

Please provide the following information. Complete all questions on the application. Mark questions that are not applicable with "N/A". If needed, use a separate sheet of paper. On all attachments or separate sheets you are submitting; please indicate the application question number you are addressing. If applying for more than one trophy, be sure to answer questions 1-6 for each trophy addressed in this application. If importing trophies from more than one country, you must submit a separate application for each shipment in order to obtain separate import permits.

---

1. Name and address where you wish the permit to be mailed, **if different from page 1**. If you would like expedited shipping, please enclose a self-addressed, pre-paid, computer-generated, courier service airway bill. If unspecified, all documents will be mailed via regular mail through the U.S. Postal Service.

2. Who should we contact if we have questions about the application (name, phone number, and e-mail)?

   Conservation Force, 504-837-1233, cf@conservationforce.org

3. Have you or your client (if a broker applying on behalf of your client), been assessed a civil penalty or convicted of any criminal provision of any statute or regulation relating to the activity for which the

application is filed; been convicted, or entered a plea of guilty or nolo contendere, for a felony violation of the Lacey Act, the Migratory Bird Treaty Act, or the Bald and Golden Eagle Protection Act; forfeited collateral; OR are currently under charges for any violation of the laws mentioned above?

No X Yes ____

If you answered "Yes" to Question 3, provide: a) the individual's name; b) date of charge; c) charge(s); d) location of incident; e) court, and f) action taken for each violation. Please be aware that a "Yes" response does not automatically disqualify you from getting a permit.

4. For each trophy to be imported, provide:

   a. Scientific name (genus, species, and, if applicable, subspecies) and common name.

   Panthera leo, African lion

   b. Sex (if known). Male

5. **IF ANIMAL IS CURRENTLY LIVING IN THE WILD**, please enter the following information:

   a. Country and place (area, region, GIS coordinates, ranch, conservancy, management area, or hunting block, AND nearest city) where wildlife is to be taken from the wild:

   b. Date wildlife is to be hunted:

   b. Name of hunting outfitter, safari company, or professional hunter you will be hunting with:

6. **IF THE TROPHY HAS ALREADY BEEN TAKEN**, please enter the following:

   a. Country and place (area, region, GIS coordinates, ranch, conservancy, management area, or hunting block, AND nearest city) where trophy was removed from the wild:

   b. Date wildlife was hunted: 09/16/18

   b. Name of hunting outfitter, safari company, or professional hunter you hunted with:

   Zambezi Hunters

   c. The current location of the trophy (address and country) [the U.S. import permit will identify this country as the country of export/re-export and must match with the export/re-export document]:

   Trophy Consultants International 4 Josiak Chinamano Rd Belmont, Bulawayo, Zimbabw

7. Please provide a copy of any applicable foreign government permits or licenses that were required to remove this animal from the wild (if you have not hunted yet and do not currently hold any such permits or licenses, please indicate so).

8. Complete name and address of overseas person or business shipping the trophy to you. If you are applying to import a trophy directly from Namibia, you **must** provide the name and address of the professional hunter listed on your Namibian hunting permit [this name will appear on the face of the export permit].

Name:	TROPHY CONSULTANTS INTERNATIONAL
Business Name:	4 JOSIAH CHINAMANO ROAD
Address:	BELMONT
City:	BULAWAYO
State/Province:	ZIMBABWE
Country, Postal Code:	

9. For species listed under the Endangered Species Act, please be aware that the U.S. Fish and Wildlife Service must make a finding that your activities will enhance or benefit wild populations of the species involved. While we will communicate with the range country for the species you will hunt or hunted when making the required findings, if you have any information that could support this finding, it would be helpful to our review if you could provide it. Please submit such information on a separate page with your application.

   a. Do you have any information regarding the population status or trend data on the species hunted?

   See attached.

   b. In order to hunt, you likely paid for licenses or trophy fees. What were those fees and do you have any information on how those funds were used by either the landowner, community, or government?

   $44,252

   c. Do you have information on other funding activities that are being carried out, or were carried out, by the safari outfitter, professional hunter, concession holder, or land owner that provide a conservation benefit to the species being hunted/species hunted?

   See attached.

CERTIFICATION STATEMENT (original signature must be provided for either 10 or 11 below)

10. **If you are a broker or taxidermist applying on behalf of a U.S. hunter or foreign national,** provide documentation to show you have a **Power of Attorney** to act on your client's behalf and sign the following statement.

    I acknowledge that the sport-hunted trophy/trophies to be imported has been/will be personally hunted by my client and is being imported only for my client's personal use (i.e., **not for sale, transfer, donation, or exchange that is reasonably likely to result in economic use, gain, or benefit**). I understand that my client may only import two leopard trophies and two elephant trophies within the same calendar year (if applicable). In addition, I have advised my client that raw ivory, once imported into the United States, cannot be re-exported.

    Taxidermist/Broker's signature: _____ Date: _____

11. **If you are the hunter applying to import your own trophy,** please read and sign the following statement.

    I acknowledge that the sport-hunted trophy/trophies to be imported has been/will be personally hunted by me and is being imported only for my personal use (i.e., **not for sale, transfer, donation, or exchange that is reasonably likely to result in economic use, gain, or benefit**). I understand that I may only import two leopard trophies and two elephant trophies within the same calendar year. In addition, I understand that [redacted] United States, cannot be re-exported.

    Applicant's signature: [redacted] Date: 11/13/18

    Be aware that there may be additional permitting or approval requirements by your local or state governments, as well as required by other Federal agencies or foreign government to conduct your propose activity. While the Service will attempt to assist where possible, it is your responsibility to obtain such approval.

All international shipment(s) must be imported through a designated port. A list of designated ports (where an inspector is posted) is available from http://www.fws.gov/le/designated-ports.html. If you wish to use a port not listed, please contact the Office of Law Enforcement for a Designated Port Exemption Permit (form 3-200-2).

SANGO
save valley conservancy

PABST HOLDINGS ZIMBABWE PRIVATE LIMITED

31 October 2018

Replies to questions posed by the US Fish and Wildlife Service for the Male Lion hunted by Mr Frank Cavallo.

For species listed under the Endangered Species Act, please be aware that the U.S. Fish and Wildlife Service must make a finding that your activities will enhance or benefit wild populations of the species involved. While we will communicate with the range country for the species you will hunt or hunted when making the required findings, if you have any information that could support this finding, it would be helpful to our review if you could provide it. Please submit such information on a separate page with your application.

a. *Do you have any information regarding the population status or trend data on the species hunted?* *The male lion was hunted on Sango, a 60'000'Hec property within the Save Valley Conservancy (240'000' Hec) Sango carries a lion population of +/- 80 lion and the Save Valley has a population of 223 lion, these figures from the 2017 predator spoor survey. The lion population in the Save Valley has grown from a population of 40 in 2005 to 223 in 2018 due to good management, and abundant prey populations. The recommended sustainable hunting percentage for male lion is 8%,*
Sango could ask for 6 male lions, in the interests of conservation and sustainable utilisation, Sango normally hunts 2.

b. *In order to hunt, you likely paid for licenses or trophy fees. What were those fees and do you have any information on how those funds were used by either the landowner, community, or government?*

Total fees paid $..... The fees paid to Sango run the property, they help pay; 130 staff of which 44 are game scouts, water pumping and pipe line repairs, fire breaks, infrastructure maintenance etc. Sango also assists 4 local schools that are situated along its boundaries and maintains 9 community boreholes.

c. *Do you have information on other funding activities that are being carried out, or were carried out, by the safari outfitter, professional hunter, concession holder, or land owner that provide a conservation benefit to the species being hunted/species hunted?* *Sango was founded in 1993 and has since grown a sizable population of wildlife ,the property is funded by sustainable use conservation (Hunting). The success of Sango can be measured by the fact that Sango restocked 1300 plains game animals into the Gonarezhou and Zambezi National Parks in 2013 and translocated 100 elephant to the Rifa conservation area in the Zambezi Valley in 2018 due to over populations on Sango.*

Operator Enhancement Questionnaire

v.5/8/18

1. Name of area operator: ZAMBEZI HUNTERS

   a. Years in business: 40 YRS

   b. Name of company conducting hunt: ZAMBEZI HUNTERS

2. Name of concession: SAVUTI Size in km²: 6000

   a. Land tenure: __ Government lease __ Community __ Private ranch (Private conservancy

   b. Length of concession agreement: N/A Can it be renewed? __ Yes __ No N/A

   c. Length of renewal, if applicable: N/A

   d. Estimated total amount received in trophy fees last year, if applicable: $114 200

   e. Are there any special obligations under the concession agreement such as annual reporting, poaching control, community investment, community employment, etc.? If so, please explain:
   STANDARD CONCESSION OBLIGATIONS

   f. Please provide the concession location and nearest city. Please attach a map or maps with the boundaries marked and showing the nearest city:
   BOTSWANA, NEAREST CITY - KASANE INTERNATIONAL

   g. If the concession borders a national park, please provide the park name: N/A

   h. Description of general and distinctive habitat features and any water features:
   SAVUTI MARSH, MOREMI PARK, 9 DAMS IN MARSH

3. Are there any communities living in the concession? __ Yes (No)

   a. If so, estimated number of people or villages in the concession? N/A

4. Are there communities bordering this concession? (Yes) __ No

   a. If so, estimated number of people or villages around the concession? 3500

5. Relevant game populations in the concession:[1]

Species name	Relative Abundance (dense/avg./sparse)	Est. population	3-Year trend (up/ down/ stable)	How monitored?
Elephant	DENSE	550+	UP	AERIAL COUNT
Lion	DENSE	120	UP	" "
Leopard	DENSE	150	UP	" "
Prey species	DENSE		STABLE	" "

6. Total employment number: 130

   a. Please identify the number and type of all employees:

[1] The new FWS import permit application form asks the applicant: "9. a. Do you have any information regarding the population status or trend on the species hunted?"

Type:	Total number of this type	Number of this type who are local/from nearby communities
Professional Hunters	[illegible]	
Trackers	[illegible]	
Anti-poaching scouts/rangers	44	
Other anti-poaching	[illegible]	
Cooks/housekeepers	19	[illegible]
Community coordinators	[illegible]	
Managers	[illegible]	
Biologists	1	
Others:	[illegible]	

7. Number of staff employed in the off-season: [illegible]

   a. Please identify the number and type of staff that are engaged when the season is not open:

Type	Total number of this type	Number of locals/from nearby communities	When employed?
Anti-poaching staff			
Managers			
Maintenance			
Road opening/construction	[illegible]		
Community relations personnel	[illegible]		
Others:			

8. Anti-poaching efforts:[2]

   a. Number of anti-poaching staff: 44

   b. Are anti-poaching patrols conducted during the hunting season, off-season, or both? [illegible]

   c. Months during which anti-poaching patrols are conducted: [illegible]

   d. Number of anti-poaching patrols per month: [illegible]

   e. Description of anti-poaching equipment, vehicles, etc.: [illegible]

   f. Who is responsible for organizing and coordinating anti-poaching from prevention through successful prosecution? [illegible]

   g. Do you offer rewards to poaching informants leading to arrest? (Yes) No

   h. Do you offer rewards to poaching informants upon conviction? Yes (No)

   i. Please describe the company's anti-poaching expenditures below. What currency are the expenditures given in? USD

[2] The new FWS import permit application asks for activities that provide a "conservation benefit" to the species. The FWS considers anti-poaching a "conservation benefit."

Type of expense	Spending 2015	Spending 2016	Spending 2017	Remarks
Salaries for anti-poaching scouts			11 600	
Equipment			11 000	
Vehicles			NIL	
Petrol Diesel			12 120	
Rewards paid			3 000	
Other:				
Other:				
TOTALS			147 520	

9. Anti-poaching results:

Category	2015	2016	2017	Remarks
Poaching incidents discovered			16	
Elephant carcasses observed			NIL	
Lion carcasses observed			NIL	
Leopard carcasses observed			NIL	
Ivory poachers arrested			NIL	
Meat poachers arrested			16	
Other poachers arrested			NIL	
Poachers convicted			16	
Snares/gin traps collected			NIL	
Firearms confiscated			NIL	
Vehicles confiscated			NIL	
Bicycles confiscated			NIL	
Boats/nets confiscated			NIL	
Tusks recovered			NIL	
Other:				

10. Community investment:[3]

a. Does the company contribute money or goods/services to local communities? (Yes) ___ No

b. If so, what percentage or amount is shared, how often, and why (e.g., required by law, required by contract, voluntary contribution)? [illegible]

c. Does the company provide game meat to nearby communities? ___ Yes ___ No

d. If so, please estimate the amount and/or value of meat contributed in prior year and describe the meat contribution program: [illegible]

e. If the company performs problem animal activities for surrounding communities (e.g., patrolling fields during the harvest, chasing away problem animals, conducting PAC hunts or PAC killings), please describe. NIL

[3] The new FWS import permit application asks for activities that provide a "conservation benefit" to the species. The FWS considers community investment a "conservation benefit."

f. Please describe any consolation payments made to local residents damaged by game species. What currency are the expenditures reported in? _____

Species	Damage caused	Consolation paid 2015	Consolation paid 2016	Consolation paid 2017
Elephant				
Lion				
Leopard

RE: PRT No. 16345D / Frank Cavallo / Lion Trophy / Zimbabwe

Dear Chief Cogliano:

This is a supplement to our existing application, PRT No. 16345D for a lion trophy import from Zimbabwe for Frank Cavallo.

Please note the GPS Coordinates are: -20.24392, 32.03735
The nearest town is: Masvingo, in the Bikita Concession.

Documents show that the hunting is well managed and governed by science-based quotas and age-based regulation on lawful trophies. Further, the hunting revenues mitigate the three primary threats to lion identified by the U.S. Fish and Wildlife Service by creating incentives to secure habitat, protect lion and their prey base through extensive anti-poaching, and reduce conflicts through benefits for rural communities. Please consider this and the attached documents (listed below) in making a positive enhancement finding for this lion permit.

- Conservation Status for the African Lion in Zimbabwe
- Sport- Hunting and Lion *Panthera leo* Conservation in Zimbabwe

PRT No. 16345D

Please do not hesitate to contact us if you have questions about this permit application.

Sincerely,

John J. Jackson III

SUMMARY OF STEPS TAKEN BY ZIMBABWE TO IMPROVE THE MANAGEMENT OF LION SPORT-HUNTING

i – Banning of all lioness hunting in Zimbabwe

ii – Hunting moratoria around the Gonarezhou and Hwange National Parks

iii – Removal of fixed hunting quotas

iv – Age restrictions on sport-hunted lions

v – Scientifically-based adaptive quota management system

SUMMARY OF LION SPORT-HUNTING'S CONTRIBUTION TO CONSERVATION

i – Lion sport-hunting contributes 33.9% to 42.4% of total revenue on private land

ii – Lion sport-hunting generates up to US$ 557 km^{-2}

iii – Anti-poaching (in particular that of rhinoceroses) costs ~US$ 216 km^{-2}

INTRODUCTION

THE United States Fish and Wildlife Service (USFWS) have recently evaluated the conservation status of the lion *Panthera leo* with particular regard to sport-hunting (http://www.fws.gov/endangered/what-we-do/lion.html [accessed 2015-01-19]). The results of this evaluation have led to the formal protection of two subspecies under the Endangered Species Act, classifying *P. l. leo* as endangered and *P. l. melanochaita* as threatened. Together these subspecies apparently represent all of the lions in Africa (Barnett et al. 2014).

Sport-hunting is a legal activity in which the international import/export of trophies is both sanctioned and carefully controlled by the Convention on International Trade in Endangered Species of Wild Fauna and Flora (CITES). The USFWS found that the sport-hunting of *P. l. melanochaita* "*if well managed, may provide a benefit to the subspecies*" (http://www.fws.gov/endangered/what-we-do/lion.html [accessed 2015-01-19]). Here we explore this statement further, and present data from three long-term *in situ* lion research projects; the Bubye Valley Conservation Research Initiative, Savé Val-

ley Conservancy Research, and the Hwange Lion Research Project.

The data presented in this report clearly illustrates the positive conservation benefit that well-managed trophy hunting of lions can have for the species, as well as the importance of hunting in maintaining the wildlife in an area; addressing Point 5 on page 3 of the Federal Fish and Wildlife Permit Application Form (Form 3-200-20) [i.e. "*Please be aware that the U.S. Fish and Wildlife Service must make a finding that your activities will enhance or benefit wild populations of the species involved. If you have any information that could support this finding (e.g., population status or trend data; how the funds from license/trophy fees will be spent; what portion of the hunting fee will support conservation), please submit such information on a separate page with your application*"].

Figure 1: The lions pictured here, known as Winston (*standing*) and Geronimo (*lying*), were both collared in March 2012 when they were the dominant males in the Matombosa area and have been continuously monitored ever since as part of the on-going long-term WildCRU Bubye Valley Conservation Research Initiative. In November 2015 Geronimo, who was approximately 9 years old, died after succumbing to injuries sustained from fighting with another male. Winston, also 9 years old, has since lost his dominant status, lost his territory to two 4.5 year old males, become nomadic and avoids contact with other males. As of this report being written, the recent litter of cubs that both Winston and Geronimo sired are still alive.

Most importantly, since July 2013 there has been a continuous self-imposed internal reform of the lion hunting industry in Zimbabwe that is actively participated in and supported by all of the relevant stakeholders, including; the Zimbabwe Parks and Wildlife Management Authority (ZPWMA), non-governmental organisations, professional hunters, safari operators, scientists and researchers.

Here we discuss the results of this process in terms of robust evidence regarding the sustainability and self-regulation of lion hunting in Zimbabwe.

Figure 2: Winston and Geronimo's cubs.

LIONS – *Panthera leo*

The IUCN Red List have recently reclassified lions as Vulnerable (remaining as such since 1996; IUCN 2015), estimating that there are between 20,000 and 30,000 free-ranging lions left (Bauer et al. 2015a) in less than 25% of their historic range (IUCN 2006). However, this generalised classification does not take into account an apparent conservation dichotomy: sample subpopulations of lions in Botswana, Namibia, South Africa and Zimbabwe have in fact increased overall (Bauer et al. 2015a). Lions were historically present throughout Africa, some of Europe, the Middle East and Asia (Bauer and Van Der Merwe 2004), but current conservation strongholds remain only in parts of eastern

and southern Africa (Brassine and Parker 2012; Nowell and Jackson 1996). The current lion population estimate for Zimbabwe's major lion areas is approximately 2,600 individuals [Hwange-Matetsi Complex: 750, South Eastern Lowveld: 350, Gonarezhou National Park: 60, Malilangwe: 37, Savé Valley Conservancy: 284, Bubye Valley Conservancy: 500, Mid-Zambezi Valley Complex: 600], though the actual number would be larger if there were data available for the countries minor lion areas that are yet to be surveyed] (ZPWMA 2015).

The lion is a uniquely social felid, forming coalitions of up to nine males associated with one or more female prides that may consist of more than 20 individuals (Macdonald et al. 2010; Schaller 1972). Lions are infamously infanticidal (Schaller 1972), where males will kill unrelated cubs so as to bring the female into oestrus and present an opportunity to sire their own litter, which is often used as an argument against sport-hunting of the species (e.g. Packer et al. 2010), where it is feared that the removal of dominant males causes cub mortality that eventually results in lowered population recruitment and survival (Packer et al. 2009). Infanticide, however, does not result from sport-hunting when age-appropriate males, past their prime and no longer territorial or with dependent cubs, are harvested (Whitman et al. 2004). Moreover, the fission-fusion nature of lion society (Mosser and Packer 2009; Pusey and Packer 1987) means that infanticide may still occur where the dominant males are simply not present there and then to defend their cubs (B. du Preez, pers. obs.).

In the 1990's, lions were successfully reintroduced into private areas in parts of their former range, where they achieved high reproductive and survival rates (Miller and Funston 2014). However, the resultant population growth inevitably led to the potential problem of overabundance (Funston 2008) and low genetic diversity (Trinkel et al. 2010), with both of these issues requiring active and intensive management (Hunter et al. 2007) and ultimately reducing the conservation value of these lion populations (Miller and Funston 2014). The ability to translocate lions originally facilitated the relief of overpopulation, but as the available areas for relocations were used up, sport-hunting and euthanasia have subsequently become the main methods of lion population control (Miller and Funston 2014).

The lion is the apex predator wherever it occurs (Macdonald et al. 2010), and is an ideal conservation umbrella; being large, charismatic and easily observable (e.g. Williams et al. 2000). Lions are important to commercial wildlife ventures, which risk losing significant market share where they cannot offer them to clients (Lindsey et al. 2007), and are thus prioritised in conservation; exploiting their charisma to attract tourists and raise the funds required in ensuring that wildlife areas remain viable. The lion is also a particularly valuable species in the sport-hunting industry, rivalled only in demand by buffalo *Syncerus caffer* and leopard *Panthera pardus* (Creel and Creel 1997), and are therefore prevalent in private wildlife areas (Packer et al. 2013) where their populations can achieve exponential growth rates given the protection and resources afforded by well-managed operations (Smuts et al. 1978; Loveridge et al. 2007b; Kettles and Slotow 2009; Miller and Funston 2014).

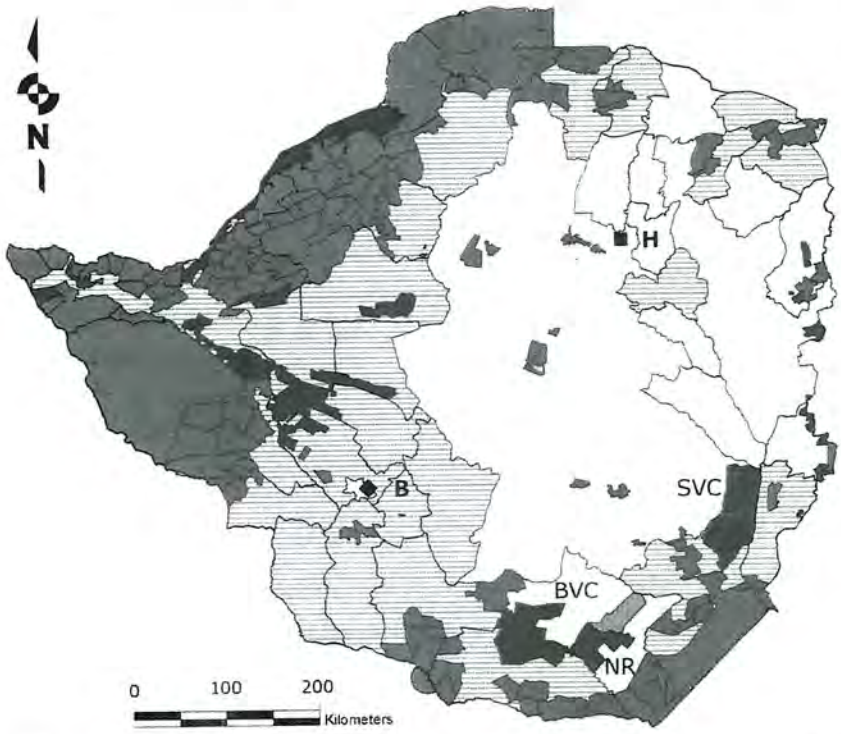

Figure 3: Map of Zimbabwe's main wildlife areas: [*i*] National Parks are represented in light blue; [*ii*] Safari areas are represented in orange; [*iii*] Forestry areas are represented in dark green; [*iv*] Community and Private wildlife areas are represented in light green; [*v*] Communal Land (CAMPFIRE Areas) in which sport-hunting may occur is represented by light green horizontal stripes; [*vi*] Communal Land in which sport-hunting does not occur is represented by grey vertical stripes. [*vii*] The Bubye Valley [BVC] and Savé Valley [SVC] Conservancies are represented in red. [*viii*]The Nuanetsi Ranch [NR] on which sport-hunting takes place is represented in dark purple (light purple represents the Nuanetsi Ranch cattle area); [*ix*] Lake Kariba is represented in dark blue. Harare (the capital city) is represented by a black square and letter 'H'. Bulawayo is represented by a black diamond and letter 'B'. Sport-hunting may occur in areas: *ii, iii, iv, v, vii & viii*

The ability of lions to rapidly increase in abundance is an aspect of their ecology that is often overlooked. Lion populations can achieve exponential growth rates (Miller and Funston 2015; Groom and Watermeyer 2015; du Preez et al. in prep.), and the problems associated with high lion densities fast present themselves and require significant investment in their solution (Hunter et al. 2007; Kettles and Slotow 2009; Loveridge et al. 2007; Packer et al. 2013; Smuts 1978). Whilst unregulated sport-hunting of lions (in particular that of dominant males and pride females) may result in population declines (e.g. Packer et al. 2010; Packer et al. 2009), restricting offtake to only males over

a certain age (i.e. have already bred and/or are no longer dominant) has no impact on lion population persistence, irrespective of quota size (Whitman et al. 2004). Such is the situation currently facing both the Bubye Valley and Savé Valley Conservancies, where the lion populations continue to grow despite sport-hunting and increasing quotas. Whilst sport-hunting may not alleviate over-population in these areas, it does somewhat offset the cost of keeping lions. Culling of lions may be the only realistic option for controlling numbers in larger areas, as the use of contraceptives is likely to be inefficient and expensive. Because of fears about public sentiment associated with sport-hunting, it has now become common practice for managers to cull excess lions in more than 45 wildlife areas in South Africa to which lions have been introduced and which resulted in the wasteful destruction of about 200 lions in 2012 (Miller and Funston 2014).

CONSERVATION AND SPORT-HUNTING

There is more land area in Africa conserved for hunting than there is in all of Africa's formally protected areas combined: approximately 1.4 million km^2, which exceeds the total area covered by national parks by 22% (Lindsey et al. 2007). For wildlife conservation to be successful outside of national parks, these areas must be self-sufficient and able to generate sufficient revenue to cover the considerable costs of protecting the habitat and wildlife therein (Lindsey et al. 2006). Indeed, conservation would benefit from an incentive to utilise land for wildlife rather than the alternatives of livestock grazing, agriculture, and deforestation.

The international trade of lions, including trophies, is controlled by a strict CITES licensing system on the basis that this trade does not endanger the ultimate survival of the population (https://www.cites.org/eng/disc/how.php [accessed 2015-01-19]). The positive aspects of sport-hunting as a conservation tool include a focus on males and a low percentage off-take; neither of which generally jeopardise populations, and also suggest that hunting could play a role in population recovery (Leader-Williams et al. 2005).

The recommendation of setting uniform harvest limits, e.g. 1 lion 2,000 km^{-2} (Lindsey et al. 2012; Packer et al. 2010), may be overly simplistic, affect the economics of wildlife based landscape use, and disincentivise investment in conservation (Lindsey et al. 2007). A more practical approach to sustainably setting realistic lion sport-hunting quotas could involve using a positive/negative feedback method that calculates a fluid quota per area based on the previous season's performance. Such an adaptive quota management system has already been implemented in Zimbabwe.

ZIMBABWE'S ADAPTIVE LION QUOTA MANAGEMENT SYSTEM

An adaptive quota management system for lion hunting based on the ages of lions hunted was agreed on in July 2013 in Harare, Zimbabwe, during a meeting hosted by the Zimbabwe Parks and Wildlife Management Authority (ZPWMA) and an independent non-governmental conservation organisation. The points system is summarised in Table 1.

Table 1: *Points allocated to hunting blocks arising from the harvest of lions of different ages*

	≥ 6 years	No trophy	5 years old	4 years old	< 4 years	Failure to submit return, or incomplete return
For quotas of ≥3	4	3	3	2	-3	0
For quotas of 2	4	3	3	2	0	0
For quotas of 1	6	3	3	2	0	0
Resultant quota	*These points are added up and divided by 3 to yield the quota for next year*					

During 2013, operators were requested to submit hunt returns and photos as a trial run to get the system up and running. In 2014 operators were requested to do the same but were informed that the age of the lions hunted in 2014 would determine their lion quotas in 2015. The 2015 lion hunt results would thus also determine the 2016 quota.

Results of the Adaptive Lion Quota Management System

In 2015 there was a marked increase in the age of lions hunted in Zimbabwe as a whole. Notably, only one lion of <4 years of age was hunted and the large majority of lions were 5 years or older (Figure 4). In 2013, only 28% of the lions hunted were 5 years or older, in 2014 that figure had risen to 49% and in 2015 to 77.3% (Figure 5). The proportion of lions hunted that were less that 5 years of age dropped overall between 2013 and 2015 (Figure 6). For this achievement, credit is due to the hunting community for showing greater selectivity of harvest. A word of caution however, is that the majority of lions hunted were on the cusp of 5 - 6 years of age and were not older than six years. Restricting hunting to individuals that are at least six (and preferably older) is desirable from a biological perspective due to the reduced risk of the loss of pride males and infanticide of cubs associated with the harvest of such individuals (Whitman et al. 2004).

In 2015 the Zimbabwe national lion hunting quota was set at 85 lions. Of this 85, only 39 were hunted in 2015, and based on the resultant score from aging the trophies, and the fact that operators chose not to hunt lions of inadequate age (see Figures 4, 5 & 6), the recommended quota for 2016 was set at 75 [Harare 2015-11-11]. (The Rural District Council areas in which lions occur are currently exempted from the age restrictions, as was agreed upon at the 2013 lion management meeting in Harare, as a means of ensuring that impoverished communities obtain the opportunity to benefit from the presence of lions, recognising the potential negative impacts the species has on the livelihoods of livestock farmers).

Using these figures and estimating the average value of a lion safari at approximately US$ 80,000 then a 50% offtake (35 lions) would generate US$ 2,800,000 annually. If management costs are approximately $150 km^{-2} (V. Booth, pers. comm.), then the lion safaris alone can support 18,600 km^{-2} of wildlife habitat in Zimbabwe.

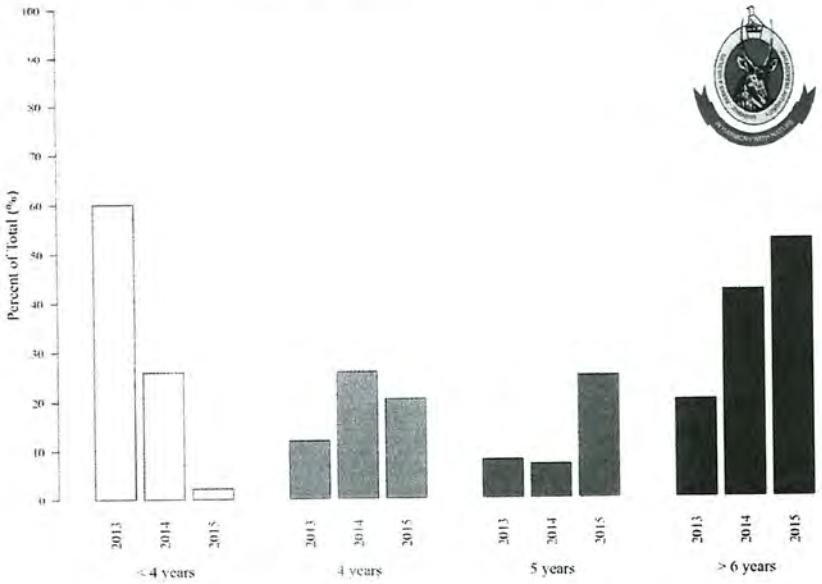

Figure 4: The percentage of lions hunted in each age class in 2013, 2014 and 2015 in Zimbabwe.

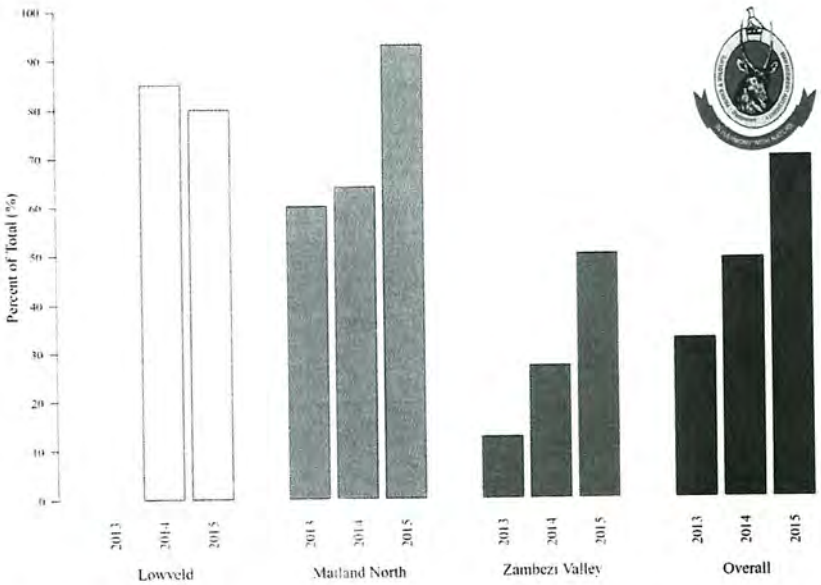

Figure 5: The proportion of lions hunted that were 5 years or older in the three main lion-hunting areas of Zimbabwe.

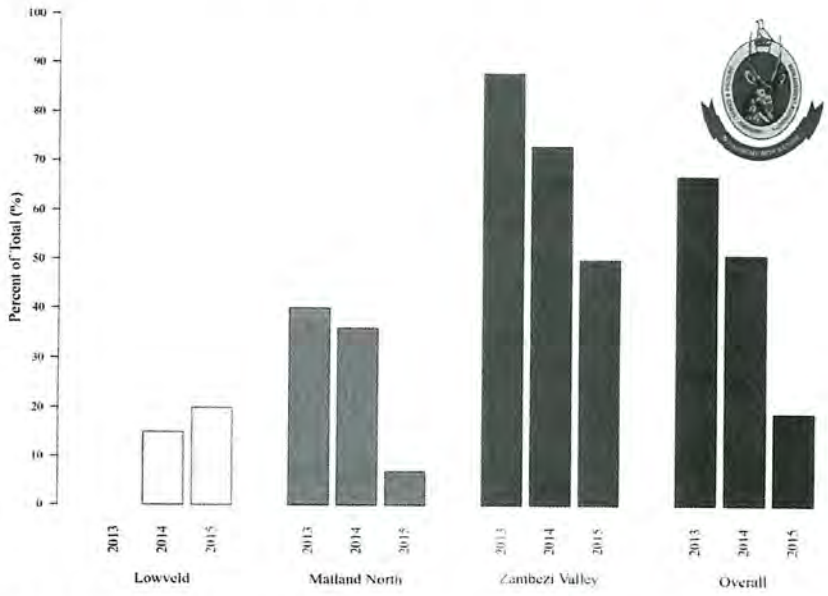

Figure 6: The proportion of lions hunted that were less than 5 years of age in the three main lion-hunting areas of Zimbabwe.

Table 2: *Human and Lion Conflict (2009 - 2011) in Zimbabwe, including human mortality caused by lion (CAMPFIRE Association, 2012)*

Mbire	5	7	*0*	*5*
Binga	9	39	*0*	*0*
Total	**44**	**183**	***2***	***7***

Human-Lion Conflict

The lion is a flagship species and powerful symbol of Africa; yet living with lions poses hardships for many communities (e.g. Table 2). In some areas, the lion is a major predator on domestic livestock, inevitably leading to conflicts with local herders. Both sides suffer in this situation.

Outside of protected areas, the lion's prey base is much reduced, which results in relatively greater chance of encountering livestock. Co-existence of lions with people may be enhanced by giving value to lions through tourism and hunting promoted in communal lands under the Communal Area Management Programme for Indigenous Resources (CAMPFIRE). This hunting contributes to the conservation of lions via the financial revenue generated, which is ploughed back into conservation of the resource and empowers local communities to invest in their own rural development programs.

THE BUBYE VALLEY CONSERVANCY

History of the Bubye Valley Conservancy

Towards the end of the nineteenth century, the Liebig's Extract of Meat Company (LEMCO) founded an extensive cattle ranch in the Zimbabwean lowveld, to the detriment of the indigenous wildlife that was initially eliminated because of competition for grazing with the livestock, as well as a risk of disease transmission from buffalo and wildebeest *Connochaetes taurinus*. As their natural prey base became depleted, the predators were subsequently persecuted when they began to prey on the livestock. Some wildlife persisted in small pockets of remote habitat, however lion, elephant *Loxodonta africana*, buffalo and rhinoceros *Diceros bicornis* [black] & *Ceratotherium simum* [white] were all completely eradicated. A monoculture of cattle dominated the landscape and impacted on the environment for the better part of a century.

Then, in 1992, Zimbabwe suffered one of the worst droughts on record, a relatively short time after the devastating one of 1983 that LEMCO was still trying to recover from. The frequency and severity of the droughts effectively reduced confidence in the economic viability of cattle ranching in the area, and the Bubye Valley Conservancy was subsequently founded in 1994 with the realisation that endemic wildlife, which are better adapted than livestock to cope with the local climate, could be successfully commercialised (Child 1988; Bond 1993).

The conversion from cattle ranching back to a wildlife area was neither straightforward nor cheap, requiring a significant initial investment and annual running costs. In just 20 years of operation the Bubye Valley Conservancy now protects the world's third largest black rhinoceros population, one of Zimbabwe's largest lion populations, a large and increasing elephant population, and abundant game.

Sport-hunting is an essential step in converting areas that were previously dedicated to livestock farming into non-consumptive tourism areas (Child 1993), and was fundamental to the formation of Bubye Valley Conservancy and allowing the wildlife populations to recover. The Samanyanga area of the Bubye Valley Conservancy, probably the most scenic section, was originally set aside for non-consumptive photographic tourism, but made an annual loss for several years, before, largely due to Zimbabwe's land reform program and resultant instability in the country, it was reverted back to sport-hunting as the only practical and economically viable option (K. Leathem, pers. comm.). Sustainable sport-hunting provides the sole economic incentive to continue operating the Bubye Valley Conservancy as a wildlife conservation area.

Bubye Valley Conservancy Community Support

The Bubye Valley Conservancy donates over 45 tonnes of meat from sport-hunting to the local communities each year. This meat donation is worth over US$ 100,000 per year, and the communities are free to decide how they use it. In addition to this, the Conservancy also supports several schools, clinics, and community projects in the three surrounding districts of Mwenezi, Maranda and Jopempe. The local community thus

sees a direct benefit from the wildlife on the Bubye Valley Conservancy, but is also empowered by job opportunities created both with these special projects, as well as on the Conservancy. A summary of the Bubye Valley Conservancy community support effort between 2011 and 2015 is provided in Table 4.

Bubye Valley Conservancy Lion Monitoring and Management

After originally being eradicated by cattle ranchers in the area, 13 lions were reintroduced to the Bubye Valley Conservancy in 1999, and four young males broke into the Conservancy that same year. From the original 17 animals present in 1999, the Bubye Valley Conservancy lion population was estimated at approximately 280 individuals in 2009 when robust population surveys were initiated by a research team from the University of Oxford Wildlife Conservation Research Unit (WildCRU), and this population has continued to grow. Today it is estimated that there are over 500 lions on the Bubye Valley Conservancy (du Preez et al. 2015). The exponentially increasing Bubye Valley Conservancy lion population currently exists at one of the highest densities in Africa (~0.187 lions km^{-2}: du Preez et al. 2015; Figure 7), greater than that of the Serengeti, Tanzania (0.100 lions km^{-2}: Pusey and Packer 1987; Spong 2002), Selous, Tanzania (0.080 - 0.130 lions km^{-2}: Creel and Creel 1996, 1997), Kruger National Park, South Africa (0.096 - 0.112 lions km^{-2}: Mills 1995), and Hwange National Park Zimbabwe (0.027 lions km^{-2}: Loveridge et al. 2007). This equates to one of the largest contiguous lion populations in Zimbabwe.

Bubye Valley Conservancy Lion Hunting

The Bubye Valley Conservancy offsets the cost of lion predation on its wildlife via sport-hunting of the species, and which began in 2002. In 2014, the lion hunting quota allocated to the Bubye Valley Conservancy by ZPWMA was 10 individuals. Based on the fact that the entire quota was harvested and that maximum points were scored for each individual trophy (more than six years in age), the allocated quota was raised to 13 lions for 2015. Only 12 out of 13 lions were hunted in 2015 due to a late cancellation. Nevertheless eight lions over six years old and four lions of five years old were harvested and the resultant points justifying a quota of 15 lions for 2016.

Table 3: *The Bubye Valley Conservancy annual lion hunting quota and offtake from 2002 to 2015.*

	2002	2003	2004	2005	2006	2007	2008	2009	2010	2011	2012	2013	2014	2015

Quota taken	1	2	3	2	2	2	2	3	5	8	12	10	10	12
Percentage success	100	100	100	100	100	100	67	100	100	100	100	100	100	92

Note that while the lion hunting quota for Zimbabwe has been voluntarily reduced by the national steering committee, the Bubye Valley Conservancy lion hunting quota has been successively raised twice based on both hunt success and age of lions hunted and the resultant points scored under the national adaptive quota management system (Table 3).

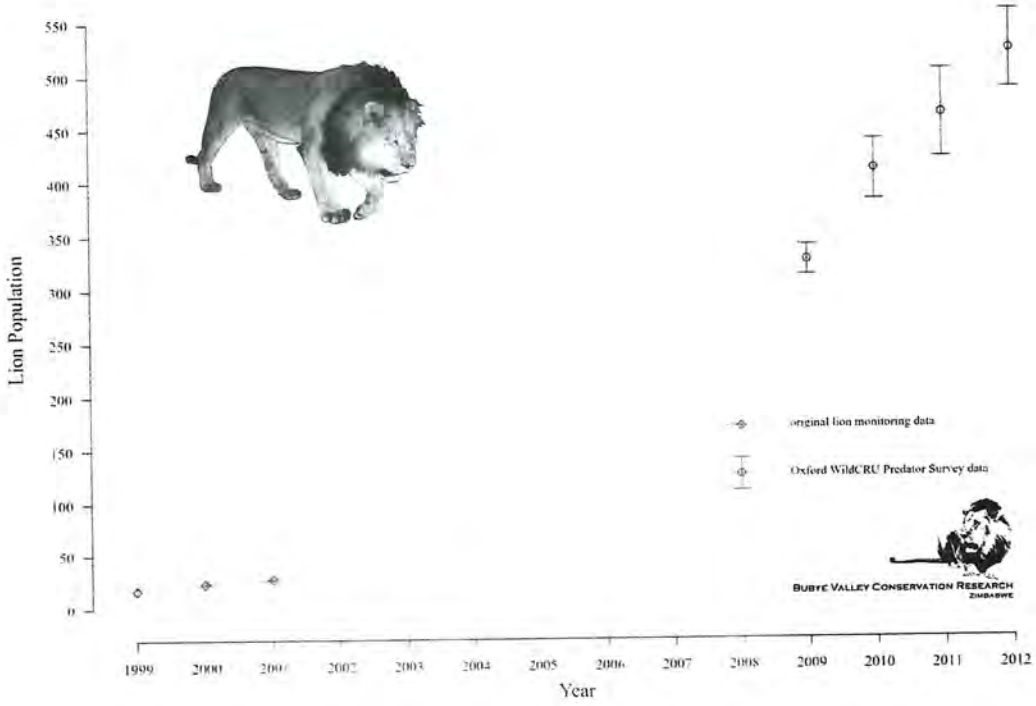

Figure 7: The Bubye Valley Conservancy lion population has grown exponentially since the reintroduction of lions in 1999. Diamonds represent the known lion abundance from monitoring of the original individuals introduced; Points indicate lion abundance calculated from spoor transect analyses; error bars represent the standard error of the mean.

