Study Guide for USFWS Casey's June Beetle Practical Examination

This practical examination is administered to those potentially qualified applicants who seek to apply, renew, or amend a federal 10(a)(1)(A) permit for Casey's June beetle (*Dinacoma caseyi*). Permit applicants should have the ability to identify scarab beetles to family. Individuals should be familiar with genera of common nocturnal scarabs likely to be encountered during their surveys, including: *Cyclocephala*, *Diplotaxis*, *Serica*, and *Tomarus* (formerly, *Ligyrus*). Rarely, *Polyphylla decemlineata* (the ten-lined June beetle) is found in the Palm Springs area. Likewise, applicants should be familiar with *Polyphylla cavifrons*, though it is not known to be sympatric with Casey's June beetle. *Polyphylla cavifrons* is known from nearby desert riparian areas.

List of scarab genera permit applicants should be able to identify: *Dinacoma; Parathyce, Polyphylla; Cyclocephala; Tomarus* (= *Ligyrus*); *Coenonycha; Serica; Phyllophaga; Phobetus, Diplotaxis; Cotinis; Aphodius.*
