I found in our library here two older accounts of mammals in Colorado...will go take a look.

Yes, I think it is worth looking into. I'll see if we can get the track data.

I understand that the focus has been on denning. Just thought this would give us an idea as to occupation (potentially suitable habitat) within this region since we have no historic information.

Hi Betty, We should talk about this with Steve. The elevation work we are doing in Glacier focuses on denning sites, M56 was a male so I'm not sure how comparable this would be.
Best, John

Hi John - Per my comment about projections for snow cover and Rocky Mtn National Park related to wolverine habitat/use, see Audrey's attachment Y, which shows the tracking locations for M56 in Colorado. I would guess that the GIS shapefiles for this map are available, either from Bob or the State of Colorado.
