Federal Fish and Wildlife Permit Application Form

NOV 16 2017

Return to: U.S. Fish and Wildlife Service
Division of Management Authority (DMA)
Branch of Permits, MS: IA
5275 Leesburg Pike
Falls Church, VA 22041-3803
1-800-358-2104 or 703-358-2104

Type of Activity:
Import of Sport-hunted Trophies of Southern African Leopard, African Elephant, and Namibian Southern White Rhinoceros

Complete Sections A or B, and C, D, and E of this application. U.S. address may be required in Section C, see instructions for details.
See attached instruction pages for information on how to make your application complete and help avoid unnecessary delays.

A. Complete if applying as an individual

1.a. Last name	1.b. First name	1.c. Middle name or initial	1.d. Suffix
Staton	Edward	(b) (6)	

2. Date of birth (mm/dd/yyyy)	3. Occupation	4. Affiliation/ Doing business as (see instructions)
(b) (6)		

5.a. Telephone number	5.b. Alternate telephone number	5.c. Fax number	5.d. E-mail address
(b) (6)			(b) (6)

B. Complete if applying on behalf of a business, corporation, public agency, Tribe, or institution

1.a. Name of business, agency, Tribe, or institution	1.b. Doing business as (dba)

2. Tax identification no.	3. Description of business, agency, Tribe, or institution

4.a. Principal officer Last name	4.b. Principal officer First name	4.c. Principal officer Middle name/ initial	4.d. Suffix

5. Principal officer title	6. Primary contact name

7.a. Business telephone number	7.b. Alternate telephone number	7.c. Business fax number	7.d. Business e-mail address

C. All applicants complete address information

1.a. Physical address (Street address, Apartment #, Suite #, or Room #; no P.O. Boxes)
(b) (6)

1.b. City	1.c. State	1.d. Zip code/Postal code	1.e. County/Province	1.f. Country
Plano	TX	(b) (6)		USA

2.a. Mailing Address (include if different than physical address; include name of contact person if applicable)

2.b. City	2.c. State	2.d. Zip code/Postal code	2.e. County/Province	2.f. Country

D. All applicants MUST complete

1. Attach check or money order payable to the U.S. FISH AND WILDLIFE SERVICE **in the amount of $100, nonrefundable processing fee**. Federal, Tribal, State, and local government agencies, and those acting on behalf of such agencies, are exempt from the processing fee – ***attach documentation of fee exempt status as outlined in instructions.*** (50 CFR 13.11(d))

2. Do you currently have or have you ever had any Federal Fish and Wildlife permits?
Yes ☑ If yes, list the number of the most current permit you have held or that you are applying to renew/re-issue. 17US24213C/9 No ☐

3. Certification. I hereby certify that I have read and am familiar with the regulations contained in ***Title 50, Part 13 of the Code of Federal Regulations*** and the other ***applicable parts in subchapter B of Chapter I of Title 50***, and I certify that the information submitted in this application for a permit is complete and accurate to the best of my knowledge and belief. I understand that any false statement herein may subject me to the criminal penalties of 18 U.S.C. 1001.

Signature of applicant/person responsible for permit (No photocopied or stamped signatures) — Date of signature (mm/dd/yyyy): 11/14/2017

E. IMPORT OF SPORT-HUNTED TROPHIES OF SOUTHERN AFRICAN LEOPARD, AFRICAN ELEPHANT, AND NAMIBIAN SOUTHERN WHITE RHINOCEROS

Note 1: If you hold an import permit for a trophy/trophies that you did not use, please **return the unused original permit.** If you are requesting reissuance of a permit because you have taken a trophy, but were unable to import it prior to the expiration of the permit, please use the renewal form (3-200-52; http://www.fws.gov/international/permits/by-form-number/index.html) and return your original permit with that form.

Note 2: *Sport-hunted trophy* is defined at 50 CFR 23.74 as follows: *Sport-hunted trophy* means a whole dead animal or a readily recognizable part or derivative of an animal specifically identified on the accompanying CITES document that meets the following criteria:

(1) Is raw, processed, or manufactured;
(2) Was legally obtained by the hunter through hunting for his or her personal use;
(3) Is being imported, exported, or re-exported by or on behalf of the hunter as part of the transfer from its country of origin ultimately to the hunter's country of usual residence; and
(4) Includes worked, manufactured, or handicraft items made from the sport-hunted animal only when:
  (i) Such items are contained in the same shipment as raw or tanned parts of the sport-hunted animal and are for the personal use of the hunter;
  (ii) The quantity of such items is no more than could reasonably be expected given the number of animals taken by the hunter as shown on the license or other documentation of the authorized hunt accompanying the shipment; and
  (iii) The accompanying CITES documents (export document and, if appropriate, import permit) contain a complete itemization and description of all items included in the shipment.

Note 3: Certain hunting trophies, including leopard, elephant, and rhinoceros hunting trophies, are subject to restrictions on their use after import into the United States. Please see 50 CFR 23.55 for more information or contact the Division of Management Authority.

Please provide the following information. Complete all questions on the application. Mark questions that are not applicable with "N/A". If applying for more than one trophy, be sure to answer questions 2 and 3 for each trophy.

If importing trophies from more than one country, you must submit a separate application for each shipment in order to obtain separate import permits.

1. ENTER the quantity next to the name of the species you are applying to import (you may apply to import specimens of more than one species provided they have been/are being hunted in the same country):

Leopard (*Panthera pardus*) Quantity:_____(Import is limited to two per hunter per calendar year)

African elephant (*Loxodonta africana*) Quantity:__1__(Import is limited to two per hunter per calendar year)
Note: once imported, ivory cannot be re-exported.

Southern white rhinoceros (*Ceratotherium simum simum*) from Namibia Quantity:_____ (An import permit is not required for trophies harvested in South Africa or Swaziland. If you wish to import from a different country, please use form 3-200-37).

2. **IF ANIMAL IS CURRENTLY LIVING IN THE WILD,** please enter the following:
   a. Country and place (area, region, GIS coordinates, ranch AND nearest city) where wildlife is to be taken from the wild:

   b. Date wildlife is to be hunted:

c. Description of the trophy and parts you intend to import (e.g., skin, skull, shoulder mount, life size mount, claws, horns, tusks).

3. **IF THE ANIMAL IS DEAD,** please enter the following:
   a. Country and place (area, region, GIS coordinates, ranch, and/or AND nearest city) where trophy was removed from the wild: South Africa, Limpopo, Mopani, Croc Ranch, Pretoria

   b. Date wildlife was hunted: 30Jul2016

   c. Description of the trophy and parts you intend to import (e.g., skin, skull, shoulder mount, life size mount, claws, horn, tusks):

      Skull, Tusks, Skin

   d. The current location of the trophy (address and country) [the U.S. import permit will identify this country as the country of export/re-export and must match with the export/re-export document]:

      7 Aluminium Road, White River, Mpumalanga 1240, South Africa

4. Complete name and address of overseas person or business shipping the trophy to you. If you are applying to import a trophy directly from Namibia, you **must** provide the name and address of the professional hunter listed on your Namibian hunting permit [this name will appear on the face of the export permit].

Name: Business Name:	Life Form Taxidermy
Address:	7 Aluminium Road
City:	White River
State/Province:	Mpumalanga
Country, Postal Code:	South Africa, 1240

5. Please be aware that the U.S. Fish and Wildlife Service may need to make a finding that your activities will enhance or benefit wild populations of the species involved. If you have any information that could support this finding (e.g., how the funds from license/trophy fees will be spent, what portion of the hunting fee will support conservation), please submit such information on a separate page with your application.

CERTIFICATION STATEMENT (original signature must be provided for either 6 or 7 below)

6. **If you are a broker or taxidermist applying on behalf of a foreign national,** provide documentation to show you have a **Power of Attorney** to act on your client's behalf and sign the following statement.

   I acknowledge that the sport-hunted trophy/trophies to be imported has been/will be personally hunted by my client and is being imported only for my client's personal use (i.e., **not for sale, transfer, donation, or exchange that is reasonably likely to result in economic use, gain, or benefit**). I understand that my client may only import two leopard trophies in one calendar year. I understand that my client may only import two African elephant trophies in one calendar year. In addition, I have advised my client that raw ivory, once imported into the United States, cannot be re-exported.

   Taxidermist/Broker's signature:_____ Date: _____

7. **If you are the hunter applying to import your own trophy**, please read and sign the following statement.

I acknowledge that the sport-hunted trophy/trophies to be imported has been/will be personally hunted by me and is being imported only for my personal use (i.e., **not for sale, transfer, donation, or exchange that is reasonably likely to result in economic use, gain, or benefit**). I understand that I may only import two leopard trophies in one calendar year. I understand that I may only import two African elephant trophies in one calendar year. In addition, I understand that raw ivory, once imported into the United States, cannot be re-exported.

Applicant's signature: _____ Date: 11/14/2017

Be aware that there may be additional permitting or approval requirements by your local or state governments, as well as required by other Federal agencies or foreign government to conduct your propose activity. While the Service will attempt to assist where possible, it is your responsibility to obtain such approval.

8. All international shipment(s) must be through a designated port. A list of designated ports (where an inspector is posted) is available from http://www.fws.gov/le/designated-ports.html. If you wish to use a port not listed, please contact the Office of Law Enforcement for a Designated Port Exemption Permit (form 3-200-2).

9. Name and address where you wish the permit to be mailed, **if** different from page 1 (All permits will be mailed via the U.S. Postal Service, unless you identify an alternative means below):

10. If you wish the permit to be delivered by means other than USPS regular mail, provide an air bill, pre-paid envelope, or billing information. If you do not have a pre-paid envelope or air bill and wish to pay for a courier service with your credit card, please check the box below. Please DO NOT include credit card number or other information; you will be contacted for this information.

☐ If a permit is issued, please send it via a courier service to the address on page 1 or question 9. I understand that you will contact me for my credit card information once the application has been processed.

11. Who should we contact if we have questions about the application? (Include name, phone number, and email):

Edward (b) (6) Staton, (b) (6) [redacted]

12. **Disqualification Factor.** A conviction, or entry of a plea of guilty or nolo contendere, for a felony violation of the Lacey Act, the Migratory Bird Treaty Act, or the Bald and Golden Eagle Protection Act disqualifies any such person from receiving or exercising the privileges of a permit, unless such disqualification has been expressly waived by the Service Director in response to a written petition. (50 CFR 13.21(c)) Have you or any of the owners of the business, if applying as a business, been convicted, or entered a plea of guilty or nolo contendere, forfeited collateral, or are currently under charges for any violations of the laws mentioned above?

☐ Yes ☑ No If you answered "Yes" provide: a) the individual's name, b) date of charge, c) charge(s), d) location of incident, e) court, and f) action taken for each violation.

(50 CFR 13.21(c)) Have you or any of the owners of the business, if applying as a business, been convicted, or entered a plea of guilty or nolo contendere, forfeited collateral, or are currently under charges for any violations of the laws mentioned above?

☐ Yes ☑ No If you answered "Yes" provide: a) the individual's name, b) date of charge, c) charge(s), d) location of incident, e) court, and f) action taken for each violation.

Ndumo Safaris (Namibia) motivational letter for Enhancement permits for elephant and leopard imports into the USA:

Ndumo Safaris Ltd is a northeast Namibia based outfitter striving to combine sustained big game hunting with a focus on wildlife conservation within 3 vast concessions of land. The concession is managed in an integrated approach with both the Namibian Government and local communal conservancies to enhance and benefit wildlife through conservation. This partnership approach with Ndumo and the communal conservancies, which have been awarded hunting quotas on 3 hunting blocks.

This communal conservancies' model of adopted by Namibia, especially those with a hunting quota awarded, works very well in helping local, impoverished communities to:

1) Co- exist on land that has elephants and leopard on them
2) Derive an income from the animals that occur on their communal land, sometimes on land that is not really suitable for eco-tourism
3) Create core hunting areas where no or very few livestock enters, thus creating a wildlife only zone
4) Create buffer zones around dedicated National Parks and human habitation
5) Decrease human/ wild game conflict
6) Create employment opportunities for local communities
7) Provide local communities, that are often live below the bread line, with much needed protein in the form of game meat
8) Create funds for these communities to do their own anti-poaching
9) Create funds for the Game Products trust fund, which helps them in developing the areas for wildlife, compensate them for wildlife conflicts and educate them on the value of wildlife in the area.

Currently, we own and operate the following concessions in the Caprivi / Zambezi region of Namibia:

- Sobbe communal conservancy
- Sikunga communal conservancy
- The joint venture area called Bwabwata East or Kwando core area, inside the Bwabwata National Park.

The Namibian government has adopted integrated park management with the residents of the land on which the National Park is situated. Park residents are mostly from the Barakwena tribe, a Khwe San bushmen minority group. The residents have formed the Kyaramachan Association to represent them and manage income from tourism and trophy hunting. Ndumo has been awarded the trophy hunting concession from the Association. Ndumo Safaris pays close to US$ 550,000 to both the Namibian government and local communities in concession and license fees per annum.

We currently employ 33 people from the region, paying them around double what the minimum requirements are. These jobs thus support 33 families from the region, where any type of permanent employment is scarce.

We further provide over a 100 metric tonnes of meat to the local communities per annum, in the form of game meat from the animals harvested.

E. IMPORT OF SPORT-HUNTED TROPHIES OF SOUTHERN AFRICAN LEOPARD, AFRICAN ELEPHANT, AND NAMIBIAN SOUTHERN WHITE RHINOCEROS

Note 1: If you hold an import permit for trophy/trophies that you did not use, please **return the unused original permit**. If you are requesting reissuance of a permit because you have taken a trophy, but were unable to import it prior to the expiration of the permit, please use the renewal form (3-200-52; http://www.fws.gov/international/permits/by-form-number/index.html) and return your original permit with that form.

Note 2: The U.S. FWS has determined that a trophy consists of raw or tanned parts of a specimen taken by a hunter during a sport hunt for personal use. It may include the bones, claws, hair, head, hide, hooves, horns, meat, skull, teeth, tusks, or any taxidermied part, including, but not limited to, a rug or taxidermied head, shoulder, or full mount. It does not include articles made from a trophy, such as worked, manufactured, or handicraft items for use as clothing, curios, ornamentation, jewelry, or other utilitarian items. If you wish to import such products, please contact the Division of Management Authority for the proper application form.

Note 3: Certain hunting trophies, including leopard, elephant, and rhinoceros hunting trophies, are subject to restrictions on their use after import into the United States. Please see 50 CFR 23.55 for more information or contact the Division of Management Authority.

Please provide the following information. Complete all questions on the application. Mark questions that are not applicable with "N/A". If applying for more than one trophy, be sure to answer questions 2 and 3 for each trophy. If importing trophies from more than one country, you must submit a separate application for each shipment in order to obtain separate import permits.

1. ENTER the quantity next to the name of the species you are applying to import (you may apply to import specimens of more than one species provided they have been/are being hunted in the same country):

Leopard (*Panthera pardus*) Quantity: _____ (Limited to the import of two per calendar year)

African elephant (*Loxodonta africana*) Quantity: 1 (Import permit is not required for trophies harvested in Botswana, Namibia, South Africa, or Zimbabwe). **Note: once imported, ivory cannot be re-exported.**

Southern white rhinoceros (*Ceratotherium simum simum*) from Namibia Quantity: _____ (An import permit is not required for trophies harvested in South Africa or Swaziland. If you are looking to import from a different country, please use form 3-200-37).

2. **IF ANIMAL IS CURRENTLY LIVING IN THE WILD**, please enter the following:
   a. Country and place (area, region, GIS coordinates, ranch AND nearest city) where wildlife is to be taken from the wild: SOUTH AFRICA. GPS CO-ORDS IS 24 DEGREES 15' 35.40" SOUTH AND 30 DEGREES 55' 06.89" EAST. AREA/REGION OR PROVINCE IS LIMPOPO PROVINCE. CLOSEST TOWN OR CITY IS Hoedspruit
   b. Date wildlife is to be hunted: MARCH 19th THRU MARCH 26th 2018
   c. Description of the trophy and parts you intend to import (e.g., skin, skull, shoulder mount, life size mount, claws, horns, tusks). SKIN, TUSKS, TAIL, feet, ears

3. **IF THE ANIMAL IS DEAD**, please enter the following:
   a. Country and place (area, region, GIS coordinates, ranch, and/or AND nearest city) where trophy was removed from the wild:
   b. Date wildlife was hunted:

c. Description of the trophy and parts you intend to import (e.g., skin, skull, shoulder mount, life size mount, claws, horn, tusks):
SKIN, TUSKS, TAIL, FEET, EARS

d. The current location of the trophy (address and country) [the U.S. import permit will identify this country as the country of export/re-export and must match with the export/re-export document]:
SOUTH AFRICA, TOWN OR CITY IS HOEDSPRUIT

4. Complete name and address of overseas person or business shipping the trophy to you. If you are applying to import a trophy directly from Namibia, you **must** provide the name and address of the professional hunter listed on your Namibian hunting permit [this name will appear on the face of the export permit].

Name: RUPERT DEDEKIND
Business Name: UNIVERSAL TROPHY SERVICES
Address: PLOT 114 BASHEWA, PRETORIA 0056
Address:
City: PRETORIA
State/Province: SOUTH AFRICA
Country, Postal Code:

SAFARI AIR CARGO SYSTEM

PHONE 011 979-3770

5. Please be aware that the U.S. Fish and Wildlife Service may need to make a finding that your activities will enhance or benefit wild populations of the species involved. If you have any information that could support this finding (e.g., how the funds from license/trophy fees will be spent, what portion of the hunting fee will support conservation), please submit such information on a separate page with your application.

CERTIFICATION STATEMENT (original signature must be provided for either 6 or 7 below)

6. **If you are a broker or taxidermist applying on behalf of a foreign national,** provide documentation to show you have a **Power of Attorney** to act on your client's behalf and sign the following statement.

I acknowledge that the sport-hunted trophy/trophies to be imported has been/will be personally hunted by my client and is being imported only for my client's personal use (i.e., **not for sale, transfer, donation, or exchange that is reasonably likely to result in economic use, gain, or benefit**). I understand that my client may only import two leopard trophies in one calendar year (if applicable). In addition, I have advised my client that raw ivory, once imported into the United States, cannot be re-exported.

Taxidermist/Broker's signature: _____ Date: _____

7. **If you are the hunter applying to import your own trophy**, please read and sign the following statement.

I acknowledge that the sport-hunted trophy/trophies to be imported has been/will be personally hunted by me and is being imported only for my personal use (i.e., **not for sale, transfer, donation, or exchange that is reasonably likely to result in economic use, gain, or benefit**). I understand that I may only import two leopard trophies in one calendar year (if applicable). In addition, I understand that raw ivory, once imported into the United States, cannot be re-exported.

Applicant's signature: Bruce Kohn Date: 12/11/2017

Be aware that there may be additional permitting or approval requirements by your local or state governments, as well as required by other Federal agencies or foreign government to conduct your propose activity. While the Service will attempt to assist where possible, it is your responsibility to obtain such approval.

8. All international shipment(s) must be through a designated port. A list of designated ports (where an inspector is posted) is available from http://www.fws.gov/le/designated-ports.html. If you wish to use a port not listed, please contact the Office of Law Enforcement for a Designated Port Exemption Permit (form 3-200-2).

I will use
FAUNA AND FLORA, A division of HIA Logistics
152-31 135th Avenue, Jamaica, New York 11434
FAX 718-276-3300

9. Name and address where you wish the permit to be mailed, **if** different from page 1 (All permits will be mailed via the U.S. Postal Service, unless you identify an alternative means below):

SAME AS Listed

10. If you wish the permit to be delivered by means other than USPS regular mail, provide an air bill, pre-paid envelope, or billing information. If you do not have a pre-paid envelope or air bill and wish to pay for a courier service with your credit card, please check the box below. Please DO NOT include credit card number or other information; you will be contacted for this information.

☐ If a permit is issued, please send it via a courier service to the address on page 1 or question 9. I understand that you will contact me for my credit card information once the application has been processed.

11. Who should we contact if we have questions about the application? (Include name, phone number, and email):

Mike Red KOBRIN (b) (6) Las Vegas, Nevada
(b) (6)
(b) (6)

12. **Disqualification Factor**. A conviction, or entry of a plea of guilty or nolo contendere, for a felony violation of the Lacey Act, the Migratory Bird Treaty Act, or the Bald and Golden Eagle Protection Act disqualifies any such person from receiving or exercising the privileges of a permit, unless such disqualification has been expressly waived by the Service Director in response to a written petition. (50 CFR 13.21(c)) Have you or any of the owners of the business, if applying as a business, been convicted, or entered a plea of guilty or nolo contendere, forfeited collateral, or are currently under charges for any violations of the laws mentioned above?

☐ Yes ☒ No If you answered "Yes" provide: a) the individual's name, b) date of charge, c) charge(s), d) location of incident, e) court, and f) action taken for each violation.

E. IMPORT OF SPORT-HUNTED TROPHIES OF SOUTHERN AFRICAN LEOPARD, AFRICAN ELEPHANT, AND NAMIBIAN SOUTHERN WHITE RHINOCEROS

Note 1: If you hold an import permit for a trophy/trophies that you did not use, please **return the unused original permit**. If you are requesting reissuance of a permit because you have taken a trophy, but were unable to import it prior to the expiration of the permit, please use the renewal form (3-200-52; http://www.fws.gov/international/permits/by-form-number/index.html) and return your original permit with that form.

Note 2: *Sport-hunted trophy* is defined at 50 CFR 23.74 as follows: *Sport-hunted trophy* means a whole dead animal or a readily recognizable part or derivative of an animal specifically identified on the accompanying CITES document that meets the following criteria:

(1) Is raw, processed, or manufactured;
(2) Was legally obtained by the hunter through hunting for his or her personal use;
(3) Is being imported, exported, or re-exported by or on behalf of the hunter as part of the transfer from its country of origin ultimately to the hunter's country of usual residence; and
(4) Includes worked, manufactured, or handicraft items made from the sport-hunted animal only when:
  (i) Such items are contained in the same shipment as raw or tanned parts of the sport-hunted animal and are for the personal use of the hunter;
  (ii) The quantity of such items is no more than could reasonably be expected given the number of animals taken by the hunter as shown on the license or other documentation of the authorized hunt accompanying the shipment; and
  (iii) The accompanying CITES documents (export document and, if appropriate, import permit) contain a complete itemization and description of all items included in the shipment.

Note 3: Certain hunting trophies, including leopard, elephant, and rhinoceros hunting trophies, are subject to restrictions on their use after import into the United States. Please see 50 CFR 23.55 for more information or contact the Division of Management Authority.

Please provide the following information. Complete all questions on the application. Mark questions that are not applicable with "N/A". If applying for more than one trophy, be sure to answer questions 2 and 3 for each trophy.

If importing trophies from more than one country, you must submit a separate application for each shipment in order to obtain separate import permits.

1. ENTER the quantity next to the name of the species you are applying to import (you may apply to import specimens of more than one species provided they have been/are being hunted in the same country):

Leopard (*Panthera pardus*) Quantity: n/a (Import is limited to two per hunter per calendar year)

African elephant (*Loxodonta africana*) Quantity: 1 (Import is limited to two per hunter per calendar year)
Note: once imported, ivory cannot be re-exported.

Southern white rhinoceros (*Ceratotherium simum simum*) from Namibia Quantity: n/a (An import permit is not required for trophies harvested in South Africa or Swaziland. If you wish to import from a different country, please use form 3-200-37).

2. **IF ANIMAL IS CURRENTLY LIVING IN THE WILD**, please enter the following:
   a. Country and place (area, region, GIS coordinates, ranch AND nearest city) where wildlife is to be taken from the wild:
   n/a

   b. Date wildlife is to be hunted:
   n/a

c. Description of the trophy and parts you intend to import (e.g., skin, skull, shoulder mount, life size mount, claws, horns, tusks).

n/a

3. **IF THE ANIMAL IS DEAD**, please enter the following:
   a. Country and place (area, region, GIS coordinates, ranch, and/or AND nearest city) where trophy was removed from the wild:
   b. Date wildlife was hunted: 10/13/2017 - Concession - N#a Jagna Conservancy, Closest town is Tsumkwe. Namibia, Bushmanland Region, GPS coordinates - S 19 11 47.6 / E 020 04 17.0
   c. Description of the trophy and parts you intend to import (e.g., skin, skull, shoulder mount, life size mount, claws, horn, tusks):

      skin, claws, horn, tusks

   d. The current location of the trophy (address and country) [the U.S. import permit will identify this country as the country of export/re-export and must match with the export/re-export document]:

      Caspers Taxidermy, Industrial Area, Grootfontein, Namibia / P.O. Box 1322 Grootfontein, Namibia

4. Complete name and address of overseas person or business shipping the trophy to you. If you are applying to import a trophy directly from Namibia, you **must** provide the name and address of the professional hunter listed on your Namibian hunting permit [this name will appear on the face of the export permit].

Name: Business Name:	Caspers Taxidermy
Address:	Industrial Area (P.O. Box 1322, Grootfontein, Namibia)
City:	Grootfontein
State/Province:	Namibia
Country, Postal Code:	(Professional Hunter - Anton Mynhardt Alberts, 92 Nelson Mandela Avenue, Stillwater #5 Klein Windhoek, City of Windhoek, Namibia)

5. Please be aware that the U.S. Fish and Wildlife Service may need to make a finding that your activities will enhance or benefit wild populations of the species involved. If you have any information that could support this finding (e.g., how the funds from license/trophy fees will be spent, what portion of the hunting fee will support conservation), please submit such information on a separate page with your application.

CERTIFICATION STATEMENT (original signature must be provided for either 6 or 7 below)

6. **If you are a broker or taxidermist applying on behalf of a foreign national,** provide documentation to show you have a **Power of Attorney** to act on your client's behalf and sign the following statement.

   I acknowledge that the sport-hunted trophy/trophies to be imported has been/will be personally hunted by my client and is being imported only for my client's personal use (i.e., **not for sale, transfer, donation, or exchange that is reasonably likely to result in economic use, gain, or benefit**). I understand that my client may only import two leopard trophies in one calendar year. I understand that my client may only import two African elephant trophies in one calendar year. In addition, I have advised my client that raw ivory, once imported into the United States, cannot be re-exported.

   Taxidermist/Broker's signature:_____ Date: _____

7. **If you are the hunter applying to import your own trophy**, please read and sign the following statement.

I acknowledge that the sport-hunted trophy/trophies to be imported has been/will be personally hunted by me and is being imported only for my personal use (i.e., **not for sale, transfer, donation, or exchange that is reasonably likely to result in economic use, gain, or benefit**). I understand that I may only import two leopard trophies in one calendar year. I understand that I may only import two African elephant trophies in one calendar year. In addition, I understand that raw ivory, once imported into the United States, cannot be re-exported.

E. IMPORT OF SPORT-HUNTED TROPHIES OF SOUTHERN AFRICAN LEOPARD, AFRICAN ELEPHANT, AND NAMIBIAN SOUTHERN WHITE RHINOCEROS

Note 1: If you hold an import permit for a trophy/trophies that you did not use, please **return the unused original permit**. If you are requesting reissuance of a permit because you have taken a trophy, but were unable to import it prior to the expiration of the permit, please use the renewal form (3-200-52; http://www.fws.gov/international/permits/by-form-number/index.html) and return your original permit with that form.

Note 2: *Sport-hunted trophy* is defined at 50 CFR 23.74 as follows: *Sport-hunted trophy* means a whole dead animal or a readily recognizable part or derivative of an animal specifically identified on the accompanying CITES document that meets the following criteria:

(1) Is raw, processed, or manufactured;
(2) Was legally obtained by the hunter through hunting for his or her personal use;
(3) Is being imported, exported, or re-exported by or on behalf of the hunter as part of the transfer from its country of origin ultimately to the hunter's country of usual residence; and
(4) Includes worked, manufactured, or handicraft items made from the sport-hunted animal only when:
  (i) Such items are contained in the same shipment as raw or tanned parts of the sport-hunted animal and are for the personal use of the hunter;
  (ii) The quantity of such items is no more than could reasonably be expected given the number of animals taken by the hunter as shown on the license or other documentation of the authorized hunt accompanying the shipment; and
  (iii) The accompanying CITES documents (export document and, if appropriate, import permit) contain a complete itemization and description of all items included in the shipment.

Note 3: Certain hunting trophies, including leopard, elephant, and rhinoceros hunting trophies, are subject to restrictions on their use after import into the United States. Please see 50 CFR 23.55 for more information or contact the Division of Management Authority.

Please provide the following information. Complete all questions on the application. Mark questions that are not applicable with "N/A". If applying for more than one trophy, be sure to answer questions 2 and 3 for each trophy.

If importing trophies from more than one country, you must submit a separate application for each shipment in order to obtain separate import permits.

1. ENTER the quantity next to the name of the species you are applying to import (you may apply to import specimens of more than one species provided they have been/are being hunted in the same country):

Leopard (*Panthera pardus*) Quantity: NA (Import is limited to two per hunter per calendar year)

African elephant (*Loxodonta africana*) Quantity: 1 (Import is limited to two per hunter per calendar year)
Note: once imported, ivory cannot be re-exported.

Southern white rhinoceros (*Ceratotherium simum simum*) from Namibia Quantity: NA (An import permit is not required for trophies harvested in South Africa or Swaziland. If you wish to import from a different country, please use form 3-200-37).

2. **IF ANIMAL IS CURRENTLY LIVING IN THE WILD**, please enter the following:
   a. Country and place (area, region, GIS coordinates, ranch AND nearest city) where wildlife is to be taken from the wild: NA

   b. Date wildlife is to be hunted: NA

c. Description of the trophy and parts you intend to import (e.g., skin, skull, shoulder mount, life size mount, claws, horns, tusks). NA

3. **IF THE ANIMAL IS DEAD**, please enter the following:
   a. Country and place (area, region, GIS coordinates, ranch, and/or AND nearest city) where trophy was removed from the wild: Namibia, Otimbojo/Uhungu, Africa
   b. Date wildlife was hunted: September 19, 2017
   c. Description of the trophy and parts you intend to import (e.g., skin, skull, shoulder mount, life size mount, claws, horn, tusks): 4 Elephant feet mounted as bar stools, tanned skin panels as leather, tanned face panel, tanned trunk, 2 tanned ears, tail as a flyswatter, 2 tusks
   d. The current location of the trophy (address and country) [the U.S. import permit will identify this country as the country of export/re-export and must match with the export/re-export document]:
   Reisec Taxidermy
   Plot 43, Brakwater, Windhoek, ~~Namibia~~ Africa Namibia 9000

4. Complete name and address of overseas person or business shipping the trophy to you. If you are applying to import a trophy directly from Namibia, you **must** provide the name and address of the professional hunter listed on your Namibian hunting permit [this name will appear on the face of the export permit].

   Name: Business: Reisec Taxidermy
   Name: Address: Sven Baard
   Address: Plot 43, Brakwater
   City: Windhoek
   State/Province:
   Country, Postal Code: Namibia 9000

5. Please be aware that the U.S. Fish and Wildlife Service may need to make a finding that your activities will enhance or benefit wild populations of the species involved. If you have any information that could support this finding (e.g., how the funds from license/trophy fees will be spent, what portion of the hunting fee will support conservation), please submit such information on a separate page with your application.

CERTIFICATION STATEMENT (original signature must be provided for either 6 or 7 below)

6. **If you are a broker or taxidermist applying on behalf of a foreign national,** provide documentation to show you have a **Power of Attorney** to act on your client's behalf and sign the following statement.

   I acknowledge that the sport-hunted trophy/trophies to be imported has been/will be personally hunted by my client and is being imported only for my client's personal use (i.e., **not for sale, transfer, donation, or exchange that is reasonably likely to result in economic use, gain, or benefit**). I understand that my client may only import two leopard trophies in one calendar year. I understand that my client may only import two African elephant trophies in one calendar year. In addition, I have advised my client that raw ivory, once imported into the United States, cannot be re-exported.

   Taxidermist/Broker's signature:_____ Date: _____

7. **If you are the hunter applying to import your own trophy**, please read and sign the following statement.

I acknowledge that the sport-hunted trophy/trophies to be imported has been/will be personally hunted by me and is being imported only for my personal use (i.e., **not for sale, transfer, donation, or exchange that is reasonably likely to result in economic use, gain, or benefit**). I understand that I may only import two leopard trophies in one calendar year. I understand that I may only import two African elephant trophies in one calendar year. In addition, I understand that raw ivory, once imported into the United States, cannot be re-exported.

Applicant's signature: _____ Date: 01-18-2018

Be aware that there may be additional permitting or approval requirements by your local or state governments, as well as required by other Federal agencies or foreign government to conduct your propose activity. While the Service will attempt to assist where possible, it is your responsibility to obtain such approval.

8. All international shipment(s) must be through a designated port. A list of designated ports (where an inspector is posted) is available from http://www.fws.gov/le/designated-ports.html. If you wish to use a port not listed, please contact the Office of Law Enforcement for a Designated Port Exemption Permit (form 3-200-2).

9. Name and address where you wish the permit to be mailed, **if** different from page 1 (All permits will be mailed via the U.S. Postal Service, unless you identify an alternative means below):

10. If you wish the permit to be delivered by means other than USPS regular mail, provide an air bill, pre-paid envelope, or billing information. If you do not have a pre-paid envelope or air bill and wish to pay for a courier service with your credit card, please check the box below. Please DO NOT include credit card number or other information; you will be contacted for this information.

☐ If a permit is issued, please send it via a courier service to the address on page 1 or question 9. I understand that you will contact me for my credit card information once the application has been processed.

11. Who should we contact if we have questions about the application? (Include name, phone number, and email):

12. **Disqualification Factor**. A conviction, or entry of a plea of guilty or nolo contendere, for a felony violation of the Lacey Act, the Migratory Bird Treaty Act, or the Bald and Golden Eagle Protection Act disqualifies any such person from receiving or exercising the privileges of a permit, unless such disqualification has been expressly waived by the Service Director in response to a written petition. (50 CFR 13.21(c)) Have you or any of the owners of the business, if applying as a business, been convicted, or entered a plea of guilty or nolo contendere, forfeited collateral, or are currently under charges for any violations of the laws mentioned above?

☐ Yes ☑ No If you answered "Yes" provide: a) the individual's name, b) date of charge, c) charge(s), d) location of incident, e) court, and f) action taken for each violation.

RE: Namibia Africa Elephant Hunt September 19, 2017

Nick Nolte Hunting was contacted by the Namibia Ministry Of Environment and Tourism on or about September 17, 2017 to help in the removal of a problem/rogue bull elephant in the Otjimbojo/Uhungu (see attached Permit To Hunt For Trophies) area of Namibia, Africa. The Namibia Ministry Of Environment and Tourism stated that the Elephant was responsible for the deaths of two people and destroying approximately 20 huts in a village. The Namibia Ministry Of Environment and Tourism was seeking a hunter to pay to hunt the Elephant and the funds they were seeking would go to help the victims and their family's. The Namibia Ministry Of Environment and Tourism stated that if no paying hunter could be found the Elephant would be killed within 2-3 days time. The meat from the Elephant would go to the people of the village once it was dead.

Thank you.

David Johnson

Import of Sport-hunted Trophies of Southern African Leopard, African Elephant, and Namibian Southern White Rhinoceros

Complete Sections A or B, and C, D, and E of this application. U.S. address may be required in Section C, see instructions for details.
See attached instruction pages for information on how to make your application complete and help avoid unnecessary delays.

A. Complete if applying as an individual

1.a. Last name	1.b. First name	1.c. Middle name or initial	1.d. Suffix
DE NATALE	Ralph	(b) (6)	

2. Date of birth (mm/dd/yyyy)	3. Social Security No.	4. Occupation	5. Affiliation/ Doing business as (see instructions)
(b) (6)			

6.a. Telephone number	6.b. Alternate telephone number	6.c. Fax number	6.d. E-mail address
(b) (6)			

B. Complete if applying on behalf of a business, corporation, public agency, Tribe, or institution

1.a. Name of business, agency, Tribe, or institution	1.b. Doing business as (dba)

2. Tax identification no.	3. Description of business, agency, Tribe, or institution

4.a. Principal officer Last name	4.b. Principal officer First name	4.c. Principal officer Middle name/ initial	4.d. Suffix

5. Principal officer title	6. Primary contact name

7.a. Business telephone number	7.b. Alternate telephone number	7.c. Business fax number	7.d. Business e-mail address

C. All applicants complete address information

1.a. Physical address (Street address; Apartment #, Suite #, or Room #; no P.O. Boxes)
(b) (6)

1.b. City	1.c. State	1.d. Zip code/Postal code:	1.e. County/Province	1.f. Country
Woodbridge	CT	(b) (6)		USA

2.a. Mailing Address (include if different than physical address; include name of contact person if applicable)

2.b. City	2.c. State	2.d. Zip code/Postal code:	2.e. County/Province	2.f. Country

D. All applicants MUST complete

1. Attach check or money order payable to the U.S. FISH AND WILDLIFE SERVICE **in the amount of $100, nonrefundable processing fee.** Federal, Tribal, State, and local government agencies, and those acting on behalf of such agencies, are exempt from the processing fee – ***attach documentation of fee exempt status as outlined in instructions.*** (50 CFR 13.11(d))

2. Do you currently have or have you ever had any Federal Fish and Wildlife permits?
Yes ☐ If yes, list the number of the most current permit you have held or that you are applying to renew/re-issue: _____ No ☒

3. Certification: I hereby certify that I have read and am familiar with the regulations contained in ***Title 50, Part 13 of the Code of Federal Regulations*** and the other ***applicable parts in subchapter B of Chapter I of Title 50***, and I certify that the information submitted in this application for a permit is complete and accurate to the best of my knowledge and belief. I understand that any false statement herein may subject me to the criminal penalties of 18 U.S.C. 1001.

E. IMPORT OF SPORT-HUNTED TROPHIES OF SOUTHERN AFRICAN LEOPARD, AFRICAN ELEPHANT, AND SOUTHERN WHITE RHINOCEROS

Below is the details of Save Valley etc
Address is P.O. Box CH381 Chispite Harare
Area hunted Save Valley Conservancy
Area:Nyika Region: Masvingo
Ranch Matendere and Mapari
Nearest City Masvingo
Co ordinates 20.516985 32.096167

ies that you did not use, please **return the unused original**
ecause you have taken a trophy, but were unable to import it
ewal form (3-200-52;
nber/index.html) and return your original permit with that

Note 2: The U.S. FWS has determined that a trophy consists of raw or tanned parts of a specimen taken by a hunter during a sport hunt for personal use. It may include the bones, claws, hair, head, hide, hooves, horns, meat, skull, teeth, tusks, or any taxidermied part, including, but not limited to, a rug or taxidermied head, shoulder, or full mount. It does not include articles made from a trophy, such as worked, manufactured, or handicraft items for use as clothing, curios, ornamentation, jewelry, or other utilitarian items. If you wish to import such products, please contact the Division of Management Authority for the proper application form.

Note 3: Certain hunting trophies, including leopard, elephant, and rhinoceros hunting trophies, are subject to restrictions on their use after import into the United States. Please see 50 CFR 23.55 for more information or contact the Division of Management Authority.

Please provide the following information. Complete all questions on the application. Mark questions that are not applicable with "N/A". If applying for more than one trophy, be sure to answer questions 2 and 3 for each trophy. If importing trophies from more than one country, you must submit a separate application for each shipment in order to obtain separate import permits.

1. ENTER the quantity next to the name of the species you are applying to import (you may apply to import specimens of more than one species provided they have been/are being hunted in the same country):

Leopard (*Panthera pardus*) Quantity: _____ (Limited to the import of two per calendar year)

African elephant (*Loxodonta africana*) Quantity: 1 (Import permit is not required for trophies harvested in Botswana, Namibia, South Africa, or Zimbabwe). **Note: once imported, ivory cannot be re-exported.**

Southern white rhinoceros (*Ceratotherium simum simum*) from Namibia Quantity: _____ (An import permit is not required for trophies harvested in South Africa or Swaziland. If you are looking to import from a different country, please use form 3-200-37).

2. **IF ANIMAL IS CURRENTLY LIVING IN THE WILD,** please enter the following:
   a. Country and place (area, region, GIS coordinates, ranch AND nearest city) where wildlife is to be taken from the wild: SAVE VALLEY CONSERVANCY, P.O. BOX CH381 CHISPITE HARARE, ZIMBABWE AREA: NYIKA REGION: MASVINGO RANCH: MATENDERE AND MAPARI NEAREST CITY: MASVINGO, COORDINATES 20.516985 & 32.096167
   b. Date wildlife is to be hunted: 06/25/2018 – 07/14/2018
   c. Description of the trophy and parts you intend to import (e.g., skin, skull, shoulder mount, life size mount, claws, horns, tusks).
      SKIN, SKULL, TUSKS, FEET
3. **IF THE ANIMAL IS DEAD,** please enter the following:
   a. Country and place (area, region, GIS coordinates, ranch, and/or AND nearest city) where trophy was removed from the wild:
   b. Date wildlife was hunted:

c. Description of the trophy and parts you intend to import (e.g., skin, skull, shoulder mount, life size mount, claws, horn, tusks):

d. The current location of the trophy (address and country) [the U.S. import permit will identify this country as the country of export/re-export and must match with the export/re-export document]:

4. Complete name and address of overseas person or business shipping the trophy to you. If you are applying to import a trophy directly from Namibia, you **must** provide the name and address of the professional hunter listed on your Namibian hunting permit [this name will appear on the face of the export permit].

Name: GAVIN ROURKE PROFESSIONAL HUNTER LICENSE 318
Business Name: SAFARI SERVICES AFRICA LLC
Address: 6 MILLAR ROAD,
Address:
City: BORROWDALE HARARE
State/Province:
Country, Postal Code: ZIMBABWE

5. Please be aware that the U.S. Fish and Wildlife Service may need to make a finding that your activities will enhance or benefit wild populations of the species involved. If you have any information that could support this finding (e.g., how the funds from license/trophy fees will be spent, what portion of the hunting fee will support conservation), please submit such information on a separate page with your application.

CERTIFICATION STATEMENT (original signature must be provided for either 6 or 7 below)

6. **If you are a broker or taxidermist applying on behalf of a foreign national,** provide documentation to show you have a **Power of Attorney** to act on your client's behalf and sign the following statement.

I acknowledge that the sport-hunted trophy/trophies to be imported has been/will be personally hunted by my client and is being imported only for my client's personal use (i.e., **not for sale, transfer, donation, or exchange that is reasonably likely to result in economic use, gain, or benefit**). I understand that my client may only import two leopard trophies in one calendar year (if applicable). In addition, I have advised my client that raw ivory, once imported into the United States, cannot be re-exported.

Taxidermist/Broker's signature: _____ Date: _____

7. **If you are the hunter applying to import your own trophy**, please read and sign the following statement.

I acknowledge that the sport-hunted trophy/trophies to be imported has been/will be personally hunted by me and is being imported only for my personal use (i.e., **not for sale, transfer, donation, or exchange that is reasonably likely to result in economic use, gain, or benefit**). I understand that I may only import two leopard trophies in one calendar year (if applicable). In addition, I understand that raw ivory, once imported into the United States, cannot be re-exported.

Applicant's signature: Adolph (b)(6) De Natale Date: 01/28/2018

Be aware that there may be additional permitting or approval requirements by your local or state governments, as well as required by other Federal agencies or foreign government to conduct your propose activity. While the Service will attempt to assist where possible, it is your responsibility to obtain such approval.

8. All international shipment(s) must be through a designated port. A list of designated ports (where an inspector is posted) is available from http://www.fws.gov/le/designated-ports.html. If you wish to use a port not listed, please contact the Office of Law Enforcement for a Designated Port Exemption Permit (form 3-200-2).

NEW York, NEW York

9. Name and address where you wish the permit to be mailed, if different from page 1 (All permits will be mailed via the U.S. Postal Service, unless you identify an alternative means below):

10. If you wish the permit to be delivered by means other than USPS regular mail, provide an air bill, pre-paid envelope, or billing information. If you do not have a pre-paid envelope or air bill and wish to pay for a courier service with your credit card, please check the box below. Please DO NOT include credit card number or other information; you will be contacted for this information.

☐ If a permit is issued, please send it via a courier service to the address on page 1 or question 9. I understand that you will contact me for my credit card information once the application has been processed.

11. Who should we contact if we have questions about the application? (Include name, phone number, and email):

Ralph (b) (6) DE NATALE (b) (6) [redacted]

email: (b) (6) [redacted]

12. **Disqualification Factor.** A conviction, or entry of a plea of guilty or nolo contendere, for a felony violation of the Lacey Act, the Migratory Bird Treaty Act, or the Bald and Golden Eagle Protection Act disqualifies any such person from receiving or exercising the privileges of a permit, unless such disqualification has been expressly waived by the Service Director in response to a written petition. (50 CFR 13.21(c)) Have you or any of the owners of the business, if applying as a business, been convicted, or entered a plea of guilty or nolo contendere, forfeited collateral, or are currently under charges for any violations of the laws mentioned above?

☐ Yes ☒ No If you answered "Yes" provide: a) the individual's name, b) date of charge, c) charge(s), d) location of incident, e) court, and f) action taken for each violation.

E. IMPORT OF SPORT-HUNTED TROPHIES *(Appendix I of CITES* and/or *ESA)*

Note 1: If you hold an import permit for trophy/trophies that you did not use, please **return the unused original permit**. If you are requesting reissuance of a permit because you have taken a trophy, but are unable to import it prior to the expiration of the permit, please use the renewal form (3-200-52; http://www.fws.gov/international/permits/by-form-number/index.html) and return your original permit with that form.

Note 2: Applications for species listed as endangered under the U.S. Endangered Species Act are published in the Federal Register for a 30-day public comment period. Please allow at least **90 days** for the application to be processed.

Note 3: USFWS has determined that a trophy consists of raw or tanned parts of a specimen taken by a hunter during sport hunt for personal use. It may include the bones, claws, hair, head, hide, hooves, horns, meat, skull, teeth, tusks, or any taxidermied part, including, but not limited to, a rug or taxidermied head, shoulder, or full mount. It does not include articles made from a trophy, such as worked, manufactured, or handicraft items for use as clothing, curios, ornamentation, jewelry, or other utilitarian items. If you wish to import such products, please contact the Division of Management Authority for the proper application form.

Note 4: Certain hunting trophies, including leopard, elephant, and rhinoceros hunting trophies, are subject to restrictions on their use after import into the United States. Please see 50 CFR 23.55 for more information or contact the Division of Management Authority.

Please provide the following information. Complete all questions on the application. Mark questions that are not applicable with "N/A". If needed, use a separate sheet of paper. On all attachments or separate sheets you are submitting; please indicate the application question number you are addressing. If applying for more than one trophy, be sure to answer questions 1-5 for each trophy addressed in this application. If importing trophies from more than one country, you must submit a separate application for each shipment in order to obtain separate import permits.

1. For each trophy to be imported, provide:
   a. Scientific name (genus, species, and, if applicable, subspecies) and common name.
   - Panthera Pardus Pardus, African Leopard
   - Loxodonta Africana African Elephant
   b. Sex (if known).
   - Male - African Leopard
   - Male - African Elephant
2. **IF ANIMAL IS CURRENTLY LIVING IN THE WILD,** please enter the following:
   a. Country and PLACE (area, region, GIS coordinates, ranch AND nearest city) where wildlife is to be taken from the wild:

      N/A

   b. Date wildlife is to be hunted:

      N/A

   c. Description of the trophy and parts you intend to import (e.g., skin, skull, shoulder mount, life size mount, claws, horn, tusks).

      N/A

3. **IF THE ANIMAL IS DEAD,** please enter the following:
   a. Country and PLACE (area, region, GIS coordinates, ranch AND nearest city) where wildlife was removed from the wild (provide a map if possible):

Leopard - Zimbabwe, Matetsi Unit 3 - Nearest City Victoria Falls
Elephant - Zimbabwe, Matetsi Unit 3 - Nearest City Victoria Falls

   b. Date wildlife was hunted:

      6-29-2016 - Elephant
      7-4-2016 - Leopard

c. Description of the trophy and parts you intend to import (e.g., skin, skull, shoulder mount, life size mount, claws, horn, tusks).
Elephant - Tusks, Skin, Ears, Feet, Tail, Trunk
Leopard - Life size mount

d. The current location of the trophy (address and country) [the U.S. import permit will identify this country as the country of export/re-export and must match with the export/re-export documents]:
47 Goud St. Laboria
Polokwane, Limpopo Province, RSouth Africa 0704

4. Complete name and address of overseas person or business shipping the trophy to you. If you are applying to import a trophy directly from Namibia, you must provide the name and address of the professional hunter listed on your Namibian hunting permit [this name will also appear on your Namibian export permit and must match the U.S. import permit].

Name: David Alexander Hadden
Business Name: Safari Taxidermy
Address: 47 Goud Street Laboria
Address:
City: Polokwane
State/Province: Limpopo Province
Country, Postal Code: RSA 0704

5. Please be aware that the U.S. Fish and Wildlife Service must make a finding that your activities will enhance or benefit wild populations of the species involved. If you have any information that could support this finding (e.g., population status or trend data; how the funds from license/trophy fees will be spent; what portion of the hunting fee will support conservation), please submit such information on a separate page with your application.

CERTIFICATION STATEMENT (original signature must be provided for either 6 or 7 below)

6. **If you are a broker or taxidermist applying on behalf of a foreign national,** provide documentation to show you have a **Power of Attorney** to act on your client's behalf and sign the following statement.

I acknowledge that the sport-hunted trophy/trophies to be imported has been/will be personally hunted by my client and is being imported only for my client's personal use (i.e., **not for sale, transfer, donation, or exchange that is reasonably likely to result in economic use, gain, or benefit**). I understand that my client may only import two leopard trophies in one calendar year (if applicable). In addition, I have advised my client that raw ivory, once imported into the United States, cannot be re-exported.

Taxidermist/Broker's signature: _____ Date: _____

7. **If you are the hunter applying to import your own trophy**, please read and sign the following statement.

I acknowledge that the sport-hunted trophy/trophies to be imported has been/will be personally hunted by me and is being imported only for my personal use (i.e., **not for sale, transfer, donation, or exchange that is reasonably likely to result in economic use, gain, or benefit**). I understand that I may only import two leopard trophies in one calendar year (if applicable). In addition, I understand that raw ivory, once imported into the United States, cannot be re-exported.

Applicant's signature: David Hadden Date: 1-19-2018

Be aware that there may be additional permitting or approval requirements by your local or state government, as well as required by other Federal agencies or foreign government to conduct your propose activity. While the Service will attempt to assist you, it is your responsibility to obtain such approval.

8. All international shipment(s) must be through a designated port. A list of designated ports (where an inspector is posted) is available from http://www.fws.gov/le/designated-ports.html. If you wish to use a port not listed, please contact the Office of Law Enforcement for a Designated Port Exemption Permit (form 3-200-2). Houston, TX

9. Name and address where you wish permit mailed, if different from page 1 (All permits will be mailed via the U.S. Postal Service, unless you identify an alternative means below):

N/A

10. If you wish the permit to be delivered by means other than USPS regular mail, provide an air bill, pre-paid envelope, or billing information. If you do not have a pre-paid envelope or air bill and wish to pay for a courier service with your credit card, please check the box below. Please DO NOT include credit card number or other information; you will be contacted for this information.

☐ If a permit is issued, please send it via a courier service to the address on page 1 or question 9. I understand that you will contact me for my credit card information once the application has been processed.

N/A

11. Who should we contact if we have questions about the application? (Include name, phone number, and email):

David Hadden, (b) (6) [redacted]

12. **Disqualification Factor**. A conviction, or entry of a plea of guilty or nolo contendere, for a felony violation of the Lacey Act, the Migratory Bird Treaty Act, or the Bald and Golden Eagle Protection Act disqualifies any such person from receiving or exercising the privileges of a permit, unless such disqualification has been expressly waived by the Service Director in response to a written petition. (50 CFR 13.21(c)) Have you or any of the owners of the business, if applying as a business, been convicted, or entered a plea of guilty or nolo contendere, forfeited collateral, or are currently under charges for any violations of the laws mentioned above?

☐ Yes ☑ No If you answered "Yes" provide: a) the individual's name, b) date of charge, c) charge(s), d) location of incident, e) court, and f) action taken for each violation.

Import of Sport-hunted Trophies of
Southern African Leopard, African Elephant, and
Namibian Southern White Rhinoceros

Complete Sections A or B, and C, D, and E of this application. U.S. address may be required in Section C, see instructions for details.
See attached instruction pages for information on how to make your application complete and help avoid unnecessary delays.

A. Complete if applying as an individual

1.a. Last name	1.b. First name	1.c. Middle name or initial	1.d. Suffix
DOUGLAS	LLOYD	(b) (6)	

2. Date of birth (mm/dd/yyyy)	3. Occupation	4. Affiliation/ Doing business as (see instructions)
(b) (6)		

5.a. Telephone number	5.b. Alternate telephone number	5.c. Fax number	5.d. E-mail address
(b) (6)			

B. Complete if applying on behalf of a business, corporation, public agency, Tribe, or institution

1.a. Name of business, agency, Tribe, or institution	1.b. Doing business as (dba)
N/A	

2. Tax identification no.	3. Description of business, agency, Tribe, or institution

4.a. Principal officer Last name	4.b. Principal officer First name	4.c. Principal officer Middle name/ initial	4.d. Suffix

5. Principal officer title	6. Primary contact name

7.a. Business telephone number	7.b. Alternate telephone number	7.c. Business fax number	7.d. Business e-mail address

C. All applicants complete address information

1.a. Physical address (Street address, Apartment #, Suite #, or Room #, no P.O. Boxes)
(b) (6)

1.b. City	1.c. State	1.d. Zip code/Postal code	1.e. County/Province	1.f. Country
ALEDO	TX	(b) (6)		USA

2.a. Mailing Address (include if different than physical address; include name of contact person if applicable)
(b) (6)

2.b. City	2.c. State	2.d. Zip code/Postal code	2.e. County/Province	2.f. Country
ALEDO	TX	(b) (6)		USA

D. All applicants MUST complete

1. Attach check or money order payable to the U.S. FISH AND WILDLIFE SERVICE **in the amount of $100, nonrefundable processing fee**. Federal, Tribal, State, and local government agencies, and those acting on behalf of such agencies, are exempt from the processing fee – ***attach documentation of fee exempt status as outlined in instructions.*** (50 CFR 13.11(d))

2. Do you currently have or have you ever had any Federal Fish and Wildlife permits?
Yes ☑ If yes, list the number of the most current permit you have held or that you are applying to renew/re-issue MA12428C-0 No ☐

3. Certification: I hereby certify that I have read and am familiar with the regulations contained in ***Title 50, Part 13 of the Code of Federal Regulations*** and the other ***applicable parts in subchapter B of Chapter I of Title 50***, and I certify that the information submitted in this application for a permit is complete and accurate to the best of my knowledge and belief. I understand that any false statement herein may subject me to the criminal penalties of 18 U.S.C. 1001.

Signature of applicant/person responsible for permit (No photocopied or stamped signatures) — Date of signature (mm/dd/yyyy): 02/09/2018

E. IMPORT OF SPORT-HUNTED TROPHIES OF SOUTHERN AFRICAN LEOPARD, AFRICAN ELEPHANT, AND NAMIBIAN SOUTHERN WHITE RHINOCEROS

Note 1: If you hold an import permit for a trophy/trophies that you did not use, please **return the unused original permit**. If you are requesting reissuance of a permit because you have taken a trophy, but were unable to import it prior to the expiration of the permit, please use the renewal form (3-200-52; http://www.fws.gov/international/permits/by-form-number/index.html) and return your original permit with that form.

Note 2: *Sport-hunted trophy* is defined at 50 CFR 23.74 as follows: *Sport-hunted trophy* means a whole dead animal or a readily recognizable part or derivative of an animal specifically identified on the accompanying CITES document that meets the following criteria:

(1) Is raw, processed, or manufactured;
(2) Was legally obtained by the hunter through hunting for his or her personal use;
(3) Is being imported, exported, or re-exported by or on behalf of the hunter as part of the transfer from its country of origin ultimately to the hunter's country of usual residence; and
(4) Includes worked, manufactured, or handicraft items made from the sport-hunted animal only when:
  (i) Such items are contained in the same shipment as raw or tanned parts of the sport-hunted animal and are for the personal use of the hunter;
  (ii) The quantity of such items is no more than could reasonably be expected given the number of animals taken by the hunter as shown on the license or other documentation of the authorized hunt accompanying the shipment; and
  (iii) The accompanying CITES documents (export document and, if appropriate, import permit) contain a complete itemization and description of all items included in the shipment.

Note 3: Certain hunting trophies, including leopard, elephant, and rhinoceros hunting trophies, are subject to restrictions on their use after import into the United States. Please see 50 CFR 23.55 for more information or contact the Division of Management Authority.

Please provide the following information. Complete all questions on the application. Mark questions that are not applicable with "N/A". If applying for more than one trophy, be sure to answer questions 2 and 3 for each trophy.

If importing trophies from more than one country, you must submit a separate application for each shipment in order to obtain separate import permits.

1. ENTER the quantity next to the name of the species you are applying to import (you may apply to import specimens of more than one species provided they have been/are being hunted in the same country):

Leopard (*Panthera pardus*) Quantity:_____(Import is limited to two per hunter per calendar year)

African elephant (*Loxodonta africana*) Quantity:__1__(Import is limited to two per hunter per calendar year)
Note: once imported, ivory cannot be re-exported.

Southern white rhinoceros (*Ceratotherium simum simum*) from Namibia Quantity:_____ (An import permit is not required for trophies harvested in South Africa or Swaziland. If you wish to import from a different country, please use form 3-200-37).

2. **IF ANIMAL IS CURRENTLY LIVING IN THE WILD,** please enter the following:
   a. Country and place (area, region, GIS coordinates, ranch AND nearest city) where wildlife is to be taken from the wild:

   b. Date wildlife is to be hunted:

c. Description of the trophy and parts you intend to import (e.g., skin, skull, shoulder mount, life size mount, claws, horns, tusks).

3. **IF THE ANIMAL IS DEAD**, please enter the following:
   a. Country and place (area, region, GIS coordinates, ranch, and/or AND nearest city) where trophy was removed from the wild:

   b. Date wildlife was hunted: Namibia, Concession Area Baleyrwa, GPS Coorinates -18.2912270 23.6067500 21 September 2017

   c. Description of the trophy and parts you intend to import (e.g., skin, skull, shoulder mount, life size mount, claws, horn, tusks):

   2 x tusks, 4 x feet, skull, 2 x ears, 6 x panels, 2 x femur bones, trunk, tail, 2x eye panels, penis.

   d. The current location of the trophy (address and country) [the U.S. import permit will identify this country as the country of export/re-export and must match with the export/re-export document]:

   Trophaendienste CC, Plot 65/16, Kappsfarm, Windhoek, Namibia

4. Complete name and address of overseas person or business shipping the trophy to you. If you are applying to import a trophy directly from Namibia, you **must** provide the name and address of the professional hunter listed on your Namibian hunting permit [this name will appear on the face of the export permit].

Name: Business	Trophaendienste CC;
Name: Address:	Louw Nel; Telephone +264 232 236
Address:	Plot 65/16
City:	Kappsfarm
State/Province:	PO Box 21068
Country, Postal Code:	Windhoek Namibia

5. Please be aware that the U.S. Fish and Wildlife Service may need to make a finding that your activities will enhance or benefit wild populations of the species involved. If you have any information that could support this finding (e.g., how the funds from license/trophy fees will be spent, what portion of the hunting fee will support conservation), please submit such information on a separate page with your application.

Please see current enhancement finding for Namibia.

CERTIFICATION STATEMENT (original signature must be provided for either 6 or 7 below)

6. **If you are a broker or taxidermist applying on behalf of a foreign national,** provide documentation to show you have a **Power of Attorney** to act on your client's behalf and sign the following statement.

   I acknowledge that the sport-hunted trophy/trophies to be imported has been/will be personally hunted by my client and is being imported only for my client's personal use (i.e., **not for sale, transfer, donation, or exchange that is reasonably likely to result in economic use, gain, or benefit**). I understand that my client may only import two leopard trophies in one calendar year. I understand that my client may only import two African elephant trophies in one calendar year. In addition, I have advised my client that raw ivory, once imported into the United States, cannot be re-exported.

   Taxidermist/Broker's signature: N/A _____ Date: _____

7. **If you are the hunter applying to import your own trophy**, please read and sign the following statement.

I acknowledge that the sport-hunted trophy/trophies to be imported has been/will be personally hunted by me and is being imported only for my personal use (i.e., **not for sale, transfer, donation, or exchange that is reasonably likely to result in economic use, gain, or benefit**). I understand that I may only import two leopard trophies in one calendar year. I understand that I may only import two African elephant trophies in one calendar year. In addition, I understand that raw ivory, once imported into the United States, cannot be re-exported.

Applicant's signature: _____ Date: 2/9/2018

Be aware that there may be additional permitting or approval requirements by your local or state governments, as well as required by other Federal agencies or foreign government to conduct your propose activity. While the Service will attempt to assist where possible, it is your responsibility to obtain such approval.

8. All international shipment(s) must be through a designated port. A list of designated ports (where an inspector is posted) is available from http://www.fws.gov/le/designated-ports.html. If you wish to use a port not listed, please contact the Office of Law Enforcement for a Designated Port Exemption Permit (form 3-200-2).

9. Name and address where you wish the permit to be mailed, if different from page 1 (All permits will be mailed via the U.S. Postal Service, unless you identify an alternative means below):

10. If you wish the permit to be delivered by means other than USPS regular mail, provide an air bill, pre-paid envelope, or billing information. If you do not have a pre-paid envelope or air bill and wish to pay for a courier service with your credit card, please check the box below. Please DO NOT include credit card number or other information; you will be contacted for this information.

☐ If a permit is issued, please send it via a courier service to the address on page 1 or question 9. I understand that you will contact me for my credit card information once the application has been processed.

11. Who should we contact if we have questions about the application? (Include name, phone number, and email):

Conservation Force, 504-837-1233, cf@conservationforce.org ---------and---------
Lorna Hamblin (b) (6) [redacted]

12. **Disqualification Factor**. A conviction, or entry of a plea of guilty or nolo contendere, for a felony violation of the Lacey Act, the Migratory Bird Treaty Act, or the Bald and Golden Eagle Protection Act disqualifies any such person from receiving or exercising the privileges of a permit, unless such disqualification has been expressly waived by the Service Director in response to a written petition. RE: Elephant Import Permit

To Whom it Concerns,

My name William (b) (6) Perry, shortly after I heard of the President of the United States signing a bill to legally import elephants from Zimbabwe I booked a hunt. I did harvest a mature elephant shortly before Christmas 2017. It was a very joyous and happy occasion for the village that the elephant was taken by and for myself.

Several hundred people from the village showed up when the elephant was being butchered. 141 families in the village benefited from the meat from the elephant.

There was a financial benefit from the cost of the hunt that was distributed to the people in the village as well.

Your consideration for this permit would be greatly appreciated.

Sincerely,

William (b) (6) Perry

E. IMPORT OF SPORT-HUNTED TROPHIES OF SOUTHERN AFRICAN LEOPARD AND NAMIBIAN SOUTHERN WHITE RHINOCEROS

Note 1: If you hold an import permit for trophy/trophies that you did not use, please **return the unused original permit to the address on page one.**

Note 2: If you are requesting reissuance of a permit because you have taken a trophy, but were unable to import it prior to the expiration of the permit, please use the renewal form (3-200-52) and return your original permit with that form.

Note 3: *Sport-hunted trophy* is defined at 50 CFR 23.74 as follows: *Sport-hunted trophy* means a whole dead animal or a readily recognizable part or derivative of an animal specifically identified on the accompanying CITES document that meets the following criteria:

- Is raw, processed, or manufactured;
- Was legally obtained by the hunter through hunting for his or her personal use;
- Is being imported, exported, or re-exported by or on behalf of the hunter as part of the transfer from its country of origin ultimately to the hunter's country of usual residence; and
- Includes worked, manufactured, or handicraft items made from the sport-hunted animal only when:
  - i. Such items are contained in the same shipment as raw or tanned parts of the sport-hunted animal and are for the personal use of the hunter;
  - ii. The quantity of such items is no more than could reasonably be expected given the number of animals taken by the hunter as shown on the license or other documentation of the authorized hunt accompanying the shipment; and
  - iii. The accompanying CITES documents (export document and, if appropriate, import permit) contain a complete itemization and description of all items included in the shipment.

Note 4: Certain hunting trophies, including leopard and rhinoceros hunting trophies, are subject to restrictions on their use after import into the United States. Please see 50 CFR 23.55 for more information or contact the Division of Management Authority.

- **Complete all questions on the application.**
- **Mark questions that are not applicable with "N/A".**
- **If applying for more than one trophy, be sure to answer questions 2 and 3 for each trophy.**
- **If importing trophies from more than one country, you must submit a separate application for each shipment in order to obtain separate import permits.**

1. Name and address where you wish the permit to be mailed, if different from page 1. If you would like expedited shipping, please enclose a self-addressed, pre-paid, computer-generated, courier service airway bill. If unspecified, all documents will be mailed via the U.S. Postal Service.

(b) (6) [redacted]

WICHITA, KANSAS (b) (6) [redacted]

ATT: WILLIAM (b) (6) [redacted] PERRY

2. Who should we contact if we have questions about the application (name, phone number, and e-mail)?

WILLIAM (b) (6) [redacted] PERRY

(b) (6) [redacted]

3. Have you or your client (if a broker applying on behalf of your client), been assessed a civil penalty or convicted of any criminal provision of any statute or regulation relating to the activity for which the application is filed; been convicted, or entered a plea of guilty or nolo contendere, for a felony violation of the Lacey Act, the Migratory Bird Treaty Act, or the Bald and Golden Eagle Protection Act; forfeited collateral; OR are currently under charges for any violation of the laws mentioned above?

(No) Yes

If you answered "Yes" to Question 3, provide: a) the individual's name; b) date of charge; c) charge(s); d) location of incident; e) court, and f) action taken for each violation. Please be aware that a "Yes" response does not automatically disqualify you from getting a permit.

4. ENTER the quantity next to the name of the species you are applying to import (you may apply to import specimens of more than one species provided they have been/are being hunted in the same country):

   a. Leopard (*Panthera pardus*) Quantity: ____ (Limited to the import of two per calendar year). If you wish to import a leopard taken in northern or western Africa, please use form 3-200-20.

   b. Southern white rhinoceros (*Ceratotherium simum simum*) from Namibia Quantity: ____ (An import permit is not required for trophies harvested in South Africa or Swaziland. If you are looking to import from a different country, please use Form 3-200-20).

5. **IF ANIMAL IS CURRENTLY LIVING IN THE WILD**, Please enter the following information:

   a. Country and place (area, region, GIS coordinates, ranch, conservancy, management area, or hunting block, AND nearest city) where wildlife is to be taken from the wild:

   b. Date wildlife is to be hunted:

   c. Name of hunting outfitter, safari company, or professional hunter you will be hunting with:

6. **IF THE ANIMAL HAS ALREADY BEEN TAKEN**, please enter the following:

   d. Country and place (area, region, GIS coordinates, ranch, conservancy, management area, or hunting block, AND nearest city) where wildlife is to be taken from the wild:

ZIMBABWE GPS - SE 182526
PROPERTY - MASIKILI VICTORIA FALLS

   e. Date wildlife is to be hunted:

f. Name of hunting outfitter, safari company, or professional hunter you will be hunting with:

g. The current location of the trophy (address and country) [the U.S. import permit will identify this country as the country of export/re-export and must match with the export/re-export document]:

COLLETTS WILDLIFE ARTISTRY
15 JOSIAH CHINAMANO ROAD
BELMONT, BULAWAYO +263 9 885868

7. Please provide a copy of any applicable foreign government permits or licenses that were required to remove this animal from the wild (if you have not hunted yet and do not currently hold any such permits or licenses, please indicate so).

8. Complete name and address of overseas person or business shipping the trophy to you.

   a. If you are applying to import a trophy directly from **Namibia**, you **must** provide the name and address of the professional hunter listed on your Namibian hunting permit [this name will appear on the face of the export permit].

CERTIFICATION STATEMENT (original signature must be provided for either 9 or 10 below)

9. **If you are a broker or taxidermist applying on behalf of a U.S. hunter or foreign national,** provide documentation to show you have a **Power of Attorney** to act on your client's behalf and sign the following statement.

I acknowledge that the sport-hunted trophy/trophies to be imported has been/will be personally hunted by my client and is being imported only for my client's personal use (i.e., **not for sale, transfer, donation, or exchange that is reasonably likely to result in economic use, gain, or benefit**). If applying for the import of a leopard trophy, I understand that my client may only import two leopard trophies in one calendar year.

Taxidermist/Broker's signature: _____ Date: _____

10. **If you are the hunter applying to import your own trophy**, please read and sign the following statement.

I acknowledge that the sport-hunted trophy/trophies to be imported has been/will be personally hunted by me and is being imported only for my personal use (i.e., **not for sale, transfer, donation, or exchange that is reasonably likely to result in economic use, gain, or benefit**). If applying to import a leopard trophy, I understand that I may only import two leopard trophies in one calendar year.

Applicant's signature: William (b) (6) Date: 2/28/18

Be aware that there may be additional permitting or approval requirements by your local or state governments, as well as required by other Federal agencies or foreign government to conduct your propose activity. While the Service will attempt to assist where possible, it is your responsibility to obtain such approval.

11. **All international shipment(s) must be through a designated port. A list of designated ports (where an inspector is posted) is available from the list of designated ports. If you wish to use a port not listed, please contact the Office of Law Enforcement for a Designated Port Exemption Permit (form 3-200-2).**

E. IMPORT OF SPORT-HUNTED TROPHIES OF SOUTHERN AFRICAN LEOPARD, AFRICAN ELEPHANT, AND NAMIBIAN SOUTHERN WHITE RHINOCEROS

Note 1: If you hold an import permit for a trophy/trophies that you did not use, please **return the unused original permit**. If you are requesting reissuance of a permit because you have taken a trophy, but were unable to import it prior to the expiration of the permit, please use the renewal form (3-200-52; http://www.fws.gov/international/permits/by-form-number/index.html) and return your original permit with that form.

Note 2: *Sport-hunted trophy* is defined at 50 CFR 23.74 as follows: *Sport-hunted trophy* means a whole dead animal or a readily recognizable part or derivative of an animal specifically identified on the accompanying CITES document that meets the following criteria:

(1) Is raw, processed, or manufactured;
(2) Was legally obtained by the hunter through hunting for his or her personal use;
(3) Is being imported, exported, or re-exported by or on behalf of the hunter as part of the transfer from its country of origin ultimately to the hunter's country of usual residence; and
(4) Includes worked, manufactured, or handicraft items made from the sport-hunted animal only when:
  (i) Such items are contained in the same shipment as raw or tanned parts of the sport-hunted animal and are for the personal use of the hunter;
  (ii) The quantity of such items is no more than could reasonably be expected given the number of animals taken by the hunter as shown on the license or other documentation of the authorized hunt accompanying the shipment; and
  (iii) The accompanying CITES documents (export document and, if appropriate, import permit) contain a complete itemization and description of all items included in the shipment.

Note 3: Certain hunting trophies, including leopard, elephant, and rhinoceros hunting trophies, are subject to restrictions on their use after import into the United States. Please see 50 CFR 23.55 for more information or contact the Division of Management Authority.

Please provide the following information. Complete all questions on the application. Mark questions that are not applicable with "N/A". If applying for more than one trophy, be sure to answer questions 2 and 3 for each trophy.

If importing trophies from more than one country, you must submit a separate application for each shipment in order to obtain separate import permits.

1. ENTER the quantity next to the name of the species you are applying to import (you may apply to import specimens of more than one species provided they have been/are being hunted in the same country):

Leopard (*Panthera pardus*) Quantity:_____(Import is limited to two per hunter per calendar year)

African elephant (*Loxodonta africana*) Quantity:__1__(Import is limited to two per hunter per calendar year)
Note: once imported, ivory cannot be re-exported.

Southern white rhinoceros (*Ceratotherium simum simum*) from Namibia Quantity:_____ (An import permit is not required for trophies harvested in South Africa or Swaziland. If you wish to import from a different country, please use form 3-200-37).

2. **IF ANIMAL IS CURRENTLY LIVING IN THE WILD**, please enter the following:
   a. Country and place (area, region, GIS coordinates, ranch AND nearest city) where wildlife is to be taken from the wild:

   b. Date wildlife is to be hunted:

E. IMPORT OF SPORT-HUNTED TROPHIES OF SOUTHERN AFRICAN LEOPARD, AFRICAN ELEPHANT, AND NAMIBIAN SOUTHERN WHITE RHINOCEROS

Note 1: If you hold an import permit for a trophy/trophies that you did not use, please **return the unused original permit**. If you are requesting reissuance of a permit because you have taken a trophy, but were unable to import it prior to the expiration of the permit, please use the renewal form (3-200-52; http://www.fws.gov/international/permits/by-form-number/index.html) and return your original permit with that form.

Note 2: *Sport-hunted trophy* is defined at 50 CFR 23.74 as follows: *Sport-hunted trophy* means a whole dead animal or a readily recognizable part or derivative of an animal specifically identified on the accompanying CITES document that meets the following criteria:

(1) Is raw, processed, or manufactured;
(2) Was legally obtained by the hunter through hunting for his or her personal use;
(3) Is being imported, exported, or re-exported by or on behalf of the hunter as part of the transfer from its country of origin ultimately to the hunter's country of usual residence; and
(4) Includes worked, manufactured, or handicraft items made from the sport-hunted animal only when:
(i) Such items are contained in the same shipment as raw or tanned parts of the sport-hunted animal and are for the personal use of the hunter;
(ii) The quantity of such items is no more than could reasonably be expected given the number of animals taken by the hunter as shown on the license or other documentation of the authorized hunt accompanying the shipment; and
(iii) The accompanying CITES documents (export document and, if appropriate, import permit) contain a complete itemization and description of all items included in the shipment.

Note 3: Certain hunting trophies, including leopard, elephant, and rhinoceros hunting trophies, are subject to restrictions on their use after import into the United States. Please see 50 CFR 23.55 for more information or contact the Division of Management Authority.

Please provide the following information. Complete all questions on the application. Mark questions that are not applicable with "N/A". If applying for more than one trophy, be sure to answer questions 2 and 3 for each trophy.

If importing trophies from more than one country, you must submit a separate application for each shipment in order to obtain separate import permits.

1. ENTER the quantity next to the name of the species you are applying to import (you may apply to import specimens of more than one species provided they have been/are being hunted in the same country):

Leopard (*Panthera pardus*) Quantity:_____(Import is limited to two per hunter per calendar year)

African elephant (*Loxodonta africana*) Quantity: 1 (Import is limited to two per hunter per calendar year)
Note: once imported, ivory cannot be re-exported.

Southern white rhinoceros (*Ceratotherium simum simum*) from Namibia Quantity:_____ (An import permit is not required for trophies harvested in South Africa or Swaziland. If you wish to import from a different country, please use form 3-200-37).

2. **IF ANIMAL IS CURRENTLY LIVING IN THE WILD**, please enter the following:
a. Country and place (area, region, GIS coordinates, ranch AND nearest city) where wildlife is to be taken from the wild:

N/A

b. Date wildlife is to be hunted:

c. Description of the trophy and parts you intend to import (e.g., skin, skull, shoulder mount, life size mount, claws, horns, tusks).

3. **IF THE ANIMAL IS DEAD**, please enter the following:
   a. Country and place (area, region, GIS coordinates, ranch, and/or AND nearest city) where trophy was removed from the wild: Klaserie Private Nature Reserve, South Africa

   b. Date wildlife was hunted: August 4, 2018

   c. Description of the trophy and parts you intend to import (e.g., skin, skull, shoulder mount, life size mount, claws, horn, tusks):

   Skull, 2x Skin panels, 4x Feet, 2x Ears, Tail, Trunk, 2x Tusks (ZA/17/2656/16.30MP;ZA/17/2655/14.95MP)

   d. The current location of the trophy (address and country) [the U.S. import permit will identify this country as the country of export/re-export and must match with the export/re-export document]:

   Safari Taxidermy
   47 Goud Street, Laboria, Polokwane, RSA

4. Complete name and address of overseas person or business shipping the trophy to you. If you are applying to import a trophy directly from Namibia, you **must** provide the name and address of the professional hunter listed on your Namibian hunting permit [this name will appear on the face of the export permit].

Name: Business	Safari Taxidermy
Name: Address:	PO Box 235, Ladanna, 0704
Address:	47 Goud Street
City:	Laboria
State/Province:	Polokwane
Country, Postal Code:	RSA

5. Please be aware that the U.S. Fish and Wildlife Service may need to make a finding that your activities will enhance or benefit wild populations of the species involved. If you have any information that could support this finding (e.g., how the funds from license/trophy fees will be spent, what portion of the hunting fee will support conservation), please submit such information on a separate page with your application.

CERTIFICATION STATEMENT (original signature must be provided for either 6 or 7 below)

6. **If you are a broker or taxidermist applying on behalf of a foreign national,** provide documentation to show you have a **Power of Attorney** to act on your client's behalf and sign the following statement.

   I acknowledge that the sport-hunted trophy/trophies to be imported has been/will be personally hunted by my client and is being imported only for my client's personal use (i.e., **not for sale, transfer, donation, or exchange that is reasonably likely to result in economic use, gain, or benefit**). I understand that my client may only import two leopard trophies in one calendar year. I understand that my client may only import two African elephant trophies in one calendar year. In addition, I have advised my client that raw ivory, once imported into the United States, cannot be re-exported.

   Taxidermist/Broker's signature: Atty. In Fact for Ernest P. Bundrant Date: 02/28/2018

7. **If you are the hunter applying to import your own trophy**, please read and sign the following statement.

I acknowledge that the sport-hunted trophy/trophies to be imported has been/will be personally hunted by me and is being imported only for my personal use (i.e., **not for sale, transfer, donation, or exchange that is reasonably likely to result in economic use, gain, or benefit**). I understand that I may only import two leopard trophies in one calendar year. I understand that I may only import two African elephant trophies in one calendar year. In addition, I understand that raw ivory, once imported into the United States, cannot be re-exported.

Applicant's signature:_____ Date: _____

Be aware that there may be additional permitting or approval requirements by your local or state governments, as well as required by other Federal agencies or foreign government to conduct your propose activity. While the Service will attempt to assist where possible, it is your responsibility to obtain such approval.

8. All international shipment(s) must be through a designated port. A list of designated ports (where an inspector is posted) is available from http://www.fws.gov/le/designated-ports.html. If you wish to use a port not listed, please contact the Office of Law Enforcement for a Designated Port Exemption Permit (form 3-200-2).

9. Name and address where you wish the permit to be mailed, **if** different from page 1 (All permits will be mailed via the U.S. Postal Service, unless you identify an alternative means below):

HUNTER INT'L BROKERAGE SERVICES, INC.
5674 Stoneridge Drive, Suite 209
Pleasanton, CA 94588

10. If you wish the permit to be delivered by means other than USPS regular mail, provide an air bill, pre-paid envelope, or billing information. If you do not have a pre-paid envelope or air bill and wish to pay for a courier service with your credit card, please check the box below. Please DO NOT include credit card number or other information; you will be contacted for this information.

☐ If a permit is issued, please send it via a courier service to the address on page 1 or question 9. I understand that you will contact me for my credit card information once the application has been processed.

11. Who should we contact if we have questions about the application? (Include name, phone number, and email):

Vanessa Tabugan
Tel# (925) 417 5270 ext 104 / E-mail: import@b.hunter-international.net

12. **Disqualification Factor**. A conviction, or entry of a plea of guilty or nolo contendere, for a felony violation of the Lacey Act, the Migratory Bird Treaty Act, or the Bald and Golden Eagle Protection Act disqualifies any such person from receiving or exercising the privileges of a permit, unless such disqualification has been expressly waived by the Service Director in response to a written petition. (50 CFR 13.21(c)) Have you or any of the owners of the business, if applying as a business, been convicted, or entered a plea of guilty or nolo contendere, forfeited collateral, or are currently under charges for any violations of the laws mentioned above?

☐ Yes ☑ No If you answered "Yes" provide: a) the individual's name, b) date of charge, c) charge(s), d) location of incident, e) court, and f) action taken for each violation.

(Full legal name of individual)

residing at (b) (6) [redacted] PERALTA NEW MEXICO (b) (6) [redacted]

(Residential or physical mailing address, P.O. Box is not accepted)

hereby constitutes and appoints: **HUNTER INTERNATIONAL BROKERAGE SERVICES, INC., its officers, authorized employees and duly appointed sub-agents** to act for and on its behalf as a true and lawful agent and attorney of the grantor named above for and in the name, place, and stead of said grantor from this date and in all Customs Districts, and in no other name to make, endorse, sign, declare, or swear to any entry, withdrawal, declaration, certificate, bill of lading, carnet or other document required by law or regulation in connection with the importation, transportation, or exportation of any merchandise shipped or consigned by or to said grantor, to perform any act or condition which may be required by law or regulation in connection with such merchandise to receive any merchandise deliverable to said grantor:

To make endorsements on bills of lading conferring authority to transfer title, make entry or collect drawback, and to make sign, declare, or swear to any statement, supplemental statement, schedule, supplemental schedule, certificate of delivery, certificate of manufacture, certificate of manufacture and delivery, abstract of manufacturing records, declaration of proprietor on drawback entry, declaration of exporter on drawback entry, or any other affidavit or document which may be required by law or regulation for drawback purposes, regardless of whether such bill of lading, sworn statement, schedule, certificate, abstract, declaration, or other affidavit or document is intended for filing in any customs district:

To sign, seal and deliver for and as the act of said grantor any bond required by law or regulation in connection with the entry or withdrawal of imported merchandise or merchandise exported with or without benefit of drawback, or in connection with the entry, clearance, lading, unlading or navigation of any vessel or other means of conveyance owned or operated by said grantor, and any and all bonds which may be voluntarily given and accepted under applicable laws and regulations, consignee's and owner's declarations provided for in section 485, Tariff Act of 1930, as amended, or affidavits in connection with the entry of merchandise;

To sign and swear to any document and to perform any act that may be necessary or required by law or regulation in connection with the entering, clearing, lading, unlading, or operation of any vessel or other means of conveyance owned or operated by said grantor;

To authorize other Customs Brokers to act as grantor's agent; to receive, endorse and collect checks issued for Customs duty refunds in grantor's name drawn on the Treasurer of the United States; if the grantor is a nonresident of the United States, to accept service of process on behalf of the grantor;

To waive the requirement of other Customs Brokers transmitting a copy of the customs entry CF7501 and the Customs Broker's bill of services directly to the undersigned grantor in accordance with CF 111.36(a) & (b). Such entry summary and bill will be transmitted through Hunter International Brokerage Services, Inc. It is also understood that the agreement between Hunter International Brokerage Services, Inc. and other Customs Brokers does not forbid or prevent the Customs Broker from having direct contact with the grantor in accordance with CFR 111.36(c)(3).

To generally to transact at the customs houses in any district any and all customs business, including making, signing, and filing of protests under section 514 of the Tariff Act of 1930, in which said grantor is or may be concerned or interested and which may properly be transacted or performed by an agent and attorney, giving to said agent and attorney full power and authority to do anything whatever requisite and necessary to be done in the premises as fully as said grantor could do if present and acting, hereby ratifying and confirming all that the said agent and attorney shall lawfully do by virtue of these presents the forgoing power of attorney to remain in full force until notice of revocation in writing is duly given to and received by a District Director of Customs.

The undersigned grantor of this power of attorney hereby agrees to HUNTER INTERNATIONAL BROKERAGE SERVICES, INC. Terms and Conditions of Service, which are attached hereto and incorporated herein by reference.

IN WITNESS WHEREOF, the said (Print full legal name) ERNEST (b) (6) [redacted] BUNDRANT

has caused these presents to be sealed and signed: (Signature) Ernest (b) (6) [redacted] Bundrant

(Capacity) _____ (Date) FEBRUARY 16 2018

Important note: If you are the importer of record, payment to the broker will not relieve you of liability for Customs charges (duties, taxes or other debts owed Customs) in the event the charges are not paid by the broker. Therefore, if you pay by check, Customs charges may be paid with a separate check payable to the "U.S. Customs Service" which shall be delivered to Customs by the broker. Importers who wish to utilize this procedure must contact our office in advance to arrange timely receipt of duty checks.

NOTICE OF REPRESENTATION

This is a notice to the U.S. Fish and Wildlife Service that I have appointed John J. Jackson, III and Regina Lennox of the non-profit firm Conservation Force as my attorneys and legal representatives for all matters concerning my applications for a permit to import a lawfully hunted _Bull Elephant____ trophy.

This authority is inclusive and extends to all applications and filings, whether administrative or judicial, including but not limited to any request for reconsideration, appeal, and litigation.

I also request that these attorneys, through the address for Conservation Force below, be copied with all correspondence, acknowledgements, notices and decisions concerning my application to import my trophy at the following address:

Conservation Force
3240 S. I-10 Service Road W., Suite 200
Metairie, Louisiana 70001 USA
T: (504) 837-1233
F: (504) 837-1145
E: cf@conservationforce.org

Signed: Dwight Miloff

Name: Dwight MILOFF

Date: 3/8/18

Type of Activity:

IMPORT OF SPORT-HUNTED TROPHIES
(Appendix I of CITES and/or ESA)

Complete Sections A or B, and C, D, and E of this application. U.S. address may be required in Section C, see instructions for details.
See attached instruction pages for information on how to make your application complete and help avoid unnecessary delays.

A. Complete if applying as an individual

1.a. Last name	1.b. First name	1.c. Middle name or initial	1.d. Suffix
Miloff	Dwight	(b) (6)	

2. Date of birth (mm/dd/yyyy)	3. Telephone number	3.a. Alternate telephone number	4. E-mail address
(b) (6)			

B. Complete if applying on behalf of a business, corporation, public agency, Tribe, or institution

1.a. Name of business, agency, Tribe, or institution	1.b. Doing business as (dba)		
2. Tax identification no.	3. Description of business, agency, Tribe, or institution		
4.a. Principal officer Last name	4.b. Principal officer First name	4.c. Principal officer Middle name/ initial	4.d. Suffix
5. Principal officer title	6. Primary contact name		
7.a. Business telephone number	7.b. Alternate telephone number	7.c. Business fax number	7.d. Business e-mail address

C. All applicants complete address information

1.a. Physical address (Street address; Apartment #, Suite #, or Room #; no P.O. Boxes) (If Broker or Taxidermist is applying on behalf of a foreign national, provide Broker or Taxidermist's name and address in this block; U.S. hunters must provide their U.S. address)
(b) (6)

1.b. City	1.c. State	1.d. Zip code/Postal code:	1.e. County/Province	1.f. Country
Billings	Montana	(b) (6)		USA

2.a. Mailing Address (include if different than physical address; include name of contact person if applicable)
Same as above

2.b. City	2.c. State	2.d. Zip code/Postal code:	2.e. County/Province	2.f. Country

D. All applicants MUST complete

1. Attach check or money order payable to the U.S. FISH AND WILDLIFE SERVICE **in the amount of $100, nonrefundable processing fee**. Federal, Tribal, State, and local government agencies, and those acting on behalf of such agencies, are exempt from the processing fee – ***attach documentation of fee exempt status as outlined in instructions.*** (50 CFR 13.11(d))

2. Certification: I hereby certify that I have read and am familiar with the regulations contained in ***Title 50, Part 13 of the Code of Federal Regulations*** and the other ***applicable parts in subchapter B of Chapter I of Title 50***, and I certify that the information submitted in this application for a permit is complete and accurate to the best of my knowledge and belief. I understand that any false statement herein may subject me to the criminal penalties of 18 U.S.C. 1001.

Dwight Miloff — 3/8/18

Signature of applicant/Principal Officer for permit (No photocopied or stamped signatures) — Date of signature (mm/dd/yyyy)

E. IMPORT OF SPORT-HUNTED TROPHIES *(Appendix I of CITES and/or ESA)*

Note 1: This form should be used to request authorization to import trophies of species listed on Appendix I of CITES and/or as threatened or endangered under the ESA (examples include elephants, lions, cheetahs, wood bison, and markhor).

PLEASE USE FORM 3-200-19 FOR SOUTHERN AFRICAN LEOPARD TROPHIES AND SOUTHERN WHITE RHINOCEROS TROPHIES TAKEN IN NAMIBIA.

Note 2: If you hold an import permit for trophy/trophies that you did not use, please **return the unused original permit.** If you are requesting reissuance of a permit because you have taken a trophy, but were unable to import it prior to the expiration of the permit, please use the renewal form (3-200-52) and return your original permit with that form.

Note 3: Applications for species listed as endangered under the U.S. Endangered Species Act are published in the Federal Register for a 30-day public comment period. Please allow at least **90 days** for the application to be processed.

Note 4: *Sport-hunted trophy* is defined at 50 CFR 23.74 as follows: *Sport-hunted trophy* means a whole dead animal or a readily recognizable part or derivative of an animal specifically identified on the accompanying CITES document that meets the following criteria:
(1) Is raw, processed, or manufactured;
(2) Was legally obtained by the hunter through hunting for his or her personal use;
(3) Is being imported, exported, or re-exported by or on behalf of the hunter as part of the transfer from its country of origin ultimately to the hunter's country of usual residence; and
(4) Includes worked, manufactured, or handicraft items made from the sport-hunted animal only when:
(i) Such items are contained in the same shipment as raw or tanned parts of the sport-hunted animal and are for the personal use of the hunter;
(ii) The quantity of such items is no more than could reasonably be expected given the number of animals taken by the hunter as shown on the license or other documentation of the authorized hunt accompanying the shipment; and
(iii)The accompanying CITES documents (export document and, if appropriate, import permit) contain a complete itemization and description of all items included in the shipment.

Note 5: Certain hunting trophies, including elephants, are subject to restrictions on their use after import into the United States. Please see 50 CFR 23.55 for more information or contact the Division of Management Authority.

Please provide the following information. Complete all questions on the application. Mark questions that are not applicable with "N/A". If needed, use a separate sheet of paper. On all attachments or separate sheets you are submitting; please indicate the application question number you are addressing. If applying for more than one trophy, be sure to answer questions 1-6 for each trophy addressed in this application. If importing trophies from more than one country, you must submit a separate application for each shipment in order to obtain separate import permits.

---

1. Name and address where you wish the permit to be mailed, **if different from page 1**. If you would like expedited shipping, please enclose a self-addressed, pre-paid, computer-generated, courier service airway bill. If unspecified, all documents will be mailed via regular mail through the U.S. Postal Service.

   Same Address

2. Who should we contact if we have questions about the application (name, phone number, and e-mail)?

   Dwight Miloff (b) (6) [redacted]

3. Have you or your client (if a broker applying on behalf of your client), been assessed a civil penalty or convicted of any criminal provision of any statute or regulation relating to the activity for which the

application is filed; been convicted, or entered a plea of guilty or nolo contendere, for a felony violation of the Lacey Act, the Migratory Bird Treaty Act, or the Bald and Golden Eagle Protection Act; forfeited collateral; OR are currently under charges for any violation of the laws mentioned above?

No X Yes ____

If you answered "Yes" to Question 3, provide: a) the individual's name; b) date of charge; c) charge(s); d) location of incident; e) court, and f) action taken for each violation. Please be aware that a "Yes" response does not automatically disqualify you from getting a permit.

4. For each trophy to be imported, provide:

   a. Scientific name (genus, species, and, if applicable, subspecies) and common name.

   Loxodonta Africana African Elephant

   b. Sex (if known). Male

5. **IF ANIMAL IS CURRENTLY LIVING IN THE WILD**, please enter the following information:

   a. Country and place (area, region, GIS coordinates, ranch, conservancy, management area, or hunting block, AND nearest city) where wildlife is to be taken from the wild:

   Matetsi Unit 1 in Zimbabwe . Nearest City is Victoria Falls.

   b. Date wildlife is to be hunted: 10/5/2018 thru 10/18/2018

   b. Name of hunting outfitter, safari company, or professional hunter you will be hunting with:

   KLIPKRAAL SAFARI SERVICES & AGENCIES. Gary Hopkins PH.

6. **IF THE TROPHY HAS ALREADY BEEN TAKEN**, please enter the following:

   a. Country and place (area, region, GIS coordinates, ranch, conservancy, management area, or hunting block, AND nearest city) where trophy was removed from the wild:

   b. Date wildlife was hunted:

   b. Name of hunting outfitter, safari company, or professional hunter you hunted with:

   c. The current location of the trophy (address and country) [the U.S. import permit will identify this country as the country of export/re-export and must match with the export/re-export document]:

7. Please provide a copy of any applicable foreign government permits or licenses that were required to remove this animal from the wild (if you have not hunted yet and do not currently hold any such permits or licenses, please indicate so). N/A

8. Complete name and address of overseas person or business shipping the trophy to you. If you are applying to import a trophy directly from Namibia, you **must** provide the name and address of the professional hunter listed on your Namibian hunting permit [this name will appear on the face of the export permit].

Name:
Business Name:
Address: Collette's,15 Josiah Chinamano Road, Bulawayo Zimbabwe.
City:
State/Province:
Country, Postal Code:

9. For species listed under the Endangered Species Act, please be aware that the U.S. Fish and Wildlife Service must make a finding that your activities will enhance or benefit wild populations of the species involved. While we will communicate with the range country for the species you will hunt or hunted when making the required findings, if you have any information that could support this finding, it would be helpful to our review if you could provide it. Please submit such information on a separate page with your application.

   a. Do you have any information regarding the population status or trend data on the species hunted?

   See attached sheet

   b. In order to hunt, you likely paid for licenses or trophy fees. What were those fees and do you have any information on how those funds were used by either the landowner, community, or government?

   See attached sheet

   c. Do you have information on other funding activities that are being carried out, or were carried out, by the safari outfitter, professional hunter, concession holder, or land owner that provide a conservation benefit to the species being hunted/species hunted?

   See attached sheet

CERTIFICATION STATEMENT (original signature must be provided for either 10 or 11 below)

10. **If you are a broker or taxidermist applying on behalf of a U.S. hunter or foreign national,** provide documentation to show you have a **Power of Attorney** to act on your client's behalf and sign the following statement.

    I acknowledge that the sport-hunted trophy/trophies to be imported has been/will be personally hunted by my client and is being imported only for my client's personal use (i.e., **not for sale, transfer, donation, or exchange that is reasonably likely to result in economic use, gain, or benefit**). I understand that my client may only import two leopard trophies and two elephant trophies within the same calendar year (if applicable). In addition, I have advised my client that raw ivory, once imported into the United States, cannot be re-exported.

    Taxidermist/Broker's signature: _____ Date: _____

11. **If you are the hunter applying to import your own trophy**, please read and sign the following statement.

    I acknowledge that the sport-hunted trophy/trophies to be imported has been/will be personally hunted by me and is being imported only for my personal use (i.e., **not for sale, transfer, donation, or exchange that is reasonably likely to result in economic use, gain, or benefit**). I understand that I may only import two leopard trophies and two elephant trophies within the same calendar year. In addition, I understand that raw ivory, once imported into the United States, cannot be re-exported.

    Applicant's signature: Dwight Miloff Date: 3/8/18

    Be aware that there may be additional permitting or approval requirements by your local or state governments, as well as required by other Federal agencies or foreign government to conduct your propose activity. While the Service will attempt to assist where possible, it is your responsibility to obtain such approval.

All international shipment(s) must be imported through a designated port. A list of designated ports (where an inspector is posted) is available from http://www.fws.gov/le/designated-ports.html. If you wish to use a port not listed, please contact the Office of Law Enforcement for a Designated Port Exemption Permit (form 3-200-2).

9. For species listed under the Endangered Species Act, please be aware that the U.S. Fish and Wildlife Service must make a finding that your activities will enhance or benefit wild populations of the species involved. While we will communicate with the range country for the species you will hunt or hunted when making the required findings, if you have any information that could support this finding, it would be helpful to our review if you could provide it. Please submit such information on a separate page with your application.

.

A. Do you have any information regarding the population status or trend data on the species hunted?

The Matetsi Safari Area Elephant populations are basically overflow populations from two major populations being that of the Greater Hwange Areas and Greater Chobe Areas. Counts from both these populations combined is over 50000 Elephants.

B. In order to hunt, you likely paid for licenses or trophy fees. What were those fees and do you have any information on how those funds were used by the landowner, community, or government?

Funds generated from the Safaris directly work for the whole safari operation. Being employment of Professional Hunters, trackers, skinners, cooks, waiters, camp staff etc., plus also providing employment to National Parks employees as well; in the form of Permits Officers Warden, Game Rangers etc. Indirectly helping with economy of the nearest local town (Victoria Falls) with food, general supplies, fuel etc. all being purchased from here, thus again stimulating the country economy by providing jobs etc. Meat that is harvested from the animals taken also used to help feed the people in the Safari area.

C. Do you have information on other funding activities that are being carried out, or were carried out, by the safari outfitter, professional hunter, concession holder, or land owner that provide a conservation benefit to the species being hunted/species hunted?
Rev.

Funding again generated from safaris also are allocated to anti-poaching activities that not only benefit elephant (although Elephant are always a priority) but other game as well.

CURRENT ISSUES

Poaching of elephants for ivory has escalated in the past ten years and has become a major problem in Zimbabwe. A worrying recent development has been the emergence of poisoning as a poaching technique. Just over 100 elephants were killed in a single cyanide poisoning incident in Hwange National Park in late 2013 (Muboko et al., 2014). The impact of poaching has been highest in the north of the country, particularly in the Sebungwe Region to the south of Lake Kariba, and the Lower Zambezi Region (Dunham et al., 2015c). Although elephant numbers have increased in Gonarezhou National Park, it too experienced an increase in poaching in 2015 (Dunham & van der Westhuizen, 2015).

Concern has been expressed about the impact of high numbers of elephants on vegetation and other biodiversity in Zimbabwe's protected areas. Despite the increase in poaching, this remains a problem in protected areas such as Hwange NP, where the provision of artificial water supplies has led to high elephant densities (ZPWMA, 2015)

Zimbabwe published a national elephant management plan covering the period 2015 to 2020 (ZPWMA, 2015).

In 2008, Zimbabwe undertook an approved one-off sale of 3,764 kg of ivory to Japan and China, at a price of USD $487,162 (Wijnstekers, 2011).

Zimbabwe's annual declared export quota of elephant trophies remains unchanged since 2007 at 1,000 (tusks as hunting trophies from 500 animals) (CITES, n.d.-b). In 2015, the US Fish and Wildlife Service removed its 'non-detriment' finding, thus banning the import of elephant trophies into the USA (USFWS, 2015a).

NUMBERS AND DISTRIBUTION

The estimated number of elephants in areas surveyed in the last ten years in Zimbabwe is 82,630 ± 8,589 at the time of the last survey for each area. There may be an additional 1,635 to 1,805 elephants in areas not systematically surveyed. These guesses likely represent a minimum number, and actual numbers could be higher than those reported. Together, this estimate and guess apply to 78,839 km², which is 97% of the estimated known and possible elephant range. There remains an additional 3% of the estimated range for which no elephant population estimates are available.

There has been a decline of just over 10,000 elephants from surveyed populations since the AESR 2007 and an increase of about 1,000 in guesses, mostly from previously unsurveyed areas in North West Matabeleland. Although there have been large losses from the Sebungwe and Lower Zambezi populations, these have been partially compensated by increases in Gonarezhou and North West Matabeland.

The major populations of the Lower Zambezi Valley (including Mana Pools National Park), Sebungwe (including Matusadona and Chizarira National Parks), North-west Matabeleland (including Hwange and Zambezi National Parks) and the south-east Lowveld (including Gonarezhou NP) were surveyed in 2014 using **aerial sample counts** (including block counts in hilly areas) as part of the Great Elephant Census.

The estimate from the Lower Zambezi Valley in 2014 was 11,656 ± 2,259 (Dunham et al., 2015c). The previous comparable estimate was 19,297 ± 2,527 in 2001 (Mackie, 2002). The 2014 figure replaces an estimate from the AESR 2007 of 19,981 ± 2,392 from 2003 (Dunham, 2004). This survey was less comparable than the 2001 one because it covered a slightly smaller area. There was an approximately 40% decline in the 13 years between 2001 and 2014. The observed carcass ratio of 6% is not as high as one would expect given the rate of population reduction and might suggest that the level of poaching has reduced in recent years. The corridor between the Mavuradonha Wilderness Area and the rest of the Zambezi Valley range has been changed to **possible range** (Packenham quoting Varden, pers. comm., 2016).

The 2014 estimate for Sebungwe was 3,407 ± 1,215 (Dunham et al., 2015b) which replaces an estimate of 15,024 ± 2,133 from a 2006 survey (Dunham et al., 2006a). The observed carcass ratio of 30% indicates an unsustainably high offtake of elephants. There were almost no elephants left in the communal areas, with the main surviving sub-populations in Matusadona and Chizarira National Parks and the Chirisa Safari Area. Wildlife scouts reported 70-100 elephants in Kavira Forest Land at the western end of Sebungwe (M. Sebele pers. comm. in Dunham et al., 2015b).

The 2014 estimate for North-west Matabeleland was 53,991 ± 7,711 (Dunham et al., 2015a), which replaces an estimate of 49,310 ± 7,051 from 2001 (Dunham & Mackie, 2002). There was no significant difference between the totals although the increased carcass ratio of 7% from 3% in 2001 is a worrying sign. Other aerial sample counts were carried out in 2006 and 2007 but they were not

suitable for comparative purposes (Dunham et al., 2007; Dunham et al., 2006b). Since the 2014 Botswana survey was carried out a month earlier than the north-west Matabeleland survey there is a possibility of double-counting or missing animals that had moved from Hwange into Botswana. There was a surprisingly large number of elephants seen in the Ngwasho/Sepako stratum in Botswana adjoining the southern half of Hwange NP (estimate 11,744) (Chase et al., 2015) and evidence from radio-tracking shows that elephants do move out of Hwange into adjoining areas of Botswana (Chamaillé-Jammes, pers. comm., 2016; Ferguson & Chase, 2010).

Elephant range in North-west Matabeleland has probably increased. Water hole counts and scout reports indicated 308 elephants in the Fuller Forest Land, 165 in Gwaai, Bembezi and Umguza Forest Lands (which has been marked as new **known range**) and 150 in Gwampa/Lake Alice Forest Reserves (M. Sebele pers. comm in Dunham et al., 2015a) which are all recorded as **new populations**. I. Du Preez (pers. comm. in Dunham et al., 2015a) reported an **informed guess** of 36 elephants in the privately owned Stanley & Livingstone Game Reserve (Nakavango).

The estimate for Gonarezhou NP from the 2014 survey was 11,120 ± 2,709 (Dunham & van der Westhuizen, 2015). This replaces an estimate of 4,987 ± 1,577 from a comparable 2001 survey. Another survey in 2009 gave an estimate of 9,123 ± 1,898 (Dunham et al., 2010). The elephant population of Gonarezhou NP is continuing to increase, and is at its highest level since surveys started in 1980. There was a relatively low carcass ratio of 4%. There are limited movements of elephants from Gonarezhou into adjoining parts of Mozambique, and one radio-collared elephant moved from Kruger to Gonarezhou (Henley, 2011).

The 2014 survey of the south east Lowveld included some neighbouring areas. No elephants were observed in the Malapati Safari Area immediately south-west of Gonarezhou but there was an estimate of 332 ± 519 in the Mahenye communal land to the north-east of Gonarezhou, which replaces a zero estimate from the 2001 survey. The 2014 survey gave an estimate of 1,585 ± 1,295 for the Savé Valley Conservancy. This replaces an estimate of 527 ± 310 (Dunham, 2003). There is no statistical difference between the two results. Aerial total counts were carried out in 2013 and 2015 (Jooste & Lenton, 2015; Joubert & Joubert, 2013), which did not cover the entire area: 1,538 and 1,490 elephants were counted respectively. Sengwe, further to the south-west, adjoining the northern boundary of Kruger National Park in South Africa, was not counted in the 2014 survey, but there was an estimate of 35 ± 99 in 2013 (Dunham et al., 2013). In the Malilangwe Conservancy 272 elephants were counted using a helicopter in 2013 (Clegg, 2013). This replaces an estimate of 116 from an aerial total count in 2001 (Dunham, 2002). There was an estimate of 55 in 2014 for the Chiredzi River Conservancy (Warth in Dunham & van der Westhuizen, 2015) compared to 28 in 2001 (Dunham, 2002). Although Chipinge Safari Area is marked as possible elephant range, this is now highly unlikely.

There are a number of small isolated populations in other parts of Zimbabwe, which have updated estimates for 2014. There is an informed guess of 150 elephants for Chegutu Safari Area (Mwale, pers. comm. in Dunham, 2015), formerly Hartley Safari Area, west of Harare and this replaces a guess of 100 from 2001 (Dunham & Mackie, 2002). Some 30 elephants reportedly move from the Nyatana Wildlife Management Area in the north east of the country into Mozambique and this replaces a guess of 150 from 2001 (Dunham & Mackie, 2002).

Some 20 bull elephants were photographed, and there was a further unverified report of 40 elephants, near Mangwe Dam in the vicinity of Home Farm and Greystone Ranches, across the border from Francistown in Botswana (Robertson and Winch, pers. comm. in Dunham, 2015) replacing a guess of three from 2002 (Dunham & Mackie, 2002). A helicopter total count enumerated 174 elephants on Shangani Ranch near Bulawayo (Edwards, pers. comm. in Dunham, 2015) and this replaces a guess of 60 from 2001 (Dunham & Mackie, 2002).

There was a **total aerial count** of 212 elephants in 2014 in the Zimbabwe section of the Mapungubwe Transfrontier Conservation Area which includes Tuli Safari Area, Sentinel, Nottingham and River Ranches (Selier & Page, 2015). This replaces an estimate of 82 from 2001 (Dunham & Mackie, 2002).

There were **informed guesses** in 2014 of 500-600 in Bubye Valley (Leathem & English pers. comm. in Dunham, 2015), and 100 on Bubiana Conservancy (Drummond pers. comm. in Dunham, 2015) in the south of Zimbabwe, replacing guesses of 53 and 50 respectively (Dunham & Mackie, 2002). An old estimate of ten elephants in the Mambali Communal Lands on the Botswana border has been retained from the AESR 2007 (Dunham & Mackie, 2002). A report of 54 elephants on Nuanetsi Ranch is recorded as a **new population**.

*RANGE OF INFORMED GUESS

KEY TO REASONS FOR CHANGE

DA: Different Area, DD: Data Degraded; DT: Different Technique; NA: New Analysis; NG: New Guess; NP: New population; PL: Population Lost; RS: Repeat Survey (RS denotes a repeat survey that is not statistically comparable for reasons such as different season);
— : No Change

KEY TO SURVEY REPORT

AS: Aerial Sample Count; AT: Aerial Total Count; DC: Dung Count; GD: Genetic Dung Count; GS: Ground Sample Count; GT: Ground Total Count; IG: Informed Guess; IR: Individual Registration; OG: Other Guess. Survey Reliability is keyed A-E (best to worst).

PFS

Priority for Future Surveys (PFS) is ranked from 1 to 5 (highest to lowest). Based on the precision of estimates and the proportion of national range accounted for by the site in question, PFS is a measure of the importance and urgency for future population surveys. All areas of unassessed range have a priority of 1. See Introduction for details on how the PFS is derived.

NOTICE OF REPRESENTATION

This is a notice to the U.S. Fish and Wildlife Service that I have appointed John J. Jackson, III and Regina Lennox of the non-profit firm Conservation Force as my attorneys and legal representatives for all matters concerning my applications for a permit to import a lawfully hunted _Elephant_____ trophy.

This authority is inclusive and extends to all applications and filings, whether administrative or judicial, including but not limited to any request for reconsideration, appeal, and litigation.

I also request that these attorneys, through the address for Conservation Force below, be copied with all correspondence, acknowledgements, notices and decisions concerning my application to import my trophy at the following address:

Conservation Force
3240 S. I-10 Service Road W., Suite 200
Metairie, Louisiana 70001 USA
T: (504) 837-1233
F: (504) 837-1145
E: cf@conservationforce.org

Signed: _____

Name: Mark Saulsbury

Type of Activity:
Import of Sport-hunted Trophies of
Southern African Leopard, African Elephant, and
Namibian Southern White Rhinoceros

Complete Sections A or B, and C, D, and E of this application. U.S. address may be required in Section C, see instructions for details.
See attached instruction pages for information on how to make your application complete and help avoid unnecessary delays.

A. Complete if applying as an individual

1.a. Last name	1.b. First name	1.c. Middle name or initial	1.d. Suffix
Saulsbury	Mark	(b) (6)	

2. Date of birth (mm/dd/yyyy)	3. Occupation	4. Affiliation/ Doing business as (see instructions)
(b) (6)		N/A

5.a. Telephone number	5.b. Alternate telephone number	5.c. Fax number	5.d. E-mail address
(b) (6)			(b) (6)

B. Complete if applying on behalf of a business, corporation, public agency, Tribe, or institution

1.a. Name of business, agency, Tribe, or institution	1.b. Doing business as (dba)
N/A	

2. Tax identification no	3. Description of business, agency, Tribe, or institution

4.a. Principal officer Last name	4.b. Principal officer First name	4.c. Principal officer Middle name/ initial	4.d. Suffix

5. Principal officer title	6. Primary contact name

7.a. Business telephone number	7.b. Alternate telephone number	7.c. Business fax number	7.d. Business e-mail address

C. All applicants complete address information

1.a. Physical address (Street address, Apartment #, Suite #, or Room #, no P.O. Boxes)
(b) (6)

1.b. City	1.c. State	1.d. Zip code/Postal code	1.e. County/Province	1.f. Country
Odessa	Texas	(b) (6)		USA

2.a. Mailing Address (include if different than physical address, include name of contact person if applicable)

2.b. City	2.c. State	2.d. Zip code/Postal code	2.e. County/Province	2.f. Country

D. All applicants MUST complete

1. Attach check or money order payable to the U.S. FISH AND WILDLIFE SERVICE **in the amount of $100, nonrefundable processing fee**. Federal, Tribal, State, and local government agencies, and those acting on behalf of such agencies, are exempt from the processing fee – ***attach documentation of fee exempt status as outlined in instructions.*** (50 CFR 13.11(d))

2. Do you currently have or have you ever had any Federal Fish and Wildlife permits?
Yes ☐ If yes, list the number of the most current permit you have held or that you are applying to renew/re-issue: unknown No ☑

3. Certification: I hereby certify that I have read and am familiar with the regulations contained in ***Title 50, Part 13 of the Code of Federal Regulations*** and the other ***applicable parts in subchapter B of Chapter I of Title 50***, and I certify that the information submitted in this application for a permit is complete and accurate to the best of my knowledge and belief. I understand that any false statement herein may subject me to the criminal penalties of 18 U.S.C. 1001.

E. IMPORT OF SPORT-HUNTED TROPHIES OF SOUTHERN AFRICAN LEOPARD, AFRICAN ELEPHANT, AND NAMIBIAN SOUTHERN WHITE RHINOCEROS

Note 1: If you hold an import permit for a trophy/trophies that you did not use, please **return the unused original permit.** If you are requesting reissuance of a permit because you have taken a trophy, but were unable to import it prior to the expiration of the permit, please use the renewal form (3-200-52; http://www.fws.gov/international/permits/by-form-number/index.html) and return your original permit with that form.

Note 2: *Sport-hunted trophy* is defined at 50 CFR 23.74 as follows: *Sport-hunted trophy* means a whole dead animal or a readily recognizable part or derivative of an animal specifically identified on the accompanying CITES document that meets the following criteria:

(1) Is raw, processed, or manufactured;
(2) Was legally obtained by the hunter through hunting for his or her personal use;
(3) Is being imported, exported, or re-exported by or on behalf of the hunter as part of the transfer from its country of origin ultimately to the hunter's country of usual residence; and
(4) Includes worked, manufactured, or handicraft items made from the sport-hunted animal only when:
  (i) Such items are contained in the same shipment as raw or tanned parts of the sport-hunted animal and are for the personal use of the hunter;
  (ii) The quantity of such items is no more than could reasonably be expected given the number of animals taken by the hunter as shown on the license or other documentation of the authorized hunt accompanying the shipment; and
  (iii) The accompanying CITES documents (export document and, if appropriate, import permit) contain a complete itemization and description of all items included in the shipment.

Note 3: Certain hunting trophies, including leopard, elephant, and rhinoceros hunting trophies, are subject to restrictions on their use after import into the United States. Please see 50 CFR 23.55 for more information or contact the Division of Management Authority.

Please provide the following information. Complete all questions on the application. Mark questions that are not applicable with "N/A". If applying for more than one trophy, be sure to answer questions 2 and 3 for each trophy.

If importing trophies from more than one country, you must submit a separate application for each shipment in order to obtain separate import permits.

1. ENTER the quantity next to the name of the species you are applying to import (you may apply to import specimens of more than one species provided they have been/are being hunted in the same country):

Leopard (*Panthera pardus*) Quantity: N/A (Import is limited to two per hunter per calendar year)

African elephant (*Loxodonta africana*) Quantity: 1 (Import is limited to two per hunter per calendar year)
Note: once imported, ivory cannot be re-exported.

Southern white rhinoceros (*Ceratotherium simum simum*) from Namibia Quantity: N/A (An import permit is not required for trophies harvested in South Africa or Swaziland. If you wish to import from a different country, please use form 3-200-37).

2. **IF ANIMAL IS CURRENTLY LIVING IN THE WILD**, please enter the following:
   a. Country and place (area, region, GIS coordinates, ranch AND nearest city) where wildlife is to be taken from the wild:

   b. Date wildlife is to be hunted:

c. Description of the trophy and parts you intend to import (e.g., skin, skull, shoulder mount, life size mount, claws, horns, tusks).

3. **IF THE ANIMAL IS DEAD**, please enter the following:
   a. Country and place (area, region, GIS coordinates, ranch, and/or AND nearest city) where trophy was removed from the wild: Namibia, Nyae-Nyae Conservancy, OTJOZONDJUPA Region, Nearest Town: Tsumkwe

   b. Date wildlife was hunted: August 8, 2017

   c. Description of the trophy and parts you intend to import (e.g., skin, skull, shoulder mount, life size mount, claws, horn, tusks):

      2 Tusks, 2 Ears, Cape, 2 Skin Panels, 1 Tail

   d. The current location of the trophy (address and country) [the U.S. import permit will identify this country as the country of export/re-export and must match with the export/re-export document]:

      International Air Cargo Services, Unit No. 10, Northern Industrial Park, Newcastle Street, Windhoek Namibia

4. Complete name and address of overseas person or business shipping the trophy to you. If you are applying to import a trophy directly from Namibia, you **must** provide the name and address of the professional hunter listed on your Namibian hunting permit [this name will appear on the face of the export permit].

Name: Business Name:	S.M. Jacobs SMJ Safaris
Address:	P.O. Box 601
City:	Grootfontein
State/Province:	Namibia
Country, Postal Code:	

5. Please be aware that the U.S. Fish and Wildlife Service may need to make a finding that your activities will enhance or benefit wild populations of the species involved. If you have any information that could support this finding (e.g., how the funds from license/trophy fees will be spent, what portion of the hunting fee will support conservation), please submit such information on a separate page with your application.

Please see current enhancement finding for Namibia.

CERTIFICATION STATEMENT (original signature must be provided for either 6 or 7 below)

6. **If you are a broker or taxidermist applying on behalf of a foreign national,** provide documentation to show you have a **Power of Attorney** to act on your client's behalf and sign the following statement.

   I acknowledge that the sport-hunted trophy/trophies to be imported has been/will be personally hunted by my client and is being imported only for my client's personal use (i.e., **not for sale, transfer, donation, or exchange that is reasonably likely to result in economic use, gain, or benefit**). I understand that my client may only import two leopard trophies in one calendar year. I understand that my client may only import two African elephant trophies in one calendar year. In addition, I have advised my client that raw ivory, once imported into the United States, cannot be re-exported.

   Taxidermist/Broker's signature: N/A Date: _____

7. **If you are the hunter applying to import your own trophy**, please read and sign the following statement.

I acknowledge that the sport-hunted trophy/trophies to be imported has been/will be personally hunted by me and is being imported only for my personal use (i.e., **not for sale, transfer, donation, or exchange that is reasonably likely to result in economic use, gain, or benefit**). I understand that I may only import two leopard trophies in one calendar year. I understand that I may only import two African elephant trophies in one calendar year. In addition, I understand that raw ivory, once imported into the United States, cannot be re-exported.

Applicant's signature: _____ Date: 3-5-18

Be aware that there may be additional permitting or approval requirements by your local or state governments, as well as required by other Federal agencies or foreign government to conduct your propose activity. While the Service will attempt to assist where possible, it is your responsibility to obtain such approval.

8. All international shipment(s) must be through a designated port. A list of designated ports (where an inspector is posted) is available from http://www.fws.gov/le/designated-ports.html. If you wish to use a port not listed, please contact the Office of Law Enforcement for a Designated Port Exemption Permit (form 3-200-2).

9. Name and address where you wish the permit to be mailed, **if** different from page 1 (All permits will be mailed via the U.S. Postal Service, unless you identify an alternative means below):

10. If you wish the permit to be delivered by means other than USPS regular mail, provide an air bill, pre-paid envelope, or billing information. If you do not have a pre-paid envelope or air bill and wish to pay for a courier service with your credit card, please check the box below. Please DO NOT include credit card number or other information; you will be contacted for this information.

☑ If a permit is issued, please send it via a courier service to the address on page 1 or question 9. I understand that you will contact me for my credit card information once the application has been processed.

11. Who should we contact if we have questions about the application? (Include name, phone number, and email):

Conservation Force, 504-837-1233, cf@conservationforce.org

12. **Disqualification Factor**. A conviction, or entry of a plea of guilty or nolo contendere, for a felony violation of the Lacey Act, the Migratory Bird Treaty Act, or the Bald and Golden Eagle Protection Act disqualifies any such person from receiving or exercising the privileges of a permit, unless such disqualification has been expressly waived by the Service Director in response to a written petition. (50 CFR 13.21(c)) Have you or any of the owners of the business, if applying as a business, been convicted, or entered a plea of guilty or nolo contendere, forfeited collateral, or are currently under charges for any violations of the laws mentioned above?

☐ Yes ☑ No If you answered "Yes" provide: a) the individual's name, b) date of charge, c) charge(s), d) location of incident, e) court, and f) action taken for each violation.

No trophy hunter may hunt unless accompanied by a professional hunter,, master hunting guide or hunting guide.

This permit must be kept on the person of the permit-holder at all times while hunting.

Only guide(s) as specified on the permit ma conduct the hunt.

Complementary benefits of tourism and hunting to communal conservancies in Namibia

Robin Naidoo,* L. Chris Weaver,† Richard W. Diggle,† Greenwell Matongo,† Greg Stuart-Hill,† and Chris Thouless†‡

Abstract: *Tourism and hunting both generate substantial revenues for communities and private operators in Africa, but few studies have quantitatively examined the trade-offs and synergies that may result from these two activities. We evaluated financial and in-kind benefit streams from tourism and hunting on 77 communal conservancies in Namibia from 1998 to 2013, where community-based wildlife conservation has been promoted as a land-use that complements traditional subsistence agriculture. We used data collected annually for all communal conservancies to characterize whether benefits were derived from hunting or tourism. We classified these benefits into 3 broad classes and examined how benefits flowed to stakeholders within communities under the status quo and under a simulated ban on hunting. Across all conservancies, total benefits from hunting and tourism increased at roughly the same rate, although conservancies typically started generating benefits from hunting within 3 years of formation as opposed to after 6 years for tourism. Disaggregation of data revealed that the main benefits from hunting were income for conservancy management and food in the form of meat for the community at large. The majority of tourism benefits were salaried jobs at lodges. A simulated ban on trophy hunting significantly reduced the number of conservancies that could cover their operating costs, whereas eliminating income from tourism did not have as severe an effect. Given that the benefits generated from hunting and tourism typically begin at different times in a conservancy's life-span (earlier vs. later, respectively) and flow to different segments of local communities, these 2 activities together may provide the greatest incentives for conservation on communal lands in Namibia. A singular focus on either hunting or tourism would reduce the value of wildlife as a competitive land-use option and have grave repercussions for the viability of community-based conservation efforts in Namibia, and possibly other parts of Africa.*

Keywords: communal lands, community-based conservation, financial benefits, hunting ban, in-kind benefits, stakeholders

Resumen: *El turismo y la caza generan ingresos públicos sustanciales para las comunidades y los operadores privados en África, pero pocos estudios han examinado cuantitativamente las compensaciones y las sinergias que pueden resultar de estas dos actividades. Evaluamos las oleadas de beneficios financieros y de pago en especie provenientes del turismo y la caza en 77 zonas de conservación comunal en Namibia desde 1998 a 2013, donde la conservación de vida silvestre basada en la comunidad ha sido promovida como un uso de suelo que complementa la agricultura tradicional de subsistencia. Usamos datos colectados anualmente de todas las zonas comunales para caracterizar si los beneficios se derivaron de la caza o el turismo. Clasificamos estos beneficios en tres categorías generales y examinamos cómo los beneficios fluyeron hacia los accionistas dentro de las comunidades bajo el status quo y bajo una prohibición simulada de la caza. En todas las zonas de conservación comunal, los beneficios totales de la caza y el turismo incrementaron aproximadamente a la misma tasa, aunque en estas zonas se comenzaron a generar beneficios de la caza normalmente dentro de los 3 años de formación, en contraste con del turismo que se generaron después de 6 años. La desagregación de los datos reveló que los principales beneficios de la caza fueron los ingresos para*

are not monolithic entities; rather, they are composed of different groups of people who will experience different costs and benefits from wildlife conservation (Agrawal & Gibson 1999; Roe et al. 2009). For example, wealthy cattle owners and poor subsistence farmers will have different perceptions of wildlife conservation given the particular costs and benefits they are likely to experience. Diversifying benefit streams from wildlife conservation so that the variety of stakeholders within local communities are incentivized to promote or at minimum tolerate living with wildlife will provide the greatest likelihood that conservation as a land use will ultimately prove more attractive than wildlife-unfriendly alternatives. Because communal lands comprise a large fraction of rural Africa (up to 500% more than state-managed forest reserves and national parks [Alden Wily 2011]), management of these lands will play a huge role in determining the success or failure of biodiversity conservation efforts across the continent.

We focused on how different types of benefits provided by wildlife vary over time, space, and community stakeholder groups in communal conservancies in Namibia. Namibia's Community-Based Natural Resource Management (CBNRM) program began in the mid-1990s, when progressive legislation for the devolution of conditional rights to natural resources allowed communities to register areas of customary landholding as "communal conservancies." Registering these conservancies (involving developing zoning and sustainable resource management plans and a constitution) allows local communities to manage and benefit from wildlife and other natural resources on their traditional lands. Prior to the legislation, natural resources were the sole property of the state. Although wildlife has been used by people for millennia in the region that is now Namibia, the last century was characterized by declines in various species, starting with the rinderpest outbreak at the end of the 19th century, followed by overhunting of big game species by colonial hunters, and more recently by a major drought combined with a poaching increase in the 1980s (Owen-Smith 2010). Namibia's CBNRM program is widely recognized as having contributed to a strong recovery of wildlife in large parts of the country, through the creation of social and economic incentives for the sustainable coexistence of wildlife and people on communal lands (Owen-Smith 2010; Naidoo et al. 2011*b*; NACSO 2013). Additionally, the principles used to incentivize communities to steward wildlife across very large spatial scales are already being adopted by numerous other countries in Africa and beyond (NACSO 2013). We examined how changes in benefits over time generated on communal conservancies in Namibia vary according to whether they were derived from tourism or hunting (the 2 most significant benefits derived from wildlife). We also assessed how these benefits flow to different stakeholders within local communities and how factors such as time of establishment and changes in resource management policies affect such benefit flows on communal lands.

Methods

We used data from 77 communal conservancies registered by 2012 in Namibia to examine benefit flows associated with hunting and photographic tourism. The first four of these conservancies were established in 1998, and we used data through the 2013 calendar year for all of them. For both hunting and tourism, conservancies negotiate agreements with private operators. The agreements between conservancies and operators specify the portion of income the conservancy receives (typically 8–12% of total lodge revenue and from 30–75% of trophy price, depending on the species) and jobs to be offered to community members with the operation (from 20–50 for tourism lodges, depending on factors such as size and location, and 8–10 for hunting camps). In addition, community members hunt for subsistence and allow local sales of meat from wildlife through game cropping. Information on fees paid to conservancy management committees; salaries of community members employed in the tourism or hunting industry; and nonfinancial benefits (primarily meat from hunting, but also meals, training, human-wildlife conflict compensation, and other donations to the community at large) is compiled annually by every conservancy. Financial reporting of conservancies is supported by various nongovernmental organizations, is ground-truthed, and is double-checked against analogous reports from tourism and hunting operators.

We used these data and categorized each source of benefit as to whether it was derived from tourism or from hunting. The CBNRM program uses the price of buying alternative meat as the value of wild meat distributed from animals that were hunted (replacement-cost shadow price approach). In 2013, it was 18 Namibian dollars/kg of meat (NACSO 2013). This shadow price can vary and is adjusted from year to year to reflect supply and demand, but the same rate is applied across the country in order to maintain comparability of meat benefits generated in different regions. We used a consumer price index produced by the Bank of Namibia to standardize benefit figures from all years into constant 2013 Namibian dollars. We subsequently expressed all figures in 2013 U.S. dollars (U.S.$) based on the average monthly exchange rate in 2013 of U.S.$1 = N$9.64.

We divided benefits into the 3 classes (described above) because each represented a different type of gain that is channeled to different parts of a conservancy and has different implications for the sustainability of the conservancy and for its livelihood value to members. Income (i.e., fees from lodge and hunting concessions) to management committees is used by conservancies to cover operational and management costs

these financial time series by calculating 4 metrics per conservancy: temporal trend (slope from a linear regression of benefits on year); volatility (root mean square error from the linear regression); end point (magnitude of benefits in 2013); and lag time between year conservancy registered and year the first benefits were generated.

We used t tests on these metrics to assess whether temporal flows of benefits to conservancies were significantly different between hunting and tourism.

Results

Of the 77 conservancies established by 2012, 25 reported not generating any benefits from either hunting or tourism. Considering all conservancies in Namibia's CBNRM program, aggregate benefits increased over time (Fig. 1). Total benefits from tourism and hunting were similar in the early years of the program, but tourism benefits exceeded those from hunting from 2003 to 2010, whereas from 2011 to 2013 the benefits from hunting were greater than tourism benefits (Fig. 1a). Although fee payments to conservancies and nonfinancial benefits (primarily meat) from hunting accumulated at higher levels than those from tourism (Figs. 1b and d), total salaries from tourism enterprise jobs increased 10 times faster than salaries from hunting jobs (Fig. 1c). Nonfinancial benefits from tourism dropped sharply from 2011–2013 relative to continued increasing nonfinancial benefits from hunting (Fig. 1d), a result that may have coincided with the worldwide economic downturn in 2008 and fewer available resources for tourism companies to make additional contributions to conservancies.

Conservancies were formed in roughly 4 cohorts that coincided with (1) initial heavy donor investment (1998–2001, 15 conservancies), (2) a period of declining donor investment (2003–2005, 29 conservancies), (3) an upturn in investment peaking in 2009 (2006–2009, 15 conservancies), and (4) a further increased-investment phase (2011–2013, including 18 conservancies registered by the end of 2012). The earliest conservancies, in cohort 1, had similar levels of total benefits for the first 6 years after registration, after which benefits from both hunting and tourism continued to increase but at a faster rate for tourism (Fig. 2a). Conservancies in cohort 2 (Fig. 2b) had roughly similar rates of growth in total benefits from tourism and hunting, whereas cohorts 3 (Fig. 2c) and 4 (Fig. 2d) earned virtually no benefits from tourism and had either moderate (cohort 3) or low (cohort 4) benefits from hunting.

Disaggregating the national-level data revealed that pathways for generating benefits over time varied substantially among conservancies (Supporting Information). Of the 52 conservancies that derived some level of benefits from wildlife, 28 derived all or almost all of their total benefits from hunting, 6 derived all or almost all benefits from tourism, and 18 had substantial levels of benefits from both hunting and tourism.

Although there was a tendency for the total benefits from tourism to be higher than those from hunting, there were no significant differences for any of the conservancy time series metrics (Table 1). The only exception to this was the lag time between conservation formation and the beginning of benefits generation. After their formation, conservancies derived benefits from hunting approximately twice as quickly as they derived benefits from tourism (Table 1). On average, conservancies started generating benefits from hunting about 3 years after their formation, whereas it took 6 years, on average, after conservancy formation to start generating benefits from tourism.

In addition to temporal and spatial differentiation, there were differences in how benefits from tourism and trophy hunting flowed to the different constituencies contained within communal conservancies (Fig. 3). Based on detailed financial accounting data from 2011–2013, 58.3% of the financial benefits from tourism were in the form of jobs to conservancy members at joint-venture lodges, whereas 30.3% of the benefits were lodge contractual fees used for conservancy management and 11.5% were nonfinancial benefits to the community at large less.

In contrast, the majority (64.3%) of the benefits from hunting were in the form of cash for the operation of the conservancy, and a substantial fraction went to the community at large in the form of meat from hunted animals (32.0%, or approximately 1.4 million kg over the 3 years). Conservancies used income from trophy hunting and tourism in a variety of ways that benefited the entire community (Fig. 3), most importantly for the salaries of conservancy employees and for other conservancy operating costs, but also for compensation for wildlife conflict, payments to traditional authority structures, direct cash dividends, community-level projects, and infrastructure development. Our data suggest that operational costs, conservancy employee salaries, and the various benefits to the community at large were mostly derived from hunting because hunting operators paid fees from 2011–2013 of $5.41 million (72% of the total), whereas tourism operators paid $2.13 million (28%).

Currently, many conservancies cover their operating costs with income derived from trophy hunting and from tourism that is directed to conservancy management. Simulation of a trophy hunting ban showed a reduction in the number of conservancies with incomes greater than operating costs in 2013, from 74% (37 of 50) under the status quo to 16% (8 of 50) when conservancy income from hunting was eliminated. If this reduction were to occur throughout the country, it would cover nearly 50,000 km^2 (Fig. 4). When conservancy income from tourism was removed, the effect was again negative but

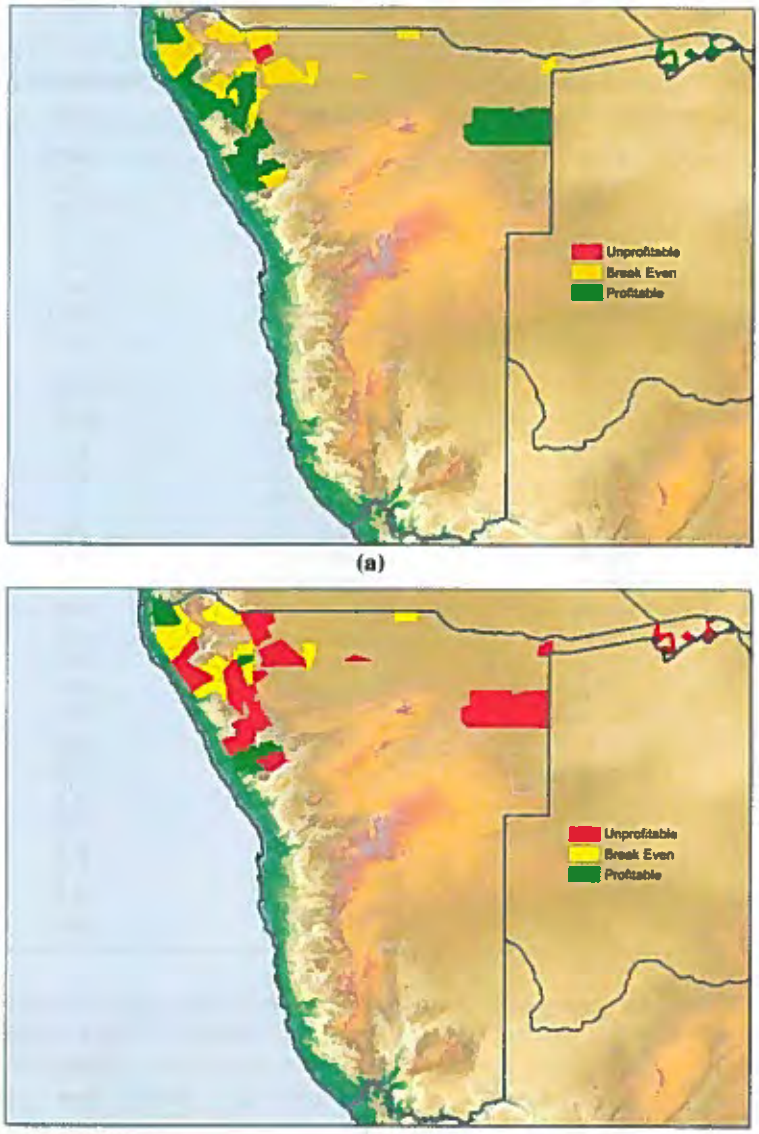

Figure 4. Revenues minus operating costs for 50 communal conservancies for which detailed management cost data were available in 2013 under (a) the status quo and (b) a simulated trophy hunting ban. Break-even conservancies indicate those for which revenues and operating costs are within $5000 of one another.

less marked; 59% of conservancies remained able to cover their operating costs.

Finally, of the 303 animals harvested by trophy hunters in 2013, individuals from 2 of the Big-5 (buffalo [*Syncerus caffer*], elephant [*Loxodonta africana*], lion [*Panthera leo*], leopard [*Panthera pardus*], rhinoceros [*Diceros bicornis* and *Ceratotherium simum*) species hunted in Africa, buffalo and elephant, accounted for 78.3% of hunting revenue; over 55% was attributable just to elephants (Table 2).

Discussion

Despite the importance of both tourism and hunting to conservation, and the debate surrounding their implementation, we are the first study to use detailed quantitative data across multiple jurisdictions and over a lengthy time span to directly compare the financial performance of these two activities. Our data from 77 Namibian conservancies from 1998 to 2013 showed that trophy hunting and tourism reached similar aggregate levels but began to generate benefits at different times (earlier vs. later in a conservancy's life-span) and flowed to different beneficiaries (community management committees and the community at large vs. individual employees). Previous work in Namibia has demonstrated that benefits from hunting and tourism are also spatially differentiated; conservancies are more likely to generate benefits from hunting in areas with diverse wildlife and Big-5 species, whereas the presence of black rhinoceros (*Diceros bicornis*) and broader environmental conditions (distance to tourist routes, topographical diversity, and rainfall) are correlated with higher benefits from tourism (Naidoo et al. 2011*b*). In addition, the first conservancies established were typically those with the highest potential to

where nature-based tourism is not viable (e.g., Blom 2004).

Benefits from trophy hunting and tourism also accrue to different stakeholders within communal conservancies. Benefits from tourism were mainly in the form of employment income to conservancy members who are hired to work at lodges built on conservancy land. Although these employees normally come from among a group of conservancy members nominated by the conservancy, ultimately staff are hired based on their knowledge, communication skills, and potential. Jobs of any kind are extremely rare in remote rural areas and thus highly sought after; therefore, tourism is viewed very favorably by local residents who are employed in the industry (Suich 2010; Silva & Motzer 2015). In contrast, agreements between communities and hunting operators provide significantly higher levels of income for conservancy management, as well as greater nonfinancial benefits (largely from meat) distributed directly to the community at large.

The income to management committees is essential; without it, most communal conservancies in Namibia would be unable to cover their operating costs (which three-quarters of the 50 conservancies we assessed were doing). Conservancies unable to cover their operating costs will likely cease to pursue conservation as a viable land use because without conservancy income, game guards cannot be paid, management and monitoring plans cannot be developed and instituted, the sense of local ownership over natural resources dissipates, and wildlife becomes much more vulnerable to declines from poaching and overharvest. This link between income from hunting and the conditions and incentives that permit wildlife to persist as an economically viable land use is critical but often unrecognized. Our data also show that almost 80% of hunting benefits are delivered by two species (elephant and buffalo); elephants alone generate over 50% of all hunting benefits from an increasing population base (7500 individuals in 1995 to over 20,000 in 2012 [Craig 1999; Ministry of Environment and Tourism 2012]). Therefore, even a targeted hunting ban on elephants or an import ban such as those that currently prevent the import of elephant trophies from Tanzania and Zimbabwe into the United States is likely to have a very negative impact on Namibia's CBNRM program by severely undermining conservancy governance structures and incentives for conservation. Anecdotal accounts of the impact of Botswana's 2014 hunting ban suggests that similar negative consequences (an increase in poaching for meat and trade and increased collaboration of local communities with international poaching gangs) may be occurring there (Somerville 2015).

Although we found there were impressive financial gains from trophy hunting, the sustainability (both ecological and economic) of these operations on communal lands in Namibia is rightly of major concern. As such, it is regulated via annual estimates of species' populations and harvest quotas derived in agreement with local communities and the Ministry of Environment and Tourism (NACSO 2013). Although data from the various conservancy landscapes within the country indicate populations in these areas have generally increased since the advent of Namibia's CBNRM program (Naidoo et al. 2011*b*), evidence on possible negative impacts of trophy hunting on wildlife populations in other parts of Africa (Packer et al. 2010; Lindsey et al. 2013*a*) means that trophy hunting must be carefully monitored in Namibia to ensure the same does not happen. There have been no assessments on how trophy size or quality in particular species may be changing over time, a concern that has been raised for trophy hunting in Africa (Crosmary et al. 2013) and that may result in undesirable genetic changes within hunted populations (Coltman et al. 2003). It is therefore critical that data on the size and quality of trophy exports be analyzed for Namibia's CBNRM program to inform monitoring, evaluation, and management of the trophy-hunting industry. High-profile, apparently illegal hunts such as of lions on the borders of national parks in Zimbabwe, and ethically dubious practices, such as canned hunting of captive animals, also illustrate that the industry itself must play a greater role in addressing issues that throw the sector into disrepute. Finally, growing human populations and a tremendous increase in elephant poaching for the international ivory market may eventually result in reduced quotas of elephants and therefore threaten the financial benefits communal conservancies have generated through trophy hunting.

The sustainability of photographic nature-based tourism in Africa and beyond has also come under scrutiny (Buckley 2004; Newsome et al. 2012). In Namibia relevant issues for ecological sustainability include impacts of intense wildlife viewing on animal behavior, localized environmental implications of the development of tourism infrastructure (lodges, campsites, roads, disposal facilities, etc.) in sensitive arid environments, and climate-change impacts from the carbon emissions of increasing numbers of international visitors. As with trophy hunting, there are few studies, particularly for the first two considerations, that have evaluated the sustainability of tourism initiatives on communal conservancies in Namibia. Furthermore, from a socioeconomic point of view nature-based tourism on communal lands in Namibia has been criticized as having power imbalances or elite capture issues that render communities unable to secure significant shares of the benefits (Hoole 2010; Lapeyre 2011), even though residents of conservancies with high benefit levels are themselves strongly supportive of tourism (Silva & Motzer 2015). Finally, to assess more fully the overall costs and benefits of wildlife conservation on communal lands in Namibia, there is a need for greater investigation of both human-wildlife conflict costs and who bears them, as well as the opportunity

CITES Appendix	II
Listing Year	1997

CURRENT ISSUES

Namibia's elephants occur across the northern region of the country, mostly in national parks and community areas. Their range encompasses a wide variety of habitats, from the extremely arid north-west Kunene Region to the well-watered Zambezi (formerly Caprivi) Region, where the elephants form part of the KAZA transfrontier population. Although poaching has increased in the Zambezi Region in the past ten years, it is not seen as a significant threat in Etosha National Park or for populations in Khaudum National Park and Kunene Region.

Elephant hunting takes place in Namibia, and the revenue generated provides significant income to community conservancies (Naidoo et al., 2006). From 2007 to 2015, Namibia declared an annual export quota of elephant hunting trophies of 180, defined as tusks from 90 animals (CITES, n.d.-a).

Namibia's elephant management plan was published in 2007 (Ministry of Environment and Tourism, 2007).

In 2008, Namibia undertook an approved one-off sale of 7,503 kg of ivory to Japan and China, at a price of USD $1,147,369 (Wijnstekers, 2011).

NUMBERS AND DISTRIBUTION

The estimated number of elephants in areas surveyed in the last ten years in Namibia is 22,754 ± 4,305 at the time of the last survey for each area. There may be an additional 90 elephants in areas not systematically surveyed. These guesses likely represent a minimum number, and actual numbers could be higher than those reported. Together, this estimate and guess apply to 84,283 km^2, which is 52% of the estimated known and possible elephant range. There remains an additional 48% of the estimated range for which no elephant population estimates are available.

The elephant population of Namibia has continued to increase although, with wide confidence limits in aerial surveys and elephants moving across international borders, it is not possible to be precise about how great the increase in the national population has been.

There are four main populations, the transfrontier population (with Zambia, Angola, Botswana and Zimbabwe) in the Zambezi Region, in Khaudum National Park in the north-east, the Etosha National Park population, and the Kunene population in the north-west which includes the "desert" elephants.

There has been an increasing trend in elephant numbers in the Zambezi Region since surveys started in the 1980s. This is likely to have been a result of both natural growth and movement from neighbouring countries. **Aerial sample counts** were carried out in 2007, 2011, 2013, 2014, and 2015, giving estimates of 8,380, 10,847 ± 3,580, 9,165 ± 2,016, 14,097 ± 2,678 and 13,116 ± 3,413 (Chase, 2007; Craig & Gibson, 2013b, 2014; Craig, 2011b; Gibson & Craig, 2015a). The previous estimate in the AESR 2007 was 8,725 ± 2,206 (Kolberg, 2004). There was also a total count carried out in 2007 (Chase, 2007) and a sample count in 2008 (Kolberg, 2008). However the latter was carried out with an inexperienced crew and the results were thought to be a considerable underestimate (Kolberg, 2008).

The elephant population of Khaudum NP and the neighbouring community conservancies of Nyae Nyae and N≠a Jaqna have been established since the 1980s, with the provision of artificial water and movements across the border from Botswana. Three **aerial sample counts** were carried out in 2011, 2013 and 2015 giving estimates of 4,731 ± 1,940, 3,638 ± 1,164, and 6,413 ± 2,566 (Craig & Gibson, 2013a; Gibson & Craig, 2015b; MET, 2012). The 2015 figure replaces an estimate of 3,758 ± 2,289 for Khaudum, 61 ± 115 for N#a Jaqna (Kolberg, 2004) and 967 ± 481 for Nyae Nyae (Stander, 2004). None of these are significant differences.

There is a limited movement of elephants between Angola and the Kavango region to the north-west of Khaudum (Terblanche, 2016).

There is a small elephant population in the Mangetti area between Khaudum and Etosha. The AESR 2007 indicated that they occupy the Mangetti Game Reserve, whereas their range is actually concentrated around the Mangetti Cattle Ranch to the west, and also probably extends into the Ukwuangali communal area to the north. Ninety individuals were observed in Mangetti in 2015 (Lindeque, pers. comm., 2016). This **informed guess** replaces one of 20 from 2005 (Ministry of Environment and Tourism, 2005).

Etosha National Park in northern Namibia has an increasingly isolated elephant population, since the perimeter fencing has been upgraded in recent years. There has been a gradual increase in elephant numbers, moderated by deaths from anthrax and poaching. Aerial sample counts were carried out in 2011 and 2012, giving estimates of 3,378 ± 1,756 and 2,810 (confidence limits not available) (Kolberg, 2012; MET, 2012). The most recent **aerial sample count** from 2015 gave an estimate of 2,911 ± 637 (Kilian, 2015) and replaces an estimate of 2,057 ± 598 from 2004 (Kilian & Kolberg, 2004).

It is technically very difficult to count the widely scattered elephant population in the Kunene Region, which includes the 'desert elephants' in the dry, western extremity of the range and there has been controversy about the numbers in this area. A combined sample block count and **aerial total count** was carried out by helicopter in 2011, giving an estimate of 314 ± 154 (MET, 2012). This replaces an estimate of 210 ± 157 from a 2005 survey (Ministry of Environment and Tourism, 2005). It should be noted that the count did not include the extreme northern part of the range around Opuwo, nor the farms to the south of Etosha. There has been some range expansion to both the south and north, with elephants now being resident in the Ugab river basin and about ten elephants resident in the northern Etanga area (Owen-Smith, pers. comm., 2014). The area of **known range** has been changed, and the Etanga group is shown as a point record on the map. The Kunene population appears to have been increasing in numbers and range, despite evidence that the 'desert elephant' sub-population in the Houanib and Houarusib dry riverbeds reduced from 42 to 31 between 2002 and 2015 (Ramey & Brown, 2015).

There are occasional sightings of elephants in livestock ranching areas to the south of their normal range in the area north and east of Windhoek. These are shown as point records on the range map (Hartman, 2014; The Namibian, 2014).

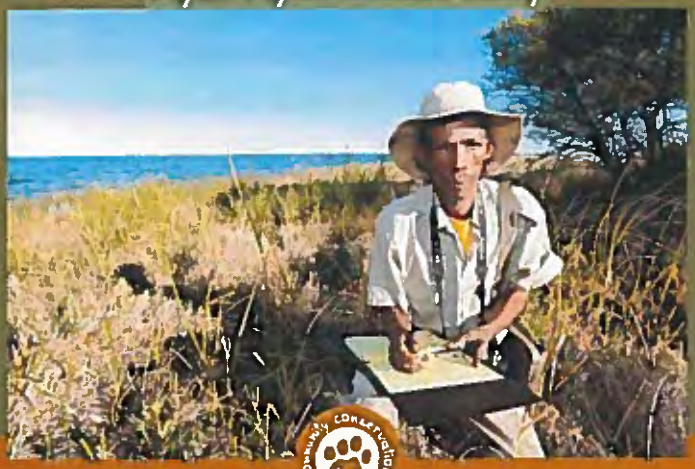
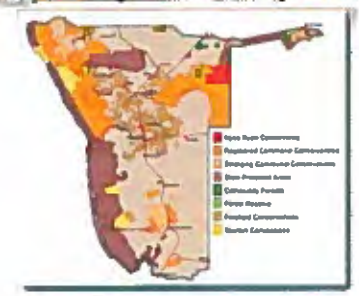
Living with wildlife

the story of Nyae Nyae Conservancy



Nyae Nyae – Ju|hoansi for the place without mountains but rocky



A CONSERVANCY IS...

- a legally registered area with clearly defined borders and a constituted management body run by the community for the development of residents and the sustainable use of wildlife and tourism
- managed by a group elected to serve the interests of all its members
- a place where residents can add income from wildlife and tourism to traditional farming activities
- a place where wildlife populations increase as they are managed for productive gain
- a place where the value of the natural resources increases, enhancing the value of the land
- a forum through which services and developments can be channelled and integrated
- zoned for multiple uses to minimise conflict and maximise the interests of all stakeholders

Conservancies
enable development and conservation over large areas...

MILESTONES AND SUCCESSES

1991 – an NGO that over time evolves into the Nyae Nyae Development Foundation of Namibia is formed to support the community
1994 – the Nyae Nyae community begins the process to register as a conservancy
1996 – policy changes allow communal area residents to benefit from wildlife and tourism by forming conservancies
1998 – Nyae Nyae Conservancy is registered in February, becoming the first communal conservancy in Namibia
1999 – the Nyae Nyae Conservancy office is established at Tsaraka
99-04 – each year, wildlife is re-introduced into the conservancy, including springbok, red hartebeest, gemsbok, eland, kudu and blue wildebeest, with a total of 2,300 animals being introduced
2001 – an annual game count is started in Nyae Nyae
2002 – the Event Book monitoring system is implemented in Nyae Nyae
2003 – the conservancy office is moved to Tsumkwe
04/05 – a large game-proof camp is erected to manage the remaining Nyae Nyae buffalo population and avoid contact with livestock
2006 – the Nyae Nyae Trust is formed
2008 – black rhino are re-introduced into the conservancy
2009 – an application is lodged with the Ministry of Environment & Tourism to extend the borders of the conservancy to include the village of N!homa
2011 – an application is lodged with the Ministry of Agriculture to register Nyae Nyae Communal Forest, having the same borders and management structures as the conservancy

QUICK FACTS

Region: Otjozondjupa
Approximate population: 2,300
Date of registration: February 1998
Size: 8,992 square kilometres
Main language: Ju'hoansi

interesting culture and dynamic communities committed to sustainability – people living in Nyae Nyae share a common vision for managing their area and its resources

vast, diverse and spectacular landscapes – Nyae Nyae Pans, bushland, magical baobabs... a healthy environment diversifies economic opportunities and drives economic growth

charismatic, free-roaming wildlife – elephant, lion, leopard, wild dog, diverse plains game, abundant birdlife... wildlife generates a variety of benefits for local people

people are living with wildlife, are managing natural resources wisely and are reaping the benefits...

A LITTLE HISTORY

Prior to Namibia's independence in 1990, communal area residents had few rights to use wildlife. Wild animals were often seen as little more than a threat to crops, livestock and infrastructure, as well as community safety. Ground-breaking legislation passed in the mid-nineties laid the foundation for a new approach to the sustainable use of natural resources. By forming a conservancy, people in communal areas can now actively manage – and generate benefits from – wildlife and other resources in their area, encouraging wildlife recoveries and environmental restoration. While a conservancy is a natural resource management structure, it is defined by social ties. Conservancies unite groups of people with the common goal of managing their resources. Today, over 60 communal conservancies embrace one in four rural Namibians, underlining a national commitment to both rural development and conservation.

Nyae Nyae is the oldest, as well as the second largest conservancy in the country, covering close to 9,000 square kilometres. Most of the 2,300 residents are from the Ju'hoansi ethnic group, a sub-group of the San. Historically, the Nyae Nyae area occupied by the Ju'hoansi stretched into Botswana in the east, north beyond what is today Khaudum National Park, south to the settlements of Eiseb and Gam and west beyond the settlement of Aasvoëlnes. Today, Botswana creates the eastern border of the conservancy, while to the south, west and north, Otjiku and Nhe-Jaqna Conservancies and Khaudum National Park adjoin Nyae Nyae, and in turn border onto other conservancies to form a huge contiguous conservation landscape.

The long process to mobilise, unite and support the Nyae Nyae community in forming a conservancy in a sense already began prior to Namibia's independence. In 1981, what is today the Nyae Nyae Development Foundation was formed to support the community in development and resource management. By the time the conservancy legislation was passed in 1996, the Nyae Nyae community was well placed to register the conservancy, which was gazetted in early 1998.

San or Bushman? *Both terms have a slightly derogatory origin. Bushman originates from the Dutch word boesman – an outcast who lives in the bush. San comes from the Nama 'saa' – referring to poor people without cattle. While the Regional San Conference of 1993 adopted San as the official term, Bushman has also lost much of its negative connotation and today is taken to refer more to the great environmental knowledge and bush skills of the San.*

Conservancies are living landscapes...

The culture of the San is legendary, as often idealised lives of a balanced existence within the natural environment. The San have superb hunting skills and 'bush knowledge'. Their keen perception and understanding of the environment has allowed them to live in inhospitable ecosystems such as the Kalahari for countless generations. Nyae Nyae is rich in archaeological artefacts and recent finds indicate a presence of people from the Middle Stone Age. It seems likely that the ancestors of the Ju/'hoansi have roamed across the area for thousands of years and their traditional knowledge and skills have great value.

stalking through African wilderness with a band of hunters, meandering through the veld gathering food, huddled around the evening fire watching traditional dances... the San culture has the power to inspire in us a search for a more harmonised existence

Today, most people in Nyae Nyae no longer live an active hunter-gatherer lifestyle and find themselves very much in a state of cultural transition and social change. Yet wonderful living museums make the past accessible again – for both visitors and a new generation of San no longer in touch with their heritage. 'Keeping our culture alive for our children is one of the most important aspects of the living museum' says Kantee Daqm, a museum guide.

The vast, mostly unfenced Nyae Nyae environment retains a strong wilderness atmosphere, which is enhanced by the fascination of the San culture. Located on the western rim of the Kalahari Basin – the largest accumulation of sand in the world – much of Nyae Nyae is covered by wind blown sands. Areas of rocky ground retain seasonal surface water in the so called 'pannetjieveld' (area of many pans). Here the Nyae Nyae Pans become a very important wetland after good rains. Nyae Nyae is generally flat, varying between 1,100 and 1,200 metres above sea level. The Aha Hills in the far south east of the conservancy create the only real topographical variation.

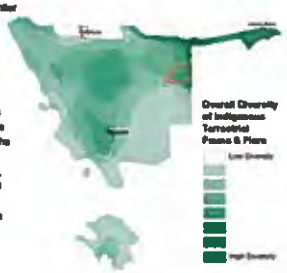
Huge baobabs punctuate the savanna woodland and create a sense of ancient Africa. Rainfall in Nyae Nyae is low and unpredictable, with an annual average of around 450 millimetres. The harshness of the environment is increased by high temperatures and extremely high evaporation. However, the water table is close to the surface, generally lying between two and 25 metres. All these environmental factors contribute to interesting habitat variations and the highest biodiversity found in the communal areas of the Otjozondjupa Region.

a seemingly endless world of bushland and pannetjieveld, dotted here and there with the magical shapes of baobabs and brought to life by the mere expectation of seeing game, by the calls of lion and hyaena at night – and by the light tread of the first people

Since the establishment of conservancies, wildlife numbers in communal areas have rebounded from historic lows prior to independence. Nyae Nyae is one of the last refuges of the African wild dog in Namibia and the only place in the country where all of the Big Five occur – elephant, black rhino, lion, buffalo and leopard. Other mammals include giraffe, eland, kudu, blue wildebeest, roan, gemsbok, hartebeest, springbok, duiker, steenbok, warthog, spotted and brown hyaena, cheetah and jackal. More than 200 bird species have been recorded in the conservancy. Birding around the seasonal Nyae Nyae Pans is spectacular after good rains, when more than 10,000 waterbirds of over 60 species gather here, including great painted snipes, flamingos, wattled cranes and breeding stork egrets. The area has been designated an Important Bird Area by Birdlife International and is eligible for Ramsar Site status.

Nyae Nyae is also rich in flora, and over 100 species of edible plants are utilized by the San. Huge baobabs are the most distinctive feature of many landscapes, but many other plants are of interest and importance, including manketti, teakwood, terminalia, false mopane and a variety of acacia trees, as well as devil's claw and Kalahari melon.

Around Nyae Nyae... The nearby Khaudum National Park is known especially for its numbers of elephant and roan, as well as for its wilderness feel. Both Nyae Nyae and Khaudum form part of the Kavango Zambezi Transfrontier Conservation Area (KAZA). The initiative links five countries and is one of the largest contiguous conservation areas in the world, with the aim of facilitating wildlife movement, conserving natural resources and improving the lives of rural people.



Conservancies
empower rural people...

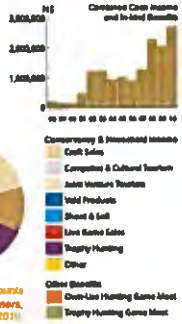
With a national **population** of around 30,000 the San constitute less than two percent of the total Namibian population and have the lowest per capita income of all language groups in the country. Many communities rely on a variety of support and are challenged by social disintegration, alcohol abuse and poverty. Only around 15 percent of San in Namibia have resource utilisation rights to land. The literacy rate is low at around 30%, with school attendance at only half the national average. The few opportunities for formal employment are thus further inhibited by limited levels of formal education. The San have negligible representation in government and the Ju'hoansi are one of only two out of

Nyae Nyae facilitates access to diverse training and capacity building, empowers individuals, especially women, to actively take part in decision-making, as well as instilling a renewed sense of pride in cultural heritage

the six San traditional authorities who have received official recognition. All this is the result of many years of marginalisation.

A variety of **development** initiatives by both government and non-government organisations over the last 30 years have attempted to move the San into modern society. Schools and health facilities have been developed, permanent water points have been established and livestock herding and gardening have been promoted. These activities have had a large influence on San culture. The Nyae Nyae Conservancy has returned natural resource use rights to the Ju'hoansi community. San traditionally live in small groups in a democratic society that has never been structured into typical tribal leadership systems. Each group has a home ground or area with exclusive resource use rights. Around 40 settlements are spread throughout the conservancy.

Tsumkwe, originally a store water source, was established as the administrative centre of the area in 1958. An area of 30 square kilometres around Tsumkwe is excluded from the conservancy. The small town is the only place to buy goods and provides access to a combined school, a clinic and other government **facilities and services**. The nearest hospitals to outside the conservancy at Mangetti Dune and Grootfontein. There are five primary schools in Nyae Nyae and Ju'hoan speakers participating in the Village School Programme have access to schooling in their mother tongue.



Benefits to the conservancy and its members come from a variety of sources. Sources and amounts vary from year to year depending on factors such as agreements with private sector partners, and market fluctuations. The pie chart shows the main benefit sources in 2010.

Harvesting of devil's claw for the health industry is practiced widely, providing income to around 300 to 400 harvesters. Craft production has become an important source of income for both men and women, with over 300 craft producers in the conservancy. While the men concentrate on producing traditional implements such as bows and arrows, women create exquisite ostrich egg shell jewellery and other beautiful items. The Gihumbu Crafts shop, located next to the conservancy office, is a superb local outlet for these crafts.

The C44 gravel road provides **access for visitors** to the area, connecting Tsumkwe with the B8 tar road between Grootfontein and Rundu in the west, as well as the Dobe border post leading to Botswana in the east. Four wheel drive is needed beyond the gravel road, both within Nyae Nyae and to access Khaudum, or when proceeding into Botswana.

the conservancy is enabling a range of new livelihood options for its residents, including tourism, craft production, hunting and indigenous plant harvesting, all of which enable the Ju'hoansi to utilise their traditional knowledge and skills

The people of Nyae Nyae today survive on a complex mix of **livelihood activities**. Veld food and seasonal hunting still supplement other food sources, while livestock herding and small scale gardening are becoming increasingly important. The conservancy itself, as well as related natural resource use activities, provide employment and other benefits. The conservancy has paid for the development of numerous bursaries and distributes individual benefits each year, including annual cash payments, meat from trophy and own-use hunting, the supply of blankets, solar radios and other goods.

The conservancy spends money and provides community and individual benefits in various areas. Areas and amounts vary from year to year depending on factors such as conservancy income and priorities. Private sector jobs are created through agreements with private sector partners. The pie chart shows the main expenditure and benefit areas in 2010.

The Tsumkwe Country Lodge, located in the town, is currently the only fixed **tourism** accommodation. While it does not have a formal relationship with the conservancy, lodge activities include village visits to the living museums at Mountain Pos and Doo Pos, with income going directly to the villages. Another excellent cultural experience, the Living Hunter's Museum, is located at //Xa:ba village along the track to Khaudum and includes a campsite. Wilderness campsites are also located at Mahuri, Djoma and Kramertshop and, although undeveloped, provide nearby villages with some income.

Trophy hunting is currently the biggest source of income for the conservancy and also provides important employment. The area has yielded superb trophies and is considered one of the foremost big game hunting concessions in Namibia.

Nyae Nyae has received a lot of attention from local and international film teams and photographers, and the conservancy has received income from filming and photographic fees, although guidelines for these activities need to be improved and enforced.

the Nyae Nyae Conservancy provides vital structures for managing the communal natural resources of the area in a way that enhances development and ensures sustainability

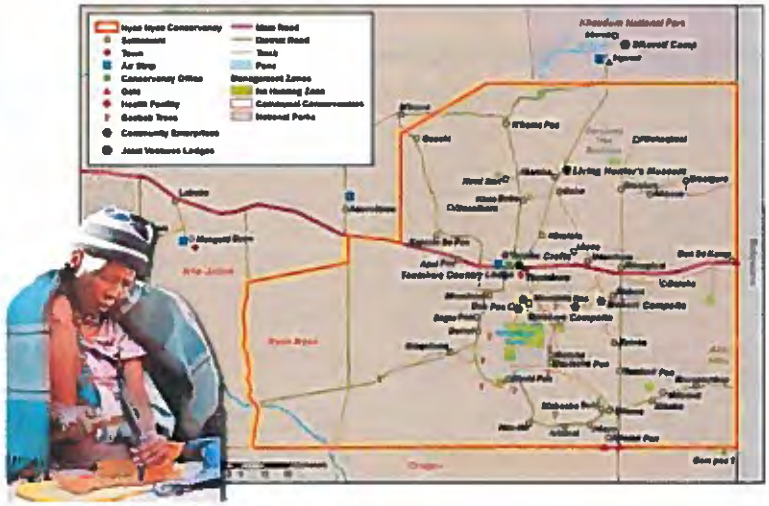
Conservancies
facilitate sustainability...

Nyae Nyae is divided into four areas for management purposes. The **management structure** includes the conservancy board, made up of representatives of each area, as well as the paid positions of chairperson and conservancy manager. The board focuses on appointing the management committee and manager, as well as on strategic planning. The management committee consists of a minimum of five members, including the conservancy manager. It appoints staff, supervises performance and makes short term decisions. Employees include 14 rangers, a CBNRM field officer, three water team staff, a craft trainer, a craft shop coordinator (funded through shop income), a devil's claw coordinator, an agriculture coordinator, an office administrator and a cleaner. Annual general meetings are attended by village representatives, the board and the management committee and are used to decide on benefit distribution, elect board members and the chairperson, approve annual budgets and work plans, as well as deliberate on strategies or programme amendments. The conservancy office is located in Tsumkwe and integrates Ghanzi Crafts. The office is owned by the conservancy, which also owns two four-wheel drives. Conservancy funds are spent on running costs, community development and individual benefit distribution. The funds are managed by a trust administered by the Nyae Nyae Development Foundation.

Activities... The conservancy is based on the traditional Ju'/hoansi /daro land management system, which was recognised by government in 1991. Members have the right to hunt approved game within their /daro on foot with bow and arrows, spears or bird traps. Hunting is reported to the /daro owner and records are submitted to conservancy rangers and the Ministry of Environment & Tourism (MET). The conservancy has been zoned for a variety of land uses, including hunting and tourism. Wildlife reintroductions have significantly boosted game numbers and increased the value of the area for tourism and trophy hunting. An annual game count, done as a simultaneous "full moon count" at waterholes in the conservancy, is carried out in collaboration with the MET and the support of NGOs. Conservancy rangers also do active natural resource monitoring through the Event Book monitoring system, recording data such as game sightings, human wildlife conflict, poaching incidents, game utilisation and any other data deemed important by the conservancy. All data is aggregated into monthly and annual reporting charts that facilitate adaptive management. Based on the game count and Event Book information, the MET sets annual quotas for using wildlife.

The conservancy is active in mitigating human wildlife conflict. With support from the Nyae Nyae Development Foundation and other NGOs, the conservancy has developed "elephant pans" water reservoirs for villages, which has reduced conflicts with elephants to isolated problems at gardens. A system of providing financial offsets for losses is being implemented through the National Policy on Human Wildlife Conflict Management. It will be applied by the conservancy with MET assistance.

A grazing management project seeks to ensure sustainable use of rangeland and mitigate the effects of overgrazing. The conservancy has also attempted to address repeated illegal livestock incursions from neighbouring communal areas. The devil's claw coordinator helps with sustainable harvesting methods and the required permit system, as well as collecting harvests for sale. Further support for the sector is provided by the Centre for Research Information Action in Africa (CRIAA-SADC) and the Millennium Challenge Account - Namibia (MCA). In order to better manage all plant resources of the area, a community forest is in the process of formation, which will be directly integrated with the conservancy



the conservancy uses a mix of modern technologies and traditional knowledge and skills to enable healthy wildlife populations, a productive environment, and the effective management of natural resources

Conservancies
are full of opportunities...

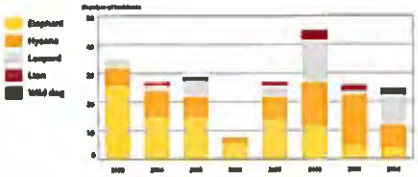
The wonderful mixture of environmental and cultural resources provides largely untapped potential in Nyae Nyae.

Challenges... The San culture is in a state of transition and is susceptible to external pressures, requiring sensitive and well-coordinated developments. Numerous government and NGO support agencies, with a mix of emphasis on social, religious, agricultural and environmental aspects, are active in Nyae Nyae. A more integrated approach to the various activities can facilitate a broader range of benefits for residents.

Nyae Nyae harbours great potential to overcome the social and environmental challenges that the area seems to face — and the conservancy is the ideal structure to coordinate many of the developments

Human wildlife conflict is a challenge where ever people coexist with wild animals, especially if these include elephants and large predators. The creation of artificial water points has increased the resident elephant population in Nyae Nyae, which poses a threat to the area's woodlands, especially in the vicinity of water. Nonetheless, human elephant conflicts have been significantly reduced through village water point protection measures and water points for game. With increases in livestock, predator problems are also increasing. At least some of these can be mitigated by herding livestock and keeping it in secure enclosures at night. Importantly, predators and elephants are of great value, both to the ecosystem and to tourism, and in the long run the benefits gained from these species should outweigh the costs of living with them. Human wildlife conflicts can be further mitigated through actively enforced zoning that sets aside different areas for wildlife and agricultural uses.

There are many unrealised tourism **opportunities** within Nyae Nyae, as well as the greater region. The mixture of the iconic San culture and authentic wilderness experience provides various development options. Interpretation through qualified guiding and excellent information materials can make the complexity of modern San existence and the diversity of the environment accessible to visitors.



Human wildlife conflicts are monitored using the Event Book, indicating trends and improvements, such as reduced elephant conflicts achieved through water point protection measures.

Strategic development, sensitive to social and cultural dynamics as well as the environment, can facilitate a bright future for the oldest and second largest conservancy in Namibia

A variety of **places** for tourism development in Nyae Nyae exist. These need to be well coordinated and should receive continued input from tourism experts. While the planned developments are likely to fill most current gaps in accommodation needs, it is the interpretation of the products and the enhancement of the areas resources that can unlock the full potential. Tourism products could include well laid-out four-by-four routes with wilderness camping, serviced campsites near roads but away from larger settlements, luxury lodges and tented camps, high quality local guiding, birding and other special interest tours. Improvements to the current infrastructure in Khaudum, including the state of artificial waterholes, can facilitate the establishment of the Khaudum tourism route while maintaining the area's wilderness appeal. The development of tourism routes through Nyae Nyae and Khaudum into the Caprivi or Botswana can help the area become one of Namibia's primary wilderness tourism destinations.

Hunting forms an integral part of the San culture. Trophy hunting can play a vital role, providing significant income to the conservancy through concession fees, as well as creating employment that utilises traditional San hunting skills. The superb hunting potential of the vast area in conjunction with the San culture creates a unique and very valuable product. Zoning is especially important to maximise the potential of tourism and hunting products and strengthen core wildlife areas and tourism sites.

Developments should work through the conservancy or coordinate with it, as well as working with the Nyae Nyae Development Foundation. Strategic, well coordinated initiatives can unlock the full value of the area's wildlife and natural plant products, the traditional knowledge and skills of the San, and of course both cultural and wilderness tourism, as well as trophy hunting and other forms of sustainable use. Numerous options exist that can enable a bright future for the conservancy.

Falls Church, VA 22041-3803
1-800-358-2104 or 703-358-2104

Type of Activity:
Import of Sport-hunted Trophies of Southern African Leopard, African Elephant, and Namibian Southern White Rhinoceros

MAR 23 2018

Complete Sections A or B, and C, D, and E of this application. U.S. address may be required in Section C, see instructions for details.
See attached instruction pages for information on how to make your application complete and help avoid unnecessary delays.

A. Complete if applying as an individual

1.a. Last name	1.b. First name	1.c. Middle name or initial	1.d. Suffix
Williams	Christopher	(b) (6)	

2. Date of birth (mm/dd/yyyy)	3. Occupation	4. Affiliation/ Doing business as (see instructions)
(b) (6)		n/a

5.a. Telephone number	5.b. Alternate telephone number	5.c. Fax number	5.d. E-mail address
(b) (6)			(b) (6)

B. Complete if applying on behalf of a business, corporation, public agency, Tribe, or institution

1.a. Name of business, agency, Tribe, or institution	1.b. Doing business as (dba)

2. Tax identification no.	3. Description of business, agency, Tribe, or institution

4.a. Principal officer Last name	4.b. Principal officer First name	4.c. Principal officer Middle name/ initial	4.d. Suffix

5. Principal officer title	6. Primary contact name

7.a. Business telephone number	7.b. Alternate telephone number	7.c. Business fax number	7.d. Business e-mail address

C. All applicants complete address information

1.a. Physical address (Street address, Apartment #, Suite #, or Room #, no P.O. Boxes)
(b) (6)

1.b. City	1.c. State	1.d. Zip code/Postal code	1.e. County/Province	1.f. Country
Anniston	AL	(b) (6)		USA

2.a. Mailing Address (include if different than physical address, include name of contact person if applicable)

2.b. City	2.c. State	2.d. Zip code/Postal code	2.e. County/Province	2.f. Country

D. All applicants MUST complete

1. Attach check or money order payable to the U.S. FISH AND WILDLIFE SERVICE **in the amount of $100, nonrefundable processing fee**. Federal, Tribal, State, and local government agencies, and those acting on behalf of such agencies, are exempt from the processing fee – ***attach documentation of fee exempt status as outlined in instructions.*** (50 CFR 13.11(d))

2. Do you currently have or have you ever had any Federal Fish and Wildlife permits?
Yes ☐ If yes, list the number of the most current permit you have held or that you are applying to renew/re-issue:_____ No ☑

3. Certification: I hereby certify that I have read and am familiar with the regulations contained in ***Title 50, Part 13 of the Code of Federal Regulations*** and the other ***applicable parts in subchapter B of Chapter I of Title 50***, and I certify that the information submitted in this application for a permit is complete and accurate to the best of my knowledge and (b) (6) understand that any false statement herein may subject me to the criminal penalties of 18 U.S.C. 1001.

Signature of applicant/person responsible for permit (No photocopied or stamped signatures)

E. IMPORT OF SPORT-HUNTED TROPHIES OF SOUTHERN AFRICAN LEOPARD, AFRICAN ELEPHANT, AND NAMIBIAN SOUTHERN WHITE RHINOCEROS

Note 1: If you hold an import permit for a trophy/trophies that you did not use, please **return the unused original permit.** If you are requesting reissuance of a permit because you have taken a trophy, but were unable to import it prior to the expiration of the permit, please use the renewal form (3-200-52; http://www.fws.gov/international/permits/by-form-number/index.html) and return your original permit with that form.

Note 2: *Sport-hunted trophy* is defined at 50 CFR 23.74 as follows: *Sport-hunted trophy* means a whole dead animal or a readily recognizable part or derivative of an animal specifically identified on the accompanying CITES document that meets the following criteria:

(1) Is raw, processed, or manufactured;
(2) Was legally obtained by the hunter through hunting for his or her personal use;
(3) Is being imported, exported, or re-exported by or on behalf of the hunter as part of the transfer from its country of origin ultimately to the hunter's country of usual residence; and
(4) Includes worked, manufactured, or handicraft items made from the sport-hunted animal only when:
  (i) Such items are contained in the same shipment as raw or tanned parts of the sport-hunted animal and are for the personal use of the hunter;
  (ii) The quantity of such items is no more than could reasonably be expected given the number of animals taken by the hunter as shown on the license or other documentation of the authorized hunt accompanying the shipment; and
  (iii) The accompanying CITES documents (export document and, if appropriate, import permit) contain a complete itemization and description of all items included in the shipment.

Note 3: Certain hunting trophies, including leopard, elephant, and rhinoceros hunting trophies, are subject to restrictions on their use after import into the United States. Please see 50 CFR 23.55 for more information or contact the Division of Management Authority.

Please provide the following information. Complete all questions on the application. Mark questions that are not applicable with "N/A". If applying for more than one trophy, be sure to answer questions 2 and 3 for each trophy.

If importing trophies from more than one country, you must submit a separate application for each shipment in order to obtain separate import permits.

1. ENTER the quantity next to the name of the species you are applying to import (you may apply to import specimens of more than one species provided they have been/are being hunted in the same country):

Leopard (*Panthera pardus*) Quantity: n/a (Import is limited to two per hunter per calendar year)

African elephant (*Loxodonta africana*) Quantity: 1 (Import is limited to two per hunter per calendar year)
Note: once imported, ivory cannot be re-exported.

Southern white rhinoceros (*Ceratotherium simum simum*) from Namibia Quantity: n/a (An import permit is not required for trophies harvested in South Africa or Swaziland. If you wish to import from a different country, please use form 3-200-37).

2. **IF ANIMAL IS CURRENTLY LIVING IN THE WILD,** please enter the following:
   a. Country and place (area, region, GIS coordinates, ranch AND nearest city) where wildlife is to be taken from the wild:

   n/a

   b. Date wildlife is to be hunted:

   n/a

c. Description of the trophy and parts you intend to import (e.g., skin, skull, shoulder mount, life size mount, claws, horns, tusks).

n/a

3. **IF THE ANIMAL IS DEAD**, please enter the following:
   a. Country and place (area, region, GIS coordinates, ranch, and/or AND nearest city) where trophy was removed from the wild:

   b. Date wildlife was hunted: Maremiani Singelele Nature Reserve, Musina, South Africa
   May 12, 2016

   c. Description of the trophy and parts you intend to import (e.g., skin, skull, shoulder mount, life size mount, claws, horn, tusks):

   (2) tusks, (2) ears prepared for decorative painting, tail with mounting hardware, (2) skin panels, 4 feet (2 to made into stools) and (2 to made into trash cans).

   d. The current location of the trophy (address and country) [the U.S. import permit will identify this country as the country of export/re-export and must match with the export/re-export document]:

   Safari Taxidermy
   47 Goud St.,Laboria, Polokwane, RSA

4. Complete name and address of overseas person or business shipping the trophy to you. If you are applying to import a trophy directly from Namibia, you **must** provide the name and address of the professional hunter listed on your Namibian hunting permit [this name will appear on the face of the export permit].

Name: Business	Safari Taxidermy
Name: Address:	PO Box 235, Ladanna, 0704
Address:	47 Goud St., Labotia,
City:	Polokwane
State/Province:	Limpopo
Country, Postal Code:	Republic of South Africa 0704

5. Please be aware that the U.S. Fish and Wildlife Service may need to make a finding that your activities will enhance or benefit wild populations of the species involved. If you have any information that could support this finding (e.g., how the funds from license/trophy fees will be spent, what portion of the hunting fee will support conservation), please submit such information on a separate page with your application.

CERTIFICATION STATEMENT (original signature must be provided for either 6 or 7 below)

6. **If you are a broker or taxidermist applying on behalf of a foreign national,** provide documentation to show you have a **Power of Attorney** to act on your client's behalf and sign the following statement.

   I acknowledge that the sport-hunted trophy/trophies to be imported has been/will be personally hunted by my client and is being imported only for my client's personal use (i.e., **not for sale, transfer, donation, or exchange that is reasonably likely to result in economic use, gain, or benefit**). I understand that my client may only import two leopard trophies in one calendar year. I understand that my client may only import two African elephant trophies in one calendar year. In addition, I have advised my client that raw ivory, once imported into the United States, cannot be re-exported.

   Taxidermist/Broker's signature:_____ Date: _____

7. **If you are the hunter applying to import your own trophy**, please read and sign the following statement.

I acknowledge that the sport-hunted trophy/trophies to be imported has been/will be personally hunted by me and is being imported only for my personal use (i.e., **not for sale, transfer, donation, or exchange that is reasonably likely to result in economic use, gain, or benefit**). I understand that I may only import two leopard trophies in one calendar year. I understand that I may only import two African elephant trophies in one calendar year. In addition, I understand that raw ivory, once im(b)(6) into the United States, cannot be re-exported.

Applicant's signature: [redacted] Date: 3/11/18

Be aware that there may be additional permitting or approval requirements by your local or state governments, as well as required by other Federal agencies or foreign government to conduct your propose activity. While the Service will attempt to assist where possible, it is your responsibility to obtain such approval.

8. All international shipment(s) must be through a designated port. A list of designated ports (where an inspector is posted) is available from http://www.fws.gov/le/designated-ports.html. If you wish to use a port not listed, please contact the Office of Law Enforcement for a Designated Port Exemption Permit (form 3-200-2).

9. Name and address where you wish the permit to be mailed, **if** different from page 1 (All permits will be mailed via the U.S. Postal Service, unless you identify an alternative means below):

10. If you wish the permit to be delivered by means other than USPS regular mail, provide an air bill, pre-paid envelope, or billing information. If you do not have a pre-paid envelope or air bill and wish to pay for a courier service with your credit card, please check the box below. Please DO NOT include credit card number or other information; you will be contacted for this information.

☐ If a permit is issued, please send it via a courier service to the address on page 1 or question 9. I understand that you will contact me for my credit card information once the application has been processed.

11. Who should we contact if we have questions about the application? (Include name, phone number, and email):

12. **Disqualification Factor.** A conviction, or entry of a plea of guilty or nolo contendere, for a felony violation of the Lacey Act, the Migratory Bird Treaty Act, or the Bald and Golden Eagle Protection Act disqualifies any such person from receiving or exercising the privileges of a permit, unless such disqualification has been expressly waived by the Service Director in response to a written petition. (50 CFR 13.21(c)) Have you or any of the owners of the business, if applying as a business, been convicted, or entered a plea of guilty or nolo contendere, forfeited collateral, or are currently under charges for any violations of the laws mentioned above?

☐ Yes ☑ No If you answered "Yes" provide: a) the individual's name, b) date of charge, c) charge(s), d) location of incident, e) court, and f) action taken for each violation.

Type of Activity:
Import of Sport-hunted Trophies of Southern African Leopard, African Elephant, and Namibian Southern White Rhinoceros

Complete Sections A or B, and C, D, and E of this application. U.S. address may be required in Section C, see instructions for details.
See attached instruction pages for information on how to make your application complete and help avoid unnecessary delays.

A. Complete if applying as an individual

1.a. Last name	1.b. First name	1.c. Middle name or initial	1.d. Suffix
Roberts	Scott	(b) (6)	

2. Date of birth (mm/dd/yyyy)	3. Occupation	4. Affiliation/ Doing business as (see instructions)	
(b) (6)			

5.a. Telephone number	5.b. Alternate telephone number	5.c. Fax number	5.d. E-mail address
(b) (6)			info@safarispecialtyimporters.com

B. Complete if applying on behalf of a business, corporation, public agency, Tribe, or institution

1.a. Name of business, agency, Tribe, or institution	1.b. Doing business as (dba)		

2. Tax identification no.	3. Description of business, agency, Tribe, or institution		

4.a. Principal officer Last name	4.b. Principal officer First name	4.c. Principal officer Middle name/ initial	4.d. Suffix

5. Principal officer title	6. Primary contact name		

7.a. Business telephone number	7.b. Alternate telephone number	7.c. Business fax number	7.d. Business e-mail address

C. All applicants complete address information

1.a. Physical address (Street address; Apartment #, Suite #, or Room #; no P.O. Boxes)
(b) (6)

1.b. City	1.c. State	1.d. Zip code/Postal code:	1.e. County/Province	1.f. Country
Benton City	WA	(b) (6)		USA

2.a. Mailing Address (include if different than physical address; include name of contact person if applicable)

2.b. City	2.c. State	2.d. Zip code/Postal code:	2.e. County/Province	2.f. Country

D. All applicants MUST complete

1. Attach check or money order payable to the U.S. FISH AND WILDLIFE SERVICE **in the amount of $100, nonrefundable processing fee**. Federal, Tribal, State, and local government agencies, and those acting on behalf of such agencies, are exempt from the processing fee – ***attach documentation of fee exempt status as outlined in instructions.*** (50 CFR 13.11(d))

2. Do you currently have or have you ever had any Federal Fish and Wildlife permits?
Yes ☐ If yes, list the number of the most current permit you have held or that you are applying to renew/re-issue: _____ No ☑

3. Certification: I hereby certify that I have read and am familiar with the regulations contained in ***Title 50, Part 13 of the Code of Federal Regulations*** and the other ***applicable parts in subchapter B of Chapter I of Title 50***, and I certify that the information submitted in this application for a permit is complete and accurate to the best of my knowledge and belief. I understand that any false statement herein may subject me to the criminal penalties of 18 U.S.C. 1001.

E. IMPORT OF SPORT-HUNTED TROPHIES OF SOUTHERN AFRICAN LEOPARD, AFRICAN ELEPHANT, AND NAMIBIAN SOUTHERN WHITE RHINOCEROS

Note 1: If you hold an import permit for a trophy/trophies that you did not use, please **return the unused original permit**. If you are requesting reissuance of a permit because you have taken a trophy, but were unable to import it prior to the expiration of the permit, please use the renewal form (3-200-52; http://www.fws.gov/international/permits/by-form-number/index.html) and return your original permit with that form.

Note 2: *Sport-hunted trophy* is defined at 50 CFR 23.74 as follows: *Sport-hunted trophy* means a whole dead animal or a readily recognizable part or derivative of an animal specifically identified on the accompanying CITES document that meets the following criteria:

(1) Is raw, processed, or manufactured;
(2) Was legally obtained by the hunter through hunting for his or her personal use;
(3) Is being imported, exported, or re-exported by or on behalf of the hunter as part of the transfer from its country of origin ultimately to the hunter's country of usual residence; and
(4) Includes worked, manufactured, or handicraft items made from the sport-hunted animal only when:
  (i) Such items are contained in the same shipment as raw or tanned parts of the sport-hunted animal and are for the personal use of the hunter;
  (ii) The quantity of such items is no more than could reasonably be expected given the number of animals taken by the hunter as shown on the license or other documentation of the authorized hunt accompanying the shipment; and
  (iii) The accompanying CITES documents (export document and, if appropriate, import permit) contain a complete itemization and description of all items included in the shipment.

Note 3: Certain hunting trophies, including leopard, elephant, and rhinoceros hunting trophies, are subject to restrictions on their use after import into the United States. Please see 50 CFR 23.55 for more information or contact the Division of Management Authority.

Please provide the following information. Complete all questions on the application. Mark questions that are not applicable with "N/A". If applying for more than one trophy, be sure to answer questions 2 and 3 for each trophy.

If importing trophies from more than one country, you must submit a separate application for each shipment in order to obtain separate import permits.

1. ENTER the quantity next to the name of the species you are applying to import (you may apply to import specimens of more than one species provided they have been/are being hunted in the same country):

Leopard (*Panthera pardus*) Quantity: 0 (Import is limited to two per hunter per calendar year)

African elephant (*Loxodonta africana*) Quantity: 1 (Import is limited to two per hunter per calendar year)
Note: once imported, ivory cannot be re-exported.

Southern white rhinoceros (*Ceratotherium simum simum*) from Namibia Quantity: 0 (An import permit is not required for trophies harvested in South Africa or Swaziland. If you wish to import from a different country, please use form 3-200-37).

2. **IF ANIMAL IS CURRENTLY LIVING IN THE WILD**, please enter the following:
   a. Country and place (area, region, GIS coordinates, ranch AND nearest city) where wildlife is to be taken from the wild:

   b. Date wildlife is to be hunted:

c. Description of the trophy and parts you intend to import (e.g., skin, skull, shoulder mount, life-size mount, claws, horns, tusks). Full Leopard

3. **IF THE ANIMAL IS DEAD**, please enter the following:
   a. Country and place (area, region, GIS coordinates, ranch, and/or AND nearest city) where trophy was removed from the wild:

   b. Date wildlife was hunted: Salambala Farm (Closest Town Katima Mulilo), NAMIBIA
   9-9-2016

   c. Description of the trophy and parts you intend to import (e.g., skin, skull, shoulder mount, life size mount, claws, horn, tusks):

   Full

   d. The current location of the trophy (address and country) [the U.S. import permit will identify this country as the country of export/re-export and must match with the export/re-export document]:

   Reisner Taxidermy
   Windhoek, Namibia

4. Complete name and address of overseas person or business shipping the trophy to you. If you are applying to import a trophy directly from Namibia, you **must** provide the name and address of the professional hunter listed on your Namibian hunting permit [this name will appear on the face of the export permit].

Name: Business	JAPSIE BLAAUW
Name: Address:	OMUJEVE SAFARIS
Address:	ONGOMBO WEST SECTION 2, NUMBER 56
City:	Windhoek
State/Province:	NAMIBIA
Country, Postal Code:	

5. Please be aware that the U.S. Fish and Wildlife Service may need to make a finding that your activities will enhance or benefit wild populations of the species involved. If you have any information that could support this finding (e.g., how the funds from license/trophy fees will be spent, what portion of the hunting fee will support conservation), please submit such information on a separate page with your application.

CERTIFICATION STATEMENT (original signature must be provided for either 6 or 7 below)

6. **If you are a broker or taxidermist applying on behalf of a foreign national,** provide documentation to show you have a **Power of Attorney** to act on your client's behalf and sign the following statement.

   I acknowledge that the sport-hunted trophy/trophies to be imported has been/will be personally hunted by my client and is being imported only for my client's personal use (i.e., **not for sale, transfer, donation, or exchange that is reasonably likely to result in economic use, gain, or benefit**). I understand that my client may only import two leopard trophies in one calendar year. I understand that my client may only import two African elephant trophies in one calendar year. In addition, I have advised my client that raw ivory, once imported into the United States, cannot be re-exported.

   Taxidermist/Broker's signature:_____ Date: _____

7. **If you are the hunter applying to import your own trophy**, please read and sign the following statement.

I acknowledge that the sport-hunted trophy/trophies to be imported has been/will be personally hunted by me and is being imported only for my personal use (i.e., **not for sale, transfer, donation, or exchange that is reasonably likely to result in economic use, gain, or benefit**). I understand that I may only import two leopard trophies in one calendar year. I understand that I may only import two African elephant trophies in one calendar year. In addition, I understand that raw ivory, once imported into the United States, cannot be re-exported.

Applicant's signature: Rosella Quartarone for Scott N. Roberts (POA) Date: 12-27-2017

Be aware that there may be additional permitting or approval requirements by your local or state governments, as well as required by other Federal agencies or foreign government to conduct your propose activity. While the Service will attempt to assist where possible, it is your responsibility to obtain such approval.

8. All international shipment(s) must be through a designated port. A list of designated ports (where an inspector is posted) is available from http://www.fws.gov/le/designated-ports.html. If you wish to use a port not listed, please contact the Office of Law Enforcement for a Designated Port Exemption Permit (form 3-200-2).

9. Name and address where you wish the permit to be mailed, if different from page 1 (All permits will be mailed via the U.S. Postal Service, unless you identify an alternative means below):

SEE ATTACHED PREPAID FEDEX LABEL TO: Safari Specialty Importers, 758 Sheldon Rd, Wallkill NY 12589

10. If you wish the permit to be delivered by means other than USPS regular mail, provide an air bill, pre-paid envelope, or billing information. If you do not have a pre-paid envelope or air bill and wish to pay for a courier service with your credit card, please check the box below. Please DO NOT include credit card number or other information; you will be contacted for this information.

☐ If a permit is issued, please send it via a courier service to the address on page 1 or question 9. I understand that you will contact me for my credit card information once the application has been processed.

11. Who should we contact if we have questions about the application? (Include name, phone number, and email):

Rosella Quartarone, SAFARI SPECIALTY IMPORTERS
845-943-5943 or eMail info@safarispecialtyimporters.com

12. **Disqualification Factor.** A conviction, or entry of a plea of guilty or nolo contendere, for a felony violation of the Lacey Act, the Migratory Bird Treaty Act, or the Bald and Golden Eagle Protection Act disqualifies any such person from receiving or exercising the privileges of a permit, unless such disqualification has been expressly waived by the Service Director in response to a written petition. (50 CFR 13.21(c)) Have you or any of the owners of the business, if applying as a business, been convicted, or entered a plea of guilty or nolo contendere, forfeited collateral, or are currently under charges for any violations of the laws mentioned above?

☐ Yes ☑ No If you answered "Yes" provide: a) the individual's name, b) date of charge, c) charge(s), d) location of incident, e) court, and f) action taken for each violation.

Type of Activity:
Import of Sport-hunted Trophies of Southern African Leopard, African Elephant, and Namibian Southern White Rhinoceros

Complete Sections A or B, and C, D, and E of this application. U.S. address may be required in Section C, see instructions for details.
See attached instruction pages for information on how to make your application complete and help avoid unnecessary delays.

A. Complete if applying as an individual

1.a. Last name	1.b. First name	1.c. Middle name or initial	1.d. Suffix
Berg	Verlin	(b) (6) [redacted]	

2. Date of birth (mm/dd/yyyy)	3. Social Security No.	4. Occupation	5. Affiliation/ Doing business as (see instructions)
(b) (6) [redacted]			

6.a. Telephone number	6.b. Alternate telephone number	6.c. Fax number	6.d. E-mail address
(b) (6) [redacted]			

B. Complete if applying on behalf of a business, corporation, public agency, Tribe, or institution

1.a. Name of business, agency, Tribe, or institution	1.b. Doing business as (dba)

2. Tax identification no.	3. Description of business, agency, Tribe, or institution

4.a. Principal officer Last name	4.b. Principal officer First name	4.c. Principal officer Middle name/ initial	4.d. Suffix

5. Principal officer title	6. Primary contact name

7.a. Business telephone number	7.b. Alternate telephone number	7.c. Business fax number	7.d. Business e-mail address

C. All applicants complete address information

1.a. Physical address (Street address, Apartment #, Suite #, or Room #; no P.O. Boxes)
(b) (6) [redacted]

1.b. City	1.c. State	1.d. Zip code/Postal code	1.e. County/Province	1.f. Country
Petersburg	WV	(b) (6) [redacted]		USA

2.a. Mailing Address (include if different than physical address, include name of contact person if applicable)
same

2.b. City	2.c. State	2.d. Zip code/Postal code.	2.e. County/Province	2.f. Country

D. All applicants MUST complete

1. Attach check or money order payable to the U.S. FISH AND WILDLIFE SERVICE **in the amount of $100, nonrefundable processing fee** Federal, Tribal, State, and local government agencies, and those acting on behalf of such agencies, are exempt from the processing fee – ***attach documentation of fee exempt status as outlined in instructions.*** (50 CFR 13.11(d))

2. Do you currently have or have you ever had any Federal Fish and Wildlife permits?
Yes ☒ If yes, list the number of the most current permit you have held or that you are applying to renew/re-issue: 15US80094B/9 No ☐

3. Certification: I hereby certify that I have read and am familiar with the regulations contained in ***Title 50, Part 13 of the Code of Federal Regulations*** and the other ***applicable parts in subchapter B of Chapter I of Title 50***, and I certify that the information submitted in this application for a permit is complete and accurate to the best of my knowledge and belief. I understand that any false statement herein may subject me to the criminal penalties of 18 U.S.C. 1001.

Signature (**in blue ink**) of applicant/person responsible for permit (No photocopied or stamped signatures) — Date of signature (mm/dd/yyyy): 12/15/2017

E. IMPORT OF SPORT-HUNTED TROPHIES OF SOUTHERN AFRICAN LEOPARD, AFRICAN ELEPHANT, AND NAMIBIAN SOUTHERN WHITE RHINOCEROS

Note 1: If you hold an import permit for trophy/trophies that you did not use, please **return the unused original permit.** If you are requesting reissuance of a permit because you have taken a trophy, but were unable to import it prior to the expiration of the permit, please use the renewal form (3-200-52; http://www.fws.gov/international/permits/by-form-number/index.html) and return your original permit with that form.

Note 2: The U.S. FWS has determined that a trophy consists of raw or tanned parts of a specimen taken by a hunter during a sport hunt for personal use. It may include the bones, claws, hair, head, hide, hooves, horns, meat, skull, teeth, tusks, or any taxidermied part, including, but not limited to, a rug or taxidermied head, shoulder, or full mount. It does not include articles made from a trophy, such as worked, manufactured, or handicraft items for use as clothing, curios, ornamentation, jewelry, or other utilitarian items. If you wish to import such products, please contact the Division of Management Authority for the proper application form.

Note 3: Certain hunting trophies, including leopard, elephant, and rhinoceros hunting trophies, are subject to restrictions on their use after import into the United States. Please see 50 CFR 23.55 for more information or contact the Division of Management Authority.

Please provide the following information. Complete all questions on the application. Mark questions that are not applicable with "N/A". If applying for more than one trophy, be sure to answer questions 2 and 3 for each trophy. If importing trophies from more than one country, you must submit a separate application for each shipment in order to obtain separate import permits.

1. ENTER the quantity next to the name of the species you are applying to import (you may apply to import specimens of more than one species provided they have been/are being hunted in the same country):

Leopard (*Panthera pardus*) Quantity: _____ (Limited to the import of two per calendar year)

African elephant (*Loxodonta africana*) Quantity: ___1___ (Import permit is not required for trophies harvested in Botswana, Namibia, South Africa, or Zimbabwe). **Note: once imported, ivory cannot be re-exported.**

Southern white rhinoceros (*Ceratotherium simum simum*) from Namibia Quantity: _____ (An import permit is not required for trophies harvested in South Africa or Swaziland. If you are looking to import from a different country, please use form 3-200-37).

2. **IF ANIMAL IS CURRENTLY LIVING IN THE WILD**, please enter the following:
   a. Country and place (area, region, GIS coordinates, ranch AND nearest city) where wildlife is to be taken from the wild:

   b. Date wildlife is to be hunted:

   c. Description of the trophy and parts you intend to import (e.g., skin, skull, shoulder mount, life size mount, claws, horns, tusks).

3. **IF THE ANIMAL IS DEAD**, please enter the following:
   a. Country and place (area, region, GIS coordinates, ranch, and/or AND nearest city) where trophy was removed from the wild: All days, Property name Mapungubwe
   b. Date wildlife was hunted: 6-23-2017

c. Description of the trophy and parts you intend to import (e.g., skin, skull, shoulder mount, life size mount, claws, horn, tusks): 2 - 4-feet and tail - 2 Ears

d. The current location of the trophy (address and country) [the U.S. import permit will identify this country as the country of export/re-export and must match with the export/re-export document]:
PLOT 114, BASHEWA P.O BOX 11526
Tigerport, Pretoria 0056 South Africa

4. Complete name and address of overseas person or business shipping the trophy to you. If you are applying to import a trophy directly from Namibia, you **must** provide the name and address of the professional hunter listed on your Namibian hunting permit [this name will appear on the face of the export permit].

Name: Rupert DEDEKIND
Business Name: Universal Trophy Services
Address: PLOT 114, BASHEWA
Address: P.O Box 11526
City: TIGERPORT, PRETORIA 0056
State/Province:
Country, Postal Code: South AFRICA

5. Please be aware that the U.S. Fish and Wildlife Service may need to make a finding that your activities will enhance or benefit wild populations of the species involved. If you have any information that could support this finding (e.g., how the funds from license/trophy fees will be spent, what portion of the hunting fee will support conservation), please submit such information on a separate page with your application.

CERTIFICATION STATEMENT (original signature must be provided for either 6 or 7 below)

6. **If you are a broker or taxidermist applying on behalf of a foreign national,** provide documentation to show you have a **Power of Attorney** to act on your client's behalf and sign the following statement.

I acknowledge that the sport-hunted trophy/trophies to be imported has been/will be personally hunted by my client and is being imported only for my client's personal use (i.e., **not for sale, transfer, donation, or exchange that is reasonably likely to result in economic use, gain, or benefit**). I understand that my client may only import two leopard trophies in one calendar year (if applicable). In addition, I have advised my client that raw ivory, once imported into the United States, cannot be re-exported.

Taxidermist/Broker's signature: _____ Date: _____

7. **If you are the hunter applying to import your own trophy**, please read and sign the following statement.

I acknowledge that the sport-hunted trophy/trophies to be imported has been/will be personally hunted by me and is being imported only for my personal use (i.e., **not for sale, transfer, donation, or exchange that is reasonably likely to result in economic use, gain, or benefit**). I understand that I may only import two leopard trophies in one calendar year (if applicable). In addition, I understand that raw ivory, once imported into the United States, cannot be re-exported.

Applicant's signature: _____ Date: 12/15/2017

Be aware that there may be additional permitting or approval requirements by your local or state governments, as well as required by other Federal agencies or foreign government to conduct your propose activity. While the Service will attempt to assist where possible, it is your responsibility to obtain such approval.

8. All international shipment(s) must be through a designated port. A list of designated ports (where an inspector is posted) is available from http://www.fws.gov/le/designated-ports.html. If you wish to use a port not listed, please contact the Office of Law Enforcement for a Designated Port Exemption Permit (form 3-200-2).

Catherine Cockey, Wildlife Inspector 410-694-9590
BWI Air Cargo Complex
Building F, Suite 1500 Baltimore MD 21240

9. Name and address where you wish the permit to be mailed, if different from page 1 (All permits will be mailed via the U.S. Postal Service, unless you identify an alternative means below):

10. If you wish the permit to be delivered by means other than USPS regular mail, provide an air bill, pre-paid envelope, or billing information. If you do not have a pre-paid envelope or air bill and wish to pay for a courier service with your credit card, please check the box below. Please DO NOT include credit card number or other information; you will be contacted for this information.

☐ If a permit is issued, please send it via a courier service to the address on page 1 or question 9. I understand that you will contact me for my credit card information once the application has been processed.

11. Who should we contact if we have questions about the application? (Include name, phone number, and email):

12. **Disqualification Factor.** A conviction, or entry of a plea of guilty or nolo contendere, for a felony violation of the Lacey Act, the Migratory Bird Treaty Act, or the Bald and Golden Eagle Protection Act disqualifies any such person from receiving or exercising the privileges of a permit, unless such disqualification has been expressly waived by the Service Director in response to a written petition. (50 CFR 13.21(c)) Have you or any of the owners of the business, if applying as a business, been convicted, or entered a plea of guilty or nolo contendere, forfeited collateral, or are currently under charges for any violations of the laws mentioned above?

