a) The Zimbabwe Environmental Management Act Chapter 20:27 of 2002 criminalizes the administration of poison such as cyanide which is used by poachers to kill elephants. Through the Environmental Management Agency of the Zimbabwe Government, sample collection from poisoned sites is being handled by professionals in this unit who have laboratories for testing such poisons and hazardous substances which results are used in any trial that is related to elephant poisoning. The Act was implemented during trial of accused persons involved in elephant poisoning leading to the conviction of poachers who poisoned elephants in Hwange National Park in 2013. Most of the offenders were given sentences of up to 18 years in prison.
b) Awareness workshops that targeted the judiciary, the prosecutors, law-enforcement agencies and other stakeholders involved in the fight against elephant poaching were held and this resulted in significant improvements in the expeditious preparation of dockets and finalization of cases with a marked improved in convictions in the various courts around the country.
c) Task force teams at all level of Government in the law enforcement units have been put in place at national, provincial as well as district level. These units deal with poaching related matters in their areas of policing. Stakeholders in the private sector are assisting

with the provision of scarce resources that are needed to combat poaching and ivory trafficking.

d) The use of helicopters and other aircrafts in the fight against poaching has also increased and this has assisted with deployments and detection of poachers in the field.

e) Cross border collaboration with law-enforcement agencies with neighbouring countries such as Botswana, South Africa, Zambia and Mozambique in information sharing on poacher movements and dealing with immediate incursions has tremendously helped in detection of cross-border poaching and trafficking incidents.

Urgent Measure 3

a) Elephant poaching has been elevated to the level of National Security in the Government of Zimbabwe. All security organs of the state are now playing a role in the fight of elephant poaching.

b) The Zimbabwe Republic Police Support Unit in collaboration with the Zimbabwe Parks and Wildlife Management Authority carries out anti-poaching activities at all levels. The Minerals and Border Control Unit of Zimbabwe Republic Police Criminal Investigations Department is a specialized unit that investigates and prepares wildlife cases for court.

c) The Air-force of Zimbabwe plays a major role upon request in the provision of services and equipment in the fight against poaching.

Urgent Measure 4

a) Within the Zimbabwe's National Joint Operations Command (JOC) structure, elephant and rhino poaching have been elevated to a higher level of National Security Threat thereby making it a priority area of focus.

b) The same structures of the JOC committees have been activated both at national, provincial and district levels for effective monitoring of poaching situation on the ground.

Urgent Measure 5

a) Information of illegal killing of elephants is being submitted to the CITES MIKE Programme.

b) The ETIS data on illegal trade is also submitted to TRAFFIC.

Urgent Measure 6

Zimbabwe is participating in various law-enforcement activities involving neighbouring states, countries in the SADC region. Officers from Zimbabwe have also attended a number of workshops and training on anti-poaching and wildlife trafficking including the execution of controlled deliveries. Valuable expertise has been imparted to the officers and this has assisted in the carrying out of joint cross-border operations.

Urgent Measure 7

Zimbabwe is a member of the regional wildlife enforcement network, SAWEN, and has assisted in information sharing and information sharing and intelligence gathering on the latest techniques in the fight against elephant poaching and ivory trade.

Urgent Measure 8

a) The Zimbabwe Government established the Wildlife Ecological Trust whose mandate is to mobilize resources for the fight against elephant poaching through whatever means. Its thrust is to source for funds and material resources that are allocated to needy areas according to the nature of threat and threat levels in each particular area.
b) Resources in the form of funds, vehicles and field equipment have been raised for Hwange National Park.

Urgent Measure 9

a) Public awareness campaigns for local communities are being carried out in affected areas. The awareness and outreach programmes also target school children.

Urgent Measure 10

a) Zimbabwe has secure facilities for elephant ivory storage at the Central Ivory Stores and also a good registration and database system. The security systems have recently been upgraded to minimize risk.

Urgent Measure 11

a) The principal law and Act which governs and regulates the purchasing, selling and exporting of worked elephant ivory and ivory products for non-commercial purposes is the Parks and Wildlife Act Chapter 20:14. The Act prohibits the hunting of any animal and removal of parts of animals in any from any land without authority. The Act provides for the protection of animals in the following designated arrears, National Parks, Parks and Wild life Estates, Parks and Wild life land, Sanctuaries and Safari Areas. The Act further provides for categorization of animals into protected and specially protected animals. Of particular interest in this case is Part XII which prohibits the hunting, removal and sale of live animals and animal products.
b) From the enabling provisions in the Act, the Minister has issued Statutory Instrument 362 of 1990 Parks and Wild Life (General) Regulations which provides in sections 66-75 for the regulation of manufacture and dealing in trophies to include worked elephant ivory.
c) In addition there is Statutory Instrument number76 of 1998, Parks and Wild Life (Import and Export) (Wild Life) Regulations which specifically deals with Import and Export of wildlife products.

Urgent Measure 12

a) Zimbabwe's Communal Areas Management Programme for Indigenous Resources (CAMPFIRE) is currently under review. Several community empowerment strategies are also being implemented in areas adjacent to protected areas.

Urgent Measure 13

a) Zimbabwe is collaborating with Interpol at national and international levels. Elephant poaching is categorized as a serious crime attracting a heavy penalty in Zimbabwe.

Urgent Measure 14

a) The Government is collaborating with the Government of South Africa through a bilateral arrangement with the University of Pretoria whereby rhino samples are submitted through the RHODIS system for DNA analysis. It is hoped that the same process will be initiated and undertaken in the near future for African Elephant samples

Legislation

All activities allowable in a protected area are governed by relevant legislation. The primary legislation dictating how parks operate is the Parks and Wildlife Act and accompanying statutory instruments. The legislation is obviously not static but can be adjusted to meet desired outputs.

Park management plans

It is the organization's policy that every protected wildlife area is run in accordance with a management plan. It however has to be noted that some of the plans are outdated. To rectify this problem, ZPWMA is in the process of updating protected area management plans. Recently the Authority completed plans for Gonarezhou and Mana Pools National Parks and the plan for Hwange National Park is in the final stages of drafting. The planning process is done in phases and all relevant stakeholders, government and private, are invited to partake. The plans usually cover all facets of the management of the respective area including tourism, infrastructure, and biodiversity management and recommended staffing levels.

Elephant management policy

The elephant's life cycle and longevity requires means that it needs to be managed through a long term management plan. The country's elephant management policy is in its drafting stage and will replace one which expired in 2007. The planning process relied on a number of experts from various fields and also sought input from other stakeholders within the region.

Commercial exploitation of wildlife

It is a government's policy that Zimbabwe should benefit from her natural resources. In addition to non-consumptive tourism, the elephant is also one of the key species in the hunting industry.

This form of exploitation is strictly governed by the Parks' Act and quotas are allocated through a quota setting process described in subsequent sections.

Community Based Natural Resources Management

The government also recognizes that the elephant shares some of its home range with local communities and these communities benefit through the CAMPFIRE program. This apportioning of benefits, is hoped, should translate to a community more tolerant to wildlife.

How ZPWMA is addressing these challenges:

Review of CAMPFIRE

It is now acknowledged that the current CAMPFIRE model has been overtaken by events. The government is therefore in the process of reviewing the concept so that is produces tangible benefits to local communities living with wildlife, especially elephants and large carnivores. This should make locals more cooperative in fostering the country's conservation goals.

Set a board to source donations for the biggest elephant home range in Zimbabwe

The Hwange poisoning incident made clear that poachers are using new and dangerous methods to illegally kill elephant, and ZPWMA must have adequate, additional resources to combat this threat. In trying to address that, the country through the Ministry of Environment water established a board to source funds for the country' conservation programmes. The board, called the Wildlife and Ecological Trust, was instrumental in sourcing 10 vehicles for Hwange National Park.

Increased men on the ground

High levels of staffing are needed to sufficiently control poaching. Zimbabwe, like other African range states, faces significant resource constraints. In key elephant range areas, this challenge has been addressed through a number of strategies:

- ***Ranger call up system*:** The poaching pressure is not the same in all areas under the management of ZPWMA. There is now a working system were rangers from low threat areas are temporarily deployed to high threat areas like the Zambezi Valley and Hwange.
- ***Joint anti-poaching patrols*:** The ranger compliment in high threat areas has been augmented by enlisting the services of other law enforcing arms of the state, the Zimbabwe Republic police and the Zimbabwe National Army. The police now have almost permanent presence in North West Matabeleland wildlife estates whilst the army is called in when needed.
- ***Recruitment of rangers:*** The Authority has a staff complement of 1,504 active field rangers. This translatesto ground coverage of more than 100 km^2/ranger against an ideal

staffing level of 20km^2/ ranger. Though the Authority is constrained with regards to resources to pay and kit existing rangers, it employed and trained 50 rangers in 2014. It also recalled 50 more rangers who had left the organization as a way of reducing its training budget. Most of the employed rangers were deployed in the Zambezi Valley (see attached annual reports). These measures have resulted in improved patrol effort (see figure 4below).

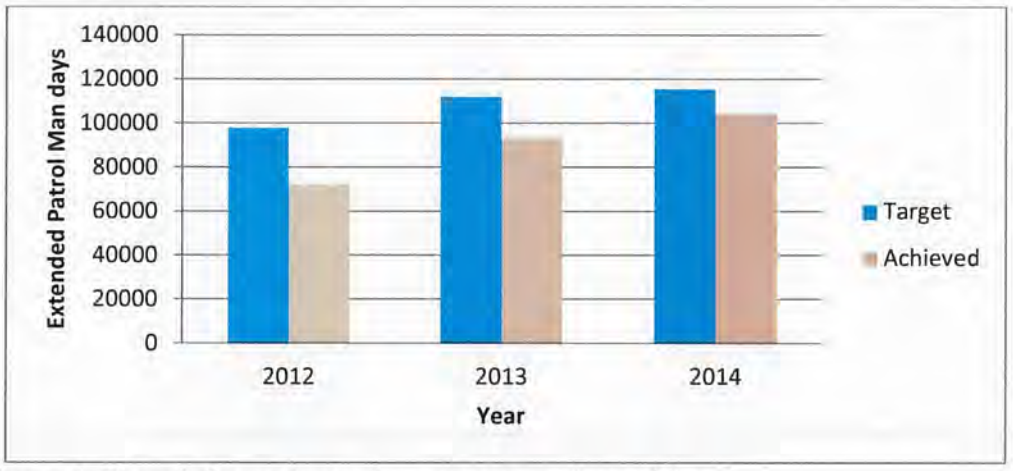

Figure 4: Extended patrol man days, targets against achieved

As seen from the graph, patrol man-days increased from 2013 as a reaction to increased poaching pressure. This was also boosted by the bringing in of details from other law enforcement agents.

Result Based Management (RBM) System for performance management

Poaching of wildlife, especially elephant, is a problem that it acknowledged by the Authority. It has therefore been realized that all Parks employees should give their best efforts in trying to address this scourge. It is with this background that the Authority has instituted performance based contracts for all its employees. These contracts are result oriented and it is expected that all the employees will work to meet targets set in the contracts.

Engagement of the private sector to support conservation initiatives

Conservation is always an expensive undertaking and is always evolving. The Authority on its own can be overwhelmed and as such is always ready to engage private or nongovernmental players in the industry. In the Hwange – Sanyati area, the Authority has enlisted the assistance of WWF Zimbabwe for the implementation of the Hwange–Sanyati Biological Corridor project. This project has a number of components which include improved management of Hwange National Park and neighbouring areas under the management of Forestry Commission of Zimbabwe as well as a component on improving livelihoods of the people in the Hwange Communal Area through the CAMPFIRE program (see attached Project Appraisal Document).

This project, if successful, will result in a more tolerant human population as well as a viable source of wildlife used in hunting areas around Hwange.

The Authority also works with the safari industry, which already conducts anti-poaching operations, to formalize anti-poaching requirement in new concession leases. Further, part of the review of CAMPFIRE will address how to better engage communities in anti-poaching support.

Research is also a vital component of wildlife management. The Authority has a deliberate policy to encourage research within its estate. The permit application process is easy and streamlined for efficiency. Some of the researchers working on elephant related projects include CIRAD, CNRS, Chinhoyi University of Technology and National University of Science and Technology.

Awareness and education

Extensive awareness programmes targeting local communities and schools are carried out throughout the country. Strategies include translating some of the key issues in the Elephant Management Action Plan into appropriate formats such as popular articles, radio programmes, online content, and drama as well as other formats targeting specific groups. Some local NGOs are assisting with the development and distribution of some of the materials. Awareness programmes that target the judiciary on wildlife crime have also been implemented.

Awareness workshops for the judiciary

Though there is legislation guiding how wildlife crimes are to be handled by the courts, it was realized that some provisions of the law were not being fully implemented and some offenders were getting away with light sentences. It is with this background that a national workshop was held with the law enforcement agents and the judiciary in 2011 in Hwange to make them aware of these challenges. This has resulted in stiff sentences being handed down to offenders. Table 6 below shows a summary of cases handled by the authority's investigations department.

Anti-poaching manpower and budget for anti-poaching in protected areas overseen by ZPWMA.

ZPWMA has a staff complement of 1,500 field rangers whose core mandate is anti-poaching activities. Table 5 below is an indicative budget for effective protection of the Parks and Wildlife Estates.

Table 5. Budget for anti-poaching activities

Budget item	Cost (US$)
Staff Costs	14,130,000
Field allowances	971,889
Patrol provisions	1,244,612
Fuels and lubricants	698,977
Vehicles	272,000
Communication	20,000
Air craft hire	120, 000
Drone	60, 000

Summary of serious wildlife crime cases in recent years (i.e., arrests, outcome of trials, sentences).

In 2013, cyanide poisoning led to the death of 105 elephants in Hwange National Park. Following the increase in poaching and trafficking of wildlife products, Zimbabwe adopted zero tolerance to poaching. Thirty-five (35) poachers were convicted for the poisoning incidents and they received between nine (9) and sixteen (16) years jail terms. A summary of serious wildlife crimes is detailed in table 6 below:

Table 6: Summary of Serious Wildlife Crime Cases recorded in Zimbabwe.

	2009	2010	2011	2012	2013	2014	2015 (Jan – Apr.)	Total
Cases investigated	45	66	45	57	76	48	17	354
Cases finalized	20	20	29	30	40	15	4	158
Local poachers arrested	81	55	121	137	109	41	12	556
Poachers	9	5	6	4	3	10	1	38

killed								
Accused prosecuted	65	79	86	83	72	50	15	450
Accused acquitted	4	4	4	6	3	1	0	22
Foreigners arrested	6	19	3	5	13	6	4	56
Tusks recovered	163	118	122	158	197	265	56	1079
Firearms recovered	13	32	29	25	16	15	2	132
Ammunition recovered	261	226	195	454	133	229	51	1549

4. Regulations and Enforcement

The current operating budget for ZPWMA, including sources of funding (e.g., allocated by Parliament, obtained through hunting permits or concessions, conservation fees, donations, etc.).

The budget for ZPWMA is premised on a Results Based Management System where allocation of funds is predicated on projected operational activities and a review of previous operation performance. The budget include sources of funding (e.g., allocated by Parliament, obtained through hunting permits or concessions, conservation fees, donations, etc.).The major sources of funds are conservation fees (land and river) constituting a total of US$9 898 695 and hunting constituting a total of US$ 4 032 733 for 2014. The bulk of the revenue generated in ZPWMA goes towards staff costs (69%) and operation costs (18%) which translated toUS$17,751,988and US$ 4,706,787 respectively for 2014. See Tables7a and 7b below. Full details are specified in the attached approved budgets for the year 2015.

Table 7a:ZPWMA Actual and projected Budgets for 2014 and 2015 in US$

Revenue	**2014 Actual**	**2015 Budget**
Conservation fees-land	8,457,106	9,595,000
Conservation fees-river	1,441,589	1,650,000
Accommodation	2,234,281	3,516,000
Annual registration fees	360,616	794,000
Permit fees	1,489,154	2,067,400
Services & facilities	140,369	347,700
Law enforcement	219,473	257,300
Hunting	5,072,493	6,220,000
Fishing permits	948,491	1,236,000
Leases and rentals	2,298,781	3,513,000
Sale of park products	976,678	2,177,000
Examinations	32,481	52,900
Projects	131,487	1,492,100
Other income (Donations)	957,634	1,909,200
Government grants	1,600,000	716,000
Total	**26,360,633**	**35,543,600**

Table 7b: Expenditure for ZPWMA

EXPENDITURE	**2014 Actual**	**2015 Budgeted**
Staff costs	17,751,988	20,943,500
Operational costs	4,706,787	8,235,700
Administration costs	3,100,758	3,815,800
Marketing costs	184,879	1,060,000
Total	**25,744,412**	**34,055,000**
Net surplus/(deficit)	**616,221**	**1,488,600**

Note the surplus for 2014 is a result of a 1,600,000 US$ government grant and spending cuts that have reduced manpower levels for ground patrols despite the shortages in manpower.

Revenue Streams

Conservation fees (Park entry and fishing permits) and hunting revenue constitute the bulk of the sources of revenue for ZPWMA, with a contribution of 42% and 17% respectively. See Figure 5a and b below for the categories of revenue streams and the percentages contributed.

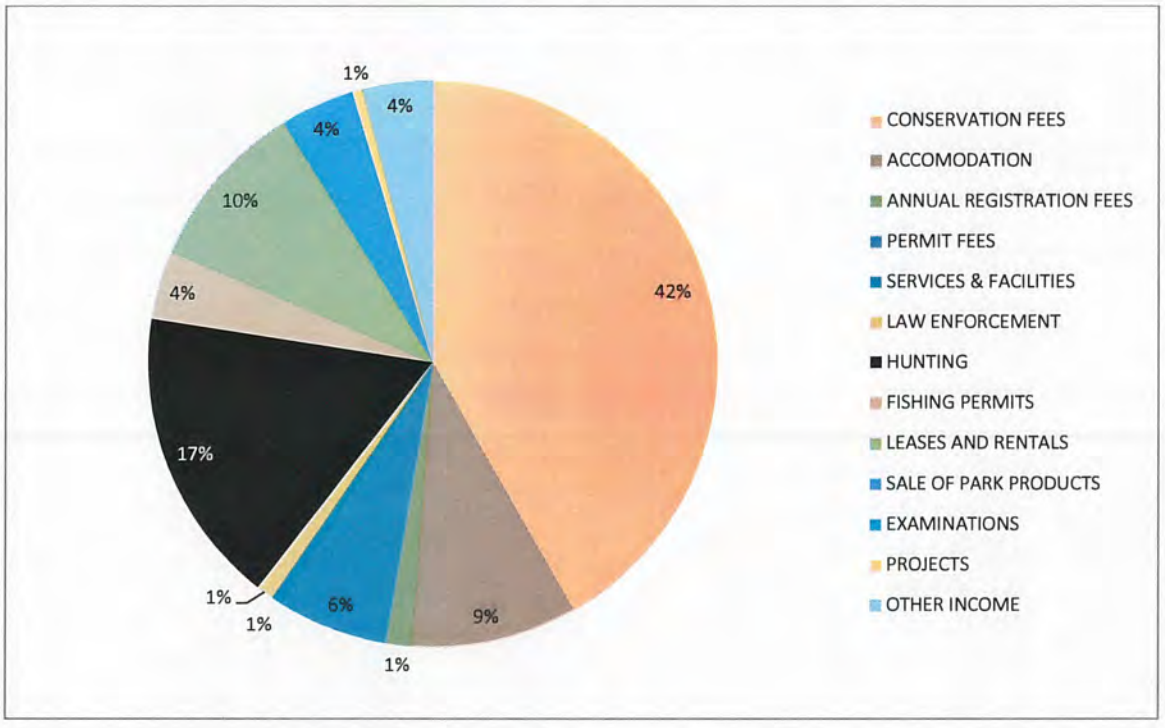

Figure 5a: Main Sources of Revenue for 2014

Expenditure:

Most of the expenditure for ZPWMA (69%) goes to staff and operational costs (18%) (See Figure 5b for the breakdown of the costs).

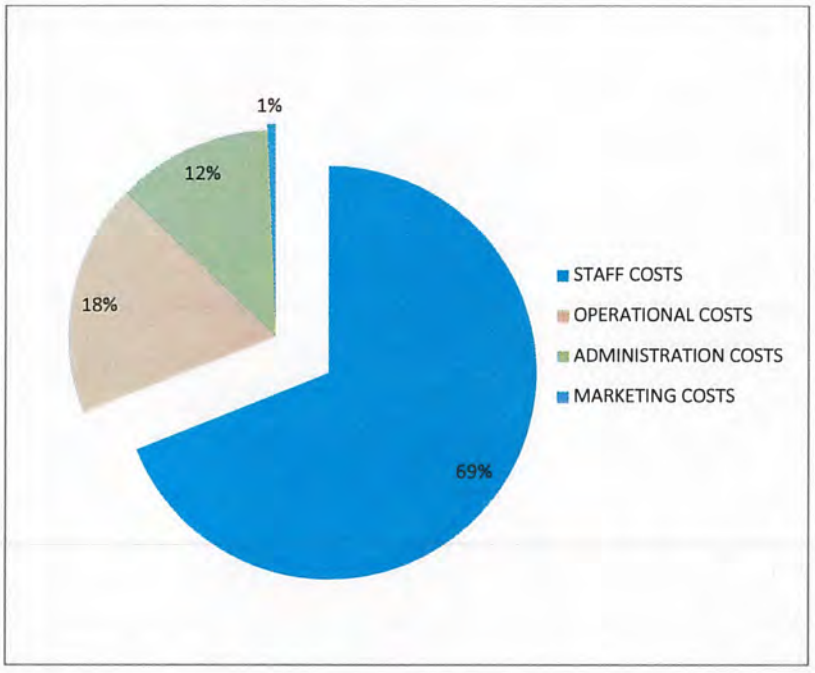

Figure5b: Itemized costs for ZPWMA.

Note: See attached approved budget for 2015 for budget details.

The amount of revenue generated from elephant hunting by U.S .hunters and how those funds are distributed?

The US hunting market constituted 51% and 54% of the elephant trophy hunting in Zimbabwe for the years 2013 and 2014 respectively. See figures6a and 6b below.

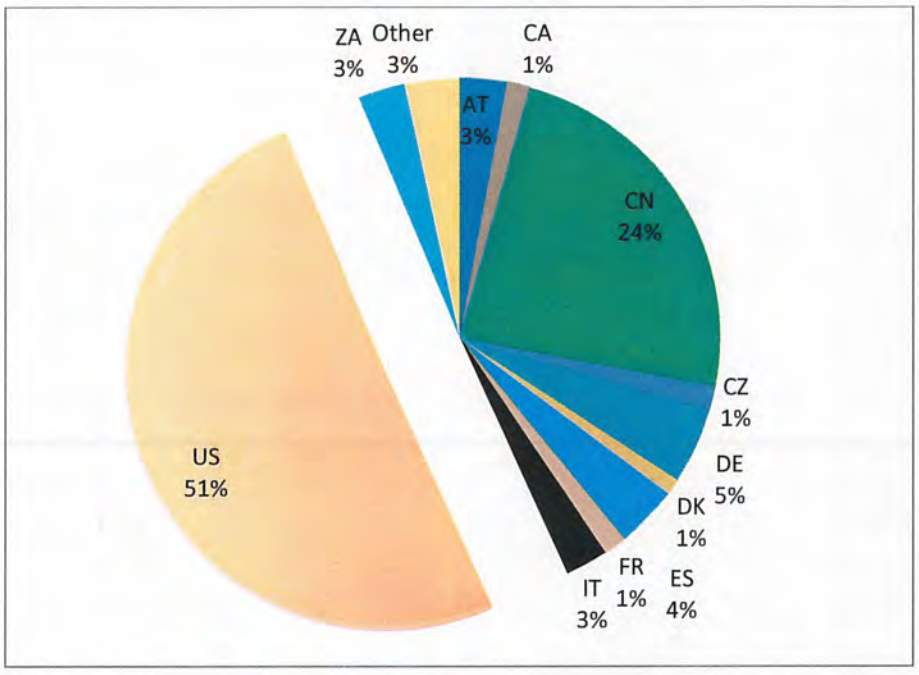

Figure 6a: Source markets for Safari Hunting in Zimbabwe in 2013 from ZPWMA Database

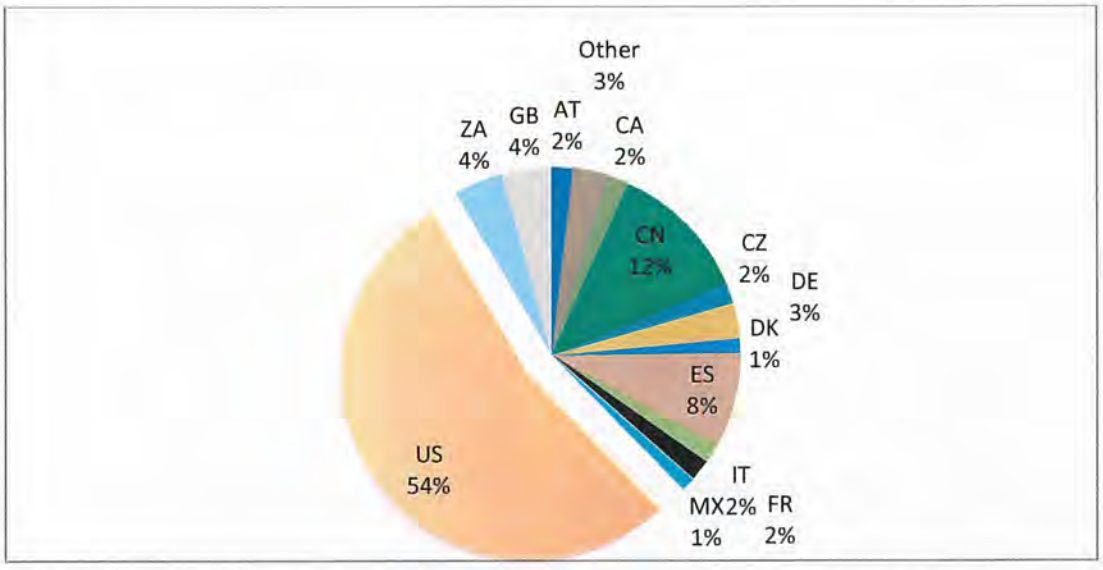

Figure7: Source markets for Sport Hunting in Zimbabwe in 2014 from ZPWMA Database

Hunting revenue is distributed by land-use categories as to sustain the upkeep of the land area where it is accrued. These land areas administered by different authorities with the ZPWMA having the overall authority to oversee wildlife use on these areas. These areas are grouped into the following categories namely National Parks Areas, Forestry areas, CAMPFIRE areas and Private lands (Conservancies and private farms). Hence the accounts are managed separately and will be presented separately.

Over a four year period revenue collected from hunting contributed a total of US$ 21,339,609. There was an11.9% decrease in revenue collection from hunting in 2014 compared to 2013. Table 8abelow summarizes the revenue generated from hunting from 2011 to 2014.

Table 8a: Revenue collected from hunting within the parks Estate 2011 to 2014.

	2011	**2012**	**2013**	**2014**	**Totals**
Total hunting revenue	5,362,198	5,144,579	5,760,339	5,072,493	21,339,609

Of all the hunting received the American market is estimated to 54% and is inclusive of concession fees and trophy fees,

Hunting outside protected areas is also conducted in other land categories. The revenue from direct elephant hunts is categorized and shared according to land use as specified in Table 8b below. This revenue is mainly generated through trophy fees.

Table 8b: Revenue Distribution from Elephant Hunt by USA citizens in Zimbabwe on other land areas.

Land Category	Revenue 2013 (US$)	Revenue 2014 (US$)
CAMPFIRE	1,783,928	1,419,384
Forest Land	240,000	101,500
Private Sector	5,5-6 000,000	1.8-2.3 000,000

Source: Forestry, ZPWMA, SOAZ

It is important to note that CAMPFIRE revenue has been sustained by USAID funding over the period 1989 to 1994 (see the attached budget).

5. Sustainable Use

The number of elephant taken per year in each of these categories [sport-hunting, cropping, live animal sale and capture, natural mortality, accidents, poaching, problem animals, management off-takes

Elephant mortalities were recorded under various categories as shown in Table 9 below. The major causes of mortalities over the five year period are natural, poaching and sport hunting.

Table 9: Causes of elephant death from 2010 to 2015

Year	**2010**	**2011**	**2012**	**2013**	**2014**	**2015**
Sport Hunting	134	274	247	258	162	75
Cropping	57	23	0	0	0	0
Live Sales	0	0	4	0	7	0
Natural Mortalities	208	1015	1373	124	1981	455
Accidents (Train)	6	8	38	13	9	6
Poaching	77	223	212	293	194	70
PAC	61	53	173	44	49	52
Other Management	65	53	172	44	47	0
TOTALS	**608**	**1649**	**2219**	**776**	**2449**	**658**

It should be noted that other management off-takes entail ration and training quotas which were set at about 95 animals nationally for ZPWMA run areas. While cropping was carried out in the Save Valley Conservancy between 2012 and 2013 during which a total of 11 elephants were removed.

Details on how the number of elephants to be hunted in each area is decided (i.e., quota setting).

ZPWMA subscribes to the concept of adaptive wildlife management and this also applies to setting national hunting off-takes. One example being a hunting moratorium that was placed on the hunting of lions in the Gwayi area adjacent Hwange National Park after it was realized that the trophy quality was getting poorer and poorer. This also led to the setting up of a point based system for allocating quotas which resulted in some areas getting no lions on quota from four in 2014.

Trophy hunting of elephants, or any wildlife species in Zimbabwe, is undertaken through a strictly regulated quota setting system. Quotas are issued each year to approved landholders by ZPWMA and this is done through national quota setting workshops. These workshops rely on

information supplied by landholders as well as ecological reports submitted by Parks' ecologists and independent wildlife consultants.

Analysis of trophy quality trends from major hunting areas have indicated that we are still finding mature bulls. It can therefore be assumed that current off-takes are sustainable. It however has to be noted that adjustments to quotas will definitely be made in light of recent upsurges in poaching in areas like Sebungwe and the Zambezi valley. It is also acknowledged that blanket cuts may be detrimental for the species since most of the wildlife farmers depend on income from elephants to fund activities in their areas.

All offtakes for the African elephant in Zimbabwe are sustainable. Key factors that Zimbabwe considers when setting quotas are shown in the Table 10.

Table 10:- Quota allocation for 2014 by major range

Area	Population estimate	Population proportion	Off-takes for 2016	
Zambezi Valley	11657	0.23	69	
Sebungwe	3407	0.07	21	
North West Matabeleland	53991	0.58	174	
South East Lowveld	13037	0.11	33	
Total	82092	0.99	297	

Table 11: Factors considered in quota setting

Factor	**Comments**
Environment	Effects of droughts and other environmental factors are considered when setting quotas (for example die-offs in an area).
Population estimates and indices of abundance	Population estimates for African Elephants are determined using aerial surveys, waterhole counts, road strip counts and field based ranger monitoring. Population estimates are used to determine annual quotas including the 2014 aerial survey

	results.
Trophy size and quality	Data on hunt returns is captured into a database that is analysed to determine future off takes basing on trophy quality and trends (i.e. the lower the trophy quality, the quota is adjusted accordingly). Hunting success rate is also required to determine quotas. A hunting moratorium can be imposed in an area with declining trophy quality.
CITES National Export Quotas	Zimbabwe has an Annual CITES National Quota of 1000 tusks of 500 sport hunted elephants. Allocation of quotas at the national level does not exceed this limit.
Size of hunting area	Hunting quotas are allocated according to the size of any given property.
Management Systems in place in hunting areas	The following factors are also considered when setting quotas: • Existence of game fences or open access systems • Anti-poaching efforts • Game water supply • Translocations and reintroductions
Illegal off takes	Illegal off takes from poaching are also considered when setting quotas in an area. Quotas are adjusted accordingly in order to ensure that harvests are sustainable. Quotas are set on a localized basis.
Trade	Very strict export and import regulations and trade monitoring systems are in place. Analysis of export data is used to set annual quotas.
Monitoring	The Scientific Authority through an adaptive management process and ongoing rigorous resource monitoring programmes uses all the data and information to ensure that quotas are sustainable. The monitoring programmes include the following: Off takes/Harvests, Legal and Illegal Harvest and Trade; Ranger based Monitoring, Hunt Returns, Live Sales and Translocations; Natural Mortalities, Trophy Quality, Hunting Regulations,

	Biological: Population Estimates and Densities, Distribution Patterns, Habitat Quality, Local Ground Counts, Hunting Success Rate,

Sustainable quotas are established and monitored through a participatory and adaptive management process (Fig 5) involving private landowners, ZPWMA personnel and CAMPFIRE or local community wildlife managers. Quotas are set so as to have a representative number of animals that can be safely removed during a hunting season without inflicting biological damage to the population. The aim of quotas is to ensure that the utilization of wildlife is sustainable. Data on genetic drift, estimated population, disease outbreak, trophy size, age of animal hunted, habitat status and illegal off take is used to safeguard sustainable quotas. On average, quotas are set based on current data at approximately. The quota for 2016 is set at 400 elephant which is 0.49% of the national population. This is considered a conservative figure according to WWF guidelines and also the population changes in sections of Sebungwe and the Zambezi Valley. Taking into consideration the 2014 survey results the sustainable off take for trophy hunting in Zimbabwe would be 615 individuals. The thrust of wildlife management in Parks Estates is an adaptive management approach which emphasizes scientific research and monitoring. Quotas are set regionally during participatory quota setting workshops (see attached press invitations).

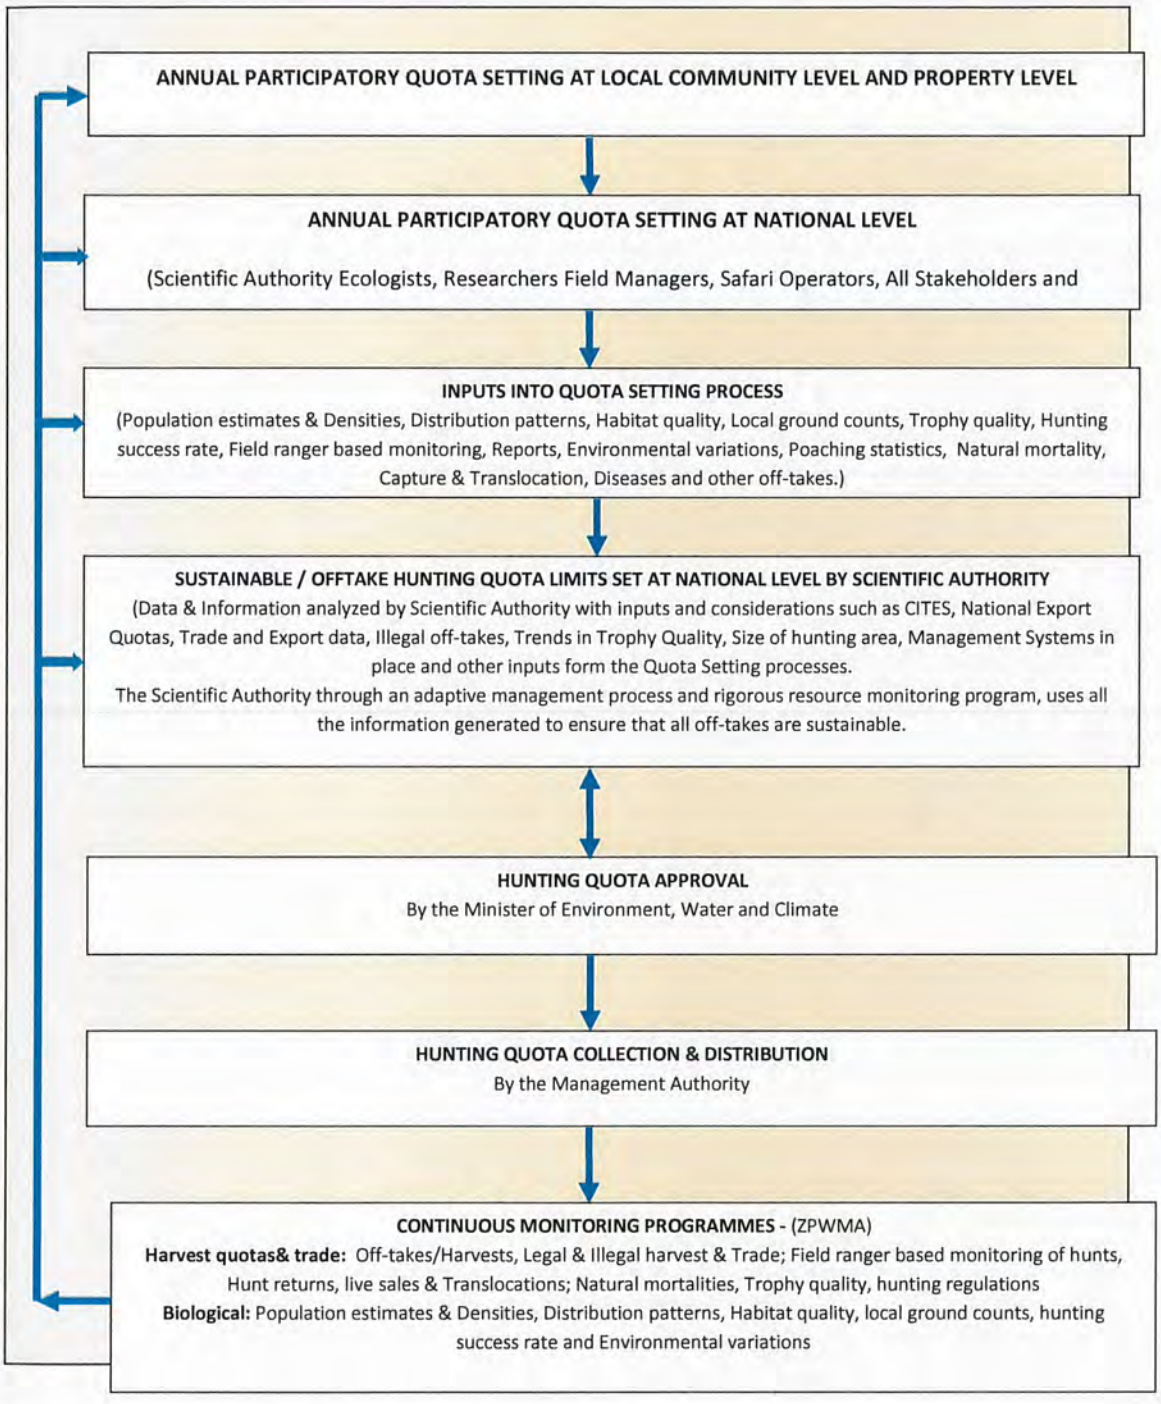

Figure 8: Multi stakeholder participatory quota setting

6. Revenue

Please provide information on: elephant populations on the four aforementioned land types, the number of elephants hunted on each land type, and the fees paid or the revenues earned from elephant hunts each land type.

Of the four land use types (Safari Areas, Communal Land, Forest Estates and Private Land) where safari hunting is carried out, Safari areas have the highest elephant population, although CAMPFIRE areas have the largest percentage of elephants hunted. Across all land categories, the elephant, even in the private land category where only a small proportion of properties have elephants, accounts for the highest proportion of revenue. Table 12below highlights elephant populations and revenue generated in the four land use categories in terms of trophy fees.

For each of the land uses, on which elephant hunting occurs, please provide the total number of elephant hunts, the total revenue, and a summary for each of management on how the revenues are spent.

Table12: Elephant populations and revenue generated from elephant hunts in four land use types.

Land Use	**Elephant population Estimate (2014)**	**Number of hunts**	**Number shot**	**Revenue generated US$ (Trophy fees)**
Safari Area	9824	58	49	5,072,493 the total includes trophy fees and concession fees for all hunted wildlife on ZPWMA land.
Communal land	6041	69	55	550,000,00
Private land	1585	61	19	190,000.00
Forestry Land	1117	43	39	390,000.00
Totals	**18 567**	**231**	**162**	**6,202,493.00**

Note: - These are population estimates for the major range areas surveyed in 2014. Source ZPWMA records

As shown in Table 12above, a total of 18 567 elephants occur within surveyed wildlife areas where elephant hunting takes place. The most important form of revenue is the trophy fees, which average US$10,000 per trophy elephant. Other forms of revenue include hunting daily rates and incidental revenue which can raise the value of an elephant hunt up to $25,000.00. In the ZPWMA run Safari Areas, most of the revenue is from trophy fees, although from the concessions, in which the Authority actually carries out hunts daily rates also accrue, significantly raising the value of a single elephant hunts.

How revenue generated is spent

ZPWMA safari areas

Safari Areas mentioned herewith are hunting concessions under the ZPWMA and are allocated to Zimbabwean private operators through an auction system. The total value of safari hunting in this category accruing to the ZPWMA is obtained from right to hunt fees, trophy fees and concession fees. It should be noted that in cases where Safari Areas are leased to private operators, ZPWMA does not benefit from daily rate fees, as these accrue to the operator.

The revenue accrued from these areas is paid directly to ZPWMA and contributes wholly to the conservation budget of ZPWMA. It has to be noted that ZPWMA has a mandate to conserve wildlife in the whole country and as such some of the revenue generated from the safari areas is used for the upkeep of other areas which do not generate revenue but are important wildlife habitats. ZPWMA requires about 200 /km^2 /year to effectively run all the areas under its estate.

Specifically for safari areas, cost centres include paying for staff salaries (a key anti-poaching tool), upkeep of facilities, habitat protection (roads and fireguards), fuels and game water supply. The total staff complement of field rangers in safari areas in the state hunting areas stands at 325 Rangers, and Table12 shows the salary bill for manpower in all safari areas under ZPWMA.

Table13: Staff costs incurred in Safari Areas

Grade	Number	Unit cost	Yearly total
Wildlife officer	11	1,043.75/month	137,775.00
Senior ranger	13	872.03/month	136,036.68
Ranger 1	61	785.87/month	575,256.84
Ranger II	138	749.67/month	1,241,453.52
Ranger III	102	714.51/month	874,560.24
Field allowances	39 912 man days	$5/day	199,560.00
Total			3,164,642.28

As shown on the table above, the bulk of the money generated goes in safari areas to meeting staff / labour costs in those areas. Field allowance refers to daily allowances given to rangers when they spend time out in the field doing extended patrols. Other cost centres include fuel and

in 2014 a total of 149,760 litres of diesel worth US$ 209,664.00 (about 30% of total fuel used within the whole Parks Estate) diesel was used was used in ZPWMA safari areas.

Communal areas

The communal areas benefits from wildlife through the CAMPFIRE program. This program is key in that it helps to encourage the communities to co-existence with wildlife. Communities are key ally in the country's fight against poaching and we believe that the off-takes from communal areas are sustainable. It therefore follows that legal elephant hunt is a sustainable way of incentivizing locals to help in conservation and is obviously more sustainable than cash hand-outs through donors. The CAMPFIRE program covers a total of 58 districts, covering 50 000 km^2 and more than 777 000 households. Figure 10 is a map showing CAMPFIRE areas in Zimbabwe, which is roughly equivalent to the Parks Estate.

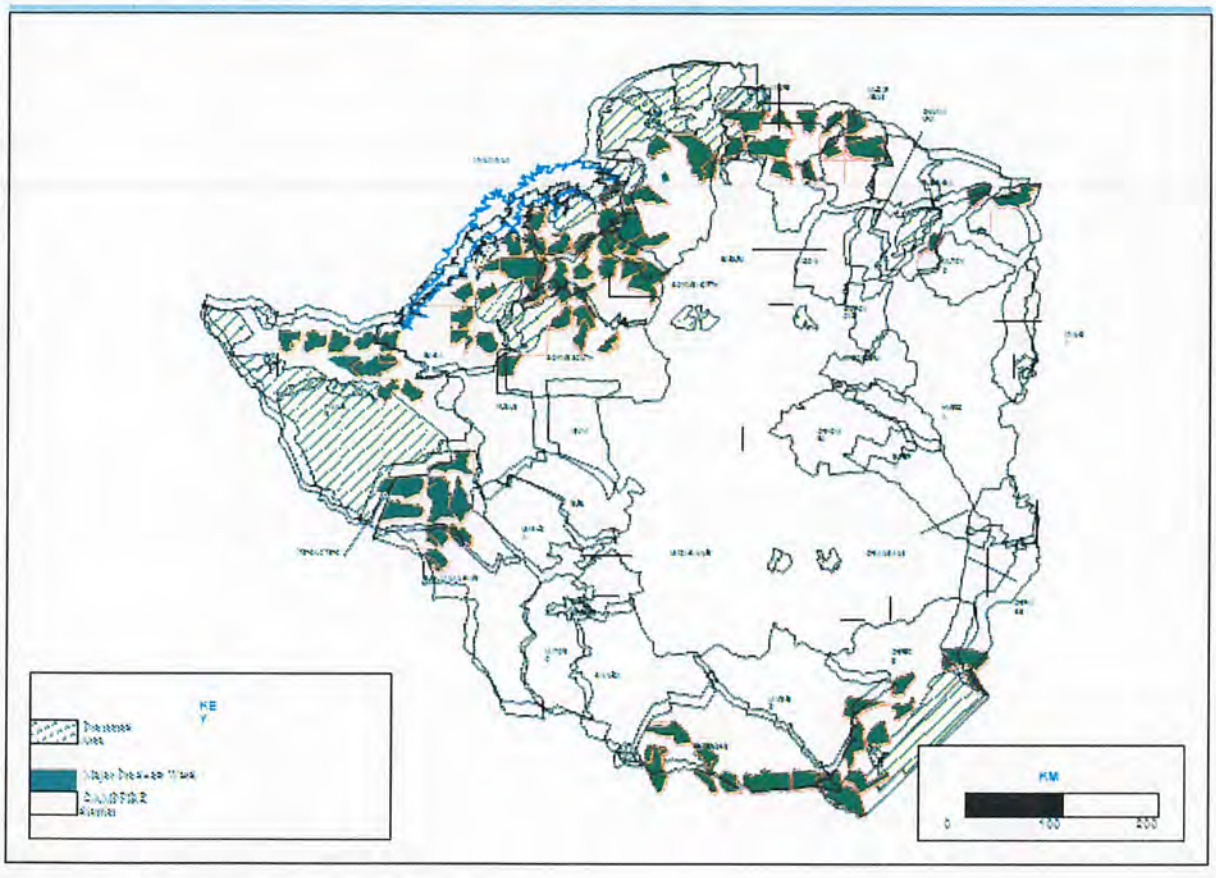

Figure9: CAMPFIRE Areas of Zimbabwe

The most common and lucrative wildlife based activity is sport hunting and the elephant provides the bulk (up to 80%) of revenue generated from wildlife based land use to the communities and the RDC's overseeing the CAMPFIRE program. During the 2014 hunting

season, a total of about US$1,419,384.00 (costs including trophy fees, daily rates and concession fees) was realized as revenue from elephant hunts under the CAMPFIRE program. Revenue generated from the CAMPFIRE program is ploughed back into managing and protecting the wildlife resource through activities such as anti-poaching patrols, wildlife censuses and problem animal control (PAC), and wildlife surveys. The distribution and use of CAMPFIRE revenue is done in accordance with the CAMPFIRE constitution developed in 1991 according to guidelines developed by the Government of Zimbabwe. The constitution was amended in 2007 with a view to increase the percentage of revenue for the local communities. The distribution of revenue between the Communities, RDC and CAMPFIRE Association is summarized in Table 14.

Table 14: Distribution of Revenue between Communities, RDC and CAMPFIRE Association.

Community	**RDC**	**CAMPFIRE Association**
55%	41%	4%

All major RDCs use CAMPFIRE revenue sharing guidelines, and in these districts revenue is paid directly into community controlled bank accounts by safari operators. Table 15 is a summary of how revenue allocated to communities is utilized based on the CAMPFIRE constitution.

Table 15: The Distribution of CAMPFIRE Revenue by Communities.

Project	**Percentage allocation**
Resource management	26%
Households	22%
Community projects	52%

It is apparent, however, that certain perceptions exist among some communities and observers that the sharing model is no longer being religiously adhered to, raising concerns regarding transparency over the revenue distribution system in CAMPFIRE areas. Some communities feel they are not benefiting adequately from the utilization of the wildlife resource. To this end, a review of the CAMPFIRE concept is being undertaken by the Government of Zimbabwe through the Ministry of Environment, Water and Climate. A funding proposal has been submitted to the European Union (EU) and if approved, the initial workshops will be held in August 2015.

The communities within CAMFIRE areas also benefit from elephant hunting revenue through community development projects as shown in Table 16.

Table 16.Some of the community development projects funded by hunting revenue in selected CAMPFIRE districts.

District	Project
Beitbridge	Rehabilitation of schools, clinics and irrigation schemes
Bililima	Rehabilitation of 3 clinics and 3 primary schools, hall, fencing field and rehabilitation of lodge
Binga	Schools, clinics and sub offices, rudimentary elephant dung paper making and tanning
Chipinge	3 grinding mills, lorry, teachers houses, community office, shop
Chiredzi	Clinic, teachers' houses, primary school, community-grinding mill, Police sub-office, piped water and electrification of clinic.
Gokwe North	6 grinding mills
Hurungwe RDC	Tillage tractors
Hwange	Agricultural inputs, goats restocking
Matobo	Organic farming gardens
Mbire	Clinic, nurses houses, office, storerooms, 14 classrooms, 7 teachers houses, grinding mill, school office, wildlife administration offices, 2 hand pump bore holes, water pipes, toilet, water storage tanks, 2 tractors, a tourist camp with 4 chalets;
Mudzi	Construction of Chingamuka primary and Chori pre-school
Nyaminyami	Tillage tractors, renovation of dispensary at clinic, nurse's house. Construction of Mayovhe classroom block, 3 grinding mills, Teacher's house, Jongola school. School bursaries x 3 students at Seke Teacher's College. Renovation of pre-schools x 2. Negande: Rehabilitation of water pipeline, grinding mill. Nebiri: Chikuro primary block, rehabilitation of Harudziva water pipeline. Kasvisva: Rehabilitation of water pipeline to supply water to Kasvisva clinic, Kasvisva Secondary school block. Msampa: Teacher's house, Majazu pry, renovation of ward warehouse; Kanyati: Cement for teacher's house renovation.
Tsholotsho	6 classroom blocks, clinic, 10 water engines, 2 F14 cottages
Umguza	Mlandwa secondary school
Vungu	Construction of primary school, borehole, dip tank

The CAMPFIRE program has managed to bring some important infrastructural development in some communities in Zimbabwe. It is important to note that most of the districts that have significant wildlife and in particular elephant populations are remote and generally underdeveloped, thus the proceeds from CAMPFIRE and the resulting developments go a long way in uplifting communities.

Private land

Revenue generated from these areas accrues to the respective land holders. Ideally ZPWMA, as the custodian of wildlife expects that some of the revenue is ploughed back to conservation. This money will be used for resource protection that is anti-poaching, fire management and water provision. Annually, ZPWMA carries out assessments in all wildlife farms to have an idea of the status of the infrastructure on respective properties.

Forestry commission

The forestry commission, to an extent, is like ZPWMA. They have to raise money for their operation. The revenue generated from elephant hunts is used for funding general activities in their concessions. Some of their major activities are anti-poaching, fire suppression and game water provision.

CONCLUSION

Zimbabwe still has a significant and healthy elephant population, which is the second largest in Africa, with most protected areas having a density of more than 1.5 elephants/km^2. The country has also experienced an increase in human population and the attendant increase in demand for land and natural resources. As such, habitat loss and modification remain as the most serious threat to viability of elephants in Zimbabwe, and also throughout Africa. Elephant management is based on the adaptive management approach which has resulted in the evolution of management strategies to cope with emerging and new methods of poaching. The ZPWMA also realizes the need for consistent and regular monitoring and emphasis has been placed on carrying out more frequent and regular aerial surveys, as well as routine ranger based monitoring of the elephant and other wildlife species populations. This will allow timely management interventions should the elephant population rise above, or fall below set TPCs. Elephants, despite being a constant source of problems for some communities, are an important source of revenue to these same communities, especially through their consumptive utilization. It is an accepted philosophy that wildlife can and should play a significant role in paying for its conservation. There is no doubt that elephant populations without direct economic value are at peril through lack of funding for conservation and also conflict with humans. It is apparent that despite Zimbabwe

deriving substantial benefits from utilization of elephants, this revenue is not sufficient to support conservation programmes. Considering that the elephant is an internationally recognized iconic species, it follows that local, regional and international efforts need to be initiated and maintained in order to secure the viability of elephant populations. Instead of restrictions being imposed on Zimbabwe in terms of sustainably utilizing elephants, international co-financing of management/protection of Zimbabwe's elephant population can go a long way in sustaining the elephant population. Given the global iconic status of the elephant, and that Zimbabwe has the second largest population of the African elephant, Zimbabwe must not be left to bear the sole burden of conserving the African elephant population.

THE ZIMBABWE NATIONAL ELEPHANT SUPPLEMENTARY MANAGEMENT PLAN (2015 – 2020)

Introduction and Background

The supplementary Elephant Management Plan (EMP) is a supplement that has been developed from the Zimbabwe National Elephant Management Plan (2015 – 2020). This supplementary plan looks at all the deliverables from this plan and highlights the priorities for the successful implementation of the plan. The supplement also highlights the progress that has been made towards the successful implementation of the EMP from the time it was adopted in 2015.

It was noted that the EMP was an ambitious plan and it required the cooperation of all internal and external stakeholders in order to achieve its obligations. The urgency that was placed upon well-equipped men on the ground to combat illegal killing of elephants, improved monitoring and research, and the provision of incentives to maintain and if possible increase the elephant range, requires huge resources.

This supplementary EMP recognises that the implementation of the Zimbabwe Elephant Management Plan (2015 – 2020) requires adequate and sustainable funding and provision of other resources to effectively protect the elephant and to curb illegal trade in elephant products. Thus there is need to fully resource all the components of this plan in order to successfully manage Zimbabwe's elephant population.

Resources are being mobilized from within ZPWMA, from its own business ventures, by the private sector, and by intergovernmental and nongovernmental organizations. Partnerships between ZPWMA and other stakeholders are also in place to secure some of the resources for elephant conservation. There is a need for the Government to provide additional support to the conservation of elephants given the present poaching crisis affecting the species continentally.

This supplementary elephant management plan recognises the work and the resource allocation that has made towards full implementation of the plan, and provides detail of the milestones achieved and work covered. It also prioritises the major areas of the EMP into immediate areas that are meant to arrest poaching and illegal trade in elephants. However, it details the impressive extent to which most of the structures have been set up and some of the innovations that have been put in place to attempt to bridge the funding gap.

Resources Available

An audit has been conducted of the implementation of the EMP to date and resources have thus far been channelled into the following areas.

Table 1: Financial resources deployed up to August 2016

BUDGET (USD)					
Item	**North West Matabeleland**	**Sebungwe**	**Mid Zambezi Valley**	**South East Lowveld**	**Total Current**
Law Enforcement	158,948	113,920	244,650	318,000	835,518
Monitoring	31,000	-	8,155	15,500	54,655

Investigations	-	-	16,500	8,000	24,500
Training	12,548	-	30,124	23,000	65,672
Community Relations	4,854	-	9,770	15,000	29,624
Total (USD)	205,350	113,920	309,199	379,500	1,009,969

Progress towards Implementation of the Elephant Management Plan (2015 – 2020)

Several milestones stated in the Elephant Management Plan have already been achieved which include the following:

a. Appointment of the Elephant Manager as in section 4.5 of the Zimbabwe Elephant Management Plan (2015 – 2020).

b. Getting a basic agreement of implementation in the 4 relevant regions.
c. Some work towards Law Enforcement, Monitoring, Investigations, Training and Community Relations. As of August 2016, more than USD 1million had been spent on these activities. Table 1 above. More detailed breakdown of how this was spent see Annexes 1.0, 2.0, 3.0 and 4.0.

Constraints and Challenges

One of the major challenges regarding implementation of the EMP is with regards to the adoption of stricter domestic measures by the United States of America. This has had the net effect of further reducing the revenue from hunting into the Authority, which therefore affects the budget allocated to resource protection, in particular the elephant in this case.

One of the key impediments towards the full and comprehensive implementation of the Elephant Management Plan is the limited resources. However, Zimbabwe is at an advanced stage in the development of resource mobilisation strategies. These strategies include partnering with both local and international institutions in resourcing and financing aspects of the programme.

Priorities

Due to the fact that Zimbabwe is experiencing some funding constraints with respect to the full implementation of the Elephant Management Plan, which means therefore that it will not be possible to fully implement every aspect of the plan at the same time, we have developed a set of priorities (all drawn from the plan), that we feel are implementable and enable the work of conservation to proceed smoothly.

1. Law Enforcement
   Law enforcement continues to be one of the most critical aspects of this strategy. From the perspective of the EMP, it has also to date been allocated the biggest budget (Table 1). While strategic gaps still exist with respect to the law enforcement capacity (the numbers of rangers on the ground are still in need of improving to effectively cover that Parks Estate, more patrol kits and equipment are still required to improve enforcement capacity). In order to effectively combat poaching and illegal trade the Law enforcement capabilities are top priority.
2. Monitoring
   Biological monitoring and management, with respect to the priorities for this plan would come in as a second priority. This enables monitoring programmes and research to support science based adaptive management of elephants in this action plan. The resource allocation to this activity needs to be dramatically improved, although innovations have had to be put in place to manage that insufficient resource allocation. Rangers on patrol also carry out significant monitoring activities which feed into the biological monitoring and management of the elephants.
3. Investigations/Intelligence
   The investigations capacity (together with training) are critical components of this action plan. To date of the available resources, allocations to investigations have been minimal. Innovations have also been developed in this area, for support from various private players, institutions and state institutions in the investigative processes.

Assistance with areas like crime scene attendance have been improved through the assistance of the Zimbabwe Republic Police involvement.

4. Appointment of Elephant Manager

   While the appointment of the National Elephant Manager has been concluded (April 2016) to enhance implementation, monitoring and evaluation of the Action Plan, funding constraints still exists. Some funding for the activities of the Elephant Manager have been unlocked through cooperation with stakeholders in the monitoring and evaluation activities of the office. This includes setting up of the Regional Elephant Management Committees and funding their activities.

ANNEX 1.0 Northwest Matabeleland Action Plan – *Status and progress report Aug - 2016*

9.4.1. Protection and Law Enforcement (Northwest Matabeleland)			
Output	**Activities**	**Key Performance Indicators**	**Narrative Report on Progress in Implementation**
1.1 Highly trained rapid response anti-poaching units established/ strengthened	- Assess / audit current law enforcement capacity, prioritise needs - Mobilise resources to meet shortfalls in personnel and equipment and new technology - Recruit rangers, train and retrain staff - Review / establish Standard Operating Procedures (SOPs) for all law enforcement operations	- Assessment of enforcement capacity completed - Fully staffed and trained anti-poaching units in place and operating - SOPs established and being implemented - Trends in illegal killing of elephants documented	- Collaborations with other stakeholders (e.g. WWF, Government of the People's republic of China) in law enforcement efforts was done were equipment such as camping tents, GPSs, vehicles, road maintenance equipment (graders, tipper trucks, lorries) were sourced - Training was done in Spatial Monitoring and Reporting Tool (SMART). 4 Officers and 40 Ranger were trained - New recruitment and recruitment drive for rangers initiated - Database on elephant illegally killed is maintained and updated
1.2 Informer network, investigation and intelligence system strengthened / established and operating	- Recruit informers and contacts - Recruit investigators and deploy strategically - Train investigators - Set up anonymous whistle-blowing system (through hotline) - Carry out awareness campaign within communities on value of conservation and how to report illegal activity (to stimulate social involvement) - Establish intelligence database	- Number of arrests based on information from intelligence system - Number of investigators recruited and trained - Number of calls to whistle blowing system that result in effective follow up - Number of incursions reported on by local communities and reacted to by ZPWMA/ZRP	- 5 cases based on information from intelligence were attended to. No recruitment of investigators and training done 6 calls to whistle blowing systems resulted in effective follow up 10 incursions reported on by local communities and reacted to by ZPWMA/ZRP under the joint operations initiative

9.4.1. Protection and Law Enforcement (Northwest Matabeleland)			
Output	**Activities**	**Key Performance Indicators**	**Narrative Report on Progress in Implementation**
1.3 Investigation and prosecution of wildlife crimes improved	- Establish Standard Operating Procedures (to include guidelines in collaboration with ZRP, Prosecutors, Magistrates, EMA, etc., and evidence gathering - Identify gaps (e.g. ballistics and forensics) and solicit external expertise - Establish regular training and retraining schedule - Procure / hire specialized equipment that may be required	- Proportion of arrests leading to prosecution - Proportion of successful prosecutions	- The SOP for Joint Operations with ZRP and other law enforcement agencies not available - 100 % proportion of arrests leading to prosecution - 95 % proportion of successful prosecutions
1.4 Database that is compliant with national database established	- Set up databases at regional HQ and field stations that can feed compliant information through to regional and national databases - Train staff in appropriate data collection and data capture using standardised recording forms and procedures	- Databases bases established and operational - Recording protocols in place and being used	- Database is available at station levels feeding into the Regional and National levels. - Reporting protocols in place
1.5 Joint law enforcement operations within the NWM region	- Conduct joint operations - Convene joint meetings of law enforcement agencies - Conduct awareness campaigns for other law enforcement agencies - Agree on operational order / SOPs (including information sharing)	- Number of joint operations leading to arrests and successful prosecutions - Number of meetings held per year - Number of successes from shared wildlife crime information	5 joint operations leading to arrests and successful prosecution were done 16 meetings have been done to date Have been successful on all shared information wildlife crime
1.6 Full compliance with hunting and guiding regulations enforced	- Ensure all operators within the region are fully aware of regulations - Appropriate measures are taken to fine / apprehend / prosecute breaches of regulations	Implementation of revised quota setting models in the NWM	Enhanced data collection and collation of returns for quota setting implemented
1.7 Illegal settlement / human encroachment in designated wildlife areas reduced / reversed	- Liaise with RDCs, Traditional Leaders, ZRP and DA's office, and Lands Office - Conduct awareness, education, extension programmes in areas affected - Conduct regular satellite monitoring of areas likely to be affected	Percentage of designated wildlife area in the NWM that are settled has not increased, or has declined, from 2015 levels	There are no increases or decreases in settlements within protected areas. It should be noted however, that there is illegal grazing in Hwange National Park from the communities in the Tsholotsho area.

9.4.1. Protection and Law Enforcement (Northwest Matabeleland)			
Output	**Activities**	**Key Performance Indicators**	**Narrative Report on Progress in Implementation**
1.8 Collaboration in law enforcement with neighbouring countries established	- Convene joint meetings of law enforcement agencies - Agree on standard operational procedures - Conduct joint cross border operations	- Agreed SOPs for cross border law enforcement operations - Number of joint operations leading to arrests and successful prosecutions	There are no agreed SOP for cross border law enforcement operations 5 cases of joint operations leading to arrests and successful prosecution

9.4.2. Biological Monitoring and Management (North West Matabeleland)			
Output	**Activities**	**Key Performance Indicators**	**Narrative Report on Progress in Implementation**
2.1 Elephant population numbers, structure, mortality (using aerial, ground, and ranger based methods) regularly monitored	- Carry out regular surveys - Carry out aerial monitoring of wildlife and illegal activities - Adopt standardized databases for all stations, forest areas, and RDCs in NWM - Introduce ranger-based monitoring across all stations in NWM - Analyze the data and report on trends - Annual water hole count continued	- Information on trends in elephant numbers, structure and mortality analysed and available	Analysis data is based on the national survey of elephants and large herbivore done in 2014, road count data and from waterhole counts which are done yearly.
2.2 Impacts of elephants on selected habitats, selected indicator plant and animal species, and water use and supplies monitored and assessed	- Measure and monitor vegetation indicators, e.g. woodland cover and changes in specific species e.g. Baobabs - Measure and monitor functional biodiversity indicators, e.g. bird species richness and responses to structural changes in woodlands - Measure and assess water use and its sustainability	Elephant impacts on selected habitats monitored, analysed and reported Elephant impacts on indicator species measured analysed and reported Sustainability of water use completed	Permanent vegetation plots are monitored regularly for the effects of elephants and the data analysed. The effect of elephants on indicator plants species is monitored. Research is ongoing on their effects on major herbivores. A study on the effects of drawing on underground water to water elephants is about to be initiated
2.3 Upper and lower thresholds of potential concern (TPCs) related to spatial and temporal impacts (ecological, social, economic) of elephants established	- Compile and analyse historical trends in habitats, selected species, economic performance of consumptive and non-consumptive use, and HWC in the region - Consultations with experts and the public on acceptable limits to change - Propose TPCs for elephant impacts and densities	- Research reports completed - PCP consultation results analysed and reported - TPC recommendations submitted - Results of timely analyses and expert and public opinion being used in determining adaptive management measures	A study looking at changes in vegetation has recently been completed in collaboration with WWF, data is yet to be analysed Adaptive management is exercised through adopting results from research work within the park

9.4.2. Biological Monitoring and Management (North West Matabeleland)			
Output	**Activities**	**Key Performance Indicators**	**Narrative Report on Progress in Implementation**
2.4 Appropriate adaptive management actions undertaken when TPCs approached or exceeded	- Regularly monitor levels and trends in TPC indicators that have been developed - Alert management when and if trends indicate that TPCs are likely to be exceeded - Decide on and implement appropriate management action	- Adaptive management actions taken in response to elephant impacts	More boreholes have been drilled to ensure there is enough water for other animals and to relieve pressure on some areas.
2.5 Age and quality of all elephant killed (trophies, PAC, rations, culls, poached) monitored and quotas to meet desired trophy quality adjusted	- Record age, sex and tusk size (length and weights) of all elephants killed each year - Set up and maintain database - Analyse trends and adjust quotas as necessary to meet desired trophy size - Introduce flexible and adaptable quota system (review fixed quota system) - Produce annual report	Age, sex and tusk sizes for all elephant killed recorded Elephant trophy quality is maintained or improved in relation to the stipulated desired age and trophy size.	A database with information on elephants killed is maintained Trophy quality is maintained through the policing of the hunting industry and record keeping and adaptive management of quotas.
2.6 Elephant range defined and managed to maintain (and/or recover) habitats and elephant populations, and connectivity between fragmented populations and buffer zone populations initiated	- Define elephant range use and existing buffer zones and potential connectivity - Identify priority corridors and land use barriers - Conduct spatial analyses to inform land use planning to facilitate connectivity and reduce human-wildlife conflict	- Elephant range maintained and lost habitats recovered - Corridors between fragmented elephant populations maintained/ established	13% of land in Zimbabwe is maintained for wildlife Corridors are being resuscitated such as the Hwange Sanyati Biological corridor which is being maintained in collaboration with WWF.
2.7 Reports to international monitoring systems prepared and submitted (e.g. AED, ETIS, MIKE, MIKES)	- Timely reports prepared and submitted as required to regional and national levels for transmission to international agencies	- Required reports submitted on time	Done at National level. However through our normal reporting system we feed in with the related information

9.4.3. Social, Economic and Cultural Framework (North West Matabeleland)			
Output	**Activities**	**Key Performance Indicators**	**Narrative Report on Progress in Implementation**
3.1 Joint venture and sustainable use opportunities to strengthen elephant conservation and management explored	- Initiate policy formulation and /or protocols for the development of joint ventures involving public, private, community partnerships (PPCPs) - Involve all relevant stakeholders in identifying potential areas and in the planning / selection process for potential joint ventures / PPCPs - Implement identified and feasible joint ventures / PPCPs	- Policy framework and protocols for establishing Joint Ventures /PPCPs in NWM adopted - At least three Joint Ventures / PPCPs initiated and operating by 2018	HSBS, KAZA, CAMPFIRE, save Australia are some of the joint venture operations adopted and being implemented in NWM
3.2 Transparent distribution of the benefits and costs of elephant management and conservation facilitated	- Develop instruments / protocols to: ○ Increase elephant revenues at the ward level. ○ Provide for traditional leaders to be involved in the management and distribution of elephant related benefits. - Revise CAMPFIRE guidelines to increase the share of revenues at the ward level beyond 55%. - Develop a system to ensure accountability of the revenue sharing mechanism from District to ward level. - Periodically audit the revenue sharing system	- A greater proportion of revenues from wildlife utilisation accrue to communities - Traditional leaders involved in elephant management and revenue sharing - Revenues from wildlife accounted for and audited	There is need to review the benefit-sharing frameworks of CAMPFIRE and other schemes. There is little involvement of traditional leadership in revenue sharing There are no audits and accountability is minimum for revenue from wildlife
3.3 Effective techniques and land use strategies and protocols to mitigate human-wildlife conflict (HWC) implemented.	- Review current human-elephant conflict mitigation measures and potential incentives / policies to reduce conflict - Implement proposals / options emerging from review - Monitor levels of HWC, enter data in database, analyse trends	Land use strategies and protocols for mitigating HWC adopted and implemented Trends in HWC incidents show reduced levels of conflict	There are distinct land use regimes governed through government statutes and policies. Decline on human-wildlife conflicts is evident. For example data shows that lion conflicts have reduced by 50%
3.4 Recovery and use of all products from legally killed elephants improved	- Provide guidelines for the effective recovery, treatment, storage, and sale of elephant products -	Proportion of legally killed elephants from which products were effectively recovered Revenue earned	100%

9.4.3. Social, Economic and Cultural Framework (North West Matabeleland)			
Output	**Activities**	**Key Performance Indicators**	**Narrative Report on Progress in Implementation**
3.5 Information on elephant conservation, management and benefits in communal areas neighbouring key elephant populations included in school curricula	- Liaise with Ministry of Primary and Secondary Education on the development, production, and inclusion of elephant conservation material in school curricula - Engage with specialists and communities to develop suitable educational material on elephant conservation and management for NWM - Distribute material developed and undertake awareness campaigns on elephant conservation in selected areas	- Number and quality of elephant information items developed and delivered to schools in NWM - Proportion of schools within or neighbouring elephant areas receiving and using information provided	There is little information distributed on elephants to communities. Distribution is largely done by private organisations such as painted dogs The proportion is low

9.4.4. Building Conservation Capacity (North West Matabeleland)			
Output	**Activities**	**Key Performance Indicators**	**Narrative Report on Progress in Implementation**
4.1 Funding to initiate and sustain the implementation of this plan secured	- Develop and submit bankable project proposals to identified potential funders - Explore potential partnerships (NGOs, Private Sector) - Review fee structure for elephant hunting and the potential generation and distribution of revenues for conservation and communities from alternative models	- Value of funding and support in kind for conservation of elephants in NWM realised each year	There is high value in funding of elephant conservation (WWF HSBC, WEZ, Friends of Hwange and Other Stakeholders)…funding coming in in terms of drilling of boreholes, vehicles, camping equipment, solar panels, fuels radio communication, roads and fire guards
4.2 Current capacity and staff, training, and equipment needs identified	- Carry out full audit of current human and financial resources required to implement this plan and identify needs	Capacity needs assessment (audit) completed by June 2016	Was done and is being implemented through HSBC
4.3 Capacity for sustained research and monitoring strengthened and collaboration with research institutions enhanced [Linked to and informed by Components 2 and 3]	- Develop and implement a multi-disciplinary research and monitoring strategy for the NWM - Develop and implement a research programme based on that strategy - Provide appropriate tertiary level training for ZPWMA - Engage universities to establish in-service mentoring system - Identify and provide needed equipment - Identify and recruit community research/ monitoring personnel - Identify and train community monitors in the use and application of the Event Book System	- Explicit research strategy for NWM developed by June 2016 - Functional research programme in place by June 2017 - No of research proposals developed, submitted, funded, and equipped - 2 persons trained per annum - No of research personnel on the ground - Research publications - No of active community monitors using the Event Book system	Research strategy is under development 1 done by University of Zimbabwe Under review n/a 3 No publications have been done

9.4.4. Building Conservation Capacity (North West Matabeleland)			
Output	**Activities**	**Key Performance Indicators**	**Narrative Report on Progress in Implementation**
			None
4.4 Training and in-service retraining of personnel in law enforcement, research and monitoring, education awareness community elephant management, etc., established & operating	- Use capacity training needs assessment (4.2) to develop training modules / curricula - Draw up training/retraining programme	- Training modules and curricula developed and being used - 50 to 100% increase in: a) No. of training days and programmes initiated b) No. of staff trained c) No. of communities trained and implementing elephant management programmes d) No. of elephant management campaigns conducted	No modules developed as yet - - - About 10 elephant management campaigns were conducted.
4.5 Infrastructure and housing to facilitate effective protection, conservation and management of elephant in the NWM developed	- Rebuild / refurbish all main access and internal roads within NWM wildlife areas - Maintain / establish necessary airstrips - Undertake a feasibility study for the strategic development of new bases and pickets to support effective law enforcement, research and monitoring - Review staff accommodation requirements for the NWM - Renovate existing buildings - As needed develop staff accommodation and associated infrastructure	- Roads, bridges, airstrips refurbished and maintained as planned - Feasibility study of required field stations completed by June 2016 - Identified infrastructure requirements prioritised and required developments undertaken and completed by 2018	2 airstrips were refurbished and 1650km of roads were graded The list has been produced and is included in the Hwange Management Plan

9.4.4. Building Conservation Capacity (North West Matabeleland)			
Output	**Activities**	**Key Performance Indicators**	**Narrative Report on Progress in Implementation**
4.6 Effective, secure communications network across the region established	- Establish digital VHF and GPS communication and tracking systems across the NWM (repeater links, base sets, handhelds, mobile radio sets, computers for monitoring purposes	Fully operational secure communications system in place and being maintained	The communication system has been improved, however more is required in relation to the repeater links

9.4.5. Coordination, Collaboration and Programme Management (North West Matabeleland)			
Output	**Activities**	**Key Performance Indicators**	**Narrative Report on Progress in Implementation**
5.1 Regional elephant management committee with membership from key stakeholders established and operating	- Appoint committee members - Hold meetings twice each year - Circulate minutes and actionable points within one month of each meeting	- Timely minutes of each bi-annual meeting produced and circulated - Number of committee resolutions and actionable points initiated and acted upon	N/A N/A
5.2 Technical support team to assist in implementation of the plan established and operational	- Convene technical support team of volunteers - Establish Terms of Reference for the team with ZPWMA & FC	- Functional team established - Technical support provided in keeping with TORs and planned activities implemented	N/A N/A
5.3 Effective communication and collaboration between Private sector, NGOs, State Agencies, and neighbouring communities (via a Forum) established	- Establish a formal forum for private sector agencies to interact with ZPWMA and FC - Establish terms of reference and recognition as a formal entity - Establish effective engagement with RDCs, and Traditional Leaders in NWM and neighbouring communities	- Formal recognition by ZPWMA / FC achieved - Meetings held - Effective engagement with neighbours	Quarterly stakeholder meetings There is effective engagement with neighbours…working with RDCs, KAZA, communities in law enforcement, human wildlife conflicts
5.4 Links with neighbouring Botswana, Namibia and Zambia to confer on the management of shared elephant populations established / strengthened	- Establish links with Botswana, Namibia and Zambia to confer on cross border elephant management issues	- Links established and operating	The KAZA forum allows for the mentioned countries to tackle cross border management issues

9.4.5. Coordination, Collaboration and Programme Management (North West Matabeleland)			
Output	**Activities**	**Key Performance Indicators**	**Narrative Report on Progress in Implementation**
5.5 Information dissemination strategy developed and implemented	- Undertake an awareness campaign to promote and market the plan locally and internationally - Produce and disseminate regular progress reports on the implementation of the plan	- At least one awareness campaign conducted each year - Annual progress reports produced - Number of briefs / news releases on major developments or progress released - Funds raised to support elephant conservation	This is yet to be done

ANNEX 2.0 **Sebungwe Action Plan** - *Status and progress report Aug - 2016*

9.5.1 Protection and Law Enforcement (Sebungwe)			
Output	**Activities**	**Key Performance Indicators**	**Narrative Report on Progress in Implementation**
1. Joint operation reaction team established and existing base renovated at Bumi Hills old ZRP Camp as primary base. Followed by 3 others (Binga, Siabuwa, Old Chizarira Lodge/ Sengwa Wildlife Research Institute) *Manpower* *Vehicles* *Aircrafts* *Communication – eg radios* *Equipment eg firearms, boats* *Training* *Central database* *Intelligence networks*	**Manpower** – Draw up 20 man reaction team from law enforcement agencies and other stakeholders from the whole Sebungwe sub-region. (Prioritise Bumi, Sengwa) **Refurbish main base** **Training** – Initial database training Refresher course **Transport and Equipment** Procurement of 3 vehicles (land cruisers) Procurement of 3 boats (speedboats – 1 mothership and 2 patrol boats) **Communications** – establish an independent inter-agency communication network	- Number of arrests - Number of cases detected - Number of recoveries made (eg ivory, firearms etc) - Number of patrols conducted - Number cases finalized (convictions) - Number of carcasses detected - Number of joint operations carried out - Number of refresher courses carried out - Number of failed cases	The Sebungwe Region whose greater part is under the jurisdiction of Central has stations which include Sengwa Wildlife Research Area, Chirisa Safari Area, Chizarira National Park, Chete Safari Area and Matusadona National Park. During the reporting period of August 2016 we had a total of 22 incursions with the highest incursions happening in Chirisa Safari Area while the least was in Chete Safari Area. We had a total of 5 visual contacts with poachers but all were unarmed contacts. No ivory was recovered, no fire arms were recovered. 203 wire snares were removed. 8 people were arrested however all the arrests were not ivory cantered. No refresher course was conducted in the Region. Joint operations were conducted by our investigations section with MBCU, the police and MAPP. A total of 6 elephant carcasses were discovered of which 2 were natural mortalities in Matusadona, 1 was poached in Matusadona, 2 were poached in Chete and 1 was poached in Chizarira.
1.2 Informer network, Investigation and intelligence system strengthened	- Recruit informers and contacts - Maintain hotline for whistle-blowers - Procurement of 2 vehicles and 2 motorbikes - Recruit investigators (6) and deploy strategically - Train investigators - Constant liaison with informers - Rewards to informers standardized	- Number arrests and successful convictions based on information from intelligence system - Number of incursions reported on/reacted to by local communities - Number of informer reports per informer leading to arrests and convictions	From the month of August to date 2016,based on information given through informer network assisted in arresting two persons found in possession of a pangolin in Sengwa,Gokwe Davison Goredema and Batau Murambiwa Both were sentenced to 9 years effective each.On the 14th of September 2016 One suspect was arrested for possessing approximately 5kgs of ivory.The case is still pending in court.Approximately 8 ivory deals have been reported through informer network and are still being worked on for reaction.10 deposit fine tickets were also issued for separate offences .

9.5.1 Protection and Law Enforcement (Sebungwe)			
Output	**Activities**	**Key Performance Indicators**	**Narrative Report on Progress in Implementation**
1.3 Zambezi Valley deployment tactics revisited and implemented	- ZV deployment tactics revised - Identification of OP sites, crossing points etc - Identification and procurement of specialized equipment (eg night vision) - Provision of dry rations for operations - Introduction of aerial surveillance flights	- Resource books - Number of successes on detections - Number of contacts - Number of recoveries - Patrol effort (surveillance)	MAPP assisted in deployments for Matusadona both in the Lake with a boat and in the land with a vehicle. MAPP also assisted in joint operations and following up information from informers within the Gokwe and Nyaminyami districts. Recoveries and surveillances were made by our Investigations team together with the informers, MBCU and sometimes with the duty uniform ZRP
1.4 Ranger patrols strengthened	- Establish effective patrolling force of deployable rangers - Establish (or review) standard operating procedures (SOP) - Establish well-equipped reaction teams - Honorary Officer system re-established to support ranger patrols - Increase support for establishing/ improving dedicated APU for every concession.	- Number of deployable rangers at any one time - Total man-days spent on patrol - SOPs in place - Area patrolled each month - Reaction time to incidents - Number of APUs established	A total of 90 rangers were deployable and a total of 1099 man-days were spent on patrol during the month of August 2016
1.5 Training of staff enhanced	• Establish regular training and retraining schedule (includes training on weaponry, bushcraft, tracking, information gathering, crime scene management, Judiciary procedures etc • Training on standard operation procedures (harmonization)	• Number of training and retraining sessions carried out	8 rangers went for a refresher course at Head Office with the Army training them in drilling movements during the month.
1.6 Conviction rates improved	• Judiciary sensitization (incl. workshops) • Formulation of proper charges, indictment and summons • Gathering all evidence available using legal means • Completion of dockets timeously, submission and concluding cases in a reasonable time • Creation of a district sub-committee on elephant and wildlife issues • Hold workshops to share information on wildlife issues	• Number of successful prosecutions • Decrease in number of crimes committed • Number of workshops or meetings held	From August 2016 to date one case of ivory possession was successfully finalized and one for ivory is still pending trial.Generally poaching seem to have decreased as compared to the other years due to deterrent sentences being given by the courts,Conviction of ring leaders,changing of area of operation and current economic challenges which are also hitting the market on acquiring the us dollar.One workshop was held at Midlands black Rhino Concervancy with the judiciary to address challenges being faced .

9.5.2 Biological Monitoring and Management (Sebungwe)			
Output	**Activities**	**Key Performance Indicators**	**Narrative Report on Progress in Implementation**
2.1 Viable population, geographical distribution, and habitat connectivity targets established.	- Establish TPC for all areas to set viable population target. - Collect spatial data (livestock densities, human population densities, forest cover, and agricultural cover) to map potential geographic distribution of elephants - Identify potential connectivity areas and promote wildlife-based land uses in those areas.	- Viable population target of minimum 5,000 for the region with minimum and maximum thresholds in different land categories - Updated geographical distribution map and spatial datasets - Number of conservancies approved/ green-lighted by communities	There are no private conservancies in the Sebungwe Region, however the 4 Rural District Councils within the Region are very active in conservation and also CAMPFIRE is active. The 4 RDCs are Gokwe North, Gokwe South, Nyaminyami and Binga RDC.
2.2 Monitoring system for population trends, habitat, and impacts designed and implemented.	- Establish regional database for data on population, habitat, HEC, patrolling, poaching, and trophies (for trophies, see also Output 5). - Design and adopt standardized reporting formats. (i.e. MOMS) - Report to the regional management committee to review data and decide on management actions. - Conduct annual aerial surveys for the "core area" (to be defined).	- Regional database operational - Number of reporting formats designed and distributed - Number of persons, patrols, and sectors submitting data - Quarterly reports - Quarterly reviews	We have formats for different reports which start from Incidental reports, Daily reports, Weekly reports, Monthly reports, Quarterly reports and Annual reports. The reports come from the stations and are consolidated at the Regional Office before they are sent to HQ.
2.3 Direct and indirect causes of decline (2006-2014) researched.	- Causes of mortality quantified using the regional database. - Gather information from local communities and experts. - Examine potential socio-economic factors related to decline - Research habitat changes. - Publish research in scientific publication.	Data and analyses	For the month of August 2016, the Sebungwe Region lost a total of 6 elephants, 2 of them died of natural causes in Matusadona National Park, 1 was poached in Matusadona, 2 were poached in Chete Safari Area and 1 was poached in Chizarira National Park. A long term elephant research programme to be launched in Matusadona National Park in conjunction with a private partner

9.5.2 Biological Monitoring and Management (Sebungwe)			
Output	**Activities**	**Key Performance Indicators**	**Narrative Report on Progress in Implementation**
2.4 Viable population, geographical distribution, and habitat connectivity achieved and maintained.	- Establish wildlife-based land-use system (not a land use plan) with community conservancies acting as corridors between protected areas - Reduce human-elephant conflict to acceptable levels. - Implement responsible habitat management (with regard to fires, REDD+, mining, illegal and legal settlement) - Conduct integrated land-use planning. - Support extension of REDD initiative	- Number of operational conservancies/ corridors - Elephant Population data - Number of elephants and people involved in "serious HEC incidents" - Effective, non-lethal elephant deterrents in place - Regional land-use plan - Number of stakeholders, meetings in planning process - Utilization of corridors by elephants	The Authority is supporting efforts to establish conservancies in the Region and we have approved the setting up of a conservancy in the Gatshe Gatshe Area. The Chirisa-Sengwa excision area is also planned to be established as a community conservancy
2.5 Sustainable offtakes established through participatory quota setting and monitored through adaptive management.	- Establish a database of offtakes, trophy qualities, and age classes (See Output 2, Activity 1). - Using participatory quota setting following best practices, set optional quotas based on scientific survey data, with no more than 0.5% of the estimate as the elephant quota for the region. - Revisit quota system and establish optional quotas as opposed to fixed quotas - Set minimum trophy size and a variable trophy fee with large increments based on size - Identify and enforce best hunting practices through a code of conduct incorporated in lease agreements and hunting permits.	- Trophy quality improving - Record of hunting practice transgressions	Quotas for the Nyaminyami District and the Sebungwe Region as a whole have been greatly reduced and all elephant hunts are now being monitored by Parks

9.5.2 Biological Monitoring and Management (Sebungwe)			
Output	**Activities**	**Key Performance Indicators**	**Narrative Report on Progress in Implementation**
2.6 Robust and comprehensive research program enhanced and maintained.	- Research the impact of decline on population dynamics. - Investigate migration hypothesis. - Develop applied research projects, especially interdisciplinary and multidisciplinary research. - Establish research oversight body, building on existing approval processes.	Publications, particularly with management guidance	A long term elephant research programme to be launched in Matusadona National Park in conjunction with a private partner

9.5.3 Social, Economic and Cultural Framework (Sebungwe)			
Output	**Activities**	**Key Performance Indicators**	**Narrative Report on Progress in Implementation**
3.1 Transparent and equitable distribution of benefits established	- Develop an instrument to increase elephant revenues at the ward level. - Instrument to provide for traditional leaders to be involved in management and distribution of elephant related benefits. - Revise CAMPFIRE guide lines to increase the share of revenues at the ward level beyond 55%. - Develop a system to ensure accountability of the revenue sharing mechanism from District to ward level. - Periodic auditing of the revenue sharing system.	- Instrument approved. - CAMPFIRE guidelines revised and approved - Revenue accountability system established - Number of audits	The Zimbabwe Elephant Nursery to establish a community outreach program that will provide community educational and developmental projects and activities in the region
3.2 Economic management of consumptive and non-consumptive tourism of elephants in Sebungwe improved.	- Preventing human settlement in protected areas - Review length of concession leases to encourage greater investment. - Rehabilitate the depleted Safari areas - Promote PPCPs	- Number of eviction notices issued. - Number of reviewed leases - Number of safari areas under proper management/concessions - Record of PPCPs established.	Mokore safaris is currently operating in Sengwa Wildlife Research Area and the lease is under proper management, Statunga Safaris has also got the Chirisa hunting lease and will start operating in the year 2017. Chete Safri Area is currently still open however there are applicants who may take it at anytime.
3.3 Land use strategies to mitigate human elephant conflicts (HEC) established	- Review of human elephant conflict measures (consultancy) - Increase sense of ownership of wildlife as a mitigation measure to HEC (review) - Traditional leaders to set up a compensation scheme for land holders directly affected by HEC. - Support review and development of land –use plans to optimize agricultural livestock and farming activities	- Reports - Link with activity 1 and 2 output1(benefits) - Compensation scheme functioning and record of HEC in place. - Land use plans supported	Established a Problem Animal Control Committee in Nyaminyami and Gokwe that includes all stakeholders to assist in the effective coordination of all PAC issues

9.5.3 Social, Economic and Cultural Framework (Sebungwe)			
Output	**Activities**	**Key Performance Indicators**	**Narrative Report on Progress in Implementation**
3.4 Investment of wildlife revenue in income generating community products established	- Revitalize technical support services to communities/ community initiatives - Participatory business plan at community level. - Explore micro financing opportunities - Explore markets for community projects related to elephant conservation	- Technical support services established through proper instrument. - Participatory business plan adopted.	There is a strong move to promote the development of aquaculture projects to enhance food security
3.5 Relationship and communication mechanism established	- Sebungwe WG to include Traditional leaders and RDCs - Methodologies for regular communication with communities and their leaders established	- Traditional leaders and RDC included in the WG - Communication strategy developed	
3.6 Education on elephant conservation in the community increased	- Information campaign explaining reasons for quota decrease (see Biological Component for cross check) - Explain what trophy hunting means and how it links to benefits - Share census results and explain implications - Extend conservation education to Sebungwe wards (NGOs?)	- Number of Outreach meetings with Traditional leaders / Wards/ RDC including the 4 key activities	The Zimbabwe Elephant Nursery to establish a community outreach program that will provide educational and developmental projects and activities in the region

9.5.4 Building Conservation Capacity Component (Sebungwe)			
Output	**Activities**	**Key Performance Indicators**	**Narrative Report on Progress in Implementation**
4.1 Capacity needs for elephant management in Parks and CAMPFIRE areas analysed and identified	- Draw up TOR - Appoint consultant	Report produced	Still outstanding
4.2 Training provided	- Analyse training needs - Prioritise and develop training curricula if not already available - Implement in-service training and re-training	Numbers of people trained and certified	Still outstanding
4.3 Best practice standards for elephant management in place	- Standards defined by and through National Elephant Policy and CAMPFIRE Principles and Guidelines - Define clear objectives for elephant management in the Sebungwe - Support CITES MIKES site(s) and application of SMART and RBM	- MIKES PIKE database - SMART database	Nyaminyami RDC is a MIKE site and efforts are needed to adopt the SMART database system in th region
4.4 Research and monitoring capacity strengthened	- Provide appropriate tertiary level training for ZPWMA - Engage universities to establish in-service mentoring systems - Identify equipment needs, source and provide - Identify and recruit community research/ monitoring personnel - Identify and train community monitors in the use and application of the Event Book System	- 2 persons trained per annum - 5+ people in mentoring system each year - Equipment procured and in place - Active community research programme underway - Event Book System functional and operationalised	Still outstanding
4.5 Funding secured	- Complete Sebungwe Elephant Management Plan and disseminate for funding purposes - Development of funding proposals for each of the components, if necessary - Identify donors (e.g. bilateral, WB GEF, NGO, other) - Submit proposals - Develop Sebungwe branding and marketing campaign	Number of successfully funded proposals	Still outstanding
4.6 Infrastructure refurbished and functioning	- Roads rehabilitation: Parks and CL - Karoi-Binga road - Airstrips	- 2,000 km repaired to standard - Airstrips registered and functioning	Still outstanding

9.5.4 Building Conservation Capacity Component (Sebungwe)			
Output	**Activities**	**Key Performance Indicators**	**Narrative Report on Progress in Implementation**
4.7 Communications	- Procure and install radio communications systems	System installed and operational	Still outstanding

9.5.5 Coordination and Programme Management (Sebungwe)			
Output	**Activities**	**Key Performance Indicators**	**Narrative Report on Progress in Implementation**
5.1. Sebungwe Management Committee with an Elephant Working Task Force and Project Coordinator established	-Identify committee members, select WTF and appoint Coordinator -ToR for each institution (from national plan)	Committee meeting twice yearly; WTF meets quarterly, identifies priority activities and oversees implementation by Coordinator	Still outstanding
5.2. Coordination and communication between Traditional Authorities, their communities and the elephant management programme and plan strengthened	-Address the community through CAMPFIRE and traditional leadership -Introduce elephant management plan in easily understandable format – maps and graphs – and disseminate through all levels/actors in Sebungwe	• Management plan documents for dissemination	Still outstanding
5.3. Coordination between Sebungwe safari operators and implementation of the elephant management plan strengthened	-SOAZ, ZPHGA appoint liaison officer for Sebungwe elephant management plan -Encourage non-members of associations to participate in plan implementation	Liaison officer appointed and operating and non-members of associating participating in implementation of the action plan	Still outstanding
5.4. Links with neighbouring states established – shared elephant management	-Establish relationship with KAZA Secretariat -Establish links and synergies with transboundary natural resource mgmt -Bilateral JOC to focus on illegal wildlife trade and trade routes -Establish links with TRAFFIC	• KAZA Secretariat aware of Sebungwe elephant management plan • TBNRM established and functional • Reduced illegal trade	Still outstanding

ANNEX 3.0 Lower Zambezi Valley Action Plan - *Status and progress report Aug - 2016*

9.6.1. Protection and Law Enforcement (Lower Zambezi Valley)			
Output	**Activities**	**KPIs**	**Narrative Report on Progress in Implementation**
1.1 Highly trained rapid response anti-poaching units established/ strengthened	- Assess / audit current law enforcement capacity, prioritise needs - Mobilise resources to meet shortfalls in personnel and equipment and new technology - Recruit rangers, train and retrain staff - Review / establish Standard Operating Procedures (SOPs) for all law enforcement operations	- Assessment of enforcement capacity completed - Fully staffed and trained anti-poaching units in place and operating - SOPs established and being implemented - Trends in illegal killing of elephants	-
1.2 Informer network, investigation and intelligence system established	- Recruit informers and contacts - Recruit investigators and deploy strategically - Train investigators - Set up anonymous whistle-blowing system (through hotline) - Carry out awareness campaign within communities on value of conservation and how to report illegal activity (to stimulate social involvement) - Establish intelligence database	- Number of arrests based on information from intelligence system - Number of investigators recruited and trained - Number of calls to whistle blowing system that result in effective follow up - Number of incursions reported on by local communities and reacted to by ZPWMA/ZRP	5 informers were recruited, one more investigator was recruited. 10 calls were received indicating poachers coming in from the local community and 3 calls indicating foreign poachers coming in. Since January 2016, 4 foreigners have been arrested from tip offs and one local person. A total of 32 incursions were recorded whereby the majority of them were recorded during the first quarter of the year.
1.3 Investigation and prosecution of wildlife crimes improved	- Establish Standard Operating Procedures (to include guidelines on collaboration with ZRP, Prosecutors, Magistrates, EMA, etc., and evidence gathering) - Identify gaps (e.g. ballistics and forensics) and solicit external expertise - Establish regular training and retraining schedule - Procure / hire specialized equipment that may be required	- Proportion of arrests leading to prosecution - Proportion of successful prosecutions	Of all the five arrested poachers, all were sent for prosecution and were all convicted and sentenced

9.6.1. Protection and Law Enforcement (Lower Zambezi Valley)			
Output	**Activities**	**KPIs**	**Narrative Report on Progress in Implementation**
1.4 Database that is compliant with national database established	- Set up databases at regional HQ and field stations that can feed compliant information through to regional and national databases - Train staff in appropriate data collection and data capture using standardised recording forms and procedures	- Databases bases established and operational - Recording protocols in place and being used	The current data base in place is the MIKE data base system where one Senior Ranger and two rangers were trained to manage the input of information into that system. Recording starts from the time the callsign are deployed using patrol briefing form, patrol details will then record information of their findings onto the ground patrol data form whilst out on patrol; on return, a report is then reproduced which will be used together with the ground data form to then enter the information onto the MIKE system data base.
1.5 Joint law enforcement operations within the LZV	- Convene joint meetings of law enforcement agencies - Conduct awareness campaigns for other law enforcement agencies - Agree on operational order / SOPs (including information sharing) - Conduct joint operations	- Number of meetings held per year - Number of successes from shared wildlife crime information - Number of joint operations leading to arrests and successful prosecutions	One liaison meeting conducted with our Zambian counter parts, 3 community outreach programs with the Nyamakate and Chundu community. -
1.6 Full compliance with hunting and guiding regulations enforced	- Ensure all operators within the region are fully aware of regulations - Appropriate measures are taken to fine / apprehend / prosecute breaches of regulations	Implementation of revised quota setting models in the LZV	Implementation of the LZV Action plan is in progress with
1.7 Illegal settlement / human encroachment in designated wildlife areas reduced / reversed	- Liaise with RDCs, Traditional Leaders, ZRP and DA's office, and Lands Office - Conduct awareness, education, extension programmes in areas affected - Conduct regular satellite monitoring of areas likely to be affected	Percentage of designated wildlife area in the LZV settled has not increased, or has declined, from 2015 levels	
1.8 Collaboration in law enforcement with neighbouring countries established	- Convene joint meetings of law enforcement agencies - Agree on standard operational procedures - Conduct joint cross border operations	- Agreed SOPs for cross border law enforcement operations - Number of joint operations leading to arrests and successful prosecutions	

9.6.2. Biological Monitoring and Management (Lower Zambezi Valley)			
Output	**Activities**	**Key Performance Indicators**	**Narrative Report on Progress in Implementation**
2.1 Elephant population numbers, structure, mortality (using aerial, ground, and ranger based methods) regularly monitored	- Carry out regular surveys - Carry out aerial monitoring of wildlife and illegal activities - Adopt standardized databases for all stations and RDCs in LZV - Introduce ranger-based monitoring (SMART, MIKE, ETIS) across all stations in LZV - Analyze the data and report on trends	- Information on trends in elephant numbers, structure and mortality analysed and available	-According to the 2014 Aerial Survey report, Mana Pools has 2984 elephants. From 2009 to 2016, Mana Pools has lost 95 elephants to poaching of which 16 were recorded this year. The report states that there was 40% reduction in elephant populations from the 2001 survey. Causes of reduction include natural deaths, migration and poaching.
2.2 Impacts of elephants on selected habitats and selected indicator plant and animal species monitored and assessed	- Measure and monitor vegetation indicators, e.g. woodland cover and changes in specific species e.g. Baobabs - Measure and monitor functional biodiversity indicators, e.g. bird species richness and responses to structural changes in woodlands	Elephant impacts on selected habitats monitored, analysed and reported Elephant impacts on indicator species measured analysed and reported	-Elephant damage has been observed and recorded on woody species on the flood plain where they are greatly concentrated. Impacts shown were ring barking and uprooting of woody species such as *Combretum spp* and, *Fidherbia albida.* The impacts have resulted in weakening of the tree species, making them susceptible to diseases and mistletoes. -These species also do not have recruitment due to impacts of elephants. -Introduction of enclosures are at initial stages to monitor the impacts and enhance recruitment.
2.3 Upper and lower thresholds of potential concern (TPCs) related to spatial and temporal impacts (ecological, social, economic) of elephants established	- Compile and analyse historical trends in habitats, selected species, economic performance of consumptive and non-consumptive use, HWC, in the LZV - Consultations with experts and the public on acceptable limits to change - Propose TPCs for elephant impacts and densities	- Research report completed - Survey results analysed and reported - TPC recommendations submitted - Results of timely analyses and expert and public opinion being used in determining adaptive management measures	-Recommendations have been submitted to release pressure on the Mana Pools national park through stopping hunting on the Sapi Safari Area flood plain.
2.4 Appropriate adaptive management actions undertaken when TPCs approached or exceeded	- Regularly monitor levels and trends in TPC indicators that have been developed - Alert management when and if trends indicate that TPCs are likely to be exceeded - Decide on and implement appropriate management action	- Adaptive management actions taken in response to elephant impacts	-Sapi Safari Area turned hunting in the process of being stopped, and the area to promote photographic safaris instead of hunting.

9.6.2. Biological Monitoring and Management (Lower Zambezi Valley)			
Output	**Activities**	**Key Performance Indicators**	**Narrative Report on Progress in Implementation**
2.5 Age and quality of all elephant killed (trophies, PAC, rations, culls, poached) monitored and quotas to meet desired trophy quality adjusted	- Record age, sex and tusk size (length and weights) of all elephants killed each year - Set up and maintain database - Analyse trends and adjust quotas as necessary to meet desired trophy size - Introduce flexible and adaptable quota system (review fixed quota system) - Produce annual report	Elephant trophy quality is maintained or improved in relation to the stipulated desired trophy size.	Non-trophy hunting area. Mana Pools being a non-hunting areas, the sizes of trophies hunted from management quota and those picked from natural deaths, trophy sizes are more constant.
2.6 Current elephant range defined and management to recover habitats and elephant populations and maintain connectivity between fragmented populations and buffer zone populations initiated	- Define elephant range use and existing buffer zones and potential connectivity - Identify priority corridors and land use barriers - Conduct spatial analyses to inform land use planning to facilitate connectivity and reduce human-wildlife conflict	- Elephant range and maintained and lost habitats recovered - Corridors between fragmented elephant populations maintained/ established	Elephants aggregation on the flood plain during the dry season has resulted in a lot of pressure being exerted on the area. Changing of management system of Sapi's flood plain could contribute to recovery of the habitat on the floodplain once animals disperse.
2.7 Reports to international monitoring systems prepared and submitted (e.g. AED, ETIS, MIKE, MIKES)	- Timely reports prepared and submitted as required to regional and national levels for transmission to international agencies	- Required reports submitted on time	Situational reports involving poaching of elephants have been submitted in time. MIKE Data Base is also being maintained. A record of recovered of all ivory obtained is kept and the recovered tusks are constantly submitted to Head Office where they are again reweighed and recorded as well.

