John - I am teleworking today (our office had a power outage earlier).
I was reading a 2010 paper that looked at wolverines in Ontario, Canada, particularly home range sizes, but also potential effects of road density - paper is attached.

Do you think this is something we could evaluate for the U.S.? One idea would be to take Bob Inman's primary habitat and look at road density in those areas. But I don't work enough with GIS to know what layers are available for western U.S.