☐ Yes ☑ No If you answered "Yes" provide: a) the individual's name, b) date of charge, c) charge(s), d) location of incident, e) court, and f) action taken for each violation.

E. IMPORT OF SPORT-HUNTED TROPHIES *(Appendix I of CITES and/or ESA)*

Note 1: This form should be used to request authorization to import trophies of species listed on Appendix I of CITES and/or as threatened or endangered under the ESA (examples include elephants, lions, cheetahs, wood bison, and markhor).

PLEASE USE FORM 3-200-19 FOR SOUTHERN AFRICAN LEOPARD TROPHIES AND SOUTHERN WHITE RHINOCEROS TROPHIES TAKEN IN NAMIBIA.

Note 2: If you hold an import permit for trophy/trophies that you did not use, please **return the unused original permit**. If you are requesting reissuance of a permit because you have taken a trophy, but were unable to import it prior to the expiration of the permit, please use the renewal form (3-200-52) and return your original permit with that form.

Note 3: Applications for species listed as endangered under the U.S. Endangered Species Act are published in the Federal Register for a 30-day public comment period. Please allow at least **90 days** for the application to be processed.

Note 4: *Sport-hunted trophy* is defined at 50 CFR 23.74 as follows: *Sport-hunted trophy* means a whole dead animal or a readily recognizable part or derivative of an animal specifically identified on the accompanying CITES document that meets the following criteria:

- Is raw, processed, or manufactured;
- Was legally obtained by the hunter through hunting for his or her personal use;
- Is being imported, exported, or re-exported by or on behalf of the hunter as part of the transfer from its country of origin ultimately to the hunter's country of usual residence; and
- Includes worked, manufactured, or handicraft items made from the sport-hunted animal only when:
  - i. Such items are contained in the same shipment as raw or tanned parts of the sport-hunted animal and are for the personal use of the hunter;
  - ii. The quantity of such items is no more than could reasonably be expected given the number of animals taken by the hunter as shown on the license or other documentation of the authorized hunt accompanying the shipment; and
  - iii. The accompanying CITES documents (export document and, if appropriate, import permit) contain a complete itemization and description of all items included in the shipment.

Note 5: Certain hunting trophies, including elephants, are subject to restrictions on their use after import into the United States. Please see 50 CFR 23.55 for more information or contact the Division of Management Authority.

Please provide the following information. Complete all questions on the application. Mark questions that are not applicable with "N/A". If needed, use a separate sheet of paper. On all attachments or separate sheets you are submitting; please indicate the application question number you are addressing. If applying for more than one trophy, be sure to answer questions 1-6 for each trophy addressed in this application. If importing trophies from more than one country, you must submit a separate application for each shipment in order to obtain separate import permits.

1. Name and address where you wish the permit to be mailed, if different from page 1. If you would like expedited shipping, please enclose a self-addressed, pre-paid, computer-generated, courier service airway bill. If unspecified, all documents will be mailed via the U.S. Postal Service.

   same

2. Who should we contact if we have questions about the application (name, phone number, and e-mail)?

   John (b) Lott (b) (6) [redacted]

3. Have you or your client (if a broker applying on behalf of your client), been assessed a civil penalty or convicted of any criminal provision of any statute or regulation relating to the activity for which the application is filed; been convicted, or entered a plea of guilty or nolo contendere, for a felony violation of the Lacey Act, the Migratory Bird Treaty Act, or the Bald and Golden Eagle Protection Act; forfeited collateral; OR are currently under charges for any violation of the laws mentioned above?

XXXX XXXX Yes

If you answered "Yes" to Question 3, provide: a) the individual's name; b) date of charge; c) charge(s); d) location of incident; e) court, and f) action taken for each violation. Please be aware that a "Yes" response does not automatically disqualify you from getting a permit.

4. For each trophy to be imported, provide:

   a. Scientific name (genus, species, and, if applicable, subspecies) and common name. Loxodonta Africana African elephant

   b. Sex (if known). Male

5. **IF ANIMAL IS CURRENTLY LIVING IN THE WILD**, please enter the following information:

   a. Country and place (area, region, GIS coordinates, ranch, conservancy, management area, or hunting block, AND nearest city) where wildlife is to be taken from the wild:

   NA

   b. Date wildlife is to be hunted:

   NA

   c. Name of hunting outfitter, safari company, or professional hunter you will be hunting with:

   NA

6. IF THE TROPHY HAS ALREADY BEEN TAKEN, please enter the following:

   a. Country and place (area, region, GIS coordinates, ranch, conservancy, management area, or hunting block, AND nearest city) where trophy was removed from the wild:

   country NAMIBIA, place Dzoti Conservancy, Zambezi Region(Conservancy Office GIS coord. S18 16'48.97"/E23 47'42.93")
   nearest city Katima Mulilo GIS coord.: S 18 19'33.45" / E 23 43'14.05"

   b. Date wildlife was hunted:

   September 10, 2017

c. Name of hunting outfitter, safari company, or professional hunter you hunted with:

outfitter : Ondjou Safaris cc
Professional Hunter : Barend Hendrik van Heerden

d. The current location of the trophy (address and country) [the U.S. import permit will identify this country as the country of export/re-export and must match with the export/re-export document]:

Postal Address: P.O. Box 21068 Windhoek, NAMIBIA
Residential address: Kappsfarm,Plot # 16, Khomas Region, NAMIBIA

7. Please provide a copy of any applicable foreign government permits or licenses that were required to remove this animal from the wild (if you have not hunted yet and do not currently hold any such permits or licenses, please indicate so). see attachments

8. Complete name and address of overseas person or business shipping the trophy to you. If you are applying to import a trophy directly from Namibia, you must provide the name and address of the professional hunter listed on your Namibian hunting permit [this name will appear on the face of the export permit].

Name: Barend Hendrick van Heerden
Business Name: Ondjou Safaris cc
Address: P.O. Box 30208 Pionierspark,Windhoek, NAMIBIA / residential(office) Farm Augeigas # 34 Portion of Plot 17
City: Windhoek
State/Province: Khomas Region
Country, Postal Code: NAMIBIA

9. For species listed under the Endangered Species Act, please be aware that the U.S. Fish and Wildlife Service must make a finding that your activities will enhance or benefit wild populations of the species involved. While we will communicate with the range country for the species you will hunt or hunted when making the required findings, if you have any information that could support this finding, it would be helpful to our review if you could provide it. Please submit such information on a separate page with your application.

a. Do you have any information regarding the population status or trend data on the species hunted? yes
regional game counts taken twice yearly. For Dzoti the first game counts were done in 2010 and ever since two per year.
The game guards have monthly patrols were game encountered are recorded and the population trend is stable. I encountered several different herds of thirty plus elephants.

b. In order to hunt, you likely paid for licenses or trophy fees. What were those fees and do you have any information on how those funds were used by either the landowner, community, or government?
Daily rate total USD 24,000, trophy fee elephant USD 28,000. Yes, a big portion of the funds were used for conservancy,staff,salaries, anti-poaching effort(transport,wages,etc.),drill multiple wells(waterholes) for wildlife as well for the community, supporting local schools, soccer and sports teams, and the funding of the local game guards

c. Do you have information on other funding activities that are being carried out, or were carried out, by the safari outfitter, professional hunter, concession holder, or land owner that provide a conservation benefit to the species being hunted/species hunted
yes, they made donations toward carnivore zensus in the region, constant support and donation towards ongoing research in the region and enviormental awareness campaigns at the local schools (see pictures)

CERTIFICATION STATEMENT (original signature must be provided for either 10 or 11 below)

10. If you are a broker or taxidermist applying on behalf of a U.S. hunter or foreign national, provide documentation to show you have a Power of Attorney to act on your client's behalf and sign the following statement.

I acknowledge that the sport-hunted trophy/trophies to be imported has been/will be personally hunted by my client and is being imported only for my client's personal use (i.e., not for sale, transfer, donation, or exchange that is reasonably likely to result in economic use, gain, or benefit). If applying for the import of a leopard trophy, I understand that my client may only import two leopard trophies in one calendar year.

Taxidermist/Broker's signature: NA Date: _____

11. If you are the hunter applying to import your own trophy, please read and sign the following statement.

I acknowledge that the sport-hunted trophy/trophies to be imported has been/will be personally hunted by me and is being imported only for my personal use (i.e., not for sale, transfer, donation, or exchange that is reasonably likely to result in economic use, gain, or benefit). If applying to import a leopard trophy, I understand that I may only import two leopard trophies in one calendar year.

Applicant's signature: (b)(6) Date: 3-14-2018

Be aware that there may be additional permitting or approval requirements by your local or state governments, as well as required by other Federal agencies or foreign government to conduct your propose activity. While the Service will attempt to assist where possible, it is your responsibility to obtain such approval.

12. All international shipment(s) must be through a designated port. A list of designated ports (where an inspector is posted) is available from **the list of designated ports**. If you wish to use a port not listed, please contact the Office of Law Enforcement for a Designated Port Exemption Permit (form 3-200-2).

following certificate must be completed immediately after each animal that has been hunted (please print)

RCVD JAN 17 2018

Complete Sections A or B, and C, D, and E of this application. U.S. address may be required in Section C, see instructions for details.
See attached instruction pages for information on how to make your application complete and help avoid unnecessary delays.

A. Complete if applying as an individual

1.a. Last name	1.b. First name	1.c. Middle name or initial	1.d. Suffix
Campagna	Jeffrey	(b) (6)	

2. Date of birth (mm/dd/yyyy)	3. Occupation	4. Affiliation/ Doing business as (see instr
(b) (6)		

5.a. Telephone number	5.b. Alternate telephone number	5.c. Fax number	5.d. E-mail address
(b) (6)			(b) (6)

B. Complete if applying on behalf of a business, corporation, public agency, Tribe, or institution

1.a. Name of business, agency, Tribe, or institution	1.b. Doing business as (dba)

2. Tax identification no.	3. Description of business, agency, Tribe, or institution

4.a. Principal officer Last name	4.b. Principal officer First name	4.c. Principal officer Middle name/ initial	4.d. Suffix

5. Principal officer title	6. Primary contact name

7.a. Business telephone number	7.b. Alternate telephone number	7.c. Business fax number	7.d. Business e-mail address

C. All applicants complete address information

1.a. Physical address (Street address; Apartment #, Suite #, or Room #; no P.O. Boxes)
(b) (6)

1.b. City	1.c. State	1.d. Zip code/Postal code:	1.e. County/Province	1.f. Country
Moline	IL	(b) (6)		USA

2.a. Mailing Address (include if different than physical address; include name of contact person if applicable)
same

2.b. City	2.c. State	2.d. Zip code/Postal code:	2.e. County/Province	2.f. Country

D. All applicants MUST complete

1. Attach check or money order payable to the U.S. FISH AND WILDLIFE SERVICE **in the amount of $100, nonrefundable processing fee**. Federal, Tribal, State, and local government agencies, and those acting on behalf of such agencies, are exempt from the processing fee – ***attach documentation of fee exempt status as outlined in instructions.*** (50 CFR 13.11(d))

2. Do you currently have or have you ever had any Federal Fish and Wildlife permits?
Yes ☐ If yes, list the number of the most current permit you have held or that you are applying to renew/re-issue:_____ No ☑

3. Certification: I hereby certify that I have read and am familiar with the regulations contained in ***Title 50, Part 13 of the Code of Federal Regulations*** and the other ***applicable parts in subchapter B of Chapter I of Title 50***, and I certify that the information submitted in this application for a permit is complete and accurate to the best of my knowledge and belief. I understand that any false statement herein may subject me to the criminal penalties of 18 U.S.C. 1001.

Signature of applicant/person responsible for permit (No photocopied or stamped signatures) — Date of signature (mm/dd/yyyy): 1-9-18

E. IMPORT OF SPORT-HUNTED TROPHIES OF SOUTHERN AFRICAN LEOPARD, AFRICAN ELEPHANT, AND NAMIBIAN SOUTHERN WHITE RHINOCEROS

Note 1: If you hold an import permit for a trophy/trophies that you did not use, please **return the unused original permit.** If you are requesting reissuance of a permit because you have taken a trophy, but were unable to import it prior to the expiration of the permit, please use the renewal form (3-200-52; http://www.fws.gov/international/permits/by-form-number/index.html) and return your original permit with that form.

Note 2: *Sport-hunted trophy* is defined at 50 CFR 23.74 as follows: *Sport-hunted trophy* means a whole dead animal or a readily recognizable part or derivative of an animal specifically identified on the accompanying CITES document that meets the following criteria:

(1) Is raw, processed, or manufactured;
(2) Was legally obtained by the hunter through hunting for his or her personal use;
(3) Is being imported, exported, or re-exported by or on behalf of the hunter as part of the transfer from its country of origin ultimately to the hunter's country of usual residence; and
(4) Includes worked, manufactured, or handicraft items made from the sport-hunted animal only when:
(i) Such items are contained in the same shipment as raw or tanned parts of the sport-hunted animal and are for the personal use of the hunter;
(ii) The quantity of such items is no more than could reasonably be expected given the number of animals taken by the hunter as shown on the license or other documentation of the authorized hunt accompanying the shipment; and
(iii) The accompanying CITES documents (export document and, if appropriate, import permit) contain a complete itemization and description of all items included in the shipment.

Note 3: Certain hunting trophies, including leopard, elephant, and rhinoceros hunting trophies, are subject to restrictions on their use after import into the United States. Please see 50 CFR 23.55 for more information or contact the Division of Management Authority.

Please provide the following information. Complete all questions on the application. Mark questions that are not applicable with "N/A". If applying for more than one trophy, be sure to answer questions 2 and 3 for each trophy.

If importing trophies from more than one country, you must submit a separate application for each shipment in order to obtain separate import permits.

1. ENTER the quantity next to the name of the species you are applying to import (you may apply to import specimens of more than one species provided they have been/are being hunted in the same country):

Leopard (*Panthera pardus*) Quantity:_____(Import is limited to two per hunter per calendar year)

African elephant (*Loxodonta africana*) Quantity:__1__(Import is limited to two per hunter per calendar year)
Note: once imported, ivory cannot be re-exported.

Southern white rhinoceros (*Ceratotherium simum simum*) from Namibia Quantity:_____ (An import permit is not required for trophies harvested in South Africa or Swaziland. If you wish to import from a different country, please use form 3-200-37).

2. **IF ANIMAL IS CURRENTLY LIVING IN THE WILD,** please enter the following:
   a. Country and place (area, region, GIS coordinates, ranch AND nearest city) where wildlife is to be taken from the wild:

   b. Date wildlife is to be hunted:

c. Description of the trophy and parts you intend to import (e.g., skin, skull, shoulder mount, life size mount, claws, horns, tusks).

3. **IF THE ANIMAL IS DEAD**, please enter the following:
   a. Country and place (area, region, GIS coordinates, ranch, and/or AND nearest city) where trophy was removed from the wild:

   b. Date wildlife was hunted: Zimbabwe, South-East, Masvingo Province, 21,29'53 S"/30,47'02 E", Nuanetsi Ranch, Masvingo
   July 03, 2014
   c. Description of the trophy and parts you intend to import (e.g., skin, skull, shoulder mount, life size mount, claws, horn, tusks):

      2 Tusks, 2 Panels, 2 Feet, 1 Tail, 2 Ears

   d. The current location of the trophy (address and country) [the U.S. import permit will identify this country as the country of export/re-export and must match with the export/re-export document]:

      733 Iona Close, Harare, Borrowdale, BW957, Zimbabwe

4. Complete name and address of overseas person or business shipping the trophy to you. If you are applying to import a trophy directly from Namibia, you **must** provide the name and address of the professional hunter listed on your Namibian hunting permit [this name will appear on the face of the export permit].

Name: Business	Safari Air Services
Name: Address:	
Address:	733 Iona Close
City:	Harare
State/Province:	Borrowdale
Country, Postal Code:	BW957 Zimbabwe

5. Please be aware that the U.S. Fish and Wildlife Service may need to make a finding that your activities will enhance or benefit wild populations of the species involved. If you have any information that could support this finding (e.g., how the funds from license/trophy fees will be spent, what portion of the hunting fee will support conservation), please submit such information on a separate page with your application.

CERTIFICATION STATEMENT (original signature must be provided for either 6 or 7 below)

6. **If you are a broker or taxidermist applying on behalf of a foreign national,** provide documentation to show you have a **Power of Attorney** to act on your client's behalf and sign the following statement.

   I acknowledge that the sport-hunted trophy/trophies to be imported has been/will be personally hunted by my client and is being imported only for my client's personal use (i.e., **not for sale, transfer, donation, or exchange that is reasonably likely to result in economic use, gain, or benefit**). I understand that my client may only import two leopard trophies in one calendar year. I understand that my client may only import two African elephant trophies in one calendar year. In addition, I have advised my client that raw ivory, once imported into the United States, cannot be re-exported.

   Taxidermist/Broker's signature:_____ Date: _____

7. **If you are the hunter applying to import your own trophy,** please read and sign the following statement.

I acknowledge that the sport-hunted trophy/trophies to be imported has been/will be personally hunted by me and is being imported only for my personal use (i.e., **not for sale, transfer, donation, or exchange that is reasonably likely to result in economic use, gain, or benefit**). I understand that I may only import two leopard trophies in one calendar year. I understand that I may only import two African elephant trophies in one calendar year. In addition, I understand that raw ivory, once imported into the United States, cannot be re-exported.

Applicant's signature: Date: 1-9-18

Be aware that there may be additional permitting or approval requirements by your local or state governments, as well as required by other Federal agencies or foreign government to conduct your propose activity. While the Service will attempt to assist where possible, it is your responsibility to obtain such approval.

8. All international shipment(s) must be through a designated port. A list of designated ports (where an inspector is posted) is available from http://www.fws.gov/le/designated-ports.html. If you wish to use a port not listed, please contact the Office of Law Enforcement for a Designated Port Exemption Permit (form 3-200-2).

9. Name and address where you wish the permit to be mailed, if different from page 1 (All permits will be mailed via the U.S. Postal Service, unless you identify an alternative means below):

10. If you wish the permit to be delivered by means other than USPS regular mail, provide an air bill, pre-paid envelope, or billing information. If you do not have a pre-paid envelope or air bill and wish to pay for a courier service with your credit card, please check the box below. Please DO NOT include credit card number or other information; you will be contacted for this information.

☐ If a permit is issued, please send it via a courier service to the address on page 1 or question 9. I understand that you will contact me for my credit card information once the application has been processed.

11. Who should we contact if we have questions about the application? (Include name, phone number, and email):

Jeff Campagna (b) (6)

12. **Disqualification Factor**. A conviction, or entry of a plea of guilty or nolo contendere, for a felony violation of the Lacey Act, the Migratory Bird Treaty Act, or the Bald and Golden Eagle Protection Act disqualifies any such person from receiving or exercising the privileges of a permit, unless such disqualification has been expressly waived by the Service Director in response to a written petition. (50 CFR 13.21(c)) Have you or any of the owners of the business, if applying as a business, been convicted, or entered a plea of guilty or nolo contendere, forfeited collateral, or are currently under charges for any violations of the laws mentioned above?

☐ Yes ☑ No If you answered "Yes" provide: a) the individual's name, b) date of charge, c) charge(s), d) location of incident, e) court, and f) action taken for each violation.

E. IMPORT OF SPORT-HUNTED TROPHIES OF SOUTHERN AFRICAN LEOPARD, AFRICAN ELEPHANT, AND NAMIBIAN SOUTHERN WHITE RHINOCEROS

Note 1: If you hold an import permit for a trophy/trophies that you did not use, please **return the unused original permit.** If you are requesting reissuance of a permit because you have taken a trophy, but were unable to import it prior to the expiration of the permit, please use the renewal form (3-200-52; http://www.fws.gov/international/permits/by-form-number/index.html) and return your original permit with that form.

Note 2: *Sport-hunted trophy* is defined at 50 CFR 23.74 as follows: *Sport-hunted trophy* means a whole dead animal or a readily recognizable part or derivative of an animal specifically identified on the accompanying CITES document that meets the following criteria:

(1) Is raw, processed, or manufactured;
(2) Was legally obtained by the hunter through hunting for his or her personal use;
(3) Is being imported, exported, or re-exported by or on behalf of the hunter as part of the transfer from its country of origin ultimately to the hunter's country of usual residence; and
(4) Includes worked, manufactured, or handicraft items made from the sport-hunted animal only when:
  (i) Such items are contained in the same shipment as raw or tanned parts of the sport-hunted animal and are for the personal use of the hunter;
  (ii) The quantity of such items is no more than could reasonably be expected given the number of animals taken by the hunter as shown on the license or other documentation of the authorized hunt accompanying the shipment; and
  (iii) The accompanying CITES documents (export document and, if appropriate, import permit) contain a complete itemization and description of all items included in the shipment.

Note 3: Certain hunting trophies, including leopard, elephant, and rhinoceros hunting trophies, are subject to restrictions on their use after import into the United States. Please see 50 CFR 23.55 for more information or contact the Division of Management Authority.

Please provide the following information. Complete all questions on the application. Mark questions that are not applicable with "N/A". If applying for more than one trophy, be sure to answer questions 2 and 3 for each trophy.

If importing trophies from more than one country, you must submit a separate application for each shipment in order to obtain separate import permits.

1. ENTER the quantity next to the name of the species you are applying to import (you may apply to import specimens of more than one species provided they have been/are being hunted in the same country):

Leopard (*Panthera pardus*) Quantity: N/A (Import is limited to two per hunter per calendar year)

African elephant (*Loxodonta africana*) Quantity: One (1) (Import is limited to two per hunter per calendar year)
Note: once imported, ivory cannot be re-exported.

Southern white rhinoceros (*Ceratotherium simum simum*) from Namibia Quantity: N/A (An import permit is not required for trophies harvested in South Africa or Swaziland. If you wish to import from a different country, please use form 3-200-37).

2. **IF ANIMAL IS CURRENTLY LIVING IN THE WILD,** please enter the following:
   a. Country and place (area, region, GIS coordinates, ranch AND nearest city) where wildlife is to be taken from the wild:

   Sentinel Limpopo Safaris, Wape Ranch, Mwenezi, Masvingo Province, Zimbabwe
   21°59'13.25"S, 30°53'37.13"E

   b. Date wildlife is to be hunted:

   September 14, 2018-September 28, 2018

c. Description of the trophy and parts you intend to import (e.g., skin, skull, shoulder mount, life size mount, claws, horns, tusks).

Tusks, Hide, Ears, Skull

3. **IF THE ANIMAL IS DEAD**, please enter the following:
   a. Country and place (area, region, GIS coordinates, ranch, and/or AND nearest city) where trophy was removed from the wild:

   b. Date wildlife was hunted: N/A

   c. Description of the trophy and parts you intend to import (e.g., skin, skull, shoulder mount, life size mount, claws, horn, tusks):

   N/A

   d. The current location of the trophy (address and country) [the U.S. import permit will identify this country as the country of export/re-export and must match with the export/re-export document]:

   N/A

4. Complete name and address of overseas person or business shipping the trophy to you. If you are applying to import a trophy directly from Namibia, you **must** provide the name and address of the professional hunter listed on your Namibian hunting permit [this name will appear on the face of the export permit].

Name: Business	Collett's Wildlife Artistry
Name: Address:	15 Josiah Chinamano Road
Address:	
City:	Bulawayo
State/Province:	Belmont
Country, Postal Code:	Zimbabwe

5. Please be aware that the U.S. Fish and Wildlife Service may need to make a finding that your activities will enhance or benefit wild populations of the species involved. If you have any information that could support this finding (e.g., how the funds from license/trophy fees will be spent, what portion of the hunting fee will support conservation), please submit such information on a separate page with your application.

CERTIFICATION STATEMENT (original signature must be provided for either 6 or 7 below)

6. **If you are a broker or taxidermist applying on behalf of a foreign national,** provide documentation to show you have a **Power of Attorney** to act on your client's behalf and sign the following statement.

   I acknowledge that the sport-hunted trophy/trophies to be imported has been/will be personally hunted by my client and is being imported only for my client's personal use (i.e., **not for sale, transfer, donation, or exchange that is reasonably likely to result in economic use, gain, or benefit**). I understand that my client may only import two leopard trophies in one calendar year. I understand that my client may only import two African elephant trophies in one calendar year. In addition, I have advised my client that raw ivory, once imported into the United States, cannot be re-exported.

   Taxidermist/Broker's signature:_____ Date: _____

7. **If you are the hunter applying to import your own trophy**, please read and sign the following statement.

I acknowledge that the sport-hunted trophy/trophies to be imported has been/will be personally hunted by me and is being imported only for my personal use (i.e., **not for sale, transfer, donation, or exchange that is reasonably likely to result in economic use, gain, or benefit**). Mr Lou Wickas
(b) (6)
Gallipolis, OHIO, (b) (6) **USA**

Date: 20 January 2018

Dear Lou

RE: INVITATION TO HUNT

This letter serves to confirm that you have booked to stay with Sentinel Limpopo Safaris on Wape Ranch, Mwenezi, in September 2018 to hunt Elephant (M), Leopard (M), and Buffalo (M) and other Plainsgame species.

We confirm your itinerary as follows:

- You will be met in Bulawayo (BUQ) on 13 September 2018 and travel by road to Wape Ranch, Mwenezi.
- Your hunt (14 days) will take place from 14-27 September 2018.
- We will return you to Bulawayo on 28 September 2018 from where you will start your return journey to the United States.

With reference to the CITES listed species you will be hunting (Elephant and Leopard) please rest assured that

a) A quota for each of these species has been applied for and approved by the Zimbabwe National Parks and Wildlife Management Authority, specific to Wape Ranch, and that your hunt is within the confines of said quota, and
b) Your daily rate and trophy fees for your hunt go directly towards the maintenance and conservation of the animals and the natural habitat of the 6,000Ha property on which you will be hunting. These funds are used to maintain electric fences (designed to meet Veterinary-specifications to contain FMD Buffalo), to maintain and operate a number of waterpoints and to equip and provide for a 5-man anti-poaching team year round. Elephants numbers in particular must be controlled/ reduced, as at present numbers, they exceed the carrying capacity of the ranch, and do a great deal of damage to infrastructure (waterpoints, pumps and external fences) and have a visible negative impact on large indigenous tree species (Albizia breviflora, Acacia senegal, Commiphora merkeri, Combretum imberbe, Commiphora tenuipetiolata, Acacia xanthophloea, Hyphaene petersiana, Sclerocarya

birrea, Kirkia acuminata, Ficus sycamorous and Colophospermum mopane, to name a few). Without creating a value through hunting, these animals would more than likely have to be culled.

We thank you for booking your hunt with Sentinel Limpopo Safaris, and look forward to sharing the campfire with you once again.

Kind regards

VANESSA B BRISTOW
DIRECTOR - SENTINEL LIMPOPO SAFARIS (Reg. No. HOP0101)

Type of Activity:
Import of Sport-hunted Trophies of Southern African Leopard, African Elephant, and Namibian Southern White Rhinoceros

Complete Sections A or B, and C, D, and E of this application. U.S. address may be required in Section C, see instructions for details.
See attached instruction pages for information on how to make your application complete and help avoid unnecessary delays.

A. Complete if applying as an individual

1.a. Last name	1.b. First name	1.c. Middle name or initial	1.d Suffix
Benben	Michael	(b) (6)	

2. Date of birth (mm/dd/yyyy)	3. Social Security No.	4. Occupation	5. Affiliation/ Doing business as (see instructions)
(b) (6)			N/A

6.a. Telephone number	6.b. Alternate telephone number	6.c. Fax number	6.d. E-mail address
(b) (6)		(b) (6)	

B. Complete if applying on behalf of a business, corporation, public agency, Tribe, or institution

1.a. Name of business, agency, Tribe, or institution	1.b. Doing business as (dba)
N/A	N/A

2. Tax identification no.	3. Description of business, agency, Tribe, or institution
N/A	N/A

4.a. Principal officer Last name	4.b. Principal officer First name	4.c. Principal officer Middle name/ initial	4.d. Suffix
N/A	N/A	N/A	

5. Principal officer title	6. Primary contact name
N/A	N/A

7.a. Business telephone number	7.b. Alternate telephone number	7.c. Business fax number	7.d. Business e-mail address
N/A	N/A	N/A	N/A

C. All applicants complete address information

1.a. Physical address (Street address; Apartment #, Suite #, or Room #; no P.O. Boxes)
(b) (6)

1.b. City	1.c. State	1.d. Zip code/Postal code	1.e. County/Province	1.f. Country
Racine	WI	(b) (6)		USA

2.a. Mailing Address (include if different than physical address, include name of contact person if applicable)
Same - contact (b) (6)

2.b. City	2.c. State	2.d. Zip code/Postal code	2.e. County/Province	2.f. Country

D. All applicants MUST complete

1. Attach check or money order payable to the U.S. FISH AND WILDLIFE SERVICE **in the amount of $100, nonrefundable processing fee.** Federal, Tribal, State, and local government agencies, and those acting on behalf of such agencies, are exempt from the processing fee – ***attach documentation of fee exempt status as outlined in instructions.*** (50 CFR 13.11(d))

2. Do you currently have or have you ever had any Federal Fish and Wildlife permits?
Yes ☒ If yes, list the number of the most current permit you have held or that you are applying to renew/re-issue: from 1989- don't know number No ☐

3. Certification I hereby certify that I have read and am familiar with the regulations contained in ***Title 50, Part 13 of the Code of Federal Regulations*** and the other ***applicable parts in subchapters B of Chapter I of Title 50***, and I certify that the information submitted in this application for a permit is complete and accurate to the best of my knowledge and belief. I understand that any false statement herein may subject me to the criminal penalties of 18 U.S.C. 1001.

Signature (in blue ink) of applicant/person responsible for permit (No photocopied or stamped signatures) — Date of signature (mm/dd/yyyy): 3/14/2018

E. IMPORT OF SPORT-HUNTED TROPHIES OF SOUTHERN AFRICAN LEOPARD, AFRICAN ELEPHANT, AND NAMIBIAN SOUTHERN WHITE RHINOCEROS

Note 1: If you hold an import permit for trophy/trophies that you did not use, please **return the unused original permit.** If you are requesting reissuance of a permit because you have taken a trophy, but were unable to import it prior to the expiration of the permit, please use the renewal form (3-200-52; http://www.fws.gov/international/permits/by-form-number/index.html) and return your original permit with that form.

Note 2: The U.S. FWS has determined that a trophy consists of raw or tanned parts of a specimen taken by a hunter during a sport hunt for personal use. It may include the bones, claws, hair, head, hide, hooves, horns, meat, skull, teeth, tusks, or any taxidermied part, including, but not limited to, a rug or taxidermied head, shoulder, or full mount. It does not include articles made from a trophy, such as worked, manufactured, or handicraft items for use as clothing, curios, ornamentation, jewelry, or other utilitarian items. If you wish to import such products, please contact the Division of Management Authority for the proper application form.

Note 3: Certain hunting trophies, including leopard, elephant, and rhinoceros hunting trophies, are subject to restrictions on their use after import into the United States. Please see 50 CFR 23.55 for more information or contact the Division of Management Authority.

Please provide the following information. Complete all questions on the application. Mark questions that are not applicable with "N/A". If applying for more than one trophy, be sure to answer questions 2 and 3 for each trophy. If importing trophies from more than one country, you must submit a separate application for each shipment in order to obtain separate import permits.

1: ENTER the quantity next to the name of the species you are applying to import (you may apply to import specimens of more than one species provided they have been/are being hunted in the same country):

Leopard (*Panthera pardus*) Quantity: _____ (Limited to the import of two per calendar year)

African elephant (*Loxodonta africana*) Quantity: 1 (Import permit is not required for trophies harvested in Botswana, Namibia, South Africa, or Zimbabwe). **Note: once imported, ivory cannot be re-exported.**

Southern white rhinoceros (*Ceratotherium simum simum*) from Namibia Quantity: _____ (An import permit is not required for trophies harvested in South Africa or Swaziland. If you are looking to import from a different country, please use form 3-200-37).

2. **IF ANIMAL IS CURRENTLY LIVING IN THE WILD,** please enter the following:
   a. Country and place (area, region, GIS coordinates, ranch AND nearest city) where wildlife is to be taken from the wild: Zimbabwe, Matabeleland South, Bubye Valley Conservancy, Beit Bridge(nearest town)

   b. Date wildlife is to be hunted:
   May 20, 2018 thru June 4, 2018

   c. Description of the trophy and parts you intend to import (e.g., skin, skull, shoulder mount, life size mount, claws, horns, tusks).
   skull, Tusks and skin

3. **IF THE ANIMAL IS DEAD,** please enter the following:
   a. Country and place (area, region, GIS coordinates, ranch, and/or AND nearest city) where trophy was removed from the wild: N/A

   b. Date wildlife was hunted:

c. Description of the trophy and parts you intend to import (e.g., skin, skull, shoulder mount, life size mount, claws, horn, tusks):

N/A

d. The current location of the trophy (address and country) [the U.S. import permit will identify this country as the country of export/re-export and must match with the export/re-export document]:

N/A

4. Complete name and address of overseas person or business shipping the trophy to you. If you are applying to import a trophy directly from Namibia, you **must** provide the name and address of the professional hunter listed on your Namibian hunting permit [this name will appear on the face of the export permit].

Name: Mazunga Safaris
Business Name:
Address: 8 Norfolk Road Hillside
Address:
City: Bulawayo
State/Province: Zimbabwe
Country, Postal Code: Africa

5. Please be aware that the U.S. Fish and Wildlife Service may need to make a finding that your activities will enhance or benefit wild populations of the species involved. If you have any information that could support this finding (e.g., how the funds from license/trophy fees will be spent, what portion of the hunting fee will support conservation), please submit such information on a separate page with your application.

CERTIFICATION STATEMENT (original signature must be provided for either 6 or 7 below)

6. **If you are a broker or taxidermist applying on behalf of a foreign national,** provide documentation to show you have a **Power of Attorney** to act on your client's behalf and sign the following statement.

I acknowledge that the sport-hunted trophy/trophies to be imported has been/will be personally hunted by my client and is being imported only for my client's personal use (i.e., **not for sale, transfer, donation, or exchange that is reasonably likely to result in economic use, gain, or benefit**). I understand that my client may only import two leopard trophies in one calendar year (if applicable). In addition, I have advised my client that raw ivory, once imported into the United States, cannot be re-exported.

Taxidermist/Broker's signature: N/A Date: _____

7. **If you are the hunter applying to import your own trophy,** please read and sign the following statement.

I acknowledge that the sport-hunted trophy/trophies to be imported has been/will be personally hunted by me and is being imported only for my personal use (i.e., **not for sale, transfer, donation, or exchange that is reasonably likely to result in economic use, gain, or benefit**). I understand that I may only import two leopard trophies in one calendar year (if applicable). In addition, I understand that raw ivory, once imported into the United States, cannot be re-exported.

Applicant's signature: _____ Date: 3/14/2018

Be aware that there may be additional permitting or approval requirements by your local or state governments, as well as required by other Federal agencies or foreign government to conduct your propose activity. While the Service will attempt to assist where possible, it is your responsibility to obtain such approval.

8. All international shipment(s) must be through a designated port. A list of designated ports (where an inspector is posted) is available from http://www.fws.gov/le/designated-ports.html. If you wish to use a port not listed, please contact the Office of Law Enforcement for a Designated Port Exemption Permit (form 3-200-2).
Port - Chicago, IL USA
Contact Mike Lewis @ Coppersmith Inc. 760 Bonnie Lane
Elk Grove Village, IL 60007 Phone: 847-437-1500 Ext 220

9. Name and address where you wish the permit to be mailed, if different from page 1 (All permits will be mailed via the U.S. Postal Service, unless you identify an alternative means below):

10. If you wish the permit to be delivered by means other than USPS regular mail, provide an air bill, pre-paid envelope, or billing information. If you do not have a pre-paid envelope or air bill and wish to pay for a courier service with your credit card, please check the box below. Please DO NOT include credit card number or other information; you will be contacted for this information.

☐ If a permit is issued, please send it via a courier service to the address on page 1 or question 9. I understand that you will contact me for my credit card information once the application has been processed.

11. Who should we contact if we have questions about the application? (Include name, phone number, and email):
Michael (b)(6) Benben cell: (b)(6)
email: [redacted]

12. **Disqualification Factor.** A conviction, or entry of a plea of guilty or nolo contendere, for a felony violation of the Lacey Act, the Migratory Bird Treaty Act, or the Bald and Golden Eagle Protection Act disqualifies any such person from receiving or exercising the privileges of a permit, unless such disqualification has been expressly waived by the Service Director in response to a written petition. (50 CFR 13.21(c)) Have you or any of the owners of the business, if applying as a business, been convicted, or entered a plea of guilty or nolo contendere, forfeited collateral, or are currently under charges for any violations of the laws mentioned above?

☐ Yes ☒ No If you answered "Yes" provide: a) the individual's name, b) date of charge, c) charge(s), d) location of incident, e) court, and f) action taken for each violation.

E. IMPORT OF SPORT-HUNTED TROPHIES OF SOUTHERN AFRICAN LEOPARD, AFRICAN ELEPHANT, AND NAMIBIAN SOUTHERN WHITE RHINOCEROS

Note 1: If you hold an import permit for a trophy/trophies that you did not use, please **return the unused original permit.** If you are requesting reissuance of a permit because you have taken a trophy, but were unable to import it prior to the expiration of the permit, please use the renewal form (3-200-52; http://www.fws.gov/international/permits/by-form-number/index.html) and return your original permit with that form.

Note 2: *Sport-hunted trophy* is defined at 50 CFR 23.74 as follows: *Sport-hunted trophy* means a whole dead animal or a readily recognizable part or derivative of an animal specifically identified on the accompanying CITES document that meets the following criteria:

(1) Is raw, processed, or manufactured;
(2) Was legally obtained by the hunter through hunting for his or her personal use;
(3) Is being imported, exported, or re-exported by or on behalf of the hunter as part of the transfer from its country of origin ultimately to the hunter's country of usual residence; and
(4) Includes worked, manufactured, or handicraft items made from the sport-hunted animal only when:
  (i) Such items are contained in the same shipment as raw or tanned parts of the sport-hunted animal and are for the personal use of the hunter;
  (ii) The quantity of such items is no more than could reasonably be expected given the number of animals taken by the hunter as shown on the license or other documentation of the authorized hunt accompanying the shipment; and
  (iii) The accompanying CITES documents (export document and, if appropriate, import permit) contain a complete itemization and description of all items included in the shipment.

Note 3: Certain hunting trophies, including leopard, elephant, and rhinoceros hunting trophies, are subject to restrictions on their use after import into the United States. Please see 50 CFR 23.55 for more information or contact the Division of Management Authority.

Please provide the following information. Complete all questions on the application. Mark questions that are not applicable with "N/A". If applying for more than one trophy, be sure to answer questions 2 and 3 for each trophy.

If importing trophies from more than one country, you must submit a separate application for each shipment in order to obtain separate import permits.

1. ENTER the quantity next to the name of the species you are applying to import (you may apply to import specimens of more than one species provided they have been/are being hunted in the same country):

Leopard (*Panthera pardus*) Quantity: 1 (Import is limited to two per hunter per calendar year)

African elephant (*Loxodonta africana*) Quantity: 1 (Import is limited to two per hunter per calendar year)
Note: once imported, ivory cannot be re-exported.

Southern white rhinoceros (*Ceratotherium simum simum*) from Namibia Quantity: na (An import permit is not required for trophies harvested in South Africa or Swaziland. If you wish to import from a different country, please use form 3-200-37).

2. **IF ANIMAL IS CURRENTLY LIVING IN THE WILD,** please enter the following:
   a. Country and place (area, region, GIS coordinates, ranch AND nearest city) where wildlife is to be taken from the wild:

   b. Date wildlife is to be hunted:

c. Description of the trophy and parts you intend to import (e.g., skin, skull, shoulder mount, life size mount, claws, horns, tusks).

3. **IF THE ANIMAL IS DEAD**, please enter the following:
   a. Country and place (area, region, GIS coordinates, ranch, and/or AND nearest city) where trophy was removed from the wild: Leopard - 3-3-17 — 3-18-17
   b. Date wildlife was hunted: ELEphant - 11-7-2016 — 11-21-2016 —
   Elephant - Mangetti Park - Windhoek Namibia
   Leopard — Okakango Ptn 4 #58 — Windhoek Namibia
   c. Description of the trophy and parts you intend to import (e.g., skin, skull, shoulder mount, life size mount, claws, horn, tusks):

      leopard-life size mount elephant-skin,skull,tusks,shoulder mount

   d. The current location of the trophy (address and country) [the U.S. import permit will identify this country as the country of export/re-export and must match with the export/re-export document]:
      The Yellow Shark Holdings (pty) ltd.
      POBox 81413
      Olympia, Windhook Republic of Namibia, Namibia

4. Complete name and address of overseas person or business shipping the trophy to you. If you are applying to import a trophy directly from Namibia, you **must** provide the name and address of the professional hunter listed on your Namibian hunting permit [this name will appear on the face of the export permit].

Name: Business	The Yellow Shark Holdings (pty) ltd
Name: Address:	po box 81413
Address:	
City:	Olympia-Windhook,
State/Province:	Republic of Namiba
Country, Postal Code:	Namibia

5. Please be aware that the U.S. Fish and Wildlife Service may need to make a finding that your activities will enhance or benefit wild populations of the species involved. If you have any information that could support this finding (e.g., how the funds from license/trophy fees will be spent, what portion of the hunting fee will support conservation), please submit such information on a separate page with your application.

CERTIFICATION STATEMENT (original signature must be provided for either 6 or 7 below)

6. **If you are a broker or taxidermist applying on behalf of a foreign national,** provide documentation to show you have a **Power of Attorney** to act on your client's behalf and sign the following statement.

   I acknowledge that the sport-hunted trophy/trophies to be imported has been/will be personally hunted by my client and is being imported only for my client's personal use (i.e., **not for sale, transfer, donation, or exchange that is reasonably likely to result in economic use, gain, or benefit**). I understand that my client may only import two leopard trophies in one calendar year. I understand that my client may only import two African elephant trophies in one calendar year. In addition, I have advised my client that raw ivory, once imported into the United States, cannot be re-exported.

   Taxidermist/Broker's signature:_____ Date: _____

7. **If you are the hunter applying to import your own trophy**, please read and sign the following statement.

I acknowledge that the sport-hunted trophy/trophies to be imported has been/will be personally hunted by me and is being imported only for my personal use (i.e., **not for sale, transfer, donation, or exchange that is reasonably likely to result in economic use, gain, or benefit**). I understand that I may only import two leopard trophies in one calendar year. I understand that I may only import two African elephant trophies in one calendar year. In addition, I understand that raw ivory, once imported into the United States, cannot be re-exported.

Applicant's signature: Paul (b) (6) Hardman Date: Feb. 18, 2018

Be aware that there may be additional permitting or approval requirements by your local or state governments, as well as required by other Federal agencies or foreign government to conduct your propose activity. While the Service will attempt to assist where possible, it is your responsibility to obtain such approval.

8. All international shipment(s) must be through a designated port. A list of designated ports (where an inspector is posted) is available from http://www.fws.gov/le/designated-ports.html. If you wish to use a port not listed, please contact the Office of Law Enforcement for a Designated Port Exemption Permit (form 3-200-2).

9. Name and address where you wish the permit to be mailed, **if** different from page 1 (All permits will be mailed via the U.S. Postal Service, unless you identify an alternative means below):

10. If you wish the permit to be delivered by means other than USPS regular mail, provide an air bill, pre-paid envelope, or billing information. If you do not have a pre-paid envelope or air bill and wish to pay for a courier service with your credit card, please check the box below. Please DO NOT include credit card number or other information; you will be contacted for this information.

☒ If a permit is issued, please send it via a courier service to the address on page 1 or question 9. I understand that you will contact me for my credit card information once the application has been processed.

11. Who should we contact if we have questions about the application? (Include name, phone number, and email):

Paul Hardman (b) (6)

12. **Disqualification Factor.** A conviction, or entry of a plea of guilty or nolo contendere, for a felony violation of the Lacey Act, the Migratory Bird Treaty Act, or the Bald and Golden Eagle Protection Act disqualifies any such person from receiving or exercising the privileges of a permit, unless such disqualification has been expressly waived by the Service Director in response to a written petition. (50 CFR 13.21(c)) Have you or any of the owners of the business, if applying as a business, been convicted, or entered a plea of guilty or nolo contendere, forfeited collateral, or are currently under charges for any violations of the laws mentioned above?

☐ Yes ☑ No If you answered "Yes" provide: a) the individual's name, b) date of charge, c) charge(s), d) location of incident, e) court, and f) action taken for each violation.

E. IMPORT OF SPORT-HUNTED TROPHIES *(Appendix I of CITES and/or ESA)*

Note 1: This form should be used to request authorization to import trophies of species listed on Appendix I of CITES and/or as threatened or endangered under the ESA (examples include elephants, lions, cheetahs, wood bison, and markhor).

PLEASE USE FORM 3-200-19 FOR SOUTHERN AFRICAN LEOPARD TROPHIES AND SOUTHERN WHITE RHINOCEROS TROPHIES TAKEN IN NAMIBIA.

Note 2: If you hold an import permit for trophy/trophies that you did not use, please **return the unused original permit.** If you are requesting reissuance of a permit because you have taken a trophy, but were unable to import it prior to the expiration of the permit, please use the renewal form (3-200-52) and return your original permit with that form.

Note 3: Applications for species listed as endangered under the U.S. Endangered Species Act are published in the Federal Register for a 30-day public comment period. Please allow at least **90 days** for the application to be processed.

Note 4: *Sport-hunted trophy* is defined at 50 CFR 23.74 as follows: *Sport-hunted trophy* means a whole dead animal or a readily recognizable part or derivative of an animal specifically identified on the accompanying CITES document that meets the following criteria:

- Is raw, processed, or manufactured;
- Was legally obtained by the hunter through hunting for his or her personal use;
- Is being imported, exported, or re-exported by or on behalf of the hunter as part of the transfer from its country of origin ultimately to the hunter's country of usual residence; and
- Includes worked, manufactured, or handicraft items made from the sport-hunted animal only when:
  - i. Such items are contained in the same shipment as raw or tanned parts of the sport-hunted animal and are for the personal use of the hunter;
  - ii. The quantity of such items is no more than could reasonably be expected given the number of animals taken by the hunter as shown on the license or other documentation of the authorized hunt accompanying the shipment; and
  - iii. The accompanying CITES documents (export document and, if appropriate, import permit) contain a complete itemization and description of all items included in the shipment.

Note 5: Certain hunting trophies, including elephants, are subject to restrictions on their use after import into the United States. Please see 50 CFR 23.55 for more information or contact the Division of Management Authority.

Please provide the following information. Complete all questions on the application. Mark questions that are not applicable with "N/A". If needed, use a separate sheet of paper. On all attachments or separate sheets you are submitting; please indicate the application question number you are addressing. If applying for more than one trophy, be sure to answer questions 1-6 for each trophy addressed in this application. If importing trophies from more than one country, you must submit a separate application for each shipment in order to obtain separate import permits.

1. Name and address where you wish the permit to be mailed, if different from page 1. If you would like expedited shipping, please enclose a self-addressed, pre-paid, computer-generated, courier service airway bill. If unspecified, all documents will be mailed via the U.S. Postal Service.

2. Who should we contact if we have questions about the application (name, phone number, and e-mail)?

3. Have you or your client (if a broker applying on behalf of your client), been assessed a civil penalty or convicted of any criminal provision of any statute or regulation relating to the activity for which the application is filed; been convicted, or entered a plea of guilty or nolo contendere, for a felony violation of the Lacey Act, the Migratory Bird Treaty Act, or the Bald and Golden Eagle Protection Act; forfeited collateral; OR are currently under charges for any violation of the laws mentioned above?

(No) Yes

If you answered "Yes" to Question 3, provide: a) the individual's name; b) date of charge; c) charge(s); d) location of incident; e) court, and f) action taken for each violation. Please be aware that a "Yes" response does not automatically disqualify you from getting a permit.

4. For each trophy to be imported, provide:

   a. Scientific name (genus, species, and, if applicable, subspecies) and common name.
   LOXODONTA AFRICANA

   b. Sex (if known).
   MALE

5. **IF ANIMAL IS CURRENTLY LIVING IN THE WILD**, please enter the following information:

   a. Country and place (area, region, GIS coordinates, ranch, conservancy, management area, or hunting block, AND nearest city) where wildlife is to be taken from the wild:
   ZIMBABWE, NGAMO/SIKUMI FOREST, VICTORIA FALLS

   b. Date wildlife is to be hunted:
   23 SEPTEMBER — 07 OCTOBER, 2018

   c. Name of hunting outfitter, safari company, or professional hunter you will be hunting with:
   MARTIN PIETERS SAFARIS

6. IF THE TROPHY HAS ALREADY BEEN TAKEN, please enter the following:

   a. Country and place (area, region, GIS coordinates, ranch, conservancy, management area, or hunting block, AND nearest city) where trophy was removed from the wild:

   b. Date wildlife was hunted:

c. Name of hunting outfitter, safari company, or professional hunter you hunted with:

d. The current location of the trophy (address and country) [the U.S. import permit will identify this country as the country of export/re-export and must match with the export/re-export document]:

7. Please provide a copy of any applicable foreign government permits or licenses that were required to remove this animal from the wild (if you have not hunted yet and do not currently hold any such permits or licenses, please indicate so). I DO NOT CURRENTLY HAVE PERMITS IN HAND. BEING APPLIED FOR BY MARTIN PIETERS SAFARIS
8. Complete name and address of overseas person or business shipping the trophy to you. If you are applying to import a trophy directly from Namibia, you must provide the name and address of the professional hunter listed on your Namibian hunting permit [this name will appear on the face of the export permit].

   Name:
   Business Name:
   Address:
   City:
   State/Province:
   Country, Postal Code:

9. For species listed under the Endangered Species Act, please be aware that the U.S. Fish and Wildlife Service must make a finding that your activities will enhance or benefit wild populations of the species involved. While we will communicate with the range country for the species you will hunt or hunted when making the required findings, if you have any information that could support this finding, it would be helpful to our review if you could provide it. Please submit such information on a separate page with your application.

   a. Do you have any information regarding the population status or trend data on the species hunted?
   REFER TO LETTER FROM HON. E.D. MNANGAGWA, PRES ZIMBABWE TO PRESIDENT TRUMP DATED 6 DECEMBER 2017

   b. In order to hunt, you likely paid for licenses or trophy fees. What were those fees and do you have any information on how those funds were used by either the landowner, community, or government?
   SEE ENCLOSED CONTRACT FOR PIETERS WITH THIS INFORMATION

   c. Do you have information on other funding activities that are being carried out, or were carried out, by the safari outfitter, professional hunter, concession holder, or land owner that provide a conservation benefit to the species being hunted/species hunted
   PART OF THE FEES PAID ARE USED:
   1. FOR FUNDING TO ASSIST ANIMAL CONSERVATION
   2. FOR ANTI POACHING EFFORTS
   3. COMMUNITY IMPROVEMENT
   4. MOST OF THE ANIMAL WILL BE DISTRIBUTED TO LOCAL FOLK FOR FOOD

CERTIFICATION STATEMENT (original signature must be provided for either 10 or 11 below)

10. If you are a broker or taxidermist applying on behalf of a U.S. hunter or foreign national, provide documentation to show you have a Power of Attorney to act on your client's behalf and sign the following statement.

    I acknowledge that the sport-hunted trophy/trophies to be imported has been/will be personally hunted by my client and is being imported only for my client's personal use (i.e., not for sale, transfer, donation, or exchange that is reasonably likely to result in economic use, gain, or benefit). If applying for the import of a leopard trophy, I understand that my client may only import two leopard trophies in one calendar year.

    Taxidermist/Broker's signature: _____ Date: _____

11. If you are the hunter applying to import your own trophy, please read and sign the following statement.

    I acknowledge that the sport-hunted trophy/trophies to be imported has been/will be personally hunted by me and is being imported only for my personal use (i.e., not for sale, transfer, donation, or exchange that is reasonably likely to result in economic use, gain, or benefit). If applying to import a leopard trophy, I understand that I may only import two leopard trophies in one calendar year.

    Applicant's signature: _____ Date: MARCH 22, 2018

    Be aware that there may be additional permitting or approval requirements by your local or state governments, as well as required by other Federal agencies or foreign government to conduct your propose activity. While the Service will attempt to assist where possible, it is your responsibility to obtain such approval.

12. All international shipment(s) must be through a designated port. A list of designated ports (where an inspector is posted) is available from **the list of designated ports**. If you wish to use a port not listed, please contact the Office of Law Enforcement for a Designated Port Exemption Permit (form 3-200-2).

Washington, D.C. 20 006

RE: CONSERVATION OF ZIMBABWE'S ELEPHANT

On behalf of the people and Government of Zimbabwe, and indeed on my own behalf, I write to express profound appreciation for the US Fish and Wildlife Service determination that Zimbabwe's elephant conservation programme warrants the issuance of import permits in the United States of America after nearly three years. The conservation of elephant and other wildlife species in Zimbabwe is based on sustainable use and approach, much like the user-pay system in North America or the North American Model of Conservation. It is imperative that American safari hunters be permitted to bring their trophies home for the success of our conservation programme

Your Excellency, Zimbabwe has the second largest elephant population in Africa and the most up-to-date national elephant action plan which includes four regional plans. We need the participation of American hunters for revenues needed for management and to better control poaching. Importantly, our rural communities working with our Communal Areas Management Programme for Indigenous Resources (CAMPFIRE) programme need the support and incentives as well. Elephants will only survive in the long term if they are more valuable to people than their damage to alternative forms of land use, such as subsistence farming.

Furthermore, without a way of benefitting from the elephants, they are regarded as a liability and economic cost to poor rural communities, who suffer crop losses, other damages and loss of human life. Consequently, the

most effective strategy to prevent this displacement is to integrate elephants into rural economies as assets and to demonstrate that elephants contribute to the welfare and development of people. The involvement and empowerment of rural people in natural resources management, in combination with economic and financial incentives through sustainable use, capacity building and skills development, have been driving forces behind changes in attitudes towards wildlife on communally owned land in Zimbabwe.

Your Excellency, I wish to assure you that under my Presidency, the successful elephant programme will continue, including the implementation of the National Elephant Action Plan. Our country is politically stable, and we had a smooth transition from the previous administration, following my inauguration and swearing in as President and Commander-in-Chief of the Zimbabwe Defence Forces on 24 November 2017. All noble conservation initiatives being championed by Zimbabwe will not be reversed but enhanced. The Minister, Permanent Secretary and Director General are confirmed to remain in place.

Going forward, I do hope to improve communications and cooperation between your great country and Zimbabwe, in general, and particularly with the U.S. Fish and Wildlife Service, with the aim of strengthening our partnership in wildlife conservation, rural development and related spheres for an improved quality of life for our people.

Please accept, Your Excellency, the assurances of my highest consideration.

Hon. E.D. Mnangagwa
President of the Republic of Zimbabwe

cc e-mail to Secretary Ryan Zinke and Greg Sheehan - USFWS

MARTIN PIETERS SAFARIS

AGREEMENT

Agreement Between Martin Pieters Safaris and

Client Name: BOB OLIVER
Client Address: (b) (6) [redacted] Terrebonne, OR (b) (6) [redacted] USA
Location of Hunt: NGAMO/SIKUMI FOREST, ZIMBABWE
Date of Arrival: 22 EPTEMBER 2018 Travel Day to Camp
Date of Departure: 08 October 2018 Travel Day to Vic Falls
Location hunt starts: VICTORIA FALLS 23 September 2018
Location hunt ends: VICTORIA FALLS 07 October 2018
Number of hunting clients per Professional Hunter: 1
Number of non-hunting clients: N/A

Martin Pieters safaris will provide the following services & assumes responsibility for:

1. Suitable hunting concession.

E. IMPORT OF SPORT-HUNTED TROPHIES OF SOUTHERN AFRICAN LEOPARD, AFRICAN ELEPHANT, AND NAMIBIAN SOUTHERN WHITE RHINOCEROS

Note 1: If you hold an import permit for a trophy/trophies that you did not use, please **return the unused original permit**. If you are requesting reissuance of a permit because you have taken a trophy, but were unable to import it prior to the expiration of the permit, please use the renewal form (3-200-52; http://www.fws.gov/international/permits/by-form-number/index.html) and return your original permit with that form.

Note 2: *Sport-hunted trophy* is defined at 50 CFR 23.74 as follows: *Sport-hunted trophy* means a whole dead animal or a readily recognizable part or derivative of an animal specifically identified on the accompanying CITES document that meets the following criteria:

(1) Is raw, processed, or manufactured;
(2) Was legally obtained by the hunter through hunting for his or her personal use;
(3) Is being imported, exported, or re-exported by or on behalf of the hunter as part of the transfer from its country of origin ultimately to the hunter's country of usual residence; and
(4) Includes worked, manufactured, or handicraft items made from the sport-hunted animal only when:
  (i) Such items are contained in the same shipment as raw or tanned parts of the sport-hunted animal and are for the personal use of the hunter;
  (ii) The quantity of such items is no more than could reasonably be expected given the number of animals taken by the hunter as shown on the license or other documentation of the authorized hunt accompanying the shipment; and
  (iii) The accompanying CITES documents (export document and, if appropriate, import permit) contain a complete itemization and description of all items included in the shipment.

Note 3: Certain hunting trophies, including leopard, elephant, and rhinoceros hunting trophies, are subject to restrictions on their use after import into the United States. Please see 50 CFR 23.55 for more information or contact the Division of Management Authority.

Please provide the following information. Complete all questions on the application. Mark questions that are not applicable with "N/A". If applying for more than one trophy, be sure to answer questions 2 and 3 for each trophy.

If importing trophies from more than one country, you must submit a separate application for each shipment in order to obtain separate import permits.

1. ENTER the quantity next to the name of the species you are applying to import (you may apply to import specimens of more than one species provided they have been/are being hunted in the same country):

Leopard (*Panthera pardus*) Quantity: 0 (Import is limited to two per hunter per calendar year)

African elephant (*Loxodonta africana*) Quantity: 1 (Import is limited to two per hunter per calendar year)
Note: once imported, ivory cannot be re-exported.

Southern white rhinoceros (*Ceratotherium simum simum*) from Namibia Quantity: 0 (An import permit is not required for trophies harvested in South Africa or Swaziland. If you wish to import from a different country, please use form 3-200-37).

2. **IF ANIMAL IS CURRENTLY LIVING IN THE WILD**, please enter the following:
   a. Country and place (area, region, GIS coordinates, ranch AND nearest city) where wildlife is to be taken from the wild:

   b. Date wildlife is to be hunted:

c. Description of the trophy and parts you intend to import (e.g., skin, skull, shoulder mount, life size mount, claws, horns, tusks).

3. **IF THE ANIMAL IS DEAD**, please enter the following:
   a. Country and place (area, region, GIS coordinates, ranch, and/or AND nearest city) where trophy was removed from the wild: REPUBLIC OF SOUTH AFRICA, ALLDAYS, LIMPOPO PROVINCE GPS COORDINATES: S22 15.205; E029 06.509
   b. Date wildlife was hunted: Elephant was harvested on Sept. 11, 2017
   c. Description of the trophy and parts you intend to import (e.g., skin, skull, shoulder mount, life size mount, claws, horn, tusks): 2 elephant tusks from one elephant

   d. The current location of the trophy (address and country) [the U.S. import permit will identify this country as the country of export/re-export and must match with the export/re-export document]: Karoo Taxidermy 15 Van der Bijl Street, Graaff-Reinet, East Cape Province, Republic of South Africa, 6280

4. Complete name and address of overseas person or business shipping the trophy to you. If you are applying to import a trophy directly from Namibia, you **must** provide the name and address of the professional hunter listed on your Namibian hunting permit [this name will appear on the face of the export permit].

   Name: Business Karoo Taxidermy
   Name: Address: 15 Van der Bijl Street
   Address:
   City: Graaff-Reinet
   State/Province: Eastern Cape Province
   Country, Postal Code: Republic of South Africa 6280

5. Please be aware that the U.S. Fish and Wildlife Service may need to make a finding that your activities will enhance or benefit wild populations of the species involved. If you have any information that could support this finding (e.g., how the funds from license/trophy fees will be spent, what portion of the hunting fee will support conservation), please submit such information on a separate page with your application.

CERTIFICATION STATEMENT (original signature must be provided for either 6 or 7 below)

6. **If you are a broker or taxidermist applying on behalf of a foreign national,** provide documentation to show you have a **Power of Attorney** to act on your client's behalf and sign the following statement.

   I acknowledge that the sport-hunted trophy/trophies to be imported has been/will be personally hunted by my client and is being imported only for my client's personal use (i.e., **not for sale, transfer, donation, or exchange that is reasonably likely to result in economic use, gain, or benefit**). I understand that my client may only import two leopard trophies in one calendar year. I understand that my client may only import two African elephant trophies in one calendar year. In addition, I have advised my client that raw ivory, once imported into the United States, cannot be re-exported.

   Taxidermist/Broker's signature: N.A. Date: _____

7. **If you are the hunter applying to import your own trophy**, please read and sign the following statement.

I acknowledge that the sport-hunted trophy/trophies to be imported has been/will be personally hunted by me and is being imported only for my personal use (i.e., **not for sale, transfer, donation, or exchange that is reasonably likely to result in economic use, gain, or benefit**). In addition, I understand that raw ivory, once imported into the United States, cannot be re-exported.

Applicant's signature: Bruce (b) (6) Tatarchuk Date: 02/21/2018

Be aware that there may be additional permitting or approval requirements by your local or state governments, as well as required by other Federal agencies or foreign government to conduct your propose activity. While the Service will attempt to assist where possible, it is your responsibility to obtain such approval.

8. All international shipment(s) must be through a designated port. A list of designated ports (where an inspector is posted) is available from http://www.fws.gov/le/designated-ports.html. If you wish to use a port not listed, please contact the Office of Law Enforcement for a Designated Port Exemption Permit (form 3-200-2).

9. Name and address where you wish the permit to be mailed, if different from page 1 (All permits will be mailed via the U.S. Postal Service, unless you identify an alternative means below):
mail to my home address

10. If you wish the permit to be delivered by means other than USPS regular mail, provide an air bill, pre-paid envelope, or billing information. If you do not have a pre-paid envelope or air bill and wish to pay for a courier service with your credit card, please check the box below. Please DO NOT include credit card number or other information; you will be contacted for this information.

☐ If a permit is issued, please send it via a courier service to the address on page 1 or question 9. I understand that you will contact me for my credit card information once the application has been processed.

11. Who should we contact if we have questions about the application? (Include name, phone number, and email):
Bruce Tatarchuk (b) (6) (home), (b) (6) (cell),
(b) (6)

12. **Disqualification Factor**. A conviction, or entry of a plea of guilty or nolo contendere, for a felony violation of the Lacey Act, the Migratory Bird Treaty Act, or the Bald and Golden Eagle Protection Act disqualifies any such person from receiving or exercising the privileges of a permit, unless such disqualification has been expressly waived by the Service Director in response to a written petition. (50 CFR 13.21(c)) Have you or any of the owners of the business, if applying as a business, been convicted, or entered a plea of guilty or nolo contendere, forfeited collateral, or are currently under charges for any violations of the laws mentioned above?

☐ Yes ☒ No If you answered "Yes" provide: a) the individual's name, b) date of charge, c) charge(s), d) location of incident, e) court, and f) action taken for each violation.

HUNTING SPECIAL CONDITIONS

PERMIT NO: 13818

PERMIT HOLDER: Mr.B.J Tatarchuk

1. This permit does not absolve the holder thereof in obtaining any other permit, licence, certificate or document as may be required by any other relevant legislation from any province or country.
2. This permit must be signed by the permit holder and must be in his/her possession for the duration of the hunt.
3. This permit does not allow the hunting with a bow and arrow or any other prohibited method unless specified on the permit.
4. This permit does not authorise the hunting during the night, unless specified on the permit
5. This permit does not allow the hunting of listed species which is under the influence of a tranquilising, narcotic, immobilising or similar agent,
6. If a wounded animal crosses into a neighbouring country, province or property the Department as well as the country where the animal entered into must be notified within 24 hours
7. No driving of listed species for the purpose of hunting is authorised.
8. The Department reserves the right to nominate an official to be present during any or all hunts conducted in accordance with this permit.
9. The outcome of the hunt in the case of TOPS threatened species must be reported within two working days after the listed species was hunted, the hunt terminated or in the case where the hunt was not successful. This office reserves the right to inspect the hunting sight or any relevant product of such hunt.
10. In the case where trophies will not be exported from RSA the permit holder must immediately apply for a TOPS Possession Permit in the case of TOPS species
11. Elephant tusks must be marked by an Environmental officer
12. A TOPS Ordinary permit is required to convey any part of any TOPS specie hunted to any facility within the country, except a taxidermy
13. The Department may require scientific information or material from the animal hunted.
14. The non-compliance with the permit details as well as these special conditions will result in criminal charges and may influence the granting of similar permits to the permit holder.
15. Issued in terms of the Limpopo Environmental Management Act 2003, Act no. 7 of 2003.
16. An elephant/ crocodile may not be hunted next to the water's edge of an international border
17. In the case of dangerous game the minimum calibre requirement is a 375.
18. This permit does not absolve the applicant from conforming to the norms and standards for hunting
19. No put and take system of hunting is allowed.
20. No animal may be hunted in a controlled environment.
21. The use of dogs may only be used to flush birds or track wounded animals.
22. All clients must be accompanied by a Professional Hunter.

Re: Applications for Import of Sport-Hunted Trophies

Dear Acting Chief:

Enclosed please find two applications to import sport-hunted trophies.

- The first applicant is hunting an elephant on communal land in the Southeastern Lowveld range of Zimbabwe. The proceeds of this hunt benefit CAMPFIRE communities, as detailed in the various CAMPFIRE reports submitted to the DMA by Conservation Force, the Zimbabwe Parks and Wildlife Management Authority (ZPWMA), and the CAMPFIRE Association. Moreover, the elephant population in this range area in Zimbabwe is increasing, as reflected in the most recent survey reports. Please consider the enclosed documents and all information in the DMA's files regarding the benefits of elephant hunting in Zimbabwe in making a positive enhancement finding for this applicant.
- The second applicant is hunting an African lion in the Matetsi region of Zimbabwe with Martin Pieters Safaris. In April 2016, we provided significant enhancement information from this operator, and information about the increasing lion population in this area and the benefits of lion hunting in Zimbabwe was provided in the October 2016 non-detriment and enhancement finding from ZPWMA. Please consider that information, and all other information provided by Conservation Force, ZPWMA, Zimbabwean operators, and CAMPFIRE communities in making a positive enhancement finding for this applicant.

Please do not hesitate to contact us if you have questions about these applicants or need further information.

Sincerely,

Regina Lennox

NOTICE OF REPRESENTATION

RCVD MAR 30 2018

This is a notice to the U.S. Fish and Wildlife Service that I have appointed John J. Jackson, III and Regina Lennox of the non-profit firm Conservation Force as my attorneys and legal representatives for all matters concerning my applications for a permit to import a lawfully hunted ___Bull Elephant___ trophy.

This authority is inclusive and extends to all applications and filings, whether administrative or judicial, including but not limited to any request for reconsideration, appeal, and litigation.

I also request that these attorneys, through the address for Conservation Force below, be copied with all correspondence, acknowledgements, notices and decisions concerning my application to import my trophy at the following address:

Type of Activity:

IMPORT OF SPORT-HUNTED TROPHIES (Appendix I of CITES and/or ESA)

Complete Sections A or B, and C, D, and E of this application. U.S. address may be required in Section C, see instructions for details.
See attached instruction pages for information on how to make your application complete and help avoid unnecessary delays.

A. Complete if applying as an individual

1.a. Last name	1.b. First name	1.c. Middle name or initial	1.d. Suffix
Reeves	Steven	(b) (6)	

2. Date of birth (mm/dd/yyyy)	3. Telephone number	3.a. Alternate telephone number	4. E-mail address
(b) (6)			(b) (6)

B. Complete if applying on behalf of a business, corporation, public agency, Tribe, or institution

1.a. Name of business, agency, Tribe, or institution	1.b. Doing business as (dba)		
2. Tax identification no.	3. Description of business, agency, Tribe, or institution		
4.a. Principal officer Last name	4.b. Principal officer First name	4.c. Principal officer Middle name/ Initial	4.d. Suffix
5. Principal officer title	6. Primary contact name		
7.a. Business telephone number	7.b. Alternate telephone number	7.c. Business fax number	7.d. Business e-mail address

C. All applicants complete address information

1.a. Physical address (Street address; Apartment #, Suite #, or Room #; no P.O. Boxes) (If Broker or Taxidermist is applying on behalf of a foreign national, provide Broker or Taxidermist's name and address in this block; U.S. hunters must provide their U.S. address)

(b) (6)

1.b. City	1.c. State	1.d. Zip code/Postal code:	1.e. County/Province	1.f. Country
Hooper	UT	(b) (6)		USA

2.a. Mailing Address (include if different than physical address; include name of contact person if applicable)

2.b. City	2.c. State	2.d. Zip code/Postal code:	2.e. County/Province	2.f. Country

D. All applicants MUST complete

1. Attach check or money order payable to the U.S. FISH AND WILDLIFE SERVICE **in the amount of $100, nonrefundable processing fee**. Federal, Tribal, State, and local government agencies, and those acting on behalf of such agencies, are exempt from the processing fee – ***attach documentation of fee exempt status as outlined in instructions.*** (50 CFR 13.11(d))

2. Certification: I hereby certify that I have read and am familiar with the regulations contained in ***Title 50, Part 13 of the Code of Federal Regulations*** and the other ***applicable parts in subchapter B of Chapter I of Title 50***, and I certify that the information submitted in this application for a permit is complete and accurate to the best of my knowledge and belief. I understand that any false statement herein may subject me to the criminal penalties of 18 U.S.C. 1001.

E. IMPORT OF SPORT-HUNTED TROPHIES *(Appendix I of CITES and/or ESA)*

Note 1: This form should be used to request authorization to import trophies of species listed on Appendix I of CITES and/or as threatened or endangered under the ESA (examples include elephants, lions, cheetahs, wood bison, and markhor).

PLEASE USE FORM 3-200-19 FOR SOUTHERN AFRICAN LEOPARD TROPHIES AND SOUTHERN WHITE RHINOCEROS TROPHIES TAKEN IN NAMIBIA.

Note 2: If you hold an import permit for trophy/trophies that you did not use, please **return the unused original permit**. If you are requesting reissuance of a permit because you have taken a trophy, but were unable to import it prior to the expiration of the permit, please use the renewal form (3-200-52) and return your original permit with that form.

Note 3: Applications for species listed as endangered under the U.S. Endangered Species Act are published in the Federal Register for a 30-day public comment period. Please allow at least **90 days** for the application to be processed.

Note 4: *Sport-hunted trophy* is defined at 50 CFR 23.74 as follows: *Sport-hunted trophy* means a whole dead animal or a readily recognizable part or derivative of an animal specifically identified on the accompanying CITES document that meets the following criteria:
(1) Is raw, processed, or manufactured;
(2) Was legally obtained by the hunter through hunting for his or her personal use;
(3) Is being imported, exported, or re-exported by or on behalf of the hunter as part of the transfer from its country of origin ultimately to the hunter's country of usual residence; and
(4) Includes worked, manufactured, or handicraft items made from the sport-hunted animal only when:
(i) Such items are contained in the same shipment as raw or tanned parts of the sport-hunted animal and are for the personal use of the hunter;
(ii) The quantity of such items is no more than could reasonably be expected given the number of animals taken by the hunter as shown on the license or other documentation of the authorized hunt accompanying the shipment; and
(iii) The accompanying CITES documents (export document and, if appropriate, import permit) contain a complete itemization and description of all items included in the shipment.

Note 5: Certain hunting trophies, including elephants, are subject to restrictions on their use after import into the United States. Please see 50 CFR 23.55 for more information or contact the Division of Management Authority.

Please provide the following information. Complete all questions on the application. Mark questions that are not applicable with "N/A". If needed, use a separate sheet of paper. On all attachments or separate sheets you are submitting; please indicate the application question number you are addressing. If applying for more than one trophy, be sure to answer questions 1-6 for each trophy addressed in this application. If importing trophies from more than one country, you must submit a separate application for each shipment in order to obtain separate import permits.

---

1. Name and address where you wish the permit to be mailed, **if different from page 1**. If you would like expedited shipping, please enclose a self-addressed, pre-paid, computer-generated, courier service airway bill. If unspecified, all documents will be mailed via regular mail through the U.S. Postal Service.

2. Who should we contact if we have questions about the application (name, phone number, and e-mail)?

   Conservation Force, 504-837-1233, cf@conservationforce.org

3. Have you or your client (if a broker applying on behalf of your client), been assessed a civil penalty or convicted of any criminal provision of any statute or regulation relating to the activity for which the

application is filed; been convicted, or entered a plea of guilty or nolo contendere, for a felony violation of the Lacey Act, the Migratory Bird Treaty Act, or the Bald and Golden Eagle Protection Act; forfeited collateral; OR are currently under charges for any violation of the laws mentioned above?

No ✓ Yes ____

If you answered "Yes" to Question 3, provide: a) the individual's name; b) date of charge; c) charge(s); d) location of incident; e) court, and f) action taken for each violation. Please be aware that a "Yes" response does not automatically disqualify you from getting a permit.

4. For each trophy to be imported, provide:

   a. Scientific name (genus, species, and, if applicable, subspecies) and common name.
   LOXODONTA AFRICANA, ELEPHANT

   b. Sex (if known). MALE

5. **IF ANIMAL IS CURRENTLY LIVING IN THE WILD**, please enter the following information:

   a. Country and place (area, region, GIS coordinates, ranch, conservancy, management area, or hunting block, AND nearest city) where wildlife is to be taken from the wild:
   ZIMBABWE, SENGWE 1 + 2 TTL (CAMPFIRE AREAS)

   b. Date wildlife is to be hunted: APRIL 13-24, 2018

   b. Name of hunting outfitter, safari company, or professional hunter you will be hunting with:
   SSG SAFARIS, NIXON DZINGAI, OWNER + PH

6. **IF THE TROPHY HAS ALREADY BEEN TAKEN**, please enter the following:

   a. Country and place (area, region, GIS coordinates, ranch, conservancy, management area, or hunting block, AND nearest city) where trophy was removed from the wild:
   N/A

   b. Date wildlife was hunted:

   b. Name of hunting outfitter, safari company, or professional hunter you hunted with:

   c. The current location of the trophy (address and country) [the U.S. import permit will identify this country as the country of export/re-export and must match with the export/re-export document]:

7. Please provide a copy of any applicable foreign government permits or licenses that were required to remove this animal from the wild (if you have not hunted yet and do not currently hold any such permits or licenses, please indicate so). NOT YET ISSUED

8. Complete name and address of overseas person or business shipping the trophy to you. If you are applying to import a trophy directly from Namibia, you **must** provide the name and address of the professional hunter listed on your Namibian hunting permit [this name will appear on the face of the export permit].

   Name: SSG SAFARIS
   Business Name:
   Address:
   City:
   State/Province:
   Country, Postal Code:

9. For species listed under the Endangered Species Act, please be aware that the U.S. Fish and Wildlife Service must make a finding that your activities will enhance or benefit wild populations of the species involved. While we will communicate with the range country for the species you will hunt or hunted when making the required findings, if you have any information that could support this finding, it would be helpful to our review if you could provide it. Please submit such information on a separate page with your application.

   a. Do you have any information regarding the population status or trend data on the species hunted?

   PLEASE SEE ATTACHED + INFORMATION SUBMITTED BY CONSERVATION FOCUS + ZPWMA

   b. In order to hunt, you likely paid for licenses or trophy fees. What were those fees and do you have any information on how those funds were used by either the landowner, community, or government?

   SEE 9.A

   c. Do you have information on other funding activities that are being carried out, or were carried out, by the safari outfitter, professional hunter, concession holder, or land owner that provide a conservation benefit to the species being hunted/species hunted?

   SEE 9.A

CERTIFICATION STATEMENT (original signature must be provided for either 10 or 11 below)

10. **If you are a broker or taxidermist applying on behalf of a U.S. hunter or foreign national,** provide documentation to show you have a **Power of Attorney** to act on your client's behalf and sign the following statement.

    I acknowledge that the sport-hunted trophy/trophies to be imported has been/will be personally hunted by my client and is being imported only for my client's personal use (i.e., **not for sale, transfer, donation, or exchange that is reasonably likely to result in economic use, gain, or benefit**). I understand that my client may only import two leopard trophies and two elephant trophies within the same calendar year (if applicable). In addition, I have advised my client that raw ivory, once imported into the United States, cannot be re-exported.

    Taxidermist/Broker's signature: _____ Date: _____

11. **If you are the hunter applying to import your own trophy**, please read and sign the following statement.

    I acknowledge that the sport-hunted trophy/trophies to be imported has been/will be personally hunted by me and is being imported only for my personal use (i.e., **not for sale, transfer, donation, or exchange that is reasonably likely to result in economic use, gain, or benefit**). I understand that I may only import two leopard trophies and two elephant trophies within the same calendar year. In addition, I understand that raw ivory, once imported into the United States, cannot be re-exported.

    Applicant's signature: [redacted] (b) (6) Date: 7 March 201

    Be aware that there may be additional permitting or approval requirements by your local or state governments, as well as required by other Federal agencies or foreign government to conduct your propose activity. While the Service will attempt to assist where possible, it is your responsibility to obtain such approval.

All international shipment(s) must be imported through a designated port. A list of designated ports (where an inspector is posted) is available from http://www.fws.gov/le/designated-ports.html. If you wish to use a port not listed, please contact the Office of Law Enforcement for a Designated Port Exemption Permit (form 3-200-2).

Steven Reeves Permit Application

9. B:

This declaration is made by the Zimbabwean hunting operator:

We charge 1.400 USD per day on elephant hunts as our daily rate that broken down as follows:

15% of the daily rate goes to the hunting agent that books the hunt.

250 USD per day goes to the professional hunter that guides the hunt, this includes the clients hiring of his modern 4x4 hunting vehicle for purposes of the hunt.

We pay the fuel for the vehicle, usually around 50 litres per day @ 2 usd per litre in Zimbabwe = 100 USD

We use 2 trackers on elephant hunts @ 30 USD each per day daily rates = 60 USD per day.

We provide accommodation including housekeeping and a laundry service = 150 USD per day.

We cater for the clients' food and drinks including alcohol = 120 USD per day.

We provide a cook and a waitress plus kitchen cleaning staff @ 30 USD each per day x 4 = 120 USD per day.

We pay a Zimbabwe National Parks game scout to National Parks 75 USD per day to observe the hunt on behalf of the Government.

We feed all persons on the hunt not only the client.

We charge 15.500 USD for each elephant hunted.

We pay 12.500 USD of that amount to the local community on the following basis:

55% goes to the local rural African community that they use for schools, medical care, food, clothes roads and infrastructure.

4% goes to the campfire program, there is lots of information about the campfire project online: https://en.wikipedia.org/wiki/Communal_Areas_Management_Programme_for_Indigenous_Resources

41% goes to the Chiredzi Rural District Council (CRDC) this money is used by the council to increase/better the living conditions of the local people that live with these animals and suffer damages to their crops as a result of the human/animal conflict that exists in our areas and is getting worse year on year.

These trophy fee payments allow for the local people to be more tolerant of the animals that co-exist with them in these areas.

Steven Reeves Permit Application

9. C:

We employ 4 full time anti-poaching personnel who patrol the hunting area on a full time rotational basis to help stop poaching in our areas that for now we have under control, without these hunts our ability to perform anti poaching duties is impossible.

We employ 19 full time staff members that without our safari operation would be un-employed; the meat from our hunts gets distributed amongst the local people including the families of our staff at no charge at all, this much needed protein that would otherwise not be available at all, this is rural Africa.

The local people tolerate these elephants, buffalos and lions destroying their crops and cattle on the basis of the compensation agreements we have with them, if these animals were not paying their way they would not be tolerated in these areas by the locals due the damage they cause in the human/wild animal conflict.

It is of the utmost importance in terms of safe guarding the animals that the hunting operations and hunting operators are allowed to continue their work, or sadly these animals will all be destroyed by the locals.

We are an African based, African owned, African run Safari operation, we were born in these areas and have worked these areas all our lives and cared for the animals that exist here all our lives.

We do not hunt female or breeding animals at all; we hunt only the old males/old bulls.

Best regards

Nixon Dzingai (pictured below)

Type of Activity

IMPORT OF SPORT-HUNTED TROPHIES (Appendix I of CITES and/or ESA)

Complete Sections A or B, and C, D, and E of this application. U.S. address may be required in Section C, see instructions for details.
You may find instructions on how to make your application complete and help avoid unnecessary delays at the following link: .

Section A: Complete if applying as an individual

1.a. Last Name	1.b. First Name	1.c. Middle Name/Initial	1.d. Suffix
MARTIN	HENRY	(b) (6)	

2. Date of Birth (mm/dd/yyyy)	3. Telephone Number	3.a. Alternate Telephone Number	4. E-mail address
(b) (6)			

Section B: Complete if applying on behalf of a business, corporation, public agency, Tribe, or institution

1.a. Name of business, agency, Tribe, or institution		1.b. Doing business as (DBA)	
2. Tax identification no.		3. Description of business, agency, Tribe, or institution	
4.a. Principal officer Last name	4.b. Principal officer First Name	4.c. Principal officer Middle name/initial	4.d. Suffix
5. Principal officer title		6. Primary contact name	
7.a. Business telephone number	7.b. Alternate telephone number	7.c. Business fax number	7.d. Business e-mail address

Section C: All applicants complete address information

1.a. Physical address: (b) (6)				
1.b. City	1.c. State	1.d. Zip code/Postal code	1.e. County/Province	1.f. Country
SAN ANTONIO	TEXAS	(b) (6)		U.S.A.
2.a. Mailing address (include if different than physical address; include name of c				
2.b. City	2.c. State	2.d. Zip code/Postal code	2.e. County/Province	2.f.Country

Section D: All applicants MUST complete

1. Attach check or money order payable to the U.S. FISH AND WILDLIFE SERVICE **in the amount identified on page 2, nonrefundable processing fee.** Federal, Tribal, State, and local government agencies, and those acting on behalf of such agencies, are exempt from the processing fee – *attach documentation of fee exempt status as outlined in instructions.* [50 CFR 13.11(d)]
2. Certification: I hereby certify that I have read and am familiar with the regulations contained in ***Title 50 Part 13 of the Code of Federal Regulations*** and the other ***applicable parts in subchapter B of Chapter I of Title 50***, and I certify that the information submitted in this application for a permit is complete and accurate to the best of my knowledge and belief. I understand that any false statement herein may subject me to the criminal penalties of 18 U.S.C. 1001.

E. IMPORT OF SPORT-HUNTED TROPHIES *(Appendix I of CITES and/or ESA)*

Note 1: This form should be used to request authorization to import trophies of species listed on Appendix I of CITES and/or as threatened or endangered under the ESA (examples include elephants, lions, cheetahs, wood bison, and markhor).

PLEASE USE FORM 3-200-19 FOR SOUTHERN AFRICAN LEOPARD TROPHIES AND SOUTHERN WHITE RHINOCEROS TROPHIES TAKEN IN NAMIBIA.

Note 2: If you hold an import permit for trophy/trophies that you did not use, please **return the unused original permit**. If you are requesting reissuance of a permit because you have taken a trophy, but were unable to import it prior to the expiration of the permit, please use the renewal form (3-200-52) and return your original permit with that form.

Note 3: Applications for species listed as endangered under the U.S. Endangered Species Act are published in the Federal Register for a 30-day public comment period. Please allow at least **90 days** for the application to be processed.

Note 4: *Sport-hunted trophy* is defined at 50 CFR 23.74 as follows: *Sport-hunted trophy* means a whole dead animal or a readily recognizable part or derivative of an animal specifically identified on the accompanying CITES document that meets the following criteria:

- Is raw, processed, or manufactured;
- Was legally obtained by the hunter through hunting for his or her personal use;
- Is being imported, exported, or re-exported by or on behalf of the hunter as part of the transfer from its country of origin ultimately to the hunter's country of usual residence; and
- Includes worked, manufactured, or handicraft items made from the sport-hunted animal only when:
  - i. Such items are contained in the same shipment as raw or tanned parts of the sport-hunted animal and are for the personal use of the hunter;
  - ii. The quantity of such items is no more than could reasonably be expected given the number of animals taken by the hunter as shown on the license or other documentation of the authorized hunt accompanying the shipment; and
  - iii. The accompanying CITES documents (export document and, if appropriate, import permit) contain a complete itemization and description of all items included in the shipment.

Note 5: Certain hunting trophies, including elephants, are subject to restrictions on their use after import into the United States. Please see 50 CFR 23.55 for more information or contact the Division of Management Authority.

Please provide the following information. Complete all questions on the application. Mark questions that are not applicable with "N/A". If needed, use a separate sheet of paper. On all attachments or separate sheets you are submitting; please indicate the application question number you are addressing. If applying for more than one trophy, be sure to answer questions 1-6 for each trophy addressed in this application. If importing trophies from more than one country, you must submit a separate application for each shipment in order to obtain separate import permits.

1. Name and address where you wish the permit to be mailed, if different from page 1. If you would like expedited shipping, please enclose a self-addressed, pre-paid, computer-generated, courier service airway bill. If unspecified, all documents will be mailed via the U.S. Postal Service.

2. Who should we contact if we have questions about the application (name, phone number, and e-mail)?

H. (b) (6) MARTIN

OMB Control No. 1018-0093
Expires 08/31/2020

3. Have you or your client (if a broker applying on behalf of your client), been assessed a civil penalty or convicted of any criminal provision of any statute or regulation relating to the activity for which the application is filed; been convicted, or entered a plea of guilty or nolo contendere, for a felony violation of the Lacey Act, the Migratory Bird Treaty Act, or the Bald and Golden Eagle Protection Act; forfeited collateral; OR are currently under charges for any violation of the laws mentioned above?

(No) Yes

If you answered "Yes" to Question 3, provide: a) the individual's name; b) date of charge; c) charge(s); d) location of incident; e) court, and f) action taken for each violation. Please be aware that a "Yes" response does not automatically disqualify you from getting a permit.

4. For each trophy to be imported, provide:

   a. Scientific name (genus, species, and, if applicable, subspecies) and common name.
   LOXODONTA AFRICANUS
   b. Sex (if known). MALE

5. **IF ANIMAL IS CURRENTLY LIVING IN THE WILD**, please enter the following information:

   a. Country and place (area, region, GIS coordinates, ranch, conservancy, management area, or hunting block, AND nearest city) where wildlife is to be taken from the wild:
   ZIMBABWE MASINGO HUMANI
   SAVE VALLEY LATITUDE 20° 28' 40.1 (20.4778°) SO
   CHIBUWE LONGITUDE 32° 14' 55.2 (32.2487)° EAS

   b. Date wildlife is to be hunted:
   SEPTEMBER 15, 2018

   c. Name of hunting outfitter, safari company, or professional hunter you will be hunting with:
   ROGER WHITTAL SAFARIS
   BUTCH COATON

6. IF THE TROPHY HAS ALREADY BEEN TAKEN, please enter the following:

   a. Country and place (area, region, GIS coordinates, ranch, conservancy, management area, or hunting block, AND nearest city) where trophy was removed from the wild:

   b. Date wildlife was hunted:

OMB Control No. 1018-0093
Expires 08/31/2020

c. Name of hunting outfitter, safari company, or professional hunter you hunted with:

d. The current location of the trophy (address and country) [the U.S. import permit will identify this country as the country of export/re-export and must match with the export/re-export document]:

7. Please provide a copy of any applicable foreign government permits or licenses that were required to remove this animal from the wild (if you have not hunted yet and do not currently hold any such permits or licenses, please indicate so). NOT HUNTED YET.

8. Complete name and address of overseas person or business shipping the trophy to you. If you are applying to import a trophy directly from Namibia, you must provide the name and address of the professional hunter listed on your Namibian hunting permit [this name will appear on the face of the export permit].

   Name:
   Business Name:
   Address:
   City:
   State/Province:
   Country, Postal Code:

9. For species listed under the Endangered Species Act, please be aware that the U.S. Fish and Wildlife Service must make a finding that your activities will enhance or benefit wild populations of the species involved. While we will communicate with the range country for the species you will hunt or hunted when making the required findings, if you have any information that could support this finding, it would be helpful to our review if you could provide it. Please submit such information on a separate page with your application.

   a. Do you have any information regarding the population status or trend data on the species hunted?
   NO

   b. In order to hunt, you likely paid for licenses or trophy fees. What were those fees and do you have any information on how those funds were used by either the landowner, community, or government?
   N/A

   c. Do you have information on other funding activities that are being carried out, or were carried out, by the safari outfitter, professional hunter, concession holder, or land owner that provide a conservation benefit to the species being hunted/species hunted
   NO

OMB Control No. 1018-0093
Expires 08/31/2020

CERTIFICATION STATEMENT (original signature must be provided for either 10 or 11 below)

10. If you are a broker or taxidermist applying on behalf of a U.S. hunter or foreign national, provide documentation to show you have a Power of Attorney to act on your client's behalf and sign the following statement.

I acknowledge that the sport-hunted trophy/trophies to be imported has been/will be personally hunted by my client and is being imported only for my client's personal use (i.e., not for sale, transfer, donation, or exchange that is reasonably likely to result in economic use, gain, or benefit). If applying for the import of a leopard trophy, I understand that my client may only import two leopard trophies in one calendar year.

Taxidermist/Broker's signature: _____ Date: _____

11. If you are the hunter applying to import your own trophy, please read and sign the following statement.

I acknowledge that the sport-hunted trophy/trophies to be imported has been/will be personally hunted by me and is being imported only for my personal use (i.e., not for sale, transfer, donation, or exchange that is reasonably likely to result in economic use, gain, or benefit). If applying to import a leopard trophy, I understand that I may only import two leopard trophies in one calendar year.

Applicant's signature: [redacted] Date: MARCH 24, 2018

Be aware that there may be additional permitting or approval requirements by your local or state governments, as well as required by other Federal agencies or foreign government to conduct your propose activity. While the Service will attempt to assist where possible, it is your responsibility to obtain such approval.

12. All international shipment(s) must be through a designated port. A list of designated ports (where an inspector is posted) is available from **the list of designated ports**. If you wish to use a port not listed, please contact the Office of Law Enforcement for a Designated Port Exemption Permit (form 3-200-2).

E. IMPORT OF SPORT-HUNTED TROPHIES OF SOUTHERN AFRICAN LEOPARD, AFRICAN ELEPHANT, AND NAMIBIAN SOUTHERN WHITE RHINOCEROS

Note 1: If you hold an import permit for trophy/trophies that you did not use, please **return the unused original permit.** If you are requesting reissuance of a permit because you have taken a trophy, but were unable to import it prior to the expiration of the permit, please use the renewal form (3-200-52; http://www.fws.gov/international/permits/by-form-number/index.html) and return your original permit with that form.

Note 2: The U.S. FWS has determined that a trophy consists of raw or tanned parts of a specimen taken by a hunter during a sport hunt for personal use. It may include the bones, claws, hair, head, hide, hooves, horns, meat, skull, teeth, tusks, or any taxidermied part, including, but not limited to, a rug or taxidermied head, shoulder, or full mount. It does not include articles made from a trophy, such as worked, manufactured, or handicraft items for use as clothing, curios, ornamentation, jewelry, or other utilitarian items. If you wish to import such products, please contact the Division of Management Authority for the proper application form.

Note 3: Certain hunting trophies, including leopard, elephant, and rhinoceros hunting trophies, are subject to restrictions on their use after import into the United States. Please see 50 CFR 23.55 for more information or contact the Division of Management Authority.

Please provide the following information. Complete all questions on the application. Mark questions that are not applicable with "N/A". If applying for more than one trophy, be sure to answer questions 2 and 3 for each trophy. If importing trophies from more than one country, you must submit a separate application for each shipment in order to obtain separate import permits.

1. ENTER the quantity next to the name of the species you are applying to import (you may apply to import specimens of more than one species provided they have been/are being hunted in the same country):

Leopard (*Panthera pardus*) Quantity: N/A (Limited to the import of two per calendar year)

African elephant (*Loxodonta africana*) Quantity: 2 (Import permit is not required for trophies harvested in Botswana, Namibia, South Africa, or Zimbabwe). **Note: once imported, ivory cannot be re-exported.**

Southern white rhinoceros (*Ceratotherium simum simum*) from Namibia Quantity: N/A (An import permit is not required for trophies harvested in South Africa or Swaziland. If you are looking to import from a different country, please use form 3-200-37).

2. **IF ANIMAL IS CURRENTLY LIVING IN THE WILD**, please enter the following:
   a. Country and place (area, region, GIS coordinates, ranch AND nearest city) where wildlife is to be taken from the wild: N/A
   b. Date wildlife is to be hunted: N/A
   c. Description of the trophy and parts you intend to import (e.g., skin, skull, shoulder mount, life size mount, claws, horns, tusks). N/A

3. **IF THE ANIMAL IS DEAD**, please enter the following:
   a. Country and place (area, region, GIS coordinates, ranch, and/or AND nearest city) where trophy was removed from the wild: 1/ Divunda Natl Park, Namibia 2/ Bwabwata West, Katima Mal. IV
   b. Date wildlife was hunted:
      1/ 06/10/2017
      2/ 06/11/2017

c. Description of the trophy and parts you intend to import (e.g., skin, skull, shoulder mount, life size mount, claws, horn, tusks): 4 TUSKS, SKIN, 2 Feet

d. The current location of the trophy (address and country) [the U.S. import permit will identify this country as the country of export/re-export and must match with the export/re-export document]:

Trophaendienst
Box 21068
Windhoek Namibia

4. Complete name and address of overseas person or business shipping the trophy to you. If you are applying to import a trophy directly from Namibia, you **must** provide the name and address of the professional hunter listed on your Namibian hunting permit [this name will appear on the face of the export permit].

Name: J.H. Pienaar
Business Name:
Address: Private Bag 2105
Address:
City: Gobabis
State/Province: Namibia
Country, Postal Code:

5. Please be aware that the U.S. Fish and Wildlife Service may need to make a finding that your activities will enhance or benefit wild populations of the species involved. If you have any information that could support this finding (e.g., how the funds from license/trophy fees will be spent, what portion of the hunting fee will support conservation), please submit such information on a separate page with your application.

CERTIFICATION STATEMENT (original signature must be provided for either 6 or 7 below)

6. **If you are a broker or taxidermist applying on behalf of a foreign national,** provide documentation to show you have a **Power of Attorney** to act on your client's behalf and sign the following statement.

I acknowledge that the sport-hunted trophy/trophies to be imported has been/will be personally hunted by my client and is being imported only for my client's personal use (i.e., **not for sale, transfer, donation, or exchange that is reasonably likely to result in economic use, gain, or benefit**). I understand that my client may only import two leopard trophies in one calendar year (if applicable). In addition, I have advised my client that raw ivory, once imported into the United States, cannot be re-exported.

Taxidermist/Broker's signature: Laura Durgin Date: 1/31/2018

7. **If you are the hunter applying to import your own trophy**, please read and sign the following statement.

I acknowledge that the sport-hunted trophy/trophies to be imported has been/will be personally hunted by me and is being imported only for my personal use (i.e., **not for sale, transfer, donation, or exchange that is reasonably likely to result in economic use, gain, or benefit**). I understand that I may only import two leopard trophies in one calendar year (if applicable). In addition, I understand that raw ivory, once imported into the United States, cannot be re-exported.

Applicant's signature: _____ Date: _____

Be aware that there may be additional permitting or approval requirements by your local or state governments, as well as required by other Federal agencies or foreign government to conduct your propose activity. While the Service will attempt to assist where possible, it is your responsibility to obtain such approval.

8. All international shipment(s) must be through a designated port. A list of designated ports (where an inspector is posted) is available from http://www.fws.gov/le/designated-ports.html. If you wish to use a port not listed, please contact the Office of Law Enforcement for a Designated Port Exemption Permit (form 3-200-2).

Chicago, IL

9. Name and address where you wish the permit to be mailed, if different from page 1 (All permits will be mailed via the U.S. Postal Service, unless you identify an alternative means below):

D&L CHB
1500 Midway Ct.
Ste W201
Elk Grove Village, IL 60007

10. If you wish the permit to be delivered by means other than USPS regular mail, provide an air bill, pre-paid envelope, or billing information. If you do not have a pre-paid envelope or air bill and wish to pay for a courier service with your credit card, please check the box below. Please DO NOT include credit card number or other information; you will be contacted for this information. N/A

☐ If a permit is issued, please send it via a courier service to the address on page 1 or question 9. I understand that you will contact me for my credit card information once the application has been processed.

11. Who should we contact if we have questions about the application? (Include name, phone number, and email):

Laura Durgin
847-690-0690 laura.durgin@dlchb.com

12. **Disqualification Factor.** A conviction, or entry of a plea of guilty or nolo contendere, for a felony violation of the Lacey Act, the Migratory Bird Treaty Act, or the Bald and Golden Eagle Protection Act disqualifies any such person from receiving or exercising the privileges of a permit, unless such disqualification has been expressly waived by the Service Director in response to a written petition. (50 CFR 13.21(c)) Have you or any of the owners of the business, if applying as a business, been convicted, or entered a plea of guilty or nolo contendere, forfeited collateral, or are currently under charges for any violations of the laws mentioned above?

☐ Yes ☒ No If you answered "Yes" provide: a) the individual's name, b) date of charge, c) charge(s), d) location of incident, e) court, and f) action taken for each violation.

Perform any act or condition which may be required by law or regulation in connection with such merchandise deliverable to said grantor; to receive any merchandise;

Make endorsements on bills of lading conferring authority to transfer title; make entry or collect drawback; and to make, sign, declare, or swear to any statement or certificate required by law or regulation for drawback purposes, regardless of whether such document is intended for filing with U.S. Customs and Border Protection;

Sign, seal, and deliver for and as the act of said grantor any bond required by law or regulation in connection with the entry or withdrawal of imported merchandise or merchandise exported with or without benefit of drawback, or in connection with the entry, clearance, lading, unlading or navigation of any vessel or other means of conveyance owned or operated by said grantor, and any and all bonds which may be voluntarily given and accepted under applicable laws and regulations, consignee's and owner's declarations provided for in section 485, Tariff Act of 1930, as amended, or affidavits or statements in connection with the entry of merchandise;

Sign and swear to any document and to perform any act that may be necessary or required by law or regulation in connection with the entering, clearing, lading, unlading, or operation of any vessel or other means of conveyance owned or operated by said grantor;

Authorize other Customs Brokers duly licensed within the territory to act as grantor's agent; to receive, endorse and collect checks issued for CBP duty refunds in grantor's name drawn on the Treasurer of the United States if the grantor is a nonresident of the United States, to accept service of process on behalf of the grantor;

And generally to transact Customs business, including filing of claims or protests under section 514 of the Tariff Act of 1930, or pursuant to other laws of the territories, in which said grantor is or may be concerned or interested and which may properly be transacted or performed by an agent and attorney;

Giving to said agent and attorney full power and authority to do anything whatever requisite necessary to be done in the premises as fully as said grantor could do if present and acting, hereby ratifying and confirming all that the said agent and attorney shall lawfully do by virtue of these presents;

This power of attorney to remain full force and effect until revocation in writing is duly given to and received by grantee (if the donor of this power of attorney is a partnership, the said power shall in no case have any force or effect in the United States after the expiration 2 years from the dates of its execution);

Grantor acknowledges receipt of ✓ D & L CHB (Grantee's Name) Terms and Conditions of Service governing all transactions between the Parties.

If the Grantor is a Limited Liability Company, the signatory certifies that he/she has full authority to execute this power on behalf of the Grantor.

IN WITNESS WHEREOF, the said ✓ Richard (b) (6) Pahlau (Full name of individual, partnership, corporation, sole proprietorship, or limited liability company)

caused these presents to be sealed and signed: (Signature) ✓ Richard (b) (6) Pahlau

(Capacity) ✓ N/A Date: 03/23/2017

Witness: (if required) N/A

If you are the importer of record, payment to the broker will not relieve you of liability for CBP charges (duties, taxes or other debts owed CBP) in the event the charges are not paid by the broker. Therefore, if you pay by check, CBP charges may be paid with a separate check payable to "U.S. Customs and Border Protection" which shall be delivered to CBP by the broker. Importers who wish to utilize this procedure must contact our office in advance to arrange timely receipt of duty checks.

Complete Sections A or B, and C, D, and E of this application. U.S. address may be required in Section C, see instructions for details.
See attached instruction pages for information on how to make your application complete and help avoid unnecessary delays.

A. Complete if applying as an individual

1.a. Last name	1.b. First name	1.c. Middle name or initial	1.d. Suffix
Milam	Robert	(b) (6)	

2. Date of birth (mm/dd/yyyy)	3. Occupation	4. Affiliation/ Doing business as (see instructions)
(b) (6)		

5.a. Telephone number	5.b. Alternate telephone number	5.c. Fax number	5.d. E-mail address
(b) (6)			(b) (6)

B. Complete if applying on behalf of a business, corporation, public agency, Tribe, or institution

1.a. Name of business, agency, Tribe, or institution	1.b. Doing business as (dba)

2. Tax identification no	3. Description of business, agency, Tribe, or institution

4.a. Principal officer Last name	4.b. Principal officer First name	4.c. Principal officer Middle name/ initial	4.d. Suffix

5. Principal officer title	6. Primary contact name

7.a. Business telephone number	7.b. Alternate telephone number	7.c. Business fax number	7.d. Business e-mail address

C. All applicants complete address information

1.a. Physical address (Street address; Apartment #, Suite #, or Room #; no P.O. Boxes)
(b) (6)

1.b. City	1.c. State	1.d. Zip code/Postal code	1.e. County/Province	1.f. Country
Midland	Texas	(b) (6)		U.S.A.

2.a. Mailing Address (include if different than physical address, include name of contact person if applicable)

2.b. City	2.c. State	2.d. Zip code/Postal code	2.e. County/Province	2.f. Country

D. All applicants MUST complete

1. Attach check or money order payable to the U.S. FISH AND WILDLIFE SERVICE **in the amount of $100, nonrefundable processing fee** Federal, Tribal, State, and local government agencies, and those acting on behalf of such agencies, are exempt from the processing fee – ***attach documentation of fee exempt status as outlined in instructions.*** (50 CFR 13.11(d))

2. Do you currently have or have you ever had any Federal Fish and Wildlife permits?
Yes ☐ If yes, list the number of the most current permit you have held or that you are applying to renew/re-issue _____ No ☑

3. Certification I hereby certify that I have read and am familiar with the regulations contained in ***Title 50, Part 13 of the Code of Federal Regulations*** and the other ***applicable parts in subchapter B of Chapter I of Title 50***, and I certify that the information submitted in this application for a permit is complete and accurate to the best of my knowledge and belief. I understand that any false statement herein may subject me to the criminal penalties of 18 U.S.C. 1001.

E. IMPORT OF SPORT-HUNTED TROPHIES OF SOUTHERN AFRICAN LEOPARD, AFRICAN ELEPHANT, AND NAMIBIAN SOUTHERN WHITE RHINOCEROS

Note 1: If you hold an import permit for a trophy/trophies that you did not use, please **return the unused original permit.** If you are requesting reissuance of a permit because you have taken a trophy, but were unable to import it prior to the expiration of the permit, please use the renewal form (3-200-52; http://www.fws.gov/international/permits/by-form-number/index.html) and return your original permit with that form.

Note 2: *Sport-hunted trophy* is defined at 50 CFR 23.74 as follows: *Sport-hunted trophy* means a whole dead animal or a readily recognizable part or derivative of an animal specifically identified on the accompanying CITES document that meets the following criteria:

(1) Is raw, processed, or manufactured;
(2) Was legally obtained by the hunter through hunting for his or her personal use;
(3) Is being imported, exported, or re-exported by or on behalf of the hunter as part of the transfer from its country of origin ultimately to the hunter's country of usual residence; and
(4) Includes worked, manufactured, or handicraft items made from the sport-hunted animal only when:
(i) Such items are contained in the same shipment as raw or tanned parts of the sport-hunted animal and are for the personal use of the hunter;
(ii) The quantity of such items is no more than could reasonably be expected given the number of animals taken by the hunter as shown on the license or other documentation of the authorized hunt accompanying the shipment; and
(iii) The accompanying CITES documents (export document and, if appropriate, import permit) contain a complete itemization and description of all items included in the shipment.

Note 3: Certain hunting trophies, including leopard, elephant, and rhinoceros hunting trophies, are subject to restrictions on their use after import into the United States. Please see 50 CFR 23.55 for more information or contact the Division of Management Authority.

Please provide the following information. Complete all questions on the application. Mark questions that are not applicable with "N/A". If applying for more than one trophy, be sure to answer questions 2 and 3 for each trophy.

If importing trophies from more than one country, you must submit a separate application for each shipment in order to obtain separate import permits.

1. ENTER the quantity next to the name of the species you are applying to import (you may apply to import specimens of more than one species provided they have been/are being hunted in the same country):

Leopard (*Panthera pardus*) Quantity:_____(Import is limited to two per hunter per calendar year)

African elephant (*Loxodonta africana*) Quantity:__1__(Import is limited to two per hunter per calendar year)
Note: once imported, ivory cannot be re-exported.

Southern white rhinoceros (*Ceratotherium simum simum*) from Namibia Quantity:_____ (An import permit is not required for trophies harvested in South Africa or Swaziland. If you wish to import from a different country, please use form 3-200-37).

2. **IF ANIMAL IS CURRENTLY LIVING IN THE WILD**, please enter the following:
   a. Country and place (area, region, GIS coordinates, ranch AND nearest city) where wildlife is to be taken from the wild:

   b. Date wildlife is to be hunted:

c. Description of the trophy and parts you intend to import (e.g., skin, skull, shoulder mount, life size mount, claws, horns, tusks).

3. **IF THE ANIMAL IS DEAD**, please enter the following:
   a. Country and place (area, region, GIS coordinates, ranch, and/or AND nearest city) where trophy was removed from the wild: DE BEERS MINES, 36 STOCKDALE ROAD, KIMBERLY 8301, RSA
   b. Date wildlife was hunted: 03/30/2016
   c. Description of the trophy and parts you intend to import (e.g., skin, skull, shoulder mount, life size mount, claws, horn, tusks):

      skin (tanned), skull, four leg stools, tusks, ear (tanned w/artwork)

   d. The current location of the trophy (address and country) [the U.S. import permit will identify this country as the country of export/re-export and must match with the export/re-export document]:

      Safari Taxidermy, 47 Goud Street, Laboria, Polokwane, RSA

4. Complete name and address of overseas person or business shipping the trophy to you. If you are applying to import a trophy directly from Namibia, you **must** provide the name and address of the professional hunter listed on your Namibian hunting permit [this name will appear on the face of the export permit].

Name: Business Name:	Safari Taxidermy
Address:	47 Goud street
City:	Laboria, Polokwane
State/Province:	
Country, Postal Code:	RSA, 0704

5. Please be aware that the U.S. Fish and Wildlife Service may need to make a finding that your activities will enhance or benefit wild populations of the species involved. If you have any information that could support this finding (e.g., how the funds from license/trophy fees will be spent, what portion of the hunting fee will support conservation), please submit such information on a separate page with your application.

CERTIFICATION STATEMENT (original signature must be provided for either 6 or 7 below)

6. **If you are a broker or taxidermist applying on behalf of a foreign national,** provide documentation to show you have a **Power of Attorney** to act on your client's behalf and sign the following statement.

   I acknowledge that the sport-hunted trophy/trophies to be imported has been/will be personally hunted by my client and is being imported only for my client's personal use (i.e., **not for sale, transfer, donation, or exchange that is reasonably likely to result in economic use, gain, or benefit**). I understand that my client may only import two leopard trophies in one calendar year. I understand that my client may only import two African elephant trophies in one calendar year. In addition, I have advised my client that raw ivory, once imported into the United States, cannot be re-exported.

   Taxidermist/Broker's signature:_____ Date: _____

7. **If you are the hunter applying to import your own trophy**, please read and sign the following statement.

I acknowledge that the sport-hunted trophy/trophies to be imported has been/will be personally hunted by me and is being imported only for my personal use (i.e., **not for sale, transfer, donation, or exchange that is reasonably likely to result in economic use, gain, or benefit**). I understand that I may only import two leopard trophies in one calendar year. I understand that I may only import two African elephant trophies in one calendar year. In addition, I understand that raw ivory, once imported into the United States, cannot be re-exported.

Applicant's signature: Robert (b) (6) Milam Date: 7/15/16

Be aware that there may be additional permitting or approval requirements by your local or state governments, as well as required by other Federal agencies or foreign government to conduct your propose activity. While the Service will attempt to assist where possible, it is your responsibility to obtain such approval.

8. All international shipment(s) must be through a designated port. A list of designated ports (where an inspector is posted) is available from http://www.fws.gov/le/designated-ports.html. If you wish to use a port not listed, please contact the Office of Law Enforcement for a Designated Port Exemption Permit (form 3-200-2).

9. Name and address where you wish the permit to be mailed, **if** different from page 1 (All permits will be mailed via the U.S. Postal Service, unless you identify an alternative means below):

10. If you wish the permit to be delivered by means other than USPS regular mail, provide an air bill, pre-paid envelope, or billing information. If you do not have a pre-paid envelope or air bill and wish to pay for a courier service with your credit card, please check the box below. Please DO NOT include credit card number or other information; you will be contacted for this information.

☐ If a permit is issued, please send it via a courier service to the address on page 1 or question 9. I understand that you will contact me for my credit card information once the application has been processed.

11. Who should we contact if we have questions about the application? (Include name, phone number, and email):

Robe(b) (6) Milam, (b) (6) [redacted]

12. **Disqualification Factor.** A conviction, or entry of a plea of guilty or nolo contendere, for a felony violation of the Lacey Act, the Migratory Bird Treaty Act, or the Bald and Golden Eagle Protection Act disqualifies any such person from receiving or exercising the privileges of a permit, unless such disqualification has been expressly waived by the Service Director in response to a written petition. (50 CFR 13.21(c)) Have you or any of the owners of the business, if applying as a business, been convicted, or entered a plea of guilty or nolo contendere, forfeited collateral, or are currently under charges for any violations of the laws mentioned above?

☐ Yes ☑ No If you answered "Yes" provide: a) the individual's name, b) date of charge, c) charge(s), d) location of incident, e) court, and f) action taken for each violation.

2/10/17

US Fish and Wildlife Serice

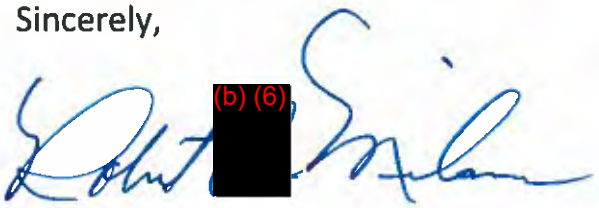
Attn: Jorge Zillaviciencio

RCVD FEB 13 2017 LB

I spoke with Kara in your offices today regarding an error made on my Import Permit No. 16US02051C/9 and she advised me to send in this form 3-200-52 Amendment with no additional payment due to the error was made by Fish and Wildlife in assigning the Appendix no. for my sport hunted trophy African Elephant. The exception for South Africa should have listed it as 2 W, instead of the assigned 1 W on my import permit. I am also enclosing the original import permit for replacement.

Please let me know if you need any further information.

Sincerely,



Robert (b) (6) Milam

Return to: U.S. Fish and Wildlife Service
(Enter address from pages 5 and 6 of application)

Type of Activity:
REISSUANCE, RENEWAL, OR AMENDMENT OF A PERMIT
(For this application, all permits, registrations, and certificates are referred to as a permit.)

Complete Sections A or B, C, D, and E of this application. U.S. address may be required in Section C, see instructions for details.
See attached instruction pages for information on how to make your application complete and help avoid unnecessary delays.

A. Complete if applying as an individual

1.a. Last name	1.b. First name	1.c. Middle name or initial	1.d. Suffix
Milam	Robert	(b) (6)	

2. Date of birth (mm/dd/yyyy)	3. Social Security No	4. Occupation	5. Affiliation/ Doing business as (see instructions)
(b) (6)			

6.a. Telephone number	6.b. Alternate telephone number	6.c. Fax number	6.d. E-mail address
(b) (6)			(b) (6)

B. Complete if applying on behalf of a business, corporation, public agency, Tribe, or institution

1.a. Name of business, agency, Tribe, or institution	1.b. Doing business as (dba)

2. Tax identification no.	3. Description of business, agency, Tribe, or institution

4.a. Principal officer Last name	4.b. Principal officer First name	4.c. Principal officer Middle name/ initial	4.d. Suffix

5. Principal officer title	6. Primary contact name

7.a. Business telephone number	7.b. Alternate telephone number	7.c. Business fax number	7.d. Business e-mail address

C. All applicants complete address information

1.a. Physical address (Street address, Apartment #, Suite #, or Room #, no P.O. Boxes)
(b) (6)

1.b. City	1.c. State	1.d. Zip code/Postal code	1.e. County/Province	1.f. Country
Midland	TX	(b) (6)		USA

2.a. Mailing Address (include if different than physical address; include name of contact person if applicable)

2.b. City	2.c. State	2.d. Zip code/Postal code	2.e. County/Province	2.f. Country

D. All applicants MUST complete

1. Attach check or money order payable to the U.S. FISH AND WILDLIFE SERVICE **in the amount indicated on pages 6 and 7**. Federal, Tribal, State, and local government agencies, and those acting on behalf of such agencies, are exempt from the processing fee – ***attach documentation of fee exempt status as outlined in instructions.*** (50 CFR 13.11(d))

2. Do you currently have or have you ever had any Federal Fish and Wildlife permits?
Yes ☑ If yes, list the number of the most current permit you have held or that you are applying to renew/re-issue: 16US02051C/9 No ☐

3. Certification: I hereby certify that I have read and am familiar with the regulations contained in ***Title 50, Part 13 of the Code of Federal Regulations*** and the other ***applicable parts in subch*** (b) (6) ***of Chapter I of Title 50***, and I certify that the information submitted in this application for a permit is complete and accurate to the best of my knowledge an[illegible] understand that any false statement herein may subject me to the criminal penalties of 18 U.S.C. 1001.

Robert [redacted] Milam — 02/10/2017

Signature (**in blue ink**) of applicant/person responsible for permit (No photocopied or stamped signatures) — Date of signature (mm/dd/yyyy)

E. REISSUANCE, RENEWAL, OR AMENDMENT OF A PERMIT (For this application, all permits, registrations, and certificates are referred to as a permit.)

NOTE 1: If you are renewing your Designated Port Exemption permit, use form 3-200-2 (http://www.fws.gov/forms/3-200-2.pdf) and submit to appropriate Office of Law Enforcement address. If you are renewing your Import/Export license (required for commercial activities), use form 3-200-3 (http://www.fws.gov/forms/3-200-3.pdf) and submit to appropriate Office of Law Enforcement address.

NOTE 2: This form **cannot** be used for lost or damaged permit. If you need to replace a lost or damaged permit, please use form 3-200-66, http://www.fws.gov/international/pdf/permit-application-form-3-200-66-replacement-document.pdf. The application **must** be submitted to the office that issued the initial permit. Lost or damaged permit

NOTE 3: Some activities, such as all master files for multiple shipments, Certificate of Scientific Exchange (COSE), circus/traveling exhibits, and artificially propagated plants, can only be re-issued, renewed, or amended by submitting a new application for permits for those activities. Please refer to http://www.fws.gov/international/permits/by-form-number/index.html to determine if another application form would be more appropriate or contact the Division of Management Authority for more information.

1. **Permit number.** Enter the permit number to be reissued/renewed/amend 16US02051C/9 .

2. Submit the original permit with this application.

3. **Past activities.**
   a. Provide copies of all cleared documents and form 3-177 (FWS declaration of wildlife) associated with this permit.
   b. Provide a summary detailing activities conducted under this permit, as well as a brief statement of why you are seeking reissuance/renewal.

4. **Annual Report.** If required by your permit, provide an annual report as conditioned (Please disregard if you have already submitted your annual report.)

5. **Sport-hunted trophies:** If you did not hunt during the hunting season stated in your original application, you are not eligible for a renewal. Please submit a new application form.

6. **Certification** - Complete one of the statements below and supply any additional documentation requested: (original signature is required)

   a. For **NO CHANGES** to original application:

   I certify that the information submitted in support of my original application for the permit indicated above has not changed and is still currently correct. I hereby request reissuance or renewal of this permit.

   Permittee's signature: _____ Date: _____

   b. For **CHANGES** to original application:

   On an attached page(s), provide a complete description of any changes (e.g., change in principal officer, personnel, address, location of activities, types of activities). Please sign each attached page. Also note that we need to request additional information regarding the changes after reviewing your initial request.

   I certify that the information submitted in support of my original application for the permit indicated above is still currently correct EXCEPT for the changes noted on the attached, signed page(s). I hereby request re-issuance or ren[redacted] this permit with the indicated changes.

   Permittee's signature: Robert [redacted] Williams Date: 02/10/2017

7. All international shipment(s) must be through a designated port, unless otherwise authorized. A list of designated ports (where an inspector is posted) is available from http://www.fws.gov/le/designated-ports.html. If you wish to use a port not listed, please contact either the Office of Law Enforcement for a Designated Port Exemption Permit (form 3-200-2) or the Division of Management Authority.

8. Name and address where you wish the permit to be mailed, **if** different from page 1 (All permits will be mailed via the U.S. Postal Service, unless you identify an alternative means below):

9. If you wish the permit to be delivered by means other than USPS regular mail, provide an air bill, pre-paid envelope, or billing information. If you do not have a pre-paid envelope or air bill and wish to pay for a courier service with your credit card, please check the box below. Please DO NOT include credit card number or other information; you will be contacted for this information.

   ☒ If a permit is issued, please send it via a courier service to the address on page 1 or question 8. I understand that you will contact me for my credit card information once the application has been processed.

11. Who should we contact if we have questions about the application? (Include name, phone number, and email):

Robert Milam(b) (6) [redacted]

12. **Disqualification Factor.** A conviction, or entry of a plea of guilty or nolo contendere, for a felony violation of the Lacey Act, the Migratory Bird Treaty Act, or the Bald and Golden Eagle Protection Act disqualifies any such person from receiving or exercising the privileges of a permit, unless such disqualification has been expressly waived by the Service Director in response to a written petition. [50 CFR 13.21(c)]. Have you or any of the owners of the business, if applying as a business, been convicted, or entered a plea of guilty or nolo contendere, forfeited collateral, or are currently under charges for any violations of the laws mentioned above?

☐ Yes ☑ No If you answered "Yes" provide: a) the individual's name, b) date of charge, c) charge(s), d) location of incident, e) court, and f) action taken for each violation.

E. IMPORT OF SPORT-HUNTED TROPHIES OF SOUTHERN AFRICAN LEOPARD, AFRICAN ELEPHANT, AND NAMIBIAN SOUTHERN WHITE RHINOCEROS

Note 1: If you hold an import permit for a trophy/trophies that you did not use, please **return the unused original permit**. If you are requesting reissuance of a permit because you have taken a trophy, but were unable to import it prior to the expiration of the permit, please use the renewal form (3-200-52; http://www.fws.gov/international/permits/by-form-number/index.html) and return your original permit with that form.

Note 2: *Sport-hunted trophy* is defined at 50 CFR 23.74 as follows: *Sport-hunted trophy* means a whole dead animal or a readily recognizable part or derivative of an animal specifically identified on the accompanying CITES document that meets the following criteria:

(1) Is raw, processed, or manufactured;
(2) Was legally obtained by the hunter through hunting for his or her personal use;
(3) Is being imported, exported, or re-exported by or on behalf of the hunter as part of the transfer from its country of origin ultimately to the hunter's country of usual residence; and
(4) Includes worked, manufactured, or handicraft items made from the sport-hunted animal only when:
  (i) Such items are contained in the same shipment as raw or tanned parts of the sport-hunted animal and are for the personal use of the hunter;
  (ii) The quantity of such items is no more than could reasonably be expected given the number of animals taken by the hunter as shown on the license or other documentation of the authorized hunt accompanying the shipment; and
  (iii) The accompanying CITES documents (export document and, if appropriate, import permit) contain a complete itemization and description of all items included in the shipment.

Note 3: Certain hunting trophies, including leopard, elephant, and rhinoceros hunting trophies, are subject to restrictions on their use after import into the United States. Please see 50 CFR 23.55 for more information or contact the Division of Management Authority.

Please provide the following information. Complete all questions on the application. Mark questions that are not applicable with "N/A". If applying for more than one trophy, be sure to answer questions 2 and 3 for each trophy.

If importing trophies from more than one country, you must submit a separate application for each shipment in order to obtain separate import permits.

1. ENTER the quantity next to the name of the species you are applying to import (you may apply to import specimens of more than one species provided they have been/are being hunted in the same country):

Leopard (*Panthera pardus*) Quantity: 0 (Import is limited to two per hunter per calendar year)

African elephant (*Loxodonta africana*) Quantity: 1 (Import is limited to two per hunter per calendar year)
Note: once imported, ivory cannot be re-exported.

Southern white rhinoceros (*Ceratotherium simum simum*) from Namibia Quantity:_____ (An import permit is not required for trophies harvested in South Africa or Swaziland. If you wish to import from a different country, please use form 3-200-37).

2. **IF ANIMAL IS CURRENTLY LIVING IN THE WILD,** please enter the following:
   a. Country and place (area, region, GIS coordinates, ranch AND nearest city) where wildlife is to be taken from the wild:

NA

   b. Date wildlife is to be hunted:

NA

c. Description of the trophy and parts you intend to import (e.g., skin, skull, shoulder mount, life size mount, claws, horns, tusks).

NA

3. **IF THE ANIMAL IS DEAD**, please enter the following:
   a. Country and place (area, region, GIS coordinates, ranch, and/or AND nearest city) where trophy was removed from the wild: South Africa, Umbabat Private Nature Reserve
   b. Date wildlife was hunted: 12/22/2014 Hoedsplut
   c. Description of the trophy and parts you intend to import (e.g., skin, skull, shoulder mount, life size mount, claws, horn, tusks): Processed Leather from animal, Ivory Tusks, Feet
   d. The current location of the trophy (address and country) [the U.S. import permit will identify this country as the country of export/re-export and must match with the export/re-export document]: Trophex CC Po Box 5432 Onverwacht Limpopo Province 0557 South Africa

4. Complete name and address of overseas person or business shipping the trophy to you. If you are applying to import a trophy directly from Namibia, you **must** provide the name and address of the professional hunter listed on your Namibian hunting permit [this name will appear on the face of the export permit].

Name: Business Name: Address:	Trophex CC
Address:	PO Box 5432
City:	ONVERWACHT
State/Province:	LIMPOPO
Country, Postal Code:	PROVINCE 0557
	SOUTH Africa

5. Please be aware that the U.S. Fish and Wildlife Service may need to make a finding that your activities will enhance or benefit wild populations of the species involved. If you have any information that could support this finding (e.g., how the funds from license/trophy fees will be spent, what portion of the hunting fee will support conservation), please submit such information on a separate page with your application.

CERTIFICATION STATEMENT (original signature must be provided for either 6 or 7 below)

6. **If you are a broker or taxidermist applying on behalf of a foreign national,** provide documentation to show you have a **Power of Attorney** to act on your client's behalf and sign the following statement.

   I acknowledge that the sport-hunted trophy/trophies to be imported has been/will be personally hunted by my client and is being imported only for my client's personal use (i.e., **not for sale, transfer, donation, or exchange that is reasonably likely to result in economic use, gain, or benefit**). I understand that my client may only import two leopard trophies in one calendar year. I understand that my client may only import two African elephant trophies in one calendar year. In addition, I have advised my client that raw ivory, once imported into the United States, cannot be re-exported.

   Taxidermist/Broker's signature: NA Date: NA

7. **If you are the hunter applying to import your own trophy**, please read and sign the following statement.

I acknowledge that the sport-hunted trophy/trophies to be imported has been/will be personally hunted by me and is being imported only for my personal use (i.e., **not for sale, transfer, donation, or exchange that is reasonably likely to result in economic use, gain, or benefit**). I understand that I may only import two leopard trophies in one calendar year. I understand that I may only import two African elephant trophies in one calendar year. In addition, I understand that raw ivory, once imported into the United States, cannot be re-exported.

Applicant's signature: _____ Date: 10/08/2017

Be aware that there may be additional permitting or approval requirements by your local or state governments, as well as required by other Federal agencies or foreign government to conduct your propose activity. While the Service will attempt to assist where possible, it is your responsibility to obtain such approval.

8. All international shipment(s) must be through a designated port. A list of designated ports (where an inspector is posted) is available from http://www.fws.gov/le/designated-ports.html. If you wish to use a port not listed, please contact the Office of Law Enforcement for a Designated Port Exemption Permit (form 3-200-2).

Dallas/ Fort Worth
PO Box 610069
DFW AIRPORT, Tx 75261

Dallas / Fort Worth
1639 west 23, Suite 105

9. Name and address where you wish the permit to be mailed, if different from page 1 (All permits will be mailed via the U.S. Postal Service, unless you identify an alternative means below):

Nt

10. If you wish the permit to be delivered by means other than USPS regular mail, provide an air bill, pre-paid envelope, or billing information. If you do not have a pre-paid envelope or air bill and wish to pay for a courier service with your credit card, please check the box below. Please DO NOT include credit card number or other information; you will be contacted for this information.

☐ If a permit is issued, please send it via a courier service to the address on page 1 or question 9. I understand that you will contact me for my credit card information once the application has been processed.

11. Who should we contact if we have questions about the application? (Include name, phone number, and email):

James (b)(6) Bethune (b)(6) [redacted]

12. **Disqualification Factor**. A conviction, or entry of a plea of guilty or nolo contendere, for a felony violation of the Lacey Act, the Migratory Bird Treaty Act, or the Bald and Golden Eagle Protection Act disqualifies any such person from receiving or exercising the privileges of a permit, unless such disqualification has been expressly waived by the Service Director in response to a written petition. (50 CFR 13.21(c)) Have you or any of the owners of the business, if applying as a business, been convicted, or entered a plea of guilty or nolo contendere, forfeited collateral, or are currently under charges for any violations of the laws mentioned above?

☐ Yes ☒ No If you answered "Yes" provide: a) the individual's name, b) date of charge, c) charge(s), d) location of incident, e) court, and f) action taken for each violation.

(2) Was legally obtained by the hunter through hunting for his or her personal use;
(3) Is being imported, exported, or re-exported by or on behalf of the hunter as part of the transfer from its country of origin ultimately to the hunter's country of usual residence; and
(4) Includes worked, manufactured, or handicraft items made from the sport-hunted animal only when:
(i) Such items are contained in the same shipment as raw or tanned parts of the sport-hunted animal and are for the personal use of the hunter;
(ii) The quantity of such items is no more than could reasonably be expected given the number of animals taken by the hunter as shown on the license or other documentation of the authorized hunt accompanying the shipment; and
(iii) The accompanying CITES documents (export document and, if appropriate, import permit) contain a complete itemization and description of all items included in the shipment.

Note 3: Certain hunting trophies, including leopard, elephant, and rhinoceros hunting trophies, are subject to restrictions on their use after import into the United States. Please see 50 CFR 23.55 for more information or contact the Division of Management Authority.

Please provide the following information. Complete all questions on the application. Mark questions that are not applicable with "N/A". If applying for more than one trophy, be sure to answer questions 2 and 3 for each trophy.

If importing trophies from more than one country, you must submit a separate application for each shipment in order to obtain separate import permits.

1. ENTER the quantity next to the name of the species you are applying to import (you may apply to import specimens of more than one species provided they have been/are being hunted in the same country):

Leopard (*Panthera pardus*) Quantity: N/A (Import is limited to two per hunter per calendar year)

African elephant (*Loxodonta africana*) Quantity: 1 (Import is limited to two per hunter per calendar year)
Note: once imported, ivory cannot be re-exported.

Southern white rhinoceros (*Ceratotherium simum simum*) from Namibia Quantity: N/A (An import permit is not required for trophies harvested in South Africa or Swaziland. If you wish to import from a different country, please use form 3-200-37).

2. **IF ANIMAL IS CURRENTLY LIVING IN THE WILD,** please enter the following:
   a. Country and place (area, region, GIS coordinates, ranch AND nearest city) where wildlife is to be taken from the wild:

   N/A

   b. Date wildlife is to be hunted:

   N/A

c. Description of the trophy and parts you intend to import (e.g., skin, skull, shoulder mount, life size mount, claws, horns, tusks).

N/A

3. **IF THE ANIMAL IS DEAD**, please enter the following:
   a. Country and place (area, region, GIS coordinates, ranch, and/or AND nearest city) where trophy was removed from the wild: Zimbabwe Grid Reference 086276, Mbire Guruve North Area 1, Ward 2 Nearest City: Mushumbi Pools, Guruve
   b. Date wildlife was hunted: February 25, 2015
   c. Description of the trophy and parts you intend to import (e.g., skin, skull, shoulder mount, life size mount, claws, horn, tusks):

      Tusks (Ivory)

   d. The current location of the trophy (address and country) [the U.S. import permit will identify this country as the country of export/re-export and must match with the export/re-export document]:

      CMS Safaris, 14 Yellow Wood Lane, Kambanji, Harare, Zimbabwe

4. Complete name and address of overseas person or business shipping the trophy to you. If you are applying to import a trophy directly from Namibia, you **must** provide the name and address of the professional hunter listed on your Namibian hunting permit [this name will appear on the face of the export permit].

Name: Business	CMS Safaris
Name: Address:	14 Yellow Wood Lane
Address:	Kambanji
City:	Harare
State/Province:	
Country, Postal Code:	Zimbabwe

5. Please be aware that the U.S. Fish and Wildlife Service may need to make a finding that your activities will enhance or benefit wild populations of the species involved. If you have any information that could support this finding (e.g., how the funds from license/trophy fees will be spent, what portion of the hunting fee will support conservation), please submit such information on a separate page with your application.

CERTIFICATION STATEMENT (original signature must be provided for either 6 or 7 below)

6. **If you are a broker or taxidermist applying on behalf of a foreign national,** provide documentation to show you have a **Power of Attorney** to act on your client's behalf and sign the following statement.

   I acknowledge that the sport-hunted trophy/trophies to be imported has been/will be personally hunted by my client and is being imported only for my client's personal use (i.e., **not for sale, transfer, donation, or exchange that is reasonably likely to result in economic use, gain, or benefit**). I understand that my client may only import two leopard trophies in one calendar year. I understand that my client may only import two African elephant trophies in one calendar year. In addition, I have advised my client that raw ivory, once imported into the United States, cannot be re-exported.

   Taxidermist/Broker's signature:_____ Date: _____

7. **If you are the hunter applying to import your own trophy,** please read and sign the following statement.

I acknowledge that the sport-hunted trophy/trophies to be imported has been/will be personally hunted by me and is being imported only for my personal use (i.e., **not for sale, transfer, donation, or exchange that is reasonably likely to result in economic use, gain, or benefit**). I understand that I may only import two leopard trophies in one calendar year. I understand that I may only import two African elephant trophies in one calendar year. In addition, I understand that raw ivory, once imported into the United States, cannot be re-exported.

Applicant's signature: _____ Date: 08/04/2016

Be aware that there may be additional permitting or approval requirements by your local or state governments, as well as required by other Federal agencies or foreign government to conduct your propose activity. While the Service will attempt to assist where possible, it is your responsibility to obtain such approval.

8. All international shipment(s) must be through a designated port. A list of designated ports (where an inspector is posted) is available from http://www.fws.gov/le/designated-ports.html. If you wish to use a port not listed, please contact the Office of Law Enforcement for a Designated Port Exemption Permit (form 3-200-2).

9. Name and address where you wish the permit to be mailed, **if** different from page 1 (All permits will be mailed via the U.S. Postal Service, unless you identify an alternative means below):

N/A

10. If you wish the permit to be delivered by means other than USPS regular mail, provide an air bill, pre-paid envelope, or billing information. If you do not have a pre-paid envelope or air bill and wish to pay for a courier service with your credit card, please check the box below. Please DO NOT include credit card number or other information; you will be contacted for this information.

☐ If a permit is issued, please send it via a courier service to the address on page 1 or question 9. I understand that you will contact me for my credit card information once the application has been processed.

11. Who should we contact if we have questions about the application? (Include name, phone number, and email):

Michael (b) (6) Jines, (b) (6) [redacted]

12. **Disqualification Factor**. A conviction, or entry of a plea of guilty or nolo contendere, for a felony violation of the Lacey Act, the Migratory Bird Treaty Act, or the Bald and Golden Eagle Protection Act disqualifies any such person from receiving or exercising the privileges of a permit, unless such disqualification has been expressly waived by the Service Director in response to a written petition. (50 CFR 13.21(c)) Have you or any of the owners of the business, if applying as a business, been convicted, or entered a plea of guilty or nolo contendere, forfeited collateral, or are currently under charges for any violations of the laws mentioned above?

☐ Yes ☑ No If you answered "Yes" provide: a) the individual's name, b) date of charge, c) charge(s), d) location of incident, e) court, and f) action taken for each violation.

N/A

E.5 Supplemental Information

Please see information provided by ZPWMA, CM Safaris, other safari operators and Conservation Force since the date of the suspension. The elephant population has been established to be more than 80,000 and the poaching incidents (alleged 300 poisoned) have been greatly exaggerated by agenda driven Johnny Rodrigues.

Re: Request for Reconsideration of Denial of Permit Applications PRT-04846C and PRT-04205C

Dear Chief Van Norman:

We request reconsideration of the denials of two applications for permits to import hunting trophies of elephant taken in Zimbabwe in 2015 ("Denials"). The first application was submitted by Richard Bonander, PRT-04846C, for a bull elephant taken in the Ngamo/Sikumi Forest Block in Zimbabwe on March 21, 2015. The second was submitted by Michael Jines, PRT-04205C, for a bull elephant taken in the Mbire CAMPFIRE District in Zimbabwe on February 25, 2015. Conservation Force represents both Applicants.

The Denials should be reconsidered and reversed for eight primary reasons. First, they rely upon the *Enhancement Finding for African Elephant Taken as Sport-Hunted Trophies in Zimbabwe on or after January 1, 2015*, dated March 26, 2015 ("Finding"). But the Finding fails to consider significant information submitted by Conservation Force, Zimbabwe's Parks and Wildlife Management Authority ("ZPWMA"), and others. If considered, the negative conclusion would have to be reversed. The information provided:

- Establishes that Zimbabwe has the most up-to-date management plan for African elephant in the world, with adaptive and regionally-specific action items, clear assignment of responsibilities, and means of verifying its implementation successes;
- Establishes that Zimbabwe has a relatively stable elephant population, as determined by a recent countrywide survey;
- Demonstrates that Zimbabwe has been effectively enforcing laws and policies to protect elephant and other species, and has implemented new measures and ramped-up national and local efforts to combat poaching;
- Demonstrates that hunting offtakes are sustainable and based on the consideration of all causes of elephant mortality, biological and critical social factors, and scientific recommendations;
- Reflects the full cooperation of ZPWMA in responding to the FWS' information demands, including production of sensitive budget information that underscores the essential role hunting, especially elephant hunting, plays in supporting wildlife conservation, management, and protection, both in the Parks estate and community areas;
- Evidences how the government's grant of Appropriate Authority to local landholders has created a public-private-community partnership that obligates all stakeholders to invest in protection and conservation of wildlife on their lands; and

- Proves that licensed, regulated hunting enhances the survival of elephant and other species in the country by securing habitat, generating management funding, underwriting and supporting anti-poaching, and incentivizing greater tolerance of elephant by rural community members.

In sum, because the information provided demonstrates that the enhancement standard is met, and this information was not relied upon in denying the applications, we respectfully request reconsideration and reversal of the Denials and issuance of the requested import permits.

Reason for Reconsideration 1: Failure to Consider Best-Available Information

In the Finding, the FWS repeatedly stated it would review its negative conclusion if additional information was provided.[1] But the FWS has not done so. It has not considered hundreds of pages of information in the Denials, which rely upon the Finding.

The Finding was made on March 26, 2015. Information has been provided to the FWS from April 17, 2014 through as recently as February 2017 by Conservation Force, ZPWMA, the IUCN African Elephant Specialist Group ("AfESG"), the Safari Operators Association of Zimbabwe ("SOAZ"), Safari Club International ("SCI"), individual hunting operators, and others.[2] Most of this data has ***not*** been discussed in the Finding or in an updated finding, in the two-plus years since the Finding was made.

Rather, entire paragraphs in the Finding are identical to the July 22, 2014 negative enhancement finding.[3] Because they are not updated from July 2014, they fail to address points made by Conservation Force and ZPWMA to correct errors in that July finding. Moreover, the Finding states in several places that the FWS was not provided with specific information. However, Conservation Force previously cited to where the information was provided,[4] and ZPWMA submitted additional data in its prompt and thorough July 2015 response ("ZPWMA July 2015 Response") to the FWS' third questionnaire, dated May 12, 2015 (***after*** the Finding). The ZPWMA July 2015 Response was not considered in the Denials, which rely upon the Finding. However, the July 2015 Response provides substantial information the FWS asserts is missing.[5]

This up-to-date information cannot be ignored. It demonstrates that Zimbabwe's hunting program is well-managed and sustainable. It shows how hunting in Zimbabwe enhances the survival of the elephant. The FWS' failure to consider this information requires reconsideration of the Denials. The Finding is based on outdated information, and its reservations have been resolved. Once the new information is considered

---

[1] E.g., *Finding*, p. 1, 3, 6, 11.

[2] An index of the information previously submitted to the FWS is attached.

[3] *Enhancement Finding for African Elephants Taken as Sport-Hunted Trophies in Zimbabwe During 2014*, dated July 22, 2014, p. 2 ¶ 6; p. 3 ¶¶ 1-3; p. 4 ¶¶ 1-2; p. 5 ¶¶ 2-3; p. 7 ¶¶ 3-4; p. 8 ¶ 4; p. 9 ¶ 1 (changed "2002 Panel of Experts" to "1997"); p. 9 ¶ 4; p. 10 ¶¶ 1-4; p. 11 ¶¶ 3-5; p. 12 ¶¶ 1-2, 5; p. 13 ¶ 1-2; p. 17 ¶ 3; p. 18 ¶¶ 2, 4; see also paragraphs in which several sentences are identical or nearly so: p. 4 ¶¶ 3-4; p. 5 ¶ 1; p. 6 ¶ 3-4; p. 7 ¶ 2; p. 8 ¶ 3; p. 9 ¶ 3; p. 14 ¶ 4 (changed numbers of RDCs); p. 16 ¶ 4; p. 17 ¶ 5; p. 18 ¶ 3.

[4] Conservation Force also provided an Appendix that cross-referenced statements claiming not to have information against the FWS' April 4, 2014 questionnaire to ZPWMA, which did not ask for much of this information. Conservation Force, *Comment Opposing the Negative Enhancement Finding for African Elephant Taken as Sport-Hunted Trophies in Zimbabwe in 2014*, dated Oct. 16, 2014 ("*CF Oct. Comment*"), passim, & Appendix 1.

[5] E.g., Compare *Finding*, p. 9, 11 (seeking revenue information), p. 11 (seeking offtake information) with ZPWMA July 2015 Response, p. 36-43 (providing revenue and offtake tables).

by the FWS, the "enhancement" generated by elephant hunting is clear, and the requested permits should issue.

The urgency of issuing these permits has not changed since the suspension was imposed in April 2014. As the Finding recognizes, elephant hunting generates operating budget revenue for ZPWMA, incentives for Zimbabwe's community-based natural resources management program (CAMPFIRE), anti-poaching, and more. The information provided, including two CAMPFIRE reports, a SOAZ report, the ZPWMA July 2015 Response and more, makes clear that American elephant hunters are the largest source of these benefits.[6] Continued refusal to issue import permits jeopardizes this enhancement and the survival of the species.

The failure to consider the best-available information is made worse because ZPWMA responded promptly to the FWS' requests. ZPWMA responded to the first questionnaire within two weeks. Its Director-General and high-level representatives immediately traveled to DC to reinforce their response. ZPWMA responded to the second questionnaire in under six weeks; responded to third—not considered in the Finding—in five weeks; responded to the fourth—not considered in the Finding—in two weeks; and responded to the fifth —not considered in the Finding—within several weeks, with the final plan prioritization completed within six months. ZPWMA has repeatedly redirected its resources to provide information to the FWS. But the FWS has repeatedly moved the target to create an unreachable standard and demanded additional, more intensive information. The bar has been raised beyond "enhancement." The FWS has acknowledged that elephant benefit from well-managed hunting.[7] But the Finding seems to require more than well-managed —it seeks management perfection. That is simply not possible, either in Zimbabwe or in this country (even the FWS is constrained by limited resources).

The information submitted shows that licensed, regulated hunting increases habitat security, generates law enforcement funding and support, and incentivizes tolerance for elephant. It shows a sustainable use of elephant at a level far too low to be detrimental. It shows that the enhancement standard, as originally defined[8] has been met. Thus, the Denials should be reconsidered and reversed.

---

[6] E.g., *ZPWMA July 2015 Response*, p. 40-41 ("The US hunting market constitutes 51% and 54% of elephant trophy hunting in Zimbabwe for the years 2013 and 2014 respectively."); CAMPFIRE Association, *Trophy Imports Suspension and the CAMPFIRE Program*) (2014), p. 4 (*"CAMPFIRE Association Report"*) (U.S. hunters represent two-thirds or more of CAMPFIRE clients); E. Gandiwa, *Proceedings of the CAMPFIRE Stakeholders' Workshop: Towards the Development of a New Elephant Management Plan and Policy* (Nov. 2014) (*"CAMPFIRE Workshop Proceedings"*), p. 6-21; CAMPFIRE Association, *CAMPFIRE Hunting Income & Distribution* (Dec. 1, 2015) (*"CAMPFIRE Income Analysis"*), p. 6; ZPWMA, Presentation, *Legal Trade, Conservation, and Rural Livelihoods: A Zimbabwean Perspective* (Dec. 2016), p. 19; SOAZ, *Status of Elephant Populations, Hunting, and Anti-Poaching Effort in Safari Areas in Zimbabwe* (2014), p. 3-4 (*"SOAZ Report"*)

[7] E.g., FWS, *Suspension of Import of Elephant Hunting Trophies Taken in Tanzania and Zimbabwe in 2015 and Beyond, Questions & Answers* (2014).

[8] In denying import permits for elephant from Tanzania, the FWS defined enhancement as: "activities that provide a direct benefit to the specie being hunted. Such benefits could include the use of revenue generated by the hunt to support conservation projects or to manage the species. Other benefits that could result from activities that enhance the survival of the species include improving human-wildlife conflicts, anti-poaching efforts, or habitat conservation." According to this standard and definition, and not the one created in the Finding, there is no doubt the importation of sport-hunted elephant into the U.S. enhances the species.

Reason for Reconsideration 2:
The Denials Fail to Consider Zimbabwe's State-of-the-Art Elephant Management Plans

ZPWMA has recently adopted and is implementing the most cutting-edge elephant management regime among range nations, the *Zimbabwe Elephant Management Plan (2015-2020)* ("Plan"). This effort attests to ZPWMA's commitment to elephant management and conservation. The new Plan further exemplifies the importance of sport-hunting in this system. The Denials fail to consider this essential new Plan, which the FWS has had for over one year.

Instead, the outdated Finding errs by considering *Elephant Management in Zimbabwe* to be the country's management plan, despite being told it was not.[9] The FWS' concerns about a claimed lack of measurable outcomes in Zimbabwe's actual former management plan, the *Policy and Plan for Elephant Management in Zimbabwe*, have been resolved. As the FWS was repeatedly told, a new management plan was adopted, with specific action items, deliverables, and deadlines (as suggested was necessary by the April and July negative enhancement findings).[10] The FWS knew of the new Plan's details because the FWS received the *Plan Workshop Proceedings* in December 2014, before the Finding was made.[11] The FWS was also informed that Zimbabwe would manage each main range area adaptively pursuant to a regional plan. The FWS was sent the proceeding of regional workshops, and the final regional plans as part of the final national Plan.[12] And in November 2016, the FWS was provided with information on the implementation and prioritization of these plans at the request of the Chief of Permits.[13] In short, throughout the Plan's drafting, ZPWMA and Conservation Force kept the FWS fully apprised of the status and what the Plan would entail. However, little of this information was considered in the Finding or the Denials.

Had the new Plan been considered, these permits would have to be approved. The Plan incorporates an adaptive management framework with higher-level Targets, Key Components, Strategic Objectives, and Outputs. It breaks each Key Component into specific management actions, the achievement of which will be measured and verified through Key Performance Indicators ("KPIs") and Means of Verification of KPIs. The Plan sets deadlines and assigns specific responsibility for achieving each Action. It focuses on five key components: 1. Protection and Law Enforcement, 2. Biological Monitoring and Management, 3. Social,

Economic, and Cultural Framework, 4. Building Conservation Capacity, and 5. Coordination, Collaboration, and Program Management.[14]

The Plan breaks down elephant management by range, as their challenges differ. For example, authorities must manage overpopulated elephant and provision of water in North West Matabeleland compared to a reduced population targeted to recover in Sebungwe. These differences are addressed in the actions and indicators of each regional plan.[15]

The Plan provides for accountability, transparency, and effective implementation in the terms of reference for an Elephant Manager tasked with directing elephant management in Zimbabwe. The Plan also created a National Elephant Management Committee and four range-specific committees to review progress and oversee implementation.[16]

Examples of "Protection" activities include establishing a rapid-response anti-poaching unit in conjunction with the Zimbabwe Republic Police, expanding ZPWMA's informer networks, and connecting national law enforcement databases. Monitoring activities include periodic surveys and setting Thresholds of Potential Concern as early-warning indicators in key habitats. An example KPI for "Building Conservation Capacity" is to channel most income from elephant hunting back into elephant management, with ongoing oversight through reports on funds available and utilized.[17] As these examples show, the Plan incorporates ***specific*** actions and KPIs, and specific oversight mechanisms.

The Plan addresses human-elephant conflict in the Social, Economic, and Cultural Framework component. The Plan recognizes there is no single solution to conflict, and commits to "undertake additional research on problem animal control and minimizing conflict." It emphasizes the importance of local communities' tolerance towards elephants through a system of benefits-sharing as a long-term solution to conflict.[18]

The Plan also specifically integrates licensed, regulated elephant hunting as a management tool:

> To have a future, elephant must have a value. Value to the governing authorities and to the local people. The greater the value, the greater the tolerance of them is likely to be ... Regulated sport hunting converts wildlife into assets for the benefit of local people and the country as a whole... elephant and other wildlife populations will be negatively affected though reduced conservation efforts arising from low funding and reduced goodwill from the communities, when... the elephant has the economic potential to raise adequate funds to support itself and other species. For these reasons, Zimbabwe confirms its commitment to the sustainable use of elephant and other wildlife in this Action Plan.[19]

---

[14] *Plan*, p. 16-17.

[15] *Plan*, p. 38-80 (Annexes 9.4-9.7).

[16] *Plan*, p. 13-14, 35-37.

[17] E.g., *Plan*, p. 19-27.

[18] *Plan*, p. 15.

[19] *Plan*, p. 12.

The Plan addresses the Finding's concerns on every level. It implements an effective management system, with the necessary "specific goals and measures with specific actions to be taken."[20] Moreover, ZPWMA provided to FWS a 2016 report on its progress in implementing the Plan and prioritizing implementation, including of the regional plans. The Plan Supplement emphasizes law enforcement and training to combat poaching and ivory trafficking.[21] The FWS requested the prioritization, and ZPWMA again demonstrated its good faith in preparing and providing the document, which was not considered in the Finding or the Denials. Because the Finding's concerns are resolved and new information reveals an effective, adaptive management plan and implementation thereof in Zimbabwe, the Denials should be reconsidered and reversed.[22]

Reason for Reconsideration 3:
Zimbabwe has Current Elephant Population Information that Guides its Sustainable Use

The AfESG recently estimated Zimbabwe's elephant population at 82,630 ± 8,589 across a range of 81,228 km^2.[23] Zimbabwe maintains the second-largest elephant population in Africa, at a level nearly double its estimated carrying capacity.[24] The population is most concentrated in the North West Matabeleland and South East Lowveld ranges. The current national estimate is approximately 6,000 lower than the 2001 countrywide estimate, a percentage calculated as "not statistically significant" by the survey's authors.[25] Zimbabwe's current elephant population is 20% larger than its population in 1997 (66,000), when the FWS made a positive enhancement finding. The Finding does not explain why a 20% increase is insufficient.[26]

---

[20] *Finding*, p. 6. The Plan applies a multi-tiered approach, using tailored goals leading to achievement of the "Long-Term Vision," which is: "To conserve elephants at levels that will enable them to contribute to the conservation of biodiversity, national development and Zimbabwe's cultural heritage." The Plan establishes intermediate "Targets" to achieving these goals, which are in line with the 1997 *Policy and Plan*: "1. To maintain at least four demographically and genetically viable elephant populations in Zimbabwe[;] 2. To maintain or increase core protected range of elephant in Zimbabwe[;] 3. To maintain numbers/density of elephant at levels that do not adversely impact on biodiversity conservation goals while contributing to economically viable and sustainable wildlife-based land uses in Zimbabwe." As in the draft provided to the FWS in December 2014, the final Plan is organized by "Key Components," and then "Strategic Objectives" that explain the "Key Components." "Outputs" describe the desired outcomes, and are to be achieved through implementation of "Key Activities/Actions." That implementation is monitored by the KPIs and Means of Verification of the KPIs.

[21] *Plan Supplement*, p. 6.

[22] As ZPWMA explained, Zimbabwe conserves and manages elephant on every level. Zimbabwe and bordering range states have formed Trans-Frontier Conservation Areas ("TFCAs") to address the elephant's migratory nature and cross border populations. Further, through the Plan Zimbabwe implements the action plans adopted by the Southern African Development Community ("SADC"), and the SADC Regional Elephant Management Strategy of 2007. E.g., *ZPWMA April 2014 Response*, p. 12; *ZPWMA July 2015 Response*, p. 15; *CF June 2014 Comment*, p. 12 & related attachments; *CF Oct. 2014 Comment*, p. 9 & related attachments.

[23] IUCN/AfESG, African Elephant Status Report 2016 (Sept. 2016), publicly available at https://www.dropbox.com/s/7a8w3kk6r9hzm0r/AfESG%20African%20Elephant%20Status%20Report%202016.pdf?dl=1.

[24] *Plan*, p. 3.

[25] *Plan*, p. 3. As explained above, the Management Plan incorporates regional plans to address challenges unique to each range and manage elephant within regional targets.

[26] The Finding suggests an increase to over 100,000 elephant would be acceptable. P. 8. As ZPWMA, Conservation Force, Rowan Martin, and others pointed out, a population of that size would be a catastrophe for the country's biodiversity. The Finding does not account for the expansion in Zimbabwe's elephant since 1997, or the management measures implemented since then. Zimbabwe's elephant population has rebounded incredibly, from a low of 4,000

Worse, the Finding does not rely on this up-to-date estimate, although the FWS received the preliminary survey results in December 2014.[27] Nor does the Finding rely on the best-available information in the FWS' possession as of March 2015, which included comments from the AfESG and numerous survey results.[28] The Denials should be reconsidered because the Finding relies upon outdated data that was proven to be inaccurate by Conservation Force, ZPWMA, and the AfESG.

For example, the Finding reuses language that cites a statistic from *Elephant Management in Zimbabwe*. The statement was disavowed by its author, and Conservation Force explained how the percent limitation was being taken out of context.[29] The Finding's failure to consider information that undercuts a "fact" on which its negative conclusion was based is clear grounds for reconsideration. Similarly, the Finding admits the April finding erroneously interpreted the AfESG's Elephant Database by misconstruing its data quality categories. This error was pointed out in CF's June 2014 Comment and in a May 30, 2014 email from Dr. Holly Dublin, AfESG Chair.[30] It was corrected in the July enhancement finding.

However, the July finding continued to ignore pertinent information in the database, prompting Dr. Dublin to send a November 3, 2014 comment in which she corrected several critical points of information. First, the addition of a 2007 survey resulted in the addition of 30,000 "Definite" elephant in Zimbabwe. Second, the results of four recent surveys did not show a "substantial decline," as the July finding stated, but largely reflected stable or increasing populations. The Finding apparently accepted these comments, and edited the prior statements to incorporate Dr. Dublin's corrections.[31]

However, Dr. Dublin offered three more corrections not discussed in the Finding. Instead, the challenged language was copied and pasted from the July document into the Finding.

- Dr. Dublin criticized the July finding's dismissal of a 2013 survey in Save Valley Conservancy for so-called "double counting," stating that, even if double-counting occurred, the count still reflected an increase in the elephant population;

[30] Compare *Finding*, p. 7; with *CF June 2014 Comment*, p. 9 & related attachments; H. Dublin Email to T. Van Norman commenting on the April finding's misinterpretation of the AfESG Database (May 30, 2014).

[31] Compare *AfESG Letter*, p. 2 ("The AED shows, however, that three surveys carried out in this period ... estimated higher totals than their respective previous, comparable surveys, although the differences were not significant. A fourth survey, Chewore (2010), resulted in an estimate lower than its previous, comparable survey, but the difference was also not statistically significant. Furthermore, the 2010 survey for Chewore did not cover the entire Zambezi Valley ecosystem, and therefore it is possible that the apparent decline, however slight, may be due to elephant movements within the ecosystem rather than to an actual decline.") with July finding, p. 6; *March Finding*, p. 7.

- Dr. Dublin concluded that a 4% carcass ratio in a 2013 survey of Gonarezhou National Park was a "reasonable figure," and the July finding erroneously "conflat[ed] ... carcass ratios ... and mortality rates, and its conclusion is unwarranted";
- Dr. Dublin noted that updated PIKE data was publicly available months before the July finding was made, yet "the finding stated that 2012 and 2013 data were not available," and pointed out that the two PIKE sites in Zimbabwe "have relatively small elephant populations and are by no means intended to be representative of the situation in the country as a whole."[32]

Given that Dr. Dublin is one of the world's foremost experts in elephant, due deference should have been given to her comments and suggestions. Conservation Force made similar points in our June and October comments as well, and provided comments from the authors of the Save Valley survey report responding to the FWS' statements.[33] We provided fice surveys pending the AfESG's review and not included in the AfESG's or FWS' estimates, and submitted updated PIKE information showing the Proportion of Illegally Killed Elephant had declined at the Zimbabwe sites[34]—contrary to the July finding's statements, copied-and-pasted into the Finding. The Denials' failure to review this best-available information, and reliance upon out-of-date or misinterpreted information, requires reconsideration.

Reason for Reconsideration 4: The Best-Available Information Demonstrates that Zimbabwe has been Enforcing its National Regulations as Effectively as Possible

ZPWMA is succeeding in managing and conserving its elephant. The most compelling evidence is the historic increase in its population, to become Africa's second-largest. ZPWMA achieved these results by largely curbing poaching and successfully prosecuting poachers as a result of adaptive and pro-active law enforcement measures. ZPWMA has also implemented a system of sharing responsibility with the private sector and communal landholders so as to share the financial burden of its management and enforcement obligations. The Finding fails to acknowledge these achievements and responsibility-sharing.[35] Its failure to do so requires reconsideration, and reversal of the Denials.

Evidence of ZPWMA's enforcement success was provided in their April 2014 and July 2015 Responses, and in Conservation Forces' June 2014 and October 2014 Comments. For instance, ZPWMA rapidly responded to the 2013 Hwange poisoning incident. Working with the hunting operator's team to track the poachers,

[33] CF Email to T. Van Norman forwarding response from authors of the Save Valley Conservancy survey (Jan. 6, 2015); *CF Oct. 2014 Comment*, p. 13 & related attachments.

[34] E.g., 2005 Aerial Survey of Elephants and Other Large Herbivores in the Mid-Zambezi Valley; 2007 Aerial Survey of Elephants and Other Large Herbivores in North-West Matabeleland; 2010 Aerial Survey of Elephants and Other Large Herbivores in Chewore Safari Area; 2013 Aerial Survey of Elephants and Other Large Herbivores in the Save Valley Conservancy; and 2013 Aerial Survey of Elephants and Other Large Herbivores in Gonarezhou National Park; *see CF June 2014 Comment*, p. 4-7 & related attachments; *CF Oct. 2014 Comment*, p. 11 & related attachments.

[35] The FWS recognizes "there may be limited resources available for elephant management." *Finding*, p. 2. However, the FWS does not account for this in evaluating ZPWMA's efforts and results. "Enhancement" does not call for unlimited resources and perfect implementation, it seeks benefits. The benefits provided through the sport-hunting of elephant are clear and convincing, and the Denials should be reversed.

ZPWMA successfully arrested all 35 members of the team. ZPWMA's investigation and prosecution efforts led to the deterrent sentencing of each poacher to terms of 9 to 16 years in prison.[36]

ZPWMA specifically responded to the threat of poaching in Hwange by improving radio communications, adding aerial surveillance, and holding 35 public awareness meetings in the area.[37] ZPWMA then stepped-up its anti-poaching nationally by adopting a number of "Urgent Measures." ZPWMA acted to increase poaching penalties, criminalize the use of cyanide in poaching, increase air surveillance of protected areas, collaborate with national law enforcement and military agencies to raise elephant poaching to "a level of National Security in Zimbabwe," improve intelligence-sharing across international borders, and other important undertakings.[38] ZPWMA also held a judiciary awareness program to ensure full implementation of relevant poaching laws and penalties throughout prosecution and sentencing.[39]

ZPWMA directs most of its financial resources to anti-poaching and enforcement. As shown in the July 2015 Response, most of ZPWMA's budget (77%) is allocated for staff costs and patrol provisions.[40] These expenditures fund anti-poaching throughout the elephant range. Despite financial constraints, ZPWMA has been able to continuously hire to expand the number of patrol days in the field. ZPWMA has a staff of 1,504 active field rangers, with the intent to add more.[41] ZPWMA has shown that it can mobilize when called upon: after the Hwange poisoning, a new station with 15 field rangers was established in the area.[42]

Over 80% of spending under the new elephant management Plan has been on law enforcement (anti-poaching) and trainings, with law enforcement identified as the number one priority going forward.[43] The budget and operational data provided in the ZPWMA July 2015 Response and Plan Supplement addresses the FWS' asserted lack of information in the Finding. And although financial constraints exist in Zimbabwe (as in most range states), ZPWMA has effectively and efficiently maximized the impact of every dollar spent on anti-poaching. ZPWMA's results in curbing poaching speak for themselves.

The Finding continues to rely on outdated, unfounded criticisms from the July finding that were corrected by Conservation Force and ZPWMA. First, though the Finding claims not to have received information on Zimbabwe's poaching arrests and prosecutions, that information was not requested until May 2015, yet was provided in ZPWMA's April 2014 Response. It would be unfair to base a negative finding on data that had not been requested. But the data ***was*** provided, and should have been reviewed.[44]

Further, the Denials mistaken rely on the Finding's comments and interpretation of outdated ETIS reports. Conservation Force objected to these reports being taken out of context in our October 2014 Comment,

and provided evidence of improvements since 2010.[45] The Finding's reuse of these paragraphs, whose validity and applicability were challenged, merits reconsideration.

Finally, as discussed further under "Local Conservation Efforts," the Parks and Wildlife Act Chapter 20:14 devolved authority to manage and benefit from wildlife on communal and private lands to the landholders. In Safari Areas, ZPWMA leases concessions to pre-qualified hunting operators, which gives them authority to manage and benefit from approved wildlife in those areas.[46] "ZPWMA is engaging private players in co-management in some areas... this will help in resource mobilization and management for law enforcement. Long-term lease agreements (10-25 years) are being entered into to manage some protected areas."[47] In certain areas, ZPWMA partners with safari operators[48]; in others, they partner with non-profits, such as the Tashinga Initiative in the Zambezi Valley and WWF in the Hwange-Sanyati Biological Corridor.[49] In these ways, ZPWMA is sharing responsibility for enforcement of national regulations. This allows ZPWMA to do more with less, and has been especially crucial since receipts from hunting have fallen since the FWS suspension on ivory imports.

Reason for Reconsideration 5: Elephant Hunting in Zimbabwe is a Sustainable, Beneficial Use

ZPWMA's elephant hunting program is sustainable. Information submitted to the FWS demonstrates that quotas and offtakes are responsibly set in a participatory process, considering a range of inputs including all causes of elephant mortality; ZPWMA allocates quotas by region and locality; and recent poaching has remained fairly low, especially in comparison to other range states. This information has been submitted to the FWS on multiple occasions, including but not limited to:

- April 2014: poaching statistics; poacher arrest and prosecution statistics; four-page description of ZPWMA's quota-setting process;
- June 2014: poaching statistics in CAMPFIRE areas;
- December 2014: poaching and PAC statistics; offtake percentages from management, hunting, and trade in skins; two-page supplemental explanation of ZPWMA's quota-setting process;
- December 2014: hunting and PAC offtakes; quota utilization in CAMPFIRE areas;
- December 2014: carcass observance and estimates from the 2014 aerial survey;
- March 2015: updated MIKE/PIKE statistics;
- May 2015: poaching statistics from Mana Pools workshop;
- May 2015: poaching and offtake statistics in the Sebungwe;
- July 2015: carcass observance and estimates from the 2014 aerial survey; PIKE data; offtakes from six categories requested by the FWS; poaching and poacher investigation, arrest, and prosecution statistics; five-page supplemental explanation of ZPWMA's quota-setting process; quota allocation by range;
- September 2015: poaching and hunting offtakes from the South East Low Veld workshop;
- December 2015: hunting off-takes and quota utilization in CAMPFIRE areas;

- December 2016: two-page supplemental explanation of ZPWMA's quota-setting process;
- And more.[50]

This long list of information provided refutes the Finding's complaint that the FWS did not have "adequate information" about elephant offtakes, poaching, or quota-setting. The information was available. But the Denials do not consider it. If it had been considered, the FWS would have had to make a positive finding.

This best-available information demonstrates that ZPWMA's quotas are "scientifically determined" not to "compromise[e] [the species'] biological proliferation... In Zimbabwe, determination and implementation of hunting quotas goes through a rigorous quota-setting methodology" that accounts for all mortalities, including from hunting, poaching, PAC, natural causes and disease. In setting quotas, ZPWMA considers population sizes, trends, and densities; property sizes and habitat quality; environmental changes; human-wildlife conflict, national policies, and management targets; poaching trends; land tenure; trophy quality; hunt success; ranger monitoring; species sensitivity and research on the species; and more.[51] Quotas are set in participatory workshops for each range area. While stakeholders may propose an initial quota, their proposals are reviewed and revised as needed by ZPWMA ecologists to ensure the quotas are assessed at a sustainable level, having negligible impact on the population.[52] In 2014, Zimbabwe's offtake quota was set under 300 elephant; in 2016, it was set at 400.[53] The level of ***offtake*** authorized is well below that of ***export*** allowed under Zimbabwe's CITES quota (500 elephant), for good reason—exports may be delayed due to transport, taxidermy/processing, or permitting issues.

ZPWMA's 2014 quota of 300 mature elephant bulls represents only 0.37% of the total elephant population (82,000+). Zimbabwe's 2016 quota represents only 0.49%. These percentages are comfortably below the sustainability threshold of 0.6-0.75%. Most critically, however, actual offtakes are even lower, on average only 204 mature elephant bulls per year. That represents only 0.25% of Zimbabwe's elephant population. The Denials should be reconsidered and reversed, as there can be no question this limited use of elephant through sport- hunting is sustainable.

Van Norman attaching background data on elephant in the Sebungwe range (May 11, 2015); *ZPWMA July 2015 Response*, p. 22-27, 43-49; *Proceedings of the South East Lowveld Elephant Management Planning Workshop* (Sept. 2015); CF Email forwarding *Hunting Income Analysis of CAMPFIRE Districts from Hunting* (Dec. 1, 2015); ZPWMA, Presentation, *Legal Trade, Conservation, and Rural Livelihoods: A Zimbabwean Perspective* (Dec. 2016), p. 5-6.

Publicly available data from the Great Elephant Census identified Zimbabwe as having one of the four lowest carcass ratios in Africa, behind only Uganda, Malawi, and Botswana, publicly available at www.greatelephantcensus.org.

[51] E.g., *ZPWMA Apr. 2014 Response*, p. 19-22; *ZPWMA Dec. 2014 Response*, p. 22-25; *ZPWMA July 2015 Response*, p. 43-47; ZPWMA, Presentation, *Legal Trade, Conservation, and Rural Livelihoods: A Zimbabwean Perspective* (Dec. 2016), p. 5-6.

[52] *ZPWMA July 2015 Response*, p. 43-46; ZPWMA, Presentation, *Legal Trade, Conservation, and Rural Livelihoods: A Zimbabwean Perspective* (Dec. 2016), p. 5-6. Licensed, regulated hunting has nominal effect on elephant population, because of the selectivity of the harvest. E.g., *CF June 2014 Comment*, p. 3, 9-10 & related attachments (including R. Martin, *Second Report: Trophy Hunting from Declining Population* (2014), p. 8, 10, 15, 18-20, & R. Martin, *Background Study, Elephants* (2015), p. 34, 56).

[53] *ZPWMA July 2015 Response*, p. 44, 46.

Further, the extensive documentation provided by ZPWMA, Conservation Force, and others demonstrates that other offtakes, including poaching and PAC, are sustainable. Poaching has largely been controlled in the last several years, and PAC is kept in check through the incentives generated by CAMPFIRE (please see the next section).[54]

Poaching levels have declined in Zimbabwe, and across Africa, since the worst of the impact in 2011.[55] As shown in ZPWMA's July 2015 Response, a decline in elephant poaching is evident since the high of 223 in 2011, to 212 in 2012 and 194 in 2014. (Poaching figures in 2013 are skewed by the mass poisoning incident at Hwange National Park that killed 103 elephant, but if that number is "normalized" to 190, it is consistent with the decreasing trend.)[56] Likewise, the Proportion of Illegally Killed Elephants ("PIKE") at the Chewore and Nyami Nyami Monitoring the Illegal Killing of Elephants ("MIKE") sites in Zimbabwe has fallen: to 0.40 in 2013, 0.17 in 2014, and 0.29 in 2015 at Chewore, and from 0.81 in 2011 to 0.27, 0.22, 0.37, and 0.35 in the years 2012 to 2015 at Nyami Nyami. The most recent figures are well below the 0.5% threshold which signifies unsustainable poaching.[57] The decline in poaching undoubtedly stems from ZPWMA's enhanced anti-poaching, as described in the section above.

Recognizing both a mutual interest, and that collaboration will allow for a more efficient use of resources, ZPWMA and the hunting sector collaborate extensively in anti-poaching. Conservation Force submitted numerous specific evidence of this.[58] A few examples from this evidence are below:

- The Dande Anti-Poaching Unit ("DAPU") in the Zambezi Valley has catalyzed a significant decrease in poaching in their areas. In 2010, DAPU reported 40 elephant carcasses. In 2016, they observed seven. DAPU team members have grown so skilled in anti-poaching tactics they work alongside ZPWMA rangers in patrolling Mana Pools National Park. Charlton McCallum Safaris spent $95,006 on DAPU's anti-poaching activities in 2016, including salaries, rations, rewards, equipment, and

---

[54] PAC offtakes have been between 44-52 elephant from 2013-2015, a negligible amount in a population over 82,000 elephant, and at or below 1.0% when added to poaching and hunting offtakes. ZPWMA issues few PAC permits, and instead relies on the benefits of the CAMPFIRE program and voluntary actions of hunting operators to minimize crop-raiding and losses to elephant, and thus minimize PAC. The CAMPFIRE Workshop demonstrated that this system is working, as PAC figures were typically low across the districts. *CAMPFIRE Workshop Proceedings*, p. 6-21; *see also CF June 2014 Comment*, p. 15-7 & related attachments; *CF Oct. 2014 Comment*, p. 26-33 & related attachments; *CF Dec. 2014 Comment*, p. 3-7 & related attachments; *CF Jan. 2015 Comment* & related attachments.

The uncited "anecdotal evidence" relied upon in the Finding is unreliable, and is another incorrect "fact" on which the negative finding was based that requires reconsideration.

Van Norman forwarding DAPU Reports (June 15, 2015, May 23, 2016, & Jan. 18, 2017).

vehicles. DAPU's expenditures in 2015 topped $80,000 and in 2014, they were over $72,000. This is an expanding program, and has contributed significantly to anti-poaching in the Zambezi Valley, including through the additional support of aerial surveillance. ***Mr. Jines' hunt took place in the Mbire District and with Charlton McCallum Safaris. Mr. Jines' hunting fees, including his trophy fee and voluntary contributions, are directly contributing to DAPU and the operators' extensive community investment***.

- The SOAZ Report identified almost $1 million spent on anti-poaching in 2013 by a small sample of 14 operators. These operators employed a total of 245 scouts on the ground, an average of 17-18 scouts per company.
- Lodzi Hunters collaborates with the Binga district council to restore wildlife in their concession, on which they have a long-term lease. They maintain a 12-member anti-poaching team that patrols the concession and the borders of Hwange National Park. Lodzi Hunters coordinates with ZPWMA to ensure full and efficient coverage. Lodzi Hunters' anti-poaching and incentives programs cost the company over $350,000 per year, in addition to their contractual payments to the CAMPFIRE district and wards. 95% of Lodzi Hunters' income comes from elephant hunting.

In short, the private-sector's contributions against poaching are extensive. They were not duly considered in the Denials, even though they are an essential component of Zimbabwe's elephant management.[59] For this reason, the Denials should be reconsidered, and will need to be reversed based on proper evaluation of the submitted data.

Reason for Reconsideration 6: Revenues Generated from Elephant Hunting in Zimbabwe are Reinvested in Elephant Conservation Efforts by ZPWMA and CAMPFIRE Communities

The information provided to the FWS documents that elephant hunting accounts for the largest percent of revenue generated by hunting across all four land categories (safari areas, communal land, private land, and forestry areas). In 2014, over $6.2 million in trophy fees was generated from elephant hunts, with $5 million of that revenue accruing to ZPWMA to reinvest in wildlife management and enforcement.[60] Over 50% of that revenue comes from U.S. hunters.[61] Put differently, "the African elephant is one of the biggest drawcard species from a hunting perspective and is at the centre of all the major hunts... Generally hunting contributed an average of USD22m to the country's GDP in 2014 and 2015..."[62]

A significant portion of ZPWMA's operating budget relies upon hunting income (although that proportion declined in 2015, as hunting income has decreased, largely due to the FWS' elephant suspension and non-issuance of lion import permits).[63] Most of this is attributable to elephant hunts. In turn, most of ZPWMA's operating funds are directed to ranger salaries, anti-poaching, and law enforcement—over $3.1 million in Safari Areas alone (and staff costs in Safari Areas are covered by hunting revenues). Put simply, most of the revenues coming in from elephant hunting are reinvested in and contribute to the protection and

[63] *ZPWMA Dec.* 2014 *Response*, p. 21.

recovery of elephant by being reinvested in law enforcement and anti-poaching.[64] The Denials' failure to consider the July 2015 Response and information about ZPWMA's revenue, budget, and expenditures requires reconsideration and reversal.

In communal areas, elephant hunting is the financial backbone of CAMPFIRE. CAMPFIRE is the mechanism whereby communities benefit from living with wildlife, and largely from living with elephant. The program has built tolerance within communities through creation of incentives, especially due to the funding of infrastructure projects that improve rural livelihoods across communities.[65] The Finding correctly admits that "CAMPFIRE plays a role in elephant management." More precisely, CAMPFIRE plays an ***essential*** role in elephant conservation by reducing conflicts between elephant and the communities who maintain elephant on their lands. Zimbabwe's Parks and Wildlife Act Chapter 20:14 empowered rural people living among wildlife to effectively benefit from it. CAMPFIRE is the mechanism created to facilitate this.

From 1989-2006, CAMPFIRE channeled more than $20 million to rural villages and $17 million to rural district councils.[66] From 2010-2015, hunting fees accounted for over $11 million in revenue, 70% of which came from elephant hunting (until the suspension reduced demand for elephant hunting), and two-thirds of which came from U.S. elephant hunters. Put differently, over $5 million accrued directly to CAMPFIRE communities from U.S. elephant hunters until the suspension reduced that amount, e.g., to 54% of hunts in 2014.[67] (Until then, 70% of CAMPFIRE revenue was generated by elephant hunts and $550,000 in trophy fees alone were generated in communal lands in 2014.[68]) These income receipts are "often understated," as economic multipliers "are not captured as part of CAMPFIRE income," and "[t]he proportion of safari operating expenses paid locally in the form of wages and salaries, and purchase of materials is often not recorded."[69]

According to the most recent audit of participating CAMPFIRE districts, "Data from 9 CAMPFIRE Districts ... shows that approximately 60% of the allocated quota is utilized and that the majority of hunters (53%) originate from America. These hunters have contributed US$9 million ... during the period 2010-2015 compared to US$8 million by the 40 other nations.... The income generated from trophy fees in the last 6

[65] E.g., *CAMPFIRE Association Report*, p. 1-11; *CAMPFIRE Workshop Proceedings*, p. 6-24; CF Email to T. Van Norman attaching *CAMPFIRE Income Analysis*; CAMPFIRE Association, *The Role of Trophy Hunting of Elephant in Support of the Zimbabwe CAMPFIRE Program* (Dec. 2016), p. 12-16 ("*CAMPFIRE—Role of Hunting Report*"), publicly available at http://campfirezimbabwe.org/index.php/downloads.

[66] *CAMPFIRE Association Report*, p. 8; *CAMPFIRE—Role of Hunting Report*, p. 9-11; ZPWMA, Presentation, *Legal Trade, Conservation, and Rural Livelihoods: A Zimbabwean Perspective* (Dec. 2016), p. 19, (U.S. hunters make up 76% of CAMPFIRE clients).

[67] *CAMPFIRE Association Report*, p. 3-4; *CAMPFIRE Income Analysis*, p. 1, 6 ("it is highly probable that the decline in hunting income for 2014 was largely caused by the suspension of trophy imports by United States of America. The suspension has a lag effect on income, and preliminary calculations of earnings for 2015 indicate a further continuing decline."); *CAMPFIRE—Role of Hunting Report*, p. 9-11.

[68] *ZPWMA July 2015 Response*, p. 48, 50; *see also CAMPFIRE Workshop Proceedings*, p. 6-24.

[69] ZPWMA, Presentation, *Legal Trade, Conservation, and Rural Livelihoods: A Zimbabwean Perspective* (Dec. 2016), p. 17; *see also* p. 11-20.

years (2010 – 2015) is approximately US$11.4 million of which elephant trophy fees contributed 65%."[70] In short, U.S. elephant hunters are the critical source of funds for CAMPFIRE communities.

Hunting funds are invested in projects that benefit the communities overall: building classrooms or clinics; purchasing farm equipment; rehabilitating water supplies; purchasing vehicles used in wildlife monitoring and anti-poaching; installing solar power; and many other infrastructure improvements. CAMPFIRE links these tangible benefits for rural residents to protection of wildlife. Its infrastructure creates conservation officers and monitoring programs, and employs game scouts, which generates significant benefits for the elephant as well. This is vital because otherwise elephant are largely viewed as threats, not assets.[71]

The grant of Appropriate Authority means that ZPWMA foregoes the fees from hunting in CAMPFIRE areas, and the fees and other benefits accrue to the communities. Operators in CAMPFIRE communities contract with the district councils, and are bound to pay trophy, concession, and other fees—or more, depending on their contracts—to the councils (41%) and to the wards directly (55%). Conservation Force submitted documentation evidencing that many operators contribute much more than just fees. For example, in the Mbire District in which Mr. Jines hunted, Charlton McCallum Safaris operates a "genuine joint venture" with the Mbire district council and wards. In 2013-2015, Charlton McCallum Safaris paid over $1.05 million in fees and revenue-sharing, including over $470,000 directly into ward accounts. The district significantly benefits from this partnership, including: constructing a clinic and nurses' houses; constructing a wildlife administration office; constructing storerooms; constructing 14 classroom blocks, seven teachers' houses, and one school office; constructing and equipping of grinding mills; and constructing and equipping two hand-pump boreholes, water pipes, toilets, water storage; constructing one tourist camp; acquiring two tractors.[72] 90% of the district's income comes from hunting and ~35% of that is from elephant hunting. 90% of hunting clients are U.S. citizens. In short, at least $330,750 accrued to the Mbire district and rural communities as a result of U.S. elephant hunters in 2013-2015.[73] This is but one example. Conservation Force has submitted evidence of many more, including contributions of Lodzi Hunters and Martin Pieters Safaris, among others.[74]

The Denials do not consider the best-available information. They rely upon the Finding, which cites to old and limited data on CAMPFIRE. The best-available information demonstrating CAMPFIRE's benefits must be evaluated, and accordingly, the Denials should be reconsidered and reversed.

Reason for Reconsideration 7:
Local Conservation Efforts Effectively Share the Responsibilities of Elephant Conservation

The Denials should be reconsidered because Conservation Force, ZPWMA, SOAZ, and others have provided extensive documentation of the benefits to elephant generated by "local conservation efforts." The FWS does not discuss this information specifically, but it should. This information proves that the contributions of safari operators, anti-poaching units, CAMPFIRE communities, private landholders/conservancies, and associated non-profits are integral to the functioning of Zimbabwe's wildlife management system. They are not "limited" efforts. They are extensive, and reduce the burden on ZPWMA's resources.

As Conservation Force and ZPWMA previously explained, conservation work is ***frequently*** carried out by non-governmental entities in Zimbabwe.[75] The Parks and Wildlife Act Chapter 20:14 devolved Appropriate Authority to private and communal landholders. Through this "government mechanism," the "legal right to utilize and manage wildlife on their property" was transferred to the landholders.[76] Due to this transfer, non-governmental entities such as safari operators, CAMPFIRE district councils, and private conservancies have both the authority and the obligation to protect, conserve, monitor, and benefit from wildlife in their areas.[77] As ZPWMA wrote:

> Fundamentally, ZimParks supports local efforts by providing a conducive legislative and policy environment which allows the private and community sectors to thrive. The grant of Appropriate Authority Status to private properties and Rural District councils is a case in point.[78]

ZPWMA supports local conservation efforts through training, support, and more.

The contributions of non-governmental interest to wildlife conservation are not limited or localized. Taken together, they cover the country.[79] A few examples from the information provided to the FWS are below:

- Lodzi Hunters, in the Northwest Matabeleland and Sebungwe ranges, contributed over $680,000 over two years to CAMPFIRE wards, to improve livelihoods, employ scouts, and increase tolerance of elephant and other species. The operator also maintains a twelve-person anti-poaching team.[80] Similarly, Charlton McCallum Safaris in the Zambezi Valley shares revenues with Mbire CAMPFIRE wards and the district council. In two years, the fees shared topped $750,000 (of which $380,000+

[78] *ZPWMA April 2014 Response*, p. 25.

[79] Please see attached map, which shows the breadth of these "local" operations.

[80] *CF Jan. 2015 Comment* & related attachments.

went directly to ward accounts) and anti-poaching expenditures topped $150,000.[81] Each of these operators is lessening the government's burden of community support and anti-poaching patrols by committing their private resources to these purposes.

- A small operator, Pro Safaris in the Zambezi Valley, allocates 6% of its turnover for water pumping, water pan installation, and other conservation activities. Pro Safaris maintains a ten-person anti-poaching team to patrol a 40-km international border,[82] which allows ZPWMA rangers to focus on patrolling the national park instead of the Safari Area.
- The Tashinga Initiative is a non-profit in the Zambezi Valley that obtains anti-poaching equipment, coordinates anti-poaching efforts, and organized the Sebungwe elephant management planning workshop. The Tashinga Initiative is supported by local safari operators (hunting and photo), and international donors like the Houston Safari Club.[83]
- Also in the Zambezi Valley/Sebungwe range, Martin Pieters Safaris maintains three patrol teams, and are helping develop a community-owned conservancy with two additional patrol teams. The company teams have recovered 15,000+ snares since 2007, and their nearly 300 patrols support ZPWMA's monitoring in this area. The community scouts were intensively trained by the operator teams. These scouts cooperate with ZPWMA against poaching in the Omay and Gokwe communal lands.[84]
- Save and Bubye Valley Conservancies in the Southeast Lowveld range each spend over $500,000 annually on anti-poaching and invest another $200,000+ in nearby villages. The conservancies do not draw on ZPWMA resources at all. They are wholly responsible (and largely depend on hunting income) to secure a land area about the size of New Jersey, the world's third-largest black rhino population, and an elephant population that exceeds 2,000.[85]
- CAMPFIRE communities monitor poaching losses and PAC off-take. They collaborate with ZPWMA to detect poaching and have developed a mutual informer network together. They also work with ZPWMA and safari operators to avoid problem animal off-takes and non-destructively deter crop-raiding elephant.[86] Because they have Appropriate Authority, they collaborate with ZPWMA, but do not need to depend on ZPWMA for wildlife management.
- The SOAZ report included data from 14 operators across the entire elephant range. It reported on these operators' monitoring of elephant populations and poaching losses and their anti-

[86] *See generally CAMPFIRE Workshop Proceedings.*

poaching investment of almost $1 million in 2013. The 14 companies together employed 245 anti-poaching personnel, and cooperated closely with ZPWMA.[87]

The Finding highlights the Mana Pools elephant management planning workshop. It should also mention the Sebungwe and South East Lowveld workshops. They exemplify the public-private-communal partnership existing in Zimbabwe because stakeholders have Appropriate Authority. The Finding reveals the FWS' misunderstanding of Zimbabwe's conservation system, which requires reconsideration and reversal of the Denials.[88]

Reason for Reconsideration 8: Enhancement has been Shown

The FWS has defined "enhancement" as benefits to the species, such as protection of habitat, generation of conservation and anti-poaching funding, and reduction of human-wildlife conflicts through generation of conservation incentives. The information submitted to the FWS demonstrates that licensed, regulated hunting of elephant in Zimbabwe satisfies this standard. This information shows how hunting justifies the existence of significant elephant range.[89] It substantiates the anti-poaching partnership among ZPWMA, hunting operators, and communities, and demonstrates the success of their efforts (declining PIKE). It shows that communities are incentivized not to retaliate against elephant (low PAC offtakes). It describes the pre-suspension benefits generated for CAMPFIRE communities. The success of Zimbabwe's elephant management is underscored by the fact there are over 80,000 elephants in the country, and significant anti-poaching gains in the border area of the Zambezi Valley.

The FWS demands "enhancement." It has been shown. Sustainable offtakes have been shown. A stable elephant population has been shown. A well-managed and responsive elephant management system has been proven. The continued suspension obstructs this enhancement from reaching the elephant—and the people—of Zimbabwe. We encourage the FWS to stop moving the target. The FWS cannot continue to rely upon a Finding that ignores the facts.

---

[87] *SOAZ Report*, p. 4.

[88] The Finding's first sentence is almost verbatim to the July finding, and still fails to respond to CF's objections on this point. We objected that we did not "emphasize the economic impact of the suspension to local conservation efforts," though that information was available in our submissions. The Finding's failure to respond to this objection, and its cutting-and-pasting of prior writing, merits reconsideration; it clearly does not consider the best-available and most current information. Note that the attachments in CF's comment also pointed to data showing "whether and to what extent these individuals would reduce their conservation efforts based on the inability of U.S. hunters to import a sport-hunted trophy," e.g., in the submitted Declarations, Charlton McCallum Safaris and DAPU documents, SOAZ Report, CAMPFIRE Reports, R. Martin Fourth Report, and more. E.g., *CF June 2014 Comment* Attachments; *CF Oct. 2014 Comment* Attachments.

[89] It should be noted that there is far more land secured in areas which allow, and largely rely upon, sustainable use. Compare the approximately 27,000 km^2 of habitat in national parks to the approximately 19,000 km^2 in Safari Areas, ~48,000 km^2 in CAMPFIRE areas, and 7,000+ km^2 in conservancies.

Note: This list is not and is not intended to be a complete record of the FWS' Zimbabwe elephant file. The FWS undoubtedly received information not listed here, including at least two information productions by Safari Club International. We believe that the FWS has received direct communications from applicants for import permits, safari hunting operators, ZPWMA, and others.

United States Department of the Interior

FISH AND WILDLIFE SERVICE
Washington, D.C. 20240

FEB 2 3 2017

In Reply Refer To:
FWS/AIA/DMA/PRT– 04205C

Mr. Michael (b) Jines
(b) (6) (6)
Kingwood, Texas (b) (6)

Dear Mr. Jines:

This letter responds to your August 4, 2016, application to import under the U.S. Endangered Species Act (Act), a personal sport-hunted African elephant (*Loxodonta africana*) trophy taken in Zimbabwe during the 2015 hunting season. After careful review of your request for a permit, and after reviewing all available data and information on activities and circumstances occurring in Zimbabwe at the time you conducted your hunt, your application is being denied for the reasons outlined below.

The African elephant is listed as threatened under the Act with a special rule under Section 4(d) of the Act[1], which is set forth in regulations found at 50 CFR 17.40 (e)[2]. Under the special rule, issuance of an import permit can only occur if the U.S. Fish and Wildlife Service (Service) finds that the killing of the trophy animal intended for import would enhance the survival of the species [50 CFR 17.40(e)(6)(i)(B)]. and the trophy is accompanied by a threatened species permit issued under 50 CFR 17.32[3]. To enhance the survival of the species, the importation must be associated with activities that provide a direct or indirect benefit to the species in the wild. In evaluating whether the killing of the trophy animal intended for import into the United States contributes to the enhancement of African elephant populations within a given country, the Service looks at a number of factors. Such factors may include: current elephant population estimates in a given country, whether said county has a valid national and/or regional management plan, is the plan currently being implemented and does it contain achievable and measurable objectives, does the plan take an adaptive management approach and how often is it reviewed and/or updated, the designated authorities responsible for overseeing elephant management and how they are funded, the level of human-wildlife conflict taking place and how it is being addressed, any anti-poaching efforts undertaken, habitat conservation measures currently in place, as well as the amount of revenue generated by elephant hunting and how it is utilized in supporting conservation projects and/or managing the species.

The best available scientific and management data, as well as information provided to the Service by Zimbabwe Parks & Wildlife Management Authority (ZPWMA), Conservation Force, and Safari Club International, was used in our evaluation. In evaluating the available data and information on elephant hunting in Zimbabwe at the time your hunt occurred, the Service was unable to determine that the killing of African elephants in Zimbabwe, whose trophies are intended for importation into the United States, would enhance the survival of the species. Therefore, the import of sport-hunted elephant trophies taken in Zimbabwe during the 2015 hunting season cannot be authorized. A copy of the Division of Management Authority's finding for the 2015 hunting season is enclosed for your reference.

As provided in 50 CFR 13.29(a)[4], you may request reconsideration of our decision to deny your application. Such a request must be in writing with the original signature of the person requesting reconsideration or by that person's legal representative, must contain a certification statement as provided at 50 CFR 13.12(a)(5)[5], should refer to your file number, PRT–04205C, and must be received in this office within 45 days of the date of this letter. The reconsideration of the decision to deny your request will be based on the information you provided in your original application. As such, your letter requesting reconsideration must address how our decision to deny your application was based on a misinterpretation of the information provided in your application or information available to the Service when making the original denial or it must present clarification of this information. **Should you supply new information that changes the scope of your original application, a new application will need to be submitted to this office before such information can be considered.**

If you have any questions, please contact Supervisory Policy Specialist Michael S. Moore of this office: Division of Management Authority, Branch or Permits, MS:IA, 5275 Leesburg Pike, Falls Church, VA 22041-3803 (703-358-2104, ext. 1983).

Sincerely,

Timothy J. Van Norman, Chief

FWS/AIA/DMA/PRT– 04205C

MAY 16 2017

Mr. Michael (b) (6) Jines
(b) (6)
Kingwood, Texas (b) (6)

Dear Mr. Jines:

This letter responds to your April 6, 2017, letter from your representative, John J. Jackson, III, requesting reconsideration of the February 23, 2017, decision to deny your application for a permit to import a personal sport-hunted African elephant (*Loxodonta africana*) trophy taken on February 25, 2015, in Zimbabwe. After a thorough review of Mr. Jackson's response on your behalf, it is my decision to uphold the original denial of your application.

As you know, the African elephant is listed as threatened with a special rule under Section 4(d) of the U.S. Endangered Species Act (Act)[1]. Under the special rule, issuance of an import permit for a sport-hunted trophy can only occur if the U.S. Fish and Wildlife Service (Service) finds that the killing of the trophy animal would enhance the survival of the species, and the trophy is accompanied by a threatened species permit. To enhance the survival of the species, the importation must be associated with activities that provide a direct or indirect benefit to the species in the wild.

At the time you originally applied for a permit, the Service had reviewed the best available scientific and management data, including information made available to the Service by Zimbabwe Parks & Wildlife Management Authority (ZPWMA), Conservation Force, and Safari Club International, in evaluating the status of Zimbabwe's elephant management program at the time you conducted your hunt. Based on this material, the Division of Management Authority (DMA) made a finding on March 26, 2015, that we were unable to find that the import of an elephant trophy taken during the 2015 hunting season would meet the requirements of the Act and the special rule for African elephant. Mr. Jackson's April 6, 2017, letter asked that the Service reconsider your application, in part, based on his assertion that the enhancement finding failed to consider significant information submitted by Conservation Force, ZPWMA, and others, both before and after the finding was made, that would lead to a reversal of the Service's negative finding.

Regarding Mr. Jackson's assertion that the Service failed to consider significant information submitted by Conservation Force and ZPWMA when making its determination, the Service has taken into consideration all of the information available to the Service regarding elephant hunting

1 The text of this Act can be found by using the search bar at the top of the following web page: http://Go.USA.Gov/xr6dd.

in Zimbabwe at the time your hunt occurred (February 25, 2015). While Mr. Jackson's request for reconsideration included additional information that was not available to the Service at the time the March 26, 2015, finding was made, most of the new information documented activities and actions that occurred after the conclusion of your hunt. While this new information may be relevant to hunts that occurred after our March 26, 2015 finding, it does not demonstrate that the situation in Zimbabwe, at the time of your hunt, was different than previously considered by the Service and would result in a revision of the March 2015 finding. Therefore, I am upholding the original denial of your application.

As provided in 50 CFR 13.29(e)[2], you may appeal to the Director of the Fish and Wildlife Service, through this office: Division of Management Authority, Branch of Permits, MS: IA, 5275 Leesburg Pike, Falls Church, Virginia 22041-3803. This appeal must be in writing with the original signature of the person requesting an appeal or of that person's legal representative, should refer to your file number, PRT-04205C, and must be submitted to this office within 45 calendar days of the date of this letter. The appeal must state the reason(s) and issue(s) upon which the appeal is based. Your written appeal must address how the decision to deny the reconsideration of your request was based on a misinterpretation of the information provided in your request for reconsideration, or it must present a clarification of this information. **Should you supply new information that changes the content of your original request for reconsideration, you must submit a new application to this office before such information can be considered.**

If you have any questions, please contact Supervisory Policy Specialist Michael S. Moore of this office: Division of Management Authority, Branch or Permits, MS:IA, 5275 Leesburg Pike, Falls Church, VA 22041-3803 (703-358-2104, ext. 1983).

Sincerely,

Craig Hoover, Chief
Division of Management Authority

BY EMAIL AND FEDERAL EXPRESS

RE: Appeal of the Denials of PRT-04846C and PRT-04205C and Request for Oral Argument

Dear Director Sheehan:

We respectfully request reversal of the Division of Management Authority's denials of two trophy import permit applications. The first application, PRT-04846C, requested a permit to import an elephant hunting trophy lawfully taken in the Ngamo/Sikumi Forest Block in Zimbabwe on March 21, 2015. The second, PRT-04205C, requested a permit to import an elephant hunting trophy lawfully taken in the Mbire CAMPFIRE District in Zimbabwe on February 25, 2015. Conservation Force represents both applicants as a pro bono, public legal service. Both hunts generated revenue and conservation incentives to enhance the survival of Zimbabwe's elephant. However, both trophy import applications were denied in February 2017.

On April 6, 2017, we submitted a request for reconsideration of these denials, which was also denied in a letter dated May 16, 2017. This second denial relies on a negative enhancement finding made by the DMA on March 26, 2015 (the "Finding"). We turn to you for a final appeal on behalf of the applicants and the well-managed and beneficial hunting system in Zimbabwe, which has the world's second-largest elephant population.

These applications should be approved. The over-three-year suspension of elephant trophy imports from Zimbabwe should be lifted, for three primary reasons. First, it is based on errors and misinterpretation of facts. The DMA suspended imports without notifying or consulting Zimbabwe. Given the lack of contact with Zimbabwe, it is hardly surprising the three negative enhancement findings made in 2014 and 2015[1] are full of mistakes. When these mistakes were corrected by Zimbabwe's wildlife management authority, Conservation Force, and others, the DMA failed to make the changes, raised new "issues," and complained about not receiving information for which it had never asked. But this feint does not change the fact the reasons given for suspending elephant trophy imports from Zimbabwe did not and do not exist.

Second, the regulatory "enhancement" requirement has been satisfied several times over. The benefits of lawful elephant hunting in Zimbabwe were proven in the thousands of pages submitted to the DMA by

[1] Chief, Branch of Permits, *Enhancement Finding for African Elephants Taken as Sport-Hunted Trophies in Zimbabwe during 2014* (Apr. 17, 2014) ("*April Finding*"); Chief, Branch of Permits, *Enhancement Finding for African Elephants Taken as Sport-Hunted Trophies in Zimbabwe during 2014* (July 22, 2014) ("*July Finding*"); Chief, Branch of Permits, *Enhancement Finding for African Elephants Taken as Sport-Hunted Trophies in Zimbabwe on or after January 1, 2015* (Mar. 26, 2015) ("*Finding*").

the Zimbabwe Parks and Wildlife Management Authority ("ZPWMA"), Conservation Force, tourist hunting operators, and others. This information demonstrates tourist hunting revenues justify habitat protection, fund most elephant management and anti-poaching, and increase community tolerance of elephant and other game. The continued suspension of trophy imports obstructs all this. It blocks resources ZPWMA needs to successfully manage the country's 83,000+ elephant. The DMA has redefined "enhancement," and set ZPWMA up to fail the new test by cutting off the support on which ZPWMA relies. This is a "Catch-22" situation.

Third, denial of the applicants' request for reconsideration is arbitrary, capricious, and contradictory. The Finding's mistakes should be updated and corrected. The Finding itself requires this—it promises, at least four times, that the DMA will consider additional information when provided and re-evaluate its negative conclusion.[2] The DMA received such information in July 2015 in response to a May questionnaire sent by the Director of International Affairs almost two months after the Finding was made. Yet, the Finding has not been updated or revised. The denial of the request for reconsideration is wrong. It cannot be based on the best information because the Finding and this denial fail to consider the most up-to-date, complete data requested and received by the DMA.

Therefore, we respectfully appeal the DMA's errors to you, and request oral argument on the appeal.

I. THE SUSPENSION OF ELEPHANT TROPHY IMPORTS FROM ZIMBABWE IS BASED ON ERRONEOUS INFORMATION AND MISINTERPRETATION OF FACT AND HAS BEEN FROM THE VERY BEGINNING

The suspension has been improper from the start. The DMA's negative April Finding cited a "lack of recent data on what is occurring in Zimbabwe" as the "most significant aspect of our analysis."[3] But an asserted lack of data does not justify the suspension because it was due entirely to the DMA's failure to ask. The April Finding admits that prior to the suspension, the DMA had not reached out to ZPWMA in writing since 2007, and ZPWMA provided the requested information at that time. The DMA also met with Zimbabwean representatives "at various times in the past 6 years," but does not claim to have expressed concern about a lack of data during those meetings.[4] To our knowledge, there is no record of a 2007 information request, or any other written request until April 4, 2014.[5]

Rather than consulting with Zimbabwe as recommended by CITES Res. Conf. 11.3, or "provid[ing] … specific actions that can be taken by Zimbabwe … that might allow the Service to reconsider its findings" and "early engagement with the sport-hunting community to maintain positive relations and create opportunity for

[2] E.g., *Finding*, p. 1 & 3 ("The suspension on importation of trophies taken during calendar year 2015 or future hunting seasons could be lifted if additional information on the status and management of elephants in Zimbabwe becomes available…"), p. 6, 11 ("the Service can re-evaluate this finding, and the suspension on importation of trophies taken during calendar year 2015 or future hunting seasons could be lifted, if additional information on the status and management of elephants in Zimbabwe becomes available…").

[3] *April Finding*, p. 6.

[4] *April Finding*, p. 1, 2, 6; *July Finding*, p. 3.

[5] Conservation Force obtained documents in response to a Freedom of Information Act ("FOIA") request for the basis of the April 2014 suspension. That production included the April 4, 2014 questionnaire to ZPWMA, but no others.

cooperative action to affect [*sic*] change," as suggested in an internal memorandum,[6] the DMA suspended the import of elephant trophies without warning. The DMA's failure to engage Zimbabwe or the hunting community, and the resultant errors and omissions in the Findings, are so flagrant as to seem intentional. This conduct suggests an unpublished policy against regulated tourist hunting as a conservation tool.