9.6.3 Social, Economic and Cultural Framework (Lower Zambezi Valley)			
Output	**Activities**	**Key Performance Indicators**	**Narrative Report on Progress in Implementation**
3.1 Joint venture and sustainable use opportunities to strengthen elephant conservation and management explored	- Initiate policy formulation and /or protocols for the development of joint ventures involving public, private, community partnerships (PPCPs) - Involve all relevant stakeholders in identifying potential areas and in the planning / selection process for potential joint ventures / PPCPs - Implement identified and feasible joint ventures / PPCPs	- Policy framework and protocols for establishing Joint Ventures /PPCPs in the LZV adopted - At least three Joint Ventures / PPCPs initiated and operating by 2018	A number of organisations have come aboard in support of conservation through Joint Ventures and Memorandum of Agreements such organisations like: Zambezi Society, Tashinga Initiative, Animal Wildlife Fund Foundation, Sino Zimbabwe Wildlife Foundation Fund, and Kariba Animal Wildlife Fund Foundation, these have formalised they assistance to Mana Pools which vary from Anti-Poaching assistance to treatment of injured animals.
3.2 Transparent distribution of the benefits and costs of elephant management and conservation facilitated	- Develop instruments / protocols to: o Increase elephant revenues at the ward level. o Provide for traditional leaders to be involved in the management and distribution of elephant related benefits. - Revise CAMPFIRE guidelines to increase the share of revenues at the ward level beyond 55%. - Develop a system to ensure accountability of the revenue sharing mechanism from District to ward level. - Periodically audit the revenue sharing system	- A greater proportion of revenues from wildlife utilisation accrue to communities - Traditional leaders involved in elephant management and revenue sharing - Revenues from wildlife accounted for and audited	Benefits from wildlife utilisation are channelled through CAMPFIRE program through the local Rural District Council.
3.3 Effective techniques and land use strategies and protocols to mitigate human-wildlife conflict (HWC) implemented.	- Review current human-elephant conflict mitigation measures and potential incentives / policies to reduce conflict - Implement proposals / options emerging from review - Monitor levels of HWC, enter data in database, analyse trends	Land use strategies and protocols for mitigating HWC adopted and implemented Trends in HWC incidents show reduced levels of conflict	Only one case of Human Wildlife Conflict has been recorded since January where one person was attacked by a hippo but survived the attack. Cases of Wildlife encroachment onto the communities on the southern boundary are dealt with by the CAMPFIRE because of the buffer zone between the southern boundary of the park and the community.
3.4 Recovery and use of all products from legally killed elephants improved	- Provide guidelines for the effective recovery, treatment, storage, and sale of elephant products -	Proportion of legally killed elephants from which products were effectively recovered Revenue earned	Of the 16 located elephant carcass, six elephant carcasses were recovered from two contacts. Note that 22 other elephant carcass were recovered in Chirundu again from a contact but we cannot directly link them to the elephants poached in mana Pools though there is a very high possibility of having the elephants poached in Mana Pools as well or in Marongora or Sapi..

9.6.3 Social, Economic and Cultural Framework (Lower Zambezi Valley)			
Output	**Activities**	**Key Performance Indicators**	**Narrative Report on Progress in Implementation**
3.5 Information on elephant conservation, management and benefits in communal areas neighbouring key elephant populations included in school curricula	- Liaise with Ministry of Primary and Secondary Education on the development, production, and inclusion of elephant conservation material in school curricula - Engage with specialists and communities to develop suitable educational material on elephant conservation and management for the LZV - Distribute material developed and undertake awareness campaigns on elephant conservation in selected areas	- Number and quality of elephant information items developed and delivered to schools in the LZV - Proportion of schools within or neighbouring elephant areas receiving and using information provided	2014 Elephant Survey Report

9.6.4 Building Conservation Capacity (Lower Zambezi Valley)			
Output	**Activities**	**Key Performance Indicators**	**Narrative Report on Progress in Implementation**
4.1 Funding to initiate and sustain the implementation of this plan secured	- Develop and submit bankable project proposals to identified potential funders - Explore potential partnerships (NGOs, Private Sector) - Review fee structure for elephant hunting and the potential generation and distribution of revenues for conservation and communities from alternative models	- No of project proposals developed, submitted and funded - Value of funding and support in kind for conservation of elephants in LZV realised each year	A proposal was submitted by Tishinga Initiative for the establishment of the Nyakasikana Anti-poaching Base and has been funded and near completion. See section 9.6.3.1
4.2 Current capacity and staff, training, and equipment needs identified	- Carry out full audit of current human and financial resources required to implement this plan and identify needs	Capacity needs assessment (audit) completed by June 2016	
4.3 Capacity for sustained research and monitoring strengthened and collaboration with research institutions enhanced [Linked to and informed by Components 2 and 3]	- Develop and implement a multi-disciplinary research and monitoring strategy for the LZV - Develop and implement a research programme based on that strategy - Provide appropriate tertiary level training for ZPWMA - Engage universities to establish in-service mentoring system - Identify equipment needs and provide - Identify and recruit community research/ monitoring personnel - Identify and train community monitors in the use and application of the Event Book System	- Explicit research strategy for the LZV developed by June 2016 - Functional research programme in place by June 2017 - No of research proposals developed, submitted, funded, and equipped - 2 persons trained per annum - No of research personnel on the ground - Research publications - No of active community monitors using the Event Book system	Mana Pools has one Ecologist

9.6.4 Building Conservation Capacity (Lower Zambezi Valley)			
Output	**Activities**	**Key Performance Indicators**	**Narrative Report on Progress in Implementation**
4.4 Training and in-service retraining of personnel in law enforcement, research and monitoring, education awareness community elephant management, etc., established & operating	- Use capacity training needs assessment (4.2) to develop training modules / curricula - Draw up training/retraining programme	- Training modules and curricula developed and being used - 50 to 100% increase in: a) No. of training days and programmes initiated b) No. of staff trained c) No. communities trained and implementing elephant management programmes	Training modules are guided as per the Mushandike College of Wildlife Management at the organisation training institute. The station has 8 staff members who have undergone training at Mushandike College of Wildlife Management in various fields from Accounting, Certificate in Wildlife Management, Diploma in Wildlife Management, and IT courses
4.5 Infrastructure and housing to facilitate effective protection, conservation and management of elephant in the LZV developed	- Rebuild / refurbish all main access roads to the LZV (c.150 km) - Repair, clear, grade where necessary some 600 km of internal roads and several bridges - Maintain / establish necessary airstrips - Undertake a feasibility study for the strategic development of new bases and pickets to support effective law enforcement, research and monitoring - Review staff accommodation requirements for the LZV - Renovate existing buildings - As needed develop staff accommodation and associated infrastructure	Roads, bridges, airstrips refurbished and maintained as planned Feasibility study of required field stations completed by June 2016 Identified infrastructure requirements prioritised and required developments undertaken and completed	New operational roads are in the process of being opened, existed roads were maintained, the Mana Main Airstrip was renovated this year 2016 Of priority was to establish an anti-poaching base at Nyakasikana which I now near completion
4.6 Effective, secure communications network across the region established	- Establish digital VHF and GPS communication and tracking systems across the LZV (repeater links, base sets, handhelds, mobile radio sets, computers for monitoring purposes	Fully operational communications system in place and being maintained	New operational radios, repeater links and potable GPS systems have been secured.

9.6.5 Coordination, Collaboration and Programme Management (Lower Zambezi Valley)			
Output	**Activities**	**Key Performance Indicators**	**Narrative Report on Progress in Implementation**
5.1 Regional elephant management committee with membership from key stakeholders established and operating	- Appoint committee members - Hold meetings twice each year - Circulate minutes and actionable points within one month of each meeting	Timely minutes of each meeting produced and circulated Committee resolutions and actionable points initiated and acted upon	
5.2 Technical support team to assist in implementation of the plan established and operational	- Convene technical support team of volunteers - Establish Terms of Reference for the team with ZPWMA	Functional team established Technical support provided in keeping with TORs and planned activities implemented	A technical person has been seconded to Mana Pools by AWF to assist in Anti-poaching
5.3 Effective communication and collaboration between Private sector, NGOs, State Agencies, and neighbouring communities (via a Forum) established	- Establish a formal forum for private sector agencies to interact with ZPWMA - Establish terms of reference and recognition as formal entity - Establish effective engagement with RDCs, and Traditional Leaders in the LZV and neighbouring communities	Formal recognition by ZPWMA achieved Meetings held Effective engagement with neighbours	In 2016, 1 Meeting has been held between ZIMPARKS officers and the Chief (Chief Chundu) together with his village heads. Another meeting has also been held between Mana Pools Officers and Safari Operators to discuss their support in conservation.
5.4 Links with neighbouring Zambia and Mozambique to confer on the management of shared elephant populations established / strengthened	- Establish links with Zambia and Mozambique to confer on cross border elephant management issues	Links established and operating	There is cordial communication with ZAWA counterparts.
5.5 Information dissemination strategy developed and implemented	- Undertake an awareness campaign to promote and market the plan locally and internationally - Produce and disseminate regular progress reports on the implementation of the plan	At least one awareness campaign conducted each year Annual progress reports produced Briefs / news releases on major developments or progress released Funds raised to support elephant conservation	Funds have been raised by Non-Governmental organisations through provision of camping equipment, availing vehicles for use in Anti-poaching, assisting in opening up of roads, developing of base camp for rangers and training

ANNEX 4.0 South East Lowveld Action Plan - *Status and progress report Aug – 2016*

9.7.1 Protection and Law Enforcement (South East Lowveld)			
Output	**Activities**	**Key Performance Indicators**	**Narrative Report on Progress in Implementation**
1.1 Highly trained rapid response anti-poaching units strengthened	– Appoint anti-poaching coordinator (for region and/or separate areas) – Recruit staff – Train staff – Procure vehicles and equipment – Deploy unit – Support existing units	Trained and fully equipped units established and operating with relevant security agency by June 2016	Five units were established in Gonarezhou National Park, trained and fully equipped. Three new Lancruiser vehicles were procured to augment the existing patrol fleet. -Two candidates identified with one to be elected for the post of antipoaching coordinator for the Region. - 35 Cadet rangers recruited by the Gonarezhou Conservation Project to boost the existing staff compliment. Cadet Rangers trained in basic paramillitary skills by the Gonarezhou Conservation Project -A Gonarezhou Antipoaching Reaction Unit established and operating throughout the Gonarezhou Nationa Park. -Out of the 20 properties in Save Valley Conservancy, 8 properties have 2X call signs of 3 rangers each who are highly trained and able to carry out combined operations with security agencies in addition to the15scouts also highly trained with AggressiveTracking Specialist a security private company assisting in the protection of rhinos and elephants in SEL.
1.2 Informer and intelligence systems established and/or strengthened	– Identify and recruit informers – Establish and implement incentive protocols – Set up, implement hotline for anonymous reports and communicate it to the public – Analyse and use information – Ensure information is included in database outlined in Output 1.6	An active informer system/network operating within the SEL by Jan. 2016 Hotline widely advertised and operational by Jan 2016	-Informer network is being established and had a number of informer lead success. Awareness of the hotlines began in September 2016 by Regional team. -Informers recruited by the Gonarezhou Conservation Project. -A hotline set up for Gonarezhou and Save Valley Conservancy. -Data being analysed and a data base in place and being mantained at the Regional Office. -Hotline facility fully advertised through the Parks Investigations Branch.
1.3 Investigation of wildlife crime improved	– Implement training programmes for investigation personnel – Ensure collaboration between Parks, ZRP and intelligence officers	At least two law enforcement staff trained in scene of crime collection and preservation of	-3 Investigations officers trained in scene of crime collection and preservation of exhiits course

9.7.1 Protection and Law Enforcement (South East Lowveld)			
Output	**Activities**	**Key Performance Indicators**	**Narrative Report on Progress in Implementation**
	– Recruit more investigators – Put in place Investigator incentive system – Collaborate with forensic scientists and ballistic experts, as well as agencies such as EMA and approved universities (e.g. Chinhoyi University of Technology, University of Zimbabwe, National University of Science and Technology)	evidence, ballistics evidence, etc. in SEL. Percentage of investigations resulting in successful prosecutions in SEL greater than in 2014	-1 investigations officer trained in Wildlife, Pestcide and Forensic Crime Scene Investigation Course. -Collaboration with other law enforcement agencies satisfactorily yielding results. -Collaboration with other agencies strengthened -plans are underway to recruit more investigators and to open an investigations office in Chiredzi. -Some stakeholders have pledged to assist the investigators with some incentives. -In Save Valley Conservancy one trained personnel is dealing with wildlife crimes and is based at Humani Ranch. -The % of successfulness on investigated cases is now higher than 2014, and the current % is estimated to be 60% after lobbying with the Judiciary Services
1.4 Prosecution of wildlife crimes improved	– Train prosecutors on legislation and processes available to deal with wildlife crimes – Conduct awareness / outreach programs with Prosecution, Judiciary – Utilize ancillary laws, such as those dealing with economic crime, organized crime, money laundering, – Communicate status of prosecutions to the public via ZPWMA website – Clear backlog of wildlife cases – Explore the possibility of appointing dedicated wildlife crime prosecutors at Regional and National level	Monthly liaison sessions on wildlife crime and law enforcement held with members of the judiciary Relevant legislation available and being used Wildlife crime prosecutors available and being used in SEL	-Liaison with the Judiciary, Courts and the Prosecuting Authority on wildlife crimes conducted. -Relevant legislation available and referred to in dealing with wildlife crimes -Wildlife Crime Prosecutors not available from the Wildlife Authorities but Public Prosecutors being used to deal with wildlife crimes to which they may not be well versed with certain technical wildlife issues. -No wildlife crime prosecutors appointed. -Inadequate resources of transport and fuels to fully implement monthly liaison.

9.7.1 Protection and Law Enforcement (South East Lowveld)			
Output	**Activities**	**Key Performance Indicators**	**Narrative Report on Progress in Implementation**
1.5 Law enforcement in collaboration with communities enhanced [Links to Component 3]	– Engage and collaborate on curbing wildlife crimes (ZRP & Communities) – Establish anti-poaching clubs/ community natural resource monitors that collaborate with ZPWMA and ZRP – Lobby support from Chiefs to deal with local poachers – Hold workshops with Chiefs and communities about wildlife and wildlife crimes – Establish incentives for communities to provide information	Incentive schemes that encourage the public and members of rural communities to contribute to law enforcement (e.g. through informer hotline) established in SEL Increasing number of incidents of community contribution to law enforcement (e.g. whistle blowers) by Dec. 2017	Trained community rangers from Sengwe area, four passed and ready to carry out ant poaching operations within the Sengwe area. Several meetings on wildlife issues were held with Chief Sengwe. - Collaboration with ZRP and Communities strengthened and yielding results. - We have opened a hotline and fliers facility that we distributed through the Save Valley Conservancy, Gonarezhou and surrounding areas and information is coming in. - All stakeholders workshop on wildlife issues is planned soon - Some stakeholders have pledged to incentivize the whistle blowers - In Save Valley Conservancyseveral education awareness campaigns have been carried out in all areas bordering wildlife protected areas. - meetings with chiefs have been maintained regarding protection of wildlife. - Resource monitors have been selected by the communites. - The surrounding communities are benefitting from meat obtained from problem animal control and trophy hunting.
1.6 Local wildlife law enforcement database established	– Set up database, as per national database – Ensure inclusion of prosecution status in database – Implement national data recording protocols – Train data entry staff and crime analysts	Local database established and operating Illegal activities recorded and analyzed	Spatial Monitoring And Reporting Tool is being used in Gonarezhou and all captured data can be easily analysed.The SMART approachaims at improving conservation effectiveness and tracking of wildife crimes. -No SMART use in Save Valley Conservancy -A poaching database from when the crime is committed up to the final court outcome is in place. -A database of poachers and their modus operandi in place -Crime Registers being mantained.
1.7 Illegal settlements / grazing in wildlife areas reduced	– Liaise with RDC, Traditional Leaders and ZRP, DA's Office – Conducted Education programmes – Regular updated satellite mapping	Illegal settlements reduced to less than 5% of wildlife areas by 2020 (i.e. state protected areas, conservancies and community wildlife areas)	Illegal settlement in the park is still very low no other settlement after 2000 (Chitsa communities). Grazing of cattle in the park is under control in the GonarezhouT National Park. -The Southern part of the Save Valley Conservancy 85 % settled.An inter ministerial committee set up to look at the possibilities of fencing out the settlers and also there

9.7.1 Protection and Law Enforcement (South East Lowveld)			
Output	**Activities**	**Key Performance Indicators**	**Narrative Report on Progress in Implementation**
[Links to activities on land use mapping and planning in Component 2 – Output 2.2 and incentivization / alternative livelihood activities in Component 3]			are proposals to remove some of the settlers from some of the properties to pave way for a game corridor and allow free movement of game within. -Local authority currently working out on orderly settlement in the Save Valley Conservancy. -Fencing of the Save Valley Conservancy is also expected to assist in reduced human and domestic animal movements.

9.7.2 Biological Monitoring and Management (South East Lowveld)			
Output	**Activities**	**Key Performance Indicators**	**Narrative Report on Progress in Implementation**
2.1Research programme to understand temporal and spatial drivers of elephants established [Links to Component 4]	– Create enabling opportunities and environment for research – Prioritise research needs – Conduct localised case studies and research projects – Monitor and evaluate poaching and other drivers - hunting, water, food, human disturbance – Explore possibility of GLTFCA flagship research programme for elephants [linked to Component 5] – Carry out ground surveys to monitor distribution and density	Research programme that enables local and international researchers, and links with the GLTFCA research programme, in place and producing reports	-Ten elephants were collared to monitor elephant movement in Gonarezhou.
2.2Current elephant range defined and options for extending range and maintaining connectivity between fragmented populations explored	– Define elephant range use, and existing and potential connectivity – Identify priority corridors and human land use barriers – Conduct spatial analyses to inform land use planning – Advocate land use planning to facilitate connectivity and reduce human wildlife conflict – Explore options for translocating elephants to under-stocked areas	Identified priority corridors for elephant connectivity within SEL, between SEL and other areas in Zimbabwe, and with neighbouring countries	-Research is in progress in the Gonarezhou National Park -Elephant corridors are known in Save Valley Conservancy but because of illegal settlements the problem of understanding this is still far from reality.

9.7.2 Biological Monitoring and Management (South East Lowveld)			
Output	**Activities**	**Key Performance Indicators**	**Narrative Report on Progress in Implementation**
2.3Elephant population numbers, structure, mortality and trends monitored, quotas adjusted, and desired levels of trophy quality maintained	– Undertake standardised, regular, aerial and ground surveys of the elephant range – Explore methods to monitor elephant presence and abundance in Mozambique (to Zinave) and up to the Chimanimani range – Undertake trend analysis – Define elephant age and sex structures and extract birth and death rates – Establish annual monitoring plans – Record and analyse elephant mortalities (all causes e.g. poaching, PAC, natural, hunting, etc.) – Monitor trophy quality and age – Develop and implement an age-based and size-based trophy quota	Elephant range surveyed at regular intervals Demographic data available and analysed Annual monitoring plans implemented Evidence-based and research-based information and recommendations (consumptive, non-consumptive) provided to managers and used in quota setting	-Biannual aerial survey carried in Gonarezhou and surrounding. Last survey in September 2016. Could not get authority to survey in Mozambique. Elephant's mortalities recorded in park security registers -Elephant survey in Save Valley Conservancy done 2013 -Quota setting being a wild life management tool is implemented annually - taking cognisance of research data -PAC , hunting etc information is kept
2.4Elephant impacts on their habitats and selected indicator species of biodiversity monitored	– Establish annual monitoring plans – Measure vegetation indicators such as woodland cover – Measure other functional biodiversity indicators e.g. bird responses to structural changes to woodlands – Measure ecosystem functions – Relate desired impact to measures of elephant abundance and spatial use – Research other drivers of ecological impact (climate change, change in land use, water provision, and fencing, amongst others) – Use research findings, expert opinion and informed public opinion to establish thresholds of potential concern (TPC or limits to change) to initiate management action in respect of elephant impacts in protected areas and effects in communal land – Identify areas with key vegetation communities that are utilized by elephants	Annual monitoring plans defined and implemented for selected indicator species of biodiversity TPC's established Evidence-based and research-based information and recommendations (consumptive, non-consumptive) provided to managers	-Annual monitoring through sightings when conducting hunts and patrol is in place.

9.7.2 Biological Monitoring and Management (South East Lowveld)			
Output	**Activities**	**Key Performance Indicators**	**Narrative Report on Progress in Implementation**
2.5Costs and benefits of elephants to local and national economy monitored and costs of elephants to local communities reduced	– Monitor and evaluate extent and costs of human-wildlife conflict incidents – Relate human-wildlife conflict to elephant abundance and spatial use – Understand drivers and social and economic consequences of human-wildlife conflict – Evaluate the direct and indirect contribution (financial, economic and social) and the direct and indirect costs of elephants to the well-being of people and to conservation, through both consumptive and non-consumptive uses – Implement ongoing and new mitigation for human-wildlife conflict	Annual monitoring plans implemented Evidence-based and research-based information and recommendations (consumptive, non-consumptive) provided to managers	-PAC programmes are conducted, meat shared among the communities affected, skins and ivory may be sold and money ploughed back in to the affected communities.
2.6Adaptive elephant management framework adopted and implemented [Links to Component 4]	– Ensure collaboration between Regional Elephant Management Committee and regional and local resource management committees (e.g. LOCAL Forum) – Implement annual process of adaptive planning, implementation and monitoring in line with elephant management objectives and TPCs within the SEL – Develop and implement localised management plans (e.g. SVC plan) – Ensure alignment and harmonisation with other Zimbabwean, regional and international plans	Annual elephant management plans developed, adopted and implemented	-Annual elephant management plans have only been confined to hunting and PAC and cropping to a large extent has not been done. -Huge costs of this exercise are a major impediment as evidenced by the number of elephants taken off so far this year under such local arrangements.

9.7.2 Biological Monitoring and Management (South East Lowveld)			
Output	**Activities**	**Key Performance Indicators**	**Narrative Report on Progress in Implementation**
2.7Alternative outcomes modelled	– Develop framework for examining and modelling potential linked impacts between biodiversity issues, elephant issues, and societal issues, including any 'surprises', such as disease or extreme weather events. – Implement the modelling framework to define the outcomes of various management scenarios	Established modelling framework being used to guide adaptive management Scenario outcome recommendations and being used in management	Nothing to report
2.8SEL reporting to meet national / international standards achieved	– Advocate key summary set of elephant KPIs/outcomes for national reporting (e.g. potential population sizes against actual population sizes) – Comply with national and international legal obligations – Explore the designation of GNP as a MIKE site	CITES reporting requirements met National reporting compliance requirements	-Gonarezhou National Park meeting CITES requirements. Park not yet a MIKE site. -No information on Save Valley Conservancy and the area is still not a MIKE site

9.7.3 Social, Economic and Cultural Framework (South East Lowveld)			
Output	**Activities**	**Key Performance Indicators**	**Narrative Report on Progress in Implementation**
3.1 Community partnerships and joint venture oportunities are incentivised and facilitated	– Establish protocols, policies and models for development of joint ventures (PPCPs) – Identify potential areas – Facilitate development of new, and strengthen existing, institutional frameworks and legal entities for beneficiaries at sub-district level – Develop concepts, business plans and prospectuses for different areas through consultative processes with Communities – Develop a SEL Tourism plan and review potential concessions within the framework of this Plan – Develop mechanisms for inclusive and transparent engagement and selection of operators and JV partners. – Facilitate communication, endorsement and support of JVs – Explore potential incentives and avenues of material and technical support that can be provided by Local Government and Authorities to promote establishment and sustainability of Community JVs – Promote access to affordable capital funding – Enhance capacity of community members to engage in wildlife and tourism management through training and employment	Models and protocols for joint ventures established Community institutions to engage in joint ventures established Joint ventures established and operating, resulting in financial benefit to communities SEL tourism developed and potential concessions identified Mechanisms of support and incentivisation to JVs established	- Save Valley Conservancy has a Joint Venture model and community share ownership trust with the local communities - PPCPs envisaged with the Gonarezhou Conservation Trust.
3.2 Elephant management in community wildlife areas improved	– Promote improved and professionalized elephant management and security in community wildlife areas through establishment and maintenance of improved capacity, infrastructure, security and management systems – Develop and implement a transparent Performance Based Quota system which incentivises improved management and security systems for elephant in community hunting areas and which promotes effective buffering of source populations – Update terms of lease agreements in community wildlife areas to confer a broader range of roles and responsibilities on operators including resource management and protection; re-investment and	Infrastructure, equipment and systems for elephant management in community wildlife areas established and operational Reduced human-elephant conflict Community capacity for wildlife management improved	-**WILD project** working on two community wildlife areas that is Naivasha in Chiredzi district and Jamanda in Chipinge district.WILD(Wildlife In Livelihood Development Programme is an intiative of SAT (Sustainable Agriculture Technology) and ZWVT (Zimbabwe Wild Vet Trust) funded by the European Union and is aimed at improving socio-economic and ecological resilience in semi arid communal areas through incorporation of robust wildlife based land use enterprise into the mainstream of communal areas. -Nyangambe in Save Valley Conservancy is part of the elephant managemnt in the community.

9.7.3 Social, Economic and Cultural Framework (South East Lowveld)			
Output	**Activities**	**Key Performance Indicators**	**Narrative Report on Progress in Implementation**
	infrastructure development; employment targets; local sourcing; etc. – Review key cooperation opportunities across different land uses and countries within GLTFCA, e.g. Sengwe-Tshipise Wilderness Corridor	Opportunities for cooperation within GLTFCA identified	
3.3 3.3 Additional elephant-based tourism and sustainable utilisation oportunities explored	– Promote awareness and marketing of iconic tuskers – Explore opportunities for expansion of community wildlife areas in viable wildlife corridors to enable establishment of additional sustainable utilisation areas and enterprises. [Links to Output 2.2 – identification of corridors]	Corridors identified and Agreements concluded Tourism and awareness campaigns undertaken	- No corridors agreed and concluded as as yet.
3.4 Transparent distribution of the benefits and costs of elephant management and conservation facilitated [Links to Output 2.5]	– Conduct regular and comprehensive Community Awareness campaigns regarding quotas, revenues and distribution within Communities – Capacitate and incorporate direct community involvement in management of Community Wildlife Areas, enterprises and JVs. – Diversify downstream natural resources enterprises to multiply the revenues from CBNRM, e.g. NTFPs	Awareness campaigns conducted Community structures have improved capacity to manage NRs and wildlife areas CBNRM revenues are invested in establishment of natural-resource based enterprises Community realises greater employment and financial benefit from CBNRM revenues	Awaerness campaigns are being conducted in areas arround Gonarezhou National Park and Save Valley Conservancy focusing on natural resources management not rvenue management. -The community share ownership trust is a clear testimony of improved capacity to manage NRs and Wildlife areas.These programmes bring about financial benefits to the communities.
3.5 Effective techniques and land use strategies to mitigate human-elephant conflict are implemented	– Review land use zonation through consultative processes [link to Output 2.2] – Promote awareness and adoption of effective HEC mitigation measures – Promote improved rangeland rehabilitation and grazing management to reduce competition between livestock and wildlife. – Promote improved and rationalised crop production and alternative mechanisms to promote food security to reduce habitat destruction for inefficient dry land cropping (e.g. irrigation development; carbon sequestration credits to generate income & purchase of staple grains).	HEC is effectively reduced Availability and application of HEC mitigation measures improved There is participation in effective grazing management schemes Grazing is better managed and rangeland health is improved	-Proposed irrigation schemes in fenced areas will help reduce human/wildlife conflict -Grazing areas for domestic animals are to be separated from wildlife areas again to reduce human wildlife conflict

9.7.3 Social, Economic and Cultural Framework (South East Lowveld)			
Output	**Activities**	**Key Performance Indicators**	**Narrative Report on Progress in Implementation**
		There is increased uptake of improved cropping techniques Crop yields are improved Alternative land uses evaluated	
3.6 Information on elephants and their conservation is included in school curriculae and environmental education adjacent to key elephant populations in the SEL is promoted	– Promote awareness of elephant conservation (and other issues) through cultural events, art, plays, sport, etc. – Participate in syllabus review of national environmental science curriculum approved by the Ministry of Education – Develop approved environmental training and extension material and promote dissemination to different stakeholder groups within the community – Promote the formation of environmental science clubs at schools – Coordinate various education, training and extension campaigns operating within the district	School children and communities have greater appreciation of elephant conservation issues Greater participation in environmental clubs at schools with greater understanding of environmental issues More social events linked to environmental and conservation awareness are held Elephant conservation messages are conveyed through art and cultural events & competitions Parallel education programmes are coordinated through stakeholder planning sessions at district level	Education extension programe established that is Chilojo club focusing on all schools close to Gonarezhou. Environmental books distributed to above schools. -Education extension programme in place in save Valley Conservancy and being conducted and funded by the Painted Dog Conservation and the Gonarezhou Conservation Project targeting schools surrrrounding the Save Valley Conservancy. -Education awawreness campaigns regulary conducted in schools by our Extension and Interpretation Unit. --Essay competions with prize giving are regularly done in schools to effectively disseminate information on wildlife conservation.
3.7 Cultural tourism is developed and marketed as a centre-piece of SEL attractions and linked explicitly to conservation of flagship species including elephant	– Promote existing cultural tourism events and attractions and promote incorporation of messages of elephant conservation within these – e.g. Machangana Cultural Festival; GL-Cultural Festival – Explore and develop additional cultural tourism opportunities – including development of interpretive centres, craft centres, museums, monuments, events, etc. and market these – Document and communicate the specific cultural importance of elephant to communities in the SEL and incorporate this into education, marketing, event and cultural messages and interpretative centres.	Community participation and tourist attendance of cultural events is increased Messages relating to elephant conservation and environmental issues are key themes	-GonarezhouNational Park actively involved in cultural festivals. Supported the Muhlanguleni cultural festival this year(2016). -

9.7.3 Social, Economic and Cultural Framework (South East Lowveld)			
Output	**Activities**	**Key Performance Indicators**	**Narrative Report on Progress in Implementation**
		The number of cultural tourism developments and enterprises is increased Anecdotes, artifacts and oral tradition regarding cultural importance of elephants are recorded and insinuated into marketing strategies and event messages	
3.8 Regional tourism is promoted	– Promote the development of infrastructure critical to accessibility of the region: e.g. border crossing at Pafuri; road development and maintenance; scheduled flights to Chiredzi; etc. – Promote diversification, branding and marketing of SEL-specific tourism products linked within the region and with other attractions in Zimbabwe and neighbouring countries. – Focus special attention on development of community-led tourism initiatives that contribute to the sustainability of the STWC as a movement corridor for elephant – Clear mines from STWC	Increased tourism traffic and arrivals Infrastructure upgrades Scheduled flights established Pafuri border crossing operational Tourism products are diversified Marketing and branding consultants engaged to develop branding and strategy Scoping, feasiblilty studies are undertaken Increased number of CB enterprises are operational	-The current global economic challenges faced are still a draw back to marketing efforts , however some individuals within the are putting much effort on consumptive tourism.
3.9 Policy framework for conservation and CBNRM is well understood by communities and other stakeholders in SEL	– Compile factsheets on policy framework for conservation and CBNRM and disseminate to communities and other stakeholders	Communities have access to existing CBNRM and Policy frameworks	- The awareness campaigns which are frequently conducted through out the year also attempts to explain about the existence of these policies as well as on traditional gatherings, village and council meetings.
	– Consider innovative mechanisms for trans boundary resource sharing and expanding “space for elephants”	Workshops conducted	- Still a challenge as the conept has not been fully embraced by the affected communities.

9.7.4 Building Conservation Capacity(South East Lowveld)			
Output	**Activities**	**Key Performance Indicators**	**Narrative Report on Progress in Implementation**
4.1 Funding to implement the plan secured	– Implement variable / graduated trophy fee structure based on trophy size – Review levy / fee structure for elephant hunting and the distribution of these revenues for conservation and communities – Develop and submit bankable project proposals to potential funders – Explore potential business partnerships – Increase capacity and law enforcement coverage by ensuring that all key stakeholders contribute to and are engaged in law enforcement activities: hunting operators, tour operators, and community anti-poaching teams [Links to Output 1.1] – Explore the potential for a dedicated elephant fund for SEL.	Revised trophy fee structure developed, resulting in increased funds available or secured for elephant conservation Number of project proposals developed submitted and funded Number of developed and functional partnerships contributing to improved elephant management	Gonarezhou Conservation Trust's establishment could secure funding for improved elephant management. - Funding not yet secured for the entire Save Valley Conservancy, but expecting the EU to come in with an aid once the fencing boundaries have been established.
4.2 Current capacity analysed and needs identified	– Analysed current capacity – Carry out a needs assessment across the full range of human resources – Carry out a needs assessment for equipment and infrastructure – Develop a strategy to address the identified needs	Needs assessment report	
4.3 Capacity for research and monitoring strengthened and collaboration with research institutions enhanced [Linked to and informed by Components 2 and 3]	– Develop and implement a multi-disciplinary research and monitoring strategy – Develop and implement a research programme based on that strategy, including graduate studies, post graduate and external researchers as well as ZPWMA researchers – Undertake periodic research meetings / conferences – Recruit and meet demands and requirements for research personnel in Parks and surrounding areas – Collaborate with external research institutions – Develop and implement a mentoring programme for researchers – Procure relevant research equipment	Functional research programme in place Research meetings held Publications Number of research projects developed and implemented Number of research personnel on the ground Number of collaborative projects Mentoring plan / number of days spent with experienced researchers Inventory of equipment for research procured	-Nothing to report for Gonarezhou National Park -No Parks Resident Ecologist in Save Valley Conservancy.

9.7.4 Building Conservation Capacity(South East Lowveld)			
Output	**Activities**	**Key Performance Indicators**	**Narrative Report on Progress in Implementation**
4.4 Training and retraining programmes established	– Carry out a training needs assessment for law enforcement, resource and wildlife management, research and monitoring, education and awareness, community elephant management, etc. – Develop and implement strategies based on the needs assessment – Standardise and harmonize training in law enforcement	Training needs assessment report Training programmes established	-Training needs for law enforcement and research staff known.

9.7.5 Coordination, Collaboration and Programme Management (South East Lowveld)			
Output	**Activities**	**Key Performance Indicators**	**Narrative Report on Progress in Implementation**
5.1 SEL Regional elephant conservation and management steering committee of 8 established (ZPWMA, SVC, MT, Bubi Conservancy, Chiefs' rep, GCP, ZRP, RDC) This committee should include a core set of competencies (and can co-opt expertise if needed).	– Develop TOR for the steering committee – Identify members – Oversee the implementation of the regional elephant strategy as per national mandate – Meet biannually – Attend national elephant management meetings	Functional committee meetings held biannually with adequate attendance	- Steering committee members identified - Logistics for first meeting have been concluded in collaboration with stakeholders
5.2 Links with neighbouring states to confer on the management of shared elephant populations strengthened	– GLTFCA coordinator to identify relevant stakeholders to participate in the implementation of the regional elephant action plan – Sustain collaboration with regional partners+(one committee member for the regional committee meetings) – Share knowledge / data of all 5 key components of the plan with the regional partners	Number of consultative meetings held Tangible regional collaboration and participation	-Relevant stakeholders known.
5.3 Coordination between the tourism industry (consumptive and non-consumptive) and the elephant management programme strengthened	– Identify consumptive and non-consumptive operators in SEL – Liaise with SOAZ, ZPHGA, ZATSO, ZHA, etc. – Encourage non-members to be affiliated to relevant associations – Hold quarterly meetings with operators – Consider scale of operations in non-consumptive tourism	Regular meetings and workshops convened with the operators	
5.4 Effective information dissemination and communication strategy implemented	– Ensure clear communication of progress against action plan to all relevant stakeholders – Identify target groups, i.e. traditional leaders, school groups, amongst others – Develop a communications strategy, making use of relevant media (print, social, road shows) – Implement communication strategy – Monitor and evaluate	Outreach programmes conducted	Outreach programmes conducted by the Gonarezhou Conservation Project's Liaison Officer and the Parks' Extension and Interpretation staff.

THE ZIMBABWE NATIONAL ELEPHANT SUPPLEMENTARY MANAGEMENT PLAN (2015 – 2020)

Introduction and Background

The supplementary Elephant Management Plan (EMP) is a supplement that has been developed from the Zimbabwe National Elephant Management Plan (2015 – 2020). This supplementary plan looks at all the deliverables from this plan and highlights the priorities for the successful implementation of the plan. The supplement also highlights the progress that has been made towards the successful implementation of the EMP from the time it was adopted in 2015.

It was noted that the EMP was an ambitious plan and it required the cooperation of all internal and external stakeholders in order to achieve its obligations. The urgency that was placed upon well-equipped men on the ground to combat illegal killing of elephants, improved monitoring and research, and the provision of incentives to maintain and if possible increase the elephant range, requires huge resources.

This supplementary EMP recognises that the implementation of the Zimbabwe Elephant Management Plan (2015 – 2020) requires adequate and sustainable funding and provision of other resources to effectively protect the elephant and to curb illegal trade in elephant products. Thus there is need to fully resource all the components of this plan in order to successfully manage Zimbabwe's elephant population.

Resources are being mobilized from within ZPWMA, from its own business ventures, by the private sector, and by intergovernmental and nongovernmental organizations. Partnerships between ZPWMA and other stakeholders are also in place to secure some of the resources for elephant conservation. There is a need for the Government to provide additional support to the conservation of elephants given the present poaching crisis affecting the species continentally.

This supplementary elephant management plan recognises the work and the resource allocation that has made towards full implementation of the plan, and provides detail of the milestones achieved and work covered. It also prioritises the major areas of the EMP into immediate areas that are meant to arrest poaching and illegal trade in elephants. However, it details the impressive extent to which most of the structures have been set up and some of the innovations that have been put in place to attempt to bridge the funding gap.

Resources Available

An audit has been conducted of the implementation of the EMP to date and resources have thus far been channelled into the following areas.

Table 1: Financial resources deployed up to August 2016

BUDGET (USD)					
Item	**North West Matabeleland**	**Sebungwe**	**Mid Zambezi Valley**	**South East Lowveld**	**Total Current**
Law Enforcement	158,948	113,920	244,650	318,000	835,518
Monitoring	31,000	-	8,155	15,500	54,655

Investigations	-	-	16,500	8,000	24,500
Training	12,548	-	30,124	23,000	65,672
Community Relations	4,854	-	9,770	15,000	29,624
Total (USD)	205,350	113,920	309,199	379,500	1,009,969

Progress towards Implementation of the Elephant Management Plan (2015 – 2020)

Several milestones stated in the Elephant Management Plan have already been achieved which include the following:

a. Appointment of the Elephant Manager as in section 4.5 of the Zimbabwe Elephant Management Plan (2015 – 2020).

b. Getting a basic agreement of implementation in the 4 relevant regions.
c. Some work towards Law Enforcement, Monitoring, Investigations, Training and Community Relations. As of August 2016, more than USD 1million had been spent on these activities. Table 1 above. More detailed breakdown of how this was spent see Annexes 1.0, 2.0, 3.0 and 4.0.

Constraints and Challenges

One of the major challenges regarding implementation of the EMP is with regards to the adoption of stricter domestic measures by the United States of America. This has had the net effect of further reducing the revenue from hunting into the Authority, which therefore affects the budget allocated to resource protection, in particular the elephant in this case.

One of the key impediments towards the full and comprehensive implementation of the Elephant Management Plan is the limited resources. However, Zimbabwe is at an advanced stage in the development of resource mobilisation strategies. These strategies include partnering with both local and international institutions in resourcing and financing aspects of the programme.

Priorities

Due to the fact that Zimbabwe is experiencing some funding constraints with respect to the full implementation of the Elephant Management Plan, which means therefore that it will not be possible to fully implement every aspect of the plan at the same time, we have developed a set of priorities (all drawn from the plan), that we feel are implementable and enable the work of conservation to proceed smoothly.

1. Law Enforcement
   Law enforcement continues to be one of the most critical aspects of this strategy. From the perspective of the EMP, it has also to date been allocated the biggest budget (Table 1). While strategic gaps still exist with respect to the law enforcement capacity (the numbers of rangers on the ground are still in need of improving to effectively cover that Parks Estate, more patrol kits and equipment are still required to improve enforcement capacity). In order to effectively combat poaching and illegal trade the Law enforcement capabilities are top priority.
2. Monitoring
   Biological monitoring and management, with respect to the priorities for this plan would come in as a second priority. This enables monitoring programmes and research to support science based adaptive management of elephants in this action plan. The resource allocation to this activity needs to be dramatically improved, although innovations have had to be put in place to manage that insufficient resource allocation. Rangers on patrol also carry out significant monitoring activities which feed into the biological monitoring and management of the elephants.
3. Investigations/Intelligence
   The investigations capacity (together with training) are critical components of this action plan. To date of the available resources, allocations to investigations have been minimal. Innovations have also been developed in this area, for support from various private players, institutions and state institutions in the investigative processes.

Assistance with areas like crime scene attendance have been improved through the assistance of the Zimbabwe Republic Police involvement.

4. Appointment of Elephant Manager

   While the appointment of the National Elephant Manager has been concluded (April 2016) to enhance implementation, monitoring and evaluation of the Action Plan, funding constraints still exists. Some funding for the activities of the Elephant Manager have been unlocked through cooperation with stakeholders in the monitoring and evaluation activities of the office. This includes setting up of the Regional Elephant Management Committees and funding their activities.

ANNEX 1.0 Northwest Matabeleland Action Plan – *Status and progress report Aug - 2016*

9.4.1. Protection and Law Enforcement (Northwest Matabeleland)			
Output	**Activities**	**Key Performance Indicators**	**Narrative Report on Progress in Implementation**
1.1 Highly trained rapid response anti-poaching units established/ strengthened	- Assess / audit current law enforcement capacity, prioritise needs - Mobilise resources to meet shortfalls in personnel and equipment and new technology - Recruit rangers, train and retrain staff - Review / establish Standard Operating Procedures (SOPs) for all law enforcement operations	- Assessment of enforcement capacity completed - Fully staffed and trained anti-poaching units in place and operating - SOPs established and being implemented - Trends in illegal killing of elephants documented	- Collaborations with other stakeholders (e.g. WWF, Government of the People's republic of China) in law enforcement efforts was done were equipment such as camping tents, GPSs, vehicles, road maintenance equipment (graders, tipper trucks, lorries) were sourced - Training was done in Spatial Monitoring and Reporting Tool (SMART). 4 Officers and 40 Ranger were trained - New recruitment and recruitment drive for rangers initiated - Database on elephant illegally killed is maintained and updated
1.2 Informer network, investigation and intelligence system strengthened / established and operating	- Recruit informers and contacts - Recruit investigators and deploy strategically - Train investigators - Set up anonymous whistle-blowing system (through hotline) - Carry out awareness campaign within communities on value of conservation and how to report illegal activity (to stimulate social involvement) - Establish intelligence database	- Number of arrests based on information from intelligence system - Number of investigators recruited and trained - Number of calls to whistle blowing system that result in effective follow up - Number of incursions reported on by local communities and reacted to by ZPWMA/ZRP	- 5 cases based on information from intelligence were attended to. No recruitment of investigators and training done 6 calls to whistle blowing systems resulted in effective follow up 10 incursions reported on by local communities and reacted to by ZPWMA/ZRP under the joint operations initiative

9.4.1. Protection and Law Enforcement (Northwest Matabeleland)			
Output	**Activities**	**Key Performance Indicators**	**Narrative Report on Progress in Implementation**
1.3 Investigation and prosecution of wildlife crimes improved	- Establish Standard Operating Procedures (to include guidelines in collaboration with ZRP, Prosecutors, Magistrates, EMA, etc., and evidence gathering - Identify gaps (e.g. ballistics and forensics) and solicit external expertise - Establish regular training and retraining schedule - Procure / hire specialized equipment that may be required	- Proportion of arrests leading to prosecution - Proportion of successful prosecutions	- The SOP for Joint Operations with ZRP and other law enforcement agencies not available - 100 % proportion of arrests leading to prosecution - 95 % proportion of successful prosecutions
1.4 Database that is compliant with national database established	- Set up databases at regional HQ and field stations that can feed compliant information through to regional and national databases - Train staff in appropriate data collection and data capture using standardised recording forms and procedures	- Databases bases established and operational - Recording protocols in place and being used	- Database is available at station levels feeding into the Regional and National levels. - Reporting protocols in place
1.5 Joint law enforcement operations within the NWM region	- Conduct joint operations - Convene joint meetings of law enforcement agencies - Conduct awareness campaigns for other law enforcement agencies - Agree on operational order / SOPs (including information sharing)	- Number of joint operations leading to arrests and successful prosecutions - Number of meetings held per year - Number of successes from shared wildlife crime information	5 joint operations leading to arrests and successful prosecution were done 16 meetings have been done to date Have been successful on all shared information wildlife crime
1.6 Full compliance with hunting and guiding regulations enforced	- Ensure all operators within the region are fully aware of regulations - Appropriate measures are taken to fine / apprehend / prosecute breaches of regulations	Implementation of revised quota setting models in the NWM	Enhanced data collection and collation of returns for quota setting implemented
1.7 Illegal settlement / human encroachment in designated wildlife areas reduced / reversed	- Liaise with RDCs, Traditional Leaders, ZRP and DA's office, and Lands Office - Conduct awareness, education, extension programmes in areas affected - Conduct regular satellite monitoring of areas likely to be affected	Percentage of designated wildlife area in the NWM that are settled has not increased, or has declined, from 2015 levels	There are no increases or decreases in settlements within protected areas. It should be noted however, that there is illegal grazing in Hwange National Park from the communities in the Tsholotsho area.

9.4.1. Protection and Law Enforcement (Northwest Matabeleland)			
Output	**Activities**	**Key Performance Indicators**	**Narrative Report on Progress in Implementation**
1.8 Collaboration in law enforcement with neighbouring countries established	- Convene joint meetings of law enforcement agencies - Agree on standard operational procedures - Conduct joint cross border operations	- Agreed SOPs for cross border law enforcement operations - Number of joint operations leading to arrests and successful prosecutions	There are no agreed SOP for cross border law enforcement operations 5 cases of joint operations leading to arrests and successful prosecution

9.4.2. Biological Monitoring and Management (North West Matabeleland)			
Output	**Activities**	**Key Performance Indicators**	**Narrative Report on Progress in Implementation**
2.1 Elephant population numbers, structure, mortality (using aerial, ground, and ranger based methods) regularly monitored	- Carry out regular surveys - Carry out aerial monitoring of wildlife and illegal activities - Adopt standardized databases for all stations, forest areas, and RDCs in NWM - Introduce ranger-based monitoring across all stations in NWM - Analyze the data and report on trends - Annual water hole count continued	- Information on trends in elephant numbers, structure and mortality analysed and available	Analysis data is based on the national survey of elephants and large herbivore done in 2014, road count data and from waterhole counts which are done yearly.
2.2 Impacts of elephants on selected habitats, selected indicator plant and animal species, and water use and supplies monitored and assessed	- Measure and monitor vegetation indicators, e.g. woodland cover and changes in specific species e.g. Baobabs - Measure and monitor functional biodiversity indicators, e.g. bird species richness and responses to structural changes in woodlands - Measure and assess water use and its sustainability	Elephant impacts on selected habitats monitored, analysed and reported Elephant impacts on indicator species measured analysed and reported Sustainability of water use completed	Permanent vegetation plots are monitored regularly for the effects of elephants and the data analysed. The effect of elephants on indicator plants species is monitored. Research is ongoing on their effects on major herbivores. A study on the effects of drawing on underground water to water elephants is about to be initiated
2.3 Upper and lower thresholds of potential concern (TPCs) related to spatial and temporal impacts (ecological, social, economic) of elephants established	- Compile and analyse historical trends in habitats, selected species, economic performance of consumptive and non-consumptive use, and HWC in the region - Consultations with experts and the public on acceptable limits to change - Propose TPCs for elephant impacts and densities	- Research reports completed - PCP consultation results analysed and reported - TPC recommendations submitted - Results of timely analyses and expert and public opinion being used in determining adaptive management measures	A study looking at changes in vegetation has recently been completed in collaboration with WWF, data is yet to be analysed Adaptive management is exercised through adopting results from research work within the park

9.4.2. Biological Monitoring and Management (North West Matabeleland)			
Output	**Activities**	**Key Performance Indicators**	**Narrative Report on Progress in Implementation**
2.4 Appropriate adaptive management actions undertaken when TPCs approached or exceeded	- Regularly monitor levels and trends in TPC indicators that have been developed - Alert management when and if trends indicate that TPCs are likely to be exceeded - Decide on and implement appropriate management action	- Adaptive management actions taken in response to elephant impacts	More boreholes have been drilled to ensure there is enough water for other animals and to relieve pressure on some areas.
2.5 Age and quality of all elephant killed (trophies, PAC, rations, culls, poached) monitored and quotas to meet desired trophy quality adjusted	- Record age, sex and tusk size (length and weights) of all elephants killed each year - Set up and maintain database - Analyse trends and adjust quotas as necessary to meet desired trophy size - Introduce flexible and adaptable quota system (review fixed quota system) - Produce annual report	Age, sex and tusk sizes for all elephant killed recorded Elephant trophy quality is maintained or improved in relation to the stipulated desired age and trophy size.	A database with information on elephants killed is maintained Trophy quality is maintained through the policing of the hunting industry and record keeping and adaptive management of quotas.
2.6 Elephant range defined and managed to maintain (and/or recover) habitats and elephant populations, and connectivity between fragmented populations and buffer zone populations initiated	- Define elephant range use and existing buffer zones and potential connectivity - Identify priority corridors and land use barriers - Conduct spatial analyses to inform land use planning to facilitate connectivity and reduce human-wildlife conflict	- Elephant range maintained and lost habitats recovered - Corridors between fragmented elephant populations maintained/ established	13% of land in Zimbabwe is maintained for wildlife Corridors are being resuscitated such as the Hwange Sanyati Biological corridor which is being maintained in collaboration with WWF.
2.7 Reports to international monitoring systems prepared and submitted (e.g. AED, ETIS, MIKE, MIKES)	- Timely reports prepared and submitted as required to regional and national levels for transmission to international agencies	- Required reports submitted on time	Done at National level. However through our normal reporting system we feed in with the related information

9.4.3. Social, Economic and Cultural Framework (North West Matabeleland)			
Output	**Activities**	**Key Performance Indicators**	**Narrative Report on Progress in Implementation**
3.1 Joint venture and sustainable use opportunities to strengthen elephant conservation and management explored	- Initiate policy formulation and /or protocols for the development of joint ventures involving public, private, community partnerships (PPCPs) - Involve all relevant stakeholders in identifying potential areas and in the planning / selection process for potential joint ventures / PPCPs - Implement identified and feasible joint ventures / PPCPs	- Policy framework and protocols for establishing Joint Ventures /PPCPs in NWM adopted - At least three Joint Ventures / PPCPs initiated and operating by 2018	HSBS, KAZA, CAMPFIRE, save Australia are some of the joint venture operations adopted and being implemented in NWM
3.2 Transparent distribution of the benefits and costs of elephant management and conservation facilitated	- Develop instruments / protocols to: ○ Increase elephant revenues at the ward level. ○ Provide for traditional leaders to be involved in the management and distribution of elephant related benefits. - Revise CAMPFIRE guidelines to increase the share of revenues at the ward level beyond 55%. - Develop a system to ensure accountability of the revenue sharing mechanism from District to ward level. - Periodically audit the revenue sharing system	- A greater proportion of revenues from wildlife utilisation accrue to communities - Traditional leaders involved in elephant management and revenue sharing - Revenues from wildlife accounted for and audited	There is need to review the benefit-sharing frameworks of CAMPFIRE and other schemes. There is little involvement of traditional leadership in revenue sharing There are no audits and accountability is minimum for revenue from wildlife
3.3 Effective techniques and land use strategies and protocols to mitigate human-wildlife conflict (HWC) implemented.	- Review current human-elephant conflict mitigation measures and potential incentives / policies to reduce conflict - Implement proposals / options emerging from review - Monitor levels of HWC, enter data in database, analyse trends	Land use strategies and protocols for mitigating HWC adopted and implemented Trends in HWC incidents show reduced levels of conflict	There are distinct land use regimes governed through government statutes and policies. Decline on human-wildlife conflicts is evident. For example data shows that lion conflicts have reduced by 50%
3.4 Recovery and use of all products from legally killed elephants improved	- Provide guidelines for the effective recovery, treatment, storage, and sale of elephant products -	Proportion of legally killed elephants from which products were effectively recovered Revenue earned	100%

9.4.3. Social, Economic and Cultural Framework (North West Matabeleland)			
Output	**Activities**	**Key Performance Indicators**	**Narrative Report on Progress in Implementation**
3.5 Information on elephant conservation, management and benefits in communal areas neighbouring key elephant populations included in school curricula	- Liaise with Ministry of Primary and Secondary Education on the development, production, and inclusion of elephant conservation material in school curricula - Engage with specialists and communities to develop suitable educational material on elephant conservation and management for NWM - Distribute material developed and undertake awareness campaigns on elephant conservation in selected areas	- Number and quality of elephant information items developed and delivered to schools in NWM - Proportion of schools within or neighbouring elephant areas receiving and using information provided	There is little information distributed on elephants to communities. Distribution is largely done by private organisations such as painted dogs The proportion is low

9.4.4. Building Conservation Capacity (North West Matabeleland)			
Output	**Activities**	**Key Performance Indicators**	**Narrative Report on Progress in Implementation**
4.1 Funding to initiate and sustain the implementation of this plan secured	- Develop and submit bankable project proposals to identified potential funders - Explore potential partnerships (NGOs, Private Sector) - Review fee structure for elephant hunting and the potential generation and distribution of revenues for conservation and communities from alternative models	- Value of funding and support in kind for conservation of elephants in NWM realised each year	There is high value in funding of elephant conservation (WWF HSBC, WEZ, Friends of Hwange and Other Stakeholders)…funding coming in in terms of drilling of boreholes, vehicles, camping equipment, solar panels, fuels radio communication, roads and fire guards
4.2 Current capacity and staff, training, and equipment needs identified	- Carry out full audit of current human and financial resources required to implement this plan and identify needs	Capacity needs assessment (audit) completed by June 2016	Was done and is being implemented through HSBC
4.3 Capacity for sustained research and monitoring strengthened and collaboration with research institutions enhanced [Linked to and informed by Components 2 and 3]	- Develop and implement a multi-disciplinary research and monitoring strategy for the NWM - Develop and implement a research programme based on that strategy - Provide appropriate tertiary level training for ZPWMA - Engage universities to establish in-service mentoring system - Identify and provide needed equipment - Identify and recruit community research/ monitoring personnel - Identify and train community monitors in the use and application of the Event Book System	- Explicit research strategy for NWM developed by June 2016 - Functional research programme in place by June 2017 - No of research proposals developed, submitted, funded, and equipped - 2 persons trained per annum - No of research personnel on the ground - Research publications - No of active community monitors using the Event Book system	Research strategy is under development 1 done by University of Zimbabwe Under review n/a 3 No publications have been done

9.4.4. Building Conservation Capacity (North West Matabeleland)			
Output	**Activities**	**Key Performance Indicators**	**Narrative Report on Progress in Implementation**
			None
4.4 Training and in-service retraining of personnel in law enforcement, research and monitoring, education awareness community elephant management, etc., established & operating	- Use capacity training needs assessment (4.2) to develop training modules / curricula - Draw up training/retraining programme	- Training modules and curricula developed and being used - 50 to 100% increase in: a) No. of training days and programmes initiated b) No. of staff trained c) No. of communities trained and implementing elephant management programmes d) No. of elephant management campaigns conducted	No modules developed as yet - - - About 10 elephant management campaigns were conducted.
4.5 Infrastructure and housing to facilitate effective protection, conservation and management of elephant in the NWM developed	- Rebuild / refurbish all main access and internal roads within NWM wildlife areas - Maintain / establish necessary airstrips - Undertake a feasibility study for the strategic development of new bases and pickets to support effective law enforcement, research and monitoring - Review staff accommodation requirements for the NWM - Renovate existing buildings - As needed develop staff accommodation and associated infrastructure	- Roads, bridges, airstrips refurbished and maintained as planned - Feasibility study of required field stations completed by June 2016 - Identified infrastructure requirements prioritised and required developments undertaken and completed by 2018	2 airstrips were refurbished and 1650km of roads were graded The list has been produced and is included in the Hwange Management Plan

9.4.4. Building Conservation Capacity (North West Matabeleland)			
Output	**Activities**	**Key Performance Indicators**	**Narrative Report on Progress in Implementation**
4.6 Effective, secure communications network across the region established	- Establish digital VHF and GPS communication and tracking systems across the NWM (repeater links, base sets, handhelds, mobile radio sets, computers for monitoring purposes	Fully operational secure communications system in place and being maintained	The communication system has been improved, however more is required in relation to the repeater links

9.4.5. Coordination, Collaboration and Programme Management (North West Matabeleland)			
Output	**Activities**	**Key Performance Indicators**	**Narrative Report on Progress in Implementation**
5.1 Regional elephant management committee with membership from key stakeholders established and operating	- Appoint committee members - Hold meetings twice each year - Circulate minutes and actionable points within one month of each meeting	- Timely minutes of each bi-annual meeting produced and circulated - Number of committee resolutions and actionable points initiated and acted upon	N/A N/A
5.2 Technical support team to assist in implementation of the plan established and operational	- Convene technical support team of volunteers - Establish Terms of Reference for the team with ZPWMA & FC	- Functional team established - Technical support provided in keeping with TORs and planned activities implemented	N/A N/A
5.3 Effective communication and collaboration between Private sector, NGOs, State Agencies, and neighbouring communities (via a Forum) established	- Establish a formal forum for private sector agencies to interact with ZPWMA and FC - Establish terms of reference and recognition as a formal entity - Establish effective engagement with RDCs, and Traditional Leaders in NWM and neighbouring communities	- Formal recognition by ZPWMA / FC achieved - Meetings held - Effective engagement with neighbours	Quarterly stakeholder meetings There is effective engagement with neighbours…working with RDCs, KAZA, communities in law enforcement, human wildlife conflicts
5.4 Links with neighbouring Botswana, Namibia and Zambia to confer on the management of shared elephant populations established / strengthened	- Establish links with Botswana, Namibia and Zambia to confer on cross border elephant management issues	- Links established and operating	The KAZA forum allows for the mentioned countries to tackle cross border management issues

9.4.5. Coordination, Collaboration and Programme Management (North West Matabeleland)			
Output	**Activities**	**Key Performance Indicators**	**Narrative Report on Progress in Implementation**
5.5 Information dissemination strategy developed and implemented	- Undertake an awareness campaign to promote and market the plan locally and internationally - Produce and disseminate regular progress reports on the implementation of the plan	- At least one awareness campaign conducted each year - Annual progress reports produced - Number of briefs / news releases on major developments or progress released - Funds raised to support elephant conservation	This is yet to be done

ANNEX 2.0 **Sebungwe Action Plan** - *Status and progress report Aug - 2016*

9.5.1 Protection and Law Enforcement (Sebungwe)			
Output	**Activities**	**Key Performance Indicators**	**Narrative Report on Progress in Implementation**
1. Joint operation reaction team established and existing base renovated at Bumi Hills old ZRP Camp as primary base. Followed by 3 others (Binga, Siabuwa, Old Chizarira Lodge/ Sengwa Wildlife Research Institute) *Manpower* *Vehicles* *Aircrafts* *Communication – eg radios* *Equipment eg firearms, boats* *Training* *Central database* *Intelligence networks*	**Manpower** – Draw up 20 man reaction team from law enforcement agencies and other stakeholders from the whole Sebungwe sub-region. (Prioritise Bumi, Sengwa) **Refurbish main base** **Training** – Initial database training Refresher course **Transport and Equipment** Procurement of 3 vehicles (land cruisers) Procurement of 3 boats (speedboats – 1 mothership and 2 patrol boats) **Communications** – establish an independent inter-agency communication network	- Number of arrests - Number of cases detected - Number of recoveries made (eg ivory, firearms etc) - Number of patrols conducted - Number cases finalized (convictions) - Number of carcasses detected - Number of joint operations carried out - Number of refresher courses carried out - Number of failed cases	The Sebungwe Region whose greater part is under the jurisdiction of Central has stations which include Sengwa Wildlife Research Area, Chirisa Safari Area, Chizarira National Park, Chete Safari Area and Matusadona National Park. During the reporting period of August 2016 we had a total of 22 incursions with the highest incursions happening in Chirisa Safari Area while the least was in Chete Safari Area. We had a total of 5 visual contacts with poachers but all were unarmed contacts. No ivory was recovered, no fire arms were recovered. 203 wire snares were removed. 8 people were arrested however all the arrests were not ivory cantered. No refresher course was conducted in the Region. Joint operations were conducted by our investigations section with MBCU, the police and MAPP. A total of 6 elephant carcasses were discovered of which 2 were natural mortalities in Matusadona, 1 was poached in Matusadona, 2 were poached in Chete and 1 was poached in Chizarira.
1.2 Informer network, Investigation and intelligence system strengthened	- Recruit informers and contacts - Maintain hotline for whistle-blowers - Procurement of 2 vehicles and 2 motorbikes - Recruit investigators (6) and deploy strategically - Train investigators - Constant liaison with informers - Rewards to informers standardized	- Number arrests and successful convictions based on information from intelligence system - Number of incursions reported on/reacted to by local communities - Number of informer reports per informer leading to arrests and convictions	From the month of August to date 2016,based on information given through informer network assisted in arresting two persons found in possession of a pangolin in Sengwa,Gokwe Davison Goredema and Batau Murambiwa Both were sentenced to 9 years effective each.On the 14th of September 2016 One suspect was arrested for possessing approximately 5kgs of ivory.The case is still pending in court.Approximately 8 ivory deals have been reported through informer network and are still being worked on for reaction.10 deposit fine tickets were also issued for separate offences .

9.5.1 Protection and Law Enforcement (Sebungwe)			
Output	**Activities**	**Key Performance Indicators**	**Narrative Report on Progress in Implementation**
1.3 Zambezi Valley deployment tactics revisited and implemented	- ZV deployment tactics revised - Identification of OP sites, crossing points etc - Identification and procurement of specialized equipment (eg night vision) - Provision of dry rations for operations - Introduction of aerial surveillance flights	- Resource books - Number of successes on detections - Number of contacts - Number of recoveries - Patrol effort (surveillance)	MAPP assisted in deployments for Matusadona both in the Lake with a boat and in the land with a vehicle. MAPP also assisted in joint operations and following up information from informers within the Gokwe and Nyaminyami districts. Recoveries and surveillances were made by our Investigations team together with the informers, MBCU and sometimes with the duty uniform ZRP
1.4 Ranger patrols strengthened	- Establish effective patrolling force of deployable rangers - Establish (or review) standard operating procedures (SOP) - Establish well-equipped reaction teams - Honorary Officer system re-established to support ranger patrols - Increase support for establishing/ improving dedicated APU for every concession.	- Number of deployable rangers at any one time - Total man-days spent on patrol - SOPs in place - Area patrolled each month - Reaction time to incidents - Number of APUs established	A total of 90 rangers were deployable and a total of 1099 man-days were spent on patrol during the month of August 2016
1.5 Training of staff enhanced	• Establish regular training and retraining schedule (includes training on weaponry, bushcraft, tracking, information gathering, crime scene management, Judiciary procedures etc • Training on standard operation procedures (harmonization)	• Number of training and retraining sessions carried out	8 rangers went for a refresher course at Head Office with the Army training them in drilling movements during the month.
1.6 Conviction rates improved	• Judiciary sensitization (incl. workshops) • Formulation of proper charges, indictment and summons • Gathering all evidence available using legal means • Completion of dockets timeously, submission and concluding cases in a reasonable time • Creation of a district sub-committee on elephant and wildlife issues • Hold workshops to share information on wildlife issues	• Number of successful prosecutions • Decrease in number of crimes committed • Number of workshops or meetings held	From August 2016 to date one case of ivory possession was successfully finalized and one for ivory is still pending trial.Generally poaching seem to have decreased as compared to the other years due to deterrent sentences being given by the courts,Conviction of ring leaders,changing of area of operation and current economic challenges which are also hitting the market on acquiring the us dollar.One workshop was held at Midlands black Rhino Concervancy with the judiciary to address challenges being faced .

9.5.2 Biological Monitoring and Management (Sebungwe)			
Output	**Activities**	**Key Performance Indicators**	**Narrative Report on Progress in Implementation**
2.1 Viable population, geographical distribution, and habitat connectivity targets established.	- Establish TPC for all areas to set viable population target. - Collect spatial data (livestock densities, human population densities, forest cover, and agricultural cover) to map potential geographic distribution of elephants - Identify potential connectivity areas and promote wildlife-based land uses in those areas.	- Viable population target of minimum 5,000 for the region with minimum and maximum thresholds in different land categories - Updated geographical distribution map and spatial datasets - Number of conservancies approved/ green-lighted by communities	There are no private conservancies in the Sebungwe Region, however the 4 Rural District Councils within the Region are very active in conservation and also CAMPFIRE is active. The 4 RDCs are Gokwe North, Gokwe South, Nyaminyami and Binga RDC.
2.2 Monitoring system for population trends, habitat, and impacts designed and implemented.	- Establish regional database for data on population, habitat, HEC, patrolling, poaching, and trophies (for trophies, see also Output 5). - Design and adopt standardized reporting formats. (i.e. MOMS) - Report to the regional management committee to review data and decide on management actions. - Conduct annual aerial surveys for the "core area" (to be defined).	- Regional database operational - Number of reporting formats designed and distributed - Number of persons, patrols, and sectors submitting data - Quarterly reports - Quarterly reviews	We have formats for different reports which start from Incidental reports, Daily reports, Weekly reports, Monthly reports, Quarterly reports and Annual reports. The reports come from the stations and are consolidated at the Regional Office before they are sent to HQ.
2.3 Direct and indirect causes of decline (2006-2014) researched.	- Causes of mortality quantified using the regional database. - Gather information from local communities and experts. - Examine potential socio-economic factors related to decline - Research habitat changes. - Publish research in scientific publication.	Data and analyses	For the month of August 2016, the Sebungwe Region lost a total of 6 elephants, 2 of them died of natural causes in Matusadona National Park, 1 was poached in Matusadona, 2 were poached in Chete Safari Area and 1 was poached in Chizarira National Park. A long term elephant research programme to be launched in Matusadona National Park in conjunction with a private partner

9.5.2 Biological Monitoring and Management (Sebungwe)			
Output	**Activities**	**Key Performance Indicators**	**Narrative Report on Progress in Implementation**
2.4 Viable population, geographical distribution, and habitat connectivity achieved and maintained.	- Establish wildlife-based land-use system (not a land use plan) with community conservancies acting as corridors between protected areas - Reduce human-elephant conflict to acceptable levels. - Implement responsible habitat management (with regard to fires, REDD+, mining, illegal and legal settlement) - Conduct integrated land-use planning. - Support extension of REDD initiative	- Number of operational conservancies/ corridors - Elephant Population data - Number of elephants and people involved in "serious HEC incidents" - Effective, non-lethal elephant deterrents in place - Regional land-use plan - Number of stakeholders, meetings in planning process - Utilization of corridors by elephants	The Authority is supporting efforts to establish conservancies in the Region and we have approved the setting up of a conservancy in the Gatshe Gatshe Area. The Chirisa-Sengwa excision area is also planned to be established as a community conservancy
2.5 Sustainable offtakes established through participatory quota setting and monitored through adaptive management.	- Establish a database of offtakes, trophy qualities, and age classes (See Output 2, Activity 1). - Using participatory quota setting following best practices, set optional quotas based on scientific survey data, with no more than 0.5% of the estimate as the elephant quota for the region. - Revisit quota system and establish optional quotas as opposed to fixed quotas - Set minimum trophy size and a variable trophy fee with large increments based on size - Identify and enforce best hunting practices through a code of conduct incorporated in lease agreements and hunting permits.	- Trophy quality improving - Record of hunting practice transgressions	Quotas for the Nyaminyami District and the Sebungwe Region as a whole have been greatly reduced and all elephant hunts are now being monitored by Parks

9.5.2 Biological Monitoring and Management (Sebungwe)			
Output	**Activities**	**Key Performance Indicators**	**Narrative Report on Progress in Implementation**
2.6 Robust and comprehensive research program enhanced and maintained.	- Research the impact of decline on population dynamics. - Investigate migration hypothesis. - Develop applied research projects, especially interdisciplinary and multidisciplinary research. - Establish research oversight body, building on existing approval processes.	Publications, particularly with management guidance	A long term elephant research programme to be launched in Matusadona National Park in conjunction with a private partner

9.5.3 Social, Economic and Cultural Framework (Sebungwe)			
Output	**Activities**	**Key Performance Indicators**	**Narrative Report on Progress in Implementation**
3.1 Transparent and equitable distribution of benefits established	- Develop an instrument to increase elephant revenues at the ward level. - Instrument to provide for traditional leaders to be involved in management and distribution of elephant related benefits. - Revise CAMPFIRE guide lines to increase the share of revenues at the ward level beyond 55%. - Develop a system to ensure accountability of the revenue sharing mechanism from District to ward level. - Periodic auditing of the revenue sharing system.	- Instrument approved. - CAMPFIRE guidelines revised and approved - Revenue accountability system established - Number of audits	The Zimbabwe Elephant Nursery to establish a community outreach program that will provide community educational and developmental projects and activities in the region
3.2 Economic management of consumptive and non-consumptive tourism of elephants in Sebungwe improved.	- Preventing human settlement in protected areas - Review length of concession leases to encourage greater investment. - Rehabilitate the depleted Safari areas - Promote PPCPs	- Number of eviction notices issued. - Number of reviewed leases - Number of safari areas under proper management/concessions - Record of PPCPs established.	Mokore safaris is currently operating in Sengwa Wildlife Research Area and the lease is under proper management, Statunga Safaris has also got the Chirisa hunting lease and will start operating in the year 2017. Chete Safri Area is currently still open however there are applicants who may take it at anytime.
3.3 Land use strategies to mitigate human elephant conflicts (HEC) established	- Review of human elephant conflict measures (consultancy) - Increase sense of ownership of wildlife as a mitigation measure to HEC (review) - Traditional leaders to set up a compensation scheme for land holders directly affected by HEC. - Support review and development of land –use plans to optimize agricultural livestock and farming activities	- Reports - Link with activity 1 and 2 output1(benefits) - Compensation scheme functioning and record of HEC in place. - Land use plans supported	Established a Problem Animal Control Committee in Nyaminyami and Gokwe that includes all stakeholders to assist in the effective coordination of all PAC issues

9.5.3 Social, Economic and Cultural Framework (Sebungwe)			
Output	**Activities**	**Key Performance Indicators**	**Narrative Report on Progress in Implementation**
3.4 Investment of wildlife revenue in income generating community products established	- Revitalize technical support services to communities/ community initiatives - Participatory business plan at community level. - Explore micro financing opportunities - Explore markets for community projects related to elephant conservation	- Technical support services established through proper instrument. - Participatory business plan adopted.	There is a strong move to promote the development of aquaculture projects to enhance food security
3.5 Relationship and communication mechanism established	- Sebungwe WG to include Traditional leaders and RDCs - Methodologies for regular communication with communities and their leaders established	- Traditional leaders and RDC included in the WG - Communication strategy developed	
3.6 Education on elephant conservation in the community increased	- Information campaign explaining reasons for quota decrease (see Biological Component for cross check) - Explain what trophy hunting means and how it links to benefits - Share census results and explain implications - Extend conservation education to Sebungwe wards (NGOs?)	- Number of Outreach meetings with Traditional leaders / Wards/ RDC including the 4 key activities	The Zimbabwe Elephant Nursery to establish a community outreach program that will provide educational and developmental projects and activities in the region

9.5.4 Building Conservation Capacity Component (Sebungwe)			
Output	**Activities**	**Key Performance Indicators**	**Narrative Report on Progress in Implementation**
4.1 Capacity needs for elephant management in Parks and CAMPFIRE areas analysed and identified	- Draw up TOR - Appoint consultant	Report produced	Still outstanding
4.2 Training provided	- Analyse training needs - Prioritise and develop training curricula if not already available - Implement in-service training and re-training	Numbers of people trained and certified	Still outstanding
4.3 Best practice standards for elephant management in place	- Standards defined by and through National Elephant Policy and CAMPFIRE Principles and Guidelines - Define clear objectives for elephant management in the Sebungwe - Support CITES MIKES site(s) and application of SMART and RBM	- MIKES PIKE database - SMART database	Nyaminyami RDC is a MIKE site and efforts are needed to adopt the SMART database system in th region
4.4 Research and monitoring capacity strengthened	- Provide appropriate tertiary level training for ZPWMA - Engage universities to establish in-service mentoring systems - Identify equipment needs, source and provide - Identify and recruit community research/ monitoring personnel - Identify and train community monitors in the use and application of the Event Book System	- 2 persons trained per annum - 5+ people in mentoring system each year - Equipment procured and in place - Active community research programme underway - Event Book System functional and operationalised	Still outstanding
4.5 Funding secured	- Complete Sebungwe Elephant Management Plan and disseminate for funding purposes - Development of funding proposals for each of the components, if necessary - Identify donors (e.g. bilateral, WB GEF, NGO, other) - Submit proposals - Develop Sebungwe branding and marketing campaign	Number of successfully funded proposals	Still outstanding
4.6 Infrastructure refurbished and functioning	- Roads rehabilitation: Parks and CL - Karoi-Binga road - Airstrips	- 2,000 km repaired to standard - Airstrips registered and functioning	Still outstanding

9.5.4 Building Conservation Capacity Component (Sebungwe)			
Output	**Activities**	**Key Performance Indicators**	**Narrative Report on Progress in Implementation**
4.7 Communications	- Procure and install radio communications systems	System installed and operational	Still outstanding

9.5.5 Coordination and Programme Management (Sebungwe)			
Output	**Activities**	**Key Performance Indicators**	**Narrative Report on Progress in Implementation**
5.1. Sebungwe Management Committee with an Elephant Working Task Force and Project Coordinator established	-Identify committee members, select WTF and appoint Coordinator -ToR for each institution (from national plan)	Committee meeting twice yearly; WTF meets quarterly, identifies priority activities and oversees implementation by Coordinator	Still outstanding
5.2. Coordination and communication between Traditional Authorities, their communities and the elephant management programme and plan strengthened	-Address the community through CAMPFIRE and traditional leadership -Introduce elephant management plan in easily understandable format – maps and graphs – and disseminate through all levels/actors in Sebungwe	• Management plan documents for dissemination	Still outstanding
5.3. Coordination between Sebungwe safari operators and implementation of the elephant management plan strengthened	-SOAZ, ZPHGA appoint liaison officer for Sebungwe elephant management plan -Encourage non-members of associations to participate in plan implementation	Liaison officer appointed and operating and non-members of associating participating in implementation of the action plan	Still outstanding
5.4. Links with neighbouring states established – shared elephant management	-Establish relationship with KAZA Secretariat -Establish links and synergies with transboundary natural resource mgmt -Bilateral JOC to focus on illegal wildlife trade and trade routes -Establish links with TRAFFIC	• KAZA Secretariat aware of Sebungwe elephant management plan • TBNRM established and functional • Reduced illegal trade	Still outstanding

ANNEX 3.0 Lower Zambezi Valley Action Plan - *Status and progress report Aug - 2016*

9.6.1. Protection and Law Enforcement (Lower Zambezi Valley)			
Output	**Activities**	**KPIs**	**Narrative Report on Progress in Implementation**
1.1 Highly trained rapid response anti-poaching units established/ strengthened	- Assess / audit current law enforcement capacity, prioritise needs - Mobilise resources to meet shortfalls in personnel and equipment and new technology - Recruit rangers, train and retrain staff - Review / establish Standard Operating Procedures (SOPs) for all law enforcement operations	- Assessment of enforcement capacity completed - Fully staffed and trained anti-poaching units in place and operating - SOPs established and being implemented - Trends in illegal killing of elephants	-
1.2 Informer network, investigation and intelligence system established	- Recruit informers and contacts - Recruit investigators and deploy strategically - Train investigators - Set up anonymous whistle-blowing system (through hotline) - Carry out awareness campaign within communities on value of conservation and how to report illegal activity (to stimulate social involvement) - Establish intelligence database	- Number of arrests based on information from intelligence system - Number of investigators recruited and trained - Number of calls to whistle blowing system that result in effective follow up - Number of incursions reported on by local communities and reacted to by ZPWMA/ZRP	5 informers were recruited, one more investigator was recruited. 10 calls were received indicating poachers coming in from the local community and 3 calls indicating foreign poachers coming in. Since January 2016, 4 foreigners have been arrested from tip offs and one local person. A total of 32 incursions were recorded whereby the majority of them were recorded during the first quarter of the year.
1.3 Investigation and prosecution of wildlife crimes improved	- Establish Standard Operating Procedures (to include guidelines on collaboration with ZRP, Prosecutors, Magistrates, EMA, etc., and evidence gathering) - Identify gaps (e.g. ballistics and forensics) and solicit external expertise - Establish regular training and retraining schedule - Procure / hire specialized equipment that may be required	- Proportion of arrests leading to prosecution - Proportion of successful prosecutions	Of all the five arrested poachers, all were sent for prosecution and were all convicted and sentenced

9.6.1. Protection and Law Enforcement (Lower Zambezi Valley)			
Output	**Activities**	**KPIs**	**Narrative Report on Progress in Implementation**
1.4 Database that is compliant with national database established	- Set up databases at regional HQ and field stations that can feed compliant information through to regional and national databases - Train staff in appropriate data collection and data capture using standardised recording forms and procedures	- Databases bases established and operational - Recording protocols in place and being used	The current data base in place is the MIKE data base system where one Senior Ranger and two rangers were trained to manage the input of information into that system. Recording starts from the time the callsign are deployed using patrol briefing form, patrol details will then record information of their findings onto the ground patrol data form whilst out on patrol; on return, a report is then reproduced which will be used together with the ground data form to then enter the information onto the MIKE system data base.
1.5 Joint law enforcement operations within the LZV	- Convene joint meetings of law enforcement agencies - Conduct awareness campaigns for other law enforcement agencies - Agree on operational order / SOPs (including information sharing) - Conduct joint operations	- Number of meetings held per year - Number of successes from shared wildlife crime information - Number of joint operations leading to arrests and successful prosecutions	One liaison meeting conducted with our Zambian counter parts, 3 community outreach programs with the Nyamakate and Chundu community. -
1.6 Full compliance with hunting and guiding regulations enforced	- Ensure all operators within the region are fully aware of regulations - Appropriate measures are taken to fine / apprehend / prosecute breaches of regulations	Implementation of revised quota setting models in the LZV	Implementation of the LZV Action plan is in progress with
1.7 Illegal settlement / human encroachment in designated wildlife areas reduced / reversed	- Liaise with RDCs, Traditional Leaders, ZRP and DA's office, and Lands Office - Conduct awareness, education, extension programmes in areas affected - Conduct regular satellite monitoring of areas likely to be affected	Percentage of designated wildlife area in the LZV settled has not increased, or has declined, from 2015 levels	
1.8 Collaboration in law enforcement with neighbouring countries established	- Convene joint meetings of law enforcement agencies - Agree on standard operational procedures - Conduct joint cross border operations	- Agreed SOPs for cross border law enforcement operations - Number of joint operations leading to arrests and successful prosecutions	

9.6.2. Biological Monitoring and Management (Lower Zambezi Valley)			
Output	**Activities**	**Key Performance Indicators**	**Narrative Report on Progress in Implementation**
2.1 Elephant population numbers, structure, mortality (using aerial, ground, and ranger based methods) regularly monitored	- Carry out regular surveys - Carry out aerial monitoring of wildlife and illegal activities - Adopt standardized databases for all stations and RDCs in LZV - Introduce ranger-based monitoring (SMART, MIKE, ETIS) across all stations in LZV - Analyze the data and report on trends	- Information on trends in elephant numbers, structure and mortality analysed and available	-According to the 2014 Aerial Survey report, Mana Pools has 2984 elephants. From 2009 to 2016, Mana Pools has lost 95 elephants to poaching of which 16 were recorded this year. The report states that there was 40% reduction in elephant populations from the 2001 survey. Causes of reduction include natural deaths, migration and poaching.
2.2 Impacts of elephants on selected habitats and selected indicator plant and animal species monitored and assessed	- Measure and monitor vegetation indicators, e.g. woodland cover and changes in specific species e.g. Baobabs - Measure and monitor functional biodiversity indicators, e.g. bird species richness and responses to structural changes in woodlands	Elephant impacts on selected habitats monitored, analysed and reported Elephant impacts on indicator species measured analysed and reported	-Elephant damage has been observed and recorded on woody species on the flood plain where they are greatly concentrated. Impacts shown were ring barking and uprooting of woody species such as *Combretum spp* and, *Fidherbia albida.* The impacts have resulted in weakening of the tree species, making them susceptible to diseases and mistletoes. -These species also do not have recruitment due to impacts of elephants. -Introduction of enclosures are at initial stages to monitor the impacts and enhance recruitment.
2.3 Upper and lower thresholds of potential concern (TPCs) related to spatial and temporal impacts (ecological, social, economic) of elephants established	- Compile and analyse historical trends in habitats, selected species, economic performance of consumptive and non-consumptive use, HWC, in the LZV - Consultations with experts and the public on acceptable limits to change - Propose TPCs for elephant impacts and densities	- Research report completed - Survey results analysed and reported - TPC recommendations submitted - Results of timely analyses and expert and public opinion being used in determining adaptive management measures	-Recommendations have been submitted to release pressure on the Mana Pools national park through stopping hunting on the Sapi Safari Area flood plain.
2.4 Appropriate adaptive management actions undertaken when TPCs approached or exceeded	- Regularly monitor levels and trends in TPC indicators that have been developed - Alert management when and if trends indicate that TPCs are likely to be exceeded - Decide on and implement appropriate management action	- Adaptive management actions taken in response to elephant impacts	-Sapi Safari Area turned hunting in the process of being stopped, and the area to promote photographic safaris instead of hunting.

9.6.2. Biological Monitoring and Management (Lower Zambezi Valley)			
Output	**Activities**	**Key Performance Indicators**	**Narrative Report on Progress in Implementation**
2.5 Age and quality of all elephant killed (trophies, PAC, rations, culls, poached) monitored and quotas to meet desired trophy quality adjusted	- Record age, sex and tusk size (length and weights) of all elephants killed each year - Set up and maintain database - Analyse trends and adjust quotas as necessary to meet desired trophy size - Introduce flexible and adaptable quota system (review fixed quota system) - Produce annual report	Elephant trophy quality is maintained or improved in relation to the stipulated desired trophy size.	Non-trophy hunting area. Mana Pools being a non-hunting areas, the sizes of trophies hunted from management quota and those picked from natural deaths, trophy sizes are more constant.
2.6 Current elephant range defined and management to recover habitats and elephant populations and maintain connectivity between fragmented populations and buffer zone populations initiated	- Define elephant range use and existing buffer zones and potential connectivity - Identify priority corridors and land use barriers - Conduct spatial analyses to inform land use planning to facilitate connectivity and reduce human-wildlife conflict	- Elephant range and maintained and lost habitats recovered - Corridors between fragmented elephant populations maintained/ established	Elephants aggregation on the flood plain during the dry season has resulted in a lot of pressure being exerted on the area. Changing of management system of Sapi's flood plain could contribute to recovery of the habitat on the floodplain once animals disperse.
2.7 Reports to international monitoring systems prepared and submitted (e.g. AED, ETIS, MIKE, MIKES)	- Timely reports prepared and submitted as required to regional and national levels for transmission to international agencies	- Required reports submitted on time	Situational reports involving poaching of elephants have been submitted in time. MIKE Data Base is also being maintained. A record of recovered of all ivory obtained is kept and the recovered tusks are constantly submitted to Head Office where they are again reweighed and recorded as well.

9.6.3 Social, Economic and Cultural Framework (Lower Zambezi Valley)			
Output	**Activities**	**Key Performance Indicators**	**Narrative Report on Progress in Implementation**
3.1 Joint venture and sustainable use opportunities to strengthen elephant conservation and management explored	- Initiate policy formulation and /or protocols for the development of joint ventures involving public, private, community partnerships (PPCPs) - Involve all relevant stakeholders in identifying potential areas and in the planning / selection process for potential joint ventures / PPCPs - Implement identified and feasible joint ventures / PPCPs	- Policy framework and protocols for establishing Joint Ventures /PPCPs in the LZV adopted - At least three Joint Ventures / PPCPs initiated and operating by 2018	A number of organisations have come aboard in support of conservation through Joint Ventures and Memorandum of Agreements such organisations like: Zambezi Society, Tashinga Initiative, Animal Wildlife Fund Foundation, Sino Zimbabwe Wildlife Foundation Fund, and Kariba Animal Wildlife Fund Foundation, these have formalised they assistance to Mana Pools which vary from Anti-Poaching assistance to treatment of injured animals.
3.2 Transparent distribution of the benefits and costs of elephant management and conservation facilitated	- Develop instruments / protocols to: o Increase elephant revenues at the ward level. o Provide for traditional leaders to be involved in the management and distribution of elephant related benefits. - Revise CAMPFIRE guidelines to increase the share of revenues at the ward level beyond 55%. - Develop a system to ensure accountability of the revenue sharing mechanism from District to ward level. - Periodically audit the revenue sharing system	- A greater proportion of revenues from wildlife utilisation accrue to communities - Traditional leaders involved in elephant management and revenue sharing - Revenues from wildlife accounted for and audited	Benefits from wildlife utilisation are channelled through CAMPFIRE program through the local Rural District Council.
3.3 Effective techniques and land use strategies and protocols to mitigate human-wildlife conflict (HWC) implemented.	- Review current human-elephant conflict mitigation measures and potential incentives / policies to reduce conflict - Implement proposals / options emerging from review - Monitor levels of HWC, enter data in database, analyse trends	Land use strategies and protocols for mitigating HWC adopted and implemented Trends in HWC incidents show reduced levels of conflict	Only one case of Human Wildlife Conflict has been recorded since January where one person was attacked by a hippo but survived the attack. Cases of Wildlife encroachment onto the communities on the southern boundary are dealt with by the CAMPFIRE because of the buffer zone between the southern boundary of the park and the community.
3.4 Recovery and use of all products from legally killed elephants improved	- Provide guidelines for the effective recovery, treatment, storage, and sale of elephant products -	Proportion of legally killed elephants from which products were effectively recovered Revenue earned	Of the 16 located elephant carcass, six elephant carcasses were recovered from two contacts. Note that 22 other elephant carcass were recovered in Chirundu again from a contact but we cannot directly link them to the elephants poached in mana Pools though there is a very high possibility of having the elephants poached in Mana Pools as well or in Marongora or Sapi..

9.6.3 Social, Economic and Cultural Framework (Lower Zambezi Valley)			
Output	**Activities**	**Key Performance Indicators**	**Narrative Report on Progress in Implementation**
3.5 Information on elephant conservation, management and benefits in communal areas neighbouring key elephant populations included in school curricula	- Liaise with Ministry of Primary and Secondary Education on the development, production, and inclusion of elephant conservation material in school curricula - Engage with specialists and communities to develop suitable educational material on elephant conservation and management for the LZV - Distribute material developed and undertake awareness campaigns on elephant conservation in selected areas	- Number and quality of elephant information items developed and delivered to schools in the LZV - Proportion of schools within or neighbouring elephant areas receiving and using information provided	2014 Elephant Survey Report

9.6.4 Building Conservation Capacity (Lower Zambezi Valley)			
Output	**Activities**	**Key Performance Indicators**	**Narrative Report on Progress in Implementation**
4.1 Funding to initiate and sustain the implementation of this plan secured	- Develop and submit bankable project proposals to identified potential funders - Explore potential partnerships (NGOs, Private Sector) - Review fee structure for elephant hunting and the potential generation and distribution of revenues for conservation and communities from alternative models	- No of project proposals developed, submitted and funded - Value of funding and support in kind for conservation of elephants in LZV realised each year	A proposal was submitted by Tishinga Initiative for the establishment of the Nyakasikana Anti-poaching Base and has been funded and near completion. See section 9.6.3.1
4.2 Current capacity and staff, training, and equipment needs identified	- Carry out full audit of current human and financial resources required to implement this plan and identify needs	Capacity needs assessment (audit) completed by June 2016	
4.3 Capacity for sustained research and monitoring strengthened and collaboration with research institutions enhanced [Linked to and informed by Components 2 and 3]	- Develop and implement a multi-disciplinary research and monitoring strategy for the LZV - Develop and implement a research programme based on that strategy - Provide appropriate tertiary level training for ZPWMA - Engage universities to establish in-service mentoring system - Identify equipment needs and provide - Identify and recruit community research/ monitoring personnel - Identify and train community monitors in the use and application of the Event Book System	- Explicit research strategy for the LZV developed by June 2016 - Functional research programme in place by June 2017 - No of research proposals developed, submitted, funded, and equipped - 2 persons trained per annum - No of research personnel on the ground - Research publications - No of active community monitors using the Event Book system	Mana Pools has one Ecologist

9.6.4 Building Conservation Capacity (Lower Zambezi Valley)			
Output	**Activities**	**Key Performance Indicators**	**Narrative Report on Progress in Implementation**
4.4 Training and in-service retraining of personnel in law enforcement, research and monitoring, education awareness community elephant management, etc., established & operating	- Use capacity training needs assessment (4.2) to develop training modules / curricula - Draw up training/retraining programme	- Training modules and curricula developed and being used - 50 to 100% increase in: a) No. of training days and programmes initiated b) No. of staff trained c) No. communities trained and implementing elephant management programmes	Training modules are guided as per the Mushandike College of Wildlife Management at the organisation training institute. The station has 8 staff members who have undergone training at Mushandike College of Wildlife Management in various fields from Accounting, Certificate in Wildlife Management, Diploma in Wildlife Management, and IT courses
4.5 Infrastructure and housing to facilitate effective protection, conservation and management of elephant in the LZV developed	- Rebuild / refurbish all main access roads to the LZV (c.150 km) - Repair, clear, grade where necessary some 600 km of internal roads and several bridges - Maintain / establish necessary airstrips - Undertake a feasibility study for the strategic development of new bases and pickets to support effective law enforcement, research and monitoring - Review staff accommodation requirements for the LZV - Renovate existing buildings - As needed develop staff accommodation and associated infrastructure	Roads, bridges, airstrips refurbished and maintained as planned Feasibility study of required field stations completed by June 2016 Identified infrastructure requirements prioritised and required developments undertaken and completed	New operational roads are in the process of being opened, existed roads were maintained, the Mana Main Airstrip was renovated this year 2016 Of priority was to establish an anti-poaching base at Nyakasikana which I now near completion
4.6 Effective, secure communications network across the region established	- Establish digital VHF and GPS communication and tracking systems across the LZV (repeater links, base sets, handhelds, mobile radio sets, computers for monitoring purposes	Fully operational communications system in place and being maintained	New operational radios, repeater links and potable GPS systems have been secured.

9.6.5 Coordination, Collaboration and Programme Management (Lower Zambezi Valley)			
Output	**Activities**	**Key Performance Indicators**	**Narrative Report on Progress in Implementation**
5.1 Regional elephant management committee with membership from key stakeholders established and operating	- Appoint committee members - Hold meetings twice each year - Circulate minutes and actionable points within one month of each meeting	Timely minutes of each meeting produced and circulated Committee resolutions and actionable points initiated and acted upon	
5.2 Technical support team to assist in implementation of the plan established and operational	- Convene technical support team of volunteers - Establish Terms of Reference for the team with ZPWMA	Functional team established Technical support provided in keeping with TORs and planned activities implemented	A technical person has been seconded to Mana Pools by AWF to assist in Anti-poaching
5.3 Effective communication and collaboration between Private sector, NGOs, State Agencies, and neighbouring communities (via a Forum) established	- Establish a formal forum for private sector agencies to interact with ZPWMA - Establish terms of reference and recognition as formal entity - Establish effective engagement with RDCs, and Traditional Leaders in the LZV and neighbouring communities	Formal recognition by ZPWMA achieved Meetings held Effective engagement with neighbours	In 2016, 1 Meeting has been held between ZIMPARKS officers and the Chief (Chief Chundu) together with his village heads. Another meeting has also been held between Mana Pools Officers and Safari Operators to discuss their support in conservation.
5.4 Links with neighbouring Zambia and Mozambique to confer on the management of shared elephant populations established / strengthened	- Establish links with Zambia and Mozambique to confer on cross border elephant management issues	Links established and operating	There is cordial communication with ZAWA counterparts.
5.5 Information dissemination strategy developed and implemented	- Undertake an awareness campaign to promote and market the plan locally and internationally - Produce and disseminate regular progress reports on the implementation of the plan	At least one awareness campaign conducted each year Annual progress reports produced Briefs / news releases on major developments or progress released Funds raised to support elephant conservation	Funds have been raised by Non-Governmental organisations through provision of camping equipment, availing vehicles for use in Anti-poaching, assisting in opening up of roads, developing of base camp for rangers and training

ANNEX 4.0 South East Lowveld Action Plan - *Status and progress report Aug – 2016*

9.7.1 Protection and Law Enforcement (South East Lowveld)			
Output	**Activities**	**Key Performance Indicators**	**Narrative Report on Progress in Implementation**
1.1 Highly trained rapid response anti-poaching units strengthened	– Appoint anti-poaching coordinator (for region and/or separate areas) – Recruit staff – Train staff – Procure vehicles and equipment – Deploy unit – Support existing units	Trained and fully equipped units established and operating with relevant security agency by June 2016	Five units were established in Gonarezhou National Park, trained and fully equipped. Three new Lancruiser vehicles were procured to augment the existing patrol fleet. -Two candidates identified with one to be elected for the post of antipoaching coordinator for the Region. - 35 Cadet rangers recruited by the Gonarezhou Conservation Project to boost the existing staff compliment. Cadet Rangers trained in basic paramillitary skills by the Gonarezhou Conservation Project -A Gonarezhou Antipoaching Reaction Unit established and operating throughout the Gonarezhou Nationa Park. -Out of the 20 properties in Save Valley Conservancy, 8 properties have 2X call signs of 3 rangers each who are highly trained and able to carry out combined operations with security agencies in addition to the15scouts also highly trained with AggressiveTracking Specialist a security private company assisting in the protection of rhinos and elephants in SEL.
1.2 Informer and intelligence systems established and/or strengthened	– Identify and recruit informers – Establish and implement incentive protocols – Set up, implement hotline for anonymous reports and communicate it to the public – Analyse and use information – Ensure information is included in database outlined in Output 1.6	An active informer system/network operating within the SEL by Jan. 2016 Hotline widely advertised and operational by Jan 2016	-Informer network is being established and had a number of informer lead success. Awareness of the hotlines began in September 2016 by Regional team. -Informers recruited by the Gonarezhou Conservation Project. -A hotline set up for Gonarezhou and Save Valley Conservancy. -Data being analysed and a data base in place and being mantained at the Regional Office. -Hotline facility fully advertised through the Parks Investigations Branch.
1.3 Investigation of wildlife crime improved	– Implement training programmes for investigation personnel – Ensure collaboration between Parks, ZRP and intelligence officers	At least two law enforcement staff trained in scene of crime collection and preservation of	-3 Investigations officers trained in scene of crime collection and preservation of exhiits course

9.7.1 Protection and Law Enforcement (South East Lowveld)			
Output	**Activities**	**Key Performance Indicators**	**Narrative Report on Progress in Implementation**
	– Recruit more investigators – Put in place Investigator incentive system – Collaborate with forensic scientists and ballistic experts, as well as agencies such as EMA and approved universities (e.g. Chinhoyi University of Technology, University of Zimbabwe, National University of Science and Technology)	evidence, ballistics evidence, etc. in SEL. Percentage of investigations resulting in successful prosecutions in SEL greater than in 2014	-1 investigations officer trained in Wildlife, Pestcide and Forensic Crime Scene Investigation Course. -Collaboration with other law enforcement agencies satisfactorily yielding results. -Collaboration with other agencies strengthened -plans are underway to recruit more investigators and to open an investigations office in Chiredzi. -Some stakeholders have pledged to assist the investigators with some incentives. -In Save Valley Conservancy one trained personnel is dealing with wildlife crimes and is based at Humani Ranch. -The % of successfulness on investigated cases is now higher than 2014, and the current % is estimated to be 60% after lobbying with the Judiciary Services
1.4 Prosecution of wildlife crimes improved	– Train prosecutors on legislation and processes available to deal with wildlife crimes – Conduct awareness / outreach programs with Prosecution, Judiciary – Utilize ancillary laws, such as those dealing with economic crime, organized crime, money laundering, – Communicate status of prosecutions to the public via ZPWMA website – Clear backlog of wildlife cases – Explore the possibility of appointing dedicated wildlife crime prosecutors at Regional and National level	Monthly liaison sessions on wildlife crime and law enforcement held with members of the judiciary Relevant legislation available and being used Wildlife crime prosecutors available and being used in SEL	-Liaison with the Judiciary, Courts and the Prosecuting Authority on wildlife crimes conducted. -Relevant legislation available and referred to in dealing with wildlife crimes -Wildlife Crime Prosecutors not available from the Wildlife Authorities but Public Prosecutors being used to deal with wildlife crimes to which they may not be well versed with certain technical wildlife issues. -No wildlife crime prosecutors appointed. -Inadequate resources of transport and fuels to fully implement monthly liaison.

9.7.1 Protection and Law Enforcement (South East Lowveld)			
Output	**Activities**	**Key Performance Indicators**	**Narrative Report on Progress in Implementation**
1.5 Law enforcement in collaboration with communities enhanced [Links to Component 3]	– Engage and collaborate on curbing wildlife crimes (ZRP & Communities) – Establish anti-poaching clubs/ community natural resource monitors that collaborate with ZPWMA and ZRP – Lobby support from Chiefs to deal with local poachers – Hold workshops with Chiefs and communities about wildlife and wildlife crimes – Establish incentives for communities to provide information	Incentive schemes that encourage the public and members of rural communities to contribute to law enforcement (e.g. through informer hotline) established in SEL Increasing number of incidents of community contribution to law enforcement (e.g. whistle blowers) by Dec. 2017	Trained community rangers from Sengwe area, four passed and ready to carry out ant poaching operations within the Sengwe area. Several meetings on wildlife issues were held with Chief Sengwe. - Collaboration with ZRP and Communities strengthened and yielding results. - We have opened a hotline and fliers facility that we distributed through the Save Valley Conservancy, Gonarezhou and surrounding areas and information is coming in. - All stakeholders workshop on wildlife issues is planned soon - Some stakeholders have pledged to incentivize the whistle blowers - In Save Valley Conservancyseveral education awareness campaigns have been carried out in all areas bordering wildlife protected areas. - meetings with chiefs have been maintained regarding protection of wildlife. - Resource monitors have been selected by the communites. - The surrounding communities are benefitting from meat obtained from problem animal control and trophy hunting.
1.6 Local wildlife law enforcement database established	– Set up database, as per national database – Ensure inclusion of prosecution status in database – Implement national data recording protocols – Train data entry staff and crime analysts	Local database established and operating Illegal activities recorded and analyzed	Spatial Monitoring And Reporting Tool is being used in Gonarezhou and all captured data can be easily analysed.The SMART approachaims at improving conservation effectiveness and tracking of wildife crimes. -No SMART use in Save Valley Conservancy -A poaching database from when the crime is committed up to the final court outcome is in place. -A database of poachers and their modus operandi in place -Crime Registers being mantained.
1.7 Illegal settlements / grazing in wildlife areas reduced	– Liaise with RDC, Traditional Leaders and ZRP, DA's Office – Conducted Education programmes – Regular updated satellite mapping	Illegal settlements reduced to less than 5% of wildlife areas by 2020 (i.e. state protected areas, conservancies and community wildlife areas)	Illegal settlement in the park is still very low no other settlement after 2000 (Chitsa communities). Grazing of cattle in the park is under control in the GonarezhouT National Park. -The Southern part of the Save Valley Conservancy 85 % settled.An inter ministerial committee set up to look at the possibilities of fencing out the settlers and also there

9.7.1 Protection and Law Enforcement (South East Lowveld)			
Output	**Activities**	**Key Performance Indicators**	**Narrative Report on Progress in Implementation**
[Links to activities on land use mapping and planning in Component 2 – Output 2.2 and incentivization / alternative livelihood activities in Component 3]			are proposals to remove some of the settlers from some of the properties to pave way for a game corridor and allow free movement of game within. -Local authority currently working out on orderly settlement in the Save Valley Conservancy. -Fencing of the Save Valley Conservancy is also expected to assist in reduced human and domestic animal movements.