Table 4: *Summary of the Bubye Valley Conservancy support to the surrounding local communities (2011 - 2015)*

Boreholes:	- 1 x Jompembi Village 2 - 1 x Penemene - 1 x Jompembi Village 4 - 1 x Nyimani village (Mwenezi) - 1 x Driehoek School - 1 x Mgaladhivha School - 2 x Mtetengwe to supply water to the clinic site - 2 new bush pumps (complete) purchased and installed at Village 2 & Village 3 and troughs built at both sites *Drinking trough for cattle built at Village 2 borehole* *All boreholes equiped with new bushpumps, piping and cylinders* *Boreholes at Village 3, Mtetengwe, Mdzwiti, Vumani and Penemene and Makado Police post repaired and maintained* *All new piping and pumps etc. are supplied by BVC*
Buildings:	- Mtetengwe Clinic's main building built - 3 x F13 staff houses built *Clinic and House fenced - everything funded and built by BVC* *The clinic is a standard large Government clinic - male & female wards + maternity ward and outpatients* *Storerooms, offices etc. also built* *All houses and buildings are electrified, painted and supplied with running water* - Mtetengwe School school office block and staff room built and painted *All classroom windows repaired and the schools second borehole repaired.* - Secure engine house was built at the second borehole site - Borehole equipped with BH15S mono pump unit driven by a rebuilt Lister LT 1 engine - 5000 litre header tank and stand erected - new 5000 litre header tank purchased and fitted - pipeline laid to connect the borehole to the clinic - another pipeline connected to the same borehole to supply the Mtetengwe school with fresh water - New coldroom and refrigeration unit purchased and fitted at the Lutumba butchery *Part of aid program to get the Beit Bridge RDC self funding projects up and running* - New coldroom and refrigeration unit was purchased and fitted at the Rutenga butchery *Part of aid program to get the Mwenezi RDC self funding projects up and running*
Meat Donations:	- BVC donates meat on a regularly basis to the Mwenezi Orphange - Numerous donations of meat were made to support school sports days & speech nights/prize giving events *Both Beit Bridge & Mwenezi districts* - 1600 kgs of meat has been donated each month since July 2011 to a Maranda trust *Administered by Chiefs andlocal headmen* *Excess meat sold and funds used for community projects* *Classroom roof replaced at Vhongwe school* *4 new classroom blocks constructed at other schools using funds from these monthly allocations* - 1000 kgs of meat per month is been donated to Beit Bridge communities since April 2014 - 1000 kgs of meat per month is been donated to Mwenezi communities since August 2013
Miscellaneous:	- Sports uniforms for the Penemene school team purchased ($2600) *Sports uniforms required for inter-schools sports* - Transport the soccor teams representing Mgaladivha, Jompembi and Tongwe *To Lutumba for the inter-school competitions* - 2 sets of soccer goal posts & 2 sets of Netball poles were made for Mgaladivha School *New soccer field graded by BVC* - 2m security fencing supplied to Penemene School - Second hand door and window frames donated to Mapiri school (ex Mazunga School) - 1 new 3 1/2 " rod pump cylinder was purchased and fitted to the Vumhani borehole *All repairs to b/holes in the Vumhani area are done by BVC* - 26 bags of cement were donated to Mgaladivha School - Fencing donated to the Mgaladivha School - Supplied 10 x 5/8" mono shafts for the Botalele Clinic (Maranda) borehole - Water supply to Mlelezi Clinic - 400 m pipeline laid to supply the Nyimani Villarge's cattle with water *3.5 m drinking trough build for this same project* - 60 bags cement donated to the Welkom for repairs to a dam wall - 6 loads of riversand and 20 cement donated to Vumani Preschool - Various school renovations in both the Beit Bridge and Maranda areas
Current Projects:	- Construction of a School admin block at Mgaladhivha School - Supply of 24 loads of riversand to Mdzwiti School (value $1200) - All roofing materials supplied to Mdzwiti School - Supply roofing materials, cement, all window and door frames for Vumani Preschool

THE SAVÉ VALLEY CONSERVANCY

History of the Savé Valley Conservancy

The Savé Valley was a wildlife-rich wilderness until the early 1900's, when the first cattle ranching initiatives started in the area. The establishment of Devuli Ranch and Angus Ranch in 1920 paved the way for seven decades of commercial cattle ranching in the area we know today as the Savé Valley Conservancy. Roads were cut, fences erected and an everlasting 'battle' ensued against the wildlife, especially against all predators.

The large predators, especially lions, were virtually eradicated (Pole 1999). However, by the late 1980's, declining range productivity, depressions and droughts forced the landowners to consider alternative options. Around that time, empirical evidence of the competitive advantage of wildlife over livestock began to emerge (Child 1988; Bond 1993), especially in arid areas (Jansen et al 1992; Cumming 1993), and wildlife was finally given serious consideration as a viable land use option.

In 1989, a proposal was drawn up (du Toit 1989) to turn what was then the Sabi Valley Intensive Conservation Area into a wildlife conservancy. The plan was to create a single large wildlife area, especially for the re-establishment of endangered species and overexploited species, with cattle remaining the primary income generator. The Savé Valley Conservancy was constitutionally inaugurated in June 1991, and following the severe 1991/1992 drought, wildlife ranching became the primary land-use. At the time this was the largest private wildlife conservancy in the world (3,410 km^2).

The conservancy members then restocked the wildlife, removed all internal fencing, erected a common perimeter fence and developed effective security systems. A double, electrified, veterinary-approved fence was completed in 1995, and the following decade saw a massive investment in wildlife re-stocking and security systems.

Sport-hunting was essential for the successful transition of the conservancy from cattle to wildlife. During the early years, wildlife densities were low, resulting in poor potential for ecotourism, and hunting generated the income needed to erect the fence, re-stock game, and improve security, especially because of the significant numbers of black rhinoceros now found there. Gradually, some of the ranchers shifted more into ecotourism. One property, Senuko Ranch, completed a 16 bed up-market lodge with a view of marketing non-consumptive safaris, offering game drives and bush walks and specializing in rhino walks and African wild dog *Lycaon pictus* den visits. Lodge occupancy rose from 0% in 1996 to 62% by the end of 1999.

However, the Zimbabwean land reform program, which was initiated in February 2000, soon made a strong negative impression in the international community, and resulted in travel bans and warning from most of Zimbabwe's source markets. This, together with the political instability meant that the wildlife industry and ecotourism industry collapsed over-night: sport-hunting became the only economically viable land use option, and has remained the only tangible source of income to the landowners of the Savé Valley Conservancy. In the case of the Senuko Lodge, for example, the land reform program resulted in a 98% cancellation of

the confirmed bookings. After four years of seeking alternative markets, the lodge could achieve no higher than 17% occupancy, and in 2005 moved back into a hunting-based operation.

A more direct impact of the land reform program for the Savé Valley Conservancy was the loss of 33% of the area of the conservancy to invading subsistence farmers (Lindsey et al 2008). The loss of land was catastrophic and the related pressure from wire snare poaching was extreme. In the following eight years (2001 to 2009), 10,520 illegal hunting incidences were recorded, 84,396 wire snares were removed and at least 6,454 wild animals killed (Lindsey et al. 2011).

Savé Valley Conservancy Community Support and Anti-Poaching

In 2012, conservancy members provided over US$ 100,000 worth of support to adjacent villages or farmers in the resettled areas. Assistance included drilling boreholes, maintaining boreholes, dredging of dams, assisting with building projects in clinics and schools, assisting with repairs, maintenance and materials at schools, education initiatives, school field trips, provision of computer equipment in schools, craft programs and regular donations of meat.

Moreover, the conservancy recently entered into a mutually dependent agreement with the Chiefs representing the communities surrounding the Savé Valley Conservancy. The agreement links the communities to the Natural Resource Utilisation that occurs through the business operation of the conservancy and opens up opportunities for the local indigenous populations to share in any wealth creation. This agreement strengthens relations between the conservancy and the surrounding local communities and creates an environment that helps to protect, conserve and sustain the natural assets of the area. The hunting tourism of the conservancy is currently the only form of income by which the surrounding communities can benefit. Revenues from trophy lion hunting constitute a significant portion of income and thus an important part of the community benefits. Any reduction would seriously jeopardise the growth of this infant positive relationship and community empowerment initiative.

The Savé Valley Conservancy is thus pioneering private-community partnerships in Zimbabwe, and trade restrictions on lion trophies will indirectly adversely affect these already seriously impoverished communities through a reduction in available income to share with communities. This is very likely to have a knock on impact on the lions themselves with a significantly reduced tolerance and an increase in retaliatory poisoning of lions for livestock predation. Without a demonstration of income from lions, the political pressure from the surrounding communities to remove them from the conservancy altogether will be a challenge to resist.

Savé Valley Conservancy Lion Monitoring and Management

After the Conservancy was formed, and persecution stopped, lions, mainly males, recolonized the area and their numbers started to increase in the late 1990's / early 2000's. Few lionesses were observed until 2003, when small family groups and male-female pairs were seen, and by 2004 - 2005 there were some reports of cubs. During this period 13

lions were also reintroduced into the Savé Valley Conservancy. After an initial lag phase the lion population on the Savé Valley Conservancy has increased dramatically and at present is growing exponentially (Figure 8; Groom and Watermeyer 2015).

Monitoring of the lion population began in 1999 (Pole 1999) with track index or call-up surveys being conducted sporadically until 2006. From 2007 to present, annual conservancy-wide track index surveys have been conducted using a standardized methodology (Groom and Watermeyer 2015). The resulting population estimates were verified in 2011 by a baited lion call-up survey and a collation of managers' estimates, all of which provided similar results.

Prey availability models (Hayward et al. 2007) suggest that the carrying capacity for the lion population in the Savé Valley Conservancy is approximately 270 lions. The population estimate for 2015 was 284 lions, suggesting lions have reached their ecological carrying capacity, even whilst being responsibly hunted.

A professional lion management plan was commissioned by the conservancy in 2011 (Funston 2011), to provide the Savé Valley Conservancy members with a science-based plan to help them ethically and sustainably manage their lion population. This plan specifically advocates the use of hunting as a conservation management tool. It also demonstrates willingness by the conservancy to guide their lion management based on science and advice from professionals.

Savé Valley Conservancy Lion Hunting

Lions have been hunted in the Savé Valley Conservancy since 2002, although that was largely for removal of problem animals. Hunting began properly in 2005 with quotas increasing annually to a maximum of seven per year from 2009 onwards (Table 5), with the quota being raised to ten for 2016 based on trophy ages.

Despite offtakes of lions through sport-hunting, the lion population has continued to increase in the Conservancy. The revenue generated from hunting lions has enabled landowners to invest in proper land management, anti-poaching, water provision and fence maintenance, all of which benefit the lion population (especially as lions seem to be vulnerable to being caught in wire snares; Becker et al 2013; R. Groom, pers. obs.).

Table 5: *The Savé Valley Conservancy annual lion hunting quota and offtake from 2002 to 2015.*

	2002	2003	2004	2005	2006	2007	2008	2009	2010	2011	2012	2013	2014	2015
Approved quota	5	5	1	3	3	4	6	7	7	7	4	2	3	5
Quota taken	1	0	1	3	3	3	3	6	5	3	4	1	3	5
Percentage success	20	0	100	100	100	75	50	86	71	43	100	50	100	100

Sport-hunting of lions brings considerable revenue to the Conservancy, revenue that is vital for the continued functioning of the area for wildlife conservation. Without the costs of lions being offset by the income from sport-hunting, landowners cannot reasonably be expected to tolerate such high lion densities and their numbers would have to be reduced significantly.

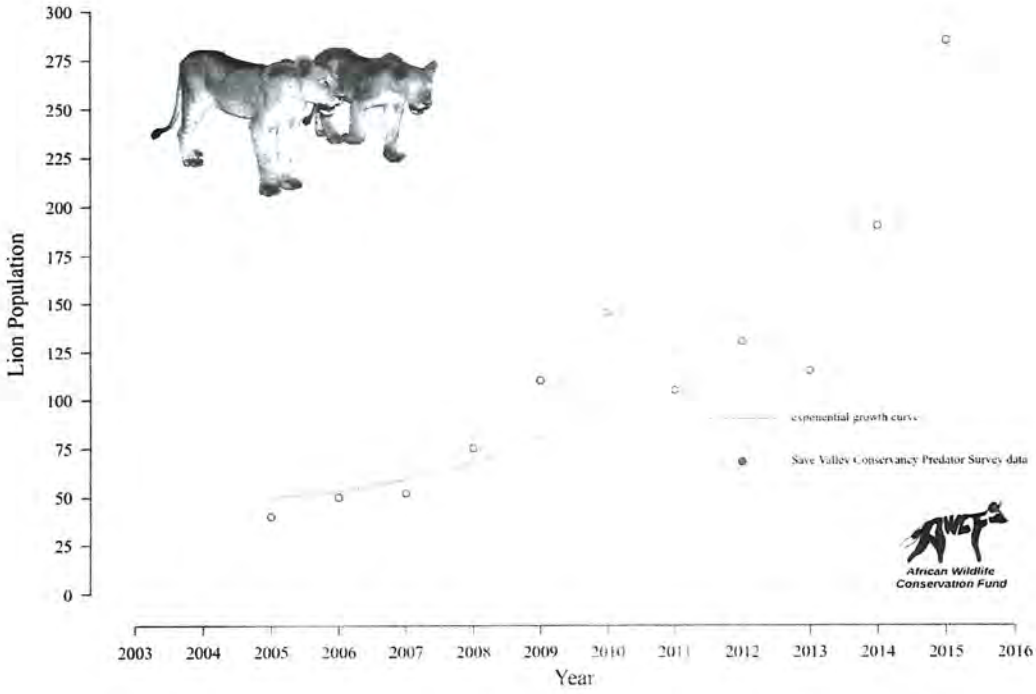

Figure 8: The Savé Valley Conservancy lion population, like that of the Bubye Valley Conservancy, has grown exponentially. Points indicate estimated lion abundance calculated from field surveys; the line represents the exponential growth curve.

THE PROS AND CONS OF CONSERVING LIONS

The saturation of lions in wildlife areas on both state and private land is positive for their future conservation security; but it is also critical to that of incidentally conserved endangered species, such as both species of rhinoceros on private wildlife conservancies in Zimbabwe (Lindsey et al. 2009; Suzuki 2001), which benefit from the same resources and protection that are incentivised and provided by the revenue generated from sport-hunting. The Bubye Valley Conservancy now boasts the world's third largest black rhinoceros population (P. Anderson [Lowveld Rhino Trust], pers. comm.), which is classified as Key 1 by the African Rhino Specialist Group and means that this population is considered key to the overall survival of the species. The Savé Valley Conservancy has the second largest black rhinoceros population in Zimbabwe after Bubye. These are not coincidences. These rhinoceros (and other endangered species, such as wild dog) strongholds are the result of the incidental conservation benefits derived entirely from sport-hunting activities - there are no photographic tourists visiting either the Bubye Valley or Savé Valley Conservancies, and the rhinoceros are not habituated. Having rhinoceros on the land therefore generates no revenue - and in fact there is a significant cost associated with protecting these animals; US$ 590,000 (not including incentive and reward bonuses donated for these purposes) was spent on anti-poaching by the Bubye Valley Conservancy during 2015 (K. Leathem, pers. comm.), and US$ 546,000 is spent annually on anti-poaching by the Savé Valley Conservancy (Lindsey et al. 2012). This expense is covered mainly by the revenue generated by sport-hunting with additional donations from the clients; and most importantly, the habitat for the rhinoceros is preserved by maintaining the land as a conservation area, as opposed to converting it into agricultural or grazing land for example.

However, the high densities of lion populations achieved within commercial wildlife areas have the potential for intense intraguild persecution. Lions are aggressively competitive, and research on the relationship between lions and leopards has shown that high densities of lions can negatively affect leopard population density, demographic structure, cub survival, and spatial ecology down to even the step-wise decisions that leopards make regarding habitat use and behaviour based on both the actual and potential risk of encountering lions (du Preez 2014; du Preez 2015). Leopards are a generalist species that are able to cope with persecution by adapting their behaviour and ecological niche, and even they suffer under a burgeoning lion population; ecological specialists and endangered species, such as cheetah *Acinonyx jubatus* and wild dog, do not fare nearly as well under such intense competitive pressure. In fact, competition with lions has been directly linked to reductions in cheetah (e.g. Durant 1998, 2000; Laurenson 1995) and wild dog (e.g. Creel 2001; Creel and Creel 1996; Vucetich and Creel 1999) densities both of which face local extinction where lion abundance, and the respective level of persecution, is high. Excessive lion densities may also result in population declines of ungulate prey (e.g. Wegge et al. 2009). It is vital to holistic conservation that wildlife managers can understand and deal with the level of impact that lions exert on other species; particularly those that

are elusive difficult to observe, and which face decline if not carefully monitored. To this end, a conservation research initiative in partnership with WildCRU was established on the Bubye Valley Conservancy in 2009, and research conducted on the Savé Valley Conservancy since 2007.

Based on the number of kills made (du Preez et al. in prep.) and the current value of the meat (K. Leathem, pers. comm.), the Bubye Valley Conservancy lion population consumes hundreds of thousands of dollars worth of prey each year. These lions are mainly tolerated because of their ability to generate the revenue that helps to offset this expense - although it is estimated that economically it is still not worth keeping the lions whose cost outweighs their value (Funston et al. 2013).

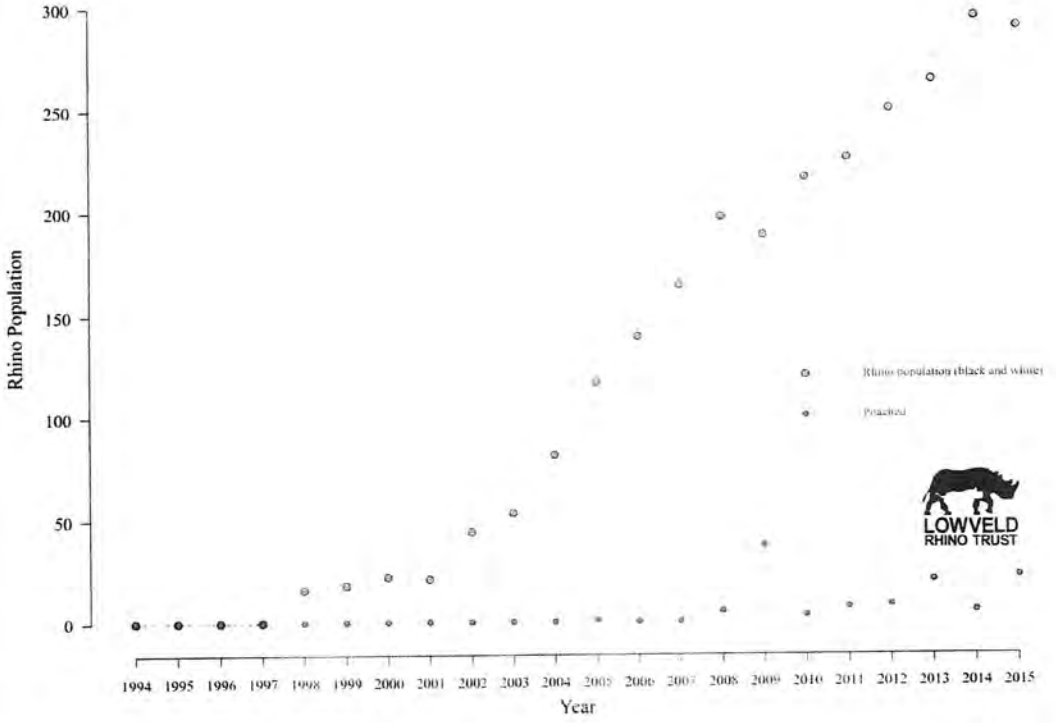

Figure 9: The Bubye Valley Conservancy black rhino population is rated as Key 1 by the African Rhino Specialist Group which means that the population is considered key to the overall survival of the species.

WHERE THE MONEY GOES: THE FINANCES OF LION SPORT-HUNTING AND REINVESTMENT IN THEIR CONSERVATION

Break-down of the finances involved in a typical lion hunt on the Bubye Valley Conservancy:

Lion Trophy fee: US$ 42,000
Lion Hunt Daily rate: US$ 2,950 day^{-1}
(Minimum lion hunt duration = 18 days [*total daily rate of US$ 53,100 lion hunt^{-1}*])

Additional costs include:
ZPWMA scout
Observers
Bait used
Other trophy species taken during the lion hunt, etc.
[*These additional costs average approximately US$ 6,500 lion hunt^{-1}*]

BUBYE VALLEY CONSERVANCY – LION SPORT-HUNTING REVENUE GENERATED (2015):

((18 days × 2,950 day^{-1}) + 42,000 trophy fee + 6,500 additional costs) × 12 lions
= **US$ 1,219,200**

Lion sport-hunting therefore represents approximately 33.9% of the Bubye Valley Conservancy's total annual revenue generation (which includes post-hunt meat and hide sales).

All of the revenue generated from lion sport-hunting on the Bubye Valley Conservancy has gone back into the running costs of the Conservancy, which is all part of conservation, and which includes: anti-poaching and fence monitoring and maintenance (approximately US$ 506,000 year^{-1}), research (approximately US$ 34,700 year^{-1} not including client and sponsor donations), and community support assistance (approximately US$ 210,000 year^{-1}).

[*No profit after costs has been declared, nor dividends taken by shareholders, since the Bubye Valley Conservancy was formed in 1994. All revenue generated to date has been spent on running costs, improvements and restocking.*]

DISCUSSION

Here we have shown that since their reintroduction after historical eradication, both the Bubye Valley and Savé Valley Conservancies' lion populations have increased exponentially - not despite sport-hunting, but because of sport-hunting and the incentive it provides for protection.

The success of the Bubye Valley and Savé Valley Conservancies, in terms of both of their hunted lion and non-hunted rhinoceros populations, may also provide the motivation for other areas in the country to sustainably manage their wildlife resource. A case in point is the Nuanetsi Ranch, a wildlife area that is also a legacy of failed cattle ranching, located almost directly between the Bubye Valley and Savé Valley Conservancies in Zimbabwe (Figure 3). At present there is a single lion on the Nuanetsi Ranch but management is not able to justify introducing more due to the current uncertainty over the future of lion hunting (B. Lees-May [Nuanetsi Ranch Conservator], pers. comm.). The Nuanetsi Ranch is a wildlife area of 1,489 km^2, and could conceivably sustainably hold between 201 and 278 lions (based on the most recently estimated lion densities of the Savé Valley [0.135 lions km^{-2}; Groom and Watermeyer 2015]; and Bubye Valley [0.187 lions km^{-2}; du Preez et al. 2015] Conservancies respectively). However, the Nuanetsi Ranch has invested in building up an abundant wildlife population, which is sport-hunted, and the management will not risk losing a significant amount of valuable game, that could otherwise be sold as trophies or meat, to a species from which it can not recuperate lost revenue, and instead that requires further investment in control measures (B. Lees-May [Nuanetsi Ranch Conservator], pers. comm.).

Between 2005 and 2015 the United States market has represented 70.4% of the total Zimbabwean lion sport-hunting industry (http://trade.cites.org/en/cites_trade/ [accessed 2015-01-29]), though in reality it constituted over 90% for both the Bubye Valley and Savé Valley Conservancies. If this market was effectively lost due an inability of prospective clients to import their trophies, based on the economics involved it would become inviable to continue managing the Bubye Valley Conservancy as a wildlife area in its current form, and lions would either have to be re-exterminated, or at least severely reduced via culling; or else what is the largest privately owned wildlife area in the world would be converted back into a cattle ranching area (K. Leathem, pers. comm.). This is the reality of any business, in that it needs to cover costs and pay staff and cannot run at a loss for luxury of conservation. Child (1993) states "*A fusal to treat wildlife in the same way as other resources and maintenance of centralised protectionist management prejudices its survival. Only by raising its commercial value will wildlife be able to compete for space on the scarce African landscape. Trade bans which detract from wildlife's commercial value will reduce its chances of survival in the long term*".

Although the USFWS understandably categorises lion conservation by country for simplicity, rather than individual properties, the Bubye Valley and Savé Valley Conservancies currently and deservedly hunt more than a third of the total Zimbabwean lion quota between them. Here we have shown that this sport-hunting does not negatively affect the lion population, which remains in positive growth despite off-take. In addition

to this, other areas, such as the Nuanetsi Ranch, could be incentivised to invest in lion conservation if the ability to sustainably utilise the lions as a resource was guaranteed.

The USFWS identified five primary factors that threaten lion survival in the wild, namely: habitat loss; loss of prey; retaliatory killing due to increased human-lion conflicts; inadequate regulatory mechanisms; and weak management of protected areas (http://www.fws.gov/endangered/what-we-do/lion.html [accessed 2015-07-19]). Each and every point on this list, which notably does not include sport-hunting, supports the fact that incentivising tolerance for lions through sustainable use would enhance the species' overall survival.

As responsible conservationists, we are not arguing against tight regulation of sport-hunting, especially with regard to sensitive species such as lions, and we support the need for transparency and accountability within the industry. However this reform is a process being driven from within as any indiscretion is an affront on all stakeholders. For example, long-term lion monitoring by WildCRU in Hwange National Park (HNP), Matabeleland North, Zimbabwe, documented a 'vacuum effect' and reduction in male lion density in the Park as a result of sport-hunting in the surrounding areas (Loveridge et al. 2007). A result of this research was the recommendation that ZPWMA implement a hunting moratorium in western Zimbabwe, which was accepted and enforced from 2005 to 2009 (Davidson 2009). Subsequent monitoring of the HNP lion population showed that the perturbation effects caused by sport-hunting were reversed during the moratorium, and sport-hunting was reinstated at a reduced, more sustainable quota (Davidson 2009). This example demonstrates both the relationship between independent researchers and ZPWMA, and that the research assists ZPWMA in robust decision making. This study has also shown that the lion population was able to recover quickly, and that a blanket-ban would have been as unnecessary as it would have been detrimental to overall lion conservation in the country.

In addition to the self-imposed hunting moratorium in the Matabeleland North district, Zimbabwe has voluntarily stopped sport-hunting of any lioness. The fixed-quota concept, in which hunting quotas had to be paid for upfront before the hunting season even began, and which was resultantly attributed to poor quality trophies and young animals being hunted, has also been abandoned. The adaptive quota management system for lion hunting based on the ages of lions hunted has been accepted and embraced by all stakeholders. This adaptive quota management system has not only led to a reduced national lion hunting quota, but has also resulted in a significant increase in the age of harvested lions to a level that is considered to have minimal ecological impact, being old individuals that are no longer contributing to the gene pool nor protecting cubs.

The IUCN Red List lion conservation status has remained unchanged for 20 years even in the face of Africa's ever-changing landscape. Despite fears that lion abundance is decreasing overall, in southern Africa it is in fact increasing (Bauer et al. 2015b).

CONCLUSION

Given the evidence presented, the arguments against sport-hunting would appear to be based more in emotion than logic and reality (e.g. Lindsey et al. 2015). Conservation, however, is not about individuals within populations, but the overall populations themselves. Sustainable sport-hunting of lions is just that: *sustainable* - and ironically, without it, the lions themselves become unsustainable. Conservation objectives need to be balanced with both social and economic factors if they are to be achieved.

The USFWS states "Well-managed conservation programs use trophy hunting revenues to sustain lion conservation, research and anti-poaching activitie" (http://www.fws.gov/endangered/what-we-do/lion.html [accessed 2015-01-19]). The Bubye Valley and Savé Valley Conservancies both fully meet each one of these conditions clearly contributing to lion conservation in Zimbabwe, having long-term conservation research programs; and self-funded anti-poaching units.

The histories regarding the formation of both the Bubye Valley and Savé Valley Conservancies were both presented in this report, despite being remarkably similar; the point being that lion conservation in both areas, and many others, has the same fate either way. The Bubye Valley and Savé Valley Conservancies are both excellent examples of focussed and determined efforts to make wildlife based land use viable in an otherwise cattle dominated landscape. However, the fact remains that the cost of having lions, both ecologically and financially, is high. Simply increasing the abundance of one species at the expense of another cannot be considered a conservation success.

1.0 INTRODUCTION

The African lion (*Panthera leo*) is an important species that plays a big role in the savannah ecosystem. It is a flagship species with huge social, economic and ecological values. It is a powerful symbol for Africa, and yet living with lions poses hardships for many communities. In some areas, the lion is a major predator on domestic livestock leading to profound conflicts with local communities.

The lion is not only a source of personal and economic damage and danger but is also of economic and personal benefits. The species contributes positively to the livelihoods of local communities through sport hunting. Trophy hunting also contributes to the conservation of lions through financial benefits that are ploughed back into its conservation and that local communities use for rural development programmes. Trophy hunting of the African lion is undertaken through a strict scientific based quota setting process with an objective of ensuring that utilization and any form of harvesting is sustainable.

Zimbabwe is one country that sustainably manages its lion population inside and outside protected areas. The African lion population is increasing in most areas. Research and monitoring of the species is being done collaboratively with external researchers and there is a lot of baseline information and publications. Zimbabwe has a lion management plan and strategy that is being implemented and reviewed on a regular basis. Rigorous monitoring of lion trophy hunting through adaptive management principles is carried out in Zimbabwe and non-detrimental findings are conducted for all exports. In conclusion, harvesting and any other forms of off take are not detrimental to the survival of the African lion in Zimbabwe.

2.0 SPECIES BIOLOGY AND LIFE HISTORY CHARACTERISTICS

2.1 Taxonomy

Class	Mammalia
Order	Carnivora
Family	Felidae
Species	*Panthera leo*
English	African lion
Shona	Shumba
Ndebele	Islwane

African lions are the only social fields, with each pride comprising an average of 4 to 6 adult lionesses, their dependent offspring, and a temporary coalition of pride males. In lion prides there is no dominance hierarchy amongst lionesses, and female lions are "free agents'' who only contribute to communal care when they have cubs of their own. Although the pride is a stable social unit, it is a fission–fusion social group, in which individuals are typically found in a range of subgroup sizes and compositions. Although earlier studies suggested otherwise, grouping patterns within lion prides are not associated with foraging efficiency or any other aspect of hunting. However Packer *et al.*, (1990) concluded that group territoriality and group defence of cubs are the main reasons for sociality in lions. Mosser *et al.*, (2009) conclude that female sociality has largely to do with interactions between neighbouring prides supporting the group territorial hypothesis. Larger prides/subgroups usually win encounters with neighbouring prides (Packer *et al.*, 1990; Grinnell *et al.*, 1995). Larger prides are generally found in higher quality habitats, which typically have numerous buffalo herds and several river confluences (Mosser 2008). The threat posed by neighbours leads to larger group sizes than does the threat of infanticide (Mosser *et al.*, 2009). Cooperative defence against infanticide is another benefit of grouping for female lions (Pusey & Packer 1994). Playback experiments revealed that pride with dependent cubs typically retreat from foreign males, but that lionesses approach female intruders (Mc Comb et al., 1993, 1994).

Leaving cubs unprotected puts them at considerable risk, suggesting that the need to respond to territorial threat may often override the value of protecting cubs. Cooperative defence against infanticide is another benefit of grouping for female lions (Pusey & Packer 1994).

Although pride males are not always with the pride they fulfil a key function defending the pride and chasing off would be invading or "infanticidal males". In order to do so, males typically form coalitions of two or three males, with solitary males seldom being able to defend a territory. Territories are defended through roaring, patrolling, scent marking and direct aggressive encounters. Importantly male lions impact their reproductive success, mortality and wounding of females. Neighbouring resident males also influence the female grouping patterns within larger prides, and improve the quality of their own pride"s territory. Thus male lions are important in group-territorial competition and may use lethal aggression to tip the balance of power in favour of their prides (Mosser et al. 2009). Numerical advantage may additionally benefit large male coalitions by reducing levels of inter-pride competition for their females. The effects of intergroup competition between females are direct and immediate, so much so that male coalitions attempt to modify the dynamics of territorial competition. Group-territorial competition therefore provides strong selection for sociality in both male and females lions. Lions are matrilineal (females stay in their natal pride), with one-third of females dispersing to form new prides (Pusey and Packer 1987). Males leave their natal pride by the age of 4 years and remain solo or form a coalition with other males (Pusey and Packer 1987). Large coalitions of young males (4-5 years of age) are able to easily oust single pride males from their territories, and in areas with no males older than six years of age successfully maintaining reproduction in lion prides

Although there is *not yet any empirical evidence* on how the group territorial nature of lions is affected by excessive trophy hunting, the findings from Mosser *et al.*, (2009) suggest that these could be substantive. Without males to co-operate in group territorial defence lionesses might:

- Have to alter their groupings patterns (which may have as yet not described negative consequences)
- Lose more cubs to infanticide, both from foreign males and ***importantly to lionesses from neighbouring prides*** that will kill cubs if the opportunity exists
- Experience higher wounding and mortality rates

3.0 LION DISTRIBUTION AND RANGE

In Zimbabwe, lions are found in three broad land use types, namely gazetted protected areas (parks estate and indigenous forest areas), CAMPFIRE areas and on private land.

3.1 Parks and Wildlife Estate

Parks Estate is under the jurisdiction of the Zimbabwe Parks and Wildlife Management Authority and covers about 13% of the area of the country (390 580 km^2). The Parks Estate comprises six categories of protected areas that are gazetted under the Parks and Wildlife Act, Chapter 20:14. The six categories of protected areas are national parks, recreational parks, sanctuaries, safari areas, botanical reserves and botanic gardens. In these areas, wildlife is the primary and only land use permitted except in botanic gardens.

The African lions occur in most of Zimbabwe Parks and Wildlife Estates with the exception of a few areas located in the high and central parts of the country i.e. Matopos National Park, Sebakwe, Ngezi, Chivero, Kyle and Chegutu Safari Area. There are no free ranging lions found in the country's recreational parks, which are located in areas of high human densities where conventional agricultural practices in the surrounding areas preclude the establishment of viable population sizes.

Recreational Parks are not suitable for lions due to the small size of the areas, existing prey base and are therefore subject to high human-wildlife conflict. Most of the National Parks and Safari Areas located on the borders of the country support lion populations. Connectivity of lion range has been enhanced by the creation of Transfrontier

Conservation Areas such as Greater Limpopo Transfrontier Park (GLTP) and Greater Mapungubwe Transfrontier Conservation Area. Trophy hunting of wildlife is legally permitted in safari areas. There are sixteen safari areas found in the country and lions are found in Matetsi in the north-western area, Chete, Chirisa (in the Sebungwe region), Charara, Hurungwe, Sapi, Doma (in the Zambezi Region), Malipati (South-eastern part of the country) and Tuli safari areas (Figure 1).

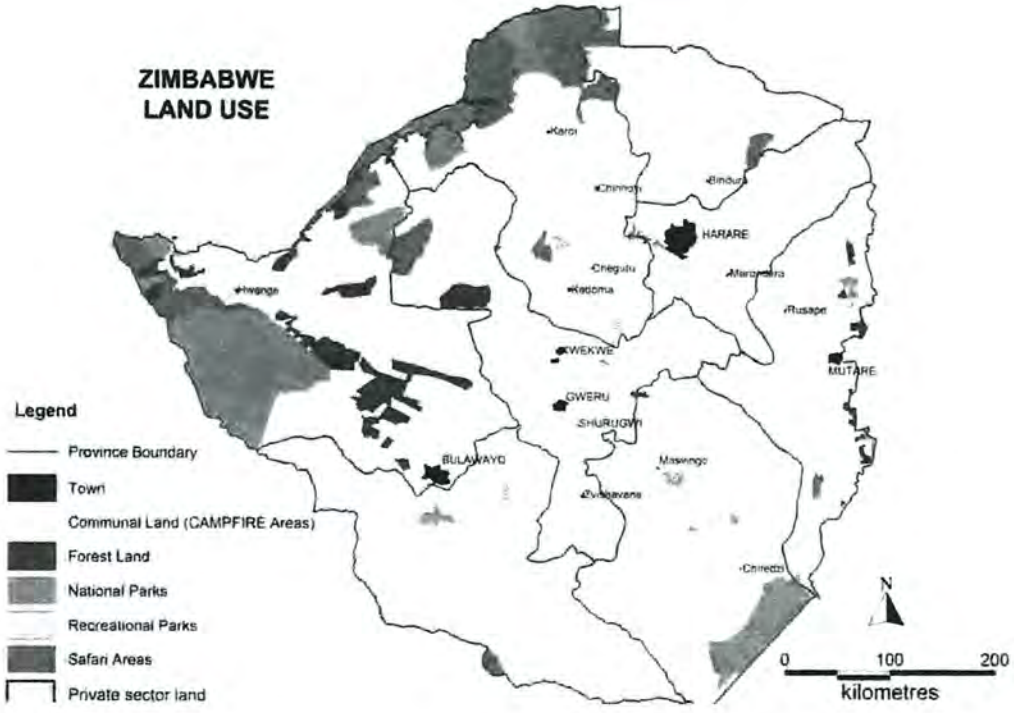

Figure 1: Map of Zimbabwe showing areas where trophy hunting is legally permitted.

3.2 Gazetted Indigenous Forest Areas

According to the Forest Act, Chapter 19:05, twenty-four gazetted indigenous forest areas

are under the jurisdiction of a State parastatal, Forestry Commission and cover about 880 000 ha (2%) of the area of the country. In gazetted indigenous forest areas, lions are found and hunted in Fuller, Kazuma, Pandamasuwe, Ngamo, Sikumi, Gwayi, Sijarira and Gwampa Forests. The above mentioned State gazetted areas are found on Kalahari sands in the north-western part of the country Zimbabwe.

3.3 Private Land

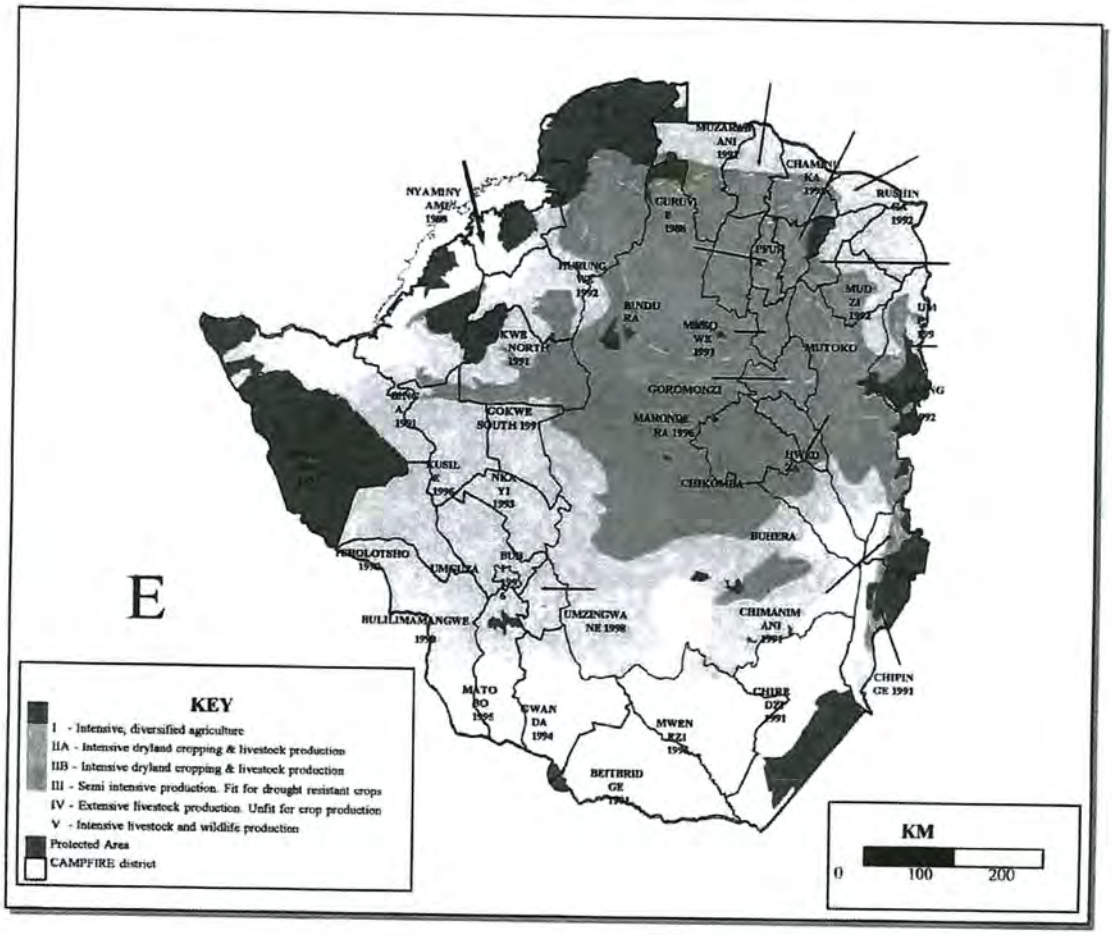
In 1960's there was a shift in wildlife policy from State control to individual proprietorship for white commercial farmers who could now benefit financially from the wildlife on their farms. In 1975, the Parks and Wildlife Act 14/1975 gave commercial farmers the right to exploit wildlife, including lions on their land. The Act legally formalized the policy shift towards sustainable utilization by aiming to confer privileges on owners or occupiers of alienated land as custodians of wildlife. The Act designated these owners or occupiers of alienated land as Appropriate Authorities over wildlife. On commercial private land, lions are found on single ranches and on conservancies. A conservancy is defined as a contractually legitimated entity which involves two or more recognized land and resource authorities. Most of the private farms that have lions are adjacent to major gazetted protected areas.

3.4 Communal Area Management Programme for Indigenous Resources

It was until 1982 that the right to exploit wildlife was extended to communal areas through granting the Appropriate Authority Status over their wildlife resources to Rural District Councils. Such Authority allows Rural District Councils to manage and benefit from wildlife resources occurring in them. The intention was to return rights of access to natural resources through legislative change, devolve responsibility and economic empowerment. The Communal Areas Management Programme for Indigenous Resources (CAMPFIRE) is the process through which Government is devolving the management of wildlife resource to communal farmers. Currently (January 2015), 58 Rural Districts have been granted the Appropriate Authority status to manage wildlife

resources in their areas. Lions are found in communal areas that are adjacent to major protected areas (Figure2). Lion hunting is allowed in CAMPFIRE districts. Outside of protected areas, lions largely exist on areas peripheral to National Parks.

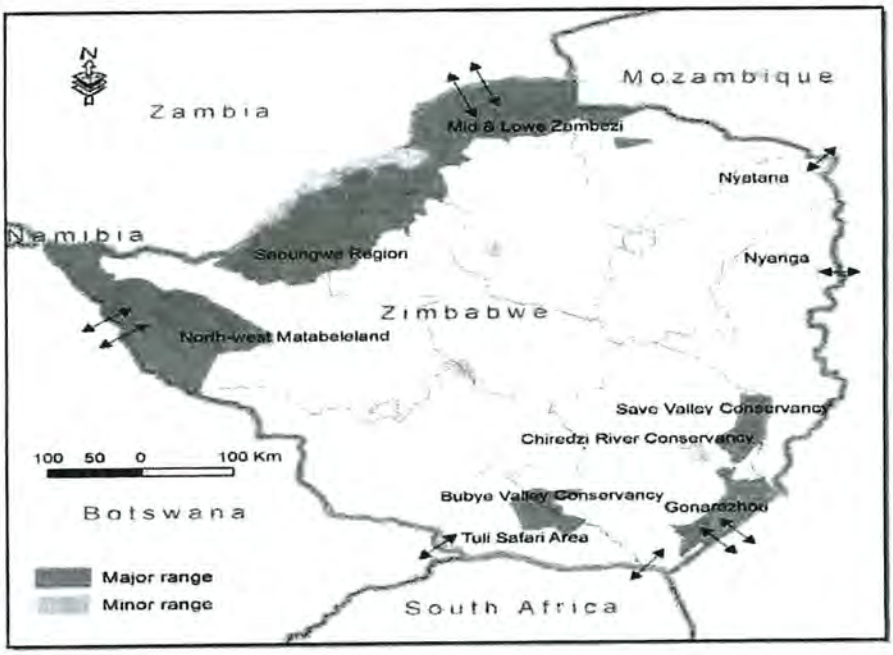
Figure 2: Map of Zimbabwe showing CAMPFIRE districts.