For example, despite identifying a lack of data as the primary basis for suspending imports, the DMA did not request updated information from Zimbabwe until April 4, 2014—the same day it publicly announced the suspension in a press release.[7] ZPWMA was blindsided and its reaction was immediate. Its Director-General objected in a letter dated April 14 and sent a 32-page response to the questionnaire on April 17, 2014.[8] The Director-General took the initiative to explain the response, answer questions, and meet with FWS representatives in person in D.C.[9] (Note that ZPWMA was equally responsive to the FWS' October 31, 2014 and May 12, 2015 information requests.)[10]

But likely due to the failure to consult ZPWMA and reliance instead upon uninformed, biased sources, each negative enhancement finding has contained numerous errors.[11] And though the DMA received updated, best-available information and corrections, it has barely adjusted its findings and maintained much of the same language—and the same negative conclusion.

The import suspension was based initially on an inexplicable misunderstanding of Zimbabwe's elephant population status and poaching level. According to the April Finding, the IUCN African Elephant Specialist Group's ("AfESG") database showed Zimbabwe's elephant population "had been reduced" from 84,416 in 2007 to 47,366 in 2012; ZPWMA failed to properly monitor or manage these elephant; and a "2013 CITES Panel of Experts" identified weaknesses in ZPWMA's management, funding, and infrastructure. The April Finding also claimed "over 300" elephant were poisoned in Hwange National Park in 2013, and "anecdotal

[9] Conservation Force, *Comment Opposing the Negative Enhancement Finding for African Elephant Taken as Sport-Hunted Trophies in Zimbabwe in 2014* (Oct. 16, 2014), p. 5 & attachments ("*CF Oct. 2014 Comment*").

[10] E.g., Conservation Force, *Request for Reconsideration of Denial of Permit Applications PRT-04846C and PRT-04205C* (Apr. 6, 207), p. 2-3, 8-10, 13-14 ("*Request for Reconsideration*") ("ZPWMA responded to the first questionnaire within two weeks … ZPWMA responded to the second questionnaire in under six weeks; responded to third—not considered in the Finding—in five weeks; responded to the fourth—not considered in the Finding—in two weeks; and responded to the fifth —not considered in the Finding—within several weeks, with the final plan prioritization completed within six months."); ZPWMA, *Response to the USFWS* (July 2015) ("*ZPWMA July 2015 Response*"); ZPWMA, *Response to the USFWS* (Dec. 10, 2014) ("*ZPWMA Dec. 2014 Response*").

[11] The FOIA production revealed largely dated articles in the record, FWS employees who recommended "unilaterally stop[ping] issuing any permits for any trophies from Zimbabwe immediately," without consulting ZPWMA, and the immediate refutation of the news reports by WWF. One of the most-cited sources in these articles, Johnny Rodrigues of the Zimbabwe Conservation Task Force ("ZCTF"), was shown to have alleged "twisted" and incorrect information, and was unknown to WWF or the Chair of the National Task Force on Poaching and Habitat Loss. See, e.g., *FWS FOIA Production*, p. 162, 176-78.

evidence" indicated that Zimbabwe's elephant population was "under siege."[12] These were all reasons to justify the suspension in the April Finding. And none of these were based in fact. They were factual errors, copied language from the positive, 1997 enhancement finding, or fabrications from anti-hunting sources the FWS knew already to be unreliable.

ZPWMA and Conservation Force submitted extensive information to correct these DMA mistakes. Among other things, we explained how the DMA misinterpreted the AfESG database's data categories to reflect a "reduction."[13] Even the AfESG corrected the DMA's misunderstanding.[14] We also submitted seven surveys dating from the past ten years, including a 2007 aerial estimate of North West Matabeleland/Hwange to correct the April Finding's incorrect opinion that ZPWMA did not monitor the elephant population.[15] The surveys covered over three-fourths of Zimbabwe's estimated elephant range, and were available through a website link to "new" surveys which the DMA apparently did not choose to click.[16]

This information provided showed that ~105 elephants were poisoned in Hwange, not 300, largely due to the quick intervention of ZPWMA rangers and the erly warning and assistance of the neighboring hunting

---

[12] *April Finding*, p. 3-6; FWS Division of Public Affairs, *Service Suspends Import of Elephant Trophies from Tanzania and Zimbabwe* (Apr. 4, 2014) ("*Press Release*") ("Anecdotal evidence, such as the widely publicized poisoning last year of 300 elephants in Hwange National Park, suggests that Zimbabwe's elephants are also under siege.").

[13] As we previously explained, "The enhancement finding badly misunderstands the currentness and completeness of the AfESG's '2013 Africa' analysis. That data is updated only through a point in 2012 [as stated in the database], and only to the extent the under-funded volunteers of AfESG are able to review and incorporate 'new' surveys. The AfESG working group's pace is not always consistent or speedy due to funding constraints [discussed by the Chair in a document we attached from the Sixty-Fifth Meeting of the CITES Standing Committee]. Accordingly, there are '251 new surveys' advertised on the main page of the Database (which FWS should have visited to get to the '2013 Africa' report). These surveys 'have not yet been reviewed by the appropriate Data Review Working Group' [page attached] and are not reflected in the database tables. Had FWS clicked the link … it would have counted seven from Zimbabwe on the list. Of the seven, five were completed before 2012. (In fact, 221 of the 246 'new' surveys were conducted prior to 2013 and 185 were conducted prior to 2012, making most of the surveys on this list not very 'new.') Shouldn't FWS be sophisticated enough to understand the database's limitations?" *CF Oct. 2014 Comment*, p. 10-11.

[14] Zimbabwe requested the AfESG comment on the April and July Findings, which was done by email dated May 30, 2014 and a comprehensive letter dated November 3, 2014. The Chair wrote that the July Finding relied on a "serious oversight" in the database—the failure to include the 2007 survey of NW Matabeleland in the country total, although "this survey was listed in the 'New Surveys' portion of the AED website (http://www.elephantdatabase.org/population_submissions/154)." The Chair pointed out "four other instances in which the use of data from the AED presented within the finding's 'Population Status' section demonstrated oversights or misinterpretations as well as a fifth instance meriting clarification." These included: five surveys conducted between 2006-2010 estimated higher populations, contradicting the July Finding's statement that 2006-2010 surveys indicated "a substantial decline in the population"; even if "double-counting" occurred during the Save Valley Conservancy survey the population would still have increased, contradicting the July Finding's criticism; the statement about "a carcass ratio of less than 4%" "suggests a conflation of carcass ratios from aerial surveys and mortality rates," and "4% seems a reasonable figure"; and "sample counts are not inferior to total counts," contradicting the finding's suggestion and "betray[ing] a likely misunderstanding of the relative value of sample v. total counts," among other corrections. *AfESG Letter*, p. 1-4.

[15] Conservation Force, *Comment Opposing the Interim Suspension of Imports of Elephant Trophies from Zimbabwe* (June 6, 2014), p. 4-7 & attachments ("*CF June 2014 Comment*"). We also provided evidence of the monitoring which supplement periodic aerial surveys, including water hole game counts, road strip and walking transects, and ranger-based monitoring. E.g., *ZPWMA Apr. 2014 Response*, p. 6; *CF June 2014 Comment*, p. 4 & attachments; *CF Oct. 2014 Comment*, p. 10-12 & attachments.

[16] *CF Oct. 2014 Comment*, p. 11 & attachments (including website print); *ZPWMA Apr. 2014 Response*, p. 5; *AfESG Letter*, p. 1-2.

operator (an act of enhancement as discussed below). The poachers received deterrent 15-year sentences. In response, ZPWMA initiated a "private sector driven fund raising initiative" and "massive [ranger] recruitment drive" and increased criminal penalties for wildlife poisoning. Moreover, ZPWMA's data indicated poaching was lower in Zimbabwe than most other African countries. Zimbabwe's elephant were not "under siege," but generally stable or increasing.[17]

Moreover, the information proved that the "2013 CITES Panel of Experts" did not exist, and certainly did not query ZPWMA's dedicated elephant management. The 1997 enhancement finding—which approved trophy imports—included almost verbatim language. It seems this language was retained, and somehow edited to "2013," without any fact-checking by the author.[18] These avoidable, perhaps intentional, errors undercut the April Finding's negative conclusion. The DMA's express concerns did not and do not exist.

But instead of admitting its mistakes, the July Finding compounded them. It continued to claim Zimbabwe was suffering from a poaching crisis, lacked updated surveys, and was criticized by a "2002 CITES Panel of Experts." It relied upon outdated CITES/ETIS reports, incorrectly insisted a historical review of elephant management actions was Zimbabwe's elephant management plan, ignored four pages of explanation on quota-setting, and ignored a data-rich report from the CAMPFIRE Association. The "updated" July Finding did little more than entrench the prior finding's errors and omissions.[19]

Once again, Conservation Force tried to rectify these mistakes in a 34-page, substantive comment with 58 attachments. The comment painstakingly went through and fact-checked each section of the July Finding and pointed to information that had been ignored.[20] We emphasized the on-going update to Zimbabwe's

[17] *ZPWMA Apr. 2014 Response*, p. 5-13; *CF June 2014 Comment*, p. 3-8 & attachments; *CF Oct. 2014 Comment*, p. 18 & attachments; G. Wittmyer et al., *Illegal Killing for Ivory Drives Global Decline in African Elephants*, Proceedings of the National Academy of Sciences (July 22, 2014). Reduced poaching in Zimbabwe was reflected in the Proportion of Illegally Killed Elephant ("PIKE") after 2012. In copying-and-pasting from the April Finding, the July Finding incorrectly stated that 2013 PIKE data was unavailable. But it was, as pointed out by the AfESG and Conservation Force. *AfESG Letter*, p. 4; *CF Oct. 2014 Comment*, p. 21-22 & attachments. Updated 2013 PIKE showed the illegal killing of elephant fell to 0.4 at the Chewore site and 0.22 at the NyamiNyami site, below the "unsustainable" level. CITES Secretariat, SC65 Doc. 42.1 & Inf. 42.1 (data reflected a "statistically significant" decline in poaching); *AfESG Letter*, p. 4-5; see also *ZPWMA July 2015 Response*, p. 25 (providing PIKE 2000-2014).

ZPWMA's July 2015 Response (p. 24-31) reports on "Urgent Measures" undertaken to bring about this reduction; see also *ZPWMA Dec. 2014 Response*, p. 13-14.

[18] *CF June 2014 Comment*, p. 14; compare *April Finding*, p. 3-4, with Chief, Branch of Permits, Enhancement Finding for African Elephants Taken Sport-Hunted Trophies in Zimbabwe (July 2, 1997), p. 3 ("*1997 Finding*").

[19] E.g., *July Finding*, p. 5 (failing to address pledge to update elephant management plan), p. 6 (misinterpreting AfESG database with almost verbatim language to April Finding), p. 6 (dismissing Save Valley Conservancy survey as "partial" and with "double counting"), p. 6-7 (misconstruing carcass ratio in Gonarezhou NP survey), p. 7 (claiming 2012 and 2013 PIKE unavailable), p. 7 (claiming to lack data on ZPWMA's funding), p. 7 (citing "2002 CITES Panel of Experts"), p. 8 (relying upon ivory seizure reports), p. 9 (complaining to lack offtakes figures), p. 10 (conflating human-elephant conflict with PAC offtake), p. 10 (raising a red herring of the CITES approved trade in hides), p. 10-11 (dictating what factors ZPWMA must consider in quota-setting), p. 11-12 (failing to discuss the CAMPFIRE Association Report).

[20] E.g., *CF Oct. 2014 Comment*, p. 8, 15-16 (explaining how *Elephant Management in Zimbabwe* was not a management plan and quote referred to maintaining trophy quality, not sustainability), p. 10-11 (correcting misinterpretation of AfESG database and existence of "new surveys"), p. 11-12 (noting additional surveys provided which refuted claims that "very few new surveys" had been conducted, Hwange had not been surveyed, and surveys showed downward trend), p. 13 (demonstrating that SVC survey was comparable to prior and "double-counting," if it even occurred, had minimal effect), p. 13-14 (correcting misreading of GNP survey report and omission of sentence in quote), p. 16-17

elephant management action plan that was largely omitted in the July Finding (although the DMA was kept informed of the process) and the 2014 aerial survey being planned with Zimbabwe's transfrontier partners to be comparable with past surveys, among (many) other things.[21]

However, the Finding still does not adequately consider these corrections and submitted data. As detailed in the Request for Reconsideration, the Finding repeatedly copies-and-pastes from the July Finding. (At least half the substantive paragraphs contain similar, sometimes verbatim language to the July Finding). The Finding fails to incorporate significant information submitted by ZPWMA or Conservation Force. Some of the errors made are fundamental.

For example, as in July, the Finding does not consider four of the seven recent elephant surveys provided, and cherry-picked from the two surveys it cited (and was corrected by the AfESG).[22] As in July, the Finding purportedly quotes from a "CITES Panel of Experts" that did not exist.[23] As in July, the Finding dismisses what it labels as "bright spots of conservation" as being "not enough," and criticizes Zimbabwe's lack of a "government mechanism" to encourage conservation. But Zimbabwe was the first African country to give "Appropriate Authority" to local communal land holders to manage and benefit from wildlife on their land. That authority is <u>exactly</u> the mechanism which incentivizes the existence of populations of elephant, lion, leopard, and other dangerous game that otherwise would not exist (see p. 11 below).[24] At the turn of the twentieth century, the elephant population in Zimbabwe was estimated to be fewer than 5,000. Now, thanks in part to the "bright spots" of hunter conservation and largely to the devolution of management authority, elephant populations are stable or increasing.[25] They are also sustainably hunted, as explained

---

(explaining why 2014 national survey did not require cameras and comparability was main goal), p. 20-21 (proving "2002" CITES Panel of Experts did not exist), p. 21-22 (providing 2012 and 2013 PIKE data (which had been available in July)), p. 22 (explaining that ETIS data is "confounded" by some CITES-authorized, lawful trade in ivory in Zimbabwe that is subject to seizure abroad), p. 25-26 (justifying quota-setting process), p. 26-28 (noting omission of CAMPFIRE Association Report data), Appendix I (quoting April 4 inquiry and claimed lack of data to demonstrate that data was not requested).

[21] *CF Oct. 2014 Comment*, p. 9, 16-17, & attachments; *AfESG Letter*, p. 4-5. Please note that the DMA received the report of the national Elephant Management Plan Workshop in December 2014, and was sent invitations, agendas, and proceedings of the regional elephant management planning workshops as these were issued.

[22] *AfESG Letter*, p. 2-5 (correcting errors with paragraphs on Save Valley Conservancy and Gonarezhou surveys); CF Oct. 2014 Comment, p. 10-14.

[23] The Finding cannot possibly quote the Panel of Experts' report, which was clearly not reviewed, because the author still cannot get the correct date for the Panel after three tries. The author first chose 2013, then cut off a decade in the July Finding. Perhaps he or she considered 1997 to be a safe bet because Zimbabwe's elephant population was down-listed from Appendix I to Appendix II of CITES in 1997. However, that down-listing was in the works for several CoPs, and Zimbabwe's elephant status and management were reviewed by the CITES Panel of Experts in 1992. CITES Res. Conf. 7.9; Zimbabwe, *Consideration of Proposals for Amendment of Appendices I and II* (Prop. 10.27); CITES Panel of Experts, *Review of the Proposals Submitted by Botswana, Namibia, and Zimbabwe to Transfer Their National Populations of Loxodonta africana* (1992). Please note that even if the Finding intends to cite this Panel, their report is <u>twenty-five years old</u>.

[24] *CF Oct. 2014 Comment*, p. 27-30; *Request for Reconsideration*, p. 16-18. The Finding (p. 10) criticizes ZPWMA due to the commitment of hunting operators to provide enhancement. That should not be a criticism. It is a <u>benefit</u> to the elephant and other species. It represents the devolution of anti-poaching and community support obligations to the private sector, relieving some of the financial burden on ZPWMA. Accord *ZPWMA Apr. 2014 Response*, p. 14-16, 27-28; *ZPWMA Dec. 2014 Response*, p. 4, 17-20, 25-26; *ZPWMA July 2015 Response*, p. 14, 31-33.

[25] ZPWMA, *Zimbabwe National Elephant Management Plan (2015-2020)*, p. 3-11 ("*Plan*").

in three ZPWMA Responses and the non-detriment determination.[26] The participatory, locally allocated quotas represent a fraction (0.37% in 2014 and 0.49% in 2016) of the elephant population, and offtakes are even lower—0.23% on average (2010-2015).[27]

Rather than accepting the evidence of enhancement and sustainability, the Finding, as in July, twists facts, ignores relevant data, claims not to have information, and does everything it can to justify the negative conclusion in light of everything that points to a positive finding of enhancement. The DMA then tacitly admitted it had not requested information it claimed not to have when it sent a May 2015 questionnaire to ZPWMA.[28]

The concerns on which the trophy import suspension was based have been proven baseless. Zimbabwe's elephant management and tourist hunting system have been proven to benefit the species. If all of the submissions by ZPWMA, Conservation Force, and others are reviewed without a preconceived conclusion, then that best-available and most current information requires the suspension to be lifted. An unbiased and open-minded review is what we request by this appeal.

II. THE SUSPENSION OBSTRUCTS THE ENHANCEMENT GENERATED BY LAWFUL TOURIST HUNTING

During the last 38 months and counting, ZPWMA, Conservation Force, and others have provided far more than enough information to demonstrate that the "enhancement" standard is satisfied. Far more than in prior enhancement findings. This information reflects "activities that provide a direct or indirect benefit to the species in the wild."[29] Tourist hunting benefits elephant by creating incentives for habitat protection and expansion, operating funding for ZPWMA, funding for anti-poaching and "boots on the ground," rural community employment and investment, and much more. This is not an empty claim. It is borne out in the extensive documentation submitted.

A. Expansion and Protection of Habitat and Sustainable Funding

Tourist hunting enhances the survival of elephants in Zimbabwe by justifying protection of two-and-a-half times more habitat than in strictly-protected national parks. Although the ~28,000 km^2 in national parks contribute greatly to wildlife conservation, the parks are much smaller than the approximately 19,000 km^2 in safari areas, 40,000 km^2 in communal/CAMPFIRE areas, and over 7,100 km^2 in private conservancies.[30]

Note, this estimate does not include all communal areas, but only nine significant hunting areas. It does not include all conservancies (most specifically, the 1,400 km^2 Nuanetsi area or the Gwayi Valley). And it does not include the

The revenue from lawful hunting sustains this expanded habitat. It is obviously an incentive in safari areas, but also in CAMPFIRE areas (prior to the suspension), hunting generated ~90% of all revenue, and elephant hunting generated three-quarters of this total.[31] In private conservancies such as Bubye and Savé Valley, operations, anti-poaching, and community programs are exclusively supported by hunting income.[32]

Hunting revenue also provides most of the operating budget on which ZPWMA relies to secure this habitat and police the national parks.[33] Conservation fees charged to hunting clients and others, and hunting fees charged for concession leases, licenses, and trophies, are the primary source of ZPWMA's funds. Elephant hunting fees account for the largest percent of revenue generated across all user-pay land categories (e.g., safari areas, communal land, private conservancies, and forestry concessions). In 2014, over $6 million in trophy fee revenue derived from elephant hunts. Approximately $5 million accrued to ZPWMA and was "ploughed back into conservation," law enforcement, and management.[34] Over 50% of the revenue had come from U.S. hunters prior to the suspension.[35]

According to ZPWMA's Elephant Coordinator: "the African elephant is one of the biggest drawcard species from a hunting perspective and is at the centre of all the major hunts … Generally hunting contributed an average of USD22m to the GDP in 2014 and 2015..."[36] Most of the revenue from elephant hunting is re-invested in and contributes to the recovery of the species by being used for law enforcement and anti-poaching.[37] Without this revenue, ZPWMA is hard-pressed to implement its state-of-the-art national and regional elephant management plans. The trophy import suspension reduced, and continues to reduce, this much-needed revenue.[38]

---

forest reserves that allow sustainable hunting, such as those in the Matetsi/Kazuma Pan area. The habitat provided and protected in hunting areas is even larger than stated above.

One of the key impediments towards and full and comprehensive implementation of the Elephant Management Plan is limited resources."); CAMPFIRE Assn., *The Role of Trophy Hunting of Elephant in Support of the Zimbabwe CAMPFIRE Program* (Dec. 2016), p. 1, 22-25 ("*CAMPFIRE—Role of Hunting Report*"), publicly available at http://campfirezimbabwe.org/index.php/downloads.

B. Anti-Poaching and Encroachment

Lawful tourist safari hunting enhances the survival of elephant by being a key component of Zimbabwe's national anti-poaching strategy.[39] Hunting operators are often the first to observe poaching and the first line of defense against poachers because concessions frequently buffer national parks and international borders. The DMA was provided extensive documentation to evidence this enhancement, yet somehow misinterprets this evidence as a negative.

The Hwange National Park poisoning referenced in the April Finding and press release was first discovered by a hunting company's team of anti-poaching scouts. The scouts initially tracked the poachers, and the operator and team worked closely with ZPWMA rangers to minimize the damage.[40] This is a clear example of how hunting operators in the field[41] benefit elephant. Their presence adds to the capacity to police a park like Hwange, 1.6 times the size of Yellowstone National Park. Hunting operators' anti-poaching teams add a significant number of "boots on the ground." According to SOAZ, a sample of just fourteen operators invested almost $1 million in anti-poaching in 2013, including salaries for 245 scouts.[42] (The DMA received this data, but has never discussed or cited it in the Findings.)

Conservation Force submitted specific examples to further demonstrate the operators' commitments and contributions. One operator in an area bordering Mozambique "picked up over 5,000 snares and arrested over 60 poachers (in four years)," with an annual anti-poaching expenditure of $80,000 to $90,000. The scouts have grown so skilled in anti-poaching that they work with ZPWMA rangers to patrol Mana Pools National Park, in addition to patrolling the concession. The operator spent over $95,000 on anti-poaching activities in 2016 alone, and more in community payments (as discussed in the next section).[43]

Similarly, a hunting operator discovered the Hwange poisoning because the company's twelve-person anti-poaching team patrols the park's edge. This is an inherent benefit of tourist hunting. The company's anti-poaching and community programs exceeded $350,000 in 2014. Ninety-five percent of the company's revenue derived from elephant hunting prior to the trophy import suspension.[44]

[39] *ZPWMA Apr. 2014 Response*, p. 26-28; *ZPWMA Dec. 2014 Response*, p. 17; *ZPWMA July 2015 Response*, p. 27, 33-34.

[40] *CF June 2014 Comment*, p. 4, 18-19 (attaching email and declaration from operator involved).

[41] The Finding, p. 10, misconstrues this as hunting clients ("armed hunters"). But our submissions have never claimed hunting **clients** contribute to anti-poaching. Rather, the extensive operator patrols protect the habitat and provide the key enhancement. E.g., *CF June 2014 Comment*, p. 4, 17-19 & attachments; CF Oct. 2014 Comment, p. 22, 27-33 & attachments; *Request for Reconsideration*, p. 12-13, 16-18 & attachments (e.g., examples of Charlton McCallum Safaris, Lodzi Hunters, Pro Safaris, Martin Pieters Safaris, etc.); *SOAZ Report*, p. 4.

[42] *SOAZ Report*, p. 4.

[43] Information for Charlton McCallum Safaris submitted in: *CF June 2014 Comment*, p. 16,18-19 & attachments; *CF Oct. 2014 Comment*, p. 27-30 & attachments; Conservation Force, *Supplementary Comment Opposing [July] Finding and Information Provided in Support of a Positive Enhancement Finding for 2015* (Dec. 15, 2014) p. 3-6 & attachments ("*CF Dec. 2014 Comment*"); CF, *Supporting Documentation for Comments Demonstrating Enhancement from Tourist Hunting in Zimbabwe* (Jan. 19, 2015), p. 1-4 & attachments ("*CF Jan. 2015 Comment*"); *Request for Reconsideration*, p. 12 (citing emails sent to the DMA attaching Charlton McCallum Safaris documents).

[44] Information for Lodzi Hunters: *CF Dec. 2014 Comment*, p. 3-6 & attachments; *CF Jan. 2015 Comment*, p. 1-4 & attachments; *Request for Reconsideration*, p. 13 & attachments.

Another hunting operator along the Zambian border invests over six percent of turnover in a ten-member anti-poaching team, and coordinates with ZPWMA rangers to police the over 500 km^2 concession (a little smaller than Zion National Park).[45] In 2013-2014, anti-poaching teams in the Omay communal area (which forms a corridor with several safari areas and national parks) conducted 289 patrols, recovered 165 snares, and arrested 123 poachers.[46]

The revenue from tourist hunting, and especially elephant hunting, underwrites anti-poaching programs throughout Zimbabwe. In the national parks, hunting operators work with and support ZPWMA rangers.[47] Their contributions do not "raise … concerns about the effectiveness of funds utilization" by ZPWMA,[48] but benefit the elephant and other wildlife by sharing law enforcement costs with the private sector, reducing the government burden. This is a customary and widely-recognized "enhancement" of regulated hunting in Zimbabwe and throughout Southern and Eastern Africa. As we previously explained:

> The examples … are not just "bright spots," as dismissed in the [July] finding … they form a steady beam of light that shines on Zimbabwe's elephant. These examples represent a consistent commitment throughout the safari community in Zimbabwe, and a shared goal of ensuring the conservation of elephant and other wildlife. That is … enhancement.[49]

And that enhancement is being reduced and threatened by the denial of these import permits.

C. CAMPFIRE/Reduction of Human-Elephant Conflicts

Zimbabwe was the first African country to devolve control over natural resources to the local communities living on that land. CAMPFIRE's innovation was to give communities a proprietary interest in the resource, including wildlife.[50] CAMPFIRE communities rely upon lawful tourist hunting to generate revenues, which are used for building schools and clinics, improving water supplies, paying school fees or pensions, shoring up food supplies, and more.[51] Benefits for rural communities are multiplied in jobs, gratuities, game meat, and other financial opportunities much valued in a country with high unemployment and poverty rates.[52]

Before the suspension of elephant trophy imports, approximately 90% of CAMPFIRE revenue derived from hunting concessions. The revenue is split among wards, rural district councils, and the national CAMPFIRE Association, with 55% of funds directed to ward bank accounts, and 26% of funds invested in community projects.[53] Elephant hunting was the financial backbone of CAMPFIRE. Over 70% of the revenue derived

[50] *CAMPFIRE—Role of Hunting Report*, p. 2-3.

[51] From 1986-2006, CAMPFIRE channeled more than $20 million to rural villages and $17 million to RDCs. *CAMPFIRE Association Report*, p. 3-4, 8.

[52] *CAMPFIRE Association Report*, p. 3-4, 7-11; *CAMPFIRE—Role of Hunting*, Annex 1; *ZPWMA Apr. 2014 Response*, 24-28 *CF June 2014 Comment*, p. 15-17 & attachments; *CF Oct. 2014 Comment*, p. 26-27, 30-33.

[53] Relying on outdated information, the July Finding (p. 11) and Finding (p. 18) each criticize distribution of CAMPFIRE revenues, but generally that has not been an issue in the last decade, since the CAMPFIRE Constitution and revenue-sharing guidelines were revised. It is "NOT about noncompliance in disbursement of revenue to communities. It is the quality of services provided by RDCs to communities, e.g. anti-poaching, problem animal control, hunting

from elephant hunting. This exceeded $1.7 million in 2012.[54] Over 53-66% of clients were U.S. citizens, and from 2010-2015, over $5 million was generated for CAMPFIRE communities from elephant hunts by U.S. hunters.[55] However, that number has fallen since 2014.[56]

The grant of Appropriate Authority means ZPWMA foregoes the hunting fees in CAMPFIRE areas. Fees and other benefits accrue directly to the communities. CAMPFIRE communities also benefit from contracts or joint ventures with hunting operators. Conservation Force submitted specific examples of community-operator arrangements which have reduced poaching and human-wildlife conflicts. In the Mbire District where applicant PRT-04205C hunted, the operator and community maintain a "genuine joint venture." In 2013 to 2015, the operator paid over $1 million to local wards.[57] Ninety percent of this income came from hunting, 90% of clients were U.S. citizens, and over one-third of the revenue derived from elephant hunts by U.S. citizens.[58]

Likewise, under contract with the Tsholotsho district council, one operator has paid over $530,000 to the community in the same period. Over $318,000 was deposited in ward bank accounts. The operator assists with village projects on top of these payments.[59]

These are two of the many examples of livelihood improvements related to tourist hunting, with reduced encroachment and conflict as the intended results. The continued suspension of elephant trophy imports, however, obstructs the benefits generated for local communities and reverses the tolerance gains.[60] The CAMPFIRE Association wrote four reports that have been submitted to the DMA, including the CAMPFIRE Workshop report, to raise the alarm about the suspension's detrimental impact. Yet CAMPFIRE's concerns and supporting statistics have not been credited or even discussed in the Findings.

The positive, 1997 enhancement finding cited CAMPFIRE as the means Zimbabwe used to mitigate human-elephant conflict.[61] In the past, the FWS consistently supported CAMPFIRE. CAMPFIRE was considered "an excellent example of a social program built on values obtained from the sustainable utilization of wildlife resources" and "an important political-economic-sociological institution that developed an environmental ethic, restored the perception of wildlife as a valuable resource, advocated wildlife management … and encouraged the conservation of natural ecosystems and wildlife habitats on tribal lands."[62]

---

administration, that often creates tension." *CF Oct. 2014 Comment*, p. 31-32 (quoting C. Jonga (Sept. 30, 2014)). The Finding quotes a portion of this email, but still reaches the opposite conclusion.

In Zimbabwe, CAMPFIRE remains the primary way rural communities benefit from the sustainable use of wildlife. The DMA's failure to consider CAMPFIRE's enhancement or damage caused by the suspension is irresponsible and detrimental to the elephant.[63] CAMPFIRE's concerns, and the suspension's impact, have recently been corroborated by an independent paper concluding that tourist hunting is important to both wildlife conservation and rural development in Zimbabwe.[64]

D. Summary of Proven Enhancement

These direct and indirect benefits have been documented.[65] Every hectare of habitat secured, every dollar generated for management and enforcement, every snare picked up, every elephant spared based on the value of a hunting fee **is enhancement**. This satisfies the "special rule" self-imposed by the FWS.[66]

Unfortunately, the DMA has chosen to obstruct this enhancement. It admits "some benefits are shown." But it has repeatedly raised the bar. Instead of requiring hunting enhance the survival of the species, the DMA apparently requires the hunting "ensure" or "guarantee" the species' survival. But neither the ESA nor the special rule uses those words. Nor does the ESA or special rule mention detailed financial break-downs, changes to a country's accounting, tracking of every dollar spent by a U.S. citizen, or a completely flawless system. The DMA has invented a standard far higher than enhancement, perhaps to legitimize its original mistake in suspending imports of lawful elephant trophies and justify continued suspension. These decisions have seemed to be pre-made and based on a political imperative, not the reality of elephant in Zimbabwe or the ESA's legal requirements.

III. DENIAL OF THE REQUEST FOR RECONSIDERATION IS BASELESS AND CONTRADICTORY

Denial of the request for reconsideration is error. Like the enhancement Findings, the DMA's denial letter is based on misconceptions. The letter claims, "[at] the time you originally applied for a permit, the Service had reviewed the best available scientific and management data…"[67] But that is impossible. The Finding dates to 2015. These applications were filed in 2016. (Until then, no permit application was even required for CITES Appendix II-listed, ESA-threatened-listed elephant imports.[68]) Within its first three paragraphs, the denial misrepresents the facts.

Moreover, the best-available information for 2015 was not considered in the Finding, which copies-and-pastes most of the July Finding and fails to engage with most of the data submitted by Conservation Force. How can a finding purport to rely upon the best-available and most up-to-date information, when so much is repeated and so little new and additional information is incorporated?[69] Moreover, the DMA was aware that it had not asked for all the information it claimed not to have, as shown in the May 12, 2015 request

[69] See generally *Request for Reconsideration*.

for information sent to ZPWMA.[70] ZPWMA's July 2015 Response has not been discussed in any finding or otherwise considered, even though it provides information relevant to 2015 and before, and fills in alleged information gaps. Denial of the request for reconsideration is improper because the Finding should have been updated, in keeping with its own terms, to consider this 2015 response.[71]

Last, although the denial draws a line at March 26, 2015, there is no magic date by which a finding must be made. We have DMA enhancement findings dated in March, April, July, October, and December, and there are undoubtedly findings made in other months for other species.[72] It is arbitrary, capricious, and unfair to stand on a March finding when the DMA knew Zimbabwe was updating its elephant management plan and taking other steps to satisfy the DMA's own critiques and to cut off Zimbabwe's year-long hunting season after three months.[73] This line need not be drawn, and should be reversed.

CONCLUSION

More than sufficient information has been provided to override the anecdotal information cited as grounds to support the April 2014 suspension of elephant trophy imports. Enhancement has been shown, and the DMA's mistakes in the April, July, and March findings have been corrected in the submissions by ZPWMA, Conservation Force, and others. However, the DMA has not considered a great deal of that information submitted, to the detriment of the elephant, CAMPFIRE communities, and well-managed tourist hunting system in Zimbabwe.

Reversal of the over-long suspension is urgently due. In constantly re-defining "enhancement," the DMA has blocked the very benefits it purports to require for elephant and other species. Zimbabwe's elephant management strategy largely depends upon the revenues and incentives that come from a limited hunting offtake and trade. We remain concerned that little reason remains for Zimbabwe to maintain such a large and costly elephant population, when the incentive of U.S. hunters has been blocked by the U.S. FWS. The continued suspension of elephant trophy imports is itself the greatest threat to Zimbabwe's elephant.

The best-available information demonstrates that the suspension was a mistake from inception based on anecdote and misinformation. The best-available information demonstrates that lawful hunting fulfills its promise in Zimbabwe—it secures the most habitat, pays for management and anti-poaching, and improves human tolerance of elephant and other dangerous game. Because the enhancement standard is met, the continued suspension of elephant trophy imports is arbitrary, capricious, and unlawful.

Last, the best-available information demonstrates that denial of applicants' request for reconsideration was also in error. The March 25, 2016 enhancement finding is not updated. Its arbitrary time frame should be rejected. When the best-available information is properly considered, the import of elephant hunting trophies from 2015 and beyond should be approved. When the dependent conservation program of the elephant is considered, the permits should be approved.

---

[70] B. Arroyo, *Letter to Minister Kasukuwere* (May 12, 2015); *ZPWMA July 2015 Response*.

[71] E.g., *March Finding*, p. 1, 3, 6, 11.

[72] The DMA made a positive enhancement finding for the import of sport-hunted elephant trophies from Zambia in December 2012, and a positive enhancement finding for the import of wild and wild-managed lion hunting trophies from South Africa in October 2016.

[73] The DMA apparently has not denied import permit applications for hunts occurring later in 2015, as we are aware of an applicant who hunted an elephant in Zimbabwe on May 5, 2015 who has not received a denial letter.

Accordingly, we respectfully request that you reverse the denial of these permit applications and order the DMA to issue these permits.

On behalf of the applicants, we respectfully request oral argument on this appeal. We ask that you provide a contact for scheduling or contact our office to schedule this argument.

Respectfully submitted,

Re: Request for Reconsideration of Denial of Permit Applications PRT-04846C and PRT-04205C

Dear Chief Van Norman:

We request reconsideration of the denials of two applications for permits to import hunting trophies of elephant taken in Zimbabwe in 2015 ("Denials"). The first application was submitted by Richard Bonander, PRT-04846C, for a bull elephant taken in the Ngamo/Sikumi Forest Block in Zimbabwe on March 21, 2015. The second was submitted by Michael Jines, PRT-04205C, for a bull elephant taken in the Mbire CAMPFIRE District in Zimbabwe on February 25, 2015. Conservation Force represents both Applicants.

The Denials should be reconsidered and reversed for eight primary reasons. First, they rely upon the *Enhancement Finding for African Elephant Taken as Sport-Hunted Trophies in Zimbabwe on or after January 1, 2015*, dated March 26, 2015 ("Finding"). But the Finding fails to consider significant information submitted by Conservation Force, Zimbabwe's Parks and Wildlife Management Authority ("ZPWMA"), and others. If considered, the negative conclusion would have to be reversed. The information provided:

- Establishes that Zimbabwe has the most up-to-date management plan for African elephant in the world, with adaptive and regionally-specific action items, clear assignment of responsibilities, and means of verifying its implementation successes;
- Establishes that Zimbabwe has a relatively stable elephant population, as determined by a recent countrywide survey;
- Demonstrates that Zimbabwe has been effectively enforcing laws and policies to protect elephant and other species, and has implemented new measures and ramped-up national and local efforts to combat poaching;
- Demonstrates that hunting offtakes are sustainable and based on the consideration of all causes of elephant mortality, biological and critical social factors, and scientific recommendations;
- Reflects the full cooperation of ZPWMA in responding to the FWS' information demands, including production of sensitive budget information that underscores the essential role hunting, especially elephant hunting, plays in supporting wildlife conservation, management, and protection, both in the Parks estate and community areas;
- Evidences how the government's grant of Appropriate Authority to local landholders has created a public-private-community partnership that obligates all stakeholders to invest in protection and conservation of wildlife on their lands; and

- Proves that licensed, regulated hunting enhances the survival of elephant and other species in the country by securing habitat, generating management funding, underwriting and supporting anti-poaching, and incentivizing greater tolerance of elephant by rural community members.

In sum, because the information provided demonstrates that the enhancement standard is met, and this information was not relied upon in denying the applications, we respectfully request reconsideration and reversal of the Denials and issuance of the requested import permits.

Reason for Reconsideration 1: Failure to Consider Best-Available Information

In the Finding, the FWS repeatedly stated it would review its negative conclusion if additional information was provided.[1] But the FWS has not done so. It has not considered hundreds of pages of information in the Denials, which rely upon the Finding.

The Finding was made on March 26, 2015. Information has been provided to the FWS from April 17, 2014 through as recently as February 2017 by Conservation Force, ZPWMA, the IUCN African Elephant Specialist Group ("AfESG"), the Safari Operators Association of Zimbabwe ("SOAZ"), Safari Club International ("SCI"), individual hunting operators, and others.[2] Most of this data has ***not*** been discussed in the Finding or in an updated finding, in the two-plus years since the Finding was made.

Rather, entire paragraphs in the Finding are identical to the July 22, 2014 negative enhancement finding.[3] Because they are not updated from July 2014, they fail to address points made by Conservation Force and ZPWMA to correct errors in that July finding. Moreover, the Finding states in several places that the FWS was not provided with specific information. However, Conservation Force previously cited to where the information was provided,[4] and ZPWMA submitted additional data in its prompt and thorough July 2015 response ("ZPWMA July 2015 Response") to the FWS' third questionnaire, dated May 12, 2015 (***after*** the Finding). The ZPWMA July 2015 Response was not considered in the Denials, which rely upon the Finding. However, the July 2015 Response provides substantial information the FWS asserts is missing.[5]

This up-to-date information cannot be ignored. It demonstrates that Zimbabwe's hunting program is well-managed and sustainable. It shows how hunting in Zimbabwe enhances the survival of the elephant. The FWS' failure to consider this information requires reconsideration of the Denials. The Finding is based on outdated information, and its reservations have been resolved. Once the new information is considered

[1] E.g., *Finding*, p. 1, 3, 6, 11.

[2] An index of the information previously submitted to the FWS is attached.

[3] *Enhancement Finding for African Elephants Taken as Sport-Hunted Trophies in Zimbabwe During 2014*, dated July 22, 2014, p. 2 ¶ 6; p. 3 ¶¶ 1-3; p. 4 ¶¶ 1-2; p. 5 ¶¶ 2-3; p. 7 ¶¶ 3-4; p. 8 ¶ 4; p. 9 ¶ 1 (changed "2002 Panel of Experts" to "1997"); p. 9 ¶ 4; p. 10 ¶¶ 1-4; p. 11 ¶¶ 3-5; p. 12 ¶¶ 1-2, 5; p. 13 ¶ 1-2; p. 17 ¶ 3; p. 18 ¶¶ 2, 4; see also paragraphs in which several sentences are identical or nearly so: p. 4 ¶¶ 3-4; p. 5 ¶ 1; p. 6 ¶ 3-4; p. 7 ¶ 2; p. 8 ¶ 3; p. 9 ¶ 3; p. 14 ¶ 4 (changed numbers of RDCs); p. 16 ¶ 4; p. 17 ¶ 5; p. 18 ¶ 3.

[4] Conservation Force also provided an Appendix that cross-referenced statements claiming not to have information against the FWS' April 4, 2014 questionnaire to ZPWMA, which did not ask for much of this information. Conservation Force, *Comment Opposing the Negative Enhancement Finding for African Elephant Taken as Sport-Hunted Trophies in Zimbabwe in 2014*, dated Oct. 16, 2014 ("*CF Oct. Comment*"), passim, & Appendix 1.

[5] E.g., Compare *Finding*, p. 9, 11 (seeking revenue information), p. 11 (seeking offtake information) with ZPWMA July 2015 Response, p. 36-43 (providing revenue and offtake tables).

by the FWS, the "enhancement" generated by elephant hunting is clear, and the requested permits should issue.

The urgency of issuing these permits has not changed since the suspension was imposed in April 2014. As the Finding recognizes, elephant hunting generates operating budget revenue for ZPWMA, incentives for Zimbabwe's community-based natural resources management program (CAMPFIRE), anti-poaching, and more. The information provided, including two CAMPFIRE reports, a SOAZ report, the ZPWMA July 2015 Response and more, makes clear that American elephant hunters are the largest source of these benefits.[6] Continued refusal to issue import permits jeopardizes this enhancement and the survival of the species.

The failure to consider the best-available information is made worse because ZPWMA responded promptly to the FWS' requests. ZPWMA responded to the first questionnaire within two weeks. Its Director-General and high-level representatives immediately traveled to DC to reinforce their response. ZPWMA responded to the second questionnaire in under six weeks; responded to third—not considered in the Finding—in five weeks; responded to the fourth—not considered in the Finding—in two weeks; and responded to the fifth —not considered in the Finding—within several weeks, with the final plan prioritization completed within six months. ZPWMA has repeatedly redirected its resources to provide information to the FWS. But the FWS has repeatedly moved the target to create an unreachable standard and demanded additional, more intensive information. The bar has been raised beyond "enhancement." The FWS has acknowledged that elephant benefit from well-managed hunting.[7] But the Finding seems to require more than well-managed —it seeks management perfection. That is simply not possible, either in Zimbabwe or in this country (even the FWS is constrained by limited resources).

The information submitted shows that licensed, regulated hunting increases habitat security, generates law enforcement funding and support, and incentivizes tolerance for elephant. It shows a sustainable use of elephant at a level far too low to be detrimental. It shows that the enhancement standard, as originally defined[8] has been met. Thus, the Denials should be reconsidered and reversed.

---

[6] E.g., *ZPWMA July 2015 Response*, p. 40-41 ("The US hunting market constitutes 51% and 54% of elephant trophy hunting in Zimbabwe for the years 2013 and 2014 respectively."); CAMPFIRE Association, *Trophy Imports Suspension and the CAMPFIRE Program*) (2014), p. 4 ("*CAMPFIRE Association Report*") (U.S. hunters represent two-thirds or more of CAMPFIRE clients); E. Gandiwa, *Proceedings of the CAMPFIRE Stakeholders' Workshop: Towards the Development of a New Elephant Management Plan and Policy* (Nov. 2014) ("*CAMPFIRE Workshop Proceedings*"), p. 6-21; CAMPFIRE Association, *CAMPFIRE Hunting Income & Distribution* (Dec. 1, 2015) ("*CAMPFIRE Income Analysis*"), p. 6; ZPWMA, Presentation, *Legal Trade, Conservation, and Rural Livelihoods: A Zimbabwean Perspective* (Dec. 2016), p. 19; SOAZ, *Status of Elephant Populations, Hunting, and Anti-Poaching Effort in Safari Areas in Zimbabwe* (2014), p. 3-4 ("*SOAZ Report*")

[7] E.g., FWS, *Suspension of Import of Elephant Hunting Trophies Taken in Tanzania and Zimbabwe in 2015 and Beyond, Questions & Answers* (2014).

[8] In denying import permits for elephant from Tanzania, the FWS defined enhancement as: "activities that provide a direct benefit to the specie being hunted. Such benefits could include the use of revenue generated by the hunt to support conservation projects or to manage the species. Other benefits that could result from activities that enhance the survival of the species include improving human-wildlife conflicts, anti-poaching efforts, or habitat conservation." According to this standard and definition, and not the one created in the Finding, there is no doubt the importation of sport-hunted elephant into the U.S. enhances the species.

Reason for Reconsideration 2:
The Denials Fail to Consider Zimbabwe's State-of-the-Art Elephant Management Plans

ZPWMA has recently adopted and is implementing the most cutting-edge elephant management regime among range nations, the *Zimbabwe Elephant Management Plan (2015-2020)* ("Plan"). This effort attests to ZPWMA's commitment to elephant management and conservation. The new Plan further exemplifies the importance of sport-hunting in this system. The Denials fail to consider this essential new Plan, which the FWS has had for over one year.

Instead, the outdated Finding errs by considering *Elephant Management in Zimbabwe* to be the country's management plan, despite being told it was not.[9] The FWS' concerns about a claimed lack of measurable outcomes in Zimbabwe's actual former management plan, the *Policy and Plan for Elephant Management in Zimbabwe*, have been resolved. As the FWS was repeatedly told, a new management plan was adopted, with specific action items, deliverables, and deadlines (as suggested was necessary by the April and July negative enhancement findings).[10] The FWS knew of the new Plan's details because the FWS received the *Plan Workshop Proceedings* in December 2014, before the Finding was made.[11] The FWS was also informed that Zimbabwe would manage each main range area adaptively pursuant to a regional plan. The FWS was sent the proceeding of regional workshops, and the final regional plans as part of the final national Plan.[12] And in November 2016, the FWS was provided with information on the implementation and prioritization of these plans at the request of the Chief of Permits.[13] In short, throughout the Plan's drafting, ZPWMA and Conservation Force kept the FWS fully apprised of the status and what the Plan would entail. However, little of this information was considered in the Finding or the Denials.

Had the new Plan been considered, these permits would have to be approved. The Plan incorporates an adaptive management framework with higher-level Targets, Key Components, Strategic Objectives, and Outputs. It breaks each Key Component into specific management actions, the achievement of which will be measured and verified through Key Performance Indicators ("KPIs") and Means of Verification of KPIs. The Plan sets deadlines and assigns specific responsibility for achieving each Action. It focuses on five key components: 1. Protection and Law Enforcement, 2. Biological Monitoring and Management, 3. Social,

Economic, and Cultural Framework, 4. Building Conservation Capacity, and 5. Coordination, Collaboration, and Program Management.[14]

The Plan breaks down elephant management by range, as their challenges differ. For example, authorities must manage overpopulated elephant and provision of water in North West Matabeleland compared to a reduced population targeted to recover in Sebungwe. These differences are addressed in the actions and indicators of each regional plan.[15]

The Plan provides for accountability, transparency, and effective implementation in the terms of reference for an Elephant Manager tasked with directing elephant management in Zimbabwe. The Plan also created a National Elephant Management Committee and four range-specific committees to review progress and oversee implementation.[16]

Examples of "Protection" activities include establishing a rapid-response anti-poaching unit in conjunction with the Zimbabwe Republic Police, expanding ZPWMA's informer networks, and connecting national law enforcement databases. Monitoring activities include periodic surveys and setting Thresholds of Potential Concern as early-warning indicators in key habitats. An example KPI for "Building Conservation Capacity" is to channel most income from elephant hunting back into elephant management, with ongoing oversight through reports on funds available and utilized.[17] As these examples show, the Plan incorporates ***specific*** actions and KPIs, and specific oversight mechanisms.

The Plan addresses human-elephant conflict in the Social, Economic, and Cultural Framework component. The Plan recognizes there is no single solution to conflict, and commits to "undertake additional research on problem animal control and minimizing conflict." It emphasizes the importance of local communities' tolerance towards elephants through a system of benefits-sharing as a long-term solution to conflict.[18]

The Plan also specifically integrates licensed, regulated elephant hunting as a management tool:

> To have a future, elephant must have a value. Value to the governing authorities and to the local people. The greater the value, the greater the tolerance of them is likely to be … Regulated sport hunting converts wildlife into assets for the benefit of local people and the country as a whole… elephant and other wildlife populations will be negatively affected though reduced conservation efforts arising from low funding and reduced goodwill from the communities, when… the elephant has the economic potential to raise adequate funds to support itself and other species. For these reasons, Zimbabwe confirms its commitment to the sustainable use of elephant and other wildlife in this Action Plan.[19]

[14] *Plan*, p. 16-17.

[15] *Plan*, p. 38-80 (Annexes 9.4-9.7).

[16] *Plan*, p. 13-14, 35-37.

[17] E.g., *Plan*, p. 19-27.

[18] *Plan*, p. 15.

[19] *Plan*, p. 12.

The Plan addresses the Finding's concerns on every level. It implements an effective management system, with the necessary "specific goals and measures with specific actions to be taken."[20] Moreover, ZPWMA provided to FWS a 2016 report on its progress in implementing the Plan and prioritizing implementation, including of the regional plans. The Plan Supplement emphasizes law enforcement and training to combat poaching and ivory trafficking.[21] The FWS requested the prioritization, and ZPWMA again demonstrated its good faith in preparing and providing the document, which was not considered in the Finding or the Denials. Because the Finding's concerns are resolved and new information reveals an effective, adaptive management plan and implementation thereof in Zimbabwe, the Denials should be reconsidered and reversed.[22]

Reason for Reconsideration 3:
Zimbabwe has Current Elephant Population Information that Guides its Sustainable Use

The AfESG recently estimated Zimbabwe's elephant population at 82,630 ± 8,589 across a range of 81,228 km^2.[23] Zimbabwe maintains the second-largest elephant population in Africa, at a level nearly double its estimated carrying capacity.[24] The population is most concentrated in the North West Matabeleland and South East Lowveld ranges. The current national estimate is approximately 6,000 lower than the 2001 countrywide estimate, a percentage calculated as "not statistically significant" by the survey's authors.[25] Zimbabwe's current elephant population is 20% larger than its population in 1997 (66,000), when the FWS made a positive enhancement finding. The Finding does not explain why a 20% increase is insufficient.[26]

---

[20] *Finding*, p. 6. The Plan applies a multi-tiered approach, using tailored goals leading to achievement of the "Long-Term Vision," which is: "To conserve elephants at levels that will enable them to contribute to the conservation of biodiversity, national development and Zimbabwe's cultural heritage." The Plan establishes intermediate "Targets" to achieving these goals, which are in line with the 1997 *Policy and Plan*: "1. To maintain at least four demographically and genetically viable elephant populations in Zimbabwe[;] 2. To maintain or increase core protected range of elephant in Zimbabwe[;] 3. To maintain numbers/density of elephant at levels that do not adversely impact on biodiversity conservation goals while contributing to economically viable and sustainable wildlife-based land uses in Zimbabwe." As in the draft provided to the FWS in December 2014, the final Plan is organized by "Key Components," and then "Strategic Objectives" that explain the "Key Components." "Outputs" describe the desired outcomes, and are to be achieved through implementation of "Key Activities/Actions." That implementation is monitored by the KPIs and Means of Verification of the KPIs.

[21] *Plan Supplement*, p. 6.

[22] As ZPWMA explained, Zimbabwe conserves and manages elephant on every level. Zimbabwe and bordering range states have formed Trans-Frontier Conservation Areas ("TFCAs") to address the elephant's migratory nature and cross border populations. Further, through the Plan Zimbabwe implements the action plans adopted by the Southern African Development Community ("SADC"), and the SADC Regional Elephant Management Strategy of 2007. E.g., *ZPWMA April 2014 Response*, p. 12; *ZPWMA July 2015 Response*, p. 15; *CF June 2014 Comment*, p. 12 & related attachments; *CF Oct. 2014 Comment*, p. 9 & related attachments.

[24] *Plan*, p. 3.

[25] *Plan*, p. 3. As explained above, the Management Plan incorporates regional plans to address challenges unique to each range and manage elephant within regional targets.

[26] The Finding suggests an increase to over 100,000 elephant would be acceptable. P. 8. As ZPWMA, Conservation Force, Rowan Martin, and others pointed out, a population of that size would be a catastrophe for the country's bio-diversity. The Finding does not account for the expansion in Zimbabwe's elephant since 1997, or the management measures implemented since then. Zimbabwe's elephant population has rebounded incredibly, from a low of 4,000

Worse, the Finding does not rely on this up-to-date estimate, although the FWS received the preliminary survey results in December 2014.[27] Nor does the Finding rely on the best-available information in the FWS' possession as of March 2015, which included comments from the AfESG and numerous survey results.[28] The Denials should be reconsidered because the Finding relies upon outdated data that was proven to be inaccurate by Conservation Force, ZPWMA, and the AfESG.

For example, the Finding reuses language that cites a statistic from *Elephant Management in Zimbabwe*. The statement was disavowed by its author, and Conservation Force explained how the percent limitation was being taken out of context.[29] The Finding's failure to consider information that undercuts a "fact" on which its negative conclusion was based is clear grounds for reconsideration. Similarly, the Finding admits the April finding erroneously interpreted the AfESG's Elephant Database by misconstruing its data quality categories. This error was pointed out in CF's June 2014 Comment and in a May 30, 2014 email from Dr. Holly Dublin, AfESG Chair.[30] It was corrected in the July enhancement finding.

However, the July finding continued to ignore pertinent information in the database, prompting Dr. Dublin to send a November 3, 2014 comment in which she corrected several critical points of information. First, the addition of a 2007 survey resulted in the addition of 30,000 "Definite" elephant in Zimbabwe. Second, the results of four recent surveys did not show a "substantial decline," as the July finding stated, but largely reflected stable or increasing populations. The Finding apparently accepted these comments, and edited the prior statements to incorporate Dr. Dublin's corrections.[31]

However, Dr. Dublin offered three more corrections not discussed in the Finding. Instead, the challenged language was copied and pasted from the July document into the Finding.

- Dr. Dublin criticized the July finding's dismissal of a 2013 survey in Save Valley Conservancy for so-called "double counting," stating that, even if double-counting occurred, the count still reflected an increase in the elephant population;

Van Norman attaching AfESG Letter/Comment on July finding (Nov. 3, 2014), p. 2-9 ("*AfESG Letter*"); Aerial Survey of Elephants and Other Large Herbivores in the Mid-Zambezi Valley; 2007 Aerial Survey of Elephants and Other Large Herbivores in North-West Matabeleland; 2010 Aerial Survey of Elephants and Other Large Herbivores in Chewore Safari Area; 2013 Aerial Survey of Elephants and Other Large Herbivores in the Save Valley Conservancy; and 2013 Aerial Survey of Elephants and Other Large Herbivores in Gonarezhou National Park.

[29] *CF Oct. 2014 Comment*, p. 9, 15 & related attachments.

[30] Compare *Finding*, p. 7; with *CF June 2014 Comment*, p. 9 & related attachments; H. Dublin Email to T. Van Norman commenting on the April finding's misinterpretation of the AfESG Database (May 30, 2014).

[31] Compare *AfESG Letter*, p. 2 ("The AED shows, however, that three surveys carried out in this period … estimated higher totals than their respective previous, comparable surveys, although the differences were not significant. A fourth survey, Chewore (2010), resulted in an estimate lower than its previous, comparable survey, but the difference was also not statistically significant. Furthermore, the 2010 survey for Chewore did not cover the entire Zambezi Valley ecosystem, and therefore it is possible that the apparent decline, however slight, may be due to elephant movements within the ecosystem rather than to an actual decline.") with July finding, p. 6; *March Finding*, p. 7.

- Dr. Dublin concluded that a 4% carcass ratio in a 2013 survey of Gonarezhou National Park was a "reasonable figure," and the July finding erroneously "conflat[ed] … carcass ratios … and mortality rates, and its conclusion is unwarranted";
- Dr. Dublin noted that updated PIKE data was publicly available months before the July finding was made, yet "the finding stated that 2012 and 2013 data were not available," and pointed out that the two PIKE sites in Zimbabwe "have relatively small elephant populations and are by no means intended to be representative of the situation in the country as a whole."[32]

Given that Dr. Dublin is one of the world's foremost experts in elephant, due deference should have been given to her comments and suggestions. Conservation Force made similar points in our June and October comments as well, and provided comments from the authors of the Save Valley survey report responding to the FWS' statements.[33] We provided fice surveys pending the AfESG's review and not included in the AfESG's or FWS' estimates, and submitted updated PIKE information showing the Proportion of Illegally Killed Elephant had declined at the Zimbabwe sites[34]—contrary to the July finding's statements, copied-and-pasted into the Finding. The Denials' failure to review this best-available information, and reliance upon out-of-date or misinterpreted information, requires reconsideration.

Reason for Reconsideration 4: The Best-Available Information Demonstrates that Zimbabwe has been Enforcing its National Regulations as Effectively as Possible

ZPWMA is succeeding in managing and conserving its elephant. The most compelling evidence is the historic increase in its population, to become Africa's second-largest. ZPWMA achieved these results by largely curbing poaching and successfully prosecuting poachers as a result of adaptive and pro-active law enforcement measures. ZPWMA has also implemented a system of sharing responsibility with the private sector and communal landholders so as to share the financial burden of its management and enforcement obligations. The Finding fails to acknowledge these achievements and responsibility-sharing.[35] Its failure to do so requires reconsideration, and reversal of the Denials.

Evidence of ZPWMA's enforcement success was provided in their April 2014 and July 2015 Responses, and in Conservation Forces' June 2014 and October 2014 Comments. For instance, ZPWMA rapidly responded to the 2013 Hwange poisoning incident. Working with the hunting operator's team to track the poachers,

[32] *AfESG Letter*, p. 4-5.

[33] CF Email to T. Van Norman forwarding response from authors of the Save Valley Conservancy survey (Jan. 6, 2015); *CF Oct. 2014 Comment*, p. 13 & related attachments.

[34] E.g., 2005 Aerial Survey of Elephants and Other Large Herbivores in the Mid-Zambezi Valley; 2007 Aerial Survey of Elephants and Other Large Herbivores in North-West Matabeleland; 2010 Aerial Survey of Elephants and Other Large Herbivores in Chewore Safari Area; 2013 Aerial Survey of Elephants and Other Large Herbivores in the Save Valley Conservancy; and 2013 Aerial Survey of Elephants and Other Large Herbivores in Gonarezhou National Park; *see CF June 2014 Comment*, p. 4-7 & related attachments; *CF Oct. 2014 Comment*, p. 11 & related attachments.

[35] The FWS recognizes "there may be limited resources available for elephant management." *Finding*, p. 2. However, the FWS does not account for this in evaluating ZPWMA's efforts and results. "Enhancement" does not call for unlimited resources and perfect implementation, it seeks benefits. The benefits provided through the sport-hunting of elephant are clear and convincing, and the Denials should be reversed.

ZPWMA successfully arrested all 35 members of the team. ZPWMA's investigation and prosecution efforts led to the deterrent sentencing of each poacher to terms of 9 to 16 years in prison.[36]

ZPWMA specifically responded to the threat of poaching in Hwange by improving radio communications, adding aerial surveillance, and holding 35 public awareness meetings in the area.[37] ZPWMA then stepped-up its anti-poaching nationally by adopting a number of "Urgent Measures." ZPWMA acted to increase poaching penalties, criminalize the use of cyanide in poaching, increase air surveillance of protected areas, collaborate with national law enforcement and military agencies to raise elephant poaching to "a level of National Security in Zimbabwe," improve intelligence-sharing across international borders, and other important undertakings.[38] ZPWMA also held a judiciary awareness program to ensure full implementation of relevant poaching laws and penalties throughout prosecution and sentencing.[39]

ZPWMA directs most of its financial resources to anti-poaching and enforcement. As shown in the July 2015 Response, most of ZPWMA's budget (77%) is allocated for staff costs and patrol provisions.[40] These expenditures fund anti-poaching throughout the elephant range. Despite financial constraints, ZPWMA has been able to continuously hire to expand the number of patrol days in the field. ZPWMA has a staff of 1,504 active field rangers, with the intent to add more.[41] ZPWMA has shown that it can mobilize when called upon: after the Hwange poisoning, a new station with 15 field rangers was established in the area.[42]

Over 80% of spending under the new elephant management Plan has been on law enforcement (anti-poaching) and trainings, with law enforcement identified as the number one priority going forward.[43] The budget and operational data provided in the ZPWMA July 2015 Response and Plan Supplement addresses the FWS' asserted lack of information in the Finding. And although financial constraints exist in Zimbabwe (as in most range states), ZPWMA has effectively and efficiently maximized the impact of every dollar spent on anti-poaching. ZPWMA's results in curbing poaching speak for themselves.

The Finding continues to rely on outdated, unfounded criticisms from the July finding that were corrected by Conservation Force and ZPWMA. First, though the Finding claims not to have received information on Zimbabwe's poaching arrests and prosecutions, that information was not requested until May 2015, yet was provided in ZPWMA's April 2014 Response. It would be unfair to base a negative finding on data that had not been requested. But the data ***was*** provided, and should have been reviewed.[44]

Further, the Denials mistaken rely on the Finding's comments and interpretation of outdated ETIS reports. Conservation Force objected to these reports being taken out of context in our October 2014 Comment,

[44] *ZPWMA April 2014 Response*, p. 12, 14.

and provided evidence of improvements since 2010.[45] The Finding's reuse of these paragraphs, whose validity and applicability were challenged, merits reconsideration.

Finally, as discussed further under "Local Conservation Efforts," the Parks and Wildlife Act Chapter 20:14 devolved authority to manage and benefit from wildlife on communal and private lands to the landholders. In Safari Areas, ZPWMA leases concessions to pre-qualified hunting operators, which gives them authority to manage and benefit from approved wildlife in those areas.[46] "ZPWMA is engaging private players in co-management in some areas … this will help in resource mobilization and management for law enforcement. Long-term lease agreements (10-25 years) are being entered into to manage some protected areas."[47] In certain areas, ZPWMA partners with safari operators[48]; in others, they partner with non-profits, such as the Tashinga Initiative in the Zambezi Valley and WWF in the Hwange-Sanyati Biological Corridor.[49] In these ways, ZPWMA is sharing responsibility for enforcement of national regulations. This allows ZPWMA to do more with less, and has been especially crucial since receipts from hunting have fallen since the FWS suspension on ivory imports.

Reason for Reconsideration 5: Elephant Hunting in Zimbabwe is a Sustainable, Beneficial Use

ZPWMA's elephant hunting program is sustainable. Information submitted to the FWS demonstrates that quotas and offtakes are responsibly set in a participatory process, considering a range of inputs including all causes of elephant mortality; ZPWMA allocates quotas by region and locality; and recent poaching has remained fairly low, especially in comparison to other range states. This information has been submitted to the FWS on multiple occasions, including but not limited to:

- April 2014: poaching statistics; poacher arrest and prosecution statistics; four-page description of ZPWMA's quota-setting process;
- June 2014: poaching statistics in CAMPFIRE areas;
- December 2014: poaching and PAC statistics; offtake percentages from management, hunting, and trade in skins; two-page supplemental explanation of ZPWMA's quota-setting process;
- December 2014: hunting and PAC offtakes; quota utilization in CAMPFIRE areas;
- December 2014: carcass observance and estimates from the 2014 aerial survey;
- March 2015: updated MIKE/PIKE statistics;
- May 2015: poaching statistics from Mana Pools workshop;
- May 2015: poaching and offtake statistics in the Sebungwe;
- July 2015: carcass observance and estimates from the 2014 aerial survey; PIKE data; offtakes from six categories requested by the FWS; poaching and poacher investigation, arrest, and prosecution statistics; five-page supplemental explanation of ZPWMA's quota-setting process; quota allocation by range;
- September 2015: poaching and hunting offtakes from the South East Low Veld workshop;
- December 2015: hunting off-takes and quota utilization in CAMPFIRE areas;

[45] *CF Oct. 2014 Comment*, p. 22 (pointing out that the ETIS report was known to "confound" legal and illegal trade in small ivory products) & related attachments.

[46] *ZPWMA April 2014 Response*, p. 23-25.

[47] *ZPWMA Dec. 2014 Response*, p. 19.

[48] *ZPWMA July 2015 Response*, p. 34.

[49] *ZPWMA July 2015 Response*, p. 33.

- December 2016: two-page supplemental explanation of ZPWMA's quota-setting process;
- And more.[50]

This long list of information provided refutes the Finding's complaint that the FWS did not have "adequate information" about elephant offtakes, poaching, or quota-setting. The information was available. But the Denials do not consider it. If it had been considered, the FWS would have had to make a positive finding.

This best-available information demonstrates that ZPWMA's quotas are "scientifically determined" not to "compromise[e] [the species'] biological proliferation… In Zimbabwe, determination and implementation of hunting quotas goes through a rigorous quota-setting methodology" that accounts for all mortalities, including from hunting, poaching, PAC, natural causes and disease. In setting quotas, ZPWMA considers population sizes, trends, and densities; property sizes and habitat quality; environmental changes; human-wildlife conflict, national policies, and management targets; poaching trends; land tenure; trophy quality; hunt success; ranger monitoring; species sensitivity and research on the species; and more.[51] Quotas are set in participatory workshops for each range area. While stakeholders may propose an initial quota, their proposals are reviewed and revised as needed by ZPWMA ecologists to ensure the quotas are assessed at a sustainable level, having negligible impact on the population.[52] In 2014, Zimbabwe's offtake quota was set under 300 elephant; in 2016, it was set at 400.[53] The level of ***offtake*** authorized is well below that of ***export*** allowed under Zimbabwe's CITES quota (500 elephant), for good reason—exports may be delayed due to transport, taxidermy/processing, or permitting issues.

ZPWMA's 2014 quota of 300 mature elephant bulls represents only 0.37% of the total elephant population (82,000+). Zimbabwe's 2016 quota represents only 0.49%. These percentages are comfortably below the sustainability threshold of 0.6-0.75%. Most critically, however, actual offtakes are even lower, on average only 204 mature elephant bulls per year. That represents only 0.25% of Zimbabwe's elephant population. The Denials should be reconsidered and reversed, as there can be no question this limited use of elephant through sport- hunting is sustainable.

[52] *ZPWMA July 2015 Response*, p. 43-46; ZPWMA, Presentation, *Legal Trade, Conservation, and Rural Livelihoods: A Zimbabwean Perspective* (Dec. 2016), p. 5-6. Licensed, regulated hunting has nominal effect on elephant population, because of the selectivity of the harvest. E.g., *CF June 2014 Comment*, p. 3, 9-10 & related attachments (including R. Martin, *Second Report: Trophy Hunting from Declining Population* (2014), p. 8, 10, 15, 18-20, & R. Martin, *Background Study, Elephants* (2015), p. 34, 56).

[53] *ZPWMA July 2015 Response*, p. 44, 46.

Further, the extensive documentation provided by ZPWMA, Conservation Force, and others demonstrates that other offtakes, including poaching and PAC, are sustainable. Poaching has largely been controlled in the last several years, and PAC is kept in check through the incentives generated by CAMPFIRE (please see the next section).[54]

Poaching levels have declined in Zimbabwe, and across Africa, since the worst of the impact in 2011.[55] As shown in ZPWMA's July 2015 Response, a decline in elephant poaching is evident since the high of 223 in 2011, to 212 in 2012 and 194 in 2014. (Poaching figures in 2013 are skewed by the mass poisoning incident at Hwange National Park that killed 103 elephant, but if that number is "normalized" to 190, it is consistent with the decreasing trend.)[56] Likewise, the Proportion of Illegally Killed Elephants ("PIKE") at the Chewore and Nyami Nyami Monitoring the Illegal Killing of Elephants ("MIKE") sites in Zimbabwe has fallen: to 0.40 in 2013, 0.17 in 2014, and 0.29 in 2015 at Chewore, and from 0.81 in 2011 to 0.27, 0.22, 0.37, and 0.35 in the years 2012 to 2015 at Nyami Nyami. The most recent figures are well below the 0.5% threshold which signifies unsustainable poaching.[57] The decline in poaching undoubtedly stems from ZPWMA's enhanced anti-poaching, as described in the section above.

Recognizing both a mutual interest, and that collaboration will allow for a more efficient use of resources, ZPWMA and the hunting sector collaborate extensively in anti-poaching. Conservation Force submitted numerous specific evidence of this.[58] A few examples from this evidence are below:

- The Dande Anti-Poaching Unit ("DAPU") in the Zambezi Valley has catalyzed a significant decrease in poaching in their areas. In 2010, DAPU reported 40 elephant carcasses. In 2016, they observed seven. DAPU team members have grown so skilled in anti-poaching tactics they work alongside ZPWMA rangers in patrolling Mana Pools National Park. Charlton McCallum Safaris spent $95,006 on DAPU's anti-poaching activities in 2016, including salaries, rations, rewards, equipment, and

[54] PAC offtakes have been between 44-52 elephant from 2013-2015, a negligible amount in a population over 82,000 elephant, and at or below 1.0% when added to poaching and hunting offtakes. ZPWMA issues few PAC permits, and instead relies on the benefits of the CAMPFIRE program and voluntary actions of hunting operators to minimize crop-raiding and losses to elephant, and thus minimize PAC. The CAMPFIRE Workshop demonstrated that this system is working, as PAC figures were typically low across the districts. *CAMPFIRE Workshop Proceedings*, p. 6-21; *see also CF June 2014 Comment*, p. 15-7 & related attachments; *CF Oct. 2014 Comment*, p. 26-33 & related attachments; *CF Dec. 2014 Comment*, p. 3-7 & related attachments; *CF Jan. 2015 Comment* & related attachments.

The uncited "anecdotal evidence" relied upon in the Finding is unreliable, and is another incorrect "fact" on which the negative finding was based that requires reconsideration.

Van Norman forwarding DAPU Reports (June 15, 2015, May 23, 2016, & Jan. 18, 2017).

vehicles. DAPU's expenditures in 2015 topped $80,000 and in 2014, they were over $72,000. This is an expanding program, and has contributed significantly to anti-poaching in the Zambezi Valley, including through the additional support of aerial surveillance. ***Mr. Jines' hunt took place in the Mbire District and with Charlton McCallum Safaris. Mr. Jines' hunting fees, including his trophy fee and voluntary contributions, are directly contributing to DAPU and the operators' extensive community investment***.

- The SOAZ Report identified almost $1 million spent on anti-poaching in 2013 by a small sample of 14 operators. These operators employed a total of 245 scouts on the ground, an average of 17-18 scouts per company.
- Lodzi Hunters collaborates with the Binga district council to restore wildlife in their concession, on which they have a long-term lease. They maintain a 12-member anti-poaching team that patrols the concession and the borders of Hwange National Park. Lodzi Hunters coordinates with ZPWMA to ensure full and efficient coverage. Lodzi Hunters' anti-poaching and incentives programs cost the company over $350,000 per year, in addition to their contractual payments to the CAMPFIRE district and wards. 95% of Lodzi Hunters' income comes from elephant hunting.

In short, the private-sector's contributions against poaching are extensive. They were not duly considered in the Denials, even though they are an essential component of Zimbabwe's elephant management.[59] For this reason, the Denials should be reconsidered, and will need to be reversed based on proper evaluation of the submitted data.

Reason for Reconsideration 6: Revenues Generated from Elephant Hunting in Zimbabwe are Reinvested in Elephant Conservation Efforts by ZPWMA and CAMPFIRE Communities

The information provided to the FWS documents that elephant hunting accounts for the largest percent of revenue generated by hunting across all four land categories (safari areas, communal land, private land, and forestry areas). In 2014, over $6.2 million in trophy fees was generated from elephant hunts, with $5 million of that revenue accruing to ZPWMA to reinvest in wildlife management and enforcement.[60] Over 50% of that revenue comes from U.S. hunters.[61] Put differently, "the African elephant is one of the biggest drawcard species from a hunting perspective and is at the centre of all the major hunts… Generally hunting contributed an average of USD22m to the country's GDP in 2014 and 2015..."[62]

A significant portion of ZPWMA's operating budget relies upon hunting income (although that proportion declined in 2015, as hunting income has decreased, largely due to the FWS' elephant suspension and non-issuance of lion import permits).[63] Most of this is attributable to elephant hunts. In turn, most of ZPWMA's operating funds are directed to ranger salaries, anti-poaching, and law enforcement—over $3.1 million in Safari Areas alone (and staff costs in Safari Areas are covered by hunting revenues). Put simply, most of the revenues coming in from elephant hunting are reinvested in and contribute to the protection and

[59] *Plan*, p. 12 ("The Role of Sport Hunting in Elephant Conservation").

recovery of elephant by being reinvested in law enforcement and anti-poaching.[64] The Denials' failure to consider the July 2015 Response and information about ZPWMA's revenue, budget, and expenditures requires reconsideration and reversal.

In communal areas, elephant hunting is the financial backbone of CAMPFIRE. CAMPFIRE is the mechanism whereby communities benefit from living with wildlife, and largely from living with elephant. The program has built tolerance within communities through creation of incentives, especially due to the funding of infrastructure projects that improve rural livelihoods across communities.[65] The Finding correctly admits that "CAMPFIRE plays a role in elephant management." More precisely, CAMPFIRE plays an ***essential*** role in elephant conservation by reducing conflicts between elephant and the communities who maintain elephant on their lands. Zimbabwe's Parks and Wildlife Act Chapter 20:14 empowered rural people living among wildlife to effectively benefit from it. CAMPFIRE is the mechanism created to facilitate this.

From 1989-2006, CAMPFIRE channeled more than $20 million to rural villages and $17 million to rural district councils.[66] From 2010-2015, hunting fees accounted for over $11 million in revenue, 70% of which came from elephant hunting (until the suspension reduced demand for elephant hunting), and two-thirds of which came from U.S. elephant hunters. Put differently, over $5 million accrued directly to CAMPFIRE communities from U.S. elephant hunters until the suspension reduced that amount, e.g., to 54% of hunts in 2014.[67] (Until then, 70% of CAMPFIRE revenue was generated by elephant hunts and $550,000 in trophy fees alone were generated in communal lands in 2014.[68]) These income receipts are "often understated," as economic multipliers "are not captured as part of CAMPFIRE income," and "[t]he proportion of safari operating expenses paid locally in the form of wages and salaries, and purchase of materials is often not recorded."[69]

According to the most recent audit of participating CAMPFIRE districts, "Data from 9 CAMPFIRE Districts … shows that approximately 60% of the allocated quota is utilized and that the majority of hunters (53%) originate from America. These hunters have contributed US$9 million … during the period 2010-2015 compared to US$8 million by the 40 other nations.... The income generated from trophy fees in the last 6

[65] E.g., *CAMPFIRE Association Report*, p. 1-11; *CAMPFIRE Workshop Proceedings*, p. 6-24; CF Email to T. Van Norman attaching *CAMPFIRE Income Analysis*; CAMPFIRE Association, *The Role of Trophy Hunting of Elephant in Support of the Zimbabwe CAMPFIRE Program* (Dec. 2016), p. 12-16 ("*CAMPFIRE—Role of Hunting Report*"), publicly available at http://campfirezimbabwe.org/index.php/downloads.

[66] *CAMPFIRE Association Report*, p. 8; *CAMPFIRE—Role of Hunting Report*, p. 9-11; ZPWMA, Presentation, *Legal Trade, Conservation, and Rural Livelihoods: A Zimbabwean Perspective* (Dec. 2016), p. 19, (U.S. hunters make up 76% of CAMPFIRE clients).

[67] *CAMPFIRE Association Report*, p. 3-4; *CAMPFIRE Income Analysis*, p. 1, 6 ("it is highly probable that the decline in hunting income for 2014 was largely caused by the suspension of trophy imports by United States of America. The suspension has a lag effect on income, and preliminary calculations of earnings for 2015 indicate a further continuing decline."); *CAMPFIRE—Role of Hunting Report*, p. 9-11.

[68] *ZPWMA July 2015 Response*, p. 48, 50; *see also CAMPFIRE Workshop Proceedings*, p. 6-24.

[69] ZPWMA, Presentation, *Legal Trade, Conservation, and Rural Livelihoods: A Zimbabwean Perspective* (Dec. 2016), p. 17; *see also* p. 11-20.

years (2010 – 2015) is approximately US$11.4 million of which elephant trophy fees contributed 65%."[70] In short, U.S. elephant hunters are the critical source of funds for CAMPFIRE communities.

Hunting funds are invested in projects that benefit the communities overall: building classrooms or clinics; purchasing farm equipment; rehabilitating water supplies; purchasing vehicles used in wildlife monitoring and anti-poaching; installing solar power; and many other infrastructure improvements. CAMPFIRE links these tangible benefits for rural residents to protection of wildlife. Its infrastructure creates conservation officers and monitoring programs, and employs game scouts, which generates significant benefits for the elephant as well. This is vital because otherwise elephant are largely viewed as threats, not assets.[71]

The grant of Appropriate Authority means that ZPWMA foregoes the fees from hunting in CAMPFIRE areas, and the fees and other benefits accrue to the communities. Operators in CAMPFIRE communities contract with the district councils, and are bound to pay trophy, concession, and other fees—or more, depending on their contracts—to the councils (41%) and to the wards directly (55%). Conservation Force submitted documentation evidencing that many operators contribute much more than just fees. For example, in the Mbire District in which Mr. Jines hunted, Charlton McCallum Safaris operates a "genuine joint venture" with the Mbire district council and wards. In 2013-2015, Charlton McCallum Safaris paid over $1.05 million in fees and revenue-sharing, including over $470,000 directly into ward accounts. The district significantly benefits from this partnership, including: constructing a clinic and nurses' houses; constructing a wildlife administration office; constructing storerooms; constructing 14 classroom blocks, seven teachers' houses, and one school office; constructing and equipping of grinding mills; and constructing and equipping two hand-pump boreholes, water pipes, toilets, water storage; constructing one tourist camp; acquiring two tractors.[72] 90% of the district's income comes from hunting and ~35% of that is from elephant hunting. 90% of hunting clients are U.S. citizens. In short, at least $330,750 accrued to the Mbire district and rural communities as a result of U.S. elephant hunters in 2013-2015.[73] This is but one example. Conservation Force has submitted evidence of many more, including contributions of Lodzi Hunters and Martin Pieters Safaris, among others.[74]

The Denials do not consider the best-available information. They rely upon the Finding, which cites to old and limited data on CAMPFIRE. The best-available information demonstrating CAMPFIRE's benefits must be evaluated, and accordingly, the Denials should be reconsidered and reversed.

Yet despite these challenges, communities still retain a high level of tolerance for elephants, but this support is rapidly dissipating as a result of the loss of income from trophy hunting. This places almost two million ha of land at risk, including the risk of increasing retaliatory killing through poisoning and illegal wildlife crime.").

Reason for Reconsideration 7:
Local Conservation Efforts Effectively Share the Responsibilities of Elephant Conservation

The Denials should be reconsidered because Conservation Force, ZPWMA, SOAZ, and others have provided extensive documentation of the benefits to elephant generated by "local conservation efforts." The FWS does not discuss this information specifically, but it should. This information proves that the contributions of safari operators, anti-poaching units, CAMPFIRE communities, private landholders/conservancies, and associated non-profits are integral to the functioning of Zimbabwe's wildlife management system. They are not "limited" efforts. They are extensive, and reduce the burden on ZPWMA's resources.

As Conservation Force and ZPWMA previously explained, conservation work is ***frequently*** carried out by non-governmental entities in Zimbabwe.[75] The Parks and Wildlife Act Chapter 20:14 devolved Appropriate Authority to private and communal landholders. Through this "government mechanism," the "legal right to utilize and manage wildlife on their property" was transferred to the landholders.[76] Due to this transfer, non-governmental entities such as safari operators, CAMPFIRE district councils, and private conservancies have both the authority and the obligation to protect, conserve, monitor, and benefit from wildlife in their areas.[77] As ZPWMA wrote:

> Fundamentally, ZimParks supports local efforts by providing a conducive legislative and policy environment which allows the private and community sectors to thrive. The grant of Appropriate Authority Status to private properties and Rural District councils is a case in point.[78]

ZPWMA supports local conservation efforts through training, support, and more.

The contributions of non-governmental interest to wildlife conservation are not limited or localized. Taken together, they cover the country.[79] A few examples from the information provided to the FWS are below:

- Lodzi Hunters, in the Northwest Matabeleland and Sebungwe ranges, contributed over $680,000 over two years to CAMPFIRE wards, to improve livelihoods, employ scouts, and increase tolerance of elephant and other species. The operator also maintains a twelve-person anti-poaching team.[80] Similarly, Charlton McCallum Safaris in the Zambezi Valley shares revenues with Mbire CAMPFIRE wards and the district council. In two years, the fees shared topped $750,000 (of which $380,000+

[78] *ZPWMA April 2014 Response*, p. 25.

[79] Please see attached map, which shows the breadth of these "local" operations.

[80] *CF Jan. 2015 Comment* & related attachments.

went directly to ward accounts) and anti-poaching expenditures topped $150,000.[81] Each of these operators is lessening the government's burden of community support and anti-poaching patrols by committing their private resources to these purposes.

- A small operator, Pro Safaris in the Zambezi Valley, allocates 6% of its turnover for water pumping, water pan installation, and other conservation activities. Pro Safaris maintains a ten-person anti-poaching team to patrol a 40-km international border,[82] which allows ZPWMA rangers to focus on patrolling the national park instead of the Safari Area.
- The Tashinga Initiative is a non-profit in the Zambezi Valley that obtains anti-poaching equipment, coordinates anti-poaching efforts, and organized the Sebungwe elephant management planning workshop. The Tashinga Initiative is supported by local safari operators (hunting and photo), and international donors like the Houston Safari Club.[83]
- Also in the Zambezi Valley/Sebungwe range, Martin Pieters Safaris maintains three patrol teams, and are helping develop a community-owned conservancy with two additional patrol teams. The company teams have recovered 15,000+ snares since 2007, and their nearly 300 patrols support ZPWMA's monitoring in this area. The community scouts were intensively trained by the operator teams. These scouts cooperate with ZPWMA against poaching in the Omay and Gokwe communal lands.[84]
- Save and Bubye Valley Conservancies in the Southeast Lowveld range each spend over $500,000 annually on anti-poaching and invest another $200,000+ in nearby villages. The conservancies do not draw on ZPWMA resources at all. They are wholly responsible (and largely depend on hunting income) to secure a land area about the size of New Jersey, the world's third-largest black rhino population, and an elephant population that exceeds 2,000.[85]
- CAMPFIRE communities monitor poaching losses and PAC off-take. They collaborate with ZPWMA to detect poaching and have developed a mutual informer network together. They also work with ZPWMA and safari operators to avoid problem animal off-takes and non-destructively deter crop-raiding elephant.[86] Because they have Appropriate Authority, they collaborate with ZPWMA, but do not need to depend on ZPWMA for wildlife management.
- The SOAZ report included data from 14 operators across the entire elephant range. It reported on these operators' monitoring of elephant populations and poaching losses and their anti-

[86] *See generally CAMPFIRE Workshop Proceedings*.

poaching investment of almost $1 million in 2013. The 14 companies together employed 245 anti-poaching personnel, and cooperated closely with ZPWMA.[87]

The Finding highlights the Mana Pools elephant management planning workshop. It should also mention the Sebungwe and South East Lowveld workshops. They exemplify the public-private-communal partnership existing in Zimbabwe because stakeholders have Appropriate Authority. The Finding reveals the FWS' misunderstanding of Zimbabwe's conservation system, which requires reconsideration and reversal of the Denials.[88]

Reason for Reconsideration 8: Enhancement has been Shown

The FWS has defined "enhancement" as benefits to the species, such as protection of habitat, generation of conservation and anti-poaching funding, and reduction of human-wildlife conflicts through generation of conservation incentives. The information submitted to the FWS demonstrates that licensed, regulated hunting of elephant in Zimbabwe satisfies this standard. This information shows how hunting justifies the existence of significant elephant range.[89] It substantiates the anti-poaching partnership among ZPWMA, hunting operators, and communities, and demonstrates the success of their efforts (declining PIKE). It shows that communities are incentivized not to retaliate against elephant (low PAC offtakes). It describes the pre-suspension benefits generated for CAMPFIRE communities. The success of Zimbabwe's elephant management is underscored by the fact there are over 80,000 elephants in the country, and significant anti-poaching gains in the border area of the Zambezi Valley.

The FWS demands "enhancement." It has been shown. Sustainable offtakes have been shown. A stable elephant population has been shown. A well-managed and responsive elephant management system has been proven. The continued suspension obstructs this enhancement from reaching the elephant—and the people—of Zimbabwe. We encourage the FWS to stop moving the target. The FWS cannot continue to rely upon a Finding that ignores the facts.

---

[87] *SOAZ Report*, p. 4.

[88] The Finding's first sentence is almost verbatim to the July finding, and still fails to respond to CF's objections on this point. We objected that we did not "emphasize the economic impact of the suspension to local conservation efforts," though that information was available in our submissions. The Finding's failure to respond to this objection, and its cutting-and-pasting of prior writing, merits reconsideration; it clearly does not consider the best-available and most current information. Note that the attachments in CF's comment also pointed to data showing "whether and to what extent these individuals would reduce their conservation efforts based on the inability of U.S. hunters to import a sport-hunted trophy," e.g., in the submitted Declarations, Charlton McCallum Safaris and DAPU documents, SOAZ Report, CAMPFIRE Reports, R. Martin Fourth Report, and more. E.g., *CF June 2014 Comment* Attachments; *CF Oct. 2014 Comment* Attachments.

[89] It should be noted that there is far more land secured in areas which allow, and largely rely upon, sustainable use. Compare the approximately 27,000 km^2 of habitat in national parks to the approximately 19,000 km^2 in Safari Areas, ~48,000 km^2 in CAMPFIRE areas, and 7,000+ km^2 in conservancies.

Mr. Richard (b) Bonander
(b) (6)
Casper, Wyoming (b) (6)

Dear Mr. Bonander:

This letter responds to your April 6, 2017, letter from your representative, John J. Jackson, III, requesting reconsideration of the February 23, 2017, decision to deny your application for a permit to import a personal sport-hunted African elephant (*Loxodonta africana*) trophy taken on March 21, 2015, in Zimbabwe. After a thorough review of Mr. Jackson's response on your behalf, it is my decision to uphold the original denial of your application.

As you know, the African elephant is listed as threatened with a special rule under Section 4(d) of the U.S. Endangered Species Act (Act)[1]. Under the special rule, issuance of an import permit for a sport-hunted trophy can only occur if the U.S. Fish and Wildlife Service (Service) finds that the killing of the trophy animal would enhance the survival of the species, and the trophy is accompanied by a threatened species permit. To enhance the survival of the species, the importation must be associated with activities that provide a direct or indirect benefit to the species in the wild.

At the time you originally applied for a permit, the Service had reviewed the best available scientific and management data, including information made available to the Service by Zimbabwe Parks & Wildlife Management Authority (ZPWMA), Conservation Force, and Safari Club International, in evaluating the status of Zimbabwe's elephant management program at the time you conducted your hunt. Based on this material, the Division of Management Authority (DMA) made a finding on March 26, 2015, that we were unable to find that the import of an elephant trophy taken during the 2015 hunting season would meet the requirements of the Act and the special rule for African elephant. Mr. Jackson's April 6, 2017, letter asked that the Service reconsider your application, in part, based on his assertion that the enhancement finding failed to consider significant information submitted by Conservation Force, ZPWMA, and others, both before and after the finding was made, that would lead to a reversal of the Service's negative finding.

Regarding Mr. Jackson's assertion that the Service failed to consider significant information submitted by Conservation Force and ZPWMA when making its determination, the Service has taken into consideration all of the information available to the Service regarding elephant hunting

1 The text of this Act can be found by using the search bar at the top of the following web page: http://Go.USA.Gov/xr6dd.

in Zimbabwe at the time your hunt occurred (March 21, 2015). While Mr. Jackson's request for reconsideration included additional information that was not available to the Service at the time the March 26, 2015, finding was made, most of the information documented activities and actions that occurred after the conclusion of your hunt. While this new information may be relevant to hunts that occurred after our March 26, 2015 finding, it does not demonstrate that the situation in Zimbabwe, at the time of your hunt, was different than previously considered by the Service and would result in a revision of the March 2015 finding. Therefore, I am upholding the original denial of your application.

As provided in 50 CFR 13.29(e)[2], you may appeal to the Director of the Fish and Wildlife Service, through this office: Division of Management Authority, Branch of Permits, MS: IA, 5275 Leesburg Pike, Falls Church, Virginia 22041-3803. This appeal must be in writing with the original signature of the person requesting an appeal or of that person's legal representative, should refer to your file number, PRT-04846C, and must be submitted to this office within 45 calendar days of the date of this letter. The appeal must state the reason(s) and issue(s) upon which the appeal is based. Your written appeal must address how the decision to deny the reconsideration of your request was based on a misinterpretation of the information provided in your request for reconsideration, or it must present a clarification of this information. **Should you supply new information that changes the content of your original request for reconsideration, you must submit a new application to this office before such information can be considered.**

If you have any questions, please contact Supervisory Policy Specialist Michael S. Moore of this office: Division of Management Authority, Branch or Permits, MS:IA, 5275 Leesburg Pike, Falls Church, VA 22041-3803 (703-358-2104, ext. 1983).

Sincerely,

Craig Hoover, Chief
Division of Management Authority

Memorandum

To: The File

From: Chief, Branch of Permits

Date: MAR 26 2015

Subject: Enhancement Finding for African Elephants Taken as Sport-hunted Trophies in Zimbabwe On or After January 1, 2015.

The African Elephant (*Loxodonta africana*) is listed as threatened under the U.S. Endangered Species Act (ESA) and is regulated under an ESA section 4(d) special rule [50 CFR 17.40(e)]. The 4(d) special rule gives the requirements for the import of sport-hunted trophies. Under paragraph 17.40(e)(3)(iii)(C), in order for the U.S. Fish and Wildlife Service (Service) to authorize the import of a sport-hunted elephant trophy, the Service must make a finding that the killing of the animal whose trophy is intended for import would enhance the survival of the species in the wild. In evaluating the available data on elephant hunting in Zimbabwe, the Service has determined that it is unable to make a finding that the killing of elephants in Zimbabwe, on or after January 1, 2015, whose trophies are intended for importation into the United States, would enhance the survival of the African elephant in the wild. Therefore, the trophies, part or products, of elephants taken in Zimbabwe during the 2015 hunting season and future hunting seasons, will not be allowed to be imported into the United States. The suspension on importation of trophies taken during calendar year 2015 or future hunting seasons could be lifted if additional information on the status and management of elephants in Zimbabwe becomes available, including utilization of revenue generated through sport-hunting by U.S. hunters, which satisfies the conditions of the 4(d) special rule under the ESA.

General considerations:

As stated in previous findings, in evaluating whether the killing of the animal whose sport-hunted trophy is intended for import into the United States contributes to the enhancement of African elephants within a country, the Service looks at a number of factors. We evaluate whether a country has a valid national or regional management plan and if the country has the resources and political will to enact the plan. If there is a plan, what government entities

implement the plan and how often is it reviewed and updated? Does the plan have clear, achievable objectives? Are the objectives measurable and are they being achieved? Is there an adaptive management approach within the plan so that enacting agencies can quickly respond to changing environmental or social issues?

The Service also evaluates the status of the elephant population within a country and trends over time. Particularly, we are interested in population numbers, sex and age-class distribution, and mortality rates (both natural and human-induced). Are standardized surveys being conducted and, if so, what are the timing, census methodology, and coverage? Since elephant populations can move across international borders, what level of cooperation is there between neighboring countries in management and surveying efforts for shared populations? How is poaching accounted for within survey efforts?

The Service takes into account all forms of offtake when evaluating population viability and sustainability, including human-elephant conflicts, problem animal control, poaching, and sport-hunting. While recognizing that there may be limited resources available for elephant management, the Service considers what national policies are in place to address human-elephant conflicts and problem elephant control. Is there a policy on culling surplus animals and removal of nuisance animals? Does domestic harvesting of elephants occur for local consumption or use? The amount of protected area either set aside for elephants or managed for elephant populations and the level of protection provided are also important in the Service's evaluation of whether imports of trophies could be authorized.

Finally, the Service considers the country's sport-hunting program and whether it contributes to the conservation and management of the species. Is the hunting program scientifically based and has it been incorporated into national/regional management strategies, particularly in light of data on population numbers and trends and levels of utilization (both legal and illegal)? Are the funds generated by hunters going directly to in-situ conservation and management efforts or deposited into a general treasury fund? How are hunting quotas distributed? If there are concession areas, how are they managed and allocated? Do U.S. hunters, through their participation in the hunting program, contribute sufficient funds to address management needs of the species, and are those funds utilized in a meaningful manner?

In short, the Service is looking to determine if a country has sufficient numbers of elephants to support a hunting program, if the country has a management plan and adequate laws and regulations to effectively implement a hunting program, and if the participation of U.S. hunters in the program provides a clear benefit to the species to meet the requirements for the import of sport-hunted trophies under paragraph 17.40(e)(3)(iii)(C).

Basis for Finding for Zimbabwe:

In the April 4, 2014, finding, and the revised finding of April 17, 2014, the Service stated that it was unable to make a positive finding to allow imports, primarily due to the limited information available to the Service at that time. On April 4, 2014, the Fish and Wildlife Service sent a letter

to the Zimbabwe Parks & Wildlife Management Authority (ZPWMA) with a series of questions that would assist the Service in making a final determination on trophy imports. On April 14, 2014, the Director-General of ZPWMA sent a letter to the Service expressing concerns over our decision to establish a temporary suspension. On April 17, 2014, the Director-General sent a response to the Service inquiry. Several weeks later, the Service received a number of documents, including copies of Zimbabwean laws, and other items referenced in the ZPWMA response. In addition, on June 6, 2014, the Service received additional information from Conservation Force, a U.S.-based conservation and hunting non-governmental organization (NGO). In its July 17, 2014 finding, as revised on July 22, 2014, the Service stated that it continued to be unable to make a positive finding to allow imports. Since that time, the Service has received a number of comments from individuals and associations connected to the hunting industry in Zimbabwe or southern Africa. On October 21, 2014, the Service received additional comments from Conservation Force. Further information was provided by Conservation Force on January 19, 2015. After reviewing this information, the Service delivered a second letter, dated October 31, 2014, to ZPWMA while attending the 13th Annual African Wildlife Consultative Forum in Ethiopia. This letter requested clarification of information submitted to the Service, and also requested additional information to address questions that were raised from our review of available information. The Service received a response to this inquiry on December 10, 2014. Safari Club International also provided supplemental information on December 17, 2014, and January 23, 2015. This finding is the result of an analysis of all of this information. Based on the information available to the Service, we are unable to make a finding that the killing of elephants in Zimbabwe, on or after January 1, 2015, whose trophies are intended for importation into the United States, would enhance the survival of the African elephant in the wild. As noted above, the suspension on importation of trophies taken during calendar year 2015 or future hunting seasons could be lifted if additional information on the status and management of elephants in Zimbabwe becomes available which satisfies the conditions of the 4(d) special rule under the ESA.

Management Plans: In its April 4, 2014, letter, the Service asked whether Zimbabwe had a current national management plan for elephants. In the ZPWMA response, Zimbabwe responded that the "management plan" consisted primarily of The Policy and Plan for Elephant Management in Zimbabwe (1997) and Elephant Management in Zimbabwe, third edition (July 1996). In addition, ZPWMA stated that they also implement other plans: "The African Elephant Action Plan" (CoP15 Inf. 68), SADC Protocol on Wildlife, and Elephant and Rhino Security Plan. In the ZPWMA response, ZPWMA stated that all of the protected areas in Zimbabwe have "specific aspects of elephant monitoring programs that are implemented and reviewed on an annual basis". ZPWMA stated that information on the status of the elephant is derived from aerial surveys, water hole counts, walking transects, visitor observation, and ranger-based monitoring. In addition, ZPWMA stated that they are regularly monitoring the status of the elephant population, including poaching, at two sites through the CITES "Monitoring the Illegal Killing of Elephants" (MIKE) program.

According to their initial response, ZPWMA is the sole legal authority, under the terms of the Parks and Wildlife Act, Chapter 20:14, for administering the management plans and overall

management of elephants in Zimbabwe. Through an adaptive management approach, ZPWMA stated that aspects of the elephant management plan are "reviewed through annual stakeholder consultative national workshops" with government, NGO, local community, safari operator, and private sector participation.

Elephant Management in Zimbabwe provides a historical review of elephant status in Zimbabwe prior to 1996. The document also identifies three major management goals for ZPWMA: maintain at least four demographically and genetically viable populations; maintain numbers and densities below levels that will not compromise biodiversity; and maintain or increase elephant range at or above 1996 levels. However, the document primarily focuses on intentional reduction of elephant populations through culling rather than on maintenance or increase of populations under threat. While the Service recognizes the potential role of culling as part of a management program, Elephant Management in Zimbabwe is largely irrelevant since it does not establish specific measurables or management actions that need to be taken. Instead, it largely presents a philosophical discussion of the merits of culling and efforts that must be taken to ensure that culls meet the desired management results. The document did make one relevant statement that when managing elephant males for sport hunting, it is essential to account for all adult males removed from a population, including animals taken through problem animal control and poaching. The document goes on to state that the "sport hunting quota should be reduced, to zero if necessary, if more than 0.75% of the populations [per annum] is being killed in other ways."

The Policy and Plan for Elephant Management in Zimbabwe was the outcome of a "Zimbabwe Elephant Management Framework" workshop held on January 13, 1997, in Harare. The document summarizes the issues that were affecting elephant populations in Zimbabwe at the time, and recommended policy statements on elephant management. While the document states a clear goal and establishes ten objectives with management actions identified, it does not sufficiently expand on any methodology to meet the objectives or complete management actions. Without a plan to take specific actions to meet the objectives, or at least a clear framework on how adaptive management efforts would be monitored to ensure that they are meeting the stated objectives, it is not clear to the Service how this document could serve as a "management plan". Given the general nature of the stated objectives, it could be stated that the objectives and, possibly, the management actions of this 1997 document are still valid, but without specific measurable outcomes identified to implement these goals and actions, the document is insufficient to address the management of elephants. Further, while the material received from Conservation Force and the ZPWMA in response to the Service's April 4, 2014, and October 31, 2014, inquiries provided some information related to the objectives, the Service has not received sufficient information to indicate, since the inception of this document in 1997, which objectives are being met or how they are being met.

Other documents provided by ZPWMA in response to our inquiries, e.g. "The African Elephant Action Plan" (CoP15 Inf. 68), SADC Protocol on Wildlife, and Elephant and Rhino Security Plan also establish broad policy goals and objectives, but provide very little with regard to specific management actions or measurables. At a December 2014, three-day workshop, hosted by ZPWMA, to review Zimbabwe's Elephant Conservation Policy and Management Plan, the participants discussed the SADC Protocol, which went into effect in 2003. According to the

information from this workshop, the participants felt that the protocol was a good framework for Southern African countries to work together on law enforcement and anti-poaching efforts. It is not clear, however, how successful Zimbabwe has been in implementing this protocol (limited information has been provided supporting or refuting Zimbabwe's implementation of the Plan). The Zimbabwe Policy for Wild Life is a general framework, published in November 2000, on how ZPWMA would be managed to ensure that Zimbabwe's wildlife and their habitats are appropriately managed. This document specifically acknowledges that "[I]t is intended that [this] policy will be followed by detailed management plans and enabling legislation for those issues which merit them." It is not clear if detailed management plans for elephants have not been developed because ZPWMA does not believe that elephants merit such plans, or if detailed plans have been developed, but were not provided to the Service.

Finally, the National Environmental Policy and Strategies, published in June 2009, is a general policy framework for all environmental issues in Zimbabwe. The document, while addressing ways to maintain environmental integrity, social issues, economic issues, and environmental management, establishes "guiding principles" and "strategic directions" for addressing biodiversity (Guiding Principle #9 and 10), flora (#11 and 12), fauna (#13), genetic resources (#14), protected areas(#15), natural resource management (#43), and wildlife and fisheries (#45). However, these guiding principles and corresponding strategic directions are only broad guidance and do not identify any specific management activities.

Without a management plan or plans, or other guiding document, with specific, measurable goals and actions, it is very difficult for the Service to determine if ZPWMA is implementing the well-articulated, but general, goals and objectives that appear in Elephant Management in Zimbabwe, The Policy and Plan for Elephant Management in Zimbabwe, and other Zimbabwean policy documents. It should also be noted that both elephant management plans are more than 15 years old.

In several documents available to the Service, ZPWMA stated that they do not have a proscriptive management plan because they utilize an adaptive management approach to elephant conservation and management. However, no information has been provided that indicates how this adaptive management approach is carried out. While the Service acknowledges the value of such an approach generally, a clear framework or guidance would be necessary to ensure consistent implementation on a national basis. Even if the documents mentioned above were the overarching guidance for the country and adaptive management was carried out independently for each of the four subpopulations (North West Matabeleland, Zambezi Valley, Sebungwe, and Gonarezhou (or South-East Lowveld)), it would stand to reason that each subpopulation would need guidance that is more specific. In both of the ZPWMA responses to the Service, they spoke of "devolving wildlife management authority to local branches, private conservancies, and CAMPFIRE's RDC [rural development councils]". The Service does not disagree with a regional or local management approach, however, since the Service has been informed that elephants in Zimbabwe are managed at a national level, there needs to be a national approach and understanding of the basis of this adaptive management and that the country, as a whole, is taking a logical, scientifically based approach to reaching the agreed upon end result.

In December 2014, ZPWMA hosted a three-day workshop at Hwange Safari Lodge in Zimbabwe to review Zimbabwe's Elephant Conservation Policy and Management Plan. The workshop was attended by the ZPWMA Director General, the Permanent Secretary for Environment, Water and Climate, members of the Zimbabwe Parks and Wildlife Board, Executive Directors of Rural District Councils, and various NGOs. Both the Permanent Secretary and the Director General acknowledged at the workshop that the 1997 management plan was outdated and has been overtaken by events at the global, regional, and local level and cannot address current challenges.

The workshop participants agreed on a framework for the upcoming management plan. The proposed revised management plan has the same long-term vision of the 1997 plan and basically the same target goals (i.e., maintain at least 4 demographically and genetically viable populations; maintain or increase elephant range; maintain numbers/densities of elephants at levels that do not adversely impact biodiversity conservation goals while contributing to economically viable and sustainable wildlife-based land uses). The workshop participants identified the beginnings of strategic objectives and outputs, as well as some key activities. The outcome of the workshop appears to be a starting point for reevaluating the current management plan(s). However, according to the Proceedings, there was insufficient time at the workshop to complete the section on means of verifying the key performance indicators. A schedule was agreed upon: by Dec. 15, 2014, ZPWMA would appoint a drafting team to write up the management plan; the 1st draft of the plan would be ready by Jan. 30, 2015; the Elephant Management Plan Coordinating Committee would be convened by ZPWMA by Feb. 28, 2015; Final draft of management plan by April 30, 2015; and Operational annual management plans for 4 sub-regions by May 30, 2015.

Overall, ZPWMA has not provided, and the Service has not otherwise received, any information regarding the 2014 or future hunting seasons that indicates that Zimbabwe is implementing appropriate management of the national elephant population. While the Service does not have adequate information to conclude that the current management regime is sufficient to meet the criteria under 50 CFR 17.40(e)(3)(iii)(C), a revised national plan that includes specific goals and measures with specific actions to be taken is a necessary first step towards a re-evaluation of this finding in the future.

Population Status: To manage any population to ensure an appropriate population level and determine whether sport-hunting is having a positive effect, it is vital to have sufficient data on population numbers and population trends to base management decisions. Elephant Management in Zimbabwe states that sport-hunting quotas should be reduced or eliminated if the overall offtake of male elephants, from all sources, is greater than 0.75% of the total population per annum. Without current population data, it is not clear how one can calculate the number to offtake. Without information on population demography and mortality, it is not possible to determine accurately what impact hunting, in conjunction with other offtakes, including problem animal control and poaching, is having on Zimbabwe's elephant population. However, Rowan Martin, author of this document, stated in comments submitted to the Service that he wished he could "disavow one's own writing". Dr. Martin stated that "It [the document] is correct in saying that close attention should be paid to problem animal control and illegal hunting…[but] my current thinking is that trophy hunting should continue regardless and the management thrust should be on reducing illegal hunting and problem animal control. A well-functioning trophy hunting industry

could be the one factor that reduces number of elephants killed illegally and as problem animals." While the Service agrees that a well-functioning hunting industry can provide financial benefits, we also believe that a clear understanding of all off-take is necessary and hunting should not continue without adequate population data.

At the time the Service made its April and July 2014 findings, we relied heavily on population information in the IUCN SSC African Elephant Database report "2013 Africa". According to this this report, the elephant population in Zimbabwe in 2007 was estimated to be 99,107, of which 85% (84,416) was classified as "definite", although less than 1% of these animals were identified by aerial or direct counts, and only 0.3% (291) was classified as "speculative". While the total population in 2012 was estimated at 100,291, only 47% (47,366) was classified as "definite" and 45% (45,375) was classified as "speculative". Only 304 "definite" animals were counted by aerial or ground counts (less than 1% of the definite animals), while 41,840 of these animals were counted through sample counts or dung counts, a less accurate methodology than properly conducted aerial surveys, and the remaining 5,222 were estimated through "other guesses". According to this report, 23 of 40 population estimates included in 2012 are older than 10 years, undermining the quality of the data. Further, according to the report, only eight of the 40 estimates used in the "2013 Africa" report were the result of repeated surveys. As noted in that report, "this lack of systematic and updated monitoring data is of serious concern for possibly the third largest elephant population in Africa." However, in a November 3, 2014, letter to the Service, the IUCN/SSC African Elephant Special Group stated that data had been inadvertently left out of the 2013 provisional report. Specifically, a 2007 survey of Hwange National Park was left off, although it was recorded under "New Surveys" on their website. The results of this survey would have added an additional 30,000 elephants to the "definite" category (from the "speculative" category), while not changing the overall population estimate. Nonetheless, the majority of surveys that contributed to the overall population estimate of 100,291 were more than 10 years old. Given the current circumstances in Zimbabwe and across the continent (e.g., poaching, habitat loss, human population expansion), this information is outdated and cannot be relied upon to show the current status of elephants.

In 2012-2013, according to information provided by ZPWMA, two surveys were conducted in Save Valley Conservancy and in Gonarezhou National Park (and surrounding areas). In Aerial Survey of the Larger Herbivores, Save Valley Conservancy, Zimbabwe, a report compiled in September 2013 by the Technical Advisory Committee of the Save Valley Conservancy, 1,538 elephants were counted. Based on nine years of aerial surveys (2004-2010 and 2012-2013), not all of which covered all of the Save Valley Conservancy, there does appear to be a short-term increase in elephant population density of 9.5%. However, trend analysis of the last three aerial surveys indicated only a 2.2% population increase in elephants. Further, the 2012-2013 surveys were only partial surveys and conditions were such that some double counting may have occurred.

In October 2013, additional aerial surveys were conducted in Gonarezhou National Park, Malapati Safari Area, and adjacent communal lands. From these surveys, it was estimated that there were 10,151 elephants in the Gonarezhou National Park area, the highest estimate since sample surveys began there in 1975. The estimated total number of elephant carcasses in the entire survey was 513. The "1+2" carcass ratio (fresh carcasses (category 1) and recent carcasses (category 2)),

however, was 0.39% in the entire survey area. The Service recognizes that the apparent elephant population increase in Gonarezhou National Park is excellent news. However, a carcass ratio of less than 4%, which is the expected carcass level due to natural mortality alone, is low. This low number could be an indication that the aerial survey method did not accurately detect all carcasses.

In 2014, the Pan African Aerial Elephant Survey (http://www.greatelephantcensus.com/) was carried out over a significant portion of the elephant's range in Africa. Preliminary results from the Pan African survey report a provisional estimate for elephant abundance in Zimbabwe to be between 82,000 and 83,000 individuals. This represents a 6% decline since 2001 surveys. This decline in elephant abundance is important when compared to 5% increase in elephant abundance per annum during the time period immediately prior to the 2001 survey. This overall downward decline in elephant abundance in Zimbabwe is troubling, as an example if elephant abundance in Zimbabwe was predicted to be 99,107 in 2007 and had a constant growth rate of 5% per annum, the Zimbabwe population would be predicted to exceed 139,454 by 2014.

Figures presented at the 16th Meeting of the Conference of the Parties to the Convention on International Trade in Endangered Species of Wild Fauna and Flora in Bangkok, Thailand, March 3-14, 2013 (CoP16 Doc. 53.1) indicated that, during 2002 – 2010, the percentage of illegally killed elephants (PIKE) in the Chewore area (Mana Pools and Chewore Safari Park) Zimbabwe was circa .24, whereas in 2011 that number jumped to .67. A PIKE level of 0.5 or higher (half or more of all carcasses were the result of illegally killed elephants) means that the elephant population is very likely to be in net decline. At the 65th meeting of the Standing Committee, updated PIKE data were provided for Zimbabwe (SC65 Inf.1). PIKE numbers from the two MIKE sites in Zimbabwe showed an increase in 2012 to 0.79 (out of 43 carcasses found) and 0.27 (out of 52 carcasses found). In 2013, the PIKE rates reported for the same two sites were 0.4 (91 carcasses found) and 0.22 (36 carcasses found). From these data, it appears that there was an increase in elephant poaching in 2012, but the poaching level might have declined in 2013 to below the 2011 level. According to the preliminary results from the Pan African Aerial Survey, carcass counts in Mid Zambezi Valley were estimated at 553 (4.3% of live population); Sebungwe had an estimated 1,424 (28.2%). North West Matabeleland was estimated at 4,087 (7.6%) and Gonarezhou National Park at 523 (4.6%) carcasses. There are no estimates available as to the proportion of these carcasses that were the result of poaching.

Regulations and Enforcement: The regulatory mechanisms for ZPWMA and its programs have been established under the Parks and Wild Life Act. This law includes sections on virtually every aspect of ZPWMA, including requirements for annual financial audits and reporting to the central government. The law also provides for substantial penalties for the unlawful possession of or trading in ivory. The first offense carries a minimum of 5 years and a maximum of 15 years in prison. The second offense carries a minimum prison term of 7 years and a maximum of 15 years. However, according to the response from ZPWMA to our April 4, 2014, inquiry, the General Laws Amendment Act (No. 5) of 2010 provides for a mandatory imprisonment of not less than nine years for poaching. If properly enforced, it appears these penalties would be a sufficient deterrent to poaching. However, we did not receive any information on the number of poaching crimes that are prosecuted nor the average sentence or penalty.

In January 1996, the Government of Zimbabwe approved the establishment of the Parks and Wild Life Conservation Fund, a statutory "Fund" that provides for financing wildlife operations directly from revenues generated through wildlife related activities. However, only revenues generated through sport-hunting conducted on state and private lands are used to finance ZPWMA; to our knowledge, no other government funding is provided, and only limited outside funding from NGOs or other governments appears to be available. The 1997 CITES Panel of Experts raised concerns as to the status of ZPWMA relating to its weak financial base, lack of management skills, inadequate and old equipment, and poor infrastructure. While the concerns raised by the Panel of Experts are dated, no new information was provided by ZPWMA or other sources regarding these concerns in response to the Service's April 4, 2014, inquiry.

Based on their December 10, 2014, letter, ZPWMA has a current operating budget in excess of US$28 million. In 2013, ZPWMA reported having revenues of US$29 million against expenditures of US$26 million. According to the letter, "...except for activities like game water supplies in Hwange NP and aerial surveys, there is no budget specifically to manage elephant because ZimParks takes a holistic approach to conservation of all wildlife resources including elephants." ZPWMA also stated that elephant hunting contributes in excess of US$14 million annually and that approximately 30% of ZPWMA's revenue is from hunting, of which the elephant is the major contributor. Besides these statements, however, we do not have adequate information about how much money is generated by elephant hunting, how these funds are distributed, or how these funds impact the ability of ZPWMA to adequately enforce the Parks and Wild Life Act, day-to-day management, or anti-poaching efforts.

That being stated, the Service received documents written by Rowan B. Martin entitled "Ban on Import of Elephant Trophies into the USA from Tanzania and Zimbabwe: Costs of Protection of Elephant Areas." The undated documents discussed the budget requirements for protecting wildlife areas in Zimbabwe based on calculations developed by Mr. Martin in 1996 and 2004. The documents stated that for Zimbabwe, given the total elephant range within the areas controlled by ZPWMA, the annual budget required to protect the elephant range would be US$21 million. In 2013, ZPWMA requested $28 million from the Treasury, the major part of which was intended for anti-poaching efforts. They were allocated only $1.5 million. According to Martin, this amount, along with the revenue from trophy hunting licenses, is not sufficient to provide the needed level of protection for land under ZPWMA's authority. However, in their December 10, 2014, letter, ZPWMA stated that they did not accept Dr. Martin's evaluation and did not consider it accurate. Dr. Martin also presented at the December workshop on this issue. According to the proceedings from the workshop, Dr. Martin suggested that ZPWMA would need US$5,275,480 to protect the National Parks, US$7,055,268 to protect safari areas, and US$3,891,536 for forest areas annually. In addition, communal lands would need US$6,101,101 and private land $3,826,770. Since we have not received a communication from ZPWMA since their December 10, 2014, letter, it is unclear if they agree or disagree with these numbers.

In evaluating the resources available to ZPWMA and their ability to implement regulations and enforcement, we also considered documents from recent Meetings of the Conference of the Parties to CITES. At the 15th Meeting of the Conference of the Parties to CITES, a report on the Elephant Trade Information System (ETIS) was presented (CoP15 Doc. 44.1 Annex). In the report,

Zimbabwe was specifically identified with regard to illicit ivory trade. The report noted the existence of organized criminal activities within Zimbabwe, including reports of the involvement of politicians, military personnel, and Chinese nationals in illicit wildlife trade. The report goes on to state that the law enforcement effort ratio within the countries grouped for the analysis had dropped to 40%, a decline of 4% from the CoP14 analysis. This decline indicates a less than average performance and was attributed to the situation in Zimbabwe.

At the 16th Meeting of the Conference of the Parties to CITES, the report on ETIS (CoP16 Doc. 53.2.2) expressed concerns about Zimbabwe with regard to illegal trade in ivory. The report stated that, as a group, Zimbabwe, Botswana, and Namibia were in the middle range, when compared to 64 other consumer or producer countries of elephant ivory, in terms of the mean number of seizures identified, but ranked fifth in the measure of scale, indicating that most of the seizures were in the 10-100 kg class (i.e., an average number of seizures that were predominately smaller in size). The report noted that 65% of the ivory trade between 2006 and 2011 had occurred since 2009, indicating that illegal ivory trade is increasing. Governance indicators were mixed, with a much lower than average World Bank "rule of law" score, but the second highest law enforcement ratio of any group of countries evaluated. The report, however, supports the Service's governance concerns by specifically identifying Zimbabwe as pulling these scores down in both cases, "especially in the 'rule of law' score, indicating that far greater challenges exist in that country." The report also noted that Zimbabwe was the source of nearly two tons of worked ivory seized in Cape Town, South Africa, in 2009.

In several letters sent to the Service by Zimbabwean safari outfitters and hunting guide organizations, it was stated many times that the presence of hunters, specifically U.S. hunters since they appear to make up the vast majority of sport-hunters in Zimbabwe, and subsequently the professional hunters and safari outfitters guiding the hunters, are the major deterrent to poaching in Zimbabwe. Several specific incidents were reported where safari outfitters and hunters, and not the ZPWMA rangers, thwarted poachers. In at least one incident, the 2013 Hwange National Park poisoning, it was reported that the safari outfitter paid for all of the anti-poaching efforts, including paying for all transportation for the ZPWMA rangers and feeding them. We would expect that the presence of anyone in the field, particularly armed hunters, could deter poachers from carrying out illegal activities where the likelihood of being captured is heightened. However, no evidence was presented to the Service that supports the belief that, without hunters, specifically U.S. elephant hunters, poaching in Zimbabwe would significantly increase. Based on the information provided, we believe that it is not likely that legal hunting for elephants or other wildlife is widespread enough or at a high enough density level to reduce significantly poaching levels in and of itself. This is particularly true for national parks, where hunting is not allowed.

Various statements about trophy hunters and outfitters being a major deterrent to poaching raise concern about existing ZPWMA funding levels and funding utilization. First, concerns center on the ability of ZPWMA to generate sufficient funds to support adequately their stated mission. Secondly, there is concern about ZPWMA's ability to utilize existing funding to support on-going activities. Without additional information on ZPWMA's funding sources (or income) and operating expenses, the Service is unable to determine if Zimbabwe has adequate resources to

enforce existing laws and regulations.

Even with the revised December 10, 2014, information regarding the current ZPWMA budget, we continue to lack sufficient information regarding funding levels or any indication that the financial base, management skills, equipment, or infrastructure have improved. It is possible, of course, that recent and upcoming events, such as the Hwange meeting in December 2014 and other meetings scheduled for early 2015, may lead to a clearer understanding of funding levels and the utilization of ZPWMA revenue. As noted previously, the Service can re-evaluate this finding, and the suspension on importation of trophies taken during calendar year 2015 or future hunting seasons could be lifted, if additional information on the status and management of elephants in Zimbabwe becomes available which satisfies the conditions of the 4(d) special rule under the ESA.

Sustainable Use: We have not been provided with adequate information regarding offtake in Zimbabwe, including basic fundamental information like the number of elephants that have been sport-hunted annually and the number of elephants that have been legally killed for the hide trade. For both the 2014 and 2015 hunting seasons (January – December), Zimbabwe has established an annual export quota of 500 elephants (1000 tusks). This is the same quota that Zimbabwe has reported to the CITES Secretariat since 2004. According to available information, it does not appear that Zimbabwe actually fills this quota each year, but due to variation in how trophies are categorized in CITES trade data, it is difficult to categorically identify the actual numbers of hunted elephants that are exported each year. Information provided by ZPWMA in response to our April 4, 2014, inquiry did not identify the number of trophies exported annually. Several statements from safari outfitters indicated that approximately 160 elephants are taken annually, but this number is not supported by any documentation.

ZPWMA categorizes offtake into six categories: Cropping (hunting and population control, which may include meat supply to rural communities and live animals to breeders), Natural Mortality (found dead of natural causes), Accidents (killed by trains, landmines, or vehicles), Poaching (illegal take), Problem Animals (elephants killed to protect human life and property), and Management Offtake (offtake due to other management decisions). No information was given on the number of elephants that are taken in each of these categories. It does not appear that Zimbabwe is currently conducting any culling operations, besides trophy hunting if considered a "cull".

According to information from ZPWMA, 293 elephants were poached in 2013, including the 105 elephants poisoned in Hwange National Park.[1] Of the five years of data ZPWMA provided in their April 17, 2014, response, an average of 190 elephants were identified as being poached annually. In 2009 and 2010, there was an average of 111 elephants poached; however, between 2011 and 2013, the average more than doubled to 243 elephants. It is not clear what stimulated this significant increase. Many countries have experienced a marked increase in poaching, due to the increase in demand for ivory. It is also possible that shifts in land tenure, governance,

[1] In our April 4, 2014, finding, we incorrectly stated that over 300 elephants had been poisoned.

ZPWMA's limited financial resources, or economic factors contributed to the increase. Further, while the number of animals poached in Zimbabwe does not appear to be as high as in other countries, information that was presented at CoP16 (CoP16 Doc. 53.1) indicates that there has been a steep rise in poaching incidents. Without more definitive population data, like what should come from the Pan African Aerial Elephant Survey when all of the data are released, there is no way to determine whether these numbers, combined with other offtake, are sustainable.

While the number of elephants taken as problem animals was not elucidated in material provided by ZPWMA in April 2014, it appears, based on their response and documentation provided by Conservation Force, that a large number of elephants are taken each year. ZPWMA reported that in a 3-year period (2009-2011), there were 372 human-elephant conflict cases for four "hot spot" districts. It is not clear if elephants were removed in each of these cases. However, the Service has anecdotal evidence suggesting that the number of problem animals may equal or exceed the number of elephants taken through sport-hunting.

The December 10, 2014, letter from ZPWMA, however, included some further information on off-takes. According to this letter, the percentage breakdown of all off-takes was as follows: 5% from problem animal control, 55-60% from hunting, and 35% from poaching and natural mortality. While specific numbers were not provided, the letter also stated that an average of 40 elephants was taken annually as problem animals. Therefore, if these percentages are correct, hunting off-take would be 440-480 animals, and poaching/natural mortality would be approximately 280 animals. However, the December letter also stated that management offtake (culling, training exercise, and meat production for park staff) was approximately 95 elephants annually. Based on these numbers and with a reported 3-year average of 180 elephants taken annually due to poaching (the 2013 Hwange incident of 105 elephants being poisoned was not included in this average), the natural mortality of elephants in Zimbabwe is approximately 100 animals/year or 0.12% annually. Since this is far below the likely natural mortality rate of healthy elephant populations, we question the accuracy of the percentage breakdown provided by ZPWMA in their letter.

African elephants in Zimbabwe are listed in CITES Appendix II, with an annotation that allows trade in hides. According to CITES trade data, at least 2,373 hides were exported in 2010, 3,204 in 2011, and 4,675 in 2012. It should be noted that these numbers probably do not equate to whole animals, but include whole hides and parts of hides. Some of these hides may have been obtained from sport-hunted trophies, problem animal control, or culling operations. Based on these reported numbers, it is not possible to determine the elephants taken specifically for the hide trade, however. While the Service asked about the export of hides in its October 31 letter, ZPWMA did not directly address the issue in its response letter. They did state that the export of hides was authorized under the annotation for African elephants and that all hides that are exported are legally obtained.

We continue to have fundamental questions regarding how the number of elephants to be hunted in an area is decided. In addition to questions about how the overall offtake is determined, we also have not received an adequate explanation on how the quota is allocated spatially. According to information from ZPWMA, and from safari outfitters and professional hunters associations, the principle form of utilization of the elephant in Zimbabwe is sport-hunting.

Quotas are apparently set to maximize the sustainable production of high-quality trophies without detriment to the population. However, it appears that the national export quota of 500 elephants may be the primary driver when establishing individual quotas for each hunting area, as opposed to determining the best quota to facilitate management goals for those areas. According to the material provided to the Service, it appears that the annual national quota of 500 elephants is divided up and allocated to each area based on recommendations from ZPWMA ecologists, field staff, safari operators, other stakeholders, and technical specialists through "multiple stakeholder participatory quota setting". According to information provided by ZPWMA, on an annual basis, stakeholders use available population data to propose a particular quota for an area to a Quota Setting Workshop. At this workshop, it is determined if the proposed quota should be adopted or modified in relation to other proposed quotas. Factors that are considered each year include population estimates, growth rates of populations, size of hunting areas, status of habitat, and target elephant population size.

While the material provided to the Service lays out the general process, the Service did not receive any specific information on how quotas are established in practice. ZPWMA provided the District Quota Setting Toolbox and the Quota Setting Manual, published in 2000 and 1997, respectively. While these documents are useful training material, they only provide a general overview of quota setting for all species in Zimbabwe. In establishing a quota, one must take into consideration not only the habitat, population size, and size of the hunting area, but other offtakes and environmental impacts that may be affecting the species. Nothing that ZPWMA provided addresses these elements specifically. Further, if ZPWMA starts with the premise that the sum of all established quotas must equal the national export quota, it is not clear if the science is driving the quota-setting process or if the social/economic benefits derived from hunting is the driving force. Finally, without current population data and information on the distribution of elephants across the country, both of which would come from scientifically based population surveys, it would appear that establishing a scientifically viable quota, either higher or lower than previous years, would be impossible. The current quota-setting process utilized by ZPWMA may take into consideration issues raised in this document, but without providing an explanation of the system used and describing the calculations, the Service cannot determine if sport-hunting quotas are reasonable or beneficial to elephant populations, and therefore whether sport-hunting is enhancing the survival of the species.

One of the aspects of whether current elephant management facilitates long-term sustainability of hunting programs is the length of hunting leases. There is a general consensus, supported by antidotal evidence, that shorter leases do not give safari operators an incentive for long-term planning. A representative of the Safari Operators Association of Zimbabwe (SOAZ) and the Zimbabwe Professional Hunters and Guides Association (ZPHGA) at the 2014 workshop, stated that the "present 5-year leases are not working as areas are being abused at the expense of wildlife" and that "[l]onger leases will provide better protection and investment in such areas. All leases must be open and transparent." In addition, he expressed that "[a]t present, large fixed quotas are forcing concession holders to take young animals that should not be shot, to recoup moneys paid for leases and trophy fees. Authorities need to stop transfers of quotas from one area to another for elephant and for all trophy species." He spoke of the need for taking smaller,

non-trophy bulls that are conducting crop raids to compensate local communities. He also spoke of stopping commercial hunts in the national parks and "most of all, keep the South Africans out – they are abusing our wildlife". He recommended that ZPWMA allocate all quotas by December 1 each year so that operators can market their hunts effectively. He also called for greater communication between ZPWMA and SOAZ and ZPHGA.

A second presenter at the workshop representing the Zambezi Society, stated in the working session on Coordination, Monitoring, Reporting, and Annual Adaptive Management that "we are looking at managing a multi-million dollar resource and what is a major project but appointing a part-time coordinator to attempt to pull together a multitude of stakeholders with a result that will fail". The speaker further stated, "[t]he way elephant conservation has been managed over the last several years in the face of an escalating poaching threat has clearly failed. ...The four sub-regions have differing characteristics and problems and separate plans are required for each sub-region" and called for a professional project manager to head the elephant conservation and management program in Zimbabwe, "otherwise it will not succeed."

While the above comments were made by two individuals at the workshop, since both individuals represented National organizations, their statements could be taken as an indication that additional work is needed to better coordinate professional hunters, safari outfitters, and NGOs with ZPWMA and communities. Without this "partnership" long-term sustainability of the hunting program could be affected and the role that U.S. hunters play could be questioned.

Revenue Utilization: On communal lands in Zimbabwe, the protection of elephants falls primarily under the Communal Areas Management Programme for Indigenous Resources (CAMPFIRE), which encourages reductions in human-elephant conflicts through conservation-based community development. The program was established in 1989 as a means of providing an economic incentive and return to rural communities while encouraging tolerance for the elephant and sustainable use of natural resources. This program has been the model for community-based conservation efforts in several other African countries and identified as an innovative program in the past. Under this program, there are currently 29 Rural District Councils (RDCs) that have been granted Appropriate Authority status under the Parks and Wild Life Act. Based on several CAMPFIRE documents presented to the Service, between 12 and 16 RDCs with exploitable wildlife resources make up the core of the CAMPFIRE program. While the Service recognizes that CAMPFIRE plays a role in elephant management, we did not receive clear information on the significance they play in elephant conservation (e.g., amount of elephant habitat occurring on RDC land or the percentage of elephant trophies taken on RDC lands).

According to the Revised CAMPFIRE Revenue Sharing Guidelines, which were incorporated into the Constitution of the CAMPFIRE Association in 2007, at least 55% of generated revenue from hunting should be devolved to producer communities, no more than 26% and 15% for management and overhead at RDC level, respectively, and 4% as a levy to the CAMPFIRE Association. According to an undated document (but presumably produced in late 2014) produced by CAMPFIRE (CAMPFIRE report undated) at least 10 RDCs comply with the Revenue Guidelines. As reported in this document, data were presented in an October 2013

report stating an estimated US$2,496,349 was generated by 15 RDCs in 2012 from hunting revenue. While this report states that 5 out of 13 RDCs contributed 84% of the hunting revenue, the supporting table to this statement does not reflect this number. Further, the report states that an assessment of 18 main CAMPFIRE districts allocated hunting quotas for 2014 shows that 106 out of 167 bull elephant hunts were booked by U.S. hunters and that elephant hunting contributes more than 70% of the income to the CAMPFIRE program, and that 90% of all CAMPFIRE revenue comes from all hunting.

The CAMPFIRE report (undated) reported that in the Community Based Natural Resources Management Stocktaking Assessment Report by Mazambani and Dembetembe (2010) [Service does not have a copy of this report], between 1989 and 2006, US$88.9 million in gross revenue was realized by key stakeholders in the CAMPFIRE program. Of this revenue, 55% went to safari outfitters, 23.4% to producer communities, 19.8% to RDCs, and 1.8% to CAMPFIRE Association. (The Service has no additional documentation or information to validate these figures.)

CAMPFIRE may well provide a "multiplier effect" concerning ecosystems goods and services. According to information received by the Service, in 2007, an estimated 777,000 households from 37 RDCs benefited directly or indirectly from CAMPFIRE. According to an estimate by CAMPFIRE officials (CAMPFIRE report undated), given that 58 RDCs now participate in CAMPFIRE (other sources state that there are 60 RDCs in CAMPFIRE), it has been extrapolated that over 1 million households now benefit from CAMPFIRE.

Several reports provided to the Service identify a large number of community projects funded by CAMPFIRE. These reports indicate CAMPFIRE programs contribute to employment at a local level – CAMPFIRE managers and officers, timber measurers, office clerks, game scouts; community projects employ resource monitors, tour guides, preschool teachers, grain millers, bookkeepers; and safari operators employ managers, scouts, trackers, drivers, cooks, camp minders, and professional staff such as bookkeepers and professional hunters.

On 17-18 November 2014, a workshop titled "CAMPFIRE Stakeholder's workshop: Towards the Development of a New Elephant Management Plan and Policy" was held in Zimbabwe. The discussions and recommendations touched on the effectiveness of the CAMPFIRE concept and its relationship to tourist hunting. At the workshop, Charles McCallum Safari reported that they had contributed over $349,000 to CAMPFIRE wards and the RDC in 2013 – U.S. elephant hunters contributed 40% of this total ($132,870). In 2014, the total was up to $400,995 but contributions due to U.S. hunters dropped to 27% ($100,800) – all elephant hunting was only 32% of the total ($118,425). It appears that the workshop may have been a good starting point to address issues faced by RDCs and to improve the effectiveness of CAMPFIRE. However, according to Conservation Force, represented at the workshop, CAMPFIRE needs to find a balance between a large elephant population and human population pressures, as well as ensure that revenue from tourist hunting and other resource uses continue to flow to local communities. The 2014 Pan African survey preliminary results appear to confirm that elephant populations in the Zambezi Valley and in Sebungwe have decreased significantly. These areas include

communal land. The declines indicate that the persistence of elephants in these areas may be in question in future years if the trend is not halted or reversed.

Dr. Martin states in his "Third Report: Potential Financial Returns from Trophy Hunting" (pg. 19, 21) that "when the results from all the available hunting areas in Zimbabwe are added up, there is sufficient income from trophy hunting to meet the conservation budgets for all the areas [of the elephant range]..." This may very well be true, but no such data was provided to the Service. We received reports from some private areas, conservancies, and RDCs, but even in these cases, insufficient information was provided. We received generalized reporting of hunting as a whole, without a breakdown of elephant vs. other species, or U.S. hunter vs. all hunters. Although there is some indication that some benefits are occurring, insufficient information has been provided to show that revenues generated by U.S. elephant hunters satisfy the conditions of enhancement under the ESA.

FWS does not disagree that local communities can benefit from well-managed resource management programs, but we are unable to determine how much revenue is generated by elephant hunting, how those funds are distributed within Zimbabwe, and what portion of that budget is accounted for by US hunters? SCI indicates, in their January 23, 2015 letter, that the inability to import trophies in 2014 resulted in an increase in human-elephant conflicts in CAMPFIRE RDCs from 412 incidents in 2013 to 597 in 2014. No data was provided to document a link between the increase in human-elephant conflicts indicated by SCI and the suspension of imports in 2014.

Local conservation efforts: Conservation Force and other commenters emphasized the economic impact of the suspension to local conservation efforts being carried out by individual landowners and leaseholders, safari outfitters, and conservancies. Effective conservation work is being carried out in some independently managed areas. Individuals may be impacted by a suspension of elephant trophy imports, however, it is unknown whether and to what extent these individuals would reduce their conservation efforts based on the inability of U.S. hunters to import a sport-hunted trophy. In addition, the information available to the Service on the conservation work being carried out by non-governmental entities, at this time, is limited, and is not the norm for Zimbabwe as a whole. While these pockets of conservation are greatly needed, there does not appear to be a mechanism in place, such as government support, tax incentives, or land tenure security, to promote or sustain these efforts across Zimbabwe's elephant range. The Service was made aware of several workshops that will be held or were held in the beginning of 2015. According to Conservation Force, a workshop on anti-poaching strategies for Mana Pools National Park was held on 26-29 January 2015. The workshop appears to have been sponsored by ZPWMA with NGO, safari operators, and some RDC representation; however, we have not received any information on the purpose of the workshop or any results. In addition, a workshop in Sebungwe was held sometime in January or February 2015. Again, we are not clear on the purpose of the workshop or any results. However, if these and other workshops were held that bring ZPWMA, RDCs, and safari operators together to discuss elephant conservation and management, it would appear that steps are being made to move forward in increasing communication and addressing issues.

Therefore, with the information made available to us, the Service cannot at this time determine that these limited activities would provide the enhancement required under the ESA to allow imports of trophies taken throughout Zimbabwe.

Summary: The issue before us is whether the killing of an elephant in Zimbabwe whose trophy is intended for import into the United States would enhance the survival of the species in the wild. When the Service announced the interim suspension on the import of elephant trophies from Zimbabwe on April 4, 2014, we based the decision on the lack of information available to the Service at that time that would enable us to make a positive finding. In response to our April 4, 2014, announcement and letters sent to the Government of Zimbabwe on April 4 and October 31, 2014, we received a large volume of information directly from ZPWMA, Conservation Force, Safari Club International, and a number of safari outfitters and professional hunter associations. Some information indicated that hunting in Zimbabwe was providing a benefit to elephants, while other information raised questions that were not answered. Many of our specific questions were not answered with the information provided. Based on our review of all of this information, we are unable to find that the killing of an elephant whose trophy is intended for import would enhance the survival of the species in the wild due to the following factors:

- Zimbabwe's current elephant management plan consists of two primary documents drafted in 1996 and 1997. Although the documents provide a well-developed list of goals and objectives, there is no information on whether these goals and objectives have been met or could be met. This is supported by statements from ZPWMA that the plans are outdated and need to be revised.

- Now that the Pan African Elephant Aerial Survey has been conducted in Zimbabwe and preliminary findings have been announced, ZPWMA and RDCs have a better elephant baseline population abundance estimate to assess future off-take quotas, management efforts, and anti-poaching activities. This is a significant, positive, step forward in Zimbabwe having adequate information to establish scientifically defensible hunting quotas, particularly in light of the limited information on other means of off-take, such as poaching and problem animal control. If this information is incorporated into ZPMWA management activities in a scientifically sound manner, the Service may have a better basis to re-evaluate our finding with regard to importation of elephants taken in the future.

- There appear to be adequate laws and regulations in place to address elephant management, but it is not clear if or to what extent ZPWMA is able to successfully implement them. Since the central Zimbabwean Government is not allocating funding to ZPWMA and the vast majority of funding must come from hunting revenues, ZPWMA, and CAMPFIRE need to document more fully the amount of revenue generated and how it is utilized. For the 2014 hunting season, the Service received limited evidence to support a positive enhancement finding. If accounting mechanisms are in place or are put in place that document hunting revenue and details are provided on how those funds are used for resource protection such that the Service would be able to find that hunting revenues generated

through sport-hunting of elephants in Zimbabwe whose trophies are intended for import into the United States would enhance the survival of the species in the wild, the Service could re-evaluate our finding with regard to importation of elephants taken during the 2015 hunting season or future hunting seasons.

- According to the information provided, Zimbabwe has established hunting quotas for all areas of the country. However, the Service did not receive specific information on how these quotas are established, whether other forms of offtake, such as poaching and problem animal control, were taken into account, or to what extent biological factors are taken into consideration (as opposed to economic and societal considerations).

- While CAMPFIRE has provided conservation benefits in the past and improved tolerance of wildlife in rural communities, the program has more recently come under criticism relating to excessive retention of generated funds by district councils, resulting in diminished benefits to communities. Sport-hunting may be an important tool that gives these communities a stake in sustainable management of the elephant as a natural and economic resource and offsets the costs of conflict with wildlife. However, without current information on how funds are utilized and the basis for hunting off-takes, the Service is unable to confirm whether revenue generated through sport-hunting actually provides an incentive to local communities to conserve elephants. The Service was pleased to hear about the November workshop and acknowledges that additional work is needed by CAMPFIRE to address current management concerns. Again, if additional information is forthcoming regarding activities in 2015, the Service may be able to revisit this finding.

- As stated in the previous finding, there are "bright spots" regarding elephant conservation efforts, particularly those carried out by non-governmental entities that are providing a benefit to elephants in some areas. However, there are not enough of these "bright spots" to overcome the problems currently facing Zimbabwe elephant populations and to support a finding that sport-hunting is enhancing the survival of the species. Without more support from the Central Government and Rural District Councils, these efforts are not likely to be fully successful or to compensate for the management deficiencies described above.

Therefore, based on this finding, no elephants harvested in Zimbabwe on or after January 1, 2015 may be imported into the United States.

ATTACHMENT

Chart of Key Documents and Supporting Evidence

EXCERPTS FROM KEY DOCUMENTS IN SUPPORT OF THIS APPEAL

The charts below contain key quotations from some of the key documents submitted during the thirty-eight months of the suspension. These documents include ZPWMA responses to FWS information requests, reports from the CAMPFIRE Association, reports from safari hunting operators, and the letter from the AfESG, among others. The following charts are broken down by the sub-topics of the March 26, 2015 Finding. Issue-by-issue, the documents refute the alleged lack of data, reliance on "anecdotal" or "antidotal" information, and mistakes in the Finding and provide extensive documentation of enhancement.

All documents have previously been produced to the FWS including, most recently, in support of the applicants' request for reconsideration.

Management Plans

DOCUMENT NAME	SAMPLE OF KEY QUOTATIONS
ZPWMA Apr. 2014 Response	- The Authority supervises the implementation of the plan outside protected areas including communal areas, Conservancies, Forestry Commission area and private land. (p. 2)
ZPWMA Dec. 2014 Response	- 1.4 Has ZimParks established specific measurables of management actions for the goals identified in the management plan documents that will/are being taken? … Yes we have specific measurables of management actions for example: - i) Population parameters: numbers, Eg Aerial survey results, age, sex, distribution movement patterns through satellite tracking and collaring (through monitoring and surveys), trophy quality - ii) Law enforcement effort: Number of patrols, patrol nights, number of convictions, number of elephants poached, number of new Statutory Instruments approved - iii) Game water supple: number of boreholes working, number of elephant mortalities - iv) Fire management: Annual fire management plans developed and implemented, area burnt by unplanned fires, length of fireguards - v) Awareness programs: No. of awareness campaigns held, no. of people reached (p. 11-14)
ZPWMA July 2015 Response	- The population estimate from the 2014 aerial survey stands at 82,092 elephants. In the early 1900s the elephant population in Zimbabwe was estimated to be about 4,000. By 1980 the population had increased to an estimate of 46 426 elephants. The population continued to increase … twenty-fold … despite attempts to limit elephant population growth between 1960 and 1989 … The human population has also increased twenty-fold between 1900 and 2000, resulting in increased demand for land for

	agriculture and other forms of land-use outside protected areas thereby limiting the area available for elephants with a resultant increase in human elephant conflict … The high economic value conferred to the elephant through consumptive utilization has also resulted in increased tolerance by local communities. (p. 1) - Explanation of specifics of Elephant Management Plan (p. 9-19) - Zimbabwe has developed a number of national policies, as well as adopting regional and international protocols to address poaching. As explained the 17 April 2014 response to the USFWS poaching incidents are handled though a coordinated public-private response, including heightened law enforcement, severe deterrent sentencing, awareness campaigns, and substantial donations from the private sector to boost ranger and equipment capacity. Steps were also taken after the Hwange poisoning incidents to improve radio communications in that area, as well as establishing a new station with 15 rangers, to increase law enforcement coverage. Aerial surveillance in Hwange and other areas has been intensified. (p. 27) - It is one of the ZPWMA's policies to cooperate with safari operators, who provide significant assistance by alerting ZPWMA rangers to poaching threats; providing equipment, training and transport; and conducting their own anti-poaching patrols among other things. (p. 27)
ZPWMA, Elephant Management Plan 2015-2020	- The Role of Sport Hunting in Elephant Conservation: Elephants are a charismatic species but can also be destructive when they destroy crops, threaten livestock and even human lives. To have a future, elephants must have value. Value to the governing authorities and to the local people. The greater the value, the greater the tolerance of them is likely to be. The local people who live closest to them will determine the long-term survival of species like elephant. Regulated sport hunting converts wildlife into assets for the benefit of local people and the country as a whole. Wildlife can be a most valuable asset and in turn empower local communities and provide basic necessities. When it is viewed as a valuable asset, wildlife becomes an economically competitive land use in Zimbabwe, which leads to habitat preservation instead of habitat destruction and conversion to agriculture or livestock production. Game animals have a survival advantage because of user-pay stewardship systems where use revenue generated from tourist hunters is paid through to wildlife authorities and local communities. The presence of regulated hunting can also reduce illegal activities. Many hunting operators in Zimbabwe have specialised anti-poaching units. Private operators' lease agreements are being reviewed to include anti-poaching as an obligation of the concessionaire. Regulated hunting is the opposite of poaching. One is a lawful activity designed by government wildlife authorities and experts to perpetuate resources and the other is prohibited thievery outside of and away from the system. The first is like making a bank

	deposit and the second is like a bank robbery, without sustainable limits. Trophy hunting revenues are vital because there are not enough tourists to otherwise generate income to support all protected areas. Eco-tourism revenues are typically sufficient to cover the costs of only some of the parks and certainly not to justify wildlife as a land use outside of protected areas. Hunting is able to generate revenues under a wider range of scenarios than eco-tourism, including in remote areas lacking infra-structure, attractive scenery, or high densities of viewable wildlife. Consequently, elephant and other wildlife populations will be negatively affected through reduced conservation efforts arising from low funding and reduced goodwill from the communities, when in reality the elephant has the economic potential to raise adequate funds to support itself and other species. For these reasons, Zimbabwe confirms its commitment to the sustainable use of elephant and other wildlife in this Action Plan. (p. 12, Box 1) - v) Private sector: The corporate community participates in elephant management mainly through resource mobilization. Safari operators report poaching and assist in anti-poaching patrols. Through lease and trophy fees they provide revenue to ZPWMA. They help develop infrastructure, provide funds to communities and supplement diets with meat from trophy animals. Zimbabwe subscribes to the principle of sustainable utilisation of wildlife resources including elephants. Sport hunting is the principal form of wildlife utilisation whereby offtakes are adaptively managed and monitored through a participatory and science based process. This process allows for sustainable offtakes, and rigorous resource monitoring programmes that allow recruitment within a population to ensure the continued survival of the population in the wild. The high economic value conferred to the elephant through consumptive utilisation has also resulted in increased tolerance by local communities. (p. 12) - vi) Local communities: Local communities are involved in elephant management in CAMPFIRE areas, through sharing of information, advocacy and wildlife protection. They report human-elephant conflicts and carryout some of the conflict management activities. (p. 12-13) - The Importance of Community Based Conservation to the Future of Elephant Management in Zimbabwe: The Community Areas Management Programme for Indigenous Resources (CAMPFIRE) of Zimbabwe has been widely regarded as one of Africa's most successful contemporary conservation initiatives. It permits the residents of communal lands – basically the poor rural communities – to share in the benefits generated by wildlife utilization on those lands by granting Appropriate Authority to Rural District Councils (RDCs) to manage wildlife on communal lands and requiring a certain percentage of revenue to be paid to the wards and councils. CAMPFIRE operates in about 50,000 km2 (12.7%) of land in Zimbabwe. This is roughly equivalent landmass to the Parks and Wildlife Estate. CAMPFIRE encompasses about 777,000 households with an average family size of five, who face food insecurity and deep poverty (average income $1 a day). Between 1994 and 2012, CAMPFIRE generated $39 million of which $21.5 million was allocated to communities and used for resource management (22%), household benefits

	(26%), and community projects (52%). About 90% of CAMPFIRE's revenue comes from hunting, with elephant hunting contributing more than 70% of annual revenue. Based on the Constitution of the CAMPFIRE Association as amended in 2007, all major hunting RDCs use CAMPFIRE revenue-sharing guidelines. In these districts safari operators pay revenue directly into community-controlled bank accounts using the following breakdown: CAMPFIRE community share (55%), RDC fees (41%), CAMPFIRE Association levy (4%). Despite its achievements CAMPFIRE still faces fundamental challenges. In particular, the development strategies of households in CAMPFIRE areas focus on land uses that are incompatible with wildlife such as human immigration to rural areas, the extension of basic agricultural schemes and increased livestock numbers. Other CAMPFIRE challenges include: (i) the downturn in Zimbabwe's economy and tourism sector post-2000, (ii) great reliance on consumptive trophy hunting and less focus on other uses and non-consumptive uses of natural resources, (iii) increasing human populations averaging 16-20 people per km^2 in some key wildlife districts, and (iv) lack of re-investment in development, fixed assets, human capital, and management and protection of wildlife in CAMPFIRE areas. Despite these challenges, CAMPFIRE stands very high in the agenda of Zimbabwe's Government, and a review dedicated to improving the programme, including greater devolution of ownership of wildlife to communities, is ongoing and should be finalized by the end of 2015. Zimbabwe's Government recognizes that the survival of wild animals depends entirely on those among whom they live. Unless local people want to save them, wildlife will be poached to the point where just a few remain in fortified reserves. CAMPFIRE is meant to avoid this and the future of wildlife in communal areas rests on the success of this programme. (p. 12-13, Box 2) - 1.3.5 Links with continental (African Elephant Action Plan / SADC) and other regional initiatives: This Action Plan recognizes the existence of the African Elephant Action Plan and initiatives that are currently taking place at a continental level, including by the African Union. These include the development of the Common Strategy on Combating Illegal Exploitation and Illegal Trade in Wild Fauna and Flora in Africa. At the SADC level initiatives involve developing a Plan of Action and implementing the SADC Protocol on Wildlife Conservation and Law Enforcement. This Action Plan will be reviewed periodically in the light of developments that are taking place in the SADC Region, Africa and beyond. - 1.3.6 Regional strategies within Zimbabwe: The devolution of management oversight to regional levels, with more detailed action plans within the national plan, provides the basis for effective adaptive management at regional and local levels. As set forth in the framework below (Sections 3 and 4), four regional plans have been drafted to address the unique challenges of each region, and will implement the broader goals of this national Action Plan at a more specific level. In addition, Park-level plans for specific protected areas (including Hwange National Park, Mana Pools National Park, and Gonarezhou

	National Park) contribute to this Action Plan and govern the management of elephant within those protected areas. (p. 14) - 1.3.8 Human elephant conflict: As Zimbabwe's human population grows, elephant are being restricted to smaller areas and as their populations expand they increasingly move out of their designated habitat, and raid crops and sometimes threaten human lives. As a result in many rural areas where elephants exist in Zimbabwe, human-elephant conflicts are increasing, creating substantial negative attitudes to the conservation efforts of elephants. These are often among the poorest rural farmers, which makes the issue complex in social and economic terms. Unresolved conflicts stimulate poaching or retaliation. Poachers or retaliators can be seen as "local heroes" because they provide meat to the communities and resolve the conflict. A major challenge for elephant management is keeping human-elephant conflicts to a minimum. Developing a Social, Economic, and Cultural Framework has been identified as a Key Component of this Action Plan in an effort to address and reduce human-elephant conflicts. (p. 15) - Towards a Comprehensive Strategy to Reduce Human-Elephant Conflict: Some methods of reducing human-elephant conflict focus on curing the effects, not the cause. Such methods include chilli sprays, fences, and evening patrols to scare off marauding elephants. However, these are not necessarily long-term solutions. Long-term solutions require growing the tolerance of local communities for elephant by ensuring the communities benefit from having elephant on their lands. Tolerance is likely to increase if communities realise and appreciate economic returns earned from the sustainable use of elephant. Economic returns may be generated by consumptive and non-consumptive tourism. The devolution of decision-making on aspects of problem animal control to communities may result in better outcomes for the management of the costs and benefits of this activity. Problem animal control includes disturbing, removing, translocating, or ultimately killing those elephant that persist in damaging crops or threatening human life. Clearly, no one management option will successfully deal with all problem elephants and conflict situations. As part of this Action Plan, ZPWMA will undertake additional research on problem animal control and minimizing conflict, and will develop new solutions and a more comprehensive response to these issues. (p. 15, Box 4)
ZPWMA, Elephant Management Plan Supplement (2016)	- Table 1: Financial resources deployed up to August 2016 (p. 1) - Table 2: Other Non-Financial Resources (p. 2) - Progress towards Implementation of the Elephant Management Plan (2015 – 2020): Several milestones stated in the Elephant Management Plan have already been achieved which include the following: - Appointment of the Elephant Manager as in section 4.5 of the Zimbabwe Elephant Management Plan (2015 – 2020).

	- Getting a basic agreement of implementation in the 4 relevant regions. - Some work towards Law Enforcement, Monitoring, Investigations, Training and Community Relations. As of August 2016, more than USD 1 million had been spent on these activities. - Constraints and Challenges: One of the major challenges regarding implementation of the EMP is with regards to the adoption of stricter domestic measures by the United States of America. This has had the net effect of further reducing the revenue from hunting into the Authority, which therefore affects the budget allocated to resource protection, in particular the elephant in this case. One of the key impediments towards the full and comprehensive implementation of the Elephant Management Plan is the limited resources. However, Zimbabwe is at an advanced stage in the development of resource mobilisation strategies. These strategies include partnering with both local and international institutions in resourcing and financing aspects of the programme. (p. 2-3) - Priorities: Due to the fact that Zimbabwe is experiencing some funding constraints with respect to the full implementation of the Elephant Management Plan, which means therefore that it will not be possible to fully implement every aspect of the plan at the same time, we have developed a set of priorities (all drawn from the plan), that we feel are implementable and enable the work of conservation to proceed smoothly. - Law Enforcement: Law enforcement continues to be one of the most critical aspects of this strategy. From the perspective of the EMP, it has also to date been allocated the biggest budget (Table 1). While strategic gaps still exist with respect to the law enforcement capacity (the numbers of rangers on the ground are still in need of improving to effectively cover that Parks Estate, more patrol kits and equipment are still required to improve enforcement capacity). In order to effectively combat poaching and illegal trade the Law enforcement capabilities are top priority. - Monitoring: Biological monitoring and management, with respect to the priorities for this plan would come in as a second priority. This enables monitoring programmes and research to support science based adaptive management of elephants in this action plan. The resource allocation to this activity needs to be dramatically improved, although innovations have had to be put in place to manage that insufficient resource allocation. Rangers on patrol also carry out significant monitoring activities which feed into the biological monitoring and management of the elephants. - Investigations/Intelligence: The investigations capacity (together with training) are critical components of this action plan. To date of the available resources, allocations to investigations have been minimal. Innovations have also been developed in this area, for support from various private players, institutions and state institutions in the investigative processes. (p. 3)

	- Appointment of Elephant Manager: While the appointment of the National Elephant Manager has been concluded (April 2016) to enhance implementation, monitoring and evaluation of the Action Plan, funding constraints still exists. Some funding for the activities of the Elephant Manager have been unlocked through cooperation with stakeholders in the monitoring and evaluation activities of the office. This includes setting up of the Regional Elephant Management Committees and funding their activities. (p. 4) - Four annexes – status of implementation of each regional elephant management plan

Population Status

DOCUMENT NAME	SAMPLE OF KEY QUOTATIONS
ZPWMA Apr. 2014 Response	- Information on the status of elephants is derived from surveys which include, aerial, water-hole, road strip, walking transects, visitor observations /sightings and ranger based monitoring. (p. 1) - Currently the Authority is in the process of planning a national aerial survey in the dry season of 2014… (p. 4)
ZPWMA Dec. 2014 Response	- Population estimates for elephants are determined through various methodologies which include: aerial surveys, water hole counts, road strip counts and ranger based monitoring. Waterhole counts are conducted for Hwange and Mana Pools on an annual basis. A national aerial survey of elephants was conducted in 2014 as part of the Pan African Aerial Survey for Elephants. Monitoring of trends in trophy quality and other forms of utilization are on-going programs. Results from the monitoring are used to adjust hunting quotas in order to achieve the desired levels of trophy quality. (p. 2) - In addition to aerial surveys, the Authority conducts regular waterhole counts and road strip counts. Water hole surveys, for instance, provide valuable information which can be used to make decisions in the absence of aerial survey data. A good example is the general increase of the Hwange elephant population shown by water hole counts that have been conducted annually from 1972 to 20 14. (p. 15)
ZPWMA July 2015 Response	- The population estimate from the 2014 aerial survey stands at 82,092 elephants [and attaching survey results]. In the early 1900s the elephant population in Zimbabwe was estimated to be about 4,000. By 1980 the population had increased to an estimate of 46 426 elephants. The population continued to increase … twenty-fold … despite attempts to limit elephant population growth between 1960 and 1989 … The human population has also increased twenty-fold between 1900 and 2000, resulting in increased demand for land for agriculture and other forms of land-use outside protected areas thereby limiting the

area available for elephants with a resultant increase in human elephant conflict … The high economic value conferred to the elephant through consumptive utilization has also resulted in increased tolerance by local communities. (p. 1)

- Table 4a & 4b: MIKE data 2000-2014 (p. 25)

Chewore

ZPWMA, Non-Detriment Finding (2014)

- In Zimbabwe, despite the threat of poaching in some areas, the elephant populations have continued to increase in all the protected areas as indicated in Tables 4 and 5. Illegal off-takes remain at a low level. The major threat to the survival of viable populations is habitat loss and fragmentation outside protected areas due to the expansion of human settlements and agriculture. The protected areas within the Sebungwe region (Fig 1), for example, are relatively small (less than 10,000 km^2) and surrounded by communal lands. The existence of a hard edge between such protected areas and communal lands leads to serious human/elephant conflicts. Healthy and viable populations inside protected areas are depended on the existence of suitable habitats in communal areas. (p. 19)

IUCN AFESG Letter

- … on the basis of the AfESG's 2013 Provisional Status Report, the USFWS enhancement finding indicated that no surveys had been conducted in Hwange National Park … but in fact, a survey had been completed in 2007 … this survey was listed in the "New Surveys" portion of the AED website … the estimate … (financed by the USFWS) was 39,765 elephants … which would have added over 30,000 elephants to the DEFINITE category and changed the distribution of elephants across all data categories. (p. 2)
- There are four other instances in which the use of data from the AED presented within the finding's "Population Status" section demonstrated oversights or misinterpretations, as well as a fifth instance meriting clarification. First, the finding stated, "Several areas that were covered in the current surveys

	(2006-2010) indicate that there has been a substantial decline in the population" (page 6). The AED shows, however, that three surveys carried out in this period … estimated higher totals than their respective previous, comparable surveys [and pointing out that these four surveys plus the NW Matabeleland survey all dated since 2006 and exceeded 70,000 elephants] … As a result, we do not find support for the claim that these four surveys from 2006 to 2010 indicate a substantial population decline, nor do we understand the basis for this statement in the enhancement finding. (p. 2) - Even if all of these elephants [in the Save Valley survey] were double counted, which is highly unlikely, the total number would decline from 1,538 to 1,492 – a figure still higher than any previous counts of the area. (p. 3) - Additionally, the finding states that "A carcass ratio of less than 4% … is considered unrealistically low…" The first sentence suggests a conflation of carcass ratios from aerial surveys and mortality rates, and its conclusion is unwarranted… In the opinion of our DRWG, 4% seems a reasonable figure for a population not particularly affected by poaching. (p. 3) - Fourth, … the finding's comment that "only 304 definite animals were counted by aerial or ground counts" …, considering methodology within the DEFINITE category, is not relevant; and as stated in the next section, sample counts are not inferior to total counts. (p. 3) - [T]he USFWS also presented statements regarding the appropriateness of Zimbabwe's survey methodology … Our opinion … is that the methodological approaches applied in Zimbabwe are both adequate to estimate elephant population numbers and to allow the most consistent possible means for comparing these numbers over time. (p. 3-4) - [T]he enhancement finding suggests the incorporation of new technology as being necessary to improve estimate accuracy … This statement disregards the well-recognised and accepted advantages to maintaining consistent survey methods while indirectly implying the approach undertaken in Zimbabwe has been somehow sub-standard. While it is always the case that some improvements in accuracy might result from the use of new techniques, it is generally recognized that the survey techniques used in Zimbabwe are of a high standard and have been consistently applied over time. (p. 4) - Despite the fact that PIKE data for 2012 has been available … and updated findings for 2013 were posted … nearly a month before the enhancement finding was updated, the finding stated that 2012 and 2013 data were not available. (p. 4-5)
SOAZ Report	- We have received information from fourteen safari operators in Zimbabwe. The operations of these companies cover a wide range of safari concessions including Government Safaris Areas, Campfire Areas and Private Conservancies. They also include safari concessions in the three main wildlife systems in

	Zimbabwe being; (1) Zambezi Valley and Sebungwe, (2) the North West including Hwange/Matetsi/Vic Falls and (3) the South & South East Lowveld including Gonarezhou, Save Valley Conservancy & Bubye Conservancy. (p. 1) - The members of SOAZ do not believe that the national population of elephant is in decline or under threat as a result of poaching. On consultation with our members, most populations would appear to be increasing or stable. There does seem to be concern about the elephant population in the Sebungwe region where the impact of poaching is indicated as significant. While much of this information is anecdotal and not based on scientific survey, we are confident that in the vast majority of safari areas throughout the country, the elephant population is not significantly declining or under threat. (p. 4) - While National Parks provide the primary refuge for elephant populations in Zimbabwe, a significant proportion of elephant live in the safari areas which are generally more marginal in terms of wildlife numbers and often have large rural human populations within or adjacent to them. The role of safari operations in providing a benefit to such communities and enforcing anti poaching as a means of maintaining elephant and other wildlife populations in these areas cannot be underestimated. (p. 4)

Regulations and Enforcement

<table>
<tr><th>DOCUMENT NAME</th><th>SAMPLE OF KEY QUOTATIONS</th></tr>
<tr><td>ZPWMA Apr. 2014 Response</td><td>- (p. 12):
<table>
<tr><td>Year</td><td>2009</td><td>2010</td><td>2011</td><td>2012</td><td>2013</td></tr>
<tr><td>No. of Elephants Poached</td><td>145</td><td>77</td><td>223</td><td>212</td><td>293</td></tr>
</table>
- It is however important to note that although the trends in poaching have increased in recent years, the impact of poaching on the national elephant population is not significant. The Government of Zimbabwe reacted swiftly to the unprecedented elephant poisoning incident in Hwange National Park in 2013. A private sector driven fund raising initiative was set up which has to date managed to mobilize 21 vehicles, communication and field equipment for enhanced law enforcement. The ZPWMA has increased manpower level for Hwange and other protected areas through a massive recruitment drive. The police and the judiciary also actively collaborated with the ZPWMA in apprehending all 35 poachers that were involved in the elephant poisoning... (p. 13)
- Summary of arrests and prosecution of elephant poaching cases for period between 2011 and 2013 (p. 14)</td></tr>
</table>

	- The Parks and Wildlife Act Chapter 20:14 … recognises any land that is being used for wildlife conservation and designates the legal occupant of that land as Appropriate Authority. On communal lands/tribal Appropriate Authority is accorded to the Rural District Council. Appropriate Authority is the legal right to utilize and manage wildlife on the property under community jurisdiction. (p. 15-16)
ZPWMA Dec. 2014 Response	- Law enforcement activities are carried out in and outside protected areas through various strategies including extended, daily and strategic patrols in the elephant range areas. There are also regular training exercises in basic, intermediate and advanced anti-poaching tactics for the rangers as part of management activities to improve law enforcement. Rapid response anti-poaching units who have specialized training for deployment to high risk areas have been constituted as a result of the training activities. In 2013, countrywide law enforcement efforts resulted in the detection of a large number of poacher incursions and armed contacts including recovery of poached wildlife specimens and ammunition. In the same year, there were 27 armed contacts that resulted in 9 poachers being killed during field operations, whilst recoveries from poachers and illegal traders included 35 rifles, 1000 rounds of ammunition, 9 rhino horns and 491 elephant tusks. (p. 2) - There are no amendments to land tenure however, the elephant range extends into large areas of communal lands which form part of the migratory routes. Elephants are also found on private land where there is enough space for relatively sizable populations, e.g. in Conservancies. In most cases there is connectivity from core protected areas to communal areas under CAMPFIRE and to private farms, in some cases. The elephant range and migration corridors have been extended through the TFCA program—a regional policy initiative which Zimbabwe is implementing in collaboration with its neighbours. Currently Zimbabwe is pursuing six TFCA initiatives. Most of Zimbabwe's large protected areas are on the countries boundaries and the elephant populations are linked to these neighbouring countries' boundaries and as such, creation of these large conservation areas is a viable option for elephant range expansion. In doing so, Zimbabwe is implementing a policy direction adopted at a regional level to increase the habitat available to wildlife including elephants. (p. 11) - The Authority has successfully lobbied the Judiciary for stiffer penalties for wildlife crime including poaching … The measurable indicators include number of Statutory Instruments (SI) that have been gazetted, for example SI 45 of 2014. Capacity building workshops to improve investigations and prosecution of wildlife crime are conducted in partnerships with NGOs and these are also measurable indicators of management actions. (p. 13-14) - Table 1 shows the number and trends in elephant poaching in the parks estate since 2012 to October 2014. (p. 15)

ZPWMA July 2015 Response	- ZPWMA has a staff complement of 1,500 field rangers whose core mandate is anti-poaching activities. Table 5 below is an indicative budget for effective protection of the Parks and Wildlife Estates. Table 5: Budget for anti-poaching activities (p. 34-35) - Table 6: Summary of Serious Wildlife Crime Cases recorded in Zimbabwe (p. 35-36)
ZPWMA, Non-Detriment Finding (2014)	- Elephant poaching in Zimbabwe is relatively low but trends have been increasing in recent years … The conviction rate for the period under review (2011-2014 February) is 69% of locals and 95% of foreigners arrested. The high conviction rates indicate the level of understanding and appreciation of the elephant value by judiciary. Elephant poaching and illegal possession of elephant products are classified as an economic crime which carry a mandatory sentence of not less than nine years on conviction. The provision of a mandatory imprisonment of not less than nine years crimes as provided for in the General Laws Amendment Act (No. 5) of 2010 ensures deterrent sentences for poaching. (p. 19-20)
CAMPFIRE—Role of Hunting Report	- In 1982, the government amended the 1975 Parks and Wildlife Act to enable Rural District Councils (RDCs) to obtain 'appropriate authority' (AA) to utilize wildlife for commercial gain … This Act provided an opportunity to extend to communities in the Communal Lands the benefits that the private landowners enjoyed as a result of the 1975 Parks and Wild Life Act. This eventually led to the birth of Zimbabwe's Community Areas Management Program for Indigenous Resources (CAMPFIRE), which had far reaching impacts on wildlife productivity as well as the socio-economic wellbeing of CAMPFIRE communities. (p. 2) - The CAMPFIRE program was conceptually designed to focus on wildlife, woodlands, water, grazing resources, and grasslands. In practice, it focused on managing wildlife because of the direct monetary benefits which this resource offered to producer communities. The CAMPFIRE concept … was developed in response to the realization that unless communities living adjacent to National Parks can obtain direct value from wildlife, they will not protect the wildlife. These communities would also need to have a much greater say in how those benefits would be derived and utilized. (p. 2)
SOAZ Report	- We have received information from fourteen safari operators in Zimbabwe. The operations of these companies cover a wide range of safari concessions including Government Safaris Areas, Campfire Areas and Private Conservancies. They also include safari concessions in the three main wildlife systems in Zimbabwe being; (1) Zambezi Valley and Sebungwe, (2) the North West including Hwange/Matetsi/Vic Falls and (3) the South & South East Lowveld including Gonarezhou, Save Valley Conservancy & Bubye Conservancy. (p. 1)

<table>
<tr><td></td><td>
- Table 2 shows that the 14 Safari Operators that responded to the questionnaire spent a combined total of $957,843.00 on anti poaching in their areas and this employs 245 people specifically for anti poaching. (p. 4)
- Table 2. The expenditure on Anti Poaching and number of Anti Poaching personnel employed by 14 Safari Operators in Zimbabwe (p. 4)
<table>
<tr><td>Anti Poaching expenditure – 2013</td><td>Anti Poaching Personnel Employed</td></tr>
<tr><td>US$957,843.00</td><td>245</td></tr>
</table>
- As in Section 3, if these figures are extrapolated out to give figures relative to the 160 sport hunted elephant imported into the USA each year from Zimbabwe, we can make the assumption that US hunters are assisting with the funding of $1,388,872.35 towards anti poaching in Zimbabwe through their safari payments and that this is enabling the employment of 355 anti poaching personnel along with all the equipment and support required. The imposed suspension on the import of sport hunted elephant into the USA from Zimbabwe will have a significant detrimental impact on these figures and in many cases the anti poaching efforts will not be sustained. (p. 4)
</td></tr>
<tr><td></td><td></td></tr>
<tr><td>FWS Press Release</td><td>
- In Zimbabwe, available data, though limited, indicate a significant decline in the elephant population. Anecdotal evidence, such as the widely publicized poisoning last year of 300 elephants in Hwange National Park, suggests that Zimbabwe's elephants are also under siege.
- Legal, well-regulated sport hunting, as part of a sound management program, can benefit the conservation of listed species by providing incentives to local communities to conserve the species and by putting much-needed revenue back into conservation. At this time, the Service does not have conservation concerns with African elephant sport hunting in Namibia, South Africa, or Botswana; though it should be noted that Botswana is not currently open to elephant sport hunting.
</td></tr>
</table>

Sustainable Use

DOCUMENT NAME	SAMPLE OF KEY QUOTATIONS
ZPWMA Apr. 2014 Response	- Allocation of quotas in hunting areas is based on a consultative process that involves ZPWMA authorities, hunters, safari operators, local communities, land owners, researchers, and NGOs. The participatory approach ensures that the quotas allocated for each hunting area are sustainable. (p. 4) - Factors considered for quota-setting annually (p. 20-22)

ZPWMA Dec. 2014 Response	- The quota-setting process is participatory involving private landowners, ZimParks and CAMPFIRE or local community wildlife managers. Quotas are set so as to have a representative number of animals that can be safely removed during a hunting season without inflicting biological damage to the population. The aim of quotas is to ensure that the utilization of wildlife is sustainable. Data on genetic drift, estimated population, disease outbreak, trophy size, age of animal hunted, habitat status and illegal offtake is used to safeguard sustainable quotas … Trophy quality is monitored and quotas are adjusted in order to maintain desired trophy quality. (p. 7-8) - As an example in 2014 to date over 90 cases of PAC have been reported whilst only 37 elephants have been killed. This is in line with the annual average offtake of 40 individuals [as PAC]. It is therefore not true to state that the number of elephants taken on PAC is equal to or may exceed the number of elephants taken on sport hunting. (p. 23) - In Zimbabwe, the quota setting process is participatory. This participatory quota setting process is ideal as it aims at having a co management approach where all the relevant stake holders become active participants who complement the Authority's efforts. Inputs into the quota setting process includes population estimates, densities, distribution patterns, habitat quality, trophy quality, hunting success rate, ranger based monitoring reports, environmental variations, natural mortality, capture and translocations, diseases, size of hunting area, management systems in place, CITES National Export quotas, trade and export data. Before any hunting takes place in Zimbabwe, the hunter has to have a hunting quota which will have been determined through an annual transparent consultative quota setting workshops. The workshops are done at local community and property level first and foremost. At this level stakeholders include: field managers, safari operators, technical specialists and local community. Secondly, the process then goes to a national quota setting level where the Scientific Authority in this case ZIMPARKS ecologists and all other stakeholders will be present. The Scientific Authority through an adaptive management process and rigorous resource monitoring programme, uses all the information generated to ensure that all off-takes are sustainable. Quotas can be reduced to allow recruitment into a population if there is a decline in trophy quality or low hunting success rate and other factors such as poaching. Quotas are therefore adjusted annually in response to prevailing conditions. As an example, the proposed 2015 sport hunting quotas were set in consultative workshops held at various centres around the country using a participatory approach taking into account factors that influence the ecological viability of the hunted species such as population numbers, spatial distribution, management practices (especially for private properties), illegal harvest levels, offtake rates (hunting success) and trophy quality trends. Preliminary results of the just concluded aerial census of elephants and other mega herbivores, trophy quality trends and offtake rates from the TR2 database were the main sources of information for input into the quota determination process. Overall, there

	were downward revisions for quotas for all the major species in the year 2015 except for crocodile. The proposed 2015 quotas for the other major species are as follows, (for comparison, 2014 quota are in brackets); Elephant 380 (500), Buffalo 1 268 (1 363), Leopard 500 (483) and Lion 74 (99). (p. 23-24)
ZPWMA July 2015 Response	- Elephant mortalities were recorded under various categories as shown in Table 9 below. The major causes of mortalities over the five year period are natural, poaching and sport hunting. It should be noted that other management off-takes entail ration and training quotas which were set at about 95 animals nationally for ZPWMA run areas. (p. 43) - Table 9: Causes of elephant death from 2010 to 2015 (p. 43) - Trophy hunting of elephants, or any wildlife species in Zimbabwe, is undertaken through a strictly regulated quota setting system. Quotas are issued each year to approved landholders by ZPWMA and this is done through national quota setting workshops. These workshops rely on information supplied by landholders as well as ecological reports submitted by Parks' ecologists and independent wildlife consultants … All offtakes for the African elephant in Zimbabwe are sustainable. Key factors that Zimbabwe considers when setting quotas are shown in the Table 10. (p. 43-44) - Table 10: Quota allocation for 2014 by major range (p. 44) - Table 11: Factors considered in quota setting (p. 44-46) - Quotas are set so as to have a representative number of animals that can be safely removed during a hunting season without inflicting biological damage to the population. The aim of quotas is to ensure that the utilization of wildlife is sustainable. Data on genetic drift, estimated population, disease outbreak, trophy size, age of animal hunted, habitat status and illegal off take is used to safeguard sustainable quotas. On average, quotas are set based on current data at approximately. The quota for 2016 is set at 400 elephant which is 0.49% of the national population. (p. 46) - Figure 8: Multi stakeholder participatory quota setting (p. 47)
ZPWMA, Non-Detriment Finding (2014)	- Trophy hunting of elephants is undertaken through a strictly regulated quota system. Quotas are issued each year to approved landholders by the Zimbabwe Parks and Wildlife Management Authority and non-detriment findings are conducted for all exports. Policies and legislation related to utilization of the African elephant are strictly adhered to and implemented. In areas where there is a decline in trophy quality, a hunting moratorium can be imposed to allow the population to recover as was the case with African lions North West Matabeleland from 2004 to 2008. Quotas are also reduced in areas where

	there is a decline in trophy quality. All the off-takes for the African elephant in Zimbabwe are sustainable. Key factors that Zimbabwe considers when setting quotas are shown in Table 8. (p. 25) - Table 8: Some key factors considered in quota setting (p. 26) - Figure 8: Export of sport hunted elephant trophies from Zimbabwe (2008 – 2013) Source: (TR2 Database ZPWMA 2014) (p. 31) - The ZPWMA has a comprehensive system to monitor off-takes from the elephant population. All field stations report on a monthly basis, animals killed through all forms of offtake. Safari operators are required by law to submit returns to the ZPWMA of all the animals taken through a Tourism Hunt Return Form (TR2). All elephants killed through Problem Animal Control (PAC) and recreational hunting are considered as part of the annual off-take quota to ensure that the offtakes are sustainable. Trophies taken on PAC cannot be exported. (p. 31) - Some elephants are taken in communal areas during problem animal management but the off-takes other very low and insignificant. In addition to problem elephant management, other elephant off takes are for training of ZPWMA staff and professional hunters on how to handle dangerous game and again the numbers are very low and insignificant. Private properties have approved Elephant Management Plans but apply for annual sport hunting and management quotas. For example, Save Valley Conservancy has an approved Elephant Management Plan for its closed elephant population. The elephant population is increasing in this closed system. On this private property, culling is done on an annual basis as a management tool to control the elephant population… (p. 31-32) - CONCLUSION: In view of the foregoing, Zimbabwe is making use of the best available scientific information on the status of the African elephant in the country to make non-detriment findings. The current harvest levels are not detrimental to the survival of the species. It is also evident that both quantitative and qualitative data is used in the decisionmaking process. The African elephant population in Zimbabwe is growing and that current levels of trade are not detrimental to the survival of the African elephant in the wild. The species exists and is well monitored throughout its range. In most of the areas where the elephant occurs however there is local over-abundance and severe habitat conversion. The Government of Zimbabwe has recently revised its policies and legislation to promote wildlife conservation and to support local community development programmes. Levels of harvest and quotas for the African elephant are determined through an adaptive management approach, using baseline data, monitoring the impacts of previous harvests and responding to environmental variations. It is evident that quotas and offtake levels for the African elephant fall within very safe and sustainable limits in Zimbabwe. Protocols for monitoring are in place but significant resources are required to carry out regular national aerial surveys. Efforts by the Government of Zimbabwe through the strict management

	regimes and trade controls promote the conservation of not only African elephant but other wildlife species. (p. 49-50)

ZPWMA, Legal Trade, Conservation and Rural Livelihoods: A Zimbabwean Perspective	- A hunting quota is a scientifically determined system of harvesting animals from a population without compromising its biological proliferation. In Zimbabwe determination and implementation of hunting quotas goes through a rigorous quota setting methodology that entails factoring population sizes, property (area) sizes, habitats, national policies among other parameters. With all the set parameters met, it is anticipated that biodiversity and hunting industry are sustained and the economy improves as the country maintains its position as a prime hunting destination. (p. 5)
	- [Factors considered in quota-setting (p. 6)]
	  - 1. CITES National Quota
	  - 2. National aerial survey results
	  - 3. Research publications and preliminary results
	  - 4. Off takes for key species including leopards, lion and elephant
	  - 5. Size of property relative to the species requested and distribution
	  - 6. Illegal Off-take/Poaching
	  - 7. Property based Ecological assessments
	  - 8. Management regime on the properties (habitat, fire, water, land-use planning and zonation, fencing, supplementary feeding).
	  - 9. Human wildlife Conflict hotspots, Communal Benefits and conflict mitigation
	  - 10. Species sensitivity
	  - 11. Other off-takes (illegal management offtakes, live sells)
	  - 12. Trophy Quality
	  - 13. Habitat Change/fragmentation
	  - 14. Recommended sustainable off-take levels
	  - 15. Offtake Data

CAMPFIRE Association Report	- A participatory quota setting methodology adaptively adjusts quotas in response to animal numbers, trophy quality, community monitoring, illegal off-take and safari operator “catch effort”. (p. 3)
CAMPFIRE Income Analysis	- Figure 7: Numerical Elephant Quota and Take Off per District (p. 7)

SOAZ Report	- It is estimated that trophies of 160 sport hunted elephant are imported into the USA from Zimbabwe each year. If the information in Table 1 is extrapolated out for a quota of 160 elephant (I.e. multiply each figure by a factor of 1.45) then we can assume that the financial loss to Zimbabwe of the suspension will be in the region $4,878,452.50. It will have a direct impact on 126 Operators and Professional Hunters, 1132 staff, 355 anti poaching personnel and approximately 155,000 people living in rural communities. (p. 3)

Revenue Utilization

DOCUMENT NAME	SAMPLE OF KEY QUOTATIONS
ZPWMA Apr. 2014 Response	- The Parks and Wildlife Act Chapter 20:14 … recognises any land that is being used for wildlife conservation and designates the legal occupant of that land as Appropriate Authority. On communal lands/tribal Appropriate Authority is accorded to the Rural District Council. Appropriate Authority is the legal right to utilize and manage wildlife on the property under community jurisdiction. (p. 15-16) - The Zimbabwe Parks and Wildlife Management Authority, which is the Government's Agency responsible for managing all wildlife in the country ploughs back all the money into managing conservation and protection of the Parks Estate, which includes the range areas for elephants. (p. 25)
ZPWMA Dec. 2014 Response	- The Parks and Wildlife Act accorded Appropriate Authority status to communal and private property areas with significant wildlife populations which confer user rights to the property owners. Appropriate Authority allows the property owners or tenants to manage and benefit from the wildlife on their land. Local communities through CAMPFIRE programs participate in quota setting workshops in which local communities get the opportunity to learn wildlife management practices from the various technocrats who will be presenting their game management practices. The local communities also get an opportunity to market their offtake to safari operators, which if they get a hunting client, proceeds, are remitted to the community thereby improving their livelihoods. This arrangement incentivizes landowners and tenants to not only tolerate wildlife, but to conserve and promote conservation and protection of wildlife. ZPWMA also provides para-military training to Rural District Council game guards, to equip them with law enforcement and anti-poaching techniques. In the communal areas, ZPWMA is working towards increasing its network of informers to assist in intelligence gathering, a vital tool in the fight against poaching. (p. 20) - The current operating budget is estimated to be in excess of USD28 million. (p. 20)

	- Elephant hunting contributes in excess of USD$ 14 million every year … Approximately, 67% of the annual elephant export quota is allocated to local communities and private sectors with more than half of this going to local communities. It is worth noting that elephants contribute approximately 60% of total hunting revenue by Rural District Councils. Approximately 30% of the Authority's revenue is from hunting, of which the elephant is the major contributor. (p. 21)
ZPWMA July 2015 Response	- ZPWMA has a staff complement of 1,500 field rangers whose core mandate is anti-poaching activities. Table 5 below is an indicative budget for effective protection of the Parks and Wildlife Estates. Table 5: Budget for anti-poaching activities (p. 34-35) - The major sources of [budget] funds [for ZPWMA] are conservation fees (land and river) constituting a total of US$9 898 695 and hunting constituting a total of US$ 4 032 733 for 2014. The bulk of the revenue generated in ZPWMA goes towards staff costs (69%) and operation costs (18%) which translated to US$17,751,988 and USS 4,706,787 respectively for 2014 … Full details are specified in the attached approved budgets for 2015 (p. 36) - Table 7a: ZPWMA Actual and projected Budgets for 2014 and 2015 in USS (p. 37) - Table 7b: Expenditure for ZPWMA (p. 37) - Conservation fees (Park entry and fishing permits) and hunting revenue constitute the bulk of the sources of revenue for ZPWMA, with a contribution of 42% and 17% respectively. (p. 38) - Figure 5a: Main Sources of Revenue for 2014 (p. 38) - Figure 5b: Itemized costs for ZPWMA … Note: See attached approved budgets for 2015 for budget details. (p. 39) - The US hunting market constituted 51% and 54% of the elephant trophy hunting in Zimbabwe for the years 2013 and 2014 respectively. (p. 40) - Figure 6a: Source markets for Safari Hunting in Zimbabwe in 2013 from ZPWMA Database (p. 40) - Figure 7: Source markets for Sport Hunting in Zimbabwe in 2014 from ZPWMA Database (p. 41) - Hunting revenue is distributed by land-use categories as to sustain the upkeep of the land area where it is accrued. These land areas administered by different authorities with the ZPWMA having the overall authority to oversee wildlife use on these areas … Over a four year period revenue collected from hunting contributed a total of US$ 21,339,609. There was a 11.9% decrease in revenue collection from hunting in 2014 compared to 2013. Of all the hunting received the American market is estimated to 54% and is inclusive of concession fees and trophy fees. (p. 41)

</table>
- Across all land categories, the elephant, even in the private land category where only a small proportion of properties have elephants, accounts for the highest proportion of revenue. Table 12 below highlights elephant populations and revenue generated in the four land use categories in terms of trophy fees … The most important form of revenue is the trophy fees, which average US$ 10,000 per trophy elephant. Other forms of revenue include hunting daily rates and incidental revenue which can raise the value of an elephant hunt up to $25,000.00. (p. 48)
- Table 13: Staff costs incurred in Safari Areas (p. 49)
- The communal areas benefits from wildlife through the CAMPFIRE program. This program is key in that it helps to encourage the communities to co-existence with wildlife. (p. 50)
- During the 2014 hunting season, a total of about US$ 1,419,384.00 (costs including trophy fees, daily rates and concession fees) was realized as revenue from elephant hunts under the CAMPFIRE program. Revenue generated from the CAMPFIRE program is ploughed back into managing and protecting the wildlife resource through activities such as anti-poaching patrols, wildlife censuses and problem animal control (PAC), and wildlife surveys. … Table 14: Distribution of Revenue between Communities, RDC and CAMPFIRE Association. (p. 50-51)

</td></tr>
<tr><td colspan="2"></td></tr>
<tr><td>ZPWMA, Elephant Management Plan (2015-2020)</td><td>
- vi) Local communities: Local communities are involved in elephant management in CAMPFIRE areas, through sharing of information, advocacy and wildlife protection. They report human-elephant conflicts and carryout some of the conflict management activities. (p. 12-13)
- The Importance of Community Based Conservation to the Future of Elephant Management in Zimbabwe: The Community Areas Management Programme for Indigenous Resources (CAMPFIRE) of Zimbabwe has been widely regarded as one of Africa's most successful contemporary conservation initiatives. It permits the residents of communal lands – basically the poor rural communities – to share in the benefits generated by wildlife utilization on those lands by granting Appropriate Authority to Rural District Councils (RDCs) to manage wildlife on communal lands and requiring a certain percentage of revenue to be paid to the wards and councils. CAMPFIRE operates in about 50,000 km2 (12.7%) of land in Zimbabwe. This is roughly equivalent landmass to the Parks and Wildlife Estate. CAMPFIRE encompasses about 777,000 households with an average family size of five, who face food insecurity and deep poverty
</td></tr>
</table>

	(average income $1 a day). Between 1994 and 2012, CAMPFIRE generated $39 million of which $21.5 million was allocated to communities and used for resource management (22%), household benefits (26%), and community projects (52%). About 90% of CAMPFIRE's revenue comes from hunting, with elephant hunting contributing more than 70% of annual revenue. Based on the Constitution of the CAMPFIRE Association as amended in 2007, all major hunting RDCs use CAMPFIRE revenue-sharing guidelines. In these districts safari operators pay revenue directly into community-controlled bank accounts using the following breakdown: CAMPFIRE community share (55%), RDC fees (41%), CAMPFIRE Association levy (4%). Despite its achievements CAMPFIRE still faces fundamental challenges. In particular, the development strategies of households in CAMPFIRE areas focus on land uses that are incompatible with wildlife such as human immigration to rural areas, the extension of basic agricultural schemes and increased livestock numbers. Other CAMPFIRE challenges include: (i) the downturn in Zimbabwe's economy and tourism sector post-2000, (ii) great reliance on consumptive trophy hunting and less focus on other uses and non-consumptive uses of natural resources, (iii) increasing human populations averaging 16-20 people per km^2 in some key wildlife districts, and (iv) lack of re-investment in development, fixed assets, human capital, and management and protection of wildlife in CAMPFIRE areas. Despite these challenges, CAMPFIRE stands very high in the agenda of Zimbabwe's Government, and a review dedicated to improving the programme, including greater devolution of ownership of wildlife to communities, is ongoing and should be finalized by the end of 2015. Zimbabwe's Government recognizes that the survival of wild animals depends entirely on those among whom they live. Unless local people want to save them, wildlife will be poached to the point where just a few remain in fortified reserves. CAMPFIRE is meant to avoid this and the future of wildlife in communal areas rests on the success of this programme. (p. 12-13, Box 2) - 1.3.8 Human elephant conflict: As Zimbabwe's human population grows, elephant are being restricted to smaller areas and as their populations expand they increasingly move out of their designated habitat, and raid crops and sometimes threaten human lives. As a result in many rural areas where elephants exist in Zimbabwe, human-elephant conflicts are increasing, creating substantial negative attitudes to the conservation efforts of elephants. These are often among the poorest rural farmers, which makes the issue complex in social and economic terms. Unresolved conflicts stimulate poaching or retaliation. Poachers or retaliators can be seen as "local heroes" because they provide meat to the communities and resolve the conflict. A major challenge for elephant management is keeping human-elephant conflicts to a minimum. Developing a Social, Economic, and Cultural Framework has been identified as a Key Component of this Action Plan in an effort to address and reduce human-elephant conflicts. (p. 15) - Towards a Comprehensive Strategy to Reduce Human-Elephant Conflict: Some methods of reducing human-elephant conflict focus on curing the effects, not the cause. Such methods include chilli sprays,

	fences, and evening patrols to scare off marauding elephants. However, these are not necessarily long-term solutions. Long-term solutions require growing the tolerance of local communities for elephant by ensuring the communities benefit from having elephant on their lands. Tolerance is likely to increase if communities realise and appreciate economic returns earned from the sustainable use of elephant. Economic returns may be generated by consumptive and non-consumptive tourism. The devolution of decision-making on aspects of problem animal control to communities may result in better outcomes for the management of the costs and benefits of this activity. Problem animal control includes disturbing, removing, translocating, or ultimately killing those elephant that persist in damaging crops or threatening human life. Clearly, no one management option will successfully deal with all problem elephants and conflict situations. As part of this Action Plan, ZPWMA will undertake additional research on problem animal control and minimizing conflict, and will develop new solutions and a more comprehensive response to these issues. (p. 15, Box 4)
ZPWMA, Elephant Management Plan Supplement (2016)	- Table 1: Financial resources deployed up to August 2016 (p. 1) - Table 2: Other Non-Financial Resources (p. 2) - Constraints and Challenges: One of the major challenges regarding implementation of the EMP is with regards to the adoption of stricter domestic measures by the United States of America. This has had the net effect of further reducing the revenue from hunting into the Authority, which therefore affects the budget allocated to resource protection, in particular the elephant in this case. One of the key impediments towards the full and comprehensive implementation of the Elephant Management Plan is the limited resources. However, Zimbabwe is at an advanced stage in the development of resource mobilisation strategies. These strategies include partnering with both local and international institutions in resourcing and financing aspects of the programme. (p. 2-3)
ZPWMA, Non-Detriment Finding (2014)	- In Zimbabwe a foreign hunter buys a bag which may or may not include an elephant. If an elephant is included, the amount paid increases. The amount declines depending on key species in the bag such as leopard and buffalo. A foreign hunter pays to the operator who then pays to the Authority relevant trophy fees where applicable. A hunting permit is only issued to the hunting operator or a private land holder or to communities with Appropriate Authority Status. The foreign hunter only pays for the daily rates and trophy fees to the particular operator they will be hunting with. Both the daily rates and trophy fees vary with the area being hunted, type of animals in the hunting package and the target market of the operator. The daily rate is paid for services received in camp which include accommodation, food and beverages, professional hunter services etc. The hunter also pays government

	levies which are 2% Zimbabwe Tourism Authority levy on daily rate and 4% on trophy fees … The Zimbabwe Parks and Wildlife Management Authority, which is the Government's Agency responsible for managing all wildlife in the country ploughs back all the money into managing conservation and protection of the Parks Estate, which includes the range areas for elephants. (p. 37) - Communities are provided for through the Communal Areas Management Programme for Indigenous Resources of Flora and Fauna. Some of the revenue that accrues to Rural District Councils under this program is ploughed back into wildlife conservation activities in CAMPFIRE areas. Proceeds are used directly for elephant conservation, provision of game water supplies, wildlife monitoring and anti-poaching programs on communal land as well as community development programmes in the form of schools, clinics, roads and other infrastructural development projects. (p. 37) - The centralised command and control approach to law enforcement to protect the elephant is unlikely to work as proved in most parts of Africa. The long-term solution is to ensure greater return of elephants to the community. Conservation of elephants will be achieved as a by-product of the quest for sustainability. (p. 37) - Resources Available For Law Enforcement and Fire Management: A total of 1,346 of the 1,437 recruited rangers were available for deployment against a field ranger establishment of 2,200. The current ranger complement is able to cover 29,120 km^2 giving a variance of 33, 110 km^2 from the total Parks area of 62, 230 km^2. As at 31 December 2013, the Authority had a total of 103 vehicles for field law-enforcement duties and only 69 vehicles were operational. Ideally the Authority should have 150 vehicles dedicated for law enforcement duties. Thirteen (13) of the vehicles were received from donors. The Authority also bought 7 vehicles and 2 boats. 38 radios and 3 repeater links were also procured. Due to financial constraints, the Authority is not able to procure all of its transport (vehicle and fuel) requirements including field equipment and patrol kits. The rangers for field patrols are also not adequate. Table 11 below shows the ranger staffing levels, vehicles and boats status in the Authority in 2013. (p. 39) - Table 11: Status of Rangers, Vehicles and Boats in 2013 (p. 39)
ZPWMA, Legal Trade, Conservation and Rural Livelihoods: A Zimbabwean Perspective	- Zimbabwe's Protected Area Management Funding (table) (p. 10) - As shown in the Table above, CAMPFIRE income is often understated as it is largely recorded based on income receipts from safari hunting only. Economic multipliers like taxidermy, travel, extended tourism activities, food and others, are not captured as part of CAMPFIRE income. The proportion of safari operating expenses paid locally in the form of wages and salaries, and purchase of materials is also not recorded. Income from tourism ventures under CAMPFIRE is also mostly unrecorded, as a result of low investment and returns due to the current downturn in tourism receipts for the country. (p. 17)

	- American clients generally constitute 76% of hunters in CAMPFIRE areas for all animals hunted each year. The suspension of ivory imports from Tanzania and Zimbabwe by the United States of America (USA) in April 2014 resulted in the cancellation of 108 out of 189 (57%) elephant hunts initially booked by US citizens in CAMPFIRE areas. As a result of the ban, CAMPFIRE income dropped to US$2,1 million in 2014, compared to US$2,3 million in 2013, as fewer American hunters conducted their safaris nevertheless in anticipation of the lifting of the ban. However, the ban continued into 2015, resulting in a massive decline of total CAMPFIRE income to US$1,6 million. (p. 19)
CAMPFIRE Association Report	- CAMPFIRE generates on average US$2 million in net income every year … mostly through the lease of sport hunting rights to commercial safari operators (p. 1) - … the CAMPFIRE program at national level still protects an area of wild land in excess of 50,000 km^2, which is roughly equivalent in extent to the Parks and Wildlife Estate (Table 1). There are over 200,000 households that actively participate in the Program in CAMPFIRE hunting areas. Revenue received by communities, though relatively small, is used to directly offset the costs of living with wildlife through employment of game scouts or resource monitors. (p. 2) - Revised CAMPFIRE Revenue Sharing Guidelines, which were incorporated into the Constitution of the CAMPFIRE Association (CA) in 2007, prescribe that at least 55% of revenues should be devolved to producer communities, no more than 26%, and 15% for management and overheads (respectively) at RDC level, and 4% as a levy to the CAMPFIRE Association. At least 10 RDCs are in compliance with the Revenue Guidelines, and in these districts CAMPFIRE revenue is paid directly into community controlled bank accounts by safari operators (Table 4). (p. 3-4) - An analysis of data presented in October 2013 … provides an estimated total of US$2,496,349 from hunting in 2012 (Table 5). Hunting contributes an average of 90% of CAMPFIRE revenue annually. (p. 4) - An assessment of 18 main CAMPFIRE districts allocated hunting quotas for 2014 shows that 106 out of 167 Bull Elephant hunts were booked by US citizens (Table 6). Elephant trophy hunting contributes more than 70% income to the CAMPFIRE program. (p. 4) - Photographic tourism contributes an estimated 1.8% of total CAMPFIRE revenue annually according to 2006 evaluation reports on CAMPFIRE (Table 7). (p. 6) - In all CAMPFIRE districts, revenue from hunting is used to support various management activities such as; fire awareness and purchase of fire-fighting equipment; opening of roads and fireguards; training of committees; look and learn tours to other CAMPFIRE districts; purchase of communication equipment; purchase of firearms for Resource Monitors; and rehabilitation of water supply systems to hunting areas. CAMPFIRE thus contributes to job creation, empowerment, and diversification of livelihoods for rural

	communities. Substantial investments are also made annually by RDCs and safari operators in problem animal control (PAC) and anti-poaching. (p. 8) - Most of the income has been invested in infrastructure which has long term benefits to local communities. Infrastructure such as clinics, schools, and grinding mills, boreholes, roads, fencing to keep out wildlife, has been set up in a number of districts (Table 10). Purchase of tractors and drought relief food by communities has also contributed to food security in many drought prone CAMPFIRE areas. Children benefit from reduced walking distances through the construction of schools in the wards. Others benefit through procurement of learning materials and payment of school fees from CAMPFIRE proceeds. Communities also benefit from meat from safari hunting operations and occasionally from problem animal control. (p. 8-9) - Table 10: Summary of CAMPFIRE Revenue Funded Projects per District (p. 9)
CAMPFIRE Income Analysis	- In 2014, … CAMPFIRE generated a total net hunting income of US$2,102,007 in 13 districts of Zimbabwe that hunt most species, including elephant. … The major hunted species is elephant, which contributed 54% (US$1,138,375.09) of the total income. (p. 1) - Table 1: Income generated by Elephants vs. Total Income; and Percentage Income (p. 2) - Figure 6: Total Hunting Income for 12 Districts: 2009-2014 (p. 5) - As shown in Figure 6, it is highly probable that the decline in hunting income for 2014 was largely caused by the suspension of trophy imports by United States of America. The suspension has a lag effect on income, and preliminary calculations of earnings for 2015 indicate a further continuing decline. The major contributor to hunting income, elephants, had a 52% off-take rate in the 13 districts (animals hunted vs the quota). Seven districts out of 13 had an elephant off-take rate below 50% as shown in Figure 6. (p. 6) - Table 2: Examples of Community Projects funded from CAMPFIRE Revenue: 2010-14 (p. 7-8)
CAMPFIRE—Role of Hunting Report	- The income generated from trophy fees in the last 6 years (2010 – 2015) is approximately US$11.4 million of which elephant trophy fees contributed 65%, while a further US$4 million has come from the sale of hides, concession fees and other sundry income. These funds have been distributed to CAMPFIRE communities in various Wards who received approximately 57% (range 39% - 77%) of the Trophy Fees … At the District level, approximately 80% of the funds are used to support the administration and management of the CAMPFIRE program, including investment on law enforcement. In contrast, 55% of revenues provided to the producer Wards are channeled towards supporting social services such schools,

	clinics and other programs that benefit the community. The cost of living with wildlife, and particularly elephants, is shown through providing data on the scale of crop damage (7,000ha over 6 years) that has a significant impact in terms of its monetary value on rural communities who face food insecurity and deep poverty (average income US$1 a day). 96 human lives were lost to wildlife attacks, with elephant accounting for more than half of those deaths. Yet despite these challenges, communities still retain a high level of tolerance for elephants, but this support is rapidly dissipating as a result of the loss of income from trophy hunting. This places almost two million hectares of wild land at risk, including the risk of increasing retaliatory killing through poisoning and illegal wildlife crime. A way forward is discussed outlining how the resumption of trophy imports can offset the challenges facing the CAMPFIRE program and through this, enhance the conservation of elephant outside of the protected areas. (p. ii)
	- In summary, CAMPFIRE protects about 50,000 km^2 (12.7%) of land in Zimbabwe (Figure 1). Benefits from wildlife and other incomes encompass:
	  - Approximately 777,000 households (25%) in Zimbabwe benefited from CAMPFIRE directly or indirectly;
	  - Approximately 25% of Zimbabwe's people are receiving incentives to conserve wildlife and prevent anti-poaching through CAMPFIRE;
	  - Between 1994 and 2012, CAMPFIRE generated US$39 million of which US$21.5 million was allocated to communities and used for resource management (22%), household benefits (26%), and community projects (52%).
	  - About 90% of CAMPFIRE revenue comes from hunting with elephant hunting contributing up to 70% of annual revenue.
	  - Based on Constitution of the CAMPFIRE Association as amended in 2007, all major RDCs use CAMPFIRE revenue sharing guidelines, and in these districts revenue is paid directly into community controlled bank accounts by safari operators using the following guideline: RDC fees (41%), CAMPFIRE Association Levy (4%), and CAMPFIRE community (55%). (p. 5)
	- The CAMPFIRE program relies almost exclusively on income from hunting. (p. 5)
	- Figure 2: Total allocation of trophy elephant (N=1087) to nine major CAMPFIRE areas over a 6-year period (p. 7)
	- A total of 1,087 elephants have been allocated on quota to nine major CAMPFIRE areas since 2010 (Figure 2). This equates to 180 elephants per year. The distribution of this quota among the nine CAMPFIRE areas is dictated by the relative density of elephants in the neighboring protected areas and those residing in the CAMPFIRE areas. Tsholotsho, for example, that borders the southern boundary of Hwange National Park, was allocated 158 elephants (or 26/year) while Hwange, Binga and Hurungwe

	CAMPFIRE Areas that do not border onto areas of high elephant densities receive approximately 10 elephants/year. (p. 7) - Figure 3: Overall utilization (%) of elephant quotas in nine major CAMPFIRE Areas over a 6-year period (p. 8) - Table 2: Origin of hunting clients visiting the major CAMPFIRE Areas :2010 – 2015. (p. 8) - Figure 4: Contribution of hunting clients to the CAMPFIRE Program (p. 9) - Figure 5: Income (US$) generated from the sale of key trophies (p. 10) - The importance of the income from elephant is clear from these data. Trophy fees from elephant account for 64% of all fees generated from the key species (approximately US$1.2 million/year). Buffalo (20%) are ranked second while leopard, hippo and crocodile contribute approximately 5% each. Noteworthy here is the low contribution of lion (approximately 2%). This low level of income generation is partly a result of the impact of the lion import suspension into the USA and Europe, decreasing quota allocations and decreasing offtake levels brought about by the recently imposed lion age hunting regulations. By comparison, the 897 American clients who hunted in CAMPFIRE Areas in the six-year period paid US$9 million in trophy fees and daily rates. Other nationalities, contributed US$8 million. (p. 10) - RDCs can generate income for other revenue streams, notably receiving a percentage of the daily rate, concession fees, bed night levies from photographic camps and from the lease/rent of equipment (Figure 6). The eight RDCs for which data are available generated approximately US$4 million from these revenue streams. Excluded here are revenues that could have been earned from the sale of ivory recovered from problem animal control (PAC) and natural deaths, and from the distribution of meat estimated at 550,000kg over the 6-year period. (p. 10) - Figure 6: Income (US$) accruing to the RDCs from related income revenue streams (p. 10) - Over the last 6 years, the income generated from trophy fees is approximately US$11 million while a further US$4 million has come from the sale of hides, concession fees and other sundry income. The agreed split of these funds is that not less than 55% of the revenues is paid as Ward dividends, not more than 35% is allocated to the RDC for wildlife management (habitat management, fire control, monitoring, hiring of game scouts, etc.), and 15% is retained by the RDC as an administrative levy. Some RDCs do not consider all these revenues as “CAMPFIRE Funds” and segregate trophy fees from the other revenues. On average, the CAMPFIRE District Wards received 42% (range 23% - 66%) of the combined Concession and Trophy Fees, but the Wards received approximately 58% (range 26% - 77%) of the Trophy Fees (Table 3). (p. 11)

	- Table 3: Summary of the benefit sharing (US$) of hunting related income between RDCs and Wards: 2010 – 2015 (p. 12) - Most RDCs employ Game Scouts to conduct routine patrols and undertake basic law enforcement activities. In most cases this is low key since the CAMPFIRE program relies on members of the community to report incidents of wildlife crime, and any other matters related to wildlife in their respective Wards and villages. (p. 14) - Although the data are incomplete, it is estimated that 7,000ha of crops were destroyed by elephant during the 6-year period under review. It is not possible to accurately place a monetary value to this because crop production varies greatly from one year to the next, and from one region to another. It is important however to take into consideration that the impact of crop destruction in the highly prone drought areas and areas of low rainfall (e.g. Beit Bridge, Binga, Tsholotsho) is more acute than in areas where crop production may be higher. To place this into perspective, the national average maize yield is estimated at 300 – 600kg/ha, and the minimum cash value is US$180/ton. The approximate value of the maize lost is therefore US$500,000 – US$1.0 million … (p. 18) - Table 8: Summary of the extent of human – wildlife conflict recorded in CAMPFIRE Wards: 2010 – 2015 (p. 18) - Table 10: Examples of Social Services funded in selected CAMPFIRE areas from Ward Revenues generated from sport hunting: 2010-15 (p. 20) - The income to CAMPFIRE from the sustainable use of elephants has been declining since 2013, with 2014 registering a significant drop following the announcement of the ban on ivory imports into America (Figure 9). Although the hunting industry responded by seeking alternative markets (e.g. Russia, Middle East), this trend continued through 2015 and unconfirmed reports suggest that the decline has continued in 2016. (p. 22) - Figure 9: Annual income (US$) and offtake of elephants in 10 CAMPFIRE Districts (p. 23) - It is difficult to show concisely how the American ban on importation of elephant ivory from Zimbabwe has contributed to the decline in CAMPFIRE revenue and how hunting has enhanced the conservation of this species, due to the nature of the hunting industry in the CAMPFIRE areas. The hunting sector is integrated across a wide range of socio-economic activities and withdrawing one segment adversely affects a range of other wildlife based activities. Several indicators are provided here to demonstrate this: - 1. The US suspension of ivory imports from Zimbabwe has had a significant impact on CAMPFIRE, and resulted in the cancellation of 108 out of 189 (57%) elephant hunts in all major districts initially

	booked by US citizens in 2014. The net impact of this was a reduction of CAMPFIRE income for all areas from US$2.2m in 2013 to US$1.7m in 2014. A similar pattern prevailed in 2015 (US$1.6m), and a further decline is anticipated in 2016 where outfitters struggled to sell elephant safaris and those that did had to heavily discount their prices. - 2. The key trophy species (elephant, buffalo, leopard, hippo, crocodile and lion) contribute approximately US$1.2 million/year to CAMPFIRE revenues. Elephant account for 64% of these fees. (p. 22) - 3. Quota utilisation of elephant prior to the ban did not exceed 60% of the CAMPFIRE quota allocation. - 4. American hunters make up 53% of the clients in CAMPFIRE areas. - 5. CAMPFIRE producer Wards receive on average 57% of all trophy revenues. - 6. The CAMPFIRE hunting industry in the 9 RDCs covered in this analysis directly supports 104 producer Wards, representing 737 villages or 85,847 households. - 7. The CAMPFIRE program employs managers, officers and game scouts at both the District and Ward level who are responsible for monitoring wildlife based land use activities in their areas and these are directly paid from safari hunting income. - 8. Both RDCs and Wards invest in a variety of equipment that benefits communities and wildlife management. The operational and maintenance costs for this equipment are drawn from safari hunting income. - 9. RDCs utilise 80% of the CAMPFIRE revenues to support administration and management of the program. 20% is invested in global social services that benefit communities at the District level. - 10. Producer Wards, representing approximately 2.6 million hectares, bear the cost of living with wildlife. Under the 6-year period under review, elephants are responsible for the destruction of approximately 7,000ha of croplands in the 9 Districts. The minimum cost of this in terms of food production is estimated at US$500,000 – US$1.0 million. - 11. Producer Wards have elected to invest 55% of their dividends from CAMPFIRE revenues in social services (schools, clinics etc.). 74% of these revenues are generated through trophy fees where elephant play a significant role. - 12. Although CAMPFIRE communities suffer most from elephant crop damage, the number of elephant destroyed as problem animals is well within acceptable limits and with few exceptions, has little or no impact on population numbers. (p. 23) - In conclusion, the CAMPFIRE program relies almost exclusively on revenues generated through hunting. These revenues cannot be replaced through alternative wildlife based activities. This places almost two million hectares of wild land at risk, including the risk of increasing retaliatory killing through poisoning

	and illegal wildlife crime. Wildlife in Communal Lands is under pressure. Removing any benefits will tip the balance and disgruntled CAMPFIRE communities will turn to pastoralism and unsustainable agricultural practices, thereby reducing wildlife habitat. The suspension of trophy imports is effectively encouraging communities to become willing tools for poaching – a forced abandonment of CAMPFIRE. (p. 23) - The presence of regulated hunting can also reduce illegal activities, and private outfitters' lease agreements are being reviewed to include anti-poaching as an obligation of the concessionaire. Trophy hunting revenues are vital to facilitating not only law enforcement activities but also general wildlife management. Alternative wildlife land use practices, e.g. eco-tourism, cannot generate sufficient revenues to cover these costs, and certainly not to justify wildlife as a land use outside of protected areas. Hunting can generate revenues under a wider range of scenarios than eco-tourism, including in remote areas lacking infra-structure, attractive scenery, or high densities of viewable wildlife. Consequently, elephant and other wildlife populations will be negatively affected through reduced conservation efforts arising from low funding and reduced goodwill from the communities. CAMPFIRE has been widely regarded as one of Africa's most successful contemporary conservation initiatives. Hunting of elephants plays an integral part in promoting CAMPFIRE as it permits the residents of communal lands to share in the benefits generated by wildlife utilization on those lands. (p. 24) - As shown above, the bulk of CAMPFIRE's revenue comes from hunting, with elephant hunting contributing more than 60% of annual revenue. The current revenue sharing guidelines require safari outfitters to pay revenue directly into community-controlled bank accounts and this has had a positive impact on community attitudes to wildlife conservation. These funds have been used by RDCs and producer Wards to promote wildlife conservation, but despite its achievements, CAMPFIRE still faces fundamental challenges. The most crucial of these challenges is developing strategies to accommodate the increasing human populations averaging 16-20 people per km^2 in some key CAMPFIRE areas. Understandably, the focus of these households is on food security requiring the extension of basic agricultural schemes and increased livestock numbers. Such land uses are incompatible with wildlife based land use … Despite these challenges, CAMPFIRE stands very high in the agenda of Zimbabwe's Government, and an evaluation dedicated to improving the program is ongoing and should be finalized by the end of 2017. Zimbabwe's Government recognizes that the survival of wild animals depends entirely on those among whom they live. Unless local people want to save them, wildlife will be poached to the point where just a few remain in fortified reserves. CAMPFIRE is meant to avoid this and the future of wildlife in communal areas rests on the success of this program. (p. 24) - The hunting of elephants, under sustainable and well-regulated conditions, has the potential to raise adequate funds to support itself and other species in CAMPFIRE areas. For these reasons, Zimbabwe

<table>
<tr><td></td><td>confirms its commitment to the sustainable use of elephant and other wildlife in its Elephant Management Plan, and recognizes the role that elephant play in the CAMPFIRE program. (p. 25)</td></tr>
<tr><td colspan="2"></td></tr>
<tr><td>SOAZ Report</td><td>
- The results of questionnaire responses from 14 safari operators indicate that for the 110 elephant on quota between them, there will be a combined financial loss of $3,364,450 to them and to Zimbabwe (Table 1). This will have a direct impact on 87 operators and Professional Hunters, 781 Staff, 245 Anti poaching personnel and approximately 108,000 people in rural communities living with elephants. (p. 3)
- Table 1. Results to show the number of dependents, elephant on quota and the loss of revenue and hunting days as a result of the US Fish & Wildlife Services suspension on import of elephant trophies for 14 Safari Operators in Zimbabwe (p. 3)
<table>
<tr><th colspan="4">Dependents</th><th rowspan="2">Number of Elephant on Quota</th><th rowspan="2">Hunting Days Lost Suspension</th><th rowspan="2">Value of Loss</th></tr>

<tr><td>87</td><td>781</td><td>245</td><td>108312</td><td>110</td><td>1430</td><td>US$3,364,450.00</td></tr>
</table>
- It is estimated that trophies of 160 sport hunted elephant are imported into the USA from Zimbabwe each year. If the information in Table 1 is extrapolated out for a quota of 160 elephant (I.e. multiply each figure by a factor of 1.45) then we can assume that the financial loss to Zimbabwe of the suspension will be in the region $4,878,452.50. It will have a direct impact on 126 Operators and Professional Hunters, 1132 staff, 355 anti poaching personnel and approximately 155,000 people living in rural communities. (p. 3)
- Table 2 shows that the 14 Safari Operators that responded to the questionnaire spent a combined total of $957,843.00 on anti poaching in their areas and this employs 245 people specifically for anti poaching. (p. 4)
- Table 2. The expenditure on Anti Poaching and number of Anti Poaching personnel employed by 14 Safari Operators in Zimbabwe (p. 4)
<table>
<tr><th>Anti Poaching expenditure – 2013</th><th>Anti Poaching Personnel Employed</th></tr>
<tr><td>US$957,843.00</td><td>245</td></tr>
</table>
- As in Section 3, if these figures are extrapolated out to give figures relative to the 160 sport hunted elephant imported into the USA each year from Zimbabwe, we can make the assumption that US hunters are assisting with the funding of $1,388,872.35 towards anti poaching in Zimbabwe through their safari
</td></tr>
</table>

	payments and that this is enabling the employment of 355 anti poaching personnel along with all the equipment and support required. The imposed suspension on the import of sport hunted elephant into the USA from Zimbabwe will have a significant detrimental impact on these figures and in many cases the anti poaching efforts will not be sustained. (p. 4)
FWS Press Release	- Legal, well-regulated sport hunting, as part of a sound management program, can benefit the conservation of listed species by providing incentives to local communities to conserve the species and by putting much-needed revenue back into conservation. At this time, the Service does not have conservation concerns with African elephant sport hunting in Namibia, South Africa, or Botswana; though it should be noted that Botswana is not currently open to elephant sport hunting.

