FINDING OF NO SIGNIFICANT IMPACT

Listing Four Large Constrictor Snakes as Injurious Wildlife under the Lacey Act

Background

The purpose of the action to list live specimens, gametes, viable eggs, or hybrids of Python molurus, including Burmese python (Python molurus bivittatus) and Indian Python (Python molurus molurus), reticulated python (Broghammerus reticulatus or Python reticulatus), Northern African python (Python sebae), Southern African python (Python natalensis), boa constrictor (Boa constrictor), yellow anaconda (Eunectes notaeus), DeSchauensee’s anaconda (Eunectes deschauenseei), green anaconda (Eunectes murinus), and Beni anaconda (Eunectes beniensis) as injurious species under the Lacey Act is to prevent the importation and interstate movement, thereby preventing the spread beyond their current locations and their further introduction into natural or wild areas of the United States. This action was considered to fulfill the U.S. Fish and Wildlife Service’s (Service) obligations to protect our trust resources pursuant to the Lacey Act (18 U.S.C. 42, as amended). The Service is moving forward with publication of a final rule for four species (Burmese or Indian python, Northern African python, Southern African python, yellow anaconda), and the other five species (reticulated python, boa constrictor, DeSchauensee’s anaconda, green anaconda, and Beni anaconda) remain under consideration for listing as injurious. None of these four species selected for listing is native to the United States.

Decision

The Service has completed its determinations under 18 U.S.C. 42 of the Lacey Act and found that four evaluated species of constrictor snakes are injurious wildlife: the Indian python (including Burmese python), Northern African python, Southern African python, and yellow anaconda. Based upon my review of all alternatives as set forth in the Environmental Assessment, we have decided to implement Alternative 2B to list these four species as injurious wildlife while the other five species remain under consideration. This action will prohibit importation into the United States and interstate transport between States, the District of Columbia, the Commonwealth of Puerto Rico, or any territory or possession of the United States of the listed species. By prohibiting the importation and interstate transportation, Alternative 2B will protect wildlife and wildlife resources from negative impacts due to large constrictor snake introductions. None of these four species of constrictor snakes is native to the United States. All are injurious. Therefore, preventing the introduction into the United States or spread of an already introduced wildlife species into a U.S. ecosystem where it has not previously occurred cannot have a significant harmful effect on the environment. This decision to list these four species as injurious will reduce the risk of establishment of these four large constrictor snakes in the wild. It will minimize the likelihood that the species already present will spread beyond their current locations into other natural areas of the United States and insular territories. These large constrictor snakes have been imported or could be imported into the United States. All but two species of the nine considered under the proposed rule (possibly three, but identification of one is unconfirmed) have escaped or been released into natural and developed areas of the United States; all are likely to survive and become established, are likely to spread if introduced, and are
likely to prey on native wildlife species and compete with native species for food in vulnerable areas of the United States. Therefore, it will be difficult to prevent, eradicate, manage, or control the spread of large constrictor snakes, and it will be difficult to rehabilitate or recover ecosystems disturbed by any of these species. Furthermore, because of the predatory behavior of these four species, the negative effects to threatened and endangered species could be permanent. This decision provides the opportunity to prevent large constrictor snakes from establishing new populations in the United States or its territories.

The risk assessment conducted by USGS (Reed and Rodda 2009) concluded that the organism risk potential, which is calculated based on the probability and consequences of establishment, was “high” for five species (Indian or Burmese python, Northern African python, Southern African python, boa constrictor, and yellow anaconda), and “medium” for four species (reticulated python, DeSchauensee’s anaconda, green anaconda, and Beni anaconda). None of the nine species evaluated in the risk assessment was determined to be a low risk.

Alternatives Considered

In deciding to list these four species, I considered four alternatives: Alternative 1, No action, which refers to continuing the existing course of action or, more specifically, taking no action to list the large constrictor snakes as an injurious species under the Lacey Act, which would allow the continued importation and interstate transport of all live forms, gametes, eggs, and hybrids; Alternative 2A, list as injurious all nine large constrictor snakes (five “high” risk and four “medium” risk); Alternative 2B, list as injurious four large constrictor snakes (four “high” risk) while continuing to consider the status of five other large constrictor snakes (one “high” risk and four “medium” risk); Alternative 3, list as injurious seven large constrictor snakes (five “high” risk and two “medium” risk); and Alternative 4, list five large constrictor snakes (five “high” risk). A comparison of these alternatives can be found in the Final Environmental Assessment.