3.5 Summary Distribution of Lions

Figure 3 shows a summary of the distribution of lions in Zimbabwe. The distribution of the African lion in Zimbabwe coincides with the major wildlife areas in the country; which are as follows, the North West Matabeleland Region, Sebungwe Region, the Mid-Lower Zambezi valley and South-Eastern part of the country (Gonarezhou National Park, Save Valley Conservancy, Chiredzi River Conservancy, Malilangwe Conservancy, Beitbridge-Tuli complex). Zimbabwe's main lion range includes the Hwange-Matetsi Ecosystem which is about 25000 km^2, the Mid Zambezi Valley (17127 km^2), Sebungwe (15622 km^2) and the South East Lowveld (11000 km^2) (Table 3). In addition to the main geographic ranges listed above, lions are found on privately owned game farms, conservancies, and isolated state protected areas throughout the country. Occasional African lion sightings have been recorded in other areas from time to time such as Nyanga National Park in Zimbabwe's Eastern Highlands and Nyatana Wilderness in the North Eastern border with Mozambique.

Figure 3: African Lion (*Panthera leo*) Range in Zimbabwe (Zimbabwe Parks and Wildlife Management Authority, 2014)



3.6 Threats to Lion conservation in Zimbabwe

Human-Lion Conflicts

Butler in 2000 noted that countrywide in Zimbabwe's communal lands, 1 to 2% of cattle and 3.4% of goats were taken by predators. In the years 1999 to 2001, 32 reports were made in Nyaminyami District in Mashonaland West, with approximately 50 goats, 13 donkeys and one lion destroyed per year (Chardonnet at al, 2010). In traditional agro-pastoral regions, bordering National parks, livestock predation is a serious problem. In Gokwe communal lands 82 livestock, small and large were killed by lions (Butler 2000).

From 2002 to 2006, in all CAMPFIRE Rural District Councils, 58 Lions were reported as Problem Animals and of these, only 36 reports were attended to resulting in 9 lions being killed. In Mbire Rural District Council, 6 people were killed by lions and 12 lions were killed on Problem Animal Control in 2010 (CAMPFIRE Annual Report).

Human- lion conflict is a significant issue in areas around Hwange National Park where lions come into contact with local communities. Conflict is most intense in the wet season (November- April) when wild prey is sparsely distributed. Over 600 head of domestic stock have been lost directly adjacent to Hwange National Park between 2007 and 2011. Retaliatory killing accounts for close to 40% of recorded lion mortality, suggesting that this may be a significant threat to the population.

Depletion of prey base

Lion presence and abundance in an area is related to the abundance of its prey species which include zebra, buffalo, wildebeest, sable, impala and warthog. Depletion of this resource base in an area mostly through human activities such as poaching, settlement and livestock grazing leads to human-lion conflict as lions replace their natural prey base with livestock. For instance, an incursion by a lion pride in 2007 from Mozambique, into Nyanga National Park, which has a low prey density, resulted in the lions mauling and killing eight horses which

were used by the Parks Authority for conducting horse rides, in addition to killing livestock in settled areas, surrounding the park.

Habitat Loss

In Zimbabwe the threat to lions from habitat loss exists in the Sebungwe and the South East Low Veld where the fragmented nature of the protected areas is compounded by an increasing human and livestock populations surrounding these areas. In these areas, habitat loss, reduction in prey populations and killing of problem lions are the major threats to long term lion survival.

Due to the large size of the protected area system in the Zambezi Valley and North West Matabeleland, threats are limited to lion range which extends into adjacent settled areas. The huge natural prey base in these protected areas, reduced killing of problem animals associated with lions preying on livestock in adjacent settled areas.

Within their range areas, lions dominate the carnivore guild with site-specific competition affecting the distribution and abundance of other large carnivores (cheetahs, Africa wild dogs, hyenas and leopard).

Diseases

Diseases do not appear to be a major issue in Zimbabwe lion population. Recent disease screening reveals an absence of Tuberculosis (TB) and Feline Leukemia (FeLV) in the South Eastern Lowveld. Nine of the sixteen lions sampled for Feline Immunodeficiency Virus (FIV) showed a positive reaction to the test in Hwange National Park. However it is thought that FIV has little clinical effect on lions and this is therefore unlikely to be a threat. FIV is prevalent in many wild populations (Loveridge 2011 pers comm).

4.0 SURVEY METHODOLOGY

The population estimates of African lions in Zimbabwe are determined through carnivore spoor surveys, systematic lion collaring and call-up surveys. With the strategy to maintain the wilderness values of most protected areas, there is low road penetration in the parks estates, however all suitable roads are used as transects, and in areas of suitable substrate, spoor surveys have shown to be an effective and efficient means to assess wildlife

densities (Stander 1998: Fuston et al. 2001; Davidson and Romanach 2007). Patrol reports, field observations by Zimbabwe Parks and Wildlife Management Authority rangers and other sightings by tour operators and tourists also contribute to knowledge of the status of lions in Zimbabwe's protected areas. Between 2006 and 2012 leopard and lion spoor surveys were conducted in the major wildlife areas. The surveyed areas are shown in the map in Figure 4. A total of 28 sites were surveyed between 2006 and 2012. The survey covered the major areas within the lion range in the country. The survey sites covered 48123km^2 **(12% of the country)** and 14 400km of transects.

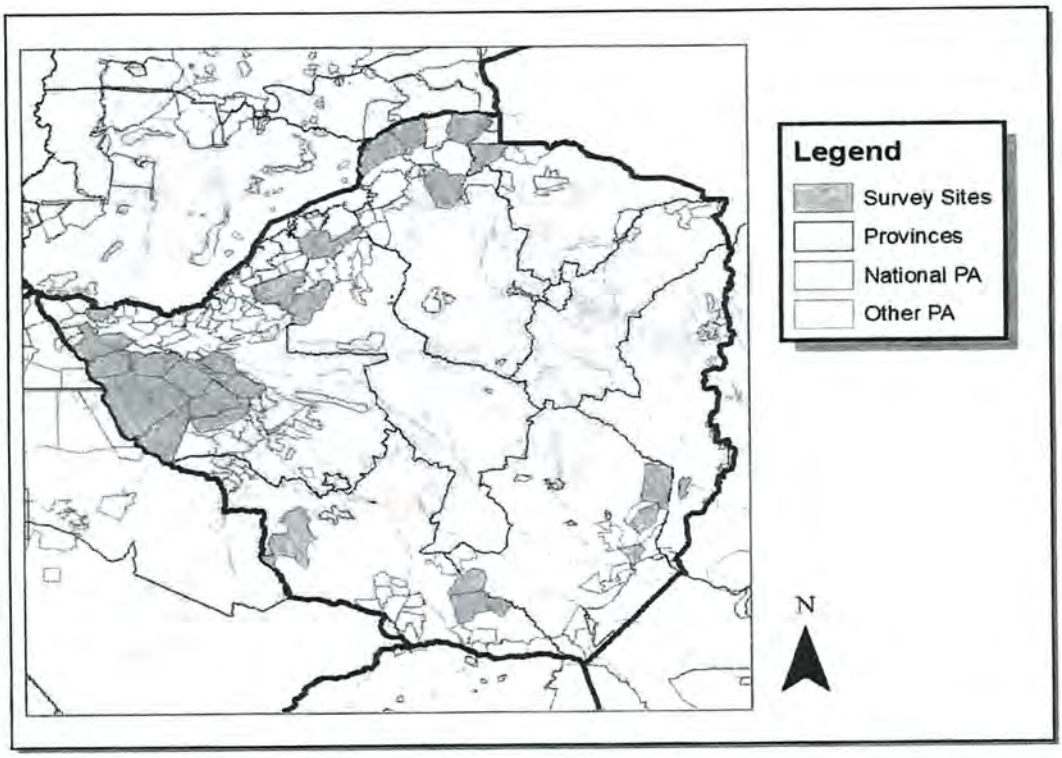


Figure 4: African Lion Survey Sites in Zimbabwe (2012)

Lion population surveys provide useful indices of abundance that can be used to determine spatial distribution, as well as temporal trends in population numbers. Different survey methods are conducted in most of the wildlife estates and areas of minor distribution for purposes of generating information for setting sustainable lion trophy hunting quotas and for population management. In most protected areas, lions compete

for food with other carnivores such as spotted hyenas, leopard and wild dog. Carnivore density information can offer early warnings about conservation needs, and provide information for successful future management as well as offer input for decisions regarding hunting quotas or any management requirement. Moreover, carnivore density trends are a reflection of prey densities and therefore save as useful indicator (Conservation Strategy and Action plan for the Lion (*Panthera leo*) In Zimbabwe, 2006).

5.0 POPULATION ESTIMATES

The lion population estimate at national level ranges from 1700 to 2043 animals (Chardonnet 2002, Bauer and Van Der Merwe 2004) (Table 1). The current lion population estimate for the Hwange Matetsi complex is 750, South Eastern Lowveld 350, between 150-175 in the Save Valley Conservancy, 59 in Gonarezhou National Park, 37 in Malilangwe and 400 animals in Bubye Valley Conservancy. The Mid Zambezi Valley comprising of Matusadonha and Mana Pools National Parks, Charara, Chewore and Sapi Safari Areas has a current population estimate of 600 lions (Zimbabwe Parks and Wildlife Management Authority Reports 2011). The current lion population estimates in the minor range areas are also significant.

Table 1: Lion Population Estimates (Bauer & Van Der Merwe, 2004, Chardonnet, 2002)

		Bauer & Van Der Merwe (2004)			Chardonnet (2002)		
Area	**Sq km's**	**Estimated population**	**Estimated minimum**	**Estimated maximum**	**Estimated population**	**Estimated minimum**	**Estimated maximum**

Totals	72 840	1057	678	1397	1686	1328	2043

6.0 POPULATION DENSITIES

Table 2 shows the current lion population estimates and densities in the Hwange-Matetsi ecosystem. The 12 year average density in the Hwange National Park is 2.8 lions per 100km^2 (2000-2011) with the population fluctuating over this time. This estimate is based on spoor transects and detailed population estimates and on individual recognition of animals in an intensively studied population.

Table 2: Results of lion population surveys of lions in the North West Matabeleland (Hwange Lion Research, 2014)

	Density	Area (km2)	Estimated number of lions	Year of survey
Hwange NP	3.75	14900	559	2013
Matetsi Units 1-5	3.04	1934	59	2008

Matetsi Units 6-7 and Zambezi NP	2.98	1585	47	2013

Matusadonha NP	2.17	1427	31	2013
TOTAL Lion Estimate			**750**	

The South Eastern Lowveld has a lion population density of about 6 lions per 100km^2 in the Save Valley Conservancy, 9 lions per 100 km^2 in Malilangwe and 0.8 lions per 100 km^2 in the Gonarezhou National Park (Zimbabwe Parks and Wildlife Management Authority Annual Report, 2013) (Figure 5).

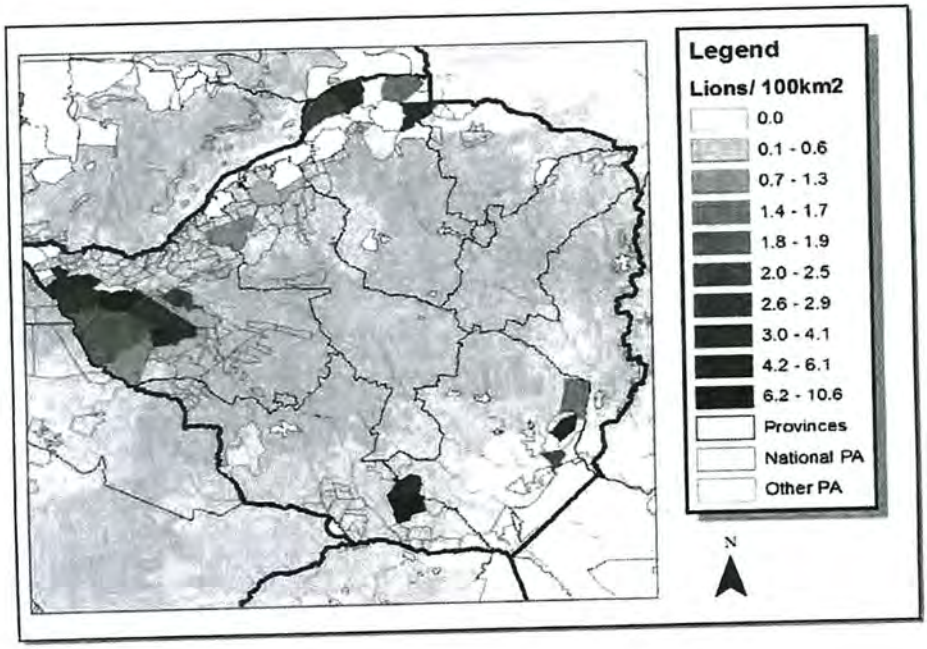

Figure 5: Lion densities in Zimbabwe (Leopard and Lion Spoor Survey Report, 2012).

The Matetsi-Kazuma-Zambezi complex to the North West of Hwange (4935km^2; composed of Deka and Matetsi Safari Areas, Kazuma and Zambezi National Parks and Kazuma and Pandamasuie Forests) is estimated to have a population of 222 lions based on a density of 4.5 lions per 100km^2. This estimate is extrapolated from a spoor survey of 1600km^2 area of the Matetsi-Kazuma-Zambezi complex in 2007. Table 3 shows lion population estimates and densities in selected survey sites in the Zambezi Valley and surrounding areas from the spoor survey done between 2011 and 2012. Table 4 shows the population estimates for Gonarezhou National Park in 2013.

Table 3: Population estimates and lion densities in selected survey sites in the Zambezi Valley (Hwange Lion Research, 2014)

Survey Site	Density/ 100km^2	Area (km^2)	Estimated number	Year of Survey
Omay	0.28	1865	5	2012
Chewore North	1.92	1648	32	2012
Dande	1.83	1155	21	2012
Hurungwe (Nyakasanga & Rifa)	1.89	1709	32	2011
Mana Pools	4.52	1287	58	2011
Hurungwe Mukwichi CAMPFIRE Area	0	1853	0	2011

Table 4: Population estimates from call up survey for Gonarezhou National Park (Lion Call Up Survey, 2013)

Parameter	Northern GNP	Southern GNP	Total
Area (km^2)	1665	2121	3786
Combined transect length (km)	229.8	301.8	531.6
Penetration ratio	1:7.25	1:7.03	1:7.12
Results			
Number of Individual lion spoor seen	22	5	27
Lion spoor frequency (km/spoor)	10.45	60.36	19.69
Spoor density (spoor/100km)	9.57	1.66	5.08
Density of lions per $100km^2$ (Y=0.3049X)	2.9	0.5	1.5
Estimated number of lions	48	11	59

7.0 POPULATION TRENDS

In Zimbabwe, trends in the population estimates of African lions show a growing

population trend. The average lion densities in most protected areas are also showing an increasing trend. For example in Gonarezhou National Park as shown in Table 5, an estimate of 24 lions was established in 2009 and by 2013 the population had grown by 150% to an estimated 60 individuals within a period of 4 years. Other areas within other protected areas with similar management regimes are also reflecting similar trends in population estimates.

Table 5: African Lion population estimates for Gonarezhou National Park (2009 to 2013) (Annual Report, 2013)

Species	2009	2010	2011	2012	2013
Lion	24	34	55	49	59

Bubye Valley Conservancy is a closed protected are system with a large resident lion population. Figure 6 shows the trend in lion population growth for the Conservancy from the time of introduction of lions into the property in 1999 to present. Bubye valley conservancy has the highest lion density of 14 lions per 100km^2.

Population trends of lions in Bubye Valley Conservancy

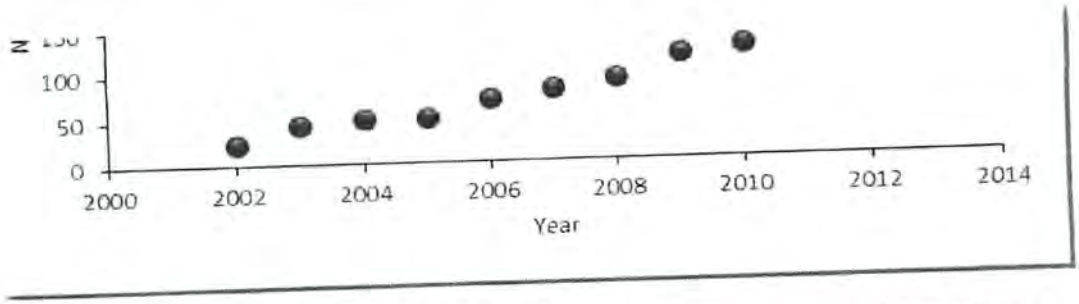

Figure 6: Trends in lion population for Bubye Valley Conservancy (Lion Report, 2014)

8.0 LEGAL UTILIZATION OF LIONS

8.1 Annual Trophy Quotas

Lions are used for consumptive and non-consumptive purposes. The main uses are trophy sport hunting, photographic safaris and educational purposes in captive breeding operations. Table 8 shows national annual lion trophy quotas for different broad land use types. The quotas set for trophy hunting are declining from 114 in 2004 to 89 in 2014 as part of adaptive management of the lions.

Table 8: National Annual Lion Trophy Quotas (ZPWMA Utilisation Unit, 2014)

	2004	2005	2006	2007	2008	2009	2010	2011	2012	2013	2014
Parks	36	30	34	30	29	25	26	29	31	36	38
Communal	58	45	43	34	35	38	34	33	31	24	26
Forestry	9	8	3	3	3	3	3	4	4	4	4
Private	11	15	22	26	25	24	19	20	17	21	21
Totals	**114**	**98**	**102**	**93**	**92**	**90**	**82**	**86**	**83**	**85**	**89**

8.2 Quota Setting

African lions are one of the most sought after species by international hunting clients and are key for the viability of the trophy hunting industry. However, during recent years there has been increasing awareness of the negative impacts associated with lion hunting on lion populations in some areas, including in Zimbabwe. However, research has also demonstrated that lion hunting can be sustainable if quotas are established in a

scientific manner, and that lion populations are able to recover quickly from over-harvest if the pressure on them is removed.

8.2.1 The Quota Setting Process

For the African lion, a specific Hunt Return Form was introduced in 2013 hunting season. On this Hunt Return Form, key variables are recorded such as trophy quality, hunting success and hunting effort. Photos of all lion trophies are also included on the Hunt Return Form and are used to determine the age of the lion trophy. A Points System is being used to determine the 2015 Sport Hunting Quotas for African lions in Zimbabwe (Table 9)

Table 9: Proposed points system for lion age restrictions and quota setting in Zimbabwe

	≥6 years	No trophy	5 years	4-4.9 Years	<4 years	Failure to submit hunt return/incomplete hunt returns
For quotas of 3 or more	4	3	3	2	-3	0
For quotas of 2	4	3	3	2	0	0
For quotas of 1	6	3	3	2	0	0
Quota setting process	These points are added up and divided by 3 to yield the quota for next year					

The new Points System will restrict hunting to old males. Hunters are recommended to hunt mature males that are older than 5 years old. Latest scientific evidence suggests that if harvesting of lions is restricted to animals of 5-6 years or older, the impact of trophy hunting on the species population is likely to be minimal (Whitman et al. 2007).. By age 5 or 6, the lion has a chance to sire at least one litter. Restricting offtakes to older lions also increases the net number of lions that can be harvested over time.

In the Points System, operators would be penalized if they hunted animals less than 5 years old by not getting an approval for a lion quota on the same property for the

subsequent hunting season. If however, the operator hunts a lion older than 6 years, they would be rewarded through an increased quota of the same species in the subsequent hunting season.

Lion aging will be conducted through different aging characteristics including: the degree of facial scarring; teeth colour and degree of wear; mane development (particularly regarding the shape around the ear and the mohawk); and through post mortem analysis of the width of the pulp cavity of the second premolar (which becomes narrower with age).

Field-based training on aging techniques has already been conducted for the Zimbabwe Parks and Wildlife Management Authority and Safari Operators. Specialized training manuals including Field Guides have also been developed.

8.2.2 Monitoring of quota utilization and trade data

- Approved quota are issued to local authority/landowner
- Quotas are utilized by contracted Safari Operators
- Monitoring at the local level is carried out by community game guards and wildlife monitors
- The Zimbabwe Parks and Wildlife Authority undertakes monitoring programmes at the national level including monitoring of biological and trade information on the species, environmental and other data. The Authority also ensures compliance with wildlife laws and regulations.
- A Hunt Return Form is completed for each hunt by the safari operator and local authority and is submitted to the Zimbabwe Parks and Wildlife Management Authority,
- The Hunt Return Form allows key variables to be captured for input into national database and provides further datasets for subsequent quota setting exercises

9.0 ILLEGAL TRADE IN LIONS AND THEIR PRODUCTS

Illegal trade in lions and their products is very insignificant. There are no records of people found in possession of illegally acquired lion specimens in Zimbabwe. Anyone found in possession of illegally acquired lion specimens pays a fine of USD5000 or faces a mandatory jail sentence. In On conviction for lion poaching, courts may ask the convict to pay compensation fee of US**$20 000.** Some illegal off takes occur when lions are accidentally killed through snares or chemical poisoning meant for herbivores. Other cases involve retaliatory killing of lions as a result of livestock predation outside protected areas.

10.0 HUMAN AND LION CONFLICT MANAGEMENT

The lion is a flagship species and powerful symbol of Africa, and yet living with lions poses hardships for many communities. In some areas, the lion is a major predator on domestic livestock, leading to profound conflicts with local herders.

Table 10 Human and Lion Conflict (2009 to 2011) (CAMPFIRE Association, 2012)

District	Total incidents	People Injured	People Killed	Livestock killed
Hurungwe	5	2	2	1
Chiredzi	25	0	0	136
Mbire	5	0	5	7
Binga	9	0	0	39
Total	**44**	**2**	7	**183**

11.0 MANAGEMENT INITIATIVES AND CONTROL MEASURES WITH REGARD TO LION CONSERVATION

11.1 Conservation strategy and action plan for the lion (*Panthera leo*) in Zimbabwe

Zimbabwe is one of the few lion range states in Africa, where large areas of land which have been set aside as protected areas, still have viable lion populations. In some parts of Africa, lions have been completely wiped out through uncontrolled hunting, revenge killings, habitat loss and other factors with the only record to indicate their existence in the past now left as anecdotal evidence. The conflict with local communities and the threat to livestock and human lives in many parts of the world including Zimbabwe is well documented. While its attraction in ecotourism as one of the most beautiful and graceful cats, and as a trophy animal in sport hunting, its economic benefits are huge. Its social and cultural values are an integral part of the Zimbabwean lifestyle, therefore efforts to ensure lion conservation need to be strengthened.

The Zimbabwe Conservation Strategy and Action Plan for the Lion will guide the conservation and management of this important top predator. The strategy and action plan is the outcome of a workshop in which stakeholders representing the wildlife industry, technocrats, inter and non-governmental organizations, wildlife producers etc, actively participated.

11. 2 Law enforcement efforts being implemented in Zimbabwe with regard to lion conservation

- Intensive anti-poaching efforts by Parks rangers throughout the country.
- Joint investigative operations based on intelligence between the Zimbabwe Parks and Wildlife Management Authority other law-enforcement agencies like the police and the army.
- Joint Field Anti-poaching by the Zimbabwe Republic Police and Parks Rangers on Private game farms and Conservancies and on Stateland.

- Border Control – Trade compliance officers at ports of exit and entry who monitor and enforce compliance together with Customs Officials, Immigration and the Zimbabwe Republic Police.
- Information led deployment
- Problem animal control by Zimbabwe Parks and Wildlife Management Authority- Management Division (Anti poaching Rangers) in the communal areas and Natural Resource Monitors in Rural District Councils
- Harvesting controls: sustainable quotas, hunting permits and hunt monitoring and Tourism Return Forms (TR2).
- Trade controls: Issuing of CITES Export and Import Permits following recommendations based on non-detriment findings by the Scientific Authority.

12.0 LEGAL FRAMEWORK GOVERNING LION CONSERVATION

Zimbabwe's National Legislation is very comprehensive to ensure long term survival of the African Lion. Zimbabwe has a full range of national legislative and administrative measures needed to effectively implement all aspects of the Convention on Trade In Endangered Species of wild flora and fauna (CITES) and related Resolutions and Decisions of the Conference of Parties. Zimbabwe's legislation is in Category 1 of CITES and therefore meets all the requirements of CITES implementation.

The African Lion is a specially protected species whose conservation is regulated through a policy and legal framework and regulations which include:

- Parks and Wildlife Act; Chapter 20:14 (1996) as amended in 2001
- Environmental Management Act; Chapter 20:27
- Forest Act; Chapter 19:05
- Statutory Instrument 362 of 1990 : Parks and Wildlife (General) Regulations, 1990

- Statutory Instrument 76 of 1998 :Import and Export of Wildlife Products
- Statutory Instrument 40 of 1994 : Parks and Wildlife Act (General) Amendments
- Statutory Instrument 26 of 1998: Parks & Wildlife Act (General) Amendment
- Statutory Instrument 92 of 2009; Compensation Values for Wildlife
- Statutory Instrument 93 of 2009; Compensation Values for Trapping of Animals
- Trapping of Animals Control Act 20.16
- Licensing and Protection of wildlife properties
- Conservation Strategy and Action Plan for Lion (*Panthera leo*) in Zimbabwe (2006). Prepared following a Workshop. 30-31 October 2006. Harare.
- Tourism Hunt Return Forms (TR2)
- Code of Ethics for Hunting in Zimbabwe

Parks and Wild Life Act Chapter 20:14 of 1996 as amended in 2001

It is the Principal legislation which governs and regulates the purchasing, selling and exporting of parts and derivates including live animals. It also protects the gazetted protected areas which form the major range and habitat for the African lion.

The Act prohibits the hunting of any animal and removal of parts of animals from any land without authority. The Act provides for the protection of animals in the following designated areas, National Parks, Parks and Wild life Estates, Parks and Wild life land, Sanctuaries and Safari Areas.

The Act further provides for categorization of animals into protected and specially protected animals. Of particular interest to lion conservation is Part XII of the Act which prohibits the hunting, removal and sale of live animals and animal products from designated national parks.

The Act has the following provisions which address issues related to Control of live animals, trophies and trade;

- Section 59 provides for the general protection of all wildlife which is not covered by the above categories.

This Act empowers the Minister responsible for the Parks and Wild Life to issue regulations governing certain activities such as-:

- Section 60 where the Minister may prohibit or restrict hunting and removal of animals in defined areas.
- Section 66 provides for the licensing of professional hunters who undertake legalized hunting safaris.
- Section 72 provides for the sale of animals born or hatched and held in captivity.
- Section 73 provides for the sale and manufacture of articles from trophies.

Environmental Management Act Chapter 20:27 Of 2006

This Act provides for the sustainable management of natural resources and protection of the environment. The Act also provides for the preparation of National Environmental Plans for the management and protection of the environment in Zimbabwe.

Forest Act Chapter 19:05

This Act provides for the establishment of a commission, to control, manage and protect of State forests as well as private forests thus providing a secure habitat for lions and other wildlife species.

Statutory Instrument 362 Of 1990
This legislation provides in sections 66-75 for the Regulation of Manufacture, Processing and Dealing in trophies.

Statutory Instrument 76 Of 1998
Statutory Instrument number 76 of 1998, Parks and Wild Life (Import and Export) (Wild Life) Regulations specifically deals with Import and Export of wildlife products. This legislation was enacted to ensure compliance with CITES requirements for export and import of wild flora and fauna. These provide for the following-:

- Section 3 deals with the Control of Import and Export of wild life and trophies.

The above section lays down a general prohibition on the import into or export from Zimbabwe of any "wild life" or trophy of "wild life" except in accordance with either a certificate issued in terms of section 5 by the Director or Director of Customs, or an open general permit:

- Section 5 deals with Permits and Certificates and is consistent with CITES legislation.

- Section 15 deals with Offences and Penalties.

Any person who contravenes any of the provisions of subsection 1 shall be guilty of an offence, and liable to a fine or imprisonment. To effectively ensure compliance, the Zimbabwe Parks and Wildlife Management Authority deployed a permanent team of officers based at all ports of exit and entry to assist border control officials in monitoring and inspection of all wildlife exports.

Statutory Instrument 26 Of 1998
The regulations provides for the monitoring of all hunting activities in the country to ensure compliance by all Safari Operators and international clients and to ensure that the TR2 Form. (Tourism Hunting Return Form) is duly completed.

Trapping Of Animals (Control) Act Chapter 20:21
The Act provides for the control, restriction and regulation of the construction, possession and use of certain traps for the purpose of trapping animals; to control the sale and disposal of certain animals, to include lions and to provide for matters incidental to or connected with the foregoing.

Statutory Instrument 92 Of 1992
Parks and Wild Life (Payment for Hunting of Animals and Fish) Notice, 2009
This instrument provides for compensation values of various wildlife forms to include animals and fish. It acts as an additional deterrent measure in matters where poaching cases are being dealt with in accordance with the law. The compensation value for illegal hunting of lion is USD 5 000, 00.

Statutory Instrument 93 Of 2009
Parks and Wild Life (Payment for Trapping of Wild Animals) Notice, 2009
This instrument provides for the payment of compensation to the state or game owners in the event that one is convicted for illegally trapping wild animals on various land categories. The compensation value for illegal hunting of lion is USD 5 000, 00.

Statutory Instrument 40 Of 1994
Parks and Wildlife (Appropriate Authorities for Communal Land) Notice, 1994, resulted in the according of Appropriate Authority status to various Rural District Councils. This legislation devolved authority to Rural District Councils and gave rights to local communities to sustainable utilize wildlife and other natural resources in their areas of jurisdiction.

New Draft Statutory Instrument
A draft Statutory Instrument, Parks and Wildlife (Inspection, Registration and Licensing of Wildlife Properties) Regulations is currently under consideration in the Office of The Attorney General. This legislation will assist the Zimbabwe Parks Management Authority to adequately monitor the activities of private property owners whose premises have wildlife.

Code of Hunting Ethics for Zimbabwe

A Code of Ethics for Hunting in Zimbabwe is in place which regulates all forms of hunting including all lion hunts.

Ms. Brisendine,

Please see the attached letter and document to be included with all applications listed, which should be all outstanding lion import permit applications for trophies coming from Zimbabwe that were filed through Conservation Force.

If you have any questions regarding this matter, please do not hesitate to contact me.

Thank you,

Aimee Korver

Ms. Brisendine:

The document attached is to be included as supplement to all original import permit applications filed with the U.S. Fish and Wildlife Service listed above.

Since filing these applications we have received additional documentation of conservation efforts for lions in Zimbabwe that further detail the populations as stable and growing. The CAMPFIRE document strongly argues the importance of trophy imports and the value that they provide to communities in Zimbabwe through income flows from tourism and hunting which serve to support sustainable community livelihoods in a way that promotes conservation of wild species and habitat.

The Campfire document details the drastic effects that COVID-19 has had and is having on Zimbabwe's tourism and hunting market, which is in a state of collapse. It is leaving the country uncertain of how wild-life and anti-poaching programs will be supported on the ground in the coming months. This information can be used to predict what might transpire if trophy hunting and imports were to cease to exist and the tragic outcome it could have on the conservation efforts of wildlife in the area.

We ask that you please consider these documents when making your decision on enhancement in each import permit application.

Please feel free to contact me if you have any questions regarding this mater.

Cordially,

Aimee Korver
Permits Paralegal

1. CAMPFIRE communities Concern on Import Bans

Open Letter to the United States Fish and Wildlife Service

Dear Dr Mary Cogliano

CAMPFIRE Communities Concern on Import Bans

CA/MPFIRE Association, otherwise known as the Community Areas Management Program for Indigenous Resources in Zimbabwe wishes to register its opposition to continuing campigns for the banning of trophy imports. We are fully aware that the general outrage in both print and social media against sport hunting, which many distant voices refer to as unethical, is aimed at influencing policy action by importing countires.. These arguments, none of which are supported by science, are based on a perfected art of global misinformation and do not represent the views of rural communities who live side by side with wildlife. To us as a people with substantial wildlife populations, trophy hunting is indispensable for conservation and rural livelihoods.

Zimbabwe has one of the most resilient and successful conservation programs in Africa. Its conservation efforts have historically enabled local communities to thrive on sustainable livelihoods in biodiversity-rich landscapes. At least 800 000 households or 2.5 million people (out of a national population of 16 million) benefit directly and indirectly from the sustainable use of wildlife and tourism related investments in their areas. However, our ever growing elephant population has increased the levels of conflict between humans and wildlife in recent years, which, together with recurrent droughts that threaten food security, have made traditional livelihoods more difficult, especially for subsistence farming communities that live in the wildlife rich areas of the country.

Communities in CAMPFIRE areas reside in an environment where conflict between humans and wildlife is common, as both compete for the limited available land and water resources. But this comes at a high price: people in Zimbabwe are paying with their lives for tolerating wild animals in their areas. As recently as 23rd March 2020, Barnabas Mwinga, a 50 year old man, was killed by an elephant in his field in front of his wife and young daughter in Gonono Ward, Mbire District. He is one of seven other people that have needlessly lost their lives to wildlife attacks throughout the country since the beginning of 2020, in addition to the 41 killed in 2019. Yet despite this high cost, wildlife is still highly valued by rural communities who continue to tolerate massive crop destruction and livestock losses from wildlife without compensation. For example, elephant poaching in Mbire District where Barnabas Mwinga was recently killed has gone down from a peak of 40 in 2010 to only 3 elephants poached in 2019 (Figure 1). The decline in poaching incidents is a result of collaborative efforts between the Safari Operator and the hunting clients who invest nearly $100,000 annually into an anti-poaching unit.

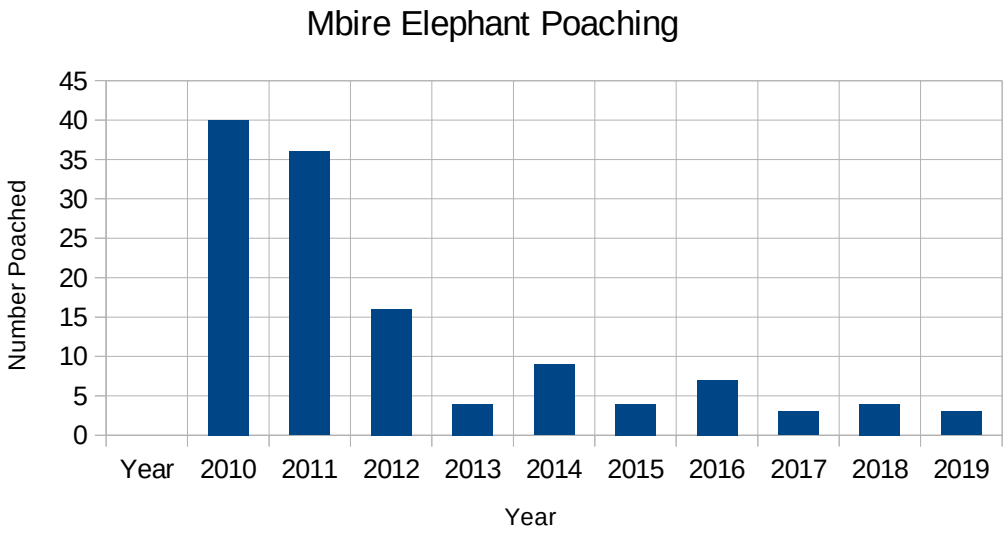

Figure 1: Mbire Elephant Poaching Trends (Source – Mbire Rural District Council)

The aim of the CAMPFIRE programme is to support sustainable community livelihoods in a way that promotes conservation of wild species and habitat. For nearly 30 years, trophy hunting, which relies heavily on the American market, has been cautiously implemented in the absence of other tourism opportunities to achieve this goal. Not only has it resulted in increasing food and livelihood security of rural people, it has also played a role in undermining the drivers of poaching and mitigating human and wildlife conflict. The net impact is seen in securing wildlife habitat and assisting in the regeneration of degraded landscapes.

The financial resources to succeed with this programme in CAMPFIRE areas are heavily dependent on the sustainable hunting of big game, especially elephants. The monies generated from these activities finance the local economies, social services as well as anti-poaching efforts and wildlife management at the District and Ward levels. For example, as can be seen from Table 1 below, the total number of elephants hunted as trophies over nine years is 807 out of a cumulative quota of 1381, from an estimated national population of 83,000 elephants. Hunting quotas are set at no more than 0.5% of the population estimate compared to an elephant population growth of 5% to 6% annually. The levels of off-take (58%) also demonstrate that while hunting is based on controlled numbers for each species annually, it is not uncommon for a client to pay for a full hunt and enjoy the wild experience, but not take a trophy. It is also important to note that communities do not view international hunting clients just as tourists, but as vital conservation partners.

Table 1: Trophy Hunting Quota Summary and Income: 2010-2018

Source: *The Role of Trophy Hunting of Elephant in Support of the Zimbabwe CAMPFIRE Program: Vernon Booth* (in progress).

District and Ward-level institutions in the CAMPFIRE areas rely on income from hunting to provide significant local livelihood benefits (income, jobs, skills) and social services (schools, clinics, irrigation schemes, boreholes) in remote regions where agriculture is marginal and there are very few jobs or other sources of cash income. Table 2 and Table 3 below summarise the impact of pre- and post-elephant trophy import suspension expenditure on the CAMPFIRE programme at the District and Ward level. The District administration costs absorb 89% of the budget with 30% devoted to law enforcement. With the suspension of elephant trophy imports to the USA and Europe in 2016, expenditure on law enforcement dropped from 33% to 9% as a result of District administration having to offset the human and wildlife costs which increased from 1% to 33%. At the Ward level, 46% of the budget is allocated to administration and 54% to community benefits (45% devoted to social services, Table 3).

Table 2: District level expenditure on administration and community benefits: 2010-2018

With growing awareness from several years of CAMPFIRE implementation, communities have been demanding their rightful place in the management of wildlife resources for their own benefit. To accommodate this, CAMPFIRE has undergone a review of its policy framework to enable communities to reap greater and more tangible benefits from living in harmony with nature. A key aspect of this review is to establish Community Conservancies that redefine ways in which communities can benefit more from wildlife and other income generation opportunities, as well as the mitigation of human and wildlife conflict. This initiative is being directed under the Global Environment Facility (GEF) 5 and 6 cycles covering five districts with the aim of developing innovative ways to improve the management of wildlife for the benefit or rural people. If trophy hunting and trade here was stopped, the impact on local livelihood would be severe, and both poaching and changes to alternative land use would increase. Non-consumptive tourism currently plays virtually no positive conservation role in the CAMPFIRE areas (<4% of overall income is generated through tourism). Instead of banning the import of trophies, more international oversight and support is needed from importing states, and of in-country CITES controls, to ensure sound sustainable management e.g. quota-setting, permit allocation, independent population surveys; building robust, equitable and transparent benefit allocation mechanisms at local level, particularly where communities have elected to invest their land and time in Community Conservancies.

STOP PRESS: The pressure for imports bans comes at the worst possible time as the Covid-19 pandemic has severely disrupted income flows from tourism and hunting. The collapse of both markets leaves rural people and safari operators with virtually no income, and it is uncertain how wildlife protection and anti-poaching programs will be supported on the ground in the coming months. What remains clear is that trophy import bans will seriously undermine conservation in Zimbabwe, and indeed open floodgates for rural people to destroy wildlife and wildlife habitat through conversion of land for other subsistence uses, even if unviable.

Enhancement Finding

Applicant: Francescomaria Tiberio Cavallo (PRT–16345D)

Introduction

Francescomaria Tiberia Cavallo submitted an application on November 19, 2018, for the importation of one male lion *(Panthera leo melanochaita)* taken on September 16, 2018, from the Savé Valley Conservancy (SVC), Humani Ranch, Masvingo Province, Zimbabwe, for the purpose of enhancing the propagation or survival of the species in the wild. After evaluating the available information submitted with the application, information provided by the Government of Zimbabwe, other information available to the U.S. Fish & Wildlife Service (Service), and comments received from interested parties, the Service has determined that the importation of the sport-hunted trophy meets the requirements for making a positive enhancement finding pursuant to 50 CFR 17.40(r) and 50 CFR 17.32(a). The rationale for our finding follows.

U.S. Permit Requirements for Import of Lions (*Panthera leo melanochaita*)

ESA

The African lion, subspecies *Panthera leo melanochaita* (southern and eastern Africa), is a threatened species under the U.S. Endangered Species Act (ESA or Act) and is regulated under a species-specific 4(d) rule, 50 C.F.R. § 17.40(r) that provides specific conservation measures for this subspecies. Under the 4(d) rule for *P. l. melanochaita*, all of the prohibitions at 50 C.F.R. § 17.21 and 50 C.F.R. § 17.31 apply to *P. l. melanochaita* specimens. These prohibitions, in part, make it illegal for any person subject to the jurisdiction of the United States to import or export any lion specimens.

Although import of the lion subspecies *P. l. melanochaita* is a prohibited activity under the Act, exceptions may be made in accordance with the 4(d) rule at 50 C.F.R. § 17.40(r) when

the import activity qualifies for and the Service issues an ESA threatened-species enhancement permit under 50 C.F.R. § 17.32(a). The preamble to the 4(d) rulemaking, 80 Fed. Reg. 79999, 80043-46 (Dec. 23, 2015), explains the factors the Service considers when making an enhancement finding for importation of sport-hunted trophies of *P. l. melanochaita*, as described below.

Our threatened species permitting regulations at 50 CFR 17.32 provide issuance criteria for threatened species permits (50 CFR 17.32(a)(2)), but do not specify what would constitute the enhancement of propagation or survival with regard to authorizing the import of parts or products of *P. l. melanochaita,* including sport-hunted trophies. Therefore, when making a determination of whether an otherwise prohibited activity enhances the propagation or survival of *P. l. melanochaita,* the Service will examine the overall conservation and management of the subspecies in the country where the specimen originated and whether that management of the subspecies addresses the threats to the subspecies (*i.e.,* that it is based on sound scientific principles and that the management program is actively addressing the current and longer term threats to the subspecies). In that review, we will evaluate whether the import contributes to the overall conservation of the species by considering whether the biological, social, and economic aspects of a program from which the specimen was obtained provide a net benefit to the subspecies and its ecosystem.

The Service will evaluate any application received that involves *P. l. melanochaita* in the context of enhancement of propagation or survival permitting in accordance with our threatened species permitting regulations at 50 CFR 17.32 and issuance criteria for threatened species permits (50 CFR 17.32(a)(2)). These include, in addition to the general permitting criteria in 50 CFR 13.21(b):

(i) Whether the purpose for which the permit is required is adequate to justify removing from the wild or otherwise changing the status of the wildlife sought to be covered by the permit;
(ii) The probable direct and indirect effect that issuing the permit would have on the wild populations of the wildlife sought to be covered by the permit;
(iii) Whether the permit, if issued, would in any way, directly or indirectly, conflict with any known program intended to enhance the survival probabilities of the population from which the wildlife sought to be covered by the permit was or would be removed;
(iv) Whether the purpose for which the permit is required would be likely to reduce the threat of extinction facing the species of wildlife sought to be covered by the permit;
(v) The opinions or views of scientists or other persons or organizations having expertise concerning the wildlife or other matters germane to the application; and
(vi) Whether the expertise, facilities, or other resources available to the applicant appear adequate to successfully accomplish the objectives stated in the application.

In addition to these factors, particularly in relation to sport hunting, we find the *IUCN Species Survival Commission (SSC) Guiding Principles on Trophy Hunting as a Tool for Creating Conservation Incentives, Ver. 1.0* (IUCN SSC 2012), to provide useful principles, which, considered in conjunction with our threatened species issuance criteria, will aid the Service when making an enhancement finding for importation of sport-hunted trophies of *P. l. melanochaita.* This document sets out guidance from experts in the field on the use of trophy hunting as a tool for "creating incentives for the conservation of species and their habitats and for the equitable sharing of the benefits of use of natural resources" (IUCN SSC

2012, p. 2) and recognizes that recreational hunting, particularly trophy hunting, can contribute to biodiversity conservation and more specifically, the conservation of the hunted species.