Local Conservation Efforts

DOCUMENT NAME	SAMPLE OF KEY QUOTATIONS
ZPWMA Apr. 2014 Response	- The Parks and Wildlife Act Chapter 20:14 … recognises any land that is being used for wildlife conservation and designates the legal occupant of that land as Appropriate Authority. On communal lands/tribal Appropriate Authority is accorded to the Rural District Council. Appropriate Authority is the legal right to utilize and manage wildlife on the property under community jurisdiction. (p. 15-16)
ZPWMA Dec. 2014 Response	- The Parks and Wildlife Act accorded Appropriate Authority status to communal and private property areas with significant wildlife populations which confer user rights to the property owners. Appropriate Authority allows the property owners or tenants to manage and benefit from the wildlife on their land. Local communities through CAMPFIRE programs participate in quota setting workshops in which local communities get the opportunity to learn wildlife management practices from the various technocrats who will be presenting their game management practices. The local communities also get an opportunity to market their offtake to safari operators, which if they get a hunting client, proceeds, are remitted to the community thereby improving their livelihoods. This arrangement incentivizes landowners and tenants to not only tolerate wildlife, but to conserve and promote conservation and protection of wildlife. ZPWMA also provides para-military training to Rural District Council game guards, to equip them with law enforcement and anti-poaching techniques. In the communal areas, ZPWMA is working towards increasing its network of informers to assist in intelligence gathering, a vital tool in the fight against poaching. (p. 20) - ZPWMA strongly believes that local effort has played a major role in elephant conservation.

	- Safari operators in the field are cooperating with Government agencies in anti-poaching and intelligence gathering. Very often they generally provide transport and other resources to rangers. - NGOs have played a pivotal role in supporting elephant surveys, game water supply and research. - Private owned conservancies provide key habitats for elephants outside the protected area system, including law enforcement and research into elephant population dynamics. In some communal areas, land has been set aside as wildlife management areas. Many farmers with wildlife on their properties are receiving technical assistance on wildlife conservation including intensive breeding and ranching operations. (p. 25) - Fundamentally, ZimParks supports local efforts by providing a conducive legislative and policy environment which allows the private and community sectors to thrive. The granting of Appropriate Authority Status to private properties and Rural District Councils is a case in point. - In addition, we also do the following: - share anti-poaching intelligence with the stakeholders - hold joint patrols and send reinforcements when required - restocking - offer technical advisory services - collaborate in implementing the TFCA Programme - Partnerships and joint ventures (p. 26) - Mechanisms have been put in place such as tax incentives to promote and sustain efforts across Zimbabwe's elephant range. The Parks and Wildlife Act accorded Appropriate Authority status to communal and private properties areas with significant wildlife populations which confers user rights to the property owners. Appropriate Authority allows the property owners or tenants to manage and benefit from the wildlife on their land in a coordinated manner. This arrangement gives incentives to landowners and tenants to not only tolerate wildlife, but to conserve and promote conservation and protection of wildlife. The Wildlife Based Land Reform Policy and other related policies; measures have been put in place to encourage wildlife production in areas that are not suitable for agriculture… (p. 26)
ZPWMA July 2015 Response	- The communal areas benefits from wildlife through the CAMPFIRE program. This program is key in that it helps to encourage the communities to co-existence with wildlife. (p. 50)
ZPWMA, Elephant Management Plan 2015-2020	- The Role of Sport Hunting in Elephant Conservation: Elephants are a charismatic species but can also be destructive when they destroy crops, threaten livestock and even human lives. To have a future, elephants must have value. Value to the governing authorities and to the local people. The greater the

	value, the greater the tolerance of them is likely to be. The local people who live closest to them will determine the long-term survival of species like elephant. Regulated sport hunting converts wildlife into assets for the benefit of local people and the country as a whole. Wildlife can be a most valuable asset and in turn empower local communities and provide basic necessities. When it is viewed as a valuable asset, wildlife becomes an economically competitive land use in Zimbabwe, which leads to habitat preservation instead of habitat destruction and conversion to agriculture or livestock production. Game animals have a survival advantage because of user-pay stewardship systems where use revenue generated from tourist hunters is paid through to wildlife authorities and local communities. The presence of regulated hunting can also reduce illegal activities. Many hunting operators in Zimbabwe have specialised anti-poaching units. Private operators' lease agreements are being reviewed to include anti-poaching as an obligation of the concessionaire. Regulated hunting is the opposite of poaching. One is a lawful activity designed by government wildlife authorities and experts to perpetuate resources and the other is prohibited thievery outside of and away from the system. The first is like making a bank deposit and the second is like a bank robbery, without sustainable limits. Trophy hunting revenues are vital because there are not enough tourists to otherwise generate income to support all protected areas. Eco-tourism revenues are typically sufficient to cover the costs of only some of the parks and certainly not to justify wildlife as a land use outside of protected areas. Hunting is able to generate revenues under a wider range of scenarios than eco-tourism, including in remote areas lacking infra-structure, attractive scenery, or high densities of viewable wildlife. Consequently, elephant and other wildlife populations will be negatively affected through reduced conservation efforts arising from low funding and reduced goodwill from the communities, when in reality the elephant has the economic potential to raise adequate funds to support itself and other species. For these reasons, Zimbabwe confirms its commitment to the sustainable use of elephant and other wildlife in this Action Plan. (p. 12, Box 1) - v) Private sector: The corporate community participates in elephant management mainly through resource mobilization. Safari operators report poaching and assist in anti-poaching patrols. Through lease and trophy fees they provide revenue to ZPWMA. They help develop infrastructure, provide funds to communities and supplement diets with meat from trophy animals. Zimbabwe subscribes to the principle of sustainable utilisation of wildlife resources including elephants. Sport hunting is the principal form of wildlife utilisation whereby offtakes are adaptively managed and monitored through a participatory and science based process. This process allows for sustainable offtakes, and rigorous resource monitoring programmes that allow recruitment within a population to ensure the continued survival of the population in the wild. The high economic value conferred to the elephant through consumptive utilisation has also resulted in increased tolerance by local communities. (p. 12)

ZPWMA, Non-Detriment Finding (2014)	- The centralised command and control approach to law enforcement to protect the elephant is unlikely to work as proved in most parts of Africa. The long-term solution is to ensure greater return of elephants to the community. Conservation of elephants will be achieved as a by-product of the quest for sustainability. (p. 37)
SOAZ Report	- We have received information from fourteen safari operators in Zimbabwe. The operations of these companies cover a wide range of safari concessions including Government Safaris Areas, Campfire Areas and Private Conservancies. They also include safari concessions in the three main wildlife systems in Zimbabwe being; (1) Zambezi Valley and Sebungwe, (2) the North West including Hwange/Matetsi/Vic Falls and (3) the South & South East Lowveld including Gonarezhou, Save Valley Conservancy & Bubye Conservancy. (p. 1) - The results of questionnaire responses from 14 safari operators indicate that for the 110 elephant on quota between them, there will be a combined financial loss of $3,364,450 to them and to Zimbabwe (Table 1). This will have a direct impact on 87 operators and Professional Hunters, 781 Staff, 245 Anti poaching personnel and approximately 108,000 people in rural communities living with elephants. (p. 3) - While National Parks provide the primary refuge for elephant populations in Zimbabwe, a significant proportion of elephant live in the safari areas which are generally more marginal in terms of wildlife numbers and often have large rural human populations within or adjacent to them. The role of safari operations in providing a benefit to such communities and enforcing anti poaching as a means of maintaining elephant and other wildlife populations in these areas cannot be underestimated. (p. 4)
FWS Press Release	- In Zimbabwe, available data, though limited, indicate a significant decline in the elephant population. Anecdotal evidence, such as the widely publicized poisoning last year of 300 elephants in Hwange National Park, suggests that Zimbabwe's elephants are also under siege. - Legal, well-regulated sport hunting, as part of a sound management program, can benefit the conservation of listed species by providing incentives to local communities to conserve the species and by putting much-needed revenue back into conservation. At this time, the Service does not have conservation concerns with African elephant sport hunting in Namibia, South Africa, or Botswana; though it should be noted that Botswana is not currently open to elephant sport hunting.

Type of Activity:
Import of Sport-hunted Trophies of Southern African Leopard, African Elephant, and Namibian Southern White Rhinoceros

Complete Sections A or B, and C, D, and E of this application. U.S. address may be required in Section C, see instructions for details.
See attached instruction pages for information on how to make your application complete and help avoid unnecessary delays.

A. Complete if applying as an individual

1.a. Last name	1.b. First name	1.c. Middle name or initial	1.d. Suffix
Yacobucci	Dean	(b) (6)	

2. Date of birth (mm/dd/yyyy)	3. Social Security No.	4. Occupation	5. Affiliation/ Doing business as (see instructions)
(b) (6)			

6.a. Telephone number	6.b. Alternate telephone number	6.c. Fax number	6.d. E-mail address
(b) (6)			(b) (6)

B. Complete if applying on behalf of a business, corporation, public agency, Tribe, or institution

1.a. Name of business, agency, Tribe, or institution	1.b. Doing business as (dba)

2. Tax identification no.	3. Description of business, agency, Tribe, or institution

4.a. Principal officer Last name	4.b. Principal officer First name	4.c. Principal officer Middle name/ initial	4.d. Suffix

5. Principal officer title	6. Primary contact name

7.a. Business telephone number	7.b. Alternate telephone number	7.c. Business fax number	7.d. Business e-mail address

C. All applicants complete address information

1.a. Physical address (Street address; Apartment #, Suite #, or Room #; no P.O. Boxes)
(b) (6)

1.b. City	1.c. State	1.d. Zip code/Postal code:	1.e. County/Province	1.f. Country
East Aurora	NY	(b) (6)		US

2.a. Mailing Address (include if different than physical address; include name of contact person if applicable)

2.b. City	2.c. State	2.d. Zip code/Postal code:	2.e. County/Province	2.f. Country

D. All applicants MUST complete

1. Attach check or money order payable to the U.S. FISH AND WILDLIFE SERVICE **in the amount of $100, nonrefundable processing fee**. Federal, Tribal, State, and local government agencies, and those acting on behalf of such agencies, are exempt from the processing fee – ***attach documentation of fee exempt status as outlined in instructions.*** (50 CFR 13.11(d))

2. Do you currently have or have you ever had any Federal Fish and Wildlife permits?
Yes ☐ If yes, list the number of the most current permit you have held or that you are applying to renew/re-issue: _____ No ☒

3. Certification: I hereby certify that I have read and am familiar with the regulations contained in ***Title 50, Part 13 of the Code of Federal Regulations*** and the other ***applicable parts in subchapter B of Chapter I of Title 50***, and I certify that the information submitted in this application for a permit is complete and accurate to the best of my knowledge and belief. I understand that any false statement herein may subject me to the criminal penalties of 18 U.S.C. 1001.

E. IMPORT OF SPORT-HUNTED TROPHIES OF SOUTHERN AFRICAN LEOPARD, AFRICAN ELEPHANT, AND NAMIBIAN SOUTHERN WHITE RHINOCEROS

Note 1: If you hold an import permit for trophy/trophies that you did not use, please **return the unused original permit**. If you are requesting reissuance of a permit because you have taken a trophy, but were unable to import it prior to the expiration of the permit, please use the renewal form (3-200-52; http://www.fws.gov/international/permits/by-form-number/index.html) and return your original permit with that form.

Note 2: The U.S. FWS has determined that a trophy consists of raw or tanned parts of a specimen taken by a hunter during a sport hunt for personal use. It may include the bones, claws, hair, head, hide, hooves, horns, meat, skull, teeth, tusks, or any taxidermied part, including, but not limited to, a rug or taxidermied head, shoulder, or full mount. It does not include articles made from a trophy, such as worked, manufactured, or handicraft items for use as clothing, curios, ornamentation, jewelry, or other utilitarian items. If you wish to import such products, please contact the Division of Management Authority for the proper application form.

Note 3: Certain hunting trophies, including leopard, elephant, and rhinoceros hunting trophies, are subject to restrictions on their use after import into the United States. Please see 50 CFR 23.55 for more information or contact the Division of Management Authority.

Please provide the following information. Complete all questions on the application. Mark questions that are not applicable with "N/A". If applying for more than one trophy, be sure to answer questions 2 and 3 for each trophy. If importing trophies from more than one country, you must submit a separate application for each shipment in order to obtain separate import permits.

1. ENTER the quantity next to the name of the species you are applying to import (you may apply to import specimens of more than one species provided they have been/are being hunted in the same country):

Leopard (*Panthera pardus*) Quantity: _____ (Limited to the import of two per calendar year)

African elephant (*Loxodonta africana*) Quantity: 1 (Import permit is not required for trophies harvested in Botswana, Namibia, South Africa, or Zimbabwe). **Note: once imported, ivory cannot be re-exported.**

Southern white rhinoceros (*Ceratotherium simum simum*) from Namibia Quantity: _____ (An import permit is not required for trophies harvested in South Africa or Swaziland. If you are looking to import from a different country, please use form 3-200-37).

2. **IF ANIMAL IS CURRENTLY LIVING IN THE WILD**, please enter the following:
   a. Country and place (area, region, GIS coordinates, ranch AND nearest city) where wildlife is to be taken from the wild:

   b. Date wildlife is to be hunted:

   c. Description of the trophy and parts you intend to import (e.g., skin, skull, shoulder mount, life size mount, claws, horns, tusks).

3. **IF THE ANIMAL IS DEAD**, please enter the following:
   a. Country and place (area, region, GIS coordinates, ranch, and/or AND nearest city) where trophy was removed from the wild: Impalila, Namibia
   b. Date wildlife was hunted: 8-18-2015

c. Description of the trophy and parts you intend to import (e.g., skin, skull, shoulder mount, life size mount, claws, horn, tusks): tusks, molars, lower jaw bone, skin, tail, four feet

ISO codes NA IS 0060 12.70 NA IS 0059 13.10

d. The current location of the trophy (address and country) [the U.S. import permit will identify this country as the country of export/re-export and must match with the export/re-export document]:

Reiser Taxidermy
P.O. Box 11908
Windhoek, Namibia 9000

4. Complete name and address of overseas person or business shipping the trophy to you. If you are applying to import a trophy directly from Namibia, you **must** provide the name and address of the professional hunter listed on your Namibian hunting permit [this name will appear on the face of the export permit].

Name:	Reiser Taxidermy/Shipping	professional hunter
Business Name:		Tobie Engelbrecht
Address:	P.O. Box 11908	P.O. Box 66
Address:		
City:	Windhoek	Tsumeb, Namibia
State/Province:	Namibia 9000	
Country, Postal Code:		

5. Please be aware that the U.S. Fish and Wildlife Service may need to make a finding that your activities will enhance or benefit wild populations of the species involved. If you have any information that could support this finding (e.g., how the funds from license/trophy fees will be spent, what portion of the hunting fee will support conservation), please submit such information on a separate page with your application.

CERTIFICATION STATEMENT (original signature must be provided for either 6 or 7 below)

6. **If you are a broker or taxidermist applying on behalf of a foreign national,** provide documentation to show you have a **Power of Attorney** to act on your client's behalf and sign the following statement.

I acknowledge that the sport-hunted trophy/trophies to be imported has been/will be personally hunted by my client and is being imported only for my client's personal use (i.e., **not for sale, transfer, donation, or exchange that is reasonably likely to result in economic use, gain, or benefit**). I understand that my client may only import two leopard trophies in one calendar year (if applicable). In addition, I have advised my client that raw ivory, once imported into the United States, cannot be re-exported.

Taxidermist/Broker's signature: _____ Date: _____

7. **If you are the hunter applying to import your own trophy**, please read and sign the following statement.

I acknowledge that the sport-hunted trophy/trophies to be imported has been/will be personally hunted by me and is being imported only for my personal use (i.e., **not for sale, transfer, donation, or exchange that is reasonably likely to result in economic use, gain, or benefit**). I understand that I may only import two leopard trophies in one calendar year (if applicable). In addition, I understand that raw ivory, once imported into the United States, cannot be re-exported.

Applicant's signature: _____ Date: 8-11-2016

Be aware that there may be additional permitting or approval requirements by your local or state governments, as well as required by other Federal agencies or foreign government to conduct your propose activity. While the Service will attempt to assist where possible, it is your responsibility to obtain such approval.

8. All international shipment(s) must be through a designated port. A list of designated ports (where an inspector is posted) is available from http://www.fws.gov/le/designated-ports.html. If you wish to use a port not listed, please contact the Office of Law Enforcement for a Designated Port Exemption Permit (form 3-200-2).

9. Name and address where you wish the permit to be mailed, if different from page 1 (All permits will be mailed via the U.S. Postal Service, unless you identify an alternative means below):

10. If you wish the permit to be delivered by means other than USPS regular mail, provide an air bill, pre-paid envelope, or billing information. If you do not have a pre-paid envelope or air bill and wish to pay for a courier service with your credit card, please check the box below. Please DO NOT include credit card number or other information; you will be contacted for this information.

☐ If a permit is issued, please send it via a courier service to the address on page 1 or question 9. I understand that you will contact me for my credit card information once the application has been processed.

11. Who should we contact if we have questions about the application? (Include name, phone number, and email):

Dean Yacobucci
(b) (6) [redacted]

12. **Disqualification Factor**. A conviction, or entry of a plea of guilty or nolo contendere, for a felony violation of the Lacey Act, the Migratory Bird Treaty Act, or the Bald and Golden Eagle Protection Act disqualifies any such person from receiving or exercising the privileges of a permit, unless such disqualification has been expressly waived by the Service Director in response to a written petition. (50 CFR 13.21(c)) Have you or any of the owners of the business, if applying as a business, been convicted, or entered a plea of guilty or nolo contendere, forfeited collateral, or are currently under charges for any violations of the laws mentioned above?

☐ Yes ☒ No If you answered "Yes" provide: a) the individual's name, b) date of charge, c) charge(s), d) location of incident, e) court, and f) action taken for each violation.

To: US Fish and Wildlife Service

Re: Support of permit to import African Elephant

To whom it may concern,

The African Elephant that I harvested was taken in the Eastern Caprivi region of Namibia, which is currently known for its healthy elephant population and Namibia is well-known for its low poaching activity. The conservancy it was taken in is administered by the indigenous peoples and well established conservation policies are in force. Literally, within minutes of harvesting the elephant, natives were present to obtain the elephant meat. The taking of game animals provides needed protein for the local inhabitants and at least 100 villagers were quickly present to obtain the meat, some were even refugees from Zambia. In four hours all the elephant meat was gone, taken away by the villagers. In addition to the meat, the tribal conservancy benefits from monies that are paid to it from the harvest of the game animals in their area. While in that conservancy, I harvested a Buffalo exclusively for the tribal Chief to be used in his yearly celebration. A hippo was also later taken. All the meat and the monies from these additional animals went as well to the local populous to fund building infrastructure, conservation measures, and crime prevention including control of the poaching of game animals. I was personally thanked by the regional tribal chief for my support of their community.

Sincerely,

Dean Yacobucci

CHIEF, BRANCH OF PERMITS, DMA

Permittee:
DEAN (b) (6) YACOBUCCI
(b) (6)
EAST AURORA, NY (b) (6)
U.S.A.

Authority: Statutes and Regulations: 16 USC 1539 (a); 50 CFR 17.40 (e).

Location where authorized activity may be conducted:
IMPORT THROUGH ANY PORT LISTED IN 50 CFR 14.12

Reporting requirements: Not applicable

Conditions and Authorizations:

A. General conditions set out in Subpart D of 50 CFR 13, and specific conditions contained in Federal regulations cited above, are hereby made a part of this permit. All activities authorized herein must be carried out in accord with and for the purposes described in the application submitted. Continued validity, or renewal of this permit is subject to complete and timely compliance with all applicable conditions, including the filing of all required information and reports.

B. The validity of this permit is also conditioned upon strict observance of all applicable foreign, state, local, tribal, or other federal law.

C. Valid for use by permittee named above.

D. Acceptance of this permit serves as evidence that the permittee understands and agrees to abide by the "General Permit Conditions" (copy attached).

E. Authorized to import the sport-hunted trophy of one African elephant (*Loxodonta africana*), taken in Namibia for the purpose of enhancement of the survival of the species.

F. Specimen may not be sold or transferred for any financial remuneration.

G. U.S. Threatened Species: tusks must be marked as per [50 CFR 17.40(e)]. In accordance with the African Elephant Conservation Act, raw ivory, including sport-hunted trophies that are wholly or partially ivory, may not be re-exported from the U.S.

H. **Trophy must have been taken during the 2015 hunting season.**

I. Trophy must be accompanied by a valid Convention on International Trade in Endangered Species (CITES) Appendix II export permit issued by the Management Authority of Namibia.

Re: Permit Renewal Permit Number MA04322C-0

Dear Officer,

Over 1 year ago I applied for and was issued Permit MA04322C-0 for the Import of Elephant from Namibia. The taxidermist and shipper were aware of the expiration date of the permit as 10/06/2017 for months and the trophies had been ready for export for weeks. Despite this, the trophies were finally transferred to the airport cargo hold in Namibia as the permit was due to expire. At the risk of not having them arrive before the permit expired, a stop was put on their transport from Namibia on the last day of the permit. Please renew the existing permit that has expired. There have been no changes from the original application.

Thank you,

Dean Yacobucci

Federal Fish and Wildlife Permit Application Form

Return to: U.S. Fish and Wildlife Service
(Enter address from pages 5 and 6 of application)

Type of Activity:
REISSUANCE, RENEWAL, OR AMENDMENT OF A PERMIT
(For this application, all permits, registrations, and certificates are referred to as a permit.)

Complete Sections A or B, C, D, and E of this application. U.S. address may be required in Section C, see instructions for details.
See attached instruction pages for information on how to make your application complete and help avoid unnecessary delays.

A. Complete if applying as an individual

1.a. Last name	1.b. First name	1.c. Middle name or initial	1.d. Suffix
Yacobucci	Dean	(b) (6)	

2. Date of birth (mm/dd/yyyy)	3. Social Security No.	4. Occupation	5. Affiliation/ Doing business as (see instructions)
(b) (6)			

6.a. Telephone number	6.b. Alternate telephone number	6.c. Fax number	6.d. E-mail address
(b) (6)			(b) (6)

B. Complete if applying on behalf of a business, corporation, public agency, Tribe, or institution

1.a. Name of business, agency, Tribe, or institution	1.b. Doing business as (dba)

2. Tax identification no.	3. Description of business, agency, Tribe, or institution

4.a. Principal officer Last name	4.b. Principal officer First name	4.c. Principal officer Middle name/ initial	4.d. Suffix

5. Principal officer title	6. Primary contact name

7.a. Business telephone number	7.b. Alternate telephone number	7.c. Business fax number	7.d. Business e-mail address

C. All applicants complete address information

1.a. Physical address (Street address; Apartment #, Suite #, or Room #; no P.O. Boxes)
(b) (6)

1.b. City	1.c. State	1.d. Zip code/Postal code:	1.e. County/Province	1.f. Country
East Aurora	NY	(b) (6)		USA

2.a. Mailing Address (include if different than physical address; include name of contact person if applicable)

2.b. City	2.c. State	2.d. Zip code/Postal code:	2.e. County/Province	2.f. Country

D. All applicants MUST complete

1. Attach check or money order payable to the U.S. FISH AND WILDLIFE SERVICE **in the amount indicated on pages 6 and 7**. Federal, Tribal, State, and local government agencies, and those acting on behalf of such agencies, are exempt from the processing fee – ***attach documentation of fee exempt status as outlined in instructions.*** (50 CFR 13.11(d))

2. Do you currently have or have you ever had any Federal Fish and Wildlife permits?
Yes [X] If yes, list the number of the most current permit you have held or that you are applying to renew/re-issue: MA04322C-0 No [ ]

3. Certification: I hereby certify that I have read and am familiar with the regulations contained in ***Title 50, Part 13 of the Code of Federal Regulations*** and the other ***applicable parts in subchapter B of Chapter I of Title 50***, and I certify that the information submitted in this application for a permit is complete and accurate to the best of my knowledge and belief. I understand that any false statement herein may subject me to the criminal penalties of 18 U.S.C. 1001.

Signature (in blue ink) of applicant/person responsible for permit (No photocopied or stamped signatures) — Date of signature (mm/dd/yyyy): 10-10-2017

E. REISSUANCE, RENEWAL, OR AMENDMENT OF A PERMIT (For this application, all permits, registrations, and certificates are referred to as a permit.)

NOTE 1: If you are renewing your Designated Port Exemption permit, use form 3-200-2 (http://www.fws.gov/forms/3-200-2.pdf) and submit to appropriate Office of Law Enforcement address. If you are renewing your Import/Export license (required for commercial activities), use form 3-200-3 (http://www.fws.gov/forms/3-200-3.pdf) and submit to appropriate Office of Law Enforcement address.

NOTE 2: This form **cannot** be used for lost or damaged permit. If you need to replace a lost or damaged permit, please use form 3-200-66, http://www.fws.gov/international/pdf/permit-application-form-3-200-66-replacement-document.pdf. The application **must** be submitted to the office that issued the initial permit. Lost or damaged permit

NOTE 3: Some activities, such as all master files for multiple shipments, Certificate of Scientific Exchange (COSE), circus/traveling exhibits, and artificially propagated plants, can only be re-issued, renewed, or amended by submitting a new application for permits for those activities. Please refer to http://www.fws.gov/international/permits/by-form-number/index.html to determine if another application form would be more appropriate or contact the Division of Management Authority for more information.

1. **Permit number.** Enter the permit number to be reissued/renewed/amend MA04322C-0

2. Submit the original permit with this application.

3. **Past activities.**
   a. Provide copies of all cleared documents and form 3-177 (FWS declaration of wildlife) associated with this permit.
   b. Provide a summary detailing activities conducted under this permit, as well as a brief statement of why you are seeking reissuance/renewal.

4. **Annual Report.** If required by your permit, provide an annual report as conditioned (Please disregard if you have already submitted your annual report.)

5. **Sport-hunted trophies:** If you did not hunt during the hunting season stated in your original application, you are not eligible for a renewal. Please submit a new application form.

6. **Certification** - Complete one of the statements below and supply any additional documentation requested: (original signature is required)

   a. For **NO CHANGES** to original application:

   I certify that the information submitted in support of my original application for the permit indicated above has not changed and is still currently correct. I hereby request reissuance or renewal of this permit.

   Permittee's signature: _____ Date: 10-10-2017

   b. For **CHANGES** to original application:

   On an attached page(s), provide a complete description of any changes (e.g., change in principal officer, personnel, address, location of activities, types of activities). Please sign each attached page. Also note that we need to request additional information regarding the changes after reviewing your initial request.

   I certify that the information submitted in support of my original application for the permit indicated above is still currently correct EXCEPT for the changes noted on the attached, signed page(s). I hereby request re-issuance or renewal of this permit with the indicated changes.

   Permittee's signature: _____ Date: _____

7. All international shipment(s) must be through a designated port, unless otherwise authorized. A list of designated ports (where an inspector is posted) is available from http://www.fws.gov/le/designated-ports.html. If you wish to use a port not listed, please contact either the Office of Law Enforcement for a Designated Port Exemption Permit (form 3-200-2) or the Division of Management Authority.

8. Name and address where you wish the permit to be mailed, if different from page 1 (All permits will be mailed via the U.S. Postal Service, unless you identify an alternative means below):

9. If you wish the permit to be delivered by means other than USPS regular mail, provide an air bill, pre-paid envelope, or billing information. If you do not have a pre-paid envelope or air bill and wish to pay for a courier service with your credit card, please check the box below. Please DO NOT include credit card number or other information; you will be contacted for this information.

   ☐ If a permit is issued, please send it via a courier service to the address on page 1 or question 8. I understand that you will contact me for my credit card information once the application has been processed.

11. Who should we contact if we have questions about the application? (Include name, phone number, and email):

Dean Yasharian
(b) (6) [redacted]

12. **Disqualification Factor.** A conviction, or entry of a plea of guilty or nolo contendere, for a felony violation of the Lacey Act, the Migratory Bird Treaty Act, or the Bald and Golden Eagle Protection Act disqualifies any such person from receiving or exercising the privileges of a permit, unless such disqualification has been expressly waived by the Service Director in response to a written petition. [50 CFR 13.21(c)]. Have you or any of the owners of the business, if applying as a business, been convicted, or entered a plea of guilty or nolo contendere, forfeited collateral, or are currently under charges for any violations of the laws mentioned above?

☐ Yes ☒ No If you answered "Yes" provide: a) the individual's name, b) date of charge, c) charge(s), d) location of incident, e) court, and f) action taken for each violation.

If you need to replace a lost or damaged permit, please use form 3-200-66, http://www.fws.gov/international/pdf/permit-application-form-3-200-66-replacement-document.pdf. The application **must** be submitted to the office that issued the initial permit. Lost or damaged permit

NOTE 3: Some activities, such as all master files for multiple shipments, Certificate of Scientific Exchange (COSE), circus/traveling exhibits, and artificially propagated plants, can only be re-issued, renewed, or amended by submitting a new application for permits for those activities. Please refer to http://www.fws.gov/international/permits/by-form-number/index.html to determine if another application form would be more appropriate or contact the Division of Management Authority for more information.

1. **Permit number.** Enter the permit number to be reissued/renewed/amend MA043276-0

2. Submit the original permit with this application.

3. **Past activities.**
   a. Provide copies of all cleared documents and form 3-177 (FWS declaration of wildlife) associated with this permit.
   b. Provide a summary detailing activities conducted under this permit, as well as a brief statement of why you are seeking reissuance/renewal.

4. **Annual Report.** If required by your permit, provide an annual report as conditioned (Please disregard if you have already submitted your annual report.)

5. **Sport-hunted trophies:** If you did not hunt during the hunting season stated in your original application, you are not eligible for a renewal. Please submit a new application form.

6. **Certification** - Complete one of the statements below and supply any additional documentation requested: (original signature is required)

   a. For **NO CHANGES** to original application:

   I certify that the information submitted in support of my original application for the permit indicated above has not changed and is still currently correct. I hereby request reissuance or renewal of this permit.

   Permittee's signature: _____ (b) (6) _____ Date: 8-31-17

   b. For **CHANGES** to original application:

   On an attached page(s), provide a complete description of any changes (e.g., change in principal officer, personnel, address, location of activities, types of activities). Please sign each attached page. Also note that we need to request additional information regarding the changes after reviewing your initial request.

   I certify that the information submitted in support of my original application for the permit indicated above is still currently correct EXCEPT for the changes noted on the attached, signed page(s). I hereby request re-issuance or renewal of this permit with the indicated changes.

   Permittee's signature: _____ Date: _____

7. All international shipment(s) must be through a designated port, unless otherwise authorized. A list of designated ports (where an inspector is posted) is available from http://www.fws.gov/le/designated-ports.html. If you wish to use a port not listed, please contact either the Office of Law Enforcement for a Designated Port Exemption Permit (form 3-200-2) or the Division of Management Authority.

8. Name and address where you wish the permit to be mailed, if different from page 1 (All permits will be mailed via the U.S. Postal Service, unless you identify an alternative means below):

9. If you wish the permit to be delivered by means other than USPS regular mail, provide an air bill, pre-paid envelope, or billing information. If you do not have a pre-paid envelope or air bill and wish to pay for a courier service with your credit card, please check the box below. Please DO NOT include credit card number or other information; you will be contacted for this information.

   ☒ If a permit is issued, please send it via a courier service to the address on page 1 or question 8. I understand that you will contact me for my credit card information once the application has been processed.

11. Who should we contact if we have questions about the application? (Include name, phone number, and email):

12. **Disqualification Factor.** A conviction, or entry of a plea of guilty or nolo contendere, for a felony violation of the Lacey Act, the Migratory Bird Treaty Act, or the Bald and Golden Eagle Protection Act disqualifies any such person from receiving or exercising the privileges of a permit, unless such disqualification has been expressly waived by the Service Director in response to a written petition. [50 CFR 13.21(c)]. Have you or any of the owners of the business, if applying as a business, been convicted, or entered a plea of guilty or nolo contendere, forfeited collateral, or are currently under charges for any violations of the laws mentioned above?

☐ Yes ☒ No If you answered "Yes" provide: a) the individual's name, b) date of charge, c) charge(s), d) location of incident, e) court, and f) action taken for each violation.

Re: Two Applications for Import of Elephant Trophies from Zimbabwe:

Dear Chief Van Norman,

Enclosed please find two permit applications for harvested African elephant trophies from Zimbabwe:

- Richard (b) (6) Bonander
- Thomas (b) (6) Whaley

Please refer to the numerous documents and responses previously sent to the U.S. Fish and Wildlife Service by the Zimbabwe Parks and Wildlife Management Authority, Conservation Force, professional hunters and operators, professional hunting organizations, and the CAMPFIRE Association, which demonstrates that Zimbabwe's elephant hunting program is well managed and the hunting enhances the survival of the species.

Sincerely,

John J. Jackson, III

NOTICE OF REPRESENTATION

RCVD AUG 22 2016

This is a notice to the U.S. Fish and Wildlife Service that I have appointed John J. Jackson, III and Regina Lennox of the non-profit firm Conservation Force as my attorneys and legal representatives for all matters concerning my application for a permit to import a threatened-listed African elephant trophy.

This authority is inclusive and extends to all applications and filings, whether administrative or judicial, including but not limited to any request for reconsideration, appeal, and litigation.

I also request that these attorneys, through the address for Conservation Force below, be copied with all correspondence, acknowledgements, notices and decisions concerning my application to import my ~~lion~~ Elephant trophy at the following address:

Type of Activity:
Import of Sport-hunted Trophies of Southern African Leopard, African Elephant, and Namibian Southern White Rhinoceros

Complete Sections A or B, and C, D, and E of this application. U.S. address may be required in Section C, see instructions for details.
See attached instruction pages for information on how to make your application complete and help avoid unnecessary delays.

A. Complete if applying as an individual

1.a. Last name	1.b. First name	1.c. Middle name or initial	1.d. Suffix
Bonander	Richard	(b) (6)	

2. Date of birth (mm/dd/yyyy)	3. Occupation	4. Affiliation/ Doing business as (see instructions)
(b) (6)		

5.a. Telephone number	5.b. Alternate telephone number	5.c. Fax number	5.d. E-mail address
(b) (6)			

B. Complete if applying on behalf of a business, corporation, public agency, Tribe, or institution

1.a. Name of business, agency, Tribe, or institution	1.b. Doing business as (dba)

2. Tax identification no.	3. Description of business, agency, Tribe, or institution

4.a. Principal officer Last name	4.b. Principal officer First name	4.c. Principal officer Middle name/ initial	4.d. Suffix

5. Principal officer title	6. Primary contact name

7.a. Business telephone number	7.b. Alternate telephone number	7.c. Business fax number	7.d. Business e-mail address

C. All applicants complete address information

1.a. Physical address (Street address; Apartment #, Suite #, or Room #; no P.O. Boxes)
(b) (6)

1.b. City	1.c. State	1.d. Zip code/Postal code:	1.e. County/Province	1.f. Country
Casper	Wyoming	(b) (6)		USA

2.a. Mailing Address (include if different than physical address; include name of contact person if applicable)

2.b. City	2.c. State	2.d. Zip code/Postal code:	2.e. County/Province	2.f. Country

D. All applicants MUST complete

1. Attach check or money order payable to the U.S. FISH AND WILDLIFE SERVICE **in the amount of $100, nonrefundable processing fee**. Federal, Tribal, State, and local government agencies, and those acting on behalf of such agencies, are exempt from the processing fee – ***attach documentation of fee exempt status as outlined in instructions.*** (50 CFR 13.11(d))

2. Do you currently have or have you ever had any Federal Fish and Wildlife permits?
Yes ☑ If yes, list the number of the most current permit you have held or that you are applying to renew/re-issue: MA66124B-0 No ☐

3. Certification: I hereby certify that I have read and am familiar with the regulations contained in ***Title 50, Part 13 of the Code of Federal Regulations*** and the other ***applicable parts in subchapter B of Chapter I of Title 50***, and I certify that the information submitted in this application for a permit is complete and accurate to the best of my knowledge and belief. I understand that any false statement herein may subject me to the criminal penalties of 18 U.S.C. 1001.

Richard Bonander — 07/18/2016

E. IMPORT OF SPORT-HUNTED TROPHIES OF SOUTHERN AFRICAN LEOPARD, AFRICAN ELEPHANT, AND NAMIBIAN SOUTHERN WHITE RHINOCEROS

Note 1: If you hold an import permit for a trophy/trophies that you did not use, please **return the unused original permit.** If you are requesting reissuance of a permit because you have taken a trophy, but were unable to import it prior to the expiration of the permit, please use the renewal form (3-200-52; http://www.fws.gov/international/permits/by-form-number/index.html) and return your original permit with that form.

Note 2: *Sport-hunted trophy* is defined at 50 CFR 23.74 as follows: *Sport-hunted trophy* means a whole dead animal or a readily recognizable part or derivative of an animal specifically identified on the accompanying CITES document that meets the following criteria:

(1) Is raw, processed, or manufactured;
(2) Was legally obtained by the hunter through hunting for his or her personal use;
(3) Is being imported, exported, or re-exported by or on behalf of the hunter as part of the transfer from its country of origin ultimately to the hunter's country of usual residence; and
(4) Includes worked, manufactured, or handicraft items made from the sport-hunted animal only when:
(i) Such items are contained in the same shipment as raw or tanned parts of the sport-hunted animal and are for the personal use of the hunter;
(ii) The quantity of such items is no more than could reasonably be expected given the number of animals taken by the hunter as shown on the license or other documentation of the authorized hunt accompanying the shipment; and
(iii) The accompanying CITES documents (export document and, if appropriate, import permit) contain a complete itemization and description of all items included in the shipment.

Note 3: Certain hunting trophies, including leopard, elephant, and rhinoceros hunting trophies, are subject to restrictions on their use after import into the United States. Please see 50 CFR 23.55 for more information or contact the Division of Management Authority.

Please provide the following information. Complete all questions on the application. Mark questions that are not applicable with "N/A". If applying for more than one trophy, be sure to answer questions 2 and 3 for each trophy.

If importing trophies from more than one country, you must submit a separate application for each shipment in order to obtain separate import permits.

1. ENTER the quantity next to the name of the species you are applying to import (you may apply to import specimens of more than one species provided they have been/are being hunted in the same country):

Leopard (*Panthera pardus*) Quantity:_____(Import is limited to two per hunter per calendar year)

African elephant (*Loxodonta africana*) Quantity:__1__(Import is limited to two per hunter per calendar year)
Note: once imported, ivory cannot be re-exported.

Southern white rhinoceros (*Ceratotherium simum simum*) from Namibia Quantity:_____ (An import permit is not required for trophies harvested in South Africa or Swaziland. If you wish to import from a different country, please use form 3-200-37).

2. **IF ANIMAL IS CURRENTLY LIVING IN THE WILD,** please enter the following:
   a. Country and place (area, region, GIS coordinates, ranch AND nearest city) where wildlife is to be taken from the wild:

   b. Date wildlife is to be hunted:

c. Description of the trophy and parts you intend to import (e.g., skin, skull, shoulder mount, life size mount, claws, horns, tusks).

3. **IF THE ANIMAL IS DEAD**, please enter the following:
   a. Country and place (area, region, GIS coordinates, ranch, and/or AND nearest city) where trophy was removed from the wild: Zimbabwe, Ngamo/Sikumi Forest Block Matabeleland N Grid Reference 246130, Wanke, Zimbabwe (Hwange)
   b. Date wildlife was hunted: March 21, 2015
   c. Description of the trophy and parts you intend to import (e.g., skin, skull, shoulder mount, life size mount, claws, horn, tusks):

      Skin, tusks, skull and 2 leg bones

   d. The current location of the trophy (address and country) [the U.S. import permit will identify this country as the country of export/re-export and must match with the export/re-export document]:

      Trophy Consultants International, No. 4 Josiah Chinamana Road, Belmont, Bulawayo, Zimbabwe

4. Complete name and address of overseas person or business shipping the trophy to you. If you are applying to import a trophy directly from Namibia, you **must** provide the name and address of the professional hunter listed on your Namibian hunting permit [this name will appear on the face of the export permit].

Name: Business	Trophy Consultants International
Name: Address:	No. 4 Josiah Chinamano Road
Address:	Belmont
City:	Bulawayo
State/Province:	
Country, Postal Code:	Zimbabwe

phone # 263-9-74356

5. Please be aware that the U.S. Fish and Wildlife Service may need to make a finding that your activities will enhance or benefit wild populations of the species involved. If you have any information that could support this finding (e.g., how the funds from license/trophy fees will be spent, what portion of the hunting fee will support conservation), please submit such information on a separate page with your application.

Please see information submitted by Conservation Force, range state authorities, safari hunting operators, and others.

CERTIFICATION STATEMENT (original signature must be provided for either 6 or 7 below)

6. **If you are a broker or taxidermist applying on behalf of a foreign national,** provide documentation to show you have a **Power of Attorney** to act on your client's behalf and sign the following statement.

   I acknowledge that the sport-hunted trophy/trophies to be imported has been/will be personally hunted by my client and is being imported only for my client's personal use (i.e., **not for sale, transfer, donation, or exchange that is reasonably likely to result in economic use, gain, or benefit**). I understand that my client may only import two leopard trophies in one calendar year. I understand that my client may only import two African elephant trophies in one calendar year. In addition, I have advised my client that raw ivory, once imported into the United States, cannot be re-exported.

   Taxidermist/Broker's signature:_____ Date: _____

If you are the hunter applying to import your own trophy, please read and sign the following statement.

I acknowledge that the sport-hunted trophy/trophies to be imported has been/will be personally hunted by me and is being imported only for my personal use (i.e., **not for sale, transfer, donation, or exchange that is reasonably likely to result in economic use, gain, or benefit**). I understand that I may only import two leopard trophies in one calendar year. I understand that I may only import two African elephant trophies in one calendar year. In addition, I understand that raw ivory, once imported into the United States, cannot be re-exported.

Applicant's signature: _____ Date: July 18, 2016

Be aware that there may be additional permitting or approval requirements by your local or state governments, as well as required by other Federal agencies or foreign government to conduct your proposed activity. While the Service will attempt to assist where possible, it is your responsibility to obtain such approval.

8. All international shipment(s) must be through a designated port. A list of designated ports (where an inspector is posted) is available from http://www.fws.gov/le/designated-ports.html. If you wish to use a port not listed, please contact the Office of Law Enforcement for a Designated Port Exemption Permit (form 3-200-2).

   Portland, OR

9. Name and address where you wish the permit to be mailed, **if different from page 1** (All permits will be mailed via the U.S. Postal Service, unless you identify an alternative means below):

10. If you wish the permit to be delivered by means other than USPS regular mail, provide an air bill, pre-paid envelope, or billing information. If you do not have a pre-paid envelope or air bill and wish to pay for a courier service with your credit card, please check the box below. Please DO NOT include credit card number or other information; you will be contacted for this information.

    ☐ If a permit is issued, please send it via a courier service to the address on page 1 or question 9. I understand that you will contact me for my credit card information once the application has been processed.

11. Who should we contact if we have questions about the application? (Include name, phone number, and email):

    Applicant or John J. Jackson, III or Regina Lennox of Conservation Force, 504-837-1233, cf@conservationforce.org

12. **Disqualification Factor.** A conviction, or entry of a plea of guilty or nolo contendere, for a felony violation of the Lacey Act, the Migratory Bird Treaty Act, or the Bald and Golden Eagle Protection Act disqualifies any such person from receiving or exercising the privileges of a permit, unless such disqualification has been expressly waived by the Service Director in response to a written petition. (50 CFR 13.21(c)) Have you or any of the owners of the business, if applying as a business, been convicted, or entered a plea of guilty or nolo contendere, forfeited collateral, or are currently under charges for any violations of the laws mentioned above?

    ☐ Yes ☑ No If you answered "Yes" provide: a) the individual's name, b) date of charge, c) charge(s), d) location of incident, e) court, and f) action taken for each violation.

Mr. Richard (b) Bonander
(b) (6)
Casper, Wyoming (b) (6)

Dear Mr. Bonander:

This letter responds to your July 18, 2016, application to import under the U.S. Endangered Species Act (Act), a personal sport-hunted African elephant (*Loxodonta africana*) trophy taken in Zimbabwe during the 2015 hunting season. After careful review of your request for a permit, and after reviewing all available data and information on activities and circumstances occurring in Zimbabwe at the time you conducted your hunt, your application is being denied for the reasons outlined below.

The African elephant is listed as threatened under the Act with a special rule under Section 4(d) of the Act[1], which is set forth in regulations found at 50 CFR 17.40 (e)[2]. Under the special rule, issuance of an import permit can only occur if the U.S. Fish and Wildlife Service (Service) finds that the killing of the trophy animal intended for import would enhance the survival of the species [50 CFR 17.40(e)(6)(i)(B)], and the trophy is accompanied by a threatened species permit issued under 50 CFR 17.32[3]. To enhance the survival of the species, the importation must be associated with activities that provide a direct or indirect benefit to the species in the wild. In evaluating whether the killing of the trophy animal intended for import into the United States contributes to the enhancement of African elephant populations within a given country, the Service looks at a number of factors. Such factors may include: current elephant population estimates in a given country, whether said county has a valid national and/or regional management plan, is the plan currently being implemented and does it contain achievable and measurable objectives, does the plan take an adaptive management approach and how often is it reviewed and/or updated, the designated authorities responsible for overseeing elephant management and how they are funded, the level of human-wildlife conflict taking place and how it is being addressed, any anti-poaching efforts undertaken, habitat conservation measures currently in place, as well as the amount of revenue generated by elephant hunting and how it is utilized in supporting conservation projects and/or managing the species.

The best available scientific and management data, as well as information provided to the Service by Zimbabwe Parks & Wildlife Management Authority (ZPWMA), Conservation Force, and Safari Club International, was used in our evaluation. In evaluating the available data and information on elephant hunting in Zimbabwe at the time your hunt occurred, the Service was unable to determine that the killing of African elephants in Zimbabwe, whose trophies are intended for importation into the United States, would enhance the survival of the species. Therefore, the import of sport-hunted elephant trophies taken in Zimbabwe during the 2015 hunting season cannot be authorized. A copy of the Division of Management Authority's finding for the 2015 hunting season is enclosed for your reference.

As provided in 50 CFR 13.29(a)[4], you may request reconsideration of our decision to deny your application. Such a request must be in writing with the original signature of the person requesting reconsideration or by that person's legal representative, must contain a certification statement as provided at 50 CFR 13.12(a)(5)[5], should refer to your file number, PRT–04846C, and must be received in this office within 45 days of the date of this letter. The reconsideration of the decision to deny your request will be based on the information you provided in your original application. As such, your letter requesting reconsideration must address how our decision to deny your application was based on a misinterpretation of the information provided in your application or information available to the Service when making the original denial or it must present clarification of this information. **Should you supply new information that changes the scope of your original application, a new application will need to be submitted to this office before such information can be considered.**

If you have any questions, please contact Supervisory Policy Specialist Michael S. Moore of this office: Division of Management Authority, Branch or Permits, MS:IA, 5275 Leesburg Pike, Falls Church, VA 22041-3803 (703-358-2104, ext. 1983).

Sincerely,

Timothy J. Van Norman, Chief
Branch of Permits
Division of Management Authority

MAY 16 2017

Mr. Richard (b) Bonander
(b) (6) (6)
Casper, Wyoming (b) (6)

Dear Mr. Bonander:

This letter responds to your April 6, 2017, letter from your representative, John J. Jackson, III, requesting reconsideration of the February 23, 2017, decision to deny your application for a permit to import a personal sport-hunted African elephant (*Loxodonta africana*) trophy taken on March 21, 2015, in Zimbabwe. After a thorough review of Mr. Jackson's response on your behalf, it is my decision to uphold the original denial of your application.

As you know, the African elephant is listed as threatened with a special rule under Section 4(d) of the U.S. Endangered Species Act (Act)[1]. Under the special rule, issuance of an import permit for a sport-hunted trophy can only occur if the U.S. Fish and Wildlife Service (Service) finds that the killing of the trophy animal would enhance the survival of the species, and the trophy is accompanied by a threatened species permit. To enhance the survival of the species, the importation must be associated with activities that provide a direct or indirect benefit to the species in the wild.

At the time you originally applied for a permit, the Service had reviewed the best available scientific and management data, including information made available to the Service by Zimbabwe Parks & Wildlife Management Authority (ZPWMA), Conservation Force, and Safari Club International, in evaluating the status of Zimbabwe's elephant management program at the time you conducted your hunt. Based on this material, the Division of Management Authority (DMA) made a finding on March 26, 2015, that we were unable to find that the import of an elephant trophy taken during the 2015 hunting season would meet the requirements of the Act and the special rule for African elephant. Mr. Jackson's April 6, 2017, letter asked that the Service reconsider your application, in part, based on his assertion that the enhancement finding failed to consider significant information submitted by Conservation Force, ZPWMA, and others, both before and after the finding was made, that would lead to a reversal of the Service's negative finding.

Regarding Mr. Jackson's assertion that the Service failed to consider significant information submitted by Conservation Force and ZPWMA when making its determination, the Service has taken into consideration all of the information available to the Service regarding elephant hunting

1 The text of this Act can be found by using the search bar at the top of the following web page: http://Go.USA.Gov/xr6dd.

in Zimbabwe at the time your hunt occurred (March 21, 2015). While Mr. Jackson's request for reconsideration included additional information that was not available to the Service at the time the March 26, 2015, finding was made, most of the information documented activities and actions that occurred after the conclusion of your hunt. While this new information may be relevant to hunts that occurred after our March 26, 2015 finding, it does not demonstrate that the situation in Zimbabwe, at the time of your hunt, was different than previously considered by the Service and would result in a revision of the March 2015 finding. Therefore, I am upholding the original denial of your application.

As provided in 50 CFR 13.29(e)[2], you may appeal to the Director of the Fish and Wildlife Service, through this office: Division of Management Authority, Branch of Permits, MS: IA, 5275 Leesburg Pike, Falls Church, Virginia 22041-3803. This appeal must be in writing with the original signature of the person requesting an appeal or of that person's legal representative, should refer to your file number, PRT-04846C, and must be submitted to this office within 45 calendar days of the date of this letter. The appeal must state the reason(s) and issue(s) upon which the appeal is based. Your written appeal must address how the decision to deny the reconsideration of your request was based on a misinterpretation of the information provided in your request for reconsideration, or it must present a clarification of this information. **Should you supply new information that changes the content of your original request for reconsideration, you must submit a new application to this office before such information can be considered.**

If you have any questions, please contact Supervisory Policy Specialist Michael S. Moore of this office: Division of Management Authority, Branch or Permits, MS:IA, 5275 Leesburg Pike, Falls Church, VA 22041-3803 (703-358-2104, ext. 1983).

Sincerely,

Craig Hoover, Chief
Division of Management Authority

Re: Request for Reconsideration of Denial of Permit Applications PRT-04846C and PRT-04205C

Dear Chief Van Norman:

We request reconsideration of the denials of two applications for permits to import hunting trophies of elephant taken in Zimbabwe in 2015 ("Denials"). The first application was submitted by Richard Bonander, PRT-04846C, for a bull elephant taken in the Ngamo/Sikumi Forest Block in Zimbabwe on March 21, 2015. The second was submitted by Michael Jines, PRT-04205C, for a bull elephant taken in the Mbire CAMPFIRE District in Zimbabwe on February 25, 2015. Conservation Force represents both Applicants.

The Denials should be reconsidered and reversed for eight primary reasons. First, they rely upon the *Enhancement Finding for African Elephant Taken as Sport-Hunted Trophies in Zimbabwe on or after January 1, 2015*, dated March 26, 2015 ("Finding"). But the Finding fails to consider significant information submitted by Conservation Force, Zimbabwe's Parks and Wildlife Management Authority ("ZPWMA"), and others. If considered, the negative conclusion would have to be reversed. The information provided:

- Establishes that Zimbabwe has the most up-to-date management plan for African elephant in the world, with adaptive and regionally-specific action items, clear assignment of responsibilities, and means of verifying its implementation successes;
- Establishes that Zimbabwe has a relatively stable elephant population, as determined by a recent countrywide survey;
- Demonstrates that Zimbabwe has been effectively enforcing laws and policies to protect elephant and other species, and has implemented new measures and ramped-up national and local efforts to combat poaching;
- Demonstrates that hunting offtakes are sustainable and based on the consideration of all causes of elephant mortality, biological and critical social factors, and scientific recommendations;
- Reflects the full cooperation of ZPWMA in responding to the FWS' information demands, including production of sensitive budget information that underscores the essential role hunting, especially elephant hunting, plays in supporting wildlife conservation, management, and protection, both in the Parks estate and community areas;
- Evidences how the government's grant of Appropriate Authority to local landholders has created a public-private-community partnership that obligates all stakeholders to invest in protection and conservation of wildlife on their lands; and

- Proves that licensed, regulated hunting enhances the survival of elephant and other species in the country by securing habitat, generating management funding, underwriting and supporting anti-poaching, and incentivizing greater tolerance of elephant by rural community members.

In sum, because the information provided demonstrates that the enhancement standard is met, and this information was not relied upon in denying the applications, we respectfully request reconsideration and reversal of the Denials and issuance of the requested import permits.

Reason for Reconsideration 1: Failure to Consider Best-Available Information

In the Finding, the FWS repeatedly stated it would review its negative conclusion if additional information was provided.[1] But the FWS has not done so. It has not considered hundreds of pages of information in the Denials, which rely upon the Finding.

The Finding was made on March 26, 2015. Information has been provided to the FWS from April 17, 2014 through as recently as February 2017 by Conservation Force, ZPWMA, the IUCN African Elephant Specialist Group ("AfESG"), the Safari Operators Association of Zimbabwe ("SOAZ"), Safari Club International ("SCI"), individual hunting operators, and others.[2] Most of this data has ***not*** been discussed in the Finding or in an updated finding, in the two-plus years since the Finding was made.

Rather, entire paragraphs in the Finding are identical to the July 22, 2014 negative enhancement finding.[3] Because they are not updated from July 2014, they fail to address points made by Conservation Force and ZPWMA to correct errors in that July finding. Moreover, the Finding states in several places that the FWS was not provided with specific information. However, Conservation Force previously cited to where the information was provided,[4] and ZPWMA submitted additional data in its prompt and thorough July 2015 response ("ZPWMA July 2015 Response") to the FWS' third questionnaire, dated May 12, 2015 (***after*** the Finding). The ZPWMA July 2015 Response was not considered in the Denials, which rely upon the Finding. However, the July 2015 Response provides substantial information the FWS asserts is missing.[5]

This up-to-date information cannot be ignored. It demonstrates that Zimbabwe's hunting program is well-managed and sustainable. It shows how hunting in Zimbabwe enhances the survival of the elephant. The FWS' failure to consider this information requires reconsideration of the Denials. The Finding is based on outdated information, and its reservations have been resolved. Once the new information is considered

---

[1] E.g., *Finding*, p. 1, 3, 6, 11.

[2] An index of the information previously submitted to the FWS is attached.

[3] *Enhancement Finding for African Elephants Taken as Sport-Hunted Trophies in Zimbabwe During 2014*, dated July 22, 2014, p. 2 ¶ 6; p. 3 ¶¶ 1-3; p. 4 ¶¶ 1-2; p. 5 ¶¶ 2-3; p. 7 ¶¶ 3-4; p. 8 ¶ 4; p. 9 ¶ 1 (changed "2002 Panel of Experts" to "1997"); p. 9 ¶ 4; p. 10 ¶¶ 1-4; p. 11 ¶¶ 3-5; p. 12 ¶¶ 1-2, 5; p. 13 ¶ 1-2; p. 17 ¶ 3; p. 18 ¶¶ 2, 4; see also paragraphs in which several sentences are identical or nearly so: p. 4 ¶¶ 3-4; p. 5 ¶ 1; p. 6 ¶ 3-4; p. 7 ¶ 2; p. 8 ¶ 3; p. 9 ¶ 3; p. 14 ¶ 4 (changed numbers of RDCs); p. 16 ¶ 4; p. 17 ¶ 5; p. 18 ¶ 3.

[4] Conservation Force also provided an Appendix that cross-referenced statements claiming not to have information against the FWS' April 4, 2014 questionnaire to ZPWMA, which did not ask for much of this information. Conservation Force, *Comment Opposing the Negative Enhancement Finding for African Elephant Taken as Sport-Hunted Trophies in Zimbabwe in 2014*, dated Oct. 16, 2014 ("*CF Oct. Comment*"), passim, & Appendix 1.

[5] E.g., Compare *Finding*, p. 9, 11 (seeking revenue information), p. 11 (seeking offtake information) with ZPWMA July 2015 Response, p. 36-43 (providing revenue and offtake tables).

by the FWS, the "enhancement" generated by elephant hunting is clear, and the requested permits should issue.

The urgency of issuing these permits has not changed since the suspension was imposed in April 2014. As the Finding recognizes, elephant hunting generates operating budget revenue for ZPWMA, incentives for Zimbabwe's community-based natural resources management program (CAMPFIRE), anti-poaching, and more. The information provided, including two CAMPFIRE reports, a SOAZ report, the ZPWMA July 2015 Response and more, makes clear that American elephant hunters are the largest source of these benefits.[6] Continued refusal to issue import permits jeopardizes this enhancement and the survival of the species.

The failure to consider the best-available information is made worse because ZPWMA responded promptly to the FWS' requests. ZPWMA responded to the first questionnaire within two weeks. Its Director-General and high-level representatives immediately traveled to DC to reinforce their response. ZPWMA responded to the second questionnaire in under six weeks; responded to third—not considered in the Finding—in five weeks; responded to the fourth—not considered in the Finding—in two weeks; and responded to the fifth —not considered in the Finding—within several weeks, with the final plan prioritization completed within six months. ZPWMA has repeatedly redirected its resources to provide information to the FWS. But the FWS has repeatedly moved the target to create an unreachable standard and demanded additional, more intensive information. The bar has been raised beyond "enhancement." The FWS has acknowledged that elephant benefit from well-managed hunting.[7] But the Finding seems to require more than well-managed —it seeks management perfection. That is simply not possible, either in Zimbabwe or in this country (even the FWS is constrained by limited resources).

The information submitted shows that licensed, regulated hunting increases habitat security, generates law enforcement funding and support, and incentivizes tolerance for elephant. It shows a sustainable use of elephant at a level far too low to be detrimental. It shows that the enhancement standard, as originally defined[8] has been met. Thus, the Denials should be reconsidered and reversed.

---

[6] E.g., *ZPWMA July 2015 Response*, p. 40-41 ("The US hunting market constitutes 51% and 54% of elephant trophy hunting in Zimbabwe for the years 2013 and 2014 respectively."); CAMPFIRE Association, *Trophy Imports Suspension and the CAMPFIRE Program*) (2014), p. 4 (*"CAMPFIRE Association Report"*) (U.S. hunters represent two-thirds or more of CAMPFIRE clients); E. Gandiwa, *Proceedings of the CAMPFIRE Stakeholders' Workshop: Towards the Development of a New Elephant Management Plan and Policy* (Nov. 2014) (*"CAMPFIRE Workshop Proceedings"*), p. 6-21; CAMPFIRE Association, *CAMPFIRE Hunting Income & Distribution* (Dec. 1, 2015) (*"CAMPFIRE Income Analysis"*), p. 6; ZPWMA, Presentation, *Legal Trade, Conservation, and Rural Livelihoods: A Zimbabwean Perspective* (Dec. 2016), p. 19; SOAZ, *Status of Elephant Populations, Hunting, and Anti-Poaching Effort in Safari Areas in Zimbabwe* (2014), p. 3-4 (*"SOAZ Report"*)

[7] E.g., FWS, *Suspension of Import of Elephant Hunting Trophies Taken in Tanzania and Zimbabwe in 2015 and Beyond, Questions & Answers* (2014).

[8] In denying import permits for elephant from Tanzania, the FWS defined enhancement as: "activities that provide a direct benefit to the specie being hunted. Such benefits could include the use of revenue generated by the hunt to support conservation projects or to manage the species. Other benefits that could result from activities that enhance the survival of the species include improving human-wildlife conflicts, anti-poaching efforts, or habitat conservation." According to this standard and definition, and not the one created in the Finding, there is no doubt the importation of sport-hunted elephant into the U.S. enhances the species.

Reason for Reconsideration 2:
The Denials Fail to Consider Zimbabwe's State-of-the-Art Elephant Management Plans

ZPWMA has recently adopted and is implementing the most cutting-edge elephant management regime among range nations, the *Zimbabwe Elephant Management Plan (2015-2020)* ("Plan"). This effort attests to ZPWMA's commitment to elephant management and conservation. The new Plan further exemplifies the importance of sport-hunting in this system. The Denials fail to consider this essential new Plan, which the FWS has had for over one year.

Instead, the outdated Finding errs by considering *Elephant Management in Zimbabwe* to be the country's management plan, despite being told it was not.[9] The FWS' concerns about a claimed lack of measurable outcomes in Zimbabwe's actual former management plan, the *Policy and Plan for Elephant Management in Zimbabwe*, have been resolved. As the FWS was repeatedly told, a new management plan was adopted, with specific action items, deliverables, and deadlines (as suggested was necessary by the April and July negative enhancement findings).[10] The FWS knew of the new Plan's details because the FWS received the *Plan Workshop Proceedings* in December 2014, before the Finding was made.[11] The FWS was also informed that Zimbabwe would manage each main range area adaptively pursuant to a regional plan. The FWS was sent the proceeding of regional workshops, and the final regional plans as part of the final national Plan.[12] And in November 2016, the FWS was provided with information on the implementation and prioritization of these plans at the request of the Chief of Permits.[13] In short, throughout the Plan's drafting, ZPWMA and Conservation Force kept the FWS fully apprised of the status and what the Plan would entail. However, little of this information was considered in the Finding or the Denials.

Had the new Plan been considered, these permits would have to be approved. The Plan incorporates an adaptive management framework with higher-level Targets, Key Components, Strategic Objectives, and Outputs. It breaks each Key Component into specific management actions, the achievement of which will be measured and verified through Key Performance Indicators ("KPIs") and Means of Verification of KPIs. The Plan sets deadlines and assigns specific responsibility for achieving each Action. It focuses on five key components: 1. Protection and Law Enforcement, 2. Biological Monitoring and Management, 3. Social,

Economic, and Cultural Framework, 4. Building Conservation Capacity, and 5. Coordination, Collaboration, and Program Management.[14]

The Plan breaks down elephant management by range, as their challenges differ. For example, authorities must manage overpopulated elephant and provision of water in North West Matabeleland compared to a reduced population targeted to recover in Sebungwe. These differences are addressed in the actions and indicators of each regional plan.[15]

The Plan provides for accountability, transparency, and effective implementation in the terms of reference for an Elephant Manager tasked with directing elephant management in Zimbabwe. The Plan also created a National Elephant Management Committee and four range-specific committees to review progress and oversee implementation.[16]

Examples of "Protection" activities include establishing a rapid-response anti-poaching unit in conjunction with the Zimbabwe Republic Police, expanding ZPWMA's informer networks, and connecting national law enforcement databases. Monitoring activities include periodic surveys and setting Thresholds of Potential Concern as early-warning indicators in key habitats. An example KPI for "Building Conservation Capacity" is to channel most income from elephant hunting back into elephant management, with ongoing oversight through reports on funds available and utilized.[17] As these examples show, the Plan incorporates ***specific*** actions and KPIs, and specific oversight mechanisms.

The Plan addresses human-elephant conflict in the Social, Economic, and Cultural Framework component. The Plan recognizes there is no single solution to conflict, and commits to "undertake additional research on problem animal control and minimizing conflict." It emphasizes the importance of local communities' tolerance towards elephants through a system of benefits-sharing as a long-term solution to conflict.[18]

The Plan also specifically integrates licensed, regulated elephant hunting as a management tool:

> To have a future, elephant must have a value. Value to the governing authorities and to the local people. The greater the value, the greater the tolerance of them is likely to be ... Regulated sport hunting converts wildlife into assets for the benefit of local people and the country as a whole... elephant and other wildlife populations will be negatively affected though reduced conservation efforts arising from low funding and reduced goodwill from the communities, when... the elephant has the economic potential to raise adequate funds to support itself and other species. For these reasons, Zimbabwe confirms its commitment to the sustainable use of elephant and other wildlife in this Action Plan.[19]

---

[14] *Plan*, p. 16-17.

[15] *Plan*, p. 38-80 (Annexes 9.4-9.7).

[16] *Plan*, p. 13-14, 35-37.

[17] E.g., *Plan*, p. 19-27.

[18] *Plan*, p. 15.

[19] *Plan*, p. 12.

The Plan addresses the Finding's concerns on every level. It implements an effective management system, with the necessary "specific goals and measures with specific actions to be taken."[20] Moreover, ZPWMA provided to FWS a 2016 report on its progress in implementing the Plan and prioritizing implementation, including of the regional plans. The Plan Supplement emphasizes law enforcement and training to combat poaching and ivory trafficking.[21] The FWS requested the prioritization, and ZPWMA again demonstrated its good faith in preparing and providing the document, which was not considered in the Finding or the Denials. Because the Finding's concerns are resolved and new information reveals an effective, adaptive management plan and implementation thereof in Zimbabwe, the Denials should be reconsidered and reversed.[22]

Reason for Reconsideration 3:
Zimbabwe has Current Elephant Population Information that Guides its Sustainable Use

The AfESG recently estimated Zimbabwe's elephant population at 82,630 ± 8,589 across a range of 81,228 km^2.[23] Zimbabwe maintains the second-largest elephant population in Africa, at a level nearly double its estimated carrying capacity.[24] The population is most concentrated in the North West Matabeleland and South East Lowveld ranges. The current national estimate is approximately 6,000 lower than the 2001 countrywide estimate, a percentage calculated as "not statistically significant" by the survey's authors.[25] Zimbabwe's current elephant population is 20% larger than its population in 1997 (66,000), when the FWS made a positive enhancement finding. The Finding does not explain why a 20% increase is insufficient.[26]

---

[20] *Finding*, p. 6. The Plan applies a multi-tiered approach, using tailored goals leading to achievement of the "Long-Term Vision," which is: "To conserve elephants at levels that will enable them to contribute to the conservation of biodiversity, national development and Zimbabwe's cultural heritage." The Plan establishes intermediate "Targets" to achieving these goals, which are in line with the 1997 *Policy and Plan*: "1. To maintain at least four demographically and genetically viable elephant populations in Zimbabwe[;] 2. To maintain or increase core protected range of elephant in Zimbabwe[;] 3. To maintain numbers/density of elephant at levels that do not adversely impact on biodiversity conservation goals while contributing to economically viable and sustainable wildlife-based land uses in Zimbabwe." As in the draft provided to the FWS in December 2014, the final Plan is organized by "Key Components," and then "Strategic Objectives" that explain the "Key Components." "Outputs" describe the desired outcomes, and are to be achieved through implementation of "Key Activities/Actions." That implementation is monitored by the KPIs and Means of Verification of the KPIs.

[21] *Plan Supplement*, p. 6.

[22] As ZPWMA explained, Zimbabwe conserves and manages elephant on every level. Zimbabwe and bordering range states have formed Trans-Frontier Conservation Areas ("TFCAs") to address the elephant's migratory nature and cross border populations. Further, through the Plan Zimbabwe implements the action plans adopted by the Southern African Development Community ("SADC"), and the SADC Regional Elephant Management Strategy of 2007. E.g., *ZPWMA April 2014 Response*, p. 12; *ZPWMA July 2015 Response*, p. 15; *CF June 2014 Comment*, p. 12 & related attachments; *CF Oct. 2014 Comment*, p. 9 & related attachments.

[23] IUCN/AfESG, African Elephant Status Report 2016 (Sept. 2016), publicly available at https://www.dropbox.com/s/7a8w3kk6r9hzm0r/AfESG%20African%20Elephant%20Status%20Report%202016.pdf?dl=1.

[24] *Plan*, p. 3.

[25] *Plan*, p. 3. As explained above, the Management Plan incorporates regional plans to address challenges unique to each range and manage elephant within regional targets.

[26] The Finding suggests an increase to over 100,000 elephant would be acceptable. P. 8. As ZPWMA, Conservation Force, Rowan Martin, and others pointed out, a population of that size would be a catastrophe for the country's biodiversity. The Finding does not account for the expansion in Zimbabwe's elephant since 1997, or the management measures implemented since then. Zimbabwe's elephant population has rebounded incredibly, from a low of 4,000

Worse, the Finding does not rely on this up-to-date estimate, although the FWS received the preliminary survey results in December 2014.[27] Nor does the Finding rely on the best-available information in the FWS' possession as of March 2015, which included comments from the AfESG and numerous survey results.[28] The Denials should be reconsidered because the Finding relies upon outdated data that was proven to be inaccurate by Conservation Force, ZPWMA, and the AfESG.

For example, the Finding reuses language that cites a statistic from *Elephant Management in Zimbabwe*. The statement was disavowed by its author, and Conservation Force explained how the percent limitation was being taken out of context.[29] The Finding's failure to consider information that undercuts a "fact" on which its negative conclusion was based is clear grounds for reconsideration. Similarly, the Finding admits the April finding erroneously interpreted the AfESG's Elephant Database by misconstruing its data quality categories. This error was pointed out in CF's June 2014 Comment and in a May 30, 2014 email from Dr. Holly Dublin, AfESG Chair.[30] It was corrected in the July enhancement finding.

However, the July finding continued to ignore pertinent information in the database, prompting Dr. Dublin to send a November 3, 2014 comment in which she corrected several critical points of information. First, the addition of a 2007 survey resulted in the addition of 30,000 "Definite" elephant in Zimbabwe. Second, the results of four recent surveys did not show a "substantial decline," as the July finding stated, but largely reflected stable or increasing populations. The Finding apparently accepted these comments, and edited the prior statements to incorporate Dr. Dublin's corrections.[31]

However, Dr. Dublin offered three more corrections not discussed in the Finding. Instead, the challenged language was copied and pasted from the July document into the Finding.

- Dr. Dublin criticized the July finding's dismissal of a 2013 survey in Save Valley Conservancy for so-called "double counting," stating that, even if double-counting occurred, the count still reflected an increase in the elephant population;

[30] Compare *Finding*, p. 7; with *CF June 2014 Comment*, p. 9 & related attachments; H. Dublin Email to T. Van Norman commenting on the April finding's misinterpretation of the AfESG Database (May 30, 2014).

[31] Compare *AfESG Letter*, p. 2 ("The AED shows, however, that three surveys carried out in this period ... estimated higher totals than their respective previous, comparable surveys, although the differences were not significant. A fourth survey, Chewore (2010), resulted in an estimate lower than its previous, comparable survey, but the difference was also not statistically significant. Furthermore, the 2010 survey for Chewore did not cover the entire Zambezi Valley ecosystem, and therefore it is possible that the apparent decline, however slight, may be due to elephant movements within the ecosystem rather than to an actual decline.") with July finding, p. 6; *March Finding*, p. 7.

- Dr. Dublin concluded that a 4% carcass ratio in a 2013 survey of Gonarezhou National Park was a "reasonable figure," and the July finding erroneously "conflat[ed] ... carcass ratios ... and mortality rates, and its conclusion is unwarranted";
- Dr. Dublin noted that updated PIKE data was publicly available months before the July finding was made, yet "the finding stated that 2012 and 2013 data were not available," and pointed out that the two PIKE sites in Zimbabwe "have relatively small elephant populations and are by no means intended to be representative of the situation in the country as a whole."[32]

Given that Dr. Dublin is one of the world's foremost experts in elephant, due deference should have been given to her comments and suggestions. Conservation Force made similar points in our June and October comments as well, and provided comments from the authors of the Save Valley survey report responding to the FWS' statements.[33] We provided fice surveys pending the AfESG's review and not included in the AfESG's or FWS' estimates, and submitted updated PIKE information showing the Proportion of Illegally Killed Elephant had declined at the Zimbabwe sites[34]—contrary to the July finding's statements, copied-and-pasted into the Finding. The Denials' failure to review this best-available information, and reliance upon out-of-date or misinterpreted information, requires reconsideration.

Reason for Reconsideration 4: The Best-Available Information Demonstrates that Zimbabwe has been Enforcing its National Regulations as Effectively as Possible

ZPWMA is succeeding in managing and conserving its elephant. The most compelling evidence is the historic increase in its population, to become Africa's second-largest. ZPWMA achieved these results by largely curbing poaching and successfully prosecuting poachers as a result of adaptive and pro-active law enforcement measures. ZPWMA has also implemented a system of sharing responsibility with the private sector and communal landholders so as to share the financial burden of its management and enforcement obligations. The Finding fails to acknowledge these achievements and responsibility-sharing.[35] Its failure to do so requires reconsideration, and reversal of the Denials.

Evidence of ZPWMA's enforcement success was provided in their April 2014 and July 2015 Responses, and in Conservation Forces' June 2014 and October 2014 Comments. For instance, ZPWMA rapidly responded to the 2013 Hwange poisoning incident. Working with the hunting operator's team to track the poachers,

---

[32] *AfESG Letter*, p. 4-5.

[33] CF Email to T. Van Norman forwarding response from authors of the Save Valley Conservancy survey (Jan. 6, 2015); *CF Oct. 2014 Comment*, p. 13 & related attachments.

[34] E.g., 2005 Aerial Survey of Elephants and Other Large Herbivores in the Mid-Zambezi Valley; 2007 Aerial Survey of Elephants and Other Large Herbivores in North-West Matabeleland; 2010 Aerial Survey of Elephants and Other Large Herbivores in Chewore Safari Area; 2013 Aerial Survey of Elephants and Other Large Herbivores in the Save Valley Conservancy; and 2013 Aerial Survey of Elephants and Other Large Herbivores in Gonarezhou National Park; *see CF June 2014 Comment*, p. 4-7 & related attachments; *CF Oct. 2014 Comment*, p. 11 & related attachments.

[35] The FWS recognizes "there may be limited resources available for elephant management." *Finding*, p. 2. However, the FWS does not account for this in evaluating ZPWMA's efforts and results. "Enhancement" does not call for unlimited resources and perfect implementation, it seeks benefits. The benefits provided through the sport-hunting of elephant are clear and convincing, and the Denials should be reversed.

ZPWMA successfully arrested all 35 members of the team. ZPWMA's investigation and prosecution efforts led to the deterrent sentencing of each poacher to terms of 9 to 16 years in prison.[36]

ZPWMA specifically responded to the threat of poaching in Hwange by improving radio communications, adding aerial surveillance, and holding 35 public awareness meetings in the area.[37] ZPWMA then stepped-up its anti-poaching nationally by adopting a number of "Urgent Measures." ZPWMA acted to increase poaching penalties, criminalize the use of cyanide in poaching, increase air surveillance of protected areas, collaborate with national law enforcement and military agencies to raise elephant poaching to "a level of National Security in Zimbabwe," improve intelligence-sharing across international borders, and other important undertakings.[38] ZPWMA also held a judiciary awareness program to ensure full implementation of relevant poaching laws and penalties throughout prosecution and sentencing.[39]

ZPWMA directs most of its financial resources to anti-poaching and enforcement. As shown in the July 2015 Response, most of ZPWMA's budget (77%) is allocated for staff costs and patrol provisions.[40] These expenditures fund anti-poaching throughout the elephant range. Despite financial constraints, ZPWMA has been able to continuously hire to expand the number of patrol days in the field. ZPWMA has a staff of 1,504 active field rangers, with the intent to add more.[41] ZPWMA has shown that it can mobilize when called upon: after the Hwange poisoning, a new station with 15 field rangers was established in the area.[42]

Over 80% of spending under the new elephant management Plan has been on law enforcement (anti-poaching) and trainings, with law enforcement identified as the number one priority going forward.[43] The budget and operational data provided in the ZPWMA July 2015 Response and Plan Supplement addresses the FWS' asserted lack of information in the Finding. And although financial constraints exist in Zimbabwe (as in most range states), ZPWMA has effectively and efficiently maximized the impact of every dollar spent on anti-poaching. ZPWMA's results in curbing poaching speak for themselves.

The Finding continues to rely on outdated, unfounded criticisms from the July finding that were corrected by Conservation Force and ZPWMA. First, though the Finding claims not to have received information on Zimbabwe's poaching arrests and prosecutions, that information was not requested until May 2015, yet was provided in ZPWMA's April 2014 Response. It would be unfair to base a negative finding on data that had not been requested. But the data ***was*** provided, and should have been reviewed.[44]

Further, the Denials mistaken rely on the Finding's comments and interpretation of outdated ETIS reports. Conservation Force objected to these reports being taken out of context in our October 2014 Comment,

and provided evidence of improvements since 2010.[45] The Finding's reuse of these paragraphs, whose validity and applicability were challenged, merits reconsideration.

Finally, as discussed further under "Local Conservation Efforts," the Parks and Wildlife Act Chapter 20:14 devolved authority to manage and benefit from wildlife on communal and private lands to the landholders. In Safari Areas, ZPWMA leases concessions to pre-qualified hunting operators, which gives them authority to manage and benefit from approved wildlife in those areas.[46] "ZPWMA is engaging private players in co-management in some areas... this will help in resource mobilization and management for law enforcement. Long-term lease agreements (10-25 years) are being entered into to manage some protected areas."[47] In certain areas, ZPWMA partners with safari operators[48]; in others, they partner with non-profits, such as the Tashinga Initiative in the Zambezi Valley and WWF in the Hwange-Sanyati Biological Corridor.[49] In these ways, ZPWMA is sharing responsibility for enforcement of national regulations. This allows ZPWMA to do more with less, and has been especially crucial since receipts from hunting have fallen since the FWS suspension on ivory imports.

Reason for Reconsideration 5: Elephant Hunting in Zimbabwe is a Sustainable, Beneficial Use

ZPWMA's elephant hunting program is sustainable. Information submitted to the FWS demonstrates that quotas and offtakes are responsibly set in a participatory process, considering a range of inputs including all causes of elephant mortality; ZPWMA allocates quotas by region and locality; and recent poaching has remained fairly low, especially in comparison to other range states. This information has been submitted to the FWS on multiple occasions, including but not limited to:

- April 2014: poaching statistics; poacher arrest and prosecution statistics; four-page description of ZPWMA's quota-setting process;
- June 2014: poaching statistics in CAMPFIRE areas;
- December 2014: poaching and PAC statistics; offtake percentages from management, hunting, and trade in skins; two-page supplemental explanation of ZPWMA's quota-setting process;
- December 2014: hunting and PAC offtakes; quota utilization in CAMPFIRE areas;
- December 2014: carcass observance and estimates from the 2014 aerial survey;
- March 2015: updated MIKE/PIKE statistics;
- May 2015: poaching statistics from Mana Pools workshop;
- May 2015: poaching and offtake statistics in the Sebungwe;
- July 2015: carcass observance and estimates from the 2014 aerial survey; PIKE data; offtakes from six categories requested by the FWS; poaching and poacher investigation, arrest, and prosecution statistics; five-page supplemental explanation of ZPWMA's quota-setting process; quota allocation by range;
- September 2015: poaching and hunting offtakes from the South East Low Veld workshop;
- December 2015: hunting off-takes and quota utilization in CAMPFIRE areas;

- December 2016: two-page supplemental explanation of ZPWMA's quota-setting process;
- And more.[50]

This long list of information provided refutes the Finding's complaint that the FWS did not have "adequate information" about elephant offtakes, poaching, or quota-setting. The information was available. But the Denials do not consider it. If it had been considered, the FWS would have had to make a positive finding.

This best-available information demonstrates that ZPWMA's quotas are "scientifically determined" not to "compromise[e] [the species'] biological proliferation... In Zimbabwe, determination and implementation of hunting quotas goes through a rigorous quota-setting methodology" that accounts for all mortalities, including from hunting, poaching, PAC, natural causes and disease. In setting quotas, ZPWMA considers population sizes, trends, and densities; property sizes and habitat quality; environmental changes; human-wildlife conflict, national policies, and management targets; poaching trends; land tenure; trophy quality; hunt success; ranger monitoring; species sensitivity and research on the species; and more.[51] Quotas are set in participatory workshops for each range area. While stakeholders may propose an initial quota, their proposals are reviewed and revised as needed by ZPWMA ecologists to ensure the quotas are assessed at a sustainable level, having negligible impact on the population.[52] In 2014, Zimbabwe's offtake quota was set under 300 elephant; in 2016, it was set at 400.[53] The level of ***offtake*** authorized is well below that of ***export*** allowed under Zimbabwe's CITES quota (500 elephant), for good reason—exports may be delayed due to transport, taxidermy/processing, or permitting issues.

ZPWMA's 2014 quota of 300 mature elephant bulls represents only 0.37% of the total elephant population (82,000+). Zimbabwe's 2016 quota represents only 0.49%. These percentages are comfortably below the sustainability threshold of 0.6-0.75%. Most critically, however, actual offtakes are even lower, on average only 204 mature elephant bulls per year. That represents only 0.25% of Zimbabwe's elephant population. The Denials should be reconsidered and reversed, as there can be no question this limited use of elephant through sport- hunting is sustainable.

---

Van Norman attaching newest MIKE/PIKE data (Mar. 11, 2015); *Proceedings of the Mana Pools Anti-Poaching Workshop* (May 2015); CF Email to T. Van Norman attaching background data on elephant in the Sebungwe range (May 11, 2015); *ZPWMA July 2015 Response*, p. 22-27, 43-49; *Proceedings of the South East Lowveld Elephant Management Planning Workshop* (Sept. 2015); CF Email forwarding *Hunting Income Analysis of CAMPFIRE Districts from Hunting* (Dec. 1, 2015); ZPWMA, Presentation, *Legal Trade, Conservation, and Rural Livelihoods: A Zimbabwean Perspective* (Dec. 2016), p. 5-6.

Publicly available data from the Great Elephant Census identified Zimbabwe as having one of the four lowest carcass ratios in Africa, behind only Uganda, Malawi, and Botswana, publicly available at www.greatelephantcensus.org.

[51] E.g., *ZPWMA Apr. 2014 Response*, p. 19-22; *ZPWMA Dec. 2014 Response*, p. 22-25; *ZPWMA July 2015 Response*, p. 43-47; ZPWMA, Presentation, *Legal Trade, Conservation, and Rural Livelihoods: A Zimbabwean Perspective* (Dec. 2016), p. 5-6.

[52] *ZPWMA July 2015 Response*, p. 43-46; ZPWMA, Presentation, *Legal Trade, Conservation, and Rural Livelihoods: A Zimbabwean Perspective* (Dec. 2016), p. 5-6. Licensed, regulated hunting has nominal effect on elephant population, because of the selectivity of the harvest. E.g., *CF June 2014 Comment*, p. 3, 9-10 & related attachments (including R. Martin, *Second Report: Trophy Hunting from Declining Population* (2014), p. 8, 10, 15, 18-20, & R. Martin, *Background Study, Elephants* (2015), p. 34, 56).

[53] *ZPWMA July 2015 Response*, p. 44, 46.

Further, the extensive documentation provided by ZPWMA, Conservation Force, and others demonstrates that other offtakes, including poaching and PAC, are sustainable. Poaching has largely been controlled in the last several years, and PAC is kept in check through the incentives generated by CAMPFIRE (please see the next section).[54]

Poaching levels have declined in Zimbabwe, and across Africa, since the worst of the impact in 2011.[55] As shown in ZPWMA's July 2015 Response, a decline in elephant poaching is evident since the high of 223 in 2011, to 212 in 2012 and 194 in 2014. (Poaching figures in 2013 are skewed by the mass poisoning incident at Hwange National Park that killed 103 elephant, but if that number is "normalized" to 190, it is consistent with the decreasing trend.)[56] Likewise, the Proportion of Illegally Killed Elephants ("PIKE") at the Chewore and Nyami Nyami Monitoring the Illegal Killing of Elephants ("MIKE") sites in Zimbabwe has fallen: to 0.40 in 2013, 0.17 in 2014, and 0.29 in 2015 at Chewore, and from 0.81 in 2011 to 0.27, 0.22, 0.37, and 0.35 in the years 2012 to 2015 at Nyami Nyami. The most recent figures are well below the 0.5% threshold which signifies unsustainable poaching.[57] The decline in poaching undoubtedly stems from ZPWMA's enhanced anti-poaching, as described in the section above.

Recognizing both a mutual interest, and that collaboration will allow for a more efficient use of resources, ZPWMA and the hunting sector collaborate extensively in anti-poaching. Conservation Force submitted numerous specific evidence of this.[58] A few examples from this evidence are below:

- The Dande Anti-Poaching Unit ("DAPU") in the Zambezi Valley has catalyzed a significant decrease in poaching in their areas. In 2010, DAPU reported 40 elephant carcasses. In 2016, they observed seven. DAPU team members have grown so skilled in anti-poaching tactics they work alongside ZPWMA rangers in patrolling Mana Pools National Park. Charlton McCallum Safaris spent $95,006 on DAPU's anti-poaching activities in 2016, including salaries, rations, rewards, equipment, and

---

[54] PAC offtakes have been between 44-52 elephant from 2013-2015, a negligible amount in a population over 82,000 elephant, and at or below 1.0% when added to poaching and hunting offtakes. ZPWMA issues few PAC permits, and instead relies on the benefits of the CAMPFIRE program and voluntary actions of hunting operators to minimize crop-raiding and losses to elephant, and thus minimize PAC. The CAMPFIRE Workshop demonstrated that this system is working, as PAC figures were typically low across the districts. *CAMPFIRE Workshop Proceedings*, p. 6-21; *see also CF June 2014 Comment*, p. 15-7 & related attachments; *CF Oct. 2014 Comment*, p. 26-33 & related attachments; *CF Dec. 2014 Comment*, p. 3-7 & related attachments; *CF Jan. 2015 Comment* & related attachments.

The uncited "anecdotal evidence" relied upon in the Finding is unreliable, and is another incorrect "fact" on which the negative finding was based that requires reconsideration.

[55] G. Wittmeyer et al., *Illegal Killing for Ivory Drives Global Decline in African Elephants*, Proceedings of the National Academy of Sciences (July 22, 2014).

Van Norman forwarding DAPU Reports (June 15, 2015, May 23, 2016, & Jan. 18, 2017).

vehicles. DAPU's expenditures in 2015 topped $80,000 and in 2014, they were over $72,000. This is an expanding program, and has contributed significantly to anti-poaching in the Zambezi Valley, including through the additional support of aerial surveillance. ***Mr. Jines' hunt took place in the Mbire District and with Charlton McCallum Safaris. Mr. Jines' hunting fees, including his trophy fee and voluntary contributions, are directly contributing to DAPU and the operators' extensive community investment***.

- The SOAZ Report identified almost $1 million spent on anti-poaching in 2013 by a small sample of 14 operators. These operators employed a total of 245 scouts on the ground, an average of 17-18 scouts per company.
- Lodzi Hunters collaborates with the Binga district council to restore wildlife in their concession, on which they have a long-term lease. They maintain a 12-member anti-poaching team that patrols the concession and the borders of Hwange National Park. Lodzi Hunters coordinates with ZPWMA to ensure full and efficient coverage. Lodzi Hunters' anti-poaching and incentives programs cost the company over $350,000 per year, in addition to their contractual payments to the CAMPFIRE district and wards. 95% of Lodzi Hunters' income comes from elephant hunting.

In short, the private-sector's contributions against poaching are extensive. They were not duly considered in the Denials, even though they are an essential component of Zimbabwe's elephant management.[59] For this reason, the Denials should be reconsidered, and will need to be reversed based on proper evaluation of the submitted data.

Reason for Reconsideration 6: Revenues Generated from Elephant Hunting in Zimbabwe are Reinvested in Elephant Conservation Efforts by ZPWMA and CAMPFIRE Communities

The information provided to the FWS documents that elephant hunting accounts for the largest percent of revenue generated by hunting across all four land categories (safari areas, communal land, private land, and forestry areas). In 2014, over $6.2 million in trophy fees was generated from elephant hunts, with $5 million of that revenue accruing to ZPWMA to reinvest in wildlife management and enforcement.[60] Over 50% of that revenue comes from U.S. hunters.[61] Put differently, "the African elephant is one of the biggest drawcard species from a hunting perspective and is at the centre of all the major hunts... Generally hunting contributed an average of USD22m to the country's GDP in 2014 and 2015..."[62]

A significant portion of ZPWMA's operating budget relies upon hunting income (although that proportion declined in 2015, as hunting income has decreased, largely due to the FWS' elephant suspension and non-issuance of lion import permits).[63] Most of this is attributable to elephant hunts. In turn, most of ZPWMA's operating funds are directed to ranger salaries, anti-poaching, and law enforcement—over $3.1 million in Safari Areas alone (and staff costs in Safari Areas are covered by hunting revenues). Put simply, most of the revenues coming in from elephant hunting are reinvested in and contribute to the protection and

[63] *ZPWMA Dec.* 2014 *Response*, p. 21.

recovery of elephant by being reinvested in law enforcement and anti-poaching.[64] The Denials' failure to consider the July 2015 Response and information about ZPWMA's revenue, budget, and expenditures requires reconsideration and reversal.

In communal areas, elephant hunting is the financial backbone of CAMPFIRE. CAMPFIRE is the mechanism whereby communities benefit from living with wildlife, and largely from living with elephant. The program has built tolerance within communities through creation of incentives, especially due to the funding of infrastructure projects that improve rural livelihoods across communities.[65] The Finding correctly admits that "CAMPFIRE plays a role in elephant management." More precisely, CAMPFIRE plays an ***essential*** role in elephant conservation by reducing conflicts between elephant and the communities who maintain elephant on their lands. Zimbabwe's Parks and Wildlife Act Chapter 20:14 empowered rural people living among wildlife to effectively benefit from it. CAMPFIRE is the mechanism created to facilitate this.

From 1989-2006, CAMPFIRE channeled more than $20 million to rural villages and $17 million to rural district councils.[66] From 2010-2015, hunting fees accounted for over $11 million in revenue, 70% of which came from elephant hunting (until the suspension reduced demand for elephant hunting), and two-thirds of which came from U.S. elephant hunters. Put differently, over $5 million accrued directly to CAMPFIRE communities from U.S. elephant hunters until the suspension reduced that amount, e.g., to 54% of hunts in 2014.[67] (Until then, 70% of CAMPFIRE revenue was generated by elephant hunts and $550,000 in trophy fees alone were generated in communal lands in 2014.[68]) These income receipts are "often understated," as economic multipliers "are not captured as part of CAMPFIRE income," and "[t]he proportion of safari operating expenses paid locally in the form of wages and salaries, and purchase of materials is often not recorded."[69]

According to the most recent audit of participating CAMPFIRE districts, "Data from 9 CAMPFIRE Districts ... shows that approximately 60% of the allocated quota is utilized and that the majority of hunters (53%) originate from America. These hunters have contributed US$9 million ... during the period 2010-2015 compared to US$8 million by the 40 other nations.... The income generated from trophy fees in the last 6

years (2010 – 2015) is approximately US$11.4 million of which elephant trophy fees contributed 65%."[70] In short, U.S. elephant hunters are the critical source of funds for CAMPFIRE communities.

Hunting funds are invested in projects that benefit the communities overall: building classrooms or clinics; purchasing farm equipment; rehabilitating water supplies; purchasing vehicles used in wildlife monitoring and anti-poaching; installing solar power; and many other infrastructure improvements. CAMPFIRE links these tangible benefits for rural residents to protection of wildlife. Its infrastructure creates conservation officers and monitoring programs, and employs game scouts, which generates significant benefits for the elephant as well. This is vital because otherwise elephant are largely viewed as threats, not assets.[71]

The grant of Appropriate Authority means that ZPWMA foregoes the fees from hunting in CAMPFIRE areas, and the fees and other benefits accrue to the communities. Operators in CAMPFIRE communities contract with the district councils, and are bound to pay trophy, concession, and other fees—or more, depending on their contracts—to the councils (41%) and to the wards directly (55%). Conservation Force submitted documentation evidencing that many operators contribute much more than just fees. For example, in the Mbire District in which Mr. Jines hunted, Charlton McCallum Safaris operates a "genuine joint venture" with the Mbire district council and wards. In 2013-2015, Charlton McCallum Safaris paid over $1.05 million in fees and revenue-sharing, including over $470,000 directly into ward accounts. The district significantly benefits from this partnership, including: constructing a clinic and nurses' houses; constructing a wildlife administration office; constructing storerooms; constructing 14 classroom blocks, seven teachers' houses, and one school office; constructing and equipping of grinding mills; and constructing and equipping two hand-pump boreholes, water pipes, toilets, water storage; constructing one tourist camp; acquiring two tractors.[72] 90% of the district's income comes from hunting and ~35% of that is from elephant hunting. 90% of hunting clients are U.S. citizens. In short, at least $330,750 accrued to the Mbire district and rural communities as a result of U.S. elephant hunters in 2013-2015.[73] This is but one example. Conservation Force has submitted evidence of many more, including contributions of Lodzi Hunters and Martin Pieters Safaris, among others.[74]

The Denials do not consider the best-available information. They rely upon the Finding, which cites to old and limited data on CAMPFIRE. The best-available information demonstrating CAMPFIRE's benefits must be evaluated, and accordingly, the Denials should be reconsidered and reversed.

Reason for Reconsideration 7:
Local Conservation Efforts Effectively Share the Responsibilities of Elephant Conservation

The Denials should be reconsidered because Conservation Force, ZPWMA, SOAZ, and others have provided extensive documentation of the benefits to elephant generated by "local conservation efforts." The FWS does not discuss this information specifically, but it should. This information proves that the contributions of safari operators, anti-poaching units, CAMPFIRE communities, private landholders/conservancies, and associated non-profits are integral to the functioning of Zimbabwe's wildlife management system. They are not "limited" efforts. They are extensive, and reduce the burden on ZPWMA's resources.

As Conservation Force and ZPWMA previously explained, conservation work is ***frequently*** carried out by non-governmental entities in Zimbabwe.[75] The Parks and Wildlife Act Chapter 20:14 devolved Appropriate Authority to private and communal landholders. Through this "government mechanism," the "legal right to utilize and manage wildlife on their property" was transferred to the landholders.[76] Due to this transfer, non-governmental entities such as safari operators, CAMPFIRE district councils, and private conservancies have both the authority and the obligation to protect, conserve, monitor, and benefit from wildlife in their areas.[77] As ZPWMA wrote:

> Fundamentally, ZimParks supports local efforts by providing a conducive legislative and policy environment which allows the private and community sectors to thrive. The grant of Appropriate Authority Status to private properties and Rural District councils is a case in point.[78]

ZPWMA supports local conservation efforts through training, support, and more.

The contributions of non-governmental interest to wildlife conservation are not limited or localized. Taken together, they cover the country.[79] A few examples from the information provided to the FWS are below:

- Lodzi Hunters, in the Northwest Matabeleland and Sebungwe ranges, contributed over $680,000 over two years to CAMPFIRE wards, to improve livelihoods, employ scouts, and increase tolerance of elephant and other species. The operator also maintains a twelve-person anti-poaching team.[80] Similarly, Charlton McCallum Safaris in the Zambezi Valley shares revenues with Mbire CAMPFIRE wards and the district council. In two years, the fees shared topped $750,000 (of which $380,000+

[78] *ZPWMA April 2014 Response*, p. 25.

[79] Please see attached map, which shows the breadth of these "local" operations.

[80] *CF Jan. 2015 Comment* & related attachments.

went directly to ward accounts) and anti-poaching expenditures topped $150,000.[81] Each of these operators is lessening the government's burden of community support and anti-poaching patrols by committing their private resources to these purposes.

- A small operator, Pro Safaris in the Zambezi Valley, allocates 6% of its turnover for water pumping, water pan installation, and other conservation activities. Pro Safaris maintains a ten-person anti-poaching team to patrol a 40-km international border,[82] which allows ZPWMA rangers to focus on patrolling the national park instead of the Safari Area.
- The Tashinga Initiative is a non-profit in the Zambezi Valley that obtains anti-poaching equipment, coordinates anti-poaching efforts, and organized the Sebungwe elephant management planning workshop. The Tashinga Initiative is supported by local safari operators (hunting and photo), and international donors like the Houston Safari Club.[83]
- Also in the Zambezi Valley/Sebungwe range, Martin Pieters Safaris maintains three patrol teams, and are helping develop a community-owned conservancy with two additional patrol teams. The company teams have recovered 15,000+ snares since 2007, and their nearly 300 patrols support ZPWMA's monitoring in this area. The community scouts were intensively trained by the operator teams. These scouts cooperate with ZPWMA against poaching in the Omay and Gokwe communal lands.[84]
- Save and Bubye Valley Conservancies in the Southeast Lowveld range each spend over $500,000 annually on anti-poaching and invest another $200,000+ in nearby villages. The conservancies do not draw on ZPWMA resources at all. They are wholly responsible (and largely depend on hunting income) to secure a land area about the size of New Jersey, the world's third-largest black rhino population, and an elephant population that exceeds 2,000.[85]
- CAMPFIRE communities monitor poaching losses and PAC off-take. They collaborate with ZPWMA to detect poaching and have developed a mutual informer network together. They also work with ZPWMA and safari operators to avoid problem animal off-takes and non-destructively deter crop-raiding elephant.[86] Because they have Appropriate Authority, they collaborate with ZPWMA, but do not need to depend on ZPWMA for wildlife management.
- The SOAZ report included data from 14 operators across the entire elephant range. It reported on these operators' monitoring of elephant populations and poaching losses and their anti-

[86] *See generally CAMPFIRE Workshop Proceedings.*

poaching investment of almost $1 million in 2013. The 14 companies together employed 245 anti-poaching personnel, and cooperated closely with ZPWMA.[87]

The Finding highlights the Mana Pools elephant management planning workshop. It should also mention the Sebungwe and South East Lowveld workshops. They exemplify the public-private-communal partnership existing in Zimbabwe because stakeholders have Appropriate Authority. The Finding reveals the FWS' misunderstanding of Zimbabwe's conservation system, which requires reconsideration and reversal of the Denials.[88]

Reason for Reconsideration 8: Enhancement has been Shown

The FWS has defined "enhancement" as benefits to the species, such as protection of habitat, generation of conservation and anti-poaching funding, and reduction of human-wildlife conflicts through generation of conservation incentives. The information submitted to the FWS demonstrates that licensed, regulated hunting of elephant in Zimbabwe satisfies this standard. This information shows how hunting justifies the existence of significant elephant range.[89] It substantiates the anti-poaching partnership among ZPWMA, hunting operators, and communities, and demonstrates the success of their efforts (declining PIKE). It shows that communities are incentivized not to retaliate against elephant (low PAC offtakes). It describes the pre-suspension benefits generated for CAMPFIRE communities. The success of Zimbabwe's elephant management is underscored by the fact there are over 80,000 elephants in the country, and significant anti-poaching gains in the border area of the Zambezi Valley.

The FWS demands "enhancement." It has been shown. Sustainable offtakes have been shown. A stable elephant population has been shown. A well-managed and responsive elephant management system has been proven. The continued suspension obstructs this enhancement from reaching the elephant—and the people—of Zimbabwe. We encourage the FWS to stop moving the target. The FWS cannot continue to rely upon a Finding that ignores the facts.

---

[87] *SOAZ Report*, p. 4.

[88] The Finding's first sentence is almost verbatim to the July finding, and still fails to respond to CF's objections on this point. We objected that we did not "emphasize the economic impact of the suspension to local conservation efforts," though that information was available in our submissions. The Finding's failure to respond to this objection, and its cutting-and-pasting of prior writing, merits reconsideration; it clearly does not consider the best-available and most current information. Note that the attachments in CF's comment also pointed to data showing "whether and to what extent these individuals would reduce their conservation efforts based on the inability of U.S. hunters to import a sport-hunted trophy," e.g., in the submitted Declarations, Charlton McCallum Safaris and DAPU documents, SOAZ Report, CAMPFIRE Reports, R. Martin Fourth Report, and more. E.g., *CF June 2014 Comment* Attachments; *CF Oct. 2014 Comment* Attachments.

[89] It should be noted that there is far more land secured in areas which allow, and largely rely upon, sustainable use. Compare the approximately 27,000 km^2 of habitat in national parks to the approximately 19,000 km^2 in Safari Areas, ~48,000 km^2 in CAMPFIRE areas, and 7,000+ km^2 in conservancies.

Dear John,

MAPP have recently been asking Zambezi Elephant Fund for support to fund Enock Muziringa, ex Prosecutor from Kariba who has taken on the work of collation of all the results from the action in the field. This is it.

This is for one month only, and a very fine start.

I have by email advised Kevin Higgins that USD500.00 is available to the key informant which led to the arrest of the ivory poacher from Conservation Force.

This is a very good start to 2016.

I do not know to whom Kevin has sent this onto at Parks and will leave that to him to conclude.

Best wishes
Lynne

Hi John,

Happy New Year to you. Any news from Fish and Wildlife on the Zim ban. I will go to Parks and tomorrow and try and find out if they replied to Fish & Wildlife questions.

Probably a bit late but below is response from Dusty Joubert who did all the SVC Aerial surveys on double counting.

On another note, we have secured all the funding for the Mana Pools anti poaching workshop so this will go ahead as planned end of January. I haven't heard anything more from Richard on the Sebungwe one, is this still all on track.

Very best

Alistair

Morning Dave

Please find below my response to Conservation Force.

- Potential double counting – Any aerial survey to an extent a chance of over- or under counting. These over/under counts are potentially caused by time delays resulting from large area sizes needing consecutive days or refuelling and long transect lines whilst the survey is conducted. Whilst animal movement for the latter is easily recognised and accounted for it is not the case for animals moving across transect lines from one day to the next. Because of this effect and especially for clumped species it is important to count as often as possible. In the case of the SVC it was attempted to count once a year. A trend is established over time rather than exact numbers, although the attempt is to be as accurate as possible. The trend is used to establish population health status whilst a most accurate figure is necessary for management purposes. The mentioning of potential double counting on Senuko was as a result of one or two herds (not in excess of 50 animals) that was observed as potentially crossing the next transect whilst the survey was conducted. The mentioning of potential double counting in the report was merely a comment for interpreting results gathered from future surveys and should not be seen as a definite.
- Growth rates – If one considers the past two survey results the population grew at 9.5% in one year. Natural or large elephant populations can breed up to 8%. The survey results suggest thus that there has either been an influx of animals from one survey to the next or there has been some double counting or a bit of both. The fact is we will never know. What we do know is that the population in its entirety is increasing and in a healthy state. Whether it is 1.6% over 12 years or 8.1% since 2010 etc. is not relevant. A good argument in your favour would be the 8.1% since 2010 as it was after the culling. A population response indicating growth when pressured. I would bring Rowan Martin's assessment into this argument and indicate the projections for culling 60 and then scale down to 30. As the aerial survey results complement his predictions very well.
- Culling – Graham Connear will be able to supply all the details. If I may ask that these are also passed onto me as I have an elephant issue down here that I would like to address as well.

Apologies for the long delay but sure the arguments are going to take some time. I fear that the decision to ban elephant hunting is a political one. So good luck having any rationale. Hope all is well in Zimbabwe, you all had a great Christmas and may your 2015 be blessed with goodwill.

Regards Dusty

Hi Dusty,

Yes please if you could still comment, we are in for a long fight on this one.

I will use your new address from now on. Hope all is well with you and the family.

Regards
David

Willy,
We could use your assistance in responding to the FWS' negative enhancement finding, which upholds the suspension of elephant trophy imports from Zimbabwe. In addressing updated population surveys provided by ZimParks and Conservation Force, the enhancement finding criticizes in part the 2013 Save Valley aerial survey. Attached is an excerpt from the enhancement finding related to Save Valley. My staff reviewed the 2013 aerial survey and made a few recommendations about a possible response. If you would prepare a brief response to the FWS' criticism, or perhaps ask the survey's authors to prepare a brief response, it could help strengthen the upcoming comment we will be filing with the FWS.
Copies of the July 22, 2014 enhancement finding and the 2013 Save Valley Conservancy survey are attached for ease of reference.
Thanks for your support,
John

Dear Charles,

I am ready to help to draft a CAMPFIRE supplement response to the July USFWS Final Enhancement determination, in conjunction with PWMA, as I am assisting Conservation Force on this issue.

I will be in Harare from 1st September and the full first week will be dedicated to the USFWS issue. Conservation Force have already done throughout analysis of the USFWS document.

Also I am ready to assist you in the preparation of a CAMPFIRE Elephant workshop to be held before the planned National Workshop on Elephant Management Plan, organized by PWMA with the financial assistance of Conservation Force and other sponsors

The second part of my mission includes a 3 day (6 to 8) field trip to a representative Elephant and Communities area, and I am wondering if you can assist in the preparation of the field trip, where we could have a good opportunity to draft and plan the above. In this way we can optimize time.

Best wishes

Marco,

Make sure to meet with Charles Jonga of CAMPFIRE and offer to help him submit a Supplement ASAP to the July Final Enhancement Determination and, second, see what if anything he may suggest to better represent CAMPFIRE's interest. What does he think about holding a CAMPFIRE Workshop of some sort before the December (now first week of December) Elephant Workshop? If it is a good strategy we may be able to fund it. Tentatively, CAMPFIRE will have two representatives at the Elephant Workshop but he may see value in holding their own meeting beforehand since the suspension of imports directly reduces their single largest source of revenue - elephant hunting. Their interest in elephant hunting is too important to neglect! My legal staff will be getting an email to him within a few days about a CAMPFIRE Supplement to the FWS questions to Zimbabwe that were CAMPFIRE-related and the FWS July Final Enhancement Finding that included FWS's response to CAMPFIRE's own document.

Best,
John

Subject: Enhancement information for lion and elephant permit applications -- DAPU Report
From: "Regina A. Lennox" <regina.lennox@conservationforce.org>
Date: 1/18/2017 10:04 AM
To: "Vannorman, Tim" <tim_vannorman@fws.gov>
CC: Bryan Arroyo <bryan_arroyo@fws.gov>, "Vargas, Darcy" <darcy_vargas@fws.gov>, "John J. Jackson, III" <cf@conservationforce.org>

Dear Tim,

Please see the attached Dande Anti-Poaching Unit (DAPU) end of year report. Please consider this information in making an enhancement finding for the import of elephant and lion trophies from Zimbabwe, including but not limited to the permit applications PRT 86473B, 86471B, etc. (lion), submitted on January 26 of last year; the permit applications PRT 94868B, 94870B, etc. (lion), submitted on April 20 of last year; and the permit applications PRT 03369C, 03902C, etc. (elephant), submitted in August of last year.

As the attached report demonstrates, all wildlife populations have increased in this area due to the committed anti-poaching efforts of Charlton McCallum Safaris and DAPU. For example, buffalo have increased to over 2,000, at a rate of almost 10% per year. Poaching is greatly decreased. In 2015, DAPU picked up 2,375 snares. But in 2016, they only had to collect 1,479. That is almost a 40% decline in snaring.

Charlton McCallum invests extensively in the Mbire community and runs the company as a joint venture with the community. (We provided details of their community programs in our January 19, *2015* letter providing enhancement information for the elephant.) As the attached report explains, in 2016, they drilled additional boreholes for the community to help relieve pressure from the continued drought.

However, it is an open question how long this success will last, with the decline in U.S. clients due to the suspension of elephant imports and the non-issuance of lion permits. Charlton McCallum Safaris' sales are down 40% since 2014. DAPU and the company's community programs are expensive (see page 9, showing $80,000+ in expenditures for 2016 and the proposed $95,000+ for 2017). We hope the FWS will act to issue permits before another of the best and most involved operators is irreparably damaged by the continued suspension of trophy imports.

DAPU

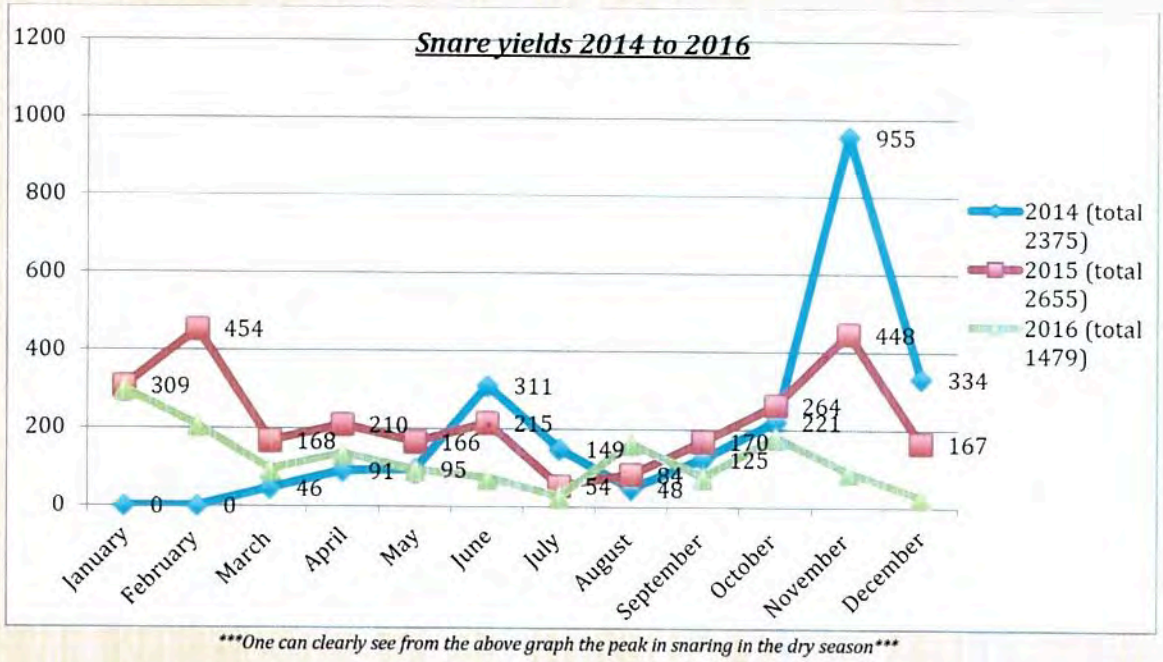
DANDE ANTI POACHING UNIT

End of year 2016

Dear Friends,

We have had a good 2016 – in fact after 7 years of running in DAPU Buzz and I can finally say for the first time we have really noticed the positive effects of our efforts. Every patrol report and every hunter or visitor is reporting more and more game. We estimate that we have consistently in excess of 2000 resident buffalo now – up from the 1200 in 2010 so the population has increased over 60% in 7 years (nearly 10% per annum).
With the exception of waterbuck it is safe to say that all game populations have increased nicely – so in theory, our year on year gains now should really accelerate as the math is finally on our side!

Snaring & general poaching.
We have long used "snaring" as an index with which to measure our general poaching, and we are happy to report that in 2016 our total snare yield of 1479 snares was 60% less than the 2375 snares found in 2014. Bongi and his teams have managed to really keep on top of their patrols.



****One can clearly see from the above graph the peak in snaring in the dry season****

2016 DAPU summary (12 months).

Month	No. of snares	Dogs shot	Meat Poachers convicted	Elephant poachers	Weapons retrieved	Rewards paid
January	300	0	3	0	0	US$821
February	208	0	0	2	0	US$978
March	95	0	0		0	US$97
April	137	0	1	0	2	US$321
	740	**0**	**4**	**2**	**2**	**US$2,217**
May	94	0	5	0	4	US$1,310
June	75	0	0	0	0	US$83
July	27	0	0	0	2	US$67
August	164	1	0	0	0	US$254
	360	**1**	**5**	**0**	**6**	**US$1,714**
September	78	0	0	0	1	US$97
October	181	0	1	0	1	US$447
November	92	0	2	0	0	US$442
December	28	0	0	0	0	US$532
	379	**0**	**3**	**0**	**2**	**US$1,518**
Total 2016	**1479**	**1**	**12**	**2**	**10**	**US$5,449**

**** It is clear to see the decline in poaching during the hunting season and also ... the impending increase in poaching activity as hunting slows down and we head towards Christmas. ****

****DAPU call sign posing proudly with "their" poacher and "his" warthog! ****

**** A typical haul of snares****

Third time offender – kudu cow

Elephant poaching.

Dande North and East (180,000 ha/ 462,000 acres) total loss for 2016 was 7 elephants. It is still too high a number but a fraction of those suffered by our surrounding areas (including Mana Pools National Park). There is most certainly a gang still operating in Dande and surrounding areas that we have failed to account for.

National Parks had a lucky break on Friday 25th November at 2250 hours when they arrested a gentleman with "1.8kgs of cyanide at Dande River Bridge. The accused was en route to Angwa where the cyanide was to be bought by a poaching syndicate and to be used on elephants for their ivory"

*** The accused with his Cyanide***

**** poached bull found by DAPU on neighbouring concession October 2017 – what a waste.****

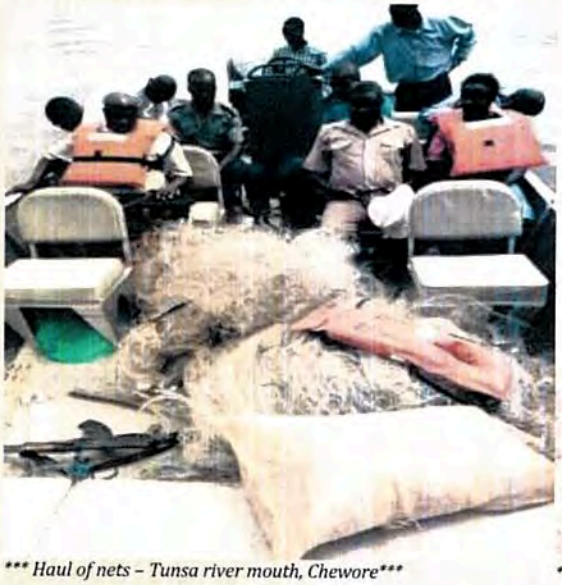
Year	No. of Elephant Carcasses
2010	40
2011	36
2012	16
2013	4
2014	9
2015	4
2016	7

Pushing the boundaries.

Now that the core areas of Dande North and East are much better controled and managed we have started "pushing the boundaries" which basically means DAPU along with National Parks has begun to conduct offensive partols in:

1. *Our neighbouring (Zim) concessions South of us and*
2. *Along the Zambezi river from Kanyemba way up into Chewore – and area that has been to long neglected. Considering that 75% of elephant poachers and ivory trade originates in Zambia – it only makes sense. Squirrel Merredith of Masau camp has been the driving force behind the initiative and DAPU/ CMS assisted with $500.00 which was used for rewards. DAPU will continue to be involved and help grow in this initiative .*

Area	Meters of nets	Dugouts	Banana boats	Arrests
Tunsa (Chewore)	600	0	4	2
DDF Kanyemba	1200	2	0	2



*** Haul of nets – Tunsa river mouth, Chewore***

lioness and kudu remains – neighboring concession

Horror scene

53 dead buffalo – in Mozambique close to our Zim border. An entire village turned out and chased the buffalo into the mud then killed them.

Problem Animal Control.

Duties for DAPU scouts also include attending to Problem Animal reports (PAC).

a. Elephant – There were not many serious reports in 2016 mostly because of the drought. Bongi and crew managed to successfully chase all elephant's out of crops and avoided shooting any which was great.

b. Lions – No loss of life reported in 2016 but a fair number of cattle were killed. No lions shot.

c. Buffalo – One man was seriously injured in the East in April, another killed in Kanyemba on the 14th August by a dagga boy and a second person injured by the same bull two weeks prior. As the buffalo population increases so there is more and more conflict.

d. Crocodiles – One person killed 2016.

e. Snake bites – One person killed 2016.
f. Hyenas – there are consistent and accurate reports of hyenas killing livestock especially in the East. It is a problem that is going to be addressed in 2017.

"Patrol Kit"

In the previous newsletters we mentioned that we were expecting some boots from the USA. Well they have arrived and have been issued so we have VERY happy Scouts!!! There is a second shipment expected with still more boots, handcuffs and water bottles. A HUGE thank you to Duke McCall who single handedly organized this!!!

Goals for 2016	Completed?
1. Continue with anti-poaching patrols.	Yes
2. Replace scouts that are not performing.	Yes
3. Early burning	Yes
4. Repair firearms where possible or replace	No
5. New boots and patrol kit.	Yes

Cost savings.

One of our biggest costs is obviously, vehicles, which are all but irreplaceable. In order to optimize our DAPU vehicle mileage we have had satellite-tracking units fitted to AAX 9832 as well as ABK 7074. The tracking units were both sponsored and fitted by "Trackit" – so a huge thank you to Richard Tennant and Hannes Scholtz of Trackit for their extremely valuable and useful donation.
If any of you are interested in specifically sponsoring one of these vehicles we will supply you with the login details and you can track the vehicle live!

Outreach work and general improvements.

In addition to our normal annual social programs, CMS drilled 7 boreholes in 2016 – of which 3 were successful and consequently equipped. The best of them was at Sende Village in the East and it will improve immeasurably the quality of life for those folk. One borehole was in the DSA for game. We are constantly looking for ways to improve Dande – ultimately the better managed the area is, and the more it yields then clearly it is easier to:

1. *Better afford anti poaching efforts.*
2. *Easier to push home long-term arguments to continue to protect the environment.*
3. *Easier to push forward long-term arguments to look after the animals – as they are worth looking after.*

**** Sende Village 30,000 liters/ hr.****

****Bongi at pumped pan in DSA – water is life****

The year behind us – 2016.

As I mentioned earlier 2016 has been our best year to date. The poaching trend has continued to decline and game populations have really started to improve quite quickly now. Elephant poaching trends continue to be stable. As DAPU has managed to really get on top of our local poaching, so they have begun to build momentum with offensive external patrols. In the end it is not enough for only Dande to be safe and healthy – we need our neighbors to be in the same state!

Massive thankyous to

Buzz and I would like to extend our eternal gratitude to so many well wishers, without whose help - none of what DAPU has achieved would have been possible. Our company sales have been down 40% since 2014 (thanks to USFWS) BUT we still to met our own annual commitments to DAPU and thanks entirely to the generosity of folk listed below actually received $15,000.00 more than we anticipated allowing us to exceed our budget by 18% (or ... $15,000!).

The list seems endless and includes but is not limited to:
Safari club International, The National Capital Chapter of Safari Club, The Chisholm Trail Chapter of Safari Club, The Sylvarnus Charitable Trust, Trackit, Flying for Wildlife,
Jytte Merjentsen, Juel Granum, Barry Shaw, Ike Ikeguchi, William Shores, Carl Frederick Nagel, Robert Keeler, Duke McCall, Mike Core, Bob Keeler, David Adams, Jerry Jurena, Marty Vick, Morten Skarra, Jerry Beardmore and Bob Schofield.

And <u>every client</u> that hunted with us in 2016 – they all contributed generously.

Special mention to <u>three young Zimbabwean farmers</u>, Charl Grobbelar, Pieter Greytenbach and Pip Madinson – who have helped suppliment rations and fuel. We know how tough it is for them so that makes their help even more special and shows the broad support DAPU has earned for itself.

<u>Artsits.</u> Gareth Hook and Peter Stewart who donated stunning work to be auctioned – proceeds to DAPU.

We must not forget <u>National Parks</u> and the <u>DAPU Scouts</u>, who are the ones that are actually out there, often in dangerous and uncomfortable conditions. Not only do they run the risk of being hurt by poachers but also by the wildlife.

Lastly a big thank you to Bongani Ndebele – aka "Bongi" who is a true leader and is responsible in no small part for the success. Bongi was deputized by Muno and Alfa both of whom made very positive impacts in their own way.

The year ahead 2017.

Bongi will continue to lead DAPU and our mission is to continue to improve our patrols and their effectiveness to help ensure the long-term viability of Dande North and East (.46% of Zimbabwe's total area!). With DAPU's help we are well on the way to making Dande the Zimbabwean flagship model for responsible sustainable use conservation.

All the very best for 2017.

Buzz and Myles

Re: Supporting Documentation for Comments Demonstrating Enhancement from Tourist Hunting in Zimbabwe

Dear Tim,

Enclosed are recently received documents we are submitting in support of our previous comments in opposition to the FWS's negative 2014 enhancement determination for Zimbabwe and in support of a positive determination for 2015.

The first set of documents is from safari operator Lodzi Hunters (Lodzi). As explained in our December 15 comment, over the past two years, Lodzi has paid $531,300 to the CAMPFIRE communities in the Tsholotsho District and $150,000 to the Lusulu CAMPFIRE communities as part of their community development initiatives. Over and above these payments, they transport food and building materials, repair and drill boreholes and roads, provide vehicles and transport for the communities and community leaders, and much more. They contribute directly to anti-poaching by maintaining a 12-man team who patrols the area near Hwange National Park. These additional contributions have cost the company over $350,000, rendering their total contribution over $1 million.

The enclosed documents include receipts, contracts, community requests and responses, and other evidence of Lodzi's extensive contributions. In addition to the contributions described above, the enclosed documents demonstrate, among other things, that Lodzi directly contributes to their local CAMPFIRE districts and wards, to the Zimbabwe police force, to game scouts, and to individuals who seek their assistance and resources. They contractually bound themselves to support the CAMPFIRE communities, and have far exceeded those obligations. For instance:

- **Payments to CAMPFIRE Communities:** As documented in the enclosed receipts, in the past two years Lodzi has made direct payments to CAMPFIRE wards of $236,794 and

payments to the RDC of $216,634, not including further payments to the CAMPFIRE Association and funds for the social responsibility programs discussed below. In a poor rural area, this is vital income which supports infrastructure development, food security, health and education programs, etc.

- **Anti-Poaching:** As previously explained, Lodzi discovered the first carcasses in the 2013 Hwange poisoning. They assisted the Zimbabwe Parks and Wildlife Management Authority (ZPWMA) in many ways, and "provided numerous small 4x4 vehicles and 4x4 trucks, 4 000 liters of fuel for deploying scouts and made [their] own anti-poaching scouts/ trackers available as part of the operation to hunt down the poachers. [They] … provided 2 helicopters, which [flew] 24 hours between the two as part of the mission…."
- Lodzi actively contributes to the Tsholotsho South area of Hwange National Park. They continue to assist ZPWMA with transport and deployment of rangers; aerial surveillance of poaching "hot spots"; research on cyanide poisoning; and resuscitation of an important water hole. In 2012, in an acute water shortage, Lodzi assisted ZPWMA by providing the heavy equipment needed to scoop a major water hole.
- In September 2013, Lodzi's anti-poaching team documented the arrest of a poacher who killed 12 elephant with cyanide.
- **Construction and Water Management:** In their 2013 statement to the Tsholotsho South CAMPFIRE district council, Lodzi reported that they had provided 170 bags of cement and other building materials and funds for constructing the Tshithatshawa Clinic, installed new desks in the Pelela School, and provided river sand to two local chiefs. In 2014, they donated window panels and putty to Pelela School and carried loads of river sand for construction of a cottage at Zibalongwe Primary School. Pelela School thanked Lodzi for the "maximum support you are showing to our school." Lodzi aided Khumbula Primary School, with an enrollment of 160 students, by rehabilitating their borehole. On a whole, Lodzi donated building materials and water to a dozen schools in 2013 and 2014.
- Lodzi receives multiple requests per year for assistance in digging or repairing boreholes and repairing pumping equipment. In July 2013, they provided a "monohead" part for an engine to aid Yukuzenzele Village, which was suffering from a water crisis. In October 2013, they provided additional boreholes to the Mpisini community of over 60 households (500 people). In early 2014, they provided monopump equipment to the Gibixhegu ward to rehabilitate the community borehole. And in July 2014, Lodzi rehabilitated a borehole in the Matopo ward, which the Chief called "a great stride in providing safe water to the community." These are just a few examples of a critical service Lodzi provides to people living in a very dry area of Zimbabwe.
- **Support to Local Schools:** In addition to building materials, Lodzi supports local schools like Pelela, Khumbula, St. Joseph's, Mpilo, Mgomeni, Tembbile, Pelendaba, Mkauzaneni, Zibalongwe, Zimwatuga, Sasedza, St. Mary's, Samahuru, and Khumbula (primary and high schools) through donations of cash, books, food and water, clothing and uniforms, sports equipment, and prizes (in addition to donations of building materials and transport as described here). One example of a request for donations, dated October 21, 2013, recognized Lodzi's "usual co-operation" in assisting the school.
- **Food Security:** In 2013, Lodzi supplied over 7,600 kilograms (over $16,000) in meat to local communities of the Tsholotsho district, providing a much needed source of protein. They also supply meals to game scouts when the scouts receive medical care, and provide ox and meal to local wards.

- **Transport:** Lodzi empowers local communities by providing transportation in a poor rural area with limited access to fuel. Lodzi ferries community leaders, allowing them to attend important meetings; school children desiring to play football against their regional rivals; and women who needed to cut and transport thatching grass for their homes. (Notably, Lodzi houses the women at its camp while they cut this grass.)
- **Support to the Local Police:** In response to a request, Lodzi helped repair the Zimbabwe Republic Police station's sewage system at a cost of over $1,500. The request had noted, "Your usual co-operation is appreciated."
- **Human Capacity Building:** Similarly, Lodzi responds to a wide array of requests from the Tsholotsho South Rural District Council, whose letters also frequently note, "Looking forward to your usual cooperation." In 2013, for example, they funded a training session for the CAMPFIRE Committee staff in an amount exceeding $3,200.
- **Contractual Obligations:** When they tendered for the Tsholotsho CAMPFIRE concession, Lodzi promised to remit trophy and concession fees of $17,940 per elephant and to fund a social responsibility program. Under that program, the company promised to employ 80% of its staff from local communities; to provide the local communities with at least 90% of the elephant meat harvested; to use company equipment and expertise to repair pans, dams, canals, and boreholes and to dig and maintain new boreholes; to assist community leaders in traveling throughout the district; to improve PAC by donating a vehicle and fuel so the district game scouts can get to problem areas; to establish a permanent anti-poaching team in the area; and to transport, feed, and equip district scouts on anti-poaching missions. The tender proposal forecasts paying a total of $1,329,300 in trophy and concession fees to the CAMPFIRE district council in the period from 2013-17.
- The Memorandum of Understanding between Lodzi and the Tsholotsho council commits Lodzi to build a safari camp that will revert to district property and generate income for the CAMPFIRE district. It commits Lodzi to the obligations discussed in the tender proposal and then some, including mandating all elephant meat taken in the district belongs to the wards and requiring Lodzi to assist the district with PAC. Of course, it commits Lodzi to the payment of concession and trophy fees and a social responsibility program. As shown in the enclosed documents, Lodzi has more than lived up to its contractual obligations and has taken its social responsibilities very seriously.

We hope you carefully review the enclosed documentation. The highlights described here are a small example of the huge contributions made by Lodzi to the Tsholotsho communities.

We request that you treat this information as confidential and proprietary, most especially the Memorandum of Understanding, the tender proposal, and the payment and check receipts. This information is the confidential business information of Lodzi. It represents sensitive, proprietary information including bank account numbers of the operator and the communities and negotiated agreements between the operator and the district that could put the operator at a disadvantage in future competitive bidding for the concession if publicly released.

The second book is from operator Charlton McCallum Safaris, whom we discussed in all of our prior submissions. With all three comments, we provided documentation of the company's anti-poaching activities, and with the December 15 comment, we provided documentation of the company's community development expenditures for 2013 and 2014 in the amount of $750,210. As we previously described. Charlton McCallum Safaris (CM Safaris) has been very successful

through the Dande Anti-Poaching Unit (DAPU) and reduced poaching in their concession from 40 carcasses in 2010 to only 7 in 2014.

The enclosed book further documents DAPU's anti-poaching successes. It shows, among other things, that in 2014 DAPU expended over $72,661 for salaries, rations, rewards, equipment, and vehicle costs. DAPU's budget for 2015 is even higher – $80,837. Funds for 2015 activities will come from CM Safaris' revenue (generated by hunts), and from donations made by safari clients **on top of** the costs of their hunts. These clients donate to DAPU through Conservation Force, in addition to the price they pay for hunts, because they support DAPU's mission. CM Safaris' anti-poaching spending is **on top of** the amounts contributed to local communities.

Also enclosed is a declaration which shows an additional $15,000 in anti-poaching funds that have been contributed to DAPU through Conservation Force, but which have not yet been received by CM Safaris or incorporated into the book.

The enclosed book documents the actual dollar amounts being spent by an operator on its anti-poaching coverage in one concession, and shows that almost half the anti-poaching spending comes directly from hunting clients, **on top of** the costs of the hunts. The enclosed declaration reinforces the generosity of hunters towards protecting and preserving elephant and other wildlife. These two documents are undeniable evidence of enhancement.

The enclosed information further documents the enhancement provided by tourist hunting and safari operators in Zimbabwe. We hope FWS will consider these documents and use this "hard evidence" in reversing the trophy import suspension for 2014. Further, we hope FWS will consider this documentation in making a positive enhancement determination for 2015, so these clear benefits will not be interrupted or diminished.

Re: Supporting Documentation for Comments Demonstrating Enhancement from Tourist Hunting in Zimbabwe

Dear Tim,

Enclosed are recently received documents we are submitting in support of our previous comments in opposition to the FWS's negative 2014 enhancement determination for Zimbabwe and in support of a positive determination for 2015.

The first set of documents is from safari operator Lodzi Hunters (Lodzi). As explained in our December 15 comment, over the past two years, Lodzi has paid $531,300 to the CAMPFIRE communities in the Tsholotsho District and $150,000 to the Lusulu CAMPFIRE communities as part of their community development initiatives. Over and above these payments, they transport food and building materials, repair and drill boreholes and roads, provide vehicles and transport for the communities and community leaders, and much more. They contribute directly to anti-poaching by maintaining a 12-man team who patrols the area near Hwange National Park. These additional contributions have cost the company over $350,000, rendering their total contribution over $1 million.

The enclosed documents include receipts, contracts, community requests and responses, and other evidence of Lodzi's extensive contributions. In addition to the contributions described above, the enclosed documents demonstrate, among other things, that Lodzi directly contributes to their local CAMPFIRE districts and wards, to the Zimbabwe police force, to game scouts, and to individuals who seek their assistance and resources. They contractually bound themselves to support the CAMPFIRE communities, and have far exceeded those obligations. For instance:

- **Payments to CAMPFIRE Communities:** As documented in the enclosed receipts, in the past two years Lodzi has made direct payments to CAMPFIRE wards of $236,794 and

payments to the RDC of $216,634, not including further payments to the CAMPFIRE Association and funds for the social responsibility programs discussed below. In a poor rural area, this is vital income which supports infrastructure development, food security, health and education programs, etc.

- **Anti-Poaching:** As previously explained, Lodzi discovered the first carcasses in the 2013 Hwange poisoning. They assisted the Zimbabwe Parks and Wildlife Management Authority (ZPWMA) in many ways, and "provided numerous small 4x4 vehicles and 4x4 trucks, 4 000 liters of fuel for deploying scouts and made [their] own anti-poaching scouts/ trackers available as part of the operation to hunt down the poachers. [They] ... provided 2 helicopters, which [flew] 24 hours between the two as part of the mission...."
- Lodzi actively contributes to the Tsholotsho South area of Hwange National Park. They continue to assist ZPWMA with transport and deployment of rangers; aerial surveillance of poaching "hot spots"; research on cyanide poisoning; and resuscitation of an important water hole. In 2012, in an acute water shortage, Lodzi assisted ZPWMA by providing the heavy equipment needed to scoop a major water hole.
- In September 2013, Lodzi's anti-poaching team documented the arrest of a poacher who killed 12 elephant with cyanide.
- **Construction and Water Management:** In their 2013 statement to the Tsholotsho South CAMPFIRE district council, Lodzi reported that they had provided 170 bags of cement and other building materials and funds for constructing the Tshithatshawa Clinic, installed new desks in the Pelela School, and provided river sand to two local chiefs. In 2014, they donated window panels and putty to Pelela School and carried loads of river sand for construction of a cottage at Zibalongwe Primary School. Pelela School thanked Lodzi for the "maximum support you are showing to our school." Lodzi aided Khumbula Primary School, with an enrollment of 160 students, by rehabilitating their borehole. On a whole, Lodzi donated building materials and water to a dozen schools in 2013 and 2014.
- Lodzi receives multiple requests per year for assistance in digging or repairing boreholes and repairing pumping equipment. In July 2013, they provided a "monohead" part for an engine to aid Yukuzenzele Village, which was suffering from a water crisis. In October 2013, they provided additional boreholes to the Mpisini community of over 60 households (500 people). In early 2014, they provided monopump equipment to the Gibixhegu ward to rehabilitate the community borehole. And in July 2014, Lodzi rehabilitated a borehole in the Matopo ward, which the Chief called "a great stride in providing safe water to the community." These are just a few examples of a critical service Lodzi provides to people living in a very dry area of Zimbabwe.
- **Support to Local Schools:** In addition to building materials, Lodzi supports local schools like Pelela, Khumbula, St. Joseph's, Mpilo, Mgomeni, Tembbile, Pelendaba, Mkauzaneni, Zibalongwe, Zimwatuga, Sasedza, St. Mary's, Samahuru, and Khumbula (primary and high schools) through donations of cash, books, food and water, clothing and uniforms, sports equipment, and prizes (in addition to donations of building materials and transport as described here). One example of a request for donations, dated October 21, 2013, recognized Lodzi's "usual co-operation" in assisting the school.
- **Food Security:** In 2013, Lodzi supplied over 7,600 kilograms (over $16,000) in meat to local communities of the Tsholotsho district, providing a much needed source of protein. They also supply meals to game scouts when the scouts receive medical care, and provide ox and meal to local wards.

- **Transport:** Lodzi empowers local communities by providing transportation in a poor rural area with limited access to fuel. Lodzi ferries community leaders, allowing them to attend important meetings; school children desiring to play football against their regional rivals; and women who needed to cut and transport thatching grass for their homes. (Notably, Lodzi houses the women at its camp while they cut this grass.)
- **Support to the Local Police:** In response to a request, Lodzi helped repair the Zimbabwe Republic Police station's sewage system at a cost of over $1,500. The request had noted, "Your usual co-operation is appreciated."
- **Human Capacity Building:** Similarly, Lodzi responds to a wide array of requests from the Tsholotsho South Rural District Council, whose letters also frequently note, "Looking forward to your usual cooperation." In 2013, for example, they funded a training session for the CAMPFIRE Committee staff in an amount exceeding $3,200.
- **Contractual Obligations:** When they tendered for the Tsholotsho CAMPFIRE concession, Lodzi promised to remit trophy and concession fees of $17,940 per elephant and to fund a social responsibility program. Under that program, the company promised to employ 80% of its staff from local communities; to provide the local communities with at least 90% of the elephant meat harvested; to use company equipment and expertise to repair pans, dams, canals, and boreholes and to dig and maintain new boreholes; to assist community leaders in traveling throughout the district; to improve PAC by donating a vehicle and fuel so the district game scouts can get to problem areas; to establish a permanent anti-poaching team in the area; and to transport, feed, and equip district scouts on anti-poaching missions. The tender proposal forecasts paying a total of $1,329,300 in trophy and concession fees to the CAMPFIRE district council in the period from 2013-17.
- The Memorandum of Understanding between Lodzi and the Tsholotsho council commits Lodzi to build a safari camp that will revert to district property and generate income for the CAMPFIRE district. It commits Lodzi to the obligations discussed in the tender proposal and then some, including mandating all elephant meat taken in the district belongs to the wards and requiring Lodzi to assist the district with PAC. Of course, it commits Lodzi to the payment of concession and trophy fees and a social responsibility program. As shown in the enclosed documents, Lodzi has more than lived up to its contractual obligations and has taken its social responsibilities very seriously.

We hope you carefully review the enclosed documentation. The highlights described here are a small example of the huge contributions made by Lodzi to the Tsholotsho communities.

We request that you treat this information as confidential and proprietary, most especially the Memorandum of Understanding, the tender proposal, and the payment and check receipts. This information is the confidential business information of Lodzi. It represents sensitive, proprietary information including bank account numbers of the operator and the communities and negotiated agreements between the operator and the district that could put the operator at a disadvantage in future competitive bidding for the concession if publicly released.

The second book is from operator Charlton McCallum Safaris, whom we discussed in all of our prior submissions. With all three comments, we provided documentation of the company's anti-poaching activities, and with the December 15 comment, we provided documentation of the company's community development expenditures for 2013 and 2014 in the amount of $750,210. As we previously described, Charlton McCallum Safaris (CM Safaris) has been very successful

through the Dande Anti-Poaching Unit (DAPU) and reduced poaching in their concession from 40 carcasses in 2010 to only 7 in 2014.

The enclosed book further documents DAPU's anti-poaching successes. It shows, among other things, that in 2014 DAPU expended over $72,661 for salaries, rations, rewards, equipment, and vehicle costs. DAPU's budget for 2015 is even higher – $80,837. Funds for 2015 activities will come from CM Safaris' revenue (generated by hunts), and from donations made by safari clients **on top of** the costs of their hunts. These clients donate to DAPU through Conservation Force, in addition to the price they pay for hunts, because they support DAPU's mission. CM Safaris' anti-poaching spending is **on top of** the amounts contributed to local communities.

Also enclosed is a declaration which shows an additional $15,000 in anti-poaching funds that have been contributed to DAPU through Conservation Force, but which have not yet been received by CM Safaris or incorporated into the book.

The enclosed book documents the actual dollar amounts being spent by an operator on its anti-poaching coverage in one concession, and shows that almost half the anti-poaching spending comes directly from hunting clients, **on top of** the costs of the hunts. The enclosed declaration reinforces the generosity of hunters towards protecting and preserving elephant and other wildlife. These two documents are undeniable evidence of enhancement.

The enclosed information further documents the enhancement provided by tourist hunting and safari operators in Zimbabwe. We hope FWS will consider these documents and use this "hard evidence" in reversing the trophy import suspension for 2014. Further, we hope FWS will consider this documentation in making a positive enhancement determination for 2015, so these clear benefits will not be interrupted or diminished.

Confidential Anti-Poaching Information for Zimbabwe

1 message

Regina A. Lennox <regina.lennox@conservationforce.org> Wed, Feb 1, 2017 at 9:51 AM
To: "Vannorman, Tim" <tim_vannorman@fws.gov>

Dear Tim,
Attached please find confidential anti-poaching information for Zimbabwe. This reflects implementation of the Mana Pools/Lower Zambezi regional elephant management plan.
Please consider this information in making an enhancement finding for Zimbabwe.
Best wishes,
Regina

Oggetto: 2016 AFRICAN CONSERVANCIES report (2).docx - Hword
Data: 31 gennaio 2017 15:21:32 CET
A: Marco Pan (b) (6)

Hi Marco,

Not as dramatic as 2015, not from lack of effort but we had far fewer incursions due to removal of space and removal of firearms 2015. We are working on securing the southern boundary now. I am going to have to find some funding this year. I feel my best way is to auction some hunts?

I hope this finds you well and when are you and Mr. Jackson coming to visit us in Omay to hunt a nyami?

Chris

2016 AFRICAN CONSERVANCIES report (2).docx

AFRICAN CONSERVANCIES

ANTI-POACHING REPORT

2016

AFRICAN CONSERVANCIES

African Conservancies was established in 2014, and the first project was in Nyaminyami Rural District Council, the Omay Communal Land hunting area. AC comprises Carbon Green International, the relevant Rural District Council and the relevant community in which the conservation plan falls. A trust has been formed that will include these parties as beneficiaries.

The primary goal of AC was to locate a suitable area to form, build and manage a sustainable community conservation area. The Omay 1 hunting area between the Ume and Sengwa Rivers was selected as a perfect phase one. The criteria of selection include: being communal land hunting area, falling within the CGI REDD+ project area, and having a suitable residual resource and forest land to be able to resuscitate.

OBJECTIVES OF AFRICAN CONSERVANCIES

The primary objective of AC was to select an area within the REDD+ project, (stretching from Binga to Kanyemba in the communal areas) and partner the community and council. The belief in building sustainable conservation areas and in particular enabling communities to truly and directly benefit from this sustainable utilization is at the core of this project.

The immediate goals with the Ume River Community Conservation Area were to reduce hunting offtake and reduce poaching. The hunting offtake was reduced in 2014, 2015 and in 2016. For example, 2014 saw twelve buffalo being hunted from the quota of thirty five. In 2015 we had a buffalo offtake of ten from the possible thirty five. Having done our own numbers on the ground, our offtakes are very conservative and the population increase through relocation due to no hunting pressure is clearly visible, with far better trophy quality and substantial numbers increases across species.

Anti-poaching began in 2014, with six CGI game scouts based out of Manyuli camp close to the Gokwe boundary and six scouts based out the Ume hunting camp. We decided at the close of 2014 that the anti-poaching was not having enough effect on the structured elephant poaching, so in March 2015 Steve Wentzel and I decided that it needed direction and management. So beginning in March, I personally came into the Omay to oversee and manage the anti-poaching teams.

I immediately amalgamated the two teams and brought in Mr Charles Khumalo to head up this new team. Charles is ex-Zimbabwean National Army, a brave, dedicated leader, who has commanded not only the respect of this unit, but myself and the community at large.

We started in-house training incorporating firearms training, tactical house clearances, offensive tracking and in the process building a more intense unit that could cope with a far more aggressive outlook to the poaching problems. This immediately began to produce results.

This team has increased in size and area of operations; in 2015 additional capacity was attained to eighteen personnel and there are four fixed bases of operations.

Our focus has been on hardened, armed poachers with the theory that the fish, snare, and dog bushmeat poachers would be dealt with in the process of eliminating the more "serious" elements.

AREA OF OPERATIONS

Though we in theory are based in the Omay communal land, our operations stretch into Gokwe, around Chizarira and Charisa and Binga. Due to our operations being outside of the National Parks we predominantly operate with Zimbabwe Republic Police details and RDC game scouts. Our entire unit has now been accepted as Police reservists and we are awaiting our Police force numbers.

It has been agreed that our unit, having been accepted as reservists, will establish a dedicated reaction team within the police force that I shall train and manage. The first in-house courses in conjunction with Police and ourselves are set to begin early 2017. We hope to achieve better safety, operational cohesion and teamwork by implementing standardized Standard Operating Procedures and insight into our intelligence and operations work.

OPERATIONS

In August 2015 Charles Khumalo was tasked with resurrecting and bettering the information gathering networks, as reacting to shots fired is almost a pointless affair. The poaching teams shoot toward last light and fifteen minutes from shots fired the elephant's face is chopped off and the poachers are moving. There is no way to track them fast enough to catch them up at this stage. The needle-in-a-haystack affair is almost pointless for arresting poachers. There are over two million acres of bush to patrol and it would require an army to do this.

The informant/intelligence network has had significant effect; we had over one hundred and twenty people on our books at the beginning of 2015. We have over one hundred and eighty at this time. Over ninety five percent of our arrests have occurred and been made possible through the capturing or purchasing of intelligence that is then collated, vetted and prioritized.

Our full-time Intel man has proven time and time again that our focus on the "funnies" department produces results. By taking away the safe zones of the community that the poaching teams utilized in the past, they are now severely limited as to where and how to carry out illegal operations without being compromised. We incorporate many layers into this department.

EDUCATION

Educating people and school children to the value of their wildlife and ensuring the CAMPFIRE funds trickle down and are utilized correctly is essential. In doing this we ask communities to embrace the teams' desire to protect their valuable resources and to understand that without the participation of the community in our protection efforts there is very little hope for the future as the community only has their renewable resources to consistently rely on.

PAC

We make sure the community is protected from the wildlife and ensure that we promptly carry out PAC (Problem Animal Control) operations. We carry out PAC work in predominantly a non-

lethal method, fireworks, implementation of beehive projects on elephant entrance routes, reinforcing stock pens against lions, and teaching methods of pushing unwanted wildlife back into the conservation areas - and supporting communities to do this.

UNDERCOVER OPERATIONS

There are continual rolling undercover operations taking place. These again vary in style and target various criminal elements. The “sales” department, “purchase” department and “poaching” department. The covert teams pose as the above, leading to sting operations carried out in conjunction with the police. These teams actively work their way into the ivory trade in the area, building up intelligence and “networking” the illegals and setting up stings that protect the identities and integrity of undercover teams and Confidential Informants. These ops by nature are very testing and have a high danger component that takes a certain type of individual to carry out with a high degree of success.

ENTRIES AND EXITS

The poaching teams generally originate from south of Nyaminyami district, with a few (under 5%) from Zambia to the north. Over 85% of them have to enter and exit the areas and cover substantial distances generally on foot. A substantial amount of time is put into understanding these routes, mapping them, walking and timing them, watching them physically or with trail cameras or in establishing informants to monitor the routes. By doing so we have formed a very good idea of which team is on the way in or has come into the area and where to intercept them on the way out or set up sting ops to catch them on exit.

GENERAL PATROLS

General cross-graining for spoor is carried out between intel operations, with the entries and exits work helping to minimalize the amount of area that requires coverage. We will also utilize this quiet time to carry out work on lesser criminal activities like bushmeat and fish poaching.

SUCCESFUL OPERATIONS

25 January. Confidential Informant (CI) resulted in a night operation on a poacher’s home resulting in an arrest and recovery of an illegal firearm used for elephant poaching.

13 March. CI led to an ambush of an entrance route from Binga. The poaching team changed their route, resulting in an imperfect ambush. On contact, one was arrested and three escaped. Tracker team follow-up found the escapees fled to Zambia to avoid arrest.

21 March. A patrol found a fresh snare line. Tracker team followed up approximately 30 km to homesteads. Subsequent search and questioning led to the arrest of two and recovery of 25 snares and spears.

4 April. CI led to a night op on two locations. One with an illegal firearm and the second with the ammunition, both recovered. Warrants of arrest have been issued for the individuals involved.

13 July. Tracker team follow-up of suspicious spoor led to the arrest of an individual laying cable snares, 17 cable snares were recovered.

15 July. Observation team sighted a suspicious fire at night. OP guided tracker team in at first light. Were fired upon, poachers fled during exchange of fire.

15 October. Tracker team with information from CI followed spoor of elephant poaching team leading to Matusadona National Park. Contact and exchange of fire ensued, contact initiated prematurely due poaching teams imminent entry to the Park. Suspects fled into the Park unfortunately holding the firearm but dropping other equipment. Cross-boundary follow up delayed due the time of day.

3 November. Suspect photographed by trail cam exiting Park with Ivory. After positive ID, night op resulted in his arrest. Trial is ongoing, critical due to the first time photographic evidence of this nature will be utilized for state prosecution.

3 November. CI information led to the arrest of a poacher found in possession of poached buffalo meat and poaching equipment.

18 December. CI information led to arrest of an individual in possession of pangolin scales and skins, buffalo carcass and equipment.

26 December. CI information led to a night op and the arrest of a known meat poacher. Illegal bush meat, snares and equipment were recovered.

ARRESTS

ELEPHANT POACHING	**3**
MEAT POACHING	**12**
ILLEGAL FISHING	**30**
GOLD PANNING	**7**

	52
RECOVERIES	
WEAPONS	**2**
SNARES	**119**
ILLEGAL NETS	**+ 4000m**

GENERAL

2016 saw a massive reduction in poaching activities and the increase in game numbers is now quite visible. Over the last nineteen months only four elephant have been poached in the whole of Omay. We believe that these results have been achieved by the continuous efforts to reduce the operating space and safe zones for poaching teams and the significant reduction in firearms available to the teams from our 2015 recoveries of illegal weapons.

Poaching teams still enter Matusadona National Park via their southern boundary, and 2017 will see our teams operating to close these routes down and we expect significant action over the coming months.

2015 saw the unfortunate murder of one of our confidential informants. The person targeted was the head of our intel section. His brother, the CI was poisoned and died. The subsequent attempts to poison senior members of our team and myself just go to prove the impact that we have had on the illegal elephant poaching in the Omay and to the lengths these gangs will go.

We would not be able to operate without the significant financial assistance we receive from Carbon Green Africa and the Safari stakeholders in the Omay. Hunting and the sustainable utilization of forests plays a pivotal role in the subsistence of the communities that live in Omay. Our role in contributing to a sustainable livelihood from these renewable resources on behalf of the communities is imperative. Any assistance contributed toward this in any format always goes a long way.

Interesting because it refers ton a "new hit-and-run tactic." The good news is that ZimParks was quick to respond.

Zambian poacher shot dead in Zimbabwe

news/africa /

22 February 2016 at 11:22am

By: Oscar Nkala [this guy writes for the National Geographic Wildlife Watch blog]

Gaborone - A Zambian poacher was killed by Zimbabwean game rangers in a gun-battle that led to recovery of a rifle and 13 rounds of live ammunition at the Matetsi National Park, near the resort town of Victoria Falls on Saturday morning, a leading conservation group has reported.

According to a statement released on Sunday by Trevor Lane, chairman of the Victoria Falls-based conservation group Bhejane Trust, two other suspects escaped arrest and abandoned their cellphones after being ambushed by game rangers.

The rangers recovered the carcass of an elephant the poachers had just killed. The tusks were still intact.

“Two shots were reported early on Sunday morning, and parks rangers immediately reacted by deploying patrols in the area,”said Lane, adding that “two more shots were then heard, and the patrol went to investigate and found a dead elephant with the tusks intact”.

Giving further details Lane said: “They went into ambush and three Zambians showed up. The rangers killed the gunner in the ensuing gun-battle, but the other two escaped. They recovered the body, a .375 rifle, 13 rounds and two cell phones”.

Further, he said the poaching operation confirmed a new hit-and-run tactic developed by Zambian poachers, who enter Zimbabwe in small groups and escape back to their country immediately after committing poaching crimes.

The fatal shooting of the poacher came a few days after the bodies of two more Zambian poachers were found floating on the Zambezi River near Victoria Falls.

Police believe the two dead poachers could have been shot in a February 14 gun-battle with game rangers.

The relatives of the deceased have since collected the bodies for burial in Zambia.

Another Zambian poacher who was arrested with 25 rounds of ammunition, two axes, butcher knives and 2kg of dagga was due to appear at the Victoria Falls Magistrates Court on Monday.

Christopher Malasa Mandanya is facing charges of illegal possession of firearms, possession of drugs and illegal entry into Zimbabwe.

Dear Tim,

In the email below, please find links to four recent videos documenting the benefits of conservation hunting in Tanzania, Zambia, and Zimbabwe. These videos include interviews with government officials, anti-poaching scouts, safari operators, landowners, and others. They demonstrate the enhancement generated by lion hunting: it protects the most habitat, provides the backbone for anti-poaching, and incentivizes community participation in wildlife conservation. Without hunting, these benefits would be lost, and the wildlife would be lost. As Tanzania's former Minister of Natural Resources and Tourism put it in the video titled "Custodians of Wilderness": "So for those who are anti-hunting and would like to see hunting closed: if hunting is completely gone, you're gonna kill Selous, you're gonna kill all the 28 game reserves in this country for sure, and all the wildlife coming out of the protected areas into the open areas for example will be gone."

Please consider this information in evaluating whether to issue import permits for hunting trophies of African lion and elephant, including but not limited to elephant trophies from Tanzania and Zimbabwe and lion trophies from Tanzania, Zambia, and Zimbabwe (including but not limited to the applications already submitted by Conservation Force, such as the applications submitted on January 26, 2016, which include MA86474B-0 and MA86472B-0, and MA88388B).

There are many important points in these videos which document and demonstrate enhancement. A few examples are included here, but the videos should be considered on the whole.

First, in the video "Custodians of Wilderness," safari operators discuss and demonstrate their community development programs. Among other things, Derrick Hurt of Robin Hurt Safaris/Robin Hurt Wildlife Foundation points out that over $100,000 in community assistance was spent in one schoolyard in one village – all proceeds from hunting, and the Hurt Foundation makes clear to the community these benefits come directly from the protection of wildlife.

Another representative from the Hurt Foundation points out that there are around 50 hunting companies in Tanzania with 3 to 4 blocks each, meaning there are approximately 200 vehicles patrolling hunting areas every day, adding an incredible amount of anti-poaching value to protect the lion's prey base. This Tanzania video is available at: http://theconservationimperative.com/.

Second, in the video "The Fate of the African Lion: Tanzania," a representative of the Friedkin Conservation Fund points out there is a lot of pressure on the boundaries of hunting areas in Tanzania because of the extensive population growth and human, livestock, and agricultural encroachment. The hunting areas are buffer zones for the national parks and the private sector bears the cost of opposing the encroachment pressure. But if the hunting areas disappeared, the pressure would be on the national parks directly. In his words: "What is interesting in Tanzania is that when the hunting concessions were designated as such, a lot of them were

designated around the national parks. And this forms a buffer zone around the national park. If these [hunting] areas become degazetted or lose viability ... the human pressures that are occurring on those hunting concessions can be directly transferred onto the national parks. And we're talking national treasures ... This happened in Kenya..."

Put differently, hunting areas play a key role in maintaining the viability of national parks, and thus serve to expand and better protect habitat and prey base and keep human-wildlife conflicts out of the treasured national parks. This Tanzania video is available at: http://theconservationimperative.com/?p=124.

Third, the video "The Fate of the African Lion: Zambia" focuses on several hunting concessions in Game Management Areas in Zambia. It interviews a former poacher turned anti-poaching officer who talks about the communities around the Game Management Areas benefiting from the sustainable use of lion and turning away from poaching. This Zambia video is available at: http://theconservationimperative.com/?p=118.

Last but not least, the video "The Fate of the African Lion: Bubye Valley Conservancy" describes the history and conservation of the conservancy and current challenges it faces, including an overpopulation of lion. The video shows how the revenue generated by lion hunting pays for extensive anti-poaching to protect the prey base and important populations of black and white rhino (among other species; put differently, the hunting of one species pays for the protection of many). Bubye Valley Conservancy derives its income from hunting, and hunting has proven to be the most viable use for the area, which is proven because ranching and other uses were tried. As Bubye Valley's anti-poaching manager notes: "Having this large unit of land set aside for wildlife has meant that endangered species like black and white rhinoceros thrive here. We've got important populations of cheetah, wild dog as well, brown hyena, pangolins ... So under the umbrella of hunting, this whole habitat is benefiting a whole variety of other species that are not consumptively hunted but they're benefiting from this wildlife area. Without hunting, we would be very hard put to justify keeping this big expensive land in its current land use."

The video also evidences the community assistance program of Bubye Valley Conservancy, which includes among other things, a clinic, a water supply for a school, and a meat donation system that gives local chiefs the choice about how to use the meat (i.e., whether to eat or sell it). The game meat donation program is a "direct spinoff" of the hunting, and builds a strong relationship with the chiefs. Poachers from these communities are taken to the chiefs' courts and prosecuted there, and "asked to compensate for the value of the animals killed and the compensation goes back to the community kitty." This is a powerful community engagement system that benefits the wildlife directly.

The video emphasizes that Bubye's lion population has to be managed (because the conservancy is fenced and the lion will over-eat the plains game). The options are hunting or culling, but hunting offers a better value generation. As the video concludes: "Bubye Valley Conservancy is one of the most ambitious, self-sustaining private sector initiatives for wildlife conservation in Africa today. It is not reliant on donor or government handouts for its existence. It is an extremely efficient game sanctuary with a comprehensive management plan which includes detailed research projects. It also provides a land use model not only for Zimbabwe, but the whole of Africa and beyond. But, it is reliant on sport-hunting for its survival." This Zimbabwe video is available at: http://theconservationimperative.com/?p=112.

Please let us know if you have any questions about these videos.

Kind regards,

Regina

John,

Thank you very much for your message.

I have not yet established my flights and trip organization because I was waiting for an invitation. I will email Lynne to see at which stage of preparation they are.

Best

Marco

ZimParks recovers $50 000 elephant tusks from poachers

February 26, 2015 in **News**

The Zimbabwe Parks and Wildlife Management Authority (ZimParks) ambushed 12 suspected poachers from Zambia and recovered almost $50 000 worth of elephant tusks in a recent operation in Katombora, Zambezi National Parks' Mdhaka area.

BY OUR STAFF

ZimParks public relations manager Caroline Washaya-Moyo said the success of the operation was achieved through regional collaborations with rangers from neighbouring countries.

"However the suspects, believed to be Zambian nationals, fled leaving behind the 29 tusks which weighed 297,3kg and valued at $47 468, a giraffe tail, digital scale and some food items," she said in a statement.

Investigations were in progress including another case in which two rhinos, one female and a calf, were poached in Save Valley Conservancy. Both had all their horns removed.

Recently, two poachers were shot and killed by ZimParks rangers during an armed contact in the Kapungashiri area on the southern boundary of Matusadonha National Park.

Rangers who were on patrol in the area were alerted by two heavy calibre gunshots which led them to three poachers who opened fire.

During the shootout two of the poachers were killed while the third one escaped unhurt.

Poaching remains a threat in the country's vast game parks as long as there is a ready market for ivory and rhino horn. Stakeholders have called for stiffer penalties to deter poachers.

Dear All,

Geoffreys Matipano has confirmed yesterday evening by email that the Workshop can go

ahead.

I have made payment to Chirundu Safari Lodge using the funding raised by John and Nicci! Fantastic!

I do not know when the invitations will be sent out, but the DRAFT versions, one for Parks, one for non-Parks invitees, are attached for your information again.

I met with Alistair Pole this morning and TI will complete the Grant Award Agreement from AWF for its fantastic donation towards the Mana Pools Workshop. Thank you very very much Alistair for making this happen.

Best wishes,
Lynne

INVITATION

A COLLABORATIVE WORKSHOP HELD BY PARKS AND WILDLIFE MANAGEMENT AND PRIVATE SECTOR TO DEVELOP AN ANTIPOACHING STRATEGY FOR MANA POOLS NATIONAL PARK

Zimbabwe Parks and Wildlife Management authority cordially invites you to attend a Workshop

To travel to Chirundu Safari Lodge on 30th March, Workshop to be held 31st March and 1st April, depart 2nd April, 2015

at CHIRUNDU SAFARI LODGE

RATIONALE:

There is need for a greater coordinated and collaborative effort than before amongst Zimbabwe's people to deal with ongoing wildlife crimes that are threatening biodiversity conservation. Specifically, private sector tourism and safari operators providing safari services in the Parks and Wildlife Estate see the threat as not only undermining the conservation status of the PWMA Estate but the very resources upon which their businesses depend.

As the threat of poaching grows, the need for better and improved communication, collaboration and coordination has become increasingly apparent amongst various partners operating in Mana Pools National Park. This is essential if optimum efficiency and effectiveness in wildlife protection is to be achieved.

In the Zambezi Valley with its unique and aesthetic settings and abundance of wildlife, offers from the private sector to provide antipoaching support to PWMA have increased. However, careful thought needs to be given as to how best to harness this goodwill so that ZPWMA and the private sector can work together within a coordinated framework so as to achieve measurable success against wildlife crime.

Current trends in poaching in the Zambezi Valley have demanded that a facilitated workshop hosted by ZPWMA and attended by key stakeholders from the tourism, conservation agency, and relevant Government sectors specific to Mana Pools, to strategise on wildlife protection. .

The goal of the workshop is to *undertake detailed stakeholder and problem analyses from which a set of solutions and associated objectives can be developed leading to an action plan for implementation.*

ACCOMMODATION AT CHIRUNDU SAFARI LODGE

The Workshop Organisers will provide the participants' accommodation, 3 x meals per day, 2 x teas per day. Drinks are for participants' own account.

TRANSPORTATION:

- Would participants please make their own way to Chirundu Safari Lodge, on 30th March, 2015 to arrive no later than 1600hrs please.
- Thursday 2nd April: After breakfast, a Workshop working session until 1000hrs. Departure from 1000hrs onwards for Harare and other destinations through own transport arrangements.
- Please contact lynne@thetashingainitiative.org or 0772348671 with any further enquiries.

WORKSHOP:

The workshop will be held at Chirundu Safari Lodge, with workshop materials provided on site. Workshop will be facilitated by Dr David Cumming.

NB: PARTICIPATION!

Please respond by email to this invitation as soon as possible, clearly stating MANA POOLS WORKSHOP ATTENDANCE in your email subject line, thank you.

INVITATION

A COLLABORATIVE WORKSHOP HELD BY PARKS AND WILDLIFE MANAGEMENT AND PRIVATE SECTOR TO DEVELOP AN ANTIPOACHING STRATEGY FOR MANA POOLS NATIONAL PARK

Zimbabwe Parks and Wildlife Management authority cordially invites you to attend a Workshop

To travel to Chirundu Safari Lodge on 30th March, Workshop held on 31st March, and 1st April, and depart on 2nd April, 2015

at CHIRUNDU SAFARI LODGE

ZPWMA INVITEES: PLEASE RESPOND BY EMAIL OR BY COMPLETING THE ATTACHED FORM TO THIS INVITATION AS SOON AS POSSIBLE. PLEASE INDICATE YOUR REQUIRED MODE OF TRANSPORTATION FROM WHICH DEPARTURE POINT, I.E. MANA, CHEWORE, HARARE

RATIONALE:

There is need for a greater coordinated and collaborative effort than before amongst Zimbabwe's people to deal with ongoing wildlife crimes that are threatening biodiversity conservation. Specifically, private sector tourism and safari operators providing safari services in the Parks and Wildlife Estate see the threat as not only undermining the conservation status of the PWMA Estate but the very resources upon which their businesses depend.

As the threat of poaching grows, the need for better and improved communication, collaboration and coordination has become increasingly apparent amongst various partners operating in Mana Pools National Park. This is essential if optimum efficiency and effectiveness in wildlife protection is to be achieved.

In the Zambezi Valley with its unique and aesthetic settings and abundance of wildlife, offers from the private sector to provide antipoaching support to PWMA have increased. However, careful thought needs to be given as to how best to harness this goodwill so that ZPWMA and the private sector can work together within a coordinated framework so as to achieve measurable success against wildlife crime.

Current trends in poaching in the Zambezi Valley have demanded that a facilitated workshop hosted by ZPWMA and attended by key stakeholders from the tourism,

conservation agency, and relevant Government sectors specific to Mana Pools, to strategise on wildlife protection. .

The goal of the workshop is to *undertake detailed stakeholder and problem analyses from which a set of solutions and associated objectives can be developed leading to an action plan for implementation.*

ACCOMMODATION AT CHIRUNDU SAFARI LODGE

The Workshop Organisers will provide the participants' accommodation, 3 x meals per day, 2 x teas per day, plus a per diem for all PWMA personnel to cover drinks.

TRANSPORTATION

1. Transportation from Harare to Chirundu

    - Monday 30th March: Transportation for Participants from PWMA Head Office: For those who require transportation, the organisers are liaising with PWMA on Transport arrangements which will be advised. Participants should arrive at Chirundu Safari Lodge no later than 1600hrs.

    - Thursday 2nd April: After breakfast, departure time will be 1000hrs

2. Transportation from Chewore North and South, Mana Pools National Park and Marongora to Chirundu and return:

    - Fuel funds will be provided to Head Office and Regional Office, Chinhoyi.to assist in transport arrangements.

    - If there is a need for collection from field stations,, i.e. should PWMA vehicle not be available, please advise TTI - lynne@thetashingainitiative.org or 0772348671 by 20th March 2015.

WORKSHOP:

The workshop will be held at Chirundu Safari Lodge with workshop materials provided on site. The workshop will be facilitated by Dr David Cumming

NB: PARTICIPATION! A form is attached for your completion please

Subject: FW: MIKE Trend Update 2014
From: "John J. Jackson, III" <jjw-no2@att.net>
Date: 3/11/2015 12:03 PM
To: Tim Vannorman <Tim_Vannorman@fws.gov>, Pamela_Hall@fws.gov, Bryan Arroyo - FWS <bryan_arroyo@fws.gov>, "Gnam, Rosemarie" <rosemarie_gnam@fws.gov>

FYI

CITES recently released a 2014 MIKE update. Please note that PIKE has declined and is below 0.5 for Eastern Africa, for the first time since 2010. PIKE was substantially reduced at the Ruaha-Rungwa site in Tanzania. PIKE is also below 0.5 in Southern Africa. Like Ruaha-Rungwa, the Chewore site in Zimbabwe was listed as a site "with a substantial reduction" in PIKE in 2014. The decline in illegal killings in Chewore results from the efforts of safari operators, as the Chewore MIKE site is a safari area.

Best,
John

Monitoring the Illegal Killing of Elephants

UPDATE ON ELEPHANT POACHING TRENDS IN AFRICA TO 31 DECEMBER 2014

Introduction

The CITES programme for Monitoring the Illegal Killing of Elephants, commonly known as MIKE, was established by the Conference of the Parties (CoP) at its 10th Meeting (Harare, 1997) in accordance with the provisions in Resolution Conf. 10.10 (Rev. CoP16) on *Trade in elephant specimens*. The MIKE Programme is managed by the CITES Secretariat under the supervision of the CITES Standing Committee. Since implementation began in 2001, the operation of the MIKE Programme in Africa has been possible thanks to the financial support of the European Union.

MIKE aims to inform and improve decision-making on elephants by measuring trends in levels of illegal killing of elephants, identifying factors associated with those trends, and building capacity for elephant management in range States. MIKE operates in a large sample of sites spread across elephant range in 30 countries in Africa and 13 countries in Asia. There are some 60 designated MIKE sites in Africa, which together hold an estimated 30 to 40% of the African elephant population, and 27 sites in Asia.

MIKE data is collected by law enforcement patrols and other means in designated MIKE sites. When an elephant carcass is found, site personnel try to establish the cause of death and other details, such as sex and age of the animal, status of ivory and stage of decomposition of the carcass. This information is recorded in standardized carcass forms, details of which are then submitted to the MIKE Programme. A database of more than 15,000 carcass records has been assembled so far, providing a substantial information base for statistical analysis.

MIKE evaluates relative poaching levels based on the Proportion of Illegally Killed Elephants (PIKE), which is calculated as the number of illegally killed elephants found divided by the total number of elephant carcasses encountered by patrols or other means, aggregated by year for each site. Coupled with estimates of population size and natural mortality rates, PIKE can be used to estimate numbers of elephants killed and absolute poaching rates.

While PIKE provides a sensitive measure of poaching trends, it may be affected by a number of potential biases related to data quality, carcass detection probabilities, variation in natural mortality rates and other factors, and hence results need to be interpreted with caution. However, the fact that the quantitative results presented below are in good agreement with quantitative information available from the Elephant Trade Information System (ETIS), as well as with qualitative information from the IUCN/SSC African elephant Specialist Group, gives confidence as to the robustness of the results.

Trend analysis 2014

Previous trend analyses of MIKE data using standardized methodology have been presented to the 15th and 16th Meetings of the Conference of the Parties to CITES; to the 61st, 62nd and 65th Meetings of the CITES Standing Committee, as well as to other meetings such as the African Elephant Summit (Gaborone, December 2013). In addition, analyses of MIKE data have been published in the peer-reviewed scientific literature (Burn et al. 2011; Wittemyer et al. 2014). Since the report submitted to the 65th Meeting of the Standing Committee (SC65), records for 1,440 carcasses found in 2014 were received from 46 sites in Africa.

The data set used for analysis consist of 13,511 records of elephant carcasses found between 2002 and the end of 2014 at 53 MIKE sites in 29 range States in Africa, representing a total of 488 site-years.

Figure 1 shows empirically derived time trends in PIKE at the continental level for reporting African MIKE sites, with 95% confidence intervals. The chart shows a steady increase in levels of illegal killing of elephants starting in 2006, peaking in 2011 and slightly declining and leveling off thereafter. The PIKE level in 2014 remained virtually unchanged compared to 2013.

Despite the slight decline since 2011, estimated poaching rates overall remain higher than the normal growth rate of elephant populations. Therefore, the elephant population at MIKE sites overall is likely to have continued to decline in 2014. In some areas, a decline in PIKE may be the result of a substantial decline in the elephant population, making it more difficult for poachers to find suitable targets in such areas. However, without recent and reliable elephant population estimates from such areas, it is difficult to verify the impact of poaching on such populations.

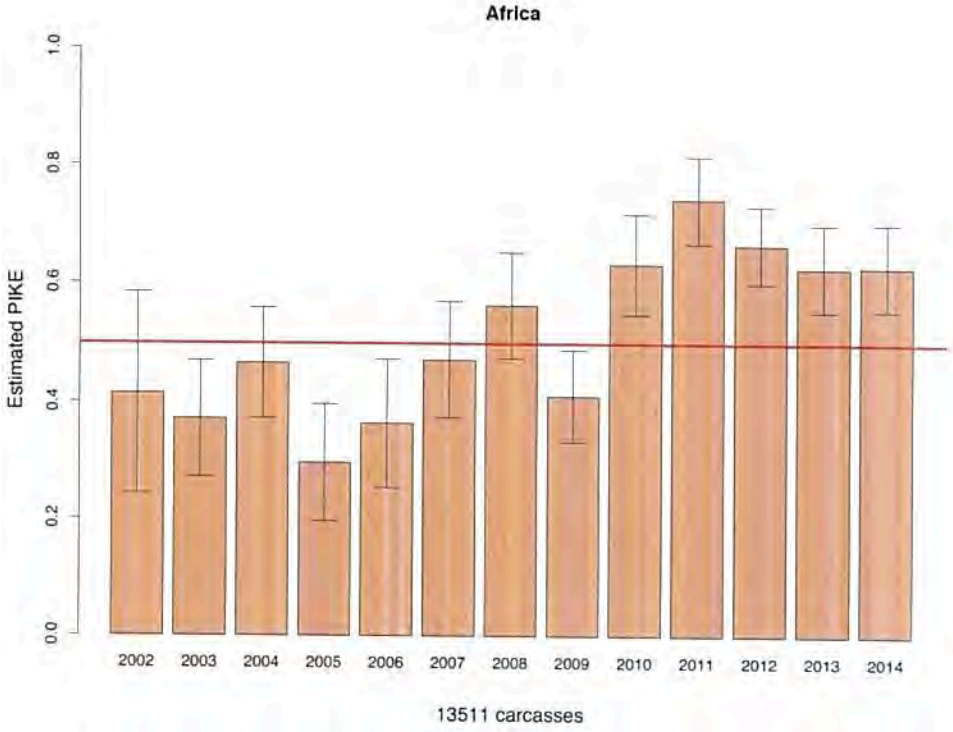

Figure 1. PIKE trends in Africa with 95 % confidence intervals. PIKE levels above the horizontal line at 0.5 (i.e. where half of dead elephants found are deemed to have been illegally killed) are likely to be unsustainable. The number of carcasses on which the chart is based is shown at the bottom of the figure.)

It is also difficult to estimate poaching impact at the site level, especially in sites that do not have sufficiently large carcass sample sizes, or where there may be indications of bias in reported PIKE levels. Among sites that have reported 20 or more carcasses in 2014, where the site-level PIKE can be taken to be relatively reliable, those that remain of particular concern (with a PIKE level of 0.7 or higher) in 2014 include Bangassou (Central African Republic); Garamba (Democratic Republic of the Congo); Niassa (Mozambique); Pendjari (Benin); and Selous-Mikumi (United Republic of Tanzania). On the other hand, substantial declines in PIKE in 2014 have been reported in Caprivi (Namibia); Chewore (Zimbabwe); Meru and Samburu Laikipia (Kenya); Ruaha-Rungwa (United Republic of Tanzania); and South Luangwa (Zambia).

The stability in PIKE levels in the last two years is also reflected at the subregional level, although there are differences between the subregions (Figure 2). The downward trend since 2011 in Central Africa was broken in 2014 with a slight (but not statistically significant) increase over 2013. The downward trend did continue in Eastern Africa, although the PIKE value in 2014 is not significantly different from the value recorded in 2013. It is nevertheless worth noting that, for the first time since 2010, the PIKE level in Eastern Africa in 2014 was below 0.5. In Southern Africa, PIKE in 2014 remained very similar to the levels recorded in 2012 and 2013. The only subregion where a substantial increase in PIKE was recorded in 2014 was West Africa, but the

paucity of carcass data from that subregion continue to make inferences on trends unreliable. However, it is worth pointing out that the value of PIKE for West Africa in 2014 is the highest ever recorded in that subregion.

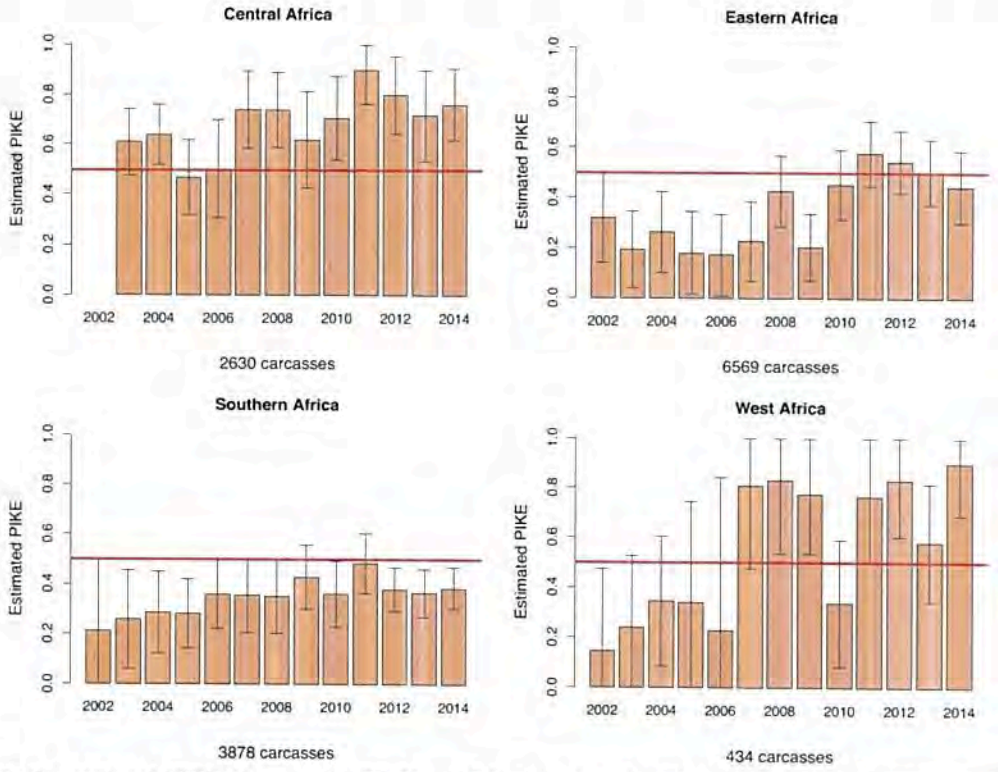

Figure 2. Subregional PIKE trends with 95 % confidence intervals. The numbers of carcasses on which the graphs are based are shown at the bottom of each graph.

In conclusion, while poaching levels seem to be stabilizing across MIKE sites, they remain above the likely sustainability threshold, especially in Central and West Africa, but also in specific sites in Eastern and Southern Africa.

Subject: Enhancement Finding for African Elephants Taken as Sport-hunted Trophies in Zimbabwe On or After January 1, 2015.

The African Elephant (*Loxodonta africana*) is listed as threatened under the U.S. Endangered Species Act (ESA) and is regulated under an ESA section 4(d) special rule [50 CFR 17.40(e)]. The 4(d) special rule gives the requirements for the import of sport-hunted trophies. Under paragraph 17.40(e)(3)(iii)(C), in order for the U.S. Fish and Wildlife Service (Service) to authorize the import of a sport-hunted elephant trophy, the Service must make a finding that the killing of the animal whose trophy is intended for import would enhance the survival of the species in the wild. In evaluating the available data on elephant hunting in Zimbabwe, the Service has determined that it is unable to make a finding that the killing of elephants in Zimbabwe, on or after January 1, 2015, whose trophies are intended for importation into the United States, would enhance the survival of the African elephant in the wild. Therefore, the trophies, part or products, of elephants taken in Zimbabwe during the 2015 hunting season and future hunting seasons, will not be allowed to be imported into the United States. The suspension on importation of trophies taken during calendar year 2015 or future hunting seasons could be lifted if additional information on the status and management of elephants in Zimbabwe becomes available, including utilization of revenue generated through sport-hunting by U.S. hunters, which satisfies the conditions of the 4(d) special rule under the ESA.

General considerations:

As stated in previous findings, in evaluating whether the killing of the animal whose sport-hunted trophy is intended for import into the United States contributes to the enhancement of African elephants within a country, the Service looks at a number of factors. We evaluate whether a country has a valid national or regional management plan and if the country has the resources and political will to enact the plan. If there is a plan, what government entities

implement the plan and how often is it reviewed and updated? Does the plan have clear, achievable objectives? Are the objectives measurable and are they being achieved? Is there an adaptive management approach within the plan so that enacting agencies can quickly respond to changing environmental or social issues?

The Service also evaluates the status of the elephant population within a country and trends over time. Particularly, we are interested in population numbers, sex and age-class distribution, and mortality rates (both natural and human-induced). Are standardized surveys being conducted and, if so, what are the timing, census methodology, and coverage? Since elephant populations can move across international borders, what level of cooperation is there between neighboring countries in management and surveying efforts for shared populations? How is poaching accounted for within survey efforts?

The Service takes into account all forms of offtake when evaluating population viability and sustainability, including human-elephant conflicts, problem animal control, poaching, and sport-hunting. While recognizing that there may be limited resources available for elephant management, the Service considers what national policies are in place to address human-elephant conflicts and problem elephant control. Is there a policy on culling surplus animals and removal of nuisance animals? Does domestic harvesting of elephants occur for local consumption or use? The amount of protected area either set aside for elephants or managed for elephant populations and the level of protection provided are also important in the Service's evaluation of whether imports of trophies could be authorized.

Finally, the Service considers the country's sport-hunting program and whether it contributes to the conservation and management of the species. Is the hunting program scientifically based and has it been incorporated into national/regional management strategies, particularly in light of data on population numbers and trends and levels of utilization (both legal and illegal)? Are the funds generated by hunters going directly to in-situ conservation and management efforts or deposited into a general treasury fund? How are hunting quotas distributed? If there are concession areas, how are they managed and allocated? Do U.S. hunters, through their participation in the hunting program, contribute sufficient funds to address management needs of the species, and are those funds utilized in a meaningful manner?

In short, the Service is looking to determine if a country has sufficient numbers of elephants to support a hunting program, if the country has a management plan and adequate laws and regulations to effectively implement a hunting program, and if the participation of U.S. hunters in the program provides a clear benefit to the species to meet the requirements for the import of sport-hunted trophies under paragraph 17.40(e)(3)(iii)(C).

Basis for Finding for Zimbabwe:

In the April 4, 2014, finding, and the revised finding of April 17, 2014, the Service stated that it was unable to make a positive finding to allow imports, primarily due to the limited information available to the Service at that time. On April 4, 2014, the Fish and Wildlife Service sent a letter

to the Zimbabwe Parks & Wildlife Management Authority (ZPWMA) with a series of questions that would assist the Service in making a final determination on trophy imports. On April 14, 2014, the Director-General of ZPWMA sent a letter to the Service expressing concerns over our decision to establish a temporary suspension. On April 17, 2014, the Director-General sent a response to the Service inquiry. Several weeks later, the Service received a number of documents, including copies of Zimbabwean laws, and other items referenced in the ZPWMA response. In addition, on June 6, 2014, the Service received additional information from Conservation Force, a U.S.-based conservation and hunting non-governmental organization (NGO). In its July 17, 2014 finding, as revised on July 22, 2014, the Service stated that it continued to be unable to make a positive finding to allow imports. Since that time, the Service has received a number of comments from individuals and associations connected to the hunting industry in Zimbabwe or southern Africa. On October 21, 2014, the Service received additional comments from Conservation Force. Further information was provided by Conservation Force on January 19, 2015. After reviewing this information, the Service delivered a second letter, dated October 31, 2014, to ZPWMA while attending the 13th Annual African Wildlife Consultative Forum in Ethiopia. This letter requested clarification of information submitted to the Service, and also requested additional information to address questions that were raised from our review of available information. The Service received a response to this inquiry on December 10, 2014. Safari Club International also provided supplemental information on December 17, 2014, and January 23, 2015. This finding is the result of an analysis of all of this information. Based on the information available to the Service, we are unable to make a finding that the killing of elephants in Zimbabwe, on or after January 1, 2015, whose trophies are intended for importation into the United States, would enhance the survival of the African elephant in the wild. As noted above, the suspension on importation of trophies taken during calendar year 2015 or future hunting seasons could be lifted if additional information on the status and management of elephants in Zimbabwe becomes available which satisfies the conditions of the 4(d) special rule under the ESA.

Management Plans: In its April 4, 2014, letter, the Service asked whether Zimbabwe had a current national management plan for elephants. In the ZPWMA response, Zimbabwe responded that the "management plan" consisted primarily of The Policy and Plan for Elephant Management in Zimbabwe (1997) and Elephant Management in Zimbabwe, third edition (July 1996). In addition, ZPWMA stated that they also implement other plans: "The African Elephant Action Plan" (CoP15 Inf. 68), SADC Protocol on Wildlife, and Elephant and Rhino Security Plan. In the ZPWMA response, ZPWMA stated that all of the protected areas in Zimbabwe have "specific aspects of elephant monitoring programs that are implemented and reviewed on an annual basis". ZPWMA stated that information on the status of the elephant is derived from aerial surveys, water hole counts, walking transects, visitor observation, and ranger-based monitoring. In addition, ZPWMA stated that they are regularly monitoring the status of the elephant population, including poaching, at two sites through the CITES "Monitoring the Illegal Killing of Elephants" (MIKE) program.

According to their initial response, ZPWMA is the sole legal authority, under the terms of the Parks and Wildlife Act, Chapter 20:14, for administering the management plans and overall

management of elephants in Zimbabwe. Through an adaptive management approach, ZPWMA stated that aspects of the elephant management plan are "reviewed through annual stakeholder consultative national workshops" with government, NGO, local community, safari operator, and private sector participation.

Elephant Management in Zimbabwe provides a historical review of elephant status in Zimbabwe prior to 1996. The document also identifies three major management goals for ZPWMA: maintain at least four demographically and genetically viable populations; maintain numbers and densities below levels that will not compromise biodiversity; and maintain or increase elephant range at or above 1996 levels. However, the document primarily focuses on intentional reduction of elephant populations through culling rather than on maintenance or increase of populations under threat. While the Service recognizes the potential role of culling as part of a management program, Elephant Management in Zimbabwe is largely irrelevant since it does not establish specific measurables or management actions that need to be taken. Instead, it largely presents a philosophical discussion of the merits of culling and efforts that must be taken to ensure that culls meet the desired management results. The document did make one relevant statement that when managing elephant males for sport hunting, it is essential to account for all adult males removed from a population, including animals taken through problem animal control and poaching. The document goes on to state that the "sport hunting quota should be reduced, to zero if necessary, if more than 0.75% of the populations [per annum] is being killed in other ways."

The Policy and Plan for Elephant Management in Zimbabwe was the outcome of a "Zimbabwe Elephant Management Framework" workshop held on January 13, 1997, in Harare. The document summarizes the issues that were affecting elephant populations in Zimbabwe at the time, and recommended policy statements on elephant management. While the document states a clear goal and establishes ten objectives with management actions identified, it does not sufficiently expand on any methodology to meet the objectives or complete management actions. Without a plan to take specific actions to meet the objectives, or at least a clear framework on how adaptive management efforts would be monitored to ensure that they are meeting the stated objectives, it is not clear to the Service how this document could serve as a "management plan". Given the general nature of the stated objectives, it could be stated that the objectives and, possibly, the management actions of this 1997 document are still valid, but without specific measurable outcomes identified to implement these goals and actions, the document is insufficient to address the management of elephants. Further, while the material received from Conservation Force and the ZPWMA in response to the Service's April 4, 2014, and October 31, 2014, inquiries provided some information related to the objectives, the Service has not received sufficient information to indicate, since the inception of this document in 1997, which objectives are being met or how they are being met.

Other documents provided by ZPWMA in response to our inquiries, e.g. "The African Elephant Action Plan" (CoP15 Inf. 68), SADC Protocol on Wildlife, and Elephant and Rhino Security Plan also establish broad policy goals and objectives, but provide very little with regard to specific management actions or measurables. At a December 2014, three-day workshop, hosted by ZPWMA, to review Zimbabwe's Elephant Conservation Policy and Management Plan, the participants discussed the SADC Protocol, which went into effect in 2003. According to the

information from this workshop, the participants felt that the protocol was a good framework for Southern African countries to work together on law enforcement and anti-poaching efforts. It is not clear, however, how successful Zimbabwe has been in implementing this protocol (limited information has been provided supporting or refuting Zimbabwe's implementation of the Plan). The Zimbabwe Policy for Wild Life is a general framework, published in November 2000, on how ZPWMA would be managed to ensure that Zimbabwe's wildlife and their habitats are appropriately managed. This document specifically acknowledges that "[I]t is intended that [this] policy will be followed by detailed management plans and enabling legislation for those issues which merit them." It is not clear if detailed management plans for elephants have not been developed because ZPWMA does not believe that elephants merit such plans, or if detailed plans have been developed, but were not provided to the Service.

Finally, the National Environmental Policy and Strategies, published in June 2009, is a general policy framework for all environmental issues in Zimbabwe. The document, while addressing ways to maintain environmental integrity, social issues, economic issues, and environmental management, establishes "guiding principles" and "strategic directions" for addressing biodiversity (Guiding Principle #9 and 10), flora (#11 and 12), fauna (#13), genetic resources (#14), protected areas(#15), natural resource management (#43), and wildlife and fisheries (#45). However, these guiding principles and corresponding strategic directions are only broad guidance and do not identify any specific management activities.

Without a management plan or plans, or other guiding document, with specific, measurable goals and actions, it is very difficult for the Service to determine if ZPWMA is implementing the well-articulated, but general, goals and objectives that appear in Elephant Management in Zimbabwe, The Policy and Plan for Elephant Management in Zimbabwe, and other Zimbabwean policy documents. It should also be noted that both elephant management plans are more than 15 years old.