9.7.2 Biological Monitoring and Management (South East Lowveld)			
Output	**Activities**	**Key Performance Indicators**	**Narrative Report on Progress in Implementation**
2.1Research programme to understand temporal and spatial drivers of elephants established [Links to Component 4]	– Create enabling opportunities and environment for research – Prioritise research needs – Conduct localised case studies and research projects – Monitor and evaluate poaching and other drivers - hunting, water, food, human disturbance – Explore possibility of GLTFCA flagship research programme for elephants [linked to Component 5] – Carry out ground surveys to monitor distribution and density	Research programme that enables local and international researchers, and links with the GLTFCA research programme, in place and producing reports	-Ten elephants were collared to monitor elephant movement in Gonarezhou.
2.2Current elephant range defined and options for extending range and maintaining connectivity between fragmented populations explored	– Define elephant range use, and existing and potential connectivity – Identify priority corridors and human land use barriers – Conduct spatial analyses to inform land use planning – Advocate land use planning to facilitate connectivity and reduce human wildlife conflict – Explore options for translocating elephants to under-stocked areas	Identified priority corridors for elephant connectivity within SEL, between SEL and other areas in Zimbabwe, and with neighbouring countries	-Research is in progress in the Gonarezhou National Park -Elephant corridors are known in Save Valley Conservancy but because of illegal settlements the problem of understanding this is still far from reality.

9.7.2 Biological Monitoring and Management (South East Lowveld)			
Output	**Activities**	**Key Performance Indicators**	**Narrative Report on Progress in Implementation**
2.3Elephant population numbers, structure, mortality and trends monitored, quotas adjusted, and desired levels of trophy quality maintained	– Undertake standardised, regular, aerial and ground surveys of the elephant range – Explore methods to monitor elephant presence and abundance in Mozambique (to Zinave) and up to the Chimanimani range – Undertake trend analysis – Define elephant age and sex structures and extract birth and death rates – Establish annual monitoring plans – Record and analyse elephant mortalities (all causes e.g. poaching, PAC, natural, hunting, etc.) – Monitor trophy quality and age – Develop and implement an age-based and size-based trophy quota	Elephant range surveyed at regular intervals Demographic data available and analysed Annual monitoring plans implemented Evidence-based and research-based information and recommendations (consumptive, non-consumptive) provided to managers and used in quota setting	-Biannual aerial survey carried in Gonarezhou and surrounding. Last survey in September 2016. Could not get authority to survey in Mozambique. Elephant's mortalities recorded in park security registers -Elephant survey in Save Valley Conservancy done 2013 -Quota setting being a wild life management tool is implemented annually - taking cognisance of research data -PAC , hunting etc information is kept
2.4Elephant impacts on their habitats and selected indicator species of biodiversity monitored	– Establish annual monitoring plans – Measure vegetation indicators such as woodland cover – Measure other functional biodiversity indicators e.g. bird responses to structural changes to woodlands – Measure ecosystem functions – Relate desired impact to measures of elephant abundance and spatial use – Research other drivers of ecological impact (climate change, change in land use, water provision, and fencing, amongst others) – Use research findings, expert opinion and informed public opinion to establish thresholds of potential concern (TPC or limits to change) to initiate management action in respect of elephant impacts in protected areas and effects in communal land – Identify areas with key vegetation communities that are utilized by elephants	Annual monitoring plans defined and implemented for selected indicator species of biodiversity TPC's established Evidence-based and research-based information and recommendations (consumptive, non-consumptive) provided to managers	-Annual monitoring through sightings when conducting hunts and patrol is in place.

9.7.2 Biological Monitoring and Management (South East Lowveld)			
Output	**Activities**	**Key Performance Indicators**	**Narrative Report on Progress in Implementation**
2.5Costs and benefits of elephants to local and national economy monitored and costs of elephants to local communities reduced	– Monitor and evaluate extent and costs of human-wildlife conflict incidents – Relate human-wildlife conflict to elephant abundance and spatial use – Understand drivers and social and economic consequences of human-wildlife conflict – Evaluate the direct and indirect contribution (financial, economic and social) and the direct and indirect costs of elephants to the well-being of people and to conservation, through both consumptive and non-consumptive uses – Implement ongoing and new mitigation for human-wildlife conflict	Annual monitoring plans implemented Evidence-based and research-based information and recommendations (consumptive, non-consumptive) provided to managers	-PAC programmes are conducted, meat shared among the communities affected, skins and ivory may be sold and money ploughed back in to the affected communities.
2.6Adaptive elephant management framework adopted and implemented [Links to Component 4]	– Ensure collaboration between Regional Elephant Management Committee and regional and local resource management committees (e.g. LOCAL Forum) – Implement annual process of adaptive planning, implementation and monitoring in line with elephant management objectives and TPCs within the SEL – Develop and implement localised management plans (e.g. SVC plan) – Ensure alignment and harmonisation with other Zimbabwean, regional and international plans	Annual elephant management plans developed, adopted and implemented	-Annual elephant management plans have only been confined to hunting and PAC and cropping to a large extent has not been done. -Huge costs of this exercise are a major impediment as evidenced by the number of elephants taken off so far this year under such local arrangements.

9.7.2 Biological Monitoring and Management (South East Lowveld)			
Output	**Activities**	**Key Performance Indicators**	**Narrative Report on Progress in Implementation**
2.7Alternative outcomes modelled	– Develop framework for examining and modelling potential linked impacts between biodiversity issues, elephant issues, and societal issues, including any 'surprises', such as disease or extreme weather events. – Implement the modelling framework to define the outcomes of various management scenarios	Established modelling framework being used to guide adaptive management Scenario outcome recommendations and being used in management	Nothing to report
2.8SEL reporting to meet national / international standards achieved	– Advocate key summary set of elephant KPIs/outcomes for national reporting (e.g. potential population sizes against actual population sizes) – Comply with national and international legal obligations – Explore the designation of GNP as a MIKE site	CITES reporting requirements met National reporting compliance requirements	-Gonarezhou National Park meeting CITES requirements. Park not yet a MIKE site. -No information on Save Valley Conservancy and the area is still not a MIKE site

9.7.3 Social, Economic and Cultural Framework (South East Lowveld)			
Output	**Activities**	**Key Performance Indicators**	**Narrative Report on Progress in Implementation**
3.1 Community partnerships and joint venture oportunities are incentivised and facilitated	– Establish protocols, policies and models for development of joint ventures (PPCPs) – Identify potential areas – Facilitate development of new, and strengthen existing, institutional frameworks and legal entities for beneficiaries at sub-district level – Develop concepts, business plans and prospectuses for different areas through consultative processes with Communities – Develop a SEL Tourism plan and review potential concessions within the framework of this Plan – Develop mechanisms for inclusive and transparent engagement and selection of operators and JV partners. – Facilitate communication, endorsement and support of JVs – Explore potential incentives and avenues of material and technical support that can be provided by Local Government and Authorities to promote establishment and sustainability of Community JVs – Promote access to affordable capital funding – Enhance capacity of community members to engage in wildlife and tourism management through training and employment	Models and protocols for joint ventures established Community institutions to engage in joint ventures established Joint ventures established and operating, resulting in financial benefit to communities SEL tourism developed and potential concessions identified Mechanisms of support and incentivisation to JVs established	- Save Valley Conservancy has a Joint Venture model and community share ownership trust with the local communities - PPCPs envisaged with the Gonarezhou Conservation Trust.
3.2 Elephant management in community wildlife areas improved	– Promote improved and professionalized elephant management and security in community wildlife areas through establishment and maintenance of improved capacity, infrastructure, security and management systems – Develop and implement a transparent Performance Based Quota system which incentivises improved management and security systems for elephant in community hunting areas and which promotes effective buffering of source populations – Update terms of lease agreements in community wildlife areas to confer a broader range of roles and responsibilities on operators including resource management and protection; re-investment and	Infrastructure, equipment and systems for elephant management in community wildlife areas established and operational Reduced human-elephant conflict Community capacity for wildlife management improved	-**WILD project** working on two community wildlife areas that is Naivasha in Chiredzi district and Jamanda in Chipinge district.WILD(Wildlife In Livelihood Development Programme is an intiative of SAT (Sustainable Agriculture Technology) and ZWVT (Zimbabwe Wild Vet Trust) funded by the European Union and is aimed at improving socio-economic and ecological resilience in semi arid communal areas through incorporation of robust wildlife based land use enterprise into the mainstream of communal areas. -Nyangambe in Save Valley Conservancy is part of the elephant managemnt in the community.

9.7.3 Social, Economic and Cultural Framework (South East Lowveld)			
Output	**Activities**	**Key Performance Indicators**	**Narrative Report on Progress in Implementation**
	infrastructure development; employment targets; local sourcing; etc. – Review key cooperation opportunities across different land uses and countries within GLTFCA, e.g. Sengwe-Tshipise Wilderness Corridor	Opportunities for cooperation within GLTFCA identified	
3.3 3.3 Additional elephant-based tourism and sustainable utilisation oportunities explored	– Promote awareness and marketing of iconic tuskers – Explore opportunities for expansion of community wildlife areas in viable wildlife corridors to enable establishment of additional sustainable utilisation areas and enterprises. [Links to Output 2.2 – identification of corridors]	Corridors identified and Agreements concluded Tourism and awareness campaigns undertaken	- No corridors agreed and concluded as as yet.
3.4 Transparent distribution of the benefits and costs of elephant management and conservation facilitated [Links to Output 2.5]	– Conduct regular and comprehensive Community Awareness campaigns regarding quotas, revenues and distribution within Communities – Capacitate and incorporate direct community involvement in management of Community Wildlife Areas, enterprises and JVs. – Diversify downstream natural resources enterprises to multiply the revenues from CBNRM, e.g. NTFPs	Awareness campaigns conducted Community structures have improved capacity to manage NRs and wildlife areas CBNRM revenues are invested in establishment of natural-resource based enterprises Community realises greater employment and financial benefit from CBNRM revenues	Awaerness campaigns are being conducted in areas arround Gonarezhou National Park and Save Valley Conservancy focusing on natural resources management not rvenue management. -The community share ownership trust is a clear testimony of improved capacity to manage NRs and Wildlife areas.These programmes bring about financial benefits to the communities.
3.5 Effective techniques and land use strategies to mitigate human-elephant conflict are implemented	– Review land use zonation through consultative processes [link to Output 2.2] – Promote awareness and adoption of effective HEC mitigation measures – Promote improved rangeland rehabilitation and grazing management to reduce competition between livestock and wildlife. – Promote improved and rationalised crop production and alternative mechanisms to promote food security to reduce habitat destruction for inefficient dry land cropping (e.g. irrigation development; carbon sequestration credits to generate income & purchase of staple grains).	HEC is effectively reduced Availability and application of HEC mitigation measures improved There is participation in effective grazing management schemes Grazing is better managed and rangeland health is improved	-Proposed irrigation schemes in fenced areas will help reduce human/wildlife conflict -Grazing areas for domestic animals are to be separated from wildlife areas again to reduce human wildlife conflict

9.7.3 Social, Economic and Cultural Framework (South East Lowveld)			
Output	**Activities**	**Key Performance Indicators**	**Narrative Report on Progress in Implementation**
		There is increased uptake of improved cropping techniques Crop yields are improved Alternative land uses evaluated	
3.6 Information on elephants and their conservation is included in school curriculae and environmental education adjacent to key elephant populations in the SEL is promoted	– Promote awareness of elephant conservation (and other issues) through cultural events, art, plays, sport, etc. – Participate in syllabus review of national environmental science curriculum approved by the Ministry of Education – Develop approved environmental training and extension material and promote dissemination to different stakeholder groups within the community – Promote the formation of environmental science clubs at schools – Coordinate various education, training and extension campaigns operating within the district	School children and communities have greater appreciation of elephant conservation issues Greater participation in environmental clubs at schools with greater understanding of environmental issues More social events linked to environmental and conservation awareness are held Elephant conservation messages are conveyed through art and cultural events & competitions Parallel education programmes are coordinated through stakeholder planning sessions at district level	Education extension programe established that is Chilojo club focusing on all schools close to Gonarezhou. Environmental books distributed to above schools. -Education extension programme in place in save Valley Conservancy and being conducted and funded by the Painted Dog Conservation and the Gonarezhou Conservation Project targeting schools surrrrounding the Save Valley Conservancy. -Education awawreness campaigns regulary conducted in schools by our Extension and Interpretation Unit. --Essay competions with prize giving are regularly done in schools to effectively disseminate information on wildlife conservation.
3.7 Cultural tourism is developed and marketed as a centre-piece of SEL attractions and linked explicitly to conservation of flagship species including elephant	– Promote existing cultural tourism events and attractions and promote incorporation of messages of elephant conservation within these – e.g. Machangana Cultural Festival; GL-Cultural Festival – Explore and develop additional cultural tourism opportunities – including development of interpretive centres, craft centres, museums, monuments, events, etc. and market these – Document and communicate the specific cultural importance of elephant to communities in the SEL and incorporate this into education, marketing, event and cultural messages and interpretative centres.	Community participation and tourist attendance of cultural events is increased Messages relating to elephant conservation and environmental issues are key themes	-GonarezhouNational Park actively involved in cultural festivals. Supported the Muhlanguleni cultural festival this year(2016). -

9.7.3 Social, Economic and Cultural Framework (South East Lowveld)			
Output	**Activities**	**Key Performance Indicators**	**Narrative Report on Progress in Implementation**
		The number of cultural tourism developments and enterprises is increased Anecdotes, artifacts and oral tradition regarding cultural importance of elephants are recorded and insinuated into marketing strategies and event messages	
3.8 Regional tourism is promoted	– Promote the development of infrastructure critical to accessibility of the region: e.g. border crossing at Pafuri; road development and maintenance; scheduled flights to Chiredzi; etc. – Promote diversification, branding and marketing of SEL-specific tourism products linked within the region and with other attractions in Zimbabwe and neighbouring countries. – Focus special attention on development of community-led tourism initiatives that contribute to the sustainability of the STWC as a movement corridor for elephant – Clear mines from STWC	Increased tourism traffic and arrivals Infrastructure upgrades Scheduled flights established Pafuri border crossing operational Tourism products are diversified Marketing and branding consultants engaged to develop branding and strategy Scoping, feasiblilty studies are undertaken Increased number of CB enterprises are operational	-The current global economic challenges faced are still a draw back to marketing efforts , however some individuals within the are putting much effort on consumptive tourism.
3.9 Policy framework for conservation and CBNRM is well understood by communities and other stakeholders in SEL	– Compile factsheets on policy framework for conservation and CBNRM and disseminate to communities and other stakeholders	Communities have access to existing CBNRM and Policy frameworks	- The awareness campaigns which are frequently conducted through out the year also attempts to explain about the existence of these policies as well as on traditional gatherings, village and council meetings.
	– Consider innovative mechanisms for trans boundary resource sharing and expanding “space for elephants”	Workshops conducted	- Still a challenge as the conept has not been fully embraced by the affected communities.

9.7.4 Building Conservation Capacity(South East Lowveld)			
Output	**Activities**	**Key Performance Indicators**	**Narrative Report on Progress in Implementation**
4.1 Funding to implement the plan secured	– Implement variable / graduated trophy fee structure based on trophy size – Review levy / fee structure for elephant hunting and the distribution of these revenues for conservation and communities – Develop and submit bankable project proposals to potential funders – Explore potential business partnerships – Increase capacity and law enforcement coverage by ensuring that all key stakeholders contribute to and are engaged in law enforcement activities: hunting operators, tour operators, and community anti-poaching teams [Links to Output 1.1] – Explore the potential for a dedicated elephant fund for SEL.	Revised trophy fee structure developed, resulting in increased funds available or secured for elephant conservation Number of project proposals developed submitted and funded Number of developed and functional partnerships contributing to improved elephant management	Gonarezhou Conservation Trust's establishment could secure funding for improved elephant management. - Funding not yet secured for the entire Save Valley Conservancy, but expecting the EU to come in with an aid once the fencing boundaries have been established.
4.2 Current capacity analysed and needs identified	– Analysed current capacity – Carry out a needs assessment across the full range of human resources – Carry out a needs assessment for equipment and infrastructure – Develop a strategy to address the identified needs	Needs assessment report	
4.3 Capacity for research and monitoring strengthened and collaboration with research institutions enhanced [Linked to and informed by Components 2 and 3]	– Develop and implement a multi-disciplinary research and monitoring strategy – Develop and implement a research programme based on that strategy, including graduate studies, post graduate and external researchers as well as ZPWMA researchers – Undertake periodic research meetings / conferences – Recruit and meet demands and requirements for research personnel in Parks and surrounding areas – Collaborate with external research institutions – Develop and implement a mentoring programme for researchers – Procure relevant research equipment	Functional research programme in place Research meetings held Publications Number of research projects developed and implemented Number of research personnel on the ground Number of collaborative projects Mentoring plan / number of days spent with experienced researchers Inventory of equipment for research procured	-Nothing to report for Gonarezhou National Park -No Parks Resident Ecologist in Save Valley Conservancy.

9.7.4 Building Conservation Capacity(South East Lowveld)			
Output	**Activities**	**Key Performance Indicators**	**Narrative Report on Progress in Implementation**
4.4 Training and retraining programmes established	– Carry out a training needs assessment for law enforcement, resource and wildlife management, research and monitoring, education and awareness, community elephant management, etc. – Develop and implement strategies based on the needs assessment – Standardise and harmonize training in law enforcement	Training needs assessment report Training programmes established	-Training needs for law enforcement and research staff known.

9.7.5 Coordination, Collaboration and Programme Management (South East Lowveld)			
Output	**Activities**	**Key Performance Indicators**	**Narrative Report on Progress in Implementation**
5.1 SEL Regional elephant conservation and management steering committee of 8 established (ZPWMA, SVC, MT, Bubi Conservancy, Chiefs' rep, GCP, ZRP, RDC) This committee should include a core set of competencies (and can co-opt expertise if needed).	– Develop TOR for the steering committee – Identify members – Oversee the implementation of the regional elephant strategy as per national mandate – Meet biannually – Attend national elephant management meetings	Functional committee meetings held biannually with adequate attendance	- Steering committee members identified - Logistics for first meeting have been concluded in collaboration with stakeholders
5.2 Links with neighbouring states to confer on the management of shared elephant populations strengthened	– GLTFCA coordinator to identify relevant stakeholders to participate in the implementation of the regional elephant action plan – Sustain collaboration with regional partners+(one committee member for the regional committee meetings) – Share knowledge / data of all 5 key components of the plan with the regional partners	Number of consultative meetings held Tangible regional collaboration and participation	-Relevant stakeholders known.
5.3 Coordination between the tourism industry (consumptive and non-consumptive) and the elephant management programme strengthened	– Identify consumptive and non-consumptive operators in SEL – Liaise with SOAZ, ZPHGA, ZATSO, ZHA, etc. – Encourage non-members to be affiliated to relevant associations – Hold quarterly meetings with operators – Consider scale of operations in non-consumptive tourism	Regular meetings and workshops convened with the operators	
5.4 Effective information dissemination and communication strategy implemented	– Ensure clear communication of progress against action plan to all relevant stakeholders – Identify target groups, i.e. traditional leaders, school groups, amongst others – Develop a communications strategy, making use of relevant media (print, social, road shows) – Implement communication strategy – Monitor and evaluate	Outreach programmes conducted	Outreach programmes conducted by the Gonarezhou Conservation Project's Liaison Officer and the Parks' Extension and Interpretation staff.

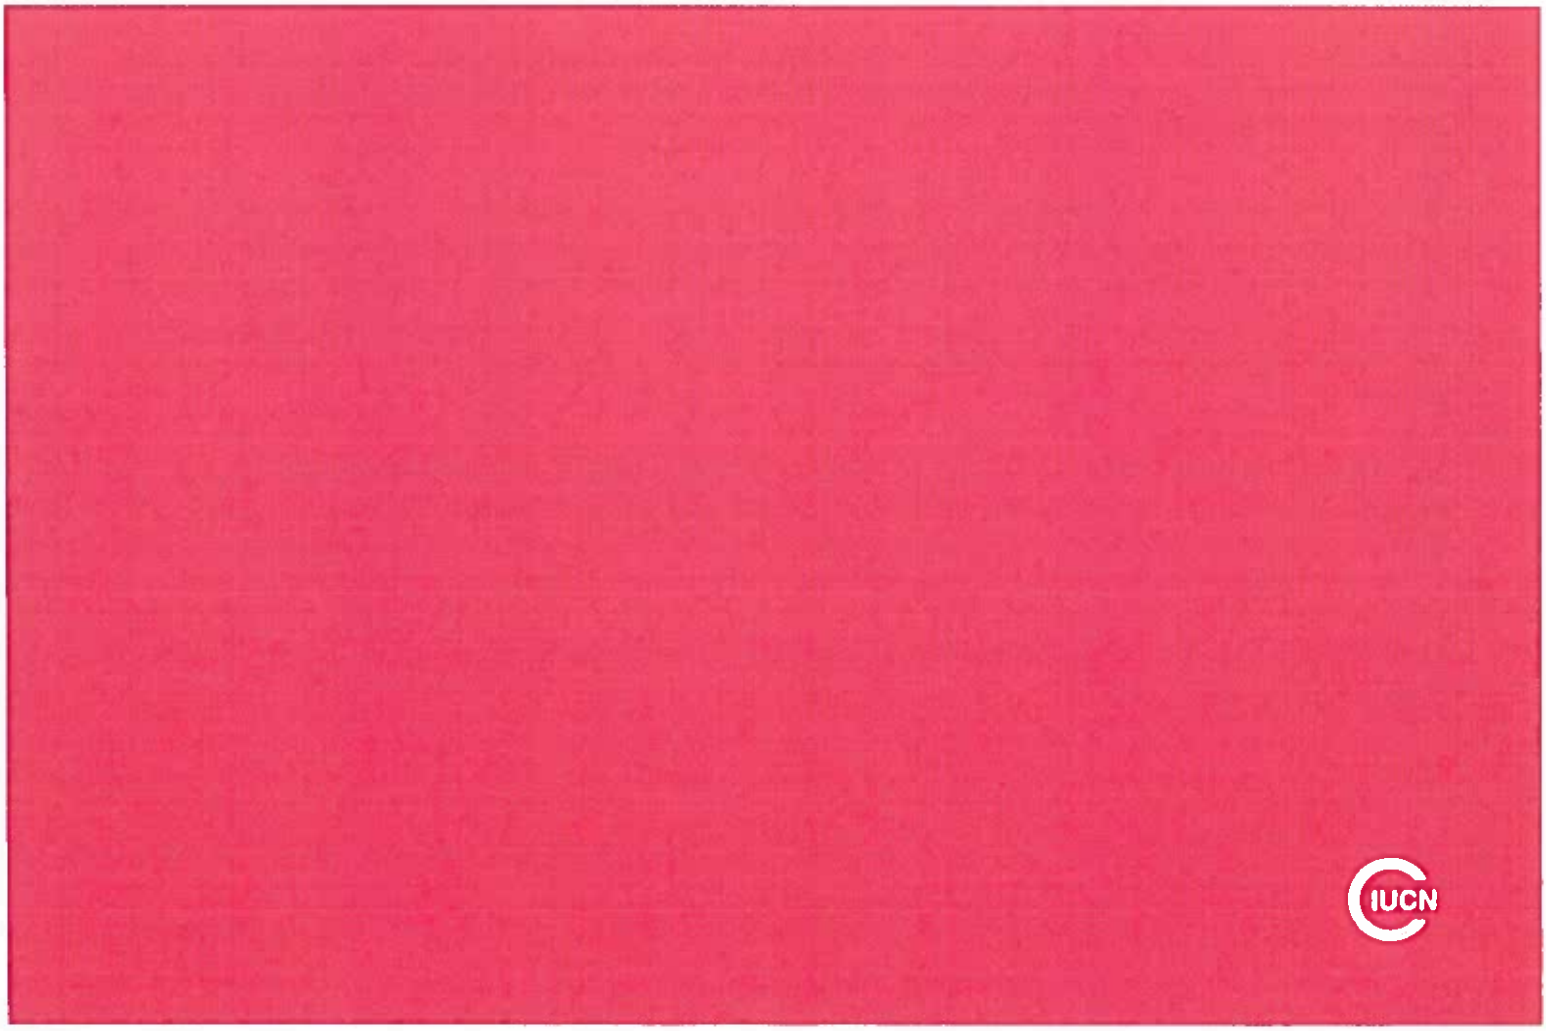
PAPER NO.60

African Elephant Status Report 2016



Acknowledgments

The information contained within the African Elephant Status Report 2016 derives from hundreds of sources, too many to thank by name. We have tried to capture and attribute their contributions in individual personal communications throughout the text.

We would like to extend a special thank you to: Peter Mwangi for helping to keep data flowing into the African Elephant Database between status reports; Colin Craig and John Hart from the AfESG's Data Review Working Group, who provided insights on Namibia and the Democratic Republic of Congo, respectively. Dave Balfour and Justine Cordingley for stepping in to help with editing, referencing, fact-finding and just about everything we threw their way. Blake Abel, and his team at Flint, for their professionalism, patience and willingness to respond to our feedback each and every time. Rob Heittman and Carl Scott of Solertium for driving the back-end of the African Elephant Database in order to deliver the final numbers and tables. Selwyn Willoughby and Reuben Roberts of Refleqt for their tireless efforts on all the mapping issues, especially the extensive new range changes.

We would like to especially recognise Dr Iain Douglas-Hamilton, the originator of the African Elephant Database, and a continuing supporter through his leadership of Save the Elephants, which has provided financial support to this report.

We would like to acknowledge the efforts of Mike Chase, from Elephants Without Borders, for initiating and contributing with many other individuals, governments and institutions to carrying out the Great Elephant Census project funded and administered by Paul G. Allen's organization, Vulcan Inc.

The AfESG enjoyed a close collaboration with the Vulcan team and would like to express our sincere appreciation for their wonderful technical, financial and moral support throughout the further development of the AED, including their assistance in streamlining the system for adding new data, enhancing its web-based platform, and other aspects of the production of this report. It was a pleasure to work with and draw on the collective expertise of, among others, Kirk Larsen, James Deutsch, Ted Schmitt, and Robert Reis. We were especially grateful for the incredible programme management skills of Aliya Walji, who led us across the finish line with grace and fortitude.

We would also like to acknowledge the generous support we received from: our range state colleagues through a donation from the African Elephant Action Plan's African Elephant Fund; the African Wildlife Foundation; CITES MIKE; Safari Club International Foundation; the United Kingdom Department of Environment, Food and Rural Affairs; the United States Fish & Wildlife Service and WWF.

Lastly, we wish to thank all the governments of the range states of Africa's elephants. While we have worked with some more closely than others on this report, we are grateful for the continued commitment of all these countries to conserving and managing the African elephant across its range.

Executive Summary

This is the fifth printed African Elephant Status Report (AESR) produced by the African Elephant Specialist Group (AfESG) of the IUCN Species Survival Commission (SSC). Like its predecessors, the AESR 2016 is based on data from the African Elephant Database (AED), the most comprehensive database on the status of any species of mammal in the wild. This is the first comparison of continental populations between 2006 and 2015 across the 37 range states of the African elephant. Importantly this report not only provides information on changes in elephant numbers but also, because it is spatial, shows where these changes have taken place.

The AESR 2016 is the most authoritative and up-to-date compilation of information on the numbers and distribution of the African elephant at national, regional and continental levels across all range states in sub-Saharan Africa. The last year of data collected for this report is 2015. The title follows the convention of using the year of publication rather than the last year of data collection. We hope this report contributes to a wider discussion about the value of monitoring to conservation and to addressing the needs of the African Elephant Action Plan (AEAP), ensuring that policy decisions and the assessment of conservation activities and their performance are evidence-based, and that new conservation initiatives budget for support to monitoring programmes including the AED.

Status reports are intended to help address contemporary elephant management and conservation needs and, therefore, a key question is how the estimates and guesses in the AESR 2016 relate to the true number of elephants in Africa at the end of 2015. When populations are declining, any time difference between the date of surveys and the cut-off date for the report will lead to the true number being lower than the recorded figure. This is more of an issue with the guesses than with estimates, since the largest savanna populations have all been surveyed within the last two years. There are also reasons why the AED may under-record the true number of elephants: aerial counts, which make up the majority of the estimates, tend to undercount the true number of elephants; many of the guesses come from areas which are known to contain substantial elephant populations but have just not been surveyed to the standard required for an estimate, and there are areas of elephant range for which there are no estimates or guesses. On balance the true number of elephants are likely greater than the estimates based on surveys alone, though not necessarily greater than the combined estimates and guesses.

The AESR 2016 provides sound scientific evidence, a deep understanding of the context and a strong technical base to support the management and conservation of Africa's elephants across their range.

THE CONTINENTAL OVERVIEW

The desire to conserve and manage elephants is widespread, and even if opinions differ as to how best this goal can be achieved, it is widely agreed that decisions should be informed by the most up-to-date and reliable information available on the numbers and distribution of Africa's elephants.

Since the publication of the AESR 2007, this goal has been furthered among the African elephant range states through their joint development and adoption by consensus of the African Elephant Action Plan (African elephant range states, 2010), which provides objectives, strategies, and activities for the conservation and management of Africa's elephants. The AEAP recognizes the fundamental importance of monitoring progress and performance through constant reassessment of information on the status of the species throughout its range.

The AfESG and its AED occupy a unique and pivotal position with regard to this need, having been designated as the repository for information on the conservation status of the species by the parties to CITES (CITES Conference of the Parties, 2013a).

This report presents more than 275 new or updated estimates for elephant populations across Africa, with over 180 of these arising from systematic surveys. All aerial survey data from the Great Elephant Census, (greatelephantcensus.com), a Paul G. Allen project, and data from dung counts in Central Africa carried out primarily by the Wildlife Conservation Society (WCS) and World Wide Fund for Nature (WWF) were submitted through the AED for inclusion in this report.

In the AESR 2016, the estimated number of elephants in areas surveyed in the last ten years in Africa is 415,428 ± 20,111 at the time of the last survey for each area. There may be an additional 117,127 to 135,384 elephants in areas not systematically surveyed. Together, this estimate and guess apply to 1,932,732 km², which is 62% of the estimated known and possible elephant range. There remains an additional 38% of range for which no elephant population estimates are available, although it is likely that average elephant densities in this range are much lower than in the surveyed areas.

This is the first AESR in 25 years that has reported a continental decline in elephant numbers. Between the AESR 2007 and this report, there has been a reduction of approximately 118,000 in estimates for populations where comparable surveys have been carried out. However, some populations have been surveyed for the first time, particularly in Central Africa, and this has led to an increase of approximately 18,000 in the "new population" category. The result is that the total estimated number of elephants from surveys has decreased by a smaller figure of about 93,000 since the AESR 2007. The estimated number of elephants from surveys and guesses combined has decreased since the AESR 2007 by about 104,000-114,000.

The decline is largely caused by the surge in poaching for ivory that began around 2006 (CITES, 2016), the worst that Africa has experienced since the 1970s and 1980s. Losses in Tanzania account for the major share of this decline. Other underlying drivers of population decline, such as loss of habitat and increasing human elephant conflict, are still of critical conservation importance but have been receiving less attention from managers, conservationists and policy-makers due to the immediacy of the poaching crisis.

Continuing uncertainties about the number of elephants in Botswana have a substantial potential impact on continental population estimates. Botswana holds the single largest population but national estimates since 2006 have differed by as much as 80,000 elephants. In order to better understand the current status of this critically important population, which is shared with four neighbouring countries, a coordinated survey of the entire cross-border population of Angola, Botswana, Namibia, Zambia and Zimbabwe remains a high priority.

The proportion of elephant range for which elephant estimates are available currently stands at 62%, which has increased from 51% since the previous report. The overall reliability of estimates has increased considerably, with estimates from systematic surveys now accounting for 37% of total range, compared to 29% in the previous report.

Holding over 70% of the estimated elephants in Africa (56% of estimated and guessed elephants) in 42% of the total range area for the species, Southern Africa has by far the largest number of elephants in any of the four regions. Eastern Africa comes second, with 20% of estimated elephants (18% of estimated and guessed elephants) in 28% of the range, while Central Africa is an even more distant third (6%) for estimated elephants in 25% of the range. There remain a high proportion of guesses for Central Africa, giving a total of 23% of estimated and guessed elephants. West Africa continues to hold the smallest regional population with under 3% of both categories in the remaining 5% of range.

Improved knowledge of elephant distribution is reflected by the proportion of range categorised as known, which has increased from 63% to 67%. Significant range expansion has occurred in Botswana and Kenya. The actual distribution of elephants across this range varies considerably across the four regions – from small, fragmented populations in West Africa to large, virtually undisturbed tracts of elephant range in Central and Southern Africa, with a mixture in Eastern Africa.

THE REGIONAL OVERVIEW

CENTRAL AFRICA

Central Africa's elephants have been severely affected by ivory poaching over the past ten years (CITES, 2015b; Maisels, Strindberg et al., 2013b; UNEP et al., 2013; Wittemyer et al., 2014). Evidence from the carcass reports sent to MIKE shows that poaching was already a problem in this region by 2003, long before it became unsustainable in Eastern Africa (CITES Secretariat, 2016).

The estimated number of elephants in areas surveyed in the last ten years in Central Africa is 24,119 ± 2,865 at the time of the last survey for each area. There may be an additional 87,190 to 103,355 elephants in areas not systematically surveyed. Together, this estimate and guess apply to 546,471 km^2, which is 70% of the estimated known and possible elephant range in the region. The number of elephants estimated from systematic surveys in Central Africa increased by about 10,000 between the AESR 2007 and the present. However, this was largely a consequence of "new populations" being surveyed and in some cases there have been major reductions in these populations in subsequent surveys.

Gabon and Congo still hold Africa's most important forest elephant populations but both have been affected by heavy poaching in recent years. Some populations in Cameroon have also been badly impacted, as has Chad's largest remaining population in Zakouma National Park, which has now stabilized. The savanna populations of the Central African Republic have almost completely disappeared, with the only remaining populations occurring in the forested south-west. There are only small remnant populations in Democratic Republic of Congo and Equatorial Guinea.

Populations recorded as having been lost in the last ten years have included one in Chad and another in the DRC. However, since populations in the extensive Central African forests are much less clearly defined than in other parts of Africa, loss of numbers and range is more likely to be recorded than that of discrete populations.

Substantial changes have been made to the range maps, but these are mostly the result of improved information, rather than real changes in range. There has been a decrease of recorded range from about 975,000 km^2 to about 780,000 km^2 with known range decreasing from 82% to 58%.

EASTERN AFRICA

Eastern Africa has been the region most affected by poaching, having experienced an approximately 50% population decline in estimates from surveys since the AESR 2007, largely attributed to a greater than 60% decline in Tanzania's elephant numbers.

The estimated number of elephants in areas surveyed in the last ten years in Eastern Africa is 86,373 ± 10,549 at the time of the last survey for each area. There may be an additional 11,973 to 12,060 elephants in areas not systematically surveyed.

Together, this estimate and guess apply to 548,587 km^2, which is 62% of the estimated known and possible elephant range in the region, a significant improvement on the 45% of estimated known and possible elephant range assessed in the AESR 2007, that resulted in reported survey estimates of 165,151 ± 27,990 and an additional 10,722 to 12,066 guesses in areas not systematically surveyed.

Between the AESR 2007 and this report, elephant numbers in Eastern Africa have declined by almost 87,000, on the basis of updated estimates for sites where comparable survey techniques were employed. However, some populations have been surveyed for the first time and this has led to an increase of approximately 9,000 in the "new population" category. The result is that the current total number of elephants from surveyed populations represents a smaller estimated reduction of about 79,000 elephants, still close to a 50% loss, during the period from late 2006 to the end of 2015.

Elephant numbers have been stable or increasing since the AESR 2007 in Uganda, Kenya, Rwanda and Ethiopia, although these national level figures include reductions in some of their populations. Significant losses have been recorded in Tanzania. There has been an apparent increase in elephant numbers in South Sudan, because the major populations were surveyed for the first time in 30 years after 2006, and it is suspected that there is no longer a resident elephant population in Somalia.

No populations are recorded as having been lost in Eastern Africa.

While there has been no net increase in range, known range has increased from 57% to 85% of total range in 2015. Range expansion is reported in two areas of Kenya.

SOUTHERN AFRICA

Southern Africa continues to hold by far the largest number of elephants on the continent, and nearly 75% of these elephants form part of a single population in the Kavango Zambezi Transfrontier Conservation Area (KAZA TFCA), some 520,000 km² in extent. Whereas conservation challenges associated with high elephant densities in large protected areas were common in the region a decade ago, contemporary elephant conservation in southern Africa is now also faced with the emergence of a growing poaching threat (UNEP et al., 2013). While overall, poaching has not had the same impact in Southern Africa as in other regions it has severely affected populations in Zimbabwe, Angola, Mozambique and to a lesser extent, Zambia.

The estimated number of elephants in areas surveyed in the last ten years in Southern Africa is 293,447 ± 16,682 at the time of the last survey for each area. There may be an additional 15,157 to 16,672 elephants in areas not systematically surveyed. These guesses likely represent a minimum number, and actual numbers could be higher than those reported. Together, this estimate and guess apply to 734,824 km², which is 55% of the estimated known and possible elephant range in the region.

Between the AESR 2007 and this report, elephant numbers in Southern Africa have declined by almost 30,000, on the basis of updated estimates for sites where comparable survey techniques were employed. However, some populations have been surveyed for the first time and this has led to an increase of approximately 3,000 in the "new population" category. The result is that the current total number of elephants from surveyed populations represents a smaller estimated reduction of about 27,000 elephants. Although there have been real declines in Mozambique and Zimbabwe, the main contributor to this decline is a reduction in the estimate for Botswana, which may be the result of uncounted elephants, range expansion, increased poaching or methodological differences between surveys. Some major populations in Namibia (Zambezi, Etosha NP and Khaudum NP), South Africa (Kruger NP) and Zimbabwe (South-east Lowveld and North-west Matabeleland) are stable or increasing.

Southern Africa has a relatively high reliability and quantity of elephant information, especially for the larger populations. Although overall survey coverage has increased since 2007, largely as a result of the Great Elephant Census carried out in 2014-2015, there is still wide variation amongst countries.

One population is reported as having been lost from Angola.

The current range area for Southern Africa is 1,325,998 km², a slight increase from the 1,305,140 km² recorded in the AESR 2007, and the percentage of this which is known range has increased from 53% to 60%. There has been no major loss of elephant range, and one notable southern expansion of range in Botswana. Other changes result from improved information, particularly in Angola.

WEST AFRICA

West Africa's elephant populations are mostly small, fragmented and isolated. With increasing human populations and infrastructural development, many countries in West Africa are experiencing increased pressure on natural areas from mining, logging and rapid transformation of land to agriculture.

The AESR 2016 provides more information than previous status reports on countries known to have small, isolated and highly vulnerable populations, with some stark results. Although numbers are small relative to continental levels, West Africa reported losing twelve populations of elephants since the AESR 2007: one each in Côte d'Ivoire, Ghana, Guinea Bissau, Sierra Leone and Togo; two in Guinea and five in Nigeria. It is surprising, however, that there is recent evidence for the continued survival of a number of populations that were already at a very low level 10-20 years ago. The transfrontier "WAP" complex that straddles the border between Benin, Burkina Faso and Niger remains the region's largest population and of great significance as one of West Africa's few populations with potential long-term viability.

The estimated number of elephants in areas surveyed within the last ten years in West Africa is 11,489 ± 2,583 at the time of the last survey for each area. There may be an additional 2,886 to 3,376 elephants in areas not systematically surveyed. These guesses likely represent a minimum number, and actual numbers could be higher than those reported. Together, this estimate and guess apply to 102,850 km², which is 72% of the estimated known and possible elephant range in the region.

The overall numbers of elephants in West Africa appear to have increased since 2006. This is largely due to the apparent growth in the WAP complex population.

At the national level, population estimates for both Benin and Burkina Faso suggest increases in the WAP complex. Estimates for Côte d'Ivoire, Ghana, Guinea Bissau, Senegal, Sierra Leone and Togo have stayed more or less constant with some higher and lower guesses, while estimates for Guinea, Mali and Nigeria have declined since 2006. Guinea's elephants are now reduced to a single small population. Niger's few remaining elephants are thought to still move in and out of the country as part of the WAP complex. Information on Liberia's elephants has been substantially improved in this report, adding a small number to guesses originating from 1989/90.

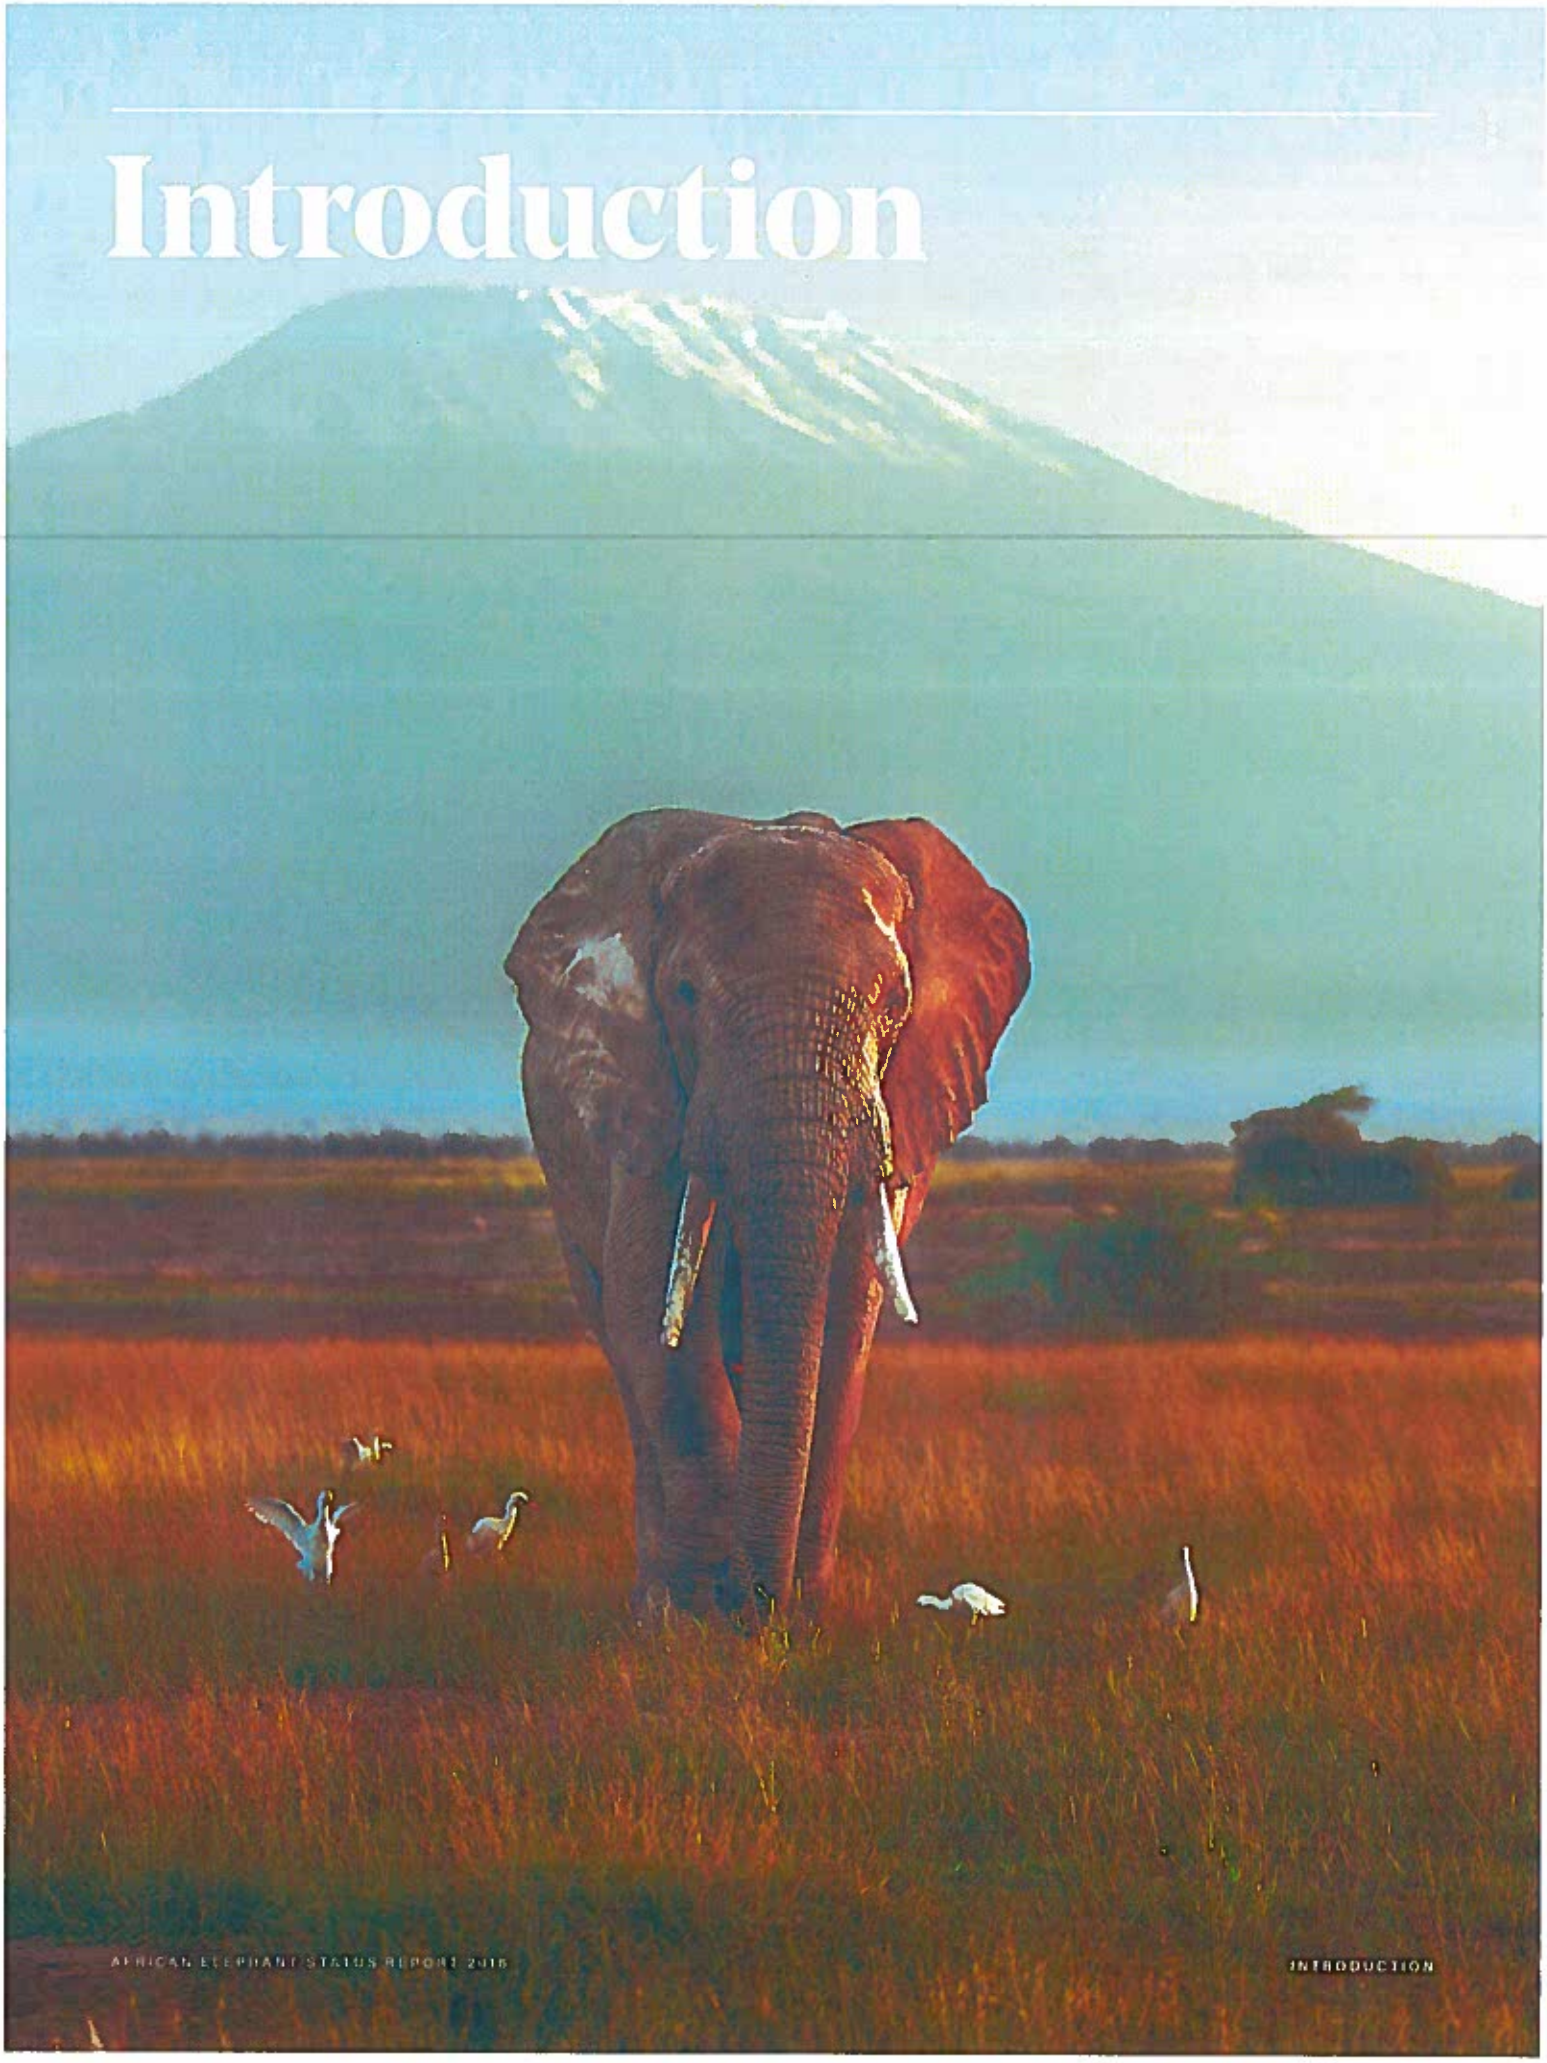
A substantial update of the West African elephant range has been completed for this report, and this has the effect of reducing the total range (known and possible) from around 176,000 km² to approximately 143,000 km², but the percentage of known range has increased from 71% to 79%.

THE AED ONLINE

Since the AESR 2007, the AED has moved to an online, web-based platform africanelephantdatabase.org. This online resource, which was launched initially in 2012 and has been substantially redesigned and updated to coincide with the production of this report, not only offers a platform for displaying data between the published status reports, but also provides new ways to view the data from all the status reports and access more detailed information on new surveys than are presented in this report. Readers are encouraged to visit the website to further explore the data.

With the transition to an online platform, the AED has undergone a very significant change. This has been both challenging and rewarding and lessons we have learnt are being used by other groups working on species databases. In the years to come, we hope to demonstrate meaningful advances in the analytical potential of the AED to provide a strong and relevant evidence base for the management and conservation of the African elephant.

Introduction



Background

HISTORY OF THE *AFRICAN ELEPHANT DATABASE* AND STATUS REPORTS

The African Elephant Database (AED) originated from the African Elephant Survey carried out by Iain Douglas-Hamilton in the late 1970s, which led to the first continental estimate for elephant numbers, produced in 1979 (Douglas-Hamilton, 1979). In 1986, Douglas-Hamilton and colleagues started to compile this information into a geographical information system. Using data accumulated from questionnaire replies, surveys and interviews, a database of elephant population estimates and distribution was assembled (Burrill & Douglas-Hamilton, 1987). An updated version was produced in 1992 (Douglas-Hamilton et al., 1992), which included the use of spatial models to estimate populations for the central African forests, as only a very small proportion of this area had been surveyed at that time.

In 1992, the AED became the direct responsibility of the IUCN Species Survival Commission's African Elephant Specialist Group (AfESG). Since that time, the structure and management of the AED has been overseen by a group of technical experts from within the AfESG known as the Data Review Working Group (DRWG), and chaired since mid-2014 by Dr. Chris Thouless. The DRWG oversees the selection and categorisation of data to be included in the AED; agrees on new features, tools and analyses; and reviews the content of the AESR. Decisions made by the DRWG and additional reviewers are coordinated and implemented by AfESG Secretariat staff and contracted consultants. For this report, additional reviewers were added to focus on and strengthen specific areas. The authorship of this report reflects these contributions.

Initially housed at the United Nations Environment Programme (UNEP) headquarters in Nairobi, Kenya, the AED was until April 1998 a collaborative effort of the Global Environment Monitoring System (GEMS), the Global Resource Information Database (GRID) of UNEP and the IUCN/SSC AfESG. In April 1998 the AED was moved from UNEP to its present location in the AfESG offices in Nairobi. Although the AED was transitioned to a web-based platform in 2012 it continues to be managed by the AfESG Secretariat from Nairobi through its website at africanelephantdatabase.org, where data from all earlier AED updates is publicly accessible, and more recent data is provisionally released whenever possible.

Today the AED is the most comprehensive database on the status of any single species of mammal in the wild.

HISTORY OF THE AFRICAN ELEPHANT DATABASE AND STATUS REPORTS CONT.

The AfESG's preparation of African Elephant Status Reports (AESR) began in the mid-1990s. Status reports are published to provide a complete picture of the status of the species based on the data within the database up to a certain point in time. Prior to the present report, four reports of the AED were published: the African Elephant Database 1995 (Said et al., 1995), the African Elephant Database 1998 (Barnes et al., 1999), the African Elephant Status Report 2002 (Blanc et al., 2003), and the African Elephant Status Report 2007 (Blanc et al., 2007). These reports are freely accessible as well as available for download, in PDF format, on the AED website. Other provisional data were posted on the AED website between the AESR 2007 and the AESR 2016, but this report replaces them.

With the transition to an online platform (www.africanelephantdatabase.org), the AED has undergone its most significant change in over 20 years. This has been both challenging and rewarding, with many lessons we have learned now being used by other groups working on species databases. We hope this report contributes to a wider discussion about the value of monitoring to conservation, ensuring that policy decisions and the assessment of conservation activities are evidence-based whenever possible and that new initiatives plan and budget for support to databases to better enable the monitoring of progress and evaluation of performance.

THE CONTINUING NEED FOR A CONTINENTAL APPROACH

A key issue in African elephant conservation is the variation in the status of the species across the 37 range states in which elephants occur. The desire to conserve and manage elephants is widespread, and even if opinions differ as to how best this goal can be achieved, it is widely agreed that decisions should rely on the best and most recent available information on the status of Africa's elephants.

Since the publication of the African Elephant Status Report 2007, this goal has been furthered among the African elephant range states through their joint development and adoption by consensus of the African Elephant Action Plan (African elephant range states, 2010a), which provides objectives, strategies, and activities for the conservation and management of Africa's elephants. The AEAP recognizes the fundamental importance of monitoring progress and performance through constant reassessment of information on the status of the species throughout its range.

IUCN SSC's African Elephant Specialist Group (AfESG) and its African Elephant Database (AED) occupy a unique and pivotal position with regard to this need, having been designated as the repository for information on the conservation status of the species by the parties to CITES (CITES Conference of the Parties, 2013b). The AfESG has had a specific mandate since CITES CoP15 in 2010 to provide the CITES Standing Committee "any new and relevant information on the conservation status of elephants" (CITES Conference of the Parties, 2013a) along with information and analyses from the CITES MIKE and ETIS monitoring programmes. This reporting, completed for four meetings of the CITES Standing Committee to date, draws heavily on the AED and has been proposed to CITES CoP17 in September 2016 to be adopted as a permanent reporting mandate. The AEAP also recognizes the vital contribution of the AED in one of its component activities to "maintain and update databases on elephant populations for management purposes".

CONTINUING NEED FOR A CONTINENTAL APPROACH CONT.

Such management information is required not only at the site and national level, but also regionally and continentally. Many elephant populations occur across international borders and a policy or management decision made in one country can affect elephant populations elsewhere. Changing land-use patterns or different approaches to tourism, such as trophy hunting in border areas, may have impacts beyond national boundaries. Likewise, the impact of policies concerned with ivory management and trade may affect elephants elsewhere. Civil instability and wars in Africa have sometimes led to a shift in populations across national boundaries. A regional and continental perspective is critical to identify and understand these ongoing dynamics and to support international and regional decision-making, including management of transfrontier conservation areas (TFCAs).

These issues become all the more important as African elephants have faced a devastating new wave of illegal killing over the last decade (CITES Secretariat, 2016). Despite the intense pressures of illegal killing, with some results detailed later in this report, African elephants continue to live outside protected areas and the majority of elephant range may still be found in unprotected areas. This poses additional challenges for wildlife authorities and wildlife managers, as levels of human-elephant conflict continue to be high, increasing and politically charged in many parts of the continent, and especially where human and agricultural expansion moves into new areas already occupied by African elephants. Many lessons have been learned regarding the challenges in mitigating this conflict (Hoare, 2000, 2015), the importance of broader landscape level land-use planning and what will be required in the future if elephants are to persist in the long term.

All these issues highlight the need to census and manage elephants across borders and the need to keep this information up to date and available in the AED in support of conservation action across the continent. The demand for and continued use of publications like the AESR and other analyses enabled by the AED demonstrate the ongoing need for this type of data even after the current pressures from illegal wildlife trafficking have been reduced. Conservation efforts, including implementation and monitoring of national, regional and continental strategies and action plans, should be informed by up-to-date and reliable data on elephant numbers and distribution. The AED and AESRs can also provide invaluable insights into the effectiveness of conservation responses.

About this Report

THE AFRICAN ELEPHANT STATUS REPORT 2016

The AESR 2016 is the fifth printed AESR produced by the AfESG. Like its predecessors, it aims to provide the most authoritative, comprehensive and up-to-date information on the numbers and distribution and of the African elephant at national, regional and continental levels. The last year of admissible data collected for this report was 2015. The title refers to the year of publication rather than the last year of data included. This is the first status report since the AESR 2007 and some modifications have been implemented since that publication.

In preparing the AESR 2016, the AfESG has enjoyed a close collaboration with the technical staff of Vulcan Inc to ensure that data from the Great Elephant Census (greatelephantcensus.com), sponsored by Paul G. Allen, were captured and presented in this report. Vulcan colleagues have also helped with the further development of the database, its web-based platform and in particular streamlining the system for adding new data. All elephant survey data from the GEC were submitted through the AED for inclusion in this report.

Status reports are intended to help address contemporary elephant management and conservation needs and, therefore, a key question is how the estimates and guesses in the AESR 2016 relate to the true number of elephants in Africa at the end of 2015. When populations are declining, any time difference between the date of surveys and the cut-off date for the report will lead to the true number being lower than the recorded figure. This is more of an issue with the guesses than with the estimates in this report since the largest savanna populations have all been surveyed within the last two years. There are also reasons why the AED may under-record the true number of elephants: aerial counts, which make up the majority of the estimates, tend to undercount the true number of elephants; many of the guesses come from areas which are known to contain substantial elephant populations but have not been surveyed to the standard required for an estimate; and there are areas of elephant range for which there are no estimates or guesses. On balance the true number of elephants are likely greater than the estimates based on surveys alone, though not necessarily greater than the combined estimates and guesses. It is the continuing need to improve the accuracy and coverage of these numbers and ensure that they are as up to date as possible that make survey efforts such as the Great Elephant Census and periodic national surveys so important.

CHANGES SINCE THE AESR 2007

Since the fourth report, the AESR 2007, the AED has moved to a web-based platform. Provisional, online-only updates have filled the gaps between the AESR 2007 and this report, and have been published on the AED website. Launched in 2012, the website is a platform for displaying new information incorporated into the database between full status reports, and also provides new ways to access the data from all the status reports as well as more detailed information on new surveys than is available in the AESR 2016. Readers are encouraged to visit the website to further explore the database.

A system for categorising and tracking changes in numbers was first introduced in the AESR 2007, resulting in the display of a "Cause of Change" for each area and an Interpretation of Changes table for each country and region as well as the continent. ("Cause of Change" has been renamed "Reason for Change" in this report; see below.) This system is intended to distinguish between real changes in numbers and changes in survey techniques or area of survey coverage, thus limiting inappropriate extrapolations about trends over time.

The Definite, Probable, Possible, and Speculative (DPPS) system, in use since 1995, was designed to describe uncertainty and data quality. However the calculations underpinning it are complex and its display of population numbers difficult to understand and interpret. Although the AESR 2007 emphasizes that "comparing guesses to derive population trends is a meaningless exercise," the four-category "DPPS" itself does not explicitly articulate the proportion of elephant numbers that are guesses (i.e. population figures that do not meet the criteria required to qualify as population estimates).

To simplify the presentation of elephant numbers and clearly demonstrate the calculations leading to the totals at the national, regional, and continental levels, the DPPS has been replaced in this report by the Alternative Data Display (ADD), which classifies numbers either as estimates or guesses, and distinguishes what kinds of surveys have provided the figures. In contrast to the DPPS, the estimates derived from surveys in the AESR 2016 are additive, so that the rows, listed by survey types, total to the country totals and the country level totals add to the regional totals, and so forth. Very small differences in the totals in the tables may occur due to rounding of decimal places. Guesses are not completely additive because they include upper and lower confidence limits from certain types of survey. Columns involving confidence limits (CL) remain the necessary exception, as adding CLs requires the pooling of variances to derive a new CL appropriate for the sum total. Furthermore, population estimates are now aligned with the range area (km^2) they cover in the same table. While the printed AESR 2016 only uses the ADD, the DPPS has been retained on the online platform for comparative purposes.

DATA TYPES AND CATEGORISATION

The AED contains both spatial and non-spatial (attribute) data, managed using GIS software and a relational database management system. Spatial and relational data are both maintained in a PostgreSQL database with the PostGIS extension. These data sets are combined with base map data derived from the Digital Chart of the World (ESRI, Inc., 1992) a widely available global geographical dataset, the World Database of Protected Areas (UNEP-WCMC & IUCN, n.d.), the World Resource Institute's protected area data set (WRI, 2016) and a variety of other sources. Each of these background datasets is used as appropriate for the production of this report and none are considered authoritative datasets produced by the AfESG.

Data in a variety of formats are collected and received into the AED. Survey reports are obtained from wildlife management agencies and other organizations, and non survey-report data are shared in many formats by individuals and organizations with expert knowledge of an area. Preliminary range maps are shared with relevant experts to aid in modifying and revising.

Data regarding an estimate or a guess are entered into the database using a submission form specific to the type of survey. Every estimate or guess is linked to spatial data, which is digitized and geo-referenced if not supplied by the data provider. Each submission consists of spatial data accompanied by appropriate attribute data manually extracted from the source material, such as transect length, flight speed, or dung decay rate. The source material (survey report, map, email, etc.) is then uploaded and linked to the submission.

Area measurements in the tables are calculated using geodetic coordinates on the WGS84 spheroid, for consistency across the African continent without projection-related errors. The surface areas of input zones, protected areas and elephant range are tallied at national, regional and continental levels. The overlay capabilities of GIS are used to determine percentages of both protected and surveyed elephant range.

The AED stores data on two basic variables reflecting the conservation status of African elephants, namely, numbers (abundance) and distribution (range). There are specific challenges associated with these kinds of data, related to their reliability and the availability and timing of new surveys. The ways that these issues are handled in this report are described in the following sections.

ELEPHANT NUMBERS

Although there are many different ways to count elephants, no single method is perfect. Possible sources of bias include the choice of survey technique, surveyor skill, quality and availability of adequate equipment, financial constraints, climatic conditions and vegetation cover. Ideally, data on elephants in any country should be collected by a wildlife management authority using qualified staff and standardized methods for collecting, recording and analysing data (Craig, 2012c; Hedges & Lawson, 2006). In reality very few countries have the means, either financial or in the form of expertise, to conduct systematic surveys on a regular basis and political strife in many range states sometimes makes survey work impossible.

As a result, elephant population data is collected by a variety of agencies and individuals, often without any direct linkage to one another and using a variety of different techniques. It is sometimes necessary to combine data from different types of surveys and different habitats to calculate a national estimate. Seasonal and cross-border movements of elephants are additional factors that can lead to inaccurate national estimates. Few cross-border surveys are conducted simultaneously to accurately estimate the size of such populations. Instead, they are generally treated as separate populations on either side of the border, which may occasionally result in either under- or over-counting. The end result is a collection of data of variable quality for most countries, and no data from formal surveys for many populations.

METHODS OF ESTIMATING ELEPHANT NUMBERS

While there is no single or ideal method for counting elephants, each method has its advantages and disadvantages under different conditions. The brief description of some of the most important methods below is not intended to be detailed or exhaustive. For more details, the reader is referred to the specialized treatments of these subjects (Barnes, 1993; Craig, 1993, 2004, 2012c; Douglas-Hamilton, 1996; Hedges et al., 2013; Hedges & Lawson, 2006; Kangwana, 1996; Norton-Griffiths, 1978).

Methods for establishing elephant numbers fall into three broad categories: estimates from total counts, estimates from sample counts, and guesses.

Total Counts aim to see and record all the elephants in a defined area, either from the air or from the ground. Aerial total counts are conducted from fixed-wing aircraft or helicopters. The speed at which the aircraft is flown influences the accuracy of the count, with high speeds usually leading to undercounts (Norton-Griffiths, 1978). Aerial total counts are commonly used in open, savanna habitats, where elephants are unlikely to be hidden by forest or thick bush, especially but not exclusively in Eastern and Southern Africa.

Total counts of a limited area can also be conducted at ground level by teams in vehicles or on foot. These are uncommon in Africa, but in a handful of places, total ground counts have been accomplished by attempting to identify every individual in the population. This is only possible for intensively studied populations where animals can be observed readily. For such individual recognition studies to provide high quality data for the AED, every individual in the population must be registered. Many ongoing studies have so far covered only a fraction of these focal populations, and cannot therefore provide reliable estimates of entire populations. If elephants are being identified in a place where they concentrate for a specific resource (such as the Amboseli swamps in Kenya and Dzanga Bai in the Central African Republic), it may be difficult to work out how large an area is covered by the identified elephants, and the estimate will be affected by the timescale over which elephants have been enumerated (if too short it will not include occasionally seen individuals, if too long it may include ones that have already died).

Sample Counts, in which only a sample of the area is counted (usually between 3% and 20%), are generally conducted along transects which may be randomly distributed or systematically placed across the study area. The resulting data are used to calculate a population estimate with

confidence limits. In contrast with total counts, which tend to produce underestimates of the true population, sample counts have in principle an equal chance of underestimating or overestimating the true population, provided that sampling error is the main source of error. In practice, however, factors such as high aircraft speed or dense vegetation cover lead to undercounts.

Direct Sample Counts are most commonly made from the air, but may also be conducted on the ground, either on foot or from vehicles. Aerial sample counts require considerable technical expertise and coordination, as well as the use of expensive additional equipment such as radar altimeters. Aerial sample counts are the most commonly employed survey technique in Eastern and Southern Africa.

Indirect Sample Counts are also referred to as dung counts. In low-visibility tropical forests, elephant abundance estimates typically use elephant dung density as a proxy for elephant density. Distance sampling (Buckland et al., 2001, 2015) along line transects estimates dung density and CLs within the area of interest (Hedges, 2012a; Strindberg, 2012). DISTANCE software (Thomas et al., 2010) is used for both survey design and analysis. Careful field protocol ensures accurate and precise estimates (Hedges et al., 2012a; Hedges & Lawson, 2006). Dung density is converted to elephant abundance using estimates of the rates of elephant defecation and dung decay and the surface area of the area surveyed. Dung decay rates can vary considerably across space and time; site and time-specific estimates of decay rates greatly improve accuracy in elephant abundance estimates (Hedges et al., 2012b; Laing et al., 2003). Estimates from well-conducted dung counts can be as accurate as those from direct methods, and more precise than those of aerial sample counts (Barnes, 2001, 2002).

At sites < 5,000km^2 and where elephant numbers are between a few tens and a few thousand, DNA-based capture-recapture methods have been used (Eggert et al., 2003; Gray et al., 2014; Hedges, 2012b; Hedges et al., 2013; Karanth et al., 2012b; Karanth et al., 2012c). Elephant DNA is extracted from as many dung piles as possible within the area of interest, and genetic fingerprinting is used to identify the number of unique genotypes (individuals) in the samples. The rates of repeat samples obtained can then be used to estimate the population size (Karanth et al., 2012a).

Often, it is not possible to carry out a systematic survey and the only type of information available for many areas is either an informed or other guess.

Survey Reliability

Population estimate data entered into the AED varies in quality from the identification of individual animals to plain guesswork. The addition of population numbers of varying quality into national, regional and continental totals is, from a statistical viewpoint, invalid and produces misleading results. On the other hand, discarding low-quality numbers can produce equally misleading estimates, as high-quality survey estimates are not available for many areas in which elephants are found.

In order to solve this problem, the AED incorporates a system to accommodate all types of numbers by classifying them according to their type and designating them as estimates and guesses.

As with the previous data aggregation system, which separated numbers into Definite, Probable,

METHODS OF ESTIMATING ELEPHANT NUMBERS
CONT.

Possible, and Speculative, the new ADD system uses a scale of survey reliability, ranging from A (highest) to E (lowest). Survey reliability gives an indication of the level of certainty that can be placed on a given number, as determined by the method employed and how it was carried out.

Tables 1 and 2 show the different types of surveys with the range of reliabilities that could be assigned to them and how each number contributes to the columns of estimates and guesses depending on its reliability and other criteria. How the columns are then summed to create country, regional, and continental totals is detailed in the next section, "Integration and Presentation of Data."

The unit of analysis for assigning these categories is the "input zone" and these are listed in each country table. An input zone has only one source of information and may align with a protected area or other land unit, or simply with an area for which there was previous information, better enabling comparison to previous AESRs. Each input zone is assigned a reliability category, and the figure associated with that input zone contributes to the estimates and guesses as shown in Table 2.

Carcass Ratios

The carcass ratio, a measure often calculated in aerial total and sample counts, is the estimated number of dead elephants divided by the sum of estimated dead plus live elephants. Carcass ratios can provide supporting information to changes in numbers in successive surveys and thus are included in the narrative text alongside survey estimates where available and appropriate. Douglas-Hamilton and Burrill (1991) showed that carcass ratios in excess of 8% for sample counts or 3.3% for total counts were indicative of declining populations.

ELEPHANT DISTRIBUTION

African elephants occur in a wide variety of habitats, from tropical swamp forests to deserts. They often move extensively in search of food, water and minerals or in response to disturbance, and the extent to which they move may depend on a large number of factors. In certain areas, seasonal movements are predictable, while in others, movement patterns are far more difficult to decipher. These factors, together with the scarcity of animals at the edges of their distribution, make elephant range a difficult concept to articulate and map. For these reasons, elephant range is broadly defined by the AfESG as the entire area where the species occurs in the wild at any time.

Collecting precise distribution information on such a wide-ranging species as the African elephant presents a number of practical problems, often related to the inaccessibility of some of the habitats in which elephants are found. As a result, the quality of information varies considerably from one area to another and its mapping heavily relies on expert opinion. The range map for a particular country is often updated by a single individual, and thus has a subjective element. Trying to draw a precise range boundary on maps of varying quality and scale is an inexact exercise. Neat, rounded lines may be indicative of scanty knowledge in comparison to the fragmented, more detailed pictures which emerge from countries where more precise information is available. Elephant range often appears to coincide directly with the boundaries of protected areas, because that is where most population surveys are carried out, and elephant movements in and out of protected areas are often unknown or unaccounted for.

TABLE 1. CATEGORISATION OF ELEPHANT ABUNDANCE DATA IN THE AED

SURVEY TYPE	RELIABILITY	CATEGORISATION
Aerial Total Count Ground Total Count	A	Reliability A if well-designed and implemented*; downgraded to an informed guess of reliability D if there are concerns about whether the count was well designed or implemented or if a range of estimates is provided
Individual Registration	A	Reliability A, downgraded to an informed guess of reliability D if a range of estimates is given, or other information suggesting the individual registration estimate does not include the entire population
Aerial Sample Count Ground Sample Count	B	Reliability B if 95% confidence intervals or other measures of precision are provided; otherwise, or if there are other concerns about survey design or implementation*, the estimate is downgraded to an informed guess of reliability D
Reliable Dung Count	B	Reliability B; as "reliable" dung counts are defined by having 95% confidence limits and a dung decay rate obtained on site
Other Dung Count	C	Reliability C; as "other" dung counts are defined by having 95% confidence limits but no on-site measurement of dung decay rate
Informed Guess	D	Reliability D, includes aerial sample counts, ground sample counts, and dung counts without 95% confidence limits or other methodological details or information and guesses that are based on a clearly explained logic for extrapolating from observations
Other Guess	E	Reliability E; any guess that does not fulfill the requirements for an Informed Guess
Degraded Data	E	Reliability E; any estimate or guess that is at least ten years old. For this report this includes any estimates from 2005 or earlier
Modeled Extrapolations	E	Reliability E; guesses derived from models that do not rely on elephant survey data at a site level but use instead other data such as habitat type, land use or human population density to extrapolate from elephant densities measured in other areas.

** The AfESG's Data Review Working Group (DRWG) reviews all surveys to ensure that key standards have been met and parameters included in the report to allow determination of the quality of survey design and implementation. The AfESG and its DRWG make every effort to engage with data providers to secure any essential missing information.*

TABLE 2. CATEGORISATION OF ELEPHANT NUMBERS BY SURVEY TYPE & CONTRIBUTION TO ESTIMATES AND GUESSES

SURVEY TYPE	RELIABILITY	# OF ELEPHANTS		GUESSES	
		ESTIMATE	± 95% CI	FROM	TO
Aerial Total Counts* Ground Total Counts* Individual Registrations*	A	Estimate	—	—	—
Aerial Sample Counts* Ground Sample Counts* Reliable Dung Counts	B	Estimate, if given, or else number seen	95% confidence interval divided by two	—	—
Other Dung Counts	C	Number Seen	—	Lower confidence limit minus number seen	Upper confidence limit minus number seen
Informed Guesses	D	Number Seen	—	Lower limit of guess minus number seen	Upper limit of guess minus number seen
Other Guesses Degraded Data Modeled Extrapolations	E	—	—	Lower limit of guess Estimate Modeled Estimate	Upper limit of guess Estimate Modeled Estimate

** These survey types may be downgraded to lower reliabilities and thus treated as informed or other guesses. See the criteria in Table 1.*

ELEPHANT DISTRIBUTION CONT.

Frequently, the depiction of range is also delimited by a natural boundary such as a river or a mountain range for convenience rather than accuracy. When range information in one country extends to a national border, it does not always match the adjacent range in the neighbouring country. While this is sometimes due to different human population densities or land uses across a border, more often lack of reliable information is the cause of what appear to be hard boundaries.

In order to address some of these difficulties, the AED classifies and maps elephant range information into four levels of certainty, as described in Table 3. In addition, range information in the AED is documented and referenced to original sources of data wherever possible to allow some evaluation of the reliability of range information and the reasons why range has either increased or decreased. In some cases these are real changes, while in others they are the result of improved knowledge. Where possible these distinctions have been mentioned in the text.

INTEGRATION AND PRESENTATION OF DATA

DERIVATION OF NATIONAL, REGIONAL AND CONTINENTAL TOTALS

The categorisation system described on the previous page is implemented in the AED through a series of algorithms applied to input zones, or each area for which an individual number is listed in the country tables displaying Elephant Estimates. When executed, these algorithms categorise each input zone in terms of survey type and reliability. The categorised records are then used to produce national, regional and continental totals.

It is important to note that the totals presented for each country and region are minimum numbers, based on the areas that have been surveyed or for which guesses are available. It should also be noted, however, that the totals can include relatively old estimates and if the population is declining, this will yield an overestimate, while it will understate the true number of elephants in an increasing population. In many countries, and in all regions, there are large areas of elephant range where neither surveys nor guesses are available. In the case of Gabon, a modeled extrapolation has been used to generate a guess for unsurveyed areas of the country. This is because there is a large proportion of known range in Gabon that has not been surveyed, but the factors affecting elephant numbers are well known. As the available estimates generally represent only a proportion of the elephant range in a country, they cannot be considered total estimates of the national population. Likewise, the estimates given for the regions and for the continent cannot be interpreted as total regional and continental estimates either.

CHANGES IN ELEPHANT NUMBERS AND DISTRIBUTION OVER TIME

A key question for African elephant conservation and management is whether elephant populations are increasing, decreasing or stable. Comparing estimates from different AESRs to derive continental trends is often attempted but can be invalid and potentially misleading for a number of reasons.

Many of the continent's elephant populations have never been systematically surveyed. Thus any differences reported between the AESRs refer to a subset of all elephant populations, and may

CHANGES IN ELEPHANT NUMBERS & DISTRIBUTION OVER TIME
CONT.

therefore not reflect overall changes, including those in unsurveyed populations. While it is likely that elephant densities in unsurveyed range are lower on average than in surveyed areas, there still may be significant numbers of elephants in areas for which there are no currently estimates or guesses.

Populations surveyed for the first time or populations newly added to the AED (i.e. "new populations" in Table 4) contribute to an apparent overall increase in numbers, even though these do not reflect a true increase in elephants, but rather an improvement in knowledge. Repeated surveys of the same area may use different techniques or cover different areas, so the results are not directly comparable between different time periods. Where new surveys have not been carried out recently, old estimates will be retained and, over time, degraded to guesses. Retention of these numbers for a significant proportion of the population can lead to a situation where the extent of real change is not reflected in the AESR totals.

In order to disentangle these confounding factors from real changes in elephant numbers, the AED relies on a system that links figures contained in the current version of the AED to the corresponding figures in the previous report, and assigns a "reason for change" to each pair, as described in Table 4. The AESR then displays the numbers associated with these reasons for change at the national, regional and continental levels.

Where the more recent surveys in methodologically comparable survey pairs account for a large proportion of the estimate column for a given region, a statistical comparison of elephant numbers over time for those populations can be performed (see Blanc et al., 2005 for details). A list of methodologically comparable surveys featured in this and the previous report is provided in Appendix I.

This report refers to the reason for change "population lost", or PL, more than it did in the AESR 2007 because of a focus on more deeply investigating the current status of small, isolated populations. The authors recognize the significance of this label and apply it only where there is reliable evidence regarding the loss of a population that is distinct and isolated from other populations.

OVERALL QUALITY OF INFORMATION AND SURVEY PRIORITIES

The state of knowledge on elephant numbers and distribution varies widely across the continent. Some populations have never been surveyed, or are only surveyed rarely, while others are counted more frequently. The objectives of the AED include promoting the use of standardized, reliable survey techniques, as well as facilitating the task of donors, wildlife authorities and decision-makers in prioritizing their efforts to monitor elephant populations.

In order to assist in meeting these objectives, a simple index measures the quality of elephant population data available at the national, regional and continental levels. Based on this index, a system to identify and prioritize the areas where systematic surveys are most needed has been developed. These measures, both of which are calculated from data contained in the AED, are described below.

OVERALL QUALITY OF INFORMATION AND SURVEY PRIORITIES CONT.

The **Information Quality Index (IQI)** is an unbiased, normalized and scalable index of the overall quality of information on elephant population estimates and guesses. The IQI ranges from zero (no reliable information) to one (full range coverage using good-quality estimates) and is the product of two key variables: a measure of the quality of available data and a measure of the completeness of estimate coverage. The data quality measure is based on the ratio of good quality population data (estimates) to total population data (estimates + guesses); the data completeness measure is based on the ratio of assessed range to total known and possible range.

The **Priority for Future Surveys (PFS)** index is designed as an unbiased system for setting priorities for future surveys in order to improve the accuracy of the continental estimate. For a truly accurate continental picture of elephant abundance to emerge, reliable estimates would have to be available for all elephant range. Countries accounting for a larger proportion of total continental range should therefore be prioritized more highly.

PFS is therefore based on the IQI (as described above) together with a measure of continental range coverage represented by each country. When calculated for each country, the PFS provides a measure, ranging from one (highest priority) to five (lowest priority), of the countries where population surveys are needed. At the input zone level, the PFS is based on the proportion of national range accounted for by each area. All areas of elephant range that have never been surveyed, i.e. those for which estimates are currently unavailable, are automatically assigned a priority of one. Systematic surveys should be conducted in areas of unsurveyed known range. In areas of doubtful range and unsurveyed possible range, elephant presence/absence should be established prior to conducting systematic population surveys.

It is important to stress that neither the IQI nor the PFS are measures of the health of elephant populations, or of overall elephant conservation priorities, but rather of the quality of elephant population data and of the need to conduct systematic surveys in the future. For instance, range loss in a country will often result in a decline in the proportion of unassessed range, thus causing the IQI to increase and the priority ranking to decline. A list of all African elephant range states with their IQI and PFS scores is shown in Appendix II.

While it is hoped that the PFS system will prove useful for prioritizing populations needing to be surveyed, the system is not intended to be prescriptive. Individual range states may have good reasons to use different criteria and different systems for prioritizing elephant population surveys.

Further details on how the IQI and PFS are calculated are available in the "Data Types and Categories" section of the AESR 2007.

TABLE 3. CATEGORISATION OF ELEPHANT RANGE DATA IN THE AED

RANGE CATEGORY	DEFINITION
Known	Areas in suitable habitat, which, if searched with reasonable intensity, are likely to yield signs of elephant presence. If no information is obtained confirming presence of elephants for a 10-year period, known range is downgraded to possible range (below).
Possible	Areas within previous elephant range, including former areas of known range where the source information is more than 10 years old where there is no confirmation that elephants still occur, but no evidence that they have been lost. Areas of possible range are considered to be a priority for studies to establish the presence or absence of elephants.
Doubtful	Areas where there are reasons to believe that elephants are no longer present, but for which there is no recent positive or negative information. Areas of doubtful range are also a priority for presence/absence studies.
Non-Range	Areas that are believed to hold no elephants. A change to non-range ideally requires a clear statement from a knowledgeable person who has actually visited the area, though sometimes range is classified this way as a result of known habitat transformation or high human population densities.
Point Records	Sightings of elephants or evidence of their occasional presence outside of known elephant range, shown as crosses on the map.

TABLE 4. CODES & DESCRIPTIONS OF REASONS FOR CHANGE AS IMPLEMENTED IN THE AED

CODE	REASON FOR CHANGE	DEFINITION
RS	**Repeat Survey**	Both surveys were conducted using comparable methodologies and covering the same area
NP	**New Population**	A new entry into the AED; i.e. no previous survey or guess to compare with
DT	**Different Technique**	The most recent survey uses a different survey methodology, or replaces a guess
DA	**Different Area**	Both surveys were conducted using the same methodology, but the extent of the areas covered differed by 10% or more*
NG	**New Guess**	A guess replaces an older guess or a survey estimate that was degraded data
PL	**Population Lost**	A distinct population is known to have disappeared from an area, be it through translocation or local extinction
DD	**Data Degraded**	The estimate or guess has been degraded after 10 years
—	**No Change**	The estimate or guess has been retained unchanged from the previous report

** The 10% difference is a guideline; at times, differences in areas deemed to be non-significant by reviewers in terms of capturing elephant populations (e.g. in the case of other recent surveys showing no elephants in the omitted area) may result in the assignation of other causes of change*

How this Report is Organised

→
Information in this report is presented at three levels—continental, regional and national. The continental section is followed by the regional sections, Central, Eastern, Southern and West. Each of these contains the relevant individual country sections. All sections follow the format described below.

NARRATIVE OVERVIEW

Each continental, regional, and national section begins with a brief narrative overview intended to supplement the information provided by the maps and tables that follow. The overviews are not intended to provide the reader with exhaustive information on each country, but simply to describe the current situation and to highlight any factors that may have contributed to it or notable changes in these factors since the AESR 2007.

The overview contains the three following sub-sections:

General Statistics. This section provides summary statistics of country area, area of elephant range, proportion of elephant range in protected areas, and the amount of range which has been surveyed or has elephant population estimates, IQI, CITES Appendix and year of that listing for each range state.

Current Issues. This section covers any issues that may, directly or indirectly, affect elephant populations and their conservation and management. These may include poaching, political stability, land use changes, large infrastructure developments or relevant new wildlife policies or management arrangements.

Numbers and Distribution. This section starts by describing the total population estimates and guesses before discussing individual areas that have been surveyed, the methods employed, and how the data and information were interpreted to result in changes to the tables and maps since the last report. The former sub-sections on "Range Data," "Population Data" and "Cross-border movements" from the AESR 2007 have been integrated under this heading.

TABLES

Summary Totals. These tables (see Table 5) present numbers at the national, regional and continental levels, separated into estimates and guesses. These tables depict the contribution of each survey type to the total area (in km^2) for which estimates and guesses are available. In addition, areas of unassessed known and possible range are also shown.

Total numbers from the previous report are also displayed in the table, the AESR 2007 data was

converted into the AED's new data display format for direct comparability, after first correcting AESR 2007 errata. For further explorations of the AESR 2007 dataset, and for comparisons between the former and the new data display approaches visit the AED website (www.africanelephantdatabase.org).

The Interpretation of Changes in Elephant Estimates from the Previous Report. These tables show the breakdown and net changes in the estimates and guesses, grouped by the categorised reason for change described in Table 4.

Elephant Estimates. These tables display the detailed inputs for each country that contribute to the summary totals and interpretation of changes tables. At the national level the table shows results for individual input zones. The centroid of each input zone is provided in decimal geographic coordinates to assist the reader in locating the areas on the accompanying maps. In addition, these input zone tables within each country present details on estimates, their reliability and other metadata, as described in Table 6. Input zones are, as a general rule, listed alphabetically. Where there are many input zones distributed across many parts of a country, sets of geographically adjoining input zones that indicate contiguous elephant populations or other geographically defined subsets are grouped into populations for ease of review and interpretation.

TABLE 5. DETAILS SHOWN IN REGIONAL & CONTINENTAL TABLES OF ESTIMATES IN THIS REPORT

COLUMN	DESCRIPTION
Country/Region	Name of the country or region
Elephant Numbers	Elephant numbers in terms of estimates and guesses
Range Area (km²)	Estimate total range area (known plus possible range) in the country or region
% of Regional Range	Percentage of the regional/continental range accounted for by the country/region in question, rounded to the nearest integer
% of Range Assessed	Percentage of elephant range in the country or region for which estimates and guesses are available
Information Quality Index (IQI)	Number from zero (lowest) to one (highest) that gives an index of the overall quality of information on elephant population estimates and guesses (as described in the Overall Quality of Information and Survey Priorities section)
Priority for Future Surveys (PFS)	Number from one (highest) to five (lowest) indicating urgency and need for future systematic surveys, based on the precision of estimates and the proportion of regional/continental range accounted for by the region's/continent's estimates and guesses

TABLE 6. DETAILS & SURVEY PARAMETERS PROVIDED IN NATIONAL TABLES OF ESTIMATES AND GUESSES

COLUMN	DESCRIPTION
Populations	A grouping of adjacent input zones to indicate contiguous elephant populations or other geographically defined subsets. These designations have been made for some countries only, particularly those with many input zones
Input Zone	Name of the input zone
Reliability	Category (A, B, C, D, and E) to which the estimate or guess is assigned; dependent on survey type and additional criteria (as described in the Data Types and Categorisation section, Table 1)
Survey Type	Type of survey conducted (as described in the Data Types and Categorisation section, Table 2)
Reason for Change	Attributed reason for change with respect to the previous report (as described in the Integration and Presentation of Data section, Table 4)
Survey Year	Year in which the survey was conducted or to which the guess applies
Number of Elephants	Elephant population estimate or guess
95 % C.L.	Where available, the 95% confidence limit for the estimate (in the case of asymmetric confidence intervals, the difference between the lower and upper confidence interval divided by two). For informed guesses, the upper range of the guess, marked with an asterisk
Source	Author and year of the source material (full citations given in the list of references)
Priority for Future Surveys (PFS)	Number from one (highest) to five (lowest) indicating urgency and need for future systematic surveys, based on the precision of estimates and the proportion of national range accounted for by the input zone
Area	Size of the input zone in square kilometers (km^2), when available, the area given is that reported in the source material; if unreported, the area is calculated from the spatial data for the input zone
Map Location	Longitude and latitude of the centroid of the input zone, given in decimal degrees

EXAMPLE MAP

Section of country map shown for visual reference in context to the map legend

MAPS

A map is shown for the continent, each region and each country, showing elephant distribution, input zones, protected areas within elephant range, national and/or regional boundaries, major towns, rivers and lakes. Countries of adjacent regions are shown to highlight important transfrontier populations, as well as the spatial relationships between elephant populations in neighbouring countries.

EDITORIAL CONVENTIONS AND REFERENCING

In these overviews, several conventions have been adopted for ease of reading. Survey types are marked in bold when referring to the data included in this report, aligning with the tables. Range categories are also marked in bold in reference to the current range, not the category assigned in 2007. Estimates from sample counts are given with 95% confidence limits in the form xx ± yy. Asymmetrical confidence limits are shown in parentheses following the survey estimate. Abbreviations are used for protected areas after they are first named as a "National Park," (NP), "Forest Reserve," (FR) or other conservation area.

The AED relies on a huge number of discrete pieces of information, in the form of maps, survey reports, management plans, emails, phone calls, and news reports, among others. In addition to their inclusion in this report, these references are all eventually housed in the African Elephant Library, an invaluable and growing archive of over 7,500 references on the African elephant.

Range Area	3,132,238 km² (15%)
Protected Range	30 %
Information Quality Index (IQI)	0.45

CURRENT ISSUES

This is the first African Elephant Status Report in 25 years which has reported a continental decline in elephant numbers. The decline is largely caused by the surge in poaching for ivory that began around 2006 (CITES, 2016), the worst that Africa has experienced since the 1970s and 1980s. Underlying conservation issues, particularly loss of habitat and increasing human elephant conflict, are still of critical significance but are receiving less attention because of the poaching crisis.

Systematic information on elephant poaching comes from the programme for Monitoring the Illegal Killing of Elephants (MIKE). This was established at the 10th Conference of the Parties to the Convention on International Trade in Endangered Species of Wild Fauna and Flora (CITES) in Harare in 1997 and subsequently modified in accordance with the provisions in Resolution 10.10 (Rev. CoP16) on Trade in elephant specimens (CITES Secretariat, 2013). MIKE covers sites in 30 of the 37 African elephant range states, and 13 Asian elephant range states. In Africa, 60 MIKE sites together hold an estimated 30 to 40% of the African elephant population (CITES Secretariat, 2016). MIKE relies on ranger-based monitoring of elephant carcasses. When an elephant carcass is located, rangers record, if possible, the cause of death, allowing the calculation of the Proportion of Illegally Killed Elephants (PIKE). The dataset used for the 2016 analysis of MIKE data consisted of 14,606 records of elephant carcasses found in 54 MIKE sites in 29 African elephant range states from 2003 to 2015 (CITES Secretariat, 2016). PIKE levels above 0.5 (i.e. where half of dead elephants found are deemed to have been illegally killed) are considered to be unsustainable. Continental poaching levels have remained above this sustainability threshold since 2010 (Figure A). Further details are provided in the regional summaries.

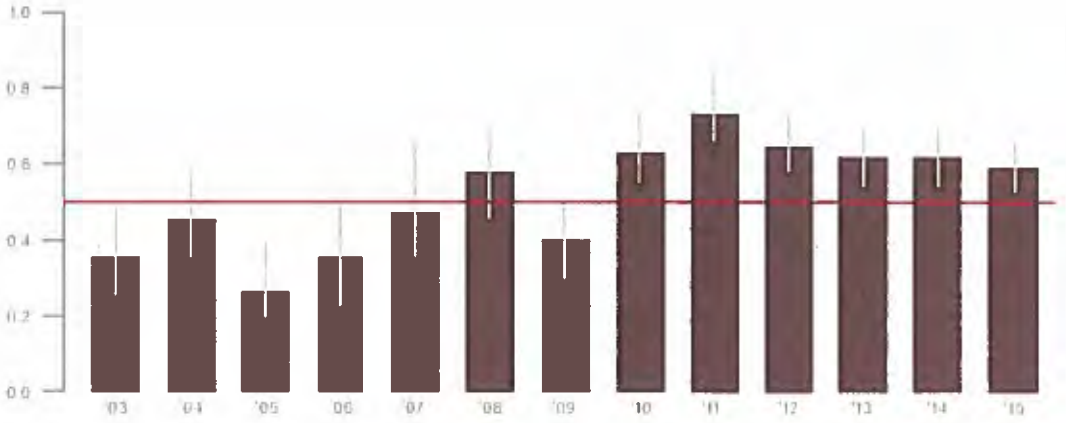

FIGURE A: *PIKE trends in Africa from 2003 - 2015 with 95% confidence intervals (CITES Secretariart, 2016)*

There has been much discussion as to whether one or two species of elephant should be recognized, with the forest elephant being acknowledged as a distinct species from the savanna elephant. The general opinion of taxonomists, particularly those with genetic expertise, is that two species should be recognized. However, this is complicated by lack of exact knowledge about where each species occurs and the presence of an unknown number of hybrid populations in areas around the fringe of the Congo Basin forests, including in Uganda (Mondol et al., 2015). Because of these uncertainties the African elephant is treated as a single species in this report. The use of the terms savanna and forest elephant is relevant at national and site level, and the terms are used in this report. Savanna elephants are found predominantly in Eastern and Southern Africa, while forest elephants occur primarily in the Congo Basin of Central Africa. In West Africa elephants live in both forest and savanna habitats; it is believed, however, that they are genetically forest elephants (Roca et al., 2015).

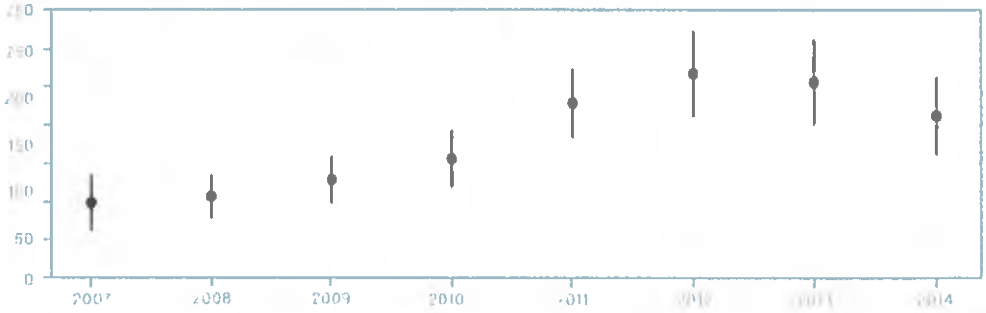

FIGURE B: *The overall trend of illegal ivory trade activity globally where all ivory types and weight classes are consolidated with mean (bold dot) and 90% confidence intervals, 2007-2014. (Milliken et al., 2016)*

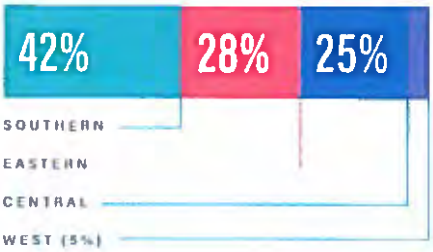
The African Elephant Action Plan (AEAP) was developed to respond to the needs of African elephant range states for the conservation and management of Africa's elephants. It was adopted in March 2010 at the 15th meeting of the Conference of the Parties to CITES (African elephant range states, 2010). The AEAP was developed over two years through a consultative process, facilitated by the IUCN SSC African Elephant Specialist Group and the CITES Secretariat, and is a consensus document fully owned and managed by the African elephant range states. It is intended to provide an overarching framework and a clear statement of shared objectives, to be achieved through activities implemented by the range states and their partners. The African Elephant Fund and the African Elephant Fund Steering Committee were established in accordance with CITES Decision 14.79 (Rev. CoP15) in 2010 to support and facilitate implementation of the action plan. As a follow

on to the AEAP development, national and regional level planning exercises are meant to highlight those actions urgently in need of funding if Africa's elephants are to be protected from the threats they face. The development of regional and national level plans, including those developed under the Elephant Protection Initiative, is described in the regional and national summaries.

All African elephant range states, except for South Sudan, are parties to CITES. Most range states have been parties to CITES for well over 20 years, except Angola, which joined the Convention in 2013. The elephant populations of four countries are in Appendix II of CITES: Botswana, Namibia, South Africa and Zimbabwe (CITES, 2015a). International trade in elephants and elephant specimens is allowed from these four countries under restricted conditions that differ slightly between the four countries, and there is currently a moratorium on international ivory sales until 2017. Elephant populations from the other range states are listed in Appendix I of CITES, and the trade in elephants and elephant specimens regulated accordingly.

In addition to the listing of the African elephant in the CITES Appendices, there is a CITES resolution governing trade in elephant specimens. Resolution Conf. 10.10 (Rev. CoP16) outlines a number of important provisions and regulations regarding trade in elephants and elephant specimens, as well as important reporting and monitoring responsibilities, such as the submission of data to the CITES monitoring systems MIKE and the Elephant Trade Information System (ETIS) (CITES Conference of the Parties, 2013b). CITES Decision 14.78 (Rev. CoP16) calls on the IUCN SSC's African and Asian Elephant Specialist Groups, MIKE, ETIS and the United Nations Environment Programme – World Conservation Monitoring Centre (UNEP-WCMC) to prepare a joint analysis on the conservation

FIGURE C. ELEPHANT RANGE PER REGION



Southern Africa has the largest extent of elephant range of any region, and accounts for 42% of the species' total range area. Eastern and Central Africa follow with 28% and 25% of the continental total respectively, while West Africa accounts for only 5%.

status and management of live elephants, illegal killing, ivory trafficking and trade. The CITES Standing Committee has recommended that this decision be enshrined in Resolution Conf. 10.10 (Rev CoP16) at the CoP17 in September 2016 (CITES, 2016).

ETIS measures and records the levels and trends of illegal trade in ivory and other elephant specimens. The most recent analysis, produced for the 66th meeting of the CITES Standing Committee, demonstrates a trend in illegal ivory trade activity (Figure B) that parallels the illegal killing of elephants reported by MIKE since 2008, with a possible leveling and even a decline in recent years (CITES Secretariat, 2016; Milliken et al., 2016).

Recent analyses of ivory seizure data prepared by ETIS for CITES have identified those countries of most concern in relation to the illegal ivory trade (CITES Secretariat, 2012; Milliken et al., 2013;

2016). A number of countries were tasked by the CITES Standing Committee to prepare, implement and report on National Ivory Action Plans, a set of specific, time bound activities related to the control of poaching and the illegal ivory trade and compliance with Resolution Conf. 10.10 (Rev. CoP16). The CITES Secretariat has established a website devoted to tracking progress on National Ivory Action Plans, available at cites.org/niaps (CITES, n.d.-a).

Reported ivory stockpile destructions (2011 - August 2016.) ** African elephant range states*

CURRENT ISSUES
CONT.

Since 2007, there have been a number of destructions of ivory stockpiles, either by burning or crushing (Table 2). Three additional countries were known to have carried out stock destructions, Japan (2.8 tonnes in 2008) and unknown amounts in India and Portugal in 2014.

The nine range states listed above have submitted elephant hunting trophy quotas to CITES and these are shown below as the equivalent number of animals taken on quota derived from tusks and other trophies. In 2015 the United States imposed a suspension on permits for the import of African elephant trophies from Zimbabwe and Tanzania (USFWS, 2015a, 2015b) and the European Union imposed a suspension on the permits for the import of African elephant trophies from Mozambique (EU, 2015).