The SSC document lays out five guiding principles that, considered in conjunction with our threatened species issuance criteria, will aid the Service when making an enhancement finding for importation of sport-hunted trophies of *P. l. melanochaita:*

(a) *Biological sustainability:* The hunting program cannot contribute to the long-term decline of the hunted species. It should not alter natural selection and ecological function of the hunted species or any other species that share the habitat. The program should not inadvertently facilitate poaching or illegal trade in wildlife by acting as a cover for such illegal activities. The hunting program should also not manipulate the ecosystem or its component elements in a way that alters the native biodiversity.
(b) *Net Conservation Benefit:* The biologically sustainable hunting program should be based on laws, regulations, and scientifically based quotas, established with local input, that are transparent and periodically reviewed. The program should produce income, employment, and other benefits to create incentives for reducing the pressure on the target species. The program should create benefits for local residents to co-exist with the target species and other species. It is also imperative that the program is part of a legally recognized governance system that supports conservation.
(c) *Socio-Economic-Cultural Benefit:* A well-managed hunting program can serve as a conservation tool when it respects the local cultural values and practices. It should be accepted by most members of the community, involving and benefiting local residents in an equitable manner. The program should also adopt business practices that promote long-term economic sustainability.
(d) *Adaptive Management: Planning, Monitoring, and Reporting:* Hunting can enhance the species when it is based on appropriate resource assessments and monitoring (*e.g.,* population counts, trend data), upon which specific science-based quotas and hunting programs can be established. Resource assessments should be objective, well documented, and use the best science available. Adaptive management of quotas and programs based on the results of resource assessments and monitoring is essential. The program should monitor hunting activities to ensure that quotas and sex/age restrictions of harvested animals are met. The program should also generate reliable documentation of its biological sustainability and conservation benefits.
(e) *Accountable and Effective Governance:* A biologically sustainable trophy-hunting program should be subject to a governance structure that clearly allocates management responsibilities. The program should account for revenues in a transparent manner and distribute net revenues to conservation and community beneficiaries according to properly agreed decisions. All necessary steps to eliminate corruption should be taken and to ensure compliance with all relevant national and international requirements and regulations by relevant bodies such as administrators, regulators and hunters.

The Service's approach to enhancement findings for the importation of sport-hunted trophies of *P. l. melanochaita* is consistent with the purpose and intent of the Endangered Species Act. Before we will authorize the importation of a sport-hunted trophy, we must determine that the trophy hunting program is managed to ensure the long-term survival of the species. In many parts of the world, wildlife exists outside of protected areas and must share the same habitat

and compete with humans living in these areas for space and resources. If communities that share these resources with wildlife do not perceive any benefits from the presence of wildlife, they may be less willing to tolerate the wildlife. However, under certain circumstances, trophy hunting can address this problem by making wildlife more valuable to the local communities and encourage community support for managing and conserving the hunted species, as well as other species.

When evaluating whether the importation of a trophy of *P. l. melanochaita* would be authorized pursuant to 50 CFR 17.32, in accordance with our threatened species issuance criteria, we will examine how a country's management program for lions addresses the three main threats that have led to the decline of the subspecies: Habitat loss, loss of prey base, and human-lion conflict. When examining a management program and whether trophies taken as part of that program meet the issuance criteria, we would study a number of factors. Some of the factors we would consider include whether the program is based on sound scientific information and identifies mechanisms that would arrest the loss of habitat or increase available habitat (*i.e.,* by establishing protected areas and ensuring adequate protection from human encroachment). We would consider whether the management program actively address the loss of the lion's prey base by addressing poaching or unsustainable offtake within the country. A component of a management plan from which trophy imports would meet the issuance criteria would be whether there are government incentives in place that encourage habitat protection by private landowners and communities and incentives to local communities to reduce the incursion of livestock into protected areas or to actively manage livestock to reduce conflicts with lions. We would examine if the hunting component of the management program supports all of these efforts by looking at whether hunting concessions/tracts are managed to ensure the long-term survival of the lion, its prey base, and habitat. As stated previously, hunting can generate significant economic benefits if properly conducted. In looking at whether we would be able to authorize the import of a trophy under the issuance criteria of 50 CFR 17.32, we would examine if the trophy hunting provides financial assistance to the wildlife department to carry out elements of the management program and if there is a compensation scheme or other incentives to benefit local communities that may be impacted by lion predation. We would also consider how a U.S. hunter's participation in the hunting program contributes to the overall management of lions within a country.

Management programs for *P. l. melanochaita* would be expected to address, but are not limited to, evaluating population levels and trends; the biological needs of the species; quotas; management practices; legal protection; local community involvement; and use of hunting fees for conservation. In evaluating these factors, we will work closely with the range countries and interested parties to obtain the information. By allowing entry into the United States of *P. l. melanochaita* trophies from range countries that have science-based management programs, we anticipate that other range countries would be encouraged to adopt and financially support the sustainable management of lions that benefits both the species and local communities. In addition to addressing the biological needs of the subspecies, a scientifically based management program would provide economic incentives for local communities to protect and expand *P. l. melanochaita* habitat.

As stated, under this 4(d) rule any person wishing to conduct an otherwise prohibited activity, including all imports of *P. l. melanochaita* specimens, must first obtain a permit under 50

CFR 17.32. As with all permit applications submitted under 50 CFR 17.32, the individual requesting authorization to import a sport-hunted trophy of *P. l. melanochaita* bears the burden of providing information in their application showing that the activity meets the requirements for issuance criteria under 50 CFR 17.32. In some cases for imports, such as sport-hunted trophies, it is not always possible for the applicant to provide all of the necessary information needed by the Service to make a positive determination under the Act to authorize the activity. For the import of sport-hunted trophies of *P. l. melanochaita,* the Service will typically consult with the range country to the extent practicable and other interested parties to obtain necessary information.

The Service has the discretion to make the required findings on sport-hunted trophy imports of *P. l. melanochaita* on a country-wide basis, although individual import permits will be evaluated and issued or denied for each applicant. While the Service may make enhancement findings for sport-hunted trophy imports of *P. l. melanochaita* on a country-wide basis, the Service encourages the submission of information from individual applicants. We would rely on the information available to the Service and may rely on information from sources other than the applicant when making a permitting decision.

CITES

The African lion is also included in Appendix II of the Convention on International Trade in Endangered Species of Wild Fauna and Flora (CITES). It is unlawful for any person subject to the jurisdiction of the United States to engage in international trade in CITES specimens contrary to the provisions of the Convention, the ESA, or our CITES implementing regulations in 50 CFR part 23. 16 U.S.C. § 1538(c)(1), (g); 50 C.F.R. § 23.13. As required by CITES, export of a specimen of an Appendix II species to another country requires prior issuance of a CITES permit. Under CITES, importation of an Appendix II species does not require issuance of an import permit from the importing country. Consequently, the United States is not required to issue a CITES permit in order for U.S. hunters to import their sport-hunted lions. In compliance with CITES, the United States does require CITES imports to meet all CITES requirements, including that the imported lion trophies be accompanied by the required CITES export permits issued by the exporting countries, *see* 50 C.F.R. §§ 23.20; 23.23; 23.24; 23.26; 23.27, and including requirements for sport-hunted trophies at 50 C.F.R. § 23.74.

Individual Permit Adjudication Considerations

When the African lion listing under the ESA became effective, January 22, 2016, the Service began issuing enhancement findings for *P. l. melanochaita* on a countrywide basis, as had been the practice for a number of other threatened sport-hunted species. On March 1, 2018, however, in response to a D.C. Circuit Court opinion (*Safari Club Int'l v. Zinke*, 878 F.3d 316 (D.C. Cir. 2017)), the Service withdrew its countrywide enhancement findings for a range of species, including lions, across several countries, and began assessing applications to import sport-hunted trophies of these species on an application-by-application basis. These withdrawals were upheld in a D.C. Circuit Court opinion (*Friends of Animals v. Bernhardt*, No. 19-5147 (D.C. Cir. June 16, 2020); *Center for Biological Diversity v. Bernhardt*, No. 19-5152 (D.C. Cir. June 16, 2020)). No countrywide ESA enhancement findings are currently in effect. Therefore, since March 1, 2018, the Service has been making

ESA enhancement findings for the import of sport-hunted trophies of lions on an application-by-application basis, ensuring consistent application of the regulatory criteria across all permit application adjudications and ensuring that each permit decision is based on the best scientific and management information available.

Although the Service makes the required enhancement findings on sport-hunted trophy imports of *P. l. melanochaita* on an individual application basis, information obtained for the range country as a whole is also considered, as it is pertinent to the Service's evaluation. In addition to considering national-level species management, we also consider species management and contributions to species enhancement on a smaller-scale (e.g., at the regional or hunting management unit scale such as at the hunting operator, community conservancy, concessionaire, reserve, or ranch-level scale). In addition, we consider how the hunter's personal involvement in the hunting experience directly or indirectly contributes to enhancement of the species in the wild. In its enhancement evaluation, the Service, therefore, considers efforts made by the hunting management unit and/or individual hunter to directly or indirectly address the threats posed to lions in the wild together with other information available concerning the overall management and population status of the lion in the range country at the time of the hunt.

In making ESA enhancement findings, we review all relevant information available to us, including information submitted with the individual permit applications, information received in response to inquiries we make of the range countries, and all other reliable information we receive from interested parties, such as species experts, hunting organizations, hunting operators, community groups, and non-governmental organizations. We evaluate and consider all relevant information obtained or submitted to the Service on an ongoing basis as it relates to permit applications received for import of sport-hunted trophies of *P. l. melanochaita*.

The Service considers information at these different levels in order to assess:

1) How the range country government manages the hunted species and how hunting serves to enhance the survival of the species in the wild in the context of the management system;
2) How hunting serves to enhance the survival of the species in the wild in the context of the management unit at the hunting operator, concessionaire, community conservancy, reserve, or ranch level; and
3) How the individual hunter has contributed (where the hunt has already taken place) or will contribute (where the hunt has not yet taken place) to enhancement of survival of that species through their hunting activities and contributions to the survival of the species in the wild associated to the hunt and subsequent import.

Government-Level Factors Considered

- Enforcement of wildlife laws and regulations, particularly with regard to the range country's ability to implement wildlife regulations developed for the hunted species
- Implementation of a scientifically-based management plan that addresses the major threats to the species and provides economic incentives for local communities to conserve the species
- Investment of hunting fees into conservation, including whether the range country has standard processes and infrastructure in place to ensure an effective transfer of hunting revenues back into the country's management of the species and community benefits
- Management of human-lion conflict, including whether the range country has a compensation scheme or other incentives to local communities to reduce the incursion of livestock into protected areas or to actively manage livestock to reduce conflicts with lions
- Management of the lion's prey base by addressing poaching or unsustainable offtake of the lion's prey species
- Management of lion hunting areas through a system that ensures the long-term survival of the lion, its prey base, and habitat
- Protection of lion habitat through establishment of protected areas, ensuring adequate protection from human encroachment and providing incentives that encourage habitat protection by private landowners and communities
- Establishment and use of science-based quotas, a sex and age-based harvest system, and a monitoring program for the lion and its prey species

Hunting Management Unit-Level Factors Considered

- Monitoring populations of the hunted species and their prey-base
- Protecting and/or increasing the prey-base for lions in the wild
- Maximizing biodiversity of the lion's prey species
- Protecting and improving the habitat for lions in the wild to ensure maintenance of ecosystem functions and biodiversity (e.g., creating water holes, habitat management, etc.)
- Engaging in anti-poaching activities for lion and their prey base
- Managing human-lion conflict
- Investing in community benefits and employment, where such investments provide incentives for conservation of lions in the wild
- Complying with harvest laws and regulations
- Re-investing hunting fees or other contributions associated to lion hunting to a fund that supports conservation of lions in the wild

Hunter-Level Factors Considered

- Complying with harvest laws and regulations
- Paying hunting/import-related fees or other contributions associated to lion hunting that are re-invested to support conservation of lions in the wild (e.g., funding habitat protection for lions in the wild, protection of the lion's prey base, or mitigation of human-lion conflict)
- Participating in a hunting program with an operator that supports sustainable use of the species

This application-by-application permit review process offers an opportunity to incentivize hunting in concessions, conservancies, reserves, or ranches that support conservation of the species through rigorous anti-poaching programs, local wildlife monitoring activities, and compliance with government rules and regulations. By complying with our enhancement requirements, a hunter's personal import will help conserve lion populations in the wild by supporting the local communities where they hunt and promoting conservation of these species and their habitats by providing protection incentives to communities that live alongside these species.

Basis for Finding

On February 1, 2016, the Service sent a letter to the Parks and Wildlife Management Authority in Zimbabwe (ZPWMA) with a list of questions related to management plans, population status, conservation, management, hunting policies, and regulations of Zimbabwe's lion populations. Additionally in the letter, the Service referenced the IUCN SSC Guiding Principles on Trophy Hunting as a Tool for Creating Conservation Incentives Ver. 1.0 (09 August 2012), as it provides useful principles which, when considered in conjunction with the Service's permit issuance criteria, would aid when making the required enhancement findings for permitting importation of sport-hunted lion trophies.

On February 16, 2016, the Service sent a second request to ZPWMA for specific documents related to the conservation status of lions in Zimbabwe. ZPWMA responded to the Service's request on February 17, 2016, with a copy of *Conservation Status of African Lion in Zimbabwe,* and subsequently, on November 29, 2016, provided a copy of its *Enhancement and Non-detriment Finding for Lion (Panthera leo) in Zimbabwe.* The Service has also been corresponding with ZPWMA regarding African elephant management for several years. In this correspondence, ZPWMA, as well as other sources, have provided the Service with documents and information that are relevant to our evaluation of lions in Zimbabwe.

Since 2016, the Service has met with officials from Zimbabwe multiple times to receive updated information on the status of and management of lions in Zimbabwe with respect to imports of sport-hunted lion trophies. For example, Service representatives met with Zimbabwe officials in January 2018 at the annual Safari Club International convention in Las Vegas, and November 2018 at the African Wildlife Consultative Forum in Uganda. In September 2018, Zimbabwe officials provided to the Service the May 2017 Zimbabwe National CAMPFIRE Stakeholder's Review and the Zimbabwe Parks and Wildlife Management Authority Strategic Plan, 2019-2023. In addition, in September 2018 the Service received a letter dated 6 December 2017 from Hon. E.D. Mnangagwa, President of the Republic of Zimbabwe, addressed to President Donald Trump, addressing the

change of administration in Zimbabwe. In this letter Hon. E.D. Mnangagwa provided assurance to the United States that Zimbabwe is politically stable and that Zimbabwe's previous conservation initiatives would be enhanced, with the previous Minister, Permanent Secretary, and Director General confirmed to remain in place.

This information provided by the Zimbabwe authorities (including verbal updates and presentations at the 16th Annual African Wildlife Consultative Forum (Uganda, November 2018), along with the Service's final rule on the lion listing under the Act and other relevant information from reliable sources, are the basis of this finding.

Governance of Lions in Zimbabwe

The legal framework for Zimbabwe's regulatory mechanism is informed by its Wildlife Policy (1992), which is intended to maintain a protected area network for the conservation of the nation's wild resources and biological diversity. The Wildlife Policy (1992) provides for the Government of Zimbabwe to maintain a network of protected areas known as the Parks and Wild Life Estate, comprised of the country's National Parks, safari areas, botanical gardens, and sanctuary and recreational areas for the conservation of the nation's wild resources and biological diversity (CITES 2016; ZPWMA 2016). The framework is intended to create economic activity to enhance rural development and encourages the conservation of wild animals and their habitats outside the protected areas.

ZPWMA was established by the Parks and Wildlife Act of 1996 (Chapter 20:14) [as amended by Act Number 19 of 2001] which came into operation on June 1, 2002, through Statutory Instrument 144C of 2002. The Act provides for the establishment of a Parks and Wildlife Board; establishment of national parks, botanical reserves, botanical gardens, sanctuaries, safari areas and recreational parks; and the preservation, conservation, propagation or control of wildlife, fish, and plants of Zimbabwe and the protection of Zimbabwe's natural landscape and scenery. This Act includes sections on virtually every aspect of ZPWMA, including requirements for annual financial audits and reporting to the central government. The Act also provides for substantial penalties for the unlawful possession of or trading in protected wildlife species. In addition, the General Laws Amendment Act (No. 5) of 2010 provides for mandatory imprisonment for poaching.

The Parks and Wildlife Act, Chapter 20:14, devolved authority to manage and benefit from wildlife on communal and private lands to the landholders. In 1982, the legal provisions of this Act were extended to Rural District Councils (RDCs), on behalf of rural communities in communal lands whose areas contain viable populations of wildlife. Communal areas in Zimbabwe are administered by RDCs which have become a mechanism for implementation of the government's policy of conservation by utilization of natural resources. The Act enables local communities to manage and benefit from wildlife resources through the Communal Areas Management Programme for Indigenous Resources (CAMPFIRE) established in 1989.

CAMPFIRE was developed to encourage reduction in human-wildlife conflicts through conservation-based community development and to provide an economic incentive to

improve community tolerance of wildlife, including lions. At the time, the CAMPFIRE program was the model for community-based conservation efforts in several other African countries and was identified as an innovative program. Under a community-based conservation program, like CAMPFIRE, rural communities should benefit from revenue generated by sport-hunting.

As Zimbabwe's premiere wildlife agency, the main functions of the ZPWMA are to control, manage, and maintain Zimbabwe's wildlife resources with the primary role of protecting and conserving Zimbabwe's natural heritage for present and future generations on behalf of the country. It also provides the cornerstone of Zimbabwe's tourism industry (ZPWMA 2015). The rationale behind the establishment of the ZPWMA was to allow for a self-funding mechanism, and thereby reduce its dependence on the national treasury. In January 1996, the Government of Zimbabwe approved the establishment of the Parks and Wild Life Conservation Fund that provides for financing wildlife operations directly from revenues generated through wildlife-related activities. The funding for ZPWMA is therefore coming from revenue generated through sport hunting conducted on state and private lands, concession leases, National Park visitor fees, and other wildlife-related fees. While there have been requests by ZPWMA for funding from the central treasury in the past, to our knowledge, no other significant government funding has been provided, and only limited outside funding from non-governmental organizations (NGOs) or other governments appears to be available.

A major component of ZPWMA mandate is law enforcement. Poaching mainly occurs along the boundaries of protected areas where lions are incidentally snared as non-target prey. Between 2013 and 2015, 21 lions were killed illegally, with six animals killed through snaring in the area adjacent to Hwange National Park in 2015; poverty stands as the major driver of illegal hunting (ZPWMA 2016). If anyone is found in possession of poached specimens, they must pay a fine of USD 5,000 or face a mandatory jail sentence. If convicted of lion poaching, courts could require the payment of a compensation fee of USD 20,000 (ZPWMA 2014). Hunting operators are obligated through their concession lease agreements to assist with anti-poaching efforts (ZPWMA 2016). Reportedly, USD 590,000 was spent on anti-poaching efforts by the Bubye Valley Conservancy (BVC) alone during 2015 (K. Leathern, pers. comm., as cited in Du Preez et al. 2016), and USD 546,000 is spent annually on anti-poaching by the Savé Valley Conservancy (SVC) (Lindsey et al. 2012); these expenses are mainly covered by sport-hunting revenue (Du Preez et al. 2016). In 2002, ZPWMA had 2,146 rangers at its establishment (ZPWMA 2016); however, by the end 2015, there were 1,448 rangers in post (67% of 2002 level). Of the 1,448 rangers in post, 1,004 are deployable for anti-poaching operations (ZPWMA 2016).

Safari operators in Zimbabwe are required to be registered and licensed by the Zimbabwe Tourism Authority (https://www.soaz.net/index.php/2, accessed August 16, 2019). Operators must hold a lease or agreement on a suitable concession with an approved quota of animals. They are responsible for the official paperwork and permits connected to the hunt. Hunting operators are required by law to provide the services of a Zimbabwe Licensed Professional Hunter to accompany foreign hunters in Zimbabwe. Licensing is undertaken by the National Parks & Wildlife Authority.

Zimbabwe is a member of the Southern African Development Community (SADC). Under the SADC Treaty, Article 5(g) establishes objectives to, among other aspects, promote the sustainable use of wildlife, harmonize legal instruments governing wildlife use and conservation, promote the conservation of shared wildlife resources through the establishment of trans-frontier conservation areas (TFCA), and facilitate community-based natural resources management practices. To implement the SADC Treaty, member states are required to establish management programs for the conservation and sustainable use of wildlife.

Currently Zimbabwe is pursuing six TFCA initiatives at various stages of development. These are: Great Limpopo Transfrontier Park (GLTP) / Great Limpopo Transfrontier Conservation Area (GLTFCA); Chimanimani TFCA; Greater Mapungubwe TFCA; Kavango-Zambezi (KAZA) TFCA; Lower Zambezi-Mana Pools LZMP (TFCA) and Zimbabwe-Mozambique-Zambia (ZIMOZA) TFCA (Mandisodza-Chikerema 2018, p. 34).

Through TFCAs, wildlife management entities are linking many of the major protected areas by removing boundary fences along national borders that separate many reserves in addition to creating or improving corridors to link good-quality habitat for wildlife (Newmark 2008). The principle of ecological and migratory connectivity lies at the heart of the TFCA initiative linking large protected areas across international boundaries and providing space for wildlife populations.

Another provision of the SADC Treaty is that member states are required to establish management programs for the conservation and sustainable use of wildlife. Zimbabwe has met this criterion for African lions through the development of its 2006 *Conservation Strategy and Action Plan/or the Lion (Panthera leo) in Zimbabwe* (ZPWMA), which is still in use.

As previously mentioned, Zimbabwe is also a Party to CITES, and the African lion species is included in Appendix II of the Convention. As an Appendix-II species, certain criteria must be met before the CITES Management Authority of the country of export may issue an export permit, including a finding from the exporting country's CITES Scientific Authority that the proposed activity will not be detrimental to the survival of the species in the wild (non-detriment finding; NDF) and a finding from the CITES Management Authority that the specimens proposed for export were legally acquired (legal acquisition finding).

The ZPWMA has provided the Service with a copy of its standing CITES non-detriment finding (NDF), dated October 2016, for the export of African lion specimens. The NDF explains that lion populations in Zimbabwe are being managed sustainably for the benefit of the species and that Zimbabwe's management program for lion provides economic incentives for local communities to protect and expand lion habitats. The NDF document provides information to support the following:

- The Zimbabwe hunting industry is based on sound scientific information, provides mechanisms to arrest habitat loss, or where feasible increase habitat, and provides protection from human encroachment.

- Government incentives are in place to encourage habitat protection by private landowners and communities.
- Government Incentives are provided to local communities to reduce human-wildlife conflicts.
- Hunting concessions are managed to ensure the long-term survival of the African lion and its habitat.
- Trophy hunting provides financial assistance to the ZPWMA, the communal CAMPFIRE program, and private landowners to implement wildlife management programs.
- Local communities directly and indirectly benefit from the presence of lion in their areas.
- Participation of U.S. hunters in the Zimbabwe hunting industry contributes to the overall conservation and management of lions in Zimbabwe (ZPWMA 2016).

Lion Status in Zimbabwe

When the Service listed the subspecies of lion in southern and eastern Africa (*P. l. melanochaita*) as threatened under the Act (80 FR 79999), three primary threats to the species throughout its range were identified: loss of habitat, loss of prey base, and human-lion conflict. While human population growth clearly has an impact due to loss of available habitat for lions, increasing human population has a direct impact on prey base. Prey availability affects the reproduction, recruitment, and foraging behavior of lions and, as a result, strongly influences lion movements, abundance, and population viability (Winterbach *et al.* 2012, as cited in USFWS 2015). Lion densities are directly dependent on prey biomass (Hayward *et al.* 2007). Outside of protected areas, the lion's prey base is much reduced (Du Preez et al. 2016); inadequate management and law enforcement have led to poaching of the lion's prey base for bushmeat, which has been critically depleted (USFWS 2015). Population trends across eastern and southern Africa show that most prey species have declined in recent years; and for Zimbabwe, droughts have been a critical factor (ZPWMA 2016).

A reduced prey base results in a relatively greater chance of lions encountering livestock (Du Preez et al. 2016). While actual losses of livestock to predators may be relatively low, the perceived financial cost to farmers can be high, and lions are persecuted intensely in livestock areas as a consequence. Their scavenging behavior makes them particularly vulnerable to the practice of lacing prey carcasses with poison to eliminate predators (CITES 2016). Co-existence of lions and people is promoted through giving value to lions, such as through tourism and hunting in CAMPFIRE areas (ZPWMA 2014). The threat to lions from habitat loss is especially present in Sebungwe and the South East Low Veld where the fragmented nature of the protected areas is compounded by increasing human and livestock populations surrounding these areas (ZPWMA 2016).

According to the Service's CoPl7 *Consideration of Proposals for Amendment of Appendices I and II,* international trade in lion products is emerging as an additional threat; however, the relative extent to which this threat has contributed to lion population declines is difficult to evaluate accurately (CITES 2016). According to ZPWMA (2016), the illegal local and international trade in lions and their products poses an insignificant risk to the

species in Zimbabwe, as there are no records of people found in possession of illegally acquired lion specimens in Zimbabwe. It is not clear what level of legal trade of lion products, if any, occurs within Zimbabwe.

The bulk of Zimbabwe's wildlife occurs within the Parks Estate which includes 11 national parks, 16 safari areas, 16 recreational parks, 6 sanctuaries, 12 botanical reserves and 3 botanical gardens, all spread across the country (Parks and Wildlife Act 2001 Chapter 20:14). Wildlife populations also occur on the state Forest Areas, Communal CAMPFIRE areas, and private conservancies dedicated to wildlife-based land use. There are approximately 319,317 km^2 of land where some form of wildlife-based land use is practiced in Zimbabwe (ZPWMA 2016). Lions occur permanently in 45% of this available range (circa 145,000 km^2) with the majority occurring in national parks (96%) and safari areas (92%). Lions also occur permanently in 47% of the State forest areas and 66% of privately owned conservancies. The CAMPFIRE areas comprise approximately 247,000 km^2 and lions occur in 36% of these areas. Lions are transient in CAMPFIRE, conservancy, and resettled areas adjacent to the major protected areas, and lions move across the border into Zambia, Mozambique, South Africa, and Botswana.

Zimbabwe's main lion range includes the Hwange-Matetsi Ecosystem, Mid Zambezi Valley, Sebungwe, and South East Lowveld. The lion population estimates in Zimbabwe are determined primarily through carnivore spoor surveys, systematic lion collaring, and call-up surveys. According to ZPWMA's *Conservation Status of the African lion (Panthera leo) in Zimbabwe* July 2014 report, starting in 2015, lion spoor surveys were to be done at two-year intervals in all wildlife areas, and lion call-up surveys were to be done every three years in all major lion areas (ZPWMA 2014). Although the Service has not received confirmation that these surveys have been conducted since 2015, in September 2018, the Service received Zimbabwe's Parks and Wildlife Management Authority's Strategic Plan for 2019-2023, which indicates that Zimbabwe is actively working to improve the monitoring and management of their wildlife species. In their updated strategic plan, signed in December 2018, they indicated that one of their strategic objectives is protection of wildlife resources. Their identified timeline is to update and implement key species management plans (lion is identified as one of these) by December 2023.

ZPWMA (ZPWMA 2016) has estimated that the minimum number of lions that occur on approximately 5l,642 km^2 of land where reliable survey data are available is approximately 1,900 (range 1,800 - 2,000). The western portion of the country, consisting primarily of Hwange National Park and the surrounding safari areas, forest areas, communal areas, and private conservancies, supports approximately 737 lions (or 38% of the overall population). The southern portion of the country, dominated by the two major conservancies (SVC and BVC) and Gonarezhou National Park supports approximately 896 lions (48%). These numbers are supported by several studies.

Within Gonarezhou National Park, Groom et al. 2014, used call-up surveys to obtain direct estimates of the lion population and compared actual lion densities with potential density estimates. In this study, while lions were only seen at five percent of calling stations, this equated to a population estimate of 33 lions, which is consistent with spoor survey results conducted in June 2010 (Groom et al. 2014). A 2015 spoor count

survey of Gonarezhou National Park revealed an estimated 125 lions within the park (ZPWMA 2016).

From 2007 to present, annual track index surveys at the SVC have been conducted using a standardized methodology (Groom and Watermeyer 2015, as cited in Du Preez et al. 2016). Prey availability models suggest that the carrying capacity for this lion population is approximately 271 lions (Hayward et al. 2007). In 2015, the estimated population was 284 lions (Du Preez et al. 2016). The Rifa Safari Area was surveyed using camera trapping and spoor counts in 2015, which supported an estimated population of 68 lions. The central and northern portions of the country reportedly support an estimated population of 284 lions (15%). The 12-year (2000-2011) average lion density per 100 km^2 is 2.8 in Hwange National Park, 6.0 for South Eastern Lowveld in the SVC, 9.0 in Malilangwe, and 0.8 in Gonarezhou National Park (ZPWMA Annual Report 2013, as cited in ZPWMA 2014). SVC's website indicates that at SVC, an annual predator spoor count is conducted by the African Wildlife Conservation Fund (AWCF), an independent organization (http://savevalleyconservancy.org/conservation.html#header1-z, accessed August 14, 2019).

According to Riggio et al. 2013 (p. 32), and Bjorklund in Riggio et al 2013 (p. 32), the minimum number of lions that are estimated to constitute a viable population is 500 individuals. Hwange National Park, with an estimated population of 559, is the only area within Zimbabwe that has a viable population as laid out by Riggio et al. 2013. However, the two regions that make up the largest percentage of the country's lion population (Western 38% and Southern 48%) have regional populations of 737 and 896, respectively. The areas within the Central and Northern regions of Zimbabwe, albeit smaller, encompass parks that are part of Transfrontier Conservation Areas, such as the Mana Pools region.

Lion Management in Zimbabwe

In response to discussions surrounding a possible up-listing of lion to Appendix I under CITES at the 13th Meeting of the Conference of the Parties (CoP13), and subsequent workshops involving lion range states, IUCN, ZPWMA, and other key stakeholders held a workshop to develop the *Conservation Strategy and Action Plan for the Lion (Panthera leo) in Zimbabwe* which was published by ZPWMA in 2006. The plan responds to regional and international standards set by Treaties such as CITES and the Convention on Biological Diversity (CBD), among others. The plan states "it will guide the conservation and management of this top predator" which "addresses the needs of th[e] country." The Service is not aware of any additional or updated iterations of the plan since 2006; however, in Zimbabwe's 2016 response, *Enhancement and Non-Detrimental Findings for Panthera leo in Zimbabwe,* ZPWMA provided updates on each of the outputs and respective targets established under the 2006 *Conservation Strategy and Action Plan/or the Lion (Panthera leo) in Zimbabwe* (ZPWMA 2016).

The 2006 plan identifies a vision that "...lions should be conserved and managed sustainably for their aesthetic, cultural, and ecological values, and the socio-economic

development of Zimbabwe." The plan lays out three broad targets to achieve this objective:

- Ensure the persistence of key lion populations and other important populations including those of doubtful viability.
- Human and livestock loss reduced.
- Optimize wildlife conservation-related net benefits to local communities.

All three targets are stepped down to seven specific outputs with their own targets and activities to meet such targets. Although the plan does not identify a time period, some activities do, of which a period of 5 years is the most common. In response to inquiries from the Service, ZPWMA has provided a summary of the progress made to implement the 2006 strategy.

While all three of the broad targets appear to serve a valuable role in lion management in Zimbabwe, three of the specific outputs are most relevant to determining if the implementation of the strategy enhances the propagation or survival of the species, as required by the Act for the issuance of import permits. The first output, "lion populations, their habitats and wild prey effectively conserved and managed in collaboration with local stakeholders" is broken down into a number of targets: establish a baseline survey and monitoring program; maintain and strengthen capacity for lion conservation, management, monitoring and research; identify and implement best management standards and practices for the hunting program; develop and implement co-management frameworks; and expand the geographic distribution range of lions. Baseline surveys have been completed for the Parks Estate using monitoring protocols for key variables (populations, habitats, prey), and selected surveys have been undertaken in areas outside National Parks (ZPWMA 2016).

Carnivore research programs conducted by NGOs and research institutions such as WildCRU are taking place in various parts of the country; in addition, personnel have been trained in data collection and capture, management, and lion aging and analysis. Adaptive age-based criteria for male trophy animals are in place and functioning. The quota for a certain year is determined by a point system based off the hunts from the previous season. Therefore, ZPWMA is actively working toward meeting the target areas for this output.

The second output, "human-lion related conflicts minimized and, where possible, eliminated" has also been broken down into a number of targets: develop and establish databases on lion-human conflicts; identify and implement methods to reduce and mitigate livestock losses and lion attacks on humans; and train and properly staff problem animal control (PAC) units to conduct rapid response and precisely target problem animals. According to information from ZPWMA (2016), approaches to mitigate livestock losses and lion attacks on humans are in the process of being tested and implemented in Hwange, and methods to mitigate lion attacks on livestock are being implemented as appropriate at selected sites (e.g. Tsholotshe). Data on PAC reports for lion-related problems have been collated, and PAC units at ZPWMA field station and/or RDC levels have been partially established. In Matusadona, Hwange, and Gonarezhou regions, specific awareness and education packages on lion conservation and

management have been developed and implemented. The information submitted in the ZPWMA update suggests that they have met one target, and are in the process of implementing the remaining two.

The third output, "the costs and benefits of long-term lion management equitably distributed," is a socio-economic output to establish agreement and implementation of area-specific lion management plans with identified stakeholders in each wildlife region, and implementing a transparent mechanism to equitably distribute lion-related income to identified stakeholders." The specific targets for this output are: complete an inventory of stakeholders directly affected by lion conservation, deliver appropriate training and capacity building to prioritized stakeholders, agree to and implement collaboratively developed area-specific lion management plans with identified stakeholder groups in each wildlife region within 5 years, and implement transparent mechanisms to equitably distribute lion-related/generated income to identified stakeholders (groups and/or communities). Current information from ZPWMA shows that they have identified key stakeholders and assessed the financial impacts of lion conservation and the magnitude of socio-economic impacts on each stakeholder group. Limited training has been undertaken for representative stakeholders in Hwange, Matusadona, and Gonarezhou. ZPWMA has also implemented an adaptive management program across four wildlife regions and is in the progress of developing and implementing area-specific lion management plans with identified stakeholder groups. According to ZPWMA, a Management Plan for Hwange was approved. The Hwange National Park (HNP) Management Plan was updated in 2015 and officially accepted at Zimbabwe's Ministry of Environment level in 2016 (Conservation and Wildlife Fund (CWF) 2018, p. 16). One of the four components of this 10-year plan is implementation of a cooperation plan between the park and park neighbors. The Conservation and Wildlife Fund – Hwange (CWF) is a relatively new model of the private and NGO sectors in and around Hwange National Park (HNP) Zimbabwe, formalizing an alliance of individual members to materially and in-kind assist authorities with conservation work.

The Hwange Lion Research (HLR) which is part of the Wildlife Conservation Research Unit (WILDCRU), Oxford University, UK, with some financial support and collaborative effort from CWF, set up a comparative camera trap survey in May 2018, to establish a baseline of both lion and lion prey identification and densities in contiguous areas with differing management – the exact CWF project area. Although data were only obtained from the 40-day HNP camera grid, combined sources of complimentary data on the lion population in Forest Areas outside the national park suggest that anthropogenic mortality is slowing down, believed to be in part due to CWF's new law enforcement activities (CWF 2018, p. 21).

Zimbabwe's conservation strategy for lions also identifies roles and responsibilities for a number of participants in Zimbabwe's lion conservation efforts. According to the strategy, there is a national lion coordinator that coordinates all national activities on lion conservation, research, and management, including census surveys, setting up monitoring needs, and coordinating data on human-lion conflicts. The strategy identifies roles for the field stations, wardens, ecologists and utilization units, which are responsible for ensuring compliance with hunting regulations and maintaining safari hunting databases. In addition, the strategy identifies roles for CAMPFIRE, safari operators, and

professional hunters to facilitate training and ensure compliance with hunting regulations.

The Conservation Strategy and Action Plan for the Lion in Zimbabwe (ZPWMA 2006) borrows language from the *IUCN Conservation Strategy* (2006). It iterates areas in need of improvement regarding lion conservation in Zimbabwe, including standardized lion census methods and surveys, further mitigating human-lion conflicts, and maximizing benefits for rural communities that live with lions. ZPWMA (2006) notes their intention to review and put in place criteria for age-based identification of male trophy animals, but do not mention if they will be reviewing possible combination strategies. As part of the 2006 lion conservation strategy for eastern and southern Africa, six objectives were established to secure and restore sustainable lion populations, which were housed under the following categories: management, mitigation, socio-economics, policy and land-use, politics, and trade. The strategy was intended to be implemented within 10 years (Macdonald 2016), and Zimbabwe gave an update on progress regarding these objectives in their *Enhancement and Non-Detrimental Findings for Panthera leo in Zimbabwe* (ZPWMA 2016) that also addressed outputs and targets laid out in their 2006 action plan.

Additionally, to mitigate human-lion conflict, the "Long Shields Guardian Programme" was initiated whereby communities are notified of movements of collared lions into their areas via cell phone, and then have the opportunity to take appropriate action, such as moving cattle. In 2013 alone, 1,850 warnings were passed to the "Long Shields." These actions may reduce the incidents of lions marauding livestock; however, retaliatory killing of lions still occur. Further, as is policy under the Parks and Wildlife Act of 2001, any lions that attack humans or livestock will be lethally eliminated (ZPWMA 2016). Between 2007 and 2013 a total of 1,113 conflict incidents were recorded in the Hwange area in which 915 head of stock were lost to lions.

In and around Hwange National Park, data collected between 1999 and 2004 suggested that hunting surrounding the park was having a negative impact on the lion population. As a result, sport hunting of lions was suspended in the area surrounding the park between 2005 and 2009. Following the lifting of the moratorium, and by implementing stricter monitoring and hunting guidelines through the Hwange Lion Research Project, the overall Hwange lion population has continued to show a positive trend, and as of 2015 the population was estimated at over 550 animals (ZPWMA 2015).

<u>Hunting, Management, and Utilization of Lions</u>

In Zimbabwe, much of the trophy hunting occurs in Safari Areas which are managed mainly for the sustainable use and as buffer zones next to National Parks (Jeke et al 2019, p. 2). Trophy hunting of wildlife is legally permitted in safari areas; as of 2014, there were 16 in Zimbabwe (ZPWMA 2014). According to the Forest Act, Chapter 19:05, there are 24 gazetted indigenous forest areas in Zimbabwe; within these forest areas, lions may be hunted in the following forests: Fuller, Kazuma, Pandamasuwe, Ngamo, Sikumi, Gwayi, Sijarira, and Gwampa (ZPWMA 2014).

As of 2016, the minimum number of lions that occur in approximately 51,642 km^2 of land in Zimbabwe, where reliable survey data are available, is estimated to be 1,917 (range 1,800 - 2,000), the majority of which occur in western and southern Zimbabwe. When taking this population estimate into consideration, trophy hunting harvests a yearly mean of 2.7% of adult male lions. This figure decreased since the establishment of age restrictions on lion hunting (ZPWMA 2016).

In 2013, an adaptive quota management system for lion hunting based on the ages of lions hunted was agreed to in Harare, Zimbabwe, during a meeting hosted by ZPWMA and an independent non- governmental conservation organization (Du Preez et al. 2016). After reviewing aging techniques, attendees at the July 2013 meeting in Harare, Zimbabwe were confident that hunters could be expected to categorize lions as being below or above five years of age. In determining quotas for the following years, operators would be rewarded with increased quotas if they hunted animals of six years or older, would not be penalized if they hunted animals five years of age, but would have quotas cut if they hunted animals younger than five years old, or if they failed to complete hunt returns (ZPWMA and Panthera 2014). In 2013, only 28% of lions hunted were five years old or older. In 2015, that figure rose to 77.3% (ZPWMA 2016).

According to Hunter et al. (2013), an adaptive quota management system utilizing age-based criteria would not only aid in the prevention of over-harvesting lions, but would also prevent excessively conservative quotas. Further, according to Miller et al. (2016), results indicate that age-based hunting is feasible for sustainably managing threatened and economically significant species such as the lion, but must be guided by rigorous training, strict monitoring of compliance and error, and conservative quotas. No single trait can be relied upon exclusively to precisely age lions. Rather, multiple traits must be examined in combination to cross-validate an individual's age and, according to Whitman et al. (2004), restricting hunting to individuals that are at least six years old is desirable from a biological perspective due to the reduced risk of the loss of pride males and infanticide of cubs associated with the harvest of such individuals (Whitman et al. 2004).

During 2013, operators were requested to submit hunt returns and photos as a trial run to get the adaptive quota system up and running. In 2014, operators were requested to do the same but were informed that the age of the lions hunted in 2014 would determine their lion quotas in 2015 (Du Preez et al. 2016). In 2015, there was a marked increase in the age of lions hunted in Zimbabwe as a whole. The majority of lions hunted were on the cusp of 5-6 years of age but were not older than six years. National hunting offtakes for lions in Zimbabwe from 2013 to 2015 were 29, 42, and 47 respectively (Masterson 2016). It appears these do not include illegal forms of hunting offtake. In 2011, Zimbabwe's quota was set at 101 lions; in 2014, it was reduced to 50 male lions following the implementation of age restrictions (Henschel 2015, pers. comm., as cited in USFWS 2015).

As described above, CAMPFIRE is the program through which the Government of Zimbabwe has relegated the management of wildlife resources to communal farmers. As of July 2014, there are at least 58 Rural Districts that have been granted the Appropriate Authority status to manage wildlife resources in their areas; however,

according to *Enhancement and Non-Detrimental Findings for Panthera leo in Zimbabwe* ZPWMA 2016, only 16 are actively engaged in some form of wildlife-based land use (ZPWMA 2016). Lions are found in communal areas that are adjacent to major protected areas, and lion hunting is allowed in CAMPFIRE districts (ZPWMA 2014).

In setting adaptive lion quotas, Zimbabwe uses scientific information including spoor surveys, camera traps, and ranger-based sighting. In CAMPFIRE areas, incidences of human-lion conflict are also taken into consideration where survey information is not readily available, when determining quotas for those areas (ZPWMA 2014). The quota-setting process involves all stakeholders, including the ZPWMA, landowners, safari operators, and CAMPFIRE managers and their representatives. During the annual quota-setting workshop, presentations are made by the proponents who then make proposals for quotas. Where it is felt that not enough information has been presented, a precautionary quota will be issued (ZPWMA 2014).

ZPWMA (2016) mentions seven concessions that are leased on five-year terms, and how these concessionaires pay a 5-year "right to lease" fee, annual rental, fixed quota fee (payable if animals are shot or not) and a supplementary quota fee that allows additional animals to be bought as needed. It is unclear to what extent Zimbabwe still utilizes fixed quotas, as Du Preez et al. claims fixed quotas are no longer being used by Zimbabwe, but a fixed quota fee is mentioned in ZPWMA (2016). It is also unclear how many animals concessionaires are able to "buy as needed," and how such requests may be accommodated without going over the national quota (ZPWMA 2016). However, when evaluating the lower quota with higher utilization reported by ZPWMA (2016), and taking into consideration the land area of the Parks Estate alone, Zimbabwe did not exceed the best management practice of 0.5 lions/1,000 km^2; the 2015 off-take would have accounted for 0.125 lions/1,000 km^2.