In several documents available to the Service, ZPWMA stated that they do not have a proscriptive management plan because they utilize an adaptive management approach to elephant conservation and management. However, no information has been provided that indicates how this adaptive management approach is carried out. While the Service acknowledges the value of such an approach generally, a clear framework or guidance would be necessary to ensure consistent implementation on a national basis. Even if the documents mentioned above were the overarching guidance for the country and adaptive management was carried out independently for each of the four subpopulations (North West Matabeleland, Zambezi Valley, Sebungwe, and Gonarezhou (or South-East Lowveld)), it would stand to reason that each subpopulation would need guidance that is more specific. In both of the ZPWMA responses to the Service, they spoke of "devolving wildlife management authority to local branches, private conservancies, and CAMPFIRE's RDC [rural development councils]". The Service does not disagree with a regional or local management approach, however, since the Service has been informed that elephants in Zimbabwe are managed at a national level, there needs to be a national approach and understanding of the basis of this adaptive management and that the country, as a whole, is taking a logical, scientifically based approach to reaching the agreed upon end result.

In December 2014, ZPWMA hosted a three-day workshop at Hwange Safari Lodge in Zimbabwe to review Zimbabwe's Elephant Conservation Policy and Management Plan. The workshop was attended by the ZPWMA Director General, the Permanent Secretary for Environment, Water and Climate, members of the Zimbabwe Parks and Wildlife Board, Executive Directors of Rural District Councils, and various NGOs. Both the Permanent Secretary and the Director General acknowledged at the workshop that the 1997 management plan was outdated and has been overtaken by events at the global, regional, and local level and cannot address current challenges.

The workshop participants agreed on a framework for the upcoming management plan. The proposed revised management plan has the same long-term vision of the 1997 plan and basically the same target goals (i.e., maintain at least 4 demographically and genetically viable populations; maintain or increase elephant range; maintain numbers/densities of elephants at levels that do not adversely impact biodiversity conservation goals while contributing to economically viable and sustainable wildlife-based land uses). The workshop participants identified the beginnings of strategic objectives and outputs, as well as some key activities. The outcome of the workshop appears to be a starting point for reevaluating the current management plan(s). However, according to the Proceedings, there was insufficient time at the workshop to complete the section on means of verifying the key performance indicators. A schedule was agreed upon: by Dec. 15, 2014, ZPWMA would appoint a drafting team to write up the management plan; the 1st draft of the plan would be ready by Jan. 30, 2015; the Elephant Management Plan Coordinating Committee would be convened by ZPWMA by Feb. 28, 2015; Final draft of management plan by April 30, 2015; and Operational annual management plans for 4 sub-regions by May 30, 2015.

Overall, ZPWMA has not provided, and the Service has not otherwise received, any information regarding the 2014 or future hunting seasons that indicates that Zimbabwe is implementing appropriate management of the national elephant population. While the Service does not have adequate information to conclude that the current management regime is sufficient to meet the criteria under 50 CFR 17.40(e)(3)(iii)(C), a revised national plan that includes specific goals and measures with specific actions to be taken is a necessary first step towards a re-evaluation of this finding in the future.

Population Status: To manage any population to ensure an appropriate population level and determine whether sport-hunting is having a positive effect, it is vital to have sufficient data on population numbers and population trends to base management decisions. Elephant Management in Zimbabwe states that sport-hunting quotas should be reduced or eliminated if the overall offtake of male elephants, from all sources, is greater than 0.75% of the total population per annum. Without current population data, it is not clear how one can calculate the number to offtake. Without information on population demography and mortality, it is not possible to determine accurately what impact hunting, in conjunction with other offtakes, including problem animal control and poaching, is having on Zimbabwe's elephant population. However, Rowan Martin, author of this document, stated in comments submitted to the Service that he wished he could "disavow one's own writing". Dr. Martin stated that "It [the document] is correct in saying that close attention should be paid to problem animal control and illegal hunting…[but] my current thinking is that trophy hunting should continue regardless and the management thrust should be on reducing illegal hunting and problem animal control. A well-functioning trophy hunting industry

could be the one factor that reduces number of elephants killed illegally and as problem animals." While the Service agrees that a well-functioning hunting industry can provide financial benefits, we also believe that a clear understanding of all off-take is necessary and hunting should not continue without adequate population data.

At the time the Service made its April and July 2014 findings, we relied heavily on population information in the IUCN SSC African Elephant Database report "2013 Africa". According to this this report, the elephant population in Zimbabwe in 2007 was estimated to be 99,107, of which 85% (84,416) was classified as "definite", although less than 1% of these animals were identified by aerial or direct counts, and only 0.3% (291) was classified as "speculative". While the total population in 2012 was estimated at 100,291, only 47% (47,366) was classified as "definite" and 45% (45,375) was classified as "speculative". Only 304 "definite" animals were counted by aerial or ground counts (less than 1% of the definite animals), while 41,840 of these animals were counted through sample counts or dung counts, a less accurate methodology than properly conducted aerial surveys, and the remaining 5,222 were estimated through "other guesses". According to this report, 23 of 40 population estimates included in 2012 are older than 10 years, undermining the quality of the data. Further, according to the report, only eight of the 40 estimates used in the "2013 Africa" report were the result of repeated surveys. As noted in that report, "this lack of systematic and updated monitoring data is of serious concern for possibly the third largest elephant population in Africa." However, in a November 3, 2014, letter to the Service, the IUCN/SSC African Elephant Special Group stated that data had been inadvertently left out of the 2013 provisional report. Specifically, a 2007 survey of Hwange National Park was left off, although it was recorded under "New Surveys" on their website. The results of this survey would have added an additional 30,000 elephants to the "definite" category (from the "speculative" category), while not changing the overall population estimate. Nonetheless, the majority of surveys that contributed to the overall population estimate of 100,291 were more than 10 years old. Given the current circumstances in Zimbabwe and across the continent (e.g., poaching, habitat loss, human population expansion), this information is outdated and cannot be relied upon to show the current status of elephants.

In 2012-2013, according to information provided by ZPWMA, two surveys were conducted in Save Valley Conservancy and in Gonarezhou National Park (and surrounding areas). In Aerial Survey of the Larger Herbivores, Save Valley Conservancy, Zimbabwe, a report compiled in September 2013 by the Technical Advisory Committee of the Save Valley Conservancy, 1,538 elephants were counted. Based on nine years of aerial surveys (2004-2010 and 2012-2013), not all of which covered all of the Save Valley Conservancy, there does appear to be a short-term increase in elephant population density of 9.5%. However, trend analysis of the last three aerial surveys indicated only a 2.2% population increase in elephants. Further, the 2012-2013 surveys were only partial surveys and conditions were such that some double counting may have occurred.

In October 2013, additional aerial surveys were conducted in Gonarezhou National Park, Malapati Safari Area, and adjacent communal lands. From these surveys, it was estimated that there were 10,151 elephants in the Gonarezhou National Park area, the highest estimate since sample surveys began there in 1975. The estimated total number of elephant carcasses in the entire survey was 513. The "1+2" carcass ratio (fresh carcasses (category 1) and recent carcasses (category 2)),

however, was 0.39% in the entire survey area. The Service recognizes that the apparent elephant population increase in Gonarezhou National Park is excellent news. However, a carcass ratio of less than 4%, which is the expected carcass level due to natural mortality alone, is low. This low number could be an indication that the aerial survey method did not accurately detect all carcasses.

In 2014, the Pan African Aerial Elephant Survey (http://www.greatelephantcensus.com/) was carried out over a significant portion of the elephant's range in Africa. Preliminary results from the Pan African survey report a provisional estimate for elephant abundance in Zimbabwe to be between 82,000 and 83,000 individuals. This represents a 6% decline since 2001 surveys. This decline in elephant abundance is important when compared to 5% increase in elephant abundance per annum during the time period immediately prior to the 2001 survey. This overall downward decline in elephant abundance in Zimbabwe is troubling, as an example if elephant abundance in Zimbabwe was predicted to be 99,107 in 2007 and had a constant growth rate of 5% per annum, the Zimbabwe population would be predicted to exceed 139,454 by 2014.

Figures presented at the 16th Meeting of the Conference of the Parties to the Convention on International Trade in Endangered Species of Wild Fauna and Flora in Bangkok, Thailand, March 3-14, 2013 (CoP16 Doc. 53.1) indicated that, during 2002 – 2010, the percentage of illegally killed elephants (PIKE) in the Chewore area (Mana Pools and Chewore Safari Park) Zimbabwe was circa .24, whereas in 2011 that number jumped to .67. A PIKE level of 0.5 or higher (half or more of all carcasses were the result of illegally killed elephants) means that the elephant population is very likely to be in net decline. At the 65th meeting of the Standing Committee, updated PIKE data were provided for Zimbabwe (SC65 Inf.1). PIKE numbers from the two MIKE sites in Zimbabwe showed an increase in 2012 to 0.79 (out of 43 carcasses found) and 0.27 (out of 52 carcasses found). In 2013, the PIKE rates reported for the same two sites were 0.4 (91 carcasses found) and 0.22 (36 carcasses found). From these data, it appears that there was an increase in elephant poaching in 2012, but the poaching level might have declined in 2013 to below the 2011 level. According to the preliminary results from the Pan African Aerial Survey, carcass counts in Mid Zambezi Valley were estimated at 553 (4.3% of live population); Sebungwe had an estimated 1,424 (28.2%). North West Matabeleland was estimated at 4,087 (7.6%) and Gonarezhou National Park at 523 (4.6%) carcasses. There are no estimates available as to the proportion of these carcasses that were the result of poaching.

Regulations and Enforcement: The regulatory mechanisms for ZPWMA and its programs have been established under the Parks and Wild Life Act. This law includes sections on virtually every aspect of ZPWMA, including requirements for annual financial audits and reporting to the central government. The law also provides for substantial penalties for the unlawful possession of or trading in ivory. The first offense carries a minimum of 5 years and a maximum of 15 years in prison. The second offense carries a minimum prison term of 7 years and a maximum of 15 years. However, according to the response from ZPWMA to our April 4, 2014, inquiry, the General Laws Amendment Act (No. 5) of 2010 provides for a mandatory imprisonment of not less than nine years for poaching. If properly enforced, it appears these penalties would be a sufficient deterrent to poaching. However, we did not receive any information on the number of poaching crimes that are prosecuted nor the average sentence or penalty.

In January 1996, the Government of Zimbabwe approved the establishment of the Parks and Wild Life Conservation Fund, a statutory "Fund" that provides for financing wildlife operations directly from revenues generated through wildlife related activities. However, only revenues generated through sport-hunting conducted on state and private lands are used to finance ZPWMA; to our knowledge, no other government funding is provided, and only limited outside funding from NGOs or other governments appears to be available. The 1997 CITES Panel of Experts raised concerns as to the status of ZPWMA relating to its weak financial base, lack of management skills, inadequate and old equipment, and poor infrastructure. While the concerns raised by the Panel of Experts are dated, no new information was provided by ZPWMA or other sources regarding these concerns in response to the Service's April 4, 2014, inquiry.

Based on their December 10, 2014, letter, ZPWMA has a current operating budget in excess of US$28 million. In 2013, ZPWMA reported having revenues of US$29 million against expenditures of US$26 million. According to the letter, "...except for activities like game water supplies in Hwange NP and aerial surveys, there is no budget specifically to manage elephant because ZimParks takes a holistic approach to conservation of all wildlife resources including elephants." ZPWMA also stated that elephant hunting contributes in excess of US$14 million annually and that approximately 30% of ZPWMA's revenue is from hunting, of which the elephant is the major contributor. Besides these statements, however, we do not have adequate information about how much money is generated by elephant hunting, how these funds are distributed, or how these funds impact the ability of ZPWMA to adequately enforce the Parks and Wild Life Act, day-to-day management, or anti-poaching efforts.

That being stated, the Service received documents written by Rowan B. Martin entitled "Ban on Import of Elephant Trophies into the USA from Tanzania and Zimbabwe: Costs of Protection of Elephant Areas." The undated documents discussed the budget requirements for protecting wildlife areas in Zimbabwe based on calculations developed by Mr. Martin in 1996 and 2004. The documents stated that for Zimbabwe, given the total elephant range within the areas controlled by ZPWMA, the annual budget required to protect the elephant range would be US$21 million. In 2013, ZPWMA requested $28 million from the Treasury, the major part of which was intended for anti-poaching efforts. They were allocated only $1.5 million. According to Martin, this amount, along with the revenue from trophy hunting licenses, is not sufficient to provide the needed level of protection for land under ZPWMA's authority. However, in their December 10, 2014, letter, ZPWMA stated that they did not accept Dr. Martin's evaluation and did not consider it accurate. Dr. Martin also presented at the December workshop on this issue. According to the proceedings from the workshop, Dr. Martin suggested that ZPWMA would need US$5,275,480 to protect the National Parks, US$7,055,268 to protect safari areas, and US$3,891,536 for forest areas annually. In addition, communal lands would need US$6,101,101 and private land $3,826,770. Since we have not received a communication from ZPWMA since their December 10, 2014, letter, it is unclear if they agree or disagree with these numbers.

In evaluating the resources available to ZPWMA and their ability to implement regulations and enforcement, we also considered documents from recent Meetings of the Conference of the Parties to CITES. At the 15th Meeting of the Conference of the Parties to CITES, a report on the Elephant Trade Information System (ETIS) was presented (CoP15 Doc. 44.1 Annex). In the report,

Zimbabwe was specifically identified with regard to illicit ivory trade. The report noted the existence of organized criminal activities within Zimbabwe, including reports of the involvement of politicians, military personnel, and Chinese nationals in illicit wildlife trade. The report goes on to state that the law enforcement effort ratio within the countries grouped for the analysis had dropped to 40%, a decline of 4% from the CoP14 analysis. This decline indicates a less than average performance and was attributed to the situation in Zimbabwe.

At the 16th Meeting of the Conference of the Parties to CITES, the report on ETIS (CoP16 Doc. 53.2.2) expressed concerns about Zimbabwe with regard to illegal trade in ivory. The report stated that, as a group, Zimbabwe, Botswana, and Namibia were in the middle range, when compared to 64 other consumer or producer countries of elephant ivory, in terms of the mean number of seizures identified, but ranked fifth in the measure of scale, indicating that most of the seizures were in the 10-100 kg class (i.e., an average number of seizures that were predominately smaller in size). The report noted that 65% of the ivory trade between 2006 and 2011 had occurred since 2009, indicating that illegal ivory trade is increasing. Governance indicators were mixed, with a much lower than average World Bank "rule of law" score, but the second highest law enforcement ratio of any group of countries evaluated. The report, however, supports the Service's governance concerns by specifically identifying Zimbabwe as pulling these scores down in both cases, "especially in the 'rule of law' score, indicating that far greater challenges exist in that country." The report also noted that Zimbabwe was the source of nearly two tons of worked ivory seized in Cape Town, South Africa, in 2009.

In several letters sent to the Service by Zimbabwean safari outfitters and hunting guide organizations, it was stated many times that the presence of hunters, specifically U.S. hunters since they appear to make up the vast majority of sport-hunters in Zimbabwe, and subsequently the professional hunters and safari outfitters guiding the hunters, are the major deterrent to poaching in Zimbabwe. Several specific incidents were reported where safari outfitters and hunters, and not the ZPWMA rangers, thwarted poachers. In at least one incident, the 2013 Hwange National Park poisoning, it was reported that the safari outfitter paid for all of the anti-poaching efforts, including paying for all transportation for the ZPWMA rangers and feeding them. We would expect that the presence of anyone in the field, particularly armed hunters, could deter poachers from carrying out illegal activities where the likelihood of being captured is heightened. However, no evidence was presented to the Service that supports the belief that, without hunters, specifically U.S. elephant hunters, poaching in Zimbabwe would significantly increase. Based on the information provided, we believe that it is not likely that legal hunting for elephants or other wildlife is widespread enough or at a high enough density level to reduce significantly poaching levels in and of itself. This is particularly true for national parks, where hunting is not allowed.

Various statements about trophy hunters and outfitters being a major deterrent to poaching raise concern about existing ZPWMA funding levels and funding utilization. First, concerns center on the ability of ZPWMA to generate sufficient funds to support adequately their stated mission. Secondly, there is concern about ZPWMA's ability to utilize existing funding to support on-going activities. Without additional information on ZPWMA's funding sources (or income) and operating expenses, the Service is unable to determine if Zimbabwe has adequate resources to

enforce existing laws and regulations.

Even with the revised December 10, 2014, information regarding the current ZPWMA budget, we continue to lack sufficient information regarding funding levels or any indication that the financial base, management skills, equipment, or infrastructure have improved. It is possible, of course, that recent and upcoming events, such as the Hwange meeting in December 2014 and other meetings scheduled for early 2015, may lead to a clearer understanding of funding levels and the utilization of ZPWMA revenue. As noted previously, the Service can re-evaluate this finding, and the suspension on importation of trophies taken during calendar year 2015 or future hunting seasons could be lifted, if additional information on the status and management of elephants in Zimbabwe becomes available which satisfies the conditions of the 4(d) special rule under the ESA.

Sustainable Use: We have not been provided with adequate information regarding offtake in Zimbabwe, including basic fundamental information like the number of elephants that have been sport-hunted annually and the number of elephants that have been legally killed for the hide trade. For both the 2014 and 2015 hunting seasons (January – December), Zimbabwe has established an annual export quota of 500 elephants (1000 tusks). This is the same quota that Zimbabwe has reported to the CITES Secretariat since 2004. According to available information, it does not appear that Zimbabwe actually fills this quota each year, but due to variation in how trophies are categorized in CITES trade data, it is difficult to categorically identify the actual numbers of hunted elephants that are exported each year. Information provided by ZPWMA in response to our April 4, 2014, inquiry did not identify the number of trophies exported annually. Several statements from safari outfitters indicated that approximately 160 elephants are taken annually, but this number is not supported by any documentation.

ZPWMA categorizes offtake into six categories: Cropping (hunting and population control, which may include meat supply to rural communities and live animals to breeders), Natural Mortality (found dead of natural causes), Accidents (killed by trains, landmines, or vehicles), Poaching (illegal take), Problem Animals (elephants killed to protect human life and property), and Management Offtake (offtake due to other management decisions). No information was given on the number of elephants that are taken in each of these categories. It does not appear that Zimbabwe is currently conducting any culling operations, besides trophy hunting if considered a "cull".

According to information from ZPWMA, 293 elephants were poached in 2013, including the 105 elephants poisoned in Hwange National Park.[1] Of the five years of data ZPWMA provided in their April 17, 2014, response, an average of 190 elephants were identified as being poached annually. In 2009 and 2010, there was an average of 111 elephants poached; however, between 2011 and 2013, the average more than doubled to 243 elephants. It is not clear what stimulated this significant increase. Many countries have experienced a marked increase in poaching, due to the increase in demand for ivory. It is also possible that shifts in land tenure, governance,

[1] In our April 4, 2014, finding, we incorrectly stated that over 300 elephants had been poisoned.

ZPWMA's limited financial resources, or economic factors contributed to the increase. Further, while the number of animals poached in Zimbabwe does not appear to be as high as in other countries, information that was presented at CoP16 (CoP16 Doc. 53.1) indicates that there has been a steep rise in poaching incidents. Without more definitive population data, like what should come from the Pan African Aerial Elephant Survey when all of the data are released, there is no way to determine whether these numbers, combined with other offtake, are sustainable.

While the number of elephants taken as problem animals was not elucidated in material provided by ZPWMA in April 2014, it appears, based on their response and documentation provided by Conservation Force, that a large number of elephants are taken each year. ZPWMA reported that in a 3-year period (2009-2011), there were 372 human-elephant conflict cases for four "hot spot" districts. It is not clear if elephants were removed in each of these cases. However, the Service has anecdotal evidence suggesting that the number of problem animals may equal or exceed the number of elephants taken through sport-hunting.

The December 10, 2014, letter from ZPWMA, however, included some further information on off-takes. According to this letter, the percentage breakdown of all off-takes was as follows: 5% from problem animal control, 55-60% from hunting, and 35% from poaching and natural mortality. While specific numbers were not provided, the letter also stated that an average of 40 elephants was taken annually as problem animals. Therefore, if these percentages are correct, hunting off-take would be 440-480 animals, and poaching/natural mortality would be approximately 280 animals. However, the December letter also stated that management offtake (culling, training exercise, and meat production for park staff) was approximately 95 elephants annually. Based on these numbers and with a reported 3-year average of 180 elephants taken annually due to poaching (the 2013 Hwange incident of 105 elephants being poisoned was not included in this average), the natural mortality of elephants in Zimbabwe is approximately 100 animals/year or 0.12% annually. Since this is far below the likely natural mortality rate of healthy elephant populations, we question the accuracy of the percentage breakdown provided by ZPWMA in their letter.

African elephants in Zimbabwe are listed in CITES Appendix II, with an annotation that allows trade in hides. According to CITES trade data, at least 2,373 hides were exported in 2010, 3,204 in 2011, and 4,675 in 2012. It should be noted that these numbers probably do not equate to whole animals, but include whole hides and parts of hides. Some of these hides may have been obtained from sport-hunted trophies, problem animal control, or culling operations. Based on these reported numbers, it is not possible to determine the elephants taken specifically for the hide trade, however. While the Service asked about the export of hides in its October 31 letter, ZPWMA did not directly address the issue in its response letter. They did state that the export of hides was authorized under the annotation for African elephants and that all hides that are exported are legally obtained.

We continue to have fundamental questions regarding how the number of elephants to be hunted in an area is decided. In addition to questions about how the overall offtake is determined, we also have not received an adequate explanation on how the quota is allocated spatially. According to information from ZPWMA, and from safari outfitters and professional hunters associations, the principle form of utilization of the elephant in Zimbabwe is sport-hunting.

Quotas are apparently set to maximize the sustainable production of high-quality trophies without detriment to the population. However, it appears that the national export quota of 500 elephants may be the primary driver when establishing individual quotas for each hunting area, as opposed to determining the best quota to facilitate management goals for those areas. According to the material provided to the Service, it appears that the annual national quota of 500 elephants is divided up and allocated to each area based on recommendations from ZPWMA ecologists, field staff, safari operators, other stakeholders, and technical specialists through "multiple stakeholder participatory quota setting". According to information provided by ZPWMA, on an annual basis, stakeholders use available population data to propose a particular quota for an area to a Quota Setting Workshop. At this workshop, it is determined if the proposed quota should be adopted or modified in relation to other proposed quotas. Factors that are considered each year include population estimates, growth rates of populations, size of hunting areas, status of habitat, and target elephant population size.

While the material provided to the Service lays out the general process, the Service did not receive any specific information on how quotas are established in practice. ZPWMA provided the District Quota Setting Toolbox and the Quota Setting Manual, published in 2000 and 1997, respectively. While these documents are useful training material, they only provide a general overview of quota setting for all species in Zimbabwe. In establishing a quota, one must take into consideration not only the habitat, population size, and size of the hunting area, but other offtakes and environmental impacts that may be affecting the species. Nothing that ZPWMA provided addresses these elements specifically. Further, if ZPWMA starts with the premise that the sum of all established quotas must equal the national export quota, it is not clear if the science is driving the quota-setting process or if the social/economic benefits derived from hunting is the driving force. Finally, without current population data and information on the distribution of elephants across the country, both of which would come from scientifically based population surveys, it would appear that establishing a scientifically viable quota, either higher or lower than previous years, would be impossible. The current quota-setting process utilized by ZPWMA may take into consideration issues raised in this document, but without providing an explanation of the system used and describing the calculations, the Service cannot determine if sport-hunting quotas are reasonable or beneficial to elephant populations, and therefore whether sport-hunting is enhancing the survival of the species.

One of the aspects of whether current elephant management facilitates long-term sustainability of hunting programs is the length of hunting leases. There is a general consensus, supported by antidotal evidence, that shorter leases do not give safari operators an incentive for long-term planning. A representative of the Safari Operators Association of Zimbabwe (SOAZ) and the Zimbabwe Professional Hunters and Guides Association (ZPHGA) at the 2014 workshop, stated that the "present 5-year leases are not working as areas are being abused at the expense of wildlife" and that "[l]onger leases will provide better protection and investment in such areas. All leases must be open and transparent." In addition, he expressed that "[a]t present, large fixed quotas are forcing concession holders to take young animals that should not be shot, to recoup moneys paid for leases and trophy fees. Authorities need to stop transfers of quotas from one area to another for elephant and for all trophy species." He spoke of the need for taking smaller,

non-trophy bulls that are conducting crop raids to compensate local communities. He also spoke of stopping commercial hunts in the national parks and "most of all, keep the South Africans out – they are abusing our wildlife". He recommended that ZPWMA allocate all quotas by December 1 each year so that operators can market their hunts effectively. He also called for greater communication between ZPWMA and SOAZ and ZPHGA.

A second presenter at the workshop representing the Zambezi Society, stated in the working session on Coordination, Monitoring, Reporting, and Annual Adaptive Management that "we are looking at managing a multi-million dollar resource and what is a major project but appointing a part-time coordinator to attempt to pull together a multitude of stakeholders with a result that will fail". The speaker further stated, "[t]he way elephant conservation has been managed over the last several years in the face of an escalating poaching threat has clearly failed. ...The four sub-regions have differing characteristics and problems and separate plans are required for each sub-region" and called for a professional project manager to head the elephant conservation and management program in Zimbabwe, "otherwise it will not succeed."

While the above comments were made by two individuals at the workshop, since both individuals represented National organizations, their statements could be taken as an indication that additional work is needed to better coordinate professional hunters, safari outfitters, and NGOs with ZPWMA and communities. Without this "partnership" long-term sustainability of the hunting program could be affected and the role that U.S. hunters play could be questioned.

Revenue Utilization: On communal lands in Zimbabwe, the protection of elephants falls primarily under the Communal Areas Management Programme for Indigenous Resources (CAMPFIRE), which encourages reductions in human-elephant conflicts through conservation-based community development. The program was established in 1989 as a means of providing an economic incentive and return to rural communities while encouraging tolerance for the elephant and sustainable use of natural resources. This program has been the model for community-based conservation efforts in several other African countries and identified as an innovative program in the past. Under this program, there are currently 29 Rural District Councils (RDCs) that have been granted Appropriate Authority status under the Parks and Wild Life Act. Based on several CAMPFIRE documents presented to the Service, between 12 and 16 RDCs with exploitable wildlife resources make up the core of the CAMPFIRE program. While the Service recognizes that CAMPFIRE plays a role in elephant management, we did not receive clear information on the significance they play in elephant conservation (e.g., amount of elephant habitat occurring on RDC land or the percentage of elephant trophies taken on RDC lands).

According to the Revised CAMPFIRE Revenue Sharing Guidelines, which were incorporated into the Constitution of the CAMPFIRE Association in 2007, at least 55% of generated revenue from hunting should be devolved to producer communities, no more than 26% and 15% for management and overhead at RDC level, respectively, and 4% as a levy to the CAMPFIRE Association. According to an undated document (but presumably produced in late 2014) produced by CAMPFIRE (CAMPFIRE report undated) at least 10 RDCs comply with the Revenue Guidelines. As reported in this document, data were presented in an October 2013

report stating an estimated US$2,496,349 was generated by 15 RDCs in 2012 from hunting revenue. While this report states that 5 out of 13 RDCs contributed 84% of the hunting revenue, the supporting table to this statement does not reflect this number. Further, the report states that an assessment of 18 main CAMPFIRE districts allocated hunting quotas for 2014 shows that 106 out of 167 bull elephant hunts were booked by U.S. hunters and that elephant hunting contributes more than 70% of the income to the CAMPFIRE program, and that 90% of all CAMPFIRE revenue comes from all hunting.

The CAMPFIRE report (undated) reported that in the Community Based Natural Resources Management Stocktaking Assessment Report by Mazambani and Dembetembe (2010) [Service does not have a copy of this report], between 1989 and 2006, US$88.9 million in gross revenue was realized by key stakeholders in the CAMPFIRE program. Of this revenue, 55% went to safari outfitters, 23.4% to producer communities, 19.8% to RDCs, and 1.8% to CAMPFIRE Association. (The Service has no additional documentation or information to validate these figures.)

CAMPFIRE may well provide a "multiplier effect" concerning ecosystems goods and services. According to information received by the Service, in 2007, an estimated 777,000 households from 37 RDCs benefited directly or indirectly from CAMPFIRE. According to an estimate by CAMPFIRE officials (CAMPFIRE report undated), given that 58 RDCs now participate in CAMPFIRE (other sources state that there are 60 RDCs in CAMPFIRE), it has been extrapolated that over 1 million households now benefit from CAMPFIRE.

Several reports provided to the Service identify a large number of community projects funded by CAMPFIRE. These reports indicate CAMPFIRE programs contribute to employment at a local level – CAMPFIRE managers and officers, timber measurers, office clerks, game scouts; community projects employ resource monitors, tour guides, preschool teachers, grain millers, bookkeepers; and safari operators employ managers, scouts, trackers, drivers, cooks, camp minders, and professional staff such as bookkeepers and professional hunters.

On 17-18 November 2014, a workshop titled "CAMPFIRE Stakeholder's workshop: Towards the Development of a New Elephant Management Plan and Policy" was held in Zimbabwe. The discussions and recommendations touched on the effectiveness of the CAMPFIRE concept and its relationship to tourist hunting. At the workshop, Charles McCallum Safari reported that they had contributed over $349,000 to CAMPFIRE wards and the RDC in 2013 – U.S. elephant hunters contributed 40% of this total ($132,870). In 2014, the total was up to $400,995 but contributions due to U.S. hunters dropped to 27% ($100,800) – all elephant hunting was only 32% of the total ($118,425). It appears that the workshop may have been a good starting point to address issues faced by RDCs and to improve the effectiveness of CAMPFIRE. However, according to Conservation Force, represented at the workshop, CAMPFIRE needs to find a balance between a large elephant population and human population pressures, as well as ensure that revenue from tourist hunting and other resource uses continue to flow to local communities. The 2014 Pan African survey preliminary results appear to confirm that elephant populations in the Zambezi Valley and in Sebungwe have decreased significantly. These areas include

communal land. The declines indicate that the persistence of elephants in these areas may be in question in future years if the trend is not halted or reversed.

Dr. Martin states in his "Third Report: Potential Financial Returns from Trophy Hunting" (pg. 19, 21) that "when the results from all the available hunting areas in Zimbabwe are added up, there is sufficient income from trophy hunting to meet the conservation budgets for all the areas [of the elephant range]..." This may very well be true, but no such data was provided to the Service. We received reports from some private areas, conservancies, and RDCs, but even in these cases, insufficient information was provided. We received generalized reporting of hunting as a whole, without a breakdown of elephant vs. other species, or U.S. hunter vs. all hunters. Although there is some indication that some benefits are occurring, insufficient information has been provided to show that revenues generated by U.S. elephant hunters satisfy the conditions of enhancement under the ESA.

FWS does not disagree that local communities can benefit from well-managed resource management programs, but we are unable to determine how much revenue is generated by elephant hunting, how those funds are distributed within Zimbabwe, and what portion of that budget is accounted for by US hunters? SCI indicates, in their January 23, 2015 letter, that the inability to import trophies in 2014 resulted in an increase in human-elephant conflicts in CAMPFIRE RDCs from 412 incidents in 2013 to 597 in 2014. No data was provided to document a link between the increase in human-elephant conflicts indicated by SCI and the suspension of imports in 2014.

Local conservation efforts: Conservation Force and other commenters emphasized the economic impact of the suspension to local conservation efforts being carried out by individual landowners and leaseholders, safari outfitters, and conservancies. Effective conservation work is being carried out in some independently managed areas. Individuals may be impacted by a suspension of elephant trophy imports, however, it is unknown whether and to what extent these individuals would reduce their conservation efforts based on the inability of U.S. hunters to import a sport-hunted trophy. In addition, the information available to the Service on the conservation work being carried out by non-governmental entities, at this time, is limited, and is not the norm for Zimbabwe as a whole. While these pockets of conservation are greatly needed, there does not appear to be a mechanism in place, such as government support, tax incentives, or land tenure security, to promote or sustain these efforts across Zimbabwe's elephant range. The Service was made aware of several workshops that will be held or were held in the beginning of 2015. According to Conservation Force, a workshop on anti-poaching strategies for Mana Pools National Park was held on 26-29 January 2015. The workshop appears to have been sponsored by ZPWMA with NGO, safari operators, and some RDC representation; however, we have not received any information on the purpose of the workshop or any results. In addition, a workshop in Sebungwe was held sometime in January or February 2015. Again, we are not clear on the purpose of the workshop or any results. However, if these and other workshops were held that bring ZPWMA, RDCs, and safari operators together to discuss elephant conservation and management, it would appear that steps are being made to move forward in increasing communication and addressing issues.

Therefore, with the information made available to us, the Service cannot at this time determine that these limited activities would provide the enhancement required under the ESA to allow imports of trophies taken throughout Zimbabwe.

Summary: The issue before us is whether the killing of an elephant in Zimbabwe whose trophy is intended for import into the United States would enhance the survival of the species in the wild. When the Service announced the interim suspension on the import of elephant trophies from Zimbabwe on April 4, 2014, we based the decision on the lack of information available to the Service at that time that would enable us to make a positive finding. In response to our April 4, 2014, announcement and letters sent to the Government of Zimbabwe on April 4 and October 31, 2014, we received a large volume of information directly from ZPWMA, Conservation Force, Safari Club International, and a number of safari outfitters and professional hunter associations. Some information indicated that hunting in Zimbabwe was providing a benefit to elephants, while other information raised questions that were not answered. Many of our specific questions were not answered with the information provided. Based on our review of all of this information, we are unable to find that the killing of an elephant whose trophy is intended for import would enhance the survival of the species in the wild due to the following factors:

- Zimbabwe's current elephant management plan consists of two primary documents drafted in 1996 and 1997. Although the documents provide a well-developed list of goals and objectives, there is no information on whether these goals and objectives have been met or could be met. This is supported by statements from ZPWMA that the plans are outdated and need to be revised.

- Now that the Pan African Elephant Aerial Survey has been conducted in Zimbabwe and preliminary findings have been announced, ZPWMA and RDCs have a better elephant baseline population abundance estimate to assess future off-take quotas, management efforts, and anti-poaching activities. This is a significant, positive, step forward in Zimbabwe having adequate information to establish scientifically defensible hunting quotas, particularly in light of the limited information on other means of off-take, such as poaching and problem animal control. If this information is incorporated into ZPMWA management activities in a scientifically sound manner, the Service may have a better basis to re-evaluate our finding with regard to importation of elephants taken in the future.

- There appear to be adequate laws and regulations in place to address elephant management, but it is not clear if or to what extent ZPWMA is able to successfully implement them. Since the central Zimbabwean Government is not allocating funding to ZPWMA and the vast majority of funding must come from hunting revenues, ZPWMA, and CAMPFIRE need to document more fully the amount of revenue generated and how it is utilized. For the 2014 hunting season, the Service received limited evidence to support a positive enhancement finding. If accounting mechanisms are in place or are put in place that document hunting revenue and details are provided on how those funds are used for resource protection such that the Service would be able to find that hunting revenues generated

through sport-hunting of elephants in Zimbabwe whose trophies are intended for import into the United States would enhance the survival of the species in the wild, the Service could re-evaluate our finding with regard to importation of elephants taken during the 2015 hunting season or future hunting seasons.

- According to the information provided, Zimbabwe has established hunting quotas for all areas of the country. However, the Service did not receive specific information on how these quotas are established, whether other forms of offtake, such as poaching and problem animal control, were taken into account, or to what extent biological factors are taken into consideration (as opposed to economic and societal considerations).

- While CAMPFIRE has provided conservation benefits in the past and improved tolerance of wildlife in rural communities, the program has more recently come under criticism relating to excessive retention of generated funds by district councils, resulting in diminished benefits to communities. Sport-hunting may be an important tool that gives these communities a stake in sustainable management of the elephant as a natural and economic resource and offsets the costs of conflict with wildlife. However, without current information on how funds are utilized and the basis for hunting off-takes, the Service is unable to confirm whether revenue generated through sport-hunting actually provides an incentive to local communities to conserve elephants. The Service was pleased to hear about the November workshop and acknowledges that additional work is needed by CAMPFIRE to address current management concerns. Again, if additional information is forthcoming regarding activities in 2015, the Service may be able to revisit this finding.

- As stated in the previous finding, there are "bright spots" regarding elephant conservation efforts, particularly those carried out by non-governmental entities that are providing a benefit to elephants in some areas. However, there are not enough of these "bright spots" to overcome the problems currently facing Zimbabwe elephant populations and to support a finding that sport-hunting is enhancing the survival of the species. Without more support from the Central Government and Rural District Councils, these efforts are not likely to be fully successful or to compensate for the management deficiencies described above.

Therefore, based on this finding, no elephants harvested in Zimbabwe on or after January 1, 2015 may be imported into the United States.

EXECUTIVE SUMMARY

In April 2014, the United States Fish and Wildlife Service (FWS) suspended the import of elephant trophies taken in Zimbabwe. In March 2015, the suspension was extended to include future hunting seasons. For it to reverse this decision, the FWS must make a finding that the killing of the animal whose trophy is intended for import would enhance the survival of the species in the wild. The Zimbabwe Parks and Wildlife Management Authority (ZPWMA) defended its position and provided the FWS with significant amounts of information and data related to elephant management. While this is acknowledged, the FWS was still of the opinion that its concerns had not been addressed, and identified six areas where additional information was required.

The CAMPFIRE Association has taken these into consideration, especially the issues regarding "excessive retention of generated funds by Rural District Councils", and how much revenue elephant sport-hunting provides and how much of that comes from U.S. hunters. This document addresses part of the information requested by the FWS under "Revenue Utilization" to demonstrate that by allowing the importation of trophies taken by U.S. hunters, the survival of elephants in Zimbabwe would be enhanced. To support this position, the CAMPFIRE Association outlines the evolution of the CAMPFIRE Program, describing the extent of its coverage and the impact that it has had on wildlife conservation in Communal Areas of Zimbabwe.

Evidence from the 2014 national elephant survey is provided to show that Zimbabwe has a substantial elephant population that is managed sustainably through an adaptive quota setting mechanism. Data from 9 CAMPFIRE Districts that participated in this audit of CAMPFIRE revenue shows that approximately 60% of the allocated elephant quota is utilized and that the majority of hunters (53%) originate from America. These hunters have contributed US$9 million towards the CAMPFIRE Program during the period 2010-2015 compared to US$8 million by the 40 other nations.

The income generated from trophy fees in the last 6 years (2010 – 2015) is approximately US$11.4 million of which elephant trophy fees contributed 65%, while a further US$4 million has come from the sale of hides, concession fees and other sundry income. These funds have been distributed to CAMPFIRE communities in various Wards who received approximately 57% (range 39% - 77%) of the Trophy Fees.

A standardized tool designed to gather baseline data has provided information on the physical and human parameters of the 9 participating Districts including how and on what the revenues from hunting have been utilized. At the District level, approximately 80% of the funds are used to support the administration and management of the CAMPFIRE program, including investment on law enforcement. In contrast, 55% of revenues provided to the producer Wards are channeled towards supporting social services such schools, clinics and other programs that benefit the community.

The cost of living with wildlife, and particularly elephants, is shown through providing data on the scale of crop damage (7,000ha over 6 years) that has a significant impact in terms of its monetary value on rural communities who face food insecurity and deep poverty (average income US$1 a day). 96 human lives were lost to wildlife attacks, with elephant accounting for more than half of those deaths. Yet despite these challenges, communities still retain a high level of tolerance for elephants, but this support is rapidly dissipating as a result of the loss of income from trophy hunting. This places almost two million hectares of wild land at risk, including the risk of increasing retaliatory killing through poisoning and illegal wildlife crime.

A way forward is discussed outlining how the resumption of trophy imports can offset the challenges facing the CAMPFIRE program and through this, enhance the conservation of elephant outside of the protected areas.

1 INTRODUCTION

In April 2014, the United States Fish and Wildlife Service (FWS) suspended the import of elephant trophies taken in Zimbabwe. The suspension was extended to include future hunting seasons on March 26, 2015. In May 2015, the Assistant Director (International Affairs) from the United States Fish and Wildlife Service (FWS), Mr. Byron Arroyo, wrote to the (then) Minister of Environment, Water and Climate outlining the reasons why the Service made a determination on 26th March 2015 that it was unable to authorize the import of elephant trophies taken in Zimbabwe in future. This is further explained in detail in the "Enhancement Findings for African Elephant Taken as Sport-hunted Trophies in Zimbabwe during 2014" published on the 7/22/14 (see reference FWS/AIA/DMA).

The FWS make the point that for it to authorize imports of sport-hunted African elephant trophies into the USA, the Service must be able to determine that the requirements of the special rule for the African elephant under the U.S. Endangered Species Act (ESA) have been met (see 50 CFR 17.40(e)(3)(iii)C). Specifically, the FWS must make a finding that the killing of the animal whose trophy is intended for import would enhance the survival of the species in the wild.

In defense of this, the Zimbabwe Parks and Wildlife Management Authority (ZPWMA) provided the FWS with significant amounts of information and data related to elephant management. The FWS also communicated with various stakeholders including the Safari Operators Association of Zimbabwe (SOAZ), Zimbabwe Professional Hunters and Guides Association (ZPHGA), the CAMPFIRE Association, as well as individual professional hunters and outfitters, and independent scientific researchers.

The FWS acknowledged this input but still believed the data received did not fully address the questions regarding how elephants are managed in Zimbabwe, and how, by allowing the importation of trophies taken by U.S. hunters, that the survival of elephants in Zimbabwe would be enhanced. Six areas were identified where additional information was required. These are:

1: Updated Elephant Management Plan with formalized targets or indicators

2: Current elephant population data and the impact of hunting on the elephant population

3: Levels of poaching and prevention, including MIKE and PIKE data

4: Regulation and enforcement, particularly regarding the use of funds generated by U.S. hunters to support law enforcement and management

5: Sustainable use of elephant, specifically information of the levels of legal and illegal offtake

6: Revenue utilization from the hunting of elephant on Communal Lands, Safari Areas, Forestry and Private Conservancies.

The CAMPFIRE Association is not able to address these issues since these are the prerogative of the ZPWMA who is responsible for the conservation and management of elephant at the national level. Nonetheless, the CAMPFIRE Association is in a position to address part of the information requested under "Revenue Utilization", and contribute indirectly to the other five issues raised by the FWS.

2 Overview of Community Based Natural Resources Management in Zimbabwe

There are numerous reports and references in the literature that analyze the community based natural resources management program (CBNRM) in Zimbabwe. A more recent assessment can be found in the document prepared for USAID Zimbabwe by Mazambani and Dembetembe (2010).

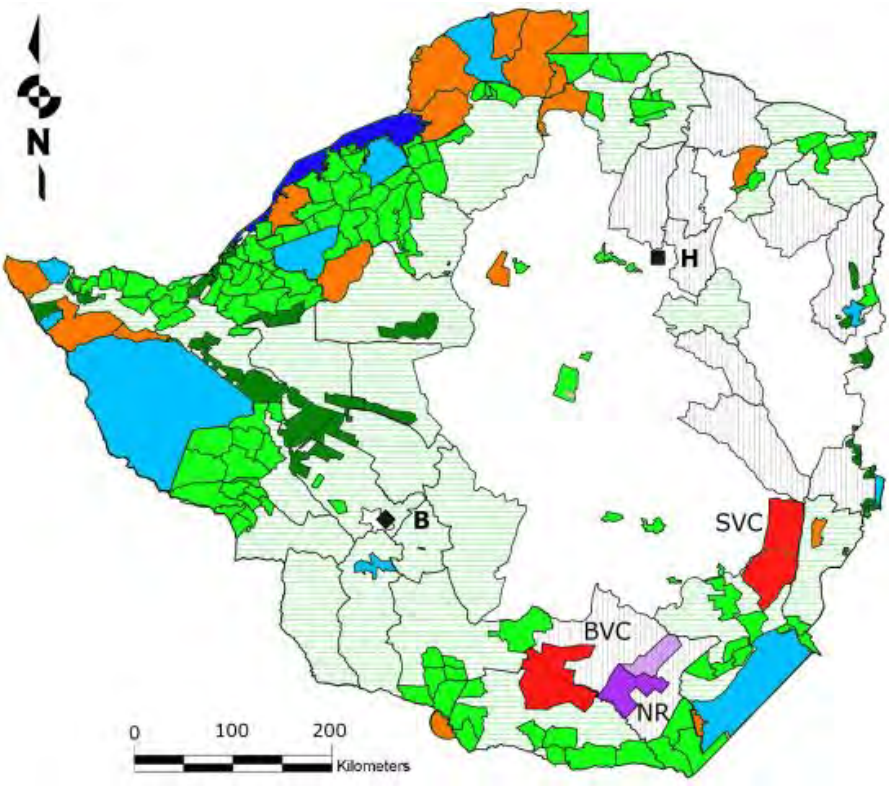

Figure 1: The location of CAMPFIRE areas (in light green) relative to National Parks (blue), Safari Areas (orange), Forest Areas (dark green) and Conservancies (red).

In 1982, the government amended the 1975 Parks and Wildlife Act to enable Rural District Councils (RDCs) to obtain 'appropriate authority' (AA) to utilize wildlife for commercial gain. The proposed changes were aimed at finding alternative forms of land use to subsistence agriculture on marginal lands. At that time, there was no particular model as to how this could happen without threatening the resource base. The (then) Department of National Parks and Wildlife Management (DNPWLM) began to explore options within the framework of an integrated landuse plan for the communal lands bordering National Parks and Safari Areas. This Act provided an opportunity to extend to communities in the Communal Lands the benefits that the private landowners enjoyed as a result of the 1975 Parks and Wild Life Act. This eventually led to the birth of Zimbabwe's Community Areas Management Program for Indigenous Resources (CAMPFIRE), which had far reaching impacts on wildlife productivity as well as the socio-economic wellbeing of CAMPFIRE communities.

2.1 The CAMPFIRE Program

The CAMPFIRE program was conceptually designed to focus on wildlife, woodlands, water, grazing resources, and grasslands. In practice, it focused on managing wildlife because of the direct monetary benefits which this resource offered to producer communities. The CAMPFIRE concept (see Murphree, 1993; Jones and Murphree, 2001) was developed in response to the realization that unless communities living adjacent to National Parks can obtain direct value from wildlife, they will not protect the wildlife. These communities would also need to have a much greater say in how those benefits would be derived and utilized.

While the 1982 amendment of the 1975 Parks and Wildlife Act permitted devolution of authority over wildlife to Rural District Councils (RDCs), the DNPWLM had meager resources to render the program operational (Jones and Murphree, 2001). The DNPWLM therefore turned to such institutions as the Center for Applied Social Sciences (CASS) at the University of Zimbabwe, which was assigned a socio-economic research and evaluation role; the WWF Multispecies Animal Production System Project in Zimbabwe; and the Zimbabwe Trust—an NGO focusing on rural development. These agencies had different but complementary objectives and together with the DNPWLM they formed the original CAMPFIRE Collaborative Group (CCG).

From 1986 to 1988, DNPWLM and its CCG partners engaged in discussions with selected communities and RDCs to identify locations for the inception of the program. The discussions focused on two main criteria, namely:

(a) voluntary interest in participation by communities and District Councils, and

(b) the presence of wildlife populations capable of producing sustainable and economically significant revenues.

The CCG work during this period also involved securing political support for the program, and attending to the demands of institutional and administrative detail associated with the conferment of Appropriate Authority (AA) by DNPWLM to RDCs, including the guidelines for awarding revenues and other benefits to communities from the the number of animals harvested within a local community's area each hunting season.

The agreed but non-binding guidelines stated that not less than 50% of the revenues was to be paid to the communities (as wards), not more than 35% was to be allocated to wildlife management (habitat management, fire control, monitoring, hiring of game scouts, etc.), and that 15% could be retained by the District Councils as an administrative levy.

Under the CCG, the CAMPFIRE Program attracted donor support and evolved through a number of phases.

- **Phase I** 1989-1994: (US$10m grant support – USAID and various partners). The period saw the initiation of CAMPFIRE and donor support was channelled towards the improvement of safari hunting in major districts that had been granted AA by 1995. This is also the period in which CAMPFIRE Association was established to coordinate the program.
- **Phase II** 1994-2003: (US$30m - USAID). This support focused on the capture of other natural resources (e.g. timber, sand, fishing, etc.). High-end non-consumptive tourism facilities were developed in Nyaminyami and Chipinge districts in the early 1990s, and 12 'joint venture' eco-tourism lodges were in operation in communal areas by 1999. Small grants were also provided to support the development of eco-tourism, crafts, and other community based natural resources management projects. Investments were also made in the production of natural resource products (e.g. fish in Beitbridge, Mwenezi; mopane worms in Bulilima Mangwe and Gwanda; honey in Binga, Kusile, Mutoko, and Nyanga districts) and many other products.
- **Phase III** 2003-2007: (US$165,000 – Ford Foundation). This period saw the cessation of major donor funding to CAMPFIRE, and it also coincided with larger macro level policy changes in

Zimbabwe after 2000, and the subsequent adverse socio-economic conditions. This led to the collapse of financial and technical support previously provided by the CCG.

- **Phase IV** 2007-present: (US$350,000 WK Kellogg Foundation). During this period, there was hyper-inflation, which led to the loss of income from hunting in real terms. This situation stabilised in 2009, when multiple foreign currencies were introduced. The CAMPFIRE Association maintained operations through a 4% levy paid by major hunting districts amounting to less than US$100,000 annually.

Following are key achievements in the development of CAMPFIRE (see Mazambani and Dembetembe, 2010):

I. Guruve and Nyaminyami, the first RDCs to be granted AA status, received their first hunting revenues in 1988. This had a dramatic effect in that many districts that are rich in wildlife applied for AA status and by the end of 1991 eleven additional districts had been granted AA status.

II. By the end of 1991, the 13 districts participating in the program collectively grossed US$1.1 million in revenue for that year.

III. By 1995 there were 23 districts participating in the program.

IV. The CAMPFIRE Association (CA), the secretariat for all districts with CAMPFIRE activities, was formed in 1992. Its primary objectives were to promote the wildlife interests of RDCs and to serve as an association of producer communities. The association played an important role in securing full government support for wildlife management in communal lands so that CAMPFIRE became a recognized conservation program.

V. Between 1995 and 2000 CAMPFIRE not only witnessed growth in terms of attracting more districts, but also in building the capacity of the RDCs, and in diversifying their activities to include other natural resources. The number of RDCs that were awarded AA status to manage wildlife increased from 2 in 1988 to 27 in 1996. Institutional capacity building grants via United States Agency for International Development (USAID) funding were secured for 24 districts from 1996 to 1999.

VI. Between 1989 and 2001, CAMPFIRE revenues amounted to almost USD $ 20.3 million, 97% of which originated in the original 13 districts. Of this, 49% was disbursed to communities (118 wards with over 121,500 households), 20% used for wildlife management, just over 12% retained by the District Councils as a levy, 3% used for other expenses (including the then 1.5% levy to the CAMPFIRE Association), and about 15% was retained by the RDCs pending allocation (Khumalo, 2003). Almost 90% of this income came from safari trophy hunting.

VII. The period from 2001 to 2003 witnessed two significant developments in CAMPFIRE:
   a. formation and registration of community trusts as a strategy for devolving decision making and control over resources from the RDCs to community groups, and
   b. a concerted drive to diversify CAMPFIRE. Twenty-eight non-wildlife-based community projects received financial support through CAMPFIRE compared to only five wildlife-based community projects.

VIII. At its peak in 2002, CAMPFIRE encompassed 53 districts with AA, though only 23 of these really functioned as intended, while only 12 received regular income from wildlife.

IX. The Association has spearheaded the revision of CAMPFIRE revenue sharing guidelines to improve the community's share of income from 50% to 55% of hunting income. A Direct Payment System was developed in 2006 to ensure that communities receive their income on

time. A standard hunting contract has been developed to improve hunting administration by RDCs.

In summary, CAMPFIRE protects about 50,000 km^2 (12.7%) of land in Zimbabwe (Figure 1). Benefits from wildlife and other incomes encompass:

- Approximately 777,000 households (25%) in Zimbabwe benefited from CAMPFIRE directly or indirectly;
- Approximately 25% of Zimbabwe's people are receiving incentives to conserve wildlife and prevent anti-poaching through CAMPFIRE;
- Between 1994 and 2012, CAMPFIRE generated US$39 million of which US$21.5 million was allocated to communities and used for resource management (22%), household benefits (26%), and community projects (52%).
- About 90% of CAMPFIRE revenue comes from hunting with elephant hunting contributing up to 70% of annual revenue.
- Based on Constitution of the CAMPFIRE Association as amended in 2007, all major RDCs use CAMPFIRE revenue sharing guidelines, and in these districts revenue is paid directly into community controlled bank accounts by safari operators using the following guideline:
  - RDC fees (41%), CAMPFIRE Association Levy (4%), and CAMPFIRE community (55%).

In the following sections, we describe how the income from the hunting of elephant is generated and utilized using data from 9 Districts (Beitbridge, Binga, Bulilima, Chipinge, Chiredzi, Hwange, Mbire, Nyaminyami, and Tsholotsho) for the period 2010 and 2015[1]. For each of these areas we provided:

- Total number of elephant hunted
- Total revenue earned from elephant (and other trophy species)
- How the revenue is spent on various management and social services

We also provide examples of community project support and the impact of human-wildlife conflict over this period.

3 Sustainable Use and Utilization of CAMPFIRE Resources and Revenues

The CAMPFIRE program relies almost exclusively on income from hunting. Since 2009, the number of RDCs where hunting is practiced has decreased, mostly because of the prevailing socio-economic conditions that have resulted in high levels of poverty. This is seen as the key driver of the escalating levels of illegal wildlife crime, and poaching of elephant in particular. Maintaining elephant numbers outside of the protected areas is important to their overall conservation, and the reason why Zimbabwe regards the sustainable utilization of all wildlife as critical to its national conservation strategy. The hunting of elephant in CAMPFIRE areas thus plays an important role and is the major source of income to communities in these areas.

[1] Hurungwe provided partial information, as explained in relevant parts of the report

3.1 NUMBERS, DISTRIBUTION AND REGIONAL TRENDS OF ELEPHANT IN ZIMBABWE

Elephants are distributed in four main regional populations in Zimbabwe, namely, Northwest Matabeleland, the Sebungwe, the mid-Zambezi Valley, and the South-East Lowveld**.** Crude ecological densities vary between 2.16 elephant/km^2 in Northwest Matabeleland and 0.46 elephant/km^2 in the Sebungwe region**.**

Elephant densities in the Communal Areas varies from 1.50 elephant/km^2 in the south-east Lowveld to 0.06 elephant/km^2 in the Sebungwe region. Overall it is estimated that 5,000 elephants reside in Communal Areas and occupy approximately 16,000km^2 (Table 1, Zimbabwe Elephant Management Plan: 2015-2020).

Table 1. Numbers and densities of elephants in the four regions of elephant range within Zimbabwe. (Source: Zimbabwe National Elephant Management Plan 2015 - 2020, see Dunham *et. al.* 2015a, b, c and d).

Name of Region & Area	Area (km2)	Estimated Number of Elephants	Density of Elephants/km^2

Communal Lands	**16,087**	**4,934**	**0.18**

* The survey did not include Bubye Valley Conservancy or the Tuli Safari Area and some other small populations that likely add another 1,000 elephants to the estimated total for the country. The area surveyed in Mozambique is not included in the national total or in the South-East Lowveld total area.

3.2 ELEPHANT QUOTA ALLOCATION AND UTILISATION

Zimbabwe is allocated an export quota of 500 elephants (1,000 tusks) in terms of the CITES regulations (see https://cites.org/eng/res/10/E-Res-10-10R16.pdf). In practice, Zimbabwe adopts an adaptive management strategy that sets the overall elephant quota at up to 0.75% of the overall population. This implies that the maximum national quota should not exceed 600 animals at the current population estimate of 80,000 elephants. However, to maintain trophy quality at approximately 35kg (77lbs), the national quota is set at 0.3 – 0.5% of the overall population i.e. 240 – 400 elephants, assuming an average offtake of 60% (R.B. Martin, pers. comm.).

The approach applied to the CAMPFIRE areas is to set quotas that use parameters that are higher than these national guidelines. This strategy is adopted to provide incentives to local communities that reside in areas where high levels of human-elephant conflict is recorded, and to facilitate benefits to local communities through sport hunting.

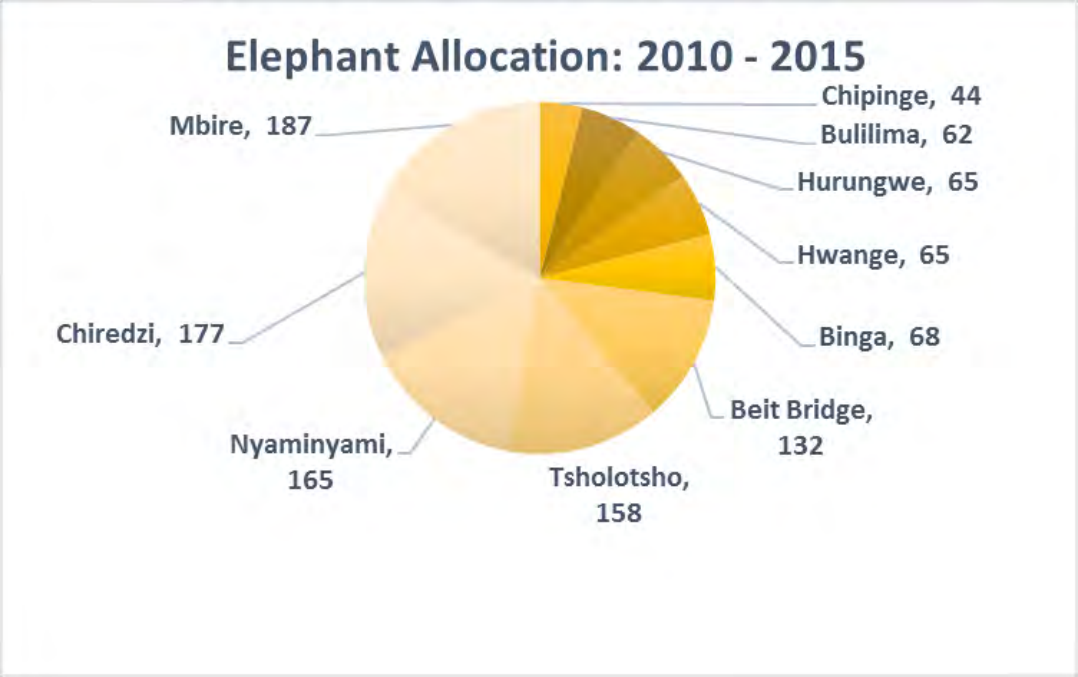

Figure 2: Total allocation of trophy elephant (N=1087) to nine major CAMPFIRE areas over a 6-year period

A total of 1,087 elephants have been allocated on quota to nine major CAMPFIRE areas since 2010 (Figure 2). This equates to 180 elephants per year. The distribution of this quota among the nine CAMPFIRE areas is dictated by the relative density of elephants in the neighboring protected areas and those residing in the CAMPFIRE areas. Tsholotsho, for example, that borders the southern boundary of Hwange National Park, was allocated 158 elephants (or 26/year) while Hwange, Binga and Hurungwe CAMPFIRE Areas that do not border onto areas of high elephant densities receive approximately 10 elephants/year.

The historical trend of utilization of the elephant quota (667 elephant or 61% of the quota allocation) is provided in Figure 3.

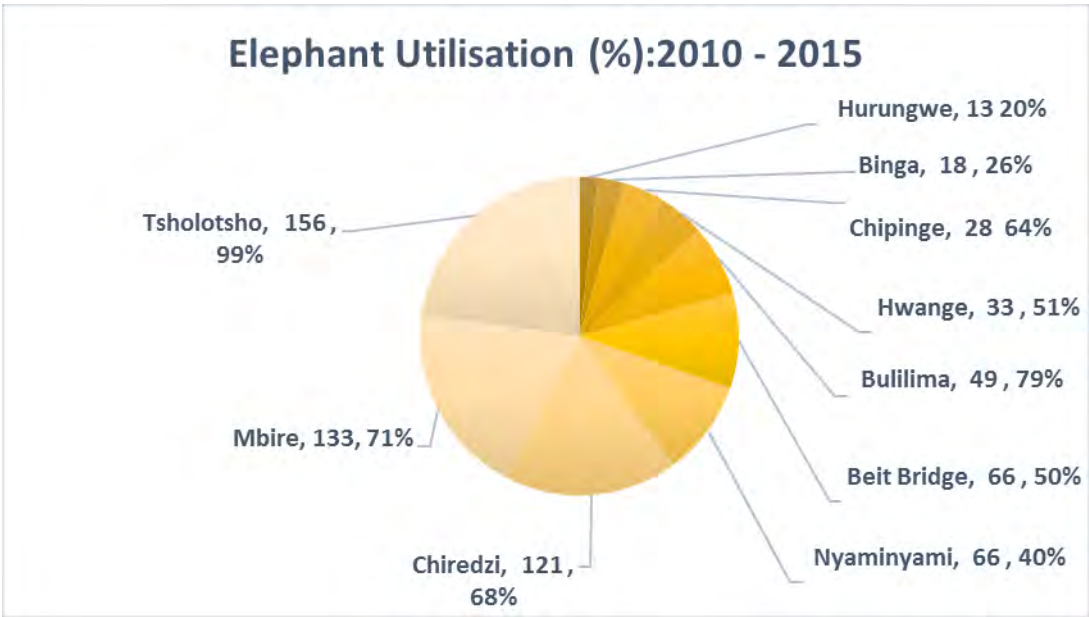

Figure 3: Overall utilization (%) of elephant quotas in nine major CAMPFIRE Areas over a 6-year period

Over the six years, Tsholotsho (99%), Mbire (71%) and Chiredzi (68%) have successfully utilized their allocated quotas while areas such as Hurungwe (20%) and Binga (26%) have not performed as well. The origin of clients hunting in these areas is summarized in Table 2. Over the 6-year period 1702 clients (average 284/year) have hunted in the seven CAMPFIRE Areas (excluding Binga and Hurungwe for which no data are available). Of these 897 clients (c.150/year or 53%) originated from the USA and 461 (c.77 or 27%) from Europe.

Table 2: Origin of hunting clients visiting the major CAMPFIRE Areas :2010 – 2015. Note. No data are available for Binga and Hurungwe

Origin of Clients	USA	Europe	Africa	Asia	South America	Oceania	Canada	Middle East	Total	Average
Beit Bridge	172	36	10	3	14	9	3	0	247	41
Bulilima	17	9	0	0	7	0	0	4	37	6
Chipinge	17	5	0	0	1	0	0	0	23	4

3.3 Income Generation from Sport Hunting of elephants and other Key Species

3.3.1 Income received by Outfitters

To fully account for earnings in the hunting sector, the Reserve Bank of Zimbabwe, in collaboration with all the relevant stakeholders, introduced the Tourism Receipts Accounting System (TRAS) that required all outfitters to submit returns listing the revenue generated for hunting activities. This system has been in place for several years but required manual analysis of the data to extract the information. In January 2015, a web-based system (TRAS2) was introduced which links Safari Operators, Zimbabwe Parks and Wildlife Management Authority, Taxidermists, Shipping Agents, International Marketing Agents and Reserve Bank. Under this system all authorized hunts are registered allowing for the capture of hunting data (origin of clients, value of trophies and hunts, area hunted etc.), monitoring hunting quota utilization and tracking hunted trophies (Chitauro, 2016). The Exchange Control Division of the Reserve Bank of Zimbabwe and the ZPWMA are now able to:

1. Assess regional price differentials of similar hunts and the reasons thereof;
2. Present TRAS2 systems updates and reports to the users including international marketing agents;
3. Engage with international marketing agents of sport-hunting;
4. Obtain relevant insights on governing of the hunting sector; and
5. Come up with an effective mechanism to fully account for export proceeds from the hunting sector.

Outfitters that operate hunting concessions in CAMPFIRE Areas are required to deposit copies of the TRAS2 form with the CAMPFIRE Office in their respective RDCs/Wards. Each Office is therefore able to extract data on daily rates, trophy fees and other incidental revenues. Figure 4 provides a summary of the income by country of origin. This data confirms the major role of American hunters to the CAMPFIRE program who contribute 52% of the overall income.

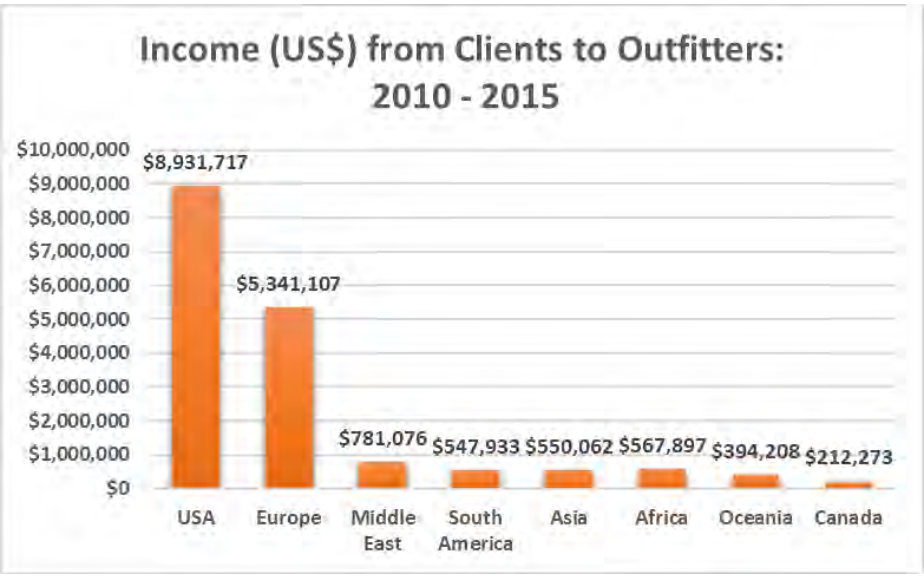

Figure 4: Contribution of hunting clients to the CAMPFIRE Program

3.3.2 Income from Trophy Fees

The data for the total amount of revenue generated for elephant, buffalo, leopard, hippo, crocodile and lion between 2010 – 2015 (approximately US$11 million) is shown in Figure 5.

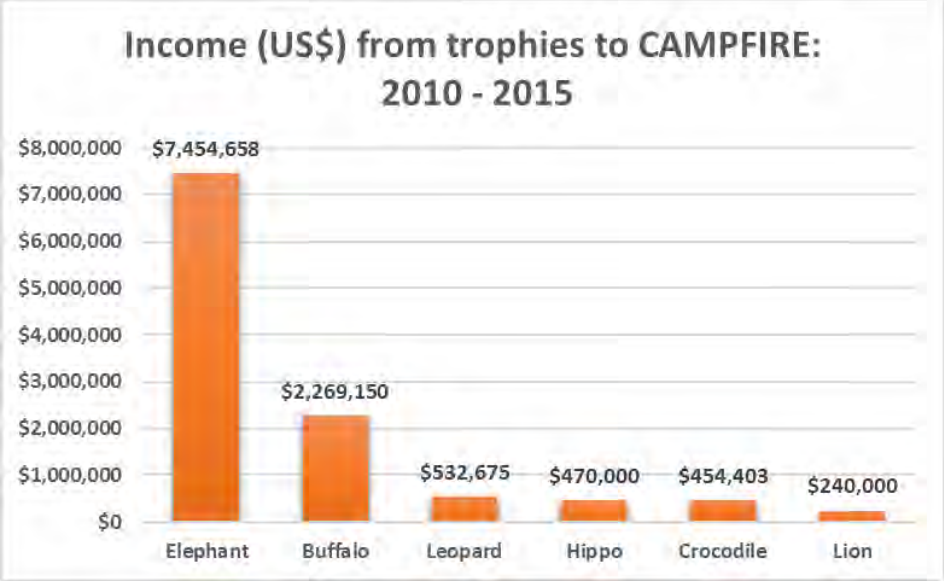

Figure 5: Income (US$) generated from the sale of key trophies

The importance of the income from elephant is clear from these data. Trophy fees from elephant account for 64% of all fees generated from the key species (approximately US$1.2 million/year). Buffalo (20%) are ranked second while leopard, hippo and crocodile contribute approximately 5% each. Noteworthy here is the low contribution of lion (approximately 2%). This low level of income generation is partly a result of the impact of the lion import suspension into the USA and Europe, decreasing quota allocations and decreasing offtake levels brought about by the recently imposed lion age hunting regulations. By comparison, the 897 American clients who hunted in CAMPFIRE Areas in the six-year period paid US$9 million in trophy fees and daily rates. Other nationalities, contributed US$8 million.

3.3.3 Other Income to RDCs

RDCs can generate income for other revenue streams, notably receiving a percentage of the daily rate, concession fees, bed night levies from photographic camps and from the lease/rent of equipment (Figure 6). The eight RDCs for which data are available generated approximately US$4 million from these revenue streams. Excluded here are revenues that could have been earned from the sale of ivory recovered from problem animal control (PAC) and natural deaths, and from the distribution of meat estimated at 550,000kg over the 6-year period.

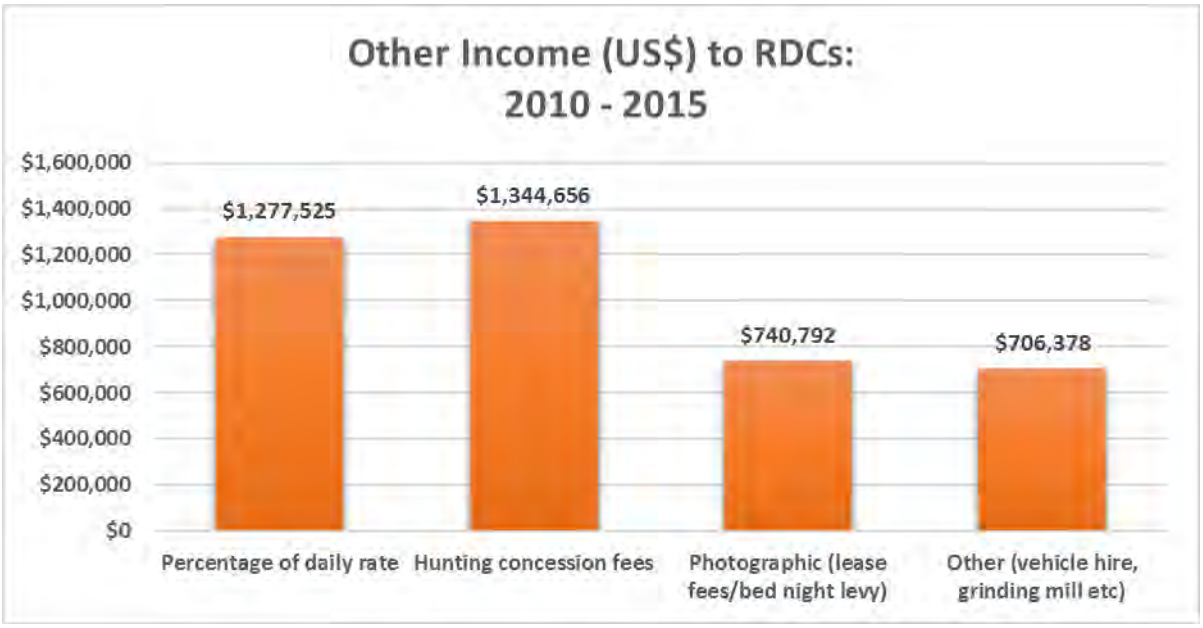

Figure 6: Income (US$) accruing to the RDCs from related income revenue streams

3.3.4 Benefit sharing: RDC vs Wards

Communities at the Ward level receive funds directly from the outfitter utilizing their area, except for those in Beitbridge and Hwange who are paid from dedicated CAMPFIRE accounts with the respective RDC. These funds are generated through trophy fees and income from the sale of hides, concession fees etc. (Table 3).

Over the last 6 years, the income generated from trophy fees is approximately US$11 million while a further US$4 million has come from the sale of hides, concession fees and other sundry income. The agreed split of these funds is that not less than 55% of the revenues is paid as Ward dividends, not more than 35% is allocated to the RDC for wildlife management (habitat management, fire control, monitoring, hiring of game scouts, etc.), and 15% is retained by the RDC as an administrative levy. Some RDCs do not consider all these revenues as "CAMPFIRE Funds" and segregate trophy fees from the other revenues. On average, the CAMPFIRE District Wards received 42% (range 23% - 66%) of the ***combined Concession and Trophy Fees***, but the Wards received approximately 58% (range 26% - 77%) of the ***Trophy Fees*** (Table 3).

Table 3: Summary of the benefit sharing (US$) of hunting related income between RDCs and Wards: 2010 - 2015

Districts	Income to RDC from trophy fees	Income to RDC from Hides, Concession fees etc.	Income to Wards	% All Revenue share: RDC vs Wards	% Trophy Fee Revenue share: RDC vs Wards
Beit Bridge	$657,458	$12,298	$370,228	55%	56%
Binga	$299,800	$364,224	$162,062	24%	54%
Bulilima	$521,700	$46,337	$403,685	71%	77%
Chipinge	$349,500	$139,259	$135,572	28%	39%
Chiredzi	$1,848,600	$181,420	$1,339,678	66%	72%
Hwange	$394,000	$105,131	$237,245	48%	60%
Mbire	$3,022,250	$54,420	$1,740,714	57%	58%
Nyaminyami	$1,883,853	$1,319,772	$1,132,204	35%	60%
Tsholotsho	$2,136,000	$1,990,200	$1,109,956	27%	52%
Total	**$11,420,886**	**$4,213,061**	**$6,631,342**	**42%**	**58%**

4 USE OF FUNDS BY RDCS AND WARDS

The CAMPFIRE Association prepared two templates in conjunction with district based CAMPFIRE Managers that were used as tools to audit the flow of income from safari hunting for the period 2010-2015, and how these funds are used to benefit CAMPFIRE communities. The tools gathered information on the following:

Tool 1: Data related to Rural District Councils

1. Area of district (either sq. km / ha) and total number of wards
2. The income generated by elephant, lion, leopard, hippo and crocodile i.e. Allocated quota (Number), Trophy fee, number hunted (offtake), percentage quota utilization.
3. The origin of the hunters (i.e. USA, Germany etc.) and the value of the safaris extracted from the TRAS2 forms where available. This data provided an indication of the income generation by outfitters.
4. The gross income that CAMPFIRE Districts received from the hunting and photographic activities (i.e. trophy fees, daily rates, concession fees, photographic fees, meat and any other sundry income).
5. Human resources employed at the District level (i.e. number of Wildlife Managers, number of Game Scouts, equipment (e.g., vehicles, patrol equipment etc.), patrol days per year.
6. The use of the funds to support:
    a. Meetings and Administration (i.e. the “15%” of funds)

   b. Law enforcement (RDC Game scouts, equipment, operational costs etc.)
   c. Compensation schemes (burial expenses, education, payment for hospital expenses etc.)
7. Management activities (fire guards, rehabilitation of water supplies, anti-poaching, problem animal control etc.)
8. Social services i.e. support to clinics, schools etc.
9. Other expenses not related to the above.

Tool 2: Data related to Wards

The following data was summarized for each ward in the District. The data collected at the Ward level was supported with evidence of income and expenditure e.g. copy of accounts, photographs of infrastructure etc.

1. Name of ward and ward number
2. Name and size of hunting area(s)
3. Name and number of village(s) and number of household beneficiaries
4. Income received at Ward level from hunting income, income generating projects from wildlife and other income (grinding mills etc.)
5. Allocation and use of income at Ward level for
   a. Meetings and Administration
   b. Wages/salaries
   c. Compensation schemes (e.g., burial expenses, education)
   d. Management activities (e.g., fire guards, rehabilitation of water supplies, anti-poaching, problem animal control.)
   e. Project running costs
   f. Social services (e.g. clinics, schools, grinding mills, roads, fencing, equipment, boreholes/pumps)
   g. Food security
   h. Direct cash benefits (i.e. to individuals, households, if applicable)
   i. Other
6. Human resources employed at the Ward level (i.e. number of Wildlife Managers, number of Game Scouts, equipment (e.g., vehicles, patrol equipment etc.), patrol days per year.
7. Number of Human and Wildlife Conflict cases by year and type (human death, injury, livestock, infrastructure)
8. Population estimates of major species (where available)

4.1 Profile of Rural District Councils

The data presented here has been extracted from Tool 1. For ease of understanding, these are presented below as follows:

- Characteristics of CAMPFIRE Districts
- Human resources and patrol effort
- Investment in equipment
- Expenditure

4.1.1 Characteristics of the CAMPFIRE Districts

The main parameters of the 10 RDCs (including Hurungwe) that provided data for this analysis are provided in Table 4. These RDCs represent approximately 9 million hectares of which 3.7 million hectares fall under the CAMPFIRE program. These RDCs have entered into agreements with both hunting and photographic outfitters who have invested in 26 hunting camps and 8 photographic camps respectively.

Altogether there are 224 Wards represented in these areas of which 104 are under the CAMPFIRE program. Excluding Hurungwe, there are 737 villages with a minimum of 85,847 households. This represents a community of approximately 600,000 people assuming that the average household is represented by 7 family members.

Table 4: Baseline features of the nine CAMPFIRE Districts

District	Total Area (Ha)	CAMPFIRE Area (Ha)	Hunting camps	Photo camps	Number of Wards	Number of Campfire Wards	Number of Villages	Number of Households
Beit Bridge	1,269,700	310,300	4	1	15	8	15	5,070
Binga	1,230,800	364,000	1	0	25	21	51	19,474
Bulilima	203,300	203,300	1	0	22	13	51	7,767
Chipinge	522,300	40,800	1	1	33	2	15	951
Chiredzi	1,710,239	481,004	5	0	32	9	52	9,461
Hurungwe	1,967,834	529,800	2	1	26	7	N/A	N/A
Hwange	376,963	376,963	2	1	20	18	93	13,980
Mbire	781,000	898,000	6	0	17	9	328	12,302
Nyaminyami	369,931	140,000	3	3	12	6	62	5,875
Tsholotsho	833,600	410,000	2	1	22	11	70	10,967
Total	**9,265,667**	**3,754,167**	**26**	**8**	**224**	**104**	**737**	**85,847**

4.1.2 Human resources and equipment employed at the District Level

Each of the RDCs employ staff to manage the CAMPFIRE program in their Districts. The number of people employed and the roles that they play is dependent on the level of income generated by the CAMPFIRE program. The core function of these staff is to monitor wildlife related activities in their respective areas, notably recording and dealing with human and wildlife conflict, coordinating meetings at the Ward level and monitoring outfitter hunting activities.

Most RDCs employ Game Scouts to conduct routine patrols and undertake basic law enforcement activities. In most cases this is low key since the CAMPFIRE program relies on members of the community to report incidents of wildlife crime, and any other matters related to wildlife in their respective Wards and villages.

Table 5: Summary of Human Resources Employed at District Level.

District	Wildlife Managers	Wildlife Officers	Game Scouts	Employees	Patrol Days
Beit Bridge	2	0	0	76	0
Binga	2	0	9	0	48
Bulilima	1	0	4	5	24
Chipinge	1	0	10	0	365
Chiredzi	2	0	8	8	91
Hurungwe	1	1	4	0	31
Hwange	1	0	6	0	144
Mbire	2	0	21	50	255
Nyaminyami	1	0	23	46	112
Tsholotsho	1	0	10	30	162
Total	**14**	**1**	**94**	**215**	**1231**

All RDCs have invested in various equipment that are employed on wildlife management activities. The number and type of equipment depends on the level of income and sophistication of the CAMPFIRE program. For example, the relatively wildlife endowed Mbire RDC has invested in a VHF radio system and camping gear for its scout force.

Table 6: Examples of equipment used in the CAMPFIRE Districts.

District	Vehicle (4 x 4, pick up etc.)	Truck	Tractor	Trailer	Grader/Tow Grader	Motor cycle	Bicycles	Radio Base Station	Radio hand sets	Rifles	Tents	Other
Beit Bridge	2	-	-	-	-	-	-	-	-	7	-	-
Binga	1	-	-	-	-	-	-	-	-	-	-	-
Bulilima	1	1	-	-	-	-	2	-	-	-	-	-
Chiredzi	2	-	1	1	1	-	-	-	-	-	-	-
Chipinge	1	-	-	-	-	-	-	-	-	7	-	-
Hurungwe	1	-	-	-	-	-	-	-	-	-	-	-
Hwange	1	-	-	-	-	3	-	-	-	7	1	-
Mbire	3	-	-	-	-	2	20	6	15	-	23	8
Nyaminyami	1	-	-	-	-	-	-	-	-	27	-	10
Tsholotsho	2	-	-	-	-	-	-	-	-	-	-	-
Total	**15**	**1**	**1**	**1**	**1**	**5**	**22**	**6**	**15**	**48**	**24**	**18**

4.1.3 RDC expenditure

CAMPFIRE related expenditure over the 6-year period is approximately US$6.2 million (or US$1.0 million/year). Figure 7 represents a breakdown of how the RDCs utilize the income from hunting to support the CAMPFIRE Program in their respective areas. These can be broken down into Administration, Management and Law Enforcement which accounts for approximately 80% of the expenses (or approximately US$835,000/year). The remaining 20% are used to support various community benefits and are aggregated under Social Services, Compensation and Other[2] activities. This equates to approximately US$220,000/year.

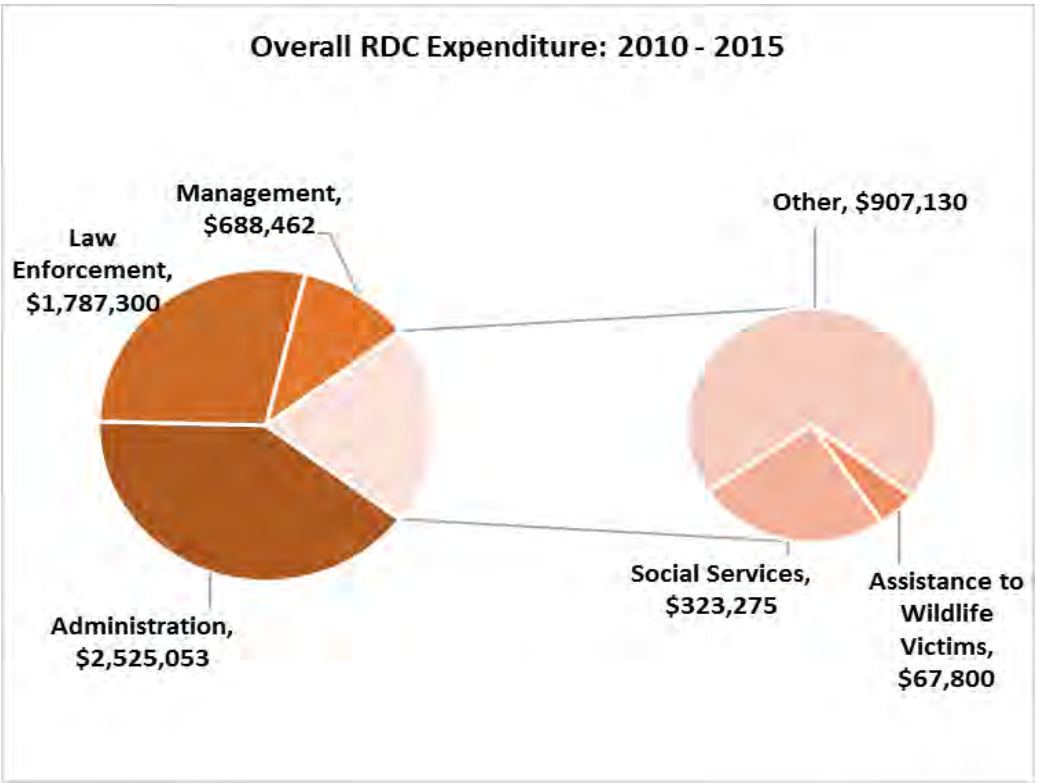

Figure 7: Breakdown of expenditure at the District level on CAMPFIRE program activities

A strategy employed by most RDCs is to invest more in activities related to the management and administration of the CAMPFIRE program rather than on social services. On average, 40% is spent on administration, 20% of law enforcement and 11% on management related expenses while 6% is allocated to support social services. There is no official national compensation scheme, however, RDCs and Wards (including outfitters) assist people and families who are injured or killed by wildlife.

4.2 PROFILE OF CAMPFIRE PRODUCER WARDS

[2] The "Other" activities have been skewed by the inclusion of a number of expenses registered by Mbire RDC that include construction and maintenance of staff housing, promoting and managing a community cattle production scheme and purchasing vehicles and office equipment.

The data presented here has been extracted from Tool 2. For ease of understanding, these are presented below as follows:

- Human resources and patrol effort
- Human and Wildlife Conflict
- Investment in equipment
- Expenditure

4.2.1 Human Resources, Patrol Effort and Equipment

Table 7 represents the decision that the CAMPFIRE producer Wards elect to invest in their respective CAMPFIRE Programs. Each Ward is required to establish a Wildlife Committee to which at least 7 members are elected from the villages located in that ward. Each Wildlife Committee employs several people either as ward based monitors or as Game Scouts. This workforce is responsible for approximately 2.6 million hectares of land and represents the 85,847 households that reside in the 737 villages.

The decision to invest in equipment is dictated by the level of income that each producer Ward receives, and the ability of the Ward to service and maintain the equipment in the long term. The records kept at the Ward level under estimate the number of patrol days (minimum 3,002/year) achieved.

Table 7: Average number of staff employed at the Ward level, patrol effort and investment in equipment

District	Number of Wildlife Committee members	Number of Employees paid by community	Number of Game Scouts paid by community	Patrol days per year	Equipment (e.g., vehicles, tractors, grinding mills)	Concession Area (Ha)	Number of Villages	Number of Households
Beit Bridge	66	1	3	152	1	324,300	15	5,070
Binga	7	-	-	-	-	364,000	51	19,474
Bulilima	-	-	100	7	-	193,984	51	7,767
Chiredzi	56	32	-	-	3	N/A	52	9,461
Chipinge	9	5	5	1,584	4	9,400	15	951
Hwange	49	-	-	-	-	342,750	93	13,980
Mbire	76	90	48	1,259	19	898,000	328	12,302
Nyaminyami	45	30	12	-	-	140,000	62	5,875
Tsholotsho	77	2	-	-	1	410,000	70	10,967
Total	**385**	**161**	**168**	**3,002**	**28**	**2,682,434**	**737**	**85,847**

4.2.2 Human and Wildlife Conflict and Problem Animal Control

Communities living in CAMPFIRE areas are on the front line and are required to deal with wildlife problems almost on a daily basis. Table 8 below provides a summary of the magnitude of human and wildlife conflict (HWC) recorded over a 6-year period (2010 – 2015) in 9 CAMPFIRE Districts.

Conflict with wildlife falls under two areas: crop damage and livestock deaths. While there are many other wildlife species responsible for crop damage (baboons, monkeys, bushpig, rats, quelea birds etc.), elephant are considered the greatest threat and problem.

Although the data are incomplete, it is estimated that 7,000ha of crops were destroyed by elephant during the 6-year period under review. It is not possible to accurately place a monetary value to this because crop production varies greatly from one year to the next, and from one region to another. It is important however to take into consideration that the impact of crop destruction in the highly prone drought areas and areas of low rainfall (e.g. Beit Bridge, Binga, Tsholotsho) is more acute than in areas where crop production may be higher. To place this into perspective, the national average maize yield is estimated at 300 – 600kg/ha, and the minimum cash value is US$180/ton[3]. The approximate value of the maize lost is therefore US$500,000 – US$1.0 million. Applying this to livestock losses, the average price of cattle is US$400 – US$700/head depending on the time of year and condition of the livestock. Lion and crocodile are responsible for most cattle deaths and at these prices, the value of stock lost to these predators is US$500,000 – US$1.0 million. Hyena equally destroy cattle but are more likely to kill small livestock (goats, sheep). At US$75 – US$125/head, the minimum cost of predation on small livestock is estimated at US$170,000 – US$300,000 (Table 8).

Table 8: Summary of the extent of human – wildlife conflict recorded in CAMPFIRE Wards: 2010 - 2015

District	Crop Damage (estimated Ha)			Livestock killed (cattle, goats, sheep)				Human deaths
	Elephant	Hippo	Buffalo	Lion	Leopard	Crocodile	Hyena	
Beit Bridge	268	-	1	3	-	-	30	4
Binga	26	35	-	1	-	32	29	7
Bulilima	522	-	-	5	-	-	231	-
Chiredzi	18	9	-	122	-	21	-	2
Chipinge	22	10	-	5	-	7	-	7
Hwange	461	-	-	71	2	15	-	2
Mbire	3,878	475	1,146	426	52	416	1,870	53
Nyaminyami	1,216	49	102	59	6	9	-	13
Tsholotsho	1,085	-	20	175	19	-	211	8
Total	**7,495**	**578**	**1,269**	**867**	**79**	**500**	**2,371**	**96**
	9,342ha			**3,817**				
Cost (US$)	**@300kg/ha*$180/ton**		**$504,473**	**Cattle@$400 - $700/head**		**$546,800 - $1,040,400**		
	@600kg/ha*$180/ton		**$1,008,947**	**Small livestock@$75 - $125/head**		**$177,825 - $296,375**		

Communities who live with wildlife also pay the ultimate price and 96 people have lost their lives and others injured after encountering dangerous animals. Crocodile and hippo are responsible for most human deaths and injuries but there are many incidents where elephant have killed and maimed people who were tending their fields or traversing wildlife areas.

[3] Note: the official price for maize is approximately $350/ton but sellers rarely receive this price from the millers and other interested buyers.

Table 9 summarizes the incidents of problem animal control and illegal activities recorded in the 9 major CAMPFIRE RDCs (data extracted from The Proceedings of the CAMPFIRE workshop, Gandiwa et. al. 2014).

Table 9: Summary of problem elephant destroyed and through illegal activities in 9 CAMPFIRE Districts

	2009	2010	2011	2012	2013	2014	Total
Conflict	250	283	340	208	295	478	**1854**
PAC	55	66	41	33	36	66	**297**
Illegal	7	14	12	11	16	19	**79**

It is not unexpected that local communities will seek to mitigate these losses either through retaliatory killings (this applies mostly to the carnivores) or through removal of problem animals. With respect to elephant, it is important to understand the relationship between trophy hunting, problem animal control and illegal offtake. The interactions amongst all three variables are not simply additive. For example, a relatively small offtake of problem animals can have a significant influence on the mean tusk weight of hunting trophies taken from the population and, hence, the income derived from hunting. Martin (pers. comm.) uses a population simulation model (Craig et. al. 2011) to carry out an analysis to examine these interactions. This model assumes that Problem Animal Control (PAC) is selective, and that most of the elephants killed are males between the ages of 13-36 years old and females between the ages of 22-42 years old. Moreover, more males are killed than females (5:1).

Martin demonstrates that the combined effect of trophy hunting quotas and level of PAC shows that in a scenario where there is no PAC, trophy hunting quotas can be set ranging from 0.1 - 0.6 % of the population. However, as PAC increases, so the trophy hunting quotas must be decreased to maintain trophy quality. The magnitude of the changes caused by relatively minor increments in PAC are highly significant. The modelling shows that increases in the trophy hunting quotas and PAC offtake causes only a minor drop in the rate of increase of the population which remains above 4% per annum, however, if the PAC offtake exceeds 1% of the population, then hunting quotas should not exceed 0.1% of the population. Unless these ratios are maintained, there is a real risk that the elephant populations will decline with the consequential loss of income from sport hunting.

Currently Zimbabwe adheres to quotas set at 0.3 – 0.4% of the population, and slightly higher in the CAMPFIRE areas. The PAC levels shown in Table 9 do not approach these critical thresholds, however, close attention needs to be paid to trophy quality and age (see discussion of elephant hunting in Mbire - in The Proceedings of the CAMPFIRE workshop, Gandiwa et. al. 2014).

4.2.3 Beneficiaries of CAMPFIRE Income at the Ward Level

The beneficiaries of revenues from the CAMPFIRE program are the community's resident in the producer Wards. However, the volume of people residing in these areas precludes providing individuals with direct dividends since the value of such dividends would be meaningless. The CAMPFIRE wards have therefore elected to invest in projects that provide social services to the whole community and only in special circumstances are dividends paid out for food security and direct cash benefits.

Table 10: Examples of Social Services funded in selected CAMPFIRE areas from Ward Revenues generated from sport hunting: 2010-15

District	Project
Beitbridge	Rehabilitation of schools, clinics and protection of irrigation schemes
Bililima	Rehabilitation of 3 clinics and 3 primary schools, hall, fencing of fields and rehabilitation of lodge, community truck, tractor, dam repair machinery.
Chipinge	3 grinding mills, lorry, teachers houses, community office, shop
Chiredzi	Clinic, teachers' houses, primary school, community-grinding mill, Police sub-office, piped water and electrification of clinic.
Hurungwe	Construction of classroom block Nyamakate Secondary, Maintenance of Nyamakate bridge. Purchase of tractor tube, payment of carpenters, Roofing Chipfuko Primary School and Huyo Secondary School, CAMPFIRE Ward tractor major service, Purchase of Treasurers bicycle, Payment of Nyamakate Clinic guard, 7 resource monitors allowances, 26 bag cement Chitindiva, Kabidza , Manyenyedzi and Mawau schools for toilets construction, renovation Karuru School (5 bags cement), and toilet construction, Chitindiva Clinic toilet construction, Roofing Chikova Secondary School, Purchase of buiding materials Chikova Secondary Block, Painting Dete Primary School, Building toilets Makwiye school, Building shed Mupuse school, Roofing Bhashungwe primary school, Sanyati Bridge camp renovation, Purchase of Cement Tashinga Primary School, 6 pairs uniform for resource monitors, Purchase of 20 bags cement Chisipite Primary School, Purchase of tires for Ward tractor, Bridge maintenance
Mbire	Clinic, nurse's houses, office, storerooms, 14 classrooms, 7 teachers houses, grinding mill, school office, wildlife administration offices, 2 hand pump boreholes, water piping, toilet, water storage tanks, 2 tractors, a basic tourist camp with 4 chalets;
Nyaminyami	Tillage tractors, renovation of dispensary at clinic, nurse's house. Construction of Mayovhe classroom block, 3 grinding mills, Teacher's house, Jongola school. School bursaries x 3 students at Seke Teacher's College. Renovation of pre-schools x 2. Negande: Rehabilitation of water pipeline, grinding mill. Nebiri: Chikuro primary block, rehabilitation of Harudziva water pipeline. Kasvisva: Rehabilitation of water pipeline to supply water to Kasvisva clinic, Kasvisva Secondary school block. Msampa: Teacher's house, Majazu primary, renovation of ward warehouse; Kanyati: Cement for teacher's house renovation.
Tsholotsho	Classroom blocks and furniture (Sihazela, Mlevu, Mtshwayeli, Ntulula, Dibutibu, Gwaai, Nkwizhi, Zibalongwe, Malindi, Mgodimasili, Phelela, Mpilo, Jimila, and Kapane Primary schools), 2 F14 cottages, 10 sewing machines (Dibutibu Secondary school), 7km piped water system for Thembile primary school, Sikente Clinic, Tshitatshawa and Jowa clinics construction, fencing of Madlangombe clinic, 10 water engines, borehole drilling and repairs and repair kits, Lister diesel engines for 6 villages in ward 21 and at Sihazela Line in ward 1, grinding mills, solar water pumping in wards 1, 2 and 4. 2 pickup trucks for wildlife monitoring purchased in 2015.

Figure 8 summaries the distribution of the US$5.4 million that Wards in 9 CAMPFIRE areas received over the 6-year period under review (2010 – 2015). As with the District expenditure, the Ward Wildlife Committees allocate 42% of the funds (US$2.2 million) for administrative functions (i.e. Meetings and Administration, Wages and Salaries, Management and Projects) and 55% of the funds (US$2.9 million) to

community benefits. Most of the funds are allocated to social services (US$2.4 million) that support schools, clinics and other infrastructure that benefit the whole community. Examples of this support are provided in Annex 1.

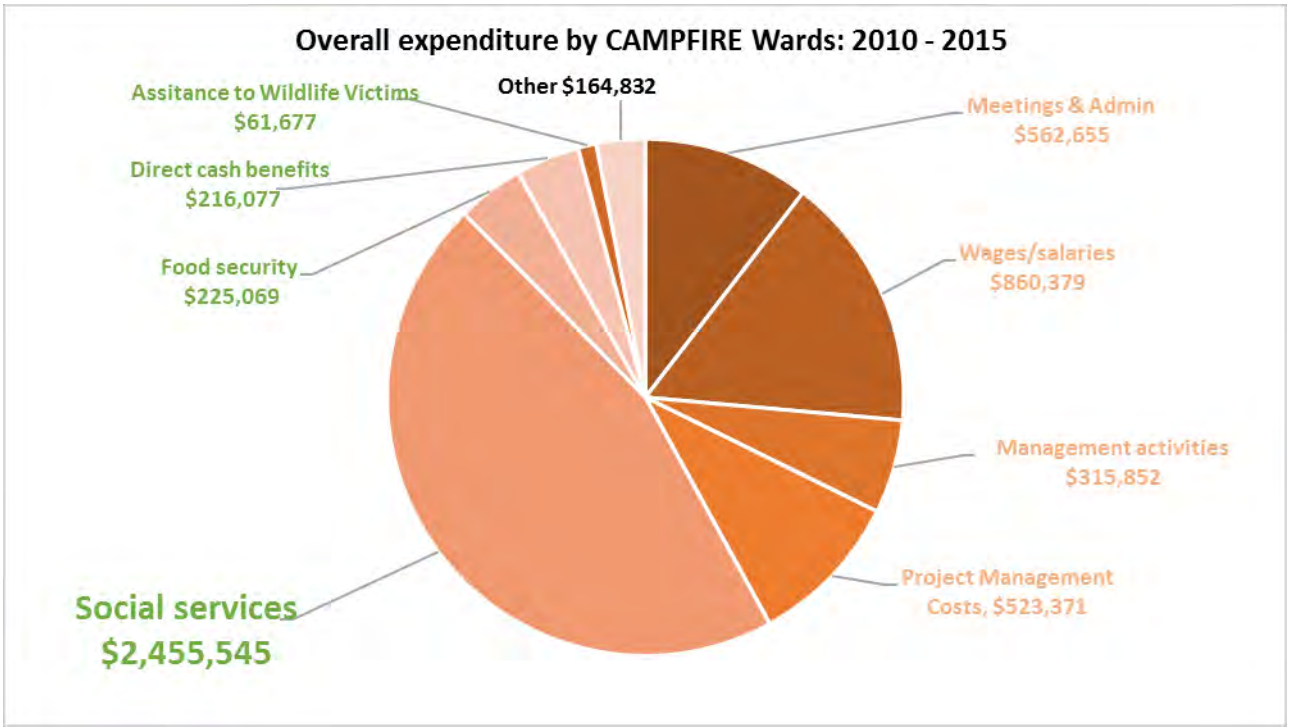

Figure 8: Allocation of Ward Campfire funds

5 IMPACT OF THE SUSPENSION OF ELEPHANT TROPHY IMPORTS TO THE UNITED STATES ON THE CAMPFIRE PROGRAM

The income to CAMPFIRE from the sustainable use of elephants has been declining since 2013, with 2014 registering a significant drop following the announcement of the ban on ivory imports into America (Figure 9). Although the hunting industry responded by seeking alternative markets (e.g. Russia, Middle East), this trend continued through 2015 and unconfirmed reports suggest that the decline has continued in 2016.

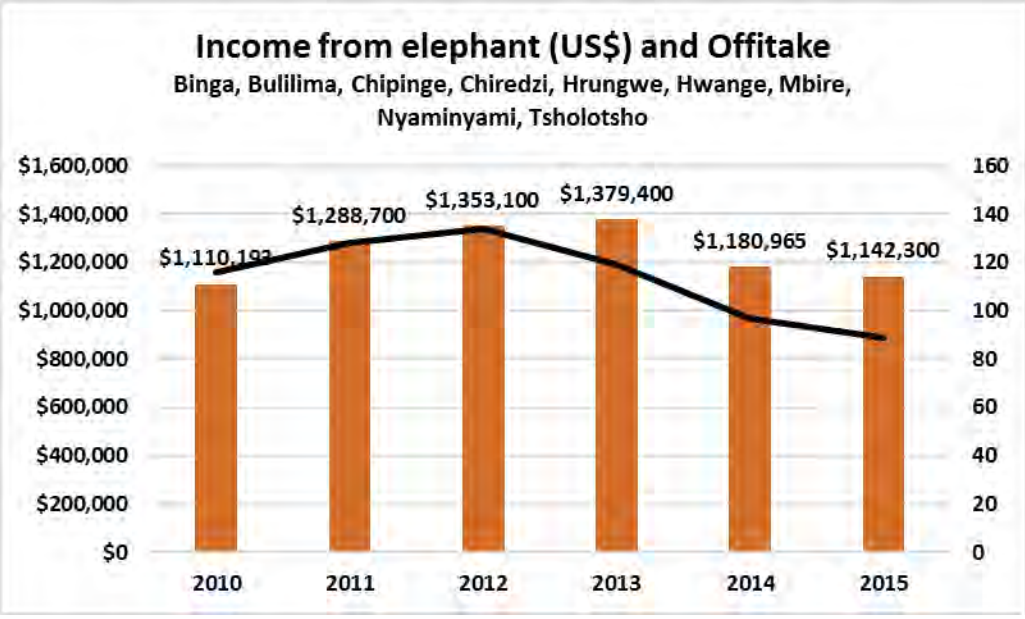

Figure 9: Annual income (US$) and offtake of elephants in 10 CAMPFIRE Districts

It is difficult to show concisely how the American ban on importation of elephant ivory from Zimbabwe has contributed to the decline in CAMPFIRE revenue and how hunting has enhanced the conservation of this species, due to the nature of the hunting industry in the CAMPFIRE areas. The hunting sector is integrated across a wide range of socio-economic activities and withdrawing one segment adversely affects a range of other wildlife based activities. Several indicators are provided here to demonstrate this:

1. The US suspension of ivory imports from Zimbabwe has had a significant impact on CAMPFIRE, and resulted in the cancellation of 108 out of 189 (57%) elephant hunts in all major districts initially booked by US citizens in 2014. The net impact of this was a reduction of CAMPFIRE income for all areas from US$2.2m in 2013 to US$1.7m in 2014. A similar pattern prevailed in 2015 (US$1.6m), and a further decline is anticipated in 2016 where outfitters struggled to sell elephant safaris and those that did had to heavily discount their prices.
2. The key trophy species (elephant, buffalo, leopard, hippo, crocodile and lion) contribute approximately US$1.2 million/year to CAMPFIRE revenues. Elephant account for 64% of these fees.

3. Quota utilisation of elephant prior to the ban did not exceed 60% of the CAMPFIRE quota allocation.
4. American hunters make up 53% of the clients in CAMPFIRE areas.
5. CAMPFIRE producer Wards receive on average 57% of all trophy revenues.
6. The CAMPFIRE hunting industry in the 9 RDCs covered in this analysis directly supports 104 producer Wards, representing 737 villages or 85,847 households.
7. The CAMPFIRE program employs managers, officers and game scouts at both the District and Ward level who are responsible for monitoring wildlife based land use activities in their areas and these are directly paid from safari hunting income.
8. Both RDCs and Wards invest in a variety of equipment that benefits communities and wildlife management. The operational and maintenance costs for this equipment are drawn from safari hunting income.
9. RDCs utilise 80% of the CAMPFIRE revenues to support administration and management of the program. 20% is invested in global social services that benefit communities at the District level.
10. Producer Wards, representing approximately 2.6 million hectares, bear the cost of living with wildlife. Under the 6-year period under review, elephants are responsible for the destruction of approximately 7,000ha of croplands in the 9 Districts. The minimum cost of this in terms of food production is estimated at US$500,000 – US$1.0 million.
11. Producer Wards have elected to invest 55% of their dividends from CAMPFIRE revenues in social services (schools, clinics etc.). 74% of these revenues are generated through trophy fees where elephant play a significant role.
12. Although CAMPFIRE communities suffer most from elephant crop damage, the number of elephant destroyed as problem animals is well within acceptable limits and with few exceptions, has little or no impact on population numbers.

In conclusion, the CAMPFIRE program relies almost exclusively on revenues generated through hunting. These revenues cannot be replaced through alternative wildlife based activities. This places almost two million hectares of wild land at risk, including the risk of increasing retaliatory killing through poisoning and illegal wildlife crime.

Wildlife in Communal Lands is under pressure. Removing any benefits will tip the balance and disgruntled CAMPFIRE communities will turn to pastoralism and unsustainable agricultural practices, thereby reducing wildlife habitat. The suspension of trophy imports is effectively encouraging communities to become willing tools for poaching – a forced abandonment of CAMPFIRE.

6 THE WAY FORWARD

The ZPWMA has recently developed and approved its 5-year Elephant Management Plan (ZPWMA, 2015). This plan recognizes that if elephants are to survive in the future, they must have a value, both to the governing authorities and to the local people. Unless the local communities, who live closest to elephants, are tolerant of this charismatic yet destructive species, it is unlikely that they will survive in the long term.

The Elephant Management Plan recognizes that "*regulated sport hunting converts wildlife into assets for the benefit of local people and the country as a whole. Wildlife can be a most valuable asset and in turn empower local communities and provide basic necessities. When it is viewed as a valuable asset, wildlife becomes an economically competitive land use in Zimbabwe, which leads to habitat preservation instead of habitat destruction and conversion to agriculture or livestock production*."

The presence of regulated hunting can also reduce illegal activities, and private outfitters' lease agreements are being reviewed to include anti-poaching as an obligation of the concessionaire. Trophy hunting revenues are vital to facilitating not only law enforcement activities but also general wildlife management. Alternative wildlife land use practices, e.g. eco-tourism, cannot generate sufficient revenues to cover these costs, and certainly not to justify wildlife as a land use outside of protected areas.

Hunting can generate revenues under a wider range of scenarios than eco-tourism, including in remote areas lacking infra-structure, attractive scenery, or high densities of viewable wildlife. Consequently, elephant and other wildlife populations will be negatively affected through reduced conservation efforts arising from low funding and reduced goodwill from the communities.

CAMPFIRE has been widely regarded as one of Africa's most successful contemporary conservation initiatives. Hunting of elephants plays an integral part in promoting CAMPFIRE as it permits the residents of communal lands to share in the benefits generated by wildlife utilization on those lands.

As shown above, the bulk of CAMPFIRE's revenue comes from hunting, with elephant hunting contributing more than 60% of annual revenue. The current revenue sharing guidelines require safari outfitters to pay revenue directly into community-controlled bank accounts and this has had a positive impact on community attitudes to wildlife conservation. These funds have been used by RDCs and producer Wards to promote wildlife conservation, but despite its achievements, CAMPFIRE still faces fundamental challenges.

The most crucial of these challenges is developing strategies to accommodate the increasing human populations averaging 16-20 people per km^2 in some key CAMPFIRE areas. Understandably, the focus of these households is on food security requiring the extension of basic agricultural schemes and increased livestock numbers. Such land uses are incompatible with wildlife based land use.

Other CAMPFIRE challenges include: (i) the downturn in Zimbabwe's economy and tourism sector post-2000, (ii) great reliance on consumptive trophy hunting and less focus on other uses and non-consumptive uses of natural resources due to viability considerations, and (iii) low re-investment in development, fixed assets, human capital, and management and protection of wildlife in CAMPFIRE areas.

Despite these challenges, CAMPFIRE stands very high in the agenda of Zimbabwe's Government, and an evaluation dedicated to improving the program is ongoing and should be finalized by the end of 2017. Zimbabwe's Government recognizes that the survival of wild animals depends entirely on those among whom they live. Unless local people want to save them, wildlife will be poached to the point where just a few remain in fortified reserves. CAMPFIRE is meant to avoid this and the future of wildlife in communal areas rests on the success of this program.

The hunting of elephants, under sustainable and well-regulated conditions, has the potential to raise adequate funds to support itself and other species in CAMPFIRE areas. For these reasons, Zimbabwe confirms its commitment to the sustainable use of elephant and other wildlife in its Elephant Management Plan, and recognizes the role that elephant play in the CAMPFIRE program.

MIKE REPORT

LEVELS AND TRENDS OF ILLEGAL KILLING OF ELEPHANTS IN AFRICA TO 31 DECEMBER 2016 – PRELIMINARY FINDINGS

Background on MIKE

The CITES programme for Monitoring the Illegal Killing of Elephants, commonly known as MIKE, was established by the Conference of the Parties (CoP) to CITES at its 10th Meeting (Harare, 1997) in accordance with the provisions in Resolution Conf. 10.10 (Rev. CoP16) on Trade in elephant specimens. The MIKE Programme is managed by the CITES Secretariat under the supervision of the CITES Standing Committee. Since implementation began in 2001, the operation of the MIKE Programme in Africa has been possible thanks to the generous financial support of the European Union.

MIKE aims to inform and improve decision-making on elephants by measuring trends in levels of illegal killing of elephants, identifying factors associated with those trends, and building capacity for elephant management in range States. MIKE operates in a large sample of sites spread across elephant range in 30 countries in Africa and 13 countries in Asia. There are some 60 designated MIKE sites in Africa, which together hold an estimated 30 to 40% of the African elephant population, and 27 sites in Asia.

MIKE data is collected by ranger patrols in the field and other means in designated MIKE sites. When an elephant carcass is found, site personnel try to establish the cause of death and other details, such as sex and age of the animal, status of ivory and stage of decomposition of the carcass. This information is recorded in standardized carcass forms, details of which are then submitted to the MIKE Programme. A database of more than 15,900 carcass records has been assembled to date, providing the most substantial information base available for making a statistical analysis of the levels of illegal killing of elephants.

MIKE evaluates relative poaching levels based on the Proportion of Illegally Killed Elephants (PIKE), which is calculated as the number of illegally killed elephants found divided by the total number of elephant carcasses encountered by patrols or other means, aggregated by year for each site. Coupled with estimates of population size and natural mortality rates, PIKE can be used to estimate numbers of elephants killed and absolute poaching rates.

While PIKE provides a sensitive measure of poaching trends, it may be affected by a number of potential biases related to data quality, reporting rate, carcass detection probabilities, variation in natural mortality rates and other factors, and hence results need to be interpreted with caution. However, the fact that the quantitative results presented below are in good agreement with quantitative information available from other sources, such as the Elephant Trade Information System (ETIS) and the African Elephant Database of the IUCN/SSC African Elephant Specialist Group, gives confidence as to the robustness of the results.

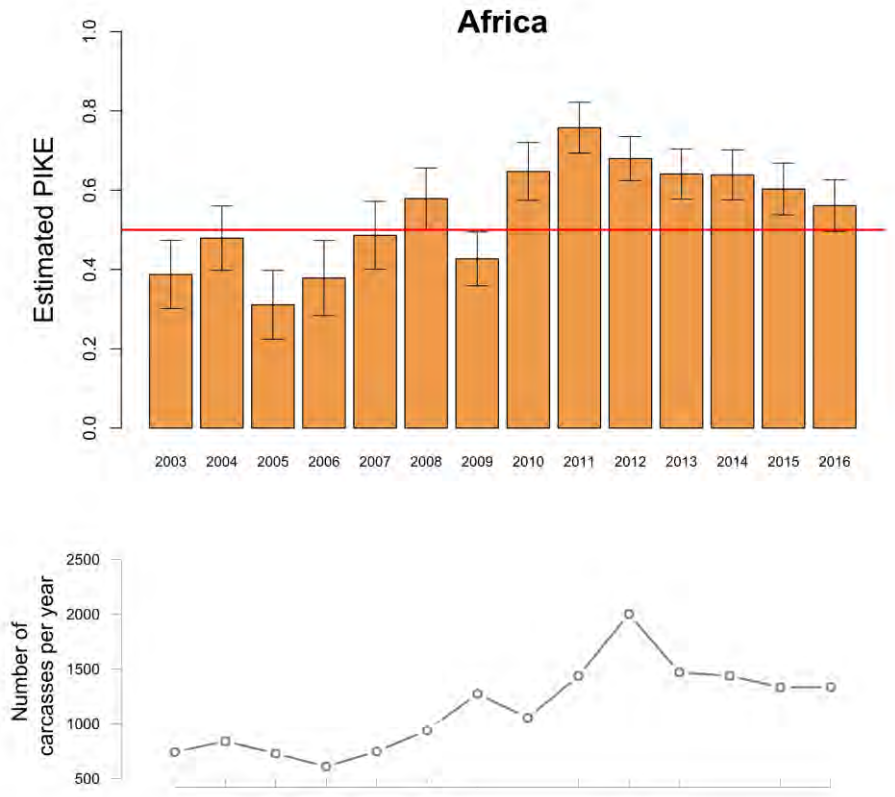
Details of the MIKE trend analysis for 2016

Trend analyses of MIKE data using standardized methodology have been presented to the 15th, 16th and 17th meetings of the Conference of the Parties to CITES, in 2010, 2013 and 2016 respectively; to the 61st, 62nd, 65th and 66th meetings of the CITES Standing Committee, as well as to other meetings such as the African Elephant Summit (Gaborone, December 2013) and the Kasane Conference on Illegal

Wildlife Trade (Kasane, March 2015). In addition, analyses of MIKE data have been published in the peer-reviewed scientific literature (Burn et al. 2011; Wittemyer et al. 2014).

Since the report submitted to the 17th meeting of the Conference of the Parties to CITES held in South Africa in September-October 2016, which included records received up to the end of 2015, records for 1,335 elephant carcasses encountered in the course of 2016 were received from 33 sites in Africa. Records are still being sought from sites that have not reported, as a result this report is a preliminary analysis based on records received up to 31 December 2016. While the number of reporting sites declined compared to 2015, when 38 sites reported, the number of carcass records received is comparable (see Fig 1, lower chart).

The data set used for analysis consists of 15,942 records of elephant carcasses found between 2003 and



the end of 2016 at 51 MIKE sites in 27 range States in Africa, representing a total of 539 site-years. Data for Asian sites is still being compiled and will be presented in the MIKE report to the 69th Meeting of the CITES Standing Committee, which will be held in Geneva, Switzerland, from 27 November to 1 December 2017.

Figure 1. The upper chart shows the PIKE trend in Africa with 90% confidence intervals, based on 15,942 elephant carcasses (illegally killed or otherwise) reported to MIKE for the period 2003-2016. PIKE levels above the horizontal line at 0.5 (i.e. where half of dead elephants found are deemed to have been illegally killed) are considered cause for concern. The lower graph shows the total number of carcasses reported by year, irrespective of cause of death. The total number of carcasses reported per year has remained relatively unchanged since 2013.

Figure 1 shows empirically derived time trends in PIKE at the continental level for reporting African MIKE sites, with 90% confidence intervals. The chart shows a steady increase in levels of illegal killing of elephants starting in 2006, peaking in 2011, and leveling off and slightly declining thereafter. As in 2015, the PIKE level shows a slight decline but the estimated poaching rate in 2016 remains high – that is above a PIKE value of a half, more elephants die from poaching that die from natural causes. This may imply that elephant population at MIKE sites overall is likely to have continued to decline in 2016.

It is difficult to estimate poaching impact at the site level, especially in sites that do not have sufficiently large carcass sample sizes, or where there may be indications of bias in reported PIKE levels or where climatic conditions have dramatically varied, such as drought. Uncharacteristically, in 2016 the number of carcass records from Tanzania dropped by 55% relative to 2015 from three MIKE sites (Katavi Rukwa, National Park & Game Reserve, Ruaha Rungwa, National Park & Game Reserve and Selous-Mikumi, Game Reserve and National Park). As of now no explanation has been received why there was a significant drop in the number of carcasses reported from these sites in Tanzania. The absolute number of carcass records from Kruger (South Africa) notably increased from 74 records in 2015 compared to 165 in 2016. While the number of illegally killed elephants reported remained almost the same: 30, in 2015 and 46 in 2016, the resulting PIKE value for Kruger declined from 0.41 to 0.2. This may be explained by two consecutive years of below average rainfall and potentially higher natural mortality rather than an actual decline in the poaching losses there.

Among sites that have reported 20 or more carcasses in 2016, where the site-level PIKE can be taken to be relatively reliable, those that remain of concern (with a PIKE of 0.7 or higher) in 2016 include Garamba (Democratic Republic of the Congo); Gourma (Mali); Odzala-Koukoua (Republic of the Congo) and Niassa (Mozambique). In a recent correspondence in Cell Biology (Poulsen, 2017), 161 carcasses of poached elephants between 2012 and 2015 were reported at Minikèbè N.P (Gabon). This MIKE site last reported in 2014 with a total of 63 illegally-killed carcasses between 2012-2014. If the published numbers are correct then a total of 98 (=161-63) illegally-killed carcasses have not been reported in 2015. As of now no official numbers for 2015 and 2016 have been reported to the MIKE programme.

From 2015 to 2016 PIKE levels changed at several sites. Among these, where the change in site-level PIKE can be taken to be relatively reliable - sufficiently large carcass sample size (an average of 20 or more carcasses across years) - were Dzanga-Sangha (Central African Republic) where PIKE dropped from 0.43 to 0.23 (a decrease of 20%), and Tsavo Conservation Area (Kenya), where PIKE declined by 11%; in contrast, in Gourma (Mali), PIKE increased from 0.77 in 2015 to 1.0 in 2016 (a 23% increase). Sites from South Africa and Tanzania, that had unusual reporting patterns from previous years (see above), were not included in the analysis.

The PIKE levels over the last three years are reflected at the sub-regional level, with the PIKE values in the African sub-regions in 2016 being statistically indistinguishable from those reported in 2015 except for Eastern Africa (Figure 2). In Eastern Africa, PIKE levels declined from 0.42 in 2015 to 0.30 in 2016. This decline is principally due to the PIKE-site level in Tsavo Conservation Area (Kenya) in 2016, coupled with the number of elephant carcasses (illegally killed or otherwise) reported (170). Systematic exclusion of carcass data from East African MIKE sites in 2016 from the analysis shows that the carcass numbers from Tsavo had the highest influence on the decline of PIKE from 2015 to 2016 for the sub region. Without the 2016 Tsavo data in the analysis PIKE changed from 0.42 in 2015 to 0.36, a 6% decrease in 2016 whereas including the Tsavo data, PIKE changed from 0.42 in 2015 to 0.30, a 12% decrease in 2016. This highlights that regional trends can be influenced by local change at a single site.

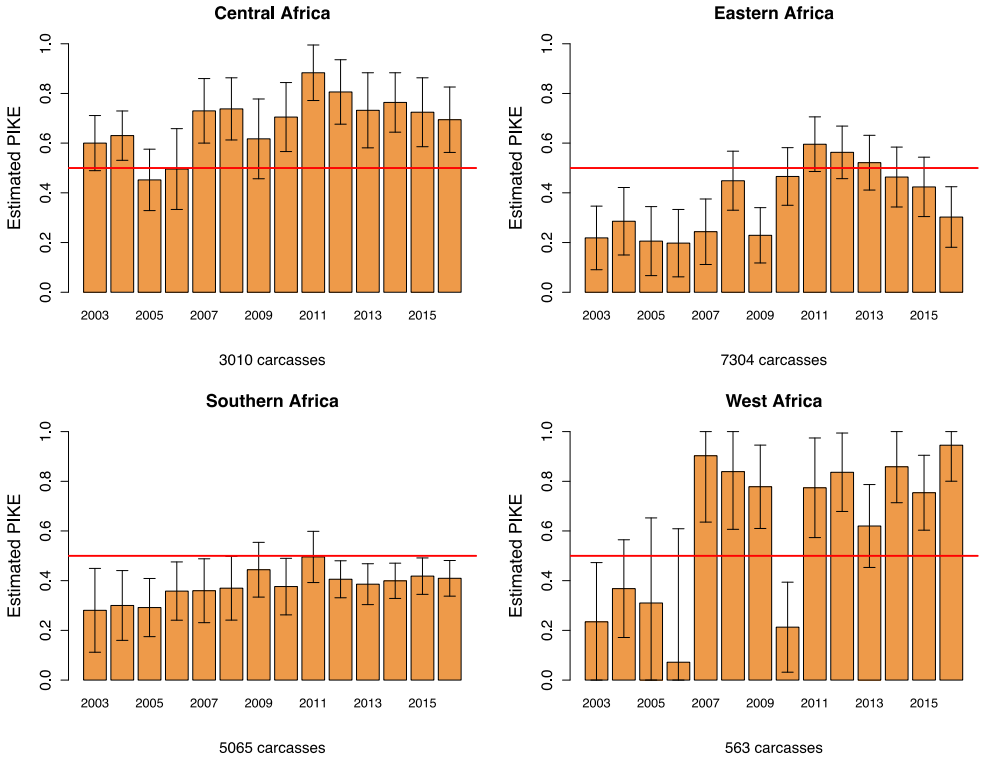


Figure 2. Sub regional PIKE trends with annual 90 % confidence intervals. The numbers of carcasses on which the graphs are based are shown at the bottom of each graph.

With only seven sites reporting data for 2016, West Africa continues to be a cause for concern in terms of data quantity and quality, making reliable inference on trends impossible for the sub-region.

Despite variation at the site level, poaching levels show a slight downward trend since 2011 at the continental scale, albeit at a potentially worrying levels, especially in Central Africa and specific sites in Eastern and Southern Africa. In West Africa, due to low reporting rates, it is hard to make reliable inference with the year over year trend.

Zimbabwe: United States Ban Hits Campfire Revenues

06/04/2015 00:00:00

by Staff Reporter

A UNITED States ban on the importation of sport-hunted trophies of elephants from Zimbabwe has resulted in a significant dip in revenues for the Community Areas Management Programme for Indigenous Resources (CAMPFIRE), a report has indicated.

Established by the government in the 1980s, CAMPFIRE is a wildlife management programme under which local communities to sell hunting concessions to tour operators with the revenues used for communal development projects.

However, in April, 2014, the United States' Fish and Wildlife Service (Service) banned the import of sport-hunted black rhinoceros trophies from Namibia and prohibited Americans from bringing home elephant corpses after hunting and killing the animals in Zimbabwe.

The department recently lifted the ban on Namibia but indefinitely extended the Zimbabwe embargo "due to the inadequacy of information on Zimbabwe's

elephant management program, as well as lingering questions about law enforcement and the use of hunting revenues".

However, CAMPFIRE says its revenues have declined from $2, 2 million to $1,5 million due to the ban.

The organisation has been actively involved in elephant hunting for more than 20 years and exports of elephant trophies to the U.S. and other countries.

Seventy per-cent of CAMPFIRE's income comes from elephant hunting.

"The ban technically expired last April but the US has failed to announce its review to ascertain its position regarding 2015 imports," said a source at the organisation.

"The ban has caused a massive disruption of hunting revenue inflows to communities. It has negatively also affected investment into the protection of wildlife and removed direct incentives at community level."

NewZimbabwe.com was also told that the loss of revenues would adversely impact conservation activities in affected communities.

"The loss of this income stream will certainly increase the loss of confidence by communities in wildlife management, and consequently threaten tolerance and survival of elephants in communal areas," the source said.

The embargo has also affected the local tourism industry.

Hunters can earn as much as $2,000 a day helping clients from America, Eastern Europe and Spain shoot anything from antelope to lion and elephant, according to the Zimbabwe Parks and Wildlife Management Authority.

A client will pay about $30,000 in permit fees and for the hire of a professional hunter to get an elephant. A lion kill will likely cost a hunter about $55,000, according to the authority's guidelines.

Environment minister, Saviour Kasukuwere, said he believed the ban was an extension of U.S. sanctions against members of President Robert Mugabe's government and ruling party over alleged human rights violations.

"It's very unfortunate that they've extended their sanctions to animals as well," he said last year.

Jerry Gotora, chairman of the Zimbabwe Parks and Wildlife Authority, said the embargo would not help conservation efforts.

"This ban just encourages poachers," he said by phone. "It just doesn't make any

> sense."
>
> "As soon as you ban hunting, there's no income for the people and they resort to poaching," added South Africa-based hunter Lampies Bredenkamp.

BUBYE VALLEY CONSERVANCY LION RESEARCH REPORT

Dr Byron du Preez [Oxford]
2016-01-12

INTRODUCTION

The United States Fish and Wildlife Service (USFWS) have recently evaluated the conservation status of the lion *Panthera leo* with particular regard to sport-hunting (http://www.fws.gov/endangered/what-we-do/lion.html – accessed 2015-01-08). The results of this evaluation have led to the formal protection of two subspecies under the Endangered Species Act, classifying *P. l. leo* as endangered and *P. l. melanochaita* as threatened. Together these subspecies apparently represent all of the lions in Africa (Barnett et al. 2014).

Sport-hunting is a legal activity that is both sanctioned and carefully controlled by the Convention on International Trade in Endangered Species of Wild Fauna and Flora (CITES). The USFWS found that the sport-hunting of *P. l. melanochaita* "if well managed, may provide a benefit to the subspecies" (http://www.fws.gov/endangered/what-we-do/lion.html – accessed 2015-01-08). Here we aim to explore this statement further and present data from a long-term *in situ* lion research project.

Please note that this is a preliminary report that just focuses on the Bubye Valley Conservancy in Zimbabwe. A more comprehensive report regarding the status of Zimbabwe's lion populations is currently being produced in collaboration with Dr Andrew Loveridge of Hwange National Park, Dr Rosemary Groom of the Save Valley Conservancy, Dr Peter Lindsey of Panthera, and Roseline Mandisodza-Chikerema of the Zimbabwe Parks and Wildlife Management Authority (ZPWMA), and of course Dr Byron du Preez of the Bubye Valley Conservancy.

LIONS *PANTHERA LEO* AND SPORT-HUNTING

The IUCN Red List have recently reclassified lions as Vulnerable (remaining as such since 1996; IUCN 2015), estimating that there are between 20,000 and 30,000 free-ranging lions left (Bauer et al. 2015) in less than 25% of their historic range (IUCN 2006). However, this generalised classification does not take into account an apparent conservation dichotomy: sample subpopulations of lions in Botswana, Namibia, South Africa and Zimbabwe have in fact increased overall (Bauer et al. 2015). Lions were historically present throughout Africa, some of Europe, the Middle East and Asia (Bauer and Van Der Merwe 2004), but current conservation strongholds remain only in parts of eastern and southern Africa (Brassine and Parker 2012; Nowell and Jackson 1996).

Lions are uniquely social felids, forming coalitions of up to nine males associated with female prides that may consist of 20 individuals or more (Macdonald et al. 2010; Schaller 1972). In the 1990's, lions were successfully (in terms of high reproductive and survival rates) reintroduced into private areas in parts of their former range (Miller and Funston

2014). However, this population growth rate inevitably led to the potential problem of overabundance (Funston 2008) and low genetic diversity (Trinkel et al. 2010), with both of these issues requiring active and intensive management (Hunter et al. 2007), and ultimately reducing the conservation value of these lion populations (Miller and Funston 2014). The ability to translocate lions originally facilitated the relief of overpopulation, but as the available areas for relocations were used up, sport-hunting and euthanasia have subsequently become the main methods of lion population control (Miller and Funston 2014).

The lion is the apex predator wherever it occurs (Macdonald et al. 2010), and is an ideal conservation umbrella; being large, charismatic and easily observable (e.g. Williams et al. 2000). The lion is important to commercial wildlife ventures, which risk losing significant market share where they cannot offer them to clients (Lindsey et al. 2007). The lion is thus prioritised in conservation, and their charisma exploited to attract tourists and raise the funds required in ensuring that wildlife areas remain viable (Lindsey et al. 2007). Lions are also a particularly valuable species in the sport-hunting industry, rivalled only in demand by buffalo *Syncerus caffer* and leopard *Panthera pardus* (Creel and Creel 1997). Lions are therefore prevalent in private wildlife areas (Packer et al. 2013), where their populations can achieve exponential growth rates given the protection and resources afforded by well-managed operations (Miller and Funston 2014).

There is more land area in Africa conserved for hunting than there is in all of Africa's formally protected areas combined: approximately 1.4 million km^2, which exceeds the total area covered by national parks by 22% (Lindsey et al. 2007). For wildlife conservation to be successful outside of national parks, these areas must be self-sufficient and able to generate sufficient revenue to cover the considerable costs of protecting the habitat and wildlife therein (Lindsey et al. 2006).

Hunting quotas are sanctioned by CITES on the basis that sport-hunting does not endanger the ultimate survival of the population. The positive aspects of sport-hunting as a conservation tool include a focus on males and a low percentage off-take; neither of which generally jeopardise populations, and also suggest that hunting could play a role in endangered species conservation (Leader-Williams et al. 2005).

An adaptive quota management system for lion hunting based on the ages of lions hunted was agreed on in July 2013 in Harare, Zimbabwe, during a meeting hosted by the Zimbabwe Parks and Wildlife Management Authority (ZPWMA) and the independent non-governmental conservation organisation Panthera. The points system is summarised in Table 1.

Table 1. Points allocated to hunting blocks arising from the harvest of lions of different ages under different quota regimes

	≥6 years	No trophy	5 years old	4 years old	<4 years	Failure to submit hunt

						return/incomplete hunt returns
For quotas of 3/more	4	3	3	2	-3	0
For quotas of 2	4	3	3	2	0	0
For quotas of 1	6	3	3	2	0	0
Quota setting process	These points are added up and divided by 3 to yield the quota for next year					

During 2013, operators were requested to submit hunt returns and photos as a trial run to get the system up and running. In 2014 operators were requested to do the same but were informed that the age of the lions hunted in 2014 would determine their lion quotas in 2015. The 2015 lion hunt results would thus also determine the 2016 quota.

THE BUBYE VALLEY CONSERVANCY

After originally being eradicated by cattle ranchers in the area, 13 lions were reintroduced to the Bubye Valley Conservancy in 1999, and four young males broke into the Conservancy that same year. From the original 17 animals present in 1999, the Bubye Valley Conservancy lion population was estimated at approximately 280 individuals in 2009 when robust population surveys were initiated by a team from the University of Oxford Wildlife Conservation Research Unit (WildCRU), and this population has continued to grow. Today it is estimated that there are over 500 lions on the Bubye Valley Conservancy.

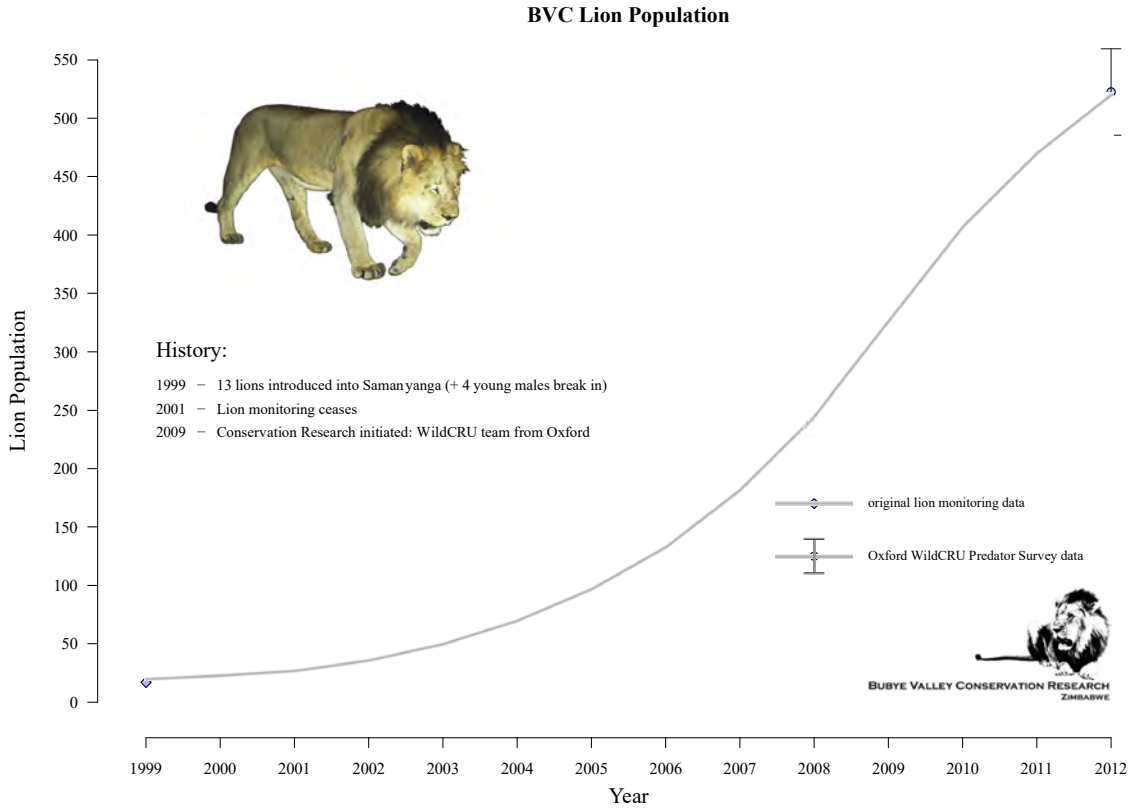

Figure 1: The Bubye Valley Conservancy lion population has increased exponentially since the original reintroduction of the species to the conservancy in 1999.

The exponentially increasing Bubye Valley Conservancy lion population currently exists at one of the highest densities in Africa (~0.190 lions km^{-2}: du Preez et al. 2015), greater than that of the Serengeti, Tanzania (0.100 lions km^{-2}: Pusey and Packer 1987; Spong 2002), Selous, Tanzania (0.080 – 0.130 lions km^{-2}: Creel and Creel 1996, 1997), Kruger National Park, South Africa (0.096 – 0.112 lions km^{-2}: Mills 1995), and Hwange National Park, Zimbabwe (0.027 lions km^{-2}: Loveridge et al. 2007). This equates to the largest contiguous lion population in Zimbabwe.

The Bubye Valley Conservancy offsets the cost of lion predation on its wildlife via sport-hunting of the species. In 2014, the lion hunting quota allocated to the Bubye Valley Conservancy by ZPWMA was 10 individuals. Based the fact that the entire quota was harvested and maximum points were scored for each individual trophy (more than six years in age), the allocated quota was raised to 13 lions for 2015. Only 12/13 lions were hunted in 2015 due to a late cancellation; nevertheless eight lions over six years old and four lions of five years old were harvested and the resultant points justifying a quota of 15 lions for 2016. Note that while the lion hunting quota for Zimbabwe has been voluntarily reduced by a national steering committee, the Bubye Valley Conservancy lion hunting quota has been successively raised twice based on hunt success and age of lions hunted under the *national adaptive quota management system*.

DISCUSSION

The saturation of lions in wildlife areas on both state and private land is positive for their future conservation security; but it is also critical to that of incidentally conserved endangered species, such as both species of rhinoceros (*Diceros bicornis* [black] and *Ceratotherium simum* [white]) on private wildlife conservancies in Zimbabwe (Lindsey et al. 2009; Suzuki 2001), which benefit from the same resources and protection that are incentivised and provided by the revenue generated from sport-hunting. The Bubye Valley Conservancy now boasts the world's third largest black rhinoceros population (N. Anderson [Lowveld Rhino Trust], pers. comm.). This remarkable achievement is an incidental conservation benefit derived entirely from trophy hunting activities – there are no photographic tourists visiting the Bubye Valley Conservancy, and these rhinos are not hunted. Having rhinos on the land therefore generates no revenue – and in fact there is a significant cost associated with protecting these animals. This expense is covered by the revenue generated by sport-hunting, with additional donations from the clients, and the habitat for the rhino is also preserved by maintaining the land as a conservation area, as opposed to converting it into agricultural or grazing land for example. The Bubye Valley Conservancy lion population has increased from an original 17 individuals in 1999 to over 500 in 2015 – not despite hunting, but because of the incentive provided by sport-hunting for their protection.

However, the high densities of lion populations achieved within commercial wildlife areas have the potential for intense intraguild persecution. Lions are aggressively competitive, and have been linked to reductions in cheetah (e.g. Durant 1998, 2000; Laurenson 1995) and wild dog (e.g. Creel 2001; Creel and Creel 1996; Vucetich and Creel 1999) densities, both of which face local extinction where lion abundance, and the respective level of persecution, is high. Excessive lion density may also result in population declines of ungulate prey (e.g. Wegge et al. 2009). It is vital to holistic conservation that wildlife managers can understand and deal with the level of impact that lions exert on other species; particularly those that are elusive difficult to observe, and which face decline if not carefully monitored. To this end, a conservation research initiative in partnership with WildCRU was established on the Bubye Valley Conservancy in 1999.

Based on the number of kills made (du Preez et al. *in prep*.) and the current value of the meat (K. Leathem, *pers. comm*.), the Bubye Valley Conservancy lion population consumes hundreds of thousands of dollars worth of prey each year. These lions are mainly tolerated because of their ability to generate the revenue that helps to offset this expense – although it is estimated that economically it is still not worth keeping the lions whose cost outweighs their value (Funston et al. 2013). If lion hunting were to be banned, based on the economics involved it would become unviable to continue managing the Bubye Valley Conservancy as a wildlife area in its current form, and lions would either have to be re-exterminated (or at least severely reduced via culling), or what is the largest privately owned wildlife area in the world would be converted back into a cattle ranching area (K. Leathem, *pers. comm*.). This is the reality of any business, in that it needs to cover costs and pay staff and cannot run at a loss for luxury of conservation. Childs (1993) states “A refusal to treat wildlife in the same way as other resources and maintenance of centralised protectionist management

prejudices its survival. Only by raising its commercial value will wildlife be able to compete for space on the scarce African landscape. Trade bans which detract from wildlife's commercial value prejudice its chances of survival in the long term."

The USFWS state "Well-managed conservation programs use trophy hunting revenues to sustain lion conservation, research and anti-poaching activities" (http://www.fws.gov/endangered/what-we-do/lion.html – accessed 2015-01-08). The Bubye Valley Conservancy meets each one of these points: clearly contributing to lion conservation with Zimbabwe's largest contiguous population; a long-term conservation research partnership with WildCRU; and with a self-funded anti-poaching unit that protects the world's third largest rhino population (the largest on private land).

The success of the Bubye Valley Conservancy, in terms of both its hunted lion and non-hunted rhino populations, provides the incentive for other areas in the country to sustainably manage their wildlife resource. Although the USFWS understandably categorises lion conservation by country rather than individual properties, the Bubye Valley Conservancy currently and deservedly hunts nearly a third of the total Zimbabwean lion quota. This sport-hunting does not negatively affect the lion population, which remains in positive growth despite the off-take.

Anti poaching …fighting back

AFRICAN CONSERVANCIES ANTI-POACHING 2015

AFRICAN CONSERVANCIES

African Conservancies was established in 2014, it's first project was in Nyaminyami Rural District Council in the Omay Communal Land hunting area. A.C comprises Carbon Green International, the relevant Rural District Council and the relevant community in which the conservation plan falls. A trust has been formed that will include these parties as beneficieries.The primary goal of A.C was to locate a suitable area to form, build and manage a sustainable community conservation area. The Omay 1 hunting area between the Ume and Sengwa Rivers was selected as a perfect phase one. The criteria of selection includes; being communal land hunting area, fall within the C.G.I REDD+ project area.

OBJECTIVES OF AFRICAN CONSERVANCIES

The primary objective of A.C was to select an area within the REDD+

› Zimbabwe hunting

project, (stretching from Binga to Kanyemba in the communal areas) and partner the community and council. The belief in building sustainable conservation areas and in particular enabling communities to truly and directly benefit from from this sustainable utilization is at the core of this project.

The immediate goals with the Ume River Community Conservation Area were to reduce hunting offtake and reduce poaching. The hunting offtake was reduced in 2014 and in 2015. For example, 2014 saw twelve buffalo being hunted from the quota of thirty five. 2015 we will have a buffalo offtake of ten from the possible thirty five. Having done our own numbers on the ground, our offtakes are very conservative and the population increase through relocation due no pressure is clearly visible with far better trophy quality.

Anti poaching began in 2014, the six C.G.I scouts based out of Manyuli camp close to the Gokwe boundary and six scouts based out the Ume hunting camp. We decided at the close of 2014 that the anti poaching was not having enough effect on the structured elephant poaching, so in March 2015 Steve Wentzel and I decided that it needed direction and management. So beginning March, I personally came into the Omay to oversee and manage the anti poaching teams.

I immediately amalgamated the two teams and brought in Mr. Charles Khumalo to head up this new team. Charles is ex Zimbabwean National Army, a brave, dedicated leader who has commanded not only the respect of this unit, but myself and the community at large.

We started in house training incorporating weapons training, tactical house clearances, offensive tracking and building a more intense unit that could cope with a far more aggressive natured outlook to the poaching problems. This immediately began to produce results.

Our focus has been on hardened armed poachers with the theory that the snare and dog meat poachers would be dealt with in the process of eliminating the more “serious” elements.

AREA OF OPERATIONS

Though we in theory are based in the Omay communal land, our operations stretch into Gokwe, around Chizarira and Charisa and Binga. due to our operations being outside of the National Parks we predominantly operate with Police details and R.D.C scouts. Our entire unit has now been accepted as Police reservists and are awaiting their Police force numbers. It has been agreed that our unit

- May 2015

having been accepted as reservists, will establish a dedicated reaction team within the police force that I shall train and manage.

OPERATIONS

Begining 2014 we funded the basing of James Mcallwain from MAPP out our hunting camp in Chipfudze on the Southern boundary of the Matusadona National Park. The reasoning for this was obviously to maintain the Parks presence on this boundary, which was non existent due to lack of capacity. Secondarily, James was to establish an informant network that would offer up targets for our unit to react to. This was very effective and results were immediate.

With James leaving MAPP in August 2015, the MAPP trustees unfortunately decided to move their operations back into the Park. This led to a huge information breakdown and vacuum.

August 2015 Charles Khumalo was tasked in resurrecting and bettering the information networks as reacting to shots fired is almost a pointless affair. The poaching teams shoot toward last light, fifteen minutes from shots fired, the elephants face is chopped off and they are moving.There is no way to track them fast enough to catch them up at this stage. The needle in haystack affair is almost pointless for arresting poachers. There are over one hundred and fifty square kilometers of bush to patrol, it would require an army to do this. Our first goal was to bring into operations a full time intelligence operative whome we had been grooming for this position.

The informant/intelligence network has had significant effect, we have over one hundred and twenty people on our books. Over ninety percent of our arrests have occurred and been made possible through the capturing or paying for intel. We have put in place “watchers” who monitor targets and wait for opportunity to ensure arrests have hard tangible evidence for prosecution. “Mapani” whom he was second on our priority list and pulled the trigger on the three elephant days after the Sebungwe Action Plan Meeting; was monitored for four months prior to his arrest late October. Literally we actioned the arrest when his “watcher” informed us that he had begun drinking beer with tusks and firearms still being present. After four long months, he eventually made a mistake!

ARRESTS

Below are a list of arrests of hardened elephant poachers, I have omitted all of our lessor arrests of meat poachers.

February 7th 2015

Reaction to shots fired Matusadona southern boundary resulted in a joint op with Parks rangers with our tracker team. Poaching team ambushed and two armed poachers killed. One “John Raymond” being a casualty of this contact was fourth on our priority list. Firearm 303 recovered.

February 12th 2015

Sting operation on the Gokwe boundary resulted in the arrest of three “dealers” supplying arms and ammo to the poaching syndicates. One tusk, thirty rounds 303 and forty five 7.62 intermediate (AK 47) rounds recovered.

March 12th 2015

Contact and exchange of fire in Manyuli, no casualties but a 303 rifle recovered.

April 22nd 2015

Raid carried out on “Magura” syndicate whilst infiltrating. Arrests effected on entire team of four with recovery of 303 rifle.

April 23rd 2015

Intel from “Magura” arrests led to the arrest of “Mark Neberi” who was third on our priority list.

June 23rd 2015

“Jabu” syndicate shot and killed an elephant in the park on the late

FUTURE OPERATIONS

Future operations will continue in the Omay communal land, the hard hitting unit has had a serious effect on poaching syndicates. The informant network has reduced the “safety” factor for the syndicates. We are able to reach right into their homes and they have no secure areas to operate in.

The community outreach via the chiefs seems to be having an effect. Chief Negande has issued an order that anyone assisting poaching syndicates will be banished from the Omay. The subsequent banishing of two of his subjects over the last month has sent a very strong message about how serious he has become!

The upsurge in armed Zambian incursions in the lower Zambezi has us concerned with intel coming in of Zambian teams planning to operate here. The Cyanide is our major concern. Having only picked up poisoned fruit in July with no further cyanide incidents we were fairly relaxed about it. Subsequent to the MAPP arrest of the “Kariba” cyanide team, one of their members who escaped prosecution has been into our area. I am currently running a campaign in the community educating them of this problem. It is finally dawning on people that these elephant poachers will poison water sources that will not only kill elephant, but their livestock and families are at risk to.

As always, funding these operations and supplies of material are a constant battle. Carbon Green and Ume River Conservancy face the brunt of this funding with perpetual short falls. We rely on cell phones for communications, which is erratic at best! Firearms and ammunition have been supplied by me personally, again we are short if all members are in field. The idea of us tackling these teams with catapults and axes sounds ludicrous but is whats happening! So we are perpetually looking for help keeping the ball rolling.

Sustainable off take benefiting communities

Sustainable off take

Since 2007 we have been involved in dedicated wildlife conservation through sustainable off take, quota control, anti poaching and community based wildlife education in the Omay campfire concession.

The Omay (NyamiNyami RDC) is a vast (2 million acres) populated communal land which one of the first areas to be given the CAMPFIRE status, whereby local communities benefit from wildlife off take, it is not rocket science that this program works as we continue to see an increase in wildlife numbers in our area. Communities receive direct benefit both financially and through various projects implemented by Martin Pieters safaris such as clinics, schools, vehicles for anti poaching and the employment of scouts. It must be noted that the Nyaminyami RDC is a remote inhospitable concession that has no other land use model due to very erratic and low rainfalls, an abundance of mosquitos, tsetse flies and poor soils. The only benefit local people have, is to receive financial remuneration from hunting safari off take and employment.

We at Martin Pieters safaris, www.martinpieterssafaris.com employ locals in all our camps as well as a dedicated anti poaching team that works alongside the RDC (council), national parks, the police and the MAPP (Matusadonna anti poaching project), we continue to collect snares, arrest poachers and follow up on convictions and more importantly, educate people on the long term sustainable use of our national heritage. This method has been proven and several past poachers have turned tables and are now our most trusted wildlife officers, using their past notorious skills to help us protect our wildlife.

Every year several local villagers are killed or maimed by elephant, lion, buffalo, hippo and crocodile, they live in close proximity to these animals and only tolerate them because we as a hunting

- May 2015

company give back to the community. It is very important for the protection of our wildlife in these remote areas that we continue to assist the RDC with anti poaching, continue to pay for the sustainable off take of a select quota, because if we do not, the locals will kill every animal, they will not tolerate wildlife disruptions to their families, be it through the destruction of their crops on an annual basis, or the loss of one of their family members.

Our wildlife populations are on the rise, we border the Matusadonna national park, there are no fences to stop animals movements, we are very much needed, even more so now with current rainfall patterns at their lowest, poaching will increase as people find it difficult to grow crops, we will not let the last 10 years of effort to protect our wildlife be a waste, we will not leave these villagers high and dry with no form of income or food.

We thank our hunters for their continued support. It is because of you that our conservation methods are successful.

We spend in excess of $ 40 000 / annum on anti poaching

We have collected over 15 000 wire snares since 2007 saving thousands of animals.

We assist in arrests of subsistence poachers and heavily armed

elephant poachers, we follow up with convictions so that these men and women can be put away and our animals will be safe.

We monitor game movements and patterns and adjust our quotas accordingly so that we continually have an increase for future generations

We have assisted in the construction of clinics, schools and information centers.

We employ over 30 locals in our camps and in the field thus as siting hundreds of locus through indirect benefits.

Last but not else, we pay over $ 200 000 in direct benefits annually to the RDC and the local wards for wildlife off take.

Big game hunting in Zimbabwe……making a difference to communities

Hunting in Zimbabwe

When you think of Africa, what comes to your mind……lush plains,flowing rivers,animal migrations……big cats, safari lodges and kitted game drive vehicles, visions conjured up by numerous wildlife documentaries, dvd's showing exclusive photographic safaris with discerning clientele being pampered by attentive staff…….yes the scenes shown to us make us believe that all is well in Africa. Thats all very well, but realistically, Africa is not all about the above, there are many, many areas that have limited land use options, this is based on rainfall, wildlife numbers, accessibility and terrain. Most of these ' forgotten areas ' are not good enough for the photographic companies, no one wants to invest in the unknown, return on investment would be negative……, so what happens……

Enter the safari operator,professional hunter and dedicated wildlife enthusiast……the client. Countless millions of dollars are poured into these areas annually throughout Africa by true conservationists, people who care about the preservation of our species for future generations. One such area (and there are many) is the Omay, Nyaminyami RDC, operated by Martin Pieters Safaris, www.martinpieterssafaris.com

For many years we have poured hunters dollars into this remote area, educating communities, conducting anti poaching actives, reintroduction and relocation of wildlife , construction of clinics and schools…… 9 years down the road, what do we have…….an area renowned for big game, a community that is happy and a generation that focuses on wildlife conservation and not poaching activities.

In 2014, African conservancies was born and plans for the Ume River Conservancy were laid on the table, further cementing the relationship between dedicated safari operators and the community, allowing them to be directly involved in wildlife based decisions. Plans are currently underway with approval from local government to create a large remote conservancy where sustainable off take of certain species will form the back bone of wildlife conservation. 2 years down the road, we are already seeing the results as populations of several species are increasing whilst poaching activities are decreasing.

There is a lot to be done, but by taking these positive steps, by involving the local residents, by making use of these ‘ remote and forgotten areas ‘, areas that are unsuitable for the typical pampered photo safari enthusiast……we will continue to turn them into areas teeming with wildlife, an area to be proud of……thank you to our hunters.

RIFA SAFARI AREA – PRO SAFARIS AFRICA

Lion - *Panthera Leo*

Louis Muller

25th January 2016

Rifa Safari Area

Rifa forms part of the Hurungwe Safaris area in the north east of Zimbabwe in the upper Zambezi Valley. The escarpment is the southern boundary and therefore is in the Zambezi valley. Rifa is 615 km2 (Dunham & Mackie 2015)

Rifa boundaries Makuti Safari area to its South, Zambia to its West and North. Nyakasanga Safarir area is located between Mana Pools National Park and Rifa and is Rifa's Eastern Boundary.

Adaptive Lion Quota

Rifa has good prey base for Lion with the following population estimates:

2015	Ground Estimates
Buffalo	646
Lion	68
Hippo	300
Kudu	346
Eland	81
Impala	1829
Bushbuck	139
Hyena	285
Warthog	169
Waterbuck	41
Zebra	68
Sable	0

Population estimates are done with daily game sighting reports done by Professional Hunters and Game scouts.

Lion population is estimated at 68 as of August 2015. This is done with camera traps and spoor count done during the season.

Rifa Safari Area quota has been as follows since Pro Safaris has been the Lease holder

Lion Quota

	2008	2009	2010	2011	2012	2013	2014	2015
Approved Quota	2	2	2	2	2	2	2	2
Quota Taken	2	2	2	2	2	2	0	2

The aged based program was introduced 1ST January 2014, where Lions of 5 years or older are to be harvested. In 2014 season the Professional hunters did not feel that they had any Lion males on bait that they could comfortably call 5 years or older. The decision was made by the operator to not take the risk in fear of losing on tag for the following season.

In 2015 both Lions on quota were harvested as PH's became better in ageing and more importantly, Lions matured and numbers increased. The Lions were aged at the annual Lion ageing workshop conducted by ZPWMA and Panthera represented by Dr. P. Lindsey. Both Lions were aged at 5 years old, however Dr. Lindsey indicated that one was on the cusp of 5-6 years. The quota will remain at 2 for 2016.

Human-Lion Conflict

Rifa safari area is surrounded by safari areas and the Zambezi River. Lion – Human conflict is limited to the Border town of Chirundu. The only incident was in 2012 when a woman was killed by a Lioness. The lioness was killed.

Hunting as conservation and Lion contribution

	% of Turnover	
	2014	2015
Turnover	100%	
Elephant contribution	21%	
Lion contribution	12%	
Salaries	19%	
ZPWMA	39%	
Anti-poaching	6%	
Conservation	6%	
Cost Of Sales	6%	
Operating Costs	15%	
Meat	2%	

ZPWMA receive 39% of gross. From this they fund ZPWMA but also their own anti-poaching teams.

6% of gross is spent on anti-poaching funded by the operator to have his own anti-poaching unit, over above the ZPWMA anti-poaching teams. All efforts are co-ordinated by our team. Since there are no communities surrounding Rifa, there is minimal meat poaching. However due to a 48Km Zambezi River border with Zambia, Elephant poaching is rampant. This is due to ease of crossing back across and international border with little persecution. Meat poaching from Zambians is however simply not worth the risk vs the reward. Ivory, however is.

The conservation programs listed at 6% of gross are, water points installation, pipeline maintenance, water pumping, de-silting of water pans and donations in equipment to ZPWMA anti-poaching units.

Wages are at 19% and we employ 14 staff, 10 anti-poaching scouts, 3 Professional hunters, 6 trackers with an average of 5 dependants to each person. Total of 165 dependants. We also have a training program of training 2 staff members each year for a PH license.

Further meat in a Safari area belongs to the operator since there is no community. The meat is used as ration for staff and anti-poaching patrols including ZPWMA Rangers. Each person gets allocated 2kg meat every 6 days. Apart from our staff there will be a minimum of 2 sticks (3 Rangers) in Rifa at

any given time. Totalling to about : 4137kg Meat. Further we donate meat for state functions in order to prevent ZPWMA shooting animals for these functions. This meat comes to about 1000kg p. annum. Lastly all left over meat is donated to the Children's Home (Orphanage) in Karoi. This amounts to about 1000kg p. annum. The total value of meat not sold but rather donated comes to about US$12,250. This would amount to 2% of gross income.

Lion hunts contribute about 12% of total Gross. They are sold on 18 -28 day safaris. Due to not contributing a significant amount of days to the hunting calendar, the loss of Lion hunting will not really have an impact on our Cost of sales. Further operating costs are fixed and so are wages. The loss of Lion hunting would therefore have a 12% loss in gross, however it would leave the operator the choice to lose the existing 9% profit margin, or cut the existing 12% spending on conservation.

Either way, the outcome would have a detrimental effect to the conservation of Rifa Safari area.

USA vs Other markets

Since Pro Safaris has secured the lease in 2008, 12 Lions have been harvested. 9 have been sold to USA hunters vs 3 from other countries. This is 75% of our Lion hunting market. USA hunters is therefore a significant contributor and therefore creates demand far outweighing supply. We estimate we would have to drop our price by a minimum of 30%. This would mean Lion contribution to gross would drop to 8.4%.

This means conservation funding would be cut by 36%.

Rifa Safari area has a small quota on all species. Lion therefore is a major contributor to the conservation of Elephant and the habitat to all species. Even if we have to find other markets, the Loss of the US Hunters will have a major negative impact on the survival of the viability of this area as a wildlife area.

Summary of Steps Taken by Zimbabwe to Improve the Management of Lion Sport-Hunting

i – Banning of all lioness hunting in Zimbabwe

ii – Hunting moratoria around the Gonarezhou and Hwange National Parks

iii – Removal of fixed hunting quotas

iv – Age restrictions on sport-hunted lions

v – Scientifically-based adaptive quota management system

Summary of Lion Sport-Hunting's Contribution to Conservation

i – Lion sport-hunting contributes 33.9% to 42.4% of total revenue on private land

ii – Lion sport-hunting generates up to US$ 557 km^{-2}

iii – Anti-poaching (in particular that of rhinoceroses) costs ∼US$ 216 km^{-2}

Introduction

The United States Fish and Wildlife Service (USFWS) have recently evaluated the conservation status of the lion *Panthera leo* with particular regard to sport-hunting (http://www.fws.gov/endangered/what-we-do/lion.html [accessed 2015-01-19]). The results of this evaluation have led to the formal protection of two subspecies under the Endangered Species Act, classifying *P. l. leo* as endangered and *P. l. melanochaita* as threatened. Together these subspecies apparently represent all of the lions in Africa (Barnett et al. 2014).

Sport-hunting is a legal activity in which the international import/export of trophies is both sanctioned and carefully controlled by the Convention on International Trade in Endangered Species of Wild Fauna and Flora (CITES). The USFWS found that the sport-hunting of *P. l. melanochaita* "*if well managed, may provide a benefit to the subspecies*" (http://www.fws.gov/endangered/what-we-do/lion.html [accessed 2015-01-19]). Here we explore this statement further, and present data from three long-term *in situ* lion research projects; the Bubye Valley Conservation Research Initiative, Savé Val-

ley Conservancy Research, and the Hwange Lion Research Project.

The data presented in this report clearly illustrates the positive conservation benefit that well-managed trophy hunting of lions can have for the species, as well as the importance of hunting in maintaining the wildlife in an area; addressing Point 5 on page 3 of the Federal Fish and Wildlife Permit Application Form (Form 3-200-20) [i.e. "*Please be aware that the U.S. Fish and Wildlife Service must make a finding that your activities will enhance or benefit wild populations of the species involved. If you have any information that could support this finding (e.g., population status or trend data; how the funds from license/trophy fees will be spent; what portion of the hunting fee will support conservation), please submit such information on a separate page with your application*"].

Figure 1: The lions pictured here, known as Winston (*standing*) and Geronimo (*lying*), were both collared in March 2012 when they were the dominant males in the Matombosa area and have been continuously monitored ever since as part of the on-going long-term WildCRU Bubye Valley Conservation Research Initiative. In November 2015 Geronimo, who was approximately 9 years old, died after succumbing to injuries sustained from fighting with another male. Winston, also 9 years old, has since lost his dominant status, lost his territory to two 4.5 year old males, become nomadic and avoids contact with other males. As of this report being written, the recent litter of cubs that both Winston and Geronimo sired are still alive.

Most importantly, since July 2013 there has been a continuous self-imposed internal reform of the lion hunting industry in Zimbabwe that is actively participated in and supported by all of the relevant stakeholders, including; the Zimbabwe Parks and Wildlife Management Authority (ZPWMA), non-governmental organisations, professional hunters, safari operators, scientists and researchers.

Here we discuss the results of this process in terms of robust evidence regarding the sustainability and self-regulation of lion hunting in Zimbabwe.

Figure 2: Winston and Geronimo's cubs.

Lions – *Panthera leo*

The IUCN Red List have recently reclassified lions as Vulnerable (remaining as such since 1996; IUCN 2015), estimating that there are between 20,000 and 30,000 free-ranging lions left (Bauer et al. 2015a) in less than 25% of their historic range (IUCN 2006). However, this generalised classification does not take into account an apparent conservation dichotomy: sample subpopulations of lions in Botswana, Namibia, South Africa and Zimbabwe have in fact increased overall (Bauer et al. 2015a). Lions were historically present throughout Africa, some of Europe, the Middle East and Asia (Bauer and Van Der Merwe 2004), but current conservation strongholds remain only in parts of eastern

and southern Africa (Brassine and Parker 2012; Nowell and Jackson 1996). The current lion population estimate for Zimbabwe's major lion areas is approximately 2,600 individuals [Hwange-Matetsi Complex: 750, South Eastern Lowveld: 350, Gonarezhou National Park: 60, Malilangwe: 37, Savé Valley Conservancy: 284, Bubye Valley Conservancy: 500, Mid-Zambezi Valley Complex: 600], though the actual number would be larger if there were data available for the countries minor lion areas that are yet to be surveyed] (ZPWMA 2015).

The lion is a uniquely social felid, forming coalitions of up to nine males associated with one or more female prides that may consist of more than 20 individuals (Macdonald et al. 2010; Schaller 1972). Lions are infamously infanticidal (Schaller 1972), where males will kill unrelated cubs so as to bring the female into oestrus and present an opportunity to sire their own litter, which is often used as an argument against sport-hunting of the species (e.g. Packer et al. 2010), where it is feared that the removal of dominant males causes cub mortality that eventually results in lowered population recruitment and survival (Packer et al. 2009). Infanticide, however, does not result from sport-hunting when age-appropriate males, past their prime and no longer territorial or with dependent cubs, are harvested (Whitman et al. 2004). Moreover, the fission-fusion nature of lion society (Mosser and Packer 2009; Pusey and Packer 1987) means that infanticide may still occur when the dominant males are simply not present there and then to defend their cubs (B. du Preez, pers. obs.).

In the 1990's, lions were successfully reintroduced into private areas in parts of their former range, where they achieved high reproductive and survival rates (Miller and Funston 2014). However, the resultant population growth inevitably led to the potential problem of overabundance (Funston 2008) and low genetic diversity (Trinkel et al. 2010), with both of these issues requiring active and intensive management (Hunter et al. 2007) and ultimately reducing the conservation value of these lion populations (Miller and Funston 2014). The ability to translocate lions originally facilitated the relief of overpopulation, but as the available areas for relocations were used up, sport-hunting and euthanasia have subsequently become the main methods of lion population control (Miller and Funston 2014).

The lion is the apex predator wherever it occurs (Macdonald et al. 2010), and is an ideal conservation umbrella; being large, charismatic and easily observable (e.g. Williams et al. 2000). Lions are important to commercial wildlife ventures, which risk losing significant market share where they cannot offer them to clients (Lindsey et al. 2007), and are thus prioritised in conservation; exploiting their charisma to attract tourists and raise the funds required in ensuring that wildlife areas remain viable. The lion is also a particularly valuable species in the sport-hunting industry, rivalled only in demand by buffalo *Syncerus caffer* and leopard *Panthera pardus* (Creel and Creel 1997), and are therefore prevalent in private wildlife areas (Packer et al. 2013) where their populations can achieve exponential growth rates given the protection and resources afforded by well-managed operations (Smuts et al. 1978; Loveridge et al. 2007b; Kettles and Slotow 2009; Miller and Funston 2014).

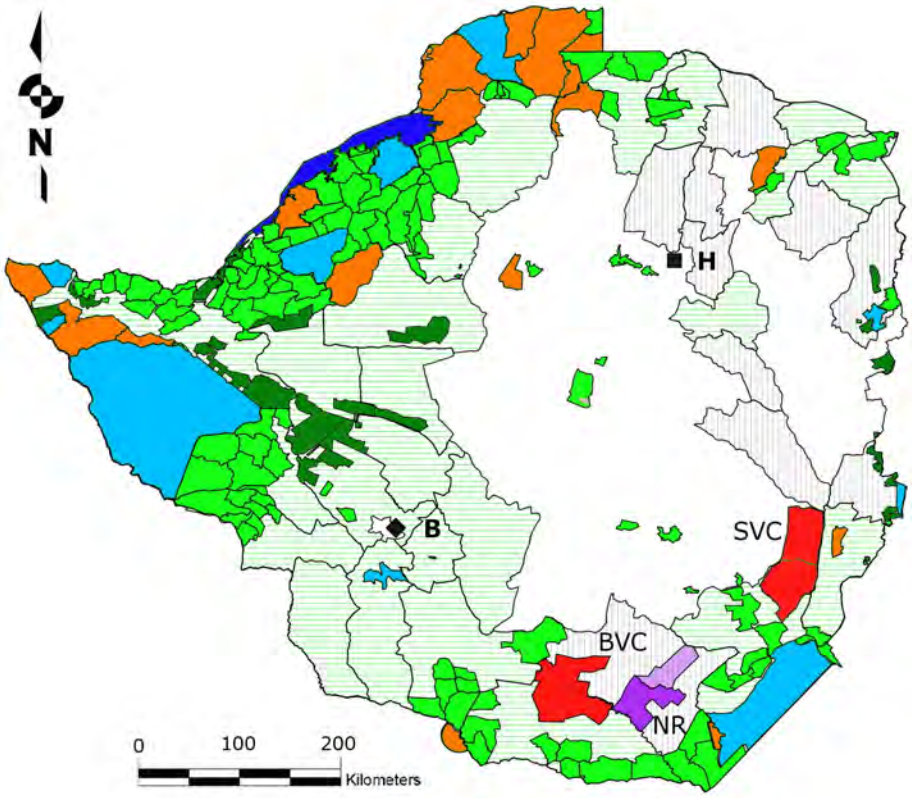

Figure 3: Map of Zimbabwe's main wildlife areas: [*i*] National Parks are represented in light blue; [*ii*] Safari areas are represented in orange; [*iii*] Forestry areas are represented in dark green; [*iv*] Community and Private wildlife areas are represented in light green; [*v*] Communal Land (CAMPFIRE Areas) in which sport-hunting may occur is represented by light green horizontal stripes; [*vi*] Communal Land in which sport-hunting does not occur is represented by grey vertical stripes. [*vii*] The Bubye Valley [BVC] and Savé Valley [SVC] Conservancies are represented in red. [*viii*]The Nuanetsi Ranch [NR] on which sport-hunting takes place is represented in dark purple (light purple represents the Nuanetsi Ranch cattle area); [*ix*] Lake Kariba is represented in dark blue. Harare (the capital city) is represented by a black square and letter '**H**'. Bulawayo is represented by a black diamond and letter '**B**'. Sport-hunting may occur in areas: *ii*, *iii*, *iv*, *v*, *vii* & *viii*

The ability of lions to rapidly increase in abundance is an aspect of their ecology that is often overlooked. Lion populations can achieve exponential growth rates (Miller and Funston 2015; Groom and Watermeyer 2015; du Preez et al. in prep.), and the problems associated with high lion densities fast present themselves and require significant investment in their solution (Hunter et al. 2007; Kettles and Slotow 2009; Loveridge et al. 2007; Packer et al. 2013; Smuts 1978). Whilst unregulated sport-hunting of lions (in particular that of dominant males and pride females) may result in population declines (e.g. Packer et al. 2010; Packer et al. 2009), restricting offtake to only males over

a certain age (i.e. have already bred and/or are no longer dominant) has no impact on lion population persistence, irrespective of quota size (Whitman et al. 2004). Such is the situation currently facing both the Bubye Valley and Savé Valley Conservancies, where the lion populations continue to grow despite sport-hunting and increasing quotas. Whilst sport-hunting may not alleviate over-population in these areas, it does somewhat offset the cost of keeping lions. Culling of lions may be the only realistic option for controlling numbers in larger areas, as the use of contraceptives is likely to be inefficient and expensive. Because of fears about public sentiment associated with sport-hunting, it has now become common practice for managers to cull excess lions in more than 45 wildlife areas in South Africa to which lions have been introduced, and which resulted in the wasteful destruction of about 200 lions in 2012 (Miller and Funston 2014).

Conservation and Sport-Hunting

There is more land area in Africa conserved for hunting than there is in all of Africa's formally protected areas combined: approximately 1.4 million km^2, which exceeds the total area covered by national parks by 22% (Lindsey et al. 2007). For wildlife conservation to be successful outside of national parks, these areas must be self-sufficient and able to generate sufficient revenue to cover the considerable costs of protecting the habitat and wildlife therein (Lindsey et al. 2006). Indeed, conservation would benefit from an incentive to utilise land for wildlife rather than the alternatives of livestock grazing, agriculture, and deforestation.

The international trade of lions, including trophies, is controlled by a strict CITES licensing system on the basis that this trade does not endanger the ultimate survival of the population (https://www.cites.org/eng/disc/how.php [accessed 2015-01-19]). The positive aspects of sport-hunting as a conservation tool include a focus on males and a low percentage off-take; neither of which generally jeopardise populations, and also suggest that hunting could play a role in population recovery (Leader-Williams et al. 2005).

The recommendation of setting uniform harvest limits, e.g. 1 lion 2,000 km^{-2} (Lindsey et al. 2012; Packer et al. 2010), may be overly simplistic, affect the economics of wildlife based landscape use, and disincentivise investment in conservation (Lindsey et al. 2007). A more practical approach to sustainably setting realistic lion sport-hunting quotas could involve using a positive/negative feedback method that calculates a fluid quota per area based on the previous season's performance. Such an adaptive quota management system has already been implemented in Zimbabwe.

Zimbabwe's Adaptive Lion Quota Management System

An adaptive quota management system for lion hunting based on the ages of lions hunted was agreed on in July 2013 in Harare, Zimbabwe, during a meeting hosted by the Zimbabwe Parks and Wildlife Management Authority (ZPWMA) and an independent non-governmental conservation organisation. The points system is summarised in Table 1.

Table 1: *Points allocated to hunting blocks arising from the harvest of lions of different ages*

	≥ 6 years	No trophy	5 years old	4 years old	< 4 years	Failure to submit return, or incomplete return
For quotas of ≥3	4	3	3	2	-3	0
For quotas of 2	4	3	3	2	0	0
For quotas of 1	6	3	3	2	0	0
Resultant quota	*These points are added up and divided by 3 to yield the quota for next year*					

During 2013, operators were requested to submit hunt returns and photos as a trial run to get the system up and running. In 2014 operators were requested to do the same but were informed that the age of the lions hunted in 2014 would determine their lion quotas in 2015. The 2015 lion hunt results would thus also determine the 2016 quota.

Results of the Adaptive Lion Quota Management System

In 2015 there was a marked increase in the age of lions hunted in Zimbabwe as a whole. Notably, only one lion of <4 years of age was hunted and the large majority of lions were 5 years or older (Figure 4). In 2013, only 28% of the lions hunted were 5 years or older, in 2014 that figure had risen to 49% and in 2015 to 77.3% (Figure 5). The proportion of lions hunted that were less that 5 years of age dropped overall between 2013 and 2015 (Figure 6). For this achievement, credit is due to the hunting community for showing greater selectivity of harvest. A word of caution however, is that the majority of lions hunted were on the cusp of 5 - 6 years of age and were not older than six years. Restricting hunting to individuals that are at least six (and preferably older) is desirable from a biological perspective due to the reduced risk of the loss of pride males and infanticide of cubs associated with the harvest of such individuals (Whitman et al. 2004).

In 2015 the Zimbabwe national lion hunting quota was set at 85 lions. Of this 85, only 39 were hunted in 2015, and based on the resultant score from aging the trophies, and the fact that operators chose not to hunt lions of inadequate age (see Figures 4, 5 & 6), the recommended quota for 2016 was set at 75 [Harare 2015-11-11]. (The Rural District Council areas in which lions occur are currently exempted from the age restrictions, as was agreed upon at the 2013 lion management meeting in Harare, as a means of ensuring that impoverished communities obtain the opportunity to benefit from the presence of lions, recognising the potential negative impacts the species has on the livelihoods of livestock farmers).

Using these figures and estimating the average value of a lion safari at approximately US$ 80,000 then a 50% offtake (35 lions) would generate US$ 2,800,000 annually. If management costs are approximately \$150 km^{-2} (V. Booth, pers. comm.), then the lion safaris alone can support 18,600 km^{-2} of wildlife habitat in Zimbabwe.

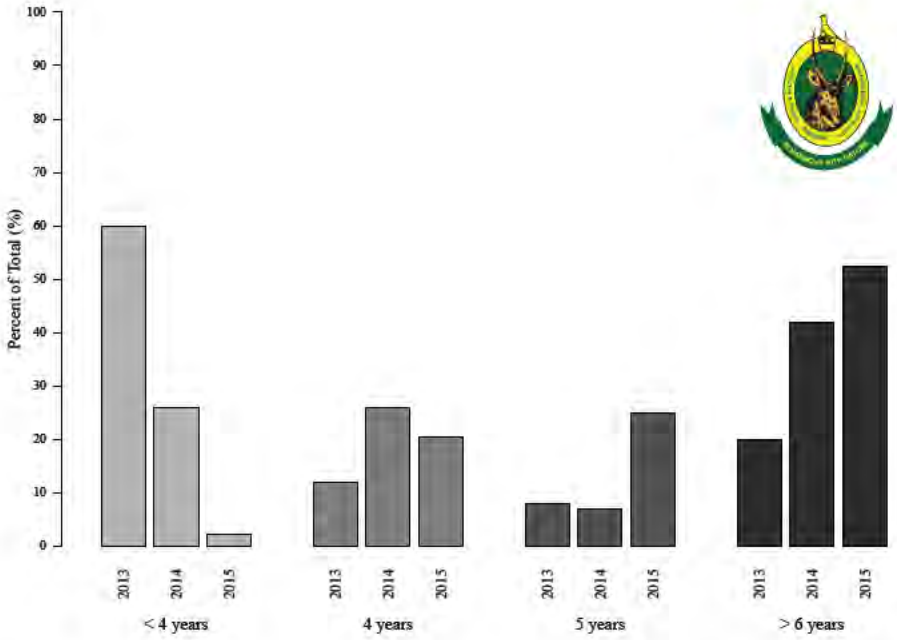

Figure 4: The percentage of lions hunted in each age class in 2013, 2014 and 2015 in Zimbabwe.

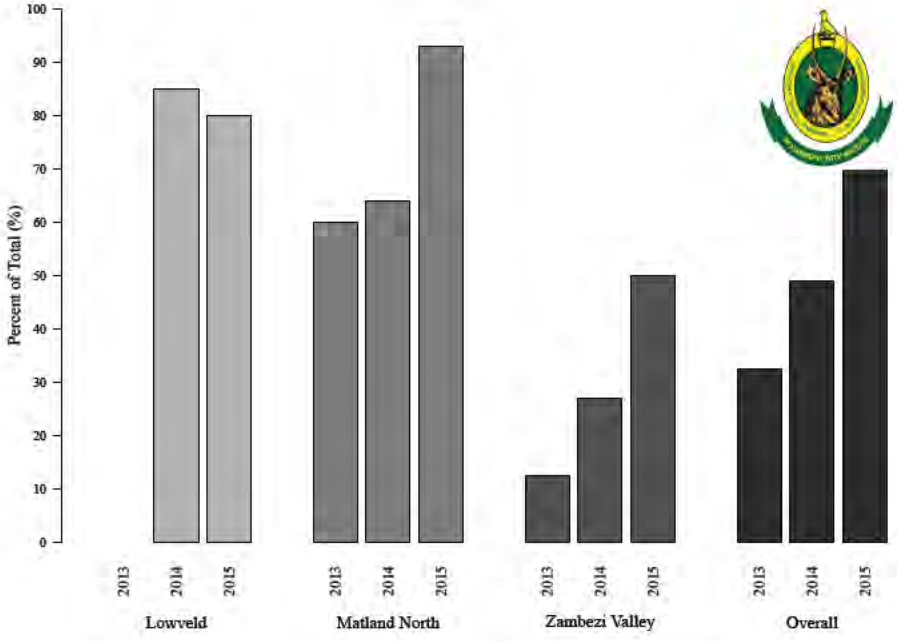

Figure 5: The proportion of lions hunted that were 5 years or older in the three main lion-hunting areas of Zimbabwe.

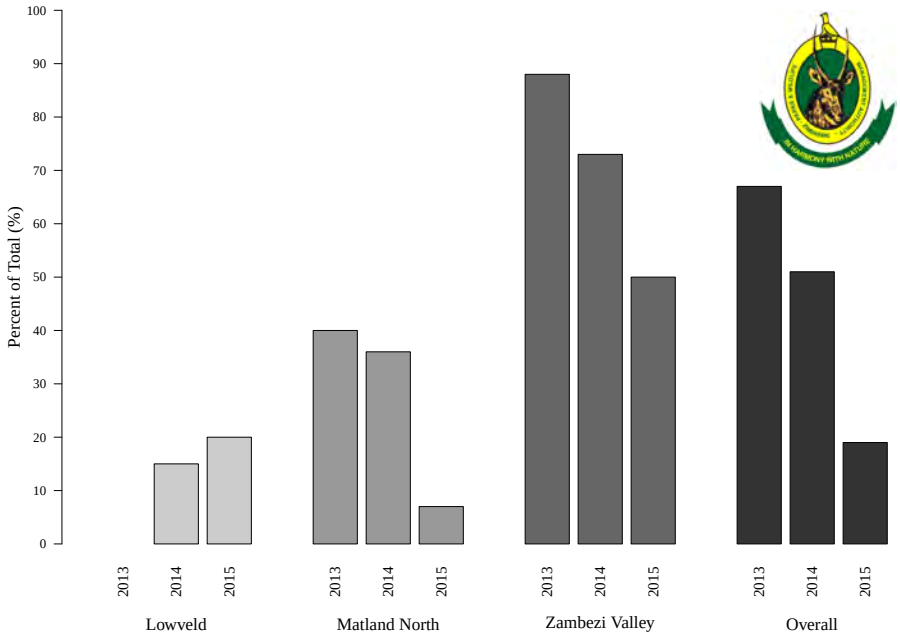

Figure 6: The proportion of lions hunted that were less than 5 years of age in the three main lion-hunting areas of Zimbabwe.

Table 2: *Human and Lion Conflict (2009 - 2011) in Zimbabwe, including human mortality caused by lion (CAMPFIRE Association, 2012)*

District	Total incidents	Livestock killed	*People Injured*	*People Killed*
Hurungwe	5	1	*2*	*2*
Chiredzi	25	136	*0*	*0*
Mbire	5	7	*0*	*5*
Binga	9	39	*0*	*0*
Total	**44**	**183**	***2***	***7***

Human-Lion Conflict

The lion is a flagship species and powerful symbol of Africa; yet living with lions poses hardships for many communities (e.g. Table 2). In some areas, the lion is a major predator on domestic livestock, inevitably leading to conflicts with local herders. Both sides suffer in this situation.

Outside of protected areas, the lion's prey base is much reduced, which results in relatively greater chance of encountering livestock. Co-existence of lions with people may be enhanced by giving value to lions through tourism and hunting promoted in communal lands under the Communal Area Management Programme for Indigenous Resources (CAMPFIRE). This hunting contributes to the conservation of lions via the financial revenue generated, which is ploughed back into conservation of the resource and empowers local communities to invest in their own rural development programs.

The Bubye Valley Conservancy

History of the Bubye Valley Conservancy

Towards the end of the nineteenth century, the Liebig's Extract of Meat Company (LEMCO) founded an extensive cattle ranch in the Zimbabwean lowveld, to the detriment of the indigenous wildlife that was initially eliminated because of competition for grazing with the livestock, as well as a risk of disease transmission from buffalo and wildebeest *Connochaetes taurinus*. As their natural prey base became depleted, the predators were subsequently persecuted when they began to prey on the livestock. Some wildlife persisted in small pockets of remote habitat, however lion, elephant *Loxodonta africana*, buffalo and rhinoceros *Diceros bicornis* [black] & *Ceratotherium simum* [white] were all completely eradicated. A monoculture of cattle dominated the landscape and impacted on the environment for the better part of a century.

Then, in 1992, Zimbabwe suffered one of the worst droughts on record, a relatively short time after the devastating one of 1983 that LEMCO was still trying to recover from. The frequency and severity of the droughts effectively reduced confidence in the economic viability of cattle ranching in the area, and the Bubye Valley Conservancy was subsequently founded in 1994 with the realisation that endemic wildlife, which are better adapted than livestock to cope with the local climate, could be successfully commercialised (Child 1988; Bond 1993).

The conversion from cattle ranching back to a wildlife area was neither straightforward nor cheap, requiring a significant initial investment and annual running costs. In just 20 years of operation the Bubye Valley Conservancy now protects the world's third largest black rhinoceros population, one of Zimbabwe's largest lion populations, a large and increasing elephant population, and abundant game.

Sport-hunting is an essential step in converting areas that were previously dedicated to livestock farming into non-consumptive tourism areas (Child 1993), and was fundamental to the formation of Bubye Valley Conservancy and allowing the wildlife populations to recover. The Samanyanga area of the Bubye Valley Conservancy, probably the most scenic section, was originally set aside for non-consumptive photographic tourism, but made an annual loss for several years, before, largely due to Zimbabwe's land reform program and resultant instability in the country, it was reverted back to sport-hunting as the only practical and economically viable option (K. Leathem, pers. comm.). Sustainable sport-hunting provides the sole economic incentive to continue operating the Bubye Valley Conservancy as a wildlife conservation area.

Bubye Valley Conservancy Community Support

The Bubye Valley Conservancy donates over 45 tonnes of meat from sport-hunting to the local communities each year. This meat donation is worth over US$ 100,000 per year, and the communities are free to decide how they use it. In addition to this, the Conservancy also supports several schools, clinics, and community projects in the three surrounding districts of Mwenezi, Maranda and Jopempe. The local community thus

sees a direct benefit from the wildlife on the Bubye Valley Conservancy, but is also empowered by job opportunities created both with these special projects, as well as on the Conservancy. A summary of the Bubye Valley Conservancy community support effort between 2011 and 2015 is provided in Table 4.

Bubye Valley Conservancy Lion Monitoring and Management

After originally being eradicated by cattle ranchers in the area, 13 lions were reintroduced to the Bubye Valley Conservancy in 1999, and four young males broke into the Conservancy that same year. From the original 17 animals present in 1999, the Bubye Valley Conservancy lion population was estimated at approximately 280 individuals in 2009 when robust population surveys were initiated by a research team from the University of Oxford Wildlife Conservation Research Unit (WildCRU), and this population has continued to grow. Today it is estimated that there are over 500 lions on the Bubye Valley Conservancy (du Preez et al. 2015). The exponentially increasing Bubye Valley Conservancy lion population currently exists at one of the highest densities in Africa (∼0.187 lions km^{-2}: du Preez et al. 2015; Figure 7), greater than that of the Serengeti, Tanzania (0.100 lions km^{-2}: Pusey and Packer 1987; Spong 2002), Selous, Tanzania (0.080 - 0.130 lions km^{-2}: Creel and Creel 1996, 1997), Kruger National Park, South Africa (0.096 - 0.112 lions km^{-2}: Mills 1995), and Hwange National Park, Zimbabwe (0.027 lions km^{-2}: Loveridge et al. 2007). This equates to one of the largest contiguous lion populations in Zimbabwe.

Bubye Valley Conservancy Lion Hunting

The Bubye Valley Conservancy offsets the cost of lion predation on its wildlife via sport-hunting of the species, and which began in 2002. In 2014, the lion hunting quota allocated to the Bubye Valley Conservancy by ZPWMA was 10 individuals. Based on the fact that the entire quota was harvested and that maximum points were scored for each individual trophy (more than six years in age), the allocated quota was raised to 13 lions for 2015. Only 12 out of 13 lions were hunted in 2015 due to a late cancellation; nevertheless eight lions over six years old and four lions of five years old were harvested and the resultant points justifying a quota of 15 lions for 2016.

Table 3: *The Bubye Valley Conservancy annual lion hunting quota and offtake from 2002 to 2015.*

	2002	2003	2004	2005	2006	2007	2008	2009	2010	2011	2012	2013	2014	2015
Approved quota	1	2	3	2	2	2	3	3	5	8	12	10	10	13
Quota taken	1	2	3	2	2	2	2	3	5	8	12	10	10	12
Percentage success	100	100	100	100	100	100	67	100	100	100	100	100	100	92

Note that while the lion hunting quota for Zimbabwe has been voluntarily reduced by the national steering committee, the Bubye Valley Conservancy lion hunting quota has been successively raised twice based on both hunt success and age of lions hunted and the resultant points scored under the national adaptive quota management system (Table 3).

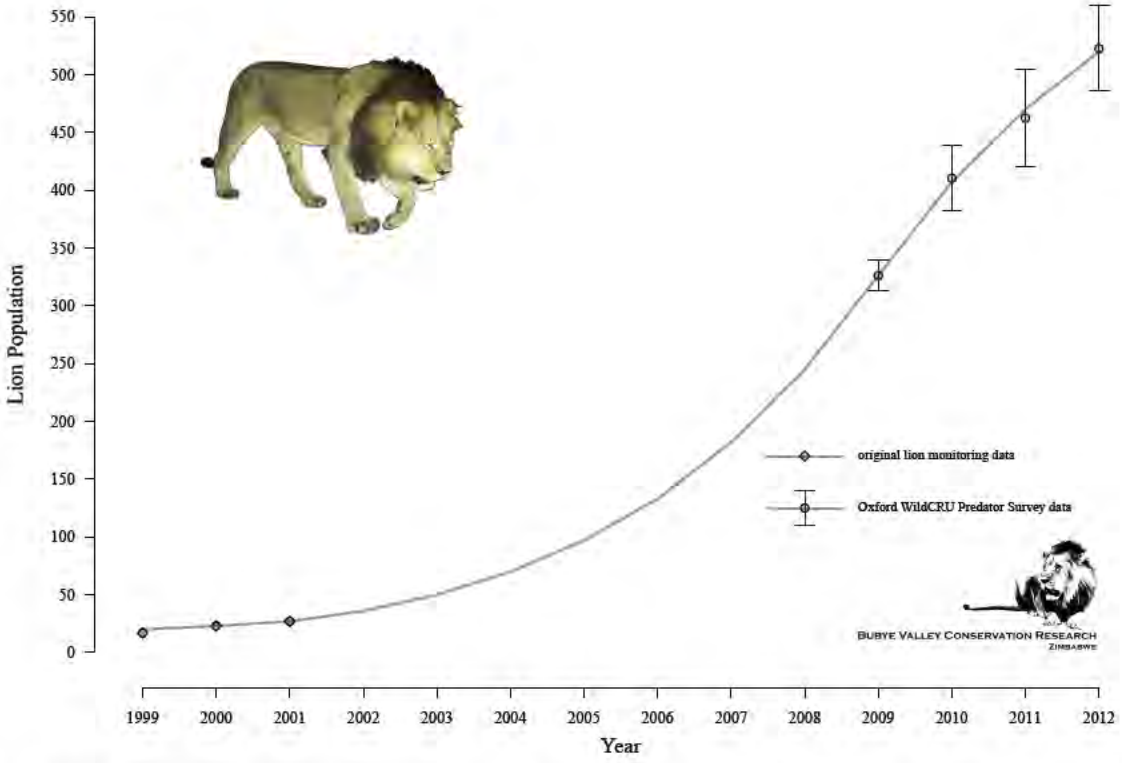

Figure 7: The Bubye Valley Conservancy lion population has grown exponentially since the reintroduction of lions in 1999. Diamonds represent the known lion abundance from monitoring of the original individuals introduced; Points indicate lion abundance calculated from spoor transect analyses; error bars represent the standard error of the mean.

Table 4: *Summary of the Bubye Valley Conservancy support to the surrounding local communities (2011 - 2015)*

Boreholes:	- 1 x Jompembi Village 2 - 1 x Penemene - 1 x Jompembi Village 4 - 1 x Nyimani village (Mwenezi) - 1 x Driehoek School - 1 x Mgaladhivha School - 2 x Mtetengwe to supply water to the clinic site - 2 new bush pumps (complete) purchased and installed at Village 2 & Village 3 and troughs built at both sites *Drinking trough for cattle built at Village 2 borehole* *All boreholes equiped with new bushpumps, piping and cylinders* *Boreholes at Village 3, Mtetengwe, Mdzwiti, Vumani and Penemene and Makado Police post repaired and maintained* *All new piping and pumps etc. are supplied by BVC*
Buildings:	- Mtetengwe Clinic's main building built - 3 x F13 staff houses built *Clinic and House fenced - everything funded and built by BVC* *The clinic is a standard large Government clinic - male & female wards + maternity ward and outpatients* *Storerooms, offices etc. also built* *All houses and buildings are electrified, painted and supplied with running water* - Mtetengwe School school office block and staff room built and painted *All classroom windows repaired and the schools second borehole repaired.* - Secure engine house was built at the second borehole site - Borehole equipped with BH15S mono pump unit driven by a rebuilt Lister LT 1 engine - 5000 litre header tank and stand errected - new 5000 litre header tank purchased and fitted - pipeline laid to connect the borehole to the clinic - another pipeline connected to the same borehole to supply the Mtetengwe school with fresh water - New coldroom and refrigeration unit purchased and fitted at the Lutumba butchery *Part of aid program to get the Beit Bridge RDC self funding projects up and running* - New coldroom and refrigeration unit was purchased and fitted at the Rutenga butchery *Part of aid program to get the Mwenezi RDC self funding projects up and running*
Meat Donations:	- BVC donates meat on a regularly basis to the Mwenezi Orphange - Numerous donations of meat were made to support school sports days & speech nights/prize giving events *Both Beit Bridge & Mwenezi districts* - 1600 kgs of meat has been donated each month since July 2011 to a Maranda trust *Administered by Chiefs andlocal headmen* *Excess meat sold and funds used for community projects* *Classroom roof replaced at Vhongwe school* *4 new classroom blocks constructed at other schools using funds from these monthly allocations* - 1000 kgs of meat per month is been donated to Beit Bridge communities since April 2014 - 1000 kgs of meat per month is been donated to Mwenezi communities since August 2013
Miscellaneous:	- Sports uniforms for the Penemene school team purchased ($2600) *Sports uniforms required for inter-schools sports* - Transport the soccor teams representing Mgaladivha, Jompembi and Tongwe *To Lutumba for the inter-school competitions* - 2 sets of soccer goal posts & 2 sets of Netball poles were made for Mgaladivha School *New soccer field graded by BVC* - 2m security fencing supplied to Penemene School - Second hand door and window frames donated to Mapiri school (ex Mazunga School) - 1 new 3 1/2 " rod pump cylinder was purchased and fitted to the Vumhani borehole *All repairs to b/holes in the Vumhani area are done by BVC* - 26 bags of cement were donated to Mgaladivha School - Fencing donated to the Mgaladivha School - Supplied 10 x 5/8" mono shafts for the Botalele Clinic (Maranda) borehole - Water supply to Mlelezi Clinic - 400 m pipeline laid to supply the Nyimani Villarge's cattle with water *3.5 m drinking trough build for this same project* - 60 bags cement donated to the Welkom for repairs to a dam wall - 6 loads of riversand and 20 cement donated to Vumani Preschool - Various school renovations in both the Beit Bridge and Maranda areas
Current Projects:	- Construction of a School admin block at Mgaladhivha School - Supply of 24 loads of riversand to Mdzwiti School (value $1200) - All roofing materials supplied to Mdzwiti School - Supply roofing materials, cement, all window and door frames for Vumani Preschool

The Savé Valley Conservancy

History of the Savé Valley Conservancy

The Savé Valley was a wildlife-rich wilderness until the early 1900's, when the first cattle ranching initiatives started in the area. The establishment of Devuli Ranch and Angus Ranch in 1920 paved the way for seven decades of commercial cattle ranching in the area we know today as the Savé Valley Conservancy. Roads were cut, fences erected and an everlasting 'battle' ensued against the wildlife, especially against all predators.

The large predators, especially lions, were virtually eradicated (Pole 1999). However, by the late 1980's, declining range productivity, depressions and droughts forced the landowners to consider alternative options. Around that time, empirical evidence of the competitive advantage of wildlife over livestock began to emerge (Child 1988; Bond 1993), especially in arid areas (Jansen et al 1992; Cumming 1993), and wildlife was finally given serious consideration as a viable land use option.

In 1989, a proposal was drawn up (du Toit 1989) to turn what was then the Sabi Valley Intensive Conservation Area into a wildlife conservancy. The plan was to create a single large wildlife area, especially for the re-establishment of endangered species and overexploited species, with cattle remaining the primary income generator. The Savé Valley Conservancy was constitutionally inaugurated in June 1991, and following the severe 1991/1992 drought, wildlife ranching became the primary land-use. At the time this was the largest private wildlife conservancy in the world (3,410 km^2).

The conservancy members then restocked the wildlife, removed all internal fencing, erected a common perimeter fence and developed effective security systems. A double, electrified, veterinary-approved fence was completed in 1995, and the following decade saw a massive investment in wildlife re-stocking and security systems.

Sport-hunting was essential for the successful transition of the conservancy from cattle to wildlife. During the early years, wildlife densities were low, resulting in poor potential for ecotourism, and hunting generated the income needed to erect the fence, re-stock game, and improve security, especially because of the significant numbers of black rhinoceros now found there. Gradually, some of the ranchers shifted more into ecotourism. One property, Senuko Ranch, completed a 16 bed up-market lodge with a view of marketing non-consumptive safaris, offering game drives and bush walks and specializing in rhino walks and African wild dog *Lycaon pictus* den visits. Lodge occupancy rose from 0% in 1996 to 62% by the end of 1999.

However, the Zimbabwean land reform program, which was initiated in February 2000, soon made a strong negative impression in the international community, and resulted in travel bans and warning from most of Zimbabwe's source markets. This, together with the political instability meant that the wildlife industry and ecotourism industry collapsed over-night: sport-hunting became the only economically viable land use option, and has remained the only tangible source of income to the landowners of the Savé Valley Conservancy. In the case of the Senuko Lodge, for example, the land reform program resulted in a 98% cancellation of

the confirmed bookings. After four years of seeking alternative markets, the lodge could achieve no higher than 17% occupancy, and in 2005 moved back into a hunting-based operation.

A more direct impact of the land reform program for the Savé Valley Conservancy was the loss of 33% of the area of the conservancy to invading subsistence farmers (Lindsey et al 2008). The loss of land was catastrophic and the related pressure from wire snare poaching was extreme. In the following eight years (2001 to 2009), 10,520 illegal hunting incidences were recorded, 84,396 wire snares were removed and at least 6,454 wild animals killed (Lindsey et al. 2011).

Savé Valley Conservancy Community Support and Anti-Poaching

In 2012, conservancy members provided over US$ 100,000 worth of support to adjacent villages or farmers in the resettled areas. Assistance included drilling boreholes, maintaining boreholes, dredging of dams, assisting with building projects in clinics and schools, assisting with repairs, maintenance and materials at schools, education initiatives, school field trips, provision of computer equipment in schools, craft programs and regular donations of meat.

Moreover, the conservancy recently entered into a mutually dependent agreement with the Chiefs representing the communities surrounding the Savé Valley Conservancy. The agreement links the communities to the Natural Resource Utilisation that occurs through the business operation of the conservancy and opens up opportunities for the local indigenous populations to share in any wealth creation. This agreement strengthens relations between the conservancy and the surrounding local communities and creates an environment that helps to protect, conserve and sustain the natural assets of the area. The hunting tourism of the conservancy is currently the only form of income by which the surrounding communities can benefit. Revenues from trophy lion hunting constitute a significant portion of inflow and thus an important part of the community benefits. Any reduction would seriously jeopardise the growth of this infant positive relationship and community empowerment initiative.

The Savé Valley Conservancy is thus pioneering private-community partnerships in Zimbabwe, and trade restrictions on lion trophies will indirectly adversely affect these already seriously impoverished communities through a reduction in available income to share with communities. This is very likely to have a knock on impact on the lions themselves with a significantly reduced tolerance and an increase in retaliatory poisoning of lions for livestock predation. Without a demonstration of income from lions, the political pressure from the surrounding communities to remove them from the conservancy altogether will be a challenge to resist.

Savé Valley Conservancy Lion Monitoring and Management

After the Conservancy was formed, and persecution stopped, lions, mainly males, recolonized the area and their numbers started to increase in the late 1990's / early 2000's. Few lionesses were observed until 2003, when small family groups and male-female pairs were seen, and by 2004 - 2005 there were some reports of cubs. During this period 13

lions were also reintroduced into the Savé Valley Conservancy. After an initial lag phase the lion population on the Savé Valley Conservancy has increased dramatically and at present is growing exponentially (Figure 8; Groom and Watermeyer 2015).

Monitoring of the lion population began in 1999 (Pole 1999) with track index or call-up surveys being conducted sporadically until 2006. From 2007 to present, annual conservancy-wide track index surveys have been conducted using a standardized methodology (Groom and Watermeyer 2015). The resulting population estimates were verified in 2011 by a baited lion call-up survey and a collation of managers' estimates, all of which provided similar results.

Prey availability models (Hayward et al. 2007) suggest that the carrying capacity for the lion population in the Savé Valley Conservancy is approximately 271 lions. The population estimate for 2015 was 284 lions, suggesting lions have reached their ecological carrying capacity, even whilst being responsibly hunted.

A professional lion management plan was commissioned by the conservancy in 2011 (Funston 2011), to provide the Savé Valley Conservancy members with a science-based plan to help them ethically and sustainably manage their lion population. This plan specifically advocates the use of hunting as a conservation management tool. It also demonstrates willingness by the conservancy to guide their lion management based on science and advice from professionals.

Savé Valley Conservancy Lion Hunting

Lions have been hunted in the Savé Valley Conservancy since 2002, although that was largely for removal of problem animals. Hunting began properly in 2005 with quotas increasing annually to a maximum of seven per year from 2009 onwards (Table 5), with the quota being raised to ten for 2016 based on trophy ages.

Despite offtakes of lions through sport-hunting, the lion population has continued to increase in the Conservancy. The revenue generated from hunting lions has enabled landowners to invest in proper land management, anti-poaching, water provision and fence maintenance, all of which benefit the lion population (especially as lions seem to be vulnerable to being caught in wire snares; Becker et al 2013; R. Groom, pers. obs.).

Table 5: *The Savé Valley Conservancy annual lion hunting quota and offtake from 2002 to 2015.*

	2002	2003	2004	2005	2006	2007	2008	2009	2010	2011	2012	2013	2014	2015
Approved quota	5	5	1	3	3	4	6	7	7	7	4	2	3	5
Quota taken	1	0	1	3	3	3	3	6	5	3	4	1	3	5
Percentage success	20	0	100	100	100	75	50	86	71	43	100	50	100	100

Sport-hunting of lions brings considerable revenue to the Conservancy, revenue that is vital for the continued functioning of the area for wildlife conservation. Without the costs of lions being offset by the income from sport-hunting, landowners cannot reasonably be expected to tolerate such high lion densities, and their numbers would have to be reduced significantly.