NUMBERS AND DISTRIBUTION

The estimated number of elephants in areas surveyed in the last ten years in Africa is 415,428 ± 20,111 at the time of the last survey for each area. There may be an additional 117,127 to 135,384 elephants in areas not systematically surveyed. Together, this estimate and guess apply to 1,932,732 km^2, which is 62% of the estimated known and possible elephant range, an increase from 51% in the previous report. There remains an additional 38% of range for which no elephant population estimates are available, although it is likely that average elephant densities are much lower than in the surveyed areas. The overall reliability of estimates has increased considerably, with estimates from systematic surveys now accounting for 37% of total range, versus 29% in the previous report. The overall quality of information, as measured by the Information Quality Index (IQI), has not changed.

This report presents more than 275 new or updated estimates for elephant populations across Africa, with over 180 of these arising from systematic surveys. All aerial survey data from the Great Elephant Census, a Paul G. Allen project, and data from dung counts in Central Africa carried out primarily by the Wildlife Conservation Society (WCS) and World Wide Fund for Nature (WWF) were submitted through the AED for inclusion in this report.

Holding over 70% of the estimated elephants in Africa (56% of estimated and guessed elephants), Southern Africa has by far the largest number of elephants in any of the four regions. Botswana continues to have the largest national population. Eastern Africa comes second, with 20% of estimated elephants (18% of estimated and guessed elephants), while Central Africa is an even more distant third (6%) for estimated elephants. There is a high proportion of guesses for Central Africa, giving a total of 23% of estimated and guessed elephants. This is because most Central African surveys are dung counts, and many of these are recorded as guesses, since dung decay studies have not been done on site. West Africa continues to hold the smallest regional population with under 3% of both categories.

Between the AESR 2007 and this report, there has been a reduction of 118,000 in estimates for populations across Africa where comparable surveys have been carried out. However some populations have been surveyed for the first time, particularly in Central Africa, and this has led to an increase of approximately 18,000 in the 'new population' category. The result is that the current total estimated number of elephants from surveys has decreased by a smaller figure of about 93,000 since the AESR 2007. Continued uncertainties about the number of elephants in Botswana have

a substantial potential impact on the continental population, because Botswana holds the single largest population but national estimates since 2006 have differed greatly, by as much as 80,000 elephants. In order to better understand the current status of this critically important population, which extends into neighbouring countries, a well-coordinated survey of the entire cross-border population of Angola, Botswana, Namibia, Zambia and Zimbabwe remains a very high priority.

The estimated number of elephants from surveys and guesses has decreased since the AESR 2007 by 104,000 to 114,000.

Elephants are found in 37 range states in sub-Saharan Africa. There has been one change since the AESR 2007, as South Sudan became independent from Sudan and all of former Sudan's confirmed elephant populations occurred in the south. It is still possible that small numbers of elephants either visit seasonally or reside in Dinder National Park in Sudan (Mohammad, pers. comm., 2016). There have been no national level extinctions since the AESR 2007, although the populations in Guinea Bissau and Senegal are so small that they are in imminent danger of extinction. It was widely reported in 2009 that elephants had gone extinct in Sierra Leone as a result of a single poaching incident (AFP, 2009) but this was not correct and there are still at least four small populations surviving in the country.

The distribution of elephants varies considerably across the four regions from small, fragmented populations in West Africa to large, virtually undisturbed tracts of elephant range in Central and Southern Africa, with a mixture in Eastern Africa. Detailed knowledge of the status of elephant distribution is scanty in many parts of the continent, particularly in Central Africa and in countries that are emerging from armed conflict, such as Angola, Sudan and Sierra Leone.

The total area of known and possible elephant range at the continental level is currently estimated at slightly over 3.1 million km^2. This is hardly changed since the previous report. This is because most of the changes since the AESR 2007 were minor modifications rather than large scale changes. Improved knowledge of elephant distribution is reflected by the proportion of range categorized as known, which has increased from 63% to 67%. Significant range expansion has occurred in Botswana and Kenya.

CURRENT ISSUES

Central Africa's elephants have been substantially affected by ivory poaching over the past ten years (CITES, 2016; Maisels, Strindberg et al., 2013b; UNEP et al., 2013; Wittemyer et al., 2014). Evidence from the systematic carcass reports sent to MIKE shows that significant Central African poaching was already occurring in 2003, long before it became unsustainable in Eastern Africa (CITES Secretariat, 2016). Because elephant distribution and abundance in Central Africa is driven primarily by poaching and not by habitat availability, elephant strong-holds are the areas with least human impact. They are generally areas with effective anti-poaching protection and are also usually remote from roads, settlements, navigable rivers, or even hunting trails (Blake et al., 2008; Laurance et al., 2006; Maisels, Strindberg et al., 2013b; Yackulic et al., 2011). New development corridors being created throughout the region are likely to have a negative impact on elephant populations (Laurance et al., 2015). Political insecurity and lack of government control over remote areas continues to have a negative impact on elephant conservation, particularly in the Central African Republic and the Democratic Republic of Congo (DRC).

Central Africa has 16 MIKE sites. Two sites, Monte Alén National Park in Equatorial Guinea and Kahuzi-Biega National Park in DRC, have not submitted any carcass data since the MIKE programme began in 2002. While reporting rates vary, the remaining 14 sites submitted carcass data between 2007 and 2015, though eight of these sites did not submit any carcass data in 2015. Estimated PIKE levels in 2015 sustained the pattern of being above the 0.5 level in Central Africa (Figure 1, on the following page) (CITES Secretariat, 2016).

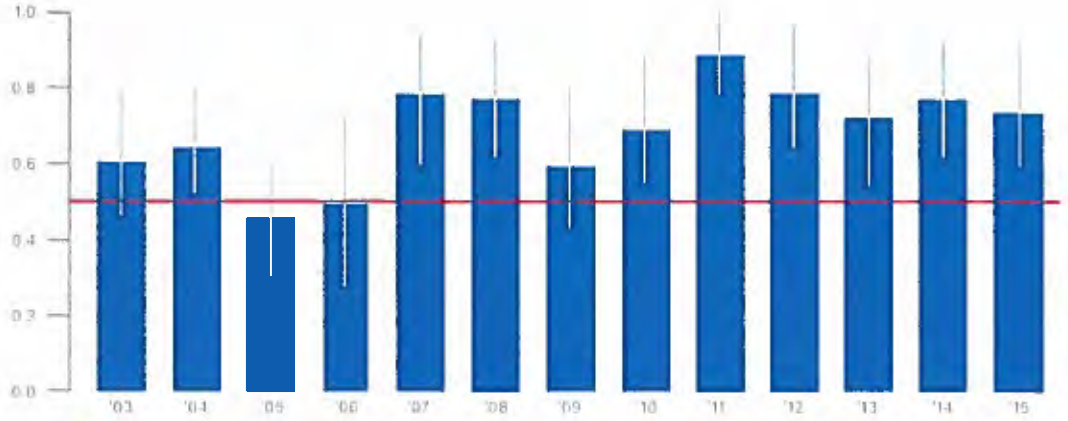

FIGURE 1: *Central African PIKE trends with 95% confidence intervals (CITES Secretariart, 2016)*

The Strategy for the Conservation of Elephants in Central Africa 2005-2015 was adopted by all Central African range states in 2005 (African Elephant Specialist Group, 2005a). The volume of seized ivory and illegal killings have greatly increased over the ten-year period in contrast to the 80% decrease projected (CITES, 2016). As a result, in 2013, the seven Central African range states adopted a Plan of Extreme Urgency to Combat Poaching (PEXULAB) (ECCAS, 2013)

In recent analyses of seizure data in ETIS, prepared for the CITES Standing Committee and Conference of the Parties, a number of countries within Central Africa were identified as having a worrying involvement in illegal ivory trade. Cameroon, Congo, DRC and Gabon have been requested to prepare and implement National Ivory Action Plans (CITES Secretariat, 2012; Milliken et al., 2013).

ETIS measures and records the levels and trends of illegal trade in ivory and other elephant specimens. The most recent analysis, produced for the 66th meeting of the CITES Standing Committee, demonstrates a trend in illegal ivory trade activity (Figure 8) that parallels the illegal killing of elephants reported by MIKE since 2008, with a possible leveling and even a decline in recent years (CITES Secretariat, 2016, Milliken et al., 2016).

NUMBERS AND DISTRIBUTION

The estimated number of elephants in areas surveyed in the last ten years in Central Africa is 24,119 ± 2,865 at the time of the last survey for each area. There may be an additional 87,190 to 103,355 elephants in areas not systematically surveyed. Together, this estimate and guess apply to 546,471 km², which is 70% of the estimated known and possible elephant range. There remains an additional 30% of range for which no elephant population estimates are available.

The number of elephants estimated from systematic surveys in Central Africa increased by about 10,000 between the AESR 2007 and the present. However, this was largely a consequence of new populations being surveyed. In a number of cases, the first survey for an area took place after the publication of the AESR 2007 and a subsequent survey showed a decline – which does not show up in the comparisons between the present report and the AESR 2007. The number of elephants recorded as guesses declined between 14,000 and 26,000. Models for the entire region derived from the surveyed populations indicated that Central African elephants declined by over 60% between 2002 and 2011 (Maisels, Strindberg et al., 2013b) and the decline continued at least to 2014 at a rate of about 9% per year (Maisels, Strindberg et al., 2014b).

The proportion of elephant range for which elephant estimates are available currently stands at 70%, an increase from 52% in the previous report. The overall quality of information, as measured by the IQI, has decreased from 0.22 to 0.13.

Historically, elephants were distributed fairly evenly throughout the forests of the region but they are now concentrated in the small country of Gabon, which contains 12% of the total African tropical moist forest area (Verhegghen et al., 2012), and roughly half of Africa's forest elephants. By contrast, the DRC contains 60% of the region's forest and less than 10% of its forest elephants.

A number of Central African countries have experienced dramatic losses in some of their elephant populations in the last ten years. These include the loss of between 16,000 and 20,000 forest elephants, representing 60 to 80% of the population, in Minkébé National Park in Gabon (ANPN, 2013), the loss of approximately 3,000 elephants, representing 50% of the population, in the Ndoki landscape in Congo (Maisels et al., 2012), the loss of several thousand elephants in the Cameroon section of the TRIDOM and the loss of more than 50% from a number of smaller populations in Cameroon and the DRC.

There has been a major decline in elephant numbers in Chad, with the major population in Zakouma National Park declining by an order of magnitude between 2005 and 2011, although it has since stabilized. The savanna populations of the Central African Republic have almost completely disappeared, with the only remaining populations occurring in the forested south-west.

Eighty percent of elephant range in Gabon has not been surveyed in the past five years, and some of it has never been surveyed, but there are plans to rectify this in 2017-2018. The main elephant populations of Cameroon were surveyed between 2014 and 2016. In Congo, the Ndoki Likouala area has not been surveyed since 2010-2011 (surveys are ongoing in 2016) and Odzala National Park has not been surveyed since 2012. In DRC, two important populations, Salonga National Park and adjacent areas and the Okapi Faunal Reserve, have not been completely surveyed since 2004 and 2011, respectively, although about 40% of Salonga NP was resurveyed in late 2015.

Populations recorded as having been lost in the last ten years include those of the Siniaka-Minia FR in Chad and Bushimae in the DRC. However, since populations in the extensive Central African forests are much less clearly defined than in other parts of Africa, loss of numbers and range is more likely to be recorded than the loss of discrete populations.

Substantial changes have been made to the range maps, but these are mostly the result of improved information, rather than real changes in range, except in the case of the Central African Republic, where almost all of the range in the north and east of the country has been lost. There has been a decrease of recorded range from about 975,000 km^2 to about 780,000 km^2 with known range decreasing from 82% to 58%.

CURRENT ISSUES

Elephants in Cameroon occur in three distinct bio-geographical regions. Savanna elephants are found in the northern Sahelian and Sudanian regions, while forest elephants occur in the southern forested area (Roca et al., 2015; Tchamba et al., 1997). Northern Cameroon used to hold some of the most important elephant populations in the Central African savanna. However, heavy poaching was reported in 2012 and it appears that the majority of these elephants have been lost.

A new protected area, the Mt Cameroon National Park, was declared in 2009.

In 2010 Cameroon adopted a new Strategy and Management Plan for Elephants covering the period 2011 to 2020 (Ministère des Forêts et de la Faune, 2010).

In recent analyses of seizure data in ETIS, prepared for CITES, Cameroon has been identified as a country with a worrying involvement in illegal ivory trade (CITES Secretariat, 2012; Milliken et al., 2013, 2016). Cameroon was requested by the CITES Standing Committee, at its 65th meeting, to prepare a National Ivory Action Plan, which it did in February 2015 (CITES, n.d.-a).

Cameroon declared an export quota of 160 tusks (as hunting trophies from 80 animals) for each year from 2007 to 2014. In 2015 and 2016, Cameroon did not submit a quota for elephant hunting trophies, resulting in an assumed zero quota (CITES, n.d.-b).

NUMBERS AND DISTRIBUTION

The estimated number of elephants in areas surveyed in the last ten years in Cameroon is 6,830 ± 943 at the time of the last survey for each area. There may be an additional 1,985 to 2,134 elephants in areas not systematically surveyed. These guesses likely represent a minimum number, and actual numbers could be higher than those reported. Together, this estimate and guess apply to 61,186 km^2, which is 68% of the estimated known and possible elephant range. There remains an additional 32% of the estimated range for which no elephant population estimates are available.

A number of elephant populations have been surveyed using dung counts of a higher standard than before, which has resulted in an increase of about 6,500 in the estimated number of elephants since the AESR 2007, but a decline of more than 12,000 in the guesses category.

An **aerial total count** of Waza National Park in the north of Cameroon was carried out in 2007 (Foguekem et al., 2010) and 246 elephants were counted inside the park, with another 250 seen during the course of a reconnaissance flight further north in the Zgague area (Omondi et al., 2007). This replaces an informed guess of 475 to 1,500 elephants from a ground survey in 2002 (Saleh et al., 2002). Anti-poaching patrols stopped in 2014 because of the presence of the Boko Haram insurgents but were restarted in 2016; there is no information on the current status of elephants (Bechem, pers. comm., 2016).

In 2015 an **aerial sample count** of the Sudanian area, including the national parks of Bénoué, Bouba Ndjidah and Faro and the surrounding hunting blocks, was carried out as part of the Great Elephant Census, giving an estimate of 89 ± 288 (Elkan et al., 2016). In Bouba Ndjidah NP four live elephants were seen outside the counting strips; none were seen in Bénoué NP or Faro NP and 98 elephants were counted in the hunting blocks. By contrast 253 carcasses were seen. The range map has been modified using the results from this survey. These figures replace an estimate of 1,620 from 1991 (Direction de la Faune et des Parcs Nationaux, 1991). In addition an aerial total count was carried out in 2008 (Omondi et al., 2008) with 535 elephants reported in Bouba Ndjidah NP and the hunting areas, with none seen in the other two national parks. In early 2012 it was reported that 250-300 elephants had been killed by poachers in Bouba Ndjidah NP and it appears that there has been a substantial reduction in elephant numbers in this region (Elkan et al., 2016).

Mbam et Djerem National Park, in the savanna-forest ecotone in the centre of the country, is Cameroon's second largest protected area. The first **dung count** of Mbam et Djerem in 2009 produced an estimate of 901 (593-1369) elephants, which has been treated as an **informed guess** because of the lack of an on-site dung decay study (Maisels et al., 2009). A reconnaissance survey in 2014 confirmed the continued presence of elephants (Maisels, 2014).

Deng Deng National Park and the nearby logging concession were surveyed in 2012 (Maisels et al., 2013a). Only one dung pile and a few footprints and feeding signs were observed, so an **informed guess** of one elephant has been recorded. It is entered as a **new population**.

An old guess of 60 elephants in the vicinity of the town of Yoko to the south-west of Mbam-Djerem has been replaced with an **informed guess** of zero elephants (Maisels, 2014). There is an even older guess of 100 elephants in the Abong-Mbang Forest Reserve to the south of Mbam-Djerem (Ekobo, pers comm., 1994), but two surveys north and west of this reserve in 2001 (Fotso et al.,

2002) recorded no elephant signs, so a zero estimate has been entered.

There are several small elephant populations in the south-west of Cameroon, close to the Nigerian border. These include Mt Cameroon, for which an **informed guess** of 118 from 2013 (The Ministry of Forestry and Wildlife, 2014) replaces a 2003 estimate of 178 elephants (Ekobo, 2003).

A 2002 guess of 63 from the Yabassi area (the proposed Ebo National Park) has been updated to 5-30 (Morgan, pers. comm., 2016) and the area of **known range** reduced. There was an old estimate of 425 for Korup National Park on the Nigerian border from 1993 (Powell, pers. comm., 1993) but a survey in 2009 showed few signs, all concentrated in a very small area in the north of the park and to the south in an adjacent logging concession (Ekobo, 2009). A new **guess** of 10-20 for 2011 based on modelling has been entered (Maisels, Strindberg, et al., 2013b).

A **dung count** was carried out in the Banyang-Mbo Wildlife Sanctuary in 2007, resulting in an **informed guess** of 153 to 256 elephants (Greengrass & Maisels, 2007), which replaces an older estimate of 457 elephants in 2011 (Bechem & Nchanji, 2001). Elephants were still present in the north of the sanctuary in late 2015 (Greengrass, pers. comm., 2016).

There are some areas in the south-west which were marked as 'possible range' in 2007. A reconnaissance survey carried out in 2013 in the Takamanda National Park found some signs and gave an **informed guess** of 20 elephants (Ikfuingei & Kuchambi, 2013) so this has been changed to **known range**. These elephants are believed to cross into Cross River NP in Nigeria (Ikfuingei & Kuchambi, 2013).

A **dung count** was conducted in 2014 in the Campo-Ma'an area, giving an estimate of 539 (215-446) (WWF Cameroon, 2016a), of which just over half were estimated to be in the Campo-Ma'an National Park. This replaces estimates of 548 ± 255 from 2003, for a smaller area covering part of the park (Bekhuis & Prins, 2003), and 4-14 for the remaining Ma'an Region (Matthews & Matthews, 2000).

The largest remaining elephant populations are in the forested region in south-eastern Cameroon and these are described in the following section.

A **dung count** of Dja Faunal Reserve was carried out in 2015 (MINFOF/UICN, 2015) giving an estimate of 420 (313-563) elephants, compared to a guess of 1,500-2,000 in 1995 (Tchamba, pers. comm., 1995).

The Ngoyla-Mintom Forest, an area of logging concessions between Dja FR and Nki National Park, was surveyed in 2011 for the first time with an estimate of 1,735 (1,431-2,103) (Nzooh Dongmo et al., 2012). Another survey in 2015 gave an estimate of 395 (243-642) and four neighbouring logging concessions were also surveyed, resulting in two additional estimates of 82 (47-143) and 22 (8-56) (WWF Cameroon, 2016b). This total estimate of 499 is recorded as a **new population**.

Nki NP was surveyed in 2015 by **dung count** (WWF Cameroon, 2016b) giving an estimate of 565 (355-898), which replaces an earlier estimate of 2,178 from 1998 (Ekobo, pers. comm., 1998). A 2005 estimate of 2,577 was not captured in the AESR 2007 (Nzooh Dongmo et al., 2006).

NUMBERS AND DISTRIBUTION CONT.

A **dung count** was carried out in Boumba-Bek National Park in 2015 (WWF Cameroon, 2016b) giving an estimate of 143 (85-242) elephants. This replaces a guess of 318 from 2004 (Blake, 2005). Another dung count in 2012 gave an estimate of 2,062 (1,545-2,752) (Maisels et al., 2014a).

There was an estimate of 185 ± 86 for the forest concessions north of Nki in 2015 (these areas had not been previously surveyed) and 547 ± 242 for Mongokele Forest Reserve (WWF Cameroon, 2016c), which replaces an estimate of 773 from 1991 (Ekobo, 1993).

A guess of 1,354 for the Mengame Wildlife Sanctuary (to the west of Ngoyla-Mintom Forest) from 2003 (Halford et al., 2003) has been replaced by a **guess** of 10 (Maisels, Strindberg et al., 2013b).

Lobéké National Park is surrounded by logging and hunting concessions. Together they form the Cameroonian part of the 'Trinational de la Sangha' transfrontier protected area. A **dung count** of this area was carried out in 2015 (WWF Cameroon, 2016d). For Lobéké NP the estimate of 1,029 (670-1582) replaces one of 3,719 ± 2125 from 1993 (Ekobo, 2003). Another dung count in 2009 gave an estimate of 1,426 (Blake et al., 2012). There was also an estimate of 2,737 ± 603 for the previously unsurveyed areas around Lobéké NP (WWF Cameroon, 2016).

CURRENT ISSUES

Elephant populations in the Central African Republic (CAR) occur in the savannas of the north and in forest areas, particularly in the south-west. Elephants, along with many other wildlife species, have almost disappeared from the north of the country, despite a very low human population. The main reasons are thought to be the increase in cattle transhumance, civil disorder, the increase in weapons and commercial poachers from other countries. Protected areas have been ineffective, since elephant densities were lower there than in nearby hunting areas (Bouché et al., 2010).

Conservation efforts have been hampered by a lack of stability. The country was plunged into turmoil in 2013 when the Seleka rebel group seized power and was then countered by the Anti-Balakas. A transitional government took over in 2014 but violence continued despite the presence of peace-keeping forces.

The African Parks Network began working in Chinko in 2015 and was given a mandate to manage the area for 50 years by the Ministry of Forestry, the Environment and Tourism (Walley, 2014).

CAR published an elephant conservation action plan in 1992, although this is now out of date (Ministère des Eaux, des Forets, 1992).

NUMBERS AND DISTRIBUTION

The estimated number of elephants in areas surveyed in the last ten years in Central African Republic is 702 ± 245 at the time of the last survey for each area. There may be an additional 699 to 826 elephants in areas not systematically surveyed. These guesses likely represent a minimum number, and actual numbers could be higher than those reported. Together, this estimate and guess apply to 21,812 km², which is 89% of the estimated known and possible elephant range. There remains an additional 11% of the estimated range for which no elephant population estimates are available.

There has been a reduction in both estimates and guesses since the AESR 2007, but the differences in the estimates from the main population in the south-western forest block are not significant.

The northern savanna elephant population occurs in an area that includes the Bamingui-Bangoran National Park and Manovo Gounda-St. Floris National Park. A 2010 **aerial sample count** (Bouché et al., 2011) gave an estimate of 68 ± 113 elephants for the northern savanna landscape. This replaces an estimate of 929 ± 950 elephants from an aerial sample count of a smaller area in 2005 (Renaud et al., 2005). The carcass ratio was 30% in 2005 and 53% in 2010, indicating a very high level of poaching (Bouché, 2010).

There is very little recent information on the status of elephants in the Bangassou Forest in the south-east region of the country. The last estimate was of 500-1,000 elephants in 2004 (Blake, 2005) and a guess of 500 has been retained from the AESR 2007, although it is very unlikely that this number of elephants still survives in the area. During a reconnaissance survey in 2009, Luhunu and Bechem (Luhunu & Bechem, 2009) only found signs of elephants in an area to the west of Bangassou, which had not been surveyed in 2004, and none in Bangassou Forest itself. The range has been changed to **doubtful** with a point record in the western area.

In the AESR 2007, the area to the north of Bangassou Forest was classified as doubtful range. However, African Parks Network staff report that there are at least 50, and perhaps as many as 150 elephants (believed to be forest elephants) in the Chinko area, just over 30 kilometres to the north of Bangassou Forest (Aebischer, pers. comm., 2016) so this is recorded as a **new population** with a small amount of **known range**.

The Dzanga Sangha landscape in the extreme south-west is the only remaining elephant stronghold in the country, and is contiguous with the Nouabalé-Ndoki landscape in Congo. Elephants in Dzanga-Sangha are part of a single population that extends across the border with Congo into the Nouabalé-Ndoki National Park, as shown by satellite collaring of elephants in the area and by individual recognition of 68 individual elephants moving between the two countries (Blake et al., 2008). A **dung count** carried out in 2011-12 gave an estimate of 631 ± 218 individuals (Princée, 2013) (excluding Yobe-Lidjombe, which has been treated separately for comparative purposes). In the same year 1,150 individuals were individually identified in Dzanga Bai, suggesting that this may have been an underestimate (Princée, 2013). The 2011-12 estimate replaces one of 869 ± 214 from a 2003 to 2004 dung count (Blake, 2005) indicating that no significant change took place over this time. The 2011-12 guess for the reconnaissance survey of Yobe-Lidjombe was 152-179. This area was not covered in the 2003-2004 survey so is recorded as a **new population**. The widely reported killing of at least 26 elephants in May 2013 at Dzanga Bai post-dates the 2011 survey, but

the prompt response to this incident probably limited the impact on the overall population (Canby, 2015).

The south of N'gotto Classified Forest still held elephants in 2000 (Dethier & Ghiurghi, 2000), but in a 2002 survey by Hicks, no elephant dung was found in over 150 kilometres walked (Maisels, Strindberg et al., 2013b) indicating that elephants may have been eliminated in the area or were only seasonally present (Brugière et al., 2005). This has been changed to **possible range**.

PFS

Priority for Future Surveys (PFS) is ranked from 1 to 5 (highest to lowest). Based on the precision of estimates and the proportion of national range accounted for by the site in question, PFS is a measure of the importance and urgency for future population surveys. All areas of unassessed range have a priority of 1. See Introduction for details on how the PFS is derived.

GENERAL STATISTICS

Country Area	1,284,000 km²
Range Area	61,490 km² (5%)
Protected Range	23 %
Information Quality Index (IQI)	0.32
CITES Appendix	I
Listing Year	1990

CURRENT ISSUES

The northern part of Chad is desert, and elephants are confined to the south, particularly in the Sudanian zone in the far south. Conservation efforts have been affected by a difficult security situation, including coup attempts in 2006 and 2008, and the presence of Boko Haram in the west of the country. Substantial areas of elephant range are being lost due to exp-anded settlement and conversion of rangeland to agriculture. However, there are also some areas of increased elephant range, apparently a result of elephants moving to safer areas from Cameroon and Central African Republic (Antonínová et al., 2015).

Zakouma National Park, which holds Chad's largest elephant population, lost over 3,000 to poaching between 2005 and 2010; the reproductive rate appeared to reduce substantially and the elephants aggregated into a single herd. In 2010 the government of Chad signed a long-term private public partnership agreement with the African Parks Foundation (APF) for the management of Zakouma NP and its periphery. Law enforcement has improved, poaching has reduced and the reproductive rate has increased (Antonínová et al., 2015).

A National Elephant Action Plan has been written and covers the period 2016-2025 (Antonínová et al., 2015). The National Elephant Protection Centre (NEPC) was established in 2013 with a control room and database on elephant issues. Two toll-free telephone numbers enable people to report information about elephants.

CURRENT ISSUES
CONT.

In 2008 Chad introduced the first legislation governing forests, wildlife and fishery resources since independence in 1960. This legislation provides for the creation of Community Wildlife Areas and co-management of natural resources.

Chad is a major ivory transit area, with ivory from within the country and from other countries in the region being smuggled mainly via Sudan, Cameroon and Nigeria (UNEP et al., 2013).

In February 2014, Chad destroyed 1.1 tonnes of stock-piled ivory (Godard, 2014b).

NUMBERS AND DISTRIBUTION

The estimated number of elephants in areas surveyed in the last ten years in Chad is 794 at the time of the last survey for each area. There may be an additional 273 to 353 elephants in areas not systematically surveyed. These guesses probably represent a minimum number, and actual numbers could be higher than those reported. Together, this estimate and guess apply to 28,561 km², which is 46% of the estimated known and possible elephant range. There remains an additional 54% of the estimated range for which no elephant population estimates are available.

Both estimates and guesses have declined substantially since the AESR 2007. The range map has been substantially modified following data collection for the National Elephant Action Plan, with major changes including the reduction of known range to the west of Zakouma NP and around Lake Fitri.

Zakouma NP holds the largest remaining elephant population in Chad, although the numbers have declined by an order of magnitude in the last ten years due to poaching, which was heaviest between 2005 and 2009 (Poilecot, 2010), the situation has more or less stabilised since 2010. An **aerial total count** was conducted in 2014 as part of the Great Elephant Census which gave a count of 443 elephants (Antonínová et al., 2014a) replacing one of 3,885 from 2005 (Fay et al., 2005). A sample count in 2008 gave an estimate of 2,285 carcasses and 939 live elephants. Total counts in 2009, 2010, 2011 and 2012 showed a small decline in live elephant estimates from 617 to 542 to 454 to 444 (Antonínová et al., 2014a). Carcass ratios decreased from 71% in 2008 to 19% in 2014, indicating a reduction in poaching pressure. There has been a steady reduction in poaching events; from 125 elephants killed in 2008, to 41 in 2009, 32 in 2010, 7 in 2011, 7 in 2012, 0 in 2013 and 0 in 2014 (Antonínová et al., 2014a).

Approximately 500-600 elephants were believed to occur in the Siniaka-Minia Faunal Reserve to the west of Zakouma NP (Malachie & Lassou, 2002) but they are no longer resident in the area, and survivors may have moved into Zakouma NP during the period of intense poaching. This has therefore been recorded as a **lost population**.

The Heban-Mourraye area to the north-east of Zakouma NP has a small population of elephants that may overlap with the Zakouma NP population during the rainy season. After nine elephants were killed in 2012, there were six individuals remaining (Antonínová et al., 2014a). There was no previous estimate for this area and it is thus recorded as a **new population**.

During an aerial survey carried out in the Birket Fatime-Eref area north of Zakouma in 2013, a herd of seven individuals was observed, but there may be up to 25 individuals in three herds (Antonínová et al., 2015). There was no previous estimate for this area so it is recorded as a **new population**.

Seventy three elephants were observed in the Lake Fitri area north-west of Zakouma NP in 2014 (Antonínová et al., 2015). This **informed guess** replaces a guess of 200-300 from 2002 (Malachie & Lassou, 2002).

There are two elephant populations in the vicinity of Lake Chad. There are thought to be 60 in the Doum Doum area at the south end of the lake (Antonínová et al., 2015). This **guess** replaces one of 50-100 for the Koloudia-Doum-Doum area from 2002 (Malachie & Lassou, 2002). The second population lives further north near Baga Sola town and six elephants were seen in 2013, but there may be up to 20 (Antonínová et al., 2015). This has been recorded as a **new population**.

An **aerial total count** was conducted in the Chari Baguirimi and Mayo Kebbi Est regions in 2014 as part of the Great Elephant Census, during which 168 elephants were observed (Antonínová et al., 2014c). This elephant population was heavily affected by poaching in 2012 when about 65 elephants were killed (Antonínová et al., 2014c). This area has a high human population and there is much human-elephant conflict. There was no previous estimate so it is recorded as a **new population** and the range changed from doubtful to **known range**. There was guess of 150-200 in the AESR 2007 for the nearby Massenya-Mandjafa area (Malachie & Lassou, 2002), which is not currently considered to be elephant range.

Elephants were not known to inhabit the Binder Léré ecosystem, which includes the Binder Léré Faunal Reserve, prior to 2007. In 2010, 236 elephants were seen in this area during the course of a ground survey, and it is thought that they had moved in from Waza National Park in Cameroon. About 90 elephants were killed in a single poaching incident in January 2013. During an **aerial total count** conducted in 2014 as part of the Great Elephant Census 132 elephants were observed (Antonínová et al., 2014b). This is recorded as a **new population**.

There are a further two small elephant populations on the Cameroon border, adjoining Bouba Ndjidah NP in Cameroon, which has been heavily impacted by poaching. One is in the Gagal-Yapala-Beinamar area where there may be up to 50 elephants, but only 18 have been confirmed (Antonínová et al., 2015). This **guess** replaces one of 400-500 for the Gagal-Yapala area from 2002 (Malachie & Lassou, 2002). There also may be 50 elephants in the Larmanaye area further south (Antonínová et al., 2015). This **guess** replaces one of 100-150 from 2002 (Malachie & Lassou, 2002).

There are believed to be four elephant populations living close to the southern border of Chad with Central African Republic (CAR). According to local communities, elephants started to return to Chad from CAR in the past few years, probably as a result of a safer environment on the Chadian side of the border, but it is not clear if these are resident populations. There are **guesses** of 30 elephants, with 14 confirmed, in the Mbaibokoum-Mbitoye-Bekan area, 50 in Baké - Yamodo - Goré , and perhaps 20 each in the Ngourou - Gondei (Aouk) area and the Dembo-Djéké Djéké- Sido area (Antonínová et al., 2015). The AESR 2007 gave one guess of 600-700 elephants for the Dembo area, so the other areas are recorded as **new populations** for this report.

CURRENT ISSUES

Congo probably still holds Central Africa's second largest number of forest elephants, although they are increasingly threatened by poaching and human encroachment. Almost all of Congo's elephants occur in forest areas in the north of the country, with smaller numbers on the Atlantic coast, and along the Gabonese border to the west. Elephants have been almost totally eliminated from the savanna-forest mosaic of the rest of the country.

The construction and upgrading of access roads for national transport and logging purposes, particularly the surfacing of the road linking Ouesso and Brazzaville in 2013, which runs through core elephant range, is likely to have a negative impact on elephant populations. This is because forest elephants, which tend to avoid roads, get compressed into smaller and smaller tracts of relatively remote forests (Blake et al., 2001, 2007, 2008). Some logging concessions have received Forest Stewardship Council (FSC) certification for adopting conservation-friendly measures (Morgan et al., 2013) and in contrast to other parts of Central Africa, some of these forest concessions in Congo hold significant numbers of elephants.

The government of Congo signed co-management agreements with the Wildlife Conservation Society for Nouabalé-Ndoki National Park in 2014 (WCS, 2014) and with African Parks Network for Odzala-Kokoua National Park in 2010 (African Parks, n.d.-a).

In recent analyses of seizure data in ETIS, prepared for CITES, the Republic of Congo has been identified as a country with a worrying involvement in illegal ivory trade (CITES Secretariat, 2012; Milliken et al., 2013, 2016). The Republic of Congo was requested by the CITES Standing Committee,

at its 65th meeting, to prepare a National Ivory Action Plan. Congo submitted its National Ivory Action Plan to CITES in 2015, which is now in the process of being implemented (CITES, n.d.-a). In April 2015, Congo destroyed its entire national ivory stockpile of 4.7 tonnes (Smith, 2015).

NUMBERS AND DISTRIBUTION

The estimated number of elephants in areas surveyed in the last ten years in Congo is 6,057 ± 1,222 at the time of the last survey for each area. There may be an additional 20,924 to 26,942 elephants in areas not systematically surveyed. These guesses likely represent a minimum number, and actual numbers could be higher than those reported. Together, this estimate and guess apply to 85,698 km², which is 57% of the estimated known and possible elephant range. There remains an additional 43% of the estimated range for which no elephant population estimates are available.

Since the AESR 2007 there has been a substantial apparent increase in both estimates and guesses. However, this is largely as a result of many new areas having been surveyed.

A **dung count** of Nouabalé Ndoki NP was conducted in 2011 giving an estimate of 2,324 ± 544 (Maisels et al., 2012) and this replaces the estimate of 3,032 ± 755 from 2003 (Blake, 2005). The 2003 survey only covered the park and a small buffer zone to the east, while the 2011 survey included a far larger area of neighbouring logging concessions; the estimate for the entire area was 8,792 (6,651-11,622) (Maisels et al., 2012). A previous survey in 2006 was not included in the AESR 2007, but provided an estimate of 11,076 elephants (8,223-14,920) for the larger area (Stokes et al., 2010).

The estimate of 380 (239-602) (Blake, 2005) from 2003 for the Mokabi logging concession to the north of Nouabalé Ndoki NP has been retained but degraded due to age. A 2006 estimate published in 2010 indicated only 59 elephants, but this data could not be included in this report because of its late receipt.

The Bailly Swamp North and Nouabalé Ndoki peripheral zones are recorded as **new populations** with estimates of 827 ± 656, and 5,345 ± 2,133 respectively from the 2011 count (Maisels et al., 2012). The range map has been modified, with a new area of **known range** to the south-west and south-east of Lac Télé, and some areas of **possible range** in the east.

The 2011 survey gave an estimate of 296 (92-948) for the Lac Télé Community Reserve (Maisels et al., 2012) which replaces an estimate of 316 from 2004 (Iyenguet et al., 2007).

A **dung count** conducted in the Batanga area just to the east of Lac Télé Community Reserve in 2012 (Iyenguet et al., 2012) gave an estimate of 104 (32-338) compared to an earlier estimate of 73 elephants (20-268) (Malanda et al., 2008). In the AESR 2007 this area was recorded as **possible range** and is now **known range**. There was no estimate for this area in the AESR 2007 so this is recorded as a **new population**.

A **dung count** of Odzala-Kokoua NP conducted in 2012 gave an estimate of 9,292 (7,468 - 12,357) (Maisels et al., 2013b) of which approximately 65% were in the southern sector. This replaces a 2005 estimate of 13,545 ± 3,252 (Hart, 2006a). However a reanalysis of the 2005 results gave an

estimate of 7,460 (5,738-9,705) and there was no significant change between 2005 and 2012. The area of **known range** to the south of Odzala has been reduced (Maisels, pers. comm., 2016a).

Elephants also occur in the Ngombe Forestry Concession and the Ntokou-Pikounda National Park to the east of Odzala-Kokoua, which were first surveyed in 2007. Based on a **dung count** which was carried out in the Ngombe landscape in 2014 (Maisels et al., 2014b), the elephant population is estimated at 4,143 (2,994-5,731). In 2007 the estimate was 4,992 (3,192-7,802) (Maisels et al., 2014). This has been recorded as a **new population** and the area of **known range** extended accordingly.

On the basis of a **dung count** from 2006 (Bassouama et al., 2006), which was not recorded in the AESR 2007, it has been suggested (Maisels, pers. comm., 2016d) that there might be approximately 490 elephants in the Lossi-Kelle area to the south-west of Odzala-Kokoua NP and this is also recorded as a **new population**.

A **dung count** was carried out in 2013 in the Messok-Dja area to the north of Odzala-Kokoua NP which gave an estimate of 346 (202-604) (Mantsila et al., 2013) as a **new population**. Most elephant signs were observed in the extreme north-east of the area. Part of this area has been changed from known to **possible range**.

The first **dung count** of Djoua-Ivindo area was carried out in 2015, and gave an estimate of 1,311 (778-2209) elephants (Allam et al., 2016). This is recorded as a **new population** and the range changed from mostly doubtful to **known**.

There is also a population of elephants on the Batéké Plateau in the area straddling the Congo-Gabon border, referred to as Ogooue-Leketi. Transect surveys in 2010 gave an estimate of 200 (116-345) (Maisels, pers. comm., 2016b), while individual observations in clearings suggest that there are least 285 elephants (Inkamba-Nkulu et al., 2015). There is a **guess** of 36 elephants from 2012 from the neighbouring MPD iron mine concession area. Neither of these areas had estimates in the AESR 2007 so are entered as **new populations**.

There are new **guesses** for populations in the south-west close to the Gabon border which had not previously been included in the AED. These include Mayoko for which there is a **guess** of 340 from 2005 based on a reconnaissance survey (Inkamba-Nkulu, 2007), and the Mount Fouari complex for which there is a **guess** of 200 from 2005 (Maisels, pers. comm., 2016c).

A **dung count** was carried out in Conkouati-Douli National Park in 2013 giving an estimate of 947 ± 180 (Vanleeuwe, 2014), which replaces an estimate of 772 ± 370 from 2005 (Vanleeuwe, 2006).

An area that was formerly recorded as possible range to the south-east of Conkouati, adjoining the Cabinda enclave in DRC has been changed to **non-range** since it is mostly savanna and has been heavily affected by hunting (Maisels, pers. comm., 2016d).

While much of the southern part of Congo consists of savanna, there are gallery forests along the watercourses in the Lefini Forest Reserve north of Brazzaville, and it is known that there are at least six elephants in this area (Inkamba-Nkulu & Tsoumou, 2008). This has been changed from doubtful range to **known range**.

CURRENT ISSUES

The Democratic Republic of Congo (DRC) has the largest expanse of tropical forest of all the Central African countries, comprising around 61% of the total (Verhegghen et al., 2012). A civil war from 1996 to 2003 resulted in high levels of poaching as militias, refugees and military personnel occupied protected areas, and the Institut Congolais pour la Conservation de la Nature (ICCN) was forced to cease normal operations, in some cases abandoning entire protected areas, while many staff members were killed. Elephant meat and ivory was used to provision and fund insurgents and the military (Beyers et al., 2011). Even after the end of the civil war, there have been continuing impacts from the displacement of human populations, ready availability of weapons, the activities of remaining rebel groups and rogue elements of the army, as well as growing threats such as new road developments, growing human populations and immigration (Beyers et al., 2011, Nackoney et al., 2014). The consequence of this is that elephant populations, even in major protected areas, have been reduced to extremely low densities, and substantial areas of range appear to have been lost. Despite this, the only population recorded as having been completely lost is that of the Bushimae Reserve and Hunting Area, and there have probably not been elephants there for many years.

Most elephants in DRC are believed to be forest elephants. There are known to be forest-savanna hybrids in Garamba National Park and at other sites at the northern and eastern limits of the forest zone (Mondol et al., 2015; Roca et al., 2015).

There are a number of collaborative management partnerships in place. African Parks Network (African Parks, n.d.-b) has been managing Garamba NP since 2005, in 2015 WWF received a

CURRENT ISSUES
CONT.

3-year management agreement for Salonga National Park and the Virunga Foundation signed an agreement to manage Virunga National Park until 2021 ("Virunga National Park - Who we are," n.d.).

DRC published an elephant conservation plan in 1991, although this is now out of date (Institut Zairois pour la Conservation de la Nature, 1991).

In recent analyses of seizure data in ETIS, prepared for CITES, DRC has been identified as a country with a worrying involvement in illegal ivory trade (CITES Secretariat, 2012; Milliken et al., 2013, 2016). DRC was requested by the CITES Standing Committee, at its 65th meeting, to prepare a National Ivory Action Plan. This was submitted in April 2015 and progress on this plan was reported on in September 2015 (CITES, n.d.-a) Although none of the 27 planned activities had been completed, 15 of them were considered to be in progress.

NUMBERS AND DISTRIBUTION

The estimated number of elephants in areas surveyed in the last ten years in DRC is 1,794 ± 52 at the time of the last survey for each area. There may be an additional 7,803 to 9,557 elephants in areas not systematically surveyed. These guesses probably represent a minimum number, and actual numbers could be higher than those reported. Together, this estimate and guess apply to 114,733 km^2, which is 51% of the estimated known and possible range. There remains an additional 49 % of the estimated range for which no population estimates are available.

There has been an approximately 70% reduction in elephant estimates for DRC since the AESR 2007 and a 50% reduction in the guesses.

The elephant population in Garamba NP in the north-east of the country has continued to decline in the last ten years as a result of intense poaching pressure from different groups, including the Lord's Resistance Army, which raided the park headquarters in 2009 (Agger & Hutson, 2013). An **aerial total count** in 2014 gave an estimate of 1,718 elephants from the total count in the southern portion of the park plus 206 from an **aerial sample count** in the northern part of the park and the neighbouring hunting areas (Mónico, 2014). This replaces the 2004 estimate of 6,354 ± 4,081 from an aerial sample count (Hillman Smith et al., 2006) and a guess of 1,000 to 1,450 for the neigbouring Gangala-na-Bodio hunting area. Aerial total counts were also carried out in 2007 and in April and May of 2012, giving estimates of 3,696, 1,847 and 1,708 respectively (Bolaños, 2012). The northern part of Garamba NP was shown as **non-range** in the AESR 2007, but radio-tracking data shows that elephants use the entire park (Mararv, pers. comm., 2016).

Large areas to the west of Garamba are now settled by people, and residents reported that elephants have not occurred here for decades (Hart, 2014) so these areas are shown as **non-range**.

The eastern savanna sector of the Bili-Uere complex has been overrun by hundreds of Fulani pastoralists with their cattle, and by 2010 most of the elephants in this area were gone; it has been changed to **doubtful range** (Hart, 2014). A 2011 **dung count** of the Bili Gangu sector gave an estimate of 365–799 elephants (Hart, 2014), which is recorded as a **new population** since it had not previously been surveyed.

South of Bili-Gangu, elephant range in north-central DRC is now limited to five areas of **possible range** where elephant signs or information on their presence was recorded between 2006 and 2009 (C.T. Hicks, unpublished data, in Hart, 2014).

Between five and 25 elephants may remain in the central Rubi Tele Hunting Zone, based on reconnaissance surveys in 2007 and 2011 (Hart, 2014). Previously this was recorded as possible range with no estimate, so this is recorded as a **new population**.

A survey of the western part of the Lomako Faunal Reserve on the south bank of the Congo River in 2014 indicated that there were still small numbers of elephants present, with an estimate of 105 to 185 (Maputla, 2015) so this is recorded as a **new population** and an area of **known range** added to the map. An additional two small areas south of Lomako had elephant signs (Maputla, 2015). The Okapi Faunal Reserve in the north-east of DRC used to form part of a continuous elephant population including Maiko National Park, although numbers and range have been greatly reduced in this area. The presence of illegal miners and militias severely affected the conservation status of the reserve, but the situation has improved since 2012 (Okapi Conservation Project, 2014). A **dung count** was carried out from December 2010 to January 2011 (Vosper et al., 2012), which gave an estimate of 1,701 (1,031-2,831). This replaces an estimate of 2,688 ± 1,348 from 2006 (Grossman et al., 2006). The 2006 survey covered less than half the area of the 2011 study. However, almost the whole area was surveyed in 2007 giving an estimate of 2,698 (1892-3836) elephants (Vosper et al., 2012). Just to the east of the Okapi is an area known as Mai Tatu. Surveys in 2008 and 2015 here show elephants are still present but very rare.

A guess of 3,000 elephants for Maiko National Park from 2006 (Hart, 2006a) has been replaced by a **guess** of 100-750 (Nixon & Plumptre, pers. comm., 2016). Most of the Park has been reclassified from known to **possible range** apart from some small areas on the periphery, where elephant presence was confirmed during surveys and patrols between 2013 and 2015 (Plumptre et al., 2015).

Virunga National Park has elephants both in savanna and forest areas (Owiunji et al., 2004; Wanyama et al., 2014a). The park has come under sustained assault from poachers and displaced people seeking sanctuary over many years of civil unrest (Virunga National Park, 2016). An **aerial sample count** of the Virunga National Park savanna sector in 2014 gave an estimate of 35 ± 60 (Wanyama et al., 2014b), which replaces an estimate of 348 ± 177 from 2006 (Kujirakwinja et al., 2006). Elephants move back and forth across the border into Queen Elizabeth National Park in Uganda (Douglas-Hamilton, pers. comm., 2016) so changes in numbers may reflect movements as much as mortality. Older guesses for the forest populations of Virunga NP have been retained – 75 for the southern section (Mubalama, pers. comm., 2003) and 43 for the Mikeno section (Gray, pers. comm., 2005).

There is a new **guess** of 20 elephants for the upland section of Kahuzi-Biega National Park (Plumptre, pers. comm., 2010), which replaces one of 20 to 50 from 2005 (Hart, 2006b). Also, there is a new **guess** of 50 to 100 for the lowland section (Plumptre, pers. comm., 2010) which is recorded as a **new population**, although in 2002 there was an estimate of 1,125, which was not recorded in the AESR 2007 (Hart, pers. comm., 2003).

The western section of the Sankuru Natural Reserve was surveyed in 2008, and it seems that no elephants remain at this site (Liengola et al., 2009).

A major, previously undocumented population of elephants was discovered in the centre of the country in the newly-designated Lomami National Park and its surrounding area, the Tshuapa Lomami landscape. A **dung count** carried out in 2008 gave an estimate for the core zone of 551 elephants (353-860) with an additional estimate of 265 elephants (120–700) in the adjoining peripheral zone (Hart, pers. comm., 2016), resulting in an **informed guess** of 500-1000 from the survey author (Hart, 2009). Subsequently, a 2012 dung count of the core zone gave an estimate of 462 elephants (261-813) (Hart, pers. comm., 2016). In late 2014, patrols reported small numbers of elephants (estimated at 10-15 animals) in the south of the park in an area that had not been occupied by elephants since 2007 (Hart, pers. comm., 2016). There was no previous estimate for the Tshuapa Lomami landscape, which is treated as a **new population** although it was recognized as known range in the AESR 2007.

In 2015 and 2016 the existence of several additional areas of elephant range in Central Congo were documented through arrests and seizures of ivory (Hart, n.d.) and these are marked as new areas of **known range** to the west and south of Tshuapa Lomami.

Salonga National Park has experienced poaching for decades, although anti-poaching operations starting in 2011 appear to have improved the situation (Dianzenza, 2015). Surveys have been carried out of different parts of the park. Partial surveys give an estimate of about 400 elephants in about 24% of the park (Reinartz, 2016; WCS, 2015a). Surveys outside the park in 2006 showed that only a few pockets of this vast landscape were occupied by elephants (Steel, 2007). Since the recent surveys did not cover the entire area, the estimates of 1,186 ± 692 inside the park in 2004 (Blake, 2005) and 2,800 outside the park in 2006 (Hart, 2006b) have been retained. There was no significant difference in dung density in the Lokofa area between 2006 and 2015 (WCS, 2015a).

A new **guess** from the Luama Hunting Zone of 21 elephants (Mubalama, pers. comm., 2013) replaces the guess of 110 ± 15 from 2002 (Mubalama, pers. comm., 2006). A new **guess** of 40-60 for Upemba National Park (Hasson, pers. comm., 2013) replaces a guess of 145 from 2005 (Mubalama, pers. comm., 2006).

In the AESR 2007 there is possible range shown close to the southern town of Lubumbashi. It has been many years since elephants occurred in this area, and this has been degraded to **non-range** (Hasson, pers. comm., 2013).

There are no longer believed to be any elephants in the Bushimaie Reserve and Hunting Area so this has been reported as a **lost population** (IUCN PAPACO, 2010).

Reports were received in 2012 of more than 20 elephants moving across the border from Angola and spending time in the Swa Kibula hunting area (Mbende et al., 2012). The map now shows this area as **known range**.

Low densities of elephants were found in the area south-west of Lake Tumba, close to the Congo River north of Kinshasa (Mbende et al., 2012). This has been changed from doubtful to **known range**.

884 ± 676

GUESSES

0 - 0

GENERAL STATISTICS

Country Area	28,050 km²
Range Area	19,701 km² (70%)
Protected Range	21 %
Information Quality Index (IQI)	0.57
CITES Appendix	I
Listing Year	1992 (year of accession)

CURRENT ISSUES

Río Muni is the mainland portion of Equatorial Guinea, a country with a rapidly developing economy based on petroleum extraction, and associated infrastructure development, which is having a negative impact on wildlife. Around 80% of Río Muni is covered in mostly secondary tropical forest. Commercial hunting has been facilitated in recent years by the expansion of the road network across the country and the ongoing construction of a new capital city in the centre-east of the country. Elephant poaching is widespread, especially near roads. Hunting signs were found inside all protected areas during the course of a nationwide survey (Murai et al., 2013).

Although a protected area network was created in 1988, Monte Alén National Park is the only area that has any effective protection (Larziliere & Doumenge, 2015).

Equatorial Guinea published an elephant conservation plan in 1991, although this is now out of date (Ministry of Agriculture, Livestock, Fisheries and Forestry, 1991).

NUMBERS AND DISTRIBUTION

The estimated number of elephants in areas surveyed in the last ten years in Equatorial Guinea is 884 ± 676. This estimate applies to 19,704 km², which is 100% of the estimated known and possible elephant range in Equatorial Guinea.

In 2011 a systematic countrywide line transect survey was carried out (Murai et al., 2013) giving an estimate of 884 elephants (437-1,789). This replaces an estimate of 700 ± 330 from 2004 for the southern part of the Monte Alén National Park plus a guess of 300 for the remaining part of the park. There were no estimates from the remaining elephant range in Equatorial Guinea in the AESR 2007, so the new estimate covers a **different area**. Given that the current estimate for the entire country is lower than the previous estimate for Monte Alén National Park, a substantial reduction in overall numbers seems likely.

Elephants were most abundant within Monte Alén National Park and the Monts de Mitra region extending south towards Gabon and the Rio Campo Nature Reserve (contiguous with the Campo Ma'an National Park in Cameroon) and the region to the east of the reserve. The range map has been modified to include new areas of **known range** in the eastern and western parts of the country.

GUESSES

59,057 - 67,094

GENERAL STATISTICS

Country Area	267,670 km²
Range Area	213,373 km² (80%)
Protected Range	18 %
Information Quality Index (IQI)	0.93
CITES Appendix	I
Listing Year	1990

CURRENT ISSUES

Gabon is a relatively stable country with a low human population concentrated in the cities. Over 80% of the country is forested, with Gabon's forests accounting for 12% of the total African tropical moist forest area (Verheggen et al., 2012). There are small areas of savanna in the Batéké Plateau in the south-east and behind the coastal strip. All elephants found in Gabon are forest elephants including those found in the savanna patches (Roca et al., 2015).

Until recently much of the forest was relatively inaccessible and Gabon has been a stronghold for forest elephants, holding about half of Africa's forest elephants (Maisels & Strindberg, 2012). In 2002, Gabon created a network of 13 national parks, which cover about 11% of the country. Until recently levels of poaching were far lower than in neighbouring range states, but this has changed in recent years as road access has improved and ivory prices increased, and poaching is now seen as a serious threat.

In recent analyses of seizure data in ETIS, prepared for CITES, Gabon has been identified as a country with a worrying involvement in illegal ivory trade (CITES Secretariat, 2012; Milliken et al., 2013, 2016). Gabon was requested by the CITES Standing Committee, at its 65th meeting, to prepare a National Ivory Action Plan. Gabon submitted this to CITES in 2014 (CITES, n.d.-a). In June 2012, Gabon destroyed 4.8 tonnes of ivory from its national stockpile (Jones, 2012).

In 2015, as part of the Elephant Protection Initiative, Gabon developed a draft national strategy for elephant management (Government of Gabon, 2015), which is still under review. The Agence Nationale des Parcs Nationaux (ANPN) announced the creation, by presidential order, of a 240-strong

special forces unit within ANPN to operate as a rapid reaction unit anywhere in Gabon (Presidential Press Service, 2016).

NUMBERS AND DISTRIBUTION

The estimated number of elephants in areas surveyed in the last ten years in Gabon is 7,058 ± 2,303 at the time of the last survey for each area. There may be an additional 59,057 to 67,094 elephants in areas not systematically surveyed. These guesses likely represent a minimum number, and actual numbers could be higher than those reported. Together, this estimate and guess apply to 213,373 km², which is 100% of the estimated known and possible elephant range.

Elephants are believed to occur throughout much of Gabon, with the exception of a number of areas with high human population densities, but only 20% of Gabon has been surveyed. For this reason an estimate from a spatial model has been used for the remaining area (Maisels, Strindberg et al., 2013b).

The estimated number of elephants through systematic surveys has increased by 4,300, largely because of an increased number from a repeat survey of Lopé National Park. Guesses on the other hand have decreased by 10,000-20,000, partly because of the reduced numbers recorded from Minkébé NP.

A **dung count** of Minkébé NP and its neighbouring buffer zone in the north-east of the country in 2013 gave an estimate of 6,875 (3,677-12,852) (ANPN, 2013). This replaces an estimate of 21,070 ± 7,942 from 2004 (Blake, 2005). The more recent survey was less intense but indicated a dramatic decline in both numbers and range, with elephants now almost totally confined to the southern and eastern borders of the park. The 2013 survey included areas outside the park but a direct comparison of areas surveyed in 2004 and 2013 suggests that 60-80% of the population has been lost (ANPN, 2013). This increase in poaching was associated with the presence of over 6,000 gold miners in the park and buffer zone from about 2008 onwards until they were moved out in 2011 by ANPN and the Gabonese military (ANPN, 2013).

Djouah Bélinga is south-east of Minkébé NP on the Republic of Congo border. The estimate of 4,035 from 2002 (Lahm & Barnes, pers. comm., 2006) has been degraded to a guess.

A **dung count** of Mwagna National Park and its proposed extension to the north-west in 2012 (Maisels & Akou, 2012) gave an estimate of 1,680 (1,254 to 2,251) elephants for the whole area, of which 81% were in the park. This replaces a 2004 guess of 2,483 (Lahm & Barnes, pers. comm., 2006). A 2004 guess of 151 elephants is available for the Mwagna buffer area (Maisels & Strindberg, 2012).

The Plateaux Batéké National Park in the extreme south-east of the country is largely composed of savanna with small areas of forest. A reconnaissance **dung count** in 2006 (which was not reported in the AESR 2007) gave a **guess** of 301 elephants (Maisels & Strindberg, 2012). However 337 elephants have been individually identified in clearings to the north-west of the park (Douckaga, 2014) of which 17 were recognisable from the Batéké population just across the border with Congo.

A **dung count** of Ivindo NP and its southern buffer zone in 2009 gave an estimate of 3,489 ± 732

elephants (Maisels et al., 2010) of which 82% were in the park. This replaced an estimate of 1,216 (730-2,000) (Maisels, pers. comm., 2006). As the area surveyed in 2009 was 11% larger than the 2005 area, this was recorded as a **different area**.

A **dung count** was carried out in Lopé NP, in the centre of Gabon, in 2009. This gave an estimate of 4,142 (2,508-6,842) (Bezangoye & Maisels, 2010), replacing an estimate of 2,350 (1,385 to 4,200) from a similar survey in 2005 (Maisels, pers. comm., 2006). A logging company started operations on the western border of the park after the end of the 2006 survey, which may have caused elephants to seek refuge in the park (Bezangoye & Maisels, 2010).

A reconnaissance survey of the neighbouring Waka National Park was carried out in 2006, giving a **new guess** of 690 (Maisels & Strindberg, 2012). The intervening Lopé-Waka corridor was surveyed using **line transects** and **dung counts** in 2008 giving an estimate of 1,343 ± 778 (Maisels et al., 2008). There were no previous estimates for these sites.

The Monts Birougou National Park was not marked as elephant range in the AESR 2007 and this has been changed to **known range**. A **dung count** was carried out in 2007 which gave an estimate of 216 (168-554) elephants (Aba'a & Bezangoye, 2007) and this is recorded as a **new population**.

A reconnaissance survey of the Monts de Cristal area, along the border with Equatorial Guinea, in 2006 gave an estimate of 2,416 elephants (Aba'a, 2006; Maisels & Strindberg, 2012). This replaces an estimate from a smaller area of 1,396 from 2001 (Lahm & Barnes, pers. comm., 2006).

Several new **dung counts** have been carried out of elephant populations along the Gabon coast. However, Pongara NP in the north was not surveyed and an estimate of 344 ± 152 (Latour, 2006) has been retained from the AESR 2007.

Wonga-Wongue Presidential Reserve was surveyed in 2011 for the first time, giving an estimate of 1,039 (601-1,797) (new analysis of the raw data by Maisels, Motsaba & Aba'a, 2012). Some of these elephants visit savanna areas in the reserve and monthly **aerial total counts** are conducted. Just over 1,000 elephants were seen in a single flight in 2015 and it is thought that there may be 2,000-3,000 elephants (Fay, pers. comm., 2016). A reconnaissance survey was carried out of the previously unsurveyed Evaro area in the swamps of the Ogooue Delta in 2006, but this was not included in the AESR 2007. This gave a **guess** of 469 (Maisels & Strindberg, 2012).

Several surveys have been carried out of different parts of the Gamba Forest Complex. A **dung count** was carried out in Loango NP in 2007, resulting in a guess of 290 elephants (Maisels, pers. comm., 2016e). A **transect survey** of the Kivoro logging concession was carried out in 2008 (Blake et al., 2012) which gave an estimate of 900 elephants (231-1,617). There was a previous estimate of 11,205 ± 969 from 1999 (Thibault et al., 2001) for the entire area but this is not comparable because a larger area was covered and a different decay rate was used.

A survey of the Mayombe area, further south along the coast, gave a **new estimate** of 299

elephants (299-634) (Aba'a et al., 2011) and there was a **new guess** from a reconnaissance survey for Mayumba NP of 80 (Maisels & Strindberg, 2012).

Finally, a small part of the Moukalaba-Doudou NP and a part of the adjacent Sette Cama Reserve was surveyed in 2011 giving an estimate of 236 (183-304) (Ngoran, pers. comm., 2014).

Using the model of Maisels, Strindberg, et al. (2013b) and excluding the sites for which specific estimates are available, the remaining unsurveyed suitable for-est habitat is predicted to contain 32,378 elephants.

Range Area	880,648 km² (20%)
Protected Range	35 %
Information Quality Index (IQI)	0.49

CURRENT ISSUES

Eastern Africa has been the region most affected by poaching, having experienced an approximately 50% decline in estimates from surveys since the AESR 2007, largely attributed to a greater than 60% decline in Tanzania's elephant numbers, including heavy losses in some of the region's formerly most significant populations.

The free flow of small arms in the region, providing a ready supply for poachers (Small Arms Survey, 2015), continues to be of concern. While major economic development has been underway in Ethiopia, Kenya, Rwanda, Uganda and Tanzania, political instability continues to cause problems for elephant conservation in South Sudan and Somalia. Extensive land transformation for agricultural expansion and exploration by extractive industries is taking place and elephant habitats are increasingly being fragmented, degraded and lost.

Eastern Africa has 16 MIKE sites. Mount Elgon National Park MIKE site in Uganda has not submitted any carcass data since the MIKE programme began in 2002. While reporting rates vary, the remaining 15 sites have submitted carcass data between 2007 and 2015. After a peak in 2011, 2015 was the fourth consecutive year in which the PIKE value declined in Eastern Africa. The PIKE value for Eastern Africa in 2015 is comparable to the levels recorded in the region in 2008 but is higher than the values for the five years prior to that (Figure 1, on the following page). (CITES Secretariat, 2016).

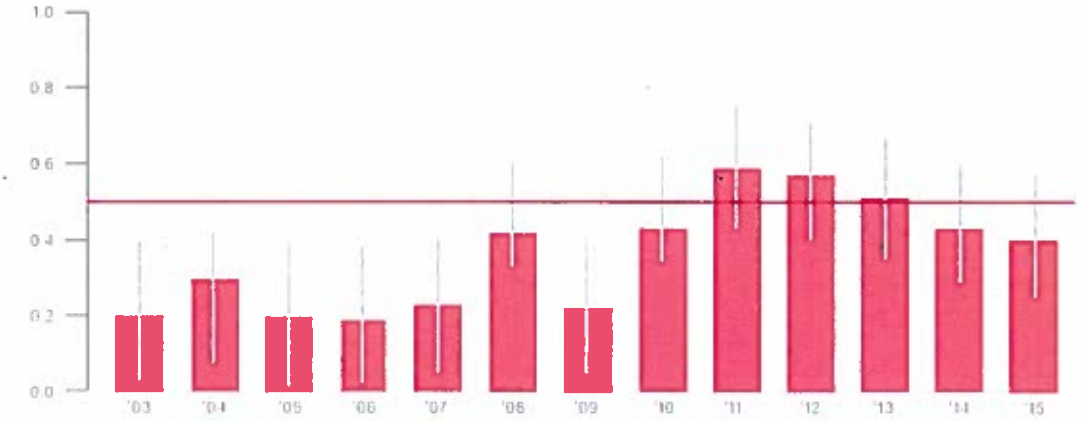

FIGURE 1: *Eastern African PIKE trends with 95% confidence intervals (CITES Secretariat, 2016)*

In recent analyses of seizure data prepared for CITES, Ethiopia, Kenya, Tanzania and Uganda were identified as countries with a worrying involvement in illegal ivory trade (CITES Secretariat, 2012; Milliken et al., 2013, 2016) and are currently part of the National Ivory Action Plan process. Further details are provided in the country summaries.

NUMBERS AND DISTRIBUTION

The estimated number of elephants in areas surveyed in the last ten years in Eastern Africa is 86,373 ± 10,549 at the time of the last survey for each area. There may be an additional 11,973 to 12,060 elephants in areas not systematically surveyed. Together, this estimate and guess apply to 548,587 km^2, which is 62% of the estimated known and possible elephant range. There remains an additional 38% of range for which no elephant population estimates are available.

Between the AESR 2007 and this report, elephant numbers in Eastern Africa have declined by about 87,000, on the basis of updated estimates for sites where comparable survey techniques were employed. However, some populations have been surveyed for the first time and this has led to an increase of approximately 9,000 in the "new population" category. The result is that the current total number of elephants from surveyed populations represents a smaller estimated reduction of almost 79,000 elephants, still close to a 50% loss, during the period from late 2006 to the end of 2015.

The proportion of elephant range for which elephant estimates are available currently stands at 62%, an increase from 38% in the previous report. In fact, the AESR 2016 shows an important, essentially reversed situation from the AESR 2007, which reported approximately 40% assessed and 60% unassessed range for Eastern Africa. Furthermore, the overall reliability of estimates has increased considerably, with estimates from systematic surveys now accounting for 53% of total range, versus 38% in the previous report. The overall quality of information, as measured by the IQI, has also increased from 0.36 to 0.49.

The large reported losses, primarily due to poaching in Tanzania, account for much of the continent's overall decline since the AESR 2007. The Selous and Ruaha-Rungwa ecosystems suffered the heaviest losses. Other areas, such as the Moyowosi-Kigosi and Sagara-Nyamagoma ecosystem and Ugalla Game Reserve also suffered losses, primarily from 2009–2013. Although Tanzania remains an important range state with about 50,000 elephants, this has been a catastrophic time

for elephants in that country, which is especially tragic following the strong recovery they experienced following the last poaching crisis in the 1970s and 1980s.

Despite worrying levels of poaching, and continued concerns over the trafficking of illegal ivory through the region, Kenya and Uganda's overall populations have remained stable with indications of small but not significant increases in the latter. All estimates from Kenya's forest populations were degraded due to age, though a new round of forest surveys have recently been initiated. Kenya's elephant stronghold remains in the Tsavo National Park and its surrounding areas. The Laikipia-Samburu population lost some elephants to poaching but over the 10-year period there was a slight increase. There were concerning levels of poaching in Masai Mara and surrounding areas.

Both Ethiopia's slight increases and South Sudan's more substantial increases probably result from an improvement in knowledge rather than genuine increment in elephant numbers. Most of South Sudan's elephant populations were surveyed for the first time in many years from 2007-2010. The resurgence of civil unrest in South Sudan has made it impossible to carry out surveys more recently. Rwanda's elephant numbers remain stable at just over 100 elephants in two widely-separated populations. The fate of elephants in Eritrea and Somalia remains unknown.

No populations are recorded as having been lost in Eastern Africa.

There has been no net increase in range but improved information has led to an increase in the proportion of known range, which has increased from approximately 500,000 km^2 (57% of overall range) in the AESR 2007 to approximately 736,000 km^2 (about 85% of total range) in 2015. This is mostly the result of better information on range in South Sudan and Tanzania but also a real increase in range in the Laikipia-Samburu and Magadi areas in Kenya.

Country Area	121,320 km²
Range Area	5,275 km² (4%)
Protected Range	0 %
Information Quality Index (IQI)	0.00
CITES Appendix	I
Listing Year	1994 (year of accession)

CURRENT ISSUES

Elephants in Eritrea are confined to the small area of Gash-Setit along the Ethiopian border in the southwest of the country. Continued tension between Eritrea and Ethiopia make conservation and research difficult in this area. The elephants are not within a protected area and conflicts with farmers are common (Shoshani et al., 2004).

A study of the genetics of Eritrean elephants indicates that they are savanna elephants, with limited genetic diversity (Brandt et al., 2014).

No elephant action plan has been developed for Eritrea.

NUMBERS AND DISTRIBUTION

There may be 100 to 120 elephants in areas of Eritrea which have not been systematically surveyed. This guess likely represents a minimum number, and actual numbers could be higher than those reported. It applies to 5,275 km², which is the entirety of the estimated known and possible elephant range.

There is very little recent information on the status of Eritrea's elephant population, with no surveys since 1997 (Litoroh, 1997a, 1997b). Brandt et al. (2014) suggested there may be as many as 120 elephants and this has been entered as an **informed guess**, replacing the previous guess of 104 (Shoshani, pers. comm., 2006). Since this is a cross-border population with Kafta Sheraro National Park in Ethiopia, there is a possibility that elephants may have been double counted.

No changes have been made to the range map for this report, which is based on an old study of elephant sign and spoor. There appears to be a regular movement pattern, with elephants spending the dry season (October to March) in Eritrea and crossing the border twice every year to spend the wet season in Ethiopia. The mapped elephant range extends to the Sudanese border, but it is believed that elephants do not cross the border (Shoshani et al., 2004).

PFS

Priority for Future Surveys (PFS) is ranked from 1 to 5 (highest to lowest). Based on the precision of estimates and the proportion of national range accounted for by the site in question, PFS is a measure of the importance and urgency for future population surveys. All areas of unassessed range have a priority of 1. See Introduction for details on how the PFS is derived.

Listing Year	1990

CURRENT ISSUES

Elephant populations in Ethiopia are mostly small and scattered, primarily occurring in the peripheral low-lying parts of the country, or in remnant forests. The formal establishment and gazettement of protected areas in Ethiopia took place in 2014. Delays in this process were in part due to the devolution of authority to a regional level. In many instances boundaries have not been demarcated and people continue to live in protected areas. There is little active management or patrolling of protected areas. Large-scale agricultural developments are a threat to a number of Ethiopia's remaining elephant populations, particularly around Omo and Gambella National Parks in the west of the country.

African Parks Network was responsible for the management of Omo NP (2005-2007) and has provided support to the management of Gambella NP since 2014.

The Ethiopian Elephant Action Plan (EEAP) was drafted in 2015, but remains under review.

In recent analyses of seizure data in ETIS, prepared for CITES, Ethiopia has been identified as a country with a worrying involvement in illegal ivory trade (CITES Secretariat, 2012; Milliken et al., 2013, 2016). Ethiopia was requested by the CITES Standing Committee, at its 65th meeting, to prepare a National Ivory Action Plan. Ethiopia's plan was submitted in January 2015 (CITES, n.d.-a). In March 2015, Ethiopia destroyed 6.1 tons of ivory from its national stockpile (BBC News, 2015b). Ivory trafficking through Bole Airport remains a concern, since it is an important hub for air traffic from the rest of Africa to the Middle and Far East.

CURRENT ISSUES CONT.

While elephant trophy hunting remains legal in Ethiopia, no quotas were declared to the CITES Secretariat between 2007 and 2015.

NUMBERS AND DISTRIBUTION

The estimated number of elephants in areas surveyed in the last ten years in Ethiopia is 1,017 at the time of the last survey for each area. There may be an additional 1,160 elephants in areas not systematically surveyed. This guess probably represents a minimum number, and actual numbers could be higher than those reported. Together, this estimate and guess apply to 18,598 km^2, which is 84% of the estimated known and possible elephant range. There remains an additional 16% of the estimated range for which no elephant population estimates are available.

There has been an increased estimate of about 700 elephants since the AESR 2007, largely because of the increase in numbers observed in Gambella NP. Previously there had been much uncertainty about the status of the elephant population of Gambella NP, in the far west of the country, and it was not known whether elephants were resident, or only visiting from the Boma area of South Sudan. A reconnaissance survey in 2009 found six elephants, and only four were seen in 2010 (TFCI, 2010). However, during an aerial total count in 2013, 337 elephants were seen (Grossmann et al., 2013). In 2015, 550 elephants were observed in the south-west of the park in an aerial total count, and another 56 were seen during the course of an **aerial sample count** of the wider ecosystem (Mònico & Schapira, 2015). This replaces a guess of 200 from 2002 (Ethiopia Wildlife Conservation Organization, 2002). Radio-collared elephants moved in a single large herd along the southern edge of the park close to the South Sudanese border and south-east to the Akobo CHA (Rolkier et al., 2015); using this information a new area of **known range** has been added to the range map, and the amount of **possible range** reduced. A point record to the north of Gambella has been added for a sighting during the 2015 survey.

While Mizan Teferi Controlled Hunting Area was previously considered to be the main area for elephants in the south-western forests, more recent reports suggest that Chebera Churchura National Park, which was gazetted in 2014, holds the largest remaining population. Ground counts from 2012-14 in Chebera Churchura indicated that there were 420 elephants (Ali, pers. comm., 2016). No details were given so this is treated as an **informed guess**, which replaces the previous informed guess of 60 from 2001 (Chago et al., 2001). The AESR 2007 included an old guess of 500 elephants for Mizan Teferi, which has been replaced by a new **informed guess** of 20 (Ali, pers. comm., 2016).

The elephant population in the Omo Valley is believed to move between Omo and Mago National Parks and the intervening Tama Controlled Hunting Area, and possibly into South Sudan. This population is under pressure from the development of sugar plantations in Tama (Chase et al., 2014a). During a **sample aerial count** in 2014, no elephants were observed on transect but 411 elephants were seen in Omo NP and 32 in Mago NP (Chase et al., 2014a). However, it is thought that there are more elephants in Mago NP and an estimate of 80 has been used (Ali, pers. comm., 2016). The previous guess for both Omo and Mago was 324-524 elephants in 2002 (Demeke, pers. comm., 2006).

NUMBERS AND DISTRIBUTION
CONT.

There have been occasional reports of elephants in the Geralle National Park to the south of the country. It is not known whether this is a resident population, or if it moves between Ethiopia and Kenya. Local residents reported about 50 elephants in this area in 2015 (Ali, pers. comm., 2016). There was no estimate in the AESR 2007. An area of **possible range** has been added.

A helicopter-based aerial survey in 2014, carried out as part of the Great Elephant Census, only located 36 elephants in the Babille Elephant Sanctuary (Chase et al., 2014a), but elephant are difficult to count from the air when they are in thick riverine vegetation. A ground count, also in 2014, estimated 250 elephants, which has been treated as an **informed guess** (Ali, pers. comm., 2016). The previous informed guess was 264 in 2005 (Demeke, pers. comm., 2006).

A ground survey in 2014 of the Kafta-Sheraro National Park (previously Shire Wildlife Reserve) in the north of Ethiopia (a transfrontier population shared with Eritrea) indicated that it contains about 300 elephants (Ali, pers. comm., 2016). This **informed guess** replaces an old total count estimate of 12 for the neighboring Shire and Tekezze Valley areas (Litoroh, 1997b).

It is estimated that there are 20 elephants in the Alitash National Park (Ali, pers. comm., 2016). This is likely to be a transfrontier population with Dinder National Park in Sudan. There was no estimate for this population in the AESR 2007. An area of **possible range** has been added.

There is an **informed guess** of 20 elephants close to the Sudanese border in the Dabus Valley Controlled Hunting Area on the Blue Nile (Ali, pers. comm., 2016). This replaces a guess of 200 from 1998 (Abdi, pers. comm., 1998).

AFRICAN ELEPHANT STATUS REPORT 2016

COUNTRY

Kenya

ESTIMATED TOTAL ELEPHANTS

22,809 ± 0

GUESSES

8,023 - 8,090

GENERAL STATISTICS

Country Area	582,650 km²
Range Area	130,725 km² (22%)
Protected Range	27%
Information Quality Index (IQI)	0.59
CITES Appendix	I
Listing Year	1990

CURRENT ISSUES

There was an upsurge in poaching between 2008 and 2012, particularly in Laikipia-Samburu and Tsavo. This had reduced by 2014-15 due to improved law enforcement, and increased penalties for illegal killing of endangered species, including elephants laid out in a new Wildlife Conservation and Management Act (Republic of Kenya, 2013).

In 2012, Kenya adopted the Conservation and Management Strategy for the Elephant in Kenya, 2012 -2021 (Litoroh et al., 2012).

In analyses of seizure data in ETIS, prepared for CITES, Kenya was identified as a country with a worrying involvement in illegal ivory trade (CITES Secretariat, 2012; Milliken et al., 2013, 2016). Kenya was requested by the CITES Standing Committee, at its 65th meeting, to prepare a National Ivory Action Plan, which was submitted to CITES in 2015, and is now in the process of being implemented (CITES, n.d.-a).

In July 2011, Kenya destroyed approximately 5 tonnes of ivory from its national stockpile (BBC News, 2011). In February 2015, Kenya destroyed approximately 15 tonnes of ivory from its national stockpile (BBC News, 2015a) and in April 2016 destroyed a further 105 tonnes of ivory (Gettleman, 2016).

NUMBERS AND DISTRIBUTION

The estimated number of elephants in areas surveyed in the last ten years in Kenya is 22,809 at the time of the last survey for each area. There may be an additional 8,023 to 8,090 elephants in areas not systematically surveyed. These guesses likely represent a minimum number, and actual numbers could be higher than those reported. Together, this estimate and guess apply to 104,711 km², which is 80% of the estimated known and possible elephant range. There remains an additional 20% of the estimated range for which no elephant population estimates are available.

Since the AESR 2007, a decrease of about 1,200 elephants has been recorded in population estimates from surveys and an increase of about 1,500-2,400 in guesses. This is largely because of the degrading of data quality from old forest surveys, rather than any real population changes. There was an increase of about 1,100 elephants in areas where repeat surveys had been carried out.

Tsavo National Park and its surrounding areas have the largest elephant population in Kenya. Total and sample aerial counts were carried out nearly simultaneously in 2014 as part of the Great Elephant Census. The **aerial sample count** gave an estimate of 14,087 ± 21% (Chase et al., 2014b) compared to the aerial total count of 11,158 (Kyale et al., 2014). Although sample counts generally give more accurate results than total counts, the total count has been used for consistency with previous estimates. This replaces an estimate from an aerial total count in 2005 of 10,397 elephants (Omondi & Bitok, 2005). An aerial total count was also carried out in 2011, which gave an estimate of 12,182 (Ngene et al., 2013b).

At the end of 2015, there were 1,656 **individually registered** elephants in the Amboseli ecosystem (Fishlock, pers. comm., 2016) compared to 1,417 at the end of 2005 (Poole, pers. comm., 2006). This apparent stability conceals substantial drought mortality in 2009 followed by rapid growth - there has been very little poaching. An aerial total count in 2013 gave an estimate of 1,281 (Kenana et al., 2013) and aerial sample count in 2014 gave an estimate of 1,736 ± 77% (Chase et al., 2014b).

There has been an increase in the number of elephants seen in the Magadi area (which includes part of the Nguruman Hills) together with an expansion of range. Four hundred and forty nine elephants were counted in 2013 in an **aerial total count** (Kenana et al., 2013). This replaces a guess of 120-150 for the Ngurumans from 2005 (Mwathe et al., 2006).

An **aerial total count** of the Masai Mara ecosystem was carried out in 2014 as part of the Great Elephant Census (Mduma et al., 2014) giving an estimate of 1,428 elephants. This replaces a comparable estimate of 2,116 from 2002. However, there was another aerial total count in 2010 which gave a surprisingly high estimate of 3,069 (Kiambi et al., 2012). There were high levels of illegal killing in the Mara ecosystem, which peaked in 2012 (Poole et al., 2016). Elephants move between the Masai Mara and Serengeti National Park in Tanzania (Poole et al., 2016).

The elephants in the TransMara forests to the west of the Masai Mara have come under severe pressure as a result of deforestation and their range has reduced. It is now guessed that there are only 100 elephants in the area (Sitati, pers. comm., 2016) compared to an informed guess of 513 ± 49 from a dung count carried out in 2007 (Sitati & Bitok, 2007). This new **informed guess** replaces one of 200 ± 139 from 1997 (Wamukoya et al., 1997).

There is no new information on elephant numbers from the Mau Forest Complex to the north of the Masai Mara and a guess of 1,003 from the early 1990s has been retained but its reliability degraded due to age (Njumbi et al., 1995). It is likely that there has been a significant reduction in elephant numbers in this area, due to parts of the forest being converted to agriculture.

An **aerial total count** of the Laikipia-Samburu ecosystem was carried out in 2012 which gave an estimate of 6,365 elephants (Ngene et al., 2013a). This replaces another total count estimate of 5,447 from 2002 (Omondi et al., 2002a), although the population estimate had risen to 7,415 in 2008 (Litoroh et al., 2010). The decline between 2008 and 2012 was associated with high reported poaching levels from 2008 to 2014 as well as a drought in 2009 (Ngene et al., 2013a). A combined total and sample count was carried out as part of the Great Elephant Census in 2015, giving an estimate of 7,134 ± 786 (Chase et al., 2014b). However, this survey differed both in methodology and area from previous surveys of the ecosystem, so is not directly comparable.

The old estimate for Loroki Forest, which is part of the Laikipia-Samburu ecosystem, has been replaced by a **other guess** of zero (Thouless, pers comm., 2016) since most of the elephants present in the forest in the dry season would probably have been counted in the wet season surveys of surrounding areas.

Range expansion has taken place in the north-east of the Laikipia-Samburu ecosystem, linked to the development of community based conservation and the recovery of elephants from the poaching of the 1970s to 1980s, which eliminated them from the area (Douglas-Hamilton, pers. comm., 2016b).

A **dung count** was carried out of Mt Marsabit in 2014, giving an estimate of 100 (72–139) elephants (Kiambi et al., 2014). This replaces an informed guess of 150 (Omondi, pers. comm., 2006). Eighty six elephants were counted in an aerial total count in 2012 (Ngene et al., 2013a) and 55 were seen in an aerial total count carried out as part of the Great Elephant Census in 2015 (Chase et al., 2016).

An **aerial total count** was carried out of the core of the Meru ecosystem in 2015 as part of the Great Elephant Census, giving an estimate of 659 animals (Chase et al., 2016). This replaces an estimate of 377 from an aerial total survey in 2002 (Omondi et al., 2002c) although an aerial total count in 2007 gave a total of 747 elephants (Mwangi et al., 2007). It is unlikely that there are significant numbers of elephants left in Kora National Park and Rahole National Reserve but there is a new **guess** of zero (Kiambi, 2016) and an estimate of 27 from 2007 (Mwangi et al., 2007) for these areas.

No detailed survey of the Mt Kenya National Park and Forest Reserve has been carried out since the **dung counts** carried out by Vanleeuwe (2004) which gave an estimate of 2,911 ± 640. This figure is being retained, in preference to a survey from 2009 (Ngoru et al., 2009), which was probably an over-estimate since reconnaissance data was analysed as line transect data. There has never been a full survey of the Aberdares National Park and the surrounding forests, including the Kipipiri Forest Reserve and the combined estimate of 3,553 from the AESR 2007 has been retained (Bitok & Kones, 2005) although this is also likely to be an over-estimate for the same reason as the 2009 Mt Kenya survey.

An **aerial total count** of the small fenced population of elephants in the Mwea National Reserve was carried out as part of the Great Elephant Census in 2016, giving an estimate of 71 elephants (Chase et al., 2016), replacing a ground count estimate of 55 from 1998 (Managene & Musoki, 1998). Another aerial total count in 2012 found 90 elephants (Ngene et al., 2012).

There are a number of small coastal elephant populations, which are difficult to count because they inhabit densely forested areas. An **aerial total count** of Shimba Hills National Reserve, Mkongani Forest Reserve and Mwaluganje Elephant Sanctuary was carried out in 2012, giving an estimate of 274 individuals (Ngene & Mukeka, 2012). This replaces an estimate of 649 ± 151 from a dung count carried out in 2002 (Litoroh, 2002a). One hundred and fifty elephants were translocated out of the Shimba Hills to Tsavo NP after the 2002 survey (Pinter-Wollman et al., 2009).

The Arabuko-Sokoke Forest Reserve is now fenced. The old estimate of 184 ± 43 from a dung count carried out in 2002 has been retained but degraded due to age (Litoroh, 2002b).

A small population of elephants lives in Lamu District along the lower reaches of the Tana River and be-tween the river and the Somali border. An **aerial total count** was carried out as part of the Great Elephant Census in 2015 (Chase et al., 2016) and 60 elephants were counted. However, it is difficult to count elephants in thick woodland, so there may be more elephants here. This replaces a series of guesses amounting to 182 elephants (Knocker, pers. comm., 2003, 2005; Litoroh, pers. comm., 2003). At least one elephant has moved from this area to just across the border in Somalia (Douglas-Hamilton, pers. comm., 2016a).

A **total aerial count** was carried out of the Kerio Valley, and the Nasalot and South Turkana National Reserves in western Kenya in 2015 (Chase et al., 2016). Three hundred and eleven elephants were seen in the Kerio Valley and 351 in South Turkana (total 662). This replaces an estimate of 490 for the whole area in 2002 (Omondi et al., 2002b). Another total aerial count in 2010 gave an estimate of 362 elephants (Edebe et al., 2010). Since the area between South Turkana NR and the Kerio Valley is heavily settled, and no elephants have been seen here in recent surveys, it has been changed to **possible range**.

No systematic surveys have been carried out in the Mt Elgon forests bordering Uganda since the last update. However there are currently thought to be about 200 elephants (Redmond, 2015), compared to a guess of 139 from 2002 (Bitok, pers. comm., 2002).

GENERAL STATISTICS

Country Area	26,340 km²
Range Area	1,079 km² (4%)
Protected Range	100%
Information Quality Index (IQI)	0.70
CITES Appendix	I
Listing Year	1990

CURRENT ISSUES

Rwanda is one of Africa's smallest and most densely populated nations and there is little space for wildlife. Only two fragments of elephant range remain: the Akagera National Park on the north-eastern border with Tanzania, to which elephants were translocated in the mid-1970s, and the Volcans National Park on the northern border with the DRC. In 2010, the African Parks Network took over responsibility for the management of Akagera NP (Sullivan, 2014).

Rwanda published an elephant conservation plan in 1991, although this is now 25 years out of date (Office Rwandais du Tourisme et des Parcs Nationaux, 1991).

NUMBERS AND DISTRIBUTION

The estimated number of elephants in areas surveyed in the last ten years and at the time of the last survey in Rwanda is 88. There may be an additional 37 elephants in an area not systematically surveyed. This guess likely represents a minimum number, and actual numbers could be higher than those reported. Together, this estimate and guess apply to 1,079 km², which is the entirety of the estimated known and possible elephant range.

There have been minor changes in elephant population estimates in Rwanda since AESR 2007. The Akagera population appears to be stable or increasing, although survey methodologies have not been consistent.

NUMBERS AND DISTRIBUTION
CONT.

After the elephant population of Akagera NP in eastern Rwanda was eliminated in the early 1960s, 22 elephants were translocated to Akagera NP from Bugusera, south of Kigali (Van de Weghe, 1990). The number of elephants subsequently increased, despite a reduction in the size of the park. The most recent survey, an **aerial total count** carried out in 2013 (Macpherson, 2013a), provided an estimate of 88 individuals. This replaces a guess of 34-80 from 2002 based on an aerial sample count (Lamprey, 2002). A sample count in 2010 gave an estimate of 27 individuals (Viljoen, 2010). A dung count was also conducted in 2006 (Parker, 2006); the elephant population estimate for the lakeside stratum was 28 (17-45). Due to a low dung encounter rate, it was not possible to calculate dung density and elephant numbers for the highland stratum. Elephants used to move between Akagera and Ibanda, Burigi and Biharamulo in Tanzania, but their passage was restricted by high levels of refugee settlement on the Tanzanian side starting in the mid-1990s (TAWIRI, 2015c) and it is unlikely that such movements continue.

The estimate of 37 for the Volcans NP has been retained (Gray, pers. comm., 2005) but degraded due to age. The range has been left as known because of recent reports that there are still elephants (Kanyesigye, 2013), and confirmed records just across the border in Virunga NP in DRC.

Range Area	4 525 km² (1%)
Protected Range	0 %
Information Quality Index (IQI)	0.00
CITES Appendix	I
Listing Year	1990

CURRENT ISSUES

Ongoing political instability in Somalia has made conservation assessment work impossible for over 25 years, and it is not known whether there is still a resident elephant population in the country.

It has been suggested that the Al-Shabaab insurgents derive much of their income from the illegal ivory trade. However, a detailed review in 2015 indicated that any Al-Shabaab involvement in the ivory trade is likely to have been opportunistic, ad hoc and small-scale (Maguire & Haenlein, 2015). Ivory was reported to be openly for sale in Mogadishu in 2015 (Amir, pers. comm., 2016).

Somalia published an elephant conservation plan in 1991 (National Range Agency, 1991) and it has not been updated since.

NUMBERS AND DISTRIBUTION

It is unknown whether there is still a resident elephant population in Somalia. There may be 70 elephants in areas not systematically surveyed. This guess applies to 3,089 km², which is 68% of the estimated known and possible elephant range. There remains an additional 32% of the estimated range for which no elephant population estimates are available.

There is only one area, in the far south of the country and adjacent to the border with Kenya, which remains categorised as possible range while the Juba and Webi Shabeelli valleys remain as doubtful range.

NUMBERS AND DISTRIBUTION CONT.

The only estimate remaining, for Lag Badana-Bushbush (Bauer, pers. comm., 1995), has already been degraded to the category of 'other guess'. Local residents reported in 2016 that elephants were regular visitors to the area, but not resident (Amir et al., 2016). A collared elephant from Kenya moved briefly into the border regions of Somali in 2016 (Douglas-Hamilton, pers. comm., 2016a). Press reports in 2015 suggested that security operations in the Boni-Dodori area of Kenya had driven elephants north into Somalia (Mohamed, 2015).

PFS

Priority for Future Survey (PFS) is ranked from 1 to 5 (highest to lowest). Based on the precision of estimates and the proportion of national range at country for by the site in question, PFS is the measure of the importance and urgency for future population surveys. All areas of unassessed range have a priority of 1. See Introduction for details on how the PFS is derived.

Listing Year	-

CURRENT ISSUES

South Sudan acquired its independence from Sudan in 2011, after a long running civil war which ended in 2005. Efforts were made by the new country to develop a conservation programme and to support protected areas, but these were suspended when a new civil war broke out in 2013. A series of surveys, which took place from 2007-2010, gave hope that more elephants had survived than was previously thought, but there may have been a reduction in numbers thereafter. A third of the 60 elephants collared by the Wildlife Conservation Society from 2010 were believed to have been poached (Russo, 2014).

An elephant conservation plan was developed for Sudan in 1991 (Winter, 1991), but this has not been updated or replaced and there is no current plan for South Sudan.

NUMBERS AND DISTRIBUTION

The estimated number of elephants in areas surveyed in the last ten years in South Sudan is 7,103 ± 5,911 at the time of the last survey for each area. This estimate applies to 129,362 km², which is 42% of the estimated known and possible elephant range. There remains an additional 58% of the estimated range for which no elephant population estimates are available.

In the AESR 2007, no survey results were reported for Sudan except for a guess for Nimule National Park, so there is no information on change in numbers. Results from the 2007-2010 aerial surveys have allowed a more accurate delineation of range in the eastern part of the country. There is less certainty about range in the west since the surveys were less extensive in this area. With the

outbreak of civil war in late 2013, further survey work was no longer possible, and the planned surveys supported by the Great Elephant Census could not be carried out.

The largest surviving elephant population is in the Jonglei ecosystem, covering the Sudd swamplands of the White Nile. A low-intensity **aerial sample count** in 2007 gave an estimate of 5,462 ± 5,644 elephants (Fay et al., 2007). A sample count was carried out in 2010 of Shambe, a previously unsurveyed area to the south-east of the Sudd. Only five elephants were seen in transects so no estimate was given, but a total of 135 elephants was observed and entered as an **informed guess** (Grossman et al., 2011).

Boma National Park is in the south-east of the country, close to the Ethiopian border. An **aerial sample count** in 2007 gave an estimate of 606 ± 836 elephants (Fay et al., 2007). Radio-collared elephants have moved between Gambella National Park in Ethiopia and the area immediately north of Boma (Rolkier, 2015) and it is possible that elephants have been double-counted on both sides of the border. No elephants were observed in the Badingilo ecosystem to the west during the 2009 survey, but there were many tracks, suggesting that elephants use this area in the wet season (Grossman et al., 2011).

A few elephant signs were seen in 2008 in the Kidepo Game Reserve on the Ugandan border, suggesting that the elephants from this principally Ugandan population occasionally cross the border (Grossmann et al., 2008).

Nimule National Park is a small park on the White Nile, contiguous with the Ugandan border. A total aerial count in 2008 gave a minimum of 69 elephants (Grossmann et al., 2008), and a **dung count** from 2010-2012 indicated a population of 118 (47 to 297) (Tomor, 2015). This dung count replaces the 300 estimated in 2002 (Ojok, pers. comm., 2002) for the AESR 2007. Elephants move from here to the Otze Forest in Uganda (Tomor, 2015).

Southern National Park is in the south-west of the country. An **aerial sample count** in 2007 gave an estimate of 782 ± 1,425 elephants (Fay et al., 2007). This shows a significant reduction from the estimated 15,000 elephants in the area in the late 1970s (Boitani, 1981).

There have been recent camera trap photographs of what appear to be forest elephants in Western Equatoria (Flora & Fauna International, 2015). This is shown on the range map as a point record, with an approximate location.

CURRENT ISSUES

Tanzania still has important elephant populations, a large elephant range and significant coverage of protected areas, despite heavy losses of elephants in the west and south of the country. With a rapidly growing human population, the country faces serious challenges in conserving elephant populations. The loss of connectivity between core wildlife habitat areas is a growing concern as corridors are becoming blocked by expanding agriculture, human settlements and livestock grazing, and destruction of habitats for logging and charcoal production (TAWIRI, 2010).

In response to the poaching crisis, Tanzania adopted a national strategy to combat poaching and illegal wildlife trade in 2014 (Ministry of Natural Resources and Tourism, 2014). The country launched a major anti-poaching operation - Operation Tokomeza, in 2013, which was halted after a few months due to allegations of human rights abuses (Legal and Human Rights Centre, 2015). In 2015 there were significant successes in anti-trafficking efforts, with some arrests of middlemen and poachers (John, 2016; Saria & Tesha, 2016).

Tanzania's most recent conservation plan, the Tanzania Elephant Management Plan, covered the period from 2010 to 2015 (TAWIRI, 2010).

In recent analyses of seizure data in ETIS, prepared for CITES, Tanzania was identified as a country with a worrying involvement in illegal ivory trade (CITES Secretariat, 2012; Milliken et al., 2013, 2016). Tanzania was requested by the CITES Standing Committee to prepare a National Ivory Action Plan. The plan was finalized in May 2013, and a number of progress reports have been submitted to CITES (CITES, n.d.-a). Information from DNA analyses have indicated that

ivory from many large-scale ivory seizures has originated from Tanzania (Milliken et al., 2013; Wasser et al., 2015).

Tanzania is the only country in Eastern Africa with active legal trophy hunting of African elephants, declaring an annual export quota of 400 tusks (as hunting trophies from 200 animals) from 2007 to 2013, and a decreased annual quota of 200 tusks (as hunting trophies from 100 animals) in 2014 and 2015. The United States and the European Union have suspended imports of elephant trophies from Tanzania (EU, 2015; USFWS, 2015b).

NUMBERS AND DISTRIBUTION

The estimated number of elephants in areas surveyed in the last ten years in Tanzania is 50,433 ± 8,502 at the time of the last survey for each area. There may be an additional 1,930 elephants in areas not systematically surveyed in the country. These guesses likely represent a minimum number, and actual numbers could be higher than those reported. Together, this estimate and guess apply to 273,031 km^2, which is 70% of the estimated known and possible elephant range. There remains an additional 30% of the estimated range for which no elephant population estimates are available.

Tanzania has lost the majority of its estimated elephant population in the last ten years, with a reduction of more than 90,000 elephants from areas with repeat surveys. Some doubts have been expressed about the previous high estimates, particularly in the Selous and Ruaha-Rungwa ecosystems, but even so, there has been a large decline in numbers as a result of poaching for ivory.

Substantial changes have been made to the range map, primarily resulting from better knowledge coming from survey work done by the Tanzania Mammal Atlas Project (Foley, pers. comm., 2016). These include an increase in **known range** in the Longido area to the north, continuous range between Saadani National Park and Mikumi National Park and an extension of **known range** in the west towards Mahale National Park and south towards Zambia.

A 2014 **aerial sample count** of the Moyowosi-Kigosi ecosystem as part of the Great Elephant Census gave an estimate of 1,645 ± 2,389 (TAWIRI, 2015d), which replaces an estimate of 9,541 ± 3,657 in 2006 (TAWIRI, 2007b). To the south is the Sagara-Nyamagoma ecosystem, and the same survey gave an estimate of 503 ± 592, which replaces the 2007 estimate of 4,635 ± 3,028 (Tanzania Wildlife Research Institute, 2007). For Ugalla Game Reserve the estimate was 659 ± 549, with a very high carcass ratio of 26%, which replaces the 2007 figure of 4,133 ± 1,778 (TAWIRI, 2007b). For areas outside Ugalla Game Reserve, an estimate of 146 ± 278 replaces 1,352 ± 837 (TAWIRI, 2007b). Not all of these areas show a statistically significant decline, but the combined results point to a collapse in elephant numbers.

The 2014 **aerial sample count** of Katavi National Park and Rukwa Game Reserve, part of the Great Elephant Census (TAWIRI, 2015a) gave an estimate of 5,738 ± 2,993 for the entire ecosystem. This estimate replaces one of 6,261 ± 1,344 from 2006 (TAWIRI, 2007b). However, it should be noted that the 'outside' survey covered a larger area in 2014 so this estimate is not directly comparable. Other surveys were carried out in 2009 giving an estimate of 6,396 ± 3,763 (TAWIRI, 2009b) and again in 2012 giving an estimate of 7,107 ± 5,149 (TAWIRI, 2015a). None of these surveys have

provided statistically different estimates, suggesting that the population has been relatively stable over this period. However, the carcass ratio of 10% in 2014 (TAWIRI, 2015a) is a cause for concern.

The 2015 **aerial sample count** of the Ruaha-Rungwa ecosystem gave an estimate of 14,283 ± 6,123 (TAWIRI, 2015f) which replaces the 2006 figure of 35,409 ± 11,507 (TAWIRI, 2007b). A high carcass ratio of 15% supported the evidence of a substantial decline in numbers (TAWIRI, 2015f). Two intermediate surveys were carried out. An aerial sample count conducted in 2013 gave an estimate of 20,090 ± 6,433 (TAWIRI, 2013b), with a carcass ratio of 15%. Another aerial sample count conducted in 2014 as part of the Great Elephant Census gave a much lower estimate of 8,272 ± 3,181 (TAWIRI, 2015f) and a carcass ratio of 29%. This is believed to have underestimated true numbers, as elephants appeared to have moved out of Ruaha-Rungwa to an area in the west which was not surveyed (TAWIRI, 2015f). A survey in 2009 gave an estimate of 34,664 ± 8,188 (TAWIRI, 2009b), indicating that the major decline took place after this date. The 2015 survey also covered the Itigi Extension, which had not previously been surveyed, giving an estimate of 1,553 ± 2,956.

Figures from two areas not surveyed in 2014 have been retained from the AESR 2007. These are a guess of 600 from the Inyonga Game Conservation Area between Rungwa and Rukwa from 2002 (Angelides, pers. comm., 2003) and a guess of 200-300 from the Piti East Hunting Block just to the south of Inyonga from 2002 (Hurt, pers. comm., 2002).

The **aerial sample count** of the Selous-Mikumi ecosystem carried out in 2014 as part of the Great Elephant Census gave an estimate of 14,040 ± 3,252 with a very high carcass ratio of 40% (TAWIRI, 2015b), which replaces the estimate of 70,406 ± 24,843 in 2006 (TAWIRI, 2007a). However, there are concerns that the 2006 survey may have been an over-estimate (TAWIRI, 2009a) and the confidence limits allow for a wide range of population values. Other surveys carried out in 2009 and 2013 gave estimates of 38,975 ± 5,182 with a 2% carcass ratio and 13,084 ± 3,559 with a 30% carcass ratio (TAWIRI, 2009a, 2013a). The combination of a reduction in estimates together with a high carcass ratio indicates that the Selous elephant population has been significantly reduced in the last ten years.

In 2014 there was an estimate of 16 ± 31 from an **aerial sample count** in the Masasi area south of Selous (TAWIRI, 2015b) and 1,161 ± 1,341 in the Selous Niassa corridor (TAWIRI, 2015b) which replace estimates of 1,076 ± 107 from 2000 (Mduma, pers. comm., 2002a) and 0 from 2000 (TAWIRI, 2001) respectively, although somewhat different areas were surveyed. There was an additional estimate for Selous Niassa, of 4,577 ± 1,126, from 2009 (TAWIRI, 2009a).