According to *The Role of Trophy Hunting of Elephant in Support of the Zimbabwe CAMPFIRE Program -December 2016,* a report the Service received in December 2016, the Reserve Bank of Zimbabwe, in collaboration with relevant stakeholders, established the Tourism Receipts Accounting System (TRAS2) that required all outfitters to submit returns listing the revenue generated for hunting activities. This system has been in place for several years, but it required manual analysis of the data to extract information on hunting revenue. In January 2015, to account fully for earnings in the hunting sector, the Reserve Bank of Zimbabwe in collaboration with relevant stakeholders, introduced TRAS, a web-based system that links Safari operators, ZPWMA Authority, taxidermists, shipping agents, International marketing agents, and the Reserve Bank. Under this system, all authorized hunts are registered, allowing for the capture of hunting data, such as the origin of clients, value of trophies and hunts, and area hunted, to monitor hunting quota utilization and track hunted trophies. According to the December 2016 report, the Exchange Control Division of the Reserve Bank of Zimbabwe and the ZPWMA are now able to:

1. Assess regional price differentials of similar hunts and the reasons thereof;
2. Present TRAS2 system updates and reports to the users, including international marketing agents;
3. Engage with international marketing agents of sport hunting;

4. Obtain relevant insights on governing of the hunting sector; and
5. Come up with an effective mechanism to fully account for export proceeds from the hunting sector.

The TRAS2 information provides a breakdown of the source of hunting income, and the amount of funds generated by trophy fees by land category, among other insights, and has demonstrated the TRAS2 system's ability to obtain relevant insights on governing of the hunting sector.

Evaluation

Francescomaria Tiberio Cavallo hunted in the Savé Valley Conservancy (SVC) in southeastern Zimbabwe, reportedly one of the largest private game reserves in Africa (https://savevalleyconservancy.org/). In the early 1900's, the 3,440 km^2 of land that now comprises the SVC was used for cattle ranching, which led to the elimination of most large herbivores and predators, including lions. In the 1990's upon establishment of the SVC, the cattle farms were converted to a wildlife-based land use system and wildlife populations were restored (Pole 1999).

In evaluating whether the importation of Mr. Cavallo's trophy of *P. l. melanochaita* would be authorized pursuant to 50 CFR 17.40(r) and 50 CFR 17.32(a), in accordance with our threatened species permit issuance criteria, we examined how Zimbabwe's management of lions overall as well as how Savé Valley Conservancy and Mr. Cavallo himself have contributed to enhancement of wild lions both directly and indirectly by addressing the three main threats that led to the decline of the subspecies: habitat loss, loss of prey base, and human-lion conflict.

Below, we summarize our evaluation with reference to each of the permit issuance criteria at 50 CFR 17.32(a)(2) on the basis of information available to the Service.

17.32(a)(2)(i): Whether the purpose for which the permit is required is adequate to justify removing from the wild or otherwise changing the status of the wildlife sought to be covered by the permit:

Zimbabwe's lion hunting industry generated 9% of all sport-hunting revenue in 2015; 51% was contributed by U.S. hunters during 2010-2015 country-wide, and 90% of the sport-hunting market in the Bubye Valley Conservancy (BVC) and the Savé Valley Conservancy (SVC) from 2005-2015. Even though 9% may not seem like much, lions are a key component of the sport hunting industry, as they are part of the "Big 5" trophies and draw U.S. hunters to Zimbabwe. Without the hunting industry, protected wildlife areas such as BVC and SVC, which have become conservation havens in the threat of human encroachment across much of Zimbabwe, would not be economically viable, and therefore would likely not exist. These wildlife areas not only provide habitat for lions, but also support the lion's prey species. As previously noted, the southern portion Zimbabwe, which is dominated by SVC, BVC, and Gonarezhou National Park, supports approximately 896 lions (48% of the Zimbabwe lion population).

According to Lindsey et al. (2012), hunting operators in the SVC spend USD 546,000 annually on anti-poaching activities and employ 186 permanent game scouts. Hunting revenues are used to support expenses associated with these activities (Du Preez et al. 2016).

The *Strategy and Action Plan* has put into place mechanisms to adequately oversee the harvest of lions in Zimbabwe. With an annual harvest of approximately 85 lions, Zimbabwe is not exceeding the limits identified of 0.5 lions/1,000 sq. km. The objectives of the *Strategy and Action Plan* and the actions and monitoring activities that have been put into place to achieve these objectives should support the adaptive management approach that Zimbabwe has established for managing lions. The Service will continue to monitor the effectiveness of the Strategy and Action Plan, for consideration in future findings.

As described above, we have determined that the government of Zimbabwe and the Savé Valley Conservancy contribute towards positive conservation outcomes by addressing the main threats of habitat loss, human-lion-livestock conflict, and prey depletion, which contributes to improving the status of lions in Zimbabwe. Further, the fees garnered through Mr. Cavallo's hunt will provide revenue to support these positive conservation outcomes.

Therefore, based on the information available to the Service, the purpose for which the permit is being requested, import of this trophy lion, is adequate to justify removing the sport-hunted trophy lion from the wild or otherwise changing its status.

17.32(a)(2)(ii): The probable direct and indirect effect that issuing the permit would have on the wild populations of the wildlife sought to be covered by the permit:

The total area under wildlife-based land use and conservation in Zimbabwe amounts to 10.7 million hectares and represents 27% of the total surface area of the country. Of this, 7.9 million hectares, or 75% of all conservation land in the country, falls under safari hunting as the primary or only source of revenue. Sport hunting of lions by U.S. hunters such as Mr. Cavallo supports the programs in Zimbabwe that provide the opportunity for locals to see value in lions, which in turn conserves the species in the long-term.

A scientifically based quota is the number of a given species that can be removed from a specific population without damaging the biological integrity and sustainability of that population (WWF 1997). However, full implementation and enforcement of the age-based strategy could potentially cause the need for quotas to become irrelevant or eliminated (USFWS 2015). Age restrictions will naturally restrict offtake to a limited number of individuals that meet the age criteria (Loveridge *et al.* 2007, Whitman *et al.* 2004).

Based on the information provided to the Service, it is clear that Zimbabwe has made strides in their management of their lion populations. Additionally, Zimbabwe appears to be transparent in its management processes, including its quota setting. In 2013, Zimbabwe proposed an adaptive age-based strategy for setting hunting quotas. This

adaptive quota management system for lion hunting based on the ages of lions hunted has been accepted and embraced by all stakeholders; it has not only led to a reduced national lion hunting quota, but has also resulted in a significant increase in the age of harvested lions to a level that is considered to have a reduced ecological impact (Du Preez et al. 2016).

In 2015, the development of TRAS2 allowed the country to better monitor and govern the hunting sector, including developing an effective mechanism to fully account for export proceeds from the hunting sector. The continued participation of U.S. hunters, including Mr. Cavallo, in this market is anticipated to continue to maintain the viability of managing areas such as the BVC and SVC in their current form, including their contribution to conservation of lions in the wild. In 2015, lion sport-hunting generated USD 753,000 in revenue, which accounts for about 9% of all sport hunting revenue in Zimbabwe that year (ZPWMA 2016).

After evaluating the information provided by the Zimbabwe government and other sources, it appears that the hunting program in Zimbabwe is addressing the three main threats that were identified by the Service when making the determination that the species was threatened with the possibility of extinction. Moreover, hunting areas such as BVC and SVC are maintaining habitat for lions and ensuring that there is no further loss, provided that the hunting areas can remain economically viable. In order to maintain a viable population of lions, the parks, safari areas, and CAMPFIRE areas must maintain biodiversity and a sustainable prey base. Finally, Zimbabwe is actively working to reduce human-lion conflicts and the number of lions killed in retaliation for killing livestock. Therefore, the management of lions within Zimbabwe and the limited hunting of lions contributes to the on-going survival of the species in Zimbabwe.

The participation of Mr. Cavallo in the hunting and subsequent import of the trophy lion he harvested in the SVC provides an indirect benefit to wild lion populations by helping to support the reserves where lions are found; Mr. Cavallo's hunt has generated revenue to help support a hunting area where lions are found and conserved. Therefore, based on the information available to the Service, the probable direct and indirect effect that issuing an import permit for a legally hunted lion would have on the species would be positive.

17.32(a)(2)(iii): Whether the permit, if issued, would in any way, directly or indirectly, conflict with any known program intended to enhance the survival probabilities of the population from which the wildlife sought to be covered by the permit was or would be removed:

As stated above, Zimbabwe is monitoring and controlling the harvest of lions through permitting under their regulations and through the *Strategy and Action Plan*. The issuance of import permits for lions legally hunted under these authorities would not conflict with any programs intended to enhance the survival probability of the species in Zimbabwe. Issuance of a permit authorizing import of Mr. Cavallo's trophy lion from Zimbabwe would work in favor of, not against, the principal acts governing lion conservation in Zimbabwe. Furthermore, sport

hunting opportunities help local communities realize the value in conserving the African lion.

Therefore, based on the information available to the Service, the issuance of an import permit for a legally hunted lion does not conflict with known conservation programs.

17.32(a)(2)(iv): Whether the purpose for which the permit is required would be likely to reduce the threat of extinction facing the species of wildlife sought to be covered by the permit:

Considering Zimbabwe's limited, controlled off-take of lions in a manner that maintains sustainability, Mr. Cavallo's legal hunt contributes to reducing the threat of extinction of lions. It appears that the permitting activities under Zimbabwe's laws and CITES, as well as the implementation of the adaptive age-based lion quota, and a continuation of implementation of the outputs in the *Strategy and Action Plan* are working in concert to promote the long-term survival of lions in the wild in Zimbabwe. The use of revenue received from hunters, such as Mr. Cavallo, to manage the populations on the reserves is an important element of the success of lion management in Zimbabwe. For example, hunting operators in the SVC spend USD 546,000 annually on anti-poaching activities (Lindsey et al. 2012). Therefore, based on the information available to the Service, the issuance of the requested import permit for Mr. Cavallo's legally hunted lion will likely reduce the threat of extinction facing lions in Zimbabwe.

17.32(a)(2)(v): The opinions or views of scientists or other persons or organizations having expertise concerning the wildlife or other matters germane to the application:

Based on reviewing comments made during the listing process for lions, as well as information obtained through personal conversations and literature, there is general agreement that hunting, done properly and well managed, would not have an adverse effect on lion populations. Numerous researchers have stated that, while they may not support hunting in general, they see that benefits can be received through a scientifically based hunting program for lions.

Based on the information available to the Service, there is general support by scientists and other persons or organizations having expertise concerning lions that the legal and sustainable harvest of lions, and the subsequent import of legally harvested lion trophies, as proposed in this application, would not have an adverse effect on the species and would further efforts to conserve the species in the wild into the future.

17.32(a)(2)(vi): Whether the expertise, facilities, or other resources available to the applicant appear adequate to successfully accomplish the objectives stated in the application:

Mr. Cavallo submitted a permit application to import a trophy of his personally, legally harvested lion from Zimbabwe for the purpose of enhancing the propagation or survival of the species in the wild. As a sport-hunter, Mr. Cavallo plays a large role in the hunting industry of Zimbabwe; the hunting and subsequent import of Mr. Cavallo's trophy lion increases the funds available to the Zimbabwe Government and SVC to implement lion conservation initiatives. Therefore, based on the Service's review of the information available relating to Mr. Cavallo's permit request, we find that the expertise, facilities, or other resources available to Mr. Cavallo appear adequate to successfully accomplish the objectives stated in the application.

Conclusion

As described above, the Government of Zimbabwe has been documented to implement the *Strategy and Action Plan* in the manner identified in the documents referenced in making this finding. The on-going adaptive management and limited and sustainable off-take of lions is important to the survival of lions in Zimbabwe, and the funds generated by Mr. Cavallo's participation contributes to the ongoing benefits the program provides to lions in the wild.

Therefore, based on the Service's consideration and analysis of the information associated with Mr. Cavallo's permit application and other relevant information available to the Service, as described above, we find that the import of the lion harvested by Mr. Cavallo on September 16, 2018, from the Savé Valley Conservancy, Zimbabwe, meets the requirements for making a positive enhancement finding pursuant to 50 CFR 17.40(r) and 50 CFR 17.32(a). Therefore, the Service is able to authorize the import of the trophy of one lion taken from the wild in Zimbabwe, to Francescomaria Tiberio Cavallo of El Campo, Texas.

I. **Service Program and Geographic Area or Station Name**: Branch of Permits, Division of Management Authority, International Affairs

II. **Flexible Funding Program** (e.g. Joint Venture, etc.) if applicable: N/A

III. **Location**: 5275 Leesburg Pike, MS: IA, Falls Church, VA 22041-3803

IV. **Species/Critical Habitat**:

Southern and Eastern African lion (*Panthera leo melanochaita*)

Critical Habitat: N/A

V. **Project Description:** Describe proposed project or action or, if referencing other documents, prepare an executive summary (attach additional pages as needed):

As described in the permit application, 16345D, Francescomaria Tiberio Cavallo, has requested a permit to import a trophy of one lion that he lawfully hunted in Zimbabwe. The import is for personal purposes.

VI. **Determination of Effects:**

(A) Description of Effects: Describe the action(s) that may affect the species and critical habitats listed in item IV. Your rationale for the Section 7 determinations made below (B) should be fully described here.

Issuance of the requested import permit by the Branch of Permits will result in the importation of one personally sport-hunted lion that has been lawfully taken in Zimbabwe on the date specified in the permit application.

The trophy will be accompanied by the required CITES export permit issued by the CITES Management Authority of Zimbabwe.

The requestd U.S. Federal Fish and Wildlife import permit does not authorize the killing of an African lion; the authorization to hunt and lawfully take a lion is under the purview of the government of Zimbabwe. Therefore, the proposed action of issuing a Federal Fish and Wildlife import permit for this lawfully hunted lion will not directly or indirectly affect individuals of listed or proposed species or designated/proposed critical habitat of such species.

(B) Determination: Determine the anticipated effects of the proposed project on species and critical habitats listed in item IV. Check all applicable boxes and list the species (or attach a list) associated with each determination**.**

Determination

No Effect: This determination is appropriate when the proposed project will not directly or indirectly affect (neither negatively nor beneficially) individuals of listed/proposed/candidate species or designated/proposed critical habitat of such species. **No concurrence from DSA/ESFO required.** **X**

May Affect but Not Likely to Adversely Affect: This determination is appropriate when the proposed project is likely to cause insignificant, discountable, or wholly beneficial effects to individuals of listed species and/or designated critical habitat. **Concurrence from DSA/ESFO required.** _____

May Affect and Likely to Adversely Affect: This determination is appropriate when the proposed project is likely to adversely impact individuals of listed species and/or designated critical habitat. **Formal consultation with DSA/ESFO required.** _____

May affect but Not Likely to Jeopardize candidate or proposed species/critical habitat: This determination is appropriate when the proposed project may affect, but is not expected to jeopardize the continued existence of a species proposed for listing or a candidate species, or adversely modify an area proposed for designation as critical habitat. **Concurrence from DSA/ESFO optional.** _____

Likely to Jeopardize candidate or proposed species/critical habitat: This determination is appropriate when the proposed project is reasonably expected to jeopardize the continued existence of a species proposed for listing or a candidate species, or adversely modify an area proposed for designation as critical habitat. **Conference with DSA/ESFO required.** _____

U.S.A.

Authority: Statutes and Regulations: 50 CFR 17.40(r).

Location where authorized activity may be conducted:
IMPORT THROUGH ANY PORT LISTED IN 50 CFR 14.12

Reporting requirements: Not applicable

Authorizations and Conditions:

A. Authorized to import the sport-hunted trophy of one male African lion (*Panthera leo melanochaita*), taken in Zimbabwe for the purpose of enhancement of the survival of the species.

B. Specimen may not be sold or transferred for any financial remuneration.

C. **Trophy must have been taken during the 2018 hunting season.**

D. Trophy must be accompanied by a valid trophy permit or hunting license issued by the government of Zimbabwe for the 2018 season.

E. Trophy must be accompanied by a valid Convention on International Trade in Endangered Species of Wild Fauna and Flora (CITES) Appendix II export permit/re-export certificate, source code "W", issued by the Management Authority of Zimbabwe.

F. General conditions set out in Subpart D of 50 CFR 13, and specific conditions contained in Federal regulations cited above, are hereby made a part of this permit. All activities authorized herein must be carried out in accord with and for the purposes described in the application submitted. Continued validity, or renewal of this permit is subject to complete and timely compliance with all applicable conditions, including the filing of all required information and reports.

G. The validity of this permit is also conditioned upon strict observance of all applicable foreign, state, local, tribal, or other federal law. **This permit can be photocopied.**

H. Valid for use by permittee named above.

I. Acceptance of this permit serves as evidence that the permittee understands and agrees to abide by the "General Permit Conditions" (copy attached).

Type of Activity

IMPORT OF SPORT-HUNTED TROPHIES under Appendix I of the Convention on International Trade in Endangered Species (CITES) and/or U.S. Endangered Species Act (ESA)

Complete Sections A or B, and C, D, and E of this application. U.S. address may be required in Section C, see instructions for details.
Instructions on how to make your application complete and help avoid unnecessary delays are attached.

Section A: Complete if applying as an individual

1.a. Last Name	1.b. First Name	1.c. Middle Name/Initial	1.d. Suffix
Schnetzler	Christopher	R	

2. Date of Birth (mm/dd/yyyy)	3. Telephone Number	3.a. Alternate Telephone Number	4. E-mail address
(b) (6)			

Section B: Complete if applying on behalf of a business, corporation, public agency, Tribe, or institution

1.a. Name of business, agency, Tribe, or institution		1.b. Doing business as (DBA)	
2. Tax identification no.		3. Description of business, agency, Tribe, or institution	
4.a. Principal officer Last name	4.b. Principal officer First Name	4.c. Principal officer Middle name/initial	4.d. Suffix
5. Principal officer title	6. Primary contact name		
7.a. Business telephone number	7.b. Alternate telephone number	7.c. Business fax number	7.d. Business e-mail address

Section C: All applicants complete address information

1.a. Physical address (Street address; Apartment #, Suite #, or Room #; no P.O. Boxes)
(b) (6)

1.b. City	1.c. State	1.d. Zip code/Postal code	1.e. County/Province	1.f. Country
Powell	Ohio	43065	Delaware	USA

2.a. Mailing address (include if different than physical address; include name of contact person if applicable)

2.b. City	2.c. State	2.d. Zip code/Postal code	2.e. County/Province	2.f.Country

Section D: All applicants MUST complete

1. Attach the **nonrefundable application processing fee** in the form of a check or money order payable to the U.S. FISH AND WILDLIFE SERVICE **in the amount of $100**. Federal, Tribal, State, and local government agencies, and those acting on behalf of such agencies, are exempt from the processing fee–attach documentation of fee exempt status as outlined in instructions [50 CFR 13.11(d)].

2. Certification: I hereby certify that I have read and am familiar with the regulations contained in ***Title 50 Part 13 of the Code of Federal Regulations*** and the other ***applicable parts in subchapter B of Chapter I of Title 50***, and I certify that the information submitted in this application for a permit is complete and accurate to the best of my knowledge and belief. I understand that any false statement herein may subject me to the criminal penalties of 18 U.S.C. 1001.

E. IMPORT OF SPORT-HUNTED TROPHIES *(Appendix I of CITES and/or ESA)*

Note 1: This form should be used to request authorization to import trophies of species listed on Appendix I of CITES and/or as threatened or endangered under the ESA (examples include elephants, lions, cheetahs, wood bison, and markhor).

PLEASE USE FORM 3-200-19 FOR SOUTHERN AFRICAN LEOPARD TROPHIES AND SOUTHERN WHITE RHINOCEROS TROPHIES TAKEN IN NAMIBIA.

Note 2: If you hold an import permit for a trophy that you did not use, please **return the unused original permit**. If you are requesting reissuance of a permit because you have taken a trophy, but were unable to import it prior to the expiration of the permit, please use the renewal form (3-200-52) and return your original permit with that form.

Note 3: Applications for species listed as endangered under the U.S. Endangered Species Act are published in the Federal Register for a 30-day public comment period. Please allow at least **90 days** for the application to be processed.

Note 4: *Sport-hunted trophy* is defined at 50 CFR 23.74 as follows: *Sport-hunted trophy* means a whole dead animal or a readily recognizable part or derivative of an animal specifically identified on the accompanying CITES document that meets the following criteria:

- Is raw, processed, or manufactured;
- Was legally obtained by the hunter through hunting for his or her personal use;
- Is being imported, exported, or re-exported by or on behalf of the hunter as part of the transfer from its country of origin ultimately to the hunter's country of usual residence; and
- Includes worked, manufactured, or handicraft items made from the sport-hunted animal only when:
  - i. Such items are contained in the same shipment as raw or tanned parts of the sport-hunted animal and are for the personal use of the hunter;
  - ii. The quantity of such items is no more than could reasonably be expected given the number of animals taken by the hunter as shown on the license or other documentation of the authorized hunt accompanying the shipment; and
  - iii. The accompanying CITES documents (export document and, if appropriate, import permit) contain a complete itemization and description of all items included in the shipment.

Note 5: Certain hunting trophies, including elephants, are subject to restrictions on their use after import into the United States. Please see 50 CFR 23.55 for more information or contact the Division of Management Authority.

Please provide the following information. Complete all questions on the application. Mark questions that are not applicable with "N/A". If needed, use a separate sheet of paper. On all attachments or separate sheets you are submitting; please indicate the application question number you are addressing. If applying for more than one trophy, be sure to answer questions 4-6 for each trophy addressed in this application. If importing trophies from more than one country, you must submit a separate application for each shipment in order to obtain separate import permits.

1. Name and address where you wish the permit to be mailed, if different from page 1. If you would like expedited shipping, please enclose a self-addressed, pre-paid, computer-generated, courier service airway bill. If unspecified, all documents will be mailed via the U.S. Postal Service.

2. Who should we contact if we have questions about the application (name, phone number, and e-mail)?

Amy Wicklund Phone (b) (6) [redacted]

3. Disqualification factor. A conviction, or entry of a plea of guilty or nolo contendere, for a felony violation of the Lacey Act, the Migratory Bird Treaty Act, or the Bald and Golden Eagle Protection Act disqualifies any such person from receiving or exercising the privileges of a permit, unless such disqualification has been expressly waived by the Service Director in response to a written petition. (50 CFR 13.21(c)) Have you or any of the owners of the business, if applying as a business, been convicted, or entered a plea of guilty or nolo contendere, forfeited collateral, or are currently under charges for any violations of the laws mentioned above?

☒ No ☐ Yes

If you answered "Yes" to Question 3, provide: a) the individual's name; b) date of charge; c) charge(s); d) location of incident; e) court; and f) action taken for each violation. Please be aware that a "Yes" response does not automatically disqualify you from getting a permit.

4. For each trophy to be imported, provide:

   a. Scientific name (genus, species, and, if applicable, subspecies) and common name.

Panthera leo leo

   b. Sex (if known). Male

5. **IF ANIMAL IS CURRENTLY LIVING IN THE WILD**, please enter the following information:

   a. Country and place (area, region, GIS coordinates, ranch, conservancy, management area, or hunting block, AND nearest city) where wildlife is to be taken from the wild:

   b. Date wildlife is to be hunted:

   c. Name of hunting outfitter, safari company, or professional hunter you will be hunting with:

6. **IF THE TROPHY HAS ALREADY BEEN TAKEN**, please enter the following information:

   a. Country and place (area, region, GIS coordinates, ranch, conservancy, management area, or hunting block, AND nearest city) where wildlife was removed from the wild:

Country-Zimbabwe, Province-Masvingo, Conservancy-Save Valley Conservancy, Area-Humani Ranch, coordinate where lion was harvested- 36k 143 280, Nearest City- Chiredzi

   b. Date wildlife was hunted:

10-12-2018 through 10-27-2018 Lion was harvested on 10-19-2018

c. Name of hunting outfitter, safari company, or professional hunter you hunted with:

Name of Safaris Outfitter- Tredelk Safaris Name of Safaris Company- Tredelk Safaris. Name of professional hunter - Guy Whittall- Professional hunter number 421

d. The current location of the trophy (address and country) [the U.S. import permit will identify this country as the country of export/re-export and must match with the foreign export/re-export document]:

Trophy Consultants International 4 Josiah Chinamano Road Belmont Bulawayo Zimbabwe

7. Please provide a copy of any applicable foreign government permits or licenses that were required to remove this animal from the wild (if you have not hunted yet and do not currently hold any such permits or licenses, please indicate so). See attached.

8. Complete name and address of overseas person or business shipping the trophy to you. If you are applying to import a trophy directly from **Namibia**, you must provide the name and address of the professional hunter listed on your Namibian hunting permit [this name will appear on the face of the export permit].

Name:	
Business Name:	Trophy Consultants International
Address:	4 Josiah Chinamano Road
City:	Belmont
State/Province:	Bulawayo Zimbabwe
Country, Postal Code:	

9. For species listed under the U.S. Endangered Species Act, please be aware that the U.S. Fish and Wildlife Service (Service) must make a finding that your activities will enhance or benefit wild populations of the species involved. While we will communicate with the range country for the species you will hunt or hunted when making the required findings, if you have any information that could support this finding, it would be helpful for our review if you could provide it. Please submit such information on a separate page with your application.

a. Do you have any information regarding the population status or trend data on the species hunted?

Please see information included with application

b. In order to hunt, you likely paid for licenses or trophy fees. What were those fees and do you have any information on how those funds were used by either the landowner, local community, or government?

Please see information included with application

c. Do you have information on other funding activities that are being carried out, or were carried out, by the safari outfitter, professional hunter, concession holder, or landowner that provide a conservation benefit to the species being hunted/species hunted?

Please see information included with application

OMB Control No. 1018-0093
Expires 08/31/2020

CERTIFICATION STATEMENT (original signature must be provided for either 10 or 11 below)

10. If you are a broker or taxidermist applying on behalf of a U.S. hunter or foreign national, provide documentation to show you have a Power of Attorney to act on your client's behalf and sign the following statement:

I acknowledge that the sport-hunted trophy/trophies to be imported has been/will be personally hunted by my client and is being imported only for my client's personal use (i.e., not for sale, transfer, donation, or exchange that is reasonably likely to result in economic use, gain, or benefit). If applying for the import of an elephant trophy, I understand that my client may import no more than two elephant trophies in one calendar year.

Taxidermist/Broker's signature: _____ Date: _____

11. If you are the hunter applying to import your own trophy, please read and sign the following statement:

I acknowledge that the sport-hunted trophy/trophies to be imported has been/will be personally hunted by me and is being imported only for my personal use (i.e., not for sale, transfer, donation, or exchange that is reasonably likely to result in economic use, gain, or benefit). If applying to import an elephant trophy, I understand that I may import no more than two elephant trophies in one calendar year.

Applicant's signature: (b) (6) _____ Date: 01/17/2019

Be aware that there may be additional permitting or approval requirements by your local or state governments, as well as required by other Federal agencies or foreign governments to conduct your propose activity. While the Service will attempt to assist where possible, it is your responsibility to obtain such approval.

12. All international shipments must be through a designated port. A list of designated ports (where an inspector is posted) is available from **the list of designated ports**. If you wish to use a port not listed, please contact the Office of Law Enforcement for a Designated Port Exemption Permit (form 3-200-2).

Please use New York, NY Port

ZIMBABWE PARKS AND WILDLIFE MANAGEMENT AUTHORITY

MEMORANDUM

To: Director General

From: Area Manager HQ

Date: 9 October 2018

RE: AUTHORITY TO PROCESS SPECIAL PERMIT FOR HUNTING OUTSIDE PARKS ESTATE

Your authority is kindly sought to process the permit for Tredelk Safaris who have applied for a permit to hunt 1 x lion with client **Chris Schnetzler** in the following property:

- Humani and Bedford in Save Valley Conservancy Masvingo Province

The hunt will be **from 12 October 2018 to 26 October 2018**under the guidance of professional hunter G. Whittal PH license number 421.

Kindly find attached application from the operator and copies of 2018 hunting permit and quota.

Recommended/ ~~Not Recommended~~ 9/10/18

Investigation and Security Manager **Date**

Approved/ Not ~~Approved~~: 10/10/18

Head Management Services **Date**

For and on behalf of the Director General

Question 9b

9 b.

- The trophy fee on the lion is US$15,000.00 of this US$5,000.00 is paid to Zimbabwe Parks an Wildlife Authority.
- The operator (Tredelk Safaris) pays Zimbabwe Parks and Wildlife Authority the gazetted license fees for all trophies hunted.
- The operator (Tredelk Safaris) pay a further 15% of the government gazetted trophy license fees to the Zimbabwe Parks and Wildlife Authority.
- The operator bought the Humani on the Auction in december of 2014 for 5 years with the option of renewing for another 5 years. The sale of the auction is paid to Zimbabwe Parks an Wildlife Authority.
- The Zimbabwe Parks and Wildlife authority are responsible for the welfare of the community through license fees,15% of the annual quota allocated and the Auction price paid by the operator.
- The operator is then responsible for all the anti poaching, water management and wildlife management.

HUNTING RETURN FORM - TRAS2
APPLICATION FOR HUNTING NP/CITES

Issued in terms of Exchange Control Act (Chapter 22:05),
The Parks and Wild Life Act (Chapter 20:14) and the Tourism Act (Chapter 14:20)

Lion Hunting in Zimbabwe's Savé Valley Conservancy
A Conservation Success Story

Dr Rosemary Groom
African Wildlife Conservation Fund

1 Background

This document is a case study of the Savé Valley Conservancy in south-east Zimbabwe, where the African lion (*Panthera leo*) population is increasing exponentially, and where lions have been hunted since 2002. This case study clearly illustrates the positive conservation benefit that trophy hunting of lions can have for the species, and briefly describes the importance of hunting to maintaining wildlife in the area.

2 History of the Savé Valley Conservancy

The Savé Valley was a wildlife-rich wilderness until the early 1900s, when the first cattle ranching initiatives started in the area. The establishment of Devuli Ranch and Angus Ranch in 1920 paved the way for seven decades of commercial cattle ranching in the area we know today as the Savé Valley Conservancy. Roads were cut, fences erected and an everlasting "battle" ensued against the wildlife, especially against all predators.

After the Second World War, cattle prices soared to new heights, and the 1950s were years of development and expansion for the cattle industry. The large predators, especially lions, were virtually eradicated (Pole 1999). However, by the late 1980s, declining range productivity, depressions and droughts forced the landowners to consider alternative options. Around that time, empirical evidence of the competitive advantage of wildlife over livestock began to emerge (Child 1988; Bond 1993), especially in arid areas (Jansen et al 1992; Cumming 1993), and wildlife was finally given serious consideration as a viable land use option.

In 1989, proposals were drawn up to form what would have been known as the Savé Valley Intensive Conservation Area (du Toit 1989). The initial focus of the proposal was to create a single large wildlife area, especially for the re-establishment of endangered species and species that had been overexploited in the past. Cattle ranching would still remain the primary land use option with wildlife an additional source of income.

The formation of the Savé Valley Conservancy came in June 1991 with the signing of the first constitution by the various members. However, the following 1991/1992 rainy season proved to be the driest season ever recorded, and proved to be a deciding factor for the landowners of the Savé Valley Conservancy with regards to future land use. At a workshop held in November 1992 a decision was taken that wildlife would be the primary land use option and that all cattle still owned within the conservancy would be disposed of. This created what was at the time the largest private wildlife conservancy in the world, with 340 839 hectares included (Fig 1).

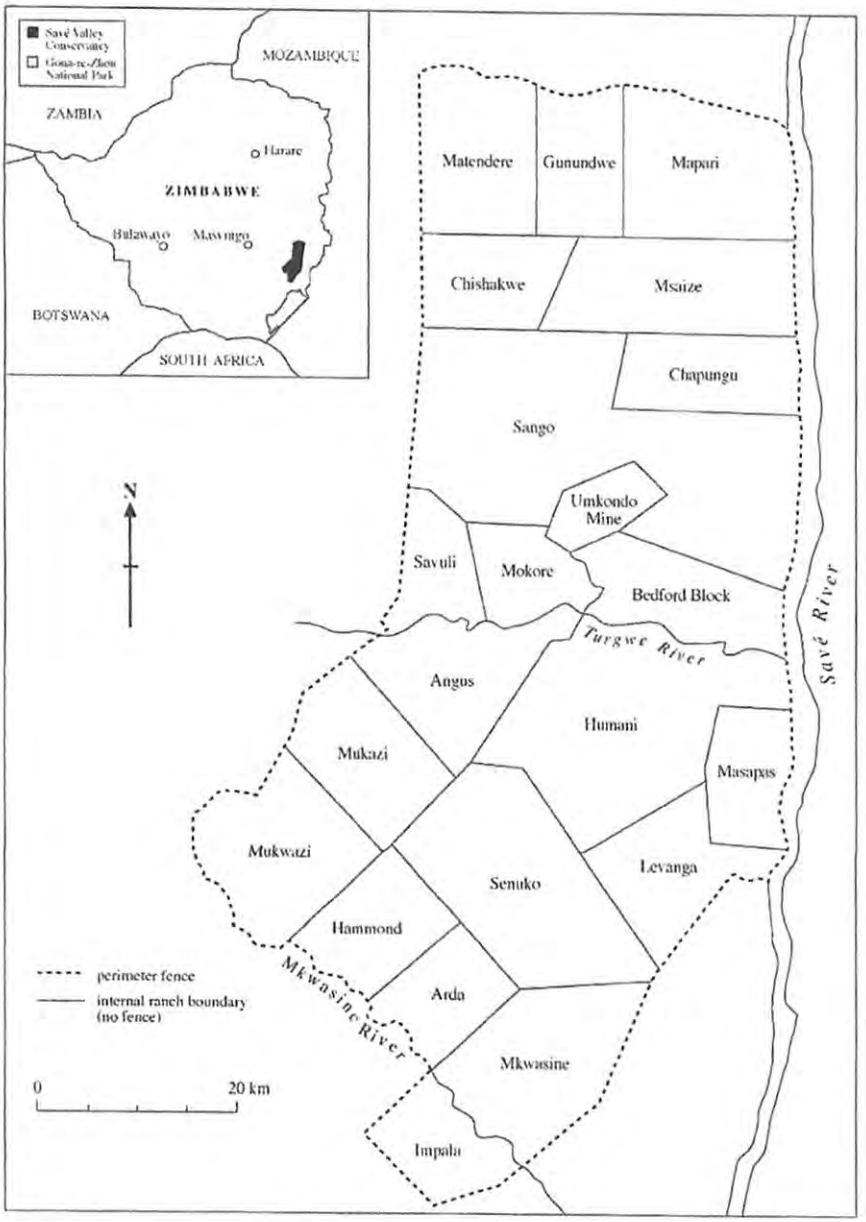

Figure 1 The Savé Valley Conservancy (taken from Lindsey et al 2008)

The conservancy members were then faced with the challenge of rebuilding the wildlife population, removal of all internal fencing, the erection of a common perimeter fence and security. A double, electrified, veterinary-approved fence was completed in 1995, and the following decade saw a massive investment in wildlife re-stocking and security systems.

Some wildlife species had been translocated into the conservancy prior to 1991 (including black rhino, elephant, sable, eland, nyala, giraffe, waterbuck, wildebeest and zebra; Table 1). Species relocated into the SVC since signing the constitution in June 1991 include more black rhino, buffalo, elephant, eland, giraffe, nyala, sable antelope, spotted hyena, tsessebe, Lichtenstein's hartebeest, warthog, waterbuck, blue wildebeest, zebra and lion (Table 1).

Table 1: Species and the number of animals per species re-introduced into the Savé Valley Conservancy, Zimbabwe

Animal Species	Number Of Animals Re-introduced				
	Prior to October 1993	November 1993 to December 1999	January 2000 to December 2002	January 2003 to present	**Total**
African buffalo (*Syncerus caffer*)	91	88	253	40	**472**
African elephant (*Loxodonta africana*)	624	-	-	-	**624**
Black rhinoceros (*Diceros bicornis*)	-	31	-	-	**31**

Waterbuck (*Kobus ellipsiprymnus*)	177	66	82	32	**357**
White rhinoceros (*Cerathotherium simum*)	-	-	-	20	**20**
TOTAL					**4349**

3 Trophy hunting vs Ecotourism in the Savé Valley Conservancy

Trophy hunting was essential for the successful transition of the conservancy from cattle to wildlife. During the early years, wildlife densities were low, resulting in poor potential for ecotourism, and hunting generated the income needed to erect the fence, continue the re-stocking and increase the security, especially due to the now significant numbers of black rhino in the conservancy. Gradually, some of the ranchers shifted more into ecotourism. One property, Senuko Ranch, completed a 16 bed up-market lodge with a view of marketing non-consumptive safaris, doing game drives and bush walks and specializing in rhino walks and African wild dog den visits. Lodge occupancy rose from 0% in 1996 to 62% by the end of 1999.

3.1 The Land Reform Program

The land reform program was launched in February 2000 and created negative press from the international community. This resulted in travel bans and warnings from most of Zimbabwe's source markets, which, compounded by the negative publicity in the media, resulted in major suppliers withdrawing their support. In the case of the Senuko Lodge, this resulted in a 98% cancelation of the confirmed bookings. After four years of seeking alternative markets, the lodge could achieve no higher than 17% occupancy, and in 2005 moved into a hunting-based operation.

A more direct impact of the land reform program for the Savé Valley Conservancy was the loss of 33% of the area of the conservancy to invading subsistence farmers (Lindsey et al 2008). The loss of land was catastrophic and the related pressure from wire snaring (bushmeat poaching) was extreme. For example, in the following eight year

period (2001 to 2009), 10,520 illegal hunting incidences were recorded in the conservancy, 84,396 wire snares were removed and at least 6,454 wild animals killed (Lindsey et al 2011).

The associated political instability meant that the wildlife industry and ecotourism industry collapsed over-night. Sport hunting and trophy hunting became the only economically viable land use options and have remained the only tangible source of income to the landowners of the SVC.

4 Lions in the Savé Valley Conservancy

As mentioned, lions, and all other large predators were virtually or completely eradicated during the cattle ranching era (du Toit 1994, Pole 1999). Once persecution stopped, lion numbers began to pick up, but initial recovery was slow, probably because of a depleted source population. Evidence of lions were first noticed in the late 1990s / early 2000s, but were almost exclusively of males. Very few signs of females were observed until 2003, when small family groups and male-female pairs were observed. By 2004-5 there were some reports of cubs. Population recovery has been largely through natural recolonisation, although 13 lions were reintroduced between 1993 and 2005.

In 1993, three lions were brought into the conservancy by Humani Ranch; two adult females and one adult male. One of the females was pregnant and four cubs were reared successfully. A further ten lions (four lionesses and six small cubs) were brought in in 2005 and released on Sango Ranch. A few months later three were killed by wire snares, and the rest of the group split up. Tracks suggest that three adult females and one cub survived.

4.1 Lion monitoring

Lions have been monitored in the Savé Valley Conservancy since 1999 when the first survey was conducted (Pole 1999). Track index or call-up surveys were then conducted sporadically until 2006. From 2007 to present, annual conservancy-wide track index surveys have been conducted using a standardized methodology (Groom 2012). The resulting population estimates were verified in 2011 by a baited lion call-up survey and a collation of managers' estimates, all of which provided similar results.

Results of the surveys indicate that the lion population in the Savé Valley Conservancy has been undergoing exponential population increase (Figure 1; Groom 2012). Using prey availability models (Hayward et al 2007), it was calculated that the population in 2011 was only at 60% of ecological carrying capacity, and thus we can expect to see the upward trend continue unless controlled.

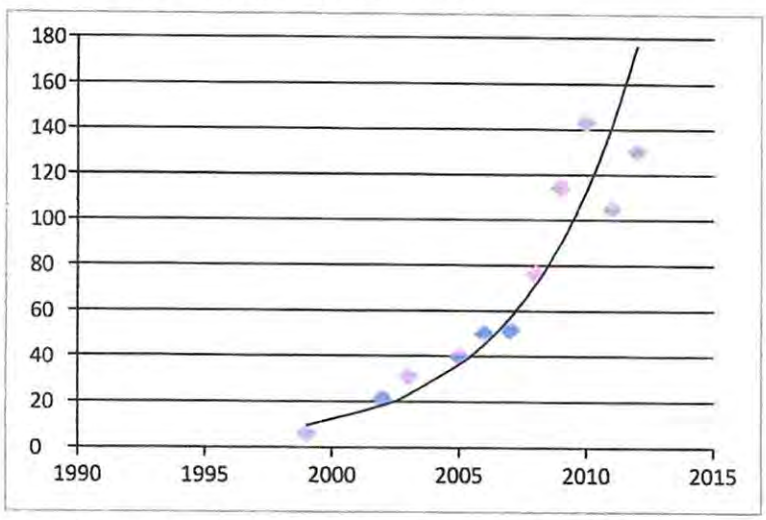

Figure 1 – Lion numbers in Savé Valley Conservancy (1999 – 2012).
Trendline is an exponential growth curve. (Adapted from Groom (2012))

4.2 Lion management plan

A professional, scientific lion management plan was commissioned by the conservancy in 2011 (Funston 2011; Appendix 1). The aim of the plan was to provide the SVC members with a science-based plan to help them ethically and sustainably manage their lion population. This plan specifically advocates the use of hunting as a conservation management tool, based on the evidence of good hunting practice in the conservancy. It demonstrates willingness by the conservancy to guide their hunting policy based on science and advice from professionals.

4.3 Lion hunting in the Savé Valley Conservancy

Lions have been hunted in Savé Valley Conservancy since 2002, although that was largely for removal of problem animals. Hunting began properly in 2005 with quotas increasing annually to a maximum of seven per year from 2009 onwards (Table 2), but with offtake never exceeding six.

Table 2 Lion quotas and offtakes in Savé Valley Conservancy from 2001 to 2011

Approved quota and success (offtake)	2001	2002	2003	2004	2005	2006	2007	2008	2009	2010	2011
Approved quota	4	5	5	1	3	3	4	6	7	7	7
Quota taken (Success)	0	1	0	1	3	3	3	3	6	5	3
Percentage success	0%	20%	0%	100%	100%	100%	75%	50%	86%	71%	43%

Despite offtakes of lions through trophy hunting, the lion population has continued to increase in the conservancy in recent years. This is largely because the lion population is still building up after the initial persecution, and trophy hunting of select, older males does not impact this growth. The revenue generated from hunting lions has enabled landowners to invest in proper land management, anti-poaching and fence maintenance, all of which benefit the lion population (especially as lions seem to be vulnerable to being caught in wire snares; pers. obs.).

Trophy hunting of lions brings considerable revenue to the conservancy, revenue that is vital for the continued functioning of the area for wildlife conservation. A 21 day lion hunt is sold for c. $2,500 per day (prices vary slightly depending on the operator), with an additional trophy fee of $10,000. Net income from lion hunting from 2005 to 2011 (N = 26 lions) would therefore have amounted to c. US $1,365,000 in bed nights and $260,000 in trophy fees.

5 The impact of listing lions as endangered on the US Endangered Species Act

In the current political climate, landowners in the Savé Valley Conservancy have no alternative way to generate sufficient income from wildlife, other than from hunting. Lions are one of the most valuable species to the conservancy. If lions are upgraded to endangered on the Endangered Species Act in the US, the resulting ban on lion trophy imports into the US will effectively result in a collapse of the lion hunting industry in the Savé Valley Conservancy, where on average 90% of hunting clients are American (up to 98% for some properties; SVC members, pers. comm.). The loss of the c. $375,000 annual revenue will be catastrophic for the conservancy, inevitably resulting in less investment in security and other conservation measures.

Lions impose a significant cost on conservancy landowners through predation on valuable prey species that could otherwise be sold as trophies or meat. For the Savé Valley Conservancy, this was calculated as a loss of US$ 494,776 in 2009, an 8% loss relative to gross income from the species when hunted at current levels (Funston et al, unpublished data). Without these costs being offset by the income from lion hunting, landowners cannot reasonably be expected to tolerate such high lion numbers, and lion numbers would have to be reduced significantly.