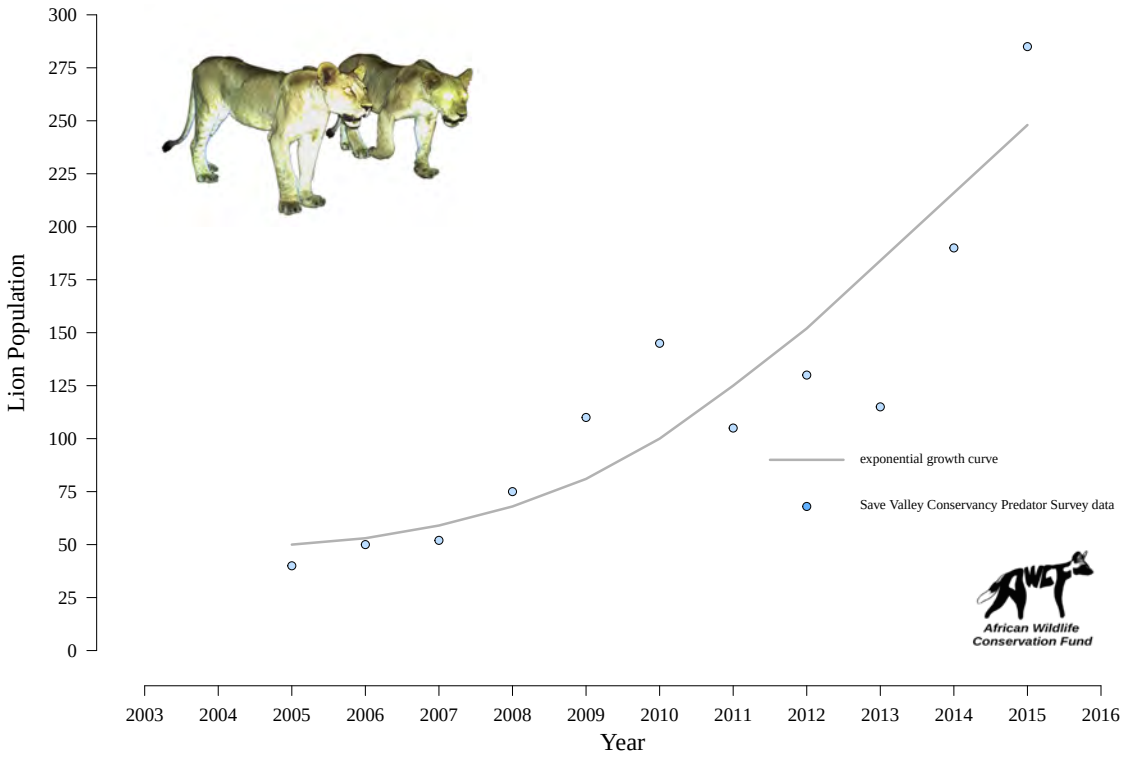

Figure 8: The Savé Valley Conservancy lion population, like that of the Bubye Valley Conservancy, has grown exponentially. Points indicate estimated lion abundance calculated from field surveys; the line represents the exponential growth curve.

The Pros and Cons of Conserving Lions

The saturation of lions in wildlife areas on both state and private land is positive for their future conservation security; but it is also critical to that of incidentally conserved endangered species, such as both species of rhinoceros on private wildlife conservancies in Zimbabwe (Lindsey et al. 2009; Suzuki 2001), which benefit from the same resources and protection that are incentivised and provided by the revenue generated from sport-hunting. The Bubye Valley Conservancy now boasts the world's third largest black rhinoceros population (N. Anderson [Lowveld Rhino Trust], pers. comm.), which is classified as Key 1 by the African Rhino Specialist Group and means that this population is considered key to the overall survival of the species. The Savé Valley Conservancy has the second largest black rhinoceros population in Zimbabwe after Bubye. These are not coincidences. These rhinoceros (and other endangered species, such as wild dog) strongholds are the result of the incidental conservation benefits derived entirely from sport-hunting activities - there are no photographic tourists visiting either the Bubye Valley or Savé Valley Conservancies, and the rhinoceros are not hunted. Having rhinoceros on the land therefore generates no revenue - and in fact there is a significant cost associated with protecting these animals; US$ 590,000 (not including incentive and reward bonuses donated for these purposes) was spent on anti-poaching by the Bubye Valley Conservancy during 2015 (K. Leathem, pers. comm.), and US$ 546,000 is spent annually on anti-poaching by the Savé Valley Conservancy (Lindsey et al. 2012). This expense is covered mainly by the revenue generated by sport-hunting with additional donations from the clients; and most importantly, the habitat for the rhinoceros is preserved by maintaining the land as a conservation area, as opposed to converting it into agricultural or grazing land for example.

However, the high densities of lion populations achieved within commercial wildlife areas have the potential for intense intraguild persecution. Lions are aggressively competitive, and research on the relationship between lions and leopards has shown that high densities of lions can negatively affect leopard population density, demographic structure, cub survival, and spatial ecology down to even the step-wise decisions that leopards make regarding habitat use and behaviour based on both the actual and potential risk of encountering lions (du Preez 2014; du Preez 2015). Leopards are a generalist species that are able to cope with persecution by adapting their behaviour and ecological niche, and even they suffer under a burgeoning lion population; ecological specialists and endangered species, such as cheetah *Acinonyx jubatus* and wild dog, do not fare nearly as well under such intense competitive pressure. In fact, competition with lions has been directly linked to reductions in cheetah (e.g. Durant 1998, 2000; Laurenson 1995) and wild dog (e.g. Creel 2001; Creel and Creel 1996; Vucetich and Creel 1999) densities, both of which face local extinction where lion abundance, and the respective level of persecution, is high. Excessive lion densities may also result in population declines of ungulate prey (e.g. Wegge et al. 2009). It is vital to holistic conservation that wildlife managers can understand and deal with the level of impact that lions exert on other species; particularly those that

are elusive difficult to observe, and which face decline if not carefully monitored. To this end, a conservation research initiative in partnership with WildCRU was established on the Bubye Valley Conservancy in 2009, and research conducted on the Savé Valley Conservancy since 2007.

Based on the number of kills made (du Preez et al. in prep.) and the current value of the meat (K. Leathem, pers. comm.), the Bubye Valley Conservancy lion population consumes hundreds of thousands of dollars worth of prey each year. These lions are mainly tolerated because of their ability to generate the revenue that helps to offset this expense - although it is estimated that economically it is still not worth keeping the lions whose cost outweighs their value (Funston et al. 2013).

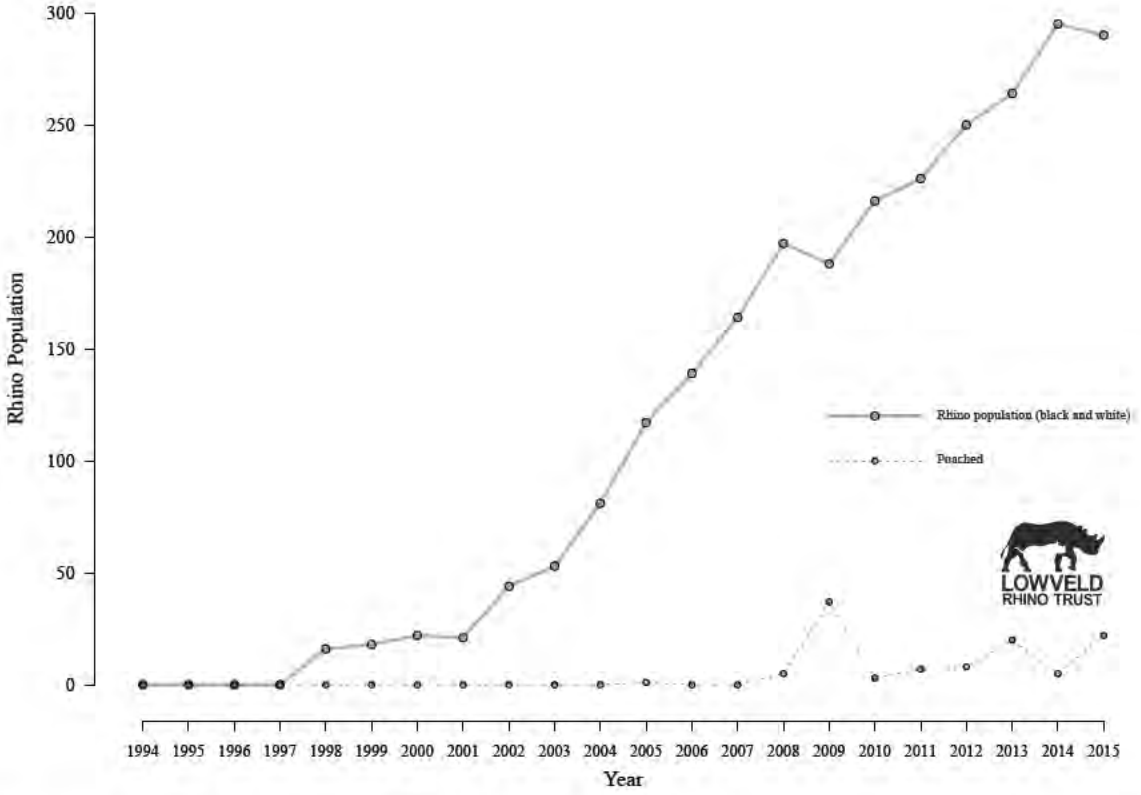

Figure 9: The Bubye Valley Conservancy black rhino population is rated as Key 1 by the African Rhino Specialist Group which means that the population is considered key to the overall survival of the species.

Where the Money Goes: The Finances of Lion Sport-Hunting and Reinvestment in their Conservation

Break-down of the finances involved in a typical lion hunt on the Bubye Valley Conservancy:

Lion Trophy fee: US$ 42,000
Lion Hunt Daily rate: US$ 2,950 day^{-1}
(Minimum lion hunt duration: 18 days [*total daily rate of US$ 53,100 lion hunt^{-1}*])

Additional costs include:
ZPWMA scout
Observers
Bait used
Other trophy species taken during the lion hunt, etc.
[*These additional costs average approximately US$ 6,500 lion hunt^{-1}*]

Bubye Valley Conservancy - Lion Sport-Hunting Revenue Generated (2015):

((18 days × 2,950 day^{-1}) + 42,000 trophy fee + 6,500 additional costs) × 12 lions
= **US$ 1,219,200**

Lion sport-hunting therefore represents approximately 33.9% of the Bubye Valley Conservancy's total annual revenue generation (which includes post-hunt meat and hide sales).

All of the revenue generated from lion sport-hunting on the Bubye Valley Conservancy has gone back into the running costs of the Conservancy, which is all part of conservation, and which includes: anti-poaching and fence monitoring and maintenance (approximately US$ 506,000 year^{-1}), research (approximately US$ 34,700 year^{-1} not including client and sponsor donations), and community support assistance (approximately US$ 210,000 year^{-1}).

[*No profit after costs has been declared, nor dividends taken by shareholders, since the Bubye Valley Conservancy was formed in 1994. All revenue generated to date has been spent on running costs, improvements and restocking.*]

Discussion

Here we have shown that since their reintroduction after historical eradication, both the Bubye Valley and Savé Valley Conservancies' lion populations have increased exponentially - not despite sport-hunting, but because of sport-hunting and the incentive it provides for protection.

The success of the Bubye Valley and Savé Valley Conservancies, in terms of both of their hunted lion and non-hunted rhinoceros populations, may also provide the motivation for other areas in the country to sustainably manage their wildlife resource. A case in point is the Nuanetsi Ranch, a wildlife area that is also a legacy of failed cattle ranching, located almost directly between the Bubye Valley and Savé Valley Conservancies in Zimbabwe (Figure 3). At present there is a single lion on the Nuanetsi Ranch but management is not able to justify introducing more due to the current uncertainty over the future of lion hunting (B. Lees-May [Nuanetsi Ranch Conservator], pers. comm.). The Nuanetsi Ranch is a wildlife area of 1,489 km^2, and could conceivably sustainably hold between 201 and 278 lions (based on the most recently estimated lion densities of the Savé Valley [0.135 lions km^{-2}; Groom and Watermeyer 2015]; and Bubye Valley [0.187 lions km^{-2}; du Preez et al. 2015] Conservancies respectively). However, the Nuanetsi Ranch has invested in building up an abundant wildlife population, which is sport-hunted, and the management will not risk losing a significant amount of valuable game, that could otherwise be sold as trophies or meat, to a species from which it can not recuperate lost revenue, and instead that requires further investment in control measures (B. Lees-May [Nuanetsi Ranch Conservator], pers. comm.).

Between 2005 and 2015 the United States market has represented 70.4% of the total Zimbabwean lion sport-hunting industry (http://trade.cites.org/en/cites_trade/ [accessed 2015-01-19]), though in reality it constituted over 90% for both the Bubye Valley and Savé Valley Conservancies. If this market was effectively lost due an inability of prospective clients to import their trophies, based on the economics involved it would become unviable to continue managing the Bubye Valley Conservancy as a wildlife area in its current form, and lions would either have to be re-exterminated, or at least severely reduced via culling; or else what is the largest privately owned wildlife area in the world would be converted back into a cattle ranching area (K. Leathem, pers. comm.). This is the reality of any business, in that it needs to cover costs and pay staff and cannot run at a loss for luxury of conservation. Child (1993) states "*A refusal to treat wildlife in the same way as other resources and maintenance of centralised protectionist management prejudices its survival. Only by raising its commercial value will wildlife be able to compete for space on the scarce African landscape. Trade bans which detract from wildlife's commercial value prejudice its chances of survival in the long term*".

Although the USFWS understandably categorises lion conservation by country for simplicity, rather than individual properties, the Bubye Valley and Savé Valley Conservancies currently and deservedly hunt more than a third of the total Zimbabwean lion quota between them. Here we have shown that this sport-hunting does not negatively affect the lion population, which remains in positive growth despite off-take. In addition

to this, other areas, such as the Nuanetsi Ranch, could be incentivised to invest in lion conservation if the ability to sustainably utilise the lions as a resource was guaranteed.

The USFWS identified five primary factors that threaten lion survival in the wild, namely: habitat loss; loss of prey; retaliatory killing due to increased human-lion conflicts; inadequate regulatory mechanisms; and weak management of protected areas (http://www.fws.gov/endangered/what-we-do/lion.html [accessed 2015-01-19]). Each and every point on this list, which notably does not include sport-hunting, supports the fact that incentivising tolerance for lions through sustainable use would enhance the species' overall survival.

As responsible conservationists, we are not arguing against tight regulation of sport-hunting, especially with regard to sensitive species such as lions, and we support the need for transparency and accountability within the industry. However, this reform is a process being driven from within, as any indiscretion is an affront on all stakeholders. For example, long-term lion monitoring by WildCRU in Hwange National Park (HNP), Matabeleland North, Zimbabwe, documented a 'vacuum effect' and reduction in male lion density in the Park as a result of sport-hunting in the surrounding areas (Loveridge et al. 2007). A result of this research was the recommendation that ZPWMA implement a hunting moratorium in western Zimbabwe, which was accepted and enforced from 2005 to 2008 (Davidson 2009). Subsequent monitoring of the HNP lion population showed that the perturbation effects caused by sport-hunting were reversed during the moratorium, and sport-hunting was reinstated at a reduced, more sustainable quota (Davidson 2009). This example demonstrates both the relationship between independent researchers and ZP-WMA, and that the research assists ZP-WMA in robust decision making. This study has also shown that the lion population was able to recover quickly, and that a blanket-ban would have been as unnecessary as it would have been detrimental to overall lion conservation in the country.

In addition to the self-imposed hunting moratorium in the Matabeleland North district, Zimbabwe has voluntarily stopped sport-hunting of any lioness. The fixed-quota concept, in which hunting quotas had to be paid for upfront before the hunting season even began, and which was resultantly attributed to poor quality trophies and young animals being hunted, has also been abandoned. The adaptive quota management system for lion hunting based on the ages of lions hunted has been accepted and embraced by all stakeholders. This adaptive quota management system has not only led to a reduced national lion hunting quota, but has also resulted in a significant increase in the age of harvested lions to a level that is considered to have minimal ecological impact, being old individuals that are no longer contributing to the gene pool nor protecting cubs.

The IUCN Red List lion conservation status has remained unchanged for 20 years even in the face of Africa's ever-changing landscape. Despite fears that lion abundance is decreasing overall, in southern Africa it is in fact increasing (Bauer et al. 2015b).

Conclusion

Given the evidence presented, the arguments against sport-hunting would appear to be based more in emotion than logic and reality (e.g. Lindsey et al. 2015). Conservation, however, is not about individuals within populations, but the overall populations themselves. Sustainable sport-hunting of lions is just that: *sustainable* - and ironically, without it, the lions themselves become unsustainable. Conservation objectives need to be balanced with both social and economic factors if they are to be achieved.

The USFWS states "Well-managed conservation programs use trophy hunting revenues to sustain lion conservation, research and anti-poaching activitie" (http://www.fws.gov/endangered/what-we-do/lion.html [accessed 2015-01-19]). The Bubye Valley and Savé Valley Conservancies both fully meet each one of these conditions: clearly contributing to lion conservation in Zimbabwe; having long-term conservation research programs; and self-funded anti-poaching units.

The histories regarding the formation of both the Bubye Valley and Savé Valley Conservancies were both presented in this report, despite being remarkably similar; the point being that lion conservation in both areas, and many others, has the same fate either way. The Bubye Valley and Savé Valley Conservancies are both excellent examples of focussed and determined efforts to make wildlife based land use viable in an otherwise cattle dominated landscape. However, the fact remains that the cost of having lions, both ecologically and financially, is high. Simply increasing the abundance of one species at the expense of another cannot be considered a conservation success.

Good afternoon,
Please see the article below about continued losses to Zimbabwe's safari industry due to the elephant import suspension among other factors.
This is a 20% projected loss on top of the actual 30% loss they reported last year (we previously sent you that article as well, available at http://allafrica.com/stories/201512180502.html).

http://www.theindependent.co.zw/2016/04/29/safari-operators-see-20-revenue-decline/

Safari operators see 20% revenue decline

April 29, 2016 in Business

The Safari Operators Association of Zimbabwe (Soaz) has projected a further 20% slump in revenue this year owing to various internal and external challenges affecting the sector, businessdigest has learnt.

By Kudzai Kuwaza

Safari operators last year suffered a 30% reduction in revenue as the continued ban on the importation of sport hunted elephant trophies from Zimbabwe imposed in April 2014 by the United States government took its toll on the sector.

Soaz president Emmanuel Fundira told businessdigest last week that the tightening of regulations by the government since the killing of the famous lion, Cecil, last year,

among other challenges, is having adverse effects on their operations.

"The season has commenced in earnest albeit with many challenges which are both internally and externally driven," Fundira said. "Internally, the demise of Cecil the Lion has prompted the authorities to introduce a myriad of controls and measures not conducive to the running of efficient and profitable operations. For example, of late there has been a tightening of controls over the issuance of permits and supervision of hunts which have become both costly and cumbersome."

He added that externally there has been "massive" lobbying against sustainable wildlife use compounded by the continued ivory ban and the decision by the United States in January this year to uplift lions by introducing a cumbersome permit system "has not helped either"

Given the challenges, Fundira said although it was too early in the year to forecast revenue projections, a decline of not less than 20% was forecasted from last year's figures.

The Soaz president said the sector continues to develop new markets, adding responses from Central Europe and Russia "are somewhat a bit encouraging."

He said developing new markets was a long drawn exercise and is bound to take time.

Fundira expressed relief that the attempt by the European parliament members to stop the import of hunting trophies earlier this month had failed.

"The Safari Operators Association of Zimbabwe noted with relief that a move by a group of European Parliament members to pass a Written Declaration that would restrict the import of all hunting trophies to the European Union failed to achieve the requisite number of votes to be considered at the Parliament's next sitting," Fundira said.

"Reason and common sense prevailed over emotions and populist sentiment.

Sweeping changes to hunting practices in Africa can have a detrimental impact on conservation models and marginalised poverty-stricken communities that depend on hunting for their livelihoods.

d r a f t PWMA INVITATION 2015 SEBUNGWE WORKSHOP v2nd May 2015.docx	597 KB

INVITATION

Zimbabwe Parks and Wildlife Management Authority cordially invites you to attend a Collaborative Workshop

SEBUNGWE ELEPHANT MANAGEMENT ACTION PLAN WORKSHOP

To be held at

MUSANGO SAFARI LODGE

19 – 22 May 2015.

To travel to Musango Safari Lodge by road or by lake, on 19th May, Workshop to be held 20th May, 21st May and ending late morning of 22nd May, 2015

RATIONALE:

This workshop will produce a sub-regional Action Plan for the Sebungwe Elephant population, and will be strongly linked to, and based on, the outcomes of the National Elephant Management Plan. The Sebungwe plan should be one that is applicable, practical, achievable and one that is produced at the workshop without further work after that time.

There is need for a greater coordinated and collaborative effort than ever before amongst the Sebungwe's stakeholders to deal with ongoing wildlife crimes and other challenges that are threatening biodiversity conservation. Specifically, private sector tourism and safari operators providing safari services in the Parks and Wildlife Estate see the threat as not only undermining the conservation status of the PWMA Estate but the very resources upon which their businesses depend.

As the Sebungwe's human densities increase, combined with the increased poaching of eelphant and deforestation levels, the need for better and improved communication between all stakeholders, collaboration and coordination of conservation effort have become increasingly apparent. This is essential if optimum efficiency and effectiveness in the management of Elephant populations is to be achieved.
The outcomes of the Sebungwe Workshop will be based on two documents:

(1) The final draft of the National Elephant Management Plan
(2) The data, and specifically that related to the Sebungwe Region, from the National Elephant Aerial Survey undertaken in 2014.

The Principle Sponsor of the meetingh requests that you come prepared to suggest and discuss potential action items within your sector of interest and expertise (safari hunting, photographic tourism, community interest, NGO interests, government) a more effective force for survival of elephant in the Sebungwe Region over the next 5 years.

ACCOMMODATION AT MUSANGO SAFARI CAMP

The Workshop, funded by Conservation Force, will take care of Participants as invited by the Director General, Parks and Wildlife Management Authority and Participants from PWMA, Participants from Campfire Association, Participants from Law Enforcement Agencies, Judiciary, Participant representatives from Communities living in the Sebungwe, and Participants from Chinhoyi University of Technology. This provision will cover accommodation, 3 x meals per day, 2 x teas per day. A small per diem will be provided to cover each Participant's drinks.

All Participants invited by the Director General Parks and Wildlife Management Authority who are from NGO's, donor organisations, charitable trusts, tourism photographic sector, safari hunting sector, technical experts will be expected to pay a registration fee on arrival which will cover all accommodation and boat transfers from Kariba to Musango return @ USD165.00 each.

TRANSPORTATION:

- **Would participants please make their way to Musango Safari Camp, on 19th May, 2015 to arrive no later than 1600hrs please. This can be achieved by road via Siakobvu, or by boat from Marineland Harbour, Kariba. The boat transfer will leave no later than 1430hrs on 19th May 2015.**

- **For all participants coming in by road:**

  From Mola Village, we will be putting up signposts which you can follow and which road will end at a parking area on the BUMI HILLS SIDE of Musango Safari Camp. From this point, you will be picked up by boat to reach Musango Safari Camp on the other side of the bay, just a short distance away.

- **Thursday 22nd May 2015: After breakfast, a Working session will be held until 1030hrs. Departure from 1030hrs onwards for Kariba by boat and other destinations through own transportation arrangements. Transportation across the Bay back to the Car Park will be provided.**

- **Please contact lynne@thetashingainitiative.org or 0772348671 with any further enquiries.**

WORKSHOP:

The workshop will be held at Musango Safari Camp, with workshop notebook and pen, name-tag, provided on site. The Workshop will be facilitated by Dr David Cumming.

NB: PARTICIPATION!
Please respond by email to this invitation as soon as possible, clearly stating SEBUNGWE WORKSHOP ATTENDANCE in your email subject line, thank you.

Dear Edson and Olivia,

please find attached a draft document on critical points in preparation of the Sebungwe workshop.

The aim of this document is to provide a base for discussions before the workshop in order to achieve a practical and implementable action plan for this region which is so important and challenging.

Eventually it can contribute to the preparation of the agenda of the workshop.

I leave up to you the consideration of the importance to enlarge the distribution of this document to other stakeholders.

I would be happy to receive your thoughts.

Best wishes

Marco

SEBUNGWE WORKSHOP PREPARATIONv1.docx	126 KB
Attached Message Part	2.8 KB

SEBUNGWE WORKSHOP PREPARATION

A. Information from the 2014 Aerial Survey. (Olivia Mufute, Kevin Dunham)
   1. Elephant Densities and distribution
   2. Other Wildlife Densities and Distribution
   3. Livestock densities and distribution
   4. Poacher's Camp distribution
   5. Comparison with the 2001 and 2006 Aerial Surveys
   6. Establish realistic population goal

B. Land Use (ZPWMA, Ministry of Land)
   1. Recent Aerial Photos or Satellite Imagery
   2. Options to stop encroachment
   3. Lessons learned

C. Community-based Conservation (Chiefs, CAMPFIRE, CASS, University, Hunting Operators)
   1. Views from the Communities
      a) Indigenous
      b) New settlers
   2. CAMPFIRE Status
   3. Revenues from Wildlife Use
      a) Options for increasing the percentage of revenues retained at Community Level.
   4. Lessons learned

D. Depleted Safari Areas (ZPWMA, Hunting Operators,)
   1. Chirisa
   2. Chete
   3. Actual Status and Options to revitalize the Safari Areas
   4. Infrastructure, personnel and enabling environment

E. National Parks and Forest Areas (ZPWMA, Photo Operators)
   1. Matusadona
   2. Chirasira

3. Sijarira Forest Area
4. Infrastructure, personnel and enabling environment

F. Action Plan (Drafting Group to be selected)

1. Built from Strategic Elephant Policy and Management Framework (attached)
    a) Law Enforcement
    b) Biological Monitoring
    c) Social, Economic and Cultural Framework
    d) Building Conservation Capacity
    e) Coordination Collaboration and Programme Management.
2. How to make hunting a greater force for enhancement of elephant conservation
3. How to make photo-tourism a greater force for enhancement of elephant conservation
4. How to make local people a greater force for enhancement of elephant conservation
5. Establishment of a Regional Coordination Committee for the implementation of the Action Plan (basic rules of procedure, frequency of meetings, responsibilities.)
6. Inclusion of the Action plan into the National Plan

Outline of Strategic Elephant Policy and Management Framework

(Extract from Proceedings Hwange Safari Lodge Workshop 2-4th December 2014)

Table 1. Structure of the Strategic Elephant Policy and Management Framework

Long-term Vision	The long term vision adopted by the workshop retained the essential components of the 1997 plan
Targets	The three targets included in the 1997 policy were retained but the provision to maintain or increase elephant range not linked to a specific benchmark as it was in 1997
Key Components	The key components are the primary themes or headings of the strategy under which the framework is organised. The ten policy and management objectives included in the 1997 plan are included within these headings
Strategic Objectives	The strategic objectives reflect briefly but more explicitly the policy intention for the respective components
Outputs	The outputs are statements that reflect the expected result that will be realised during the time the plan. Outputs are therefore expressed in the past tense
Key Activities	Key activities represent the necessary and sufficient actions that need to be carried out effectively and efficiently to achieve the Outputs. They may be a subset of a wider range of activities that can be added but, as key activities, they are those that are vital to achieve the Outputs and are those on which the major emphasis should be placed.
Key Performance Indicators (KPIs)	The Key Performance Indicators provide a basis on which to measure and monitor the success or otherwise of the Strategic Objectives, Outputs and Activities.
Means of Verifying the KPIs	Means of verifying the KPIs were not developed during the Workshop and will need to be included in the Management Plan. A preliminary draft for verifying these is included in this report, as discussed at the workshop. It is important that KPIs and means of verification are standardised across the regions and areas of the country and that they can be combined in an unbiased way to reflect national progress in the implementation of the strategic plan.

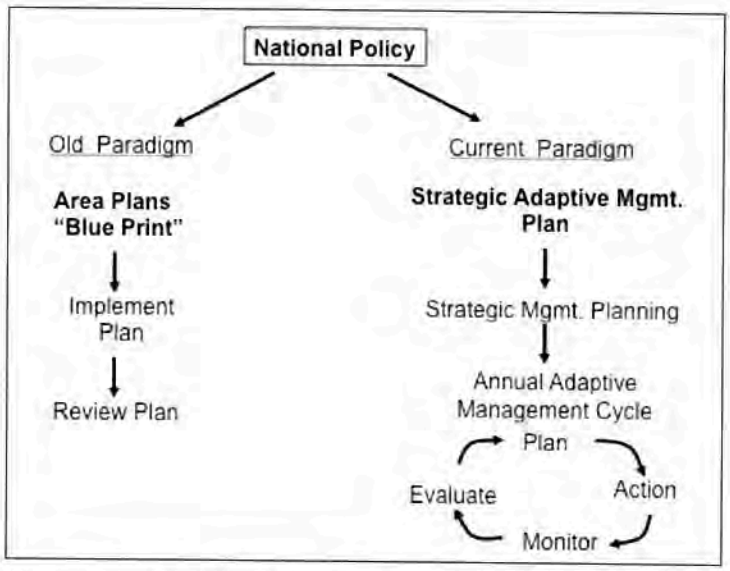

Figure 1. Resource management plans answer to national policy and legislation but in recent years have shifted from "blue print plans" to strategic adaptive management and planning. The strategic level plan developed in this workshop provides the basis for regional and local planning that includes action, monitoring and evaluation on an annual basis.

4.2 Zimbabwe Strategic Elephant Conservation Policy and Management Plan Framework (As agreed at Hwange Safari Lodge Workshop on 4 December 2014)

> ***Long-term Vision:*** To conserve elephants at levels that will enable them to contribute to the conservation of biodiversity, national development and Zimbabwe's cultural heritage

Targets:

1. To maintain at least four demographically and genetically viable elephant populations in Zimbabwe
2. To maintain or increase elephant range in Zimbabwe
3. To maintain numbers / densities of elephant at levels that do not adversely impact on biodiversity

Key Components	1. Protection and law enforcement	2. Biological Monitoring and Management	3. Social, Economic and Cultural Framework	4. Building Conservation Capacity	5. Coordination, collaboration and programme management
Strategic Objectives	**Objective 1.** Ensuring effective protection of all populations of elephant in Zimbabwe	**Objective 2.** Implementing effective biological and ecological management to achieve populations that are within upper and lower acceptable limits to change in numbers and distribution	**Objective 3.** Implementing strategies that enhance the contribution of elephant to rural livelihoods and national development	**Objective 4.** Ensuring that sufficient and appropriately trained personnel, equipment, infrastructure and financing are mobilised, available and used efficiently and effectively	**Objective 5.** Ensuring effective coordination and collaboration with national and international stakeholders to achieve these strategic objectives,
Outputs	**Output #1:** Management actions, security and law enforcement to minimise illegal losses of elephants and their habitats from all populations implemented	**Output #2:** Adaptive management to achieve viable populations in all four sub-populations implemented	**Output #3:** Fair distribution of financial benefits from elephants improved and tolerance for living with elephants increased	**Output #4:** Sufficient numbers of trained, equipped, motivated and effective personnel are deployed and operational	**Output #5:** Coordination mechanisms to assess and review adaptive elephant population management and strategic planning established and operating

Key ACTIVITIES that are required to achieve the OUTPUTS, Key performance indicators (KPIs), and means of verifying KPIs

	Output#1: *Law enforcement*	**Output #2:** *Biological monitoring and management*	**Output #3:** *Social, Economic and Cultural Framework*	**Output #4:** *Building conservation capacity*	**Output #5:** *Coordination and programme management*
Key Activities	• For each key population establish a highly trained rapid response anti-poaching unit for deployment to areas under threat • Appropriate informer systems established and supported at regional, national and local levels • Improve investigation and prosecution of crimes (collection and preservation of evidence, ballistics evidence, professional prosecution of cases, information for legal profession) • Set up National and local intelligence databases • Enhance international and transboundary collaboration in law enforcement • Enhance social (community) involvement in law enforcement • Reduce illegal settlements in all wildlife areas • Revisit the appointment	• Monitor elephant population trends and elephant impacts on biodiversity through aerial, ground and ranger-based methods, among others • Use research findings, expert opinion and informed public opinion to establish thresholds of potential concern (TPCs) to initiate management action in respect of elephant impacts for protected areas • Carry out appropriate management actions when populations exceed, or are projected to exceed, TPCs • Monitor trophy quality and adjust quotas to maintain desired levels of trophy quality • Define current elephant range and explore options for extending the range and maintaining connectivity between fragmented populations • Recognising the long response time of elephants to management	• Provide incentives and promote partnerships and joint venture opportunities to strengthen elephant management, including across boundaries • Explore additional elephant-based tourism and sustainable utilization opportunities. • Facilitate the transparent distribution of the benefits and costs of elephant management and conservation • Implement effective techniques and land use strategies to mitigate human-elephant conflict. • Promote effective recovery and use of all products from dead elephants • Include information on elephants and their conservation in school curricula and promote environmental education in rural areas adjacent to key elephant populations • Develop and implement an effective	• Secure funding to initiate the implementation of the elephant management plan • Establish sustainable funding programs to build and maintain necessary human resources and strengthen elephant conservation and management capacity • Analyse current capacity and identify needs • Initiate and/or maintain continuity in research and monitoring necessary for the conservation and adaptive management of elephants and habitats • Strengthen research capacity in ZPWMA and collaborate with other research institutions • Establish training and in-service retraining of personnel in law enforcement, research and monitoring, education and awareness, community elephant management, management	• Establish a national elephant conservation & management task force / steering committee that includes stakeholders meetings at least bi-annually to review progress and to develop an annual implementation plan • Establish four regional management committees to meetings at least twice each year and implement sub-regional plans • Strengthen links with neighbouring states to confer on the management of shared elephant populations, particularly in relation to TFCA populations • Establish a full-time elephant manager to be responsible for coordinating the implementation of the elephant management plan • Strengthen coordination between the hunting industry and the elephant management programme • Implement an effective information dissemination and communication strategy, including regular progress reports on the implementation of the plan

	Output#1: *Law enforcement*	**Output #2:** *Biological monitoring and management*	**Output #3:** *Social, Economic and Cultural Framework*	**Output #4:** *Building conservation capacity*	**Output #5:** *Coordination and programme management*
	of Honorary Officers to assist in law enforcement • Ensure full compliance with hunting regulations and quotas set	interventions, use modelling to project alternative outcomes of management	communication strategy for local, regional and international audiences	• Strive to achieve best standards for elephant management, including any forms of utilization • Engage available expertise and capacity within ZW	

	Output#1: *Law enforcement*	**Output #2:** *Biological monitoring and management*	**Output #3:** *Social, Economic and Cultural Framework*	**Output #4:** *Building conservation capacity*	**Output #5:** *Coordination and programme management*
Key Performance Indicators	• Number of dead elephants located each year • Number of dead elephants killed illegally • Percentage of animals from which tusks were recovered • Number of elephant poachers arrested • Number of successful convictions • Number of poachers sentenced (and record of sentence severity) • Patrol effort and effectiveness indices (see sample reporting form) • Number of infringements of hunting regulations • ETIS law enforcement effort ratio • Number of ivory seizures (including number of tusks and weight) • Number of joint operations	• Elephant population estimates and distribution from aerial surveys at least every three years for each of the four sub-populations • Records of all elephant deaths with data on dates, locations, cause of death, reason killed (trophy hunting, problem animal control, natural mortality, management, illegally killed elephants), age, sex, tusk size • Trophies taken as % of quota, and trend in trophy quality • Thresholds of potential concern established for each area and selected indicators of change monitored • Management actions taken in relation to TPCs being exceeded • Range expansion/contraction estimated from all available data • Use and effectiveness of corridors assessed, inter alia, from aerial surveys, ground sightings and reports, satellite collared animals • Reporting into international monitoring systems as required (e.g. AED, ETIS and MIKE)	• Policy instruments that demonstrate and establish incentives to conserve elephants • Levels of private and community investment in elephant conservation measures • Annual record of distribution of elephant derived benefits (revenue, development projects, products received by beneficiaries) • Record of Human-Elephant conflict incidents (in HEC Database) • Record of mitigation measures taken to reduce HEC (in HEC Database) • Levels of investment (funds and manpower) in mitigating HEC by ZPWMA, communities and partners • Number of poaching incidents/arrests based on prior information and leads from communities / land holders. • Trends in elephant numbers in non-protected areas	• Annual funds and resources available for elephant conservation • Record of staff training and re-training • Manpower density for protection of elephant (No of km^2/operational field person) • Effective deployment of field staff (e.g. % of available man days spent on patrol in the field) • Research person days spent on monitoring elephant population parameters in each population • Number of research-person days spent on monitoring / assessing elephant impacts in relation to TPCs • Number of researchers, programs and reports • Number of vehicle months available during the year • % of area that has secure VHF radio capacity • % of the year that the secure VHF radio system was functional • Number (or %?) of ranger stations in key population areas fully functional • Number of operational research facilities	• National and regional committees functional and meeting at specified intervals • Committee meeting minutes with actionable points approved and circulated within one month of meeting • Record of attendance at and reporting to regional and international elephant conservation bodies of which Zimbabwe is a member • Elephant manager appointed with full terms of reference • Regular reports from elephant manager on implementation

	Output#1: *Law enforcement*	Output #2: *Biological monitoring and management*	Output #3: *Social, Economic and Cultural Framework*	Output #4: *Building conservation capacity*	Output #5: *Coordination and programme management*
Means of verifying KPIs	• Numbers of dead elephants in various categories recorded at field stations, conservancies, and CAMPFIRE District Offices, compiled at regional and national levels and presented to the Regional and National Coordinating Committees (R&NCC) bi-annually • Arrests and convictions from Station and Area records and reports compiled and submitted to R&NCC • Patrol effort Indices - see under Component #4 • Hunting regulation infringements derived from SOAZ/ZPHGA reports and from field station reports compiled and presented to R&NCC • ETIS law enforcement effort ratio available from TRAFFIC • Ivory seizure details from ivory stockpile records	• Elephant population numbers, distribution, carcass ratios and trends from aerial survey reports • Elephant deaths and trophy quality - as for records under Law Enforcement with additional analysis of data and trends reported to the R&NCC bi-annually • Reports on Thresholds of Potential Concern where these have been established • Research and monitoring reports of elephant impacts in selected sites in relation to TPCs • Reports on elephant locations from ground and aerial sightings • Use of corridors based on field reports and studies of elephant movements using tracking devices • Copies of required reports sent to international monitoring systems	• Documented policies and list of operating partnerships / joint ventures that promote elephant conservation & management • Record of investments in elephant conservation measures assembled by elephant programme manager/coordinator • Summaries from Human-Elephant Conflict database reported at Annual Meeting of R&NCC • Records and annual summary of arrests and poaching incidents intercepted based on leads provided by communities • Elephant censuses that have covered non-protected areas	• Record of funds available (USD) and investment by ZPWMA, Private sector, NGOS, and CAMPFIRE in elephant conservation measures (Compiled annually by Elephant Manager / Coordinator) • Consolidated record of number of field personnel and days operational (law enforcement, research & monitoring, elephant management) for each area in the elephant range compiled and reported on at annual planning meetings • Research reports and papers on elephant conservation and management • Records of vehicle months, VHF radio operation, fully functional stations, operating research facilities, compiled and consolidated at station, area and regional levels and reported on to the R&NCC bi-annually	• Record of meetings, minutes actions completed, attendance at national and regional committee meetings • Record of when minutes of meetings were completed and circulated • Date on which terms of reference for elephant management position were completed, date the position was filled and operational • Record of reports by the person in the elephant management position

Note: It will be necessary to design record sheets that serve to standardise the manner in which records are maintained at field station, area, and regional levels so that they can be combined and summarised in a consistent manner to provide clear and transparent national level indicators of progress in the conservation and management of elephant from year to year. An example of one such form for law enforcement effort is provided below. The forms being used at MIKE sites may also be used more widely.

MPNP Anti-Poaching Workshop - Summary Report - 25 April 2015.pdf 1.1 MB

A collaborative workshop held by ZPWMA to develop an anti-poaching strategy for Mana Pools National Park and neighbouring Safari Areas

30 March 2015 – 2 April 2015
Chirundu Safari Lodge

Summary Report

List of Acronyms

AFZ	Air Force of Zimbabwe
AWF	African Wildlife Foundation
CAMPFIRE	Communal Areas Management Programme for Indigenous Resources
CASS	Centre for Applied Social Sciences
CUT	Chinhoyi University of Technology
ETIS	Elephant Trade Information System
JOC	Joint Operations Committee
LRT	Lowveld Rhino Trust
LZTOA	Lower Zambezi Tour Operators Association
LZV	Lower Zambezi Valley
MAPP	Matusadona Anti Poaching Project
MEWC	Ministry of Environment Water and Climate
MFA	Ministry of Foreign Affairs
MIKE	Monitoring the Illegal Killing of Elephants
MPNP	Mana Pools National Park
RDC	Rural District Council
SMART	Spatial Monitoring And Reporting Tool
TFCA	Transfrontier Conservation Area
ZNA	Zimbabwe National Army
ZPWMA	Zimbabwe Parks and Wildlife Management Authority
ZRP	Zimbabwe Republic Police

Keynote address

The evening before the start of the workshop, Tom Milliken from TRAFFIC gave an address on the global situation for elephants and the illegal ivory trade. After providing an overview of the two CITES monitoring systems - MIKE (Monitoring the Illegal Killing of Elephants) and ETIS (Elephant Trade Information System), Tom then outlined their key results. Both poaching and the illegal ivory trade had peaked from 2011-2013, and indications were that these levels were remaining unsustainably high. While Zimbabwe had made a number of seizures, which were recorded in ETIS, an equal number of seizures had been made outside of Zimbabwe, but which implicated the country (i.e. seized outside of Zimbabwe, but indicating that the shipment had originated from or passed through the country). Tom clarified that the seizures made only represented an unknown percentage of the overall movement of illegal ivory, and noted that the recent elephant survey results likely meant a loss of a large number of elephants from the Zambezi Valley since 2006, which apparently had not been captured in the ETIS data. Tom also gave an overview of shifting strategies to engage in the illegal wildlife trade, such as moving shipments through Asian transit countries to reduce likelihood of detection in Chinese ports. Finally, Tom responded to a number of questions from the group.

Welcome and opening remarks

The Director General for the Zimbabwe Parks and Wildlife Management Authority (ZPWMA), Edson Chidziya, opened the meeting. He thanked the hosts, the Chair, the committee and the delegates and welcomed all the participants. He noted that Mana Pools National Park (MPNP) cannot operate as an island in a sea of poaching and poverty. As a part of a trans-frontier conservation area, a World Heritage site, and a biosphere reserve, MPNP is a flagship site and a world-renowned tourist attraction. He noted that the purpose of the workshop was to develop effective protection strategies, based on resource mobilization and collaboration, and coordination of stakeholders, at a time when the illegal wildlife trade is threatening hard-won conservation gains. He recalled the extinction of rhinos in the Zambezi Valley and called on participants to define strategies to ensure that other species are not lost. He noted that ZPWMA had not been spared from the macroeconomic situation facing Zimbabwe and faced serious resource constraints. Despite this, ZPWMA continues to work closely with other national law enforcement agencies under a 5-year strategic plan. He closed by noting that all these strategies required the engagement of diverse stakeholders and welcomed the participation of NGOs and the private sector, wishing the group successful deliberations.

Introductions

The meeting participants introduced themselves. A full participant list is available in Annex I to this report.

Background to the workshop

Richard Maasdorp from the Zambezi Society provided a short background to the workshop. He noted that the participants in the workshop have a great diversity of skills and the hope was that those skills could be centred around a common vision. He encouraged the group to recognize that we were talking about an unsurpassed stretch of wilderness, which could be sustained for the future of Zimbabwe, forever. He also mentioned the hope that a

collaborative body could help to support the implementation of any action plan identified in this workshop.

Objectives and purpose of the workshop

The facilitator, David Cumming, introduced the agenda (see Annex II) and aims of the Workshop. As indicated in the invitation "The primary goal of the workshop is to undertake detailed stakeholder and problem analyses from which a set of solutions and associated objectives can be developed leading to an action plan for implementation." He referred to the national elephant management planning process, which had been initiated in December 2014, and the national "Outline of Strategic Elephant Policy and Management Framework" which was included in the workshop documentation (See Annex VII). The framework provided for the development of four sub-regional management plans of which the Lower Zambezi Valley was one. The key activities within the national plan would form outputs at the regional and local level with a focus on key activities to achieve effective protection and law enforcement. He noted that monitoring for adaptive management was central. The geographical focus of the meeting was confirmed to be MPNP, the outcomes of which would build towards a regional plan for the larger Lower Zambezi landscape.

Law enforcement and anti-poaching in Mana Pools

The Area Manager for MPNP, Marvellous Mbikiyana, gave a presentation on law enforcement and anti-poaching in MPNP. He noted that the Park, which is 2,196 square kilometres, is a World Heritage Site in the centre of a network of protected areas in Zimbabwe which stretch from Kariba to the Mozambique border. Much of the bank on the Zambian side of the river is also protected.

While the ideal staffing level for rangers is 110 for the Park, 75 have been approved, and only 38 are on site. Of the 38 on site, only 13 are deployable at any one time, due to a number of other commitments, such as driving duties, serving in the front office, and so on. Enforcement activities consist of regular patrols along the shoreline, boat patrols, and extended patrols into the hinterland. Patrols also respond to specific incidents where possible.

Poaching in the Park usually targets big game, and uses guns, snares and poisons. Poachers are both local and foreign, and most poaching occurs in the escarpment area. There are a number of known poaching hotspots, mostly around permanent water. These include the Kanga / Mafuku, Chiuye / Rukometchi, Nyamahwani / Kasawe / Man'ain'ai, Mazunga / Sore Sore / Matrench, and Chitake areas.

Local poachers tend to enter MPNP from Southern boundaries via rivers such as Mashayenyi, Rukometchi, Chiuye (through the gorge), Chitake and Chewore. Foreign poachers tend to use Nyakasanga river mouth to enter and exit the Park. These hotspots and entry and exit points need constant monitoring. Poachers tend to move in groups of 4-8, with at least two being armed (one with either a .458 rifle or .375 rifle and another one with an assault rifle in most cases an AK47 rifle). They carry enough food to last for almost one month, and in some cases they carry GPS systems to enable them to locate ivory caches and to retrace their route. Poachers also sometimes pretend to be mad and walk along main roads in order to undertake reconnaissance missions. Poaching and law enforcement statistics from 2009 to 2014 were presented. The statistics showed a low

number of poached animals and contacts. This may be a function of low patrol coverage and monitoring frequency.

An equipment inventory was presented. There are a number of key needs, such as vehicles, boats, and rifles. The Tashinga Initiative was thanked for its assistance in improving the radio infrastructure.

A number of strategies were proposed, including: aerial surveillance, night surveillance, strengthen intelligence gathering, extension work coordinated at station level, manning areas threatened by poisoning, mobile patrols, provision of dry ration packs to enhance quick reaction patrols, increasing the number of actionable rangers, monitoring of Nyakasanga mouth, liaison with other stations on movements, location and detection of poachers. Longer-term strategies included: establishment of tourist camp / semi permanent base at Mazunga or Nyamahwani pan, employment of required station ranger establishment, use of UAVs, construction of bridges at key crossing points.

Finally, Marvellous provided constraints and limitations, which included shortage of resources and equipment, low manpower levels, poor state of roads, and inadequate communication equipment.

There were a number of points of discussion and clarification following the presentation:

- Most of the poached elephants were bulls.
- Other species that are targeted are buffalo, usually by snare.
- Poisoning is mainly by cyanide and does not seem to have impacted vulture populations through secondary poisoning.
- There is intent to exchange information with Zambian counterparts, but to date this has not happened effectively.
- Prosecutions are tracked. Where poachers were caught with ivory, they are receiving high sentences. Where poachers are caught with no ivory, they usually are charged with illegal entry.
- Ivory is moving within Zimbabwe (if local poachers) and across to Zambia (if Zambian poachers).

Ranger patrols and monitoring in Chewore

Simba Sandram, the Area Manager for Chewore, gave a presentation on ranger patrols and monitoring. Firstly he reminded participants of the Vision and Mission Statement of ZPWMA, as well as the legal framework regulating wildlife in Zimbabwe.

In Chewore / Dande, day or local reconnaissance, extended clandestine, reaction/contact, strategic and roadblock patrols are operated. Day and local reconnaissance patrols are intended to gather information on vegetation, wildlife and illegal activity. A minimum of three rangers are deployed for a duration of less than a day long from the station administration office, either on foot or by boat, vehicle, or plane.

Extended clandestine patrols are aimed at widening ground coverage, to gather more detailed information on the terrain, local populations and poaching indicators. Movement is slower and patrolling can be done from a temporary base (hide) or the patrol team can move from one lay-up site to the next and sleep where they are at the time. A minimum of

three rangers is recommended for 7-14 nights and rangers are informed at least a day before deployment (although the route is not disclosed until rangers are en route).

Reaction (contact) patrols are carried out based on reliable intelligence that contact will be made with poachers. Rangers go out well armed and in strength and contingency plans are put in place to evacuate and treat possible casualties. The patrol is carried out in less than three days and the patrol team reacts within 30 minutes upon receiving the information.

Strategic patrols are carried out with partially or reliable information from informers, investigation team or past trends. Patrols are conducted either during the day or overnight and usually takes less than five days.

Joint patrols are planned operations based on situations that may have arisen, and are usually conducted with other law enforcement agencies e.g. ZRP, ZNA, CIO, etc. The patrol team is briefed in advance and the period of operation is determined by the outcome.

The patrol execution process includes strategic planning, briefing, deployment/execution, debriefing, data storage, and data analysis. Simba provided examples of forms for patrol briefing, MIKE elephant carcasses, and ground patrol data. He provided details on elephant mortalities in the area from 2009-2014.

Data are managed through SMART (Spatial Monitoring And Reporting Tool), which takes data and turns it into information that can be used to make decisions about park management activities. These data are managed through a quality assurance process and help conservation areas to adapt to changing threats. Finally SMART allows you to track and manage your law enforcement effort.

There were a number of points of discussion and clarification following the presentation:

- The use of cell phones on patrol is generally not encouraged, and only allowed where necessary. Cell phones used are personal cell phones. It was suggested that official cell phones may be necessary.
- Strong collaboration with stakeholders is necessary. It was acknowledged that cooperation between ZPWMA and private sector operators was crucial for anti-poaching efforts. Both photographic operators in MPNP, as well as safari operators throughout the Lower Zambezi Valley were providing fuel, transport, helicopter and other aerial assistance towards anti-poaching efforts.
- Rangers are monitored through reporting at certain times of the day.
- In 2014, 24 offenders were taken to court – some are finalized, some still pending.
- Delays in rapid patrol deployment are due to the need to have weapons and rations ready to go.
- Compliance with mining and forestry laws can also help with prosecutions.

Stakeholder analysis

A stakeholder analysis was undertaken via a card exercise to identify the key stakeholders and actors and the links between them.

Annex III outlines the results of the stakeholder analysis. Key linkages were identified:

- between ZPWMA and consumptive and non-consumptive operators (strong in some areas but could be strengthened);

- between ZPWMA and ZRP;
- between ZRP and the judiciary (could be strengthened);
- between ZPWMA and researchers (could be strengthened); and
- between ZPWMA & provincial JOC.

Key discussion points

- Are there formal lines of communication between different stakeholders, or are these ad hoc?
- The proposed Lower Zambezi Valley Collaborative Group could provide a funding and communication mechanism to support implementation.
- Lower Zambezi Tour Operators Association (LZTOA) could serve as the main stakeholder to bring operators and NGOs to the table.
- How will communications and funding be dealt with?
- If ZPWMA is the core (regional office), it needs to interact with NGOs, the private sector, communities, and other government agencies.

Problem Analysis

A detailed problem analysis was undertaken. During an initial plenary session using cards, a number of key problems were identified, which are available in Annex IV. The participants then moved into working groups to undertake a more detailed problem analysis. The detailed reports of these working groups are available in Annex V. A synthesis of the problem analysis was prepared and refined in plenary.

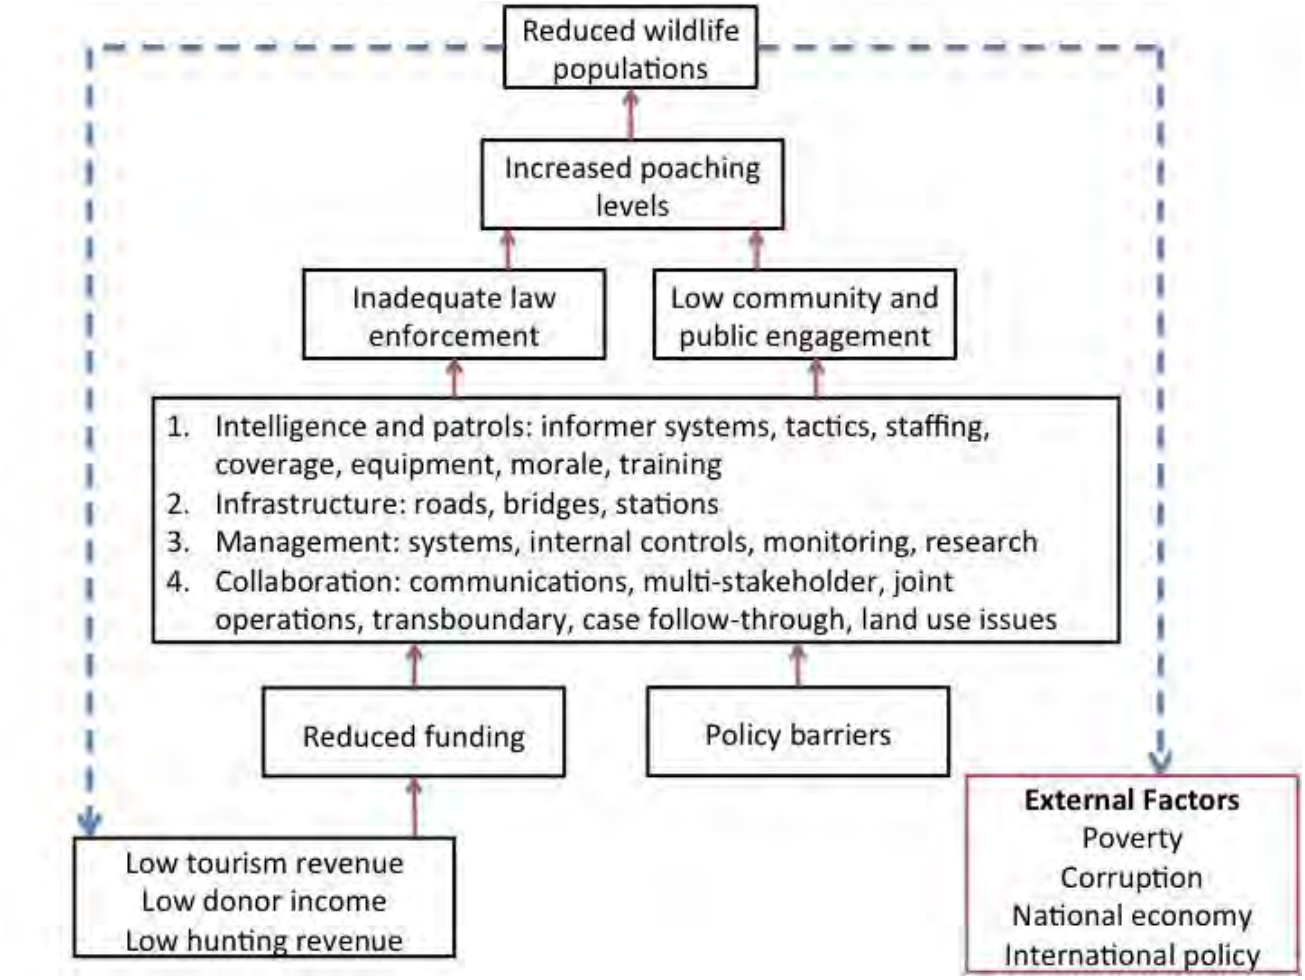

Fig. 1 Cause-effect diagramme to illustrate the main linkages and feed back loops (dashed lines) between funding, inadequate law enforcement, increased poaching and reduced wildlife populations. The four components in the central box formed the focus for four working groups to undertake more detailed problem analyses. The working group reports were then combined and examined in plenary to produce the Action Plan below.

Draft Mana Pools National Park Anti-Poaching Action Plan

The plan includes four main components:

1. Law enforcement
2. Infrastructure, equipment and access
3. Monitoring and data analysis for adaptive management
4. Stakeholder collaboration

1. Law enforcement

Output	Activities	Key Performance Indicator	Means of verification	Timeframe	Indicative costs	Lead Agency
1.1 Informer network, investigation and Intelligence system established	- Recruit informers and contacts - Recruit investigators and deploy strategically - Train investigators - Set up anonymous whistleblowing system (through hotline) - Carry out awareness campaign within communities on value of conservation and how to report illegal activity (to stimulate social enforcement) - Establish intelligence database - liaise with existing successful anti-poaching units in the Zambezi Valley (e.g. DAPU)	- Number of arrests based on information from intelligence system - Number of calls to whistle blowing system that result in effective follow up - Number of incursions reported on / reacted to by local communities	- Validation of informer record - Records and reports of training session - Whistle-blower system reports - Records / reports	Incremental set up over 1 year, then on going	Staff salaries Transport Rewards and payments to informers Telecommunications costs (Malilangwe, MAPP, Bubye Valley Conservancy, LRT, Gonarezhou, and hunting safari operators could help with budget numbers.	ZPWMA
1.2 Well equipped, trained and fully operational units in place	- Carry out an assessment / audit of current capacity, prioritise needs and mobilize resources to fill gaps - Recruit and train field rangers and research staff - Explore the Gonarezhou model for NGO	- Recruited and trained rangers and research staff operating - Number of units operating - Manpower strength, e.g. how many rangers, researchers, etc.	- HR records	Assessment within six months On going		ZPWMA / consultant

Output	Activities	Key Performance Indicator	Means of verification	Timeframe	Indicative costs	Lead Agency
	employment of cadet rangers - Conduct frequent retraining					
1.3 Patrols strengthened	- Establish effective patrolling force of 40 deployable rangers (exclusive of those on other duties or on leave) - Establish (or review?) Standard Operating Procedures - Establish regular training and retraining schedule - Establish well-equipped reaction teams - Re-examine the practice of appointing Honorary Officers.	- Number of deployable (including equipment) rangers at any one time (standard = 40) - Total man days spent on patrol - Standard Operating Procedures in Place - Number of training and retraining sessions carried out - Areas of Park patrolled each month (related to threat) - Reaction time to incidents	- Monthly reports - Subsistence claims	SOPs to be established within 3 months. Staffing to be established within 6 months. Then on going	Salaries Equipment Vehicles etc.	ZPWMA
1.4 Crime scene investigations improved	- Establish Standard Operating Procedures (to include guidelines on collaboration with ZRP, EMA, etc., evidence gathering) - Identify gaps (e.g. ballistics and forensics) and solicit external expertise - Establish regular training and retraining schedule - Procure / hire specialized equipment	- Number of arrests leading to prosecution - Number of successful prosecutions - Reports / records	- Exhibit register - Court records - Reports	SOPs to be established within 3 months. On going	Training costs Expert costs Specialized equipment	ZPWMA ZRP Tikki Hywood Trust
1.5 Prosecutions effectively supported	- Undertake appropriate processes for laying charges and preparing information for prosecution (Draft the most appropriate charge(s) and outline of state case, Secure exhibits, Peruse crime docket, Summon witnesses to court, Re-	- Number of poachers arrested during the year - Number given bail - Number convicted - Number given jail sentences - Number given mandatory sentences - Record of ZPWMA Legal Services involvement in	- Records	Substantive charge must be laid within 48 hours Awareness programme within one year, then on going	Training workshops	ZRP Judiciary ZPWMA Tikki Hywood Trust (?)

Output	Activities	Key Performance Indicator	Means of verification	Timeframe	Indicative costs	Lead Agency
	interview witnesses, Prepare pre-trial questions for state witnesses, Liaise with the investigation officer, Follow up) [include in SOPs in clear detail] - Build awareness on wildlife crime issues - prosecutors and magistrates - ZPWMA Legal Services liaise with Prosecution - Distribute Hywood Trust booklet to staff involved.	prosecution processes				
1.6 Joint operations (national and cross-border) established	- Convene joint meetings of law enforcement agencies - Conduct awareness campaigns for other law enforcement agencies - Agree on operational order / SOPs (including information sharing) - Conduct joint operations	- Number of meetings held per year - Number of successes from shared information - Number of joint operations leading to arrests and prosecutions -	- Minutes - Joint operation reports - Records - Manpower involved (by agency)	Meetings: Quarterly (national) and Monthly (cross-border) On going	Meeting costs (travel, etc.) Operational costs	ZRP **ZPWMA** ZNA
1.7 SOPs for all operations established	- Revised and adapted in the light of on going operations. Can include: - Training - Stop and search - Deployment - Aerial surveillance - Use of modern technology - Random testing for poisons - Infiltrate known poaching rings	- Number of training sessions - Number of arrests, recoveries, stop & searches conducted - Number of deployments - Number of flights and quantity of flight hours - Availability of gadgets etc. - Number of tests conducted - Number of poaching rings infiltrated - Profile of poachers - Number of forward bases and teams	- Training reports - Report - Inventory - Records	On going Aerial – fortnightly Establishment of well-equipped reaction team – within 6 months		ZPWMA

2. Infrastructure, equipment and access

Output	Activities	Key Performance Indicator	Means of verification	Timeframe	Indicative costs	Lead Agency
2.1 Main access road to Mana improved (31 km Chimutsi to Nyakisakana and 45 km Nyakisakana to Mana HQ).	- Rebuild the 31 km section (gate to gate) followed by annual grading - Regravel the 45 km section (gate to HQ) followed by annual grading - Until rebuild and regravel happen, grading is required immediately and then every three months	- Specified road standard maintained	- Reports on road status - Road user questionnaire - Number of tourist complaints	Rebuild (31km) – 6 months after funds available Regravel (45km) – 3 months after funds available Grading- immediate and on going (Ensure that Ministry of Transport has agreed for the 31 km section)	Rebuild (31 km): USD 248,000 Regravel (45km): USD 225,000 Grading: Quotes range from USD 7,000 to USD 14,000 for each time	Ministry of Transport and Infrastructural Development (31km) / ZPWMA (45km)
2.2 Internal road network (about 600km) improved (N.B. does not include concessions)	Annual: - Clear - Grade (where necessary) - Repair low crossings One-time - Repair two bridges - Replace slip drains/ culverts	- Number and distance of passable roads - Number of functional bridges / crossing points	- Annual road assessment report	Prioritise and implement over 3 months every year	Approximately USD 10,000 (needs to be revised based on 600km) annual Bridges? Culverts/slip drains - ?	ZPWMA / Tour operators
2.3 Periphery road (210 km) established [Are the east and west roads necessary and is there any need for more internal roads in the South?]	New project – opening of a 9m wide road [is this size road necessary? Or is this serving an additional purpose – e.g. fire break? This could be a major erosion hazard]	- Monitoring incursions and rapid deployment	- Monthly reporting on reduced numbers and spoor seen crossing into the park	Within 3 years	USD 180,000 Cost effectiveness to be examined	ZPWMA, targeted Funding and implementing agencies
2.4 Bicycles and motorbikes	- Bike patrols to check for any incursions	- Number of rotations done per month - Number of followups / detections	- Monthly reports		USD 5000 per year for 15 bikes. USD 6,000 per year for 4 motorbikes	ZPWMA Targeted donors

2.5 Airstrips (Mana Main)	- Regravel and build apron	- CAAZ certification	- CAAZ licence	Within one year	USD 22,000	ZPWMA, Operators
2.6 Access: 3 4x4 vehicles (operational for law enforcement only) 1 lorry 1 tractor 3 boats (1 Pelican and 2 Aluminium – 90HP Mercury or Marina) Aircraft: Microlight / Bathawk / Plane / Helicopter - rental	- Acquire vehicles and boats - Establish management and maintenance protocols and packages for vehicles and boats, including supporting a capable mechanic based at the Park. - Outsource aircraft and pilot package	- Vehicles and boats purchased and operational - Bathawk undertaking 20 hours per month on recce. - Helicopter deployments	- Management reports with tracking, logbooks - Number of sightings from the air - Number of arrests	Vehicles and boats: ASAP to 6 months Aircraft – 5-6 months	USD 230,000 for vehicles and boats Lorry and tractor Mechanic Microlight/ Bathawk rate ($25 per hour) Plane rate (to be confirmed) Helicopter rate ($800-1200 per hour)	ZPWMA FUNDING AND IMPLEMENTING AGENCIES AFZ ZPWMA
2.7 Field stations	- Undertake feasibility study for new bases and pickets in relation to hotspots. - Establish anti-poaching bases at Nyakisakana - Establish [anti-poaching or picket?] base at Sore Sore - Establish boundary pickets & hot spot pickets (refer to Maps) - [Use MPNP Management Plan Zone Plans and develop approaches for each.]	- Feasibility study completed - Number of established bases, pickets - Effective deployment of anti-poaching staff	- Reports -	Study: within 3 months Bases: within 6 months - Pickets: within 3 years	USD 60,000 per base USD 300,000 for 20 pickets	ZPWMA Funding and implementing agencies Private sector
2.8 Communications - VHF - Solar power - [Cell phones - Computer - GIS - SMART software	- Establish digital VHF radio GPS communication tracking systems across LZV (repeater links, base sets, handhelds, mobile radio sets, computers	- Established digital VHF radio GPS communication tracking systems in place and operating	- Record of coverage	Within 6 months	USD 310,000 (for all LZV)	Tashinga Initiative ZPWMA

- Cyber Tracking]	for monitoring purposes) - Complete activity list for other tech needs.					
2.9 Staff accommodation	- Review staff accommodation requirements - Refurbish existing buildings - As needed, develop staff accommodation infrastructure - Work with Rukometchi Research Station to explore posting rangers there -	- Review report completed - Number of rangers (and families) appropriately accommodated - Report on negotiations with Rukometchi	- Reports	Reports within six months Accommodation within two years	USD 20,000 per building refurbishment	ZPWMA

3. Monitoring and data analysis for adaptive management

Output	Activities	Key Performance Indicator	Means of verification	Timeframe	Indicative costs	Lead Agency
3.1 Monitoring system for wildlife populations and illegal activities established	- Carry out regular surveys (ground counts carried out by rangers) - Carry out aerial monitoring of wildlife and illegal activities - Adopt standardized databases for all stations and RDCs in LZV - Introduce ranger-based monitoring (SMART, MIKE, ETIS) across all stations in LZV - Analyze the data and use in adaptive management	- Number of surveys carried out - Number of aerial operations carried out - Number of functional databases - Reports into international systems, e.g. MIKE and ETIS - Results of timely analyses being used in adaptive management	- Databases and reports	Aerial surveys done every 3 years (LZV) Ground and waterhole counts annually Illegal activities and ground counts monthly Database and monitoring ongoing	Aerial survey – USD 150,000 Computers and software Training in SMART	ZPWMA
3.2 Trophy monitoring system in place	- Upgrade the trophy / age monitoring system, including database, for LZV [N.B. will require training] - Introduce a flexible and adaptable quota system (review fixed quota system)	- Trophy / age measurement records, returns year on year -	Completed return forms	Within a year / immediate		ZPWMA Operators
3.3 Wildlife populations and habitat in buffer zones recovered	- Motivate for review the CAMPFIRE programme - Allocate / mobilize resources for wildlife management in the buffer zones - Carryout mapping exercise and establish the extent of land use change or pressure	- Size of area affected - Direct benefits to locals from sustainable off-take	- Reviewed policy on CBNRM - Resources allocated - Land use maps	3-5 years		MEWC ZPWMA CAMPFIRE Association (Universities – CUT, CASS)

3.4 Allocation and utilization of resources improved	- Rationalization of resources - Carry out regular asset audits	Assets allocated per station	- Registers - Issue Vouchers - Reports	Immediate		ZPWMA Funding & implementing agencies
3.5 Analysis of law enforcement data on going (See section 1)	- Create database - Capture data - Training - Data synthesis - Access control -	- Databases in place - Number of training sessions held - Reports - Security mechanisms in place	- Databases - Reports	Database in place within one year On going		ZPWMA Researchers ZRP

4. Stakeholder collaboration

Output	Activities	Key Performance Indicator	Means of verification	Timeframe	Indicative costs	Lead Agency
4.1 Technical Support Team established to support implementation of the plan	- Establish membership and TORs -	- Functional Team established and meeting at specified intervals - Number of meetings and reports	- Minutes -	Within 1 month	Meetings	ZPWMA
4.2 Inter-agency and inter-ministerial collaboration improved	- Regular reporting to JOC - Regular reporting and input to Environmental Sub Committees - ZPWMA engagement with other relevant ministries and agencies	- Number of reports - Formal records of engagement	- Reports -	On going	None	ZPWMA MEWC
4.3 Effective private sector collaboration established	- Establish a formal forum for private sector bodies to interact with ZPWMA – corporates, business, and consumptive and non-consumptive operators (MUST be a constituted organization – not individuals)	- Formal recognition adopted - Formal records and engagement	- Minutes	Within 6 months	Meetings	ZPWMA
4.4 Effective NGO collaboration established	- Establish NGO coordinating body / bodies	- Functional and meeting at specified intervals	- Minutes	Within 3 months		Mana Pools Anti-Poaching Collaborative Group ZPWMA
4.5 Effective international collaboration established	- Streamline existing protocols with Zambia and Mozambique on law enforcement issues - Improve communication and operational procedures to enable	- Number of contacts between the JOC (e.g. Zambia/ Zimbabwe) - Number of contacts between the area managers of relevant parks (e.g. Mana AM and Lower Zambezi AM)	- Area Manager reports - Cross-border protocol reports	Initiate AM-AM contacts within 2 months, then on going		ZPWMA MEWC JOC (MFA)

	better cross-border linkages to fight wildlife crime					
4.6 Effective engagement with communities (link to Section 1)	- Organize needs assessment of local communities and RDCs - Establish local chiefs forum on biodiversity conservation - Awareness campaign at local level	- Meetings organized and reports prepared - Number of events performed. - Assessment of community response and links to law enforcement	- Minutes - Reports	On going		ZPWMA Funding and implementing agencies Local leadership RDCs
Action plan is promoted and adequately resourced	- Finalize action plan and budget - Agree on funding structure and roles and responsibilities - Identify strategic NGO partners (to facilitate funding) - Approach funding agencies - Manage funds -	- Anti-poaching plan and budget produced - Funding structures in place and roles/responsibilities established. - Number of grant applications prepared - Number of grants secured - Number of grants completed	- Plan	Action plan finalized in two weeks Funding and business plan established within 3 months Then on going		Funding / implementing agencies ZPWMA
4.7 Effective information dissemination and communication strategy implemented	- Undertake awareness campaign promoting and marketing the plan - Undertake regular progress reports on the implementation of the plan	- Number of campaigns - Frequency of progress reports	- Reports - Campaign materials - Press releases	Initial campaign within 6 months On going		ZPWMA Support Team Ministry of Tourism Ministry of Information

National elephant survey

Olivia Mufute, the Chief Ecologist for ZPWMA, gave a brief presentation on the national elephant survey. Zimbabwe participated in the Great Elephant Census, funded by Paul Allen, in 2014. Zimbabwe's surveys took place from 27 June to 1 November. The methodology and survey area was the same as the last countrywide survey held in 2001. At a national level, the population estimate was 82,092, a statistically insignificant decline from the 2001 estimate of 88,123. For Northwest Matabeleland, the estimate was 53,991 (2001 estimate was 49,310), a statistically insignificant increase. In the Sebungwe region, the estimate was 3,407 (2001 estimate was 13,989), a statistically significant decline of approximately 75%. In the Southeast Lowveld, the estimate was 11,120 (2001 estimate was 4,992), a statistically significant increase of around 115%. In the Zambezi Valley, the estimate was 11,657 (2001 estimate was 19,297), a statistically significant decrease of around 36%.

At the national level, if the elephant population had been growing at 5% per annum, then it should have been close to 140,000 – raising questions about 'missing' elephants. We also monitored carcasses, looking at the age of the carcasses. For most of the areas, there were few fresh or recent carcasses.

For the Zambezi Valley, most other mammals have also declined since 2001. Survey data show that those declines were happening before 2001, although elephants had been increasing up until 2001. Elephant bulls had not showed a major decline, while the cowherds had. There was evidence of encroachment into protected areas, such as Charara Safari Area, and fires in the Matetsi Safari Area. The surveys in the Zambezi Valley were carried out in June-July 2014, as opposed to July-August 2001. ZPWMA is developing a set of key research questions to help understand the dynamics in the area.

Opportunities and success factors

An analysis of the strengths, opportunities, success factors and core competencies was undertaken in a set of working groups. The detailed feedback from the working groups is available in Annex VI.

Address from Public Prosecutor, Kariba

The Public Prosecutor from Kariba joined the meeting to provide some details on his experiences dealing with wildlife crime. He clarified bail procedures, as well as noting that under the Parks and Wildlife Act, offences with certain species shift the burden of proof to the accused. He noted that there is no extradition agreement with Zambia, which means that in general the Public Prosecutor opposes bail in those cases.

A short discussion on inquests when rangers shoot poachers ensued. Rangers sometimes suffer from retribution from public inquests. While it is not currently possibly to close these inquests, the Public Prosecutor recommended that the ZPWMA legal department could compile issues for discussion with the Office of Public Prosecution.

Next steps

The meeting agreed on a number of key next steps:

1. Write up of workshop proceedings by 2 April 2015, sent to Facilitator
2. Facilitator reviews workshop proceeding by 4 April 2015
3. Circulate draft workshop proceedings and draft action plan to workshop participants by 7 April 2015
4. Comments from participants by Tuesday 14 April 2015.
5. Final workshop proceedings and plan circulated by Tuesday 21 April 2015.
6. Business plan and budget finalized by 30 May 2015.
7. Next meeting “open”.

Meeting close

Closing remarks were made by the Director-General, who thanked participants for their commitment and dedication. The Regional Manager, Northern Region, gave the vote of thanks, thanking the donors and organizers (The Tashinga Initiative, Zambezi Society, John and Nicci Stevens, Kavinga Safaris, AWF). He expressed particular thanks to the Director-General for his comprehensive participation in and support for the initiative. He also thanked those who had travelled a long way to attend the workshop. He expressed particular appreciation to the members of the private sector and of other government agencies for taking time out of their busy schedules to attend the workshop. Finally, he thanked the facilitation team and the Chirundu Safari Lodge.

To close the meeting, Lynne Taylor of The Tashinga Initiative presented Marvellous Mbikiyana, the Area Manager for Mana Pools National Park, with Easter eggs for the community at Mana Pools National Park.

Annex II – Agenda

A collaborative workshop held by ZPWMA to develop an anti-poaching strategy for Mana Pools National Park and neighbouring Safari Areas
Venue: Chirundu Date: 30th March to 2nd April, 2015

Day 1 - Monday 30th March
1500: Arrivals settle in, fishing, sundowner cruises
1900: Welcome Dinner with Address by TRAFFIC - (T. Milliken)
Day 2 - Tuesday 31st March
0800: Welcome and Opening Remarks - DG - ZPWMA
0815: Introductions
0830: Background to the workshop - R. Maasdorp, Zambezi Society
0845: Objectives and Purpose of the Workshop - Facilitator
0900: Law enforcement and anti-poaching in Mana Pools - Area Manager (Mana) Mbikiyana
0930: Ranger patrols and monitoring - Area Manager (Chewore) Sandram
1000: TEA/COFFEE
1030: 1st Working Session: Stakeholder Analysis - who are the key stakeholders and actors and what are the links between them? (Plenary)
1245: LUNCH
1400: 2nd Working Session - Problem Analysis - What are the key issues and the cause-effect relationships ships between them? (Working Groups on selected themes?)
1530: TEA/COFFEE
1600: Report back from Working Groups
1640: Synthesise results and Finalise Problem Analysis
1730: Break for the evening (Fishing and/or sun downer cruise)
1900: DINNER
Day 3 - Wednesday 1st April
0800: 3rd Working Session: Strengths and Opportunities
0800: What are the opportunities (external factors)? - Working Groups
0900: Report back from Working Groups
0930: What are our success factors and core competencies? Working Groups
1030: TEA/COFFEE
1100: Report back from Working Groups
1130: 4th Working Session: Develop Draft Strategic Action Plan with Indicators - Working Groups
1245: LUNCH
1400: Report back on Strategic Options
1500: Synthesis of Strategic Options and Priorities
1530: TEA/COFFEE
1600: 5th Working Session: Activities, responsibilities and Costs - Working Groups
1700: Report back to plenary by Working Groups
1745: Break for the evening
Day 4 - Thursday 2nd April
0730: 6th Working Session: Development of Draft Strategic Action Plan with performance indicators and next steps
0945: Closing Remarks - DG - ZPWMA
1000: Participants Depart

Annex III – Stakeholder analysis

Stakeholder analysis – by sector

Law enforcement	Private Sector	Monitoring	NGOs	Communities	Ministries	District Admin	Cross-border	Other
PWMA	Lower Zambezi Tour Operators Association	Monitoring Systems (MIKE & ETIS)	Tashinga Initiative	Traditional leadership	MEWC	Hurungwe RDC	TFCA	Poachers
ZRP	Mana Pools Tour Operators	Researchers	AWF	Local communities	ZTA	Mbire RDC	ZAWA	
ZRP Support Unit Foxtrot Troop	Mongwe Fishing Camps	IUCN	WEZ	Local chief	Ministry of Education		Conservation Lower Zambezi

	ZNA	
	ZINWA	
	Local communities	
	Traditional leadership	
	CAMPFIRE	

Annex IV - Initial problem analysis

Funding & resources	Coordination	Corruption	Patrols	Policy	Access	Poverty	Other
Financial constraints	Lack of coordinated effort in inventing modern technology	organized poaching & corruption	Agencies (law enforcement) should discuss what they intend to achieve before they deploy or patrol an area	Absence of stiffer sentences on the accused / arrested	Inaccessibility of road network	Poverty has caused communities to turn against wildlife for survival	Mistrust
Lack of funding	Lack of cooperation between key players in the area	Corruption	Lack of manpower to cover all the ground and emphasis should be made on the training aspect	Lobbying for stiffer sentences	Accessibility	Community poverty	Failure of the protectionism model
Funding	Lack of strong dedicated leadership		Limited access for patrols and reaction	Indemnity	Improve condition of road network in parks areas	Greed / poverty	Informer payment mercenary type of informers

Funding & resources	Coordination	Corruption	Patrols	Policy	Access	Poverty	Other
Funding	Participation and commitment		men on the ground		Poor state of access roads	Climate change affecting agriculture - people resort to poaching	
Depressed earnings from tourism	Lack of collaborative effort among stakeholders		poor ground coverage - low detection and deterrence				
I am of the opinion that there is inadequate funding involved in the conservation of all animals and those who police the laws	Clear & effective structure		Patrols				
Funding	Implementation systems		effective patrols along the rivers				
Lack of resources but focus being on harnessing what is currently available to achieve more in terms of law	Communication						

Funding & resources	Coordination	Corruption	Patrols	Policy	Access	Poverty	Other
enforcement							
no donor funding							
Anti-poaching resources constraint							
Resource constraints							
Many power shortages because of financial support							
Transport shortage due to lack of funding							

Annex V – Problem analysis working group feedback

Group 1

Funding

Internal funding
- poor revenue base
- competing needs (e.g. PAC)
- poor cash flow realized as a low number of tourists

External funding
- reduced donor support
- currently small-scale donor funding channelled through other donors, e.g. Tashinga Initiative
- large-scale donor funding affected by poor government relations

Solutions
- Channel external funding through supporting NGOs (e.g. WWF, Tashinga Initiative)
- Get assistance from government through budget allocations
- Formulate a clear plan that attracts investors

Effectiveness of law enforcement

- Coverage is uneven
- Deployments are biased towards easily accessible areas
- Manpower levels are low
- Motivated and skilled leadership inadequate
- Recruitment and selection criteria not implemented
- Fitness levels are not adequate
- Training and skills development is poor
- Conditions of service are poor – living and working conditions, remuneration, assurance, and back up services, insurance, rewards/incentives.

Equipment is inadequate
- Radios
- GPS
- strictly controlled use of cell phones
- Firearms (serviceable)
- Readily available air support
- More suitable vehicles
- JCB vehicles
- Camping and patrol equipment

Intelligence gathering is poor
- network system
- poor coordination of information and ineffective communication system

Community involvement is poor

Solutions

- improve access to the southern part of the Park
- management of the deployment period (14 day extended patrols?)

Coordination

- Promote more joint patrols between key stakeholders
- Better coordination among stakeholders in resource mobilization and information sharing
- joint planning between stakeholders
- Joint investigations and interrogations
- Communication

Linkages

Coordination – Funding
Funding – Coordination
Coordination – effective law enforcement
Funding – effective law enforcement

Group 2

Manpower

- Present manpower is not adequate. Ideal should be 75 trained and fully equipped deployable rangers.

Fully equipped, motivated and trained rangers

- Not the current situation

Communication networks

- Establish proper networks between relevant stakeholders inside & outside the Park
- Community engagement / awareness
    - CAMPFIRE strengthening policy issue
    - Chiefs Indaba – listen

Infrastructure

- Enabling environment (roads, accommodation, energy, water, community, education) is not adequate.
- Forward bases are not fully equipped
    - Nyakisakana
    - Mazunga

Group 3

Funding and capacity issues

- low manpower
- low budget

- shortage of equipment
- lack of motivation and morale
- poor accessibility

Poor communication
- Lack of effective collaboration amongst stakeholders – not only law enforcement, but also private sector. Extends to NGOs and ZPWMA.
- Lack of radio communication

Poverty and lack of awareness on wildlife issues
- Lack of education in wildlife issues
- lack of alternative livelihood
- lack of perceived and tangible benefits

Lack of appreciation of value of wildlife
- at community level
- at judicial level – lack of effective sentencing, insufficient field training and intelligence gathering

Change in land use patterns
- encroachment
- lack of fences (is it time to look at this issue?)

Transboundary land use conflicts
- specifically along Zambezi River, between ZW, ZM and MZ.

Corruption
- age old and pervasive

Questions
- Lack of effective sentencing – is that really true? Sentences are strong, but evidence gathering is poor, and data on follow through to prosecution often not available. Some magistrates still need information and training.
- Fencing – general discussion. Must look at inherent weaknesses of the current law enforcement approach.
-

<u>Group 4</u>

Policy

- Decision-making within ZPWMA is too slow.
- Indemnity is an issue (solution - honorary officers, police reservists)
- UAVs?
- Other acts such as forestry and mining – contextualization, training
- Stiffer penalties need to be implemented effectively and reviewed (e.g. trespassing).
- CAMPFIRE – review and revamp
- Parks use of motorbikes not allowed

Training
- Ranger

    - Operational, legal, evidence, scene attendance
    - Investigation
    - Driving – defensive & 4X4 skills
    - GPS, GoPro, Radio
    - Tracking skills
    - Use of Operational Procedures and special tactics
    - Weapons training
- Management skills
- Conditions of service – morale
- Boat handling
- Courts

Access
- Rehab existing roads
- Additional reach
- Bridges
- Airstrips are OK (don't need).
- Scope of work
- Collaborating
- Funding

Corruption and collaboration
- mind set change – conditions of service, incentives, barefoot example.
- Research drivers of corruption
- PWMA cell phones (no personal phones)
- Poor conditions of service lead to illegal hunting (rations) or complicity with poachers
- Alleged hunter complicity (rations)

Equipment
- 4X4, quadbikes
- Access to aircover
- Sell old boats and secure appropriate types

Ranger motivation and morale
- conditions of service
- timeous pay
- incentive fund
- legality of reward for successes
- equipment
- housing
- Head Office visits and briefings
- Regional recognition

Funding
- improved $$
- coordination and collaboration centralized both consumptive and non-consumptive
- ration killing leads to PR problems with some donors
- "infrastructure for lease" – i.e. capital investments instead of lease fee

Cross-Border

- Interpol
- Zimbabwe JOC & Zambia JOC

Community

- no known initiatives
- Poverty, lack of awareness
- local community leadership
- CSR
- CAMPFIRE Review and rehabilitation
- No sense of ownership
- Free access for local schools and community leaders
- Lack of feedback all stakeholders
- Improve and assist with farming methods
- Projects proactive
- Curio outlet

Patrols

- Only 13 active rangers
- Quality, equipment, access, mobility, reaction time, supervision & accountability
- New tactics & methods – forward camps, focusing on hot spots and so on.
- Boundaryless synergies – should we focus on a specialist crowd that deals with the escarpment and another that deals with the flat land
- Microlight - air cover
- Local stakeholder command centre

Other

- Lack of 'invested' operators in Nyakasanga and Sapi
- Park Plan LZV rather than just Mana.

Linkages

Access

Training

Annex VI - Opportunities and success factors – working group feedback

Group 1

Opportunities

- Partnerships – e.g. NGO, Government, Private, Communities. Assist with pooling of resources, community participation, targeting embassies
- Realignment of the law in terms of the constitution (tightening our legislation)
- TFCA (Lower Zambezi) – joint marketing, joint law enforcement, joint management
- World Heritage Site – great opportunity for funding
- Review of CAMPFIRE – rebuild confidence, other alternative land use, fire management, participation of communities in tourism, additional eyes and ears on the ground.
- Advanced technology – night vision, internet, cyber tracking, UAVs

Strengths

- Wilderness value
- Local knowledge
- Skilled manpower – supportive education
- Management commitment
- Supportive local leadership
- Dedication and loyalty (both management and employees)
- Availability of informers
- Availability of manpower (labour) from local communities
- Stakeholder collaboration – pooling resources, technical skills, create synergies.
- Large biodiversity

Group 2

Internal – LZV
External – outside LZV

Internal strengths

- PA lies under one management and no conflict of interest as to how the area is managed.
- Existing infrastructure, skills and abilities.
- Mana wildlife population has not crashed (yet)
- Zambezi Valley – Mana Pools – is a jewel in Zimbabwe's crown. Biodiversity and richness of the Zambezi Valley.
- Willingness of all ZV stakeholders to work together for a common vision.
- Operator support (could be more organized and structured)
- Data collection / monitoring
- Aerial support (Agricair, Microlight association, Chifuti Helicopter)
- Increased collaboration with all stakeholders – law enforcement agencies, operators, NGOS – both supportive and implementation agencies.
- Availability of technical support to Parks – Training, Honorary rangers, law enforcement.
- Communities – harness skills and gain support – make inclusive employment.
- Upgrading status of Sapi Safari Area to stand alone station.

- Research

External opportunities

- Build on enhancement of public awareness through tour operators
- Operator support – harness support from clients towards conservation
- Research – build on current data – harness availability of international researchers
- Monitoring / surveillance technology
- Increased collaboration with all stakeholders (clients/NGOs)
- Technical support – harness funding
- Communities (explore Namibia model) – IUCN Beyond Enforcement advisory bodies
- Upgrading status of safari areas – permanent presence of clients and funding

Group 3

Opportunities

- Resilient ecosystem (rich biodiversity)
- World Heritage Status – easy to draw attention
- Established tour operators
- Surrounded by other PAs – no hard edge effects, no encroachment
- Good vantage points used as observation points
- Donor interest
- Potential increase in tourism coverage
- Potential to fund itself (*ceteris paribus*)

Strengths

- Traditional leaders' support from local community in Chundu
- Strong legal framework to support law enforcement
- Current experience and skills
- Government support through other law enforcement agencies
- Infrastructural strength (airstrip, floodplain access good)
- Reaction unit presence (to be located at Mana Pools)
- Adequate and serviceable firearms
- Tourists coverage of the Park (although seasonal)
- Commitment by staff
- Inter-state joint patrols, especially with Zambian personnel (if it has been moved back to government from ZAWA)
-

Group 4

External opportunities

- International commitment to fight wildlife crime is massive and diverse
- Mana has huge international profile
- Partnerships – private sector/NGO/public/state
- Bilateral relationship with neighbouring countries (Zambia)
- Improved technological systems are available
- Ability to exploit available international networks and expertise

Internal strengths

- Good local ability – good

- Capacity (skills ad experience)
- Will (teamwork) for stakeholders to work together
- Sharing of technology and systems
- Contiguous system of Protected Areas (Gache Gache) to Mozambique border
- Knowledge of the area
- Potential for development of tourist facilities (roads) in southern sector of the Park.
- Government departs are available to support Parks
- Potential for immediate revenue increase through an upgrade to the central booking office
- Honorary officers are volunteers
- Revival of CAMPFIRE
- High value of wildlife & wilderness area

Annex VII – Outline of Strategic Elephant Policy and Management Framework

(Extract from Proceedings Hwange Safari Lodge Workshop 2-4th December 2014)

Table 1. Structure of the Strategic Elephant Policy and Management Framework

Long-term Vision	The long term vision adopted by the workshop retained the essential components of the 1997 plan
Targets	The three targets included in the 1997 policy were retained but the provision to maintain or increase elephant range not linked to a specific benchmark as it was in 1997
Key Components	The key components are the primary themes or headings of the strategy under which the framework is organised. The ten policy and management objectives included in the 1997 plan are included within these headings
Strategic Objectives	The strategic objectives reflect briefly but more explicitly the policy intention for the respective components
Outputs	The outputs are statements that reflect the expected result that will be realised during the time the plan. Outputs are therefore expressed in the past tense
Key Activities	Key activities represent the necessary and sufficient actions that need to be carried out effectively and efficiently to achieve the Outputs. They may be a subset of a wider range of activities that can be added but, as key activities, they are those that are vital to achieve the Outputs and are those on which the major emphasis should be placed.
Key Performance Indicators (KPIs)	The Key Performance Indicators provide a basis on which to measure and monitor the success or otherwise of the Strategic Objectives, Outputs and Activities.
Means of Verifying the KPIs	Means of verifying the KPIs were not developed during the Workshop and will need to be included in the Management Plan. A preliminary draft for verifying these is included in this report, as discussed at the workshop. It is important that KPIs and means of verification are standardised across the regions and areas of the country and that they can be combined in an unbiased way to reflect national progress in the implementation of the strategic plan.

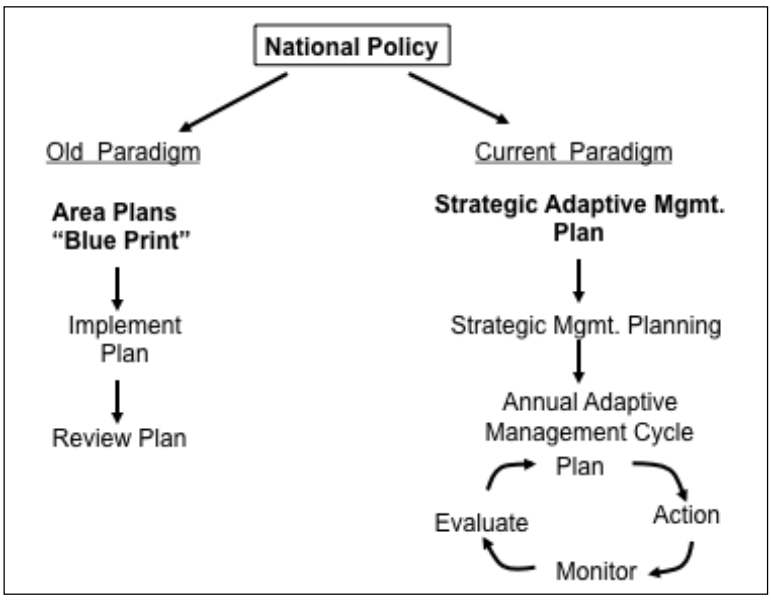

Figure 1. Resource management plans answer to national policy and legislation but in recent years have shifted from "blue print plans" to strategic adaptive management and planning. The strategic level plan developed in this workshop provides the basis for regional and local planning that includes action, monitoring and evaluation on an annual basis.

4.2 Zimbabwe Strategic Elephant Conservation Policy and Management Plan Framework (As agreed at Hwange Safari Lodge Workshop on 4 December 2014)

Long-term Vision: To conserve elephants at levels that will enable them to contribute to the conservation of biodiversity, national development and Zimbabwe's cultural heritage

Targets:

1. To maintain at least four demographically and genetically viable elephant populations in Zimbabwe
2. To maintain or increase elephant range in Zimbabwe
3. To maintain numbers / densities of elephant at levels that do not adversely impact on biodiversity conservation goals while contributing to economically viable and sustainable wildlife-based land uses

Key Components	**1. Protection and law enforcement**	**2. Biological Monitoring and Management**	**3. Social, Economic and Cultural Framework**	**4. Building Conservation Capacity**	**5. Coordination, collaboration and programme management**
Strategic Objectives	**Objective 1**. Ensuring effective protection of all populations of elephant in Zimbabwe	**Objective 2.** Implementing effective biological and ecological management to achieve populations that are within upper and lower acceptable limits to change in numbers and distribution	**Objective 3.** Implementing strategies that enhance the contribution of elephant to rural livelihoods and national development	**Objective 4.** Ensuring that sufficient and appropriately trained personnel, equipment, infrastructure and financing are mobilised, available and used efficiently and effectively	**Objective 5**. Ensuring effective coordination and collaboration with national and international stakeholders to achieve these strategic objectives,
Outputs	**Output #1:** Management actions, security and law enforcement to minimise illegal losses of elephants and their habitats from all populations implemented	**Output #2:** Adaptive management to achieve viable populations in all four sub-populations implemented	**Output #3:** Fair distribution of financial benefits from elephants improved and tolerance for living with elephants increased	**Output #4:** Sufficient numbers of trained, equipped, motivated and effective personnel are deployed and operational	**Output #5:** Coordination mechanisms to assess and review adaptive elephant population management and strategic planning established and operating

Key ACTIVITIES that are required to achieve the OUTPUTS, Key performance indicators (KPIs), and means of verifying KPIs

	Output#1: ***Law enforcement***	**Output #2:** ***Biological monitoring and management***	**Output #3:** ***Social, Economic and Cultural Framework***	**Output #4:** ***Building conservation capacity***	**Output #5:** ***Coordination and programme management***
Key Activities	• For each key population establish a highly trained rapid response anti-poaching unit for deployment to areas under threat • Appropriate informer systems established and supported at regional, national and local levels • Improve investigation and prosecution of crimes (collection and preservation of evidence, ballistics evidence, professional prosecution of cases, information for legal profession) • Set up National and local intelligence databases • Enhance international and transboundary collaboration in law enforcement • Enhance social (community) involvement in law enforcement • Reduce illegal settlements in all	• Monitor elephant population trends and elephant impacts on biodiversity through aerial, ground and ranger-based methods, among others • Use research findings, expert opinion and informed public opinion to establish thresholds of potential concern (TPCs) to initiate management action in respect of elephant impacts for protected areas • Carry out appropriate management actions when populations exceed, or are projected to exceed, TPCs • Monitor trophy quality and adjust quotas to maintain desired levels of trophy quality • Define current elephant range and explore options for extending the range and maintaining connectivity between fragmented populations • Recognising the long response time of elephants to management interventions, use modelling to project alternative outcomes of management	• Provide incentives and promote partnerships and joint venture opportunities to strengthen elephant management, including across boundaries • Explore additional elephant-based tourism and sustainable utilization opportunities. • Facilitate the transparent distribution of the benefits and costs of elephant management and conservation • Implement effective techniques and land use strategies to mitigate human-elephant conflict. • Promote effective recovery and use of all products from dead elephants • Include information on elephants and their conservation in school curricula and promote environmental education in rural areas adjacent to key	• Secure funding to initiate the implementation of the elephant management plan • Establish sustainable funding programs to build and maintain necessary human resources and strengthen elephant conservation and management capacity • Analyse current capacity and identify needs • Initiate and/or maintain continuity in research and monitoring necessary for the conservation and adaptive management of elephants and habitats • Strengthen research capacity in ZPWMA and collaborate with other research institutions • Establish training and in-service retraining of personnel in law enforcement, research and monitoring, education and awareness, community elephant management, management • Strive to achieve best standards for elephant management, including any forms of utilization • Engage available expertise and capacity within ZW	• Establish a national elephant conservation & management task force / steering committee that includes stakeholders meetings at least bi-annually to review progress and to develop an annual implementation plan • Establish four regional management committees to meetings at least twice each year and implement sub-regional plans • Strengthen links with neighbouring states to confer on the management of shared elephant populations, particularly in relation to TFCA populations • Establish a full-time elephant manager to be responsible for coordinating the implementation of the elephant management plan • Strengthen coordination between the hunting industry and the elephant management programme • Implement an effective information dissemination and communication strategy, including regular progress reports on the implementation

	Output#1: *Law enforcement*	Output #2: *Biological monitoring and management*	Output #3: *Social, Economic and Cultural Framework*	Output #4: *Building conservation capacity*	Output #5: *Coordination and programme management*
	wildlife areas • Revisit the appointment of Honorary Officers to assist in law enforcement • Ensure full compliance with hunting regulations and quotas set		elephant populations • Develop and implement an effective communication strategy for local, regional and international audiences		of the plan

	Output#1: *Law enforcement*	Output #2: *Biological monitoring and management*	Output #3: *Social, Economic and Cultural Framework*	Output #4: *Building conservation capacity*	Output #5: *Coordination and programme management*
Key Performance Indicators	• Number of dead elephants located each year • Number of dead elephants killed illegally • Percentage of animals from which tusks were recovered • Number of elephant poachers arrested • Number of successful convictions • Number of poachers sentenced (and record of sentence severity) • Patrol effort and effectiveness indices (see sample reporting form) • Number of infringements of hunting regulations • ETIS law enforcement effort ratio • Number of ivory seizures (including number of tusks and weight) • Number of joint operations	• Elephant population estimates and distribution from aerial surveys at least every three years for each of the four sub-populations • Records of all elephant deaths with data on dates, locations, cause of death, reason killed (trophy hunting, problem animal control, natural mortality, management, illegally killed elephants), age, sex, tusk size • Trophies taken as % of quota, and trend in trophy quality • Thresholds of potential concern established for each area and selected indicators of change monitored • Management actions taken in relation to TPCs being exceeded • Range expansion/contraction estimated from all available data • Use and effectiveness of corridors assessed, inter alia, from aerial surveys, ground sightings and reports, satellite collared animals • Reporting into international monitoring systems as required (e.g. AED, ETIS and MIKE)	• Policy instruments that demonstrate and establish incentives to conserve elephants • Levels of private and community investment in elephant conservation measures • Annual record of distribution of elephant derived benefits (revenue, development projects, products received by beneficiaries) • Record of Human-Elephant conflict incidents (in HEC Database) • Record of mitigation measures taken to reduce HEC (in HEC Database) • Levels of investment (funds and manpower) in mitigating HEC by ZPWMA, communities and partners • Number of poaching incidents/arrests based on prior information and leads from communities / land holders. • Trends in elephant numbers in non-protected areas	• Annual funds and resources available for elephant conservation • Record of staff training and re-training • Manpower density for protection of elephant (No of km^2/operational field person) • Effective deployment of field staff (e.g. % of available man days spent on patrol in the field) • Research person days spent on monitoring elephant population parameters in each population • Number of research-person days spent on monitoring / assessing elephant impacts in relation to TPCs • Number of researchers, programs and reports • Number of vehicle months available during the year • % of area that has secure VHF radio capacity • % of the year that the secure VHF radio system was functional • Number (or %?) of ranger stations in key population areas fully functional • Number of operational research facilities	• National and regional committees functional and meeting at specified intervals • Committee meeting minutes with actionable points approved and circulated within one month of meeting • Record of attendance at and reporting to regional and international elephant conservation bodies of which Zimbabwe is a member • Elephant manager appointed with full terms of reference • Regular reports from elephant manager on implementation

	Output#1: *Law enforcement*	Output #2: *Biological monitoring and management*	Output #3: *Social, Economic and Cultural Framework*	Output #4: *Building conservation capacity*	Output #5: *Coordination and programme management*
Means of verifying KPIs	• Numbers of dead elephants in various categories recorded at field stations, conservancies, and CAMPFIRE District Offices, compiled at regional and national levels and presented to the Regional and National Coordinating Committees (R&NCC) bi-annually • Arrests and convictions from Station and Area records and reports compiled and submitted to R&NCC • Patrol effort Indices - see under Component #4 • Hunting regulation infringements derived from SOAZ/ZPHGA reports and from field station reports compiled and presented to R&NCC • ETIS law enforcement effort ratio available from TRAFFIC • Ivory seizure details from ivory stockpile records	• Elephant population numbers, distribution, carcass ratios and trends from aerial survey reports • Elephant deaths and trophy quality - as for records under Law Enforcement with additional analysis of data and trends reported to the R&NCC bi-annually • Reports on Thresholds of Potential Concern where these have been established • Research and monitoring reports of elephant impacts in selected sites in relation to TPCs • Reports on elephant locations from ground and aerial sightings • Use of corridors based on field reports and studies of elephant movements using tracking devices • Copies of required reports sent to international monitoring systems	• Documented policies and list of operating partnerships / joint ventures that promote elephant conservation & management • Record of investments in elephant conservation measures assembled by elephant programme manager/coordinator • Summaries from Human-Elephant Conflict database reported at Annual Meeting of R&NCC • Records and annual summary of arrests and poaching incidents intercepted based on leads provided by communities • Elephant censuses that have covered non-protected areas	• Record of funds available (USD) and investment by ZPWMA, Private sector, NGOS, and CAMPFIRE in elephant conservation measures (Compiled annually by Elephant Manager / Coordinator) • Consolidated record of number of field personnel and days operational (law enforcement, research & monitoring, elephant management) for each area in the elephant range compiled and reported on at annual planning meetings • Research reports and papers on elephant conservation and management • Records of vehicle months, VHF radio operation, fully functional stations, operating research facilities, compiled and consolidated at station, area and regional levels and reported on to the R&NCC bi-annually	• Record of meetings, minutes actions completed, attendance at national and regional committee meetings • Record of when minutes of meetings were completed and circulated • Date on which terms of reference for elephant management position were completed, date the position was filled and operational • Record of reports by the person in the elephant management position

	Output#1: *Law enforcement*	Output #2: *Biological monitoring and management*	Output #3: *Social, Economic and Cultural Framework*	Output #4: *Building conservation capacity*	Output #5: *Coordination and programme management*
Note: It will be necessary to design record sheets that serve to standardise the manner in which records are maintained at field station, area, and regional levels so that they can be combined and summarised in a consistent manner to provide clear and transparent national level indicators of progress in the conservation and management of elephant from year to year. An example of one such form for law enforcement effort is provided below. The forms being used at MIKE sites may also be used more widely.					

Elephant mortality and law enforcement annual reporting form - a draft example of data that may be required from each station

SEE NOTES BELOW	Name of person completing this data form					
	Date on which this data from was completed					
	Name of area covered					
	Size of area in km^2					
	YEAR	2015	2016	2017	2018	2019
	Date of aerial census population estimate					
	Aerial census elephant population estimate (number)					
	Aerial census carcass ratio (%)					
	Number of natural mortalities					
	Number of tusks recovered					
	Number killed illegally					
	Number killed on PAC					
	No killed for rations					
	Number killed on trophy hunts					
	Number of carcasses found that died in previous years					
	Total mortalities					
1	Number of elephant poaching incursions/attempts detected					
	Number of incursions/poaching attempts intercepted					
	Elephant poachers arrested during the year					
	- How many were given bail					
	- How many were given jail sentences?					
2	- Of these how many received mandatory sentences?					
	Number of poachers killed during the year					
	Number of firearms recovered from poachers					
3	Total man-days spent on patrol					
4	Average number of staff available to patrol at any one time					
5	Total number of vehicle months available during the year					
6	% of the area that has secure VHF radio communications					
7	% of the year that that the VHF system was functional					
8	Number of incursions reported on / reacted to by local community					
9	Hunting regulations infringements					

NOTES:

1	These are incursions into the area by poachers clearly intending to use firearms, poison, heavy snares, etc. to kill elephants and/or rhinos, or attempted incursions that were intercepted before they took place
2	Mandatory sentences for elephant / rhino poachers or dealers are 9 years for first offence and 11 years on second

3	This is actual patrolling effort expressed in patrol man-days carried out per year (not total staff x 365 days)
4	This is the average number of men (including deployments from other areas) in the field at any one time
5	Each vehicle available for law enforcement operations should be multiplied by the number of months it was available for field operations
6	e.g. if only three-quarters of the area has VHF radio reception then this figure will be 75
7	e.g. if the VHF radio system was only functional for 3 months of the year then this figure would be 25
8	Refers to the number of times the local community (not paid informers) volunteered information on actual or potential incursions of elephant/rhino poachers, and/or freely provided information/help leading to interception/ arrests
9	Refers to infringements of the regulations by safari operators/hunters/guides (e.g. shooting under age trophies, exceeding quotas, transfers of quotas from other areas, hunting from vehicles, etc.

Annex VIII – Comments received during document review

A small number of comments were received during the review of the summary report that represented new thoughts or ideas that had not been raised during the workshop. As this report represents a summary of the discussions of the workshop, these points have not been integrated into the above report. However, they are summarized below.

It was suggested that it may be helpful to have a facilitated workshop that would bring together all Area Managers across the country to share ideas, and discuss their challenges and successes.

While trophy hunting is not a management option in Mana Pools National Park, it was suggested that the Safari Operators Association of Zimbabwe (SOAZ) was an important stakeholder, particularly in collaboration with neighbouring Safari Areas, and that there could be significant scope for complementary action and collaboration with the safari operators in the Lower Zambezi Valley. This could include enhancement of communication, periodic meetings, and adjustments to concession agreements.

Comments on the draft summary report were received from

FYI - Please note the attached report that clearly demonstrates the long-term reason for elephant decline in the related area that has not been caused by mismanagement or lack of effort. An extended suspension of imports will worsen the situation, reduce the value of those elephant and hasten the decline. Thank you for your attention.

Landuse Changes, Wildlife Conservation and Utilisation, and the Sustainability of Agro-ecosystems in the Zambezi Valley

SUMMARY

Introduction.

The Zambezi Valley below the Victoria Falls is an ancient landscape which has changed little in the last two to three million years. For much of the last 35,000 years it was inhabited by stone age hunter-gatherers and only more recently by cultivators. Intensive settlement and agricultural development of the mid-Zambezi Valley is less than 50 years old. Development has followed the eradication of tsetse flies and the associated provision of access roads and infrastructure. High rates of immigration into the Valley have also been influenced by rapidly growing human populations and overcrowding in communal farming lands elsewhere in the country. Macro-economic factors affecting labour and industrial development in Zimbabwe have also played a role.

The aims of this study were: (¥) to describe changes in patterns of settlement over the last four decades and examine associated changes in wildlife and livestock distribution over the last decade and a half; (ii) to examine how households used natural resources and designed their agricultural systems to meet their needs, and (iii) to attempt to synthesize these two lines of investigation into a predictive understanding of how land use systems in the Valley may, or may not, meet human needs under various bio-physical and socio-economic conditions in the future. We were concerned not only to describe landuse changes and practice but to try and elucidate the processes involved. The study was thus conducted at two scales. At a macro scale (1:250,000) using aerial photography and aerial censuses we examined changes in the distribution of human settlement (from 1951-1993) and livestock and wildlife (from 1980-1995) over the entire study area. At a smaller, meso-scale (1:50,000) we examined household use of natural resources and agro-ecosystem processes in five wards distributed though the study area. Spatial analysis using GIS was not envisaged in the initial project design but it soon became clear that it was necessary. The resources for developing a GIS capacity were provided by WWF=s Multispecies Animal Production Systems Project (ZW0007) from January 1994 to September, 1996.

The study was carried out in two areas of the mid-Zambezi Valley. The Sebungwe region which covered 16,000 km^2 to the south of Lake Kariba and the Dande/Chiswiti area of 8,000 km^2 below the Zambezi escarpment in the north east (**Fig. 1**).

This report is divided into three sections which conform to the aims of the study, namely, changes in human settlement, wildlife and livestock at a macro-scale; meso-scale analyses of household natural resource use and agro-ecosystem sustainability and finally a section which integrates these two scales of analysis.

Changes in human settlement, wildlife and livestock

Aerial photography at a scale of 1:25,000 to cover both study areas was commissioned in June 1993 and successfully completed by early 1994. This has been the only aerial photographic coverage at this scale of the two study areas in the last decade. The photography is available to other agencies at the cost of the prints. We attempted to develop techniques to use scanned aerial photographic images to determine areas of settled and cultivated land. This approach was eventually abandoned in favour of using UTM grid overlays (500m x 500m or 0.25 km^2) directly on the 1:25,000 scale photographs and then transferring the recorded occupance scores for each grid square to a GIS database. For the Sebungwe region we used six sets of photographic coverage, namely, 1951, 1959, 1964, 1973, 1981 and 1993. For Dande/Chiswiti the early photographic coverage (1951 and 1955) was incomplete and we also used coverages for 1959, 1961 & 1966, 1973, 1981 and 1993. In both study areas only the 1973, 1981 and 1993 photographic coverages were complete. In all we extracted data by 0.25 km^2 from some 15,000 aerial photographs.

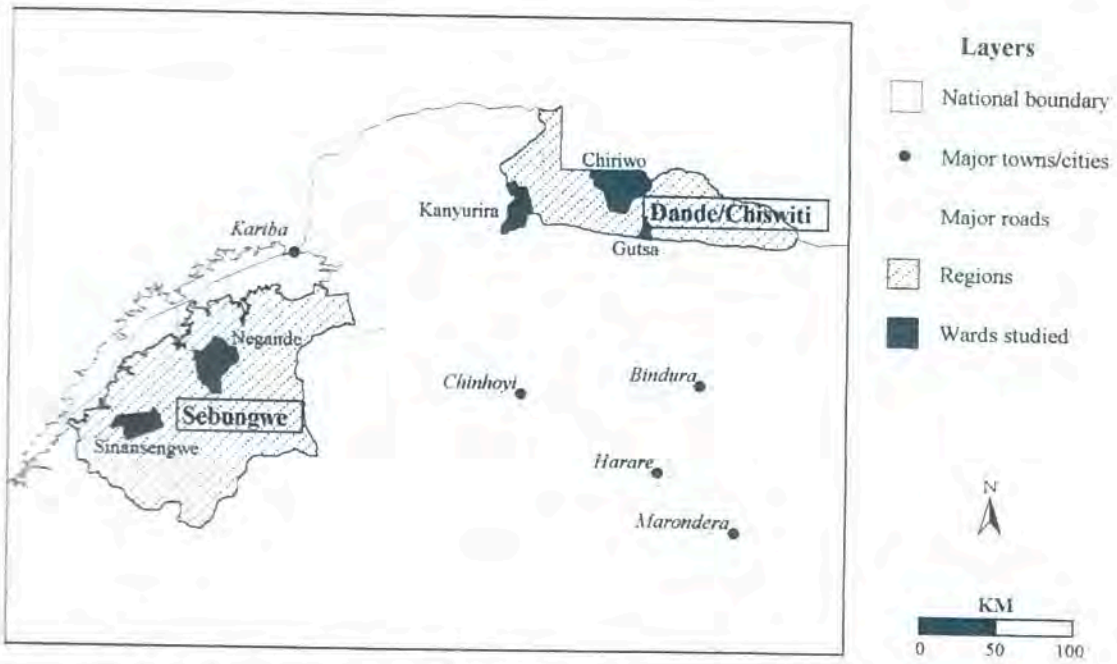

Fig. 1. Map of northern Zimbabwe showing study areas in the mid-Zambezi Valley

An aerial census of wildlife and livestock covering both study areas and funded by this project was carried out during August to October, 1993. Aerial census data for the period 1980 to 1995 have been collated and entered into our data base which, in addition to population estimates and densities, provides the location and number by species for each animal or group of animals sighted on the surveys. The data base contains over 7,000 records covering >10 wild species as well as cattle donkeys goats and sheep.

Human Settlement

Analysis of the changing patterns of settlement indicates that land was being cleared for settlement and cultivation at variable rates over the last 40 years. In the Sebungwe there were two peaks in the rate of land clearance. The first, at 10% per annum, occurred between 1959 and 1964 which coincided with the filling of Lake Kariba and the onset of infrastructural development for tsetse control. The second peak occurred during the period 1981 to 1993 when cleared land increased at the rate of 8 % per annum. The rate at which settlement expanded in the region between 1951 and 1993 averaged nearly 5 % per annum. Analysis of rates of change in the Dande/Chiswiti area before 1973 was complicated by gaps in the aerial photographic coverage. Between 1973 and 1981 there was an exodus of people due to the liberation war which was reflected in a slight decline in the area settled. However, between 1981 and 1993 land clearance occurred an a rate of 9% per annum. This influx of people to the Dande/Chiswiti area coincided with the mid-Zambezi Valley Resettlement scheme and active government promotion of resettlement in the Valley. Broad patterns of change in human settlement in the Sebungwe and the Dande/Chiswiti regions over the 20 year period between 1973 and 1993 are graphically illustrated in **Fig. 2.** Intensive settlement on river systems is particularly apparent and, apart from its direct environmental impacts, it effectively excludes wildlife from key dry season riparian habitats and water. This in turn reduces wildlife populations and the effective use, by wildlife, of large blocks of unsettled and agriculturally unsuitable habitat away from the rivers.

The total areas cleared for villages and cultivation are still low relative to the overall land area and in 1993 stood at 12.4% of the communal land in the Sebungwe study area and 9.2% of the Dande/Chiswiti area. However, cultivation of close to 10% of the overall land area, where arable soils generally cover less than 5%, suggests that cultivation has already extended into marginal soils and terrain. Goals for sustainable forms of rural development and conservation are unlikely to be realised under existing trends let alone under conditions of further population growth and immigration. The sustainability issue is examined at greater depth in the meso-scale, ward level studies below.

Wildlife and Livestock

In the Sebungwe, as expected, the highest wildlife densities were found in the protected areas which cover 6,441 km^2 , or 32% of the 16,450 km^2 study area. The elephant population in the Sebungwe increased from 9,750 in the early 1980's to approximately 11,600 in the mid 1990s. Elephant dry season range declined by about 15%. The area most affected was in the south east of the region **(Fig. 3)**. The buffalo population increased over the same period from 12,600 to 20,400 but also showed a reduction in range. The black rhino population collapsed after the poaching onslaught in 1990-91 from over 500 rhinos in 1989 to less than 35 in 1993 of which 25 were confined to the Matusadona National Park. Livestock, particularly cattle, increased from 3,700 in 1983 more than 45,000 in 1996 with their range extending **(Fig. 3)** as tsetse flies were eradicated. Goats and donkeys also increased in number and distribution between 1983 and 1995. Livestock numbers were probably much higher than indicated here because our morning censuses started before many villagers released livestock from their pens.

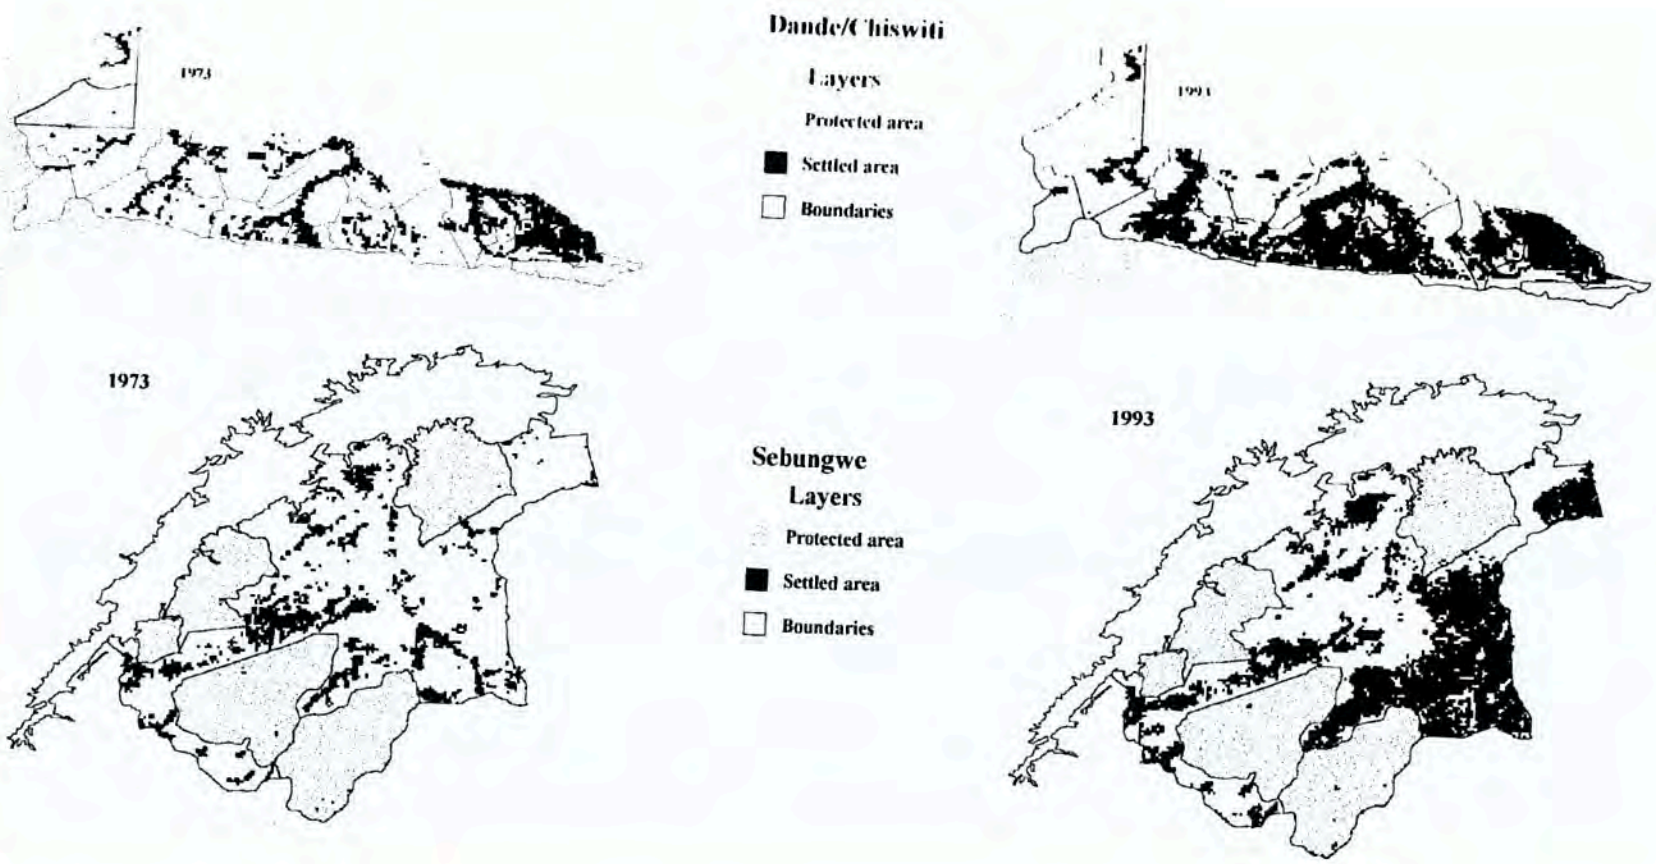

Fig. 2. Changes in human settlement patterns between 1973 and 1993

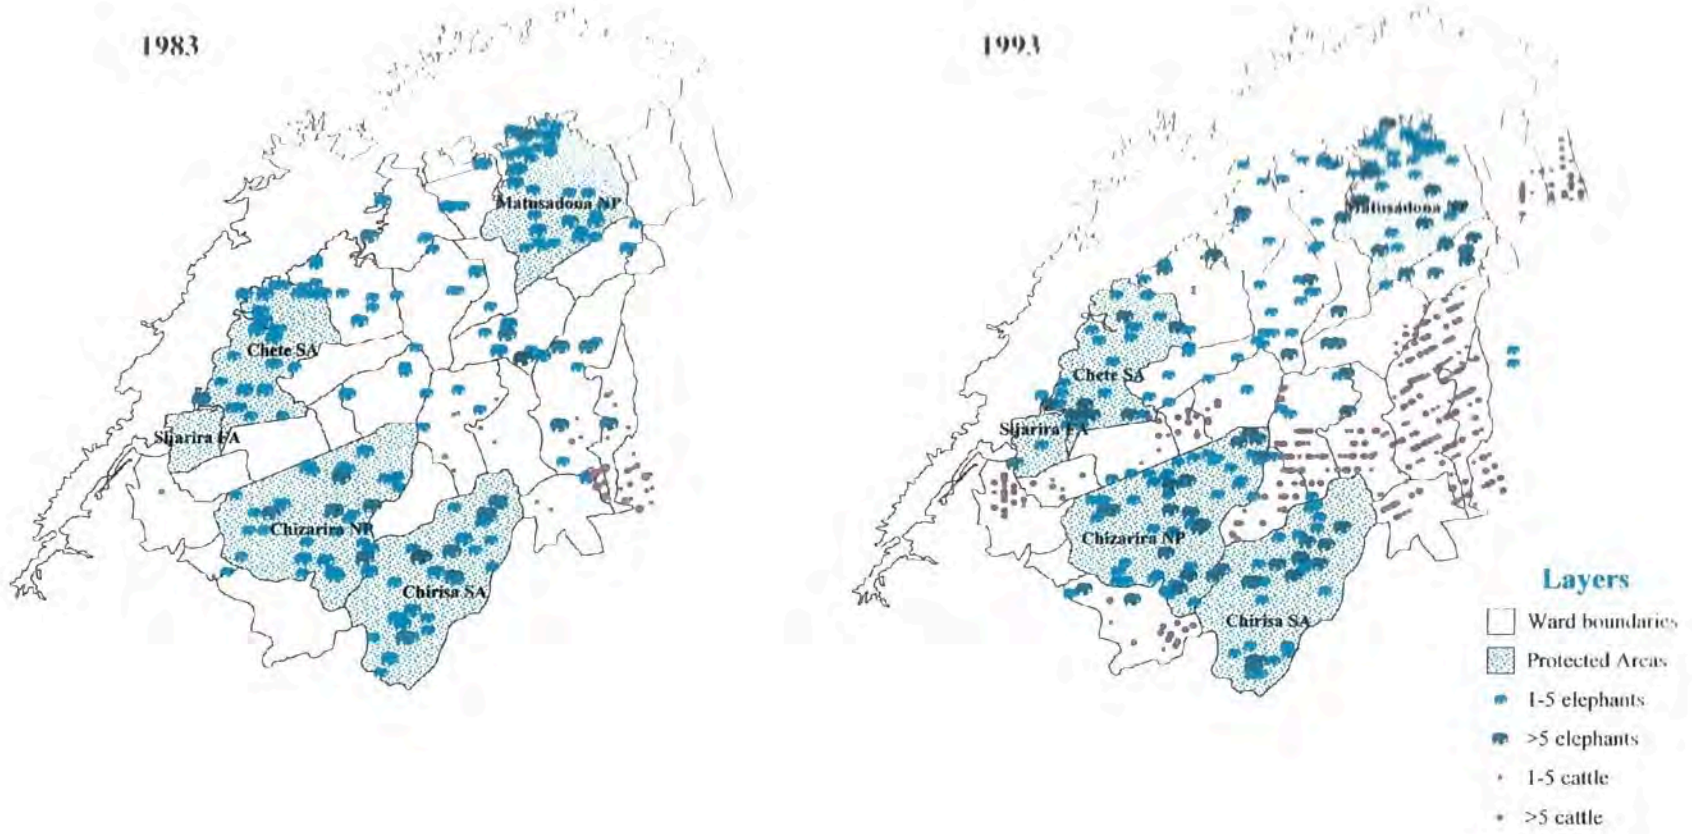

Fig. 3. Changes is distribution of Elephants and Cattle in the Sebungwe between 1983 and 1993

In the Dande/Chiswiti area elephant numbers showed little change over the period 1980 to 1995. Buffalo declined and black rhino were eliminated. Livestock numbers escalated, particularly in the eastern part of the study area - again in response to immigration and the control of tsetse flies.

Macro-scale trends, Conservation and Sustainable use of wildlife.

Human population growth and immigration, continuing land clearance and increasing livestock populations in the Zambezi Valley have already greatly reduced the potential for multispecies systems of animal production. Wildlife as a land use option has been curtailed over the last decade and, in the Sebungwe, the corridors of wildland between existing protected areas are in danger of disappearing. While elephant and buffalo populations have increased overall the reduction of their range and higher densities within protected areas has consequences for conservation within the protected areas of the mid-Zambezi Valley. Elephant densities within protected areas have exceeded densities of 1 km^{-2} for the last 15 years and large areas of woodlands (e.g. 85% of miombo woodlands) have been reduced to scrub and grasslands with marked impacts on the biodiversity of other groups of animals. In both the Sebungwe and the Dande/Chiswiti areas there has been a marked decline of rare but valuable antelope such as sable, roan, tsessebe and eland, both within and outside protected areas. The impacts on biodiversity of habitat fragmentation through land clearance outside protected areas has still be critically measured.

Elephant and buffalo populations are still high in the region and provide the major source of revenue to Rural District Councils (and indirectly to households) from safari hunting licence fees and concessions. However, the larger areas of wildland needed for such ecotourism ventures are becoming increasingly fragmented and confined as land clearance proceeds. The thresholds of human population density at which large mammals such as elephant and buffalo are reduced to very low or non-existent populations are rapidly approaching over much of the area (**Fig. 2**). The loss of wildland and of key large mammals has long term implications for the conservation of biodiversity in these areas and the region. The erection of fences to contain elephants and control animal diseases further exacerbates the problem.

A continuation of the macro-level trends described here for a further decade will almost certainly compromise the survival of viable populations of large wild herbivores outside protected areas and reduce biodiversity within the mid-Zambezi Valley. The sustainability of the Communal Areas Management Programme for Indigenous Resources (CAMPFIRE) and associated eco-tourism ventures in the area will also be compromised. The sustainability of agro-ecosystems under current policy and practice and under higher human population densities are covered below.

Household natural resource use and agro-ecosystem sustainability

Mid-Zambezi Valley agro-ecosystems are complex. Multiple actors seek to satisfy multiple objectives in a politically, economically and bio-physically very variable environment. In a single agricultural season it was not feasible to take sufficient measurements, even when limited to the five wards on which we focused (**Fig. 1**), to develop a predictive understanding of the major processes that gave rise to the agro-ecosystems we observed. Instead we enlisted the help of the people who know best how these systems are structured, how they work and how they are likely to change. Many of these experts were Zimbabwean scientists but most were village people (Village Representatives) elected by the communities in which we worked. We asked the scientists to take measurements that

would inform us about the state of resources in each of the five study wards and we asked them to measure how these resources change with use. Working in intensive workshops the Village Representative groups provided a window onto the world of mid-Zambezi Valley households through which we were able to explore, in great detail, the structure and functioning of these agro-ecosystems.

To explore the spatial and temporal detail of their economies 110 households were monitored each week for between nine and eleven months. To index our detailed investigations of the 110 households we also interviewed 1,088 heads of household. Information on the structure, activities, perceptions and values, and production of each household was obtained. The 110 households were randomly selected from six classes of household development stage and two classes of wealth. A semi-structured data collection process was designed and used to gather information on what was done, by whom, where, when and with what results. This information was checked, calibrated and entered into a digital database to provide the information source for the analysis of household economies. The family labour database, for example, contains over 23,000 records of activities carried out in fields, woodlands, at the homestead, in riverine gardens or with the household livestock. Well over 5,500 maps showing household activities in community woodlands were digitised and linked to the attribute databases.

From this wealth of information and knowledge we have tested our understanding of these complex agro-ecosystems. In the next section we summarise our findings on the contributions natural resources make to household economies. Thereafter we discuss the sustainability of mid-Zambezi Valley agro-ecosystems in the light of our research findings.

Household economies in Communal Area agro-ecosystems of the mid-Zambezi Valley.

Village representatives ranked *land, water, food, cash, livestock or draft, knowledge or education, equipment, community and leadership, clothing and bedding and health* as the ten most important groups of needs necessary to lead an acceptable life. That these needs include factors of production (land, water, livestock and equipment), social goods and services (community, leadership and health) as well as consumable commodities has been neglected in previous studies and their inclusion as household objectives has important implications for assessing the sustainability of landuse systems.

Our analyses provide the following broad assessment of household needs in the mid-Zambezi Valley:

Land. Total areas of land required to satisfy basic household needs using current technology were estimated as being **45 to 50 ha**. This included 5 to 14 ha arable for rainfed crop production, 7 to 9 ha woodland for timber and fuel wood and 28 ha grazing land for a herd of 11 cattle and 10 goats.

Water. An average household (5.5 members) was estimated to require about **80,000** litres of water per year for household use with about half this amount being potable. This amount excluded that required for agricultural production and for livestock.

Food, cash and other basic household needs. The annual cash needs to satisfy basic household requirements for food, clothing, bedding, education, household utensils, leisure and entertainment were between **Z$6,000 and Z$16,000** per household. With increased integration into the broader economy household needs increased. These basic needs levels were equivalent to the total annual salaries of between 2 and 5 full time farm employees in the commercial agricultural sector.

Activities households engaged in to achieve these needs. Households engaged in a range of production and harvesting activities in order to achieve their needs. All households used or sold **natural resources; 97%** of households engaged in **rainfed crop production** activities, **93%** kept or produced **livestock** (including fowls); **59%** had **irrigated vegetable gardens**; **36%** received **remittances** from wage earning family members and about **34%** produced or sold **craft goods** of some sort. On average about 35% of recorded household **cash income** was generated from crop sales, 24% from wage earnings, 14% from livestock sales, 12% from craft sales, 11% from remittances, 9% from beer sales, 4% from wildlife dividends, and 3% from vegetable sales. Natural resources were important inputs to all of these activities with the possible exception of wage earnings and remittances. Virtually all nutrients used in crop and vegetable production were derived from soil stocks; all livestock feeds, most materials used in craft production and the fuel wood used in beer production were derived from woodland resources. Wildlife dividends were derived, via the District Council, from hunting concessions leased to commercial safari operators. **Natural resources** were therefore, **the major material input** to the generation of household **cash income**.

Using median yields for maize, cotton and sorghum, as well as current areas of cultivation and livestock offtake rates, households in Kanyurira, Chiriwo and Gutsa could only just satisfy the most basic requirements if it was assumed that **they grew cotton**. Without growing cotton households would not be able to satisfy their basic food and cash needs from rainfed agriculture and livestock production. Only 43% of surveyed households grew cotton suggesting a high proportion were not satisfying their basic needs. In the Wards with lower production potential (Negande and Sinansengwe) few households were likely to be able to satisfy their basic needs using current crop and livestock technologies. These results suggest it was unlikely that investment in production, and hence that population induced development, would occur.

Relative contributions of Natural Resources to household economies.

Cash incomes formed only a part of the total household economy. Many activities involved resources for which there were no market prices. We therefore, used *labour time* as a common currency and multiplied median time spent on each activity by the local wage rate for each activity to estimate the price of goods and services consumed.

Of the expenditure so estimated **35%** was allocated to the collection and use of **natural resources**, **33%** to the management of **animals**, **24%** to **field crops**, **7%** to the **home** and about **1%** was allocated to vegetable gardens. **Natural resources** also contributed to the production of the goods and services derived from animals, from field crops and from vegetable gardens. Households used natural resources from areas of between **6 and 17 km^2**. As a conservative estimate, **natural resources** account for **well over one third of the value added in the economy** of households in the Zambezi Valley. This value is a conservative estimate as households do not, in general, pay the full costs of their use of natural resources. The direct contributions of natural resources to household economies was greatest in female headed households and in the early stages of household development.

Sustainability of land use practices in mid-Zambezi Valley agro-ecosystems.

The sustainability of land uses and agro-ecosystems depends on their political and social acceptability, on their economic and financial viability, on the nature and use of their bio-physical resources and on the behaviour of the political, socio-economic and bio-physical systems with which they are strongly coupled.

Social sustainability.

Land plays an extremely important cultural as well as economic role in mid-Zambezi Valley communities and was identified as the most important household need in all study sites. Communal Area households need land in the same way urban dwellers need education; it provides them with the basic tool to ensure their livelihood. Obviously the land resource is finite. Whilst education could provide a substitute where the economy provides secure employment opportunities, historically this has not been the case nor do we see much chance of this changing over the next decade. Demand for the finite land resource as a means of ensuring household livelihoods is likely therefore, to intensify. Satisfaction of this demand is not sustainable.

Population growth in the five wards examined was daunting; from 1969 to 1992 the populations in these wards grew by between 3.8 % in Sinansengwe to 25.4% in Gutsa. There is little to suggest that these high growth rates will be curtailed in the near future. The most pessimistic of AIDS related mortality predictions suggests a zero population growth over the next two decades whilst more conservative scenarios suggest a 1 to 2% population growth rate for Zimbabwe as a whole. The population of humans that mid-Zambezi Valley agro-ecosystems are expected to support is growing at an alarming rate. Without significant changes in technology or large increases in the demand for labour in the formal or informal sectors of the economy these population pressures are likely to negatively impact mid-Zambezi Valley agro-ecosystems. Employment in the agricultural, manufacturing and mining sectors has been declining over the past several years and the formal sector is unable to absorb the surplus labour from Zimbabwe=s Communal Areas. Establishment of small scale informal businesses requires capital and access to markets. The low levels of production achieved in three of the five wards investigated suggest little capital (including human capital) is being accumulated and the poor infrastructure and distance to markets add greatly to the transaction costs of producers. High population growth rates have the potential to completely undermine the sustainability of mid-Zambezi Valley agro-ecosystems.

Political sustainability.

Land use activities that are not politically acceptable are unlikely to be sustainable. Wildlife as a land use option has only recently become politically acceptable in some mid- Zambezi Valley communities and its acceptance is not yet assured. Village Representatives in Negande, for example, informed us that wildlife was not a generally accepted land use and that there were considerable pressures on local leaders and political institutions to open wildlife areas to cultivators. Pressures to forego the wildlife option tend to be greatest from immigrants. Agriculture, on the other hand, was a generally accepted form of land use with a broad base of local and national political support. Wildlife as a land use option does not yet enjoy the local, or national, political support that agriculture does. With the uncertain property rights governing natural resource use in the Communal Areas, wildlife and natural resource use are very vulnerable to variation in local and national political attitudes.

Economic sustainability.

Households living in mid-Zambezi Valley agro-ecosystems rely heavily on natural capital to ensure their livelihoods. The *full costs of natural resource use* are not however, being carried by the direct users of these resources. Preliminary investigations suggest, for example, that cattle may be only marginally economic when the full opportunity costs of the resources are included in the calculations. The value of nutrient subsidy to household cropping systems from soil reserves was estimated at about Z$100 per year. The common property tenure regimes prevalent in the mid-Zambezi Valley communities means that market prices probably will not efficiently allocate resources. This could make natural resource use unsustainable unless other allocative institutions are developed. One of the most important contributions of the CAMPFIRE programme has been the development of **new institutions** for the allocation and control of natural resources. Faced with rapidly growing demands for the goods and services provided by natural resources and central government=s ambiguity with regard to traditional structures, these embryonic institutions may be key determinants of sustainable natural resource use and hence the sustainability of agro-ecosystems.

The financial and economic returns to land and to labour in rainfed crop production are an order of magnitude higher, per ha of arable soils, than those arising from other uses of the land and labour in Zambezi Valley agro-ecosystems[1]. The demands for arable land and the desire to cultivate the land is entirely rational and understandable. Despite these high returns the high population growth rates coupled with limited arable land and the generally poor productive performance of current crop technologies means that rainfed crop production is unlikely to sustain future populations. The returns to land and labour in livestock production, with current technology, is much lower than that from crop production and is unlikely to provide an alternative that will sustain future livelihoods. Harvests of wildlife and other natural resources also do not provide a means of sustaining future populations.

Bio-physical sustainability.

By 1993 all arable land had been allocated in Gutsa, Sinansengwe and Negande wards. With current technologies and prices rainfed agricultural production is therefore unlikely to be a sustainable means of supporting future human populations in these areas. Only Chiriwo and Kanyurira had arable land areas sufficient to meet the needs of limited future population growth. Areas of irrigable land in the study sites were small and irrigated agricultural production was unlikely to make a notable contribution to household needs satisfaction and future development. Preliminary investigation of the effects of irrigated cultivation on some mid-Zambezi Valley soils indicates that irrigation will need high levels of management to be sustainable.

[1]/ But note that riparian areas are also key areas for wildlife and the opportunity costs of cultivating these areas as opposed to using them to sustain wildlife over a much larger landscape needs to be examined - particularly at low human population densities.

Continuous cultivation of mid-Zambezi Valley soils (we examined 10 different soils cultivated for over 10 years) had several detrimental effects; soil organic carbon was reduced by about 19%, soil erodibility was increased by 2 to 5%, the time to run off for wet soils was reduced by 2% and the proportion of stable soils aggregates decreased by 31%. These factors have important implications for the sustainability of agriculture and for the environment, particularly when coupled to larger scale processes. Reduction in soil organic carbon contributes to reducing soil structural stability as well as the nutrient and water retention capacities of the soil. Water use and nutrient use are therefore, likely to be less efficient. In these water constrained environments the loss in efficiency with regard to water use, the reduced infiltration of water as a result of the loss of soil stability and the reduced time it takes for water to begin running off wet soils are likely to have a major impact on the economic and environmental sustainability of dry land agriculture. Increased soil erodibility when coupled with the extension of land use under increased human populations could add greatly to the removal of productive soils and nutrients and their redistribution over the landscape, their discharge into river systems, or both.

Investigations on the impacts of timber harvesting patterns on the woodland resource indicated that current patterns of use led to changes in the structure of woodlands with increasing numbers of small and fewer medium to large trees. At current levels of use woodland resources (poles and fuel wood) are not constraining. Kanyurira, Negande and Sinansengwe households all had sufficient areas of woodland within about 3 km of the household. In Gutsa, where the population density was the highest at about 19 people km^{-1}, households would need to venture almost six kilometres to access the required 7.5 ha of woodland. Good quality timber and graze resources are likely to become constraining in all sites within the next few decades if current population growth rates are maintained.

The well being of households in mid-Zambezi Valley agro-ecosystems is tightly coupled to the river systems which generally arise on the plateau and drop into the valley towards the Zambezi. Most people live, and most activities occur, within **5 km** of main rivers. Rivers are the arteries of life providing water for humans, livestock and vegetable gardens; alluvial soils for cultivation; water for wildlife and riverine tree species; fish for food and for sale. The people of the valley do not however, currently have a say in the allocation or use of water upstream of their wards (although the new Water Act should change this). The people and their agro-ecosystems are critically vulnerable to upper catchment water and land use. Changes in the flow of water from above the escarpment could completely undermine the sustainability of Zambezi Valley agro-ecosystems and severely reduce available land use options.

WWF=s study on climate change in Southern Africa indicates higher temperatures and evaporation in the Zambezi Valley areas in the future. There is, however, great uncertainty with regard to changes in rainfall. The core scenarios suggest changes will be slight. If higher temperatures prevail without an increase in rainfall, reduced production from the land will ensue.

Land use, conservation and future livelihoods

Current trends in population growth, resettlement and land clearance within the Zambezi Valley show little sign of abating. Our results indicate, quite convincingly, that current land use systems, are unlikely to be socially, economically, politically or bio-physically sustainable. A dual land use system of communal farming land (57%) and protected areas (43%), is becoming more sharply defined. In the communal lands the diversity of production and harvesting systems is being

threatened by the burgeoning demands of rapidly growing rural populations. Land based production alone can scarcely support existing populations, let alone expected future growth, and the national economic environment provides few alternatives. The rights of peasant farmers in natural resource management and harvesting are still rudimentary and insecure. Centralised, prescriptive and often *ad hoc* planning has in some cases led to the repeated resettlement of the same communities in different areas while in others it has fostered uncontrolled immigration and haphazard settlement on marginal lands. In protected areas ecological resilience and biodiversity conservation are being threatened by an excess of elephants, inappropriate fire management and low levels of protection from poaching. At the same time the cultural and economic relevance of protected areas to the people of the Valley is being undermined by a lack of meaningful investment and by the self serving policies of a centralised, national administration.

Options and Opportunities.

An extension of current trends is clearly not a desirable option and it is important that we recognise successes and build on them, for not everywhere in the valley does the future look bleak. Among our study sites Gutsa and Kanyurira Wards stand out as exceptions. Kanyurira has a low population density, bountiful wildlife and natural resources which meet a high proportion (up to 90%) of household needs and, with a strong institutional framework enhanced by the CAMPFIRE programme, the community=s future is bright. Gutsa, despite its relatively high population densities, has very high education levels and high agricultural potential and good roads which brings it far nearer the markets of the plateau than most mid-Zambezi Valley communities. Diversification into multiple economic activities is already evident and their future looks positive. Both communities provide pointers to the future. Kanyurira highlights the benefits of sensible land use planning which combines agriculture with *high value wildlife production and tourism,* Gutsa, the potential to diversify and enhance economic production options by *maximising the value added* ***in situ***.

Wildlife and Tourism Development.

The mid-Zambezi Valley=s comparative advantage lies in its wildlife and scenery and in developing higher valued production options, particularly those based on tourism. This is the fastest growing sector of the national (world ?) economy at 8% pa. It has major multiplier effects on employment and markets and can combine the generation of wealth with benign use of the resource base. Realisation of the full potential of the wildlife industry in the mid-Zambezi Valley requires enabling policy and legislation which involves households in resource management and brings them tangible benefits. Without such involvement and benefits wildland will continue to be settled and a promising sustainable development opportunity will be lost. The Omay Communal Land around Matusadona National Park provides a clear example of present and potential incentives - gross ecotourism and wildlife values are of the order of US $8 million per annum, or more than US$ 1,000 per household, but returns of US$ 20 or less per household from wildlife and tourism based revenue are the norm. Economic links between protected areas and surrounding communal lands in the mid-Zambezi Valley are presently weak but could be developed through appropriate joint ventures and leasing arrangements. Protected areas could form the centre piece of the mid-Zambezi Valley rural economy rather than remain ecologically, economically and culturally isolated islands.

Diversity of Production and Enterprise Development.

The seeds of a diverse and appropriate technology and enterprise development already exist: exploitation of *musawu* (a wild fruit) is already happening on a large scale; small scale livestock enterprises based on ostrich, fish or crocodiles are being developed elsewhere; the expected growth in the tourism industry provides ready opportunities for the supply of horticultural and craft products; the valuable timber resources in the valley as well as local bamboo species provide opportunities for export orientated furniture and craft production. The first steps in institutional development have already been taken; existing legislation and CAMPFIRE institutions have partially empowered several mid-Zambezi Valley communities; local, national and international markets exist and await development. It is clear that the viability of many of these options depends on the *concomitant development of political and economic institutions as well as human resources, technologies and infrastructure.*

Investment in human resources.

Large investments in the development of human resources, education and training are an essential pre-requisite both to slowing population growth and to the development and implementation of new technologies. Investment is also required in the development of institutions, both economic and political, that are able to exploit the opportunities that capital investment brings. If we assume that common property regimes will persist in the valley then innovative institutions need to be explored that will facilitate the efficient and equitable generation of wealth. Quite clearly the success of these initiatives is dependent on the legislative environment. A clear commitment from central and local government to facilitate and promote innovation will be essential.

Local Resource Management and Landuse Planning culture.

Key to the efficient use of land based resources is the ability of local farmers and communities to make their own choices and trade offs without imposed taxes and distorted values on their natural resources. The empowerment of farmers and local communities with the tools for landuse planning and natural resource management as an ongoing process, rather than as a periodic, top-down exercise, is vital [2/]. The Amanagement by committee@ model common in CAMPFIRE communities may not be adequate as these communities seek to take advantage of opportunities that arise. Alternative management institutions need to be explored with management consultants rather than with development scientists. The legislation enabling local communities to use their resources to earn incomes, to raise loans and to invest in their futures needs to be reviewed and strengthened. It is vital that central and local governments support these processes.

[2/]WWF Resource Management Support to Campfire Project (ZW0022) has been working with communities in the mid-Zambezi Valley to develop participatory landuse and resource management approaches which can be used at a local level and working towards developing expert systems and decision support tools to assist communities.

Sustaining the resilience and integrity of the mid-Zambezi Valley requires above all a recognition that:

a) current practice and trends in landuse and development will not meet peoples needs;

b) appropriate institutions, markets and technologies that foster sustainable landuse and enterprise development must be developed, and,

c) these institutions, markets and technologies must be adapted to the variable environments of the mid-Zambezi Valley.

The comparative advantage of the mid-Zambezi Valley lies in its wildlife resources and biodiversity and the existing extensive protected area system needs to be a central component of the development process.

NOTE:

This report was prepared by Dr. D H M Cumming (Project Executant and Head of WWF=s Programme in Zimbabwe) and Dr. T J L Lynam (Senior Research Fellow and Agro-ecosystem Specialist. Many people contributed to the project and to all of them we are extremely grateful. Those who have been involved, both in the project and in the final production of this report, are acknowledged in the main report and also indicated in the authorship to Annexes and elsewhere when appropriate.

TERMS OF REFERENCE:

Land use changes, wildlife conservation and utilisation and the sustainability of agro-pastoral systems in the Zambezi valley.

I (a) OBJECTIVES

In examining whether land use options and wildlife utilisation in the Zambezi Valley are sustainable, this study will provide sound baseline information on trends in land use, in wildlife and livestock populations and current data on agro-economics particularly in relation to wildlife utilisation. The results of this study will be used to analyse current and potential agro-ecosystem designs which might include wildlife and their long term sustainability in the Zambezi valley. The study will focus on two areas of the Zambezi valley which have faced rapid increases in human population and changes in land use over the last three decades. The changes have followed the filling of Lake Kariba in 1960 and the eradication of tsetse flies over much of the area during the last decade. The two areas are the Sebungwe area lying to the south of Lake Kariba and the Dande/Muzarabani/Chiswiti Communal land in the Guruve, Centenary and Darwin Districts.

The main components of the study will include :

1) the changing patterns of land use in the two study areas between 1958 and 1993;

2) changes in wildlife and livestock populations in the two study areas between 1980 and 1993;

3) a 12 month economic survey of selected households in the communal land farming systems in the two study areas. The survey will focus on the contributions of wildlife, other natural resources and agriculture to the economies of selected households through the annual cycle.

4) analysis of whether agro-ecosystems, which may or may not include wildlife, in the two study areas are able to continuously (sustainably) meet the needs of their inhabitants.

The four project components also contribute to a five year study on multispecies animal production systems being undertaken by the WWF Multispecies Project.

I (b) METHODS AND MEANS

Aerial photographic surveys of changing patterns of land use

This will be examined by analysing existing and new aerial photography of the study areas. Aerial photographic coverage of the Sebungwe area is available at scales of between 1:25,000 and 1:80,000 from 1951 to 1985. It is available for part of the study area (Kariba and Dande) for 1990. In order to obtain up to date coverage of the entire Sebungwe study area and the Dande/Muzarabani/Chiswiti area it will be necessary to commission an aerial survey for May/June 1993. This aerial photographic survey will be done at a scale of 1:40,000 using panchromatic film. This would involve surveying approximately 25,000 km^2.

Aerial censuses of changes in wildlife and livestock populations

Aerial censuses of large wild mammals and livestock have been carried out in both study areas since 1980. These surveys were last carried out by the Multispecies Project in 1991 for the Omay and in 1990 for western Dande. Both need to be repeated in August/September 1992. This would involve approximately 75 hours of flying time in a Cessna 206 which will be hired locally. WWF already has the necessary navigation equipment and radar altimeter which can be fitted to the aircraft.

Year long survey of household economies.

The survey will be designed to provide information on the seasonal contribution of alternative land use options to income, employment and food security. This would include the collection of household data on crop yields, sales, own consumption, physical inputs and costs as well as, wildlife earnings, livestock sales, contribution to cropping activities and to household security. The actual and potential contribution of wildlife to income and employment would also be assessed. This study would require the appointment of two short term Research Fellows, one working in the Sebungwe and one in the Dande, and both of whom would be supervised by the WWF Multispecies Project staff.

Analysis of sustainability of agro-ecosystems

This component forms an extension of an existing research project within the WWF Multispecies Project. The current project is developing systems modeling techniques and Participatory Rural Appraisal (PRA) methods to examine communal land agro-ecosystems in the Zambezi valley. The methodology will provide a basis for analysing existing agro-ecosystems and for designing alternatives. It will also provide a basis for analysing the sustainability of agro-ecosystems in the valley. Up to ten study sites will be selected within the two project areas representing extremes and mid points of sustainable/ unsustainable agro-ecosystems.

Important determinants guiding site selection will be rainfall, soils and population density. Secondary data (rainfall, soils, maps, air photos etc.) will be collected and collated during June - September 1993, prior to the gathering of primary data in the field by Participatory Rural Appraisal (PRA) teams. These teams will include at least a Team Leader, Sociologist, Livestock Specialist, Agronomist and Economist. Field data collection by the PRA teams working with each communal farming community will include a needs analysis, system identification, problem formulation, abstract modeling (at a level and using techniques appropriate to the field and village situation), discussion and synthesis.

The field work sessions will each be followed by a two day expert workshop to examine field data and models and also by simulation modeling in the laboratory.

I (c) RESULTS

The results of the components of the project will be summarised in a Final Report which will address the project objective of examining sustainable land use options n the Zambezi Valley.

Specifically, the expected results for each component are as follows:

Changing patterns of land use

The proposed aerial photographic survey will produce a set of 1:40,000 aerial photographs of the two study areas. These will provide up to date baseline information on settlement patterns and land use and allow recent changes and developments in land use to be measured and catalogued. More specifically this component, using the long time series of available aerial photography, will provide data on the spatial and temporal changes in settlement, cultivation and deforestation in the study areas. It will also provide up to date information on the state of woodlands in National Parks areas in the Sebungwe which continue to be seriously damaged by high elephant densities.

Changes in wildlife and livestock populations

Up to date baseline data on numbers and distribution of major wildlife and livestock species will be produced. Trends in the numbers and distribution of the larger wild mammals and domestic livestock in the study areas over the last ten years will also be analysed and reviewed in the light of the updated census results. The links between settlement patterns and changing distributions and densities of wildlife will be elucidated by comparing results from this component of the project with those from the analysis of aerial photographs.

Year-long survey of household economies

Data collected from the household survey, combined with other available micro-economic data will provide a baseline report on the current contribution of cropping, livestock and wildlife to household income, employment, draught power and food security. It will also enable an estimate to be made of the potential contribution of these alternative land uses under various pricing, marketing, macro-economic and immigration scenarios. The economic and ecological tradeoffs and complementarities between these land uses will also be assessed. The economic data collected in the household survey and the economic analyses will contribute to the examination of agro-ecosystem sustainability and design. It will also provide invaluable baseline data for future work.

Sustainability of agro-ecosystems

After analysis of the sustainability of agro-ecosystems, the following concrete actions are foreseen :

- training in participatory rural appraisal (PRA)
- development of methods of agro-ecosystem appraisal
- models of Zambezi Valley agro-ecosystems
- identification of land use systems most likely to be sustainable in the Zambezi Valley.

I (c) RESOURCES

The following project staff, under the overall direction of the Project Leader, will be responsible for project implementation and supervision:

- Dr. D. H. M. Cumming (Project Leader)
- Dr. R. D. Taylor (Ecologist)
- Dr. D Jansen (Resource Economist) (*Replaced by Mr. I Bond -WWF Research Fellow*)
- Mr. T. J. Lynam (WWF Research Fellow)

The project will be supervised by Senior staff of the WWF Multispecies Project and Project resources in the form of vehicles, equipment and office facilities will be available

I (d) OPERATIONAL PROGRAMME AND TIMETABLE

As and when results of the various components are available these will be written up and distributed as project papers and submitted to the EEC delegation in Harare. Material from this project will be submitted to international scientific journals. Manuscripts prepared for publication will also be made available locally as Project Papers.

Implementation of the project components will be as follows:

Changing patterns of land use

The aerial photographic survey would need to be carried out in June -July 1993 with the photography being produced and ready for analysis by August 1993. Recruitment of research assistants to work on the basic examination and analysis of the photography under the supervision of Drs. Cumming and Taylor would take place in September 1993. Aerial photographic work should be complete by the end of January 1994.

Changes in wildlife and livestock populations

Aerial censuses of wildlife and livestock populations would be carried out during August and September, 1993 and analysis of the results would be completed by the end of November, 1993.

Year long survey of household economies

Two Research Fellows could be recruited by the beginning of June, 1993. An initial period of 3 months for literature review and developing survey instruments would be required and field work could begin in September, 1993. The field work would require logistical support in the form of vehicles (supplied by the MAPS project) and running and subsistence expenses. For each study area ten field enumerators would be required to cover a survey of up to 100 households over the period September, 1993 to August, 1994. A further three months would required to complete the analyses and write up by each Research Fellow.

Sustainability of agro-ecosystems

Preliminary work on the development of the methodology for Participatory Rural Appraisal of agro-ecosystems is well advanced and will be completed by May 1993. A Senior Research Fellow will be employed to conduct PRA during the 1993/94 cropping season. This would mean starting in October

1993 and completing the cycle PRA's and Workshops by March 1994. A further five months will be required for modeling and analysis with write up of the modeling component being completed by August 1993. The Senior Research Fellow would then contribute to the final synthesis during the last four months of the project.

Supervision and Synthesis

Senior staff of the WWF Multispecies Project would be involved in supervising and guiding all aspects of the project. They would also be directly involved some of the field work, in overseeing the collection and preliminary [analysis] of data both in the field and the laboratory. For the most part the collection of field data, data input and initial analysis of results will be nearly complete by August 1994. The major task of final write up and synthesis of the results from the four components will then be completed during the period August 1994 to November 1994.

1.2 Acknowledgments

This work was carried out under the auspices of the European Union (EU Contract Ref: B7-5040/93/06: *Land-use changes, wildlife conservation and utilisation, and the sustainability of agro-pastoral systems in the Zambezi Valley*) and the WWF Multispecies Animal Production Systems Project (ZW0007). Aspects of the final analysis and write up were carried out and supported by staff of the WWF Programme Office in Zimbabwe. We gratefully acknowledge the financial support of the European Union and the World Wide Fund for Nature as well as the institutional support of the WWF Programme Office in Harare and WWF International in Gland, Switzerland.

The people and leaders of Chiriwo, Gutsa, Kanyurira, Negande and Sinansengwe Wards made vital and important contributions to our research and we are indebted to them for their openness and their generosity.

The Director, Department of National Parks & Wildlife Management, supported our application to the European Union for a grant to carry out this study and we gratefully acknowledge this support.

We also wish to recognise the support we received from the EU Advisors in Harare, Dr. Otto Möller and Dr. Artur Runge-Metzger and the administrative support throughout the project provided by Kathryn Dickinson at WWF International and Sam Mutsauri at WWF in Harare. Sharon Jones, Executive Secretary in the WWF Programme Office, provided invaluable help in compiling and editing the final report and in bringing documents from various sources together in a common format. Madeleine Howard, Tarirai Masarira and Natasha Shade helped produce final copies of GIS work.

It is a pleasure to acknowledge the assistance we received from the Directors and staff of the following institutions:

- Tsetse and Trypansomiasis Control Branch of the Department of Veterinary Services who provided access to their holdings of aerial photographs and assisted in airphoto interpretation
- National Archives for access to the 1951 aerial photography
- The Surveyor General for the use of aerial photographs
- Department of Surveying, University of Zimbabwe, for the use of equipment
- Food Early Warning Systems Unit (FEWS) who provided a geat deal of spatial and attribute data
- Department of Research and Specialist Services (DR&SS) for many productive partnerships in soil survey and field studies of household needs and the use of livestock.
- Agritex, Institute of Agricultural Engineering , for the use of equipment and laboratory assistance
- Rural District Councils - Guruve, Muzarabani, Omay, Binga
- Department of National Parks & Wild Life Management whose staff assisted in the aerial censuses.
- Regional Tsetse and Trypansomiasis Control Programme

The project was supervised by Dr D H M Cumming (Project Exectutant and Head of WWF Programme Office in Zimbabwe) and Dr T J P Lynam (Senior Research Fellow and Agro-ecosystem Specialist) and the following participated in one or more of the necessary processes of data collection, analysis, writing, and criticism and advice, during the course of the project. Their contributions are indicated, where appropriate, in the particular chapters or appendices to the report:

AGENDA

SEBUNGWE ELEPHANT MANAGEMENT ACTION PLAN WORKSHOP

Venue: Musango Safari Camp **Date:** 19th to 22nd May, 2015

Day 1 - Tuesday 19th May

1600: Arrivals, registration and settle in

1900: Welcome Dinner

Day 2 - 20th May

0745: Welcome and Opening Remarks - DG - ZPWMA

0800: Introductions

0815: Law enforcement and anti-poaching in the Sebungwe - T. Gotosa and V. Mkhwebu

0840: Research on law enforcement - G. Moyo and A. Mudungwe

0900: Community perspectives - J. Miyozi

0920: Elephants and people in the Sebungwe - D. Cumming

0945: Objectives and purpose of the workshop - Facilitator

1000: TEA/COFFEE

1030: **1st Working Session**: Stakeholder Analysis - who are the key stakeholders and actors and what are the links between them? (Plenary)

1145: **2nd Working Session** - Initial Problem Analysis - What are the key issues and the cause-effect relationships between them? (Plenary - within the 5 Key Components of the Framework)

1245: LUNCH

1400: **3rd Working Session** - Strengths, opportunities and core competencies within each of the 5 Key Components of the framework and key stakeholder inputs (e.g. Hunting, Photo-tourism, Communities, ZRP/ZPWMA, NGOs) (Working Groups)

1530: TEA/COFFEE

1600: Report back from Working Groups

1730: Break for the evening

1900: DINNER

2030: Synthesis working group on problems and opportunities

Day 3 - Wednesday 21st May

0800: Report back from synthesis working group

0830: **4th Working Session:** Develop Draft Strategic Action Plan with Indicators - Working Groups

1030: TEA/COFFEE

1200: Report back from Working Groups

1245: LUNCH

1400: **5th Working Session:** Activities, responsibilities and Costs - Working Groups

1530: TEA/COFFEE

1600: Report back to plenary by Working Groups and development of Action Plan, Indicators and responsibilities

1745: Break for the evening

1900: DINNER

Day 4 - Thursday 22nd May

0730: **6th Working Session**: Final Development of Draft Strategic Action Plan with performance indicators, responsibilities and Next Steps

0945: Closing Remarks - DG - ZPWMA

1000: **Participants Depart**

Detection of anthropogenic mortality in elephant *Loxodonta africana* populations: a long-term case study from the Sebungwe region of Zimbabwe

Kevin M. Dunham

Abstract A survey of the Sebungwe elephant *Loxodonta africana* population in Zimbabwe in 2006 revealed a large rise in the number of dead elephants. The estimated number of carcasses increased >16-fold from 1989 to 2006 and the carcass ratio (number of all elephant carcasses as a percentage of the number of all elephants) rose from 1.25 to 15.4%. The ratio for fresh or recent carcasses, which reflected the mortality rate during the survey year, increased from 0.19 to 1.70% during 1995-2006. Records of elephants killed before 1995 were supplemented with estimates of the numbers killed after 1995, with these estimates increasing exponentially, as did the observed number of fresh or recent carcasses. A maximum likelihood analysis to compare population models revealed that the best fit to the survey estimates of this closed population was a model that started with 9,500 elephants in 1979 and that each year increased at 4.02% and decreased by the number killed, with the number killed annually increasing at 23.5% per year after 1995. A rise in anthropogenic mortality, mostly due to poaching, caused the increase in carcass numbers observed after 1999. Since 1997 the mortality rate of elephants in the National Parks and Safari Areas in the Sebungwe has been positively correlated with the observed number of poachers' camps. Anthropogenic mortality is now great enough to keep the elephant population approximately constant at 14,000-16,000 animals. The population number was also constant (at a lower level) during the 1980s, when elephants were culled and the sale of meat, hides and ivory covered the costs of elephant management but there have been no recent culls, partly because the ivory trade ban prevents tusks from culled elephants being sold to offset the costs of management. This study illustrates the value of a long-term data set collected with consistent techniques, and including data on other species and the environment collected at no extra cost under the financial umbrella of a charismatic species.

Keywords Aerial survey, carcass, elephant, *Loxodonta africana*, MIKE, poaching, population model, Zimbabwe.

Introduction

The African elephant *Loxodonta africana* is categorized as Vulnerable on the IUCN Red List (IUCN, 2007) and international trade in ivory is banned except for occasional sales by the management authorities of some southern African countries. However, the ban and the sales are controversial (Reeve *et al.*, 2003), with some range states supporting the resumption of the ivory trade as a means to provide funds for conservation and to protect woodlands. Although ivory sales by Namibia, Botswana and South Africa were approved in principle by CITES in 2002, these sales are conditional on the ability of the Monitoring of Illegal Killing of Elephants (MIKE) programme (CITES, 2004) to establish up-to-date and comprehensive data on elephant poaching and populations.

Kevin M. Dunham PO Box CH385, Chisipite, Harare, Zimbabwe. E-mail faykevin@zol.co.zw

Received 12 March 2007. Revision requested 15 May 2007. Accepted 25 June 2007.

The 2006 survey of the closed population of elephants in the Sebungwe region of Zimbabwe, a mosaic of national parks, safari areas and communal lands, revealed that since 2001 there had been a large increase in the number of elephant carcasses, but no decrease in the number of live elephants. The Sebungwe survey programme commenced in 1979 but despite the considerable effort that has gone into it, the population trend has been unclear, being described as stable but with the possibility of a slight increase (Price Waterhouse, 1996; Cumming & Lynam, 1997), or as stable or declining (Hoare, 1998). Prior to 1980 the number of elephants in the Sebungwe increased at *c.* 5% annually (Cumming, 1981) and, since the last cull in 1992, mortality was thought to be low (Hoare, 2000). Hence, if the population growth rate was still 5% the Sebungwe elephants should have almost doubled in number since 1992.

This study of the long-term trends in the Sebungwe elephant population was undertaken to address two questions: (1) Why was there a large increase in the number of elephant carcasses between 2001 and 2006

© 2008 FFI, *Oryx*, **42**(1), 36 48 doi:10.1017/S0030605308000471 Printed in the United Kingdom

but no decrease in the number of live elephants? (2) What is the current trend of the Sebungwe elephant population and, if the population growth rate is not *c*. 5% as it was before 1980, why has it changed?

A simple population model was used to mimic the observed trends in the Sebungwe elephant population, and then the mortality rate in the modelled population was compared with the observed trend in the number of elephant carcasses. The relevance of this study goes beyond both Sebungwe and its elephant population, and relates to the credibility of sample surveys for monitoring long-term trends in the numbers of savannah elephants and other large herbivores in Africa and beyond. The international attention attracted by elephant poaching during the 1970s (Cumming *et al.*, 1990) and the 1989 ivory trade ban has caused the African elephant to be probably the best monitored of the world's widely-distributed large mammals (Blanc *et al.*, 2004). Sample surveys are often used to census elephants and are a recommended technique for the MIKE programme (Craig, undated).

Study area

The Sebungwe study area covers *c*. 15,000 km^2 in north-west Zimbabwe, with the southern shore of the man-made Lake Kariba as its northern boundary (Fig. 1). The

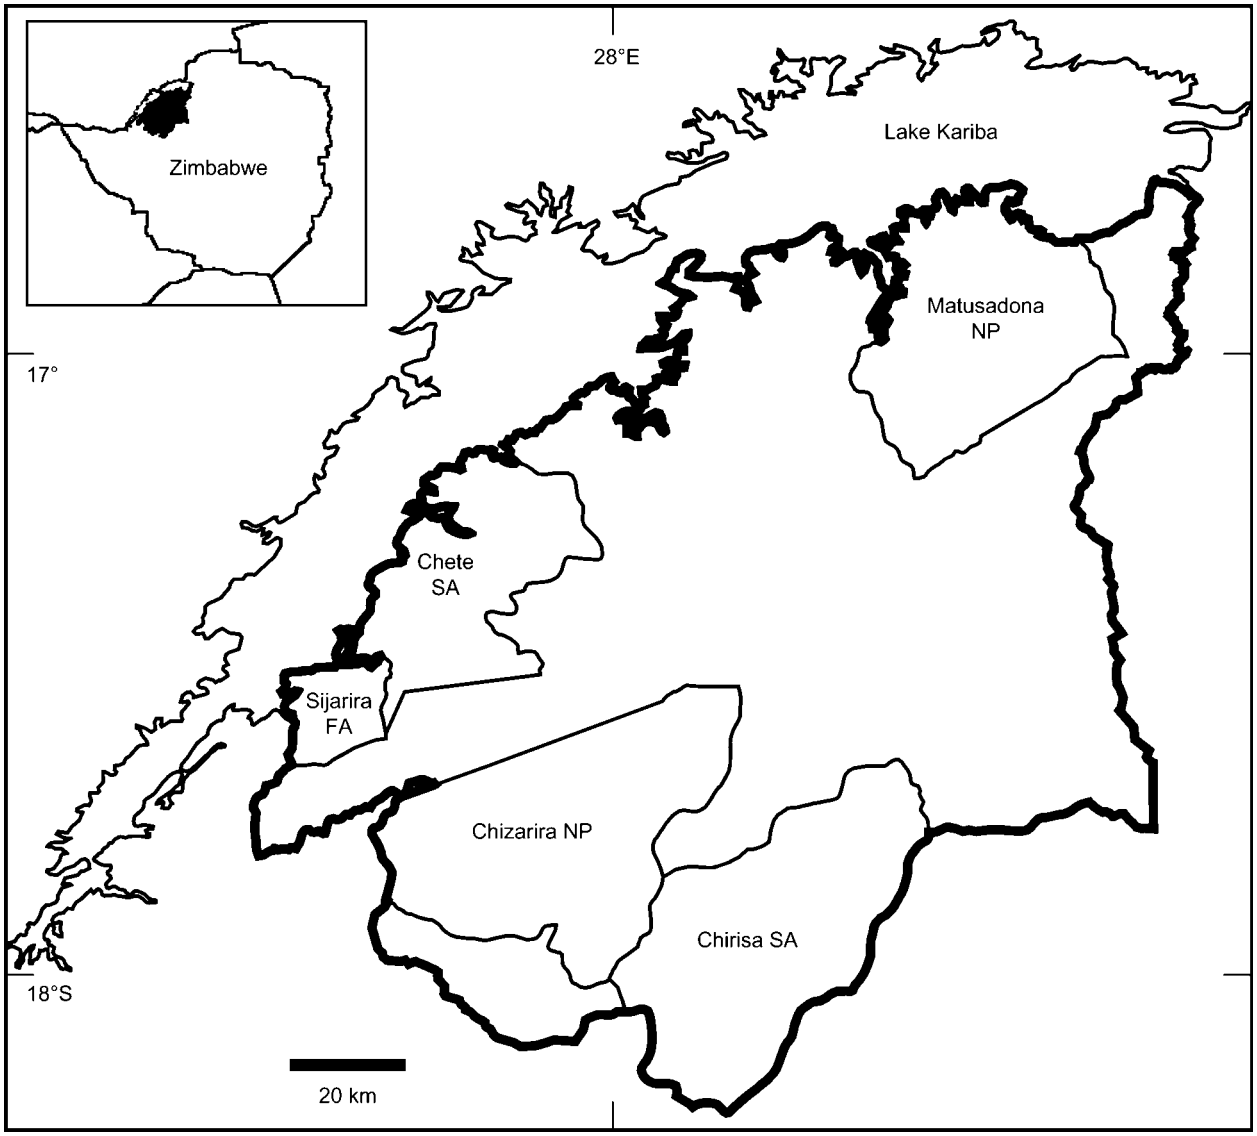

Fig. 1 The Sebungwe region (the insert shows its location in north west Zimbabwe). The region includes two National Parks (NP), two Safari Areas (SA) and a Forest Area (FA). The remainder of the region is communal land. To the south and the east the boundary of the study area (bold solid line) is the line of the old northern Sebungwe game fence.

topography varies from almost flat in the unflooded sections of the Zambezi Valley, through undulating hills, to steep escarpments. Mostly-seasonal rivers flow generally north-westwards into Lake Kariba. The natural vegetation is mostly *Brachystegia* and *Julbernardia* woodland on higher ground with shallow, light-textured soils, and *Colophospermum mopane* woodland on heavier soils on valley floors, with riparian woodland along rivers and streamlines, and small areas of thickets and grasslands (Timberlake *et al.*, 1993). Generally, the region experiences a hot wet season during November-April, a cool dry season during May-July and a hot dry season during August-October. Annual rainfall at the Sengwa Wildlife Research Institute in the south of the area averaged 668 mm (range 288 1,026 mm) during 1965-1996 (Osborn, 1998). Even at the end of the dry season few parts of the Sebungwe are >10 km from drinking water for elephants (Cumming, 1981).

The Sebungwe contains a mosaic of protected areas (Chizarira National Park, 1,910 km^2; Matusadona National Park, 1,407 km^2; Chirisa Safari Area, 1,713 km^2; Chete Safari Area, 1,081 km^2; collectively known as Parks and Wildlife estate), Sijarira Forest Area (*c.* 270 km^2) and communal lands. Cumming (1981) described the history of land use before 1980, noting how the region's elephants became isolated from other populations by the flooding of the Zambezi Valley following completion of Kariba Dam in 1958, and by a tsetse fly (*Glossina* spp.) control programme that involved the erection during 1956-1969 of game fences to the south and east of the study area and the shooting of >2,600 elephants outside the southern boundary of the study area. Later, many people moved into the area and now people and domestic livestock occupy much of the communal land, and large areas of woodland have been cleared for subsistence and small-scale commercial agriculture (Cumming & Lynam, 1997). Consequently, the elephant population has been compressed into the Parks and Wildlife estate and those communal areas where the density of people is low (Hoare, 1999; Hoare & du Toit, 1999). The close proximity of people and elephants prompted the establishment of community-based natural resource management programmes (CAMPFIRE; Martin, 1986). The Sebungwe includes the MIKE study site of Nyami Nyami (CITES, 2004).

Since 1980 elephant management in the Sebungwe has included sport hunting in Chirisa and Chete Safari Areas, in CAMPFIRE areas, and in Sijarira Forest Area, the shooting of problem animals, and the shooting of entire herds (culls) to reduce elephant numbers in the two National Parks and in Chirisa Safari Area during the 1980s and early 1990s. However, the boundaries of the different land-use categories are largely artificial and elephants can and do move freely between the National Parks (where they are legally protected), the Forest and Safari Areas (where small numbers of elephants and other large mammals are hunted annually under licence by sport hunters), and the communal lands (where sport hunting also occurs, and where people, cultivation and domestic livestock are present but at variable densities; Hoare & du Toit, 1999).

Methods

Elephant surveys

The first rigorous census of the Sebungwe elephants was in 1979 (Cumming, 1981). Since then, similar sample aerial surveys have been undertaken regularly during the dry season by the Parks and Wild Life Management Authority (formerly the Department of National Parks & Wild Life Management), often in partnership with the WWF Southern African Regional Programme Office (references in Table 1). The methods were those recommended for surveys of large African herbivores (Jolly, 1969; Norton-Griffiths, 1978). Dunham *et al.* (2006) detail the methods. Observers searched for elephants and elephant carcasses but other large herbivores, wild and domestic, and items of interest, e.g. poachers' camps, were also counted. Attempts were made to ensure that observer bias was minimized, and approximately constant between years, by employing keen, experienced, volunteer observers of proven ability and immune to airsickness, and ensuring that search intensity and the widths of search strips were approximately constant between years. Early during the survey programme strata boundaries varied between years, as more information about elephant distribution became available. But since a 1996 review of elephant censusing in Zimbabwe (Price Waterhouse, 1996), techniques have been standardized, thereby facilitating between-year comparisons. The scale of each survey is illustrated by the 2006 census, which involved 72.6 hours of flying, and searching 15% of the 15,622 km^2 survey area (divided into 26 strata, with 24 strata sampled with systematically-arranged transects and two with blocks; Dunham *et al.*, 2006).

Data sources

Surveys were conducted in 20 years during 1980-2006 and I extracted data on elephants and carcasses from the published reports, and from Price Waterhouse's (1996) summary (Table 1). The number of domestic cattle in the Parks and Wildlife estate provides one index of illegal activities. Since 1997 the reports have included the estimated number of poachers' camps and this estimate provides a second index.

The number of elephants recorded killed by people each year in the Sebungwe for whatever reason, legal or illegal, is given by Martin (1992a) for 1960-1991 and by

Table 1 Summary of the sample aerial surveys of elephants in the Sebungwe region of Zimbabwe during 1980 2006. There were no surveys in 1986, 1990, 2000 or 2002 2005.

Year	Size of survey area (km^2)	Estimated number of elephants	Variance of estimate	Source

*Not given
[1]Highlands of Matusadona National Park were not surveyed; the peak population estimate for this 1,010 km^2 stratum was 1,628 elephants during 1997.
[2]Matusadona National Park was not surveyed
[3]With corrections to the carcass estimate

Booth *et al.* (1996) for 1960-1995. The number killed annually was usually <100, except during 1980-1981, 1984-1986 and 1991-1992 when >2,000 elephants in total were culled. Martin's (1992a) numbers of those killed during 1989-1991 are greater than Booth *et al.*'s (1996) and I have used the greater numbers because other sources (Payne, 1998) suggest these are more likely to be correct.

Data evaluation

Prior to 1996 the area of the Sebungwe elephant range that was surveyed varied greatly from year to year (Table 1). Parts of the Parks and Wildlife estate (which contains 65-70% of the region's elephants; Martin & Taylor, 1983) were not surveyed during some years. Hence, my analysis included only post-1979 surveys that (1) sampled all of Matusadona and Chizarira National Parks, and Chirisa and Chete Safari Areas, and (2) surveyed a total area >12,500 km^2, i.e. >80% of the Sebungwe elephant range. Surveys during 13 years met these conditions.

Preliminary inspection of the elephant data revealed that the annual rate of population growth between consecutive surveys varied from 24% during 1997-1998 to +58% during 1998-1999. The latter rate is not credible for a closed population of elephants, and further inspection revealed that of seven large herbivores with populations of >1,000 during 1997, six (elephant, buffalo *Syncerus caffer*, sable *Hippotragus niger*, kudu *Tragelaphus strepsiceros*, waterbuck *Kobus ellipsiprymnus* and zebra *Equus burchelli*) supposedly experienced a decline of >21% between 1997 and 1998, and then an increase of >58% between 1998 and 1999. Increases of this size are not biologically possible in closed populations of these species and the most likely explanation for these observations is that there was marked under-counting bias during the 1998 survey, which I eliminated from the data set. Twelve surveys remained in this set and the annual rate of population increase between consecutive surveys varied from 21 to +12%.

Elephant carcasses

The time since death was recorded approximately for each elephant carcass by the observers, who allocated each carcass to an age category (Douglas-Hamilton & Hillman, 1981), with category 1 representing fresh carcasses, category 2 recent carcasses, and category 3 old carcasses. Generally, category 1 and 2 carcasses were elephants that died during the year of the survey (mostly since the end of the rainy season) and category 3 carcasses were elephants that died either during earlier years, or possibly during the previous rainy season. Carcasses at cull sites were not recorded as carcasses during surveys (Gibson, 1989).

The survey reports usually gave the carcass ratio *sensu* Douglas-Hamilton & Burrill (1991; although it is a percentage, not a ratio), which is the estimated number of all elephant carcasses as a percentage of the estimated number of all elephants (i.e. live plus dead). This all-carcass ratio is an index of the elephant mortality rate (excluding mortality due to culls) during the several years prior to the survey. If the reports included data on carcass categories, I calculated the category 1+2 carcass ratio, which is an index of the elephant mortality rate during the year of the survey (excluding deaths due to culls but including all other causes, natural and anthropogenic). The category 1+2 carcass ratio is defined as the estimated number of elephant carcasses in age category 1 or 2, expressed as a percentage of the sum of this number and the estimated number of live elephants. I calculated the 1+2 carcass ratio for the entire Sebungwe, and separate ratios for the Parks and Wildlife estate and the communal lands.

Population trend analysis

The observed trend in the elephant population was determined by regressing the natural logarithms of the population estimates against time (Caughley, 1977). The slope of this line is the exponential rate of population increase per annum (r) but here population growth rates are presented as percentages ($= 100(e^{r} \quad 1)$), which are generally easier to understand. Statistical analyses were conducted using *SYSTAT* (Wilkinson, 1997). Regression analysis was also used to determine trends in carcass numbers and ratios. Trends were regarded as statistically significant if the slope of a regression line was significantly different from zero. Two population estimates were regarded as significantly different if their 95% confidence intervals did not overlap.

Population model

The number of elephants in the Sebungwe was mimicked with a model that started with an assumed population number, and determined elephant number during the following year by increasing the starting population by an assumed population growth rate, and then reducing it by the number killed during that year (Martin, 1992b). Thus $N_t = [(1 + r/100). N_{t-1}] \quad C_{t,}$ where N_t = number of elephants in year t, C_t = number of elephants killed during year t, and r = mean rate of population increase per year, as a percentage (where $(1 + r/100) = \lambda$, the growth multiplier (Caughley, 1977)).

The trend in the number of elephants predicted by a model was compared to the survey estimates of elephant number using Martin's (1992b) maximum likelihood estimator (Appendix). The outcome of this analysis is an estimator that equals one if the predicted and estimated numbers are identical during all survey years, and declines towards zero the less perfect the fit between the predicted and estimated numbers. For convenience, this estimator is multiplied by 1,000 to give an index value. When several models are compared, the one that gives the greatest index value is the model that provides the best fit to the survey estimates.

I considered the possibility that additional elephants may have been killed before 1995 and that the real number killed may have been greater than the recorded number. During the first phase of the modelling the model was run for 1979-1995 and the *Microsoft Excel* add-in *Solver* was used to determine the values of the starting population during 1979, the population growth rate and the number of additional (unrecorded) elephants shot annually during 1980-1995 that maximized the index value. The initial assumed starting population was 10,000 and constrained to be an integer ≥8,000 and ≤12,000, as estimated by a 1979 survey (Cumming, 1981). The initial assumed mean growth rate of the population was 3.5% annually (and constrained to be ≥0 and ≤7%). The initial assumed number of additional elephants killed annually was 100 (and constrained to be an integer ≥0 and ≤200). Executing *Solver* was equivalent to running a series of models with different combinations of a starting population, a growth rate and a number of additional elephants killed. There were seven surveys during 1980-95, and to determine the robustness of the conclusions the procedure was repeated seven times, each time dropping a different survey estimate from the calculation of Martin's (1992b) index value.

The first phase of the modelling revealed that the fit of the predicted population numbers to the survey estimates during 1980-1995 was not improved by assuming that unrecorded elephants were killed during this period. Hence, during the second phase I assumed that the numbers killed during 1980-1995 were the recorded numbers. However, there are no published records of the numbers killed during 1996-2006 and I assumed that the number killed annually after 1995 may have increased. The model was run for 1979-2006 and *Solver* used to determine the values of the starting population during 1979, the population growth rate and the exponential rate of increase in the number of elephants killed annually after 1995 that maximized Martin's index value. The initial assumed exponential rate of increase in the number of elephants killed annually was zero, equivalent to a constant number killed each year after 1995, and the exponential constant was constrained to be ≥0 and ≤0.5. There were 12 surveys during 1980-2006 and to determine the robustness of the conclusions the procedure was repeated 12 times, each time dropping a different survey estimate from the calculation of the index value.

Results

Elephants

The number of elephants in the Sebungwe increased from 9,000-11,000 during the early 1980s to 14,000 16,000 during 1999-2006 (Fig. 2). The mean observed rate of increase during 1980-2006 was 1.85% annually (equivalent to an exponential rate of 0.0183 per annum).

Carcasses

The estimated number of all elephant carcasses in the Sebungwe increased >16-fold from 1989 to 2006. Carcass number was approximately constant during 1989-1993, then increased three-fold to a new constant level during 1996-1999 and thereafter increased dramatically to 2,733 during 2006 (Fig. 3a). Similarly, the all-carcass ratio increased from 1.25% during 1989 to 15.4% during 2006 (Fig. 3b).

The estimated number of fresh or recent carcasses in the Sebungwe increased from 23 during 1995 to 260 during 2006, with an exponential model providing a good fit to the mean estimates (Fig. 3c). Similarly, the category 1+2 carcass ratio increased from 0.19% during 1995 to 1.70% during 2006 (Fig. 3d). The increase in this ratio indicated there was a large rise in the mortality rate: the increase in the number of fresh or recent carcasses was not simply a consequence of a larger number of elephants dying because there were more live elephants. In the communal lands the major increase in the category 1+2 carcass ratio (and therefore in the mortality rate) was between 1999 and 2001, but in the Parks and Wildlife estate the major rise was between 2001 and 2006 (Fig. 3d).

The estimated number of old carcasses in the Sebungwe increased >5-fold between 1995 and 2006. There were 1,717 more old carcasses during 2006 than in 2001 and most of these were elephants that died before, not during, 2006. This indicated that the mortality rate was high not only during 2006 but also during the intervening (non-survey) years of 2002-2005.

Population model

The maximum likelihood analysis to compare population models for 1979-1995 revealed that a model population during 1979 of approximately 9,600 elephants, which each year increased at a rate of 3.77% and decreased by only the recorded number killed, provided a better fit to the survey estimates during 1980-1995 than alternative models with different starting populations, growth rates, or any additional (unrecorded) elephants killed. Although there were small variations in the starting population and growth rate according to which survey estimates were included in the likelihood analysis, the number of additional elephants killed was consistently zero in the best models (Table 2).

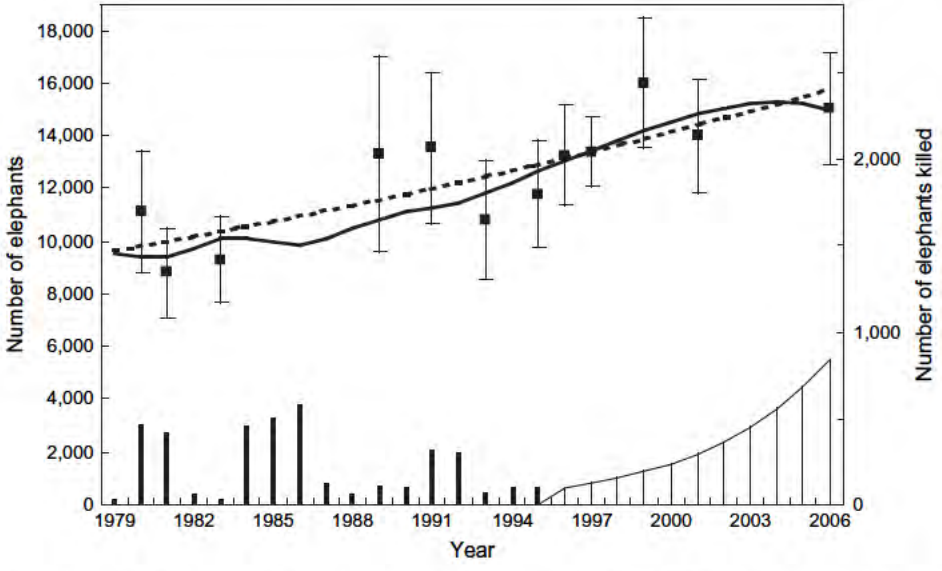

Fig. 2 Number of elephants in the Sebungwe, as estimated by aerial surveys during 1980 2006, with mean population estimates and 95% confidence intervals (left axis). Data sources as in Table 1. The observed trend (dashed line) is an exponential curve calculated from the slope (r) of a linear regression of the natural logarithm of the mean estimate against year (r 0.0183 ± SE 0.0042, n 12, t 4.341, P 0.0015). The trend (bold line) in a modelled population that gave the best fit to the survey estimates is also shown. The modelled population started with 9,501 elephants during 1979, grew at 4.02% per annum and each year was reduced by the number killed that year (histogram, right axis: for 1980 1995, number recorded killed; for 1996 2006, estimated number killed, with the estimated number killed increasing at 23.5% per annum). Note differing scales for left and right axes.

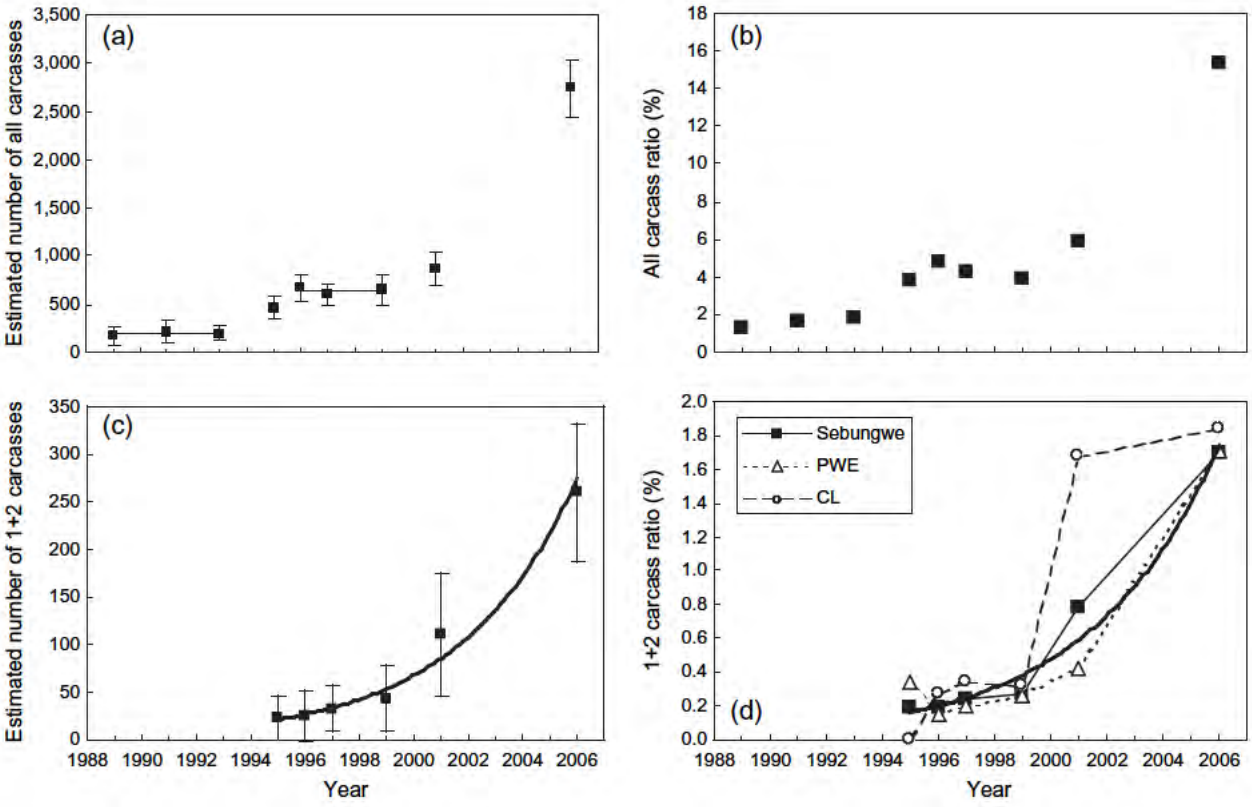

Fig. 3 (a) The number of all carcasses of elephants in the Sebungwe, as estimated by aerial surveys, with mean estimates and 95% confidence intervals. This estimate is an index of the number of elephants that died during the several (but unknown number of) years prior to the survey. The horizontal lines indicate the mean values for 1989 1993 (196) and 1996 1999 (641). Data sources as in Table 1. Carcass data were not reported for pre 1989 surveys. (b) The all carcass ratio for elephants in the Sebungwe during 1989 2006. This ratio provides an index of the mortality rate of elephants during the several (but unknown number of) years prior to the survey. (c) The number of fresh or recent carcasses (category 1 or 2) of elephants in the Sebungwe, as estimated by aerial surveys, with mean estimates and confidence intervals. This estimate is an index of the number of elephants that died during the survey year. Carcass age categories have been reported for all surveys since 1995. The observed trend (bold line) is an exponential curve calculated from the slope (r) of a linear regression of the natural logarithm of the mean estimate against year (r 0.2336 ± SE 0.0200, 95% confidence limits 0.18 & 0.29, n 6, t 11.658, P 0.0003, r^2_{adj} 0.97). (d) The category 1+2 carcass ratio for elephants in the Sebungwe during 1995 2006. This ratio provides an index of the mortality rate of elephants during the survey year. Ratios are shown separately for the entire Sebungwe study area, for the Parks and Wildlife estate (PWE) and for the communal lands (CL).

The maximum likelihood analysis to compare population models for 1979-2006 revealed that the best fit to the survey estimates during 1980-2006 was a model that started with a population of *c*. 9,500 elephants during 1979 and that each year increased at a rate of 4.02% and decreased by the number of elephants recorded killed during 1980-1995 and estimated killed during 1996-2006, with this estimated number increasing by 23.5% annually (equivalent to an exponential rate of 0.211 per year; Fig. 2, Table 3). The fit of this model was better than that of alternative models with different starting populations, growth rates, or rates of increase in the number of elephants killed annually after 1995. If the 2006 survey estimate was not included in the likelihood analysis, the predicted population trend after 2001 was a poor fit to the observed trend because the increase in the number of elephants killed annually after 1995 was overestimated.

The rate of increase in the number of elephants killed annually after 1995 (23.5%) in the best-fitting population model was within the confidence limits of the annual rate of increase in the number of fresh and recent carcasses observed during surveys (26.3%; Fig. 3c). This same model predicted that 2,894 elephants were killed between the 2001 and 2006 surveys.

Illegal activities

Illegal activities in the Parks and Wildlife estate, as indicated by the numbers of poachers' camps and cattle,

Table 2 Parameters for elephant population models for 1979 1995 that assumed that the number killed annually during 1980 1995 may have been greater than the number recorded killed. A series of models was run using different combinations of an assumed starting population, an assumed growth rate, and an assumed number of additional (unrecorded) elephants killed. This table gives the parameters for the model that provided the best fit of the predicted population numbers to the estimated numbers. Index values were calculated first using all survey estimates and then recalculated seven times, each time dropping one estimate from the calculation. The mean values are for models selected using index values calculated with only six survey estimates.

Survey year dropped from index value calculation	Peak index value	Starting population number during 1979	Population mean growth rate (% per yr)	Number of additional elephants killed annually during 1980 1995
none	*	9,603	3.77	0
1980	34.7	9,066	4.30	0
1981	15.7	10,105	3.33	0
1983	19.4	10,089	3.39	0
1989	26.5	9,517	3.76	0
1991	50.5	9,552	3.60	0
1993	12.4	9,574	3.96	0
1995	12.1	9,464	4.17	0
Mean		9,624	3.78	0

*Not given because this index value was calculated as the product of seven relative values and so cannot be compared with the other index values in this table, which were calculated as the product of six relative values.

increased between 2001 and 2006 (Fig. 4a). The elephant mortality rate in the Parks and Wildlife estate during any survey year (as indexed by the category 1+2 carcass ratio) was significantly and positively correlated with the number of poachers' camps in the estate during the same year (Fig. 4b).

Discussion

Trends in the Sebungwe elephant population

The trend of the modelled population that gave the best fit to the survey estimates (Fig. 2) is likely to be a reasonable representation of the trend exhibited by the

Table 3 Parameters for elephant population models for 1979 2006 that assumed that the number of elephants killed annually after 1995 may have increased exponentially. A series of models was run using different combinations of an assumed starting population, an assumed growth rate and an assumed rate of increase in the number of elephants killed annually after 1995. This table gives the parameters for the model that provided the best fit of the predicted population numbers to the estimated numbers. Index values were calculated first using all survey estimates and then recalculated 12 times, each time dropping one estimate from the calculation. When the 2006 estimate was dropped the predicted population trend line did not pass through the confidence interval of the 2006 survey estimate. The mean values are for the models selected using the reduced data sets for the analysis, but excluding the model selected when the 2006 estimate was dropped.

Survey year dropped from index value calculation	Peak index value	Starting population number during 1979	Population mean growth rate (% per yr)	Rate of increase in number of elephants killed annually after 1995 (% per yr)
none	*	9,501	4.02	23.5
1980	8.02	9,049	4.38	25.6
1981	2.98	9,870	3.74	21.7
1983	3.98	9,934	3.70	21.6
1989	5.00	9,380	4.10	23.7
1991	7.39	9,355	4.10	23.4
1993	3.08	9,572	4.00	23.9
1995	2.97	9,531	4.04	24.3
1996	2.02	9,500	4.01	23.2
1997	1.98	9,496	4.04	23.8
1999	6.86	9,601	3.86	21.3
2001	2.91	9,394	4.16	24.7
2006	2.19	9,421	4.14	38.0
Mean (excluding when 2006 dropped)		9,517	4.01	23.4

*Not given because this index value was calculated as the product of 12 relative values and so cannot be compared with the other index values in this table, which were calculated as the product of 11 relative values.

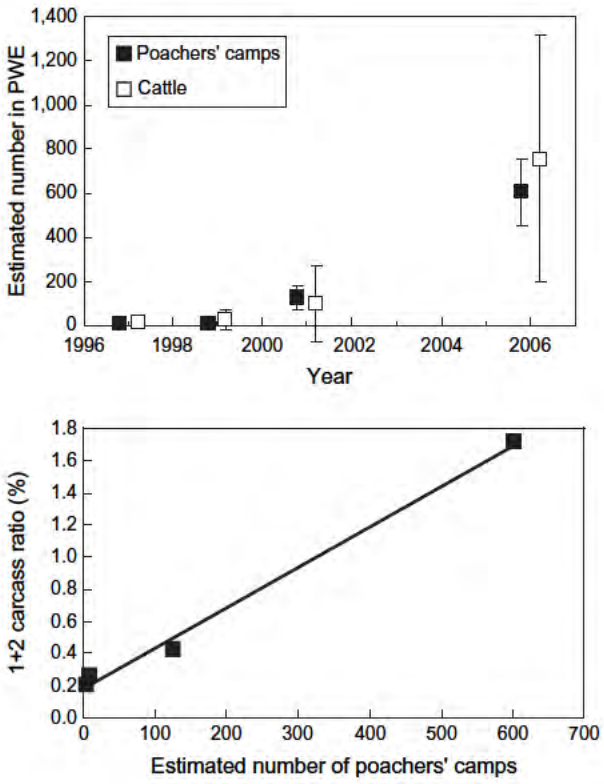

Fig. 4 (a) The numbers of poachers' camps and cattle (indices of illegal activity) in the Parks and Wildlife estate (PWE) of the Sebungwe, as estimated by aerial surveys, with mean estimates and 95% confidence intervals. Data sources as in Table 1. Poachers'camps were not reported for pre 1997 surveys. (b) The mortality rate of elephants in the Sebungwe Parks and Wildlife estate, as indexed by the category 1+2 carcass ratio for the estate, was correlated with the estimated number of poachers'camps in the estate (n 4 surveys; 1997, 1999, 2001 and 2006, correlation coefficient 0.9968, P <0.01; line for illustrative purposes).

Sebungwe elephant population since 1980. When anthropogenic mortality was discounted this population increased at 4.02% annually. This mean rate represented the excess of births over natural deaths. It is close to the 5% rate displayed before 1980 (Cumming, 1981) and similar to two predictions (4.32 and 4.89%) based largely on data from elephants culled in the Sebungwe (Craig, 1989).

The simple population model used here assumed that the difference between the fecundity and mortality rates was approximately constant from year to year, although for elephants this is not always so (Gough & Kerley, 2006). The model's predicted population trend would always be a poor fit to survey estimates if there is unusually high natural mortality in any year. An apparent decline in the number of elephants in the Sebungwe between 1991 and 1993 coincided with a severe drought across southern Africa and some elephant populations, e.g. in Gonarezhou, suffered significant mortality (Leggett, 1994). However, the Sebungwe population appeared to be relatively unaffected, with no obvious increase in mortality (S. Alibhai & Z. Jewell, pers. comm.; K. Payne, pers. comm.). In the Sebungwe it was during 1994-1995 that rainfall was particularly low and while there was no evidence that the number of live elephants declined then, the all-carcass ratio doubled between 1993 and 1995. But 95% of carcasses seen during the 1995 survey were of elephants that died before the 1995 dry season. Hence, the Sebungwe elephants appeared to be less susceptible to drought-related mortality than some other elephant populations.

There were three phases in the trend of the Sebungwe elephant population during 1980-2006. During 1980-1987 population number was approximately constant, with the culling of >2,000 elephants preventing any increase. After 1987, until *c.* 1999, the population number increased steadily because anthropogenic mortality was generally low (the numbers of elephants culled during 1991 and 1992 were too small to prevent the increase). After 1999 the mortality rate rose sharply and was high enough during the early 2000s to check any further increase in elephant number. There is close agreement between the observed rate of increase after 1995 in the number of fresh or recent carcasses, and the rate of increase in the number of elephants killed annually after 1995 that must be included in a model that mimics the most recent trend in the elephant population.

To keep elephant numbers in the Sebungwe approximately constant at 15,000 (mean of the 1999, 2001 and 2006 estimates) would require 600 elephants to be killed annually, assuming a population growth rate of 4%. These 600 deaths are in addition to natural deaths. For comparison, the observed increase in the number of elephant carcasses between the 2001 and 2006 surveys averaged 373 per year but this figure, which includes natural deaths, makes no allowance for carcasses that decayed or otherwise disappeared.