During the course of an **aerial sample count**, part of the Great Elephant Census, of the Burigi-Biharamulo ecosystem in 2014, no elephants were counted in the sampling strips, but a single observation was made of 110 elephants (TAWIRI, 2015c). This replaces a previous estimate of 761 ± 821 from 2000 (Mduma, pers. comm., 2002b). Another count was carried out in 2012 in which 30 elephants were seen (TAWIRI, 2013a). The area has been under constant threat since 1994, with refugee incursions and invasions by cattle (TAWIRI, 2015c).

An **aerial total count** of Tarangire National Park and surrounding areas in northern Tanzania

was carried out in 2014 as part of the Great Elephant Census, giving an estimate of 3,282 for the Tarangire NP and 797 for surrounding areas (TAWIRI, 2015e). These estimates replace 1,119 for the Tarangire NP and 183 for the surrounding areas from 2006 (TAWIRI, 2007b).

An additional 19 elephants were recorded for Mto wa Mbu, an area which had not previously been counted. The population increase is too high to be explained solely through natural increase, and is probably affected by immigration. Lake Manyara National Park was counted in the same **aerial total count** in 2014 (TAWIRI, 2015e) giving an estimate of 104, which replaces the previous estimate of 36 (TAWIRI, 2007b); there was also a count of 94 in 2009 (TAWIRI, 2009b).

An **aerial total count** of the Serengeti ecosystem was carried out as part of the Great Elephant Census in 2014, giving an estimate of 6,087 (Mduma et al., 2014) replacing the estimate of 1,472 from 2006 (TAWIRI, 2007b). An aerial total count in 2009 gave an estimate of 2,941 (TAWIRI, 2009b). Movement from Kenya's Masai Mara ecosystem may account for some of this increase, as well as higher intensity surveys, additional blocks counted and the possibility of immigration of elephants from unsurveyed adjoining areas. An **aerial total count** of the adjoining Loliondo Game Controlled Area gave a zero estimate in 2009 (TAWIRI, 2009b), compared to one of 88 in 2006 (TAWIRI, 2007b).

An **aerial total count** of the West Kilimanjaro/Lake Natron system, which connects with Amboseli in Kenya, was carried out in 2013 and gave an estimate of 200 elephants (Kenana et al., 2013). This replaces an aerial total count of 79 from 2002 (TAWIRI, 2003). An old guess of 793 for the adjoining Kilimanjaro Forest Reserve has been retained (Munishi & Maganga, 2003).

The Arusha NP elephant population was estimated at 200 individuals in 2014 (TAWIRI, 2015a), and was not in the AESR 2007, so it is recorded as a **new population**.

Mkomazi National Park shares an elephant population with the much larger Tsavo National Park in Kenya, and elephant numbers are affected by movements across the border. In 2014 an **aerial total count** gave an estimate of 59 (Kyale et al., 2014), which replaces a count of 41 from 2005 (Omondi & Bitok, 2005).

A single herd of 30 elephants was seen in the coastal Saadani NP in 2014 (TAWIRI, 2015a), replacing a previous guess of 55 from 1998 (Mduma, pers. comm., 2002b).

Rubondo Island in Lake Victoria has an introduced population of elephants. A **dung count** was conducted in 2014, resulting in an estimate of 102 ± 35 (Mwambola et al., 2016). This replaces a guess of 20 from 2002 (Borner, pers. comm., 2003).

CURRENT ISSUES

Elephant numbers in Uganda were reduced to a very low level by the late 1980s as a result of poaching for ivory and conflict for land with Uganda's dense human population (Uganda National Parks, 1991). Since then elephant populations, which are mostly confined to a small number of protected areas, are believed to have slowly increased.

Elephant poaching is currently at a significantly lower level than it was during the years of civil unrest and insecurity during the late 1970s and early 1980s but an upward trend has been detected in recent years (Harrison et al., 2015).

In recent analyses of seizure data in ETIS, prepared for CITES, Uganda has been identified as a country with a worrying involvement in illegal ivory trade (CITES Secretariat, 2012; Milliken et al., 2013, 2016). Uganda was requested to prepare a National Ivory Action Plan which was finalized in May 2013 and a number of progress reports have been submitted (CITES, n.d.-a).

In 2015, as part of the Elephant Protection Initiative, Uganda developed a draft national strategy for elephant management.

NUMBERS AND DISTRIBUTION

The estimated number of elephants in areas surveyed in the last ten years in Uganda is 4,923 ± 2,012 at the time of the last survey for each area. There may be an additional 653 elephants in areas not systematically surveyed. These guesses likely represent a minimum number, and actual numbers could be higher than those reported. Together, this estimate and guess apply to 13,455 km², which is 79% of the estimated known and possible elephant range. There remains an additional 21% of the estimated range for which no elephant population estimates are available.

Although there has been an increase of nearly 1,000 elephants in the estimates for Uganda, confidence limits associated with these surveys are high, and this increase is not statistically significant.

Elephants in Uganda are largely confined to protected areas in the western region of the country, and most are thought to be savanna elephants. Some forest-savanna hybrids have been found in the south-west (Mondol et al., 2015).

An **aerial total count** of Kidepo Valley (including the Kidepo Valley NP and Karenga Community Wildlife Area) in the extreme north-east of Uganda was carried out in 2014, giving an estimate of 621 elephants (Wanyama et al., 2014c). This replaces a total count estimate of 454 from 2005 (Rwetsiba & Wanyama, 2005). Other aerial total counts were con-ducted in 2008 (WCS Flight Programme, 2008) and 2012 (Wanyama, 2012) giving estimates of 387 and 502 respectively. An aerial sample count carried out in 2012 gave an estimate of 656 ± 663 (Wanyama et al., 2014c). In the 1990s, elephants of Kidepo mostly occurred in a single group in the vicinity of the park headquarters, but as numbers have increased, their range has expanded into the Kidepo Valley to the east of the park, and into the Karenga corridor to the south. The range map has been amended and a new area of **known range** was added to show this. There are believed to be movements between Kidepo NP and adjacent range in southern Sudan and, sporadically, into north-western Kenya (Grossmann et al., 2008).

There are still small numbers of elephants in the Otze Forest but they are probably not resident and come from Nimule National Park in South Sudan (Tomor, 2015). A **guess** of six from 2004 (Lamprey, pers. comm., 2015) replaces the earlier guess of 200 from 1998 (Michelmore, pers. comm., 1998).

An **aerial sample count** was conducted in the Murchison Falls Conservation Area (including Murchison Falls National Park) in 2014, resulting in an estimate of 1,352 ± 900 (Wanyama, et al., 2014b). This estimate replaces a comparable one of 516 ± 635 from 2005 (Rwetsiba & Wanyama, 2005). Additional aerial sample count surveys were conducted in 2010 (Rwetsiba & Wanyama, 2010) and 2012 (Rwetsiba et al., 2012) giving estimates of 904 ± 333 and 1,617 ± 1,174 respectively. The majority of elephants are found on the north bank of the Victoria Nile, but there are extensive patches of woodland on the south bank and elephants there may be under-recorded in aerial surveys. Oil exploration has been carried out in the northern part of Murchison Falls NP and some road and well infrastructure has been constructed. In order to study the impact of this development, a number of elephants were fitted with radio collars (Plumptre et al., 2015a) and the **known range** has been extended to the north-east using information from this study.

NUMBERS AND DISTRIBUTION
CONT.

The status of elephants in East Madi and the Madi corridor, north of Murchison Falls National Park, is uncertain. An aerial sample survey carried out in 2008 found no elephants in the area (WCS Flight Programme, 2008) but 19 were reported as having been seen in the corridor in 2009 (Edward, 2009). Radio-collared elephants have been recorded moving north from Murchison NP but not as far as East Madi, so this area has been changed to **possible range** (Rwetsiba et al., 2012).

An **aerial sample count** of the Queen Elizabeth Conservation Area (including Queen Elizabeth National Park) was carried out in 2014 giving an estimate of 2,904 ± 1,800 (Wanyama et al., 2014a). This replaces a comparable 2006 estimate of 2,959 ± 1,476. Another sample count was carried out in 2010, giving an estimate of 2,502 ± 1,440 (Plumptre et al., 2010). Total counts were conducted in 2010, 2012 and 2014 giving estimates of 1,570, 3,018 and 2,561 respectively (Plumptre et al., 2010; Wanyama, 2012; Wanyama et al., 2014a). Part of the reason for this variability in numbers may be movements of elephants between Queen Elizabeth NP and Virunga National Park across the border in the DRC. This has been demonstrated by movements of elephants fitted with radio collars in Virunga NP in 2015 (Douglas-Hamilton, pers. comm., 2016b).

An aerial total count was carried out in the Toro Semliki Wildlife Reserve in 2013, giving a minimum estimate of 27 elephants (Wanyama, 2013) and the UWA provides an **informed guess** of 27 (Uganda Wildlife Authority, 2016). This replaces a guess of 80 from 1998 (Michelmore, pers. comm., 1998). Forty- seven elephants were counted in another aerial total count in 2010 (Wanyama, 2013).

There are some new **guesses** from other areas of elephant range in the vicinity of Queen Elizabeth NP, including 11 in the Mgahinga Gorilla National Park and 43 in Bwindi National Park (Uganda Wildlife Authority, 2016). A guess of 30 from the Semliki National Park (Michelmore, pers. comm., 1998) and one of 20 in Rwenzori National Park (Keigwin, pers. comm., 2005) have been retained from the AESR 2007.

There is a new estimate of 487 elephants in Kibale National Park from a **dung count** in 2010 (Uganda Wildlife Authority, 2016) which replaces an estimate of 393 ± 210 (Wanyama, 2005). There is a remnant population of perhaps 20 elephants in the Katonga Game Reserve, east of Kibale NP (Uganda Wildlife Authority, 2016). These elephants are thought to have once been part of a larger population extending to Kibale NP, but are now isolated.

Elephants are still believed to occur in the Sango Bay area in the south of Uganda and there is a new **guess** of 36 (Uganda Wildlife Authority, 2016) replacing an old guess of 30 (Michelmore, pers. comm., 1998).

CURRENT ISSUES

Southern Africa continues to hold by far the largest number of elephants on the continent, and nearly 75% of southern Africa's elephants occur as part of a single population in the Kavango Zambezi Transfrontier Conservation Area (KAZA TFCA), some 520,000 km² in extent. Whereas conservation challenges associated with high elephant densities in large protected areas were common in the region a decade ago, contemporary elephant conservation in southern Africa is now also faced with the emergence of a growing poaching threat (UNEP et al., 2013). While overall, poaching has not had the same impact in Southern Africa as in other regions, it has severely affected populations in Zimbabwe, Angola, Mozambique, and to a lesser extent, Zambia.

As human population growth has often not been matched by regional economic growth, many unemployed people either remain at or have returned to their rural homes from urban areas (Taylor, 2009). These communally owned unprotected areas have previously provided up to 60% or more of elephant range (Blanc et al., 2007; Cumming & Jones, 2005). However, habitat encroachment and transformation, together with ivory poaching, growing human-wildlife conflict and unsustainable bushmeat harvesting increasingly threaten the survival of elephant populations in these areas (Ripple et al., 2015). Poor governance could become potentially threatening for the long-term survival of elephants in southern Africa (CITES Secretariat, 2014).

Under the Convention on International Trade in Endangered Species of Fauna and Flora (CITES), there are ten sites in Southern Africa for Monitoring the Illegal Killing of Elephants (MIKE). Elephant carcass data from these sites can be used to calculate the Proportion of Illegally Killed Elephants (PIKE). For Southern Africa between 2007 and 2015 the PIKE values show an increasing

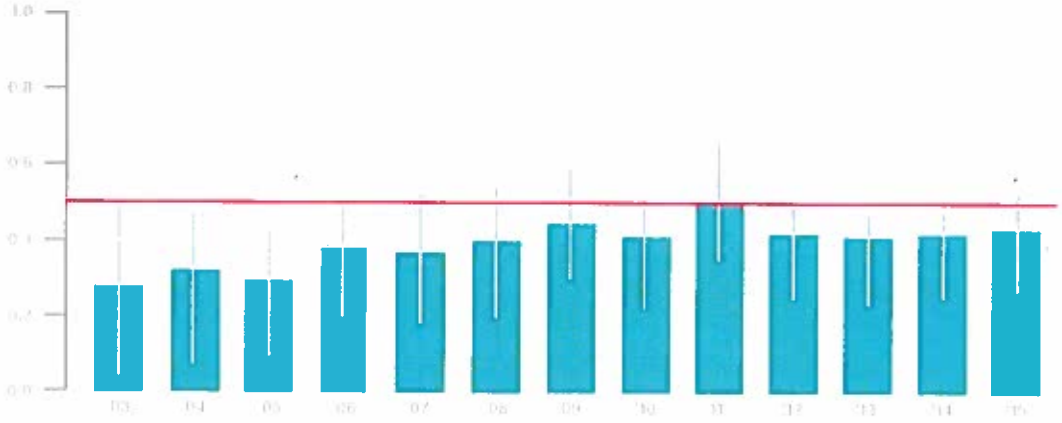

FIGURE 1: *Southern African PIKE trends with 95% confidence intervals (CITES Secretariat, 2016)*

trend, with a spike of 0.5 in 2011. PIKE levels above 0.5 (i.e. where half of dead elephants found are deemed to have been illegally killed) are considered to be unsustainable and Southern Africa is the only region whose overall PIKE values have not risen above 0.5 since 2003 (Figure 1) (CITES Secretariat, 2016).

In response to the challenge of increased poaching of elephants, rhinos and other wildlife, in 2015 the Southern African Development Community (SADC) ministers responsible for environment and natural resources approved the SADC Law Enforcement and Anti-Poaching Strategy 2016-2021 (SADC, 2015). The 2005 Southern Africa Regional Elephant Conservation and Management Strategy (SADC, 2007) is in need of revision.

In recent analyses of seizure data from the Elephant Trade Information System (ETIS), prepared for CITES, a number of countries in Southern Africa have been identified as having a worrying involvement in illegal ivory trade (CITES, 2012; Milliken et al., 2013, 2016). Angola and Mozambique have been requested to prepare and implement National Ivory Action Plans.

Whereas all populations of the African elephant have been listed in CITES Appendix I since 1989, those of Botswana, Namibia and Zimbabwe were transferred to Appendix II in 1997 and South Africa's was transferred in 2000. In 2008, these four elephant range states conducted a one-off legal sale of 101,766 kg of raw ivory to approved trading partners in China and Japan (CITES, 2009; Wijnstekers, 2011) (Table 1).

		Weight (kg)	*Price USD*
Sellers	Botswana	43,153	$7,093,551
	Namibia	7,583	$1,147,369
	South Africa	47,348	$6,702,695
	Zimbabwe	3,764	$487,162
Buyers	Japan	39,434	$6,545,374
	China	62,333	$8,990,622

TABLE 1: *Ivory sales in 2008 (Wijnstekers, 2011)*

NUMBERS AND DISTRIBUTION

The estimated number of elephants in areas surveyed in the last ten years in Southern Africa is 293,447 ± 16,682 at the time of the last survey for each area. There may be an additional 15,157 to 16,672 elephants in areas not systematically surveyed. These guesses likely represent a minimum number, and actual numbers could be higher than those reported. Together, this estimate and guess apply to 734,824 km², which is 55% of the estimated known and possible elephant range. There remains an additional 45% of range for which no elephant population estimates are available.

Between the AESR 2007 and this report, elephant numbers in Southern Africa have declined by almost 30,000, on the basis of updated estimates for sites where comparable survey techniques were employed. However, some populations have been surveyed for the first time and this has led to an increase of approximately 3,000 in the 'new population' category. The result is that the current total number of elephants from surveyed populations represents a smaller estimated reduction of about 27,000 elephants. Although there have been real declines in Mozambique and Zimbabwe, the main contributor to this decline is a reduction in the estimate for Botswana, which may be the result of uncounted elephants, range expansion, increased poaching or methodological differences between surveys.

Southern Africa has a relatively high reliability and quantity of elephant information, especially for the larger populations. Although overall survey coverage has increased since 2007, largely as a result of the Great Elephant Census carried out in 2014-2015, there is still wide variation amongst countries.

One population was recorded as having been lost from Angola.

The proportion of elephant range for which elephant estimates are available currently stands at 55%, an increase from 53% in the previous report. The overall quality of information, as measured by the IQI, has increased from 0.48 to 0.50.

There is reliable information available for Botswana, Namibia, Swaziland, South Africa, Zambia and Zimbabwe. In Angola, only the south east region of the country has been surveyed, and one population in the Bongola area on the Angola-Namibia international border has been reported as lost (Vaz Pinto & Verissimo, pers. comm., 2014). Detailed nationwide surveys of elephant abundance and distribution are urgently needed in Angola. Surveys in Mozambique, although improved, have been spatially and temporarily variable and have used different techniques, apart from in the Niassa ecosystem in the north. Malawi with its high human population and small fragmented elephant population has relied mostly on total counts or informed guesses.

Southeast Angolan and southwest Zambian elephant populations continue to experience losses to poaching (Chase & Schlossberg, 2016, DNPW, 2016). Population trends from repeat surveys in northern Botswana remain equivocal. Mozambique's elephant population has been reduced by an estimated 25%, mostly in the north due to severe poaching.

In Namibia the elephant population has increased, notably in the north-east Kavango and Zambezi Regions. South Africa's elephant population, mostly contained within Kruger National Park, is

NUMBERS AND DISTRIBUTION
CONT.

increasing, with small but growing numbers of elephants in other provincial and private reserves. Zambia's elephant population appears to be relatively stable apart from losses in the south-west of the country which amount to approximately 2% of the overall population. Zimbabwe's elephant population has declined due to reductions in two populations, partially compensated by increases in two other populations.

The current range area for Southern Africa is 1,325,998 km^2, a slight increase from the 1,305,000 km^2 recorded in the AESR 2007, and the percentage of this which is known range has increased from 53% to 60%. There has been no major loss of elephant range, and one notable expansion of range in Botswana where elephants were observed in large groups for the first time in the Central Kalahari Game Reserve (DWNP, 2016). Other changes result from improved information, particularly in Angola.

CURRENT ISSUES

Although elephant conservation and monitoring started in Angola after the end of the civil war in 2002, it has concentrated largely in the south-east of the country. A detailed nationwide study of elephant distribution and density is urgently required. Threats include poaching, illegal wildlife trade, human population expansion and settlement together with subsistence agriculture, fire and logging activities. There are weak incentives for elephant conservation and law enforcement is poor due to limited staff and capacity.

Wildlife legislation in Angola is limited largely due to the challenges of rebuilding administrative and governmental infrastructure after decades of conflict. Angola published an elephant conservation plan in 1991, although this is now seriously out of date (Instituto de Desenvolvimento Florestal, 1991). The development of a new plan was underway as of June 2016.

A study in Luanda in 2006 (Milliken et al., 2006) exposed a large and unregulated domestic ivory market in Luanda and eight years later this market was still flourishing with over 10,000 recently carved and illegal ivory items reported (Svensson et al., 2014; Vigne & Martin, 2014). It is believed that the majority of this ivory comes from forest elephants in countries such as the DRC. The increased demand for worked ivory was believed to be linked to the rising number of Chinese citizens working in Angola.

In recent analyses of seizure data in ETIS, prepared for CITES, Angola has been identified as a country with a worrying involvement in illegal ivory trade (CITES Secretariat, 2012; Milliken et al.,

2013, 2016). Angola, a Party to CITES since 2013, was requested by the CITES Standing Committee to prepare a National Ivory Action Plan which it submitted in February 2015 (CITES, n.d.-a). Commencing in May 2016, the Government of Angola enacted a ban on domestic trade of ivory (Hungerford, 2016).

NUMBERS AND DISTRIBUTION

The estimated number of elephants in areas surveyed in the last ten years in Angola is 3,396 ± 1,562 at the time of the last survey for each area. There may be an additional 96 to 111 elephants in areas not systematically surveyed in Angola. These guesses likely represent a minimum number, and actual numbers could be higher than those reported. Together, this estimate and guess apply to 41,847 km², which is 13% of the estimated known and possible elephant range. There remains an additional 87% of the estimated range for which no elephant population estimates are available.

The national totals show an increase of nearly 2,000 in estimated numbers. However, this is a result of a larger proportion of the main elephant population being covered than in earlier surveys, rather than a real increase.

Elephants are believed to be present in the far north and far south of the country, with forest elephants in the north-west and savanna elephants in the north-east and south (Enock, pers. comm., 2002), although the genetic status of these elephants has not been confirmed.

In 2015 an **aerial sample count** survey was carried out between the Kwando and Cuito-Kavango rivers in the south-east of Angola (Chase & Schlossberg, 2016). Elephants in this area form part of the KAZA transboundary population. The survey gave an overall estimate of 3,396 ± 1,562 elephants. This replaced an estimate of 1,827 ± 598 from the Luiana Partial Reserve in 2005 (Chase & Griffin, 2011). The 2015 survey expanded the range covered to include Cubango Game Reserve in the west and Mavinga on the Kwando to the north (though no elephants were sighted there). Data extracted by Chase and Schlossberg (Chase & Schlossberg, 2016) from their 2015 dataset for Luiana PR only, provided a comparable estimate of 1,437 ± 600 elephants, which although lower than the 2005 results, was not significantly so. The overall carcass ratio from the 2015 survey was 30%, suggesting a high level of mortality.

Thirty two elephants from South Africa were introduced to the Quiçama National Park by the Kissama Foundation in 2000 and 2001 and put into a 10,000-hectare, fenced, "soft release" area in the north of the park. In a 2015 survey 89 elephants were counted in the release area (Carmignani, 2015), and there were believed to be another 50 individuals in the rest of the park in 2002 (Vaz Pinto, pers. comm., 2003).

There is a small population of perhaps 10-25 elephants living on the escarpment to the east of Luanda in the Kambondo forest (Hines, pers. comm. 2015) and sightings of these elephants are marked as point records.

Reports were received in 2012 of more than 20 elephants moving across the border from Angola, spending time in the south-western part of Congo (Mbende et al., 2012) and this area is marked as **known range**.

NUMBERS AND DISTRIBUTION
CONT.

In the AESR 2007 there was an estimate of 60 elephants in the Bongola area on the Namibia border from 1992, but since this is no longer marked as elephant range, it has been removed and this is recorded as a **lost population**.

There is also a small area of elephant range in the Cabinda Enclave, a separate section of Angola surrounded by DRC and the Republic of Congo (Heffernan, 2005) but there is no estimate for this area.

Substantial changes have been made to the range map (Vaz Pinto & Verissimo, pers. comm., 2014). These include the removal of a large area of **possible range** in the dry south-west part of the country, the addition of a new area of **possible range** on the Zambian border, and a more defined range, including some **known range**, both east of Luanda and on the border with the DRC.

CURRENT ISSUES

Botswana has by far the largest elephant population of any country in Africa. The vast majority occur in the north of Botswana within the Kavango-Zambezi Transfrontier Conservation Area (KAZA TFCA), shared by Botswana, Namibia, Zambia, Zimbabwe and Angola, and elephants move between these countries.

Poaching of elephants by armed gangs has become an increasing threat in northern Botswana. Anti-poaching is undertaken by the Department of Wildlife and National Parks (DWNP), the Botswana Defence Force (BDF) and the Botswana Police (KAZA Secretariat, 2014a). DWNP has recently produced an approved National Anti-Poaching Strategy (Blackbeard, pers. comm., 2014).

The National Policy and Strategy for the Conservation and Management of the African Elephant was published in 2003 (DG Ecological Consulting, 2003). It is now outdated and in need of revision.

In 2008, Botswana undertook an approved one-off sale of 43,153 kg of ivory to Japan and China, at a total price of USD $7,093,551 (Wijnstekers, 2011).

Botswana declared an export quota of 600 tusks and other hunting trophies in 2007. The annual export quota for tusks and other hunting trophies fluctuated from 600 to 800 between 2009 and 2014. However, in 2014 a ban was placed on trophy hunting in the country and in 2015 a zero quota for exports of elephant hunting trophies was declared (CITES, n.d.-a).

NUMBERS AND DISTRIBUTION

The estimated number of elephants in areas surveyed in the last ten years in Botswana is 131,626 ± 12,508 at the time of the last survey for each area. This estimate applies to 128,856 km², which is 57% of the estimated known and possible elephant range. There remains an additional 43% of the estimated known and possible elephant range for which no elephant population estimates are available.

The movement of elephants between northern Botswana and neighbouring countries requires that coordinated, simultaneous surveys are conducted to avoid the possibility of double counting or of missing animals entirely (KAZA Secretariat, 2014b). Counts flown of contiguous range in neighbouring countries were not synchronized with the 2014 Botswana survey.

The Botswana elephant population appeared to increase substantially from about 50,000 in 1990 to over 150,000 in 2006. However, this increase has been disputed (Junker et al., 2008). The estimate used in the AESR 2007 was the previously accepted national total of 154,658 ± 21,253 (Department of Wildlife and National Parks, 2006). More recent surveys have provided incompatible results. In 2010 and 2014 **aerial sample counts** of northern Botswana were undertaken by Elephants without Borders (Chase et al., 2015; Songhurst & Chase, 2010) and in 2012 and 2013 surveys were conducted by DWNP (DWNP, 2012). Results from the 2013 survey have not been released. The other surveys gave estimates of 128,340 ± 9,938 (2010), 207,545 ± 21,771 (2012) and 129,939 ± 12,501 (2014). These differences are so great that they are more likely to result from differences in survey technique or calculations rather than real population change or elephant movements.

Although a new total of 129,939 ± 12,501 from the Great Elephant Census in 2014 (Chase et al., 2015) has been included in the AED, this result raises questions with respect to the 2010 and 2012 surveys. It indicates no significant change since 2010 although a population that shows no evidence of serious poaching, excessive natural mortality or high levels of net emigration would be expected to show some increase. Compared to the 2012 survey results, the 2014 estimate would indicate a marked decline that is unlikely in the absence of any other indicators. Given that the KAZA TFCA transboundary population is the largest elephant population in Africa, of which the majority is within Botswana, it remains of the highest priority to carry out a simultaneous and coordinated count of the entire population.

The 2014 survey report gave a carcass ratio of 7% for northern Botswana (Chase et al., 2015), which is not considered exceptionally high, as carcass ratios of up to 8% are considered typical of a stable or increasing elephant population (Douglas-Hamilton & Burrill, 1991). However, it shows a notable increase over the earlier carcass ratio of 2% in 2010 and 2012.

Botswana is one of the few countries in Africa with confirmed elephant range expansion for elephants. In recent years the range has increased to the west towards Namibia (Songhurst, pers. comm. 2016) as well as southwards with large herds sighted for the first time in the Central Kalahari Game Reserve (CKGR) (Mokhandla, pers. comm., 2016). The 2015 dry season **aerial sample count** in Ghanzi District estimated 797 ± 437 (DWNP, 2016) of which 411 ± 252 were in CKGR. This is the first time that elephants have been counted in this area.

NUMBERS AND DISTRIBUTION
CONT.

There is a population estimated at 890 elephants from an **aerial total count** in 2014 in the Tuli Block in the extreme eastern part of the country (Selier & Page, 2015). This is part of a larger transboundary population in the Greater Mapungubwe Transfrontier Conservation Area that includes South Africa and Zimbabwe. This replaces an estimate of 1,038 ± 685 (Department of Wildlife and National Parks, 2006).

CITES Appendix	I
Listing Year	1990

CURRENT ISSUES

Because of the country's high human population density, Malawi's elephants are almost entirely confined to protected areas. As a consequence, elephant populations in Malawi are small and fragmented. Human-elephant conflict is prevalent as a result, and poaching for meat and ivory is believed to be further reducing certain populations.

In an attempt to manage these populations a number of translocations have taken place in the last ten years. In 2006, 70 elephants were moved into Majete Wildlife Reserve from Liwonde National Park and a further 64 were moved in 2008 (Macpherson, 2012). In 2009, 83 elephants were moved into Majete WR from Phirilongwe Forest (Cunliffe, 2010).

Co-management of protected areas in Malawi is well established with the African Parks Network taking contractual responsibility for the management of Majete WR in 2003, and Liwonde NP and Nkhotakota Game Reserve in 2015.

In 2015, as part of the Elephant Protection Initiative, Malawi developed a draft 10-year national action plan for elephant management. This strategy is still under review. In addition Malawi is undertaking a review of the national wildlife policy (Ministry of Information, Tourism and Culture, 2014) as well as an illegal wildlife trade assessment (Lewis & Clark Law School, 2014).

In recent analyses of seizure data in ETIS, prepared for CITES, Malawi has been identified as a country with a worrying involvement in illegal ivory trade (CITES Secretariat, 2012; Milliken et al.,

2013, 2016). Malawi has formed an Inter-Agency Committee to Combat Wildlife Crime (The Times Group, 2016) and in 2013, suspended its domestic ivory trade. In March 2016, following a national ivory inventory, Malawi destroyed approximately 2.6 tonnes of ivory (Reuters, 2016).

NUMBERS AND DISTRIBUTION

The estimated number of elephants in areas surveyed in the last ten years in Malawi is 1,307 at the time of the last survey for each area. There may be an additional 398 elephants in areas not systematically surveyed. These guesses likely represent a minimum number, and actual numbers could be higher than those reported. Together, this estimate and guess apply to 5,616 km^2, which is 72% of the estimated known and possible elephant range. There remains an additional 28% of the estimated range for which no elephant population estimates are available.

An **aerial total count** was conducted by helicopter in Nyika National Park in 2013 in which 47 elephants were seen (Macpherson, 2013c). However, because elephants occur in heavily wooded and rugged country, it is likely that some were missed. This replaces a sample count estimate of 339 ± 239 from 1997 (Gibson, 1997). A ground survey in 2005 in part of the Nyika NP resulted in a zero estimate (Ferreira et al., 2005) and a total aerial count in 2009 also gave a zero estimate (WCS Flight Programme, 2009), showing the difficulty of carrying out surveys in Nyika NP. Since elephants were observed in the south-west of the park in the 2013 survey, an additional area of **known range** was added. This population extends a short distance into Zambia (Macpherson, 2013c).

In Vwaza Marsh Wildlife Reserve to the south-west of Nyika NP 310 elephants were observed during an **aerial total count** in 2013 (Macpherson, 2013d). This replaces a guess of 270 (Ferreira et al., 2005) based on an uncompleted survey. A lower intensity total count was carried out in 2009 with 151 elephants observed (WCS Flight Programme, 2009).

Kasungu National Park used to hold Malawi's largest elephant population. However, in 2014, only 40 elephants were counted in Kasungu NP during an **aerial total count** (Macpherson, 2015a) which was part of the Great Elephant Census. Elephants now only occur in the immediate vicinity of the park headquarters and the area of **known range** has been adjusted accordingly. This replaces an estimate from 2005 of 58 ± 218 (Ferreira et al., 2005).

A **ground sample count** of Nkhotakota Wildlife Reserve in 2013 provided an estimate of 92 elephants, compared to 169 in 2011 (Sichali & Mkumbwa, 2014). The 2013 estimate replaces one of 1,037 ± 1,511 from a sample block count in 1995 (Japan Overseas Forestry Consultants Association & Pasco International Incorporated, 1997). There are doubts as to the validity of the 1995 numbers, since even in the 1980s there were thought to be no more than 300 elephants in the reserve. The northern section has been changed to **doubtful range** (Macpherson, 2013b).

The Thuma and Dedza-Salima Forest Reserves lie on the escarpment between Lilongwe and Lake Malawi. In 2015 a minimum of 133 elephants were observed during a **ground total count** (Clifford, 2016). This replaces a guess of 30-50 from 1998 (Munthali, pers. comm., 1998). The area of **known range** has been refined to fit the actual distribution.

It is believed that six elephant remained in the Phirilongwe Forest after the translocation exercise (Kaunga-Nyirenda, pers. comm., 2014). This replaces a guess of 50 elephants from 1998 (Munthali, pers. comm., 1998).

Liwonde NP on the Shire River close to Lake Malawi holds Malawi's largest population. Seven hundred and seventy seven elephants were observed in an **aerial total count** in 2014, which was part of the Great Elephant Census (Macpherson, 2015b). This replaces a guess of 530 from 2006 (African Parks Foundation, 2006). Aerial surveys were carried out on an annual basis from 2007 to 2012, giving estimates from 404 to 696 (Macpherson, 2015b). This increase in numbers has taken place despite 134 elephants being translocated out of Liwonde. Variations in numbers may be due to seasonal movements to the north-east into the Mangochi Forest Reserve, which has been changed to **known range** (Macpherson, pers. comm., 2015c).

All of the elephants in the Majete WR were believed to have been exterminated by 2002. Two hundred seventeen elephants were translocated into the reserve between 2006 and 2009. A total aerial survey was carried out in 2012 during which 163 elephants were counted (Macpherson, 2012), but there are currently believed to be about 300 (Fearnhead, pers. comm., 2015), which seems more reasonable given the number brought in, and the limited amount of poaching. This **guess** replaces one of 70 from 2006 (African Parks Foundation, 2006). The **known range** has been expanded to cover the whole reserve, since the fenced elephant release area has been extended to include the whole reserve.

Listing Year	1990

CURRENT ISSUES

Mozambique has been severely affected by the recent upsurge in elephant poaching. This has been particularly striking in the country's largest population in the Niassa ecosystem (WCS, 2015b).

The Wildlife Conservation Society (WCS) co-manages Niassa National Reserve with the National Administration of Conservation Areas (ANAC) (WCS, 2015b). Considerable effort has gone into the rehabilitation of Gorongosa National Park, under joint venture arrangements with a private sector partner and foreign investor (Wilson, 2013).

In 2014 a new Biodiversity Law, which criminalises poaching, imposes deterrent sentences, and allows asset seizure, was signed into law (WCS, 2015b).

A five year strategy and action plan for the conservation and management of elephants in Mozambique was developed in 2010 (National Directorate of Conservation Areas, 2010).

Sport hunting of elephants is permitted in Mozambique. From 2007 to 2010, Mozambique's declared annual export quota increased from 80 (tusks as hunting trophies from 40 animals) to 200 (tusks as hunting trophies from 100 animals). The annual export quota of 200 remained from 2010 to 2015 (CITES, n.d.-b).

In recent analyses of seizure data in ETIS, prepared for CITES, Mozambique has been identified as a country with a worrying involvement in illegal ivory trade (CITES Secretariat, 2012; Milliken et al., 2013, 2016). Mozambique was requested by the CITES Standing Committee, at its 65th

meeting, to prepare a National Ivory Action Plan. Mozambique's plan was submitted in January 2015 (CITES, n.d.-a). In July 2015, Mozambique destroyed 2.4 tonnes of ivory from its national stockpile (Vaughan, 2015).

NUMBERS AND DISTRIBUTION

The estimated number of elephants in areas surveyed in the last ten years in Mozambique is 10,884 ± 2,228 at the time of the last survey for each area. There may be an additional 4,299 to 5,519 elephants in areas not systematically surveyed. These guesses likely represent a minimum number, and actual numbers could be higher than those reported. Together, this estimate and guess apply to 261,669 km², which is 82% of the estimated known and possible elephant range. There remains an additional 18% of the estimated range for which no elephant population estimates are available.

A country-wide aerial survey was carried out in 2008 (Agreco, 2008) and while it was undertaken at a low sampling intensity and did not cover all areas, it provided an important baseline. The country's most important population is in the far north, in and around the Niassa NR. Smaller populations occur in the west and centre of the country in Tete and Sofala Provinces and in the south in Gaza Province. The range map has been substantially altered using the information from the 2008 survey. Because surveys have been conducted using a variety of different techniques, it is not easy to compare the national estimates with those from the AESR 2007. The number of elephants estimated from systematic surveys in Mozambique has declined by about 4,000. However, this includes elephants in some areas that had not been previously surveyed, and there has actually been a decrease of about 9,000 in populations which have been surveyed using comparable techniques. There has also been a decline of about 3,000 in the guessed number of elephants.

An **aerial sample count** was conducted in the Niassa Ecosystem in 2014 as part of the Great Elephant Census, giving an estimate of 4,441 ± 1,360 (Grossman et al., 2014d), which replaces an estimate of 12,477 ± 2,111 from 2004 (Craig & Gibson, 2004). In 2009 and 2011 aerial sample count estimates of 20,118 ± 2,701 and 12,029 ± 2,531 were obtained (Craig, 2011a, 2009). There appears to have been a substantial population decline, which is supported by a carcass ratio of 42% in 2014. The 2009 result may have been an over-estimate (Booth & Dunham, 2014) or the result of elephants having moved into the area due to disturbance elsewhere (Craig, 2009).

The 2008 national elephant census (Agreco, 2008) indicated that there were elephants just to the south of Niassa. An additional 1,015 ± 591 elephants were counted in an extension zone on the southern boundary of Niassa in 2014 (Grossman et al., 2014d). In 2011 an **aerial sample count** gave an estimate of 333 ± 309 in the Chipanje Chetu area to the west of the Niassa Reserve, which was not counted in 2014 (Craig, 2012a).

The Quirimbas National Park to the south-east of Niassa was surveyed in 2011, in 2013 (Craig, 2012b, 2013) and in 2014 as part of the Great Elephant Census (Grossman et al., 2014c) giving estimates of 555 ± 448, 560 ± 460 and 328 ± 361 elephants respectively. The 2014 estimate replaces a guess of 2,000 from 2005 (Cumming & Jones, 2005). Estimates in a corridor linking Quirimbas NP to Niassa NR were 294 ± 231 and 306 ± 365 elephants respectively in 2013 and 2014 (Craig, 2013; Grossman et al., 2014c). The estimate for the Palma area of the Quirimbas ecosystem was 58 ± 83 (Craig, 2012b). The confidence limits associated with all these elephant estimates are too wide to draw

any conclusions about changes in numbers. However the carcass ratios were very high at 15% in 2011, 49% in 2013 and 45% in 2014, indicating an unsustainable offtake.

A ground survey of Gilé National Reserve was carried out in 2011-12 (Ntumi et al., 2012) which gave an **informed guess** of 21-166 elephants. This replaces a guess of 15-33 from 2002 (Ntumi, pers. comm., 2003).

Gorongosa National Park lost most of its large mammals during the civil conflict of 1977-1992. There were believed to be 2,000 elephants before the war compared to about 200 in 1994 (Cumming et al., 1994). An **aerial total count** in 2014 covering 50% of Gorongosa NP estimated at least 535 elephants (Stalmans et al., 2014), replacing an estimate of 22 from 2004 (Dunham, 2004), which suggests that numbers may be increasing (WCS, 2015).

A series of total counts, carried out in Marromeu Game Reserve since the mid-1960s (Bento et al., 2010), had been previously overlooked and thus no estimate was provided in the AESR 2007. In 2014, an **aerial sample count** was carried out as part of the Great Elephant Census, a few weeks after a helicopter count. The aerial sample count gave an estimate of 606 ± 634, which serves as the estimate for Marromeu GR, compared to 350 from the helicopter count (Grossman et al., 2014a).

An **aerial sample count**, which was part of the Great Elephant Census, estimated the elephant population in the Magoe area south of Lake Cahora Bassa in 2014 at 1,051 ± 721 and that of southern Tete Province further east at 604 ± 431 (Grossman et al., 2014b). These estimates replace an estimate of 1,628 ± 794 from 2003 (Dunham, 2004) and a guess of 2,260 to 3,910 from 1998 (Direcção Nacional de Florestas e Fauna Bravia, 1999) respectively. The 2014 survey had a high carcass ratio of 15%. Another aerial sample count in 2010 gave an estimate of 1,985 ± 1,102 (Dunham, 2010), suggesting that there had been no significant change between 2010 and 2014. No elephants were observed in the area north-west of Lake Cahora Bassa in 2014, compared to 90 in 2003 (Dunham, 2004). Note that the AESR 2007 incorrectly recorded an estimate of 1,718 elephants in this area. The 2014 survey did not cover the area between Lake Cahora Bassa and the Zambian border to the north, but there is recent evidence for the continued survival of elephants here (Jacobson, pers. comm., 2015) and the map shows the revised range based on this information.

An **aerial sample count** of Limpopo National Park and a southern extension along the South African border was carried out in 2014 as part of the Great Elephant Census (Grossmann et al., 2014e). This survey covered the entire national park and gave an estimate of 1,081 ± 641 elephants, which replaces an estimate of 630 (Whyte & Swanepoel, 2006) from a survey that covered only a section of the park. A further 173 ± 259 were estimated in the southern extension in 2014. There was a high carcass ratio of 17%. Fixed wing surveys were carried out in 2010 and 2013 but the results were considered unreliable (Grossmann et al., 2014e). A 2010 helicopter survey (Swanepoel, 2010) gave a minimum count of 1,007 elephants.

There are new records of elephants from the area north-east of the Limpopo Transfrontier Conservation Area, which includes Banhine National Park. In the AESR 2007, Banhine NP was shown as non-range with an estimate of zero. Five elephants were seen in an **aerial total count** of Banhine NP in 2012 (Stalmans, pers. comm., 2012) and further evidence of the survival of elephants

in this area was collected during the course of predator surveys (Andresen, pers. comm., 2015), so the area of **known range** has been modified accordingly. The numbers are likely to be low, however, as the 2014 Great Elephant Census survey of Gonarezhou in Zimbabwe covered the adjoining Massangena West area in Mozambique and no elephants were seen there (Dunham & van der Westhuizen, 2015).

Helicopter based counts were carried out in the Maputo Special Reserve in 2004, 2006, 2008, 2011 and 2012. During this period the maximum number counted was 348 in 2008 (Matthews, 2008) with a minimum of 80 in 2004. Although Bodasing and Cumbane (2013) counted 264 elephants in 2012, the authors considered that there were at least 400 elephants in the population (Bodasing & Cumbane, 2013). This count also included the Futi Corridor extension to Tembe Elephant Park in South Africa. The 2008 figure has been used in the report, since it is considered to be closer to the true number.

Some areas surveyed in 2008 have not been surveyed more recently, and a figure for the rest of Mozambique of 4,278 has been extracted from this dataset (Agreco, 2008). However, because of the uncertain overlaps in time and space with the other surveys this has been treated as an **informed guess**.

Listing Year	1997

CURRENT ISSUES

Namibia's elephants occur across the northern region of the country, mostly in national parks and community areas. Their range encompasses a wide variety of habitats, from the extremely arid north-west Kunene Region to the well-watered Zambezi (formerly Caprivi) Region, where the elephants form part of the KAZA transfrontier population. Although poaching has increased in the Zambezi Region in the past ten years, it is not seen as a significant threat in Etosha National Park or for populations in Khaudum National Park and Kunene Region.

Elephant hunting takes place in Namibia, and the revenue generated provides significant income to community conservancies (Naidoo et al., 2006). From 2007 to 2015, Namibia declared an annual export quota of elephant hunting trophies of 180, defined as tusks from 90 animals (CITES, n.d.-a).

Namibia's elephant management plan was published in 2007 (Ministry of Environment and Tourism, 2007).

In 2008, Namibia undertook an approved one-off sale of 7,503 kg of ivory to Japan and China, at a price of USD $1,147,369 (Wijnstekers, 2011).

NUMBERS AND DISTRIBUTION

The estimated number of elephants in areas surveyed in the last ten years in Namibia is 22,754 ± 4,305 at the time of the last survey for each area. There may be an additional 90 elephants in areas not systematically surveyed. These guesses likely represent a minimum number, and actual numbers could be higher than those reported. Together, this estimate and guess apply to 84,283 km^2, which is 52% of the estimated known and possible elephant range. There remains an additional 48% of the estimated range for which no elephant population estimates are available.

The elephant population of Namibia has continued to increase although, with wide confidence limits in aerial surveys and elephants moving across international borders, it is not possible to be precise about how great the increase in the national population has been.

There are four main populations, the transfrontier population (with Zambia, Angola, Botswana and Zimbabwe) in the Zambezi Region, in Khaudum National Park in the north-east, the Etosha National Park population, and the Kunene population in the north-west which includes the "desert" elephants.

There has been an increasing trend in elephant numbers in the Zambezi Region since surveys started in the 1980s. This is likely to have been a result of both natural growth and movement from neighbouring countries. **Aerial sample counts** were carried out in 2007, 2011, 2013, 2014, and 2015, giving estimates of 8,380, 10,847 ± 3,580, 9,165 ± 2,016, 14,097 ± 2,678 and 13,116 ± 3,413 (Chase, 2007; Craig & Gibson, 2013b, 2014; Craig, 2011b; Gibson & Craig, 2015a). The previous estimate in the AESR 2007 was 8,725 ± 2,206 (Kolberg, 2004). There was also a total count carried out in 2007 (Chase, 2007) and a sample count in 2008 (Kolberg, 2008). However the latter was carried out with an inexperienced crew and the results were thought to be a considerable underestimate (Kolberg, 2008).

The elephant population of Khaudum NP and the neighbouring community conservancies of Nyae Nyae and N≠a Jaqna have been established since the 1980s, with the provision of artificial water and movements across the border from Botswana. Three **aerial sample counts** were carried out in 2011, 2013 and 2015 giving estimates of 4,731 ± 1,940, 3,638 ± 1,164, and 6,413 ± 2,566 (Craig & Gibson, 2013a; Gibson & Craig, 2015b; MET, 2012). The 2015 figure replaces an estimate of 3,758 ± 2,289 for Khaudum, 61 ± 115 for N#a Jaqna (Kolberg, 2004) and 967 ± 481 for Nyae Nyae (Stander, 2004). None of these are significant differences.

There is a limited movement of elephants between Angola and the Kavango region to the north-west of Khaudum (Terblanche, 2016).

There is a small elephant population in the Mangetti area between Khaudum and Etosha. The AESR 2007 indicated that they occupy the Mangetti Game Reserve, whereas their range is actually concentrated around the Mangetti Cattle Ranch to the west, and also probably extends into the Ukwuangali communal area to the north. Ninety individuals were observed in Mangetti in 2015 (Lindeque, pers. comm., 2016). This **informed guess** replaces one of 20 from 2005 (Ministry of Environment and Tourism, 2005).

NUMBERS AND DISTRIBUTION
CONT.

Etosha National Park in northern Namibia has an increasingly isolated elephant population, since the perimeter fencing has been upgraded in recent years. There has been a gradual increase in elephant numbers, moderated by deaths from anthrax and poaching. Aerial sample counts were carried out in 2011 and 2012, giving estimates of 3,378 ± 1,756 and 2,810 (confidence limits not available) (Kolberg, 2012; MET, 2012). The most recent **aerial sample count** from 2015 gave an estimate of 2,911 ± 637 (Kilian, 2015) and replaces an estimate of 2,057 ± 598 from 2004 (Kilian & Kolberg, 2004).

It is technically very difficult to count the widely scattered elephant population in the Kunene Region, which includes the 'desert elephants' in the dry, western extremity of the range and there has been controversy about the numbers in this area. A combined sample block count and **aerial total count** was carried out by helicopter in 2011, giving an estimate of 314 ± 154 (MET, 2012). This replaces an estimate of 210 ± 157 from a 2005 survey (Ministry of Environment and Tourism, 2005). It should be noted that the count did not include the extreme northern part of the range around Opuwo, nor the farms to the south of Etosha. There has been some range expansion to both the south and north, with elephants now being resident in the Ugab river basin and about ten elephants resident in the northern Etanga area (Owen-Smith, pers. comm., 2014). The area of **known range** has been changed, and the Etanga group is shown as a point record on the map. The Kunene population appears to have been increasing in numbers and range, despite evidence that the 'desert elephant' sub-population in the Houanib and Houarusib dry riverbeds reduced from 42 to 31 between 2002 and 2015 (Ramey & Brown, 2015).

There are occasional sightings of elephants in livestock ranching areas to the south of their normal range in the area north and east of Windhoek. These are shown as point records on the range map (Hartman, 2014; The Namibian, 2014).

CURRENT ISSUES

Apart from the large population of elephants in the Kruger National Park, most of South Africa's elephant populations exist in relatively small fenced areas (Department of Environmental Affairs and Tourism, 2008), many of which are privately owned. In some places, local elephant overabundance has led to adverse impacts on other biodiversity and a number of management approaches have been undertaken. These include the use of immuno-contraception to control reproduction (Delsink et al., 2013).

Until 2008, there was little elephant poaching in South Africa. However this has recently changed, with increased poaching for ivory, particularly in Kruger National Park (AFP, 2014).

South Africa published a set of Norms and Standards for Managing African Elephants in 2008 (Department of Environmental Affairs and Tourism, 2008) and these were under review in 2014 (Department of Environmental Affairs, 2014).

In 2008, South Africa undertook an approved one-off sale of 47,346 kg of ivory to Japan and China, at a price of USD $6,702,695 (Wijnstekers, 2011). Trophy hunting of elephants is legal in South Africa, and from 2007 to 2015, the declared annual quota increased from 200 tusks as hunting trophies (from 100 animals) to 300 (CITES, n.d.-b).

In recent analyses of seizure data in ETIS, prepared for CITES, South Africa has been identified as a country with a worrying involvement in illegal ivory trade (Milliken et al., 2013, 2016).

NUMBERS AND DISTRIBUTION

The estimated number of elephants in areas surveyed in the last ten years in South Africa is 18,841 at the time of the last survey for each area. There may be an additional 8,425 to 8,435 elephants in areas not systematically surveyed. These guesses likely represent a minimum number, and actual numbers could be higher than those reported. Together, this estimate and guess apply to 28,203 km^2, which is 92% of the known and possible elephant range. There remains an additional 8% of the estimated range for which no population estimates are available.

There has been a reported increase of about 1,000 elephants in the form of estimates, and about 8,000 in guesses since the AESR 2007. While the major population in Kruger NP has increased substantially, the quality of information for other areas is lower than in the AESR 2007, and many areas that previously had documented surveys now have unsupported population figures, which means that elephant numbers are recorded as guesses.

South Africa's elephants are confined to protected areas, private reserves and other privately-owned properties, largely in the north and east of the country, though some populations remain – or are being newly established – in the far south. The largest population of elephants is found within and around Kruger NP, from where most of the elephants in other populations have been translocated.

Following implementation of a policy of managing landscapes rather than managing elephants, and the cessation of culling in 1994, the elephant population of Kruger NP has increased. Annual total counts were carried out until 2012, followed by an **aerial total count** in 2015 which gave an estimate of 17,086 (Ferreira et al., 2015). This replaces a count of 12,427 from 2006 (Whyte, 2007). Since 2003 the growth rate has slowed to 4.2% and this may be connected to the closure of artificial water sources in the park (Ferreira et al., 2015). Fences between Kruger and many neighboring private reserves have been removed, allowing free movement of elephants. However, there is no figure for the entire Kruger ecosystem, since one major private reserve has asked for its numbers to be aggregated with private reserves in other parts of the country (Garai, pers. comm., 2016). Elephants from Kruger NP move into adjacent areas of Mozambique, especially the adjoining Limpopo National Park. One radio-collared elephant from northern Kruger moved through Mozambique as far as Gonarezhou National Park in Zimbabwe (Henley, 2011).

The population at Addo Elephant National Park has increased slightly, with an overall count of 595 in 2012 (Ferreira et al., 2012), replacing one of 459 in 2005.

In Eastern Cape province there are two elephants in Knysna and two in the Great Fish River Provincial Reserve (Selier, pers. comm., 2016). In KwaZulu Natal, Hluhluwe-Imfolozi Game Reserve has 700 elephants, Ithala Game Reserve has 162, uMkhuze Game Reserve has 90 and Tembe Elephant Reserve, linked via the Futi Corridor to Maputo Special Reserve in Mozambique, supports at least 220 elephants (EKZNW, 2016). The St Lucia Reserves have 110 elephants (EKZNW, 2016). These are all **informed guesses** and reflect increased numbers compared to earlier estimates, with the exception of Hluhluwe GR from where elephants have been translocated (EKZNW, 2016).

NUMBERS AND DISTRIBUTION
CONT.

In Mpumalanga Province, there are 57 elephants in the Mthetomusha Provincial Reserve and 105 in Songimvelo Game Reserve (Garaï, pers. comm., 2016); these are both **informed guesses** and represent increases on previous estimates.

In North West Province both Madikwe Provincial Nature Reserve (1,006 elephants) and Pilanesberg Provincial Nature Reserve (240 elephants) show increases based on **informed guesses** (Garaï, pers. comm., 2016). In Limpopo Province **informed guesses** indicate that Atherstone Provincial Nature Reserve holds 105 elephants, Letaba Provincial Nature Reserve 621, Makuya Provincial Nature Reserve nine (Garaï, pers. comm., 2016), and Manyeleti Game Reserve 222 (SANParks, 2009). Marakele National Park has 171 elephants (Ferreira et al., 2012).

As part of a total count survey of the Greater Mapungubwe Transfrontier Conservation Area (Selier & Page, 2015), 347 elephants were counted in Mapungubwe National Park and three in the surrounding area.

Information on elephants in private reserves and other privately-owned elephant properties has been obtained from the Elephant Management and Owners Association (Garaï, pers. comm., 2016). At the request of their owners, some private reserves are grouped under one overall estimate and are not shown on the map. This **guess** totals 2,482 elephants. Other private nature reserves for which numbers are available are Maremani (64), Kwandwe (57), Kariega (41) and Balule, Timbavati, Umbabat and Klaserie combined (2,772).

GENERAL STATISTICS

Country Area	17 360 km²
Range Area	50 km² (0%)
Protected Range	80 %
Information Quality Index (IQI)	0
CITES Appendix	I
Listing Year	1997 (year of accession)

CURRENT ISSUES

Swaziland has only two small fenced populations of elephants and concerns have been raised about their impact on the biodiversity of these areas. In 2016, the U.S. Fish and Wildlife Service approved an application to import 18 African elephants from Swaziland to three zoos in the United States. In March 2016 the elephants were flown to the US despite a pending legal challenge to block the importation (Peters, 2016).

There is no current or past action plan or strategy for the management of African elephants in Swaziland.

NUMBERS AND DISTRIBUTION

The estimated number of elephants in areas surveyed in the last ten years in Swaziland is 42 at the time of the last survey for each area. This number applies to 50 km², which is 100% of the estimated known and possible elephant range in Swaziland.

Elephant distribution is well known in Swaziland, being mainly restricted to fenced enclosures within Hlane Royal National Park and Mkhaya Game Reserve. The enclosures only occupy a fraction of the reserves (6% and 19% respectively). **Individual registration** of all elephants is maintained for the Hlane Royal NP and Mkhaya GR populations. There were 25 elephants in Hlane in 2015 compared to 13 in 2005, and 14 in Mkhaya in 2015 compared to 15 in 2005 (Reilly, pers. comm., 2016).

Three elephants originating from the Songimvelo Game Reserve in South Africa are regularly seen in the Mololotja Nature Reserve in north-western Swaziland (Reilly, pers. comm., 2012). During 2014, two elephants, a cow and a sub-adult crossed from Mozambique into Swaziland at Lomahasha. Over a period of three days they traveled across Hlane Royal NP and west to the escarpment, west of eBuhleni, traversing communal areas. They then returned along a similar route, crossing Hlane Royal NP and Mlawula Nature Reserve, returning to Mozambique via the Umbuluzi river gorge (Reilly, pers. comm., 2016).

PFS

Priority for Future Surveys (PFS) is ranked from 1 to 5 (highest to lowest). Based on the precision of estimates and the proportion of national range accounted for by the site in question, PFS is a measure of the importance and urgency for future population surveys. All areas of unassessed range have a priority of 1. See Introduction for details on how the PFS is derived.

Listing Year	1990

CURRENT ISSUES

Zambia has a number of large protected areas, and much of the country is covered by game management areas. However, wildlife densities are generally low. Elephant populations were badly affected by poaching in the late 1970s and poaching for ivory continues to be a problem (Nyirenda et al., 2015). The large size of the national parks and particularly of the game management areas makes it difficult to manage them effectively with limited resources (Lindsey et al., 2014).

The Bangweulu Wetlands are being co-managed by the African Parks Network and North Luangwa National Park is being co-managed by the Frankfurt Zoological Society.

The Zambia Wildlife Act (1998), which established the parastatal Zambia Wildlife Authority, was repealed by the Zambia Wildlife Act (2015), which placed responsibility for wildlife management under the National Parks and Wildlife Department. Zambia published a national policy and action plan for elephant management in 2003 (Ministry of Tourism, 2003).

Trophy hunting of elephants is legal in Zambia. From 2007 to 2012, Zambia increased its annual export quota of elephant hunting trophies from 40 (tusks and other hunting trophies from 20 animals) to 160 (tusks and other trophies from 80 animals) (CITES, n.d.-b). Zambia declared a temporary suspension of elephant hunting in 2013, and the quota declared to CITES in 2013 and 2014 was zero. There appears to be some confusion about whether the suspension had been lifted in late 2014 (Kunda, 2014). The declared quota to CITES for 2015 and 2016 was 160 (CITES, n.d.-b).

NUMBERS AND DISTRIBUTION

The estimated number of elephants in areas surveyed in the last ten years in Zambia is 21,967 ± 4,703 at the time of the last survey for each area. There may be an additional 214 to 314 elephants in areas not systematically surveyed. These guesses likely represent a minimum number, and actual numbers could be higher than those reported. Together, this estimate and guess apply to 105,461 km², which is 62% of the estimated known and possible elephant range. There remains an additional 38% of the estimated range for which no elephant population estimates are available.

Elephant numbers in Zambia have changed little since the last update. The main changes have been a reduction in guesses from isolated small populations such as West Lunga and Bangweulu. There has been a substantial reduction in numbers in Sioma Ngwezi National Park but this makes up a small proportion of the national population.

A country wide aerial survey was carried out in 2015 as part of the Great Elephant Census, covering the four major elephant range areas (DNPW, 2016): the Luangwa Valley, the Kafue ecosystem, the Lower Zambezi Valley and Sioma Ngwezi NP and surrounding game management areas (GMAs). A 2013 countrywide survey was carried out but the results were not released. The previous country-wide survey was carried out in 2008 (Simukonda, 2009), but it is unclear how comparable the methods were to the 2015 survey.

The Luangwa Valley includes South Luangwa National Park, North Luangwa NP, Luambe National Park, Lukusuzi National Park and a number of GMAs. In the 1970s this area held a population of perhaps 100,000 elephants (Caughley & Goddard, 1975), but this was greatly reduced by poaching in the late 1970s and 1980s (Jachmann & Billiouw, 1997). Aerial sample counts have been carried out since the 1970s but they have been inconsistent in coverage and methodology, making comparisons difficult.

An **aerial sample count** was carried out in the Luangwa ecosystem in 2015 as part of the Great Elephant Census (DNPW, 2016). The total estimate was 13,898 ± 3,555 (DNPW, 2016). A series of earlier surveys had appeared to show a decline in numbers, going from 18,634 ± 3592 in 2008 (Simukonda, 2009) to 10,649 ± 2,205 in 2011 and 6,361 ± 1652 in 2012 (DNPW, 2016) so the higher figure in 2015 was unexpected.

The sub-total for North Luangwa NP in 2015 was 4,673 ± 1,788 elephants (DNPW, 2016). This replaces an estimate of 3,235 ± 695 from 2003 (van der Westhuizen, 2003). The estimate for South Luangwa NP in 2015 was 3,302 ± 1,194 (DNPW, 2016) which replaces an estimate of 4,459 ± 695 from 2002 (Dunham & Simwanza, 2002).

There was no estimate for Luambe NP in the AESR 2007, whereas the 2015 survey gave an estimate of 54 ± 77. No elephants were seen in Lukusuzi National Park in the 2015 survey, nor in the preceding 2005 count of the area (Fourie & Ferreira, 2005). West Petauke and Luano GMAs were not covered in the 2015 survey, so a zero estimate from 2009 (WCS Flight Programme, 2009) and guess of 150 from 1996 (Jachmann, 1996) have been retained.

Some changes have been made to the range map for the Luangwa ecosystem on the basis of these surveys. The southern GMA of West Petauke has been changed from known range to **possible range** as has much of the eastern part of the ecosystem.

Kafue National Park and adjoining GMAs hold the country's second largest elephant population. The 2015 **aerial sample count** gave an estimate of 6,689 ± 1,418 (4,813 ± 2,265 in the NP and 1,876 ± 2,064 in the surrounding GMAs (DNPW, 2016). These replace a 2004 estimate of 6,306 ± 5,227 in the park only (Simwanza, 2004). The carcass ratio for Kafue NP was only 1% in 2008 and increased to 7% by 2015 (DNPW, 2016) giving some cause for concern, despite the apparent stability of the population. Minor changes have been made to the range map (Beattie, pers. comm., 2015).

The 2015 survey gave an estimate for the Lower Zambezi system, comprising the Lower Zambezi National Park and surrounding GMAs, of 973 ± 589 for the park and 153 ± 172 for the surrounding GMAs (DNPW, 2016). This replaces a 2003 estimate of 1,477 ± 744 for the park, and 45 ± 53 for the GMAs (Dunham, 2004). Another count in 2008 gave an estimate of 1,298 ± 438 (Simukonda, 2009). The elephants in Lower Zambezi NP are confined to a fairly small area along the Zambezi River below the escarpment and the area of known range has been reduced on the basis of sightings from aerial surveys and mortality records (Stevenson, pers. comm., 2015).

Sioma Ngwezi National Park is surrounded by GMAs in the south-west close to the Namibian and Angolan borders. The 2015 **aerial sample count** gave an estimate of 48 ± 78 for the park and a zero estimate for the GMAs (DNPW, 2016). This replaces an estimate of 385 ± 371 from 2005 (Chase & Griffin, 2005). There were also aerial sample counts in 2008 (Simukonda, 2009), 2009 and 2013 (Chase et al., 2013) which gave estimates of 2,433 ± 2,210, 400 (no confidence limits given) and 133 ± 149, respectively. The carcass ratio increased dramatically from 3% to 85% between 2008 and 2015 (DNPW, 2016) indicating either high levels of poaching and/or a seasonally varying population. Elephants move between Sioma Ngwezi, Namibia and Botswana (Chase et al., 2013).

There is a small population of elephants in the Mosi-oa-Tunya National Park next to Victoria Falls. An **aerial total count** of 31 in 2008 (Simukonda, 2009) replaces a guess of 306 from 2006 (Chase, 2006). No elephants were observed in the adjoining Kazungula ecosystem in an **aerial sample count** in 2008 (Simukonda, 2009). This area had not previously been surveyed.

There are only five resident elephants (Willems, pers. comm., 2016) in the Bangweulu Wetlands, contributing to an **informed guess** of 45 for the entire Bangweulu/Kasanka/Lavusha Manda system close to the DRC border. This replaces a series of old guesses amounting to 144 from the 1990s (Blanc et al., 2007). The area of **known range** has been increased.

There is a small isolated elephant population on the north bank of Lake Kariba, in the Kotakota area. An estimate of 19 animals from 1991 has been retained from the AESR 2007 (Tembo, pers. comm., 1993).

There are about 100 elephants in Nsumbu National Park (Tanganyika ecosystem) on the southern shores of Lake Tanganyika. In the past this was thought to be connected to the elephant population in Katavi and there was an annual migration to the southern region of the DRC but this has not

taken place since 2007, after a major poaching incident on the border. The elephants are now restricted to part of the park and the area of **known** and **possible range** has been reduced accordingly (Zytkow, pers. comm., 2016).

West Lunga National Park is in the far west, close to the Angolan border. There were estimated to be over 500 elephants in 1996, but numbers appear to have dropped considerably since then. There were sightings of 21 individuals in 2014 as well as a number of other scattered recordings (Tilbury, pers. comm., 2015; ZAWA & WWF, 2014). The area of **known range** has been expanded to the area of these sightings.

CURRENT ISSUES

Poaching of elephants for ivory has escalated in the past ten years and has become a major problem in Zimbabwe. A worrying recent development has been the emergence of poisoning as a poaching technique. Just over 100 elephants were killed in a single cyanide poisoning incident in Hwange National Park in late 2013 (Muboko et al., 2014). The impact of poaching has been highest in the north of the country, particularly in the Sebungwe Region to the south of Lake Kariba, and the Lower Zambezi Region (Dunham et al., 2015c). Although elephant numbers have increased in Gonarezhou National Park, it too experienced an increase in poaching in 2015 (Dunham & van der Westhuizen, 2015).

Concern has been expressed about the impact of high numbers of elephants on vegetation and other biodiversity in Zimbabwe's protected areas. Despite the increase in poaching, this remains a problem in protected areas such as Hwange NP, where the provision of artificial water supplies has led to high elephant densities (ZPWMA, 2015).

Zimbabwe published a national elephant management plan covering the period 2015 to 2020 (ZPWMA, 2015).

In 2008, Zimbabwe undertook an approved one-off sale of 3,764 kg of ivory to Japan and China, at a price of USD $487,162 (Wijnstekers, 2011).

Zimbabwe's annual declared export quota of elephant trophies remains unchanged since 2007 at 1,000 (tusks as hunting trophies from 500 animals) (CITES, n.d.-b). In 2015, the US Fish and Wildlife Service removed its 'non-detriment' finding, thus banning the import of elephant trophies into the USA (USFWS, 2015a).

NUMBERS AND DISTRIBUTION

The estimated number of elephants in areas surveyed in the last ten years in Zimbabwe is 82,630 ± 8,589 at the time of the last survey for each area. There may be an additional 1,635 to 1,805 elephants in areas not systematically surveyed. These guesses likely represent a minimum number, and actual numbers could be higher than those reported. Together, this estimate and guess apply to 78,839 km², which is 97% of the estimated known and possible elephant range. There remains an additional 3% of the estimated range for which no elephant population estimates are available.

There has been a decline of just over 10,000 elephants from surveyed populations since the AESR 2007 and an increase of about 1,000 in guesses, mostly from previously unsurveyed areas in North West Matabeleland. Although there have been large losses from the Sebungwe and Lower Zambezi populations, these have been partially compensated by increases in Gonarezhou and North West Matabeland.

The major populations of the Lower Zambezi Valley (including Mana Pools National Park), Sebungwe (including Matusadona and Chizarira National Parks), North-west Matabeleland (including Hwange and Zambezi National Parks) and the south-east Lowveld (including Gonarezhou NP) were surveyed in 2014 using **aerial sample counts** (including block counts in hilly areas) as part of the Great Elephant Census.

The estimate from the Lower Zambezi Valley in 2014 was 11,656 ± 2,259 (Dunham et al., 2015c). The previous comparable estimate was 19,297 ± 2,527 in 2001 (Mackie, 2002). The 2014 figure replaces an estimate from the AESR 2007 of 19,981 ± 2,392 from 2003 (Dunham, 2004). This survey was less comparable than the 2001 one because it covered a slightly smaller area. There was an approximately 40% decline in the 13 years between 2001 and 2014. The observed carcass ratio of 6% is not as high as one would expect given the rate of population reduction and might suggest that the level of poaching has reduced in recent years. The corridor between the Mavuradonha Wilderness Area and the rest of the Zambezi Valley range has been changed to **possible range** (Packenham quoting Varden, pers. comm., 2016).

The 2014 estimate for Sebungwe was 3,407 ± 1,215 (Dunham et al., 2015b) which replaces an estimate of 15,024 ± 2,133 from a 2006 survey (Dunham et al., 2006a). The observed carcass ratio of 30% indicates an unsustainably high offtake of elephants. There were almost no elephants left in the communal areas, with the main surviving sub-populations in Matusadona and Chizarira National Parks and the Chirisa Safari Area. Wildlife scouts reported 70-100 elephants in Kavira Forest Land at the western end of Sebungwe (M. Sebele pers. comm. in Dunham et al., 2015b).

The 2014 estimate for North-west Matabeleland was 53,991 ± 7,711 (Dunham et al., 2015a), which replaces an estimate of 49,310 ± 7,051 from 2001 (Dunham & Mackie, 2002). There was no significant difference between the totals although the increased carcass ratio of 7% from 3% in 2001 is a worrying sign. Other aerial sample counts were carried out in 2006 and 2007 but they were not

suitable for comparative purposes (Dunham et al., 2007; Dunham et al., 2006b). Since the 2014 Botswana survey was carried out a month earlier than the north-west Matabeleland survey there is a possibility of double-counting or missing animals that had moved from Hwange into Botswana. There was a surprisingly large number of elephants seen in the Ngwasho/Sepako stratum in Botswana adjoining the southern half of Hwange NP (estimate 11,744) (Chase et al., 2015) and evidence from radio-tracking shows that elephants do move out of Hwange into adjoining areas of Botswana (Chamaillé-Jammes, pers. comm., 2016; Ferguson & Chase, 2010).

Elephant range in North-west Matabeleland has probably increased. Water hole counts and scout reports indicated 308 elephants in the Fuller Forest Land, 165 in Gwaai, Bembezi and Umguza Forest Lands (which has been marked as new **known range**) and 150 in Gwampa/Lake Alice Forest Reserves (M. Sebele pers. comm in Dunham et al., 2015a) which are all recorded as **new populations**. I. Du Preez (pers. comm. in Dunham et al., 2015a) reported an **informed guess** of 36 elephants in the privately owned Stanley & Livingstone Game Reserve (Nakavango).

The estimate for Gonarezhou NP from the 2014 survey was 11,120 ± 2,709 (Dunham & van der Westhuizen, 2015). This replaces an estimate of 4,987 ± 1,577 from a comparable 2001 survey. Another survey in 2009 gave an estimate of 9,123 ± 1,898 (Dunham et al., 2010). The elephant population of Gonarezhou NP is continuing to increase, and is at its highest level since surveys started in 1980. There was a relatively low carcass ratio of 4%. There are limited movements of elephants from Gonarezhou into adjoining parts of Mozambique, and one radio-collared elephant moved from Kruger to Gonarezhou (Henley, 2011).

The 2014 survey of the south east Lowveld included some neighbouring areas. No elephants were observed in the Malapati Safari Area immediately south-west of Gonarezhou but there was an estimate of 332 ± 519 in the Mahenye communal land to the north-east of Gonarezhou, which replaces a zero estimate from the 2001 survey. The 2014 survey gave an estimate of 1,585 ± 1,295 for the Savé Valley Conservancy. This replaces an estimate of 527 ± 310 (Dunham, 2003). There is no statistical difference between the two results. Aerial total counts were carried out in 2013 and 2015 (Jooste & Lenton, 2015; Joubert & Joubert, 2013), which did not cover the entire area: 1,538 and 1,490 elephants were counted respectively. Sengwe, further to the south-west, adjoining the northern boundary of Kruger National Park in South Africa, was not counted in the 2014 survey, but there was an estimate of 35 ± 99 in 2013 (Dunham et al., 2013). In the Malilangwe Conservancy 272 elephants were counted using a helicopter in 2013 (Clegg, 2013). This replaces an estimate of 116 from an aerial total count in 2001 (Dunham, 2002). There was an estimate of 55 in 2014 for the Chiredzi River Conservancy (Warth in Dunham & van der Westhuizen, 2015) compared to 28 in 2001 (Dunham, 2002). Although Chipinge Safari Area is marked as possible elephant range, this is now highly unlikely.

There are a number of small isolated populations in other parts of Zimbabwe, which have updated estimates for 2014. There is an informed guess of 150 elephants for Chegutu Safari Area (Mwale, pers. comm. in Dunham, 2015), formerly Hartley Safari Area, west of Harare and this replaces a guess of 100 from 2001 (Dunham & Mackie, 2002). Some 30 elephants reportedly move from the Nyatana Wildlife Management Area in the north east of the country into Mozambique and this replaces a guess of 150 from 2001 (Dunham & Mackie, 2002).

NUMBERS AND DISTRIBUTION
CONT.

Some 20 bull elephants were photographed, and there was a further unverified report of 40 elephants, near Mangwe Dam in the vicinity of Home Farm and Greystone Ranches, across the border from Francistown in Botswana (Robertson and Winch, pers. comm. in Dunham, 2015) replacing a guess of three from 2002 (Dunham & Mackie, 2002). A helicopter total count enumerated 174 elephants on Shangani Ranch near Bulawayo (Edwards, pers. comm. in Dunham, 2015) and this replaces a guess of 60 from 2001 (Dunham & Mackie, 2002).

There was a **total aerial count** of 212 elephants in 2014 in the Zimbabwe section of the Mapungubwe Transfrontier Conservation Area which includes Tuli Safari Area, Sentinel, Nottingham and River Ranches (Selier & Page, 2015). This replaces an estimate of 82 from 2001 (Dunham & Mackie, 2002).

There were **informed guesses** in 2014 of 500-600 in Bubye Valley (Leathem & English pers. comm. in Dunham, 2015), and 100 on Bubiana Conservancy (Drummond pers. comm. in Dunham, 2015) in the south of Zimbabwe, replacing guesses of 53 and 50 respectively (Dunham & Mackie, 2002). An old estimate of ten elephants in the Mambali Communal Lands on the Botswana border has been retained from the AESR 2007 (Dunham & Mackie, 2002). A report of 54 elephants on Nuanetsi Ranch is recorded as a **new population**.

CURRENT ISSUES

West Africa's elephant populations are mostly small, fragmented and isolated. With growing human populations and increasing infrastructure development, many countries in West Africa are experiencing increased pressure on natural areas from mining, logging and rapid transformation of land to agriculture. These challenges are particularly acute in those countries that have recently emerged from civil strife (GEF, 2010; Mallon et al., 2015).

The AESR 2016 provides more information than previous status reports on countries known to have small, isolated and highly vulnerable populations, with some stark results. Although numbers are small relative to continental levels, West Africa reported losing twelve populations of elephants since the AESR 2007: one each in Cote d'Ivoire, Ghana, Guinea Bissau, Sierra Leone and Togo; two in Guinea and five in Nigeria. It is surprising, however, that there is recent evidence for the continued survival of a number of populations that were already at a very low level 10-20 years ago.

The transboundary "WAP" complex ("W" National Park, Arly National Park and Pendjari National) straddles the border between Benin, Burkina Faso, Niger, continues to hold the region's largest population which has great significance as one of West Africa's few populations with potential long-term viability.

West Africa has 18 MIKE sites. While reporting rates vary, three sites (Comoé National Park in Côte d'Ivoire, Babban Rafi Forest in Niger, and Kéran NP in Togo) have not reported any elephant carcasses since MIKE started in 2002 and about half the remaining 15 sites did not report any carcasses in 2015. While small populations, such as those prevalent in West Africa, cannot be

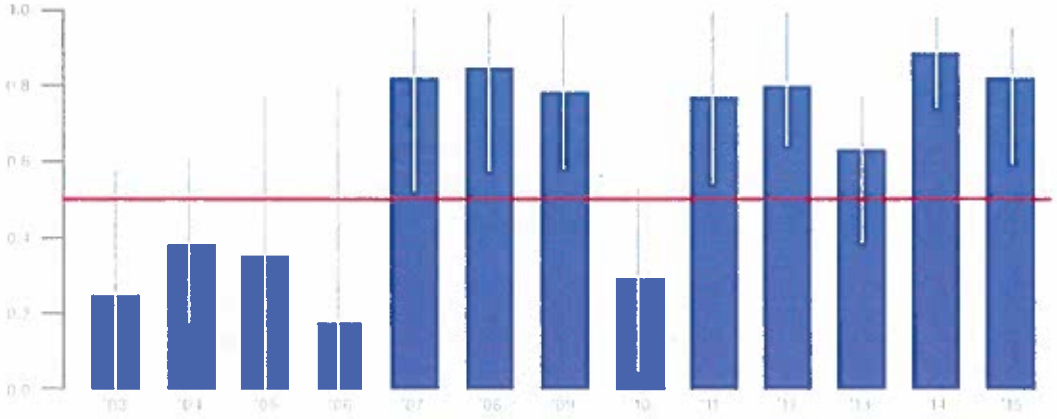

FIGURE 1: *West African PIKE trends with 95% confidence intervals (CITES Secretariat, 2016)*

expected to yield large numbers of carcasses, there have been apparent examples of under-reporting (CITES Secretariat, 2016). Figure 1 provides the most recent PIKE figures for West Africa. The low level of reporting of data for West African MIKE sites in 2015 is cause for concern, in terms of both the regularity of reporting and data quality, which makes reliable inferences on trends impossible for the region.

The Strategy for the Conservation of West African Elephants (African Elephant Specialist Group, 2005b) is now outdated as is the series of national level plans that followed its development. The third wave of planning is currently underway using the framework provided by the African Elephant Action Plan (AEAP) which was adopted by CITES in 2010 (African elephant range states, 2010). Niger was the first country to produce a national plan under the AEAP in 2010 (Direction de la Faune, de la Chasse et des Aires Protégées, 2010), and Liberia is scheduled to initiate their process in 2016 as part of the Elephant Protection Initiative.

In recent analyses of seizure data prepared for CITES, a number of countries in West Africa have been identified as having a worrying involvement in illegal ivory trade (CITES Secretariat, 2012; Milliken et al., 2013, 2016). Nigeria has been requested to prepare and implement a National Ivory Action Plan. Further details are provided in the country summaries.

NUMBERS AND DISTRIBUTION

The estimated number of elephants in areas surveyed within the last ten years in West Africa is 11,489 ± 2,583 at the time of the last survey for each area. There may be an additional 2,886 to 3,376 elephants in areas not systematically surveyed. These guesses likely represent a minimum number, and actual numbers could be higher than those reported. Together, this estimate and guess apply to 102,850 km^2, which is 72% of the estimated known and possible elephant range. There remains an additional 28% of the estimated range for which no population estimates are available.

The overall number of elephants in West Africa appears to have increased since 2006. The 2015 survey of the WAP complex supported by the Great Elephant Census (Bouché et al., 2015), produced an estimate of 8,953 ± 2,486 compared to 4,592 for the "WAPOK" complex in 2003 (WAPOK is the WAP complex plus parts of Togo) (Bouché et al., 2004b). The latest data for Togo's portion of

this population indicates that its contribution is negligible. The apparent growth in population, the region's largest, is the major contributor to the overall increase in the region since the AESR 2007.

The proportion of elephant range for which elephant estimates are available currently stands at 72%, an increase from 66% in the previous report. The overall quality of information, as measured by the IQI, has increased from 0.44 to 0.48.

At the national level, population estimates for both Benin and Burkina Faso suggest increases in the WAP complex. Estimates for Côte d'Ivoire, Ghana, Guinea Bissau, Senegal, Sierra Leone and Togo have stayed more or less constant with some higher and lower guesses, while estimates for Guinea, Mali and Nigeria have declined since 2006. Guinea is now reduced to a single small population. Niger's few remaining elephants are thought to still move in and out of the country as part of the WAP complex. Information on Liberia's elephants has been substantially improved in this report, adding a small number to guesses originating from 1989/90. Some of the previous numbers, primarily guesses, for Côte d'Ivoire, Ghana, and Nigeria remain unchanged in this report but have become degraded data due to age.

A substantial update of the West African elephant range has been completed for this report, and this has the effect of reducing the total range (known and possible) from 176,000 km^2 to approximately 143,000 km^2, but the percentage of known range has increased from 71% to 79%. The 2015 Great Elephant Census survey of the WAP complex resulted in the addition of areas of known range in Benin and Burkina Faso but more areas were moved to possible and doubtful range. In Côte d'Ivoire, Ghana, Guinea, Guinea Bissau, Niger, Sierra Leone and Togo, many areas of previously known range have been changed to possible and doubtful range. Range loss has been particularly severe in Côte d'Ivoire. In Liberia, the area of known range has been increased with improved access to information following many years of war. In Mali, small areas of doubtful range have been removed, and sightings and data from collared elephants have provided information to refine the range of the Gourma elephants. In Nigeria, two small areas have been moved to known range, but far more has been changed to possible range and even doubtful range.

PFS

Priority for Future Surveys (PFS) is ranked from 1 to 5 (highest to lowest). Based on the precision of estimates and the proportion of national range accounted for by the site in question, PFS is a measure of the importance and urgency for future population surveys. All areas of unassessed range have a priority of 1. See Introduction for details on how the PFS is derived.

CURRENT ISSUES

Elephants in Benin are now almost completely confined to the northern border region adjoining Burkina Faso and Niger. The group of protected areas in this region are known collectively as the WAP complex (Parc W, Arly National Park and Pendjari National Park), with Pendjari NP, Parc W du Benin and hunting zones within Benin.

The relatively high density of elephants in Pendjari NP has had an impact on the vegetation including baobab trees and borassus palms (Salako et al., 2016).

Benin's national strategy for elephant conservation was developed and published in 2005 (Ministère de l'Agriculture, de l'Elevage et de la Pêche, 2005).

NUMBERS AND DISTRIBUTION

The estimated number of elephants in areas surveyed in the last ten years in Benin is 2,984 ± 1,460 at the time of the last survey for each area. This estimate applies to 9,112 km², which is all of the estimated known and possible elephant range.

There has been an increase in recorded estimates at a national level, although this increase results from comparison of surveys using different techniques, so may not represent a true increase in numbers.

An **aerial sample count** conducted in the Benin, Burkina Faso, and Niger WAP complex in 2015 (Bouché et al., 2015), showed the main elephant concentrations in Benin to be in the Pendjari

NUMBERS AND DISTRIBUTION CONT.

NP, in Parc W and in the Mekrou Hunting Zone. The estimate for Pendjari NP was 1,632 ± 1,394, which replaces an estimate of 788 from a total count conducted in 2003 (Bouché et al., 2004). No elephants were seen in the central part of Pendjari NP, with most elephants occurring along the border with Burkina Faso. The estimate for Parc W du Benin NP in 2015 was 462 ± 174, compared to 56 from the 2003 total count (Bouché et al., 2004b). The estimate for the Konkombri Hunting Zone was 87 ± 87 in 2015, with Mekrou Hunting Zone having an estimate of 803 ± 390 in the same survey. In the AESR 2007 these areas were combined as Atakora, and there was a 2003 total count of 343 (Bouché et al., 2004b). On the basis of the 2015 survey, two areas of **doubtful range** have been changed to **known range**.

An aerial total count of parts of Parc W du Benin NP and the Djona Hunting Zone was also carried out in 2012 (Bouché, 2012a) and a foot survey of Parc W, Pendjari NP and adjoining hunting zones was carried out in 2013 (Bouché et al., 2013a). However, since these surveys did not cover the entirety of any protected areas, it is not possible to use their results for comparative purposes.

The 2003 and 2015 surveys used different techniques and were not directly comparable but there was a striking increase in estimates. It cannot be explained by movements from the other two WAP countries, since the estimate for the entire area, including the other countries, increased from 4,592 in 2003 to 8,953 ± 1,253 in 2015. There seems to have been little opportunity for elephants to have been compressed into these protected areas from other parts of the range, since there were not thought to be significant numbers outside the WAP complex even in 2003. It has been suggested that the population may have increased after 2003 but declined in recent years, as indicated by the high carcass ratio of 10% recorded across the WAP complex (Bouché et al., 2015). However it is also possible that the 2003 result was an underestimate, or that 2015 was an overestimate, or both.

According to Bouché (pers. comm., 2015) it is unlikely that any elephants remain in the forests of Alibori Supérieur, Goungoun and Trois Rivières and they have been changed to **doubtful range**. Another area to the north of the Djona Hunting Zone has also been changed to **doubtful range** (Bouché, pers. comm., 2015).

CURRENT ISSUES

Burkina Faso hosts the largest population of elephants in West Africa, most inhabiting the trans-frontier WAP complex, which includes Parc W du Burkina, Arly NP and surrounding hunting zones in Burkina Faso. Since 2012, Burkina Faso has experienced a new wave of elephant poaching. While few elephants (13 to 20 per year) were poached during the previous decade, the number of carcasses increased to 50 to 86 per year in the last ten years (DFC, 2015). During the 2015 survey of the WAP complex, 76% of the observed carcasses were recorded in the Burkina Faso portion of the complex (Bouché et al., 2015). This is occurring in the context of strong socio-political change and associated insecurity in the country.

Burkina Faso published an elephant management strategy in 2003 (Belemsobgo et al., 2003), which is outdated.

In 2015, a new law formally established Arly National Park and nearly doubled the area of the former "Arly National Park", which had been a park in name but not status (Conseil National de Transition, 2015).

NUMBERS AND DISTRIBUTION

The estimated number of elephants in areas surveyed over the last ten years in Burkina Faso is 6,850 ± 2,123 at the time of the last survey for each area. There may be an additional 67 to 69 elephants in areas not systematically surveyed. These guesses likely represent a minimum number, and actual numbers could be higher than those reported. Together, this estimate and guess apply to 12,149 km^2, which is 80% of the estimated known and possible range. There remains an additional 20% of range for which no elephant population estimates are available.

The increase of just over 2,000 in recorded estimates at a national level is a result of the increased numbers recorded in the WAP complex.

The WAP complex was covered in an **aerial sample count** in 2015 (Bouché et al., 2015). Most of the 3,969 elephants estimated were in the hunting blocks around Arly, with 985 ± 400 in Arly NP, and 1,099 ± 1,276 in Parc W du Burkina. Elephants were found throughout the area, and the area of **known range** has been increased to include the whole of Parc W du Burkina. There was a high carcass ratio of 11% suggesting that the population has been affected by poaching. These results replace estimates from an aerial total count conducted in 2003 (Bouché et al., 2004b) of 2,119 in the hunting blocks, 422 for Arly NP and 740 for Parc W. A total count of Parc W was carried out in 2012 (Bouché, 2012a). This covered only part of the Burkina Faso sector of the park. A ground sample count covering most of the WAP complex was carried out in 2013 (Bouché et al., 2013a) but because of incomplete coverage neither of these surveys were directly comparable.

A **ground sample count** of Nazinga Game Ranch, on the border with Ghana, estimated 893 ± 507 elephants in 2012 (Bouché, 2012b). This replaces an estimate of 583 elephants of a larger area from an aerial total count conducted in 2003 (Bouché et al., 2004a). At least 34 elephants are known to have been lost to poaching in the Nazinga area between 2010 and 2015 (DFC, 2015).

Elephants may occasionally move between Nazinga, Kaboré Tambi NP and Zabré, on the Volta River next to the border with Ghana, but there are no longer resident elephants, so this area has been changed to **doubtful range** (Bouché, pers. comm., 2015).

An aerial total count conducted in the Mouhoun Protected Area Complex in 2013 recorded five elephants in the Deux Balé protected area, which forms part of the complex. However, between 2007 and 2012, between 35 and 40 elephants were seen and photographed from the ground in Deux Balé, and it is believed that these elephants still survived in 2013 (Bouché et al., 2013b). This new **guess** replaces an aerial sample count estimate of 541 from 2002 (Belemsobgo, 2002). There was no evidence of elephants in other parts of the complex, which had large numbers of domestic livestock. Therefore the other areas in the complex have been changed to **doubtful range**. During the course of the 2013 **aerial total count** elephant signs were seen in the Mare aux Hippopotames Biosphere Reserve, but no animals were found. This is therefore considered a minimum estimate of one elephant, and the area is marked as **known range**. This replaces an estimate of 46 from an aerial total count in 2005 (Bouché, 2005).

There is an updated **guess** of 18–20 elephants from the Bontioli Partial and Total Faunal Reserve on the Ghana border to the south of the Mouhoun complex (Bouché, 2007a), which replaces a

NUMBERS AND DISTRIBUTION CONT.

guess of 50 (Chardonnet, pers. comm., 1998). Based on Bouché (pers. comm., 2015), this has been changed from possible to **known range**, while the area outside the reserve has been changed to **doubtful range**.

Fifteen elephants have been reported from the Niangoloko forest north-west of Comoé-Léraba (Karama, pers. comm., 2016). This has been added as a **new population**. These elephants are believed to move to the Comoé-Léraba forest. The existing guess for Comoé- Léraba of three animals (Bouché, 2005) has been retained.

Elephants from Gourma in Mali have occasionally come south into Burkina Faso to a maximum of 20 km from the border (Wall et al., 2013).

CURRENT ISSUES

Côte d'Ivoire has suffered from civil unrest and violence in recent years, and this has affected conservation efforts. The civil war, which started in 2002, split the country between the rebel-held north and the government-controlled south. A power-sharing deal in 2007 presented the prospect of peace, but a 2010 presidential poll led to further violence (International Crisis Group, 2011). This lack of stability has meant that little attention has been paid to conservation and protected areas (Koné, 2013). Wildlife in protected areas is threatened by hunting, the encroachment of cocoa plantations on protected area boundaries in the forest zone, and expansion of illegal cocoa farming within parks and reserves (Bitty et al., 2015).

Most of Côte d'Ivoire's elephant population is found in small fragments of forest. Some of these populations have survived for a surprisingly long time, but there are many for which there is no recent information, and a number of these are likely to have disappeared. There is only one forest population in Taï National Park which is estimated to have more than a hundred elephants, and the status of elephants in Comoé National Park, the country's largest protected area, is unclear.

Following the invasion of Marahoué National Park by people fleeing post-election violence in 2010-11, 12 elephants moved into farming areas near the city of Daloa and were responsible for the deaths of three people. As a result, four male elephants were translocated from Daloa to Azagny National Park on the coast in January 2014, and a further two died during the exercise (McPherson,

2014). The population of Marahoué NP is now recorded as lost, having previously been one of the country's largest elephant populations.

Côte d'Ivoire published its national strategy for elephant management in 2004, covering a time period from 2005 to 2014 (Ministère des Eaux et Forêts, 2004).

NUMBERS AND DISTRIBUTION

The estimated number of elephants in areas surveyed in the last ten years in Côte d'Ivoire is 189 ± 135 at the time of the last survey for each area. There may be an additional 647 to 652 elephants in areas not systematically surveyed. These guesses likely represent a minimum number, and actual numbers could be higher than those reported. Together, this estimate and guess apply to 13,334 km², which is 92% of the estimated known and possible elephant range. There remains an additional 8% of the estimated range for which no elephant population estimates are available.

There has been almost no change in the population estimates, because an apparent increase in numbers in Taï NP from a survey using a different technique is matched by the loss of the Marahoué NP population. Total guesses have been reduced, mostly as a result of populations being lost.

Taï NP in the southwest, close to the Liberian border, holds what is probably the largest remaining elephant population in the country. A **dung count** conducted there in 2010 gave an estimate of 189 (54-324) elephants (Baofo & Nandjui, 2011). This replaces an estimate of 53 ± 26 from a DNA survey (Eggert, 2004b).

Comoé NP, which lies in the northern savanna zone, is the largest protected area in the country. An aerial sample count of the park and some surrounding areas was carried out in 2010 (N'Goran et al., 2010). Although some signs were seen from the air, no actual elephants were observed. However, the sampling intensity was low, and elephants are thought to concentrate in gallery forests where they would be difficult to see from an aircraft. A researcher who worked in Comoé NP between 2014 and 2015 estimated at least 100 elephants in the park (Lapuente, pers. comm., 2016), concentrated in the west close to the Komoé river, and this **informed guess** replaces an informed guess of 10-20 elephants from 2002 (Fischer, 2005). There were also at least another 20 elephants in the neighbouring areas of Mont Tingui and Kinkené (Lapuente, pers. comm., 2016). The area in the east of the park has been changed to **doubtful** range, as has the area between Comoé NP and the Burkina Faso border.

Most other estimates remain unchanged from the AESR 2007 report but many are now more than ten years old, and have therefore become degraded data. Continued records of crop-raiding indicate that elephants remain widespread, albeit in small numbers. An **informed guess** of 15-20 for the Beki Bossematié Classified Forest from 2013 (Lapuente, pers. comm., 2016) replaces a guess of 35 from 1993 (Theuerkauf et al., 2001). A **guess** of two elephants in Mont Sangbé National Park in 2013 (Lapuente, pers. comm., 2016) replaces a guess of 47 (Lauginie et al., 2001). There were still elephants in Mont Péko in 2012 (Sissler-Beinvenu, pers. comm., 2016), but probably fewer than the guess of 40 from 2000 (Kobon, pers. comm., 2002) which has not been replaced because this confirmation of presence did not include an estimate of new numbers.

NUMBERS AND DISTRIBUTION
CONT.

The elephant population of Marahoué NP, which had an estimate of 159 ± 53 from a genetic dung count in 2002 (Eggert, 2004a), was lost in about 2010 after the park was almost completely settled by local people. In early 2013, no evidence of elephants was found in a survey covering 506 km of transects (Sissler-Beinvenu, pers. comm., 2016). Marahoué NP has been changed to **doubtful range**. Since it is not clear whether all the elephants from neighbouring Daloa were translocated, this has been added as a point record, where an unknown number of elephants may remain.

Prior to the translocation of elephants from Daloa, there were almost no elephants left in Azagny NP. Whereas there had been an estimate of 65-117 in 2003 (Nandjui, 2003) no evidence of human-elephant conflict was found on the periphery of the park for the two years prior to 2013 and only a few signs of the presence of elephants inside the park. Local hunters said that there were only three surviving elephants, compared to 9-10 in 2010 (Sissler-Beinvenu, pers. comm., 2016).

Crop raiding has been reported from three widely separated sites in the south of the country and these have been added as point records (Bakayoko, 2015; Kan, 2015; La Dépêche d'Abidjan, 2015).

CURRENT ISSUES

Ghana has a small number of elephant populations in savanna and forest habitats. As a result of habitat fragmentation and human population density, elephants are becoming increasingly restricted to protected areas. A new approach to anti-poaching in Ghana's protected areas was introduced in 2004. This focused on adaptive management and patrol management, as well as increasing ranger numbers in some areas, and had the effect of reducing poaching levels (Jachmann, 2008).

Several studies have been carried out on crop raiding by elephants on the periphery of the Kakum Conservation Area. These have shown the efficacy of pepper-grease fences (Wiafe & Sam, 2014) and also that elephants damage oil palms less than plantain, cocoa and cassava (Dakwa et al., 2016).

A survey of retail outlets selling ivory in Accra in 2010 found very few items, attributed to a clampdown by the authorities in November 2008 on the main curio market, where several hundred kilos of ivory items were confiscated and dealers were fined and imprisoned (Martin, 2010).

Some of Ghana's most important elephant areas have not been surveyed in many years, leading to a degradation of many estimates, and one population is now recorded as lost.

Ghana's national elephant conservation strategy was published in 2000 (Wildlife Division, 2000).

NUMBERS AND DISTRIBUTION

The estimated number of elephants in areas surveyed in the last ten years in Ghana is 994 ± 67 at the time of the last survey for each area. There may be an additional 238 to 288 elephants in areas not systematically surveyed. These guesses likely represent a minimum number, and actual numbers could be higher than those reported. Together, this estimate and guess apply to 7,609 km², which is 50% of the estimated known and possible elephant range. There remains an additional 50% of the range for which no population estimates are available.

There has been little change recorded in elephant numbers since the publication of the AESR 2007. This is because most populations have not been recently surveyed, and there has been little change in those that have been surveyed.

The main forest populations are in Bia National Park and Conservation Area, Goaso Forest Reserves Complex, Dadieso Forest Reserve, Ankasa Conservation Area and Kakum Conservation Area, with Mole and Digya National Parks holding the only surviving savanna populations.

Dung counts of Bia NP and Resource Reserve were carried out in 2007 and 2009, giving estimates of 135 (114-156) elephants in 2007 (Danquah et al., 2009), and 146 (98-172) elephants in 2009 (Danquah & Oppong, 2014). The latter replaces an estimate of 115 ± 29 from 2004 (Sam et al., 2006) reported in the AESR 2007. This population is now considered to be isolated within the protected area (Danquah & Oppong, 2013) and surrounding areas of **possible range** have been removed from the map. However, improved protection allowed elephants to expand their range within Bia NP from 2007 (Danquah, 2009).

There are other forested areas to the north and east of Bia known as the Goaso Forest Reserves Complex. The Goaso elephant population has suffered major declines in both numbers and range, and is currently confined to a few of the reserves in the northern portion of the block. A **dung count** carried out in 2009 gave an estimate of 90 ± 41 (Danquah et al., 2009). This replaces an estimate of 72 from 2004 (Sam, 2004). The area of **known range** has been reduced (Danquah & Oppong, 2013).

There have been no new surveys in the Dadieso Forest Reserve to the south of Bia, and therefore the informed guess of seven from 2002 (Ayesu, 2003) has been retained from the AESR 2007 but is now degraded. The range has been changed to **possible range**.

The Ankasa Conservation Area is further south, close to the coast. A **dung count** carried out in 2009 gave an estimate of 56 (31-81) (Danquah, 2009). This replaces an estimate of 21 for 2001 (Danquah et al., 2001).

No new surveys have been carried out in the Kakum Conservation Area, so the estimate of 164 ± 36 from 2004 (Danquah, 2004) has been retained, but degraded to a guess, as the estimate is more than ten years old. An acoustic survey of Kakum CA was carried out in 2000, but the results were not published until 2010 (Thompson et al., 2010). This study estimated 294 elephants (259-329), and an extended acoustic model, estimating the frequency with which elephants are silent when present, yielded an estimate of 350 elephants (315-384).

NUMBERS AND DISTRIBUTION CONT.

Digya National Park and the Chichibon Corridor are in a forest-savanna mosaic. No recent surveys have been carried out in Digya NP so the estimate of 357 ± 54 from 2006 has been retained (Kumordzi & Danquah, 2007). Crop-raiding by elephants is still a problem in the Chichibon Corridor (Nutsuakor et al., 2015) and the old guess of 12-15 (Sam & Wilson, 1994) from 1994 has been retained.

An aerial survey of northern Ghana in 2006 showed no signs of elephants in the Red and White Volta areas (Bouché, 2007b), so this area has been changed to **doubtful range** and the population is recorded as a **population lost**. Other areas in the north-west have no recent records and have been downgraded to **possible range**.

No new counts have been carried out in Mole National Park, in the northern savanna zone, so the estimate of 401 from an aerial total count in 2006 (Bouché, 2006) has been retained.

CURRENT ISSUES

Ziama Strict Nature Reserve is believed to hold Guinea's single remaining elephant population. The area is under pressure from growing human populations and increased cultivation at the edges of the reserve. Crop raiding by elephants is a continuing problem (Ministère de l'Agriculture, de l'Elévage, de l'Environnement, des Eaux et des Forêts, 2007). Law enforcement improved in 2015 with support from Fauna and Flora International (Mollon, pers. comm., 2016).

Ouré Kaba, a population referred to in the AESR 2007, is recorded as lost. Guinea published a national elephant management strategy in 2007 (Ministère de l'Agriculture, de l'Elévage, de l'Environnement, des Eaux et des Forêts, 2007).

NUMBERS AND DISTRIBUTION

There have been no surveys carried out in Guinea in the last 10 years to the standards required for generating an estimate. There may be 64 to 138 elephants in areas not systematically surveyed. These guesses likely represent a minimum number, and actual numbers could be higher than those reported. Together, this estimate and guess apply to 1,207 km², which is 78% of the estimated known and possible elephant range. There remains an additional 22% of the estimated elephant range for which no elephant population estimates are available.

The Wild Chimpanzee Foundation (WCF) surveyed a number of forest areas in Guinea between May 2009 and May 2011. Signs of elephants were only observed in Ziama Strict Nature Reserve. Elephants had long been absent from Ziama Strict Nature Reserve and surrounding forests until 1996, when it is thought they arrived from neighbouring Liberia (Sagnah & Sagnah, 2000). It is

believed that movement across this border continues, and it is possible that these elephants also move as far as Côte d'Ivoire (Mollon, pers. comm., 2016). The absence of elephant signs in the Mt. Nimba area, however, during the WCF surveys suggest that these movements, if they occur, are intermittent.

The **dung count** of Ziama SNR gave a new estimate of 64 - 138 (Wild Chimpanzee Foundation, 2012). This replaces an estimate of 214 ± 79 from 2004 (Barnes & Nandjui, 2005). However, based on the distribution of elephants and the abundance of their signs, Fauna & Flora International staff members working in the area feel that this estimate is too low and there are probably still around 200 elephants in the area (Mollon, pers. comm., 2016). Elephants are found throughout the reserve, although at lower densities around the two settlements in the east, and the hilly country in the west (Wild Chimpanzee Foundation, 2012). Therefore the range has been changed to include the whole reserve. There is recent evidence of elephants moving from Ziama SNR towards the Simandou range, about 50 km north-east, with a small group possibly resident around the Pic de Fon (Mollon, pers. comm., 2016).

The WCF found no signs of elephants in the Ouré Kaba area, on the border with Sierra Leone. Therefore this area has been removed from the range map, and recorded as a **lost population**. In the AESR 2007, the area of Sansalé in the northwest, on the border with Guinea Bissau, had an estimate of zero (Sagnah, pers. comm., 1998) and was recorded as a lost population. The corresponding area of **doubtful range** has now been removed. There has been no information from the Corubal-Dulombi cross-border population in more than 10 years, so this has been changed to **possible range**.