The Savé Valley Conservancy is extremely expensive to run due to pressure from the illegal bushmeat trade and from rhino poaching. In recent years, robust earnings from trophy hunting have allowed investment of c. US$ 136.000 per year in ranch-based anti-poaching, ensuring that wildlife populations remained stable in all but the areas that were settled (and the heavily impacted immediately adjacent sections). An additional US$ @@@ was spent by members on a central anti-poaching unit for the battle against rhino poaching. A removal of lions from the hunting quota due to collapsed demand would reduce the ability of the Savé Valley Conservancy to protect the wildlife resource, including endangered species like its valuable populations of African wild dogs and especially black rhinos (an IUCN Key 1 population).

In the Savé Valley Conservancy therefore – and it is by no means the only area in this situation – the listing of lions as endangered on the US Endangered Species Act, and the subsequent collapse of the US lion hunting market, would necessitate a culling or contraceptive program for lions, in order to decrease their numbers to economically and ecologically tolerable levels. The upgrade would therefore, instead of protecting lions in these areas, effectively sign their death warrant.

5.1 The impact on neighbouring communities

A knock-on impact of this listing will be felt in the communities which neighbour the Savé Valley Conservancy. In 2012, conservancy members provided over US$85,000 worth of support to adjacent villages or farmers in the resettled areas. Assistance included drilling boreholes, maintaining boreholes, dredging of dams, assisting with building projects in clinics and schools, assisting with repairs, maintenance and materials at schools, education initiatives, school field trips, provision of computer equipment in schools, craft programs and regular donations of meat.

Recently the conservancy has signed a deal with the chiefs of all the neighbouring wards.....

The Savé Valley Conservancy is thus pioneering private-community partnerships in Zimbabwe, and trade restrictions on lion trophies will indirectly adversely affect these already seriously impoverished communities through a reduction in available income to share with communities.

6 Conclusion

The Savé Valley Conservancy is an excellent example of a focussed and determined effort to make a wildlife based land use viable in an otherwise cattle dominated landscape. From inception, conservancy members and international investors have invested huge amounts of finance and effort into re-stocking the area, building up the wildlife to the incredible numbers and diversity found in the conservancy today, and protecting it from poachers. The revenue to do this has been almost exclusively generated through hunting, due to the collapse of the ecotourism industry after 2000.

In recent years, lion hunts have provided a significant financial contribution to the ever-more-expensive operation of the conservancy, enabling significant investment in security and community support and engagement. Should lions become listed as endangered on the US Endangered Species Act, the resulting collapse of the lion hunting industry will have serious negative implications. The cost of having lions, both ecologically and financially is high, and with no generation of revenue from the species, numbers will inevitably have to be curtailed.

Carnivore Densities in the Savé Valley Conservancy

Results of the 2018 Spoor Survey & Wild Dog Monitoring Project

Jessica Watermeyer and Dr Rosemary Groom, African Wildlife Conservation Fund

(Spoor survey carried out by Amy Wolton, Rueben Boté, and Douglas Tomwe)

Introduction

The African Wildlife Conservation Fund carries out an annual large carnivore spoor survey in order to assess population trends of carnivores within the Savé Valley Conservancy (SVC / the conservancy) to aid management decisions. A standardised methodology is used to ensure consistency through time and comparability with other studies. Since 2008, the spoor surveys have been done using the same roads and the same observer.

Spoor surveys have been shown to be an effective and efficient means to assess wildlife densities (Stander 1998; Funston et al. 2001; Davidson & Romañach 2007; Funston et al 2010) with strong correlations existing between spoor density and true density. The technique is considered to produce reliable estimates for lions, spotted hyenas, and leopards, when sample sizes (spoor encounter rates) are sufficient. Other carnivores are included in our counts simply to monitor trends over time.

This report presents the results of the October 2018 carnivore spoor survey for the SVC, together with results from the long term wild dog monitoring project, and looks at trends in the main carnivore species over time.

Methodology

The 2018 carnivore spoor survey used the methods pioneered in SVC by Davidson and Romañach (2007), based on those used by Stander (1998) in Namibia. Exactly the same methodology has been used annually since 2008. Road transects were chosen throughout the SVC to represent a fair coverage of all (non-resettled) areas, and these transects were scanned for spoor. The number of kilometres of transects surveyed was chosen to maintain consistency with previous spoor surveys. Thus, for every 6-7km^2 of

sample area, 1km of transect was surveyed, creating a penetration density (expressed as a ratio of kilometres of transect surveyed to total sample area) of between 1:6 and 1:7.

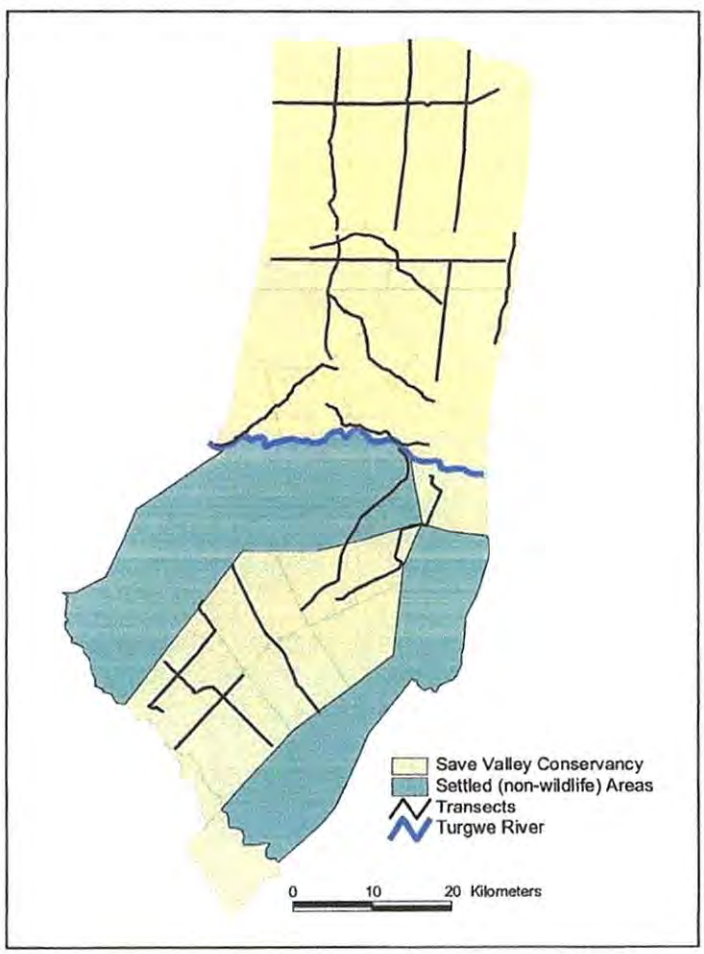
The total area of the Savé Valley Conservancy is 3,490km^2. However, the effective wildlife area (excluding the 1051km^2 of resettled land), comes to only 2,439km^2; 1,639km^2 north of the Turgwe river and 800km^2 south of the Turgwe (see Table 1).

In northern SVC, the total length of all transects combined was 259.5 km, giving a penetration ratio of 6.32. In southern SVC, the combined transect length was 130.9 km, giving a penetration ratio of 6.12. For the conservancy as a whole, 390.4 km were driven (penetration ratio 6.25).

Transects surveyed were the same as those used in 2007-2017 (Figure 1). Each transect was driven at a speed of between 10 and 20 km/hr with one tracker, AWCF head scout Rueben Boté, sitting on the front of the vehicle scanning for spoor. Transects ranged between 12.6 km and 29.1 km in length, with a mean transect length of 21.7 km.

Each transect survey started as close to sunrise as possible, and wherever feasible was driven from west to east to ensure the best possible tracking conditions. Only tracks less than 24 hours old were counted. Road conditions are generally sandy, such that spoor is relatively easy to see. Where possible, spoor of individual animals were followed to reduce the likelihood of that individual being counted twice on a given transect. Spoor was recorded for all mammalian carnivores bigger than a genet.

Figure 1. Map of the transects driven – October 2018



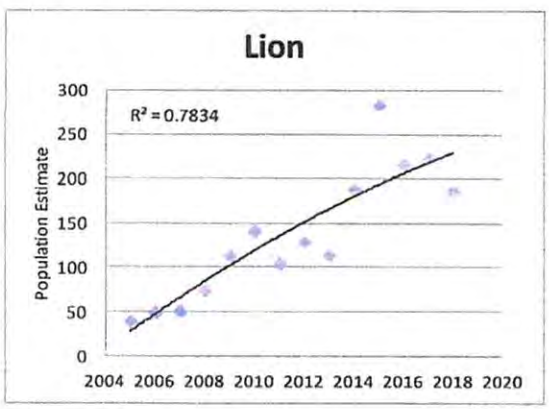
Results

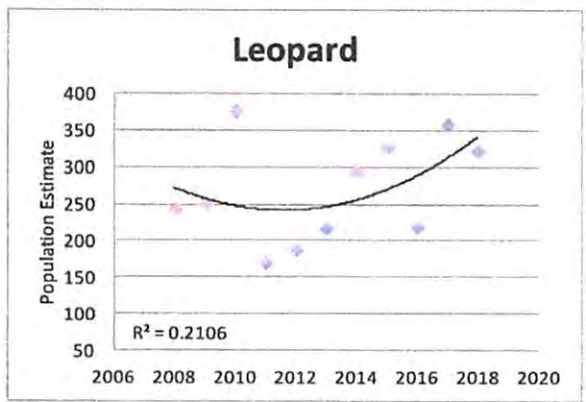
Table 1: Summary of survey parameters (2018)

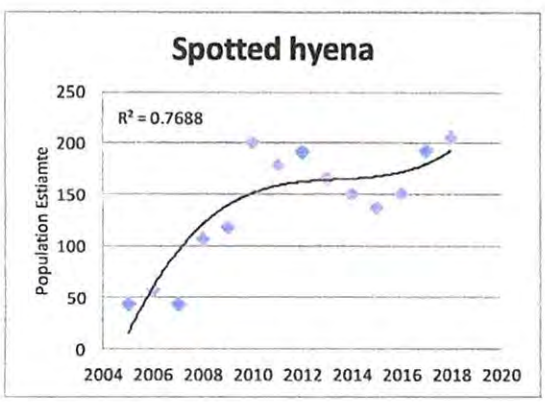
Parameter	Northern SVC	Southern SVC	Total SVC
Area (km^2)	1639	800	2439
Total number of km driven	259.5	130.9	390.4
Penetration ratio	6.32	6.12	6.25

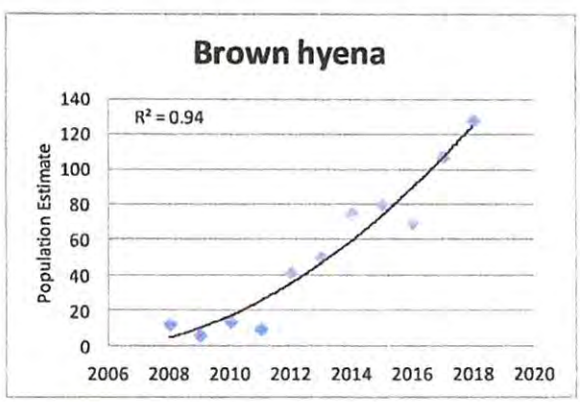
Table 2: Population estimates of the key carnivore species in the **whole of Savé Valley Conservancy** from 2008-2018 (from 2005-2018 for lion and spotted hyena).
Data for lion, leopard, spotted and brown hyenas and black backed jackal are from spoor surveys; **data for wild dogs is from the Lowveld Wild Dog Project's direct monitoring efforts** (counts are taken from April of each year and include adult and yearling wild dogs only).

Species	2005	2006	2007	2008	2009	2010	2011	2012	2013	2014	2015	2016	2017	2018
Lion	40	50	52	76	114	143	105	130	115	190	284	217	223	187
Leopard				245	252	378	172	189	218	295	328	221	359	323
Spotted hyena	44	58	44	107	118	201	178	192	166	150	137	150	193	206
Brown hyena				12	6	14	10	41	50	75	80	70	107	128
African Wild dog				45	60	64	61	86	90	81	91	99	94	96
Black backed jackal				188	190	157	141	151	199	229	241	234	296	153









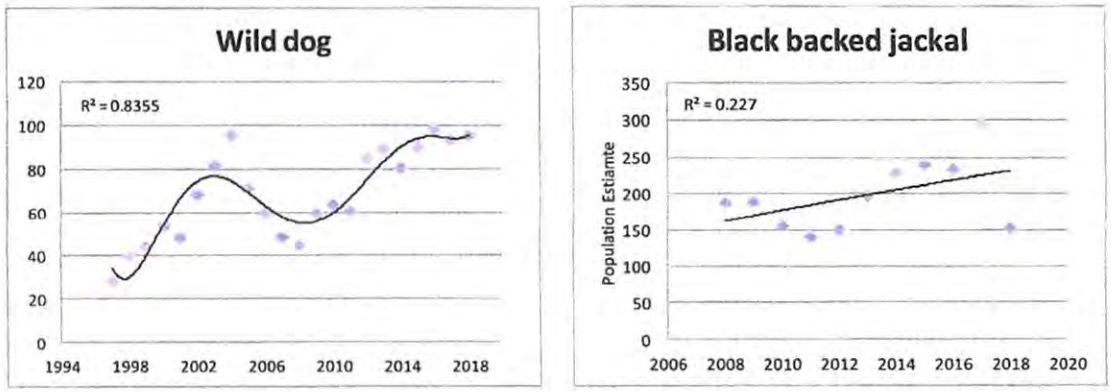


Figure 2: Trends in the populations of key carnivores in SVC for all years for which data is available. Data for lion, leopard and spotted and brown hyenas and black backed jackal are from spoor surveys; data for wild dogs is from the Lowveld Wild Dog Project's direct monitoring efforts (counts are taken from April of each year and include adult and yearling wild dogs). *A breakdown of all survey results for all species between the north and south of the conservancy is given in Appendix 1.*

Discussion

The results show a slight drop in lion and leopard numbers, and a significant decline in black backed jackals (currently unclear as to whether this represents a genuine decline or simply a low count). The spotted and brown hyenas, and wild dog population, remain stable and/or increasing.

Interpretation of results for each species

The **lion population** in the conservancy has increased significantly from c. 40 individuals in 2005 to 190 in 2014. Excluding the anomalous over count in 2015, the population appears to have been relatively stable since 2014, with a few natural fluctuations. Despite the slight decrease in estimated individuals since last year, the population **estimate of 187 lions** in 2018 is within range of the long-term population trend (Figure 2).

The number of lions in SVC equates to a **density of 7.7 lions / 100km²**, which is in line with densities recorded elsewhere (9.6 lions / 100km² - average over Kruger, Hwange, Selous and Serengeti), although in areas notably larger than SVC. Finally, of the 98 lion tracks we encountered, 22% were adult males, with 65% identified as adult females, 6% as young cubs, and 7% of tracts were unidentified. With regards to quota considerations, it is important to not only consider the population trend of the species, but age grouping and sex ratios too.

In 2018 there were an estimated **323 leopard** in the conservancy. If one disregards the 2016 count as an anomalous undercount, and considers the long-term trend data from 2011 – 2017 (inclusive), it is clear that the conservancy's **leopard population** is displaying a positive trend (Figure 2).

Leopards are at a **density of 13.3 leopards / 100km²** in the conservancy. This is considerably higher than densities recorded in other places, for example in Phinda and Mkhuze in South Africa (average 9.7 / 100km²; Balme et al. 2009) and in neighbouring Gonarezhou National Park (8.1 / 100km²; Groom & Watermeyer 2018). Finally, the SVC leopard population appears to display a 2:1 ratio skewed in the favour

of females. Of the 74 leopard tracks we recorded, 62% were adult females and 30% were adult males. No cub tracts were recorded (0%) and 8% of the tracts were unidentified.

Derivation of population estimates from spoor densities is controversial for leopards (there are several different equations available which give different numbers) so the numbers themselves should be treated with caution. Looking ahead, it may be useful to adopt alternative research methods (e.g. mark recapture camera trap survey) to calibrate the survey results, and obtain a more comprehensive understanding of leopard numbers in the conservancy.

Spotted hyenas appear to have stabilised over the last few years at between 150-200 individuals. Indeed, there were an estimated **206 spotted hyenas** in 2018. The hyena population could be doing better in light of the recently stabilising lion numbers, but we will need to monitor the population to determine if a true trend is emerging.

Spotted hyenas are at a density of **8.4 spotted hyenas / 100km²**. This is lower than other populations; 13.5 / 100km² in Kruger (Mills 1985), 17.0 / 100km² in Hwange (Bowler 1992), and 10.4 / 100km² in Gonarezhou National Park (Groom & Watermeyer 2018). Given the relatively lower density of the species in the conservancy, they may still increase more (especially if the lion numbers continue to drop).

There were an estimated **128 brown hyenas** in the conservancy in 2018. Overall and ignoring the 2016 undercount, the **brown hyena population** is displaying a stable and positive growth trend (Figure 2). The estimated density of brown hyenas was **5.2 brown hyenas / 100km²** in 2018 which is higher than the average (3.4 brown hyenas / 100km²) over the last few years (2014-2017).

As reported consistently for the past few years, the **African wild dog** population appears to be levelling off. **From our comprehensive and direct monitoring of the species, there are 96 adult and yearling wild dogs in the conservancy (3.9 wild dogs / 100km²)**. Average wild dog densities are generally lower (average 2.5 wild dogs / 100km² across five populations; Pole 1999). The spoor survey results estimated 278 wild dogs in the conservancy, with a density of 11.4 African wild dogs / 100km². This is clearly a significant overestimate of the wild dog population, and serves to demonstrate that spoor surveys are not a reliable indicator of wild dog numbers.

When counts include pups (as spoor surveys do); the numbers are likely to be higher (particularly in October when densities are highest because it is directly after the denning season). Further, there is the potential to 'hit' or 'miss' a large pack of wild dogs during a spoor survey which can have a large effect on the results. However, looking at the detailed monitoring results, the long term trend for the species is as expected. Wild dogs are a classic 'boom and bust' species showing major population fluctuations over time. Nonetheless, their population has been relatively stable since 2011.

There has been a significant decrease in the **black backed jackal** population estimate for the conservancy. At an estimated **153 black backed jackals** in 2018, this is the lowest count of the species since 2013. Whether this is a true decline or not is unclear. At this stage, however, we are cautiously treating the 2018 count as an anomaly, but this species will need to be watched very closely. The estimated density of jackals was **6.3 jackals / 100km²** in 2018.

We once again stress, that the spoor encounter rate for **cheetah** in the conservancy is very low, and thus it is impossible to accurately estimate the number of resident cheetah, even with large confidence intervals. Indeed, **we did not pick up a signal track for cheetah in the 2018 spoor survey**. Although we know that there are resident cheetah in the conservancy, we can safely say the population is still very low (zero cheetah tracks were seen in the 390.4 km of transects driven in 2018). However, spoor surveys are not appropriate techniques for monitoring cheetah because they use the roads a lot less than other large carnivores, and the species would be more accurately surveyed by a mark recapture camera trap survey using cheetah play trees and other key areas. **The Cheetah Conservation Project Zimbabwe, which collected updated photographic information on cheetah throughout Zimbabwe, estimated c. 12 adult cheetahs in SVC in 2015 (van der Meer, 2016).** We have no reason to think this number has changed much.

Word of caution

When interpreting the results in the graphs and tables at the end, please do so with caution, especially to quote specific numbers. For lions and hyenas we are confident that these spoor surveys are relatively accurate in the numbers they predict, although occasional anomalous over and undercounts need to be treated carefully. Likewise, we can trust the numbers for wild dogs, as they are from AWCF's detailed population monitoring study. For leopards however, several different equations (all considered suitable for estimating leopard numbers from spoor) can give different population estimates from each other. The spoor survey technique has not been calibrated for species like jackals, civets, even brown hyenas, so while the data is useful for looking at trends, using population figures directly from the graphs for these species is unadvisable.

Acknowledgements

Permission to conduct this research was given by the Research Council of Zimbabwe, and the Savé Valley Conservancy, with the support of the Zimbabwe Parks and Wildlife Management Authority. Thank you to Chishakwe Ranch for hosting the project team and for providing logistical support. Thanks also to all of the landowners and managers in the conservancy for allowing us to conduct this spoor survey on their properties. Rueben Bote deserves special mention for his excellent track identification.

Dear Ms. Amy Wicklund,

The following is in response to your request regarding the status of the application.

As background, on March 1, 2018, in response to a recent D.C. Circuit Court opinion, the U.S. Fish and Wildlife Service (Service) informed the public that it is revising its procedure for assessing applications to import certain sport-hunted species like the African lion. We have withdrawn our countrywide enhancement findings for a range of species across several countries, including elephants and lions. In their place, we intend to make findings for trophy imports on an application-by application basis.

The Service is continuing to monitor the status and management of these species in their range countries. We review each application received for the import of sport-hunted African lion and evaluate the information provided in the application as well as other information available to us regarding the status and management of the species to ensure that the hunting program is promoting the conservation of the species. Each application must also meet all other applicable permitting requirements before it may be authorized. Therefore, your application is pending at this time.

Sincerely,

Anna Barry

Dear Ms. Wicklund,

The application is still pending at this time. We cannot give you a clear timeframe for when it will be finalized, but, once it is submitted to the supervisor for final review and signature, I will have Amy Brisendine (the person assigned to the application) contact you.

We are processing these applications as fast as we can.

Sincerely,

Anna Barry

Ms. Wicklund,

Since after March 2018, we had to change our procedure on how these applications are processed, we cannot compare how long it took before to how long it takes now. Again we are doing the best we can.

RE: Applicant: Chris Schnetzler
Location: Zimbabwe
Species: Lion
PRT No.: 22129D

Dear Ms. Barry & Ms. Brisendine:

Please be advised that Conservation Force has been asked to represent the applicant, Mr. Schnetzler, in respect to his application for a Zimbabwe lion sport hunted trophy. A signed Notice of Representation is attached.

This is a supplement to his original import permit application. Since his original application had some blanks we have provided that information. The amendments are on Page 4 and apply to questions #7 and #9. I have attached a new page 4, which should replace the old page 4 of the original application. Also, attached are the documents supporting question #7. Finally, I have attached additional enhancement documentation as follows: (1) Lion Hunting In Zimbabwe's Savé Valley Conservancy, *A Conservation Success Story* by Dr. Rosemary Groom, (2) *Carnivore Densities in the Savé Valley Conservancy* and (3) Appendix I: All Spoor Survey Results for All Species Counted (2018). I believe these additional documents should suffice to complete the application.

Please contact, Tammy Piker at 504-837-1233, should you need more.

With best regards, I remain

Cordially,

Tammy L. Piker
Permits Clerk

cc: Mr. Chris Schnetzler ***(w/o attachments)***

REVISED PAGE 4

c. Name of hunting outfitter, safari company, or professional hunter you hunted with:

Name of Safaris Outfitter- Tredelk Safaris Name of Safaris Company- Tredelk Safaris. Name of professional hunter - Guy Whittall- Professional hunter number 421

d. The current location of the trophy (address and country) [the U.S. import permit will identify this country as the country of export/re-export and must match with the foreign export/re-export document]:

Trophy Consultants International 4 Josiah Chinamano Road Belmont Bulawayo Zimbabwe

7. Please provide a copy of any applicable foreign government permits or licenses that were required to remove this animal from the wild {if you have not hunted yet and do not currently hold any such permits or licenses, please indicate so).

Please see attached documentation.

8. Complete name and address of overseas person or business shipping the trophy to you. If you are applying to import a trophy directly from **Namibia,** you must provide the name and address of the professional hunter listed on your Namibian hunting permit [this name will appear on the face of the export permit].
Name:

Business Name:	Trophy Consultants International
Address:	4 Josiah Chinamano Road
City:	Belmont
State/Province:	Bulawayo Zimbabwe
Country, Postal Code:	

9. For species listed under the U.S. Endangered Species Act. please be aware that the U.S. Fish and Wildlife Service (Service) must make a finding that your activities will enhance or benefit wild populations of the species involved. While we will communicate with the range country for the species you will hunt or hunted when making the required findings, if you have any information that could support this finding, it would be helpful for our review if you could provide it. Please submit such information on a separate page with your application.

a. Do you have any information regarding the population status or trend data on the species hunted?

Please see information included with application

b. In order to hunt, you likely paid for licenses or trophy fees. What were those fees and do you have any information on how those funds were used by either the landowner, local community, or government?

Please see information included with application

c. Do you have information on other funding activities that are being carried out, or were carried out, by the safari outfitter, professional hunter, concession holder, or landowner that provide a conservation benefit to the species being hunted/species hunted?

Please see information included with application

NOTICE OF REPRESENTATION

This is a notice to the U.S. Fish and Wildlife Service that I have appointed John J. Jackson, III of the non-profit firm Conservation Force as my attorney and legal representative for all matters concerning my application for a permit to import a lawfully hunted lion trophy.

This authority is inclusive and extends to all applications and filings, whether administrative or judicial, including but not limited to any request for reconsideration, appeal, and litigation.

In the case of a permit an ESA endangered listed species this is also a request for Ten Days Notice before the permit is issued so I and my attorney can know of approval as soon as those that may have opposed the issuance of the permit.

Lion Hunting in Zimbabwe's Savé Valley Conservancy
A Conservation Success Story

Dr Rosemary Groom
African Wildlife Conservation Fund

1 Background

This document is a case study of the Savé Valley Conservancy in south-east Zimbabwe, where the African lion (*Panthera leo*) population is increasing exponentially, and where lions have been hunted since 2002. This case study clearly illustrates the positive conservation benefit that trophy hunting of lions can have for the species, and briefly describes the importance of hunting to maintaining wildlife in the area.

2 History of the Savé Valley Conservancy

The Savé Valley was a wildlife-rich wilderness until the early 1900s, when the first cattle ranching initiatives started in the area. The establishment of Devuli Ranch and Angus Ranch in 1920 paved the way for seven decades of commercial cattle ranching in the area we know today as the Savé Valley Conservancy. Roads were cut, fences erected and an everlasting "battle" ensued against the wildlife, especially against all predators.

After the Second World War, cattle prices soared to new heights, and the 1950s were years of development and expansion for the cattle industry. The large predators, especially lions, were virtually eradicated (Pole 1999). However, by the late 1980s, declining range productivity, depressions and droughts forced the landowners to consider alternative options. Around that time, empirical evidence of the competitive advantage of wildlife over livestock began to emerge (Child 1988; Bond 1993), especially in arid areas (Jansen et al 1992; Cumming 1993), and wildlife was finally given serious consideration as a viable land use option.

In 1989, proposals were drawn up to form what would have been known as the Savé Valley Intensive Conservation Area (du Toit 1989). The initial focus of the proposal was to create a single large wildlife area, especially for the re-establishment of endangered species and species that had been overexploited in the past. Cattle ranching would still remain the primary land use option with wildlife an additional source of income.

The formation of the Savé Valley Conservancy came in June 1991 with the signing of the first constitution by the various members. However, the following 1991/1992 rainy season proved to be the driest season ever recorded, and proved to be a deciding factor for the landowners of the Savé Valley Conservancy with regards to future land use. At a workshop held in November 1992 a decision was taken that wildlife would be the primary land use option and that all cattle still owned within the conservancy would be disposed of. This created what was at the time the largest private wildlife conservancy in the world, with 340 839 hectares included (Fig 1).

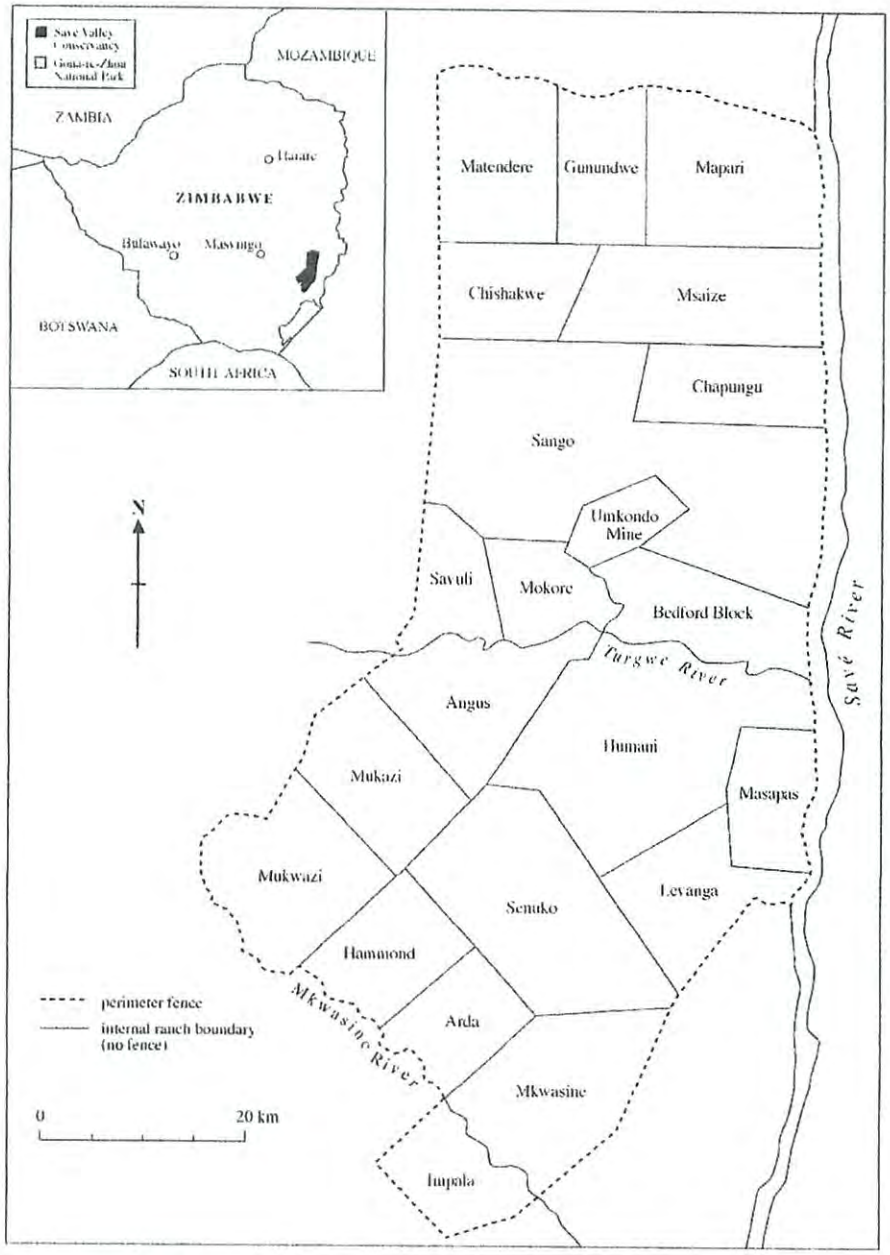

Figure 1 The Savé Valley Conservancy (taken from Lindsey et al 2008)

The conservancy members were then faced with the challenge of rebuilding the wildlife population, removal of all internal fencing, the erection of a common perimeter fence and security. A double, electrified, veterinary-approved fence was completed in 1995, and the following decade saw a massive investment in wildlife re-stocking and security systems.

Some wildlife species had been translocated into the conservancy prior to 1991 (including black rhino, elephant, sable, eland, nyala, giraffe, waterbuck, wildebeest and zebra; Table 1). Species relocated into the SVC since signing the constitution in June 1991 include more black rhino, buffalo, elephant, eland, giraffe, nyala, sable antelope, spotted hyena, tsessebe, Lichtenstein's hartebeest, warthog, waterbuck, blue wildebeest, zebra and lion (Table 1).

Table 1: Species and the number of animals per species re-introduced into the Savé Valley Conservancy, Zimbabwe

Animal Species	Number Of Animals Re-introduced				
	Prior to October 1993	November 1993 to December 1999	January 2000 to December 2002	January 2003 to present	**Total**
African buffalo (*Syncerus caffer*)	91	88	253	40	**472**
African elephant (*Loxodonta africana*)	624	-	-	-	**624**
Black rhinoceros (*Diceros bicornis*)	-	31	-	-	**31**
Blue wildebeest (*Connochaetes taurinus*)	223	525	49	-	**797**
Burchell's zebra (*Equus burchellii*)	17	309	66	-	**392**

3 Trophy hunting vs Ecotourism in the Savé Valley Conservancy

Trophy hunting was essential for the successful transition of the conservancy from cattle to wildlife. During the early years, wildlife densities were low, resulting in poor potential for ecotourism, and hunting generated the income needed to erect the fence, continue the re-stocking and increase the security, especially due to the now significant numbers of black rhino in the conservancy. Gradually, some of the ranchers shifted more into ecotourism. One property, Senuko Ranch, completed a 16 bed up-market lodge with a view of marketing non-consumptive safaris, doing game drives and bush walks and specializing in rhino walks and African wild dog den visits. Lodge occupancy rose from 0% in 1996 to 62% by the end of 1999.

3.1 The Land Reform Program

The land reform program was launched in February 2000 and created negative press from the international community. This resulted in travel bans and warnings from most of Zimbabwe's source markets, which, compounded by the negative publicity in the media, resulted in major suppliers withdrawing their support. In the case of the Senuko Lodge, this resulted in a 98% cancelation of the confirmed bookings. After four years of seeking alternative markets, the lodge could achieve no higher than 17% occupancy, and in 2005 moved into a hunting-based operation.

A more direct impact of the land reform program for the Savé Valley Conservancy was the loss of 33% of the area of the conservancy to invading subsistence farmers (Lindsey et al 2008). The loss of land was catastrophic and the related pressure from wire snaring (bushmeat poaching) was extreme. For example, in the following eight year

period (2001 to 2009), 10,520 illegal hunting incidences were recorded in the conservancy, 84,396 wire snares were removed and at least 6,454 wild animals killed (Lindsey et al 2011).

The associated political instability meant that the wildlife industry and ecotourism industry collapsed over-night. Sport hunting and trophy hunting became the only economically viable land use options and have remained the only tangible source of income to the landowners of the SVC.

4 Lions in the Savé Valley Conservancy

As mentioned, lions, and all other large predators were virtually or completely eradicated during the cattle ranching era (du Toit 1994, Pole 1999). Once persecution stopped, lion numbers began to pick up, but initial recovery was slow, probably because of a depleted source population. Evidence of lions were first noticed in the late 1990s / early 2000s, but were almost exclusively of males. Very few signs of females were observed until 2003, when small family groups and male-female pairs were observed. By 2004-5 there were some reports of cubs. Population recovery has been largely through natural recolonisation, although 13 lions were reintroduced between 1993 and 2005.

In 1993, three lions were brought into the conservancy by Humani Ranch; two adult females and one adult male. One of the females was pregnant and four cubs were reared successfully. A further ten lions (four lionesses and six small cubs) were brought in in 2005 and released on Sango Ranch. A few months later three were killed by wire snares, and the rest of the group split up. Tracks suggest that three adult females and one cub survived.

4.1 Lion monitoring

Lions have been monitored in the Savé Valley Conservancy since 1999 when the first survey was conducted (Pole 1999). Track index or call-up surveys were then conducted sporadically until 2006. From 2007 to present, annual conservancy-wide track index surveys have been conducted using a standardized methodology (Groom 2012). The resulting population estimates were verified in 2011 by a baited lion call-up survey and a collation of managers' estimates, all of which provided similar results.

Results of the surveys indicate that the lion population in the Savé Valley Conservancy has been undergoing exponential population increase (Figure 1; Groom 2012). Using prey availability models (Hayward et al 2007), it was calculated that the population in 2011 was only at 60% of ecological carrying capacity, and thus we can expect to see the upward trend continue unless controlled.

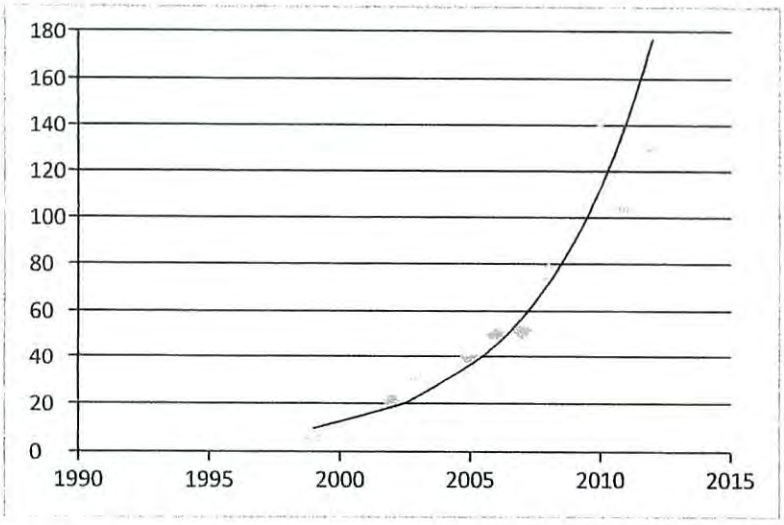

Figure 1 – Lion numbers in Savé Valley Conservancy (1999 – 2012).
Trendline is an exponential growth curve. (Adapted from Groom (2012))

4.2 Lion management plan

A professional, scientific lion management plan was commissioned by the conservancy in 2011 (Funston 2011; Appendix 1). The aim of the plan was to provide the SVC members with a science-based plan to help them ethically and sustainably manage their lion population. This plan specifically advocates the use of hunting as a conservation management tool, based on the evidence of good hunting practice in the conservancy. It demonstrates willingness by the conservancy to guide their hunting policy based on science and advice from professionals.

4.3 Lion hunting in the Savé Valley Conservancy

Lions have been hunted in Savé Valley Conservancy since 2002, although that was largely for removal of problem animals. Hunting began properly in 2005 with quotas increasing annually to a maximum of seven per year from 2009 onwards (Table 2), but with offtake never exceeding six.

Table 2 Lion quotas and offtakes in Savé Valley Conservancy from 2001 to 2011

Approved quota and success (offtake)	**2001**	**2002**	**2003**	**2004**	**2005**	**2006**	**2007**	**2008**	**2009**	**2010**	**2011**
Approved quota	4	5	5	1	3	3	4	6	7	7	7
Quota taken (Success)	0	1	0	1	3	3	3	3	6	5	3
Percentage success	0%	20%	0%	100 %	100 %	100 %	75%	50%	86%	71%	43%

Despite offtakes of lions through trophy hunting, the lion population has continued to increase in the conservancy in recent years. This is largely because the lion population is still building up after the initial persecution, and trophy hunting of select, older males does not impact this growth. The revenue generated from hunting lions has enabled landowners to invest in proper land management, anti-poaching and fence maintenance, all of which benefit the lion population (especially as lions seem to be vulnerable to being caught in wire snares; pers. obs.).

Trophy hunting of lions brings considerable revenue to the conservancy, revenue that is vital for the continued functioning of the area for wildlife conservation. A 21 day lion hunt is sold for c. $2,500 per day (prices vary slightly depending on the operator), with an additional trophy fee of $10,000. Net income from lion hunting from 2005 to 2011 (N = 26 lions) would therefore have amounted to c. US $1,365,000 in bed nights and $260,000 in trophy fees.

5 The impact of listing lions as endangered on the US Endangered Species Act

In the current political climate, landowners in the Savé Valley Conservancy have no alternative way to generate sufficient income from wildlife, other than from hunting. Lions are one of the most valuable species to the conservancy. If lions are upgraded to endangered on the Endangered Species Act in the US, the resulting ban on lion trophy imports into the US will effectively result in a collapse of the lion hunting industry in the Savé Valley Conservancy, where on average 90% of hunting clients are American (up to 98% for some properties; SVC members, pers. comm.). The loss of the c. $375,000 annual revenue will be catastrophic for the conservancy, inevitably resulting in less investment in security and other conservation measures.

Lions impose a significant cost on conservancy landowners through predation on valuable prey species that could otherwise be sold as trophies or meat. For the Savé Valley Conservancy, this was calculated as a loss of US$ 494,776 in 2009, an 8% loss relative to gross income from the species when hunted at current levels (Funston et al, unpublished data). Without these costs being offset by the income from lion hunting, landowners cannot reasonably be expected to tolerate such high lion numbers, and lion numbers would have to be reduced significantly.

The Savé Valley Conservancy is extremely expensive to run due to pressure from the illegal bushmeat trade and from rhino poaching. In recent years, robust earnings from trophy hunting have allowed investment of c. US$ 136.000 per year in ranch-based anti-poaching, ensuring that wildlife populations remained stable in all but the areas that were settled (and the heavily impacted immediately adjacent sections). An additional US$ @@@ was spent by members on a central anti-poaching unit for the battle against rhino poaching. A removal of lions from the hunting quota due to collapsed demand would reduce the ability of the Savé Valley Conservancy to protect the wildlife resource, including endangered species like its valuable populations of African wild dogs and especially black rhinos (an IUCN Key 1 population).

In the Savé Valley Conservancy therefore – and it is by no means the only area in this situation – the listing of lions as endangered on the US Endangered Species Act, and the subsequent collapse of the US lion hunting market, would necessitate a culling or contraceptive program for lions, in order to decrease their numbers to economically and ecologically tolerable levels. The upgrade would therefore, instead of protecting lions in these areas, effectively sign their death warrant.

5.1 The impact on neighbouring communities

A knock-on impact of this listing will be felt in the communities which neighbour the Savé Valley Conservancy. In 2012, conservancy members provided over US$85,000 worth of support to adjacent villages or farmers in the resettled areas. Assistance included drilling boreholes, maintaining boreholes, dredging of dams, assisting with building projects in clinics and schools, assisting with repairs, maintenance and materials at schools, education initiatives, school field trips, provision of computer equipment in schools, craft programs and regular donations of meat.

Recently the conservancy has signed a deal with the chiefs of all the neighbouring wards.....

The Savé Valley Conservancy is thus pioneering private-community partnerships in Zimbabwe, and trade restrictions on lion trophies will indirectly adversely affect these already seriously impoverished communities through a reduction in available income to share with communities.

6 Conclusion

The Savé Valley Conservancy is an excellent example of a focussed and determined effort to make a wildlife based land use viable in an otherwise cattle dominated landscape. From inception, conservancy members and international investors have invested huge amounts of finance and effort into re-stocking the area, building up the wildlife to the incredible numbers and diversity found in the conservancy today, and protecting it from poachers. The revenue to do this has been almost exclusively generated through hunting, due to the collapse of the ecotourism industry after 2000.

In recent years, lion hunts have provided a significant financial contribution to the ever-more-expensive operation of the conservancy, enabling significant investment in security and community support and engagement. Should lions become listed as endangered on the US Endangered Species Act, the resulting collapse of the lion hunting industry will have serious negative implications. The cost of having lions, both ecologically and financially is high, and with no generation of revenue from the species, numbers will inevitably have to be curtailed.

Carnivore Densities in the Savé Valley Conservancy

Results of the 2018 Spoor Survey & Wild Dog Monitoring Project

Jessica Watermeyer and Dr Rosemary Groom, African Wildlife Conservation Fund

(Spoor survey carried out by Amy Wolton, Rueben Boté, and Douglas Tomwe)

Introduction

The African Wildlife Conservation Fund carries out an annual large carnivore spoor survey in order to assess population trends of carnivores within the Savé Valley Conservancy (SVC / the conservancy) to aid management decisions. A standardised methodology is used to ensure consistency through time and comparability with other studies. Since 2008, the spoor surveys have been done using the same roads and the same observer.

Spoor surveys have been shown to be an effective and efficient means to assess wildlife densities (Stander 1998; Funston et al. 2001; Davidson & Romañach 2007; Funston et al 2010) with strong correlations existing between spoor density and true density. The technique is considered to produce reliable estimates for lions, spotted hyenas, and leopards, when sample sizes (spoor encounter rates) are sufficient. Other carnivores are included in our counts simply to monitor trends over time.