Elephants have been killed in the Sebungwe for various reasons, including culls, tsetse control, sport hunting, Parks and Wild Life Management Authority staff training and rations, problem animal control, crop protection and illegal hunting (Martin, 1992a). There have been no culls since 1992 and tsetse control operations no longer use game fences or game-free corridors. Sport hunting is unlikely to account for the increased mortality of elephants after 1999 because the number of elephants that sport hunters were licensed to kill annually was constant at 60-70 during 1994-2002 (Grobbelaar & Masulani, 2003). Ivory records account for an average of <100 elephants per year that died in the communal lands between the 2001 and 2006 surveys (O. Ndoro, pers. comm.) and this number includes elephants killed during problem animal control and sport hunting, and

some natural deaths. There are no published data on the numbers shot by Parks and Wild Life Management Authority staff for rations, or staff training. Despite gaps in the data, it is most unlikely that the increase in elephant mortality since 1999 can be accounted for by the legal killing of elephants.

The significant and positive correlation between the elephant mortality rate in the Parks and Wildlife estate and the number of poachers' camps there strongly implies that, at least within the estate, the increase in elephant mortality was due to poaching. A simultaneous increase in the number of domestic cattle illegally in the estate, and the recent presence of cattle-drawn carts (Dunham *et al.*, 2006), suggests that the problem was not just elephant poaching but a wider problem of a lack of law enforcement. Zimbabwe's capacity to provide effective law enforcement in the Parks and Wildlife estate is constrained by small budgets (Cumming & Jones, 2005), often compounded by inappropriate allocations of resources (Attwell & Cotterill, 2000).

That the sharp rises in the mortality rates of elephants in the Parks and Wildlife estate and in the communal lands occurred at different times may suggest different causes. However, the limited records of elephant offtake in the Sebungwe communal lands during 1996-2006 provide no evidence of a major rise in the legal offtake (O. Ndoro, pers. comm.). One could speculate that poaching caused both rises but that extensive poaching started in the communal lands before the 2001 survey and in the Parks and Wildlife estate afterwards.

Conservation implications

That the number of dead elephants within an area can increase significantly without the number of live ones declining may appear counter-intuitive, and could be dismissed as erroneous, especially if survey techniques are not consistent. In the Sebungwe a population that had been increasing was subjected to additional illegal hunting, hence the extra carcasses, which caused the population number to level off. The value of a long-term data set is further emphasized when additional information is collected during surveys so that temporal and spatial trends in the numbers of elephants and other large herbivores can be related to trends in, for example, human density, woodland clearance and domestic livestock (Cumming & Lynam, 1997). The elephant enjoys a high international profile and the Sebungwe surveys were often funded specifically to census elephants: additional data, on other species and the environment, were collected at no extra cost under the financial umbrella of the charismatic study species. The methods used here to determine the long-term trend in elephant number can be extended to these other species and any population censused in a consistent manner for a reasonable period.

In future both the all-carcass ratio and the category 1+2 carcass ratio should be reported for elephant surveys. As an index of the mortality rate the all-carcass ratio can suggest a trend in a population even when survey data are too few or too variable to reveal one (Douglas-Hamilton & Burrill, 1991). But because the all-carcass ratio represents the mortality rate during an unknown period prior to the survey, it reveals only the recent trend, at least in general terms, not necessarily the current trend. The category 1+2 carcass ratio, as an index of the mortality rate during the survey year, is more useful in revealing the current trend. This is well illustrated for the Sebungwe: while the all-carcass ratio was 21% greater during 2001 than during any previous survey, the category 1+2 carcass ratio was 193% greater. The category 1+2 carcass ratio reveals that the rise in the mortality rate of the Sebungwe elephants commenced before 2001, useful information that was inadequately captured by the all-carcass ratio.

Surveys of other elephant populations are needed to determine if the poaching upsurge is confined to the Sebungwe, or a national problem, or a continent-wide problem. Zimbabwe's elephants in north-west Matabeleland and Gonarezhou were last surveyed in 2001 and plans to re-survey them in 2006 were postponed. Zimbabwe's fourth major elephant population, in the unflooded Middle Zambezi Valley, was surveyed during 2005 but the report is still (December 2007) awaited. Media reports that at least some poaching in the Sebungwe is conducted by Zambian nationals suggest that there is an international dimension to the poaching and that it is not simply a local breakdown in law enforcement. That the Sebungwe elephant poaching may be part of a wider problem is also implied by an analysis of the Elephant Trade Information System records of world-wide seizures of illegal ivory, which suggest that the illicit trade in ivory is once again increasing (Milliken *et al.*, 2007). The MIKE programme has yet to report on temporal trends in poaching (CITES, 2004, 2007).

This study provides no support for claims that variations in natural mortality, the inter-calving interval and the age at sexual maturity make significant contributions to the variation in the observed trends in southern African elephant populations (van Aarde & Jackson, 2007). The Sebungwe contains a matrix of land use types, without artificial waterpoints for wildlife or fences to limit dispersal but despite this the variation in the trend of the elephant population since 1980, and before (Cumming, 1981), appears to be mostly due to fluctuations in the level of anthropogenic mortality. Although the Sebungwe population has now been stabilized by this mortality, the overall mean density of

elephants in the protected areas is greater than that which is likely to permit the recovery of woodlands that have been converted to shrublands by elephants (Martin *et al.*, 1989). Zimbabwe's elephant policy calls for elephant density in protected areas to be kept below levels that 'compromise biodiversity' (Department of National Parks & Wild Life Management, undated), in practice <0.75 elephants km^{-2} (D.H.M. Cumming, pers. comm.).

During most of the 1980s elephant number in the Sebungwe was kept approximately constant by culling, with the sale of meat, hides and ivory from culled elephants covering the costs of elephant management. However, there have been no recent culls, partly because the ivory trade ban prevents tusks from culled elephants being sold to offset the costs of management and protection. Although poachers are now limiting the Sebungwe elephant population, the current number (14,000-16,000) is greater than during the 1980s (9,000-11,000). Thus, the advent of the ivory trade ban was followed by an increased density of elephants and presumably by greater impacts on the woody vegetation, already seriously modified by elephants. If there is a continued absence of effective law enforcement, poachers rather than managers may be responsible for reducing elephant density in the Sebungwe to that set by the national policy. It will be ironic if a consequence of the ivory trade ban is more poaching, rather than less.

The credibility of the Sebungwe surveys is confirmed: there is no contradiction between the increase observed during 2006 in the number of dead elephants and the approximately constant population of live elephants. The carcasses represented what would have been an increase in the live population if there had not been additional mortality, mainly due to poaching, after 1999. During the 1990s the number of elephants was increasing but by 2006 the number killed annually was high enough to keep the population number constant.

Acknowledgements

I thank Rowan Martin, Abel Khumalo, Jon Cadd, Russell Taylor and Onias Ndoro for help in various ways, and Fay Robertson and David Cumming for criticisms of earlier drafts. Many people have contributed to the Sebungwe surveys: I mention especially Ian Coulson, Timothy Chifamba, Andrew Masarirevhu and Jill Adair, all of whom died as a consequence of the crash of the survey plane in 1994.

Biographical sketch

Kevin Dunham is an independent wildlife biologist based in Zimbabwe. His interests include the management and conservation of large mammals. Since 1999 he has often been a member of the WWF SARPO/ PWMA teams that have conducted elephant surveys in Zimbabwe.

Appendix A maximum likelihood estimator to compare population estimates, complete with variances, to predicted population numbers (adapted with the permission of Rowan Martin, from Martin, 1992b).

The temporal trend in the number of elephants in a model population can be compared with survey estimates of the real population number using Martin's (1992b) maximum likelihood analysis. For each year during which a population is surveyed the analysis compares the population number predicted by the model to the survey estimate. It does this by relating the difference between the predicted and estimated numbers to the variance of the mean estimate of population number.

For each survey year the number of elephants predicted by a model is compared to the survey estimate (Fig. A1). The bell-shaped curve for the normal distribution is represented by the formula for the normal probability density function (Sokal & Rohlf, 1981). There are two parameters in this formula, namely the population mean and the population standard deviation. The population mean is assumed to equal the mean (sample) estimate of the number of elephants, as determined by the survey, and the population standard deviation is assumed to equal the square root of the variance of this sample estimate. The values on the curve corresponding to the predicted number of elephants and the estimated number of elephants are determined (Fig. A1), and the first value divided by the second to give Martin's (1992b) 'relative value'. Martin points out that the relative value is not a true probability but a value that equals one if the predicted and estimated numbers are identical, and declines towards zero as the difference between these two numbers increases.

The product of the relative values for all survey years forms a maximum likelihood estimator that equals one if the predicted and estimated numbers are identical during all survey years, and declines towards zero the less perfect the fit between the predicted and estimated population numbers. For convenience, the product is multiplied by 1,000 to give the 'index value'.

The analysis is performed by running several models (for example, models with different combinations of a starting population number and a population growth rate), and determining which model gives the greatest value for this index value. This is the model that provides the best fit to the survey estimates.

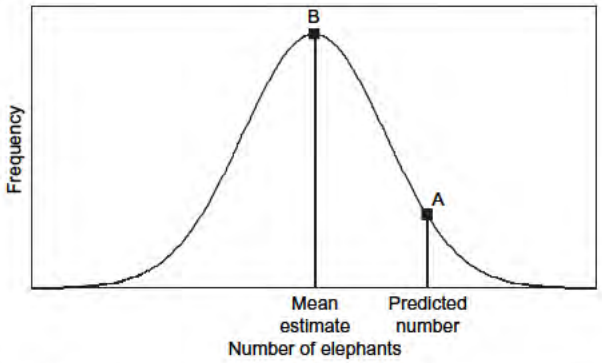

Fig. A1 An illustration of how the number of elephants predicted by a model was compared to that year's survey estimate of elephant number, using Martin's (1992b) 'relative value'. The bell shaped curve for a normal distribution (shown) is represented by the formula for the normal probability density function. In this formula, the population mean is taken to be the mean (sample) estimate of the number of elephants, as determined by the survey; and the population standard deviation is taken to be the square root of the variance of this sample estimate. The vertical lines indicate the values on the curve that correspond to the number of elephants predicted by the model (value A) and the estimated number of elephants (value B). Martin's 'relative value' A/B. This relative value equals one if the predicted and estimated numbers are identical and declines towards zero as the difference between them increases.

- 2014 aerial survey reports, including details on how the surveys were conducted (i.e., methodology) and coverage, including maps of elephant observations, herd size and distribution, carcass observations, and distribution.
- Any additional data on carcasses, including carcass class and proportion of illegally killed elephants [PIKE].
- Any demographic analysis of populations by site (e.g., sex and age class, population histograms, projected growth rates).

3. Poaching levels and prevention

Without adequate control of poaching, even a well-managed elephant management program may fail to meet established goals of population levels and densities. Specifically, we request:

- A table summarizing MIKE and PIKE information from the major populations in Zimbabwe, since recording started in 1999.
- National policies to address poaching.
- Actions taken by the Zimbabwe government to protect wildlife, prevent poaching and punish criminals of wildlife crimes. This should include:
    - Anti-poaching manpower and budget for anti-poaching in protected areas overseen by ZPWMA.
    - Summary of serious wildlife crime cases in recent years (i.e., arrests, outcome of trials, sentences).

4. Regulations and Enforcement

While we have received detailed information from a few areas or programs operating within Zimbabwe, we do not have adequate information on the overall picture at the national level. In particular we seek information on how much money is generated by U.S. hunters through elephant hunting, how these funds are distributed, and how these funds impact the ability of ZPWMA to adequately enforce the Parks and Wild Life Act, day-to-day management, or anti-poaching efforts. Specifically, the following would assist us:

- The current operating budget for ZPWMA, including sources of funding (e.g., allocated by Parliament, obtained through hunting permits or concessions, park fees, donations, etc.).
- The amount of revenue generated from elephant hunting by U.S. hunters and how those funds are distributed?

5. Sustainable Use

To date, we have not received adequate information regarding offtake in Zimbabwe, including basic fundamental information like the number of elephants killed annually, both legally and illegally. According to ZPWMA, categories of offtake are:

- Sport-hunting by trophy hunters,
- Cropping (culling and population control, which may include meat supply to rural communities and elephants shot for the skin trade),
- Live animal capture and sale,
- Natural Mortality (found dead of natural causes),
- Accidents (killed by trains, landmines, or vehicles),
- Poaching (illegal take),

- Problem Animals (elephants killed to protect human life and property), and
- Management Offtake (offtake due to other management decisions).

Please provide:

- The number of elephants taken per year in each of these categories.
- Details on how the number of elephants to be hunted in each area is decided (i.e., quota setting).

6. Revenue Utilization

We understand from our own research and information provided to us that hunting in Zimbabwe occurs on the following land uses: Communal Lands (under CAMPFIRE), and on Safari Areas, Forest Estates, and on Private Conservancies (under the supervision of ZPWMA).

- Please provide information on: elephant populations on the four aforementioned land types, the number of elephants hunted on each land type, and the fees paid or the revenues earned for elephant hunts on each land type.

- For each of the land uses on which elephant hunting occurs, please provide the total number of elephant hunts, the total revenue, and a summary for each type of management on how the revenues are spent.

I truly appreciate any further assistance and information you and the ZPWMA can provide to further fill the information gaps. If it would be of assistance in meeting this shared goal, I would be happy to send key Service personnel to Zimbabwe to meet with you or relevant staff to discuss these issues further.

It is the Service's position that U.S. hunters can play a constructive role in the conservation of the African elephant. While the United States has specific stricter domestic measures that require additional findings beyond those required for the issuance of an export permit by your country, we recognize that scientifically based management programs and close monitoring and control of hunting alongside an effective anti-poaching program can allow U.S. hunters to provide a significant benefit to African elephant conservation.

We look forward to working with you to gather additional information and determine whether our legal threshold can be met. If you have any questions, please feel free to contact me at +1 202 208 6394 or by e-mail at Bryan_Arroyo@fws.gov.

Sincerely,

Bryan Arroyo
Assistant Director – International Affairs

Workshop_organisation statement.doc 458 KB

ZIMBABWE PARKS AND WILDLIFE MANAGEMENT AUTHORITY
SEBUNGWE ELEPHANT MANAGEMENT ACTION PLAN WORKSHOP

FACTS ABOUT THE WORKSHOP ORGANISATION

The workshop is led by Zimbabwe Parks and Wildlife Management Authority

The workshop has been funded by:

- **CONSERVATION FORCE**
- **PADENGA HOLDINGS**

The workshop has been voluntarily organized by:

- TASHINGA INITIATIVE
- ZAMBEZI SOCIETY

The workshop is being hosted at a considerably reduced rate by Musango Safari Camp, Lake Kariba.

Mr John J Jackson III of Conservation Force asked for the following requirements to be met through his donation:

- That the workshop financially supports the participation by members of ZPWMA, ZRP, Prosecutors Office, Chiefs, CAMPFIRE, Community RDC_CEOs, Universities.

- That Participants from all NGO's, trusts, charitable organisations, antipoaching units, safari operators: consumptive and non-consumptive, technical experts, wildlife consultants, and others, be asked to meet all the charges themselves. This includes TI and ZS.

The charges are: USD85.00 per day if staying at Musango
USD70.00 per day for the workshop, if staying elsewhere

Any objections, kindly speak to Mr Marco Pani, Conservation Force who will take your enquiries.

Lynne Taylor
Tashinga Initiative on behalf of Conservation Force

DAPU First quarter newsletter 2015.pdf 159 KB

DAPU

DANDE ANTI POACHING UNIT

First quarter newsletter 2015

Dear Friends,

Thank you so much for your support thus far. DAPU has gotten off to a good start in 2015.

Changes

Bongi, who has had so much success in the East, has now been promoted to manage DAPU in the North. Muno has been promoted from Mukanga camp manager to manager of the East (Bongi's old job). These changes have really given all DAPU staff a fresh perspective and even more motivation than ever.

For the 22 scouts after a long negotiation with community leaders, we now deduct the community's share of the wages at source (CMS pays and deducts from hunts owed) so now finally all staff are fully paid up. We also negotiated that we be allowed to move scouts between areas or wards meaning from now on it will be seldom that a DAPU scout will be patrolling his home area. This makes for much more honest policing as he or she are now not required to arrest family members and also it means on their time off they do not get harassed.

Snaring & general poaching.

December, January and February were hectic months for snaring mostly because it is our "off season" along with the fact that locals can only expect to harvest crops in March so are getting hungry. Figures over the last couple years definitely point to the fact that PH's and clients whilst out hunting are still some of the best scouts available i.e. in peak hunting months poaching is way down!!! March and April snare counts have come down to the normal +/-200 per month range.
Very heavy rain in January washed away most riverbank crops so genuine hunger has compounded things.
Three sables were poached in the East – suspects were arrested but released due to lack of evidence.

Elephant poaching.

To date three elephant carcasses have been reported – poached in the "off season". One young bull was also destroyed – he had been wounded by poachers.

Problem Animal Control.

Duties for DAPU scouts also include attending to Problem animal reports (PAC).

a. Elephant -

As always the wet season is peak time for elephants to raid crops and 2015 has been no exception. Luckily aggressive chasing at night has meant to date that we have not had to shoot any elephants.

b. Lions – the same cattle killing pride of lions has continued in to 2015. National Parks were able to shoot one young male in the East. Two females remain in that pride and are killing on average two cattle per week in the Gonono area.

In Kanyemba a 14-year-old girl was killed and eaten by lions. We expect more problems from them. That same pride has killed 6 people 2010 to date.

c. Buffalo – one dagga boy has been chasing kids en route to school in the Pedza village area.

d. Crocs – one child lost his arm on the Manyame River.

e. Snake bites – two people killed in their fields.

Goals for Second quarter.

1. *Continue with anti poaching patrols.*
2. *Replace scouts that are not performing.*
3. *Early burning will start in June as soon as it is dry enough.*
4. *Repair firearms where possible or replace*
5. *Replenish ammunition stocks.*
6. *New boots.*
7. *New Uniforms.*
8. *New (better quality) tents.*
9. *Three new GPS's (coming with Mike Core).*

All the very best and thank you to all of you whom have helped make DAPU possible!

Buzz and Myles.

Attention: Mr. Bryan Arroyo

RE: ELEPHANT CONSERVATION IN ZIMBABWE

With reference to your letter dated 12 May 2015 please find attached a response to the questions you raised on the conservation of the African elephant in Zimbabwe. We hope that the information provided will contribute towards a positive enhancement finding by the United States Fish and Wildlife Service (USFWS).

With regards to your offer to send USFWS personnel to Zimbabwe, we welcome such a visit and look forward to closer cooperation.

The Government of Zimbabwe avails itself of this opportunity to renew to the Government of the United States of America the assurances of its highest consideration.

Hon. O. Muchinguri-Kashiri

MINISTER OF ENVIRONMENT, WATER AND CLIMATE

Board of Directors: Mr Alvin D. Ncube (Board Chairman), Prof. Gilbert Pwiti, Rtd Air Marshal Henry Muchena, Ms Nellie R.F.T Jinjika, Mr Wilson Mutinhima, Mr Tichafa E. Mundangepfupfu, Mr T Mundoga, Mr E Chidziya (Ex Officio)

RESPONSE TO THE UNITED STATES DEPARTMENT OF THE INTERIOR

FISH AND WILDLIFE SERVICE (USFWS)

JULY 2015

BACKGROUND TO ELEPHANT MANAGEMENT IN ZIMBABWE

Zimbabwe has a proud history of successful elephant conservation, and is one of the key elephant range states and home to the second largest remaining elephant population after Botswana. The population estimate from the 2014 aerial survey stands at 82,092 elephants.

In the early 1900s the elephant population in Zimbabwe was estimated to be about 4,000. By 1980 the population had increased to an estimate of 46 426 elephants. The population continued to increase and in 1993 it was 58,185, in 2001 it was 88,123. A twenty fold increase in elephant populations was observed from the early 1900 to 2001. This increase was noted despite attempts to limit elephant population growth between 1960 and 1989 through culling exercises in tsetse control areas and state protected areas.

The number of elephants taken off during this period was approximately 45,000elephants. The primary rationale for limiting elephant numbers in protected areas was to reduce their impact on woodland habitats and the loss of plant and animal species as a result of elephant induced habitat change. Between 1990 and 2006 elephant populations grew exponentially but growth has since been limited by an escalation of illegal killing among other factors. The elephant population estimate between 2001 and 2014 has experienced a statistically insignificant change from an estimate of 88,123 to 82,092 elephants.

The human population has also increased twenty-fold between 1900 and 2000, resulting in increased demand for land for agriculture and other forms of land-use outside protected areas thereby limiting the area available for elephants with a resultant increase in human elephant conflict.

The high elephant population in some protected areas has resulted in ecological problems associated with localized overabundance which include: conversion of woodlands to scrubland and grasslands, and decrease in species diversity of both flora and fauna. Recent studies indicate that elephant densities that are as low as 0.27 elephants per km^2, elephants will convert the woodland into coppice in 120 years due to the massive declines of large trees (Mapaure, 2013). The same result is achieved in 10 years if the density is at 2 elephants per km^2; however other factors such as fire also have a huge influence on woodlands. It is generally accepted that the elephant density that can allow for the recovery of woody species is 0.5 elephant per km^2 in less than 100 years.

Zimbabwe subscribes to the principle of sustainable utilization of all wildlife resources including elephants. Sport hunting is the principal form of wildlife utilization whereby off takes are adaptively managed and monitored through a participatory and science based process. This process allows for sustainable off takes, and rigorous resource monitoring programmes that allow recruitment within a population to ensure the continued survival of the population in the wild. The high economic value conferred to the elephant through consumptive utilization has also resulted in increased tolerance by local communities.

1. Management Plan

What is Zimbabwe's target elephant population, both nationally and by sub-regions (e.g., how many individuals and/or populations or what percentage of land with elephants)?

Zimbabwe's major elephant range which is the basis for all national surveys is 67,898km^{2}covering approximately17% of the country's total land area. The major elephant range comprises of South East Lowveld (10,409km^2), Sebungwe (15,527km^2) North West Matabeleland (24,959km^2) and Zambezi Valley (17,003km^2) as shown in Figure 1 below.

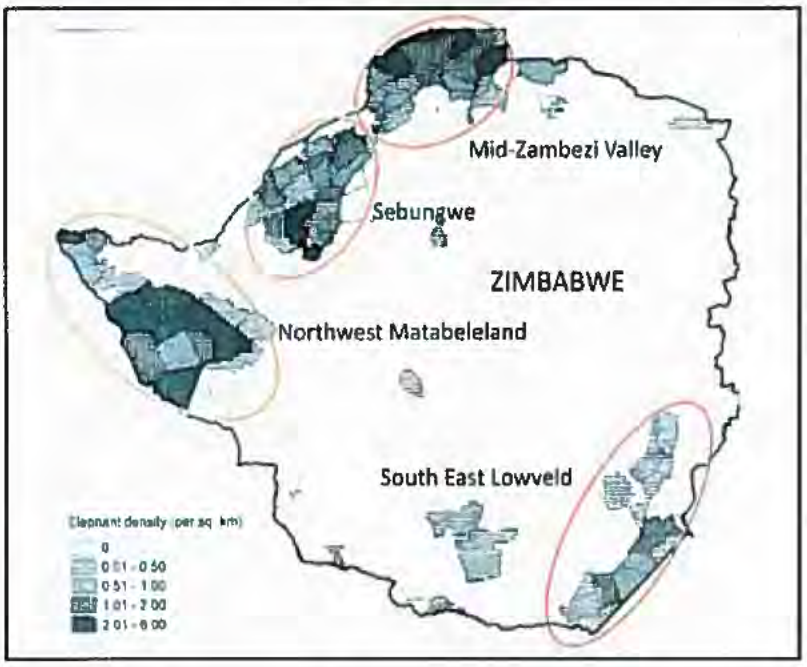

Figure 1.Distribution of the four major and minor elephant ranges in Zimbabwe.

The range covers all land categories which include protected areas, private, forest and some communal lands. The map above shows the four major elephant range in Zimbabwe. According to the 2014 National Elephant population aerial survey, Northwest Matabeleland had the highest population of elephants (53,991) followed by South East Lowveld (13,037), Zambezi Valley (11,657) and Sebungwe (3,407).

As discussed below, ZPWMA has set a preferred density, but most of the ranges already exceed this density at varying degrees. As such it has become apparent to develop range based Elephant Conservation plans to factor in the special variations in management interventions required for

each range area. Accordingly, population targets for each major range, which take into account the preferred density and other factors, have been or will be set at participatory workshops for each area. Generally, Zimbabwe's target is to maintain essentially the same range (or perhaps expand the range), which is at least 17% of land as elephant habitat.

At the strategic level the in the Elephant Conservation and Management Plan the following three targets are outlined:

- To maintain at least four demographically and genetically viable elephant populations in Zimbabwe
- To maintain or increase the elephant range in Zimbabwe
- To maintain numbers /densities of elephant at levels that do not adversely impact on biodiversity conservation goals while contributing to economically viable and sustainable land uses

At an operational level the following targets have been set following a series of workshops to develop sub-regional action plans:

A target of 5,000 elephants has been set as a minimum viable population (MVP) for the Sebungwe region. The 2014 aerial surveys established a population estimate of 3,407elephants in approximately 7,000km^2 of available habitat. The objectives for the sub-region therefore are to increase the elephant population to international standards for minimum viable elephant populations. This target was set during the Sebungwe Elephant Management Plan Workshop held at the Musango Safari Camp in May 2015.

The MVP is the population size that is required for a high probability of survival of a population over a given period of time. The MVP is the minimum population size that is considered large enough to avoid inbreeding depression, with sufficient genetic diversity for adaptive change to occur and large enough to avoid new deleterious mutations to occur. The MVP however is also largely depends on habitat quality, law enforcement effort, social factors and other key variables including stochastic events therefore is cautiously used as a target.

For the remaining 3 regions namely North West Matabeleland, Zambezi Valley and South East Lowveld target populations will be developed through participatory Elephant Management Planning Workshops. A workshop for Mana Pools National Park / Zambezi Valley was held 30 March – 2 April 2015 while that for South East Lowveld is scheduled for to run between 2nd and 4th of September 2015. Workshops for the other ranges are in final planning stages and the dates will be announced once they have been finalized.

- One of the major targets at the strategic level is to maintain the elephant range at the 1996 level through enforcement of legislation

- To increase the range and habitat availability for elephants through initiatives such as Trans-frontier Conservation Areas which include Great Limpopo Transfrontier Park (GLTP) / Great Limpopo Transfrontier Conservation Area (GLTFCA); Kavango-Zambezi (KAZA) TFCA; Lower Zambezi-Mana Pools LZMP (TFCA) and Zimbabwe-Mozambique-Zambia (ZIMOZA) TFCAs. In addition to the TFCAs new conservancies have been formed thus increasing the size of the range available to elephants.
- To increase connectivity between sub-populations through the creation of wildlife migration corridors such as Hwange Sanyati Biological corridor project linking North West Matabeleland and Sebungwe.

A copy of Draft Zimbabwe's Elephant Conservation and Management Plan will be provided shortly. Certain Key Activities, Key Performance Indicators (KPIs), and Means of Verifying KPIs have been included here in response to questions.

How have these targets been set (e.g., ecological carrying capacity estimate, historic numbers)?

The target for Sebungwe has been set using the MVP size of 5,000 elephants which is considered genetically viable internationally (Armbruster andLande1993). In setting the MVP target for Sebungwe, population viability analyses and simulation models to predict the impacts of elephants on habitat among other variables as well as thorough analyses of habitat quality and other factors were used.

The targets for the following sub regions North West Matabeleland, Zambezi Valley and the South East Lowveld will be set using preferred densities and ecological carrying capacity, geographical distribution and habitat connectivity, and also take into account historic numbers and the economic viability for wildlife based tourism as well as genetically viability. It should be noted that Zimbabwe's elephant population exceeds preferred densities in every range except Sebungwe, but preferred density is only one factor among many taken into account.

Within the framework of the National Elephant Conservation and Management Plan, the setting of targets is incorporated the setting of targets is incorporated under each of the five key components as shown in the table1below:

Table 1. Strategic Objectives in Elephant Management Plans

Key Component	Strategic Objective
Protection & law enforcement	Ensure effective protection of all population of elephant in Zimbabwe
Biological monitoring & management	Implement effective biological, ecological management to achieve populations that are within upper and lower acceptable limits to change in numbers and distribution
Social, economic & cultural framework	Implement strategies that enhance the contribution of elephants to rural livelihoods and national development
Building conservation capacity	Ensure that sufficiently and appropriately trained personnel, equipment, infrastructure and financing are mobilized, available and used efficiently and effectively
Coordination, collaboration& programme management	Ensure effective coordination and collaboration with national and international stakeholders

Under biological monitoring and management, "targets will be set based on results of extensive long term monitoring as well as on-going research on elephant-vegetation dynamics. Thresholds of potential concern will be established, spatial data on geographical distribution mapped and wildlife based land uses promoted in connectivity areas and biological corridors."

Due to the high elephant population in some protected areas, localized over-abundance and associated problems are being experienced, for example the threat to *Colophospermum mopane*. In some areas human population growth and settlements in buffer zones has led to elephant population compression in protected areas, which poses a high risk to woodland persistence. However, the Zimbabwe Parks and Wildlife Management Authority (ZPWMA or the Authority) seeks to balance protection of biodiversity and woodland cover with concerns over the declining elephant populations in some countries and international focus on the elephant as a species under severe threat from poaching. Accordingly, ZPWMA would prefer to maintain a density of 0.5 or 0.25 elephant per sq. km. Density levels are however determined at a local level in accordance with the objectives of the Park or habitat area. Whilst there are no formulas to determine definite density levels to maintain biodiversity, available literature, (G. C, Craig unpublished, 1997) suggest that tree canopy cover only exceeds 50% at elephant densities of between of between 0.1 – 0.5 per sq.km. As such, a precautionary principle, Zimbabwe would want to maintain elephant densities within the afore-mentioned acceptable levels. However, variation to this exists where tourism objectives have been met and public opinion is saying otherwise (e.g. the international lobby against culling)

While the Sebungwe Action Plan is ready and one for the Zambezi Valley is being drafted, there are two regional stakeholder workshops in advanced stages of planning, for North West Matabeleland and South East Lowveld. These workshops will set targets for the sub-regional populations as well as measurable action items and indicators.

However, ZPWMA seeks to balance protection of biodiversity and woodland cover with concerns over the declining elephant populations in some countries and international focus on elephant as a species under severe threat from poaching and human encroachment.

How are current human settlements, as well as anticipated growth of these settlements, factored into these targets?

It should be borne in mind that the human population of Zimbabwe also increased twenty-fold between 1900 and 2000, with the result the range available to elephants accordingly under increasing threat. Zimbabwe's human population growth has led to increasing demand for agricultural land especially in the Sebungwe region thus putting pressure on some previously unsettled areas mainly in the Sebungwe Region. For this area the target population has been set at the minimum viable population level of 5,000 elephants.

There is currently effort through the Hwange-Sanyati Biological Corridor project to sustain movement of wildlife through from North-West Matabeleland (areas with high elephant densities) to the Sebungwe Region. This is envisaged to ensure the free movement of elephants, reducing some of the population pressures in North-West Matabeleland while populating the Sebungwe region to the targeted minimum sustainable population level of 5,000 elephants.

Current human settlements as well as anticipated growth of these settlements have been factored in the Action Plan for Elephant Conservation and Management in Zimbabwe through various initiatives which include increasing habitat connectivity. In some populations such as North-West Matabeleland the TFCA concept is being implemented to ensure connectivity of range areas at the national level with neighbouring Range States (Botswana, Zambia, Namibia and Angola). TFCA initiatives like the Great Limpopo Transfrontier Park (GLTP) / Great Limpopo Transfrontier Conservation Area (GLTFCA); Kavango-Zambezi (KAZA) TFCA; Lower Zambezi-Mana Pools LZMP (TFCA) and Zimbabwe-Mozambique-Zambia (ZIMOZA) TFCAs help in maintaining a demographically and genetically viable population, creating landscapes for ecosystem processes suitable for elephants. There is a lot of research work being undertaken by ZPWMA researchers in collaboration with external researchers on elephant population dynamics, spatial distribution, impacts on vegetation and human wildlife conflict, etc. The research outputs have been published in peer reviewed international journals.

In areas where the human population has grown substantially, sustainable livelihood options are currently being explored so as to diversify income from wildlife, thus sustaining a wildlife based land-use which is critical in sustaining Wildlife Areas. Currently the Government is reviewing

the CAMPFIRE concept so as to present it as an efficient Community Based Natural Resources Management program. This is envisaged to ensure sustainable coexistence's-management of wildlife resources is vitally important as it instils value attachment to wildlife and hence increases its protection by communities.

Maintaining the integrity of protected areas in the range through enforcement of legislation is another way the targets are being met. The country is enforcing legislation that prevents human settlements within the state protected areas which form the bulk of the National Elephant Range. Zimbabwe is also a signatory to Regional and International legal and policy frameworks that enhance cooperation in curbing wildlife crimes across borders such as Interpol. Also within the protected areas any proposed developments that occur are supposed to have Environmental Impact Assessments to determine the effect of any such proposed developments will have on the environment and the biological resource. These measures as well as anticipated growth of settlements are factored into the targets in the Action Plan for Elephant Conservation and Management in Zimbabwe.

The implementation of integrated land-use planning as well as the review of the CAMPFIRE model will promote the development of buffer zones between the protected areas and human settlements. These buffer zones will have minimal developments and will be used as wildlife areas. Monitoring plans as well as regular assessment through land use planning will be used to ensure that buffer zones and biological corridors are maintained. Development of joint management plans and joint implementation of activity plans at the local level are factored into the development of targets.

Targets to ensure that viable elephant populations, geographical distribution and habitat connectivity are achieved and maintained are included in the Action Plan. Wildlife based land use systems as well as the promotion of the establishment of community conservancies are among the activities for areas within the elephant range with high human population densities and human settlements. Anticipated growth of human settlements factored into the targets through implementation of integrated land use planning.

In areas where human populations have grown substantially, sustainable livelihood options are currently being explored so as to diversify income from wildlife, thus sustaining a wildlife based land-use which is critical in sustaining Wildlife Areas. Currently Zimbabwe is reviewing the CAMPFIRE concept so as to present it as an efficient Community Based Natural Resources Management program. This is envisaged to ensure sustainable coexistence.

What mechanisms will be utilized to reach these targets?

The mechanisms that will be utilized to reach the targets include key activities that will be implemented in order to achieve the desired outputs in the Action Plan for Elephant Conservation and Management in Zimbabwe. The activities under each component are outlined below:

Protection and law enforcement:

- For each key population establish a highly trained rapid response anti-poaching unit for deployment to areas under threat
- Enhance international and trans-boundary collaboration in law enforcement
- Enhance social (community) involvement in law enforcement
- Reduce illegal settlements
- Revisit the appointment of Honorary Officers to assist in law enforcement
- Ensure full compliance with hunting regulations and quotas set
- Adopt, adapt and apply new technology (including aerial) for area surveillance
- Appropriate informer systems established
- Improve investigation and prosecution of crimes
- Set up national and local intelligence databases

Biological monitoring and management:

- Monitor elephant population trends and elephant impacts on biodiversity through aerial, ground and ranger-based methods, among others
- Use research findings, expert opinion and informed public opinion to establish thresholds of potential concern (TPCs) to initiate management action in respect of elephant impacts for protected areas
- Monitor trophy quality and adjust quotas to maintain desired levels of trophy quality
- Carry out appropriate management actions when populations exceed TPCs
- Monitor trophy quality and adjust quotas to maintain desired levels of trophy quality
- Define current elephant range and explore options for extending range and maintaining connectivity
- Recognizing the long response time of elephants to management interventions, use modelling to project alternative outcomes or scenarios of management

Social, economic and cultural:

- Facilitate the transparent distribution of the benefits and costs of elephant management and conservation
- Implement effective techniques and land-use strategies to mitigate human-elephant conflict.
- Develop and implement an effective communication strategy for local, regional and international audiences
- Provide incentives and promote partnerships and joint venture opportunities
- Explore additional elephant-based tourism and sustainable utilization opportunities
- Information on elephants and their conservation in academic institutions
- [Further develop sustainable use opportunities for elephant]

Building conservation capacity:

- Secure funding to initiate the implementation of the elephant management plan
- Establish sustainable funding programs to build and maintain necessary human resources and strengthen elephant conservation and management capacity
- Strive to achieve best standards for elephant management, including any forms of utilization
- Engage available expertise and capacity within Zimbabwe
- Unlock value in elephants and their products
- Analyse current capacity and identify needs
- Initiate and/or maintain continuity in research and monitoring
- Strengthen research capacity in ZPWMA
- Establish training and in-service retraining

Coordination and collaboration:

- Establish a national elephant conservation and management taskforce/steering committee that includes stakeholders meetings at least bi-annually to review progress and to develop an annual implementation plan
- Complete regional planning and population target setting
- Establish four regional management committees to meet at least twice each year and implement regional plans
- Strengthen coordination between the hunting industry and the elephant

management program

- Implement an effective information dissemination and communication strategy, including regular progress reports on the implementation of the plan
- Strengthen links with neighbouring states to confer on the management of shared elephant populations
- Establish a full-time elephant manager

What monitoring will be conducted to measure progress toward these targets?

Monitoring is being and will be performed through Key Performance Indicators (KPIs) and means of verification. These indicators are included in the draft framework developed at the National Elephant Conservation and Management Planning workshop and will be included in the final National Elephant Management Action Plan, which will be made available shortly.

Monitoring and analysis of data from surveys such as water hole censuses, road strip counts and aerial surveys expected to be conducted in 2017, if funds permit, ranger-based monitoring and reporting of carcasses and carcass trend analysis; tracking of anti-poaching efforts and prosecutions; tracking of land resettlements or removal of illegal settlements.

Monitoring to measure progress towards the targets will be conducted through consideration of the following:

Protection and law enforcement

- Reports on results of law enforcement effort in various categories recorded at field stations, conservancies, and CAMPFIRE District Offices, compiled at regional and national levels and presented to the Regional and National Coordinating Committees (R&NCC) bi-annually
- Reports on Hunting regulation infringements derived from SOAZ/ZPHGA reports and from field station reports compiled and presented to R&NCC
- Consolidated record of number of field personnel and days operational (law enforcement, research &monitoring, elephant management) for each area in the elephant range compiled and reported on at annual planning meetings
- Research reports and papers on elephant conservation and management
- Training on new technologies
- Legislation (e.g. tracking illegal financial flow sand deterrent sentences)

Biological monitoring and management

- Reports on elephant surveys
- Elephant distribution maps
- Database on elephant mortality
- Assessment report on Thresholds of Potential Concern in elephant ranges
- Report on trophy quality trends
- Reports to international monitoring systems as required (e.g.AED,ETISand MIKE)
- Reports and maps of active corridors.
- Report on trend in trophy quality
- Hunting as a management tool (dispersal/containment)
- Capture and translocation
- Fire management protecting elephant habitats

Social, economic and cultural

- Record of beneficiaries and benefits availed
- Report on costs associated with elephant censuses, protection outside protected areas
- Database on HEC
- Documented policies and list of operating partnerships/joint ventures that promote elephant conservation and management
- Record of investments in elephant conservation measures assembled by elephant program manager/coordinator
- Records and annual summary of arrests and poaching incidents intercepted based on leads provided by communities
- Hunting/live sales to generate revenue incentivize, HEC

Building conservation capacity

- Record of funds available (USD) and investment by ZPWMA, Private sector, NGOS, and CAMPFIRE in elephant conservation measures (Compiled annually by the Authority's Elephant Manager/Coordinator)
- Record of funds generated from elephants and their products

Coordination and collaboration

- Record of meetings, minutes, actions completed, attendance at national and regional committee meetings
- Record of when minutes of meetings were completed and circulated
- Record of reports by the person in the elephant management position

What actions are authorized to ensure progress towards these targets?

The government of Zimbabwe has developed and institutionalized pieces of legislation and is party to regional and international conservation initiatives to ensure effective biodiversity conservation. Actions that are authorized to ensure progress towards these targets are summarised in Table 2below;

Table 2: Actions authorized to ensure elephant population protection

Authorised action	**Enabling legislation, policy and treaties**
Protection and law enforcement Protection and law enforcement regarding wildlife and habitats is augmented by a rigorous array of legislative instruments.	• Parks and Wildlife Act 1996(amended) • Criminal Law Codification and Reform of 2013Act Chapter 19:23 • Protection of Wildlife (Indemnity) Act of1999 Chapter 20:15 • Environmental Management Act of 2002 Chapter 20:27 • Statutory Instrument 26 of 1998 • The Parks and Wild Life General Laws Amendment number 5 of 2011 • Statutory Instrument 45 of 2014 • Parks and Wildlife Management Authority (Tariff of Fees) By-laws, 2015 • Elephant Conservation and Management Action Plan, 2015 -2020 (Draft) • Sebungwe Region Elephant Management Plan, 2015 to

	2020 (Draft) • Environmental Management Act of 2002, Chapter 20:20 • Forestry Act Chapter of 1990, Chapter 19:05 • Statutory Instrument 57 of 2012 Parks and Wildlife (Payment for Trapping of Wild Animals) Notice, 2012 • Statutory Instrument 56 of 2012 Parks and Wildlife (Payment for hunting of animals) Notice, 2012 • Firearms Act • The Customs and Excise Act • Urgent Measures (African Elephant Summit on 2- 4 December 2013 • Interpol • Prevention of Cruelty to Animals 19:09 • Zimbabwe Policy on Wildlife • Policy and plan for elephant management in Zimbabwe 1997 • ETIS Programme
Biological monitoring and management Monitoring and management of elephants in Zimbabwe conforms to the requirements of locally and internationally adopted standards and guidelines.	• National Elephant Management and Conservation Action Plan(Draft) 2015/2016-2020/2021 • Sebungwe Region Elephant Management and Conservation Plan 2015 – 2020 (Draft) • MIKE Programme

	• WWF Quota Setting Manual • IUCN Guidelines on introductions and reintroductions
Social, economic and cultural Elephant management takes into account the enables derivation of economic benefits to local communities and the country at large, by conferring elephants with an economic value. Co-existence between wildlife by local and elephants is enhanced by mitigating human and elephant conflict.	• CAMPFIRE • Wildlife Based Land Reform Policy of 2008, • Statutory Instrument 26 of 1998 • Traditional Leaders Act No. 25 of 1998 as amended last by Act No. 22 of 2001.
Coordination and collaboration Zimbabwe collaborates with local, regional and international organisations in elephant conservation. It is also a party and signatory to various regional and international treaties.	• Trans-frontier Initiatives • SADC Protocol on Wildlife Conservation and Law and Enforcement • MOU's with Tertiary Education Institutes • Interpol • Zimbabwe's National Joint Operations Command (JOC) • Southern African Wildlife Enforcement Network (SAWEN) • CITES • CBD • CMS • African Elephant Action Plan of 2010

	• SADC Regional Elephant Management Strategy of 2007 • IUCN African Elephant Specialist Group

Biological monitoring and management

- Monitor elephant population trends and elephant impacts on biodiversity through aerial, ground and ranger-based methods, among others
- Use research findings, expert opinion and informed public opinion to establish thresholds of potential concern (TPCs) to initiate management action in respect of elephant impacts for protected areas
- Monitor trophy quality and adjust quotas to maintain desired levels of trophy quality

Social, economic and cultural

- Facilitate the transparent distribution of the benefits and costs of elephant management and conservation
- Implement effective techniques and land-use strategies to mitigate human-elephant conflict
- Develop and implement an effective communication strategy for local, regional and international audiences

Building conservation capacity

- Secure funding to initiate the implementation of the elephant management plan
- Establish sustainable funding programs to build and maintain necessary human resources and strengthen elephant conservation and management capacity
- Strive to achieve best standards for elephant management, including any forms of utilization
- Engage available expertise and capacity within Zimbabwe
- Unlock value in elephants and their products

Coordination and collaboration

- Establish a national elephant conservation and management taskforce/steering committee that includes stakeholders meetings at least bi-annually to review progress and to develop an annual implementation plan
- Establish four regional management committees to meet at least twice each year and implement regional plans
- Strengthen coordination between the hunting industry and the elephant management program
- Implement an effective information dissemination and communication strategy, including regular progress reports on the implementation of the plan

What are the specific measurable of the management actions?

Specific measurables of management actions (labelled "means of verification of KPIs") are detailed in the Action Plan, a draft of which will be provided to USFWS soon.

The specific measurable of management actions under each key component include the following:

Protection and law enforcement:

- Effectiveness of law enforcement (LE), arrests, elephants killed (A/DC performance contract for KPIs
- Reports on results of law enforcement efforts in various categories recorded at field stations, conservancies, and CAMPFIRE District Offices, compiled at regional and national levels and presented to the Regional and National Coordinating Committees (R&NCC) bi-annually
- Reports on Hunting regulation infringements derived from SOAZ/ZPHGA reports and from field station reports compiled and presented to R&NCC
- Consolidated record of number of field personnel and days operational (law enforcement, research &monitoring, elephant management) for each area in the elephant range compiled and reported on at annual planning meetings
- Research reports and papers on elephant conservation and management

Biological monitoring and management:

- Reports on elephant surveys
- Elephant distribution maps
- Database on elephant mortality
- Assessment report on Thresholds of Potential Concern in elephant ranges
- Report on trophy quality trends
- Reports to international monitoring systems as required (e.g.AED,ETIS andMIKE)
- Reports and maps of active corridors
- Reports on trends in trophy quality

Social, economic and cultural:

- Records of beneficiaries and benefits availed
- Reports on costs associated with elephant censuses, protection outside protected areas.

- Database on Human Elephant Conflict
- Documented policies and list of operating partnerships/joint ventures that promote elephant conservation and management
- Record of investments in elephant conservation measures
- Records and annual summary of arrests and poaching incidents intercepted based on leads provided by communities

Building conservation capacity:

- Record of funds available (USD) and investment by ZPWMA, Private sector, NGOS, and CAMPFIRE in elephant conservation measures (Compiled annually by Elephant Manager/Coordinator)
- Record of funds generated from elephants and their products

Coordination and collaboration:

- Record of meetings,minutes,actions completed, attendance at national and regional committee meetings
- Record of when minutes of meetings were completed and circulated
- Record of reports by the elephant coordinator / manager

2. Population Status

2014 aerial survey reports, including details on how the surveys were conducted (i.e., methodology) and coverage, including maps of elephant observations, herd size and distribution, carcass observations, and distribution.

Any additional data on carcasses, including carcass class and proportion of illegally killed elephants [PIKE].

In the dry season of 2014, elephants and other large herbivores were counted from the air during the period 27 June-14 July (block counts) and 21 August to 1 November 2014 (transect counts). Transects were used over the major part of the area. The area surveyed totalled 60 392km^2 (15 430 km^2 covering the Zambezi Valley, 14 818km^2 covering the Sebungwe Region, 25073 km^2 North West Matabeleland and 5071km^2 for Gonarezhou National Park and Mahenye Communal Lands). Some of the surveyed areas include Mana Pools National Park, Mudungwe, Chewore, Matusadonha National Park, Chizarira National Park, Gonarezhou National Park and Hwange National Park, Matetsi Safari Area, Forest Areas and parts of the communal lands of Tsholotsho, Mudungwe, Mbire and Guruve Districts and Mahenye where elephants are resident.

The principal objective of the survey was to provide relatively precise and accurate estimates of the number of elephants and other large herbivores including their spatial in the survey area as a whole, using a technique that could be executed within a reasonable time and at a reasonable cost. The methods used were repeatable and technically robust and similar to those used during the 2001 serial survey to allow for direct comparison between the years.

The procedures used followed those well established for aerial surveys of large African herbivores and livestock and utilized during earlier surveys of large herbivores in Zimbabwe. The survey was designed using WWF-SARPO's custom software (AIRDESW, version dated 29/05/97).

Overall sampling intensity in this areas was planned to be 15%, with a transect width (i.e. combined width of the two search strips) of 300 m. The planned sampling intensity in each stratum was determined by using the mean of the elephant densities in each stratum during previous surveys (Mackie, 2001; Dunham, 2004) as the predicted elephant densities in equation 1 of Gibson (1992). The population survey result is summarized in Table 3a to 3h below:

Table 3a.Summary of Aerial Survey Results for Elephant in Zimbabwe 2014

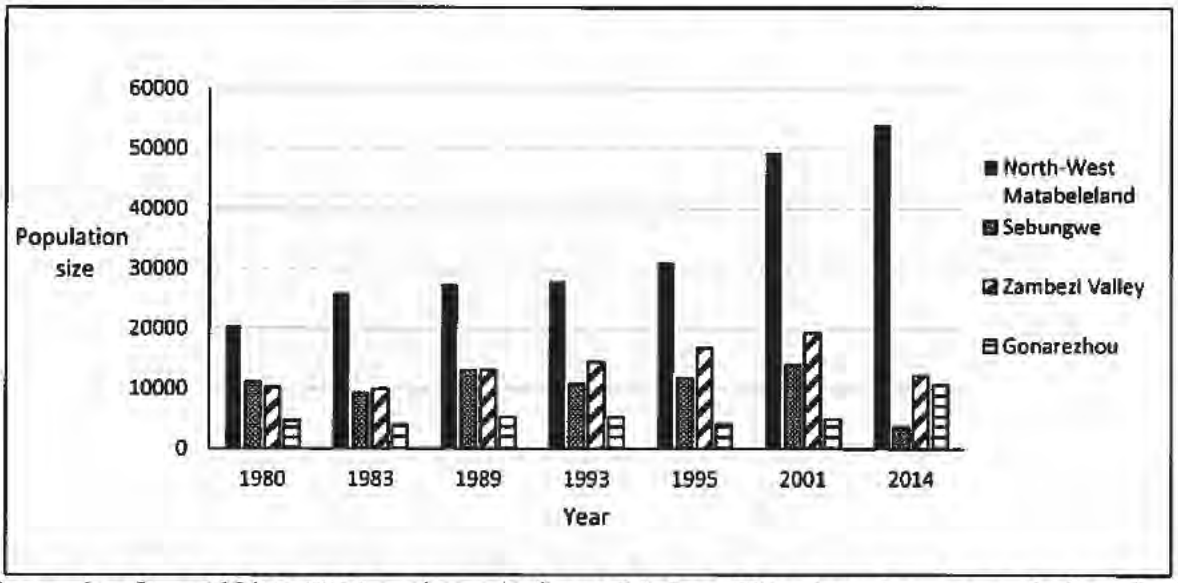
Any demographic analysis of populations by site (e.g., sex and age class, population histograms, projected growth rates).

Please see above gender analysis.

The elephant population in North West Matabeleland and South East Lowveld has been



increasing from 1980 to 2014 as shown in figure 2 below. There have been some declines in the other regions over the same period, although as a whole the country's population has remained relatively stable.

Figure 2. Elephant population trends 1980 to 2014

2. Poaching levels and prevention

A table summarizing Mike and PIKE information from the major populations in Zimbabwe, since recording started in 1999.

Zimbabwe is implementing the MIKE program in the two sites of Nyaminyami and Chewore. Nyaminyami is administered through the CAMPFIRE model while Chewore is a Safari Area managed by the Zimbabwe Parks and Wildlife Management Authority. Zimbabwe has secured funding to establish Mana-Pools as an additional MIKE site.

Table 4a and 4b summaries MIKE and PIKE information from the major populations in Zimbabwe, since recording started in 2000.

Table 4a: Elephant carcasses recorded in Chewore 2000 to 2014

	2000	2001	2002	2003	2004	2005	2006	2007	2008	2009	2010	2011	2012	2013	2014
Total Carcasses	2	14	19	10	14	20	17	14	13	26	29	51	43	91	52
# Illegally Killed	0	0	7	3	3	0	2	11	1	10	4	34	34	36	9

Table 4b: Elephant Carcasses recorded Nyaminyami 2000 to 2014

	2000	2001	2002	2003	2004	2005	2006	2007	2008	2009	2010	2011	2012	2013	2014
Total Carcasses	13	10	3	7	11	6	3	10	20	52	19	16	52	36	27
Illegally Killed	8	7	2	2	9	5	2	5	18	45	19	13	14	8	10
PIKE	0.61	0.70	0.67	0.29	0.82	0.83	0.67	0.50	0.90	0.87	1.00	0.81	0.27	0.22	0.37

Data from http://cites.org/eng/prog/mike/data_and_reports and MIKE Baseline information (SC55 Doc. 10.2 (Rev. 1), 2007). Site-level PIKE is likely subject to bias, especially where the total carcass number is less than 30.

It has to be noted that the greater part of the elephant range in Zimbabwe does not have running MIKE of PIKE monitoring regimes. North West Matabeleland, which is not a MIKE site, has the highest elephant population in the country. The poisoning incidents in Hwange in 2013 resulted in a sharp increase in the number of elephant poached. Figure 3 below shows the number of poached elephants in Zimbabwe from 2010 to 2014.

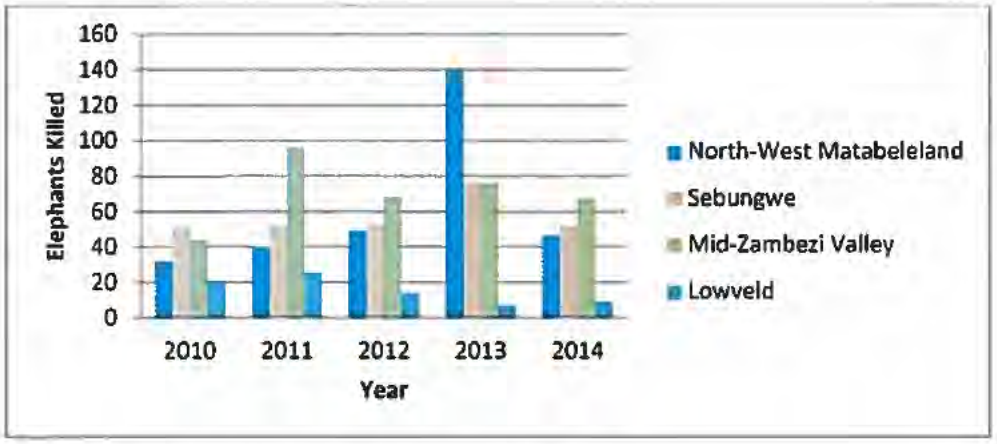

Figure3: Poached elephants Zimbabwe 2010 to 2014

National Policies to address poaching

- Parks and Wildlife Act 1996(amended)
- The Parks and Wildlife Act Chapter 20:14
- Criminal Law Codification and Reform of 2013Act Ch. 19:23
- Protection of Wildlife (Indemnity) Act of 1999 Ch. 20:15
- Environmental Management Act of 2002 Ch. 20:27
- Statutory Instrument 26 of 1998
- The Parks and Wild Life General Laws Amendment number 5 of 2011
- Statutory Instrument 45 of 2014
- Parks and Wildlife Management Authority (Tariff of Fees) By-laws, 2015
- Elephant Conservation and Management Action Plan, 2015/2016-2020/2021
- Sebungwe Region Elephant Management Plan, 2015-2020
- Environmental Management Act of 2002, Ch. 20:20
- Forestry Act Ch. of 1990, Ch. 19:05
- Statutory Instrument 57 of 2012 Parks and Wildlife (Payment for Trapping of Wild Animals) Notice, 2012
- Statutory Instrument 56 of 2012 Parks and Wildlife (Payment for hunting of animals) Notice, 2012
- Firearms Act
- The Customs and Excise Act
- Urgent Measures (African Elephant Summit on 2- 4 December 2013
- Interpol
- Prevention of Cruelty to Animals 19:09
- Zimbabwe Policy on Wildlife
- Policy and plan for elephant management in Zimbabwe 1997

Actions taken by the Zimbabwe government to protect wildlife prevent poaching and punish criminals of wildlife crimes. This should include:

- ***Anti-poaching manpower and budget for anti-poaching in protected areas overseen by ZPWMA.***
- ***Summary of serious wildlife crime cases in recent years (i.e., arrests, outcome of trials, sentences).***
-

Zimbabwe has developed a number of national policies, as well as adopting regional and international protocols to address poaching. As explained the17 April 2014 response to the USFWS poaching incidents are handled though a coordinated public-private response, including heightened law enforcement, severe deterrent sentencing, awareness campaigns, and substantial donations from the private sector to boost ranger and equipment capacity. Steps were also, taken after the Hwange poisoning incidents to improve radio communications in that area, as well as establishing a new station with 15 rangers, to increase law enforcement coverage. Aerial surveillance in Hwange and other areas has been intensified.

It is one of the ZPWMA's policies to cooperate with safari operators, who provide significant assistance by alerting ZPWMA rangers to poaching threats; providing equipment, training and transport; and conducting their own anti-poaching patrols among other things.

Among other things, Zimbabwe has adopted "Urgent Measures" and policies to combat poaching and wildlife trafficking. Following the adoption of the Urgent Measures to halt and reverse the trends in illegal killing of elephant at the high level African Elephant Summit held from 2-4 December 2013 in Gaborone, Botswana, the government of Zimbabwe has implemented the following Urgent Measures;

Urgent Measure 1

a) Zimbabwe has adopted a zero tolerance initiative to poaching, illegal ivory trade and trafficking. The Parks and Wild Life General Laws Amendment number 5 of 2011 provides for a nine year jail term for anyone found in possession of elephant ivory or for the illegal killing of an elephant through whatever means. On a second and subsequent conviction the law provides for an eleven years jail term up to a maximum of twenty years in prison to the offender.
b) Statutory instrument 45 of 2014, Parks and Wildlife Management Authority (Tariff of Fees) By-laws, 2014 provides for the value of raw elephant ivory pegged at US$180 per kilogram and such value is used in the preparation of expert assessment the value of the recovered or intercepted ivory. This assessment forms the basis of docket preparation and will assist in determination by the courts as the offence will already be classified as serious.

c) Statutory Instrument 57 of 2012 Parks and Wildlife (Payment for Trapping of Wild Animals) Notice, 2012, place the value of a live elephant at US$50 000 which value will form the compensation that a sitting magistrate will recover from the accused person in the event of a successful trial and subsequent conviction.
d) Statutory Instrument 56 of 2012 Parks and Wildlife (Payment for hunting of animals) Notice, 2012, place the value of an elephant at US$50 000 which forms the value of compensation which will be paid out by the accused to the complainant in the event of a successful trial and subsequent conviction.
e) The three legal instruments cited in b, c, and d above are legislative efforts to ensure that there are no loopholes depending on the circumstance that are available for an offender will to escape prosecution under the circumstances.
f) The Criminal Law Codification and Reform Act Chapter provides for the charge of criminal abuse of office by law enforcement or public officials involved in corrupt practices related to poaching and trafficking.
g) The Firearms Act criminalizes the use of automatic weapons such as AK47 assault rifles that are currently utilized by poachers to further their illegal activities. The same Act further criminalizes a person for mere possession of ammunition and arms of war which effectively attracts a jail term of up to 5 years in prison for such related offences.
h) The Customs and Excise Act makes it an offence to anyone caught smuggling elephant ivory out of Zimbabwe and import of such into Zimbabwe.

Urgent Measure 2

a) The Zimbabwe Environmental Management Act Chapter 20:27 of 2002 criminalizes the administration of poison such as cyanide which is used by poachers to kill elephants. Through the Environmental Management Agency of the Zimbabwe Government, sample collection from poisoned sites is being handled by professionals in this unit who have laboratories for testing such poisons and hazardous substances which results are used in any trial that is related to elephant poisoning. The Act was implemented during trial of accused persons involved in elephant poisoning leading to the conviction of poachers who poisoned elephants in Hwange National Park in 2013. Most of the offenders were given sentences of up to 18 years in prison.
b) Awareness workshops that targeted the judiciary, the prosecutors, law-enforcement agencies and other stakeholders involved in the fight against elephant poaching were held and this resulted in significant improvements in the expeditious preparation of dockets and finalization of cases with a marked improved in convictions in the various courts around the country.
c) Task force teams at all level of Government in the law enforcement units have been put in place at national, provincial as well as district level. These units deal with poaching related matters in their areas of policing. Stakeholders in the private sector are assisting

with the provision of scarce resources that are needed to combat poaching and ivory trafficking.

d) The use of helicopters and other aircrafts in the fight against poaching has also increased and this has assisted with deployments and detection of poachers in the field.
e) Cross border collaboration with law-enforcement agencies with neighbouring countries such as Botswana, South Africa, Zambia and Mozambique in information sharing on poacher movements and dealing with immediate incursions has tremendously helped in detection of cross-border poaching and trafficking incidents.

Urgent Measure 3

a) Elephant poaching has been elevated to the level of National Security in the Government of Zimbabwe. All security organs of the state are now playing a role in the fight of elephant poaching.
b) The Zimbabwe Republic Police Support Unit in collaboration with the Zimbabwe Parks and Wildlife Management Authority carries out anti-poaching activities at all levels. The Minerals and Border Control Unit of Zimbabwe Republic Police Criminal Investigations Department is a specialized unit that investigates and prepares wildlife cases for court.
c) The Air-force of Zimbabwe plays a major role upon request in the provision of services and equipment in the fight against poaching.

Urgent Measure 4

a) Within the Zimbabwe's National Joint Operations Command (JOC) structure, elephant and rhino poaching have been elevated to a higher level of National Security Threat thereby making it a priority area of focus.
b) The same structures of the JOC committees have been activated both at national, provincial and district levels for effective monitoring of poaching situation on the ground.

Urgent Measure 5

a) Information of illegal killing of elephants is being submitted to the CITES MIKE Programme.
b) The ETIS data on illegal trade is also submitted to TRAFFIC.

Urgent Measure 6

Zimbabwe is participating in various law-enforcement activities involving neighbouring states, countries in the SADC region. Officers from Zimbabwe have also attended a number of workshops and training on anti-poaching and wildlife trafficking including the execution of controlled deliveries. Valuable expertise has been imparted to the officers and this has assisted in the carrying out of joint cross-border operations.

Urgent Measure 7

Zimbabwe is a member of the regional wildlife enforcement network, SAWEN, and has assisted in information sharing and information sharing and intelligence gathering on the latest techniques in the fight against elephant poaching and ivory trade.

Urgent Measure 8

a) The Zimbabwe Government established the Wildlife Ecological Trust whose mandate is to mobilize resources for the fight against elephant poaching through whatever means. Its thrust is to source for funds and material resources that are allocated to needy areas according to the nature of threat and threat levels in each particular area.
b) Resources in the form of funds, vehicles and field equipment have been raised for Hwange National Park.

Urgent Measure 9

a) Public awareness campaigns for local communities are being carried out in affected areas. The awareness and outreach programmes also target school children.

Urgent Measure 10

a) Zimbabwe has secure facilities for elephant ivory storage at the Central Ivory Stores and also a good registration and database system. The security systems have recently been upgraded to minimize risk.

Urgent Measure 11

a) The principal law and Act which governs and regulates the purchasing, selling and exporting of worked elephant ivory and ivory products for non-commercial purposes is the Parks and Wildlife Act Chapter 20:14. The Act prohibits the hunting of any animal and removal of parts of animals in any from any land without authority. The Act provides for the protection of animals in the following designated arrears, National Parks, Parks and Wild life Estates, Parks and Wild life land, Sanctuaries and Safari Areas. The Act further provides for categorization of animals into protected and specially protected animals. Of particular interest in this case is Part XII which prohibits the hunting, removal and sale of live animals and animal products.
b) From the enabling provisions in the Act, the Minister has issued Statutory Instrument 362 of 1990 Parks and Wild Life (General) Regulations which provides in sections 66-75 for the regulation of manufacture and dealing in trophies to include worked elephant ivory.
c) In addition there is Statutory Instrument number76 of 1998, Parks and Wild Life (Import and Export) (Wild Life) Regulations which specifically deals with Import and Export of wildlife products.

Urgent Measure 12

a) Zimbabwe's Communal Areas Management Programme for Indigenous Resources (CAMPFIRE) is currently under review. Several community empowerment strategies are also being implemented in areas adjacent to protected areas.

Urgent Measure 13

a) Zimbabwe is collaborating with Interpol at national and international levels. Elephant poaching is categorized as a serious crime attracting a heavy penalty in Zimbabwe.

Urgent Measure 14

a) The Government is collaborating with the Government of South Africa through a bilateral arrangement with the University of Pretoria whereby rhino samples are submitted through the RHODIS system for DNA analysis. It is hoped that the same process will be initiated and undertaken in the near future for African Elephant samples

Legislation

All activities allowable in a protected area are governed by relevant legislation. The primary legislation dictating how parks operate is the Parks and Wildlife Act and accompanying statutory instruments. The legislation is obviously not static but can be adjusted to meet desired outputs.

Park management plans

It is the organization's policy that every protected wildlife area is run in accordance with a management plan. It however has to be noted that some of the plans are outdated. To rectify this problem, ZPWMA is in the process of updating protected area management plans. Recently the Authority completed plans for Gonarezhou and Mana Pools National Parks and the plan for Hwange National Park is in the final stages of drafting. The planning process is done in phases and all relevant stakeholders, government and private, are invited to partake. The plans usually cover all facets of the management of the respective area including tourism, infrastructure, and biodiversity management and recommended staffing levels.

Elephant management policy

The elephant's life cycle and longevity requires means that it needs to be managed through a long term management plan. The country's elephant management policy is in its drafting stage and will replace one which expired in 2007. The planning process relied on a number of experts from various fields and also sought input from other stakeholders within the region.

Commercial exploitation of wildlife

It is a government's policy that Zimbabwe should benefit from her natural resources. In addition to non-consumptive tourism, the elephant is also one of the key species in the hunting industry.

This form of exploitation is strictly governed by the Parks' Act and quotas are allocated through a quota setting process described in subsequent sections.

Community Based Natural Resources Management

The government also recognizes that the elephant shares some of its home range with local communities and these communities benefit through the CAMPFIRE program. This apportioning of benefits, is hoped, should translate to a community more tolerant to wildlife.

How ZPWMA is addressing these challenges:

Review of CAMPFIRE

It is now acknowledged that the current CAMPFIRE model has been overtaken by events. The government is therefore in the process of reviewing the concept so that is produces tangible benefits to local communities living with wildlife, especially elephants and large carnivores. This should make locals more cooperative in fostering the country's conservation goals.

Set a board to source donations for the biggest elephant home range in Zimbabwe

The Hwange poisoning incident made clear that poachers are using new and dangerous methods to illegally kill elephant, and ZPWMA must have adequate, additional resources to combat this threat. In trying to address that, the country through the Ministry of Environment water established a board to source funds for the country' conservation programmes. The board, called the Wildlife and Ecological Trust, was instrumental in sourcing 10 vehicles for Hwange National Park.

Increased men on the ground

High levels of staffing are needed to sufficiently control poaching. Zimbabwe, like other African range states, faces significant resource constraints. In key elephant range areas, this challenge has been addressed through a number of strategies:

- ***Ranger call up system***: The poaching pressure is not the same in all areas under the management of ZPWMA. There is now a working system were rangers from low threat areas are temporarily deployed to high threat areas like the Zambezi Valley and Hwange.
- ***Joint anti-poaching patrols***: The ranger compliment in high threat areas has been augmented by enlisting the services of other law enforcing arms of the state, the Zimbabwe Republic police and the Zimbabwe National Army. The police now have almost permanent presence in North West Matabeleland wildlife estates whilst the army is called in when needed.
- ***Recruitment of rangers:*** The Authority has a staff complement of 1,504 active field rangers. This translatesto ground coverage of more than 100 km^2/ranger against an ideal

staffing level of 20km^2/ ranger. Though the Authority is constrained with regards to resources to pay and kit existing rangers, it employed and trained 50 rangers in 2014. It also recalled 50 more rangers who had left the organization as a way of reducing its training budget. Most of the employed rangers were deployed in the Zambezi Valley (see attached annual reports). These measures have resulted in improved patrol effort (see figure 4below).

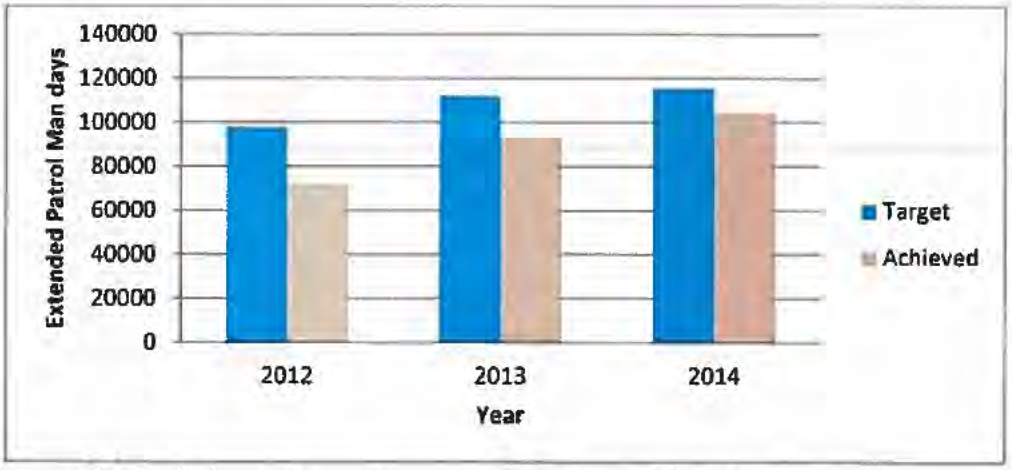

Figure 4: Extended patrol man days, targets against achieved

As seen from the graph, patrol man-days increased from 2013 as a reaction to increased poaching pressure. This was also boosted by the bringing in of details from other law enforcement agents.

Result Based Management (RBM) System for performance management

Poaching of wildlife, especially elephant, is a problem that it acknowledged by the Authority. It has therefore been realized that all Parks employees should give their best efforts in trying to address this scourge. It is with this background that the Authority has instituted performance based contracts for all its employees. These contracts are result oriented and it is expected that all the employees will work to meet targets set in the contracts.

Engagement of the private sector to support conservation initiatives

Conservation is always an expensive undertaking and is always evolving. The Authority on its own can be overwhelmed and as such is always ready to engage private or nongovernmental players in the industry. In the Hwange – Sanyati area, the Authority has enlisted the assistance of WWF Zimbabwe for the implementation of the Hwange–Sanyati Biological Corridor project. This project has a number of components which include improved management of Hwange National Park and neighbouring areas under the management of Forestry Commission of Zimbabwe as well as a component on improving livelihoods of the people in the Hwange Communal Area through the CAMPFIRE program (see attached Project Appraisal Document).

This project, if successful, will result in a more tolerant human population as well as a viable source of wildlife used in hunting areas around Hwange.

The Authority also works with the safari industry, which already conducts anti-poaching operations, to formalize anti-poaching requirement in new concession leases. Further, part of the review of CAMPFIRE will address how to better engage communities in anti-poaching support.

Research is also a vital component of wildlife management. The Authority has a deliberate policy to encourage research within its estate. The permit application process is easy and streamlined for efficiency. Some of the researchers working on elephant related projects include CIRAD, CNRS, Chinhoyi University of Technology and National University of Science and Technology.

Awareness and education

Extensive awareness programmes targeting local communities and schools are carried out throughout the country. Strategies include translating some of the key issues in the Elephant Management Action Plan into appropriate formats such as popular articles, radio programmes, online content, and drama as well as other formats targeting specific groups. Some local NGOs are assisting with the development and distribution of some of the materials. Awareness programmes that target the judiciary on wildlife crime have also been implemented.

Awareness workshops for the judiciary

Though there is legislation guiding how wildlife crimes are to be handled by the courts, it was realized that some provisions of the law were not being fully implemented and some offenders were getting away with light sentences. It is with this background that a national workshop was held with the law enforcement agents and the judiciary in 2011 in Hwange to make them aware of these challenges. This has resulted in stiff sentences being handed down to offenders. Table 6 below shows a summary of cases handled by the authority's investigations department.

Anti-poaching manpower and budget for anti-poaching in protected areas overseen by ZPWMA.

ZPWMA has a staff complement of 1,500 field rangers whose core mandate is anti-poaching activities. Table 5 below is an indicative budget for effective protection of the Parks and Wildlife Estates.

Table 5. Budget for anti-poaching activities

Budget item	Cost (US$)
Staff Costs	14,130,000
Field allowances	971,889
Patrol provisions	1,244,612
Fuels and lubricants	698,977
Vehicles	272,000
Communication	20,000
Air craft hire	120, 000
Drone	60, 000

Summary of serious wildlife crime cases in recent years (i.e., arrests, outcome of trials, sentences).

In 2013, cyanide poisoning led to the death of 105 elephants in Hwange National Park. Following the increase in poaching and trafficking of wildlife products, Zimbabwe adopted zero tolerance to poaching. Thirty-five (35) poachers were convicted for the poisoning incidents and they received between nine (9) and sixteen (16) years jail terms. A summary of serious wildlife crimes is detailed in table 6 below:

Table 6: Summary of Serious Wildlife Crime Cases recorded in Zimbabwe.

	2009	2010	2011	2012	2013	2014	2015 (Jan – Apr.)	Total
Cases investigated	45	66	45	57	76	48	17	354
Cases finalized	20	20	29	30	40	15	4	158

4. Regulations and Enforcement

The current operating budget for ZPWMA, including sources of funding (e.g., allocated by Parliament, obtained through hunting permits or concessions, conservation fees, donations, etc.).

The budget for ZPWMA is premised on a Results Based Management System where allocation of funds is predicated on projected operational activities and a review of previous operation performance. The budget include sources of funding (e.g., allocated by Parliament, obtained through hunting permits or concessions, conservation fees, donations, etc.).The major sources of funds are conservation fees (land and river) constituting a total of US$9 898 695 and hunting constituting a total of US$ 4 032 733 for 2014. The bulk of the revenue generated in ZPWMA goes towards staff costs (69%) and operation costs (18%) which translated toUS$17,751,988and US$ 4,706,787 respectively for 2014. See Tables7a and 7b below. Full details are specified in the attached approved budgets for the year 2015.

Table 7a:ZPWMA Actual and projected Budgets for 2014 and 2015 in US$

Revenue	2014 Actual	2015 Budget
Conservation fees-land	8,457,106	9,595,000
Conservation fees-river	1,441,589	1,650,000
Accommodation	2,234,281	3,516,000
Annual registration fees	360,616	794,000
Permit fees	1,489,154	2,067,400
Services & facilities	140,369	347,700
Law enforcement	219,473	257,300
Hunting	5,072,493	6,220,000
Fishing permits	948,491	1,236,000
Leases and rentals	2,298,781	3,513,000
Sale of park products	976,678	2,177,000
Examinations	32,481	52,900
Projects	131,487	1,492,100
Other income (Donations)	957,634	1,909,200
Government grants	1,600,000	716,000
Total	**26,360,633**	**35,543,600**

Table 7b: Expenditure for ZPWMA

EXPENDITURE	2014 Actual	2015 Budgeted
Staff costs	17,751,988	20,943,500
Operational costs	4,706,787	8,235,700
Administration costs	3,100,758	3,815,800
Marketing costs	184,879	1,060,000
Total	**25,744,412**	**34,055,000**
Net surplus/(deficit)	**616,221**	**1,488,600**

Note the surplus for 2014 is a result of a 1,600,000 US$ government grant and spending cuts that have reduced manpower levels for ground patrols despite the shortages in manpower.

Revenue Streams

Conservation fees (Park entry and fishing permits) and hunting revenue constitute the bulk of the sources of revenue for ZPWMA, with a contribution of 42% and 17% respectively. See Figure 5a and b below for the categories of revenue streams and the percentages contributed.

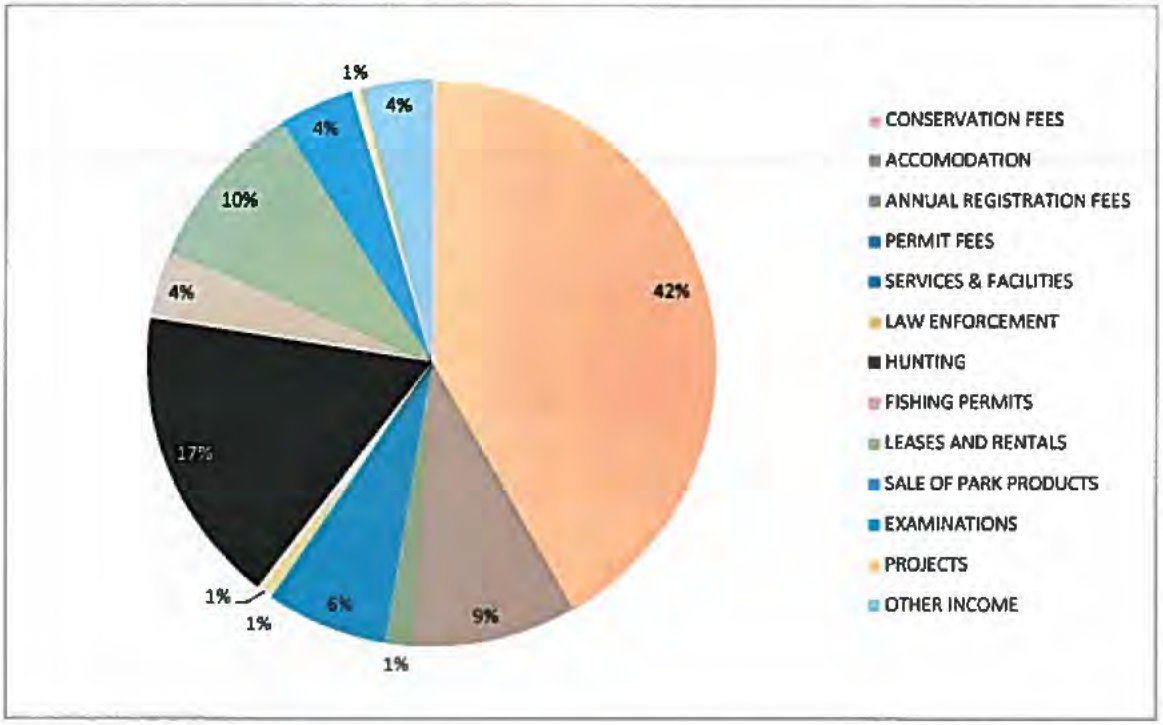

Figure 5a: Main Sources of Revenue for 2014

Expenditure:

Most of the expenditure for ZPWMA (69%) goes to staff and operational costs (18%) (See Figure 5b for the breakdown of the costs).

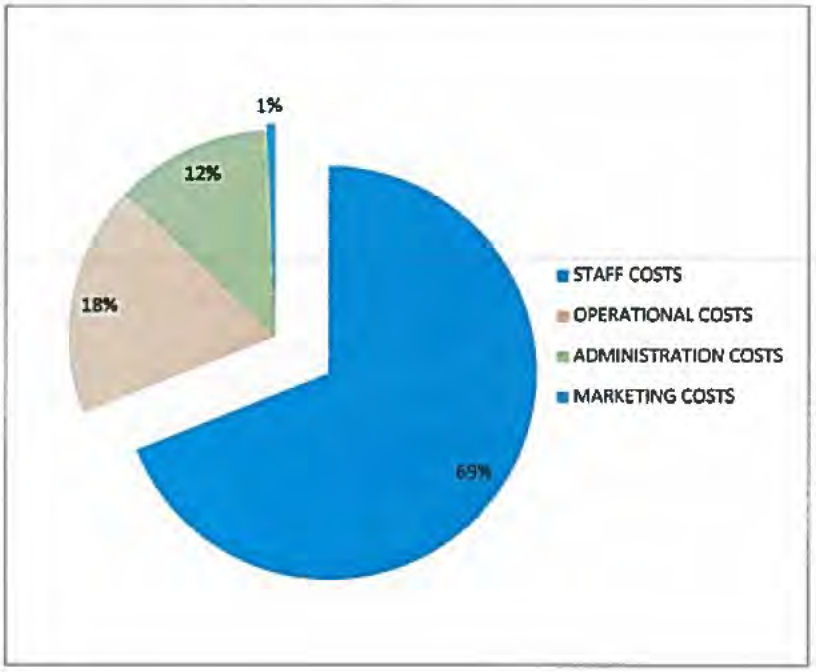

Figure5b: Itemized costs for ZPWMA.

Note: See attached approved budget for 2015 for budget details.

The amount of revenue generated from elephant hunting by U.S .hunters and how those funds are distributed?

The US hunting market constituted 51% and 54% of the elephant trophy hunting in Zimbabwe for the years 2013 and 2014 respectively. See figures6a and 6b below.

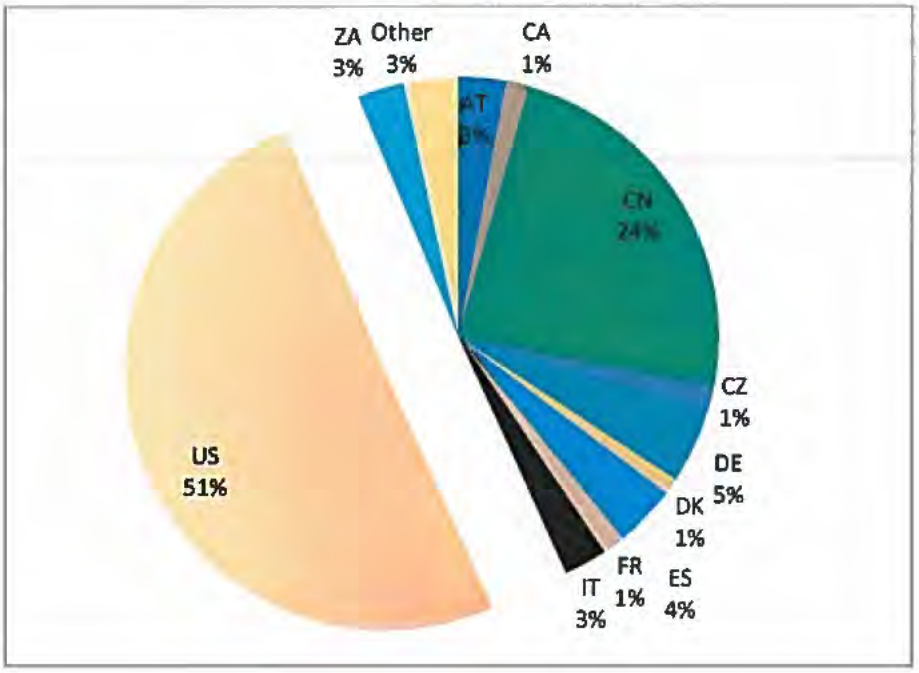

Figure 6a: Source markets for Safari Hunting in Zimbabwe in 2013 from ZPWMA Database

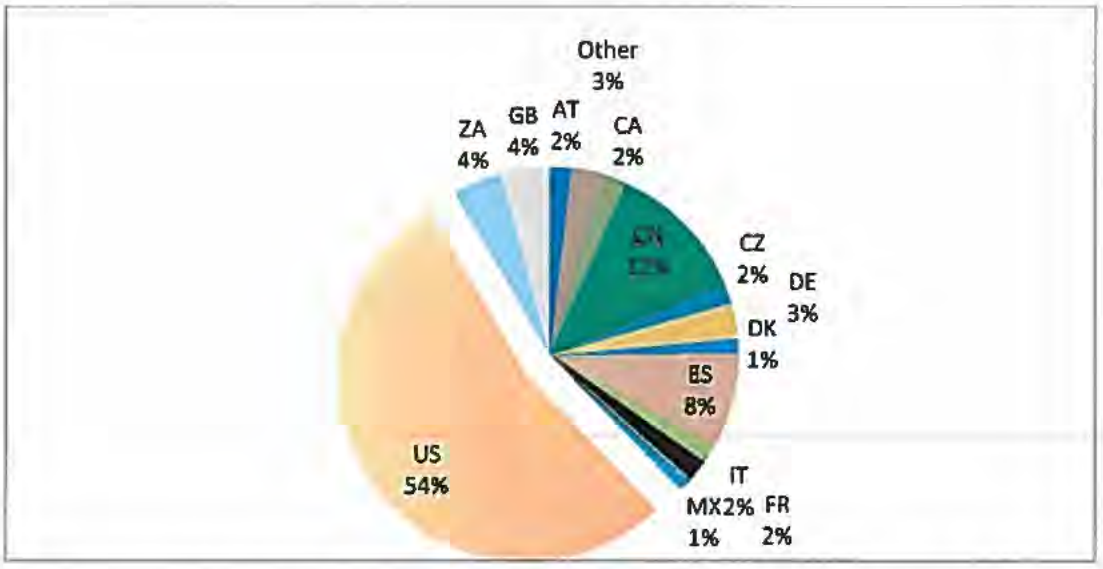

Figure7: Source markets for Sport Hunting in Zimbabwe in 2014 from ZPWMA Database

Hunting revenue is distributed by land-use categories as to sustain the upkeep of the land area where it is accrued. These land areas administered by different authorities with the ZPWMA having the overall authority to oversee wildlife use on these areas. These areas are grouped into the following categories namely National Parks Areas, Forestry areas, CAMPFIRE areas and Private lands (Conservancies and private farms). Hence the accounts are managed separately and will be presented separately.

Over a four year period revenue collected from hunting contributed a total of US$ 21,339,609. There was an11.9% decrease in revenue collection from hunting in 2014 compared to 2013. Table 8abelow summarizes the revenue generated from hunting from 2011 to 2014.

Table 8a: Revenue collected from hunting within the parks Estate 2011 to 2014.

	2011	2012	2013	2014	Totals
Total hunting revenue	5,362,198	5,144,579	5,760,339	5,072,493	21,339,609

Of all the hunting received the American market is estimated to 54% and is inclusive of concession fees and trophy fees,

Hunting outside protected areas is also conducted in other land categories. The revenue from direct elephant hunts is categorized and shared according to land use as specified in Table 8b below. This revenue is mainly generated through trophy fees.

Table 8b: Revenue Distribution from Elephant Hunt by USA citizens in Zimbabwe on other land areas.

5. Sustainable Use

The number of elephant taken per year in each of these categories [sport-hunting, cropping, live animal sale and capture, natural mortality, accidents, poaching, problem animals, management off-takes

Elephant mortalities were recorded under various categories as shown in Table 9 below. The major causes of mortalities over the five year period are natural, poaching and sport hunting.

Table 9: Causes of elephant death from 2010 to 2015

Year	2010	2011	2012	2013	2014	2015
Sport Hunting	134	274	247	258	162	75
Cropping	57	23	0	0	0	0
Live Sales	0	0	4	0	7	0
Natural Mortalities	208	1015	1373	124	1981	455
Accidents (Train)	6	8	38	13	9	6
Poaching	77	223	212	293	194	70
PAC	61	53	173	44	49	52
Other Management	65	53	172	44	47	0
TOTALS	**608**	**1649**	**2219**	**776**	**2449**	**658**

It should be noted that other management off-takes entail ration and training quotas which were set at about 95 animals nationally for ZPWMA run areas. While cropping was carried out in the Save Valley Conservancy between 2012 and 2013 during which a total of 11 elephants were removed.

Details on how the number of elephants to be hunted in each area is decided (i.e., quota setting).

ZPWMA subscribes to the concept of adaptive wildlife management and this also applies to setting national hunting off-takes. One example being a hunting moratorium that was placed on the hunting of lions in the Gwayi area adjacent Hwange National Park after it was realized that the trophy quality was getting poorer and poorer. This also led to the setting up of a point based system for allocating quotas which resulted in some areas getting no lions on quota from four in 2014.

Trophy hunting of elephants, or any wildlife species in Zimbabwe, is undertaken through a strictly regulated quota setting system. Quotas are issued each year to approved landholders by ZPWMA and this is done through national quota setting workshops. These workshops rely on

43

information supplied by landholders as well as ecological reports submitted by Parks' ecologists and independent wildlife consultants.

Analysis of trophy quality trends from major hunting areas have indicated that we are still finding mature bulls. It can therefore be assumed that current off-takes are sustainable. It however has to be noted that adjustments to quotas will definitely be made in light of recent upsurges in poaching in areas like Sebungwe and the Zambezi valley. It is also acknowledged that blanket cuts may be detrimental for the species since most of the wildlife farmers depend on income from elephants to fund activities in their areas.

All offtakes for the African elephant in Zimbabwe are sustainable. Key factors that Zimbabwe considers when setting quotas are shown in the Table 10.

Table 10:- Quota allocation for 2014 by major range

Area	Population estimate	Population proportion	Off-takes for 2016	
Zambezi Valley	11657	0.23	69	
Sebungwe	3407	0.07	21	
North West Matabeleland	53991	0.58	174	
South East Lowveld	13037	0.11	33	
Total	82092	0.99	297	

Table 11: Factors considered in quota setting

Factor	**Comments**
Environment	Effects of droughts and other environmental factors are considered when setting quotas (for example die-offs in an area).
Population estimates and indices of abundance	Population estimates for African Elephants are determined using aerial surveys, waterhole counts, road strip counts and field based ranger monitoring. Population estimates are used to determine annual quotas including the 2014 aerial survey

44

	results.
Trophy size and quality	Data on hunt returns is captured into a database that is analysed to determine future off takes basing on trophy quality and trends (i.e. the lower the trophy quality, the quota is adjusted accordingly). Hunting success rate is also required to determine quotas. A hunting moratorium can be imposed in an area with declining trophy quality.
CITES National Export Quotas	Zimbabwe has an Annual CITES National Quota of 1000 tusks of 500 sport hunted elephants. Allocation of quotas at the national level does not exceed this limit.
Size of hunting area	Hunting quotas are allocated according to the size of any given property.
Management Systems in place in hunting areas	The following factors are also considered when setting quotas: • Existence of game fences or open access systems • Anti-poaching efforts • Game water supply • Translocations and reintroductions
Illegal off takes	Illegal off takes from poaching are also considered when setting quotas in an area. Quotas are adjusted accordingly in order to ensure that harvests are sustainable. Quotas are set on a localized basis.
Trade	Very strict export and import regulations and trade monitoring systems are in place. Analysis of export data is used to set annual quotas.
Monitoring	The Scientific Authority through an adaptive management process and ongoing rigorous resource monitoring programmes uses all the data and information to ensure that quotas are sustainable. The monitoring programmes include the following: Off takes/Harvests, Legal and Illegal Harvest and Trade; Ranger based Monitoring, Hunt Returns, Live Sales and Translocations; Natural Mortalities, Trophy Quality, Hunting Regulations,

45

	Biological: Population Estimates and Densities, Distribution Patterns, Habitat Quality, Local Ground Counts, Hunting Success Rate,

Sustainable quotas are established and monitored through a participatory and adaptive management process (Fig 5) involving private landowners, ZPWMA personnel and CAMPFIRE or local community wildlife managers. Quotas are set so as to have a representative number of animals that can be safely removed during a hunting season without inflicting biological damage to the population. The aim of quotas is to ensure that the utilization of wildlife is sustainable. Data on genetic drift, estimated population, disease outbreak, trophy size, age of animal hunted, habitat status and illegal off take is used to safeguard sustainable quotas. On average, quotas are set based on current data at approximately. The quota for 2016 is set at 400 elephant which is 0.49% of the national population. This is considered a conservative figure according to WWF guidelines and also the population changes in sections of Sebungwe and the Zambezi Valley. Taking into consideration the 2014 survey results the sustainable off take for trophy hunting in Zimbabwe would be 615 individuals. The thrust of wildlife management in Parks Estates is an adaptive management approach which emphasizes scientific research and monitoring. Quotas are set regionally during participatory quota setting workshops (see attached press invitations).

46

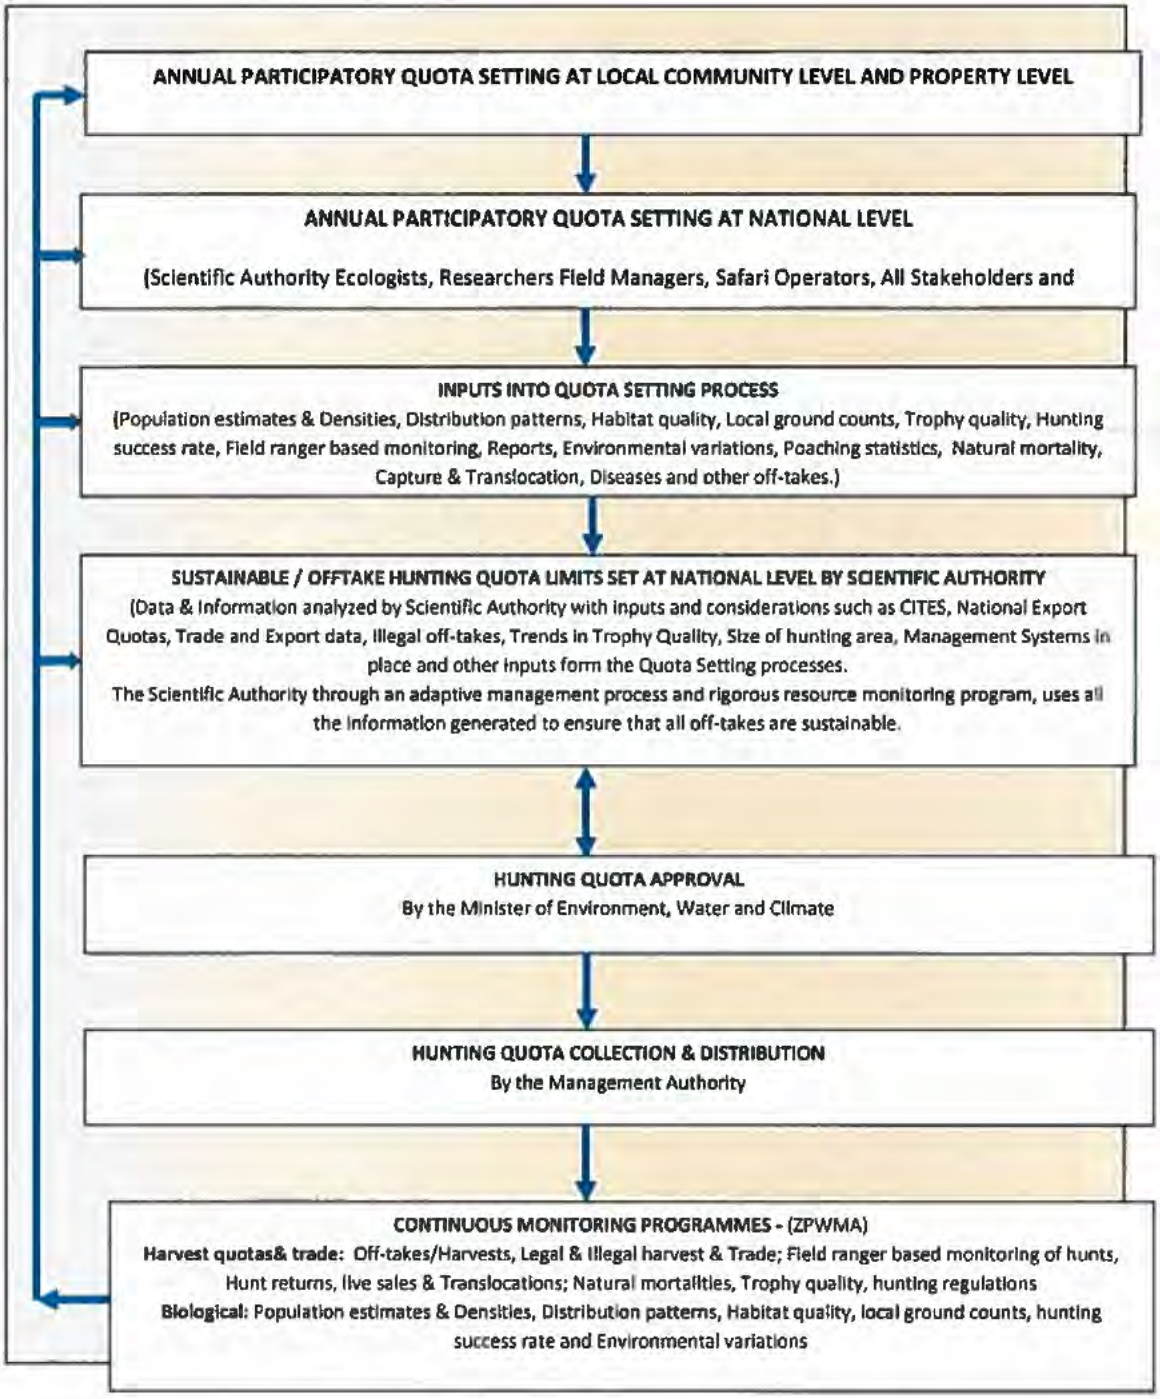

Figure 8: Multi stakeholder participatory quota setting

47

6. Revenue

Please provide information on: elephant populations on the four aforementioned land types, the number of elephants hunted on each land type, and the fees paid or the revenues earned from elephant hunts each land type.

Of the four land use types (Safari Areas, Communal Land, Forest Estates and Private Land) where safari hunting is carried out, Safari areas have the highest elephant population, although CAMPFIRE areas have the largest percentage of elephants hunted. Across all land categories, the elephant, even in the private land category where only a small proportion of properties have elephants, accounts for the highest proportion of revenue. Table 12below highlights elephant populations and revenue generated in the four land use categories in terms of trophy fees.

For each of the land uses, on which elephant hunting occurs, please provide the total number of elephant hunts, the total revenue, and a summary for each of management on how the revenues are spent.

Table12: Elephant populations and revenue generated from elephant hunts in four land use types.

Land Use	**Elephant population Estimate (2014)**	**Number of hunts**	**Number shot**	**Revenue generated US$ (Trophy fees)**
Safari Area	9824	58	49	5,072,493 the total includes trophy fees and concession fees for all hunted wildlife on ZPWMA land.
Communal land	6041	69	55	550,000,00
Private land	1585	61	19	190,000.00
Forestry Land	1117	43	39	390,000.00
Totals	**18 567**	**231**	**162**	**6,202,493.00**

Note: - These are population estimates for the major range areas surveyed in 2014. Source ZPWMA records

As shown in Table 12above, a total of 18 567 elephants occur within surveyed wildlife areas where elephant hunting takes place. The most important form of revenue is the trophy fees, which average US$10,000 per trophy elephant. Other forms of revenue include hunting daily rates and incidental revenue which can raise the value of an elephant hunt up to $25,000.00. In the ZPWMA run Safari Areas, most of the revenue is from trophy fees, although from the concessions, in which the Authority actually carries out hunts daily rates also accrue, significantly raising the value of a single elephant hunts.

48

How revenue generated is spent

ZPWMA safari areas

Safari Areas mentioned herewith are hunting concessions under the ZPWMA and are allocated to Zimbabwean private operators through an auction system. The total value of safari hunting in this category accruing to the ZPWMA is obtained from right to hunt fees, trophy fees and concession fees. It should be noted that in cases where Safari Areas are leased to private operators, ZPWMA does not benefit from daily rate fees, as these accrue to the operator.

The revenue accrued from these areas is paid directly to ZPWMA and contributes wholly to the conservation budget of ZPWMA. It has to be noted that ZPWMA has a mandate to conserve wildlife in the whole country and as such some of the revenue generated from the safari areas is used for the upkeep of other areas which do not generate revenue but are important wildlife habitats. ZPWMA requires about 200 /km^2 /year to effectively run all the areas under its estate.

Specifically for safari areas, cost centres include paying for staff salaries (a key anti-poaching tool), upkeep of facilities, habitat protection (roads and fireguards), fuels and game water supply. The total staff complement of field rangers in safari areas in the state hunting areas stands at 325 Rangers, and Table12 shows the salary bill for manpower in all safari areas under ZPWMA.

Table13: Staff costs incurred in Safari Areas

Grade	Number	Unit cost	Yearly total
Wildlife officer	11	1,043.75/month	137,775.00
Senior ranger	13	872.03/month	136,036.68
Ranger 1	61	785.87/month	575,256.84
Ranger II	138	749.67/month	1,241,453.52
Ranger III	102	714.51/month	874,560.24
Field allowances	39 912 man days	$5/day	199,560.00
Total			3,164,642.28

As shown on the table above, the bulk of the money generated goes in safari areas to meeting staff / labour costs in those areas. Field allowance refers to daily allowances given to rangers when they spend time out in the field doing extended patrols. Other cost centres include fuel and

49

in 2014 a total of 149,760 litres of diesel worth US$ 209,664.00 (about 30% of total fuel used within the whole Parks Estate) diesel was used was used in ZPWMA safari areas.

Communal areas

The communal areas benefits from wildlife through the CAMPFIRE program. This program is key in that it helps to encourage the communities to co-existence with wildlife. Communities are key ally in the country's fight against poaching and we believe that the off-takes from communal areas are sustainable. It therefore follows that legal elephant hunt is a sustainable way of incentivizing locals to help in conservation and is obviously more sustainable than cash hand-outs through donors. The CAMPFIRE program covers a total of 58 districts, covering 50 000 km^2 and more than 777 000 households. Figure 10 is a map showing CAMPFIRE areas in Zimbabwe, which is roughly equivalent to the Parks Estate.

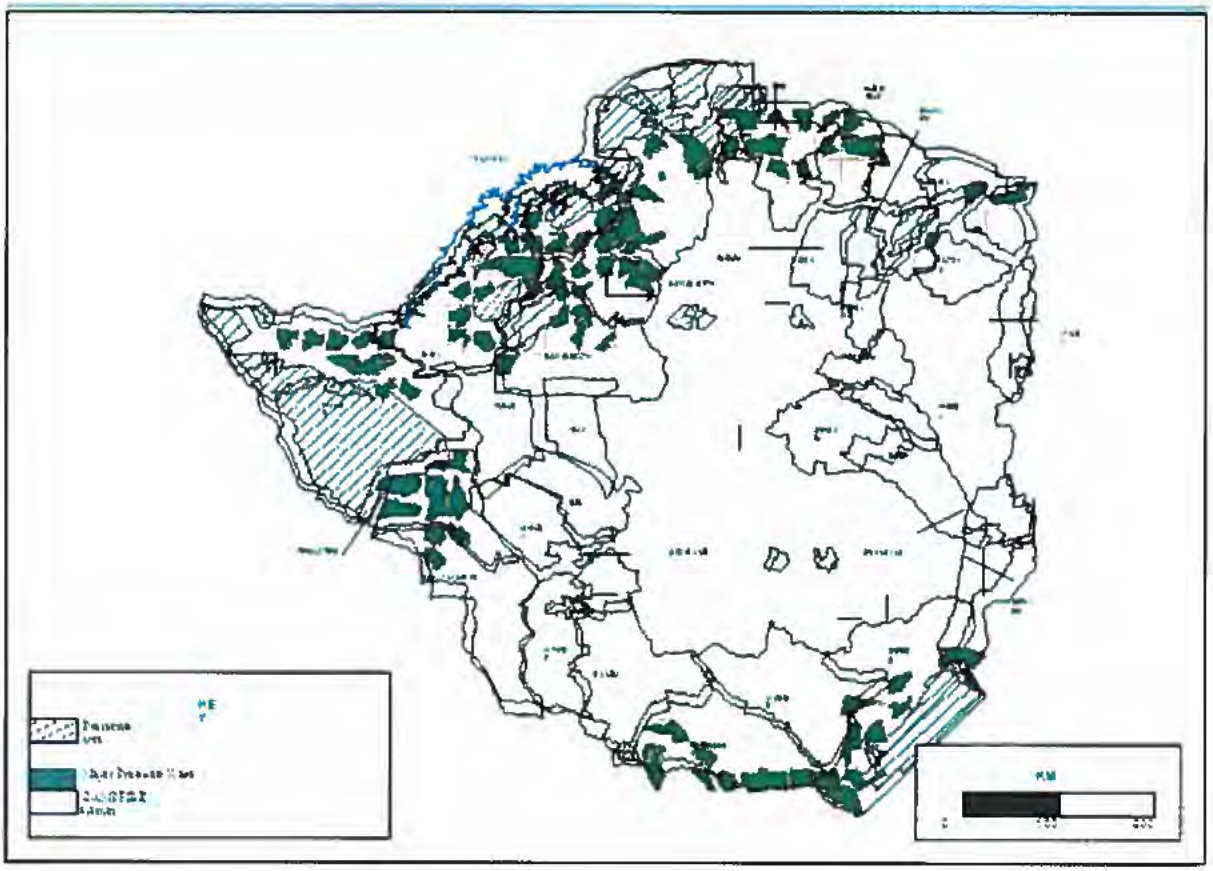

Figure9: CAMPFIRE Areas of Zimbabwe

The most common and lucrative wildlife based activity is sport hunting and the elephant provides the bulk (up to 80%) of revenue generated from wildlife based land use to the communities and the RDC's overseeing the CAMPFIRE program. During the 2014 hunting

50

season, a total of about US$1,419,384.00 (costs including trophy fees, daily rates and concession fees) was realized as revenue from elephant hunts under the CAMPFIRE program. Revenue generated from the CAMPFIRE program is ploughed back into managing and protecting the wildlife resource through activities such as anti-poaching patrols, wildlife censuses and problem animal control (PAC), and wildlife surveys. The distribution and use of CAMPFIRE revenue is done in accordance with the CAMPFIRE constitution developed in 1991 according to guidelines developed by the Government of Zimbabwe. The constitution was amended in 2007 with a view to increase the percentage of revenue for the local communities. The distribution of revenue between the Communities, RDC and CAMPFIRE Association is summarized in Table 14.

Table 14: Distribution of Revenue between Communities, RDC and CAMPFIRE Association.

Community	RDC	CAMPFIRE Association
55%	41%	4%

All major RDCs use CAMPFIRE revenue sharing guidelines, and in these districts revenue is paid directly into community controlled bank accounts by safari operators. Table 15 is a summary of how revenue allocated to communities is utilized based on the CAMPFIRE constitution.

Table 15: The Distribution of CAMPFIRE Revenue by Communities.

Project	Percentage allocation
Resource management	26%
Households	22%
Community projects	52%

It is apparent, however, that certain perceptions exist among some communities and observers that the sharing model is no longer being religiously adhered to, raising concerns regarding transparency over the revenue distribution system in CAMPFIRE areas. Some communities feel they are not benefiting adequately from the utilization of the wildlife resource. To this end, a review of the CAMPFIRE concept is being undertaken by the Government of Zimbabwe through the Ministry of Environment, Water and Climate. A funding proposal has been submitted to the European Union (EU) and if approved, the initial workshops will be held in August 2015.

The communities within CAMFIRE areas also benefit from elephant hunting revenue through community development projects as shown in Table 16.

51

Table 16.Some of the community development projects funded by hunting revenue in selected CAMPFIRE districts.

District	Project
Beitbridge	Rehabilitation of schools, clinics and irrigation schemes
Bililima	Rehabilitation of 3 clinics and 3 primary schools, hall, fencing field and rehabilitation of lodge
Binga	Schools, clinics and sub offices, rudimentary elephant dung paper making and tanning
Chipinge	3 grinding mills, lorry, teachers houses, community office, shop
Chiredzi	Clinic, teachers' houses, primary school, community-grinding mill, Police sub-office, piped water and electrification of clinic.
Gokwe North	6 grinding mills
Hurungwe RDC	Tillage tractors
Hwange	Agricultural inputs, goats restocking
Matobo	Organic farming gardens
Mbire	Clinic, nurses houses, office, storerooms, 14 classrooms, 7 teachers houses, grinding mill, school office, wildlife administration offices, 2 hand pump bore holes, water pipes, toilet, water storage tanks, 2 tractors, a tourist camp with 4 chalets;
Mudzi	Construction of Chingamuka primary and Chori pre-school
Nyaminyami	Tillage tractors, renovation of dispensary at clinic, nurse's house. Construction of Mayovhe classroom block, 3 grinding mills, Teacher's house, Jongola school. School bursaries x 3 students at Seke Teacher's College. Renovation of pre-schools x 2. Negande: Rehabilitation of water pipeline, grinding mill. Nebiri: Chikuro primary block, rehabilitation of Harudziva water pipeline. Kasvisva: Rehabilitation of water pipeline to supply water to Kasvisva clinic, Kasvisva Secondary school block. Msampa: Teacher's house, Majazu pry, renovation of ward warehouse; Kanyati: Cement for teacher's house renovation.
Tsholotsho	6 classroom blocks, clinic, 10 water engines, 2 F14 cottages
Umguza	Mlandwa secondary school
Vungu	Construction of primary school, borehole, dip tank

52

The CAMPFIRE program has managed to bring some important infrastructural development in some communities in Zimbabwe. It is important to note that most of the districts that have significant wildlife and in particular elephant populations are remote and generally underdeveloped, thus the proceeds from CAMPFIRE and the resulting developments go a long way in uplifting communities.

Private land

Revenue generated from these areas accrues to the respective land holders. Ideally ZPWMA, as the custodian of wildlife expects that some of the revenue is ploughed back to conservation. This money will be used for resource protection that is anti-poaching, fire management and water provision. Annually, ZPWMA carries out assessments in all wildlife farms to have an idea of the status of the infrastructure on respective properties.

Forestry commission

The forestry commission, to an extent, is like ZPWMA. They have to raise money for their operation. The revenue generated from elephant hunts is used for funding general activities in their concessions. Some of their major activities are anti-poaching, fire suppression and game water provision.

CONCLUSION

Zimbabwe still has a significant and healthy elephant population, which is the second largest in Africa, with most protected areas having a density of more than 1.5 elephants/km^2. The country has also experienced an increase in human population and the attendant increase in demand for land and natural resources. As such, habitat loss and modification remain as the most serious threat to viability of elephants in Zimbabwe, and also throughout Africa. Elephant management is based on the adaptive management approach which has resulted in the evolution of management strategies to cope with emerging and new methods of poaching. The ZPWMA also realizes the need for consistent and regular monitoring and emphasis has been placed on carrying out more frequent and regular aerial surveys, as well as routine ranger based monitoring of the elephant and other wildlife species populations. This will allow timely management interventions should the elephant population rise above, or fall below set TPCs. Elephants, despite being a constant source of problems for some communities, are an important source of revenue to these same communities, especially through their consumptive utilization. It is an accepted philosophy that wildlife can and should play a significant role in paying for its conservation. There is no doubt that elephant populations without direct economic value are at peril through lack of funding for conservation and also conflict with humans. It is apparent that despite Zimbabwe

53

deriving substantial benefits from utilization of elephants, this revenue is not sufficient to support conservation programmes. Considering that the elephant is an internationally recognized iconic species, it follows that local, regional and international efforts need to be initiated and maintained in order to secure the viability of elephant populations. Instead of restrictions being imposed on Zimbabwe in terms of sustainably utilizing elephants, international co-financing of management/protection of Zimbabwe's elephant population can go a long way in sustaining the elephant population. Given the global iconic status of the elephant, and that Zimbabwe has the second largest population of the African elephant, Zimbabwe must not be left to bear the sole burden of conserving the African elephant population.

Dear all,

Please find attached the draft proceedings of the South East Lowveld Elephant Management Plan Workshop. Dr. Cumming and I worked together to finalize and consolidate the attached, based on the discussions held at Hakamela last week.

As agreed, any comments on the draft proceedings should be provided to me by the 30th September to allow finalization of the proceedings by 7th October.

Very best,

Diane

Annex 2 – Workshop agenda 36
Annex 3 – Stakeholder analysis 38
Annex 4 – Strengths, opportunities and core competencies 39
Annex 5 – Comments received following the workshop 42

Introductions

The Facilitator, Dr David Cumming introduced himself and requested Mrs Doris Tom, Regional Manager, to extend the appropriate welcome to the traditional leaders present. Participants were then asked to introduce themselves. The detailed participant list is attached in Annex 1.

The representative of the Director General of the Zimbabwe Parks and Wildlife Management Authority was then requested to formally open the workshop.

Welcome and opening remarks

Arthur Musakwa, Acting Director of Conservation, welcomed participants and opened the workshop on behalf of the Director-General of the Zimbabwe Parks and Wildlife Management Authority (ZPWMA). The full text of the opening remarks follows.

Good afternoon everyone. I would like to acknowledge the presence of our traditional leaders Chief Gudo, Chief Mundau, Chief Sengwe and Chief Jojo, representatives from Frankfurt Zoological Society, Conservation Force representative, Chief Executive Officer of Chiredzi Rural District Council, non-governmental organisations here present, elephant technical experts here present, ZRP, Zimbabwe Parks and Wildlife Management Authority officials, distinguished guests.

Ladies and Gentlemen, on behalf of the Director General of ZPWMA who unfortunately is unable to be with us today, I would like to welcome you all to this special gathering where we are going to deliberate on the future of the South East Lowveld elephant population. Allow me to extend a special welcome to representatives from Conservation Force, Frankfurt Zoological Society and members from Mozambique and South Africa.

I am deeply honoured to preside over the planning workshop for the management of elephants in Gonarezhou National Park and its surrounding areas. It is with no doubt that Gonarezhou, which means a place of elephants, holds an impressive and growing number of elephants in the whole of Zimbabwe. It is an opportune time to meet as different stakeholders and discuss conservation issues of mutual interest as we formulate this Management Plan; a document that will guide and enable us to effectively conserve and manage our elephant population in this sub-region of the South East Lowveld.

Ladies and gentleman, I would like to thank you most sincerely for the sacrifice that you have made in terms of your business schedules and time to be here for this very important workshop. It is gratifying to note that the agenda of this workshop covers a wide range of very interesting items that will give us all the opportunity to discuss and share ideas.

Dear colleagues, we are coming here on the backdrop of the 2014 nationwide survey of elephants whose results confirmed and evidently showed that the elephant population for Gonarezhou is increasing, the results from the survey revealed a 5.6% growth rate. This is highly commendable considering the poaching threats that we are currently experiencing. Escalation in the illegal killing of elephants across the country poses a major threat to the survival of their populations and other wildlife species; we should therefore be wary of this imminent threat and put in place effective measures to curb this scourge. To this end I would like to commend the tremendous effort being made by Frankfurt Zoological Society (FZS) in assisting with the management and protection of elephant population in Gonarezhou National Park. Our management efforts here are therefore challenged to ensure that we have a collective progression and that we take lessons from other areas to solidify South East Lowveld conservation plans and achievements.

The Zimbabwe Parks and Wildlife Management Authority is finalising the National Elephant Management Plan and this can only be completed with input from the four sub-regions i.e. Zambezi Valley, Sebungwe, Hwange-Matetsi Complex and South East Lowveld. It is therefore only logical for each of these four sub-regions to have a management plan that feeds into the National Plan. The development of the Elephant Management Plan for the South East Lowveld will have a tremendous impact on the local populations in Gonarezhou and its surrounding wildlife communities that include Save, Malilangwe, Malipati Safari Area, Bubye, Mwenezi and Chiredzi District.

I have no doubt that given the sum total of expertise gathered here representing a cross section ranging from policy makers, wildlife managers, security agencies, wildlife researchers, local communities and non-governmental organisations, we should be capable to develop a relevant and effective management plan that should help to conserve our elephants.

I wish to thank Frankfurt Zoological Society, for making this workshop possible through their generous sponsorship. Before I hand you over to the Facilitator, I want to thank you once more for your sacrifice and support to elephant conservation and wish you fruitful deliberations and a pleasant stay at this wonderful Camp. I take this opportunity to declare this workshop officially opened. Thank you.

Objectives and purpose of the workshop

The facilitator provided background for the workshop. He made reference to the national elephant management planning process, and noted that the main objective of the workshop was an action plan for the conservation of elephants in the South East Lowveld. He then provided a brief overview of the agenda, included in Annex 2.

Update on poaching and anti-poaching in Gonarezhou

Evious Mpofu, from ZPWMA, provided a brief update on the situation in Gonarezhou with regards to anti-poaching. The Gonarezhou National Park was established in 1975, and covers 5,053 km^2. It forms part of the Great Limpopo Transfrontier Conservation Area, which covers approximately 100,000km^2, incorporating a mosaic of land use types with wildlife conservation as a unifying theme.

Elephants are a critical species in the area. They serve as a major attraction for tourists, and are a vital species for the trophy hunting industry. The Gonarezhou National Park serves as the source of most trophy animals in the surrounding areas. Elephants generally remain inside the park boundaries, and there is a high density of elephants inside the national park, leading to adverse impacts on habitat. It is hoped that improved security and elephant management in areas outside the park would lead to increased movement of elephants outside the park.

Elephant poaching is carried out by both locals and foreigners and occurs along the border areas and around water sources. Most foreign poachers are suspected to be coming from Mozambique using undesignated points to enter and exit. Local people are mostly involved in subsistence poaching, however some syndicates are involved in commercial poaching. The methods of poaching include snaring, dogs and traps for subsistence poaching and firearms and poison for commercial poaching. Wildlife poisoning incidents have increased in frequency and have major ecological impacts.

The poaching hotspots in Gonarezhou National Park include:

- Seasonal pans, such as Guluweni Chefu, Mateke, Gorwe, Makandwa, and Sokwe;
- Save Runde confluence area, which includes two major rivers and perennial pans;

– Areas close to Chitanga, Chicualacuala and Mavhuve settlements in Mozambique; and
– Mafuku/Soshangane area, which is close to the Mwenezi River.

Table 1: Law enforcement statistics for Gonarezhou National Park.

Year	Elephants poached	Contacts	Poachers killed	Poachers arrested	Firearms recovered	Number of incursions
2009	7	50	0	82	0	170
2010	15	160	0	254	1	150
2011	21	120	2	187	0	208
2012	16	90	0	142	1	260
2013	12	130	1	185	3	250
2014	12	54	0	99	0	170
2015	40*	45	2	85	1	308

*Increase in patrol effort in 2015.

A number of strategies had been implemented to counter poaching in the area:
– Establishment of two pickets along Zimbabwe-Mozambique border;
– Establishment of eight pickets along the western boundary of the park;
– Formation of border reaction team and rence reaction team;
– Adoption of mobile patrols so as to increase ground coverage;
– Fencing of part of the northern side of the park to prevent further encroachment into the park;
– Adoption of weekly aerial surveillance;
– Recruitment of 71 cadet rangers to enhance existing manpower; and
– Training, including annual refresher anti-poaching and leadership courses.

Human resources remain an issue. The necessary, and government-approved, scout force in Gonarezhou National Park is 180 rangers. Of the 64 rangers available, only 48 are currently deployable. There is also a lack of investment in anti-poaching by surrounding CAMPFIRE areas and in Mozambique. There is limited cooperation from Mozambique authorities to curb poaching, and follow-up of poachers once they cross the border is difficult. There are also key prosecution challenges, with penalties low and prosecution of poisoning cases very difficult.

Update on poaching and anti-poaching in Chipinge

A representative from Chipinge then provided an update on poaching and anti-poaching in the Chipinge area. He outlined a number of key challenges, including human encroachment into the buffer zone, movement of cattle into the protected area, and shortage of resources. There had been an increase in poisoning incidents, as well as availability of firearms. Problem animal control (PAC) had become a major challenge with the removal of the fence separating the Save Valley Conservancy (SVC) from the community areas.

In the Chipinge area, a number of strategies had been put in place to overcome these challenges. Disturbance methods were used to scare elephants and buffalo away from community areas. Problem lion were usually killed. Awareness campaigns had been increased and wildlife committees had been formed. A patrol system and snare sweeps had been introduced. The local authority (RDC) had been engaged. A longer-term solution would be to use fencing to reduce human-wildlife conflict.

Update on poaching and anti-poaching in the Chiredzi District CAMPFIRE Area

Chenjerai Zanamwe, from the Chiredzi Rural District Council, provided an update on poaching and anti-poaching in the Chiredzi District CAMPFIRE area.

Table 2: Elephant populations in Chiredzi District hunting areas

Name of hunting area	Species	2015 Population Estimates	Chiredzi RDC assessment of status
Chibwedziva	Elephant	Migratory	Stable But Increase In Population
Chitsa	Elephant	Migratory	High Increase In Population
Malipati Communal Area	Elephant	Migratory	Low Increase In Population
Malipati Safari Area	Elephant	Migratory	High Increase In Population
Naivasha	Elephant	Migratory	High Increase In Population
Sengwe I	Elephant	Migratory	Stable But Increase In Population
Sengwe Ii	Elephant	Migratory	Low Increase In Population

The Chiredzi RDC was undertaking a number of activities with regard to elephant management including: awareness creation; capacity development; anti-poaching; data collection and information management; resolution of land disputes; community mobilisation; participation in various projects, trainings or workshops; PAC and PAC data management; habitat management; and fire management, including by-laws.

A number of challenges were faced, including: resource constraints; problem animals; shrinking markets; competing claims; low appreciation on how Councils operate; and low appreciation of the CAMPFIRE programme.

In the discussion following the presentation a number of points were raised:

- Problem animal removals are above and beyond the existing quota.
- Information about whether night hunts were conducted was not available.
- ZPWMA is bearing the anti-poaching costs, while the RDC is receiving a large proportion of the trophy fee and should also be bearing anti-poaching costs.

Update on poaching and anti-poaching in Save Valley Conservancy

Dave Goosen provided a brief update on the situation in the Save Valley Conservancy (SVC), where the total area was down to 2,400km^2 from about 3,500km^2, due to resettlement. SVC holds a diverse membership, including Agriculture and Rural Development Authority (ARDA), RDCs, and private investors. Anti-poaching is undertaken by 90 scouts employed by members, as well as a 34-person special species protection unit. There is currently an upsurge in meat poaching due to the removal of fences, as well as an increase in rhino poaching. To date there has been no targeted elephant poaching.

Malilangwe Trust

Mark Saunders provided a short update on activities in the Malilangwe Trust. The property is fenced entirely and it is likely that the carrying capacity for elephants has been exceeded. Cropping permits have been secured and utilized, resulting in the distribution of 64 tonnes of

meat into communities. There is an 80 scout anti-poaching unit that works across 16 sectors. To date there has been no elephant poaching.

Results of the 2014 aerial survey of the South East Lowveld

Kevin Dunham presented the results of the 2014 aerial survey of the South East Lowveld, which was funded as part of the Great Elephant Census, and conducted in partnership with ZPWMA and FZS. The South East Lowveld survey was part of a national survey to determine the number and distribution of elephants in Zimbabwe. The methods used were repeatable, technically robust and the same as those used during 2001.

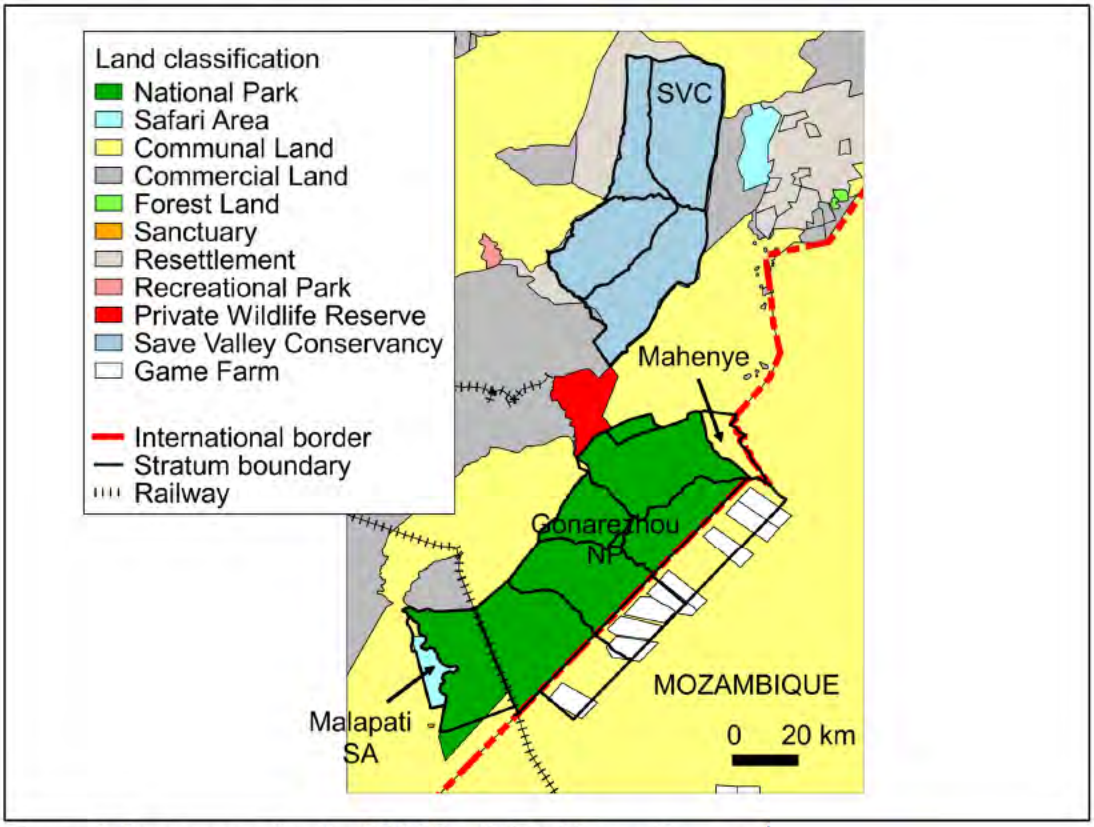

Figure 1: Survey area for the 2014 South East Lowveld survey[1]

Kevin described the survey methodology and noted that elephants and elephant carcasses were the focus of the survey, although all wild and domestic large herbivores were counted and estimated.

Table 3: Initial results from South East Lowveld survey

Area	**Estimate**
Gonarezhou National Park	11 120 +/- CI 25 %
Mahenye	332 +/- CI 156 %
Save Valley Conservancy	1585 +/- CI 85 %

[1] Dunham, K. M. & van der Westhuizen, H.F. (2015) *Aerial Survey of Elephants and other Large Herbivores in Gonarezhou National Park and Save Valley Conservancy (Zimbabwe): 2014.* Frankfurt Zoological Society Gonarezhou Conservation Project, Chiredzi, Zimbabwe.

There are a number of small areas in the South East Lowveld that hold small populations of elephants. These areas were not included in the aerial survey, but information from land managers on each of these populations was solicited at the time of the survey, and represented around 1,200 elephants.

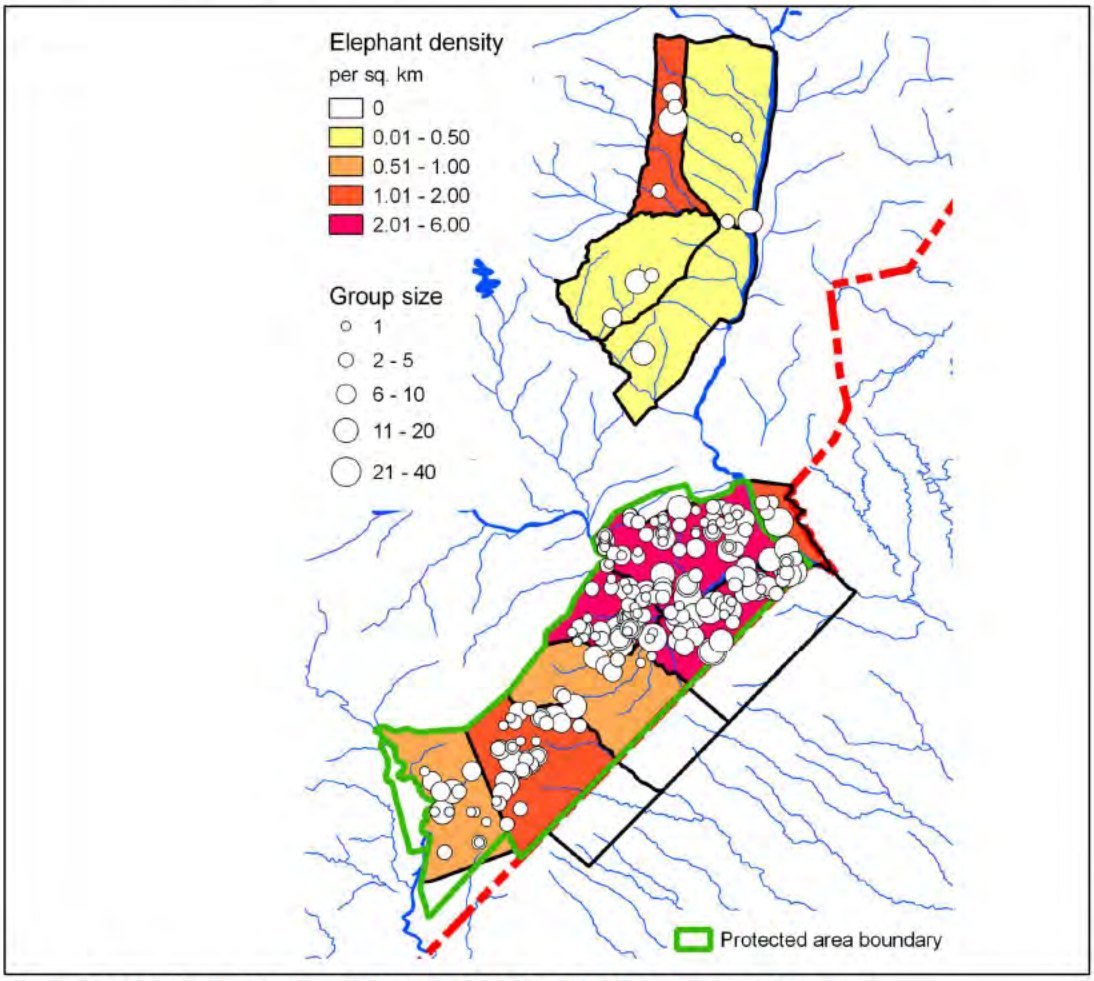

Figure 2: Elephant density during the 2014 South East Lowveld survey[2]

Gonarezhou is likely the best surveyed park in Zimbabwe, with a number of different surveys conducted since 2001. The population has been increasing since 1998 at a rate of 6% per annum. Bull numbers have been going up at 11% per annum, indicating that it may not be a closed population. Carcass ratios do not currently indicate any high levels of poaching.

Following the presentation, a number of key points were raised during the discussion:

- A small strip was surveyed in Mozambique, with the appropriate permissions. No elephants were seen inside or outside the survey strips. Elephants may be using these areas in another season or at night.
- The communal areas in Zimbabwe were not surveyed in 2014, but the 2013 survey turned up very few elephants.
- No elephants were seen in the Malipati area.
- Cow herds were seen in the Mahenye area.

[2] Dunham, K. M. & van der Westhuizen, H.F. (2015) *Aerial Survey of Elephants and other Large Herbivores in Gonarezhou National Park and Save Valley Conservancy (Zimbabwe): 2014.* Frankfurt Zoological Society Gonarezhou Conservation Project, Chiredzi, Zimbabwe.

Stakeholder analysis

The workshop then moved into a working session to analyse stakeholders. The full list of identified stakeholders is available in Annex 3. Primary stakeholders were identified as:

- Ministry of Environment Wildlife and Climate
- Rural District Councils
- Local communities
- ZPWMA
- FZS Gonarezhou Conservation Project
- Malilangwe Trust
- Conservancies
- Security agencies, including the ZRP
- Tourists
- NGOs
- Donors
- Judiciary

Problem analysis

The key issues were identified through a working session using cards, and are summarized below.

Social, Economic and Cultural Framework

- Community development / benefits
- Sour relationship between communities and authorities
- Benefits to the community
- Non-payment of CAMPFIRE proceeds
- Transparency
- Realization of full value to local people
- Benefits / incentives
- Lack of education to communities
- Traditional leadership empowerment
- International perception on elephant conservation (politics!)
- Banning of trophy hunting

Conservation Capacity

- Funding support
- Inadequate funding
- Financing
- Lack of resources

Law enforcement

- Poaching
- Elephant poisoning
- Increased demand for ivory (black market)
- Density reduced of elephants
- Cross-border poaching
- Ivory trafficking
- Lack of anti-poaching activities

Biological and Landscape issues

- HWC
- Compensation
- Informal settlement
- Land use conflict

- Encroachment and fragmentation
- Landscape level management issues
- Elephants restricted to Gonarezhou
- Increase in elephant numbers
- Impact on vegetation
- Impact on biodiversity
- No protection given to iconic animals (large tuskers)
- Fire management
- Artificial water
- Lack of effective monitoring

Coordination issues
- Need for better stakeholder coordination
- Inadequate inter-agency cooperation

Report on Kruger National Park

Sam Ferreira, responsible for Large Mammal Ecology in SANParks, provided a presentation on elephants in Kruger National Park. He summarized the various management paradigms that had been used for elephant conservation in Kruger. Throughout these various paradigms, the monitoring focus had always been on the response of elephants to any management intervention. However, the team at SANParks was now moving to measure the responses of the impacts of elephants, rather than the elephants themselves. The focus has therefore moved to managing elephant impacts, rather than trying to manage elephants numbers or densities. This is based on the assumption that elephants use different areas in different ways at different times.

The number of artificial water points at Kruger had been reduced, and experiments were ongoing surrounding the recreation of 'landscapes of fear' to reduce elephant impacts on certain resources at certain times.

He also provided a small overview of SANParks approach to rhino protection, which included both technological approaches, as well as intensive intelligence approaches. He noted that a huge amount of information was being collected, but needed to be better used through sophisticated analysis to help predict criminal activity.

Mahenye CAMPFIRE programme

Clive Stockil provided a short overview of the CAMPFIRE programme in Mahenye, which had started nearly 35 years previously. With the introduction of trophy hunting of just two elephants, there was an instant shift in community behaviour with regard to elephant poaching. Since then, the programme had grown from strength to strength, and elephant herds were now resident in the Mahenye area, and were moving up to the southern end of the Chimanimani mountains.

This success had resulted in increased conflict with elephants, which should require an aligned increase in benefits. There had been an upsurge in poisoning incidents in the area, likely related to the increased costs associated with having elephants in the area.

Strengths, opportunities and core competencies

The workshop participants moved into five working groups, to identify strengths, opportunities and core competencies within each of the five components of the national framework. The feedback from these working groups is captured in Annex 4.

Statement by Traditional Leaders

Aaron Maramba spoke briefly on behalf of the Traditional Leaders at the workshop. He thanked the organizers and participants for the workshop. He noted the positive participation of community members and traditional leadership.

Development of draft South East Lowveld regional conservation and management action plan

Over two days, participants worked in five working groups to develop the draft South East Lowveld regional conservation and management action plan. The final session of the workshop included a detailed review of all five components of the action plan.

Component 1: protection and law enforcement

Output	Activities	KPIs	Means of Verification	Time frame	Indicative costs	Agencies
1.1 Highly trained rapid response anti-poaching units strengthened	– Appoint anti poaching coordinator (for region and/or separate areas) – Recruit staff – Train staff – Procure vehicles and equipment – Deploy unit – Support existing units	Trained and fully equipped units established and operating with relevant security agency by June 2016	Inception reports Daily and monthly reports, including details on patrols, arrests, and incursions Training reports	Established where needed by June 2016	US$ 230,000	ZPWMA ZRP Conservancies + MT
1.2 Informer and intelligence systems established and/or strengthened	– Identify and recruit informers – Establish and implement incentive protocols – Set up, implement hotline for anonymous reports and communicate it to the public – Analyse and use information – Ensure information is included in database outlined in Output 1.6	An active informer system/network operating within the SEL by Jan. 2016 Hotline widely advertised and operational by Jan 2016	Operational reports Recoveries Records of arrests and successful prosecutions Records of payments for information Records of hotline reports	By Jan 2016	Informer incentives Airtime Cost of setting up hotline	ZPWMA Security agencies Conservancies + MT
1.3 Investigation of wildlife crime improved	– Implement training programmes for investigation personnel – Ensure collaboration between Parks, ZRP and intelligence officers – Recruit more investigators – Put in place Investigator incentive system – Collaborate with forensic scientists and ballistic experts, as well as agencies such as EMA and approved universities (e.g. Chinhoyi University of Technology)	At least two law enforcement staff trained in scene of crime collection and preservation of evidence, ballistics evidence, etc. in SEL. Percentage of investigations resulting in successful	Reports on intelligence-led operations (arrests, dockets, convictions, multi-agency involvement) Training reports, including investigators wildlife crime manual	3 Months Ongoing 3 Months Ongoing Ongoing	$25,000	ZRP ZPWMA

Output	Activities	KPIs	Means of Verification	Time frame	Indicative costs	Agencies
		prosecutions in SEL greater than in 2014				
1.4 Prosecution of wildlife crimes improved	– Train prosecutors on legislation and processes available to deal with wildlife crimes – Conduct awareness / outreach programs with Prosecution, Judiciary – Utilize ancillary laws, such as those dealing with economic crime, organized crime, money laundering, etc. – Communicate status of prosecutions to the public via ZPWMA website – Clear backlog of wildlife cases – Explore the possibility of appointing dedicated wildlife crime prosecutors at Regional and National level	Monthly liaison sessions on wildlife crime and law enforcement held with members of the judiciary Relevant legislation available and being used Wildlife crime prosecutors available and being used in SEL	Reports on arrests, dockets, convictions, sentences Court records Monthly liaison meeting reports ZPWMA website	Starting 3 months, and fully operational by December 2016		ZPWMA Judiciary Prosecutor-General's Office District and Provincial Public Prosecutors
1.5 Law enforcement in collaboration with communities enhanced [Links to Component 3]	– Engage and collaborate on curbing wildlife crimes (ZRP & Communities) – Establish anti-poaching clubs/ community scouts that collaborate with Parks and ZRP – Lobby support from Chiefs to deal with local poachers – Hold workshops with Chiefs about wildlife and wildlife crimes – Establish incentives for communities to provide information	Incentive schemes that encourage the public and members of rural communities to contribute to law enforcement (e.g. through informer hotline) established in SEL Increasing number of incidents of community contribution to law enforcement (e.g. whistle blowers) by Dec. 2017	Reports received through informers or hotlines Trends in reporting from communities Intelligence reports and minutes of meetings Reports on poaching incidents dealt with through traditional leaders Reduced levels of wildlife and environmental crime in the SEL	Ongoing Ongoing	$5,000	ZPWMA RDCs Traditional Leaders ZRP
1.6 Local wildlife law enforcement database established	– Set up database, as per national database – Ensure inclusion of prosecution status in database	Local database established and operating	Inspection of database Operational database	6 months	$10,000 -Computer -Software	ZPWMA Conservancies + MT

Output	Activities	KPIs	Means of Verification	Time frame	Indicative costs	Agencies
	– Implement national data recording protocols – Train data entry staff and crime analysts	Illegal activities recorded and analyzed	Monthly and annual analysis reports		-Training	Security agencies
1.7 Illegal settlements / grazing in wildlife areas reduced [Links to activities on land use mapping and planning in Component 2 – Output 2.2 and incentivization / alternative livelihood activities in Component 3]	– Liaise with RDC, Traditional Leaders and ZRP, DA's Office – Conducted Education programmes – Regular updated satellite mapping	Illegal settlements reduced to less than 5% of wildlife areas by 2020 (i.e. state protected areas, conservancies and community wildlife areas)	Records and maps of illegal settlements and of wildlife land recovered	Ongoing to 2020		ZPWMA CAMPFIRE RDCs Conservancies + MT

Component 2: Biological management and monitoring

Output	Activities	KPIs	Means of Verification	Time frame	Indicative costs	Agencies
2.1 Research programme to understand temporal and spatial drivers of elephants established [Links to Component 4]	– Create enabling opportunities and environment for research – Prioritise research needs – Conduct localised case studies and research projects – Monitor and evaluate poaching and other drivers - hunting, water, food, human disturbance – Explore possibility of GLTFCA flagship research programme for elephants [linked to Component 5]	Research programme that enables local and international researchers, and links with the GLTFCA research programme, in place and producing reports	Annual summary research report Number of research projects Number of essential research projects Number of affiliations with national, regional and international institutions	5 year plan and annual review	Aerial surveys Satellite collars Remote sensing data layers Research operations Permit costs	ZPWMA Conservancies + MT Universities FZS GLTFCA Joint Management Board / Coordinator RDCs
2.2 Current elephant range defined and options for extending range and maintaining connectivity between fragmented populations explored	– Define elephant range use, and existing and potential connectivity – Identify priority corridors and human land use barriers – Conduct spatial analyses to inform land use planning – Advocate land use planning to facilitate connectivity and reduce human wildlife conflict – Explore options for translocating elephants to under-stocked areas	Identified priority corridors for elephant connectivity within SEL and neighbouring countries	Elephant and human range use reports and maps	December 2016	Aerial surveys Satellite collars Remote sensing data layers Research operations Permit costs	ZPWMA Conservancies + MT Universities FZS DA's Office RDCs
2.3 Elephant population numbers, structure, mortality and trends	– Undertake standardised, regular, aerial surveys of the elephant range – Explore methods to monitor elephant	Elephant range surveyed at regular intervals	Aerial survey reports	Aerial surveys - at least every	Aerial surveys	ZPWMA Conservancie

Output	Activities	KPIs	Means of Verification	Time frame	Indicative costs	Agencies
monitored, quotas adjusted, and desired levels of trophy quality maintained	presence and abundance in Mozambique (to Zinave) and up to the Chimanimani range – Undertake trend analysis – Define elephant age and sex structures and extract birth and death rates – Establish annual monitoring plans – Record and analyse elephant mortalities (all causes e.g. poaching, PAC, natural, hunting, etc.) – Monitor trophy quality and age – Develop and implement an age-based and size-based trophy quota	Demographic data available and analysed Annual monitoring plans implemented Evidence-based and research-based information and recommendations (consumptive, non-consumptive) provided to managers and used in quota setting	Minutes of the elephant management committee meeting Minutes of quota setting meetings Reports on mortality, population structure, and trophy quality and age	three years Ongoing monitoring Annual reports	Remote sensing data layers Monitoring operations Permit costs	s + MT Universities FZS International donors
2.4 Elephant impacts on their habitats and selected indicator species of biodiversity monitored	– Establish annual monitoring plans – Measure vegetation indicators such as woodland cover – Measure other functional biodiversity indicators e.g. bird responses to structural changes to woodlands – Measure ecosystem functions – Relate desired impact to measures of elephant abundance and spatial use – Research other drivers of ecological impact (climate change, change in land use, water provision, and fencing, amongst others) – Use research findings, expert opinion and informed public opinion to establish thresholds of potential concern (TPC or limits to change) to initiate management action in respect of elephant impacts in protected areas and effects in communal land	Annual monitoring plans defined and implemented for selected indicator species of biodiversity TPC's defined Evidence-based and research-based information and recommendations (consumptive, non-consumptive) provided to managers	Annual ecological impact monitoring reports Published research papers and reports Minutes of the elephant management committee meeting	Annual	Ecological surveys Remote sensing data layers Monitoring operations Permit costs	ZPWMA Conservancies + MT Universities FZS GLTFCA Coordinator
2.5 Costs and benefits of elephants to local and national economy monitored and costs of elephants to local communities reduced	– Monitor and evaluate extent and costs of human-wildlife conflict incidents – Relate human-wildlife conflict to elephant abundance and spatial use – Understand drivers and social and economic consequences of human-wildlife conflict	Annual monitoring plans implemented Evidence-based and research-based information and recommendations	Annual monitoring reports Human Wildlife Conflict Reports Research reports	Annual	Questionnaire Surveys Centralized database setup and maintenance	ZPWMA Conservancies + MT Universities

Output	Activities	KPIs	Means of Verification	Time frame	Indicative costs	Agencies
	– Evaluate the direct and indirect contribution (financial, economic and social) and the direct and indirect costs of elephants to the well-being of people and to conservation, through both consumptive and non-consumptive uses – Implement ongoing and new mitigation for human-wildlife conflict	(consumptive, non-consumptive) provided to managers	provided to managers Minutes of the elephant management committee meeting		Monitoring operational costs	FZS
2.6 Adaptive elephant management framework adopted and implemented [Links to Component 4]	– Ensure collaboration between Regional Elephant Management Committee and regional and local resource management committees (e.g. LOCAL Forum) – Implement annual process of adaptive planning, implementation and monitoring in line with elephant management objectives and TPCs within the SEL – Develop and implement localised management plans (e.g. SVC plan) – Ensure alignment and harmonisation with other Zimbabwean, regional and international plans	Annual elephant management plans developed, adopted and implemented	Elephant Management Committee Minutes Planning and monitoring reports Annual elephant management plans	Annual	Meeting costs Monitoring and analysis costs	ZPWMA Regional Elephant Management Committee
2.7 Alternative outcomes modelled	– Develop framework for examining and modelling potential linked impacts between biodiversity issues, elephant issues, and societal issues, including any 'surprises', such as disease or extreme weather events. – Implement the modelling framework to define the outcomes of various management scenarios	Established modelling framework being used to guide adaptive management Scenario outcome recommendations and being used in management	Elephant Management Committee Minutes Reports on models and scenarios Recommendations	Begin immediately Ongoing annual reports through 2020	Meeting costs Staff and consultants costs Software costs	ZPWMA Regional Elephant Management Committee Research institutions Researchers
2.8 SEL reporting to meet national standards achieved	– Advocate key summary set of elephant KPIs/outcomes for national reporting (e.g. potential population sizes against actual population sizes) – Comply with national and international legal obligations – Explore the designation of GNP as a MIKE site	CITES reporting requirements met National reporting compliance requirements	SEL regional Reports CITES Reports	Annual	Monitoring costs	ZPWMA Regional Elephant Management Committee

Component 3: Social, economic and cultural framework

Output	Activities	KPIs	Means of Verification	Time frame	Indicative costs	Agencies
3.1 Community partnerships and joint venture oportunities are incentivised and facilitated	– Establish protocols, policies and models for development of joint ventures (PPCPs) – Identify potential areas – Facilitate development of new, and strengthen existing, institutional frameworks and legal entities for beneficiaries at sub-district level – Develop concepts, business plans and prospectuses for different areas through consultative processes with Communities – Develop a SEL Tourism plan and review potential concessions within the framework of this Plan – Develop mechanisms for inclusive and transparent engagement and selection of operators and JV partners. – Facilitate communication, endorsement and support of JVs – Explore potential incentives and avenues of material and technical support that can be provided by Local Government and Authorities to promote establishment and sustainability of Community JVs – Promote access to affordable capital funding – Enhance capacity of community members to engage in wildlife and tourism management through training and employment	Models and protocols for joint ventures established Community institutions to engage in joint ventures established Joint ventures established and operating, resulting in financial benefit to communities SEL tourism developed and potential concessions identified Mechanisms of support and incentivisation to JVs established	Community institution documents (e.g. Trust deeds) Concept notes, business plans and prospectuses for JVs JV agreements and leases Records of meetings, negotiations and consultations SEL Tourism Plan RDC resolutions Community resolutions Record of incentives Project reports & accounts Training reports	Within 12-24 months, and then ongoing	Travel Meetings Drafting Consultants NGO support	RDCs Traditional Leaders and relevant community institutions NGOs Pvt Sector ZPWMA
3.2 Elephant management in community wildlife areas improved	– Promote improved and professionalized elephant management and security in community wildlife areas through establishment and maintenance of improved capacity, infrastructure, security and management systems	Infrastructure, equipment and systems for elephant management in community wildlife areas established and	Project reports Asset / infrastructure register	Ongoing Within 12 months	Capital expenditure – HQ, workshop, roads, water,	JV partners NGOs & donors Local

Output	Activities	KPIs	Means of Verification	Time frame	Indicative costs	Agencies
	– Develop and implement a transparent Performance Based Quota system which incentivises improved management and security systems for elephant in community hunting areas and which promotes effective buffering of source populations – Update terms of lease agreements in community wildlife areas to confer a broader range of roles and responsibilities on operators including resource management and protection; re-investment and infrastructure development; employment targets; local sourcing; etc. – Review key cooperation opportunities across different land uses and countries within GLTFCA, e.g. Sengwe-Tshipise Wilderness Corridor	operational Reduced human-elephant conflict Community capacity for wildlife management improved Opportunities for cooperation within GLTFCA identified	Number of scouts / employees Leases Resource monitoring data Trophy data Number of people / locals employed Invoices and receipts for local goods and services Business plans Meeting records Constitutions and agreements signed Workshop reports		fence, tourism facilities, vehicles and equipment, security infrastructure and equipment Maintenance Electricity Communications Operational costs: Staff and trraining Fuel Research & monitoring Workshops and consultations	authorities GLTFCA
3.3 Additional elephant-based tourism and sustainable utilisation oportunities explored	– Promote awareness and marketing of iconic tuskers – Explore opportunities for expansion of community wildlife areas in viable wildlife corridors to enable establishment of additional sustainable utilisation areas and enterprises. [Links to Output 2.2 – identification of corridors]	Corridors identified and agreements concluded Tourism and awareness campaigns undertaken	Tourism records Marketing materials Business plans	As part of SEL Tourism Plan Within 12 months and ongoing	As part of SEL Tourism Plan, workshops and consultatio	All stakeholders RDCs Communities

Output	Activities	KPIs	Means of Verification	Time frame	Indicative costs	Agencies
			Meeting and workshop reports Agreements signed Reports and maps of corridors		ns	
3.4 Transparent distribution of the benefits and costs of elephant management and conservation facilitated [Links to Output 2.5]	– Conduct regular and comprehensive Community Awareness campaigns regarding quotas, revenues and distribution within Communities – Capacitate and incorporate direct community involvement in management of Community Wildlife Areas, enterprises and JVs. – Diversify downstream natural resources enterprises to multiply the revenues from CBNRM, e.g. NTFPs	Awareness campaigns conducted Community structures have improved capacity to manage NRs and wildlife areas CBNRM revenues are invested in establishment of natural-resource based enterprises Community realises greater employment and financial benefit from CBNRM revenues	Meeting records Training materials & records Number of enterprises established Books of account Number of employees & beneficiaries	Within 12 months and ongoing	Consultations Scoping and feasibility studies Awareness campaigns Company set up and administration	ZPWMA Traditional leaders Communities RDCs Pvt Sector NGOs
3.5 Effective techniques and land use strategies to mitigate human-elephant conflict are implemented	– Review land use zonation through consultative processes [link to Output 2.2] – Promote awareness and adoption of effective HEC mitigation measures – Promote improved rangeland rehabilitation and grazing management to reduce competition between livestock and wildlife [is this beyond elephant management and conservation planning?] – Promote improved and rationalised crop production and alternative mechanisms to promote food security to reduce habitat destruction for inefficient dry land cropping (e.g. irrigation development; carbon sequestration credits to generate income &	HEC is effectively reduced Availability and application of HEC mitigation measures improved There is participation in effective grazing management schemes Grazing is better managed and rangeland health is improved	Land use plans Meeting records Land use plans & agreements concluded Training & awareness materials HEC data Pasture	Within 12 months and ongoing	Workshops and consultations Training materials Consultants Input costs Irrigation development	Communities RDC ZPWMA Pvt Sector NGOs (technical & financial support)

Output	Activities	KPIs	Means of Verification	Time frame	Indicative costs	Agencies
	purchase of staple grains) [is this beyond elephant management and conservation planning?]	There is increased uptake of improved cropping techniques Crop yields are improved Alternative land uses evaluated	monitoring data Crop production data			
3.6 Information on elephants and their conservation is included in school curriculae and environmental education adjacent to key elephant populations in the SEL is promoted	– Promote awareness of elephant conservation (and other issues) through cultural events, art, plays, sport, etc. – Participate in syllabus review of national environmental science curriculum approved by the Ministry of Education – Develop approved environmental training and extension material and promote dissemination to different stakeholder groups within the community – Promote the formation of environmental science clubs at schools – Coordinate various education, training and extension campaigns operating within the district	School children and communities have greater appreciation of elephant conservation issues Greater participation in environmental clubs at schools with greater understanding of environmental issues More social events linked to environmental and conservation awareness are held Elephant conservation messages are conveyed through art and cultural events & competitions Parallel education programmes are coordinated through stakeholder planning sessions at district level	Test Results Competitions Community focus groups Attendance registers Event documentation Number and type of events Workplans Meeting outputs & records	12 months and ongoing	Consultants Endorsements Community consultations Materials and dissemination School visits Training of trainers / teachers Event costs Marketing Sport kit Coordination costs	NGOs RDCs ZPWMA DEO Communities
3.7 Cultural tourism is developed	– Promote existing cultural tourism events and attractions and promote incorporation of	Community participation and tourist attendance	Tourism records	Ongoing	Support for cultural	Communities

Output	Activities	KPIs	Means of Verification	Time frame	Indicative costs	Agencies
and marketed as a centre-piece of SEL attractions and linked explicitly to conservation of flagship species including elephant	messages of elephant conservation within these – e.g. Machangana Cultural Festival; GL-Cultural Festival – Explore and develop additional cultural tourism opportunities – including development of interpretive centres, craft centres, museums, monuments, events, etc. and market these – Document and communicate the specific cultural importance of elephant to communities in the SEL and incorporate this into education, marketing, event and cultural messages and interpretative centres.	of cultural events is increased Messages relating to elephant conservation and environmental issues are key themes The number of cultural tourism developments and enterprises is increased Anecdotes, artifacts and oral tradition regarding cultural importance of elephants are recorded and insinuated into marketing strategies and event messages	Event records & themes Number of enterprises registered Documents compiled		events Planning Awareness and marketing Travel and event costs Scoping, feasibility and planning Workshops and consultations Establishment and registration costs Capex, Opex Marketing Travel & meeting costs Materials, drafting and publication	Traditional leaders Local authorities, Private sector NGOs JV partners Consultants
3.8 Regional tourism is promoted	– Promote the development of infrastructure critical to accessibility of the region: e.g. border crossing at Pafuri; road development and maintenance; scheduled flights to Chiredzi;	Increased tourism traffic and arrivals Infrastructure upgrades Scheduled flights	Tourism & economic data Upgraded	ongoing	Scoping studies Tenders	Central Government Local

Output	Activities	KPIs	Means of Verification	Time frame	Indicative costs	Agencies
	etc. – Promote diversification, branding and marketing of SEL-specific tourism products linked within the region and with other attractions in Zimbabwe and neighbouring countries. – Focus special attention on development of community-led tourism initiatives that contribute to the sustainability of the STWC as a movement corridor for elephant – Clear mines from STWC	established Pafuri border crossing operational Tourism products are diversified Marketing and branding consultants engaged to develop branding and strategy Scoping, feasiblilty studies are undertaken Increased number of CB enterprises are operational	infrastructure Border post Flight schedules Tourism enterprise info Marketing materials Scoping and feasiblity documents Business plans and registrations		 Workshops and consultations Scoping studies Consultants Development of business plans Infrastructure, equipment, operational costs Marketing	Authorities Communities GLTFCA Donors Private sector RDCs NGOs JV partners
3.9 Policy framework for conservation and CBNRM is well understood by communities and other stakeholders in SEL	– Compile factsheets on policy framework for conservation and CBNRM and disseminate to communities and other stakeholders	Communities have access to existing CBNRM and Policy frameworks	Awareness materials Focus groups & attendance registers Enterprise records Employment records	12 months ongoing	Consultation & document compilation Drafting and production of awareness materials Dissemination of materials	Traditional Leadership Communities RDCs ZPWMA NGOs
Effective communication and marketing strategy for local, regional and international	– Develop marketing materials tailored to different target audiences and communication modalities	Tourism arrivals increased	Tourism data Marketing	12 months ongoing	Marketing consultant Marketing	All SEL stakeholders

Output	Activities	KPIs	Means of Verification	Time frame	Indicative costs	Agencies
audiences is developed [Covered by Output 3.1 and Output 5 – suggest removal?]	– Promote efficient communication and feedback between stakeholders	Parallel structures and fora are amalgamated Coordination and communication is improved	materials Minutes and resolutions		materials	
[Consider moving to national plan]	– Consider innovative mechanisms for transboundary resource sharing and expanding “space for elephants” (e.g. live elephant sales to Mozambique to repopulate Zinave & Banhine) [National level activity]	Workshops conducted	Workshop outputs and resolutions	Within 12 months	Stakeholder workshops (and attendant costs) Community consultations (AAC)	All stakeholders GLTFCA

Component 4: Building conservation capacity

Output	Activities	KPIs	Means of Verification	Time frame	Indicative costs	Agencies
4.1 Funding to implement the plan secured	– Implement variable / graduated trophy fee structure based on trophy size [national-level decision] – Review levy / fee structure for elephant hunting and the distribution of these revenues for conservation and communities – Develop and submit bankable project proposals to potential funders – Explore potential business partnerships – Increase capacity and law enforcement coverage by ensuring that all key stakeholders contribute to and are engaged in law enforcement activities: hunting operators, tour operators, and community anti-poaching teams [Links to Output 1.1] – Explore the potential for a dedicated elephant fund for SEL.	Revised trophy fee structure developed, resulting in increased funds available or secured for elephant conservation Number of project proposals developed submitted and funded Number of developed and functional partnerships contributing to improved elephant management	Record of funds available for elephant conservation Record of project proposals	2016 and ongoing		ZPWMA Conservancies + MT NGOs
4.2 Current capacity analyzed and needs identified	– Analyze current capacity – Carry out a needs assessment across the full range of human resources – Carry out a needs assessment for equipment and infrastructure – Develop a strategy to address the identified needs	Needs assessment report	Records and reports	2016 and ongoing		ZPWMA
4.3 Capacity for research and monitoring strengthened and collaboration with research institutions enhanced [Linked to and informed by Components 2 and 3]	– Develop and implement a multi-disciplinary research and monitoring strategy – Develop and implement a research programme based on that strategy, including graduate studies, post graduate and external researchers as well as ZPWMA researchers – Undertake periodic research meetings / conferences – Recruit and meet demands and requirements for research personnel in Parks and surrounding areas – Collaborate with external research institutions – Develop and implement a mentoring programme for researchers	Functional research programme in place Research meetings held Publications Number of research projects developed and implemented Number of research personnel on the ground	Reports and publications Minutes of meetings Records of field personnel	2016 and ongoing	USD 100,000?	ZPWMA, Universities, NGOs, External Researchers ZPWMA, Universities, NGOs, External Researchers, SVC

Output	Activities	KPIs	Means of Verification	Time frame	Indicative costs	Agencies
	– Procure relevant research equipment	Number of collaborative projects Mentoring plan / number of days spent with experienced researchers Inventory of equipment for research procured				
4.4 Training and retraining programmes established	– Carry out a training needs assessment for law enforcement, resource and wildlife management, research and monitoring, education and awareness, community elephant management, etc. – Develop and implement strategies based on the needs assessment – Standardise and harmonize training in law enforcement	Training needs assessment report Training programmes established	Inventory records / assets check list	2016 and ongoing		ZPWMA, RDCs, NGOs, Universities

Component 5: Coordination, collaboration and programme management

Output	Activities	KPIs	Means of Verification	Time frame	Indicative costs	Agencies
5.1 SEL Regional elephant conservation and management steering committee of 8 established (ZPWMA, SVC, MT, Bubi Conservancy, Chiefs' rep, GCP, ZRP, RDC) This committee should include a core set of competencies (and can co-opt expertise if needed).	– Develop TOR for the steering committee – Identify members – Oversee the implementation of the regional elephant strategy as per national mandate – Meet biannually – Attend national elephant management meetings	Functional committee meetings held biannually with adequate attendance	Minutes with action points	Established within 60 days of the Regional strategy final document	$1500 (Fuel, Accommodation) $3,000 (Biannual Meeting) National Elephant Management Meeting - Cost Sunk) Total Budget $4500.00	Regional Manager, Southern Region, ZPWMA
5.2 Links with neighbouring states to confer on the management of shared elephant populations strengthened	– GLTFCA coordinator to identify relevant stakeholders to participate in the implementation of the regional elephant action plan – Sustain collaboration with regional partners+(one committee member for the regional committee meetings) – Share knowledge / data of all 5 key components of the plan with the regional partners	Number of consultative meetings held Tangible regional collaboration and participation	Minutes and action items	Ongoing	-Sunk -*To get confirmation from the GLTFCA coordinator.* - 1xcommitte member travelling to SA or MZ MZ=$1440.00 SA=$1320.00 Zim=$1540.00 Total=$4500	Regional Manager, Southern GLTFCA Coordinator

Output	Activities	KPIs	Means of Verification	Time frame	Indicative costs	Agencies
5.3 Coordination between the tourism industry (consumptive and non-consumptive) and the elephant management programme strengthened	– Identify consumptive and non-consumptive operators in SEL – Liaise with SOAZ, ZPHGA, ZATSO, etc. – Encourage non-members to be affiliated to relevant associations – Hold quarterly meetings with operators – Consider scale of operations in non-consumptive tourism	Regular meetings and workshops convened with the operators	Record of meetings and workshop proceedings Database of operators	Immediate and ongoing	-Sunk -Sunk -Sunk -11 people x one night x 4 times/year= $3080 Fuel=$546x 4times=$2184 Total Budget=$5400	Regional Manager, Southern-ZPWMA ZPHGA SOAZ ZATSO
5.4 Effective information dissemination and communication strategy implemented	– Ensure clear communication of progress against action plan to all relevant stakeholders – Identify target groups, i.e. traditional leaders, school groups, amongst others – Develop a communications strategy, making use of relevant media (print, social, road shows) – Implement communication strategy – Monitor and evaluate	Outreach programmes conducted	Community strategy document Flyer, brochure, websites, published papers, videos, dramas	Ongoing	-Sunk -Sunk -Website setting, double side flyers and media, outreach costs=$10,000	Regional Manager, Southern Steering Committee

Nominations/appointment of regional elephant management committee,

As per the draft action plan, it was agreed that the regional elephant management committee should include representation from and that an interim committee should be established immediately:

- Bubi Valley Conservancy
- Gonarezhou Conservation Project
- Malilangwe Trust
- RDCs
- Save Valley Conservancy
- Traditional leaders
- ZPWMA
- ZRP

In order to move forward as quickly as possible, it was agreed that each agency would nominate an interim representative to Mrs. Tom, Regional Manager, Southern Region, ZPWMA by the end of day, 9 September 2015.

Next Steps

The following next steps were agreed:

- Write up of the proceedings completed by 18 September and circulated to all participants.
- Comments on draft proceedings provided to Diane Skinner by 30 September.
- Revised final report circulated by 7th October.
- Nominations for interim regional steering committee provided by Mrs. Tom by end of day 9 September, 2015
- First steering committee meeting to be held mid-October 2015.

Meeting closing

Mrs Doris Tom, Regional Manager for the Southern Region for ZPWMA, closed the workshop on behalf of the ZPWMA Director General. The full text of the closing remarks follows.

Ladies and Gentlemen on behalf of the Director General of Zimbabwe Parks Wildlife Management Authority, I would like to take this opportunity to thank you for all for your participating at the workshop to develop a regional Elephant Management Action Plan for the South Eastern Lowveld.

I am sure that you will all agree with me that these past two days have been very productive, educational and fruitful not only for us in the South East Lowveld but for other regions as well. This workshop came at a time when we are experiencing an upsurge in elephant poaching especially in Gonarezhou. We believe that with all the contributions and inputs from everyone, we will implement appropriate intervention strategies and other measures in order to improve elephant conservation in the region. I would like therefore to thank you all for leaving your busy offices to attend this workshop and for your invaluable contributions.

We feel greatly honoured by the presence of our local chiefs namely: Chief Tshovane, Chief Sengwe, Chief Gudo, Chief Mahenye and Chief Budzi. Tinotenda!

A special thank you goes to the Frankfurt Zoological Society through the Gonarezhou Conservation Project for mobilising resources and funding to hold this workshop, in

particular Hugo and Elsabe for their commitment and dedication to wildlife conservation in the region.

A warm thank you goes to our regional representatives from neighbouring countries for travelling all the way from South Africa and Mozambique to attend the workshop. We really appreciate your presence as we have benefitted greatly from sharing experiences.

To the Chair of the African Elephant Specialist Group of IUCN, Dr Holly Dublin, we feel greatly humbled that you took time from your busy schedule to come and offer expert advice on the development of an Action Plan for Elephant Conservation in Zimbabwe. We thank you very much!

To President of Conservation Force, Mr John Jackson III, we thank you very much for attending the meeting and for all your efforts and assistance in the development of an Elephant Management Action Plan at national and regional levels.

I would also like to thank the participants representing the following NGOs, African Wildlife Foundation and Save the Elephants, for attending the workshop.

At the local level, we would like to thank the following:

- Chief Executive Officers of Chiredzi, Bikita and Chipinge Rural District Councils,
- Representatives from law enforcement agencies,
- Save Valley Conservancy,
- Safari and tour operators from the region,
- The WILD Programme
- The Lowveld Rhino Trust
- WWF
- Chinhoyi University of Science and Technology
- Technical experts and representatives of Non Governmental Organisation,

We really thank you and appreciate your support.

To Malilangwe Trust and in particular to Mark Saunders and his staff, we sincerely thank you for the warm hospitality at Hakamela, Kwali and Simbiri Camps. We thank you and value your continued support in the conservation of not only the African elephant but other wildlife species in the region.

To the Facilitator, Dr David Cumming and the Rapporteur Diane Skinner, for their professionalism, dedication and guidance, a very special thank you!

To those whose names or organisations were not mentioned, it could have been an omission on my part and I apologise for that we value your support and participation at this important workshop. We thank you very much!

Last but not least, I would like to thank my colleagues, the Regional Managers, Chief Ecologist, Area Managers and other Parks Officers for participating at the workshop.

It goes without saying that your support towards the elephant conservation in the South East Lowveld and our country in general is highly appreciated and please continue the good work. I wish you safe travel back to your respective areas. I thank you! Tatenda! Siyabonga! Hikhesile!

Annex 2 – Workshop agenda

AGENDA
SOUTH EAST LOWVELD ELEPHANT MANAGEMENT ACTION PLAN WORKSHOP
Venue: Hakamela **Date:** 7th to 10th September, 2015

Day 1 – Monday 7th September

1230: Arrivals, registration and Lunch
1400: Introductions
1415: Welcome and Opening Remarks - DG - ZPWMA
1430: Objectives and purpose of the workshop
1435: Update on Poaching/anti-poaching in GNP and Chipinge - Area Manager
1450: Update on Poaching/anti-poaching in Chiredzi District (CAMPFIRE Area)
1500: Update on Poaching/anti-poaching in Save Valley Conservancy
1510: Results of the 2014 Aerial Survey for the South East Lowveld - Kevin Dunham
1525: Report on Kruger National Park - Danie Pienaar
1540: TEA/COFFEE
1600: **1st Working Session**: Stakeholder Analysis - who are the key stakeholders and actors and what are the links between them? (Plenary)
1700: **2nd Working Session** - Initial Problem Analysis - What are the key issues and the cause- effect relationships ships between them? (Within the 5 Key Components of the Framework)
1745: Break for the evening
1900: Dinner

Day 2 – Tuesday 8th September

0700: Breakfast
0800: Review of previous day's work
0815: **3rd Working Session** - Strengths, opportunities and core competencies within each of the 5 Key Components of the national framework and key stakeholder inputs (e.g. Hunting, Photo-tourism, Communities, ZRP/ZPWMA, NGOs) (Working Groups)
1000: Report back from Working Groups
1030: TEA/COFFEE
1100: **4th Working Session:** Develop Draft Strategic Action Plan with Indicators (Working Groups on key components)
1245: Lunch
1430: Report back from working groups
1530: TEA/COFFEE
1600: Further refinement of Strategic action plans
1730: Break for the evening
1900: DINNER
2000: Small working group – working plan synthesis

Day 3 - Wednesday 9th September

0800: Report back from small working group
0830: **5th Working Session:** Activities, responsibilities and Costs - Working Groups

1000: Report back from working groups

1030: TEA/COFFEE

1130: Report back to plenary by Working Groups and development of Action Plan, Indicators and responsibilities

1245: LUNCH

1400: **6th Working Session**: Final Development of Draft Strategic Action Plan with performance indicators, responsibilities

1530: TEA/COFFEE

1600: **6th Working Session** (continued), nominations/appointment of regional elephant management committee, and Next Steps

1645: **Closing Remarks - DG – ZPWMA**

1700: Break for the evening/participants depart

Day 4 - Thursday 10th September

0700: Breakfast

0800: **Departures**

Annex 3 – Stakeholder analysis

Local government
- Rural District Council
- Local Authorities
- CAMPFIRE Association

Communities
- Communities
- Traditional leaders

Operators
- Hunting operators
- Concessions in Mozambique on the eastern boundary of GNP
- Non-consumptive tour operators

NGOs
- SVC Trust
- Senuko and Clive Stockil
- FZS – Gonarezhou Conservation Project
- Malilangwe
- Nuanetsi
- BVC
- Malipati Development Trust
- AWF
- Conservation Force

Individuals
- Tourists
- Hunters
- Consumers - Ivory
- Consumers - Meat

Donors/international agencies
- German - KFW
- International regulatory agencies (CITES, USFWS, TFCA, etc.)

Government
- ARDA
- Central Government
- Politicians
- Judiciary
- Vet services
- Environmental Management Agency
- Forestry Commission
- Ministry of Lands
- Ministry of Environment, Water and Climate

Security
- Security Agencies
- ZRP
- Forensic Services
- JOC

International
- SANParks
- GLTFCA
- MZ ANAC

Other
- New farmers
- Cattle owners

Annex 4 – Strengths, opportunities and core competencies

	Law enforcement	**Biological monitoring and management**	**Social, Economic and Cultural Framework**	**Building Conservation Capacity**	**Coordination, collaboration and programme management**
Strengths	– Strong support legislation and sentences – Collaborative structures, e.g. JOC – Support from NGOs on anti-poaching units (GNP and Malilangwe) – Training capacity – Availability of resources, e.g. GNP and Malilangwe – Involvement of private sector, SVC – Support of local traditional leaders and communities – Successful CAMPFIRE programmes, e.g. Mahenye	Monitoring – Existing information – Existing expertise Biological – Growing elephant population – Historical strength in biological management of elephants – TFCA	– Viable source population, including unique value of large tuskers – Policy enabling to sustainable utilization, both consumptive and non-consumptive – Policy framework for devolution and benefit sharing – Intact community buffer areas – Strong tradition of conservation o cultural importance o traditional leadership o by-laws o All reinforced by institutional understanding of CAMPFIRE – Connectivity across broad landscapes (TFCA) – Strong community structures and institutions, local government and traditional – Examples of success – Safe and secure environment	– Available human resources – Existing infrastructure – roads, comms – Existing training institutions, e.g. Mushandikwe College of Wildlife Management in Masvingo – Established research centres and experts – Existence of CBNRM programmes – On-the-job training	– GLTFCA Steering Committee – Conservancies + MT – Natural Resources Committee at RDC level – GCP – Gonarezhou Conservation Project – Annual quota setting meeting – Future of hunting document – Member of CITES – Strong history of wildlife conservation in the SEL – dissemination and coordination – Information dissemination o GNP CLO o MT CLO o SVC CLO o Nuanetsi CLO o CRDC Chiredzi o Chipinge RDC
Weaknesses	– Weak cross-border collaboration, e.g. between MZ and ZW – Lack of manpower in PA and non-PA – Different land use options, e.g. cross-border and in SVC – Inadequate intelligence and inter-	Monitoring – Monitoring dead elephants, including hunting – Interpretation of information – Evaluation of information (when do we know and raise the flags on a problem)		– limited funding – limited new technology (GPS units, drones, etc.) – limited collaboration and coordination (research, law enforcement) – what happened to SELCO? And Greater Gonarezhou Ecosystem Forum? And LOCAL Forum? – Lack of employment	

	Law enforcement	Biological monitoring and management	Social, Economic and Cultural Framework	Building Conservation Capacity	Coordination, collaboration and programme management
	agency cooperation – Inadequate resources – Inadequate training in crime scene investigation	– Lack of information on elephant range – Lack of indicators on the consequences of our action – Lack of cross-border coordination on law enforcement, and on quota setting – Procedural constraints on research – HWC – Lack of transparent governance – Monitoring sources of mortality – PAC, poisoning, Quotas, etc. – Demographics is critical. – Understanding movements is also critical.		opportunities to gain experience / internship acceptance – Lack of incentive to learning / capacity within the communities – Fee structure for students to be in the Park is prohibitive – Need to rebuild the capacity in resource economics	
Opportunities	– Strengthen wildlife management outside PAs – GLTP / GLTFCA initiatives – collaboration – International and regional support of wildlife conservation – Public-private partnerships – Cultural value of wildlife	Monitoring – Research – Understanding spatial drivers in elephant management – Performance based funding – Performance based funding opportunities – Exploiting non-traditional funding opportunities, e.g. Carbon Biological	– Untapped potential o Diversification of revenues ▪ consumptive - increasing number of species ▪ non-consumptive – selfdrive, volunteer, fishing, walking, high-end, cultural, etc. ▪ live sales ▪ non-timber forest products ▪ eco-credits (e.g. REDD+)	– Existing private sector players and potential for new ones – Existing strong partnerships and potential for new ones – Well-educated resource base	– CAMPFIRE – Regional Liaison – TFCA – JOC – collaboration – Crime Consultative Committees – chaired by ZRP – NGO – AWF, LRT, WILD, PARSEL, Malilangwe Trust, WWF, Conservancy Trust, GCP – Raoul – need to collaborate more

	Law enforcement	Biological monitoring and management	Social, Economic and Cultural Framework	Building Conservation Capacity	Coordination, collaboration and programme management
		– Creating linkages that provide benefits to humans and elephants – Integrated elephant space management, e.g. performance-based hunting quotas in CAMPFIRE areas	○ Access and marketing – regional and national ▪ Infrastructure, flights, regional tourism ▪ Tapping into national tourism potentials, while increasing awareness of South East Lowveld ▪ Border post at Pafuri ▪ Big Tuskers ○ GLTFCA and regional conservation / tourism / NR management – Increased natural resource value – elephant management offtakes, value of tourism – Increased management and development of wildlife areas, to increase revenue and sustainability – multi-stakeholder PPCPs. – Marketing and awareness of working examples – Monuments		with other development agencies – integrated approach from aid agencies – need to think long-term.
Core competencies	– Coordination and partnerships – Skilled manpower – Adaptive management			– Shared vision, e.g. GLTFCA – Expertise and institutional arrangements available, e.g. law enforcement, aerial survey, CBNRM – Political support / local leadership – Resilience	– vast experience in coordination and collaboration through the TFCA framework

Annex 5 – Comments received following the workshop

Following the workshop, Sam Ferreira provided some suggested measures that focused on the effectiveness and outcomes achieved at the end of the five-year lifetime of the plan if most outputs were achieved.

Key Component 1: Protection and Law Enforcement

1) Poaching is not a key driver of elephant dynamics
2) Crime indices in and around protected areas are low or declining

Key Component 2: Biological Management and Monitoring

1) Elephants have a low local extinction risk
2) Elephants use landscapes with variable intensity
3) The ecological impacts of elephants vary across landscapes

Key Component 3: Social, Economic and Cultural Framework

1) Incidences of human-wildlife conflict is low or declining
2) Human wellbeing indices are high or increasing
3) Elephants are an important contributor to human wellbeing

Key Component 4: Building Conservation Capacity

1) Fulfilled capacity needs are increasing

Key Component 5: Coordination, Collaboration and Programme Management

1) Stakeholder awareness of implementation and results are increasing.

CC: Marco Pan (b) (6) <[redacted]>, Regina Lennox <regina.lennox@conservationforce.org>

Dear John,

MAPP have recently been asking Zambezi Elephant Fund for support to fund Enock Muziringa, ex Prosecutor from Kariba who has taken on the work of collation of all the results from the action in the field. This is it.

This is for one month only, and a very fine start.

I have by email advised Kevin Higgins that USD500.00 is available to the key informant which led to the arrest of the ivory poacher from Conservation Force.

This is a very good start to 2016.

I do not know to whom Kevin has sent this onto at Parks and will leave that to him to conclude.

Best wishes
Lynne

Fishing Without a Permit	1	1	-	Issued ticket number 0094873	Axxd: Takesure Siazemba of Musamba Fishing Camp Sentence: $10-00 Fine

Fishing Without a Permit with 400M twine Nets	1	1	-	Issued ticket number 0094877	Axxd: Tonderayi Munhezhu of 23 Chalala Fishing Camp Sentence: $20-00 Fine 13Kg fresh fish recovered
Fishing Without a Permit	1	1	-	Issued ticket number 0094878	Axxd: Knowledge Samuel of 23 Chalala Fishing Camp Sentence: $20-00 Fine

Crime Appreciation

Two new cases involving ivory were dealt with by Police with the direct assistance from Mapp and National Parks. Two groups of poachers were arrested and a total of three accused persons were convicted and sentenced to 9 year jail terms each.

Two accused persons were arrested for possession of 200 x 26m twine nets in contravention of section 91(b) of the parks wildlife Act. The accused were rightfully taken to Kariba Magistrate court where they were properly convicted and sentenced. Another accused was also arrested by a patrol team but unfortunately he was not referred to court and was made to pay $20-00 fine which is not deterrent considering that he had 400 metres of twine nets.

A total of six cases of illegal fishing in Lake Kariba were dealt with and all the cases were dealt with at Police station level. The accused were made to pay deposit fines and left free. One case of illegal possession of a .303 was dealt with but accused is still outstanding. The firearm was recovered from accused's home while he was away. It had no valid licence and a bridge block was missing. Accused is a known poacher and could have been using the firearm. The Police are investigating for further links to other crimes through ballistics.

Stakeholders responded positively this month by answering to my plea for returns so that we capture all relevant information. The crimes are projected to escalate considering the state of affairs economically and the prevailing drought. More patrols are called for since more people are resorting to poaching to augment their food supplies.

The cooperation that we are getting from Kariba Magistrate Court cannot go without special mention. The Kariba Court team is awesome and dedicated to their duty to an extent of foregoing their lunch break in order to complete these poaching cases. Simpler cases are taking long to complete in other courts which I think is being attributed to by less visits to those courts due to distance and transport. However the solution

to this problem would be to utilise the Kariba court more. I am pleased to advise you that most cases of interest are being referred there where the results speak for themselves, **convictions, convictions and less acquittals.**

RECOVERIES

IVORY	FIREARMS	FISH	TWINE NETS	BOATS	OTHERS
23.5 KG	1 X .303 RIFLE	57 KGS	600 METRES	3 DINGHIES	1200 M NYLON NETS

WISHING YOU ALL A HAPPY AND PROSPEROUS NEW 2016

Best regards.

Enock Muziringa.

Subject: RE: News coverage -- Namibia and Zimbabwe -- losses from anti-hunters
Date: Mon, 30 Nov 2015 19:09:27 +0300
From: Alistair Pole <(b) (6)
To: 'John J. Jackson, III' <jjw-no2@att.net>
CC: 'Regina Lennox' <regina.lennox@conservationforce.org>, 'Marco Pani' (b) (6)

Hi John,

A cabinet sub committee was established to deal with the poaching crisis in Zimbabwe, particularly surrounding the on going use of cyanide.

The Permanent Secretary asked if we could help organise a small conference with stakeholders to discuss which we agreed to do. We managed to persuade them that the poaching is a symptom and that if we do not address the wider issues of devolved authority over natural resources and benefit sharing then we will continue to fight these issues.

It was a very positive meeting involving three Ministers (Environment, Tourism and Rural Development) and the Perm Sec from Agriculture. Attached is the presentation that I gave (the article is not very accurate but come to expect that from journalists....) and also a short brief someone wrote up for AWF internally.

Best

Alistair

26 November 2015
New Era (Windhoek)
Southern Africa: Anti-Hunting Lobbyists Cost Namibia Dearly - Shifeta
Minister of Environment and Tourism, Pohamba Shifeta, says that anti-hunting lobbyists cost the Namibian government US$650 000 last year after pressurising the United States government on the legal auction of a black rhino hunt.
Shifeta said the hunt received negative publicity from people who did not understand the principle of conservation through sustainable utilisation.
"The permit sold for US$350 000, but could have generated more than US$1 million, which was in fact the offer on the table as confirmed by Dallas Safari Club, but which was withdrawn shortly before the auction due to pressure from anti-hunting lobbyists.

"One could therefore say that the lobby groups cost Namibia's Rhino conservation initiative US$650 000, as the total proceeds from the auction were earmarked to go to the Namibia Game Products Trust Fund and would have been distributed among a number of rhino conservation projects," said Shifeta at the 42nd Annual General Meeting of the Namibia Professional Hunting Association (NAPHA).
Shifeta explained that scientists from his ministry select mature, post-reproductive Black Rhino that have previously been identified as overtly aggressive and which pose a serious threat to herd growth and sustainability for the hunt.
"Such animals often charge and kill younger bulls, cows and also calves. These facts are well substantiated, and are very much at the core of our ministry's strategic effort to reduce natural herd mortality," said Shifeta.
Meanwhile, the hunt for the identified black rhino was delayed due to the hold-up for more than a year of the issuing of an import permit for the Black Rhino trophy because of pressure by animal rights activists on the U.S. government.
"During that period the bull, which had been scientifically select to be hunted had killed another black rhino. The non-hunters did in fact not only cost our country's conservation efforts hundreds of thousands of US dollars, but also the life of an additional Black Rhino," said Shifeta at the AGM, which ended at a local hotel yesterday.
Shifeta explained that Namibia is a pro-wildlife country with a progressive national constitution that has formally enshrined the sustainable utilisation of living natural resources.
"We are a hunter-friendly nation with a very proud hunting heritage, and our trophy hunting community is well respected by our government and fellow Namibians as an essential and integral part of Namibia's wildlife conservation, tourism, agricultural and business sectors," the minister said.
He said trophy hunting currently provides more on-the-job training and promotional opportunities, as well as pays better salaries than any other form of agricultural land employment options, and invests

heavily in a variety of social upliftment and educational programmes in rural areas throughout Namibia.
Namibia is firmly established as one of Africa's most popular hunting and tourism destinations, and all reports indicate that 2015 was again an excellent year for the local hunting and conservation community.
However, Shifeta warned that trophy hunting was currently threatened by a number of factors, exacerbated during the last five months by the unfortunate saga of Cecil the lion in Zimbabwe. This anti-hunting sentiment, said Shifeta, is fuelled by rabid anti-hunter sentiments based on emotion rather than fact. These had spread like wildfire on both social media and international news.
"The hype has humanised the lion and demonised the hunters. Zimbabwe, like Namibia, has a sound wildlife management policy in place, which provides rural communities with an incentive to protect their valuable natural living resources. It is up to each and every one of us to raise our voices as enthusiastically as the anti-hunting community does, in order to promote the concept of sustainable hunting as the ultimate conservation triumph," he said.
Namibia is recognised as a world-leader in conservation, with specific focus on rare and endangered species such as the Black Rhino. The Convention on International Trade in Endangered Species (CITES) has granted Namibia an annual export quota of up to five hunter-taken Black Rhinos.
"Only post-reproductive males are hunted, and the revenue derived from such hunts is reinvested in Rhino management, including addressing challenges such as poaching, which is a real threat to Rhinoceros all over the world, and increasingly so in Namibia," noted Shifeta.

Financial Gazette (Harare)
Zimbabwe: Poachers Cost Zimbabwe U.S $3 Billion
By Shame Makoshori
ZIMBABWE lost about 24 000 elephants to poachers over the past 20 years, prejudicing the hard currency starved economy of an estimated US$3 billion in sport hunting fees alone, the Financial Gazette can report.
Poachers have become a menace within Zimbabwe's animal sanctuaries where they are running rings around a poorly resourced Zimbabwe Parks and Wildlife Management Authority (ZPWMA).
Elephants have been their main target, as poachers seek to satisfy an insatiable demand for ivory, skins, bones and other jumbo parts in some parts of the world.
The vast Asian market tops the list of destinations where elephant products are in huge demand.
Statistics from Africa Wildlife Foundation, whose mission is to ensure the continent's flora and fauna endure forever, suggest that an estimated 1 200 elephants are killed by marauding poachers every year.
This has been the trend from 1995 to date.
Cumulatively, a whooping 24 000 elephants have been killed inside two decades, bringing home a sad reality that the parks authorities have grappled with over the years.
These giant mammals were either gunned down, poisoned or killed through other means.
If one were to use an elephant's sport hunting price of about US$120 000, what that means is that Zimbabwe has been losing revenue at the rate of US$144 million annually.
Progressively, nearly US$3 billion has been lost over a period of 20 years.
Alistair Pole, Africa Wildlife Foundation's director of lands and conservation in Zimbabwe, called for urgent action to save the elephant specie.
For the country's conservation efforts to make an impact, Pole believes that Zimbabwe cannot go it alone without support from international agencies.
"We have been losing a lot of elephants in the past 20 years," he told delegates attending a stakeholders' conference convened recently to explore measures to combat wildlife poaching in Zimbabwe. [***What conference was this? Seems like something we should tell FWS about!***]

"A census in the Zambezi Valley showed there were 19 000 elephants in 2001. There are now 12 000 elephants, that is a loss of 7 000. The real loss is about 20 000 to 24 000 elephants," he said before posing a question: "Where are the elephants going?

Elephants across the African continent face the threat of extinction in the next 50 years amid soaring demand for ivory from Asia, according to the World Wildlife Fund.

Zimbabwe has a large elephant population of about 100,000, but the number has sharply declined in recent years.

The population in the northern Sebungwe district has dropped 75 percent since 2001 -- from 14,000 to 3,500 -- while the number of elephants in middle Zambezi Valley complex fell 40 percent to from 18,000 to 11,500, according to the Zambezi Society, a local conservation group.

In Zimbabwe, reports suggest that poachers are moving away from traditional ways of using firearms to kill wild animals.

In recent times, poachers have been spiking food and water with cyanide and leaving it as bait for the pachyderms.

The chemical is commonly used in Zimbabwe's mining industry, making it relatively easy to obtain.

Poachers began using the poison in 2013, when as many as 300 elephants died in Hwange National Park from salt pans laced with cyanide, according to elephant conservation groups.

Zimbabwe has a large elephant population of about 100,000, but the number has sharply declined in recent years.

Many vultures also died after feeding on the poisoned carcasses.

Also worrying to conservationists are reports that rangers have turned into accessories to poaching.

The country's rangers work under harsh conditions, without enough equipment to take on the increasingly sophisticated poaching syndicates, and also not being adequately remunerated.

It is these poor working conditions that could be fuelling the sharp rise in corruption within the national parks, as rangers are alleged to be assisting poachers to kill elephants for a fee.

Most of these rangers are employed by the ZPWMA.

There are also indications of more sophisticated syndicates conspiring to deplete the country's elephant herd.

Pole said the future of Zimbabwe's wildlife is not looking good unless authorities adopt a multidimensional approach to stemming the scourge.

"It is a bit sick. We have to diagnose the core problem and create a healthy wildlife sector. If we don't create a situation where communities benefit we are fighting a losing battle. We also have rhino poaching that is going on," he noted.

The amount of revenue the country is losing is much higher if losses from other animal and plant species were to be included.

Oppah Muchinguri-Kashiri, the Minister of Environment, recently said government was working around the clock to raise funding to protect wildlife.

The Environment Minister also raised concern over the country's ivory stockpile which is continuing to rise from many sources such as problem animals control and natural death.

Poachers have been spiking food and water with cyanide and leaving it as bait for the pachyderms.

"The crisis poses serious development, environmental and security challenges. It is pushing endangered species towards extinction. There are 83 000 elephants, and a large number of them continue to be prey to poachers," she said.

The country has stockpiled about 78 000kg of ivory worth US$12 million, mainly from natural deaths.

In July, wildlife officials in Zimbabwe requested the United States to reverse a ban on ivory imports it implemented a year ago citing concerns about the sustainability of the country's elephant population.

Zimbabwe's elephant-hunting industry generates US$14 million a year and helps control the population of 97,500 species that trample over trees and farmers' fields.

Presentation Ministers Committee - 12 Nov 2015.pptx	13.9 MB
Ministers Meeting (002).docx	19.7 KB

STAKEHOLDERS CONFERENCE ON MEASURES TO REDUCE WILDLIFE POACHING IN ZIMBABWE (MINISTER'S MEETING)

A Stakeholders Conference focused on measures to reduce wildlife poaching in Zimbabwe took place on 12th November in Harare. The meeting was called by the Minister of Environment, Water and Climate (Minister Mrs. Opah Muchinguri-Kashiri) as chairperson of a multi ministerial cabinet committee established to look into the current poaching crisis. AWF agreed to fund and organise this important conference. In attendance was the Minister of Environment, water and Climate; the Minister of Tourism and Hospitality and the Minister of Rural Development, Preservation of Culture and Heritage. Other delegates included the Permanent Secretaries from the Ministries of Environment and Agriculture, representatives from the Zimbabwe National Army, the Air Force, the Zimbabwe Republic Police, Rural District Councils, NGO's, industry and civil society. We were told to expect 60 people but a total of 95 people showed up. OPAH MUCHINGURI-KASHIRI took over the portfolio from Saviour Kasukuwere about 6 months ago, and so far she is being very open and reaching out for advice and input. As such everyone was relaxed, open and willing to participate. Some very pertinent aspects from poaching, management of the wildlife industry, the hunting and tour operators, Zim Parks and above all the communities' benefits were all discussed and solutions sought for each situation.

The Minister of Tourism gave an excellent presentation where, amongst other things he highlighted the dependence of the tourism industry in Zimbabwe (and Africa at large) on wildlife. He spoke about the fact that the country so far benefits just around 7% from Tourism, because maximum efforts have not been put to setup the tourism sector in the country. But that henceforth things will have to change, first by everyone uniting to fight poachers and also by ensuring Zimbabwe is known by the big international countries as a destination worth visiting.

Alistair was also one of the presenters and the main focus of his presentation was on the need to devolve authority to allow a vibrant wildlife industry to develop. He highlighted the need for the benefits from living with wildlife to outweigh the costs for both communities and private sector. Communities have to be given a greater sense of ownership or custodianship over their natural resources and that is the only way they will have an incentive to protect it.

Recommendations

- war has been declared on poachers
- To address the concerns of rangers on the ground by making donations for resources including food, water, bag packs, etc.
- Build trust among each other to tackle issues such as sports hunting, etc.
- Address the campfire situations affecting communities and also ensure they are benefiting from the industry, so that they are not helping poachers.
- Form a core team of all stakeholders and send them to neighbouring Botswana and Namibia where it is working for them to see how it's done and bring back findings for implementation in Zim. AWF is very much involved too as they assist with the funding too.
- There had been talks on the need to reform parts of the hunting industry in a workshop earlier in the year (prior to Cecil) and presently it is mostly just a case of implementing the

The minister requested that if possible these meetings be held once every month, or once in three months so that the points raised are continuously reviewed and corresponding actions taken towards their

fulfillment. This means that the future of the Wildlife Industry in Zimbabwe seems to have just risen from a very long slumber and everyone is ready to move.

This was the very first meeting of its kind and there is promise of significant changes and positive results for Zimbabwe's wildlife. Also the collaboration between the Ministers of Environment and Tourism was very encouraging, something that has not happened for a very long time. Our fingers are crossed and we will keep pushing for things to keep going forward from this point on in Zimbabwe as far as the wildlife Industry is involved.

What are next steps for AWF and Zimparks?

At the request of the permanent secretary in the Min. of Environment, Alistair who is the Director for Land and Habitat Management, AWF established an advisory committee for him and the Minister called the environment and wildlife advisory committee (EWAC). This committee has as members Alistair Pole as chairperson and other prominent people in the environmental industry including Clive Stockil, Prof. David Cumming. Daudi Sumba, vice president for program Design and Public relations, AWF was present and took part in the inauguration of this committee in Zimbabwe. Also, AWF has agreed to provide some basic funding for the operations of this committee. All this is helping to give AWF more footage as advisor with the Ministry of Environment and technical support with Zim Parks for increasing influence in Zimbabwe.

Overview of the Wildlife Industry and Issues for Zimbabwe

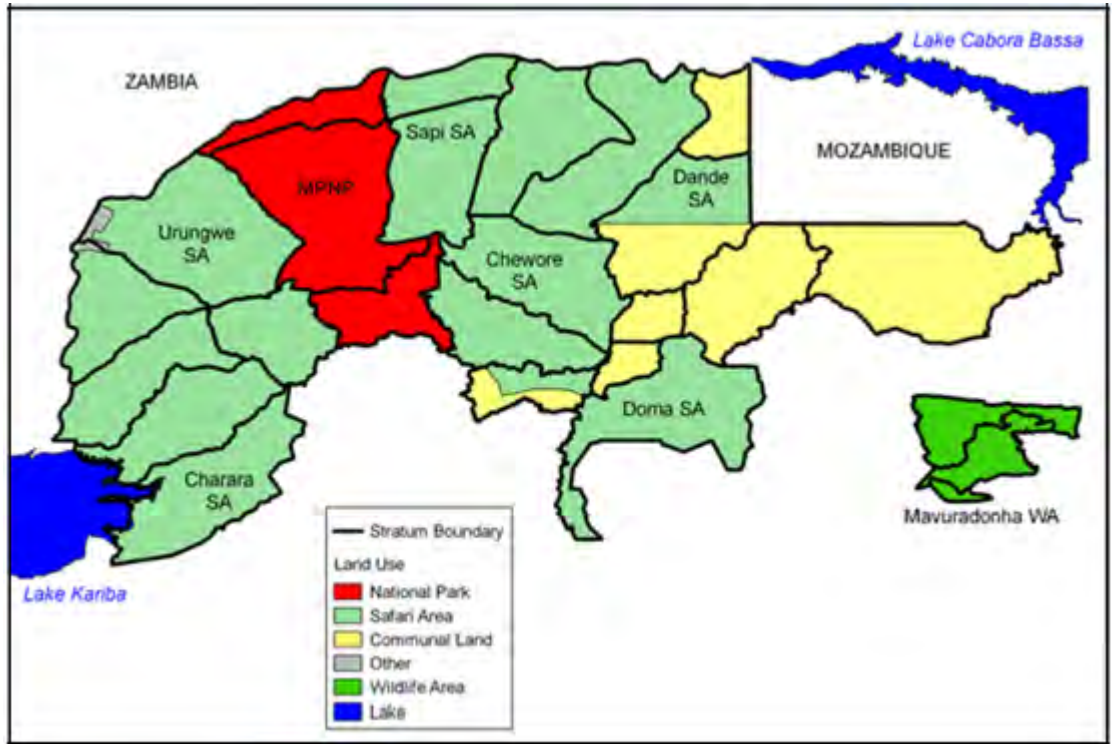
AFRICAN WILDLIFE FOUNDATION®

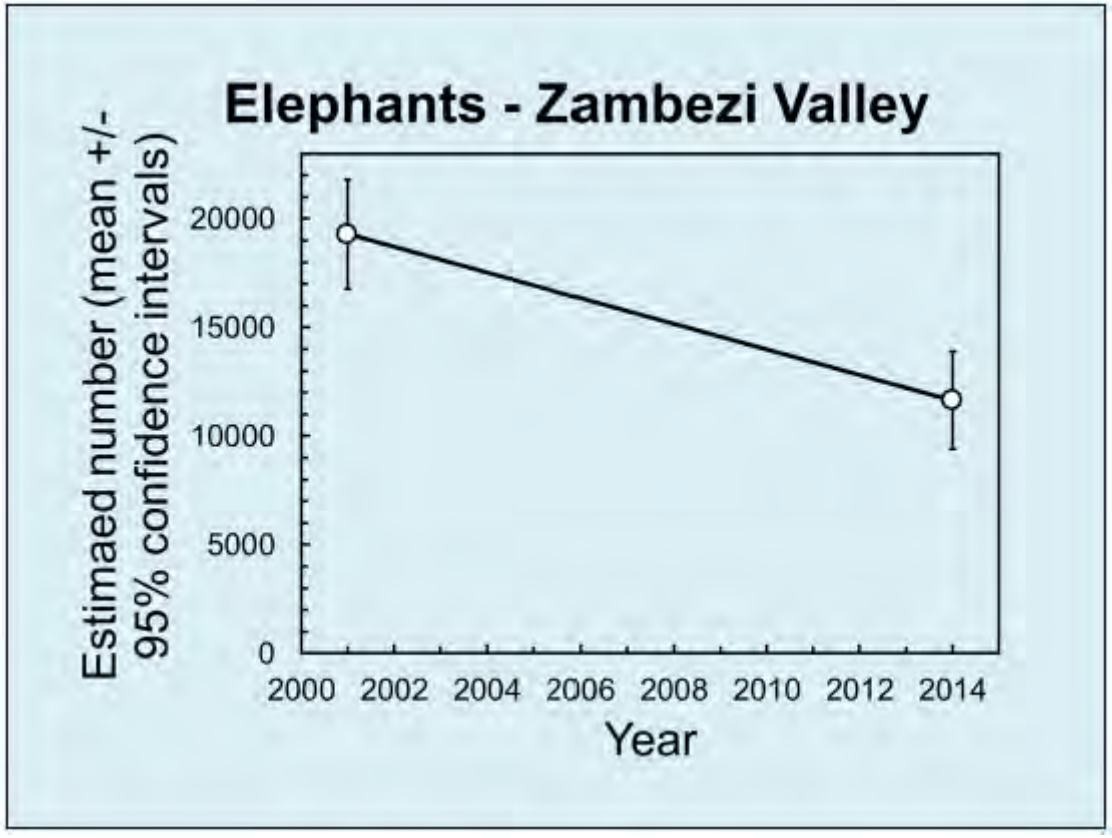
Environment and Wildlife
Advisory Committee

1. Immediate intervention which aims to catch, prosecute and deter poachers and poaching

2. Create the right environment for communities, private sector and the nation at large to benefit from the wildlife resources so they are seen as assets

Immediate Interventions





Population decreased by 7000 over 13 years

Add in expected population growth, the loss is anywhere from **20,000 to 34,000** elephant

CRIME SCENE DO NOT CROSS

Information is the most effective investment of funds and time in anti-poaching efforts

Well trained and equipped ‘Boots on the Ground’

Technology can play an important role in improving effectiveness but can also be a distraction – Be careful!

