Will do. I'll add that little bit to the record info in the data.

Here is the map with new colors.

Ed - While waiting to hear back from Bob on 3 MT NHP observations, I took another look at your CNDDDB (actually Grinnell) excel table. Based on the account in Grinnell's book, I believe those two from Sequoia National Park are reasonably good records (it says the Ranger "came upon beds where young had been born and reared..."), so lets leave those in the database.

Thanks.

Hi Betty, I went through my files and couldn't tell what dens excels I had given you so, I cleaned mine out, made new ones and figured it'd be best to send you a complete folder set.

This way we don't have files with dups in them and maybe it will be in better order.

I pulled the dups from each raw data file (if they had them) and now you can see all raw attribute fields.

Hope this helps, Ed

Wolverine Observations and Inman Modeled Habitats

This map represents areas of western United States predicted to be primary wolverine habitat (suitable for survival, i.e., use by resident adults), female dispersal habitat (suitable for relatively brief female dispersal movements), and male dispersal habitat (suitable for relatively brief male dispersal movements) based on resource selection function modeling developed with wolverine telemetry locations from the Greater Yellowstone Ecosystem, of Montana, Idaho, and Wyoming, USA, 2001-2010.