This report presents the results of the October 2018 carnivore spoor survey for the SVC, together with results from the long term wild dog monitoring project, and looks at trends in the main carnivore species over time.

Methodology

The 2018 carnivore spoor survey used the methods pioneered in SVC by Davidson and Romañach (2007), based on those used by Stander (1998) in Namibia. Exactly the same methodology has been used annually since 2008. Road transects were chosen throughout the SVC to represent a fair coverage of all (non-resettled) areas, and these transects were scanned for spoor. The number of kilometres of transects surveyed was chosen to maintain consistency with previous spoor surveys. Thus, for every 6-7km^2 of

sample area, 1km of transect was surveyed, creating a penetration density (expressed as a ratio of kilometres of transect surveyed to total sample area) of between 1:6 and 1:7.

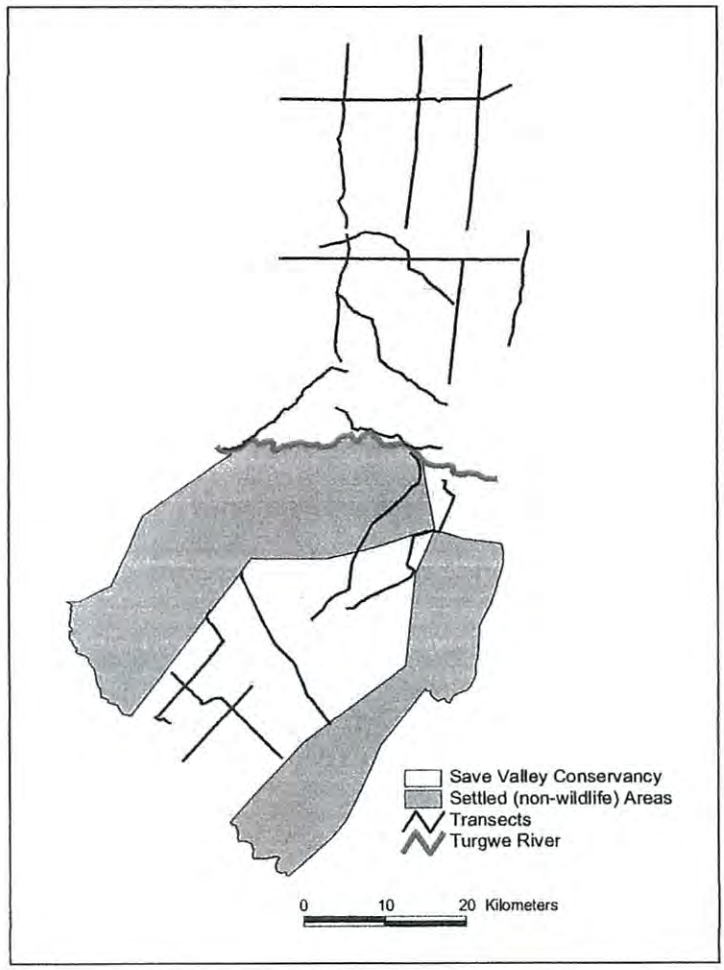
The total area of the Savé Valley Conservancy is 3,490km^2. However, the effective wildlife area (excluding the 1051km^2 of resettled land), comes to only 2,439km^2; 1,639km^2 north of the Turgwe river and 800km^2 south of the Turgwe (see Table 1).

In northern SVC, the total length of all transects combined was 259.5 km, giving a penetration ratio of 6.32. In southern SVC, the combined transect length was 130.9 km, giving a penetration ratio of 6.12. For the conservancy as a whole, 390.4 km were driven (penetration ratio 6.25).

Transects surveyed were the same as those used in 2007-2017 (Figure 1). Each transect was driven at a speed of between 10 and 20 km/hr with one tracker, AWCF head scout Rueben Boté, sitting on the front of the vehicle scanning for spoor. Transects ranged between 12.6 km and 29.1 km in length, with a mean transect length of 21.7 km.

Each transect survey started as close to sunrise as possible, and wherever feasible was driven from west to east to ensure the best possible tracking conditions. Only tracks less than 24 hours old were counted. Road conditions are generally sandy, such that spoor is relatively easy to see. Where possible, spoor of individual animals were followed to reduce the likelihood of that individual being counted twice on a given transect. Spoor was recorded for all mammalian carnivores bigger than a genet.

Figure 1. Map of the transects driven – October 2018



Results

Table 1: Summary of survey parameters (2018)

Parameter	Northern SVC	Southern SVC	Total SVC
Area (km^2)	1639	800	2439
Total number of km driven	259.5	130.9	390.4
Penetration ratio	6.32	6.12	6.25

Table 2: Population estimates of the key carnivore species in the **whole of Savé Valley Conservancy** from 2008-2018 (from 2005-2018 for lion and spotted hyena).
Data for lion, leopard, spotted and brown hyenas and black backed jackal are from spoor surveys; **data for wild dogs is from the Lowveld Wild Dog Project's direct monitoring efforts** (counts are taken from April of each year and include adult and yearling wild dogs only).

Species	2005	2006	2007	2008	2009	2010	2011	2012	2013	2014	2015	2016	2017	2018

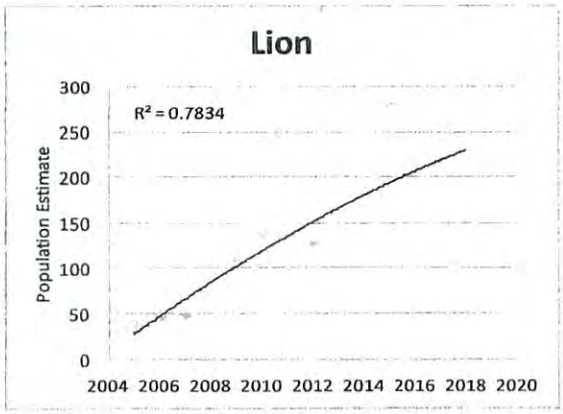

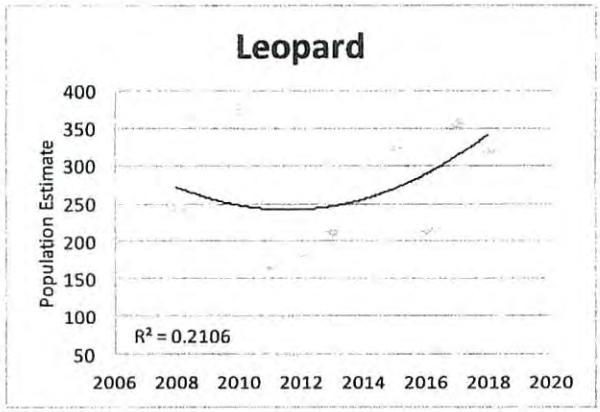

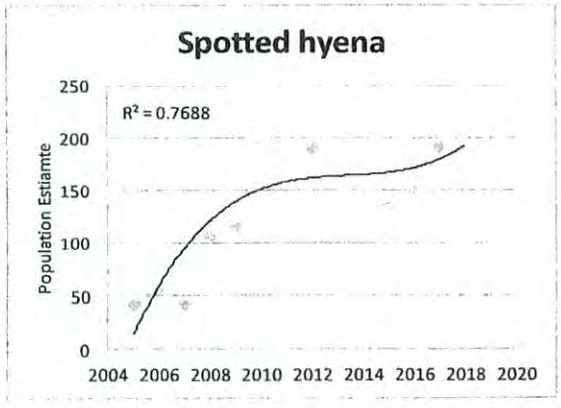

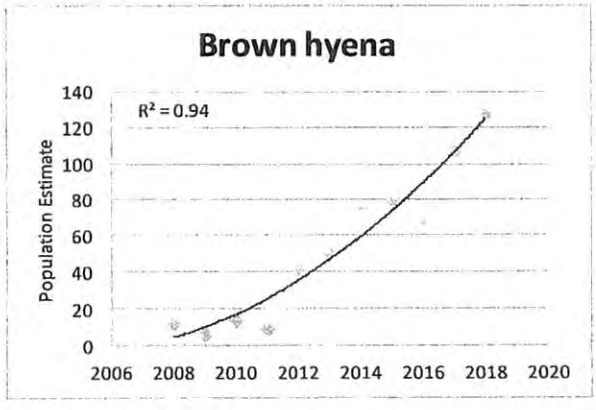

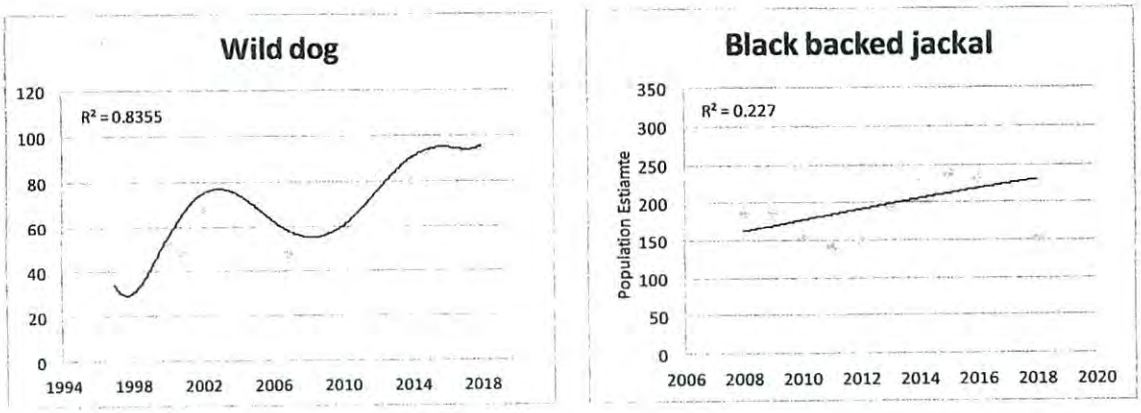

Figure 2: Trends in the populations of key carnivores in SVC for all years for which data is available. Data for lion, leopard and spotted and brown hyenas and black backed jackal are from spoor surveys; data for wild dogs is from the Lowveld Wild Dog Project's direct monitoring efforts (counts are taken from April of each year and include adult and yearling wild dogs). *A breakdown of all survey results for all species between the north and south of the conservancy is given in Appendix 1.*

Discussion

The results show a slight drop in lion and leopard numbers, and a significant decline in black backed jackals (currently unclear as to whether this represents a genuine decline or simply a low count). The spotted and brown hyenas, and wild dog population, remain stable and/or increasing.

Interpretation of results for each species

The **lion population** in the conservancy has increased significantly from c. 40 individuals in 2005 to 190 in 2014. Excluding the anomalous over count in 2015, the population appears to have been relatively stable since 2014, with a few natural fluctuations. Despite the slight decrease in estimated individuals since last year, the population **estimate of 187 lions** in 2018 is within range of the long-term population trend (Figure 2).

The number of lions in SVC equates to a **density of 7.7 lions / 100km²**, which is in line with densities recorded elsewhere (9.6 lions / 100km² - average over Kruger, Hwange, Selous and Serengeti), although in areas notably larger than SVC. Finally, of the 98 lion tracks we encountered, 22% were adult males, with 65% identified as adult females, 6% as young cubs, and 7% of tracts were unidentified. With regards to quota considerations, it is important to not only consider the population trend of the species, but age grouping and sex ratios too.

In 2018 there were an estimated **323 leopard** in the conservancy. If one disregards the 2016 count as an anomalous undercount, and considers the long-term trend data from 2011 – 2017 (inclusive), it is clear that the conservancy's **leopard population** is displaying a positive trend (Figure 2).

Leopards are at a **density of 13.3 leopards / 100km²** in the conservancy. This is considerably higher than densities recorded in other places, for example in Phinda and Mkhuze in South Africa (average 9.7 / 100km²; Balme et al. 2009) and in neighbouring Gonarezhou National Park (8.1 / 100km²; Groom & Watermeyer 2018). Finally, the SVC leopard population appears to display a 2:1 ratio skewed in the favour

of females. Of the 74 leopard tracks we recorded, 62% were adult females and 30% were adult males. No cub tracts were recorded (0%) and 8% of the tracts were unidentified.

Derivation of population estimates from spoor densities is controversial for leopards (there are several different equations available which give different numbers) so the numbers themselves should be treated with caution. Looking ahead, it may be useful to adopt alternative research methods (e.g. mark recapture camera trap survey) to calibrate the survey results, and obtain a more comprehensive understanding of leopard numbers in the conservancy.

Spotted hyenas appear to have stabilised over the last few years at between 150-200 individuals. Indeed, there were an estimated **206 spotted hyenas** in 2018. The hyena population could be doing better in light of the recently stabilising lion numbers, but we will need to monitor the population to determine if a true trend is emerging.

Spotted hyenas are at a density of **8.4 spotted hyenas / 100km²**. This is lower than other populations; 13.5 / 100km² in Kruger (Mills 1985), 17.0 / 100km² in Hwange (Bowler 1992), and 10.4 / 100km² in Gonarezhou National Park (Groom & Watermeyer 2018). Given the relatively lower density of the species in the conservancy, they may still increase more (especially if the lion numbers continue to drop).

There were an estimated **128 brown hyenas** in the conservancy in 2018. Overall and ignoring the 2016 undercount, the **brown hyena population** is displaying a stable and positive growth trend (Figure 2). The estimated density of brown hyenas was **5.2 brown hyenas / 100km²** in 2018 which is higher than the average (3.4 brown hyenas / 100km²) over the last few years (2014-2017).

As reported consistently for the past few years, the **African wild dog** population appears to be levelling off. **From our comprehensive and direct monitoring of the species, there are 96 adult and yearling wild dogs in the conservancy (3.9 wild dogs / 100km²)**. Average wild dog densities are generally lower (average 2.5 wild dogs / 100km² across five populations; Pole 1999). The spoor survey results estimated 278 wild dogs in the conservancy, with a density of 11.4 African wild dogs / 100km². This is clearly a significant overestimate of the wild dog population, and serves to demonstrate that spoor surveys are not a reliable indicator of wild dog numbers.

When counts include pups (as spoor surveys do); the numbers are likely to be higher (particularly in October when densities are highest because it is directly after the denning season). Further, there is the potential to 'hit' or 'miss' a large pack of wild dogs during a spoor survey which can have a large effect on the results. However, looking at the detailed monitoring results, the long term trend for the species is as expected. Wild dogs are a classic 'boom and bust' species showing major population fluctuations over time. Nonetheless, their population has been relatively stable since 2011.

There has been a significant decrease in the **black backed jackal** population estimate for the conservancy. At an estimated **153 black backed jackals** in 2018, this is the lowest count of the species since 2013. Whether this is a true decline or not is unclear. At this stage, however, we are cautiously treating the 2018 count as an anomaly, but this species will need to be watched very closely. The estimated density of jackals was **6.3 jackals / 100km²** in 2018.

We once again stress, that the spoor encounter rate for **cheetah** in the conservancy is very low, and thus it is impossible to accurately estimate the number of resident cheetah, even with large confidence intervals. Indeed, **we did not pick up a signal track for cheetah in the 2018 spoor survey**. Although we know that there are resident cheetah in the conservancy, we can safely say the population is still very low (zero cheetah tracks were seen in the 390.4 km of transects driven in 2018). However, spoor surveys are not appropriate techniques for monitoring cheetah because they use the roads a lot less than other large carnivores, and the species would be more accurately surveyed by a mark recapture camera trap survey using cheetah play trees and other key areas. **The Cheetah Conservation Project Zimbabwe, which collected updated photographic information on cheetah throughout Zimbabwe, estimated c. 12 adult cheetahs in SVC in 2015 (van der Meer, 2016).** We have no reason to think this number has changed much.

Word of caution

When interpreting the results in the graphs and tables at the end, please do so with caution, especially to quote specific numbers. For lions and hyenas we are confident that these spoor surveys are relatively accurate in the numbers they predict, although occasional anomalous over and undercounts need to be treated carefully. Likewise, we can trust the numbers for wild dogs, as they are from AWCF's detailed population monitoring study. For leopards however, several different equations (all considered suitable for estimating leopard numbers from spoor) can give different population estimates from each other. The spoor survey technique has not been calibrated for species like jackals, civets, even brown hyenas, so while the data is useful for looking at trends, using population figures directly from the graphs for these species is unadvisable.

Enhancement Finding

Applicant: Christopher Robert Schnetzler (PRT–22129D)

Introduction

Christopher Robert Schnetzler submitted an application on January 28, 2019, for the importation of one male lion *(Panthera leo melanochaita)* taken on October 19, 2018, from the Savé Valley Conservancy (SVC), Humani Ranch, Masvingo Province, Zimbabwe, for the purpose of enhancing the propagation or survival of the species in the wild. After evaluating the available information submitted with the application, information provided by the Government of Zimbabwe, other information available to the U.S. Fish & Wildlife Service (Service), and comments received from interested parties, the Service has determined that the importation of the sport-hunted trophy meets the requirements for making a positive enhancement finding pursuant to 50 CFR 17.40(r) and 50 CFR 17.32(a). The rationale for our finding follows.

U.S. Permit Requirements for Import of Lions (*Panthera leo melanochaita*)

ESA

The African lion, subspecies *Panthera leo melanochaita* (southern and eastern Africa), is a threatened species under the U.S. Endangered Species Act (ESA or Act) and is regulated under a species-specific 4(d) rule, 50 C.F.R. § 17.40(r) that provides specific conservation measures for this subspecies. Under the 4(d) rule for *P. l. melanochaita*, all of the prohibitions at 50 C.F.R. § 17.21 and 50 C.F.R. § 17.31 apply to *P. l. melanochaita* specimens. These prohibitions, in part, make it illegal for any person subject to the jurisdiction of the United States to import or export any lion specimens.

Although import of the lion subspecies *P. l. melanochaita* is a prohibited activity under the Act, exceptions may be made in accordance with the 4(d) rule at 50 C.F.R. § 17.40(r) when

the import activity qualifies for and the Service issues an ESA threatened-species enhancement permit under 50 C.F.R. § 17.32(a). The preamble to the 4(d) rulemaking, 80 Fed. Reg. 79999, 80043-46 (Dec. 23, 2015), explains the factors the Service considers when making an enhancement finding for importation of sport-hunted trophies of *P. l. melanochaita*, as described below.

Our threatened species permitting regulations at 50 CFR 17.32 provide issuance criteria for threatened species permits (50 CFR 17.32(a)(2)), but do not specify what would constitute the enhancement of propagation or survival with regard to authorizing the import of parts or products of *P. l. melanochaita,* including sport-hunted trophies. Therefore, when making a determination of whether an otherwise prohibited activity enhances the propagation or survival of *P. l. melanochaita,* the Service will examine the overall conservation and management of the subspecies in the country where the specimen originated and whether that management of the subspecies addresses the threats to the subspecies (*i.e.,* that it is based on sound scientific principles and that the management program is actively addressing the current and longer term threats to the subspecies). In that review, we will evaluate whether the import contributes to the overall conservation of the species by considering whether the biological, social, and economic aspects of a program from which the specimen was obtained provide a net benefit to the subspecies and its ecosystem.

The Service will evaluate any application received that involves *P. l. melanochaita* in the context of enhancement of propagation or survival permitting in accordance with our threatened species permitting regulations at 50 CFR 17.32 and issuance criteria for threatened species permits (50 CFR 17.32(a)(2)). These include, in addition to the general permitting criteria in 50 CFR 13.21(b):

(i) Whether the purpose for which the permit is required is adequate to justify removing from the wild or otherwise changing the status of the wildlife sought to be covered by the permit;
(ii) The probable direct and indirect effect that issuing the permit would have on the wild populations of the wildlife sought to be covered by the permit;
(iii) Whether the permit, if issued, would in any way, directly or indirectly, conflict with any known program intended to enhance the survival probabilities of the population from which the wildlife sought to be covered by the permit was or would be removed;
(iv) Whether the purpose for which the permit is required would be likely to reduce the threat of extinction facing the species of wildlife sought to be covered by the permit;
(v) The opinions or views of scientists or other persons or organizations having expertise concerning the wildlife or other matters germane to the application; and
(vi) Whether the expertise, facilities, or other resources available to the applicant appear adequate to successfully accomplish the objectives stated in the application.

In addition to these factors, particularly in relation to sport hunting, we find the *IUCN Species Survival Commission (SSC) Guiding Principles on Trophy Hunting as a Tool for Creating Conservation Incentives, Ver. 1.0* (IUCN SSC 2012), to provide useful principles, which, considered in conjunction with our threatened species issuance criteria, will aid the Service when making an enhancement finding for importation of sport-hunted trophies of *P. l. melanochaita.* This document sets out guidance from experts in the field on the use of trophy hunting as a tool for "creating incentives for the conservation of species and their habitats and for the equitable sharing of the benefits of use of natural resources" (IUCN SSC

2012, p. 2) and recognizes that recreational hunting, particularly trophy hunting, can contribute to biodiversity conservation and more specifically, the conservation of the hunted species.

The SSC document lays out five guiding principles that, considered in conjunction with our threatened species issuance criteria, will aid the Service when making an enhancement finding for importation of sport-hunted trophies of *P. l. melanochaita:*

(a) *Biological sustainability:* The hunting program cannot contribute to the long-term decline of the hunted species. It should not alter natural selection and ecological function of the hunted species or any other species that share the habitat. The program should not inadvertently facilitate poaching or illegal trade in wildlife by acting as a cover for such illegal activities. The hunting program should also not manipulate the ecosystem or its component elements in a way that alters the native biodiversity.
(b) *Net Conservation Benefit:* The biologically sustainable hunting program should be based on laws, regulations, and scientifically based quotas, established with local input, that are transparent and periodically reviewed. The program should produce income, employment, and other benefits to create incentives for reducing the pressure on the target species. The program should create benefits for local residents to co-exist with the target species and other species. It is also imperative that the program is part of a legally recognized governance system that supports conservation.
(c) *Socio-Economic-Cultural Benefit:* A well-managed hunting program can serve as a conservation tool when it respects the local cultural values and practices. It should be accepted by most members of the community, involving and benefiting local residents in an equitable manner. The program should also adopt business practices that promote long-term economic sustainability.
(d) *Adaptive Management: Planning, Monitoring, and Reporting:* Hunting can enhance the species when it is based on appropriate resource assessments and monitoring (*e.g.,* population counts, trend data), upon which specific science-based quotas and hunting programs can be established. Resource assessments should be objective, well documented, and use the best science available. Adaptive management of quotas and programs based on the results of resource assessments and monitoring is essential. The program should monitor hunting activities to ensure that quotas and sex/age restrictions of harvested animals are met. The program should also generate reliable documentation of its biological sustainability and conservation benefits.
(e) *Accountable and Effective Governance:* A biologically sustainable trophy-hunting program should be subject to a governance structure that clearly allocates management responsibilities. The program should account for revenues in a transparent manner and distribute net revenues to conservation and community beneficiaries according to properly agreed decisions. All necessary steps to eliminate corruption should be taken and to ensure compliance with all relevant national and international requirements and regulations by relevant bodies such as administrators, regulators and hunters.

The Service's approach to enhancement findings for the importation of sport-hunted trophies of *P. l. melanochaita* is consistent with the purpose and intent of the Endangered Species Act. Before we will authorize the importation of a sport-hunted trophy, we must determine that the trophy hunting program is managed to ensure the long-term survival of the species. In many parts of the world, wildlife exists outside of protected areas and must share the same habitat

and compete with humans living in these areas for space and resources. If communities that share these resources with wildlife do not perceive any benefits from the presence of wildlife, they may be less willing to tolerate the wildlife. However, under certain circumstances, trophy hunting can address this problem by making wildlife more valuable to the local communities and encourage community support for managing and conserving the hunted species, as well as other species.

When evaluating whether the importation of a trophy of *P. l. melanochaita* would be authorized pursuant to 50 CFR 17.32, in accordance with our threatened species issuance criteria, we will examine how a country's management program for lions addresses the three main threats that have led to the decline of the subspecies: Habitat loss, loss of prey base, and human-lion conflict. When examining a management program and whether trophies taken as part of that program meet the issuance criteria, we would study a number of factors. Some of the factors we would consider include whether the program is based on sound scientific information and identifies mechanisms that would arrest the loss of habitat or increase available habitat (*i.e.,* by establishing protected areas and ensuring adequate protection from human encroachment). We would consider whether the management program actively address the loss of the lion's prey base by addressing poaching or unsustainable offtake within the country. A component of a management plan from which trophy imports would meet the issuance criteria would be whether there are government incentives in place that encourage habitat protection by private landowners and communities and incentives to local communities to reduce the incursion of livestock into protected areas or to actively manage livestock to reduce conflicts with lions. We would examine if the hunting component of the management program supports all of these efforts by looking at whether hunting concessions/tracts are managed to ensure the long-term survival of the lion, its prey base, and habitat. As stated previously, hunting can generate significant economic benefits if properly conducted. In looking at whether we would be able to authorize the import of a trophy under the issuance criteria of 50 CFR 17.32, we would examine if the trophy hunting provides financial assistance to the wildlife department to carry out elements of the management program and if there is a compensation scheme or other incentives to benefit local communities that may be impacted by lion predation. We would also consider how a U.S. hunter's participation in the hunting program contributes to the overall management of lions within a country.

Management programs for *P. l. melanochaita* would be expected to address, but are not limited to, evaluating population levels and trends; the biological needs of the species; quotas; management practices; legal protection; local community involvement; and use of hunting fees for conservation. In evaluating these factors, we will work closely with the range countries and interested parties to obtain the information. By allowing entry into the United States of *P. l. melanochaita* trophies from range countries that have science-based management programs, we anticipate that other range countries would be encouraged to adopt and financially support the sustainable management of lions that benefits both the species and local communities. In addition to addressing the biological needs of the subspecies, a scientifically based management program would provide economic incentives for local communities to protect and expand *P. l. melanochaita* habitat.

As stated, under this 4(d) rule any person wishing to conduct an otherwise prohibited activity, including all imports of *P. l. melanochaita* specimens, must first obtain a permit under 50

CFR 17.32. As with all permit applications submitted under 50 CFR 17.32, the individual requesting authorization to import a sport-hunted trophy of *P. l. melanochaita* bears the burden of providing information in their application showing that the activity meets the requirements for issuance criteria under 50 CFR 17.32. In some cases for imports, such as sport-hunted trophies, it is not always possible for the applicant to provide all of the necessary information needed by the Service to make a positive determination under the Act to authorize the activity. For the import of sport-hunted trophies of *P. l. melanochaita,* the Service will typically consult with the range country to the extent practicable and other interested parties to obtain necessary information.

The Service has the discretion to make the required findings on sport-hunted trophy imports of *P. l. melanochaita* on a country-wide basis, although individual import permits will be evaluated and issued or denied for each applicant. While the Service may make enhancement findings for sport-hunted trophy imports of *P. l. melanochaita* on a country-wide basis, the Service encourages the submission of information from individual applicants. We would rely on the information available to the Service and may rely on information from sources other than the applicant when making a permitting decision.

CITES

The African lion is also included in Appendix II of the Convention on International Trade in Endangered Species of Wild Fauna and Flora (CITES). It is unlawful for any person subject to the jurisdiction of the United States to engage in international trade in CITES specimens contrary to the provisions of the Convention, the ESA, or our CITES implementing regulations in 50 CFR part 23. 16 U.S.C. § 1538(c)(1), (g); 50 C.F.R. § 23.13. As required by CITES, export of a specimen of an Appendix II species to another country requires prior issuance of a CITES permit. Under CITES, importation of an Appendix II species does not require issuance of an import permit from the importing country. Consequently, the United States is not required to issue a CITES permit in order for U.S. hunters to import their sport-hunted lions. In compliance with CITES, the United States does require CITES imports to meet all CITES requirements, including that the imported lion trophies be accompanied by the required CITES export permits issued by the exporting countries, *see* 50 C.F.R. §§ 23.20; 23.23; 23.24; 23.26; 23.27, and including requirements for sport-hunted trophies at 50 C.F.R. § 23.74.

Individual Permit Adjudication Considerations

When the African lion listing under the ESA became effective, January 22, 2016, the Service began issuing enhancement findings for *P. l. melanochaita* on a countrywide basis, as had been the practice for a number of other threatened sport-hunted species. On March 1, 2018, however, in response to a D.C. Circuit Court opinion (*Safari Club Int'l v. Zinke*, 878 F.3d 316 (D.C. Cir. 2017)), the Service withdrew its countrywide enhancement findings for a range of species, including lions, across several countries, and began assessing applications to import sport-hunted trophies of these species on an application-by-application basis. These withdrawals were upheld in a D.C. Circuit Court opinion (*Friends of Animals v. Bernhardt*, No. 19-5147 (D.C. Cir. June 16, 2020); *Center for Biological Diversity v. Bernhardt*, No. 19-5152 (D.C. Cir. June 16, 2020)). No countrywide ESA enhancement findings are currently in effect. Therefore, since March 1, 2018, the Service has been making

ESA enhancement findings for the import of sport-hunted trophies of lions on an application-by-application basis, ensuring consistent application of the regulatory criteria across all permit application adjudications and ensuring that each permit decision is based on the best scientific and management information available.

Although the Service makes the required enhancement findings on sport-hunted trophy imports of *P. l. melanochaita* on an individual application basis, information obtained for the range country as a whole is also considered, as it is pertinent to the Service's evaluation. In addition to considering national-level species management, we also consider species management and contributions to species enhancement on a smaller-scale (e.g., at the regional or hunting management unit scale such as at the hunting operator, community conservancy, concessionaire, reserve, or ranch-level scale). In addition, we consider how the hunter's personal involvement in the hunting experience directly or indirectly contributes to enhancement of the species in the wild. In its enhancement evaluation, the Service, therefore, considers efforts made by the hunting management unit and/or individual hunter to directly or indirectly address the threats posed to lions in the wild together with other information available concerning the overall management and population status of the lion in the range country at the time of the hunt.

In making ESA enhancement findings, we review all relevant information available to us, including information submitted with the individual permit applications, information received in response to inquiries we make of the range countries, and all other reliable information we receive from interested parties, such as species experts, hunting organizations, hunting operators, community groups, and non-governmental organizations. We evaluate and consider all relevant information obtained or submitted to the Service on an ongoing basis as it relates to permit applications received for import of sport-hunted trophies of *P. l. melanochaita*.

The Service considers information at these different levels in order to assess:

1) How the range country government manages the hunted species and how hunting serves to enhance the survival of the species in the wild in the context of the management system;
2) How hunting serves to enhance the survival of the species in the wild in the context of the management unit at the hunting operator, concessionaire, community conservancy, reserve, or ranch level; and
3) How the individual hunter has contributed (where the hunt has already taken place) or will contribute (where the hunt has not yet taken place) to enhancement of survival of that species through their hunting activities and contributions to the survival of the species in the wild associated to the hunt and subsequent import.

Government-Level Factors Considered

- Enforcement of wildlife laws and regulations, particularly with regard to the range country's ability to implement wildlife regulations developed for the hunted species
- Implementation of a scientifically-based management plan that addresses the major threats to the species and provides economic incentives for local communities to conserve the species
- Investment of hunting fees into conservation, including whether the range country has standard processes and infrastructure in place to ensure an effective transfer of hunting revenues back into the country's management of the species and community benefits
- Management of human-lion conflict, including whether the range country has a compensation scheme or other incentives to local communities to reduce the incursion of livestock into protected areas or to actively manage livestock to reduce conflicts with lions
- Management of the lion's prey base by addressing poaching or unsustainable offtake of the lion's prey species
- Management of lion hunting areas through a system that ensures the long-term survival of the lion, its prey base, and habitat
- Protection of lion habitat through establishment of protected areas, ensuring adequate protection from human encroachment and providing incentives that encourage habitat protection by private landowners and communities
- Establishment and use of science-based quotas, a sex and age-based harvest system, and a monitoring program for the lion and its prey species

Hunting Management Unit-Level Factors Considered

- Monitoring populations of the hunted species and their prey-base
- Protecting and/or increasing the prey-base for lions in the wild
- Maximizing biodiversity of the lion's prey species
- Protecting and improving the habitat for lions in the wild to ensure maintenance of ecosystem functions and biodiversity (e.g., creating water holes, habitat management, etc.)
- Engaging in anti-poaching activities for lion and their prey base
- Managing human-lion conflict
- Investing in community benefits and employment, where such investments provide incentives for conservation of lions in the wild
- Complying with harvest laws and regulations
- Re-investing hunting fees or other contributions associated to lion hunting to a fund that supports conservation of lions in the wild

Hunter-Level Factors Considered

- Complying with harvest laws and regulations
- Paying hunting/import-related fees or other contributions associated to lion hunting that are re-invested to support conservation of lions in the wild (e.g., funding habitat protection for lions in the wild, protection of the lion's prey base, or mitigation of human-lion conflict)
- Participating in a hunting program with an operator that supports sustainable use of the species

This application-by-application permit review process offers an opportunity to incentivize hunting in concessions, conservancies, reserves, or ranches that support conservation of the species through rigorous anti-poaching programs, local wildlife monitoring activities, and compliance with government rules and regulations. By complying with our enhancement requirements, a hunter's personal import will help conserve lion populations in the wild by supporting the local communities where they hunt and promoting conservation of these species and their habitats by providing protection incentives to communities that live alongside these species.

Basis for Finding

On February 1, 2016, the Service sent a letter to the Parks and Wildlife Management Authority in Zimbabwe (ZPWMA) with a list of questions related to management plans, population status, conservation, management, hunting policies, and regulations of Zimbabwe's lion populations. Additionally in the letter, the Service referenced the IUCN SSC Guiding Principles on Trophy Hunting as a Tool for Creating Conservation Incentives Ver. 1.0 (09 August 2012), as it provides useful principles which, when considered in conjunction with the Service's permit issuance criteria, would aid when making the required enhancement findings for permitting importation of sport-hunted lion trophies.

On February 16, 2016, the Service sent a second request to ZPWMA for specific documents related to the conservation status of lions in Zimbabwe. ZPWMA responded to the Service's request on February 17, 2016, with a copy of *Conservation Status of African Lion in Zimbabwe,* and subsequently, on November 29, 2016, provided a copy of its *Enhancement and Non-detriment Finding for Lion (Panthera leo) in Zimbabwe.* The Service has also been corresponding with ZPWMA regarding African elephant management for several years. In this correspondence, ZPWMA, as well as other sources, have provided the Service with documents and information that are relevant to our evaluation of lions in Zimbabwe.

Since 2016, the Service has met with officials from Zimbabwe multiple times to receive updated information on the status of and management of lions in Zimbabwe with respect to imports of sport-hunted lion trophies. For example, Service representatives met with Zimbabwe officials in January 2018 at the annual Safari Club International convention in Las Vegas, and November 2018 at the African Wildlife Consultative Forum in Uganda. In September 2018, Zimbabwe officials provided to the Service the May 2017 Zimbabwe National CAMPFIRE Stakeholder's Review and the Zimbabwe Parks and Wildlife Management Authority Strategic Plan, 2019-2023. In addition, in September 2018 the Service received a letter dated 6 December 2017 from Hon. E.D. Mnangagwa, President of the Republic of Zimbabwe, addressed to President Donald Trump, addressing the

change of administration in Zimbabwe. In this letter Hon. E.D. Mnangagwa provided assurance to the United States that Zimbabwe is politically stable and that Zimbabwe's previous conservation initiatives would be enhanced, with the previous Minister, Permanent Secretary, and Director General confirmed to remain in place.

This information provided by the Zimbabwe authorities (including verbal updates and presentations at the 16th Annual African Wildlife Consultative Forum (Uganda, November 2018), along with the Service's final rule on the lion listing under the Act and other relevant information from reliable sources, are the basis of this finding.

Governance of Lions in Zimbabwe

The legal framework for Zimbabwe's regulatory mechanism is informed by its Wildlife Policy (1992), which is intended to maintain a protected area network for the conservation of the nation's wild resources and biological diversity. The Wildlife Policy (1992) provides for the Government of Zimbabwe to maintain a network of protected areas known as the Parks and Wild Life Estate, comprised of the country's National Parks, safari areas, botanical gardens, and sanctuary and recreational areas for the conservation of the nation's wild resources and biological diversity (CITES 2016; ZPWMA 2016). The framework is intended to create economic activity to enhance rural development and encourages the conservation of wild animals and their habitats outside the protected areas.

ZPWMA was established by the Parks and Wildlife Act of 1996 (Chapter 20:14) [as amended by Act Number 19 of 2001] which came into operation on June 1, 2002, through Statutory Instrument 144C of 2002. The Act provides for the establishment of a Parks and Wildlife Board; establishment of national parks, botanical reserves, botanical gardens, sanctuaries, safari areas and recreational parks; and the preservation, conservation, propagation or control of wildlife, fish, and plants of Zimbabwe and the protection of Zimbabwe's natural landscape and scenery. This Act includes sections on virtually every aspect of ZPWMA, including requirements for annual financial audits and reporting to the central government. The Act also provides for substantial penalties for the unlawful possession of or trading in protected wildlife species. In addition, the General Laws Amendment Act (No. 5) of 2010 provides for mandatory imprisonment for poaching.

The Parks and Wildlife Act, Chapter 20:14, devolved authority to manage and benefit from wildlife on communal and private lands to the landholders. In 1982, the legal provisions of this Act were extended to Rural District Councils (RDCs), on behalf of rural communities in communal lands whose areas contain viable populations of wildlife. Communal areas in Zimbabwe are administered by RDCs which have become a mechanism for implementation of the government's policy of conservation by utilization of natural resources. The Act enables local communities to manage and benefit from wildlife resources through the Communal Areas Management Programme for Indigenous Resources (CAMPFIRE) established in 1989.

CAMPFIRE was developed to encourage reduction in human-wildlife conflicts through conservation-based community development and to provide an economic incentive to

improve community tolerance of wildlife, including lions. At the time, the CAMPFIRE program was the model for community-based conservation efforts in several other African countries and was identified as an innovative program. Under a community-based conservation program, like CAMPFIRE, rural communities should benefit from revenue generated by sport-hunting.

As Zimbabwe's premiere wildlife agency, the main functions of the ZPWMA are to control, manage, and maintain Zimbabwe's wildlife resources with the primary role of protecting and conserving Zimbabwe's natural heritage for present and future generations on behalf of the country. It also provides the cornerstone of Zimbabwe's tourism industry (ZPWMA 2015). The rationale behind the establishment of the ZPWMA was to allow for a self-funding mechanism, and thereby reduce its dependence on the national treasury. In January 1996, the Government of Zimbabwe approved the establishment of the Parks and Wild Life Conservation Fund that provides for financing wildlife operations directly from revenues generated through wildlife-related activities. The funding for ZPWMA is therefore coming from revenue generated through sport hunting conducted on state and private lands, concession leases, National Park visitor fees, and other wildlife-related fees. While there have been requests by ZPWMA for funding from the central treasury in the past, to our knowledge, no other significant government funding has been provided, and only limited outside funding from non-governmental organizations (NGOs) or other governments appears to be available.

A major component of ZPWMA mandate is law enforcement. Poaching mainly occurs along the boundaries of protected areas where lions are incidentally snared as non-target prey. Between 2013 and 2015, 21 lions were killed illegally, with six animals killed through snaring in the area adjacent to Hwange National Park in 2015; poverty stands as the major driver of illegal hunting (ZPWMA 2016). If anyone is found in possession of poached specimens, they must pay a fine of USD 5,000 or face a mandatory jail sentence. If convicted of lion poaching, courts could require the payment of a compensation fee of USD 20,000 (ZPWMA 2014). Hunting operators are obligated through their concession lease agreements to assist with anti-poaching efforts (ZPWMA 2016). Reportedly, USD 590,000 was spent on anti-poaching efforts by the Bubye Valley Conservancy (BVC) alone during 2015 (K. Leathern, pers. comm., as cited in Du Preez et al. 2016), and USD 546,000 is spent annually on anti-poaching by the Savé Valley Conservancy (SVC) (Lindsey et al. 2012); these expenses are mainly covered by sport-hunting revenue (Du Preez et al. 2016). In 2002, ZPWMA had 2,146 rangers at its establishment (ZPWMA 2016); however, by the end 2015, there were 1,448 rangers in post (67% of 2002 level). Of the 1,448 rangers in post, 1,004 are deployable for anti-poaching operations (ZPWMA 2016).

Safari operators in Zimbabwe are required to be registered and licensed by the Zimbabwe Tourism Authority (https://www.soaz.net/index.php/2, accessed August 16, 2019). Operators must hold a lease or agreement on a suitable concession with an approved quota of animals. They are responsible for the official paperwork and permits connected to the hunt. Hunting operators are required by law to provide the services of a Zimbabwe Licensed Professional Hunter to accompany foreign hunters in Zimbabwe. Licensing is undertaken by the National Parks & Wildlife Authority.

Zimbabwe is a member of the Southern African Development Community (SADC). Under the SADC Treaty, Article 5(g) establishes objectives to, among other aspects, promote the sustainable use of wildlife, harmonize legal instruments governing wildlife use and conservation, promote the conservation of shared wildlife resources through the establishment of trans-frontier conservation areas (TFCA), and facilitate community-based natural resources management practices. To implement the SADC Treaty, member states are required to establish management programs for the conservation and sustainable use of wildlife.

Currently Zimbabwe is pursuing six TFCA initiatives at various stages of development. These are: Great Limpopo Transfrontier Park (GLTP) / Great Limpopo Transfrontier Conservation Area (GLTFCA); Chimanimani TFCA; Greater Mapungubwe TFCA; Kavango-Zambezi (KAZA) TFCA; Lower Zambezi-Mana Pools LZMP (TFCA) and Zimbabwe-Mozambique-Zambia (ZIMOZA) TFCA (Mandisodza-Chikerema 2018, p. 34).

Through TFCAs, wildlife management entities are linking many of the major protected areas by removing boundary fences along national borders that separate many reserves in addition to creating or improving corridors to link good-quality habitat for wildlife (Newmark 2008). The principle of ecological and migratory connectivity lies at the heart of the TFCA initiative linking large protected areas across international boundaries and providing space for wildlife populations.

Another provision of the SADC Treaty is that member states are required to establish management programs for the conservation and sustainable use of wildlife. Zimbabwe has met this criterion for African lions through the development of its 2006 *Conservation Strategy and Action Plan/or the Lion (Panthera leo) in Zimbabwe* (ZPWMA), which is still in use.

As previously mentioned, Zimbabwe is also a Party to CITES, and the African lion species is included in Appendix II of the Convention. As an Appendix-II species, certain criteria must be met before the CITES Management Authority of the country of export may issue an export permit, including a finding from the exporting country's CITES Scientific Authority that the proposed activity will not be detrimental to the survival of the species in the wild (non-detriment finding; NDF) and a finding from the CITES Management Authority that the specimens proposed for export were legally acquired (legal acquisition finding).

The ZPWMA has provided the Service with a copy of its standing CITES non-detriment finding (NDF), dated October 2016, for the export of African lion specimens. The NDF explains that lion populations in Zimbabwe are being managed sustainably for the benefit of the species and that Zimbabwe's management program for lion provides economic incentives for local communities to protect and expand lion habitats. The NDF document provides information to support the following:

- The Zimbabwe hunting industry is based on sound scientific information, provides mechanisms to arrest habitat loss, or where feasible increase habitat, and provides protection from human encroachment.

- Government incentives are in place to encourage habitat protection by private landowners and communities.
- Government Incentives are provided to local communities to reduce human-wildlife conflicts.
- Hunting concessions are managed to ensure the long-term survival of the African lion and its habitat.
- Trophy hunting provides financial assistance to the ZPWMA, the communal CAMPFIRE program, and private landowners to implement wildlife management programs.
- Local communities directly and indirectly benefit from the presence of lion in their areas.
- Participation of U.S. hunters in the Zimbabwe hunting industry contributes to the overall conservation and management of lions in Zimbabwe (ZPWMA 2016).