Treating a Symptom

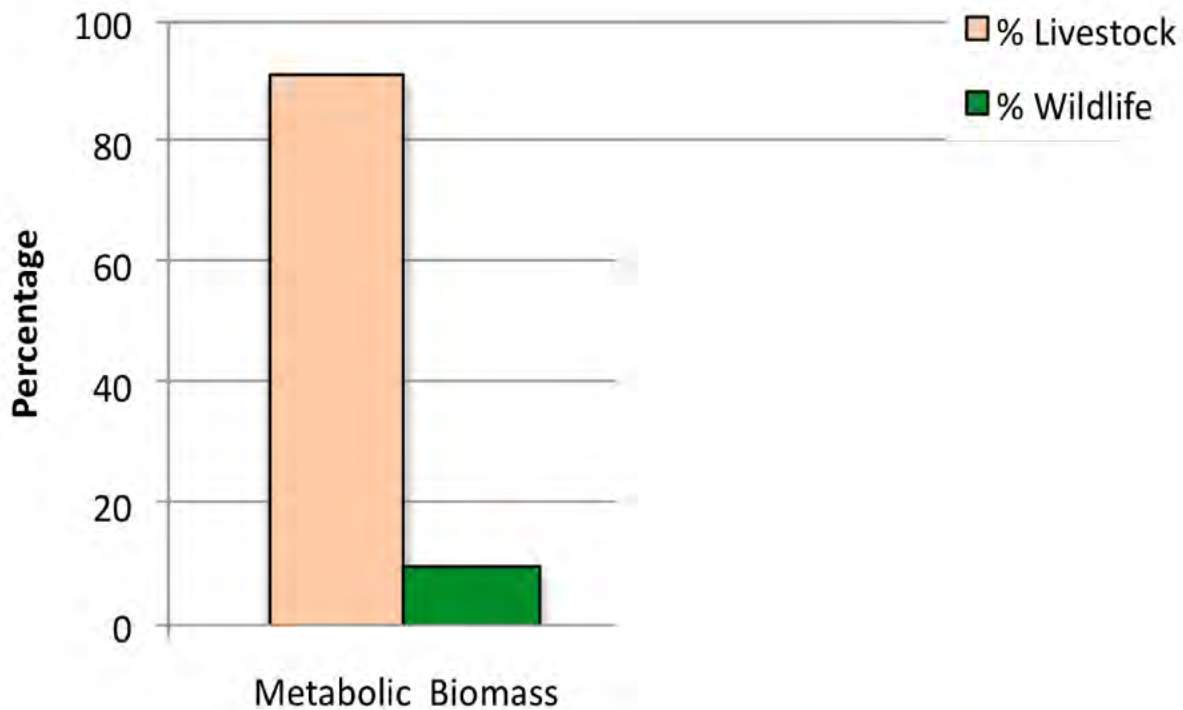
For the long term, we have to diagnose the core problems and create a **HEALTHY** wildlife sector

Wildlife has to be seen as a resource in which the benefits generated are **greater** than the costs.

Cost Benefits of Wildlife

- There are very real costs to living with Wildlife
- Very few countries have achieved benefits from wildlife at the local level that are greater than the costs incurred.
- Centralised control and ownership has largely failed
- In Africa, the only countries that have achieved increasing wildlife populations are those that have empowered communities and landowners as **custodians** of the wildlife with broad **user rights**
- Only three countries in Africa have achieved increasing wildlife populations in last 30 years: South Africa, Namibia, Zimbabwe

Contribution of domestic & wildlife large mammal biomass to GDP in Southern Africa



Rates of growth:

Livestock 2 – 3% pa Nature based tourism 5 – 15% pa

Support to Livestock > wildlife sector

Why do we place so many restrictions on the production and trade of wildlife as a resource?

SOUTH AFRICA

- In 1960, 557,000 large mammals were counted in the whole of South Africa
- There were only 3 operating private game farms.
- Today in 2015 the total “National Wildlife Herd” counts closer to 25 million animals.
- This indicates an annual growth rate of 7.2%
- Game Ranches cover 16.8% of land mass (National Parks 6.1%)
- Industry is estimated to be worth R10 billion
- 20% of red meat eaten in SA is game meat

Map production:
October 2014 by Natural Resource Working Group/NACSO

- Introduced new legislation in 1996 which gave use rights to communities
- Land under wildlife in Namibia now stands at **44%:**
  - 19.8% communal conservancies (161,900 km²);
  - 16.8% National Parks (136,800 km²);
  - 6.1 % Freehold conservancies (34,600 km²);
  - 0.8% State Tourism Concessions
- Conservancies directly support 189,372 people or 8.1% of the country's population.
- The elephant population has grown from 7,500 in 1995 to over 20,000 today;
- Largest free ranging population of black rhino outside National Parks

Zimbabwe – A Historical Leader

- One of the first countries in the world to develop local custodianship of wildlife with user rights
- Initially benefitting the private sector
- In 1981, CAMPFIRE programme drawn up
- 7 years later, in 1989, it was finally approved
- The success of the 1975 Parks Act and CAMPFIRE created a model that many other countries have emulated

Zimbabwe – What was Achieved?

- 27,000km^2 of private land under wildlife by 1999
- Over 90% of RDC's had a CAMPFIRE programme by 2000
- Over 35% of Zimbabwe's land mass was actively involved in wildlife
- Wildlife sales were common
- We were exporting wildlife to neighbouring countries

Zimbabwe - Decline

- Statutory Instrument 26 of 1998
- Failure of CAMPFIRE to ensure benefits reaching communities
- Missed opportunities within the Land Reform Programme

Zimbabwe – The Future

Reinstate a level of custodianship over wildlife to the local level and give communities and land owners broad user rights

Policy review

We need to review the needs and efficiencies of:

- Private Wildlife Sector
- Community wildlife Programmes
- PWMA

Brave Leadership

Do not let the few that break rules prevent the majority from benefitting

There is
ENORMOUS
Potential

Dear Tim,

Attached please find an analysis of income to CAMPFIRE districts from safari hunting, with elephant hunting broken out separately.

The graph on page 5 reflects reduced income from hunting in 2014 compared to 2012 and 2013, and the chart on page 7 reports reduced quota utilization.

Please let us know if you have any questions.

Kind regards,

Regina

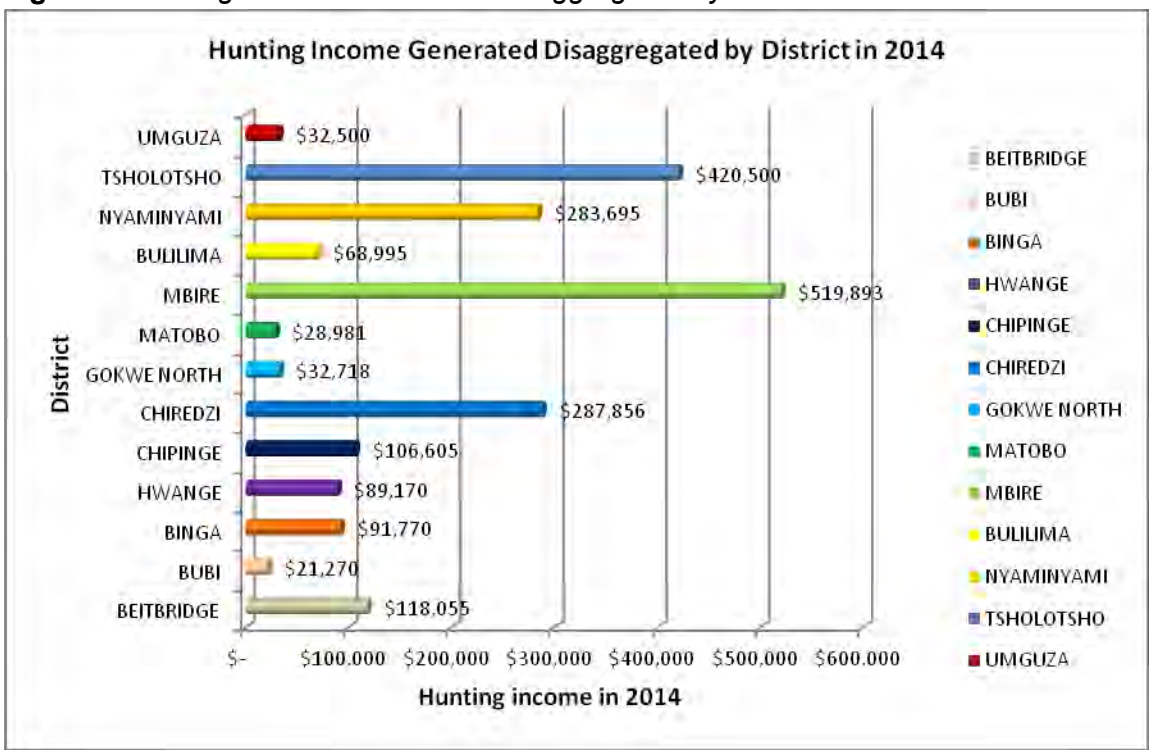
CAMPFIRE HUNTING INCOME AND DISTRIBUTION

The information in this report is based on verifiable CAMPFIRE district records as at 30th October 2015. Contact campfire@ecoweb.co.zw

Income Generated from Hunting

In 2014, Community Areas Management Programme for Indigenous Resources (CAMPFIRE) generated a total net hunting income of US$2,102,007 in 13 districts of Zimbabwe that hunt most species, including elephant. The income generated disaggregated by district is shown in Figure 1. Bubi district recorded the lowest income of US$21,270 whilst Mbire district had the highest amount of US$519,893. Average income generated per district in 2014 is US$161,692.85.

Figure 1: *Hunting Income Generated Disaggregated by District in 2014*



The major hunted species is elephant, which contributed 54% (US$1,138,375.09) of the total income. Only Matobo district did not generate any income from elephant hunting, with Hwange district getting 100% of its income from elephant as shown in Table 1.

Table 1: *Income generated by Elephants vs. Total Income; and Percentage Income*

DISTRICT	Total Income	Income from Elephants	Percentage Income
Beitbridge	118,055.00	60,600.00	51%
Bubi	21,270.00	16,000.00	75%
Binga	91,770.00	30,000.00	33%
Hwange	89,170.09	89,170.09	100%
Chipinge	106,604.52	27,000.00	25%
Chiredzi	287,856.00	226,500.00	79%
Gokwe North	32,717.50	4,000.00	12%
Matobo	28,981.00	-	0%
Mbire	519893.00	161,405.00	20%
Bulilima	68,995.00	53,000.00	77%
Nyaminyami	283,695.00	59,200.00	21%
Tsholotsho	420,500.00	381,500.00	91%
Umguza	32,500.00	30,000.00	92%
Total	**2,065,161.61**	**1,072,170.09**	**54%**

Distribution of Income Generated from Trophy Hunting

All income generated was distributed to three constituencies, namely (a) Communities; (b) Rural District Councils (RDCs) and (c) CAMPFIRE Association (CA). Figure 2 and 3 show the income and percentage distribution to three beneficiaries. The biggest chunk (52%, close enough to the prescribed 55%) of the hunting income went to the communities, in line with the CAMPFIRE objectives of ensuring that communities in hunting areas must be the biggest beneficiaries of hunting income. Councils also earned a significant percent of 44% (against 41%), for field patrols, monitoring of hunts, problem animal control, water, and fire management, and this represents major income to some council budgets that have a limited income base for district development (Mbire, Nyaminyami, Tsholotsho, etc). CA received 4% of the total income to cover administration costs and representation of the programme.

Figure 2: *Total Hunting Allocations to Communities, Councils and CA in 2014*

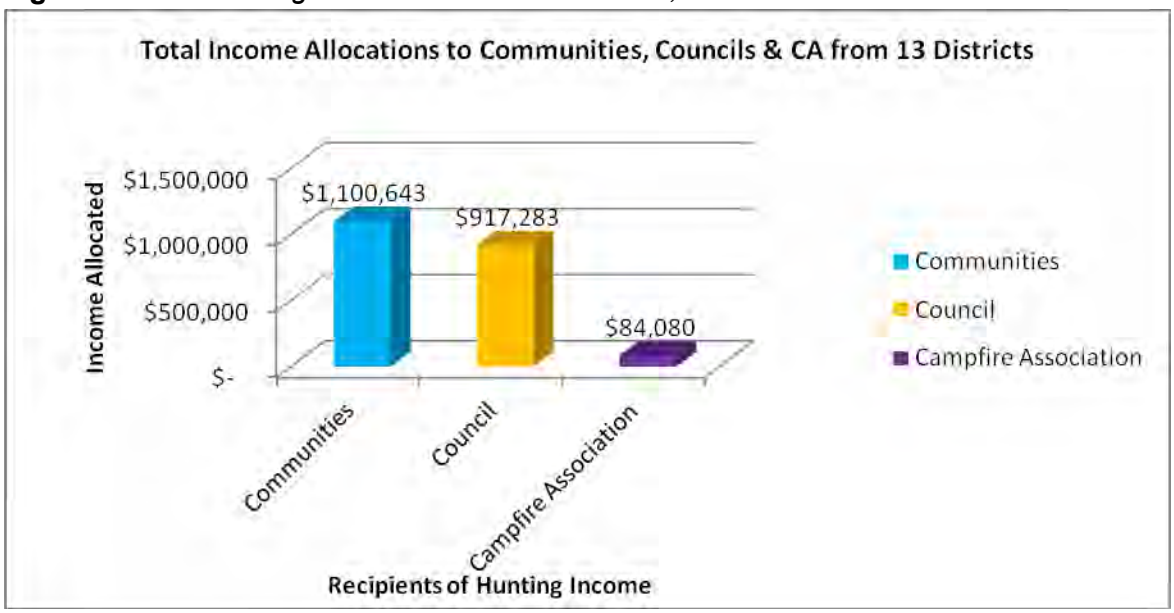


Figure 3: *Percentage Distribution of the Hunting Income in 2014*

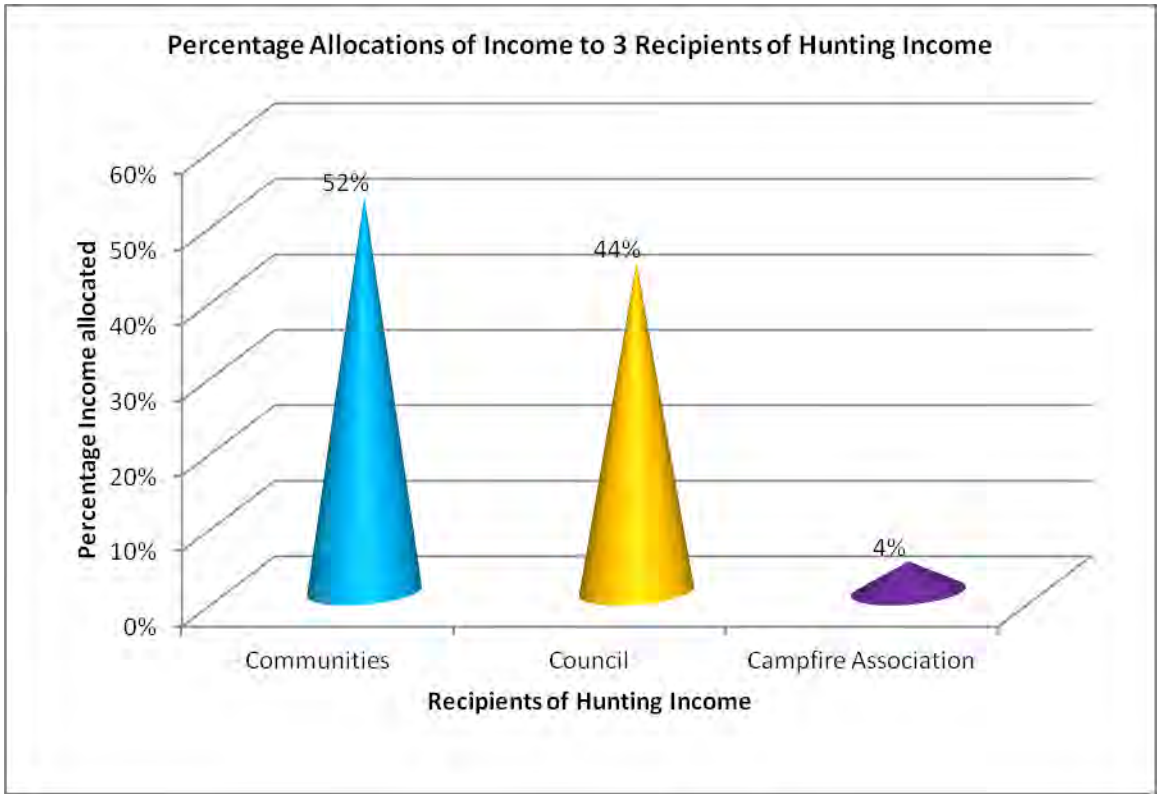

Hunting income distribution proportions to the 2 recipients (Communities and Councils) varies from district to district. Communities got the highest allocation of hunting income in Tsholotsho and Umguza districts, with the communities getting 60% and Councils 36%. In 4 districts,

namely Bubi, Binga, Hwange and Chipinge, communities got 55% and council 41% of the hunting income. In 5 districts namely, Chiredzi, Gokwe North, Matobo, Mbire and Bulilima communities got 50% and councils 46%. In Nyaminyami, communities (49%) got slightly above Councils (47%), to due a temporary suspension of CAMPFIRE Revenue Sharing Guidelines by the district. Finally, Beitbridge is the only district in which the Council's (53%) was more than communities (43%), a major departure from CAMPFIRE Revenue Sharing Guidelines. The income distributed in each of the districts and the percentage allocations per district are shown in Figure 4 and 5, respectively.

Figure 4: *Hunting Allocations in 13 Districts to 3 Beneficiaries*

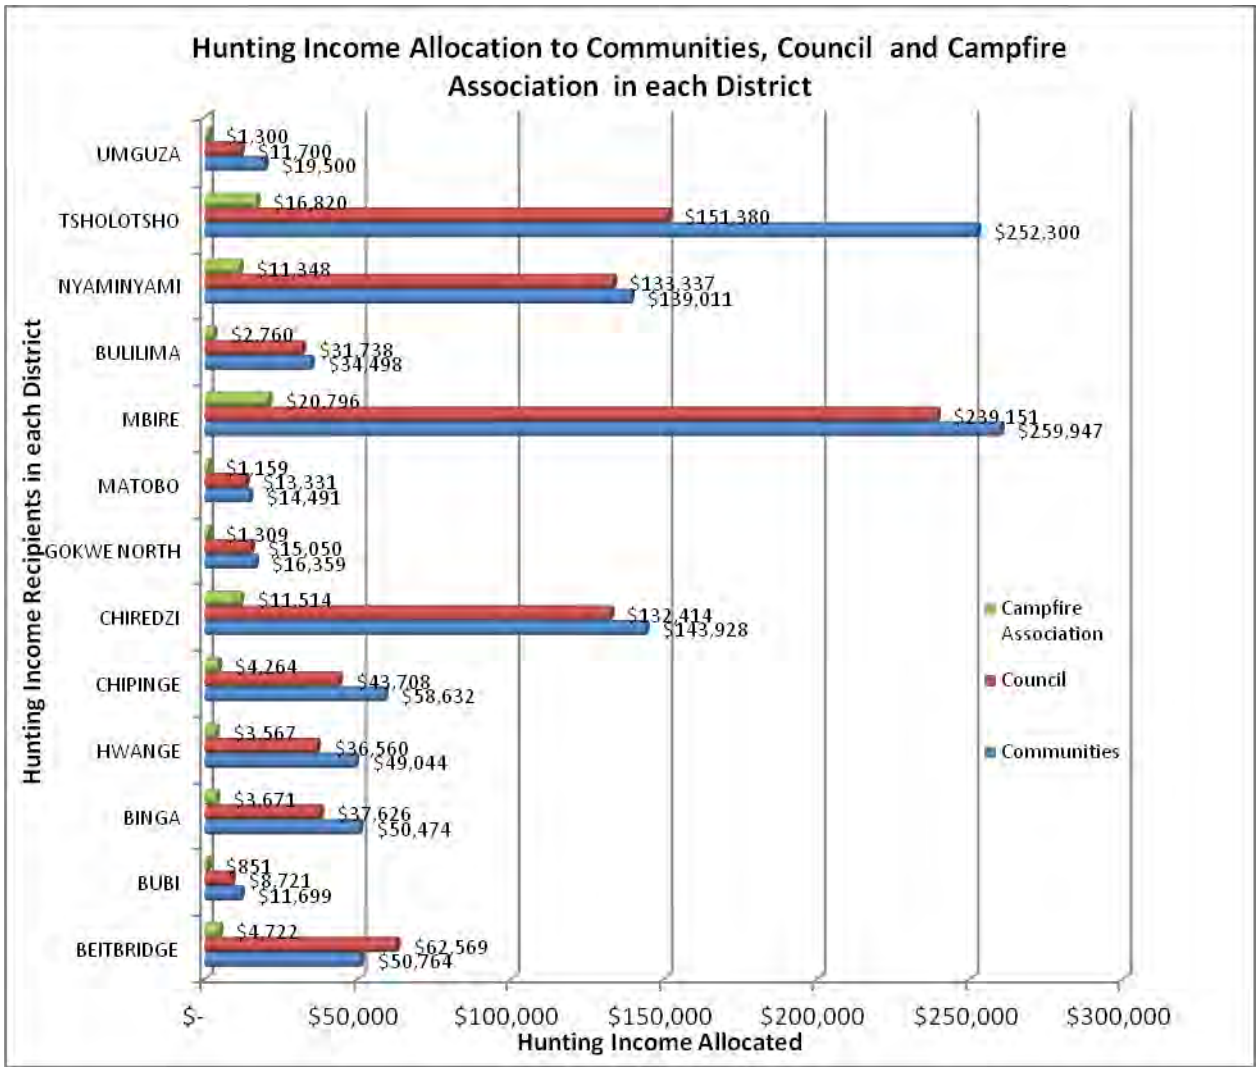

Figure 5: *Percentage Hunting Allocations in 13 Districts to 3 Beneficiaries*

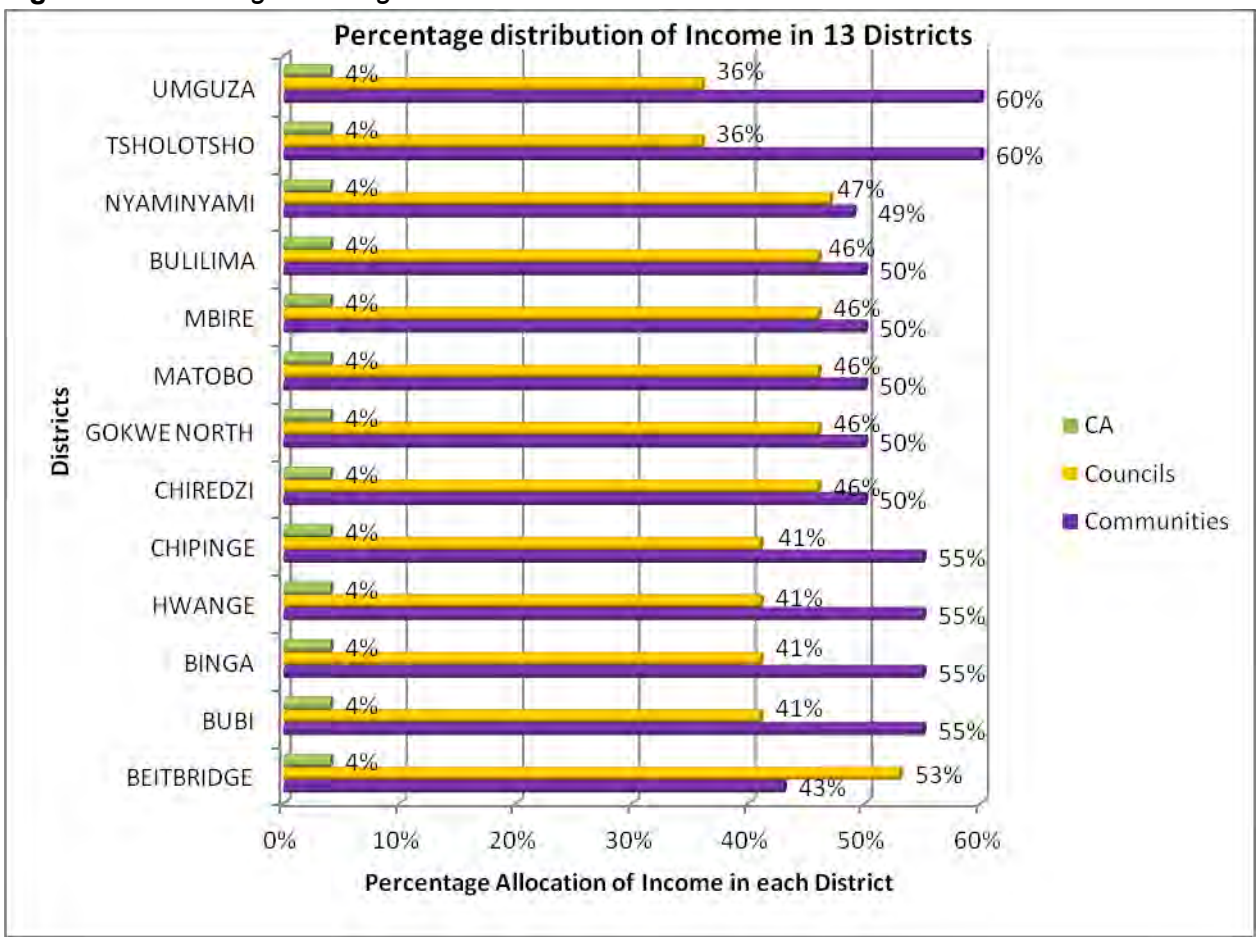

Figure 6: *Total Hunting Income for 12 Districts: 2009-2014*

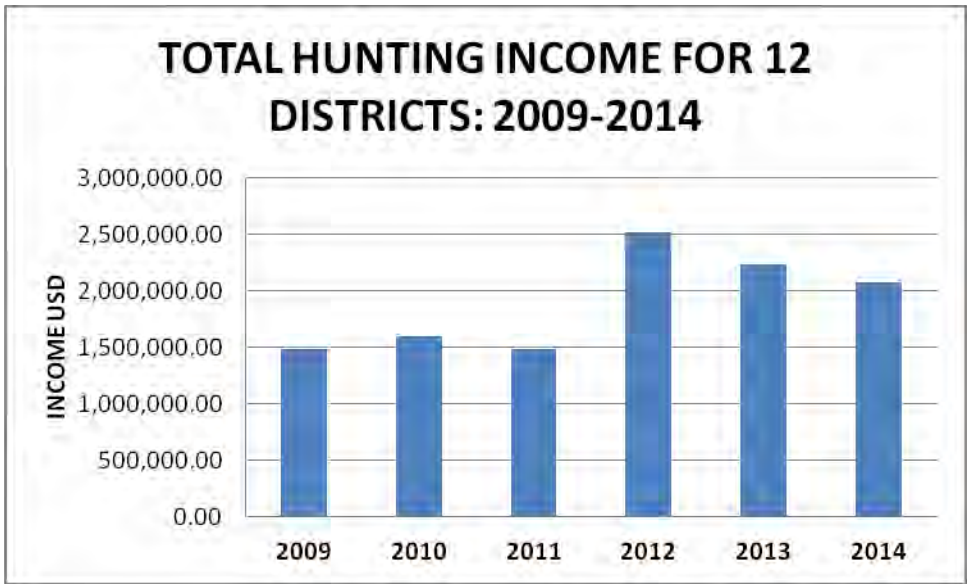
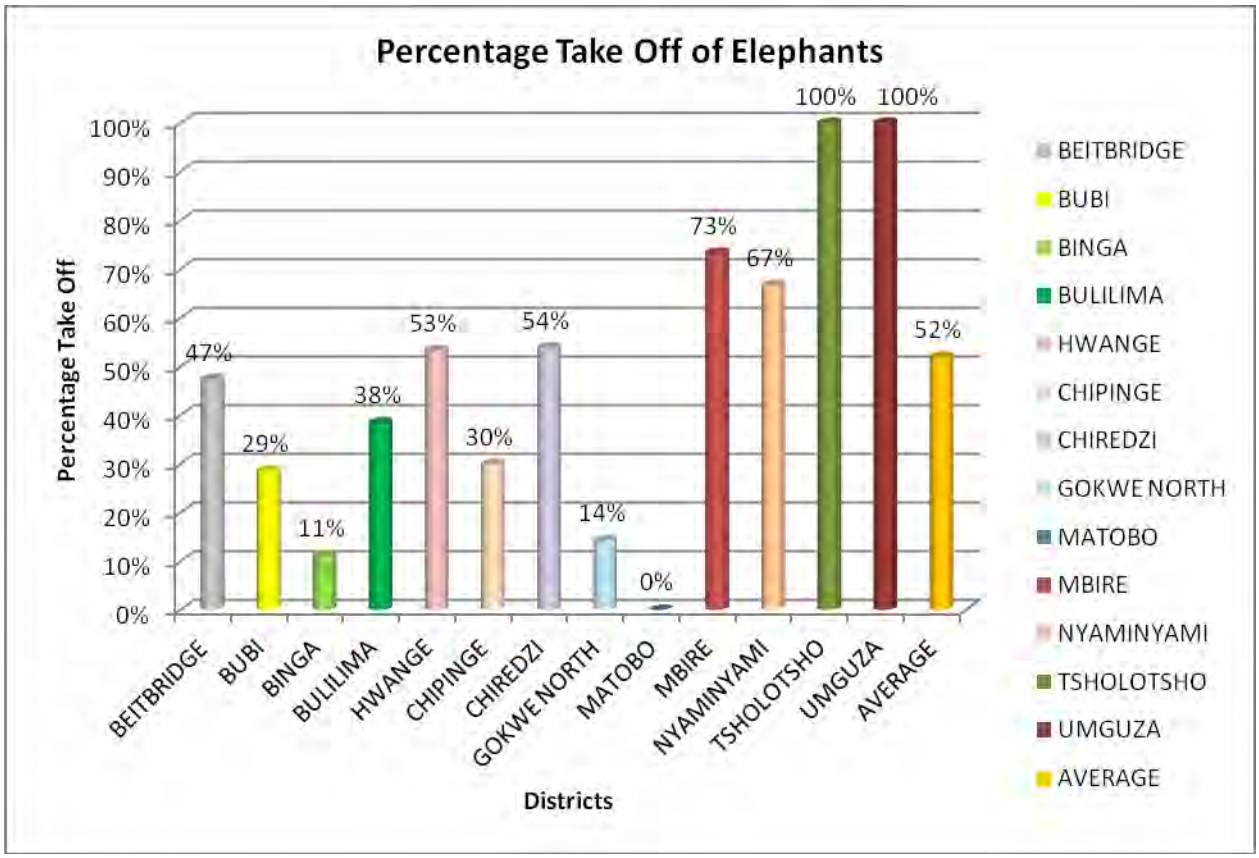


Variation of Total Hunting Income: 2009-2014

As shown in Figure 6, it is highly probable that the decline in hunting income for 2014 was largely caused by the suspension of trophy imports by United States of America. The suspension has a lag effect on income, and preliminary calculations of earnings for 2015 indicate a further continuing decline.

Figure 6: *Take Off Rate in 13 districts*



The major contributor to hunting income, elephants, had a 52% off-take rate in the 13 districts (animals hunted vs the quota). Seven districts out of 13 had an elephant off-take rate below 50% as shown in Figure 6. Figure 7 shows the numerical quota and take-off per district, including tusk-less elephant.

Figure 7: *Numerical Elephant Quota and Take Off per District*

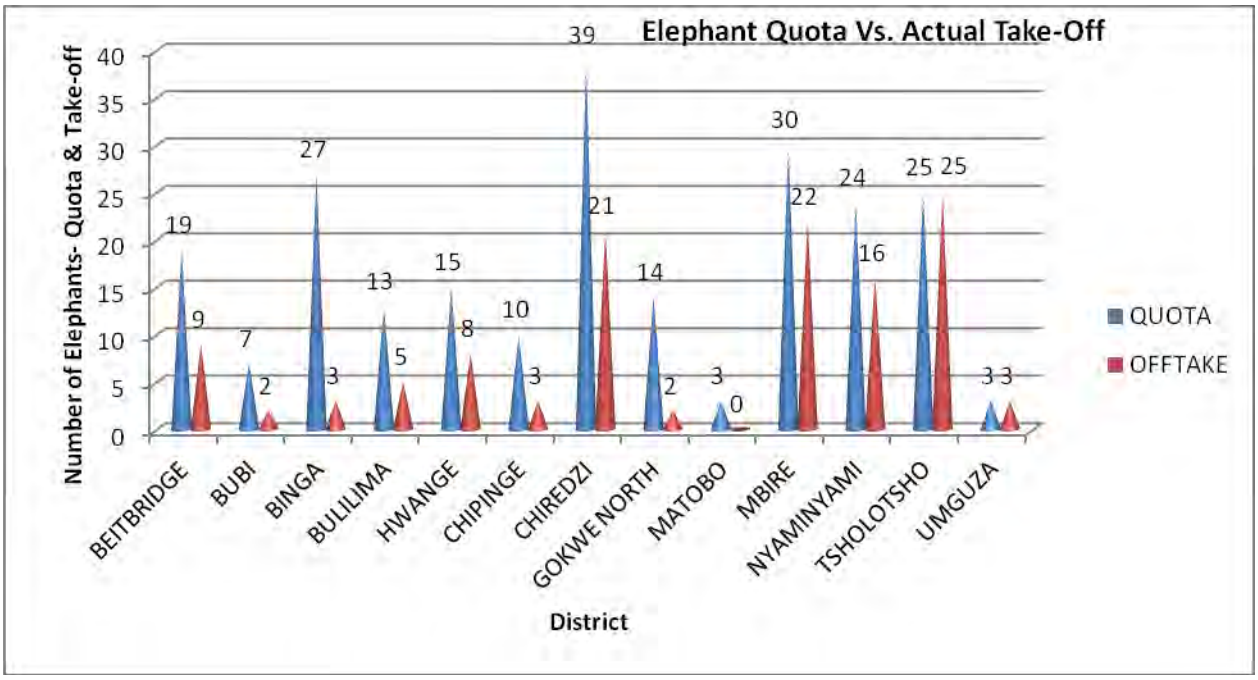


Table 2: *Examples of Community Projects funded from CAMPFIRE Revenue: 2010-14*

District	Project
Beitbridge	Rehabilitation of schools, clinics and protection of irrigation schemes
Bililima	Rehabilitation of 3 clinics and 3 primary schools, hall, fencing of fields and rehabilitation of lodge
Binga	Schools, clinics, and sub offices for wildlife monitoring
Chipinge	3 grinding mills, lorry, teachers houses, community office, shop
Chiredzi	Clinic, teachers' houses, primary school, community-grinding mill, Police sub-office, piped water and electrification of clinic.
Mbire	Clinic, nurses houses, office, storerooms, 14 classrooms, 7 teachers houses, grinding mill, school office, wildlife administration offices, 2 hand pump bore holes, water pipes, toilet, water storage tanks, 2 tractors, a tourist camp with 4 chalets;
Nyaminyami	Tillage tractors, renovation of dispensary at clinic, nurse's house. Construction of Mayovhe classroom block, 3 grinding mills, Teacher's house, Jongola school. School bursaries x 3 students at Seke Teacher's College. Renovation of pre-schools x 2. Negande: Rehabilitation of water pipeline, grinding mill. Nebiri: Chikuro primary block, rehabilitation of Harudziva water pipeline. Kasvisva: Rehabilitation of water pipeline to supply water to Kasvisva clinic, Kasvisva Secondary school block. Msampa: Teacher's house, Majazu primary, renovation of ward warehouse; Kanyati: Cement for teacher's house renovation.
Tsholotsho	Classroom blocks and furniture (Sihazela, Mlevu, Mtshwayeli, Ntulula,

	Dibutibu, Gwaai, Nkwizhi, Zibalongwe, Malindi, Mgodimasili, Phelela, Mpilo, Jimila, and Kapane Primary schools), 2 F14 cottages, 10 sewing machines (Dibutibu Secondary school), 7km piped water system for Thembile primary school, Sikente Clinic, Tshitatshawa and Jowa clinics construction, fencing of Madlangombe clinic, 10 water engines, borehole drilling and repairs and repair kits, Lister diesel engines for 6 villages in ward 21 and at Sihazela Line in ward 1, grinding mills, solar water pumping in wards 1, 2 and 4. 2 pickup trucks for wildlife monitoring purchased in 2015.

Table 3: *Scope of the CAMPFIRE Program*

Land area under CAMPFIRE	50,000 km^2 – 12% of Zimbabwe
No of CAMPFIRE Districts	58
No of wildlife districts	28
No of Safari Operators	33
No of Photographic safaris	10
Direct and indirect beneficiaries	2, 5 million people

Dear Tim,

Attached please find reports of anti-poaching missions taking place in the area surrounding Mana Pools National Park. These patrols are examples of implementation of the Mana Pools Anti-Poaching Strategy, part of the Zambezi Valley Elephant Management Plan. They are more than "bright spots." They represent an on-going and concerted public-private partnership among NGOs, safari operators, and ZPWMA. They serve as a model which is being developed in other ranges including Sebungwe.

Please let us know if you have any questions.

Kind regards,

Regina

14th AFRICAN WILDLIFE CONSULTATIVE FORUM

Impacts of the African Elephant Importation ban on the CAMPFIRE Programme in Zimbabwe

Charles Jonga
CAMPFIRE Association
Zimbabwe

11 November 2015

Legend Resort, South Africa

PERCEPTIONS ON COMMUNITY BENEFITS

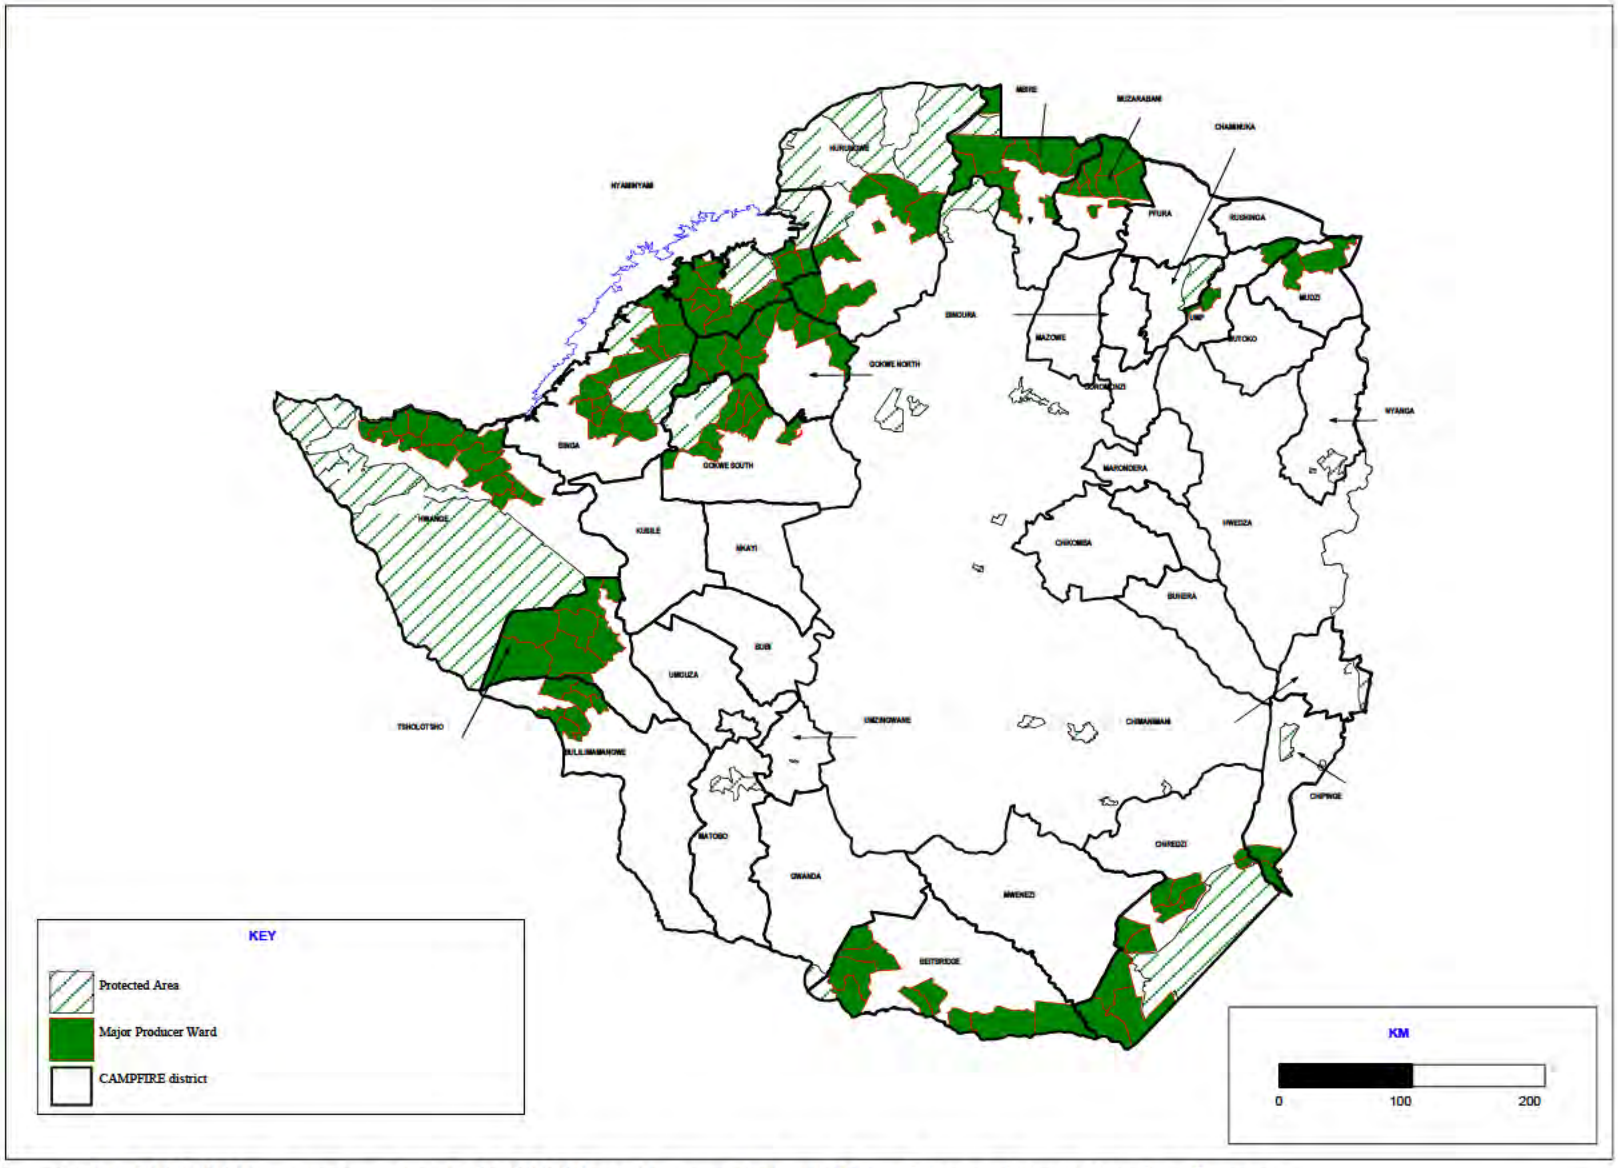
The Sunday Mail
25 October 2015

Journalist:
Another cause for the human-animal conflict could the transition from CAMPFIRE benefits. **In the old days, each household would receive a direct cash payment from the proceeds from hunting concessions. This has since been changed and the money is allocated to community programmes.**

Chief's response:
"With the allocation from CAMPFIRE, we have managed to build **a house for an extension officer, service our tractor, buy computers for the CAMPFIRE office, service community boreholes as well as offer funeral assistance to villagers**," explains Chief Chapoto.

Journalist:
Though villagers did not, and could not, open up on the snaring of animals, **there is suspicion that some might not see value in the community benefits, rather preferring personal gain**. Most of the blame is heaped on the Doma people, who until recently led a nomadic lifestyle and survived on hunting and gathering.

MAP OF CAMPFIRE DISTRICTS



CAMPFIRE protects 50,000km2 or **12.7 %** of land in Zimbabwe

BACKGROUND TO CAMPFIRE

- Land area under CAMPFIRE	50,000 km^2
- No. of wildlife districts	28
- No. of leased Parks safari areas	4
- No. of major elephant hunting districts	12
- Total no. of Safari Operators	33
- No. of Photographic safaris	10
- No of beneficiaries	120 wards 777,000 households

ALLOCATION OF CAMPFIRE REVENUE

New CAMPFIRE Revenue Sharing Guidelines - revenue is paid by Safari Operators directly into community controlled bank accounts, not through RDCs. CAMPIRE areas receive 100% of trophy fees for all animals hunted.

Communities receive 55% of CAMPFIRE income for their projects.

41% is used by Rural District Councils for field patrols, monitoring of hunts, problem animal control, water, fire management, and district development.

CAMPFIRE Association receives 4% to coordinate the programme and represent its interests at all levels.

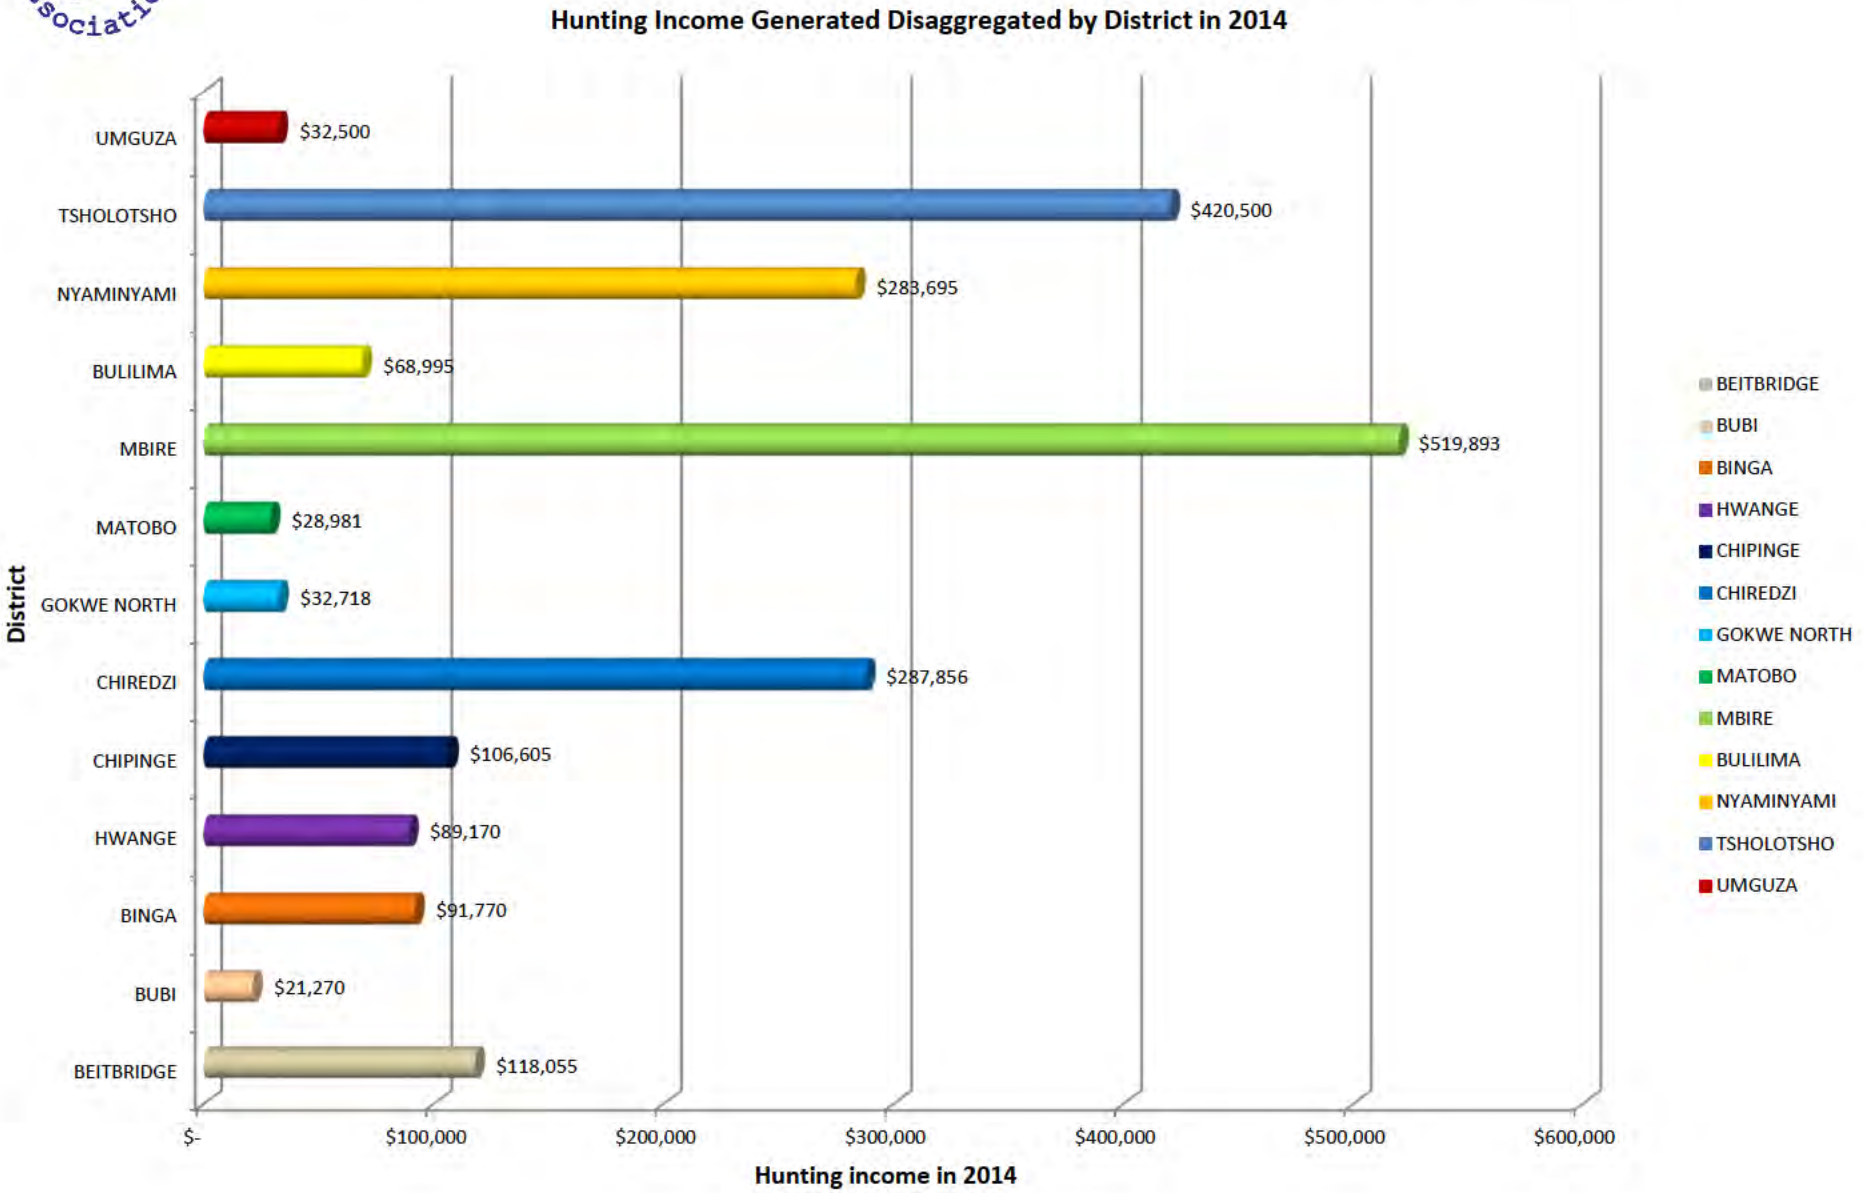
Parks also benefits in three CAMPFIRE districts that, in addition to normal (communal land) hunting areas in their environs, lease safari hunting areas (state land/Parks Estate) from Parks:

Chiredzi (Malipati Safari Area) 50%

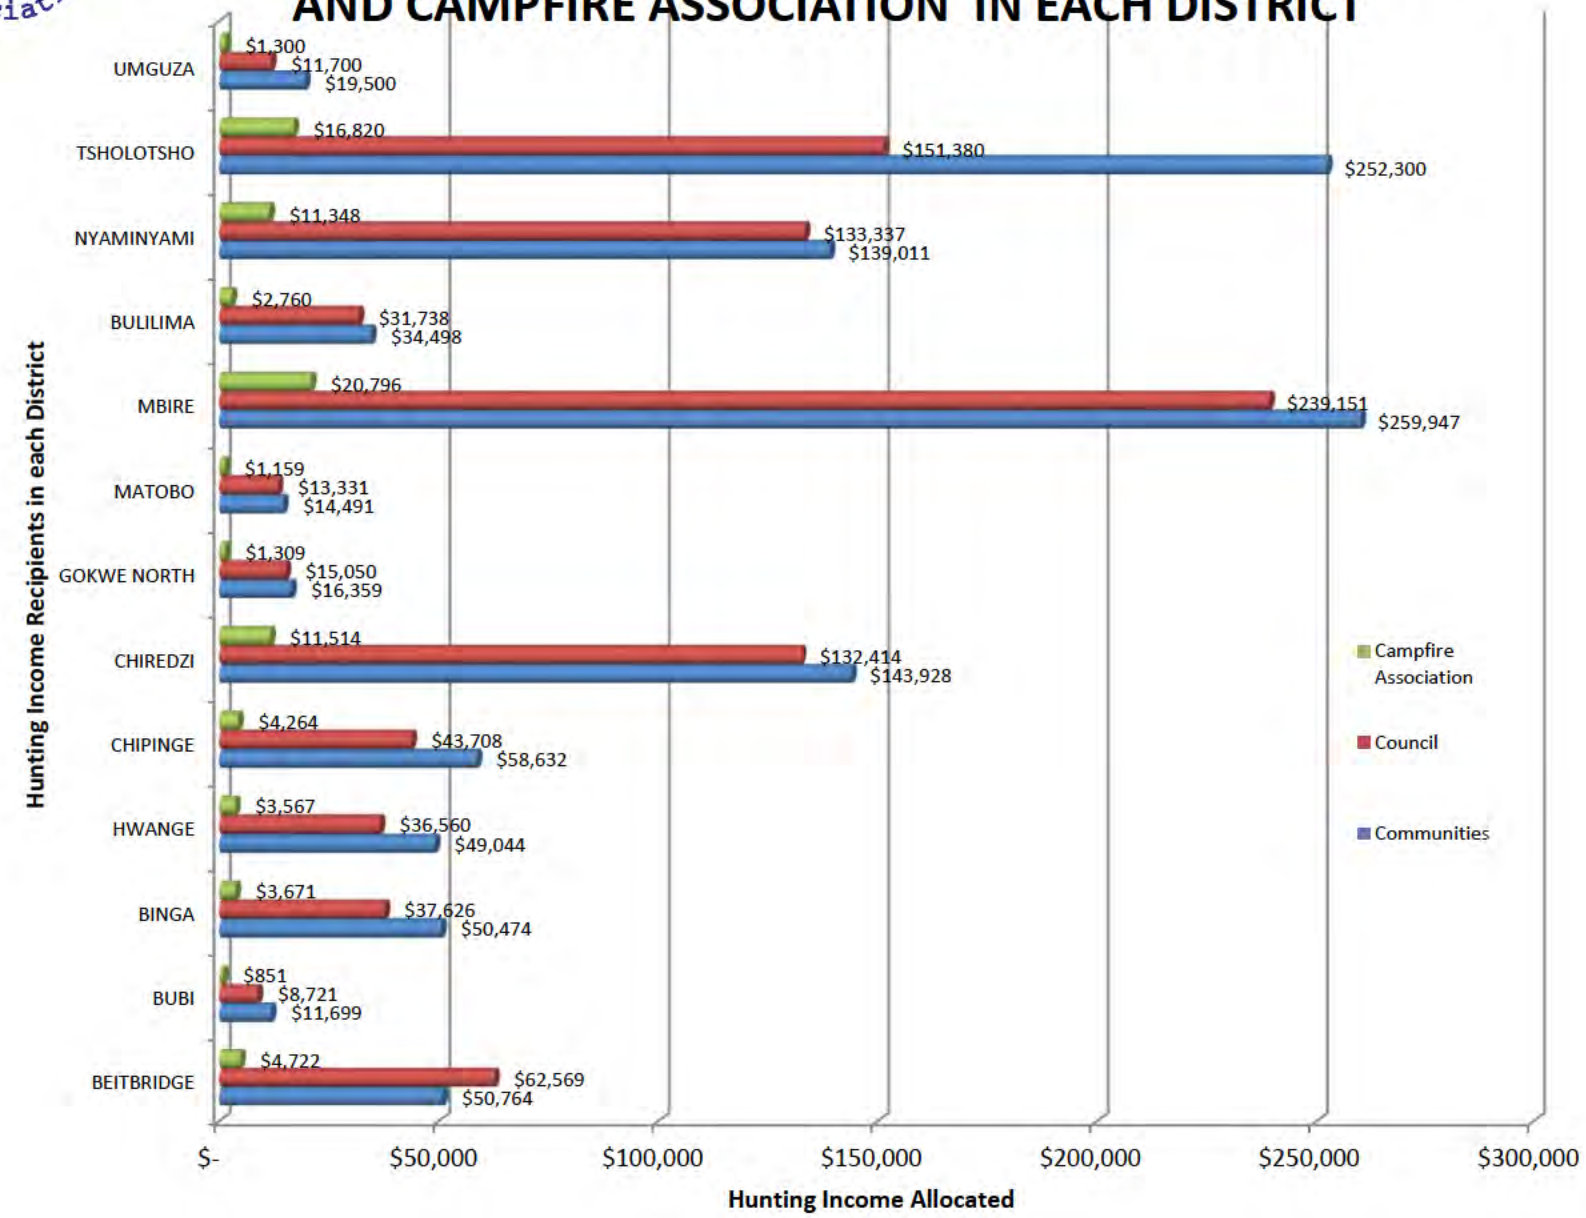
Hurungwe (Chewore/Mukwichi , Charara, Nyaodza Safari Areas) 100%

Mbire (Dande Safari Area) 100%.

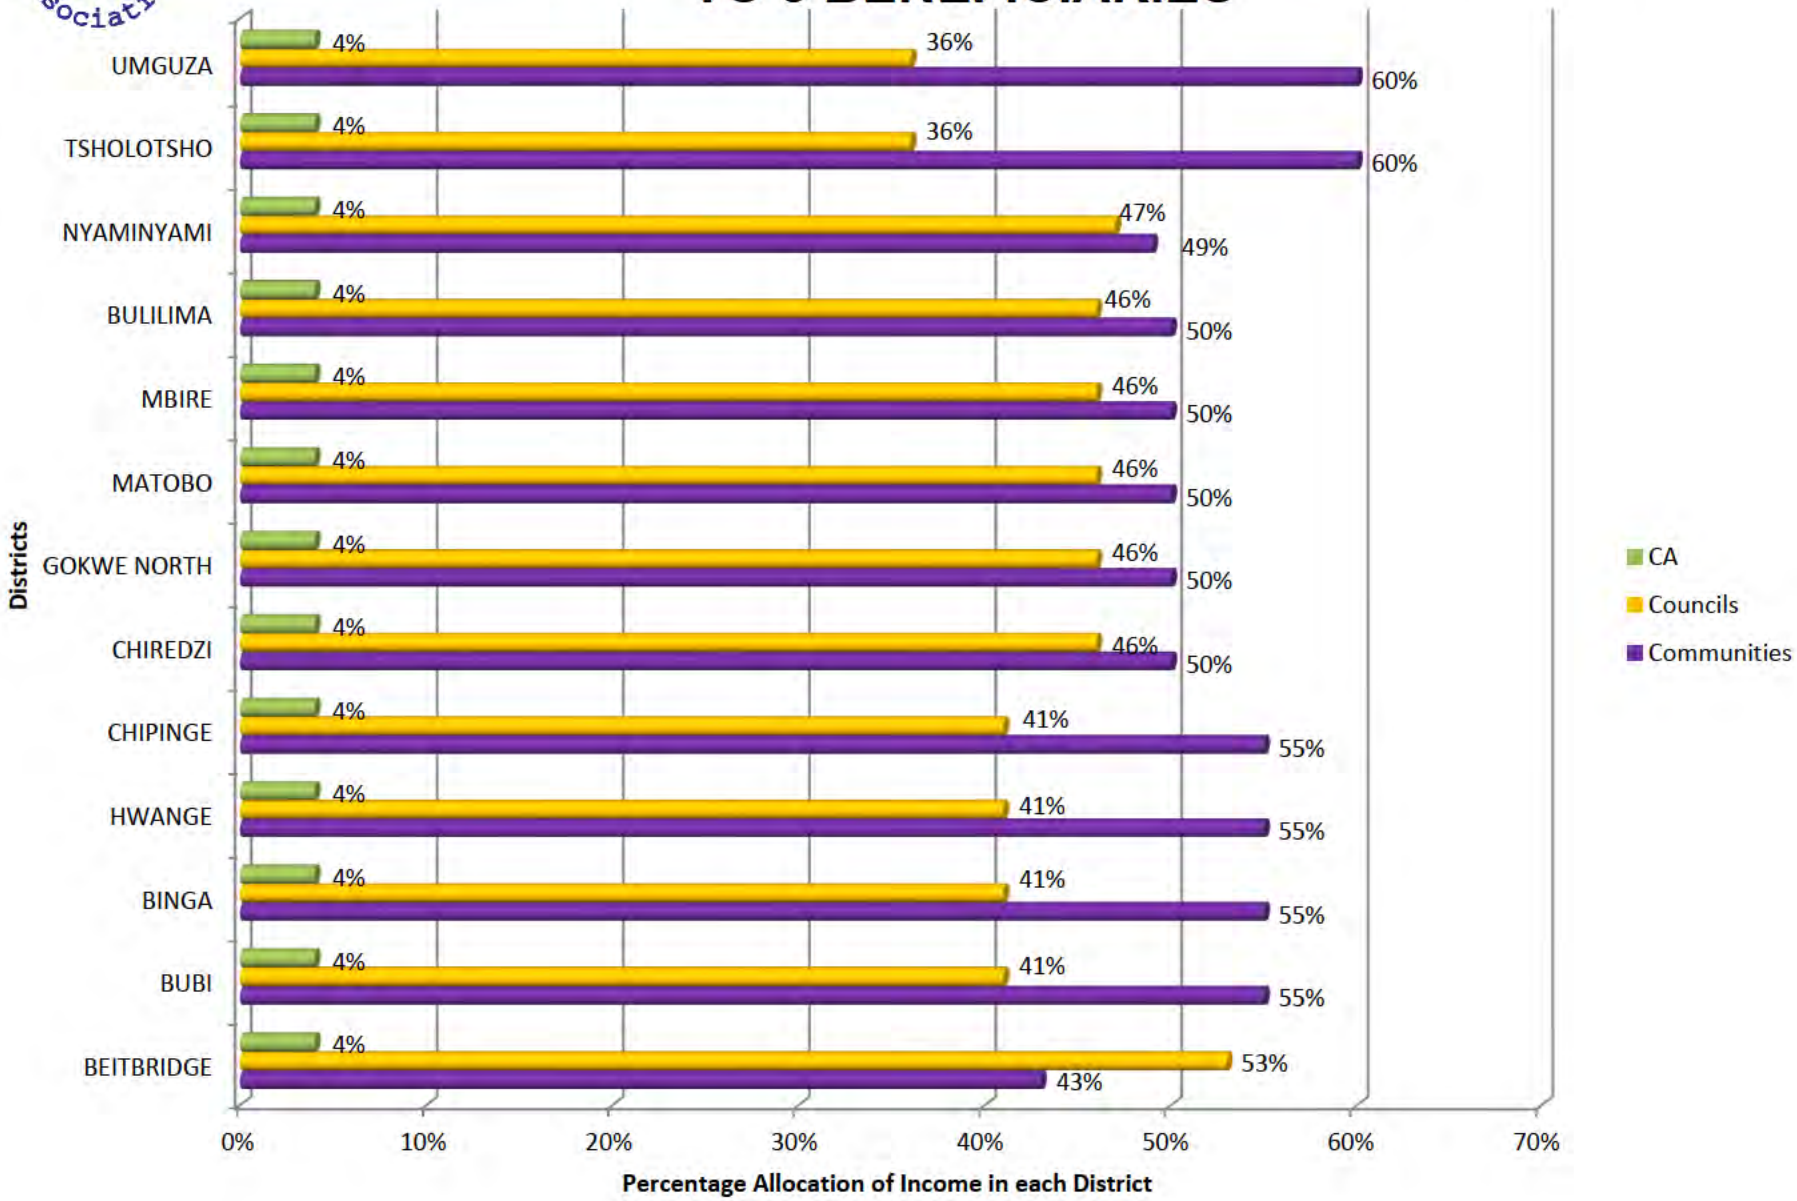
Hunting Income for Elephant Hunting Districts: 2014



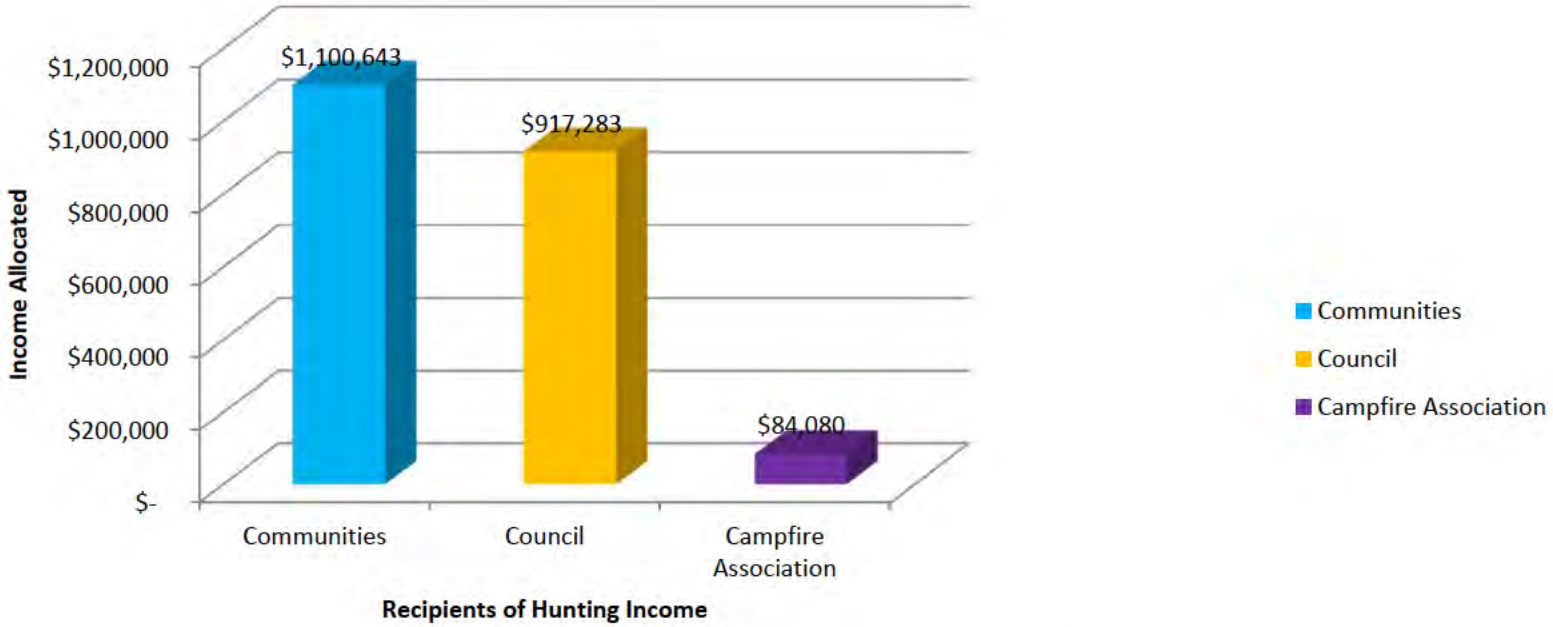
HUNTING INCOME ALLOCATION TO COMMUNITIES, COUNCILS AND CAMPFIRE ASSOCIATION IN EACH DISTRICT



PERCENTAGE HUNTING ALLOCATIONS IN 13 DISTRICTS TO 3 BENEFICIARIES



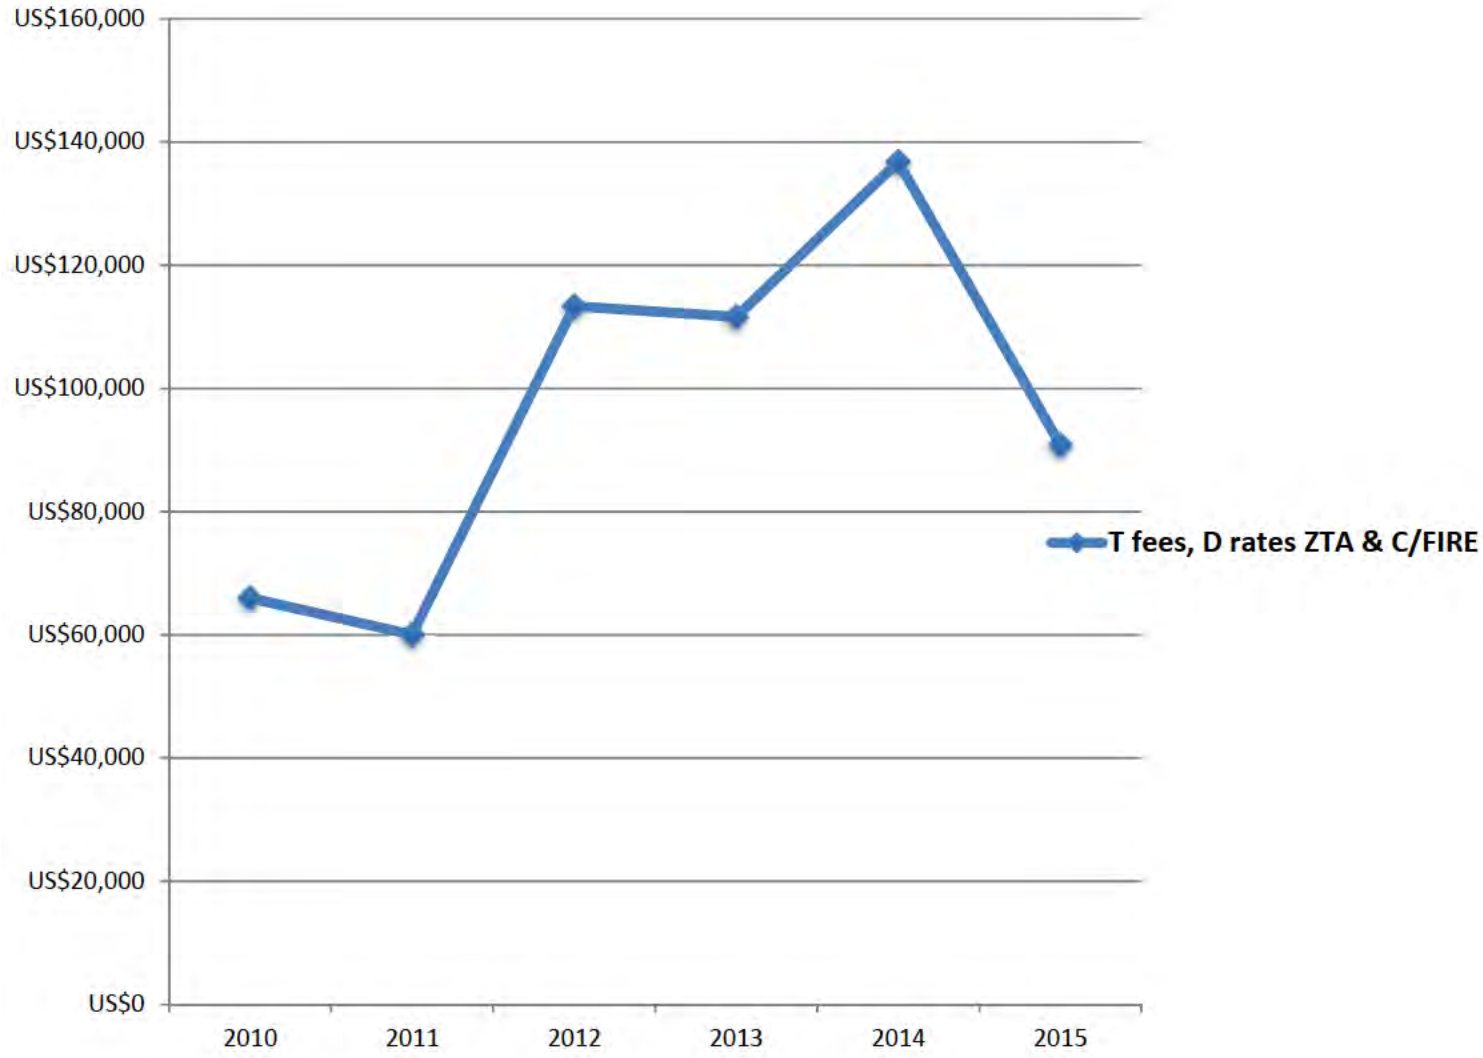
TOTAL INCOME ALLOCATIONS TO COMMUNITIES, COUNCILS & ASSOCIATION FROM 13 DISTRICTS



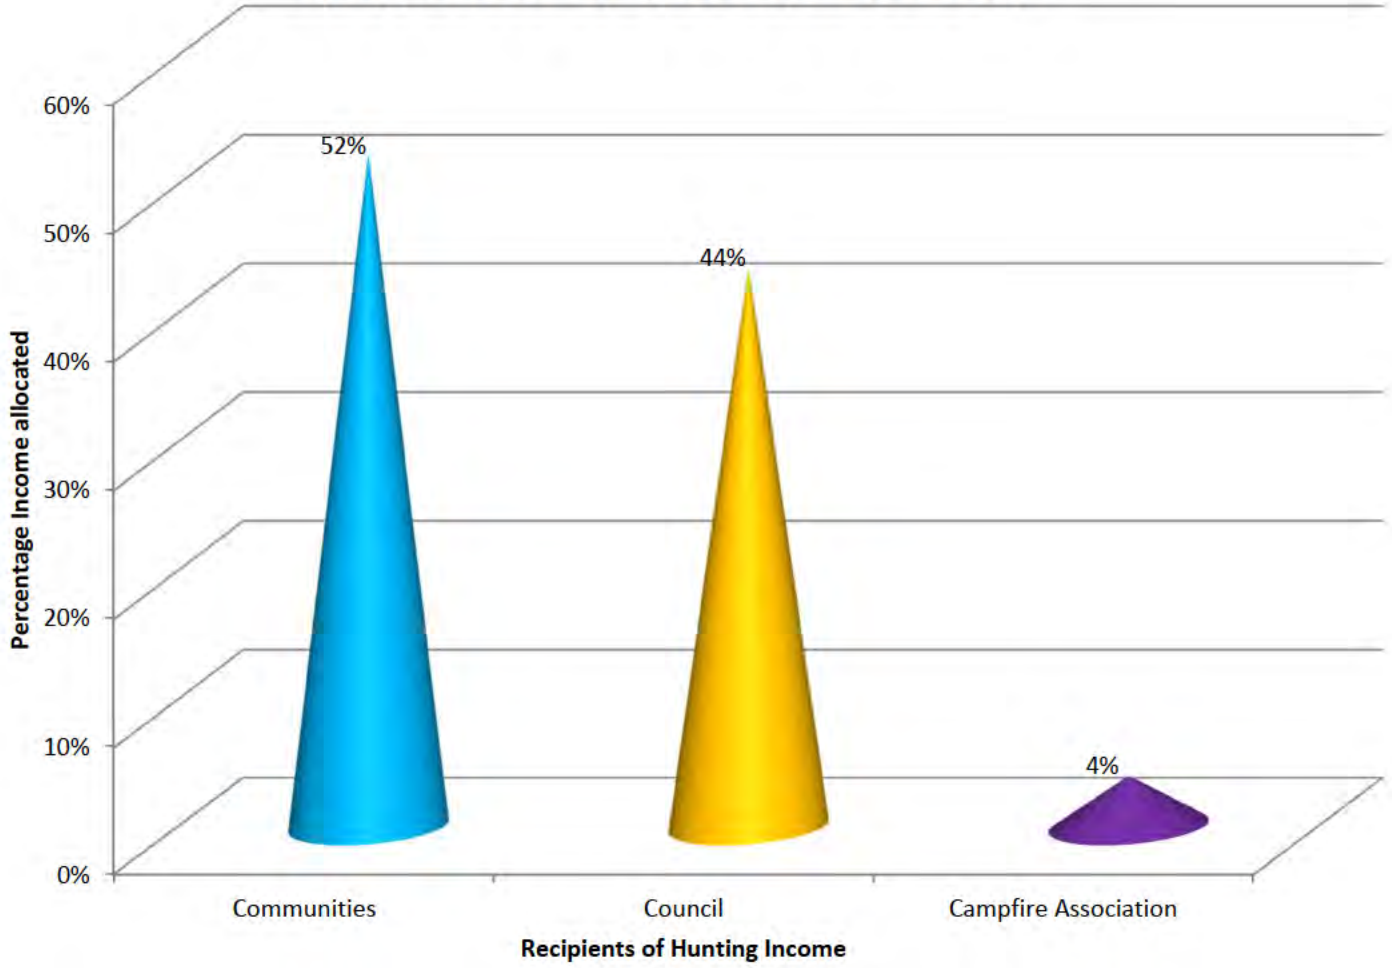
Total income for 2014 was $2,102,007, compared to $2,229,910.00 in 2013. Elephant hunting contributed 54% ($1,138,375.09) of the total hunting income. Only Matobo district did not generate any income from elephant, with Hwange district getting 100% of its income from elephant.

SIX YEAR SAMPLE - MBIRE DISTRICT, WARD 4 GROSS INCOME: 2014

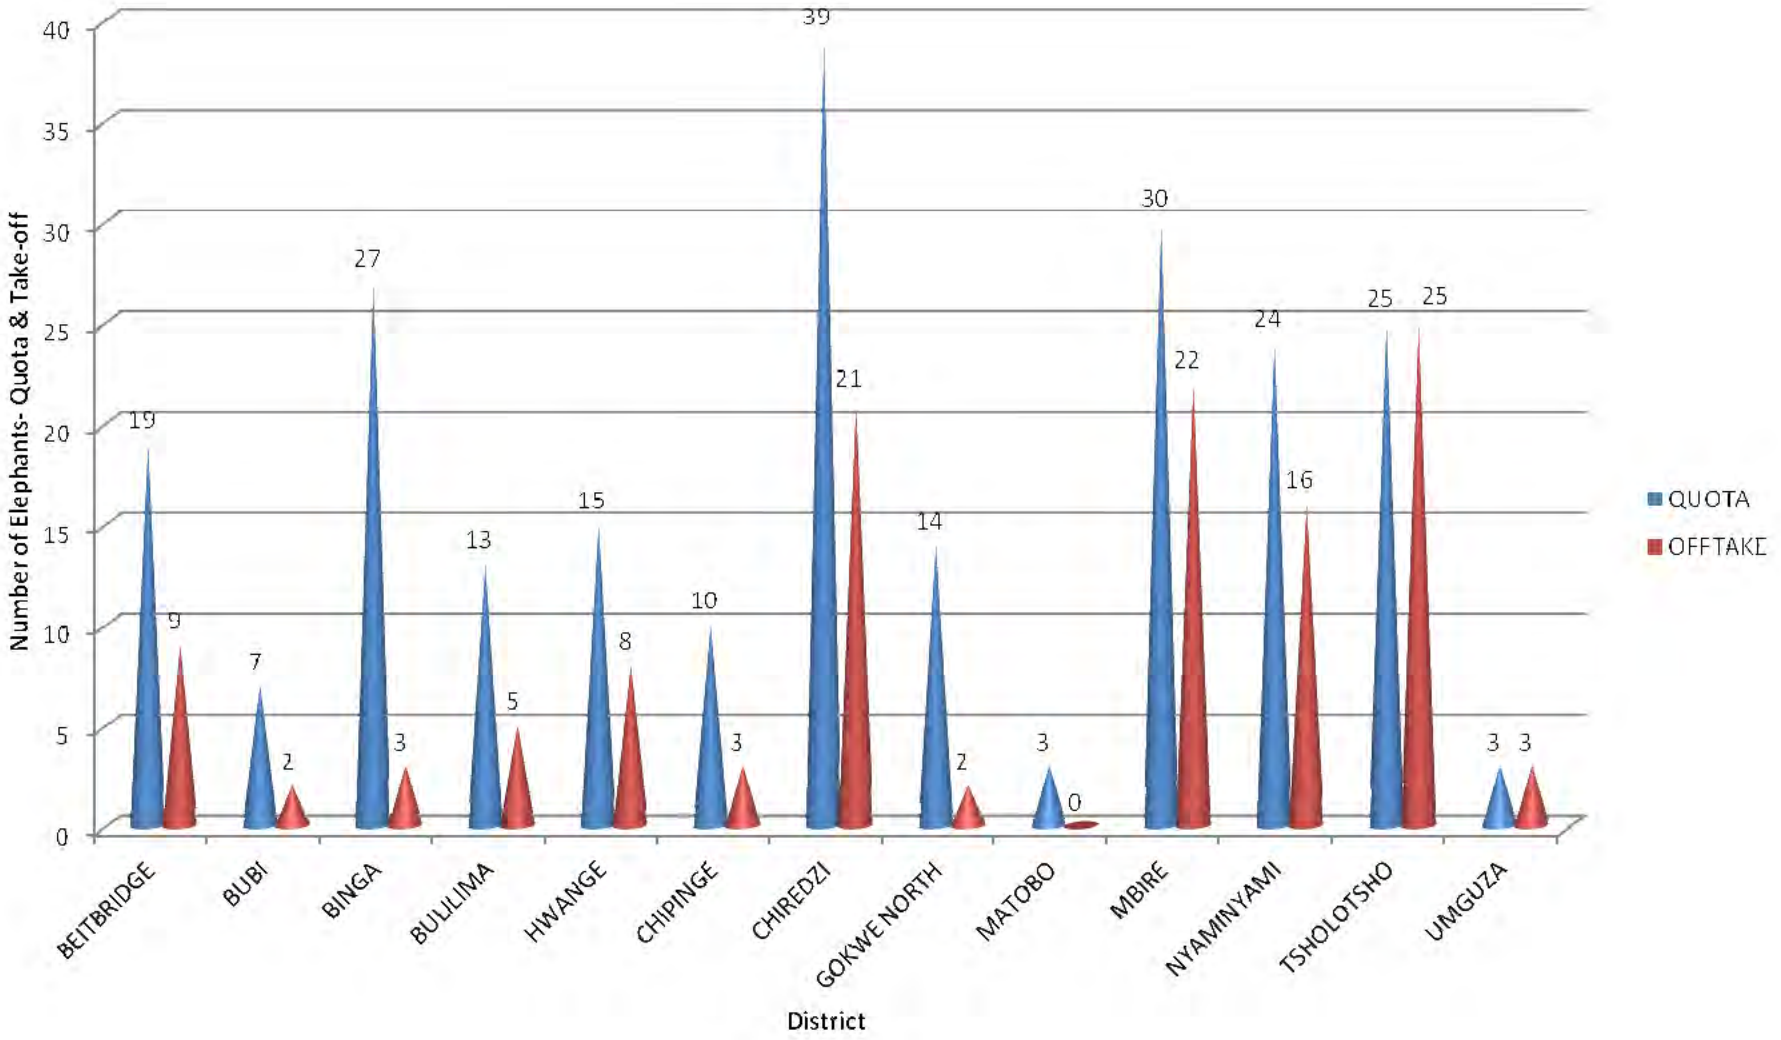
***Note this is primarily an elephant area , showing a 38% reduction in revenue ***



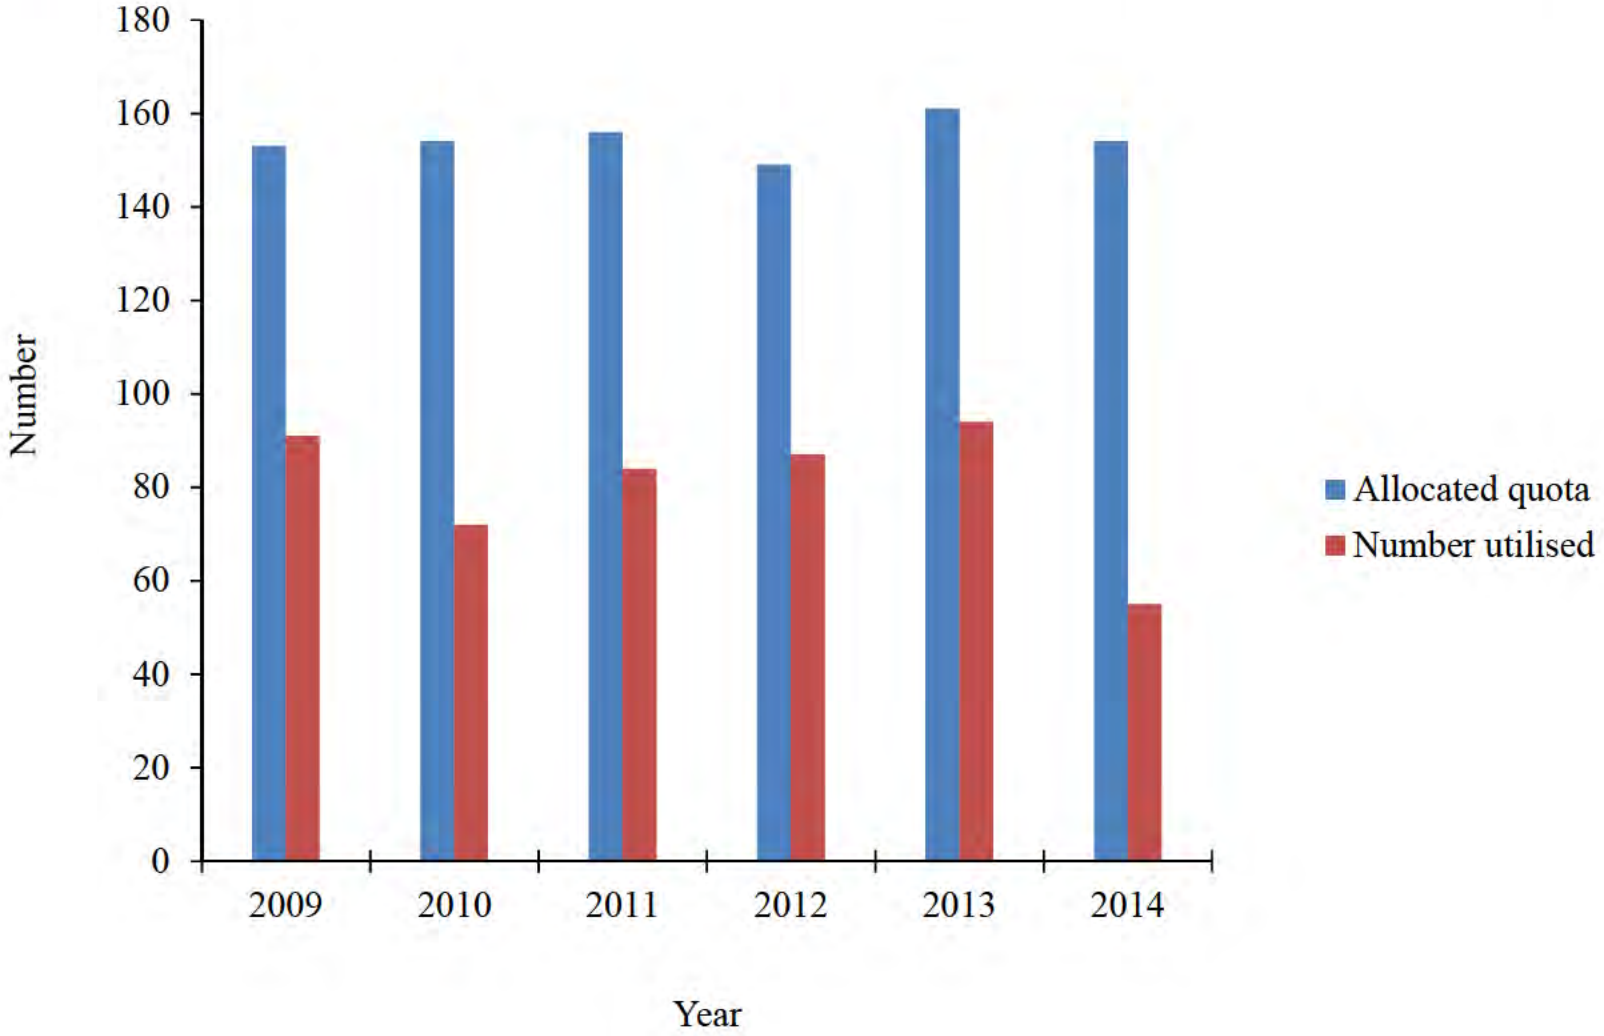
PERCENTAGE ALLOCATIONS OF INCOME TO 3 RECIPIENTS OF HUNTING INCOME



NUMERICAL ELEPHANT QUOTAS AND OFF-TAKE PER DISTRICT

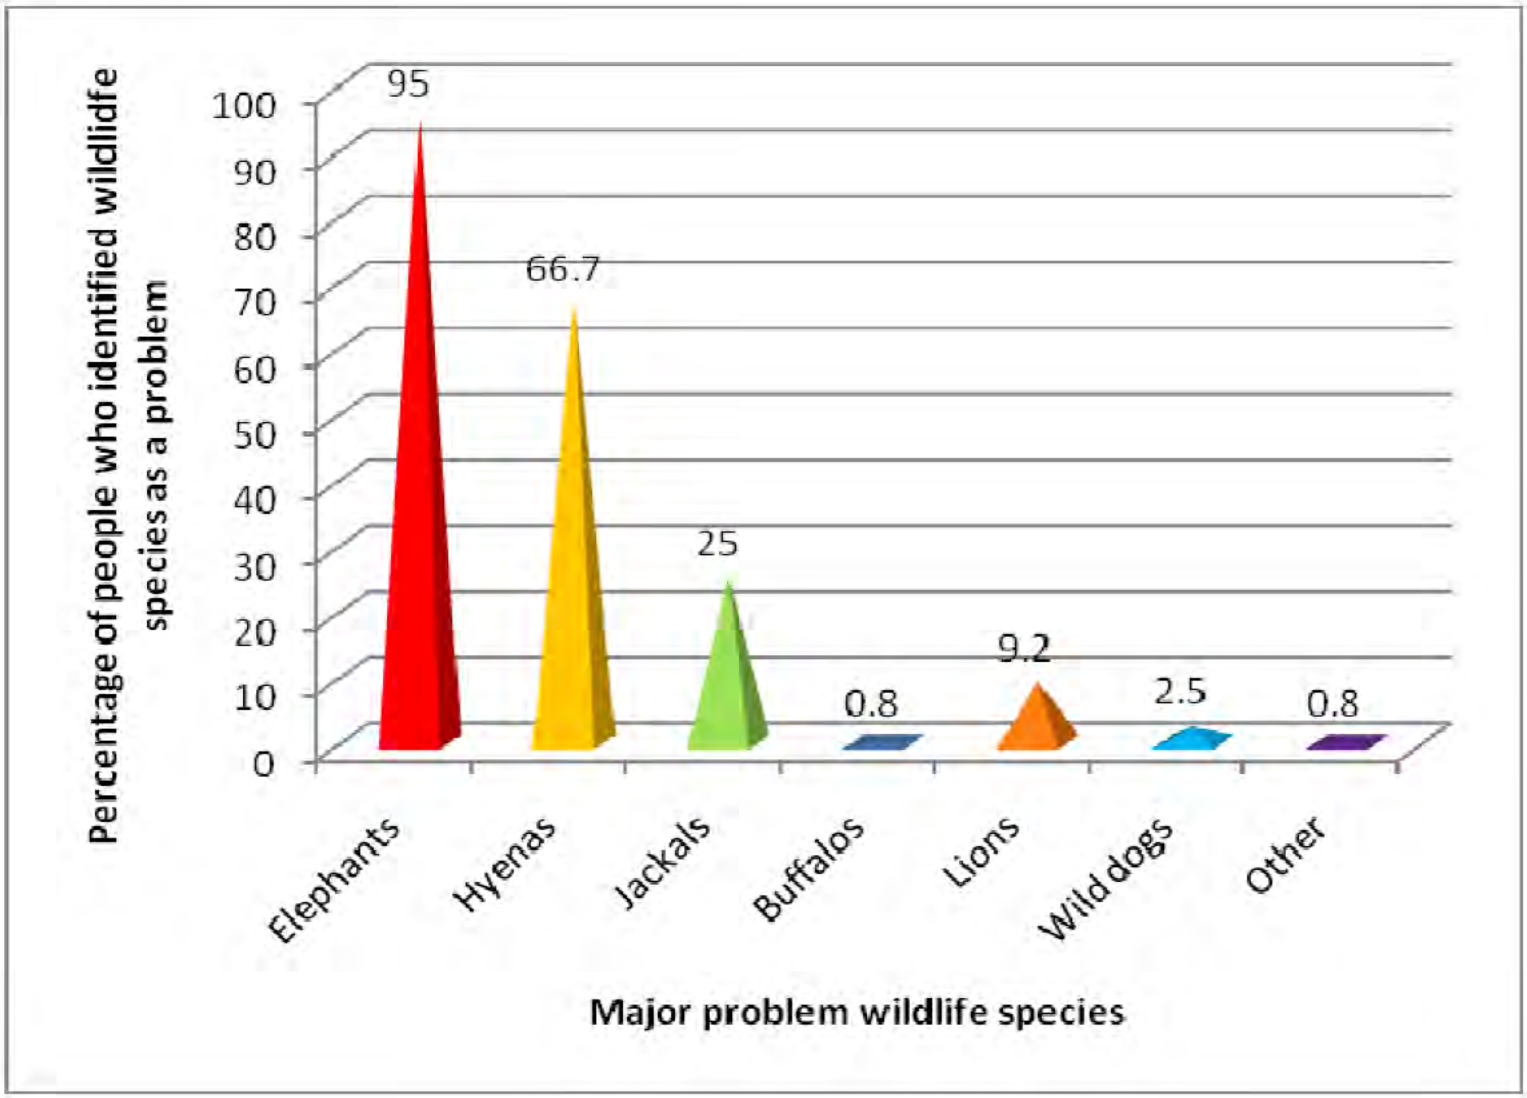


COMBINED QUOTAS AND UTILIZATION: 2009-2014



Data from 10 districts (Beitbridge, Binga, Bubi, Gokwe North, Hurungwe, Hwange, Matobo, Mbire, Mudzi, Tsholotsho)

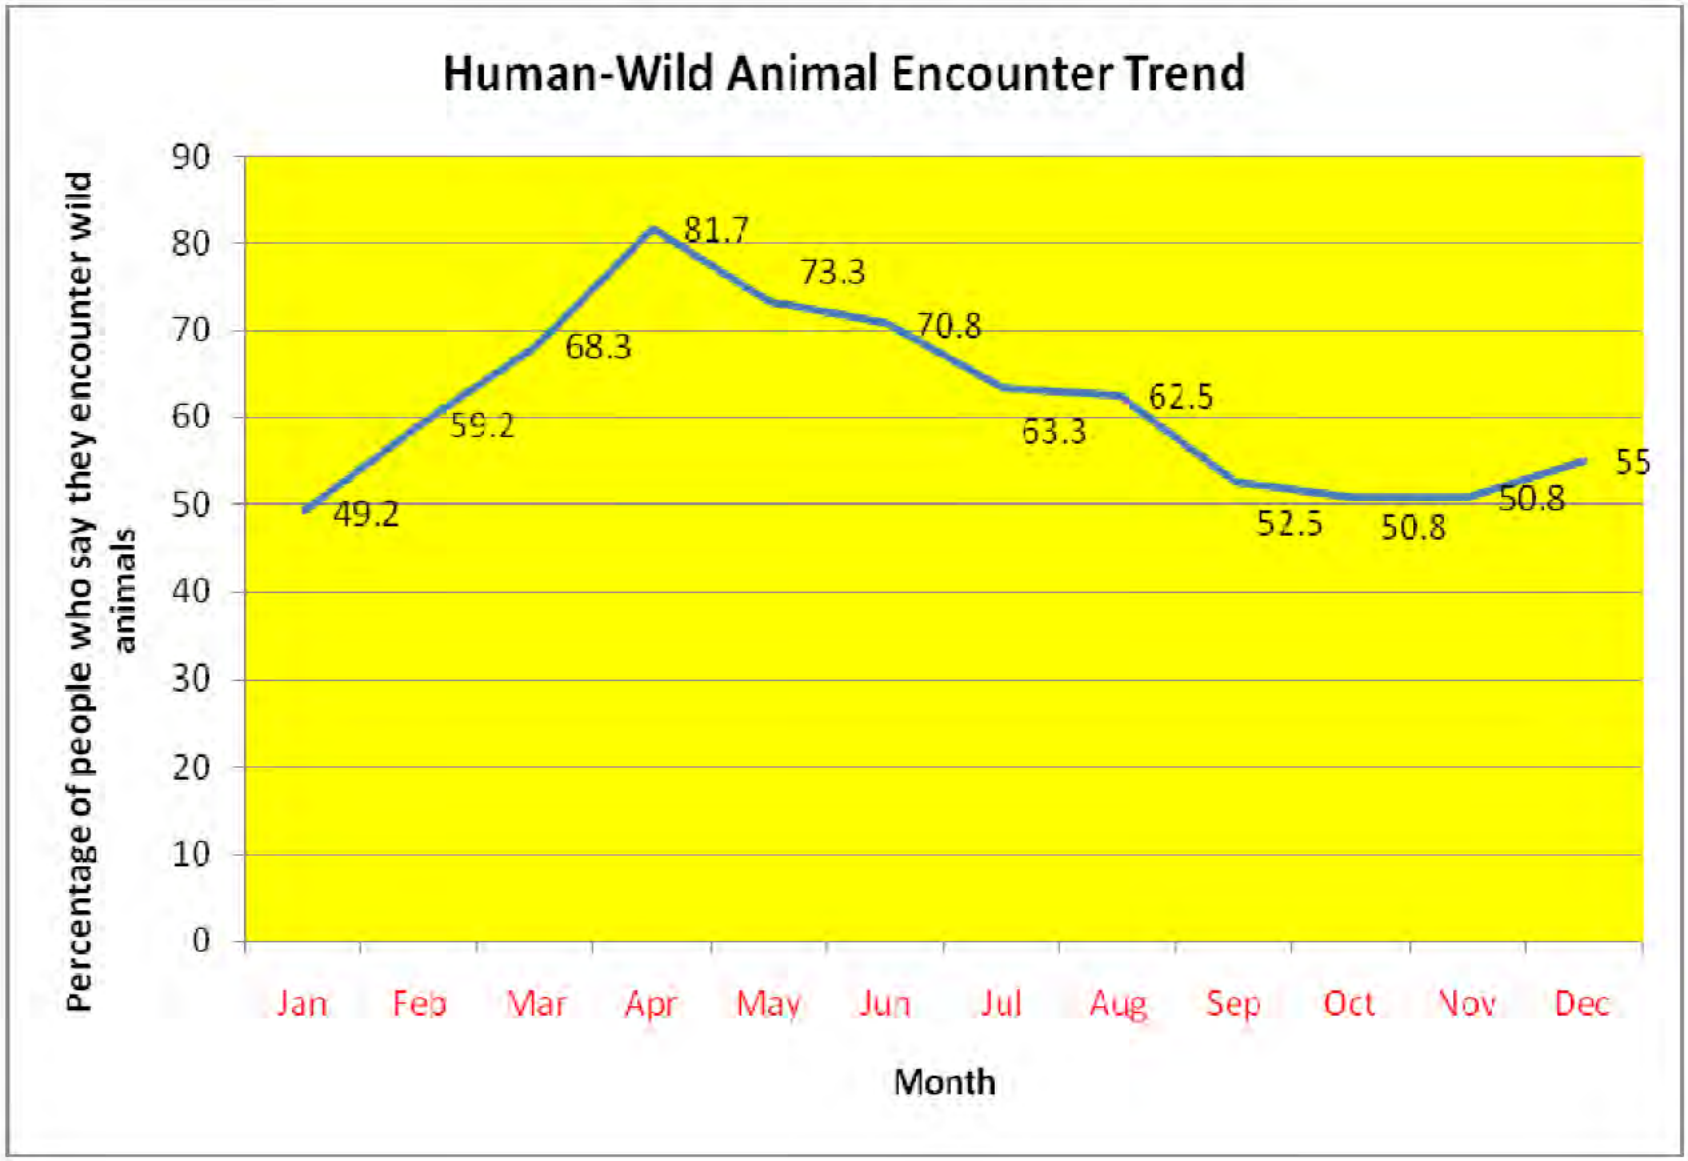
MAJOR PROBLEM ANIMAL SPECIES IN TSHOLOTSHO: 2014



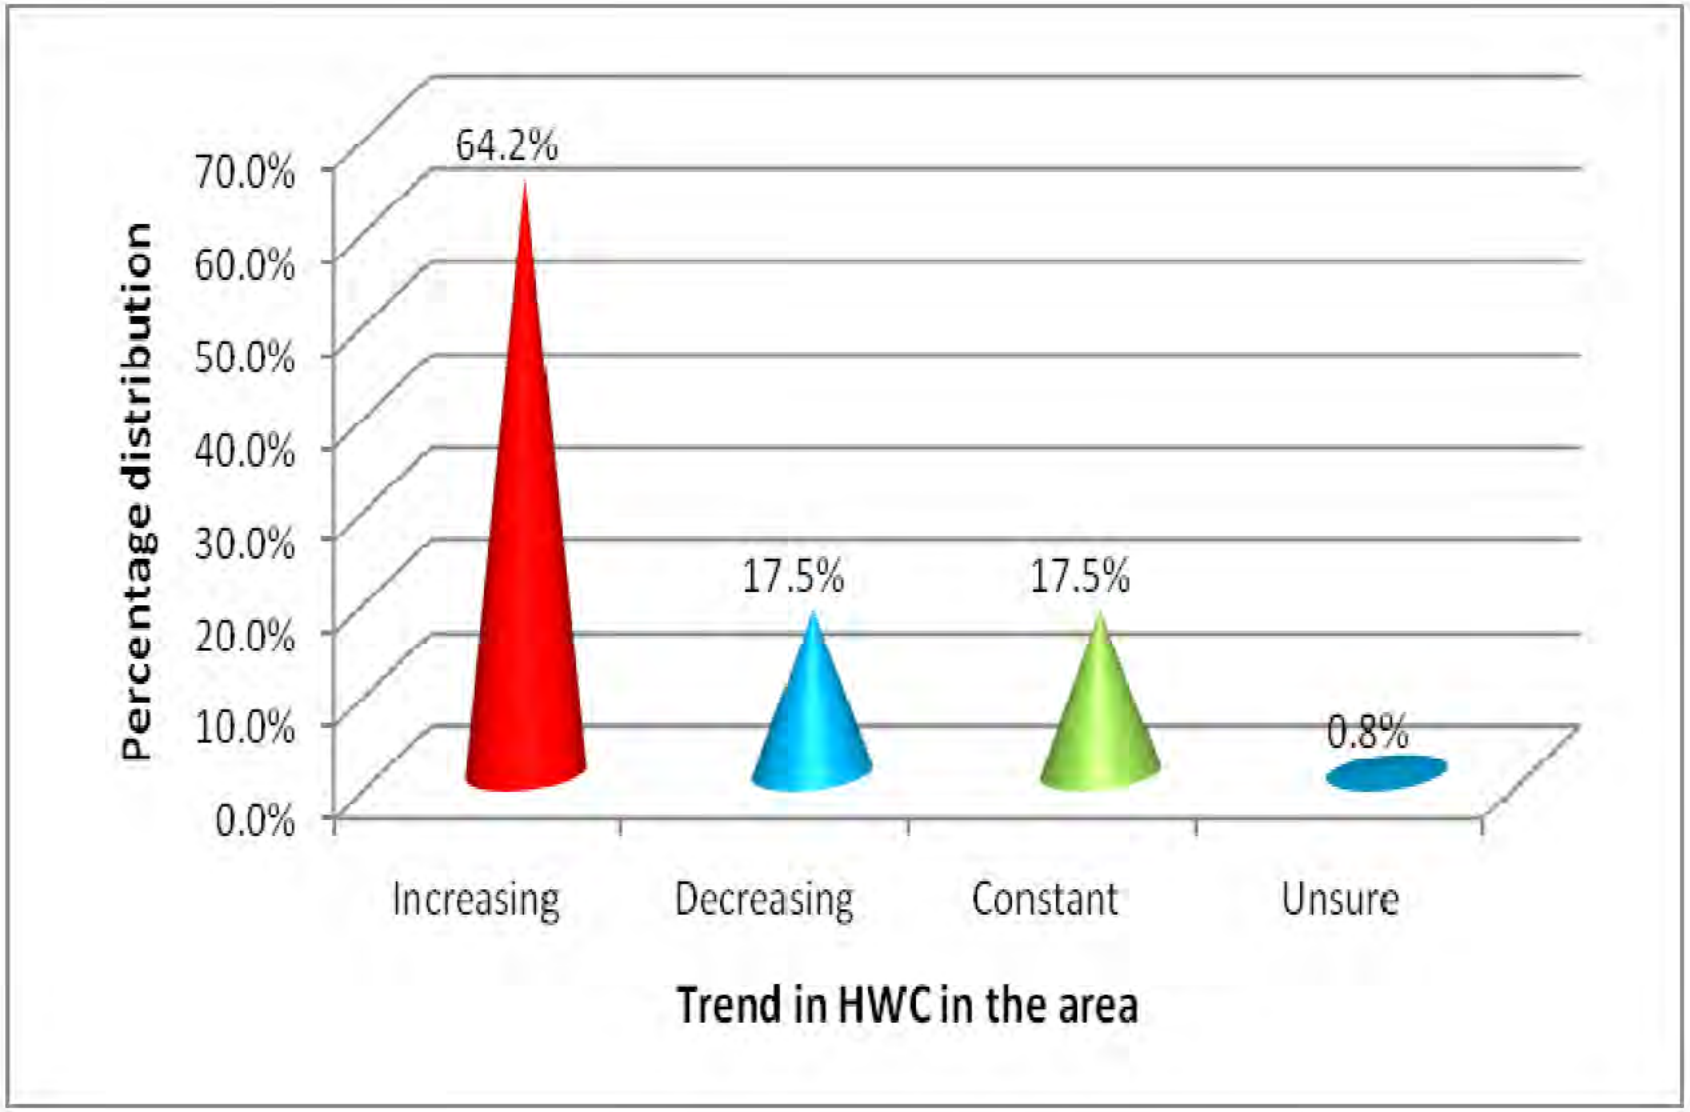
PROBLEMS CAUSED BY SPECIES

Problem	Related animal (expressed in percentage)						
	Elephants	Hyenas	Jackals	Buffalo	Lion	Wild dog	Warthog
Crop raiding	97.4%						2.6%
Contaminate water sources	95.6%			4.5%			
Human injuries & deaths	100%						
Passing on of diseases & pests to domestic animals				100%			
Livestock attacks & losses		56.8%	34.1%		6.8%	2.3%	
Damage to property	100%						

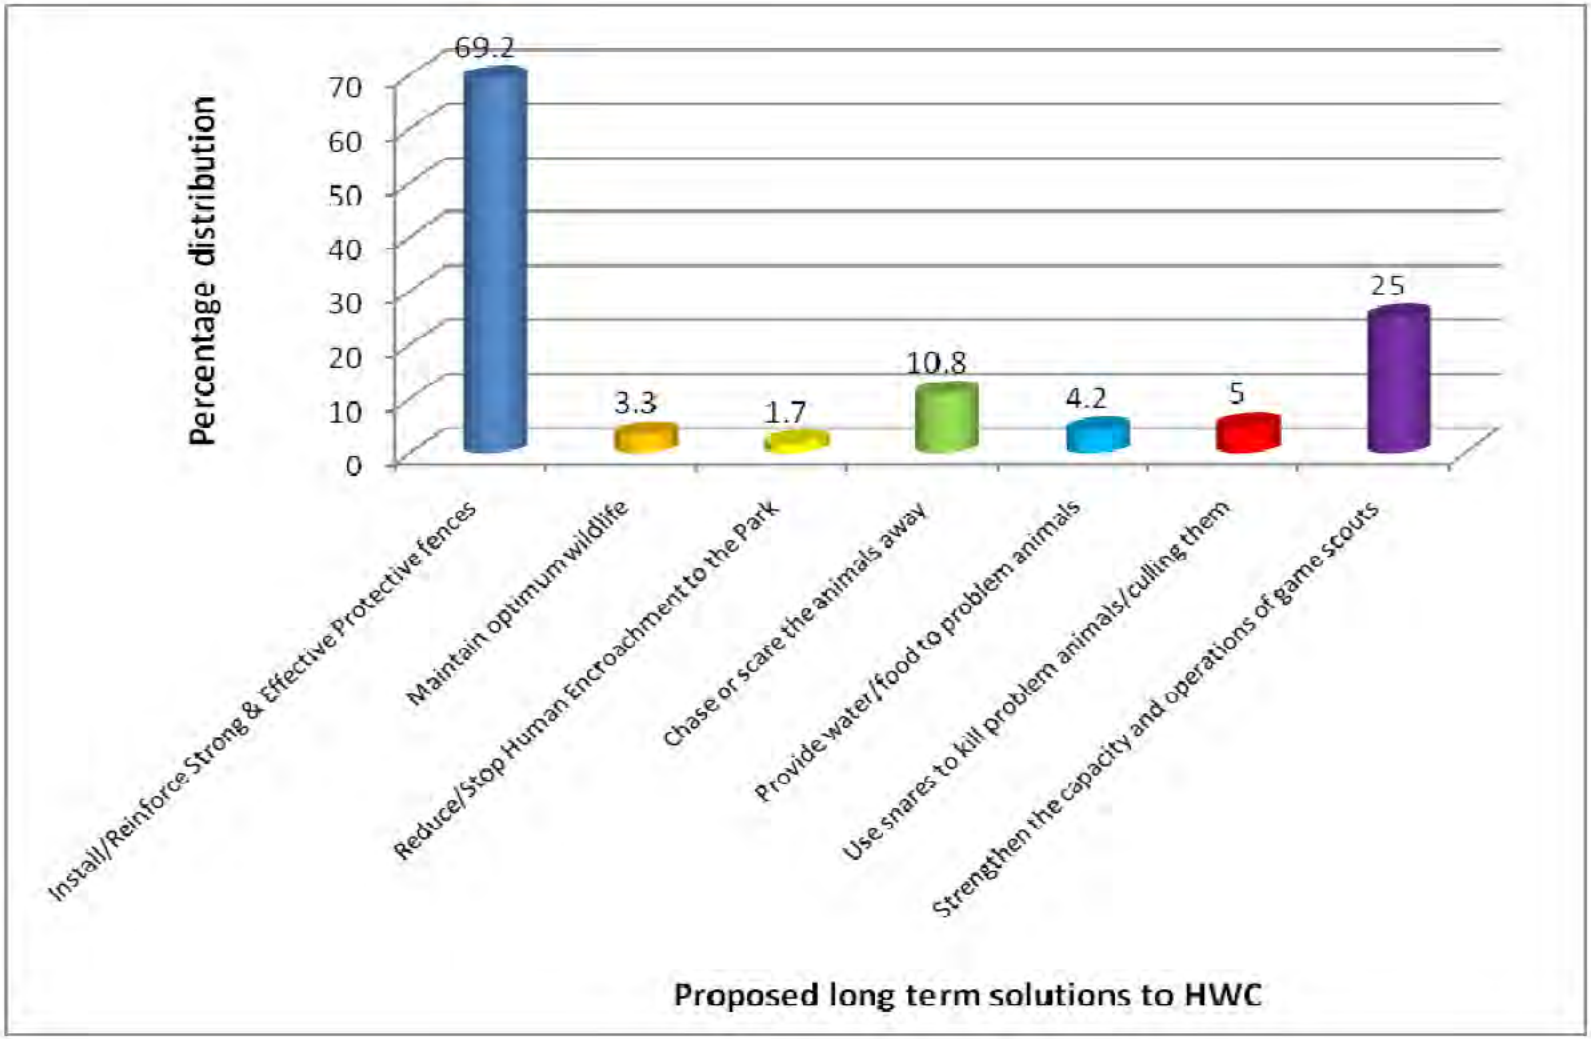
HUMAN WILD ANIMAL ENCOUNTERS



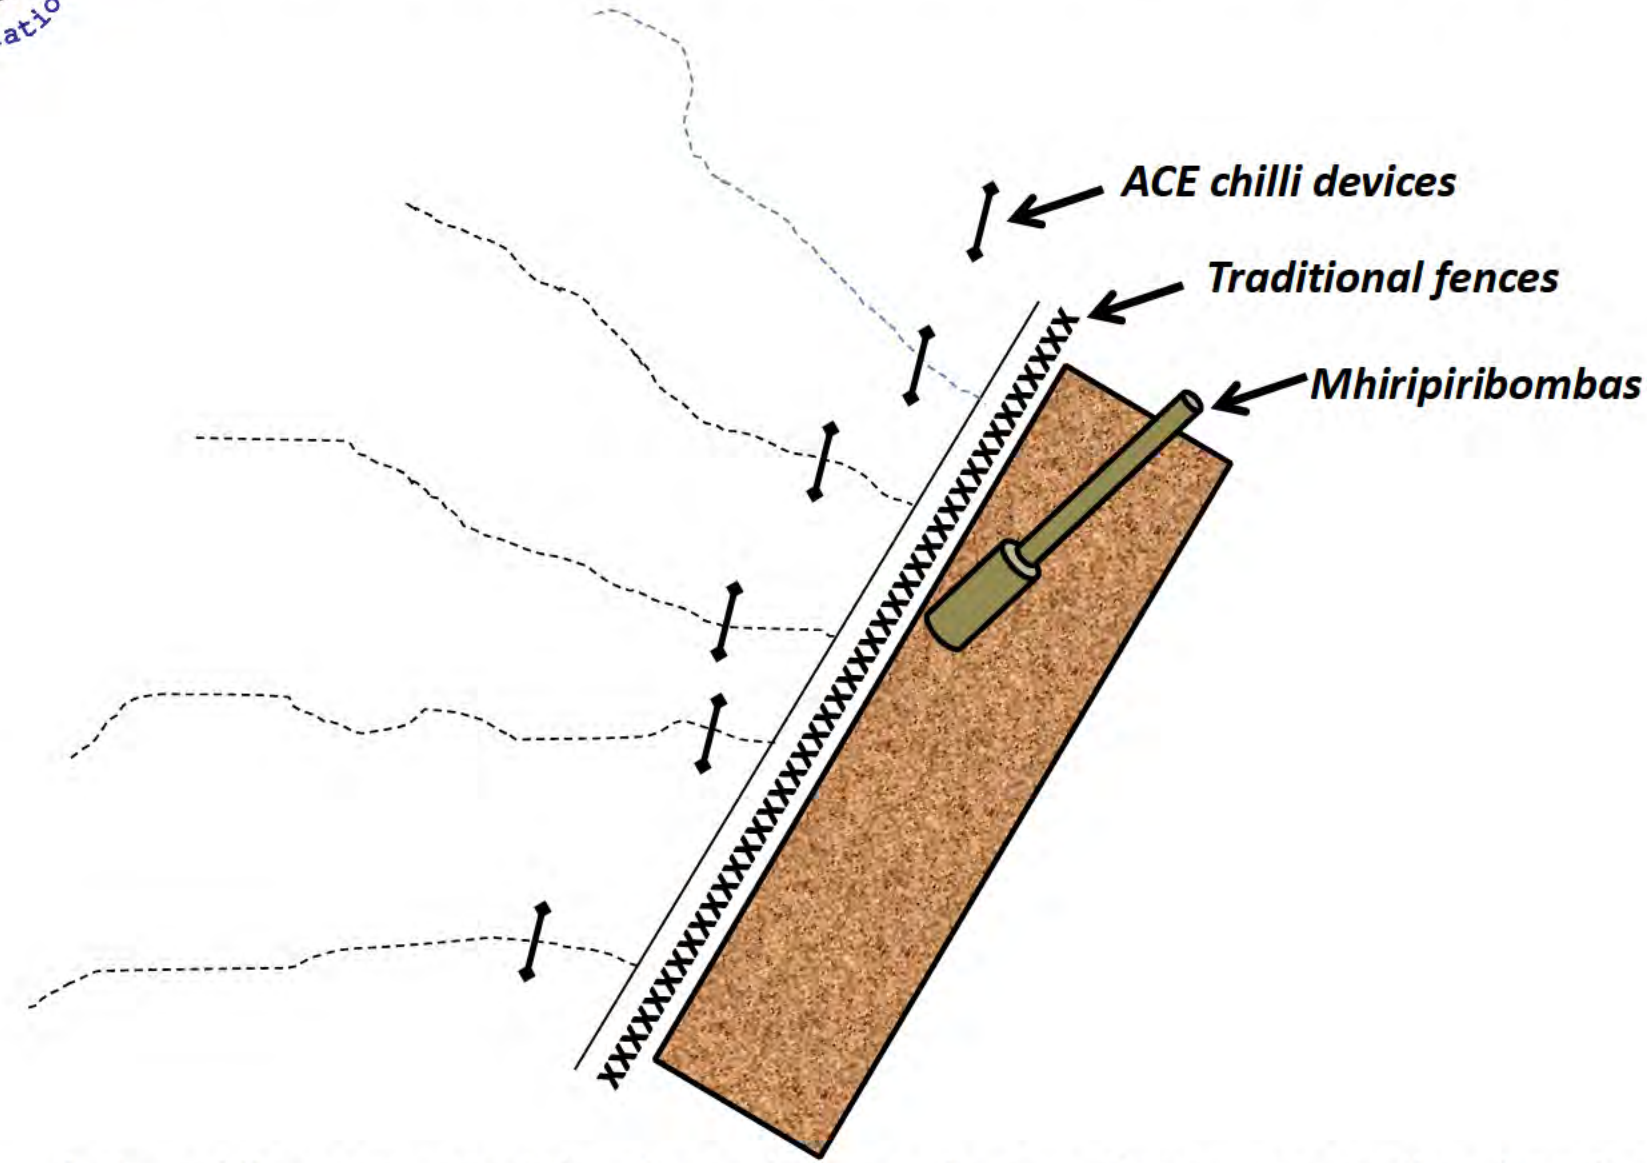
TRENDS IN HWC



PROPOSED LONG TERM SOLUTIONS

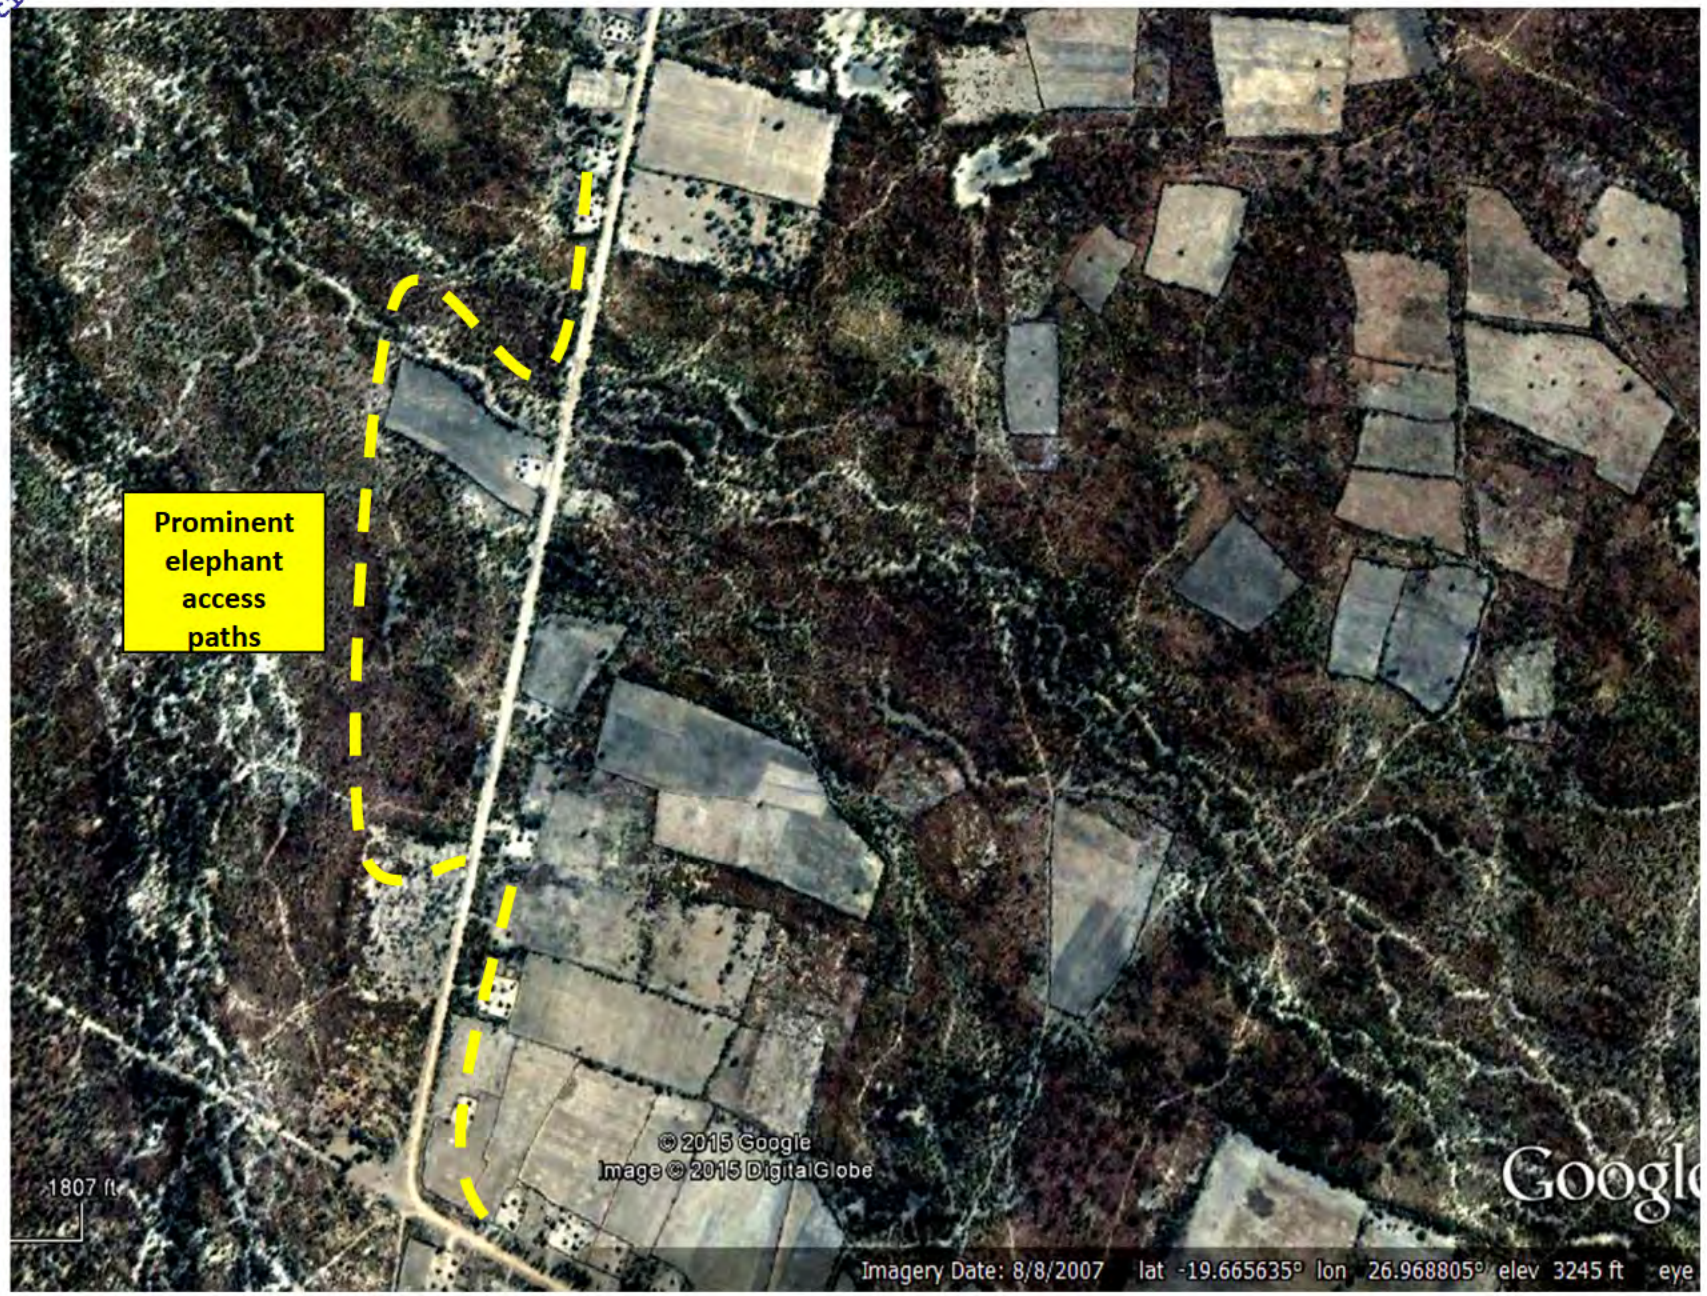


PILOT HWC MITIGATION SCHEME WARD 7 TSHOLOTSHO



A two kilometre stretch of road was chosen from across the bend near borehole 27 towards Pelendaba for the protocol.

PILOT HWC MITIGATION SCHEME WARD 7 TSHOLOTSHO



CONCLUSION

Summary of the impacts of the African Elephant importation ban on CAMPFIRE:

(a) Negatively affected the voluntary participation of communities in wildlife conservation;

(b) Elephant populations capable of producing sustainable and economically significant revenues are now a bigger cost to communities;

(c) Benefits for local communities have declined:

- The number of elephant harvested has decreased.
- The extent of the present elephant habitat can no longer compete with other alternative land uses, even if less viable in the long term.

(d) The ban has effectively galvanized a global anti-hunting lobby against Zimbabwe.

Elephant damage in Bulilima district, South Western Zimbabwe: 25 October 2015

THANK YOU

14th AFRICAN WILDLIFE CONSULTATIVE FORUM

LAND USE PLANNING AT THE LOCAL LEVEL

Chief Senator D. Chisunga
Masoka Community, Mbire District
Zimbabwe
10 November 2015

Legend Resort, South Africa

Introduction

My presentation is based on land use planning at the local level.

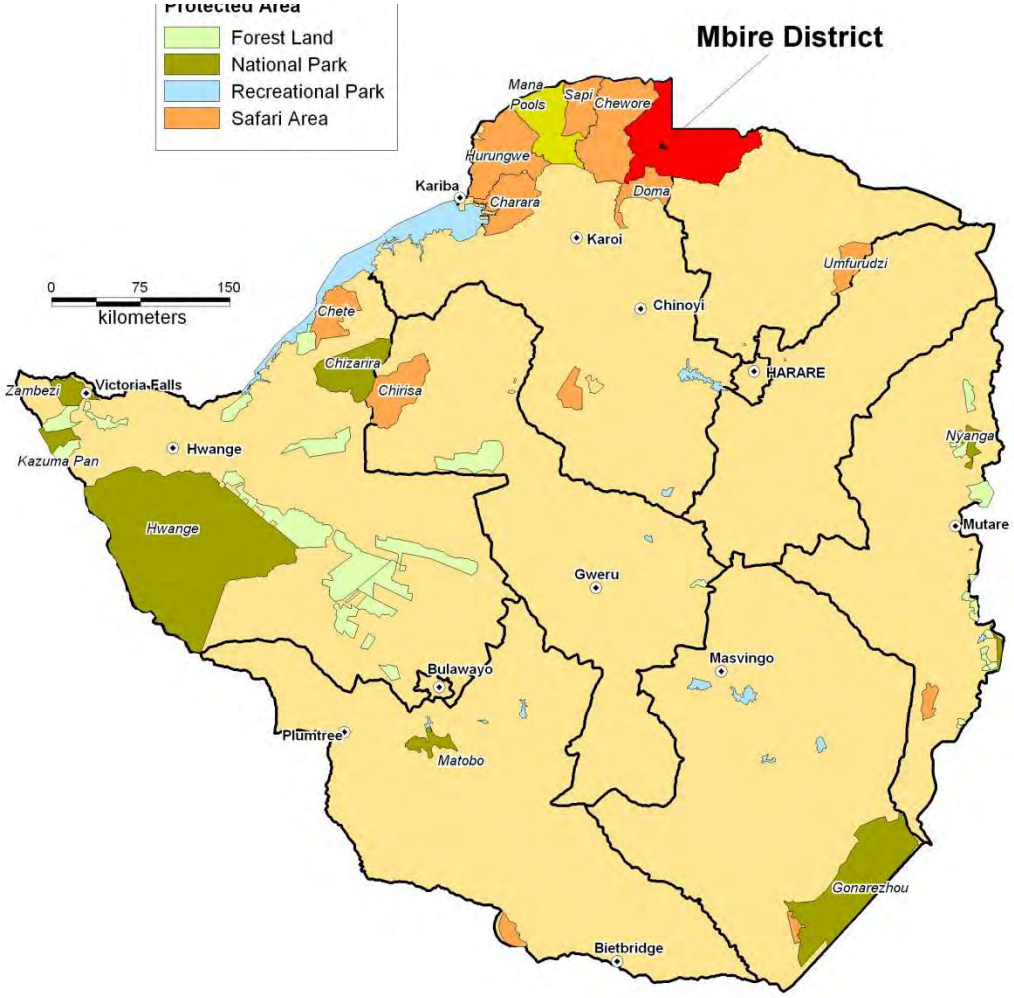
In Zimbabwe there are Acts of Parliament which underpin planning at all levels. Examples are the:
Communal Lands Act;
Regional Town and Country Planning Act;
Traditional leaders Act; and the
Rural District Councils Act

The later is the principal planning instrument at local level in rural areas.

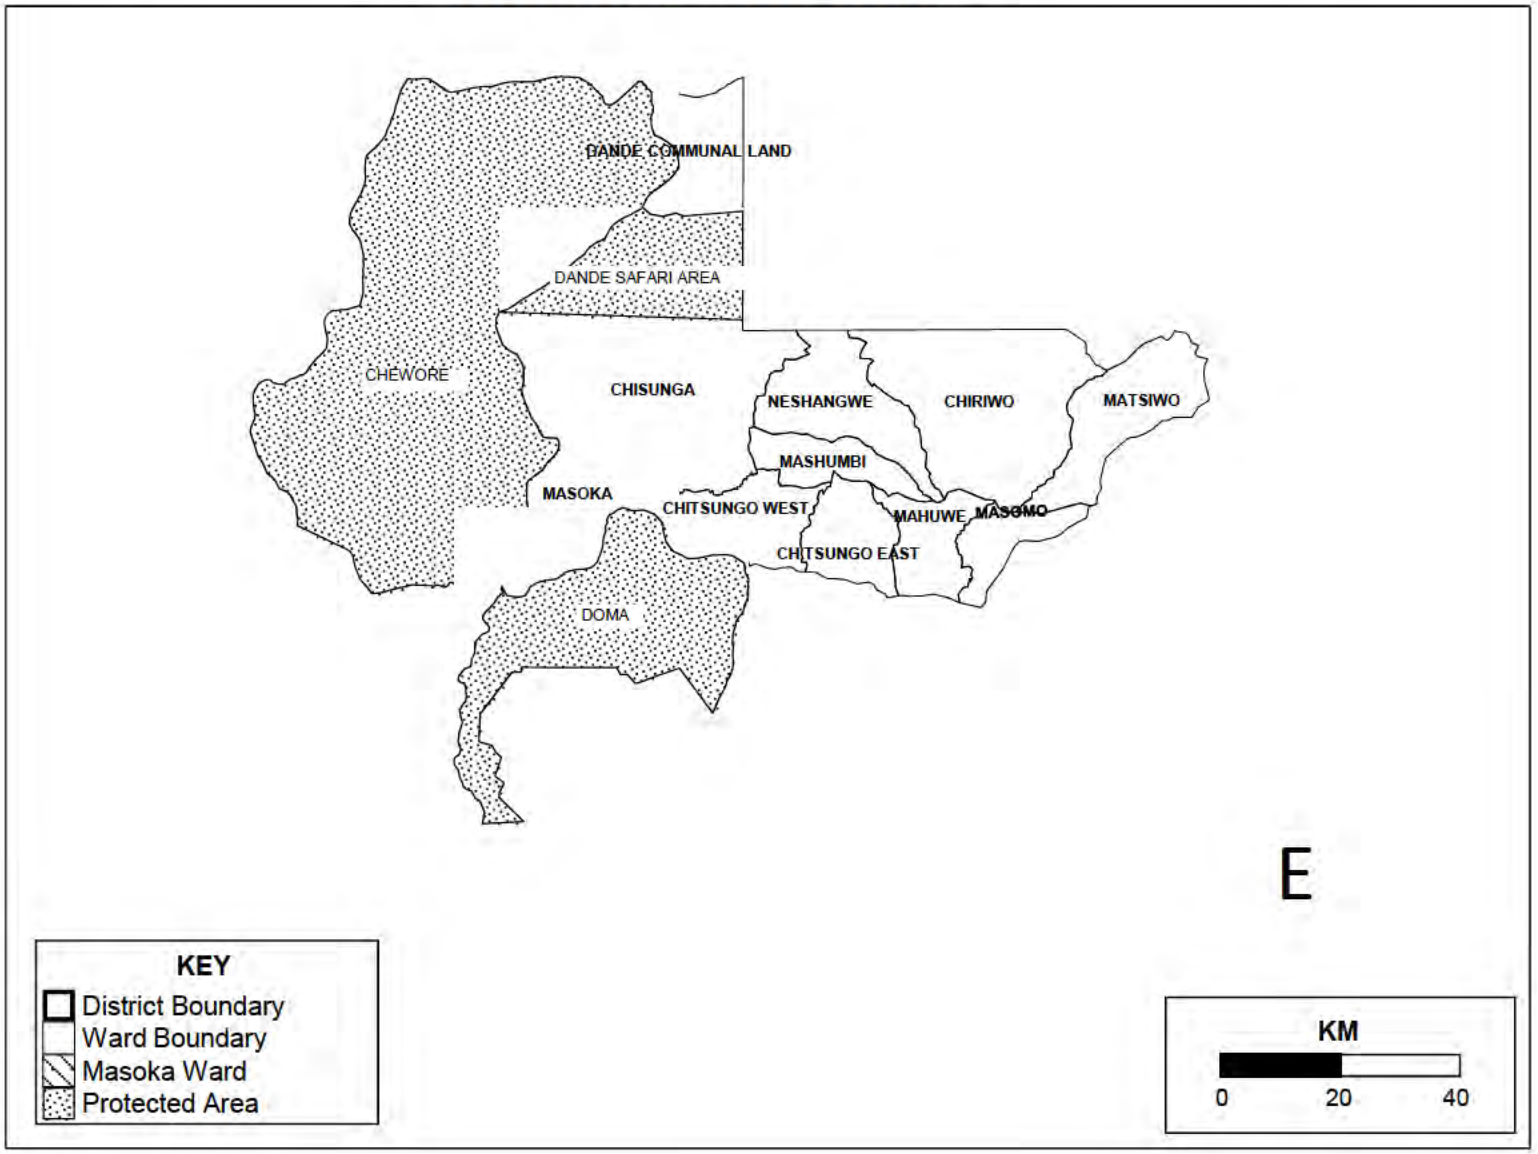
Most communal areas with abundant natural resources fall under Region V ecologically, and receive only about 400-750 mm of rainfall.

The colonial design before independence pushed black people into these areas as the areas were not suitable for commercial agriculture. This forms the basis for animal husbandry, especially wildlife, as a land use option for such communities. I come from such an area which is geographically located in the Zambezi Valley, to the north of Zimbabwe

Map of Zimbabwe



Mbire District and adjacent Chewore, Dande and Doma Safari Areas



Land Use Planning and Wildlife Conservation in Zimbabwe

Most communal area inhabitants are poor and depend on subsistence crop production and livestock rearing. Cropping is largely done in wetter areas.

Livelihoods for communities revolve around production of subsistence food crops and a limited amount of cash crops such as maize, cotton, sorghum and millet.

Wildlife conservation under CAMPFIRE is a rural development strategy that has significantly complimented economic benefits from subsistence farming in the marginal districts of Zimbabwe.

Land Use Planning and Wildlife Conservation in Zimbabwe

After Zimbabwean's independence, there was high demand for communal land for cotton growing, which had then a flourishing market internationally.

High demand of agricultural land in areas with poor rainfall and poor soils resulted in various land use options emerging.

The need to plan how land could be best utilized.

Government formalized wildlife management as a land use option through amendment of the Parks and Wildlife Act (1982) to allow community based natural resource management practices (CAMPFIRE).

An enabling environment was created and institutions were established to support community co-existence with wildlife, and manage wildlife and human conflict. Recognizing many competing livelihood options such as cattle ranching/grazing, gold panning and subsistence agriculture.

Wildlife Management in Mbire District

- Mbire district's Masoka Ward is the first community in Zimbabwe to adapt CAMPFIRE principles as a natural resource management regime for local development.
- The district's communal and adjacent State protected areas support a diverse and extensive population of large mammals.
- Governance of natural resources is done through Ward Wildlife Committees (WWCs).
- Rules and regulations exist, including constitutions.
- Project management by the communities is generally efficient, bank accounts are maintained.
- Involvement of the private sector is currently restricted to two safari operators.

2013 DANDE SAFARI AREA, DANDE NORTH AND DANDE EAST - ACTUAL PAYMENTS BY SAFARI OPERATOR

	Hunting	Social Funds	Bird quota/ Camp rental	Total
Council	US$206,624.0	US$47,000.0	US$3,000.0	US$256,624.0

2014	9
2015	3 (as of 14th October 2015)

COLLABORATIVE APPROACH TO ANTI-POACHING IN MBIRE DISTRICT

DANDE ANTI-POACHING UNIT (DAPU)

Prior to 2010 that “community scouts” were thoroughly discouraged as often they went up to a year without any pay - (hyper inflation)

Safari operator (with donor/client help) began support of the community scouts (10 to begin with) in Dande East – payment of half of their salaries, food, and equipment.

DAPU consists of:

1. Two full time “managers” employed.
2. Two dedicated land cruisers allocated.
3. 22 “community scouts” under DAPU control.
4. Access to 18 “Council Scouts”.
5. Access to 18 “Parks Rangers”.

The results are gratifying - poachers are on the back foot, thousands of snares have been picked up, and dozens of poachers arrested.

PLANNING FOR THE FUTURE OF WILDLIFE AND PEOPLE

In order for communities to conserve natural resources, value and benefits have to be attached to the resources.

Due to dwindling space there is need for planning. Communities are consulted through participatory processes which embrace the needs of communities, wildlife, in a changing environment e.g. the establishment of conservancies for both consumptive and won consumptive tourism.

Conservation must produce benefits.

Even our trees are pay for their existence through carbon storage, Carbon credits have been sold and benefitted communities in Mbire.

In Zimbabwe, CAMPFIRE has worked very well for marginalized communities.

There are also opportunity costs associated with conservation - trauma caused by all night guarding of crops or livestock from Elephants and Lions.

People get killed by Lions, Elephants, Hippos, Crocodiles and Buffaloes

The cost of conservation in rural areas is high, hence the need for elephants to pay for their survival.

CONCLUSION

Poor rural communities are at the **frontline** of human and elephant conflict. They **tolerate crop damage and refrain from taking the law into their own hands** simply because currently they enjoy the benefits of hunting.

Communities in producer wards **do not want to see their hunting benefits being depleted by poachers**. HOWEVER, if there are no rewards from legal hunting they will in turn actively assist or actually poach those same elephants for reward.

A Parks led patrol accompanied by DAPU with arrested poachers

THANK YOU

Memorandum

To: The File

From: Chief, Branch of Permits

Subject: Enhancement Finding for African Elephants Taken as Sport-hunted Trophies in Zimbabwe.

The African Elephant (Loxodonta africana) is listed as threatened under the U.S. Endangered Species Act with a special rule at 50 CFR 17.40(e). The special rule sets forth requirements for the import of sport-hunted trophies, including marking requirements for ivory. Under paragraph 17.40(e)(3)(iii)(C),the Service must make a finding that the killing of the elephant whose trophy is intended for import would enhance the survival of the species.

Based on available information, the OMA believes that Zimbabwe is effectively conserving and managing the elephant population throughout the country and finds that the import of sport-hunted elephant trophies from Zimbabwe enhances the survival of the species. This finding applies to all African elephant trophies lawfully taken in Zimbabwe, provided they are imported by the person who hunted them for personal use.

Basis for Enhancement Finding:

Population Status: Aerial surveys of elephant populations have been undertaken by the Department of National Parks & Wild Life Management (DNPWLM) since 1980 using standard sample count techniques. As a result, Zimbabwe has one of the best sets of elephant population data in Africa. There were no surveys conducted in 1996 presumably due to the loss of DNPWLM's survey craft. There were previous concerns raised about the accuracy of these surveys due to the possibility of double-counting of elephants that may move between Zimbabwe and adjoining countries, and differing population estimates. These concerns were addressed by conducting simultaneous surveys of the Matebeleland north elephant population in Zimbabwe, and those in the north of Botswana and the Caprivi Strip in Namibia. These surveys were conducted under the coordination of the European Union funded ELESMAP project. In addition, an independent survey was conducted by Price Waterhouse in 1996 which also confirmed Zimbabwe's elephant population estimates.

Zimbabwe's elephant population was estimated at approximately 46,000 elephants in 1980. The current estimates from 1995 indicate the population in Zimbabwe stands at approximately 66,000 animals. This represents a population growth of about 5% per annum. This increase has not been consistent across all sub-populations. There has been no significant increase seen in the Gonarezhou and Sebungwe populations. These elephant populations have been affected by increased human populations and by drought. There were also high levels of poaching and management offtake which took place in these areas in the late 1980's.

Management Plan: In Zimbabwe, the elephants range can be classified into four major sub-regions. They are the Matebeleland north-west, Zambezi Valley, Sebungwe and Gonarezhou. There is concern that high elephant concentrations are having a great impact on Savanna ecosystems within Zimbabwe. In 1975, Zimbabwe passed the Parks and Wild Life Act which established National Parks to preserve and protect wildlife and plants and to maintain ecological stability. Until 1989, DNPWLM managed elephant densities in protected areas through culling operations. This practice was drastically reduced due to lack of funds and possibly due to public opinion. In 1992/1993, Zimbabwe experienced a mayor elephant die-off in the Gonarezhou region due to severe drought conditions. A major culling operation was resumed in this area where 350 elephants were culled. In addition, DNPWLM conducted a translocation operation where 1,400 elephants were translocated to private conservancies and about 200 were translocated to South Africa to stock a new Game Park. Despite these efforts to reduce the Gonarezhou population, 1,500 elephants died due to natural mortality.

The increase in Zimbabwe's human population has resulted in an increase in human-elephant conflicts. Zimbabwe is dealing with this problem through a program of conservation based community development referred to as CAMPFIRE.

Management Program: Under the Parks and Wild Life Act, as amended August 1, 1991, elephants are afforded the highest level of legal protection in National Parks where the killing of elephants is undertaken only as a management tool to protect habitat. Other range areas available to the elephant include Safari areas, Communal and Private land where sustainable recreational hunting is permitted. The sale and purchase of live animals or trophies in these areas is subject to a permit, and hunting on state land also requires a permit.

In Communal lands, the protection of elephants falls under the CAMPFIRE program which encourages reductions in human-elephant conflicts through conservation-based community development. The program was established in 1989 as a means of providing an economic incentive and return to rural communities while encouraging tolerance for the elephant and sustainable use of natural resources. Under this program there are currently 29 Rural District Councils (RDC's) which have been granted Appropriate Authority status under the Parks and Wild Life Act. There are approximately 13 RDC's with exploitable wildlife resources which make up the core of the CAMPFIRE program. Revenue generated through sport-hunting is spent according to decisions taken by RDC's and their constituent Communities. The DNPWLM provides guidelines for the distribution of these funds between administrative costs, cost of wildlife management, and returns to communities in wildlife areas.

The CAMPFIRE program has come under criticism relating to excessive retention of generated funds by district councils which resulted in diminished benefits being realized by the communities it was designed to help. Information supplied by the CAMPFIRE Association to the CITES Panel of Experts indicates that this situation is improving. The Association presented evidence on revenue distribution for five districts from 1991 to 1995. In the Chipenge and Hurungwe RDC's, revenue retained by the council maintained a level of 20 % or less. In Binga it was reduced from 50% to 20%, and in Gokwe North revenue retention went from 80% to 53%. In Bulilimamangwe it remained at 50%.

Regulations/Enforcement: Under the Parks and Wild Life Act, Zimbabwe has regulations in place which provide substantial penalties for the unlawful possession of, or trading in ivory. The first offense carries a minimum of 5 years, maximum 15 year prison term. The second offense carries a minimum of 7 years, maximum 15 year prison term.

In 1993, "Operation Safeguard Heritage" was launched by the President of Zimbabwe which incorporated large numbers of army personnel along with Air Force support, the Zimbabwe Republic Police (ZRP), and DNPWLM in a coordinated anti-poaching effort throughout the country. The overall anti-poaching manpower densities in protected areas stands at one game scout per 76 sq. km. The Investigations branch of the DNPWLM currently has 9 officers and 7 game scouts based in Harare, Bulawayo, Mutare, Kariba, Hwange, and Beitbridge. The ZRP has a support unit of 112 men which assist anti-poaching programs in the districts of Makuti, Mashumbi Pools, Binga, and Hwange. Elephants located in communal lands come under the protection of the CAMPFIRE program.

The DNPWLM operational budget allocation from the central government has been severely reduced in recent years. The current law enforcement expenditure is equivalent to $49.00 spent per sq. km on the elephant range, greatly reducing enforcement capabilities. The status of DNPWLM changed in January 1996, when the Government of Zimbabwe approved the establishment of the Parks and Wild Life Conservation Fund, a statutory "Fund" responsible for financing operations directly from wildlife revenues. These revenues are generated through sport-hunting conducted on state and private lands. The CITES Panel of Experts raised concerns as to the current status of DNPWLM relating to its weak financial base, lack of management skills, inadequate and old equipment and poor infrastructure. The DNPWLM informed the Panel that this situation is improving, although it was not made clear how these improvements are being accomplished.

Sustainable Use: The CITES Secretariat has provided documentation that Zimbabwe has established a quota of 400 elephants (800 tusks) for the 1997 hunting season. These quotas are established each year by DNPWLM based upon standardized aerial surveys and analysis of biological data collected from hunts in determining the sustainability of offtake. This quota represents 0.6 per cent of the elephant population of Zimbabwe.

Total levels of current and projected offtake from the Zimbabwe elephant population are sustainable. From 1989 to 1995, problem animal control (PAC) resulted in 20 to 69 elephants being taken annually due to human-elephant conflicts. The number of elephants killed under PAC is deducted from the hunting quota for a given area. The DNPWLM has introduced

localized culling or "disturbance culling" in areas experiencing high elephant problem reports. No large scale elephant culls have been undertaken since 1989, although this remains a management option in removing the annual increment. The illegal hunting of elephants has decline in recent years with a high of 99 elephants being taken in 1990 compared to a low of 38 elephants taken in 1995. This decrease has occurred despite the drop in DNPWLM funding and manpower.

The principle form of utilization of the elephant in Zimbabwe is sport-hunting. In the 1995 hunting season, a quota of 300 elephants was approved, of which 121 were taken. These quotas are set to maximize the sustainable production of high quality trophies without detriment to the population. Under the Campfire program, rural communities benefit from revenue generated by sport-hunting. With increased human-elephant conflicts on Communal lands, sport-hunting is an important tool which gives these communities a stake in sustainable management of the elephant as a natural and economic resource.

CITES Implementation: The Control of Goods (Import and Export) (Wildlife) Regulations of 1982, and the Parks and Wild Life Act of 1975 as amended on August 1, 1990, allow for the implementation of the provisions of CITES in Zimbabwe. All exports of sport-hunted trophies from Zimbabwe will conform with CITES regulations.

Hi John,
Thank you for your e-mail and all you are doing for the hunting fraternity on this and in the past.
You are correct that we are the front line savior for the Elephant and poaching deterrent.

I do not have much proof in statements, but do the Helicopter invoices, Helicopter fuel purchases and a bunch of photos of the operations.

In a nut shell, I won the area in a tender in April of last year, but as you know I have been hunting in Tsholotsho since 1996, but under the operator that owned it. So I was pretty much just an PH bringing in my clients.
When we got control of the area in June, I immediately started anti-poaching operations and have a 20 man strong anti-poaching team in place.
We immediately started recovering snares in the area and found areas where poachers had there camps etc for meat poaching.
Anyway, we had a Russian client with us and we were hunting in several areas

for Elephant and Leopard and the only way we could get around in the minimum time was to have a Helicopter to ferry us back and forth to all the different areas we where conducting the Safari. The client tok 2 x Leopards and 8 x Elephants.

On one of our flights to one of our areas we flew partially over the Hwnage Nat. Park and I spotted a group of dead Elephant. I immediately instructed the pilot to turn back and go lower to have a look, and sure enough we saw +/- 5 carcasses with their tusks removed.
As soon as we landed at the other area we were hunting I telephoned Merilyn to advise the Nat. Parks offices of what we had spotted. As they had no clue, transport I got the Helicopter to fly back and pick up 3 scouts and go back and land and check what was happening. Which they did, I was not with as I was on the safari with the Russian client, and we discovered that they where definitely poached, but there was no bullet holes in the carcasses. With further investigations they found other dead animals, so we realized it is poison and found the area they had laced with Cyanide.

I sent a 2 x vehicles from my Tsholotsho base to get Nat Parks scouts to patrol the area, while I was finishing off the hunt with my Russian client. While I was still on the hunt, my anti-poaching scouts found fresh tracks of 4 people moving through our concession towards the Hwange Nat Park boundary. They immediately sprung into action and followed the tracks. They caught up the suspected poachers where they were seated in thick bush and cooking some food. Two of my scouts kreeped up to the suspected poachers to see what and how they can be apprehended. My senior scout realized that there was something different with these poachers as they had no wire snares, guns. But had 2 x axes, about 10 5 liter plastic containers and two 20 liter containers which looked liked they had water in them. Further they saw a whit plastic bag placed away from where they were seated.
He made the decision to pull back and radioed back to our camp base to advise and asked a vehicle to go and fetch the Nat. Parks Scouts that where on the ground patrolling about 30 km's to the north of my anti-poaching teams current position.

In the mean time the suspected poachers gathered there belongings and started on there route. My anti-poaching team followed them at a distance until they reached the Hwange Nat Park boundary with our hunting concession, Tsholotsho South.

An hour so later the Nat Parks scouts arrived at the crossing place and they took up the spoor. They followed the spoor all afternoon, slept on the spoor and kept on following the tracks the next day.
On the way they started seeing the carnage. New spots where water containers were placed and filled with water and laced with Cyanide.

They followed the tracks back to our boundary line with Hwange Nat. Park and kept on the tracks till they got to the houses where the suspected poachers where staying.
That evening / night when the unsuspected poachers where relaxed they moved in and arrested them. With a bit of interrogation they revealed where the tusks where buried and led the scouts to the plave where they recovered many tusks.
I received word that evening and immediately made plans to get the Helicopter into the air the next day to look at the full scale of the poaching problem. Luckily we were at the end of the clients hunt and he left the very day, so I could use the Helicopter for the reconnaissance. As the helicopter was a big Helicopter and cost where huge we got in smaller Helicopter a few days later to help with alll the flights.

With a bit more interrogation we got the buyers names and contact numbers and set up a sting to get the poachers and the buyers to meet. With in hours

we had also arrested the buyers as well.

That is in a nut shell of what happened.
As I wrote in a previous e-mail. All costs of this operations, future operations and still today we are funding.

I am getting all the figure together, but just the Helicopter fuel is close to USD 8 000.

If you have any questions or want to know more, let me know.
I will send some photos so long.

Thank you and Best Regards
Thys

Thys,

I need your info about your role in the discovery and response to the poisoning to show that hunting is the first line of defense. Please rush. Tell your hunters I will help them if they get caught in the middle.

Best,
John

in association with Global Marketing Consultants LLC

Tel: +263 4 499536 HOP 0259. Email: hunting@cmsafaris.com . Website: www.cmsafaris.com

9th April 2014

Dear Sir

Myself and my partner of CharltonMcCallum Safaris, being Myles McCallum and the community of the Dande communal land and Safari area, are writing this letter to you to highlight the terribly negative impact of your decision to suspend importation of elephant for 2014 with immediate effect it will have on, not only all the people living in the area, but also the elephant themselves that you seek to protect.

Our company was the first hunting company in Zimbabwe to go in a joint venture project with the communities living within the area itself, as we felt that the people were not getting their fair dues from hunting and that they should play an active role in the sustainable off take of wild animals living within their area. The primary animal that benefits them is elephant.

We hunt 15 elephant bulls in our Dande area. These are sold on 14 days at us$1100/day and trophy fees of us$15000 per elephant. This amounts to a total of $231,000. Then a further us$225,000 for the trophy fees making a grand total of us$456,000. . From this amount the communities earn 50% of this, being US$228,000. The communities themselves fund numerous projects from this income including clinics, schools, water wells etc which will be directly affected by your decision to suspend elephant trophies.

Our company uses the monies generated from the elephant hunting to operate a very successful anti-poaching unit, The Dande Anti-Poaching Unit- DAPU. Please look at the link below to understand how effective and costly this project is http://cmsafaris.com/african-elephant-research/dande-anti-poaching.htm

DAPU survives through funding from ourselves and the generous donations from our Elephant hunters who, when on the ground realise that without DAPU involvement we would be losing many elephant to poaching. For your information we started DAPU 4 years ago when we counted 40 elephant carcasses found from the previous off season. This last year we have found only one- a clear sign that we are having a great effect on conserving our elephant numbers.

I can honestly say that with a possible 14 elephant cancellations that we are now looking at for the 2014 season due to your decision we will not be able to continue the sterling work that DAPU has managed over the last 4 years and without a doubt we will reverse all the gains that we have seen and we will be back to finding dozens of elephant carcasses.

So in short, Sir, the ban will have a very negative impact on not only the people of the Dande but the very elephant you wish to protect. Should the ban not be reversed we will start to see wide spread elephant poaching again. It will also affect some 20 000 people that rely on monies and work generated through elephant hunt. I hope that you will reconsider your suspension.

Regards James Charlton

SPECIAL SUPPLEMENT

Illegal Wildlife Trade and Poaching

DATELINE:
United States

John J. Jackson III

There are a host of reactions in both the United States and the European Union to the reported upsurge in poaching and illegal trade of wildlife. President Obama's Executive Order creating both an *Illegal Wildlife Trafficking Task Force* and an *Advisory Council* conspicuously left out membership of the hunting community, but not the animal rights and protectionist groups. Consequently, many of the suggestions have been aimed at lawful, regulated trade rather than poaching and unlawful trade. Of course, licensed, regulated hunting and trade generates budget revenue for anti-poaching and crucial anti-poaching incentives for local people. Hunting operators also directly and indirectly reduce and help control poaching. In fact, the regulated hunting community is the foremost anti-poaching force in the world as hunting leadership has been for thousands of years. From the very inception, wildlife management has included anti-poaching ("Ancient Asian societies" – Raul Valdez, *Exploring Our Ancient Roots*). We are the real experts.

Conservation Force itself has funded many millions of dollars of poaching control in pass-through donations. Conservation Force's activities have tripled anti-poaching funding in Pakistan, doubled rhino anti-poaching revenue in Namibia, and routinely generates 200 to 500 thousand dollars a year in anti-poaching through partnerships with hunting operators across Africa. For example, we facilitate over $100,000 annually through the Cullman & Hurt Foundation in Tanzania as well as up to $300,000 for the Tanganyika Wildlife Foundation in Tanzania. It is well documented that the presence of hunting operators itself deters poaching and provides alerts to authorities. The absence of operators is like leaving your house open and empty – it is an invitation for thieves to move in.

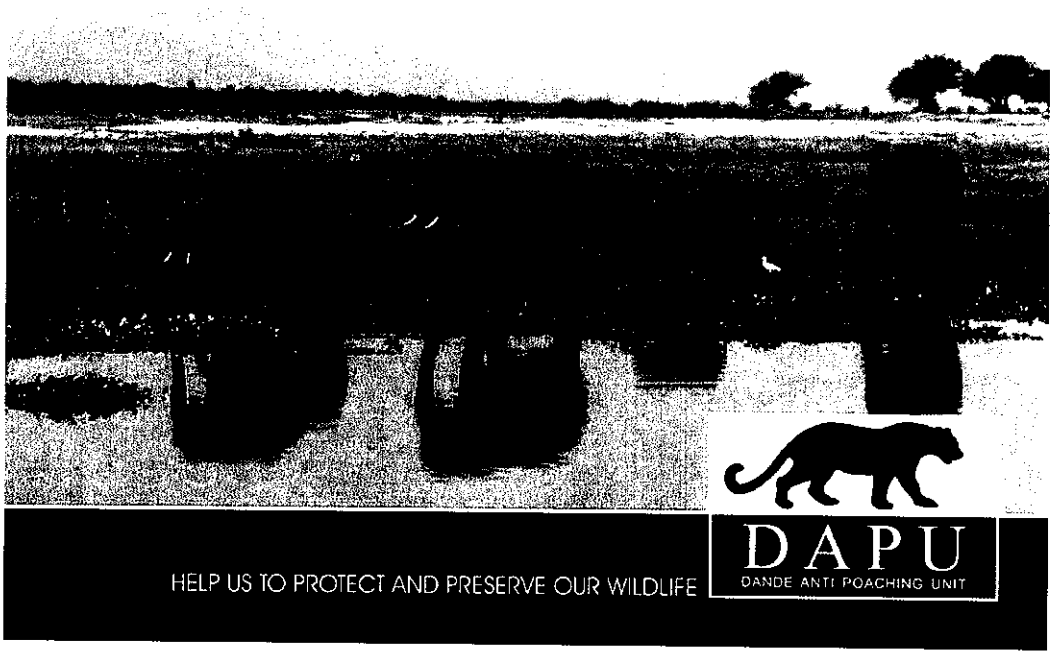
Conservation Force's partner, CIC, will hold a Global Summit entitled *Hunters United Against Wildlife Crime* at the beginning of its AGM in Milan, Italy on April 24, 2014.

The Professional Hunters Association of South Africa, PHASA, has begun collecting $500 from all rhino hunting and rhino darting safaris for rhino anti-poaching as contributions to and through Conservation Force in a new rhino anti-poaching strategy.

Conservation Force is also forming an anti-poaching partnership with all the Republic of South Africa and Mozambique hunting operators surrounding Kruger National Park to contain the rhino poaching in and around the park. It will be a ring or circle of added protection.

Of course, the funds from the recent black rhino auction at Dallas Safari Club's convention resting in Conservation Force's trust account are dedicated to control of poaching and closely related conservation measures in Namibia.

We hope to showcase these growing anti-poaching partnerships in these pages in the future. One exemplary project is the Dande Anti-Poaching Unit we have just partnered with in Zimbabwe. View the following brochure and their website at http://cmsafaris.com/african-elephant-research/dande-anti-poaching.htm. ■



THE PLIGHT OF POACHING

In 2010 Charlton McCallum Safaris took over the Dande East ('East') and the Dande Safari Area ('DSA') we soon realized that rampant poaching was something that needed to be dealt with much more effectively. The National Parks staff in the DSA were doing a decent job. However the community scouts in the East, with no incentives and seldom getting paid were an ineffective unit.

The East was considered a depleted area, only good for early season crop raiding elephant bulls from Mozambique. The primary reason for this was that the previous hunting operator only hunted the early season for elephant. Then pulling out for the rest of the year leaving it wide open to uncontrolled poaching.

In 2009 CMS enlisted the help of Dr. Russell Taylor to carry out a 'capacity study' in the East. His theoretical results were amazing and he estimated that the area could safely hold 1000 buffalo, 500 kudu, 500 sable etc.

With this in mind as soon as our contract started in 2010, we immediately formed the DANDE ANTI POACHING UNIT (DAPU). To date our full time teams in the East have picked up over 5000 snares and have arrested over 60 poachers (in four years). The game has rebounded strongly which is extremely gratifying. In 2013 we took over Dande North ('North') once again unifying it with the DSA and discovered the same sad story existed with the North. As of 2014 DAPU now supports both the East and North community scouts. The crux of the matter is that DAPU has now out grown our small company and we simply cannot afford to keep up the financial effort. Expenses and incentives paid out keep increasing, but we have to continue with our anti poaching!

CMS will continue funding the bulk of all expenses, however we hope your contributions will assist us to expand DAPU, ultimately improving the Dande North and East hunting concessions for the benefit of all hunters to come and the local communities.

You can contribute to DAPU by sending a check to Conservation Force (see back of pamphlet).
As a suggestion $20 per hunting day - **it is tax deductible!**

HOW CAN YOU HELP?

Would you like to assist us in ending the poaching? Donate a monetary amount for CMS to allocate as needed or sponsor a game scout. Any donation, no matter the amount, will help in the fight against poaching and will be greatly appreciated. To make a donation, see the back of this brochure.

CMS would like to thank you in advance for helping us continue this good cause that has resulted in Dande being one of the most sought after valley safari areas.

Keep up to date with projects and initiatives set up by Charlton McCallum Safaris, visit DAPU on our website:

Conservation Force Solves Liberia Trophy Import Problems

In October 2012, US Fish & Wildlife Service (USFWS) Law Enforcement began detaining trophies imported from newly opened Liberia. They detained some and formally seized others. In effect, it became a blockade. Conservation Force has done all that it could for the past 16 months to determine the reason for the seizures, to prevent the forfeitures during the interim, and to clear the apparent USFWS blockade of all trophies being imported from Liberia. Case-by-case, the logjam of problems was finally cleared in the first few months of 2014.

The problems have been identified and all but one hunter's trophies have been released. The first and worst problem was that USFWS Law Enforcement thought the hunting was illegal because it had been closed and the CITES trophy export permits had a number of errors and omissions. This was made worse by the refusal of Law Enforcement to even respond to inquiries about why trophies were being detained and/or seized. Under the provisions of the *Service Manual* the inspector is supposed to provide

a detailed narrative when a trophy is detained and a second detailed narrative in the *Notice of Proposed Seizure and Forfeiture.* USFWS Service Manual, Part 443 (Law Enforcement), Chapter 1 (Wildlife Inspection Policy and Procedures) 1.15, 1.16, 1.17 and 50 CFR 14.53, Detention and refusal of clearance, 12.11 and 12.23 – all require a narrative explaining "why" the detention or seizure and also mandate certain deadlines for providing "why" the import is refused. That was not provided in any of the cases, and the seizing agent would not respond to phone messages and emails. This was made worse by a change in both the Regional Solicitor and the Resident Agent in Charge of Law Enforcement. The whole thing was handled very poorly by the Service. Because there was no descriptive narrative of the factual basis of the alleged general violations of law, the errors in the export permitting could not be identified or corrected. Liberia issued amended export permits that were not accepted because there was no USFWS narrative explanation of why the export permits were considered invalid, if that was the problem at all.

The permitting problems were omissions that were rather simple to correct had they been identified. They arose only because the Liberian CITES authorities had no experience with export of hunting trophies. The Law Enforcement tone, speculation and accusations that hunting was not open and that the authorities were acting fraudulently only made resolution more difficult.

Conservation Force was concerned that the trophy blockade would discourage the experimental opening of hunting in Liberia, thus we did everything we could to identify and solve the problems. All (legal) representation has been a free, public service to the US hunters and Liberia because of the importance to the hunting and conservation community. Had we not intervened, most of the trophies would have been forfeited. But for the petitions for remission that Conservation Force filed, there would be no explanation of the detentions and seizures (though a year late) so that Liberia and the hunting community could take corrective measures. The trophies that were detained indefinitely without proper notice or explanation would no doubt have been seized and forfeited as well.

The caveat to hunters and their brokers is that **export permits from newly opened countries must be examined space-by-space for completeness and errors.** CITES export permitting requires experience. Of course, USFWS Law Enforcement performance did not help. ■

Elephant Hair and Skin Bracelets Importable

In March, USFWS issued import permits for bracelets made of the sole of elephant feet/skin of a sport hunted elephant taken in Tanzania (Appendix I of CITES). This is an important breakthrough for hunters taking elephant in Tanzania or any other country where elephant remain on Appendix I, such as Zambia, when and if Zambia reopens.

It should be understood that the Division of Management Authority (DMA) issued a CITES import permit. The DMA did not say an import permit was not necessary. Instead, DMA required a separate import application and fee than that for the ivory and other unworked parts being imported as hunting trophies. The bracelets are not treated as trophies because they are "worked" or "crafted," so USFWS requires separate import permit applications.

USFWS has published a proposed regulation to treat such crafted parts as trophies, but it has not been finalized. We were concerned that crafted parts of an Appendix I species would not be permitted since applications for import of scrimshawed/crafted elephant tusks have been denied in the past, though we don't know how such an application would be treated today.

It should be pointed out that elephant bracelets from Republic of South Africa, Namibia, Botswana and Zimbabwe, where elephant are on Appendix II, also require an import permit for the "worked" bracelet, even though an import permit is not appropriate for the unworked parts that are considered "trophy" parts. The downlisting of those elephant to Appendix II is only as trophies, which USFWS maintains excludes crafted parts. If the part is not a "trophy" because it has been crafted, then that part remains on Appendix I, thus an import permit is necessary just like in Tanzania and Zambia where even trophies are on Appendix I (not downlisted with an annotation).

We presume that bracelets of elephant hair will be treated the same as those approved skin bracelets from the soles of elephant feet. The same is true of elephant feet and bones made into useful or decorative items. ■

THE PLIGHT OF POACHING

In 2010 Charlton McCallum Safaris took over the Dande East ('East') and the Dande Safari Area ('DSA') we soon realized that rampant poaching was something that needed to be dealt with much more effectively. The National Parks staff in the DSA were doing a decent job. However the community scouts in the East, with no incentives and seldom getting paid were an ineffective unit.

The East was considered a depleted area, only good for early season crop raiding elephant bulls from Mozambique. The primary reason for this was that the previous hunting operator only hunted the early season for elephant. Then pulling out for the rest of the year leaving it wide open to uncontrolled poaching.

In 2009 CMS enlisted the help of Dr. Russell Taylor to carry out a 'capacity study' in the East. His theoretical results were amazing and he estimated that the area could safely hold 1000 buffalo, 500 kudu, 500 sable etc.

With this in mind as soon as our contract started in 2010, we immediately formed the DANDE ANTI POACHING UNIT (DAPU). To date our full time teams in the East have picked up over 5000 snares and have arrested over 60 poachers (in four years). The game has rebounded strongly which is extremely gratifying. In 2013 we took over Dande North ('North') once again unifying it with the DSA and discovered the same sad story existed with the North. As of 2014 DAPU now supports both the East and North community scouts. The crux of the matter is that DAPU has now out grown our small company and we simply cannot afford to keep up the financial effort. Expenses and incentives paid out keep increasing, but we have to continue with our anti poaching!

CMS will continue funding the bulk of all expenses, however we hope your contributions will assist us to expand DAPU, ultimately improving the Dande North and East hunting concessions for the benefit of all hunters to come and the local communities.

You can contribute to DAPU by sending a check to Conservation Force (see back of pamphlet).
As a suggestion $20 per hunting day - **it is tax deductible!**

HOW CAN YOU HELP?

Would you like to assist us in ending the poaching? Donate a monetary amount for CMS to allocate as needed or sponsor a game scout. Any donation, no matter the amount, will help in the fight against poaching and will be greatly appreciated. To make a donation, see the back of this brochure.

CMS would like to thank you in advance for helping us continue this good cause that has resulted in Dande being one of the most sought after valley safari areas.

Keep up to date with projects and initiatives set up by Charlton McCallum Safaris, visit DAPU on our website:

CHIFUTI HUNTING SAFARIS

7 Iona Close
Borrowdale
Harare
Zimbabwe
www.ChifutiSafaris.com
andrewdawson@iwayafrica.com

April 14, 2014

Director, USF&W Department

Please allow me to introduce myself. My partner Andrew Dawson and myself are the directors and owners of Chifuti Safaris, based in the Chewore North Safari Area in the country of Zimbabwe. Our firm is among the largest of it's kind in Zimbabwe, and our lower Zambezi area is one of Africa's true elephant strongholds, as well as home for countless other game. We are one of Zimbabwe Parks Departments largest cash customers, and have enjoyed a long and successful relationship with this department.

In theory, Zimbabwe Parks is assigned the duty to protect wildlife. In fact it is a department this is underpaid, sometimes under trained, and woefully short of the necessary tools (vehicles, petrol, spare parts and often motivation) to conduct their important duties as provided by the government. Here is where the hunting outfitter comes into play. To ensure vital anti poaching programs are carried out 365 days a year, the vast majority of outfitters, out of our own pockets, train, equip, and offer financial incentive to the Parks personal in our areas. In many instances, hunting clients (98% of which are US citizens) donate to our efforts as they see the results of effective anti poaching efforts in our area.
Sirs, Africa has a proven record as it pertains to wildlife: IF IT PAY"S--IT STAYS! Without regulated sport hunting, and the value it places on wildlife, the game is doomed as has been proven in once great countries such as Kenya. Elephant hunting, and the dollars it generates for our company is vital to our ability to operate. The recent, and ill advised ban on import of sport hunted elephant into the US threatens the very efforts you state as the purpose " to protect wildlife". In reality, it is a death blow to the very people and boots on the ground folks who are the one's truly on the front line of anti poaching efforts. And thus your actions loom as THE LARGEST THREAT to the elephant population in Zimbabwe.

The cancellations of booked hunters threatens anti poaching and conservation efforts in place by the Professional Hunting fraternity across the country, and we appeal to you, on behalf of the wildlife we love and are striving to protect, to lift this destructive and unwarranted import ban before permanent damage is inflicted on our national elephant herd. Safari outfitters, and the revenue flowing in from our legal elephant safaris is the life blood of this species, and our front line efforts will no longer exist if this ban stays in place.

We strongly request you to re-consider your position on the ban, take immediate steps to lift it, and begin an effort to work WITH the Zimbabwe Parks Department and Safari Outfitters like Chifuti in our efforts to protect our wildlife, and specifically elephant, through our proven Conservation Through Hunting model.

Respectfully Submitted

Paul Smith,
Director, Chifuti Safaris
Harare, Zimbabwe

KENYA'S WILDLIFE DEBACLE:

The True Cost of Banning Hunting

BY H. CHARLES KAY

A

too routinely attacked by wild animals. No American parent would tolerate what goes on in Africa.

That being the case, it is not surprising then that wildlife has simply disappeared, legal or not. So poaching has actually increased even in national parks. You have to remember that black indigenous landowners were forcefully removed at gunpoint, and without compensation, from every national park and game preserve in east and southern Africa to create "wilderness" pleasuring grounds for white elites. There are few black tourists in any African national park. So the local people "poach" to feed themselves and to earn a few dollars for their families. So would I and so would you, under similar circumstances.

Recently most of the remaining lions in Nairobi National Park, (Nairobi being the capitol of Kenya), were speared to death within sight of the Kenya Wildlife Service's national headquarters, while some 500 bureaucrats sat paralyzed at their desks. "Only a state monopoly could hope to attain such breathtaking heights of incompetence and ineptitude and hope to get away with it." All of which can be traced to the fact that white colonial governments planted the flag and claimed all land and wildlife for king and country, thereby depriving local people of their birthright. What is even more surprising is that black governments have done little to correct this injustice. Instead, policies like banning all consumptive use of wildlife have made the situation worse.

After being forced at gunpoint from every national park and game preserve in east and southern Africa, the locals are now forced to poach to feed themselves and to earn a few dollars for their families.

There is more to this than I can relate here and if you would like additional details, Google Mike Norton-Griffiths and you should be able to find the website on which he has posted a number of his research articles. Dr.

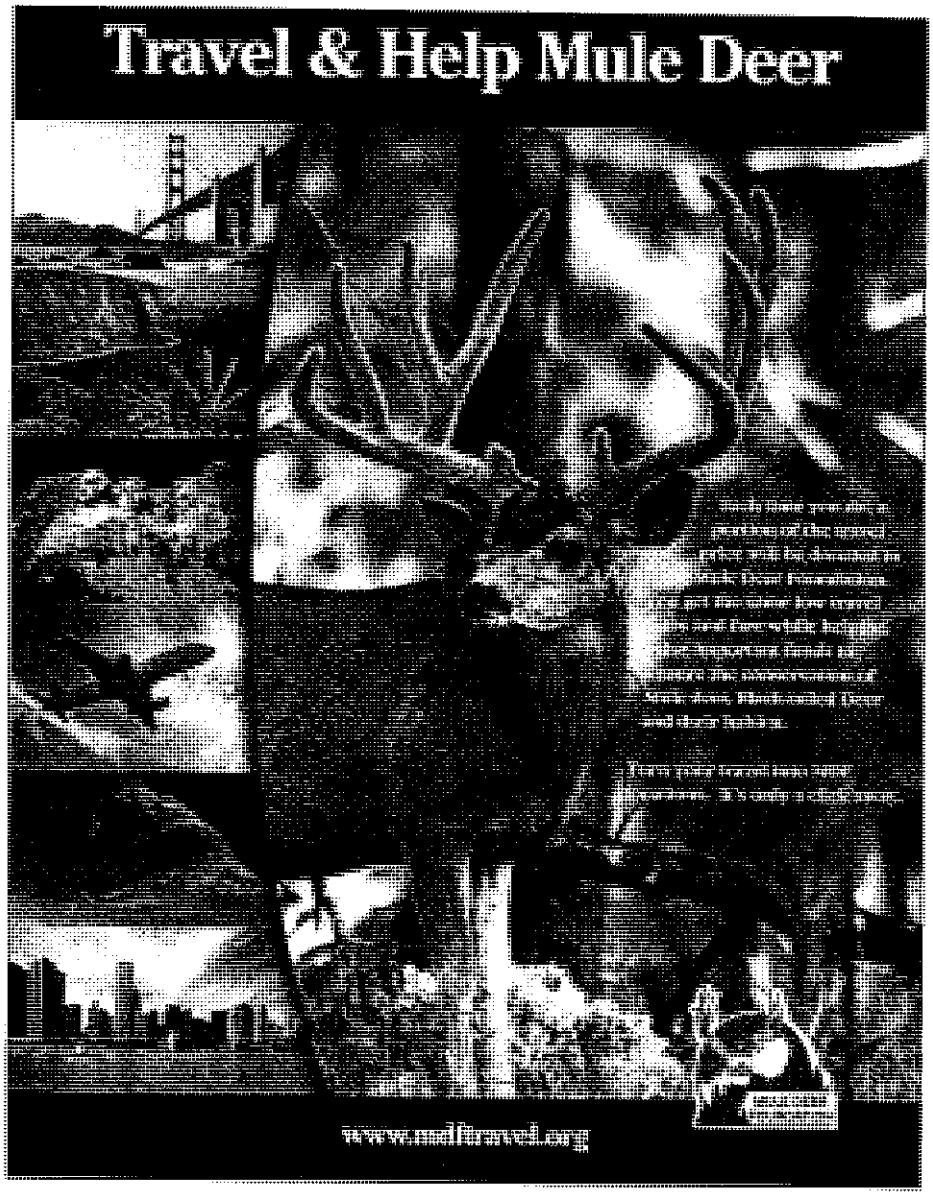
Unlike the problems facing Kenya's wildlife, hunters in the US have always been working for a better solution. Seen here is Wyoming guide, Jim Freeburn (second from right) and his crew. They are all smiles as they show what can come from proper wildlife management and from working hand in hand with private landowners.

Norton-Griffiths is an economist who was born in the U.S., educated in Britain, and who has lived in Kenya for many years. In 2007, Dr. Norton-Griffiths published a paper in World Economics [Vol. 8(2): 41-64] titled, "How Many Wildebeest Do You Need?" that chronicles this sad story. "All [the animals rights organizations] care about is that hunting and other consumptive utilization of wildlife is not reintroduced to Kenya, and whether this leads to further losses of wildlife and to the perpetuation of rural poverty is completely irrelevant to them, because their underlying purpose is not to help Kenya but [to enrich themselves through fundraising]."

At the same time that wildlife numbers have fallen precipitously in Kenya following the prohibition on hunting, wildlife populations in Namibia have doubled. While in South Africa, wildlife habitat has doubled and then doubled again. Why the difference? Because both Namibia and South Africa passed legislation giving landowners rights to wildlife. That is to say, the landowners own the wildlife, at the least the large game species. In South Africa, with which I am most familiar, the ranchers have to high-fence their properties before the government will relinquish ownership of game species, and there are other regulations, as well. But there are no closed seasons, no state licenses, no bag limits, and no prohibited methods. Shooting under the midnight sun is legal; i.e., spotlighting. There are also sanctioned markets in both game meat and live animals. The end of wildlife you say? Nothing could be further from the truth.

As the post-apartheid government has withdrawn subsidies from white cattlemen, the landowners have turned to game ranching and both wildlife populations and sport hunting have experienced phenomenal growth. Now that the government has changed the incentives from wildlife being a cost, to wildlife being an asset, a million acres a year are being converted to wildlife—unlike here in the States, where all you hear about is the loss of wildlife habitat. Private landowners, not the national government, have saved the black wildebeest, blesbok, bontebok, and other species including white and black rhinos, because sport hunting now pays the bills. Aldo Leopold predicted as much back in the 1930's when he wrote an essay on "Game Economics" in which he noted that the surest way to save habitat and enhance wildlife was to allow landowners to profit from protecting habitat and enhancing game populations.

At the present time, plains game hunting in Namibia and South Africa is the most cost efficient big game hunting in the world. Moreover, the trophy quality and hunting experience are outstanding. On my second trip to South Africa, I hunted for three weeks and shot 14 animals, six of which



made Rowland Ward, the international equivalent of Boone and Crockett. The cost? About the same as one high-end, trophy mule deer or elk hunt on a private ranch or Indian Reservation here in the West.

While this has been a blessing for white ranchers, various African governments have also passed laws giving black communal landowners rights to wildlife. In Namibia these are called conservancies and it has been shown that when local people receive a direct financial benefit from wildlife, illegal activity is reduced or even eliminated. It is really quite simple, if sport hunting pays the bills, both wildlife, and more importantly habitat, are not only conserved but enhanced.

In Kenya, animal rights groups claim that wildlife viewing by foreign tourists is more beneficial than sport hunting. In that, though, they are badly mistaken. According to Dr. Norton-Griffiths as "extraordinary as it may seem, not a single tourist company in Kenya invests in wildlife or habitat management even though their very economic future depends upon the resource." This is because most of the large tourist operations are owned by multinational companies, whose only concern is short-term profit. In addition, studies have shown that virtually none of the foreign tourist dollars make it down to the local people, who actually live with wildlife. Instead, black elites divert the money to themselves.

It has been estimated that half the gate receipts from national parks "disappear" before reaching the Kenya treasury. Similarly, there is no accountability of the large financial grants that animal-rights groups make to the government each year, rendering them little more than annual bribes. This is why the black elites that run the country have resisted calls to reinstitute hunting. If hunting was again made legal, animal-rights groups would stop giving funds to the central government and thus, there would be less opportunity for rent-seeking behavior by officials; i.e., graft and corruption.

As documented by various scientific studies, wildlife viewing is also more environmentally destructive than sport hunting. This is because the profit margin per person is less, so you have to run a much greater number of tourists through the system to achieve the economic activity generated by a single sport hunter. In addition, tourists expect paved roads and modern five-star accom-

Instead of wildlife numbers plummeting, areas of Africa outside of Kenya are seeing incredible herd numbers and excellent hunting. Yet, another example of the important role hunting plays in the dynamics of wildlife management.

modations. Water is scarce in arid Africa and tourists require a lot more of it than sport hunters. Furthermore, tourists generate larger quantities of human waste and garbage, both per person and in total, than sport hunters. Sport hunters, on the other hand, are content to stay in tents and drive dirt tracks. No one is arguing that wildlife viewing should not be part of the mix, but to call wildlife viewing "non-consumptive," is simply false. Tourists also have a much larger carbon footprint than safari hunters.

Hunting also has a huge impact in terms of social and economic aspects of certain areas. If not for hunting, many locals would have no source of income and more than likely they would become subject to a poverty stricken state.

Hopefully you will never have to confront animal-rights activists while you are out hunting, but if you do, or if you favor that sort of thing, now at least you are armed with the truth about the wildlife debacle in Kenya. Banning hunting is a surefire way to eliminate wildlife. Although to non-hunters this may seem counterintuitive, it is nevertheless true. The reality is that outlawing the consumptive use of wildlife in Kenya has been an unmitigated ecological and human disaster. While in other African countries that have modified their game laws to encourage sport hunting, wildlife populations have increased, as have the private and communal lands devoted to wildlife. As hard as it may be for some people to accept, the free-market system has been more effective at conserving wildlife in Africa than heavy-handed, state-run monopolies.

ABSTRACT

Illegal hunting of wildlife, or top-down harvesting, is a major issue in today's society, particularly in tropical ecosystems. There has been widespread concern about increasing illegal hunting of wildlife in most conservation areas in Zimbabwe following the political instability and economic decline the country faced since 2000. In this study, we focused on the northern Gonarezhou National Park (GNP), a large and unfenced protected area, and adjacent communal areas in southern Zimbabwe. We hypothesised that illegal hunting activities would (1) be perceived to have increased due to economic collapse and (2) vary with law enforcement efforts. A total of 236 local residents from eight villages adjacent to the northern GNP were interviewed using semi-structured questionnaires from December 2010 to May 2011, and law enforcement data for northern GNP between 2000 and 2010 were retrieved from the park law enforcement database. A total of 26 animal species were reportedly hunted. Bushmeat consumption and the need for local trade to raise income were reported as the main reasons behind illegal hunting. Contrary to the first hypothesis, the majority of respondents ($n = 156$, 66%) reported that illegal hunting activities had declined between 2000 and 2010 largely due to increased park protection as also supported by law enforcement data. A total of 22 animal species were recorded as having been illegally hunted in northern GNP. The number of illegal hunters arrested declined with increased law enforcement efforts although the number of wire snares recovered and hunting dogs shot appeared to increase following increased law enforcement efforts. These results partly support the second hypothesis that illegal hunting activities would vary with law enforcement efforts.

Introduction

In tropical areas, humans are commonly physically inseparable from natural systems due to the heavy dependence of local people on natural resources for their subsistence living (Robinson & Bennett 2004; Singh & Sharma 2009). However, this can lead to unsustainable forms of hunting. Illegal hunting, also known as poaching, is the taking of any kind of wildlife, including fish, in such a way that it violates local, national and international wildlife laws (e.g. Duffy 1999). Illegal hunting is often unsustainable and has led to reductions and/or local extinctions of many wildlife populations across the tropical ecosystems (Bennett et al. 2002; Bennett 2011; Ceballos & Ehrlich 2002; Corlett 2007; Emery 2007; Milner-Gulland et al. 2003; Paudel & Kindlmann 2012; Peres 2000; Wilkie et al. 2011).

Illegal hunting involves the use of traditional hunting methods such as bow and arrows, snares, pitfalls (Kümpel et al. 2008; Noss 1998; Tumusiime et al. 2010), but also the illegal use of firearms, explosives, poisons and more recently small aircraft aided techniques and immobilisation drugs. Illegal hunting is particularly severe where rural people hunt within poorly managed protected areas (Fusari & Carpaneto 2006). Although law enforcement patrols attempt to control illegal hunting activities for bushmeat (meat derived from wild animals), and/or commercial sale within conservation areas (Jachmann 2008a, 2008b; Kaltenborn et al. 2008), the expected financial benefits from such activities are far greater than the costs associated with a low probability of arrest and punitive fines (Bennett 2011; Campbell & Hofer 1995; Loibooki et al. 2002; Moyle 2009). Illegal hunting is also influenced by a poor definition of property rights to wildlife species such as no owner (*res nullius*) status (Bulte & Horan 2002; Child & Chitsike 2000).

a combination of subsistence, cash crop farming and livestock production (Gandiwa 2011). These communities manage their natural resources under CAMPFIRE programmes implemented since 1982 in an effort to generate benefits for local communities that otherwise had been deprived by protection policies (Child 1993; Murphree 1988).

Data collection

Perceptions of illegal hunting and protected area law enforcement

Data on local people's perceptions of illegal hunting were collected from eight villages occurring in the four study wards, i.e. two villages per ward, using semi-structured questionnaires administered through face-to-face interviews from December 2010 to May 2011. Perceptions are important because they reflect local people's habitual way of life, as well as their shared expectations or experiences with an activity (Uddin & Foisal 2007). Current village registers of the selected eight study villages formed the sampling pool and households were randomly selected through picking of numbers from a hat that corresponded to the households from each study village register. The household heads were targeted as the respondents. In case of their absence, another permanently resident adult (≥18 years) in the households took part in the interview in his/her residence. Interviews were conducted conditionally upon the individual's willingness to fully participate. Respondents were local villagers and no distinction was made between hunters and non-hunters. This was done to encourage local residents to openly provide illegal hunting information which can be regarded as sensitive.

The date for interview was communicated to each selected household one or two days in advance. Our questionnaire development was informed by a previous survey of perceptions of illegal hunting in southeastern Zimbabwe (Gandiwa 2011). Questions were constructed to seek information on the general perceptions of illegal hunting practices inside the GNP and adjacent areas between 2000 and 2010. Data collected included information on frequency of sighting bushmeat and/or wild animal products being traded, perceptions of illegal hunting trends, hunted animal species, reasons for hunting, and perceptions of protection status in the protected area (Table 1). With the help of one field assistant conversant in local language acting as a translator, we interviewed a total of 236 local residents, who consisted of 146 (62%) men and 90 (38%) women. Interviews took on average approximately 54 min (range: 38–76 min) to complete.

Table 1
Outline of the semi-structured questionnaire used in the household survey in the four study wards adjacent to northern Gonarezhou National Park, Zimbabwe.

Questions	Options provided
Between 2000 and 2010, how often did you see bushmeat or wild animal products being traded in your village or ward?	Once in 30 days/once between 31 and 180 days/once in >6 months/year
In your opinion, what is the trend of illegal hunting of wild animals in your ward and adjacent Gonarezhou National Park in the last eleven years, i.e. between 2000 and 2010?	Increased/decreased/remained the same
What are the reasons for the given trend in illegal hunting?	Open
May you list the wild animal species that were commonly hunted illegally in your ward and nearby Gonarezhou National Park between 2000 and 2010?	Open
In your opinion what are the main reasons why people engage in illegal hunting activities in the area?	Open
What do you think is the trend of protection given to wildlife conservation by the government between 2000 and 2010?	Increased/decreased/remained the same

Protected area law enforcement and illegal activities

We extracted law enforcement data on patrol intensity and evidence of illegal activities in northern GNP for the period 2000–2010 from the law enforcement database kept at Chipinda Pools in GNP. GNP uses the conventional law enforcement in the form of foot patrols that start from each of the ranger camps as well as from the stations' main and sub-offices. Almost all local (day) and long (over several days) patrols are done during the day in the GNP. Only strategic or ambush patrols may extend to the night with patrol rangers remaining in one particular location, often near a frequently used poaching trail, but sometimes in response to intelligence information. Standardised patrol forms were used to keep records of the number of staff on patrol, the exact duration, the area travelled, types, quantities and locations of illegal activity encountered including number of hunters and dogs, number caught, or shot in the case of dogs, number of snares recovered, number and species of animals killed in each incident. The method of conventional law enforcement has been discussed fully elsewhere (Jachmann 2008a, 2008b; Jachmann et al. 2011).

A patrol team in Chipinda Pools normally has four or five patrol rangers. This patrol team size is considered appropriate in savanna ecosystems (Jachmann 2008a, 2008b). In northern GNP, patrol data were checked at debriefing by the Senior Rangers, then by the Senior Wildlife Officer in charge of law-enforcement operations before being captured into a law enforcement database. The relationships between the law-enforcement effort and encounters with illegal activity and wildlife assume that patrol reports are reliable accounts of the activities of the patrol staff, both in terms of technical precision and in terms of being a true account of events (Jachmann 2008a). The law enforcement data for GNP revealed that the Zimbabwe Parks and Wildlife Management Authority (ZPWMA) recruited additional patrol rangers in the year 2004. Furthermore, data on large herbivore population estimates for the northern GNP (i.e. Chipinda Pools, Chilojo A and Chilojo B aerial survey strata), for 2001 and 2009, were extracted from past aerial survey reports (Dunham 2002; Dunham et al. 2010).

respondents ($\chi^2 = 31.05$, df = 2, $P < 0.0001$). However, the relationship between responses on the frequency of sighting illegally hunted animals and/or bushmeat being traded and protection given by government to wildlife was not significant (gamma = 0.07, $P = 0.455$). In contrast, there was a significant relationship between responses on the perceived illegal hunting trends and protection given by government to wildlife (gamma = 0.23, $P = 0.028$).

Law enforcement performance from law enforcement data

In 2000, a total of 18 patrol rangers were stationed at Chipinda Pools, northern GNP translating to 0.006 effective patrol staff/km^2 (Fig. 2a). The number of patrol rangers increased to 51 in 2004 following the recruitments of new rangers (0.017 effective patrol staff/km^2) and by end of December 2010, there were 38

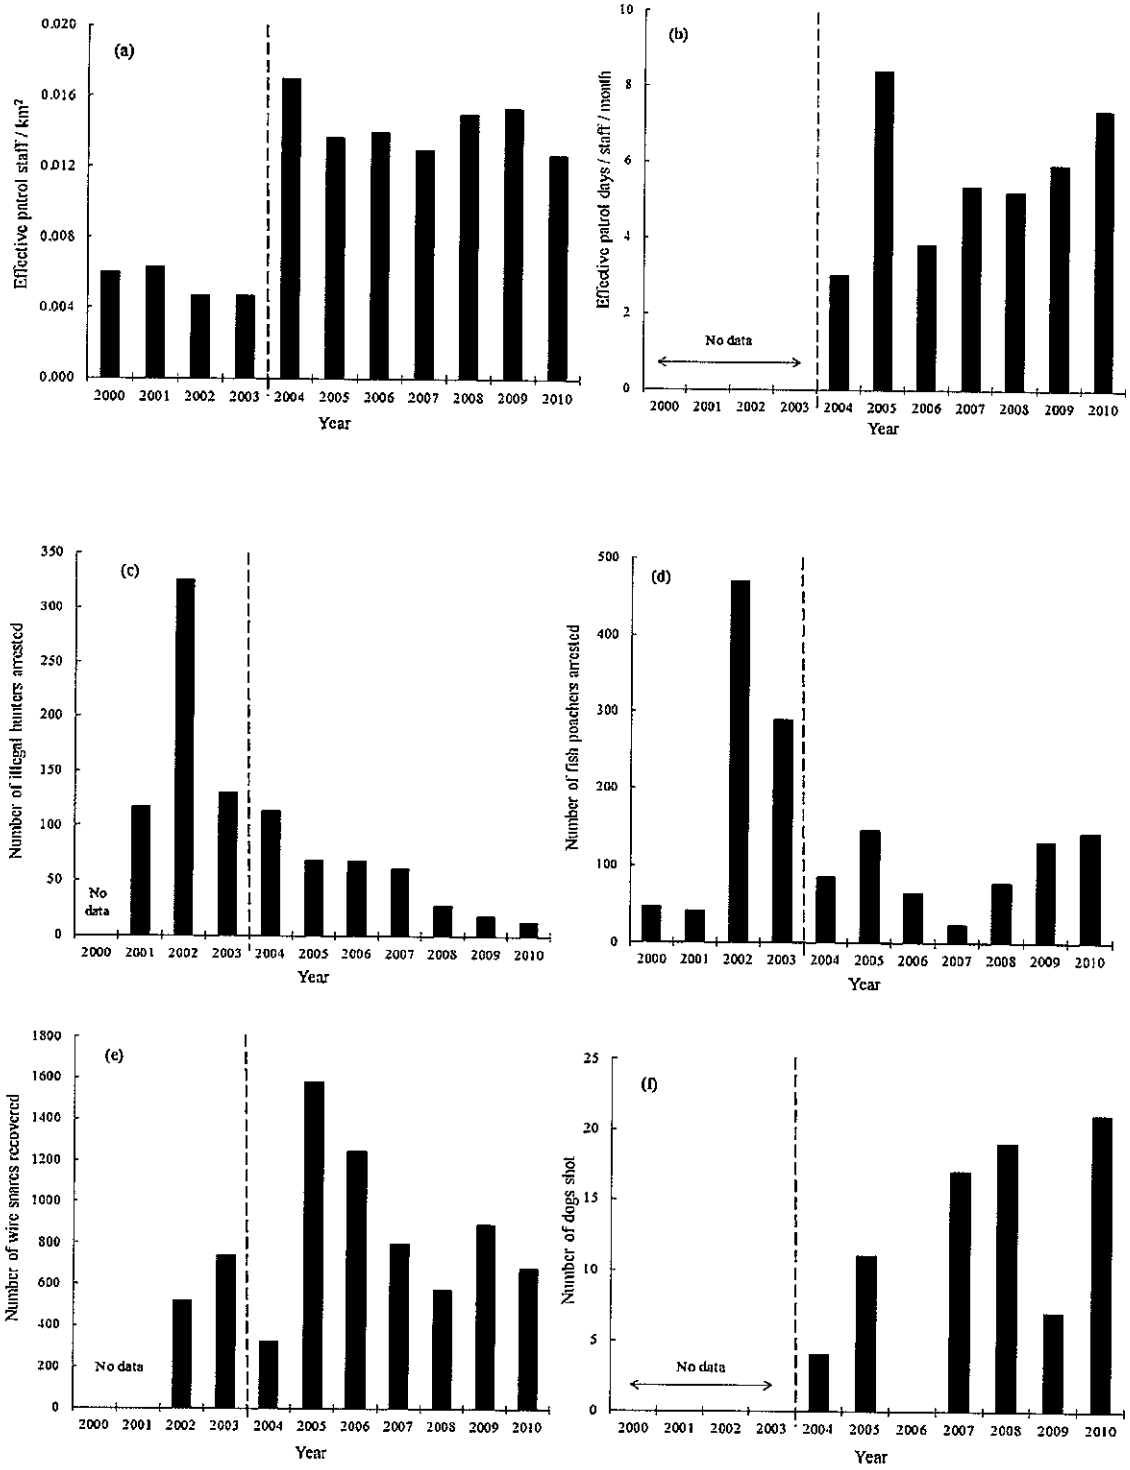

Fig. 2. Trends in law enforcement performance and recorded illegal activities in Chipinda Pools, northern Gonarezhou National Park, Zimbabwe, from January 2000 to December 2010. *Notes*: Dashed vertical lines separate the period before and after recruitments of patrol rangers.

longer went to the central government but was directly channelled to conservation (Mtsambiwa 2003). Sport-hunting has been the major revenue source for the ZPWMA and other local conservation areas. Surprisingly, sport-hunting was not severely affected by the political instability and economic decline in Zimbabwe (Balint & Mashinya 2006; Lindsey et al. 2009). Consequently, ZPWMA was able to enhance wildlife protection in the northern GNP by increasing the number of patrol rangers in 2004 (from 18 to 51 rangers). However, in terms of personnel, the coverage area per ranger in 2010, i.e. one ranger for every 79 km^2 of protected area, is far higher than the recommended minimum of one park ranger for every 24 km^2 of protected area if effective patrolling and policing is to be realised (Jachmann & Billiouw 1997). Furthermore, anti-poaching efforts in the northern GNP were also strengthened by the involvement of the Frankfurt Zoological Society in the management of the park since October 2007, which led to more resources being made available for law enforcement activities. The recurrent expenditure for law enforcement in northern GNP rose from USD 52 per km^2 annually in 2000 to USD 250 per km^2 annually in 2010. The increase in law enforcement expenditure is above the minimum range of expenditure estimated to be between USD 50 and 200 per km^2 annually that wildlife agencies in Africa need to protect large herbivores, in particular elephants, in their natural ranges (Jachmann & Billiouw 1997).

We recorded that illegal hunters hunted a wide range of animal species in this study. Out of the 26 animal species reported as being illegally hunted, 20 animal species were recorded as having been illegally killed in GNP. Differences in the number of animal species most illegally hunted are likely come from the fact that most of the animal species that were not recorded as illegally hunted are small herbivores, which are difficult to detect when illegally hunted. Our study shows that small to medium body sized animals, for example impala, were the most illegally hunted species. Subsistence hunting is primarily targeted at small-bodied species like impala with large-bodied animals such as elephants targeted for their trophies such as ivory. Some of the illegally hunted species in the northern GNP are of conservation concern: crocodile is classified as lower risk; elephant, lion, cheetah, hippopotamus are classified as vulnerable, and leopard is classified as near threatened on the IUCN Red List (IUCN 2012). Using a vulnerability classification approach based on species vulnerability to decline and extinction involving opinions from international and local experts, Van der Hoeven (2007) categorised leopard as least concern, buffalo as lower risk and elephant as vulnerable. The differences in these two vulnerability classifications points to the need for more detailed local assessments of animal species that allows the setting of appropriate local level conservation priorities (Van der Hoeven 2007).