Listing Year	1990

CURRENT ISSUES

Only a handful of elephants were reported from Guinea Bissau more than ten years ago (Brugière et al., 2006). It is believed that a small number may still survive (Brugière, pers. comm., 2016; Goedmakers, pers. comm., 2016) but their future is very uncertain.

Guinea-Bissau published its national elephant action plan in 2000 (Ministère de l'Agriculture et Développement Rurale, 2000).

NUMBERS AND DISTRIBUTION

There have been no surveys carried out in Guinea Bissau in the last ten years to the standards required for generating an estimate. There may be seven elephants in areas not systematically surveyed. This guess likely represents a minimum number, and actual numbers could be higher. This number applies to 1,346 km², which is the entirety of the estimated known and possible elephant range.

There have been no changes to numbers or distribution since the AESR 2007. A study of elephant distribution based on interviews with hunters concluded that only a small elephant population remained in the south east of Guinea Bissau (Brugière et al., 2006) with a minimum of seven elephants in the Corubal-Dulombi area, and that no more than 20 elephants remained in the country. Given the absence of recent information, the range area has been downgraded to **possible range**, while the estimate has been degraded due to age.

NUMBERS AND DISTRIBUTION CONT.

In 2006 it was believed that elephants from the Corubal Dulombi area still moved seasonally across the border to Guinea (Brugière et al., 2006), but there is no recent information on whether this is still the case.

CURRENT ISSUES

Liberia is the most densely forested country in West Africa, with two large forest blocks in the west and east of the country, including approximately 40% of the remaining Upper Guinea forest (Tweh et al., 2015). Economic development in Liberia after the end of the civil war in 2003 has led to a rapid expansion of oil palm plantations and logging concessions, meaning that natural forests are once again under great threat (Tweh et al., 2015; Wilcove & Koh, 2010).

Sapo National Park is the only national park in Liberia (Tweh et al., 2015). It is threatened by illegal farming, hunting, logging, and mining. About 5,000 illegal settlers were removed from the park in 2005 (Blanc et al., 2007). Following the eviction, Sapo NP was again occupied and by early 2010, an estimated 18,000 settlers were thought to be resident, primarily carrying out artisanal gold mining. Efforts made by the government to remove them were largely successful, and by October 2010, most were thought to have left the park voluntarily (Fauna & Flora of Liberia, 2015).

There is no current action plan or strategy for the management of African elephants in Liberia, but an elephant management planning process under the Elephant Protection Initiative is scheduled to begin in 2016.

NUMBERS AND DISTRIBUTION

The estimated number of elephants in areas surveyed in the last ten years in Liberia is 124 ± 99 at the time of the last survey for each area. There may be an additional 1,425 elephants in areas not systematically surveyed. These guesses likely represent a minimum number, and actual numbers could be higher than those reported. Together, this estimate and guess apply to 13,057 km², which is 45% of the estimated known and possible elephant range. There remains an additional 55% of the estimated range for which no elephant population estimates are available.

There has been an increase in the estimates for Liberia, because of a new survey for Sapo NP, which replaced a lower quality dung count, previously recorded as a guess.

There are four areas of known or possible elephant range in Liberia, divided between two major forest blocks in the east and west of the country. Only Sapo NP has been surveyed in recent years. However, recent elephant records were compiled from various conservation partners (FDA, FFI, MPI EVA, MIKE, RSPB, SCNL, WCF), and this allowed a new elephant range map to be drawn (Vogt & Forster, pers. comm., 2016). As a result the area of **known range** has considerably increased due to improved information; previously most areas were shown as possible range.

There is a transfrontier population between Gola Forest in Sierra Leone and Gola, Kpelle and Lorma forests in western Liberia. In the AESR 2007 this was marked as possible range. However, camera trapping has revealed that elephants still occur on both sides of the border (Tubbs, pers. comm., 2015) and this area has been recorded as **known range**. A new **guess** of 400 (Freeman, pers. comm., 2016) replaces one of 500 elephants from 1990 (Anstey & Dunn, 1991).

There is a small population of elephants in the Wenegisi National Forest, perhaps 50 individuals (Freeman, pers. comm., 2016), which is an extension of the larger population of Ziama in neighbouring Guinea. This new **guess** updates one of 33 from 1990 (Anstey & Dunn, 1991).

A **dung count** carried out in Sapo NP in 2009 gave an estimate of 124 (25-223) elephants (Boafo, 2010). This replaces an estimate of 313 ± 304 from a dung count conducted in 1989 (Barnes & Dunn, 2002). There are also believed to be elephants in the adjoining Krahn Bassa National Forest, with a **guess** of 550 (Freeman, pers. comm., 2016), which replaces a similar guess of 500 from 1990 (Anstey & Dunn, 1991).

For the Grebo National Forest, in the extreme south-east of the country on the Côte d'Ivoire border, there is a **guess** of 300 elephants, and for the nearby Barrobo National Forest, a **guess** of 125. These replace guesses of 230 and 100 respectively, both from 1990 (Anstey & Dunn, 1991). It is no longer considered likely that elephants move between Grebo and Cote d'Ivoire. Many of the classified forests in Cote d'Ivoire close to the border with Liberia have been heavily forested or degraded (Chatelain et al., 2010).

GENERAL STATISTICS

Country Area	1,240,000 km²
Range Area	25,495 km² (2%)
Protected Range	89%
Information Quality Index (IQI)	0.83
CITES Appendix	I
Listing Year	1994 (year of accession)

CURRENT ISSUES

Elephants in Mali are largely confined to Gourma, an arid area in the Sahel north of the border with Burkina Faso, where the elephants live alongside pastoralists. They are the continent's most northerly elephants, and together with Namibia's Kunene elephants, the most adapted to arid conditions. They move long distances in a circular migration pattern with individual home ranges being the largest recorded in Africa (Wall et al., 2013).

Until 2012 agricultural expansion was seen as the main threat to the Gourma elephant population, since there was little poaching and local pastoralists tolerated the elephants. This changed when the area was occupied by jihadists, and the first cases of poaching occurred. Although the government has re-established partial control of the area, the jihadists are still active, and general insecurity has allowed poaching to continue (Canney, pers. comm., 2016a). Twenty elephants were known to have been poached between January 2012 and January 2015, with an upsurge in the first half of 2015, during which period 64 were killed. By the end of 2015 the total had risen to 103 elephants killed since 2012 (Canney, pers. comm., 2016a). In addition, at least 36 elephants died of thirst and starvation in 2010 as a result of pressure from high numbers of livestock in the elephants' dry season range (Canney & Ganame, 2012).

Mali published an elephant conservation plan in 1991, although this is now out of date (Direction Nationale des Eaux et Forets, 1991).

NUMBERS AND DISTRIBUTION

The estimated number of elephants in areas surveyed in the last ten years in Mali is 253 at the time of the last survey. There may be an additional 51 elephants in areas not systematically surveyed. These guesses likely represent a minimum number, and actual numbers could be higher than those reported. Together, this estimate and guess apply to 25,495 km², which is the entire estimated elephant range in Mali.

The Gourma elephants move over a large area and are difficult to survey using conventional techniques. A reconnaissance aerial count was carried out in June 2015, which gave an estimate of 253 elephants (Dias et al., 2015). A low wing aircraft, which is not ideal for survey work, was used and the count was carried out two months later than planned, by which time the elephants had dispersed and some were known to have been missed. Subsequently, an additional 51 elephants, were recorded from the ground (Ganame, pers. comm., 2015) and these have been added, giving a total of 304. This is lower than the previous individual registration study which recorded 498 elephants in 2004-2005 (Hema et al., pers. comm., 2006), and the aerial survey of 2007 which gave an estimate of 344 elephants (Bouché, 2007c).

Nine elephants were fitted with GPS collars and tracked between 2008 and 2010 (Wall et al., 2013). They moved over a larger area than those collared in 2000-2001. This range change is shown in the revised range map. Elephants, particularly bulls, sometimes move further beyond the main range, and these movements are shown as point records. The Gourma elephants move about 20 km into northern Burkina Faso as part of their regular migration (Wall et al., 2013).

Elephants are occasionally seen in southwestern Mali and believed to come from Côte d'Ivoire or western Burkina Faso (Dakouo, pers. comm., 2004; Nomoko, 2006) although they are said to be less frequent since the end of the civil war in Côte d'Ivoire (Canney, pers. comm., 2016b).

Listing Year	1990

CURRENT ISSUES

Only one elephant population is known to occur in Niger, forming part of the WAP transfrontier population. It is possible that elephants also occur on the Nigerian border, but there is no recent information.

Niger published a strategy and action plan for the sustainable management of elephants in 2010 (Direction de la Faune, de la Chasse et des Aires Protégées, 2010).

NUMBERS AND DISTRIBUTION

There is a zero estimate for the only survey carried out in Niger in the last ten years to the standards required for generating an estimate. There may be 17 elephants in areas not systematically surveyed. This number applies to 2,333 km², which is all of the estimated known and possible elephant range in Niger.

The reduction in the estimated national population since the AESR 2007 is a result of no elephants being seen in the aerial sample count of the WAP complex in 2015, but it is possible that more elephants do come into Niger on occasion.

Parc W du Niger National Park is located in the southwest region of the country and is part of the WAP transfrontier complex. An **aerial sample count** of the complex was carried out in 2015, but no elephants were seen within the Niger portion of Parc W du Niger NP (Bouché et al., 2015). This is likely to be a result of sampling error or a consequence of a small number of elephants moving between countries rather than loss of the population, since a total aerial count conducted in 2012

NUMBERS AND DISTRIBUTION CONT.

gave a count of 136 elephants within the park and three outside (Bouché, 2012a). Additionally, a ground count in 2013 gave an estimate of 380 ± 61 (Bouché et al., 2013a).

The second, much smaller, population used to occur in the northern part of the Babban Rafi forest, which extends into Nigeria (Direction de la Faune, 1991). There is no recent information on these elephants so the estimate of 17 elephants (Issa, pers. comm., 2005) has been retained but degraded. The range has been changed to **doubtful range** in view of the lack of recent information.

CURRENT ISSUES

Nigeria's elephants live in small, relict populations, some in forests in the south of the country and others in savannas in the north. The only relatively well-protected population is in Yankari National Park in central eastern Nigeria, but poaching continues to be a threat even there (Dunn, pers. comm., 2015). Yankari NP is managed by the Wildlife Conservation Society under contract from the Bauchi State Government.

Five populations have been reported as lost.

Nigeria published an elephant conservation plan in 1991 (Natural Resources Conservation Council, 1991), which is now out of date.

In recent analyses of ivory seizure data in ETIS, prepared for CITES, Nigeria has been identified as a country with a worrying involvement in illegal ivory trade (CITES Secretariat, 2012; Milliken et al., 2013, 2016). Nigeria was requested by the CITES Standing Committee, at its 65th meeting, to prepare a National Ivory Action Plan. Nigeria has submitted a National Ivory Action Plan and a first progress report (CITES, n.d.-a).

NUMBERS AND DISTRIBUTION

The estimated number of elephants in areas surveyed in the last ten years in Nigeria is 94 at the time of the last survey for each area. There may be an additional 169 to 463 elephants in areas not systematically surveyed. These guesses likely represent a minimum number, and actual numbers could be higher than those reported. Together, this estimate and guess apply to 11,281 km^2, which is 56% of the estimated known and possible elephant range. There remains an additional 44% of the range for which no elephant population estimates are available.

There has been a reduction in the estimated numbers since the AESR 2007 because the survey of Yankari NP has been treated as an informed guess with a minimum number observed, rather than as a total count. There has been a corresponding increase in guesses.

An aerial total count of Yankari NP was carried out in 2011 in which 361 elephants were observed. However, there was a possibility that some groups were counted twice so the minimum estimate was 82, the size of the largest group. The central part of the park where the elephants are concentrated is thickly wooded, and elephants may have been missed (Bergl et al., 2011). This **informed guess** of 82-361 elephants replaces the previous aerial total count estimate of 348 from 2006 (Omondi et al., 2006). Since at least 50 elephants had been killed since the previous survey, it seems unlikely that the numbers have increased (Bergl et al., 2011). The AESR 2007 only showed **known range** in the east of the park, but more recent information from rangers and two satellite-collared elephants have revealed that elephants occur throughout the area. Poaching in Yankari NP is removing 10-20 animals per year, which would be unsustainable for this size of population (Dunn, pers. comm., 2015).

It is believed that elephants no longer occur in Kambari, south of Yankari NP (Dunn, pers. comm., 2015), so this has been recorded as a **lost population.**

An aerial survey of Sambisa Game Reserve and Marguba Forest Reserve in 2006 found no elephants and heavy human settlement (Omondi et al., 2006). Since there have been no recent records in this area and this was the main base for the Boko Haram insurgents, it seems likely that elephants no longer exist here; these populations are now recorded as **lost populations**. However, there may still be a small group of elephants to the south of Sambisa GR, in Adamawa State (Awi, 2007) and this is shown by a point record. It is believed that elephants no longer cross into the Chad Basin area and Chad Basin National Park from Waza National Park in Cameroon (Saidu, pers. comm., 2015) so these areas have been changed to **doubtful range** and the Chad Basin National Park has been recorded as a **lost population.**

Gashaka Gumti National Park is separated by less than 10 km from Faro National Park in neighbouring Cameroon. Elephants have not been seen in the park for ten years (Sommer, pers. comm., 2016) so this has been recorded as a **lost population**.

Elephants still occur in the forests along the Cameroon border in the Cross River state, including the Okwangwo (Dunn et al., 2014) and Oban Divisions of the Cross River National Park (Abanyam & Imong, 2015) and the Mbe Mountains (Dunn et al., 2014), forming a cross-border population with Korup National Park in Cameroon (Tooze, 1994). However, no surveys have been carried out in this area since 1998 (Obot et al., 1998) and the estimate of 74 from the AESR 2007 has been retained.

A small population of elephants has survived in the swamp forests of Andoni Island, in the Niger Delta. Ijeomah & Esaen (2011) provided photographs of elephant dung taken in 2010 and it is believed that there are still between two and 14 individuals (Pronatura, n.d.). This **guess** updates a guess of six to ten from 2002 (Mshelbwala, pers. comm., 2002). There is another relict population in the Taylor Creek Reserve on the main Niger River. Blench & Dendo (2007) expressed doubt about the continued survival of this population; however, elephant signs were observed in 2012 (Akani et al., 2014) and the estimate of 25 from the AESR 2007 has been retained (Thouless, 1993).

There are some small elephant populations in forests in the south west of Nigeria, including Omo Forest Reserve north-east of Lagos where there were sightings in 2015 and the estimate of 30 from the AESR 2007 has been retained (Mshelbwala, 1998). However, it is believed that they have been extirpated from the adjoining Oluwa Forest Reserve (Ikemeh, 2009), which was not recorded as a population in the AESR 2007.

There have also been recent sightings of a minimum of 12 elephants from the Okomu Game Sanctuary (Saidu, pers. comm., 2015) and this estimate replaces a guess of 40 from 1991 (Natural Resources Conservation Council, 1991). Ikemeh (2009) recorded the presence of elephants in the Akure Ofusu and Idanre Forest Reserves and these have been added as **known range**. Elephant signs were found in a small portion of the Ifon Game Reserve in 2007 (Adeleke et al., 2007) with a guess of 5-8 individuals. There was previously no estimate for this population so this has been added as **known range**.

The Old Oyo National Park, which was previously recorded as possible range, was not mentioned in Ikemeh's (2009) study of elephants in south-west Nigeria, so it has been changed to **doubtful range**.

Kainji Lakes National Park is close to the Benin border. In the AESR 2007 it was recorded as possible range with no estimate. Meduna et al. (2009) stated that all the elephants had left the park and gone to Benin as a result of disturbance from illegal grazing. However, some were seen in 2014 (Saidu, pers. comm., 2015). Seven elephants were observed to the west of Kainji Lakes NP in 2013 (Isikhuemen, pers. comm., 2016) and this has been entered as a **guess** and a **new population**.

There is a small elephant population to the north-west of Kaduna in the north-central part of the country. This range includes the Kamuku National Park, Mando Forest Reserve, Alawa Game Reserve and Kwiambana Game Reserve (Amusa et al., 2015). There are estimated to be 26 elephants (Saidu, pers. comm., 2015) and the population is highly mobile (Amusa et al., 2013) especially because there is little water in the protected areas. This **guess** replaces one of 80-120 from 1993 (Hurst, pers. comm., 1994).

There used to be a population in the transboundary region with Niger around Babban Rafi, but there has been no recent information from here so this has been changed to **doubtful range**.

Listing Year	1990

CURRENT ISSUES

Niokolo Koba National Park is the last place where elephants are known to occur in Senegal, the westernmost elephant range state, but the park is in a serious state of deterioration. Illegal activity is widespread, including cattle grazing, commercial timber exploitation and wildlife poaching. It was added to the UNESCO list of World Heritage Sites in Danger in 2007 and remains on the list (UNESCO World Heritage Centre, n.d.). Emergency funding for anti-poaching was provided by the Rapid Response Facility in 2011 (UNESCO World Heritage Centre, 2011). Under these circumstances it is remarkable that such a small and isolated elephant population has managed to survive for so long.

Senegal published an elephant conservation plan in 1991, although this is now out of date (Direction des Parcs Nationaux du Senegal, 1991).

NUMBERS AND DISTRIBUTION

There was known to be at least one elephant in Senegal in 2013. There may be an additional 9 to 14 elephants. Together, this estimate and guess apply to 1,090 km², which is the entirety of the estimated known and possible elephant range in Senegal.

It is thought that there may be 10-15 elephants still in Niokolo Koba NP, with evidence of continued presence from camera trap photos in the Mount Assirik area of the park in 2013 and a few sightings of a small group (c. 10) in 2012 (Henschel, pers. comm., 2015). This **informed guess** replaces a guess of 1-10 individuals from 2006 (Renaud et al., 2006).

It is unlikely that elephants move between Niokolo-Koba NP and neighbouring Guinea, as there have been no records of elephant presence on the Guinea side since the early 1990s (Litoroh et al., 2002).

Protected Range	58%
Information Quality Index (IQI)	0.00
CITES Appendix	I
Listing Year	1994 (year of accession)

CURRENT ISSUES

There is little information about the current status of the few elephants remaining in Sierra Leone, and it is believed that the civil war of 1991-2001 had a severe impact on them (Lindsell et al., 2011). Agence Presse Francaise (AFP, 2009) reported in November 2009 that the last elephants in Sierra Leone had been wiped out by poaching. This report has been widely circulated and repeated in news items as recently as 2013. This was not correct, several small populations still survive, although they are under pressure from poaching, mining and logging (Ballweg et al., 2013).

The Gola East Forest Reserve population has been recorded as lost.

Sierra Leone published an elephant conservation plan in 1991, although this is now out of date (Ministry of Agriculture, 1991).

NUMBERS AND DISTRIBUTION

There have been no surveys carried out in Sierra Leone in the last ten years to the standards required for generating an estimate. There may be 135 to 155 elephants in areas not systematically surveyed in Sierra Leone. These guesses likely represent a minimum number, and actual numbers could be higher than those reported. These guesses apply to 867 km², which is 64% of the estimated known and possible elephant range. There remains an additional 36% of the estimated range for which no elephant population estimates are available.

There has been a reduction in the guessed number of elephants in Sierra Leone because of the loss of the Gola East elephant population.

NUMBERS AND DISTRIBUTION CONT.

There are four areas within Sierra Leone where it is believed that elephants still occur. These are Gola North Forest, Outamba Kilimi National Park, Bagbe River Forest and the Kangari Hills Forest Reserve (Ballweg et al., 2013; Siaka, pers. comm., 2016). These are marked as **known range**, while the Nimini South Forest Reserve, from which there are no recent records, has been changed to **doubtful range**, as has a small unnamed area of range from the AESR 2007 in the north-east corner of the country. The Gola East Forest Reserve population is now presumed extinct, a conclusion confirmed by local hunters who had not seen elephants there since the war (Lindsell et al., 2011), and this has been recorded as a **lost population**.

A dung survey was carried out in Outamba Kilimi National Park in 2012 (Ballweg et al., 2013). Elephants were only found in the western part of the Outamba section of the park, and there was insufficient data to derive a population estimate. Illegal gold mining was said to be an increasing problem. Since no new estimate was given, the estimate of 80-100 from 2006 (Danquah & Nandjui, pers. comm., 2006) has been retained.

Lindsell et al. (2011) carried out biodiversity surveys in the Gola Forest Complex in 2006-2007. This area was believed to have been badly affected by the civil war, and it was confirmed that elephant numbers had declined. However, in the absence of new information on numbers, the guess of 50 elephants from 1987 (Grubb et al., 1998) has been retained. The elephants in Gola North may not be permanently resident in this area but move back and forth across the Moro River between Sierra Leone and Liberia. The distribution of elephants in Gola North has been clarified with records from camera traps, direct observations and elephant signs from 2008 to 2014 (Tubbs, pers. comm., 2015).

PFS

Priority for Future Surveys (PFS) is ranked from 1 to 5 (highest to lowest). Based on the precision of estimates and the proportion of national range accounted for by the site in question, PFS is a measure of the importance and urgency for future population surveys. All areas of unassessed range have a priority of 1. See Introduction for details on how the PFS is derived.

CITES Appendix	I
Listing Year	1990

CURRENT ISSUES

There are very few elephants remaining in Togo. During civil disturbances from 1990-1992, people were encouraged to settle in the protected areas, and it is believed that the majority of elephants were killed or fled to neighbouring countries at that time (Okoumassou et al., 1998). Some attempts have been made to rehabilitate the parks, but their suitability for elephants is limited because they are now heavily settled (Polo-Akpisso et al., 2015). There is a UNDP project to rehabilitate Kéran National Park (République Togolaise, 2015). Fazao-Malfakassa National Park was being managed by the Franz Weber Foundation, but they withdrew at the end of 2015 (Weber, pers. comm., 2016).

In recent analyses of ivory seizure data in ETIS, prepared for CITES, Togo has been identified as a country with a worrying involvement in illegal ivory trade (CITES Secretariat, 2012; Milliken et al., 2013, 2016).

Togo published its national strategy for elephant management in 2003 (Ministère de l'Environnement et des Ressources Forestières, 2003).

NUMBERS AND DISTRIBUTION

There have been no surveys carried out in Togo in the last ten years to the standards required for generating an estimate. There may be 74 to 114 elephants in areas not systematically surveyed. These guesses likely represent a minimum number, and actual numbers could be higher than those reported. Together, this estimate and guess apply to 4,085 km², which is 65% of the estimated known and possible elephant range. There remains an additional 35% of the estimated range for which no elephant population estimates are available.

There were formerly three main areas of elephant range: in and around Kéran NP and Oti-Mandori Faunal Reserve in the north, the Fazao-Malfakassa massif in the centre of the country, and Fosse aux Lions National Park in the north-west. There has been a small increase in the guessed number of elephants in Fazao-Malfakassa NP, but this is probably the result of increased knowledge, rather than a real increase in numbers.

Twenty nine sightings of elephants were recorded in the Kéran area in the north of Togo between 2011 and 2014 with a maximum of ten individuals in one sighting in 2013 (Polo-Akpisso, pers. comm., 2016b). This replaces a guess of zero from 2004 (Bouché et al., 2004b). The range map has been changed to show the area where these were recorded as **known range**, with the remainder of the previous range changed to **possible range**.

Sixty one sightings and elephant tracks were recorded in Fazao Malfakassa NP from 2012 to 2014, and eight individuals were seen in a group in 2014 (Polo-Akpisso, pers. comm., 2016a). However, former park management believes that there are 60-100 and this has been entered as a **guess** (Weber, pers. comm., 2016), which replaces a previous guess of 61 from 2002 (Okoumassou, pers. comm., 2002) The range map has been changed to show the area where elephants were recorded as **known range**, with the remainder of the previous range changed to **possible**.

There is no recent information from Fosse aux Lions NP. There was an estimate of zero in the AESR 2007, and therefore it is recorded as a **lost population** and changed to **non-range.** There is also no recent information from the Abdoulayé Faunal Reserve to the east of Fazao Malfakassa, so the existing guess of four elephants has been retained but degraded.

Elephants recorded in Oti-Kéran-Mandori are probably visitors from Benin and Burkina Faso.

Hi Lisa,

I just wanted to flag a few things for you. HSUS did a poll on trophy hunting and which revealed that voters by a margin of more than a margin of five to one, oppose allowing imports of elephant and lion trophies into the U.S. The poll was broken down by party line showing that the majority of Republicans, Democrats, and Non-partisan voters oppose trophy imports. The poll can be found here as well as a recent blog by Wayne Pacelle.

Additionally, Representative Buchanan put out a press statement on lion trophies.

Lastly, Representative Grijalva released an updated to his Trophy Hunting Report that I just wanted to make sure saw. (See below). The report outlines while it is unnecessary to create the International Wildlife Council. We submitted comments (attached) objecting to the Council and will be submitting comments tomorrow putting forward a name for consideration to sit on the Council.

Best,

Keisha

Rep. Grijalva Releases Updated Trophy Hunting Report as Trump-Zinke Moves Threaten Future of Multiple Endangered Species

Washington, D.C. – Natural Resources Committee Ranking Member Raul M. Grijalva (D-Ariz.) today released an updated version of a report on trophy hunting and endangered species protection that his staff initially released in 2016 in response to the tragic killing of Zimbabwe's famed Cecil the Lion. The release comes in the wake of Interior Secretary Ryan Zinke's recent announcements that he plans to create a federal advisory committee to promote the hunting of imperiled wildlife and to allow the importation of elephant and lion trophies from several African countries.

The report, titled *Missing the Mark: African Trophy Hunting Fails to Show Consistent Conservation Benefits*, takes a hard look at the rationale for allowing Americans to import hunting trophies of threatened and endangered species. It finds that the U.S. Fish and Wildlife Service often grants import permits for trophies that do not meet the legal requirement of enhancing the propagation or survival of the species in the wild and makes a number of recommendations for improving the program.

The updated report is available at http://bit.ly/2AkJju4.

Among other findings, the report showed that some countries where these species are hunted have serious corruption problems that make it nearly impossible to verify information provided on the supposed conservation impacts of trophy hunts. This is a major concern in Zimbabwe, which consistently ranked as one of the most corrupt and unstable countries in the world even before the coup that deposed Robert Mugabe last month. While the recent decision to allow elephant trophies from Zimbabwe and neighboring Zambia has been put on hold, significant work needs to be done before imports can be allowed.

The report also sheds some light on the extremely wealthy demographic that travels from the United States to Africa to kill threatened and endangered animals for sport. For example, the estimated cost to hunt, kill, and import a white rhinoceros trophy from South Africa is at least twice the annual income of the average American family.

Grijalva issued the following statement:

"President Trump wants a taxpayer-funded public relations department for his rich, elitist sons for the same reason he hates the inheritance tax: he thinks the government works for his family. Our report lays out clear recommendations to clean up the trophy hunting industry and make sure our environmental laws don't just help a privileged few. Secretary Zinke thinks the big game hunter fantasy lifestyle is the basis for real policy, and endangered species are going to suffer for it."

Grijalva is the author of H.R. 502, a bill to reauthorize the Land and Water Conservation Fund that has 211 bipartisan cosponsors, but has not been granted a hearing by Natural Resources Committee Chairman Rob Bishop. Last week, Grijalva and former Congressional Sportsmen's Caucus Chairman Mike Thompson (D-Calif.) introduced H.R. 4489, the Authorizing Critical Conservation for Sportsmen and Sportswomen (ACCESS) Act. ACCESS includes a host of titles with bipartisan support that are priorities for the sporting community and leaves out the anti-conservation and anti-gun safety provisions that sank Republicans' heavily partisan SHARE Act earlier this year.

Re: Comments Opposing the Establishment of an International Wildlife Conservation Council (Docket No. FWS-HQ-R-2017-N118)

Dear Mr. Winchell and Chief Van Norman,

The Humane Society of the United States ("HSUS"), Humane Society International ("HSI"), Humane Society Legislative Fund ("HSLF"), and the twenty-two undersigned organizations strongly urge the U.S. Fish and Wildlife Service ("Service") not to establish the euphemistically-named International Wildlife Conservation Council ("IWCC"), as establishing the IWCC as proposed would violate the Federal Advisory Committee Act ("FACA", 5 U.S.C. App. 2) and would be arbitrary and capricious and not in accordance with law. *See* 82 Fed. Reg. 51,857 (Nov. 8, 2017).

The Service Proposes to Create a Duplicative and Biased Advisory Council

The Service is proposing to establish the IWCC for the purpose of "**increasing public awareness** domestically regarding the **conservation**, wildlife law enforcement, and **economic benefits that result from U.S. citizens traveling to foreign nations to engage in hunting**. Additionally, the Council shall **advise the Secretary on the benefits international hunting** has on foreign wildlife and habitat conservation, anti-poaching and illegal wildlife trafficking programs, and other ways in which international hunting benefits human populations in these areas." *Id.* (emphasis added).

The duties of the IWCC would include:

- developing a plan for public engagement and education on the benefits of international hunting;
- reviewing and making recommendations for changes, when needed, on all Federal programs, and/or regulations, to ensure support of hunting as: (a) An enhancement to foreign wildlife conservation and survival, and (b) an effective tool to combat illegal trafficking and poaching;
- recommending strategies to benefit the U.S. Fish and Wildlife Service's permit office in receiving timely country data and information so as to remove barriers that impact consulting with range states;
- recommending removal of barriers to the importation into the United States of legally hunted wildlife;
- ongoing review of import suspension/bans and providing recommendations that seek to resume the legal trade of those items, where appropriate;
- reviewing seizure and forfeiture actions/practices, and providing recommendations for regulations that will lead to a reduction of unwarranted actions;
- reviewing the Endangered Species Act's foreign listed species and interaction with the Convention on International Trade in Endangered Species of Wild Flora and Fauna [*sic*], with the goal of eliminating regulatory duplications; and
- recommending methods for streamlining/expediting the process of import permits.

Id.

As detailed herein, the IWCC is unnecessary, duplicative, not in the public interest, and designed to be inappropriately influenced by the trophy hunting industry in a manner that undermines the Service's statutory duties under the Endangered Species Act (16 U.S.C. § 1531 *et seq.*) and FACA. Therefore, the IWCC cannot lawfully be established.

Requirements for Establishing a Federal Advisory Committee

The FACA provides that "new advisory committees should be established only when they are determined to be essential and their number should be kept to the minimum necessary." 5 U.S.C. App. 2 § 2(b)(2). Further, "[n]o advisory committee shall be established unless such establishment is determined…to be in the public interest in connection with the performance of duties imposed on that agency by law." *Id.* § 9(a)(2). Advisory committees can only be used "solely for advisory functions" (*id.* § 9(b)) and must serve a "clearly defined purpose" (*id.* § 5(b)(1)). The membership of an advisory committee must "be fairly balanced in terms of the points of view represented and the functions to be performed by the advisory committee" (*id.* § 5(b)(2)), and must "not be inappropriately influenced by… any special interest" (*id.* § 5(b)(3)). Agency actions contrary to the requirements of FACA are subject to judicial review under the Administrative Procedure Act (APA). *See, e.g., Fertilizer Institute v. U.S. E.P.A.*, 938 F.Supp. 52, 54-55 (D.D.C., 1996)); 5 U.S.C. § 702. *See also Food Chem. News, Inc. v. Davis*, 378 F. Supp. 1048, 1049 (D.D.C. 1974) (enjoining agency from convening advisory committee meetings unless conducted in full compliance with FACA).

Establishing the IWCC Would Violate FACA

A. The IWCC Is Duplicative and Not Essential

The purpose of FACA is "to enhance the public accountability of advisory committees established by the Executive Branch and to reduce wasteful expenditures" that result only in "worthless committee meetings and biased proposals." *Pub. Citizen v. U.S. Dep't of Justice*, 491 U.S. 440, 453, 459 (1989). To this end, it is unlawful for FWS to establish an advisory committee that exceeds the minimum number of committees necessary or to establish a committee that is not needed to advance an agency's statutory duties and regulatory agenda. *See* 5 U.S.C. App. 2 § 2(b)(2). The IWCC wholly fails to meet these standards – indeed, the IWCC raises the precise concerns that FACA was designed to guard against.

Notably, there already exists an advisory council entitled the Wildlife and Hunting Heritage Conservation Council ("WHHCC"), which has the authority to address the matters included in the IWCC's proposed purview. *See* 75 Fed. Reg. 6,056 (Feb. 5, 2010); https://www.fws.gov/whhcc/. Like the IWCC, the WHHCC's mission explicitly includes providing "advice on wildlife and habitat conservation endeavors that (1) **benefit recreational hunting**; (2) benefit wildlife resources; and (3) encourage partnerships among the public, the sporting conservation community, wildlife conservation groups, the States, Native American Tribes, and the Federal government." 75 Fed. Reg. 6,056 (Feb. 5, 2010) (emphasis added). To achieve that goal of promoting recreational hunting, the WHHCC focuses in part on "Providing appropriate access to hunting and recreational shooting on Federal lands" and "Providing recommendations to improve implementation of Federal conservation programs that benefit wildlife, hunting and outdoor recreation on private lands." *Id.* Consistent with these broad purposes, the WHHCC has multiple times discussed and formed recommendations on international trophy hunting issues.

For example, in July 2012, the WHHCC sent a letter to the Service on behalf of "millions of hunters and anglers nationwide, including many who hunt internationally and seek to import and export their trophies into and out of the United States." (Attached). That letter included criticism of the process the Service uses to interpret and apply restrictions on the import and seizure of hunting trophies, and provided eight particular recommendations relating to "1) amendments to CITES resolutions and/or decision documents; 2) modifications to FWS manuals, policies, Directors' Orders, guidance documents and/or practices; and 3) coordinating efforts with representative organizations of the international hunting community." *Id.* Similarly, in July 2014, the WHHCC sent another letter to the Service, this time urging the Service to reverse its decision to suspend the import of elephant hunting trophies from Tanzania and Zimbabwe, noting the WHHCC's "efforts on behalf of the hunting community." (Attached). That latter letter followed a June 2014 meeting of the WHHCC where Safari Club International ("SCI") presented "updates on African Lion and Elephant" trophy hunting.[1] At its March 2016 meeting, WHHCC again discussed the topic of international trophy hunting, specifically focusing on African lion import issues and including a presentation from SCI.[2] These are the precise tasks identified

[1] https://www.facadatabase.gov/committee/historymeeting.aspx?mid=123631&cid=2299&fy=2014.
[2] https://www.facadatabase.gov/committee/historymeetingdocuments.aspx?flr=135324&cid=2299&fy=2016.

in the IWCC notice, demonstrating that there already exists a forum for trophy hunters to attempt to influence FWS policy on these matters.

Indeed, the WHCC currently includes members that represent international trophy hunting interests, such as the Congressional Sportsmen's Foundation.[3] The WHCC also currently includes representatives from the Boone & Crockett Club, Backcountry Hunters & Anglers, Ducks Unlimited de Mexico, and Urban American Outdoors, many of whose members trophy hunt in the U.S.—and likely abroad. Further, the IWCC seeks representation from "the firearms or ammunition manufacturing industry," but a representative from the National Shooting Sports Foundation – a national trade association for the firearms industry – already serves as a member of the WHCC. The incredibly slight differences in the membership these councils maintain/are seeking, demonstrate the duplicative nature of the IWCC.

Therefore, it would be wholly duplicative for the Service to establish the IWCC, whose proposed purpose and tasks are matters that can and are already being carried out by another advisory group.

Similarly, the Service has failed to demonstrate that establishing the IWCC is *essential*. For example, in 2013 the Service established a Wildlife Trafficking Advisory Council to combat issues of illicit wildlife trade and to improve enforcement of wildlife trade laws. 78 Fed. Reg. 45,555 (Jul. 29, 2013). That committee discussed issues of international trophy hunting as a type of wildlife trade.[4] However, that advisory council was deemed inessential and discontinued pursuant to Executive Order No. 13811 (September 29, 2017).[5] It is arbitrary and capricious for the Service to now establish the IWCC to take on activities that were previously covered by the Wildlife Trafficking Advisory Council, which was deemed unnecessary by this Administration. Further, the duplicative nature of the IWCC is further demonstrated by the fact that the IWCC would include a representative from the U.S. Department of State – the Presidential Task Force on Wildlife Trafficking established pursuant to Executive Order No. 13,648 (July 1, 2013) already provides a forum for the Service and the State Department to discuss issues of international wildlife trade, including trade in hunting trophies.

Thus, there are already multiple fora for detailed discussion of the issues the IWCC is tasked with providing advice to the Service on, meaning that establishing the IWCC is not essential, as required by law. This is especially true given the broader statutory context, as discussed further below – the Endangered Species Act already provides the opportunity for the trophy hunting industry to submit applications for import permits that demonstrate the alleged benefit of trophy hunting and to submit comments on other permit applications and foreign species listing petitions. *See* 16 U.S.C. § 1539(c). Thus, there is no functional need

---

[3] *See, e.g.,* Congressional Sportsmen's Foundation. Press Release. Aug. 7, 2013. *Sportsmen's Priorities Moving in Congress* (supporting bill allowing import of polar bear trophies hunted in Canada), http://sportsmenslink.org/the-media-room/news/sportsmens-priorities-moving-in-congress.

[4] *See* https://www.fws.gov/International/advisory-council-wildlife-trafficking/pdf/acwt-meeting-minutes-march-20.pdf.

[5] *See* https://www.whitehouse.gov/the-press-office/2017/09/29/presidential-executive-order-continuance-certain-federal-advisory.

for an advisory committee dedicated to promoting propaganda of the trophy hunting industry.

Because the IWCC is per se inessential and duplicative, chartering the IWCC would violate FACA.

B. The IWCC Is Not in the Public Interest

Chartering the IWCC would further violate FACA because its purpose is inconsistent with the public interest and the "performance of duties imposed on [the Service] by law." 5 U.S.C. App. § 9(a)(2).

The primary stated purpose of the IWCC is to *promote* trophy hunting of foreign species and to relax the legal restrictions for importing trophies of threatened and endangered species, accepting as incontrovertible fact the notion that trophy hunting promotes the conservation of wildlife species. However, this is a highly controversial and hotly debated topic, with ample scientific evidence to the contrary, and the notice of IWCC creation patently reveals the biased and unsupported positions that the council would advance.

The FACA was specifically adopted to avoid such a circumstance. *See, e.g., Moss v. C.A.B.*, 430 F.2d 891, 893 (1970) (when the "subject matter of" a FACA council's "involve[s] serious and much-debated…issues…[t]he Government's consideration of such sensitive issues must not be unduly weighted by input from the private commercial sector, lest the Government fall victim to the devastating harm of being regulated by those whom the Government is supposed to regulate in the public interest."); H.R. REP. 92-1017, 1972 U.S.C.C.A.N. 3491, 3496 ("One of the great dangers in th[e] unregulated use of advisory committees is that special interest groups may use their membership on such bodies to promote their private concerns. Testimony received [on the passage of the FACA] pointed out the danger of allowing special interest groups to exercise undue influence upon the Government through the dominance of advisory committees which deal with matters in which they have vested interests.").

Thus, forming the IWCC as proposed would be unlawful.

1. Trophy hunting undermines conservation efforts

As detailed in numerous documents in the Service's possession (*e.g.*, petitions to list African lions, elephants, and leopards as endangered under the ESA; letters submitted with respect to the import of lions and elephants from Tanzania, Zimbabwe, Zambia, and South Africa, as well as the expert declarations in support thereof; and comments opposing the import of endangered bontebok, cape mountain zebra, and black rhinoceros trophies, attached), there is ample scientific evidence that trophy hunting of threatened and endangered species does not in fact enhance the survival of the species in the wild. With respect to three of the so-called "Big Five" species targeted by trophy hunters, a summary of that evidence is as follows.

Trophy Hunting of African Lions

With the world's preeminent lion scientist as the lead author, Packer et al. (2009)[6] and Packer et al. (2010)[7] identify trophy hunting as the likely cause of multiple lion population declines in Africa.[8] In addition to direct population reduction through lethal take, trophy hunting poses a threat to lions because it can weaken a population's genetic constitution (e.g. Allendorf et al. 2008[9]). Because hunters target the biggest and strongest males, trophy hunting removes these animals from the breeding pool and unnaturally selects for smaller or weaker animals (Allendorf and Hard, 2009[10]). In this way, trophy hunting can decrease genetic variation, shift the population structure, and cause unnatural evolutionary impacts. This effect has already been documented in other species. For example, selective hunting likely increased the occurrence of mature female African elephants (*Loxodonta africana*) lacking tusks from 10% to 38% in parts of Zambia over 20 years (Jachmann et al. 1995[11]), and recent studies of bighorn sheep suggest that horn size and body weight decreased over time as a result of trophy hunting (e.g. Coltman et al., 2003[12]; Festa-Bianchet et al., 2013[13]). Further, when trophy hunting is sanctioned, poaching activity increases, likely due to the perception that species authorized for hunting are of diminished value and the perception that legal killing increases the acceptability of poaching.[14] Moreover, trophy hunting of lions has cascading lethal impacts on lion populations, as the social instability created by removing dominant males leads to infanticide of cubs sired by the male killed for a trophy (Packer et al. 2009).

Lion scientists have produced a steady drumbeat of warnings that trophy hunting across African range states is unsustainable and is a threat to survival of the species:

African Continent:

- Rosenblatt (2014)[15]: "…overharvesting of lions has been well-documented throughout Africa", recognize trophy hunting as one of the reasons for the decline of the lion throughout its range.
- Hunter et al. (2014)[16]: "there is considerable scientific evidence of negative population impacts associated with poorly-managed trophy hunting of lions." The authors state "there have been documented negative impact on lion populations resulting from trophy hunting" and call for lion trophy hunting reform.
- Lindsey et al. (2013)[17] stated that, regarding the recent decline of lion populations, "Most of the factors that contribute to this decline are now well understood, although evidence of the impacts of trophy hunting on lions has only emerged relatively recently." The authors also state, "lion quotas remain higher than the 0.5/1,000 km2 recommended by [Packer et al. (2011)] in all countries except Mozambique" and "in all countries where data are available, harvests appear too high in a proportion of hunting blocks."

Zambia:

- Rosenblatt et al. (2014): found a declining lion population in South Luangwa National Park with low recruitment, low sub-adult and adult survivorship, depletion of adult males and an aging adult female population and attributed this to the "severe male depletion" caused by trophy hunting.
- Lindsey et al. (2014)[18]: numerous problems identified with trophy hunting in Zambia including that the Zambia Wildlife Authority establishes trophy quotas arbitrarily and "quotas of lions have been particularly excessive".
- Lindsey et al. (2013): "Excessive offtake from trophy hunting also lowered population density of lions and altered sex-ratios of lions in Hwange National Park, Zimbabwe, South Luangwa, Kafue and Lower Zambezi national parks in Zambia, and the Bénoué Complex in Cameroon." The authors also said that mean lion harvests are higher than Packer et al. (2011) 0.5/1,000 km^2 threshold in Zambia.

Tanzania:

- Dolrenry et al. (2014)[19]: populations in Tanzania are declining in part due to "overexploitation due to poor management of trophy hunting".

[16] Hunter, L., Lindsey, P., Balme, G., Becker, M., Begg, C., Brink, H. …White, P., Whitman-Gelatt, K. (2014). Urgent and comprehensive reform of trophy hunting of lions is a better option than an endangered listing; a science-based consenus [sic]. Unpublished.

[17] Lindsey, P. A., Balme, G. A., Funston, P., Henschel, P., Hunter, L., Madzikanda, H., ... & Nyirenda, V. (2013). The trophy hunting of African lions: Scale, current management practices and factors undermining sustainability. PloS one, 8(9), e73808.

[18] Lindsey, P. A., Nyirenda, V. R., Barnes, J. I., Becker, M. S., McRobb, R., Tambling, C. J., ... & t'Sas-Rolfes, M. (2014). Underperformance of African Protected Area Networks and the Case for New Conservation Models: Insights from Zambia. *PloS one*, *9*(5), e94109.

- Lindsey et al. (2013): "Trophy hunting has contributed to population declines outside (and inside some) protected areas in Tanzania, a country that holds between 30-50% of Africa's lion."

Zimbabwe:

- Groom et al. (2014)[20]: the low densities of lion populations in Gonarezhou National Park and trophy hunting concessions in Tuli are due to the collapse of these populations in the past due to "unsustainably high trophy hunting within Tuli and in the concessions around Gonarezhou …." The authors concluded, "hunting has probably had a strong negative effect on lion abundance in both reserves."
- Lindsey et al. (2013): "Excessive offtake from trophy hunting also lowered population density of lions and altered sex-ratios of lions in Hwange National Park, Zimbabwe, South Luangwa, Kafue and Lower Zambezi national parks in Zambia, and the Bénoué Complex in Cameroon."
- Lindsey et al. (2013): mean lion harvests are higher than Packer et al. (2011) 0.5/1,000 km^2 threshold in Zimbabwe.

Namibia:

- Lindsey et al. (2013): mean lion harvests are higher than Packer et al. (2011) 0.5/1,000 km^2 threshold in Namibia.

Cameroon:

- Lindsey et al. (2013): "Excessive offtake from trophy hunting also lowered population density of lions and altered sex-ratios of lions in Hwange National Park, Zimbabwe, South Luangwa, Kafue and Lower Zambezi national parks in Zambia, and the Bénoué Complex in Cameroon."

Burkina Faso:

- Lindsey et al. (2013): mean lion harvests are higher than Packer et al. (2011) 0.5/1,000 km2 threshold in Burkina Faso.

Benin:

- Sogbohossou et al. (2014)[21]: the low lion density and small group size found in Pendjari Biosphere Reserve in Benin is due to human disturbance and mortality through trophy hunting, the Pendjari lion hunting quota is three times higher than recommended by Packer et al. (2011), and the existing age limit for 'old males' is not enforced.

Trophy Hunting of African Elephants

Similarly, trophy hunting is documented to undermine the conservation of African elephants. As explained in a recent scientific study, range states from which the Service

currently allows trophy imports (such as South Africa) may be setting unsustainably high hunting quotas: in the Greater Mapungubwe Transfrontier Conservation Area scientists found that, in contrast to current hunting allowances, "only a small number of bulls (<10/year) could be hunted sustainably. At current rates of hunting, under average ecological conditions, trophy bulls will disappear from the population in less than 10 years."[22]

Researchers have found that the selective nature of trophy hunting causes changes in desirable phenotypic traits in harvested species. In particular, trophy sizes for wild herbivores experienced temporal decline in South Africa and Tanzania. "Declines in trophy size over time due to selective harvesting could be attributed to phenotypic plasticity that may result due to a decline in abundance of big tuskers and individuals with big horns or tusks as these are mostly selected by hunters."[23] Again, because hunters target the biggest and strongest male elephants, trophy hunting removes these animals from the breeding pool and unnaturally selects for smaller or weaker animals.[24] In this way, trophy hunting can decrease genetic variation, shift the population structure, and cause unnatural evolutionary impacts. For example, selective hunting likely increased the occurrence of mature female African elephants (*Loxodonta africana*) lacking tusks from 10% to 38% in parts of Zambia over 20 years.[25] Additionally, trophy hunting has been shown to disrupt family groups and social stability, negatively impacting elephant survival.[26]

Another study reviewed the functioning of Zambia's protected areas and game management areas (GMAs), where trophy hunting occurs.[27] The authors found numerous problems that pertain to management of trophy hunting in GMAs including: uncontrolled human immigration and open access to wildlife; the Zambia Wildlife Authority (ZAWA) retains most of income derived from trophy hunting, little of this income goes to people living in GMAs with affluent community members benefiting most, and there are frequent financial

irregularities associated with the distribution of this income; scouts employed in anti-poaching in GMAs are poorly and irregularly paid, insufficiently trained and equipped, and inadequate in number; ZAWA is poorly funded, has an inadequate number of staff to protect elephants against poaching, has increased hunting quotas to unsustainable levels in GMAs in order to raise money (the authors state that ZAWA 'are sometimes forced to make decisions to achieve financial survival at the expense of the wildlife they are mandated to conserve'), establishes trophy quotas arbitrarily, and does not monitor wildlife populations or trophies; and hunting concession agreements are not effectively enforced and unscrupulous concession operators are not adequately punished. The authors blame these many failures for the low numbers and diversity of wildlife, including elephants.

Thus, it is not surprising that elephant densities are lower in trophy hunting areas compared to a national park where trophy hunting is not permitted.[28] The Service itself acknowledged such impacts in 2014 when it suspended the issuance of elephant trophy imports from Tanzania and Zimbabwe.[29]

The Service has previously rejected attempts to import trophies from Zambia due to similar concerns of mismanagement including inconsistencies in reported elephant population estimates, failure to comply with monitoring requirements, absence of government funding for elephant protection, and lack of effective anti-poaching measures.[30] Further, the Service has not made enhancement findings for elephant trophy imports from either Mozambique or Cameroon even though elephant trophy hunting is allowed there.[31]

Trophy Hunting of African Leopards

Balme et al. (2010)[32] demonstrated the impact of trophy hunting on infanticide in a population of leopards in South Africa; high trophy hunting offtake resulted in particularly high male leopard mortality and high levels of male turnover; females cannot successfully raise cubs because of immigration into the population of new males; the consequences were low cub survival rates, delayed age at first parturition, reduced conception rates, and low annual litter production; the combined impact of high mortality and low reproductive

The Susceptibility of Leopards Panthera pardus to Trophy Hunting. *PLOS ONE* 10(4).

output led to a negative population growth rate. Further, the 2016 IUCN assessment for *Panthera pardus* specifically notes that "concern about unsustainable trophy hunting has lately increased" and cites studies concretely demonstrating that "trophy hunting was a key driver of Leopard population decline" (Stein et al. 2016).[33]

Moreover, few of the potential benefits from hunting are consistently realized by local communities that live amongst lions, elephants, leopards, and other species targeted by trophy hunters. According to an IUCN analysis from 2009, big-game hunting only provided one job for every 10,000 inhabitants in the area studied,[34] and many of these jobs were temporary seasonal positions like opening the trails at the start of the hunting season (IUCN 2009[35]). Trophy hunting fails to create a significant number of permanent jobs (and those that it does create do not automatically benefit conservation), but ecotourism offers a possible solution. Consider the Okavango in Botswana where, as of 2009, a safari ecotourism tourism park provided 39 times the number of jobs than would big-game hunting on an area of equal size (IUCN 2009). Another example is the Luangwa National Park in Zambia, which produced twice the number of jobs provided by Benin and Burkina Faso's trophy hunting sector combined in 2007 (IUCN 2009).

The IUCN also found that Africa's 11 main big-game hunting countries only contributed an average of 0.6% to the national GDP as of 2009 (IUCN 2009). Of this marginal profit, studies suggest that as little as 3-5% of trophy hunting revenues are actually shared with local communities (Economists at Large 2013[36]; IUCN 2009; Sachedina 2008[37]). Perhaps because of this, locals do not always view trophy hunting as the positive economic driver that hunting advocates portray it as. For example, villagers in Emboreet village in Tanzania characterized hunting as "destructive, exploitative, and disempowering," and blame hunting for jeopardizing village revenues (Sachedina 2008). The same study presents an interview with the Village Executive Officer, who explained that villagers feel more closely partnered with photographic tour operators than with hunters because hunters "are finishing off the wildlife before we've had a chance to realize a profit from it," and because villagers never see the 5% of revenue they are supposed to receive from trophy hunting (Sachedina 2008).

A 2017 report from Economists at Large[38] found that in Botswana (where trophy hunting is now prohibited since 2014), Ethiopia, Mozambique, Namibia, South Africa, Tanzania,

[38] Economists at Large. (2017). The Lion's Share? On The Economic Benefits Of Trophy Hunting. A report for the Humane Society International, prepared by Economists at Large, Melbourne,

Zambia and Zimbabwe, trophy hunting brings in less than $132 million in tourism spending to the eight study countries out of $17 billion annual tourism spending, or just 0.78 percent. And trophy hunting has only a marginal impact on employment in these eight countries, contributing only between 7,500-15,500 jobs or 0.76 percent or less of nearly 2.6 million overall tourism jobs.

On average, American trophy hunters import more than 126,000 trophies every year.[39] While not all of these species are protected under the U.S. Endangered Species Act, it is an unfounded and sweeping generalization to assert that trophy hunting always provides a biological or economic benefit to the conservation of the species, as asserted in the IWCC notice. Therefore, an advisory council designed solely to *educate* the public on the *benefits* of trophy hunting is not in the public interest, as those alleged benefits are not supported by the best available science. Nor is that conclusion supported by the American public – indeed, in the last week alone, over 435,121 members of the public have voiced their opposition to American trophy hunters killing African lions and elephants threatened with extinction, and nearly 2 million people worldwide have taken action in opposition to elephant trophy hunting in another call to action.[40]

2. Using taxpayer dollars to promote the commercial interests of trophy hunting industry is not in the public interest

The purpose of the FACA is "to eliminate useless advisory committees, strengthen independence of remaining advisory committees, and prevent advisory groups from becoming self-serving." *Consumers Union of U.S., Inc. v. Department of Health, Ed. and Welfare*, 409 F.Supp. 473, affirmed 551 F.2d 466 (D.D.C.1976). Establishing the IWCC would require the Service to expend resources on convening and participating in the council, unnecessarily diverting resources from an already strapped agency. Indeed, the Fiscal Year 2018 budget proposes to decrease funds spent on foreign species protection by $1,000,000.[41] To use precious agency resources to create a self-serving platform for trophy hunters to amplify their voice, especially while funds are already provided for other FACA advisory committees addressing these same topics, does not meet the FACA requirements for actions in the public interest.

Therefore, the IWCC is not in the public interest and cannot be lawfully chartered.

C. The IWCC Is Designed to Undermine the Implementation of the ESA and the Service's Other Legal Obligations

The IWCC represents an effort by a commercial industry to undermine the statutory duties of an agency, and as such the establishment of the IWCC would be patently *ultra vires*.

Australia.

[39] http://www.hsi.org/assets/pdfs/report_trophy_hunting_by_the.pdf; http://www.hsi.org/assets/pdfs/trophy-madness-report.pdf; http://www.ifaw.org/sites/default/files/IFAW_TrophyHuntingReport_UK_v2.pdf.

[40] https://www.thepetitionsite.com/takeaction/721/417/558/; https://secure.avaaz.org/campaign/fr/trump_vs_elephants/.

[41] https://www.fws.gov/budget/2018/FY2018-FWS-Greenbook.pdf

As an initial matter (and to be discussed further in comments submitted on or before December 8, 2017), the proposed makeup of the IWCC is inherently biased – it would include up to eighteen members who represent "Wildlife and habitat conservation/management organizations; U.S. hunters actively engaged in international and/or domestic hunting conservation; The firearms or ammunition manufacturing industry; Archery and/or hunting sports industry; and Tourism, outfitter, and/or guide industries related to international hunting." There is no suggestion that objective conservation biologists will be invited to have a roll on this committee that would make recommendations on the management of threatened and endangered species. Indeed, even the reference to participation by conservation and management organizations is so vague that it could even include biased groups like Safari Club International/Safari Club International Foundation or the National Rifle Association, groups that have filed lawsuits against the Service to assert the interests they now seek to address via the IWCC.

The IWCC is inherently designed to allow the trophy hunting industry to have an amplified voice, with an air of formality, on the question of whether killing threatened and endangered species enhances the survival of the species as required under the Endangered Species Act. 16 U.S.C. § 1539(a)(1)(A); 50 C.F.R. § 17.40. Specifically, the IWCC would be charged with:

- recommending removal of barriers to the importation into the United States of legally hunted wildlife;
- ongoing review of import suspension/bans and providing recommendations that seek to resume the legal trade of those items, where appropriate;
- reviewing seizure and forfeiture actions/practices, and providing recommendations for regulations that will lead to a reduction of unwarranted actions;
- reviewing the Endangered Species Act's foreign listed species and interaction with the Convention on International Trade in Endangered Species of Wild Flora and Fauna [*sic*], with the goal of eliminating regulatory duplications; and
- recommending methods for streamlining/expediting the process of import permits."

The ESA mandates that the Service itself make enhancement findings and determine whether listing a species is warranted, and these are not tasks that can be delegated to the regulated industry. 16 U.S.C. §§ 1533, 1539. Indeed, even without the creation of the IWCC the trophy hunting industry has had undue influence on such decisions of the Service, as evidenced by the fact that Safari Club International announced the recent decisions to allow elephant trophy imports from Zimbabwe and Zambia before such findings were even announced by the Service[42] (and before such announcements were called into question by the President).[43]

The IWCC would also apparently take on "recommending strategies to benefit the U.S. Fish and Wildlife Service's permit office in receiving timely country data and information so as to remove barriers that impact consulting with range states." But it would be inappropriate

[42] https://www.safariclub.org/detail/news/2017/11/14/u.s.-now-allows-elephants-from-zimbabwe-zambia-to-be-imported?from=groupmessage&isappinstalled=0

[43] Statement of President Trump, Nov. 17, 2017 at 8:47 pm, https://twitter.com/realDonaldTrump/status/931685146415255552; Statement of President Trump, Nov. 19, 2017 at 6:57 pm, https://twitter.com/realDonaldTrump/status/932397369655808001.

for such bilateral governmental discussions to be mediated by a third party with a financial stake in affecting the outcome of those communications. It is clear that the trophy hunting industry is aiming to minimize the impact of the ESA (indeed, they are currently arguing both in federal court[44] and before Congress that the ESA should add no more protections than what exists under CITES, even though that treaty explicitly calls for member countries to adopt national measures[45]). The IWCC would give the regulated industry a special seat at the table, to the disadvantage of conservation and animal protection groups seeking to prevent species extinction in furtherance of the statutory mandate of the ESA.

With the establishment of the ESA, Congress created "a program for the conservation of such endangered species and threatened species" and mandated federal agencies to "utilize their authorities in furtherance of the purposes of" the ESA by committing "to conserve to the extent practicable the various species of fish or wildlife and plants facing extinction . . ." 16 U.S.C. § 1531(a)(4), (b), (c)(1). The ESA defines the term "conserve" to mean "to use all methods and procedures which are necessary to bring any endangered species or threatened species to the point at which the measures provided pursuant to [the Act] are no longer necessary." 16 U.S.C. § 1532(3). It is critical that any decisions to list species or allow imports of listed species are made based on the best available science, not pursuant to the commercial interests of the trophy hunting industry as envisioned by the IWCC.

Likewise, the IWCC would be charged with reviewing ESA listed and CITES listed species. Again, the criteria for listing species (or delisting them as the case may be) in either arena are specifically inscribed. Under the ESA, species listings/delisting are reviewed using five factors and decisions are made "solely on the basis of the best scientific and commercial data," 16 U.S.C. § 1533(b)(1)(A), and CITES uses the best information available and specific biological criteria and reliance upon the precautionary principle that the Parties to CITES act in "best interest of the conservation of the species." Res. Conf. 9.24 (Rev'd CoP17). Consideration of species listing proposals is done through a public process and by the agency, a FACA committee is unnecessary and risks abdicating the Service's responsibilities.

Equally concerning, is the IWCC delineated duty to "review[] seizure and forfeiture actions/ practices." 82 Fed. Reg. at 51,858. Seizure and forfeiture actions are entirely within the Service's prosecutorial discretion – an arena in which courts generally do not tread. *See Heckler v. Chaney*, 470 U.S. 821 (1985) (finding agencies have unreviewable prosecutorial discretion unless a statute or agency policy says otherwise). It is difficult to imagine how a FACA committee could "review" what a federal court may not.

---

[44] *SCI et al. v. Zinke*, Case No. 1:14-cv-00670-RCL (D.D.C. 2017).

[45] This international law sets the floor, expressly providing that parties may adopt "stricter domestic measures" for species covered by CITES (as well as those that are not). CITES, Art. XIV, para. 1. *See also* FWS, *Ensuring the Future of the Black Rhino* (Nov. 25, 2014), *at* http://www.fws.gov/news/blog/index.cfm/2014/11/25/Ensuring-the-Future-of-the-Black-Rhino (acknowledging that the ESA enhancement standard is in addition to the CITES non-detriment standard and that trophy import permits should only be issued if the Service finds "that the [animal] is taken as part of a well-managed conservation program that contributes to the long-term survival of the species").

Therefore, the establishment of the IWCC is not in accordance with either the FACA or the ESA and must not be finalized. If the IWCC is finalized, HSUS, HSI, and one or more of the undersigned organizations will consider seeking legal review of this unlawful agency action. We will submit separate comments on the composition of the IWCC on or before December 8, 2017.

positive enhancement finding in Zimbabwe

Tom Whaley <tom@loganwhaley.com>

From:	Tom Whaley <tom@loganwhaley.com>

Subject:	positive enhancement finding in Zimbabwe

Good day gentlemen!

I was just sending you a short note to brag on each of you for lifting the suspension of sport hunted elephant trophy imports in to the United States from Zimbabwe. This suspension was really hurting the wildlife anti poaching efforts in Zimbabwe. I witnessed proof of that with my own eyes in May of 2017, while I was on a hunt in Zimbabwe. On six separate occasions we found clear evidence of elephant poaching, it was a sad sight seeing a rotting carcass of an elephant that had been killed by poachers. They had just killed these elephants and cut the tusks away, leaving the rest of it to rot and waste. Quite a sad and sickening sight for sure! I asked the landowner about this and he told me that since the USFWS suspension was started in 2014, their funding for anti poaching was pretty much non-existent. This allowed the poachers to roam the land pretty freely, now that the suspension has been lifted the much needed funding for anti poaching efforts will make a positive difference in both Zimbabwe and Zambia.

Elephant hunting in Zimbabwe generates conservation benefits that satisfy the enhancement standard. Although hunting offtakes are negligible, elephant hunting fees create extensive conservation incentives in Zimbabwe! Put simply, hunting revenues support anti poaching efforts across Zimbabwe's elephant range, and this is largely paid for by American elephant hunters! In addition to supporting ZPWMA's enforcement capacity, hunting operators deploy their own anti poaching units to police the safari areas and fund community game scouts in CAMPFIRE areas.These anti poaching efforts are funded predominantly by hunting revenue, and protect stable populations of elephant and the third largest black rhino population in the world.

According to the CITES "Monitoring the Illegal Killing of Elephants" (MIKE) program, poaching in the Southern African countries that allow regulated tourist hunting, including Zimbabwe, is lower than anywhere else on the continent and has never reached an unsustainable level. This stands in stark contrast to the West and Central African countries that do not rely upon tourist hunting as a conservation tool.

As you are well aware, there is a tremendous amount of "FakeNews" being published by all sorts of sources! Please do not allow President Trump or anyone else to be swayed by incorrect facts.

Thanks so much for all of your hard work and dedication to our wildlife!

Sincerely,
Tom Whaley

Subject:	Please Support Elephant Trophy Imports

Dear Mr Sheehan and Mr Zinke

I would ask that you support the lifting of the suspension on the import of elephant trophies from Zimbabwe and Zambia. Both Countries have larger herds now than 25 years ago thanks in part to their governments management practices and the support of the local operators. This is because of better habitat, management and enforcement and as a side benefit it creates local jobs and provides food also to the locals. Without the revenue from big game hunters from the United States there will be an increase in poaching and a decrease in enforcement and management practices as these countries will not have the resources to provide these services.

Thank you for your consideration

Dear Sir,

RE: IMPORTATION OF ELEPHANT TROPHIES INTO THE UNITED STATES OF AMERICA

We write in reference to the above subject, especially after considering the recent occurrences in the public media. In November 2017, we received notification that USA would accept imports of elephant trophies from Zambia. However, it has been reported in the media recently that this had been put on hold. We therefore hasten to point out the following facts for your consideration on the matter:

1. There has never been a "ban" on the importation of elephant trophies from Zambia. In October 2011, the Fish and Wildlife Service (FWS) made a positive enhancement finding to authorize the import of regulated elephant hunting trophies from Zambia. However, 2013 and 2014, Zambia's Wildlife Authority suspended hunting to review practices, and obtain more current wildlife population information.

   In 2015, Zambia's government lifted the hunting suspension, and set a conservative annual quota of 80 elephants. In August 2016, the Chief of Permits sent an email indicating that the FWS was trying to issue import permits for elephant trophies from Zambia before the CITES Conference of the Parties in September 2016, based on an April 2015 Non-Detriment and Enhancement Finding the FWS received from Zambia's Wildlife Authority. At the CITES Conference of the Parties, the Chief of Permits indicated that elephant permits from Zambia would likely be issued before the end of the year.

2. Management of elephant is through a well-articulated policy, law and management plan and formalized utilization guidelines. Management guidelines have set standards of utilization and the quality of trophies in agreement with International Standards. According to these standards, exportable tusks must be either 15 kg or 1.5m or both, and more.

3. Zambia's elephant population inhabits seven sub-regions covering National Parks and Game Management Areas. According to the 2016 African Elephant Status Report, Zambia's elephant population is estimated at over 21,000. This is generally considered stable over the past 25 years, and is stable compared to Zambia's population in 1992, when the FWS determined to maintain elephant as "threatened" listed. However, several population surveys indicating an estimate closer to 30,000 were not included in the 2016 African Elephant Status Report, and Zambia's wildlife authority estimates the country's population at more than 30,000.

4. Utilization of elephant is through a carefully set quota considering the population and trends. Zambia maintains a cautious quota of way below the official voluntary quota of 80 elephants. A national quota of 80 elephants represents less than 0.4% of a population of 21,967 elephant. Actual hunting offtakes are negligible and have no impact on the national population growth rate.

   2015 Hunting offtake (% of Total Elephant Population): 3 (0.014%)
   2016 Hunting offtake (% of Total Elephant Population): 12 (0.055%)
   2017 Hunting offtake (% of Total Elephant Population): 11 (0.050%)

5. Elephant sport hunting contributes significantly not only to the income for conservation of the African Elephant itself, but also to the livelihoods of local communities through income and provision of protein in the meat distributed. Between 2010 and 2012, regulated hunting revenues accounted for approximately 32% of the operating budget funding for Zambia's wildlife authority. With a potential to generate nearly $1 million in elephant hunting fees, in 2015 and 2016, these fees amounted to only $150,000, due mainly to import restrictions. This amount is divided, on 50:50 ratio, between DNPW and the Community Resource Boards in Game Management Areas (GMA). DNPW uses this revenue for payment of Community Scout salaries and resource protection through Anti-poaching operations, as well as management, surveys, staff training, and other activities. DNPW's expenditures are mostly for anti-poaching related activities.

6. Moreover, under the wildlife management regulations in Zambia, at least 50% of harvested game meat is donated and distributed to local communities. A 2015 study found that hunting outfitters in three GMAs contributed an average of 6,000 kilograms of harvested meat per season, and estimated that outfitters across all GMAs could provide ~130 tons of much-needed protein annually. This reduces the incentive for bush meat poaching in these areas bordering and buffering Zambia's National Parks.

7. The benefits from elephant hunting mitigate the hardship of communities that they have through conflict. These benefits persuade communities to have a positive attitude towards elephants and other wildlife species.

8. The consequence of withdrawing these benefits from communities is the destruction of the species through poaching and conflict retaliation. Elephant hunting helps in the conservation of the species itself through management and conflict mitigation.

9. Hunting outfitters' concession agreements with DNPW and the Community Resource Board identify mandatory anti-poaching obligations and expenditures. At present, 75 Community Resource Boards employ over 750 wildlife Community Scouts and 79 support personnel, at a monthly cost of over $38,800. Those scouts are paid emoluments from revenues from hunting tourism. A small sample of four operators spent over $201,000 on anti-poaching in 2015, community scouts and on equipping their own anti-poaching teams. Hunters largely pay for this anti-poaching support, and over half of all hunting clients in Zambia are from the U.S.A.

With the above reflections, we remain hopeful, despite the pressures that you will favourably consider our plea that the survival of the African Elephant in Zambia and other range states largely depends on the positive decision on this matter. We also wish to encourage the US Fish and Wildlife to visit Zambia and appreciate the vital link between trophy hunting and conservation.

Yours faithfully,

Dr. Liya Mutale (Mrs.)

Dear Sirs,

Thank you for the positive enhancement findings made by the US Fish & Wildlife Service for elephant from Zimbabwe and Zambia. Please help Honorable President Trump to understand all of the scientific evidence that has gone into the enhancement findings and not be swayed by falsehoods spread by the media and anti-hunting groups. Trophy elephant hunts are a powerful conservation tool that have to be utilized.

Sincerely,
Seth Ringer

Subject:	Elephant Trophy imports from Zimbabwe and Zambia

Dear Deputy Director Sheehan,

I am writing to thank you for your positive enhancement finding for elephant from Zimbabwe and Zambia. I believe the decision was based on sound biological data and is a critical decision for the future of elephant conservation. I know from your work with the DWR in my home state of Utah that you are well aware that the harvest of such a small number of elephants will have no meaningful impact on elephant populations, but that the money generated from regulated hunting will have a huge positive conservation impact on current and future elephant populations as it provides much needed funds and incentives for habitat preservation, anti-poaching efforts, local community benefits, and game management. Please do all you can to encourage President Trump to not be misled by the false arguments of the radical anti-hunting organizations and to allow imports to resume.

Thanks for all you do for Wildlife and Sportsmen,

Kirk Winward

Dear Mr Deputy Director

I urge you to not let President Trump be misled by the media and anti hunting groups regarding the importation of elephant trophies. This highly regulated hunting provides funding for a tremendous amount off the expenditures fighting illegal poaching and managing the growing elephant population.

The greatest threat to the African elephant is illegal poaching. It would be wonderful to see the United States assist the affected African countries with this problem.

Thank you

Ken Allen

Dear Mr. Sheehan,

I am asking you to please allow the legal importation of sport hunted African elephant trophies.

I have seen first hand the benefits to all wildlife when legal hunting is allowed and complete loss of all wildlife when hunting is banned.

Elephant hunting is good for Africa and good for elephants!

Thank you for your consideration.

Subject:	Elephant Importation

Dear Deputy Director, I am writing in support of the reinstatement of the importation of elephant trophies from Zimbabwe and Zambia. I support all of the Conservation Force's talking points. Furthermore as a big game hunter myself, I have experienced first hand the positive effects of hunting. The professional hunters I have had the pleasure of working with are exactly that ..... professional. They are overtly concerned with only harvesting game that is appropriate and won't negatively impact the herd. They carefully choose the trophy animal. Many animals are passed over to harvest the one trophy. They are dedicated to the environment and local people. They provide jobs to people in areas that otherwise would have no sustainable work. They coordinate with the local tribes to ensure that meat is delivered to the area most in need. They provide anti-poaching services 24/7 without which the animal population would be devastated. I would submit that most people not in support of sustainable hunting have investigated little beyond the the most recent news report. They don't realize that ultimately, the African human population is growing beyond the number that allows the sustainable maintenance of healthy wild animal populations. The loss of habitat is inevitable. The only hope is to maintain the populations of animals for the amount of land available to support them. In either instance, animals will die. Only through the manner of sustainable hunting do the animal populations have a chance to survive. Please add my support to the science which validates sustainable hunting, and uphold your decision to allow elephant importation from Zimbabwe and Zambia. The welfare of the countries, people, and wildlife will be better for it. Thank you. Dear Mr. Sheehan:

Happy Thanksgiving from a fellow Utahn! (I think that is what we call ourselves?)

Attached you will find a photo of yourself sent to me by my friend in Arusha, Tanzania, Mike Angelides. He was was honored to meet you. He likes people from Utah and appreciated the fact that you listened to him sincerely.

From September 2, 2017, through October 17, 2017, I split my time in the bush of Africa between the Caprivi Strip in Namibia where Zambia, Zimbabwe, Botswana, and Namibia meet and southwest Tanzania near Lake Rukwa at approximately 7 degrees 23.25 South and 32 degrees 29.52 East. I am NOT sending you talking points prepared by some interest group but rather my first hand experience regarding the above topic and some additional thoughts. I am a outdoorsman and hunter and support the positive finding.

Caprivi Strip

There are simply too many elephants for the habitat in this area and the animal/human conflict is very high. I hunted elephant in this area. I approached over 3,500 elephants in the first 10 days (this was my first elephant hunt and I very carefully kept track and was concerned about whether I felt I was doing the right thing by hunting elephant; unquestionably I was). We chose to harvest a very old bull who was estimated to be over 53 years old by the presence of the last set of worn-out molar teeth they receive at approximately 49 years old. He was on the edge of a herd of 200+ elephant, well past breeding age, and not allowed in the middle of the herd by the other mature animals. There were large areas where there was no tree standing over 4-5' high due to the destruction this overpopulation is causing; it looked like a large bomb went off and wiped out all vegetation.

While hunting we provided full time jobs for 22 local people and 3 Namibian citizens who live further south. We provided much-needed protein to the locals including 2 buffalo and 1 kudu harvested at the request of the Minister of Environment of Namibia in order to have meat for an anti-poaching meeting and training in Rundu. I estimate we provided nearly 15,000 pounds of meat to the locals in 10 days. The lady who was in charge of dividing up the meat among the locals asked if we would please shoot more elephant as they are overrunning their village. It was interesting to note the evidence of poaching from the Botswana border. There was an Namibian government anti-poaching patrol in the area who we reported it to but they were out of fuel and could not pursue those who had poached 2 cow buffalo. If we do not put a value on the wildlife via hunting the locals will not protect it. It is that simple.

I was not treated kindly by some European travelers who noticed we were hunting (as we were permitted to) in the Bwabwata National Park. While I contributed over $100,000 to the preservation of wildlife they paid $3 USD per person to enter the same area. Who is really valuing and preserving wildlife in this equation? Which activity do you think the locals will value and therefore self-manage their anti-poaching? Mine or the European tourists on their self-guided tour with a rented Toyota Truck and pop-up tent? I am not suggesting they should not be allowed to participate in their activity but I think we need to be realistic about which activity is POSITIVE for wildlife preservation.

Because of this I am baffled by the media reports I read regarding this issue. It is completely counter to my experience.

Southwest Tanzania

The elephants in this area are suffering and elephant hunting is not advisable for this area at this time in my opinion. It is also interesting to note that they do not hunt elephant in this area; this is not due to habitat but simply due to the years of poaching depleting the herd and the current USFWS ban on imports. The only anti-poaching that is done in this vast area is done by the operator of the concession I hunted in who has now been in this area for about 10 years (you met him). If he is not there the poachers are. We ran off 3 poaching groups and discovered a threatening message left us by a poaching group written on the side of a cut log with charcoal. The message asked us to leave the area so they could get some food; it was written in swahili so I was relying on the locals for interpretation but that was their basic response when I asked what the message stated. In this area two years I harvested a buffalo that contained poacher's muzzleloader balls in its neck. It would be more effective for the locals to have me pay to hunt buffalo and give the locals the meat like I do each time anyway.

I have hunted this area with this operator for years. I have noticed an increase in elephants each year. It seems to me that if this operator is allowed to continue to manage this area the elephant population will continue to increase to a point that sustainable hunting could occur and would benefit the elephant herd. Once again, hunting is the only activity that puts enough value on the wildlife that the locals will consequently protect it.

On another note, importation of lion by the USFWS is currently not allowed in this area. I know this because I have a pending application for import that has been sitting in some "black-hole" with the USFWS for over a year with no response other than an acknowledgement of receipt. Here is my experience. There are so many lion in this area we could not hunt leopard because most any bait we placed was taken by lion before the leopard could get to it. MIke finally did get me on a leopard and admittedly I missed cleanly. It was a great experience anyway.

Once again, I am baffled by the media reports I read regarding the African lion; at least in my experience in the areas I have been.

In conclusion I have one more point to make. Sporting hunting is Africa is an important part of their economy just as skiing is where I live in Utah. The Africans don't come to Utah and tell us how to manage our skiing environment. We know the value of it and manage it accordingly; those

ski operators who operate on federal lands are held accountable for the rules in doing so but not by a foreign government. I think the U.S. government goes a little too far in telling the African governments how to manage their sport hunting. I agree that they could use some guidance, support, communication of our concerns, education, monitoring, and possibly at times some importation permit management, however, the consistent response I received from local people was “you U.S. people think you can see a CNN report or read a National Geographic article and you are all experts on how we should manage our wildlife."

Feel free to contact me at any time. Thanks for your service. My next door neighbor is the new congressman for Utah (Curtis) and I have come to realize very quickly by watching him that these jobs in Washington are a service with a capital S.

Sincerely,

Todd Cusick

Subject:	Elephant Imports from Zimbabwe and Zambia

Dear Deputy Director Sheehan, I wrote you earlier in the week urging you to do all you can to keep President Trump from overturning the positive enhancement findings for Elephant hunting by USFW. I am sure the President and yourself are being inundated by anti-hunting organizations to stop the legal hunting of Elephants in these countries. I wanted to provide some scientific facts to support the continued legal hunting of Elephants from these countries. First, overall populations of Elephants from these countries is stable or in the case of Zimbabwe is increasing. Drammatically, in fact. The number of Elephant in Zimbabwe has increased from about 4,000 animals in 1990 to over 82,000 today. Secondly, the number of Elephants taken legally by hunters in these countries is extremely small, almost negligible, while the revenues generated by legal hunting contribute millions of dollars for anti-poaching, community development, provide much needed protein for local villages etc. This money allows Elephants to flourish in their native habitat, not just in the national parks which make up just a small portion of the country. It is clear, when there is value associated from these Elephants that comes from hunting, the local communities do their part to protect the species. I have seen that myself. Finally, both of these countries have sound regulations in place to ensure that legal hunting of Elephants will enhance the overall populations of Elephants. Besides, there are not that many hunters that have the desire and can also afford the cost of an Elephant hunt. This is not a complaint. it is simply that these large fees are required to provide the necessary funding to provide the enhancement needed. I only mention this because it will not be a case where “the flood gates will open” to large numbers of Elephant hunters and resulting increase in animals taken. That number will remain small. I do hope in the end, that facts will be used to make this determination. i am a hunter and likely biased in my opinion. However, when the facts are reviewed, there is no question that legal hunting of a small number of Elephants does enhance overall populations. All we as hunters ask is that this decision is made based on facts, with the species in mind and not based on emotion or dislike for us as hunters. Best regards, John Justus

Director Sheehan,

November 21, 2017
Deputy Director Greg Sheehan: (b) (6) **@fws.gov**
Secretary Ryan Zinke: exsec@ios.doi.gov

TALKING POINTS IN SUPPORT OF ELEPHANT TROPHY IMPORTS FROM ZIMBABWE AND ZAMBIA

ELEPHANT TROPHY IMPORTS HAVE NEVER BEEN "BANNED," AND THE POSITIVE ENHANCEMENT FINDINGS ARE BASED ON THE BEST AVAILABLE INFORMATION RECEIVED IN 2014-2016

- **There has been no "ban" on elephant trophy imports. In April 2014, the U.S. Fish and Wildlife Service (FWS) "suspended" the import of elephant trophies from Zimbabwe due to a lack of information. Zimbabwe's Parks and Wildlife Management Authority (ZPWMA) responded to two questionnaires from the FWS in April 2014 and December 2014. However, in March 2015, the FWS extended the suspension, finding information was still lacking. The negative enhancement finding dated March 2015 repeatedly affirmed, "The suspension … could be lifted if additional information on the status and management of elephants in Zimbabwe becomes available, including utilization of revenue generated through sport-hunting by U.S. hunters, which satisfies the conditions of the 4(d) special rule under the ESA." In July 2015, May 2016, and November 2016, ZPWMA responded to additional FWS questions. The November 2017 positive enhancement finding is based on these later responses and thousands of pages of supporting documents, including Zimbabwe's National Elephant Management Action Plan, 2014 countrywide elephant population surveys, 2014-2016 actual and projected budget data, 2014 and 2015 offtakes and 2016 quota data, 2014-2016 CAMPFIRE data, and much more.**
- **Issuing import permits for elephant trophies from Zimbabwe was not a political decision by this Administration. In September 2016, before the election occurred, the FWS had already indicated to ZPWMA that the suspension would be lifted. ZPWMA was told by the Chief of Permits that the FWS needed "only one more piece of information," a prioritization of the new Elephant Management Plan, before the negative enhancement finding could be reversed. That prioritization was provided on**

November 8, 2016, before the election results were in. At the end of 2016, the FWS should have made the positive enhancement finding, but was admittedly sidetracked by an influx of thousands of new permit applications due to the listing of rosewood (used extensively in musical instruments and furniture) on the CITES Appendixes effective January 2017.

• Similarly, there has been no "ban" on the import of elephant trophies from Zambia. In October 2011, the FWS made a positive enhancement finding to authorize the import of regulated elephant hunting trophies from Zambia. However, 2013 and 2014, Zambia's wildlife authority suspended hunting to obtain more current wildlife population information. In 2015, Zambia's government lifted the hunting suspension, and set a conservative quota of 80 elephant. In August 2016, the Chief of Permits sent an email indicating that the FWS was trying to issue import permits for elephant trophies from Zambia before the CITES Conference of the Parties in September 2016, based on an April 2015 Non-Detriment and Enhancement Finding the FWS received from Zambia's wildlife authority. However, the FWS ran out of time. At the Conference of the Parties, the Chief of Permits indicated that elephant permits from Zambia would likely issue before the end of the year. Again, because of the new rosewood permits, that enhancement finding was put on a back burner.

ZIMBABWE'S ELEPHANT POPULATION IS THE SECOND-LARGEST IN AFRICA

• In 1900, it was estimated that Zimbabwe had a national population of 4,000 elephant. Since then, the population has grown to over 82,000 (a twenty-fold increase). The current population is double the target national population established in the 1980s, almost 40% larger than in 1992, when the FWS determined to maintain the Endangered Species Act (ESA) "threatened" listing, and almost 20% larger than in 1997, when the last positive enhancement finding was made (before November 2017). Elephant sub-populations in Zimbabwe are generallyconsidered stable or increasing.

- **<u>North-West Matabeleland</u>: This population is estimated at 54,000, and is most densely located in Hwange National Park (45,000 elephant). In 1928, the estimated elephant population in Hwange was 2,000.**
- **<u>Sebungwe</u>: This population is estimated at 3,500 and has declined since 2001 due to human population expansion into a previously unsettled area. The human population exploded from 45,000 in 1950 to over 700,000 in 2013, which explains the decline in the elephant population. Due to the expansion of human settlement and unlike other major elephant ranges in Zimbabwe, the habitat in this area isfragmented.**
- **<u>Mid-Zambezi Valley</u>: This area has an estimatedelephant population of about 12,000. That population declined since the 2001 countrywide survey, and it is believed the decline is due to cross-border poaching and perhaps, the cross-border movement of elephants during the survey. Anti-poaching is a major component of the Zambezi Valley/Mana Pools Regional Elephant Management Action Plan, and recently the area has been chosen as a CITES MIKES site with an ongoing project.**
- **<u>South-East Lowveld</u>: Most of this population inhabits Gonarezhou National Park, whose population has been growing consistently at 5% per annum over 20 years. This region's sub-population is estimated at 13,000 elephant between the Park, surrounding communal areas, and nearby private conservancies.**

ZAMBIA'S ELEPHANT POPULATION IS STABLE

• Zambia's elephant population inhabits seven sub-regions covering National Parks and Game Management Areas. According to the 2016 African Elephant Status Report, Zambia's elephant population is estimated at over 21,000. This is generally considered stable over the past 25 years, and is stable compared to Zambia's population in 1992, when the FWS determined to maintain elephant as "threatened" listed. However, several population surveys indicating an estimate closer to 30,000 were not included in the 2016 African Elephant Status Report, and Zambia's wildlife authority estimates the country's population at more than 30,000.

ELEPHANT HUNTING OFFTAKES IN ZIMBABWE ARE SUSTAINABLE

• Zimbabwe maintains a CITES export quota of 1,000 tusks from 500 bull elephants. A national quota of 500 elephants represents only 0.6% of a population of 82,630 elephant. Actual hunting offtakes are considerably lower, have a negligible impact on the overall population rate, and have declined in the past three years due to the import suspension.

Average Hunting Offtakes 2010-2013 (% of Total Elephant Population): 228 (0.276%)
2013 Hunting Offtakes (% of Total Elephant Population): 258 (0.312%)
2014 Hunting Offtakes (% of Total Elephant Population): 162 (0.196%)
2015 Hunting Offtakes (% of Total Elephant Population): 075 (0.091%)

ELEPHANT HUNTING OFFTAKES IN ZAMBIA ARE NEGLIGIBLE

• In 2013 and 2014, Zambia suspended regulated tourist hunting to obtain a better sense of national wildlife population trends. In 2015, Zambia set a conservative export quota of 160 tusks from 80 bull elephants. Zambia maintained the quota of 80 elephants in 2016 and 2017. A national quota of 80 elephants represents less than 0.4% of a population of 21,967 elephant. Actual hunting offtakes are negligible and have no impact on the national population rate.

2015 Hunting Offtakes (% of Total Elephant Population): 03 (0.014%)
2016 Hunting Offtakes (% of Total Elephant Population): 12 (0.055%)

ELEPHANT MANAGEMENT IN ZIMBABWE IS GUIDED BY APPROPRIATE LEGISLATION AND A STATE-OF-THE-ART MANAGEMENT PLAN

• <u>Governing Law</u>: The Zimbabwe Parks and Wild Life Act provides the regulatory mechanism for ZPWMA and its programs. The Act created ZPWMA as a parastatal authority apart from the central government and established a separate fund, apart from the Central Treasury, to sustain ZPWMA's operations. The Act sets harsh penalties for elephant-related offenses, and was amended in 2010 to impose a nine-year minimum sentence for the first offense of elephant poaching. Under the Parks and Wild Life Act, Rural District Councils and other land holders are granted "appropriate authority" to benefit directly from wildlife. Under this legislation, land holders are encouraged to maintain and increase wildlife populations because they retain the benefits of sustainable use of that wildlife.

• <u>Elephant Management Plan</u>: Elephant are managed according to the Zimbabwe National Elephant Management Plan (2015-2020). The plan incorporates specific action items, deliverables, deadlines, and responsible parties. It is an adaptive management plan utilizing prioritization of targets measured by key components,

strategic objectives, and outputs. The plan focuses on five major components: Protection and Law Enforcement; Biological Monitoring and Management; Social, Economic, and Cultural Framework; Building Conservation Capacity; and Program Management. The National management plan is supplemented by four regional plans that utilize the same framework to address the unique challenges for each major elephant range in Zimbabwe. Zimbabwe's elephant management planning process was kicked off by the FWS' elephant trophy import suspension. ZPWMA held a year of stakeholder planning workshops, including a preparatory meeting of representatives from CAMPFIRE in November 2014; a national elephant management planning workshop in December 2014; an elephant management planning and anti-poaching workshop in Mana Pools (Zambezi Valley range) in March-April 2015; an elephant management planning workshop in the Sebungwe range in May 2015; and an elephant management planning workshop in the South East Lowveld range in September 2015.

ELEPHANT HUNTING IN ZIMBABWE GENERATES CONSERVATION BENEFITS THAT SATISFY THE "ENHANCEMENT" STANDARD: Although hunting offtakes are negligible, elephant hunting fees create extensive conservation incentives in Zimbabwe.

- **Habitat: Hunting areas in Zimbabwe represent ~130,000km² of protected habitat. This represents over four times the size of Zimbabwe's National Parks (~28,000 km^2). Healthy elephant populations require large tracts of habitat; the areas set aside for regulated hunting are therefore essential to the elephant's continued survival.**
- **Management and Enforcement Revenues: Revenues generated from tourist hunting conducted on state lands comprised approximately 20% of ZPWMA's revenue stream in 2014. Over $6.2 million in trophy fees came from elephant hunts, with $5 million accruing to ZPWMA to reinvest in elephant protection and species management. Over 50% of that revenue came from U.S. clients. Almost 80% of ZPWMA's operating budget is allocated towards law enforcement in the form of staff costs and patrol provisions. ZPWMA employs 1,500 active field rangers. Put simply, hunting revenues support anti-poaching efforts across Zimbabwe's elephant range—and this is largely paid for by American elephant hunters.**
- **Operator Anti-Poaching: In addition to supporting ZPWMA's enforcement capacity, hunting operators deploy their own anti-poaching units to police the Safari Areas and fund community game scouts in CAMPFIRE Areas. For example, a small sample of 14 individual operators surveyed by the Safari Operator Association of Zimbabwe spend $957,843 on anti-poaching in 2013 and deployed 245 anti-poaching scouts. One specific operator, Charlton McCullum Safaris (CMS) in the Dande Safari Area and Mbire Communal Area, spends on average $80,000-$90,000 in patrol and equipment costs and anti-poaching rewards. From 2010 to 2016, CMS' efforts led to an 82% decline in elephant poaching in an import border region. As another example, the Save Valley and Bubye Valley Conservancies together spend over $1 million on anti-poaching each year. These anti-poaching efforts are funded predominately by hunting revenue, and protect stable populations of elephant and the third-largest black rhino population in the world.**
- **Regional Anti-Poaching: According to the CITES "Monitoring the Illegal Killing of Elephants" (MIKE) program, poaching in the Southern African countries that allow regulated tourist hunting, including Zimbabwe, is lower than anywhere else on the continent and has never reached an unsustainable level. This stands in stark contrast to the West and Central African countries that do not rely upon tourist hunting as a**

conservation tool.

• Community Benefits: Zimbabwe's CAMPFIRE program is the pioneering community-based natural resource management program in Africa. The program allows rural communities to financially benefit from wildlife, thereby incentivizing the use of communal land as wildlife habitat, and the protection of wildlife in the form of increased tolerance of destructive wildlife. An estimated 77,000 households rely on CAMPFIRE benefit from CAMPFIRE. 90% of CAMPFIRE revenue is generated from regulated hunting, and 70% of this comes from elephant hunting. Thus, prior to the import suspension, elephant hunting generated over $1.6 million per year for CAMPFIRE communities and was reinvested in the construction of classrooms and clinics, the installation of water infrastructure and solar powered facilities, the purchase of vehicles for anti-poaching support, compensation for destruction of crops or livestock by dangerous game, and other benefits that improve the livelihoods of the rural communities living in CAMPFIRE Areas. These benefits offset the damage caused by game species: from 2010 to 2015, elephant destroyed 7,495 hectares of crop fields in CAMPFIRE communities and claimed the lives of approximately 40 people.

ELEPHANT MANAGEMENT IN ZAMBIA IS UP-TO-DATE AND GENERATES SUBSTANTIAL BENEFITS TO ENCOURAGE RECOVERY OF THE SPECIES

• Governing Law: The Zambian Wildlife Act No. 14 of 2015 is the guiding legislation for elephant protection and management. This cutting-edge law consolidated the prior wildlife authority into a government Department of National Parks and Wildlife (DNPW), to address the funding concerns and shortfalls experienced by the prior authority. DNPW is made up of a Wildlife Law Enforcement Unit with over 1,250 rangers; a Conservation Unit; an Infrastructure Development Unit; and a Community-Based Natural Resource Management Unit to oversee the development of conservation planning in Game Management Areas.

• Management and Enforcement Revenues: Between 2010 and 2012, regulated hunting revenues accounted for approximately 32% of the operating budget funding for Zambia's wildlife authority. With a potential to generate nearly $1 million in elephant hunting fees, in 2015 and 2016, these fees totaled only $150,000, due mainly to import restrictions. This amount was divided between DNPW and the Community Resource Boards in Game Management Areas (GMA). DNPW uses this revenue for range salaries and resource protection, as well as management surveys, staff training, and other activities. Approximately 75% of DNPW's expenditures are for anti-poaching, and Zambia's Wildlife Law Enforcement Unit conducted over 10,500 anti-poaching patrols in 2015, involving an average of 5,878 staff per quarter and 237,028 patrol days.

• Habitat: Hunting areas in Zambia (~180,000 km²) provide almost three times the amount of protected habitat compared to the country's National Parks (~64,000 km²).

• Community Benefits: In GMAs, elephant license fees are divided equally between the DNPW and the GMA's Community Resource Board, and 20% of concession fees also accrue to the Board. In 2015 and 2016, approximately $1.36 million in hunting fees was distributed to the Boards, as well as $10,000 per concession paid by the hunting operator. Under the new Wildlife Law, Boards must invest those funds as follows: 45% towards wildlife protection and patrols, 35% towards community improvement projects such as construction of schools, clinics, and water infrastructure, and 20% towards administrative costs. Written concession agreements between the operators, DNPW, and the community Boards usually obligate the concessionaire to make further

communities investments, such as constructing a classroom and paying a teacher's salary. Operators in 13 blocks were obligated to spend over $1.1 million in community infrastructure development and 3.4 million in community lease and other payments for the duration of their leases.

• Game Meat Distributions: Moreover, under Zambian law, at least 50% of harvested game meat must be donated and distributed to local communities. A 2015 study found that operators in three GMAs contributed an average of 6,000 kilograms of harvested meat per season, and estimated that operators across all GMAs could provide ~130 tons of much-needed protein annually. This reduces the incentive for bush meat poaching in these areas bordering and buffering Zambia's National Parks.

• Operator Anti-Poaching: Hunting operators' concession agreements with DNPW and the Community Resource Board identify mandatory anti-poaching obligations and expenditures. At present, 75 Boards employ over 750 wildlife scouts and 79 support personnel, at a monthly cost of over $38,800. Those scouts are paid for by revenues from tourist hunting. A small sample of four operators spent over $201,000 on anti-poaching in 2015, to fund community scouts and fund and equip their own operator anti-poaching teams. This anti-poaching support is largely paid for by U.S. hunters, as over half of all hunting clients in Zambia are from the U.S.

[Note: Supporting documents for each of these points is available by contacting Conservation Force, cf@conservationforce.org. These Talking Points largely rely on the responses of ZPWMA and DNPW to FWS information requests and supporting documents provided as part of those responses as well as individual hunting operator enhancement reports, reports of the CAMPFIRE Association, and publicly available IUCN documents.]

MINI-ARGUMENTS REFUTING FALSE FACTS

• There has never been a "ban" on elephant trophy imports from Zimbabwe. A negative enhancement finding was made in April 2014 that "suspended" the import of elephant trophies. The FWS' negative 2015 enhancement finding stated repeatedly that once additional information was received, the negative finding would be reviewed and reversed (e.g., "The suspension … could be lifted if additional information on the status and management of elephants in Zimbabwe becomes available, including utilization of revenue generated through sport-hunting by U.S. hunters, which satisfies the conditions of the 4(d) special rule under the ESA.") A "ban" suggests a permanent prohibition; a "suspension" is a "temporary abrogation or withholding." Zimbabwe's elephant trophy imports were suspended.

• Lifting of the suspension was not a political decision. The decision should have been made in July 2015, when ZPWMA provided extensive additional documentation in response to a FWS questionnaire. The FWS requested "one more piece of information" at the CITES Conference of the Parties in September 2016. That information was provided in November 2016. No further information was needed, or requested. If the FWS had properly prioritized the issuance of elephant import permits —as they told ZPWMA they would at the CITES Conference of the Parties—the positive

enhancement finding would have been made and these permits would have issued before the current Administration was in office.

• <u>The import of elephant trophies from Zimbabwe should not have been suspended in the first place.</u> In April 2014, the FWS announced the suspension based on an asserted "lack of information." In contradiction to CITES Res. Conf. 6.7's recommendation of notifying and consulting with range states before imposing stricter domestic measures, and the Endangered Species Act's requirement of "encouraging foreign conservation programs," 16 U.S.C. § 1537(b), the FWS shut down imports under an April 2014 negative enhancement finding that the FWS later admitted was wrong with respect to Zimbabwe's elephant population and level of poaching. In fact, the correct estimate for Zimbabwe's elephant population—almost 83,000—is 16,000 elephant higher than when the last, positive enhancement finding was made in 1997. That estimate is double the size of the elephant populations of Namibia and South Africa put together, yet the FWS maintains positive enhancement findings for the import of elephant trophies from Namibia and South Africa. The trophy import suspension was based on a mistaken concern that Zimbabwe's elephant population had declined, and the FWS should have admitted the mistake and reversed the suspension immediately. The failure to do so suggests a political motivation, not a scientific one.

• <u>Zimbabwe's elephant population is not "the worst managed," but is among the best.</u> That Zimbabwe maintains a stable elephant population of over 83,000, despite a despotic government, poor economy, and exploding human population growth rate, is a testament to the country's strong management. That number is almost 40% higher than in 1992, when the FWS confirmed the "threatened" listing of elephant, and almost 20% higher than in 1997, when the FWS made a positive enhancement finding authorizing the import of elephant trophies. This is due in part to ZPWMA being a parastatal separate and separately funded from the central government. It is also due to the commitment of Zimbabwe's citizens to maintaining their elephant, notwithstanding the costs—over 40 rural Zimbabweans were killed by elephant from 2010 to 2015. Zimbabwe's strong wildlife management is also demonstrated by recent IUCN Red List assessments of lion and giraffe, which indicated increasing populations of these species in Zimbabwe. The evidence demonstrates that Zimbabwe's wildlife management, not only its elephant management, is succeeding.]

• <u>Zimbabwe's elephant management is not "poor"; it is state-of-the-art and written by one of the world's foremost elephant experts.</u> In response to the April 2014 suspension of elephant trophy imports, ZPWMA took to heart the FWS' criticism that Zimbabwe's then-current elephant management plan dated to 1997. Although that plan was adaptively implemented and monitored, it was admittedly dated. Zimbabwe immediately began the process of adopting a brand-new, state-of-the-art elephant management plan—basically, to satisfy the FWS. This included a year of stakeholder planning workshops: a preparatory meeting of representatives from Zimbabwe's community-based natural resources management program, CAMPFIRE, in November 2014; a national elephant management planning workshop in December 2014; an elephant management planning and anti-poaching workshop in Mana Pools (Zambezi Valley) in early April 2015; an elephant management planning workshop in the Sebungwe range in May 2015; and an elephant management planning workshop in the South East Lowveld region in September 2015. Zimbabwe focused on regional planning because the four regions face different management challenges. Each

planning workshop produced a regional elephant management plan that was incorporated into the final. The final document was drafted by a leading elephant scientist, and the process was monitored throughout by the IUCN's African Elephant Specialist Group.

• <u>Regulated hunting is not poaching.</u> By definition, "regulated" hunting is regulated and lawful. It is carefully monitored by ZPWMA, and offtakes are recorded in a national database. Lawfully hunted ivory tusks are marked to show that they are lawful and note the year of harvest. Moreover, regulated hunting revenues underwrite most anti-poaching expenses in Zimbabwe and the rest of Southern Africa, either by fees paid to government wildlife authorities that are used for law enforcement, or by operator-funded teams that patrol concessions and keep poachers out. Finally, revenue-sharing and contributions by hunting operators creates conservation incentives for rural communities most affected by wildlife, which disincentivizes poaching. For example, Zimbabwe's CAMPFIRE communities were receiving over $1.6 million per year in revenues from elephant hunting prior to the import suspension. These funds allow for clinics and schools to be built, teachers' salaries to be paid, boreholes to be drilled, and so on. Hunting operators in Zambia are required to share at least 50% of harvested meat with rural communities. Many tons of meat can come from elephant hunts, to reduce the need and tolerance for bushmeat poaching and protect species in addition to elephant.

• <u>Allowing imports of elephant trophies will not damage the government's efforts to control ivory trafficking.</u> Elephant trophy imports have been authorized for Namibia and South Africa for the past three years, which demonstrates that a country may maintain lawful hunting and low poaching at the same time. In fact, according to the CITES MIKE data, the Southern African countries that depend upon regulated hunting as a conservation tool have the lowest Proportion of Illegally Killed Elephant (PIKE) rates in the world. PIKE, which is used to assess whether poaching levels are unsustainable, has never risen above the sustainability threshold in Southern Africa. PIKE at Zimbabwe's MIKE sites is well below that level. Moreover, national and international law requires the marking of ivory tusks taken as lawful hunting trophies, which clearly and visibly separates these lawful tusks from illegal ones.

• <u>Photographic tourism is not a substitute in most hunting areas.</u> Opponents argue that photographic tourism would be a better option than hunting. It is true that photo-tourism is available in some places; for example, some conservancies in Namibia benefit from photographic tourism revenues alone or a mixture of photo- and hunting tourism. But photo-tourism requires decent infrastructure and scenery, and dense enough wildlife populations to draw tourists. These may not be available in remote areas of a country without access to airports or other activities, and where the wildlife populations are not yet dense enough to ensure a sighting on a two-hour game drive. This is the situation in many CAMPFIRE Areas, where photographic tourism was tried … and failed. In these areas, without the benefits of hunting, the habitat would be converted to agriculture and livestock. Benefits to the rural community stakeholders are less from photographic tourism than from tourist hunting.