Public Involvement

The Service published a notice of inquiry in the Federal Register (73 FR 5784; January 31, 2008) as the first step in the rulemaking process, soliciting available biological, economic, and other information and data on the Python, Boa, and Eunectes genera for possible addition to the list of injurious wildlife under the Lacey Act and provided a 90-day period to submit information. We reviewed all information received for substantive issues and information regarding the injurious nature of species in the Python, Boa, and Eunectes genera. The Service received 1,528 responses during the information period that closed April 30, 2008, of which 115 provided economic, ecological, and other data responsive to 10 specific questions in the notice of inquiry. Most individuals responded to the notice of inquiry as though it was a proposed rule to list constrictor snakes in the Python, Boa, and Eunectes genera as injurious under the Lacey Act. As a result, most responses expressed either opposition or support for listing the large constrictor snake species. We considered the information provided in the 115 applicable comments in the preparation of the draft environmental assessment, draft economic analysis, and the proposed rule.

On March 12, 2010, we published a proposed rule (75 FR 11808) to list Python molurus, including Burmese python (Python molurus bivittatus) and Indian python (Python molurus
molurus), reticulated python (*Broghammerus reticulatus* or *Python reticulatus*), Northern African python (*Python sebae*), Southern African python (*Python natalensis*), boa constrictor (*Boa constrictor*), yellow anaconda (*Eunectes notaeus*), DeSchauensee’s anaconda (*Eunectes deschauenseei*), green anaconda (*Eunectes murinus*), and Beni anaconda (*Eunectes beniensis*) as injurious reptiles under the Lacey Act (18 U.S.C. 42). This proposed rule established a 60-day public comment period, ending May 11, 2010, and announced the availability of the draft economic analysis, draft initial regulatory flexibility analysis, and the draft environmental assessment of the proposed rule. At the request of the public, we reopened the comment period for an additional 30 days.

During the public comment periods (90 days total) for the proposed rule to list nine species, with draft economic analysis, initial regulatory flexibility analysis, and draft environmental assessment, we received approximately 56,500 comments including form letters, petitions, and post cards. We received comments from Federal agencies, State agencies, local governments, commercial and trade organizations, conservation organizations, nongovernmental organizations, and private citizens. Comments received provided a range of views on the proposed listing, as follows: (1) unequivocal support for the listing with or without additional information included; (2) equivocal support for the listing with or without additional information included; and (3) unequivocal opposition to the listing with or without additional information included. Comments received on the draft environmental assessment and Service responses are in the Appendix of the Final Environmental Assessment.

**Finding of No Significant Impact**

Based upon an evaluation of the information contained in the Final Environmental Assessment and supporting references, it is our determination that the proposal to list the Burmese or Indian python, Northern African python, Southern African python, and yellow anaconda as injurious wildlife does not constitute a major Federal action significantly affecting the quality of the environment, considering the context and intensity of impacts, under the meaning of section 102(2)(c) of the National Environmental Policy Act of 1969 (as amended). Thus, an environmental impact statement will not be prepared. The environmental assessment with supporting information is available at [www.regulations.gov](http://www.regulations.gov) or [http://www.fws.gov/verobeach](http://www.fws.gov/verobeach).

This determination is based on consideration of the following factors, which are addressed in the Final Environmental Assessment:

1. There will be no significant ecological impacts. No negative direct or indirect impacts to habitats will result from listing these four large constrictor snakes as injurious wildlife.

2. There will be no significant adverse impacts to native species. No negative impacts to native species will result from listing these four large constrictor snakes as injurious wildlife because this is a preventative action to reduce the risk from the introduction of these snakes into natural or wild areas of the United States through importation or interstate transport. Any impacts to native species from the potential increased ownership of these large constrictor snakes in States where they already are found cannot be controlled by the Service, as States regulate the species that can be utilized within State boundaries.
3. There will be no significant effects on public health and safety.

4. The effects of the quality of the human environment are not likely to be controversial.

5. The action will not establish a precedent for future actions with significant effects nor do they represent a decision in principle about a future consideration.

6. The cumulative impacts of listing these four large constrictor snakes in order to protect native species are not significant.

7. The action will not adversely affect any endangered or threatened species or its habitat that has been determined to be critical under the Endangered Species Act of 1973.

8. The action will not violate Federal, State, and local laws or requirements for the protection of the environment.

9. The action will not significantly affect any site listed in, or eligible for listing in the National Register of Historic Places, nor will this action cause losses or destruction of significant scientific, cultural, or historic resources.

10. The action does not involve highly uncertain, unique, or unknown environmental risks to the human environment.

11. Both beneficial and adverse effects have been considered and this action will not have a significant effect on the human environment.

12. The project will not significantly affect any unique characteristics of the geographic area such as proximity to historical or cultural resources, wild or scenic rivers, or ecologically critical areas.

Findings Required by Other Laws and Regulations

This decision to designate live specimens, gametes, viable eggs, or hybrids of Burmese or Indian python, Northern African python, Southern African python, and yellow anaconda as injurious wildlife under the Lacey Act is consistent with the intent of the Lacey Act, which is to protect humans, the welfare and survival of wildlife and wildlife resources and the interests of agriculture, horticulture or forestry from actual and potential negative impacts from a species by preventing their importation and interstate movement.
