South Dakota Citizen Science Pollinator Project

Photos by Doug Backlund.

They look like a Monarch dipped in chocolate.

Regal Fritillary (Speyeria idalia) is similar in size to the Monarch. The upper side of the forewing is bright red-orange with black markings. The upperside of the hindwing is black with a row of white spots. On the wing edge is a row of spots that are orange in males and white in females. The underside of the forewing is orange with a band of white spots and a black fringe. The hindwing is dark greenish brown with elongate white spots.

Monarch butterfly (Danaus plexippusis). The upperside of male is bright orange with wide black borders and black veins. The upperside of female is orangebrown with wide black borders and blurred black veins. Both sexes have white spots on borders. Males have a "pouch" on the hind wing, females do not.

Viceroy butterfly (*Limenitis archippus*) is a mimic. The coloring and pattern of Monarch and Viceroy wings look nearly identical. However, a Viceroy has a black line that runs parallel to the wing edge of the hindwing. They are smaller than a Monarch, but do not depend on size alone for identification.

Where To Look - Adult butterflies and bumble bees feed on a variety of flowers. They can be found statewide in open fields, meadows, weedy areas, marshes, roadsides, and your backyard. If you can find flowers, you will find pollinators.

When - They can be active any time spring to fall. They will be most active between 10 am and 3 pm on warm, low wind days.

Single Observation/Spot Record

Use this form if you are doing informal observations (i.e. while hiking or in your backyard).