Thank you,

Kadi Noble

Zambian Elephant imports to USA

Laura duplooy <jcrserviceszambia@gmail.com>

Subject:	Zambian Elephant imports to USA

For the attention of: Secretary Zinke & Deputy Director Greg Sheehan

Dear Sirs

RE: ELEPHANT AND LION IMPORTS TO THE USA

This email is written in regards to the current unknown status regarding future imports of sport hunted elephant trophies into USA, and the potential implications this may also have on the importation of other species such as lion.

It is requested that this decision is done not on emotion but on scientific data and actual facts. The negative effects caused as a result of closing imports to USA, and thereby effectively preventing the small but significant off take by US hunters of elephant and other species affected by such decisions, will be long lasting and devastating for the rural people and the wildlife in Zambia.

Please note that:

Safari hunting in Zambia is done based on scientifically supported quotas regulated by strict laws (Zambia Wildlife Act No 14 of 2015)

l aspects of the hunting concession agreements and quotas are reviewed annually.

Animal populations are regularly counted, and monitoring of the Zambian wildlife estate is constantly being done.

The Zambian elephant population is stable and has been so for the past twenty-five years. The Zambian Department of National Parks estimates the population at around 30,000 elephant with 2016 African Status Report putting the elephant population in excess of 21,000.

National off take of elephant is less than 0.4% of the population and is considered negligible with no effect on the species population.

Zambia has risen to the challenge of meeting all that has been asked of it in regards to USFW expectations.

Income to the wildlife department and the communities is being reduced to less than one fifth of its potential on key species such as elephant due to importation restrictions. With 75% expenditure on anti poaching the increase in income by allowing imports would increase training, equipment, manpower and technology in the fight against an ever more difficult and sophisticated poaching problem.

Legally hunted ivory, that is stamped, documented and monitored, will not affect the US government's ability to fight illegal poached ivory.

The Chifunda community gets 50% of the trophy fee with 45% of this in anti poaching and wildlife protection, 35% to community welfare projects and 20% for administration and other costs.

).Almost all the edible meat that is available from the hunting is donated to the community. This is delivered free of charge on a rotation basis so that all members throughout the game management area benefit. This helps to reduce the need for subsistence poaching to feed hungry families.

To give a bit of background Muchinga Adventures Ltd is:

A Zambian family owned safari-hunting company that operates in Chifunda GMA, North Luangwa, Zambia through a Hunting Concession Agreement. This agreement runs for seven years.

Bound by a strong code of ethics and hunting practices.

Meeting and exceeding all obligations and requirements of the hunting concession agreement to both the wildlife and the community of Chifunda GMA. As a result the operations and income derived from hunting give support, or contribute, in some capacity to the betterment of the lives of more than 2100 families and in excess of 10,000 children many of whom are living in extreme poverty.

As a company we respect the partnership the hunting concession agreement forms that upholds the right to earn an income from the resources on the land by the traditional leaders and their people, this is encompassed in the Zambian Lands Act. The income from elephant and lion hunting forms a significant part of the revenue that is raised each year and allows for a tolerance of these species that often hurt people, destroy property and are considered a pest. The community has regularly said without the financial

incentives and benefits derived from hunting they would be unable to prevent the people from destroying and poisoning the wildlife in retaliation for lost crops and livestock.

A destroyed crop from an elephant means that a family or group of families may face starvation. In contrast the one elephant hunted in Chifunda GMA in September 2017:

Fed over 1000 people for a month

Raised revenue to support anti poaching efforts to protect the rest of the elephant population

Supported educational programs that help the people live in tolerance with these animals.

This elephant was an old male, a member of a group that were crop raiding and the incidents of conflict have reduced significantly with the harvesting of this one elephant.

Contributed to the income of the Chifunda Community through revenue sharing of the trophy fee and concession fees which funds community projects and anti poaching

Contributed to the income of the Department of National Parks and Wildlife to ensure monitoring, regulation and protection of the species nationwide

In 2013 and 2014 Zambia closed most but not all of its hunting blocks and put a suspension on elephant, lion and leopard hunting. USFW did not close the importation of Zambian elephant, nor was a communication to this effect every issued. Sport hunted elephant, from a conservative national quota of 80, were imported from 2011 and 2012 to USA. A Non detrimental enhancement finding for Zambian elephant in April 2015 led to the written indication from the Chief of Permits that import permits were expected shortly in August 2016.

In this same period of many hunting areas being closed the expected revenue and support from the photographic and non hunting communities to replace the loss of income, anti poaching effort, community welfare and protection of the wildlife was never forth coming. In Chifunda GMA a photographic bush camp was opened in 2014 and the total revenue earned for each year has never exceeded US$350 to the community with two people employed.

The sad reality is that many hunting blocks are in remote areas of the country with limited infrastructure and as such any investment from non hunting entities are unlikely to be photographic or in the interests of sustainable and long term viability of wildlife populations.

We had one of our US clients go and spend a day in the North Luangwa National Park

earlier this year, he asked to leave early because he saw more animals in the hunting block than the national park which is heavily protected due to the presence of the rhino. This is an indication that the hunting block is not only working using hunting as a conservation tool but the wildlife are thriving under this management program.

Below is what Muchinga Adventures Ltd and hunting has done in one Zambian hunting concession in one year. This is still on going for 2017. Without the financial support from the hunting and especially lion, leopard and elephant we will not be able to operate and continue this support to a community that need it and a wildlife population that is scientifically proven through constant monitoring and regulation to be healthy with hunting.

We ask that you keep sport hunted elephant imports to US open. Your consideration of the facts and the impact of this decision on large numbers of people are appreciated.

Please feel free to contact me at any time if you have any queries or questions regarding this email. I am happy to furnish your office with any documentary evidence regarding Chifunda GMA.

Kind regards

Laura du Plooy

SUMMARY OF 2017 CHIFUNDA GMA PLEDGES, OBLIGATIONS AND DONATIONS: (AS OF 9 NOVEMBER 2017)

DATE	DESCRIPTION	AMOUNT/VALUE
28/12/2016	Tourism License for 2017	K6000
7 March 2017	Hunting Concession fees – Receipt 7362310	K860,973
18 Jan 2017	Outfitter license 1111 – Receipt 7137819	US$3500

13/1/2017	Resident PH – John du Plooy license 0519	K2500
13/1/2017	Training of Zambian PH Apprentice – Nyambe Sandema – 0046	K833.40
28 March 2017	Performance Bond lodged with DNPW	Completed
09/11/17	60% trophy fees: completed as of 9/11/17 US$162,060 spent on NRHL making this 76% of the quota value with 5 safaris still scheduled to be done	US$162,060 and continuing
Jan 2017	Tax clearance up todate	completed
1/6/17	ZICCTA License RFM/SAT/1759	K4166.70
22/3/17	Public Liability Occupiers Insurance DAAAPH0001861704	completed
1/5/2017	Employ Liaison Officer – A Nkoma	On employment contract
12/8/17	$20,500 to CRB as per Hunting Concession Agreement per annum 1. US$10,000 wired 27 July 2017 2. US$10,500 wired 12 August 2017 For projects to better the whole community	US$20,500
12 June 2017	Bush camp maintenance/ assistance to the local community to run their own tourism business	US$5,000
29/9/2017	K10,000 fire management: Paid as: 1. K7800 – 24 May 2017 2. K2200 – 29 September 2017	K10,000
29/9/2017	K20,000 Infrastructure development: Paid as: 1. K13,000 – 27/4/2017 2. K7000 – 29 September 2017	K20,000
20/10/2017	K60,000 law enforcement Paid as: i. K12,562.50 – 9 June 2017 ii. K4586 – 10/6/2017 iii. KK7808.56 – 5/7/17 iv. K1960.40 – 5/7/17 v. K8,753.30 – 12 July 2017 vi. K12,000 – 11 October 2017 vii. K13,002.42 – 20/10/17	K60,673.18
5/7/17	Extra anti poaching:	K11,175 plus vehicle

	i. village sweep x14 ii. arrest of poacher x21 iii. lion skin x1 recovered iv. leopard skin x2 recovered v. elephant ivory recovered x1 vi. grysbok skin receovererd x2 vii. hartebeest tail receovered x1 viii. wildebeest tail x1 recovered ix. illegal firearm recovered x12	and transport support
12/7/2017	K10,000 wildlife resource monitoring	K10,000
24/5/2017	Establish safari camp – employment to community of more than 120 people	K15,750
24/5/2017	Fly camp (tented) – employment to community	K10,200
	80% of camp staff from Chifunda	Done
	Meat distribution – throughout year (approx 12 tons of meat)	Done
24/5/2017	Teacher x2 – paid wages for two extra teachers at the school – this is educating more than 120 extra children	K19,200
30/4/2017	Meeting with CRB at start of season. Sponsored by Muchinga Adventures	K1000
	Meeting with CRB at close of season -	Pending
30/6/2017	Vehicle donated – landcruiser	US$20,000
12/9/17	Submission of leopard and lion data to DNPW	Completed
4/09/2017	Football league support (keeping the youth busy to prevent poaching)	K4500
20/10/17	Football league support	K3500
11/10/17	Cultural ceremony support	K1000
9/10/17	Scholarship 2017 for tertiary education – DNPW member from Chifunda in wildlife, conservation, education or medicine	K19,200
8/8/17	Painted the house of HRH Chief Chifunda	K4500
27/7/17	Tyres donated for landcruiser	K4000
8/9/17	Support for medical tretament to adult female victim mauled by lion	K3500
24/7/2017	Leopard destroyed 10 goats – community member relief to prevent retaliation against leopard	K1000
27/4/2017	Support to HRH Chief Chifunda (phone communications and to assist with carrying out duties)	K5000
20/1/2017	Education assistance to DNPW member (P Sakanga)	K3500
20/1/2017	CRB Chairperson medical assistance	K1500
2017	The company has provided full time employment to more than 50 people through camp staff, administration and support to	

	operations. Four staff members were sent to do and passed a university course in early 2017 as part of the commitment to skills and development training of the community.	

In red being what the company has done over and beyond its hunting concession agreement and statutory obligations.

Subject:	Letter of Support for lion and elephant imports from Zambia
Attachments:	image002.jpg

Good Morning Mr. Secretary Zinke, and Deputy Director Sheehan

On behalf of the Professional Hunters Association of Zambia (PHAZ) we fully support you in your decision to allow the import of legally hunted lion and elephant from the Republic of Zambia for the calendar years of 2016,2017 and 2018.

We are fully aware that this decision was derived at, from your good offices, after many years of fact finding and enhancement findings on the role of safari hunting in the crucial conservation of lion and elephant here in Zambia. Therefore good sirs i again extend our full support to your decision in allowing imports that we all know will provide the very funds, as paid by your american hunters, to ensure the survival of the many animals that remain. After a carefully selected trophy animal is legally and ethically hunted within the borders of Zambia and as per the laws of our country and the ethics set out not only by our association but by all professional hunters worldwide, that trophy should be allowed import into the USA.

Our association, although sovereign, is a part of something much bigger than ourselves in the form of the Safari Club International, The Operators and Professional Hunters of Africa (OPHA), Conservation Force (CF) and many more - where we all strive to ensure our members adhere and follow the most professional conduct when on safari, Not only Sirs are our members Professional Hunters but they are Professional Conservationists in the truest sense of form. They are out there in the field monitoring the game, providing immediate service to anti poaching and have a deep love of not only the fauna but also the flora and the continued well being of all those creatures and plants.

Therefore your recent announcement of the allowing of trophy imports into the United States of America (USA) was a much heralded victory for us in the conservation of the remaining wildlife in our country, Zambia.

Unfortunately the anti-conservationists used some key words like, trophy and Sport hunting and emotional video footage to place your President in a difficult situation - hence his message to put your scientific and fact based decision on 'hold'. This type of situation is not uncommon here in our third world countries, so really it comes as no shock to us, however like all courses of action that follow this type of situation, it now comes the responsibility of your good office Mr

Secretary, ably supported by your FWS department, and our associations support to you - that you kindly explain the science and the facts behind your conclusion to the highest office in your country.

I am very confident Mr Secretary that once you have explained this and provided the data and facts that the FWS have collected over the past years it will undoubtedly and irrevocably prove that funds paid by american hunters directly lead to the conservation and well being of not only the precious wildlife in Zambia but also the community living with in the area and the entire bio diversity of that area as well.

All to often these anti - conservationists have grouped together illegal (poaching) and legal hunting in the same category - you Sirs are no fools to this very bad misconception - we (you and us) are promoting the legal off take and ethical manner in which it is done for the betterment and sustainability of the wildlife, this is basic management and conservation, they are however grouping us with the illegal trade, that we know and are fighting every day, that is decimating our flora and fauna here in Zambia.

Furthermore as evidence to support our support of your office in this matter, the following points and facts gathered can be raised, all extracts from other papers we have presented on this,

Regulated hunting is not illegal - it is provided for in the Wildlife Act of 2015, there are permits and payments that have to be met prior to a safari even commencing, once these are met the safari is deemed legal as per the laws of the republic of Zambia. there is a huge difference between a legal safari and an illegal act against wildlife - we are and have only ever promoted the legal and ethical hunting of licensed game here in Zambia.

ELEPHANT TROPHY IMPORTS HAVE NEVER BEEN “BANNED,” AND THE POSITIVE ENHANCEMENT FINDINGS ARE BASED ON THE BEST AVAILABLE INFORMATION RECEIVED IN 2014-2016

- There has been no “ban” on the import of elephant trophies from Zambia. In October 2011, the FWS made a positive enhancement finding to authorize the import of regulated elephant hunting trophies from Zambia. However, 2013 and 2014, Zambia’s wildlife authority suspended hunting to obtain more current wildlife population information. In 2015, Zambia’s government lifted the hunting suspension, and set a conservative quota of 80 elephant. In August 2016, the Chief of Permits sent an email indicating that the FWS was trying to issue import permits for elephant trophies from Zambia before the CITES Conference of the Parties in September 2016, based on an April 2015 Non-Detriment and Enhancement Finding the FWS received from Zambia’s wildlife authority. However, the FWS ran out of time. At the Conference of the Parties, the Chief of Permits indicated that elephant permits from Zambia would likely issue before the end of the year. Again, because of the new rosewood permits, that enhancement finding was put on a back burner.

ZAMBIA’S ELEPHANT POPULATION IS STABLE

- Zambia’s elephant population inhabits seven sub-regions covering National Parks and Game Management Areas. According to the 2016 African Elephant Status Report, Zambia’s elephant population is estimated at over 21,000. This is generally considered stable over the past 25 years, and is stable compared to Zambia’s population in 1992, when the FWS determined to maintain elephant as “threatened” listed. However, several population surveys indicating an estimate closer to 30,000 were not included in the 2016 African Elephant Status Report, and Zambia’s wildlife authority estimates the country’s population at more than 30,000.

ELEPHANT HUNTING OFF TAKES IN ZAMBIA ARE NEGLIGIBLE

- In 2013 and 2014, Zambia suspended regulated tourist hunting to obtain a better sense of national wildlife population trends. In 2015, Zambia set a conservative export quota of 160 tusks from 80 bull elephants. Zambia maintained the quota of 80 elephants in 2016 and 2017. A national quota of 80 elephants represents less than 0.4% of a population of 21,967 elephant. Actual hunting off takes are negligible and have no impact on the national population rate.

  2015 Hunting Off takes (% of Total Elephant Population): 03 (0.014%)

  2016 Hunting Off takes (% of Total Elephant Population): 12 (0.055%)

ELEPHANT MANAGEMENT IN ZAMBIA IS UP-TO-DATE AND GENERATES SUBSTANTIAL BENEFITS TO ENCOURAGE RECOVERY OF THE SPECIES

- Governing Law: The Zambian Wildlife Act No. 14 of 2015 is the guiding legislation for elephant protection and management. This cutting-edge law consolidated the prior wildlife authority into a government Department of National Parks and Wildlife (DNPW), to address the funding concerns and shortfalls experienced by the prior authority. DNPW is made up of a Wildlife Law Enforcement Unit with over 1,250 rangers; a Conservation Unit; an Infrastructure Development Unit; and a Community-Based Natural Resource Management Unit to oversee the development of conservation planning in Game Management Areas.

- Management and Enforcement Revenues: Between 2010 and 2012, regulated hunting revenues accounted for approximately 32% of the operating budget funding for Zambia's wildlife authority. With a potential to generate nearly $1 million in elephant hunting fees, in 2015 and 2016, these fees totaled only $150,000, due mainly to import restrictions. This amount was divided between DNPW and the Community Resource Boards in Game Management Areas (GMA). DNPW uses this revenue for range salaries and resource protection, as well as management surveys, staff training, and other activities. Approximately 75% of DNPW's expenditures are for anti-poaching, and Zambia's Wildlife Law Enforcement Unit conducted over 10,500 anti-poaching patrols in 2015, involving an average of 5,878 staff per quarter and 237,028 patrol days.

- Habitat: Hunting areas in Zambia (~180,000 km²) provide almost three times the amount of protected habitat compared to the country's National Parks (~64,000 km²).

- Community Benefits: In GMAs, elephant license fees are divided equally between the DNPW and the GMA's Community Resource Board, and 20% of concession fees also accrue to the Board. In 2015 and 2016, approximately $1.36 million in hunting fees was distributed to the Boards, as well as $10,000 per concession paid by the hunting operator. Under the new Wildlife Law, Boards must invest those funds as follows: 45% towards wildlife protection and patrols, 35% towards community improvement projects such as construction of schools, clinics, and water infrastructure, and 20% towards administrative costs. Written concession agreements between the operators, DNPW, and the community Boards usually obligate the concessionaire to make further communities investments, such as constructing a classroom and paying a teacher's salary. Operators in 13 blocks were obligated to spend over $1.1 million in community infrastructure development and 3.4 million in community lease and other payments for the duration of their leases.

- Game Meat Distributions: Moreover, under Zambian law, at least 50% of harvested game meat must be donated and distributed to local communities. A 2015 study found that operators in three GMAs contributed an average of 6,000 kilograms of harvested meat per season, and estimated that operators across all GMAs could provide ~130 tons of much-needed protein annually. This reduces the incentive for bush meat poaching in these areas bordering and buffering Zambia's National Parks.

- Operator Anti-Poaching: Hunting operators' concession agreements with DNPW and the Community Resource Board identify mandatory anti-poaching obligations and expenditures. At present, 75 Boards employ over 750 wildlife scouts and 79 support personnel, at a monthly cost of over $38,800. Those scouts are paid for by revenues from tourist hunting. A small sample of four operators spent over $201,000 on anti-poaching in 2015, to fund community scouts and fund and equip their own operator anti-poaching teams. This anti-poaching support is largely paid for by U.S. hunters, as over half of all hunting clients in Zambia are from the U.S.

- Photographic tourism is not a substitute in most hunting areas. Opponents argue that photographic tourism would be a better option than hunting. It is true that photo-tourism is available in some places; for example, some conservancies in Namibia benefit from photographic tourism revenues alone or a mixture of photo- and hunting tourism. But photo-tourism requires decent infrastructure and scenery, and dense enough wildlife populations to draw tourists. These may not be available in remote areas of a country without access to airports or other activities, and where the wildlife populations are not yet dense enough to ensure a sighting on a two-hour game drive, Zambia does yet have the infrastructure for these to operate in more remote areas, therefore all photographic is currently only present around the little infrastructure we do have.

Once again be rest assured you have our support, together in the fight to conserve Zambian wildlife, we thank you very much Mr. Secretary for your tremendous effort already displayed to help us and we ask for your continuing support, having visited your great country we are well aware of how much land you set aside for parks and hunting and we are no strangers to the remarkable story of not only the whitetail and waterfowl in the US but all your fora and fauna, we too can make such a difference in Zambia for the future generations, if given a chance.

Best Regards

Mr. Deputy Director, I urge you to do whatever is in your power to support the use of science and not politics when it comes to the approval of importation of Lion and Elephant from African Range States that have demonstrated sustainable resource development such as Zimbabwe and Zambia. This decision should rest with US F& W and not the loudest voice on social media or the White House. Sincerely James M Wojciehowski (907) 350-1859

Hi Greg! I have attached the talking points about allowing me to import my elephant I took in March 2015. I legally hunted my elephant and have been deprived of my private property rights all based on some obscure politics. I am not sure why our Government is trying to manage wildlife in another country anyway. Rick

TALKING POINTS IN SUPPORT OF ELEPHANT TROPHY IMPORTS FROM ZIMBABWE AND ZAMBIA

ELEPHANT TROPHY IMPORTS HAVE NEVER BEEN "BANNED," AND THE POSITIVE ENHANCEMENT FINDINGS ARE BASED ON THE BEST AVAILABLE INFORMATION RECEIVED IN 2014-2016

- **There has been no "ban" on elephant trophy imports. In April 2014, the U.S. Fish and Wildlife Service (FWS) "suspended" the import of elephant trophies from Zimbabwe due to a lack of information. Zimbabwe's Parks and Wildlife Management Authority (ZPWMA) responded to two questionnaires from the FWS in April 2014 and December 2014. However, in March 2015, the FWS extended the suspension, finding information was still lacking. The negative enhancement finding dated March 2015 repeatedly affirmed, "The suspension … could be lifted if additional information on the status and management of elephants in Zimbabwe becomes available, including utilization of revenue generated through sport-hunting by U.S. hunters, which satisfies the conditions of the 4(d) special rule under the ESA." In July 2015, May 2016, and November 2016, ZPWMA responded to additional FWS questions. The November 2017 positive enhancement finding is based on these later responses and thousands of pages of supporting documents, including Zimbabwe's National Elephant Management Action Plan, 2014 countrywide elephant population surveys, 2014-2016 actual and projected budget data, 2014 and 2015 offtakes and 2016 quota data, 2014-2016 CAMPFIRE data, and much more.**

- **Issuing import permits for elephant trophies from Zimbabwe was not a political decision by this Administration. In September 2016, before the election occurred, the FWS had already indicated to ZPWMA that the suspension would be lifted. ZPWMA was told by the Chief of Permits that the FWS needed "only one more piece of information," a prioritization of the new Elephant Management Plan, before the negative enhancement finding could be reversed. That prioritization was provided on November 8, 2016, before the election results were in. At the end of 2016, the FWS should have made the positive enhancement finding, but was admittedly sidetracked by an influx of thousands of new permit applications due to the listing of rosewood (used extensively in musical instruments and furniture) on the CITES Appendixes effective January 2017.**

- **Similarly, there has been no "ban" on the import of elephant trophies from Zambia. In October 2011, the FWS made a positive enhancement finding to authorize the import of regulated elephant hunting trophies from Zambia. However, 2013 and 2014, Zambia's**

wildlife authority suspended hunting to obtain more current wildlife population information. In 2015, Zambia's government lifted the hunting suspension, and set a conservative quota of 80 elephant. In August 2016, the Chief of Permits sent an email indicating that the FWS was trying to issue import permits for elephant trophies from Zambia before the CITES Conference of the Parties in September 2016, based on an April 2015 Non-Detriment and Enhancement Finding the FWS received from Zambia's wildlife authority. However, the FWS ran out of time. At the Conference of the Parties, the Chief of Permits indicated that elephant permits from Zambia would likely issue before the end of the year. Again, because of the new rosewood permits, that enhancement finding was put on a back burner.

ZIMBABWE'S ELEPHANT POPULATION IS THE SECOND-LARGEST IN AFRICA

- **In 1900, it was estimated that Zimbabwe had a national population of 4,000 elephant. Since then, the population has grown to over 82,000 (a twenty-fold increase). The current population is double the target national population established in the 1980s, almost 40% larger than in 1992, when the FWS determined to maintain the Endangered Species Act (ESA) "threatened" listing, and almost 20% larger than in 1997, when the last positive enhancement finding was made (before November 2017). Elephant sub-populations in Zimbabwe are generally considered stable or increasing.**
    - **<u>North-West Matabeleland</u>: This population is estimated at 54,000, and is most densely located in Hwange National Park (45,000 elephant). In 1928, the estimated elephant population in Hwange was 2,000.**
    - **<u>Sebungwe</u>: This population is estimated at 3,500 and has declined since 2001 due to human population expansion into a previously unsettled area. The human population exploded from 45,000 in 1950 to over 700,000 in 2013, which explains the decline in the elephant population. Due to the expansion of human settlement and unlike other major elephant ranges in Zimbabwe, the habitat in this area is fragmented.**
    - **<u>Mid-Zambezi Valley</u>: This area has an estimated elephant population of about 12,000. That population declined since the 2001 countrywide survey, and it is believed the decline is due to cross-border poaching and perhaps, the cross-border movement of elephants during the survey. Anti-poaching is a major component of the Zambezi Valley/Mana Pools Regional Elephant Management Action Plan, and recently the area has been chosen as a CITES MIKES site with an ongoing project.**
    - **<u>South-East Lowveld</u>: Most of this population inhabits Gonarezhou National Park, whose population has been growing consistently at 5% per annum over 20 years. This region's sub-population is estimated at 13,000 elephant between the Park, surrounding communal areas, and nearby private conservancies.**

ZAMBIA'S ELEPHANT POPULATION IS STABLE

- **Zambia's elephant population inhabits seven sub-regions covering National Parks and Game Management Areas. According to the 2016 African Elephant Status Report, Zambia's elephant population is estimated at over 21,000. This is generally considered stable over the past 25 years, and is stable compared to Zambia's population in 1992, when the FWS determined to maintain elephant as "threatened" listed. However, several population surveys indicating an estimate closer to 30,000 were not included in the 2016 African Elephant Status Report, and Zambia's wildlife authority estimates the country's population at more than 30,000.**

ELEPHANT HUNTING OFFTAKES IN ZIMBABWE ARE SUSTAINABLE

- **Zimbabwe maintains a CITES export quota of 1,000 tusks from 500 bull elephants. A national quota of 500 elephants represents only 0.6% of a population of 82,630 elephant. Actual hunting offtakes are considerably lower, have a negligible impact on the overall population rate, and have declined in the past three years due to the import suspension.**

  Average Hunting Offtakes 2010-2013 (% of Total Elephant Population): 228 (0.276%)
  2013 Hunting Offtakes (% of Total Elephant Population): 258 (0.312%)
  2014 Hunting Offtakes (% of Total Elephant Population): 162 (0.196%)
  2015 Hunting Offtakes (% of Total Elephant Population): 75 (0.091%)

ELEPHANT HUNTING OFFTAKES IN ZAMBIA ARE NEGLIGIBLE

- **In 2013 and 2014, Zambia suspended regulated tourist hunting to obtain a better sense of national wildlife population trends. In 2015, Zambia set a conservative export quota of 160 tusks from 80 bull elephants. Zambia maintained the quota of 80 elephants in 2016 and 2017. A national quota of 80 elephants represents less than 0.4% of a population of 21,967 elephant. Actual hunting offtakes are negligible and have no impact on the national population rate.**

  2015 Hunting Offtakes (% of Total Elephant Population): 3 (0.014%)
  2016 Hunting Offtakes (% of Total Elephant Population): 12 (0.055%)

ELEPHANT MANAGEMENT IN ZIMBABWE IS GUIDED BY APPROPRIATE LEGISLATION AND A STATE-OF-THE-ART MANAGEMENT PLAN

- **Governing Law: The Zimbabwe Parks and Wild Life Act provides the regulatory mechanism for ZPWMA and its programs. The Act created ZPWMA as a parastatal authority apart from the central government and established a separate fund, apart from the Central Treasury, to sustain ZPWMA's operations. The Act sets harsh penalties for elephant-related offenses, and was amended in 2010 to impose a nine-year minimum sentence for the first offense of elephant poaching. Under the Parks and Wild Life Act, Rural District Councils and other land holders are granted "appropriate authority" to benefit directly from wildlife. Under this legislation, land holders are encouraged to maintain and increase wildlife populations because they retain the benefits of sustainable use of that wildlife.**

- **Elephant Management Plan: Elephant are managed according to the Zimbabwe National Elephant Management Plan (2015-2020). The plan incorporates specific action items, deliverables, deadlines, and responsible parties. It is an adaptive management plan utilizing prioritization of targets measured by key components, strategic objectives, and outputs. The plan focuses on five major components: Protection and Law Enforcement; Biological Monitoring and Management; Social, Economic, and Cultural Framework; Building Conservation Capacity; and Program Management. The National management plan is supplemented by four regional plans that utilize the same framework to address the unique challenges for each major elephant range in Zimbabwe. Zimbabwe's elephant management planning process was kicked off by the FWS' elephant trophy import suspension. ZPWMA held a year of stakeholder planning workshops, including a preparatory meeting of representatives from CAMPFIRE in November 2014; a national elephant management planning workshop in December 2014; an elephant management planning and anti-poaching workshop in Mana Pools (Zambezi Valley range) in March-April 2015; an elephant management planning workshop in the Sebungwe range in May 2015; and an elephant management planning workshop in the South East Lowveld range in September 2015.**

ELEPHANT HUNTING IN ZIMBABWE GENERATES CONSERVATION BENEFITS THAT SATISFY THE "ENHANCEMENT" STANDARD: Although hunting offtakes are negligible, elephant hunting fees create extensive conservation incentives in Zimbabwe.

- **Habitat: Hunting areas in Zimbabwe represent ~130,000 km^2 of protected habitat. This represents over four times the size of Zimbabwe's National Parks (~28,000 km^2). Healthy elephant populations require large tracts of habitat; the areas set aside for regulated hunting are therefore essential to the elephant's continued survival.**

- **Management and Enforcement Revenues: Revenues generated from tourist hunting conducted on state lands comprised approximately 20% of ZPWMA's revenue stream in 2014. Over $6.2 million in trophy fees came from elephant hunts, with $5 million**

accruing to ZPWMA to reinvest in elephant protection and species management. Over 50% of that revenue came from U.S. clients. Almost 80% of ZPWMA's operating budget is allocated towards law enforcement in the form of staff costs and patrol provisions. ZPWMA employs 1,500 active field rangers. Put simply, hunting revenues support anti-poaching efforts across Zimbabwe's elephant range—and this is largely paid for by American elephant hunters.

- **<u>Operator Anti-Poaching</u>: In addition to supporting ZPWMA's enforcement capacity, hunting operators deploy their own anti-poaching units to police the Safari Areas and fund community game scouts in CAMPFIRE Areas. For example, a small sample of 14 individual operators surveyed by the Safari Operator Association of Zimbabwe spend $957,843 on anti-poaching in 2013 and deployed 245 anti-poaching scouts. One specific operator, Charlton McCullum Safaris (CMS) in the Dande Safari Area and Mbire Communal Area, spends on average $80,000-$90,000 in patrol and equipment costs and anti-poaching rewards. From 2010 to 2016, CMS' efforts led to an 82% decline in elephant poaching in an import border region. As another example, the Save Valley and Bubye Valley Conservancies together spend over $1 million on anti-poaching each year. These anti-poaching efforts are funded predominately by hunting revenue, and protect stable populations of elephant and the third-largest black rhino population in the world.**

- **<u>Regional Anti-Poaching</u>: According to the CITES "Monitoring the Illegal Killing of Elephants" (MIKE) program, poaching in the Southern African countries that allow regulated tourist hunting, including Zimbabwe, is lower than anywhere else on the continent and has never reached an unsustainable level. This stands in stark contrast to the West and Central African countries that do not rely upon tourist hunting as a conservation tool.**

- **<u>Community Benefits</u>: Zimbabwe's CAMPFIRE program is the pioneering community-based natural resource management program in Africa. The program allows rural communities to financially benefit from wildlife, thereby incentivizing the use of communal land as wildlife habitat, and the protection of wildlife in the form of increased tolerance of destructive wildlife. An estimated 77,000 households rely on CAMPFIRE benefit from CAMPFIRE. 90% of CAMPFIRE revenue is generated from regulated hunting, and 70% of this comes from elephant hunting. Thus, prior to the import suspension, elephant hunting generated over $1.6 million per year for CAMPFIRE communities and was reinvested in the construction of classrooms and clinics, the installation of water infrastructure and solar powered facilities, the purchase of vehicles for anti-poaching support, compensation for destruction of crops or livestock by dangerous game, and other benefits that improve the livelihoods of the rural communities living in CAMPFIRE Areas. These benefits offset the damage caused by game species: from 2010 to 2015, elephant destroyed 7,495 hectares of crop fields in CAMPFIRE communities and claimed the lives of approximately 40 people.**

ELEPHANT MANAGEMENT IN ZAMBIA IS UP-TO-DATE AND GENERATES SUBSTANTIAL BENEFITS TO ENCOURAGE RECOVERY OF THE SPECIES

- **Governing Law: The Zambian Wildlife Act No. 14 of 2015 is the guiding legislation for elephant protection and management. This cutting-edge law consolidated the prior wildlife authority into a government Department of National Parks and Wildlife (DNPW), to address the funding concerns and shortfalls experienced by the prior authority. DNPW is made up of a Wildlife Law Enforcement Unit with over 1,250 rangers; a Conservation Unit; an Infrastructure Development Unit; and a Community-Based Natural Resource Management Unit to oversee the development of conservation planning in Game Management Areas.**

- **Management and Enforcement Revenues: Between 2010 and 2012, regulated hunting revenues accounted for approximately 32% of the operating budget funding for Zambia's wildlife authority. With a potential to generate nearly $1 million in elephant hunting fees, in 2015 and 2016, these fees totaled only $150,000, due mainly to import restrictions. This amount was divided between DNPW and the Community Resource Boards in Game Management Areas (GMA). DNPW uses this revenue for range salaries and resource protection, as well as management surveys, staff training, and other activities. Approximately 75% of DNPW's expenditures are for anti-poaching, and Zambia's Wildlife Law Enforcement Unit conducted over 10,500 anti-poaching patrols in 2015, involving an average of 5,878 staff per quarter and 237,028 patrol days.**

- **Habitat: Hunting areas in Zambia (~180,000 km^2) provide almost three times the amount of protected habitat compared to the country's National Parks (~64,000 km^2).**

- **Community Benefits: In GMAs, elephant license fees are divided equally between the DNPW and the GMA's Community Resource Board, and 20% of concession fees also accrue to the Board. In 2015 and 2016, approximately $1.36 million in hunting fees was distributed to the Boards, as well as $10,000 per concession paid by the hunting operator. Under the new Wildlife Law, Boards must invest those funds as follows: 45% towards wildlife protection and patrols, 35% towards community improvement projects such as construction of schools, clinics, and water infrastructure, and 20% towards administrative costs. Written concession agreements between the operators, DNPW, and the community Boards usually obligate the concessionaire to make further communities investments, such as constructing a classroom and paying a teacher's salary. Operators in 13 blocks were obligated to spend over $1.1 million in community infrastructure development and 3.4 million in community lease and other payments for the duration of their leases.**

- **Game Meat Distributions: Moreover, under Zambian law, at least 50% of harvested game meat must be donated and distributed to local communities. A 2015 study found that operators in three GMAs contributed an average of 6,000 kilograms of harvested meat per season, and estimated that operators across all GMAs could provide ~130 tons**

of much-needed protein annually. This reduces the incentive for bush meat poaching in these areas bordering and buffering Zambia's National Parks.

- **Operator Anti-Poaching: Hunting operators' concession agreements with DNPW and the Community Resource Board identify mandatory anti-poaching obligations and expenditures. At present, 75 Boards employ over 750 wildlife scouts and 79 support personnel, at a monthly cost of over $38,800. Those scouts are paid for by revenues from tourist hunting. A small sample of four operators spent over $201,000 on anti-poaching in 2015, to fund community scouts and fund and equip their own operator anti-poaching teams. This anti-poaching support is largely paid for by U.S. hunters, as over half of all hunting clients in Zambia are from the U.S.**

[Note: Supporting documents for each of these points is available by contacting Conservation Force, cf@conservationforce.org. These Talking Points largely rely on the responses of ZPWMA and DNPW to FWS information requests and supporting documents provided as part of those responses as well as individual hunting operator enhancement reports, reports of the CAMPFIRE Association, and publicly available IUCN documents.]

MINI-ARGUMENTS REFUTING FALSE FACTS

- **There has never been a "ban" on elephant trophy imports from Zimbabwe. A negative enhancement finding was made in April 2014 that "suspended" the import of elephant trophies. The FWS' negative 2015 enhancement finding stated repeatedly that once additional information was received, the negative finding would be reviewed and reversed (e.g., "The suspension … could be lifted if additional information on the status and management of elephants in Zimbabwe becomes available, including utilization of revenue generated through sport-hunting by U.S. hunters, which satisfies the conditions of the 4(d) special rule under the ESA.") A "ban" suggests a permanent prohibition; a "suspension" is a "temporary abrogation or withholding." Zimbabwe's elephant trophy imports were suspended.**
- **Lifting of the suspension was not a political decision. The decision should have been made in July 2015, when ZPWMA provided extensive additional documentation in response to a FWS questionnaire. The FWS requested "one more piece of information" at the CITES Conference of the Parties in September 2016. That information was provided in November 2016. No further information was needed, or requested. If the FWS had properly prioritized the issuance of elephant import permits—as they told ZPWMA they would at the CITES Conference of the Parties—the positive enhancement finding would have been made and these permits would have issued before the current Administration was in office.**
- **The import of elephant trophies from Zimbabwe should not have been suspended in the first place. In April 2014, the FWS announced the suspension based on an asserted "lack of information." In contradiction to CITES Res. Conf. 6.7's recommendation of notifying and consulting with range states before imposing stricter domestic measures, and the Endangered Species Act's requirement of "encouraging foreign conservation programs," 16 U.S.C. § 1537(b), the FWS shut down imports under an April 2014 negative enhancement finding that the FWS later admitted was wrong with respect to Zimbabwe's elephant population and level of poaching. In fact, the correct estimate for Zimbabwe's elephant population—almost 83,000—is 16,000 elephant higher than when the last, positive enhancement finding was made in 1997. That estimate is double the size of the elephant populations of Namibia and South Africa put together, yet the FWS maintains positive enhancement findings for the import of elephant trophies from Namibia and South Africa. The trophy import suspension was based on a mistaken concern that Zimbabwe's elephant population had declined, and the FWS should have admitted the mistake and reversed the suspension immediately. The failure to do so suggests a political motivation, not a scientific one.**
- **Zimbabwe's elephant population is not "the worst managed," but is among the best. That Zimbabwe maintains a stable elephant population of over 83,000, despite a despotic government, poor economy, and exploding human population growth rate, is a**

testament to the country's strong management. That number is almost 40% higher than in 1992, when the FWS confirmed the "threatened" listing of elephant, and almost 20% higher than in 1997, when the FWS made a positive enhancement finding authorizing the import of elephant trophies. This is due in part to ZPWMA being a parastatal separate and separately funded from the central government. It is also due to the commitment of Zimbabwe's citizens to maintaining their elephant, notwithstanding the costs—over 40 rural Zimbabweans were killed by elephant from 2010 to 2015. Zimbabwe's strong wildlife management is also demonstrated by recent IUCN Red List assessments of lion and giraffe, which indicated increasing populations of these species in Zimbabwe. The evidence demonstrates that Zimbabwe's wildlife management, not only its elephant management, is succeeding.]

- **<u>Zimbabwe's elephant management is not "poor"; it is state-of-the-art and written by one of the world's foremost elephant experts.</u> In response to the April 2014 suspension of elephant trophy imports, ZPWMA took to heart the FWS' criticism that Zimbabwe's then-current elephant management plan dated to 1997. Although that plan was adaptively implemented and monitored, it was admittedly dated. Zimbabwe immediately began the process of adopting a brand-new, state-of-the-art elephant management plan—basically, to satisfy the FWS. This included a year of stakeholder planning workshops: a preparatory meeting of representatives from Zimbabwe's community-based natural resources management program, CAMPFIRE, in November 2014; a national elephant management planning workshop in December 2014; an elephant management planning and anti-poaching workshop in Mana Pools (Zambezi Valley) in early April 2015; an elephant management planning workshop in the Sebungwe range in May 2015; and an elephant management planning workshop in the South East Lowveld region in September 2015. Zimbabwe focused on regional planning because the four regions face different management challenges. Each planning workshop produced a regional elephant management plan that was incorporated into the final. The final document was drafted by a leading elephant scientist, and the process was monitored throughout by the IUCN's African Elephant Specialist Group.**

- **<u>Regulated hunting is not poaching.</u> By definition, "regulated" hunting is regulated and lawful. It is carefully monitored by ZPWMA, and offtakes are recorded in a national database. Lawfully hunted ivory tusks are marked to show that they are lawful and note the year of harvest. Moreover, regulated hunting revenues underwrite most anti-poaching expenses in Zimbabwe and the rest of Southern Africa, either by fees paid to government wildlife authorities that are used for law enforcement, or by operator-funded teams that patrol concessions and keep poachers out. Finally, revenue-sharing and contributions by hunting operators creates conservation incentives for rural communities most affected by wildlife, which disincentivizes poaching. For example, Zimbabwe's CAMPFIRE communities were receiving over $1.6 million per year in revenues from elephant hunting prior to the import suspension. These funds allow for clinics and schools to be built, teachers' salaries to be paid, boreholes to be drilled, and**

so on. Hunting operators in Zambia are required to share at least 50% of harvested meat with rural communities. Many tons of meat can come from elephant hunts, to reduce the need and tolerance for bushmeat poaching and protect species in addition to elephant.

- **<u>Allowing imports of elephant trophies will not damage the government's efforts to control ivory trafficking.</u> Elephant trophy imports have been authorized for Namibia and South Africa for the past three years, which demonstrates that a country may maintain lawful hunting and low poaching at the same time. In fact, according to the CITES MIKE data, the Southern African countries that depend upon regulated hunting as a conservation tool have the lowest Proportion of Illegally Killed Elephant (PIKE) rates in the world. PIKE, which is used to assess whether poaching levels are unsustainable, has never risen above the sustainability threshold in Southern Africa. PIKE at Zimbabwe's MIKE sites is well below that level. Moreover, national and international law requires the marking of ivory tusks taken as lawful hunting trophies, which clearly and visibly separates these lawful tusks from illegal ones.**
- **<u>Photographic tourism is not a substitute in most hunting areas.</u> Opponents argue that photographic tourism would be a better option than hunting. It is true that photo-tourism is available in some places; for example, some conservancies in Namibia benefit from photographic tourism revenues alone or a mixture of photo- and hunting tourism. But photo-tourism requires decent infrastructure and scenery, and dense enough wildlife populations to draw tourists. These may not be available in remote areas of a country without access to airports or other activities, and where the wildlife populations are not yet dense enough to ensure a sighting on a two-hour game drive. This is the situation in many CAMPFIRE Areas, where photographic tourism was tried … and failed. In these areas, without the benefits of hunting, the habitat would be converted to agriculture and livestock. Benefits to the rural community stakeholders are less from photographic tourism than from tourist hunting.**

Subject:	Zimbabwe Elephant Imports

Dear Secretary Zinke and Director Sheehan, I want to thank you both and the FWS for its positive enhancement finding regarding Elephant and Lion in Southern Africa, and specifically Zimbabwe. I have been to Zimbabwe three times over the past four years and can personally attest to the positive conservation impact that sport hunting provides to African wildlife. I have hunted in Metebeleland South Province and helped conservation efforts by personally spending over $100,000 over the course of three hunts, including leopard and elephant hunts. The money sportsmen spend directly benefits the local population and the wildlife. Let me please give you a specific example of elephant conservation due directly to sport hunting support. Debshan Ranch, in Metebeleland South Province comprises of 125,000 acres of privately held land. It is a working cattle ranch, but also intensively managed for wildlife. Sean Grant owns and operates Shangani River Safaris on Debshan. When he was awarded the hunting consession, he invested a great amount of money and time into an anti poaching system. He has three anti poaching units which patrol full time removing snares and engaging poachers. When Sean started he was losing over 30 elephant a year to poachers. Through his efforts, and ENTIRELY SUPPORTED BY SPORTING DOLLARS, he now averages only two to three poached elephants each year. He legally takes about 10 elephant bulls per year and only hunts old, no longer breeding bulls. The facts are that left to defend themselves, without sportsmen, the elephant will not survive. It is obvious to me from actual experience that the denial of import permits will have a severe negative impact on the very animals FWS is supposedly trying to protect. Please rely on science and actual statistics, not on emotions and “politically expedient” yet short sighted decision making and support the recent enhancement finding. African wildlife depends on our support and the value we give it Respectfully, Jeff Nicholas 501.379.8404 Jeffnicholas@gmail.com Sent from my iPhone

Subject:	Elephant and Lion Imports from Zambia and Zimbabwe

Dear Deputy Director Sheehan, My name is John Justus. I am an avid hunter, but more importantly a conservationist. While people may call me a “murderer” or worse, they cannot deny the value that sustainable hunting brings to the long term health and growth of wildlife populations. Unfortunately, recent decisions to close hunting in various locations throughout the world has not been based on science but rather political pressures from anti-hunting groups who do understand why we hunt or spend the time to understand the role sustainable hunting plays in wildlife conservation. We are now faced with a threat by President Trump to overturn recent rulings by the US Fish and Wildlife Service and ban the import of Elephant and Lions legally taken in Zambia and Zimbabwe. Our hope, as hunters, is that he takes the time to understand the benefits that hunting plays in enhancing the populations of these species. We are confident that if President Trump bases his decision on facts, rather than political pressures, the continued import of these species taken legally will be allowed. A ruling to ban these imports will in effect stop the sustainable hunting and therefore the resulting conservation benefits that hunting provides. Without the revenues flowing back to the communities from hunting, wildlife has no value. The result will be a major decline, if not the elimination of these important species in Zambia, Zimbabwe as well as other African countries. Sincerely, John R. Justus

Subject:	Elephant Imports

Dear Secretary Zinke,and Director Sheehan, Please lift the restrictions for importation of Elephants. Not doing so causes harm and financial distress to many Africans, as well as likely the demise of the Elephant as they are so overpopulated in Zimbabwe that they are quite literally eating themselves out of house and home. Please don't listen to the press and political pundits, they have never been there to see for themselves as I have. Additionally Zimbabwe has done a fabulous job of documenting, and managing their Elephant herd. Who are we to take control of their hunting? We have no right to dictate hunting policy to their country via uninformed and liberal bias. I have been to Africa and seen the Elephants for myself if anything there are too many. Hwange National park which was determined to safely support 2000 Elephants in the 70's now has over 45,000. Please let good sense and judgement prevail. Sincerely Terry Scott

Mr, Sheehan,

November 21, 2017

Deputy Director Greg Sheehan: (b) (6) ***@fws.gov***
Secretary Ryan Zinke: exsec@ios.doi.gov

TALKING POINTS IN SUPPORT OF ELEPHANT TROPHY IMPORTS FROM ZIMBABWE AND ZAMBIA

ELEPHANT TROPHY IMPORTS HAVE NEVER BEEN "BANNED," AND THE POSITIVE ENHANCEMENT FINDINGS ARE BASED ON THE BEST AVAILABLE INFORMATION RECEIVED IN 2014-2016

- **There has been no "ban" on elephant trophy imports. In April 2014, the U.S. Fish and Wildlife Service (FWS) "suspended" the import of elephant trophies from Zimbabwe due to a lack of information. Zimbabwe's Parks and Wildlife Management Authority (ZPWMA) responded to two questionnaires from the FWS in April 2014 and December 2014. However, in March 2015, the FWS extended the suspension, finding information was still lacking. The negative enhancement finding dated March 2015 repeatedly affirmed, "The suspension … could be lifted if additional information on the status and management of elephants in Zimbabwe becomes available, including utilization of revenue generated through sport-hunting by U.S. hunters, which satisfies the conditions of the 4(d) special rule under the ESA." In July 2015, May 2016, and November 2016, ZPWMA responded to additional FWS questions. The November 2017 positive enhancement finding is based on these later responses and thousands of pages of supporting documents, including Zimbabwe's National Elephant Management Action Plan, 2014 countrywide elephant population surveys, 2014-2016 actual and projected budget data, 2014 and 2015 offtakes and 2016 quota data, 2014-2016 CAMPFIRE data, and much more.**

- **Issuing import permits for elephant trophies from Zimbabwe was not a political decision by this Administration. In September 2016, before the election occurred, the FWS had already indicated to ZPWMA that the suspension would be lifted. ZPWMA was told by the Chief of Permits that the FWS needed "only one more piece of information," a prioritization of the new Elephant Management Plan, before the negative enhancement finding could be reversed. That prioritization was provided on November 8, 2016, before the election results were in. At the end of 2016, the FWS should have made the positive enhancement finding, but was admittedly sidetracked by an influx of thousands of new permit applications due to the listing of rosewood (used extensively in musical instruments and furniture) on the CITES Appendixes effective**

January 2017.

- **Similarly, there has been no "ban" on the import of elephant trophies from Zambia. In October 2011, the FWS made a positive enhancement finding to authorize the import of regulated elephant hunting trophies from Zambia. However, 2013 and 2014, Zambia's wildlife authority suspended hunting to obtain more current wildlife population information. In 2015, Zambia's government lifted the hunting suspension, and set a conservative quota of 80 elephant. In August 2016, the Chief of Permits sent an email indicating that the FWS was trying to issue import permits for elephant trophies from Zambia before the CITES Conference of the Parties in September 2016, based on an April 2015 Non-Detriment and Enhancement Finding the FWS received from Zambia's wildlife authority. However, the FWS ran out of time. At the Conference of the Parties, the Chief of Permits indicated that elephant permits from Zambia would likely issue before the end of the year. Again, because of the new rosewood permits, that enhancement finding was put on a back burner.**

ZIMBABWE'S ELEPHANT POPULATION IS THE SECOND-LARGEST IN AFRICA

- **In 1900, it was estimated that Zimbabwe had a national population of 4,000 elephant. Since then, the population has grown to over 82,000 (a twenty-fold increase). The current population is double the target national population established in the 1980s, almost 40% larger than in 1992, when the FWS determined to maintain the Endangered Species Act (ESA) "threatened" listing, and almost 20% larger than in 1997, when the last positive enhancement finding was made (before November 2017). Elephant sub-populations in Zimbabwe are generally considered stable or increasing.**

    - **<u>North-West Matabeleland</u>: This population is estimated at 54,000, and is most densely located in Hwange National Park (45,000 elephant). In 1928, the estimated elephant population in Hwange was 2,000.**

    - **<u>Sebungwe</u>: This population is estimated at 3,500 and has declined since 2001 due to human population expansion into a previously unsettled area. The human population exploded from 45,000 in 1950 to over 700,000 in 2013, which explains the decline in the elephant population. Due to the expansion of human settlement and unlike other major elephant ranges in Zimbabwe, the habitat in this area is fragmented.**

    - **<u>Mid-Zambezi Valley</u>: This area has an estimated elephant population of about 12,000. That population declined since the 2001 countrywide survey, and it is believed the decline is due to cross-border poaching and perhaps, the cross-border movement of elephants during the survey. Anti-poaching is a major component of the Zambezi Valley/Mana Pools Regional Elephant Management Action Plan, and recently the area has been chosen as a CITES MIKES site with an ongoing project.**

    - **<u>South-East Lowveld</u>: Most of this population inhabits Gonarezhou National Park, whose population has been growing consistently at 5% per annum over 20 years. This region's sub-population is estimated at 13,000 elephant between the Park, surrounding communal areas, and nearby private conservancies.**

ZAMBIA'S ELEPHANT POPULATION IS STABLE

- **Zambia's elephant population inhabits seven sub-regions covering National Parks and Game Management Areas. According to the 2016 African Elephant Status Report, Zambia's elephant population is estimated at over 21,000. This is generally considered stable over the past 25 years, and is stable compared to Zambia's population in 1992, when the FWS determined to maintain elephant as "threatened" listed. However, several population surveys indicating an estimate closer to 30,000 were not included in the 2016 African Elephant Status Report, and Zambia's wildlife authority estimates the country's population at more than 30,000.**

ELEPHANT HUNTING OFFTAKES IN ZIMBABWE ARE SUSTAINABLE

- **Zimbabwe maintains a CITES export quota of 1,000 tusks from 500 bull elephants. A national quota of 500 elephants represents only 0.6% of a population of 82,630 elephant. Actual hunting offtakes are considerably lower, have a negligible impact on the overall population rate, and have declined in the past three years due to the import suspension.**

  Average Hunting Offtakes 2010-2013 (% of Total Elephant Population): 228 (0.276%)

  2013 Hunting Offtakes (% of Total Elephant Population): 258 (0.312%)

  2014 Hunting Offtakes (% of Total Elephant Population): 162 (0.196%)

  2015 Hunting Offtakes (% of Total Elephant Population): 075 (0.091%)

ELEPHANT HUNTING OFFTAKES IN ZAMBIA ARE NEGLIGIBLE

- **In 2013 and 2014, Zambia suspended regulated tourist hunting to obtain a better sense of national wildlife population trends. In 2015, Zambia set a conservative export quota of 160 tusks from 80 bull elephants. Zambia maintained the quota of 80 elephants in 2016 and 2017. A national quota of 80 elephants represents less than 0.4% of a population of 21,967 elephant. Actual hunting offtakes are negligible and have no impact on the national population rate.**

  2015 Hunting Offtakes (% of Total Elephant Population): 03 (0.014%)

  2016 Hunting Offtakes (% of Total Elephant Population): 12 (0.055%)

ELEPHANT MANAGEMENT IN ZIMBABWE IS GUIDED BY APPROPRIATE LEGISLATION AND A STATE-OF-THE-ART MANAGEMENT PLAN

- **<u>Governing Law</u>: The Zimbabwe Parks and Wild Life Act provides the regulatory mechanism for ZPWMA and its programs. The Act created ZPWMA as a parastatal authority apart from the central government and established a separate fund, apart from the Central Treasury, to sustain ZPWMA's operations. The Act sets harsh penalties for elephant-related offenses, and was amended in 2010 to impose a nine-year minimum sentence for the first offense of elephant poaching. Under the Parks and Wild Life Act, Rural District Councils and other land holders are granted "appropriate authority" to benefit directly from wildlife. Under this legislation, land holders are encouraged to maintain and increase wildlife populations because they retain the benefits of sustainable use of that wildlife.**

- **<u>Elephant Management Plan</u>: Elephant are managed according to the Zimbabwe National Elephant Management Plan (2015-2020). The plan incorporates specific action items, deliverables, deadlines, and responsible parties. It is an adaptive management plan utilizing prioritization of targets measured by key components, strategic objectives, and outputs. The plan focuses on five major components: Protection and Law Enforcement; Biological Monitoring and Management; Social, Economic, and Cultural Framework; Building Conservation Capacity; and Program Management. The National management plan is supplemented by four regional plans that utilize the same framework to address the unique challenges for each major elephant range in Zimbabwe. Zimbabwe's elephant management planning process was kicked off by the FWS' elephant trophy import suspension. ZPWMA held a year of stakeholder planning workshops, including a preparatory meeting of representatives from CAMPFIRE in November 2014; a national elephant management planning workshop in December 2014; an elephant management planning and anti-poaching workshop in Mana Pools (Zambezi Valley range) in March-April 2015; an elephant management planning workshop in the Sebungwe range in May 2015; and an elephant management planning**

workshop in the South East Lowveld range in September 2015.

ELEPHANT HUNTING IN ZIMBABWE GENERATES CONSERVATION BENEFITS THAT SATISFY THE "ENHANCEMENT" STANDARD: Although hunting offtakes are negligible, elephant hunting fees create extensive conservation incentives in Zimbabwe.

- **Habitat: Hunting areas in Zimbabwe represent ~130,000 km² of protected habitat. This represents over four times the size of Zimbabwe's National Parks (~28,000 km^2). Healthy elephant populations require large tracts of habitat; the areas set aside for regulated hunting are therefore essential to the elephant's continued survival.**

- **Management and Enforcement Revenues: Revenues generated from tourist hunting conducted on state lands comprised approximately 20% of ZPWMA's revenue stream in 2014. Over $6.2 million in trophy fees came from elephant hunts, with $5 million accruing to ZPWMA to reinvest in elephant protection and species management. Over 50% of that revenue came from U.S. clients. Almost 80% of ZPWMA's operating budget is allocated towards law enforcement in the form of staff costs and patrol provisions. ZPWMA employs 1,500 active field rangers. Put simply, hunting revenues support anti-poaching efforts across Zimbabwe's elephant range—and this is largely paid for by American elephant hunters.**

- **Operator Anti-Poaching: In addition to supporting ZPWMA's enforcement capacity, hunting operators deploy their own anti-poaching units to police the Safari Areas and fund community game scouts in CAMPFIRE Areas. For example, a small sample of 14 individual operators surveyed by the Safari Operator Association of Zimbabwe spend $957,843 on anti-poaching in 2013 and deployed 245 anti-poaching scouts. One specific operator, Charlton McCullum Safaris (CMS) in the Dande Safari Area and Mbire Communal Area, spends on average $80,000-$90,000 in patrol and equipment costs and anti-poaching rewards. From 2010 to 2016, CMS' efforts led to an 82% decline in elephant poaching in an import border region. As another example, the Save Valley and Bubye Valley Conservancies together spend over $1 million on anti-poaching each year. These anti-poaching efforts are funded predominately by hunting revenue, and protect stable populations of elephant and the third-largest black rhino population in the world.**

- **Regional Anti-Poaching: According to the CITES "Monitoring the Illegal Killing of Elephants" (MIKE) program, poaching in the Southern African countries that allow regulated tourist hunting, including Zimbabwe, is lower than anywhere else on the continent and has never reached an unsustainable level. This stands in stark contrast to the West and Central African countries that do not rely upon tourist hunting as a conservation tool.**

- **Community Benefits: Zimbabwe's CAMPFIRE program is the pioneering community-based natural resource management program in Africa. The program allows rural communities to financially benefit from wildlife, thereby incentivizing the use of communal land as wildlife habitat, and the protection of wildlife in the form of increased tolerance of destructive wildlife. An estimated 77,000 households rely on CAMPFIRE benefit from CAMPFIRE. 90% of CAMPFIRE revenue is generated from regulated hunting, and 70% of this comes from elephant hunting. Thus, prior to the import suspension, elephant hunting generated over $1.6 million per year for CAMPFIRE communities and was reinvested in the construction of classrooms and clinics, the installation of water infrastructure and solar powered facilities, the purchase of vehicles for anti-poaching support, compensation for destruction of crops or livestock by dangerous game, and other benefits that improve the livelihoods of the rural communities living in CAMPFIRE Areas. These benefits offset the damage caused by game species: from 2010 to 2015, elephant destroyed 7,495 hectares of crop fields in CAMPFIRE communities and claimed the lives of approximately 40 people.**

ELEPHANT MANAGEMENT IN ZAMBIA IS UP-TO-DATE AND GENERATES SUBSTANTIAL BENEFITS TO ENCOURAGE RECOVERY OF THE SPECIES

- **Governing Law: The Zambian Wildlife Act No. 14 of 2015 is the guiding legislation for elephant protection and management. This cutting-edge law consolidated the prior wildlife authority into a government Department of National Parks and Wildlife (DNPW), to address the funding concerns and shortfalls experienced by the prior authority. DNPW is made up of a Wildlife Law Enforcement Unit with over 1,250 rangers; a Conservation Unit; an Infrastructure Development Unit; and a Community-Based Natural Resource Management Unit to oversee the development of conservation planning in Game Management Areas.**

- **Management and Enforcement Revenues: Between 2010 and 2012, regulated hunting revenues accounted for approximately 32% of the operating budget funding for Zambia's wildlife authority. With a potential to generate nearly $1 million in elephant hunting fees, in 2015 and 2016, these fees totaled only $150,000, due mainly to import restrictions. This amount was divided between DNPW and the Community Resource Boards in Game Management Areas (GMA). DNPW uses this revenue for range salaries and resource protection, as well as management surveys, staff training, and other activities. Approximately 75% of DNPW's expenditures are for anti-poaching, and Zambia's Wildlife Law Enforcement Unit conducted over 10,500 anti-poaching patrols in 2015, involving an average of 5,878 staff per quarter and 237,028 patrol days.**

- **Habitat: Hunting areas in Zambia (~180,000 km²) provide almost three times the amount of protected habitat compared to the country's National Parks (~64,000 km²).**

- **Community Benefits: In GMAs, elephant license fees are divided equally between the DNPW and the GMA's Community Resource Board, and 20% of concession fees also accrue to the Board. In 2015 and 2016, approximately $1.36 million in hunting fees was distributed to the Boards, as well as $10,000 per concession paid by the hunting operator. Under the new Wildlife Law, Boards must invest those funds as follows: 45% towards wildlife protection and patrols, 35% towards community improvement projects such as construction of schools, clinics, and water infrastructure, and 20% towards administrative costs. Written concession agreements between the operators, DNPW, and the community Boards usually obligate the concessionaire to make further communities investments, such as constructing a classroom and paying a teacher's salary. Operators in 13 blocks were obligated to spend over $1.1 million in community infrastructure development and 3.4 million in community lease and other payments for the duration of their leases.**

- **Game Meat Distributions: Moreover, under Zambian law, at least 50% of harvested game meat must be donated and distributed to local communities. A 2015 study found that operators in three GMAs contributed an average of 6,000 kilograms of harvested meat per season, and estimated that operators across all GMAs could provide ~130 tons of much-needed protein annually. This reduces the incentive for bush meat poaching in these areas bordering and buffering Zambia's National Parks.**

- **Operator Anti-Poaching: Hunting operators' concession agreements with DNPW and the Community Resource Board identify mandatory anti-poaching obligations and expenditures. At present, 75 Boards employ over 750 wildlife scouts and 79 support personnel, at a monthly cost of over $38,800. Those scouts are paid for by revenues from tourist hunting. A small sample of four operators spent over $201,000 on anti-poaching in 2015, to fund community scouts and fund and equip their own operator anti-poaching teams. This anti-poaching support is largely paid for by U.S. hunters, as over half of all hunting clients in Zambia are from the U.S.**

[Note: Supporting documents for each of these points is available by contacting Conservation Force, cf@conservationforce.org. These Talking Points largely rely on the responses of ZPWMA and DNPW to FWS information requests and supporting documents provided as part of those responses as well as individual hunting operator enhancement reports, reports of the CAMPFIRE Association, and publicly available IUCN documents.]

Dear Greg,

I hope this email finds you well and you had has a safe trip back home. It was good to see you. This communication is additional information to the several discussions that we had in Tanzania. The Zimbabwe Government had a meeting with Dan Ashe of USFWS at the CITES CoP 17 in Johannesburg, South Africa.

During the meeting USFWS highlighted that they need two additional documents for them to make a decision on the elephant trophy suspension. The additional information/documents was on prioritization of activities and implementation of the elephant management plan and the second document was on community benefits from elephant trophy hunting. All these documents were submitted within the agreed time frame, but we did not get any response. The Zimbabwe delegation understood that once this information was sent to the USFWS we will certainly get a positive response on the suspension of import of elephant trophies into the US.

Let us know if you need any additional information from Zimbabwe on elephants. In the meantime i will share a video with Zimbabwe elephant facts via WhatsApp. **Please bear in mind that the elephant off take in Zimbabwe is negligible in biological terms. How can the harvest of 100 elephants endanger a population of 83 000? This low off take generate crucial revenue for livelihoods of poorest if the poor in the country and conservation work for the government.**

Kind wishes

Rose

Conservation Force has worked on the lifting of the Zimbabwe suspension every day since it was imposed including the filing and supporting of every import permit application and funding Zim's new national and four regional elephant management/action plans, national elephant coordinator, etc. Bad news for Zimbabwe and Zambia elephant budgets. What is really wrong here is both countries were promised the lifting of the suspension (not ban) by FWS at CITES CoP 17 in Joberg before Trump even took office! Bad news for the 777 K families in CAMPFIRE. Bad news for ZIMPARKS which is a parastatal earning most of its income from regulated safari hunting. The irresponsible permitting delay has been caused by the change of administration and the CITES listing of Rosewood that has wholly consumed the FWS Permitting Office. The suspension is a problem that needed fixing not more delay. John J. Jackson III

elephant positive enhancement finding

Mroczkiewicz Steve USDM <steve.mroczkiewicz@syngenta.com>

From:	Mroczkiewicz Steve USDM <steve.mroczkiewicz@syngenta.com>

Subject:	elephant positive enhancement finding

Dear Mr. Sheehan,

I've been an avid supporter of President Trump and his administration and have been very pleased by many of his and his administration's actions, among them the original acceptance of the positive enhancement finding made by the USFW for Zambia and Zimbabwe elephant. So I was greatly concerned and disappointed when I heard of the possible block to this action.

I am a lifelong hunter and a Ph.D. scientist. I have modest financial means and will never travel to Zambia or Zimbabwe to hunt elephant. In fact, I'm not sure I would want to even if I could afford it. As a hunter and conservationists, however, I fully support those who have the means and desire to hunt any species that can benefit from hunter-generated revenue and sound wildlife management principals. These elephant populations clearly fit that model.

As a scientist I have been dismayed over the last several years at the number of enormously important decisions made in the name of science while flying in the face of science. The listing of polar bears due to something that could theoretically happen, years in the future, according to computer climate models, was perhaps the pinnacle of emotional and anti-science management decisions. As a scientist, it offended me. You are no doubt more aware than I how many similar examples have occurred in recent years, so I'll refrain from listing more of them. But if the scientific community is going to stand up to policies with far-reaching implications that are based upon emotion while ignoring science, it must include issues within the realm of wildlife management and not just climate change, fuel exploration, etc. Science does not and never should have favorite causes.

Please express my gratitude to President Trump for the strides he's made thus far, including installing an administration that accepted the positive elephant enhancement finding. Please also do whatever you can to see this through.

Respectfully,

Steve Mroczkiewicz, Ph.D.
Attica, IN

Elephant imports

"William L. Shores" <lshores@shorescpa.com>

From:	"William L. Shores" <lshores@shorescpa.com>

Subject:	Elephant imports

Good day sir.

I am writing to express my support for allowing the the import of elephants parts from Zimbabwe and Zambia.

I believe that any action to deny the import of these animals legally taken by sport hunters from these countries is showing an arrogance by the United States indicating that we, in the US, know more about management of elephants in those countries than the people in this countries know. How would we feel if Africans met to determine how species here in the US should be managed? What if they were telling us how to manage, for example, white-tailed deer? It would be absurd. It is equally absurd that we are attempting to do the same thing to them.

I am a veteran of many safaris, 25 to be exact. I have witnessed first hand the benefits of sport hunting. Let me briefly summarize:

1- Locals are employed by the safari companies.
2- Money from the safaris companies are used to help build school, clinics, roads, water holes, etc.
3- Anti-poaching units are employed by the safari companies . These patrol on a daily basis. Where these are present, poaching of wildlife is GREATLY reduced. I have personally seen the piles of snares, gins traps, etc that these units have collected in their patrols. It is amazing. Actually shocking.
4- Meat taken from sport hunted animals is distributed amount the local villages thus reducing the incentive for them to poach.

It is interesting that once one leaves a safari area and crosses into an area where no hunting is allowed, the Africans have killed virtually every living thing. I have seen this time and time again in the 29 years I have been going to Africa. Hunters and their dollars are the ONLY thing protecting the wildlife of Africa.

Make no mistake, it is POACHING that has reduced Africa's elephant populations not legal sport hunting.

There is a substantial amount of rhetoric surrounding the current U.S. administration's looming decision on the import ban applying to elephant and lion trophies. A lot of this rhetoric is based up emotions , not facts and is coming from those who do not understand Africa or African issues. As a result, I am taking this opportunity to summarize the guiding principles influencing sustainable and ethical hunters.

First and foremost, I support and advocate for the sustainable and ethical use of wildlife – utilizing wildlife's inherent value in the most pragmatic manner to promote wildlife conservation. I believe I am qualified to speak on this issue because I have spent a substantial portion of my life researching and supporting conservation issues around the world. I am heavily involved in conservation issues right now. In fact, I am an officer and board member of a conservation organization with projects in several African countries right now. Those projects are in Uganda, Congo, Zimbabwe, Mozambique and South Africa. These projects include many species including species that are not now and never will be sport hunted. For example, we are supporting the Lwiro Chimpanzee Reserve in the Congo.

It is critically important (and reasonable) to understand that there is a vast difference between poaching and legal hunting performed in a sustainable and ethical manner. Like all conservationists, I abhor poaching and poachers and everything they represent. I likewise abhor non-sustainable and unethical hunting. I only support sustainable and ethical hunting and I sincerely believe that hunting that follows sustainable and ethical principles can be an incredible conservation tool. It has been estimated that sport hunting areas extend over 1.4 million square kms in Africa; that is approximately 22% more land than is covered by national parks in Africa. Much of the sport hunting areas rely on sport hunting as their sole "land use." It is unclear how much of that land could be viable converted to solely photographic or non-consumptive tourism. Having been to many of these areas, I cannot imagine that many of them would appeal to the photographic types. They are too remote and too rough. However, if we arguably give up hunting in those areas, some other economic activity must replace the hunting activities in order to sustain the local countries and communities. It would indeed be ironic to lose 1.4 million square kilometers of wildlife land and eliminate wildlife to make room for crops and domestic livestock – cattle being the most common large animal on the planet by far. They roam in the millions across landscapes that were once wild and teeming with wild game.
Perhaps as bad, if not worse, are crops. The Africans clear the land of EVERYTHING. They plant for a year, two at the most. After that, they move to another parcel and repeat the same thing. Africa is being decimated by these practices WHERE HUNTING IS NOT ALLOWED. Why not instead support sustainable and ethical hunting that in turn promotes animal conservation in areas where wildlife is abundant (and in some cases overpopulated – such as is the case with elephants in Zimbabwe & Botswana). Additionally, hunting activities can and do feed people in local communities as noted above. Therefore hunting activities provide for both feeding local populations and supporting and promoting the inherent value of wildlife populations. I can send you pictures and videos of the locals Africans taking ALL of the meat from elephants that have been harvested. They take EVERYTHING. In may cases, it is the only sources of protein that they have. I am more than happy to do this. One memorable experience that I have is of an African male swimming across the Zambezi river (a river loaded with crocodiles) to get a piece of elephant meat the size of a fist. He was that protein starved that he would risk his life for a small piece of meat. People here in the US do not realize that Africa is far different than here. In the bush, there are no grocery stores or restaurants. Wildlife is where the majority of their protein comes from.

I therefore ask that each of you consider the following premises:

1. The Inherent Value in Wildlife Is a Conservation Tool –
Where geographic sub-regional wildlife populations exist in healthy and sustainable numbers, sustainable and ethical hunting practices support and promote the inherent value that exists in wildlife. This result is due to the economic influx generated by the financial outlays expended by hunters that have a direct, significant and immediate impact on the local countries and communities in which wildlife exists. This inherent wildlife value promotes continued conservation initiatives and efforts at the grassroots, local governmental and international NGO levels. It is critical, however, that the hunting activities are supported by scientifically researched and competently-executed conservation practices that focus primarily on wildlife population health and sustainability. In Africa, they have a saying that is universal,"if it pays, it stays."

2. Elephant Populations Are Not Equally Distributed – The African continent (Africa) is composed of 54 different countries and many diverse habitats and ecosystems. There are, in fact, geographic areas in Africa whose elephant populations have been poached to the brink of local extinction (also known as extirpation). Comparatively, many other geographic sub-regions in Africa (especially in many southern African countries) contain successful and thriving elephant populations – in fact, in certain regions these Elephant populations are overpopulated/overcrowded to the point where the local ecosystem cannot adequately support the elephant populations. Consequently, any reasonable person must at least consider maximizing the conservation value of such populations by benefiting the communities and countries which they inhabit. By providing value to the local countries and communities in which elephant populations thrive, elephant populations become inherently valuable assets to those countries and communities and therefore encourage conservation efforts for the benefit of those elephant populations – this model is equally applicable to all wildlife populations. There are areas that I have personally been to in Botswana and Zimbabwe that are severely overpopulated with elephants . They are destroying everything. In fact, some ecosystems are being altered forever having a huge negative impact on the species that live there, not to mention the crop damage they do.

3. No Meaningful Reduction in Legal Hunting Practices – The ban on elephant imports into the United States does not meaningfully change how many elephants are hunted in legal hunts. It does however, reduce the revenue generated to the local countries and communities in which the elephant populations live, thereby reducing the population's inherent value to those local countries and communities and thusly negatively impacting conservation efforts that support those elephant populations. Consequently, any reasonable person must at least consider maximizing the inherent value of elephant populations by supporting legal, sustainable, and ethical hunting as a viable conservation alternative that has yielded successful results in Europe, the United States, and many other regions in the globe.

In addition, I would like you to consider the following facts:

1- Zimbabwe has the second largest population of elephants in Africa at approximately 82,000. in 1900, it is estimated that Zimbabwe had 4,000 elephants. The current population is DOUBLE the targeted population for the country. It is 40% larger than when the FWS (in 92) determined to maintain the "threatened" listing under the ESA and 20% larger than the last time the FWS made a positive enhancement finding (in 97) prior to the 11.17 determination.

2- The hunting of elephants results is miniscule off takes of elephants annually. The annual quota is 500 bulls. This is not even enough to stop the already drastically over populated species from continuing to increase the population. While the percentage of the population of elephants taken by sport hunters varies by year, it is always less than 1/2 of 1%.

3-Zimbabwe's elephant management is governed by appropriate legislation and a state of the art management plan guided by some of the formost experts in the world.

This has gotten a lot longer than I intended and I have more to say . Accordingly, I will not delve into Zambia.

What does this mean to the people of Zimbabwe? Why don't you see for yourself? The follow is a recent press release on this matter:

"CAMPFIRE ASSOCIATION PRESS STATEMENT ON LIFTING OF THE SUSPENSION OF ELEPHANT TROPHY IMPORTS INTO AMERICA

Zimbabwe's Community Areas Management Programme for Indigenous Resources

(CAMPFIRE) hails the recent decision by the United States Fish and Wildlife Service (USFWS) to lift the suspension of elephant trophy imports into the United States of America. We encourage the USFWS and the President of the United States to stand by the decision to issue import permits for sport-hunted elephant trophies.

Trophy fees and meat from elephant incentivize CAMPFIRE communities to dedicate land as habitat for elephant and other wildlife. U.S. citizens represent the largest share of CAMPFIRE hunting clients. CAMPFIRE communities have been negatively impacted by the suspension of trophy imports, and we look forward to increased benefits, and therefore additional conservation incentives, with the lifting of the suspension.

CAMPFIRE enables local communities, especially those residing in areas where the level of human and elephant conflict is high, to benefit from wildlife through sport hunting. Since the suspension of elephant trophy imports in 2014, CAMPFIRE Association has cooperated fully and worked closely with the Zimbabwe Parks and Wildlife Management Authority to provide the necessary information required by USFWS, and also participated in the development of a national Elephant Management Plan. Hunting generates about 90% of CAMPFIRE income, with elephant hunting contributing up to 70% of annual income. American hunters make up 60% of the clients in CAMPFIRE areas.

CAMPFIRE has a combined 2.4 million beneficiaries, made up of 200,000 households that are directly involved in the program. Another 600,000 households benefit indirectly from social services and infrastructure supported by wildlife related income. The size of wards that make up CAMPFIRE is approximately 50,000km2 or 12.7% of the country, which is roughly equivalent to the size of the National Parks estate. Under CAMPFIRE, based on voluntary interest in participation by local communities, wildlife is found on land outside national parks. By choice, these communities and their Rural District Councils (RDCs) maintain varying sizes of land free from subsistence and commercial agriculture, or other economic activities such as gold panning and mining that negatively impact on wildlife management and the conservation of natural resources. CAMPFIRE is therefore making significant contributions to the protection of between 2 and 3 million hectares of land in Zimbabwe. Reports by Safari Operators under CAMPFIRE show that the suspension of elephant trophy imports in 2014 resulted in the cancellation of 108 out of 189 (57%) elephant hunts booked by US citizens. This translated to a sharp decline in income to the CAMPFIRE programme from US$2.2m in 2013 to an average US$1.7m in 2014 through to 2016, putting the conservation of elephant in these areas at huge risk.

As recognized in the recent USFWS enhancement finding, the sharing of CAMPFIRE income has been satisfactory. An audit of CAMPFIRE income at community level for the period 2010-2015 was submitted in 2016 to USFWS to support the positive finding. At district level, wildlife income is used for administration, field patrols, monitoring of hunts, problem animal control, water provision, and fire management. Communities have drilled boreholes, constructed seasonal roads, erecting of fencing to keep out wildlife, purchase of tractors, and direct purchase of drought relief food. Children benefit from reduced walking distances through the construction of schools, procurement of learning materials, and payment of school fees from CAMPFIRE proceeds. Communities also benefit from meat in excess of the requirements of safari hunting operations, and from problem animal control.

Annual hunting quotas are granted based on the relative density of elephants in the neighbouring protected areas and those residing in the CAMPFIRE areas. The national trophy hunting quota is set at 0.3 – 0.5% of the overall population to maintain trophy quality at approximately 35kg (77lbs). The quality of hunting in CAMPFIRE areas remains good, and this is confirmed by repeated hunter arrivals each year, among other indicators. Zimbabwe's population of the African elephant, Loxodonta africana, is healthy and remains on Appendix II under the Convention on International Trade in Endangered Species of Wild Fauna and Flora (CITES). The IUCN Species Survival Commission's African Elephant Specialist Group (AfESG)'s 2016 estimate of Zimbabwe's elephant population is around 83,000.

CAMPFIRE Association objects to the ill informed press reports and releases against the lifting of the suspension, including appeals to US authorities for its reinstatement. CAMPFIRE Association supports the lifting of the suspension, which will benefit our participating districts and wards. The sharing of hunting income creates a real incentive to protect elephant and other game species, even when these species negatively impact people living in CAMPFIRE areas. 139 people in CAMPFIRE areas have lost their lives from wildlife attacks, including elephant, since 2010. Over 7,000ha of crops were destroyed by elephant between 2010 and 2015 in 10 CAMPFIRE districts. With the minimum cash value of maize at US$180/ton, the approximate loss to communities is between US$500,000 – US$1.0 million. These losses are endured by communities living in areas highly prone to drought and low rainfall, making the impact even more acute. Despite these losses, the poaching of elephant in CAMPFIRE areas is relatively low, with only 38 elephants poached since 2016 to the present. Effective local level anti-poaching operations through CAMPFIRE have resulted in the decline in elephant poaching in Mbire district from a peak of 40 cases in 2010 to only 5 so far in 2017.

The sustainability of hunting as a conservation tool, and its contribution to rural livelihoods is a reality in Zimbabwe. CAMPFIRE Association urges all conservationists, animal lovers and all institutions interested in the protection of wildlife to respect the livelihood choices of African communities, and to acknowledge that the protection of wildlife from poaching and illegal wildlife trafficking is more effective when rural people are allowed to exercise multiple options for the sustainable use of wildlife that they live with.

For more information, please contact:

Charles Jonga,

Director of CAMPFIRE Association,

Mukuvisi Woodlands, Harare, Zimbabwe.

Email: campfire@ecoweb.co.zw, Website: www.campfirezimbabwe.org”

Sir, this was not a political decision. All information necessary to make the decision to reinstate the imports was given the the FWS BEFORE the elections. The FWS asked for nothing else. The decision could have been made before the election.

I know the people against the imports mean well. However, in reality, people like them are going to be the downfall of all African wildlife. I respectfully request that you allow the imports to continue .

Thank you for your time. As noted earlier, I am happy to provide any information which may help you.

Deputy Director Sheehan,

I just want you to know that I support the US Fish and Wildlife Service finding to allow import of elephant trophies from Zimbabwe and Zambia. That finding was based on science and not emotion. I appreciate the members of the FWS who worked on this finding and their courage in following facts and not emotion.

Appreciate your hard work to restore freedom and sustainable use to our National Parks and Forests across this great land of ours.

Adios,

Tim

Elephant and Lion Importation into the USA

Keith Atcheson <keith@atcheson.com>

From:	Keith Atcheson <keith@atcheson.com>
Sent:	Wed Nov 22 2017 13:54:20 GMT-0700 (MST)
To:	(b) (6) @fws.gov" <(b) (6) @fws.gov>
Subject:	Elephant and Lion Importation into the USA

Dear Mr. Sheehan,

I'm writing to ask for your support in allowing elephant and lion trophy importation from Zimbabwe and Zambia for American hunters.

Our business has sent thousands of hunters to African countries for over 50 years and I've personally completed over 50 safaris myself. I believe we are very qualified and truly understand the African model of hunting, conservation, preservation and how it works. African countries do not enjoy the North American Conservation model that are funded nicely by hunters and fisherman buying licensing and sporting equipment under programs like the PR Act and others.

Africa is quite the opposite. There is no middle class. Most residents cannot own firearms or buy licenses to go hunting because the possibility does not even exist. Most areas that support healthy elephant and cat populations are heavily financially supported by worldwide hunters that pay large daily rates and trophy fees to local governments, communities, outfitters, guides, professional hunters etc… American hunters are a majority of this funding. These funds support local conservation and anti-poaching programs that actually teach people not to poach and give a value to game animals that live in areas where they co-exist with humans. It raises money for trained game guards and small game departments. Funds are also allocated to help with rural schools, hospitals and community health clinics.

If hunters are not allowed to import Lion and Elephant back into the USA it will stop many hunters from going in the first place and its extremely damaging to the very species we are all trying to protect. The anti-hunting community contributes 0 dollars into conservation and preservation of many worldwide species.

Please encourage Director Zinke and President Trump to consider the greater good for the species we all love and continue importation of well managed species like Elephant and Lion. If our government listens only to the social media hysteria line of the uninformed and ignorant anti-hunting movement it will result in far greater damage to elephant and lion populations and many other species that co-exist symbiotically.

Thank you for your consideration.

Best Regards,

DANDE ANTI POACHING UNIT

Forest Land
National Park
Recreational Park
Safari Area
Mbire District

Introduction

As you probably all know, **Charlton McCallum Safaris** is a hunting operator in the "Dande North" which is in the Mbire District. The concessions are made up of:

Dande North (communal land wards 1 & 2) = 77,500 hectares.
Dande Safari Area (National Parks) = 55,000 hectares.
Dande East (communal land wards 4 ,11,12) = 50,000 hectares
Total **= 182,500 hectares**

79 % of the area is "communal land" with a core National Parks concession. All this we operate in a genuine partnership with the council and communities under the CAMPFIRE program.

Because of:

1. People living in the area.
2. The sheer size of the Mbire district and
3. The huge and porous borders between Zimbabwe, Mozambique and Zambia.

We face a much, much larger challenge than most. For our district the CAMPFIRE model simply has got to work. People MUST get FAIR value for their game, or all is lost. So our anti poaching and conservation efforts are under pinned by:

1. Strong administrative, legal and financial i.e. we make sure that all hunting proceeds are correctly channeled into producer ward accounts.
2. Strong Sustainable Trophy Hunting Program – through adaptive quota setting and adherence to the Parks and Wildlife Act and Industry code of conduct.
3. Strong Conservation benefits – early burning, roads, anti poaching, general stewardship.
4. Strong Social benefits – transparent on-time payments, employment and meat distribution.

 # 1 Administrative, legal and financial.

At Charlton McCallum Safaris, we have always prided ourselves at being strong in the administrative, legal and economic departments.

All of our professional hunters are members of ZPGHA, CM Safaris is a paid up member of SOAZ and Myles McCallum has served on the SOAZ executive committee for 4 years.

It is extremely important to get all the administrative, legal and economics' of sport hunting correct, because ultimately the animals have to be worth money to all stakeholders in order to have broad buy in. The stakes are high for all parties to get the anti poaching and general best management practices right, as this reflects directly into the bottom line profit and thus makes it much, much easier to get everyone pulling in the same direction.

Please see slides showing distribution of revenue to Wards, National Parks, Council, ZTA and Campfire Association.

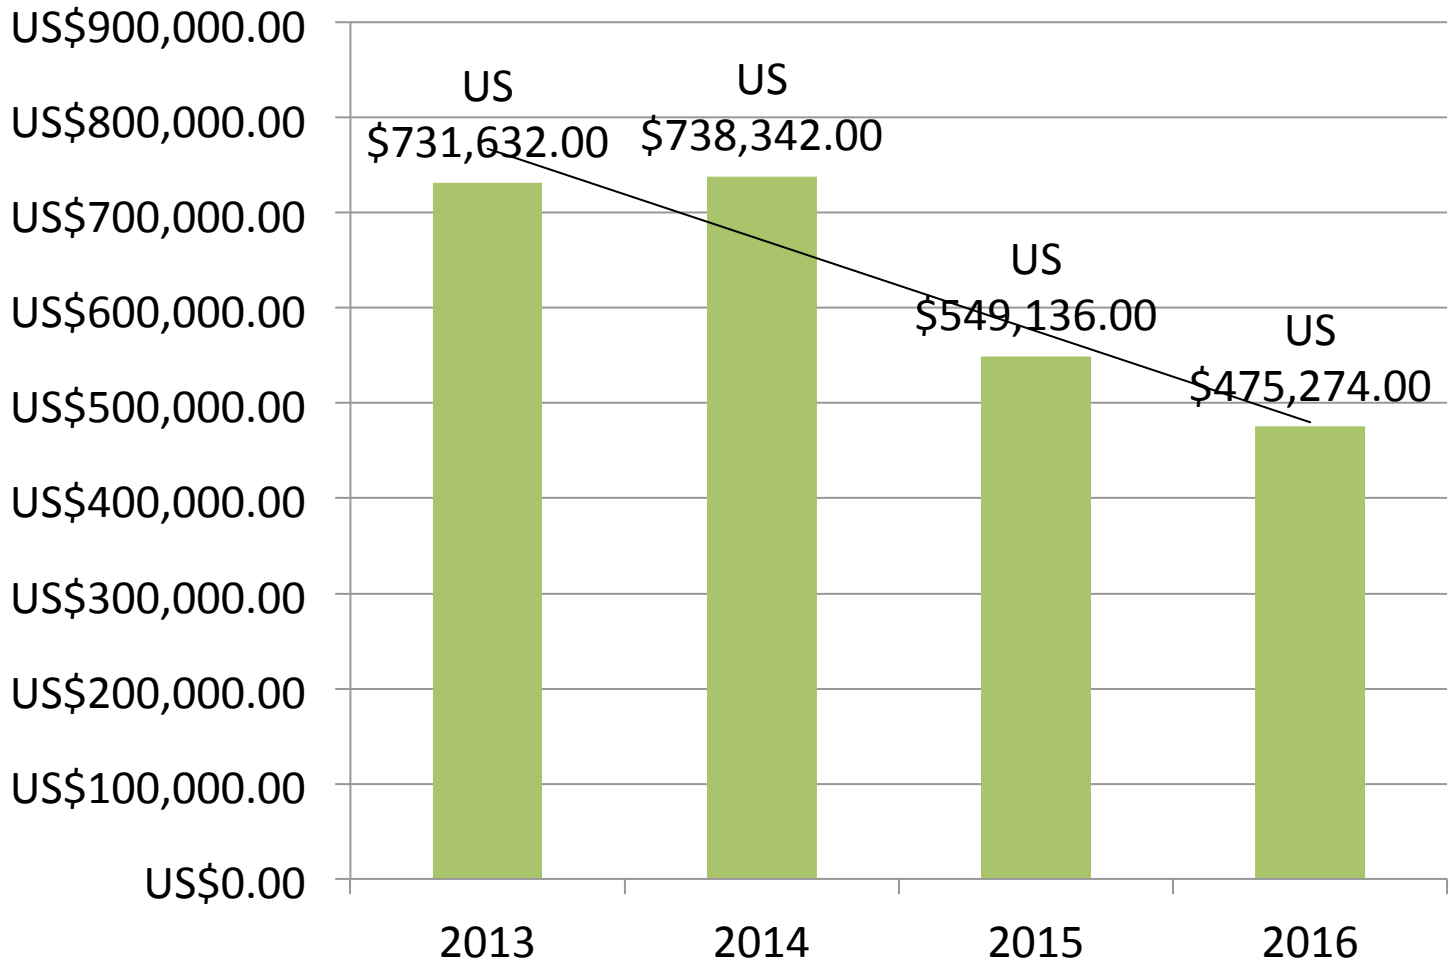
Four year earnings in US$ Dande – decrease due to USFWS elephant and lion bans.

Note 36% decrease in earnings in 2016 compared to 2014

Note combined loss in revenue $452,274.00 2015 and 2016 combined



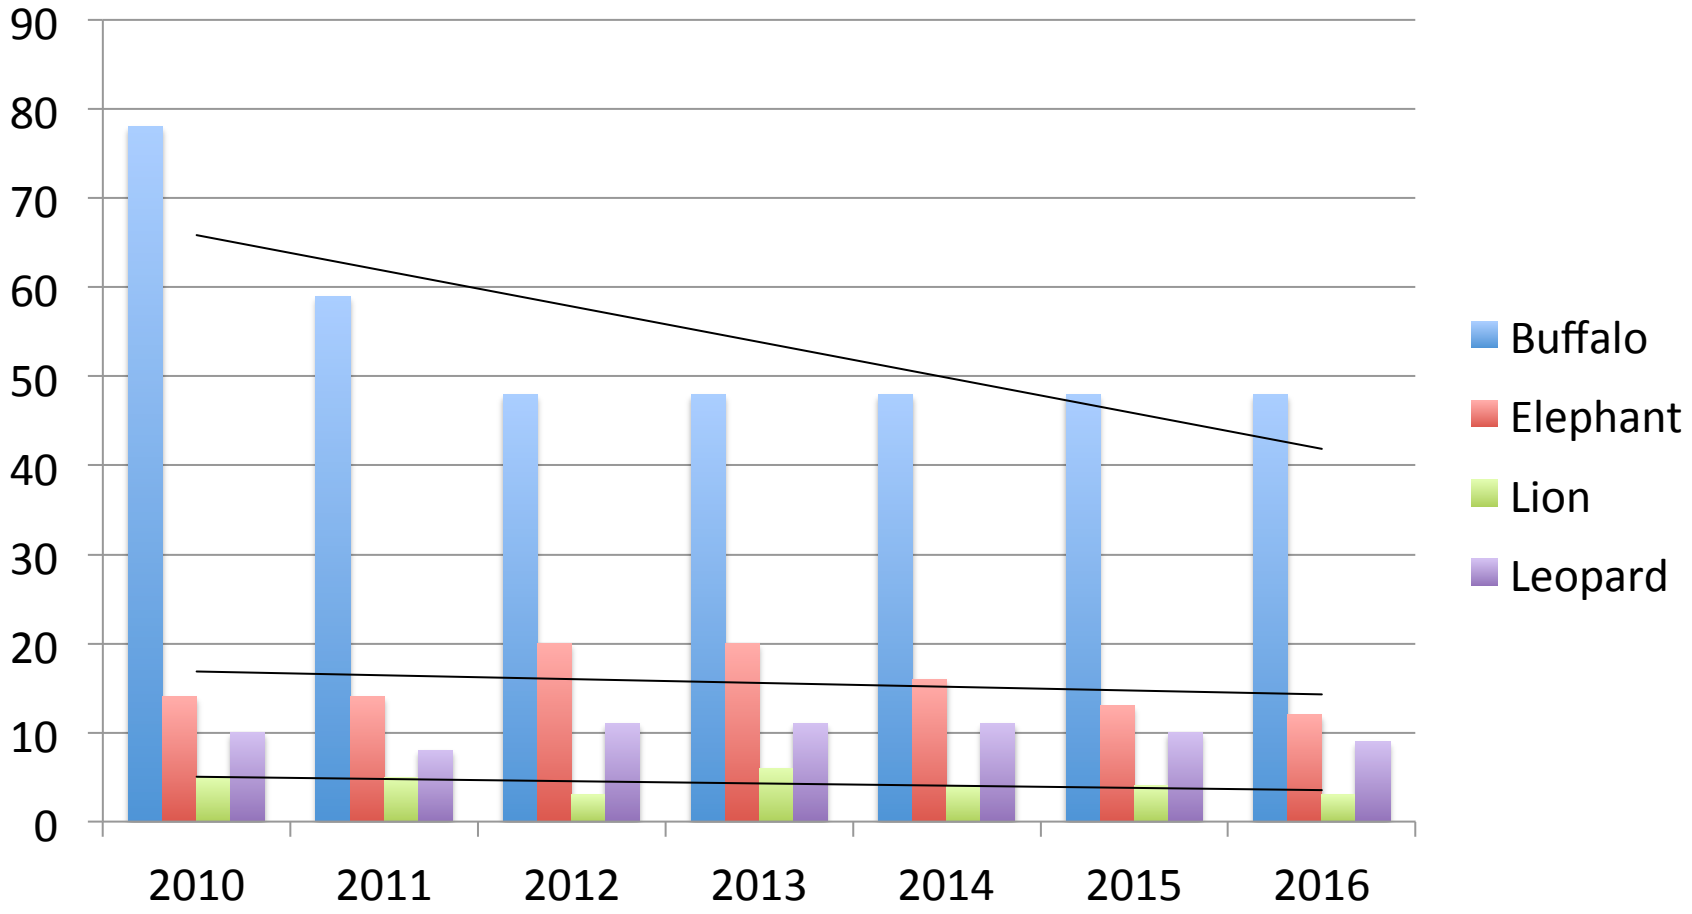
2 SUSTAINABLE HUNTING PROGRAM
(Adaptive quota setting)

Zimbabwe uses an *"adaptive quota setting system*". Information is collected annually at different levels at workshops, and is fed into the national plan. At the end of this, the government of Zimbabwe issues a "sport hunting quota "per area.

1. Ward quota setting – information is collected at ward level amongst the villages.
2. Company quota setting – CM Safaris collects information from scouts, staff and professional hunters.
3. District quota setting – information from ward and company quota setting is fed into the District plan.
4. Provincial quota setting – The results from the Mbire district quota setting feeds into the Provincial plan at the quota setting workshop.
5. National quota setting – this is done by provincial ecologists from National Parks in conjunction with the Ministry of Environment Water and Climate.

All sorts of information is collected – water hole counts, aerial counts, spoor transects, trophy quality trends, trophy ages and it is surprisingly accurate. National parks is able to cross reference numbers from all these different sources.

Sustainable Trophy Hunting Program
(Adaptive quota setting)
Mbire North, Dande Safari Area and Dande East.



3 Social Responsibility and Benefits.

Some of the things that Charlton McCallum Safaris does annually:

1. Pays $67,500.00 per annum to individual wards and council (as per tables above). This money is used per Ward and Council's discretion and must be on a capital project (house, classroom block etc…).
2. Fair and on-time distribution of revenue as per contract (see tables above)
3. Distribution of meat.
4. As per contract, we only employ locals and our annual wage bill is + $110,000 per annum (not listed in any tables above).
5. Attention to Problem animal reports.
6. Financial and physical contributions towards National holidays (Heroes, Independence, Christmas).
7. Contributions to orphans and kids in need.
8. Various sponsorships towards soccer teams and tournaments.
9. Recognition and sponsorship of the local "spirit mediums" as per local culture.
10. Financial and physical help towards main road maintenance.

3 Conservation Benefits

At Charlton McCallum Safaris we pride ourselves on having the very finest:

1. Early burning and fire management.
2. Road maintenance for - ease of access, fire breaks and security.
3. New roads into areas previously unmanaged.
4. Anti poaching – DAPU.
5. Water – dams and boreholes.
6. Cut lines and boundaries to help with zoning.

All of this has meant a real long term improvement in all aspects of the concession – greater game populations, lower poaching and greater community benefits.

Practical anti poaching.

1. Poor rural communities on the **frontline** of elephant and human conflict zones **simply will not tolerate any crop damage and will take the law in to their own hands.** These same communities are what we call **the producer wards** and currently they enjoy the benefits of hunting.

2. Currently the communities in producer wards act as our eyes and ears and actually do not want to see their hunting benefits being depleted by poachers. HOWEVER, if there are no rewards to be had from legal hunting they will in turn actively assist or actually poach those same elephants for reward.

3. The use of **POISON** is a **GAME CHANGER.** Not only are poisons readily available, but also their use is almost risk free from a poachers point of view – silent and supremely efficient . They have an added benefit from a poachers/ disgruntled communities point of view of killing lions, leopards and hyenas too.

DAPU – on the ground operations.

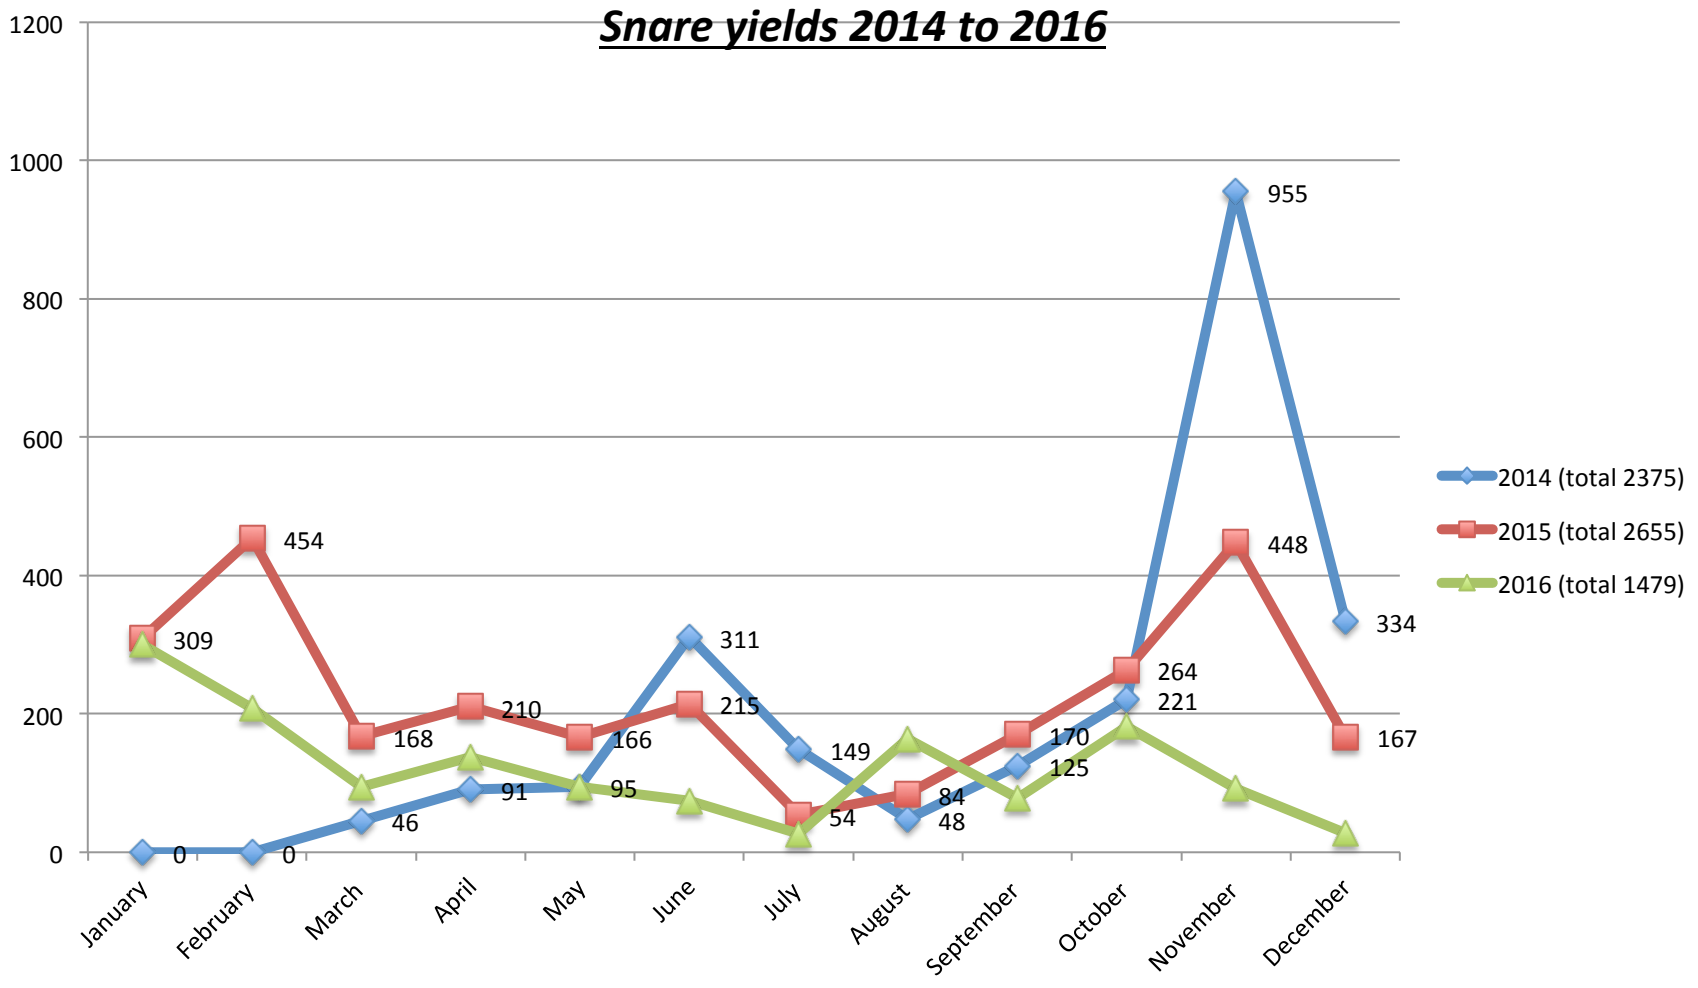
We found when we began in 2010 that the "community scouts" were thoroughly discouraged as often they went up to a year without any pay. Immediately we began support of the community scouts (10 to begin with) in Dande East. The ward paid them half their salary and we paid the other half as well as fed and equipped them. The results were gratifying and almost immediately the poachers were on the back foot and thousands of snares had been picked up and dozens of poachers were arrested.

