Hi Rich - I had a couple of questions after reviewing the map (*see attached*) that John Guinotte prepared from the data you sent to him.

1. Can you tell me why one management unit in BC has such a higher number? This is the unit with red color, labeled as 23 wolverines harvested over that time period. Is this due to higher level of trapping effort in that region, better wolverine habitat, or combination of factors?

2. Do you have a general sense, based on your on-going genetic analyses or other studies, as to the movement patterns of wolverines along this portion of the U.S.-Canada border? Do wolverines seem to be dispersing (or moving within home ranges) in both directions across the border?

Thanks for your time. Feel free to call me to discuss if that's easier.

Betty

Hi All,

Attached is a quick map I made to show total number of wolverines trapped in BC by management unit (2007-2015). This is the data from Rich Weir.

Best, John