Lion Status in Zimbabwe

When the Service listed the subspecies of lion in southern and eastern Africa (*P. l. melanochaita*) as threatened under the Act (80 FR 79999), three primary threats to the species throughout its range were identified: loss of habitat, loss of prey base, and human-lion conflict. While human population growth clearly has an impact due to loss of available habitat for lions, increasing human population has a direct impact on prey base. Prey availability affects the reproduction, recruitment, and foraging behavior of lions and, as a result, strongly influences lion movements, abundance, and population viability (Winterbach *et al.* 2012, as cited in USFWS 2015). Lion densities are directly dependent on prey biomass (Hayward *et al.* 2007). Outside of protected areas, the lion's prey base is much reduced (Du Preez et al. 2016); inadequate management and law enforcement have led to poaching of the lion's prey base for bushmeat, which has been critically depleted (USFWS 2015). Population trends across eastern and southern Africa show that most prey species have declined in recent years; and for Zimbabwe, droughts have been a critical factor (ZPWMA 2016).

A reduced prey base results in a relatively greater chance of lions encountering livestock (Du Preez et al. 2016). While actual losses of livestock to predators may be relatively low, the perceived financial cost to farmers can be high, and lions are persecuted intensely in livestock areas as a consequence. Their scavenging behavior makes them particularly vulnerable to the practice of lacing prey carcasses with poison to eliminate predators (CITES 2016). Co-existence of lions and people is promoted through giving value to lions, such as through tourism and hunting in CAMPFIRE areas (ZPWMA 2014). The threat to lions from habitat loss is especially present in Sebungwe and the South East Low Veld where the fragmented nature of the protected areas is compounded by increasing human and livestock populations surrounding these areas (ZPWMA 2016).

According to the Service's CoPl7 *Consideration of Proposals for Amendment of Appendices I and II,* international trade in lion products is emerging as an additional threat; however, the relative extent to which this threat has contributed to lion population declines is difficult to evaluate accurately (CITES 2016). According to ZPWMA (2016), the illegal local and international trade in lions and their products poses an insignificant risk to the

species in Zimbabwe, as there are no records of people found in possession of illegally acquired lion specimens in Zimbabwe. It is not clear what level of legal trade of lion products, if any, occurs within Zimbabwe.

The bulk of Zimbabwe's wildlife occurs within the Parks Estate which includes 11 national parks, 16 safari areas, 16 recreational parks, 6 sanctuaries, 12 botanical reserves and 3 botanical gardens, all spread across the country (Parks and Wildlife Act 2001 Chapter 20:14). Wildlife populations also occur on the state Forest Areas, Communal CAMPFIRE areas, and private conservancies dedicated to wildlife-based land use. There are approximately 319,317 km^2 of land where some form of wildlife-based land use is practiced in Zimbabwe (ZPWMA 2016). Lions occur permanently in 45% of this available range (circa 145,000 km^2) with the majority occurring in national parks (96%) and safari areas (92%). Lions also occur permanently in 47% of the State forest areas and 66% of privately owned conservancies. The CAMPFIRE areas comprise approximately 247,000 km^2 and lions occur in 36% of these areas. Lions are transient in CAMPFIRE, conservancy, and resettled areas adjacent to the major protected areas, and lions move across the border into Zambia, Mozambique, South Africa, and Botswana.

Zimbabwe's main lion range includes the Hwange-Matetsi Ecosystem, Mid Zambezi Valley, Sebungwe, and South East Lowveld. The lion population estimates in Zimbabwe are determined primarily through carnivore spoor surveys, systematic lion collaring, and call-up surveys. According to ZPWMA's *Conservation Status of the African lion (Panthera leo) in Zimbabwe* July 2014 report, starting in 2015, lion spoor surveys were to be done at two-year intervals in all wildlife areas, and lion call-up surveys were to be done every three years in all major lion areas (ZPWMA 2014). Although the Service has not received confirmation that these surveys have been conducted since 2015, in September 2018, the Service received Zimbabwe's Parks and Wildlife Management Authority's Strategic Plan for 2019-2023, which indicates that Zimbabwe is actively working to improve the monitoring and management of their wildlife species. In their updated strategic plan, signed in December 2018, they indicated that one of their strategic objectives is protection of wildlife resources. Their identified timeline is to update and implement key species management plans (lion is identified as one of these) by December 2023.

ZPWMA (ZPWMA 2016) has estimated that the minimum number of lions that occur on approximately 5l,642 km^2 of land where reliable survey data are available is approximately 1,900 (range 1,800 - 2,000). The western portion of the country, consisting primarily of Hwange National Park and the surrounding safari areas, forest areas, communal areas, and private conservancies, supports approximately 737 lions (or 38% of the overall population). The southern portion of the country, dominated by the two major conservancies (SVC and BVC) and Gonarezhou National Park supports approximately 896 lions (48%). These numbers are supported by several studies.

Within Gonarezhou National Park, Groom et al. 2014, used call-up surveys to obtain direct estimates of the lion population and compared actual lion densities with potential density estimates. In this study, while lions were only seen at five percent of calling stations, this equated to a population estimate of 33 lions, which is consistent with spoor survey results conducted in June 2010 (Groom et al. 2014). A 2015 spoor count

survey of Gonarezhou National Park revealed an estimated 125 lions within the park (ZPWMA 2016).

From 2007 to present, annual track index surveys at the SVC have been conducted using a standardized methodology (Groom and Watermeyer 2015, as cited in Du Preez et al. 2016). Prey availability models suggest that the carrying capacity for this lion population is approximately 271 lions (Hayward et al. 2007). In 2015, the estimated population was 284 lions (Du Preez et al. 2016). The Rifa Safari Area was surveyed using camera trapping and spoor counts in 2015, which supported an estimated population of 68 lions. The central and northern portions of the country reportedly support an estimated population of 284 lions (15%). The 12-year (2000-2011) average lion density per 100 km^2 is 2.8 in Hwange National Park, 6.0 for South Eastern Lowveld in the SVC, 9.0 in Malilangwe, and 0.8 in Gonarezhou National Park (ZPWMA Annual Report 2013, as cited in ZPWMA 2014). SVC's website indicates that at SVC, an annual predator spoor count is conducted by the African Wildlife Conservation Fund (AWCF), an independent organization (http://savevalleyconservancy.org/conservation.html#header1-z, accessed August 14, 2019).

According to Riggio et al. 2013 (p. 32), and Bjorklund in Riggio et al 2013 (p. 32), the minimum number of lions that are estimated to constitute a viable population is 500 individuals. Hwange National Park, with an estimated population of 559, is the only area within Zimbabwe that has a viable population as laid out by Riggio et al. 2013. However, the two regions that make up the largest percentage of the country's lion population (Western 38% and Southern 48%) have regional populations of 737 and 896, respectively. The areas within the Central and Northern regions of Zimbabwe, albeit smaller, encompass parks that are part of Transfrontier Conservation Areas, such as the Mana Pools region.

Lion Management in Zimbabwe

In response to discussions surrounding a possible up-listing of lion to Appendix I under CITES at the 13th Meeting of the Conference of the Parties (CoP13), and subsequent workshops involving lion range states, IUCN, ZPWMA, and other key stakeholders held a workshop to develop the *Conservation Strategy and Action Plan for the Lion (Panthera leo) in Zimbabwe* which was published by ZPWMA in 2006. The plan responds to regional and international standards set by Treaties such as CITES and the Convention on Biological Diversity (CBD), among others. The plan states "it will guide the conservation and management of this top predator" which "addresses the needs of th[e] country." The Service is not aware of any additional or updated iterations of the plan since 2006; however, in Zimbabwe's 2016 response, *Enhancement and Non-Detrimental Findings for Panthera leo in Zimbabwe,* ZPWMA provided updates on each of the outputs and respective targets established under the 2006 *Conservation Strategy and Action Plan/or the Lion (Panthera leo) in Zimbabwe* (ZPWMA 2016).

The 2006 plan identifies a vision that "...lions should be conserved and managed sustainably for their aesthetic, cultural, and ecological values, and the socio-economic

development of Zimbabwe." The plan lays out three broad targets to achieve this objective:

- Ensure the persistence of key lion populations and other important populations including those of doubtful viability.
- Human and livestock loss reduced.
- Optimize wildlife conservation-related net benefits to local communities.

All three targets are stepped down to seven specific outputs with their own targets and activities to meet such targets. Although the plan does not identify a time period, some activities do, of which a period of 5 years is the most common. In response to inquiries from the Service, ZPWMA has provided a summary of the progress made to implement the 2006 strategy.

While all three of the broad targets appear to serve a valuable role in lion management in Zimbabwe, three of the specific outputs are most relevant to determining if the implementation of the strategy enhances the propagation or survival of the species, as required by the Act for the issuance of import permits. The first output, "lion populations, their habitats and wild prey effectively conserved and managed in collaboration with local stakeholders" is broken down into a number of targets: establish a baseline survey and monitoring program; maintain and strengthen capacity for lion conservation, management, monitoring and research; identify and implement best management standards and practices for the hunting program; develop and implement co-management frameworks; and expand the geographic distribution range of lions. Baseline surveys have been completed for the Parks Estate using monitoring protocols for key variables (populations, habitats, prey), and selected surveys have been undertaken in areas outside National Parks (ZPWMA 2016).

Carnivore research programs conducted by NGOs and research institutions such as WildCRU are taking place in various parts of the country; in addition, personnel have been trained in data collection and capture, management, and lion aging and analysis. Adaptive age-based criteria for male trophy animals are in place and functioning. The quota for a certain year is determined by a point system based off the hunts from the previous season. Therefore, ZPWMA is actively working toward meeting the target areas for this output.

The second output, "human-lion related conflicts minimized and, where possible, eliminated" has also been broken down into a number of targets: develop and establish databases on lion-human conflicts; identify and implement methods to reduce and mitigate livestock losses and lion attacks on humans; and train and properly staff problem animal control (PAC) units to conduct rapid response and precisely target problem animals. According to information from ZPWMA (2016), approaches to mitigate livestock losses and lion attacks on humans are in the process of being tested and implemented in Hwange, and methods to mitigate lion attacks on livestock are being implemented as appropriate at selected sites (e.g. Tsholotshe). Data on PAC reports for lion-related problems have been collated, and PAC units at ZPWMA field station and/or RDC levels have been partially established. In Matusadona, Hwange, and Gonarezhou regions, specific awareness and education packages on lion conservation and

management have been developed and implemented. The information submitted in the ZPWMA update suggests that they have met one target, and are in the process of implementing the remaining two.

The third output, "the costs and benefits of long-term lion management equitably distributed," is a socio-economic output to establish agreement and implementation of area-specific lion management plans with identified stakeholders in each wildlife region, and implementing a transparent mechanism to equitably distribute lion-related income to identified stakeholders." The specific targets for this output are: complete an inventory of stakeholders directly affected by lion conservation, deliver appropriate training and capacity building to prioritized stakeholders, agree to and implement collaboratively developed area-specific lion management plans with identified stakeholder groups in each wildlife region within 5 years, and implement transparent mechanisms to equitably distribute lion-related/generated income to identified stakeholders (groups and/or communities). Current information from ZPWMA shows that they have identified key stakeholders and assessed the financial impacts of lion conservation and the magnitude of socio-economic impacts on each stakeholder group. Limited training has been undertaken for representative stakeholders in Hwange, Matusadona, and Gonarezhou. ZPWMA has also implemented an adaptive management program across four wildlife regions and is in the progress of developing and implementing area-specific lion management plans with identified stakeholder groups. According to ZPWMA, a Management Plan for Hwange was approved. The Hwange National Park (HNP) Management Plan was updated in 2015 and officially accepted at Zimbabwe's Ministry of Environment level in 2016 (Conservation and Wildlife Fund (CWF) 2018, p. 16). One of the four components of this 10-year plan is implementation of a cooperation plan between the park and park neighbors. The Conservation and Wildlife Fund – Hwange (CWF) is a relatively new model of the private and NGO sectors in and around Hwange National Park (HNP) Zimbabwe, formalizing an alliance of individual members to materially and in-kind assist authorities with conservation work.

The Hwange Lion Research (HLR) which is part of the Wildlife Conservation Research Unit (WILDCRU), Oxford University, UK, with some financial support and collaborative effort from CWF, set up a comparative camera trap survey in May 2018, to establish a baseline of both lion and lion prey identification and densities in contiguous areas with differing management – the exact CWF project area. Although data were only obtained from the 40-day HNP camera grid, combined sources of complimentary data on the lion population in Forest Areas outside the national park suggest that anthropogenic mortality is slowing down, believed to be in part due to CWF's new law enforcement activities (CWF 2018, p. 21).

Zimbabwe's conservation strategy for lions also identifies roles and responsibilities for a number of participants in Zimbabwe's lion conservation efforts. According to the strategy, there is a national lion coordinator that coordinates all national activities on lion conservation, research, and management, including census surveys, setting up monitoring needs, and coordinating data on human-lion conflicts. The strategy identifies roles for the field stations, wardens, ecologists and utilization units, which are responsible for ensuring compliance with hunting regulations and maintaining safari hunting databases. In addition, the strategy identifies roles for CAMPFIRE, safari operators, and

professional hunters to facilitate training and ensure compliance with hunting regulations.

The Conservation Strategy and Action Plan for the Lion in Zimbabwe (ZPWMA 2006) borrows language from the *IUCN Conservation Strategy* (2006). It iterates areas in need of improvement regarding lion conservation in Zimbabwe, including standardized lion census methods and surveys, further mitigating human-lion conflicts, and maximizing benefits for rural communities that live with lions. ZPWMA (2006) notes their intention to review and put in place criteria for age-based identification of male trophy animals, but do not mention if they will be reviewing possible combination strategies. As part of the 2006 lion conservation strategy for eastern and southern Africa, six objectives were established to secure and restore sustainable lion populations, which were housed under the following categories: management, mitigation, socio-economics, policy and land-use, politics, and trade. The strategy was intended to be implemented within 10 years (Macdonald 2016), and Zimbabwe gave an update on progress regarding these objectives in their *Enhancement and Non-Detrimental Findings for Panthera leo in Zimbabwe* (ZPWMA 2016) that also addressed outputs and targets laid out in their 2006 action plan.

Additionally, to mitigate human-lion conflict, the "Long Shields Guardian Programme" was initiated whereby communities are notified of movements of collared lions into their areas via cell phone, and then have the opportunity to take appropriate action, such as moving cattle. In 2013 alone, 1,850 warnings were passed to the "Long Shields." These actions may reduce the incidents of lions marauding livestock; however, retaliatory killing of lions still occur. Further, as is policy under the Parks and Wildlife Act of 2001, any lions that attack humans or livestock will be lethally eliminated (ZPWMA 2016). Between 2007 and 2013 a total of 1,113 conflict incidents were recorded in the Hwange area in which 915 head of stock were lost to lions.

In and around Hwange National Park, data collected between 1999 and 2004 suggested that hunting surrounding the park was having a negative impact on the lion population. As a result, sport hunting of lions was suspended in the area surrounding the park between 2005 and 2009. Following the lifting of the moratorium, and by implementing stricter monitoring and hunting guidelines through the Hwange Lion Research Project, the overall Hwange lion population has continued to show a positive trend, and as of 2015 the population was estimated at over 550 animals (ZPWMA 2015).

<u>Hunting, Management, and Utilization of Lions</u>

In Zimbabwe, much of the trophy hunting occurs in Safari Areas which are managed mainly for the sustainable use and as buffer zones next to National Parks (Jeke et al 2019, p. 2). Trophy hunting of wildlife is legally permitted in safari areas; as of 2014, there were 16 in Zimbabwe (ZPWMA 2014). According to the Forest Act, Chapter 19:05, there are 24 gazetted indigenous forest areas in Zimbabwe; within these forest areas, lions may be hunted in the following forests: Fuller, Kazuma, Pandamasuwe, Ngamo, Sikumi, Gwayi, Sijarira, and Gwampa (ZPWMA 2014).

As of 2016, the minimum number of lions that occur in approximately 51,642 km^2 of land in Zimbabwe, where reliable survey data are available, is estimated to be 1,917 (range 1,800 - 2,000), the majority of which occur in western and southern Zimbabwe. When taking this population estimate into consideration, trophy hunting harvests a yearly mean of 2.7% of adult male lions. This figure decreased since the establishment of age restrictions on lion hunting (ZPWMA 2016).

In 2013, an adaptive quota management system for lion hunting based on the ages of lions hunted was agreed to in Harare, Zimbabwe, during a meeting hosted by ZPWMA and an independent non- governmental conservation organization (Du Preez et al. 2016). After reviewing aging techniques, attendees at the July 2013 meeting in Harare, Zimbabwe were confident that hunters could be expected to categorize lions as being below or above five years of age. In determining quotas for the following years, operators would be rewarded with increased quotas if they hunted animals of six years or older, would not be penalized if they hunted animals five years of age, but would have quotas cut if they hunted animals younger than five years old, or if they failed to complete hunt returns (ZPWMA and Panthera 2014). In 2013, only 28% of lions hunted were five years old or older. In 2015, that figure rose to 77.3% (ZPWMA 2016).

According to Hunter et al. (2013), an adaptive quota management system utilizing age-based criteria would not only aid in the prevention of over-harvesting lions, but would also prevent excessively conservative quotas. Further, according to Miller et al. (2016), results indicate that age-based hunting is feasible for sustainably managing threatened and economically significant species such as the lion, but must be guided by rigorous training, strict monitoring of compliance and error, and conservative quotas. No single trait can be relied upon exclusively to precisely age lions. Rather, multiple traits must be examined in combination to cross-validate an individual's age and, according to Whitman et al. (2004), restricting hunting to individuals that are at least six years old is desirable from a biological perspective due to the reduced risk of the loss of pride males and infanticide of cubs associated with the harvest of such individuals (Whitman et al. 2004).

During 2013, operators were requested to submit hunt returns and photos as a trial run to get the adaptive quota system up and running. In 2014, operators were requested to do the same but were informed that the age of the lions hunted in 2014 would determine their lion quotas in 2015 (Du Preez et al. 2016). In 2015, there was a marked increase in the age of lions hunted in Zimbabwe as a whole. The majority of lions hunted were on the cusp of 5-6 years of age but were not older than six years. National hunting offtakes for lions in Zimbabwe from 2013 to 2015 were 29, 42, and 47 respectively (Masterson 2016). It appears these do not include illegal forms of hunting offtake. In 2011, Zimbabwe's quota was set at 101 lions; in 2014, it was reduced to 50 male lions following the implementation of age restrictions (Henschel 2015, pers. comm., as cited in USFWS 2015).

As described above, CAMPFIRE is the program through which the Government of Zimbabwe has relegated the management of wildlife resources to communal farmers. As of July 2014, there are at least 58 Rural Districts that have been granted the Appropriate Authority status to manage wildlife resources in their areas; however,

according to *Enhancement and Non-Detrimental Findings for Panthera leo in Zimbabwe* ZPWMA 2016, only 16 are actively engaged in some form of wildlife-based land use (ZPWMA 2016). Lions are found in communal areas that are adjacent to major protected areas, and lion hunting is allowed in CAMPFIRE districts (ZPWMA 2014).

In setting adaptive lion quotas, Zimbabwe uses scientific information including spoor surveys, camera traps, and ranger-based sighting. In CAMPFIRE areas, incidences of human-lion conflict are also taken into consideration where survey information is not readily available, when determining quotas for those areas (ZPWMA 2014). The quota-setting process involves all stakeholders, including the ZPWMA, landowners, safari operators, and CAMPFIRE managers and their representatives. During the annual quota-setting workshop, presentations are made by the proponents who then make proposals for quotas. Where it is felt that not enough information has been presented, a precautionary quota will be issued (ZPWMA 2014).

ZPWMA (2016) mentions seven concessions that are leased on five-year terms, and how these concessionaires pay a 5-year "right to lease" fee, annual rental, fixed quota fee (payable if animals are shot or not) and a supplementary quota fee that allows additional animals to be bought as needed. It is unclear to what extent Zimbabwe still utilizes fixed quotas, as Du Preez et al. claims fixed quotas are no longer being used by Zimbabwe, but a fixed quota fee is mentioned in ZPWMA (2016). It is also unclear how many animals concessionaires are able to "buy as needed," and how such requests may be accommodated without going over the national quota (ZPWMA 2016). However, when evaluating the lower quota with higher utilization reported by ZPWMA (2016), and taking into consideration the land area of the Parks Estate alone, Zimbabwe did not exceed the best management practice of 0.5 lions/1,000 km^2; the 2015 off-take would have accounted for 0.125 lions/1,000 km^2.

According to *The Role of Trophy Hunting of Elephant in Support of the Zimbabwe CAMPFIRE Program -December 2016,* a report the Service received in December 2016, the Reserve Bank of Zimbabwe, in collaboration with relevant stakeholders, established the Tourism Receipts Accounting System (TRAS2) that required all outfitters to submit returns listing the revenue generated for hunting activities. This system has been in place for several years, but it required manual analysis of the data to extract information on hunting revenue. In January 2015, to account fully for earnings in the hunting sector, the Reserve Bank of Zimbabwe in collaboration with relevant stakeholders, introduced TRAS, a web-based system that links Safari operators, ZPWMA Authority, taxidermists, shipping agents, International marketing agents, and the Reserve Bank. Under this system, all authorized hunts are registered, allowing for the capture of hunting data, such as the origin of clients, value of trophies and hunts, and area hunted, to monitor hunting quota utilization and track hunted trophies. According to the December 2016 report, the Exchange Control Division of the Reserve Bank of Zimbabwe and the ZPWMA are now able to:

1. Assess regional price differentials of similar hunts and the reasons thereof;
2. Present TRAS2 system updates and reports to the users, including international marketing agents;
3. Engage with international marketing agents of sport hunting;

4. Obtain relevant insights on governing of the hunting sector; and
5. Come up with an effective mechanism to fully account for export proceeds from the hunting sector.

The TRAS2 information provides a breakdown of the source of hunting income, and the amount of funds generated by trophy fees by land category, among other insights, and has demonstrated the TRAS2 system's ability to obtain relevant insights on governing of the hunting sector.

Evaluation

Christopher Robert Schnetzler hunted in the Savé Valley Conservancy (SVC) in southeastern Zimbabwe, reportedly one of the largest private game reserves in Africa (https://savevalleyconservancy.org/). In the early 1900's, the 3,440 km^2 of land that now comprises the SVC was used for cattle ranching, which led to the elimination of most large herbivores and predators, including lions. In the 1990's upon establishment of the SVC, the cattle farms were converted to a wildlife-based land use system and wildlife populations were restored (Pole 1999).

In evaluating whether the importation of Mr. Schnetzler's trophy of *P. l. melanochaita* would be authorized pursuant to 50 CFR 17.40(r) and 50 CFR 17.32(a), in accordance with our threatened species permit issuance criteria, we examined how Zimbabwe's management of lions overall as well as how Savé Valley Conservancy and Mr. Schnetzler himself have contributed to enhancement of wild lions both directly and indirectly by addressing the three main threats that led to the decline of the subspecies: habitat loss, loss of prey base, and human-lion conflict.

Below, we summarize our evaluation with reference to each of the permit issuance criteria at 50 CFR 17.32(a)(2) on the basis of information available to the Service.

17.32(a)(2)(i): Whether the purpose for which the permit is required is adequate to justify removing from the wild or otherwise changing the status of the wildlife sought to be covered by the permit:

Zimbabwe's lion hunting industry generated 9% of all sport-hunting revenue in 2015; 51% was contributed by U.S. hunters during 2010-2015 country-wide, and 90% of the sport-hunting market in the Bubye Valley Conservancy (BVC) and the Savé Valley Conservancy (SVC) from 2005-2015. Even though 9% may not seem like much, lions are a key component of the sport hunting industry, as they are part of the "Big 5" trophies and draw U.S. hunters to Zimbabwe. Without the hunting industry, protected wildlife areas such as BVC and SVC, which have become conservation havens in the threat of human encroachment across much of Zimbabwe, would not be economically viable, and therefore would likely not exist. These wildlife areas not only provide habitat for lions, but also support the lion's prey species. As previously noted, the southern portion Zimbabwe, which is dominated by SVC, BVC, and Gonarezhou National Park, supports approximately 896 lions (48% of the Zimbabwe lion population).

According to Lindsey et al. (2012), hunting operators in the SVC spend USD 546,000 annually on anti-poaching activities and employ 186 permanent game scouts. Hunting revenues are used to support expenses associated with these activities (Du Preez et al. 2016).

The *Strategy and Action Plan* has put into place mechanisms to adequately oversee the harvest of lions in Zimbabwe. With an annual harvest of approximately 85 lions, Zimbabwe is not exceeding the limits identified of 0.5 lions/1,000 sq. km. The objectives of the *Strategy and Action Plan* and the actions and monitoring activities that have been put into place to achieve these objectives should support the adaptive management approach that Zimbabwe has established for managing lions. The Service will continue to monitor the effectiveness of the Strategy and Action Plan, for consideration in future findings.

As described above, we have determined that the government of Zimbabwe and the Savé Valley Conservancy contribute towards positive conservation outcomes by addressing the main threats of habitat loss, human-lion-livestock conflict, and prey depletion, which contributes to improving the status of lions in Zimbabwe. Further, the fees garnered through Mr. Schnetzler's hunt will provide revenue to support these positive conservation outcomes.

Therefore, based on the information available to the Service, the purpose for which the permit is being requested, import of this trophy lion, is adequate to justify removing the sport-hunted trophy lion from the wild or otherwise changing its status.

17.32(a)(2)(ii): The probable direct and indirect effect that issuing the permit would have on the wild populations of the wildlife sought to be covered by the permit:

The total area under wildlife-based land use and conservation in Zimbabwe amounts to 10.7 million hectares and represents 27% of the total surface area of the country. Of this, 7.9 million hectares, or 75% of all conservation land in the country, falls under safari hunting as the primary or only source of revenue. Sport hunting of lions by U.S. hunters such as Mr. Schnetzler supports the programs in Zimbabwe that provide the opportunity for locals to see value in lions, which in turn conserves the species in the long-term.

A scientifically based quota is the number of a given species that can be removed from a specific population without damaging the biological integrity and sustainability of that population (WWF 1997). However, full implementation and enforcement of the age-based strategy could potentially cause the need for quotas to become irrelevant or eliminated (USFWS 2015). Age restrictions will naturally restrict offtake to a limited number of individuals that meet the age criteria (Loveridge *et al.* 2007, Whitman *et al.* 2004).

Based on the information provided to the Service, it is clear that Zimbabwe has made strides in their management of their lion populations. Additionally, Zimbabwe appears to be transparent in its management processes, including its quota setting. In 2013, Zimbabwe proposed an adaptive age-based strategy for setting hunting quotas. This

adaptive quota management system for lion hunting based on the ages of lions hunted has been accepted and embraced by all stakeholders; it has not only led to a reduced national lion hunting quota, but has also resulted in a significant increase in the age of harvested lions to a level that is considered to have a reduced ecological impact (Du Preez et al. 2016).

In 2015, the development of TRAS2 allowed the country to better monitor and govern the hunting sector, including developing an effective mechanism to fully account for export proceeds from the hunting sector. The continued participation of U.S. hunters, including Mr. Schnetzler, in this market is anticipated to continue to maintain the viability of managing areas such as the BVC and SVC in their current form, including their contribution to conservation of lions in the wild. In 2015, lion sport-hunting generated USD 753,000 in revenue, which accounts for about 9% of all sport hunting revenue in Zimbabwe that year (ZPWMA 2016).

After evaluating the information provided by the Zimbabwe government and other sources, it appears that the hunting program in Zimbabwe is addressing the three main threats that were identified by the Service when making the determination that the species was threatened with the possibility of extinction. Moreover, hunting areas such as BVC and SVC are maintaining habitat for lions and ensuring that there is no further loss, provided that the hunting areas can remain economically viable. In order to maintain a viable population of lions, the parks, safari areas, and CAMPFIRE areas must maintain biodiversity and a sustainable prey base. Finally, Zimbabwe is actively working to reduce human-lion conflicts and the number of lions killed in retaliation for killing livestock. Therefore, the management of lions within Zimbabwe and the limited hunting of lions contributes to the on-going survival of the species in Zimbabwe.

The participation of Mr. Schnetzler in the hunting and subsequent import of the trophy lion he harvested in the SVC provides an indirect benefit to wild lion populations by helping to support the reserves where lions are found; Mr. Schnetzler's hunt has generated revenue to help support a hunting area where lions are found and conserved. Therefore, based on the information available to the Service, the probable direct and indirect effect that issuing an import permit for a legally hunted lion would have on the species would be positive.

17.32(a)(2)(iii): Whether the permit, if issued, would in any way, directly or indirectly, conflict with any known program intended to enhance the survival probabilities of the population from which the wildlife sought to be covered by the permit was or would be removed:

As stated above, Zimbabwe is monitoring and controlling the harvest of lions through permitting under their regulations and through the *Strategy and Action Plan*. The issuance of import permits for lions legally hunted under these authorities would not conflict with any programs intended to enhance the survival probability of the species in Zimbabwe. Issuance of a permit authorizing import of Mr. Schnetzler's trophy lion from Zimbabwe would work in favor of, not against, the principal acts governing lion conservation in Zimbabwe. Furthermore, sport

hunting opportunities help local communities realize the value in conserving the African lion.

Therefore, based on the information available to the Service, the issuance of an import permit for a legally hunted lion does not conflict with known conservation programs.

17.32(a)(2)(iv): Whether the purpose for which the permit is required would be likely to reduce the threat of extinction facing the species of wildlife sought to be covered by the permit:

Considering Zimbabwe's limited, controlled off-take of lions in a manner that maintains sustainability, Mr. Schnetzler's legal hunt contributes to reducing the threat of extinction of lions. It appears that the permitting activities under Zimbabwe's laws and CITES, as well as the implementation of the adaptive age-based lion quota, and a continuation of implementation of the outputs in the *Strategy and Action Plan* are working in concert to promote the long-term survival of lions in the wild in Zimbabwe. The use of revenue received from hunters, such as Mr. Schnetzler, to manage the populations on the reserves is an important element of the success of lion management in Zimbabwe. For example, hunting operators in the SVC spend USD 546,000 annually on anti-poaching activities (Lindsey et al. 2012). Therefore, based on the information available to the Service, the issuance of the requested import permit for Mr. Schnetzler's legally hunted lion will likely reduce the threat of extinction facing lions in Zimbabwe.

17.32(a)(2)(v): The opinions or views of scientists or other persons or organizations having expertise concerning the wildlife or other matters germane to the application:

Based on reviewing comments made during the listing process for lions, as well as information obtained through personal conversations and literature, there is general agreement that hunting, done properly and well managed, would not have an adverse effect on lion populations. Numerous researchers have stated that, while they may not support hunting in general, they see that benefits can be received through a scientifically based hunting program for lions.

Based on the information available to the Service, there is general support by scientists and other persons or organizations having expertise concerning lions that the legal and sustainable harvest of lions, and the subsequent import of legally harvested lion trophies, as proposed in this application, would not have an adverse effect on the species and would further efforts to conserve the species in the wild into the future.

17.32(a)(2)(vi): Whether the expertise, facilities, or other resources available to the applicant appear adequate to successfully accomplish the objectives stated in the application:

Mr. Schnetzler submitted a permit application to import a trophy of his personally, legally harvested lion from Zimbabwe for the purpose of enhancing the propagation or survival of the species in the wild. As a sport-hunter, Mr. Schnetzler plays a large role in the hunting industry of Zimbabwe; the hunting and subsequent import of Mr. Schnetzler's trophy lion increases the funds available to the Zimbabwe Government and SVC to implement lion conservation initiatives. Therefore, based on the Service's review of the information available relating to Mr. Schnetzler's permit request, we find that the expertise, facilities, or other resources available to Mr. Schnetzler appear adequate to successfully accomplish the objectives stated in the application.

Conclusion

As described above, the Government of Zimbabwe has been documented to implement the *Strategy and Action Plan* in the manner identified in the documents referenced in making this finding. The on-going adaptive management and limited and sustainable off-take of lions is important to the survival of lions in Zimbabwe, and the funds generated by Mr. Schnetzler's participation contributes to the ongoing benefits the program provides to lions in the wild.

Therefore, based on the Service's consideration and analysis of the information associated with Mr. Schnetzler's permit application and other relevant information available to the Service, as described above, we find that the import of the lion harvested by Mr. Schnetzler on October 19, 2018, from the Savé Valley Conservancy, Zimbabwe, meets the requirements for making a positive enhancement finding pursuant to 50 CFR 17.40(r) and 50 CFR 17.32(a). Therefore, the Service is able to authorize the import of the trophy of one lion taken from the wild in Zimbabwe, to Christopher Schnetzler of Powell, Ohio.

I. **Service Program and Geographic Area or Station Name**: Branch of Permits, Division of Management Authority, International Affairs

II. **Flexible Funding Program** (e.g. Joint Venture, etc.) if applicable: N/A

III. **Location**: 5275 Leesburg Pike, MS: IA, Falls Church, VA 22041-3803

IV. **Species/Critical Habitat**:

Southern and Eastern African lion (*Panthera leo melanochaita*)

Critical Habitat: N/A

V. **Project Description:** Describe proposed project or action or, if referencing other documents, prepare an executive summary (attach additional pages as needed):

As described in the permit application, 22129D, Christopher Robert Schnetzler, has requested a permit to import a trophy of one lion that he lawfully hunted in Zimbabwe. The import is for personal purposes.

VI. **Determination of Effects:**

(A) Description of Effects: Describe the action(s) that may affect the species and critical habitats listed in item IV. Your rationale for the Section 7 determinations made below (B) should be fully described here.

Issuance of the requested import permit by the Branch of Permits will result in the importation of one personally sport-hunted lion that has been lawfully taken in Zimbabwe on the date specified in the permit application.

The trophy will be accompanied by the required CITES export permit issued by the CITES Management Authority of Zimbabwe.

The requestd U.S. Federal Fish and Wildlife import permit does not authorize the killing of an African lion; the authorization to hunt and lawfully take a lion is under the purview of the government of Zimbabwe. Therefore, the proposed action of issuing a Federal Fish and Wildlife import permit for this lawfully hunted lion will not directly or indirectly affect individuals of listed or proposed species or designated/proposed critical habitat of such species.

(B) Determination: Determine the anticipated effects of the proposed project on species and critical habitats listed in item IV. Check all applicable boxes and list the species (or attach a list) associated with each determination**.**

Determination

No Effect: This determination is appropriate when the proposed project will not directly or indirectly affect (neither negatively nor beneficially) individuals of listed/proposed/candidate species or designated/proposed critical habitat of such species. **No concurrence from DSA/ESFO required.** **X**

May Affect but Not Likely to Adversely Affect: This determination is appropriate when the proposed project is likely to cause insignificant, discountable, or wholly beneficial effects to individuals of listed species and/or designated critical habitat. **Concurrence from DSA/ESFO required.** _____

May Affect and Likely to Adversely Affect: This determination is appropriate when the proposed project is likely to adversely impact individuals of listed species and/or designated critical habitat. **Formal consultation with DSA/ESFO required.** _____

May affect but Not Likely to Jeopardize candidate or proposed species/critical habitat: This determination is appropriate when the proposed project may affect, but is not expected to jeopardize the continued existence of a species proposed for listing or a candidate species, or adversely modify an area proposed for designation as critical habitat. **Concurrence from DSA/ESFO optional.** _____

Likely to Jeopardize candidate or proposed species/critical habitat: This determination is appropriate when the proposed project is reasonably expected to jeopardize the continued existence of a species proposed for listing or a candidate species, or adversely modify an area proposed for designation as critical habitat. **Conference with DSA/ESFO required.** _____

CHIEF, BRANCH OF PERMITS, DMA

Permittee:

CHRISTOPHER ROBERT SCHNETZLER
(b) (6)
POWELL, OH 43065
U.S.A.

Authority: Statutes and Regulations: 50 CFR 17.40(r).

Location where authorized activity may be conducted:
IMPORT THROUGH ANY PORT LISTED IN 50 CFR 14.12

Reporting requirements: Not applicable

Authorizations and Conditions:

A. Authorized to import the sport-hunted trophy of one male African lion (*Panthera leo melanochaita*), taken in Zimbabwe for the purpose of enhancement of the survival of the species.

B. Specimen may not be sold or transferred for any financial remuneration.

C. **Trophy must have been taken during the 2018 hunting season.**

D. Trophy must be accompanied by a valid trophy permit or hunting license issued by the government of Zimbabwe for the 2018 season.

E. Trophy must be accompanied by a valid Convention on International Trade in Endangered Species of Wild Fauna and Flora (CITES) Appendix II export permit/re-export certificate, source code "W", issued by the Management Authority of the exporting/re-exporting country.

F. General conditions set out in Subpart D of 50 CFR 13, and specific conditions contained in Federal regulations cited above, are hereby made a part of this permit. All activities authorized herein must be carried out in accord with and for the purposes described in the application submitted. Continued validity, or renewal of this permit is subject to complete and timely compliance with all applicable conditions, including the filing of all required information and reports.

G. The validity of this permit is also conditioned upon strict observance of all applicable foreign, state, local, tribal, or other federal law. **This permit can be photocopied.**

H. Valid for use by permittee named above.

I. Acceptance of this permit serves as evidence that the permittee understands and agrees to abide by the "General Permit Conditions" (copy attached).

RE: Import Application of Zimbabwe Lion Trophy for Mark Baker

Dear Chief Cogliano:

Enclosed please find the permit application to import of a lion trophy from Zimbabwe for Mark Baker. Also attached to the permit application is the 2018 Operator Enhancement repot from Mazunga Safaris. Please refer to the hundreds of pages of enhancement information Conservation Force previously submitted to the U.S. Fish and Wildlife Service, as well as information submitted by Zimbabwe authorities, outfitters, and others, in making an enhancement finding for lion trophy imports.

Please do not hesitate to contact us if you have questions about this permit application.

Sincerely,

John J. Jackson III

NOTICE OF REPRESENTATION

This is a notice to the U.S. Fish and Wildlife Service that I have appointed John J. Jackson, III of the non-profit firm Conservation Force as my attorney and legal representative for all matters concerning my application for a permit to import a lawfully hunted lion trophy.

This authority is inclusive and extends to all applications and filings, whether administrative or judicial, including but not limited to any request for reconsideration, appeal, and litigation.

In the case of a permit an ESA endangered listed species this is also a request for Ten Days Notice before the permit is issued so I and my attorney can know of approval as soon as those that may have opposed the issuance of the permit.

E. IMPORT OF SPORT-HUNTED TROPHIES *(Appendix I of CITES and/or ESA)*

Note 1: This form should be used to request authorization to import trophies of species listed on Appendix I of CITES and/or as threatened or endangered under the ESA (examples include elephants, lions, cheetahs, wood bison, and markhor).

PLEASE USE FORM 3-200-19 FOR SOUTHERN AFRICAN LEOPARD TROPHIES AND SOUTHERN WHITE RHINOCEROS TROPHIES TAKEN IN NAMIBIA.

Note 2: If you hold an import permit for a trophy that you did not use, please **return the unused original permit**. If you are requesting reissuance of a permit because you have taken a trophy, but were unable to import it prior to the expiration of the permit, please use the renewal form (3-200-52) and return your original permit with that form.

Note 3: Applications for species listed as endangered under the U.S. Endangered Species Act are published in the Federal Register for a 30-day public comment period. Please allow at least **90 days** for the application to be processed.

Note 4: *Sport-hunted trophy* is defined at 50 CFR 23.74 as follows: *Sport-hunted trophy* means a whole dead animal or a readily recognizable part or derivative of an animal specifically identified on the accompanying CITES document that meets the following criteria:

- Is raw, processed, or manufactured;
- Was legally obtained by the hunter through hunting for his or her personal use;
- Is being imported, exported, or re-exported by or on behalf of the hunter as part of the transfer from its country of origin ultimately to the hunter's country of usual residence; and
- Includes worked, manufactured, or handicraft items made from the sport-hunted animal only when:
  - i. Such items are contained in the same shipment as raw or tanned parts of the sport-hunted animal and are for the personal use of the hunter;
  - ii. The quantity of such items is no more than could reasonably be expected given the number of animals taken by the hunter as shown on the license or other documentation of the authorized hunt accompanying the shipment; and
  - iii. The accompanying CITES documents (export document and, if appropriate, import permit) contain a complete itemization and description of all items included in the shipment.

Note 5: Certain hunting trophies, including elephants, are subject to restrictions on their use after import into the United States. Please see 50 CFR 23.55 for more information or contact the Division of Management Authority.

Please provide the following information. Complete all questions on the application. Mark questions that are not applicable with "N/A". If needed, use a separate sheet of paper. On all attachments or separate sheets you are submitting; please indicate the application question number you are addressing. If applying for more than one trophy, be sure to answer questions 4-6 for each trophy addressed in this application. If importing trophies from more than one country, you must submit a separate application for each shipment in order to obtain separate import permits.

1. Name and address where you wish the permit to be mailed, if different from page 1. If you would like expedited shipping, please enclose a self-addressed, pre-paid, computer-generated, courier service airway bill. If unspecified, all documents will be mailed via the U.S. Postal Service.

   Same as in Section A and Section C on page 1.

2. Who should we contact if we have questions about the application (name, phone number, and e-mail)?

   Charles Mark Baker
   Cell Phone: (b) (6) [redacted]

3. Disqualification factor. A conviction, or entry of a plea of guilty or nolo contendere, for a felony violation of the Lacey Act, the Migratory Bird Treaty Act, or the Bald and Golden Eagle Protection Act disqualifies any such person from receiving or exercising the privileges of a permit, unless such disqualification has been expressly waived by the Service Director in response to a written petition. (50 CFR 13.21(c)) Have you or any of the owners of the business, if applying as a business, been convicted, or entered a plea of guilty or nolo contendere, forfeited collateral, or are currently under charges for any violations of the laws mentioned above?

☒ No ☐ Yes

If you answered "Yes" to Question 3, provide: a) the individual's name; b) date of charge; c) charge(s); d) location of incident; e) court; and f) action taken for each violation. Please be aware that a "Yes" response does not automatically disqualify you from getting a permit.

Not applicable.

4. For each trophy to be imported, provide:

   a. Scientific name (genus, species, and, if applicable, subspecies) and common name.

Panthero Leo, Lion

   b. Sex (if known). Male

5. **IF ANIMAL IS CURRENTLY LIVING IN THE WILD**, please enter the following information:

   a. Country and place (area, region, GIS coordinates, ranch, conservancy, management area, or hunting block, AND nearest city) where wildlife is to be taken from the wild:

Zimbabwe, Bubye Valley Conservancy, Matabeleland South.
Nearest city: Beit Bridge. See attached Map.

   b. Date wildlife is to be hunted:

October 7-26, 2019

   c. Name of hunting outfitter, safari company, or professional hunter you will be hunting with:

Mazunga Safaris with PH John Sharp

6. **IF THE TROPHY HAS ALREADY BEEN TAKEN**, please enter the following information:

   a. Country and place (area, region, GIS coordinates, ranch, conservancy, management area, or hunting block, AND nearest city) where wildlife was removed from the wild:

   b. Date wildlife was hunted:

c. Name of hunting outfitter, safari company, or professional hunter you hunted with:

d. The current location of the trophy (address and country) [the U.S. import permit will identify this country as the country of export/re-export and must match with the foreign export/re-export document]:

7. Please provide a copy of any applicable foreign government permits or licenses that were required to remove this animal from the wild (if you have not hunted yet and do not currently hold any such permits or licenses, please indicate so). I have not hunted yet and do not currently hold any such permits or licenses.

8. Complete name and address of overseas person or business shipping the trophy to you. If you are applying to import a trophy directly from **Namibia**, you must provide the name and address of the professional hunter listed on your Namibian hunting permit [this name will appear on the face of the export permit].

Name:
Business Name: Stephen Collett
Address: Collett's Wildlife Artistry
City: 15 Josiah Chinamano Avenue
State/Province: Bulawayo
Country, Postal Code: Matabeleland, Zimbabwe NIL