DAPU has;

1. Two full time "managers" employed.
2. Two dedicated land cruisers allocated.
3. 22 "community scouts" under DAPU control.
4. Access to 18 "Council Scouts".
5. Access to 18 "Parks Rangers".

3 year poaching trend 2014 , 2015 and 2016 (indexed in snares found).

You will notice a gradual downwards trend and also a massive decrease during the hunting season



Elephant poaching statistics (90% accurate)

Biggest Challenges

1. Financial-With by far the biggest area to look after and with the most challenges I am sure I join the list of all other organizations here pleading poverty. We really are under-staffed and short of kit but are doing our best with what we can afford.
2. Short leases – are a challenge as there is little incentive to plough back in to Anti poaching and communities.
3. Meddling foreign politicians i.e the communities and National Parks lost $452,274.00 in 2015 and 2016 (compared to 2014).This is a direct result of the elephant and lion import ban to the USA. We expect a further drop in 2017. All this affects us (who no one cares about) as well as the communities – who people ought to care about. Ultimately at a time when we all need to be spending more money on anti poaching, that ability has been eroded by the EU and USFWS.
4. We have a border with Mozambique of over 100Km's and poaching there is rife and out of control. This directly affects our operations.
5. We have a porous 15km border with Zambia – which is a common threat with other folk here.
6. Human population increases.
7. Often times hugely lenient sentences by the judiciary.

Conclusion

Generally in Dande we are quite pleased with our results. I think especially if one takes into account the immense size of the area and other complicating factors I have already mentioned.

With the help of all our hunting clients, together with DAPU, National Parks and the Mbire RDC we have managed to:

- Keep safe the habitat in key areas.
- Improve game populations by approximately 50 – 100% in seven years.
- Improve the lives of the local people.
- Reduce poaching to an all time low.

All this has been achieved on a sustainable, long term basis. However if the district is to catapult itself into the next category up, then we will need funding for sure. There is huge potential for much greater game populations and that will lead to much better economies long term.

Mr. Greg J Sheehan
Principal Deputy Director, USFW
1849 C Street, N.W.
Washington, DC 20240

Mr. Sheehan,

As the Executive Director for International Wildlife Crimestoppers (IWC), I am brutally aware of the impact of poaching on global wildlife. Unfortunately, I am also aware of the massive negative impact of emotional knee jerk policy decisions that ignore the facts and proven positive effects of science based wildlife management. I won't go into the specifics as your department has already made its determination based on the range country's respective studies as well as your own and because those opposing this determination are basing opposition on emotion verses science.

IWC represents global wildlife law enforcement officers that not only enforce the law, but I can say with surety, each and every one, no matter what part of the world, are committed to seeing wildlife thrive. The law that we are all sworn to uphold is, with few exceptions, based on proven science to the benefit of all. That is how these determinations were made and that is what we support. Being that we represent ALL stake holders we represent a unique moral authority in that our members and associates collectively place their lives on the line every day around the world protecting those resources for all. Therefore, we strongly support the USFW determinations and we ask that you please do not allow these new determinations permitting the importation of legally hunted Elephant and Lion trophies to be reversed or postponed.

Sincerely,

Lewis Rather
Executive Director
International Wildlife Crimestoppers

Subject:	Zambia and Zimbabwe Trophies

Mr. Sheehan,

I write to urge you to renew…allow…and permit the import of elephant and lion trophies from Zimbabwe and Zambia.

I won't bore you with repeating talking points except to say that the evidence is clear that hunting provides real value to the animal populations…and an income to the countries that can't be replaced by tourism, photography safaris and the like.

Without hunting, anti-poaching will dwindle to an ineffective close as the animals disappear.

Without hunting, the animals in Zambia and Zimbabwe will disappear despite the professional management of the herds as documented for USFWS.

I urge your support and actions to allow import of these trophies and close by thanking you for your consideration.

Dear Greg,
I first want to thank you for all you have done and are doing in support of hunters. I have met you before in Salt Lake as a guest of SFW. I was recently at the Congressional Sportsmen Foundation event at Richard Childress's and had the pleasure to meet Secretary Zinke there. Greg, as a hunter I know you care about wildlife and conservation. That said I cannot express to you how important it is to lift the ban on elephant and lion importation. I am writing you from Africa and I can't express to you the excitement from not only the leaders in hunting and conservation but the locals to hear this ban might be lifted. I had a black lady at the airport in Johannesburg praising President Trump when news that the ban might be lifted broke. She was yelling in the airport "Thank you Trump! Thank you trump!" That said, in Africa if animals have no value they are eliminated. If the local people do not benefit from these wild creatures they want them gone. If they receive financial benefit, jobs and meat they tolerate and even protect these great beasts. I can tell you there is not much more of a rewarding thing than to hunt an elephant after days or weeks of hard work then see the smiles and elation on the faces of the locals to get a handful of meat. Or to deliver thousands of pounds of meat to a school or orphanage. I shot an elephant in Botswana in 2009 before they closed hunting. The whole animal was utilized and the next day we were still passing women walking 20 miles away with meat from my bull. Many people try to say photo safaris will take the place of hunting. This is so far from true as most places wildlife inhabit are far removed from the typical scenic tourist destinations. What about the elephants in these remote locations? And no photographer I know will pay $35,000 to $70,000 to take a picture of one elephant.

I am passionate about wildlife and conservation and an avid supporter of this President and administration but I have to say the news President Trump might not reverse this was like a kick to the stomach and I felt extreme disappointment in him for the first time. Please use any influence you have in your power to right this wrong ban that is in place because of emotion and contrary to the scientific evidence that shows these iconic species benefit as a whole from regulated sustainable use conservation through hunting. I will give you another quick example. I was talking with a gentleman today who has several rhinos on his property. He says right now he can't sell the horn. Permits to hunt them are hard to get. So right now the rhino are only costing him money. He is either ready to just get rid of them, shoot them or let poachers shoot them because with no value he can't afford to pay to keep and protect them. Again "if it pays it stays". Please from one passionate hunter and conservationist to another, please work to reverse this ban. And while you're at it, how about polar bears. 😊•

Best Regards,
James

Mr Secretary and Mr Deputy Director,

Below please find a letter from International Wildlife Crimestoppers in support of the recent determination to again begin allowing the importation of legally hunted Lions and Elephants from respective range states. I sincerely hope that you will consider the input from the men and women around the world that protect these resources.

I have also taken the liberty to copy personally United States Senator and Senate Majority Whip John Cornyn of Texas and United States Senator James Lankford of Oklahoma.

Best Regards
Marty Markl

Sent via email 21 November 2017

Mr. Secretary and Mr. Deputy Director,

As the International Liaison for International Wildlife Crimestoppers and as a Director of Texas Operation Game Thief appointed by the Director of Texas Parks and Wildlife, I am brutally aware of the impact of poaching on global wildlife. Unfortunately I am also aware of the massive negative impact of emotional knee jerk policy decisions that ignore the facts and the proven positive effects of science based wild life management. I won't go into the specifics as your department has already made its determination based on the range country's respective studies as well as your own and because those opposing this is are now making this about emotion, not science.

IWC represents global wildlife law enforcement officers that not only enforce the law, but I can say with surety, each and every one, no matter what part of the word, is committed to seeing wildlife thrive. The law that we are all sworn to uphold is, with few exceptions, based on proven science to the benefit of all. That is how these determinations were made, with science, and that is what we support. Being that we represent ALL stakeholders we represent a unique moral authority in that our members and associates collectively place their lives on the line every day around the world protecting those resources for all.

INTERNATIONAL WILDLIFE CRIMESTOPPERS, INC.

Therefore we strongly support the USFW determinations and we ask that you please do not allow these new determinations permitting the importation of legally hunted Elephant and Lion trophies to be reversed or postponed.

I am sure that you are aware of the facts and the falsehoods involved but here are some things to be aware of:

TALKING POINTS IN SUPPORT OF ELEPHANT TROPHY IMPORTS FROM ZIMBABWE AND ZAMBIA

ELEPHANT TROPHY IMPORTS HAVE NEVER BEEN "BANNED," AND THE POSITIVE ENHANCEMENT FINDINGS ARE BASED ON THE BEST AVAILABLE INFORMATION RECEIVED IN 2014-2016

- **There has been no "ban" on elephant trophy imports. In April 2014, the U.S. Fish and Wildlife Service (FWS) "suspended" the import of elephant trophies from Zimbabwe due to a lack of information. Zimbabwe's Parks and Wildlife Management Authority (ZPWMA) responded to two questionnaires from the FWS in April 2014 and December 2014. However, in March 2015, the FWS extended the suspension, finding information was still lacking. The negative enhancement finding dated March 2015 repeatedly affirmed, "The suspension … could be lifted if additional information on the status and management of elephants in Zimbabwe becomes available, including utilization of revenue generated through sport-hunting by U.S. hunters, which satisfies the conditions of the 4(d) special rule under the ESA." In July 2015, May 2016, and November 2016, ZPWMA responded to additional FWS questions. The November 2017 positive enhancement finding is based on these later responses and thousands of pages of supporting documents, including Zimbabwe's National Elephant Management Action Plan, 2014 countrywide elephant population surveys, 2014-2016 actual and projected budget data, 2014 and 2015 offtakes and 2016 quota data, 2014-2016 CAMPFIRE data, and much more.**

- **Issuing import permits for elephant trophies from Zimbabwe was not a political decision by this Administration. In September 2016, before the election occurred, the FWS had already indicated to ZPWMA that the suspension would be lifted. ZPWMA was told by the Chief of Permits that the FWS needed "only one more piece of information," a prioritization of the new Elephant Management Plan, before the negative enhancement finding could be reversed. That prioritization was provided on November 8, 2016, before the election results were in. At the end of 2016, the FWS should have made the positive enhancement finding, but was admittedly sidetracked by an influx of thousands of new permit applications due to the listing of rosewood (used extensively in musical instruments and furniture) on the CITES Appendixes effective January 2017.**

- **Similarly, there has been no "ban" on the import of elephant trophies from Zambia. In October 2011, the FWS made a positive enhancement finding to authorize the import of regulated elephant hunting trophies from Zambia. However, 2013 and 2014, Zambia's wildlife authority suspended hunting to obtain more current wildlife population information. In 2015, Zambia's government lifted the hunting suspension, and set a conservative quota of 80 elephant. In August 2016, the Chief of Permits sent an email indicating that the**

FWS was trying to issue import permits for elephant trophies from Zambia before the CITES Conference of the Parties in September 2016, based on an April 2015 Non-Detriment and Enhancement Finding the FWS received from Zambia's wildlife authority. However, the FWS ran out of time. At the Conference of the Parties, the Chief of Permits indicated that elephant permits from Zambia would likely issue before the end of the year. Again, because of the new rosewood permits, that enhancement finding was put on a back burner.

ZIMBABWE'S ELEPHANT POPULATION IS THE SECOND-LARGEST IN AFRICA

- **In 1900, it was estimated that Zimbabwe had a national population of 4,000 elephant. Since then, the population has grown to over 82,000 (a twenty-fold increase). The current population is double the target national population established in the 1980s, almost 40% larger than in 1992, when the FWS determined to maintain the Endangered Species Act (ESA) "threatened" listing, and almost 20% larger than in 1997, when the last positive enhancement finding was made (before November 2017). Elephant sub-populations in Zimbabwe are generally considered stable or increasing.**

- **North-West Matabeleland: This population is estimated at 54,000, and is most densely located in Hwange National Park (45,000 elephant). In 1928, the estimated elephant population in Hwange was 2,000.**

- **Sebungwe: This population is estimated at 3,500 and has declined since 2001 due to human population expansion into a previously unsettled area. The human population exploded from 45,000 in 1950 to over 700,000 in 2013, which explains the decline in the elephant population. Due to the expansion of human settlement and unlike other major elephant ranges in Zimbabwe, the habitat in this area is fragmented.**

- **Mid-Zambezi Valley: This area has an estimated elephant population of about 12,000. That population declined since the 2001 countrywide survey, and it is believed the decline is due to cross-border poaching and perhaps, the cross-border movement of elephants during the survey. Anti-poaching is a major component of the Zambezi Valley/Mana Pools Regional Elephant Management Action Plan, and recently the area has been chosen as a CITES MIKES site with an ongoing project.**

- **South-East Lowveld: Most of this population inhabits Gonarezhou National Park, whose population has been growing consistently at 5% per annum over 20 years. This region's sub-population is estimated at 13,000 elephant between the Park, surrounding communal areas, and nearby private conservancies.**

ZAMBIA'S ELEPHANT POPULATION IS STABLE

- **Zambia's elephant population inhabits seven sub-regions covering National Parks and Game Management Areas. According to the 2016 African Elephant Status Report, Zambia's elephant population is estimated at over 21,000. This is generally considered stable over the past 25 years, and is stable compared to Zambia's**

population in 1992, when the FWS determined to maintain elephant as "threatened" listed. However, several population surveys indicating an estimate closer to 30,000 were not included in the 2016 African Elephant Status Report, and Zambia's wildlife authority estimates the country's population at more than 30,000.

ELEPHANT HUNTING OFFTAKES IN ZIMBABWE ARE SUSTAINABLE

- **Zimbabwe maintains a CITES export quota of 1,000 tusks from 500 bull elephants. A national quota of 500 elephants represents only 0.6% of a population of 82,630 elephant. Actual hunting offtakes are considerably lower, have a negligible impact on the overall population rate, and have declined in the past three years due to the import suspension.**

Average Hunting Offtakes 2010-2013 (% of Total Elephant Population): 228 (0.276%)

2013 Hunting Offtakes (% of Total Elephant Population): 258 (0.312%)

2014 Hunting Offtakes (% of Total Elephant Population): 162 (0.196%)

2015 Hunting Offtakes (% of Total Elephant Population): 75 (0.091%)

ELEPHANT HUNTING OFFTAKES IN ZAMBIA ARE NEGLIGIBLE

- **In 2013 and 2014, Zambia suspended regulated tourist hunting to obtain a better sense of national wildlife population trends. In 2015, Zambia set a conservative export quota of 160 tusks from 80 bull elephants. Zambia maintained the quota of 80 elephants in 2016 and 2017. A national quota of 80 elephants represents less than 0.4% of a population of 21,967 elephant. Actual hunting offtakes are negligible and have no impact on the national population rate.**

2015 Hunting Offtakes (% of Total Elephant Population): 3 (0.014%)

2016 Hunting Offtakes (% of Total Elephant Population): 12 (0.055%)

ELEPHANT MANAGEMENT IN ZIMBABWE IS GUIDED BY APPROPRIATE LEGISLATION AND A STATE-OF-THE-ART MANAGEMENT PLAN

- **Governing Law: The Zimbabwe Parks and Wild Life Act provides the regulatory mechanism for ZPWMA and its programs. The Act created ZPWMA as a parastatal authority apart from the central government and established a separate fund, apart from the Central Treasury, to sustain ZPWMA's operations. The Act sets harsh penalties for elephant-related offenses, and was amended in 2010 to impose a nine-year minimum sentence for the first offense of elephant poaching. Under the Parks and Wild Life Act, Rural District**

Councils and other land holders are granted "appropriate authority" to benefit directly from wildlife. Under this legislation, land holders are encouraged to maintain and increase wildlife populations because they retain the benefits of sustainable use of that wildlife.

- Elephant Management Plan: Elephant are managed according to the Zimbabwe National Elephant Management Plan (2015-2020). The plan incorporates specific action items, deliverables, deadlines, and responsible parties. It is an adaptive management plan utilizing prioritization of targets measured by key components, strategic objectives, and outputs. The plan focuses on five major components: Protection and Law Enforcement; Biological Monitoring and Management; Social, Economic, and Cultural Framework; Building Conservation Capacity; and Program Management. The National management plan is supplemented by four regional plans that utilize the same framework to address the unique challenges for each major elephant range in Zimbabwe. Zimbabwe's elephant management planning process was kicked off by the FWS' elephant trophy import suspension. ZPWMA held a year of stakeholder planning workshops, including a preparatory meeting of representatives from CAMPFIRE in November 2014; a national elephant management planning workshop in December 2014; an elephant management planning and anti-poaching workshop in Mana Pools (Zambezi Valley range) in March-April 2015; an elephant management planning workshop in the Sebungwe range in May 2015; and an elephant management planning workshop in the South East Lowveld range in September 2015.

ELEPHANT HUNTING IN ZIMBABWE GENERATES CONSERVATION BENEFITS THAT SATISFY THE "ENHANCEMENT" STANDARD: Although hunting offtakes are negligible, elephant hunting fees create extensive conservation incentives in Zimbabwe.

- Habitat: Hunting areas in Zimbabwe represent ~130,000 km² of protected habitat. This represents over four times the size of Zimbabwe's National Parks (~28,000 km²). Healthy elephant populations require large tracts of habitat; the areas set aside for regulated hunting are therefore essential to the elephant's continued survival.

- Management and Enforcement Revenues: Revenues generated from tourist hunting conducted on state lands comprised approximately 20% of ZPWMA's revenue stream in 2014. Over $6.2 million in trophy fees came from elephant hunts, with $5 million accruing to ZPWMA to reinvest in elephant protection and species management. Over 50% of that revenue came from U.S. clients. Almost 80% of ZPWMA's operating budget is allocated towards law enforcement in the form of staff costs and patrol provisions. ZPWMA employs 1,500 active field rangers. Put simply, hunting revenues support anti-poaching efforts across Zimbabwe's elephant range—and this is largely paid for by American elephant hunters.

- Operator Anti-Poaching: In addition to supporting ZPWMA's enforcement capacity, hunting operators deploy their own anti-poaching units to police the Safari Areas and fund community game scouts in CAMPFIRE Areas. For example, a small sample of 14 individual operators surveyed by the Safari Operator Association of Zimbabwe spend $957,843 on anti-poaching in 2013 and deployed 245 anti-poaching

scouts. One specific operator, Charlton McCullum Safaris (CMS) in the Dande Safari Area and Mbire Communal Area, spends on average $80,000-$90,000 in patrol and equipment costs and anti-poaching rewards. From 2010 to 2016, CMS' efforts led to an 82% decline in elephant poaching in an import border region. As another example, the Save Valley and Bubye Valley Conservancies together spend over $1 million on anti-poaching each year. These anti-poaching efforts are funded predominately by hunting revenue, and protect stable populations of elephant and the third-largest black rhino population in the world.

- Regional Anti-Poaching: According to the CITES "Monitoring the Illegal Killing of Elephants" (MIKE) program, poaching in the Southern African countries that allow regulated tourist hunting, including Zimbabwe, is lower than anywhere else on the continent and has never reached an unsustainable level. This stands in stark contrast to the West and Central African countries that do not rely upon tourist hunting as a conservation tool.

- Community Benefits: Zimbabwe's CAMPFIRE program is the pioneering community-based natural resource management program in Africa. The program allows rural communities to financially benefit from wildlife, thereby incentivizing the use of communal land as wildlife habitat, and the protection of wildlife in the form of increased tolerance of destructive wildlife. An estimated 77,000 households rely on CAMPFIRE benefit from CAMPFIRE. 90% of CAMPFIRE revenue is generated from regulated hunting, and 70% of this comes from elephant hunting. Thus, prior to the import suspension, elephant hunting generated over $1.6 million per year for CAMPFIRE communities and was reinvested in the construction of classrooms and clinics, the installation of water infrastructure and solar powered facilities, the purchase of vehicles for anti-poaching support, compensation for destruction of crops or livestock by dangerous game, and other benefits that improve the livelihoods of the rural communities living in CAMPFIRE Areas. These benefits offset the damage caused by game species: from 2010 to 2015, elephant destroyed 7,495 hectares of crop fields in CAMPFIRE communities and claimed the lives of approximately 40 people.

ELEPHANT MANAGEMENT IN ZAMBIA IS UP-TO-DATE AND GENERATES SUBSTANTIAL BENEFITS TO ENCOURAGE RECOVERY OF THE SPECIES

- Governing Law: The Zambian Wildlife Act No. 14 of 2015 is the guiding legislation for elephant protection and management. This cutting-edge law consolidated the prior wildlife authority into a government Department of National Parks and Wildlife (DNPW), to address the funding concerns and shortfalls experienced by the prior authority. DNPW is made up of a Wildlife Law Enforcement Unit with over 1,250 rangers; a Conservation Unit; an Infrastructure Development Unit; and a Community-Based Natural Resource Management Unit to oversee the development of conservation planning in Game Management Areas.

- Management and Enforcement Revenues: Between 2010 and 2012, regulated hunting revenues accounted for approximately 32% of the operating budget funding for Zambia's wildlife authority. With a potential to generate nearly $1 million in elephant hunting fees, in 2015 and 2016, these fees totaled only $150,000, due

mainly to import restrictions. This amount was divided between DNPW and the Community Resource Boards in Game Management Areas (GMA). DNPW uses this revenue for range salaries and resource protection, as well as management surveys, staff training, and other activities. Approximately 75% of DNPW's expenditures are for anti-poaching, and Zambia's Wildlife Law Enforcement Unit conducted over 10,500 anti-poaching patrols in 2015, involving an average of 5,878 staff per quarter and 237,028 patrol days.

- **Habitat: Hunting areas in Zambia (~180,000 km²) provide almost three times the amount of protected habitat compared to the country's National Parks (~64,000 km²).**

- **Community Benefits: In GMAs, elephant license fees are divided equally between the DNPW and the GMA's Community Resource Board, and 20% of concession fees also accrue to the Board. In 2015 and 2016, approximately $1.36 million in hunting fees was distributed to the Boards, as well as $10,000 per concession paid by the hunting operator. Under the new Wildlife Law, Boards must invest those funds as follows: 45% towards wildlife protection and patrols, 35% towards community improvement projects such as construction of schools, clinics, and water infrastructure, and 20% towards administrative costs. Written concession agreements between the operators, DNPW, and the community Boards usually obligate the concessionaire to make further communities investments, such as constructing a classroom and paying a teacher's salary. Operators in 13 blocks were obligated to spend over $1.1 million in community infrastructure development and 3.4 million in community lease and other payments for the duration of their leases.**

- **Game Meat Distributions: Moreover, under Zambian law, at least 50% of harvested game meat must be donated and distributed to local communities. A 2015 study found that operators in three GMAs contributed an average of 6,000 kilograms of harvested meat per season, and estimated that operators across all GMAs could provide ~130 tons of much-needed protein annually. This reduces the incentive for bush meat poaching in these areas bordering and buffering Zambia's National Parks.**

- **Operator Anti-Poaching: Hunting operators' concession agreements with DNPW and the Community Resource Board identify mandatory anti-poaching obligations and expenditures. At present, 75 Boards employ over 750 wildlife scouts and 79 support personnel, at a monthly cost of over $38,800. Those scouts are paid for by revenues from tourist hunting. A small sample of four operators spent over $201,000 on anti-poaching in 2015, to fund community scouts and fund and equip their own operator anti-poaching teams. This anti-poaching support is largely paid for by U.S. hunters, as over half of all hunting clients in Zambia are from the U.S.**

INTERNATIONAL WILDLIFE CRIMESTOPPERS, INC.

[Note: Supporting documents for each of these points is available by contacting Conservation Force, cf@conservationforce.org. These Talking Points largely rely on the responses of ZPWMA and DNPW to FWS information requests and supporting documents provided as part of those responses as well as individual hunting operator enhancement reports, reports of the CAMPFIRE Association, and publicly available IUCN documents.]

Please Allow Elephant/Lion Imports to support conservation of the species

"Oropallo, Michael A." <MOropallo@barclaydamon.com>

Subject:	Please Allow Elephant/Lion Imports to support conservation of the species

- **There has never been a "ban" on elephant trophy imports from Zimbabwe. A negative enhancement finding was made in April 2014 that "suspended" the import of elephant trophies. The FWS' negative 2015 enhancement finding stated repeatedly that once additional information was received, the negative finding would be reviewed and reversed (e.g., "The suspension … could be lifted if additional information on the status and management of elephants in Zimbabwe becomes available, including utilization of revenue generated through sport-hunting by U.S. hunters, which satisfies the conditions of the 4(d) special rule under the ESA.") A "ban" suggests a permanent prohibition; a "suspension" is a "temporary abrogation or withholding." Zimbabwe's elephant trophy imports were suspended.**
- **Lifting of the suspension was not a political decision. The decision should have been made in July 2015, when ZPWMA provided extensive additional documentation in response to a FWS questionnaire. The FWS requested "one more piece of information" at the CITES Conference of the Parties in September 2016. That information was provided in November 2016. No further information was needed, or requested. If the FWS had properly prioritized the issuance of elephant import permits—as they told ZPWMA they would at the CITES Conference of the Parties—the positive enhancement finding would have been made and these permits would have issued before the current Administration was in office.**
- **The import of elephant trophies from Zimbabwe should not have been suspended in the first place. In April 2014, the FWS announced the suspension based on an asserted "lack of information." In contradiction to CITES Res. Conf. 6.7's recommendation of notifying and consulting with range states before imposing stricter domestic measures, and the Endangered Species Act's requirement of "encouraging foreign conservation programs," 16 U.S.C. § 1537(b), the FWS shut down imports under an April 2014 negative enhancement finding that the FWS later admitted was wrong with respect to Zimbabwe's elephant population and level of poaching. In fact, the correct estimate for Zimbabwe's elephant population—almost 83,000—is 16,000 elephant higher than when the last, positive enhancement finding was made in 1997. That estimate is double the size of the elephant populations of Namibia and South Africa put together, yet the FWS maintains positive enhancement findings for the import of elephant trophies from Namibia and South Africa. The trophy import suspension was based on a mistaken concern that Zimbabwe's elephant population had declined, and the FWS should have admitted the mistake and reversed the suspension immediately. The failure to do so suggests a political motivation, not a scientific one.**
- **Zimbabwe's elephant population is not "the worst managed," but is among the best. That Zimbabwe maintains a stable elephant population of over 83,000, despite a despotic government, poor economy, and exploding human population growth rate, is a testament to the country's strong management. That number is almost 40% higher than in 1992, when the FWS confirmed the "threatened" listing of elephant, and almost 20% higher than in 1997, when the FWS made a positive enhancement finding authorizing the import of elephant trophies. This is due in part to ZPWMA being a parastatal separate and separately funded from the central government. It is also due to the commitment of Zimbabwe's citizens to maintaining their elephant, notwithstanding the costs—over 40 rural Zimbabweans were killed by elephant from 2010 to 2015. Zimbabwe's strong wildlife management is also demonstrated by recent IUCN Red List assessments of lion and giraffe, which indicated increasing populations of these species**

in Zimbabwe. The evidence demonstrates that Zimbabwe's wildlife management, not only its elephant management, is succeeding.]

- **<u>Zimbabwe's elephant management is not "poor"; it is state-of-the-art and written by one of the world's foremost elephant experts.</u> In response to the April 2014 suspension of elephant trophy imports, ZPWMA took to heart the FWS' criticism that Zimbabwe's then-current elephant management plan dated to 1997. Although that plan was adaptively implemented and monitored, it was admittedly dated. Zimbabwe immediately began the process of adopting a brand-new, state-of-the-art elephant management plan—basically, to satisfy the FWS. This included a year of stakeholder planning workshops: a preparatory meeting of representatives from Zimbabwe's community-based natural resources management program, CAMPFIRE, in November 2014; a national elephant management planning workshop in December 2014; an elephant management planning and anti-poaching workshop in Mana Pools (Zambezi Valley) in early April 2015; an elephant management planning workshop in the Sebungwe range in May 2015; and an elephant management planning workshop in the South East Lowveld region in September 2015. Zimbabwe focused on regional planning because the four regions face different management challenges. Each planning workshop produced a regional elephant management plan that was incorporated into the final. The final document was drafted by a leading elephant scientist, and the process was monitored throughout by the IUCN's African Elephant Specialist Group.**
- **<u>Regulated hunting is not poaching.</u> By definition, "regulated" hunting is regulated and lawful. It is carefully monitored by ZPWMA, and offtakes are recorded in a national database. Lawfully hunted ivory tusks are marked to show that they are lawful and note the year of harvest. Moreover, regulated hunting revenues underwrite most anti-poaching expenses in Zimbabwe and the rest of Southern Africa, either by fees paid to government wildlife authorities that are used for law enforcement, or by operator-funded teams that patrol concessions and keep poachers out. Finally, revenue-sharing and contributions by hunting operators creates conservation incentives for rural communities most affected by wildlife, which disincentivizes poaching. For example, Zimbabwe's CAMPFIRE communities were receiving over $1.6 million per year in revenues from elephant hunting prior to the import suspension. These funds allow for clinics and schools to be built, teachers' salaries to be paid, boreholes to be drilled, and so on. Hunting operators in Zambia are required to share at least 50% of harvested meat with rural communities. Many tons of meat can come from elephant hunts, to reduce the need and tolerance for bushmeat poaching and protect species in addition to elephant.**
- **<u>Allowing imports of elephant trophies will not damage the government's efforts to control ivory trafficking.</u> Elephant trophy imports have been authorized for Namibia and South Africa for the past three years, which demonstrates that a country may maintain lawful hunting and low poaching at the same time. In fact, according to the CITES MIKE data, the Southern African countries that depend upon regulated hunting as a conservation tool have the lowest Proportion of Illegally Killed Elephant (PIKE) rates in the world. PIKE, which is used to assess whether poaching levels are unsustainable, has never risen above the sustainability threshold in Southern Africa. PIKE at Zimbabwe's MIKE sites is well below that level. Moreover, national and international law requires the marking of ivory tusks taken as lawful hunting trophies, which clearly and visibly separates these lawful tusks from illegal ones.**
- **<u>Photographic tourism is not a substitute in most hunting areas.</u> Opponents argue that photographic tourism would be a better option than hunting. It is true that photo-tourism is available in some places; for example, some conservancies in Namibia benefit from photographic tourism revenues alone or a mixture of photo- and hunting tourism. But photo-tourism requires decent infrastructure and scenery, and dense enough wildlife populations to draw tourists. These may not be available in remote areas of a country without access to airports or other activities, and where the wildlife populations are not yet dense enough to ensure a sighting on a two-hour game drive. This is the situation in many CAMPFIRE Areas, where photographic tourism was tried … and failed. In these areas, without the benefits of hunting, the habitat would be converted to agriculture and livestock. Benefits to the rural community stakeholders are less from photographic tourism than from tourist hunting.**

Deputy Director Sheehan and Secretary Zinke:

I, along with other informed sportsman, am dismayed at comments made by President Trump in the last few days regarding the importation of lion and elephant trophies from Zimbabwe. President Trump is clearly uninformed and has been incredibly irresponsible in his commentary. Below are the facts. To the extent President Trump maintains his current, uninformed position, and to the extent the FWS follows suit, he will undoubtedly harm the very wildlife he purports to protect. And he will certainly no longer have my support in any of his endeavors. Thank you for considering the below information.

ELEPHANT TROPHY IMPORTS HAVE NEVER BEEN "BANNED," AND THE POSITIVE ENHANCEMENT FINDINGS ARE BASED ON THE BEST AVAILABLE INFORMATION RECEIVED IN 2014-2016

- **There has been no "ban" on elephant trophy imports. In April 2014, the U.S. Fish and Wildlife Service (FWS) "suspended" the import of elephant trophies from Zimbabwe due to a lack of information. Zimbabwe's Parks and Wildlife Management Authority (ZPWMA) responded to two questionnaires from the FWS in April 2014 and December 2014. However, in March 2015, the FWS extended the suspension, finding information was still lacking. The negative enhancement finding dated March 2015 repeatedly affirmed, "The suspension … could be lifted if additional information on the status and management of elephants in Zimbabwe becomes available, including utilization of revenue generated through sport-hunting by U.S. hunters, which satisfies the conditions of the 4(d) special rule under the ESA." In July 2015, May 2016, and November 2016, ZPWMA responded to additional FWS questions. The November 2017 positive enhancement finding is based on these later responses and thousands of pages of supporting documents, including Zimbabwe's National Elephant Management Action Plan,**

2014 countrywide elephant population surveys, 2014-2016 actual and projected budget data, 2014 and 2015 offtakes and 2016 quota data, 2014-2016 CAMPFIRE data, and much more.

- **Issuing import permits for elephant trophies from Zimbabwe was not a political decision by this Administration. In September 2016, before the election occurred, the FWS had already indicated to ZPWMA that the suspension would be lifted. ZPWMA was told by the Chief of Permits that the FWS needed "only one more piece of information," a prioritization of the new Elephant Management Plan, before the negative enhancement finding could be reversed. That prioritization was provided on November 8, 2016, before the election results were in. At the end of 2016, the FWS should have made the positive enhancement finding, but was admittedly sidetracked by an influx of thousands of new permit applications due to the listing of rosewood (used extensively in musical instruments and furniture) on the CITES Appendixes effective January 2017.**
- **Similarly, there has been no "ban" on the import of elephant trophies from Zambia. In October 2011, the FWS made a positive enhancement finding to authorize the import of regulated elephant hunting trophies from Zambia. However, 2013 and 2014, Zambia's wildlife authority suspended hunting to obtain more current wildlife population information. In 2015, Zambia's government lifted the hunting suspension, and set a conservative quota of 80 elephant. In August 2016, the Chief of Permits sent an email indicating that the FWS was trying to issue import permits for elephant trophies from Zambia before the CITES Conference of the Parties in September 2016, based on an April 2015 Non-Detriment and Enhancement Finding the FWS received from Zambia's wildlife authority. However, the FWS ran out of time. At the Conference of the Parties, the Chief of Permits indicated that elephant permits from Zambia would likely issue before the end of the year. Again, because of the new rosewood permits, that enhancement finding was put on a back burner.**

ZIMBABWE'S ELEPHANT POPULATION IS THE SECOND-LARGEST IN AFRICA

- **In 1900, it was estimated that Zimbabwe had a national population of 4,000 elephant. Since then, the population has grown to over 82,000 (a twenty-fold increase). The current population is double the target national population established in the 1980s, almost 40% larger than in 1992, when the FWS determined to maintain the Endangered Species Act (ESA) "threatened" listing, and almost 20% larger than in 1997, when the last positive enhancement finding was made (before November 2017). Elephant sub-populations in Zimbabwe are generally considered stable or increasing.**
    - **<u>North-West Matabeleland</u>: This population is estimated at 54,000, and is most densely located in Hwange National Park (45,000 elephant). In 1928, the estimated elephant population in Hwange was 2,000.**
    - **<u>Sebungwe</u>: This population is estimated at 3,500 and has declined since 2001 due to human population expansion into a previously unsettled area. The human population exploded from 45,000 in 1950 to over 700,000 in 2013, which explains the decline in the elephant population. Due to the expansion of human settlement and unlike other major elephant ranges in Zimbabwe, the habitat in this area is fragmented.**
    - **<u>Mid-Zambezi Valley</u>: This area has an estimated elephant population of about 12,000. That population declined since the 2001 countrywide survey, and it is believed the decline is due to cross-border poaching and perhaps, the cross-border movement of elephants during the survey. Anti-poaching is a major component of the Zambezi Valley/Mana Pools Regional Elephant Management Action Plan, and recently the area has been chosen as a CITES MIKES site with an ongoing project.**
    - **<u>South-East Lowveld</u>: Most of this population inhabits Gonarezhou National Park, whose population has been growing consistently at 5% per annum over 20 years. This region's sub-population is estimated at 13,000 elephant between the Park, surrounding communal areas, and nearby private conservancies.**

ZAMBIA'S ELEPHANT POPULATION IS STABLE

- **Zambia's elephant population inhabits seven sub-regions covering National Parks and Game Management Areas. According to the 2016 African Elephant Status Report, Zambia's elephant population is estimated at over 21,000. This is generally considered stable over the past 25 years, and is stable compared to Zambia's population in 1992, when the FWS determined to maintain elephant as "threatened" listed. However, several population surveys indicating an estimate closer to 30,000 were not included in the 2016 African Elephant Status Report, and Zambia's wildlife authority estimates the country's population at more than 30,000.**

ELEPHANT HUNTING OFFTAKES IN ZIMBABWE ARE SUSTAINABLE

- **Zimbabwe maintains a CITES export quota of 1,000 tusks from 500 bull elephants. A national quota of 500 elephants represents only 0.6% of a population of 82,630 elephant. Actual hunting offtakes are considerably lower, have a negligible impact on the overall population rate, and have declined in the past three years due to the import suspension.**
  - **Average Hunting Offtakes 2010-2013 (% of Total Elephant Population): 228 (0.276%)**
  - **2013 Hunting Offtakes (% of Total Elephant Population): 258 (0.312%)**
  - **2014 Hunting Offtakes (% of Total Elephant Population): 162 (0.196%)**
  - **2015 Hunting Offtakes (% of Total Elephant Population): 075 (0.091%)**

ELEPHANT HUNTING OFFTAKES IN ZAMBIA ARE NEGLIGIBLE

- **In 2013 and 2014, Zambia suspended regulated tourist hunting to obtain a better sense of national wildlife population trends. In 2015, Zambia set a conservative export quota of 160 tusks from 80 bull elephants. Zambia maintained the quota of 80 elephants in 2016 and 2017. A national quota of 80 elephants represents less than 0.4% of a population of 21,967 elephant. Actual hunting offtakes are negligible and have no impact on the national population rate.**
  - **2015 Hunting Offtakes (% of Total Elephant Population): 03 (0.014%)**
  - **2016 Hunting Offtakes (% of Total Elephant Population): 12 (0.055%)**

ELEPHANT MANAGEMENT IN ZIMBABWE IS GUIDED BY APPROPRIATE LEGISLATION AND A STATE-OF-THE-ART MANAGEMENT PLAN

- **<u>Governing Law</u>: The Zimbabwe Parks and Wild Life Act provides the regulatory mechanism for ZPWMA and its programs. The Act created ZPWMA as a parastatal authority apart from the central government and established a separate fund, apart from the Central Treasury, to sustain ZPWMA's operations. The Act sets harsh penalties for elephant-related offenses, and was amended in 2010 to impose a nine-year minimum sentence for the first offense of elephant poaching. Under the Parks and Wild Life Act, Rural District Councils and other land holders are granted "appropriate authority" to benefit directly from wildlife. Under this legislation, land holders are encouraged to maintain and increase wildlife populations because they retain the benefits of sustainable use of that wildlife.**
- **<u>Elephant Management Plan</u>: Elephant are managed according to the Zimbabwe National Elephant Management Plan (2015-2020). The plan incorporates specific action items, deliverables, deadlines, and responsible parties. It is an adaptive management plan utilizing prioritization of targets measured by key components, strategic objectives, and outputs. The plan focuses on five major components: Protection and Law Enforcement; Biological Monitoring and Management; Social, Economic, and Cultural Framework; Building Conservation Capacity; and Program Management. The National management plan is supplemented by four regional plans that utilize the same framework to address the unique challenges for each major elephant range in Zimbabwe. Zimbabwe's elephant management planning process was kicked off by the FWS' elephant trophy import suspension. ZPWMA held a year of stakeholder planning workshops, including a preparatory meeting of representatives from CAMPFIRE in November 2014; a national elephant management planning workshop in December 2014; an elephant management planning and anti-poaching workshop in Mana Pools (Zambezi Valley range) in March-April 2015; an elephant management planning workshop in the Sebungwe range in May 2015; and an elephant management planning workshop in the South East Lowveld range in September 2015.**

ELEPHANT HUNTING IN ZIMBABWE GENERATES CONSERVATION BENEFITS THAT SATISFY THE "ENHANCEMENT" STANDARD: Although hunting offtakes are negligible, elephant hunting fees create extensive conservation incentives in Zimbabwe.

- **<u>Habitat</u>: Hunting areas in Zimbabwe represent ~130,000 km² of protected habitat. This represents over four times the size of Zimbabwe's National Parks (~28,000 km^2). Healthy elephant populations require large tracts of habitat; the areas set aside for regulated hunting are therefore essential to the elephant's continued survival.**
- **<u>Management and Enforcement Revenues</u>: Revenues generated from tourist hunting conducted on state lands comprised approximately 20% of ZPWMA's revenue stream in 2014. Over $6.2 million in trophy fees came from elephant hunts, with $5 million accruing to ZPWMA to reinvest in elephant protection and species management. Over 50% of that revenue came from U.S. clients. Almost 80% of ZPWMA's operating budget is allocated towards law enforcement in the form of staff costs and patrol provisions. ZPWMA employs 1,500 active field rangers.**

Put simply, hunting revenues support anti-poaching efforts across Zimbabwe's elephant range —and this is largely paid for by American elephant hunters.

- **Operator Anti-Poaching: In addition to supporting ZPWMA's enforcement capacity, hunting operators deploy their own anti-poaching units to police the Safari Areas and fund community game scouts in CAMPFIRE Areas. For example, a small sample of 14 individual operators surveyed by the Safari Operator Association of Zimbabwe spend $957,843 on anti-poaching in 2013 and deployed 245 anti-poaching scouts. One specific operator, Charlton McCullum Safaris (CMS) in the Dande Safari Area and Mbire Communal Area, spends on average $80,000-$90,000 in patrol and equipment costs and anti-poaching rewards. From 2010 to 2016, CMS' efforts led to an 82% decline in elephant poaching in an import border region. As another example, the Save Valley and Bubye Valley Conservancies together spend over $1 million on anti-poaching each year. These anti-poaching efforts are funded predominately by hunting revenue, and protect stable populations of elephant and the third-largest black rhino population in the world.**
- **Regional Anti-Poaching: According to the CITES "Monitoring the Illegal Killing of Elephants" (MIKE) program, poaching in the Southern African countries that allow regulated tourist hunting, including Zimbabwe, is lower than anywhere else on the continent and has never reached an unsustainable level. This stands in stark contrast to the West and Central African countries that do not rely upon tourist hunting as a conservation tool.**
- **Community Benefits: Zimbabwe's CAMPFIRE program is the pioneering community-based natural resource management program in Africa. The program allows rural communities to financially benefit from wildlife, thereby incentivizing the use of communal land as wildlife habitat, and the protection of wildlife in the form of increased tolerance of destructive wildlife. An estimated 77,000 households rely on CAMPFIRE benefit from CAMPFIRE. 90% of CAMPFIRE revenue is generated from regulated hunting, and 70% of this comes from elephant hunting. Thus, prior to the import suspension, elephant hunting generated over $1.6 million per year for CAMPFIRE communities and was reinvested in the construction of classrooms and clinics, the installation of water infrastructure and solar powered facilities, the purchase of vehicles for anti-poaching support, compensation for destruction of crops or livestock by dangerous game, and other benefits that improve the livelihoods of the rural communities living in CAMPFIRE Areas. These benefits offset the damage caused by game species: from 2010 to 2015, elephant destroyed 7,495 hectares of crop fields in CAMPFIRE communities and claimed the lives of approximately 40 people.**

ELEPHANT MANAGEMENT IN ZAMBIA IS UP-TO-DATE AND GENERATES SUBSTANTIAL BENEFITS TO ENCOURAGE RECOVERY OF THE SPECIES

- **Governing Law: The Zambian Wildlife Act No. 14 of 2015 is the guiding legislation for elephant protection and management. This cutting-edge law consolidated the prior wildlife authority into a government Department of National Parks and Wildlife (DNPW), to address the funding concerns and shortfalls experienced by the prior authority. DNPW is made up of a Wildlife Law Enforcement Unit with over 1,250 rangers; a Conservation Unit; an Infrastructure Development Unit; and a Community-Based Natural Resource Management Unit to oversee the development of conservation planning in Game Management Areas.**
- **Management and Enforcement Revenues: Between 2010 and 2012, regulated hunting revenues accounted for approximately 32% of the operating budget funding for Zambia's wildlife authority. With a potential to generate nearly $1 million in elephant hunting fees, in 2015 and 2016, these fees totaled only $150,000, due mainly to import restrictions. This amount was divided between DNPW and the Community Resource Boards in Game Management Areas (GMA). DNPW uses this revenue for range salaries and resource protection, as well as management surveys, staff training, and other activities. Approximately 75% of DNPW's expenditures are for anti-poaching, and Zambia's Wildlife Law Enforcement Unit conducted over 10,500 anti-poaching patrols in 2015, involving an average of 5,878 staff per quarter and 237,028 patrol days.**
- **Habitat: Hunting areas in Zambia (~180,000 km²) provide almost three times the amount of protected habitat compared to the country's National Parks (~64,000 km²).**
- **Community Benefits: In GMAs, elephant license fees are divided equally between the DNPW and the GMA's Community Resource Board, and 20% of concession fees also accrue to the Board. In 2015 and 2016, approximately $1.36 million in hunting fees was distributed to the Boards, as well as $10,000 per concession paid by the hunting operator. Under the new Wildlife Law, Boards must invest those funds as follows: 45% towards wildlife protection and patrols, 35% towards community improvement projects such as construction of schools, clinics, and water infrastructure, and 20% towards administrative costs. Written concession agreements between the operators, DNPW, and the community Boards usually obligate the concessionaire**

to make further communities investments, such as constructing a classroom and paying a teacher's salary. Operators in 13 blocks were obligated to spend over $1.1 million in community infrastructure development and 3.4 million in community lease and other payments for the duration of their leases.

- **Game Meat Distributions: Moreover, under Zambian law, at least 50% of harvested game meat must be donated and distributed to local communities. A 2015 study found that operators in three GMAs contributed an average of 6,000 kilograms of harvested meat per season, and estimated that operators across all GMAs could provide ~130 tons of much-needed protein annually. This reduces the incentive for bush meat poaching in these areas bordering and buffering Zambia's National Parks.**
- **Operator Anti-Poaching: Hunting operators' concession agreements with DNPW and the Community Resource Board identify mandatory anti-poaching obligations and expenditures. At present, 75 Boards employ over 750 wildlife scouts and 79 support personnel, at a monthly cost of over $38,800. Those scouts are paid for by revenues from tourist hunting. A small sample of four operators spent over $201,000 on anti-poaching in 2015, to fund community scouts and fund and equip their own operator anti-poaching teams. This anti-poaching support is largely paid for by U.S. hunters, as over half of all hunting clients in Zambia are from the U.S.**

[Note: Supporting documents for each of these points is available by contacting Conservation Force, cf@conservationforce.org. These Talking Points largely rely on the responses of ZPWMA and DNPW to FWS information requests and supporting documents provided as part of those responses as well as individual hunting operator enhancement reports, reports of the CAMPFIRE Association, and publicly available IUCN documents.]

MINI-ARGUMENTS REFUTING FALSE FACTS

- **There has never been a "ban" on elephant trophy imports from Zimbabwe. A negative enhancement finding was made in April 2014 that "suspended" the import of elephant trophies. The FWS' negative 2015 enhancement finding stated repeatedly that once additional information was received, the negative finding would be reviewed and reversed (e.g., "The suspension … could be lifted if additional information on the status and management of elephants in Zimbabwe becomes available, including utilization of revenue generated through sport-hunting by U.S. hunters, which satisfies the conditions of the 4(d) special rule under the ESA.") A "ban" suggests a permanent prohibition; a "suspension" is a "temporary abrogation or withholding." Zimbabwe's elephant trophy imports were suspended.**
- **Lifting of the suspension was not a political decision. The decision should have been made in July 2015, when ZPWMA provided extensive additional documentation in response to a FWS questionnaire. The FWS requested "one more piece of information" at the CITES Conference of the Parties in September 2016. That information was provided in November 2016. No further information was needed, or requested. If the FWS had properly prioritized the issuance of elephant import permits—as they told ZPWMA they would at the CITES Conference of the Parties—the positive enhancement finding would have been made and these permits would have issued before the current Administration was in office.**
- **The import of elephant trophies from Zimbabwe should not have been suspended in the first place. In April 2014, the FWS announced the suspension based on an asserted "lack of information." In contradiction to CITES Res. Conf. 6.7's recommendation of notifying and consulting with range states before imposing stricter domestic measures, and the Endangered Species Act's requirement of "encouraging foreign conservation programs," 16 U.S.C. § 1537(b), the FWS shut down imports under an April 2014 negative enhancement finding that the FWS later admitted was wrong with respect to Zimbabwe's elephant population and level of poaching. In fact, the correct estimate for Zimbabwe's elephant population—almost 83,000—is 16,000 elephant higher than when the last, positive enhancement finding was made in 1997. That estimate is double the size of the elephant populations of Namibia and South Africa put together, yet the FWS maintains positive enhancement findings for the import of elephant trophies from Namibia and South Africa. The trophy import suspension was based on a mistaken concern that Zimbabwe's elephant population had declined, and the FWS should have admitted the mistake and reversed the suspension immediately. The failure to do so suggests a political motivation, not a scientific one.**
- **Zimbabwe's elephant population is not "the worst managed," but is among the best. That Zimbabwe maintains a stable elephant population of over 83,000, despite a despotic**

government, poor economy, and exploding human population growth rate, is a testament to the country's strong management. That number is almost 40% higher than in 1992, when the FWS confirmed the "threatened" listing of elephant, and almost 20% higher than in 1997, when the FWS made a positive enhancement finding authorizing the import of elephant trophies. This is due in part to ZPWMA being a parastatal separate and separately funded from the central government. It is also due to the commitment of Zimbabwe's citizens to maintaining their elephant, notwithstanding the costs—over 40 rural Zimbabweans were killed by elephant from 2010 to 2015. Zimbabwe's strong wildlife management is also demonstrated by recent IUCN Red List assessments of lion and giraffe, which indicated increasing populations of these species in Zimbabwe. The evidence demonstrates that Zimbabwe's wildlife management, not only its elephant management, is succeeding.]

- **<u>Zimbabwe's elephant management is not "poor"; it is state-of-the-art and written by one of the world's foremost elephant experts.</u> In response to the April 2014 suspension of elephant trophy imports, ZPWMA took to heart the FWS' criticism that Zimbabwe's then-current elephant management plan dated to 1997. Although that plan was adaptively implemented and monitored, it was admittedly dated. Zimbabwe immediately began the process of adopting a brand-new, state-of-the-art elephant management plan—basically, to satisfy the FWS. This included a year of stakeholder planning workshops: a preparatory meeting of representatives from Zimbabwe's community-based natural resources management program, CAMPFIRE, in November 2014; a national elephant management planning workshop in December 2014; an elephant management planning and anti-poaching workshop in Mana Pools (Zambezi Valley) in early April 2015; an elephant management planning workshop in the Sebungwe range in May 2015; and an elephant management planning workshop in the South East Lowveld region in September 2015. Zimbabwe focused on regional planning because the four regions face different management challenges. Each planning workshop produced a regional elephant management plan that was incorporated into the final. The final document was drafted by a leading elephant scientist, and the process was monitored throughout by the IUCN's African Elephant Specialist Group.**
- **<u>Regulated hunting is not poaching.</u> By definition, "regulated" hunting is regulated and lawful. It is carefully monitored by ZPWMA, and offtakes are recorded in a national database. Lawfully hunted ivory tusks are marked to show that they are lawful and note the year of harvest. Moreover, regulated hunting revenues underwrite most anti-poaching expenses in Zimbabwe and the rest of Southern Africa, either by fees paid to government wildlife authorities that are used for law enforcement, or by operator-funded teams that patrol concessions and keep poachers out. Finally, revenue-sharing and contributions by hunting operators creates conservation incentives for rural communities most affected by wildlife, which disincentivizes poaching. For example, Zimbabwe's CAMPFIRE communities were receiving over $1.6 million per year in revenues from elephant hunting prior to the import suspension. These funds allow for clinics and schools to be built, teachers' salaries to be paid, boreholes to be drilled, and so on. Hunting operators in Zambia are required to share at least 50% of harvested meat with rural communities. Many tons of meat can come from elephant hunts, to reduce the need and tolerance for bushmeat poaching and protect species in addition to elephant.**
- **<u>Allowing imports of elephant trophies will not damage the government's efforts to control ivory trafficking.</u> Elephant trophy imports have been authorized for Namibia and South Africa for the past three years, which demonstrates that a country may maintain lawful hunting and low poaching at the same time. In fact, according to the CITES MIKE data, the Southern African countries that depend upon regulated hunting as a conservation tool have the lowest Proportion of Illegally Killed Elephant (PIKE) rates in the world. PIKE, which is used to assess whether poaching levels are unsustainable, has never risen above the sustainability threshold in Southern Africa. PIKE at Zimbabwe's MIKE sites is well below that level. Moreover, national and international law requires the marking of ivory tusks taken as lawful hunting trophies, which clearly and visibly separates these lawful tusks from illegal ones.**
- **<u>Photographic tourism is not a substitute in most hunting areas.</u> Opponents argue that photographic tourism would be a better option than hunting. It is true that photo-tourism is available in some places; for example, some conservancies in Namibia benefit from photographic tourism revenues alone or a mixture of photo- and hunting tourism. But photo-tourism requires decent infrastructure and scenery, and dense enough wildlife populations to draw tourists. These may not be available in remote areas of a country without access to airports or other activities, and where the wildlife populations are not yet dense enough to ensure a sighting on a two-hour game drive. This is the situation in many CAMPFIRE Areas, where photographic tourism was tried … and failed. In these areas, without the benefits of hunting, the habitat would be converted to agriculture and livestock. Benefits to the rural community stakeholders are less from photographic tourism than from tourist hunting.**

Zimbabwe & Zambia Elephant & Lion Import Permits

Richard Meyer <rich.meyer@qwestoffice.net>

From:	Richard Meyer <rich.meyer@qwestoffice.net>

To:	(b) (6) [redacted]@fws.gov>, <exsec@ios.doi.gov>
Subject:	Zimbabwe & Zambia Elephant & Lion Import Permits

Dear Secretary Zinke and Deputy Sheehan:

Having recently hunted in Zambia and Zimbabwe, I believe it is imperative to the conservation of their elephant and lion populations that the Fish & Wildlife service issue permits to U.S. citizens to import their elephant and lion trophies from these countries.

Zimbabwe and Zambia desperately need the revenue from American hunters to support their wildlife conservation programs. Removal of Robert Mugabe as president renews hopes that funds from hunting activities will go for the intended conservation programs and not to corrupt politicians.

If African wildlife cannot contribute to the African economy, it will be a nuisance to the population and result in its extermination. Raymond Bonner did an extensive economic evaluation of benefits of big game hunting in Africa in At the Hand of Man published in 1993.

Failure of the U.S. Fish & Wildlife Service to issue permits for legally taken hunting trophies from these countries will have the unintended consequence of the extermination of those species.

Thank you for your consideration.

Richard Meyer

Importation of Elephant Trophies from Zimbabwe and Zambia into the US.

Michael Ambrose <mvambrose@ambroseconsulting.net>

From:	Michael Ambrose <mvambrose@ambroseconsulting.net>

Subject:	Importation of Elephant Trophies from Zimbabwe and Zambia into the US.

Dear Secretary Sheehan,
I would like to present you with the real facts about Elephant populations and the effect allowing Trophy Hunting and the importation of their trophies into the US has on Elephant herd populations of the world. I am an ex Navy Seal and an Avid Big Game hunter and know these to be true from first hand experience. Also the voice of the populations who live in these areas should be heard and considered with equal weight as outside experts. I think you will find overwhelming support for Trophy Hunting in these areas.

ELEPHANT TROPHY IMPORTS HAVE NEVER BEEN "BANNED," AND THE POSITIVE ENHANCEMENT FINDINGS ARE BASED ON THE BEST AVAILABLE INFORMATION RECEIVED IN 2014-2016

- There has been no "ban" on elephant trophy imports. In April 2014, the U.S. Fish and Wildlife Service (FWS) "suspended" the import of elephant trophies from Zimbabwe due to a lack of information. Zimbabwe's Parks and Wildlife Management Authority (ZPWMA) responded to two questionnaires from the FWS in April 2014 and December 2014. However, in March 2015, the FWS extended the suspension, finding information was still lacking. The negative enhancement finding dated March 2015 repeatedly affirmed, "The suspension … could be lifted if additional information on the status and management of elephants in Zimbabwe becomes available, including utilization of revenue generated through sport-hunting by U.S. hunters, which satisfies the conditions of the 4(d) special rule under the ESA." In July 2015, May 2016, and November 2016, ZPWMA responded to additional FWS questions. The November 2017 positive enhancement finding is based on these later responses and thousands of pages of supporting documents, including Zimbabwe's National Elephant Management Action Plan, 2014 countrywide elephant population surveys, 2014-2016 actual and projected budget data, 2014 and 2015 offtakes and 2016 quota data, 2014-2016 CAMPFIRE data, and much more.
- Issuing import permits for elephant trophies from Zimbabwe was not a political decision by this Administration. In September 2016, before the election occurred, the FWS had already indicated to ZPWMA that the suspension would be lifted. ZPWMA was told by the Chief of Permits that the FWS needed "only one more piece of information," a prioritization of the new Elephant Management Plan, before the negative enhancement finding could be reversed. That prioritization was provided on November 8, 2016, before the election results were in. At the end of 2016, the FWS should have made the positive enhancement finding, but was admittedly sidetracked by an influx of thousands of new permit applications due to the listing of rosewood (used extensively in musical instruments and furniture) on the CITES Appendixes effective January 2017.
- Similarly, there has been no "ban" on the import of elephant trophies from Zambia. In October 2011, the FWS made a positive enhancement finding to authorize the import of regulated elephant hunting trophies from Zambia. However, 2013 and 2014, Zambia's wildlife authority suspended hunting to obtain more current wildlife population information. In 2015, Zambia's government lifted the hunting suspension, and set a conservative quota of 80 elephant. In August 2016, the Chief of Permits sent an email indicating that the FWS was trying to issue import permits for elephant trophies from Zambia before the CITES Conference of the Parties in September 2016, based on an April 2015 Non-Detriment and Enhancement Finding the FWS received from Zambia's wildlife authority. However, the FWS ran out of time. At the Conference of the Parties, the Chief of Permits indicated that elephant permits from Zambia would likely issue before the end of the year. Again, because of the new

rosewood permits, that enhancement finding was put on a back burner.

ZIMBABWE'S ELEPHANT POPULATION IS THE SECOND-LARGEST IN AFRICA

- In 1900, it was estimated that Zimbabwe had a national population of 4,000 elephant. Since then, the population has grown to over 82,000 (a twenty-fold increase). The current population is double the target national population established in the 1980s, almost 40% larger than in 1992, when the FWS determined to maintain the Endangered Species Act (ESA) "threatened" listing, and almost 20% larger than in 1997, when the last positive enhancement finding was made (before November 2017). Elephant sub-populations in Zimbabwe are generally considered stable or increasing.
    - North-West Matabeleland: This population is estimated at 54,000, and is most densely located in Hwange National Park (45,000 elephant). In 1928, the estimated elephant population in Hwange was 2,000.
    - Sebungwe: This population is estimated at 3,500 and has declined since 2001 due to human population expansion into a previously unsettled areas. The human population exploded from 45,000 in 1950 to over 700,000 in 2013, which explains the decline in the elephant population. Due to the expansion of human settlement and unlike other major elephant ranges in Zimbabwe, the habitat in this area is fragmented.
    - Mid-Zambezi Valley: This area has an estimated elephant population of about 12,000. That population declined since the 2001 countrywide survey, and it is believed the decline is due to cross-border poaching and perhaps, the cross-border movement of elephants during the survey. Anti-poaching is a major component of the Zambezi Valley/Mana Pools Regional Elephant Management Action Plan, and recently the area has been chosen as a CITES MIKES site with an ongoing project.
    - South-East Lowveld: Most of this population inhabits Gonarezhou National Park, whose population has been growing consistently at 5% per annum over 20 years. This region's sub-population is estimated at 13,000 elephant between the Park, surrounding communal areas, and nearby private conservancies.

ZAMBIA'S ELEPHANT POPULATION IS STABLE

- Zambia's elephant population inhabits seven sub-regions covering National Parks and Game Management Areas. According to the 2016 African Elephant Status Report, Zambia's elephant population is estimated at over 21,000. This is generally considered stable over the past 25 years, and is stable compared to Zambia's population in 1992, when the FWS determined to maintain elephant as "threatened" listed. However, several population surveys indicating an estimate closer to 30,000 were not included in the 2016 African Elephant Status Report, and Zambia's wildlife authority estimates the country's population at more than 30,000.

ELEPHANT HUNTING OFFTAKES IN ZIMBABWE ARE SUSTAINABLE

- Zimbabwe maintains a CITES export quota of 1,000 tusks from 500 bull elephants. A national quota of 500 elephants represents only 0.6% of a population of 82,630 elephant. Actual hunting offtakes are considerably lower, have a negligible impact on the overall population rate, and have declined in the past three years due to the import suspension.

    Average Hunting Offtakes
    2010-2013 (% of Total Elephant Population): 228 (0.276%)
    2013 Hunting Offtakes (% of Total Elephant Population): 258 (0.312%)
    2014 Hunting Offtakes (% of Total Elephant Population): 162 (0.196%)
    2015 Hunting Offtakes (% of Total Elephant Population): 075 (0.091%)

ELEPHANT HUNTING OFFTAKES IN ZAMBIA ARE NEGLIGIBLE

- In 2013 and 2014, Zambia suspended regulated tourist hunting to obtain a better sense of national wildlife population trends. In 2015, Zambia set a conservative export quota of 160 tusks from 80 bull elephants. Zambia maintained the quota of 80 elephants in 2016 and 2017. A national quota of 80 elephants represents less than 0.4% of a population of 21,967 elephant. Actual hunting offtakes are negligible and have no impact on the national population rate.

    2015 Hunting Offtakes (% of Total Elephant Population): 03 (0.014%)
    2016 Hunting Offtakes (% of Total Elephant Population): 12 (0.055%)

ELEPHANT MANAGEMENT IN ZIMBABWE IS GUIDED BY APPROPRIATE LEGISLATION AND A STATE-OF-THE-ART MANAGEMENT PLAN

- Governing Law: The Zimbabwe Parks and Wild Life Act provides the regulatory mechanism for ZPWMA and its programs. The Act created ZPWMA as a parastatal authority apart from the central government and established a separate fund, apart from the Central Treasury, to sustain ZPWMA's

operations. The Act sets harsh penalties for elephant-related offenses, and was amended in 2010 to impose a nine-year minimum sentence for the first offense of elephant poaching. Under the Parks and Wild Life Act, Rural District Councils and other land holders are granted "appropriate authority" to benefit directly from wildlife. Under this legislation, land holders are encouraged to maintain and increase wildlife populations because they retain the benefits of sustainable use of that wildlife.

- Elephant Management Plan: Elephant are managed according to the Zimbabwe National Elephant Management Plan (2015-2020). The plan incorporates specific action items, deliverables, deadlines, and responsible parties. It is an adaptive management plan utilizing prioritization of targets measured by key components, strategic objectives, and outputs. The plan focuses on five major components: Protection and Law Enforcement; Biological Monitoring and Management; Social, Economic, and Cultural Framework; Building Conservation Capacity; and Program Management. The National management plan is supplemented by four regional plans that utilize the same framework to address the unique challenges for each major elephant range in Zimbabwe. Zimbabwe's elephant management planning process was kicked off by the FWS' elephant trophy import suspension. ZPWMA held a year of stakeholder planning workshops, including a preparatory meeting of representatives from CAMPFIRE in November 2014; a national elephant management planning workshop in December 2014; an elephant management planning and anti-poaching workshop in Mana Pools (Zambezi Valley range) in March-April 2015; an elephant management planning workshop in the Sebungwe range in May 2015; and an elephant management planning workshop in the South East Lowveld range in September 2015.

ELEPHANT HUNTING IN ZIMBABWE GENERATES CONSERVATION BENEFITS THAT SATISFY THE "ENHANCEMENT" STANDARD: Although hunting offtakes are negligible, elephant hunting fees create extensive conservation incentives in Zimbabwe.

- Habitat: Hunting areas in Zimbabwe represent ~130,000 km² of protected habitat. This represents over four times the size of Zimbabwe's National Parks (~28,000 km^2). Healthy elephant populations require large tracts of habitat; the areas set aside for regulated hunting are therefore essential to the elephant's continued survival.
- Management and Enforcement Revenues: Revenues generated from tourist hunting conducted on state lands comprised approximately 20% of ZPWMA's revenue stream in 2014. Over $6.2 million in trophy fees came from elephant hunts, with $5 million accruing to ZPWMA to reinvest in elephant protection and species management. Over 50% of that revenue came from U.S. clients. Almost 80% of ZPWMA's operating budget is allocated towards law enforcement in the form of staff costs and patrol provisions. ZPWMA employs 1,500 active field rangers. Put simply, hunting revenues support anti-poaching efforts across Zimbabwe's elephant range—and this is largely paid for by American elephant hunters.
- Operator Anti-Poaching: In addition to supporting ZPWMA's enforcement capacity, hunting operators deploy their own anti-poaching units to police the Safari Areas and fund community game scouts in CAMPFIRE Areas. For example, a small sample of 14 individual operators surveyed by the Safari Operator Association of Zimbabwe spend $957,843 on anti-poaching in 2013 and deployed 245 anti-poaching scouts. One specific operator, Charlton McCullum Safaris (CMS) in the Dande Safari Area and Mbire Communal Area, spends on average $80,000-$90,000 in patrol and equipment costs and anti-poaching rewards. From 2010 to 2016, CMS' efforts led to an 82% decline in elephant poaching in an import border region. As another example, the Save Valley and Bubye Valley Conservancies together spend over $1 million on anti-poaching each year. These anti-poaching efforts are funded predominately by hunting revenue, and protect stable populations of elephant and the third-largest black rhino population in the world.
- Regional Anti-Poaching: According to the CITES "Monitoring the Illegal Killing of Elephants" (MIKE) program, poaching in the Southern African countries that allow regulated tourist hunting, including Zimbabwe, is lower than anywhere else on the continent and has never reached an unsustainable level. This stands in stark contrast to the West and Central African countries that do not rely upon tourist hunting as a conservation tool.
- Community Benefits: Zimbabwe's CAMPFIRE program is the pioneering community-based natural resource management program in Africa. The program allows rural communities to financially benefit from wildlife, thereby incentivizing the use of communal land as wildlife habitat, and the protection of wildlife in the form of increased tolerance of destructive wildlife. An estimated 777,000 households (200,000 direct participants and 600,000 secondary beneficiary families) rely on benefits from CAMPFIRE. 90% of CAMPFIRE revenue is generated from regulated hunting, and 70% of this comes from elephant hunting. Thus, prior to the import suspension, elephant hunting generated over $1.6 million per year for CAMPFIRE communities and was reinvested in the construction of classrooms and clinics, the installation of water infrastructure and solar powered facilities, the purchase of vehicles for anti-poaching support, compensation for destruction of crops or livestock by dangerous game, and other benefits that improve the livelihoods of the rural communities living in

CAMPFIRE Areas. These benefits offset the damage caused by game species: from 2010 to 2015, elephant destroyed 7,495 hectares of crop fields in CAMPFIRE communities and claimed the lives of approximately 40 people.

ELEPHANT MANAGEMENT IN ZAMBIA IS UP-TO-DATE AND GENERATES SUBSTANTIAL BENEFITS TO ENCOURAGE RECOVERY OF THE SPECIES

- Governing Law: The Zambian Wildlife Act No. 14 of 2015 is the guiding legislation for elephant protection and management. This cutting-edge law consolidated the prior wildlife authority into a government Department of National Parks and Wildlife (DNPW), to address the funding concerns and shortfalls experienced by the prior authority. DNPW is made up of a Wildlife Law Enforcement Unit with over 1,250 rangers; a Conservation Unit; an Infrastructure Development Unit; and a Community-Based Natural Resource Management Unit to oversee the development of conservation planning in Game Management Areas.
- Management and Enforcement Revenues: Between 2010 and 2012, regulated hunting revenues accounted for approximately 32% of the operating budget funding for Zambia's wildlife authority. With a potential to generate nearly $1 million in elephant hunting fees, in 2015 and 2016, these fees totaled only $150,000, due mainly to import restrictions. This amount was divided between DNPW and the Community Resource Boards in Game Management Areas (GMA). DNPW uses this revenue for ranger salaries and resource protection, as well as management surveys, staff training, and other activities. Approximately 75% of DNPW's expenditures are for anti-poaching, and Zambia's Wildlife Law Enforcement Unit conducted over 10,500 anti-poaching patrols in 2015, involving an average of 5,878 staff per quarter and 237,028 patrol days.
- Habitat: Hunting areas in Zambia (~180,000 km²) provide almost three times the amount of protected habitat compared to the country's National Parks (~64,000 km²).
- Community Benefits: In GMAs, elephant license fees are divided equally between the DNPW and the GMA's Community Resource Board, and 20% of concession fees also accrue to the Board. In 2015 and 2016, approximately $1.36 million in hunting fees was distributed to the Boards, as well as $10,000 per concession paid by the hunting operator. Under the new Wildlife Law, Boards must invest those funds as follows: 45% towards wildlife protection and patrols, 35% towards community improvement projects such as construction of schools, clinics, and water infrastructure, and 20% towards administrative costs. Written concession agreements between the operators, DNPW, and the community Boards usually obligate the concessionaire to make further community investments, such as constructing a classroom and paying a teacher's salary. Operators in 13 blocks were obligated to spend over $1.1 million in community infrastructure development and 3.4 million in community lease and other payments for the duration of their leases.
- Game Meat Distributions: Moreover, under Zambian law, at least 50% of harvested game meat must be donated and distributed to local communities. A 2015 study found that operators in three GMAs contributed an average of 6,000 kilograms of harvested meat per season, and estimated that operators across all GMAs could provide ~130 tons of much-needed protein annually. This reduces the incentive for bush meat poaching in these areas bordering and buffering Zambia's National Parks.
- Operator Anti-Poaching: Hunting operators' concession agreements with DNPW and the Community Resource Board identify mandatory anti-poaching obligations and expenditures. At present, 75 Boards employ over 750 wildlife scouts and 79 support personnel, at a monthly cost of over $38,800. Those scouts are paid for by revenues from tourist hunting. A small sample of four operators spent over $201,000 on anti-poaching in 2015, to fund community scouts and fund and equip their own operator anti-poaching teams. This anti-poaching support is largely paid for by U.S. hunters, as over half of all hunting clients in Zambia are from the U.S.

[**Note:** Supporting documents for each of these points is available by contacting Conservation Force, cf@conservationforce.org. These Talking Points largely rely on the responses of ZPWMA and DNPW to FWS information requests and supporting documents provided as part of those responses as well as individual hunting operator enhancement reports, reports of the CAMPFIRE Association, and publicly available IUCN documents.]

MINI-ARGUMENTS REFUTING FALSE FACTS

- **There has never been a "ban" on elephant trophy imports from Zimbabwe.** A negative enhancement finding was made in April 2014 that "suspended" the import of elephant trophies. The FWS' negative 2015 enhancement finding stated repeatedly that once additional information was received, the negative finding would be reviewed and reversed (e.g., "The suspension … could be

lifted if additional information on the status and management of elephants in Zimbabwe becomes available, including utilization of revenue generated through sport-hunting by U.S. hunters, which satisfies the conditions of the 4(d) special rule under the ESA.") A "ban" suggests a permanent prohibition; a "suspension" is a "temporary abrogation or withholding." Zimbabwe's elephant trophy imports were suspended.

- **Lifting of the suspension was not a political decision.** The decision should have been made in July 2015, when ZPWMA provided extensive additional documentation in response to a FWS questionnaire. The FWS requested "one more piece of information" at the CITES Conference of the Parties in September 2016. That information was provided in November 2016. No further information was needed, or requested. If the FWS had properly prioritized the issuance of elephant import permits—as they told ZPWMA they would at the CITES Conference of the Parties—the positive enhancement finding would have been made and these permits would have issued before the current Administration was in office.
- **The import of elephant trophies from Zimbabwe should not have been suspended in the first place.** In April 2014, the FWS announced the suspension based on an asserted "lack of information." In contradiction to CITES Res. Conf. 6.7's recommendation of notifying and consulting with range states before imposing stricter domestic measures, and the Endangered Species Act's requirement of "encouraging foreign conservation programs," 16 U.S.C. § 1537(b), the FWS shut down imports under an April 2014 negative enhancement finding that the FWS later admitted was wrong with respect to Zimbabwe's elephant population and level of poaching. In fact, the correct estimate for Zimbabwe's elephant population—almost 83,000—is 16,000 elephant higher than when the last, positive enhancement finding was made in 1997. That estimate is double the size of the elephant populations of Namibia and South Africa put together, yet the FWS maintains positive enhancement findings for the import of elephant trophies from Namibia and South Africa. The trophy import suspension was based on a mistaken concern that Zimbabwe's elephant population had declined, and the FWS should have admitted the mistake and reversed the suspension immediately. The failure to do so suggests a political motivation, not a scientific one.
- **Zimbabwe's elephant population is not "the worst managed," but is among the best.** That Zimbabwe maintains a stable elephant population of over 83,000, despite a despotic government, poor economy, and exploding human population growth rate, is a testament to the country's strong management. That number is almost 40% higher than in 1992, when the FWS confirmed the "threatened" listing of elephant, and almost 20% higher than in 1997, when the FWS made a positive enhancement finding authorizing the import of elephant trophies. This is due in part to ZPWMA being a parastatal separate and separately funded from the central government. It is also due to the commitment of Zimbabwe's citizens to maintaining their elephant, notwithstanding the costs—over 40 rural Zimbabweans were killed by elephant from 2010 to 2015. Zimbabwe's strong wildlife management is also demonstrated by recent IUCN Red List assessments of lion and giraffe, which indicated increasing populations of these species in Zimbabwe. The evidence demonstrates that Zimbabwe's wildlife management, not only its elephant management, is succeeding.]
- **Zimbabwe's elephant management is not "poor"; it is state-of-the-art and written by one of the world's foremost elephant experts.** In response to the April 2014 suspension of elephant trophy imports, ZPWMA took to heart the FWS' criticism that Zimbabwe's then-current elephant management plan dated to 1997. Although that plan was adaptively implemented and monitored, it was admittedly dated. Zimbabwe immediately began the process of adopting a brand-new, state-of-the-art elephant management plan—basically, to satisfy the FWS. This included a year of stakeholder planning workshops: a preparatory meeting of representatives from Zimbabwe's community-based natural resources management program, CAMPFIRE, in November 2014; a national elephant management planning workshop in December 2014; an elephant management planning and anti-poaching workshop in Mana Pools (Zambezi Valley) in early April 2015; an elephant management planning workshop in the Sebungwe range in May 2015; and an elephant management planning workshop in the South East Lowveld region in September 2015. Zimbabwe focused on regional planning because the four regions face different management challenges. Each planning workshop produced a regional elephant management plan that was incorporated into the final. The final document was drafted by a leading elephant scientist, and the process was monitored throughout by the IUCN's African Elephant Specialist Group.
- **Regulated hunting is not poaching.** By definition, "regulated" hunting is regulated and lawful. It is carefully monitored by ZPWMA, and offtakes are recorded in a national database. Lawfully hunted ivory tusks are marked to show that they are lawful and note the year of harvest. Moreover, regulated hunting revenues underwrite most anti-poaching expenses in Zimbabwe and the rest of Southern Africa, either by fees paid to government wildlife authorities that are used for law enforcement, or by operator-funded teams that patrol concessions and keep poachers out. Finally, revenue-sharing and contributions by hunting operators creates conservation incentives for rural communities most affected by wildlife, which disincentivizes poaching. For example, Zimbabwe's CAMPFIRE communities were receiving over $1.6 million per year in revenues from elephant hunting prior to the

import suspension. These funds allow for clinics and schools to be built, teachers' salaries to be paid, boreholes to be drilled, and so on. Hunting operators in Zambia are required to share at least 50% of harvested meat with rural communities. Many tons of meat can come from elephant hunts, to reduce the need and tolerance for bushmeat poaching and protect species in addition to elephant.

- **Allowing imports of elephant trophies will not damage the government's efforts to control ivory trafficking.** Elephant trophy imports have been authorized for Namibia and South Africa for the past three years, which demonstrates that a country may maintain lawful hunting and low poaching at the same time. In fact, according to the CITES MIKE data, the Southern African countries that depend upon regulated hunting as a conservation tool have the lowest Proportion of Illegally Killed Elephant (PIKE) rates in the world. PIKE, which is used to assess whether poaching levels are unsustainable, has never risen above the sustainability threshold in Southern Africa. PIKE at Zimbabwe's MIKE sites is well below that level. Moreover, national and international law requires the marking of ivory tusks taken as lawful hunting trophies, which clearly and visibly separates these lawful tusks from illegal ones.
- **Photographic tourism is not a substitute in most hunting areas.** Opponents argue that photographic tourism would be a better option than hunting. It is true that photo-tourism is available in some places; for example, some conservancies in Namibia benefit from photographic tourism revenues alone or a mixture of photo- and hunting tourism. But photo-tourism requires decent infrastructure and scenery, and dense enough wildlife populations to draw tourists. These may not be available in remote areas of a country without access to airports or other activities, and where the wildlife populations are not yet dense enough to ensure a sighting on a two-hour game drive. This is the situation in many CAMPFIRE Areas, where photographic tourism was tried … and failed. In these areas, without the benefits of hunting, the habitat would be converted to agriculture and livestock. Benefits to the rural community stakeholders are less from photographic tourism than from tourist hunting.

Dear Deputy Director Greg Sheehan

ELEPHANT TROPHY IMPORTS HAVE NEVER BEEN "BANNED," AND THE POSITIVE ENHANCEMENT FINDINGS ARE BASED ON THE BEST AVAILABLE INFORMATION RECEIVED IN 2014-2016

- There has been no "ban" on elephant trophy imports. In April 2014, the U.S. Fish and Wildlife Service (FWS) "suspended" the import of elephant trophies from Zimbabwe due to a lack of information. Zimbabwe's Parks and Wildlife Management Authority (ZPWMA) responded to two questionnaires from the FWS in April 2014 and December 2014. However, in March 2015, the FWS extended the suspension, finding information was still lacking. The negative enhancement finding dated March 2015 repeatedly affirmed, "The suspension … could be lifted if additional information on the status and management of elephants in Zimbabwe becomes available, including utilization of revenue generated through sport-hunting by U.S. hunters, which satisfies the conditions of the 4(d) special rule under the ESA." In July 2015, May 2016, and November 2016, ZPWMA responded to additional FWS questions. The November 2017 positive enhancement finding is based on these later responses and thousands of pages of supporting documents, including Zimbabwe's National Elephant Management Action Plan, 2014 countrywide elephant population surveys, 2014-2016 actual and projected budget data, 2014 and 2015 offtakes and 2016 quota data, 2014-2016 CAMPFIRE data, and much more.
- Issuing import permits for elephant trophies from Zimbabwe was not a political decision by this Administration. In September 2016, before the election occurred, the FWS had already indicated to ZPWMA that the suspension would be lifted. ZPWMA was told by the Chief of Permits that the FWS needed "only one more piece of information," a prioritization of the new Elephant Management Plan, before the negative enhancement finding could be reversed. That prioritization was provided on November 8, 2016, before the election results were in. At the end of 2016, the FWS should have made the positive enhancement finding, but was admittedly sidetracked by an influx of thousands of new permit applications due to the listing of rosewood (used extensively in musical instruments and furniture) on the CITES Appendixes effective January 2017.
- Similarly, there has been no "ban" on the import of elephant trophies from Zambia. In October 2011, the FWS made a positive enhancement finding to authorize the import of regulated elephant hunting trophies from Zambia. However, 2013 and 2014, Zambia's wildlife authority suspended hunting to obtain more current wildlife population information. In 2015, Zambia's government lifted the hunting suspension, and set a conservative quota of 80 elephant. In August 2016, the Chief of Permits sent an email indicating that the FWS was trying to issue import permits for elephant trophies from Zambia before the CITES Conference of the Parties in September 2016, based on an April 2015 Non-Detriment and Enhancement Finding the FWS received from Zambia's wildlife authority. However, the FWS ran out of time. At the Conference of the Parties, the Chief of Permits indicated that

elephant permits from Zambia would likely issue before the end of the year. Again, because of the new rosewood permits, that enhancement finding was put on a back burner.

ZIMBABWE'S ELEPHANT POPULATION IS THE SECOND-LARGEST IN AFRICA

- In 1900, it was estimated that Zimbabwe had a national population of 4,000 elephant. Since then, the population has grown to over 82,000 (a twenty-fold increase). The current population is double the target national population established in the 1980s, almost 40% larger than in 1992, when the FWS determined to maintain the Endangered Species Act (ESA) "threatened" listing, and almost 20% larger than in 1997, when the last positive enhancement finding was made (before November 2017). Elephant sub-populations in Zimbabwe are generally considered stable or increasing.
    - North-West Matabeleland: This population is estimated at 54,000, and is most densely located in Hwange National Park (45,000 elephant). In 1928, the estimated elephant population in Hwange was 2,000.
    - Sebungwe: This population is estimated at 3,500 and has declined since 2001 due to human population expansion into a previously unsettled area. The human population exploded from 45,000 in 1950 to over 700,000 in 2013, which explains the decline in the elephant population. Due to the expansion of human settlement and unlike other major elephant ranges in Zimbabwe, the habitat in this area is fragmented.
    - Mid-Zambezi Valley: This area has an estimated elephant population of about 12,000. That population declined since the 2001 countrywide survey, and it is believed the decline is due to cross-border poaching and perhaps, the cross-border movement of elephants during the survey. Anti-poaching is a major component of the Zambezi Valley/Mana Pools Regional Elephant Management Action Plan, and recently the area has been chosen as a CITES MIKES site with an ongoing project.
    - South-East Lowveld: Most of this population inhabits Gonarezhou National Park, whose population has been growing consistently at 5% per annum over 20 years. This region's sub-population is estimated at 13,000 elephant between the Park, surrounding communal areas, and nearby private conservancies.

ZAMBIA'S ELEPHANT POPULATION IS STABLE

- Zambia's elephant population inhabits seven sub-regions covering National Parks and Game Management Areas. According to the 2016 African Elephant Status Report, Zambia's elephant population is estimated at over 21,000. This is generally considered stable over the past 25 years, and is stable compared to Zambia's population in 1992, when the FWS determined to maintain elephant as "threatened" listed. However, several population surveys indicating an estimate closer to 30,000 were not included in the 2016 African Elephant Status Report, and Zambia's wildlife authority estimates the country's population at more than 30,000.

ELEPHANT HUNTING OFFTAKES IN ZIMBABWE ARE SUSTAINABLE

- Zimbabwe maintains a CITES export quota of 1,000 tusks from 500 bull elephants. A national quota of 500 elephants represents only 0.6% of a population of 82,630 elephant. Actual hunting offtakes are considerably lower, have a negligible impact on the overall population rate, and have declined in the past three years due to the import suspension.

    Average Hunting Offtakes 2010-2013 (% of Total Elephant Population): 228 (0.276%)
    2013 Hunting Offtakes (% of Total Elephant Population): 258 (0.312%)
    2014 Hunting Offtakes (% of Total Elephant Population): 162 (0.196%)
    2015 Hunting Offtakes (% of Total Elephant Population): 075 (0.091%)

ELEPHANT HUNTING OFFTAKES IN ZAMBIA ARE NEGLIGIBLE

- In 2013 and 2014, Zambia suspended regulated tourist hunting to obtain a better sense of national wildlife population trends. In 2015, Zambia set a conservative export quota of 160 tusks from 80 bull elephants. Zambia maintained the quota of 80 elephants in 2016 and 2017. A national quota of 80 elephants represents less than 0.4% of a population of 21,967 elephant. Actual hunting offtakes are negligible and have no impact on the national population rate.

    2015 Hunting Offtakes (% of Total Elephant Population): 03 (0.014%)
    2016 Hunting Offtakes (% of Total Elephant Population): 12 (0.055%)

ELEPHANT MANAGEMENT IN ZIMBABWE IS GUIDED BY APPROPRIATE LEGISLATION AND A STATE-OF-THE-ART MANAGEMENT PLAN

- Governing Law: The Zimbabwe Parks and Wild Life Act provides the regulatory mechanism for ZPWMA and its programs. The Act created ZPWMA as a parastatal authority apart from the central government and established a separate fund, apart from the Central Treasury, to sustain ZPWMA's operations. The Act sets harsh penalties for elephant-related offenses, and was amended in 2010 to impose a nine-year minimum sentence for the first offense of elephant poaching. Under the Parks and Wild Life Act, Rural District Councils and other land holders are granted "appropriate authority" to benefit directly from wildlife. Under this legislation, land holders are encouraged to maintain and increase wildlife populations because they retain the benefits of sustainable use of that wildlife.
- Elephant Management Plan: Elephant are managed according to the Zimbabwe National Elephant Management Plan (2015-2020). The plan incorporates specific action items, deliverables, deadlines, and responsible parties. It is an adaptive management plan utilizing prioritization of targets measured by key components, strategic objectives, and outputs. The plan focuses on five major components: Protection and Law Enforcement; Biological Monitoring and Management; Social, Economic, and Cultural Framework; Building Conservation Capacity; and Program Management. The National management plan is supplemented by four regional plans that utilize the same framework to address the unique challenges for each major elephant range in Zimbabwe. Zimbabwe's elephant management planning process was kicked off by the FWS' elephant trophy import suspension. ZPWMA held a year of stakeholder planning workshops, including a preparatory meeting of representatives from CAMPFIRE in November 2014; a national elephant management planning workshop in December 2014; an elephant management planning and anti-poaching workshop in Mana Pools (Zambezi Valley range) in March-April 2015; an elephant management planning workshop in the Sebungwe range in May 2015; and an elephant management planning workshop in the South East Lowveld range in September 2015.

ELEPHANT HUNTING IN ZIMBABWE GENERATES CONSERVATION BENEFITS THAT SATISFY THE "ENHANCEMENT" STANDARD: Although hunting offtakes are negligible, elephant hunting fees create extensive conservation incentives in Zimbabwe.

- Habitat: Hunting areas in Zimbabwe represent ~130,000 km^2 of protected habitat. This represents over four times the size of Zimbabwe's National Parks (~28,000 km^2). Healthy elephant populations require large tracts of habitat; the areas set aside for regulated hunting are therefore essential to the elephant's continued survival.
- Management and Enforcement Revenues: Revenues generated from tourist hunting conducted on state lands comprised approximately 20% of ZPWMA's revenue stream in 2014. Over $6.2 million in trophy fees came from elephant hunts, with $5 million accruing to ZPWMA to reinvest in elephant protection and species management. Over 50% of that revenue came from U.S. clients. Almost 80% of ZPWMA's operating budget is allocated towards law enforcement in the form of staff costs and patrol provisions. ZPWMA employs 1,500 active field rangers. Put simply, hunting revenues support anti-poaching efforts across Zimbabwe's elephant range—and this is largely paid for by American elephant hunters.
- Operator Anti-Poaching: In addition to supporting ZPWMA's enforcement capacity, hunting operators deploy their own anti-poaching units to police the Safari Areas and fund community game scouts in CAMPFIRE Areas. For example, a small sample of 14 individual operators surveyed by the Safari Operator Association of Zimbabwe spend $957,843 on anti-poaching in 2013 and deployed 245 anti-poaching scouts. One specific operator, Charlton McCullum Safaris (CMS) in the Dande Safari Area and Mbire Communal Area, spends on average $80,000-$90,000 in patrol and equipment costs and anti-poaching rewards. From 2010 to 2016, CMS' efforts led to an 82% decline in elephant poaching in an import border region. As another example, the Save Valley and Bubye Valley Conservancies together spend over $1 million on anti-poaching each year. These anti-poaching efforts are funded predominately by hunting revenue, and protect stable populations of elephant and the third-largest black rhino population in the world.
- Regional Anti-Poaching: According to the CITES "Monitoring the Illegal Killing of Elephants" (MIKE) program, poaching in the Southern African countries that allow regulated tourist hunting, including Zimbabwe, is lower than anywhere else on the continent and has never reached an unsustainable level. This stands in stark contrast to the West and Central African countries that do not rely upon tourist hunting as a conservation tool.
- Community Benefits: Zimbabwe's CAMPFIRE program is the pioneering community-based natural resource management program in Africa. The program allows rural communities to financially benefit from wildlife, thereby incentivizing the use of communal land as wildlife habitat, and the protection of wildlife in the form of increased tolerance of destructive wildlife. An estimated 77,000 households rely on CAMPFIRE benefit from CAMPFIRE. 90% of CAMPFIRE revenue is generated from regulated hunting, and 70% of this comes from elephant hunting. Thus, prior to the import suspension, elephant hunting generated over $1.6 million per year for CAMPFIRE communities and

was reinvested in the construction of classrooms and clinics, the installation of water infrastructure and solar powered facilities, the purchase of vehicles for anti-poaching support, compensation for destruction of crops or livestock by dangerous game, and other benefits that improve the livelihoods of the rural communities living in CAMPFIRE Areas. These benefits offset the damage caused by game species: from 2010 to 2015, elephant destroyed 7,495 hectares of crop fields in CAMPFIRE communities and claimed the lives of approximately 40 people.

ELEPHANT MANAGEMENT IN ZAMBIA IS UP-TO-DATE AND GENERATES SUBSTANTIAL BENEFITS TO ENCOURAGE RECOVERY OF THE SPECIES

- Governing Law: The Zambian Wildlife Act No. 14 of 2015 is the guiding legislation for elephant protection and management. This cutting-edge law consolidated the prior wildlife authority into a government Department of National Parks and Wildlife (DNPW), to address the funding concerns and shortfalls experienced by the prior authority. DNPW is made up of a Wildlife Law Enforcement Unit with over 1,250 rangers; a Conservation Unit; an Infrastructure Development Unit; and a Community-Based Natural Resource Management Unit to oversee the development of conservation planning in Game Management Areas.
- Management and Enforcement Revenues: Between 2010 and 2012, regulated hunting revenues accounted for approximately 32% of the operating budget funding for Zambia's wildlife authority. With a potential to generate nearly $1 million in elephant hunting fees, in 2015 and 2016, these fees totaled only $150,000, due mainly to import restrictions. This amount was divided between DNPW and the Community Resource Boards in Game Management Areas (GMA). DNPW uses this revenue for range salaries and resource protection, as well as management surveys, staff training, and other activities. Approximately 75% of DNPW's expenditures are for anti-poaching, and Zambia's Wildlife Law Enforcement Unit conducted over 10,500 anti-poaching patrols in 2015, involving an average of 5,878 staff per quarter and 237,028 patrol days.
- Habitat: Hunting areas in Zambia (~180,000 km²) provide almost three times the amount of protected habitat compared to the country's National Parks (~64,000 km²).
- Community Benefits: In GMAs, elephant license fees are divided equally between the DNPW and the GMA's Community Resource Board, and 20% of concession fees also accrue to the Board. In 2015 and 2016, approximately $1.36 million in hunting fees was distributed to the Boards, as well as $10,000 per concession paid by the hunting operator. Under the new Wildlife Law, Boards must invest those funds as follows: 45% towards wildlife protection and patrols, 35% towards community improvement projects such as construction of schools, clinics, and water infrastructure, and 20% towards administrative costs. Written concession agreements between the operators, DNPW, and the community Boards usually obligate the concessionaire to make further communities investments, such as constructing a classroom and paying a teacher's salary. Operators in 13 blocks were obligated to spend over $1.1 million in community infrastructure development and 3.4 million in community lease and other payments for the duration of their leases.
- Game Meat Distributions: Moreover, under Zambian law, at least 50% of harvested game meat must be donated and distributed to local communities. A 2015 study found that operators in three GMAs contributed an average of 6,000 kilograms of harvested meat per season, and estimated that operators across all GMAs could provide ~130 tons of much-needed protein annually. This reduces the incentive for bush meat poaching in these areas bordering and buffering Zambia's National Parks.
- Operator Anti-Poaching: Hunting operators' concession agreements with DNPW and the Community Resource Board identify mandatory anti-poaching obligations and expenditures. At present, 75 Boards employ over 750 wildlife scouts and 79 support personnel, at a monthly cost of over $38,800. Those scouts are paid for by revenues from tourist hunting. A small sample of four operators spent over $201,000 on anti-poaching in 2015, to fund community scouts and fund and equip their own operator anti-poaching teams. This anti-poaching support is largely paid for by U.S. hunters, as over half of all hunting clients in Zambia are from the U.S.

[Note: Supporting documents for each of these points is available by contacting Conservation Force, cf@conservationforce.org. These Talking Points largely rely on the responses of ZPWMA and DNPW to FWS information requests and supporting documents provided as part of those responses as well as individual hunting operator enhancement reports, reports of the CAMPFIRE Association, and publicly available IUCN documents.]

MINI-ARGUMENTS REFUTING FALSE FACTS

- There has never been a "ban" on elephant trophy imports from Zimbabwe. A negative enhancement finding was made in April 2014 that "suspended" the import of elephant trophies. The FWS' negative 2015 enhancement finding stated repeatedly that once additional information was received, the negative finding would be reviewed and reversed (e.g., "The suspension … could be lifted if additional information on the status and management of elephants in Zimbabwe becomes available, including utilization of revenue generated through sport-hunting by U.S. hunters, which satisfies the conditions of the 4(d) special rule under the ESA.") A "ban" suggests a permanent prohibition; a "suspension" is a "temporary abrogation or withholding." Zimbabwe's elephant trophy imports were suspended.
- Lifting of the suspension was not a political decision. The decision should have been made in July 2015, when ZPWMA provided extensive additional documentation in response to a FWS questionnaire. The FWS requested "one more piece of information" at the CITES Conference of the Parties in September 2016. That information was provided in November 2016. No further information was needed, or requested. If the FWS had properly prioritized the issuance of elephant import permits—as they told ZPWMA they would at the CITES Conference of the Parties—the positive enhancement finding would have been made and these permits would have issued before the current Administration was in office.
- The import of elephant trophies from Zimbabwe should not have been suspended in the first place. In April 2014, the FWS announced the suspension based on an asserted "lack of information." In contradiction to CITES Res. Conf. 6.7's recommendation of notifying and consulting with range states before imposing stricter domestic measures, and the Endangered Species Act's requirement of "encouraging foreign conservation programs," 16 U.S.C. § 1537(b), the FWS shut down imports under an April 2014 negative enhancement finding that the FWS later admitted was wrong with respect to Zimbabwe's elephant population and level of poaching. In fact, the correct estimate for Zimbabwe's elephant population—almost 83,000—is 16,000 elephant higher than when the last, positive enhancement finding was made in 1997. That estimate is double the size of the elephant populations of Namibia and South Africa put together, yet the FWS maintains positive enhancement findings for the import of elephant trophies from Namibia and South Africa. The trophy import suspension was based on a mistaken concern that Zimbabwe's elephant population had declined, and the FWS should have admitted the mistake and reversed the suspension immediately. The failure to do so suggests a political motivation, not a scientific one.
- Zimbabwe's elephant population is not "the worst managed," but is among the best. That Zimbabwe maintains a stable elephant population of over 83,000, despite a despotic government, poor economy, and exploding human population growth rate, is a testament to the country's strong management. That number is almost 40% higher than in 1992, when the FWS confirmed the "threatened" listing of elephant, and almost 20% higher than in 1997, when the FWS made a positive enhancement finding authorizing the import of elephant trophies. This is due in part to ZPWMA being a parastatal separate and separately funded from the central government. It is also due to the commitment of Zimbabwe's citizens to maintaining their elephant, notwithstanding the costs—over 40 rural Zimbabweans were killed by elephant from 2010 to 2015. Zimbabwe's strong wildlife management is also demonstrated by recent IUCN Red List assessments of lion and giraffe, which indicated increasing populations of these species in Zimbabwe. The evidence demonstrates that Zimbabwe's wildlife management, not only its elephant management, is succeeding.]
- Zimbabwe's elephant management is not "poor"; it is state-of-the-art and written by one of the world's foremost elephant experts. In response to the April 2014 suspension of elephant trophy imports, ZPWMA took to heart the FWS' criticism that Zimbabwe's then-current elephant management plan dated to 1997. Although that plan was adaptively implemented and monitored, it was admittedly dated. Zimbabwe immediately began the process of adopting a brand-new, state-of-the-art elephant management plan—basically, to satisfy the FWS. This included a year of stakeholder planning workshops: a preparatory meeting of representatives from Zimbabwe's community-based natural resources management program, CAMPFIRE, in November 2014; a national elephant management planning workshop in December 2014; an elephant management planning and anti-poaching workshop in Mana Pools (Zambezi Valley) in early April 2015; an elephant management planning workshop in the Sebungwe range in May 2015; and an elephant management planning workshop in the South East Lowveld region in September 2015. Zimbabwe focused on regional planning because the four regions face different management challenges. Each planning workshop produced a regional elephant management plan that was incorporated into the final. The final document was drafted by a leading elephant scientist, and the process was monitored throughout by the IUCN's African Elephant Specialist Group.
- Regulated hunting is not poaching. By definition, "regulated" hunting is regulated and lawful. It is carefully monitored by ZPWMA, and offtakes are recorded in a national database. Lawfully hunted ivory tusks are marked to show that they are lawful and note the year of harvest. Moreover, regulated hunting revenues underwrite most anti-poaching expenses in Zimbabwe and the rest of Southern

Africa, either by fees paid to government wildlife authorities that are used for law enforcement, or by operator-funded teams that patrol concessions and keep poachers out. Finally, revenue-sharing and contributions by hunting operators creates conservation incentives for rural communities most affected by wildlife, which disincentivizes poaching. For example, Zimbabwe's CAMPFIRE communities were receiving over $1.6 million per year in revenues from elephant hunting prior to the import suspension. These funds allow for clinics and schools to be built, teachers' salaries to be paid, boreholes to be drilled, and so on. Hunting operators in Zambia are required to share at least 50% of harvested meat with rural communities. Many tons of meat can come from elephant hunts, to reduce the need and tolerance for bushmeat poaching and protect species in addition to elephant.

- Allowing imports of elephant trophies will not damage the government's efforts to control ivory trafficking. Elephant trophy imports have been authorized for Namibia and South Africa for the past three years, which demonstrates that a country may maintain lawful hunting and low poaching at the same time. In fact, according to the CITES MIKE data, the Southern African countries that depend upon regulated hunting as a conservation tool have the lowest Proportion of Illegally Killed Elephant (PIKE) rates in the world. PIKE, which is used to assess whether poaching levels are unsustainable, has never risen above the sustainability threshold in Southern Africa. PIKE at Zimbabwe's MIKE sites is well below that level. Moreover, national and international law requires the marking of ivory tusks taken as lawful hunting trophies, which clearly and visibly separates these lawful tusks from illegal ones.
- Photographic tourism is not a substitute in most hunting areas. Opponents argue that photographic tourism would be a better option than hunting. It is true that photo-tourism is available in some places; for example, some conservancies in Namibia benefit from photographic tourism revenues alone or a mixture of photo- and hunting tourism. But photo-tourism requires decent infrastructure and scenery, and dense enough wildlife populations to draw tourists. These may not be available in remote areas of a country without access to airports or other activities, and where the wildlife populations are not yet dense enough to ensure a sighting on a two-hour game drive. This is the situation in many CAMPFIRE Areas, where photographic tourism was tried … and failed. In these areas, without the benefits of hunting, the habitat would be converted to agriculture and livestock. Benefits to the rural community stakeholders are less from photographic tourism than from tourist hunting.
