Thanks John. What I need to do is calculate a 95% Confidence Interval and p-value to see if this correlation is real or is the result of chance (since this is a sample) and also to test the null hypothesis that there is no linear correlation. I have various simple stats programs I can use for this, but I would like to clean-up the den site information before testing this further. Waiting to back from Bob on 3 older MT den sites; then we can send you the "final" database.
